Minerals Yearbook

1975

Volume III

AREA REPORTS: INTERNATIONAL

Prepared by staff of the

BUREAU OF MINES

UNITED STATES DEPARTMENT OF THE INTERIOR • Cecil D. Andrus, Secretary

BUREAU OF MINES • Roger A. Markle, Director

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

Foreword

The Federal Government, through the Minerals Yearbook and its predecessor volumes, has reported annually on mineral industry activities for 94 years. This edition discusses the performance of the worldwide mineral industry during 1975. In addition to statistical data, the volumes provide background information to assist in interpreting the year's developments. Content of the individual volumes follows:

Volume I, Metals, Minerals, and Fuels, contains chapters on virtually all metallic, nonmetallic, and mineral fuel commodities important to the domestic economy. In addition, it includes a general review chapter on the mineral industries, a chapter on mining and quarrying trends, and a statistical summary.

Volume II, Area Reports: Domestic, contains chapters on the mineral industry of each of the 50 States, the U.S. island possessions in the Pacific Ocean and the Caribbean Sea, and the Commonwealth of Puerto Rico. This volume also has a statistical summary, identical to that in Volume I.

Volume III, Area Reports: International, contains the latest available mineral data on more than 130 foreign countries and discusses the importance of minerals to the economies of these nations. A separate chapter reviews the international minerals industry in general and its relationship to the world economy.

The Bureau of Mines continually strives to improve the value of its publications to its users. Therefore, the constructive comments and suggestions of readers of the Yearbook will be welcomed.

ROGER A. MARKLE, *Director*

Acknowledgments

The Bureau of Mines, in preparing this volume, utilized extensively statistical and other basic data on mineral production, consumption, and trade provided by various foreign government mineral and statistical agencies through a variety of official publications. The cooperation and assistance of these agencies is gratefully acknowledged. Statistical and informational material was also obtained from airgrams of the U.S. Department of State, from United Nations publications, and from the domestic and foreign technical and trade press. Of particular help in preparing this volume were the routine and special reports submitted by the minerals, petroleum, economic, and commercial officers and other members of the Department of State. Their contributions are sincerely appreciated.

The chapters of this volume were prepared by the staff of the Assistant Director—International Data and Analysis of the Associate Directorate—Minerals and Materials Supply/Demand Analysis. The "Minerals in the World Economy" chapter and the production and trade tables of the country chapters were prepared in the Geographic Statistics Group of the Office of Technical Data Services. Final correlation and checking of this volume were performed by the Minerals Yearbook staff of the Office of Technical Data Services.

The regimes of some countries reviewed in this volume are not recognized by the U.S. Government. The information contained herein is technical and statistical in nature and is not construed as conflicting with or being contradictory of U.S. policies toward these countries.

ALBERT E. SCHRECK, *Editor-in-Chief*

Minerals in the World Economy

By Charles L. Kimbell [1] and George A. Morgan [2]

The general downturn in world economic activity that occurred in 1975 was clearly seen in almost every aspect of the mineral industry that can be readily quantified. Sharp downturns measured among market economy nations, particularly the developed market economy nations, were partly compensated for, in worldwide figures, by continued growth among the centrally planned economy countries of Eastern Europe. The world's economic problems, probably dominated by the sharp rise in the cost of energy materials, combined to reverse the general upward trends in mineral production, trade, and consumption that extended from recovery from the recession of 1958 until 1974. Specifically, the United Nations index of world extractive mineral industry output for 1975 declined 2 points to 114 (1970=100), a downturn of 1.7% compared with the index for 1974 to a level approximately equal to that of 1973.

The market economy nations registered a 5-point (4.4%) decline from 112 to 107, while the centrally planned economy nations recorded a 7-point (5.6%) increase from 124 to 131. In terms of current dollars (that is, without adjustment for inflation), the dollar value of world mineral production probably increased somewhat, but the United Nations index is adjusted for inflation. The index does, however, incorporate real gains in costs of products, so quantitative levels of mineral production diminished even more substantially than would be indicated by this value-based index. In terms of quantitative output statistics, 1975 output of 61 of 81 mineral commodities discussed in this chapter declined compared with 1974 levels, production of one commodity equaled the 1974 level and only 19 commodities registered increases.

In the area of mineral commodity trade, without adjustment for inflation, a decline of about 3% from the 1974 level of $263,140 million was indicated by preliminary returns. Owing to the continued increases in the unit value of mineral commodities in terms of current dollars, this decrease suggests a substantially greater decline in the volume of materials moved in 1975.

No comprehensive index for consumption of all commodities is available, but declines were registered on a worldwide aggregate basis for major commodities, including iron ore, iron and steel scrap, iron and steel, aluminum, copper, lead, zinc, tin, sulfur, phosphate rock, potash, and petroleum. Modest gains were registered by nitrogen fertilizers, coal, and natural gas. In terms of the aggregate of all forms of energy, total world consumption advanced 1.1% between 1974 and 1975, but world per capita consumption declined 0.6% in 1975. Perhaps more significant, however, was the fact that total energy consumption in market economy nations fell, albeit only 1.4%, while the total world increase was the result of a 6.8% increase credited to centrally planned economy nations.

The data on investment in mineral industry activities, although far from comprehensive, provide perhaps the brightest aspect of an otherwise depressed year. Investment data available seem to indicate that corporate expenditures at least paced the inflationary trend; therefore, provisions seemingly were being made for continued

[1] Supervisory physical scientist, Office of Technical Data Services.
[2] Physical scientist, Office of Technical Data Services.

growth when commodity demand again increases. One other aspect of brightness could be found in the quarter-by-quarter results of the United Nations industrial production indexes. Most of these index numbers for most world areas showed an upturn in the final quarter of 1975, portending recovery during 1976 of at least some of the ground lost in output levels.

The reopening of the Suez Canal undoubtedly had a desirable impact on the cost of at least some mineral commodity transportation, but most of the newer ore carriers and tankers are unable to use the Suez because of their immense size, both width and draft; therefore, the advantages to the mineral industry are somewhat limited. Moreover, any effort to improve the waterway to a size adequate to handle the giant bulk carriers would prove very time-consuming and costly. These factors, together with the continued unsettled conditions in the Near East, make improvement projects unlikely.

PRODUCTION

The estimated value of world crude mineral production in 1975 was $191,600 million in terms of constant 1973 dollars, about 1.7% below the revised 1974 level of $195,000 million. The quantitative decline, however, was significantly greater than is suggested by the 1.7% figure, because of increases in the unit prices of many commodities. Even in terms of constant dollars, most mineral commodities had higher unit values in 1975 than in 1974, and thus the decline in volume of production was partly compensated for by unit-price increases.

The following tabulation summarizes approximate data on value of world mineral production for selected years in the period 1950–75:

Year	Billion constant 1973 dollars: Value of 53 [1] major crude mineral commodities [2]	Billion constant 1973 dollars: Value of all crude mineral commodities [3]
1950	46.2	52.6
1953	60.3	69.3
1958	77.4	93.0
1963	85.6	104.9
1968	99.2	120.2
1972	149.4	179.8
1973	159.2	191.6
1974	162.0	195.0
1975	159.2	191.6

[1] The list of commodities included appears in table 5 of the 1974 edition of this chapter; one commodity covered for 1950–68 (beryl) is excluded from the 1972–74 figures, but the overall impact of this omission is regarded as insignificant.

[2] Data for all years except 1972, 1974 and 1975 are as reported in Annales des Mines, December 1975, p. 13; data for 1972, 1974, and 1975 are extrapolated from the 1973 Annales des Mines figures on the basis of the United Nations index of extractive industry production in the United Nations Monthly Bulletin of Statistics, August 1976, p. xii.

[3] Data were extrapolated from those values given for 53 commodities to compensate for commodities not included in the source of that data. For details on the basis for extrapolation, see relevant text in the 1974 edition of this chapter under "Value of World Mineral Production."

These figures belittle the role of the mineral industry in the world economy however, for they represent an approximation of the value of minerals in their crudest form—the actual product of a mine—and not the enhanced value that results from beneficiation, smelting, and other downstream processing, as well as the value added in transporting much of these mineral materials from the nations where they are produced in the crude form to the nations where they are ultimately consumed. If the value added through processing—smelting of metals, refining of oil, and manufacture of basic materials such as cement and fertilizers—were included, a 1975 figure on the order of $420 billion could be regarded as a conservative estimate of the value of output of primary mineral processing plants. Moreover, it should be noted that the crude and processed mineral commodities constitute the overwhelmingly dominant share of the total raw material base for all manufacturing endeavors, as well as a significant requirement for the agricultural industries because they include fertilizers.

PRODUCTION INDEX PATTERNS

The United Nations indexes for mineral industry production of the world (excluding the centrally planned economy nations of Asia) are given in table 1, together with index numbers for major sectors of the industry and for overall industrial production. All figures are provided for the world aggregate and for major individual geographic and economic areas.

The index for output of the extractive industry as a whole registered a 1.7% decline between 1974 and 1975; adjustments made in this index indicate that total world extractive industry output value increased 1.8% between 1973 and 1974 (revised from the 3.5% rise reported in the 1974 edition of this chapter). Thus, in terms of the index number, world extractive mineral industry output value in 1975 was below that of 1974 and about equal to that of 1973.

The value of output of the world coal industry went counter to the general trend of the extractive industries, registering a 2.1% increase between 1974 and 1975, a marked contrast to the 3.3% decline recorded for the petroleum and natural gas industry and the 2.8% decrease computed for the metals extractive industry. The increase noted for coal is a reflection of a shift back toward coal among major energy sources following sharp increases in world oil prices and instability of oil supplies for some nations owing to political rather than economic considerations.

Also noteworthy are the sharp differences between the index patterns for the centrally planned economy nations of Europe and those for the market economy nations. For the extractive industry index, as well as two of its three components that are shown, the centrally planned economy nations registered substantial gains between 1974 and 1975. (In the case of the third component, metals extraction, these nations did not register a decline.) Nearly all the market economy nations showed declines in all indexes except that for coal. Exceptions to this were metals extraction in Australia-New Zealand, petroleum and natural gas in market economy Europe (including the European Economic Community), petroleum and natural gas in Latin America, and total extractive industry in Australia-New Zealand.

As in the case of the extractive industries, the major sectors of processing industries that relate directly to mineral raw materials all showed declines in terms of total world output, as measured by the United Nations indexes reflecting worldwide industry. In the case of the processing industries, however, the decline in the world index was the result of shortfalls among only the developed market economy nations. Both the developing market economy nations and the centrally planned economy nations registered gains that, in part, compensated numerically for shortfalls in developed market economy countries. Clearly the general economic problems that affected the developed market economy nations were not as pronounced among developing market economy countries although they were reflected in lower levels of crude mineral production for export from the developing countries to developed countries, and thus had an impact on the economies of the developing nations. Moreover, there was only minimal effect of these general economic problems upon the centrally planned economy countries of Europe.

QUANTITATIVE COMMODITY OUTPUT

Total world production of 81 mineral commodities is given for the years 1973–75 in table 2.[3] Regional distribution of these same commodities for 1975 is given by major physical geographic area in table 3 and by economic group of nations in table 4. In addition, the statistical summary at the end of this chapter includes world output of selected major commodities by principal producing country for 1973–75.

The most prominent aspect of the data in table 2 is the vast number of commodities for which production declines were registered between 1974 and 1975—of the 81 commodities listed, 61, or over 75%, showed declines, with only 19 registering gains and 1 maintaining its 1974 production level. This was a reversal of the pat-

[3] The previous edition of this chapter covered only 71 commodities; additions in this edition are refined copper, smelter nickel, bentonite, fuller's earth, kaolin, sodium carbonate, sodium sulfate, carbon black, natural gas liquids, and refined petroleum.

tern between 1973 and 1974, when 57 commodities registered increases and 24 registered declines.

Nonfuel Mineral Commodities.—Of the 41 metallic mineral commodities listed in table 2, only 10 registered production increases between 1974 and 1975 and 31 showed declines. None of the major metals —iron, aluminum, copper, lead, and zinc— showed gains either in mine output or in production of ingot metal. Metal commodities registering increases were as follows: Beryl concentrate (2.8%), chromite (6.9%), mine cobalt (1.4%), manganese ore (7.3%), mine nickel (3.5%), smelter tin (0.7%), rutile titanium concentrate (6.0%), tungsten (1.4%), uranium (7.6%), and vanadium (12.9%). The fact that a number of ferroalloying metal minerals was included among the metals registering production increases did not alter the fact that total ferroalloy production declined 5.7%, a decrease only slightly smaller than those registered for pig iron and crude steel.

Among the 29 nonmetallic mineral commodities shown in table 2, only 4—barite, nitrogen fertilizers, sulfur from pyrite, and vermiculite—registered growth in output levels between 1974 and 1975. Most declines registered by the remaining 25 commodities were 5% or less, but there were exceptions, most notably the 46.7% fall in strontium mineral production, the 14.9% drop in output of talc and related materials, the 11% decline in gem diamond output, the 10.5% decline in gypsum output, and the 10.3% drop in feldspar output. Tables 34 to 51 in the statistical summary section of this chapter give output levels of selected major nonfuel mineral commodities (metals and nonmetals) by major producing country for 1975.

Mineral Fuel Commodities.—In 1975, world production of energy from all commercial sources (excluding wood, charcoal, bagasse, and animal dung, which are regarded as noncommercial sources) totaled 8,555 million tons of standard coal equivalent (SCE), almost 5.5% below the revised 1974 level of 8,602 million tons SCE, and only slightly above the revised 1973 level of 8,504 million tons SCE. The distribution of this energy production, by fuel source, is given in the following tabulation for 1973–75:

Energy source	Share of total energy producton [1] (percent)		
	1973	1974	1975
Coal (including lignite)	29.2	29.3	30.9
Petroleum	49.8	49.4	47.1
Natural gas	18.8	18.9	19.4
Hydro, geothermal, and nuclear electricity	2.2	2.4	2.6
Total	100.0	100.0	100.0

[1] Based on data in United Nations, World Energy Supplies, 1971–75. Statistical Papers, ser. J, No. 20, New York, 1977, p. 2. Figures for 1973 and 1974 differ from data published in previous editions of Minerals Yearbook owing to data changes in source publication.

The increased share of the total accounted for by coal, comparing the figures of 1973 with those of 1975, is notable; the share of total commercial energy derived from coal in 1973 was the lowest on record, and the share of total energy from oil in that year was the highest on record. The 19.4% of total commercial energy production accounted for by natural gas in 1975 was the highest share ever recorded for that commodity, and the 2.6% credited to hydro, geothermal, and nuclear energy for 1975 was also a record high for these primary electrical energy sources.

Of the 11 mineral fuel commodities reported in table 2, 6 showed declines between 1974 and 1975 and 5 registered gains, including all three types of coal (anthracite, bituminous and lignite), peat, and natural gas. Details on output of major fuels, by principal producing country are given in tables 52 to 56 in the statistical summary at the end of this chapter.

VALUE OF WORLD MINERAL PRODUCTION

General estimations regarding total world mineral output value in 1974 and 1975 appear in the first paragraphs of this production section and in the tabulation that accompanies them; no data are provided in this edition of the Minerals Yearbook on the subject of value of world mineral production on a country or a commodity basis. The source for this information, the French mineral industry publication *Annales des Mines,* publishes only on a 5-year cycle in this detail, the last year covered being 1973. For information on the 1973 distribution of world mineral output value by commodity and country and details on the methods used to extrapolate this data in aggregate to the present, the reader is referred to the corresponding section of the 1974 edition of Minerals in the World Economy.

TRADE

GENERAL TRENDS

The aggregate value of world mineral commodity trade rose to $322,871 million in 1974, the latest year for which reasonably comprehensive data are available. This represents a 108.9% increase over the value of world mineral commodity trade posted in 1973. Such a jump in the export value of mineral commodities is illustrative of the inflationary trend that accelerated toward yearend 1973, when prices of crude oil and refinery products were advanced excessively by a number of producing nations. Such fuels represent a very large portion of the value of all mineral commodities traded, with the mineral commodities share of all commodities traded jumping from 26.9% to 38.6%. In terms of actual dollar value, the increase represented an additional cost of $168,319 million to the consumer. The following tabulation gives 5 years' data on the estimated value of world trade in mineral commodities:

	Estimated value of all mineral commodities traded [1] (millions)	Increase from previous year (percent)	Mineral commodities share of all commodities traded (percent)
1970	r $83,558	r 17.4	26.8
1971 r	91,153	9.1	26.1
1972 r	106,405	16.7	25.6
1973 r	154,552	45.3	26.9
1974	322,871	108.9	38.6

r Revised.
[1] Value estimated from data on mineral commodities appearing in table 5, to which has been added a factor for all mineral commodities not included in that table. The factor added is based on comparison of complete mineral trade value returns for selected countries with data given for these same countries in the source for table 5, which includes only the selected mineral commodity groups specified in the footnotes to that table. This comparison indicates that the recorded mineral commodities listed in table 5 represent about 81.5% of total mineral commodity trade.

The value of world trade in major mineral commodities from developing market economies increased substantially at the expense of that from developed and centrally planned economies. In contrast to previous years, the percentage distribution of export value of the various areas to the total also changed considerably, with developed areas falling nearly 11 percentage points from their 1973 share of the total.

COMMODITY GROUP TRADE PATTERNS

Table 5 gives the value of export trade in major mineral commodity groups for 1970–74, with the value of all commodities traded included for comparison. The distribution of the total export value by each of the major mineral groups is given in table 6, while table 7 gives the growth in value of each major mineral commodity group for each year, in comparison with the growth in value of all commodities traded. The value of mineral fuels was $170,120 million, 64.6% of the total value of all major mineral commodities traded. This represents a growth in value of 161.5% compared with that of 1973. Thus, fuels gained a significantly higher percentage of the value of world mineral trade, as well as a commanding growth rate. Mineral fuels made up $105,060 million of the $137,180 million increase realized by all major mineral commodity groups in 1974. The value of iron and steel world trade increased by $17,960 million, a rise of 63.1%. The total value for that commodity group is more than 230% of the 1972 level. Because of the dominant position held by mineral fuels, the percentage of the total accounted for by each of the remaining four major mineral commodity groups declined. Iron and steel's share declined for the fourth consecutive year to 17.7%, despite a 63.1% growth in value from 1973. Nonferrous metals' percentage of total mineral trade value fell to 9.6% from 13.7%, despite a 43.2% increase in value. Value of trade in ores, concentrates, and scrap accounted for 5.9% of the total, while crude nonmetals comprised only 2.2%. The growth in value of all major mineral commodity groups was 108.9%, compared with 45.1% growth in value of all commodities traded. The value of trade in mineral fuels comprised 20.4% of all commodities traded in 1974, compared with 11.3% in 1973.

REGIONAL TRADE PATTERNS

Table 8 gives the value of world trade of the aggregate of major mineral commodity groups in comparison with the value of all commodities traded for the countries and areas listed. Table 9 gives the origins and destinations of each of the major mineral commodity groups, and table 10 amplifies the previous data by listing the origins and destinations of the aggregate of those groupings. The following tabulation represents an analysis of the value of world mineral trade by developed, developing, and centrally planned economy countries in 1974, with each area's share of the world total in percent:

Destination [1]	Source of exports [1]				
	Market economy countries		Centrally planned economies	Undistributed [2]	Total
	Developed	Developing			
Value (million dollars):					
To market economy countries:					
Developed	72,270	118,000	9,520	20	199,810
Developing	15,665	28,330	1,478	—23	45,450
To centrally planned economy countries	5,901	1,907	6,905	—23	14,690
Undistributed [2]	1,974	1,103	107	6	3,190
Total	95,810	149,340	18,010	—20	263,140
Share of world total (percent):					
To market economy countries:					
Developed	27.5	44.8	3.6	(3)	75.9
Developing	6.0	10.8	.6	(3)	17.4
To centrally planned economy countries	2.2	.7	2.6	(3)	5.5
Undistributed [2]	.8	.4	(3)	(3)	1.2
Total	36.5	56.7	6.8	(3)	100.00

[1] Sources and destinations grouped according to United Nations practice; developed market economy countries are Austria, Belgium, Canada, Denmark, Finland, West Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, the Republic of South Africa, Spain, Sweden, Switzerland, Turkey, the United States, and Yugoslavia; centrally planned economy countries are Albania, Bulgaria, the People's Republic of China, Czechoslovakia, East Germany, Hungary, North Korea, Mongolia, Poland, Romania, the U.S.S.R., and North Vietnam; developing market economy countries include all countries not specifically listed previously in this footnote.

[2] Figures represent difference between reported totals and reported detail. Explanations for negative quantities are not provided in source publication.

[3] Insignificant.

Source: United Nations. Monthly Bulletin of Statistics. V. 30, No. 2, February 1976, pp. xxviii–xlii and No. 8, August 1976, pp. xxvii–xlv.

The value of mineral commodity exports from developing nations exceeded that from developed countries for the first time, rising to $149,340 million for a 180% increase. Previously, the export value from developing nations comprised 43% of the world total, but the year's increase gained for them 56.7%. The share of the total from developed nations declined to 36.5% from 47.2% despite a gain of $37,340 million in absolute terms. Centrally planned economies were up 46.4% in value of trade, but lost 3 percentage points in their share of the total. Developed nations witnessed a 174% increase in the value of major mineral commodities imported from developing nations. Thus, developed nations again accounted for approximately 76% of all world major mineral commodity trade.

In 1974, 31.5% of the value of all commodities exported consisted of major mineral commodities, compared with 21.6% in 1973. In the Near East, 95% of the value of exports consisted of mineral fuels, with the export value of that commodity group up 259%. With the exception of the Republic of South Africa, every area listed exhibited increases in terms of the aggregate value of major mineral commodities exported and in percent of total commodity exports accounted for by minerals. In examining the countries and areas listed with regard to imports, nearly all showed an increase in the value of major mineral commodity trade, as well as an increase in the percentage of all materials imported that were of a mineral nature. The sole exception was centrally planned economy countries of the Far East and South Asia, which declined to 23.1% from 25.4% in 1974, despite a gain of $488 million in the value of major mineral commodity imports. The value of such imports by the United States jumped 115%, outpacing the gain in value of exports of the same commodities and thus widening the trade deficit of that country.

The value of iron and steel exports from the countries and areas listed in table 9 increased considerably over that of 1974. In Japan, such exports more than doubled in value; in Europe, exports from members of the European Free Trade Association (EFTA) increased 45.7%. The value of iron and steel exports from the European Economic Community (EEC) was up 59.4% over that of 1973, and imports of mineral fuels increased from $23,460 million to $62,490 million. Overall, the centrally planned economy nations displayed more modest increases in the value of major mineral commodity group trade. The value of iron and steel exports to centrally planned economy countries of the Far East and South Asia exceeded $1 billion for the first time. The relatively low value of exports of mineral fuels from those countries in 1973 was followed by a nearly eightfold increase in value in 1974, presumably because of increased exports of higher priced fuels to gain additional exchange in foreign currency.

In terms of percentage increase, the value of trade in major mineral commodities to Latin America was 204.4% above the 1973 level. Such increases are particularly severe for developing nations confronted with sudden excessive increases in fuel prices along with runaway inflation because of limited resources. The Near East experienced a 180.2% increase in value of trade in major mineral commodities, with the Republic of South Africa close behind at 170.5%. The largest portion of Latin American trade was with the United States and Canada. In most cases, the countries of the EEC and the Near East were the primary exporters to the rest of the world in terms of value of trade in major mineral commodities. By examination of the totals credited to each area or country, the relative export-import position for that region can be determined. Exports of $335 million for the Republic of South Africa, for instance, compared with imports of $1,777 million, make that country a net importer.

CONSUMPTION

NONFUEL MINERAL COMMODITIES

The inflationary excesses of 1973 and 1974, spurred by higher fuel prices, led to severely dampened demand and, consequently, recession in 1975, with consumption of most mineral and mineral-related commodities for which there is information down from that of the previous year. Higher costs for the extraction of basic raw materials resulted in higher prices, with the result that willingness to maintain production levels decreased as demand fell off, driving down consumption. The iron and steel industry, historically an indicator of overall mineral industry direction, experienced significant declines in two primary sectors.

World consumption of iron ore declined 12.3%, compared with a slight 1974 increase of 2.3%. Table 11 lists consumption by selected major countries for the 3-year period 1973–75. Market economy countries, particularly developed economies had severe declines in iron ore consumption.

Members of the EEC had a 25.1% decline, equivalent to 50.3 million tons. France and West Germany were hardest hit, down 32.7% and 25.4%, respectively. French consumption of iron ore fell 16.9 million tons, with West Germany's decrease in consumption, close behind at 16.7 million tons. Overall, EFTA consumption was up 29.1%; however, this is calculated on the basis of apparent consumption for Sweden, which was determined to be up 94.1%, or 4.8 million tons. U.S. consumption was down 24.5 million tons, a decline of 17.5%. Market conditions favored Japanese steel production in 1975, and although demand was down, the decline in iron ore consumption was not as severe as in other developed nations, falling only 2.1% or 2.6 million tons. As in past years, centrally planned economy countries generally recorded rising consumption levels, although at modest rates. Consumption in the U.S.S.R., the largest consumer, was up 3.2%.

Iron and steel scrap consumption patterns paralleled that for iron ore. World consumption fell 13.5%, with all regions or designated economic groupings showing declines, except Latin America and centrally planned economy countries of Europe. Brazil and Mexico continued to expand consumption of iron and steel scrap, together utilizing an additional 862,000 tons of scrap. Japanese consumption fell 11.9 million tons, and U.S. consumption was down 22% or 21 million tons. Denmark was the only EEC member with increased iron and steel scrap consumption. Revisions in data for the United Kingdom show that consumption has declined for 3 consecutive years from the 1972 record high. Centrally planned economy countries of Europe all registered higher iron and steel scrap consumption levels, as did India and the Republic of South Africa. It should be noted that table 12 has been revised and updated to cover 5 years' data (1971–75) and include 11 additional nations.

Information is not available on most mineral commodities regarding world consumption. However, table 13 lists consumption of five major nonferrous metals for a 3-year period. It is apparent from the table that, in the face of a general worldwide recession, basic commodities are heavily affected. In 1975, the five metals listed had declines in consumption ranging from 11.6% for copper to 15.6% for aluminum. Consumption of aluminum, an energy-intensive industry, was down 2.2 million tons. Consumption of copper was down nearly 1 million tons, while lead consumption fell 12.6% to slightly below the 1971 level. In the case of zinc, consumption was off nearly 1 million tons from the 1973 high. The 14.1% decline in tin use was second only to that of aluminum, and brought that metal's consumption down to the 1970 level.

Consumption of nonmetals also declined. World consumption of sulfur declined from 34 million tons in 1974 to 30.8 million tons in 1975, a drop of 9.4%. In the case of major commercial fertilizers, only consumption of nitrogen was up slightly for the 1974–75 fertilizer year (July 1, 1974, to June 30, 1975). That commodity's consumption rose from 38.9 million tons to 39 million tons. Consumption of phosphate fertilizers (P_2O_5 content) was down from 25.5 million tons to 24.1 million tons, a decline of 5.5%. Potash fertilizer consumption (K_2O equivalent) also decreased, falling 900,000 tons to 20 million tons.[4]

MINERAL FUEL COMMODITIES

World consumption of energy, by energy source, is given in table 14, covering the 6-year period 1970–75 in terms of million tons SCE. Total world energy consumption was up 1.1%, only slightly higher than the 0.8% increase in 1974. This compares with 5.2% in 1972 and 5% in 1973. Per capita energy consumption declined for the second consecutive year, falling 0.6% in 1975.

The differentiation of total energy consumed, by energy source, continued to follow the trends established in 1974. The share of total consumption that was liquid fuel declined again to 44% from 44.9% in 1974. Additionally, the total consumption of liquid fuels fell 1%. Consumption of solid fuels was up 3.2%, with the proportion of total energy consumption made up of solid fuels rising to 32.7% from 32.1% in 1974. While such percentage differences appear minor, they indicate the change in energy source mix from what dominated the previous 10 years. Natural gas consumption rose 1.4% to 20.4% of

[4] British Sulphur Corp. Ltd. (London). Statistical Supplement No. 14. November–December 1976, 20 pp.

total energy consumption. This increase was due in part to increased prices and demand, which made feasible the marketing of gas that would normally have been flared or vented. Although having the smallest share of total energy consumed at 2.8%, world consumption of hydro, nuclear, and imported electricity had the highest increase at 6.7% over consumption in 1974.

Regionally, centrally planned economy countries increased aggregate energy consumption 6.8%, topping North America for the first time. Consumption of individual energy sources by centrally planned economy nations increased in 1975, except for that of hydro, nuclear, and imported electricity, which was unchanged. Consumption of liquid fuels was up 8.8%, while that of natural gas increased 12.5%, mainly imported from Europe. Solid fuels consumption for that sector rose 4.1%, compared with 2.3% for market economy nations. Per capita consumption for centrally planned economies was up 5.2%, compared with a decline of 3.3% for market economy countries. Coal was regaining its importance among industrialized market economy nations; petroleum and natural gas were particularly important for centrally planned economies, especially those of Europe, which currently have access to large quantities from the U.S.S.R. through massive pipeline systems. Even Western European reliance on U.S.S.R. liquid fuels was increasing as a percent of total energy consumed by that region. Per capita consumption in North America fell 5.8% since 1973, while that of Western Europe declined 6.1% for that same period. Aggregate energy consumption by developing market economies increased generally, with the exception of Caribbean America. These same regions also tended to show improvement in aggregate and per capita energy consumption, with Africa, Near East, Far East, and Oceania aggregate consumption up 11.3%, 5.8%, 0.3%, and 3.1%, respectively.

INVESTMENT

Worldwide investment in the mineral industry increased in 1975, despite the recession that began at yearend 1974. Information available on general industry developments show an upward trend, particularly for petroleum industry expenses. Steel industry investments declined in the EEC, the only significant reduction in that sector in 1974. U.S. worldwide investment in the mineral industry was up substantially, even in the face of declining earnings and income. As in past years, comprehensive information on investment by centrally planned economies is not available, and assessment of that area's investment picture can only be construed by piecing together press announcements and proclamations made by individual governments. In the case of European centrally planned economy countries, substantial investment continued in pipeline and pumping facilities, as well as refinery construction or expansion.

Table 15 gives annual investment expenditures in the steel industry for selected countries for 1973 and 1974. The United States again increased investment in that sector 50.3%, or $704 million. Japanese investment expenditures showed a reverse in the downward trend of the past 3 years, rising 37.5% or $762 million. Steel industry investments by the nine nations making up the EEC fell 7.6% or $229 million.

Investment expenditures by market economy countries in the petroleum industry are given by geographic area in table 16, and by industry sector and exploration expense in table 17. The following tabulation gives a percentage breakdown of such expenditures by the countries and areas listed, for 1974 and 1975:

Area	Percent of total	
	1974	1975
United States	38.7	36.4
Other Western Hemisphere	11.6	11.8
Western Europe	15.5	18.0
Africa	3.0	3.6
Near East	4.0	4.0
Far East	8.2	8.8
Unspecified	19.0	17.4
Total	100.0	100.0

The United States continued to dominate the total at 36.4%, down slightly from the 1974 level. Investment expenditures in Western Europe, particularly as affected by North Sea developments, rose to 18% of the total. The remaining areas listed increased their percentage share of the total, except for "Unspecified" areas, which fell to 17.4%, and the Near East, which remained unchanged. As in the past year, capital expenditures in terms of actual dollar value increased for every area listed in table 17. While exploration expenses were up 6.4% for the world, several of the areas listed showed declines. Capital expenditures for petroleum in the United States reached an alltime high of $17,725 million, up 6.6%. Those for Western Europe were up 30.8%, or $2,130 million, one of the largest yearly increases recorded. Capital expenditures in the Near East and Far East were up 14.4% and 23.7%, respectively. However, Africa had the largest percentage gain at 37.9%, which in terms of dollar value was $460 million. Overall petroleum capital expenditures were up 13.6%, or $5,925 million. Examination of market economy petroleum industry capital expenditures by industry sector shows expenditures for production of crude oil and natural gas comprising the largest portion of total capital expenditures at 36.9%. This sector declined slightly from 1974, but the loss was more than made up by expenditures for pipelines, refineries, and chemical plants. The marketing sector again declined, with all other sectors registering an increase. Expenditures for pipelines jumped 143.7%, or $3,535 million, the largest increase of any sector on both a percentage and dollar basis.

Detailed U.S. investment in the world mining, smelting, refining, and petroleum industries is given by geographic area in table 18. Overall, value of U.S. investment in petroleum was up 15.3% in 1975, or $4,611 million, despite declines of 57.9% and 68.8% in earnings and income, respectively. Value of investment in the mining, smelting, and refining industries was up 13.1% compared with that of 1974, again despite 21.7% and 35% decreases in earnings and income, respectively. Capital outflows to Peru increased, where a major copper expansion project was underway. The additional value accounted for most of the increased investment in Latin America and other Western Hemisphere countries in 1975. In petroleum investment, Europe made up 32.7% of the total, up 14.3% from that of 1974. Investment in Far East and Pacific areas was up 31.6%, and Near East investment was up 127.7%. The sharp decline in adjusted earnings and income of petroleum affiliates was due to substantial tax and royalty increases by host countries. In the Near East, for example, earnings fell from $8,431 million to $2,364 million, a decline of $6,067 million, or 72%.

TRANSPORTATION

MARINE TRANSPORT

Tankers, bulk carriers, and freighters are the primary oceangoing vessels for transport of mineral commodities. The number, gross tonnage, and deadweight tonnage of these vessels, as reported by the U.S. Maritime Commission, are given in table 19. The data listed therein are not completely comparable to those supplied in previous years owing to the inclusion of refrigerated freighters in the freighter category, and their exclusion from vessels classified as "Other." In terms of quantity, such vessels numbered approximately 1,000 in 1974, with a combined gross tonnage of 5,433,000 tons and a combined deadweight tonnage of 5,794,000 tons. When considering seaborne traffic, it must be remembered that vessels in each of the classes listed may not be involved wholly or even partly in transport of mineral commodities. Tankers generally move petroleum and refinery products, but also included in the listing are wine, molasses, and whaling tankers. Bulk carriers move agricultural products in addition to fertilizer and crude minerals, while freighters, because of their highly evolved technical nature, move numerous and diverse materials.

The volume of trade over the 5-year period 1971–75, in terms of loadings and unloadings of tanker and dry cargo, is given in table 20. Tables 21 and 22 give a regional breakdown of such loadings and and unloadings, by cargo type. Overall, loadings of tanker cargo declined 3.7% in 1975, while unloadings were down 8.5%.

In the case of tanker loadings, the tonnages shown represent 2 consecutive years of decline from 1973, while dry cargo tonnage declined for the first time since this series of tables was begun in 1971.

Regionally, examination of unloadings of tanker cargo by developed market economies indicates a 9.9% decline from those of 1974. Most conspicuous among the declining developed market economy nations were Western European countries and the United States, down 11.6% and 9.3%, respectively; unloadings by Japan declined 7.8%. Loadings by developing market economies, which include the Near East and North Africa, were down 4.2%. Near East loadings fell 70 million tons, and Venezuelan loadings fell 25 million tons. Unloadings of tanker cargo remained unchanged for centrally planned economy countries, but loadings were up 12.2% to 83 million tons. Unloadings of dry cargo by developed market economies declined for the first time, by 5.7% or 64 million tons compared with those of 1974. This was in contrast to unloadings in developing and centrally planned economies, which were up 8.7% and 23.7%, respectively. As in the case of tanker unloadings, dry cargo unloadings were most heavily reduced by Western Europe, which were down 53 million tons. The United States maintained an approximate 6% increase in dry cargo unloadings. The cumulative effect of the downturn in many developed economies is evident in the tonnage of loadings of dry cargo attributed to Western Europe, which declined 49 million tons. Loadings of dry cargo in developing market economies as a whole declined 41 million tons, with most of the decline experienced by countries listed as "Other."

The percentage of such loadings and unloadings that were mineral commodities is indicated by an examination of traffic transiting the Panama and Suez Canals. In 1975, 62.5% of all traffic transiting the Panama Canal was mineral commodities; for the 6-month operation period of the Suez Canal, 26.1% was of mineral origin. Considering that most tanker and bulk carrier traffic bypasses the canals because of capacity limitations, it may be assumed that an even larger quantity of total seaborne traffic is mineral related.

The total merchant fleet amounted to 22,872 vessels in 1975, with a combined gross tonnage of 333,042,000 tons and a combined deadweight tonnage of 556,572,000 tons. Despite worldwide recession and the reduction in trade, the number of vessels increased 1.9%, gross tonnage was up 8.7%, and deadweight tonnage, 10.6%, compared with 1974 figures. The slight change in number of vessels in the fleet compared with extensive increases in gross weight and deadweight tonnages illustrates the increase in average size of the vessels. An additional 53,224,000 deadweight tons was added to the fleet from a net change of 423 vessels, with nearly 77% of the additional tonnage in tankers.

Bulk Carriers.—In 1975, the world bulk carrier fleet increased by 197 vessels, or 4.8%, compared with an increase of 275 vessels in 1974. Gross tonnage of all bulk carriers increased 7.1%, compared with 10.3% the previous year, while deadweight tonnage was up 7.8%, compared with 10.4% in 1974. The average size of the additional vessels was 54,888 deadweight tons, compared with 47,735 tons for the 275 vessels added in 1974. Overall, the average deadweight tonnage of all bulk carriers increased from 34,176 tons in 1974 to 35,131 tons in 1975. The following tabulation lists the leading countries with bulk carrier fleets, in order of aggregate deadweight tonnage:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	925	37,243
Japan	535	21,270
Norway	318	16,696
United Kingdom	343	14,508
Greece	483	13,205
Italy	151	6,541
Sweden	88	4,785
Panama	224	4,515
Germany, West	79	3,993
India	76	3,129
France	57	2,405
Spain	61	1,943
U.S.S.R	148	1,652
Poland	75	1,613
Singapore	44	1,613
Brazil	35	1,304
Other	630	13,665
Total	4,272	150,080

Freighters.—The number of freighters (including refrigerated freighters) in the world merchant fleet in 1975 amounted to 12,575. Advances in technology and application of these advances in shipyard construction have led to an extremely varied class of vessels. Freighters consist of general cargo carriers, full containerships, partial containerships, roll-on/roll-off vessels, and the newest design, barge carriers. The U.S. freighter fleet alone cannot be considered solely in terms of numbers of vessels, because numerous war-built vessels have been scrapped, with a resultant decline in the quantity of vessels over the past 10 years. The average age of the U.S. fleet has declined since 1968, with newer vessels having nearly a 20% increase in average speed and a 40% increase in deadweight tonnage. Because of the inseparability of refrigerated freighters from the class of freighters, the overall statistics are not readily comparable to previous years' data. The following tabulation lists the principal nations of registry of freighters, in order of their share of aggregate deadweight tonnage for 1975:

Country	Number of vessels	Deadweight tonnage (thousand tons)
U.S.S.R	1,706	10,499
Greece	918	8,653
Japan	954	7,945
United Kingdom	746	7,322
Panama	1,060	7,187
United States	511	7,051
Liberia	586	5,814
Germany, West	445	3,822
Cyprus	472	3,267
Norway	309	2,559
Netherlands	318	2,452
China, People's Republic of	261	2,351
Other	4,289	32,326
Total	12,575	101,248

Tankers.—In 1975, the world tanker fleet increased by 190 vessels, compared with an increase of 308 vessels between 1973 and 1974. The additional vessels resulted in a 14.2% increase in gross tonnage and a 15.6% increase in deadweight tonnage. Average tanker size increased once again, reaching 56,900 deadweight tons compared with 51,053 deadweight tons in 1974. Average gross tonnage of vessels rose from 28,002 tons to 30,829 tons. Table 23 lists the distribution of world oil tanker tonnage, by size group, for 1975, with 1966 included for comparison. In that 9-year period, total world tanker deadweight tonnage increased nearly threefold. The dramatic change in the composition of the fleet is evident when one compares the tonnage of vessels of 125,000 deadweight tons and over for the 2 years. In 1966, slightly more than 1% was of that size group, while in 1975, 58.2% of the fleet was in excess of 125,000 deadweight tons. As in 1974, tankers in the 205,000- to 285,000-ton class accounted for the largest percentage of tanker tonnage afloat at 43.2%, up from 41.2% in 1974. However, only 29.6% of new tankers planned or underway in 1975 were in this class, contrasted with 35.2% the previous year. Of the vessels under construction or on order by yearend 1975, 36.6% were to be 285,000 deadweight tons and over. Additionally, total tonnage of new vessel construction in progress or on order was 88.5 million tons, compared with 164.4 million tons a year earlier, a decline of 46.2%. By yearend 1975, 53.3% of the total world tanker tonnage had been added during the past 5 years. The following tabulation gives the percentage of total tonnage, in terms of year of completion, of vessels classified as tankers in 1974 and 1975:

Year of completion	Percent of total tonnage	
	1974	1975
Up to yearend 1945	1.5	1.1
1946–50	.6	.3
1951–55	4.1	2.7
1956–60	11.2	8.8
1961–65	13.5	11.3
1966–70	25.7	22.5
1971–75	43.4	53.3

Source: British Petroleum Co. Ltd. BP Statistical Review of the World Oil Industry, 1974 and 1975. Bayard Press, London, 1974, 1975.

Liberia remained the leading country of registry of vessels classed as tankers, with an increase of 15,651,000 tons from 1974. The following tabulation breaks down the world tanker fleet by flag of registry, in order of national aggregate deadweight tonnage, in 1975:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	1,014	89,470
Japan	531	33,950
United Kingdom	459	32,869
Norway	332	28,467
Greece	345	15,557
France	154	13,190
Panama	238	10,224
United States	250	9,475
Italy	236	7,953
Sweden	79	6,524
U.S.S.R	462	5,861
Germany, West	83	5,627
Spain	114	5,257
Netherlands	88	5,074
Denmark	59	4,594
Other	867	28,125
Total	5,311	302,217

OCEAN FREIGHT RATES

The economic picture of the world in 1975 as it affected the mineral commodity situation can be clearly illustrated by examining the freight-rate situation of one significant aspect of the transportation sector in the world economy. Indexes of ocean freight rates by trip charter and time charter, vessel type, and tonnage for selected countries are given in table 24. From the table it is evident that ocean freight rates plummeted in 1975. Even rates of centrally planned economy countries for the limited tanker classes that are available fell considerably, in contrast to previous years. The annual average index of freight rates fell for every type and class of vessel listed in table 24, with most of the decline occurring within the first quarter of 1975. Rates were driven down sharply and persistently for a variety of reasons, including high prices for mineral fuels, particularly crude oil and refinery products; the U.S. and world recessions, which were partly a consequence of the end of the Vietnam conflict; and a surfeit of new shipping tonnage, which has virtually replaced and superceded earlier record tonnages. Rates for Norwegian tankers on trip charter fell 63% for vessels over 150,000 deadweight tons, with rates for other Norwegian tanker classes falling 43% to 50%. Rates for United Kingdom tankers on time charter were down 24% to 32%, with dry cargo rates following the same pattern. As in the case of tankers, larger vessels transporting dry cargo showed the greatest decline, with United Kingdom time charter dry cargo vessels over 40,000 deadweight tons falling 64.3%.

PANAMA AND SUEZ CANALS

The number of transits and quantity of cargo moved through the Panama Canal decreased 3.5% and 6%, respectively, in 1975. The decline from the record tonnage set in 1974 was 9,189,000 tons to 142,893,000 tons. The reduction in traffic through the Canal was attributed to various causes, primarily inflation and simultaneous recession, but also to subsidence of a portion of one of the waterway's banks. The slide resulted in temporary closure of the entire canal, and the utilization of one-way traffic until March 21, 1975. Significantly, however, despite the decline in total tonnage moved, the quantity of mineral commodities moved rose 1.8% from fiscal 1974. Additionally, the percentage of total cargo moved that was mineral commodity increased to 62.5% from 57.7% the previous year. The following tabulation summarizes mineral commodity movement in comparison with other Panama Canal activity:

	Fiscal year		
	1973	1974	1975
Number of transits:			
Commercial ocean traffic	13,841	14,033	13,609
Other traffic	1,268	1,236	1,126
Total	15,109	15,269	14,735
Cargo moved (thousand metric tons):			
Commercial ocean traffic:			
Mineral commodities	r 72,025	r 87,696	89,250
Other commodities	r 56,103	r 62,585	53,100
Subtotal	r 128,128	r 150,281	142,350
Other traffic, all commodities	1,481	1,801	543
Total cargo moved	r 129,609	r 152,082	142,893

r Revised.

Modifications in the type and nature of vessels transiting the Panama Canal were again evident for the most recent year of operation. While transits and tonnage were down, average ship size continued to increase, with oceangoing commercial vessels averaging 9,931 net tons, compared with 9,679 tons in 1974. The trend continued toward replacement of smaller vessels in Canal trade by larger specialized vessels, primarily bulk carriers and container ships. Table 25 gives commercial ocean traffic through the Panama Canal in terms of number of transits and total tonnage moved, by vessel type, for 1974 and 1975. In terms of cargo weight, dry bulk carriers accounted for 56.4% of the total moved, followed by tankers at 17.6% and general cargo ships at 16.1%. Nearly 60% of the total cargo moved through the Canal was Pacific bound, again with bulk carriers and tankers making up most of the tonnage. In terms of number of transits, general cargo ships maintained the lead at 29%, followed closely by dry bulk carriers at 27.6%.

Table 26 gives 3 years' data on the quantity of individual mineral commodities shipped through the Panama Canal by direction of movement. While over 64% of the tonnage moved was Pacific bound, the ranking by weight of the individual mineral commodities changed. Coal and coke movement topped the list at 26,725,000 tons, exceeding crude petroleum and refinery products for the first time since 1971. Most of the coal and coke was Pacific bound, with 92% of that amount destined for Japan in the wake of high steel demand for export from that country. The reduction in Canadian and Australian coal and coke shipments to Japan and the decline in U.S. and European shipments of iron and steel semimanufactures are believed to have led to such change in the pattern of mineral commodity movement through the Canal. The tonnage of crude petroleum and refinery products was down 25.2% from that of 1974, partly from the reasons cited earlier, but also because of damage suffered by the trans-Andean pipeline. The pipeline supplies Ecuadorian crude oil to the El Balao shipping terminal near Esmeraldos for later shipment through the Panama Canal. The disruption was principally responsible for the 58.5% fall-off in crude oil tonnage from Pacific to Atlantic via the Canal. Atlantic bound iron ore shipments were up 38%, or 906,000 tons over those of 1974, while iron and steel semimanufactures increased by 2,839,000 tons, a 41.5% rise over the previous year's total from Pacific to Atlantic. Bauxite and alumina shipments continued the decline begun in 1972, having decreased 711,000 tons since that date. Other high-volume mineral commodities include phosphatic fertilizer, up 3%, sulfur, down 4.7%, unspecified ores and concentrates, up 2.7% and zinc ore and concentrate, down 13.8% to 852,000 tons. Shipment of copper ores and concentrates fell sharply 22.4% or 158,000 tons from the 1974 level.

On June 5, 1975, the Suez Canal opened officially for the first time since its closure in the 1967 Arab-Israeli conflict. The Canal is a major trade route for European and Asian seaborne traffic, and the reopening considerably reduces the distance of three major transport routes. Preliminary data indicate that considerable capacity of the Suez Canal is yet to be utilized, and while available information does not make the Suez Canal operation readily comparable to the Panama Canal, the following tabulation gives a record of the level of activity for the 6-month operation period in 1975:

Number of transits:	
Commercial ocean traffic	4,577
Other traffic	50
Total	4,627
Cargo moved, commercial ocean traffic (thousand metric tons):	
Mineral commodities	15,048
Other commodities	42,566
Total	57,614

Mineral commodity movement accounted for 26.1% of total cargo transiting the Suez Canal. Table 27 lists the number of commercial transits, by vessel type, whether in ballast or laden, through the Suez Canal. General cargo ships led with 75.9% of total transits, with tankers second at 12.4%. South-bound traffic accounted for 55.4% of total traffic transiting the Canal. Table 28 lists the movement of mineral commodities through the Suez Canal, by commodity type and direction of movement (southbound or northbound) for the first 6 months of operation. Crude oil and refinery products comprised 44.1% of mineral commodity tonnage, followed by unclassified fertilizers at 13% and cement at 12.6%. As was the case with number of transits, southbound movement of mineral commodities exceeded northbound, with 53.9% of the total. Of the southbound movement of mineral commodities, most was accounted for by fertilizer material and crude petroleum and refinery products. Northbound cargo movements are listed for various mineral commodities. However, it should be noted that, in the case of metals, in several instances the tonnage of ore and concentrate moved is reported with the quantity of metal moved. Northbound movement of iron ore was 836,000 tons, or nearly 50% of all ores and metals transiting in that direction.

PIPELINES

In 1975, an estimated 100,000 miles of pipeline was planned or under construction around the world. Nearly 45% of the total was gas pipelines, 26% was crude oil lines, and 23% was product lines; the remaining 5,600 miles was slurry pipeline. By far, the largest portion of the total was in the planning or proposal stage, with about 20,000 miles actually underway or in some stage of completion.

Pipeline activity in the United Kingdom and Ireland, centered primarily in the North Sea area where over 400 miles of undersea pipelines was to be laid in 1975, amounted to 1,260 miles planned or under construction. The deepest large-diameter undersea pipeline yet attempted, a 36-inch, 94-mile line extending from Firth's Voe in the Shetland Islands to the Brent, Cormorant, Dunlin, Houlton, and Thistle Fields in the North Sea, was 50% completed. Delivery capacity was to be 1 million barrels per day, equivalent to nearly one-half of current United Kingdom consumption. Western Europe, including Scandinavian countries, had 6,700 miles of pipeline planned or under construction, with approximately 3,200 miles as gaslines. Construction of the much-discussed trans-Mediterranean gasline continued, which was to extend 1,550 miles from Algeria to Italy. Contracts were let for the design and engineering of the 370-mile link from the Hassi R'Mel gasfield to the Algerian-Tunisian border. The first undersea stretch is currently being laid across the northern approaches of the Straits of Messina. Though only 2.5 miles wide, five separate lines are being laid for greater flexibility and security along a 9-mile course designed to avoid seabed problems. Construction on the 36-inch, 270-mile gasline from Ekofisk to Emden, West Germany, continued through 1975, despite a projected completion date for late that year. An estimated 12,820 miles of pipeline was planned for the U.S.S.R., the People's Republic of China, and the Eastern European countries, with 6,985 miles as crude oil lines and 5,552 miles as gaslines. In China, a 270-mile stretch of crude oil line from Chinhuangtao to Peking was completed. This section constitutes a significant portion of the 935-mile pipeline from the Taching oilfields in the northeast of the country. Construction was begun on the Adriatic pipeline to supply crude oil to inland refineries in Yugoslavia, Hungary, and Czechoslovakia. Yugoslavia was expanding its inland refinery capacity significantly, and crude oil landed at the planned ocean terminal at Omisalj will be piped through 105 miles of 36-inch pipeline eastward to Sisak. From there a 38-inch, 63-mile branch line to Gola, with further extensions into Hungary and Czechoslovakia, will be constructed. A 245-mile branch will also be laid eastward to refineries at Bosanski Brod, Novi Sad, and Pancevo.

In the Near East, 12,000 miles of pipeline was planned or under development. Iraq, accounting for 3,100 miles of the total, currently has the 608-mile Iraq-Turkey crude oil line underway. Contracts were finally awarded for the 40-inch crude line from Kirkuk in northern Iraq to the Turkish port of Dortyol on the Mediterranean coast. Completion was scheduled for early 1977 with an initial capacity of 500,000 barrels per day and a final capacity of 700,000 barrels per day. In Iran, separate 42-inch-diameter crude oil lines and gaslines are planned to cover the 1,000 miles between southern Iran and Iskenderum.

Far East pipeline developments were generally uncertain due to political circumstances. In total, 5,000 miles were slated for construction in that region, with India and Pakistan having major projects underway. In India, construction of 900 miles of 18-, 24-, and 30-inch crude oil lines in the Gulf of Kutch continued, while Pakistan's major task, the 18-inch, 300-mile Sui-to-Karachi gasline proceeded without abatement. In Australia, where pipeline activity was expected to grow, the 34-inch, 840-mile line from Moamba to Sydney was underway, with 1,300 miles of gasline, 713 miles of product line, and 480 miles of slurry line also planned for that country.

Canada and the United States had nearly 42,000 miles of all types of pipeline planned or underway. In the United States alone, of the 22,500 miles of such pipeline listed, 10,594 miles was for gas transmission, and half of that involved natural gas from Alaska and/or the Canadian Arctic. Study was underway for a trans-U.S. pipeline for handling crude oil from the trans-Alaska pipeline when it reached the west coast. The most likely line at this stage is from the Pacific Northwest to the Middle West crude oil refineries and industries. Another development of the mineral transportation sector in the United

States was a proposal for a coal slurry pipeline from the Powder River Basin to the Texas gulf coast. It would be a 36- to 40-inch-diameter line extending 1,260 miles, with a throughput of 22 million to 29 million tons per year.

A total of 11,000 miles of pipeline was planned or underway in Central and South America, with about 6,000 miles consisting of natural gas lines. In Ecuador, crude oil exports were halted temporarily as heavy rains and landslides damaged the trans-Andean pipeline in March. A slurry line was planned in Brazil to carry iron ore to new ocean-shipping facilities. It is to be a 20-inch-diameter, 250-mile-long pipeline with a throughput capacity of 7 million tons per year. Two mountain ranges must be crossed with a maximum elevation of 3,855 feet.

PRICES

In 1975, inflation and the high cost of fuel dampened demand for many mineral and metal commodities. The excessive cost of many raw materials and the high interest on loans tended to suppress the housing industry in many developed countries, reducing consumption of metals and industrial minerals. The pricing boom of 1974 lasted until mid-1975, during which time many industries scrambled to absorb available stocks and supplies of raw materials. Comprehensive pricing data on large-volume materials are lacking, but information on several of the major nonferrous metals reveals that prices of most of them had declined by yearend 1975, several significantly. Only in the cases of aluminum and zinc were price increases sustained.

Tables 29, 30, and 31 give monthly and annual average prices of major nonferrous metals in the United States, the United Kingdom, and Canada. Aluminum prices in the United States and the United Kingdom increased 16.6% and 13.8%, respectively, in 1975. Prices in the United States showed a slight increase at yearend, while in the United Kingdom the price showed a general decline from May to December, when a modest rise occurred. Zinc prices in the United States reached a peak price in January of 39.153 cents per pound, with the year's low occurring in September, only 0.267 cents below the January level. The annual increase was 8.4%, compared with a 5.8% increase on the Canadian market, where zinc prices were also very stable. Only 1.460 cents separated the January high from the August low on that market. Copper prices declined 17.1% on the U.S. market, 39.7% in the United Kingdom, and 21.0% in Canada. U.S. monthly prices declined steadily for the first 7 months of 1975, then rose modestly to remain at 63.165 cents per pound for the rest of the year. Copper prices in the United Kingdom were hardest hit as they were at a low annual average price of 93.097 cents per pound in 1974. The Canadian market was much less erratic, with the largest drop, 5.772 cents, occurring between January and February. Lead prices in the United Kingdom fell 30.3%, while U.S. and Canadian prices were down 4.5% and 4.0%, respectively. The U.S. price of lead remained at 24.500 cents per pound from June 1974 through April 1975, before falling to a low of 19.000 cents per pound in June and July. Canadian lead prices followed a similar trend, though at slightly lower levels. In the United Kingdom, lead prices fluctuated for 8 months before a definitive downward trend carried the price to a low of 15.098 cents per pound in December. The annual average per pound price of tin fell 56.448 cents in the United States and 59.764 cents in the United Kingdom. In the case of the latter, the decline was steady throughout the year, except for a mild rally in June. U.S. prices declined from February through October, increased slightly in November, then declined to the year's low of 303.071 cents per pound in December, still well ahead of the 1973 level. Silver price movements were relatively similar for the United States and the United Kingdom, declining about 6% at nearly equivalent prices, while Canadian prices were down 4.2% compared with those of 1974.

A general indication of price movements for basic crude mineral commodities in world trade is illustrated in table 32. Overall, crude mineral prices were up 4.4% from those of 1974, based on the change reported in the export price index. Declines were recorded for three consecutive quarters, but a jump of 7.7% took place in the fourth quarter. A similar pattern held for fuels, with an annual average index up 1.9%, but with the fourth quarter index up 8.8% over that of the previous quarter. The export price index for metal ores was up 14.3%, all of which occurred between the final quarter of 1974 and March 1975.

The distribution of export price indexes by developed and developing market economies is reported in table 33. The index of all minerals for developing nations was up 2.9%, while for developed nations an increase of 9.9% took place, though from a considerably lower base. For both areas, increases were recorded in the last quarter from a general yearly decline. The export price index for nonferrous base metals fell 16.1% and 31.9% for developed and developing areas, respectively. For both areas, the decline was persistent throughout the year, with the exception of a leveling off of the index at 123 in the third and fourth quarters for developed areas.

STATISTICAL SUMMARY OF WORLD PRODUCTION AND TRADE OF MAJOR MINERAL COMMODITIES

The final 36 tables of this chapter (tables 34 to 69) extend the statistical series that was started in the 1963 edition of the International Area Reports volume of the Minerals Yearbook and that was subsequently updated in the 1965 and 1967–74 editions. They are primarily a supplement to other statistical data within this chapter, but also serve as a summary of international production and trade data for major mineral commodities covered in greater detail on a commodity basis in individual chapters of Volume I of the 1975 Minerals Yearbook and on a country basis in the balance of Volume III.

The data presented here on production (tables 34 to 56) in most instances correspond directly to the individual commodity world production tables appearing in Volume I of the 1975 Minerals Yearbook, and as such may not correspond exactly with figures presented in the individual country chapters of Volume III. Such differences are usually the result of the receipt of revised data for inclusion in either a commodity chapter or a country chapter subsequent to the completion of the other chapter. In most cases, country chapters were prepared later than commodity chapters and should be regarded as more reliable.

The number of commodities covered by these summary tables has been increased by five in this edition. Four tables have been added to provide coverage of all minerals that rank high in terms of value of world output, on the basis of data in the *Annales des Mines* study on value of world mineral production,[5] referred to previously under production. With the addition of tables on mine production of gold, nickel and diamond, and a table on natural gas liquids plant production, the set of summary commodity production tables in this chapter now includes all of the top 16 crude mineral commodities (ranked on a value of world output basis); in descending order of 1973 value these are petroleum, anthracite and bituminous coal (taken together), natural gas, copper, iron, gold, lignite coal, natural gas liquids, zinc, nickel, lead, salt, potash, diamond, tin, and phosphates. Additionally, bauxite, sulfur (including pyrite-derived sulfur), and manganese are covered among crude mineral products because of the large volume of production.

The set of summary production tables in this chapter also includes three major downstream products obtained from listed crude minerals—aluminum metal, steel, and refined oil (the last being the fifth new production table added to this edition)—and two major downstream products for which comprehensive world production data on crude output are not available—cement and nitrogen fertilizers. The first three of these mineral product output tables are included chiefly because of the substantial difference in ranking of producing nations between the mine production stage and the processing stage, and the last two being included simply because of the lack of comprehensive data on world output of the crude materials from which they are produced and because of their significance among mineral commodities.

Further, it should be noted that pyrite (gross weight basis) has been omitted from the roster of commodities covered by individual world summary production tables. However, data on the sulfur content of

[5] Annales des Mines. No. 12, December 1975, p. 14.

pyrite has been provided as a separate entry in the revised format of the world sulfur production table, and such double coverage (both gross weight and sulfur content) is regarded as unnecessary.

The five new tables in this section have been compiled for a 5-year period, rather than the 3-year period of all other tables in this section, in order to provide data not summarized in this form in the past.

The data on world trade in major commodities presented in this chapter (tables 57 to 69) may not correspond exactly to those presented elsewhere in Volume III of the Minerals Yearbook because these summary tables are compiled, at least in part, from sources other than those used in the individual country chapters, in order to obtain data on a consistent basis. The differences, however, are regarded as unimportant from the viewpoint of indicating the general pattern of trade in these commodities. It should be noted that table 67, covering world natural gas trade, is included for the first time, thereby providing coverage on trade in all commercial mineral fuel commodities. This table has been prepared in the form of a country-to-country trade table rather than on a continent-to-continent basis because of the special nature of the facilities required for moving gas (pipeline system or natural liquefaction and deliquefaction plants). Such facilities make this trade clearly intercountry rather than interregional.

Table 2.—World production of major mineral commodities [1]—Continued

Commodity	1973	1974	1975 p
NONMETALS—Continued			
Strontium minerals [3] [4] ____metric tons__	93,187	99,184	52,873
Sulfur, elemental basis:			
Elemental [7] ____thousand metric tons__	16,128	17,932	17,859
From pyrite ____do____	10,415	10,021	10,192
Byproduct [8] ____do____	21,650	22,184	21,872
Total ____do____	48,193	50,137	49,923
Talc, soapstone, pyrophyllite ____do____	5,406	5,706	4,856
Vermiculite [3] [4] ____metric tons__	498,234	503,342	523,355
MINERAL FUELS AND RELATED MATERIALS			
Carbon black [3] [4] ____thousand metric tons__	3,558	3,540	3,110
Coal:			
Anthracite ____million metric tons__	177	176	177
Bituminous ____do____	2,088	2,126	2,240
Lignite ____do____	819	834	860
Total ____do____	3,084	3,136	3,277
Coke:			
Metallurgical [9] ____thousand metric tons__	365,826	367,317	361,198
Other [9] ____do____	17,705	18,152	17,495
Gas, natural, marketed ____billion cubic feet__	46,128	47,171	47,207
Natural gas liquids [3] ____million barrels__	1,043	1,034	1,024
Peat ____thousand metric tons__	220,145	220,695	223,327
Petroleum:			
Crude ____million 42-gallon barrels__	20,368	20,538	19,498
Refined ____do____	20,610	20,430	19,705

p Preliminary.

[1] Incorporates numerous revisions from world production tables and country production tables appearing in Volumes I and III, respectively, of the Minerals Yearbook, as well as from similar tables in Mineral Trade Notes and from the table corresponding to this table in previous editions of this chapter.

[2] Excludes data for the United States (withheld to avoid disclosing individual company confidential data).

[3] Excludes data for the People's Republic of China (no adequate basis for estimation available).

[4] Excludes data for the U.S.S.R. (no adequate basis for estimation available).

[5] Excludes data for the United States (withheld for 1974 and 1975 to avoid disclosing individual company confidential data, and excluded for 1973 in order to provide a uniform statistical series). U.S. output in 1973 totaled 111,068 metric tons, and was of the same general order of magnitude in 1974 and 1975.

[6] Includes titaniferous slag.

[7] Comprises sulfur produced by the Frasch process plus sulfur mined in the elemental state from ores.

[8] Comprises sulfur recovered from coal gasification, metallurgical operations (except pyrite processing), natural gas, petroleum, tar sands, spent oxides, and gypsum, whether recovered in the elemental state or as a sulfur compound.

[9] Production of coke, other than metallurgical coke, for the People's Republic of China and the U.S.S.R. included with metallurgical coke production.

NA Production data not available and no basis available for reliable estimate of output level.

[1] Percentages based on a world total that excludes data for the United States (withheld to avoid disclosing individual company confidential data), inclusion of which would significantly alter percentages for all countries.

[2] Percentages based on a world total that excludes data for the People's Republic of China (no adequate basis for estimation available) inclusion of which might significantly alter percentages for all countries.

[3] Percentages based on a world total that excludes data for the U.S.S.R. (no adequate basis for estimation available), inclusion of which might significantly alter percentages for all countries.

[4] Percentages based on a world total that excludes data for the United States (withheld to avoid disclosing individual company confidential data). On the basis of results for 1973, when the U.S. figure was publishable, all other nations together accounted for only slightly more than one-half of the world total (the United States accounted for 46.8% alone), and thus the percentages presented here would be virtually halved if the U.S. figure were included in the total.

[5] Production negligible (less than 0.05% of world output).

[6] Percentages based on a world total of ilmenite plus titaniferous slag.

[7] For details on forms of sulfur included in each of the three subgroups, see footnotes to table 2.

[8] Percentages based on a world total that includes coke other than metallurgical for the People's Republic of China and the U.S.S.R.

[9] Percentages based on a world total that excludes figures for the People's Republic of China and the U.S.S.R. (These data are reported as an inseparable part of the data entered under metallurgical coke.)

Crude	20.4	57.4	77.8	22.2	.4	.5	20.4	51.0	19.2
Refined	62.1	18.0	80.1	19.9	18.7	1.4	61.7	5.7	17.8

NA Production data not available and no basis available for reliable estimate of output level.

[1] Percentages based on a world total that excludes data for the United States (withheld to avoid disclosing individual company confidential data), inclusion of which would significantly alter percentages for all countries.

[2] Percentages based on a world total that excludes data for the People's Republic of China (no adequate basis for estimation available), inclusion of which might significantly alter percentages for all countries.

[3] Percentages based on a world total that excludes data for the U.S.S.R. (no adequate basis for estimation available), inclusion of which might significantly alter percentages for all countries.

[4] Percentages based on a world total that excludes data for the United States (withheld to avoid disclosing individual company confidential data). On the basis of results for 1973, when the U.S. figure was publishable, all other nations together accounted for only slightly more than one-half of the world total (the United States accounted for 46.8% alone), and thus the percentages presented here would be virtually halved if the U.S. figure were included in the total.

[5] Production negligible (less than 0.05% of world output).

[6] Percentages based on a world total of ilmenite plus titaniferous slag.

[7] For details on forms of sulfur included in each of the three subgroups, see footnotes to table 2.

[8] Percentages based on a world total that includes coke other than metallurgical for the People's Republic of China and the U.S.S.R.

[9] Percentages based on a world total that excludes figures for the People's Republic of China and the U.S.S.R. (These data are reported as an inseparable part of the data entered under metallurgical coke.)

NOTE.—EEC: European Economic Community.
EFTA: European Free Trade Association.
OECD: Organization for Economic Cooperation and Development.
OPEC: Organization of Petroleum Exporting Countries.
CMEA: Council for Mutual Economic Assistance.

Table 5.—Value of world export trade in major mineral commodity groups[1]

(Million dollars)

Commodity group[1]	1970	1971	1972	1973 r	1974
Metals:					
All ores, concentrates, scrap	8,110	7,120	7,730	11,170	15,630

r Revised.
[1] Data presented are for selected major commodity groups of the Standard International Trade Classification—Revised (SITC—R), and as such exclude mineral commodities classified in that data array together with other (nonmineral) commodities. SITC—R categories included are as follows: Ores, concentrates, and scrap—SITC Division 28; iron and steel—SITC Division 67; nonferrous metals—SITC Division 68; nonmetals (crude only)—SITC Division 27; and mineral fuels—SITC Division 3. Major items not included are the metals, metalloids, and metal oxides of SITC Group 513; mineral tar and crude chemicals from coal, petroleum, and natural gas of SITC Division 52; manufactured fertilizers of SITC Division 56; and nonmetallic mineral manufactures of SITC Groups 661, 662, 663, and 667.

[1] For detailed definition of groups, see footnote 1, table 5.

[2] Regional groups generally conform to United Nations practice; modifications and special aspects of classification scheme are as follows: (1) Latin America includes Mexico, Central America, and South America, but excludes Caribbean Islands; (2) EEC consists of Belgium, Denmark, France, West Germany, Ireland, Italy, Luxembourg, the Netherlands, and the United Kingdom; (3) EFTA consists of Austria, Finland, Iceland, Norway, Portugal, Sweden, and Switzerland; (4) other market economy Europe consists of Greece and Spain, as well as Yugoslavia (a centrally planned economy country); (5) centrally planned Europe includes Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.; (6) other Africa corresponds to the United Nations category "Developing Africa"; (7) Near East corresponds to the United Nations category "Developing Asia, Middle East"; (8) other market economy South Asia and Far East refers to the United Nations category "Developing Asia, Other"; (9) centrally planned Far East and South Asia consists of the People's Republic of China, North Korea, Mongolia, and North Vietnam; and (10) the category "Not reported" is derived by subtracting all listed figures from reported totals, and includes the Caribbean and Pacific Islands.

[3] Partial figure; value of crude nonmetals excluded but presumably included under "Not reported."

[4] Percentage based on partial figure; see footnote to entry in "Exports from" value column.

[5] Partial figure; includes value of mineral fuels and crude nonmetals only; totals for other commodity groups presumably included under "Not reported."

[6] Partial figure; value of iron and steel excluded, but presumably included under "Not reported."

[7] Partial figure; includes value of mineral fuels only; totals for other commodity groups presumably included under "Not reported."

[8] Partial figure; value of metal ores, concentrates, and scrap, as well as crude nonmetals, excluded but presumably included under "Not reported."

[9] Value of major mineral commodities from "Not reported" exceeds value of all commodities exported from that area by $160 million. Discrepancy may be due in part to (1) revisions in totals reported in later source data for developed market economy countries which could not be distributed among those countries individually, and (2) rounding.

NA Not available. XX Not applicable.

[1] For detailed listing of commodities included, see footnote 1, table 5. It should be noted that certain commodities excluded for specific areas as indicated by footnotes are presumably included in grand totals.

[2] For detailed definition of areas listed, see footnote 2, table 8.

[3] Not reported in source but derived from data therein.

[4] As reported in source. Detail may not add to listed total.

[5] Detail exceeds total by $1 million in the case of Canada and $1,450 million in the case of "Not reported." Discrepancy is presumed to be due, in part to (1) revisions in totals reported in later source data for developed market economy countries which could not be distributed among those countries individually, and (2) rounding.

[6] Excludes crude nonmetals.

[7] Includes crude nonmetals and mineral fuels only.

[8] Excludes iron and steel.

[9] Includes mineral fuels only.

[10] Excludes crude nonmetals and metal ores and scrap.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Yearly data based on a total of three categories: Iron ore for steelworks, for agglomerates, and iron ore and concentrate for blast furnaces. An estimated figure is based on a partial total of these three categories or is an apparent consumption computed by adding production and imports and then deducting exports.

[2] Includes sinter produced at mines.

[3] Includes calcined ores.

[4] Includes 211,000 tons of contained metal for steelworks in 1973, and 208,000 tons in 1974.

Source: United Nations Economic Commission for Europe. 1975 Annual Bulletin of Steel Statistics for Europe. V. 3, 1976. Official production and trade statistics for selected countries were also used as source material.

[e] Estimate.

[1] Unless otherwise noted, figures represent consumption of scrap in the production of pig iron, ferroalloys, crude steel, foundry products, and rerolled steel, as well as in other unspecified uses by the steel industry and by other (unspecified) industries. Also, unless otherwise noted, figures are from: United Nations Economic Commission for Europe. 1975 Annual Bulletin of Steel Statistics for Europe. V. 3, 1976, 97 pp.

[2] Excludes scrap consumed in rerolling.

[3] Excludes scrap consumed in foundries.

[4] Excludes scrap consumed within the steel industry for purposes other than manufacture of pig iron, ferroalloys, crude steel, and foundry products, and that used in rerolling.

[5] Excludes scrap used outside the steel industry.

[6] Total of listed figures.

[7] Central Statistics Bureau. Bergshantering (Mining) 1973. Stockholm, 1974, p. 105.

[8] Following United Nations practice, Yugoslavia has been included with other market economy nations of Western Europe.

[9] Excludes scrap used in production of pig iron.

[10] Excludes scrap used in production of steel by any method of production except open-hearth furnace.

[11] British Steel Corporation. International Steel Statistics, U.S.S.R. 1973, p. 2.

[12] 1971–72: U.S. Bureau of Mines estimates; 1973–74: Latin American Iron and Steel Institute. Anuario Estadistico de la Siderurgia y Mineria del Fierro de America Latina 1974, p. 18, Santiago (undated); 1975: Latin American Iron and Steel Institute. Informativo Estadistico No. 29, September 16, 1976 (not paginated). Data for 1973–74 are given in sources as total consumption by the steel industry, but no breakdown by use within that industry is provided, and sources do not make it clear whether or not consumption in foundries and rerolling plants is included; consumption other than in the steel industry is clearly excluded.

[13] Uruguay plus unspecified countries in Central America, as reported in source.

[14] British Steel Corporation. International Steel Statistics, India 1973, p. 2.

[15] British Steel Corporation. International Steel Statistics, Republic of South Africa 1973, p. 2.

Table 13.—Estimated world[1] consumption of major nonferrous metals

(Thousand metric tons)

Commodity	1973 r	1974	1975 p
Aluminum[2]	13,248	13,957	11,777
Copper[3]	8,785	8,401	7,430
Lead[4]	4,266	4,098	3,582
Zinc[5]	5,934	5,776	4,996
Tin[6]	213	199	171

p Preliminary. r Revised.

[1] In general, figures are totals for major consuming countries only; sum of consumption by excluded minor consumers may be significant; data included for centrally planned economy countries (except Yugoslavia) are listed as conjectural in source.

[2] Includes secondary metal.

[3] Primary and secondary refined metal.

[4] Chiefly primary, but including some secondary.

[5] Primary and secondary slab.

[6] Primary only as reported by the International Tin Council. Centrally planned economy countries (except Yugoslavia) are excluded; consumption of primary and secondary tin by these countries is estimated at about 60,000 tons annually.

Source: American Bureau of Metal Statistics, Inc. Nonferrous Metal Data, 1975. New York, 1976, 143 pp.

1974	2,540	3,559	1,611	208	7,919	2,043
1975	2,621	3,525	1,633	222	8,005	2,030

[1] In most cases, data are aggregates of country figures representing apparent inland consumption—the arithmetic result of adding production and imports and subtracting from this sum the total of exports, bunker loadings, and additions to stocks (where the latter are known). All totals in this table are reported in source except for "Total market economy," which is the sum of individual market economy areas. In some cases, totals may not represent the sum of listed parts because of rounding and/or ommission from detail of minor quantities not listed separately. A large number of entries in this table have been revised from those appearing in previous editions of this chapter due to revisions published in new edition of source; such revisions have not been identified by footnote.

[2] Areas listed are those appearing in source and have not been conformed in scope to standard terms used in the Minerals Yearbook.

[3] Includes Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

[4] Includes the People's Republic of China, North Vietnam, Mongolia, and North Korea.

[1] Maritime Administration classification. Tankers include whaling tankers. Vessels shown here as "other" include combination passenger and cargo, combination passenger and refrigerated cargo, and refrigerated freighters, except as otherwise indicated. Contribution of these vessels to mineral commodity trade is regarded as unimportant. Data are as of December 31 of year indicated.
[2] Figures include refrigerated freighters.
[3] Figures exclude refrigerated freighters.

r Revised.
1 Includes Bulgaria, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.
2 Quarterly figures are for the last month in the quarter except for those of United Kingdom dry cargo, which are averages for the quarter indicated.
3 Index numbers represent the trip/time charter of the average freight rate assessments calculated on the basis of rates prevailing during the period.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] This table includes all recorded production of sulfur, regardless of its origin or of the form in which it is recovered. Thus it includes elemental sulfur, whether mined by conventional methods or by the Frasch process, as well as elemental sulfur and the sulfur content of compounds such as H_2S, SO_2 and H_2SO_4 recovered as a principal product of pyrite mining and as a byproduct of the recovery of crude oil and natural gas, and as a byproduct of oil refining, coal treatment, and metals smelting and/or refining.

[2] Entirely Frasch-process sulfur.

[3] Includes Frasch-process sulfur as follows, in thousand metric tons: Poland: 1973—2,975, 1974—3,274, 1975—3,817; total of individually listed countries and grand total: 1973—12,705, 1974—14,234, 1975—13,957. Balance is mined elemental sulfur.

e Estimate. NA Not available. XX Not applicable.

[1] Data presented are compiled from import statistics of countries listed as recipient countries unless otherwise specified and, as such, are incomplete, but are believed to account for the overwhelming share of total world movement of bauxite and alumina.

[2] Unless otherwise specified, figures are those reported in latest country chapter of Volume III, Minerals Yearbook. Data on bauxite production are on dry equivalent basis for a number of countries, and as such may be reported on a different basis from bauxite exports, which almost universally are on a gross weight basis and which are obtained from official trade statistics of the listed countries. Data on alumina production are generally for output prior to calcination, while data on alumina exports, also from official trade statistics, include aluminum hydroxide and thus may not be exactly comparable.

[e] Estimate. XX Not applicable.

[1] Disparities between recorded total exports of source countries and recorded total imports of recipient countries from each listed source country are generally due to (1) time lag between shipment and receipt, and (2) the fact that the latter totals are incomplete, representing only the imports of the nations listed in the column heads and in footnotes 9, 10, and 11.

[2] Unless otherwise specified, data are compiled from official export statistics of listed recipient countries.

[3] Unless otherwise specified, data are compiled from official import statistics of listed recipient countries.

[4] Official import statistics for Czechoslovakia, Poland, Romania, and the United Kingdom do not fully distribute total imports by country of origin, and therefore do not clearly indicate whether these nations received shipments from any of the source countries where this footnote has been entered.

[5] Exports not available. Production reported in lieu of exports as all or nearly all output is exported.

[6] Official mineral statistics publication of source country rather than official trade returns.

[7] In previous editions of this table, import figures for various recipient countries were adjusted to account for Swedish ores shipped through Narvik, Norway, and erroneously credited to Norway by such recipient countries. No such adjustment is necessary for 1974.

[8] Summation of (1) recorded exports of the following countries, with export quantity following country name in thousand metric tons: Austria—1; Belgium-Luxembourg—69; Denmark—6; West Germany—5; Hong Kong—160; Italy—18; Republic of Korea—76; Morocco—10; Netherlands—196; New Zealand—2,235; and Tunisia—526; together with (2) apparent exports (as measured by imports of trading partner countries) with apparent export quantity following country name in thousand metric tons, and trading partner countries listed in parentheses: Indonesia—372 (Japanese imports only); North Korea—305 (Japanese imports only); Panama—24 (Mexican imports only); and Poland—10 (West German imports only). In addition to the foregoing list of countries, Mexico, Monaco, Switzerland, the United Kingdom, and Yugoslavia recorded iron ore exports, but each of these nations individually exported less than 500 tons.

[9] Includes the following countries with recorded total imports of each following the country name in thousand metric tons: Austria—2,800; Bulgaria—2,396; Denmark—less than ½ unit; Finland—1,133; East Germany—2,807; Greece—1,025; Norway—1,308; Portugal—10; Spain—5,280; Sweden—82; Switzerland—39; and Yugoslavia—431.

[10] Includes the following countries with recorded total imports of each following the country name in thousand metric tons: Australia—28; Republic of Korea—1,395; Malaysia—less than ½ unit; Singapore—10; and Taiwan—144.

[11] Includes the following countries with recorded total imports of each following the country name in thousand metric tons: Argentina—1,200; Brazil—less than ½ unit; Mexico—37; and Venezuela—less than ½ unit.

[12] Less than ½ unit.

[13] Official export statistics of source country.

[14] Includes the following reported source countries with total quantity credited to each following the country name in thousand metric tons: Belgium-Luxembourg—47; Czechoslovakia—74; Denmark—4; Finland—8; Gabon—58; West Germany—16; Greenland—10; Hong Kong—180; Indonesia—372; Iran—1; Italy—14; Japan—40; Papua New Guinea—49; North Korea—305; Republic of Korea—83; Morocco—362; Mozambique—141; Netherlands—2; New Zealand—2,409; Nigeria—2; Panama—300; People's Republic of China—less than ½ unit; Poland—1; Portugal—337; Thailand—23; Tunisia—113; and United Kingdom—less than ½ unit.

XX Not applicable.

[1] Because some countries do not report destination for a portion of exports (see unallocated column), figures given for distribution of those countries' exports by continental area are not exactly correct. However, such unallocated quantities are sizable only in the case of some of the centrally planned economy countries and the Republic of South Africa.

[2] All Western Hemisphere areas except the United States and Canada.

[3] Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

[4] Bahrain, Cyprus, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Oman, Qatar, Saudi Arabia, the People's Democratic Republic of Yemen, Syria, the United Arab Emirates, Turkey, and the Yemen Arab Republic.

[5] The People's Republic of China, North Korea, and North Vietnam; Mongolia is included under other market economy South Asia and Far East owing to its inseparability from this group in source.

unreported sources; the bulk of this material is believed to have originated from Brazil and Morocco on the basis of export statistics of those nations.

[6] Includes the following countries reporting imports (with total imports in parentheses, following the country name, in metric tons): Australia (1,906), Austria (898), Denmark (2,768), Finland (29,652), Greece (22,709), Hong Kong (680), Hungary (14,614), India (2,776), Iran (615, for year beginning March 21, 1974), Ireland (35), Kenya (535), Malaysia (1,179), Mexico (24,382), Morocco (177), Philippines (2,433), Portugal (508), Thailand (8,292), and Venezuela (145).

[7] Sum of figures listed for individual destinations, including those items covered by footnote 3.

[8] Actual recorded exports of listed source countries from official trade returns unless otherwise specified.

[9] Exports reported in source other than official trade returns.

[10] Includes the following countries (quantities in parentheses, following country name, in metric tons): Belgium-Luxembourg (202,382), Denmark (139), France (2,211), West Germany (1,294), Greece (7,624), Hungary (15,173), Italy (82), Japan (4,887), Netherlands (33,553), Norway (1,831), Philippines (2,127), Portugal (3,680), Romania (54,800), Spain (144), Sweden (849), Thailand (18,780), United Kingdom (138,302), and United States (202,382).

r Revised.

[1] Imports of countries other than those listed are generally small individually (except for Eastern European nations listed in footnote 4), but in aggregate apparently total about 125,000 tons per year. Total lead imports by Eastern European countries, including trade between countries of this group, apparently total 70,000 tons or more per year.

[2] Includes Mexico.

[3] Includes Yugoslavia.

[4] Includes Bulgaria, Czechoslovakia, East Germany, Poland, and the U.S.S.R.

[5] Reported totals.

[6] January through September for 1974 and January through June for 1975.

[7] January through October.

[e] Estimate. XX Not applicable.

[1] Compiled from official export statistics of source country unless otherwise specified.

[2] Includes the following countries with quantities in billion cubic feet and destinations as noted: 1973: Bolivia—55, all to Argentina; Brunei—59, including 54 to Japan and 5 to Malaysia (Sarawak); France—4, including 1 to Belgium-Luxembourg and 3 to Switzerland; West Germany—5, including 1 to Austria and 4 to Switzerland; Mexico—2, all to the United States; and Romania—7, all to Hungary; 1974: Bolivia—55, all to Argentina; Brunei—136, including 131 to Japan and 5 (estimated) to Malaysia (Sarawak); France—4, including 1 to Belgium-Luxembourg and 3 to Switzerland; West Germany—47, including 3 to Austria and 44 to Switzerland; Mexico—less than ½ unit, all to the United States; and Romania—7, all to Hungary.

[3] Data from import statistics of recipient country.

[4] Liquefied natural gas.

[5] Includes, in part, liquefied natural gas as indicated by footnotes in detail.

[6] Data from the U.S. Federal Power Commission, rather than official foreign trade statistics.

[7] Less than ½ unit.

[1] Figures given are for fuel commodities only, excluding lubricants and other refinery products not normally used as energy sources. Apparent discrepancies between export, import, and bunker totals evidently result from quantities of material en route at yearend, from incomplete data, and from differing practices from country to country in the method of reporting bunkering materials.

[2] Continental areas are the same as those used in table 66 except that Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R. are reported under the group term "Centrally planned Europe," while the People's Republic of China, North Korea, Mongolia, and North Vietnam are reported under the group term "Centrally planned Asia."

[3] Reported totals; may differ from sum of detail because of rounding.

The Mineral Industry of Albania

By Nikita Wells [1]

In 1975, Albania maintained its position as the world's third largest producer of chromite, following the U.S.S.R. and the Republic of South Africa and provided 9.4% of the world's production. Other mineral commodities were also produced but were of little importance by world standards. These included nickeliferous iron ore, copper ore, blister copper, crude oil, petroleum products, lignite, natural gas, natural asphalt, and cement.

Albania's fifth 5-year plan (1971–75) fell short of many of its objectives. Its 7% annual growth compared unfavorably with the 12.5% of the fourth 5-year plan and with the 9% to 10% annual growth that was planned. Industry was to have a 61% to 66% growth during this period but reached only an estimated 50%.

Albania continued construction of industrial projects during 1975 with help from the People's Republic of China. Major projects included the Elbasan Metallurgical Combine (iron and steel complex) where the first blast furnace was to have been commissioned during 1975, the 1-million ton-per-year Ballësh petroleum refinery, the ferrochromium plant at Burrel, the copper smelter at Laç, the urea plant at Fier which is to double Albania's nitrogen fertilizer production, the 500-megawatt hydroelectric powerplant at Fierzë, and the Vlora polyvinylchloride plant.

Information on the performance of Albania's mineral industry is inadequate and largely inferential since little is published directly. Some statistical information was published in a special Albanian survey in 1973.[2] In general, Albanian reporting on minerals has been minimal. Albanian official sources do indicate, however, plans and plan fulfillments or relative growth rates in some areas. Therefore, most of the actual production data are estimated; the trade tables are compiled from returns of trading partner countries.

Government Policies and Programs.—The sixth 5-year plan (1976–80) will place particular emphasis upon the oil industry. Compared with 1975, crude oil production is to increase 11% in 1980. Special attention is to be given to exploration for new deposits in order to increase industrial reserves of oil and gas. Natural gas production is to increase 48%. The mineral industry is also to be rapidly developed during this period. In 1980, as compared with 1975, production of chromite is to increase more than 46%, copper ore more than 55%, and nickeliferous iron ore by about a factor of 3.3; coal (lignite) production is to double. Production of cement is to increase 55%.

Important ferrous metallurgy projects and new copper and chrome plants are to be commissioned during the sixth 5-year plan's industrialization program. In 1980, electric energy is to be increased about 2.2 times compared with that of 1975. The output of hydroelectricity is to triple when the Fierzë hydroelectric powerplant begins operation. Construction is also to be initiated on the hydroelectric powerplant at Kaman on the Drin River.[3]

PRODUCTION

Total industrial production in 1975 increased 4.4% over that of 1974. This, however, compares unfavorably to industrial production growth reported for earlier years. Although production targets as put forward by the fifth 5-year plan were not reached, the revised tasks set for 1975 were generally fulfilled. In 1975, the annual production plans were exceeded for chromite, copper, and nickeliferous iron ores, coal, pyrites, mineral fertilizers, and cement. The production of nickeliferous iron ore increased 61.3% in order to meet the goal of the plan for 1975. The production of chromite increased 9% and blister copper 7.2%. In the mineral fuels sector, natural gas production reportedly increased, meeting its upgraded 1975 plan goal. Production of lignite increased 5%.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, a variety of crude construction materials (common clay, sand, gravel, and stone) is undoubtedly produced, but output is unreported and available information is inadequate to make reliable estimates of output levels.

[2] Smelter output used as an estimate of mine output inasmuch as there is no evidence of ore and/or concentrate exports.

[3] Petroleum data converted to barrels from metric tons using the following factors: Crude petroleum—6.672; gasoline—8.50; kerosine—7.75; distillate fuel oil—7.46; residual fuel oil—6.66; lubricants—7.00; petroleum jelly and wax—7.87; asphalt and bitumen—6.06; petroleum coke—5.50; unspecified—7.00. The tonnage figures for "unspecified" were derived by subtracting the tonnages for individual products reported from a reported total refinery product figure, which may have excluded refinery fuel.

TRADE

Minerals and related products were the major portion of Albania's exports in 1975, as in previous years; only chromium ore was important by world standards. Other important exports in 1975, besides chromium ore, were crude oil, asphaltic flux, nickeliferous iron ore, blister copper, electrolytic copper, and copper wire.

Albanian imports were mainly capital goods to increase the economic self-sufficiency of the country. The main mineral and related products imported were coke, iron and steel semimanufactures, phosphate rock, and potash.

China was Albania's principal trading partner, with an estimated $230 million, or 70% of all trade in 1975. The second largest trading partner was Yugoslavia with a total trade of $60 million, followed by Italy with $32.2 million. Some other trading partners were Poland, West Germany, Austria, Romania, Greece, and the United States. In 1974, the United States imported $218,144 worth of chromite from Albania. U.S. imports and exports to Albania were both valued around $485,000 in 1974.

Trade statistics in table 2 and 3 were compiled from returns of trading partner countries.

COMMODITY REVIEW

METALS

Chromite.—In 1975, Albania was the world's third largest producer of chromite, with 9.4% of the world's total production, following the U.S.S.R. and the Republic of South Africa. It produced 779,000 tons, an increase of 9.0% over 1974 output. The original fifth 5-year plan called for a 900,000-ton ore production in 1975, but a later revision brought this figure down to 837,000 tons.

The four principal chromite mining areas are located at Pogradec, on the southern shore of Lake Ohrid; Klos, 50 kilometers northeast of Tirana; Elbasan, 40 kilometers southeast of Tirana; and near Tropojë and Kukës in the northern part of Albania. The average grade of Albanian chromite is 42% Cr_2O_3, 13% FeO, and 22% Al_2O_3, and the material is suitable for both metallurgical and refractory purposes.[4]

Construction continued during 1975 on the ferrochromium plant at Burrel, in the Mat District, which is to supply the Elbasan Metallurgical Complex. This plant is being constructed with the help of China and will permit the reduction of chromite inside Albania for the first time. By 1980 chromite production is to increase by more than 46%.

Yearly Albanian exports of chromite are about 450,000 tons of both metallurgical and refractory qualities. The bulk of these exports go to Yugoslavia, Italy, and Poland.

Copper.—Production of copper ore met plan goals by reaching 600,000 tons in 1975. Production of blister copper in 1975 had reached 9,200 tons, showing an increase of 7.2% over that of 1974 and exceeding the planned 5% increase. According to the sixth 5-year plan, copper production is to increase in 1980 by more than 55% over that of 1975. In 1973, Albanian exports included 2,016 tons of blister and 2,481 tons of copper wire.

In 1975 about 60% of the blister copper was to be converted into wire, and the remainder into refined metal, bronze, and brass.[5] The Mirditë District accounts for about 50% of Albania's copper ore production, 45% of the blister, and all of the electrolytic copper.

In 1975, Albania was continuing the construction of its third copper smelting plant at Laç, in the Kruja District, north of Tirana. This was one of the biggest copper industry projects of the 1971–75 plan. Albania's other two copper smelting plants are located in the Mirditë and Kukës Districts.

Albanian copper deposits are located in the north of the country in the Mirditë, Pukë, Kukës, and Shkodër Districts, where reserves are estimated at 50 million tons of low-grade ore.

Iron Ore, Nickeliferous.—Albanian nickeliferous iron ore production in 1975 reached an estimated 650,000 tons, a 61.3% increase over that of 1974. The production of this ore was to be increased 16% in 1976 and by a factor of 3.3 by 1980. This ore was exported up to 1974, but in 1975 it was to be used domestically at the Elbasan Metallurgical Combine.

Albania's most important nickeliferous iron ore mines are located near Lake Ohrid at Pishkash and Prrenjas in the Pogradec and Librazhd Districts. The ore is mostly mined by open pits and contains approximately 51% iron, 1% nickel, and 0.06% cobalt.

Three new mines were under construction at Prrenjas, Guri i Kug, and Cervenaka. A 45-kilometer railroad has been laid connecting Prrenjas to the Elbasan Complex. A railroad line was also under construction to link Guri i Kug to Prrenjas. These three mines were to be completed by yearend 1975; however, no reports of completions have yet appeared.

Iron and Steel.—Construction of the Elbasan Metallurgical Combine is Albania's largest current investment project. It is being built with the help of China and is to achieve an 800,000-ton-per-year capacity of all products including wire, sheets, bars, and other products. The first blast furnace was commissioned during 1975. The bulk of the equipment for this plant is coming from China, but some machinery has reportedly been purchased from West Germany.[6]

NONMETALS

Estimates had to be made on the production of Albanian nonmetals owing to the lack of available information for 1975. Production of pyrites, mineral fertilizers, calcined and caustic soda, and cement have surpassed their goals for 1975.

Cement.—According to Albanian sources, production of cement in 1975 had reached its planned goal. Earlier sources set this goal at 1 million tons. Production in 1980 is to increase 55% as compared with 1975. Albania now has two cement plants, which are located at Fusë-Krujë and Elbasan.

Fertilizer Materials.—The production of nitrogen fertilizers in 1975 surpassed its planned goal of approximately 210,000 tons. Phosphatic fertilizer production was estimated at 120,000 tons.

Albania has one nitrogen fertilizer plant, which is located at Fier and was built with the help of China. Here a urea plant was under construction during 1975 and is to double Albania's nitrogen fertilizer production upon full operation. It was to start operations in the middle of 1976.

MINERAL FUELS

The estimated production of primary energy derived from fossil fuels and hydroelectric generation increased from 4.25 million tons of standard coal equivalent in 1974 to 4.52 million tons in 1975. In 1975, Albania exported an estimated 1.36 million tons of standard coal equivalent, mostly in the form of oil. Albania's total primary energy consumption for 1975 reached an estimated 3.2 million tons of standard coal equivalent, an increase of 8.9% over that of 1974. Oil provided 62.9% of the total primary energy, while coal represented 20.4%, natural gas 12.6%, and hydroelectric energy 4.1%. The total primary energy balances for Albania for 1974 and 1975 are shown in table 4.

Table 4.—Albania: Primary energy balance for 1974 and 1975

(Million tons of standard coal equivalent [1])

Year	Total primary energy	Coal (lignite)	Crude oil and petroleum products	Natural and associated gas	Hydroelectric power
1974: [2]					
Production	4.25	0.60	3.23	0.27	0.15
Imports	.02	.02	--	--	--
Exports	1.35	--	1.30	--	.05
Apparent consumption	2.92	.62	1.93	.27	.10
1975: [3]					
Production	4.52	.63	3.31	.40	.18
Imports	.02	.02	--	--	--
Exports	1.36	--	1.31	--	.05
Apparent consumption	3.18	.65	2.00	.40	.13

[1] 1 ton of standard coal equivalent (SCE) = 7,000,000 kilocalories. Conversion factors used are lignite, 0.7; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); hydroelectric power, 0.125 (per 1,000 kilowatt-hours). Source: United Nations. World Energy Supplies. Statistical Papers, Series J, No. 18, 1975.

[2] Data for 1974 reported in Zeri i Popullit (Tirana), Jan. 28, 1975, pp. 1–3.

[3] Data for 1975 obtained from various Albanian sources and estimates.

Albania is presently self-sufficient in all forms of energy and is exporting surplus crude oil and electric energy. It is also developing self-sufficiency in natural gas. Nearly 75% of Albania's electric power requirements are supplied by hydroelectric powerplants. In 1975, Albania produced approximately 2 billion kilowatt-hours of electric energy. The 250-megawatt powerplant, established along the Drin River, was exporting electric power to Yugoslavia. Albania's electric power production is to increase 21% in 1976.

Coal.—Albania's lignite production in 1975 was 894,000 tons, a 5% increase over that of 1974 and meeting the revised plan figure. The original planned production figure for 1975 was 1.25 million tons. Coal production is to increase 9% over that of 1975 in 1976 and is to double by 1980. More than 80% of this coal is to be obtained from existing mines and from their expansion. Plans have been made to beneficiate 60% of Albanian coal by 1980.

Albania's deposits consist of lignites and subbituminous coals having a calorific value of about 4,900 kilocalories per kilogram (8,800 Btu per pound). The largest deposits are near Korcë, at Memaliaj near Tepelenë, and in a triangular plateau with apexes at Tirana, Elbasan, and Lushnjë. Two new mines have gone into operation at Mushqeta and Mëzez.

Production was started in 1975 at the new mine at Valias, near Tirana, where a coal beneficiation plant was being built with help from China. The Memaliaj mine is expanding its production capacity and is to increase its output in 1976 by 20,000 tons.

Natural Gas.—Albanian natural gas production was approximately 300 million cubic meters. According to the original 1971–75 plan, the 1975 gas production was to be 255 million cubic meters, but the later 1975 revised plan called for the 300 million cubic meters. By 1980, natural gas production is to increase 48%. The large increase in gas production in 1975 is believed to be due to the recently discovered gas deposits in Diviakë and Budulinë in the Lushnje District. Albanian natural gas reserves are believed to be about 8 trillion cubic feet, but Albania has not released any definite reserve figures.

Petroleum.—Production of crude oil in 1975 was estimated at 2.25 million tons. By the end of the fifth 5-year plan (1971–75), Albania's crude production was to have reached 2.5 million to 2.7 million tons, but it fell short of its goal because of poor yields from oil wells. Crude oil production in 1980 is to be increased 11% compared with that of 1975. Exports of crude oil in 1974 were about 441,000 tons, and those of asphaltic flux approximately 1.0 million tons.

The Ballësh oil refinery is Albania's second most important investment following the Elbasan Metallurgical Combine. It is to have an annual capacity of 1 million tons. Construction of this refinery continued during 1975 with help from China. Once this refinery goes into operation it is to stimulate the petrochemical industry at Vlorë. The seaport of Vlorë is now connected to Albania's oilfields and refineries by an oil pipeline system. Albania's present estimated refining capacity is 2 million tons per year. The refinery at Fier has a capacity of 1 million tons per year, while the two refineries at Stalin and Cerrik have capacities of 500,000 tons per year each.

The Mineral Industry of Algeria

By John L. Albright [1]

Algeria's mineral industry was dominated by activities in petroleum and natural gas during 1975. Plans were being developed to enlarge handling and storage facilities for crude oil, refined petroleum products, petrochemicals, and liquefied natural gas (LNG) destined for export. A tanker loading area will be built at Alger to enable the export of about 230 million barrels of crude oil and 40 billion cubic meters of LNG per year. The State-owned Société Nationale pour la Recherche, la Production, le Transport, la Transformation, et la Commercialisation des Hydrocarbures (SONATRACH) was actively engaged in all phases of the petroleum industry. The Export-Import Bank of the United States extended a loan of $47.7 million [2] to SONATRACH to be used to purchase additional equipment for the liquefication of natural gas for export, and a consortium of 46 international banks extended loans totaling $400 million to the Banque Exterieure d'Algeria and the Banque Nationale d'Algerie to be used for numerous development projects in the country including the construction of cement plants and natural gas pipelines. The loans will be repayable over a period of 4 years beginning in 1979. Société Nationale de Recherches et d'Exploitations Minières (SONAREM) continued to operate as Algeria's autonomous national mining company.

Algeria selected contractors to build petroleum and natural gas related industries, including ammonia and methanol plants. SONATRACH awarded contracts to Kellogg France, S.A. and Creusot-Loire Entreprise for the construction of a 1,000-ton-per-day ammonia plant at Annaba. Creusot-Loire will act as general contractor for the project. The plant will use natural gas as feedstock, and the ammonia produced will be marketed mainly in Algeria.[3] Production has been scheduled to begin in 1978, and the plant will employ approximately 350 people. SONATRACH and a group of 14 Japanese companies agreed to carry out a $500,000 study into the feasibility of building and operating a methanol export plant that would use natural gas feedstocks from the prolific Hassi R'Mel Field.

The Algerian State budget for 1975 set revenues at $5,569 million and expenditures at $5,533 million; oil taxes were placed at $3,292 million, or nearly 60% of the total revenue.

PRODUCTION

Algeria remained as one of Africa's leading producers of petroleum and natural gas. The largest producing oilfields in the country were in the east-central section of the country between Hassi Messaoud and I-N-Amenas, near the Libyan border. There were an estimated 869 wells in production during 1975, 3 more than in 1974, of which 211 required artificial lifting.

Most of the country's mineral industries recorded minor increases in production during 1975, but crude oil output de-

[1] Mineral specialist, Division of Petroleum and Natural Gas.

[2] Where necessary, values have been converted from Algerian dinars (DA) to U.S. dollars at the rate of DA3.9494=US$1.00.

[3] Oil Daily. Kellogg Technology to be Used in 2d Algerian Ammonia Unit. No. 5815, Jan. 23, 1975, p. 3.

creased by 17 million barrels to 350.8 million barrels during the year, due mainly to pressure problems at major fields. Algeria's natural gas industry experienced a production increase. During 1975, the production of iron ore declined by 570,000 tons, and Algeria's output of phosphate rock declined by an estimated 12,000 tons.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] In addition to the commodities listed, secondary aluminum, secondary lead, and copper may be produced in small quantities and additional crude construction materials (crude clays and stone) presumably are produced for local consumption, but output is unreported and available information is inadequate to make reliable estimates of output levels.

[2] Partial figure, production by firms employing 20 or more persons only. Total output is believed to be much higher, perhaps to the order of 175,000 tons annually.

[3] Partial figure, production by firms employing 20 or more persons only. No basis available for estimating total output.

[4] Source indicates unit of measure to be square meters, but this appears to be incorrect.

TRADE

In 1975, Algeria exported large quantities of petroleum and natural gas mainly to Europe and the United States. Algeria was Africa's largest exporter of refined petroleum products to the United States, and shipments of crude oil from Algeria to the United States totaled 96.5 million barrels. The volume of crude oil delivered to the United States was more than twice that sold to U.S. companies during 1973, and nearly 31 million barrels larger than Algeria's crude oil sales to the United States in 1974. Oil shipments to the United States during 1973 and 1974 had been affected by the Arab oil embargo. Of the crude oil exported during 1975, more than one-half went to West Europe, one-fourth to North America, and the remainder to Asia, Latin America, and other areas.

France, Italy, the United States, and West Germany were Algeria's most important trading partners. Barter trade agreements were negotiated between Algeria and several foreign countries. One such agreement between Algeria and France involving an exchange of crude oil for highway trucks failed to be consummated. A $37 million agreement was concluded between Algeria and Sweden for trading 2.8 million barrels of crude oil for 1,200 trucks, along with a service center and training facilities.[4] SONATRACH did not renew its trade agreement with the Essence et Lubrifiant de France-Entreprise de Recherches et d'Activités Pétrolières (Elf-ERAP) oil concern of France during 1975, but increased its sales to Compagnie Française des Pétroles (CFP) also of France. In December 1975, the Algerians signed an agreement with CFP to buy back nearly 7.7 million barrels of CFP's crude oil during 1976.[5]

SONATRACH signed an agreement with Ecol Ltd. of the United States to supply 40,000 barrels of crude oil per day to Ecol's new petroleum refinery near New Orleans, La., over a period of 5 years beginning in 1976. The Algerian deliveries will meet 20% of the refinery's 200,000-barrel-per-day capacity. Another important agreement signed during the year was the one concluded with Ruhrkohle AG of West Germany, which called for the delivery of coking coal to Algeria in exchange for oil and natural gas. The Algerian companies involved in the transaction were SONAREM, SONATRACH, Société Nationale Algérienne de l'Electricité et du Gaz (SONELGAZ), and Société Nationale de Sidérurgie (SNS). Details of the agreement were not publicized.

COMMODITY REVIEW

METALS

Iron Ore.—A large iron ore deposit covering an area approximately 6 square kilometers was discovered in the Batna region of northeast Algeria. The ore content of the find was not reported.

SONAREM issued a contract to the French firm Fives Cail Babcock to expand storage and transportation facilities at the Bou Khadra and Ouenza iron ore mines.[6] The scheduled expansions will permit the combined annual production from these two mines to increase from 3 million to 5 million tons.

Iron and Steel.—SNS actively pursued plans to expand Algeria's iron and steel industry. Contracts valued at approximately $228 million were awarded to an 11-member consortium of foreign firms to expand the El Hadjar complex near Annaba. One contract, worth about $203 million, covered the expansion of rolling mills. The capacity of the hot rolling mills will be increased from 400,000 to 1.3 million tons per year, and that of the cold rolling mills will be enlarged from 120,000 to 700,000 tons per year. The second contract, valued at about $25 million, was for the installation of two drawn steel machines rated at 450,000 tons per year each.[7] During the year, a new blast furnace with a hearth diameter of 9 meters was completed at El Hadjar, and SNS signed a contract with a French firm for assistance in establishing several small steelworks in Algeria and supplying them with scrap.

SNS approved plans for a mill to be established at El Eulma, near Jijel on the northern coast, to produce chain, electrodes, welding rods, and wire. A West German company will supply the equipment, and the 50,000-ton-per-year plant should begin operations during 1977 at approximately 64% of its capacity.

Lead and Zinc.—Technoexportstroy of Bulgaria will construct a lead and zinc processing complex at 'Aïn Azel near the Kherzet Youssef mines, under the terms of a $10.5 million contract awarded to the firm by SONAREM. The project will provide for the annual production of 3,800 tons of lead concentrate and 20,000 tons of zinc concentrate, commencing in 1978. Nearly all of the zinc concentrate will be processed at the newly constructed electrolytic plant at Ghazaouet, adjacent to the border with Morocco.[8]

Mercury.—Algeria and five other countries (Italy, Peru, Spain, Turkey, and Yugoslavia) formed the International Association of Mercury Producers, with its headquarters in Geneva, Switzerland. The organization was formed to make joint technical studies, exchange information, monitor market prices, and promote the production and utilization of mercury.[9]

Uranium.—Algeria and West Germany held talks and initiated a feasibility study concerning the possible development of uranium ore deposits in the Ahaggar plateau in southern Algeria. The study was scheduled for completion in 1976.

NONMETALS

Barite.—SONAREM contracted a French firm to construct a plant at Chaib to process up to 50,000 tons per year of barite from nearby mines. Algeria's Mizab plant, built in 1972, had a capacity to produce up to 70,000 tons of barite per year.

Cement.—Société Nationale de Matériaux de Construction (SNMC) issued contracts to French and Japanese firms to construct cement plants in Algeria with a combined capacity of 2.5 million tons per year. Creusot-Loire of France will build two of the plants. One will be located about 3 kilometers south of Beni Saf (on the northwestern coast near Oran) and the other will be located at Hamma Bouziane (about 5 kilometers northwest of Constantine). Each will have a capacity to produce 1 million tons of cement per year, and both will become operational in 1978. Kawasaki Heavy Industries, Ltd., of Japan won a contract to build a 500,000-ton-per-year facility at Saïda, south of Mascara, scheduled for completion by mid-

1977. Construction of that plant reportedly began in 1975.

SNMC's 1-million-ton-per-year plant at Meftah (near Alger), which had been under construction since 1970, was readied for operation in 1975.

Cimenterie Algéro-Tunisienne (CIMAT), a joint Algerian-Tunisian company, signed a contract with the French company Société des Ciments Français for engineering and supervising the construction of a 1-million-ton-per-year cement plant in west-central Tunisia, near the Algerian border.[10] Originally planned to begin operations in 1976, CIMAT will commence partial production in 1979. In 1973 Algeria and Tunisia chose Djebel Boulahneche, Tunisia, as the site for their jointly-owned cement plant.

Fertilizer Materials.—SONATRACH finalized plans for the construction of nitrogenous fertilizer plants at Annaba and Arzew. Ammonia plants rated at 1,000 tons per day, utilizing feedstocks of Hassi R'Mel natural gas, will be constructed at both locations, and the company planned to build ammonium nitrate and nitric acid producing units adjacent to the ammonia plants.[11] SONATRACH also developed plans to establish plants at Annaba and Tébessa to produce phosphoric acid and sulfuric acid.[12]

SONAREM contracted a French firm to build a second unit for processing phosphate rock at Djebel Onk, with a capacity of 900,000 tons per year of refined phosphate,[13] and the company plans additional expansions to raise Algeria's phosphate rock processing capacity to 3.6 million tons per year by 1979.

Lime.—A Hungarian firm will build an $18.5 million lime plant at Saïda rated at 100,000 tons of hydrated lime and 48,000 tons of quicklime per year. The new plant will satisfy domestic demand for lime, and it will permit Algeria to become an important exporter of the commodity.

Salt.—SONAREM issued a contract to the Dravo Corp., of the United States, to construct a rock salt processing plant at El Outaya, near Biskra to produce annually 70,000 tons of chemical salt for the plastics complex at Skikda; 40,000 tons of table salt; and 30,000 tons of coarse rock salt for unspecified use. Further expansions may raise the annual output of chemical salt to 360,000 tons and that of table salt to 80,000 tons.

Stone.—*Marble.*—SONAREM signed a contract valued at about $4 million in 1975 with an Italian firm to build a marble processing plant at Sig, near Oran, to produce 80,000 cubic meters of finished natural marble per year.

MINERAL FUELS

Natural Gas.—Proved reserves of natural gas were estimated to be 3.3 trillion cubic meters at yearend 1975, an increase of about 0.5 trillion cubic meters from yearend 1974. SONATRACH carried out the production and exporting of natural gas, and SONELGAZ was responsible for marketing gas to domestic consumers. Algeria took steps during 1975 to enlarge its facilities for processing and handling LNG destined for foreign markets. Chemical Construction Corp. (Chemico) of the United States encountered delays in building the huge liquefaction/export terminal at Bettioua, near Arzew, and SONATRACH dismissed the company from the project[14] and subsequently awarded a contract to complete the complex to Bechtel International Inc. of the United States. The Bettioua plant, known as LNG-1, had been scheduled to begin deliveries to the United States in 1977.

SONATRACH was actively engaged in negotiating sales contracts with foreign utility companies during 1975. The El Paso Co. of the United States and SONATRACH negotiated a contract for delivery of 10 billion cubic meters of LNG per year over a 20-year period beginning in 1981, replacing an earlier agreement that failed to receive approval of the U.S. Government. Algeria signed a sales agreement in 1975 with Eascogas, a venture of Algonquin Gas Transmission Co. and Public Service Electric and Gas Co. of New Jersey, for the supply of LNG at the rate of

1 billion cubic meters per year during the period 1977 to 1979 and 6 billion cubic meters per year for a 20-year period beginning in 1980. Panhandle Eastern Pipe Line Co. signed a contract with SONATRACH for the purchase of natural gas from Algeria at the rate of 4.5 billion cubic meters annually for 20 years, replacing a 1973 contract for the same quantity of gas.

In 1972, a consortium of West European companies negotiated an agreement with Algeria for future supplies of natural gas and the sales agreement was renegotiated during 1973. However, in 1975 the consortium members were unable to agree to SONATRACH's terms concerning the sale, and the project was abandoned. During 1975, Algeria negotiated a contract with Gaz de France for about 4 billion cubic meters of natural gas and with the Société de Distribution du Gaz S.A. (of Belgium) for the sale of 70 billion cubic meters of natural gas over a 20-year period beginning in 1979, with the option for an additional 1.5 billion cubic meters per year. In 1975, SONATRACH also concluded an important sales contract with Empresa Nacional del Gas (Enagas), the Spanish national gas company, for the supply of LNG from Algeria to Spain for a period of 20 years beginning in 1976, at the rate of 4.5 billion cubic meters per year.

Algerian deliveries of LNG to Distrigas Corp. of the United States resumed in 1975, for the first time since late in 1973 when equipment problems at the Skikda plant cut off supplies. SONATRACH operated three liquefaction units at Skikda during 1975, and a fourth unit was under construction. Two more liquefaction units are to be added to the Skikda complex. Algeria will sell about 950,000 cubic meters of LNG to Distrigas during the period July 1976 through December 1977.

Pritchard International Corp. of the United States was awarded a $160 million contract by Algeria for the construction of a natural gas processing plant at Hassi R'Mel that will produce annually some 3.5 million tons of condensate and 18.3 billion cubic meters of dry gas.[15]

The Government devised a new pricing system for its natural gas that tied future prices to those of fuel oil marketed in the United States and in the Netherlands.[16]

Algeria awarded contracts to the Italian Group, Ente Nazionale Idrocarburi (ENI) to construct several pipeline links in Algeria. A 520-kilometer, 71-centimeter-diameter condensate line will be built from the Hassi R'Mel gasfield to Arzew, and a 160-kilometer, 102-centimeter-diameter gas pipeline will be laid from the Gassi Touil Field to Hassi Messaoud. The Italian firm will also build tanker-loading facilities at Arzew. During 1975, Saipem S.p.A. of Italy completed the 507-kilometer, 102-centimeter-diameter natural gas pipeline from the Hassi R'Mel gasfield to Arzew, under construction since 1972. Negotiations were held between Algeria and France, and the two countries agreed to build a long-distance natural gas pipeline across the Mediterranean Sea. Two possible routes were to be examined, one along the Moroccan coast and across the Straits of Gibraltar to Spain and France and the other crossing the Mediterranean Sea between Mostaganem, Algeria, and Almería, Spain, and to France bypassing Morocco. Société d'Etudes du Gazoduc de la Mediterranee Occidentale (SEGAMO), an organization jointly owned by Algeria, France, and Spain, awarded a contract to a French group to study the routes for the pipeline. The ultimate capacity of the Mediterranean pipeline will be 40 billion cubic meters of natural gas per year.

Petroleum.—Oil reserves were estimated to total 10 billion barrels at yearend 1975, an increase of nearly 1 billion barrels from the reserves at yearend 1974. In 1975, 103 wells were drilled for a total of 248,850 meters, compared with 123 wells for 237,500 meters during 1974. The 1975 drilling produced the following wells: 65 oil, 10 gas, 12 water, 6 water injection, and 2 gas injection. Eight of the wells were abandoned as dry holes.[17] The only discovery reported in Algeria during 1975 was that by Petrobrás Internacional S.A. (Braspetro) of Brazil. Its find tested 3,465 barrels per day of 35° API crude oil from a well drilled near Biskra in Eastern Algeria. Algeria awarded a contract valued at about $36 million to

a French firm for the construction of four high-pressure water injection stations to be used in secondary recovery operations in Algeria's oilfields. Three of the stations, with a combined capacity to inject 66,000 cubic meters of water per day, will be built at the Hassi Messaoud oilfields; and the fourth station, rated at 12,000 cubic meters of water per day, will be constructed at the Champ de Rhourd el Baguel oilfield.

Hispanica de Petroleos, S.A. (Hispanoil) of Spain planned to drill two delineation wells at El Meharis between Ghardaïa and Guerara in central Algeria, where its discovery well flowed 44° API crude oil at the rate of 2,200 barrels per day in 1974.

During the year negotiations broke down between SONATRACH and Elf-ERAP, the French State oil concern, for future crude oil deliveries to the latter, and the two companies did not renew their crude oil agreement. However, negotiations between SONATRACH and CFP resulted in an agreement whereby CFP will increase its liftings of oil from Algeria to France to 76.6 million barrels per year up to 1980; a 1971 agreement had permitted CFP to lift about 53.6 million barrels of Algerian crude oil per year. Under the terms of the new agreement, CFP will invest $90 million exploring for oil in new zones in Algeria over the next 5 years.[18]

The selling price for Algeria's crude oil was set at $12 per barrel during the first quarter of 1975, reduced to $11.75 per barrel during the second quarter of the year, and raised to $12.75 per barrel in October 1975. During the third quarter of 1975 SONATRACH publicized a new pricing system that would become effective on January 1, 1976. The proposed system was designed to keep basic sales prices constant for a year and maintain their competitiveness by means of a monthly price index formula that would reflect changes in freight and quality values.[19]

Algeria's refineries operated at about 86% of capacity during 1975. The following tabulation gives the output, in tons, of the Algier and Arzew refineries during the year:

Product	Algier	Arzew	Total
Butane	70,518	93,260	163,778
Diesel oil	68,632	--	68,632
Fuel oil	593,260	794,854	1,388,114
Gasoline	490,103	306,532	796,635
Gas oil	725,088	767,476	1,492,564
Kerosine and jet fuel	224,213	224,587	448,800
Lubricating oil	--	1,965	1,965
Naphtha	227,016	349,273	576,289
Propane	5,228	8,349	13,577
Other	--	88,667	88,667
Losses	73,518	56,653	130,171
Total	2,477,576	2,691,616	5,169,192

Statistics were not available for the 1975 output of the small Hassi Messaoud refinery.

SONATRACH signed contracts with two European companies to construct a 150,000-barrel-per-day petroleum refinery at Bejaïa, on the northern coast near Jijel, to process crude oil from the Hassi Messaoud oilfields. It was scheduled to begin operations in 1979, and will produce butane, fuel oil, gas oil, gasoline, jet fuel, naphtha, and propane.[20] The Algerians also contracted with two Japanese companies, the C. Itoh Commercial Group and Japan Gasoline Co., Ltd., to expand the bitumen production units at the Arzew refinery. The capacity of the bitumen section will be increased from 65,000 to 140,000 tons per year. SONATRACH also invited bids for the development of plans and the supply of equipment for construction of a lubricating oil research laboratory.

The Mineral Industry of Angola

By Janice L. W. Jolly [1]

During 1975, the mineral industry of Angola suffered a complete collapse, except for the petroleum sector. Although crude oil production and petroleum refinery throughput were down compared with 1974 production, they continued at a fairly high rate through most of 1975. Taxes and royalties accruing to the Government from crude oil production exceeded $500 million in 1975, and constituted 53% of the total revenues allotted for the 1975 general budget. Cabinda Gulf Oil Co. continued to produce from its offshore wells throughout 1975, little affected by the civil war, but ceased crude petroleum production temporarily in December 1975. Diamond production, however, was completely disrupted through most of 1975, and iron ore production ceased altogether in August.

An interim government was sworn in on January 31, 1975, to carry Angola through to independence on November 11, 1975. Under the Penin agreement signed on January 15 between three Angolan nationalist movements—the Movimento Popular para a Libertação de Angola (MPLA), the Frente Nacional para Libertação de Angola (FNLA), and União Nacional para a Independência Total de Angola (UNITA)—the interim government would be shared by a three-man presidential council, one from each movement. Within 2 weeks minor clashes started and continued intermittently until June 1975 when another peace agreement was signed in Kenya. By August, however, an allout civil war had broken out with MPLA on one side and FNLA and UNITA on the other.

Early in 1975, even before the civil war, Angola was on the brink of economic and political collapse due to the inability of the transitional government to control armed members of liberation movements. In the first 3 months of 1975, a survey showed that employment among 110 companies declined 13% while wages rose 50% and worker productivity fell between 34% and 50%. Sales declines were as much as 90% for most of the companies. Industries that imported raw materials were on the verge of closing down because of port congestion and workers' strikes. Early in 1975, the transitional government had agreed on a plan for State participation in the economy to take effect after November 11. The main features were establishment of a central bank and a new Angolan currency. The conversion of the Banco de Angola into a State-owned commercial bank was agreed upon with no other commercial banks to be established. The State was to have at least 51% ownership in all banks and insurance companies, which, in addition, could not operate in Angola unless a 70% share, which included the Government's share, was in Angolan hands. The Angolan Government was to take 50% interest or more in all mining and petroleum companies. Firms whose main business activities were in Angola were to transfer their head offices to Luanda by September 1. Some contracts were negotiated with the transitional government only to be renegotiated in 1976 with the new MPLA government. Angola achieved independence on November 11, 1975, Portuguese officials and the Portuguese army departed, and the deterioration of the Angolan economy continued. Transport and

---

[1] Physical scientist, International Data and Analysis.

communications deteriorated as roads and railways were destroyed. Most factories and mines ceased operations and many installations were damaged. Only approximately 20,000 of the original 500,000 Portuguese settlers remained.

PRODUCTION AND TRADE

Since no reliable, complete production data were available at the time of this report, the estimates for 1975 mineral production that follow have been based on partial reports. Diamond production amounted to about 27% of the 1974 production of approximately 2.0 million carats. Most of this production was in the first half of 1975 at the rate of 40% of the previous year. Diamond production was about 15% of the 1974 production rate in the second half of 1975. Petroleum production was estimated at 58 million barrels for 1975, down 6% from that of 1974. Cabinda Fields were producing at the rate of 140,000 barrels per day for 10 months of 1975 and 30,000 barrels per day for November; no output was reported in December when Gulf Oil Corp. ceased production. The onshore wells of Companhia de Petróleos de Angola (PETRANGOL) averaged about 15,000 barrels per day for 1975. Iron ore production was estimated to be 2.6 million tons for 1975, down 50% from that produced in 1974. The Cassinga mine closed in August 1975. Iron ore exports in 1975 went to Japan (1,431,000 tons), West Germany (602,000 tons), France (401,000 tons), and the United States (216,000 tons). In 1975, the United States, as in 1974, was the major market for Angolan oil, taking 50% of the exports. It was followed by Portugal with 25% and Canada with 14%. Portugal emerged as the second major market in 1974 because of the Arab oil boycott. Petroleum refinery throughput for 1975 at the PETRANGOL Luanda refinery amounted to 5.1 million barrels of refined products compared with 5.4 million barrels for 1974. Gulf also produced approximately 160,000 barrels of diesel fuel for company use from its small Cabinda refinery. The Gulf Cabinda refinery has a capacity of 450 barrels of diesel fuel per day which is for ship use only and not sold.

Most trade, imports and exports, was severely constricted in 1975. Strikes and inadequate harbor facilities led to severe congestion and delays in cargo handling. As early as May 1975, delays of up to 60 days at the Port of Luanda caused the Associated Central West African Lines (CEWAL) to increase surcharges from 50% to 60% on incoming freight. The United Kingdom-West Africa Conference later raised surcharges on both inward and outward traffic to 70% for Luanda. Some shipping companies refused to call at Luanda because of long delays. During the first quarter of 1975, only 352 ships called compared with 569 ships for the same period in 1974. The benefits of new improvements added in 1974, which enabled the Benguela railroad to double its freight capacity, were short-lived because of continued port congestion at Lobito. By late 1975, the United Kingdom-West Africa Conference had imposed a 100% surcharge on Lobito port traffic causing the Zambians to divert copper exports from Lobito to other routes. In August 1975, and again by early 1976, sabotage along the Benguela railroad had also made this route untenable for either Zairian or Zambian mineral traffic. Transportation in general became an acute problem in Angola. Before the war, most of the blue-collar workers and technical people who worked on the Benguela railroad were Portuguese. Most of these fled, leaving the railway seriously understaffed.

Table 1 gives the production of primary minerals and processed metals and nonmetals. The latest available statistics on foreign trade in mineral commodities are given in the 1973 Minerals Yearbook chapter.

COMMODITY REVIEW

METALS

Iron Ore.—Operation of the Companhia Miniera do Lobito S.A.R.L. (CML) Cassinga iron mine ceased in August 1975 and moves to transfer CML's headquarters from Lisbon to Luanda were postponed. It was understood that no stockpile remained at the Moçâmedes shipping terminal and that all technical personnel had left Cassinga. CML was approximately 85% government-owned and all CML directors were government officials, thus the question of ownership and provision of skilled management to operate the mine and port were to be negotiated between Portugal and Angola. The company was reportedly bankrupt and its high-grade hematite ore was about used up. Plans for a pelletizing plant and suitable upgrading measures for the low-grade ore reserves were postponed. Financing for these plans was to come from South African Industrial Development Corp. and Union Corp. (51%), with Fried. Krupp Hüttenwerke AG of West Germany, USINOR of France, the British Steel Corp., and CML providing the balance. Iron ore reserves at Cassinga were estimated to be 100 million tons of eluvial hematite ore with 61% iron, and 2 billion tons of itabirite ore with 40% to 50% iron. The taconite ore at Cassala-Quitungo was estimated to be 92 million tons with an average 32.5% iron. In February 1975, Cia. do Manganés de Angola (CMA) announced its Cassala project would be postponed.

NONMETALS

Diamond.—A general description of diamond occurrences and the history of their development in Angola was given in a recent Bureau de Recherches Géologiques et Minieres (BRGM) report.[2] It was pointed out that in about 40 years, Angola had produced about 36 million carats of diamond—3% by weight and 7.5% by value of the world's diamond production. The Portuguese Companhia de Diamantes de Angola (DIAMANG) was the major producer. However, in the DIAMANG 1974 company report, it was recognized that the expected Angolan independence was to bring about a new era. It was unlikely that DIAMANG was to continue operations much longer under the previous structure. Hopes for establishing effective relations with the new government was the company's major objective to ensure survival. Negotiations began in 1975 and were to continue into 1976 with the new MPLA government. DIAMANG was already paying over 50% of its profits to Angola, but its capital was mostly private, with 45% of the Portuguese-chartered company held by national and private Portuguese concerns and the rest shared by U.S., Belgian, and South African interests, notably Anglo-American Corp. and De Beers Consolidated Mines, Ltd.

DIAMANG reported that the company finances deteriorated substantially during 1974 as a result of late deliveries, chaotic port conditions, steady exodus of trained personnel, and a marked breakdown in discipline and work output. Diamond smuggling in Angola reached alarming proportions. By May 1975, it was estimated that about 50% of DIAMANG's output was being siphoned off into illicit trade by the DIAMANG work force and the company had no choice but to temporarily stop mining activities. At yearend, some diamonds were apparently still being mined by about 6,000 black African miners (from the original 20,000) who reportedly remained at the mines all during the war. All of the 2,500 European technicians had left early in 1975. It was suggested that output in 1975 had fallen around 70%. It was doubtful whether more than 4 to 5 months of full production was achieved. The company was reportedly paying royalties to MPLA which had effective control of the area.

Phosphate Rock.—In 1975, it was reported that Ammoniaco Portuguese had plans for a $40 million fertilizer complex using phosphate rock occurring at Caala. The development of the Cabinda phosphate rock resources by Companhia dos Fosfatos de Angola (COFAN) was being put aside until new guidelines for mineral development could be worked out with the new government. The Annual Report of the South African Council for Scientific and Industrial Research (CSIR) disclosed results of a survey carried out by the CSIR in conjunction with the marine biology unit of the University of Cape Town. Deposits of marine phosphates and glauconite considered to be of industrial importance were reported as occurring off the mouth of the Cunene River situated between the Angola and the Territory of South-West Africa border.

MINERAL FUELS

Petroleum.—In early 1975, Texaco Petroleum of Angola, operating in partnership with Belgian Petrofina S.A., Sociedade Portugues de Exploracao de Petróleos S.A.R.L. (ANGOLA), and PETRANGOL, struck encouraging oil shows in two separate areas northwest of Luanda. The offshore field discovered by Texaco near the small town of Santo Antonio do Zaire at the mouth of the Congo River was described as 10 times larger than Cabinda resources.[3] Recent oil strikes by Cabinda Gulf Oil in partnership with Japanese and Belgian interests were due to come onstream at an initial rate of 25,000 barrels per day in November; however, at that time fighting had spread to Cabinda and Gulf Oil cut production from an average 140,000 to 30,000 barrels per day and evacuated most of its staff. Gulf maintained more than 250 employees in Cabinda to man 120 offshore wells. Gulf suspended operations altogether on December 22, 1975, at which time Gulf deposited about $100 million in accrued taxes

[3] Quarterly Economic Review (London). Angola, Mozambique. No. 1, Feb. 19, 1975.

and royalties into a special interest-bearing account for future payment following a solution to the civil war. Gulf had been making payment to the transitional government until September 1975. At the time of the last quarterly payment of $116 million to the Bank of Angola, MPLA was in control of the capitol (Luanda), the Bank of Angola, and the transitional government. The next payment was to have been due December 31. Production onshore by the PETRANGOL Group, 25% held by Texaco, had reached 25,000 barrels per day by mid-1975 but was suspended by late January 1976. The PETRANGOL-ANGOL-Texaco pumping facility (Northern Angolan Petrangol Oil Co.) at Cabeca de Cobra was under FNLA control late in 1975.

In early 1975, the Angolan Government announced it would raise oil royalties from 12.5% to 16.7%, and the profits tax from 50% to 65.75%. Gulf Oil negotiated a new contract in which the transitional Angolan Government was to acquire 55% participation in the firm. It was also envisaged that the Government might also gain control of the Petrofina and Texaco producing consortium. However, by early 1976, renegotiation of all contracts with the new MPLA government became necessary.

PETRANGOL's Luanda petroleum refinery, running primarily on Angolan crude, had a processing capacity of 32,100 barrels per day and was to have been expanded to 40,000 barrels per day by the end of 1976. On January 30, 1975, PETRANGOL employees went on strike for better wages and working conditions, paralyzing all operations at the refinery. As the civil war picked up in intensity in August 1975, periodically there were severe shortages of gasoline and liquid petroleum gas in Luanda.

The Mineral Industry of Argentina

By Walter C. Woodmansee [1]

The Argentine mineral industry made little progress and some sectors deteriorated in 1975. It was a period of severe economic disorder with worsening inflation, a growing fiscal deficit, a heavy balance of payments deficit, major wage increases, slack demand, and labor disorders. Inflation was at an average rate of about 250% for the year and was at an annual rate of 300% in December. Several major currency devaluations throughout the year spurred inflation and labor problems. Early in the year, the exchange rate was 15 pesos to the U.S. dollar in the official financial market; by yearend, the rate had changed to 60 pesos to the dollar in the same market. Conditions worsened as the year progressed.

Despite this adverse economic situation, there were some positive factors in the mineral industry. In the metals sector, expansion was underway or planned for aluminum, copper, iron ore, iron and steel, manganese, and tungsten. A large new copper ore body was under development, and the project was to include smelter and refinery facilities. The National Iron and Steel Plan called for ambitious growth in iron ore mining and steelmaking, including new direct reduction plants. Financing for these programs through loans from international organizations was under negotiation during the year.

In the nonmetals sector, softening demand for construction materials such as cement, sand, and gravel caused slowdowns. Argentina's first sodium carbonate plant was planned, and fluorspar deposits were under investigation.

In the mineral fuels sector, a National Energy Plan called for accelerated exploration for new coal, oil, and gas resources, including foreign participation. New coal mine and washing facilities were under development. Additional gas pipelines were under construction. Prospects, particularly offshore, appeared favorable for significant new oil and gas discoveries. Construction of Argentina's second nuclear powerplant, in Cordoba Province, was delayed by contract negotiations, and schedules for two additional plants were temporarily deferred.

Restrictive laws and policies, the serious economic problems, and political instability produced an unfavorable investment climate and brought new investment in the mineral industry virtually to a halt. The foreign investment law of 1973, in effect in 1975, was restrictive and provided for extensive Government control. It permitted a 20% foreign ownership in certain sectors and established limits on profits and capital repatriation. Royalty and profit remittance could be made only via special external bonds, and foreign companies paid a special transfer tax of up to 40%. Price controls reduced profit levels, adversely affecting production and investment. A threat of nationalization to subsidiaries of three U.S. petroleum companies, among others, also had a dampening effect on further investment. The Central Bank restricted local credit to foreign companies. Money markets were erratic, and medium and long-term financing was difficult to obtain. Foreign companies were generally excluded from industrial promotion laws. A succession of tax rulings was unfavorable to foreign firms.

The best foreign investment opportunities were in joint ventures with public sector entities for the development of basic infrastructure, including the petrochemical and iron and steel industries. Late in the year, new regulations were

[1] Supervisory physical scientist, International Data and Analysis.

being promulgated to promote foreign investment in mineral development. Proposed incentives were the elimination or reduction of import duties on mining equipment, elimination of taxes on investments in exploration, and consideration of Provincial taxes when assessing Federal taxes. Foreign investment was considered important for mineral exploration under the Cordillerano Plan, the North Cordillera Plan, and the Patagonia Plan. A 3-year national reconstruction program would increase mineral technology development, prospecting, exploration, mine development, and mineral processing activities, including a network of processing plants to provide for domestic demand and for exportable surpluses. A regulatory decree interpreting a new mining law provided incentives for small- and medium-sized operations. The iron and steel, other ferrous, nonmetals, and fertilizer industries were granted first priority; construction minerals had second priority; regional mineral development had third priority; and mineral development for export had fourth priority.

The Mining Secretariat considered major investments in mining, quarrying, and processing equipment, including funds from the National Development Bank (Banco Nacional de Desarrollo—BND) and the private sector, and proceeded with the Comahue Plan for evaluating mineral resources of a 1-million-square-kilometer region in Patagonia. The first 2-year stage, scheduled for completion at yearend 1975, involved geological surveys in Río Negro, Chubut, and Neuquén Provinces.

The 1974–85 Energy Plan of the Energy Secretariat, Ministry of Economics, was designed to increase per capita energy consumption from 1,000 kilowatt-hours in 1974 to 3,000 kilowatt-hours in 1985, with principal emphasis on hydroelectric and coal development and de-emphasis of petroleum use in electricity generation. Proposed investments totaling $2,138 million were as follows: Oil and gas, $1,086 million; electricity generation, $987 million; coal, $49 million; and uranium, $16 million.[2] These programs were directed toward self-sufficiency in petroleum and nuclear fuels (uranium). They would reduce the share of the total energy supply derived from oil and gas from 85% in 1975 to 50% in 1985, and increase the share of electricity generation from hydroelectric sources to 48% in 1985. Continuing economic and political problems hindered long-term energy planning.

Early in the year, the Energy Secretariat announced a program to double electricity generation capacity by 1980. Agua y Energía Eléctrica and Electrobras of Brazil, both electrical utility companies, completed a joint study recommending three hydroelectric plants on the upper Uruguay River and priority to the middle Paraná River (Paraná Medio) projects. The program called for 26 hydroelectric, 7 thermal, and 3 nuclear plants underway or completed by 1980. Argentine electrical generating capacity would increase from 7,621 megawatts in 1975 to 15,085 megawatts in 1980.

Late in the year, a draft bill creating a National Electricity Company was presented for approval. This proposed new energy agency would take over the hydroelectric systems and the nuclear power development currently under the National Atomic Energy Commission (Comisión Nacional de Energía Atómica—CNEA).

[2] Unless otherwise specified, values have been converted from Argentine pesos (P) to U.S. dollars at the rate of P60.8=US$1.00, the exchange rate prevailing at yearend 1975.

PRODUCTION

Similar to factors affecting total industrial production, operations in the Argentine mineral industry were adversely influenced by reduced demand, financing difficulties, inflated costs, and labor problems. In the metals sector, production was fairly stable, although output of several metallic ores and crude metals was lower. In the nonmetals sector, most mineral commodities fared at least as well as in 1974, except for manufactured fertilizers, some of the construction materials, and sulfur. Among the mineral fuels, natural gas output continued to expand while crude oil output continued a downward trend. Coal production also was below that of 1974.

Values for individual minerals produced were either not available for 1975 or were difficult to estimate in U.S. dollar equivalents because of the numerous exchange rate revisions throughout the year. Based on limited available data, some of the mineral commodity values were as follows, in thousand dollars:

Commodity	*Value*
Metals:	
Refined gold	2,246
Lead concentrate	4,604
Manganese ore	21,207
Tin concentrate	1,013
Tungsten ore and concentrate	394
Zinc concentrate	5,775
Nonmetals:	
Clays	25,103
Sand and gravel	51,695
Stone, crude and worked	118,129
Other nonmetals	16,655
Mineral fuels:	
Coal	1,249

These commodities totaled slightly more than $248 million but did not include iron and steel, cement, fertilizers, oil and gas, and a few other minerals, which would add substantially to the total.

Table 1.—Argentina: Production of mineral commodities

[3] Data are for year ending June of that stated.

TRADE

The Economics Ministry changed trade regulations on several occasions in 1975. Commodity values, including products of the mineral industry, were negotiated on the financial or commercial market, each of which had different exchange rates.

For exports, a more flexible policy, adopted in July, required approval of export programs on a semiannual basis. In August, new restrictions, including taxes and a suspension of authorization to export, were adopted, affecting 750 commodities including mineral products. These restrictions were designed to regulate domestic prices and ensure domestic supply. The tax was 10% on most unprocessed minerals and 10% to 25% on the metals. In November, it was ruled that 75% of the f.o.b. value for certain export commodities must be marketed at the commercial rate and 25% at the normal financial rate. This list included chemicals, fuels, fertilizers, and iron and steel.

A decree of the Ministry in May, effective for the last half of the year, announced a new import regime, which required a declaration of import needs with prices not exceeding reference levels, and a yearend stock limitation not to exceed 10% of the allowed maximum for the year. New regulations, announced in June, further limited 1975 imports in order to save scarce foreign exchange, facilitate necessary imports to avoid supply disruptions, and increase prices to restrict import demand.

At yearend, values for all exports and imports were negotiated on the financial market. The commercial market was to be in operation only for liquidation of existing export-import contracts in effect up to November.

A large share of Argentina's mineral imports were metallic ores, concentrates, and crude metals. Mineral exports totaling $12.3 million ($17 million in 1974) were of minimal significance as a share of total exports ($2,989 million). According to the National Office of Mineral Economics, principal mineral export values in 1975 (values exceeding $100,000) were as follows, in thousand dollars:[3]

Borates, sodium and calcium, and products	4,940
Tin and silver concentrates	3,102
Salt	1,194
Bentonite	890
Granite, crude and worked	637
Gypsum	499
Marble, crude and worked	228
Fluorspar	224
Dolomite	150
Perlite	105

COMMODITY REVIEW

METALS

Aluminum.—The aluminum smelter of Aluminios Argentinos S.A. (ALUAR) at Puerto Madryn, Chubut Province, was operating at rated initial annual capacity of 35,000 tons early in the year. Plans were made for expansion to 140,000 tons per year eventually. Bauxite was imported from Australia. The new plant was expected to ease demand for imported aluminum products.

Deposits of alunite near Camarones and Alto Rio Senguerr, both in Chubut Province, were considered as possible future sources of raw material for the Puerto Madryn smelter. A large-scale survey, including a feasibility study for a commercial-scale mining operation, was planned.

Copper.—Compañía Minera Aguilar S.A. (CMA), a subsidiary of St. Joe Minerals Corp., proceeded with development plans for the Pachon ore body in southwestern San Juan Province. The deposit, at elevations of 3,600 to 3,900 meters in the Andes near the Chilean border, was discovered in the 1960's. The company envisioned a $1-billion, 100,000-ton-per-year, mine-smelter-refinery complex. CMA planned to invite U.S., European, and Japanese companies to bid on construction contracts. Ore reserves were estimated at 792 million tons averaging 0.59% to 0.62% copper, including 160 million tons with 1% copper, considered sufficient for 35 years at annual production rates of 70,000 to 100,000 tons of copper. Mine development would be by open pit with a 140-kilometer ore slurry pipeline to the smelter-refinery, which would be located 20 kilometers southwest of Barreol. A feasibility study was undertaken, but further planning was tentative pending financial arrangements and negotiations with the Argentinian Government.[4] With copper consumption estimated at 50,000 tons per year, most of which was imported, Pachon development would eliminate the copper supply deficit and provide copper for export sales.

The Mining Secretariat provided funds to the Dirección General de Fabricaciones Militares (DGFM), the main Government body engaged in strategic mineral development, for 5,000 meters of drilling on copper properties of Yacimiento Mineras de Agua de Dionisio (YMAD), the State mining agency, in the Department of Belen, Catamarca Province. YMAD estimated ore reserves at La Alambrera, Hualfin District, at 200 million tons containing an average of 0.5% copper and traces of gold. The operation appeared marginal at yearend.

[4] Engineering and Mining Journal. Two Mines Give St. Joe Latin American Base. V. 177, No. 11, November 1976, pp. 122–123.

A recent discovery in the Mercenario area, San Juan Province, was expected to add to growing copper reserves.

Iron Ore.—Resource studies, mine expansion, and new mine development continued under the ongoing National Iron and Steel Plan. Development work at Sierra Grande, Rio Negro Province, was approximately 60% completed at yearend. A 6-week strike late in the year resulted in damage to camp facilities and flooding of underground workings. The project, formerly scheduled for completion in 1976, was about 2 years behind schedule, mainly because of delays in financing and equipment delivery. The mine, preconcentration, and pelletizing plants were near completion. A 35-kilometer slurry pipeline to the pelletizing plant at the port was under construction. Development cost was estimated at $287 million for an ore capacity of 2.5 million tons per year. Mining was underway at the South ore body, which was 2.5 kilometers long and 15 meters thick. Total reserves of magnetitic ore, averaging 55% iron, were 265 million tons, and potential for additional reserves was considered good. Pellets of 69% iron were to be shipped to the State-owned steelworks of Sociedad Mixta Siderúrgica Argentina (SOMISA).

A 40% interest in the Sierra Grande project was held by Hierro Patagónica Sociedad Anónima Minerva (HIPASAM), which started the project in 1970 and which was controlled (85%) by the DGFM. Other shares were held by the Provincial Government, internal creditors, the Inter-American Development Bank (IDB), and other international organizations.

The Mining and Geology Board, Misiones Province, was considering reopening of inactive iron ore mines, development of new mines, and exploration in the Province. The Iron and Steel Institute also studied possible development of iron ore deposits in Misiones Province and in Mendoza Province.

Total iron ore reserves in nine Provinces were estimated at more than 1 billion tons containing 467 million tons of iron.[5] The Sierra Grande ore body was the largest in terms of total contained iron.

XX Not applicable.

[1] Not estimated but considered significant.

Iron and Steel.—Pig iron and crude steel production were lower, compared with that of 1974, owing to labor problems, renewed price controls, and the continuing economic crisis, which affected demand for steel products and investment in the industry. Crude steel output comprised ingots (74%) and continuous casting products (26%). Production was reported by 13 companies, the leader of which was SOMISA, which accounted for approximately one-half of the total output. On the basis of annual steelmaking capacity of 4.5 million tons, production was at about half-capacity during the year. Since 1966, demand for steel had increased 12%, and production increased only 6%, necessitating higher imports.

The 3-Year Development Plan of the National Iron and Steel Plan, directed by DGFM, involved continuing modernization and expansion throughout the industry. According to the Iron and Steel Industry Center (El Centro de Industrielles Siderúrgicos—CIS), the development program involved 10 operating companies. A new integrated steel project, Siderúrgica Integrada Sociedad Anónima Industrial y Comercial (SIDINSA), was initiated by decree in May. The plan called for expansion of annual crude steel capacity to 18 million tons by 1985, considered sufficient to meet projected demand for that year and provide an exportable surplus. Consumption in 1985 was projected to be 12 million to 13 million tons.[6]

The most significant development activities were by the leading producers—SOMISA, Acindar S.A. (the leading private iron and steel company), and Dálmine Siderca S.A.I.C. SOMISA planned expenditures of $225 million in domestic markets and $5 million on purchases from foreign sources during 1975–79. The DGFM called for bids on basic design and engineering for expansion from the current capacity of 2.5 million tons of crude steel per year to 4 million tons. A Dálmine direct reduction plant, employing the Midrex process, was scheduled for operation late in 1976. Designed capacity was 330,000 tons of sponge iron per year, based on pellet or iron ore feed. New steelmaking and rolling capacity was also under development by Dálmine.

In January, a Government decree authorized Acindar to proceed with financial arrangements for major new facilities, including integrated direct reduction, continuous billet casting, and new steelmaking and milling capacity. In February, the Economics Ministry agreed to a Midrex direct reduction plant for 462,000 tons of sponge iron (93% iron) per year from pellet feed, three 80- to 90-ton electric furnaces, and six billet lines for 600,000 tons per year. This billet capacity was scheduled for completion in 1979; a 400,000-ton capacity would be readied in 1978. The plant site was at Villa Constitución, Santa Fe Province. New facilities were also to include rolled products, wire, pipe, tubes, and forged products. Financial arrangements involved the Argentine Government, the IDB, the U.S. Export-Import Bank, New York banking interests, and the BND for local financing.[7]

Planning for the SIDINSA integrated steelworks project was given high priority by the DGFM and BND. The proposed project included sintering (5 million tons per year), coke (1.8 million tons per year), three calcining furnaces (300 tons each), two blast furnaces (3.7 million tons of pig iron per year), three oxygen converters (3.8 million tons of steel per year), continuous casting (700,000 tons per year), plate (3 million tons per year), coils (3.2 million tons per year), and electrolytic tinning lines. Completion would be in 1982, and eventual expansion to 8 million tons of steel per year was included in the program. The proposed investment plan was for $2,677 million[8] during 1975–80.

Lead, Zinc, Silver.—CMA produced 74,734 tons of zinc concentrate and 37,515 tons of lead concentrate containing 1,600,561 troy ounces of silver at its mine situated at an elevation of 4,400 meters in the Andean Altiplano, Jujuy Province, in extreme northwestern Argentina. These concentrates were shipped to Argentina zinc smelters in which CMA held interests —the 18,000-ton-per-year electrothermic smelter of Compañía Metalúrgica Austral Argentina S.A.C.I.F. and the 24,000-ton-

per-year electrolytic plant of Sulfacid S.A.I.F.C., which also produces 70,000 tons of sulfuric acid per year.

The CMA ore body is complex, and ore reserves were difficult to establish. Reserves at yearend were considered sufficient for 10 years at 1975 production rates. Mine development included 15 levels, 7 adits, and 2 underground shafts. Mill heads averaged 6.2% lead (86% recovery), 7.7% zinc (88% recovery), and 4.5 troy ounces of silver per ton. Mill capacity was 2,100 tons of ore per day.[9]

Table 5.—Argentina: Iron and steel plants operating in 1975 [1]

Source: Centro de Industriales Siderúrgicos.

Manganese.—Manganese ore and concentrate production increased sharply as new mine development continued. The bulk of the output was from mines in Santiago del Estero, Cordoba, and Mendoza Provinces.

Investigations were underway near the Seghesso rail branch line, northeast of the Ojo de Agua deposit in Santiago del Estero Province, and at Pozo Nuevo, Department of Sobremente, Cordoba Province. Ore treatment plants in these two Provinces had total capacity of 24,000 tons of manganese concentrate per year.

YMAD's Farallon Negro deposit, Catamarca Province, was planned for development by both open pit and underground mining methods. An annual initial produc-

[9] Pages 121–122 of work cited in footnote 4.

tion rate of 25,000 tons of 40% manganese ore, 80,000 troy ounces of gold and 19,000 troy ounces of silver, was envisioned.

Other Metals.—The Mining Secretariat provided funds for a tungsten concentrating plant at La Toma, San Luis Province. Construction was in progress at yearend. Planned annual capacity was 460 tons of tungsten in concentrate.

Under a CNEA program, a foundry for zirconium alloy (zircalloy) fabrication was to be built. CNEA sought a supply of zirconium sponge and semifabricated products.

NONMETALS

Cement.—Cement production was slightly below that of 1974, mainly because of reduced construction activity in the public and private sectors. Output was only 63% of annual capacity. As of January 1975, salient statistics were as follows:

Number of operating companies	16
Total installed annual capacity thousand tons	8,600
Shipments of portland cement in 1974 do	5,410
Consumption of portland cement in 1974 do	5,405
Per capita consumption in 1974 kilograms	219
Number of workers in industry	8,017

Clays.—*Kaolin.*—The processing plant of Caolines Argentinos S.A. near Dique Florentino Ameghino, Chubut Province, had daily capacity of 150 to 180 tons of crude kaolin, 48 tons prepared for the paper industry, and 24 tons with high aluminum content for use in special cements and fine ceramics.

Construction Materials.—Demand for sand, gravel, and crushed stone was lower than that of 1974 because of reductions in major public works programs. Output is expected to increase as the 3-year economic plan progresses.

Sodium Compounds.—In December, the Government ratified the decision to build Argentina's first sodium carbonate (soda ash) plant, employing the Solvay process, at San Antonio Oeste, Rio Negro Province. Alcali de la Patagonia S.A. was to be the operating company. The plant site was near large salt deposits with reserves totaling more than 400 million tons. Scheduled capacity was 200,000 tons of soda ash or other sodium products per year. Markets would be in the glass industry 60%, chemicals 10%, and miscellaneous (textiles, iron and steel, soap, china, etc.) 30%.

Total capital investment was estimated at $40 million, provided by the Government, which held a 51% interest, and by CIDASA S.A. and Ferrostaal AG, West Germany, which together held a 49% interest. Ferrostaal was to provide technical assistance and was awarded a turn-key construction contract. Completion was scheduled for late 1977.

The plant was expected to cover current domestic demand for soda ash, but additional capacity would be needed in the near future to meet growing demand.

Seven companies produced sodium hydroxide (caustic soda) by the mercury or the diaphragm process. Expansions were planned by some of the producers. Demand increased 55% since 1970 to 175,000 tons in 1974 whereas annual capacity increased only 32% to 128,000 tons during the 4-year period.

Other Nonmetals.—Federal and Provincial authorities and private interests signed agreements to re-evaluate fluorspar deposits in Chubut Province as possible sources for the aluminum industry and conduct a feasibility study for the mining and concentrating of barite from deposits also in Chubut Province.

The new iron ore mine at Sierra Grande, Rio Negro Province, scheduled for operation late in 1976, will also produce byproduct phosphates for the fertilizer industry at a rate of 170,000 tons per year.

Development plans for CMA's El Pachon copper ore body in San Juan Province included recovery of as much as 300,000 tons of byproduct sulfur per year from the copper sulfide ores.

MINERAL FUELS

Coal.—Production by Yacimientos Carboníferos Fiscales (YCF) at Rio Turbio, Santa Cruz Province, was substantially lower than that of 1974, owing to slack industrial demand during a difficult economic period. The domestic price increased 70% to an average of about $100 per ton during the year. Imports included coking coal for blending with noncoking

Rio Turbio coals for use in the iron and steel industry. Other principal uses were in thermal powerplants, railroads, and domestic heating in Santa Cruz Province.

The National Iron and Steel Plan included coal resource assessment, mine modernization and expansion, and new mine development.[10] Reserves at Rio Turbio were estimated at 450 million tons. Exploration for coal was underway at Rio Coyle and Manto Dorotea in the Rio Turbio area, and YCF planned to investigate areas of coal potential in Cordoba, La Rioja, San Juan, Mendoza, Neuquen and Rio Negro Province. Production capacity was to be expanded at Mine 3 at Rio Turbio, and a new Mine 5 was to be developed. The schedule called for total coal production of 3 million tons by 1980 and possibly 5 million tons at a later date. Demand was projected at 4 million tons in 1977 and 7.5 million tons in 1980.

Other new projects under the program were a 1,000-ton-per-hour (3 million tons per year) washing plant, transportation facilities, and expansion of the Gallegos River port to a capacity of 1.2 million tons per year.

Natural gas.—Gross and marketed production continued to expand in 1975. Yacimiento Petrolíferos Fiscales (YPF), the State petroleum company, accounted for 78% of gross output, YPF contractors for 21%, and other companies, 1%. A total of 52.5 billion cubic feet was imported from Bolivia through the Compo-Duran-Buenos Aires pipeline, compared with 51.9 billion cubic feet in 1974, at a cost of $43 million, which was 45% higher than the 1974 price. Argentina and Bolivia reached an agreement on doubling imports by 1979. Total natural gas sales in Argentina were 276 billion cubic feet in 1975. Natural gas provided about 23% of the total energy supply.

Gas del Estado, the Government-owned gas company, planned to double production at the San Sebastian gasfield on Tierra del Fuego with a new gas processing plant and a 200-kilometer pipeline to the mainland, near the entrance to the Straits of Magellan, including a 45-kilometer marine section. Capacity at the processing plant was 106 million cubic feet per day. The new line was to connect with the main line to Buenos Aires and have capacity for 120 million cubic feet per day, with construction to start in 1976. IDB financing, with imported technology and equipment, was sought.

Nuclear Energy.—The CNEA reported proven uranium reserves at 23,785 tons U_3O_8 and potential resources (recoverable at cost equivalent to $45 per pound U_3O_8) at 295,000 tons U_3O_8. The CNEA continued development of the uranium deposit at Sierra Pintada, Mendoza Province, for a mining rate of 600 tons U_3O_8 per year. Reserves were 11 million tons of ore at 0.11% U_3O_8, or about 12,000 tons U_3O_8. A contract was signed with Simons-Inconas Co. for construction of the mining complex. The Sierra Pintada deposit was expected to supply uranium for nuclear fuel needs sufficient for 15 years.

The 319-megawatt Atucha 1 nuclear powerplant, Buenos Aires Province, was shut down for a period during the year. The 600-megawatt Rio Tercero plant, under construction in Cordoba Province, was less than 10% completed at yearend and was held up pending completion of contract negotiations. Planning for an Atucha 2 unit was halted because of a shortage of funds. The CNEA was also planning for heavy water and other nuclear fuel cycle facilities.

Petroleum.— *Crude oil.*—Production continued the decline following peak output of 1972. This decline was attributable to insufficient exploration, price controls which tended to depress exploration, and the need for improved secondary recovery methods. Average output per well was 73.6 barrels per day (85.5 barrels per day in 1972). YPF accounted for 72.6% (105 million barrels) of the 1975 output, followed by YPF contractors 26.7%, and other producers 0.7%. Among the YPF contractors, the leading producers were Amoco Argentina Oil Co. (17.9 million barrels), Argentina Cities Service Co. (16.7 million barrels), and Perez Company (7.5 million barrels). The most productive districts were the Golfo San Jorge Basin, Chubut and Santa Cruz Provinces, which accounted for 36% of total 1975 output, and the Andean Basin, Mendoza Province, with 25% of total output for the year.

The Energy Secretariat embarked on a program to find more oil and increase pro-

[10] Mineria. Plan de Expansión de YCF (1975–1980), Información Proporcionada por YCF. V. 13, No. 149, July 1975, pp. 45–46.

duction. Calls for bids were to be issued for exploration and improved secondary recovery methods at existing fields onshore and offshore in Tierra del Fuego and offshore from Bahia Blanca, Buenos Aires Province, where seismographic studies indicated good potential.

Development drilling at YPF's Puesto Rojas Field in Mendoza Province, discovered in 1974, resulted in an average of 5,032 barrels per well in 1975.

A total of 547 wells were drilled (313 by YPF and 234 under private contract with YPF), of which 373 were considered capable of oil or gas production. This was 59 wells less than the total for 1974. YPF reported proven reserves of 2,466 million barrels, all onshore, including 1,333 million barrels recoverable by primary methods and 1,133 million barrels recoverable by secondary methods.

YPF concluded detailed seismic work, started in 1974, on the potential of the Continental Shelf. Three basins (Salado, Colorado, and Marina Austral) of seven basins identified as favorable for petroleum resources were explored. The latter basin, offshore from Santa Cruz Province and Tierra del Fuego, was considered particularly favorable—a gentle dip to the shelf, thick sediments, and geology similar to adjacent productive onshore deposits. A semisubmersible platform, acquired in France, was scheduled for arrival in Argentina in 1976.[11]

Imports of crude oil in 1975, totaling 15.7 million barrels, were from Libya (66.6%), Bolivia (29.0%), Peru (1.8%), Venezuela (1.7%), and Saudi Arabia (0.9%), according to the National Statistical and Census Institute (Instituto Nacional de Estadística y Censos). These imports, valued at $219 million, were 27% below the 1974 level.

Refinery Products.—Refinery throughput of crude oil in 1975 was 158 million barrels, 7% below that of 1974. A total of 142 million barrels was of domestic origin and 16 million barrels was of foreign origin. With total refinery capacity of 230 million barrels per year, refinery operations were at 69% of capacity in 1975. Sales were down from 1974 owing to the economic recession and restrictions on driving in Buenos Aires. Demand for all petroleum refinery products was about 170 million barrels, 90% of which was produced in Argentina and 10% was imported.

Petroleum products accounted for 62% of the total energy supply in 1975, although efforts were made to de-emphasize the use of petroleum and develop alternate energy sources. Price increases were sought to improve profitability and provide incentives for exploration.

The Mineral Industry of Australia

By Charlie Wyche [1]

In 1975, Australia experienced a reduced rate of expansion in mine production of most minerals, and in some cases output actually declined. The general recession which began in 1974 and continued throughout 1975 made its impact felt on world mineral commodity demands and subsequently on many Australian mining companies. Nevertheless, new records were set in both production and export of many major minerals. Those minerals showing the greatest improvement were nickel and phosphate rock, as a result of new mining operations, and tungsten, because of increased output at existing mines. However, mine production of copper and tin declined, as did exports of alumina, iron ore and pellets, lead, zinc, and mineral sands. Arising largely from renegotiation of contracts to cover escalation of costs and from the beneficial effect on export revenues of devaluation of the Australian dollar late in 1974, increased average values helped to produce another record income from mineral exports.

The value of mine and quarry production was also a record $3.4 billion,[2] an increase of nearly 17% compared with the $2.9 billion reported for 1974. The value added by domestic smelting and other processing of mineral commodities credited the mineral industry with approximately $4.7 billion. Minerals produced and initially processed during 1975 represented 6% of the estimated $80 billion adjusted gross national product (GNP).

Western Australia strengthened its position as the country's largest mineral-producing State, accounting for 24% of the total national mineral output value in 1975. The value of mineral output in Western Australia (dominated by iron, bauxite, nickel, and gold) reached about $820 million in 1975, compared with $780 million in 1974. The large-scale development of iron ore resources became a major factor in the economic and industrial progress of the State. The six companies operating in Western Australia in 1975 produced 87 million tons of iron ore, representing about 90% of the total Australian production of 97 million tons. Eleven other companies signed development agreements with the State Government.

Queensland replaced New South Wales as the second largest mineral-producing State. The value of Queensland's minerals output in 1975 was a record $725 million, accounting for 21% of the total national output. This was $30 million higher than in 1974. Coal and copper, which earned about $250 million and $210 million, respectively, were the largest contributors. New South Wales' output of silver, lead, zinc, copper, and coal ranked the State as the third largest mineral producer with 20% of the national total. Victoria, the only brown coal producing State, was in fourth place with 18%. South Australia, Tasmania, and the Northern Territory, with production of such commodities as iron ore, bauxite, tin, and copper, accounted for the remainder.

The Federal Government announced a new policy on foreign investment in Australia during 1975. While the policy had much in common with that of the previous Government (defeated in December 1974), it was much more flexible. Except for the ruling on uranium projects, the guidelines provided for discussion of the interest of local participation on an individual project

[1] Physical scientist, International Data and Analysis.

[2] Unless otherwise indicated, values have been converted from Australian dollars ($A) to U.S. dollars at the rate of $A1.00=US$1.25.

basis. The ruling on 75% local equity participation in uranium projects was the most rigid of the new requirements. However, the former administration had insisted on 100% local ownership and control of new uranium projects at the production stage. The new 75% requirement would be fulfilled at the production stage, but beyond the production of yellowcake and enrichment stages, the ruling would not apply. A 50% equity rule applied to mineral projects (including oil and gas) which involve investments of more than $1 million and must satisfy a specified set of criteria. The foreign investment guidelines should aid companies in future planning, and also in raising the ever-growing capital sums required for new and developing mine projects.

Expenditures on mineral exploration increased by 2% to $101.6 million. Of the three major States, only Western Australia experienced an increase (6%), while exploration in New South Wales and Queensland decreased by 9% and 0.5%, respectively. Of the smaller States, only Victoria and Tasmania registered increases, 30% and 24%, respectively. Government mineral exploration expenditures totaled $10.9 million.

PRODUCTION

Australia's mineral production in 1975 recorded substantial increases in both value and volume. Most of the commodities listed in table 1 showed gains, and the total value of minerals produced was 17% greater than that reported for 1974. Commodities that showed decreases during the year included copper, tin, several minor metals, and some nonmetallics.

TRADE

The trade data summaries, shown in tables 2 and 3, respectively, have been compiled principally from Overseas Trade, published by the Australia Bureau of Statistics and cover the official July 1 to June 30 annual reporting period; therefore, the data are not comparable with calendar year data presented elsewhere in this review.

Among mineral commodities exported in 1975, about one-half showed an increase, despite reduced demand in world markets. Exports of primary aluminum, coal, copper, iron and steel, nickel, and tungsten concentrates increased significantly. Although exports of such major commodities as lead, zinc, alumina, and ilmenite concentrate declined, the overall export value reached a record \$3.1 billion because of substantial price increases for a number of products. This exceeded the previous record in 1974 by 29%. Alumina exports in 1975 totaled about 4.5 million tons, compared with 4.7 million exported during 1974. However, because of a considerable increase in the average value from \$50.30 to \$76.16 per ton, f.o.b., the total value of alumina exports in 1975 was \$344 million, 37% higher than the \$251 million recorded in 1974. Lower domestic demand for primary aluminum resulted in increased availability for exports, and exports in 1975 totaled 76,700 tons, valued at \$46.2 million. The quantity was 45% higher than in 1974.

Exports of coal increased 3% to 30.2 million tons, despite reduced shipments late in 1975. Exports from New South Wales increased 8% to 14.8 million tons, while those from Queensland increased 1% to 15.4 million tons. Shipments to Japan declined for the second consecutive year. The drop from 23.1 million to 22.9 million tons in 1975 was attributed to industrial unrest in Australia and depressed conditions in the Japanese steel industry. Coal exports to Europe increased 29% to 6.1 million tons during the year.

Exports of iron ore and iron ore pellets decreased 4% to 80.4 million tons in 1975 compared with 1974. A 7% reduction (to 62 million tons) in exports to Japan was partly offset by a 6% increase (to 18.8 million tons) to Europe. Although the quantity of iron ore exported was less in 1975, the increased prices obtained resulted in an increase in value from \$589 million in 1974 to \$749 million in 1975. The value of iron ore exports amounted to 24.2% of the total value of mineral exports (excluding gold), compared with 24.5% in 1974. The value of gold shipments was excluded from the total value of mineral exports in accordance with international standards whereby shipments of refined gold and bullion were not classified as merchandise trade.

Lead and zinc exports dropped substantially in 1975 because of reduced world demand, particularly for zinc. Shipments of zinc concentrates to Japan, Australia's largest market, were greatly reduced following cutbacks in Japanese refinery output of zinc. No sales of refined lead were made to the United States during the year. Exports to this traditional market were sharply reduced in 1974 following an antidumping ruling against Australian producers late in 1973. The value of copper exports in 1975 fell because of lower prices, but the tonnage of copper metal exported increased. Nickel exports showed a gain of 84% to \$176 million. The increase was the result of both greater tonnage and higher prices. Other commodities for which significant increases in the value of exports were recorded included tin, rutile concentrate, tungsten concentrate, and manganese ore. Australia shipped minerals and metal to more than 100 countries in 1975, but Japan, the United States, the United Kingdom, and countries of the European Economic Community (EEC) accounted for about 90% of the total exports.

The value of imports of mineral products increased in 1975 to \$634 million, 9% over that of 1974. Crude oil was the major import item, and the value of crude oil represented 76% of the total imports. Imports of oil totaled 55.9 million barrels, 11% less than the quantity imported in 1974. The value of crude oil imports in 1975 was \$480 million, compared with \$420 million in 1974. The value of both 1974 and 1975 oil imports reflects substantial price increases imposed by the Organization of Petroleum Exporting Countries (OPEC) in 1973. Australia also imported large quantities of sulfur, asbestos, and industrial diamond.

Table 2.—Australia: Exports and reexports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1972–73	1973–74	Principal destinations, 1973–74

Matte	7,012	5,113	Belgium-Luxembourg 3,613; United Kingdom 1,500.
Metal including alloys:			
Copper-lead dross and speiss	2,817	1,410	Mainly to United States.
Copper slags and residues	18	288	United Kingdom 153; Belgium-Luxembourg 88.
Scrap including alloy scrap	733	311	United Kingdom 114; Spain 68; West Germany 58.
Unwrought:			
Blister and cement	7,797	10,426	All to Japan.
Other, unalloyed	49,967	50,678	West Germany 15,734; France 12,912; United Kingdom 11,691.
Alloyed	64	25	New Zealand 12; Malaysia 11.
Semimanufactures:			
Unalloyed	7,827	19,990	New Zealand 8,704; Singapore 2,328; Malaysia 2,311.
Alloyed	4,611	4,907	New Zealand 1,773; Hong Kong 1,474; Singapore 608.
Gold:			
Ore and concentrate, metal content[3] troy ounces	r 151,076	181,362	Mainly to Papua New Guinea.
Metal:			
Mint bullion do	293,207	72,388	United Kingdom 45,897; Hong Kong 25,967.
Refined and unrefined bullion do	35,287	83,370	United Kingdom 64,536; Japan 9,577.
Iron and steel:			
Ore and concentrae thousand tons	66,294	68,769	Mainly to Japan.
Metal:			
Scrap do	543	575	NA.
Pig iron and equivalent materials do	687	935	Japan 450; People's Republic of China 410.
Ferroalloys	184	682	New Zealand 534; Philippines 80.
Steel ingots and other primary forms thousand tons	757	808	Japan 235; West Germany 170.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	155	112	New Zealand 64; Papua New Guinea 13.
Universals, plates sheets do	351	152	New Zealand 50; Malaysia 18; Philippines 16; United States 16.
Hoop and strip do	10	8	Mainly to New Zealand.
Rails and accessories do	25	11	New Zealand 8; Fiji 1.
Wire do	22	21	New Zealand 11; United States 3; Papua New Guinea 2.
Tubes, pipes, fittings do	82	69	New Zealand 8; Singapore 5.
Castings and forgings rough do	2	5	Mainly to Papua New Guinea.
Total do	647	378	

See footnotes at end of table.

Table 2.—Australia: Exports and reexports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

Commodity	1972–73	1973–74	Principal destinations, 1973–74
METALS—Continued			
Lead:			
Ore and concentrate, gross weight	74,143	77,678	United States 40,137; United Kingdom 22,553; Japan 14,988.
Slag and residue	6,629	36,072	Mainly to United States.
Oxides	2,826	3,547	Malaysia 850; New Zealand 407.
Metal including alloys:			
Scrap including alloys scrap	263	937	Republic of South Africa 307; United States 252.
Unwrought:			
Bullion, lead-silver, lead content	142,270	147,820	Mainly to United Kingdom.
Refined	149,691	134,158	United Kingdom 36,821; India 21,692.
Alloys, antimonial and other	5,412	6,243	Taiwan 1,649; New Zealand 1,636; Malaysia 920.
Semimanufactures	3,068	1,588	Japan 406; Indonesia 152; Netherlands 133.
Magnesium oxide	1,419	108	New Zealand 88; United Kingdom 20.
Manganese ore, gross weight	87,000	71,922	Japan 33,945; United States 29,736; Thailand 8,027.
Nickel metal and alloys: [4]			
Unwrought value, thousands	NA	$44,741	NA.
Semimanufactures do	NA	$19,938	NA.
Platinum-group metals troy ounces	76,812	26,640	Hong Kong 21,359; Singapore 3,534.
Rare-earth metals, monazite concentrate, gross weight	4,858	3,772	France 2,531; West Germany 400.
Silver:			
Concentrates and lead-silver bullion, silver content [3] thousand troy ounces	r 13,645	13,037	NA.
Mint bullion do	5,570	3,225	Mainly to Japan.
Other do	244	181	Mainly to New Zealand.
Tin:			
Ore and concentrate, gross weight	11,281	8,641	Malaysia 5,349; United Kingdom 2,056.
Oxides	30	17	New Zealand 11; Japan 5; Canada 1.
Metal including alloys:			
Unwrought	3,978	2,821	United States 1,136; Netherlands 602; New Zealand 310.
Semimanufactures	86	582	Papua New Guinea 248; New Zealand 219.
Titanium ores and concentrates, gross weight:			
Ilmenite (excluding beneficiated ilmenite)	523,740	710,670	United Kingdom 226,938; France 171,752; Japan 146,019.
Leucoxene	18,627	16,618	Mainly to United States.
Rutile	338,509	354,126	United States 137,731; United Kingdom 72,499; Netherlands 36,543.
Tungsten ores and concentrates, gross weight:			
Scheelite	1,532	1,617	West Germany 927; United Kingdom 304.
Wolframite	836	368	Japan 198; United Kingdom 106.
Uranium and thorium ores and concentrates, excluding monazite	3	15	Mainly to France.
Vanadium ore and concentrate	--	418	Italy 232; West Germany 112.
Zinc:			
Ore and concentrate, gross weight	300,773	426,178	Japan 213,386; United Kingdom 66,347; Netherlands 60,445.
Oxide	1,315	1,940	Indonesia 692; Philippines 414; Hong Kong 245.
Metal including alloys:			
Slags and residues	5,014	6,613	Republic of South Africa 2,441; Taiwan 2,083; Belgium-Luxembourg 961.
Unwrought	203,898	164,778	United States 27,857; United Kingdom 21,041; New Zealand 19,880; India 19,009.
Semimanufactures	1,333	2,439	New Zealand 405; Japan 400.
Zirconium ores and concentrates, gross weight, minimum 30% $ZrSiO_4$	419,457	400,427	Japan 139,422; United States 72,231; Italy 43,532.

See footnotes at end of table.

Table 2.—Australia: Exports and reexports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

Commodity	1972–73	1973–74	Principal destinations, 1973–74
METALS—Continued			
Other:			
Ore and concentrate of base metals, n.e.s. value, thousands	$122,889	$79,349	NA.
Waste and scrap containing nonferrous metals	9,753	15,489	Singapore 12,764; United Kingdom 1,750.
Oxides, hydroxides and peroxides of metals n.e.s value, thousands	r $3,399	$4,537	Philippines $705; Hong Kong $527.
Metals including alloys, all forms:			
Unwrought and semimanufactures:			
Magnesium, beryllium and their alloys	30	59	New Zealand 45: Singapore 13.
Molybdenum, tungsten and their alloys	8	8	Philippines 5; United Kingdom 1; New Zealand 1.
Base metals including alloys, all forms value, thousands	r $672	$274	New Zealand $151; India $65.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc. value, thousands	r $95	$151	Japan $101; Philippines $24.
Dust and powder of precious and semiprecious stones do	r $28	$50	Philippines $19; New Zealand $16; Thailand $15.
Grinding and polishing wheels and stones do	r $458	$510	New Zealand $205; Philippines $79; Indonesia $66.
Asbestos, crude and fiber	27,817	29,372	Mainly to Japan.
Barite and witherite	5,488	1,079	Mainly to New Zealand.
Cement, hydraulic	9,987	112,779	Singapore 86,896: Reunion Island 10,200.
Clays and clay products (including all refractory brick):			
Crude clays including fire clay and sillimanite	5,581	6,043	United Kingdom 3,696; Japan 1,296; New Zealand 880.
Products:			
Refractory:			
Bricks	2,352	3,193	New Zealand 951; India 612; Indonesia 597.
Other value, thousands	r $582	$683	New Zealand $127; Nauru $108; Taiwan $85; Singapore $78.
Nonrefractory do	r $208	$321	New Zealand $125; Papua New Guinea $95; Fiji $37.
Diamond:			
Gem, not set or strung carats	4,154	7,178	New Zealand 2,700; Hong Kong 1,413; Israel 1,144; Belgium-Luxembourg 1,125.
Industrial do	103,151	160,695	Ireland 98,360; United Kingdom 30,232; Philippines 23,952.
Fertilizer materials:			
Crude, nitrogenous	6	69	Mainly to United States.
Manufactured:			
Nitrogenous	21,430	37,860	Indonesia 19,450; Philippines 16,150.
Phosphatic (excluding basic slag)	5,529	70	Mainly to Papua New Guinea.
Potassic	--	15	NA.
Other including mixed	59,484	1,453	Singapore 1,181; United Kingdom 182.
Ammonia value, thousands	r $864	$6,237	Mexico $4,393; Malaysia $1,154.
Gem stones, except diamond:			
Opals do	r $22,509	$21,928	Hong Kong $10,212; United States $3,820; Italy $3,626.
Sapphires do	r $3,747	$4,278	Thailand $1,566; Hong Kong $497.
Other do	r $1,253	$1,631	Hong Kong $389; United States $360; New Zealand $200.
Gypsum	297,136	390,028	New Zealand 162,423; Japan 106,230; Philippines 39,812.
Lime (quicklime, slaked lime, hydraulic lime)	640	5,123	Mainly to Papua New Guinea.
Magnesite	--	975	Mainly to United States.
Mica, worked and articles value, thousands	r $57	$65	All to New Zealand.

See footnotes at end of table.

Table 2.—Australia: Exports and reexports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

Commodity	1972–73	1973–74	Principal destinations, 1973–74
NONMETALS—Continued			
Pigments, mineral:			
Micaceous iron oxide	38	51	Japan 20; New Zealand 9; Singapore 9.
Iron oxides, other	7	67	New Zealand 30; Japan 18; Singapore 11.
Pyrite, unroasted, gross weight	15	109	Mainly to Papua New Guinea.
Salt and brine thousand tons	2,863	4,063	Mainly to Japan.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	465	785	New Zealand 321; Fiji 314.
Caustic potash	9	62	New Zealand 54; Fiji 9.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	1,621	2,347	Mainly to Japan.
Worked value, thousands	$31	$46	United States $33; Nauru $4.
Sand, gravel, limestone flux and other calcareous stone	387,987	554,536	Mainly to Japan.
Sulfur, sulfuric acid	10,830	14,088	Do.
Talc, steatite, soapstone, pyrophyllite	31,402	47,601	Japan 29,621; Netherlands 15,963.
Other nonmetals, n.e.s.:			
Crude:			
Quartz, mica, feldspar, fluorspar, cryolite, chiolite	2,140	1,539	Japan 1,183; New Zealand 346.
Refractory materials, except clays and magnesite	151	48	Philippines 21; Papua New Guinea 14; New Zealand 11.
Other value, thousands	r $481	$117	Japan $43; New Zealand $20; United States $14.
Oxides and hydroxides of magnesium, strontium, barium	373	666	New Zealand 520; Philippines 121.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s value, thousands	r $2,676	$3,307	Papua New Guinea $841; New Zealand $416.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	r 21,695	22,941	New Zealand 6,379; Taiwan 4,588; Indonesia 3,974.
Coal, bituminous and lignite and peat (including briquets):			
Bituminous coal and briquets thousand tons	25,800	27,853	Mainly to Japan.
Lignite, peat and briquets thereof	6	2	All to Malaysia.
Coke and semicoke thousand tons	204	141	Japan 26; Netherlands 46; New Caledonia 30.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	2,077	1,918	Mainly to Japan.
Refinery products:			
Gasoline do	1,428	3,231	Mainly to New Zealand.
Jet fuel do	1,422	1,928	New Zealand 989; Fiji 538; Singapore 238.
Kerosine do	246	480	New Zealand 398; Fiji 49.
Distillate fuel oil do	2,436	4,653	New Zealand 2,281; United Kingdom 692; Fiji 610.
Residual fuel oil do	3,408	3,189	Mainly to Japan.
Lubricants	847	632	New Zealand 242; Malaysia 125; Philippines 82.
Other do	270	359	Mainly to New Zealand.
Mineral tar and other coal–, petroleum–, or gas–derived crude chemical value, thousands	r $1,147	$3,324	New Zealand $1,866; West Germany $818; United States $506.

r Revised. NA Not available.

[1] Data are for years beginning July 1.

[2] Compiled from import statistics of selected trading partner countries.

[3] Source: Bureau of Mineral Resources, Geology and Geophysics. Australian Mineral Industry: Quarterly Review—Quarterly Statistics. V. 28, No. 4, December 1975, and are for years beginning March 1 of that stated.

[4] In addition to forms of nickel listed, Australia also exported nickel ore and concentrate, but neither quantity nor value is published in a form that is separable from other commodities.

Table 3.—Australia: Imports of mineral commodities [1]

(Metric tons unless otherwise specified)

Commodity	1972–73	1973–74	Principal sources, 1973–74
METALS			
Aluminum:			
Oxide and hydroxide	3,847	4,708	Japan 1,566; United States 1,243; West Germany 577.
Metal including alloys:			
Scrap	997	2,940	Mainly from New Zealand.
Unwrought	712	9,083	Canada 6,949; New Zealand 1,835.
Semimanufactures	3,523	8,122	United States 3,221; United Kingdom 1,316.
Antimony metal, all forms	80	125	People's Republic of China 61; United Kingdom 43; Japan 20.
Arsenic trioxide, pentoxide, acids	1,130	1,315	Territory of South-West Africa 320; Sweden 300; France 276; United States 244.
Beryllium metal including alloys, all forms value	r $2,882	$5,763	Mainly from United States.
Bismuth metal including alloys, all forms	11	14	United Kingdom 9; Japan 2.
Cadmium metal including alloys, all forms	15	10	Mainly from U.S.S.R.
Chromium:			
Chromite	586	8,270	Philippines 7,113; Republic of South Africa 1,157.
Oxide, hydroxide, trioxide	589	1,585	U.S.S.R. 610; United States 550; West Germany 252.
Metal including alloys, all forms	24	45	Japan 32, United Kingdom 13.
Cobalt:			
Oxide and hydroxide	8	38	United States 25; Belgium-Luxembourg 8.
Metal including alloys, all forms	128	198	Zaire 93; Zambia 30; Belgium-Luxembourg 25.
Copper:			
Ore and concentrate	1	NA	
Copper sulfate	2,593	2,575	Mainly from New Zealand.
Metal including alloys:			
Scrap:			
Unalloyed	1,434	1,143	New Zealand 686; Papua New Guinea 251.
Alloyed	1,592	1,106	New Zealand 453; Papua New Guinea 243; Solomon Islands 189.
Unwrought	630	1,552	United Kingdom 1,029; Israel 333.
Semimanufactures	4,488	[2] 20,601	Mainly from United Kingdom.
Gold:			
Ore and concentrate	12	16	All from Fiji.
Crude bullion, gold content troy ounces	99,709	89,830	Fiji 77,644; Papua New Guinea 10,975.
Refined bullion do	5,130	660	Papua New Guinea 453; New Zealand 182.
Iron and steel:			
Ore and concentrate, including roasted pyrite	24,988	13,964	Canada 12,317; Philippines 1,018.
Metal:			
Scrap	141	114	New Zealand 28; Solomon Island 27; Papua New Guinea 14.
Sponge iron, powder and shot	6,108	7,265	Sweden 2,821; Japan 1,653; United Kingdom 1,014.
Spiegeleisen	29	30	All from West Germany.
Ferroalloys:			
Powder:			
Ferromanganese	552	374	Japan 285; West Germany 88.
Other	179	1,186	Republic of South Africa 902; Japan 120.
Shot:			
Ferrochromium	7,645	14,646	Republic of South Africa 6,870; India 3,441; Yugoslavia 2,510.
Ferromanganese	5,817	12,196	Mainly from Republic of South Africa.
Ferromolybdenum	243	253	United States 139; United Kingdom 73; Canada 28.
Ferrosilicon	9,202	14,286	Republic of South Africa 7,793; Norway 2,844; Japan 856.
Ferronickel	1,337	1,450	All from New Caledonia.
Other	2,976	3,324	Mainly from Republic of South Africa.

See footnotes at end of table.

Table 3.—Australia: Imports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

Commodity	1972–73	1973–74	Principal sources, 1973–74
METALS—Continued			
Iron and steel—Continued			
Metal—Continued			
Steel, primary forms	60,255	212,494	Mainly from Japan.
Semimanufactures:			
Bars, rods, angles, shapes, and sections	34,426	60,462	Japan 32,092; United States 7,147; United Kingdom 5,642.
Universals, plates, sheets	221,104	371,196	Japan 259,832; Republic of Korea 32,301; United States 30,767.
Hoop and strip	31,695	49,328	Japan 25,426; United States 8,576.
Rails and accessories	322	15,925	Mainly from Japan.
Wire	10,541	45,483	Japan 15,463; Belgium-Luxembourg 13,884.
Tubes, pipes, fittings	140,815	[3] 239,355	Mainly from Japan.
Castings and forgings, rough value, thousands	r $223	$222	United States $141; United Kingdom $66.
Lead:			
Oxides	26	33	United Kingdom 19; Republic of South Africa 10.
Metal including alloys:			
Scrap	412	326	New Zealand 158; Papua New Guinea 84; Fiji 44.
Unwrought and semimanufactures	44	98	United States 69; New Zealand 10.
Magnesium metal including alloys, all forms	1,498	2,544	U.S.S.R. 1,213; Norway 878; United States 345.
Manganese:			
Ore and concentrate:			
Battery grade	1,524	299	All from United States.
Metallurgical grade	3,346	1,606	Mainly from People's Republic of China.
Oxides	1,130	1,087	Japan 640; United States 358.
Metal including alloys, all forms	721	950	Japan 637; Republic of South Africa 296.
Mercury 76-pound flasks	1,596	2,974	Spain 1,684; Philippines 435.
Molybdenum:			
Ore and concentrate	359	469	Canada 203; United States 202; West Germany 62.
Metal including alloys, all forms:			
Wire	6	8	Mainly from United States.
Other value, thousands	r $91	$88	United States $49; United Kingdom $22.
Nickel:			
Matte, speiss, and similar materials	929	177,362	All from Canada.
Metal including alloys:			
Scrap	28	5	All from New Zealand.
Unwrought	1,103	2,496	Mainly from Canada.
Semimanufactures	658	1,344	United Kingdom 500; United States 300.
Platinum-group metals and silver:			
Ore and concentrate	21	23	All from New Zealand.
Waste and sweepings value, thousands	r $256	$388	Mainly from New Zealand.
Metals including alloys:			
Platinum group troy ounces	180,762	1,392,796	Mainly from United States.
Silver containing 75% or more silver, silver content do	77,033	99,047	Hong Kong 41,736; Fiji 26,916; United States 13,656.
Silicon metal	2,366	2,496	Norway 578; Sweden 487; Canada 392; France 285.
Tin:			
Oxides	r 43	9	West Germany 5; United Kingdom 3.
Metal including alloys:			
Scrap	--	4	All from New Zealand.
Unwrought	r 65	67	Mainly from Malaysia.
Semimanufactures	r 39	1,134	Mainly from Japan.
Tungsten:			
Ore and concentrate	1	(4)	All from United Kingdom.
Metal including alloys, all forms	11	14	United States 8; United Kingdom 4.
Zinc:			
Ore and concentrate	18	21,935	All from Canada.
Oxides	771	1,574	Canada 823; United States 308; New Zealand 176.
Metal including alloys, all forms	102	119	New Zealand 85; United States 19; United Kingdom 14.

See footnotes at end of table.

Table 3.—Australia: Imports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

Commodity	1972–73	1973–74	Principal sources, 1973–74
METALS—Continued			
Other:			
Ore and concentrate:			
Of niobium, tantalum, titanium, vanadium, zirconium	1	60	United States 18; Japan 9.
Of base metals not elsewhere specified	2,448	12,048	Guyana 6,187; United States 4,510.
Ash and residue containing nonferrous metals	5,645	12,829	Mainly from Chile.
Oxides, hydroxides and peroxides of metals, n.e.s	895	230	Norway 141; New Zealand 56; United Kingdom 31.
Metals including alloys, all forms:			
Metalloids	3,224	2,820	Canada 2,177; United States 370.
Alkali, alkaline earth and rare-earth metals	101	70	United Kingdom 24; Australia 17; Japan 15; United States 11.
Base metals including alloys, all forms n.e.s	122	429	United States 275; Japan 65.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	1,308	1,396	United States 663; United Kingdom 278; New Zealand 239.
Grinding and polishing wheels and stones	979	1,301	West Germany 275; United Kingdom 207; Japan 139.
Asbestos:			
Chrysotile	50,014	40,165	Mainly from Canada.
Amosite	7,587	10,070	Mainly from Republic of South Africa.
Other	3,773	6,816	Mainly from Canada.
Barite and witherite, natural and ground	1,209	9,532	Thailand 3,948; United States 3,212; People's Republic of China 1,300; Singapore 1,000.
Boron materials:			
Crude natural borates	1,301	1,075	All from United States.
Oxide and acid	3,330	3,090	Mainly from United States.
Cement, hydraulic	[5] 8,240	[5] 48,811	Japan 26,189; United Kingdom 5,654.
Chalk	8,782	9,589	United Kingdom 6,269; France 2,392.
Clays and clay products (including all refractory brick):			
Crude clays, n.e.s.:			
Bentonite	63,139	69,054	Mainly from United States.
Fire clay and ball clay	9,968	669	Mainly from United Kingdom.
Andalusite, mullite, chamotte, dinas earths	8,464	14,513	Mainly from Republic of South Africa.
Kyanite and sillimanite	490	737	Mainly from United States.
White clays	37,535	33,592	United Kingdom 18,008; United States 15,521.

COMMODITY REVIEW

METALS

Aluminum.—The rapid growth in the Australian aluminum industry in recent years was reversed in 1975. Australia's aluminum companies traded extensively in international and domestic markets, and in both areas performance was down. Owing to cuts in smelter production by Comalco Industries Pty., Ltd. in December 1974, and by Alcan Australia Ltd. early in 1975, output of primary aluminum was 2% lower than that of 1974. The major reason for the slump in output was a recession in the building industry, which adversely affected demand for semifabricated products. Alumina production increased slightly to 5.1 million tons (4.9 million tons in 1974), with the completion of an expansion program at Pinjarra in 1974 and steady progress at Gove towards design capacity. Output from alumina refineries, however, as well as those at Gladstone and Kwinana, was restricted as a result of the worldwide decrease in demand for aluminum. Production cuts affecting output at Gladstone, Kwinana, and Pinjarra were announced in February 1975. The output of about 21 million tons of bauxite in 1975 was 5% above the 1974 level. Production by Comalco at Weipa declined, mainly because of industrial disputes. Production of both Alcoa Pty. Ltd. at Pinjarra and Nabalco Pty. Ltd. at Gove increased, offsetting the decline at Weipa.

The world's largest bauxite deposits, located at Weipa, on Cape York Peninsula in Queensland, had reserves estimated at 2.2 billion tons, with an alumina (Al_2O_3) content of more than 50%. The bauxite, in the form of fine reddish pebbles, forms a flat-lying surface deposit, ranging from 1 to 10 meters in thickness. The bauxite was mined by Comalco, which is owned 45% by Conzinc Riotinto of Australia Ltd. (CRA), 45% by Kaiser Aluminum and Chemical Corp., and 10% by Australian and New Zealand shareholders. Annual production capacity was 10.5 million tons of bauxite. Production of bauxite by Comalco in 1975 was 9.1 million tons, 200,000 tons below the level of production in 1974, due mainly to the effects of a strike at Weipa toward yearend. There was also a decline in demand for bauxite by overseas customers as the year closed. Of the 1975 tonnage shipped, 4.7 million tons (52%) went to Gladstone for processing into alumina, 1.3 million tons (14%) to Japan, and 3.1 million tons (34%) to Europe and other areas, including 1.3 million tons to Euralumina S.p.A. in Italy. Sales to customers other than companies within the Comalco group amounted to 8.3 million tons in 1975, which was 200,000 tons less than 1974. The company continued its program of progressively developing the Andoom mining area to the north of Weipa, and more than 50% of the company's bauxite output will come from that area in 1976. Sales of calcined bauxite, used in abrasives, were down sharply. Because of this downturn, one of the kilns at Weipa was closed for several months.

In 1975, the output of primary aluminum from the Bell Bay smelter and Comalco's share of metal from the Bluff smelter amounted to 137,544 tons, a decrease of 2.4% from that of 1974. Although the company was unable to increase sales of primary metal to overseas customers in Japan, Canada, the United Kingdom, South East Asia, and the People's Republic of China, the sales price was attractive.

Deposits at Jarradale and Del Park in the Darling Ranges, Western Australia, were mined by Alcoa of Australia Ltd. Reserves in the area amounted to some 510 million tons of bauxite averaging 35% Al_2O_3. Processing of bauxite from Jarradale was conducted at the company's Kwinana alumina refinery. Production for the two operations totaled 5.2 million tons. Jarradale contributed 60% of the total and Del Park, 40%.

Alcoa Pty. Ltd. began production of hydrated alumina at Kwinana. The plant, constructed at a cost of $550,000, has a rated capacity of 50,000 tons per year and will supply both local and overseas markets.

A deposit estimated at 260 million tons of bauxite averaging around 50% Al_2O_3 was mined at Gove, Northern Territory. Mining and refining facilities were operated by Gove Alumina Ltd., the Australian-owned partner in Nabalco. Bauxite produced at Gove during 1975 totaled 1.9 million tons, and the current annual production capacity is about 4 million tons. Over half was processed at Nabalco's Gove refinery, while the balance was exported.

Plans by Alumax Inc. (owned by AMAX Inc. of the United States and Mitsui Mining Co. Ltd. of Japan) to develop about 235 million tons of a lateritic bauxite deposit on the Mitchell Plateau in the Kimberley region, Western Australia, were deferred until world demand for aluminum improves. The deposit has an average thickness of 4 meters and is spread over a wide area, with about 1 meter of overburden.

Copper.—Production of copper in ore and concentrate in Australia dropped about 13% below that of 1974. Similarly, output of blister copper was down 8%, compared with that of 1974. Four of Australia's major copper producers curtailed operations. Copper mining ceased at Tennant Creek, Northern Territory, for economic reasons in February, and at Mount Isa, Queensland, mine production was curtailed early in 1975 because of reduced market demand and lower copper prices. Mine output at Mount Lyell, Tasmania, declined because of difficult underground conditions and the collapse of a waste-ore pass, and at Mount Morgan, Queensland, a major slide of ground in November restricted output.

Production by the principal copper companies in 1973–75 is shown in table 4.

Mount Isa Mines Ltd. (MIM) reported that copper ore treated for the year ending June 30, 1975, amounted to 4.95 million tons, 7% below the 1974 level. There were no serious interruptions in production during 1975, contrasting with 1974 when serious flooding in North Queensland caused reduction in operations for several weeks. In the second half of the year, the copper ore mining rate was temporarily adjusted to permit the drawdown of previously accumulated concentrate stocks to a more normal level. Approximately 90% of the copper ore was mined from the No. 1,100 ore body. Production from the No. 400 ore body, which began in 1969 and has yielded 2.8 million tons of ore, was completed. One of two new ventilation shafts under development was completed and commissioned. This resulted in improved working conditions in the southern part of the No. 1,100 ore body. Reserves of primary ore on June 30, 1975, were reported at 140 million tons with an average grade of 3.0% copper. Secondary ore reserves were 1.5 million tons containing 3.8% copper.

Mount Lyell Mining & Railway Co. Ltd. produced 23,240 tons of copper in concentrate at its Queenstown mine, Tasmania, nearly 100 tons less than in 1974. The proportion of ore produced from underground sources amounted to 90% of total production. Most of the underground ore was recovered from the Prince Lyell and Cape Horn sections. Overall ore production was 2,303,700 tons, 43,200 tons less than that of 1974, due mainly to production difficulties in the Prince Lyell, Royal Tharsis, and Crown Three stopes. Delays in the mining of these sections deferred the full transition to underground mining for about 2 years. Exploration drilling continued within the Queenstown mining lease throughout the year, and ore reserves were put at 30 million tons of 1.48% copper.

Peko-Wallsend Ltd. ceased copper production at Tennant Creek, Northern Territory, early in 1975. Production at the group of mines operated by Peko-Wallsend up to curtailment of operation was as follows: Peko mine—66,200 tons of ore treated (2,183 tons of copper); Werrego mine—304,000 tons of ore treated (6,173 tons of copper); Orando mine—5,815 tons of ore treated (303 tons of copper); and Juno mine—60,100 tons of ore treated (259 tons of copper). The flash furnace performed satisfactorily, but the decline in the price of copper and sharp increases in the cost of fuel made the operation uneconomical. Prior to closure, research work was directed at separation of copper and bismuth in concentrate form.

Cobar Mines Pty. Ltd., located 720 kilometers from the New South Wales coast, treated 604,500 tons of copper ore averaging 1.9% copper. About 70% of the ore was mined by mechanized cut-and-fill stoping, the remainder being obtained from open stopes and from development carried out in ore. Concentrates were shipped to Port Kembla, New South Wales, for smelting and refining.

Kanmantoo Mines Ltd. in Kanmantoo, South Australia, was managed by Broken Hill South Ltd. Crude ore treated during 1975 totaled 877,200 tons. The 29,700 tons of copper concentrate produced contained 6,011 tons of copper.

Gunpowder Copper Ltd. increased output at the Mammount mine in Queensland, in line with the current expansion program. The Mount Gunson project in South Australia operated by CSR Ltd. and United Uranium N.L. continued to expand, becoming the fifth-largest producer in its first full year of operation, with an output of over 9,000 tons of copper in concentrates.

Table 4.—Australia: Major copper industry facilities

Facility	Production (metric tons of copper)[1]		
	1973	1974	1975
Mine:			
Mount Isa Mines Ltd	118,110	152,510	150,112

Gold.—Australia's gold industry in 1975 reversed the downward trend in mine production of the past several years and output increased slightly compared with that of 1974. With the high gold price in 1975, mining of and exploration for gold increased, and many new claims were staked. Another feature of the gold industry was the attention given to the retreatment of tailings dumps. In addition to increased output by most existing producers, some contribution was also made by the reopening of old mines. Lack of production from any major new mine indicated the reluctance of companies to undertake the large capital expenditure necessary to bring new mines into production because of uncertainty regarding future trends in the price of gold.

Western Australia remained the principal gold-producing State, and most of the output came from Kalgoorlie, Norseman, and Mount Magnet. Kalgoorlie Lake View Pty. Ltd., formed when Gold Mines of Kalgoorlie and Lake View & Star amalgamated their Kalgoorlie operations in 1973, was becoming the dominant gold producer in Australia. Kalgoorlie Lake View produced 162,080 troy ounces of gold from its Fimiston and Mount Charlotte mines and several open pits. The company's proven ore reserves as of June 1975 were 4.5 million tons containing 0.19 troy ounce of gold per ton.

Most of the Northern Territory's gold production came from the Tennant Creek District where Peko-Wallsend Ltd. produced copper-gold ore and copper-gold-bismuth ore from its Juno, Peko, Orlando, and Warrego mines. In 1975, these mines produced 137,215 troy ounces of gold, of which the gold-rich Juno ore body (80,000 tons of ore containing 1.6 troy ounces of gold per ton as of June 1974) produced 94,500 troy ounces of gold, compared with 159,400 troy ounces in 1974. The imminent exhaustion of this ore body was expected to lower gold production to a great extent as the Warrego "gold pod," to be mined separately from the Warrego ore body, contained 830,000 tons of ore averaging 1 troy ounce of gold per ton.

Metramar Minerals Ltd. and Australian Anglo American Ltd. began redeveloping the Blue Spec gold-antimony mine near Nullagine in the Pillbara region, Western Australia. Reserves were put at 80,000 tons of ore, averaging 1.4 troy ounces of gold per ton. Production was expected to commence in 1976, and a production life of 28 months was planned. Redevelopment work also took place at the Marvel Loch mine, south of Southern Cross in the Yilgarn goldfield, Western Australia. The project was a joint venture of Kia Ora Gold Corp. (60%) and Uranium and Nickel Exploration N.L. (40%). Lennard Oil N.L. commenced treating about 20 million tons of tailings it controlled at Lancefield and Leonara in the Eastern goldfields. Treatment of about 25 tons of tailings was expected to produce 1 troy ounce of gold. At Coolgardie, Western Australia, Roeburne Exploration and Mining

Ltd. expected to recover up to 15,000 troy ounces of gold per year from the working of gold-bearing alluvials. The treatment plant started operations late in 1974. Newmont Pty., Ltd., a subsidiary of Newmont Mining Corp. of the United States, outlined a significant ore body east of Marble Bar in the Great Sandy Desert, Western Australia. Ore reserves were estimated at 3.8 million tons averaging 0.3 troy ounce of gold per ton. The open pit mine was scheduled to be commissioned in 1976. The principal gold producers and quantities recovered during 1975 were as follows:

Company	Gold produced (troy ounces)
Central Norseman Gold Corp. N.L.	29,820
Golden Plateau N.L	16,532
Kalgoorlie-Lake View Pty. Ltd	110,212
Hill 50 Gold Mine N.L	8,210
Mount Lyell Mining & Railway Co. Ltd	15,448
North Kalgurli (1912), Ltd	1,928
Peko-Wallsend Ltd	183,791

Iron and Steel.—Despite reduced demand for iron and steel products and a high level of industrial dispute, the industry advanced on all fronts in 1975. Output of both iron ore and pig iron was slightly greater than that of 1974. The increase in iron ore output resulted mainly from additional production facilities commissioned at Pilbara during 1974 and 1975. The depressed world demand for steel led to reduced shipments to Japan, but the policy of steelmakers to rebuild or increase stocks rather than retract purchase commitments assisted in maintaining a high level of production in 1975.

The Broken Hill Pty. Co. Ltd. (BHP) increased production of raw steel to 8.0 million tons, 4% above that in 1974. A 5% reduction in output to 2.7 million tons at Newcastle was offset by increases to 1.8 million tons at Whyalla and 3.5 million tons at Port Kembla, New South Wales. Production of structural, flat, and sheet products was maintained at Whyalla and Port Kembla owing to increased export sales despite substantially reduced domestic demand.

Exports of iron ore and iron ore pellets decreased 4% to 80 million tons in 1975. Australia's iron ore producers searched the world for contracts to provide the basis for expansion and new development. Although Japan remained the principal destination of exports (62 million tons or 77% of the total), the most notable feature was the increasing rise in exports to other destinations. Substantial increases occurred in exports to West Germany, the People's Republic of China, Greece, France, and the Republic of Korea. The rapid development of the Republic of Korea's shipbuilding, vehicle, and heavy machinery industries was the major factor causing the growth in that country's steel industry.

In April 1975, iron-ore-producing countries met in Geneva and approved the text of an agreement to establish an association to be known as the Association of Iron Ore Exporting Countries. Ministers from Algeria, Australia, Chile, India, Mauritania, Peru, Sierra Leone, and Venezuela attended the meeting. Representatives of Brazil and Liberia also participated while Canada, the Philippines, and Tunisia attended as observers. The basic objective of the proposed association was to provide a forum for exchange of information and discussion of mutual problems.

The principal Australian iron ore producers and their output in 1975 were as follows, in thousand tons:

Company and location	Quantity
Goldsworthy Mining Ltd., Western Australia (lump)	8,058
Hammersley Iron Pty. Ltd., Western Australia (lump, pellets)	36,107
Western Mining Corp. Ltd. (WMC), Western Australia (lump)	697
The Broken Hill Pty. Co. Ltd. (BHP), Western Australia (lump)	3,200
The Broken Hill Pty. Co. Ltd. (BHP), South Australia (lump, pellets)	7,600
Savage River Mines, Tasmania (pellets)	2,190
Frances Creek Iron Mining Corp. Ltd., Northern Territory (lump)	570
Mount Newman Iron Ore Co., Western Australia (lump)	33,242

The two mines operated by Hamersley Iron (Mount Tom Price and Paraburdoo) produced 5% more iron ore in 1975 than in 1974. The higher production rate reflected the delivery of new mining equipment, the completion of part of the plant-upgrading program at Mount Tom Price, and improved industrial relations. Recovery of salable ore from material mined rose from 49% to 51%. Total salable production at the Mount Tom Price mine increased 13.3% to 22.3 million tons, consisting of 14.3 million tons of high-grade lump ore, 7.2 million tons of high-grade fines, and 822,000 tons of low-grade fines. Total material (ore and waste) moved at the mine was 39.9 million tons. New mining equipment commissioned during 1975 included two large blast-hole drills, three 9.3-cubic-meter-capacity electric shovels, one large front-end loader (7.7-cubic-meter-capacity bucket), and two heavyweight graders. This new equipment contributed to increased productivity. Salable ore production at Paraburdoo in 1975 was 13.8 million tons compared with 14.6 million tons in 1974. Production in 1975 consisted of 7.1 million tons of high-grade fines and 92,000 tons of low-grade fines.

A major geological survey program was carried out at both the Mount Tom Price and Paraburdoo pits. This program established the presence of significant mineralization at the eastern and southern flanks of Mount Tom Price. At Paraburdoo, a drilling program to enable a more accurate interpretation of the complex Paraburdoo ore body was being actively pursued.

Production by the Mount Newman consortium, a joint venture operated by Mount Newman Mining Co. Pty. Ltd., was 15% higher than that of 1974. Of this total, 29.4 million tons was exported and 3.8 million tons was shipped to the domestic steel industry. With the addition of 4 new 17-cubic-meter electric shovels and 16 new Wabco Haulpak trucks, mining and ore hauling capacity was raised about 20%. In mid-year, the consortium announced that a further expansion had been authorized to raise capacity to 40.6 million tons per year by early 1976. Goldsworthy Mining Ltd. iron ore production dropped by 7.5 million tons, 12% below the 1974 total. The decline in production was attributed to industrial disputes and a 15% drop in requirements by the Japanese steel mills.

BHP and its wholly-owned subsidiaries continued to increase production of iron ore and steel during 1975. Iron ore production by the company's various operations, including Dampier Mining Co.'s share of the Mount Newman production (10.9 million tons), increased 7% over last year to 21.7 million tons. Relatively large increases at BHP's Yampi Sound mine were achieved to meet temporarily high export requirements.

BHP's combined production of raw steel increased 4% to a new record level of 8.0 million tons. Production would have been higher, except for industrial disputes at the Port Kembla, Newcastle Plant, and in the maritime industries. Shortages of coal, due to labor problems affecting shipping operations, affected iron production at Whyalla, South Australia. Major repairs were carried out on 6 of the company's 12 blast furnaces. The No. 1 furnace at Port Kembla remained off-line after its repair in December because of inadequate iron ore supplies brought about by industrial disruption in maritime operations. The Kwinana blast furnace, in Western Australia, was shut down for relining early in the period but then operated regularly and produced principally for the export market. The BHP consolidated annual reports for periods ending May 31, 1974, and May 31, 1975, summarize output of various products as follows, in thousand tons:

Commodity	Quantity	
	1974	1975
Pig iron	7,551	7,540
Steel ingots and billets	7,705	8,017
Blooms and slabs	6,434	6,568
Sheets, bars, billets, etc	3,123	3,218
Plate and strip	2,751	2,533
Merchant	1,730	1,585
Rod	578	565
Narrow cold-rolled strip	96	68
Tinplate	243	317

Lead and Zinc.—Mine production of lead increased to around 8% in 1975, mainly because of a marked improvement in output by Australian Mining & Smelting Ltd. (AM&S) at the Broken Hill mines in New South Wales. Mine production of zinc increased 45,571 tons owing to increased output at Mount Isa and Broken Hill mines operated by AM&S. However, production of both refined lead and zinc declined in 1975. Refined lead production was off 17% because of output reductions by Broken Hill Associated Smelters Pty. Ltd. (BHAS), the principal Australian refinery. Production of lead bullion was up 5% despite the closure of the Sulphide Corp. Pty. Ltd. plant at Cockle Creek, New South Wales, late in 1975 for maintenance. Refined zinc output totaled some 193,335 tons, compared with 276,831 tons in 1974. A series of cutbacks was announced by domestic zinc refineries late in 1974 and in 1975. Domestic concentrate stocks increased substantially in the second half of 1975 because of reduced export demand and lower demand by domestic smelters and refineries. Several producers announced intentions to stockpile unsold concentrate rather than reduce mine output. Domestic lead consumption was unchanged in 1975, but zinc consumption was about 81,000 tons, or 33%, less than in 1974.

MIM again played a significant part in Australia's lead and zinc output. Lead production in 1975 was 131,700 tons, most of which was exported to the Britannia Lead Co.'s refinery in the United Kingdom. Zinc production totaled 115,200 contained tons, and again most of it was exported as concentrate. Traditionally, this material was shipped to ASARCO, Inc. (MIM's parent company) in Amarillo, Tex., but severe pollution control requirements, which caused the Amarillo smelter to close down, forced more zinc concentrates to be sold on the free market. Reports from Japan suggested that about 30,000 tons per year would be toll-refined there in 1975–78. New MIM projects included the lead-zinc mine at Hilton, Queensland, which could come onstream around 1985. Exploration drilling continued and bulk ore samples were obtained for pilot plant metallurgical testing. Progress was made in establishing the basic techniques for treating Hilton ore, which was finer textured than the Mount Isa ore. Reserves of silver-lead-zinc ores in the Mount Isa and Hilton mines were 51 million and 37 million tons, respectively. A feasibility study continued on the establishment of a zinc refinery and associated facilities at Townsville, Queensland. A feasibility study on production of zinc oxide from lead smelter slags at Mount Isa was also undertaken.

At the McArthur River deposit, Northern Territory, an adit was being driven to obtain ore samples, and a pilot plant was being constructed. The extremely fine-grained nature of the sulfide minerals discouraged mine development, as normal flotation methods of separation could not be used. Reserves of the main deposit were estimated to be 190 million tons (9.5% zinc, 4.1% lead, and 1.4 troy ounces of silver per ton), but additional reserves were believed to exist in the area. MIM expected to spend $6 million over the next 2 years on metallurgical and other investigations. A 50-ton-per-day pilot concentration plant was built to determine whether the deposit is a commercially viable proposition.

Mine output by Zinc Corp. Ltd. and New Broken Hill Consolidated (NBHC), operated by AM&S at Broken Hill, New South Wales, was above the 1974 level. Increased emphasis was placed on mine development. AM&S increased contained zinc output from 176,629 to 205,197 tons in 1975. Ore recovered from the group's two mines at Broken Hill increased from 1.64 million to 1.84 million tons. The average grades of ore treated remained constant throughout the period at 9.3% lead, 2 troy ounces of silver per ton. and 12% zinc. Contained lead production for the year increased from 192,226 to 213,492 tons. Industrial relations were much improved in 1975.

AM&S agreed in principal with Phelps Dodge Corp. and St. Joe Minerals Corp. of the United States to develop the Woodlawn ore deposit in New South Wales. Detailed engineering studies of the deposit, located about 45 miles north of Canberra, were completed. Proven ore reserves were 10 million tons averaging 3% lead, 7.5% zinc, 1.5% copper, and 1.5 troy ounces of silver per ton. Development of the open pit zinc, lead, copper, and silver mine was expected to cost about $100 million, the first $23.3 million to be paid by AM&S and the balance financed equally by the three partners. Ownership was to be divided evenly among the three partners. The partners were also to share equally in an exploration program within a 32-kilometer radius of the deposit. Drilling in the area was being managed by Jododex Australia Pty. Ltd., which was owned 50% by St. Joe and 50% by Phelps Dodge.

Production of zinc metal at the Sulfide Corp. smelter at Cockle Creek, New South Wales, was limited to 65% of plant capacity for most of the year, while lead bullion production was about 80% of capacity. The smelter was shut down in November to conduct regular maintenance and to avoid an excessive buildup of metal stocks. Smelting operations were expected to be resumed early in 1976. Two new process developments that should lead to greater operating efficiency were successfully tested during the year. Improved control over liquid effluents and gaseous emissions was also achieved following the installation of new facilities costing $2.4 million.

Electrolytic Zinc (EZ) Co. of Australasia, Ltd., the major subsidiary of E.Z. Industries Ltd., operated three mines in the Read-Rosebery area of western Tasmania. The company also operated the Risdon refinery. Ore output from the company's Rosebery, Farrell, and Hercules mines totaled 505,191 tons, most of which came from the Rosebery mine. Ore output was 4% lower than that for 1974, primarily due

Table 5.—Australia: Lead-zinc production, by major company
(Metric tons)

Company	1973 Lead	1973 Zinc	1974 Lead	1974 Zinc	1975 Lead	1975 Zinc
North Broken Hill Ltd	63,364	46,313	58,383	46,922	57,192	39,308
The Zinc Corp. Ltd	82,860	60,900	74,850	62,800	78,950	88,700
New Broken Hill Consolidated Ltd. (NBHC)	82,140	138,100	71,150	114,200	83,120	116,300
Mount Isa Mines Ltd	112,510	102,754	124,381	103,051	131,689	115,209
Electrolytic Zinc Co. of Australasia Ltd. (Read-Rosebery)	26,290	75,894	26,311	76,777	18,162	60,801

to the effects of continuing labor shortages and a high turnover and absentee rate. Where possible, production was maximized at the Rosebery mine. The Hercules mine was operated on a single shift basis throughout the year, and the Farrell mine was temporarily closed. The supply of zinc concentrate was also temporarily interrupted by the loss of 9,700 dry tons in January, when an ore vessel, the *Lake Illawarra,* sank after colliding with the Tasman Bridge. The No. 6 fluid roaster for zinc concentrate, the largest of its type in the world, commenced operation in June after some initial difficulties with ancillary equipment. Four flash roasters were thereby superseded after giving good service dating back to 1948.

Manganese.—Australia's manganese production decreased 6% compared with that of 1974. The decline was attributed to Groote Eylandt Mining Co. Pty. Ltd., a subsidiary of BHP, where production was down 7% following industrial disputes. Output at the Groote Eylandt plant, located in the Northern Territory, accounted for over 90% of Australia's total production in 1975. A capital expenditure program of $20 million by Groote Eylandt to increase production capacity from 1.3 million to 2 million tons per year was nearing completion at yearend. The explansion included modifications of the concentrator, and increases in production handling, power generation, and general transport capacities.

A shortage of manganese ore developed early in 1975 as a result of sustained demand from the world steel industry during the preceding 2 years. Tight supplies, cost increases, increased freight rates, and currency fluctuations caused substantial increases in the price of ore scheduled for delivery during 1975. The average price for high-grade lump ore from Groote Eylandt for sale to the United States during 1975 increased from $28.99 per ton in 1974 to $38.70 per ton f.o.b. No domestic price was quoted for manganese ore. Metallurgical-grade ore for local ferroalloy production was produced and consumed by subsidiary companies of BHP. Most of the ore for export was sold on a contract basis at prices negotiated annually.

The $29 million manganese expansion program by Tasmanian Electro Metallurgical Co. Ltd. of Tasmania was expected to be completed by yearend 1975. Major items to have been installed were a 24,000-kilovolt-ampere electric furnace to provide additional production capacity for manganese alloys, a sinter machine to process manganese ore feed, and a 39,000-kilovolt-ampere furnace for the manufacture of ferrosilicon. The existing plant at Bell Bay used for producing ferromanganese and silicomanganese consisted of two electric furnaces rated at 13,400 to 16,000 kilovolt-amperes.

Nickel.—The domestic nickel industry was characterized by rapid expansion and increased output in 1975. As a result of high production from the Greenvale mine in Queensland and the Windarra, Spargoville, and Redross mines in Western Australia, total mine production reached 75,000 tons, 61% above the 1974 level. Production would have been higher except for decreased output from the Great Boulder, Scotia, and Carr Boyd mines, in Western Australia. Several new mines experienced difficulties which prevented them from achieving planned production rates. Producers increased their quoted nickel prices from $2.01 to $2.20 per pound during the year, to match those announced by International Nickel Co. in 1975. The new prices did not apply to sales previously contracted until yearend 1976 and only applied to some new spot sales during the last quarter of 1975. Output by Western

Mining Corp. Ltd. (WMC), which produced about two-thirds of Australia's nickel, was 43,767 tons. Ore treated at the Kalgoorlie smelter, Western Australia, reached 1.4 million tons containing 2.92% nickel. Smelter capacity was increased during the year through the installation of an oxygen plant to enrich the furnace air. The installation of additional equipment to achieve a feed rate of 350,000 tons of concentrate per year was nearing completion at yearend.

The WMC's nickel refinery continued to operate at a high level of efficiency. Plant modifications and new equipment installation to lift capacity to 30,000 tons per year continued. A production rate of approximately 24,000 tons per year was reached by yearend.

Metals Exploration N.L. and Freeport of Australia Inc. were equal partners in Queensland Nickel Pty. Ltd., which was formed to mine and process ore from a large lateritic deposit of weathered serpentine at Greensvale, northern Queensland. Open pit mining commenced in 1974, with output being railed 216 kilometers to a new treatment plant at Yabulu, about 24 kilometers north of Townsville, Queensland. This project represented the only commercial production of nickel from a lateritic deposit in Australia. This $260 million plant had a rated capacity of 25 million tons per year. Reserves were estimated at 45 million tons of lateritic ore averaging 1.57% nickel and 0.12% cobalt.

Development work on the large nickel deposit at Agnew, Western Australia, proceeded as scheduled. Partners in the development were Western Selcast Pty. Ltd. and MIM Holdings Ltd. Reserves totaled 47 million tons of ore, containing 2% nickel and a side deposit of 1.5 million tons, averaging 4% nickel. The large low-grade deposit was a vertical cylinder close to a sloping layer of higher grade ore. The first-stage operation, scheduled for 1978, was to concentrate on the high return extraction of the sloping layer to produce 10,000 tons per year in a 12% nickel concentrate before a final decision was made to continue with large tonnage extraction of the lower grade reserves. A concentrating plant and flash smelter were to be constructed at the mine site.

Anaconda Australia Inc., a subsidiary of the U.S.-based The Anaconda Co., held a 60% interest in a joint venture with Conzinc Riotinto (26⅔%) and AM&S (13⅓%), which controlled nickel deposits at Redross. Widgiemooltha, and Wannaway, south of Kalgoorlie, Western Australia. The company treated 182,000 tons of ore, producing 6,300 tons of nickel in 1975. Reserves at Redross were about 1 million tons with an average nickel content of 3.5%. Endeavour Oil Co. N.L. announced additional intersections of nickel sulfide mineralization at its Digger Rocks prospect at Forrestania, Western Australia, which was jointly owned by AMAX (70%) and Endeavour (30%). The most recent estimate placed probable ore reserves at Digger Rocks at 3 million tons averaging 1.11% nickel, with possible reserves of 1 million tons averaging 0.94% nickel. These reserves are minable by open pit, but further reserves were known to exist at greater depth. At the more southernly ore body, probable reserves were 2.16 million tons averaging 1.45% nickel.

Silver.—Domestic production of silver in 1975 increased 9% because of an increase in output of lead-zinc ores. Most of the silver produced was won as a byproduct of lead-zinc mining operations at Mount Isa, Broken Hill, and Rosebery in Tasmania. The metal was also produced as a byproduct of gold and copper mining at other locations in Australia. Mount Isa Mines Ltd. was the largest domestic mine producer. In 1975, 2.5 million tons of lead-zinc ore averaging 5 troy ounces of silver per ton of ore were milled to yield over 11 million troy ounces of silver. Silver was also produced as a byproduct of copper-lead-zinc mining at Mount Isa. All lead concentrate was smelted at the mine site to lead bullion, which was exported to the United Kingdom for refining and extraction of the contained silver. The zinc concentrate was exported, and silver contained in the copper concentrate was recovered at the Townsville electrolytic copper refinery as anode slimes. Electrolytic Refining & Smelting Company of Australia Pty. Ltd. recovered about 1.6 million troy ounces of silver from Cobar and Mount Lyell copper concentrates, tankhouse slimes from the electrolytic copper refinery at Townsville, mint sweepings, jewellers scrap and scrap copper.

Total production of silver at Broken Hill continued a downward trend because an increasing proportion of ore was being mined from the zinc-rich lodes; these lodes averaged about 3 troy ounces of silver per ton, compared with about 7 troy ounces per ton for the lead-rich lodes. Most of the silver produced at Broken Hill was contained in lead concentrates, which were treated at BHAS's lead refinery at Port Pirie in South Australia. Silver was mined at Rosebery in Tasmania as a byproduct of copper-lead-zinc mining operations conducted by the EZ Co. In 1975, the company treated 505,200 tons of ore averaging 6 troy ounces of silver per ton and produced 2.4 million troy ounces of silver.

Principal producers of silver and output, in thousand troy ounces, during 1974 and 1975 were as follows:

Commodity	Quantity	
	1974	1975
North Broken Hill Ltd	3,140	2,925
Zinc Corp. Ltd	1,936	1,753
New Broken Hill Consolidated Ltd	1,424	1,559
Mount Isa Mines Ltd	8,896	11,008
Electrolytic Zinc Co. of Australasia Ltd	2,571	2,468

Tin.—The downward trend in domestic production of tin-in-concentrate continued in 1975 when production was 8% lower than that in 1974. Smelter production of primary refined tin decreased more than 21% from that of 1974. Output was affected by continued low domestic consumption, and, for a portion of the year, by export controls imposed by the International Tin Council (ITC). The ITC, of which Australia was a producer member, imposed restrictions on exports from April to July. This had the effect of reducing exports from Australia approximately 18% for that period. In addition, domestic consumption was substantially below that of previous quarters so that the effect on sales was a curtailment of approximately 30% during the period of restrictions.

The largest tin producer in Australia, Renison Ltd., in 1975 treated 459,646 tons of ore and 6,368 tons of high-grade concentrate and 3,105 tons of low-grade concentrate at its plant in Tasmania. Concentrator throughput increased by 63,805 tons compared with 1974, but the head grade was down to 1.25% tin compared with 1.46% tin for the previous year. Overall recovery of tin metal in concentrates was 68.8% compared with 69.2% in 1974. Tin metal in concentrates was 3,910 tons, 41 tons lower than that of 1974. Construction of a heavy-media separation plant was completed in December 1974 and commissioned in January 1975. Combined proved and probable reserves decreased 247,400 tons after allowing for depletion by mining, but the proved reserves increased by 1 million tons.

Cleveland Tin N.L. produced tin and copper from its mine at Luina in northwest Tasmania. Some 325,120 tons of ore, with head grades of 0.75% tin and 0.25% copper, were treated to produce 1,270 tons of tin-in-tin concentrate and 71 tons of tin-in-copper concentrate. The increasing proportion of mined ore containing finer grained tin led to treatment problems and a 4.5% decline in recovery of tin. Indicated ore reserves totaled some 2.6 million tons averaging 0.8% cassiterite and 0.4% copper.

Ardlethan Tin N.L. milled 456,708 tons of ore with a head grade of 0.57% tin. Tin metal in concentrate produced was 1,310 tons, representing an average recovery of 62%. All mining during the year was from the Ardlethan West pit. Minable reserves totaled 2.5 million tons of indicated ore with an estimated average grade of 0.62% tin.

The following tabulation summarizes production of tin-in-concentrate from the principal tin producers in 1974 and 1975, in tons:

Company	Quantity	
	1974	1975
Alberfoyle Tin Co. N.L	427	412
Ardlethan Tin N.L	1,519	1,310
Cleveland Tin N.L	1,494	1,270
Gibsonvale Alluvials, N.L	447	352
Greenbushes Tin N.L	706	438
Loloma Ltd	113	343
Metals Exploration N.L	185	205
Ravenshoe Tin Dredging Ltd	498	254
Renison Ltd	3,951	3,910
Tableland Tin Dredging N.L	425	409

Titanium Concentrates.—While the domestic production of mineral sand concentrates was 7% over that of 1974, the large increases previously predicted did not materialize. The attractive market and record prices for mineral sands of 1974 were replaced in 1975 by oversupply, reduced demand, and weakening prices. The overall economic recession and its adverse effects, particularly on the pigment and steel industries, resulted in the deferment and, in some cases, cancellation of deliveries of mineral concentrates. Domestic producers postponed some expansion programs and cut their levels of output. Also, some new projects did not meet construction schedule deadlines nor achieve rated production capacities.

In February, the Western Australia Minister for Mines issued a statement which included a new estimate of reserves in the State, totaling 72.9 million tons of heavy sands. Geographically, 33.7 million tons were in the Eneabba District, 29.5 million tons in the Capel District, and 9.7 million tons at other scattered locations. The total included 46.9 million tons of ilmenite, 3.5 million tons of rutile, 9.8 million tons of zircon, and 12.7 million tons of other minerals.

In the Capel District, producers included Western Titanium Ltd., Westralian Sands Ltd., Cable Sands Pty. Ltd., Western Mineral Sands Pty. Ltd., and Mid-East Minerals. In the Eneabba District, Jennings Mining Ltd. and Allied Eneabba Pty. Ltd. came into full production during the last half of 1975, Western Titanium was building a plant to begin operation in 1976, and a fourth company, Ilmenite Pty. Ltd., while holding mineral lands, was inactive. At Jurien Bay, WMC Mineral Sands engaged in shakedown operations of its new plant. The joint venture of Westralian Sands and Lennard Oil N.L. at Gingin was inactive pending market improvement.

Western Titanium's new plant in the Eneabba area was expected to be in full production early in 1977, and then was to produce 150,000 tons of ilmenite, 30,000 tons of rutile, and 70,000 tons of zircon per year. The company was 85% owned by Consolidated Gold Fields of Australia.

In 1974, Westralian Sands introduced a new product, HYTI 68, an ilmenite-leucoxene concentrate containing 68% TiO_2.

Jennings Mining Ltd. reached capacity production about midyear, after some early difficulties. Annual production of 40,000 tons of rutile, 160,000 tons of ilmenite, and 30,000 tons of zircon was scheduled.

Allied Eneabba, owned 25% by E. I. Du-Pont de Nemours & Co., Inc., began operations in August. Reserves were estimated at 7.75 million tons proven and 27.73 million tons of probable sands. Fluor Australia Pty. Ltd. contracted for plant construction and housing.

Late in 1974, Western Mining Corp. exercised its option on the Jurien Bay heavy mineral deposit owned by Black Sands Ltd. and began building a mining and concentrating plant. The company, jointly with Mitsubishi Chemical Industries, was also considering construction of a synthetic rutile plant at the mine site.

Western Titanium produced 31,689 tons of synthetic rutile at its new 35,000-ton plant in its 1974 fiscal year. The company closed its older 13,400-ton plant because of weakening demand, rising costs, and delayed official approval for exports. The plant had produced 10,345 tons of synthetic rutile in its 1974 fiscal year.

Rutile and Zircon Mines (Newcastle) Ltd. announced a joint feasibility study with Akzo Zout Chemie of the Netherlands for upgrading ilmenite by a new high-temperature chlorination process. A pilot plant at Mt. Morgan, Queensland, was to be used.

DM Minerals, a joint venture of Murphyores Ltd. and Dillingham Corp. of Australia Ltd., began operation of its mining plant on Fraser Island, offshore Queensland, during the year. Environmental groups, to some extent supported by the Australian Government, continued to oppose the mining operation.

Uranium.—There had been no mining of uranium in Australia since 1964. Work started on the rehabilitation of the Mary Kathleen mine in Queensland early in 1975, and mining was expected to resume in mid-1976. Development and construction plans for a new mine and plant at the Ranger prospect in the Northern Territory were announced in 1974. This construction was to be subject to the completion of an environmental impact inquiry which commenced during the year. The proposed mill at Ranger was to have a designed capacity of about 2,540 tons of uranium per year. Initial production was planned for 1979.

The Mary Kathleen mine, closed since 1963, was to supply contracts calling for the delivery of 4,740 tons of U_3O_8. The first delivery was to be made in late 1976. The production rate was expected to be about 900 tons of U_3O_8 per year. Mary Kathleen Uranium Ltd. issued shares, underwritten by the Australian Government, to raise $17 million for the redevelopment. The shares were not fully subscribed to, which resulted in the Australian Atomic Energy Commission obtaining a 41.6% interest in the company, with CRA retaining its original 51% interest. The open pit mine had estimated reserves of 7.700 tons of U_3O_8.

Exploration work in recent years has proven large reserves of uranium in Australia. The Alligator River area, Northern Territory, has emerged as a major world uranium province. Four major deposits located in the area were Jabiluka, Ranger, Nabarlek, and Koongarra. Other deposits of significance were found in the Westmoreland area in Queensland, Lake Frome in South Australia, and Yeelirrie in Western Australia. Australia's reasonably assured reserves, of recoverable uranium at less than $30 per pound, were estimated at 430,000 tons U_3O_8.

NONMETALS

Phosphate Rock.—Phosphate rock production commenced in northwest Queensland during the year. The operating company, Queensland Phosphate Pty. Ltd., a wholly-owned subsidiary of Broken Hill South Ltd. (BH South), announced that in the initial development of the mining area at Duchess, 700,000 cubic meters of overburden had been removed to expose 50,000 tons of phosphate rock, 10,000 tons of which was mined and stockpiled. A crushing and screening plant was also commissioned. The product was hauled by road to Duchess for railing to Townsville, Queensland. An agreement was concluded with Queensland Railways for the rail line to be extended to the plant site. Orders for rolling stock placed by Queensland Railways included 11 locomotives and 270 cars, which were considered sufficient for the initial planned production rate of 1 million tons per year. The company anticipated an increase in production rate to 3 million tons per year by yearend 1977.

Prior to production, full-scale plant tests for the manufacture of superphosphate were arranged by the Australian Fertilizers Manufacturers Committee. Pilot plant tests were also carried out by Australian Fertilizers Ltd. for the manufacture of phosphoric acid using the dihydrate and hemihydrate/dihydrate processes. Results of these tests confirmed the suitability of the Duchess rock for this purpose. There was a strong demand for phosphates in southeast Asia and Australasia, and BH South planned to sell any surplus output under long-term contracts. Discussions were also continued with the Australian Government on exporting phosphate not required for the Australian market.

Total reserves exceeded 2 billion tons of phosphate rock grading 17.5% P_2O_5, of which approximately one-third lie in a northern and central group of deposits. The remainder, some 1.3 billion tons, was mainly at the Duchess deposit in the Cloncurry District, about 230 kilometers south of Lady Annie. The Duchess deposits consist of three main zones of measured reserves. The phosphate Hill zone in the south contained 315 million tons of 18.3% P_2O_5. Within this zone, 40 million tons with a grade in excess of 31% P_2O_5 can be classed as direct shipping rock.

Australian phosphate rock was to be supplied to the Republic of Korea under a 5-year, $15 million contract negotiated by Gollin Ltd. The rock was to be exported from BH South's deposit at a rate of 40,000 tons the first year, increasing to 100,000 tons per year by the end of the contract.

Salt.—Australia's salt production of 5 million tons in 1975 was 1% higher than the 1974 output of 4.9 million tons. Most of the production (84%) came from Western Australia and virtually all was exported, mainly to Japan. Ideal conditions exist in the State for the production of salt by solar evaporation of seawater, or by harvesting from naturally occurring brine in salt lakes. All domestic salt production was obtained by these processes.

Leslie Salt Co. at Port Hedland, Western Australia, reported a salt output of 1.04 million tons from 16 crystallizer ponds. Harvesting was a year-round operation performed on a 10- to 12-hour-shift basis, 5 days per week. The company reported that new markets were established in the Philippines and the Republic of South Africa; established markets in Japan, Korea, New Zealand, and Taiwan were also supplied. Production capacity was approximately 2 million tons per year.

Dampier Salt Ltd. reported a production of 1.5 million tons of salt from Mistaken Island, Western Australia, during 1975. Production was from 30 crystallizer ponds. The company reported that final plans were made to equip the salt field for an annual production capacity of 2.4 million tons. Texada Mines Pty. Ltd. reported salt production of 1.53 tons in 1975 from the company's plant at Cape Cuvier, 24 kilometers west of Lake McLeod, Western Australia. Approximately 4,446 acres of evaporation pans were constructed on the southern section of the lake, of which about 2,470 acres were used for sodium chloride production and the remainder for langbeinite ($K_2Mg_2(SO_4)_3$) production. Ownership of the operating company changed during the year. In 1974, C. Itoh & Co. acquired a one-third interest in Texada Mines through a transfer of shares from the U.S. parent company, Southern Cross Mines Ltd. C. Itoh increased its shareholding in 1975 to 80% through a second transfer of shares from Southern Cross. Lefroy Salt Pty. Ltd. produced 110,000 tons of salt from operations at Lake Lefroy, Western Australia, in 1975, compared with 94,365 tons in 1974. A large washing plant was installed during the year and plans were made to construct additional facilities to raise total washing capacity to 500,000 tons per year.

Sulfur.—Sulfur was one of the few minerals in short supply in Australia during 1975. Sulfur was consumed mainly as sulfuric acid to produce fertilizer, particularly superphosphate. There were no known deposits of elemental sulfur in Australia, and more than half of the total annual production of sulfuric acid in previous years came from imported brimstone. In 1975, about 70% of sulfuric acid production was from imported brimstone and 30% from indigenous raw materials, principally zinc, pyrite, and lead concentrates. Elemental sulfur was recovered from petroleum by Petroleum Refineries (Australia) Pty. Ltd. at Altona, Victoria, and Hallett's Cove, South Australia; Shell Chemical (Australia) Pty. Ltd. at Clyde, New South Wales, and Geelong, Victoria; Australian Oil Refining Pty. Ltd. at Kernell, New South Wales; and Amoco (Australia) Pty. Ltd. at Bulwer Island, Queensland. The combined capacity of the plants was about 52,000 tons per year of elemental sulfur.

Pyrite for sulfuric acid manufacture was produced only as a byproduct of base metal mining in Tasmania by EZ Co. and the Mount Lyell Mining & Railway Co. Ltd. The acid was produced at Burnie, Tasmania, by North-West Acid Pty. Ltd., a company jointly owned by the two pyrite-producing companies. Mount Lyell Mining & Railway Co. Ltd. reported production of 108,045 tons of pyrite concentrate and shipments to North-West Acid Ltd. of 105,659 tons of concentrate in 1975. EZ shipped 113,503 tons of concentrate, and acid production by North-West Acid in 1975 was estimated at about 200,986 tons.

MINERAL FUELS

Coal.—Australia's coal production (black coal, exclusive of lignite) increased 6% over the record output in 1974. The main contributions were from the Singleton-Northwest and Western Districts of New South Wales, where coal production increased 34% and 21%, respectively, and from the Bowen Basin in Queensland where Peak Downs mine, owned by the Utah Development Co. Ltd. (UDC), increased production 38%. UDC's new Saraji mine began operating at full capacity early in 1975. In terms of salable coal prepared for market, the Australian total was 66.9 million tons, of which 40.1 million tons came from New South Wales and 22.7 million tons from Queensland. About 60% of Australia's coal output was mined by open pit methods; the remainder came from underground mines.

Despite adverse factors, consumption of coal in Australia increased 9.1%, to 30 million tons during 1975. These factors were the reduced level of economic activity in many Australian industries, and industrial problems in the power-generating industry. There were no difficulties in supplying the types and qualities of coal required by some consumers. In Western Australia, Queensland, and New South Wales coal consumption increased sharply. In Victoria, an increase in consumption was attributed to lignite (brown coal).

Coal production in New South Wales increased sharply in 1975 in contrast to a reduction in 1974. The capacity of the industry in New South Wales increased as the number of employees rose and as previous plans to take advantage of expanding markets began yielding results. The plans were developed or accelerated following the oil crisis late in 1973. Raw coal production was 42.3 million tons, 5.7 million tons more than in 1974. Both underground mines and open pits contributed about equally to the improvement in 1975. There were 84 mines in production late in 1975. In addition, developmental work was proceeding at West Cliff, Macquarie, Tower, Cordeaux, and Tahmoor. Planning for several other projects was well advanced. BHP was the principal producer in New South Wales. The company operated four mines in the Newcastle District, while its subsidiary, Australian Iron and Steel Pty. Ltd., operated seven collieries in the Southern Coalfields.

The combined output of about 8 million tons of coal per year made BHP the largest producer of underground coal in Australia. Clutha Development Pty. Ltd. operated 12 coal mines in New South Wales. Eight underground mines were in the Burragorang Valley in the southern coalfields. and three open pit and one underground mine were in the Northwestern coalfield. Coal production from the 12 mines increased from 6.2 million tons in 1974 to 6.4 million tons in 1975.

The major coal producer in Queensland was UDC. UDC produced from rich beds in the Fitzroy River Basin and Bowen Basin in central Queensland. In 1975, UDC operated open pit coal mines at Blackwater, Goonyella, Peak Down, and Saraji. Feasibility studies were underway for a fifth pit, also in the Bowen Basin. The combined output from these operations totaled some 13.8 million tons in 1975. UDC also operated one of the world's largest port facilities for coal export. Through a subsidiary company, Hay Point Services Pty. Ltd., UDC exported about 12.5 million tons of high-quality coking coal, principally to Japan and Europe. Another major Queensland coal producer was Thiess Peabody Mitsui Coal Pty. Ltd. (TPM), which operated underground and open pit mines in the Kianga and Moura coalfields and supplied about 4 million tons of coking coal to Japan in 1975. Coal was also supplied to the domestic market.

Employment in the coal industry increased during 1975, and throughout the year there were few vacant positions in the mining districts. An increase of 1,284 workers lifted total coal industry employment in New South Wales to 14,988. This was the highest level since 1958.

Total measured and indicated reserves of coal in Australia, excluding lignite, were about 200 billion tons, mainly in New South Wales and Queensland. Efforts by nations to lessen dependence on Middle East crude oil for energy needs should ensure increasing development of these deposits. The Joint Coal Board reported output, by States, as follows, in thousand tons:

State	1973	1974	1975
Queensland	19,975	21,085	22,760
New South Wales	37,882	38,703	40,152
Tasmania	115	127	162
South Australia	1,510	1,671	1,751
Western Australia	1,171	1,446	2,114
Total	60,653	63,032	66,939

Domestic consumption of black coal in recent years were as follow in thousand tons:

	1972	1973	1974
Iron and steel	8,948	8,981	9,606
Electricity	13,874	14,787	16,253
Railways	33	15	13
Town gas	131	124	124
Cement	899	862	1,031
Metallurgical coke	473	393	478
Other (including bunkers)	2,303	2,521	2,685
Total	26,661	27,683	30,190

Lignite.—Victoria was Australia's only producer of lignite. In 1975 output was 28.2 million tons. Over 95% of the State's production was from the operations of the State Electricity Commission (SEC) at Yallourn and Morwell open pit mines in the Latrobe Valley. Small quantities were produced by Alcoa at Anglesea to supply its own power station, and by Maddingley Brown Coal Co. at Bacchus Marsh. The SEC planned to develop another major mine at Loy Yang in the Latrobe Valley.

Victoria had proven reserves of 66.7 billion tons of lignite, of which 64.9 billion tons were in the Latrobe Valley. In the Latrobe Valley, 30 billion tons had less than 90 meters of overburden. However, a number of factors, including the existing townships, indicate that only about 12.2 billion tons could be developed economically using known mining techniques. At Gelliondale, south of Yallourn, near the coast, International Oils Exploration N.L. held leases on lignite deposits estimated at 1.3 billion tons. One area of the 8-kilometer-long, coal-bearing belt contained 130 million tons, minable by open pit methods, but high-sulfur content makes the coal unsuitable for use as a fuel. The company planned to use a process developed by the Commonwealth Scientific Industrial Research Organization for producing high-grade industrial carbons from the coal.

Petroleum and Natural Gas.—Responding to growing domestic demand, Australian petroleum and natural gas producers set new records in 1975. Crude oil production during the year totaled 150 million barrels (410,628 barrels per day), 6.4% higher than that for 1974. Most of the oil was produced by BHP and Esso Exploration & Production Australia Inc. from the Bass Straight Fields, offshore Victoria, where production totaled 136.4 million barrels, averaging 374,000 barrels per day.

Production from both Moonie, Queensland, and Barrow Island, offshore Western Australia, continued to decrease during the year. Queensland production decreased 23.5% to 460,000 barrels (1,260 barrels per day) while Western Australian production dropped 8.6% to 13,177,400 barrels (36,102 barrels per day). These two States accounted for 0.3% and 8.7%, respectively, of total Australian production. Studies of the Gippsland Basin Field, offshore Victoria, continued throughout the year, and recovable reserves were estimated at 2 billion barrels of liquid hydrocarbons and 7.5 trillion cubic feet of natural gas.

Work was started on development of the Mackerel and Tuna oilfields, offshort Victoria. Production from these fields should begin in 1977 and 1978, respectively. BHP and Esso were granted production licenses for the Snapper and Flounder Fields, also in the Gippsland Basin, during the year. Construction of the No. 2 gasplant at Longford and the third process train of the fractionation plant at Long Island Point was in the final stages. Commissioning of both plants was expected early in 1976. The gasplant, which cost $30 million, doubled gas-processing capacity at Longford and should supply Victoria's requirements until the early 1980's.

There was an overall 15% decrease in exploration drilling activity in 1975, directly attributable to a 30% decline in offshore activity. Total exploration expenditures for oil and gas activities and development drilling during 1975 amounted to $121 million compared with $130 million in 1974. This drilling, including uncompleted holes, totaled 136,815 meters. Onshore development drilling increased slightly with renewal of the development program in the Copper Basin in Queensland.

The Tuna and Mackerel Fields were scheduled for production in 1977 and 1978, respectively. Operations involved the building and installation of a drilling and production platform in each field and the laying of the necessary submarine pipelines to connect the fields to the existing pipeline system. The platforms were being fabricated, and pipelaying operations commenced during the year. Industrial problems, however, caused delays, and it was estimated that work was about 5 months behind schedule at yearend. Crude oil production from the Tuna and Mackerel Fields will help to maintain the Gippsland supply level, as oil production from the Barracuda, Halibut, and Kingfish Fields declines.

Input of crude oil and other feedstock to Australia's 12 refineries totaled 209.2 million barrels. Domestic crude oil supplied 71.2% of this total. The remainder was imported, mainly from Saudi Arabia, Kuwait, and Iraq. Consumption of petroleum products during 1975 totaled 265 million barrels. Motor gasoline (98 million barrels) and fuel oil (48 million barrels) accounted for 55% of total consumption. Refinery product imports for the year total 83.3 million barrels, of which fuel oil, at 13.9 million barrels, was 12.9% lower than in 1974. Exports of refinery products increased 16.9% to 27.1 million barrels. Liquefied petroleum gas, totaling 130 million barrels, was the main export product.

The Mineral Industry of Austria

By William F. Keyes [1]

The Austrian economy suffered its deepest recession since the end of World War II in 1975. The effects, however, were not as severe as in the United States or many other industrialized countries. Real gross national product (GNP) declined about 2%, the first decline in 30 years, and it was forecast that antirecessional government spending and reduced revenues would produce a record government deficit in the following year (1976). Production and value of many of the major minerals were included in the general decline, among them those of aluminum, copper ore, iron ore, iron and steel, and magnesite; production of lead, zinc, and graphite increased slightly.

Austrian output of minerals, metals, and associated products was valued at around \$3 billion [2] in 1975 and accounted for about 8% of the GNP of \$37.57 billion. This figure included the products of the mining, fuels, iron and steel, and other metallurgical industries.

The fundamental mining law of Austria was revised as of October 1, 1975, and was thereafter known as Berggesetz 1975 BGBl. Nr. 259; it replaced Berggesetz 1954 BGBl. Nr. 73, as amended. Minerals were divided under both laws into *bergfrei*, which are open to prospecting and mining with permit; *bundeseigen*, which are the property of the nation; and *grundeigen*, which belong to the owner of the land. Among changes in the 1975 law were the inclusion of uranium and thorium ores specifically in the bundeseigen category; others in this category were hydrocarbons and saline deposits. Chief minerals in the bergfrei category continued to be metallic ores; the grundeigen category included chiefly magnesite and dolomite, as well as clays and nonmetallic minerals. Caverns for storage of hydrocarbons also came under the new law.

PRODUCTION

Austrian minerals production in 1975 was of only domestic significance, except for magnesite, of which it contributed about 13% of world production. Mine production of lead-zinc, copper, iron ore, coal, petroleum, and natural gas, supplemented by imports, supplied much of domestic consumption and permitted the operation of one or more refineries for each mineral. As a percentage of world production none of these minerals reached 1%; production of most was under 0.5% of world production.

1 Germanic acid.
2 Excludes clay sand.
3 Less than ½ unit.
4 Excludes stone used by the cement and iron and steel industries.
5 Includes blast furnace and coke oven gas. Manufactured gas is reported in source as gas having a caloric value of 4,200 calories per cubic meter. (One cubic meter equals 35.3145 cubic feet.)

TRADE

Austria was an exporter of a number of domestically produced minerals, including magnesite, graphite, and antimony; tungsten ore was also soon to be added to the list again. Of these, only magnesite was of importance in terms of world trade.

Net imports included crude minerals for local smelting to supplement the small domestic production. Among them were lead, copper, alumina, iron ore, and coal and coke.

COMMODITY REVIEW

METALS

Aluminum.—Two producers of aluminum from imported alumina comprised the Austrian industry in 1975, as follows:

Company	Location	Ownership	Capacity (tons per year)
Salzburger Aluminium GmbH (SAG).	Lend, Salzburg Province.	Swiss Aluminium, Ltd., (Alusuisse), 100%	12
Vereinigte Metallwerke Ranshofen-Berndorf AG (VMRB).	Ranshofen, Braunau-am-Inn.	Austrian Government, 100%	80

VMRB's plans to increase annual capacity from 80,000 to 130,000 tons were indefinitely postponed. Instead the company acquired one-third participation in Aluminiumhütte Hamburg, in West Germany, and was to receive 30,000 tons of aluminum per year from this source to supply its fabricating plants. VMRB obtained its alumina largely from the plants of Gebrüder Giulini GmbH at Ludwigshafen and Vereinigte Aluminium Werke AG at Stade, both in West Germany.

SAG cancelled plans to expand capacity from 12,000 to 28,000 tons per year by 1976, because of high electricity costs. The firm obtained alumina during the year from plants partly owned or operated by Alusuisse in Guinea, Australia, Italy, and West Germany.

Antimony.—The small production of antimony (stibnite) continued at the mine at Schlaining, near Oberwart, Bürgenland Province, owned and operated by Bleiberger Bergwerks–Union AG. Concentrates were exported for smelting and refining.

Copper.—Austria's only producer of copper ore in 1975 was the mine at Mühlbach am Hochkönig, Salzburg Province, operated by Kupferbergbau Mitterberg GmbH, a corporation owned by the Austrian Government. Concentrates from the mine were treated at the smelter and electrolytic refinery of Montanwerke Brixlegg GmbH, at Brixlegg, Tirol Province, which was a division of the Austrian Government-owned aluminum producer, VMRB. Most of the feed to Brixlegg was, however, provided by scrap and imported blister.

Work continued in 1975 on expansion of the Mühlbach mine from a capacity of 250,000 tons of ore per year to 330,000 tons (of about 1.5% copper content). Expansion at Brixlegg was also slated to raise smelter capacity to 18,000 tons per year and refinery capacity to 30,000 tons per year.

Iron and Steel.—Domestic iron ore production declined at three mines owned by the nationalized steel company, VÖEST-Alpine Montan AG (VAM). The largest of these, the Erzberg mine, located 20 kilometers northwest of Leoben, Steiermark (Styria) Province, produced around nine-tenths of the total of about 3.8 million tons of ore, containing about 31% iron. The nearby Radmer mine and the Huttenberg mine, further south in Kärnten (Carinthia) Province, each contributed half the remainder.

Imports, largely from Brazil and the U.S.S.R., were added to domestic ore and smelted at the two major pig iron-ingot steel plants at Linz, in Upper Austria on the Danube, and at Donawitz in Styria, near Leoben. Steel production also declined about 15% to around 4 million tons as a result of low demand.

In the 5-year period from 1975 to 1979 the iron and steel industry planned to spend a total of about $1 billion for capital improvements. New facilities to be installed at Linz were a sixth blast furnace of 5,500-ton-per-day capacity, a rolling mill, a continuous casting plant for the production of billets, a wire mill, and a seamless pipe mill. The trend towards replacing open-hearth capacity with basic oxygen furnaces was to continue.

In mid-1975, retroactive to January 1, 1975, the merger of three individual nationally owned specialty steel producers took place. Boehler Brothers, Schoeller-Bleckmann, and Steirische Gusstahlwerke were renamed "Vereinigte Edelstahlwerke AG" (VEW), which like its predecessors was a subsidiary of VAM.

Lead and Zinc.—All domestic mine production of lead and zinc was from the operations of the Bleiberger-Bergwerks-Union AG (BBU), an Austrian Government corporation operating at Bleiberg-Kreuth, Kärnten (Carinthia) Province, near the Italian border; the mine provided most of the domestic zinc consumption but only a quarter of lead requirements. Concentrates from the mine were treated at the nearby lead smelter and zinc refinery at Gailitz-Arnoldstein. The smelter processed lead concentrates from Italy on toll to supplement the Austrian concentrate.

Exploration continued at an intensive pace at Bleiberg-Kreuth, although no major additions to the ore body were announced. At Arnoldstein the electrolytic zinc plant, established in 1955 with a capacity of 10,000 tons per year, was to be expanded from 17,000 to 22,000 tons capacity by 1977.

Tungsten.—Mining and concentrating of tungsten ore were resumed in 1975; previously tungsten ore had been produced in Austria from 1957 to 1971 at Hinter Tux, Tirol Province, southeast of Innsbruck. Scheelite occurrences are frequent in the Austrian Alps.

The new mine and mill, located at Mittersill, Salzburg Province, were operated by Wolfram GmbH, owned by the Austrian steel combine VAM (47.5%), Metallgesellschaft AG of West Germany (47.5%), and a U.S. firm, Teledyne, Inc., of Los Angeles (5%). Total investment was estimated at $30 million.

Production at the Mittersill mine was due to reach 1,000 to 1,200 tons per year of WO_3 in scheelite concentrate from ore containing about 0.6% to 0.7% WO_3. For the first 5 years of operation the ore will be produced by open pit mining; in subsequent years underground mining will be employed. Reserves are reported to be about 2.5 million tons of ore, sufficient for about 15 years of operation at the planned rate.

The scheelite concentrates were to be converted to tungsten powder and carbide in a plant situated in Poelfing-Bergla, Steiermark (Styria) Province, south of Graz, on the site of an abandoned coal mine. This plant was due to start operations late in 1976.

Uranium.—Under the new mining law that took effect on October 1, 1975, uranium and thorium ores became property of the Federal Government.

There was no production of uranium in Austria, but exploration for uranium ore was underway in two areas. At Forstau, near Schladming, Salzburg Province, Bergbau und Mineral Gesellschaft Pryssok & Co. KG had proven reserves of about 1,600 tons of U_3O_8, and estimated reserves were set at several thousand tons. At Mitterberg, Kupferbergbau Mitterberg located uranium ore bodies in its copper mine and conducted experiments in leaching the ore.

Although average uranium content of Austrian ores was low (500 to 800 grams per ton), the Government expected that mining them would become economic in time. It was planned to establish a uranium mining company, to be controlled by Österreichische Industrieverwaltungs AG (ÖIAG), which is the Government's industrial development agency, by other Government agencies, and by Pryssok.

NONMETALS

Graphite.—Three localities yielded graphite. Two of these sites, both owned by Graphitbergbau Kaiserberg Franz Mayr-Melnhof und Co., were in the Styrian Alps, west of Leoben—the Kaiserberg mine, the largest, at St. Stefan ob Leoben, near St. Michael, and the Trieben mine at Hohentauern. In Mühldorf, Lower Austria, near Spitz, west of Vienna, graphite was recovered from old tailings.

Magnesite.—Six magnesite mines continued to operate during the year, but production fell off because of lower demand for refractories from the European steel industry.

Of the two large producers, the larger was the Österreichisch-Amerikanische Magnesit-Aktiengesellschaft (ÖMAG), controlled by General Refractories Co. of the United States. ÖMAG had three mines: Radenthein, in Carinthia, where the main plant was located; Hochfilzen, the largest mine, in the Tirol; and the Tux mine, at Mayrhofen, also in the Tirol. The other large producer, Veitscher Magnesitwerke AG, controlled by Magnesia AG of Switzerland, operated three mines in Styria: Hohentauern near Trieben, Breitenau near Mixnitz, and Oberdorf near St. Katharein a.d. Laming, which was operated by a subsidiary, the Steirische Magnesit-Industrie AG.

MINERAL FUELS

Energy.—Austria produced over one-third of its energy from domestic sources in 1974. Domestic production of petroleum, natural gas, and hydroelectric power contributed about equally to the supply, and the country was a net exporter of electrical energy. Consumption of about 31 million tons of standard coal equivalent corresponded to about 4 tons per capita, compared with about 12 tons per capita in the United States. One-half of imported energy consisted of petroleum, mainly crude, from the Middle East and eastern Europe; the remainder was in the form of coal and coke from eastern Europe and natural gas from the U.S.S.R. An energy balance for 1973 and 1974 is presented in table 4.

Coal and Coke.—Production of coal in Austria declined to 3.4 million tons in 1975, compared with 3.6 million in 1974 and a peak of 7 million in 1957. About one-sixth was classified as Glanzkohle, and the rest as Braunkohle, all being commonly referred to as brown coal or lignite.

The largest producer, with over 70% of the output, was the Graz-Köflacher Eisenbahn und Bergbaugesellschaft, which operated seven mines in Styria, in the area between Leoben and the Italian border. Other producers in Oberösterreich (Upper Austria), with five mines between them, were Wolfsegg-Traunthaler Kohlenwerks AG and Salzach-Kohlenbergbau GmbH. All were nationalized concerns.

Overall, in addition to its domestic lignite production, Austria imported lignite, coal including coking coal, and coke. The national steel company, VAM, was considering in 1975 the possible advantage of acquiring an interest in a U.S. mining operation to assure a long-term supply of coking coal and to diversify sources of supply. Present import contracts were to run until about 1984, so that time remained for careful consideration of future supply sources.

Petroleum and Natural Gas.—Austria had a modest production of crude petroleum and natural gas in 1975, both of which, however, supplied a significant part of its energy requirements. The major producer was the Österreichische Mineralölverwaltung AG (ÖMV), a government corporation, operating largely in the Matzen-Auersthal and other fields in the Vienna basin northeast of Vienna. Smaller producers were Rohoel-Aufsuchungs GmbH (RAG) and Tiefbohrunternehmen Richard K. van Sickle. ÖMV and RAG also operated in Oberösterreich (Upper Austria) Province.

The only petroleum refinery in Austria was operated by ÖMV at Schwechat, in the southeast suburbs of Vienna. Capacity of this plant reached 280,000 barrels per calendar day in 1975.

Reserves of petroleum were reported[3] to be 167 million barrels at yearend 1975. Reserves of nonassociated gas were estimated at 14,200 million cubic meters at the beginning of the year.

A third Austria-Soviet Union natural gas contract was signed in August, providing for total Soviet gas deliveries of at least 2,500 cubic meters annually until the year 2000. Soviet authorities also indicated willingness to supply 250 million to 500 million cubic meters of gas annually to help bridge possible gaps between 1975 and 1978 when deliveries under the second and third contracts begin. Austria will in turn supply the Soviet Union with at least 1 million tons of steel pipe.

The Mineral Industry of Belgium and Luxembourg

William F. Keyes [1]

Belgium in 1975 suffered the worst recession in over 20 years. Real gross national product (GNP) shrank 1.4% to $60.57 billion;[2] industrial production, including minerals, dropped almost 10%; and exports, which account for about half of Belgian GNP, were down 4% in current terms. The 12-month average unemployment rate rose from 4.4% in 1974 to 6.8% in 1975, and reached 8.7% by yearend. Inflation proceeded at an annual rate of 11%, higher than that of Belgium's chief European neighbors; oil, grain, and other commodity price increases over the preceding 2 years had led immediately to wage increases, which in Belgium were tied (indexed) to the cost of living.

During the year expansion continued at a copper smelter, expansion of one oil refinery was completed, additional coal mine closings were reported, and two direct reduction steel plants were proposed.

BELGIUM

PRODUCTION

The index of production in the extractive industries declined to just under 70 (1970=100) compared with 75 in 1974. A continuing decline in coal production accounted for most of the change; other mineral production, chiefly quarry products such as quartzite, marble, and sand, also was at a rate below the previous year. Production rates in the major sectors of the minerals economy, namely iron and steel, copper smelting, and zinc smelting, all participated in the general decline.

[1] Supervisory physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Belgian francs (BF) to U.S. dollars at the rate of BF36.78=US1.00, the approximate floating average during the year.

[1] In addition to the commodities listed individually, Belgium produces a number of other metals for which only aggregate output figures are available. These aggregates are listed under other nonferrous metals.
[2] Known to include gold and silver and may include platinum-group metals.
[3] Derived by subtracting aluminum data from a reported total for unspecified base metals.

TRADE

Belgium's balance of payments position, consolidated with that of Luxembourg, was satisfactory during the year with a surplus of $640 billion; this marked a positive balance for the sixth year in a row. However, a deficit of $1.81 billion was registered in the balance of trade to which Belgium's sizable imports of raw materials contributed.

Belgium's trading partners continued to be largely the other members of the European Economic Community (EEC). Some 71% of Belgian exports, including large amounts of refined and fabricated mineral products, went to other members of the Common Market. Of Belgian imports, 67%, including significant amounts of iron ore, coal, aluminum, clays, and fertilizers, came from Common Market members. Ores and concentrates for the important Belgian nonferrous smelting industry came largely from Africa and the Americas. There was a moderate minerals trade between the United States and Belgium in which the largest item was coal shipments to the Belgian steel industry.

Metal including alloys:			
Scrap	9,045	8,972	France 7,658.
Blue powder (dust)	28,420	31,506	West Germany 12,665; Netherlands 8,190; France 4,552.
Unwrought	221,678	193,632	West Germany 55,575; France 29,887; United States 23,277; Netherlands 19,395.
Semimanufactures	8,703	7,879	West Germany 3,177; Netherlands 1,892; Switzerland 623.

See footnotes at end of table.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
METALS—Continued			
Other:			
Ore and concentrate:			
Of columbium, tantalum, vanadium and zirconium	132	216	France 122; West Germany 91.
Of precious metals	--	1	NA.
Of base metals, n.e.s	73	627	France 331.
Ash and residue containing nonferrous metals, n.e.s	29,396	26,876	West Germany 4,985.
Waste and sweepings of precious metals ...... value, thousands	$1,406	$2,366	West Germany $811; United Kingdom $767, Italy $394.
Oxides, hydroxides, pentoxides of metals, n.e.s	5,636	5,973	West Germany 1,695; Netherlands 858; United States 839; France 704.
Metals including alloys, all forms:			
Metalloids:			
Tellurium and arsenic	30	33	West Germany 5; Italy 3.
Other	142	163	France 44; West Germany 34; Netherlands 26.
Alkali, alkaline earth, rare-earth metals	69	56	NA.
Pyrophoric alloys .. kilograms	100	26	NA.
Base metals including alloys, all forms, n.e.s	17,261	15,997	NA.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	2,952	6,553	NA.
Dust and powder of precious and semiprecious stones, natural and manufactured ...... kilograms	710	621	United States 126; Israel 107; West Germany 93.
Grinding and polishing wheels and stones	2,781	3,922	France 1,590; West Germany 402.
Asbestos	433	645	France 329; Netherlands 293.
Barite and witherite	6,887	416	NA.
Boron materials:			
Crude natural borates	4,097	9,634	Netherlands 7,394; France 983.
Oxide and acid	1,305	306	West Germany 153; Romania 45.
Bromine ...... kilograms	300	460	NA.
Cement ...... thousand tons	1,652	1,593	Netherlands 938; West Germany 136.
Chalk	82,353	67,250	Netherlands 2,619; Saudi Arabia 1,116.
Clays and clay products (including all refractory brick):			
Crude clays, n.e.s.:			
Bentonite	97	929	NA.
Kaolin	15,175	8,778	Netherlands 5,002; France 1,186; West Germany 981.
Other	6,456	3,689	France 1,329; United Kingdom 685; West Germany 488; Switzerland 125.
Products:			
Refractory (including nonclay brick)	102,130	48,379	France 22,419; Italy 6,509; Mexico 4,680.
Nonrefractory ...... value, thousands	$22,087	$22,960	Netherlands $7,278; West Germany $5,872; France $5,169.
Cryolite and chiolite	1,140	164	NA.
Diamond:			
Gem:			
Unworked .. thousand carats	5,733	5,479	India 1,766; United Kingdom 1,705; Israel 907.
Worked ...... do	2,503	2,777	United States 772; Switzerland 240.
Industrial:			
Unworked ...... do	8,865	9,104	Ireland 2,345; United States 1,857; United Kingdom 1,773.
Worked ...... do	90	27	United Kingdom 9; West Germany 7; Switzerland 4; France 3.
Diatomite and other infusorial earth	900	5,491	Netherlands 5,154.
Feldspar, leucite, nepheline, nepheline syenite	6,849	11,902	Netherlands 10,382.

See footnote at end of table.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
NONMETALS—Continued			
Fertilizer materials:			
Crude:			
Nitrogenous	957	1,323	France 599; Lebanon 500; West Germany 178.
Phosphatic	34,114	39,805	France 21,523; West Germany 6,800; United Kingdom 3,259.
Potassic K_2O content	126	207	Netherlands 189.
Manufactured:			
Nitrogenous, N_2 content thousand tons	369	389	France 95; West Germany 69.
Phosphatic P_2O content do	335	359	France 136; West Germany 106.
Potassic, K_2O content do	253	287	France 58; Norway 48.
Other including mixed do	1,385	15	France 8.
Ammonia do	170	160	France 140.
Fluorspar	557	1,321	France 7.
Graphite, natural	148	7	France 4; West Germany 1.
Gypsum and plasters	31,635	35,141	West Germany 22,354; Netherlands 9,682.
Lime thousand tons	729	709	Netherlands 590.
Magnesite	1,669	2,034	France 323; Netherlands 330.
Mica:			
Crude including splittings and waste	132	70	NA.
Worked including agglomerated splittings	1,170	1,360	United States 356; United Kingdom 321.
Pigments, mineral including processed iron oxides	4,165	4,369	France 1,615; Italy 1,474.
Precious and semiprecious stones:			
Natural (except diamond):			
Unworked kilograms	11,308	6,026	France 2,040; Switzerland 805; Italy 596.
Worked:			
Gem do	186	1,754	West Germany 173.
Industrial do	10	(2)	Mainly to Israel.
Manufactured[3] do	169	155	West Germany 100; United Kingdom 12.
Pyrite (gross weight)	1,235	548	NA.
Salt and brine	150,199	123,690	France 116,504.
Sodium and potassium compounds thousand tons	415	447	Netherlands 90; West Germany 66; France 50; United States 49.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous do	1,028	1,059	Netherlands 1,000.
Slate do	3	3	Netherlands 1; West Germany 1.
Other do	64	59	NA.
Worked:			
Slate do	1	1	Mainly to West Germany.
Paving and flagstone do	8	9	Netherlands 7; West Germany 1; France 1.
Other do	12	11	West Germany 4; France 3; Netherlands 2.
Dolomite, chiefly refractory grade do	1,545	1,835	France 170.
Gravel and crushed rock do	8,598	8,988	Netherlands 4,439; France 3,911.
Limestone (except dimension) do	532	600	Netherlands 430; France 169.
Quartz and quartzite do	10	15	West Germany 12; Mexico 1; Netherlands 1.
Sand, excluding metal bearing do	3,229	3,989	Netherlands 1,116; France 958; Italy 589; West Germany 391.
Sulfur:			
Elemental, all forms do	21,391	18,759	Morocco 5,358; France 3,631; Netherlands 2,381; Brazil 1,690.
Sulfur dioxide	46	203	NA.
Sulfuric acid	201,190	286,903	France 135,843; West Germany 85,300.
Talc, steatite, soapstone, pyrophyllite	17,538	21,813	West Germany 6,140; United Kingdom 3,230; Sweden 2,918; France 2,714.
Other nonmetals, n.e.s.:			
Crude:			
Meerschaum, amber, jet	598	231	NA.

See footnotes at end of table.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
NONMETALS—Continued			
Other nonmetals, n.e.s.—Continued			
Crude—Continued			
Lithium minerals	7,992	6,263	Netherlands 6,015.
Vermiculite, perlite, chlorite	139	233	NA.
Other thousand tons	1,521	761	Netherlands 744.
Slag, dross and similar waste, not metal bearing do	2,903	2,847	Netherlands 944; France 898.
Oxides and hydroxides of magnesium, strontium, and barium	744	666	Colombia 400.
Halogens	20	19	Brazil 9.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	19,339	9,204	Netherlands 9,073.
Carbon black and gas carbon:			
Carbon black	22,828	20,165	West Germany 19,092.
Gas carbon	58	150	NA.
Coal and briquets:			
Anthracite and bituminous coal thousand tons	591	527	West Germany 313; France 106.
Briquets of anthracite and bituminous coal do	55	61	France 32; West Germany 23.
Lignite and lignite briquets	36	32	NA.
Coke and semicoke thousand tons	456	409	France 185; Netherlands 59; Sweden 58; West Germany 56.
Gas natural million cubic feet	4	26,177	West Germany 26,135.
Hydrogen, argon, and other rare gases	13,799	15,550	France 7,342; Netherlands 2,247; West Germany 1,722; United Kingdom 1,641.
Peat including peat briquets and litter	902	4,883	Sweden 2,853; France 1,059.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	2,216	411	Sweden 225; West Germany 185.
Refinery products:			
Gasoline do	27,254	5,324	Netherlands 1,144; West Germany 769.
Kerosine do	4,783	2,213	Sweden 446; Denmark 318; United Kingdom 266.
Distillate fuel oil do	30,581	21,348	Sweden 7,310; West Germany 6,090; Netherlands 3,680.
Residual fuel oil do	39,966	31,961	Sweden 6,568; West Germany 3,494; Netherlands 2,827.
Lubricants do	2,281	2,633	Netherlands 778; West Germany 220.
Other:			
Liquefied petroleum gas do	1,550	1,653	United States 627; Netherlands 277; West Germany 247.
White spirits do	949	1,371	West Germany 578; Netherlands 241; Norway 138.
Mineral jelly and wax do	14	20	Netherlands 5.
Nonlubricating oils, n.e.s. do	25	32	Netherlands 9; Saudi Arabia 8; Lebanon 4.
Bitumen and other residues do	3,261	2,894	Netherlands 1,081; United Kingdom 712; West Germany 401.
Bituminous mixtures, n.e.s. do	68	66	Netherlands 24; West Germany 18; France 13.
Pitch, pitch coke, petroleum coke do	192	283	France 194; Netherlands 69.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons	224	230	Netherlands 73; West Germany 65; France 45; United States 26.

NA Not available.
[1] Figure does not contain thorium in 1973.
[2] Less than ½ unit.
[3] May include diamond.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS			
Aluminum:			
Bauxite and concentrate	14,961	23,814	Guyana 9,593; West Germany 9,120.
Oxide and hydroxide	16,256	17,442	West Germany 15,251.
Ash and residue containing aluminum	3,090	1,219	West Germany 522; Italy 333; France 292.
Metal including alloys:			
Scrap	18,810	18,138	Netherlands 10,582; France 4,057; West Germany 954.
Unwrought	234,740	253,205	Netherlands 104,400; France 35,902; Norway 21,731.
Semimanufactures	60,939	70,110	West Germany 31,771; Netherlands 19,243; France 8,306.
Antimony:			
Ore and concentrate	12,024	9,221	Bolivia 4,896; Canada 1,546.
Metal including alloys, all forms	352	72	West Germany 63.
Arsenic:			
Natural sulfides	24	24	NA.
Trioxide, pentoxide, acids	252	311	France 289.
Beryllium metal including alloys, all forms ---- kilograms	800	200	NA.
Bismuth metal including alloys, all forms	485	717	Bolivia 505; Peru 90.
Cadmium metal including alloys, all forms	1,259	1,477	Japan 615; U.S.S.R. 356.
Chromium:			
Chromite	3,170	4,051	Republic of South Africa 1,034; Mozambique 730; West Germany 507; Netherlands 459.
Oxide and hydroxide	778	693	West Germany 558; France 85.
Metal including alloys, all forms	118	200	West Germany 86; France 38.
Cobalt oxides and hydroxides ---- kilograms	10,500	11,900	NA.
Copper:			
Ore and concentrate	30,990	32,406	Zaire 5,406; Australia 3,928; Morocco 3,441.
Matte	223,682	201,189	Zaire 140,728.
Copper sulfate	783	652	France 434; Netherlands 106.
Ash and residue containing copper	28,224	54,878	France 21,281; Japan 10,118; United States 8,905; Chile 5,796.
Metal including alloys:			
Unwrought	308,865	292,323	Zaire 119,612; France 29,289; West Germany 25,571.
Semimanufactures	22,913	25,466	West Germany 14,557; France 3,452.
Germanium metal including alloys, all forms	16	17	Italy 15; West Germany 2.
Gold:			
Waste and sweepings ---- value, thousands	$1,207	$1,446	United States $1,343.
Metal, unworked and partly worked ---- thousand troy ounces	956	3,499	Switzerland 843.
Iron and steel:			
Ore and concentrate, except roasted pyrite ---- thousand tons	32,417	33,430	France 13,534; Sweden 8,875.
Roasted pyrite ---- do	568	497	France 305; West Germany 136.
Metal:			
Scrap ---- do	698	870	France 456; Netherlands 182; West Germany 106.
Pig iron including cast iron ---- do	234	233	West Germany 120; France 91.
Sponge iron, powder, shot ---- do	7	9	France 2; West Germany 2; Sweden 2.
Spiegeleisen ---- do	(1)	(1)	Mainly from West Germany.
Ferroalloys ---- do	202	215	France 76; Norway 75; West Germany 42.
Steel, primary forms ---- do	1,225	970	West Germany 265; Netherlands 233; France 163.
Semimanufactures:			
Bars, rods, angles, shapes, sections ---- do	764	724	France 401; West Germany 139; Netherlands 111.
Universals, plates, sheets ---- do	669	654	West Germany 222; Netherlands 149; France 102; Japan 86.
Hoop and strip ---- do	127	116	France 65; West Germany 24.
Rails and accessories ---- do	7	33	France 6; West Germany 3.
Wire ---- do	45	60	West Germany 30; France 14.

See footnotes at end of table.

Tubes, pipes, fittings thousand tons	166	182	West Germany 73; France 46; Netherlands 30.
Castings and forgings, rough do	15	16	France 4; West Germany 4.
Lead:			
Ore and concentrate	105,161	88,030	Peru 16 641; Morocco 14,521; Greece 11,934; Ireland 11,785.
Ash and residue containing lead	57,478	45,663	United States 11,426; France 9,525; United Kingdom 7,174.
Oxides	3,752	2,246	West Germany 1,330; France 386; Mexico 290.
Metal including alloys:			
Scrap	12,445	11,497	West Germany 5,455; Netherlands 2,957; United Kingdom 1,124.
Unwrought	13,614	24,786	United States 7,979; Netherlands 4,622; France 3,705; West Germany 3,025.
Semimanufactures	1,631	2,943	West Germany 1,915.
Magnesium metal including alloys:			
Scrap	111	270	Netherlands 254.
Unwrought	1,319	1,465	Norway 470; Italy 323; Netherlands 223; France 148.
Semimanufactures	95	150	West Germany 72; United States 26; Italy 25.
Manganese:			
Ore and concentrate	423,991	400,426	Republic of South Africa 210,159; Zaire 59,143; Angola 53,983.
Oxides	1,646	2,220	Japan 1,751; West Germany 276.
Metal	884	1,226	Netherlands 535; Japan 312.
Mercury 76-pound flasks	2,300	5,773	West Germany 5,454.
Molybdenum:			
Ore and concentrate	10,987	12,545	Canada 6,158; United States 3,439.
Metal including alloys, all forms	231	70	United States 17; Netherlands 17; Germany 12.
Nickel:			
Matte, speiss, similar materials	73	271	Netherlands 232.
Metal including alloys:			
Scrap	1,611	1,423	France 404; West Germany 260; United States 243.
Unwrought	2,797	3,988	United Kingdom 907; Cuba 592; U.S.S.R. 467; Canada 404.
Semimanufactures	1,850	3,427	West Germany 2,034; France 366.
Platinum-group metals including alloys, all forms troy ounces	108,695	108,881	France 39,731; United Kingdom 35,456; Brazil 9,902.
Selenium, elemental kilograms	19,600	19,100	Netherlands 8,300; West Germany 4,200; United States 3,300.
Silver metal including alloys thousand troy ounces	11,105	23,517	Netherlands 7,640; United States 7,450.
Thorium ore and concentrate kilograms	94,000	--	
Tin:			
Ore and concentrate	5,688	5,281	Zaire 2,906; Rwanda 1,934.
Oxides	49	30	West Germany 16; Netherlands 13.
Metal including alloys:			
Scrap	75	83	West Germany 58.
Unwrought	1,568	2,914	Malaysia 1,583; Zaire 450.
Semimanufactures	280	256	Netherlands 98; West Germany 83; France 26.
Titanium:			
Ore and concentrate	70,936	120,527	Canada 100,217.
Oxides	13,082	11,618	West Germany 5,413; Netherlands 4,509.
Metal including alloys, all forms	967	1,739	United States 1,376.
Tungsten:			
Ore and concentrate	418	458	People's Republic of China 311; Zaire 68.
Metal including alloys, all forms	246	266	West Germany 42; Netherlands 36.
Uranium:			
Ore and concentrate	101	52	NA.
Metal including alloys, all forms	6	6	France 6.
Zinc:			
Ore and concentrate	636,923	644,850	Canada 318,110; Netherlands 96,967; Sweden 71,399.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
NONMETALS—Continued			
Diamond (except powder)—Continued			
Gem—Continued			
Worked ---- thousand carats --	1,139	1,276	India 203; Israel 156; U.S S.R. 154; Republic of South Africa 138.
Industrial:			
Unworked ---- do ----	6,654	8,545	United States 2,489; United Kingdom 1,973; Ireland 1,704.
Worked ---- do ----	6	28	Ireland 8; United Kingdom 4.
Diatomite and other infusorial earth ---	6,599	8,402	France 3,549; Denmark 2,082; United States 1,282.
Feldspar, leucite, nepheline, nepheline syenite ----	72,562	78,559	Norway 47,805; France 17,532.
Fertilizer materials:			
Crude:			
Nitrogenous ----	18,366	19,199	Chile 18,937.
Phosphatic --- thousand tons --	2,287	2,407	Morocco 1,478.
Potassic ----	(2)	(2)	
Manufactured:			
Nitrogenous, N_2 content ----	107,216	72,490	West Germany 23,047; Netherlands 22,096; France 20,942.
Phosphatic, P_2O_5 content ----	8,867	16,534	Netherlands 6,427; Tunisia 6,164; United Kingdom 1,929.
Potassic ----	(2)	(2)	
Other including mixed ----	128,053	163,954	France 99,787; West Germany 19,387; Netherlands 18,972.
Ammonia ----	2,667	2,244	Netherlands 1,099; West Germany 963.
Fluorspar ----	12,779	15,433	France 8,473; West Germany 5,042.
Graphite, natural ----	5,518	1,454	France 534; West Germany 331; Malagasy Republic 247; Austria 208.
Gypsum and plasters ----	476,052	537,189	France 493,016.
Lime ----	187,536	210,102	France 163,868.
Magnesite ----	22,723	29,716	Greece 15,138; Brazil 3,068.
Mica:			
Crude including splittings and waste	3,397	3,171	India 1,645; Malagasy Republic 588.
Worked including agglomerated splittings ----	60	94	West Germany 31; United Kingdom 25; Switzerland 17.
Pigments, mineral, including processed iron oxides ----	8,375	11,237	West Germany 8,207.
Precious and semiprecious stones, except diamond:			
Natural:			
Unworked ---- kilograms --	10,923	5,550	West Germany 2,395; Switzerland 1,349.
Worked:			
Gem ---- do ----	1,838	3,262	West Germany 1,503.
Industrial ---- do ----	218	256	United States 186.
Manufactured ---- do ----	4,763	25,794	United States 6,905.
Pyrite (gross weight) ----	247,829	257,916	Spain 160,138.
Salt and brine ---- thousand tons --	866	1,144	Netherlands 602; West Germany 508.
Sodium and potassium, n.e.s ----	29,008	40,244	Netherlands 30,839.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked ----	191,784	143,128	France 90,133; Portugal 23,299; Italy 16,882.
Worked ----	45,441	59,257	Italy 22,235; France 13,130.
Dolomite, chiefly refractory grade --	50,052	68,724	France 39,381; West Germany 12,968.
Gravel and crushed rock thousand tons --	5,313	5,936	Netherlands 3,675; West Germany 591.
Limestone (except dimension) ----	18,928	208,571	United Kingdom 163,545.
Quartz and quartzite ----	108,555	112,231	France 72,434; Norway 12,041.
Sand, excluding metal bearing thousand tons --	8,577	8,544	Netherlands 7,656.
Sulfur:			
Elemental, all forms ----	673,779	938,533	United States 479,863; Netherlands 252,928.
Sulfur dioxide ----	3,855	4,246	West Germany 3,153.
Sulfuric acid ----	151,047	238,079	West Germany 144,816; Poland 34,146.
Talc, steatite, soapstone, pyrophyllite ---	58,491	39,958	United States 17,748; Netherlands 6,772; France 4,745.

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
NONMETALS—Continued			
Other nonmetals, n.e.s.:			
Crude:			
Lithium minerals	7,419	7,525	Mozambique 7,231.
Vermiculite, perlite, chlorite	29,527	26,841	U.S.S.R. 16,156; Greece 5,610.
Other	132,429	125,933	Netherlands 51,087; Spain 33,548; West Germany 24,314.
Slag, dross, and similar waste, not metal bearing	222,133	346,880	France 239,605; West Germany 36,470.
Oxides and hydroxides of magnesium, strontium, and barium	2,142	2,068	West Germany 591; France 380; United Kingdom 310.
Halogens (other than chlorine and bromine)	135	207	Chile 186.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	8,004	40,602	France 34,047; Netherlands 5,825.
Carbon black and gas carbon:			
Carbon black	31,295	32,920	West Germany 11,891; Netherlands 9,870.
Gas carbon	1,654	2,711	West Germany 2,367; France 299.
Coal and briquets:			
Anthracite and bituminous coal thousand tons	7,488	9,977	West Germany 4,823; Poland 1,731; United States 1,448.
Briquets of anthracite and bituminous coal do	147	89	West Germany 73; Netherlands 16.
Lignite and lignite briquets do	74	85	West Germany 84.
Coke and semicoke do	4,253	4,545	West Germany 3,510.
Gas, natural million cubic feet	342,711	1,023,186	Netherlands 402,662.
Hydrogen, argon, rare gases	8,112	7,635	Netherlands 4,483; West Germany 2,749.
Peat including peat briquets and litter	88,716	101,292	Netherlands 51,638; West Germany 48,961.
Petroleum:			
Crude and partly refined:			
Crude thousand 42-gallon barrels	264,519	205,113	Saudi Arabia 114,163; Iran 33,304; Kuwait 22,076.
Partly refined do	4,466	7,274	U.S.S.R. 1,095; Italy 1,080.
Refinery products:			
Gasoline do	7,296	25,536	West Germany 24,651.
Kerosine do	931	55	All from Netherlands.
Distillate fuel oil do	16,059	18,148	Netherlands 10,525; U.S.S.R. 2,785; Italy 1,847.
Residual fuel oil do	24,647	31,297	Kuwait 6,644; Saudi Arabia 3,618.
Lubricating oils and grease do	3,597	3,623	Netherlands 999; United Kingdom 655; France 491; West Germany 465.
Other:			
Liquefied petroleum gas do	3,782	4,446	Netherlands 3,535; West Germany 620.
White spirits do	394	3,419	Netherlands 3,380.
Mineral jelly and wax do	132	157	West Germany 63; France 27; Netherlands 27.
Nonlubricating oils, n.e.s do	21	64	Netherlands 58.
Bitumen and other residues do	420	526	France 299; Netherlands 203.
Bituminous mixtures, n.e.s. do	296	418	Netherlands 267; France 60.
Pitch, pitch coke, petroleum coke do	2,591	2,811	United States 2,021.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	81,540	120,820	Netherlands 58,352; West Germany 33,592; France 15,281.

NA Not available.
[1] Less than ½ unit.
[2] Crude and manufactured potassic fertilizers not reported separately and total of these commodities not reported in terms of gross weight, but rather in terms of K_2O equivalent. Total for 1973 was: 606,016 tons K_2O equivalent. Principal sources in 1973 were: West Germany 270,585; France 136,748; U.S.S.R. 104,737. Total for 1974 was 654,076 tons. Principal sources in 1974 were: West Germany 260,364; France 184,679; U.S.S.R. 137,624.

COMMODITY REVIEW

Metals.—*Aluminum.*—Belgium does not produce bauxite, alumina, or primary aluminum. The small aluminum metal production, which in recent years has been under 10,000 tons, was a product of a number of scrap melting operations. There was, however, an important production and trade in semimanufactures based on imported ingots.

Copper.—Belgium was in 1975 the second largest producer of refined copper in Europe, after West Germany. Copper was obtained principally as matte and ingots; Zaire was the main source, with smaller quantities from other African countries. Belgium also participated in a strong inter-European trade in smelted metal and semimanufactures. Belgium was an important supplier of the German and France manufacturing industries. By far the largest producer of refined copper was Métallurgie Hoboken-Overpelt S.A., with a smelter at Hoboken and refinery at Olen, both near Antwerp; the company also was a major producer of numerous other nonferrous metals.

In 1975, Metallo-Chimique, S.A., a smaller copper refiner, continued construction to expand the capacity of its smelter-refinery at Beerse by 50,000 tons per year. The expansion is due to be completed by 1977.

Iron and Steel.—Belgium was heavily dependent on its steel industry; production per capita was almost three times that of the United States. The industry itself was dependent on imported ore; in 1975 only one small mine near the French border was in operation.

The largest producer of crude steel was S.A. Cockerill-Ougrée-Providence et Espérance-Longdoz (Cockerill), with major plants near Liège, which accounted for about half of the Belgian production. Other important producers were Ste. Métallurgique Hainaut-Sambre S.A. (HS), at Couillet, near Charleroi; Forges de Thy-Marcinelle et Monceau S.A. (TMM) at Marcinelle, near Charleroi; S.A. Forges de Clabecq, at Clabecq, south of Brussels; Usines Gustave Boël (UGB), at La Louvière, west of Charleroi; and Maritieme Staalnijverheid N.V., also called Sidérurgie Maritime S.A. (SIDMAR), at Zelzate, north of Ghent.

The Belgian steel industry was dependent on selling its products abroad, and in 1975 suffered severely from the worldwide decline in business activity, as the index of steel production fell from 127 (that is, percent of 1970) to 87. In an effort to increase competitiveness, the industry initiated several moves that would eventually decrease costs.

A 400,000-ton-per-year direct reduction plant was proposed by TMM and HS, both of which belong to the group headed by Albert Frère, to be erected at Tertre, west of Mons. A second plant, of the same size, was under study by the same group for a site at Zeebrugge on the Belgian coast. Both plants are novel to the extent that they plan to use coke oven gas, which no direct reduction plants have so far utilized.

A project for a ministeelworks at Monceau, of a type being installed in neighboring countries, was also advanced by the Frère group, but no concrete project had been announced.

It was reported that the percentage of steel produced in open hearth and electric furnaces in Belgium remained constant at about 5% from 1970 to 1974; that produced by the basic Bessemer process declined from 42% to 14%; and that produced by basic oxygen furnaces increased from 52% to 80% during the same period. Total steel production increased from 12.6 million to 16 million tons in the same period. Employment in the Belgian steel industry remained fairly steady in the 1964–74 decade at 63,000, with a small decline in the middle of the period.

Lead and Zinc.—The production index for these two commodities fell from 127 in 1974 to 87 in 1975, reflecting the low level of economic activity in Belgium and worldwide.

Belgium was a major producer of primary zinc and a large producer of primary lead in 1975, both from imported ores and concentrates; some secondary metal was also recovered. Most of the metal produced was exported to other European countries. The two major zinc producers in 1975 were Société des Mines et Founderies de Zinc de la Vieille-Montagne, S.A., with its main office at Angleur near Liege, smelter at Flone, southwest of Liege, and electrolytic zinc plant at Balen, east of Antwerp, and Hoboken-Overpelt, at its new electrolytic zinc refinery at Overpelt, in the northeast. Vieille Montagne also produced lead at Balen, but Hoboken's smelter (at Hoboken) was a larger producer of this commodity.

Energy and Fuels.—Belgium was a large net importer of energy in 1975, largely in the form of coal from West Germany, natural gas from the Netherlands, and petroleum from the Middle East. The approximate energy balance given in table 4 for 1973 and 1974, the latest years available, shows a heavy but decreasing reliance on imported petroleum.

Coal.—Total Belgian coal production has declined severely in the post-World War II period and in 1975 reached a new low of 7.5 million tons; maximum production reached was 30.3 million tons in 1952. Imports continued high, and underground and surface employment, which was over 100,000 some 20 years ago, was down to 26,700 at the end of 1975. About three-quarters of Belgian coal production in 1975 came from the Kempen (Campine) Field, in the province of Limburg, northeast Belgium. The largest mines operated there, by the Naamloze Vennootschap Kempense Steenkolenmijnen, were at Zolder, with a current production of about 2.2 million tons per year; Waterschei, with about 1 million; and Winterslag, Eisden, and Beringen, each producing somewhat less than a million tons per year.

Table 4.—Belgium-Luxembourg: Supply and apparent consumption of chief energy-producing materials for 1973 and 1974

(Million tons of standard coal equivalent) [1]

	Total energy	Coal and coke	Petroleum and refinery products	Natural gas	Hydro-electric and nuclear power
1973:					
Production	9.1	8.9	--	0.1	0.1
Imports	86.7	8.7	64.9	12.9	.2
Exports	26.2	.8	[2]24.8	.3	.3

Petroleum.—Expansion of the Feluy oil refinery, between Brussels and Charleroi, was completed by Chevron Oil Belgium, at a total cost of $22 million. Expansion of facilities in the Antwerp port area, which are connected with Feluy by pipeline, was included. Capacity of the plant has thus been raised from 5 million to 7 million tons per year (140,000 barrels per day) of crude.

Eight refineries, with a total refinery capacity of 946,300 barrels per calendar day of crude, operated during the year. Largest was the refinery of Société Industrielle Belge des Petroles S.A. at Antwerp, with a capacity of 340,000 barrels per day of crude; other large refineries were those of Texaco at Ghent (180,000 barrels), Albatros (120,000 barrels), and Belgisch Petroleum Raffinderij N.V. (100,000 barrels), both at Antwerp. An extension of the Esso refinery at Antwerp was under construction to raise its capacity from 75,000 to 245,000 barrels per day by 1976.

LUXEMBOURG

Almost half of Luxembourg's industrial production and 20% of the GNP is accounted for by the steel sector. With nearly all steel production destined for foreign markets, both national income and balance of trade were heavily influenced by activity in world steel markets in 1975. After many years of continuing growth at an average rate of 3.5% and of increasing prosperity culminating in the boom year of 1974, 1975 came as a rude shock to the Luxembourg economy, which registered a 7.7% drop in the GNP. Luxembourg steel production fell 28.3%, and steel exports 16.9% in 1975, and the negative effect was aggravated by a fall in steel prices of between 20% and 40%.

Two companies comprised the Luxembourg steel industry. Aciériés Réunies de Burbach-Eich-Dudelange S.A. (ARBED) was by far the largest. A minor producer was Métallurgique et Minière de Rodange-Athus (MMRA). ARBED owned iron mines, steel mills, and steel fabricating plants in Luxembourg; steel mills in the Saar and Cologne area in West Germany; iron ore mines in France (the chief source of ore) and Brazil; coal mines in Germany; and a controlling interest in SIDMAR, the Belgian steel producer.

In 1975, ARBED acquired the Red Ash coal mine in West Virginia, as part of its overall strategy to remain competitive. It was also considering an ore pipeline from the coast, as well as further integration of its Luxembourg activities with its foreign interests.

[1] In addition to the commodities listed, Luxembourg also produces refractory clays and manufactured phosphatic fertilizers other than Thomas slag, but data are not published and information is inadequate to make reliable estimates of output levels.

The Mineral Industry of Bolivia

By V. Anthony Cammarota, Jr.[1]

The mineral industry of Bolivia contributed about 11% to the gross domestic product (GDP) in 1975. Petroleum and natural gas accounted for 7.2% of the GDP in 1975 compared with 10.6% in 1974. The mineral industry provided 59% and petroleum and natural gas provided 29% of the total value of Bolivia's exports.

Corporación Minera de Bolivia (COMIBOL), after taxes and other allowances, had a loss of $10.7 million[2] compared with a profit of $5.1 million in 1974. Although costs of labor, materials, and equipment continued to rise, the loss was more related to a 9% decline in sales.

The Medium Miners Association increased from about 28 companies in 1974 to about 34 in 1975. Production of tin by the Medium Miners increased 8% over that of 1974. Production of copper, lead, bismuth, and sulfur was less than that in 1974; exports of antimony, tungsten, and zinc increased slightly.

The third largest group within the mining sector of Bolivia and part of the private sector is the Small Miners Association, which during 1975 accounted for 6% of the total export value of the mining sector. Tin and antimony are the two major commodities exploited by the Small Miners and in 1975 both suffered price drops that affected mineral output. Of the about 2,000 Small Miners operating in 1974 out of the 5,000 in the Inventory of Small Mines, only one-half were operating during 1975. All of the low grade tin producers closed down operations due to high costs and low prices. Royalties paid by the Small Miners to the Government were reduced to almost nothing.

Because of falling market prices, tin export quotas were imposed by the International Tin Council for three quarters of the year. Tin exports were down more than production which led to some stockpiling and some tin being exported for refining under toll contracts. Other mineral exports also suffered because of lower prices, and the total c.i.f. value of mineral exports decreased 21% from that of 1974. The United States purchased 40% of Bolivia's mineral exports in 1975. During 1975 Bolivia took some important steps toward revitalizing the minerals sector. Harvard University completed a study of Bolivia's mining taxation system that had been commissioned by the Ministry of Mines. The mining sector bears a large percentage share of Bolivia's fiscal burden, mainly in the form of export taxes. The Ministry is reportedly moving toward a mixed system of taxes on profits and export taxes recommended by the Harvard study. Further measures to stimulate the mining industry included a planned new mining development law to come out in 1976 that will open presently closed mining areas and offer incentives to foreign and domestic capital to work these areas under mining operation contracts, and a planned revolving minerals exploration fund.

COMIBOL took a number of technical measures in 1975 as part of its triennial plan to increase efficiency in some of its mines.

The Ministry of Mines presented projects for the 5-year development plan 1976–80. Compared with past investment plans, gross investment in the mining sector will decrease as its percentage declines from 14%

[1] Physical scientist, Division of Nonferrous Metals.

[2] Where necessary, values have been converted from pesos Bolivian ($b) to U.S. dollars at the rate of 20$b=US$1.00.

to 8%. This change of emphasis implies a greater diversification of the future Bolivian economy. An important objective is the smelting and refining of a greater percentage of Bolivia's mine output. Empresa Nacional de Fundiciones (ENAF) plans to refine about three-fourths of the country's mineral production by 1980.

The Italian firm AGIP, S.p.A. completed preliminary exploration for uranium in its four areas and will go ahead with a drilling program around Corocora.

PRODUCTION

Of the 13 metals mined in Bolivia in 1975, only gold, iron, and silver showed increases. Mine output of tin at 28,720 tons, was down slightly from that of 1974. Of the nonmetals, production of cement increased 12% but elemental sulfur production fell 48%. Natural gas production fell 5%, while crude oil production fell 11%.

Total ____do____	5,533	5,932	7,365

[p] Preliminary.

[1] In addition to the commodities listed, salt and a variety of construction materials such as clays, stone (crushed, broken and dimension), sand, and gravel are produced but information is inadequate to permit formulation of reliable estimates of output levels.

[2] Unless otherwise specified, data represent the sum of production by COMIBOL and exports by medium and small mines.

[3] Total national exports; tantamount to total production.

[4] Contained in zinc concentrates produced by COMIBOL; not recovered in elemental form in Bolivia.

[5] COMIBOL output plus sales by placer mines (medium and small mines cannot legally export gold).

[6] National exports excluding some part of approximately 50,000 metric tons (gross weight) containing about 32,000 metric tons of iron that was exported from the Mutun deposit during 1972 and 1973.

[7] Sum of COMIBOL production; COMIBOL purchases from lessees in COMIBOL—owned mines and from other producers; sales of medium and small mines to the ENAF smelter and exports of medium and small mines.

[8] Sales by cement plants.

[9] Total national exports; total output is believed to considerably exceed this figure but no basis is available for formulation of reliable estimates of output levels.

TRADE

Preliminary figures indicated an export value of $217 million f.o.b. for minerals and $154 million for petroleum and natural gas in 1975. These are decreases from 1974 figures of $49 million for minerals and $34 million for petroleum and natural gas.

In 1975 the private mining sector exported minerals valued c.i.f. at approximately $142 million, down $48 million from that of 1974. COMIBOL's exports (c.i.f.) amounted to $172 million, down $24 million from that of 1974.

The value of exported silver, zinc, cadmium, iron, manganese, gypsum, arsenic, tungsten, and natural gas increased in 1975. Tin accounted for 58% of the total mineral export value in 1975 compared with 60% in 1974. The tin portion of the total export market increased to 34% from 31% in 1974.

The relation of mineral trade to total trade for 1973–75 is shown in the following tabulation:

	Value (million dollars)	
	Mineral commodity trade	Total commodity trade
Exports (f.o.b.):		
1973	154	268
1974	266	504
1975 [p]	217	420

COMMODITY REVIEW

METALS

Antimony.—The antimony smelter adjacent to the tin smelter at Vinto was completed in October. Some technical problems developed during production trials that would limit operations to about 40% of capacity. The plant is rated at an annual capacity of 4,270 tons of antimony metal, 1,000 tons of antimony alloys, and 1,000 tons of antimony trioxide.

Empressa Minera Unificada S.A. (EMUSA) is the largest Bolivian antimony producer, processing about 1,200 tons per day of ore grading about 4% antimony. EMUSA plans to increase efficiency at the Chilcobija mine and increase mill capacity by 50% at the Caracota mine.

Bismuth.—With the completion of COMIBOL's new refinery in early 1976, Bolivia will become the leading world producer of refined bismuth. Plant capacity is 600 tons per year. COMIBOL's proved and probable reserves are 8,400 tons of bismuth.

Gold.—Gold production in Bolivia has more than doubled since 1972, responding to the increase in international prices. The mining cooperatives and South American Placers Inc. (SAPI) operate concessions on the Tipuani and Kaka Rivers, which are nearing depletion. In 1975 SAPI provided 58% of total gold production, the cooperatives, 41%, and COMIBOL, 1%. Gold production has been largely maintained for internal consumption.

Lead and Silver.—A U.S. company, S. J. Groves, planned to open a new lead-silver mine, the Cascabel, in late 1976 with production slated at 2,800 tons of lead per year. ENAF and COMIBOL formed a joint venture to construct a lead-silver smelter with a capacity of 25,000 tons of lead and 150 tons of silver. COMIBOL estimated its reserves at 52,000 tons of lead and 1,900 tons of silver.

Tin.—Of the 28,720 tons of tin in concentrates produced in 1975, COMIBOL contributed 20,956 tons, the Medium Miners 5,887 tons, and the Small Miners 1,877 tons. Of COMIBOL's total proluction, its mines accounted for 77%; leased mines, 16%; purchases, 5%; and volatilization, 2%.

COMIBOL estimated its cost to produce and market its tin at $3.02 per pound, down from $3.24 in 1974. Mining and depreciation costs were $1.59, export taxes were 21 cents, royalties were 55 cents, and handling, transportation. insurance, and smelting was 67 cents. The drop in cost of 6.9% from the 1974 level was the result of a reduction in royalties to prevent the closure of marginal mines.

COMIBOL's output of about 5.5 million tons of ore, including purchased ore, assaying about 0.7% tin, was treated in concentration plants for an overall tin recovery of 54% contained in a tin concentrate.

COMIBOL estimated its measured, indicated, and inferred, underground reserves of tin ore at 19.3 million tons assaying 1.05% tin. In addition another 179 million tons of alluvial and dump material grading 0.19% tin exist on the surface.

In December ENAF completed the first phase of expansion of its Vinto smelter to 11,000 tons. By yearend 1978 the second phase, bringing total capacity to 20,000 tons, is expected to be completed. In addition, construction of the low-grade tin smelter was scheduled to begin in early 1976. Upon completion in 1978 the facility will process the tin product from the volatilization plant near Potosi.

Bolivian tin production was severely affected by the world economic slowdown, not only in lower tin prices but in higher costs for imported mining equipment and materials. On April 18 the first export control quarter imposed by the International Tin Council began; Bolivia's 1975 quota was 17,078 tons.

Tungsten.—International Mining Co., the largest tungsten producer, planned to expand the capacity of several mines and to install a plant to treat tailings dumps. There are about 5 million tons of tailings containing about 0.1% tungsten. COMIBOL, the second largest producer, planned to increase production at Kami, which was worked by cooperatives. All of COMIBOL's tungsten production comes from cooperatives.

Zinc.—Of the total zinc production of 47,114 tons, COMIBOL supplied 67%, the Medium Miners 32%, and the Small Miners, 1%. Klockner Industries Anlagen began a feasibility study for a 65,000-ton-per-year zinc smelter. Proved reserves of 658,000 tons of contained metal and an additional 962,000 tons of probable reserves would be mined as feed material for the smelter. Diamond drilling at COMIBOL's Matilde mine and exploratory work at New Jersey Zinc Co.'s Huari Huari mine could add to reserves. The Huari Huari mine is scheduled to come onstream in 1976.

COMIBOL's new flotation process at Colquiri, due onstream in early 1976, has a capacity of 19,000 tons of 45% zinc concentrate.

NONMETALS

The most important nonmetallic mineral was sulfur, the production of which fell almost 50% in 1975. The production of calcite was little changed at 85 tons. A U.S. company, Baroid Div. of NL Industries Inc., planned to build a barite and bentonite beneficiation plant in Oruro. Measured and indicated reserves of bentonite are 148,000 tons, and of barite, 320,000 tons. The domestic oil and gas industry has generated great demand for these materials. Salt was mined for local consumption.

MINERAL FUELS

Petroleum and Natural Gas.—Petroleum production decreased from 16,603,014 barrels in 1974 to 14,732,514 barrels in 1975, a decrease of 11.3%. The number of producing wells decreased from 259 to 252 during the year. All producing fields except the Río Grande and Camatindi Fields showed production decreases. No successful exploration wells were drilled during the year, but two development wells at La Peña came in late in the year.

Natural gas production fell in 1975 to 137,297 million cubic feet from a 1974 level of 144,128 million cubic feet. This decrease of 3.4% in production includes injected, flared, consumed, and exported gas. There were 247 producing wells in 16 fields in 1975. The fields showing the largest drop in production were Río Grande, Colpa, and Caranda. Seven new fields were added, mainly in the south.

Yacimientos Petrolíferos Fiscales Bolivianos (YPFB) exported 8.3 million barrels of petroleum valued at $111 million in 1975 compared with 10.8 million barrels valued at $164 million in 1974. Argentina was Bolivia's major customer, followed by the United States and Ecuador. Bolivia received a premium average price of $13.45 per barrel for its sulfur-free, light oil in 1975.

In addition, YPFB exported 54,966 million cubic feet of natural gas valued at $42.5 million compared with 54,593 million cubic feet valued at $29.2 million in 1974. All the gas went to Argentina in 1975. The price of natural gas to Argentina was $0.82 per thousand cubic feet, up from $0.65 per thousand cubic feet in 1974.

Domestic consumption of liquid hydrocarbons increased 21% over that of 1974 to 6,673,171 barrels. The largest increases were noted for high octane gasoline (65%) and diesel oil (28%). Consumption of regular gasoline decreased. Consumption of natural gas increased from 5,946 million cubic feet in 1974 to 7,045 million cubic feet in 1975. Future domestic consumption could go up sharply if planned industrial projects are realized especially the Mutún iron-steel complex and a petrochemical complex. The existing gasline to Argentina and planned gasline to Brazil will provide the largest outlets for Bolivian gas.

Table 4.—Bolivia: Crude petroleum production by YPFB, by field
(Thousand 42-gallon barrels)

Field	1974	1975 p

Lubricants	75	77
Liquefied petroleum gas	238	325

r Revised.
[1] Figures refer to actual civilian and military consumption through sales to consumers, and include YPFB consumption.

Petroleum recoverable reserves were estimated at 145 million barrels at yearend. There were no new discoveries in 1975. Reserves of natural gas were estimated by YPFB to be 4.7 trillion cubic feet. Bolivia has been adding to its gas reserves at the rate of 0.3 trillion to 0.5 trillion cubic feet per year.

YPFB paid Gulf Oil Co. $13,717,153, leaving $48,901,727 outstanding on its debt to Gulf for nationalization of its property in 1969.

YPFB's drilling operations increased from 78,375 feet drilled in 1974 to 110,862 feet drilled in 1975. Ten development wells were completed, including the reconditioning of one well in the Caranda Field. Nine exploratory wells were completed, all but one of which were barren of hydrocarbons.

In the past 3 years Bolivia has succeeded in attracting foreign companies to undertake expensive exploration work. YPFB signed 2 new operation contracts during 1975, bringing the total number to 16, and also opened for bidding 3 new areas, all in the Department of Santa Cruz. Between March 1973 and December 1975, U.S., Canadian, French, and Spanish oil companies have spent over $80 million for exploration. If the discoveries prove to be commercially viable, contractors will receive between 45% and 50% of gross production. Existing exploration contracts cover over 37 million acres on 36% of the potential oil-bearing sedimentary basins of Bolivia. In the remaining 64% of the area YPFB has spent $63 million in the same period.

YPFB has five refineries, four gas plants, one lubricant plant, two refined products plants, and two natural gas pipelines. Construction was underway to increase refinery capacity at the Cochabamba plant to 25,000 barrels per day by 1978. This plant supplies 60% of Bolivia's refinery products. The Santa Cruz refinery was being expanded to 15,000 barrels per day, and a new lubricant plant was being installed at Cochabamba. Also, construction of two pumping stations was undertaken to expand the export pipeline to Arica, Chile, to 50,000 barrels per day.

The Mineral Industry of Brazil

By Orlando Martino [1]

In 1975 Brazil's gross domestic product (GDP) increased by 4% to the equivalent of $111 billion[2] at current prices. There was a small increase in the rate of inflation from 28% in 1974 to 29% in 1975.

Production of minerals in 1975 represented about 2% of the gross national product (GNP) but accounted for 13.3% of the value of Brazilian exports. Iron ore alone accounted for 10.5% of total exports. Brazil was essentially an iron ore producer and continued to rank second after Australia as a worldwide exporter of iron ore.

With considerable inducement from and direct participation by Government, Brazil continued in 1975 to aggressively develop its mineral resources. An estimated $120 million was invested in mineral exploration, and another $350 million was spent on petroleum exploration.

Government Policies and Programs.—Considering recent trade deficits, the Economic Development Council, Brazil's highest economic policymaking body, stated that priority will be given to import substitution under the Second National Development Plan for 1975–79. Priority sectors indicated were in capital goods, steel, nonferrous metals, fertilizers, and petroleum. The Government launched a Steel Plan, a Nonferrous Plan, and a Fertilizer Plan with goals of reaching internal self-sufficiency in some commodities and an export potential in others. The Steel Plan, for example, aimed at doubling steelmaking capacity by 1980 and quadrupling it by 1985. Self-sufficiency in nonferrous metals was planned by 1983. The fertilizer group was a priority investment area because Brazil produced no potash, and little sulfur, and only about 30% of nitrogenous and phosphatic fertilizers were derived from locally produced materials.

The Federal Government, operating through the government-controlled Companhia de Pesquisas de Recursos Minerais (CPRM) and Companhia Vale do Rio Doce (CVRD), has taken a strong lead in developing the minerals industry. In addition, five States, Rio Grande do Sul, Minas Gerais, Goiás, Mato Grosso, and Bahia, have formed exploration mining companies to further the development of their regions.

CPRM continued its diversified program of mineral explorations, geological services, and financial assistance to the private sector for mineral exploration.

In addition to its own exploratory projects, CPRM executed projects in metallics and nonmetallics for the account of the Departamento Nacional do Produção Mineral (DNPM), other Government agencies, State exploration companies, and private companies.

An event of particular significance to CPRM was the promulgation in January 1975 of Decree Law No. 1387 which provided funds for financing mineral exploration by CPRM as well as by Brazilian mining companies.

CVRD, the largest Brazilian mining enterprise, was chiefly an iron ore producer and Brazil's most important earner of foreign exchange. It was also engaged in new ventures leading to the production of bauxite, aluminum, titanium, and phos-

---

[1] Physical scientist, International Data and Analysis.

[2] During 1975 there were a series of "minidevaluations," which brought the exchange rate from New Cruzeiros (NCr$)7.44=US$1.00 in December 1974 to NCr$9.02=US$1.00 in December 1975. Conversions were made at the latter rate.

phate fertilizers. CVRD was involved through its subsidiary, Rio Doce Geologia e Mineração (DOCEGEO), in geological studies and economic appraisals of nonferrous metal deposits such as copper, aluminum, zinc, and nickel. DOCEGEO's budget increased from $9.7 million in 1974 to $13.7 million in 1975.

Brazil produced only 20% of its petroleum requirements in 1975, therefore exploration efforts were being greatly accelerated. In October 1975, a change in Government policy was made permitting participation of foreign capital in oil exploration and exploitation under service contracts to further expedite the exploration process.

Of the energy consumed in Brazil, approximately 48% was derived from oil and gas, 25% from wood, 24% from hydroelectric power, and 3% from coal. Only 10% of the electricity produced was based on oil; 90% was from hydroelectric sources.

The Government was also considering energy alternatives such as vegetable alcohol, shale oil, coal, lignite, and natural gas. The State electrical company Centrais Electricas Brasileiras S.A. (ELETROBRAS) was not planning to build additional oil-fired thermal powerplants.

The Government also announced new measures to further reduce petroleum consumption: A 25% increase in the price of gasoline to the equivalent of $1.45 per gallon; the National Alcohol Program to mix up to 20% alcohol with petroleum products; and the requirement that State enterprises reduce their hydrocarbon consumption 5% in 1976, compared with that in 1975.

In response to the sharp rise in oil prices since 1973, the Government has been stimulating more intensive use of hydroelectric power. Work began on the diversion canal for the $3 billion Itaipú dam on the Paraná River that will have an installed capacity of 12,600 megawatts. This joint venture of Brazil and Paraguay was expected to begin operations in 1988.

On June 27, 1975, the Minister of Mines and Energy signed an agreement in Bonn with the Federal Republic of Germany for a 15-year nuclear development program in Brazil estimated to require investments of $10 billion. The nuclear program will provide Brazil with eight 1,300-megawatt reactors as well as uranium enrichment and fuel reprocessing facilities. The first of the reactors would come onstream in 1981 and the last unit in 1990.

In connection with the Transamazonia Highway, the Government began to reevaluate the agricultural development potential of the Amazon Basin and began to focus on industrial development and mineral exploration. Under the new "polamazonia scheme," the plan was to focus development on 12 centers or "poles." The Amazon Basin is known to have significant deposits of bauxite and iron ore. Deposits of gold, tin, and metal sulfides have been found along the Jamanxim River, one of the tributaries of the Amazon River. Exploratory surveys of other areas in the basin indicated the occurrence of manganese, iron ore, diamond, coal, tin, and sulfide minerals.

PRODUCTION

Despite the slowdown in Brazil's high rate of expansion of the last decade and the worldwide recession during 1975, Brazil maintained a high level of mineral production. The output of iron and manganese ore and pellets continued their dominant role. The State-owned CVRD, the world's largest producer and exporter of iron ore, alone achieved an output of 52.2 million tons in 1975, an increase of 345% over the decade.

Brazil continued as the world's leading producer of columbium/pyrochlore, quartz crystal, and beryl, although there was a significant decline in the output of these minerals. There was a 76% decline in the output of quartz crystal.

Commodities which had notable increases in production included: Iron ore and pellets (19%), bauxite (13%), steel (11%), ferrochromium (40%), manganese (20%), zinc ore (30%), and asbestos fiber (19%). Although there was a slight decrease of 3% in output of crude petroleum, the output of refinery products increased 11%.

The total number of workers employed in the mineral production sector in 1974 (including coal but excluding petroleum) was 49,600 of which 9,100, the largest group, was connected with the production of iron ore.

Data on mineral production are shown in table 1.

Table 1.—Brazil: Production of mineral commodities [1]

e Estimate. p Preliminary. r Revised. NA Not available.

[1] In addition to the commodities listed, molybdenite and bismuth are also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2] Exports.

[3] Includes nickel contained in ferronickel.

[4] Smelter and/or refined metal.

[5] Revised to none.

[6] Includes baddeleyite-caldesite.

[7] By far the larger part of Brazil's diamond production is not reported statistically; hence, the estimates tabulated are based only on very general market information.

[8] This material apparently includes crude quartz used to produce quartz crystal (listed separately in this table) as well as additional unreported quantities of common quartz.

[9] Produced from a portion of the crude quartzite listed above; quantity of crude quartzite processed was 376,674 tons in 1973 and 76,003 tons in 1974 (1975 not available).

TRADE

Brazil's importance as a world minerals supplier was based on iron ore, manganese, columbium/pyrochlore, beryl, and quartz crystal. In the world market, Brazilian exports of columbium/pyrochlore, beryl, and quartz crystal accounted for 60% or more of the total trade in these commodities. Within Brazil's total export sector iron ore at 10.5% ranked fourth in importance after soybeans, coffee, and sugar as a foreign exchange earner. Exports of iron ore of 72.5 million tons rose sharply in value in 1975 to $921 million, an increase of 61% over those of 1974 and continued as the dominant factor in Brazil's total mineral commodity exports. Iron ore exports were largely to Japan (37%), West Germany (17%), and the United States (12%). Exports of manganese ore were next in importance representing almost 1% of total exports.

While Brazil has been increasing minerals production each year, internal demand outstripped production for a number of commodities, requiring large imports of raw materials. Brazil's trade account swung from relative balance in 1973 to a trade deficit of $4.6 billion in 1974 and of $3.5 billion in 1975. Despite good export performance in 1975, the trade deficit was largely caused by substantial imports of pig iron and steel valued at $1.263 million, nonferrous metals at $370 million, fertilizers at $304 million, and $3.074 million for petroleum and derivatives for a total of $5.011 million which represented 41% of total imports. Brazil imported 40% of its energy requirements. Imported crude oil amounted to 263 million barrels in 1975, an increase of 8.7% over that of 1974.

Brazil did not send an observer to the October meeting in London of the iron ore exporting countries and indicated unwillingness to join an organization which sought to emulate the oil producer's cartel. Previously Brazil stated that it would be opposed to any policy of confrontation advocating instead a cooperative arrangement which included importers as well as exporters of iron ore. Brazilian officials emphasized that Brazil was rapidly and heavily investing in expanding its iron ore output and would be seriously affected by quotas to achieve price levels. It was pointed out further that mining projects had the participation of large multinational iron ore consuming companies, another factor working against a successful cartel.

Data on mineral exports and imports are given in tables 2 and 3.

Table 2.—Brazil: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
METALS			
Aluminum:			
Bauxite and concentrate	4,629	24,192	Mainly to Argentina.
Oxide (alumina) and hydroxide [1]	1,903	4,899	Argentina 3,631; Mexico 986.
Metal including alloys:			
Semimanufactures	138	367	Chile 235; Paraguay 76.
Antimony:			
Metal including alloys, all forms	34	10	All to Nicaragua.
Beryl ore and concentrate	1,210	640	Mainly to United States.
Chromium, chromite	34,924	13,378	Mainly to Japan.

COMMODITY REVIEW

METALS

Despite a varied and substantial mineral resource base, Brazil had not achieved self-sufficiency in aluminum, lead, copper, zinc, nickel, and tin. In January 1975, the Government of Brazil announced a 10-year plan requiring investment of $5.3 billion for developing the country's nonferrous metal industries as part of its import substitution program. The objective of the plan was to become self-sufficient in supplies of copper, lead, and zinc, with an exportable surplus of aluminum, nickel, and tin.

Aluminum.—Brazil was in the process of exploiting its potential for becoming a leading producer and exporter of bauxite and aluminum because of large deposits, estimated to be in excess of 3 billion tons, and the hydroelectric potential in the Amazon region.

Output of bauxite increased 13% in 1975 ranking Brazil 15th among world producers. All of the country's output of bauxite came from limited reserves of three major companies in Minas Gerais. Although imports of aluminum increased markedly in 1975, this situation was expected to reverse itself by the end of the decade. According to Brazil's new nonferrous metal plan, total aluminum output of 1.4 million tons per year was planned for 1983.

A number of national and foreign entities were actively exploring bauxite deposits in the Trombetas area east of Manaus and north of the Amazon River. Although the Trombetas bauxite was first discovered by Aluminum Company of Canada Ltd. (ALCAN) geologists in 1966, mining and investment plans were initiated only recently.

By late 1975 financing arrangements were completed for the Trombretas project of Mineração Rio do Norte S.A. The firm, established in June 1974, is an international consortium of CVRD and Companhia Brasileira de Alumínio (CBA) (of the Votorantim Group) each with shares of 41% and 10%, respectively, Alcan Aluminium Ltd. with a 19% interest, and six other partners each with a 5% interest.

The Mineração Rio do Norte project was estimated to cost $260 million, up from the 1971 capital cost estimate of $90 million, for a 3.35-million-ton-per-year facility for crushing, washing, and drying. It included a self-sufficient community for 3,000 people as well as a shipping port on the Trombetas River north of the bauxite deposits. One million tons of bauxite were scheduled for shipment to foreign partners in 1978, 3 million tons in 1979, and 3.35 million tons per year thereafter. Plans were being developed to increase production to possibly 8 million tons per year by the early 1980's.

During the year financial negotiations continued relative to the agreement signed on September 17, 1974, creating Alumínio do Brazil S.A. (ALBRAS), owned 51% by CVRD and 49% by the Light Metal Smelters Association of Japan with the participation of Nippon Light Metals Company, Ltd., Showa Denko K.K., Sumitomo Chemical Co., Ltd., Mitsubishi Chemical Industries Limited, and Mitsui Aluminium Co., Ltd. ALBRAS planned to construct a major alumina-aluminum complex 40 kilometers southwest of Belém and 1,028 kilometers away by barge from the Trombetas bauxite source to the west.

The complex estimated to cost $3 billion included a 1.3-million-ton-per-year alumina plant, a 640,000-ton-per-year aluminum smelter, and a 2,700-megawatt hydropower plant on the Tocantins River, 350 kilometers south of Belém. By yearend the Japanese group was negotiating to scale down the ALBRAS project to a 320,000-ton-per-year smelter with a proportionate reduction in the alumina plant.

To meet Brazil's growing demand for aluminum, plans were made to expand four existing smelters that have a total capacity of 130,000 tons of primary aluminum per year. The 30,000-ton plant at Poços de Caldas operated by Companhia Mineira de Alumínio (ALCOMINAS) (with 51% Alcoa interest) was being doubled in size. CBA was also doubling its 45,000-ton plant at Sorocaba. By the second half of 1975, ALCAN expanded its wholly-owned aluminum smelter at Aratú near Salvador, Bahia from 14,500 to 28,100 tons per year. A further expansion to 56,200 tons per year was foreseen by 1977. ALCAN's other Brazilian smelter at Saramenha was planned for expansion from 32,000 to 60,000 tons by 1978.

Beryllium.—Brazil was one of the most important sources of beryl among market economy countries. Most of the beryl was exported to the United States and in smaller quantities to Japan. Brazil supplied 50% of the beryl imported into the United States.

All beryl output was from small operators who selectively mine pegmatite deposits, mainly in the States of Minas Gerais, Paraíba, Bahia, and Rio Grande do Norte. The State of Minas Gerais has been the leading producer with an output fluctuating between 45% and 75% of the country's total.

Chromite.—Brazil has become a significant exporter of ferroalloys. Exports have increased from 17,700 tons in 1970 to 61,000 tons in 1975; one-half of the tonnage was accounted for by ferrochromium. The largest domestic producer of beneficated chromite and low- and high-carbon ferrochromium was Companhia de Ferro-Ligas da Bahia, S.A. (FERBASA).

Chromite reserve are located principally in Bahia and are estimated to contain 30 million tons of 40% Cr_2O_3. FERBASA operated two mines near Campo Formoso, 470 kilometers northwest of Salvador. In a separate project, FERBASA was moving forward in a joint venture with a group of Japanese firms which plan to produce 1.5 million tons of concentrates over a 10-year period.

Columbium.—Brazil maintained its dominant position as the world's leading producer of columbium minerals, accounting for about 85% of world mine production. The country's leading producer was Companhia Brasileira de Metalurgia e Mineração (CBMM), owned 50.5% by the Moreira Salles group, 33.5% by Molybdenum Corp. of America and 16% by Pato Consolidated Gold Dredging Ltd. CBMM continued to recover columbium concentrate from pyrochlore ores at its Araxá mines in Minas Gerais and to produce ferrocolumbium by the thermite process at its pyrometallurgical plant. The principal market for exports of the concentrate and the alloy was the United States.

During 1975 CBMM facilities at its three open pit mines and plant at Araxá were undergoing expansion to increase production from 20,000 to 36,000 tons per year of pyrochlore concentrate by yearend 1976. The expansion of the metallurgical plant was completed in 1974, increasing capacity to 12,000 tons per year of ferrocolumbium.

Total ore reserves of the Araxá deposit were estimated by CBMM at almost 400 million tons containing 3% to 4% Cb_2O_5, making it the largest pyrochlore ore body in the world. This was a minimum estimate since the extent of the deposit had not been fully determined.

Copper.—The only important copper mine in operation, Camaqua in Rio Grande do Sul was operated by Companhia Brasileira de Cobre, S.A. (CBC), and produced about 225,000 tons of ore in 1975 containing less than 1% copper. This company also operated a smelter and refinery at Itapeva, São Paulo.

During 1975, CPRM completed exploration of the Vale do Curaçá copper deposit in the copper region of Northern Bahia. Reserves were estimated at 100 million tons of ore averaging 1% copper content.

Although the State of Bahia has 80% of Brazil's copper reserves, their exploitation continued to be delayed. Reserves at the Caraíba deposit in Bahia were estimated at 45 million tons of ore grading 1.3% copper. In 1975 a State-owned company assumed control of Caraíba Metais S.A., part of the Grupo Minero Pignatari, which had been set up to exploit this deposit. It was estimated that production in this area would not begin in less than 5 years.

The Government made preliminary plans to build one or possibly two copper smelters using primarily imported concentrates. Late in 1975 missions were sent to Chile and Peru to formalize import agreements with these countries.

With Brazil's large electrical power program, there was a critical need for copper, which was given the highest priority in the Nonferrous Plan. Imports of copper ran about 72% of consumption and were a factor in Brazil's unfavorable trade balance. Refined copper consumption was 155,200 tons in 1975, a decrease from 173,900 tons in 1974. For the immediate future Brazil was expected to remain heavily dependent on imports.

Iron Ore.—Brazil had remained the leading producer of iron ore in Latin America since 1964 when it surpassed Venezuela. Production of iron ore in 1975 reached a new record, 19% over that of 1974.

Brazil was also a major worldwide exporter of iron ore and ranked second to Australia. Exports increased sharply in value in 1975 to $921 million, an increase of 61% over those of 1974. The price of iron ore increased by 33% to $12.92 per ton. Within Brazil's export sector, iron ore ranked fourth in importance as a foreign exchange earner. Brazil had a major position in world iron ore with reserves estimated at 26 billion tons, which includes the most recently discovered deposits in the Serra dos Carajás. CVRD, organized in 1942 and 80% owned by the Government, was the most important organization in Brazilian mining and the world's largest producer and exporter of iron ore, a position achieved in 1974. In a decade of extraordinary growth, CVRD increased production from 11.7 million tons in 1965 to 52.2 million tons in 1975; the 1975 output was 22% over the 42.7 million-ton output of 1974. During the same decade exports increased five times, from 8.9 million tons in 1965 to 47.3 million in 1975.

In the Iron Ore Quadrangle near Itabira, Minas Gerais, CVRD operated five mines—Cauê (the most important), Conceição, Dos Corregos, Periquito, and Picarrão—with ore grades ranging from 51% to 68% iron. The installed mining capacity of this group, was projected to reach 71 million tons in 1976, 84 million tons in 1977, and 104 million tons in the early 1980's. The Conceição mine was being equipped with a new concentrator to be ready in 1977, similar to the one installed at the Caue mine in 1972.

During 1975, CVRD operated two iron ore pellet plants at the port of Tubarão in Espírito Santo State with a total capacity of 5 million tons per year and had formed companies with the Government-owned Companhia Siderúrgica Nacional (CSN) and foreign entities to construct and operate seven new pellet plants with a total capacity of 28 million tons annually giving an overall capacity of 33 million tons by 1978.

Mineraçoes Brasileiras Reunidas S.A. (MBR), owned 51% by the Brazilian mining company Emprendimentos Brasileiros de Mineração S.A. and 49% by St. John d'El Rey Mining Co. Ltd., which was two-thirds owned by the M.A. Hanna Mining Co., was Brazil's newest and second-ranking ore producer. In 1975 MBR shipped 9.9 million tons of ore. During 1975 MBR was undergoing expansion to reach its planned operating capacity of 11.5 million tons per year from its Aguas Claras mine located just south of Belo Horizonte which started up in July 1973. Plans indicate staged expansion of Aguas Claras to 15 million tons in 1977 and 25 million tons in 1982. MBR also operated two other mines in the Iron Ore Quadrangle, Pico de Itabirito and Matuca, which shipped about 2.2 million tons in 1974. Furthermore, the company was studying the possibility of increasing output to 5 million tons per year at each of these two mines.

Another iron ore producer, Cia. de Mineração Ferro e Carvão (FERTECO), owned by a consortium of West German steel companies led by the August Thyssen-Hütte AG, continued its second phase of expansion which began in March 1974. Construction of the new concentrator and pellet plant at the Fabrica Mine near Congonhas do Campo was expected to be completed by late 1976 with an annual production capacity of 2.5 million tons of pellets and 2.5 million tons classified as blast furnace ore and sinter. Expansion of facilities at the Corrego de Feijao mine to 3 million tons per year was in the planning phase. Exports by FERTECO were handled by CVRD at the Tubarão port.

One of the important developments during 1975 was the start of construction of the $400 million project of SAMARCO Mineração S.A., owned 51% by S.A. Mineração da Trindade (SAMITRI) and 49% by the Marcona Corp. The SAMARCO project, scheduled for completion in 1977, included development of the Germano mine southeast of Belo Horizonte in the Iron Ore Quadrangle, a 5-million-ton-per-year pelletizing facility, and a 404-kilometer, 20-inch-diameter slurry pipeline connecting the concentrator to the new port of Ponta Ubu in Espírito Santo, south of Vitória and CVRD's Port Tubarão. The pipeline will be capable of transporting 12 million tons of concentrate slurry per year.

Plans were announced during 1975 for exploitation of the large iron ore deposit in the Serra dos Carajás discovered in 1967, in east-central Pará State about 550 kilometers southwest of Belém. A joint company, Amazonia Mineração S.A. (AMZA), owned 51% by CVRD and 49% by Cia. Meridional de Mineração S.A. (a wholly-owned subsidiary of United States Steel

Corp.), was created in 1970 to develop the extensive Carajãs reserves estimated at 15.7 billion tons of ore grading 60.9% iron. Initial production from the first phase of development was scheduled for 1980 at the 12-million-ton-per-year level; output of 50 million tons was targeted for 1985 requiring an overall investment of $3 billion. The British Steel Corp. along with Spanish and Japanese companies were negotiating for a 20% participation with AMZA in a five-nation project.

Early in 1975, Kawasaki Steel Corporation and four other Japanese firms jointly acquired an interest in Minas de Serra Geral S.A., a Brazilian iron mining firm. The Japanese consortium planned feasibility studies on the $100 million Capanema project to produce 6 million tons per year of iron ore. The output will mainly feed the planned Tubarão steelworks.

Iron and Steel.—Brazil maintained its position, first achieved in 1966, as the largest steel producer in South America, taking advantage of its large high-grade iron ore resources. The steel sector was composed of 7 Government-controlled mills and 31 private producers, some of which operated semiintegrated, low-capacity, miniplants.

In the early part of 1975, the Brazilian steel industry had only modest growth because of continued shortages of imported coking coal and interruptions caused by the installation of new equipment. By mid-1975 the coking coal shortage was alleviated and total steel ingot production continued its historical uptrend. Total production of ingot steel in 1975 of 8.3 million tons represented an 11% increase over that of 1974 and almost triple the output of 3.0 million tons in 1965, a decade before. This output represented 45% of Latin America's total steel production of 18.2 million tons for 1975. But the 1975 output fell short of the 9.5 million tons that had been projected by steel industry planners.

Despite the increase in production, Brazil suffered steel shortages during 1975, especially in the automotive and construction industries. The rapid growth of internal demand required a large increase in pig iron and steel imports which amounted to $1.3 billion in 1975. On the basis of major expansion programs underway in 1975, Brazilian steel planners expected internal demand to be satisfied by domestic mills by 1978; thereafter, Brazil was expected to be a net steel exporter.

By yearend 1975, Brazil had almost completed Phase I of the 10-year National Steel Expansion Plan, and initiated Phase II. This plan announced in 1970 had the goal of more than tripling Brazil's steel output from 5.4 million ingot tons in 1970 to 20 million tons by 1980. Early in 1975 this target was increased to 24 million ingot tons by 1980, but by yearend the Government again revised its expansion targets to 40 million tons of steel products annually by 1985. The National Steel Council—Conselho Nacional de Não-Ferrosos e Siderúrgia (CONSIDER)—was established as the principal planning agency for the steel sector.

Brazil's success in implementing its steel expansion program depended upon obtaining external financing. During 1975 commitments for financing the Phase III expansion program were obtained from France, the United Kingdom, West Germany, Japan, Australia, Finland, and Spain. The aim of the Phase III was to increase raw steel capacity of the three major producers: CSN, Companhia Siderúrgica Paulista (COSIPA), and Usinas Siderúrgicas de Minas Gerais (USIMINAS) from 7.2 million to 11.4 million tons per year by 1980, in order to make Brazil largely independent of imports.

In June CSN received development loans from the World Bank and the Inter-American Development Bank totaling $158 million to help finance Stage III expansion of the CSN steel plant at Volta Redonda west of Rio de Janeiro, and its iron mines at Casa de Pedra. This expansion was expected to raise raw steel production capacity from 2.4 million to 4.4 million tons per year, and increase mine production up to 9.2 million tons of iron ore. The cost of the overall plant and mine expansion was estimated at $2.1 billion. Estimated completion date was 1979.

COSIPA, 82% owned by the Federal Government, was granted $100 million in joint loans from the World Bank and the Inter-American Development Bank in July to help finance the Stage III expansion of its steel mill at Cubatão situated 70 kilometers from São Paulo and 20 kilometers from the port of Santos. The overall project, estimated to require financing of $1.4 billion was designed to increase COSIPA's capacity from 2.3 million to 3.5 million tons of raw steel per year. The estimated completion date was 1980.

In view of the equity participation by Government agencies in a number of steel operations, Siderúrgica Brasileira S.A. (SIDERBRAS) was established in 1973 to consolidate the Government's steel investments in a holding company. SIDERBRAS first acquired the Government's share in CSN, Usina Siderúrgica da Bahia S.A. (USIBA), Cía. Siderúrgica de Mogi das Cruzes (COSIM), and Aços Finos Piratini. By yearend 1975, the Government's shares in USIMINAS, COSIPA, Companhia Aços Especiais Itabira (ACESITA), and Companhia Ferro e Aço de Vitória (COFAVI) were also transferred to SIDERBRAS.

Late in 1975 work began on the feasibility study by Nippon Steel Corporation and SIDERBRAS of the new Itaqui mill to be located near the northern port of São Luis, State of Maranhão. The cost of the 3-million-ton-per-year first stage was estimated at $1.8 billion. The iron and steel works envisioned for Itaqui would be one of the world's largest with an eventual capacity of 16 million tons per year of semifinished and rolled products. Preliminary Stage I plans called for an initial annual capacity of 4 million tons by yearend 1980. The Itaqui complex was to be synchronized with development of the large iron ore deposits at Carajás in the adjacent State of Pará.

Construction was begun on the new iron and steel plant at Tubarão, operated by CVRD. The Tubarão steel project was a joint venture of SIDERBRAS and CVRD with 51% equity and Kawasaki Steel of Japan and Società Finanziaria Siderúrgica S.p.A. (Finsider) of Italy with 24.5% participation each. The estimated cost of the 3-million-ton first stage for the production of slabs was revised to $1.8 billion up from the earlier estimate of $743 million. Stage I was scheduled for completion by 1978 while the eventual capacity of 6 million tons was planned for 1980. In addition to the iron and steel plant approved by CONSIDER in 1974, the new Tubarão steel center was to have at least six new pelletizing plants and two rolling mills.

Brazil and Mexico signed an agreement in mid-1975 to make joint investments to develop their respective steel industries. The agreement provided for the exchange of technical information as well as collaboration in steel production and development. Mexico may also purchase Brazilian iron ore and participate in Brazilian mining operations. Mexico offered to provide information on gasification of bituminous coal for steel industry use.

Ferroalloys.—Early in 1975, the Association of Brazilian Ferro-Alloy Producers (ABRAFE) published its long-range ferroalloy forecast. It projected ferroalloy production, consumption, and trade to 1982, with the main conclusion that Brazil's near self-sufficiency would continue and could develop into a net export position. There was a slight decrease in total ferroalloy production in 1975 but since 1969 the average growth rate was over 22% per year. Expansion was favored by abundant hydroelectric power.

Lead.—Despite modest progress, Brazil continued to depend on imports to satisfy internal demand. About 95% of Brazil's lead ore was produced by two companies: Ciá. Brasileira de Chumbo (COBRAC), a wholly-owned subsidiary of Le Nickel Peñarroya Mokta Group, which operated the Boquira mine in Bahia, and PLUMBUM, also a subsidiary of Peñarroya, which operated the Panela deposit in Paraná.

COBRAC was planning a 13,000-ton expansion of its existing 44,000-ton-per-year smelter at Santo Amaro for 1978. Tonalli S.A. was planning a new 40,000-ton secondary smelter at Jacarei scheduled for production in 1977.

Although lead was included in Brazil's Nonferrous Plan, it was considered less critical than copper or zinc and given less priority because of the smaller impact on Brazil's balance of payments.

Manganese.—Brazil continued as one of the major producers of manganese ore in the world; output was at the level of recent years. Brazil was the prime source of manganese ore imports of the United States, supplying 36% of requirements. Exports of manganese, traditionally Brazil's second largest mineral export, were 1.56 million tons valued at $80.6 million during 1975. The 4% decline in export volume for 1975 was caused by depressed steel demand worldwide.

The major producer and exporter since 1957 of manganese ore and pellets was Industria e Comercio de Minerios S.A. (ICOMI), a joint venture of Companhia

Auxiliar de Empresas de Mineração (CAEMI) of the Antunes Group, and Bethlehem Steel Corp., which operated an open pit mine at the Serra do Navio deposits north of the Amapari River in Amapá Territory.

Late in 1975, ICOMI entered into an agreement with the Brazilian Government to limit exports of high-grade ore and pellets to 1.2 million tons per year, equal to the average yearly exports from the Serra do Navio deposit during most of the past decade. Considering that ICOMI's high-grade, easily transportable ore reserves in Amapá would last only 10 years at the 1975 rate of production, the Government had expressed concern for future supplies of manganese for Brazil's growing steel industry. ICOMI, believed to be the only exporter in 1975, received slightly more than $50 per ton for its ore that year, compared with $33 per ton in 1974 and $24 per ton in 1973.

The Brazilian Government increased its prospecting efforts for manganese ore and was conducting research on utilization of the country's lower grade ores.

DNPM announced the discovery of a large deposit of high-grade manganese ore near the Venezuelan border at Morro de Sete Lagoas in the Uaupes District about 40 kilometers from the Rio Negro, a navigable tributary north of the Amazon River. The size of the deposit was estimated at 25 million to 30 million tons of ore with grades of 47% to 51% manganese. The ore body was also reported to contain 1.0% to 4.0% columbium.

Based on incomplete work by Amazonia Mineração S.A., reserves of about 12 million tons of 40% manganese were identified by mid-1975 at a location 10 kilometers southwest of the original Carajás iron ore discovery site. This discovery had significance because it could be tied into the transportation system to be set up for the Carajás iron ore. Considering this discovery and that in the Uaupes District, total reserves of manganese ore in Brazil were estimated to be 194 million tons. This total does not include a more recent find in Rondônia State, whose grade and extent were being evaluated.

Nickel.—Brazil was primarily a producer of ferronickel in 1975 at a level which did not vary significantly from recent years. There was a sharp 95% increase in imports of unwrought nickel, none of which was produced locally. Empresa de Desenvolimento de Recursos Minerais (CODEMIN) (a subsidiary of Brasimet which in turn is owned by the Hochshild Group and French interests including Le Nickel) operated Mineração Morro de Niquel which produced 97% of Brazil's nickel output from a mine in Minas Gerais.

CODEMIN had a new project in the evaluation stage to produce 12,000 tons per year of electrolytic nickel. An investment of $140 million was estimated. By yearend, CODEMIN was considering cutting back planned capacity to 5,000 tons per year. CODEMIN was negotiating with the Brazilian Ministry of Mines and Energy to provide low-cost energy for its electrolytic project under a formula of sliding rates based upon the international price of nickel.

BAMINCO Mineração e Siderúrgia S.A., a joint venture of the International Nickel Co. of Canada Ltd., a West German consortium led by Metallgesellschaft AG, and minority Brazilian participation, was planning a project at Barro Alto, Goiás, 140 kilometers northwest of Brasília. The BAMINCO project would produce 60,000 tons per year of high-grade ferronickel principally for export. Reserves were estimated at 33 million tons of 1.94% contained nickel.

Tin.—Tin was one of the few metals produced in Brazil, from both domestic and imported concentrates, 150% in excess of domestic demand. Over the last decade, production of cassiterite concentrate (66% Sn) has doubled from 2,459 tons in 1965 but was still not sufficient to meet national requirements. Although tin mineralization is widespread in Brazil with primary deposits in Rondônia, Mato Grosso, Goiás, Amazonas, and Pará, two-thirds of the output was mined from eight alluvial deposits in a band south of Porto Velho in the remote Rondônia tin district east of the Bolivian border, where cassiterite was first discovered in 1952.

Brazil's six domestic tin smelters, located mostly around São Paulo and Rio de Janeiro, imported substantial quantities of cassiterite mostly from Bolivia in order to meet domestic demand for tin as well as overseas demand. Smelter production in 1975 increased 37% over the 1974 output.

Companhia Estanifera do Brasil (CESBRA) operated the largest electrolytic tin refinery at Volta Redonda with a yearly capacity of 6,800 tons.

The Brazilian Government was interested in stimulating prospecting for tin and was considering the potential for enlarging the reserves in Rondônia, Pará and Amazonas. Studies under the RADAM mapping project indicated that occurrences of cassiterite-mineralized granites are larger than originally believed, particularly along the Xingu-Aripuana belt. During 1975 six Brazilian companies were financed through CPRM to prospect for tin.

Titanium.—Early in 1975 CVRD announced plans for a major phosphate fertilizer plant at Tapira, Minas Gerais, a major byproduct of which would be anatase. Reserves were reported to contain 45 million tons of TiO_2. Association with the Japanese Ishihara group in the titanium venture was a possibility. A pigment plant, if constructed, would be operative in 1978 or early in 1979.

Tungsten.—Brazilian production of tungsten concentrate, averaging 70% WO_3, came primarily from the Currais Novos-Lages "tungsten quadrilateral" in the States of Rio Grande do Norte and Paraíba in northeast Brazil. In 1975 there was a minor increase in output over that of 1974. The major producer was Mineração Tomaz Salustino S.A. (MTS), which operated the Brejui mine in Rio Grande do Norte with a 600-ton-capacity gravity concentration plant at the mine site.

Late in 1975 it was reported that MTS would enter a joint venture with Nittetsu Mining Co., Ltd., and Kanematsu Gosho, Ltd., of Japan to set up a new tungsten mine. Construction of a pilot plan to produce 70% to 75% scheelite concentrate from 0.2% tungsten ore was scheduled for May 1976. The two Japanese companies with equity participation of 35% and 14%, respectively, would receive 90 tons of the scheelite annually when the plant operates at full production.

The Brazilian Government participated as an observer at the meeting of International Tungsten Producers Association held in La Paz, Bolivia, in April 1975.

Uranium.—In response to its energy problems, Brazil initiated a nuclear energy program which it hoped would make the country one of the significant producers of nuclear power in the world by the end of the century. Brazil's first 625-megawatt plant was scheduled for testing in 1977 and for completion by 1978. Government planners have set targets of 10,000 megawatts of installed capacity by 1990 and up to 70,000 megawatts by the year 2000.

Although Brazil has abundant thorium, uranium reserves were not so well established. Total measured uranium reserves at yearend 1975 were estimated at 10,000 tons of U_3O_8 located in the Poços de Caldas region of Minas Gerais and the Figueira area of Paraná State. Uranium was extracted in small quantities from a mine at Cercado near Poços de Caldas. A pilot plant to produce U_3O_8 (yellow cake) was inaugurated at Poços de Caldas in December 1974. A 500-ton-per-day mill was expected to produce 240 tons per year of U_3O_8 by yearend 1977.

Exploration for uranium was conducted at some 50 locations throughout the country under the auspices of Empresas Nucleares Brasileiras S.A. (NUCLEBRAS). The prospecting budget for 1975 was $19 million compared with $9 million in 1974.

Zinc.—Output of zinc ore increased by 30% over that of 1974, but Brazil still produced only about 38% of its demand for zinc in 1975. Smelter output increased by only 3%. During 1975 two companies, Companhia Mercantil e Industrial Inga, and Companhia Mineira de Metais of the Votorantim group, operated smelters using concentrates of silicate ores from their mines in Vazante, Minas Gerais. The new or expanded smelter capacity being planned follows:

Company	Location	Type of plant	Date available	Annual capacity (metric tons)	Remarks
Mineira de Metais	Tres Marias	Electrolytic	1978	12,000	Continued expansion of existing plant of 38,000 tons.
Paraibuna de Metais	Juiz de Fora	do	1980	30,000	New plant.
Metamig	Paracatu-Morro, Agudo	do	1980	35,000	Do.

Supplying the smelters with domestic zinc concentrates may be a problem since zinc reserves were considered to be critically short. Zinc received priority second only to copper in the nonferrous group for exploration and development. The Nonferrous Plan projected 315,000 tons per year of zinc production for 1983, requiring investments of $218 million.

The largest known zinc deposits in Brazil were located in the counties of Januaria and Vazante, Minas Gerais. A statement from the Ministry of Mines and Energy early in 1975 specified total known metallic zinc measured reserves of 1.6 million tons which would be sufficient until 1992 at the 1975 rate of consumption.

NONMETALS

Cement.—Brazil's production of cement increased 17% to about 17.4 million tons in 1975. The production of cement continued its steady, strong growth over the last 8 years, making Brazil practically self-sufficient in this commodity.

The new Pedro Leopoldo plant (located in Minas Gerais) of Cimento Nacional de Minas S.A. (CIMINAS) with a capacity of 1.0 million tons per year had its first full year of operation in 1975. This was the largest single cement producing facility in Brazil. Holderbank of Switzerland had equity participation in CIMINAS.

Fertilizer Materials.—The need to import fertilizer materials has been a significant factor in Brazil's foreign trade deficit. Only about 30% of nitrogenous and phosphatic fertilizers consumed in the country were derived from domestic sources in 1975. Brazil produced no potash. Brazil hopes to achieve self-sufficiency in the three basic fertilizer nutrients under the Government's Fertilizer Plan to be completed by 1980. The plan, requiring investments of $1.3 billion, is summarized as follows in thousand tons:

	N	P_2O_5	K_2O	Total
Apparent consumption in 1973	355	790	534	1,679
Annual production in 1973	156	301	--	457
New projects underway	200	480	--	680
Additional projects per fertilizer plan	1,080	1,130	1,000	3,210
Projected production in 1980	1,436	1,911	1,000	4,347
Projected demand in 1980	1,400	1,600	1,000	4,000

Government-controlled companies played a major role in fertilizer production and were expected to increase their role in the future. Practically all nitrogenous fertilizers were produced at three plants operated by Petrobrás Quimíca S.A. (PETROQUISA), a subsidiary of the 75% Government-owned Petróleo Brasileiro S.A. (PETROBRAS); two plants were at Cubatão, São Paulo, and the third at Camaçari, Bahia.

An outcome of CPRM'S priority exploratory efforts, and the major event of 1975 for that entity, was the confirmation of the extent of a major phosphate deposit at Patos de Minas in Minas Gerais. Measured reserves of 256 million tons and indicated reserves of 87 million tons, together, had an average grade of 13% P_2O_5. Additionally there were inferred reserves of 110 million tons. CPRM was constructing a 150,000-ton-per-year prototype beneficiation plant scheduled for completion in March 1976. By 1977 annual production was expected to be increased to 300,000 tons of concentrates. The Patos deposit may have the ability to provide a phosphatic material suitable for use as a direct-application fertilizer.

The single potash project located at Carmopolis, Sergipe, was expected to have 50% participation by PETROQUISA and called for production of 1 million tons of K_2O per year. Although the potassium salt beds were discovered in 1965 while drilling an oil well, exploitation of the deposits had been delayed because of concern by PETROBRAS that the proposed mining methods would interfere with petroleum activities in the area.

Magnesite.—Magnesita S.A. planned to invest about $25 million to increase output of its magnesite mine at Brumado, State of Bahia, and to expand production of refractory materials at its Belo Horizonte plant from 190,000 to 290,000 tons per year.

Quartz.—Brazil, virtually the world's only exporter of electronic-grade quartz crystal and lasca (lower quality quartz crystal chips), took action to establish a domestic manufacturing industry to produce cultured quartz, oscillators, and fused quartz products.

The Government continued its program of export quotas instituted in October 1974 and established for 1975 an export quota of 3,500 tons for lasca. Exports of high-quality quartz crystals continued to be free of controls. For lasca exports, Carteira de Comercio Exterior do Banco do Brasil (CACEX) established a schedule of minimum export prices: $6.00, $3.50, and $1.60 per kilogram f.o.b. for first, second, and third lasca grades, respectively. The minimum export prices made the cost of lasca to foreign purchasers as much as 10 times those of the prior year. An export tax of 40% ad valorem based on the f.o.b. price of lasca exports was required to be paid into a Central Bank fund for furthering domestic research and development of manufactured quartz products.

Sodium Compounds and Chlorine.—Companhia Nacional de Álcalis (CNA) was the only producer of soda ash in Brazil from a plant at Cabo Frio in the State of Rio de Janeiro. Planning continued on the new soda ash project of Alcalis do Rio Grande do Norte S.A. (ALCANORTE) to be located at Macau, Rio Grande do Norte, on the Atlantic coast near existing solar salt operations. ALCANORTE was set up as a joint venture of CNA and Akzo Zout Chemie of the Netherlands. The plant at Macau was to have a capacity of 200,000 tons of soda ash per year. Initial output was expected during 1978.

The Dow Chemical Co. began construction of Phase I of its 150,000 ton-per-year chlor-alkali complex near the new port of Aratú on the Bahia Coast. The plant, estimated to cost $250 million, was to initiate production in mid-1977 and achieve full production capacity during 1978. Phase II of the project was expected to come onstream in 1979. Dow was to supply its own raw material from salt wells on the island of Matarandiba near Aratú.

MINERAL FUELS

Coal.—After years of stagnation, Brazil's coal industry was undergoing a vigorous revival through mechanization, new mines, and increased manpower devoted to the sector. By 1978 metallurgical coal production was projected to reach 2.5 million tons per year. Nonetheless Brazil's ambitious steel expansion program would still rely mainly on higher quality imported coal.

Three States in southern Brazil contained practically all of the known coal reserves. Two of the States, Santa Catarina and Rio Grande do Sul, accounted for almost all of the production, while Paraná was marginally important for some steam coal. Of 22 operating mines in the 3 States, all but 3 were underground. The following table gives a summary of coal reserves:

	Reserves (million tons, measured, indicated, and inferred)	Type
Rio Grande do Sul	3,746	Subbituminous.
Santa Catarina	1,200	Bituminous.
Paraná	36	Subbituminous.
Total	4,982	

The hardships suffered by Brazil's steel industry in 1974 because of shortfalls in imports of metallurgical coal were largely alleviated during 1975. The Brazilian steel industry consumed 3 million tons of coal in 1975 of which 2.2 million tons was imported (chiefly from the United States, which supplied 2 million tons).

In January 1975 the Brazilian and Polish Governments signed a "protocol of intent" to barter iron ore for 14.8 million tons of coking coal over the following 11 years. It was reported that the two Governments discussed a possible Brazilian capital investment in coal production in Poland. In addition, representatives of SIBERBRAS and CVRD visited Canada, Europe, Australia, and the United States for similar discussions.

In November, Island Creek Coal Co., a subsidiary of Occidental Petroleum Corp., agreed to supply USIMINAS 5 million tons of coking coal over the next 5 years. The agreement was valued at $258 million at current prices and involved high- and low-volatile coking coal from Island Creek's Virginia and West Virginia mines.

Natural Gas.—Output of natural gas in 1975 by PETROBRAS, the Government entity with complete control of the natural gas and petroleum sectors except for marketing, was 9.2% higher than that in 1974. The production of liquefied natural gas (LNG) from two plants located in Bahia increased 14%.

Negotiations continued between Brazil and Bolivia concerning the price of natural gas to be supplied by a proposed pipeline in the amount of 240 million cubic feet per day. The natural gas pipeline would run from gasfields north and northwest of Santa Cruz, Bolivia to the border city of Corumba, Brazil, and then on to São Paulo. The Yapacani, Palometas, and Palacios gasfields near Santa Cruz were being held in reserve for the gasline to São Paulo.

Natural gas reserves of Brazil at yearend 1975 were estimated to be 915 billion cubic feet.

Oil Shale.—In October, the President of Brazil announced that PETROBRAS planned to build a commercial plant in Paraná to produce 51,000 barrels per day of petroleum from oil shale. Since mid-1972, PETROBRAS had been operating a $30 million pilot plant at São Mateus do Sul, Paraná, with a production capacity of 1,000 barrels per day of shale oil. Final approval of the project by the Board of Directors of PETROBRAS was expected early in 1976. Production cost was estimated at about $9.00 per barrel. Completion was planned for 1980.

Brazil possesses numerous oil shale deposits, the most important of which is at São Mateus located 140 kilometers southwest of Curitiba, covering an area of 64 square kilometers. The recoverable oil shale reserves in this area were estimated at 600 million barrels.

Petroleum.—Total crude oil production by PETROBRAS declined 3% below that of 1974 and accounted for only 20% of Brazil's requirements. Continued expansion of the economy widened the gap between consumption of 850,000 barrels per day and domestic production of 172,600 barrels per day (145,000 onshore and 26,600 offshore) in 1975.

Brazil's onshore production was concentrated in a cluster of coastal fields in the States of Bahia and Sergipe and was expected to remain relatively constant or decline gradually during the balance of 1970's. Onshore production in the State of Bahia accounted for 64% of the 1975 production, and offshore fields accounted for 16%. The decline in production of crude oil from the onshore fields was partially compensated by a 13% increase in production from the Continental Shelf areas.

The cost of importing petroleum and its derivatives during 1975 was estimated at $3.1 billion on an f.o.b. basis, compared with $2.8 billion in 1974 and $711 million in 1973, and was almost equal to the size of Brazil's large foreign trade deficit. Imports of crude oil amounted to 263 million barrels in 1975, compared with 242 million barrels in 1974, while imports of petroleum products amounted to 4.3 million barrels in 1975, compared with 20 million barrels in 1974.

During the year plans proceeded on the development of a submarine production system for the offshore Garoupa oilfield in the Campos Basin and two nearby structures. The production potential of the Garoupa and surrounding fields was intially estimated at 200,000 barrels per day. Initial production from the temporary subsea system was planned for early 1977 with a rate of 40,000 to 50,000 barrels per day expected by late 1977.

Six new offshore oilfields were discovered in 1975: Pargo, Badejo, and Namorado (all in the Campos Basin), Tainha (Sergipe), Cavala (Alagoas), and Agulha (Potiguar Basin, Rio Grande do Norte). Investment in exploration activities amounted to $370 million. PETROBRAS drilled 88 exploratory wells in 1975, 11 of which produced oil and 3 produced gas.

The most favorable forecasts set Brazil's onshore production at 200,000 barrels per day by 1980. On the basis of expanded exploration and development efforts, it was estimated that output from offshore fields in the Campos Basin and the Ubarana Fields as well as smaller fields off of Sergipe, Bahia, and Espírito Santo could reach 500,000 barrels per day by 1980.

A significant event in October 1975 was the abrupt ending of the 22-year exclusion of private capital in Brazilian exploration and production operations when the Government authorized PETROBRAS to enter into service contracts with foreign companies. The contracts with the private companies were to be a risk-bearing type in which contractors assume the costs of exploration and drilling and can recover their investment only as commercial production is established. The areas defined to be explored by foreign oil companies on a risk contract basis included parts of the Amazon River Delta and portions of the Continental Shelf off the States of Rio Grande do Sul, Maranhão, and São Paulo, along with onshore tracts in the lower and middle Amazon.

Petroleum reserves officially estimated at yearend 1975 were 782 million barrels, a slight increase of 4 million barrels over 1974 yearend figures.

Refining.—PETROBRAS operated nine refineries during 1975 accounting for 98% of the country's refining capacity. Construction continued on two new refineries: One at Araucaria, Paraná, with capacity of 125,800 barrels per day and the other at São José dos Campos, São Paulo, rated at 188,700 barrels per day. Both refineries were scheduled for completion in 1977.

When the new refineries start up and expansion plans for the refineries at Betim Duque de Caxias, Manaus, and Canoas are completed in 1979, Brazil's refinery capacity will increase to over 1,440,000 barrels per day from 986,300 barrels per day in 1975.

Petrochemicals.—In 1975, the Industrial Development Council of Brazil approved the creation of a third petrochemical complex near the Canoas refinery in the State of Rio Grande do Sul. The two complexes already established were at São Paulo and at Camacari in the State of Bahia.

Early in 1975 Dow Quimica S.A., a subsidiary of The Dow Chemical Co., submitted a letter of intent to the Brazilian Government to build a 400,000 ton-per-year ethylene plant at the Camacari complex using naphtha feedstocks and downstream production units for chemicals, plastics, and agricultural products. The estimated $500 million investment would be phased over a 10-year period.

The Mineral Industry of Bulgaria

By Tatiana Karpinsky [1]

Bulgaria's economy continued to grow in 1975. According to official Bulgarian sources, the national income in 1975 increased by 9% in comparison with that of 1974, reaching L14,289 million,[2] and the value of gross industrial production increased 9.9%.[3] Capital investment in the economy totaled approximately L4.6 billion in 1975, an increase of about 1.8% over that of 1974.

In 1975, the ratio between industrial and agricultural production reached 4.3 to 1. The most significant sectors of Bulgaria's economy remained its machine-building and metallurgical industries. In 1975, machine-building production increased 14.8%, ferrous metallurgy output increased 14.3%, and the production of the chemical industry increased 11.9%. In 1975, the machine-building industry accounted for about 24% of the overall industrial output, and the metallurgical industry for about 7%.

The number of industrial workers and employees in state enterprises totaled 1,153,000 in 1974. The number of workers and employees in state mineral and energy enterprises by branch follow:[4]

Branch	Workers and employees (thousands)
Fuel industry	52.6
Ferrous metallurgy (including ore mining)	30.0
Engineering and metalworking industry	320.7
Production of electricity and steam heat and power	18.1

During 1975, Bulgaria produced aluminum, copper, iron and steel, lead and zinc, coal, crude oil, natural gas, fertilizers, cement, and kaolin, among other mineral commodities; the output of most of these commodities was not of world significance.

In 1975, production of hard coal, gas, petroleum, and iron covered only a small part of domestic requirements, and about 11.6 million tons of crude oil and petroleum products, 1.2 billion cubic meters of gas, 6 million tons of hard coal, and 1.7 million tons of iron ore were imported, mostly from the U.S.S.R.[5] In comparison with 1974, imports of oil increased 6.4%, and iron ore imports rose 4.4%.

In 1975, Bulgaria participated in many multilateral investment projects of the East European countries and the U.S.S.R. Bulgaria for the 5 years (1976–80) is to continue to participate in multilateral investment projects for the development of natural gas, petroleum, asbestos, iron ore, nickel, and other mineral deposits in the Soviet Union. In exchange, Bulgaria is to receive, annually, 40,000 tons of asbestos, 2.8 billion cubic meters of gas, 650,000 tons of iron ore and concentrate, and other raw materials.

Government Policies and Programs.—Major growth areas in 1976–80 are expected to be machine building, shipbuilding, chemistry, electronics, and metallurgy. About L775.7 million is budgeted for the renovation of existing mines, and about L1.55

[1] Foreign mineral specialist, International Data and Analysis.

[2] Because of fluctuating exchange rates, a meaningful conversion to U.S. currency is impractical. Therefore, expenditures are reported in Bulgaria lev (L) and are not converted. Exchange rate June 1975: L1=US$1.03=0.71 rubles (U.S.S.R.).

[5] Vneshnyaya Torgovlya S.S.S.R. Za 1975 god (U.S.S.R. Foreign Trade for 1975), Moscow. 1975.

million for construction of new production facilities in mining and metallurgy. Among the final targets of the 7th 5-year plan (1976–80) approved by the 11th National Party Congress[6] were an increase in national income of 45%[7] and a 55% increase in gross industrial output, with a 100% growth in the machine-building industry and 80% in the chemical industry. The main emphasis of the plan is on modernization and expansion of existing plant facilities. Labor productivity in industry is expected to increase 55%. Accelerated development is planned for mineral fuel commodities and energy.

Total coal production in 1980 is to increase 33% over the 1975 level, to 37 million tons. The generation of electric energy in 1980 is to reach 38 billion kilowatt-hours and 3,000 megawatts of new generating capacity is to be added in 1976–80. In 1980, about 20% of Bulgaria's electric energy is to come from nuclear powerplants. The metallurgical industry is to be expanded and modernized. Production of steel in 1980 is to each 3.1 million tons, and output of rolled steel products, 3.7 million tons. According to Bulgarian sources, the total value of capital investment is to be about L30.7 billion[8] during 1976–80.

According to Bulgarian sources, during 1971–75 the national income of the country increased 47% (planning 45% to 50%), the gross industrial production increased 56% (planned 55% to 60%), and captial investment reached L20.7 billion (planned L20.0 billion to L21.0 billion).

The sixth 5-year plan (1971–75) was not fulfilled in all sectors according to all reports. Delays in introducing new machinery and technology and in the planned reconstruction and modernization goals led to the special emphasis in the seventh plan (1976–80) on energy and raw materials, machine building, and the chemical industry.

The 1975 plan for total industrial production was reportedly fulfilled. All ministries and departments except the Ministry of Chemical Industry and the Ministry of Supplies and State Reserves fulfilled their annual plans for total industrial production.

Percentage growth of selected indicators follows:

	1974 actual	1975 Planned	1975 Actual	1976 planned
National income	7.5	9.0	9.0	9.0
Industrial production	8.5	8.0	9.9	9.2
Machine building	13.6	--	14.8	14.4
Chemical industry	14.5	--	11.9	13.4
Construction	10.0	--	5.7	8.0
Labor productivity	6.0	8.1	8.7	8.8

PRODUCTION

In 1975, production of coal was 27.8 million tons, an increase of 14.6% over that of 1974. Included in this amount were 27.5 million tons of lignite and 330,000 tons of hard coal.[9] In 1975, over half of the lignite production came from the Maritsa-East coal basin, which is to supply 22 million tons annually by 1980 according to Bulgarian sources. In 1975, about $500 million was invested in the development and modernization of coal mines. Equipment for opencast mines was imported from East Germany and the U.S.S.R.

In 1975, production of iron ore continued to decline (it was 13% below the 1974 level), increasing Bulgaria's dependence upon imported Soviet iron ore. In 1975 the increases in output of iron, steel, and steel products compared with 1974 figures were as follows: Pig iron, 1.7%; crude steel, 3.5%; and rolled steel, 11.4%.[10] The main development targets of Bulgaria's ferrous industry in 1975 were the reconstruction and modernization of the Kremikovtsi iron and steel works. In the future, Bulgaria plans to increase investments at the rate

e Estimate. p Preliminary. r Revised.

[1] In addition to the commodities listed, bismuth, chromite, gold, silver, barite, fluorspar, magnesite, palladium, platinum, tellurium, and uranium are also produced, but information is inadequate to make reliable estimates of output levels.

of 2.5% annually to produce higher quality steels and to build two nonintegrated steel plants.

In 1975 production of crude petroleum continued to decline; crude oil production was 122,000 tons (about 15.3% below the 1974 level).[11] Crude-oil-processing capacity was 15 million tons in 1975, but only 12.5 million tons was processed.

[11] Page 78 of work cited in footnote 9.

In 1975, the second reactor of Bulgaria's first nuclear powerplant, Kozloduy, went into operation; total capacity of this plant reached 880 megawatts. This nuclear powerplant produced 2.5 billion kilowatt-hours in 1975. In 1975, total production of electrical energy reached 25.2 billion kilowatt-hours, an increase of 10.6% compared with the 1974 level.[12]

Among the more significant nonmetallic minerals, Bulgaria produced about 25,000 tons of fluorspar and 4.4 million tons of cement. In 1975, the cement output increased 1.4% compared with that of 1974.[13]

TRADE

In 1975, Bulgaria maintained trade relations with 110 countries. Bulgaria's foreign trade turnover (imports plus exports) in 1975 amounted to L9,777 million, an increase of L2,310 million, or 31.0%, over that of 1974. Total exports were valued at L4,540 million, an increase of L1,269 million, or 38.8%, and the value of imports rose to L5,236 million, an increase of L1,040 million, or 24.8%. The trade deficit decreased from L925 million in 1974 to L696 million in 1975, or 24.8%.[14]

In 1975, Bulgaria's foreign trade turnover with CMEA[15] countries was approximately 80% of its total turnover; trade with developed market economy countries amounted to about 13%, and trade with developing market economy countries to about 7%. In 1975, Bulgaria's largest trading partner among CMEA countries was the U.S.S.R. East Germany was the second largest trading partner, followed by Poland, Czechoslovakia, Romania, Hungary, and others.[16]

The value of Bulgaria's total trade with the U.S.S.R. (import and export) in 1975, amounted to 3,991 million rubles, an increase of 1,086 million rubles, or 37.4%, over that of 1974.[17] Trade with the Soviet Union accounted for about 57% of Bulgaria's total foreign trade in 1975.

In 1975, exports of machinery and equipment contributed about 40% of the value of Bulgaria's total exports to the U.S.S.R.; steel and steel products 0.5%; chemical products 2.5%; and products of remaining industries and agriculture about 57%. Imports of machinery and equipment accounted for 32% of the value of Bulgaria's total imports from the U.S.S.R.; petroleum and petroleum products 19%; gas 2%; coal (anthracite and bituminous) 7%; electrical energy 3%; iron ore 1.5%; steel and steel products 12%; pig iron 1%; rolled nonferrous metals 2%; chemical products 2.5%; and products of remaining industries 18%.

In 1975, increases in commodity imports, compared with 1974, were as follows: Crude oil 6.4%, pig iron 4.4%, superphosphate 3.8%, potash 8.1%, and cement 27.7%.

Between 1973 and 1975 the value of crude oil trade between the U.S. and Bulgaria increased eightfold to approximately $50 million. Areas in which Bulgaria is most keenly interested are U.S. equipment, technology, agriculture and food processing, chemicals, electronics, metallurgy, and construction.

By 1980, the value of total trade with foreign countries is planned to increase 60% over that of 1975. A major objective during the 1976–80 plan is to step up exports in order to achieve a better foreign trade balance.

COMMODITY REVIEW

METALS

Aluminum.—Construction of the first aluminum-processing plant, with an annual capacity of 48,000 tons of rolled semifinished products, at Shumen City continued in 1975.[18] Planned construction goals for 1975 had not been reached. It was reported that the plant may be completed in 1978. Aluminum ingots are to be supplied by the U.S.S.R. In 1975, Bulgaria imported 23,500 tons of aluminum from the U.S.S.R., an increase of 3.8% over that of 1974.

Copper.—In 1975, copper ore output amounted to 12.2 million tons, an increase of 20.8% over that of 1974. In 1976, copper ore production is planned to reach 12.3 million tons.

Cooper ore deposits are located in scattered regions of the country: In the Chelopech and Elatsite regions (the Central Balkans), in Panagurishte and Medet (the southern part of Sredna Gora), and in the Burgas area near the Black Sea Coast.

In 1975, about 70% of the national copper ore production came from the large Medet open pit mine with an annual capacity of 8 million tons; the rest came from the Chelopech underground mine (production 100,000 tons of ore per year), Burgas, Panagurishte, and other mines.

Medet ore contains about 0.36% copper and 0.008% molybdenum. The chalcopyrite copper ores at the Burgas mine were used in metallurgy and in the chemical industry as a source of sulfuric acid. The chemical composition of copper ore from Burgas mines in percent follows: Copper, 1.15; molybdenum, 0.03; iron, 12.5; sulfur, 3.5; cobalt, 0.01; zinc and lead, traces; and SiO_2, 45.[19]

Planned production of copper concentrate (20% copper content) for 1980 was about 366,000 tons. In 1975, production of electrolytic copper amounted to 52,000 tons. Consumption of copper in Bulgaria is entirely satisfied by domestic production. In 1976–80, heavy investment is planned to develop the mining industry, including copper mining. One of the major projects in the seventh 5-year plan is the development of a new open pit mine at Elatsite, about 50 miles northeast of Sofia, with a capacity of 10 million tons of ore per year (0.45% copper content). Another main project is to increase the capacity of the copper refinery at Pirdop by 30%. Future exploration is planned for new copper reserves in the western Sredna Gora area, the Chelopech Field, and the Burgas-Strandzha region.

Iron and Steel.—Production of iron ore in Bulgaria totaled 2,337,000 tons in 1975, a decrease of 13.0% compared with the 1974 level.[20] Production of iron ore fell owing to the reduction in output at the Kremikovtsi iron ore open pit.

In 1975, requirements of the iron and steel industry were met by importing iron ore mainly from the Soviet Union and partly from India and Algeria. Total imports of the iron ore and concentrates amounted to 1,918,000 tons[21] in 1975. To obtain a new source of iron ore, Bulgarian builders started to work in the Soviet Union on a new project in the area of the Kursk Magnetic Anomaly under an agreement which provided that a certain percentage of the iron concentrate would go to Bulgaria in payment for the work.

Principal Bulgarian iron ore deposits are located in Kremikovtsi, north of Sofia, and contain relatively low-grade ores. ,

The seventh 5-year plan called for future prospecting for iron ores in the Burgas-Strandzha region, Martinovo, and the Pirin Mountains.[22]

In 1975, production of pig iron totaled 1,509,000 tons,[23] an increase of 1.7% over that of 1974. It is anticipated that the output of pig iron in 1976 will reach 1.6 million tons. Imports of pig iron reached 330,000 tons in 1975, about the same as in 1974.

In 1975, Bulgaria produced 2,265,000 tons of crude steel, an increase of 3.5% over that of 1974. It is anticipated that the output of crude steel in 1976 will reach 2.6 million tons.

The output of pig iron, crude steel, and rolled steel products during the last years

[21] Page 355 of work cited in footnote 9.

[22] Spisanie na B'lgarskagoto Geologichesko Druzhestvo (Review of the Bulgarian Geological Society), Sofia. V. 37, No. 1, 1976, pp. 9–16.

[23] Page 79 of work cited in footnote 9.

of three 5-year periods follow in thousand tons:

	1965	1970	1975
Pig iron	712	1,203	1,509
Steel	586	1,789	2,265
Rolled steel products	430	1,420	2,498

From 1970 to 1975 the output of pig iron increased 25.4%, steel 26.6%, and rolled products 75.9%.

In 1975, rolled steel production totaled 2,498,000 tons, an increase of 11.4% over that of 1974. Production of welded pipe reached 186,000 tons, an increase of 3.9%. Production of rolled products in 1976 is expected to be 2.8 million tons, and that of pipe, 189,000 tons.

Rolled steel exports in 1975 totaled 829,000 tons; imports amounted to 918,000 tons. Apparent steel consumption in 1975 amounted to 3,223,000 tons, or 7% more than in 1974.

There were two large metallurgical complexes in 1975: The Lenin metallurgical complex at Pernik, commissioned in November 1953; and the Kremikovtsi complex, which started production in 1963. The Lenin metallurgical complex was developed during 1957–61, when an agglomerating plant, blast furnace, steel mill, and rolling mill were commissioned. In 1964 and in 1967, the Lenin metallurgical works was modified and enlarged. As a result, production of the Lenin metallurgical complex reached about 650,000 tons of steel products in 1975. The Kremikovtsi complex is a much larger metallurgical center. It is fully integrated enterprise with a varied line of steel products; hot-rolled products, cold-rolled products, seamless pipe, welded pipe, plastic-coated metal plates, and ferroalloys.

In 1975, the Kremikovtsi metallurgical complex produced 1,257,000 tons of pig iron, 1,658,000 tons of crude steel, and 1,804,000 tons of rolled products. From 1970 to 1975, the production of the Kremikovtsi complex increased 2.2 times.

Bulgaria's main target in the ferrous industry in 1975 was to continue construction and expansion of the Kremikovtsi works. A 1,200-millimeter cold-rolling mill was commissioned in November 1974. In 1975, a 100-ton electric arc furnace and a line for plastic coating of sheets were brought into operation. The Kremikovtsi steelworks is the principal supplier of many national industries and also an exporter of steel products. Expansion of Bulgaria's economy calls for a further enlargement of the steel industry.

The seventh 5-year plan (1976–80) calls for further development and reconstruction of the Lenin and Kremikovtsi metallurgical complexes.[24] In ferrous metallurgy, the Bulgarians are interested in U.S. technology in order to improve existing facilities and to begin a third new metallurgical complex near Varna.

Lead and Zinc.—In 1975, Bulgaria produced about 110,000 tons of lead and 80,000 tons of zinc. Bulgaria produced enough lead and zinc to cover domestic consumption and a modest export demand. Total consumption of lead was approximately 84,000 tons, and consumption of zinc was 40,000 tons in 1975.

In 1975, Bulgaria exported zinc to the United Kingdom, Italy, France, and Czechoslovakia. Bulgaria has several mining enterprises for lead-zinc production: Gorubso, Ustreme Madjorovo, Osogovo, Dimitrov, and a few others. The main lead-zinc producer is the Gorubso Mining Enterprise, which accounts for about 70% of the total Bulgarian production. The Gorubso Enterprise has about 40 mines and 7 beneficiation plants. In 1975, 1 ton of lead concentrate (70% lead) was obtained from about 35 tons of ore and 1 ton of zinc concentrate (52% zinc) from about 37 tons of ore.[25] The lead and zinc concentrates were processed mainly at the Plovdiv and Kardjali smelters, which increased output about 4% in 1975.

Considering the further development of lead-zinc production in Bulgaria, prospecting is to be concentrated mainly at greater depths in the vicinity of operating mines in the central and eastern Rhodopes, Osogovo, Sakar Mountains, and Vratsa region.

Bulgaria has signed an agreement with the U.S.S.R. for joint development of Bulgarian nonferrous metallurgy in 1976–80 and beyond. The U.S.S.R. is to aid Bulgaria in the construction and modernization of 14 nonferrous industry projects.

Uranium.—Information on Bulgaria's uranium mining and reserves in 1975 was practically nonexistent because such data

[24] Politicheska Agitatsiya (Political Agitation), Sofia. No. 15, 1976, pp. 30–34.
[25] Work cited in footnote 19.

are classified. Bulgarian production of uranium is estimated at 1,000 tons of U_3O_8 per year. All of the production is exported to the U.S.S.R. The uranium ore is mined near Sofia (Stara Planina) and in the mountain region near the Yugoslav and Greek borders.[26]

NONMETALS

Cement.—In 1975, cement production totaled 4.4 million tons, a 1.5% increase over that of 1974 and a 19% increase over that of 1970. Imports of Soviet cement amounted to 175,000 tons in 1975, an increase of 27.7% over that of 1974. The construction of two additional production lines at the Devnya cement works was in progress during 1975; one production line is to be put into operation in 1976, and the other in 1977. Total production of cement is expected to reach 2 million tons per year by 1977. The 5-year plan (1976–80) also provides for the expansion of Beli Izvoi and Temelkovo cement works.

Fertilizer Materials.—Bulgaria produced about 595,000 tons of nitrogen fertilizer (nutrient content) in 1975, an increase of 13.3% over that of 1974. Output of nitrogen fertilizer in 1976 was planned to increase 5.9%. In 1975, the output of nitrogen fertilizer exceeded domestic demand and provided some 215,000 tons for export. Urea exports amounted to 148,500 tons, or about 69% of all nitrogen fertilizer exports of the country. In 1975, Bulgarian exports of urea were to Egypt (70,000 tons), India (60,000 tons), and the People's Republic of China (about 20,000 tons). Bulgaria's exports of nitrogen fertilizers are dependent on urea and have been enhanced by a rapid expansion in urea productive capacity. The main source of nitrogen exports has been the 366,000-ton-per-year nitrogen-ammonia and/or urea complex at Vratsa, completed in 1968. The other nitrogen-urea plants are located at Dimitrovgrad and Stara Zagora.[27]

In 1975, phosphatic fertilizer production reached about 245,500 tons, an increase of 30.6%[28] over that of 1974. In 1976, production of phosphate fertilizer is expected to increase 38.3% over that of 1975. Estimated imports of phosphatic fertilizers amounted to about 38,800 tons and imports of potassium fertilizers to about 50,800 tons (nutrient content) in 1975.[29]

The new Povelianovo compound fertilizer plant at Varna started production in September 1975 with total capacity of 914,000 tons of fertilizers per year. A new nitrogen fertilizer plant was planned at Varna with a capacity of 1,800 tons per day.

Bulgaria is to produce about 716,000 tons of nitrogen and 450,000 tons of phosphorus fertilizers per year by yearend 1980 and planned to be self-sufficient in fertilizer production by that time. During 1975–80, the chemical works at Stara Zagora and Dmitrovgrad are to be adapted to use natural gas as basic raw material; the Dimitrovgrad works will produce triple superphosphate. The fertilizer works at Devnya will also be developed.

MINERAL FUELS

Coal, mostly lignite, has been the major source of primary energy in Bulgaria. Total production of primary energy derived from fossil fuels, and hydroelectric and nuclear generation rose from 13.1 million tons in standard coal equivalent in 1974 to 15.2 million tons in 1975. In 1975, the share of coal in total primary energy production was about 92.7%; other components were: Crude oil, 1.3%; natural gas, 2%; hydroelectric power, 2%; and nuclear power, 2%.

The share of nuclear energy in total primary energy output increased from 0.8% in 1974 to 2% in 1975, but the share of coal decreased from 93.9% in 1974 to 92.7% in 1975.

Total consumption of all types of primary energy in Bulgaria increased from 36.0 million tons in standard coal equivalent in 1974 to 40.8 million tons in 1975. The total primary energy balance for 1974 and 1975 is given in table 4.

Coal.—In 1975, Bulgaria produced 27.8 million tons of coal, including 330,000 tons of hard coal, an increase of 14.6% over that of 1974.[30] Coal production is expected to reach about 37 million tons in 1980 and about 50 million tons in 1990. In 1975, about 6.3 million tons of hard coal was imported, an increase of 4.9% over that of 1974; 5.9 million tons came from the U.S.S.R. and 0.4 million tons from Poland. Imports of coke amounted to 357,000 tons in 1975. In 1975, the Maritsa-East lignite

Table 4.—Bulgaria: Total primary energy balance for 1974 and 1975

(Million tons of standard coal equivalent) [1]

	Total primary energy	Coal	Crude oil	Natural gas	Hydroelectric energy	Nuclear energy	Turnover of electric energy
1974:							
Production	13.1	12.3	0.2	0.2	0.3	0.1	--
Exports	.1	.1	--	--	--	--	--
Imports	23.0	6.2	16.0	.4	--	--	0.4
Apparent consumption	36.0	18.4	16.2	.6	.3	.1	.4
1975:							
Production	15.2	14.1	.2	.3	.3	.3	--
Exports	--	--	--	--	--	--	--
Imports	25.6	6.6	17.0	1.6	--	--	.4
Apparent consumption	40.8	20.7	17.2	1.9	.3	.3	.4

[1] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories. Conversion factors used follow: Hard coal, 1.0; lignite and brown coal, 0.5; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); hydroelectric and nuclear energy, 0.125 (per 1,000 kilowatt-hours).

Sources: United Nations. Annual Bulletin of Coal Statistics for Europe. New York, v. 10, 1976, pp. 10, 44, 64, 67, 90.

V'Glishta (Coal), Sofia. July 1976, pp. 5–7.

basin supplied about 57% of the total coal production of the country, and in 1990 production of this basin is expected to be 60% of total coal production. Several new coal mines were brought into operation in 1975 including the Troyanovo 3 lignite open pit (3 million tons per year), the underground Bobov Dol hard coal mine (500,000 tons per year), and the underground Meritcherli 3 brown coal mine (300,000 tons per year). During the last 5 years (1971–75), opencast mining has been expanded considerably. Almost all opencast mines were mechanized and modernized with machinery imported from East Germany and the U.S.S.R.

Coal reserves at Marista-East are estimated at 3,000 million tons (two-thirds of all coal reserves),[31] and those at Bobov Dol at 200 million tons.[32] In the seventh 5-year plan (1976–80) coal output is planned to increase 32%. The plan foresees the develment of the Maritsa-East complex, which is to produce 22 million tons of coal annually by 1980 and is to include the modernization of Troyanovo 1 mine and development of the new Troyanovo 2 mine.

The production of Troyanovo 3 open pit mine is planned to reach 8 million tons per year in 1980. The plan also calls for expansion of the Bobov Dol mine to meet requirements of the region's electric power stations. The production of Meritcherli 3 is to be 2 million tons in 1980.[33]

Natural Gas.—In 1975, extraction of gas was estimated at about 227 million cubic meters. Imports of natural gas from the U.S.S.R. totaled 1,200 million cubic meters in 1975. In 1975, Soviet gas was used in power stations and petrochemical plants.

Bulgaria started receiving gas by the U.S.S.R.-Bulgaria pipeline in 1974, but the construction of the Orenburg pipeline is expected to result in an additional gas supply of 2,800 million cubic meters per year from the U.S.S.R., starting in the fourth quarter of 1978.

The southern branch of the U.S.S.R.-Bulgaria main pipeline is to be built in 1976–80. This stretch will be 267 kilometers long and will supply the chemical works in southern Bulgaria.

Petroleum.—Production of crude oil in Bulgaria was relatively insignificant. In 1975, the output amounted to 122,000 tons,[34] a decrease of 15.3% compared with that of 1974. In 1975, Bulgaria imported 11.6 million tons of crude oil and petroleum products from the U.S.S.R., and some additional crude oil was imported from Iran and Libya. In 1975, imports of crude oil increased 6.4% over those of 1974. According to Bulgarian sources, about 14 mil-

[33] V'Glishta (Coal), Sofia. June 1976, p. 3.

[34] Page 78 of work cited in footnote 9.

lion tons of crude oil will be imported in 1976.

Bulgaria had a crude oil processing capacity of 15 million tons per year, but only 12.5 million tons of crude oil was processed in 1975 (8 million tons at Burgas and 4.5 million tons at Pleven). Crude oil processing capacity is planned to increase to 20 million tons in 1980.

In 1975, expansion of the oil processing complex near Pleven was underway, and a new refinery with a total capacity of 2.5 million tons per year was planned at Shabla. New installations and equipment are to be put in operation in the Burgas petrochemical works during 1976–80.

Production of Bulgarian chemicals and petrochemicals is planned to increase 80% in 1976–80, and the planned investment is to be $700 million. About 35% will be allocated to petrochemicals, which will account for 40% of total chemical output in 1980.

The most productive oilfields in Bulgaria are at Dolni Dubnic, northwest of Pleven, but it was reported that by 1975 over 70% of Dolni Dubnik's reserves were depleted. A new oilfield was discovered at Dolni Lukovit (Pleven region), and development of this field began in 1975. The search for new oilfields will be continued in 1976–80. Offshore drilling in the Black Sea near Tyulenevo is to continue. Bulgarian oil shale reserves, which amount to several billion tons, are valuable potential energy raw materials. In 1976, industrial experiments are to be carried out in the U.S.S.R. on the heat treating of Bulgarian oil shales.

Electric Energy.—In 1975, Bulgaria produced 25.2 billion kilowatt-hours of electric energy, an increase of 10.6% over that of 1974. The installed capacity of electric powerplants was 6,912 megawatts in 1975, up from 4,078 megawatts in 1970. Installed capacity is planned to reach about 10,000 megawatts in 1980, and electrical energy output is to reach 38 billion kilowatt-hours.

In 1975, the nuclear powerplant in Kozloduy produced about 2.5 billion kilowatt-hours of electric energy. In 1980, 20% of Bulgaria's generated energy is to come from nuclear plants. The Soviet Union is to supply nuclear generators and fuel elements.

In 1975, Bulgaria's electric powerplants were fueled mainly by coal; about 41% of the total electric energy generated came from domestic coal, about 23% came from imported coal, 10% was derived from hydroelectric power stations, 10% came from nuclear powerplants, and 16% was derived from oil. In 1975, Bulgaria imported 4 billion kilowatt-hours of electrical energy.[35] The plans for 1976–90 call for the construction of three nuclear power stations, four thermal powerplants in Maritsa coal basin with total installed capacity of 2,260 megawatts, two hydroelectric power stations on each side of the Danube with projected total electric energy of 2 billion kilowatt-hours per year, and a few smaller projects.[36]

The Mineral Industry of Burma

By Gordon L. Kinney [1]

Burma's 1975 mineral production remained essentially unchanged from that of 1974. Lack of modern equipment, prohibition of foreign investment, student unrest, and insurgent activity combined to prevent any really significant improvements in the mining sector. The high rate of inflation continued, with 1975 prices more than 300% above the 1969–70 level. The inflation was fueled by an expanded money supply, which was used to finance successive years of large budget deficits.[2]

The Ministry of Mines was reorganized in April 1975. The new organization comprised the Minister's Office, Planning and Inspection Department, Geological Survey and Exploration Department, and five state-owned mineral corporations. The major producing mines were under these corporations, but the Myanma Oil Corporation Refinery and Petroleum Products Sales Corporation were moved to the jurisdiction of the Ministry of Industry. Small-scale, family-operated mines are still privately owned, with most of the output being sold to the Government.

The Government intends to step up production of minerals during the second 4-year plan (to start in 1975–76) and envisions an annual 4% growth. During this period, Burma also hopes to achieve self-sufficiency in crude oil production and to begin exporting small amounts.

Overall economic growth in 1975 was slow, the gross domestic product (GDP) increased 3.5% for the year at constant 1969–70 prices. Although this was well short of the targeted 6+% growth rate, and a little below the previous year's 4%, it was more than the 2.7% average annual growth rate for the past decade. Considering that Burma had an estimated population growth of 2.2% per annum, real gains in the per capita GDP were not encouraging. Gross national product (GNP) was reported at about $3 billion.[3]

Metallic ores production in 1975 remained little changed from that of 1974. Industrial minerals increased in most cases in 1975, but as their unit values were generally low, the increases did little to bolster the overall economy.

Burma was nearly self-sufficient in petroleum, and as such was less affected by increases in world prices than most developing countries. However, hopes of achieving self-sufficiency in 1975 were not realized. Crude oil output, just over 900,000 tons, decreased more than 12%. Offshore petroleum exploration failed to discover commercial amounts of oil or gas.

Owing to lack of domestic funds and international investments, Burma has had to accept technical aid and foreign grants in the form of small projects. The United Nations helped the Bawdwin lead-zinc mine with exploration some years ago, and the West Germans planned to assist in "doubling output" at the mine. Insurgency problems and the kidnapping of a West German technician in March 1975, who was subsequently released, brought the project to a virtual halt. The United Nations Development Program (UNDP) started a $1.8 million, 3-year tin exploration program in the Tenasserim region and is to help drill the Monywa copper deposits.

PRODUCTION

The Burmese Government reported that value of mineral production (less petroleum) in fiscal 1975–76 was $36.7 million[4] at constant 1972 prices. Most of this can be attributed to lead, zinc, tin, and tungsten. Value of oil production during the same year was more than twice that of mineral output.[5]

[3] Includes fire clay powder.

[4] Revised to none.

TRADE

Burma's overall foreign trade increased from about $297 million in fiscal 1974–75 to an estimated $428 million in fiscal 1975–76. The large gain, however, reflects price increases more than an increase in volume. Mineral export levels remained relatively unchanged except for silver, which declined about 25% to 560,000 troy ounces.

Burmese Government figures show that mineral exports were valued at $12.9 million for 1975, up about 17%. Exports were mainly to People's Republic of China, North Korea, India, Singapore, the United Kingdom, and Italy.

COMMODITY REVIEW

METALS

Antimony.—Production of mine antimony, while modest in value, has been increasing. Gross production of ore reportedly surpassed 1,000 tons in 1975. There are no modern mills or refining facilities in the country. Although individual miners have been able to sell their product to the Government if it assays over 50% antimony, much of the ore is probably lower in grade. In addition, Burma produces and exports a few tons of antimonial lead (assaying possibly 20% antimony) annually, derived as a byproduct of the Namtu lead-zinc smelter. Burma could significantly increase its antimony production by investing in a beneficiation plant.

Copper.—The copper picture was beginning to look brighter, with the development of low-grade porphyry deposits near Monywa moving nearer to reality. A pilot plant with a 50-ton-per-day ore-crushing capacity was built with Japanese aid and began operation in 1975. A Japanese drilling program completed in 1974 apparently confirmed the economic feasibility of a copper smelter. Reserves from two separate occurrences are reported to total more than 60 million tons of ore grading at least 0.7% copper. As a result, the Burmese Government was actively seeking investment capital to develop the deposit and to construct a smelter. However, the Japanese have since lost interest in the project, at least for the time being. West Germany may consider switching funds earmarked for modernizing the Bawdwin mine to the Monywa project. In addition, loan funds might be available from West Germany for refinery construction if West German firms could be guaranteed an option to bid on the refinery output.[6]

Burma has currently been producing only about 200 tons of copper matte annually as a byproduct of the Bawdwin lead-zinc output.

Lead, Zinc, and Silver.—Lead, zinc, and silver production continued to come mainly

[6] U.S. Embassy, Rangoon, Burma. State Department Airgram A-050, June 4, 1976.

from the Government-owned Bawdwin Mines Corporation enterprise near the Chinese border northeast of Mandalay. The fiscal 1974–75 output of ore was reported at around 160,000 tons,[7] but metal content continued to drop as high-grade ores were mined out. Present grade runs about 7% lead and 4% zinc, plus good values for byproduct silver, copper, antimony, and nickel. Production of refined lead was 9,754 tons, an 8% increase over 1974. The mine at Bawdwin and the old smelter at Namtu, 11 kilometers east of the mine, continued to operate at a loss owing to obsolete and wornout equipment. The planned conversion of the mine to open pit exploitation of lower grade ore has been shelved. The $26 million funding was not given final approval by the West German Credit Bureau for Reconstruction because of unstable security conditions in the northern Shan State area. Instead only $2 million will be used to "modernize" the mine, while the remainder may be redirected into more stable projects, mainly the development of the Monywa copper deposits and possible construction of a zinc smelter. Zinc concentrate is sold as such, since no zinc smelting facilities exist in the country. Output of zinc in concentrate was up 37% over the 1974 level. Construction of a domestic zinc smelter would have the added advantage of allowing the reclaiming of thousands of tons of zinc-rich tailings and slags which have been accumulated at the Bawdwin mine over the last 50 years.

Nickel and Chromium.—A nickel-chromium deposit was examined in 1975 by the UNDP's geological survey and exploration program. The ore body, located near Tiddim in the Chin Hills, apparently was considered unsuitable for commercial exploitation.

Tin and Tungsten.—Production of tin concentrate (gross weight) totaled over 760 tons, and gross weight, of mixed tin-tungsten concentrates, mostly coming from the Mawchi mine in Kayah State, totaled nearly 800 tons. Exports of tin-in-concentrate were around 600 tons. Total exports of tin concentrate in all forms were reportedly over 1,200 tons in calendar 1975. These production figures were probably understated because of a significant movement of smuggled, unreported, and inaccurately reported concentrate produced in the Tenasserim coastal region. In the first 9 months of 1975, the tin smelter in Penang, Malaysia, reported handling at least 3,000 tons of Burmese tin concentrate (gross weight). This large discrepancy between reported Burmese tin exports and Malaysian imports was more than the total official Burmese exports for the year. Some of the ore probably originated across the border in Thailand and was smuggled by boat to Penang. However, a large share of the ore may also have been Burmese, illegally mined and shipped under false certificates of origin.

The UNDP has begun a $1.8 million, 3-year exploration project in the Tenasserim region. It will attempt to detail the tin–tungsten deposits and reserves, both onshore and offshore. Insurgency problems were complicating the work in this region.

A West German loan to Burma continued the expansion and modernization of the Myanma Tin and Tungsten Corporation's open pit mining operation. The mine was undergoing expansion to an operating rate of 1,000 tons per year of tin concentrate. Krupp Industries of West Germany was doing the work.

Tungsten production for the year was over 1,200 tons of concentrate (gross weight) in all forms, including the Mawchi production mentioned above. Exports of tungsten concentrate remained steady at about 500 tons. Exports of mixed concentrate added almost 900 tons more, but the proportion of tungsten to tin in these mixtures was not reported. Continued Soviet aid to the Mawchi mine was aimed at increasing production to 1,800 tons of mixed concentrate per year.[8]

NONMETALS

Cement.—Cement production increased 56,000 tons to 228,000 tons in 1975 in response to last year's shortages. Exports, begun only in 1974, were stopped during 1975. Gypsum, used in the manufacture of cement, was mostly imported before 1972. Gypsum production has since risen steadily. Nearly 40,000 tons of gypsum were mined near Hsipaw in Shan State, a 30% increase over 1974 output and nearly 3½ times the 1973 level. Soviet financial assistance aided in developing the gypsum deposit.

[7] Latest available Bawdwin Mines figures.
[8] U.S. Embassy, Rangoon, Burma. State Department Airgram A-041, May 11, 1976.

MINERAL FUELS

Coal.—Burma has no anthracite but does mine modest amounts of lower rank coal from the Kalewa coalfield in the northwest. Production is being pushed as an import substitute. In 1975 it reached 24,588 tons, an increase of 46% over that of 1974. The coal was primarily used to generate electric power. Output could increase further, with the reported opening of new mines in 1976.

Petroleum.—Plans for attaining petroleum self-sufficiency by yearend 1975 fell short of success because of forced cutbacks in production onshore. The bottleneck was in the transport of oil from the producing fields to the refineries. There were five major producing fields in Burma during 1975 with the Mann Field yielding about one-half of the total. Production at Mann was cut back from 12,000 to 8,000 barrels per day pending completion of a 20-mile-long pipeline to a new barge jetty at Malun in 1976. Bottlenecks in the Irrawaddy River water transport system were being alleviated by the construction of new oil barges and the purchase of additional barges from abroad. Total domestic crude production for the calendar year was 6.7 million barrels (about 900,000 tons). By December, production was running around 16,600 barrels per day, down more than 21% from 1974. The much-heralded Letpando oil strike proved a disappointment as additional drilling did not bring in the production increases predicted last year. A large part of the exploration budget was currently being used to complete the exploration and define the reserves at the field. Additional exploration drilling was being conducted at Padaukkone near Thayetmyo, and at Natui near Pakokku.[9]

Several other crude pipelines were under construction or planned. A 10-inch-diameter line was reported under construction from the Letpando Field to the Chauk refinery. This should forestall transport problems once production begins at the field. A 136-mile, 10-inch-diameter line was being considered from the Mann Field to Prome. This would eliminate the necessity of barging oil to the Prome railhead and allow the major fields to produce at capacity.

The four foreign oil consortia, Esso, Martaban, AODA, and Total, described in detail in last year's chapter continued their offshore drilling program. Results have been discouraging for both the private and government drilling programs since only noncommercial occurrences of natural gas were found in 3 of 19 holes drilled in the Gulf of Martaban. Several oil shows off the Arakan coast were noncommercial because of insufficient reservoir rock. The Arakan drilling was complicated by very high thermal gradients in the sediments. All of the completed offshore wells were plugged and abandoned. The Government was reportedly considering offering for lease some of the remaining 12 offshore blocks.

Refining.—Burma had two small refineries, a 7,000-barrel-per-day plant at Chauk near the oilfields, and a 20,000 barrel-per-day operation at Syriam near Rangoon. Both ran at below capacity during 1975 because of the transport problems described above. As a result, targeted production for fiscal 1975–76 was well below the previous year's output for motor gasoline, kerosine, and diesel fuel. Only furnace oil was scheduled for a substantial increase. Despite the transport problems and resulting domestic shortages, petroleum imports were kept to a bare minimum. The only major entry was a shipment of special base oils and additives for the lube plant. Small amounts of coke and paraffin were exported.

Burma has the potential to again become an exporter of crude oil. Completion of pipeline and water transport improvements could allow a modest surplus of crude oil which would furnish a small but very much needed source of foreign exchange.

Natural Gas.—A modest amount of natural gas was produced in conjunction with oilfield operations. It was consumed mainly by local urea fertilizer plants. Demand will increase with completion of the Kyangin cement mill, under construction in 1975, and the Myanaung gas turbine powerplant, which reportedly went into operation in late 1975. A new gasfield at Shwepyitha near Prome was expected to come onstream to handle this increased demand. Actual marketed gas for 1975 increased 19%, to 5.6 billion cubic feet.

The Mineral Industry of Canada

By Walter C. Woodmansee [1]

In 1975, the Canadian mineral industry started a gradual recovery from the worldwide economic recession prevailing in 1974. Because Canada is a major world supplier of a number of minerals and metals, its mineral industry was strongly influenced by weak world demand that persisted through most of the year and adversely influenced sales of many mineral commodities. The economic outlook was better at yearend than at the first of the year.

These lackluster economic conditions were reflected in curtailed mineral production, idle productive capacity, deferral of modernization and/or expansion programs, and excessive mineral inventories in Canada. In addition, capital and labor costs were rising faster than market prices, thereby depressing company earnings. Labor shortages were experienced in some mining districts, and labor strikes at several mines caused production losses.

Despite this adverse economic situation, there were also favorable factors, and the Canadian mineral industry moved forward in a number of respects. The nation ranked first worldwide as a producer and supplier of zinc, nickel, silver, and asbestos, and was also a prominent source of oil and gas, coal, uranium, copper, gold, iron ore, lead, aluminum metal, potash, sulfur, and a host of other mineral commodities. In all, more than 60 minerals were extracted from more than 300 undeground and open pit mines. Key minerals lacking in Canada's resource position were bauxite and tin, chromium, manganese, and phosphate ores.

Exploration activity remained substantial and was particularly strong for certain minerals in certain regions. Several significant discoveries were reported. A large-scale search for uranium ore deposits continued in most Provinces and in the Yukon and Northwest Territories. Oil and gas exploration continued in the Territories, Arctic Islands, Beaufort Sea, and offshore from Labrador, Island of Newfoundland, and Nova Scotia. Exploration was also highly active for copper, lead, zinc, nickel, and the precious metals.

Industry considered the lull in demand and idle capacity to be temporary and was gearing up for expanded mineral production to meet growing demand in 1976 and thereafter since the recession appeared to have bottomed out. In the metals sector, new mining and metallurgical production capacity was under development or was planned for copper, lead, zinc, gold, iron ore, and iron and steel. Among the nonmetallics, relatively slack demand in the construction industry was reflected in reduced operations for construction materials such as clays, sand and gravel, lime, stone, gypsum, and cement, although a number of cement plants were undergoing expansion.

In the mineral fuels sector, new coal mines were under development or planned, particularly in the West (Alberta and British Columbia) for expanded export sales, and also for eventual shipment to the iron and steel industry and to thermal power companies in the East (Ontario). A pipeline coal slurry scheme for this shipment of Western coal to Eastern markets remained under consideration. Pipeline proposals for oil and gas from Alaska, the Yukon and Northwest Territories, the Beaufort Sea, and the Arctic Islands were under evaluation, but no decision was reached on a specific proposal. Crude oil export allocations to the United States were further reduced, and plans were made to phase out these sales. Prices for natural

[1] Supervisory physical scientist, International Data and Analysis.

gas sales in the United States were raised sharply during the year. Petro-Canada Ltd. was established as a Federal Crown company to represent the Federal Government in the oil and gas industry. Several of Canada's 41 operating oil refineries were under modernization and/or expansion. Petro-Canada and some of the Provincial Governments participated in Syncrude Canada Ltd., an operating company for a project to recover synthetic oil from the Athabasca bituminous sands. This project faced financial difficulties but was on schedule. The four operating uranium mines and mills were under expansion, and new facilities were under development.

Federal and Provincial investment and tax policies continued to cause uncertainty among potential investors in the Canadian mineral industry. The basic policy issue was whether to provide incentives for increased exploration and production and continued expansion of the mineral industry, or to provide stricter regulation of the industry and conserve mineral resources for future domestic needs. Federal and Provincial legislation were often in conflict over foreign investment and ownership. Broad policy objectives were to provide greater Canadian control and participation, expand the mineral-processing capability and sell the more advanced mineral and metal forms, insure present and future domestic mineral needs, and maximize benefits from sales of exportable surpluses of mineral resources.[2] Future transportation needs were under review, based on National as well as Provincial and regional considerations, since crude and fabricated mineral products accounted for a large share of the tonnage carried on Canadian roads and railroads and shipped from Canadian ports.

The high degree of foreign ownership continued to be of concern to Canadians. The most recent available data indicated that the United States accounted for nearly 80% of all foreign direct investment in Canada ($26 billion [3] of $33 billion), including the mineral industry, and other foreign agencies were actively seeking participation in mineral ventures in Canada. The Government acted to increase Canadian management and equity participation and to emphasize maximum benefits to Canadians. Under the Foreign Investment Review Act (FIRA), authorities continued to review foreign investment proposals. Phase II of FIRA was effective on October 15. This required prospective new investors, and those already with investments but wanting to also move into other activities, to submit proposals for approval. The Canada Development Corp. (CDC), which had been established to increase Canadian participation in investments in Canada, was active in acquiring greater shares in mining and petroleum companies.

Within the Provincial jurisdictions, Crown corporations were established to represent Provincial public interests. Legislation was introduced in Manitoba and Saskatchewan to permit direct Government participation in the mining industry. In Saskatchewan, legislation in November enabled Government purchase or expropriation in the potash mining industry, and Potash Corp. of Saskatchewan, a new Crown corporation, was formed. New tax provisions and royalty schedules became effective or were under consideration in most Provinces. The effects on the mining industry were uncertain at yearend.

The Federal Government was also studying the tax structure for operations in the Yukon and Northwest Territories. A higher tax rate, effective on January 1, 1976, was partially offset by a new resource allowance and by a tax credit to stimulate investment in production facilities. Joint Federal-Provincial mineral exploration and development programs were underway in most Provinces. Federal interests were represented by the Department of Regional Economic Planning and the Department of Energy, Mines and Resources (EMR).[4]

PRODUCTION

Mine output by quantity for most mineral commodities was lower in 1975 than in 1974 because of reduced domestic and foreign demand during a period of worldwide economic recession. However, output value was higher for many commodities because of escalating prices. This was especially true for the mineral fuels—crude oil, natural gas, and coal.

According to preliminary data provided by Statistics Canada, value of mineral production reached a record $13.4 billion, compared with $11.7 billion in 1974. This was 8.7% of the gross national product, estimated at $154.7 billion (current prices). The Province of Alberta led other Provinces, with 44.8% of mineral output value because of its oil and gas production, and was followed by Ontario 17.5%, British Columbia 9.1%, Quebec 8.5%, Saskatchewan 6.2%, Newfoundland 4.2%, Manitoba 4.0%, and other Provinces and the Territories 5.7%.

e Estimate. p Preliminary. r Revised. NA Not available.

1 Antimony content of antimonial lead alloys, flue dust, and dore slag.

2 Antimony content of smelter products, excludes output from New Brunswick, which is believed to be small.

3 Refined metal and bullion plus recoverable bismuth content of concentrates exported.

4 Refined metal from domestic ores plus cadmium content of exported ores and concentrates.

5 Actual output not reported; figure represents cobalt content of all products including cobalt in nickel sinter shipped to the United Kingdom by International Nickel Co. for further processing and cobalt in nickel-copper matte shipped to Norway by Falconbridge.

6 Total cobalt content of all products produced less the amount of cobalt metal reported as produced in Norway. Thus, this figure includes cobalt content of cobalt oxide produced in Canada for sale as such as well as cobalt metal and/or chemicals.

7 Includes shipments of ingots from primary plants for rolling elsewhere.

8 Refined nickel plus nickel content of oxide produced plus recoverable nickel in matte exported.

9 Refinery output from all sources, including imports and secondary sources.

10 Recoverable selenium content of blister copper treated at domestic refineries, plus refined selenium from domestic primary material.

11 Cement shipped and/or used by producers.

12 Includes value of bentonite and products from common clay, stoneware clay, fire clay, and other types of clay.

13 Crushed, building, ornamental, paving and other similar uses.

TRADE

Because Canada exported about 60% of its mineral production (in terms of value), including about one-half to the United States, reduced world demand for mineral commodities contributed to a continuing unfavorable trade balance in 1975. Minerals accounted for about one-third of Canada's total export value for the year. Total mineral export value was down only slightly, compared with 1974 data, but was down about 7% excluding the mineral fuels.

According to preliminary data from Statistics Canada, principal mineral commodity exports in 1975, in terms of value, were crude petroleum and natural gas, all of which went to U.S. markets. These and other principal mineral exports (table 4) totaled about $9 billion in 1975, of which nearly three-fourths were to the United States. This was 28% of total export value of $32.8 billion.

Principal mineral commodity import values were as follows, in million dollars:

	1974	1975
Crude petroleum	$2,646	$1,299
Coal	303	576
Semifabricated steel	472	277
Fuel oil	236	108

Essentially all imports of coal were from the United States. Venezuela and the Middle East were principal sources of crude oil.

[1] Many figures for 1973 are revised from those appearing in the previous edition of this chapter owing to use of revised Canadian exports.
[2] May include relatively minor quantities of certain shapes not normally included among semimanufactures.
[3] Partial figures, data given are U.S. imports for consumption only.
[4] Includes some scrap.
[5] Largely, if not all, used in the production of heavy aggregate.
[6] Excludes scrap and sweepings valued in thousands at $7,308 in 1973 and $21,791 in 1974.

[2] May include relatively minor quantities of certain shapes not normally included among semimanufactures.
[3] Less than ½ unit.

COMMODITY REVIEW

METALS

Aluminum.—Production of alumina and aluminum metal, derived wholly from imported raw materials, was substantially below that of 1974, owing to reduced domestic and world demand. Aluminum Co. of Canada Ltd. (Alcan) produced 760,000 tons of primary metal, 13% below that of 1974, according to the company's annual report. Alcan shipments of all aluminum forms were 1,272,000 tons, down 16% from 1974, and ingot shipments were 560,000 tons, down only 4%. Alcan smelters were operated at 79% of rated capacity since April, when staged plant reductions went into effect. Canadian Reynolds Metals Co. Ltd., Canada's other producer, operated at about 85% of capacity. Reynolds' shipments were 25% below those of 1974. Despite the heavy cutbacks in production rates throughout the industry, inventory levels remained excessive at yearend.

Modernization and expansion programs planned by both companies were deterred or suspended indefinitely because of the industry's relatively poor year. Alcan had initiated ingot capacity expansions of 22,000 tons per year at Arvida, Quebec, and Kitimat, British Columbia, scheduled for completion in 1975 and 1976, respectively, under a 10-year, $1 billion program that was originally scheduled to increase Alcan ingot capacity by 270,000 tons. Reynolds continued planning for a 135,000-ton-per-year expansion at its Baie Comeau smelter in Quebec. These new facilities will eventually increase total annual ingot capacity of the two companies from 1.1 million tons to 1.5 million tons.

Construction was in progress on Alcan's second cold-rolling mill at Kingston, Ontario. This will increase annual sheet capacity to 172,000 tons.

General Investment Corp., the Quebec provincial investment agency, considered new $500 million, 225,000-ton-per-year smelter and fabricating plants in partnership with National Southwire Aluminum Co. (U.S.). In April, a plant site was selected at St. Augustin, 18 kilometers west of Quebec City.

Copper.—Primary copper was derived from a variety of ores including porphyry deposits and vein-type deposits of the base metals, precious metals, and nickel. Mine production was from about 70 operations throughout Canada early in the year, and exploration was widespread. Outputs of mine, smelter, and refined copper were lower than those of 1974 during a period of reduced domestic demand and depressed international markets. Mine production, valued at slightly over $1 billion, was substantially below the $1.4 billion value for

Table 6.—Canada: Aluminum production facilities, 1975

1974, owing to soft copper prices prevailing in world markets throughout the year. Domestic shipments totaled 185,194 tons, compared with 247,984 tons in 1974. Many mines were operated below capacity levels, and new mine developments were curtailed.

In the Sudbury District, Ontario, where copper is a coproduct of nickel, production was affected by labor contract negotiations. Operations of Falconbridge Nickel Mines Ltd. were delayed by a 10-week strike during these negotiations. Falconbridge conducted a smelter environmental improvement program, scheduled for completion in 1977, and continued development of the Lockerby mine, 32 kilometers south of Sudbury, where production was at partial capacity in 1975 and was scheduled for full capacity (700,000 tons of ore per year) in 1977.

The International Nickel Co. of Canada Ltd. (INCO), the leading producer in the Sudbury District, made improvements in the feed preparation facility and worked on two waste water treatment plants at the Copper Cliff refinery. Mining at INCO's Clarabelle open pit ended in 1974, but will resume following development of a new ore extension.

A $140 million expansion was underway at the Kidd Creek base metal-silver mine and concentrator of Texasgulf Canada Ltd. in the Timmins District, Ontario, where copper content has averaged about 1.75%. A second shaft was being sunk to the 1,600-meter level. A new $300 million smelter-refinery complex (annual capacity 59,000 tons of refined copper), in the design engineering and early construction stage, will employ continuous smelting and electrolytic refining technology developed in Japan. The mine expansion will increase annual ore production capacity from 3.2 million tons to 4.5 million tons, scheduled for 1978. CDC holds a 30% interest in the project.

Elsewhere in Ontario, Mattagami Lake Mines Ltd., in which Noranda Mines Ltd. and Placer Development Corp. Ltd. hold interests, continued development of the Lyon Lake copper-zinc-silver property, Sturgeon Lake area, western Ontario, where the ore contains 1.15% Cu. Sinking was started on a 500-meter shaft. Ore output was to be 900 tons per day, starting in 1977.

Continuing exploration has increased ore reserves to 13.8 million tons averaging 1.7% Cu at the Thierry deposit, Pickle Crow District, northwest Ontario. Ore production, scheduled for 1976, was expected to be 4,000 tons per day. The operating company is Union Minière Exploration and Mining Corp. Ltd.

In Quebec, the late 1974 discovery of high-grade copper-zinc-silver ore by Selco Mining Corp. Ltd. during exploratory drilling near Mattagami led to heavy claim-staking activity by a number of companies in western Quebec and eastern Ontario.

Noranda Mines, Horne Div., at Noranda, suspended a planned expansion program at the Horne smelter early in the year, owing to a shortage of concentrate feed. Curtailed capital expenditures at the smelter included the acid recovery plant and the oxygen plant for the continuous smelter reactor.

Expansion at the Murdochville concentrator-smelter of Gaspé Copper Mines Ltd., a Noranda subsidiary, was delayed by problems in the vat leaching section.

Patino Mines (Quebec) Ltd. established wholly owned Lemoine Mines Ltd. as operator at its new high-grade copper-zinc-precious metal mine under development 33 kilometers southwest of Chibougamau, Quebec. Sinking of a 330-meter shaft and construction of a concentrator were in progress. Ore production at a rate of 360 tons per day was anticipated by 1976.

Hudson Bay Mining & Smelting Co. Ltd. continued modernization and environmental improvement programs at the Flin Flon metallurgical complex at the Manitoba-Saskatchewan border. Development at the Centennial copper-zinc mine included an incline and an internal shaft, started in January. Shaft-sinking started at the company's new Westarm mine in April. The shaft was scheduled for completion, 500 meters deep, in 1976.

In British Columbia, where major open pit mines have been developed at low-grade porphyry deposits in recent years, deliveries to Japan were cut back at customers' requests. Production and exports were reduced as much as 50% by some companies.

Despite this depressed market and oversupply position, development of new sources of copper continued in British Columbia. Afton Mines Ltd., a subsidiary of Teck Mining Ltd., planned open pit development and a 23,000-ton-per-year smelter near

Kamloops. This $80 million project moved forward following a Provincial Government announcement of proposed legislation for a royalty incentive equivalent to $0.02 per pound for 4 years.[5]

Gibraltar Mines Ltd. shut down its mine 60 kilometers north of Williams Lake, British Columbia, for 3 weeks in August and resumed production at a rate of 30,000 tons of ore per day, well below the peak of 40,000 tons per day in 1973. Reserves at a cutoff-grade of 0.25% Cu were 319 million tons of ore at 0.36% Cu.[6]

Valley Copper Mines Ltd., a subsidiary of Cominco Ltd., postponed a decision on a copper smelter in British Columbia pending a decision on development of the large low-grade Lake Zone ore body, which extends into the Bethlehem Copper Corp. Ltd. property in the Highland Valley area.

A study evaluating concentrator-smelter processes for British Columbia indicated that newly developed technology should be considered to meet strict environmental requirements.[7]

Shell Canada Ltd. reported a significant copper discovery in the Coates Lake area, Nahanni District, Northwest Territory, and planned an extensive exploration program. Other companies were staking claims over a large area of the district.

Gold.—Mine production was slightly below that of 1974. About 74% of this output was from auriferous quartz veins at 22 lode operations; 25.5% was a byproduct of base metal mining; and 0.5% was from placer operations mainly in the Yukon Territory.[8]

In Ontario, the leading Province in gold production with 46% of total output, production was down slightly from that of 1974. This decrease was held to a minimum by high gold prices prevailing in late 1974 and early 1975. With rising costs, there was relatively little exploration and development activity for gold in the Province. Rengold Mines Ltd. was expected to be producing gold bullion in the Missinabic area, 270 kilometers northeast of Sault St. Marie, before yearend. The Renabie mine, shut down in 1970, was being dewatered and reactivated. Mill restoration was underway for a milling rate of 300 tons per day. Other companies were considering reopening several adjoining properties. Amoco Canada Petroleum Ltd. reported a significant discovery in the Detour Lake area, 200 kilometers northeast of Timmins, near the Quebec border, and was diamond-drilling the deposit during the year.

The favorable gold prices early in the year also spurred exploration and development activity in Quebec. A number of old

properties and prospects were tested. Mills were under renovation, modernization, and expansion. There were also a few closures due to unsatisfactory results.

In British Columbia, where most gold production is a byproduct of base metals, Dusty Mac Mines Ltd. started ore shipments from its open pit mine, south of Penticton, to the mill at Dankoe Mines Ltd. The contract was for 10,000 tons of ore per month. Development continued at the Brandywine Falls property of Northair Mines Ltd., where production was expected in 1976. Exploration increased at a number of old prospects and former producers in the Province. Small production was derived from a few placer operations.

Placer mining activity and claim-staking continued high in several districts of the Yukon and Northwest Territories. Cominco conducted a $7 million expansion at the Con mine at Yellowknife, the first gold producer in the Northwest Territories. The shaft was being sunk to 2,000 meters, and mill capacity was under expansion to 650 tons of ore per day. Most activity was in the Great Slave Lake area, where old gold prospects were staked and tested. Giant Yellowknife Gold Mines Ltd. was reassessing old mining areas, and its reserves were expanding. According to the company's annual report, its gold production was 94,437 troy ounces, a decrease from 1974, from 355,586 tons of ore averaging 0.29 troy ounce per ton. The company reported record expenditures on gold prospecting and exploration in the Northwest Territories.

The new precious metals refinery of Johnson, Matthey and Mallory Ltd. at Brampton, a suburb of Toronto, Ontario, was scheduled for completion in 1976. Planned gold capacity is 1 million troy ounces per year, expandable to 2 million troy ounces by the addition of four induction furnaces. Equipment was moved in from the old refinery, which will continue to fabricate the precious metals.

The Royal Canadian Mint at Hull, Quebec, was making 14-karat and 22-karat gold Olympic coins. The new mint at Winnipeg, Manitoba, was in commercial operation in March and near full capacity at yearend.

Iron Ore.—Output was more than 3 million tons below that of 1974, owing to a slackening in world demand and Canada's export markets, and to labor problems at a number of iron mines. However, increased prices raised value of output by nearly $200 million. Exports totaled 36.6 million tons, slightly below those of 1974, of which 19.3 million tons went to the United States. Shipments declined to principal markets in Western Europe, the United States, and Japan. Imports nearly doubled, owing chiefly to participation of Canadian (Ontario) steel companies in new, economically attractive taconite developments in Michigan and Minnesota, Lake Superior region. Domestic consumption was estimated at 12.5 million tons, slightly below that of 1974.

The two leading producers—Iron Ore Co. of Canada Ltd. (IOC) and Quebec Cartier Mining Co. (QCM)—accounted for approximately 75% of total output. IOC alone produced in excess of 23 million wet tons in direct shipping ore and ore for concentrate and pellets at its three major facilities in Labrador and Quebec. QCM produced nearly 8 million wet tons for concentrators, close to full capacity, at Lac Jeannine, Gagnon. IOC was operating its beneficiating and pelletizing facilities at Labrador City, Labrador, near full capacity at yearend, but agglomerating problems with the pelletizing facilities at Sept-Iles, Quebec, necessitated design changes and slowed operations to above 50% of capacity for the year.

Expansion programs for mining, beneficiation, and pelletizing continued at a number of operations, although delays were caused by the weak market, labor troubles, and escalating costs. IOC expansion to 32 million tons of product per year (22 million tons of concentrate, 10 million tons of pellets) was virtually completed at Labrador City at yearend.

QCM's new mine at Mount Wright, Quebec, was in operation late in the year, and the concentrator, which will treat 135,000 tons of ore per day and produce 16 million tons of concentrate (66.5% Fe) per year, started test operations in October. The large Mount Wright ore body measures 6.4 kilometers long and 1.2 kilometers wide, and has a 75-year reserve at planned initial production rates.

In June, the Premier of Quebec announced a $500 million program for a new QCM mine at Fire Lake, redesigning of the concentrator at Lac Jeannine, Gagnon, and a new 6-million-ton-per-year pellet plant at Port Cartier on the Gulf of St. Lawrence. Participants are Sidbec-Dosco Ltd., the Provincial steel company (50.10%), British Steel Corp. (41.67%), and QCM (8.23%). There will be two separate beneficiating-pelletizing lines, each of 3-million-ton annual capacity, one producing blast furnace pellets containing 65.5% Fe and the other producing high-grade pellets containing 68% Fe for use in direct reduction to sponge iron. Ore from the Fire Lake mine will be transported 65 kilometers to the concentrator at Gagnon. The Fire Lake mine will start production at an annual rate of 1.5 million tons, which will be increased to 6 million tons as the Lac Jeannine mine is phased out.

In Ontario, the $32 million Stelco-Lurgi/Republic Steel—National Lead (SL/RN) direct reduction kiln of Steel Company of Canada Ltd. (Stelco) at the Griffith mine, near Red Lake, in the northwestern part of the Province, was completed at midyear. The kiln will convert pellets to sponge iron containing 92% Fe at a rate of 400,000 tons per year. This sponge iron will reduce dependence on scrap steel for electric furnaces at Edmonton, Alberta, and Contrecoeur, Quebec. The Algoma Steel Corp. Ltd., Algoma Ore Div., continued a $25 million deep mine development program at the MacLeod mine, near Wawa. An incline was being driven, three new levels were under development, and two 5-kilometer tunnels were underway to permit the deeper mining.

The Steep Rock Iron Mines Ltd. (SR) open pit mine at Atikokan, Ontario, was deep and costly to operate, and reserves were near depletion. Little progress was made on plans for development of SR's 600-million-ton ore body at Lake St. Joseph, 200 kilometers to the north. Negotiations continued on participation and financing. Plans called for annual capacity of 4 million tons of oxide pellets (70.5% Fe) and conversion to high-grade metal pellets for sponge iron. The Provincial Government

Table 9.—Canada: Iron ore mining and processing facilities, 1975 [1]

Province	Operating company	Location	Mill capacity (thousand metric tons)	Products	Remarks

made plans for rail facilities, townsites, and consideration of environmental impact.

Iron and Steel.—Production and shipments of pig iron and crude steel were reduced slightly in 1975, compared with 1974, owing to the general international economic recession, to which the iron and steel industry was particularly sensitive. The relatively poor market was felt late in the year; output of ingots and castings dropped by nearly 10% during the last quarter. Domestic consumption at 10 million tons was 16% below that of 1974, the largest reduction in nearly 20 years. Exports decreased nearly 25%, reflecting sharply reduced shipments to the United States, Canada's largest export market for steel products.

Despite the unfavorable economic situation, steelmakers continued expansion programs, expecting improved conditions in 1976 and thereafter. The industry invested $680 million in capital construction and equipment in 1975, compared with $367 million in 1974.[9]

Total annual crude steel capacity, which increased from 16.6 million tons to 17.8 million tons during the year, was divided as follows at yearend: Basic oxygen furnace, 9.8 million tons; electric furnace, 4.3 million tons; and open hearth furnace, 3.7 million tons.[10]

Steel companies throughout the country were involved in modernization, expansion, and pollution abatement plans and programs. Stelco, Canada's largest in the industry, produced 4.9 million tons of crude steel in 1975, slightly below the 1974 rate, mainly because of a scheduled 2-month relining of the largest blast furnace at the Hilton Works, Hamilton, Ontario and a 6-week strike at the Edmonton Works, Alberta. Stelco continued construction on its new, fully integrated iron and steel complex at Nanticoke, on the north shore of Lake Erie, Ontario. The first stage of this project, which began in 1974, was scheduled for completion in 1978 at a cost of $900 million. Initial ingot annual capacity will be 1.2 million tons; ultimately, with a fourth stage, capacity will reach in excess of 5 million tons, probably in the late 1980's.[11]

Elsewhere in Ontario, Algoma Steel Corp. Ltd., second largest among Canadian steel producers, completed a 4,500-ton-per-day blast furnace in May and raised annual ingot capacity to 3.9 million tons as an expansion program neared completion at Saul Ste. Marie. A continuous-casting machine under construction will increase slab steel capacity to 1 million tons per year by 1978. Dominion Foundries and Steel Ltd. (Dofasco) planned to double annual ingot capacity to 5.4 million tons by 1985 at Hamilton. New basic oxygen furnace installations will raise annual capacity to 3.8 million tons by 1978. Atlas Steels Co., a division of Rio Algom Mines Ltd., the largest producer of stainless and special steels, completed two new electric furnaces at Welland. Ivaco Industries Ltd. also completed new electric furnace facilities and a continuous-casting line for billets at L'Orignal, eastern Ontario.

In Quebec, Sidbec-Dosco Ltd., the Provincial company, continued a second stage of its expansion program, which will raise ingot capacity to 1.4 million tons per year at Contrecoeur by 1977. QSP Ltd. completed a second stage involving two new electric arc furnaces, two continuous-casting machines, and a 270,000-ton-per-year rolling mill at Longeuil.

In Nova Scotia, Sydney Steel Corp. Ltd., owned by the Province, proposed a $100 million, 3-year rehabilitation program at its Sydney Works. In February, legislation was introduced to establish Cansteel Corp., another Government corporation, and an iron and steel complex on Cape Breton Island. Feasibility studies and financial arrangements were underway at yearend.

In the West, new facilities were planned, completed, or under construction by Dominion Bridge Co. Ltd., Manitoba Rolling Mills Division, Selkirk, near Winnipeg, Manitoba; Interprovincial Steel and Pipe Corp. Ltd., Regina, Saskatchewan; and Western Canada Steel Ltd., Vancouver, British Columbia, and Calgary, Alberta.

Lead and Zinc.—Demand for lead and zinc was slack in 1975, resulting in excessive stocks and mine-mill cutbacks and shutdowns. Lead production was higher than that of 1974, which was a weak year,

[9] Western Miner. Steel-Steelmakers Expand With an Eye to the Future. V. 49, No. 6, June 1976, pp. 11–19.

[10] Lafleur, P. Iron and Steel. Canadian Mineral Survey—1975. Dept. of Energy, Mines and Resources, Ottawa, February 1976, pp. 60–62.

[11] The Northern Miner. Stelco's Lake Erie Development Will be a Model for Future Industrial Projects. Sept. 18, 1975, p. 19.

although domestic consumption at 90,000 tons was 22% below that of 1974.

Canada again was the leading world producer and supplier of zinc, accounting for 45% of world trade in zinc concentrate and 25% of the world's slab zinc supply in 1975. The principal markets were Japan, Western Europe, and the United States. There was little change in mine and smelter production from that of 1974. Zinc smelters operated at 70% of capacity for the year. Mine cutbacks were particularly sharp in the last half of the year. Consumption was on the order of 100,000 to 110,000 tons, 10% to 15% below 1974.

Base metal exploration, new mine development, and mine-concentrator expansions were widespread, involving most Provinces and the Yukon and Northwest Territories. Newfoundland Zinc Mines Ltd., a subsidiary of Teck Corp., produced the first zinc concentrate at its Daniel's Harbour property, Newfoundland, in June and made its first shipment in September. Exploration by a number of companies was heavy near Bathurst, New Brunswick, reportedly with encouraging results. Brunswick Mining and Smelting Corp. Ltd. continued a $48 million mine expansion program at Belledune Point, near Bathurst. The smelter, operated at only 64% of capacity, produced 324,247 tons of zinc concentrate and 154,843 tons of lead concentrate in 1975. In February, the company announced an arrangement with Canadian Electrolytic Zinc Ltd. for design and feasibility studies on a proposed new electrolytic zinc plant in the Province.

In Quebec, ongoing expansion of the Canadian Electrolytic Zinc refinery at Valleyfield, 55 kilometers southwest of Montreal on the St. Lawrence Seaway, was delayed by technical problems with electrical equipment, and the scheduled 1975 completion was not attained. Orchan Mines Ltd. (Noranda Mines 50.8%) completed shaft sinking to 480 meters at its mine in the Mattagami area, northwestern Quebec. Lemoine Mines Ltd., an operating company for Patino Mines (Quebec) Ltd., continued development of a high-grade zinc ore body in the Chibougamau area.

Texasgulf Canada continued an expansion program, which will increase mine capacity from 3.2 million tons to 4.5 million ton of ore per year at Kidd Creek, near Timmins, Ontario. A new 1,600-meter shaft was down to 600 meters at yearend. The Hoyle zinc refinery was operated below capacity for the year, and planned expansion was deferred. Delays in mine development were also encountered at the Sturgeon Lake property of Mattagami Lake Mines.

Hudson Bay Mining & Smelting Co. Ltd., which was conducting a modernization and environmental improvement plan at the smelter-refinery at Flin Flon, on the Manitoba-Saskatchewan border, curtailed copper-zinc production, particularly during the last half of the year.

Cominco Ltd. operations were normal at the Sullivan and H.B. mines, but the Trail smelter-refinery in British Columbia worked below rated capacity. At Trail, operations were at 60% of capacity for the last half of the year.

In the Yukon Territory and parts of the Northwest Territories, base metal exploration was widespread, and potential was good for future production. Regional prospecting and exploration had been at a high level since 1973, and exploration, including drilling, was underway in a number of areas in 1975.[12]

In the Yukon, lead and zinc accounted for 66% of total value of mineral production in 1975. Cyprus Anvil Mining Corp. Ltd., a major producer, sold 120,176 tons of lead concentrate and 115,155 tons of zinc concentrate from its mine near Faro in 1975, 37% and 46%, respectively, over that of 1974, according to the company's annual report. A feasibility study for a lead-zinc smelter in the Yukon, based on a Cyprus Anvil-Canadian Government agreement, was negative because of high power and transportation costs and distance from potential markets. Kerr Addison Mines Ltd.-AEX Minerals Corp. Ltd. were conducting exploration and adding to reserves at the Grum deposit, also in the Faro area.

Mining development continued on schedule at the property of Nanisivik Mines Ltd. in the Strathcona Sound area, northwestern Baffin Island, where construction started in April 1974. Interests were held by Mineral Resources International Ltd. (59.5%), the Canadian Government (18%), Metallgesellschaft AG (11.25%), and Billiton N.V. (11.25%). Progress was made in re-

[12] Brock, J. S. Selwyn-Mackenzie Zinc-Lead Province, Yukon and Northwest Territories. Western Miner. V. 49, No. 3, March 1976, pp. 9–16.

solving many difficulties encountered in construction in the High Arctic. Early in the year, more than 1,800 meters of underground development work had been completed, and, late in the year, the concentrator building was closed in, permitting inside construction work to continue during the winter months.[13]

Canex Placer Ltd. continued drilling at a large low-grade deposit in the Summit Lake area, Howard's Pass, near the Yukon-Northwest Territories border. Texasgulf Inc. established ore reserves of 7 million tons at 14.8% zinc at its Izok Lake property, 360 kilometers north of Yellowknife, Mackenzie District. Arvik Mines Ltd. (Cominco Ltd. 75%) postponed a decision on development of the high-grade Polaris deposit, Little Cornwallis Island, following a mine feasibility study.

Nickel.—Reduced output, compared with that of 1974, was mainly due to labor strikes and/or operational cutbacks by the two major producers—INCO and Falconbridge Nickel Mines—in the Sudbury District, Ontario. The latter's output was hit particularly hard by a strike lasting some 2½ months from August to November, followed by a 30% cutback in smelter operation.[14]

Total nickel deliveries were 30% lower, and domestic consumption nearly 25% lower, during a period of weak demand and rising operating costs. According to the companies' annual reports, INCO nickel output of about 209,000 tons was down 10% from that of 1974, and Falconbridge deliveries at 28,000 tons were down 31%. INCO announced plans for a new rolling mill for nickel and cupreous-nickel alloy strip at Sudbury, with construction to start in 1976. Falconbridge continued development at the new Lockerby mine, 32 kilometers south of Sudbury, where full production was scheduled for 1977.

Sherritt Gordon Mines Ltd. curtailed operations at Lynn Lake, Manitoba, because of labor shortages, and turned the mining operation over to a contractor in September. The company's refinery at Fort Saskatchewan, Alberta, was closed for 6 weeks during the summer.

Platinum-Group Metals.—Platinum-group metals output was higher in quantity than in 1974, but value increased little because of soft prices prevailing during the year. The major producers, INCO and Falconbridge, which process platinum-bearing nickel-copper ores at their smelters in Ontario and Manitoba, also processed similar ores from other operations, chiefly Noranda Mines at the Langmuir mine, near Timmins, Ontario, and Dumbarton Mines Ltd. at Bird River, Manitoba.

Texasgulf Canada took an 18-month, renewable option from Boston Bay Mines Ltd. on the Lac des Isles property, 80 kilometers north of Thunder Bay, Ontario. In August, Texasgulf was drilling to depths of 150 meters. Average grade appeared to be 0.10 to 0.15 troy ounce of platinum and palladium per ton in nickel-copper ores.

Silver.—Output was lower in 1975 than in 1974 corresponding to reductions in base metal operations, where silver is a byproduct or coproduct.

Expansions underway at a number of base metal mines will influence future silver production. Brunswick Mining and Smelting was expected to add up to 1 million troy ounces of silver output near Bathurst, New Brunswick, by 1979. In Quebec, two new base metal-silver mines went into production in 1975, and exploration drilling by Selco Mining Corp. Ltd.–Pickands Mather & Co. in Brouillan Township, northwestern Quebec, indicated silver content in excess of 1 troy ounce per ton in copper-zinc ore.

In Ontario, which again led other Provinces as a silver producer, accounting for 37% of total Canadian output, the new Texasgulf refinery complex at Kidd Creek, near Timmins, includes a silver refinery expected to produce 10 million to 12 million ounces per year by 1980. Texasgulf production of silver-in-concentrate was 9,235,000 troy ounces compared with 10,553,000 troy ounces in 1974, according to the company's annual report. Construction continued on a new hydrometallurgical plant of Canadian Smelting and Refining Ltd., the operating company for the joint venture of Péchiney Ugine Kuhlman of Paris, France, and St. Joseph Explorations Ltd. (subsidiary of St. Joe Minerals Corp., U.S.) in the Cobalt area. This refinery will be capable of processing low-grade and various secondary materials at a rate of 6 million

[13] Agar, C. F. Nanisivik Mines—Good Progress Toward Production in 1976. Western Miner. V 49, No. 4, April 1976, pp. 64–65.

[14] The Northern Miner. Falconbridge Cuts Back on Production. V. 61, No. 35, Nov. 13, 1976, p. 20.

troy ounces of silver per year, starting in 1976.

Near Flin Flon, Manitoba, the new Centennial and Westarm base metal ore bodies under exploration and development by Hudson Bay Mining & Smelting also contain silver. In British Columbia, several silver-bearing base metal and precious metal deposits were under exploration and development.

Cyprus Anvil Mining Corp. Ltd. and United Keno Hill Mines Ltd. were the leading silver producers in the Territories, where the high level of successful base metal and precious metal exploration indicated new silver resources. At United Keno, which operated several mines 45 kilometers north of Mayo, Yukon Territory, silver values were as high as 44 troy ounces per ton in proven reserves. Reduced activity of Echo Bay Mines Ltd. near Port Radium, at the eastern end of Great Bear Lake, Mackenzie District, Northwest Territories, was a significant factor in lower national silver output in 1975. Base metal ores at the new mines of Nanisivik Mines Ltd. on Baffin Island and Texasgulf Inc. near Izok Lake, north of Yellowknife, contain about 1.8 troy ounces silver per ton, and Kerr Addison Mines Ltd.'s Grum deposit, near Faro, Yukon Territory, contains about 2 troy ounces per ton.

Silver capacity at the new precious metals refinery of Johnson, Matthey and Mallory Ltd. at Brampton, Toronto area, will be 5 million troy ounces per year, mainly from scrap materials. The coinage facilities of the Royal Canadian Mint at Hull, Quebec, completed a third and fourth series and was working on a fifth series of silver Olympic coins. The overall program of seven series, to be completed in 1976, may require a total of 35 million troy ounces of silver.

Other Metals.—Consolidated Durham Mines and Resources Ltd. increased production of antimony concentrate (66% Sb), and a diamond drilling program was increasing reserves at the Lake George mine, New Brunswick. Bismuth and cadmium production, both byproduucts of base metals mining, was lower than that of 1974. Cobalt mine output also was reduced, corresponding to the drop in nickel output, of which cobalt is a major byproduct.

Demand for columbium was strong, and expansion was underway at St. Lawrence Columbium and Metals Corp. Ltd.'s (SLC) mine and mill near Oka, Quebec. SLC was expanding annual capacity from 2,500 tons to 3,600 tons and planned to produce ferrocolumbium in 1976. A new producer, Niobec Inc., will make a columbium concentrate (60% Cb, 2,500 tons per year) at its new mine and mill at St. Honore, Quebec.

Cominco, the only mercury producer in 1975, closed the Pinchi Lake mine, near Fort St. James, British Columbia, owing to rising operating costs, oversupply, and soft prices for mercury.

Molybdenum production and demand were lower than those of 1974; shipments of oxides, sulfides, and ferromolybdenum were down 11%. Canex Placer, Endako Div., British Columbia, accounted for about one-half the 1975 output; the other one-half was a byproduct of certain copper mining operations. There was minor exploration activity for molybdenum in British Columbia and the Northwest Territories.

Seuddeutsche Kalkstickstoff Werke of West Germany scheduled completion of its silicon and ferrosilicon plant at Becancour, Quebec, for 1976. Annual capacity will be 23,000 tons, each, for silicon and ferrosilicon.

Tantalum Mining Corp. of Canada Ltd. (Tanco), the only tantalum producer in Canada, shipped about 200 tons Ta_2O_5-in-concentrates from the Bernic Lake mine and mill, Manitoba. A new mill section, added to recover fine tantalum in slimes, will improve overall recovery from 60% to 75% and permit mining of lower grade ores.

Demand was high for titania slag, which was environmentally more acceptable for processing than ilmenite ores for pigments. Quebec Iron and Titanium Corp. Ltd. (QTT) production of titania slag at Sorel, Quebec, was down from that of 1974, but sales value was up 20%. About 90% of this slag was exported; the remaining 10% went to two pigment manufacturers in Canada, Canadian Titanium Pigments Ltd. at Varennes, Quebec, and Tioxide of Canada Ltd. at Tracy, Quebec. Both companies expanded capacity in 1975.

Canada Tungsten Mining Corp. Ltd., Canada's only tungsten producer in 1975, went from open pit to underground operations and increased capacity to about 1,800 tons per year at its mine at Tungsten, Northwest Territories, near the Yukon border. A high talc content in the ore caused milling problems, necessitating modification to the mill circuit. Brunswick Tin Mines Ltd. conducted pilot plant tests on a tungsten-molybdenum-bismuth ore at Mount Pleasant, New Brunswick. Amax Exploration Inc. was studying a tungsten deposit at Mac Tung, Northwest Territories. Canadian consumption of tungsten in metal, powder, chemicals and ferrotungsten was estimated at 1,100,000 tons, about 13% below that of 1974.

Demand for zirconium was mainly for use in fuel sheathing for nuclear reactors. There was no domestic production of zirconium in 1975, and supply was provided by imports of zirconium alloys. Norco Industries Ltd. was building a tube mill at Arnprior, Ontario, for use in nuclear reactor components and other products.

NONMETALS

Asbestos.—The Canadian asbestos market was strong, and prices remained firm and rising in 1975. Asbestos was in tight supply, and available supplies were allocated owing to a series of events that caused shortages and reduced shipments to about 65% of the 1974 rate. A fire in December 1974 destroyed Asbestos Corp. Ltd's King Beaver mill, Thetford, Quebec. A feasibility study will determine whether the mill will be rebuilt at an estimated cost of $60 million to $100 million. A 7-month strike affected most mines in the Thetford-Black Lake area, Quebec. A major landslide involving a high-grade section of the open pit of Canadian Johns-Manville Co. Ltd. at Jeffrey, Quebec, Canada's leading asbestos producer, caused a major disruption of operations.[15]

Cassiar Asbestos Corp. Ltd. placed its new primary concentrator and aerial tramline in operation, improving the output rate late in the year at the Cassiar mine, northern British Columbia. Feasibility studies on the property of Abitibi Asbestos Mining Co. Ltd., a subsidiary of Brinco Ltd., 80 kilometers north of Amos, Quebec, indicated possible commercial development by 1978–79. The United Asbestos Inc. new mine, near Timmins, Ontario, started operating on a tune-up basis during the year. Canadian Johns-Manville closed the Reeves mine, also near Timmins, in February because of difficulty in meeting new fiber emission standards.

A new slurry explosive was developed for use in permafrost at the open pit of Asbestos Corp., Asbestos Hill, Ungava Peninsula, in extreme northern Quebec, near Hudson Strait.[16]

Barite.—Production was higher than that of 1974. Producers were Dresser Minerals Ltd., Walton, Nova Scotia, which recovered lump and ground barite from ore stockpiles and a quarry, and ore from the

upper levels of a flooded mine; Baroid of Canada Ltd., which operated mining and milling facilities at Onoway, Alberta, and tabling facilities for lead-zinc tailings at Spillimacheen, British Columbia; and Mountain Minerals Ltd., with grinding and sizing facilities at Lethbridge, Alberta, and ores and tailings from Parson, Brisco, and Invermere, in British Columbia.

Welcome North Mines Ltd. reported mapping and sampling a barite deposit, 90 meters thick, in the Selwyn Basin, east of Ross River, Yukon.

Cement.—The slight decrease in cement output was attributed primarily to a reduced growth rate in the construction industry in Canada and the United States. Cement capacity, by Province, at yearend, including three grinding plants, was as follows, in thousand tons per year:

Province	Number of plants	Capacity
Newfoundland	1	159
Nova Scotia	1	238
New Brunswick	1	408
Quebec	7	4,742
Ontario	7	5,364
Manitoba	2	889
Saskatchewan	2	206
Alberta	3	1,017
British Columbia	4	1,381
Total	28	14,404

About 37% of this capacity existed in Ontario, 33% in Quebec, 24% in the western Provinces, and 6% in the Atlantic Provinces. With ongoing expansions, theoretical capacity had increased to 15,800,000 tons at yearend. Canada Cement Lafarge Ltd. added 450,000 tons to its annual capacity with a new kiln at St. Constant, south of Montreal, Quebec, and 180,000 tons with a major modernization program at Exshaw, Alberta. Lake Ontario Cement Ltd. added 770,000 tons per year capacity with a fourth kiln at Picton, Ontario. At yearend, modernizations and/or expansions were underway by Canada Cement Lafarge at Montreal East, Quebec, and at Brookfield, Nova Scotia; and by St. Marys Cement Ltd. at St. Marys, Ontario. A new plant, which will add capacity of 1 million tons per year, was under construction by Ocean Cement Ltd. in the Vancouver area, British Columbia.

Diamond.—Not found commercially in Canada, diamonds attracted attention to the central Arctic Islands, Northwest Territories. Kimberlite bodies were discovered during regional geological mapping, and Cominco Ltd. and Diapros Ltd. investigated these bodies for diamonds. A bulk sampling plant was in operation on Somerset Island for heavy mineral concentrates, which have been shipped to the Republic of South Africa for testing.[17]

Fluorspar.—Production at Alcan's fluorspar works, near St. Lawrence, Newfoundland, was only about 40% of that of 1974, because of a 7-month strike that continued to yearend. A concentrate (70% CaF_2) was produced by heavy media separation and shipped to Alcan's aluminum smelter at Arvida, Quebec, for use in making aluminum fluoride. The future of the St. Lawrence operations, including a new deposit under development to a depth of 450 meters, was uncertain pending strike settlement.

Gypsum.—Lower production in 1975 was attributed to a slacking of growth in the construction industry in Canada and the recession in the construction industry in the United States, which had received a large portion of the output from the Atlantic Provinces. Of 13 operating properties, 5 quarries in Nova Scotia accounted for nearly three-fourths of total output. West-

roc Industries' Silver Plains mine, south of Winnipeg, Manitoba, became inactive owing to flooding by artesian water.

There were 19 gypsum product manufacturing plants operating in 1975, including 4 in Quebec and 3 in Ontario which receive raw materials from the Atlantic Provinces, and 9 in the western Provinces.

Lime.—Despite reduced output in 1975, expansions were planned in Ontario and Quebec, which together accounted for about 85% of total output. According to EMR, 18 companies operated 85 kilns at 24 lime plants throughout Canada in early 1975. Operations apparently were at about 75% of capacity, which was about 2.3 million tons in 1975.

Mica.—A joint venture of Le Société Mineralurgique Laviolette, Montreal, and Marietta Resources International Inc., a U.S.-based company, announced plans to develop a mica deposit at Lake Letondal, near Parent, Quebec. The ore, containing 90% mica, will be shipped to a new processing plant, under construction at Boucherville, near Montreal, for production of mica flake at an initial rate of 10,000 tons per year.[18]

Nepheline Syenite.—Output was down about 16%, compared with that of 1974, at Blue Mountain, 40 kilometers northeast of Peterborough, Ontario. Producers were Indusmin Ltd., which operated a 1,000-ton-per-day mill for eight product grades at Nephton, Ontario, and Sobin Chemicals (Canada) Ltd., a subsidiary of International Minerals and Chemicals Corp. (Canada) Ltd. (IMC), with an 800-ton-per-day mill for three product grades at Havelock, Ontario. Indusmin installed new mill facilities to increase capacity for the finely ground grades. Equipment for environmental improvement was installed at both mills.

Fertilizer Materials.—*Phosphate.*—There was no phosphate rock production in Canada, which imported its supply largely from the United States. Erco Industries Ltd. produced elemental phosphorus at an annual rate of 90,000 tons at plants at Varennes, Quebec, and Long Harbour, Newfoundland. Thirteen plants manufactured phosphate fertilizers throughout Canada; total annual capacity was about 1 million tons.

IMC announced an extensive exploration project underway in the Kapuskasing District, northern Ontario, where about 15,000 meters of drilling indicated a major orebody. Drilling continued at yearend. IMC planned trenching and exploratory shaft-sinking. Overburden was 9 to 60 meters thick.[19]

Potash.—Canada accounted for 23% of the total world potash output in 1975. About 70% of this supply went to U.S. markets, 25% overseas, and 5% to domestic markets. Lower output and shipments in 1975 were attributed to labor strikes affecting three operations (Duval Corp. of Canada Ltd., Potash Corp. of America Inc. (PCA), and APM Operators Ltd.) and to a fire in July at Hudson Bay Mining & Smelting's mine at Rocanville, Saskatchewan, which lost about 3 months production. Inventories held at yearend totaled about 1 million tons K_2O equivalent.

Source: Department of Energy, Mines and Resources, Ottawa.

The confrontation between the Saskatchewan Provincial Government authorities and the potash industry over expansion desired by the Government and excessive taxation claimed by the industry resulted in a number of court actions during the year and the announcement, in November, of provincial plans to purchase or expropriate a controlling interest in the industry.

In February the Saskatchewan Government established the Potash Corp. of Saskatchewan (PCS), a Provincial Crown company. PCS planned to establish new mines on a full ownership or joint venture basis.

Following imposition of a reserve tax late in 1974, the Canadian Potash Producers Association (CPPA) claimed that a tax burden of 87.6% of pretax profit (based on 1975 production and a \$60 per ton K_2O selling price) left insufficient capital for investment in new production capacity. The industry also challenged the constitutionality of the reserve tax and, in a separate action, sought to pay this tax under a court order providing for return of these tax funds with interest, if this tax were declared unconstitutional. This was denied by the courts, but the decision was appealed by the industry.

In May the courts had ruled a prorationing fee unconstitutional and awarded compensation to Central Canadian Potash Co. Ltd. The decision was appealed by the Provincial Government. In October, the industry again brought suit against the Provincial Government for return of fees, totaling \$24 million, already paid.

On November 12 the Premier of Saskatchewan announced in a Throne Speech that he would seek legislation enabling the Government to purchase or expropriate some or all potash mines in the Province. If agreement could not be reached on sale terms, expropriation would be considered. The Government's announced goal was public ownership of at least one-half of total potash capacity. Of 14 companies with interests in the industry, 7 were U.S.-owned. The Potash Development Act of 1975, introduced into the Provincial legislature, provided for this purchase or expropriation. Interests were to be purchased on a selective basis, determined by potential for expansion, efficiency of operations, and ore quality. At yearend, all companies had met with Government authorities, and further meetings were planned.

In New Brunswick, PCA planned further exploration at its Sussex property, and IMC received a letter of intent from the Government for rights to exploration and development work at Salt Springs, south of the PCA property.

Salt.—Production losses in 1975 were due to strikes, principally at Canadian Salt Co. Ltd., Windsor, Ontario (7½ months); Domtar Chemicals Ltd., Goderich, Ontario, where a strike started in May and had not been settled at yearend; and Domtar's operation at Unity, Saskatchewan (4 months). Needed supplies were obtained from stockpiles and outside purchases.

Rock salt from bedded deposits in southwestern Ontario and Nova Scotia were the principal sources. Byproduct salt from potash mines was reserved for road use. Potash deposits being explored by PCA and IMC in New Brunswick were associated with salt.

Silica (Quartz).—Ten operations, including four in Quebec, produced silica throughout Canada, principally for use as a metallurgical flux in copper-nickel

Source: Department of Energy, Mines and Resources, Ottawa.

smelters and also for glass, ceramics, silicon and ferrosilicon. Output was lower than that of 1974, owing to continuing problems with the crushing, grinding, and classification circuits at the Midland, Ontario, mill of Indusmin Ltd., the principal producer. Indusmin has capacity for 900,000 tons of lump silica and fines per year at the Badgeley Island quarry, Georgian Bay, and 450,000 tons of products per year at the Midland mill, Ontario. The company also operated a mine and mill near Saint-Canut, Quebec.

Sulfur.—Production from 45 sour natural gas processing plants, 42 of which were in Alberta, continued a decline following a record high reached in 1973. Production had increased steadily from initial production in 1951 to 1973, and was expected to continue downward unless major new sour wet gas discoveries are made. Although production volume was lower, total sales value from all sources increased from $78.4 million in 1974 to $99.6 million (preliminary) in 1975.

According to the Energy Resources Conservation Board (ERCB), stockpiles in Alberta totaled 16 million tons at yearend, which resulted from involuntary production from natural gas exceeding sales volume. Canadian sulfur exports declined 22% from the 1974 total. Nevertheless, Canada continued to be the world's largest exporter of sulfur. Sulfur production capacity was 26,000 tons per day and 8 million tons per year.

In addition to production from sour natural gas, sulfur was also recovered from crude oil, the Athabasca bituminous sands, smelter gases (in the form of sulfuric acid), and pyrite concentrates (for sulfuric acid). Most natural gasfields contained 1% to 20% H_2S. Elemental sulfur from the hydrocarbon sources accounted for about 86% of total output, and the smelter gas source provided for the remainder (704,000 tons sulfur in sulfuric acid); pyrite was not used, producers having converted to elemental sulfur for use in sulfuric acid.

New transport and handling facilities were being installed. New liquid tank and gondola rail cars were ordered. Shell Canada Ltd., a leading producer, was installing new stockpile, loading and hauling facilities and was overhauling its sulfur slating system at the Waterton plant, Alberta. Storage capacity was also increased at Vancouver, British Columbia, so that 4 million tons per year could be moved at this port. Aquitaine Co. of Canada Ltd. also added extensive new handling, transport, and slating facilities at Ram River, Alberta.

The Alberta ERCB reported changes in yearend 1974 and 1975 proved Provincial sulfur reserves from natural gas as follows (in million tons):[20]

Dec. 31, 1974	170.3
Change 1975	−15.1
Production 1975	−6.5
Dec. 31, 1975	148.7

Proved sulfur reserves in the Athabasca bituminous sands, based on 7 long tons of sulfur per thousand barrels in reserves of recoverable synthetic crude oil, were 189 million tons. Ultimate reserves from natural gas, based on 2.7 long tons of sulfur per million cubic feet of marketable gas, were 305 million tons, and ultimate recoverable sulfur reserves from the tar sands totaled nearly 1.8 billion tons.

MINERAL FUELS

Coal and Coke.—Coal production was higher than that of 1974. There were few disruptions to operations, most mines operated at or near capacity, and new capacity became available. Value of output nearly doubled, reaching $590 million, owing to substantial price increases during the year. The average minesite price for all grades of coal increased 66% to $21.33 per short ton in 1975. A total of 31 operators reported production, 85% of which was from open pit mines and the remainder from underground mines. Twelve major producers accounted for 87% of total output. Alberta was the leading Province in coal output, accounting for 40%, followed by British Columbia 38%, Saskatchewan 14%, Nova Scotia 6%, and New Brunswick 2%.

Consumption in thermal powerplants totaled about 16.6 million tons, and 7.4 million tons of coking coal was used in producing 5.3 million tons of coke. Demand for both coking and steam coal dropped off in the latter part of the year.

[20] Energy Resources Conservation Board. Reserves of Crude Oil, Gas, Natural Gas Liquids, and Sulfur. ERCB-76-18, Calgary, Alberta, Dec. 31, 1975, pp. 8-1—8-6.

[e] Estimate.
[1] Those producing more than 1 million short tons (approximately 900,000 metric tons) for the year.

Source: Department of Energy, Mines and Resources, Ottawa.

Coal exports, principally coking coal from British Columbia and Alberta, increased 7.7% compared with those of 1974. The average coking coal export price to Japan was about $50 per ton f.o.b., Vancouver, B.C., about 60% above 1974 prices.

Imports, principally from the United States for Ontario Hydro Power Ltd. and the iron and steel industry in Ontario, were higher by 2.6 million tons as these consuming industries were rebuilding stocks following reduced deliveries in 1974. Coking coal was delivered to three iron and steel companies having coke ovens in Hamilton and Sault Ste. Marie, Ontario, and to Sydney Steel Corp. in Nova Scotia, which blends U.S. and Canadian coals for coking purposes.

The proposed program, supported by the Federal Government, to bring Western steam and coking coals to the East, principally for use by Ontario Hydro and the iron and steel industry in Ontario, was behind schedule mainly because of a moratorium on new coal mine development in Alberta, pending a new Provincial coal policy. The project was designed to provide for increasing demand, estimated at 10 million tons by 1980, thereby avoiding greater dependence on U.S. sources. Canadian National Railways, Canadian Pacific Railroads, and Neptune Coal Terminal Co. were planning infrastructure and rail capacity expansions. Negotiations were underway to establish a major terminal at Thunder Bay, Ontario.

New coal development in Alberta and British Columbia was dependent on new Provincial coal policy. In Alberta, exploration and development were limited by a moratorium on new coal mine development. In midyear, a new land-use program was announced for the eastern slope of the Rocky Mountains. The foothills and mountain regions were particularly sensitive to land-use and environmental policy. Coal resources of the mountain, foothills, and plains regions were under assessment. Production permits were awaited in connection with plans for shipping to the eastern Canadian market.[21]

Late in the year, the Minister of Mines of British Columbia proposed a $1 billion Provincial-Federal-industry cost-sharing program to develop coal reserves in the northeastern part of British Columbia.[22] Engineering and feasibility studies were to be conducted on the Sukunka, Wolverine, and Babcock properties, and new roads, rail lines, bulk-loading terminals, and other infrastructure were planned.

Because of growing demand for coking coal and increasing dependence in U.S. supply, the coking coals of both eastern

p Preliminary.

Source: Statistics Canada.

and western Canada assumed greater importance.[23] The high-volatility eastern coals, which would be blended with western coals, were of interest because of a proposed new iron and steel complex in Nova Scotia. The western coals are largely low-sulfur, moderate high-ash, and low- to medium-volatility.

Following a Kaiser Resources Ltd.-Mitsui Mining & Smelting Co. Ltd.-v/o Licensintorg (U.S.S.R.) cooperative agreement in 1974, Kaiser was mining a coal seam, 16 meters thick, at the Sparwood Mine, British Columbia, by hydraulic mining methods. Higher water pressures and volumes improved efficiency, and recovery increased from 10%–12% to 70%. Mining above the valley floor permitted coal slurry transport by gravity to a dewatering plant. Sublease agreements were made with Fording Coal Ltd. and Quintette Coal Ltd. for use of new hydraulic mining technology at other mines in British Columbia.[24]

Natural Gas.—Both gross and marketable production were similar to 1974 rates. According to the Canadian Gas Association (CGA), revenues from industrial, commercial, and residential use totaled $1,307 million, up $327 million from 1974, because of price increases during the year.[25] Actual consumption was only marginally different from 1974, owing to conservation practices, the economic slowdown, and higher prices. Exports to the United States continued a gradual downward trend, but CGA reported revenues from these exports increasing from $503 million in 1974 to $1,166 million in 1975.

No major gas discoveries were reported in 1975. Some success was achieved in the shallow gasfields in southern Alberta and southwest Saskatchewan, and in development wells in northwest Alberta. In October, Alberta Energy Co. (AEC), a joint Provincial Government-private company, purchased the mineral rights to proved reserves in the Suffield Block, a military reserve area in southeast Alberta, from the Government for $54 million. In December, AEC planned a $15 million development program, including 200 producing wells and a pipeline gathering system.

Exploration results were disappointing in the Mackenzie River Delta, Northwest Territories, and the Arctic Islands following successes in 1974. Imperial Oil Ltd. reported a gas discovery in its Beaufort Sea exploration, offshore from the Mackenzie Delta, and Panarctic Oils Ltd. was successful in development wells at its Drake Point Field on the Sabine Peninsula of Melville Island. Reserves there were estimated at 5 trillion cubic feet, but studies indicated that 20 trillion cubic feet would be necessary for commercial development, including a pipeline system.

The Canadian Petroleum Association (CPA) reported marketable natural gas reserves at 56,708 billion cubic feet at yearend 1974, and 56,975 billion cubic feet at yearend 1975. About 80% of these reserves were in Alberta, where they increased from 43,377 billion cubic feet to 45,325 billion cubic feet during the year. Alberta ERCB estimated the proved recoverable reserves in the Province at 51,494 billion cubic feet, higher than that reported by CPA, at yearend, compared with 52,763 billion cubic feet in January.

A Report on Canadian Natural Gas Supply and Requirements, prepared by the National Energy Board (NEB) and released in July, indicated that natural gas supply would be insufficient in the near future to provide for growing domestic demand and export commitments. The NEB recommended improvement in gas delivery systems in Alberta and British Columbia, higher prices to depress demand, and new governmental domestic and export allocation powers.

The wellhead price in Alberta was $0.45 per thousand cubic feet in 1974 and $0.88 per thousand cubic feet in 1975. In June, by Royal assent to the Petroleum Administration Act, the NEB was authorized to achieve a uniform national price, exclusive of transport and service costs. Late in the year, NEB recommended prices for natural gas in various national zones. The Toronto "city gate" price went from $0.82 to $1.25 per thousand cubic feet during the year. The NEB also recommended price increases for Canadian gas sold in the United States,

[25] Canadian Gas Association. Statistical Summary, 1975. Don Mills, Ontario, May 1976, 12 pp.

which was $1.00 per thousand cubic feet in January, $1.40 on August 1, and $1.60 on November 1. Further increases were expected in 1976.

In November, legislation was introduced in Alberta providing for Provincial Government ownership of virtually all natural gas production in the Province and for government price setting. A Natural Gas Pricing Agreement Act would set the Alberta border price at $0.82 per thousand cubic feet, and would grant the Province legal authority to collect export differential revenues. The Government would sell to the United States at the NEB-established price and pay the producer an average price after taking royalty.

A total of 7,600 kilometers was added to gas pipelines, mainly in gathering systems in the shallow gasfields of southern Alberta. NEB also authorized extensions to lines in British Columbia, Ontario, and Quebec. Proposed projects to bring natural gas from Alaska (through Canada), the Mackenzie Delta, and Arctic Islands were under evaluation. Canadian Arctic Gas Study Ltd., a consortium comprising 18 Canadian and U.S. companies, organized a study group to assess its proposed pipeline from Prudhoe Bay, Alaska, to the Mackenzie Delta, and southward to U.S. and Canadian markets.

A Foothills Pipelines Ltd. proposal, called the Maple Leaf Pipeline, was submitted to NEB in April. This pipeline would carry Mackenzie Delta-Beaufort Sea natural gas to the Alberta and British Columbia system for Canadian markets. The proposal assumed future increases in reserves, which were 7.5 trillion cubic feet in 1975, with 19 trillion cubic feet necessary for pipeline development. Early in the year, a commission was established to investigate the social and environmental impact of this proposal, and, in October, the NEB started hearings on this and other pipeline schemes.

There was no change in the Polar Gas Project, which would bring natural gas from the Arctic Islands southward around Hudson Bay. A question of reserve sufficiency remained.

Petroleum.—Output of crude oil continued a decline that started in 1974. Limitations on exports to the United States were the main cause of this decline, leaving substantial shut-in capacity. According to EMR, production (including natural gas liquids and synthetic oil) averaged 1,734,000 barrels per day, down 13% from 1,994,000 barrels per day in 1974. Output of crude oil averaged 1,381,000 barrels per day; condensate and natural gas liquids, 310,000 barrels per day; and synthetic oil, 43,000 barrels per day.

On June 19, a Petroleum Administration Act received Royal assent, having passed the Parliament. The Act provided a legislative basis for the existing export tax on oil and certain refinery products and for a compensation scheme for oil imports in eastern Canada. It also empowered the Federal Government to regulate oil and gas prices in interprovincial and export trade.

According to the CPA, a record $650 million was expended on exploration in 1975, due mainly to rapidly rising costs. Although a total of 4,242 wells were drilled (including a record of 3,652 wells in Alberta), slightly more than in 1974, footage at 13,928,589 feet (4,245,434 meters) was down 4.4% from that of 1974. No major discoveries were made in and near the producing fields, elsewhere in the Provinces, or in the frontier areas (Mackenzie Delta, Beaufort Sea, Arctic Islands, and Atlantic offshore from Nova Scotia, Sable Island, Newfoundland, and Labrador).

In British Columbia, exploration was virtually at a standstill until midyear, when a new Provincial Government tax policy was an incentive to renewed activity. Significant discovery wells were reported at Tableland in southeastern Saskatchewan, the Mackenzie Delta, and Cameron Island. In the northern latitudes, drilling was from ice islands. Imperial Oil Ltd. was the most active company in the Mackenzie Delta area, and Panarctic Oils Ltd., which comprises 25 companies and the Federal Government, was most active in the Arctic Islands. A NEB study on oil reserves in the Mackenzie Delta area indicated a maximum of 1 billion barrels and the necessity for 3 billion to 5 billion barrels in reserves for commercial development and a pipeline. Although exploration in the Atlantic offshore areas was unsuccessful, resource potential was considered good.[26]

According to the CPA, reserves of crude oil and natural gas liquids were revised

[26] Millan, S. M. The Province of Newfoundland and Labrador—Offshore Petroleum Resources. Dept. of Energy, Mines and Resources. St. Johns, Newfoundland, Sept. 12, 1975, 17 pp.

downward as follows at yearend, in thousand barrels:

	1974	1975
Proved	8,791,399	8,239,056
Probable additional	1,385,051	1,345,497
Total	10,176,450	9,584,553

About 88% of this reserve was in Alberta. The CPA estimate for this Province was lower than that prepared by the Alberta ERCB, which revised the Provincial reserve as follows, in million barrels: [27]

	Jan. 1, 1975	Revision to reserve estimate	Production	Dec. 31, 1975
Crude oil	6,365	+44	−425	5,984
Natural gas liquids	1,958.2	−40.6	−108.9	1,808.7

Considering advances in new recovery technology, ultimate recoverable oil reserves were increased to 18 billion barrels, of which 11.5 billion barrels were considered substantiated at yearend.

CPA reported total crude oil pipeline mileage as of January 1, 1975, at 19,323 miles (31,097 kilometers), including gathering, trunk, and product lines. In May, NEB announced authorization for Interprovincial Pipe Line Ltd. to start construction of an 830-kilometer crude oil pipeline from Sarnia, Ontario, to refineries in the Montreal area. Capacity will be 350,000 barrels per day, but initial throughput will be 250,000 barrels per day. The line will be an extension to an existing system carrying Western crude oil to Ontario. With Government subsidization, Western crude will be delivered in Montreal at Toronto prices, pending a NEB decision on tariff rates for the entire pipeline system. This pipeline extension was expected to save on oil import costs in the eastern Provinces.

Crude oil exports to the United States averaged 707,000 barrels per day, down from the 1974 rate and scheduled to be reduced further in future years, based on an export control system, adopted in 1974, for conserving petroleum resources. The U.S. allocation was reduced to 800,000 barrels per day on January 1, 650,000 barrels per day on July 1, then raised to 750,000 barrels per day later in the year. The schedule called for reductions to 365,000 barrels per day in two stages in 1976 and the phasing out of exports by 1981. In the meantime, crude imports increased by about 6,000 barrels per day to an average of 824,000 barrels per day for the year, and Canada was a net importer of crude oil for the first time since 1970. With growing demand and decreasing production, Canada was expected to continue as a net importer of crude oil in the future.

The crude oil price, which averaged $5.72 per barrel in 1974 according to CPA, was raised to $8 at the wellhead, effective July 1. Governments of the oil-producing Provinces want prices increased to international levels.

Petro-Canada, established as a Federal Crown corporation with Royal assent on July 30, was to commence operations on January 1, 1976, with headquarters in Calgary, Alberta. Its initial top priority will be exploration and development, starting in the frontier areas, but it was expected to become involved eventually in the full range of activities from exploration to marketing. Petro-Canada was committed to an expenditure of $300 million for a 15% interest in Syncrude Canada Ltd., an operating company for a project for the recovery of oil from the Athabasca bituminous sands.

Demand for crude oil at 41 operating refineries was about 1,702,000 barrels per day, below that of 1974, due to reductions in deliveries of Western crude to Quebec and Maritime refineries. Total annual capacity increased to nearly 2 million barrels per day for the first time, with new capacity onstream during the year. Irving Oil Co. Ltd. completed expansion at its St. Johns refinery, New Brunswick, from 120,000 to 250,000 barrels per day, the largest in Canada. A new 145,000-barrel-per-day refinery of Imperial Oil Ltd. near Edmonton, Alberta, at the site of an existing refinery, was near completion at yearend. Imperial will phase out three refineries of small capacity at Calgary in Alberta, Regina in Saskatchewan, and Winnipeg in Manitoba, and convert them to distribution terminals for refinery products.

Synthetic Crude Oil.—Production by Great Canadian Oil Sands Ltd. (GCOS), the only commercial producer of synthetic crude from the bituminous sands at Athabasca, Alberta, averaged about 43,000 bar-

rels per day, compared with 46,200 barrels per day in 1974. In addition, about 1,200 barrels per day was produced at a number of experimental projects, mainly for in situ recovery. GCOS decided to defer a planned expansion of production to 65,000 barrels per day and work on improved oil recovery. For a rated 55,000-barrel-per-day operation, it would be necessary to strip 40,000 tons of overburden per day and mine 130,000 tons of bituminous sands per day.[28]

The Syncrude Canada project, located 48 kilometers north of Fort McMurray, Alberta, faced a financial problem following a decision by Atlantic Richfield Canada Ltd. in 1974 to withdraw from the operating joint venture that also included Canada Cities Service Ltd., Imperial Oil Ltd., and Gulf Oil Canada Ltd. Costs for the 125,000-barrel-per-day project had doubled from the $1 billion originally estimated. In February an agreement was reached providing Federal and Provincial Government participation and ownership. The Federal Government acquired a 15% ownership with $300 million equity funds; the Government of Alberta, 10% for $200

[28] Western Miner. Oil Sand Operations Have to Overcome Technical, Manpower, Cost Problems. V. 48, No. 9, September 1975, pp. 21–22.

million; and the Government of Ontario, 5% for $100 million. The private ownership was Imperial 31.25%, Canada Cities Service 22%, and Gulf Canada 16.75%. These three operating companies increased their investment by $400 million, which included a $200 million loan from the Alberta Government. This Government was also committed to $500 million to $600 million for a powerplant, pipeline, housing, and infrastructure and held a 20% participation option, acquired through the Alberta Energy Co. in 1973. Agreement between the operating companies and the Government interests provided for a 50–50 profit split, the right to receive the world price for oil, exclusion from any prorationing of production, no royalty payments, and assumption of a share of future losses, if any, by the Government interests.

At yearend, the Snycrude project was on schedule, despite labor problems and shortages of equipment, and was at 35% of completion, which was scheduled for late 1978 or in 1979 when initial production at 52,000 barrels per day was anticipated. Two draglines for stripping overburden and three bucket wheels for mining were ordered.[29]

Other proposed new Athabasca sands projects, approved by the Alberta ERCB, were slowed by shortages of investment capital, rising costs, and uncertainty concerning the future of this emerging industry. These included Shell Canada Ltd. (100,000 barrels per day), which deferred its project; the Petrofina Canada Ltd. consortium (122,500 barrels per day), which was reassessing its project; and Home Oil Co. Ltd.-Alminex Ltd. (103,000 barrels per day), which also deferred further work.

In addition to these proposed conventional mining ventures, a number of projects for in situ recovery of oil from the sands were at the experimental or pilot plant stage in four areas of interest—Athabasca (the main area of activity because of least overburden), Cold Lake, Peace River, and Wabasco. These projects involved steam injection and/or waterflooding. In July the Oil Sands Technology and Research Authority was established in Alberta to consider financing joint-venture experimental in situ projects. A $100 million fund was provided to the Authority.

An ERCB study established recoverable reserves of 26.5 billion barrels for areas considered minable by conventional open pit methods (overburden less than 46 meters thick). Ultimate reserves in place in presently delineated oil sands were considered to be as much as 1 trillion barrels.

In March, Federal-Alberta Government authorities established the Alberta Oil Sands Environmental Research Program to devise measures for environmental protection in the oil sand operations. A $40 million fund was provided for a 5-year program, renewable for an additional 5 years.

Uranium.—Output was higher than that of 1974, and shipments increased to about 5,500 tons U_3O_8. Escalating uranium prices throughout the year spurred mining activity and permitted the working of lower grade ores. Expansions to mine and mill capacities underway or planned at the four producing operations created manpower shortages, which could become more serious if training and related programs are not successful. Training programs were expanded, and new housing facilities were under construction. Staff-shuttling, started by Gulf Minerals Canada Ltd.-Uranerz Canada Ltd. at Rabbit Lake, northern Saskatchewan, was considered by other producers for mines in the more remote regions. Labor needs by Denison Mines Ltd. and Rio Algom Mines Ltd. in the Elliot Lake district were expected to increase threefold by 1983, if the two companies were to meet their uranium sales commitments.[30]

Denison Mines, the leading producer, increased output to 1,320 tons U_3O_8 at Elliot Lake, Ontario, compared with 1,270 tons in 1974, according to the company's annual report for 1975. Denison continued mine expansion to 7,100 tons of ore per day (2,300 tons U_3O_8 per year), scheduled for completion late in 1976, and planned a further expansion to 9,000 tons per day.

Rio Algom also was expanding capacity at mines in the same district and at its Quirke Lake mill from 4,100 to 6,400 tons of ore per day, and planned to reopen and develop mines and reactivate an idle mill. Eldorado Nuclear Ltd., the Federal Crown company, planned expansion at Uranium City, Saskatchewan, to 900 tons U_3O_8 by 1979. The fourth operable mine, that of Gulf Minerals-Uranerz at Rabbit Lake, Saskatchewan, the first new uranium mine in 25 years, started "break-in" oper-

[29] Mining Magazine. Mining the Athabasca Tar Sands. V. 132, No. 1, January 1975, pp. 14–15, 17, 19, 21–23.

[30] The Northern Miner. Uranium Workers Must Triple by 1983. V. 61, No. 38, Dec. 4, 1975, p. 5.

ations late in the year. Mill capacity is 2,000 tons U_3O_8 per year.

Three properties were under development: Amok Ltd. at Cluff Lake, northern Saskatchewan, where construction was to start in 1976 for 1,800 tons U_3O_8 per year in 1978-79; Agnew Lake Mines Ltd. at Agnew Lake, 50 kilometers west of Sudbury, Ontario, where preparations for an in situ leach operation continued; and Madawaska Mines Ltd., near Bancroft, Ontario, where the Faraday mine was being reactivated.

The Atomic Energy Control Board authorized export of 66,800 tons U_3O_8, effective September 1974, in line with established new export guidelines. Domestic utilities were required to contract for 15-year fuel needs for operating and committed nuclear generating capacity. About 100,000 tons U_3O_8 have been committed in export contracts. Denison Mines alone had export contracts for 37,000 tons U_3O_8 covering operations through 1994, according to the company's annual report for 1975.

With the spot price near $30 per pound U_3O_8 and rising at yearend and projected high demand worldwide, exploration activity for uranium was extensive throughout Canada, involving small to large companies in all Provinces and the Territories. A number of significant discoveries were reported. The Geological Survey of Canada started a $30 million, 10-year reconnaissance for uranium in participation with the Provincial Governments. The program includes airborne gamma spectrometry and regional geochemical surveys and will cover two-thirds of Canada by 1985.[31] Of particular interest was an underwater exploration project in northern Saskatchewan, where a scuba diver team with experimental scintillation detection equipment was testing the floor in a series of small lakes along a fault, and at Lake Athabasca where detection equipment, towed by a boat, will test the entire lake floor under a large radiometric program.

The Uranium Resource Appraisel Group, set up by EMR in 1974, reported uranium resources, as of yearend 1975, as follows, in thousand tons U_3O_8:

Price (per pound U_3O_8)	Measured	Indicated	Inferred	Total
Up to $20	74	97	205	376
$20–$40	13	20	101	134
Total	87	117	306	510

This total was 33,000 tons of U_3O_8 more than that reported for a $30 price at yearend 1974. Resources were estimated only for the principal deposits, since data were incomplete or lacking for other known deposits, and were expected to increase further in 1976 as new exploration data became available. EMR reported "prognosticated' (potential) resources for the first time; they were 450,000 tons U_3O_8 at prices up to $40.[32]

Eldorado Nuclear Ltd. produced 4,130 tons of U_3O_8 nearly double that of 1974, with increased utilization of capacity and improved control of chemical circuits at the Port Hope refinery, Ontario, the only uranium refinery in Canada. The company also produced 540 tons of ceramic-grade UO_2 in powder form, similar to the 1974 output, for CANDU nuclear fuels, and 2,450 tons of UF_6, 20% greater than in 1974, for enrichment services.[33]

Atomic Energy of Canada Ltd. reported 2,536 megawatts electrical of operating nuclear capacity in CANDU reactors, and 9,397 megawatts electrical under construction or planned.[34]

The Mineral Industry of Chile

By Charlie Wyche [1]

The worldwide economic recession, which forced the industrialized countries to reduce their mineral activity, had a profound influence on Chile's mining industry in 1975. The Chilean economy was subjected to a severe economic recession brought on by greatly depressed copper prices and past economic problems. The gross domestic product (GDP) declined nearly 15%. Minerals remained Chile's most important commercial activity, but declining copper demand and declining metal prices resulted in a drop of about 8% in total mine output. The industry was also affected by the agreement of Conseil Intergouvernemental Des Pays Exportateurs De Cuivre (CIPEC) to reduce copper production and exports 15% in an attempt to support prices. Copper exports accounted for over 80% of the nation's foreign-exchange earnings.

Traditionally, Chile's output of copper had been about 12% of world copper production and about 18% of world copper trade. With Chilean identified reserves estimated at over 75 million tons of copper, or about 20% of known world copper reserves, this world standing could continue. Moreover, the grade of porphyry copper ores in Chile tends to be higher than that found elsewhere in the world.

Chile's copper industry is divided into major, medium, and small sectors, which accounted for about 83%, 8%, and 9%, respectively, of total Chilean copper production. Corporacíon del Cobre (CODELCO) is the state body responsible for administering the four copper mines that constitute the major mining sector of the copper industry. The annual output from each major mine is generally over 75,000 tons. The medium mining sector (less than 10 mines) produced a combined total of 68,000 tons of copper in 1975. Except for one mine (Disputada), these medium mines were in private hands. The small mining sector was composed of hundreds of independent companies or cooperatives, which employed from 1 to 50 workers each. The small miners sell their ores to agents of the Government's Empresa Nacional de Mineria (ENAMI), which owned and operated several beneficiation plants as well as a smelter at Paipote. ENAMI also operated a smelter and refinery at Ventanas, and bought gold and silver ores.

Chile was also a large producer of iodine, molybdenum, and silver, all of which showed an output decline in 1975. In addition, commodities such as iron ore, limestone, manganese, mercury, petroleum, selenium, sodium chloride, sodium sulfate, and zinc were produced. For most of these products, 1975 production was below that reported for 1974.

Chile's balance-of-trade position improved in 1975 despite a decrease in the international price of copper and the rising foreign debt. At the beginning of 1975, a potential deficit of approximately $800 million [2] was projected, but the actual deficit was $260 million. The main reason for this improvement was the substantial decrease in the level of imports and the important growth of nonmineral export products.

The World Bank approved a $30-million loan to assist Chile in expanding its existing capacity to process copper ore and byproducts. The loan was to support investment subprojects undertaken by CODELCO and ENAMI. Under this program, technical assistance could also be provided to strengthen the management of both agencies and to improve planning and policy-making for the mining sector.

---

[2] Where necessary, values have been converted from Chilean Escudos (CEsc) to U.S. dollars at the rate of CEsc72=US$1.00.

Government Policies and Programs.—Citing the international economic crisis and the sharp decrease in the price of copper, the Chilean Government promulgated a new foreign investment law, Decree Law No. 966, published in April 1975. The law permitted 100% foreign ownership in new mining developments. In 1974, the Government owned at least a 51% interest in all major mines, while foreign companies could own a majority interest only in medium or small mines. Because of the new law, the Government's Committee on Foreign Investment (CFI) approved projects valued at about $300 million. This did not include contracts still being negotiated for large copper deposits such as Andacollo, El Abra, Los Pelambres, and Quebrada Blanca, or for exploitation of the Santa Clara iron property by Ataka Mitsubishi. The country's exclusive control of uranium deposits was under review, and a decree law permitting foreign investment in this area was expected. CFI also provided for full repayment of profits, repatriation of invested capital, and the payment of interest in foreign exchange to the investor.

The Chilean Government outlined a new administrative structure for the copper industry that was to become effective on April 1, 1976. The new legislation would dissolve the old CODELCO and the five existing mining corporations and create the Corporacíon Nacional del Cobre de Chile (CODELCO-CHILE). The principal objective of CODELCO-CHILE would be to exercise the rights acquired by the state in the major mine sector of the copper industry, and in the Andina Mining Co. through nationalization. It will continue to exploit the nationalized deposits, and manage the establishments, plants, and related services. CODELCO-CHILE would market copper and its byproducts, all forms of copper ore and concentrates, and other nonferrous metals. It would promote geological and technical research in mining, metallurgical, and industrial processes for copper and related products. It would also advise CFI regarding exploitation and supervise contracts between the Government and foreign investors.

The world's major copper-exporting nations met in Lima, Peru, November 18–20, 1975, and reversed an 8-year policy of not discussing copper-trade-related matters with copper-consuming nations. The conference decided that CIPEC, through its president, should initiate a dialogue between producing and consuming countries with intentions of negotiating copper prices that would be fair to both producers and consumers. CIPEC ministers also decided to maintain the 15% production cutback (from 1974 levels) imposed upon founding members until June 30, 1976. The organization also announced plans to prepare a study on financing and operating a buffer stock.

CIPEC increased its membership by three countries during the meeting. Indonesia became a full member, and Australia and Papua New Guinea became associate members. Additionally, Mauritania applied for associate status during the meeting and will be accepted in 1976. CIPEC claimed to represent 72% of the world's copper exports.

PRODUCTION

Owing to lower demand, output of many commodities declined during 1975. Voluntary cutbacks by the producers of copper, iodine, molybdenum, and silver resulted from a decline in world demand. Chile maintained its position as the world's second-largest producer of copper, and was third in molybdenum, and eighth in silver. Both smelter and refinery output of copper decreased slightly. Mine production of copper and molybdenum was down 8% and 7%, respectively. Output of coal remained steady, but that for natural gas and crude petroleum increased slightly. Decreases were also recorded for both potassium and sodium nitrate.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] In addition to the commodities listed, lime and pyrites are produced but available information is inadequate to make reliable estimates of output levels.

[2] Data given are the nonduplicative copper content of ores, concentrates, precipitates, metal, and other copper-bearing products measured at the least stage of processing reported in available sources.

[3] Figures presented are total blister and equivalent copper output including that blister subsequently refined in Chile and copper which is produced by electrowinning.

[4] Figures presented are total refined copper distributed into two classes according to method of refining.

[5] Excluding castings.

TRADE

Chile's foreign-exchange earnings from copper exports decreased more than 50% in 1975 because of low prices in world markets. Government officials reported that Chilean copper shipments during 1975 brought in $915 million compared with $1.9 billion in 1974.

Copper accounted for approximately 80% of the country's foreign-exchange earnings. Chile was the world's second-largest copper exporter. Shipments of 869,000 tons accounted for about 20% of net world copper exports. Chile's copper markets were diversified, and about one-half of its exports were to Japan, the United Kingdom, the United States, and West Germany. In addition, shipments were made to Argentina, Brazil, Canada, France, and the People's Republic of China, and exports to Iran were resumed.

Iron ore remained Chile's second-largest mineral export earner. Approximately 85% of the total production of iron ore was exported for an income of about $90 million. Nitrate exports, the third-largest earner, were down 29%, while iodine exports decreased 57%.

Exports of nitrate fertilizers total 497,100 tons valued at $51,610,000 in 1975, compared with 311,720 tons valued at $42,238,400 in 1974. About 80% of Chilean nitrate sales went to the agricultural market; the balance was used in explosives and in production of nitric acid. Exports of sodium nitrate, essentially to Western Europe, the United States, and Brazil, totaled a combined value of $28 million. Shipments of potassium nitrate, valued at $10 million, went to the United States, Brazil, and China.

Imports of crude oil declined about 18%, despite the decrease in domestic production of 11% in 1975. This was attributed to a sharp decline in consumption of crude oil in Chile from an average of about 104,000 barrels per day in 1974 to about 88,000 barrels per day in 1975, a decline of close to 16%. This correlated closely with the overall decline of the GDP. Imports of 23 million barrels of crude petroleum cost $227 million in 1975, compared with 29 million barrels costing $338 million in 1974.

COMMODITY REVIEW

METALS

Copper.—Chile copper production (copper in ore) declined 7.8% from that of 1974, according to figures issued by CODELCO. The reduction resulted primarily from Chile's participation in CIPEC and that organization's decision that members reduce production by a total of 15%. In Chile, the cutback was accomplished by closing the Exótica mine, and reducing output about 10% at the other state-owned mines. Production of the medium and small mines was off about 6%.

Total copper production (mine copper content) of all mining operations is shown in table 4.

Production of blister copper at Chile's six smelters was about the same as that in 1974. The output of electrolytic and fire-refined copper also showed little change. CODELCO invested approximately $115 million during 1975 in projects to maintain installed capacity and to lower costs. An investment of $100 million was planned for the same purpose in 1976. The cost of production of the major mines operated by CODELCO was below 50 cents per pound of copper. This figure included operating costs, depreciation of equipment and installations, general marketing, financial expenses, and taxes. Total investments authorized in 1975 amounted to $300 million, mainly for the copper-mining sectors. In December, an agreement was reached between the Chilean Government and Noranda Mines Ltd. of Canada for the development of the Andacollo mine, which will involve an initial investment of $260 million.

The CODELCO group planned to increase production in 1976 about 15% over the 1975 levels. This would be in line with the agreement reached at CIPEC's November 1975 meeting in Lima, at which members decided to change the basis of calculation of the percentage cutback in production.

Production of electrolytic copper at the Potrerillos refinery of El Salvador increased 2% to 64,600 tons, and blister copper output was up 2% to 81,400 tons. Production would have been higher except for the CIPEC restraints on copper producers. The El Salvador concentrator processed about 13,500 tons per day of ore. This highly efficient unit produced a concentrate of 45% copper and 0.85% molybdenum. The total recovery rate was over 90%. The concentrates were piped by gravity to Llanta, about 20 kilometers from the mine. At Llanta a tailings-treatment raised the total recovery rate 3%. Both the El Salvador concentrates received by pipeline and the Llanta concentrates were sent by rail to Potrerillos for smelting and refining. Design capacity at El Salvador refinery was 90,000 tons per year of copper. The probable ore reserves in 1975 totaled 300 million tons, grading 1.25% copper.

Table 4.—Chile: Copper mine production

(Metric tons, copper content)

Sector and mine	1974	1975
CODELCO:		
Chuquicamata	356,800	320,400
El Salvador	80,000	81,400
El Teniente	225,500	234,100
Andina	68,400	62,400
Exótica	32,200	--

Others	9,900	7,000
Total	139,200	130,000
Grand total	902,100	828,300

Source: Corporación del Cobre. Departamento Estudios, Gerencia De Ventas Estadisticas: Producción y Exportaciónes Chilenas, Año 1976.

During 1975, concentrates from the large Chuquicamata open pit were used to produce 320,400 tons of blister copper, compared with 356,800 tons in 1974. Mining operations were at a rate of between 50,000 to 60,000 tons per day, predominantly sulfide ores. However, enough oxide ore remained to permit operation of the existing leaching and electrowinning facilities. As the mine is worked into the primary mineralization zone, the predominant ore will be chalcopyrite. Although the secondary sulfide ores produced concentrates containing more than 39% copper, chalcopyrite would yield concentrates of about 28% copper. Furthermore, these concentrates would contain a higher iron content, which creates different problems in smelting.

The concentrating plant produced a high volume of over 39% copper concentrate. Concentrate output exceeded smelter capacity, so that a portion had to be sent to Potrerillos or to Ventanas for refining on a toll-charge basis. A part of Chuquicamata concentrates was also exported, mostly to North Korea. Construction of a new Chuquicamata smelter was contemplated, but engineers were developing a system of oxygen feed to the reverberatory furnaces that would greatly increase smelter capacity. A similar system was successfully developed at El Teniente.

The Exótica mine, located about 2 kilometers south of the Chuquicamata pit, remained closed during the year. When in operation, ore from this mine produced a leach solution that contained a colloidal suspension of impurities such as selenium, aluminum, and iron. This inhibited the electrowinning process and produced unmarketable cathodes. The cathodes had to be cast into anodes, and either sold as blister or electro-refined, a process that pushed production costs to over 60 cents per pound. Consequently, when Chile complied with the CIPEC Agreement of 1974 to reduce copper production, it was largely through the closing of the Exótica mine. The mine is scheduled to be reopened in November 1976, but the actual reopening date will depend on copper prices. Ore reserves at Exótica were estimated at 155 million tons, averaging 1.35% copper.

At Mantos Blancos, which remained the largest privately held copper mine in Chile, production of fire refined copper increased 4% to 26,000 tons. About 6 years of reserves (20 million tons of 1.6% copper) were available from the open pit mine, and the company was opening up an underground mine at an investment cost of about $17 million. At Disputada, production of blister copper decreased 9% because of the CIPEC-imposed cutback. Ore reserves at the Disputada mine were estimated at about 100 million tons, grading 1.4% copper.

Mineral Sagasca, S.A., controlled 59% by Continental Copper & Steel Industries, Inc. of Chile, operated at 30% of capacity for the year and produced 5,400 tons of copper. Due to low oxide-leach recovery rates and difficulties in meeting long-term-debt schedules, Sagasca applied to the Chilean Government to suspend operations at yearend.

Sociedad Minera Pudahuel Ltd., owned by private Chilean interests, hired the U.S. firm, Holmes and Narver, as engineer and construction manager for the $40-million Lo Aguirre project near Santiago. The complex, which comprises a mine, mill, solvent extraction plant, and electrowinning plant, could start production in 1978 at an annual capacity of 22,000 tons of cathode copper. The Lo Aguirre deposit contained reported reserves of 10.4 million tons, averaging 2.12% copper.

Of the four large ore bodies being made available for foreign exploitation under the Foreign Investment Law (DL–600) of July 1974, Noranda Mines Ltd. signed a letter of intent on Andacolla, located in Coquimbo Province, with reserves of 193 million tons, averaging 0.75% copper and 0.15% molybdenum. Leon Tempelsman & Sons, of the United States, signed a letter of intent for El Abra, with a minimum 770 million tons grading 0.9% copper, while the other two, Quebrada Blanca and Los Pelambres, were still in an early phase of negotiations.

CODELCO published *El Cobre Chileno–1975*,[3] a comprehensive 500-page book that gives a detailed property-by-property account of all aspects of the Chilean copper industry. The book reported the magnitude of Chile's copper resources at 10.2 billion tons averaging 1.02% copper, with an additional 7.3 billion tons of identified subeconomic resources averaging 0.32% copper. CODELCO invested approximately $115 million to maintain installed capacity and lower production costs, which decreased from 51 cents to 48 cents per pound of copper during the year. The expenditures included expansion of the secondary grinding plant, a new molybdenum recovery plant at Chuquicamata, and the addition of a third reverberatory furnace and expansion of the Rancagua foundry at El Teniente.

Iron Ore.—Output increased nearly 7% over that of 1974. All ore production was controlled by the Government-owned steel company, Compañia de Acero del Pácifico, S.A. (CAP). The average grade of the ore produced was 63% iron. Approximately 85% of the total production was exported for an income of around $90 million. This made iron ore second in importance to copper as an export earner. The Santa Barbara-Santa Fe and El Romeral divisions accounted for 74% of exports.

Iron ore exports were principally to Japan and the United States, which together received about 90% of total exports. Shipments to Chile's Huachipato steel complex for domestic consumption decreased 38% from the 1974 level. Domestic and foreign shipments, by mine, are shown in table 5.

The pelletizing plant and other installations, collectively known as the Huasco Valley project, were over 50% completed and were scheduled to be finished by yearend 1977. Chile began running low on reserves of ore that could be exported without the treatment made possible by this project. The project was funded largely by Mitsubishi Co. Ltd., which signed a sales contract to take 33 million tons of pellets in payment under a 10-year contract.

CAP continued to conduct a feasibility study for a mining facility at the major Cerro Negro iron ore deposits in northern Chile.

Iron and Steel.—Reduced crude steel output, 24% below that of 1974, resulted from a decline in domestic demand. CAP,

[3] Sutulov, A. El Cobre Chileno (Chilean Copper). Editorial Universitaria, Santiago, Chile, 1975.

operating at reduced capacity, supplied 458,000 tons, or 95% of Chile's total steel production. The company produced a wide range of finished and semifinished products, such as bars, plates, galvanized sheets, and tinplate. Pig iron and cast iron production decreased 23% in 1975. CAP had a steel-ingot capacity of 620,000 tons per year at its Huachipato plant. An expansion plan, initiated in the early 1970's to increase production to 1 million tons per year, was delayed because of the decline in steel demand.

Table 5.—Chile: Iron ore shipments by CAP in 1975

(Metric tons)

Mine and product	Quantity
El Romeral Division:	
Blast furnace ore to Japan	1,311,721
Blast furnace ore to Argentina	354,795
Blast furnace ore to CAP steel mill	629,951
Fines to Japan	1,304,608
Total	3,601,075
Santa Barbara-Santa Fe Division:	
Run-of-mine ore to Japan	2,640,714
Run-of-mine ore to Europe	539,523
Blast furnace ore to United States	417,597
Blast furnace ore to Argentina	27,433
Open hearth furnace ore to United States	35,562
Open hearth furnace ore to CAP steel mill	25,401
Total	3,686,230
Algarrobo Division:	
Blast furnace ore to Japan	1,477,337
Fines to Japan	1,301,560
Total	2,778,897
Total shipments, by destination:	
Japan	8,035,939
United States	948,552
Europe	310,091
Argentina	72,139
CAP Huachipato steel mill	663,481
Total	10,030,202

Source: Skillings' Mining Review. V. 65, No. 11, Mar. 13, 1976, p. 8. (Original data in long tons were converted at a factor of 1 long ton equals 1.01605 metric tons.)

Molybdenum.—Molybdenum production showed a 7% decline in 1975, but Chile remained the world's third-largest molybdenum producer. Molybdenum was recovered as a byproduct of Chile's large copper mines, of which the most important was Chuquicamata, followed by El Teniente and El Salvador. In addition, 934 tons of ferromolybdenum and 5,271 tons of molybdenum oxide were produced.

CODELCO planned to open a new $26-million molybdenum plant at Chuquicamata in early 1976. When operating at full capacity, this plant was expected to recover about 13,000 tons per year of molybdenum. A new plant at the Andina mine, with a production capacity of 500 tons per year of molybdenum, was expected to open in 1976. Chilean reserves of molybdenum contained in copper ores were estimated at over 2 million tons.

Precious Metals.—Production of gold increased about 10% above that of 1974. Gold and silver ores supplied 40% of the total gold output, and 60% was recovered as a byproduct of copper production. A recent proposal to remove government control over gold sales was expected to stimulate gold mining.

Domestic silver production was down 6%. Approximately 98% of the production was a byproduct of copper output. Lead-zinc and silver ores accounted for the remainder.

The Coquelimpie silver mine was reopened; it is located in the Arica Plateau about 30 kilometers from the Bolivian border. A flotation installation, with a treatment capacity for 100 tons of mineral per day, yielded about 11 troy ounces of silver and 0.12 troy ounce of gold per ton.

NONMETALS

Cement.—Cement production dropped 30% in 1975, which reflected the slowdown in Chile's construction industry. Despite the relatively low output, Chile remained self-sufficient in cement, and was able to export cement worth $1.2 million, chiefly to Bolivia and Ecuador. Domestic consumption was expected to increase in 1976, but the industry may continue to export part of its production.

Iodine.—Production of iodine declined 13.9% in 1975. Only 75% of contracted sales were completed. Iodine was recovered as a byproduct of nitrate production at three plants owned by Sociedad Quimica y Minera de Chile (SOQUIMICH).

Nitrates.—The Chilean nitrate industry, operated by SOQUIMICH, consisted of four mines. Production of sodium and potassium nitrate was 5.6% and 1.2%, respectively, below 1974 levels. This decrease resulted from insufficient domestic demand brought on by increased prices. A special credit by the Government in late 1975 to consumers for nitrate purchases had a negligible effect on the industry. Exports of sodium nitrate totaled 280,119 tons, a sharp decrease from that of 1974. Of this total, 43% went to Western Europe, 41% to the United States, 7% to Brazil, 4% to Mexico, and the remainder to Japan and Argentina.

Potassium nitrate exports totaled 73,040 tons in 1975; 32% was shipped to the United States, 31% to Brazil, 26% to China, and the balance to Western Europe and Mexico. The $35-million expansion and modernization program begun by SOQUIMICH in late 1974 was nearing completion. The expansion was to increase nitrate production capacity to 850,000 tons in 1975 and to 950,000 tons by 1976. Reserves at operating mines were blocked out for 20 years of operation at 1975 production rates. Additional reserves were developed that would assure production for an additional 50 years. SOQUIMICH estimated that if extractive efficiency could be improved to where 6% ore could be processed, the amount of available reserves would double.

MINERAL FUELS

Coal.—Owing to reduced demand, coal production in Chile declined about 2% from the 1974 level. Receipts of metallurgical coal by CAP, which produced most of Chile's steel, totaled 213,000 tons of domestic and 163,000 tons of imported coking coal. The quantity supplied in 1974 from domestic sources was 222,000 tons, and from foreign sources, 187,000 tons.

Sales were down even more sharply (25%), while stocks increased to a level of 450,000 tons by December 1975. An effort to reduce this high stock level through exports met with little success. Chile planned to ultimately replace high-cost oil with coal for electric power generation at the large copper mines, and also to convert copper smelters and refineries of ENAMI to coal. This program was underway, and could lead to an increase of 350,000 tons in coal consumption in 3 years and 700,000 tons in 5 years. Chile's national coal company, Empresa Nacional del Carbon (ENACAR), also started a program to try to convince other industries to convert to coal. Data were prepared showing that the per calorie cost of coal was between 40% and 60% of that of petroleum for many uses and locations. Such conversion could augment consumption by an additional 200,000 to 250,000 tons per year.

Petroleum and Natural Gas.—The Government of Chile passed Decree Law 1089 in July 1975, which authorized Empresa Nacional del Petroleo (ENAP) to permit foreign companies to explore and exploit hydrocarbon deposits. The decree was flexible but generally provided for 5-year permits with automatic continuations up to 30 years if petroleum was found. ENAP designated seven areas for exploration, but reserved the Springhill District and the Straits of Magellan for itself.

Two areas available to foreign contractors were located near Springfield in southern Chile. Three areas in south-central Chile and one in northern Chile embraced both offshore and onshore areas. From 57 qualified firms, ENAP invited 23 to participate. Of these, 12 indicated interest, and formal invitation letters were sent on October 17 with bids due on February 27, 1976.

ENAP completed 412 kilometers of reflectivity seismic-exploration profiles in 1975, compared with 441 kilometers of reflectivity profiles in 1974. Drilling activity decreased to 65 holes, with a cumulative length of 129,000 meters, compared with 67 holes and 150,000 meters in 1974. Of the total length drilled, 55 holes and 131,000 meters were in Magallanes Province; the remainder was in the south-central zone. The types of wells drilled and drilling results were as follows:

Type of well	Number of completions			
	Petroleum	Gas	Dry	Total
1974:				
Exploration	--	1	24	25
Extension	--	1	5	6
Development	12	3	21	36
Total	12	5	50	67
1975:				
Exploration	--	2	20	22
Extension	--	1	5	6
Development	12	3	22	37
Total	12	6	47	65

Continuing the downward trend of the past 9 years, crude oil production dropped 11% in 1975. All the principal producing fields showed decreased output during the year. The mainland fields across the Straits of Magellan produced 60% of total production, and fields on Tierra del Fuego supplied the remaining 40%.

Output was expected to continue to decline until mid-1977, when the Estrecho de Magallanes Field was scheduled to start production. This could permit a progressive increase in national oil production, which is expected to reach a level of 12.6 million barrels in 1981.

Production for 1974 and 1975 was as follows, by field:

Location and field	Production (thousand 42-gallon barrels)	
	1974	1975
Mainland:		
Daniel	1,699	1,485
Daniel Este	1,529	1,261
Posesión	850	717
Cañadón	622	601
Other	1,390	1,202
Total	6,090	5,266
Tierra del Fuego:		
Calafate	1,208	1,153
Cullen	812	699
Tres Lagos	728	625
Other	1,217	1,204
Total	3,965	3,681
Grand total	10,055	8,947

Source: Empresa Nacional del Petróleo, Chile. Boletín Estadistico, 4 Trimestre y Annual, V. 70, pp. 8, 42.

Imports of crude petroleum, chiefly from Venezuela, totaled 23 million barrels, 18% less than in 1974. Imports accounted for about 70% of total petroleum refinery feedstock in 1975, compared with 75% in 1974. Concón refinery feedstock consisted of 90% foreign crude petroleum; 65% of the Concepción refinery stock was from imports. No imported crude oil was shipped to the Manatiales refinery.

Refinery output decreased 20% compared with that of 1974, owing principally to the drop in volume of imported crude oil. This reflected the low level of economic activity. The Concepción refinery processed 19 million barrels; Concón, 16 million barrels; and the Manatiales gasoline plant, 450,000 barrels.

Natural gas production remained virtually unchanged during 1975. Mainland fields accounted for over 60% of the total, and Tierra del Fuego for the remainder. The Posesión Field (mainland) remained the largest producer, supplying 38% of the total. Daniel (mainland) produced 10%, and Tres Lagos and Cullen (both on Tierra del Fuego) produced 12% and 9%, respectively. Of the total gas withdrawn from all fields, 50% was reinjected. At Posesión, 65% of the amount withdrawn was reinjected; at Daniel, 55%; at Cullen, 68%; and at Calafate, 90%.

Chile's proven natural gas reserves were estimated at 3.5 trillion cubic feet. ENAP continued plans to finance a $320-million gas-liquefaction plant at Cabo Negro in Magallanes Province. ENAP received $80 million of the required $120 million equity investment. Venezuelan investors indicated interest in the remaining $40 million. ENAP was also reported to have arranged $100 million of the $180 million to $200 million construction financing from Brazilian suppliers, and was attempting to line up the remainder through U.S., Japanese, and Swiss export guarantees.

The Mineral Industry of People's Republic of China

By K. P. Wang [1]

The economy of the People's Republic of China continued to make progress in 1975. China's gross national product (GNP) may have been approximately $260 billion to $270 billion,[2] slightly more than in 1974. Minerals, metals, and fuels made a significant contribution of between 5% and 10% to the 1975 GNP, depending on how mineral output value and value added are defined. Resources and related fields continued to be given priority in China's economic development. Large metal and equipment imports were needed to expand the production base, and these imports were primarily responsible for creating a shortage of about $1 billion in foreign exchange in 1974. To correct the shortage, the Chinese were pushing hard for exports in general and mineral-product exports in particular during 1975. The key to the balance-of-payments position was oil exports, primarily to Japan.

Early in the year, Japan was in no hurry to buy all the oil that China offered; however, it was not adverse to selling more steel and fertilizers. Near yearend, a new concept evolved; a barter of roughly 8 million tons of Chinese crude oil for 2 million tons of Japanese steel products was being considered.

Simultaneous development of both large and small industries continued to be basic policy; this is intended to localize economic strength, cut down on transportation requirements, and enable industry to better serve agriculture. Recognizing that modern technology is related to large-scale operations, the Chinese also believe that small-scale operations can be worked efficiently. The policy of "building from within," or self-reliance, was modified considerably in 1974–75; there were substantial purchases of plants, equipment, machinery, and technology. China has been arranging an increasing number of technical exchanges and trade missions, including sending a minerals and metals trade delegation to the United States in January–February 1976. On the other hand, a recently adopted industrial-planning concept of dispersing industry for strategic reasons has also been closely followed.

During the fourth National People's Congress held in late January 1975, twin long-term development goals were stated as follows: (1) Before 1980 (the last year of the fifth 5-year plan), China would establish a relatively independent and integrated industrial system; and (2) before the end of the century, China should become a totally up-to-date modern power. Mineral resources seem to be adequate for these objectives.

Premier Chou En-Lai died on January 8, 1976, and the Central Committee of the Chinese Communist Party, headed by Chairman Mao Tse-Tung, appointed Hua Kua-feng Acting Premier until the next National People's Congress is convened.

The year 1975 was one of marked growth for China's mineral industries, and the economy did reasonably well also. In particular, the petroleum industry developed rapidly in 1975, with output comparable to those of Libya and Indonesia. Less publicized were parallel developments in oil

---

[2] The unit of Chinese currency is Ren-Min-Bi (RMB). The nominal exchange rate of Chinese RMB was about RMB2.2 = US$1.00.

consumption, distribution, construction of pipelines and refineries, and petrochemicals. Production and use of natural gas also increased sharply, and the Chinese were making inquiries in international markets for equipment related to liquefaction and purification of the gas. The coal industry raised output moderately, and many large and small powerplants were being built. The thrust towards increased energy use and mechanization to support agriculture became clear; China had a large coal industry long before the new surge in petroleum.

Metal imports and consumption increased sharply in 1975, primarily owing to the building of new industrial plants, pipelines, water projects, and electrification, transmission, and transportation equipment and projects. Expanding steel production did not keep pace with the even greater steel consumption, necessitating larger imports. Unlike steel, which has a reasonably good internal resource and output base, aluminum and copper shifted towards greater reliance on imports in 1975, with considerable increases in the tonnages purchased in world markets. Cement production increased significantly to meet the growing requirements of construction activities related to roads, dams, plants, and housing. In addition to raising domestic fertilizer output, there was an effort to negotiate the most favorable prices for the indispensable imports.

China's electric power capacity has grown significantly in recent years, although the total is still less than one-tenth of U.S. capacity. By yearend 1975, China's capacity probably reached 25 million to 30 million kilowatts, and hydroelectric capacity perhaps 6 million to 9 million kilowatts. The most significant aspect of the electrification program has been in the thermal area, based mainly on coal but increasingly also on oil and gas. However, many small hydroplants have been built in south and southwest China, raising the total to over 60,000 such plants by yearend. A very important recent development was the importation of gas-turbine generating units that reflect the country's emergence as a significant natural gas producer.

China has placed five satellites into the earth's orbit since 1970, the last one on December 17, 1975.[3] The fourth, launched on November 26, 1975, reportedly returned to earth as scheduled without any malfunctioning.

PRODUCTION

In 1975, China ranked within the first three world producers of bituminous coal, anthracite, tungsten, antimony, salt, pyrite, and within the first five world producers of iron ore, coke, pig iron, steel, tin, mercury, bismuth, magnesite, phosphate rock, graphite, fluorspar, asbestos, and high-grade talc and soapstone. It was also among the first 10 in crude oil, cement, manganese, barite, and rare-earth elements. In terms of combined mineral output value, China was barely among the first five. China can be expected to move up in the next decade, and it would not be surprising if the country ranked fifth or sixth in oil production by then. According to a Bureau of Mines report,[4] China is one of the world's rich mineral provinces fully capable of supporting a modern first-rank industrial economy.

China's coal industry was nearly on a par with those of the United States and the U.S.S.R. The oil industry built up three large fields, and natural gas production was greatly increased. China's steel and cement industries, although still much smaller than those of the U.S.S.R., the United States, and Japan, became comparable with those of the leading countries of the European Economic Community (EEC). The famous export metals, particularly tungsten, tin, and antimony appeared in greater quantities in the world markets during 1975.

China has been a major factor in world fertilizer output, consumption, and international trade for more than 5 years. It produced about 3 million tons of nitrogen in 1975 and consumed over 4 million tons. China continued to be Japan's largest customer for fertilizer. The country's phosphate potential became more fully exploited, but output was still less than one-tenth that of the United States, the world leader. The Chinese salt industry, based mainly upon coastal salt flats, expanded further; China already was produc-

Refinery products ---do	[r] 325,000	[r] 422,000	509,000

[p] Preliminary. [r] Revised.

[1] In addition to the commodities listed for which quantitative estimates of output have been made, the People's Republic of China is known or is believed to have produced the following commodities for which no estimates, even of order of magnitude, have been prepared, owing to a paucity of general information upon which to base an estimate: Arsenic, chromite, nickel, titanium minerals, uranium, boron minerals, various clays (including kaolin), feldspar, lime, mica, various industrial and dimension stones, sand, gravel and carbon black. Other unlisted commodities also may be produced.

[2] Diaporic bauxite; includes an estimated 160,000 long tons annually of production for refractory applications.

[3] In terms of 50% Fe ore.

[4] Data are for year ended June 30 of that stated.

[5] Source: British Sulphur Corp. Ltd. Statistical Supplement No. 12, November-December 1975, pp. 15, 19.

[6] Sulfur content of pyrite has been listed under sulfur.

ing at more than one-half the U.S. level. China remained prominent in pyrite. Manchuria is one of the world's best known areas for magnesite, both in terms of potential and production. China improved its position as a medium-sized producer of asbestos, graphite, barite, and fluorspar. Chinese steatite-grade talc is well known in world markets.

TRADE

Total trade of the People's Republic of China was about $14 billion in 1974, with exports of $6.5 billion and imports of $7.5 billion. Overall 1975 trade was slightly higher, and the gap between exports and imports was smaller. However, China has sharply reduced imports in some areas, especially agricultural products and complete industrial plants. China exported possibly 10 million tons of crude oil in 1975 and imported nearly 5 million tons of finished steel products. Japan has been China's leading trading partner, importing $1.5 billion and exporting $2.3 billion in goods in 1975. China's crude oil exports to Japan were worth possibly $600 million, and steel imports from Japan were worth about $1 billion. Most of the remainder of the trade was with Western Europe and North America. Two-way trade with the United States in 1975 may be only $450 million—less than one-half the total trade in 1974. Trade with Eastern Europe had been small for many years, although China has sold significant tonnages of its famous export metals (particularly tungsten) to the U.S.S.R. in recent years. Trade with Far East countries, Oceania, and Latin America has been on the rise.

Minerals, metals, fuels, chemicals, fertilizers, mineral-related products, and equipment and plants for mineral and metal development, extraction, and processing were very important components of China's overall trade. Detailed data on trade are not available, so individual items of imports and exports must be estimated. Out of the roughly $6.5 million in goods exported in 1974, $550 million can be attributed to oil, $150 million to "export metals", and $10 to $15 million each to salt, fluorspar, coal, talc, and magnesia and other nonmetallics. Out of the approximately $7.5 billion of goods imported by China in 1974, $1.3 billion might be attributed to complete industrial plants; $900 million to steel products; $400 million to fertilizers and raw materials; $250 million to metals; $200 million to pig iron, scrap, and other ferrous materials; and possibly $200 million (order of magnitude) to mineral-industry-related machinery and equipment.

Partly because of the effort to avoid recurrence of the balance-of-payments deficit, the purchase of complete industrial plants in 1975 was cut nearly $1 billion compared with that of 1974. Steel imports were up at least $300 million, and machinery and equipment purchases were about the same as 1974 levels. As an order of magnitude of steel imports, China contracted to buy 2.3 million tons of steel products from Japan (by far the largest supplier) for the second half of 1975. Trade circles have reported that China bought well over 300,000 tons and possibly as much as 350,000 tons of aluminum from abroad during 1975. Imports of copper, lead, and zinc have been sizable also. Recently, China has contracted to buy moderate quantities of copper concentrates and high-grade iron ore.

Table 2.—People's Republic of China: Apparent exports of selected mineral commodities [1]

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
METALS			
Aluminum:			
Bauxite and concentrate	99,913	111,178	Canada 34,427; France 17,531; West Germany 16,076.
Oxide and hydroxide	5,999	2,250	All to Finland.
Metal including alloys, all forms	--	223	All to Belgium-Luxembourg.
Antimony:			
Ore and concentrate	8	17	All to Zambia.
Metal including alloys, all forms	250	100	All to U.S.S.R.
Arsenic oxide and acids	1,266	969	Japan 575; Italy 304.
Chromium oxide and hydroxide	--	247	Austria 116; Finland 45; Australia 35.
Copper metal including alloys, all forms	100	NA	
Iron and steel:			
Ore and concentrate	--	514	All to West Germany.
Metal:			
Scrap	--	102	Do.
Pig iron, ferroalloys, similar materials	--	560	Mainly to Sweden.
Semimanufactures:			
Wire	--	610	United States 450; West Germany 94; United Kingdom 66.
Tubes, pipes, fittings	(2)	712	Mainly to Japan.
Lead metal including alloys, all forms	--	58	Japan 50; Zambia 8.
Manganese:			
Ore and concentrate	47,750	61,273	Mainly to Japan.
Oxide and hydroxide	--	1,812	Sweden 1,422; Norway 330.
Mercury ... 76-pound flasks	1,973	4,351	France 1,131; West Germany 1,015; United Kingdom 841.
Tin metal including alloys, all forms:			
Scrap	--	20	All to United Kingdom.
Unwrought	8,153	9,159	United States 3,336; Netherlands 1,461; France 1,280.
Titanium oxides	625	490	All to Japan.
Tungsten ore and concentrate	9,997	8,073	U.S.S.R. 3,900.
Zinc:			
Oxide and hydroxide	--	30	All to Japan.
Metal including alloys, all forms	--	495	Sweden 295; Portugal 150; Netherlands 50.
Other:			
Ore and concentrate, n.e.s.[3]	3,099	5,736	Japan 1,994; France 1,586; Greece 803.

COMMODITY REVIEW

METALS

Aluminum.—Expansion of power generation and transmission facilities has greatly increased demand for aluminum in China. The country apparently entered the takeoff stage in aluminum consumption, spurred by rapid growth in oil and gas production and consumption. Meanwhile, China has not built any large aluminum-reduction facilities since completing the 100,000-ton-per-year Fushun plant in Liaoning Province during the mid-1950's, and the country faces obviously increasing shortages. This situation is in contrast with the rest of the world, where many large new aluminum plants have been constructed, mostly by international companies. Lack of adequate cheap power, high-grade resources, easily available capital, and the latest technology, plus difficulty in establishing big integrated projects, are among the reasons China has not moved forward rapidly in this area. Nonetheless, China probably produced about 200,000 tons of aluminum annually during 1974–75.

Recent information indicates that the Fushun plant has horizontal-stud Soderberg cells that produce 450 kilograms per day per cell. There are two units, each with two potlines of 160 cells per line, or a total of 640 cells. Fushun uses acidspar from Taolin. China's foremost alumina plant, Nanting in Changtien (Shantung Province), with four large rotary kilns and corresponding chemical facilities, has been steadily expanded in the last few years. Reduction plants of 20,000- to 30,000-ton initial capacity apparently have been built at the Sanmen Gorge at the Honan-Shansi border and at Lanchow, Kansu Province. Unconfirmed small plants might also have been built at Taiyuan (Shansi), Wuhan (Hüpeh), Changling (Kirin), Tsingtao (Shantung), Nanning (Kwangsi), Hofei (Anhwei), Sian (Shensi), Kweiyang (Kweichow), Chiaotso (Honan), and Changsha (Hunan). Completion of an aluminum plant with two potlines was mentioned late in the year for Yiliang County, southeast of Kunming, in Yunnan Province. One might assume that at least one-half of these small plants are in operation. Thus, the overall aluminum-reduction capacity has been raised to well over 200,000 tons per year.

Meanwhile, China had quietly imported an average of nearly 100,000 tons of aluminum annually during 1972–74. In 1975, the combined tonnage purchased by China from several international aluminum companies may have reached 350,000 tons. This reflects not only spiraling demand, but perhaps also buying at reasonable prices beyond what is immediately needed as a hedge against higher prices.

Antimony.—The most elusive of China's big three export metals, antimony, is used in batteries, bearings, type metal, solder, and munitions, and the sulfide (crude antimony) and oxide (antimony white) are used mainly in flameproofing, pigments, and ceramics. China was competing primarily with the Republic of South Africa (ores have gold) and Bolivia in world markets. The three countries had a "summit" meeting in La Paz late in 1975, but China pulled out midway, possibly because of nonrecognition by Bolivia. Nonetheless, a Bolivian antimony delegation visited China subsequently to discuss areas of further cooperation.

Chinese antimony consumption may have reached 5,000 tons during 1975, and accountable exports through statistics of importing countries have averaged nearly 7,000 tons annually in recent years. China had antimony to sell in 1975, but could not get good prices. Stockpiles are probably considerable. Output in 1975 is estimated at 12,000 tons valued at approximately $35 million. Both the regulus and antimony white are 99.5% pure, and antimony concentrates can be 25% to 60% Sb. Most Chinese antimony comes from southwest Hunan Province, mainly from Hsikwangshan, which may have reserves of 1.5 million tons of antimony. Output can be easily increased, and the Chinese industry is well acquainted with antimony technology.

Bismuth.—China continued to produce about 5% to 10% of the world's output, ranking about fifth. Little has been exported, indicating a growth in domestic consumption and possible stockpiling. Chinese bismuth is a byproduct of the tungsten from Kiangsi Province and nonferrous operations.

Copper.—Chinese consumption of copper may well have reached 300,000 tons in 1975, which is of some consequence by world standards. Electric power and machinery requirements have steadily expanded, and military-security needs for copper were also of consequence. International tension along the Chinese borders has also made it imperative to build up national stockpiles. As with aluminum, domestic production remained relatively small. Moreover, the country still did not have even one large copper mine or plant. However, some secondary materials were available, including brass, bronze, and plain copper scrap. China has had to rely heavily on imports, and this situation will continue until large integrated domestic projects, including smelters, can be developed. Copper production from domestic materials is estimated at 150,000 tons in 1975, not including refined copper made from imported blister copper.

As of 1975, China seems to have up to 10 copper mines producing between 2,000 and 20,000 tons per year of mine copper; included are Hungtoushan near Fushun, Huatung at Chingyuan in Liaoning Province, Tunghua in Kirin Province, and Tungkuanshan in Anhewei Province. More important is the potential for porphyry copper in, for example, the Chilienshan Mountains of Kansu Province and the Chungtiaoshan Mountains of Shansi Province. The Chinese seem to have difficulty developing large deposits, although it started to inquire about excavating equipment in 1974–75.

Except for Shenyang and Shanghai, information on Chinese copper smelting and processing facilities remained meager. The Shenyang smelter produces refined lead and zinc in addition to several tens of thousands of tons of refined copper; the raw material is mostly primary. The Shanghai copper and lead refineries may produce slightly more copper than Shengyang, but most raw materials consist of imported blister copper and scrap. Copper refineries have also been mentioned for Taiyuan and Chungtiaoshan in Shansi Province, Tayeh and Wuhan in Hupeh Province, Kunming in Yunnan Province, Anhwei Province, Fukien Province, and Hainan Island. There is said to be a large smelting center at Lanchow in Kansu Province, which probably produces copper among other metals, including byproduct rare-earth metals. Another "complex" smelter has been mentioned as being located in Urumchi, Sinkiang. The Chinese talked with the Japanese about building a copper smelter during 1975 and earlier, including Furukawa Mining Company about flash smelters.

China has a long-term contract with Zambia for copper as collateral for a $400 million interest-free loan to build a 2,000-kilometer railroad linking Zambia with Tanzania. Shipments from Zambia were 18,000 tons in 1974 compared with 44,000 tons in 1971. Chile furnished China with 40,000 to 60,000 tons annually in recent years. Peru's yearly shipments have been about 25,000 to 30,000 tons to repay a loan to develop the Tintaya copper deposit in Peru. Japan, Canada, and the United Kingdom have also sold China large tonnages of copper. All told, Chinese imports have hovered between 100,000 and 170,000 tons yearly. In 1975, China began receiving trial shipments of copper concentrates from the Philippines and Bougainville amounting to 10,000 to 15,000 tons in each case.

Iron and Steel.—The year was hardly impressive for the iron and steel industry in terms of achieving long-term objectives. No specific national output data and few plan-fulfillment figures for individual steel complexes or sectors were announced. Most of the activity was in the areas of basic construction, plant consolidation, and upgrading of raw materials. Although probably much below the original targets of the fourth 5-year plan, the Chinese steel industry made some gain in 1975, possibly producing about 29 million tons of crude steel.

Chinese policy apparently was aimed at increasing the size of existing large steelworks, with special emphasis on Wuhan, where newly purchased foreign rolling mills were being installed. Construction of additional integrated steelworks was not yet started. Meanwhile, effort was made to use more and larger oxygen converters, along with electric furnaces, while improving operations of existing open hearths. The iron-ore and coking-coal supply problems seems to have been solved, with good-quality materials now being charged to the blast furnaces. Medium-sized and local steelworks were also being expanded.

China was running into trouble trying to meet its short-term goals. Chinese capital and technology have not been adequate for boosting steel output to a new plateau. There was also concern that too much foreign exchange would be needed to purchase plants from abroad. The principal deals so far arranged pertain mainly to steel rolling mills and fabrication plants rather than basic steelmaking facilities. Recent developments indicate that the Chinese would be able to raise steel capacity only by about 10 million to 12 million tons in the next 5 years. Meanwhile, demand continued to increase sharply. Some Chinese planners feel that monies spent on imports of metal products might be better diverted to the purchase of capital equipment. In any case, a strong investment push in China's iron and steel industry to simultaneously produce as much basic equipment as possible and to import what is absolutely needed became a likely development. China imported about 3.0 million tons of finished steel products in 1974 and considerably more in 1975.

The Chinese started to look into the matter of compensating for its extensive but generally low-grade iron ores. Steps were taken to sweeten indigenous concentrates with very high-grade imports. A contract was made with the Hammersley Enterprise in Australia, and 1.6 million tons of iron ore were actually imported from that source in 1974. Trial shipments from Brazil's Companhia Vale do Rio Doce were also arranged in 1975. Of late, there has been much more news on the testing, washing, and availability of coking coal (see "Coal" section). Scrap iron was and will be in short supply, since recycled scrap is only about one-fourth of steel-ingot output, and collected scrap is no more than 5 million to 10 million tons yearly. China has been importing nearly 2 million tons combined pig iron and scrap annually in recent years.

Anshan overshadows all other Chinese steel plants. This integrated steelworks has had a turbulent history; built by the Japanese, it was stripped by the Soviets just after World War II, rebuilt and substantially expanded in the fifties with Soviet help, and seriously disrupted during the Cultural Revolution. It started to recover in 1968,–71, and the last and biggest blast furnace (11th, Chinese-built, and probably 2,000 cubic meters in size) was added in 1972. The main thrust in the last few years has been the installation of two large basic oxygen furnaces (BOF's) and corresponding oxygen generators, various mines and sintering and beneficiation plants, and blooming and finishing mills of various types, including plate, hot-strip, rail, and pipe and tubing mills. Steel-ingot capacity at yearend 1975 was approximately 7 million tons. Claims for Anshan in 1975 include additions in processing capacity, greater diversity of products, and significant output gains in the last 2 months.[5]

Wuhan steelworks finished its first two blast furnaces by 1960, along with five large open-hearth furnaces, all built with Soviet help. Little happened immediately after the Soviet technicians left, and it was not until 1969 and 1971 that the last two blast furnaces were finally built (the largest with a capacity of 2,000 cubic meters). Additionally, one more large open hearth, three byproduct coke ovens, a sintering plant, and various mills (including a heavy mill for rails and beams) were installed. The iron ore base was stabilized in 1975, with development of the necessary mines. Steel-ingot capacity may be as high as 3 million tons per year. Wuhan was scheduled to be the recipient of a 3-million-ton hot-strip mill, a 70,000-ton Sendzimer mill, and a 1-million-ton cold-strip mill from abroad. In due time, BOF's will probably be installed in this steelworks also. Generally, Wuhan did well in 1974–75.

The Peking steelworks, with the installation of the fourth and largest blast furnace (possibly 1,200 cubic meters), and having suitable iron mines, a sintering plant, a modern coke plant, three oxygen plants and BOF's, and at least one blooming mill, billet mill, and bar mill, has become integrated at about 1.5 million tons of annual ingot capacity. The Peking steelworks claimed that it surpassed its targets in 1975. Shanghai has eight small steel plants, aggregating perhaps 3 million tons in ingot capacity plus corresponding rolling and fabricating capacity. Combined capacity was said to have been raised 1 million tons during 1971–75. China expanded various other lesser steelworks to some degree, but the main effort in 1975 seems to be in the building up of 10 to 20 plants with capacities of less than 500,000 tons per year.

Lead and Zinc.—China's lead and zinc supply remained unsatisfactory in 1975 in the face of sharply growing demand. As more vehicles are used and additional electric power is generated as a result of the expanding oil and gas output, increasing quantities of lead will be needed for batteries and cables. More zinc will also be needed for galvanizing and plating. China may have produced 100,000 tons per year each of lead and zinc during 1974–75. Recent imports have been 20,000 to 40,000 tons of lead and less than 10,000 tons of zinc (20,000 to 25,000 tons in 1970–71). Peru, North Korea, Western Europe, and Japan have sold the most lead and zinc to China in 1973–75. Little new information has come to light on lead-zinc facilities, particularly new mines. Shenyang and Shanghai remained as the two known leading smelters, since there is no confirmation on the Shaokuan smelter using the Imperial Smelting Process in Kwangtung Province. Surprisingly, it was rumored that the Chinese had offered to sell some zinc on the London Metal Exchange early in 1975. This may mean that the zinc deficiency is improving.

Magnesium.—China imported 3,000 to 5,000 tons of magnesium metal annually in 1972–75, possibly more than one-half from Norway. There must be increasing need for this metal in aluminum-base alloys, and it is possible that titanium, which needs magnesium for its manufacture, is being produced.

Nickel.—Like chrome, domestic resources of nickel seem lacking. Thus, nearly 30,000 tons of nickel have had to be imported annually for industrial and steelmaking requirements. Cuba and the U.S.S.R. had been supplying China with moderate quantities of nickel. The Philippines and Indonesia plan to sell nickel to China. However, the principal recent supplier has been Canada (International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.), which furnished more than 60,000 tons to China during 1973–75.

Rare Metals.—According to a publication,[6] China has the technology of separat-

[5] New China News Agency (Peking). Mar. 17, 1976.

[6] China's Foreign Trade (Peking). January 1976, No. 1, p. 8.

ing, melting, and processing more than 40 rare metals. Output reportedly is increasing and provides quality material for China's ferrous and nonferrous metals, nuclear energy, chemical, electrical, electron-tube making, and semiconductor industries, as well as for advanced scientific and technological research.

China has also transformed itself from an importer of some rare metals into a major exporter. A wide variety of exotic metals and minerals are now available for export, including high-melting-point metals, rare-earth metals, rare light and precious metals, high-purity metals, semiconductor materials, various alloys and metallic compounds, and other rare mineral products.

Apparently, China has abundant columbium resources (associated with tantalum) and is producing columbium powder, bars, ingots, and oxide on a considerable scale for use in steel metallurgy, electronics, optical glasses, chemicals, and especially superconductors. China also produces and exports beryllium-copper alloys, ferrotungsten, ferrophosphorus, other ferroalloys, and electrolytic manganese. As described later (see "tungsten" section), China makes high-quality tungsten powder and bars.

A fairly comprehensive and expanding high-purity-metals, industry has been developed; this industry is necessary for producing electronics, semiconductors, and special instruments and detectors. Tellurium, arsenic, cadmium, and gallium are produced in 99.9999% pure quality. Many more metals are produced in 99.999% quality, including copper, lead, zinc, tin, bismuth, cadmium, antimony, gallium, nickel, phosphorus, sulfur, boron, arsenic and tellurium. Lithium for atomic energy and advanced technology is produced in 99.99% grade.

The Chinese make precision alloy products and seven types have been offered for export: Soft magnetic alloys deformable permanent magnets, elastic alloys, expansion alloys, thermostatic bimetals, cast alnico permanent magnets, and cold-rolled silicon steel strips.

Chinese claim to have the largest reserves of rare earths in the world,[7] and the deposits are widely distributed. Begun in 1958, the Chinese rare-earth industry reportedly produced five times more (probably measured in value) in 1974 than it did in 1965, with surpluses to export. The materials involved are mainly oxides of lutetium, praseodymium, neodymium, yttrium, dysprosium, erbium, ytterbium, gadolinium, and holmium (17 elements in all). In addition to production, Chinese scientists have done important research and development work in line with available resources. A National Rare Earth Conference was convened in Paotou during 1975. A special Rare Earths Institute was formed in Lanchow, Kansu Province, during the spring of 1975 to develop a rare earth and chloride production system.

Aside from exporting rare-earth metals and compounds, China also sells concentrates such as xenotime, columbite, zircon, lithium mica, spodumene, single silicon crystal, and natural and synthetic quartz crystals. The best columbite is better than 60% in grade and contains impurities of less than 6% TiO_2, 7% SiO_2, and 5% WO_3. Columbite is the source of columbium, tantalum, and their oxides. The highest grade of zircon concentrate is better than 65% and contains less than 0.3% TiO_2 and 0.2% Fe_2O_3. Zircon, the main source of zirconium and hafnium, is used in China in nuclear energy, metallurgy, casting, refractories, glasses, and the making of special-quality alloys.

Tin.—China produced roughly 20,000 metric tons of tin annually in recent years, and probably could expand output considerably at Kuchiu in Yunnan Province, Fuhochung and Chimou in Kwangsi Province, and elsewhere. The Chinese industry produces fairly good tin ingot from Kuchiu ores and excellent high-purity tin from placer operations in Kwangsi. Tin consumption in China may have reached 8,000 to 9,000 tons whereas exports were over 15,000 tons in 1975. The United States took about 6,330 tons of Chinese tin, worth nearly $40 million, in 1975 compared with 3,336 tons in 1974, 1,755 tons in 1973, and 163 tons in 1972. During 1972–74, France imported an average of about 1,500 tons per year of Chinese tin; Netherlands, roughly 1,200 tons; West Germany, Japan, and the U.S.S.R., 600 to 750 tons each; and Italy, Canada, and Poland, 350 to 500 tons each.

China is not a member of the International Tin Council (ITC). Its tin sales are outside of the quota established by the

[7] Jen-min Jih-pao (Peking). Oct. 10, 1975, p. 4.

ITC, do not meet with ITC approval, and probably have had a depressing effect on prices. However, China apparently did not intend to disrupt the world market flow, and there were subsequent indications that its annual tin exports would revert back to the 1973–74 level of about 10,000 tons. China no doubt has sizable stockpiles of tin (probably at least 50,000 tons) for strategic and trading purposes.

Tungsten.—China has extensive tungsten resources, possibly 100 million tons of 1.5% to 2.5% WO_3 ore. Production has never been reported, but may amount to 15,000 to 20,000 tons per year of 65% WO_3 concentrate. Consumption has grown to 6,000 to 7,000 tons, mainly because of expanded use of drill bits and machine tools. Recent exports have consistently exceeded 11,000 to 12,500 tons annually, valued at $65 million to $75 million at yearend 1975 prices. Historically, yearly exports have often been in the 15,000- to 20,000-ton range, and were close to 30,000 tons in 1957. Most exported tungsten has gone to Western Europe (led by West Germany), Eastern Europe, and the U.S.S.R. Wolframite from the Tayu District, Kiangsi Province, has long been world famous, and there are good wolframite deposits in Kwangtung Province (at Shihjenchang, Yangchiang, and Yaoling) and scheelite deposits in Hunan Province (Yangchiatan). The potential for greater output is excellent. China attended recent meetings of the United Nations Conference on Trade and Development (UNCTAD) and the Primary Tungsten Association (both partially aimed at world price stabilization), but as yet has revealed little information on its tungsten situation.

China is well versed in tungsten technology. Metallic tungsten is made from ammonium paratungstate, which in turn is derived from selected tungsten concentrates. Tungsten powder, bars, wire, and rolled material are available for both domestic use and exports. A very high-quality material of up to 99.9% purity, and a second-grade material of up to 99% purity, have been offered in world markets.

Uranium.—China apparently produced uranium ore from Maoshan and Chushan in Chuannan County of Kiangsi Province and Hsiachuang in Weiyuan County of Kwangtung Province, among other places. Western knowledge of Chinese uranium ore sources is scanty and outdated. However, it is likely that China can delineate adequate resources to support a substantial nuclear power industry. There is a beneficiation plant at Chuchou, Hunan Province, and a gaseous diffusion plant at Lanchow in Kansu Province. Recently, Gabon offered to sell China some uranium ore.

China exploded its 17th nuclear device underground on October 27, 1975. The 16th explosion (200 kilotons to 1 megaton in size) was made on June 17, 1974, near Lop Nor, Sinkiang Province, where virtually all the earlier ones were tested.[8] Most of the recent tests were of fusion (hydrogen) devices, and several were 3 megatons in size. The fissionable material used recently was apparently uranium-235 rather than plutonium.

Czech scientists who have assisted Chinese scientists in treating uranium raw materials believe that nuclear research in China has attained world levels and that a production process for the hydrogen bomb was being worked out as early as 1966. Apparently, Chinese scientists started to use lithium-7 recently to produce a thermonuclear fuel for detonating atomic bombs, which in turn create the deuterium and tritium necessary for thermonuclear reaction. Generation of nuclear electricity is of increasing interest; delegates of such background were included in survey missions dispatched to Japan and Canada during 1972–73. Late in 1975, a delegation from the 12-nation European Organization for Nuclear Research visited China and noted that controlled thermonuclear fusion and reactor technology were up-to-date, but Chinese scientists were nevertheless anxious to obtain scientific and technical help from Western scientists.

NONMETALS

Asbestos.—China has become a medium-sized world producer of asbestos, with 1975 output at possibly 150,000 tons. The most famous deposit is still Shihmien (meaning asbestos in Chinese) in Szechuan Province.[9] Its overall ore zone was described as 6,300 meters long and 350 meters wide, with reserves of about 28 million tons of plus 2% ore. Shihmien's chrysotile fibers of 2 centimeters or better represent more than one-half the total produced. There are

[8] Far Eastern Economic Review (Hong Kong). May 6, 1974, p. 34.
[9] Takungpao (Peking). Aug. 31, 1974, p. 8.

over 12 fairly up-to-date projects at Shihmien, including a good beneficiation mill, powerplant, and aerial tramway. Szechuan has a second major asbestos deposit called Penghsien, fairly close to Shihmien and not well known.

Outside of Szechuan, probably the asbestos deposits of Laiyuan County, Hopeh, are the most productive. The ore body embraces 5 to 20 veins (1 to several meters wide) that extend several kilometers in length. The chrysotile asbestos of Laiyuan is 2 to 5 centimeters long, high in tensile strength, and suitable for high-quality products. Asbestos has also been discovered in Yuankiang County, Yunnan Province.

Small quantities of Chinese asbestos have reached outside markets. Japan imported 1,394 tons in 1974 and 1,200 tons in 1975. Poland has bought some Chinese asbestos, and Mexico recently purchased some of fair quality. Apparently China does not have much asbestos to sell or is not pushing exports. Some asbestos products are offered in world markets.

Barite.—Chinese barite is coming to the forefront of mineral activity, in view of the growing domestic market created by extensive drilling for oil and gas. Output in 1975 is estimated at possibly 250,000 tons and rising. Exports were 75,000 tons or more in 1972 and 1973, and as much as 125,000 tons in 1974 (France took nearly 47,000 tons and Japan, just under 36,000 tons). A recent offer to sell large tonnages of Chinese barite is said to have been made in U.S. trade circles. Chinese barite comes in three grades—90%, 95%, and 97% $BaSO_4$.

China seems to have extensive barite resources, although current production areas are not known. Old deposits include Tangshan in Hopeh, Hwashan in Shantung, Hsuijen in Kwangsi, and Linchuan in Kiangsi. All barite deposits mentioned hitherto seem to have been high-quality, easy-to-work ore bodies, with implications of initial reserves at million of tons.

Cement.—The Chinese cement industry has become a world factor. Output is estimated at more than 30 million tons in 1975, which is close to that of leading Western European countries, and it continues to rise. Over one-half of the cement produced in 1975 (reportedly 57%) was credited to small cement plants. These small cement plants reportedly fulfilled the 1975 target 2 months ahead of schedule, with an output increase of more than 30% over the same 10-month period in 1974.[10]

As of yearend 1975, China had at least 30 large cement plants capable of producing more than 200,000 tons per year. There were probably 30 more in the 100,000- to 200,000-ton range. Four large plants are rated at 1 million tons or more, namely Hantan in Hopeh, Yao Hsien in Shensi, Huahsin in Hupeh, and Liuliho in Peking. The last-named plant joined the ranks in mid-1975 when a kiln with a capacity of over 300,000 tons was completed. Annual capacity of the old Harbin plant of only 100,000 tons was raised to 350,000 tons in recent years. It seems that Kwangchow (or Canton) has a second large plant called Chihni of 350,000 tons to complement a 700,000-ton plant built earlier at a different location. A large plant may have been built in Hunan Province, which has about 200 small plants. Most large plants employ the dry-process and LePaul type of rotary kilns. Their capacities probably can be increased considerably, if a suspension preheater system is introduced. The Chinese have been building 300,000-ton rotary kilns at the Lanchow Petrochemical Machinery plant for about 5 years.

There must have been about 3,000 small cement plants in existence throughout China at yearend 1975. One common category is the 3,000- to 7,000-ton capacity and a second, 10,000 to 50,000 tons. The smaller ones are generally batch, coal-fired, vertical kilns; slightly larger ones employ continuous operations with varied fuels and either vertical or horizontal kilns. Although some inefficient small cement plants may have been discarded, many others have been enlarged by adding new devices for improving mechanization, heating, and blowing. Over 80% of the Chinese counties now have small cement plants to support local agriculture and industry.

Fertilizer Materials.—Chinese probably produced approximately 3 million tons (nitrogen content) of nitrogenous fertilizers in 1975.[11] Existing large plants are located in Nanking, Kwangchow (or Canton), Dairen (or Talien), Lanchow, Kaifeng, Shanghai, Kirin, Luchow (in Kwangsi), Chuchow (in Hunan), Hofei

[10] New China News Agency (Peking). Nov. 11, 1975.
[11] Pages 81–84 of work cited in footnote 4.

(in Anhwei), Yangchow (in Kiangsu), Liling (in Hunan), Tsinan (in Shantung), Taiyuan (in Shansi), and Kunming (in Yunnan). Since the 1960's, more than 1,000 small- to medium-sized plants have been built around the country. The small ones have a capacity of about 3,000 tons per year and the medium ones, 50,000 to 100,000 tons. Increasing interest has been shown in installing new petrochemical and fertilizer complexes at oilfield or refinery areas, and this should add greatly to the national total in the future.

With the 13 large plants purchased from abroad, China's nitrogen production capacity will be greatly increased. All told, these plants will be producing about one-half as much nitrogenous fertilizers as is currently used in the United States. They will also bring China's production to more than 5 million tons of nitrogen by 1978. Most of these plants were bought from Kellogg Continental Co. or affiliates, and standard equipment for each plant includes a 1,000-ton-per-day ammonia unit and a 1,600-ton-per-day urea unit.

Meanwhile, China continued to import large quantities of fertilizers from abroad, mainly from Japan. That country normally furnishes China yearly with about 1.4 million tons of urea, 600,000 tons of ammonum chloride, and 500,000 tons of ammonium sulfate. Import tonnages dropped sharply in 1974 because of China's balance-of-payments difficulties, but picked up again in 1975. Contractual negotiations between the two countries have been drawn out in 1975 because of sagging prices. Chinese imports of nitrogenous fertilizers have been equivalent to more than one-third of output.

Phosphates.—China possesses sizable and widespread deposits of uneven-quality phosphate rock and apatite, located mainly in south China with some in Shantung Province. However, production has not been adequate in meeting demand. The three-fold increase in price for imported phosphate rock in recent years no doubt has spurred China on to more intensive domestic searches. Morocco was the dominant supplier until 1973, but North Vietnam (mainly Laokay), Algeria, Egypt and the United States (Florida) have since taken up the slack. Apparently, China imported 1,100,000 tons of phosphate rock in 1972, 1,800,000 tons in 1973 (1 million from Morocco), and only 400,000 tons in 1974. Chinese imports of manufactured phosphates are not large compared with the 3 million to 4 million tons per year produced within China.

Phosphate deposits and mines have been reported at Chinghsiang in Hupeh; Kaiying in Kweichow; Liuyang, Shihmen, and Huachiao in Hunan; Nantung in Kiongsu; Chaoyanglin in Kwangsi; Anching in Anhwei; Kunyang in Yunnan; and Jungcheng in Shantung. Large phosphate fertilizer plants are located at Nanking, Changsha (Hunan), Hunghochou (Yunnan), and within the Hupeh Metallurgical Works. However, three-quarters of the chemical phosphates output have come from hundreds of small and medium plants associated with local mines. The medium-sized plants generally produce tens of thousands of tons of phosphatic fertilizers annually, along with other chemical fertilizers.

Fluorspar.—China has been an important world producer and exporter of fluorspar for several decades, and output in 1975 probably topped 350,000 tons. A large surplus has been traditionally exported, mainly to Japan, which took 179,485 tons in 1974 and 105,486 tons in 1975. The U.S.S.R. took 84,840 tons in 1974. Most fluorspar is metallurgical grade, but a significant share of the output is acidspar. Very high-grade lump fluorspar was offered in the U.S. market near yearend 1975, but high shipping costs and duty ($8.40 per long ton for metspar and $2.10 for acidspar) here illustrate the difficulty in selling in faraway places. In fact, world demand was depressed for most of 1975. Possibly 80,000 tons of fluorspar were consumed in China during 1975, including at least 50,000 tons by the steel industry and 10,000 tons by the aluminum industry. China was becoming interested in hydrofluoric acid.

Historically, the leading producing districts have been Wuyi in Chekiang, Kaiping in Liaoning, and Lunghua in Jehol. The new Taolin mine in Hunan, also a lead-zinc producer, probably produced over 80,000 tons of acidspar in 1975. Chinese fluorspar resources seem to be extensive and widespread, occurring also in provinces like Shantung, Fukien, and Kwangtung.

Magnesite, Soapstone, and Talc.—These geologically associated minerals occur in a belt extending from Tashichiao (or

Taling) northeast to Lienshankuan in Liaoning Province. The country's magnesite resources are very extensive by world standards and are of reasonably high grade. Yearly production may be about 1 million tons to meet the expanding needs for refractories in the steel industry and demand for magnesia in export markets such as Japan.

Chinese talc from Tashihchiao near Haicheng is very high grade (steatite-grade talc). Japan, the main customer, imported 74,687 tons of Chinese talc in 1972, 101,070 tons in 1973, 134,624 tons in 1974, and 97,052 tons in 1975. Based upon this and imports by other countries, China's 1975 talc production probably surpassed 250,000 tons in 1973, 134,624 tons in 1974, and soapstone are also produced at Tashihchiao annually. Japan was again the leading buyer of Chinese soapstone, importing 72,163 tons in 1973 and 68,448 tons in 1974. The Luchuan deposit in Kwangsi Province has been mentioned as a new area for talc and soapstone. Increasing quantities of talc, soapstone, and pyrophyllite will be needed in China for making paper and paint and for filling materials in general.

Pyrite and Sulfur.—China's annual output of perhaps 2 million tons of pyrite makes it a large world producer. The two important pyrite mines are Hsiangshan in Anhwei and Yingte in Kwangtung. The main use of pyrite in China is in the manufacture of sulfuric acid and fertilizers. The iron residue derived is utilized, and China was interested in the Japanese Kowa Seiko process for this purpose. Additional pyrite has been produced in Szechuan and Shansi Provinces, but output is not counted towards China's total, because this pyrite is converted to possibly 250,000 tons of elemental sulfur annually. Waste sulfur dioxide gases from smelters and chemical plants are increasingly utilized. No significant brimstone deposit has been reported. Oil refineries could recover more sulfur, but sulfur-removal facilities are inadequate and Chinese oil is basically low in sulfur. China formerly exported sulfur, but has become an importer recently, indicating that demand in paper, textiles, and industries in general is rising. China apparently imported 420,000 tons of sulfur in 1973 (about two-thirds from Canada) and 300,000 tons in 1974 (about two-thirds from Mexico).

Salt.—China reportedly met its 1975 salt production target 80 days ahead of schedule, with output already topping the record year of 1974.[12] By mid-July, Hopeh Province's saltfields, headed by Tangku, had overfulfilled its 1975 plan by 40%. Szechuan Province's 1975 salt output (from brine associated with natural gas) was about one-fourth higher than in 1974. Shantung's Yangkou saltfield reportedly surpassed its yearly plan by 75%. Generally, Chinese evaporation saltfields along the coast, which supply by far the bulk of the national output, have all become much more mechanized.

China has abundant and widespread resources of various kinds of salt necessary for the developing of a strong chemical industry and feeding a very large population. Salt output may have reached 30 million tons yearly, and the rock salt potential is hardly touched. An increasing number of saltworks and derivative chemical works are being built. China has always had a surplus of salt to sell, but foreign demand is limited. However, domestic requirements are rising sharply.

MINERAL FUELS

Coal.—Many Chinese coalfields reported plan fulfillment and output gains, with the coal industry as a whole registering a production increase of possibly 5% to 7% over 1974 levels and reportedly attaining an alltime high. China's 1975 coal production is estimated at 470 million tons, a figure which includes some mine-run and off-grade coals that, nevertheless, are directly used. Even compared with U.S. coals, it is safe to say that China produced more than 400 million tons of equivalent good-quality coal in 1975.

The major thrusts in coal activity in 1975 were steady buildup of most major coalfields and their mines, development of many small and medium coal mines in the south, increased mechanization in general, improved coal beneficiation and recovery, and more careful investigation of coking coal resources, distribution, and export possibilities. Foreign countries are becoming more familiar with China's coal industry, as an increasing number of foreigners have been able to visit specific fields and

[12] New China News Agency (Peking). Nov. 17, 1975.

more Chinese workers knowledgeable in coal have gone abroad.[13]

There was specific news on China's foremost coal bureau, Kailan (or Kailuan), between Tientsin and the sea where the Takang oilfield is located. Its 1975 output through December 23 was reported at 25.2 million tons of mine-run coal.[14] Compared with U.S. marketable coal, this should be discounted 10% to 20%. Kailan's output from seven collieries has been raised more than 1 million tons yearly since 1968. One key measure has been the expansion of hoisting capacity of shafts. In early 1976, a national record of producing about 11,000 tons of raw coal at one mechanized working place in 24 hours reportedly was established at the Tangshan colliery.[15] In fact, a new coal-cutting process was developed at Tangshan. Despite the high rate of extraction, the overall position of Kailan has improved and its coking coal reserves alone are estimated at 9 billion tons. Kailan coal seams are 1–6.5 meters thick and quite variable in dip. Kailan is producing about 3 million tons of coal annually by hydraulic mining. New shafts driven through fault zones made it possible to retrieve an additional 4,500,000 tons of coal at the Tangchiachuang colliery. Consolidation of workings boosted output to nearly 5 million tons per year at the Linhsi colliery.

Improving the filtering system at the Luchiato coal-washing plant greatly cut down loss of fines. At the Machiakou colliery, where the coal seams are very steep, expanding mechanization greatly increased output. With many auxiliary facilities and workshops, Kailan has been built up into an important industrial complex.

Shansi Province, headed by the Tatung Coal Bureau and the Yangchuan Coal Bureau, produced about one-sixth of China's total output, or 60 million to 70 million tons, in 1975; this province's coal reserves recently have been estimated at 400 billion tons. With 13 pairs of major mine shafts, Tatung must be producing close to 20 million tons of mine-run coal annually. It fulfilled its target 34 days ahead of time, and 1975 output of this bureau was about 10% more than in 1974. One of Tatung's mines—Meiyukou—produced 1.63 million tons of clean coal in 1975 from gently sloping coalbeds up to 2.2 meters thick.[16] During 1966–74, Tatung's raw coal output grew at an annual rate of 1.2 million tons. To boost production further, a 10-year plan was put in effect aimed at increasing output threefold.[17] Near yearend 1975, China was exploring the possibility of selling Tatung coal to Japan. A large part of Tatung's coal is coking quality.

Yangchuan, with 12 pairs of mine shafts, is the leading anthracite producer in China, it fulfilled its 1975 target 41 days ahead of time and probably produced 7 million to 9 million tons during the year. Roughly one-half of the more than a dozen seams are workable, and most seams are 1 to 6 meters thick. Yangchuan's No. 4 mine has a daily capacity of 5,000 tons and employs nearly 5,000 workers. Yunkangshih, a coal mine bureau about 55 kilometers west of Tatung, produced about 1.5 million tons in 1975 and plans to produce 6 million tons by 1985.

Production at the Fushun Coal Bureau, north of Anshan and east of Shenyang in Liaoning, has been declining because the open pit operations are extending underground. There are now two pits and three deep mines working on 8- to 120-meter-thick coalbeds in an elongated synclinal structure dipping 20° in the west, 50° in the east, and 70° in the north. Apparently, the output of cleaned coal dropped to 12 million tons in 1975 (3.6 million from the west pit). However, Fushun is increasingly important as an industrial complex, spurred by oil-refining, chemicals, and aluminum and copper extraction. Its shale-oil operation is probably finding it increasingly difficult competing with natural petroleum. The Fuhsin Coal Bureau, southwest of Shenyang, has reported a record daily output of 93,000 tons of mine-run coal, which would suggest an annual production to 15 to 20 million tons of cleaned coal. Fushun and Fuhsin have China's most famous open pits. Actually, most coal mines and deposits in China are underground and not particularly shallow.

The old Huainan and new Huaipei Coal Bureaus in Anhwei Province together produced probably more than 20 million

tons of marketable coal in 1975. Huainan, about twice the size of Huaipei, was being rejuvenated. Both have important coal washing plants, and some Huainan coal is of coking quality. Hokang, Chihsi, and Shuangyashan Coal Bureaus located near Harbin in Heilungkiang together produced about 30 million tons of mine-run coal in 1975. Hokang (with coking coal) and Chihsi are about twice the size of Shuangyashan. The new Pingtingshan Bureau in Honan continues to expand its coking coal facilities. With 13 collieries, its annual output is already in the 10-million-ton-per-year range.

A new integrated coal center called Holanshan has been built up in Ninghsia Province, embracing four coalfields (Shihchuaishan, Shihtanchung, Juchikou, and Hulussutai) in a mining area spread over 50 kilometers.[18] Construction was started in 1956, and Holanshan now has eight pairs of big and medium shafts, an open pit coal mine, a large coal-washing plant, and industrial systems covering engineering design, shaft construction, and mining-machinery manufacture. It provides anthracite and bituminous coal for about 350 industrial enterprises in about six provinces of north and northwest China. Output in 1975 was 2.4 times that in 1965. The Holanshan center must be producing at least 5 million tons of cleaned coal annually.

A new coal mining center named Paoting has also been built up in Southwest China.[19] Located in the mountains of southern Szechnan, this center covers 100 square kilometers and was first opened in 1965. There are over 100 seams, but rugged terrain and bad weather and working conditions made it difficult to open up the center. A thermal powerplant using coal from small mines had to be built first, in order to develop large-scale mines. Paoting now has seven pairs of modern shafts, a coal-cleaning plant, six industrial plants, aerial tramways, powerlines, and mine railroads. Two of the subdivisions are called Taiping and Lungting. This coal center has an annual capacity of possibly 5 million tons of coal.

In addition to the large coal bureaus and centers described so far, China has possibly 70 more producing between 500,000 to 10 million tons per year of coal. The buildup of small to medium coal mines in the south has been mentioned. It should be pointed out also that small mines around the country, some tributary to large mines, together furnish about 30% of the national coal output.

Petroleum and Natural Gas.—Most oilfields reported significant gains. China's overall 1975 oil output reached possibly 80 million tons, roughly one-fourth over that of 1974. During the last 3 years, production rose roughly twofold. This was made possible through bringing in new oilfields and rejuvenating old ones, along with setting up facilities for oil distribution (pipelines and tankers for example), refining, further processing of the oil into petrochemicals, handling at ports, and exports. Natural gas from Szechuan came into its own, and gas from oilfields was utilized to an increasing degree. The surge of crude oil has relegated China's shale oil to an unimportant position. However, China is still one of the two world producers, and its combined output of shale oil, from Fushun and Maoming, may still be 3 million tons yearly.

Taching—China's premium oilfield—exemplifies an industry where there are no small-scale operations. Located in the Sungliao Plain northwest of Harbin, Taching became fully operational by 1964. The oilfield is of lakebed origin, mostly occurring at only 1,000 meters depth. Reserves in the old field have been estimated at up to 900 million tons, but this probably is conservative. Taching's new field, 40 to 60 kilometers away from the old field, is near the production stage and is reportedly rich in gas. The whole complex produced possibly 35 million tons of crude oil in 1975, and output should expand further when the new field reaches maturity. Taching has been very important to China's overall industrialization program; it supports many refineries and is connected by pipelines to Fushiun, Tiehling, Chinhuangtao, Peking, and North Korea. Taching's low-sulfur oil is very much preferred by Japan, and has been shipped to Shanghai and cities inland and further south as well. Taching workers have been sent around the country to help develop other oilfields, refineries, and petrochemical facilities. Another oilfield by the name of Fuyu is probably being developed in the northeast.

Shengli, located near the mouth of the Yellow River, has become one of the largest

[18] Ta-kung-pao (Peking). May 25, 1976, p. 1.
[19] China Reconstructs. New Coal Mining Center in Southwest China. May 1976, p. 19.

oilfields in China. Production began a decade ago, and full potential has not yet been reached. China claims a one-third increase in production in 1975 over that in 1974, bringing production up to possibly 15 million tons. Surveying and construction began in two new areas in 1973. Oilfield depths range from about 1,000 meters to 2,500 meters. The crude oil is low in sulfur but high in salts, requiring special treatment before shipment to domestic refineries and export markets in Japan. Shengli just finished building a 2.5 million-ton-per-year refinery in addition to its first refinery with a 3.5-million-ton capacity. The new refinery is part of a not-yet-completed petrochemical and fertilizer complex. A pipeline links Shengli with the new port of Huangtao near Tsingtao where suitable oil-handling facilities have been newly completed.

The third big new oilfield, Takang, is 60 kilometers southeast of Tientsin along the Pohai Bay coast and was discovered on top of solar salt flats. Geology and operational problems have been complicated because faulting is severe and the depth of the oil varies between 1,000 and 3,000 meters. Intensive drilling led to the conclusion that the best oil and gas wells were near the main faults, with small secondary pools near other large faults. Since Takang is near the shore, offshore oil is a possibility, although some geologists feel that the presence of grabens limit the oil potential. Takang's output has been rising sharply in recent years, after initial difficulties were overcome. Output should be topping 10 million tons annually, and eventually rising to 15 million to 20 million tons. Oil and gas are piped to Tientsin, where a large refinery and petrochemical complex is being expanded. The Chinese have been talking with the Japanese about liquefied natural gas (LNG) from this location.

Once the mainstay of the Chinese oil industry, and now revived, is the Karamai Field in Sinkiang. Output in 1974 was brought up to several times the 1965 level, and the gain in 1975 production, over that of 1974 was reported at 65%.[20] This suggests that 1975 production may have reached 5 million tons. There are local refineries and pipelines, and some crude oil goes to Lanchow. The first Chinese oilfield of any consequence, Yumen, was being stablized. According to a Japanese author "aside from Taching, Shengli, and Takang, the 9–23 field (probably I-tu, south of Shengli) and the 5–7 field (possibly Shahshih) in Hupeh Province being developed, show great promise." [21] Various fields have been discovered in Tzaidam (Tsinghai) also. These are all implications of China's great oil potential, and offshore possibilities make this potential even greater.

Szechuan Province leads China in natural gas production and utilization. Output there has quadrupled in the last decade, and may be leveling off at possibly one-tenth of total U.S. production. Careful seimic surveys revealed over 200 gas structures. More than 1,000 kilometers of pipelines have been built. Natural gas in Szechuan is said to fuel two-thirds of the iron and steel enterprises and 84% of the salt-crystallization facilities, as well as many other industries such as cement, and provides the raw material for more than 70% of the fertilizer plants. In late 1975, the Chinese were talking to Japanese not only about purchasing LNG facilities, but also natural gas refining plants. Greater utilization of natural gas is another clear indication of China's energy push.

China has made great strides in oil processing and handling. Many new refineries have been built in almost all of the large commercial, industrial, and oilfield centers. Their combined capacity approximates the difference between output minus exports of crude oil; China has also placed great stress on petrochemicals, which are now lagging somewhat behind. The pipeline-construction program had to be accelerated as existing fields were expanded and new fields brought into production. China's port-expansion program also made significant headway in 1975.[22] Various new deepwater wharves have been placed in operation, including loading terminals capable of accommodating 25,000-ton to 100,000-ton tankers and 10,000-ton berths for handling coal and mineral ores. A new refinery and petrochemicals port complex was being built in the Shanghai area, with crude oil coming by coastal tankers from the north. At Shanghai, railway lines and automatic coal- and grain-handling systems were also added, and the Yangtze estuary

[20] Jen-Min Jih-Pao. Dec. 29, 1975, p. 1.
[21] Ta-Kung-Pao. Oct. 10, 1974, p. 2.
[22] Journal of Commerce. Jan. 12, 1976, p. 10.

was dredged for 20,000-ton freighters. The first stage of an oil terminal was completed at Chinhuantao, Taching's outlet. Large-scale harbor extension has been reported at six other major ports. A recent Japanese mission says that Peking is planning to construct a large refining and petrochemical complex in the port area of Wampoa, reflecting possibly the proximity of the unconfirmed Nanhai oilfields, about 70 kilometers west of Kwangchow (or Canton).

The Mineral Industry of Colombia

By Daniel C. Adkins [1]

Colombia's mineral industry displayed an overall upward trend during 1975, although crude oil production declined for the fifth year. The output of most mineral commodities increased or remained the same, while the value of mineral production increased greatly. The estimated value of minerals produced changed from near $175 million [2] in 1974 to $250 million in 1975, representing over 2% of the Colombian gross national product (GNP). If Colombian mineral fuels were computed at their international market price, the value of Colombian minerals would be 7% of GNP. Most of the increase in value can be equally attributed to price increases in gold and hydrocarbons. Iron ore, lime, natural gas, petroleum, precious metals, and salt are the country's most valuable mineral products.

Estimated value of Colombian mineral production, in million U.S. dollars, follows:

	1974	1975
Mineral fuels	133	173
Metallic minerals	18	55
Nonmetallic minerals	24	22
Total	175	250

Government action directly affecting the mineral industry during 1975 included: (1) price increases by the Ministry of Mines and Energy of new oil, marginal crude from old oilfields, refined products, and nonassociated natural gas; (2) the phasing out of the petroleum dollar, which gives an unfavorable exchange for petroleum; and (3) the Presidents of Colombia and Ecuador signing an agreement to respect each country's sovereignty over marine and submarine areas to a distance of 200 miles.

The Colombian mineral survey agency, Institute of Geological and Mineral Investigations (Ingeominas), cooperated with the United Nations Development Program and the U.S. Agency for International Development (AID) in numerous mineral resource explorations. These explorations have resulted in the geologic mapping of 125,000 square kilometers, or 10% of Colombia. Special attention was given to searching for base metals, bauxite, gold, iron and nickel, asbestos, gypsum, limestone, phosphate, and coal. The U.S. Geological Survey has cooperated with these efforts by providing educational assistance for Colombian personnel.

PRODUCTION

Metallic minerals varied in output with significant increases only in gold and iron ore. Production changed little in nonmetallic minerals.

Petroleum output declined for the fifth consecutive year as private companies continued to encounter inadequate stimulus for investment even with an increase in price. Crude oil production was down 5.9% to 57.3 million barrels. Production of other fossil fuels increased.

[1] Physical scientist, Division of Petroleum and Natural Gas.

[2] Where necessary, values have been converted from Colombian pesos (Col$) to U.S. dollars at the exchange rate of Col$32.90=US$1.00 for 1975 and Col$26.11=US$1.00 for 1974.

e Estimate. p Preliminary. r Revised. NA Not available.
[1] In addition to the commodities listed, coal briquets are also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.
[2] Revised to none.
[3] Exports.

TRADE

Colombia maintained a $57 million petroleum trade surplus during 1975. With consumption below expected levels only 2 million barrels of gasoline was imported, while nearly 9 million barrels of fuel oil was exported. However, if current declines in oil production continue, Colombia will be a net importer of petroleum by 1976.

During April and May the Ministry of Finance and Public Credit increased import duties to increase revenues and protect local industries. The increases affected metallic ores and metals and metal products.

The latest available statistics on foreign trade in mineral commodities are given in the 1974 Minerals Yearbook.

COMMODITY REVIEW

METALS

Copper.—A copper mine near Ibaqué in the Department of Tolima attained a production of 350 tons of copper concentrate per day. This mine has limited proved reserves but substantial potential reserves. Pronociones Industriales y Mineros operates the mine, which is owned by United States, Panamanian, and Chilean interests.

Iron and Steel.—Colombia's largest iron and steel manufacturer, Acerías Paz del Río, S.A., was planning a major expansion of its Belencito plant, from 300,000 to 1 million tons per year of crude steel capacity by 1980. A study of this expansion was to be completed in early 1976 by Arthur G. McKee & Co. of Cleveland, Ohio.

Nickel.—Feasibility studies of the Cerro Matoso ferronickel project were to be finished by 1976. The studies include marketing and financing as well as a pilot plant. Total investment may be near $250 million in order to produce 25,000 short tons per year of ferronickel by 1979. The Cerro Matoso project is owned one-third by Empresa Colombiana de Niquel Limitada, a subsidiary of the State-owned Institute of Industrial Development (IFI), and two-thirds by Compañía de Niquel Colombiano, S.A., a joint venture of the Hanna Mining Co. and Chevron Oil Co.

Precious Metals.—Production of precious metals increased during 1975 with gold increasing 16%, followed by silver 10%, and platinum 5%. Gold production has increased 64% in the last 3 years owing to worldwide price increases. The Government's 1974 decision to raise the price domestic producers received for gold to the international market level resulted in a 365% increase in the value of gold produced, as the price rose from $41.90 to $153.50 per ounce in 1975. All precious metal production must be sold to the Bank of the Republic, and as of November 1975 all mining operations must be registered.

The Ministry of Mines and Energy is restricting foreign precious metal mining by prohibiting foreign remittance of development costs and by eliminating other stimuli for investment.

Radioactive Minerals.—Several known deposits of uranium and thorium have been declared national reserves by Presidential decree. The Ministry of Mines and Energy intends to preserve these resources for future use while allowing a domestic company, Minuranio, to develop deposits in the Santander Department. Current agreements with foreign firms for exploration and development will be respected.

NONMETALS

Asbestos.—Work neared completion on the Las Brisas asbestos project in the Department of Antioquia. Upon completion in 1976, the project should process 50,000 tons of fiber annually. Proven reserves will cover 15 years of production. The mining and milling facilities are to be operated by Asbestos Colombianas, S.A., which is owned by Eternit Colombiana (70%) and other private Colombian investors.

Fertilizer Materials. — *Phosphate.* — The Colombian mineral survey agency, Ingeominas, with assistance from AID has explored a phosphate deposit with proven reserves of 20 million tons and possible reserves of 300 million to 400 million tons.

MINERAL FUELS

Coal.—At yearend Colombia was planning to establish a state enterprise for exploration, production, and marketing of domestic coal in association with private investors. The company, Empresa Colombiana del Carbon (CARBOCOL), may be funded by IFI, Empresa Colombiana de Petróleos (ECOPETROL), and Ingeominas. CARBOCOL's first project will be to review concession agreements between IFI and Peabody Coal Co. and also between ECOPETROL and private energy companies.

The proposed Colombian-Brazilian exchange of coking coal for iron ore has been terminated by the Colombian Ministry of Mines and Energy.

Natural Gas.—The Colombian division of Texas Petroleum Co. (TEXPET), a subsidiary of Texaco Inc., has reported a second onshore gasfield discovery in the Department of Guajira. The discovery well is located 11 miles (18 kilometers) southwest of the Bellena gasfield and 5 miles (8 kilometers) northeast of the city of Riohacha. The natural gas well flowed at a rate of 10.7 million cubic feet daily (300,000 cubic meters daily). All of TEXPET's three gasfields are located in the same 12,150-square-kilometer association contract with ECOPETROL.

The Colombian Government established new prices for nonassociated gas in July 1975. Sales to local utilities were set at 50 cents per thousand cubic feet, while others were set at 80 cents per thousand cubic feet. Sales were to be paid 75% in dollars and 25% in pesos.

Petroleum.—Colombian policy has been: (1) to increase national participation in petroleum activities while encouraging foreign oil companies to develop petroleum production and refining; (2) to provide cheap energy as a stimulus for domestic industrialization; and (3) to earn monies from oil exports. The changes in the world petroleum markets have created a challenge to Colombian policies.

Colombia tried to insulate itself from market changes by freezing prices, but this discouraged the international oil companies which were the main energy development force. Oil production reached its high point in 1970 when the Colombian value of crude oil approximated the world price. Before the Organization of Petroleum Exporting Countries (OPEC) price hikes of 1973, Colombian oil prices had shrunk to 60% of world values. After the hike, they were at 15% of world values. The result was a rapid decline in production and exploration. As the investment climate grew dismal, oil production declined from being 40% (1970) to 10% (1975) in excess of domestic demand.

The results of Colombian attempts to increase national participation have varied. At the peak of production in 1970, state participation shrank to 12% from 15% for the previous 4 years as foreign oil companies expanded production. As the market deteriorated, Colombia-owned production increased from 12% to 45% at yearend 1975 owing to (1) ECOPETROL's purchase of concessions, (2) a shift to association contracts, (3) increased Colombian private sector activities, and (4) decreasing oilfield productivity fostered by lack of incentives for field maintenance. If the price increases initiated during 1975 continue, the Colombian share of production should decline somewhat as foreign oil companies increase production.

The possibility that current Colombian price increases may renew interest in Colombia may be seen in the one-third increase in concession area between yearend 1974 and yearend 1975 shown in the following tabulation:

Colombian concession agreements	Hectares Dec. 31, 1974	Hectares Dec. 31, 1975
Concession contract	4,573,417	2,704,312
ECOPETROL's concession	1,100,815	1,248,335
Association contract with ECOPETROL	5,157,728	10,239,400
Total	9,731,145	12,943,712

Source: American Association of Petroleum Geologists.

Exploration and drilling have declined to the lowest level in over a decade. Exploration decreased to 54 party-months of seismic and surface geologic exploration compared with nearly 60 party-months in 1974. A summary of petroleum and natural gas exploration activities during 1975 follows:

	Geological	Seismic	Total
ECOPETROL	5.0	17.0	22.0
Private companies	3.7	28.6	32.3
Total [1]	8.7	45.6	54.3

[1] American Association of Petroleum Geologists.

The number of exploratory wells dropped from 16 to 11, while ECOPETROL's plans for retaining petroleum self-sufficiency call for drilling 80 wells. Three companies made oil discoveries and two found gas. The Cayman Corp., which found oil in the Putumayo Department during 1974, sold its exploratory and pipeline interests to Farmland Industries of Kansas City, Mo. A summary of drilling activities follows:

	1974	1975
Exploratory wells	16	11
Total ECOPETROL wells	6	7
Total wells [1]	37	28
Total footage drilled [1]	277,740	197,683

[1] American Association of Petroleum Geologists.

Colombian petroleum production declined 5.9% to 57.3 million barrels. Petróleos Colombo-Brasileros (COLBRAS) was the only company showing a production increase; other firms' production declined an average of 11%. Few companies were willing to counter the falling rate of production with the price of old oil at $3.50 per barrel.

Domestic consumption of refined products leveled off at 51.9 million barrels; the only rapid increase was a 14% rise in jet fuel use to 2.4 million barrels yearly.

Table 3.—Colombia: Salient statistics of petroleum and natural gas

	1973	1974 r	1975

[3] Includes 4,696,057 barrels produced by COLPET before Texaco's share reverted to ECOPETROL on Dec. 1, 1975.
[4] No petroleum reserves for the three Guajira gasfields. Natural gas reserves for all three gasfields total 3,900 billion cubic feet.

In 1975 the Ministry of Mines and Energy took several actions to stimulate production and exploration. The price of crude from new oilfields increased from $4.00 to between $5.50 and $7.00 per barrel. Oil found west of the Cordilleras will sell for $5.50 when found down to a depth of 7,500 feet, $6.00 when found between 7,500 and 12,500 feet, and $6.50 when found below 12,500 feet. Oil found east of Cordilleras will sell for 50 cents more at each of the above-mentioned depths. Most new oil is expected to be found east of the Cordilleras below a depth of 12,500 feet. The price of marginal crude from oilfields was increased from $1.64 to $3.50 for 27° API gravity oil with a 2-cent differential per degree change. The practice of selling crude production to refineries with 25% of each payment in pesos is called the petroleum dollar. Until September 1, 1975, the peso portion of payment was fixed at 20 pesos per dollar. By October the exchange rate was increased to 23 pesos per dollar, and it will continue to increase until equal to the official exchange rate.

Refining.—ECOPETROL has contracted with Technipetrol S.p.A. to expand the Cartagena refinery to 60,000 barrels per day and to increase the gasoline yield in the Barancabermeja refinery by 15,000 barrels per day. During 1975 Technipetrol began a detailed engineering study on the Cartagena refinery and finished an engineering study on the Barancabermeja refinery. ECOPETROL has postponed the Tumaco refinery and its associated petrochemical projects. The prices of refined petroleum products were also increased during 1975, from 15% to 80%. During the last 4 months of 1975 the price of regular gasoline increased 54%, or from 10 cents to 16 cents per gallon. The higher prices still do not give ECOPETROL a profit for refining, but should eliminate the refined product subsidy.

In 1975 three petrochemical projects were completed while several were being studied or constructed. The DOW Colombiana S.A. expanded its Cartagena polystyrene plant by 5,500 tons per year. Phillips Petroquimica completed a 2,000-ton-per-year carbon black plant in Cali. Zimmer AG completed a polyester resin plant for Vanylon S.A. in Barranquilla. Peliolefinas Colombianas S.A. (POLICOLSA), a subsidiary of ECOPETROL, has several projects in Barrancabermeja including ethylene and low- and high-density polyethylene plants. POLICOLSA also has plans for a terephthalic acid and dimethyl terephthalate (DMT) plant in Cali. Studies to utilize natural gas for ammonia production are being made for the Barrancabermeja and Guajira areas.

Pipelines.—ECOPETROL completed a 201-kilometer, 14-inch-diameter crude pipeline from Ayacucho to Barrancabermeja.

The Mineral Industry of Cyprus

By E. Shekarchi [1]

Since the hostilities of 1974 Cyprus has been split into two parts by a line running east-west through the capital city of Nicosia. The northern part of the island is Turkish-controlled through the Federated Turkish Cypriots; the Government of Cyprus and its instruments operate only in the south, except for the Central Bank which receives bank returns from Turkish commercial banks in the north. In 1975, the Cyprus pound continued to be used throughout the island, although use of the Turkish lira was increasing in the north. Because there were no real economic indicators for the north and statistics were very sparse, most of the information for 1975 was based on the Government of Cyprus' annual and periodic reports, which predominantly concerned the mineral industry of the south. The Government was making great efforts to revitalize the surviving economy in the south through international borrowing, foreign aid, and by encouraging investments.

The preliminary gross national product (GNP) for 1975, based on 1973 dollars, was estimated at $651 million,[2] a 16% decrease from the 1974 GNP. Per capita GNP decreased 24% in 1975 compared with that of 1974.

During 1975 the Government worked on a master reactivation plan for the south which appeared to concentrate on the agricultural and industrial sectors. In the industrial reactivation program, the Government guaranteed loans made by commercial banks to export-oriented industries, with particular emphasis on small mining ventures. Preliminary studies were conducted on setting up new cement plants, integrated fertilizer plants, glass container factories, asbestos-cement pipe factories, and ship repair yards. In the mining industry about 2,400 people were employed, compared with 2,600 in 1974 and approximately 3,000 in 1973.

The Geological Survey Department continued detailed geologic mapping, geochemical surveying, and geophysical work in the southern section of the island. Following the preliminary work, 16 boreholes were drilled in the areas of Layio, Mandria, and Lymbia. Detailed exploration work by the Geological Survey was for chromite, nickel, and copper in the Limassol Forest. Private companies also carried on prospecting and exploration work for chromite, sulfur, pyrite, and asbestos. Thirty-nine holes with a total footage of 14,800 feet were reportedly drilled by yearend 1975.

After about 60 years of operation, the largest mining company on the island, the U.S.-owned Cyprus Mines Corp. (CMC), was compelled by civil disturbance to discontinue its copper mining, exploration, and beneficiation activities in Cyprus. By yearend, the company had relinquished most of its leases and prospecting permits and had suspended all of its activities.

[1] Supervisory physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Cyprus pounds (£C) to U.S. dollars at the rate of £C1 = US$2.43.

PRODUCTION

Mineral production on Cyprus for 1975 followed the same pattern as in 1974 except that the output from the largest company, CMC, was nil, making a serious impact on the exchange earning capacity of the country and the overall copper output.

[e] Estimate. [p] Preliminary. [r] Revised.
[1] In addition to the commodities listed, a variety of other crude construction materials are also produced, but information is inadequate to make reliable estimates of output levels.
[2] Includes the nonduplicative sum of copper content of all exportable products, including copper concentrates, cupreous pyrites, cement copper, and copper precipitates.
[3] Exports.
[4] Revised to none.

TRADE

According to available published information, mineral exports in 1975 totaled 540,000 tons, an increase of about 28% over that of 1974. Reportedly the accumulated stock of minerals mined in previous years was also exported and included in this tonnage. Cupreous concentrates ranked first in export value, about $6 million, followed by asbestos at $5.2 million and iron pyrite at $3.9 million. The remainder of mineral exports were chromite, cupreous pyrite, and umber, collectively valued at about $2.6 million. No values for cement, copper, gypsum, and calcined ore were available. Imports of minerals remained high and in considerable imbalance with exports, the main item being petroleum for the Cyprus petroleum refinery.

Table 2.—Cyprus: Exports and reexports of mineral commodities

COMMODITY REVIEW

METALS

Chromite.—Hellenic Mining Co., Ltd. (HMC), remained the only chromite producer in the country, with a production of about 28,000 tons in 1975. HMC drilled several underground holes, a total footage of 1,854 feet, primarily for exploration purposes. No new findings were reported by yearend. The export of chromite totaled 27,700 tons, mainly to Europe with small quantities to the Japanese market.

Copper.—After 60 years of successful operation, CMC was out of the mining picture in Cyprus. No final decisions by the Government were made on the company's properties, which are in both the north and the south of the island.

HMC continued work in all its mines—Mousoulos underground mine, Mavridhia opencast mine, Kokkinoyia underground mine, and Mathiatis open pit. Geophysical and geochemical surveys on mining leases and prospecting permits were followed by drilling. The results were encouraging, and HMC prepared to start opencast mining at Pirekliashia with stripping to begin in 1976.

NONMETALS

Asbestos.—Cyprus Asbestos Mines Ltd. operated intensively during the dry season and continued work on a larger scale than usual during the winter months with the help of a drying plant. Exports of both short- and long-fiber asbestos to most European countries continued, but showed a 22% decrease in 1975 compared with 1974 levels. The expansion of the processing mill which began in 1974 continued during 1975, and full production was expected in 1976.

Cement.—Cyprus Cement Co. Ltd. and Vassiliko Cement Works Ltd. were the leading cement producers in 1975. Total production of cement reportedly was about 617,000 tons. Most of the production was not utilized locally because of lack of activity by the construction industry. Vassiliko Cement Works secured a 4-million-ton cement contract with Syria during the first quarter of the year. This contract considerably reduced Vassiliko's financial burden, and the new plant capacity which Vassiliko had added in previous years was fully utilized.

Fertilizers.—A discussion at the Ministerial Council level was held in midyear to consider construction of a fertilizer complex in Cyprus. To this end, representatives of HMC were invited to visit and observe several fertilizer complexes in the Soviet Union. Information about the location, size, and financing of such a complex was not published by yearend.

Gypsum.—United Gypsum Ltd. produced a record 23,000 tons of crude gypsum, an 80% increase, in 1975; calcined gypsum production remained the same as in 1974. The increase was not due to a flourishing construction industry in the country but to the increase in cement production, which gave a direct boost to the sagging gypsum mining of 1974. Limassol Chemical Products continued quarrying gypsum rock in 1975, mostly for the company's internal consumption.

Lime.—In 1975 lime production, calcined or byproduct, was the lowest of the last 5 years, owing to a lack of construction on the island. The Akamas Lime Co.'s modern new kiln, situated near the Limni mine, produced at full capacity; production at the locations of Kythria Lime Co. was unpublished at yearend.

Pyrite.—Iron pyrite production in the south totaled about 69,000 tons in 1975, an increase of 20% compared with 1974 output. The increase was attributed to renewed European interest in Cyprus pyrite, which is high in sulfur content. Despite HMC's exploration efforts, no new pyrite deposits were reported.

MINERAL FUELS

No legislation on offshore oil drilling was enacted during 1975. The fate of this legislation, under the present political circumstances, remained uncertain.

Cyprus Petroleum Refinery Ltd. (CPR) produced about 338,000 tons of refinery products in 1975, a 20% decrease from 1974 production. Crude petroleum imports totaled about 338,400 tons, a 30% decrease compared with 1974 imports. Crude petroleum imports in declining order of magnitude were from Iraq, Saudi Arabia, and Syria; limited amounts were received from Iran and Libya. To overcome the refinery product shortage, the Government imported motor gasoline from Italy, Belgium, and the Netherlands; jet fuel from Belgium and the United Kingdom; and fuel oil from the U.S.S.R. and the United States.

The Mineral Industry of Czechoslovakia

By Tatiana Karpinsky [1]

In 1975, Czechoslovakia accounted for about 1.9% of the world's industrial production, 3.7% of world coal output, 2.2% of steel production, and 2.9% of the machine building industry. Czechoslovak output of ferroalloy castings in 1975, ranked 12th in the world and accounted for 1.5% of the world total. Foundries continued to be one of the most important branches of Czechoslovakia's industry.

According to Czechoslovak sources, 1975 national income increased 6% over that of 1974, reaching 413,000 million Czechoslovak korunas.[2] Gross industrial production increased 7% in 1975 and contributed 61% of the national income and supplied more than 85% of Czechoslovak overall exports. Agricultural production in 1975, decreased 0.7% compared with that of 1974. According to Czechoslovakia's Federal Statistical Office, capital investment increased 7.9% in 1975 over that of 1974. However, Czechoslovakia's overall growth rate remained among the lowest in Eastern Europe and was expected to decrease during 1976–80. In 1975, for the second consecutive year, Czechoslovakia had substantial overall trade deficits with both its CMEA[3] and market economy trading partners. Like some other CMEA-countries, Czechoslovakia has typically reserved two-thirds of its total international trade for centrally planned economy countries. In Czechoslovakia there are large reserves of coal, lignite, antimony, magnesite, mercury, uranium, graphite, kaolin and other clays, glass sand, limestone, and building materials, but the country remains deficient in oil, natural gas, iron ore, and nonferrous ores.

In 1975, Czechoslovakia participated in many multilateral investment projects of CMEA countries. These projects included construction of an asbestos production and processing complex in the Soviet Union; gas pipeline construction from Orenburg to the western Soviet frontier (2,750 kilometers long); construction of a 750-kilovolt transmission line from Vinnitsa (U.S.S.R.) to the Hungarian border; and many others.

Czechoslovakia's share in the construction of the asbestos complex was about 3% of the total project investment cost. In return, Czechoslovakia is to obtain asbestos deliveries totaling 7,000 tons in 1980; about 12,000 tons in 1981; and as much as 14,000 tons of asbestos per year between 1982 and 1991. For Czechoslovakia's participation in construction of the gas pipeline, the country is to receive 2,800 million cubic meters of natural gas for a period of 20 years beginning in 1978. Czechoslovakia's share in the construction of a high-voltage line from Vinnitsa to Alberirsa in Hungary was about 10% of the total project cost which is to be repaid with electricity deliveries to Czechoslovakia in 1978. In the field of nuclear power generation, Czechoslovakia will be producing equipment for the 440-megawatt-capacity Voronezh type nuclear powerplant.[4]

Government Policies and Programs.—According to the "Directives on the Economic and Social Development of Czecho-

[4] Czechoslovak Foreign Trade, No. 4, 1976, p. 39.

slovakia in 1976–1980," approved by the 15th Congress of the Communist Party of Czechoslovakia in April 1976, the basic economic policy target for the sixth 5-year plan is to increase industrial production and improve the efficiency of industrial output; to develop agricultural production; and to expand new construction. The new 5-year plan foresees an increase in national income of 29%.[5] The plan also calls for a 34% increase in gross industrial output, with a 48% to 51% growth in the heavy industry sector and a 25% increase in output of consumer products. Exports of heavy industry products are anticipated to increase 47% to 49%.

Czechoslovakia's coal and lignite will remain the basic source of energy; total coal output is to reach 122 million to 125 million tons by 1980. Production of coke is to reach about 11 million tons. The generation of electric energy in 1980 is to reach 79 billion kilowatt-hours; about 3,500 to 4,000 megawatts of new generating capacity are to be added during the 5-year period. The ferrous industry is to be expanded and modernized. Pig iron production is to reach 10.5 million tons per year and steel output is to exceed 16 million tons. The output of rolled products is to reach 11.5 million tons.

The plan calls for a 36% to 39% rise in production by 1980 in the chemical industry. Main development emphasis will be placed on oil refining capacity and petrochemicals. A total of 20 million to 21 million tons of crude oil is expected to be processed in 1980.

In the machine-building industry, the 5-year plan foresees development and manufacture of complex technological units for surface mining; development of a belt haulage system for lignite; and manufacture of nuclear power stations, rolling mills, and chemical industry equipment. The plan also foresees manufacture of high-capacity units for the production of cement and equipment for purification, liquefaction, and storage of natural gas.

PRODUCTION

Coal is important to Czechoslovakia since it is the major industrial fuel. Although the total output of bituminous coal, lignite and brown coal increased 5.2 million tons since 1970 reaching 115.1 million tons in 1975, the increase centered on brown coal output which rose 5.5 million tons reaching 83.5 million tons or 72.5% of total output in 1975.

The output of bituminous coal and lignite, for the same period of time, remained steady at approximately 28 million tons and 3.6 million tons, respectively. In 1975 brown coal production increased 5.5% over that of 1974.

Production of iron ore in 1975 (1.8 million tons) remained far below expanding national requirements; the increases in output of iron, steel, and steel products compared with 1974 were as follows: Pig iron, 4.3%; crude steel, 5%; rolled products, 4.4%; and steel tubes, 3.9%.

In 1975, the ferrous metallurgy industry concentrated on completing construction of the East Slovak Iron Works at Kosice, modernization of rolling mills at the Trinec iron works, construction of a new plant for high-grade steel production at Kladno Na Drini, and expansion of capacities for the manufacture of steel pipe. Also, there was an improvement in the efficient utilization of metal scrap. In 1975, Czechoslovakia's sources of steel scrap increased by 10% over the 1974 level and progress was achieved in powder metallurgy.

In 1975, total production of refined copper from domestic and imported ore amounted to 22,824 tons. About 75% of domestic copper ore came from Slovakia. It was estimated that copper ore production from existing deposits at Slovinky, Hodrusa, and Spania Dolina[6] can be doubled by 1985.

Lead and zinc ore production for 1975 was 562,000 tons (10,000 tons more than in 1974). This ore was mined at the Pribram and the Kutna Hora deposits. In 1975, the total production of refined lead from domestic and imported ore was 18,000 tons.

Crude oil production was about 142,000 tons in 1975 and could not meet the national demand which required an additional 15.8 million tons of crude oil, imported mostly from U.S.S.R. Domestic

[6] Rude Pravo, June 19, 1975, p. 3.

oil was produced mainly in Southern Moravia. Efforts to increase production were reflected in intensive prospecting work in Moravia. Drilling was done to a depth of 3,742 meters near Gottwaldow, 3,321 meters around Nemoicky, and 2,532 meters at Tesany. Prospecting work continued also in Slovakia. The output of natural gas was 852 million cubic meters.

In 1975, a new refinery at Kralupi on Vlata processed its first million tons of Soviet oil. It produced special grades of gasoline, light and heavy lubricants, and motor oil.

In the nonmetallics group Czechoslovakia produced about 22 million tons of limestone, 0.5 million tons of kaolin, 0.7 million tons of magnesite, and 9.3 million tons of cement.

Cement output increased 3.8%, one-half of the 1974 level. In 1975, development of a new cement works was started at Prachovice in Bohemia, with a projected capacity of 1.2 million tons per year. The works were scheduled to reach full capacity by 1980.

The first Czechoslovakian nuclear plant, the Jaslovske Bohunice, with a power generating capacity of 110 megawatts, continued to operate in 1975. Construction and installation work were in progress for three additional stages of a plant to start commercial operation in 1977.[7]

According to Czechoslovak sources, during the 5-year period (1971–75) the national income of the country increased 31.7%. Production of coal, chemicals, and power failed to meet the 5-year plan targets.[8] Instead of the planned 62,000 million kilowatt-hours of electricity for 1975, only 59,200 million kilowatt-hours were generated. The 5-year plan goal set for the crude oil processing industry also was not met. In ferrous metallurgy and in fertilizer production, the overall objectives of the fifth 5-year plan were met.[9]

The index of industrial production increased as follows with 1970=100.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, arsenic, gold, feldspar, graphite, uranium, and a variety of additional petroleum products are also produced, but information is inadequate to make reliable estimates of output levels.

[2] This material, although reported as manganese ore, is believed to be manganiferous iron ore, with a manganese content of about 17%, and as such is not equivalent to materials reported elsewhere as manganese ore, which generally contain 25% or more manganese.

[3] Derived by subtracting reported metallurgical coke from reported total coke output.

[4] Includes gas produced from coal mines; gross output of natural gas is not reported, but it is believed to exceed reported marketed output by only a relatively inconsequential amount.

[5] Data presented are for those products reported in official Czechoslovakian sources and in the Statistical Yearbook of the United Nations; no estimates have been included for other products or for refinery fuels and losses.

TRADE

In 1975, Czechoslovakia's foreign trade turnover (exports plus imports) amounted to 97,367 million korunas, an increase of 14.3% over that of 1974.[10]

In 1975, total exports were valued at 46,651 million korunas, an increase of 13.2% over that of 1974; the total value of Czechoslovakia's imports increased to 50,716 million korunas, an increase of 15.3 compared with the 1974 level.

The trade balance showed that the deficit increased from 2,761 million korunas in 1974 to 4,065 million korunas in 1975.

In 1975, exports of machinery and equipment contributed 48.0% of the total national export value; fuels, mineral raw materials, and metals, 19.6%; chemical products, 4.8%; construction materials, 2.2%; and other products, about 25.4%. The import value of machinery and equipment amounted to 36.9% of the total import value; fuels, mineral raw materials, and metals, 28.8%; chemical products, 8.5%; construction materials, 1.0% and other products, 24.8%.[11]

The main purchasers of machinery and equipment exports were centrally planned economy countries, whose share of total Czechoslovak exports was more than 80%, almost half of which went to the Soviet Union.[12] The share of the developing market economy countries was almost 10% and that of developed market economy countries almost 7%. About 75% of machinery and equipment imports came from CMEA-countries.[13]

The biggest trading partner of Czechoslovakia was the Soviet Union and its share of total Czechoslovak trade turnover increased from 28.5% in 1974 to 32.5% in 1975. Czechoslovakia's exports to the U.S.S.R. increased 25.5%, while imports increased 35.7%. Thus, the 1975 balance of trade with the U.S.S.R. ended with a deficit amounting to 889 million korunas. The second ranking trading partner was East Germany with 12% of the total trade turnover and the third, Poland with 9%.

Czechoslovak trade turnover with the United States in 1975 had a deficit of 576 million korunas, resulting from 756 million korunas of imports and 180 million korunas of exports.[14]

Czechoslovakia, which is dependent on the Soviet Union for its oil supplies, is to obtain 90% of its oil imports in the next 5 years from the U.S.S.R.[15] The prices paid for Soviet oil increased 175% from 1973 to 1975[16] and increased the deficit of Czechoslovakia's balance of trade with the U.S.S.R. in 1975.

Under the 1975 agreement between Czechoslovakia and the U.S.S.R., equipment for the 440-megawatt-capacity Voronezh type nuclear powerplant will be delivered to the U.S.S.R. by Slovakian Power Engineering Works (SES). SES will build machinery for Czechoslovak and Soviet nuclear power engineering according to Soviet documentation.

COMMODITY REVIEW

METALS

Aluminum.—Production of primary aluminum in Czechoslovakia totaled 43,000 tons in 1975, a decrease of 13.1% below the 1974 level; consumption of aluminum was 170,000 tons in 1975. Czechoslovakia imported 313,000 tons of bauxite from Hungary and 138,000 tons from Yugoslavia in 1975. About 80,000 tons of aluminum came from the U.S.S.R. and 12,000 tons from Yugoslavia. In 1975 total imports of alumina increased by 4.4% over that of 1974 and imports of aluminum decreased 24.4%.[17]

In 1976 Yugoslav deliveries of primary aluminum to Czechoslovakia are to increase 25% as compared with 1975. The most important goal of the sixth 5-year plan (1976–80) in the aluminum industry is the intensification and modernization of production of alumina and aluminum at the Slovak National Aluminum Works at Ziar. It is planned to obtain alumina from Guyana in exchange for technical aid in constructing an aluminum smelter.

Antimony.—In 1975, mine production of antimony, metal content, was about 750 tons. Two mining centers, Dubravy and Pezinek, were in operation. Plans through 1990 emphasize the need to modernize and increase the productive capacities of existing mining and ore-processing units. Two additional sections are to be set up near Dubravy and Krasne Hory in the near future. Czechoslovakia eventually expects to export antimony by 1990.[18]

The antimony plant in Bolivia, constructed with Czechoslovak assistance, was put into operation by the end of 1975. Capacity of the new Bolivian plant is 5,000 tons antimony and 1,000 tons antimony oxide (Sb_2O_3) per year.

Copper.—Czechoslovakia's copper ore production increased from 667,000 tons in 1974 to 669,000 tons in 1975, or 0.3%.

Domestic mine production of copper totaled 5,000 tons in 1975 and has maintained the same approximate level for the

[17] Pages 59 and 60 of work cited in footnote 10.
[18] Eastwest Markets, Sept. 20, 1976, p. 12.

last 2 years. Total refined copper production amounted to 22,824 tons in 1975. The U.S.S.R. copper deliveries totaled 36,000 tons and Polish deliveries 12,000 tons in 1975.[19] Imports of copper from Great Britain totaled 5,000 tons in 1975.

Deposits of copper ore occur in conjunction with iron ores at Rudnany (Slovakia) and near Roznava (Slovakia), copper-lead-zinc ores in Banska Stiavnica (Slovakia), and copper ores in the Zlote Hory (Moravia).[20] Copper mining is to be expanded at the Zlote Hory deposit in Moravia and at other mines. New investments are planned in Zlote Hory, Tisova, Slovinsky, Gelnica, Hovoveska Huta, Spania Dalina, and Zlatno. Copper production is expected to rise considerably over the next 15 years.

Iron and Steel.—In 1975, Czechoslovakia produced 1.8 million tons of iron ore,[21] or 6% above that of 1974 and 13% above the 1970 output level. In 1975, about 12 million tons of iron ore were imported from the Soviet Union and 2.1 million tons from other countries (Brazil, Liberia, India, Sweden, and Algeria). Reportedly, Czechoslovakia signed a contract for delivery of 65,000 tons of iron ore pellets from Norsk Jernverk to upgrade blast furnace feed.

The country's iron ore deposits are located in the Slovak Ore Mountains and in Central Czechoslovakia. It is estimated that total reserves of iron ore in Czechoslovakia approximate 400 million tons with an average content of 30% to 35% iron.[22] The siderite deposit at Rudnancy (Slovakia) continued to be the main local source of iron ore.[23] Production of iron ore is not likely to increase much in the future. However, further prospecting continued in both the Czech and Slovak regions.

In 1975, pig iron production totaled 9.3 million tons, an increase of 4.3% compared with that of 1974 and 23.1% compared with that of 1970. Imports of pig iron reached 1.1 million tons in 1975 an increase of 38.2% over that of 1974. Approximately 21,000 tons of pig iron were exported in 1975.

In 1975, Czechoslovakia produced 14.3 million tons of crude steel, an increase of 5% over the 1974 level. Steel production in Slovakia totaled 3.8 million tons,[24] and was produced almost exclusively at the East Slovak Iron and Steel Works at Kosice. The first stage of this metallurgical works was completed in June 1966 and the second one was put into operation in April 1974.

Czechoslovakia's production of rolled products (excluding pipe) increased 4.5% to 10.4 million tons in 1975; output of steel pipe was 1.45 million tons in 1975, 3.6% more than that of 1974.

In 1975, exports of steel semimanufactures amounted to 3.3 million tons. Exports of different kinds of pipe (casing, oil, thin wall, electric-welded, carbon, etc.) from Czechoslovakia to the U.S.S.R. amounted to about 350,000 tons in 1975.[25]

The plan provided for the production of 9.5 million tons of pig iron, 14.7 million tons of crude steel, 10.2 million tons of rolled products, and 1.4 million tons of steel pipe in 1976.[26]

In 1975, the first 100-ton electric arc furnace at the Kladno Iron and Steel Works was put into operation. The second furnace is to be commissioned in the first quarter of 1976. Two electric furnaces for the production of ferroalloys were put into operation at the Oravsky ferroalloy works at Istebna (Slovakia). A number of other smaller units also became operational in 1975.

During the fifth 5-year plan (1971–75), the ferrous industry concentrated on completing development of the East Slovak Iron Works at Kosice, which produced 3.5 million tons of crude steel in 1975; modernization of rolling mills at the Trinec Iron Works; construction of a new plant for producing high-grade steel at Kladno; expansion of capacities for the manufacture of steel pipe of all types; and the construction of important production lines related to the nuclear program. Some important projects started in 1971–75 are to be completed in 1976–80. This will include construction of an electric steel plant at Kladno, expansion of pipe production, the completion of operations for the nuclear program and the modernization of rolling

[25] Foreign Trade, Moscow. No. 3, 1976.
[26] United Nations. Economic and Social Council. New York, Steel/WP.1/R.4/Add. 2, Mar. 24, 1976.

mills. In addition, the following new projects are to be carried out during the sixth 5-year plan: (1) Expansion of pipe manufacture facilities at Chomutov and other works; (2) construction of an oxygen steel plant at Trinec with planned production of 2.8 million tons of steel per year and continuous casting installations at the East Slovak Iron Works; (3) construction of a new medium-grade rolling mill at the New Klement Gottwald Metallurgical Works in Ostrava; (4) reconstruction of some coke batteries and of blast furnace No. 1 at the same works; (5) construction of a tube mill at the Sverma Iron Works; and (6) enlargement of the Victovice and Kraluv works.

The sixth 5-year plan anticipates the following production increases by 1980 over the 1975 levels: Pig iron, 15%; crude steel, 13%; rolled products, 16%; and steel pipe, 13%. Labor productivity is to increase 22%.[27]

Lead and Zinc.—Lead and zinc ore production increased to 562,000 tons in 1975 or 1.8%. Production of lead from domestic ores reached approximately 4,000 tons, but the country's consumption of this metal was 54,000. Czechoslovakia's total lead production amounted to 18,000 tons in 1975. In addition, 25,000 tons of lead was imported from the U.S.S.R. and about 6,000 tons from Yugoslavia. The consumption of zinc totaled 60,000 tons. Domestic output totaled only about 9,000 tons. Imports of lead and zinc from the Soviet Union supplied the basic requirements of the Czech industry. In 1975 imports of zinc from the U.S.S.R. amounted to about 22,000 tons; Yugoslavia, 16,000 tons; Bulgaria, 8,000 tons; Poland, 6,000 tons; and West Germany, 6,000 tons. In December 1974, the Association of Yugoslav Lead and Zinc Producers received a credit of $75 million from the Czechoslovak Metalimex Prague Foreign Trade Corporation for the purchase of Czechoslovak goods and services. The credit will be repaid in the form of deliveries of zinc, lead, silver, cadmium, and semifinished and final products from these metals.

Czechoslovakia's lead-zinc ores are mined at Pribram, Kutna Hora, and Banska Stiavnica deposits. Czechoslovakia's mining plans through 1990 emphasize the need to find new reserves of lead-zinc ores and to modernize and increase the productive capacities of existing mining and ore processing facilities.

Tin.—Tin and tungsten were mined in the Cinavec and Horni Slavkov regions. In 1975 Czechoslovakia imported some 4,000 tons of tin, 18% of which came from Malaysia. Plans were made to double imports of tin by 1980.

Uranium.—Data on uranium mining and reserves in 1975 was practically nonexistant because such data are classified. The long-known hydrothermal uranium deposits in the Johymov and Pribram regions were mined intensively since the end of World War II, and by 1975 they were practically depleted. On the basis of surveys in 1960, deposits of radioactive raw material were found in the middle of the Moldanubicum District in Central Bohemia.

In 1973 in addition to the known deposits, a number of promising areas were found.[28] Uranium ore (U_3O_8) production was estimated at 250 tons per year in 1973;[29] however, according to new sources,[30] the annual production was given to be as much as 2,000 tons.

NONMETALS

Cement.—Construction of the Prachovice No. 2 cement plant in Eastern Bohemia, with an annual capacity of 1.2 million tons, was started in 1975. The first stage of this plant is to be put into operation in 1979 and completion of the plant is scheduled for 1980. The operation is to be automated and controlled by computers. Fly ash and waste gases are to be thoroughly retained and processed into fertilizers. In winter, the dry process cement plant at Prahovice is to be fueled by heavy oil, and in summer, by natural gas.[31]

In 1975 Czechoslovakia exported about 106,000 tons of cement to Poland, 58,000 tons to West Germany, 17,000 tons to Hungary, and 5,000 to Yugoslavia. About 386,000 tons of cement were imported from the U.S.S.R. and 133,000 tons from Romania in 1975.

[30] Glückauf, No. 6, 1976, p. 112.
[31] Czechoslovak Foreign Trade, No. 2, 1976, p. 42.

Feldspar.—Development of feldspar deposits discovered in the Territory of Halamky Community in the area of Jindrichuv continued in 1975. Reserves are estimated at approximately 150 million tons of feldspar. A new plant is to make Czechoslovakia self-sufficient in this mineral.

Fertilizer Materials.—Czechoslovakia's chemical industry produced 446,000 tons of nitrogen and 398,000 tons of phosphatic fertilizers (in terms of nutrient content) in 1975. Production of nitrogen fertilizer increased 10.1% as compared with that of 1974 and phosphatic fertilizer 11.8%.

In 1975, the country consumed 1.5 million tons of fertilizers, an increase of 3.8% compared with the 1974 level; nitrogen fertilizers constituted 31.6%; phosphatic fertilizers 26.3%; and potassium fertilizers 42.1%. The consumption of pure nutrients per hectare of agricultural land reached 222 kilograms. In 1975 Czechoslovak production of fertilizers remained below domestic needs and fertilizers continued to be imported from East Germany and the Soviet Union.

In 1975, the Soviet Union delivered 182,000 tons of potash in form of finished fertilizers and fertilizers to be further processed; 15,000 tons of granulated superphosphates; 158,000 tons of phosphates (P_2O_5); and 47,000 tons of nitrogenous fertilizers. East Germany delivered about 508,000 tons of potassium fertilizers. In addition in 1975 Morocco delivered to Czechoslovakia 102,000 tons of phosphate (P_2O_5), Tunisia, 46,000 tons, and Algeria 33,000 tons. During 1976–80, imports of fertilizers from centrally planned economy countries will increase and are to represent as much as 90% of Czechoslovakia's total fertilizer imports.

Phosphatic fertilizers were produced at the chemical complexes at Lovosice (North Bohemian region), Kolin, and Usti (Central Bohemian Regíon), and Bratislava (West Slovak region) from imported raw materials. Nitrogen fertilizers were produced at the Lovosice-Zaluzi Chemical Complex (North Bohemia), at the new chemical complex at Sala with approximate production of 430,000 tons per year (West Slovakia) and at the chemical complex at Strazske (East Slovakia) which was expanding its production of nitrogen fertilizers.

MINERAL FUELS

Energy.—For many years coal, including brown coal and lignite, has been the major source of primary energy in Czechoslovakia. Production of total energy derived from fossil fuels, hydroelectric, and nuclear generation rose from 79.6 million tons of standard coal equivalent in 1974 to 82.1 million tons in 1975. In 1975, the share of coal (bituminous, brown, and lignite) in the total primary energy production was about 97.9%, the share of crude oil 0.3%, natural gas 1.2%, and nuclear and hydropower 0.6%. Total consumption of primary energy in Czechoslovakia increased from 105.0 million tons in standard coal equivalent in 1974 to 109.8 in 1975. In 1975, coal provided about 72.0% of the total consumption while oil represented 21.4%, natural gas 5.6%, hydroelectric power 0.4%, nuclear power 0.1%, and imported electric power 0.5%.

In 1975, Czechoslovakia produced 59.2 billion kilowatt-hours of electricity, an increase of 5.7% over that of 1974.[32] New facilities with a capacity of 976 megawatts were put into operation in 1975.

The total primary energy balance for 1974 and 1975 is shown in table 4.

Coal.—During 1975 Czechoslovakia produced a total of 28 million tons of bituminous coal, an increase of 0.4% over 1974 production. Bituminous coal production in 1976 is expected to be over 28.2 million tons. Particular attention was to be given to the extraction of coking coal in Northern Moravia in 1976. Total exports of bituminous coal were estimated at 3.7 million tons in 1975. The main importers of the bituminous coal were Austria, East Germany, Romania and Hungary. Imports of bituminous coal by Czechoslovakia was 5.2 million tons in 1975; it was imported from the U.S.S.R. and Poland. The bulk of the country's bituminous coal output came from the Ostrava-Karvin Basin, which forms part of the large Upper Silesia coal deposits. In 1975, Czechoslovakia produced a total of 83.5 million tons of brown coal and 3.6 million tons of lignite. Production of brown coal increased 5.5% over that of 1974, but production of lignite declined by about 2%. In 1976, the total coal and lignite output is expected to reach 116.5 million tons. Reportedly, about 1.7 million

Table 4.—Czechoslovakia: Total primary energy balance for 1974 and 1975

(Million tons of standard coal equivalent)[1]

	Total primary energy	Coal (bituminous, brown, lignite) and coke	Crude oil and petroleum products	Natural gas	Hydroelectric power	Nuclear power	Turnover of electric power with other countries
1974:							
Production	79.6	77.6	0.2	1.3	0.4	0.1	--
Exports	6.4	6.2	--	--	--	--	0.2
Imports	31.8	5.2	21.5	4.3	--	--	.8
Apparent consumption	105.0	76.6	21.7	5.6	.4	.1	.6
1975:							
Production	82.1	80.4	.2	1.0	.4	.1	--
Exports	7.0	6.8	--	--	--	--	.2
Imports	34.7	5.5	23.3	5.1	--	--	.8
Apparent consumption	109.8	79.1	23.5	6.1	.4	.1	.6

[1] 1 ton of standard coal equivalent (SCE) = 7,000,000 kilocalories. Conversion factors used are as follows: Hard coal, 1.0; brown coal and lignite, 0.6; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); hydroelectric and nuclear power, 0.125 (per 1,000 kilowatt hours).

Source: Statistical Yearbook of Czechoslovakia, Prague, 1976.

tons of brown coal were exported in 1975. The principal importer was West Germany. The major part of brown coal output was supplied by the North Bohemian Basin. Coke production reached 10.9 million tons in 1975; coke was produced at the same level as in 1974. About 2.3 million tons of coke were exported mainly to East Germany and Romania.

In 1975, the Most District produced 51% of the total coal output, Ostrava 21%, Sokolov 18%, Prievidza 7%, and Kladno 3%. According to 1967 estimates, hard coal reserves in Czechoslovakia are 11,600 million tons and brown coal reserves about 12,500 million tons. Coking coal accounted for 10.5% of the aggregate reserves of coal of all types.[33]

In 1975 in the Ostrava coal basin, new deep shafts were being sunk in areas with coking coal. During the past 5 years over 500 million tons of coal have been discovered at the southernmost part of the Ostrava-Karvina Basin in North Moravia. This area is to become the center of a new coal mining district and development is to begin in 1978. Coal deposits with estimated reserves of 150 million tons have been discovered at Slany in Central Bohemia where production of coal is to begin in 1978. Coal deposits have been discovered in the Melnik-Benatky area north of Prague where reserves are estimated at 250 million tons.

Natural Gas.—Production of natural gas in 1975 was approximately 852 million cubic meters.[34] Imports of natural gas from the U.S.S.R. amounted to 3,800 million cubic meters, a 15.2% increase over the 3,300 million cubic meters imported in 1974. The U.S.S.R. was the sole source of imported natural gas in 1975. After completion of the Orenburg-Europe gas pipeline, Czechoslovakia is to receive an additional 2,800 million cubic meters of gas per year.[35] The Orenburg pipeline is to carry a total 28,000 million cubic meters of gas per year over a distance of some 2,750 kilometers from Orenburg to the Soviet-Czechoslovak border near the town of Uzhgorod.

On Czechoslovak territory, the Orenburg gas pipeline is to be linked with the existing 1,030-kilometer transit gas pipeline which has been carrying Soviet natural gas to Austria, West Germany, East Germany, Czechoslovakia since 1973, and also to Italy through Austria since 1974. Work on the 560-kilometer Czechoslovak section of Orenburg pipeline between the town of Alexandrov-Gay (U.S.S.R.) and Sokhranovka (U.S.S.R.) was started in July 1975 and is to be completed in the third quarter of 1978. The Czechoslovak section involves the installation of five compressor stations in addition to pipeline construction. Czechoslovakia's natural gas comes from the north part of the Vienna Basin, the Ostrau area, and Eastern Slovakia. Orenburg gas will be used mainly as an industrial feedstock rather than as a fuel.

In 1975 negotiations were continuing for imports of 3,600 million cubic meters of

[35] Czechoslovak Foreign Trade, No. 3, 1976, p. 15.

Soviet gas per year which will be replaced by additional Iranian exports to the U.S.S.R.

Petroleum.—Production of crude oil in Czechoslovakia is insignificant. In 1975 output of crude oil amounted to 142,000 tons. Czechoslovakia's oil comes from Gbely, Hodonin, and Stefanov Fields in the Vienna Basin. Petroleum consumption in 1975 was approximately 18.5 million tons. Some 90% of Czechoslovakia's petroleum supplies came from the Soviet Union. About 15.5 million tons of crude oil were imported from the U.S.S.R. in 1975,[36] an increase of 8.5% compared with that of 1974; about 0.2 million tons came from Iraq and 0.1 from other countries. According to Czechoslovak sources, imports of about 22.4 million tons of crude oil are planned from the U.S.S.R. in 1980, but the Soviet Union will not deliver all of the 16 million tons of crude oil in 1976 for which Czechoslovakia has contracted.

Czechoslovakia participated in financing an oil pipeline from an Adriatic seaport in Yugoslavia to Czechoslovakia. Completion of this line is planned for 1978 and Czechoslovakia is to receive 5 million tons per year of crude oil from Africa and the Middle East.

In 1975, Czechoslovakia produced approximately 17 million tons of refined petroleum products. The total capacity of all eight refineries, including the new 3-million-ton-per-year plant at Kralupy on Vlatava, was reported to be approximately 20 million tons.

Exploration for oil and gas deposits is to be carried out in the lowlands of East Slovakia, the Vienna Basin, and the westernmost parts of the Carpathians. Approximately 900 million korunas are to be invested for geological prospecting to confirm the existance of more oil and gas in these areas. In 1975 prospecting for oil was concentrated near Gottwaldow and Tissany.[37]

The Mineral Industry of Denmark and Greenland

By Joseph B. Huvos [1]

In 1975, Denmark and Greenland remained only minor producers of mineral commodities and had to import almost all necessary fuels and minerals. Domestic mineral production in Denmark included modest amounts of crude oil, iron ore, diatomaceous earth, salt, and construction materials including clays. Greenland produced only lead-zinc ore and cryolite.

The gross national product (GNP) of Denmark and Greenland, which is not reported separately, was approximately $33 billion in 1975.[2] The mineral industry's share in the GNP was only about 1%. Contribution of the principal sectors of the mineral industry to the GNP in 1974 and 1975, and average employment in 1975 are shown in table 1.

Table 1.—Denmark and Greenland: Contribution to the gross national product in 1974 and 1975 and employment in 1975 in the mineral industry

	Average 1975 employment (thousand persons)	Contribution to gross national product		
		Million dollars		Percent change

Source: Denmarks Statistisk (Copenhagen). Economic Trends, No. 1, April 1976, pp. 23, 27.

There were a number of significant developments in the mineral industry of Denmark and Greenland in 1975. In the North Sea, oil was found in discovery well No. 2. Exploration for petroleum continued in the North Sea and on the Danish mainland. Det Danske Staalvalsevaerk A/S continued its development into an all-electric steelmaker. In Jutland, Superfos A/S (SAS) continued construction on its new nitric acid, ammonium nitrate, and nitrogen-phosphorus-potassium (NPK) facilities.

Where necessary, values in Danish kroner (DKr) were converted to U.S. dollars at the rate of DKr5.7462=US$1.00 for 1975 and DKr6.1775=US$1.00 for 1974.

DENMARK

PRODUCTION

In 1975, production of mineral products in Denmark followed a mixed pattern. While mineral production as a whole declined, combined output of nonmetallic minerals gained slightly. Production of selected mineral commodities in 1973, 1974, and 1975 is detailed in table 2.

Table 2.—Denmark: Production of selected mineral commodities

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Sales.

[2] Excludes shipyard production of crude castings.

[3] Includes only granite and gneiss; quantity of other dimension stone is not reported, but sales value was $454,252 in 1973; $259,413 in 1974; and $209,878 in 1975.

[4] Partial figure; excludes quartz, quartzite and flint, for which the quantities produced are not available. However, sales values were $2,780,560 in 1973; $3,008,909 in 1974; and $2,806,898 in 1975.

TRADE

In 1975, there was no important change in the trade pattern of Denmark. Imports of fossil fuels dominated the picture, amounting to one-tenth of all imports, while exports of mineral products were insignificant. Most mineral trade was with the countries of Europe. Trade in 1973 and 1974 is shown in tables 3 and 4; the minor trade of Greenland is not reported separately.

r Revised. NA Not available.

[1] Not including synthetic corundum.

[2] Including spiegeleisen, grit, sponge, and powder and shot of iron and steel.

[3] Including wire rod.

COMMODITY REVIEW

Metals.—*Iron and Steel.*—Production of iron and steel continued to be based mainly on scrap, supplemented by small quantities of iron ore and roasted pyrite. DDS, with plants located at Frederiksvaerk in Sjaelland, north of Copenhagen, remained the country's main iron and steel producer, accounting for most crude steel produced and almost all rolled product output. The principal products of DDS were sections and heavy plates.

In 1975, despite reduced output due to world recession, DDS continued its expansion into an all-electric steelmaking operation. According to plans, steelmaking capacity was to be raised to 500,000 tons per year in 1976 and perhaps double that figure at some later date.

Nonmetals.—*Cement.*—In 1975, the Danish cement industry remained depressed owing to the low level of building activity in the country. Cement plant utilization was only two-thirds of full capacity. A/S Aalborg Portland-Cement-Fabrik continued to control the country's five cement plants; one each is located near Mariager, Karlslunde, and Nørresundby, and two are near Alborg.

Fertilizer Materials.—In 1975, Denmark remained a net importer of fertilizer materials. Imports included phosphate rock, mainly from North Africa and the U.S.S.R.; nitrogenous materials from Norway, the United States, and West Germany; and potassic materials imported principally from West Germany. SAS, Denmark's largest fertilizer manufacturer, accounted for most of the phosphoric, nitric, sulfuric acid, phosphorus (P), phosphorus-potassium (PK), and NPK fertilizers produced in 1975. The plants are located at Fredericia and Nørresundby, Jutland.

Construction continued on SAS's third nitric acid plant at Fredericia, in Jutland; the plant is to use imported ammonia as a raw material. Construction continued also on SAS's additional ammonium nitrate and NPK prilling facilities at the same site which are slated to raise SAS's NPK capacity from 250,000 to 600,000 tons per year in 1976.[3]

Salt.—Dansk Salt Co. continued producing rock salt by solution mining of a salt dome at Hvornum in northeast Jutland.

Stone, Sand and Gravel.—Operations in the stone, sand, and gravel business included Ahsell & Agren's industrial sand production on Bornholm Island; A/S Faxe Kalkbrud's industrial limestone; and Dansk-Landbrugs Grovvaresselskab a.m.b.a. agricultural limestone quarry. Moler, a clay containing diatomaceous earth found only in Denmark, was mined on the islands of Fur and Mors in northwest Jutland.

Mineral Fuels.—In 1975, Denmark had to rely almost completely on imports of fuels, mainly crude oil and petroleum products, while only modest quantities of crude oil and hydropower were produced domestically. There were several plans under consideration for securing the country's energy supply, and making it less susceptible to the influence of market conditions similar to those of the 1973–74 oil crisis. According to one of these plans, a 1,000-megawatt nuclear powerplant was to be built in the country, supplied eventually by fuel derived from uranium resources under exploration in Greenland. Another plan under consideration was to import natural gas from European producers.

Table 5 shows supply and apparent consumption of energy in Denmark for 1974 and 1975, including minor amounts for Greenland.

---

[3] Superfos A/S. 1974 Annual Report. 1975, p. 3.

Table 5.—Denmark and Greenland: Supply and apparent consumption of energy-producing materials in 1974 and 1975
(Million tons of standard coal equivalent)[1]

	Total energy	Coal and coke	Petroleum and refinery products[2]	Hydroelectric power[3]
1974:				
Production[4]	0.1	--	0.1	(5)
Imports	34.9	3.7	31.1	0.1
Exports	4.4	.1	4.2	.1
Apparent consumption	30.6	3.6	27.0	--
1975:p				
Production[4]	.2	--	.2	(5)
Imports	33.5	4.3	29.0	.2
Exports	4.0	--	3.9	.1
Apparent consumption	29.7	4.3	25.3	.1

p Preliminary.
[1] 1 ton of standard coal equivalent (SCE) =7,000,000 kilocalories.
[2] Includes some liquid natural gas imports.
[3] Includes foreign trade of all electricity.
[4] Includes only primary energy.
[5] Less than ½ of 0.1.

Source: Danmarks Statistik (København). Monthly Bulletin of Foreign Trade, December 1975. Danmarks Statistik (København). External Trade of Denmark 1974. U.S. Embassy, Copenhagen, Denmark. State Department Airgram A-123, Dec. 24, 1975, and Telegram No. 7869, Mar. 10, 1976.

Petroleum.—Exploration and Development.—Oil was reported in the North Sea at discovery well No. 2, 25 kilometers northwest of the Dan oilfield.[4] Crude oil production in the Danish sector of the North Sea was about 166,200 tons in 1975 and was to reach 1.2 million tons in 1978, which corresponds to only one-twentieth of present annual demand. The sole concessionaire in the Danish sector of the North Sea remained the Dansk Undergrunds Consortium (DUC) composed of Royal Dutch/Shell Group (40%), AP Møeller (30%), Standard Oil Co. of California (15%), and Texaco, Inc. (15%).

DUC also started drilling in northwest Jutland, at the 1 Oddesund well, with a target depth of 2,700 meters. Drilling of another well was to be started toward the end of 1975 at 1 Hyllebjerg, about 5 kilometers north of Farsø.

During 1975, the Danish Government started negotiations for gaining partial control of DUC.

Refining.—Oil refining capacity of the country's three refineries remained at about 11.5 million tons in 1975.[5] A/S Dansk Shell operated a 3.2-million-ton-per-year refinery at Fredericia, eastern Jutland; Dansk Esso A/S operated a 3.6-million-ton-per-year refinery at Kalundborg, western Sjaelland; and Gulf Oil Refining A/S operated a 4.7-million-ton-per-year refinery at Stignaes, southeastern Sjaelland.

GREENLAND

In 1975 Greenland produced only lead-zinc ore; trade is included with that of Denmark, and is not separately reported.

In 1975 Greenex reported finding a massive high-grade copper ore occurrence on Agpat Island near Umanak, near the west coast of Greenland. There were plans to drill this copper occurrence in 1976. Exploration for petroleum was to be started on the Continental Shelf.

The 1975 world recession had little influence on the modest lead and zinc output at Greenex Black Angel mine near Marmorilik in western Greenland. Vestron Mines Ltd. owns 62% of Greenex; in turn, Cominco Ltd. of Canada owns 62% of Vestgron. Concentrates for processing were shipped to Europe during the shipping season from early June until December in ships strengthened against the ice, and some concentrate was sent to the United States. Greenland had no lead and zinc smelting facilities in 1975. Planned development and exploration at the Black Angel mine continued in 1975.

Kryolitselskabet Øresund A/S (KØAS),

[4] The Petroleum Economist. July 1975, p. 257.
[5] Petroleum Times. Jan. 23, 1976, p. 42.

Copenhagen, invited Sweden's State-owned mining company, Luossavaara-Kirunavaara AB (LKAB), Stockholm, to participate in an underground iron ore mining project in Greenland. The project might involve an investment of up to $700 million according to LKAB. KØAS was conducting exploration to delineate the iron ore body about 75 miles north of the town of Godthab, and is interested in bringing LKAB into the project because of its extensive knowledge of underground iron ore mining.

Cryolite shipping by KØAS continued from accumulated stocks in southeast Greenland at Ivigtut. The crude ore was shipped to Copenhagen for beneficiation at the plant at KØAS.

Original plans called for doubling Greenland's proven uranium ore reserves at Kvanefjeld near Narssaq and conducting pilot plant beneficiation tests for uranium ore. The Danish Parliament has repeatedly delayed the decision to start this project, partly because of the continued study of the project's environmental effects.

Off southwest Greenland, exploration for oil was to start early in 1976 on a concession of 13 blocks with a combined area of about 5,400 square miles. The first well in the area was to be drilled by a Canadian-French-Danish consortium, TGA-Grepco, one of the six groups awarded concessions in the area in 1975. Total Grønland Olie SA, the operator for the group planned to use a dynamically positioned drilling ship, the only technique possible in these Arctic waters.

Greenland's production of mineral commodities for 1973, 1974, and 1975 is detailed in table 6.

Table 6.—Greenland: Production of mineral commodities
(Metric tons)

Commodity [1]	1973	1974	1975 p
Lead, mine output, metal content	5,700	24,100	24,300
Zinc, mine output, metal content	27,200	88,500	84,700

p Preliminary.
[1] In addition to the commodities listed, a variety of crude construction materials (common clay, sand, gravel, and stone) is undoubtedly produced, but output is unreported and available information is inadequate to make reliable estimates of output levels.

The Mineral Industry of Egypt

By Janice L. Jolly [1]

During 1975, several important events boosted Egypt's mineral industry and general economy. The return from Israeli control of important oilfields in the Sinai Peninsula in October and the reopening of the Suez Canal in June were both expected to contribute materially to hard currency earnings in 1976 and beyond. With projected production from oil discoveries made in 1975 and the recovered facilities, Egypt was expected to become a significant oil exporter by 1980. It was hoped that Suez Canal traffic would soon return to preclosure levels, and 1976 revenues were expected to total as much as $500 million,[2] again becoming a foreign exchange earning asset. The "open door" policy decision of 1974 marked a profound change in attitudes and expectations and reversed the trend toward increasing economic stagnation that had resulted from a decade or more of centralized direction. Even so, substantial foreign investment was not expected to occur before investment laws were further liberalized. Reforms in exchange rate structure and other fiscal policy areas were especially needed and were being considered by the Government. Among other fiscal problems in 1975, inflation was estimated at an annual rate of 25%. The balance of payments deficit for 1975 was about $3.2 billion, and total foreign indebtedness was reported to be in excess of $14.1 billion.[3] A 5-year plan, to begin in 1976, was being formulated to rectify the balance of payments and to decrease the existing deficit.

The 1975 gross national product (GNP) was estimated at $9,618 million, which at constant (1973) prices reached a 9.2% growth rate over that of 1974.[4] Part of the upward pace was attributable to increased production in both the iron and steel and aluminum industries. The mining industry reportedly achieved a 25% increase in 1975 production value over that of 1974. Investments for the 1975 development plan amounted to $1,874 million, up 40.8% over those of 1974. The "industry, petroleum and mineral wealth" economic sector was alloted 34.9% of the total investments. About $77 million was allocated to the iron and steel industry to establish two additional blast furnaces. The Naj Hammadi aluminum project was allocated about $26 million. The Talkha fertilizer mill was allocated $7.7 million, aiming for production of 250,000 tons of ammonia nitrate fertilizers per year. A third coke line was allocated about $7.4 million and was expected to start production by late 1976 with an annual capacity of 700,000 tons of coke. The Hamrawayn phosphates project was allocated about $8 million and was operated during 1975 at a capacity of 300,000 tons, with full capacity of 600,000 tons per year expected to be reached in late 1976. The petroleum sector was allocated about $211 million, which included about $33 million for increasing the capacity of the Mustrurud and Tanta refineries by about 5.2 million barrels, the Alexandria petroleum refinery by about 3.5 million barrels, and $17.9 million was allocated for a new Suez refinery in 1975. The electrical sector, which included the Kattara depression project, was allocated about $116.9 million. The first stage of the Kattara project will

[4] Federation of Egyptian Industries, (Cairo, Egypt). 1975 Yearbook, p. 14.

set up a power station with a capacity of 600 megawatts by 1985.

Foreign assistance to Egypt totaled about $2 billion in 1975. Saudi Arabia led with $600 million, followed by Kuwait with $500 million, and the United States with $350 million. The rest came from the United Arab Emirates, Iraq, Iran, West Germany, France, Bulgaria, Romania, Yugoslavia, and the U.S.S.R. Studies were being conducted on a number of planned foreign-capital joint ventures, including: A sponge iron project at Alexandria with initial costs estimated at $200 million and involved Japanese, Brazilian, and West German participation; an iron ore project estimated at $102 million; and a number of petroleum projects estimated at about $2 billion. About 20 petroleum agreements were concluded with foreign companies. Construction of the Suez-Mediterranean (SUMED) pipeline, financed 50% by Arab capital, was started. West Germany was assisting on the $134 million Abu Qir ammonia-urea fertilizer project, which started construction in 1975, and was to undertake studies leading to the development of the Kattara depression electrical scheme. Iran was installing a plant for the manufacture of phosphatic fertilizers, utilizing sulfur from Iran and phosphates from Egypt; establishing a petrochemical and plastics plant (with productive capacity of about 8,000 tons and 50,000 tons per year, respectively); and taking part in an international project for the establishment of the Suez-Port Said pipeline. The U.S.S.R. agreed to expand the annual production capacity of the aluminum complex from 100,000 to 166,000 tons, to establish a new cement factory in Assiut, to expand the National Cement Co., to undertake a new cement project with a capacity of 1 million tons per year, and to assist in the exploitation of the Abu Tartur phosphates. The U.S.S.R. was also to undertake necessary studies for expanding the Helwan iron and steel complex, for establishing a new iron and steel complex at Alexandria with a 3-million-ton-per-year capacity, and for installing a nuclear powerplant. A Yugoslavian loan for $80 million was made to Egypt for the construction of new cement plants in 1975. Romania was to assist with development of the Cairo petrochemicals complex, doubling the production of the Misr sodium carbonates factory, and construction of the Hamrawayan phosphate complex. Bulgaria was to cooperate with ferromanganese, ferrochrome, calcium carbide, and silicon carbide projects. The World Bank made a loan to extend the Torah cement plant and agreed to lend $35 million in 1976 to finance new railways and establish a railway maintenance center following a similar loan for $55 million made in 1975. Between 1974 and 1976, the Kuwait Fund for Arab Economic Development (KFAED) assisted with the Talkha fertilizer plant, the Torah cement plant, and the Cairo water supply. France will assist in the development of coke plants and in improving the electrical capacity at Abu Qir. On December 14, 1975, Compagnie Electromecanique (CEM) signed a contract for raising the Abu Qir capacity to 600,000 kilowatts by adding two groups of turbo-alternators of 150,000 kilowatts each. The financing was to be credits accorded by France. The first stage of the Abu Qir project was financed by the African Development Bank and the KFAED. The United States was assisting in Suez Canal reconstruction, and was considering nuclear plant development. The Alexandria Port Authority secured a $95 million loan for development of the port from the International Bank for Reconstruction and Development (IBRD), Japan, and the United States. The Egyptian Government allocated $614 million for renovation and expansion of Port Said, scheduled to start in February 1976. Port capacity was to increase to 3 million tons by 1979. Tenders were invited for phase 2 of the Suez Canal improvement program, which will allow tankers up to 150,000 deadweight tons to pass through fully loaded at yearend 1978. Egypt was planning to construct 10 nuclear power stations in the next 20 years to cope with increasing industry demands for energy. The first station at Sidi Keir was to have a capacity of 600 to 800 megawatts. Tenders were submitted by Westinghouse Corp. and General Electric Co.

The United Nations Development Program (UNDP) supported a mineral survey of the massive sulfides and nickel-copper mineralization in the ophiolitic belt of the Aswan area in southern Egypt, which was to be completed in mid-1976 at a cost of $1.3 million. The United Nations was assisting in several field missions, including geochemical exploration for zinc, lead, and copper deposits at Um Smiuky and the Khadda Hill areas; and exploration for manganese, lead, and sulfur along the Red Sea coast sites at Akarem and Um Smiuky. A new UNDP project for mineral exploration along the Red Sea coast was under consideration. The Egyptian General Organization for Geological Researches and Mining Projects (GOGRM) started a new field season running throughout 1974 and 1975 with 10 mapping, geological, and general exploration surveys. This included work on the Barramia gold mine, the iron ores at Um Smiuky, copper ore at Khadda Hill, and limestone located west of Alexandria. Three field projects for geologic exploration were done by Soviet technicians and the GOGRM, including exploration of the Safagua area, the Jabal al Sebaei area, the Barramia gold area, and Assel Hill iron ore deposits.

PRODUCTION AND TRADE

Mineral commodity production, excluding petroleum refinery products, in 1975 increased in value to an estimated $1,169 million, compared with an estimated $768 million for 1974. The value of mineral production in 1975 constituted about 12% of the GNP, compared with about 9% in 1974. Petroleum refinery production was valued at $632 million in 1975, with an input of about 57.5 million barrels of crude oil. Output of crude oil increased 57% to 84.3 million barrels in 1975, primarily because of the return of the Sinai oilfields. Other mineral industry production increases included crude steel (32%), cement (8.8%), marine salt (3.0%), iron ore (8.6%), talc (31%), and asbestos (69%). Production decreases for 1975 occurred for gypsum (2%), phosphate rock (20%), and manganese (27%) compared with 1974. Primary aluminum production in 1975 was 5,000 tons; this was the first significant production since the Naj Hammadi plant came into operation in late 1974. Figures on the quantity of minerals produced are shown in table 1.

Oil exports in 1975 were valued at $310 million and went mainly to the U.S.S.R., Bulgaria, East Germany, Yugoslavia, Brazil, Romania, and Turkey. Distillate fuel oil was exported to Sweden, Switzerland, and Italy. Petroleum was imported from Saudi Arabia, Iran, Iraq, the Netherlands, and the U.S.S.R. Refined petroleum was imported from the United Kingdom, United States, Netherlands, West Germany, and Yugoslavia. An estimated 141,600 tons of phosphate rock was exported in 1975, up from the 120,260 tons exported in 1974. North Korea was a significant importer of Egyptian phosphate rock. The United Kingdom imported 2,000 tons, and was the first market economy country to import phosphate rock from Egypt in recent years. Exports of phosphate to China also increased in the first half of 1975. Egyptian exports to East European countries were 67% of total exports and imports from East European countries were 15%. More than 60% of the 1975 imports came from western countries, and Japan. Imports from the United States nearly doubled to $768 million in 1975. The U.S.S.R. remained the biggest trading partner in 1975. Egypt and the U.S.S.R. signed a 1975 trade protocol for $851 million and for 1976, $650 million in two-way trade was scheduled. Egypt was to import coal and petroleum products and the Soviets were to receive petroleum and agricultural products. In 1975, Egypt also signed trade agreements with Iraq, Poland (from which it was to import 250,000 tons of coke plus fertilizers and sulfur), North Korea, the United States, France, Japan, and Kuwait. In a trade agreement signed with India, India was to supply coal, iron products, and other metals, and Egypt was to export crude oil to India.

The latest available trade data were published in the 1974 edition of this chapter.

Table 1.—Egypt: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity [1]	1973	1974	1975 [p]

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] Egypt produces some sodium carbonate but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2] Includes vermiculite.

[3] Production reported as 253,621 metric tons instead of in cubic meters.

[4] 1973 production includes quantity valued at $316,986 and excludes quantity valued at $72,823; 1974 production includes quantity valued at $310,191 and excludes quantity valued at $48,166.

[5] Production reported as 36,086 square meters instead of in cubic meters.

COMMODITY REVIEW

METALS

Aluminum.—The first phase of the Naj Hammadi aluminum plant came into operation in the fourth quarter of 1974. Plant capacity was expected to reach 100,000 tons per year by late 1976, and to reach full capacity of 170,000 tons per year by 1977. This $140 million project, built with Soviet aid, used imported alumina from Guinea and the U.S.S.R. The plant was owned 100% by Egypt and uses hydropower from the Aswan Dam. About 30% of 1975 production was allocated for export and that went to the U.S.S.R.

Iron and Steel.—The Helwan steel complex was enlarged in 1974 and 1975 with the addition of two blast furnaces, making a total of four increasing the production capacity to 1.5 million tons of steel per year. Production of 1.75 million tons per year is forecast eventually with about 250,000 tons earmarked for export. The plant presently produces 500,000 tons of products. The two new furnaces require less coking coal (700,000 tons of coal to produce 1.5 million tons of steel) than the two older furnaces, which consume coking coal at the rate of 1.3 million tons to produce 1 million tons of steel. The iron and steel complex also uses 1.5 billion kilowatt-hours of electricity, approximately 15% of the Aswan High Dam output. Iron ore reserves at Bahareza Oasis of the Western Desert, where mining began in 1973, were estimated at 195 million tons averaging 54% iron and 3% SiO_2. Iron ore was transported 350 kilometers by rail to the Helwan complex.

The Helwan steel plant was plagued by a number of problems[5] that have kept production at little more than half capacity. It cost more in foreign exchange to keep the plant operating than it gained in export sales. Among problems encountered were: The unusually high salt content of Egyptian iron ore, which corroded the machinery; personnel and management problems; improper use of equipment; and maintenance and supply problems. Efforts were being made to solve these problems through a United Nations Industrial Development Organization 2-year study, costing $835,575, and being carried out by a U.S. steel engineering consultant team.

Lead and Zinc.—The Mines and Quarries Design Bureau was studying a project for exploitation of lead and zinc in the Om Feig area in the Eastern Desert, north of Mersa Allam, where reserves were estimated to be 1.5 million tons of an unspecified grade.

Tin.—On February 5, 1975, the Mines and Quarries Design Bureau announced completion of a study project on extracting tin from the Al 'Algala area in the Eastern Desert, where reserves were estimated at 500,000 tons (unspecified grade).

Titanium.—Some interest was shown in ilmenite ores, estimated at 4 million tons, in the black sands at various points along the Mediterranean coast and at Abu Ghalga, about 30 kilometers from the Red Sea.

Uranium.—In November 1975, an accord was signed with the United Kingdom to exploit the uraniferous black sands and phosphates of Abu Tartur. Uranium was identified in black sands of the Nile River delta and along the Mediterranean coast. Monazite, was the major uranium-bearing mineral in these sands, and reportedly assayed up to 5% uranium. About 26,000 tons of uranium was estimated available from this source. The Abu Tartur phosphate deposits were estimated to contain about 100,000 tons of uranium. West German companies and the Egyptian Nuclear Energy Authority were expected to reach an agreement on uranium exploitation in 1976. Feasibility studies for uranium extraction and funds for exploration were being sought.

NONMETALS

Barite.—A bulk head sample of about 100 kilograms of barite ore from the Gebel El Hudi deposits in the Eastern Desert was tested, with the conclusions that the ores can be successfully dressed under certain conditions.[6] Three products were obtained through treatment in two stages: (1) crushing, grinding, and attrition scrubbing; and (2) concentration with hydroclassification

[5] The Washington Post (Washington, D.C.). Egypt's Large Steel plant is Economic Embarrassment. Oct. 11, 1976, p. A–19.

[6] Mining Magazine (London). Beneficiation of Barite Ore From Gebel El Hudi Eastern Desert, Egypt. March 1976, p. 193.

and gravity concentration by a shaking table. High-grade barite concentrate in the final product consisted of about 66.04% barite by weight, with 59.88% BaO, 1.04% SiO_2, 0.004% PbO, and 0.15% Fe_2O_3. Galena and pyrite concentrate amounted to about 2.53%. A barite slimes fraction formed about 11.25%. These slimes can be added to the high-grade barite, but will lower the grade from 59.88% to 59.40% BaO. Chemical analysis of the crushed head sample, representing all varieties of barite, showed 48.91% BaO, 12.49% SiO_2, 27.73% SO_3, and 0.94% PbO.

Cement.—In 1975, four companies manufactured cement—Egyptian Portland Cement Co. at Torah, Portland Cement Co. at Helwan, Alexandria Portland Cement Co. and the National Cement Co., both at Assiut. Cement was marketed both locally and abroad by the Egyptian Cement Office. It was planned to increase annual production capacity of the cement plants to 6 million tons, to meet domestic market requirements. The 1975 production was about 3.6 million tons. Four new cement factories were planned with a total capacity of 3.2 million tons per year. Aided by Kuwait, a 1-million-ton capacity cement plant was under construction in Red Sea Province. The Suez Cement Co., a private, joint-stock company incorporated in Egypt, was planning to build a 1-million-ton-per-year cement plant near Suez City. The U.S.S.R. was financing modernization of the Assiut cement factory. The World Bank lent $40 million to extend the Egyptian Portland Cement Co.'s plant at Torah, increasing capacity to 700,000 tons per year. The extension was to cost $93 million. The KFAED was to provide $23 million in the Torah project.

Gypsum.—A new deposit of gypsum was found 50 kilometers south of El Hamman on the northwestern coast of Egypt. About 550,000 tons of gypsum was mined at El Ballah.

Phosphates.—In an economic and technical agreement signed with Romania, Egypt was to receive help for accelerating development of the phosphate mine at Hamrawayn. The new underground mine was expected to be fully operational in 1976; it was a $200 million joint venture planned to yield 600,000 tons per year of marketable phosphate rock from an annual mine output of about 1.3 million tons. One million tons was to be exported to Romania as repayment. Proven ore was estimated at 38.5 million tons, 60% of which was below water level. The project was to employ 2,250 workers.

Protocols were being signed for the sale of at least 60% of anticipated production from the remote Abu Tartur deposits. It was estimated that the phosphate could be railed to the Red Sea for about $12.00 per ton, f.o.b. Development of Abu Tartur was to begin after financing was settled and a consultant for the joint venture operation was selected. Plans call for construction of a 500,000-ton-per-year pilot operation with 1980 as the target date. Mine facilities will process 10 million tons per year of ore to produce 7 million tons per year concentrated product. The phosphate deposit consists of a single, nearly horizontal, phosphorite bed that is nearly uniform in thickness and composition. The average thickness is 4 to 4.5 meters, with 170 to 288 meters overburden. A composite ore sample indicated 25% P_2O_5. Reserves were estimated at 1 billion tons and further exploration was expected to confirm much larger reserves. Beneficiation ore tests were conducted by the U.S.S.R. A 33.5% P_2O_5 concentrate was obtained at a recovery rate of 72.5%. Infrastructure costs, including a 520-kilometer railway to the Red Sea, a shipping port, and power transmission lines, were expected to approach $1 billion.

Salt and Soda.—Using nearby salt and limestone, the first heavy chemicals and caustic soda manufacturing plant started production in 1959 under the name of Misr Chemical Manufacturing Co., and was the first of its kind in the Middle East and Africa. The country's consumption of caustic soda amounted to 75,000 tons in 1975. The annual consumption of sodium carbonate and sodium bicarbonate, both of which were imported, was 45,000 tons and 5,000 tons, respectively. The plant uses the Solvay chemical method. Misr Chemical proposed a sodium silicate unit to be established within the 1975–80 plan period, and affiliated with the sodium carbonate factory. Doubling the sodium carbonate factory capacity was also proposed. A new plant, which went into production at the end of January 1975, was estimated to have a capacity of 100,000 tons of crude sodium carbonate, which can be processed into 45,000 tons of caustic soda, 5,000 tons of sodium bicarbonate, and 32,000 tons of heavy sodium carbonate per year. The new plant employed 100 technicians and cost about $36 million to build. Krebs, an independent French engineering and contracting firm was considering a project to expand the Alexandria soda ash plant.

Stone.—*Building Stone.*—The Egyptian Authority for Investments approved the establishment of a new company that was to fabricate products from granite and alabaster; Egypt, Kuwait, and Switzerland were the major investors. Construction of the plant was to begin in 1977. A factory for making silico-limestone bricks was being constructed with aid from West Germany. Geologic research was being done along the Suez Canal area to identify size of reserves and the best exploitation areas for sand, gravel, and limestone. New areas for mining alabaster blocks were delineated east of Assiut. Since 1973, the demand for granite quarrying licenses at Aswan has increased, as have licenses for sand, gravel, and limestone in other areas.

MINERAL FUELS

Coal.—Coke output from the Coke and Basic Chemicals factory increased 61.3% in 1974 to 500,000 tons, a result of operation of the third blast furnace at Helwan. A third coke line was to start production in 1976, raising the yearly production to 700,000 tons of coking coal and providing employment for 1,500 workers. Small coal deposits were located in the Sinai Peninsula, in the Maghara region near the northern coast, and at Kharga and Bahariya Oasis, but if mined, these would not be sufficient to supply coking coal requirements for the Helwan iron and steel industry. All coal needs were imported.

Natural Gas.—Abu Gharadia natural gasfield in the Western Desert was expected to be available for commercial use in 1976. A pipeline connecting the field to production plants was under construction. The gasfield was to produce 105.6 million cubic feet of gas per day and was to be used in cement, steel, and fertilizer plants at Helwan.

The Abu Madi gasfield, which was to supply feedstock for the Talkha fertilizer plant, was inaugurated on February 25, 1975.[7] In early March 1975, Abu Madi began production at a capacity of 3.5 million cubic feet of gas per day, and was expected to reach full capacity within a few months. The gas was to be conveyed by pipeline to the fertilizer plant for production of ammonium nitrate and urea fertilizer. The gasfield was also to serve the Mahallat al-Kuba industrial area. The Talkha plant was under construction and scheduled for completion by 1978, when it will produce 1,200 tons per day of ammonia and 1,700 tons per day of urea.

Work had started on laying pipelines from the Abu Qir offshore gas wells to serve the proposed chemical fertilizer plant and existing factories at Abu Qir, as well as to serve the growing industrial complex at Kafr Al Dawar, 24 kilometers to the south. The gasfield was to produce about 3 million cubic meters per day, and the pipeline was to be completed by yearend 1977. The pipeline was to cost about $125 million. The Abu Qir fertilizer plant was to produce 1,200 tons per day of ammonia and urea, as well as 500 tons per day of phosphoric acid from its phosphate unit.

Petroleum.—*Exploration.*—Egypt had finalized some 30 exploration agreements by May 31, 1975, and the Egyptian General Petroleum Corporation (EGPC) was forecasting gas and oil exploration expenditures of about $75 million per year over the next 10 years. The increase in exploration interest was a result of the more liberal policy adopted in the last 2 years which was based on production sharing agreements. Under the terms of these agreements, the foreign operating company must make minimum expenditures on prospecting during an initial period, which may be as much as 6 to 8 years and when oil is found, must undertake a 20- to 30-year production period. The company is then allowed to recover its actual expenses from production proceeds and a joint stock company is formed with EGPC. In nonproductive areas, concession areas are leased in 500-square-kilometer blocks; in productive areas, the leased blocks are 36 square kilometers each. Exploration agreements concluded between EGPC and foreign oil companies as of February 29, 1976[8] are shown on table 2.

Oil exploration areas are divided into six general regions, each described on the following page in order of importance.

---

[7] U.S. Embassy, Alexandria, Egypt. State Department Airgram A-64, Apr. 23, 1975, 9 p.

[8] U.S. Embassy, Alexandria, Egypt. State Department Airgram A-019, Mar. 17, 1976, 21 p.

1. Gulf of Suez: An extensively explored area of 20,000 square kilometers, extending from Suez down to latitude 30° N at Ghurdaga on the Red Sea coast. Nineteen fields have been discovered with proven reserves of 2.4 billion barrels of oil. Companies with petroleum concession agreements in this region included Transworld International, American Oil Co. International (AMOCO), Deminex (West Germany), Chevron Oil Corp., Shell International Petroleum Co., Ltd., British Petroleum (BP), the General Petroleum Co. (GPC), Compagnie Orientale des Petroles d'Egypt (COPE), Egyptian Petroleum Development Co. (Epedeco) (Japanese consortium), Gulf of Suez Petroleum Co. (GUPCO), International Egyptian Oil Co. (I.E.O.C.), a subsidiary of Ente Nazionale Idrocarburi (ENI), Mobil Oil Co., and Texaco.

2. Red Sea: Extends from Ghurdaga to the Sudan border and covers approximately 25,000 square kilometers. Only a few exploratory wells have been drilled. Seismic work has been done and more drilling was anticipated. Companies with exploration permits included: Union Oil Co., Phillips Petroleum Co., Hispanoil, and Exxon Corp.

3. Western Desert: Extends from latitude 25° N to the Mediterranean and from the Libya border to the Nile Delta. Five commercial discoveries have been made, including El-Alamein, Yidma, Abu Gharadiq, El-Rassak, and Site WD–33. Proven reserves were 190 million barrels of oil and 2,119 million cubic feet of gas at Abu Gharadiq. Companies holding petroleum concession permits included Chevron Oil Co., Atlantic Richfield Co. (ARCO), Mobil, Petroswede Oljeprospektering AB (Petroswede), Faiyum Petroleum Co. (FAPCO), Pexamin Pacific, Inc., Nile Valley Petroleum Co. (NIPCO), Shell Oil Co., Blaspetro, LVO Corp. of the United States, AMOCO, and Phillips Petroleum Co.

4. Nile Delta: This is an area of 36,000 square kilometers north of Cairo that includes an offshore zone. Twenty-two wells have resulted in four gas strikes at Abu Qir, Abu Madi, El-Wasaani, and the noncommercial Boseli strike. Companies holding petroleum and gas concession permits included Continental Oil Co. (CONOCO), I.E.O.C. Exxon, Mobil, Elf-Aquitaine, ERAP, ENI, AGIP S.p.A., and Marathon Petroleum Egypt Ltd.

5. Nile Basin: This is an area of 10,000 square kilometers extending from latitude 24° N to Cairo where four exploratory wells have been drilled with no finds. Companies holding exploration permits included NIPCO, Transworld International, Santa Fe International, and Blaspetro.

6. North Sinai Peninsula: This area covers 40,000 square kilometers including an offshore zone. Six exploratory wells have been drilled with no finds. Companies with interests in petroleum concessions included Mobil and ENI. Under the second-stage disengagement agreement concluded with Egypt in 1975, the Israelis returned several Sinai oilfields to Egypt. An Israeli rig was drilling in southern Sinai at El Tor near the Egyptian El Morgan oilfield in the Gulf of Suez. This drilling was part of an intensive search for oil that Israel was conducting as a result of its agreement to return the Sinai oilfields. Government-controlled concerns were also drilling in northeastern Sinai.

During 1975, Epedeco, a Japanese consortium led by North Sumatra Oil Development Corp. and Japan Petroleum Drilling Co. initialled a production sharing agreement on 527 square kilometers west of Bakr Field in the Gulf of Suez area. Final agreements were also signed with the Elf-ERAP-Aquitaine group of France. ELF's production sharing with EGPC would be 70% to 85% for EGPC after development and exploration costs were recovered from 40% of annual production. Marathon Oil was taking a 25% share in 13,000 square kilometers of the Nile Delta area with CONOCO (25%) and ENI (50%). Marathon was also holding an equal share with the same companies farther south in a 8,500-square-kilometer area. AMOCO received permission to explore in the Suez Canal areas covered by original agreements, but which were not accessible before 1973, in exchange for changes in production sharing agreements. Three new finds were made in the Gulf of Suez area. Two of the discoveries were made by AMOCO (a subsidiary of Standard Oil of Indiana). The first strike made by AMOCO was located 7 miles west of the Gulf of Suez at 11,177 feet. Preliminary tests indicated 3,676 barrels of crude per day. The company was to drill six wells in the concession. Another AMOCO strike was made 2 miles north of Ras Shukair on the Red Sea at 6,360 feet,

Table 2.—Egypt: Exploration agreements finalized between EGPC and foreign companies

Company	Date of agreement	Acreage (square kilometers)	Signature (S) and production (P) bonuses (million dollars)		Exploration commitments (million dollars)	Production sharing (percent)

and yielded 2,660 barrels per day of crude. A third strike, made by Deminex of West Germany on the Gulf of Suez, yielded 3,700 barrels per day and was expected to yield more when in full production.

Production.—On February 18, 1975, the Ramadan oilfield in the Gulf of Suez was inaugurated. Production in the field started in January with the first well testing out at 26,000 barrels per day. The petroleum-bearing formation is 1,427 feet thick. Eight new wells were drilled in 1975, and were expected to yield 100,000 barrels per day by yearend, and 200,000 barrels per day after full development. Crude oil from 1 acre was estimated at 286,000 barrels, compared with 279,000 barrels from Morgan Field, and 254,000 barrels from the July Field. Renewed production along the Red Sea, return of the Sinai oilfields, and recently reported finds supported the Government estimate of a more than twofold production increase in 1976 over 1975. AMOCO signed new production sharing terms covering the July, Morgan, and Ramadan operations, allowing AMOCO to recover costs from up to 40% of the production and to divide the rest in the proportion of 83% to Egypt and 17% to AMOCO for 2 years, with an 85%–15% split thereafter. Three oilfields in the Ras Sudr area of the Sinai were transferred to Egyptian management on October 10. American engineers of Mobil, which have an interest in fields owned by EGPC were operating some of the wells. ENI was operating 86 wells in the Abu Rudeis Field. Oilfields returned included Abu Rudeis, Belayim onshore and offshore, Sidri, Feiran, and Ekma, which are about 150 kilometers south of Suez and were operated in 1967 by Compagnie des Petroles d'Egypte, a 50–50 joint venture between ENI and EGPC; and the Asl, Matarma, and Sudr Fields which are about 40 kilometers south of Suez and were owned by EGPC.

Refining, and Petrochemicals.—Fertilizer-oriented petrochemical projects were materializing faster than base materials and plastics. Egypt was encountering financing problems for its petrochemical development. Initial plans called for a $1 billion, seven-unit olefins complex together with a $150 million aromatics complex. The first phase of the petrochemical complex was to consist of units producing 100,000 tons per year of low-density polyethylene, 30,000 tons per year of high-density polyethylene, and 60,000 tons per year of polyvinyl chloride. The $250 million complex was to be situated at either Suez or Alexandria. The Agency for International Development (AID) was to fund the paraxylene-DMT project, costing $40 million. A new petroleum refinery was planned for Alexandria in conjunction with a petrochemical complex using the natural gas of Abu Qir. A factory for butane bottles was constructed at Dahshour, starting service in 1976, and using gas from the Abu Gharadiq deposit. Petroleum refining capacity was about 250,000 barrels per day in 1975. Egypt produced about 30% to 40% of its lube oil needs. To serve the expanded Mustrurud and Suez refineries, EGPC was to build a pipeline from Ras Shukair to Cairo and Suez. The pipeline project was only in the design stage.

The Mineral Industry of Finland

By Joseph B. Huvos [1]

Having no energy sources other than some hydroelectric power, wood, and peat, Finland remained a modest producer of mineral commodities by world standards in 1975. The most important mineral products were as follows, with approximate percentages of world production: Vanadium, 5.9%; cobalt metal refined, 3.9%; nickel, 0.6%; and copper, 0.5%. Production of other mineral commodities important only to the national economy were iron and steel, asbestos, cement, feldspar, mixed fertilizer, talc, wollastonite, and zinc. The country's gross national product (GNP) was $26.3 billion,[2] of which industry contributed $12.1 billion. The value of production in million U.S. dollars and approximate employment figures in thousands in the principal sectors of the mineral industry in 1975 are shown in the following tabulation:

Sector	Value (millions) p	Employment (thousands)
Mining and quarrying	$162	6
Base metal production	650	16
Nonmetallic mineral processing	425	21
Chemical industry [1]	1,245	35

p Preliminary.
[1] Includes petroleum and asphalt industry.
Source: Central Statistical Office of Finland, Helsinki; Bulletin of Statistics, No. 3, 1976, p. 8; and Statistical Yearbook of Finland, 1973.

Mineral industry sales were affected to various degrees by the 1975 international recession, higher oil prices, and slackening demand in western buyer countries. The mineral processing sector was the most strongly affected; however, production at mines increased slightly, and stocks at mines also increased.

Finland's small mineral exports of metals and nonmetallic minerals went mainly to Western Europe. Principal mineral commodities imported were crude oil and petroleum products from the U.S.S.R., the Middle East, Venezuela, and the Common Market countries. Coal and coke came from the U.S.S.R., Poland, and Western Europe; phosphate, mainly from the U.S.S.R.; sulfur from France, Poland, and the United States; iron ore, mainly from Sweden and Norway; and scrap iron from the U.S.S.R. and Western Europe.

Significant developments in Finland's mineral industry in 1975 included commissioning of an iron ore mine and a blast furnace; and completion of additional capacity at a sulfuric acid plant and at two oil refineries. In addition, development continued at a chromium and an iron-vanadium mine, and construction continued at a stainless steel plant.

Rautauruukki Oy decided to proceed with development of the Savukoski phosphate deposits at Sokli, northeastern Lapland, and Kemira Oy started a feasibility study of a similar project located at Siilinjärvi, Kuopio Province. Finally, the Finnish Government allocated $23 million for fuel research, with the emphasis on peat utilization.

[2] Where necessary, values in Finland marks (Fmk) were converted to U.S. dollars at the rate of Fmk3.6867=US$1.00 for 1975 and Fmk3.774=US$1.00 for 1974. Gross National Product reported in Kansallis-Osake-Pankki Economic Review (Helsinki), No. 1, 1976, p. 33.

PRODUCTION

Finland's mineral industry is modest by world standards, but it is advanced and well integrated. Volume indices for production in the principal sectors of the mineral industry and for all industry are shown in the following tabulation:

Sector	1970=100	
	1974 [r]	1975 [p]
Mining and quarrying	97	110
Nonmetallic mineral processing	144	125
Basic metals industry	139	133
Chemical industry	160	154
Petroleum refining [1]	107	96
Electric, gas, and water industry	133	130
All industry	129	121

[p] Preliminary. [r] Revised.

TRADE

There was no significant change in the pattern of Finland's foreign trade. The country had a trade deficit of $2.1 billion or 8% of the gross national product in 1975.[8]

The principal mineral commodities, exported mostly to Western Europe, were iron and steel, cobalt, copper, nickel, vanadium, zinc, asbestos, feldspar, and talc. Mineral commodity imports were valued at about two-thirds and fuels about 6% of all imports of the country. Fuels were supplied mostly by the U.S.S.R. and Poland. Finland's mineral commodity trade in 1973 and 1974 is shown in tables 2 and 3.

COMMODITY REVIEW

METALS

In 1975, Finland had 13 metal mines. Of these, Outokumpu Oy operated nine; Rautaruukki Oy, three; and Myllykosky Oy, one. Products extracted from various metal concentrates included copper, zinc, nickel, sulfur, iron, cobalt, precious metals, selenium, cadmium, lead, and vanadium.

Chromium.—In 1975, preparation continued to shift chromite production to Outokumpu Oy's Viianlahti-Viiaranta ore body located at Kemi, at the northern end of the Gulf of Bothnia. Actual mining continued at the 14.5-million-ton[4] Elijärvi deposit, to be depleted by 1977. Part of the chromium ore produced was processed into ferrochromium at the nearby 50,000-ton-per-year Tornio ferrochrome works operated also by Outokumpu Oy; the remainder was exported.

Cobalt.—No major changes occurred in cobalt operations in 1975. Cobaltiferous pyrites with about 0.7% cobalt from Vuonos and Keretti mines near the locality of Outokumpu, were processed at Outokumpu Oy's Kokkola plant on the Gulf of Bothnia.

Copper and Nickel.—There were no outstanding changes in copper and nickel operations in 1975. Mining continued for nickel at Outokumpu's Keretti, Viaalanti, and Virtasalmi mines in the west-central part of Finland and for copper at the Hitura, Kotalahti, and Vuonos mines and Myllykosky's Kaavi mine in the same area. Concentrates were smelted mostly at Outokumpu's Harjavalta plant on the west coast, and electrolytically refined at the nearby Pori refinery.

Iron Ore.—In 1975, major events included commissioning of Rautaruukki Oy's Rautavaara mine located in Finnish Lapland. Another plant to produce iron ore pellets as a byproduct of vanadium ore processing at Rautaruukki Oy's Mustavaara mine was scheduled for commissioning in 1976. In addition, during 1975, Rautaruukki Oy continued to operate two iron ore mines, one at Otanmäki in central Finland, the other at Raajärvi in Finnish Lapland.

Iron and Steel.—In September 1975, Rautaruukki Oy's 1,033-cubic-meter No. 2 blast furnace, built by the U.S.S.R. at Raahe, was lit. Hot-metal capacity at the furnace is 850,000 tons per year, and is to raise the plant's total output to 1.6 million tons per year by late 1976. The furnace is part of an expansion program, which also included extensions of the steelmaking and rolling facilities due to start up in 1976.[5]

About half of Finland's pig iron and steel continued to be produced by Rautaruukki Oy's Raahe integrated steel plant near the northern end of the Gulf of Bothnia; the rest of the country's steel was produced by plants of the Ovako Group located at Immatra on the U.S.S.R. border, and at Turku and Koverhar at the southern end of the west coast.

Work continued also on Outokumpu Oy's stainless steel plant at Tornio, at the northern end of the Gulf of Bothnia, to become operational in July 1976.

Lead and Zinc.—Zinc ores continued to be mined at Outokumpu's Vuonos, Pyhasalmi, Hammaslahti, Vihanti, and Myllykoski Oy's Luikonlahti mines with some lead produced also at Vihanti. Zinc con-

[4] Outokumpu News (Helsinki). Proved Reserves. V. 12, No. 2, 1975, p. 10.
[5] Metal Bulletin (London). No. 6030. Oct. 7, 1975, p. 32.

centrates were processed at Outokumpu's 95,000-ton-per-year Kokkola electrolytic refinery on the west coast; lead concentrates were exported.

Titanium.—Finland's only source of ilmenite remained at the Otanmäki mine in the north, where a concentrate was produced as a byproduct of iron ore concentration. The concentrate was sold to Kemira Oy for processing into TiO_2 pigments at the company's Mantyluoto plant situated on the southwest coast.

Vanadium.—In 1975, Rautaruukki Oy continued construction of the Mustavaara iron-vanadium mine located in Taivalkoski parish. After startup in 1976, the mine is expected to provide an ore yielding about 3,000 tons of vanadium pentoxide and 200,000 tons of pelletized iron ore concentrate. Production of vanadium ore and vanadium pentoxide continued at Rautaruukki's Otanmäki mine in the central part of the country.

NONMETALS

Construction materials, asbestos, feldspar, mixed fertilizers, pyrites, quartz, sulfur, talc, and wollastonite were the principal products of Finland's small but advanced nonmetals industry in 1975.

Asbestos.—The country's entire anthophyllite asbestos production continued to come from Paraisten Kalkki Oy's Paakkila open pit mine located between Kuopio and Joensuu in eastern Finland. Most of the production was exported, mainly to the United States and West Europe.

Fertilizer Materials.—In 1975, Government-owned Rautaruukki Oy decided to start to develop the Savukoski, Sokli (Northeast Lapland) phosphate deposit, with plans to produce 100,000 tons of apatite concentrate per year by the end of this decade. Also in 1975, Kemira Oy was planning to develop a phosphate deposit near its fertilizer plant in Siilinjärvi, Kuopio Province. Mining of a trial quantity of 100,000 tons of ore and construction of a 10-ton-per-day pilot plant has started. Final decision for commercial operation by 1978 was expected in 1976. In 1975, phosphates imported mostly from the U.S.S.R. and North Africa continued to be processed at the Siilinjärvi fertilizer plant.

Finland's only nitrogen fertilizer producer, the State-owned Kemira Oy, continued production of ammonia and related products at its Oulu plant located on the Gulf of Bothnia. Potash was imported from France and West Germany.

Pyrite and Sulfur.—Finland's only sulfuric acid producer, Kemira Oy, completed expansion of the capacity of its Kokkola plant on the Gulf of Bothnia, from 607,000 tons to 937,000 tons per year of sulfuric acid in 1975.[6] The company continued the expansion of its Harjavalta plant in southeast Finland from 250,000 tons to 420,000 tons per year. Sulfur production continued at Outukumpu Oy's Kokkola west coast pyrite smelter in 1975. Synthetic iron oxide, electric energy, and SO_2 gas (sold to Kemira Oy for sulfuric acid) were byproducts of the oil-fueled process.

MINERAL FUELS

Hydroelectric power, industrial fuel wood, and some peat, the only primary energy sources domestically produced, supplied about one-sixth of Finland's energy requirements in 1975. The remainder was imported crude oil and petroleum products, natural gas, coal, and coke. Table 4 shows supply and apparent consumption of energy for 1974 and 1975.

Coal and Coke.—Finland's consumption of imported coal and coke, mainly from Poland, was as follows, in thousand tons:

Consuming sector	1974	1975
Coal:		
Electric power generation	1,785	1,758
Paper and wood industry	578	379
Other industries	545	535
Space heating	135	77
Locomotive fuel	14	4
Total	3,057	2,753
Coke:		
Metal reduction	888	837
Other	15	3
Total	903	840

Imports	24.8	4.6	19.3	.9	--	(3)
Exports	.2	--	.2	(3)	--	(3)
Apparent consumption	28.2	4.6	19.1	.9	2.1	1.5

[e] Estimate.
[1] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories.
[2] Includes only primary energy.
[3] Less than ½ unit.

Source: Foreign Trade, Monthly Bulletin, December 1975, and Bulletin of Statistics, No. 3, 1976, Central Statistics Office of Finland, Helsinki, 1976.

Peat.—The Government of Finland encourages production of peat as fuel for generating power to decrease the country's dependence on energy imports. In addition to $157,000 for basic research in the utilization of peat, the Government has allocated in its 1976 budget $23 million for a state fuel center (VAPO) that will use peat as its main source of energy,[7] in addition to conducting research on methods of using peat.

Petroleum and Natural Gas.—Expansion of State-owned Neste Oy's two refineries was completed in 1975; aggregate capacity of the Porvoo refinery located 50 kilometers east of Helsinki and the Naantali refinery on the west coast was increased from 9.3 million to 15 million tons per year.

Finland continued to import all crude oil and petroleum products, including about two-thirds of all crude oil and all natural gas from the U.S.S.R. by pipeline. Oil and gas imports continued to contribute to the country's trade deficit in 1975.

Finland's consumption of petroleum products in 1974 and 1975 was as follows, in thousand tons:

Refinery product	1974	1975
Aviation fuel	172	180
Gasoline	1,180	1,200
Kerosine	15	20
Gas and diesel oil	4,045	4,200
Residual fuel oil	4,552	5,100
Other	723	730
Total	10,687	11,430

Source: Organization for Economic Cooperation and Development (OCED), Paris. Provisional Oil Statistics by Quarter. Fourth Quarter 1975 and 1976, pp. 16–21.

Hydroelectric and Nuclear Power.—Construction of four nuclear powerplants with 1.5 million kilowatts total capacity was continued by the State-owned Imatran Voima Osakeyhito (IVO) and the Finnish Industrial Power Co., Teollisuuden Voima Oy (TVO). TVO has contracts with Atomenergi, A.B., Stockholm, for two 660,000-kilowatt nuclear powerplants at Olkiluoto on the west coast. The U.S.S.R. is to deliver to IVO two units of 440,000 kilowatts each at Lovisa, 20 kilometers west of Kotka.

Finland's almost fully developed hydroelectric resources of about 7 million kilowatts continued to supply about one-sixteenth of the country's energy.

The Mineral Industry of France

By Roman V. Sondermayer [1]

Producing modest quantities of minerals and having sizable imports, France remained among the largest processors of crude minerals in Europe during 1975. However, activities of the mineral industry were at a lower level than in 1974, reflecting the economic recession in the country and in the world.

Domestic output of crude minerals was modest by world standards, but the value of mining in France was far more significant to the country's economy than the figures indicated. Often mining was the only source of employment in a region, and the well-being of the population depended on operation of a particular mine. Closing of some marginal mines was postponed because of social consequences to the region.

The most prominent minerals and metals produced in France, with production expressed in approximate percentages of the world total, were as follows: Arsenic, 18%; diatomite, 13%; gypsum, sulfur, potash, each 11%; uranium, 9%; fluorspar and iron ore, each 7%; talc, feldspar, zinc metal, each 6%; lead metal, cement, pig iron, salt, and pumice, each 5%; alumina, cadmium, cobalt, magnesium, nitrogen, and steel, each 4%; and aluminum and bauxite, each 3%.

During 1975, the gross national product (GNP) of France, about $304.7 billion, was lower by 2% compared with that of 1974. In constant (1970) prices, inflation reached an average annual rate of 10%. Unfavorable economic conditions in France and elsewhere resulted in decreased energy consumption (the first in France since World War II), and decreased exports of metals and semimanufactured products.

Principal events in the mineral industry were construction of a pilot plant for production of alumina from alunite, startup of two ministeel plants, cessation of tin ore production, and start of production at a new 80,000-ton-per-year electrolytic zinc plant.

PRODUCTION

The latest trends in French mineral production, mostly downward, reflected economic problems in the country and in the world. According to the French publication, Annales des Mines, September-October 1976, France produced about 49.7 million tons of iron ore or approximately 9% less than in 1974; steel output was close to 22 million tons or about 5 million tons less than that of 1974; bauxite output continued to decline and in 1975 reached over 2.5 million tons or 0.4 million tons less than that of 1974; aluminum metal production of 383,000 tons was about 10,000 tons lower than that of 1974. Production of lead (151,000 tons) and zinc metal (189,000 tons) declined in comparison with that of 1974 by 15% and 35%, respectively. During 1975, production of fluorspar remained at the same levels (328,000 tons) as in 1974, when expressed in contained CaF_2. However, crude ore output (730,000 tons) was higher by about 40,000 tons, indicating mining of lower grade ores during 1975.

Table 1 shows the latest figures on French mineral production.

Total ---do----	1,002,871	950,208	809,035

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Primary and secondary.

[2] Includes smectic clay.

[3] Consists of material for the ceramic and glass industries, and reportedly contains pegmatite.

[4] Data now include quantity for glass industry as well as for ceramic use.

[5] Excludes bituminous material.

TRADE

France's trade balance in minerals and fuels remained negative. During 1975, foreign trade statistics of France did not register major changes in foreign mineral trade and retained all characteristics of foreign trade of an industrially developed country in Europe.

Metals and semimanufactured products remained the principal export items of France. Energy (crude oil and natural gas), ores and concentrates of metals, and metals were the major import items, accounting for approximately 58% of total import.

Arab countries, the U.S.S.R., and the Netherlands were the principal suppliers of hydrocarbons (liquid and gaseous), African countries, South American countries, and Canada were major suppliers of raw minerals. European Economic Community (EEC) countries supplied most of the metals and semimanufactures.

Tables 2 and 3 show trade trends, mostly down, for 1973 and 1974.

Table 2.—France: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
METALS			
Aluminum:			
Bauxite	55,242	114,365	West Germany 87,895; Switzerland 10,813.
Oxide and hydroxide [1]	r 408,457	390,939	Netherlands 203,713; Spain 85,185.
Metal including alloys:			
Scrap	21,687	20,567	Italy 10,469; West Germany 4,984; Belgium-Luxembourg 4,284.
Unwrought	183,633	179,819	Italy 46,104; Belgium-Luxembourg 35,731; West Germany 32,471.
Semimanufactures	135,805	141,663	West Germany 43,704; Italy 15,270; Belgium-Luxembourg 13,701.
Antimony metal including scrap	217	219	United Kingdom 99; West Germany 72.
Arsenic (anhydride)	9,543	9,311	United Kingdom 1,245; Australia 943.
Beryllium ---value, thousands [2]	$173	$16	NA.
Bismuth, all forms	229	158	Italy 122; United Kingdom 19.
Cadmium	132	150	Belgium-Luxembourg 92; West Germany 27.
Chromium:			
Chromite	207	581	West Germany 338.
Oxide and hydroxide	58	170	Belgium-Luxembourg 65.
Metal	440	677	West Germany 148; Belgium-Luxembourg 131; Sweden 101.
Cobalt	456	552	United States 94; Italy 63; Spain 60; West Germany 55.
Columbium (niobium), all forms value, thousands [2]	$3	$5	NA.
Copper:			
Matte	1,112	557	West Germany 335; Italy 83; Belgium-Luxembourg 74.
Metal and alloys:			
Scrap	75,171	74,412	Belgium-Luxembourg 29,546; West Germany 23,059; Italy 15,753.
Blister and other unrefined	6,835	7,770	Belgium-Luxembourg 6,310; Spain 1,242.
Refined	8,603	5,927	Italy 2,296; United Kingdom 1,992.
Semimanufactures	r 83,550	86,757	West Germany 28,044; Netherlands 11,920; United States 8,301.
Gallium [3] ---value, thousands [2]	$1,931	$3,952	Mainly to Switzerland.
Gold:			
Ashes and sweepings --kilograms	147	508	Switzerland 80.
Metal:			
For domestic use thousand troy ounces	487	104	Belgium-Luxembourg 77.
Temporary imports ---do	r 3,857	4,308	Switzerland 3,868.
Iron and steel:			
Iron ore ---thousand tons	19,454	19,833	Belgium-Luxembourg 16,174; West Germany 3,659.
Pyrite cinder ---do	109	29	Mainly to Belgium-Luxembourg.
Metal:			
Scrap ---do	2,788	3,724	Italy 2,855; Belgium-Luxembourg 461.
Pig iron including spiegeleisen [4] do	187	359	Italy 179; Belgium-Luxembourg 89; West Germany 67.
Ferroalloys ---do	575	654	West Germany 165; Italy 115; Belgium-Luxembourg 74.
Shot and powder ---do	28	36	West Germany 14; Italy 10.
Steel, primary forms, including coil ---do	914	1,115	Italy 474; Belgium-Luxembourg 188; West Germany 161.
Semimanufactures:			
Bars, rods, wire rods, sections ---do	3,009	3,644	West Germany 625; United States 576; Belgium-Luxembourg 421.
Plates, sheets, universals do	3,012	3,662	West Germany 786; United States 450; Italy 421.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
METALS—Continued			
Tungsten:			
Ore	r 1,259	1,067	Mainly to West Germany.
Oxide	25	20	Do.
Metal, all forms	333	602	United States 313; West Germany 121.
Zinc:			
Ore	9,045	18,939	Mainly to Italy.
Matte	40	1,005	Belgium-Luxembourg 740; West Germany 97.
Oxide	20,363	--	
Metal including alloys:			
Scrap	r 2,295	1,276	Italy 640; Belgium-Luxembourg 296; West Germany 229.
Dust (blue powder)	r 4,045	5,889	Norway 2,560; United States 907.
Slab and ingot	r 40,034	29,425	United Kingdom 9,530; United States 3,451.
Semimanufactures	r 24,591	24,549	West Germany 10,835; Belgium-Luxembourg, 8,040.
Zirconium:			
Ore	563	3,779	Mainly to Italy.
Oxide	[3] 144	191	West Germany 59; Netherlands 45; Spain 40; Mexico 20.
Metal including nuclear grade	169	239	West Germany 66; Sweden 63; United States 52.
Other:			
Ore and concentrate	118	4,067	West Germany 2,733.
Ash and residue from nonferrous metals:			
Aluminum	7,106	8,499	Italy 5,901; West Germany 1,824.
Copper	12,339	10,682	Belgium-Luxembourg 7,425; West Germany 1,634.
Lead	8,596	9,051	Mainly to Netherlands.
Nickel	468	638	Belgium-Luxembourg 274; Netherlands 155.
Zinc	14,507	12,964	Belgium-Luxembourg 6,103; Netherlands 2,594; Sweden 2,261.
Other	25,088	24,050	Belgium-Luxembourg 14,968; Sweden 5,783.
Ashes, sweepings, and other residues of platinum, silver, and other precious metals	r 2,148	2,019	Mainly to Switzerland.
Slag and ash, n.e.s	37,219	45,240	Belgium-Luxembourg 31,239; West Germany 5,824.
Metal including alloys, all forms [5]	r 339	356	West Germany 154; Yugoslavia 83; Belgium-Luxembourg 45.
NONMETALS			
Abrasives, natural:			
Pumice, emery and other	689	2,011	Italy 1,124.
Dust and powder of precious and semiprecious stones value, thousands [2]	$463	$673	Spain $372; Switzerland $193.
Grinding and polishing wheels	r 3,608	4,163	West Germany 687; Italy 563; Belgium-Luxembourg 560; Spain 428.
Asbestos, crude	2,694	317	NA.
Barite including witherite	16,649	25,217	Gabon, 5,567; Tunisia 5,129; Italy 4,080.
Borates, natural	2,852	1,806	Italy 904; Switzerland 389.
Cement thousand tons	2,429	2,218	Ivory Coast 369; United States 325; Algeria 313; West Germany 265.
Chalk	454,952	478,215	West Germany 203,492; Switzerland 26,483; Algeria 13,954.
Clays and clay products (including all refractory brick):			
Crude:			
Kaolin	91,781	135,397	West Germany 65,668; Italy 30,383.
Bentonite	1,937	3,564	Belgium-Luxembourg 1,003; West Germany 544; Tunisia 362.
Refractory	403	3,160	West Germany 2,709.
Other	507,362	604,757	Italy 337,802; West Germany 107,437; Belgium-Luxembourg 50,753.
Products: Refractory (including nonclay brick)	r 473,105	482,191	West Germany 142,130; Belgium-Luxembourg 137,869.

See footnotes at end of table.

Corundum:			
Natural including emery (included in abrasives above)	412	433	Algeria 244.
Artificial	19,465	23,940	Italy 4,803; West Germany 3,687; Belgium-Luxembourg 3,582; Austria 2,672.
Cryolite and chiolite, natural	24	--	
Diamond:			
Industrial, excluding powder value, thousands [2]	r $1,368	$837	Belgium-Luxembourg $403.
Gem, unset do	r $13,823	$18,143	Switzerland $8,649; Netherlands $3,187; United States $2,462.
Diatomite	16,297	19,428	West Germany 9,261; Belgium-Luxembourg 2,342.
Feldspar	43,104	43,153	Belgium-Luxembourg 17,800; Spain 12,841; West Germany 5,359.
Fertilizer materials:			
Crude:			
Nitrogenous (natural sodium nitrates)	5	515	Morocco 269.
Phosphate rock	2,406	3,972	Ecuador 1,400; Liberia 495.
Potassic salts	32,566	24,148	Mainly to Belgium-Luxembourg.
Organic	r 24,195	26,363	Switzerland 13,289; Spain 3,048; Belgium-Luxembourg 2,756.
Manufactured:			
Nitrogenous thousand tons	540	559	Egypt 99; Belgium-Luxembourg 91; Morocco 82; West Germany 68.
Phosphatic:			
Basic slag do	239	286	Switzerland 122; Austria 109; Italy 42.
Other do	68	124	Belgium-Luxembourg 30; Brazil 13; Kenya 11; United Kingdom 10.
Potassic do	700	789	Belgium-Luxembourg 312; Italy 110.
Ammonia, anhydrous do	176	207	West Germany 105; Spain 40.
Flint (pebbles)	820,552	120,512	United Kingdom 29,181; West Germany 28,025; Belgium-Luxembourg 14,404.
Fluorspar	122,828	146,743	West Germany 98,392; Italy 17,003.
Graphite	1,606	1,079	Spain 289; West Germany 134.
Gypsum and anhydrite, including plasters thousand tons	1,243	1,254	Belgium-Luxembourg 484; Netherlands 169; Denmark 162; Norway 148.
Iodine	11	14	NA.
Lime	r 371,957	398,602	West Germany 194,198; Belgium-Luxembourg 158,360.
Magnesite, including calcined	719	664	NA.
Mica	1,861	2,967	United Kingdom 1,295; West Germany 815; Belgium-Luxembourg 293.
Pigments, mineral, including iron oxide	2,323	2,143	NA.
Pozzolan, santorin, etc	20,170	29,304	Switzerland 14,975; Ivory Coast 14,038.
Precious and semiprecious stones, except diamond [6] value, thousands [2]	r $19,851	$20,768	Mainly to Switzerland.
Pyrite, gross weight	1,626	36	NA.
Salt	r 158,753	236,916	West Germany 82,050; Spain 79,324; Belgium-Luxembourg 22,342.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	503,778	566,828	Australia 98,680; Yugoslavia 75,148; Brazil 70,495; Guinea 67,841.
Caustic potash and peroxides of potassium and sodium	12,010	19,141	Netherlands 5,881; Sweden 1,530.
Stone, sand and gravel: [7]			
Building stone:			
Crude and partly worked, n.e.s.	99,792	113,336	Belgium-Luxembourg 68,416; West Germany 20,729; Switzerland 11,607.
Worked:			
Slate, including crude	39,057	48,486	Belgium-Luxembourg 22,962; Netherlands 19,422.
Not specified	13,891	14,429	Belgium-Luxembourg 7,025; West Germany 4,112.
Dolomite, chiefly refractory grade	88,937	90,156	Belgium-Luxembourg 45,460; Liberia 12,300; West Germany 10,031.

See footnotes at end of table.

Stone, sand and gravel [7]—Continued			
Gravel, and crushed stone thousand tons	r 12,926	12,676	West Germany 9,365; Switzerland 1,838.
Limestone (except dimension)	247,143	236,906	West Germany 129,987; Belgium-Luxembourg 79,153.
Quartz and quartzite	5,374	5,299	Netherlands 3,459.
Sand excluding metal bearing thousand tons	4,275	3,666	West Germany 2,094; Switzerland 1,026.
Sulfur, elemental do	870	871	United Kingdom 445; Spain 75; Tunisia 70.
Talc and steatite	68,688	76,432	West Germany 18,531; United Kingdom 13,315; United States 8,892.
Other nonmetals, n.e.s.:			
Crude	269,971	277,353	Switzerland 231,293.
Slag, dross and similar waste not metal bearing, from iron and steel manufacture thousand tons	1,340	1,161	West Germany 716; Belgium-Luxembourg 227.
Oxides and hydroxides of magnesium, strontium, barium	5,871	8,514	U.S.S.R. 1,895; West Germany 1,421.
Fluorine	21	1	NA.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	r 7,078	10,465	Mainly to United Kingdom.
Carbon black	43,732	40,496	Italy 8,302; Spain 6,486; West Germany 6,249; Belgium-Luxembourg 5,033.
Coal and briquets:			
Bituminous	951,554	638,226	West Germany 373,480; Belgium-Luxembourg 122,861.
Briquets of bituminous coal	r 80,107	77,214	United Kingdom 55,381; West Germany 9,485.
Lignite	29,112	26,247	Mainly to Spain.
Coke thousand tons	919	1,013	Belgium-Luxembourg 445; West Germany 183.
Gas, natural million cubic feet	r 2,962	4,485	Switzerland 2,531; Belgium-Luxembourg 1,715.
Hydrogen, helium, rare gases	r 814	798	Switzerland 447.
Peat, including briquets	r 4,636	3,092	NA.
Petroleum refinery products:			
Gasoline thousand 42-gallon barrels	r 25,271	21,046	United Kingdom 4,747; Switzerland 4,668; West Germany 4,478.
Kerosine and jet fuel do	5,692	5,532	Switzerland 3,172; West Germany 680.
Distillate fuel oil do	r 32,861	28,438	Switzerland 12,637; West Germany 9,295.
Residual fuel oil do	r 24,761	15,271	West Germany 4,562; Switzerland 2,140; Belgium-Luxembourg 1,946.
Lubricants do	r 2,776	3,267	Belgium-Luxembourg 654; United Kingdom 400; Netherlands 322.
Other:			
Liquefied petroleum gas do	r 6,352	6,622	Spain 3,703; Portugal 878.
Bitumen, petroleum coke, other residues do	2,375	3,005	West Germany 1,573; Switzerland 683.
Chemical derivatives of coal, petroleum, or gas	r 103,912	221,021	West Germany 82,974; United Kingdom 68,008; Belgium-Luxembourg 15,150.

r Revised. NA Not available.
[1] Excludes artificial corundum.
[2] Based on exchange rate of 4.4540 francs per U.S. dollar in 1973 and 4.8099 francs per U.S. dollar in 1974.
[3] Includes indium and thallium.
[4] Including cast iron and shot, grit, powder and sponge of iron and steel.
[5] Alkali, alkaline earth and rare-earth metals except sodium and mercury.
[6] Including synthetic and reconstituted stone, but not including diamond.
[7] Not including slate, flint, or industrial limestone.

Table 3.—France: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS			
Aluminum:			
Bauxite	587,765	1,012,251	Guinea 408,489; Australia 368,432; Greece 129,933.
Oxide and hydroxide [1]	20,583	14,162	West Germany 7,025; Netherlands 2,643; United States 1,912.
Metal including alloys:			
Scrap	30,600	27,203	Belgium-Luxembourg 9,070; West Germany 6,741; Netherlands 3,281.
Unwrought	r 229,744	262,882	Netherlands 66,751; West Germany 35,257; Greece 32,219.
Semimanufactures	136,112	132,703	West Germany 56,906; Belgium-Luxembourg 34,219.
Antimony:			
Ore and concentrate	6,286	8,104	Bolivia 2,652; Thailand 1,900; Republic of South Africa 1,487.
Metal, all forms	2,269	2,110	Belgium-Luxembourg 956; People's Republic of China 415.
Arsenic, anhydride and acid	5	20	NA.
Beryllium, metal, all forms value, thousands [2]	$391	$711	Mainly from United States.
Bismuth	1,146	1,259	Bolivia 447; Peru 324; Japan 172.
Cadmium	613	937	Japan 402; Belgium-Luxembourg 309.
Chromium:			
Ore	r 330,803	365,300	Malagasy Republic 107,427; Turkey 81,756; U.S.S.R. 69,353.
Oxide and hydroxide	2,937	2,706	West Germany 938; U.S.S.R. 531; United Kingdom 352.
Metal, all forms	83	88	West Germany 39; United States 13; Japan 10.
Cobalt:			
Ore	8,499	8,625	Mainly from Morocco.
Oxide and hydroxide	253	296	Mainly from Belgium-Luxembourg.
Metal, all forms	568	855	Zaire 432; United States 172; Norway 90.
Columbium:			
Ore (including tantalum ore) [3]	814	1,081	Canada 830; Gabon 148.
Metal, all forms value, thousands [2]	$122	$116	United States $47.
Copper:			
Ore and concentrate	r 2,959	501	NA.
Matte	1,970	2,481	United Kingdom 1,221; West Germany 679; Belgium-Luxembourg 274.
Metal including alloys:			
Scrap	r 13,209	17,817	Belgium-Luxembourg 4,875; Netherlands 3,312; West Germany 2,075.
Blister and other unrefined	18,296	42,001	Zaire 10,550; Yugoslavia 9,958; Belgium-Luxembourg 7,153; Chile 6,383.
Refined	381,374	377,458	Belgium-Luxembourg 111,682; Zambia 73,441; Chile 32,981.
Semimanufactures	r 79,509	97,240	Belgium-Luxembourg 37,101; West Germany 34,799; Italy 10,799.
Germanium, gallium, etc value, thousands [2]	$502	$988	Belgium-Luxembourg $450; West Germany $140; Japan $109.
Gold:			
Ash and sweepings ----kilograms	4,376	1,213	Netherlands 590; Switzerland 576.
Metals:			
For domestic use thousand troy ounces	1,469	360	Netherlands 174; United States 134.
Temporary imports -----do	4,130	4,726	Switzerland 1,933; Lebanon 827; Laos 643; United Kingdom 640.
Iron and steel:			
Ore and concentrate, except roasted pyrite ----------thousand tons	11,530	15,822	Brazil 4,090; Sweden 2,664; Mauritania 2,452.
Roasted pyrite	114,005	131,827	Italy 75,202; West Germany 44,055.
Metal:			
Scrap	436,566	328,123	Belgium-Luxembourg 167,130; West Germany 81,893.
Pig iron, spiegeleisen, other [4] thousand tons	411	332	West Germany 264; Canada 18.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS—Continued			
Iron and steel—Continued			
Metal—Continued			
Ferroalloys ---thousand tons--	157	197	New Caledonia 112; West Germany 26; Belgium-Luxembourg 22.
Steel, primary forms ---do----	1,911	2,027	Belgium-Luxembourg 1,305; West Germany 566; Spain 63.
Semimanufactures:			
Bar, rods, sections [5] -do----	2,519	2,332	Belgium-Luxembourg 1,063; West Germany 956; Italy 117.
Plates, sheets, universals do----	r 3,228	3,153	Belgium-Luxembourg 1,591; West Germany 941; Netherlands 124.
Hoop and strip -----do----	418	431	Belgium-Luxembourg 271; West Germany 130; Italy 19.
Rails and accessories do----	88	75	United Kingdom 43; Belgium-Luxembourg 20; West Germany 10.
Wire ---------------do----	156	154	Belgium-Luxembourg 63; West Germany 61; Netherlands 12.
Tubes, pipes, fittings do----	471	443	West Germany 193; Belgium-Luxembourg 71; Italy 57.
Castings and forgings, rough ----------------	13,407	31,988	West Germany 14,232; Switzerland 6,463; Belgium-Luxembourg 6,334.
Lead:			
Ore and concentrate --------------	150,422	165,544	Morocco 42,716; Ireland 28,774; Canada 26,948.
Oxide ----------------------------	3,207	2,982	Belgium-Luxembourg 958; Mexico 772; East Germany 525.
Metal including alloys:			
Scrap ------------------------	r 12,618	21,755	Netherlands 10,167; Belgium-Luxembourg 7,231.
Unwrought ------------------	38,815	43,940	Belgium-Luxembourg 15,350; United Kingdom 12,444; West Germany 10,279.
Semimanufactures ------------	949	1,192	West Germany 762; Belgium-Luxembourg 294.
Magnesium including alloys			
Scrap ----------------------------	344	329	Mainly from Italy.
Unwrought ----------------------	1,612	2,850	Norway 849; United States 758; U.S.S.R. 579.
Semimanufactures ---------------	93	139	United States 62; West Germany 25.
Manganese:			
Ore and concentrate thousand tons--	1,432	1,428	Gabon 719; Australia 54; Morocco 34.
Oxide ---------------------------	5,595	4,518	Japan 1,590; West Germany 1,374; Belgium-Luxembourg 892.
Metal, all forms ----------------	735	489	Mainly from Republic of South Africa.
Mercury, all forms ---76-pound flasks--	11,458	9,747	Italy 2,901; Spain 2,205; U.S.S.R. 2,031; People's Republic of China 1,131.
Molybdenum:			
Ore and concentrate --------------	7,544	8,836	Canada 4,878; United States 1,722; Netherlands 1,502.
Oxide ---------------------------	153	134	Mainly from Netherlands.
Metal, all forms ----------------	182	174	West Germany 59; Austria 37; United States 22.
Nickel:			
Matte ---------------------------	r 15,175	13,377	New Caledonia 11,765; Canada 1,549.
Oxide and hydroxide --------------	r 90	121	Canada 75; United Kingdom 36.
Metal including alloys:			
Scrap ------------------------	r 2,292	1,544	Spain 444; United Kingdom 290; Belgium-Luxembourg 289.
Unwrought ------------------	10,499	15,307	United Kingdom 3,843; Canada 3,218; U.S.S.R. 3,210.
Semimanufactures (including anodes) -------------------	4,959	5,426	West Germany 2,453; United Kingdom 1,064; United States 973.
Platinum and platinum-group:			
Ashes and sweepings --kilograms--	1,619	1,257	Mainly from Netherlands.
Metals --------------troy ounces--	425,997	350,668	United Kingdom 95,295; U.S.S.R. 73,528; Republic of South Africa 49,512.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS—Continued			
Selenium	83	107	Japan 31; United States 24; Sweden 14.
Silver:			
Ashes and sweepings ..kilograms..	11,723	18,084	Netherlands 7,619; Spain 4,731; United Kingdom 4,361.
Metal, all forms thousand troy ounces..	r 48,739	38,056	United Kingdom 10,529; West Germany 6,436; Dubai 4,842.
Tantalum, all forms	26	37	United States 20; West Germany 11.
Thorium:			
Ore (Monazite)	3,494	5,320	Australia 3,381; Brazil 862; Malaysia 756.
Metal ....value, thousands [2]..	(6)	(6)	NA.
Tin:			
Oxide	r 179	209	Belgium-Luxembourg 107; West Germany 101.
Metal including alloys:			
Scrap	185	149	Switzerland 54; Italy 53; Belgium-Luxembourg 34.
Ingots	12,242	12,019	Malaysia 5,538; Indonesia 1,624; United Kingdom 1,436.
Semimanufactures	r 186	188	West Germany 108; Netherlands 31.
Titanium:			
Ore	r 142,385	176,359	Mainly from Australia.
Oxide	35,817	31,857	West Germany 17,302; Belgium-Luxembourg 5,387; Netherlands 3,456.
Metal, all forms	1,364	1,607	U.S.S.R. 532; United Kingdom 455; United States 221.
Tungsten:			
Ore	r 2,498	2,774	Republic of Korea 587; People's Republic of China 446; Brazil 389; Australia 279.
Trioxide	31	72	Mainly from West Germany.
Metal, all forms	161	134	West Germany 64; Netherlands 21; United States 17.
Uranium:			
Ore	r 1,461	1,647	Mainly from Niger.
Metal including alloys .kilograms..	1,214,155	644,590	United States 258,564; Spain 179,298; West Germany 103,999.
Zinc:			
Ore and concentrate	r 465,178	540,499	Canada 127,872; Peru 127,171; Ireland 50,350.
Oxide	4,254	3,064	West Germany 897; Belgium-Luxembourg 862.
Metal including alloys:			
Scrap	r 22,816	23,885	Netherlands 9,061; Belgium-Luxembourg 8,258; United Kingdom 2,421.
Blue powder	4,617	4,844	Mainly from Belgium-Luxembourg.
Unwrought	r 66,666	82,191	Belgium-Luxembourg 31,045; Netherlands 12,428; West Germany 8,591.
Semimanufactures	r 4,195	2,849	West Germany 1,864; Belgium-Luxembourg 491.
Zirconium:			
Ore	39,708	42,114	Mainly from Australia.
Oxide [7]	480	590	United Kingdom 296; United States 122; U.S.S.R. 80.
Metal	134	62	NA.
Other:			
Ashes and concentrates	5,767	12,520	Guiana 5,920; Australia 1,846; People's Republic of China 1,586.
Ashes and residues containing nonferrous metals:			
Aluminum	8,926	11,250	Italy 2,479; Netherlands 2,485; Belgium-Luxembourg 2,122.
Copper	135	683	Belgium-Luxembourg 445; West Germany 100.
Lead	1,093	14,688	Italy 6,689; United Kingdom 5,877; West Germany 1,064.
Nickel	75	129	Mainly from West Germany.
Zinc	72,106	32,087	West Germany 13,171; Belgium-Luxembourg 5,747.
Other	r 9,600	14,567	Canada 9,932; West Germany 3,315.
Metal including alloys, all forms	69	72	NA.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
NONMETALS			
Abrasives:			
Emery, natural corundum, other	38,895	47,337	Mainly from Turkey.
Pumice	7,198	6,705	Italy 3,252; West Germany 1,012; Netherlands 721.
Dust and powder of precious and semiprecious stones value, thousands [2]	$8,081	$9,133	United States $4,310; Republic of South Africa $1,514.
Grinding and polishing wheels	r 7,218	6,831	Italy 1,709; West Germany 1,595; Belgium-Luxembourg 1,592.
Asbestos	158,549	177,707	Canada 84,957; U.S.S.R. 55,371; Republic of South Africa 18,567.
Barite and witherite	54,430	77,584	People's Republic of China 46,773; West Germany 24,225.
Boron materials:			
Crude natural borates	127,815	182,825	Turkey 122,700; United States 54,993.
Oxide and acid	1,966	2,196	Italy 1,348; United States 321; Turkey 300.
Bromine	260	292	Israel 216; United Kingdom 44.
Cement	183,082	32,407	West Germany 14,285; Spain 4,927; Belgium-Luxembourg 4,300.
Chalk	25,129	21,177	West Germany 12,324; Belgium-Luxembourg 8,696.
Clays and clay products:			
Crude:			
Kaolin including calcined	348,505	353,893	United Kingdom 266,228; West Germany 23,872.
Bentonite	72,907	117,099	Italy 37,040; Greece 35,977; West Germany 28,142.
Clay and construction materials (bricks, etc.)	855,573	885,064	West Germany 318,298; Italy 308,099; Belgium-Luxembourg 90,237.
Cryolite and chiolite, natural	867	1,054	Mainly from Denmark.
Diamond:			
Industrial, except dust value, thousands [2]	r $5,854	$7,022	Belgium-Luxembourg $2,797; Ireland $2,250; United Kingdom $939.
Gem unset do	r $63,260	$83,435	Belgium-Luxembourg $31,416; Switzerland $17,134; Israel $11,209.
Diatomite	7,376	6,116	United States 2,343; West Germany 1,653; Denmark 775; Algeria 619.
Feldspar	7,374	15,211	West Germany 6,972; Spain 4,256; Portugal 2,797.
Fertilizer materials:			
Crude:			
Nitrogenous (natural sodium nitrate)	11,378	18,197	Mainly from Chile.
Phosphate rock thousand tons	4,919	5,861	Morocco 2,413; Togo 1,480; Senegal 791.
Manufactured:			
Nitrogenous	r 784,880	587,133	Belgium-Luxembourg 303,732; Netherlands 135,574; West Germany 78,007.
Potassic	r 431,836	377,686	Israel 138,451; Belgium-Luxembourg 122,355; U.S.S.R. 61,916.
Phosphatic:			
Basic slag	761,665	675,400	Mainly from Belgium-Luxembourg.
Other	453,932	450,976	Belgium-Luxembourg 128,030; Netherlands 104,762; Senegal 92,674.
Ammonia	365,490	343,630	Belgium-Luxembourg 149,672; Netherlands 62,222; U.S.S.R. 33,138.
Flint (pebbles)	935,527	1,012,739	Mainly from United Kingdom.
Fluorspar	6,071	4,343	People's Republic of China 1,391; United Kingdom 1,028; Italy 922; West Germany 896.
Graphite	8,334	8,859	People's Republic of China 2,536; Malagasy Republic 2,157; Italy 1,343.
Gypsum and plaster	7,640	8,289	West Germany 5,708; Italy 1,439.
Iodine, crude	669	1,200	Mainly from Japan.
Lime	180,197	150,404	Belgium-Luxembourg 104,407; West Germany 40,804.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
NONMETALS—Continued			
Lithium and strontium minerals	3,428	5,810	Republic of South Africa 2,617; Mozambique 970; United Kingdom 900; Netherlands 622.
Magnesite including calcined	63,010	68,089	Austria 15,546; Greece 12,979; United Kingdom 8,316.
Mica	5,120	7,598	India 5,006; Republic of South Africa 886.
Pigments:			
Earth pigments, including iron oxides	1,386	1,091	West Germany 240; Austria 195.
Earth, other (pozzolanic), santorin, etc	1,995	3,806	NA.
Precious and semiprecious stones [8] value, thousands [2]	r $34,775	$43,226	Switzerland $14,521; India $13,738.
Pyrite	156,798	88,959	Cyprus 47,853; U.S.S.R. 26,540.
Salt	r 195,180	162,089	Belgium-Luxembourg 92,584; Netherlands 35,610; West Germany 15,505.
Sodium and potassium salts, n.e.s.:			
Caustic soda	84,178	98,722	Belgium-Luxembourg 48,360; West Germany 22,081.
Caustic potash and peroxides of potassium and sodium	997	498	West Germany 318; Sweden 69.
Stone, sand and gravel: [9]			
Dimension stone:			
Crude and partly worked:			
Slate	4,493	5,509	United Kingdom 3,407; Italy 678.
Other	308,619	258,540	Italy 80,229; Republic of South Africa 72,581; West Germany 38,792; Norway 29,440.
Worked:			
Slate	59,123	77,105	Mainly from Spain.
Other	134,820	133,242	Italy 97,921; West Germany 24,720.
Dolomite, chiefly refractory grade	307,370	391,205	Belgium-Luxembourg 294,980; West Germany 88,930.
Gravel and crushed stone thousand tons	r 4,797	4,612	Mainly from Belgium-Luxembourg.
Limestone	260,820	249,356	Do.
Quartz and quartzite	26,655	28,654	West Germany 14,667; Italy 11,234.
Sand, excluding metal bearing thousand tons	1,705	1,757	Belgium-Luxembourg 879; United Kingdom 424; Netherlands 360.
Sulfur, elemental, all grades	r 565,031	798,070	Poland 301,071; United States 222,299; Canada 163,678.
Talc and steatite	7,080	8,521	Italy 2,944; Belgium-Luxembourg 2,528; Norway 1,469.
Other nonmetals, n.e.s	r 993,011	840,763	Switzerland 578,408; West Germany 55,297; Belgium-Luxembourg 43,985.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	r 2,417	2,662	Mainly from United States.
Carbon black	66,306	66,518	Netherlands 37,160; West Germany 12,796; United States 9,790.
Coal and briquets:			
Coal thousand tons	12,499	16,259	West Germany 6,588; Poland 3,276; United States 2,642; U.S.S.R. 1,566.
Coal briquets do	109	81	West Germany 47; Belgium-Luxembourg 24; United Kingdom 10.
Lignite and lignite briquets do	244	250	Mainly from West Germany.
Coke do	3,498	4,603	West Germany 3,906; Netherlands 383; Belgium-Luxembourg 153.
Gas, natural million cubic feet	r 248,070	323,430	Netherlands 279,961; Algeria 43,456.
Hydrogen and rare gases	17,785	22,450	West Germany 12,458; Belgium-Luxembourg 6,492; Netherlands 3,127.
Peat including briquets thousand tons	74	76	West Germany 42; Netherlands 18; U.S.S.R. 10.
Petroleum:			
Crude thousand 42-gallon barrels	r 994,753	949,869	Saudi Arabia 305,787; Iraq 119,057; United Arab Emirates 90,762.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
MINERAL FUELS AND RELATED MATERIALS —Continued			
Petroleum—Continued			
Refinery products:			
Gasoline thousand 42-gallon barrels	15,309	13,124	West Germany 5,089; Italy 3,817; Spain 1,019.
Kerosine do	602	893	Italy 379; United Kingdom 177; Belgium-Luxembourg 90.
Distillate fuel oil do	21,030	14,361	Italy 4,383; U.S.S.R. 3,597; Romania 2,055.
Residual fuel oil do	r 11,568	16,617	Netherlands 3,683; West Germany 2,204; Italy 2,053; U.S.S.R. 1,926.
Lubricants do	587	813	United Kingdom 174; Netherlands 93; West Germany 83.
Other:			
Liquefied petroleum gas do	2,911	2,339	U.S.S.R. 1,095; Venezuela 177; Sweden 165.
Vaseline, waxes, petroleum coke, bitumen, mixtures of bitumen, etc do	3,315	2,897	United States 2,142; West Germany 442.
Mineral tar and crude chemicals derived from coal, petroleum, or gas	r 265,444	292,859	United States 106,404; Belgium-Luxembourg 51,319; West Germany 37,896.

[1] Excludes artificial corundum.
[2] Based on exchange rate of 4.4540 francs per U.S. dollar in 1973 and 4.8099 francs per U.S. dollar in 1974.
[3] Includes vanadium.
[4] Includes cast iron and sponge, powder, etc., of iron and steel.
[5] Including wire rod.
[6] Less than ½ unit.
[7] Includes oxides of germanium.
[8] Including synthetic and reconstituted stone, but not including diamond.
[9] Excludes flint and industrial limestone.

COMMODITY REVIEW

METALS

Aluminum.—The aluminum industry of France had a mixed year. Bauxite output declined; output of alumina and aluminum remained at about the same levels as in 1974. Because of lower consumption of aluminum metal, imports were cut by 30% in 1975.

During 1975 the limited proved reserves of bauxite continued to decline in France and a 3-year downtrend in output also continued, from 3.3 million tons in 1973 to 2.6 million tons in 1975. The Bureau de Recherches Géologiques et Minières (BRGM) conducted a reevaluation of French aluminum resources, and preliminary results indicated justification for new bauxite exploration programs in 1977.

Aluminium-Péchiney (part of the Péchiney Ugine Kuhlman S.A. (PUK) group) accounted for about 60% of French bauxite production; three other producers accounted for the remainder. Bauxite mines were located in the Départements[2] du Var, Hérault, Bouches-du-Rhône, and Ariège. The following tabulation shows the various départements' share of total national output in 1975:

	Percent of total
Var	76
Hérault	16
Bouches-du-Rhône	7
Ariège	1
Total	100

Domestic bauxite output was adequate to meet about 60% of indigenous demand in 1975; the remainder was supplied by imports. Australia and Guinea provided 83% of total French bauxite imports. Exports of bauxite were insignificant when compared with domestic output.

During 1975, alumina (about 1.2 million tons) was produced at three plants (Gardanne, La Barasse, and Salindres) owned

[2] Départements are basic administrative units into which the whole French territory is divided.

by PUK. Their share of the total country output was as follows:

Plant	Département	Percent of total
Gardanne	Bouches-du-Rhône	60
La Barasse	Gard	26
Salindres	do	14

Domestic output of alumina was more than adequate to meet demand, and about 27% of the production was exported. Principal purchasers were the Netherlands (61% of the total) and Spain (31% of the total). Imports were negligible when compared with exports.

PUK continued construction of a pilot plant for producing alumina from alunite using the H+ process. Startup was scheduled for 1976.

In 1975, France had 10 electrolytic aluminum plants, owned by Aluminium-Péchiney, which were located in areas with abundant cheap electric power. Output of 383,000 tons reflected plant utilization of 93%. The following tabulation shows the percent contribution of the various plants to total output during 1975:

Départements	Plant	Percent of total
Pyrénées Atlantiques	Nogueres	27
Hautes-Pyrénées	Lannemazan	14
Ariège	Auzatz	8
	Sabart	6
Savoie	La Praz	1
	Sa Saussaz	3
	Saint-Jean-de-Maurienne	16
	Venthon	7
Isère	Riouperoux	7
Haute Alpes	L'Argentiere	11

Domestic output provided 67% of the country's supply and 96% of its consumption. The Netherlands (27%), West Germany (20%), and Greece (12%) were the principal suppliers of imported aluminum. The People's Republic of China was the major importer of aluminum and aluminum alloys produced in France, receiving about 29% of total French exports of these two commodities.

Copper.—Without mine and smelter production, France was a refiner of imported blister and scrap. Three refining plants were in operation during 1975. The major electrolytic plant, located at Palais, Haute Vienne, and operated by Compagnie d'Electrolyse du Palais, produced about 39,000 tons of electrolytic copper. Feed for this plant was half imported anodes and half scrap. Another electrolytic plant and one fire refinery were modest in size compared with the Palais plant. Aggregate output of both plants was only 650 tons in 1975. The upward trend of production since 1970 reversed itself for the first time in 1975. Imported copper anodes remained the principal source of French supply in 1975 and imports, like production, declined by 11% when compared with those of 1974. The Federal Republic of Germany and Belgium were the principal suppliers.

Iron and Steel.—The French iron and steel industry had a poor year in 1975. Production in all categories was down, as were domestic consumption, trade, and investment. The worldwide economic situation was the major cause. Commissioning of two ministeel plants and expanding an existing plant were the major events in the industry.

Iron ore was produced from three major basins, Est, Ouest, and Pyrénées. The Est basin, located in Lorraine, accounted for 95% of the country's iron ore output in 1975. After 2 years at the same level of production, iron ore output started to decline in 1975 and stocks increased. A total of 9,700 persons were employed in French iron mines at yearend 1975.

Two ministeel plants came onstream during 1975. Société des Aciéries des Montereau commissioned, at Montereau, a plant with a 60-ton electric furnace, facilities for continuous castings of billets, and a rolling mill for bars and wires. Sud-Acier at Toulon starting producing reinforcing rods for concrete in a facility with a 60-ton electric furnace and a rolling mill.

A new addition to the Saint Saulve steel plant, operated by Société des Aciéries d'Anzin, started production. One 60-ton electric furnace and installations for the continuous casting of tube rounds for rolling pipe of 120- to 210-millimeter diameters were the major components of the new addition.

No general layoffs took place in the French iron and steel industry during 1975. Total employment declined by 1.0%, and at yearend was 155,550. The industry met the economic situation by shortening the work week. However, the number of hours worked to produce a ton of steel increased from 10 hours and 49 minutes in 1974 to 12 hours and 6 minutes in 1975. During 1975, underemployed workers were utilized in maintenance operations. In times of high production, maintenance was often contracted out.

Principal steel producers, their production in million tons, and major plants were:

Union Sidérurgique du Nord de la France (USINOR), (7.9), Dunkerque, Longwy, Thionville, Denain, and Valenciennes.

Sacilor Aciéries et Laminoirs de Lorraine S.A. (SACILOR), (6.0), Boussange near Grandrange; Usinede l'Orne-Amont, Homecourt; Rombas, Moselle; and Hagondange, Moselle.

Société Lorraine de Laminage Continu (SOLLAC), (2.0), Hayange, Knutange, Sermange, Ebange, and Florange, all in Moselle.

Société Lorrain et Méridionale a Laminage Continu (SOLMER), (1.6), Fos-sur-Mer near Marseilles. CREUSOT-LOIRE, Enterprise S.A., (1.3), Le Creusot, St. Ètienne Leffrincroucke near Dunkerque, Imphy, and Firkny (Loire).

The percent of total steel production by various processes for selected years were as follows:

Process	1960	1970	1974	1975
Thomas	60.5	41.1	19.2	15.2
Pure oxygen	.6	29.0	58.4	63.4
Martin	29.7	18.6	10.8	7.1
Electric	8.6	11.0	11.5	14.2
Other	.6	.3	.1	.1
Total	100.0	100.0	100.0	100.0

Data indicate a continuing change from the Thomas and Martin processes to pure oxygen and electric furnaces. While in 1960 the Thomas and Martin processes accounted for 90.2% of the total steel output, in 1975 they provided only 22.3%.

Lead.—Most of the mine production of lead came from two mines, Largenterie and Malines (Département de Gard), in southern France, operated by Société Minière & Metallurgique de Peñarroya S.A. France remained dependent (81%) on imports of lead concentrate to meet its smelter demand. Ireland, the United States, and Greenland were the principal suppliers. During 1975, both production and imports of ore declined, continuing the downtrend started in 1974.

About 27% of lead metal consumption was met by imports during 1975. Both production and imports declined, a trend that started during 1974. Peñarroya operated the only primary lead smelter in France located near Noyelle Godault. The plant, a 130,000-ton-per-year Imperial smelter and refinery, produced about 19% less lead in 1975 than in 1974 because of lower demand. Secondary lead was produced in Peñarroya's plants at Saint-Denis, Lyon, and Escaudoevres and in a plant operated by Société Chimique des Mureaux, located in the municipality of Mureaux.

Preliminary figures on French trade in lead and alloys showed imports of 58,000 tons and exports of 21,000 tons in 1975. Countries belonging to the EEC were both the major suppliers and purchasers. In 1975 consumption was down following the trend begun in 1973. Net imports accounted for about 20% of the country's consumption of lead metal.

Nickel.—Based on imported nickel matte from New Caledonia, Société le Nickel (SLN) remained the sole nickel producer in France in 1975. SLN started construction of a new nickel plant at Havre to replace the existing one. Quality requirements for nickel that prevailed on the nickel market could not be met by the old plant; consequently, its replacement became an economic necessity. France consumed about 23,000 tons of nickel including oxides. About 10,857 tons of contained nickel was produced in 1975, about 2,155 tons more than in 1974.

Tin.—In October 1975, mine production of tin stopped with the closing of the mine Saint Renan (Finistère) mine because economic reserves were exhausted. Tin metal activities were limited to recovery of secondary tin. Imports of metal were the primary sources of supply during 1975.

Tungsten.—During 1975, France remained the principal tungsten producer among the EEC countries. Two mines were in operation; the Salau mine, Ariège, operated by the Société Minière d'Anglade, was the largest producer. Production, imports, and consumption of tungsten continued the downtrend begun in 1973.

Zinc.—A new zinc mine and a new zinc electrolytic plant came onstream during 1975. The new mine, Saint-Salvy, was operated by Peñarroya. Data on ore quality, output capacity, and other factors important for evaluation of the mine were not made public. In addition, two other Peñarroya mines, Largentier and Malines, (Département de Gard) were in operation. Domestic production, however, was modest compared with ore and concentrate consumption. Consequently, to meet demand France was dependent on imports for 94% of zinc ore and concentrate requirements. Peru, Canada, Ireland, Sweden, and Morocco were the principal suppliers of zinc raw materials. Smelter production of zinc in France peaked out in 1974, and during 1975 was 35% lower.

Compagnie Royal Austurienne des Mines switched to electrolytic zinc production at its plant at Auby, Nord. The new 80,000-ton-per-year facility had the same capacity as the conventional plant that was closed. An equivalent of about U.S.$40 million was invested in the new plant and 450 persons were employed. The installation was designed to operate more cleanly by eliminating emissions associated with ore roasting.

In addition, two plants located at Viviez (Aveyron) and Creil (Oise), were operated by Société Vieille Montagne; Peñarroya operated one plant at Noyelles-Godault (Pas-de-Calais).

After a steady increase since the beginning of 1970, zinc consumption decreased in 1975. Domestic output of zinc metal was equal to 81% of consumption.

NONMETALS

Barite.—Trial production by Société des Mines de Garrot Chaillac (SMGC) started at the Rossignol deposit. The open pit mine and beneficiation plant are located about 50 kilometers southwest of Chateauroux in Indre Département. The deposit was estimated to contain about 8 million tons of crude barite ore, of which 4 million tons was considered recoverable. The deposit overlies gneissic rocks of the Massif Central, and has an average barite thickness of 12 meters. Production was scheduled at a rate of 100,000 tons per year of concentrate. The beneficiation plant incorporated gravity and flotation sections.

In addition, barite was produced from several other deposits in France. Most were located in the southern part of the country. About 100,000 tons was produced during 1975.

Borax.—Expansion of the boric acid plant at Condé-Kerque continued during 1975. When completed in 1976 the plant was to produce 50,000 tons per year. Borax Français, a wholly-owned subsidiary of Rio Tinto Zinc Borax, operated the plant and invested in the expansion.

Cement.—About 64 cement plants were in operation in 1975, with a total installed capacity of about 40.4 million tons. About 82% of the cement capacity was controlled by four companies, of which the two principal ones were Société des Ciments Français (22 plants), and Ciments Lafarge France (18 plants).

Fertilizer Materials. — *Phosphate.* — France had no significant production of phosphate ore during 1975. A small output (18,000 tons) of phosphatic chalk (about 10% P_2O_5) from a deposit in the Département of Somme was the only natural source of phosphate in the country. However, slag from iron and steel plants remained a source of phosphate and accounted for 15% to 20% of supply.

Potash.—Consolidation of the producing units in Alsace continued during 1975. A plant located at Einsisheim was closed and preparations were underway for closing the mine and plant at Bollwiller sometime in 1976. Construction continued on a potash plant at Marie-Louise.

Potash production as well as consumption declined during 1975, interrupting a steady growth. Mines de Potasse d'Alsace (MDPA) was the sole producer of mined potash. Domestic output was more than adequate to meet demand, and France remained a net exporter of potash.

Fluorspar.—A new mine located at Tarn started production. The mine was rated at 20,000 to 25,000 tons per year of acid-grade fluorspar and was operated by the Société Minière de Trebas. About 80% of fluorspar production was controlled by three companies: PUK, with operations at Tanneron (Var), Langec (Haut-Loïre), and Paulinet and Reyssac-Montroc (Tarn); Société Denain-Anzin Minéraux with operations at Escaro (Pyrénées-Orientales); and Compagnie Française de Minerais d'Uranium (CFMU) with facilities at Reclesnes (Saône-et-Loire). Although production of ore increased, output in terms of CaF_2 content remained at the same level as in 1974 reflecting a lower average content of CaF_2. In 1970 French fluorspar ores contained about 63% of CaF_2, while in 1975 this figure had declined to only 45%. Domestic output was more than adequate to meet demand and France was a net exporter of fluorspar. Consumption continued to grow, mostly in the chemical industry.

Sulfur.—The principal source of sulfur was natural gas produced in the region of Lacq. In addition, some sulfur was recovered by desulfurization units at petroleum refineries. Small quantities of pyrite were also processed for sulfur recovery. Reflecting general economic conditions, output as well as consumption was down.

Other Nonmetals.—France also produced diatomite (mines in central and southern France), gypsum, pumice, and talc but no major events were reported during 1975.

MINERAL FUELS

During 1975, France remained dependent on imported energy to meet demand. Imported petroleum remained the principal energy source in the country. Table 4 shows supply and apparent consumption of primary energy.

Coal.—During 1975, the rate of decline in coal output slowed, perhaps signaling a positive reaction to measures taken by the French Government in 1974. These measures were aimed at reviving the coal industry of the country, and at lowering dependence of France on imported fuels. The small decline in output reported during 1975 was an excellent showing in the context of the overall economic slowdown. Under normal circumstances, lower energy consumption, triggered by recession, would have resulted in a far lower output of coal. High prices for imported liquid hydrocarbons were also a factor in improved performance of the French coal industry.

The coal industry was preparing for increased production. Modernizing the Merlebach, and Simon-Wendel mines in Lorraine, and preliminary work for reopening the Saint-Fontaine mine (Lorraine) were the focal points. The French coal industry, operated by the Government-owned Charbonnages de France, was concentrated in three basins: Nord/Pas-de-Calais (northern France), Lorraine (northeastern France), and Centre-Midi (central and southern France). These basins accounted for virtually all of the country's coal output. In general, operating mines were deep, with gas, water, and thin seams. Salient statistics on the coal industry are shown in table 5.

Coke.—The principal events in the coke producing industry in Lorraine were completing maintenance of the Coppee de Carling 3 coking battery, beginning regular maintenance of the Carling 2 coking plant, and constructing a rotary kiln to produce special coke, also at Carling. In the Nord/Pas-de-Calais basin, the changing of refractory lining continued in various coking furnaces. In Aquitaine, closing a coking plant at Loire late in 1974 resulted in lower coke production at the basin. Production of coke and semicoke in the three basins, in thousand tons for 1973–75, follows:

	1973	1974	1975
Nord/Pas-de-Calais	4,245	3,632	3,112
Lorraine	2,515	2,519	2,139

At yearend 1975, installed capacity in French coking plants was about 19,055 tons of coke per day. During 1975, coking plants operated at about 81% capacity.

The outflow of coke and semicoke to various sectors of the economy, in thousand tons and percentage of total during 1973–75, follows:

	1973	Percent	1974	Percent	1975	Percent
Steel industry	4,627	61.6	3,629	55.3	2,638	54.3

Total	7,515	100	6,566	100	4,855	100

Source: Charbonnages de France, Rapport de Gestion (Paris), 1975, p. 79.

Natural Gas.—There were a number of important events related to the natural gas industry during 1975. However, no major new discoveries were made public and most of the activities were related to construction of a trunk pipeline, expansion and renovation of the distribution network, and construction of underground storage.

Completion of some sections of the Taisnieres-sur-Hon-Ferrolles-Attilly pipeline (this pipeline was intended for transportation of natural gas produced in the North Sea), construction of additional lines parallel to the pipelines in Artois, Lorraine, Vindecy-Allerey (Dôle), and to the Saint-Valéry-sur-Somme-Bourseville trunk pipeline were the major activities of gas pipeline construction.

About 1,750 kilometers of new pipelines was completed for gas distribution in localities throughout the country. With new additions, the gas distribution network totaled approximately 71,000 kilometers. In addition, about 500 kilometers of gasline was repaired during 1975. Construction of underground storage for gas continued in Tersanne. Five of 14 storage cavities in the salt dome were completed. Construction started for a new underground gas storage area near Erez. Capacities of these two new storage areas were not made public.

To assure future supplies of gas to consumers in France, new contracts for gas deliveries were signed with the U.S.S.R. (pipeline, starting in 1980), Norway (pipeline, starting in 1978), and Iran (liquefied natural gas (LNG), starting in 1981).

The region in the southwest of France and, in particular, the region of Lacq remained the principal producing area of natural gas. Compagnie Française du Methane and Société Nationale des Gas du Sud-Ouest were the principal producers. Natural gas from Lacq accounted for about 39% of domestic consumption. Algeria (LNG), the U.S.S.R. (pipeline), and the Netherlands (pipeline) were the principal suppliers of imported natural gas.

Petroleum.—France remained heavily dependent on imported crude oil to meet demand in 1975. The following tabulation shows principal sources of France's imported crude oil supply:

Source	Percent of total
Middle East	78
Africa	18
Europe	2
U.S.S.R.	1
Venezuela	1

Approximately 1% of the crude oil delivered to refineries was produced in the country. Stern conservation measures, mild winters, and introduction of nuclear energy to produce electricity resulted in lower consumption during 1975 (about 8.5% lower than that of 1974). To explore and develop new sources of petroleum and modify refinery capacity, large investments are necessary. The following tabulation shows past investments in the French petroleum industry for selected years, in millions of current French francs:

	1960	1970	1973	1974	1975 [e]
Exploration and production	383	362	170	231	350
Refining	217	1,534	1,288	1,460	1,090
Stocks and distribution	298	1,567	1,732	1,508	1,443
Pipelines	13	176	97	114	51
Tankers	206	510	1,343	1,837	1,517
Other investments	36	194	237	221	397
Total	1,153	4,343	4,867	5,371	4,848

[e] Estimated by Union des Chambres Syndicates de l'Industrie du Petrol.
Source: L'Industrie Française du Petrole (Paris), 1975, p. 32.

Exploration.—Petroleum companies operating in France have increased investments in exploration and production when compared with expenditures in 1974. At yearend, all permits for exploration in force covered an area of 116,033 square kilometers. During 1975, new permits for exploration granted by French authorities covered an area of 45,076 square kilometers on land and 42,000 square kilometers offshore. Most of the permits on land were in the Aquitaine subbasin in the Basin de Paris; offshore locations were in the Atlantic Ocean in the so-called "Mer d'Iroise".

Several successful results of exploratory drilling were made public during 1975. Natural gas was discovered in Comminges (Lannemazan) and in Pan-Tarbes, both on the Meillon concession. Traces of crude oil were discovered in a well drilled near Grenade sur Adour.

Production.—Production decreased because of a decline in reservoir energy at producing fields. A new field, Montastruc, located in southwest France, came onsrteam in 1975. Data on capacity, geology, and oil quality were not made public. In addition, French companies shared in production abroad. The following tabulation shows domestic output by basin, production by French companies abroad, and output of crude oil derived from French oil concession rights, in thousand tons:

	1970	1975
France:		
Aquitaine	1,977	797
Basin Parisien	332	231
Total crude oil	2,309	1,028
Natural gas liquids from Lacq	605	761
Grand total liquid hydrocarbons	2,914	1,789
Production abroad by French interests:		
Europe	--	1,583
Middle East	43,506	53,690
Africa	38,156	26,759
Oceania	--	604
North America	1,264	1,953
Total	82,926	84,589

Refining.—Reduction in the consumption of petroleum refinery products resulted in low utilization of installed capacities at French refineries. During 1975, refineries operated at 64% of the installed capacity of 169 million tons per year. Low demand also resulted in curtailment of investments in new refineries. However, investment continued for modifications of existing refineries aimed at energy conservation in refineries, improvement in quality of products and environmental protection, and adaptation of yield to new market demand. The future market for petroleum products is expected to change. Demand for light products is expected to increase, but demand for fuel oil is expected to decline because government planning is emphasizing nuclear power. French refinery capacity by process, in tons per day, on January 1 for selected years follows:

	1965	1970	1975	1976
Reforming:				
Thermal	6,785	1,900	--	--
Catalytic	21,910	39,025	58,290	58,290
Desulfurization:				
Thermal	7,300	6,600	6,600	5,600
Catalytic	16,332	18,788	28,720	28,720

Table 6 shows location, ownership, and capacity of petroleum refineries in France.

Uranium.—During 1975, France continued developing its uranium resources and constructing nuclear powerplants. The aim remained to have about 50% of electric power generating capacity nuclear by 1985.

The Commission d'Energie Atomique (CEA), a French Government agency, and private companies conducted exploration for uranium throughout France.

The CEA continued exploration activities near its mines at Limousin, Forez, Vendée, in areas of Berry-Bourbonnais and Var in the Vosges, and in Rouergue. New exploration started in eastern Languedoc and in Gironde.

Private companies, including CFMU, Dong-Trieu, Société Centrale de l'Uranium et de Minerais et Metaux Radioactifs (SCUMMR), and Compagnie Industrielle et Minière (CIM), explored mostly in the southern and western part of the Central Massif and in Bretagne.

No new uranium mining or processing facilities came onstream during 1975. However, CFMU completed expansion of its Lozer mines. In addition, CFMU and La Société des Mines d'Uranium du Centre (SDMUC) made a decision to start joint production from the small Limousin deposits during 1976. Furthermore, as a long-range plan CEA continued to evaluate the economic and technical aspects of starting output from the fairly large deposits at Lodevois, Hèrault. Dong-Trieu, part of the

Empain-Schneider group, was preparing to start production from deposits on a concession located at Mailhac-sur-Benaize in Haute-Vienne. SCUMMR was planning to construct a uranium beneficiation plant at Saint Pierre, Cantal.

Mine production of uranium in France in 1975 was as follows:

Company	Mine	Ore (thousand tons)	Approximate U content (kilogram per ton)	U recovered by leaching	Total U recovered (tons)
CEA	La Crouzille	245,000	2,5	42	652
Do	Vendée	248,000	1.7	29	449
Do	Forez	124,000	3.7	3	458
SIMURA	Morbihan	9,000	4.4	--	39
Do	Cantal	16,000	2.7	--	43
CFMU	Lozere	360,000	0.2–1.2	--	211

Source: Annale des Mines—August–September 1976, p. 31.

To assure an adequate supply of uranium to France, French companies explored for and produced uranium in Gabon, Niger, and Canada. This output was processed in France and used in French installations.

The Mineral Industry of Gabon

By Janice L. W. Jolly [1]

The mineral production of Gabon continued to improve in 1975 as crude petroleum (up 7%), uranium (up 16%), and cement (up 16%) showed production increases over those of 1974. Manganese production remained relatively stable and gold production decreased by about 42%. For the next 5 years, the progressive rise in the gross domestic product (GDP) was expected to continue, but at a more modest annual rate of about 12% to 15%. Petroleum production was to be held to a ceiling of about 98 million barrels per year, thereby contributing about $1.2 billion [2] to the economy. Production of manganese was not expected to expand noticeably until transportation difficulties are overcome by the completion of the Trans-Gabon Railroad. The reliance on foreign technology, personnel, and foodstuffs was expected to contribute to maintaining a rate of price inflation above 20% per year. Progress was being made on a number of development projects including the Trans-Gabon Railroad, the mineral port at Santa Clara, construction of a second petroleum refinery at Port-Gentil as well as an extension to the existing Port-Gentil petroleum refinery, and a ferroalloys plant.

The third 5-year plan (1976-80) was in preparation and Gabon's national budget for 1976 was set at $892 million, up 32% from the $674.9 million allotted for 1975. Total government revenue, which more than tripled during 1975, was expected to increase by 29% more in 1976. The new 5-year plan was expected to concentrate on diversification from mineral extraction activities into a widely spread processing sector. Emphasis was to be placed on industries that had been somewhat overshadowed by the concentration on petroleum processing in the second 5-year plan. The Port-Gentil ammonia plant was scheduled to open in 1977 with an annual capacity of 60,000 tons, while new discoveries of limestone at N'Toum, 50 kilometers east of Libreville have added impetus to plans for a new cement works to open at yearend 1977 with an annual production of 300,000 tons. The 1976–80 plan should also lay the foundations for iron, steel, and aluminum works as well as nuclear power generation. Gabon was already gathering expertise and had reached technical cooperation agreements with the Republic of Korea and Brazil for exportation of refined uranium.

The 1975 budget for Gabon was balanced with receipts and expenditures at about $674.9 million. Oil receipts contributed about $396.8 million. Approximately $104.7 million (or about 22% of development expenditures) was spent on roads and bridges (850 kilometers of main roads were to be bulit in 3 years), and $17.1 million on water and hydroelectric power projects. About $38.1 million was allotted in 1975 for increasing State participation in various industrial organizations. The 1976 fiscal year operating budget for the Trans-Gabon Railroad was fixed at about $11 million, representing an increase of about $1.5 million over that of 1975. On February 4, 1975, the Gabonese signed a loan agreement with France raising the amount of French aid for the Trans-Gabon Railroad to about $57.5 million. Of this, $15.6 million represents a nonreimbursable grant, while

[2] Where necessary values have been converted from African Financial Community francs (CFAF) to U.S. dollars at the rate of CFAF224.3=US $1.00.

the remainder ($41.9 million) is a supplier credit. Japan granted a loan for the purchase of railway cars. The Algerian Bank for Development loaned $3.8 million to furnish 130 railway cars. The Export-Import Bank loaned $2.8 million for engineering services in construction of the railroad. This loan will be combined with about the same amount from private sources not as yet designated, and the Government of Gabon will put up cash equal to about 10% of the contract (about $612,000). Two French companies, CIT-Alcatel and Cables de Lyon Alsacienne & Geoffroy Deldre S.A. will install a $4 million telecommunications system for the railway. Westinghouse Air Brake Co., a French subsidiary of American Standard Inc., received an order for braking equipment for 400 Trans-Gabon railway cars. A U.S. firm, Soros Associates, signed a contract to design the new mineral port at Santa Clara for direct shipment of manganese and iron. Soros was to complete the site investigations and detailed design of port facilities within 18 months. The new port will handle 180,000 to 250,000 deadweight-ton class vessels about 7 kilometers offshore.

The Gabonese Government acquired 25% of the new Société Italo Gabonaise des Marbres (SIGAMA), which was formed at yearend 1974 with an Italian group holding 75% of the capital. Two new industrial companies were formed in 1975: The Société Gabonaise Industrielle de Construction, formed with headquarters in Libreville and a capital of $125,000 by Essence et Lubrifiant de France of Gabon (Elf-Gabon) and the Société Française d'Entreprises de Dragages et de Travaux Publics; and the Société Nationale Gabonaise d'Etudes, formed with a capital of $208,000 for undertaking public and urban civil engineering and economic studies.[3] Elf-Gabon also established the Société Gabonaise de Forages at Libreville with an initial capital of $417,000. The creation of a France-Gabon Bank in Paris was under study. Negotiations included the Suez-Mines Union and the Odier-Bungener-Courvoisier Bank. Capital was to be divided with 60% Gabonese interest and 40% French. It was to be essentially a business bank with a role in recycling Gabonese capital and participating in the financing of large development projects in Gabon.

In January 1975, Gabon and Upper Volta drew up new job contracts stipulating the rights and obligations of both States relating to Upper Voltan migrant workers in Gabon. Discussions were held with India for economic and commercial cooperation between the two countries when a delegation of Indian research experts visited Gabon early in 1975. An economic accord was signed on July 9, 1975, in Seoul providing for export of enriched uranium, manganese, and crude petroleum to the Republic of Korea. Gabon also signed and ratified the Lomé Convention. The 44th Organization of Petroleum Exporting Countries (OPEC) ministerial conference and the first conference ever to be held in Gabon took place in June 1975. Gabon was admitted to OPEC as a full member. This was followed on June 23 to 27, 1975, by an international symposium on the natural nuclear reactor discovered at the Oklo uranium occurrence, placing Gabon at the center of the scientific community's attention. A mission of Romanian geologists also visited the principal mineral deposits of Gabon in 1975.

Until 1972, all electricity production was by thermal power. By 1975, power was derived from 14 thermal stations and two hydroelectric stations at the Kinguele dam and at Oyem. There are plans to extend the capacity at Kinguele, to build a plant at Poubara, and to construct another dam and reservoir above the Kinguele complex. The start of service at the Poubara dam was forecast to take place within 2 years. A feasibility study for the Poubara dam was being done by the French Electricité de France. The new dam was to be constructed on the Ogooué River, about 20 kilometers from Franceville. Initial production will be about 4,400 kilowatts; later it will be raised to 13,000 kilowatts. The Kinguele Dam (20 megawatts) is situated 100 kilometers from the Gabonese capital and 45 kilometers from Kango. The work was initiated in 1969 and cost an estimated $17.8 million. About $5.8 million originated from the Fonds d'Aide et Cooperation (FAC), $4.5 million from the

[3] Industries et Travaux d'Outre-Mer (Paris). Afrique du Centre (Central Africa). V. 23, No. 264, November 1975, p. 871.

Caisse Centrale de Cooperation Economique, \$4.5 million from France in the form of credits, and \$2.4 million was supplied by Gabon.[4] A study was awarded for the advance planning of a gas-powered turbine station at Port Gentil.

PRODUCTION AND TRADE

The mineral industry, including refinery production contributed \$1,024.4 million to Gabon's economy in 1975. Crude petroleum production showed a modest increase to 81.9 million barrels in 1975, valued at \$832 million. Petroleum refinery output was valued at \$50.3 million. Butane produced from natural gas was valued at \$1.1 million.

Uranium production was valued at an estimated \$36.5 million in 1975 for an average price of about \$17.80 per pound of uranium concentrate. This represented a threefold increase in value over the 1974 production. Approximately 2.2 million tons of metallurgical grade and 40,000 tons of battery and chemical grade manganese ore were produced in 1975, valued at an estimated \$101.2 million. Gold, valued at about \$543,000 and cement (92,500 tons) valued at \$2.8 million were also produced.

The export value for all materials of \$800.2 million for 1975 was down from the export value for 1974 of \$1,047.4 million. In 1975, this included \$721.5 million for exported crude petroleum. Uranium, manganese, and gold were also exported. Total imports (c.i.f.) for 1975 were valued at \$448.3 million.[5]

COMMODITY REVIEW

METALS

Copper.—The French Bureau de Recherches Géologiques et Minières (BRGM) was prospecting for copper and gold in the N'Djole-Kolissen region. An exploration permit was requested by the BRGM for the Eteke-Mavikou region.

Iron.—Contingent upon completion of the Trans–Gabon Railroad and related infrastructure, possible steel production was being considered utilizing the Belinga iron deposits. The best location for the steel plant was considered as being near Santa Clara. Approximately 10 million tons per year of iron ore could be produced at Belinga, 40% of which would be exported as pellets and 60% of which could be utilized in the local steel plant, which might produce 4 million tons of steel per year. The investment speculated as necessary for the steel plant was estimated at $1,033 million. Romania was expected to participate in Société des Mines de Fer de Mékambo (SOMIFER), which will exploit the Belinga iron deposit. Saudi Arabia and Japan were both reportedly interested in buying the potential iron ore output from Gabon.

Manganese.—A ferromanganese subsidiary, Société Gabonaise de Ferroalliages (SOGAFERRO), was set up by Compagnie Minières de l'Ogooué S.A. (COMILOG) (15%), Union Carbide Corp. (10%), Okura Trading Co., Ltd., (25%), the Gabon Government (10%), and other European and U.S. interests with an initial capital of about $4.5 million. A ferroalloys plant was to be built at Franceville with completion scheduled for 1981, to coincide with completion of the large dam at Grand Poubara and the Trans–Gabon Railway. An estimated electrical supply of 4,000 kilowatt-hours per ton would be necessary. The annual capacity of the plant would be about 85,000 tons ferromanganese and 50,000 tons silicomanganese, requiring an estimated electrical consumption of about 540 million kilowatt-hours. The total investment required was projected to be about $45 million.

Uranium.—The uranium-vanadium deposit of Mounana, in the province of Haut-Ogooué, is situated approximately 25 kilometers north of the Moanda manganese deposit. It was discovered by geologists of the French Commissariat à l'Energie Atomique (CEA) in 1956. The Compagnie des Mines d'Uranium de Franceville (COMUF) began open pit mining in 1961. The Mounana deposit is located in a fault wedge in coarse sandstones of Middle Precambrian age. The deposit is about 140 meters long, 40 meters wide, and 150 meters deep. It was worked by open pit methods to the 70-meter level and then by underground methods. Other pods were opened later near the main mine such as the Oklo where some very rich parts behave as fossil nuclear reactors. Water in porous host rock acts as a neutron moderator resulting in an impoverishment of U^{235} isotope, and a low U^{235} to U^{238} ratio. Reserves were estimated at 26,000 tons U_3O_8 (at $10 per pound). There are two distinct zones with the "black-ore zone" containing minerals of uranium and vanadium in their lower valencies, and an "oxide zone," about 40 meters thick, where aluminum, lead, and barium uranyl-vanadates form most of the mineralization.[6]

On the 15th of January 1976, a new agreement was signed in Libreville between Gabon and COMUF. The terms of the convention were to be in effect for 15 years retroactive to January 1975 and no sale was to be made without Gabon Government agreement of price and customer. Gross profits tax was to be raised from 25% to 50% and the company's turnover tax from the average 12% to a minimum of 28%. The export tax was to be raised from 4% to 7.22% on the f.o.b. value. COMUF agreed that Gabonese uranium will be processed as far as possible in Gabon. COMUF was to build a uranium refining plant over the next 2 years to supply nuclear plants to be built in Gabon. Between 1975 and 1982, investments in COMUF were expected to be on the order of $133.7 million.

The French CEA and the U.S. company Union Carbide Exploration jointly were to undertake prospecting for uranium in the Ogooué Lolo and Ogooué Ivindo areas. Six Japanese companies (Dowa, 18%; Mitsubishi Corporation, 18%; Mitsui and Co., Ltd., 18%; Okura Trading Co., 18%; C.

[6] Cesbron F., and P. Bariand. The Uranium-Vanadium Deposit of Mounana, Gabon. The Mineralogical Record, September–October 1975, pp. 237–249.

Itoh & Co., Ltd., 18%; and Nippon Mining, 10%) set up Atlantic Uranium Co. to further Japanese uranium interests in Gabon. Depending upon the outcome of operating negotiations between CEA and the Government on an exploration program, other Japanese companies (Sumitomo Metal Mining Co., Ltd., Furukawa Co., Nittetsu Mining) may also join the Atlantic Uranium group.

NONMETALS

Marble.—Following the liquidation of Société Gabonaise de Marbrerie et Matériaux (SOGAMAR), a new company was created in 1974 by contract between the Government and a new Italian group. The new company, SIGAMA was formed with the Italian group COGEPI (50% Boatti finance group and 50% Saifi of Fiat) holding 75% and the Gabon Government 25% of the capital, which was estimated to be about $1.1 million. SIGAMA will extract, transport, and sell marble from the quarry at Koussou near Tchibanga (Dousee-Ossou). Reserves were estimated at 2 million tons,[7] and in the first phase, the annual production was expected to be about 40,000 tons per year. An investment of about $4.4 million was visualized for construction of the new complex.

MINERAL FUELS

Petroleum.—In November 1973, Gabon became an associate member of OPEC and in 1974, oil postings were brought into line with other OPEC members. In 1975, Gabon became a full member of OPEC. Gabon has set stiff concessions for foreign oil companies but recognized their vital role in oil development and has officially spoken out against full nationalization. Royalties and tax are now paid on the full posted price instead of on the realized price, and the tax rate has been raised to 47% of national profits based on posted prices, compared with the previous 42% based on realized price.

Elf-Gabon spent $57.9 million for exploration in 1975, compared with $25 million in 1974. Offshore prospecting was continued with three rigs in use on the Barbier Marine, Breme Marine, and Grondin-Madroo Marine sites. The potential of the Breme offshore oilfield was confirmed by four wells drilled under a joint development program by Ocean Drilling and Exploration Co. (ODECO) and Elf-Gabon. Elf-Gabon struck oil in the Port-Gentil Sud Marine I offshore exploration well. Elf-Gabon and Hispanica de Petroleos S.A. (Hispanoil) are each taking a 25% share in the 3,000-square-kilometer Iguelda Magumba offshore concession. Gulf which previously held the concession alone, will have a half share and will act as operator. Elf-Gabon, in partnership with Gulf, struck oil in the Banio Two well, and in partnership with Japan's Mitsubishi company has struck oil in Anguille Sud Ouest 1. The Compagnie Générale pour le Dévelopment des Richesses Sousmarines, with headquarters in Paris, established a subsidiary at Port-Gentil for research and petroleum exploitation along the Gabonese coast.

The construction of a second petroleum refinery was started at Port-Gentil in an effort to raise the refinery capacity of Gabon from 1.2 million to 2.2 million tons per year. The capital of the new refinery was split between the Gabon Government (30%) and Elf-Gabon (70%) and necessitated an investment of approximately $62.4 million. The petroleum terminal at Cap Lopez, north of Port-Gentil, was inaugurated on October 1, 1975. The new loading dock will handle 250,000 deadweight-ton tankers. A new asphalt plant was also inaugurated on May 29, 1975, which will have an annual production of 17,000 tons. About 7,000 tons will be used locally and the rest will be exported to neighboring countries. The asphalt plant represented an investment of $3.1 million by the French companies Entreprise de Récherches et d'Activités Pétrolières (ERAP) and Elf-Gabon. The Gabon State has a half-share in the new national company Pizo, which was to take over the oil products marketing operations of AGIP S.p.A., Elf-Gabon, and Shell-Gabon on May 1, 1975. AGIP Elf-Gabon, and Shell each retain one-sixth interest in the new venture. Other private distribution companies, notably Texaco Overseas Petroleum Co. and Mobil Oil Gabon, Inc., will also continue to operate in Gabon. The Gabon Council of Ministers decided on December 17, 1975, to construct a new petroleum depot at Moanda and to expand the storage capacity at the Ndjole and Lambarene depots.

[7] Industries et Travaux d'Outre-Mer (Paris). Gabon. V. 23, No. 263, October 1975, p. 805.

The Mineral Industry of East Germany

By Nikita Wells [1]

In 1975, East Germany remained the world's leading producer of lignite and the third largest producer of potash accounting for approximately one-third of the world's lignite output and one-eighth of the world's output of potash. Apart from these two commodities, salt, and building sand, East Germany is relatively poor in mineral raw materials and thus heavily dependent upon imports.

East Germany reported attaining the goals of the past 5-year plan (1971–75) and showed an over fulfillment in some areas. National income as reported for 1975 increased by 6.6 billion marks[2] to 141.6 billion marks; a 5% increase over that of 1974. Production of industrial goods increased by 14 billion marks, or 6.4% over that of 1974, thus exceeding the National Economic Plan. Productivity in the sphere of the industrial ministries increased 5.8%. The Ministry for Ore Mining, Metallurgy, and Potash had fulfilled the 1975 plan with 100.4%; the Ministry of Coal and Power fulfilled the plan with 101.3%.

Legislation and Government Programs.—East Germany anticipates maintaining rapid growth throughout the coming 5-year plan (1976–80).[3] Capital investments during this period are to be approximately 240 to 243 billion marks, compared with 183 billion in the 1971–75 plan.

The produced national income for 1980 as compared with 1975 is to increase by 27% to 30% and should achieve 182 billion to 185 billion marks. Industrial production is to increase by 34% to 36%, while the rise in productivity is to be 30% to 32%. Capacities are to be increased in order to produce the following by 1980:

Electrical energy billion kilowatt hours	104–109
Lignite million tons	250–254
Brown coal briquets do	45–47
Natural gas billion cubic meters	7.8–8.2
Manufactured gas do	5.8–6

The principal goals for individual commodities in the coming 5-year plan are as follows:

1. The lignite industry is to provide the national economy with solid fuels at the lowest possible cost. This is to be done by raising the capacity and efficiency of existing strip mines and processing facilities. Capacities of the strip mines at Profen-South Greifenhain, Bergdorf, Olbersdorf, and Goitshe are to be expanded, and strip mines are to be developed at Jaenschwalde, the Grotzsch Triangle, Delitzsch-Southwest, Schlabendorf-South, Baerwalde-West, and Cospuden II. By 1980, development should be started at the Gräbendorf, Cottbus-North, Delitzsch-South, and Reichwalde-South coalfields. The exploration program for lignite is to be carried out with the goal of finding 2 billion to 3 billion tons of reserves that can be mined on an industrial scale.

The productive capacity of existing briquet plants is to be maintained by reconstruction measures. Gas works and coking plants are to be operated and reconstructed where necessary, and the capacities of the Schwarze Pumpe and Lauchhammer coking plants are to be increased.

[2] Values have not been converted from East German currency units (marks) to U.S. dollars owing to fluctuating exchange rates. The exchange rate as of October 1975 was 2.55 marks =US$1.00.

[3] Neues Deutschland (East Berlin). Jan. 15, 1976, pp. 3–14.

2. The search for natural gas is to be concentrated only in the most promising areas in order to determine new natural gas deposits and consequently provide high output of natural gas for an extended period. Gas supplies are to be stabilized by the construction of more underground gas storage facilities for indigenous and imported natural gas. The modernization of local gas distribution networks is to continue. Imported natural gas from the U.S.S.R. is to be used mainly for industrial purposes and especially for the production of nitrogen fertilizers.

3. To assure the supply of raw materials to the chemical industry and to provide motor fuel and lubricants to the national economy, oil processing is to increase from 17 million tons in 1975 to 22.5 million to 23 million tons in 1980. Most of the increase in crude oil supplies is to be imported from the U.S.S.R. The technology of oil refining and petrochemical production is to be further developed for more comprehensive utilization of crude oil.

4. The share of electric power output, as produced by nuclear powerplants, is to increase from 9% in 1975 to approximately 16% by 1980.

5. The potash industry is to be further developed, and by 1980 the production of potash fertilizers is to increase 13% to 18% over that of 1975. By 1976, output of potassium fertilizers was to have reached 3.2 million tons. Exploration for potash is aimed at finding 1.8 billion tons of reserves suitable for commercial potash production. The Zielitz Potassium Combine is to meet its planned output and expand capacity.

6. Nitrogen production is to be raised from 539,000 tons in 1975 to 745,000 tons in 1976 and to 910,000 to 925,000 tons in 1980. This is to be accomplished by increased production of ammonia and urea at the Piesteritz Fertilizer Combine VEB. The manufacture of phosphate is to increase from 461,000 to 510,000 tons per year.

7. In ferrous metallurgy, rolled-steel production is to be increased 30% to 34%. This is to be accomplished by expanding existing rolling mills, including the Riesa Pipe Factory No. 2. Further expansion of the East Ironworks Combine is to take place as planned. The recovery of steel scrap is to be increased 14% to 18%.

In nonferrous metallurgy, production based on domestic raw materials and the reclamation of secondary raw materials is to be increased. A constant copper production is to be maintained at the Sangerhausen copper ore mines with the help of mechanization in mining and ore dressing. In aluminum production, more efficient processing and increased use of aluminum scrap are to be employed, and the Lauta alumina plant is to be renovated. Tin production is to be increased 43% to 45% by the reconstruction and expansion of existing capacities for ore mining and processing. Efforts to discover copper and zinc are to be continued, and exploration is to be planned for tungsten and sulfide nickel ore deposits.

8. Cement production is to be increased 25% to 27% through better utilization of existing facilities and expansion of the Deuna cement works. Geological exploration for cement raw materials in the Pasewalk area must be completed by yearend 1977.

9. Foreign trade in the coming plan is to be dependent upon a tighter interlocking of the East German economy with the economies of the U.S.S.R. and the other COMECON[4] countries. An increase is to be made in the scientific, technical, and economic cooperation between these countries. However, foreign trade with European and non-European market economy countries is to be further developed. Economic relations are to also be expanded with the developing countries.

During the coming plan, East Germany's contribution to the expansion of Soviet primary material industries is to increase by almost a factor of four. In keeping with the "Long Term Agreement on Trade Turnover and Payments for 1976–1980," which was signed between the two countries in December 1975, the U.S.S.R. is to pay for East Germany's help by delivering raw materials. During this period, the U.S.S.R. is to deliver more than 88 million tons of oil, 21.6 billion cubic meters of natural gas, 21 million tons of coal, approximately 16 million tons of rolled steel, and large quantities of iron ore, nonferrous metals, chemicals, etc.[5]

[4] COMECON (CMEA)—Council for Mutual Economic Assistance comprising the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

[5] Voitov, M. The Prospects of Trade and Economic Ties in 1976–1980 (U.S.S.R.–G.D.R.). Foreign Trade (Moscow), No. 4, April 1976, pp. 4–7.

PRODUCTION

In 1975, East Germany's iron and steel industry showed a moderate increase in output. Crude steel production increased 5.1%, pig iron 7.7%, and steel semimanufactures 4.4%, compared with 1974 levels. Iron ore resources are almost depleted and production is small. Production of most nonferrous metal ores was on the decline and production of primary copper became insignificant. A considerable effort was given to the salvage, recovery, and processing of secondary raw materials.

In the nonmetals industry, production of potash increased 5.4%, mainly due to the new developments at the Zielitz potash combine. Nitrogen fertilizer production increased an estimated 24% due to the operation of all three plants at Piesteritz. Nitrogen production is to keep increasing well beyond 1980.

In the mineral fuels area, production of lignite increased slightly, and plans are to keep production at the present level. Production of crude oil remained at an insignificant level, and little hope is envisioned in offshore drilling in the Baltic Sea. Natural gas production has leveled off, and a considerable effort is being made to keep the production from decreasing.

The total production of electrical energy in 1975 was 84,460 million kilowatt-hours, a 5.2% increase over that of 1974. Planned production for 1976 is 88,350 million kilowatt-hours.[6]

East Germany does not report production statistics on many of its mineral commodities; therefore, much of the data presented in the production table (table 1) was estimated.

e Estimate. p Preliminary. r Revised.

[1] In addition to the commodities listed, magnesium, peat, and a variety of crude nonmetallic construction materials (clays and stone) are produced, but output is not reported, and available general information is inadequate to permit formulation of reliable estimates of output levels.

[2] Source indicates that data includes "roasted ore;" presumably roasted pyrite.

[3] Revised to none.

[4] Total of reported figures only; no estimates have been made for unreported products and/or refinery fuel and losses.

TRADE

In 1975, East Germany's foreign trade increased about 7% in volume and about 16% in value. In 1974, 68.4% of trade was with other centrally planned economy countries, 27.4% with market economy countries, and 4.2% with developing countries.

East Germany's limited mineral exports in 1975 consisted mainly of brown coal briquets, potash, salt, and iron and steel semimanufactures.

Since East Germany is poor in raw materials, it has to rely a great deal upon imports. At present, the Soviet Union supplies 97% of East Germany's iron ore, about 40% of its pig iron and rolled steel, almost 98% of its crude oil, and 40% of its natural gas. Nonferrous metals imported from the Soviet Union cover from 60% to 70% of demand. In return for the raw materials, East Germany is helping build projects in the U.S.S.R. such as the Orenburg gas pipeline, the Kiyembay asbestos complex, the Ust-Ilimsk pulp and paper complex, and several oil-refining complexes. East Germany also is helping in the development of some iron ore deposits.

East Germany's trade with West Germany reached a record level in 1975 with a total of 7.3 billion marks representing a 0.5 billion mark increase over that of 1974. Imports from West Germany increased 7%, and the exports increased 3%.

An agreement was signed in 1975 between East Germany and Peru for Peruvian mineral sales, which included refined and blister copper and refined silver and zinc totaling approximately $15 million.

Table 2.—East Germany: Exports of mineral commodities

COMMODITY REVIEW

METALS

Aluminum.—In 1975, as in previous years, East Germany imported all of its bauxite and some of its alumina requirements. The domestic consumption of aluminum is estimated at 190,000 tons per year for the last 2 years; the output of primary metal remained approximately 70,000 tons. In the last 2 years, 110,000 tons of aluminum was imported from the U.S.S.R. per year.

The VEB Chemiewerke Lauta is East Germany's only alumina plant and has a capacity of 70,000 tons per year. The plant produced an estimated 48,300 tons in 1975. Primary aluminum is produced at the VEB Elektrochemiches Kombinat in Bitterfeld with a capacity of 65,000 tons per year and at the Aluminumwerke Lauta in Lauta with a capacity of 25,000 tons per year.

Copper.—East Germany's primary copper production has virtually come to a standstill. The copper deposits at Mansfeld-Eisleben-Hettstedt are almost depleted, and the mines were closed in 1974. However, a new deposit is being developed at nearby Sangerhausen. Refined copper output was estimated at 48,000 tons for 1975. East Germany does not publish its copper imports or production but, as in the past, most of the copper was imported from the Soviet Union.

Iron and Steel.—In 1975, East Germany produced 6,472,000 tons of crude steel, 2,456,000 tons of pig iron, 4,281,000 tons of steel semimanufactures, and 50,000 tons of iron ore. Production of crude steel increased 5.0% over that of 1974, that of pig iron, 7.7%, and that of semimanufactures, 4.4% for the same period. Iron ore resources in East Germany are almost depleted, and production figures are no longer reported by German sources. Production of steel and pig iron is also inadequate to satisfy domestic demand and, therefore, East Germany must rely upon large quantities of imports of these commodities. About 97% of the iron ore, and 40% of the pig iron and rolled steel are imported from the Soviet Union.[7]

The increase in East Germany's crude and rolled steel output in 1975 was mainly due to increased production in the VEB Stahl und Walzwerk at Brandenburg and in the VEB Maxhütte, Bergbau und Hüttenkombinat at Unterwellenborn. With reconstruction of the open hearth at Brandenburg, the plant's crude steel output reached more than 2 million tons per year.[8] At this plant, all 12 open-hearth furnaces were converted to natural gas.

The iron ore sintering plant built by Romanian engineers at Eisenhüttenstadt was working at 80% capacity after 2 months of production, which began in December 1975. The design capacity is 4 million tons of sinter. The project was designed by the Institute for Metallurgical Plants and Factories of Bucharest.

An agreement was signed in April 1975 between the West German firm Fried. Krupp GmbH and the East German trade firm Industrie-Anlagen Import on expanding the Henningsdorf steelworks located west of Berlin. The principal item in the reconstruction was a high-performance electric arc furnace. The project's total cost will be approximately 120 million marks. Construction was scheduled to begin at yearend 1976 and is to be completed in 1978.

Tin.—Estimated tin production for 1975 remained unchanged from the previous 2 years at 1,200 tons for both mine output and refined tin output. At yearend 1975, a new plant at Freiberg started to process low-grade tin ores from the large tin ore deposit near Altenberg.

Uranium.—East Germany had substantial uranium deposits, which were estimated in 1961 at 100,000 tons of uranium metal (117,925 tons of U_3O_8).[9] Since the end of World War II, this uranium has probably been exported to the U.S.S.R. exclusively. The present estimated mining rate is approximately 2,000 tons per year. Elsewhere, production was reported at 5,000 tons per year, making East Germany probably the second largest uranium producer in the

world, but this could not be confirmed.[10] Uranium deposits in the Erz Mountains are now almost depleted, but mining is active in the Thüringen region, near Gera, where uranium-bearing argillite contains about 0.1% U_3O_8. A third production center is the sedimentary deposit at Elbsandstein where underground mining is employed. Most of the uranium mining is being performed by the Wismut Sowjetisch-Deutsche Aktiengesellschaft (Soviet-German Company) (SDAG). Data on current East German uranium reserves and mining are nonexistent owing to the secrecy imposed upon the uranium industries of the centrally planned economy countries.

NONMETALS

Bromine.—East Germany's largest bromine factory began test operations in February 1975 at the VEB Karl Liebknecht potash plant located in Bleicherode. The planned total output for 1975 was to have been 700 tons of bromine.[11] In East Germany, bromine is obtained from bromide-containing lyes of the potash industry.

Cement.—Cement production was estimated at 10.7 million tons in 1975. Construction of the second production line at the VEB Eischsfelder Zementwerke Deuna plant near Erfurt was scheduled to be completed by yearend 1975. As soon as all four production lines are in operation, this plant is to produce a total of 2.5 million tons per year. Work continued on expansion of the Karsdorf cement works, which produced 4.3 million tons in 1975.

Fertilizer Materials.—The total estimated fertilizer production in 1975 was 4.0 million tons of nutrients[12] and showed an increase of 8.1% over that of 1974. Potassium fertilizers constituted 75% of the total production, nitrogen fertilizers represented 14%, and phosphorous fertilizers were 11%.

Nitrogen.—Nitrogen fertilizer production in 1975 was 539,000 tons (nitrogen content), 24% increase over that of 1974. In 1976, East Germany was planning to produce 745,000 tons of nitrogen fertilizers.

All three of the production plants of the VEB Stickstoffwerk Piesteritz have entered commercial operation. The first plant has a capacity of 345,000 tons per year of nitrogen fertilizer and plastics-grade urea and was constructed by Czechoslovakia. The second plant has a capacity of 450,000 tons per year of ammonia. This plant was designed by M. W. Kellogg Co. and constructed by the Toyo Engineering Co. The third plant has a capacity of 350,000 tons per year of urea. Between 80% and 90% of the urea produced at these new plants will probably be used for fertilizer purposes.[13]

East Germany, together with Bulgaria, Czechoslovakia, and Hungary, is to assist in the construction of the Kingisepp ammonium phosphate fertilizer plant in the U.S.S.R., located in Leningrad Oblast'. As payment for its participation, East Germany is to receive Soviet deliveries of ammonium phosphate over a period of 10 years beginning in 1976.

Phosphate.—Production of phosphatic fertilizers in 1975 was estimated at 427,000 tons (P_2O_5 content), an increase of 4% over that of 1974. East Germany has virtually no phosphatic raw materials and, therefore, must import most of its needs.

Potash.—East Germany remained the world's third leading producer of potash, representing one-eighth of the total output. Production reached 3.02 million tons of potash in 1975, a 5.4% increase over that of 1974. This increase was mainly due to the output from the Zielitz potassium combine. By 1980, potash production is to increase by 13% to 18%. In 1976, production is expected to reach 3.2 million tons.

In 1974, East Germany increased its potash exports by 15%, reaching a record 2.09 million tons and delivering 26% to Poland, 23% to Czechoslovakia, 8%, each to the United Kingdom and Hungary, and smaller amounts to Yugoslavia, Austria, India, Cuba, and Sri Lanka.

East Germany is trying to improve the yield of potash mines in order to reduce mining losses 10%. The increase in production is to be achieved by greater mechanization. Potash is now mined in underground mines almost exclusively with blasting and drilling, mostly with diesel-driven equipment. The material is moved by conveyor

[13] Nitrogen (London). No. 100, March–April 1976, p. 15.

belts.[14] The potash is processed by grinding, then separated either by froth flotation or by recrystallization. The country's present potash reserves were estimated at about 13 billion tons. The total work force of the potash industry was estimated at 33,000 in 1974.

The Werra potash enterprise at Merkers, which employs 8,600 workers, is building a bromine factory that will utilize the potash deposits. It is expected to produce enough bromine to cover domestic demand.

Potassium sulfate is now produced only at Dorndorf where there are no present plans for expansion.[15]

Beginning in 1976, the potassium salt plant at Zielitz, near Magdeburg, was to start producing approximately 900,000 tons of salts per year. This plant is being developed with the cooperation of the U.S.S.R., Poland, and Czechoslovakia.

Sulfur.—Sulfur in East Germany is recovered mostly as a byproduct of fuel processing.

Sulfuric acid turnkey plants, built by Polimex Cekop, Ltd., of Poland, are being established at VEB Fahlberg-List at Magdeburg (with a 100,000-ton-per-year capacity) and at VEB Seelingstadt (with a 200,000-ton-per-year capacity). The VEB Chemiewerk Nunchritz plant, which is presently under construction, is to have a 100,000-ton-per-year capacity and will receive liquid sulfur from Poland under a long-term agreement.[16]

MINERAL FUELS

East Germany's total primary energy consumption for 1975 reached an estimated 121.1 million tons of standard coal equivalent. This represented an increase of 0.3% over that of 1974. Coal provided 69.1% of the total primary energy while oil represented 17.6%, natural gas 12.3%, nuclear power 0.7%, hydroelectric power 0.2%, and imported electric power 0.1%.

In 1975, East Germany produced 71.7% of its primary energy consumption from domestic fossil fuels, hydroelectric power, and nuclear energy. It imported 33.4% of its primary energy production and exported 5.1%. Primary energy balances for East Germany for 1974 and 1975 are shown in table 4. In general, the total primary energy distribution for 1974 and 1975 did not show any significant changes.

Coal.—In 1975, East Germany produced approximately 29% of the world's lignite output. Nearly 700,000 tons per day was mined at the 37 open pit mines to produce a total of 247 million tons in 1975. The Cottbus region is the principal mining area and produces approximately 50% of the country's total output. This basin possesses

two-thirds of East Germany's usable coal reserves, which amount to approximately 20 billion tons. The largest and most productive open pits are located here and employ the most modern equipment available. The rest of the lignite mining is done in the coal regions of Halle and Leipzig where 20 open pit mines are located.[17]

Lignite production is to increase to 250 million to 254 million tons by 1980 and to 270 million tons sometime thereafter. These high outputs can be maintained only with the replacement of depleted mines, intensification of existing open pits, fuller mechanization and development of 18 new large open pits in the Halle-Leipzig area and to the south of Cottbus.[18]

More than 80% of the electric power presently produced in East Germany is from lignite. Domestic lignite will continue to be the prime energy source; its share in 1980 is to be approximately 60%.

Future lignite mining in East Germany will encounter unfavorable geological and hydrological conditions and a greater amount of overburden will have to be removed. In 1975, the mining of 1 ton of lignite required moving 3.9 cubic meters of overburden; by 1980, this figure is expected to reach 4.5 cubic meters. Ratios of tons of lignite to cubic meters of overburden for the coming years will probably develop as follows: 1960, 1:2.8; 1975, 1:3.9; 1980, 1:45; 1985, 1:48; and 1990, 1:5.2.[19]

Deteriorating mining conditions are to be offset by more advanced open pit mining equipment and technology. By 1980, 76% of the overburden is to be removed by continuous systems including overburden conveyor bridges and belt conveyor systems. This figure is expected to increase to 85% in 1985.

More than 40% of the lignite is used for making briquets whose production reached 49 million tons in 1975. A total of 50 briquet plants, which are fairly evenly distributed over the Halle-Leipzig and Cottbus areas, produce approximately 50 million tons of briquets per year, 12 million of which go for public consumption. The Schwarze Pumpe Combine VEB, which is the most productive plant, has an output of 25,000 tons per day.

East and West Germany have signed an agreement on the mining of lignite deposits straddling the East German-West German border at Harbke and Helmstedt. The deposits are estimated to contain 15 million tons and extraction is to continue up to 1995. Approximately 5 million tons is in West German territory, and 10 million tons is in East Germany.

Natural Gas.—Natural gas production has maintained a level of 8 billion cubic meters for the past 2 years, and a considerable effort will be exerted to maintain this output in the future. Most of East Germany's recent natural gas production continues to come from the big discovery made in 1971 at the Salzwedel gasfields in the Magdeburg District near the West German border. In other parts of the country, a continuous effort is being made in order to find commercial reserves by deep drilling.

Soviet Union natural gas exports to East Germany were approximately 3 billion cubic meters in 1975. This export level is expected to increase to 7 billion cubic meters of gas in 1980.[20]

Work has begun on construction of the Orenburg gas pipeline in which East Germany is participating together with the other COMECON countries. This gas pipeline is to link the large deposit of natural gas at Orenburg, in the southern Ural mountains of the U.S.S.R., to the borders of East Europe. East Germany is responsible for construction of a 550-kilometer section of this pipeline, which lies in the Ukraine. By 1980, this pipeline is to supply East European countries with 15.5 billion cubic meters of gas per year. Each of the COMECON countries will receive deliveries of natural gas for a period of 12 years as payment for participation in the pipeline construction.

Petroleum.—Domestic crude oil production remained insignificant and as much as 98% of the national supply had to be imported. East Germany is the second largest importer of Soviet crude oil, with an estimated 15 million tons obtained in 1975. Deliveries of Soviet crude have been flowing through the 3,007-kilometer-long "Friend-

ship" oil pipeline from Almeteevsk to East Germany since December 1963.[21]

Oil refining in East Germany had increased to 17 million tons in 1975, with an especially steep rise in consumption occurring during the period of the last 5-year plan.[22] The new 5-year plan calls for an increase of oil refining to 22.5 million to 23 million tons by 1980.

An extensive drilling campaign had been carried out in spite of past failures in order to find sizable crude oil reserves. Plans were made for offshore drilling in the Baltic Sea with the cooperation of Poland and the U.S.S.R.

Nuclear Power.—In 1975, East Germany had two operating nuclear powerplants. The Rheinsberg nuclear powerplant, located approximately 100 kilometers north of Berlin, has been operating since 1966 at 70-megawatt capacity. The second nuclear powerplant is the Bruno Leuschner Nord near Greifswald, on which construction started in 1967. It had its first 440-megawatt block go into operation in December 1973 and the second block a year later. The second stage of this powerplant is presently under construction and is comprised of two 440-megawatt blocks similar to those now in operation.[23] The present share of electric energy supplied by nuclear power, is approximately 9%.

A third nuclear powerplant, to be located near Magdeburg, is still in the planning stage. The nuclear powerplants were built with very close cooperation of the Soviet Union, which has provided much of the equipment, blueprints, and technology.

The Mineral Industry of the Federal Republic of Germany

By Joseph B. Huvos [1]

In 1975, the Federal Republic of Germany was one of the world's major processors of minerals and concentrates. Only coal and potash, however, were found domestically in plentiful supply; all other fuels and minerals had to be imported. The most important mineral products of the country and their approximate percentages of world totals were as follows: Coal, 4%; lignite, 15%; coke, 9%; fuel briquets, 7%; pig iron, 6%; crude steel, 0.5%; aluminum, 6%; potash, 9%; barite, 2%; salt, 5%; and cement, 5%.

In 1975, the Federal Republic of Germany's gross national product (GNP) was about $423 billion.[2] The contribution of the minerals industry to the GNP was about 11% of the total. The contribution of the main sectors of the mineral industry to the GNP in 1974 and 1975 and average employment in 1975 are shown in table 1.

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted to U.S. dollars, from Deutsche marks (Dm) at the rate of DM2.4005=US$1.00 for 1975 and DM2.5919=US$1.00 for 1974. Source of conversion rate for 1974 and 1975 was International Monetary Fund. Source of GNP was Statistisches Bundesamt (Wiesbaden), Wirtschaft und Statistik, v. 16, No. 2, 1976, p. 69.

Depending on the commodities produced, companies in the Federal Republic of Germany's mineral industries were affected to varying degrees by the 1975 international recession and high oil prices. Among the hardest hit were the iron and steel industry, the nonferrous metals industry, cement, nitrogen compounds, bituminous coal mining, and petroleum refining. Production of sulfur and nuclear power, however, increased.

There were a number of significant developments in 1975. In the iron and steel industry the August Thyssen–Hütte AG (ATH) consolidated its leading position with the acquisition of Rheinstahl AG, Essen. In the petroleum industry, the Government-controlled VEBA AG and Gelsenberg AG continued integration of their petroleum operations. In the aluminum industry, the Hamburger Aluminium Werke GmbH transferred control of its Hamburg reduction plant to a group headed by Reynolds Aluminium Deutschland Inc. Kaiser Aluminium and Chemical Corp. AG took control of Kaiser-Preussag Aluminium Werke GmbH (KAPAL) fabricating plants.

Some of the more important plants commissioned in 1975 were ATH's two new 100,000-ton-per-year continuous steel casting plants located at Beckerwerth and Ruhrort near Duisburg, the Rheinisch-Westfälisches Elektrizitätswerk AG's 1,200-megawatt Biblis A nuclear powerplant, and the 8-million-ton-per-year Wilhelmshafen refinery of Mobil Oil AG.

Construction of the 115,000-ton-per-year coking plant of the Brikettfabrik Fortuna Nord at Niederaussem near Cologne was continued. Seven mines closed, including one potash, one lead-zinc, two iron, and three coal mines. An open hearth furnace and an oil refinery also shut down.

PRODUCTION

In 1975 production of most minerals and related products decreased owing to falling domestic and foreign demand. Production of selected mineral commodities in the Federal Republic of Germany in 1973, 1974, and 1975 is detailed in table 2.

Table 2.—Federal Republic of Germany: Production of mineral commodities

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Primary nickel and nickel contained in ferronickel, Monel metal, and nickel oxide directly used by the steel industry.

[2] K_2O equivalent of potassic constituent not added to K_2O equivalent of marketable crude and chemically processed potassic fertilizers because this would result in double counting.

[3] Produced in part from imported crude graphite.

[4] Exclusive of slate recovered from mine dumps.

[5] Includes water gas and generator gas from coke ovens.

TRADE

In 1975 the Federal Republic of Germany traded with 151 countries, although the bulk of trade was with the European Economic Community (EEC). Mineral commodities exported included petrochemicals, iron and steel including semifinished products, nonferrous metals including semifinished products, and petroleum products. Principal mineral commodities imported included crude oil, natural gas and petroleum products, nonferrous metals, iron and steel, iron ore, and minerals in that order. The Federal Republic of Germany's trade in 1973 and 1974 is shown in tables 3 and 4.

Table 3.—Federal Republic of Germany: Exports of mineral commodities
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
METALS			
Aluminum:			
Bauxite	6,360	1,255	Belgium-Luxembourg 919; Austria 196.
Alumina	109,935	245,379	Canada 80,724; Netherlands 34,106.
Aluminum hydroxide	105,864	123,398	Sweden 37,316; Netherlands 28,703.
Metal including alloys:			
Scrap	29,519	31,756	Italy 15,134; Netherlands 8,246; France 6,421.
Unwrought	104,580	174,309	Italy 46,314; France 38,897; Netherlands 26,625.
Semimanufactures	211,864	278,173	France 58,674; Netherlands 37,107; Belgium-Luxembourg 30,262.
Antimony:			
Ore and concentrate	29	55	Austria 45.
Metals including alloys, all forms	55	196	Belgium-Luxembourg 114; Netherlands 62.
Arsenic, hydroxide, acids	416	295	India 57; Netherlands 35.
Beryllium metal including alloys, all forms ... kilograms	136	(1)	(1)
Bismuth metal including alloys, all forms	316	274	United States 94; United Kingdom 66; Spain 34.
Cadmium metal including alloys, all forms	245	237	Brazil 9.
Chromium:			
Chromite	3,336	3,679	France 1,541; Austria 1,259.
Oxide and hydroxide	9,449	10,558	NA.
Metal including alloys, all forms	181	331	United States 106; Italy 71; Belgium-Luxembourg 70.
Cobalt:			
Oxide and hydroxide	27	56	Yugoslavia 18; United States 17.
Metal including alloys, all forms	205	286	United Kingdom 64; Sweden 34.
Columbium and tantalum metal including alloys, all forms:			
Columbium ... kilograms	7,609	11,959	Belgium-Luxembourg 9,037.
Tantalum ... do	36,970	59,281	NA.
Copper:			
Ore and concentrate	951	5,015	All to Yugoslavia.
Matte	1,042	--	
Copper sulfate	1,250	1,541	NA.
Metal including alloys:			
Scrap	38,015	41,790	Italy 17,974; Belgium-Luxembourg 8,011; Austria 4,939.
Unwrought:			
Blister	32,785	50,222	United Kingdom 27,970; Belgium-Luxembourg 14,959; Spain 6,916.
Refined	110,701	82,440	Austria 16,263; France 15,385; United Kingdom 9,130; Brazil 8,848.
Alloys	5,866	7,415	Italy 1,554; Austria 1,321; Netherlands 846; France 824.
Master alloys	1,026	1,024	Belgium-Luxembourg 630; France 215.
Semimanufactures	169,288	224,827	France 35,985; Netherlands 31,901.
Germanium metal including alloys, all forms ... kilograms	700	1,900	All to Belgium-Luxembourg.

See footnotes at end of table.

Commodity	1973	1974	Principal destinations, 1974
NONMETALS—Continued			
Diatomite and other infusorial earth	5,098	5,157	United Kingdom 1,484; Netherlands 857; Iran 732; Italy 676.
Feldspar, leucite, nepheline, and nepheline syenite	17,449	22,884	Italy 5,408; France 5,204; Belgium-Luxembourg 3,253; Czechoslovakia 2,862.
Fertilizer materials:			
Crude:			
Phosphatic	7,728	11,902	Hungary 7,900; Italy 1,250.
Potassic	41,258	43,117	Belgium-Luxembourg 33,035; Netherlands 5,355.
Manufactured:			
Nitrogenous thousand tons	1,294	1,579	Belgium-Luxembourg 432; United States 295.
Phosphatic:			
Thomas slag do	35	39	Brazil 16; Austria 16; Netherlands 7.
Other do	8	16	Brazil 7; Hungary 4; United States 3.
Potassic do	108	2,228	Belgium-Luxembourg 512; Denmark 189.
Mixed do	1,078	960	Denmark 109; France 85.
Ammonia, anhydrous do	32	71	Belgium-Luxembourg 30; France 19; Denmark 13; United Kingdom 8.
Fluorspar	17,391	15,907	Belgium-Luxembourg 4,890; Austria 4,746; Finland 3,049.
Graphite, natural	9,259	10,790	Italy 3,228; United States 2,332.
Gypsum and plasters	304,604	333,013	Netherlands 179,035; Switzerland 62,141; Belgium-Luxembourg 44,319.
Iodine	15	52	France 13; Netherlands 7; Italy 6.
Lime	550,453	567,090	Netherlands 464,077; Belgium-Luxembourg 45,554.
Lithium minerals	326	267	NA.
Magnesite	11,609	6,982	France 4,109; United Kingdom 452.
Mica:			
Crude including splittings and waste	832	912	Switzerland 310; Austria 151; Sweden 112; Yugoslavia 91.
Worked including agglomerated splittings	234	303	United Kingdom 83.
Pigments, mineral:			
Natural, crude	6,204	7,315	Netherlands 3,465; Belgium-Luxembourg 1,010; United States 851.
Iron oxide and hydroxide	138,028	152,013	France 22,302; United States 19,503.
Precious and semiprecious stones except diamond:			
Natural kilograms	214,856	176,613	Hong Kong 27,961; Italy 19,348.
Manufactured do	4,916	5,380	Italy 1,877; United States 1,740.
Pyrite (gross weight)	448	594	United Kingdom 299; Argentina 56.
Salt thousand tons	1,631	2,207	Belgium-Luxembourg 1,603; Sweden 308.
Sodium and potassium compounds, n.e.s.:			
Caustic soda do	699	518	Netherlands 125; Australia 74.
Caustic potash, sodic, potassic peroxide do	12	162	U.S.S.R. 36; Italy 16.
Stone, sand and gravel:			
Dimension stone:			
Crude or partly worked:			
Calcareous	3,968	3,109	Austria 483; Belgium-Luxembourg 432.
Slate	19,152	17,968	Netherlands 7,129; Belgium-Luxembourg 5,733; Denmark 3,021.
Other	366,820	267,311	Netherlands 192,282; Switzerland 52,562.
Worked:			
Building and monumental stone	16,579	17,429	Netherlands 4,631; Belgium-Luxembourg 4,492; France 4,210.
Paving and flagstone	28,656	26,592	Netherlands 13,068; Denmark 7,831; France 3,997.
Slate	812	825	Netherlands 394; Belgium-Luxembourg 203; Switzerland 157.
Dolomite	125,391	193,327	France 91,375; Netherlands 71,378; Belgium-Luxembourg 20,428.
Gravel and crushed rock thousand tons	11,060	11,241	Netherlands 8,814; Switzerland 1,262.
Limestone	158	155	Netherlands 130.

See footnote at end of table.

Table 3.—Federal Republic of Germany: Exports of mineral commodities—Continued

Commodity	1973	1974	Principal destinations, 1974
NONMETALS—Continued			
Stone, sand and gravel—Continued			
Quartz and quartzite:			
Quartz crystal ___ kilograms __	47	46	Italy 24; Austria 11.
Other	51,624	63,736	Austria 17,509; France 14,906; Belgium-Luxembourg 7,631.
Sand excluding metal bearing thousand tons __	6,894	7,704	Netherlands 6,486.
Sulfates natural, magnesium sulfate (Kieserite) ___ do ___	450	468	Netherlands 81; Norway 67; Sweden 46.
Elemental:			
Other than colloidal	66,752	140,526	Denmark 66,719; Switzerland 35,319; Austria 15,001.
Colloidal	4,347	3,756	United Kingdom 578; India 433; Republic of South Africa 376.
Sulfur dioxide	10,499	16,301	Sweden 9,629; Belgium-Luxembourg 3,238; Austria 1,951.
Sulfuric acid	563,062	427,349	Netherlands 118,705; Belgium-Luxembourg 111,159; France 105,883.
Talc, steatite, soapstone	5,557	7,115	Denmark 3,517.
Vermiculite, chlorite, perlite	440	639	Austria 396.
Other nonmetals, n.e.s.:			
Crude:			
Meerschaum, amber, jet kilograms __	2,800	1,700	NA.
Pottery	32,189	2,116	Netherlands 10,903; France 7,294; Belgium-Luxembourg 5,966; Austria 3,580.
Other ___ thousand tons __	530	889	Netherlands 735.
Slag, dross and similar waste, not metal bearing:			
From iron and steel manufactures ___ do ___	1,612	3,282	Netherlands 1,653.
Slag and ash, n.e.s ___ do ___	559	913	Netherlands 785; France 101.
Oxides and hydroxides of strontium and barium	4,013	5,804	France 2,074; United States 1,789; Belgium-Luxembourg 582.
Building materials of asphalt, asbestos and fiber cement, and unfired metals, n.e.s	113,944	150,944	France 57,516; Netherlands 34,683.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen natural	1,713	866	Switzerland 196; Austria 188; Italy 120.
Carbon black	89,260	94,385	Austria 14,944; France 12,192; Belgium-Luxembourg 11,477; Poland 10,368.
Coal and briquets:			
Anthracite and bituminous thousand tons __	13,856	17,444	France 6,620; Belgium-Luxembourg 4,838; Italy 3,373.
Briquets of anthracite and bituminous coal ___ do ___	216	239	Belgium-Luxembourg 74; Austria 50; United Kingdom 41; France 34.
Lignite and lignite briquets ___ do ___	601	680	France 249; Austria 171; Belgium-Luxembourg 84; Italy 78.
Coke and semicoke ___ do ___	10,262	13,082	Sweden 865; Netherlands 754; Romania 196.
Gas natural ___ do ___	272	299	Switzerland 133; Netherlands 47; Belgium-Luxembourg 41; Denmark 40.
Helium and other rare gases	17,437	23,135	France 12,195; Italy 4,739; Belgium-Luxembourg 2,829.
Peat and briquets ___ thousand tons __	313	337	Netherlands 177; Switzerland 59; France 41.
Petroleum refinery products:			
Gasoline, motor spirit thousand 42-gallon barrels __	9,478	7,747	Switzerland 3,105; Austria 1,798; Netherlands 1,185.
Kerosine white spirit ___ do ___	9,657	9,316	Denmark 779; United Kingdom 151.
Distillate fuel oil ___ do ___	16,516	13,495	Switzerland 4,813; Netherlands 2,342; Poland 1,334.

See footnote at end of table.

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
MINERAL FUELS AND RELATED MATERIALS—Continued			
Petroleum refinery products—Continued			
Residual fuel oil thousand 42-gallon barrels	26,180	27,140	Denmark 2,759; Sweden 2,648; France 2,167.
Lubricants do	2,592	2,958	Belgium-Luxembourg 621; Sweden 411; United Kingdom 348.
Mineral jelly and wax do	1,077	1,186	Italy 130; Netherlands 97.
Other do	17,325	19,292	Netherlands 5,830; France 4,987.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons	221	359	Netherlands 208; Belgium-Luxembourg 56; France 41.

[r] Revised. NA Not available.
[1] Value only reported at US$57,873, of which an amount valued at $23,149 was shipped to the Netherlands.
[2] Excludes quantity valued at US$72,148, of which $46,298 was shipped to Belgium-Luxembourg.
[3] Less than ½ unit.

Table 4.—Federal Republic of Germany: Imports of mineral commodities
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS			
Aluminum:			
Bauxite thousand tons	2,749	434	Guinea 47; Denmark 42.
Alumina	374,161	499,149	Surinam 145,776; Italy 139,522; Australia 139,219.
Aluminum hydroxide	2,596	1,570	United States 1,212; France 232.
Metal including alloys:			
Scrap	86,440	77,170	Netherlands 17,129; United States 9,853; Austria 8,851.
Unwrought	392,986	338,942	Norway 129,315; Netherlands 48,105; France 32,004.
Semimanufactures	162,272	144,955	France 43,924; Belgium-Luxembourg 37,658; Netherlands 27,446.
Antimony:			
Ore and concentrate	3,012	3,369	Turkey 2,090; Bolivia 932.
Metal including alloys, all forms	1,377	924	Belgium-Luxembourg 516; Italy 193.
Arsenic hydroxide	751	975	France 500; Belgium-Luxembourg 276; United States 121.
Beryllium metal including alloys, all forms kilograms	2,966	5,384	United States 4,663; Switzerland 465.
Bismuth metal including alloys, all forms	215	129	Japan 30; Netherlands 21.
Cadmium metal including alloys, all forms	1,249	1,094	Belgium-Luxembourg 280; U.S.S.R. 255; Japan 233; Bulgaria 108.
Chromium:			
Chromite	508,692	386,545	Republic of South Africa 175,586; U.S.S.R. 82,403; Turkey 55,980; Finland 35,787.
Oxide and hydroxide	2,556	1,309	U.S.S.R. 1,159.
Metal including alloys, all forms	292	551	France 183; Japan 164; United States 75.
Cobalt metal including alloys, all forms	1,681	1,956	Zaire 535; Belgium-Luxembourg 529; United States 475; Norway 191.
Columbium and tantalum metal including alloys, all forms:			
Columbium kilograms	4,504	6,349	United States 4,495; United Kingdom 1,300.
Tantalum do	98,145	89,107	United States 62,800.
Copper:			
Ore and concentrate	514,806	571,146	New Guinea 141,675; Chile 91,397; Republic of South Africa 68,112.
Matte	893	743	United Kingdom 384; Burma 349.
Copper sulfate	9,859	7,563	France 4,078; Belgium-Luxembourg 1,594.
Metal including alloys:			
Scrap	116,655	106,534	France 22,531; Netherlands 16,777; United States 11,728; United Kingdom 11,290.

Unwrought:			
Blister	121,169	98,160	Republic of South Africa 51,530; Peru 16,116; Chile 11,076.
Refined	401,792	440,025	Chile 87,115; Zambia 80,306; Belgium-Luxembourg 62,551.
Alloys	50,942	32,693	Romania 3,627; Poland 2,625; U.S.S.R. 2,373; Czechoslovakia 2,241.
Master alloys	1,688	1,500	United Kingdom 1,139.
Semimanufactures	117,506	674,602	Belgium-Luxembourg 106,651; Chile 98,462; Zambia 81,802.
Gold:			
Ashes, residue, and scrap kilograms	146,223	221,457	United States 102,625; Switzerland 26,609; Netherlands 23,743.
Metal:			
Unwrought thousand troy ounces	2,653	3,123	Switzerland 885; United States 677; United Kingdom 546; Republic of South Africa 494.
Semimanufactures do	123	166	Switzerland 76; United States 59; France 15.
Iron and steel:			
Ore and concentrate thousand tons	50,325	57,720	Sierra Leone 710; Republic of South Africa 659; India 563.
Roasted pyrite do	752	792	Spain 515; Belgium-Luxembourg 181.
Metal:			
Scrap do	1,480	1,811	Belgium-Luxembourg 342; France 264.
Pig iron including cast iron do	228	189	France 61; Netherlands 30; Norway 22.
Sponge iron, powder and shot do	37	40	France 13; United Kingdom 9.
Spiegeleisen	1,498	351	Belgium-Luxembourg 261; Italy 71.
Ferroalloys:			
Ferrochrome thousand tons	79	81	Republic of South Africa 40; Japan 7.
Ferromanganese do	182	167	France 68; Norway 58; Belgium-Luxembourg 22.
Ferronickel do	55	56	New Caledonia 26; Greece 19; Dominican Republic 5.
Ferrosilicon do	145	134	Norway 59; France 41.
Ferrosilicochrome do	20	22	Republic of South Africa 12; France 2.
Ferrosilicomanganese do	75	73	Norway 53; Czechoslovakia 8.
Other do	15	189	France 89; Belgium-Luxembourg 41.
Steel, primary forms do	2,296	2,035	Netherlands 507; Belgium-Luxembourg 502; Austria 245.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	3,178	2,528	France 562; Italy 140.
Universals, plates, sheets do	3,790	2,974	France 705; Austria 201.
Hoop and strip do	569	484	Belgium-Luxembourg 240; France 108; Netherlands 75.
Rails and accessories do	29	18	Netherlands 9; France 3; Belgium-Luxembourg 1.
Wire do	184	176	Belgium-Luxembourg 81; France 46; Czechoslovakia 18.
Tubes, pipes, fittings, do	617	558	Netherlands 169; France 81; Belgium-Luxembourg 74.
Castings and forgings, rough do	34	34	Romania 11; Netherlands 5; Belgium-Luxembourg 4.

Table 4.—Federal Republic of Germany: Imports of mineral commodities—Continued

COMMODITY REVIEW

METALS

Aluminum.—In 1975 the Federal Republic of Germany's nine reduction plants had a total capacity of about 755,000 tons per year.[3] The country's leading primary aluminum producer was the Vereinigte Aluminium Werke AG (VAW), which accounted for almost half of the total; five other producers accounted for the remainder.

There were a number of industry developments in the aluminum industry during the year. Kaiser Aluminium and Chemical Corp. acquired the remaining 50% interest in the prefabricating facilities of KAPAL. Hamburger Aluminium Werke sold its Hamburg reduction plant on a 22½-year installment plan to a group consisting of Reynolds Aluminium Deutschland, Vereinigte Aluminium Werke, and Vereinigte Metallwerke Ranshofen-Berndorf AG.

The Leichtmetall GmbH announced its intention to sell its 50% interest in its Essen reduction plant. Finally, Gebrüder Giulini GmbH declared its intention to seek partners to operate its 143,000-ton-per-year Ludwigshafen reduction plant on the Rhine River.

Reduced domestic and foreign demand resulted in a poor year for the aluminum industry by 1974 standards. Although production of primary aluminum was affected

[3] U.S. Embassy Düsseldorf, Federal Republic of Germany. State Department Airgram A-34, Mar. 19, 1976, p. 4.

only slightly, with plants running under nine-tenths of capacity, semifabricated and secondary producers suffered major declines. At $0.45 the 1975 selling price of West German aluminum was only 7% higher than in 1969.[4]

Iron and Steel.[5]—In 1975 the Federal Republic of Germany remained Europe's largest and the world's fourth largest steel producer, although the country's steel industry was hard hit by world recession. Increased production costs and tumbling selling prices resulted in sizable steel mill operation losses. Average utilization rates of plants were an estimated 64% in 1975. Of the country's raw steel output, basic oxygen plants accounted for about 69%; open-hearth plants, 17%; electric furnaces, 13%; and Bessemer plants, 1%.

The steel industry was comprised mainly of 13 integrated and 4 semiintegrated steel companies, 6 ministeel works, 24 specialty product makers, 9 tube and pipe manufacturers, and 15 various firms including rerollers and strip coaters. In 1975 the average number of persons employed in the iron and steel industry was approximately 486,000, including about 311,000 in the iron and steel works. Furthermore, the iron ore mines employed 2,550 persons.

In 1975 the Federal Republic of Germany was heavily dependent on iron ore supplies imported from Brazil, Australia, Sweden, Libya, and 19 other countries. Dwindling domestic production supplied less than one-tenth of requirements.

Industry developments in 1975 included the consolidation of the leading position of the ATH, the western world's sixth largest steel group, with the acquisition of Rheinstahl AG, Essen. Rheinstahl Hüttenwerke was renamed Thyssen Heinrichshütte and operates as one of the three integrated steel companies within the Thyssen group, the others being ATH itself and Thyssen Niederrhein AG. Following the Rheinstahl purchase, ATH took the opportunity to realize an important merger in the special steel sector, bringing together two of Germany's three largest producers in the field—its own subsidiary, Deutsche Edelstahlwerke (DEW), and Rheinstahl's Edelstahlwerke Witten. The new grouping is known as Thyssen Edelstahlwerke AG.

The Neunkirchen Eisenwerke AG and Otto Wolff AG, Köln, agreed to place the steelmaking interests of both companies under joint management.

The Common Market Commission authorized Friedrich Krupp Hüttenwerke AG, the steelmaking subsidiary of Fried. Krupp GmbH, to acquire 96% control of the Stahlwerke Südwestfalen AG, a specialty steel producer. In 1975, Südwestfalen's main shareholders were Hoesch Werke AG, another steelmaker; Allianz Versicherungs AG; and the Agricola Verwaltungs AG, a banking concern.

In another decision, the Common Market Commission ruled that a proposal to set up a subsidiary by Korf–Stahl AG of Baden-Baden and a French firm, Sacilor Acieries et Laminoirs de Lorraine S.A., did not violate EEC competition rules. The new subsidiary, Acieries et Laminoirs du Rhin S.A. of Ottmarsheim, south of Heilbronn, was to have an annual capacity of 450,000 tons of wire rods.

In 1975, ATH commissioned two new 100,000-ton-per-year continuous slab casting plants, one at its Beeckerwerth works and the other at Ruhrort, both near Duisburg. Furthermore, Fried. Krupp Hüttenwerke commissioned two 300-ton oxygen converters at its Rheinhausen steelworks.

Peine-Salzgitter AG (PS) ordered a 1.8-million-ton-per-year pig iron blast furnace from Demag AG. The furnace was to be commissioned in 1977 at PS's steelworks at Salzgitter, south of Braunschweig. Fried. Krupp Hüttenwerke also ordered a similar 1.8-million-ton-per-year blast furnace.

Stahl and Walzwerk Lübeck, a newly formed company, placed orders for a ministeel plant to be located at Travemünde on the Baltic. The plant will comprise initially a 70-ton electric arc furnace and a six-strand continuous casting machine for making billets.

In November 1975, ATH closed down one of its last open-hearth melting furnaces, at Ruhrort near Duisburg. This completed the conversion of the plant to the Linz-Donawitz (LD) steelmaking process. Previously, the Stahlwerke Röchling-Burbach GmbH had closed down its last basic bessemer steelmaking plant at Burbach near Saarbrücken, when commissioning a second 100-ton LD converter. In addition, the Eisenwerk Annahütte Alfred Zeller, the Bavarian semiintegrated steel company, terminated operations at its works at Hammerau, Oberbayern.

[4] Page 5 of work cited in footnote 3.
[5] U.S. Embassy, Düsseldorf, Federal Republic of Germany. State Department Airgram A-87. June 11, 1976, p. 6.

After exhaustion of ore reserves in the St. Anna pit, Eisenwerk Gesellschaft Maximilianhütte brought into production the 180,000-ton-per-year Eichelberg mine west of Nürnberg in northern Bavaria.

Lead and Zinc.—In 1975, a major event of the Federal Republic of Germany's lead and zinc industry was the closing of the Ramsbeck mine in Sauerland, North Rhine, Westphalia. Exploration work at the Ramsbeck mine continued, aimed at finding workable ore deposits believed to exist there.

In 1975, lead and zinc ore production decreased slightly. Smelter production of lead metal had to be cut by about one-fifth and that of zinc by one-fourth compared with 1974 production because of lesser consumer demand.

Three companies—Preussag Aktiengesellschaft Metall, Sachtleben Bergbau GmbH, and AG Des Altenbergs für Bergbau und Zinkhüttenbetrieb—operated the Federal Republic of Germany's four lead and zinc mines and beneficiation plants: Blei-Zinkerz-Bergwerk Lüderich near Cologne; Metallerz-, Schwefelkies und Schwerschpatbergwerk Meggen near Lennestadt; Erzbergwerk Rammelsberg near Goslar, Harz; and Erzbergwerk Grund in the same area. Some copper concentrate was also produced from the ores. About two-thirds of the lead ores and about one-half of the zinc ores used for metal production were imported in 1976.[6]

NONMETALS

Cement.—In 1975, production of cement decreased further under the influence of the low level of activity in the building industry. As utilization of plant and equipment was only about 60%, any investments made were restricted to the most essential replacements and economy measures.[7] At yearend 1975, 61 companies operated 86 cement plants in the country.

Fertilizer Materials.—In 1975, the Federal Republic of Germany remained one of West Europe's major potash producers and exporters, although there were some cutbacks in potash production due to lesser demand.

Kali and Salz AG, a subsidiary of Badische Anilin und Soda Fabrik AG, was the country's major potash producer. The company controlled eight mines, five of which were in the Hannover area. Production capacity of the Sigmundshall potash mine near Kassel was enlarged by 200,000 tons per year. The company's largest mine was the over-6-million-ton-per-year Wintershall mine.

Kali Chemie AG, a subsidiary of Solway & Co., S.A. of Belgium, operated only the Friedrichshall mine near Hannover after June when its Ronnenberg mine at Ronnenberg had to be abandoned after water flooding. The disaster destroyed a capacity of 800,000 tons of potash salt per year.

In 1975 nitrogen production was decreased to cope with slack demand both at home and abroad. The Federal Republic of Germany's nitrogen industry was controlled by six companies with a total installed anhydrous ammonia capacity of 2.95 million tons in 1975. A large portion of the industry was concentrated in the hands of three major chemical concerns, Badische Anilin und Soda Fabrik AG (BASF), VEBA Chemie AG, and Hoechst AG, these three accounting for two-thirds of the industry's installed nitrogen capacity in 1975. The industry was heavily concentrated in the Ruhr region and depended largely on imported hydrocarbons as a feedstock.[8]

VEBA Chemie AG was granted a license by Fried. Uhde GmbH, Dortmund, to build a 548,000-ton-per-year ammonia plant at Brunsbüttel at the western end of the Kiel Canal.

Sulfur.—Production of recovered sulfur continued to increase and is expected to grow even further as more planned plant capacity comes onstream. Ruhrchemie AG has awarded a contract to Davy Powergas GmbH for the construction of a Claus plant for converting refinery gases to elemental sulfur.

Sulfuric acid production, relying heavily on imported brimstone, decreased due to lessened domestic and foreign demand.

MINERAL FUELS

Bituminous coal, lignite, and to a lesser extent natural gas, crude oil, and hydroelectric power were the main primary energy sources produced in the Federal Republic of Germany in 1975. They supplied somewhat less than half of the country's energy requirements. The re-

[6] Fachvereinigung Metallerzbergbau E.V., (Düsseldorf). Annual Report and Statistics. 1975. P. 3.

Coal.—In 1975, the Federal Republic of Germany was one of Europe's major coal producers with about one-fifth of the continent's total. In addition, the Federal Republic of Germany was a net coal exporter. Domestic coal supplied almost one-third of the country's energy requirements. Import quotas and subsidized coal prices helped to support production of bituminous coal. However, production declined, while lignite production decreased for the first time since 1971.

In 1975, there were 46 coal mines, 25 coking plants, 6 briqueting plants, and 31 coal-fired powerplants in the Federal Republic of Germany's bituminous coal industry.[9] The industry was controlled by 15 companies, including 11 in the Ruhr, 2 in the Aachen area, and 1 each in Saarland and Lower Saxony. The industry's largest industrial group was the Ruhrkohle AG (RAG), controlling more than three-quarters of the Federal Republic of Germany's bituminous coal production and 6 out of 11 of the Ruhr's companies.[10] At yearend 1975, employment in the country's bituminous coal industry was about 206,000 persons.

The Federal Republic of Germany's lignite industry was controlled essentially by four large companies, located one each in the Rhineland, Lower Saxony, Hesse, and Bavaria. The largest among them was the Rheinische Braunkohlenwerke AG in the Rhineland, accounting for more than 76% of the country's lignite production. Employment in the lignite industry at yearend totaled about 20,000 persons.

Industry Developments.—The Federal Republic of Germany continued to uphold the concept last set forth in 1972 in the Third Electrification Law, requiring industry to buy 30 million to 33 million tons of bituminous coal per year through 1980. Actually, industry is expected to take only 28 million tons in 1976, of which 2 million are for stocks. The German consumer carries the cost of the subsidy for inducing the power industry to use more domestic coal in the form of a tax of 3.5% levied on power sales, to be raised temporarily

[9] Coal Statistics, Inc. (Statistik der Kohlenwirtschaft e. V.) (Essen). Zahlen zur Kohlenwirtschaft. V. 105, March 1976, p. 17.
[10] Verlag Glückauf GmbH. Yearbook of Mining 1976 (Jahrbuch für Bergbau, Energie, Mineralöl und Chemie, 1976). Essen, 1976, p. 942.

to 4.5% in 1976 and 1977. The bill also increases incentives to encourage industry to build 6,000 megawatts of new coal-fired generating capacity. The bill provides for investment grants of $61 to $73 per kilowatt-hour of new installed capacity.

Rapidly growing pithead stocks reached about 15 million tons by yearend, causing serious financial problems to the Federal Republic of Germany's coal industry. The industry was expecting to receive additional Government aid amounting to about $80 million to carry part of the cost of stockpiling.

Saarbergwerke AG's 1975–79, 5-year investment plan earmarked $163 million for new plant and equipment in the Saar. The main items were $27 million for a new incline and coal storage facilities at the Ensdorf mine in the Saar, $43 million for miscellaneous mechanized mining equipment, $11 million for pollution control at the Fürstenhausen, Saar, coking plant and at three other company powerplants, and $6 million for the company's coal gasification project.

The Rheinische Braunkohlenwerke AG voted to raise its capital from $93 million to $134 million. The company ordered a $40 million, 240,000-cubic-meter-per-day bucket wheel excavator from the Maschinenfabrik-Augsburg-Nürenberg (MAN). Construction continued on a new-type 115,000-ton-per-year lignite coking plant at Brikettfabrik Fortuna Nord, Niederaussem, near Köln. The company continued planning operations of a large open pit mine near Hambach, west of Köln. Overburden was to be dumped into the depleted Frechen and Fortuna-Garsdorf mines. The company's long-range investment plan provided for $4.5 billion over a period of 14 years (1990).

Preussag AG decided to close down the Westfeld mine at the Steinkohlenwerke Ibbenbüren, North Rhine, Westphalia, in 1975. Capacity of the company's larger Ostfeld mine at the same location was to be increased by 1978.

After 2 years of negotiations, the Federal Republic of Germany concluded a treaty with East Germany for exploiting the lignite deposits at the common border area of Helmstedt-Harbke, containing an estimated 15 million tons of recoverable reserves.

Construction of Steag AG's Voerde and Möllen, North Rhine, Westphalia, coal-fired powerplants of 700 megawatts each was temporarily suspended by the Düsseldorf Administrative Court's Third Chamber for environmental reasons.

Nuclear Power.—In 1975 the Federal Republic of Germany was among the world's leading nations in the field of nuclear powerplant technology, research, and development. With the commissioning of the 1,200-megawatt nuclear powerstation, Biblis A, in Biblis in April 1975, the country's nuclear industry had created a standard model suitable for export.

On January 1, 1976, the Federal Republic of Germany had 10 nuclear powerplants with a total capacity of 3,494 megawatts. Furthermore, 12 plants (total capacity, 11,975 megawatts) were under construction, and 14 additional power stations with a total capacity of 17,959 megawatts were in the planning stage. In the following six installations, under construction at yearend, the reactors were scheduled to become critical during 1975:[11]

	Megawatts
Biblis B	1,300
Neckar GKN–1	855
Brunsbüttel KKB	806
Unterweser KKU	1,300
Isar KKI	907
Philipsburg KKP–1	900

Petroleum and Natural Gas.—In 1975, the Federal Republic of Germany remained Western Europe's largest consumer of crude oil and petroleum products, accounting for about one-fifth of the total, although consumption had decreased for the second consecutive year. The Government-controlled firms, VEBA and Gelsenberg, continued to integrate their petroleum operations. VEBA lost money again ($100 million in 1975), but the company hoped to improve its competitive position by investing some $4 billion to $5 billion over the next 5 years in energy-related projects.

In 1975 the most important organizations in the petroleum industry were the Aussenhandelsverband für Mineralöl (AMF), a trade association of petroleum companies active in foreign trade; the Bundesverband Freier Tankstellen und Unabhängiger Mineralölhändler (BFT), the association of independent filling stations and merchants; the Mineralöl Zentral-

[11] Atomwirtschaft, (Atomic, Energy), Düsseldorf). March 1976, as reported in FSD A–135 (Frankfurt), July 1, 1976, p. 19.

verband (MZV), a central association for petroleum firms; UNITI, an association of middle-sized petroleum firms; and the Mineralölwirtschaftsverband, the main official organization of the whole petroleum industry. About 700 firms were members of these organizations, including about 100 that were in some competition with several of the major international companies active in the Federal Republic of Germany. They controlled only about 20% of the petroleum market; therefore, the effect on pricing was small. Only developments in the Government-sponsored oil companies, VEBA and Deminex Deutsche Erdölversorgungsgesellschaft mbH (Deminex), have any chance of affecting overall petroleum industry operations, which are dominated by the major international companies active in the Federal Republic of Germany.

The oilfields of the Federal Republic of Germany require secondary and tertiary exploitation. Recoverable proven and probable crude oil reserves on the Federal Republic of Germany's mainland were estimated at about 70 million tons[12] in 1975. Drilling during the year totaled about 220,000 meters. According to experts, a discovery of major new oilfields on the mainland is not expected. Deutsche Texaco AG led a consortium of seven companies for performing a deep exploration program. This program was started with three wells, the Miesbach 1, Bavaria, and the Vepke-Asse, and Devon 1 wells south of Wolfsburg. The Mölln Tief 1 was to be started in 1976 for surveying Schleswig-Holstein's pre-Permian subsoil to a depth of 7,000 meters.

There were plans to step up exploration in the West German sector of the North Sea. Drilling continued at the A–6–2 well and another was planned 125 kilometers northwest of the island of Borkum in the Newcomer Block H–4.

State-controlled Deminex was active in petroleum exploration and development abroad. In 1975 the company was involved in 22 exploration projects in 14 countries, covering concessions of almost 220,000 square kilometers, one-half of it offshore.

Refineries in the Federal Republic of Germany utilized only about 62.2% of capacity. This was due to lesser demand and also imports of light petroleum products. In 1975, 22 companies controlled 33 refineries with a total capacity of about 153.9 million tons per year. The 8-million-ton (throughput) Wilhelmshafen refinery of Mobil Oil AG started operations during 1975. Erdölraffinerie, Ingolstadt, reported a 1-million-ton capacity increase of its refinery, while Esso AG, Karlsruhe, reported a capacity of 1 million tons less than previously. Closing of Mobil Oil's Bremen refinery and Elf Bitumenwerke GmbH's crude oil distillation plant was also reported. There were plans to close down one of VEBA Chemie's older plants near Gelsenkirchen.[13]

Most of the Federal Republic of Germany's crude oil imports were transported from the major pipeline terminals in the Mediterranean and the North Sea directly to inland processing plants. The terminals were those of Wilhelmshafen, Trieste, Genoa, Marseilles, and Rotterdam.

The Mineral Industry of Ghana

By Janice L. W. Jolly [1]

The 1975 mineral industry of Ghana consisted of bauxite, diamond, gold, and manganese mining; salt and cement production; and refinery production of aluminum and of petroleum products from imported raw materials. Production increased compared with that of 1974 for manganese (48%) and petroleum refinery products (7.3%), but decreased for bauxite (21.4%), aluminum (8.9%), diamond (9.5%), and gold (7.6%).

Guidelines for the Government's new 5-year development plan (1975–1980) were announced early in 1975, although the plan itself was not expected to be implemented until 1976. The plan aimed at building an independent economy structured on resource potential. The development of the industrial sector was to involve rehabilitation of existing industries as well as establishment of new ones. The Kpong dam and hydroelectric scheme was to be a major project in the plan. Ghana will require this new source of power by 1981 when existing sources are expected to become fully utilized. Costs were now estimated at about $250 million,[2] of which 80% would be foreign exchange costs. In the mining sector, the plan was geared toward solving problems relating to marketing arrangements and shortages of equipment. Intensification of prospecting for new deposits, modernization of present exploitations, and reactivation of abandoned mines were all being considered. Exploitation of the Kibi bauxite deposit and creation of an aluminum industry complex were cited as major development interests. The main problems set forth in the guidelines were high urban unemployment, shortages of skilled labor, inadequate training facilities, and low labor-absorptive capacity in the modern sector of the economy. Domestic inflation persisted at about 25% annually, reflective of external influences such as costs for imported oil and food. Import problems continued into 1975 as a result of rising imported oil prices and the resulting cutback in import licenses initiated in 1974. A decline in per capita gross domestic product (GDP) was expected to continue from 1975 through 1976 as resources available to finance imports were only sufficient to support a 2% GDP growth while the population was increasing 2.9%.

The Government published a new Investment Policy Decree on April 24, 1975, establishing a policy of majority participation and Ghanaianization in much of the mining industry. According to the decree, the mineral-extraction industries (except oil and bauxite) should be 40% Ghanaian if valued below $435,000; if valued above this level, at least 55% should be owned by the Ghanaian State. All foreign enterprises were expected to set up training to allow Ghanaians to take over from expatriates. Firms extracting or processing bauxite and alumina must give the Ghanaian State a share not exceeding 30%, and must allow a share not exceeding 20% in petroleum production. The share in each case was to be determined by the National Redemption Council (NRC). An Investment Policy Implementation Committee (IPIC) was to be appointed by NRC to implement the decree and share responsibility for finance. Where the decree requires sale of part or full ownership to Ghanaians, that part of the capital shall be vested in IPIC, which shall determine

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from the Ghana new cedi (N¢) to U.S. dollars at the rate of 1N¢ = US$0.8696.

the maximum price and act as intermediary. All businesses affected by the decree were asked to provide the IPIC with details of their operations not later than August 31. The final date for implementation of the Investment Policy Decree was first set at December 31, 1975, but later changed to June 30, 1976.

Ghana established a joint agency with Togo and Dahomey to supply electrical power from Akosombo. Ghana agreed to make available 50 megawatts of electricity for a continuous period of 115 years. In line with the policy of economic cooperation in the West African subregion, the Volta River Authority (VRA) was considering interconnection of the hydroelectric power systems of Ghana and Ivory Coast. At yearend 1975, VRA was inviting tenders for civil engineering works at the proposed Kpong damsite on the Volta River, which would include a 75,000-cubic-meter concrete spillway to accommodate 15 radial gates, earth-fill abutment dams of 1,300,000 cubic meters, and a conventional power station to accommodate four 40-megawatt generating units.

A fact-finding European Communities (EC) delegation visited Ghana to discuss EC's technical and financial cooperation for 1976–80 under the Lome Convention. At the end of the visit, it was announced that the European Investment Bank (EIB) would assist the cooperative cement project of Ghana, Togo, and the Ivory Coast to be located in Togo. EIB was to loan $7 million to help finance construction of a clinker-production plant and installations at the Tabligo, Togo, limestone quarry. The World Bank also agreed to grant a $49.5 million loan to the West African Cement Co. for construction of its plant at Tabligo. In addition, the World Bank was to grant each participating country $3.5 million to acquire equity shares in the venture. Construction was to begin in January 1976, and the plant would be commissioned in 1979.

PRODUCTION AND TRADE

Mineral commodity production, excluding petroleum refinery production, was valued at $241 million in 1975 compared with an estimated $255 million for 1974. The value of aluminum refinery production was estimated at $126 million, bauxite at $3.7 million, diamond at $12 million, gold at $83 million, manganese ore at $14.7 million, cement at $450,000, and salt at about $7,000 for 1975.

Ghana Supply Commission, the sole importer of crude oil and chief exporter of petroleum products, imported 8.6 million barrels of crude petroleum for use in the Tema refinery in 1975. Crude petroleum was imported from the U.S.S.R., Nigeria, and Libya. Petroleum products (liquefied petroleum gas and fuel oil) were exported to Nigeria and the United States.

Imports increased from $460 million in 1973 to $822 million in 1974. There was a slight improvement from the 1974 situation as imports declined to $805 million in 1975. By mid-1975, import licenses for 1976 were being issued in advance to help alleviate supply problems. Allocations were being made insofar as the balance of payments permitted and were sufficient to keep factories running. The Bank of Ghana and the Ghana Manufacturers' Association were also supporting an export drive, and a research and technical services unit was set up to explore domestic and particularly foreign markets for locally produced goods. Exports in 1975 were valued at $820.5 million compared with $754.8 million in 1974, producing a badly needed trade surplus.

The export levy on gold of $2.18 per each troy ounce over 100,000, which was instituted in 1973, was raised to $2.61 in the budget proposal for fiscal year 1974–75. The levy was raised to obtain additional revenue for development programs and because the price of gold continued at a high level. An export permit is required for most items leaving Ghana. Export-control measures were adopted to encourage and protect industrial processing firms such as those utilizing the limited local supply of ferrous scrap. The majority of ferrous scrap was used by the Government-owned Tema Steelworks, which produced steel bars.

Ghana was to provide storage facilities for Nigerian goods that could not be located at Lagos because of port congestion in 1975. Building materials and cement were to be diverted to Ghana for transport by road to Nigeria. The agreement was a starter for the treaty signed by the Economic Community of West African States (ECOWAS) in Lagos on May 28.

Ghana also became a designated beneficiary under the U.S. Generalized System of Preferences (GSP) of the Trade Act of 1974; the new status is to be implemented on January 1, 1976. Based on 1974 Ghanaian exports to the United States, 25 important Ghanaian products valued at $2.1 million would enter the United States duty free under GSP, bringing to 59% the total duty free U.S. imports from Ghana.[3] In recent years, the United States has been in second or third place among Ghana's suppliers. In the first half of 1975, the United States moved into first place, accounting for 15% of Ghana's imports.

COMMODITY REVIEW

METALS

Aluminum.—Plans were finalized for expansion of the Volta Aluminium Co. Ltd. (VALCO) by Kaiser Aluminum & Chemical Corp. of the United States. The plant is now estimated to cost $65 million and be completed by late 1976. The new and 5th pot line was to increase capacity by 50,000 tons for an annual total of 198,000 tons. Kaiser Aluminum and Reynolds Metals Co. were to provide $16 million of the total expansion cost and the rest ($49 million) was to come from five other private U.S. and Ghanaian sources. Additional electrical power needed has been arranged for with VRA. VALCO imported its alumina from the United States, Jamaica, and Australia.

Bauxite and Alumina Study Co., Ltd. (BASCOL), the Ghanaian Government, and Kaiser Aluminum were proceeding with feasibility studies concerning development of the Kibi bauxite deposits and accompanying alumina plant. The Japanese company Aluminium Resources Development Co. (ARDECO) spent 1975 negotiating on the project, but at yearend was expected to withdraw. Aluminum demand declined 30% in 1975. At yearend, aluminum producers were hoping that the worst of the slump was over, and a modest improvement in shipping volume was beginning.

Ghana Bauxite Co. Ltd. (GBC) operated Ghana's only bauxite mine near Awaso. Bauxite from this mine was shipped to the United Kingdom, the United States, and Canada for processing.

Gold.—The State Gold Mining Corp. (GMC) was engaged in a development and exploration program that was expected to cost $173 million for its mines at Tarkwa, Prestea, Konongo, and Dunkwa. Prospecting was started at Busenchem near Prestea and Pepe near Tarkwa. Restoration of the Obenemase mine in the Ashanti Region was also forecast. The gold mines of Nangodi, closed since 1941, may also be reopened. Gold deposits of interest were also discovered near the small village of Same, where a mine had existed but was abandoned in 1972.

Ghana and the United Nations Development Program (UNDP) signed the first four agreements under which UNDP will assist GMC in exploring for new gold deposits. Investment in this program amounted to $3.9 million.

Prospecting was also being carried out in the Central Region near Twifu-Hemang for gold, diamond, and other minerals. A contract was awarded to Parolle Ltd., of the Reyrolle Parsons Group, Newcastle upon Tyne, United Kingdom, for supply of electrical plant items for a substantial extension to the power-distribution system at Prestea mine. The extension was scheduled for completion in 1977. A new 55-kilovolt substation and extensions to the two existing 55-kilovolt installations will be provided.

The Commissioner for Lands and Mineral Resources commissioned a new shaft for the Obuasi mine of the Ashanti Goldfields Corp. (AGC) Ghana Ltd., on July 26. The shaft, which will cost $3.2 million to construct, is expected to provide a hoisting capacity for up to 50,000 tons of rock per month. The shaft depth will be 7,000 feet. The installation will require a surface refrigeration plant with a cooling capacity of 4,000 ice tons. The life expectancy of the mine was placed at a minimum of 15 years. Gold reserves at AGC were estimated to be 3.8 million tons. The corporation was processing 45 bars per month of refined gold, which was expected to increase as AGC's 9,000 employees geared up to work weekends to raise output. The Government was encouraging the increase in gold output to take advantage of the relatively high world price for gold.

Iron.—Interest continued in the investigations of the iron deposits at Shieni and Opon Manso and their potential. The Government was studying the possibility of an iron-steel complex at Opon Manso. Construction of a $2.6 million steel plant was in progress at Takoradi as an investment by the Ghana National Investment Bank and a West German firm. The plant will function in part from local iron scrap and was forecast to have a production of 30,000 tons per year. Ghana's steel plant at Tema experienced a strike lasting several weeks, but by yearend employees were back at work. Th first phase of automatization of the plant was complete, and the extension work in progress was to permit doubling production to about 30,000 tons per year. Approximately $4.3 million was now estimated as necessary for complete rehabilitation of the Tema Steelworks. Up to $1.3 million had already been invested to recondition the wire mill and foundry.

NONMETALS

Diamond.—Ghana's diamond output continued to come mainly from the concession of Ghana Consolidated Diamonds Ltd. (GCDL). The other two firms, Cayco (Ghana) Ltd. and Dunkwa Goldfields, were small diamond producers and are no longer active. Around 90% of Ghana's diamond production is of industrial quality. GCDL is owned 55% by the Government and 45% by the British firm, Consolidated African Selection Trust (CAST), and operates mines in the Eastern Region, about 65 miles from Accra. The company was to acquire an additional concession adjacent to the present area, but mining in the new area will not be started until the present operations are no longer profitable. There are many small private diamond diggers licensed by the Ministry of Lands and Mineral Resources. Their annual production is about 150,000 carats. Diamond Marketing Corp. (DMC), a government company that markets all diamond production, handles sales of GCDL and purchases the output of private diggers. Sales, held three times a year, are made by tender to buyers registered with the DMC. No plans are being made to increase output in 1976; production is expected to remain at its present level.

Limestone and Cement.—Limestone deposits, with reserves estimated at 3.5 million tons at Aseswa in the Eastern Region, are to be entrusted for exploitation to the Development Corporation of that region. Available recognized resources of limestone, including Nauli, Bonga Da, Buipe, and Aseswa, exceed 600 million tons, and prompted the Ghanaian Government to propose participation by Norwegian investors in their development. Meanwhile, Ghana Cement Works signed a 3-year contract with Norwegian and Swedish companies for providing clinker, which is needed for its crushing plant at Tema.

Quarry Stone.—Two large stone quarries were opened in Ghana at Akaklu (district of Ho) and Alavanyo (district of Kpandu).[4]

MINERAL FUELS

Petroleum.—On January 10, Shell International Petroleum Co., Ltd. signed an oil-prospecting agreement for the Voltaian Basin near Attebubu in the Brong-Ahafo Region. The company was incorporated in Ghana and was called Shell Exploration and Production Co. The area prospected will cover 11,000 square miles in 10 selected inland areas. Preliminary seismic studies were to be carried out. The Commissioner for Lands and Mineral Resources announced that the terms of the existing oil-exploration agreement drawn up in 1968 with various exploration companies should be liberalized to attract more prospectors in view of the heavy expenditures involved in oil exploration. Among the new terms being introduced are the duty-free importation of oil-exploration equipment and a guarantee for the repatriation of profits. Should government participation in an oil company be necessary, participation would be up to 20%.

In 1975, there were 10 exploration companies searching for gas and oil in Ghana. Amoco Ghana Exploration Co. (Amoco) signed an option to acquire a 50% interest from Oceanic in an offshore block and had started drilling in the Tano Basin, 18 miles offshore in 200 feet of water with the jack-up rig "Mercury." Phillips Petroleum Co. acquired a full interest in an oil-prospecting license covering several offshore blocks, and also became operator for the Mobil group after completion of the Cape Three Points 1 well by Zapata. Volta Petroleum Co., Ltd., relinquished its permit in the Keta Basin adjacent to the Togo border. Zapata was granted an exploration license for offshore blocks 18, 19, and 20. Amoco, as operator for itself and Burmah Oil Company, Ltd. spudded Burmah 10-4 in the vicinity of the 10-1 Signal Exploration and Development Co. discovery. Amoco conducted a month of marine seismic work. Phillips shot 1,899 line miles of marine reflection surveys in their recently acquired permit, and 284 line miles on the Cape Three Points acreage.[5] Exxon Corp. discovered petroleum just north of Ghana in an Ivory Coast Field where none had previously been found.

Mobil Oil Ghana Ltd. was to join the Government in a $2 million venture to establish two ports on Volta Lake for speeding oil supplies to the area. The Government of Ghana authorized the Ghana Supply Commission to construct an asphalt plant, costing $8.7 million, near the petroleum refinery at Tema. The construction was to take place at the beginning of 1977. EC loaned Ghana $2 million for problems generated by the rise in petroleum prices. By yearend, the Government had taken full control of the country's only refinery, run by Ghanaian Italian Petroleum Co., Ltd. (GHAIP) at Tema.

The Mineral Industry of Greece

By Roman V. Sondermayer[1]

During 1975 Greece remained one of the principal producers of bauxite and nonmetals in Europe and continued to develop its mineral industry. The more important minerals produced domestically, with production expressed in approximate percentages of the world output, were as follows: Magnesite, 12%; pumice, and bauxite, 4% each; alumina, barite, lignite, and nickel, 2% each; aluminum, 1%; and pyrite, 0.49%. Output of other mineral commodities was of only domestic significance.

Performance of the Greek mineral industry in 1975 was mixed and reflected the recession in major industrialized countries, Greece's uneven economic performance, and price fluctuations on international commodities markets. Unemployment in Greece was about 7% and the inflation rate was 14% in 1975.

The mineral industry, including mining, quarrying, smelting, and refining, accounted for about 7% of the gross national product (GNP) of $19,220 million[2] in 1975. The mining and quarrying sector alone accounted for about 1.3% of the GNP.

There were a number of significant developments during 1975. Planning was underway for construction of a 600,000-ton-per-year alumina plant near Itea on the Corinthian Gulf; mine production of gold started near Servia, Kozani; doubling of nickel output at Larymna was announced; a 1-million-ton-per-year cement plant went onstream at Kamari, Boeotia; and offshore drilling continued near the island of Thassos.

During 1975 Government spokesmen emphasized the significance of the mineral industry for the economic development of the country, and Government measures were aimed at stimulating activities in the mineral industry, at the same time bringing the industry under closer supervision. During 1975 three bills to revise the mining code and improve public and private research were discussed in the Parliament. The objectives of the new legislation were to increase Government control over the mining sector; establish governmental supervision of development efforts, exploration, and research programs in the mineral sector; create an Institute of Geological and Mineral Research as the principal public research and supervisory agency in mining; empower the State to oblige mine operators to supply ore to local metallurgical installations; establish a time limit of 50 years on concessions, rights, and leases of state mines with allowance for another 25 years, and in exceptional cases, a second 25 years; exclude foreign individuals or companies from acquiring mining exploration permits; require the approval of the Council of Ministers on foreign applications for mining concessions; regulate reserves or idle mines to prevent hoarding and promote maximum production; and introduce environmental protection and pollution control requirements.

To spur investments, the Hellenic Industrial and Mining Investment Co. (HIMIC) was formed. Capitalization of $85 million was provided by the National Bank of Greece and the Hellenic Industrial Development Bank (ETVA) (37.5% each), the National Mortgage Bank (20%), and the National Investment Bank for Industrial Development (5%). The

[2] Where necessary, values of Greece's drachma (Dr) were converted to U.S. dollars at the rate of Dr32=US$1.00.

primary objective of HIMIC was to identify and execute projects that are beyond the capability of private enterprise. The Government also established the National Energy Board (NEB) to coordinate the overall energy policy of Greece.

PRODUCTION

Large, recently developed deposits, metallurgical installations, and petroleum refineries in Greece had modern production equipment. However, most of the smaller mining operations were not mechanized and productivity was low. Table 1 shows the mineral production of Greece.

Table 1.—Greece: Production of mineral commodities
(Metric tons unless otherwise specified)

Commodity [1]	1973	1974	1975 [p]
METALS			
Aluminum:			
Bauxite, gross weight ---- thousand tons --	2,748	2,783	3,244
Alumina, gross weight ---- do ----	470	498	459
Metal, primary ----	143,269	148,000	135,600
Antimony, mine output, metal content ----	[r] 120	501	426
Chromium, chromite:			
Crude ore, gross weight ----	43,394	12,813	73,823
Concentrates, gross weight ----	18,462	9,590	22,945
Copper, mine output, metal content ----	[r] 1,038	883	1,076
Iron and steel:			
Iron ore and concentrate, gross weight ----			
Nickeliferous [2] ---- thousand tons --	1,849	2,013	1,974
Other ----	1,580	--	NA
Pig iron and ferroalloys ----	[r] 511,739	500,000	540,000
Crude steel ----	753,323	612,320	1,000,000
Steel semimanufactures [3] ---- thousand tons --	1,080	NA	NA
Lead:			
Mine output, metal content ----	17,777	22,010	12,884
Metal refined: [4]			
Primary ----	[r] 24,000	14,600	12,800
Secondary ----	17,857	11,675	14,833
Manganese:			
Ore, crude, gross weight ----	42,433	52,091	45,248
Concentrate, gross weight [5] ----	6,222	9,072	11,318
Nickel:			
Mine output, nickeliferous iron ore, metal content [6] ----	[r] 26,347	28,692	28,136
Metal, content in alloys ----	13,946	14,761	14,826
Silver, smelter or refinery production thousand troy ounces --	588	575	480
Zinc, mine output, metal content ----	[r] 19,463	24,989	14,707
NONMETALS			
Abrasives, natural, emery ----	7,000	6,775	7,000

Total ... do	86,730	84,126	86,408

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, other types of crude construction materials such as clays, sand, gravel, and stone are produced, but output is unreported and available information is inadequate to make reliable estimates of output levels. Cobalt is also produced, but output is included with nickel.

[2] Nickel content reported under nickel.

[3] Black sheet, galvanized sheet, and reinforcing bars only.

[4] Includes antimonial lead and hard lead.

[5] Includes powdered manganese in tons: 1973—none; 1974—1,122; 1975—3,908.

[6] Nickel plus cobalt contained.

TRADE

Upward expansion in mineral trade remained similar to that recorded during 1974, but the trade balance in minerals remained unfavorable. Greece was dependent on imports of high-rank fuels (crude oil and bituminous coal), iron and steel semimanufactured products, and nonferrous metals. Bauxite, nonmetallic minerals, and petroleum refinery products were the principal export items. European and Middle Eastern countries were Greece's principal trading partners. Tables 2 and 3 show mineral foreign trade of Greece for selected commodities.

Table 2.—Greece: Exports of mineral commodities
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
Aluminum:			
Bauxite and concentrate thousand tons	1,369	1,457	U.S.S.R. 495; Romania 327; Netherlands 233.
Oxide and hydroxide	r 162,404	190,207	Netherlands 77,744; Spain 61,088; Romania 51,354.
Metal including alloys:			
Unwrought including scrap	r 105,473	102,465	Italy 47,658; France 32,069; Belgium-Luxembourg 17,508.
Semimanufactures	r 11,412	16,164	Italy 5,364; France 1,327; United States 1,090.
Antimony ore and concentrate	145	158	All to Belgium-Luxembourg.
Chromium, chromite	16,600	10,787	West Germany 4,950; Norway 3,212; Yugoslavia 1,500.
Copper:			
Matte	408	54	All to Belgium-Luxembourg.
Metal including alloys:			
Scrap	r 528	162	United Kingdom 90; Belgium-Luxembourg 49; France 21.
Unwrought	78	174	Belgium-Luxembourg 163.
Semimanufactures	2,351	2,938	West Germany 661; France 631; United States 485.
Iron and steel:			
Roasted pyrite	36,330	21,200	All to West Germany.
Metal:			
Scrap	r --	118	Netherlands 51; West Germany 37; Italy 30.
Ferroalloys, ferronickel	r 71,295	81,568	Sweden 32,997; West Germany 20,649.
Steel, primary forms	r 82,125	155,609	Spain 132,734; United States 12,700.
Semimanufactures:			
Bars, rods, angles, shapes, sections	r 42,720	105,826	Egypt 32,766; Yugoslavia 13,128; Libya 12,840.
Universals, plates, sheets	r 158,150	131,003	Yugoslavia 64,846; United States 27,443; Belgium-Luxembourg 13,894.
Hoop and strip	9,181	17,895	Yugoslavia 11,436.
Wire	5	340	Libya 314.
Tubes, pipes, fittings	r 19,133	29,699	Libya 18,137.
Castings and forgings, rough	--	332	Belgium-Luxembourg 148.
Lead:			
Ore and concentrate	16,000	28,480	Belgium-Luxembourg 14,000; Italy 9,600; Yugoslavia 4,880.
Metal including alloys, all forms	310	3,571	Spain 1,502; Italy 800; Turkey 502.
Manganese ore and concentrate	8,363	7,623	West Germany 3,430; France 2,693.
Silver metal including alloys thousand troy ounces	1,704	547	All to France.
Zinc ore and concentrate	43,266	51,289	Italy 21,350; Spain 12,920; France 11,700.
Other:			
Ores and concentrates	r 8,323	8,100	All to U.S.S.R.
Ash and residue containing nonferrous metals	r 13,641	26,274	Netherlands 23,389.
Waste and sweepings of precious metals	--	26	All to Belgium-Luxembourg.
NONMETALS			
Abrasives, natural, n.e.s., pumice, emery, natural corundum, etc	r 465,210	270,287	United States 192,381; West Germany 48,319.
Barite and witherite	r 69,042	101,811	United States 72,334; Nigeria 19,900.
Cement thousand tons	349	1,942	Libya 1,271; Algeria 312; Nigeria 205.
Clays and clay products (including all refractory brick):			
Crude clays, n.e.s	r 317,426	364,097	Canada 123,007; Sweden 43,600.
Products:			
Refractory (including nonclay brick)	7,974	29,649	West Germany 9,271; Iran 6,410; Sweden 5,686.
Nonrefractory	13,601	25,133	Yugoslavia 15,859; Libya 3,774.
Fertilizer materials, manufactured:			
Nitrogenous	r 92,883	13,300	Cyprus 10,500; Tunisia 2,800.
Phosphatic	r 42,730	8,770	India 5,000; Turkey 3,770.
Other including mixed	r 136,410	6,332	All to Cyprus.
Gypsum plasters	--	5,168	All to Algeria.

See footnote at end of table.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—Inauguration of a new alumina plant and expansion of existing aluminum facilities were the highlights of the aluminum industry during 1975. The aim was to increase foreign exchange earnings by changing the status of Greece from a bauxite producer and exporter to a bauxite processor and exporter of alumina and aluminum. Although Greece produced over 3 million tons of bauxite, production of alumina and aluminum for the past several years averaged only 500,000 and 136,000 tons, respectively. At yearend, Aluminium de Grèce S.A. (ADG) received approval from the Government for an $18 million expansion project to improve and modernize its plant at Aghios Nicolaos, Boeotia.

Greece's largest bauxite mining company, Bauxites Parnasse Mining Co., planned construction of a 600,000-ton-per-year alumina plant near Itea (Corinthian Gulf) with a provision to double its capacity. Hungarian technology was to be used. Chase Manhattan Bank was arranging a financial package and foreign participation for an initial investment of $200 million and an additional $100 million for expansion. Bauxites Parnasse and HIMIC will control 51% of the equity in the corporation to be created to carry out the project. In addition, the Bauxites Parnasse announced plans for increasing its annual production from 2 million tons to 3.2 million tons by investing $10 million in expansion of its mining facilities in the Parnassos-Ghiona areas. At yearend, governmental approval was reportedly imminent for these projects. A pilot plant for producing alumina from alunite on the island of Milos was contemplated by Bauxites Hellas S.A. and the Scalistiri Mining Group. A 1,500-ton-per-day bauxite crushing and screening unit started production at Aghia Marina, Stylis, near Lamia, processing bauxite from Oiti Mountain. Eleusis Bauxite Mines Inc. (Scalistiri Group) managed the project.

Iron and Steel.—The Greek Ministry of Industry announced preliminary results of exploration for metals on Thassos, an island in the Aegean Sea. Reportedly, 10 million tons of iron ore was discovered. The grade of ore was not made public.

The domestic iron and steel industry, although modest by world standards, was an important factor in the country's economy. The only integrated steel producer in the country remained Halyvourgiki, Inc., with its plant near Eleusis, which accounted for about 60% of the country's steel production. About 40% to 50% of Greece's steel demand has been met by imports in recent years. Shipbuilding remained the principal use for steel.

Gold.—One gold mine near Servia, Kozani, went onstream in October of 1975. This was the first mine in production of a total of three new mines planned for the area by Greek Gold Mines S.A., in which the Masivor Corp. of Canada had invested $600,000. Expected production of gold was not made public.

Manganese.—Production started at a new manganese dioxide (battery grade) grinding and packing facility at the Drama manganese mine, owned by Financial Mining and Industrial Shipping Corp. (FIMISCO).

Nickel.—During 1975, Société Minière et Métallurgique de Larymna (LARCO) S.A. announced plans for a $50 million improvement and expansion of installed nickel producing capacity near Larymna from the present 15,000 tons to 27,000 tons to be completed by 1978. To meet the new demand of the smelter, mining output of the nearby mine would have to double. LARCO planned to provide financing of $17 million from its own funds, while about $33 million would be borrowed abroad. At yearend, approval for this project from the Government of Greece was imminent. In addition, LARCO was planning a subsequent $170 million investment to establish an additional 13,000-ton-per-year nickel plant nearby, bringing the company's annual capacity to 40,000 tons of nickel.

Preliminary work for development of nickel laterite deposits and construction of a ferronickel plant in the Psachna area, Central Euboea, continued. Eleusis Bauxite Mines—Mining Industrial and Shipping, Inc. (Eleusis), planned to invest $65 million in the project. Production of 10,000 tons of nickel and 40,000 tons of ferronickel was to start in 1980. Elkem A/S of Norway was assisting in carrying out laboratory and pilot tests. A contract for engineering and management of the project was signed with Bechtel Corp. of the United States. Construction also started on a pilot plant for heavy media treatment of lateritic ores; equipment was of French design.

NONMETALS

Asbestos.—At yearend, contract revision negotiations continued between ETVA and Cerro Corp. over their partnership in developing the Zindanion asbestos deposit near Kozani. At yearend, the principal point of disagreement was over equity distribution, with ETVA insisting on 51% participation.

Cement.—During 1975, annual cement producing capacity reached 9.1 million tons, and the cement industry invested about $62 million in new installations. A new cement plant, with a capacity of 1 million tons per year, went onstream at Kamari, Boeotia (Titan Cement Co). Construction continued on the General Cement Co. Ltd., (AGET) 1.5-million-ton-per-year plant at Volos and on the Chalkis Cement Co. S.A. 1-million-ton-per-year cement plant near Chalkis. Completion of these two plants was scheduled for 1976, at which time the cement producing capacity of Greece would be 11.7 million tons. Furthermore, the Government of Greece authorized investments, totaling $300 million, in six new cement plants. No locations or capacities for the new plants were mentioned. Domestic cement consumption improved slightly, but for the cement industry, the large increase of cement exports, about 50% more during 1975 than during 1974, was particularly important.

Magnesite.—During 1975, magnesite remained among the most active mineral commodities in Greece.

FIMISCO obtained approval to invest $50 million in construction of a 100,000-ton-per-year refractory magnesia from seawater and dolomite plant at Euoboea, with an eventual expansion to 200,000 tons per year. The plant will be constructed under license from and with technical assistance from Harbison-Walker Refractories International, Div. of Dresser Industries, Inc. Fluor Utah supplied engineering services related to the feasibility study. Start of construction was planned for 1976, and completion was expected in 1979. In addition, FIMISCO expected to complete construction of a new flotation plant for beneficiation of low grade ores by 1976.

The Macedonian Magnesite Mining—Industrial Shipping Corp. (Macedonian Magnesite), of the Scalistiri Group, completed construction of one 50,000-ton-per-year and one 70,000-ton-per-year rotary kiln at Mantoudi, Euoboea. By 1977, the Scalistiri Group as a whole will have an annual capacity for production of 450,000 tons of dead-burned magnesite and 100,000 tons of magnesite from seawater.

A local subsidiary of General Refractories, Inc. (United States), Magnomin General Mining Company S.A., had a program underway to increase its annual production capacity for dead-burned magnesite from 50,000 tons to 120,000 tons. In addition, the company was planning annual production of 16,000 cubic meters of insulating board.

Grecian Magnesite Ltd. expanded its mining, ore dressing, and sintering installations at Gerakini, Chalkidiki. At the mine site a new 180-ton-per-day rotary kiln and eight automatic ore screeners started production in 1975.

Development of the "Troupi" mine, located in north Euboea, continued. Magnesite Mining Industrial and Commercial S.A. completed civil engineering work and started installation of an 87,000-ton-per-year magnesite dressing plant and a 35,000-ton-per-year rotary kiln for dead-burned magnesite. Start of production at the mine, ore dressing plant, and rotary kiln was planned for 1976.

MINERAL FUELS

Imported petroleum remained the principal source of energy in Greece. During 1974, the latest year for which complete data were available, about 94% of Greece's apparent energy consumption was met through imports. Crude oil and refinery products accounted for approximately 95% of primary energy imports. Coal was the principal source of energy produced in the country and provided 22% of apparent energy consumption. However, additional imports of high-rank coals were necessary to meet demand. Table 4 shows supply and apparent consumption of energy producing materials for 1973 and 1974 in million tons of standard coal equivalent (SCE).

Table 4.—Greece: Supply and apparent consumption of energy-producing materials in 1973 and 1974
(Million tons of standard coal equivalent) [1]

	Total energy	Coal and coke	Petroleum and refinery products	Natural gas	Fuelwood	Hydro-electric power	Nuclear power
1973:							
Production	4.6	4.3	--	--	(2)	0.3	--
Imports	20.7	.7	20.0	--	(2)	(2)	--
Exports	5.7	(2)	5.7	--	(2)	(2)	--
Apparent consumption	20.3	5.0	15.0	--	(2)	.3	--
1974:							
Production	4.9	4.6	--	--	(2)	0.3	--
Imports	20.5	1.0	19.5	--	(2)	(2)	--
Exports	3.6	(2)	3.6	--	(2)	(2)	--
Apparent consumption	21.8	5.6	15.9	--	(2)	.3	--

[1] 1 ton of standard coal equivalent (SCE) =7,000,000 kilocalories.
[2] Less than ½ unit.

Source: Adapted from United Nations, World Energy Supplies 1950–1974, Statistical Papers, Ser. J, No. 19, 1976, 825 pp.

Coal.—Lignite was the most important mineral fuel produced in Greece in 1975, and exploration for further deposits continued. The National Institute for Geological Research conducted exploration with funds supplied by the Public Power Corp. (PPC).

The NEB was to investigate use of lignite in production of fertilizers and manufactured gas; during 1975, most lignite was used for the production of electric power.

Petroleum and Natural Gas.—While Greece continued efforts to develop production of crude oil, imports remained the principal source of supply during 1975. With an installed petroleum throughput capacity of 19.7 million tons, at four refineries, Greece had surplus capacity and exported about two-thirds of its output of petroleum products.

Exploration for crude oil and natural gas was carried out both offshore and onshore. Following revision of its agreement with the Government of Greece, the Oceanic Exploration Co. of Denver resumed offshore drilling operations in the area of Thassos Island, and a third well was completed at yearend. Based on preliminary results of laboratory tests, the oil from this well was heavy and had a high sulfur content. Preliminary evaluation of the find indicated that available reserves could sustain a production of about 2.5 million tons of oil per year for 15 years. While drilling continued, local authorities started studies for a new city for future production workers in the Thassos oilfield.

A Houston firm, Rogers Exploration, Inc., completed seismic exploration at the Nestos River delta in northern Greece. In November 1975, the PPC, which financed the exploration, invited drilling contractors to offer bids for two 2,500-meter exploratory wells in the Nestos River delta. Opening of bids was scheduled for early 1976.

Uranium and Nuclear Energy.—The Democritus Research Center conducted uranium exploration programs in eastern Macedonia and Thrace. At yearend, no exploitable deposits had been discovered, but some preliminary results were encouraging. In 1975, the participation of the United Nations Development Program (UNDP) in training Greek personnel for uranium exploration, was extended through 1976.

The Mineral Industry of Hungary

By Nikita Wells [1]

Hungary's only significant mineral resource by world standards is bauxite, production of which represented 3.8% of the world total in 1975. Mineral fuels, iron, and steel, are next in importance to the domestic economy. Owing to its relatively poor raw material base, Hungary has to rely heavily on imports, two-thirds of which came from the U.S.S.R. and other centrally planned economy countries in 1975.

Reportedly, Hungary's gross national product (GNP) reached 402 billion forints (Ft) [2] an increase of 6.6% over that of 1974. The rise in industrial production slowed considerably in 1975 to 4.8% as the industrial share of the GNP reached 45% of the total output. The work force employed in industry was 1,794,000 persons, relatively unchanged compared with that of 1974. Most of the major investment projects scheduled for completion in 1975 were terminated by yearend, but some of them did not attain design capacities or were completed later than planned.

In 1975, the total electric generating capacity increased 750 megawatts. The Soviet-Hungarian Brotherhood natural gas pipeline was completed from the Soviet border to Zsámbok, and a long-distance, 400-kilovolt cable was built between Györ and Litér. The second section of the Rákhegy bauxite mine, with a capacity of 125,000 tons per year, was opened during 1975. The Hejöcsaba cement factory became operational during the year with an annual capacity of 1.6 million tons of portland cement. A rod and wire mill was put into operation at Ozd and a steel-alloy rolling mill went into production on an industrial scale at the Lenin metallurgical works. A new fertilizer section was commissioned at the Pet nitrogen works at yearend.

Government Policies and Programs.—The fifth Hungarian 5-year plan (for the period 1976–80) provides for a total investment of Ft 870 billion ($21.750 million). Of this total investment, 40% or $8,700,000 is earmarked for industry and is to be distributed as follows, in percent:

Mining	13.0
Electric energy industry	19.7
Metallurgy	7.9
Chemical industry	14.7
Building materials	8.5
Machine building	14.1
Light industries	8.8
Food processing	9.9
Other	3.4
Total	100.00

Compared with the preceding 5-year plan, more investment funds are being allocated to mining (bauxite and coal), energy production (thermal and nuclear power), and the chemical industry. In the other industrial sectors, planned investments generally involve purchases of special machinery and equipment.

By 1980, the proportion of hydrocarbons in the total domestic energy consumption is to increase to approximately 65%. The quantity of natural gas to be made available for consumption in 1980 is about 10 billion cubic meters, of which 6 billion is to be produced in Hungary. The capacity of the Brotherhood gas pipeline is to be increased to transport more gas from the

[1] Physical scientist, International Data and Analysis.

[2] Hungarian forints (Ft) have not been converted into U.S. dollars owing to the wide variation between the official exchange rate (Ft 8.51 =US$1.00 in 1975) and the values used for some transactions. The tourist rate was Ft 20.44=US $1.00. At the beginning of 1976, the commercial or foreign-trade multiplier rate of Ft 41.70= US$1.00 was adopted. This is the rate at which Hungarian firms obtain foreign currency for purchases abroad or are reimbursed for convertible currency.

U.S.S.R. At least 2 million tons of crude oil is to be produced annually during the 1976–80 5-year plan, and crude oil imports are also to be increased. Mechanization of coal mines is to be increased, and the production of coal is to reach 23.5 million to 24.5 million tons per year by 1980. New coal production facilities are to be established to supply coal-fired powerplants that will be going into operation after 1980. The capacity of electric powerplants is to increase 1,500 megawatts by 1980 to meet the country's electric energy requirements. The construction of the Dunamenti Höerömu powerplant is to be completed, and the Tiszai Höerömu powerplant is to be put into operation. By the end of the plan period, the first reactor unit of the Paks nuclear powerplant is to go into operation. The 750-kilovolt transmission line between Vinitsa and Albertirsa is to be completed with the cooperation of other COMECON[3] countries.

Crude steel production in 1980 is to be raised to 4.3 million to 4.5 million tons per year, and rolled steel production is to be 3.1 million to 3.3 million tons per year. The manufacture of high-alloy steel, alloy steel products, steel plates, and steel for concrete reinforcement is to increase. A new coking plant is to be built in Dunaújváros, and a new converter is to be installed at the Lenin Iron and Steel Works in Miskolc-Diósgyor. In the aluminum industry, annual production in 1980 is to reach 3.0 million to 3.1 million tons of bauxite, about 800,000 tons of alumina, and 72,000 to 73,000 tons of aluminum ingots. A special effort is to be made in the processing of aluminum. The capacity of the Szekesfehervar Light-Metal Works is to be expanded. During this plan period, research and development work for deep-mining copper in Recsk is to be initiated; this is to be followed by the construction of downstream facilities during the 1981–85 plan period.

In the chemical industry, nitrogen fertilizer production in 1980 is to reach 710,000 to 720,000 tons (nitrogen equivalent) per year. In the building-material industry, annual cement production is to be 5.4 million to 5.6 million tons. The construction of the Bélapátfalva cement plant is to be completed by 1980.

PRODUCTION

Hungary's production in the mineral and related industries in 1975, compared with that of 1974, was as follows:

Industrial Sector	*Percent of 1974 figure*
Mining	105.4
Electric energy industry	105.5
Metallurgy	99.7
Chemical industry	108.3
Building materials	105.4

Output by the entire metallurgy sector declined slightly, but the output of ferrous metals increased. Crude steel production in 1975 went up 5.9%, and rolled steel products, 11.8%, compared with that of 1974. Pig iron production, however, decreased 3.1%. In nonferrous metals, production of aluminum increased 1.7%; alumina, 9.4%; and bauxite, 5.0% compared with 1974.

In the nonmetal sector, cement production showed an increase of 9.4% over that of 1974 as the Hejöcsaba cement factory went into operation. Nitrogen and phosphatic fertilizer production (nutrient content) increased 7.1% and 8.4%, respectively. In mineral fuels, total coal production decreased 3.4% in 1975, owing mainly to small mines closing. Natural gas production showed a 1.6% increase, while crude oil production was barely 0.5% greater than in 1974. Hungary does not report the production statistics of some of its mineral commodities, and therefore some of the data presented in the production table (table 1) are estimates.

[3] COMECON—the Council for Mutual Economic Assistance—comprises the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

e Estimate. p Preliminary. r Revised.

[1] In addition to the commodities listed, diatomite, gypsum, and other crude construction materials, such as common clay, are produced but available information is inadequate to make reliable estimates of output levels.

[2] Ore contains 18% to 26% manganese.

[3] Excludes refinery fuel and losses.

TRADE

The value of Hungary's total trade turnover (exports plus imports) reached Ft 113.7 billion in 1975, an increase of 16.1% over that of 1974. Hungarian exports amounted to Ft 52.2 billion, an 11.3% increase over that of 1974; imports amounted to Ft 61.5 billion, an increase of 20.6%. In 1975, Hungary's trade with the centrally planned economy countries amounted to Ft 78.1 billion, while trade with market economy countries was Ft 35.6 billion. Hungarian mineral and fuel exports represented FT 14.2 billion, or 27.2% of the total exports. The mineral and fuel imports reached Ft 37.4 million, or 60.8% of the imports.

During the last 5 years, Hungary has built up an adverse foreign trade balance of Ft 13.0 billion (foreign-exchange conversion rate) owing to the large volume of imports compared with exports, and the price increase of imported fuels and other raw materials. The main objective in the 1976–80 5-year plan is to decrease this deficit.

Hungary's major trading partners in 1975 are shown in the following tabulation, in order of value:

Country	Exports (million forints)	Percent of total trade	Imports (million forints)	Percent of total trade
U.S.S.R.	20,278	38.9	21,504	34.9
Germany, East	5,649	10.8	6,363	10.3
Czechoslovakia	4,371	8.4	4,606	7.5
Germany, West	2,729	5.2	4,400	7.2
Poland	2,727	5.2	3,027	4.9
Other	16,417	31.5	21,637	35.2
Total	52,171	100.0	61,537	100.0

Hungary's limited mineral exports in 1975 consisted mainly of bauxite, alumina, aluminum, aluminum products, and some steel semimanufactures. Since Hungary is poor in fuels and other raw materials, it relied a great deal on imports. The imports included bituminous coal and anthracite, coke, crude oil and petroleum products, natural gas, iron ore, pig iron, steel and steel manufactures, nonferrous metals, and nonferrous metal products.

Hungary had signed a number of agreements with the U.S.S.R. that showed the intensified trade relations between the two countries and the expanded rôle of the U.S.S.R. in Hungarian foreign trade in mineral commodities. Under an agreement covering 1976–80, the U.S.S.R. is to increase its crude oil deliveries by 200,000 tons each year. In return, Hungary is to supply industrial machinery and products to be used in expanding Soviet oil output. Increasing exports of alumina are to be returned to Hungary after processing in the form of aluminum slabs and ingots. A new agreement was also signed under which the U.S.S.R. is to supply major items of equipment for 25 Hungarian projects between 1976 and 1980 in the fields of energy, metallurgy, oil processing, telecommunications, and the chemical industry.[4]

COMMODITY REVIEW

METALS

Aluminum.—Hungary's primary aluminum production increased slowly to 70,221 tons in 1975, a 1.7% increase over that of 1974. Hungary's three reduction plants—Ajka, Inota, and Tatabánya—had a total capacity of about 90,000 tons per year. The production of alumina in 1975 reached 756,000 tons. The three alumina plants—Ajka, Almásfüzitö, and Mosonmagyaróvár—together showed a 9.4% increase over the 1974 output. Bauxite production in 1975 was 2,889,000 tons, 5.0% over that of 1974. Hungary's aluminum industry production and trade is summarized in table 4.

The production of aluminum from alumina in Hungary slowed down mainly because of the lack of available electric power. The marginal expansion was made possible by an exchange agreement between Hungary (which would provide alumina) and Czechoslovakia (to provide electric power). The rest of the alumina is processed primarily under agreements with the U.S.S.R. and Poland. Under the terms of a Hungarian-Soviet cooperative agreement in effect since 1962, Hungary had been exporting increasing amounts of alumina each year to the U.S.S.R.[5] In 1975, 403,000 tons of alumina was exported and 117,000 tons of aluminum was imported from the U.S.S.R.

The Hungarian-Polish agreement calls for an export of 80,000 tons of alumina between 1976 and 1978 in exchange for the import of 17,500 tons of aluminum. In 1975, Hungary shipped a total of 136,000 tons of alumina to Poland. Other Hungarian alumina exports during 1975 included 87,000 tons to Austria, 23,000 tons to East Germany, 16,000 tons to Romania, 10,000 tons to West Germany, and 9,000 tons to Czechoslovakia.[6]

In the Hungarian aluminum industry, two companies were involved in bauxite mining. The Bakony Region Bauxite Co. mined approximately two-thirds of the country's production, while the Fejér County Bauxite Mines produced the remainder. Drilling for exploration of bauxite and for ground water control was performed by the Bauxite Prospecting Enterprise. The Bakony bauxite mines are located about 15 miles northwest of Lake Balaton north of the town of Tapolca, and mine the Iszkaszentgyörgy, Halimba, Nyirád, Szöc, and Sümeg deposits. The Fejér County mining area near Tatabánya includes the deposits at Gant near the western end of the Vertes Mountains and 30 to 40 miles west of Budapest. Bauxite also occurs in the Barzsony District (the Nezsa deposits about 25 miles north of Budapest), and in the Harsány District in southern Hungary near the Yugoslav border.[7] The Halimba No. 3 bauxite mine is one of Europe's largest and is located north of Lake Balaton, with an annual productive capacity of 600,000 tons of bauxite.

The chemical composition of Hungarian bauxite varies considerably. Most deposits contain 50% to 69% Al_2O_3 and some even

Source: Statisztikai Evkönyv 1975 (Statistical Yearbook 1975), Budapest, 1976.

reach 76.8%, while others are very low in grade.[8] In most deposits, the contained SiO_2 amounts to 1% to 5% and recently was reported in some cases 7% to 8%.[9] The Fe_2O_3 content of various deposits may vary from zero to 50%.

Estimates of Hungarian bauxite reserves in 1975 were about 150 million tons. The static or declining quality and increasing difficulties in mining bauxite precludes further expansion of mining operations. Individual bauxite deposits are becoming smaller, are at greater depths, and are below ground water levels.

Bauxite is the only nonferrous metal ore that is exported in significant quantities by Hungary. In 1975, Hungary exported a total of 603,000 tons of bauxite. Of this total, 313,000 tons went to Czechoslovakia, 110,000 tons to Poland, and 180,000 tons to East Germany.

In the fifth (1976–80) 5-year plan, a 7% increase in bauxite output is planned to raise the bauxite production to 3.1 million tons in 1980. The Nyirád and six other major mines will be opened or re-equipped by 1980, and the development of the bauxite mines in the Bakony Hills will begin in 1978.[10] The 300,000-ton-per-year bauxite mine at Izamajor is scheduled to be completed by yearend 1976. The second stage of the Rákhegy bauxite mine was opened in 1975 and was to have an annual capacity of 125,000 tons. An investment of Ft 600 million was required to open the mine.[11]

The production of semifinished aluminum products, including rolled, pressed, and forged products; bars; wire; foil; etc., reached 144,500 tons in 1975 and is to reach 167,000 tons in 1980. The most important manufacturer of semifinished aluminum goods is the Székesfehérvár Light-Metal Works, which was being expanded during 1975 and should reach an annual production of approximately 72,000 tons of hot- and cold-rolled strip, wire, sheets, foil, and other semifinished products in 1976.

To expand its aluminum industry, Hungary plans to spend Ft 9.2 billion between 1975 and 1980. An investment of Ft 4.2 billion will be applied to bauxite excavation, alumina production, and aluminum processing. The rest of the investment will be used to expand and modernize existing production facilities for finished and semifinished aluminum products.

In the fifth 5-year plan (1976–80), the capacity of the rolling mill at the Székesfehérvár Light-Metal Works is to be increased from 60,000 to 120,000 tons per year. Its rolling mill is to produce 40,000 to 50,000 tons per year compared with the 25,000 tons produced in 1974. A continuous-casting rolling mill and wire-drawing units are also planned to be put into operation during this period.[12]

Hungary has been active in exporting engineering and design technology for the construction of alumina plants. Recently Hungary helped develop alumina plants in Korba, India; Obrovac and Zvornik, Yugoslavia; Tulcea, Romania; and in Greece and the Malagassy Republic.[13]

Copper.—According to Hungarian sources, refined copper production was 13,010 tons in 1975. In 1975, Hungary imported 44,528 tons of copper, of which 33,121 tons came from the U.S.S.R.

During 1975, exploratory work continued at the newly discovered copper deposits at Recsk in the Mátra Mountains. Hungary considers the find to be a deposit of world significance and was developing its biggest mine there.[14] The ore is found at great depths but is thought to contain enough economically minable reserves to supply the country's domestic requirements in the future. The deposit also contains lead and zinc.[15] The main shaft of the new mine, which was being developed, was 1,270 meters deep. Workings to the deposits have been developed at depths of 700, 900, and 1,100 meters. The second shaft of this mine was being constructed during 1975. Soviet machinery was being used to develop the mines and over 1,000 miners were employed at this site.[16]

Gallium.—Hungary's gallium is found in bauxite, combined with aluminum. The Ajka alumina and aluminum plant, located

[16] Népszava (Budapest). Oct. 12, 1975, p. 3.

in West Hungary, was planning to double its gallium production, according to future plans.

Iron Ore.—Iron ore production in 1975 was 642,300 tons, with an iron content of 152,900 tons. Only about 10% of Hungary's requirements for iron ore was met by domestic production at the Rudabánya deposit, and there was little possibility of finding other deposits. In the course of the 1976–80 5-year plan, Rudabánya is to produce 4.3 million to 4.5 million tons of iron ore. In 1975, Hungary imported a total of 4.3 million tons of iron ore, of which 4.0 million tons came from the U.S.S.R. and 208,000 tons came from India.

Iron and Steel.—In 1975, the production of crude steel reached about 3.7 million tons, a 5.9% increase over that of 1974. Over 90% of Hungary's crude steel production came from three large metallurgical complexes: 1.2 million tons from the Ozd Metallurgical Works; 1.2 million tons from the Danube Iron Works; and 993,000 tons from the Lenin Metallurgical Works.[17] The 1975 import of crude steel totaled 19,401 tons, mainly from Yugoslavia.

The total pig iron production in 1975 was 2.2 million tons, 2.1 million tons of which was used for steel production. In 1975, Hungary imported a total of 253,000 tons of pig iron, 238,000 tons of which came from the U.S.S.R.

Steel produced by the open hearth method was 3.3 million tons, while 338,000 tons was produced by electric arc smelting. In 1975, 32% of the total steel production was produced with oxygen injection.[18] By 1980, total Hungarian crude steel production is to reach 4.3 million to 4.5 million tons per year. The output of the Ozd Metallurgical Works is to be increased to 1.4 million tons per year, while that of the Danube Iron Works is to be between 2.2 million and 2.4 million tons per year. The obsolete Siemens-Martin open hearth furnaces at the Lenin Metallurgical Works are to be dismantled and replaced by oxygen-converter steel production of approximately the same capacity.

At the Danube Iron Works, construction is scheduled to begin in mid-1976 on two 130-ton oxygen converters. The annual capacity of these converters is to be approximately 1 million tons.[19]

To increase the steel production at the Ozd Metallurgical Works, a new 110-ton open hearth furnace was built, increasing the total number of furnaces to nine. During 1975, a rod and wire rolling mill began operations at this complex. The mill was manufactured by West Germany's Siemag and had a capacity of 350,000 tons per year. It was to roll 12.5- to 40-millimeter-diameter bars and 5.5- to 12.5-millimeter-diameter wire rods.

At the Lenin Metallurgical Works, a high-alloy-steel rolling mill began operation on an industrial scale in 1975. A new steel plant, also to be built there, will consist of an 80-ton electric furnace, an 80-ton oxygen converter, an oxygen factory to supply the oxygen for steel manufacture, and a material-transport system.

Output of steel rolled products reached 2.7 million tons in 1975, an increase of 11.8% over that of 1974. By 1980, production of rolled steel is to reach 3.1 million to 3.3 million tons per year. In 1975, 955,000 tons of rolled steel semimanufactures was imported by Hungary, 688,000 tons of which came from the U.S.S.R. During the same period, 873,000 tons was exported.

Lead and Zinc.—Lead and zinc ore production in 1975 was 146,650 tons, a 10% decrease compared with that of 1974. In 1975, the production of primary and secondary lead was 716 tons and 13,000 tons, respectively. The production of primary zinc was estimated at 2,200 tons, while secondary zinc production was 680 tons. Hungary imported 212,392 tons of lead and 26,513 tons of zinc in 1975.

Manganese Ore.—In 1975, the manganese ore production was 130,800 tons, an increase of 14.7% over that of 1974, but just below the production of 1973. The average composition was reported as 21.6% manganese and 9.2% iron. Manganese mines in Hungary are located at Urkút and Csárdahegy, near the Halimba bauxite mines north of Lake Balaton.

In 1975, Hungary imported 14,914 tons of manganese ore from the U.S.S.R. and exported 18,075 tons to West Germany and 7,741 tons to Czechoslovakia. Hungary also imported a total of 40,349 tons of 75% to 80% ferromanganese in 1975, of which 22,451 tons came from the U.S.S.R., 10,720

---

[19] Work cited in footnote 18.

tons came from Japan, and 4,099 tons came from Norway.

NONMETALS

Cement.—The country's total cement production in 1975 reached 3.8 million tons, a 9.4% increase over that of 1974. In 1975, Hungary imported a total of 981,000 tons of cement, of which 754,000 tons came from the U.S.S.R., 132,000 tons from East Germany, 70,000 tons from Romania, and 11,000 tons from Bulgaria. Hungarian exports of cement in 1975 totaled 65,000 tons, most of which went to Yugoslavia and Czechoslovakia.

The Hejöcsaba cement plant, located near Miskolc, became operational during 1975. It is to produce 1.6 million tons per year of portland cement, but will not reach its full capacity until 1978. This plant was built with an investment of $230 million, West German technology, and Czechoslovakian equipment. The two major operational plants are the Danube Cement Works, located at Vác, north of Budapest, and the Beremend plant, located on Hungary's southern border. Both of these plants had annual capacities of 1 million tons each.

Hungary is constructing its fourth major cement plant at Bélapátfalva near its northern border. The plant is to have an annual capacity of 1.2 million tons and is to be onstream in 1978.

Fertilizer Materials.—Hungary produced a gross weight of over 3.1 million tons of mineral fertilizers in 1975. The nitrogen fertilizer produced was 421,000 tons (nitrogen content), while phosphatic fertilizer was 206,000 tons, (P_2O_5), showing 7.1% and 8.4% increases, respectively, over the 1974 figures. Hungary does not have any phosphate or potash raw materials and thus must import these commodities. Production of nitrogen fertilizers, however, is based largely on domestic resources of natural gas from the fields of Szeged and Hadjúszoboszló.

Trade of fertilizer materials showed no significant change in 1975, and substantial quantities were imported to satisfy domestic demand. Imports of nitrogen fertilizers totaled 411,000 tons (at 20.5% nitrogen content), of which 186,000 tons came from the U.S.S.R., 124,000 tons from Czechoslovakia, and 54,000 tons from Austria. Potassium fertilizer imports amounted to 1.4 million tons (at 40% K_2O), of which 837,000 tons came from the U.S.S.R. and 465,000 tons from East Germany. Total phosphatic fertilizer imports were 678,000 tons (at 18% P_2O_5), of which 202,000 tons came from the United States, 142,000 tons from the U.S.S.R., 131,000 tons from Yugoslavia, and 103,000 tons from Austria. Hungary also imported a total of over 702,000 tons of raw phosphate materials, of which 618,000 tons came from the U.S.S.R. as apatite concentrate.

The Pétfürdö Fertilizer Complex was commissioned at the end of 1975 at Pétfürdö (previously called Várpolota), which is located southwest of Budapest. When fully operational, it is to consist of a 330,000-ton-per-year ammonia plant, a 200,000-ton-per-year urea plant, a 430,000-ton-per-year nitric acid plant, a 236,000-ton-per-year ammonium nitrate plant, and a 746,000-ton-per-year complex fertilizer plant.[20] Full-capacity production was slated for 1978 and was to turn Hungary into an exporter of nitrogen fertilizers. A number of large chemical engineering firms from various countries were involved in the design and construction of the complex. The U.S.S.R. supplied technology and equipment for the nitric acid plant, the United Kingdom's M.W. Kellogg provided the ammonia plant, Coppée-Rust of Belgium delivered the urea plant, and the French firm Gexa provided the complex fertilizer plant. A number of Hungarian enterprises also took part in the project.

This fertilizer complex was one of the largest investments of the 1971–75 5-year plan, with a cost of approximately Ft 10 billion. According to plans, it was to produce over 600,000 tons of complex fertilizers in 1976 in addition to the 220,000 tons of nitrogen fertilizers and 200,000 tons of urea. However, major setbacks and delays were encountered owing to various problems of equipment startup and malfunction.[21] According to Hungarian sources, only one of the four boilers in the nitrogen acid plant was functioning adequately, and delivery of the replacement boilers was long overdue. The rupture of an acid-resistant pipe caused the loss of Ft 150 million worth of

[20] Nitrogen (London). No. 98, November–December 1975, pp. 30–32.
[21] Magyar Hírlap (Budapest). Sept. 18, 1975, p. 7.

gas that would have been transformed to ammonia. In the complex fertilizer plant, the French equipment could scarcely bear the stress imposed by corrosion and erosion and proved to be unreliable. To make matters worse, the French Gexa Co., which provided this equipment, became bankrupt.[22] The situation was further aggravated by the fact that the complex fertilizer plant could not receive enough raw ammonia or ammonia processed into nitric acid to keep production flowing. The whole complex was also short of manpower. The labor force was only 700, while plans called for 1,200 employees.[23]

Other Hungarian nitrogen fertilizer complexes are the Borsod Chemical Combine (BVK) at Karzincbarcika near Miskolc, the Tisza-Region Chemical Industry Combine (TVK), and the Tisza-Region Chemical Works (TVM), all of which are located in the Tisza valley.

Hungary has signed a recent trade agreement with RTB Copper of Yugoslavia to obtain extra supplies of phosphates in the future. Beginning in 1978, Yugoslavia will provide 100,000 tons per year of ammonium phosphates and 100,000 tons per year of tripolyphosphates in return for 70,000 tons per year of ammonia and other nitrogen fertilizers. The phosphates are to be imported from the Prahavo works, which were developed with Hungarian financial help.[24]

Sulfur and Sulfuric Acid.—The production of byproduct sulfur in 1975 was 8,937 tons, 4.8% less than the output in 1974. In 1975, Hungary imported a total of 208,567 tons of sulfur, of which 129,941 tons came from Poland and 78,488 tons came from the U.S.S.R. Sulfuric acid production in 1975 was 630,000 tons, while imports were 23,389 tons from Poland and 2,554 tons from the U.S.S.R. The country's sulfuric acid was produced mostly from imported sulfur.

MINERAL FUELS

Hungary's primary energy consumption for 1975 reached an estimated 40.8 million tons of standard coal equivalent, representing a 6.2% increase over that of 1974. Coal provided 39.0% of the total primary energy consumed, while oil represented 38.7%; natural gas, 19.6%; hydroelectric and imported energy, 1.7%; and fuelwood, 1.0%. In 1975, Hungary produced 59.6% of its primary energy consumption from its domestic fossil fuels, while it imported 42.6% and exported 2.2%. In general, the total primary energy distribution for 1974 and 1975 did not change except for an increase of oil and natural gas imports in 1975. The total primary energy balance for Hungary for 1974 and 1975 is shown in table 5.

In 1975, Hungary produced a total of 20.5 billion kilowatt-hours of electric energy, showing an increase of 8% over that of 1974. The total electric generating capacity in 1975 was increased by 750 megawatts. Thermal powerplants generated 99.5% of Hungary's electric power, while

[24] Page 32 of work cited in footnote 20.

Table 5.—Hungary: Total primary energy balance for 1974 and 1975

(Million tons standard coal equivalent) [1]

	Total primary energy	Coal (lignite, brown, bituminous, and coke)	Crude oil and petroleum products	Natural and associated gas	Fuelwood	Hydroelectric and other power
1974:						
Production	24.6	14.5	2.9	6.8	0.4	--
Imports	14.6	2.0	11.5	.3	--	0.8
Exports	.8	.1	.5	--	--	.2
Apparent consumption	38.4	16.4	13.9	7.1	.4	.6
1975:						
Production	24.3	14.0	3.0	6.9	.4	--
Imports	17.4	2.0	13.4	1.1	--	.9
Exports	.9	.1	.6	--	--	.2
Apparent consumption	40.8	15.9	15.8	8.0	.4	.7

[1] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories. Conversion factors used are hard coal, 1.0; lignite and brown coal, 0.5; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); hydroelectric power, 0.125 (per 1,000 kilowatt-hours).

Source: World Energy Supplies, Statistical Papers, Series J, No. 18 (United Nations), New York, 1975.

hydroelectric powerplants were responsible for 0.5%. Nuclear power was still in the developmental stage. Construction continued on the Paks nuclear powerplant, which was scheduled to begin operation in 1980 with its first 440-megawatt block. By yearend 1984, this plant is to have a capacity of 1,760 megawatts, and by 1990, Hungary's nuclear energy capacity is to reach 4,000 megawatts.

According to official reports in 1975, Hungary's reserves of energy sources were 22% bituminous coal, 41% brown coal, 23% lignite, 11% natural gas, and 3% petroleum.[25] To develop fuel for future energy requirements, Hungary will be concentrating on modernizing and expanding underground coal mining and searching for new deposits. More emphasis will also be placed on geological and coal mining research. By 1980, Hungary is to import 56% to 58% of its energy needs, of which the U.S.S.R. is to provide 47%. Hydrocarbons are to provide a higher proportion of energy, from 58% in 1975 to 64% to 66% in 1980.

Coal.—The total production of coal from Hungary's 46 underground coal mines and one open pit in 1975 approached 25 million tons, which satisfied internal demand for these commodities and supplied about 26% of the country's energy requirements. Coal production showed a 3.4% decrease compared with 1974 production, owing mainly to the closing of small submarginal mines. In striving to increase mechanization and improve productivity, Hungary was terminating uneconomical production facilities. Bituminous coal production in 1975 was 3.0 million tons, while brown coal and lignite production were 15.0 million and 7.0 million tons, respectively. During the 1976–80 5-year plan, total coal production is expected to be maintained at about 25 million tons per year.

In 1975, Hungary imported a total of 1.4 million tons of bituminous coal and anthracite. Czechoslovakia provided 569,000 tons of this coal, while Poland and the U.S.S.R. supplied 483,000 tons and 385,000 tons, respectively. A total of 554,000 tons of brown coal briquets was imported from East Germany in 1975. Hungary exported 96,000 tons of brown coal, 30,000 tons of coal briquets, and 7,000 tons of industrial and domestic coke in 1975.

About Ft 2.3 billion was invested in 1975 in development of coal mining. Ft 1.0 billion was used for obtaining machinery and for technical development, Ft 0.7 billion was used for coal inventory expansion and reconstruction, and Ft 0.5 billion was used for mining safety improvements.[26]

Hungary was planning to increase mechanization in underground coal mines to over 60% and the production from complex mechanized faces to above 40%. By 1980, 30% to 35% of the drifts are to be driven by modern machines. The production of coal at Mecsek, as well as the capacity of the coke works at Dunaujváros, is to be increased so that by 1981–82 the production of bituminous coal is to reach 3 million tons per year.

The construction of the Thorez open pit mine was finished at yearend 1975. The total of 5.4 million tons of lignite produced from this mine in 1975 was used to supply thermal powerplants. Overburden removed in 1975 reached 34 million tons.[27]

Four new underground mines are to be opened in the next 15 years in order to keep in step with the electrical power requirements. These mines, to be located in the Komárom Basin, are the Márkushegy mine at Oroszlány, the Lencsehegy mine at Dorog, and the Nagyegyháza and Mány mines in the Tatabánya area. In addition, the open pit at Bükkabrány, 150 kilometers northeast of Budapest, is expected to begin mining lignite in 1980 with a planned production capacity of twice that of the Thorez open pit. With the help of these mines, coal production in 1990 is to increase 40% to 45% to about 36 million to 37 million tons.[28] The U.S.S.R. and Poland will provide 50% and 20% of the required equipment, respectively. The rest of the equipment will probably be provided by market economy countries.

Hungary will spend Ft 1.2 billion during the 1976–80 5-year plan in exploration for new coal deposits. A deposit in the Mazaszaszvar area was expected to confirm significant coal reserves as a result of deep-drilling exploration, and a large-capacity underground mine may be developed there as a result. A new mine was to be opened in

[25] Magyar Hírlap (Budapest). June 1, 1976, p. 7.
[26] Figyelö (Budapest). No. 2, Jan. 14, 1976, pp. 1–5.
[27] Work cited in footnote 26.
[28] Work cited in footnote 26.

1976 at the coal deposit in Nagyegyháza, which borders on Tatabánya. Extensive geological research was underway in the Sajomercse and in the Ozd Basin, where approximately 90 million tons of good-quality coal was found through exploratory drillings completed in the fall of 1975. Intensive research was initiated in Menkes at the Nógrád mines to explore a coal deposit estimated at close to 10 million tons. Further geological research was carried out in the area of the Oroszlány 20 mine at Majk and the Trancsics mine at Ajka, in western Transdanubia in the vicinity of Torony, and in the Boda Valley on the border of the Kompáti township.[29] Large quantities of lignite were also discovered between Bükkábrány and Emöd.

Plans have been drawn up for Hungary's largest coking plant, which is to be built at the Danube works at Dunaujváros. Construction was to start in 1976 and last 3 to 4 years. The plant is to have a capacity of 640,000 tons per year of blast furnace coke.

Natural Gas.—The natural gas production for 1975 was 5.2 billion cubic meters (183 billion cubic feet), a 1.6% increase over that of 1974. Hungary also produced 637 million cubic meters (22.5 billion cubic feet) of manufactured gas from coal or hydrocarbons in gas plants in Budapest, Szombathely, Györ, Pécs, Baja, Sopron, and Dunaujváros. Imports of natural gas in 1975 amounted to 806 million cubic meters, of which 600 million came from the U.S.S.R. 200 million from Romania, and 5 million from Czechoslovakia. According to a long-term contract, Romania is to provide Hungary with an annual 200 million cubic meters of natural gas from Romanian gasfields. In the 1976–80 5-year plan, Hungary is to receive 10 billion cubic meters of gas from the U.S.S.R. through the Brotherhood pipeline, and 1 billion cubic meters from Romania.

The Brotherhood natural gas pipeline from the U.S.S.R. to Hungary was completed in 1975. The first section of the 230-kilometer line, which lies between the Soviet border and Leninváros, was completed in the spring of 1975. The second section, which was finished at yearend with the help of the U.S.S.R., runs between Leninváros and Zsámbok.[30]

Hungary was participating in the construction of the Orenburg gas pipeline together with the other COMECON countries. This 2,750-kilometer pipeline is to link the large natural gas deposit in Orenburg, located in the southern Ural Mountains of the U.S.S.R., with the borders of Eastern Europe. By 1980, this pipeline is to provide an annual 15.5 billion cubic meters of Soviet natural gas to the participating countries. Hungary, which is to receive 2.8 billion cubic meters per year, is responsible for a 500-kilometer length of the pipeline running from Orenburg to Aleksandrova Gai and three compressor stations at Chust, Bogorodsani, and Gusyatin.

Petroleum.—In 1975, Hungary's oil wells produced 2.0 million tons of crude oil, providing about 20% of the nation's consumption. Domestic production was expected to remain at this level during the 1976–80 5-year period, since discovery of new deposits was not deemed likely. Hungary imported a total of 8.4 million tons of crude oil in 1975, an increase of 24% over that of 1974. The U.S.S.R. provided 7.0 million tons of crude oil; Iraq provided 1.2 million tons; Algeria, 203,000 tons; Iran, 61,000 tons; and Albania, 5,000 tons.

Hungarian imports of Soviet crude oil were received through the Friendship I and II pipelines. The Friendship I pipeline runs from Sahy in Czechoslovakia to Százhalombatta in Hungary and has a capacity of about 4.5 million tons per year. The Friendship II pipeline, which was commissioned in 1973, stretches from Uzhgorod in the U.S.S.R. to Százhalombatta via Leninváros in Hungary and has an annual capacity of 10 million tons. The oilfields of Transdanubia, the Szeged area, and the Százhalombatta refinery were interconnected by other pipelines. In 1975, Hungary refined 9.5 million tons of crude oil, most of which came from the Friendship pipelines.

Construction continued on the Adriatic pipeline extending from the island of Krk, off the coast of Yugoslavia, through Hungary to Bratislava, Czechoslovakia. The pipeline is to carry Middle Eastern and African crude oil to Hungary, Czechoslovakia, and Yugoslavia by yearend 1977. By 1980, a total of 34 million tons per year of crude oil is expected to flow through the pipeline; Hungary and Czechoslovakia are

[29] Work cited in footnote 25.
[30] Hétföi Hírek (Budapest). Jan. 19, 1976, p. 5.

to receive 5 million tons each. Both Hungary and Czechoslovakia are to contribute $25 million to Yugoslavia for construction of the pipeline over Yugoslav territory, while each country was to be responsible for the construction of the pipeline on its own territory. In Hungary, the pipeline is to extend to Százhalombatta.

During the year, an agreement was signed between the U.S.S.R. and Hungary on cooperation between the oil industries of the two countries. The U.S.S.R. was to increase its crude oil deliveries to Hungary at the rate of 200,000 tons per year. In return, Hungary was to supply the U.S.S.R. with industrial products to be used in expanding the Soviet oil output, including pumps, automatic control components, data transmission systems, an instrument factory, etc.[31]

A new Soviet-Hungarian pipeline for refined petroleum products has been planned for completion in 1978. The pipeline is to have a capacity of 1.0 million tons of automobile and diesel fuel. Hungary is to work on 120 kilometers of the pipeline, which is to join the domestic network at Leninváros and extend to Nyírbagdány where the U.S.S.R. is to construct 60 kilometers of the pipeline leading to the Soviet border.

Exploratory oil drilling was planned in the Györ-Sopron county in the vicinity of Mosonszolnok, Rajka, and the valley of the Dráva River. At Zola, depleted wells were being reworked by secondary methods in the hope of recovering 70% to 80% of the original amount of crude.[32]

Nuclear Power.—Work proceeded on the nuclear powerplant at Paks on the Danube River, 120 kilometers south of Budapest. The first of the four 440-megawatt Novovoronezh-type light-water reactor blocks was scheduled to begin operation in 1980. The second block was to start up in 1981, the third in 1983, and the fourth in 1984, reaching a planned total capacity of 1,760 megawatts. By 1990, total capacity of this powerplant is to reach 4,000 megawatts with the help of 1,000-megawatt Leningrad-type units. The design and construction of this powerplant was being carried out under a Soviet-Hungarian cooperation agreement. About 30% of the equipment is to be provided by Hungary, while the rest is to come from the U.S.S.R.[33]

The Mineral Industry of Iceland

By Joseph B. Huvos [1]

In 1975 Iceland had no significant domestic mineral production. However, hydroelectric and geothermal energy helped the country to produce, from imported alumina, about 0.5% of the world's aluminum. Other minerals of lesser importance produced in Iceland included diatomite (about 1.5% of the world total) and modest amounts of hydraulic cement, fertilizer materials, sand, gravel, and stone.

In 1975, Iceland's gross national product (GNP) was about $1,134 million.[2] Of this, the aluminum industry contributed about $33 million; cement, $10 million; fertilizer materials, $8.6 million; and diatomite, $3.3 million.

PRODUCTION

The Icelandic mineral industry was strongly affected by the world recession in 1975; aluminum was among the hardest hit, while cement and fertilizer materials registered gains. Production of selected mineral commodities is detailed in table 1.

Table 1.—Iceland: Production of mineral commodities

Commodity and unit of measure	1973	1974	1975 p
Aluminum smelter production, primary ---------- metric tons --	72,000	69,600	61,800

[1] Exports.

TRADE

Iceland's mineral trade was mainly with the countries of Western Europe and the U.S.S.R. Mineral commodity exports consisted principally of aluminum metal, metallic scrap, and diatomite. Mineral commodity imports were mainly petroleum products, alumina, iron and steel semimanufactures, and salt. In 1975 all exports from Iceland were subject to government licensing aimed at controlling export channels but not at restricting exports. There was also a 12% import duty on all imports, to be lowered to 10% in 1976.

[1] Physical scientist, International Data and Analysis.

[2] U.S. Embassy, Reykjavik, Iceland. State Department Airgram A-44, July 30, 1976. Values in Icelandic kronas (Ikr) were converted to U.S. dollars at the rate of Ikr153.70=US$1.00 for 1975.

Icelandic Government policy was aimed at controlling inflation by restraining labor from excessive wage demands, by reducing deficit financing, and by restraints on imports (or encouraging exports) to reduce the trade deficit, which was about 12% of the GNP in 1974.[3]

COMMODITY REVIEW

METALS

Aluminum.—Slack foreign demand caused a cutback in Iceland's aluminum production in 1975. The Icelandic Aluminum Co., a wholly-owned subsidiary of the Schweizerische Aluminium AG (ALUSUISSE), operated the 75,000-ton-per-year Hafnafjordur reduction plant south of Reykjavik. The plant was operated with inexpensive hydroelectric energy and used alumina imported from Australia as raw material.

Ferrosilicon.—Late in 1975 officials of Icelandic Alloys, a company jointly owned by Union Carbide Co. and the Icelandic Government, announced that scheduled construction of its ferrosilicon plant had been postponed indefinitely. Original plans had called for commissioning of the plant in 1977.

MINERAL FUELS

In 1975 hydroelectric and geothermal energy supplied over 40% of Iceland's energy needs. The remainder was imported in the form of petroleum products from Western Europe and the U.S.S.R. Installed capacity of Iceland's hydroelectric powerplants in 1975 was about 378 megawatts. Iceland's supply of energy and apparent consumption in 1974 and 1975 are shown in table 3.

Geothermal Energy.—In 1975, Iceland produced an estimated 315 thermal megawatts of geothermal energy, almost one-tenth of the world's total.[4] Iceland has 17 known high-temperature geothermal fields. Space heating ranked foremost in the country's utilization of geothermal energy, and about one-half of Iceland's population was served by geothermal energy for space heating. A 60-megawatt geothermal power station was under construction during 1975 and was to be commissioned in 1976 at the Krafla Field, 8 kilometers northeast of Namafjall in the northern part of the country.

The Mineral Industry of India[1]

By Gordon L. Kinney [2]

The Indian economy recorded a generally good year in 1975; [3] there was an overall growth in the gross national product (GNP) of 6% in constant 1960 prices.[4] In current prices. India's GNP was $85.7 billion [5] in fiscal 1975. India's agricultural sector accounted for 45% of the GNP and hence continued to be the key factor affecting the economy. In 1975, overall economic gains were mainly the result of a particularly good monsoon season, which contributed to a record high production of 118 million tons of food grains.

India was in the midst of a serious industrial recession at the start of 1975. Poor monsoons for 3 years had affected agricultural production and hydroelectric generation. Labor problems were also reducing industrial production. Inflation of more than 20% per year for 1972-74 had hurt the overall economic situation. During the spring of 1975, the Government began to take firm measures to gain control of the economy. A partial freeze was placed on wages and dividends. Strong price controls were established on essential commodities, and tax concessions were made to industries and on personal income. A further attempt at stimulating economic recovery came with a proclamation of internal emergency in mid-year. The powers assumed by the Government under the emergency were heavily criticized but did stabilize the labor situation by ending strikes and lockouts. Production began to increase, and the end of the year looked favorable for an economic revival.

India's trade improved with a 19% increase in exports, which more than offset the 12% increase in total imports. The resulting balance-of-trade deficit stood at $1.25 billion, down from $1.37 billion in 1974.

That portion of the GNP attributed to mineral production was $1.18 billion, or about 1.4%.[6] Coal and lignite were the leading group with 56% of the total value, followed by petroleum and natural gas with 23%, metallic minerals with 13%, and nonmetallic minerals with 8%. Iron ore and limestone each contributed about one-half of the value of their respective groups.

As a matter of national policy, mineral exploration and development were being promoted. The fifth 5-year plan, ending in 1979, seeks to raise production of coal to 124 million tons (revised slightly downward from 135 million tons because of abundant pithead stocks), iron ore to 60 million tons, steel to nearly 10 million tons, cement to 25 million tons, and oil to 20 million tons. Development of several nonferrous-metal mines and smelters was planned as a result of exploration programs by the India Geological Survey. The overall objectives of the programs are to increase the utilization of domestically produced minerals and to increase the value of natural resources through concentration,

[1] The author would like to acknowledge the assistance of Francis E. Shafer, U.S. Regional Resources Attache, New Delhi, for his contribution of a series of specific mineral industry reports on India.

[2] Physical scientist, International Data and Analysis.

[3] The Indian fiscal year runs from Apr. 1 through Mar. 31. Hereafter, 1975 will refer to the period Apr. 1, 1975 to Mar. 31, 1976 unless the calendar year is specifically mentioned.

smelting, and production of semimanufactures prior to export.

One of the most significant achievements of the year was the rapid development of the offshore oil discovery in the Bay of Cambay. Installation of the production platforms progressed unusually well because the Indian Government was anxious to begin at least partial production of crude oil as soon as possible. Imports of crude oil and products were the largest contributors to the balance-of-payments deficit in the mineral sector, and any additional domestic production will contribute to a lowering of these payments. Continued exploration in other offshore areas could yield more discoveries in the near future.

Despite the progress in oil, coal assumed an increasingly important role in India's energy picture. Coal consumption was encouraged over that of other fuels, and many powerplants and industries were converting from oil to coal where technologically feasible. There is little, if any, chance of oil being used as a source for earning foreign credits before the end of the current 5-year plan in 1979. On the other hand, coal is abundant, and production has been steadily increasing—to nearly 100 million tons in 1975. Coal stocks at the pitheads were high, and Government plans call for an aggressive program to increase coal exports from 440,000 tons in 1975 to at least 2.5 million tons in 1979. To continue development of the coal industry, the annual plan for 1976 called for an investment of $309 million. The emphasis was to be in the transport sector, modernization and mechanization of existing mines, and opening of more efficient high-output open pit mines.

Reserve tonnages for several of the important minerals have been changing rapidly as a result of an intensified exploration program. New reserve data are discussed in the individual commodity review sections of this chapter.

PRODUCTION

All of the major metallic minerals, except gold and silver showed healthy production gains during the year. Iron ore output was up 17%, and production of pig iron and steel ingots increased 14%, and 4%, respectively. The following increases were also recorded: Copper, 39%; chromite, 26%; zinc, 19%; bauxite, 14%; and manganese, 7%.

Among the nonmetallic minerals, apatite, barite, dolomite, emerald, agate and garnet, magnesite, and ochre all recorded increases for the year. Cement production increased 14% to over 16 million tons. Limestone remained steady at about 26 million tons.

In the fossil-fuel group, bituminous coal production was encouraged and showed a gain of 14% to 96 million tons. Crude oil increased 11%, and marketable natural gas output increased 39% to nearly 1 billion cubic meters.

e Estimate. p Preliminary. r Revised.

[1] In addition to the commodities listed, India also produces bromine, other clays (bentonite, fuller's earth, and common clay), other varieties of gem stones (aquamarine, ruby, and spinel), and uranium, but production data are not available.

[2] Estimate based on 11 months of data.

[3] Data is for fiscal year Apr. 11, 1972, through Mar. 31, 1973.

[4] Nitrogen content of ammonium sulfate, nitrophosphate, and urea.

[5] P_2O_5 content of superphosphates only.

[6] Includes reinjected gas.

TRADE

The total value of India's exports was $4.6 billion, a gain of 19% over 1974 exports. The mineral industries accounted for $279 million during the first 6 months of calendar year 1975, or about 12% projected to yearend. The export of iron ore and concentrate, mica, and chromite brought in $151 million, $16 million, and $15 million, respectively. Manganese dropped to fourth place, with a value of nearly $11 million.

The total value of imports was $5.9 billion, up 12% over the 1974 value. Mineral imports were valued at $759 million to midyear, about equal to those in the same period in 1974. Nearly 85% of that figure was for imported petroleum. The total imported fuel bill for the year was estimated to be over $1.3 billion. The U.S. share of Indian imports was up 63% to $1.4 billion. The main imports from the United States in 1975 were food grains, $716 million; fertilizers, $186 million; and machinery and transport, $197 million.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—Reserves of bauxite have steadily increased in the last few years as deposits were reassessed by the Geological Survey of India in connection with the State Governments.[7] Reserves reportedly now stand at over 1 billion tons, the fifth-largest in the world. Most of that amount was in the inferred category, but the Government-owned Minerals Exploration Corp. (MEC), with support from the Geological Survey, was conducting detailed surveys of the deposits in 1976. Significant amounts of the inferred ore should accordingly be reclassified as indicated or measured when the surveys are completed. The following tabulation gives bauxite reserves, by State, in million tons:

State	Measured	Indicated	Inferred	Total
Orissa	--	128	480	608
Andhra Pradesh	43	8	362	413
Maharashtra	52	51	18	121
Madhya Pradesh	59	13	29	101
Bihar	13	11	21	45
Gujarat	22	--	22	44
Other	15	30	11	56
Total	204	241	943	1,388

Bauxite production increased about 14% to 1.27 million tons in 1975. About one-half of the production was metallurgical grade,

[7] U.S. Embassy, New Delhi, India. State Department Airgram A-150, May 21, 1976, pp. 1-12.

assaying in excess of 50% alumina. The number of mines reporting production was 47 compared with 67 in 1974. The mine closings were attributed to the electric power shortage and an accumulation of surplus stocks. Pithead prices declined from $3.29 (Rs 28) per ton in 1974 to $2.70 (Rs 23) per ton in 1975. The States of Bihar, Madhya Pradesh, and Maharashtra together accounted for 83.4% of the bauxite production. Bauxite exports were only about 1% of production.

As a result of the improved reserves, India was looking with confidence toward the development of export-oriented alumina plants. These would not endanger long-range plans for increased domestic aluminum production. Export of alumina rather than bauxite would be in keeping with India's plans to export value-added semiprocessed goods rather than basic raw materials. The Korba plant of Bharat Aluminium Co. Ltd. (BALCO) was the only plant producing alumina primarily for export. Production was about 70,000 tons in 1975, of which an estimated 50,000 tons was exported. BALCO signed an agreement to supply the U.S.S.R. with 40,000 tons in 1976.

Production of aluminum metal increased nearly 24% in 1975 to over 160,000 tons. That was a record high for India and accounted for about 1% of the world total. Plant utilization for India's six operating smelters was about 79% of capacity. An increase in available electric power and improved labor-management relations in 1975 contributed to the increased output. Particularly welcome was the increased supply of electric-conductor-grade aluminum, which had been in short supply in recent years. India's seventh plant, the 9,000-ton-per-year smelter in Asansol, West Bengal, had been closed since 1973, but was expected to be returned to service in early 1976. Total installed capacity for refined aluminum was reported at 246,000 tons per year in 1975.

Aluminum inventories went from 12,000 tons in June 1975 to over 35,000 tons by the end of the fiscal year. To lower inventories, the Government lifted the 5-year-old export ban on aluminum in December 1975. It permitted 15,000 tons of commercial-grade and 5,000 tons of electric-conductor-grade aluminum to be exported in the last quarter of 1975.

BALCO's Korba complex was scheduled to complete its second potline near yearend. The line was to be commissioned in mid-1976, and would double the 1975 capacity of the plant to 50,000 tons per year. Hindustan Aluminium Corp. Ltd.'s 95,000-ton-per-year smelter in Renukoot, Uttar Pradesh, was undergoing expansion. The new line would increase capacity by 25,000 tons per year when completed in 1978.

Chromite.—Total chromite reserves were listed at 13.8 million tons in 1973. The State of Orissa contains over 90% of India's known chromite reserves and contributes over 92% of total production. The mining areas are located about 110 kilometers northwest of the major port of Paradeep, through which most of the chromite exports flow. The reserve figures can be expected to change as more detailed exploration is conducted by the Geological Survey. Also the figures could continue to climb as improved mining technology allows deposits below the present economic limit (40 meters) to be counted as reserves and successfully mined.

Indian chromite production was about 500,000 tons. The high chromium to iron ratio of the ore (3.5 to 1) makes it desirable for the export market, and over 300,000 tons was shipped in 1974–75. Japan purchased about 290,000 tons, and the United States purchased the remainder. Growing domestic use of chromite and the limited amount of known reserves could cause a move toward conserving the ore supply for local consumption, although rising world chromite prices make the export revenue extremely attractive. Chromite was third in mineral export earnings in the first half of calendar year 1975, but reportedly moved past mica into second place by yearend.

Copper.—India's copper ore reserves (measured, indicated, and inferred) were estimated at 350 million tons ranging between 1.0% and 2.5% metal content. While copper deposits were reported in at least 11 of the Indian States, over 91% of the reported reserves occur in Bihar, Rajasthan, and Madhya Pradesh.[8]

Copper ore production was 1.8 million tons, up 28% over that of 1974 and nearly three times the production of 1971. The

[8] U.S. Embassy, New Delhi, India. State Department Airgram A-344, Dec. 30, 1976, pp. 4-12.

principal mines were Rakha Phase I, which serves the Ghatsila smelter in Bihar; and the Dariba, Chandmari, and Kolihan mines, which feed the Khetri smelter in Rajasthan. Ores from the Chandmari and Dariba mines (0.7% Cu) and the Kolihan mine (2.0% Cu) are blended before being beneficiated at the Khetri complex to produce about 12% to 14% copper concentrate.

India's copper-smelting capacity totaled 57,000 tons per year from the Government-owned Hindustan Copper Ltd.'s plants at Ghatsila and Khetri. Production of blister copper reportedly reached a record high of about 24,000 tons, more than double that of 1974. Although the plan for 1976 was 36,000 tons, production is unlikely to exceed 30,000 tons because of reported technical problems with a furnace at Khetri.

Consumption of copper dropped slightly, largely owing to substitution by aluminum. It amounted to 45,000 tons in 1975 compared with 50,000 tons in 1974. Demand for the primary metal was expected to increase gradually to about 100,000 tons by 1986.

As a result of the increased domestic production, Indian imports declined sharply from about 41,000 tons in 1974 to 20,000 tons in 1975. The Government promoted the initial establishment of a copper buffer stock because of rising international prices and as an aid in stabilizing domestic prices. As the result of this, a sharp increase in imports can be expected in 1976, possibly to around 45,000 tons.

The Government plans to continue expansion of the copper industry with the ultimate goal of national self-sufficiency. Planned expenditures for 1976 reportedly include continued development of the Khetri complex ($8 million), expansion of the Mosaboni and Rakha mines ($6 million), and expansion of the Chandmari and Sura mines ($2.7 million). The start of development at the Malanjkhand deposit apparently awaited additional detailed geological investigation by the Geological Survey and MEC. The deposit was believed to contain about 50 million tons of ore at 1.37% copper. The plan envisioned a $106 million investment in a mine and concentration plant. Startup capacity of the mine would be 1 million tons of ore annually with an ultimate capacity of around 3 million tons. The ore concentration plant would be located near Balghat in Madhya Pradesh. If constructed, it would furnish initially about 65,000 tons per year of concentrate to the Khetri smelter.

Gold.—India's gold production in calendar year 1975 was 90,285 troy ounces valued at about $14 million. Production from two mines in the Kolar goldfield accounted for one-half, with the remaining one-half coming from the Hatti mines. The Kolar Fields contain about three-fourths of the proved reserves. New exploration was being conducted by the Geological Survey to try to locate new reserves in the known fields. Some success was claimed in the Mysore mining area, but no firm ore estimates were available. New ore reserves were reported in the Anantpur District of Andhra Pradesh and the Raigarh District in Madhya Pradesh. It was also reported that the copper-zinc deposits at Dikehu in Sikkim have been found to contain 10 grams and 63 grams per ton of byproduct gold and silver, respectively.

Iron Ore.—Iron ore production in India is derived from three main types of mines: Captive mines operated by some of the steel plants; public-sector mechanized mines owned and operated by the National Mineral Development Corp., a subsidiary of the Steel Authority of India, Ltd.; and the smaller, privately owned mines using manual or partly mechanized methods. The latter category comprises about 500 mines, mostly in the State of Bihar and the Billary-Hospet region of Karnataka State. It was reported that the Iron Ore Board had recommended that these small, relatively inefficient operations be amalgamated with either the larger private mines or the public-sector mines. The merging would be done at the time of renewing individual mining leases, and would result in a more economical and efficient operation.

Reserves.—Deposits of all common iron ore minerals occur in India. Hematite deposits were the most important because of the large high-grade reserves. It was the only iron mineral being exploited for use in indigenous steel plants and for export. There are six hematite occurrences in India; the Barajamda region of Bihar and Orissa States contain over one-half of the reserves.[9] Of the 5,613 million tons of reserves, about 1,890 million tons were expected to grade above 62% Fe, and the

[9] Commerce (1935) Ltd. (Bombay). Minerals In Indian Economy. V. 133, No. 3424, 1976, pp. 1–376.

remaining range from 55% to 62% Fe. India ranks fifth in the world in recoverable iron ore reserves. The following tabulation gives Indian hematite reserves at yearend 1975, excluding banded hematite-quartzite deposits, in million tons:

State	Measured	Indicated	Inferred	Total
Bihar and Orissa	1,967	3,007	639	5,613
Madhya Pradesh and East Maharashtra	1,444	279	1,249	2,972
Karnataka	634	22	749	1,405
Goa and South West Maharashtra	124	123	215	462
Andhra Pradesh	--	--	16	16
Rajasthan	--	--	13	13
Total	4,169	3,431	2,881	10,481

The largest single iron ore deposit in the country was recently discovered near Chiria in Bihar State. Reserves were estimated by MEC at 1,970 million tons of 55% to 62% Fe. The ore was composed of about equal proportions of hematite and geothite.

Magnetite ores occur in several areas and are potentially very important. Measured reserves were reported at 1,204 million tons, and the total of all classes was set at 2,748 million tons. Indian magnetite deposits vary in grade from 20% to 70% Fe. Although the grade may be low, the ores are well suited to beneficiation into high-grade pellets by grinding, magnetic separation, and agglomeration. The most extensive deposits were at Kudremukh in Karnataka State.

Production and Exports.—India ranked eighth in the world in production of iron ore and produced nearly 5% of the total world output. Production increased from 35 million to over 41 million tons of iron ore in 1975. Most of India's iron ore was exported, and it was the main foreign-exchange earner for the country. Exports by the Government-owned Minerals and Metals Trading Corp. (MMTC), a subsidiary of the Steel Authority of India, Ltd., were around 12.5 million tons, nearly 80% of which went to Japan. Private shippers in the Goa area accounted for about 10.7 million tons; the remaining ore was processed domestically.

India was actively promoting increased ore sales abroad. MMTC contracted to sell 1.2 million tons of ore to the Republic of Korea over a 5-year period, and an additional 5.6 million tons over a 7-year period beginning in 1976. Under a long-term agreement, India is to supply 7.5 million tons per year of high-grade concentrate to Iran. A total of 210 million tons is to be supplied beginning in about 1981. Ore prices are to be based on a sliding scale related to the world market for iron ore.

Development and Expansion.—The export agreement between India and Iran involves the development of the Kudremukh iron ore deposit in Karnataka State. Iran was to provide a $250 million advance payment for the iron ore in addition to a $630 million credit to finance the cost of the project. Ore reserves at Kudremukh were estimated at 600 million tons. Ore is to be transported about 60 kilometers to the port of Mangalore by India's first major slurry pipeline. Mechanized ore handling facilities are to be constructed, and new berthing areas capable of handling ore carriers up to 60,000 deadweight tons were under development.

The development of the highly mechanized Deposit No. 5 at Bailadila had problems during the year, putting construction well behind schedule. A 2.2-kilometer tunnel crucial to the new workings was being driven through unexpectedly difficult strata. Heavy ground and extremely large flows of ground water into the tunnel slowed progress. The project is to supply 3.6 million tons per year of lump ore for export. Ore from both the new Bailadila 5 and existing Bailadila 14 is to be shipped through the new outer harbor facilities to be opened at the port of Visakhapatnam.

A Japanese steel company reportedly showed interest in collaborating with the Chowgule Co. in developing banded magnetite-quartzite deposits in the Badabudan Hills about 110 kilometers from the port of Mangalore. The project, not far from Kudremukh, is expected to mine 6 million tons per year of ore grading 35% to 40% Fe. It would require a concentration and pelletizing plant and about $500 million in development costs.

An agreement was also reported between Italy and India on the joint establishment of an ore pelletizing plant with a 200,000-ton-per-year capacity. The output would be exported to Italy. No further details were available.

Iron and Steel.—The industrial recession and governmental restrictions on construction adversely affected consumption of finished and semifinished steel, thereby contributing to a large unsold surplus. Stocks of pig iron and steel stood at a record 1.3 million tons at the end of the fiscal year. India's total production of pig iron increased 14% to 8.4 million tons in 1975. Production of salable steel by the major producers increased 18% to 5.7 million tons in the same period.[10] Total production would have been higher but there was considerable idle capacity at electric furnace units of the secondary producers in the private sector. Low domestic demand and lack of profitability compelled many secondary producers to cease production or operate at low capacity utilization.

The major producers continued to increase production in expectation of export sales and under Government pressure, while secondary producers reduced purchases of raw or semifinished steel. Capacity utilization at five of the six major integrated steel mills increased from about 73% in 1974 to 84% in 1975. Capacity utilization at electric furnace units ranged from 20% to 40%. The increase at the five main plants was due to an increased supply of electric power, raw materials, and fuel; improvement in the rail transport facilities; and improvement in the cooperation between management and the labor force. The Government announced a long-term wage agreement with steelworkers, which it hoped would assure harmony until September 1978.

Table 4 summarizes the capacity and 1973–75 production for salable steel at the six major integrated steel mills.

Production and Expansion Outlook.—India planned to raise domestic salable steel production about 16% in 1976 to about 6.6 million tons. The increased production was expected to be exported. Most of the increase should come from the new Bokaro steel plant. In light of excess steel stocks and rather soft market demand, the steel-production target for March 1979 (the end of the present planning period) has been reduced from 9.4 million to 8.8 million tons. In 1975, official policy appeared to favor attaining a minimum 90% capacity utilization, rather than starting additional new steel capacity. Inadequate domestic demand and a shortage of investment funds combined to slow India's steel-development program. The Government reportedly deferred construction of three new steel plants in south India at Salem, Visakhapatnam, and Vijayanagar.

The only new integrated steel mill to be added during the current plan period was the Bokaro plant, which was built with Soviet technical assistance. The first section of the plant was rated at 1.7 million tons

[10] U.S. Embassy, New Delhi, India. State Department Airgram A-23, Aug. 16, 1976, pp. 1–44.

Table 4.—India: Capacity and production of salable steel at major integrated steel mills

	Installed capacity (million metric tons)		Actual production (million metric tons)			Capacity utilization (percent)		
	Ingot	Salable steel	1973–74	1974–75	1975–76	1973–74	1974–75	1975–76
Public sector:								
Bhilai	2.5	1.9	1.68	1.63	1.85	86	86	95
Durgapur	1.6	1.2	.37	.50	.75	31	42	62
Rourkela	1.8	1.2	.74	.80	1.04	61	66	84

Bokaro Steel Co. (newly opened)	1.7	1.4	--	--	.15	--	--	10
Private sector:								
Tata Iron and Steel Co	2.0	1.5	1.20	1.45	1.48	80	97	99
Total	10.6	8.0	4.35	4.80	5.77	66	73	[1] 84

[1] Bokaro is not counted in capacity average.

per year. A second blast furnace and hot strip mill were reportedly near completion at yearend 1975. Work was continuing to expand the plant to its planned 4.0-million-ton-per-year capacity. Completion of the first phase took 10 years and reportedly cost over $1,100 million. The current expansion program is expected to cost another $1,100 million before the full capacity is reached.

Bhilai's expansion from 2.5 million to 4.0 million tons is going slowly and will probably be continued into the sixth 5-year plan period (1979–84). There were delays in the supply of equipment from the U.S.S.R. and the domestic supplier.

A defense-oriented superalloys plant was under construction at Hyderabad in Andhra Pradesh State. The plant was scheduled to open by 1980 and was planned to help eliminate the need for imports of high-priced specialty steels used in atomic plants and the aeronautics and electronics industry.

Construction on the new Rourkela Pipe Plant was underway. The plant was scheduled to begin operating early in 1976. The plant is to produce spirally welded pipe from 355 to 1,524 millimeters (14 to 60 inches) in diameter. The plant is to have a capacity of 55,000 tons per year and will be one of the few in the world capable of producing pipe this large in diameter. The output is to be used in the development of India's petroleum industry.

India's first sponge iron plant began operating at Vijayawada in Andhra Pradesh State. India's National Metallurgical Laboratory provided the design and technology for the plant. The plant adapted a rotary cement kiln to reportedly produce 30,000 tons per year of sponge iron from high-grade ore and nonbituminous coal.

Expansion of the ministeel plant program was at a virtual halt. More than 50% of the 202 holders of governmental licenses for electric furnaces had dropped their plans for new units. Less than 100 units were operating and these were finding operation difficult because of low demand, high taxes, and strict regulations. In an effort to help these privately owned plants, the Government announced an excise-tax reduction from Rs200 Rs50 per ton and a relaxation of some of the production controls.

Exports and Imports.—Preliminary trade statistics for the 9 months between April and December 1975 showed a sharp rise in exports of pig iron and steel materials, and a substantial drop in imports of steel. In quantity, India regained its position as a net exporter of iron and steel. Total projected exports for the year were around 900,000 tons, nearly an 80% increase over those of 1974. Although India exported a larger tonnage of steel than it imported, the value of imported steel was projected at over $300 million, far more than the $100 million India earned for its exports. The major markets for Indian steel exports were Japan, 20%; Iran, 18%; Bangladesh, 10%; and Iraq, Saudi Arabia, and Dubai each with 7%. India permitted the import only of previously contracted steel, primarily plates, sheets, seamless pipe, wire, and rods. The major countries supplying India's import needs were Japan, 32%; West Germany, 19%; the United Kingdom, 12.5%; and the U.S.S.R. 6%.

Lead and Zinc.—Total reserves of lead and zinc ores were reported to be about 194 million tons. Measured reserves totaled 113 million tons, with an estimated recoverable metal content of 3.78 million tons of lead and 3.30 million tons of zinc. Nearly 80% of the lead and zinc ore reserves are located in Rajasthan. Significant deposits also occur at Agnigundala in Andhra Pradesh, Ambamata in Gujarat, and Sargipalli in Orissa.

Production of lead-zinc ore was reported to be 714,000 tons in 1975, up about 20% over that of 1974. India's entire production of lead-zinc ore was from two underground mines in Rajasthan, the 1,800-ton-per-day Mochia Magra mine and the 800-ton-per-day Balaria mine. The Balaria mine was undergoing expansion to a 2,000-ton-per-day capacity, which could be achieved by late 1977. Preliminary work was begun on the nearby Baroi mine, which was scheduled to begin operating in 4 years. Ore from the two mines is beneficiated at the site. Lead concentrate is bagged and shipped to the Tundoo lead smelter in Bihar. Production of zinc concentrate was a record 38,000 tons in 1975, up 32% over that of 1974.[11] Development of the Rajpura-Dariba deposits near Udaipur was continuing. A 150-ton-per-day pilot plant was

[11] U.S. Embassy, New Delhi, India. State Department Airgram A-344, Dec. 13, 1976, pp. 12–20.

set up in 1975 for ore-dressing tests. Construction of the 550-meter shaft was underway and an eventual production of 900,000 tons per year was envisioned. A concentration plant was also planned but had not been started.

Zinc metal production in 1975 was from two smelters, one publicly owned and one privately owned. The Government-owned plant at Debari had a capacity of 18,000 tons per year; however, output for the year was reported at over 15,000 tons. A new roaster and other equipment were being installed to increase capacity of the plant to 45,000 tons per year. The private 20,000-ton-per-year capacity Cominco-Binani Zinc Ltd. smelter at Alwaye in Kerala State operates on imported concentrates and produced over 10,000 tons for the year. Total zinc metal output was therefore over 25,000 tons, a 22% increase over that of 1974.

A second public-sector zinc smelter was under construction at Visakhapatnam in Andhra Pradesh. The plant is to be based on the use of imported concentrates and have a capacity of 30,000 tons per year. It will bring India's total capacity to 95,000 tons per year in 1977 when the plant is scheduled for completion.

A major portion of zinc demand continued to be met by imports, despite a steady upswing in domestic production. Imports totaled 34,000 tons in 1975–76. The Government planned to establish a 15,000-ton zinc buffer stock for the first time in 1976–77, and anticipated imports will therefore be much higher, probably around 70,000 tons.

India's only lead smelter is Hindustan Zinc Ltd.'s (HZL) Tundoo plant near Dhanbad in Bihar State. Plant capacity was being increased to 8,000 tons per year from its present 5,400 tons per year. Production for the year was over 4,700 tons, derived from 15,000 tons of concentrate shipped by the Zawar mines in Rajasthan. Construction was underway on a lead smelter at Visakhapatnam. The 10,000-ton-per-year plant was to cost $44 million and be commissioned in late 1977. Plant feed will be domestic concentrate from the Sargipalli lead deposits under development in Orissa and from the Zawar mines.

India's demand for lead was met mainly by imports. These were furnished primarily by Australia, with Canada, Japan, and East Germany supplying small amounts. From imports of more than 37,000 tons in 1974, there was a drop to an estimated 17,000 tons in 1975. This was caused by a temporary drop in domestic demand. An anticipated increase in industrial growth and the Government's intention to build a buffer stock of 15,000 tons is expected to cause a rise in imports to around 27,000 tons in 1976–77.

Manganese.—Manganese ore production was reported at over 1.5 million tons, valued at $12 million. Nearly one-half of that amount would be required for domestic ferromanganese plants to operate at their 265,000-ton-per-year rated capacity. However, production was well under the rated capacity in 1975.

There are about 20 major manganese-ore locations in India, mostly in the southern half of the country. The most important deposits were those in the Balaghat and Chhindwara areas in Madhya Pradesh. These are run by Manganese Ore India Ltd. (MOIL), a company jointly owned by the national Government, two State Governments, and Central Provences Manganese Ore Co., Ltd. The largest single manganese mine in India is MOIL's Balaghat operation, which produces about 75,000 tons yearly. The mines in the Bhandara and Nagpur Districts of Maharashtra across the State border from Balaghat are also major producers. Aggregate ore production from these mines was about 190,000 tons in 1975.

To conserve manganese ore resources for domestic use, the ban on exports of high-grade ore and the ceilings on exports of lower grade ores were continued. MMTC reportedly set a 1-million-ton limit on exports for 1975–76, although actual exports may have been much less. The quota for 1976–77 was to be reduced to 0.7 million tons.

A 1,000-ton-per-year electrolytic manganese dioxide plant was under construction at Trivandrum in Kerala. The plant was scheduled for completion in 1977 and would use waste sulfuric acid from the nearby plant of Travancore Titanium Products, Ltd., in place of commercial acid. Output was to be used domestically in the growing market for dry-cell batteries.

Uranium.—The Government-owned Uranium Corp. of India (UCI) opened a pilot plant for recovering uranium from copper flotation tailings in September. The plant is adjacent to Hindustan Copper Ltd.'s complex in Ghatsila District, Bihar State. About 400 tons per day of copper tailings were processed using wet concentrating tables. The lean uranium values in the copper tailings are upgraded to about 0.12% U_3O_8 with a 50% recovery factor. The concentrate is shipped to UCI's mill at Jaduguda for further processing.

NONMETALS

Cement and Limestone.—Portland cement capacity in 1975 stood at about 21 million tons per year. Fifty-two plants operated during the year, and produced about 16.2 million tons. Five additional plants were reported under construction. Cement was produced in 15 States, but only 7 States accounted for 85% of total production. This had led to unusually high shipping costs for Indian cement because of the long distances involved between the plants and major market areas. Cement prices at the plant were adjusted by the Government on October 1, 1975, to $17.72 per ton, up from $14.83 per ton. After a predetermined allowance for the levy of taxes, packing and freight charges, and retailers' margin, cement was available to the Indian consumer at a uniform price of $36.72 per ton.

Limestone production in support of the cement industry totaled nearly 26 million tons from 97 mines.

Fertilizer Materials.—Greater availability in 1975 of power and fuel directly affected Indian fertilizer output. Production of nitrogenous fertilizers increased 14% to just over 1.2 million tons of nitrogen content. The Nangal and Kanpur plants operated at full capacity, and a number of major plants, including Namrup, Tuticorin, Madras, and Baroda, produced at over 80% of rated capacity during the year. Stocks increased during the first part of the year because high prices made it costly for farmers to use chemical fertilizers. Then, as part of a program to increase agricultural production, the Government reduced fertilizer prices in July. However, because dealers were reluctant to buy large new stocks, consumption was slow to increase. The low cost of recent imports contributed to dealers' expectations that there would be further lowering of prices. The Government then restricted the sale of imported fertilizers in 17 States and assured the merchants that there would be no more price cutting. Consumption of most types was picking up during the latter part of the year.

With the opening of the Kalol and Kandla plants, nitrogen-fertilizer capacity increased to 2.2 million tons per year, and capacity for phosphatic fertilizer, to 687,000 tons per year. Phosphate rock production was about 429,000 tons in 1975, while phosphatic fertilizer production was reported to be 320,000 tons of P_2O_5 content for all forms. Approximately 119,000 tons of this was contained in superphosphate production.

India ranked eighth in the world in fertilizer consumption. Imports of nitrogen and phosphate were up slightly to 950,000 and 326,000 tons, respectively. On the other hand, potash imports dropped about 40% to about 260,000 tons.

India depended heavily on fertilizer imports to meet its needs; however, a large expansion program was started to increase domestic production. During the year, 21 fertilizer projects were reported in various stages of construction or expansion.[12] Total capacity at the end of the 5-year plan ending 1979 was to be over 5 million tons of nitrogen and at least 1.3 million tons of phosphates.

The first fertilizer unit in the country using natural gas as feedstock was to begin operating around yearend. The unit at the Mamrup plant in Assam State would consume about 760,000 cubic meters per day of gas. The design capacity was 385,000 tons of urea and 100,000 tons of ammonium sulphate. HZL recently opened India's first phosphate-rock-beneficiation plant at Udaipur in Rajasthan. The plant was designed to treat 600 tons per day of low-grade ore and turn out a 34% P_2O_5 concentrate. Raw material for the plant was from the Maton phosphate mine, part of the extensive Jhamar Kotra deposits with proved reserves of 41 million tons. The plant was operating at reduced capacity pending expansion work on the nearby zinc smelter.

Mica.—India was the largest producer of high-grade mica in the world and traditionally has furnished over 70% of the world supply of sheet muscovite and

[12] Far Eastern Economic Review, Asia 1976 Yearbook, p. 182.

phologopite. The mica-pegmatite ore bodies occur mostly in Bihar, Andhra Pradesh, and Rajasthan. Indian mica reserves have not been assessed because of their erratic and relatively unpredictable occurrence.[13]

Production of crude mica was reported at over 11,000 tons for 1975, valued at about $2.6 million. The nearly 400 mica mines being worked were mostly small and very labor intensive. More than one-half produce less than 10 tons of mica each year. Mica was 17th in value of all minerals produced in 1975, and second after iron in export earnings during the first 6 months of calendar year 1975.[14] Exports of Indian mica of all grades were about 34,700 tons valued at $22,264,000. The figures were down only slightly in tonnage, but a substantial 21% in value. The market for high-value blocks and splittings dropped the most, reflecting technological changes allowing the increased use of low-priced scrap mica. The growing substitution of ceramics, plastics, and specialized materials in electrical and insulation uses also has contributed to a lessening dependence on natural mica by many nations.

MINERAL FUELS

Coal.—*Organization.*—Since nationalization of the coal mines was completed in 1973, development of coal and lignite deposits has been under Government jurisdiction, except for a few company-owned mines of Tata Iron and Steel Co., Ltd. These mines accounted for less than 1% of total output. In October 1974, the Department of Coal was set up under the Ministry of Energy to oversee the coal sector. On November 1, 1975, as a further step toward integrating and streamlining the structure and management of the coal industry, Coal India Limited (CIL), formerly known as Coal Mines Authority Limited, was established as a holding company under the Department of Coal. CIL subsidiary companies include: Bharat Coking Coal, Ltd. (BCCL), with headquarters at Dhanbad (Bihar); Eastern Coalfields, Ltd; (ECL), with headquarters at Sanctoria (West Bengal); Central Coalfields, Ltd., (CCL), with headquarters at Ranchi (Bihar); Western Coalfields, Ltd., (WCL), with headquarters at Nagpur (Maharashtra); and the Central Mine Planning and Design Institute, with headquarters at Ranchi. In addition to monitoring these companies, CIL's responsibilities include setting production targets, setting guidelines for implementing policy, purchasing equipment, and setting policy for marketing.[15]

The coal industry in southern India is controlled by the Singareni Colleries Company, Ltd. (SCCL). This is a joint undertaking in which CIL holds 45% and the Andhra Pradesh State Government holds 55% of the company. SCCL manages three mining districts that account for 10% of India's noncoking coal production.

Reserves.—India's total coal reserves were estimated at 85.8 billion tons in 1975. Coking coal accounts for about 23% of the total. Roughly two-thirds of the total reserves are located in five large coalfields—Raniganj (West Bengal), Jharia (Bihar), North and South Kananpura (Bihar), and Singrauli (Madhya Pradesh). The western side of the country has few good coal deposits, which causes transportation problems for consumers in southern and western India who must rely on shipments of higher grade coal from over 1,000 kilometers away in Bihar and West Bengal. Coal and lignite reserves (calculated for seams at least 1.2 meters thick and up to 610 meters deep) are as follows, in million tons:

[13] Pages 215–224 of worked cited in footnote 9.
[14] Page 62 of work cited in footnote 6.
[15] U.S. Embassy, New Delhi, India. State Department Airgram A–235, Aug. 29, 1976, pp. 1–39.

	Measured	Indicated	Inferred	Total
Coking coal:				
Prime coking	3,252	1,586	461	5,299
Medium coking	3,793	4,275	1,308	9,376
Weakly coking	1,206	2,600	915	4,721
Total	8,251	8,461	2,684	19,396
Noncoking coal	12,326	23,420	27,629	63,375
Testing coal	161	192	549	902
Lignite	1,869	202	29	2,100
Grand total	22,607	32,275	30,891	85,773

Indian press reports indicated that some impressive new reserves had been found during 1975. A 150-meter-thick coal seam (reportedly the world's thickest) was discovered in the Singrauli coalfield. Altogether, total reserves may be raised to over 100 billion tons when the new finds are more thoroughly explored.

The Government continued its coal exploration program with over 158,000 meters of drilling completed in 1975–76 and over 225,000 meters planned for 1976–77.

Production.—Coal production reached a record high of nearly 100 million tons in 1975–76, an increase of 13% over that of 1974. India ranked sixth in the world in production of coal. The increase resulted largely from greater capital expenditures, $262 million in 1975 versus $154 million in 1974. Improved labor relations in the coal mines also contributed to the increased output. Expansion of bituminous coal production is shown below, in million tons, and million dollars:

Year	Quantity	Value
1971	71.5	285
1972	74.8	305
1973	77.9	314
1974	84.1	473
1975	95.9	606

Of the total production, about 75% came from underground mines. This pattern will probably change as new mines are developed. There were 360 significant underground mines and 95 significant open pits. Plans called for adding 12 new open pit and 40 new underground mines by the end of the present plan period in March 1979. By then, the new, highly productive open pit operations should have increased the proportion of output to about 35% for open pits compared with 65% for underground mines. Since nationalization, many small inefficient mines have been closed or reorganized into larger more efficient units. This has led to the reduction in the number of significant mines from 779 in 1971 to the 455 operating in 1975.

Output per manshift in the Indian coal industry was one of the lowest in the world, approximately 0.69 tons in 1975. This was due to the labor-intensive nature of the industry, particularly in underground mines, and the relative lack of mechanization. As mechanization is increased and heavy trucks and earthmoving equipment are more widely used, output per manshift is expected to climb to 0.8 tons at the end of the fifth 5-year plan and to 1.3 tons by the end of the sixth 5-year plan (March 1984). By comparison, the U.S. average output per manshift in 1975 was over 14 tons. Indeed, many of the highly mechanized open pit mines in western United States produce over 125 tons per manshift.

Supply and Demand.—The highlight of the year in the coal industry was the greater availability for all consumers owing to improved transport and deliveries. Indian railways moved about 80 million tons in 1975, an increase of over 10 million tons from 1974. Coal, chronically in short supply, became surplus for the first time during the last half of the year. By yearend 1975, stocks at pitheads were about 12 million tons, equivalent of 35 to 40 days of production. The Government claimed that these stocks were not excessive, but the planning commission has revised the 1978 target downward from 135 million to 124 million tons. The 1976 target will probably be reduced from 108 million to about 103 million tons. Lower industry and powerplant needs were responsible for surpluses. Steel plants and powerplants accounted for 47% of total coal consumption and were expected to increase their share of the market to about 52% in 1978. Coal accounted for 61% of the total electric power generated in 1975. Consumption by other industries and the household sector will show significant increases in coming years as coal consumption is encouraged over furnace oil, kerosine, wood, and cattle dung. Some of the largest coal consumers are shown in the following tabulation, in million tons:

	1974–75	1975–76	1978–79 [e]
Steel plants	19.7	21.0	28.7
Powerplants	21.4	23.0	35.5
Railway	14.4	14.3	13.5
Cement plants	4.4	4.4	5.1
Brick kilns	2.5	3.3	4.5

[e] Estimate.

Coal washeries play an important role in the coal industry because of the high ash content of India's coal, often in the 20% to 30% range. There are presently 15 washeries in the country with an input capacity of 26 million tons of raw coal. Production of washed coal increased over 12% this year, but the plants were still running at well below rated capacity. Production from a washery generally consists of 70% clean coal (less 17% ash), 20% middlings (35% to 38% ash), and 10% rejects (50% ash). To meet the anticipated demand of the steel industry and to improve the quality of coal for other potential users, plans call for expanding capacity by 10 million tons during the current planning period. BCCL is to build coking-coal washeries at Sudamdih and Monidih, each with a capacity of 2 million tons per year. CCL is to set up a washery at Ramgarh and one at Kedla-Pundi, each with a capacity of 3 million tons per year.

Labor.—By yearend 1975, India's coal industry employed roughly 80% of the 640,000 people engaged in mining and quarrying activities. This was reportedly an increase of nearly 9% over the 1974 workforce. Nearly 54% of the labor force worked in underground mines, 15% worked in open pit mines, and the remaining 31% were engaged in aboveground support activities. The trend toward larger open pit operations is shown in the following tabulation on average monthly employment in thousands:

Year	Underground	Open pit	Aboveground	Total
1971	222.0	38.2	105.3	365.5
1972	231.3	43.1	117.2	391.6
1973	246.8	62.6	139.9	449.3
1974	258.2	73.3	153.3	484.8
1975 [1]	270.0	77.9	157.5	505.4

[1] Through March only.

Employment in coal mines will probably level off during the coming years as workers needed to operate new and expanded mines will tend to offset the surplus manpower created by expanded mechanization and improved efficiency.

Labor relations in the coal industry improved markedly during the year. Strikes, which cost over 720,000 man-days lost in 1974, accounted for only 262,000 man-days during 1975. More attention was given to work pay, fringe benefits, physical working conditions, and mine safety. A flood at the Chasnala mine in December 1975 killed 375 miners. As a result, further strict mine-safety measures are to be implemented during the coming year.

Planned Development.—The Government planned to spend over $264 million in coal mining investment for 1975–76 and $309 million in 1976–77. Most of this was to go toward the purchase of equipment to modernize existing coal mines. Several major long-term projects for coal development were underway or were to start soon.

BCCL plans to expand the Sudamdih and Monidih mines, each to a capacity of 2 million tons per year of coking coal. The combined production from these mines was 400,000 tons in 1975.

Long-term plans of ECL call for six new mines by 1985. The Jhanjra I and Jhanjra II noncoking coal mines were to be the biggest, with planned capacities of 2.8 million and 2.5 million tons, respectively. These were to be developed with Soviet assistance at a cost of about $94 million.

A large project under study by CCL is the development of the Singrauli coalfields in Madhya Pradesh. A new 10-million-ton-per-year Jayant mine is to be developed with Soviet assistance.

WCL plans to restructure the coal production under its jurisdiction. Many existing mines are to be modernized, and abandoned mines are to be repaired and reopened during the sixth 5-year plan.

Exports.—Because of surplus coal stocks, the Government launched a drive to promote the sale of coal abroad. About 440,000 tons were exported during the year and plans for 1976 call for 1.5 million tons to be exported. Paradip and Calcutta were the major ports used for exporting coal but had poor facilities for handling large tonnages. Mechanized port handling facilities were being developed at Haldia and Paradip. Haldia is located about 80 kilometers downstream from Calcutta and will have an exclusive coal berth with modern mechanized handling equipment. Annual loading capacity is to be 3.5 million tons with a potential of 5.0 million. When Haldia is commissioned, probably in early 1977, India should be in a good competitive position to sell increasing quantities of selected grades of coal to Western Europe and nearby Asian countries.

Lignite.—Most of India's lignite deposits are in Tamil Nadu State. However, the Geological Survey of India recently conducted geophysical surveys in the lignite areas and felt that reserves are considerably higher than the 2.1-billion-ton figure. Nearly all the lignite mined was from the Government-owned Neyveli Lignite Corp. (NLC). Production was reported at 2.8 million tons in calendar year 1975, a 15% drop from the 1974 figure. The NLC complex was established with Soviet collaboration in 1956 to exploit the lignite deposits for power generation and feedstock for the fertilizer industry. The open pit mine is designed for an ultimate capacity of 6.5 million tons per year in 1980. Production has not been enough to meet demands, and the Government decided to substitute fuel oil as feedstock to the fertilizer plant, a $16 million conversion. NLC has operated at a loss since its inception, with a cumulative deficit of $96 million. Losses have been declining recently and it was anticipated that NLC should begin to break even when the full 6.5-million-ton capacity of the mine is reached.

Petroleum and Natural Gas.—On January 13, 1975, the Government announced the establishment of an 11-member Oil Industry Development Board to raise funds for developing India's oil resources. Oil exploration and refining operations are to receive special attention. The board is expected to finance projects of the Oil and Natural Gas Commission (ONGC), Indian Oil Corp. Ltd., and the Indian Petrochemical Corp. These three Government-owned organizations would be responsible for implementing the projects, but the board would approve and monitor expenditures. The board was expected to receive funds for development from the oil tax imposed in July 1974 on domestic production of crude oil.

The Government announced in the fifth 5-year plan that its budget for petroleum development had been increased to $1.9 billion for the period, up from the original $470 million. The expenditure for 1975 will be aimed largely at development off the northwest coast of India.

The Government is negotiating for the purchase of refining, storage, and marketing facilities of the Burmah-Shell operation in India. Reportedly, over $60 million has been offered for the operation.

ONGC had interests in Iran, Iraq, and Tanzania. The Iranian venture has operated since September 1969. India's one-sixth interest in the Rostam offshore oilfield had produced about 3.8 million tons by the beginning of 1975. Production of the field is declining and India's share over the 1975–79 period was expected to be about 2.2 million tons. The venture has reportedly been marginally profitable because of the high Iranian tax rate. Iran was considering a lower tax rate on small fields, and ONGC could realize a profit if the change is approved.

ONGC had an agreement with the Iraq National Oil Co. to explore in a 4,200-square-kilometer area west of Basra near the Saudi Arabian border. Over 1,200 line-kilometers of seismic survey had been completed and the first well was spudded on August 14, 1975.

ONGC operations in Tanzania were the most recent foreign development. ONGC spudded its first well on the island of Songo Songo. The search was for natural gas and the drilling contract was on a daily rate.

Production and Reserves.—Domestic production of crude oil climbed modestly in 1975 to about 8.4 million tons, equivalent to one-third of the total used. India's output of crude oil is expected to increase steadily during the fifth 5-year plan. ONGC holdings accounted for an output of over 5 million tons of crude oil, and the joint sector, India Oil Comp., Ltd., accounted for over 3 million tons. The most important single producer was the Ankleshwar oilfield in Gujarat State, which yielded over 3 million tons. Oilfields in northern Gujarat produced an additional 1 million tons and will be counted on to maintain the State's overall production when output at the older Ankleshwar Field begins to decline in the next few years.[16]

Reserve figures vary widely and are sub-

[16] U.S. Embassy, New Delhi, India. State Department Airgram A-208, July 17, 1976, pp. 1–41.

ject to constant revision because of the Government's extensive exploration program. Proven reserves at the beginning of the year were believed to be about 2.4 billion barrels, most of which were in the offshore areas in northwest India. Potential resources are much higher, of course, with some sources giving figures in tens of billions of barrels.

Gross production of natural gas was about 2.3 billion cubic meters. Because of a lack of adequate pipeline facilities, however, only about 4 out of every 10 cubic meters produced were actually sold. The remainder was flared or reinjected to maintain oilfield pressure. Total proven reserves were reported in 1975 at about 100 billion cubic meters, with offshore deposits accounting for about one-third of that figure.

Imports.—The cost of petroleum imports reached a record high of $1.35 billion during 1975, up 3% over the 1974 level. Nearly 14 million tons of crude oil and over 2 million tons of petroleum products were imported in 1975. Fiscal incentives were introduced by the Government early in the year to encourage the replacement of oil-fired equipment with coal. These proved effective and allowed a 45% decrease in importation of heavy furnace oil. India obtained crude oil from the following sources: Iran, 5.85 million tons; Saudi Arabia, 4.18 million tons; Iraq, 2.9 million tons; and Abu Dhabi, 1.0 million tons. Projected imports for 1976 were placed at 13.2 million tons, with Iran and Saudi Arabia again being the main suppliers. Imports of petroleum products for 1976 were planned to be about 2.5 million tons, mainly from Kuwait and the U.S.S.R.

Exploration.—Of major importance was the rapid exploration and development of the offshore oilfield discovered in the Bay of Cambay in an area known as the Bombay High. Production platforms were being built by J. Ray McDermott Co. about 180 kilometers west of Bombay during the year.[17] The first commercial production is scheduled for shortly after yearend. Full development of the field was expected to cost over $600 million and will entail at least four platforms, a flare tower, a processing unit, and underwater pipeline connections. Ultimate production is now forecast at 200,000 barrels per day, with proved reserves now reported at about 1.5 billion barrels. A single-buoy mooring system will be installed along with an 87,000-deadweight-ton storage barge to allow tankers to load crude oil for shipment to a coastal transhipment point. Eventually a pair of pipelines are planned to bring the separated oil and natural gas ashore to a point near Bombay. The Bombay High crude oil is API 39° to 44° and less than 1% sulfur. The relatively high wax content contributes to a 30° C (86° F) pour point. This will require consideration in the design of the handling, transportation, and processing facilities for the crude oil.

A nearby area called the "Bassein structure" was being drilled at yearend. The area is geologically similar to the Bombay High and may contribute additional production and reserves.

The Government has divided its offshore area into 10 blocks for exploration purposes. So far it has awarded three blocks to foreign oil companies on an Indonesia-type production-sharing basis, with ONGC as a participating partner in some cases. These include the Natomas-Carlsberg Group (Natomas), representing a consortium of five U.S. and two Canadian companies; the Reading and Bates Group of three U.S. firms; and the Asamera Group, representing three Canadian companies.

Natomas had been surveying since May 1974, and began drilling in September 1975 in a 28,000-square-kilometer tract in the Bay of Bengal off India's northeastern coast. ONGC has a 15% equity in the group, with an option to acquire an additional 10% if a commercial discovery is made.

Reading and Bates had a 28,000-square-kilometer concession in the Gulf of Kutch off the northwestern coast of India. ONGC also had an option to acquire 10% in the event of an oil discovery. The first well was begun in October 1975, and results of the drilling were being analyzed at yearend.

Asamera was the latest foreign group to be awarded a concession. The area covers 26,000 square kilometers in the Cauvery Basin off the southeastern coast, north of Sri Lanka. The Government has a 25% interest, with an option to increase that to 50% if desired. Seismic survey work was reportedly underway at yearend.

The Government increased its onshore exploration program and had 40 rigs operating in 1975. Additional rigs were on

[17] Himachal Times (Dehra Dun, India). India's Oil Potential. July 1976, p. 122.

order from the U.S.S.R., Romania, and the United States. Some of these were to be high-capacity units capable of drilling to as deep as 6,000 meters. Some of the older rigs will be phased out as the modern equipment is received. Surveying and drilling was to be conducted in Tripura, West Bengal, Jammu and Kashmir, the Ganga valley, Punjab, Himachal Pradesh, Tamil Nadu, Maharashtra, and Rajasthan.

Pipelines.—India's first major pipeline was commissioned in 1962 to move crude oil from upper Assam State to the Barauni refinery in Bihar State. Since then, both crude and product pipelines have been constructed to facilitate the flow of petroleum between oilfields, refineries, and distribution centers. Crude oil and product pipeline mileage now totals 3,360 kilometers. Most crude oil is moved by pipeline, but products were still moved mostly by rail and highway. Product lines carried about 3.7 million tons, or about 17%, of the refinery throughout in 1975. Plans called for a major building program to upgrade the extent and capacity of the overall system.

The most important project on which work was ready to begin was a system to move crude oil from Salaya in the Gulf of Kutch to the new Mathura refinery. A branch line would also feed the Koyali refinery. The project would include an offshore terminal, a submarine pipeline to shore, and a crude oil storage depot to feed the pipeline. The line was to be over 1,200 kilometers long and would cost an estimated $209 million at 1975 prices. Design work was completed, and construction of support facilities began around yearend. Actual pipelaying on the first section, from Salaya to Viramgram, was to begin in late 1976. The line would use imported Middle East crude oil, but would also be available for input from tankers from the Bombay High oilfields.

A project under urgent consideration in 1975 was a pipeline linking the offshore Bombay High fields with the mainland. No decision was made on whether separate oil and natural gas lines would be laid or a single two-phase pipeline would be constructed. In either case, the project was vital to the efficient development of the offshore fields. Project costs were estimated to be at least $500 million.

During the year plans were completed for looping a 600-kilometer section of the existing 1,157-kilometer Nahorkatiya-Baravni crude oil pipeline in northeast India. The increased capacity would allow higher production from the Assam oilfields. Construction was to begin early in 1976.

Refining.—Ten refineries were operating in 1975—five Government owned, three jointly owned, and two privately owned. Total throughput capacity at yearend was 27.4 million tons per year. During 1975, however, the actual amount of crude oil processed was about 21.8 million tons, up about 5% over that of 1974. This underutilization was attributed to the Government's crude oil import restrictions following the sharp rise in petroleum prices in 1973. Despite the current underutilization of capacity, the Government is looking to future demands and plans to expand present refining capacity 10 million tons per year by 1980–81.

Two major projects were underway during 1975, and one was completed. The most important is the Mathura refinery project, a 6-million-ton-per-year plant to be built with both Soviet and U.S. technical assistance. The refinery, which is located about 130 kilometers south-southeast of New Delhi in Uttar Pradesh State, is expected to be completed in 1980. The plant was to operate on imported Middle East crude oil and domestic crude oil from the offshore Bombay High Field. The Soviet contribution to the project includes design and construction of the atmospheric and vacuum distillation units, construction of the visbreaker unit, bitumen blowing unit, and off-site facilities. The non-U.S.S.R. portion, much of it by a U.S. firm, consists of the processing expertise for the fluid catalytic cracker, Merox units, visbreaker, desalters, powerplant, and antipollution facilities. Total cost of the project was set at $170 million, revised upward from the original $108 million estimate.

The other project is expansion of the Koyali refinery (also referred to as the Gujarat or Baroda refinery) in Gujarat State from 4.3 million to 7.3 million tons per year. The work began in 1975; site preparation, water supply, and power facilities were completed by yearend. Construction of the footings for storage tanks was underway at yearend also.

The 2.5-million-ton-per-year Haldia refinery, 60 kilometers southwest of Calcutta, was completed, and began its first year of operation with no apparent problems.

The Mineral Industry of Indonesia

By K. P. Wang [1] and Emily Perreault [2]

The economy of Indonesia,[3] particularly its balance-of-payments position, came under pressure in 1975 from three directions—the world recession, the liquidity crisis of P.T. Pertamina (the giant State oil corporation), and high import demand. Many of Indonesia's exports met resistance in demand and price. The Government had to pay off legitimate obligations of Pertamina, and slow down Pertamina-oriented development projects. Imports remained high in quantity, and moved up sharply in price. Inflation continued at 20%. Depressed by recession abroad and uncertainties at home, new foreign investment was low in 1975. However, the economy and foreign-exchange situation improved near yearend, and the rice harvest turned out well also. With the successful conclusion of the first 5-year plan, the Indonesian Government embarked optimistically upon the second 5-year plan covering fiscal 1974 (April 1974 to March 1975) to fiscal 1978.

The oil industry was down only slightly in output, and this was compensated for by some increase in prices. Indonesian petroleum exports in 1975 were worth $5.3 billion,[4] close to the 1974 level. The president-director of Pertamina was replaced in 1975, and the oil firm was reorganized. A new Inspectorate Div. was created to place restrictions on Pertamina's participation in new joint ventures and subsidiary activities, reducing the company's involvement in costly non-oil-related activities. Responsibility for fertilizers passed from Pertamina to the directorate general for chemical industries. P.T. Krakatau Steel was removed from Pertamina and reduced in scope. The proposed Batam Island refinery, formerly under Pertamina, was delayed and was to draw on private capital. However, Pertamina's liquefied natural gas (LNG) plants, particularly the Badak plant, and the new Cilacap refinery, were moving ahead. President Suharto announced in his budget speech on January 7, 1976, that the Government would seek to increase its oil revenues 7.6% through a reduction in unit profits by oil companies. The outlook for Indonesian oil and gas in 1976 is for retrenchment in certain areas, consolidation in others, and an overall modest improvement in production.

Low world demand and prices dulled activities in tin and copper during the year. P.N. Timah, the State tin enterprise, slowed its investment activities after completing expansion of its smelter. Freeport Indonesia, Inc., temporarily shelved its plans to develop underground copper operations, although tin and copper prices have since improved. In July 1975, the Asahan aluminum and hydro project was finalized between a Japanese consortium and P.N. Aneka Tambang—the Government nonfuel, nontin enterprise.

In October, the State coal mining enterprise, P.N. Batubara, signed a pioneering production-sharing contract with Shell Mijnbouw N.V. to govern coal exploration and development in south and central Sumatra. P.T. International Nickel Indonesia (P.T. INCO) was about to finish a nickel matte operation in South Sulawesi. The P.T. Pacific Nikkel project for Gag Island awaited an assessment by the

[4] Where necessary, values have been converted from Indonesian Rupiahs (Rp) to U.S. dollars at the rate of Rp415=US$1.00.

Pacific Bechtel Corporation. The Aluminum Company of America (Alcoa) backed out of its bauxite and alumina project in West Kalimantan, but Aneka Tambang moved ahead on its large alumina plant to utilize the off-grade bauxite.

Indonesia was deliberating the "Third-Generation Contract of Work" to be offered foreign mining companies, which probably will mean fewer safeguards and incentives. The principal anticipated changes include a requirement that foreign earnings be repatriated to Indonesia and converted to rupiahs, and the imposition of export taxes on mineral commodities. There is also the question of Indonesian equity participation in mining projects; 51% is the long-term objective. So far, the policy is to seek minority shares, which are to be held by Indonesian State mining companies.

Indonesia is a member of the International Tin Council (ITC), International Bauxite Association (IBA), the Organization of Petroleum Exporting Countries (OPEC), and International Council of Copper Exporting Countries (CIPEC). The country is generally sympathetic to views of developing nations within these international organizations, although it also welcomes the principle of producer-consumer consultation. Indonesia is prominent in ITC, and would welcome U.S. participation in the fifth tin agreement.

A ministerial-level Committee on Natural Resources Inventory and Evaluation was established. Areas of concern include marine, land, human, and energy resources, and their impact on future economic development. Energy has received the most attention, since petroleum sales dominate the Indonesian economic structure. Oil's influence on the economy goes beyond exports, however; domestic consumption has risen to about one-fifth of output. To serve the well-being of the Indonesian population and stimulate industrial development, petroleum prices are subsidized and producers are often asked to sell a share of their output at discount prices. Yet, local oil use cannot go unrestrained, and Indonesia's premium low-sulfur crude oil might be more valuable sold than used; thus, the concept of energy policy started to emerge in 1975. Indonesian coal mines were being expanded for this reason, along with the investigation of geothermal potential and the hope of introducing nuclear power by the 1980's. Indonesian officials were considering no further foreign ventures in coal exploration and mining for the time being.

PRODUCTION

Indonesia's mineral production showed a nominal decline in oil and tin; slight drops in copper, nickel, and iron sands; a sharp reduction in bauxite; a good increase in coal, but from a small base; and healthy buildups in construction materials, particularly granite, a new product. International oil sales were sluggish, and there were quota problems with tin. Smelter tin output increased significantly. Copper prices were sharply down, forcing the sole producer to reevaluate plans. Now production capacity was being readied in nickel so that Indonesia will not remain just a producer and exporter of ore. Cement production was up by well over 10% as Indonesia embarked on a program to greatly expand capacity. The fertilizer industry is being built up tremendously to utilize the available natural gas. Indonesia's tin, oil and, potentially, nickel are of considerable world consequence.

e Estimate. p Preliminary. r Revised.

[1] In addition to the commodities listed, a variety of crude construction materials (such as clays, stone, sand, and gravel) are also produced, but available information is inadequate to make reliable estimates of output levels.

[2] Officially reported Indonesian statistics representing government output; private production by small unorganized producers may be as much as 30,000 troy ounces per year. Some gold recovered from copper concentrate.

[3] Includes a small amount of cobalt which is not recovered separately.

[4] Some silver recovered from copper concentrate.

[5] Revised to none.

[6] The limestone figure is understated by the considerable amounts of limestone produced by enterprises under local jurisdictions for building materials, for crushed rock to be used as aggregate, and to burn for lime.

[7] Sulfur produced by other than Frasch process.

TRADE

Indonesia has always had a strong balance-of-payments position because of its exports. For example, in 1974, exports were about $7.4 billion, compared with imports of approximately $3.9 billion. Total exports in 1975 dropped to about $7.1 billion because of world economic difficulties. On the other hand, imports rose to $4.8 billion. The balance of payments was rather muddled in 1975, with the Pertamina financial crisis weakening Indonesia's overall position.

Minerals and particularly oil were of overriding importance in total exports. Oil represented nearly 75% of all 1975 exports in value, and other minerals added another 4%. Gross receipts from Indonesia's mineral exports are tabulated below, in million dollars:

Item	1973	1974	1975
Petroleum	1,609	5,211	5,311
Tin	89	173	154
Copper concentrates	59	125	74
Nickel ore	10	14	21
Bauxite	7	7	6
Other minerals	3	3	4
Nonminerals	1,436	1,892	1,539

Specific tonnages of mineral exports and imports are shown in tables 2 and 3, respectively.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—P.N. Aneka Tambang operates the bauxite mines of Bintan Island near Singapore to furnish Japan with 53% Al_2O_3 bauxite on a long-term contract basis. However, because of economic difficulties, Japan cut the shipments from Indonesia from about 1.2 million tons to just under 1 million tons in 1975. Aneka Tambang was moving ahead on its plans to build a 500,000-ton-per-year alumina plant on Bintan Island to utilize a 50-year supply of off-grade local ores. A second proposed alumina plant under P.T. Alcoa Minerals Indonesia for West Kalimantan was shelved because of excessive costs and difficult worldwide economic conditions.

In July 1975, the Indonesian Government reached an agreement with a consortium of Japanese companies to produce 225,000 tons of aluminum and 450,000 tons of alumina yearly by the 1980's. The project site is Asahan in North Sumatra, with a 284,000-kilowatt powerplant at Segura-gura and a 320,000-kilowatt plant at Tangga. Three 75,000-ton aluminum potlines will be built at Kuala Tanjung on Sumatra's east coast. Development costs are projected at $465 million for the smelter, $260 million for the power system, and $87 million for infrastructure. The Indonesians feel that while the project might be only marginally profitable, it should be important in stimulating industrial development.

Copper.—Indonesia's primary copper production has come entirely from the Gunug Bijih copper mine in Irian Joya owned by Freeport Indonesia, Inc., which in turn is a 87% subsidiary of the U.S. firm Freeport Minerals Co. At yearend 1975, Freeport paid its first dividend of about $10 million and also made a prepayment of debt of about $12.4 million. Arrangements were made to sell 8.5% of the company's share to the Indonesian Government.

Production was down slightly, although still more than 200,000 tons of concentrates analyzing about 29% copper. Export earnings dropped from $125 million in 1974 to $74 million in 1975, reflecting mainly sharply lower copper prices. Because of reduced income and escalating costs, Freeport has been forced to reappraise its earlier plans to commence underground mining by 1980. The life of the existing open pit is only 5 to 7 years. Copper prices would have to improve considerably before underground mining is undertaken. So far, about two-thirds of the concentrates are exported to Japan, and the remainder to West Germany.

There was still significant interest in copper exploration. P.T. Tropic Endeavour is looking into the Gorontalo area of northern Sulawesi for porphyry copper.

Gold and Silver.—The State-owned Aneka Tambang produces about 12,000 troy ounces of gold and 141,000 to 247,000 troy ounces[5] annually from the Cikotok

[5] One kilogram equals 35.274 troy ounces.

mine in south Banten, West Java. High prices have helped prolong the life of this marginal mine. Unrecorded output from small private mines in Kalimantan and Sumatra might total well over twice Aneka Tambang's output. Freeport Indonesia's copper concentrate contains about 10 grams of gold and 135 grams of silver per ton, but this goes to Japanese and West German smelters. Because of good prices, many (mostly domestic) firms are exploring for gold in Sumatra, Kalimantan, and West Java.

Iron Sands.—Aneka Tambang produced just over 350,000 tons of iron sands in 1975 from the Cilacap area on the south coast of Central Java. These sands, analyzing 58% Fe and 10% TiO_2, are sold to Japanese pig iron manufacturers for blending in blast furnaces. Additional iron sands near Jogjakarta were being investigated by Aneka Tambang for the direct-reduction steelmaking process. Confirmed reserves at this second site amount to 230 million tons of 12.5% Fe sands in a 35-square-mile area. The Geological Survey of Indonesia is helping Aneka Tambang to systematically explore promising areas in the southern shores of Java and Bali. South Sulawesi Mining Corp. was investigating a nearby area with the help of Rio Tinto Bethlehem Indonesia. The State mining enterprise Aneka Tambang was drilling a large base-metal deposit in West Java, and has investigation underway in Sulawesi, Lampung, and West Kalimantan. Indonesian authorities still appeared receptive to foreign investment in base metals, including copper.

Manganese.—Demand was slack in 1975, especially in Japan. The small manganese mines in West and Central Java were unable to sell their full production. Explorations by P.D. Gama Karya have identified a 150,000-ton deposit on Pulau Doi. Indonesia has been producing only 13,000 to 18,000 tons per year of uneven-grade manganese ore in recent years.

Nickel.—Indonesia's nickel supply is totally export orientated. Ore has been the mainstay so far. Aneka Tambang operates the nickel mine at Pomalaa, southeast Sulawesi, Indonesia's only ore producer. Output declined slightly to about 800,000 tons of 2.4% Ni ore in 1975, but value increased because of higher nickel prices. Exports were about 726,000 tons, all to Japan. Japan started to contract for reduced tonnages of this lateritic, high-moisture (27%) ore for the years to come. Reserves at the present site may be adequate for only 15 years, although additional supplies might be available in nearby concessions. Aneka Tambang completed a 20,000-ton ferronickel smelter (4,500 tons contained nickel) in early 1976 to utilize the lower grade ore at Pomalaa.

P.T. International Nickel Indonesia (INCO) was getting its mine (cut-off grade of ore is 2.2% Ni) and nickel-matte plant (75% grade, with sulfur coming from Canada) at Soroko in South Sulawesi ready for first-stage operation by September 1976. Phase 1 capacity will be rated at 37 million pounds per year of contained nickel and phase 2, 107 million pounds per year by 1978. Second-stage construction began in 1975. At yearend 1975, there were about 6,500 construction and operating personnel, and the work force may increase 50% by 1977. A 165,000-kilowatt hydropower plant is being built at Larona to meet phase 2 objectives. The overall capital cost estimate has been revised upward to about $840 million. INCO is a 90% subsidiary of a Canadian parent company, but it has six Japanese partners to facilitate future sales.

P.T. Pacific Nikkel (United States Steel Corp. 48%, Hoogovens 24%, Newmont Mining Corp. 17%, and Sherritt Gordon Mines Ltd. 11%) has already spent $40 million on a project to produce metallic nickel from lateritic ores on Gag Island near the "bird's head" of Irian Jaya. Projected annual output is approximately 110 million pounds of nickel powder or briquets, 2 million pounds of nickel, and 1 million pounds of cobalt in mixed sulfide concentrate. This Sherritt-Gordon hydrometallurgical project may eventually cost about $900 million. The fate of this project may hinge upon a reassessment by Pacific Bechtel Corporation of capital and operating costs. If assessment is favorable, the World Bank may be involved in a loan to the extent of $50 million.

The Indonesian Nickel Development Co. (INDECO) has been working on nickel properties on Gebe Island near Halmakera. In September 1975, INDECO submitted a feasibility study to the Indonesian authorities indicating that its findings do not support a viable project under current economic conditions.

Steel.—The State enterprise Krakatau Steel has under construction at Cilegon in West Java an integrated mill based upon the HyL direct-reduction process and using Australian iron ore and natural gas from Central Java. First-phase production will be 1 million tons of sponge iron annually, one-half to be sold and the other one-half to be processed into billets, and then wire, bars, and shapes. The project is behind schedule, because of its connection with Pertamina, the oil giant. Lately, Kaiser Engineers and Armco Steel Corp. have been brought in to assist in the project. Steel requirements in Indonesia are steadily expanding, and this project is aimed at reducing imports.

Tin.—Indonesia maintained its position as the world's fourth ranking tin producer, and held 13.71% of the 1975 global export quota of ITC. As in 1974, production of tin-in-concentrates was just above 25,000 tons. However, pressure is building to expand production and increase Indonesia's quota. In addition to the big company, State-owned P.N. Timah, two private foreign companies started production and another foreign company delineated sizable reserves. P.T. Koba Tin, owned by an Australian company, produced 882 tons of tin in 1975 (689 tons in 1974) from gravel pump mines in Lubuk Besar (temporarily closed because of an ITC quota problem) and Nibung; Koba has ordered two 3-meter dredges.

P.T. Broken Hill Pty. Indonesia (BHPI), also a subsidiary of an Australian firm, has been exploring Billiton Island and produced small quantities of mine tin in 1975 on an experimental basis from the old Kelapa Kampit mine. BHPI is coming out with a report in August 1976 to define its findings and state its policy in the face of difficult-to-obtain ITC quotas. Billiton Exploraie Maatschappij Indonesia, B.V., subsidiary of Royal Dutch/Shell, has explored a contracted area offshore, between Bangka and Singkep Islands. Minable tin reserves so far are in the 15,000- to 20,000-ton range. A deep (45-meter) year-round, $25 million dredge, capable of processing 8 million cubic meters of gravel annually has been ordered. Production will begin in 1978, with eventual target of 2,500 tons of tin-in-concentrates per year. There is again a quota problem, but Billiton has offered one-fourth of its shares to P.N. Timah, and the proposal seemed to be well received.

P.N. Timah will always hold the controlling position, since it also owns the smelter. Its mine tin output in 1975 (1974 data in parentheses) was as follows, in tons: Bangka, 17,181 (17,659); Belitung, 5,209 (5,403); Singkep, 1,801 (1,776); and Bangkinang 200 (185). Timah has 12 fixed dredges on Bangka (one 18-cubic feet, five 14-cubic feet, and six 9-cubic feet) plus 8 small dredges that can be dismantled. On Belitung Island, there are 14 fixed dredges (five 14-cubic feet, eight 7-cubic feet, and one 5-cubic feet) plus 2 small dredges that can be dismantled. There are four dredges on Singkep Island—two 14-cubic feet, one 9-cubic feet, and one 5-cubic feet. Despite low tin prices in late 1975, Timah retained plans to acquire a seagoing dredge from the British firm Payne Co.; the dredge is rated at 50 meters in depth and has 24-cubic-foot buckets. This dredge will be in service by 1979. Overall, Timah has 15 to 20 years of reserves, according to present knowledge.

Timah's tin smelter, called Peltim, was finally expanded to 25,000 to 28,000 tons by adding conventional reverberatories to supplement the malfunctioning West German rotaries initially installed. Mackay Consultants successfully designed and helped build the new facilities. The plant is to smelt all of Indonesia's concentrates. Indonesia's tin metal production was brought up to nearly 18,000 tons in 1975.

Uranium.—Indonesian law reserves exploration for and exploitation of uranium to the national atomic energy authority Batan. Foreign participation is possible under special agreement. French firms have helped in uranium exploration in South and West Kalimantan; about 100 shallow holes were drilled in 1975 with deep drilling due to begin. West German firms were working in Lampung (Sumatra) and Central Sumatra, with plans to start drilling in 1976. Batan does not expect conclusive findings until a few years from now and hopes to start active mining in the mid-1980's. A Government nuclear-testing reactor is being built at Serpong, West Java.

NONMETALS

Cement.—Demand for cement in Indonesia has been several times production (roughly 1 million tons in 1975) during recent years. A vigorous program of expansion is now in progress with a goal to have 6.3 million tons of capacity by 1978–79, the end of the second 5-year plan. Two new plants were inaugurated in 1975—one each by P.T. Semen Cibinong (subsidiary of Kaiser Cement Co.) and Distinct Indonesia Cement Enterprise (this firm has Taiwan connections). Occupying adjoining sites in West Java, both plants will be rated at 500,000 tons per year initially, to be doubled in capacity in the next phase.

P.T. Semen Padang raised annual capacity of its Indarung plant to 330,000 tons during 1975, and P.T. Nusantara has a 500,000-ton facility under construction at Cilacap due onstream in June 1977. P.T. Semen Gresik is tripling capacity to 1.5 million tons. Baturaja, a Government joint venture with Padang and Gresik, plans to complete a 500,000-ton plant in South Sumatra by 1977–78. Plans in 1975 indicate that the Government of Indonesia will build a new 500,000-ton plant at Tonasa in South Sulawesi with a Canadian loan; the old plant is just over 100,000 tons. The Government is also expanding the Padang plant in West Sumatra by 500,000 tons with Danish financing. A private 500,000-ton cement plant is planned for Tjirebon in west-Central Java. In 1975, the existing cement plants produced about 1.4 million tons of limestone and 0.25 million tons of clays for cement manufacture.

Clays.—The tin company Timah has been exploring kaolin deposits on Bangka and Billiton Islands in 1975, as part of a program to diversify. Many clays found are intermediate in quality, between paper- and ceramic-grade and superior to filler-grade. Timah hopes also to interest the Japanese market in this regard. Use of indigenous clays for building materials was also being investigated. Timah also tested smelter slags for making mineral wool for the domestic construction industry.

Elsewhere, the cement industry produced about 250,000 tons of clays in 1975 for its own use in cement manufacture. Other small firms also produced approximately 25,000 tons of kaolin during the year.

Fertilizer Materials.—Indonesia was working on a 100% fertilizer self-supply structure by effectively utilizing its natural gas resources. Long a net importer of fertilizers (including nearly 2 million tons of urea in 1974), Indonesia is likely to become an exporter after 1977. Demand by 1978 is estimated at 2 million tons of urea, 580,000 tons of triple super phosphate (TSP), 200,000 tons of ammonium sulfate, and 160,000 tons of NP/NPK (compound fertilizers).[6] At yearend 1975, a 175,000-ton-per-year urea plant and another 46,000-ton-per-year urea plant were in operation in Palembang, and a 21,000 ton-per-year urea plant was working in Gresik.

Indonesia plans to complete the following fertilizer plants (shown with annual capacity) by yearend 1978: A 150,000-ton-per-year ammonium sulfate plant, a 570,000-ton-per-year urea plant, and a 400,000-ton-per-year TSP plant at the Petrokimia factory; 570,000-ton-per-year urea plants at the Pusri third factory, the Pusri fourth factory, and the Pupuk Jujang plant; two additional 262,000-ton-per-year urea plants at Palembang plus a 154,000-ton-per-year diammonium phosphate (DAP) plant; a 152,000-ton-per-year TSP plant and a 38,000-ton-per-year TSP plant at Gresik; 258,000 ton-per-year urea plants at Balikpapan and Tjirebon; and a 138,000-ton-per-year TSP plant in Tjilajap. Many of these projects are related to the rapidly expanding petrochemical industry of Indonesia.

Stone.—*Granite.*—P. T. Karimum Granite, a new 50-50 joint venture between Bovis Hong Kong and the Indonesian firm P.T. Indophing, operates Indonesia's only granite quarry on Karimum Island in the Ria Group just off Singapore and markets crushed rock. Most output was purchased by the State oil enterprise Pertamina for use in the construction of LNG facilities in Aceh and East Kalimantan. Remaining production goes to Singapore, which is asking for more of the future supply, because of special financial connections. The long-term target is to produce 2.9 million tons per year, about 4.5 times the 1975 level and nearly 7 times the 1974 level.

MINERAL FUELS

Coal.—Indonesia is about to launch its coal program, and recent output has no bearing on future possibilities.[7] P.N. Batubara, the State coal company, operates

[6] Japan Chemical Week (Tokyo). July 1, 1976, p. 10.

[7] Simandjuntak, M. Coal Resources and Potentials in Indonesia. Jakarta, 1974, 104 pp.

the Bukit Asam open pit mine near Palembang in south Sumatra, which produced about 130,000 tons in 1975 and the Ombilin underground mine near Padang in west Sumatra, which produced approximately 76,000 tons in 1975. Both coals are medium-grade subbituminous to bituminous varieties (mostly 6,000 to 7,500 kilocalories) suitable for general use and metallurgical blending. Bukit Asam may have 90 million tons of reserves, and Ombilin, 100 million (plus possibly another 100 million at an adjacent site). A crash program was in progress in 1975 to raise Bukit Asam's output to 2 million tons annually a decade from now at a cost of $63 million, and to raise Ombilin's output to 650,000 tons by the mid-1980's at a very tentative cost of $35 million. The World Bank may assist in the Bukit Asam project. Bukit Asam's future markets will include the Batu Raja cement plant to be built, additional industries in Palembang, the Peltim (or Muntok) tin smelter, and power projects at mine mouth Lampung Province, and Cilincing on West Java's north coast. Planning was less advanced at Ombilin, which will supply P.T. Semen Padang's Indarung cement plant, among other facilities.

In 1975, extensive coal resources were announced by Shell Mijnbouw N.V. (Shell International) in the Lampung Province of south Sumatra, about 215 kilometers inland from the coast.[8] Reserves in a 7-million-hectare area were reported to run as high as 3.5 billion tons of subbituminous to bituminous coal. Shell's reconnaissance drilling program ends June 1, 1976, at which time three-quarters of the contracted area will be relinquished. The production-sharing contract has been signed with Batubara. Shell plans to invest about $1.2 billion, including $900 million for production and $300 million for marketing and shipping. The tentative target will be to produce 25 million tons of coal annually along with removal of 75 million tons of overburden. Output would come from various operations, and the eventual overall production level would be related to export demand, mainly from Japan. Neither of the existing railroads in the coal area can accommodate greatly expanded production, and the nearest usable port, Telukbetung at Sumatra's southern tip, is good only for boats of less than 12-foot draft.

Petroleum and Gas.—Indonesia's oil production, which ranged twelfth in the world in 1975, was down slightly from 1,392,000 barrels per day (barrels per day multiplied by 50 will give the approximate equivalent of metric tons per year) in 1974 to 1,313,000 barrels in 1975. The bulk of this was exported as crude oil, which explains why Indonesia's refinery capacity is not particularly large. Oil exports netted $5.3 billion in 1975 and $5.2 billion in 1974, compared with $1.6 billion in 1973 when prices were still low. P.T. Caltex Pacific Indonesia's 1975 output was 831,000 barrels per day, which represented more than 63% of the national total. Caltex produces low-sulfur Minas light crude.

Pertamina accumulated massive debts of at least ten, if not "several tens" of billion dollars, through overspending monies to be earned in the future and despite very favorable high prices. Actually, Pertamina had completely overextended its financial lines in the face of the world recession. This forced subsequent reorganization and removal of its president during the year. Pertamina had been in many lines of business, including fertilizers, petrochemicals, LNG, steel, and even tourism. Its influence is still great, and it is the Government entity representing Indonesia in contractual arrangements. The original contract-of-work and production-sharing contracts have been greatly modified to accommodate the sharp price increases to over $12 per barrel. In 1974, revenue above $5 per barrel was shared 85% for the Government and 15% for the companies with contract-of-work arrangements.

The tight budget situation in 1975 led the Government to review the Caltex account once more. Meanwhile, Caltex's profit from a $12.60-per-barrel price was only $2.30 or about $600 million to $700 million profit in 1975, after additional cuts in selling to the domestic market. In early 1976, Pertamina was talking about $1.00 per barrel extra for Caltex and the others.

Indonesia's potential is shown by the discoveries reported.[9] In the Sangatta Field

[8] U.S. Embassy, Jakarta, Indonesia. Production-Sharing Agreement to Govern Development of Sumatra Coal. State Department Airgram A-145, Oct. 17, 1975, 3 pp.

[9] Mining Journal (London). Mining Annual Review 1976. June 1976, Pp. 403-405.

of Kalimantan, Asian Drilling Co. of Japan hit 14 oil wells and 1 gas well out of 17 holes drilled, and their combined yield may reach 15,000 barrels per day. In the Sanga-Sanga Field of Kalimantan, Tesoro discovered oil in well PT 872 and Union Oil Indonesia found oil in a fault block. Union Oil was producing 114,000 barrels per day at yearend 1970. Petromer Trend Corporation discovered a fifth well in Irian Jaya and now produces 70,000 barrels per day. Phillips Petroleum Co. Indonesia hit a third producing well on Sulawati Island in the Berau Lake area of Irian Jaya. In Sumatra, California Asiatic Oil Co. hit an eighth well in the Coastal Plains 80 kilometers southeast of the Minas Field. The Natomas Co. successfully delineated the Rama Field in its offshore southeast Sumatra contract area. Natomas already has two wells of 20,000 barrels per day, one of 8,000 barrels per day, and a gasfield of 7 million cubic feet per day.

Pertamina reported a new gas and condensate deposit in the Tapa Project in the northern part of East Kalimantan, 15 kilometers from the old field on Bunyu Island. Japex Indonesia, Ltd., and partner Total Indonesie had been producing 40,000 barrels per day from seven wells 80 kilometers northeast of Balikpapan in East Kalimantan. Another large oilfield called Handil, in the Mahakam River delta in Kalimantan, also had been recently discovered, and was expected to produce 150,000 barrels per day by 1977.

Principal oil producers in Indonesia are listed below with their estimated production capacities at the end of 1975, in barrels per day: P.T. Caltex, 856,000; P.T. Stanvac Indonesia, 36,000; Pertamina, 85,000; ARCO, 102,000; Union Oil, 76,000; Independent Indonesian American Petroleum Co. (IIAPCO), 74,000; Petromer Trend, 66,000; Total Indonesie, 60,000; and Japex, 53,000.

Hitherto, Indonesia's main oil-export markets have been Japan and the United States, but the Mining Minister has announced that the markets will be expanded to include Australia, Europe, and other members of the Association of South East Asian Nations (Malaysia, Philippines, Singapore, and Thailand). At the same time, however, exports to Japan (which have not been affected by the People's Republic of China's increased oil exports) are to be expanded, and a new contract for the supply of low-sulfur fuel oil to the United States has been agreed between Pertamina and Southern California Edison Co. This contract covers 1976 to 1985.

An important development to insure stable oil supplies to Asian countries is the proposal to build a transshipment station with a capacity of about 3.6 million barrels at Indonesia's Lombok Island. Japan, Indonesia, and Saudi Arabia have established an international consortium, capitalized at $30 million to promote the project, and the participation of other nations is being encouraged.

The Mining Minister has issued a license to Dresser AG and P.T. Rockbit Indonesia to establish a plant to produce drilling equipment on Batam Island. The proposal includes the production of drilling equipment, both for the oil industry and for the mining industries.

Natural gas from various places will be more fully utilized to produce fertilizers. Estimated gas reserves total 34.7 trillion (million-million) cubic feet.[10] The two major offshore areas of the early 1970's—Mobil Oil Indonesia Inc.'s Arunfield off northern Sumatra, and Huffco's Badak oilfield off East Kalimantan are expected to be capable of furnishing over 14 million tons of LNG for export. The onshore fields at Palembang are also expected to provide LNG shipments of 1 million tons eventually. Japan has a contract to obtain 7.5 million tons of LNG beginning March 1977. Pertamina recently asked for $372 million of overruns from Japan as a loan, which Japan has agreed to provide.

The Mineral Industry of Iran

By Bernadette Michalski [1]

While a variety of minerals and metals are mined and processed in Iran, it is the revenues from the production and export of hydrocarbons that make the substantial contribution to the Iranian economy and provide most of the financial basis for industrial diversification.

Encouraged by the fourfold increase in hydrocarbon revenues, the Government expanded its industrial investment program. This economic activity was reflected in the rapid increase of the Iranian gross national product (GNP) which grew by 34% in the Iranian year 1352 (March 1973 to March 1974) and by 42% in 1353 (March 1974 to March 1975). The growth rate for the Iranian year 1354 (March 1975 to March 1976) was reported to be only 6.5%, reflecting Iran's economic slow down in the face of reduced oil revenues.

A worldwide economic recession followed the fourfold price increases of late 1973 and resulted in a reduced demand for petroleum. Iranian petroleum revenues fell an estimated 5% while petroleum production itself declined by more than 11%. Price increases in the fourth quarter of 1975 accounted for the differences in value and production declines.

By mid-1975 credit expansion and money supply growth had peaked and Iranian budget plans were being revised as the Government reassessed priorities. At yearend the Government, while reaffirming its commitment to industrial development, proclaimed that the Iranian Fifth National Development Plan which was to cover the period from March 1973 to March 1978, was to be extended by 1.5 years.

PRODUCTION

Although petroleum and gas operations dominated Iran's mineral industry activities, the country produced a variety of minerals as indicated in table 1. Aluminum production is based on the reduction of imported alumina; however, other primary metal production was derived from indigenous ores in 1975.

Iranian crude petroleum production was reduced by more than 11% compared with 1974 production levels. Production declines are attributed to a lowered demand in face of increased petroleum prices. Petroleum production for 1975 averaged over 5 million barrels per day, approximately 1.5 million barrels per day below installed capacity levels. The posted price of Iranian crude oil was $11.47 per barrel for 34° API gravity crude and $11.24 for 31° API gravity crude in the first three quarters of 1975. On October 1, 1975, the posted price was increased to $12.50 and $12.36 per barrel, respectively. Iranian crude production averaged 5.5 million barrels per day in the first three quarters of 1975. Production averaged 4.8 million barrels per day in the last quarter, indicating an even greater reduction in demand once the additional price increase took effect.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] In addition to the commodities listed, other types of crude construction materials (such as common clays, sand, gravel, and other varieties of stone) are also produced, but output is unreported and available information is inadequate to make reliable estimates of output levels.

[2] Data are for years beginning March 21 of year stated, except for natural gas, natural gas liquids and petroleum, which are for regular calendar years.

[3] Revised to none.

[4] Excludes petroleum produced and reinjected into fields.

TRADE

Trade activity financed by the influx of petroleum revenues in 1974 had placed heavy burdens upon Iran's limited port facilities. Iranian ports have a nominal annual handling capacity of 4 million tons. During calendar year 1975, nearly 10 million tons of cargo was unloaded in Iranian ports. Delays of as much as 120 days were reported by vessels awaiting berths for unloading. Berthing delays were compounded by further delays resulting from overburdened distribution systems. As a result, the timetable for many development projects had been disrupted.

While Iran enjoyed a balance of payment surplus of $8 billion in Iranian year 1353 (March 1974 to March 1975), reduced petroleum exports combined with expanded imports dwindled the balance of payment position to a $700 million deficit by Iranian year 1354 (March 1975 to March 1976). Petroleum crude and product exports accounted for 96% of all receipts. In calendar year 1975 crude oil exports averaged 4.67 million barrels per day and petroleum product exports averaged 0.27 million barrels per day, considerably below respective export levels of 5.37 million and 0.31 million in calendar year 1974.

COMMODITY REVIEW

METALS

Aluminum.—Iran's total primary aluminum output, was produced at the Arak smelter owned by the Iranian Aluminum Co. (Iralco). The Industrial Development and Renovation Organization, an Iranian State agency, holds 82.5% interest in Iralco, Reynolds International Inc. (United States) holds 12.5% interest, and the Pakistan Government holds the remaining 5% interest. The Arak smelter is slated for expansion to a 120,000-ton-per-year capacity. The date for completion of the Arak smelter expansion, originally scheduled for 1976, was revised to early 1979. The construction of a second aluminum smelter is under study. The proposed initial capacity for the second smelter is 150,000 tons.

Alumina imported from Australia has been the traditional feedstock for the production of primary aluminum in Iran; however, preliminary discussions indicate that India and/or Guinea will be the feedstock supply source for the second smelter and possibly for the additional capacity installed at Arak also.

Approximately half of the aluminum ingot production is exported, with Japan as the principal destination.

Chromite.—Three chromite deposits are believed to be currently under exploitation: Cheshmeh Bid, Khajeh Jamali, and Neyriz. During 1975, Iran reported exports of 85,000 tons of chromite averaging 48% Cr_2O_3.

Copper.—Development work continued on the Sar Cheshmeh porphyry copper deposit. While 40 million tons of overburden was scheduled for removal by 1976, followed by mine operations commencing in March of 1977, only 10 million tons of overburden had actually been removed by yearend 1975, delaying mining operations until 1978. Construction and installation activities on the copper flotation and smelting units were reportedly 15% completed by yearend 1975. When all units are operational, the Sar Cheshmeh deposit should yield 145,000 tons of copper metal annually.

Initial production from the Qaleh Zari copper mine and concentrator was announced in 1975. At full capacity the mine and concentrator should yield annually 20,000 tons of concentrate containing 25% Cu.

Iron Ore.—The Bafg deposit in Central Iran supplied about a million tons of iron ore for use in the Aryamehr iron and steel complex in 1975. Development of Iran's second major iron ore deposit, Gol-e Gowar, was under way. Mine production is anticipated in 1978 at an annual rate of 5 million tons of ore yielding 3 million tons of concentrate suitable for direct reduction.

India will be an additional source of iron ore as ore extraction is realized from the Kudremukh deposit which is being developed with Iranian financing. Initial mine production at Kudremukh is scheduled for 1978. Full production capacity, 20 million tons per year, should be reached by 1980. Kudremukh ore averages 35% to 39% Fe content. It is to be concentrated at the mine site to 66% Fe content. The concentrate will be hydraulically transported 38 miles to the expanded port of Mangalore, India for shipment to the Port of Bandar Shahpur, Iran. From this point, it will be shipped by rail to Ahwaz, where the concentrate will be pelletized at a 5-million-ton-per-year capacity plant designed by Lurgi-Chemie und Hüttentechnick GmbH (West Germany). The pellets will be the feedstock for the direct reduction plants at the Ahwaz steel complex.

Iron and Steel.—Iran's total crude steel output was produced at the Aryamehr iron and steel complex at Isfahan. Production capacity of the complex is 750,000 tons per year. Expansion to an 8-million-ton-per-year capacity is scheduled for 1986. With the exception of the slated expansion of Aryamehr, future Iranian steel capacity growth will be based on sponge iron produced by the direct reduction of iron ore. Iron and steel complexes using direct reduction methods are under construction or proposed at Ahwaz, Bandar Abbas, Bushire-Kangan, and Isfahan. By 1980, Iran anticipates annual crude steel capacity based on direct reduction processes to be 9 million tons. During 1975, three sponge iron gas reduction plants were under construction at Ahwaz under contracts to the West German firms of Korf Industrie und Handel GmbH und Co., and Thyssen, and the American firm of Swindell-Dressler. A portion of the sponge iron from these plants will supply the 1-million-ton-per-year capacity electric furnace plant, designed by Swindell-Dressler, and now under construction. The Khuzistan Metal Industries Co. and the Ahwaz Rolling Mills Co. will process the remaining Ahwaz sponge iron output.

Lead and Zinc.—At least 15 mining companies were involved in the extraction and beneficiation of lead and zinc ores and concentrates, a raw material destined for Iran's export markets. Iran's industrial goals, however, include the development of a domestic lead and zinc smelting industry by 1980. Construction of a 70,000-ton-per-year capacity zinc smelter and a 20,000-ton-per-year capacity lead smelter was under consideration.

The largest company involved in the mining of lead and zinc ores in Iran is Société Industrielle et Minière de l'Iran (SIMIRAN). Two major deposits owned by SIMIRAN are at Angouran and Khursk. Concentrating facilities at both mines were under expansion in 1975. Initial expansion plans at Angouran included construction of a 1,000-ton-per-day capacity flotation plant in 1975; however, that capacity will be doubled with completion of facilities for a heavy media preconcentration stage. When concentrator facilities are in full operation in 1978, Angouran output will be 180,000 tons of zinc concentrate and 60,000 tons of lead concentrate annually. Expansion activities at the SIMIRAN Khursk concentrator will result in raising the concentrator's capacity to 700 tons of ore per day by 1979, doubling its present capacity level.

Molybdenum.—The Sar Cheshmeh prophyry copper deposit contains varying amounts of molybdenum. The Parsons-Jurdan Co. (United States) has contracted to build a molybdenum extraction plant within the Sar Cheshmeh complex. Plant capacity is to be 12 tons of molybdenum per day. No startup date for the plant has been announced. Considering the projected growth of Iran's steel output with its parallel demand for molybdenum, it may be assumed that every effort will be made to have the molybdenum extraction plant operational when ore extraction commences at Sar Cheshmeh (now anticipated early in 1978).

NONMETALS

Cement.—Iran's active building programs have placed heavy demands on the nation's cement manufacturing industries. Existing plants are undergoing expansion programs and 10 new cement plants were in various stages of planning and construction to raise cement output from its 1975 level of 5.5 million tons to 18 million tons by 1980.

Fertilizer Materials.—Much of Iran's chemical fertilizer needs are satisfied by products of the chemical complexes at Shahpur and Shiraz operated by the National Petrochemical Co. of Iran (NPCI). Both complexes are undergoing expansion. By 1978 ammonia production capacity at Shiraz is scheduled to be 400,000 tons per year, urea production 500,000 tons per year, and ammonium nitrates production at 220,000 tons per year. By 1977, annual capacity at the Shahpur chemical complex is scheduled to be 200,000 tons of ammonia and 730,000 tons of urea. The NPCI has proposed construction of a nitrogen fertilizer complex at Neka. The proposed annual capacity of the complex is 500,000 tons of ammonia and 525,000 tons of urea. Feedstock for the complex will be natural gas from the Khangiran deposit near Sarakhs.

MINERAL FUELS

Carbon Black.—The nation's first carbon black plant was opened late in 1974 at Ahwaz. The 16,000-ton-per-year capacity plant is owned and operated by the Iran Carbon Co. Equity in the company is held by the Cabot Corp. (United States) 50%, the Industrial Mining and Development Bank of Iran 30%, and the NPCI 20%. During 1975, its first full calendar year of operation, the plant produced 5,800 tons of carbon black. Plant feedstock is based on natural gas from the Ahwaz Field and oil residues from the Abadan refinery.

Natural Gas.—Gross production of natural gas reached 1.6 trillion cubic feet in 1975. The bulk of production is derived from the Khuzestan area in Southern Iran where gross production was reported at 1.4 trillion cubic feet for the year. More than half of the total gross production of natural gas is flared; however, flared gas expressed as a percentage of total gas production was reduced to 52% in 1975 as compared with 59% in 1973. Gas flaring will be discontinued in the near future as Iran implements its multiple gas utilization programs which include gas injection for enhanced recovery operations in the Khuzestan oilfields, expansion of the natural gas-based chemical industry, steel production based on direct reduction of iron ore, and export of natural gas in both liquid and gaseous states.

During 1975 facilities were under construction for injection of well over 1 billion cubic feet per day of natural gas into the Gachsaran and Marun oil reservoirs. Also under construction were facilities to inject dome gas from Naft-Sefid into the Haft Kel and Paris reservoirs.

Two natural gas liquefaction projects were underway in 1975. The Kalingas group in which the National Iranian Gas Co. (NIGC) holds 50% equity with a consortium of United States, Norwegian, and Japanese firms reviewed designs for liquefaction units to ultimately provide 1.6 billion cubic feet of gas per day, most of which is destined for the Japanese market. NICG launched a second liquefaction project as a joint venture with U.S.-American-Belgium consortium for the ultimate export of 2 billion cubic feet of gas per day to Europe and the United States.

The export of natural gas in a gaseous state has long been established in Iran. During 1975 more than 1 billion cubic feet per day was delivered to the Soviet Union via the Iranian Gas Trunkline (IGAT) which connects the Iranian southern fields with the U.S.S.R. on the Astara border, a distance of nearly 700 miles. A parallel line will be constructed at a cost of $2 billion to transport an additional 1.3 billion cubic feet per day to the Soviet Union. In turn, the U.S.S.R. will forward 1.1 billion cubic feet per day from the Siberian fields to Western Europe via a 2,500-mile line to the Czechoslovakian border. From that point, 530 million cubic feet per day would be shipped to West Germany, 350 million cubic feet per day to France, and the remainder to Austria.

Natural Gas Liquids.—Nearly 600 billion cubic feet of associated gas was transferred to natural gas liquid (NGL) recovery units at the Ahwaz, Marun, and Agha-Jari Fields. Raw NGL was recovered at these production sites and piped to the Bandar Mahshahr NGL refinery where 1975 production was reported at 3.3 million barrels of propane, 3.7 million barrels of butane, and 5 million barrels of natural gasoline. Associated natural gas production from the offshore Darius Field is treated at the Kharg Chemical Co. complex where 1975 production of NGL was reported at 1.1 million barrels of propane, 0.7 million barrels of butane, and 0.7 million barrels of natural gasoline.

Nuclear Energy.—The Atomic Energy Organization of Iran announced plans to produce 23,000 megawatts of nuclear power by 1994. Contracts have been awarded for the purchase and construction of nuclear powerplants totaling 5,000 megawatts-per-year capacity. These plants should come onstream in 1982 and 1983.

Petroleum.—Exploration and development activities were maintained at an accelerated pace. Total footage drilled was 1,307,154 for 133 well completions as compared with 1,065,200 feet drilled for 99 well completions in 1974. Iran's largest operator, the Oil Service Co. of Iran (OSCO), drilled 983,400 feet for completion of 64 development wells and 6 exploratory wells. Of the six exploratory wells, three resulted in oil discoveries, one well was dry, and two were suspended.

As a result of reduced world demand, petroleum production for 1975 averaged 5.3 million barrels per day representing a decrease of more than 11% from the previous year's production level. The bulk of Iran's production, 4.9 million barrels per day, was obtained from 20 onshore fields in Southwest Iran operated by OSCO under contract to the National Iranian Oil Co. (NIOC). Among the larger fields operated by OSCO are the Marun Field, averaging nearly 1.2 million barrels per day of 34° API gravity crude; the Ahwaz-Azmari, averaging 0.9 million barrels per day of 32° API gravity crude; the Agha Jari, averaging 0.8 million barrels per day of 34° API gravity crude; and the Gachsaran, averaging 0.7 million barrels per day of 31° API gravity crude. During 1975 OSCO launched an enhanced recovery project which will eventually require the injection of 13 billion cubic feet of gas per day into six southwestern oilfields including the Agha-Jari and Gachsaran Fields. The gas injection program should boost recovery to 40% of oil in place rather than the 20% to 30% recovery anticipated from primary depletion.

More than 90% of Iran's oil production is recovered by OSCO for NIOC. The remaining production is obtained from offshore operations of four companies. NIOC holds 50% equity in each of these companies. The largest offshore producer is the Iran Pan American Oil Co. (IPAC) producing a total average of 177,000 barrels per day from its Darius, Cyrus, and Fereidoon Fields. The Fereidoon Field entered production in late 1974 at 30,000 barrels per day. By yearend 1975 production increased to 125,000 barrels per day and peak production of 150,000 barrels per day is anticipated by mid-1976. Production from the Darius Field dropped to 60,000 barrels per year by yearend, about half of its peak production level. Completion of a reworking project should boost production to 70,000 barrels per day, while completion of an additional development well will boost field production to 80,000 barrels per day in 1976. The Cyrus Field produced at an average 35,000 barrels per day. A fourth field was under IPAC development in 1975. The Ardeshir Field is scheduled for production by mid-1976 at a rate of 20,000 barrels per day rising to 200,000 barrels per day by yearend 1977. Crude oil from Ardeshir is to be carried by pipeline to the Kharg Island shipping terminal. Construction of the 60-mile long pipeline and of onshore storage and loading facilities was near completion at yearend 1975.

The Lavan Petroleum Co. (LAPCO) produced 175,000 barrels per day from the Sassan Field. LAPCO is scheduled to bring the Bahram Field into production by 1977. Construction of a pipeline connecting the field to Lavan Island and construction of a 1-million-barrel storage facility on Lavan Island was near completion by yearend.

The Société Irano-Italienne de Pétroles (SIRIP) produced a combined average of 53,000 barrels per day in 1975 from its Nowruz, Hendijan, and Bahregansar Fields. Development work on the onshore Shurom Field continued. By the fourth quarter the Shurom No. 7 well was completed at a depth of 9,918 feet. Production from the Shurom Field is anticipated in 1976.

The Iranian Marine International Oil Co. (IMINOCO) produced a combined average of 53,000 barrels per day. Production was derived from its Rakhsh and Rostam Fields.

Other companies which include NIOC 50% equity participation are the Iran Nippon Petroleum Co. (INPECO), Phillips Petroleum Co. Iran (FILIRAN), and Hormuz Petroleum Co. (HOPECO). Exploration and development drilling activities were conducted in concession areas held by these groups but no production has yet been reported.

Iran exports most of its onshore production and all the crude production from offshore fields. Crude exports for 1975 averaged 4.67 million barrels per day or 88% of total production. The remaining crude output, about 630,000 barrels per day is refined in Iran. The Abadan refinery, Iran's largest, recorded a throughput average of nearly 450,000 barrels per day and a product output averaging over 435,000 barrels per day in 1975. Expansion of the Abadan refinery was undertaken in March 1974 and by mid-1976 the Abadan refining capacity should be 600,000 barrels per day ranking it among the world's largest refineries. Additional expansion programs are slated for the refinery, bringing it to an ultimate planned capacity of 1.5 million barrels per day. The Teheran refinery, also under expansion, recorded a crude throughput averaging 165,000 barrels per day and a product output averaging 157,000 barrels per day. The Shiraz refinery reported a 36,000-barrel-per-day average throughput and a product output averaging 33,000 barrels per day. Kermanshah refinery throughput averaged 17,000 barrels per day with a product yield averaging nearly 16,000 barrels per day. The Masjid Sulaiman topping plant recorded a throughput average of 16,000 barrels per day for a product yield averaging 14,000 barrels per day.

Construction of the 80,000-barrel-per-day capacity Tabriz refinery was underway by June 1975 under contract to Snam-Progetti. The refinery completion date is scheduled for mid-1977. Construction of a 20,000-barrel-per-day topping plant on Lavan Island continued in 1975 with completion scheduled for mid-1976. Fluor-Thyssen was awarded a contract for construction of a 200,000-barrel-per-day refinery at Isfahan. The refinery completion date is scheduled for 1979.

Plans for the construction of several joint venture 500,000-barrel-per-day capacity export-oriented refineries have been suspended. However, NIOC did sign agreements in 1975 establishing a joint-venture refining operation with Senegal and one with South Korea. Each joint venture involves the construction and operation of a 60,000-barrel-per-day capacity refinery.

The Mineral Industry of Iraq

By John L. Albright [1]

The Government abolished the Iraqi National Minerals Co. and replaced it with the General Minerals Organization, under the Ministry of Industry and Minerals. The new organization will undertake geological and geophysical surveys and will explore for, develop, and market minerals in Iraq.[2] The Ministry of Economy was also abolished and the Government established in its place the Ministry for Foreign Trade and the Ministry for Internal Trade.

Iraq joined eight other countries (Egypt, Jordan, Kuwait, South Yemen, Sudan, Syria, United Arab Emirates, and Yemen) to form the Arab Co. for Mining and signed an agreement with the U.S.S.R. under which the Soviets will establish vocational training centers in Iraq that will include training for the mining and petrochemical industries. A petroleum training center was already in operation in Iraq, and a facility to train iron and steel industry workers was under construction.

The Government's Planning Ministry finalized the 5-year plan for the period 1976–80, allocating about $33.8 billion [3] for investments. The plan would concentrate on developing the agricultural and industrial sectors of the economy.

The petroleum industry remained the most important mineral activity in Iraq, and it was dominated by the Iraq Co. for Oil Operations (ICOO), and the Iraq National Oil Co. (INOC), both owned and operated by the Government. The country was one of the largest producers and exporters of oil in the Middle East and was an active member of the Organization of Arab Petroleum Exporting Countries (OAPEC) and the Organization of Petroleum Exporting Countries (OPEC).

Iraq's oil revenues were estimated to total $7.6 billion in 1975, an increase of $1.9 million over those of 1974. Oil revenues for the period April 1 to December 31, 1975, were estimated to have accounted for $4.1 billion of the Iraqi budget for that 9-month period. Beginning with January 1, 1976, the fiscal year will correspond to the calendar year instead of the previously-used April to March fiscal year. Total State revenues for the April 1 to December 31, 1975, 9-month period were budgeted at $10.8 billion and expenditures at $12.3 billion. State revenues in the budget allocations for the 1974–75 (old) fiscal year, however, totaled $10.2 billion, while expenditures totaled $12.3 billion.[4]

The Iraqis developed plans to establish several petrochemical plants near Al Başrah. A project was approved to establish a plant to produce fertilizer materials, and the Government examined plans to build an ethylene plant nearby. Preliminary discussions were also held with Kuwait for the establishment of a joint petrochemical complex, but details of the project were not publicized. During 1975, Iraq was developing its petroleum industry and establishing several new heavy industries, namely aluminum, and iron and steel. Projects were developed to improve the country's transportation facilities to serve the growing economy. Tanker terminal facilities were constructed at Al Bakr on the Persian Gulf near Khor al Khafka to serve the newly completed north-south crude oil pipeline. During the next 5 years, the port facilities will be expanded at

[3] Where necessary, values have been converted from Iraqi dinars (ID) to U.S. dollars at the rate of ID1.00=US$3.38.

[4] Middle East Economic Survey (Beirut, Lebanon). Iraq's Oil Revenues for April–December 1975 Estimated at Over $4 Billion. V. 18, No. 44, Aug. 22, 1975, p. 2.

Umm Qaṣr, the railroad system will be upgraded and possibly connected to that of Syria, and new airports will be constructed at Al Baṣrah, Al Mawṣil, and Kirkūk. Several pipelines were under construction in 1975, including an export line to a tanker terminal at Dortyol, Turkey, on the Mediterranean Sea.

The country's power generating capacity will also be increased to serve the growing demand for electricity, and three West German firms received contracts during the year to supply powerplants to Iraq. AEG-Kanis Turbinenfabrik GmbH will supply a 40-megawatt plant for the Kirkūk area, AEG-Telefunken will double the capacity of the Dawrah powerplant, and Brown Boveri will install a 250-megawatt powerplant at Khor al-Zubair. Contracts were also signed during 1975 with foreign companies to build electric-generating powerplants at Al Mawṣil and Taji (near Baghdād), and Techno-Brom Export of the U.S.S.R. was awarded a contract to build an 840-megawatt plant in the southern Zikari district. Iraq held separate discussions with France and the U.S.S.R. on the peaceful use of atomic energy and discussed a project to connect the Iraqi electric power network with the systems in Kuwait, Lebanon, and Syria.

Relative to these expansion plans, it should be noted that the limited number of technicians and skilled workers, however, has been a serious problem, and the Government launched a program to attract Iraqis working in foreign countries and to attract other Arabs whose skills may be utilized in Iraq.

PRODUCTION

During 1975, Iraq increased its output of crude oil to a record 757 million barrels (averaging 2.1 million barrels per day), while most of the OPEC members reduced their production. Iraq was the third largest producer in the Middle East after Saudi Arabia and Iran. The Government oilfields accounted for slightly more than one-half of the output, and the remainder came from fields operated by the Basrah Petroleum Co., Ltd. (BPC). Total oil production in the country averaged nearly 2.2 million barrels per day during the first 6 months of the year, peaked at 2.5 million barrels per day in September, and fell to just under 2.1 million barrels per day in December. Iraq continued to expand its oil producing capacity but reportedly reduced its 1980 target level of 6 million barrels per day to 4.4 million barrels per day.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, juss (an impure sandy gypsum), lime, and a variety of crude construction materials (clays, stone, and sand and gravel) are produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

TRADE

During 1975, crude oil accounted for the bulk of Iraq's mineral exports. About 55% of the crude oil was exported by the Government (ICOO and INOC) and the remainder by BPC; the oil was exported at an average rate of 2.1 million barrels per day.

Iraq took major steps during 1975 to improve relations with its neighbors. A treaty was signed by Iran and Iraq that settled a long-standing dispute over the land boundaries and the Shatt al-'Arab waterway between Iran and Iraq. A trade agreement signed with Bahrain called for exchanging industrial products and raw materials and for establishing joint companies and projects. The agreement provides for trade centers to be maintained in the two countries, and each will allow its citizens to reside and work in the other country. Iraq and Saudi Arabia signed an agreement providing for the partition of the Neutral Zone located between the two countries, situated to the west of Kuwait. An economic and technical cooperation protocol was signed with Jordan that should lead to increased trade, and it provided for Iraqi participation in several Jordanian development projects. Discussions were also held with Kuwait concerning a long-standing border dispute, but a settlement was not reached by yearend.

COMMODITY REVIEW

METALS

Aluminum.—The Government established the General Co. for the Manufacture of Aluminum Ingots to manage the aluminum smelter that was under construction at An Nāṣirīyah, on the Al Furāt River between Al Baṣrah and Baghdād. The plant will process imported alumina. The project will utilize large amounts of electricity, and production will commence in 1977 at a rate of about 30,000 tons of aluminum per year. A plant will be built at Zikar to produce up to 22,000 tons per year of aluminum bars, foil, sheet, and wire. The Government asked for international bids for the construction of a large aluminum smelter in Iraq that would have a capacity of 300,000 tons per year.

India and Iraq held discussions concerning a project to establish an alumina smelter in Iraq that would process bauxite from India. The plant would probably be located near Al Baṣrah, in southern Iraq.

Iron and Steel.—An iron and steel mill was under construction at Khor al-Zubair and scheduled to begin operations during 1977. Japan and the U.S.S.R. were assisting Iraq with the project that will have an initial capacity of about 1.2 million tons per year of sponge iron and about 420,000 tons of steel beams, pipes, rods, and sheets. The electric furnaces for the project will be supplied by Poland, and iron ore will be imported. The project will use domestic natural gas for fuel. Studies were under consideration to increase the production capacity for sponge iron to 3 million tons per year and the production capacity of iron and steel products to 1.2 million tons per year. Most of the increase will probably be exported. During 1975, Iraq negotiated a project with the Soviet Union under which that country would assist Iraq in constructing a plant to produce steel sheet at the rate of 1.5 million tons per year at the Khor al-Zubair complex. Iraq discussed several iron and steel projects with India, including the establishment of a sponge iron plant in Iraq and an iron pelletization plant in India.

NONMETALS

Cement.—Production facilities were being enlarged, and the Government approved projects to build a 500,000-ton-per-year cement plant in the El Mathna region and one at Al Kūfah, rated at 1 million tons per year. The country's capacity to produce cement was scheduled to reach 7 million tons per year by 1977, and 9 million tons per year by 1980.

Fertilizer Materials.—Domestic natural gas and phosphate will be used to produce fertilizer materials for export at a new plant scheduled to be built in southern Iraq. Mitsubishi Heavy Industries Ltd. of Japan negotiated a $570-million contract with Iraq to build an ammonia-urea production complex at Khor al-Zubair. The plant will have a capacity to produce 1,800 tons per day of ammonia and 2,700 tons per day of urea. The plant will utilize natural gas feedstocks and will have two urea production lines, the first scheduled for completion in 1977 and the second in 1979.

Deposits of phosphate rock were discovered near Akkashat in western Iraq in 1970 by a team of Iraqi and Soviet geologists. Mines will be developed, and phosphate ore will be produced at the rate of about 3.4 million tons per year. A plant near Khor al-Zubair will produce fertilizer for export at the initial rate of 1 million tons per year, expandable to 2 million tons per year.

Stone.—*Marble.*—Iraq reportedly developed plans and signed a contract valued at $30 million with an Italian firm for the construction of facilities at Anbar, As Sulaymānīyah, and Nīnawá for the production of block marble. Expected completion dates for the projects and rates of output were not publicized.

MINERAL FUELS

Natural Gas.—At yearend 1975, Iraq's proven reserves of natural gas were estimated at 53 trillion cubic feet, the fourth largest in the Middle East. During 1974, Iraq began developing plans to utilize large quantities of natural gas, and in 1975 the Government issued contracts to several foreign companies to design specific programs to use the gas. Procon Great Britain, Ltd., and two U.S. companies will prepare a study on production and utilization of natural gas from the central and northern fields,[5] and Nippon Kokan Mitsubishi of Japan was awarded a contract valued at $91 million to make natural gas from the Rumaila Field in southern Iraq available to industrial projects nearby. Plans were also developed during the year to utilize the gas to power electrical generating plants and to be used for feedstock to new industries.

Petroleum.—Iraq's petroleum industry was actively engaged in exploration and development projects during 1975, when an estimated 45 oil wells were drilled, of which only 9 were reported as dry holes. During 1975, the drilling totaled nearly 121,400 meters, and a major oil discovery reportedly was made west of Baghdād. Details of the find were not publicized, but the Iraqi press stated that the new oilfield was of gigantic size. Crude oil reserves at yearend 1975 were estimated by several industry sources to total 34.3 billion barrels, although the Government reported the reserves at 75 billion barrels.

Indian, Iraqi, and Romanian teams searched for oil in Iraq. The Indian Oil and Natural Gas Commission conducted a seismic survey and began drilling the first exploratory well on its concession in southern Iraq, and INOC awarded at $3-million contract to the Indians to carry out seismic work in other areas of southern Iraq. Seismic surveys were scheduled also for 1975 to be carried out in the Khanaqin area by a company from the U.S.S.R. and in Al-Kufl area west of Kirkūk by an East German company. The Government oil company carried out exploratory activities in a small area west of the prolific Kirkūk oilfield. Earlier, INOC had contracted a Romanian company to conduct exploratory operations, and during 1975 the Romanians began drilling the first of five oil wells.

A computation of geodesic lines along with economic and topographic maps of Iraq will be prepared by a Polish firm. Negotiations with Czechoslovakia resulted in an agreement under which Iraqi geologists will be trained in Czechoslovakia, and Czechoslovak specialists will assist the Iraqis in geological field studies in Iraq.

In December 1975, the Iraqi Government nationalized the remaining foreign interests in oil operations in the country, the 57% foreign ownership of the BPC. The companies affected by the Government's action were the British Petroleum Exploration Co. (Middle East) Ltd., Compagnie Française des Pétroles, and the Royal Dutch-Shell Group.[6] During 1973, the Government had nationalized 43% of the holdings in BPC that had been owned by petroleum companies in Portugal, the Netherlands, and the United States.

Iraq and the Soviet Union signed a contract in 1975 providing for the develop-

[5] Oil Daily. Procon Unit Heads Iraq Gas Study Consortium. No. 5816, Jan. 24, 1975, p. 6.

[6] Wall Street Journal. Iraq to Nationalize All Foreign Interests In Its Oil Operations. V. 186, No. 113, Dec. 9, 1975, p. 18.

ment of the Lahis oilfield in southern Iraq.[7] The field should be operational in 1978, producing as much as 50,000 barrels of oil per day. Under terms of the contract, the U.S.S.R. will supply the equipment necessary for the production of crude oil from that field. Development work continued during the year on the Nahran Umar, North Rumaila, Abu Ghirab, and Buzurgan oilfields. The Nahran Umar Field began production during the year, and the Abu Ghirab and Buzurgan Fields will begin production in 1976. In October 1975, the ICOO signed a $176-million contract with an undisclosed firm for the construction of oilfield equipment necessary to develop the Bāy Ḩasan and Jambur oilfields in northern Iraq.

The Iraq Oil Tankers Co. (IOTC) took delivery of the first of four 125,000-deadweight-ton tankers from a Japanese shipyard. The second 125,000-deadweight-ton ship and one of 144,000 deadweight tons will be delivered from Japan during 1976. IOTC also had four tankers of 145,000 deadweight tons on order from a Swedish shipyard, scheduled for delivery during 1976 and 1977.

Five petroleum and two natural gas pipelines with an aggregate length of nearly 2,700 kilometers were under construction during 1975, and orders valued at $90 million were placed with four Japanese companies for steel pipe to be used in these projects.

The Abu Ghurab—Buzurgan line will transport the output from those oilfields to the southern port for export, and the Baghdād—Al Başrah petroleum products line will permit transferring fuels between petroleum refineries near those two cities, beginning in 1976. The Al Ḩadīthah to Rumaila crude oil trunkline and its parallel gasline were completed during the year. The oil line has flow-reversal capability, giving the Iraqis flexibility in transporting crude oil to the Mediterranean or to the Persian Gulf for export. The new Kirkūk line will connect the northern oilfields to tanker terminal facilities on the Mediterranean Sea at Dortyol, Turkey, and should be ready for service in 1977 with an initial throughput capacity of 500,000 barrels of oil per day. Turkey will offtake some 200,000 barrels of oil per day from the line, and the rest will be loaded on tankers for European markets.[8]

Plans were finalized and a contract issued for the construction of a 122-centimeter diameter, 35-kilometer gasline from the South Rumaila Field to the site of the proposed natural gas liquids production complex at Khor al-Zubair. Nippon Kokan Kaisha of Japan will begin construction of the pipeline during 1976, and the project should be completed by 1977. The natural gas liquids plant may be placed in service by yearend 1977, and reportedly will have a capacity to produce liquefied petroleum gases at the rate of 8,700 barrels per day and natural gasoline at the rate of 3,500 barrels per day. Most of the plant's output will be exported.

Two Japanese companies, Marubeni Corp. and Niigata Engineering Co., will build a 1,200-barrel-per-day, $100-million lubricating oil plant at Daura, near Baghdād. The project was slated for completion in 1978. Fourteen plants were established throughout the country at a cost of $5.1 million to produce asphalt for a large-scale road paving program launched by the Government.

The Mineral Industry of Ireland

By William F. Keyes [1]

Inflation, unemployment, and recession characterized the Irish economy in 1975. As a result of inflation, the real gross national product (GNP) declined an estimated 3.5%, although in current prices it increased 21% over that of 1974 to about 3,535 million Irish pounds (approximately US$7.8 billion).[2] Production of domestic minerals amounted to about 1% of the GNP.

Significant growth in base metal mining was assured by the granting of a lease by the Government for a large, new lead-zinc mine and by plans for a lead-zinc smelter. Planning also continued for the building of a major ammonia plant, and agreements to supply offshore natural gas to Irish industry were signed. On the other hand, one of the two copper mines was closed because of exhaustion of ore reserves, and exploration for additional hydrocarbons offshore was unsuccessful.

PRODUCTION

Ireland had a significant production of base metals, peat, and cement in 1975; only the base metal production was important in world markets. Copper production was about 0.2%; lead, 1.1%; and zinc, 1.2% of total world production. Concentrates of these metals were all exported, there being no base metal smelter in Ireland Plans were being made, however, for a lead-zinc smelter.

Production of copper, lead, and cement declined in 1975. Zinc production did not decrease, presumably because of increasing zinc content in ores mined at lower depths in one major mine.

[1] Supervisory physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Irish pound (£) to U.S. dollars at the rate of 1£=US$2.36 in May and 1£=US$2.05 in November.

[1] In addition to the commodities listed, substantial quantities of stone, sand, and gravel are produced by local authorities for such purposes as road maintenance, but statistics on output are not reported and available general information is inadequate to make reliable estimates of output levels.
[2] Excludes output by local authorities.
[3] Figures given as reported in source; includes granite, marble, silica rock, sand, calcspar, fire clay, and shale and clays for cement production, but excludes output of these materials by local authorities.
[4] Includes production by farmers and by Bord Na Mona.
[5] Includes milled peat used in the production of peat briquets listed previously in this table.

TRADE

The Irish economy continued to depend on imports for most of its metals and metal semimanufacture needs. The United Kingdom was the overwhelming supplier of minerals and metals to Ireland, except for crude petroleum imported from the Middle East. Irish exports of base metals were sent to smelters in Spain, France, the Netherlands, and West Germany. U.S. trade chiefly has been Irish barite exported to the U.S. petroleum industry.

COMMODITY REVIEW

METALS

Copper.—Copper production declined significantly in 1975 compared with 1974, as one mine ended production.

The open pit Gortdrum mine closed in August, sooner than originally expected, because of exhaustion of minable ore. The mine, located 5 kilometers north of the town of Tipperary, was owned by Irish Base Metals Ltd., which was in turn controlled by Northgate Exploration Ltd. of Toronto, Canada. Gortdrum was also a producer of silver and mercury during its operation, from 1967 to 1975. A stockpile remained at the mine after closing, consisting of about 1.5 million tons of low-grade ore containing impurities in the form of mercury, antimony, and arsenic.

The Avoca mine of Avoca Mines Ltd., a subsidiary of Avoca Mines Canada Ltd. of Toronto located 55 kilometers south of Dublin, was the largest copper producer in 1975, although its production was affected by lessened demand. Mill capacity in 1975 reached 4,000 tons per day, an increase of one-third. Avoca also was the source of Ireland's small pyrite production.

In addition to Gortdrum and Avoca, a small amount of copper was produced at the Tynagh lead-zinc mine, but the concentrates were low grade, with much arsenic and antimony impurities, and were stockpiled.

Lead-Zinc.—In February the Irish Government granted a 25-year mining lease to Tara Mines Ltd., controlled by Tara Exploration and Development Co. of Canada, for the exploitation of the lead-zinc-silver deposit at Navan, County Meath, some 50 kilometers northwest of Dublin. Under terms of the agreement the Government would receive a 25% shareholding free of charge with full voting and other rights; a royalty of 4.5% would be paid to the Government on mine profits; taxes at the normal company rate of 50% would be paid by Tara; Tara would pay an annual rent of £6,000 after 2 years and £35,000 per year in case of work stoppage; the lease would run for 25 years with a provision for extension; there would be a maximum extraction rate which should assure that the mine is in production for at least 20 years; Tara would surrender to the Government some mineral properties that it owned privately; provision was also made for supply of concentrates to an Irish zinc refinery to be established in the future; and the Government would appoint two directors to the Tara Board, or 25% of board membership, whichever is higher. Production at the rate of 470,000 tons per year of lead and zinc concentrates was due to start in 1977 after expenditure of an estimated $150 million.

The deposit at Navan was estimated to contain a total of 70 million tons of ore, according to supplementary information filed with the Toronto and New York stock exchanges in 1974, making it apparently the largest known lead-zinc deposit in Europe. The area north of the Blackwater River, controlled by Bula Ltd., reportedly contained 7.7 million tons of proven and 1.2 million tons of probable ore; the area south of the river, controlled by Tara Mines, contained 15.9 million tons of proven ore and 6.1 million tons of probable ore. The remaining 39.1 million tons were not classified as either proven or probable for North American stock exchange purposes.

Lead and zinc were produced in Ireland at two mines during 1975. Mogul of Ireland, Ltd., operated the larger of these mines at Silvermines, Tipperary, some 30 kilometers northeast of Limerick. The other was the Tynagh mine at Tynagh, Galway, 50 kilometers east of the town of Galway.

The construction of a smelter to process lead and zinc concentrates in Ireland was under consideration by the Government. The smelter would be supplied chiefly from the Navan-Bula deposit and would, therefore, presumably be located in the Dublin-Navan area.

Manganese.—Completion of a plant to produce electrolytic manganese dioxide from imported ore, under construction by Mitsui Denman (Ireland) Ltd., a subsidiary of Mitsui & Co., Ltd. of Japan, was not achieved in 1975 but was expected by 1976. The plant, constructed at a cost of £14 million on Little Island, near the city of Cork, was designed for an output of 12,000 tons per year.

Titanium.—DuPont relinquished its option on a tidewater site at Ringaskiddy, County Cork, and postponed indefinitely its plans to build a plant to produce 100,000 tons per year of titanium dioxide, an intermediate product. The company related the action to the European market situation.

NONMETALS

Barite.—Ireland's large barite production came from the Magcobar mine, owned by Magnet Cove Barium Corp. of Texas, located near the Silvermines lead-zinc mine in Tipperary. The product was ground and exported to the U.S. gulf coast through the port of Foynes near Limerick.

Cement.—Production of cement in 1975 continued to suffer from a lower level of construction activity. Three cement plants were operated by Cement Ltd. Two of these were near Drogheda, 45 kilometers north of Dublin; these were the original Drogheda plant, destined to be closed in 1977, and the new Platin plant, capacity 600,000 tons per year, due to be expanded to 1 million tons. A third plant, at Limerick, with capacity of 720,000 tons per year, served southern and western Ireland.

Fertilizer Materials.—A 1,350-ton-per-day ammonia plant and a 1,000-ton-per-day urea plant were to be built by 1978 by the Government-controlled Nitrigin Eireann Teoranta (NET, Irish Nitrogen, Ltd.) at Marino Point on Great Island in Cork Harbor. Natural gas for the plant will be supplied from the Kinsale Head Field, 43 kilometers offshore from the County Cork coast. In 1975 Ireland's only nitrogen-fixing facility was NET's small decade-old plant at Arklow on the coast, 65 kilometers south of Dublin, which had a capacity of 38,000 tons of ammonia per year, and was part of a fertilizer complex producing sulfuric acid (from Avoca pyrite), ammonium sulfate, nitric acid, calcium ammonium nitrate, phosphoric acid, and mixed fertilizers.

There was no production of potash or phosphate rock in Ireland.

MINERAL FUELS

Energy.—Production of energy in Ireland was confined to peat, plus a small amount of semibituminous coal; the latter contributed only 2% to 3% of the total energy output.

The first source of additional energy was expected to be the Kinsale Head offshore gasfield, which was to reach production by 1978. There was also hope that offshore sedimentary basins around Ireland would ultimately yield commercial quantities of petroleum, but results in 1975 were negative.

Table 4 presents the recent energy balance for Ireland; it shows that over 70% of energy consumption was supplied by imported petroleum (almost all of which was crude).

Table 4.—Ireland: Supply and apparent consumption of energy-producing materials for 1973 and 1974

(Million tons of standard coal equivalent)[1]

	Total Energy	Coal, coke and peat	Petroleum and refinery products	Hydro-electric power
1973:				
Production	2.1	2.0	--	0.1
Imports	9.2	.8	8.4	XX
Exports	1.3	.1	1.2	XX
Apparent consumption	10.0	2.7	[2]7.2	.1
1974:				
Production	2.1	2.0	--	.1
Imports	9.4	.9	8.5	XX
Exports	1.1	.1	1.0	XX
Apparent consumption	10.4	2.8	[2]7.5	.1

XX Not applicable.

[2] Includes refinery fuel and losses.

Source: United Nations. World Energy Supplies, 1950–74. Statistical Papers, Series J, No. 19, 1976.

Natural Gas.—A 20-year agreement was signed in July between the Bord Gais Eireann Teoranta (BGE, Irish Gas Board Ltd.) and Marathon Petroleum Ireland Ltd. for the supply of about 125 million cubic feet of natural gas per day from Marathon's Kinsale Head Field, some 43 kilometers off the coast of County Cork. First deliveries were expected in 1979. BGE will in turn sell the gas to two seminational bodies, the Electricity Supply Board (ESB) and NET, and a small amount to the city of Cork.

The Kinsale Head Field, discovered in 1971, was estimated by Marathon to contain reserves on the order of 1 trillion cubic feet of natural gas. Located under some 300 feet of water, it contains two producing sands located between 2,700 feet and 3,100 feet. Two platforms were to be installed, with seven wells to be drilled from each platform, and a 24-inch-diameter pipeline was to bring the gas onshore to a metering station near Powerhead Bay. Estimated development costs were £75 million.

All of the six wells completed in 1975 in the Marathon Celtic Sea concessions, four by Marathon and two by Esso, gave negative results.

Nuclear Energy.—Carnsore Point, County Wexford, the extreme southeastern point of Ireland, was selected by the ESB as the most suitable site for Ireland's first nuclear generating station. The tentative commissioning date was deferred until 1985 in view of a decline in the growth rate of electricity consumption. Although no firm decision was made to go ahead, preliminary design work and all legal and administrative steps were to be completed for a 600-megawatt plant.

Peat.—Peat was the main indigenous source of energy in Ireland; coal production was minor. Some 23% of the electrical energy generated in the year to March 31, 1975, was produced with peat fuel; this figure had declined from 28% in 1972.

Peat was produced by the Bord na Mona, the Irish Government peat board, at numerous locations, largely in central Ireland. Local production by farmers added to the total. A relatively small amount of peat was used in agriculture and gardening.

Petroleum.—Ireland had no indigenous production of petroleum. Exploration by Esso in the Celtic Basin off the south coast, adjacent to the area of Marathon's natural gas discovery, resulted in 1975 in two noncommercial oil strikes.

The only domestic refinery was that of the Irish Refining Co. Ltd. at Whitegate, in the harbor of the city of Cork, which had a throughput capacity of 54,000 barrels per calendar day of imported crude.

The Mineral Industry of Israel

By David E. Morse [1]

Exploitation of Israel's modest natural resources in 1975 included processing Dead Sea brines to produce potash, bromine, magnesium oxide, and salts, and mining phosphate rock, glass sand, various clay minerals, copper ore, building stone, sand, and gravel. The mining industry furnished the base for Israel's nonmetallic chemical industry. In 1975, reduced world demand for fertilizer materials caused the value of sales from phosphates and potash to decline. Copper mining recorded a large financial loss owing to low world prices in 1975. Petroleum exploration in Israel increased during 1975. Israel did not have a major domestic source of crude oil at yearend 1975 because control of the Abu Rodeis oilfield in the southwest Sinai was relinquished late in the year.

The slowdown in Israel's economic activity, which began in 1974, continued through 1975. In its first 25 years, Israel's gross national product (GNP) increased about 10% annually until 1975 when growth declined to less than 1%. The Government's series of austerity measures, begun late in 1974 to reduce inflationary pressure and safeguard foreign-exchange reserves, succeeded in lowering the inflation rate from 56% in 1974 to 23.5% in 1975. In June 1975, the Israeli pound (I£) was devaluated from I£6.00=US$1.00 to I£6.12=US$1.00. Successive devaluations followed during the rest of the year and by yearend the exchange rate was I£7.1=US$1.00.

PRODUCTION

Mining and quarrying accounted for 2.3% of total industrial output and 5.2% of total industrial exports in 1975, compared with 2.5% and 6.1%, respectively, in 1974. Declines in production took place in copper (20%), glass sand (11%), phosphates (unprocessed) (5%), and oil refinery products (3%). Bromine, dimension and crushed stone, gypsum, iron and steel, magnesium oxide, and salt production approximated 1974 levels. Potash, cement, flint clay, and kaolin production increased 26%, 22%, 52%, and 186%, respectively, during 1975 compared with 1974 outputs. The labor force in the mineral industries remained stable. Israel's production of mineral commodities is shown in table 1.

Refinery fuel and losses ......do	1,546	1,877	2,077
Total ......do	51,538	53,683	51,994

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, Israel reportedly has the capacity to produce 71 tons of U_3O_8 per year, but official data are not reported and available information is inadequate to make reliable estimates of output levels.

[2] Revised to none.

TRADE

Israel's balance of trade was still highly unfavorable in 1975 when the deficit was $2.2 billion, but this represents a 9% reduction from the 1974 deficit of $2.44 billion.

Gross commodity exports increased $107

million to $1.93 billion in 1975. Overseas sales of polished diamond were valued at $548 million, and totaled over 2.7 million carats. The 1975 value dropped 2%, but the total carat sales increased 9.5% relative to 1974 sales because Israel's diamond industry emphasized the production of smaller stones (melees) to meet contemporary market demands. The United States and Hong Kong remained Israel's largest customers of polished diamond in 1975. Other major diamond importers included the Netherlands, Japan, Belgium, Switzerland, and West Germany.

Gross commodity imports declined 3% in 1975 and totaled $4.12 billion. The import value of fuels increased 7.6% over the 1974 value to $650 million in 1975.

Exports and imports of mineral commodities for 1973 and 1974 are shown in tables 2 and 3.

Table 2.—Israel: Exports of mineral commodities

[e] Estimate. [r] Revised. NA Not available.

[1] Data for 1973 and 1974 may be incomplete. Unless otherwise specified, the figures presented are the sum of listed detail for all countries for which a quantity figure is provided in official Israeli trade returns; additional quantities may have been exported to other countries for which only a value figure was provided. In some cases, where it is clear that a significant portion was exported for which no quantity figure was provided, the value figure has been provided in a footnote.

[2] Totals exclude quantities valued at $963,000 in 1973 and $6,000 in 1974.

[3] Totals exclude quantities valued at $79,000 in 1973 and $346,000 in 1974.

[4] Totals exclude quantities valued at $141,000 in 1973 and $1,800,000 in 1974.

[5] Elemental bromine is included with chlorine, fluorine, and iodine, and is reported in this grouping under "Other nonmetals" in this table.

[6] Totals exclude quantities valued at $252,000 in 1973 and $195,000 in 1974.

[7] Total excludes quantity valued at $542,000.

[8] Bureau of Mines International Petroleum Annuals, 1973 and 1974, published in March 1974 and March 1975, respectively.

[9] Excludes quantity valued at $456,000.

COMMODITY REVIEW

METALS

Copper.—Timna Copper Mines Ltd. produced about 10,000 tons of cement copper (70%–80% Cu content) in 1975, a 20% drop from 1974 production. The Timna mining complex is located in southern Israel 20 kilometers north of the Gulf of Agaba port of Eilat. The depressed world copper price and increased production costs severely affected the viability of the copper operation, and temporary closure was being seriously considered.[2] The low copper content of the ore and the increased cost of imported sulfur used in producing cement copper were major contributors to the high production costs. In addition, Timna's cement copper did not contain extra revenue-producing elements such as gold or silver. Reserves at the company's open pit and underground works were estimated at 14 million tons of oxide zone copper ore with a copper content of 1.1% to 1.3%. Most of the 1975 cement copper production was exported.

Iron Ore.—Surveys conducted during the mid-1950's at Har Ramin, near Manara in the Upper Galilee, indicated 40 million tons of ore containing 27% Fe. New beneficiation processes developed by Israel Mining Industries and existing processes could be used to enrich the ore to 64% to 66% Fe. Approximately 6 million tons of iron ore could be produced from the Har Ramin deposits, thus significantly reducing Israel's scrap iron imports. The decision to

[2] U.S. Embassy, Tel Aviv, Israel. State Department Airgram A-182, Oct. 15, 1975, 6 pp.

develop the iron ore deposits at Har Ramin has not been reported.[3]

Magnesium.—Dead Sea Periclase Co. Ltd. manufactured periclase—high-purity magnesium oxide (MgO)—from the Dead Sea Works Ltd.'s waste brines, which were pumped by pipeline to the plant on the Rotem Plain above the Dead Sea. The plant's capacity was rated at 50,000 tons per year of MgO, but technical difficulties encountered since initial startup kept 1975 output to about 20,000 tons. During the year, nearly 43,000 tons of hydrochloric acid were produced as a byproduct and were shipped to the adjacent phosphoric acid plant run by Arad Chemical Industries Ltd. The MgO was used as a raw material in the manufacture of refractory brick as well as in the ceramic, electrical, chemical, and rubber industries. It was planned to increase the plant's capacity to 100,000 tons per year by 1980 with an additional investment of over $40 million. About 75% of the 1975 production was exported.

NONMETALS

Bromine.—Dead Sea Bromine Ltd. produced 18,000 tons of bromine and about 4,000 tons of ethylene dibromide during 1975. The company, a subsidiary of Dead Sea Works Ltd., used chlorine and the residual brines from potash extraction at the adjacent Dead Sea Works as raw materials to produce liquid bromine. Expansion was underway in 1975 to increase annual production capacity to 50,000 tons of bromine by yearend 1978. A portion of the bromine output was shipped to a sister company, Bromine Compounds Ltd. at Be'er Sheva, for the manufacture of ethyl bromide, sodium bromide, potassium bromide, and ammonium bromide, which were utilized by fertilizer and pharmaceutical industries. Bromine Compounds planned to begin production in a new plant south of Be'er Sheva in 1978. The new plant was designed to process 20,000 tons per year of raw bromine. The Government approved plans for the construction of a chlorine plant at the Dead Sea Works during 1975. When completed in 1978, the plant was to produce 33,000 tons of chlorine per year.

Cement.—Nesher Cement Co. Ltd., Israel's only cement producer, operated plants at Haifa, Ramale, and Bet Shemesh. Output increased 24% above that of 1974 to 2.2 million tons in 1975. Production in 1975 almost met domestic demand, and the company reduced its imports of cement from 325,000 tons in 1974 to 100,000 tons in 1975.

Clays and Sand.—Israel's requirements for industrial sands and clays were supplied by Negev Ceramics Ltd., which produced about 160,000 tons of quartz sand and several different types of clays during 1975. Nearly pure quartz sand and various clays were mined from the Great Crater near Yeruhan. Flint clays were mined and processed in the Ramon Crater. Both areas are located in the Negev desert of the southern district.

Fertilizer Materials.—*Phosphate.*—Israel's phosphate reserves in the Negev were estimated at about 300 million tons in over 20 known deposits in 1975. Phosphate production by Negev Phosphate Co. Ltd. from the Orin and Little Crater mines was approximately 900,000 tons (30% to 34% P_2O_5), a 10% decline from 1974 production. The decline was due to lower world phosphate demand in 1975. Planned development of phosphate mining in the Zin Valley by Negev Phosphate called for an investment of nearly $70 million. Mining operations were to begin in early 1978, and a production level of 1 million tons per year attained by 1980.

Early in 1975, Arad Chemical Industries, which operated a phosphoric acid plant on the Rotem Plain and a phosphate mine at Hazeva, was merged into Negev Phosphate Co. Arad had been operating at a loss since its establishment in 1964 because of repeated technical difficulties in the design of the fluid-bed reactors that used Dead Sea Works waste brines to produce hydrochloric acid. Arad operated the phosphoric acid end of its plant using hydrochloric acid from the adjacent Dead Sea Periclase Co., and the output of one of its fluidized-bed reactors operating at reduced capacity. The 1975 production of 19,500 tons of phosphoric acid was still well below the plant's designed 166,000-ton-per-year capacity. The Hazeva mine had an output of 215,000 tons of crude phosphate rock, for use at the phosphoric acid plant.

Potassium.—Dead Sea Works, located near the southern end of the Dead Sea, extracted over 1.1 million tons of potas-

[3] The Israel Economist. V. 31, No. 5–6, May–June 1975, p. 95.

sium chloride (KCl) from the waters of the Dead Sea in 1975. The hydrated double salt, carnallite ($KCl \cdot MgCl_2 \cdot 6H_2O$), was recovered from diked ponds by dredgers and split into KCl and various brines. The KCl was either sold directly or converted into potassium sulfate or potassium nitrate. Dead Sea Works also produced 100,000 tons of industrial and table salts. In 1975, expansion was underway to increase the annual production capacity to 1.5 million tons of KCl. About 90% of the Dead Sea Works products were exported in 1975.

Production of potassium nitrate by Haifa Chemicals Ltd. in its 110,000-ton-per-year plant at Haifa was over 100,000 tons in 1975. Installation of a second 110,000-ton-per-year plant, to be completed by late 1976, was expected to double potassium nitrate capacity. Haifa Chemicals was the world's largest producer of potassium fertilizer.[4] Over 90% of Haifa's 1975 potassium nitrate output, manufactured from domestic raw materials, was exported. Fertilizers and Chemicals Co., based in Haifa, specialized in the manufacture of fertilizers and fodder additives. The bulk of this concern's products, processed from domestic and imported minerals, was sold in the local market and supplied most of Israel's fertilizer needs. Production figures for 1975 were not available; however, sales for fiscal year ending March 31, 1975, totaled over $41 million, and export sales for the same period were $8.7 million.[5]

MINERAL FUELS

Petroleum.—The Paz Oil Co. Ltd. held exploration permits for 375 square miles along Israel's west coast and 50 square miles southwest of the Dead Sea. Oil Exploration Ltd. held permits for a 135-square-mile area near the west Negev and a 95-square-mile area in the Dead Sea. Lapidoth Israel Oil Prospectors, Inc., an agent of the Government, carried out oil prospecting and exploration in Israel, along Israel's Mediterranean shelf and in the Gulf of Suez. Petroleum exploration increased in 1975 when nine test wells were drilled, all dry. The Government announced plans to spend about $35 million per year for oil exploration during the 4 years ending March 1980.[6]

At the end of November 1975, Israel relinquished control of the Abu Rodeis oilfield near the Gulf of Suez in the southwest Sinai. The 90 producing wells in the oilfield supplied over 50% of Israel's 1975 crude oil needs. Oil production from Israel's only remaining field, the 20-year-old Helez oilfield, dropped to under 700 barrels per day and supplied less than 1% of Israel's total crude oil demand.

The Eilat-Ashkelon oil pipeline carried about 22 million tons of crude oil in 1975 compared with 25.5 million tons in 1974.[7] Drilling began in 1975 on an underground storage facility near Eilat capable of holding 8 million tons of crude oil.[8] In 1975, petroleum refinery throughput dropped slightly to 52 million barrels owing to increased crude oil import prices and decreased consumption. Israel's petroleum refinery capacity was 10 million tons per year in 1975: 6.5 million tons at Haifa, and 3.5 million tons at Ashdod. An additional 3.5-million-ton-per-year unit was planned for the Haifa refinery; its startup was scheduled for late 1980.

The Mineral Industry of Italy

By Roman V. Sondermayer [1]

During 1975 Italy was an important processor of raw minerals and crude oil, and a producer of metals, petroleum refinery products, and ornamental stone. Although the mining production of Italy ranked third in value among those of the members of the European Economic Community (EEC), the country was relatively deficient in basic industrial raw materials. The major minerals produced in Italy, with production expressed in percentages of world output, during 1972–75 were as follows: Pumice, 29% to 30%; mercury, 11% to 12%; feldspar, 7% to 8%; cement, gypsum, pyrite, and fluorspar, 5% to 6%; barite, asbestos, diatomite, steel, and zinc, 3% to 4%. However, during 1975 production and foreign trade in minerals continued to decline because of difficult economic conditions at home and abroad. Out of a gross national product (GNP) of about $172.6 billion in 1975, the mineral industry generated about 11%. Unemployment averaged 3.3%, and the consumer price index increased 11.4%.

There were several significant events in the mineral industry of Italy during 1975. Construction continued on a 100,000-ton-per-year copper rod plant; production of manganese ceased; discovery of new mercury and uranium reserves was announced; a pyrite mine was closed; preliminary work started on a new pyrite deposit; construction started on a new titanium mine and concentrator (first in Italy); deep drilling for gas continued in the Po Valley; and a plan for intensive construction of nuclear powerplants was made public.

The Government of Italy, through the Direzione Generale delle Minière, published a report entitled Relazione Generale Mineraria (General Report on Mining), which was an assessment of possibilities for increased output of minerals in the country by regions with projections of relative self-sufficiency of the country in 1980. During 1975 the number of new concessions for mining declined to 10 from 17 in 1974. However, the number of exploration permits increased from 161 in 1974 to 272 in 1975. The largest number of new permits was granted for exploration for sulfides of lead, zinc, copper, and iron.

PRODUCTION

During 1975 trends in mineral production continued to decline (7.5% when compared with the index for 1974), reflecting both the general slowdown of Italy's economy and less than stable political conditions. Table 1 shows the latest data on production.

[1] Excludes pelletized iron oxide derived from pyrite.
[2] Includes 53,820 tons of natural cement.

TRADE

The downward trend in foreign trade of Italy continued during 1975. Decreased imports and exports of mineral commodities reflected economic difficulties in the country and abroad. As in the past, Italy depended heavily on imports of high-rank coals, liquid and gaseous hydrocarbon, and metals, ores, and concentrates. Principal trading partners remained EEC countries, the United States, and oil-producing countries in the Middle East. Tables 2 and 3 show details of Italy's foreign trade for 1974, the latest year for which complete data were available.

Table 2.—Italy: Exports of mineral commodities

Table 2.—Italy: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
NONMETALS—Continued			
Clays and clay products (including all refractory brick)—Continued			
Products:			
Refractory (including nonclay bricks)	81,139	86,380	Argentina 16,066; West Germany 10,904; France 8,713.
Nonrefractory thousand tons	1,210	1,148	France 293; West Germany 212; Switzerland 134.
Cryolite and chiolite	11	1,517	Romania 1,011; Yugoslavia 308.
Diamond:			
Gem, not set or strung value, thousands	$80	$7	NA.
Industrial do	$90	$59	NA.
Diatomite and other infusorial earth	1,896	1,272	NA.
Feldspar	33,092	33,420	West Germany 12,647; Netherlands 3,369.
Fertilizer materials:			
Crude	6,205	7,990	France 5,783; Libya 1,550.
Manufactured:			
Nitrogenous thousand tons	1,040	1,349	Egypt 322; India 191; Turkey 190.
Phosphatic do	19	6	Indonesia 5.
Potassic do	26	29	Algeria 19.
Other do	199	286	Turkey 83; India 38; United States 31.
Ammonia	17,350	33,714	Greece 23,995.
Fluorspar	r 91,053	75,511	United States 37,386; West Germany 23,271.
Graphite, natural	2,295	2,673	France 1,762.
Gypsum and plasters	20,798	26,287	NA.
Lime	r 88,698	134,980	Libya 95,918; Switzerland 38,550.
Lithium ore	--	8,900	Mainly to Israel.
Magnesite	r 443	342	Cuba 206.
Mica:			
Crude including splittings and waste	206	602	NA.
Worked including agglomerated splittings	70	61	NA.
Pigments, mineral including processed iron oxides	1,839	1,673	United States 590.
Precious and semiprecious stones except diamond:			
Natural value, thousands	$34	$60	NA.
Manufactured kilograms	275	427	NA.
Pyrite (gross weight)	6,901	54,696	Switzerland 43,122.
Salt, all forms	97,643	70,840	Portugal 28,655.
Sodium and potassium compounds:			
Caustic soda	361,479	352,166	Yugoslavia 61,181; U.S.S.R. 55,826.
Caustic potash	1,354	708	NA.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous	282,590	296,707	West Germany 34,466; Spain 40,626.
Slate	3,422	3,064	NA.
Other	66,977	93,284	Switzerland 25,599; West Germany 17,183.
Worked, all forms	839,801	853,833	NA.
Dolomite, all grades	25,436	30,756	NA.
Gravel and crushed rock	r 598,714	642,550	West Germany 124,926; Libya 119,150.
Limestone (except dimension)	382	1,852	NA.
Quartz and quartzite:			
Piezoelectric crystal kilograms	--	5,540	NA.
Other	r 29,268	40,390	Switzerland 24,242; France 8,244.
Sand, excluding metal bearing	r 697,529	617,903	Switzerland 574,671.
Sulfur:			
Elemental, all forms	4,570	7,021	Yugoslavia 5,149.
Sulfur dioxide	39	59	NA.
Sulfuric acid	10,188	89,991	Greece 39,839; Yugoslavia 15,154.
Talc, steatite, soapstone	49,082	53,772	West Germany 15,552; United States 9,417.
Other:			
Slag, dross and similar waste, not metal bearing	223,167	249,236	Yugoslavia 187,706; France 28,901.
Oxides, hydroxides, and peroxides of magnesium, strontium, barium	r 1,501	5,370	United States 3,133.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals n.e.s	82,103	78,749	France 35,166; West Germany 12,796.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal destinations, 1974
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	1,033	968	NA.
Carbon black and gas carbon	48,143	33,986	Turkey 11,407; Austria 7,960; Iran 5,080.
Coal, all grades, including briquets	3,077	10,338	Switzerland 6,673.
Coke and semicoke	612,997	712,991	Romania 140,211; Spain 12,999; Algeria 66,506.
Peat	r 61	269	NA.
Petroleum refinery products:			
Gasoline thousand 42-gallon barrels	50,142	49,019	United Kingdom 9,817; Netherlands 7,494.
Kerosine do	25,304	21,413	United Kingdom 1,993; Greece 1,808; Netherlands 1,711.
Distillate fuel oil do	72,989	62,887	Netherlands 7,121; France 6,898.
Residual fuel oil do	93,606	63,369	United States 6,886.
Lubricants do	1,677	1,837	Switzerland 242.
Other:			
Liquefied petroleum gas do	4,424	3,836	Egypt 874; Spain 699; Turkey 413.
Mineral jelly, and wax do	12	6	NA.
Bitumen and other residues do	r 1,861	990	Austria 572; Yugoslavia 131.
Bituminous mixtures, n.e.s do	177	85	Yugoslavia 12.
Petroleum coke and pitch coke do	290	280	Switzerland 130; France 75; Greece 41.
Total do	r 249,982	203,722	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	33,173	71,090	Spain 14,294; Yugoslavia 12,433; West Germany 8,400.

r Revised. NA Not available.
[1] Less than ½ unit.
[2] Revised to none.

Table 3.—Italy: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS			
Aluminum:			
Bauxite	815,876	5,256	NA.
Ash and residue containing aluminum	r 41,831	42,915	Austria 24,666; France 5,871.
Oxide and hydroxide	r 188,883	67,465	France 28,431; Australia 17,674; West Germany 9,547.
Metals including alloys:			
Scrap	63,256	65,586	West Germany 16,260; France 10,888; Austria 9,555; Hungary 7,462.
Unwrought	185,558	256,065	Greece 49,343; France 48,800; West Germany 47,053; Netherlands 37,799.
Semimanufactures	46,746	70,251	West Germany 27,864; France 15,076; Belgium-Luxembourg 8,331.
Antimony:			
Ore and concentrate	r 2,687	2,326	Bolivia 905; Canada 874; Republic of South Africa 306.
Metal including alloys, all forms	172	112	Belgium-Luxembourg 42.
Arsenic trioxide, pentoxide, acids	1,082	1,852	France 964.
Beryllium metal including alloys, all forms kilograms	r 8,359	5,600	West Germany 5,100.
Bismuth metal including alloys, all forms	185	156	France 114; United Kingdom 23.
Cadmium	96	129	West Germany 32; Netherlands 18.
Chromium:			
Chromite	r 199,624	149,854	U.S.S.R. 43,820; Albania 40,945; Republic of South Africa 24,811.
Oxide and hydroxide	1,528	2,064	West Germany 1,450; U.S.S.R. 399.
Metal including alloys, all forms	r 295	208	France 52.

See footnotes at end of table.

Table 3.—Italy: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS—Continued			
Cobalt:			
Oxide and hydroxide	301	398	Belgium-Luxembourg 331.
Metal including alloys, all forms	401	512	Belgium-Luxembourg 248; United States 132; France 68.
Columbium and tantalum:			
Ore and concentrate	171	544	Canada 520.
Metal all forms, including waste and scrap	r 205	36	United States 8.
Copper:			
Matte	--	183	United Kingdom 70; Yugoslavia 38.
Ash and residue containing copper	1,338	3,711	NA.
Copper sulfate	6,555	4,851	Yugoslavia 1,758; France 1,041; U.S.S.R. 950.
Metal including alloys:			
Scrap	57,013	66,388	West Germany 18,083; United States 15,814; France 15,388.
Unwrought	295,826	340,445	Zambia 75,736; Zaire 75,513; Chile 61,409.
Semimanufactures	27,756	34,311	West Germany 16,044; France 10,689.
Gallium, indium, thallium kilograms	r 967	800	NA.
Germanium do	r 4,178	40,200	Mainly from Belgium-Luxembourg.
Iron and steel:			
Ore and concentrate thousand tons	14,194	18,133	Liberia 3,812; Brazil 3,260; Australia 2,269; Venezuela 1,836.
Roasted pyrites do	2	78	Australia 35.
Metal:			
Scrap do	5,605	6,277	France 2,757; West Germany 2,080.
Pig iron, including cast iron and spiegeleisen do	1,017	1,039	West Germany 400; France 176; Yugoslavia 110; U.S.S.R. 108.
Sponge iron, powder, shot do	17	26	France 10; Sweden 10.
Ferroalloys:			
Ferromanganese do	121	154	France 74; Republic of South Africa 44.
Other do	122	165	France 37; Norway 28; Republic of South Africa 22; Yugoslavia 18.
Steel, primary forms do	2,157	1,783	France 466; West Germany 318; Belgium-Luxembourg 194.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	723	900	West Germany 294; France 252; Belgium-Luxembourg 124.
Universals, plates, sheets do	1,576	1,557	France 438; West Germany 346.
Hoop and strip do	228	231	France 80; West Germany 61; Belgium-Luxembourg 37.
Rails and accessories do	133	122	West Germany 48; France 34; Belgium-Luxembourg 15.
Wire do	61	84	Belgium-Luxembourg 31; France 18; West Germany 13.
Tubes, pipes, fittings do	274	274	West Germany 91; France 89; Yugoslavia 28.
Castings and forgings do	27	10	Yugoslavia 2; France 2; West Germany 2.
Total do	3,022	3,178	
Lead:			
Ore and concentrate	38,478	61,144	Canada 21,207; Poland 13,616; Greece 6,804.
Ash and residue containing lead	r 3,440	1,802	Canada 1,238.
Oxide	19,646	15,458	Mexico 11,152; France 1,588.
Metal including alloys:			
Scrap	20,263	29,229	France 9,063; United States 4,874; Switzerland 4,758; United Kingdom 4,614; West Germany 3,469.
Unwrought	141,125	164,655	West Germany 44,338.
Semimanufactures	1,562	833	Yugoslavia 519.
Lithium	r 16	8	U.S.S.R. 4.

See footnotes at end of table.

Table 3.—Italy: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS—Continued			
Magnesium metal including alloys:			
Scrap	1,820	1,501	West Germany 1,145.
Unwrought	r 1,325	1,153	NA.
Semimanufactures	r 132	132	NA.
Manganese:			
Ore and concentrate	282,057	308,072	Gabon 153,187; Republic of South Africa 118,361.
Oxides	2,191	2,720	Japan 812; Belgium-Luxembourg 573.
Metal, all forms	r 2,564	2,770	France 1,346; Republic of South Africa 1,346.
Mercury 76-pound flasks	r 5,280	4,314	Yugoslavia 1,949; U.S.S.R. 600; Mexico 493.
Molybdenum:			
Ore and concentrate	r 6,699	8,439	Netherlands 5,013; United States 1,011.
Metal including alloys, all forms	r 70	79	Austria 36; Netherlands 8.
Nickel:			
Matte, speiss and similar materials	5,152	4,622	Canada 3,818.
Metals including alloys:			
Scrap	1,383	1,609	Canada 442; France 194.
Unwrought	14,276	15,441	Cuba 2,787; Norway 2,339; Republic of South Africa 1,762.
Semimanufactures	2,579	3,796	West Germany 1,309; United Kingdom 933; United States 590.
Platinum-group metals and silver including alloys:			
Platinum group thousand troy ounces	1,034	188	United Kingdom 104.
Silver do	r 54,080	43,976	United States 13,597; West Germany 8,427; United Kingdom 8,350.
Rare-earth metals:			
Oxides and other compounds value, thousands	$549	$502	France $444.
Metals:			
Cerium	93	288	NA.
Other	351	414	West Germany 268; Austria 110.
Selenium, elemental	57	35	West Germany 15; United States 7; Japan 4.
Silicon, elemental	1,504	8,951	France 1,809.
Tellurium and arsenic	54	68	Sweden 30; Canada 21.
Thorium value	$200,873	$45	NA.
Tin:			
Oxide	63	54	NA.
Metal including alloys:			
Scrap	5	39	NA.
Unwrought	9,762	11,241	Malaysia 6,042; Thailand 2,392; Indonesia 1,330.
Semimanufactures	183	311	West Germany 166; Belgium-Luxembourg 52.
Titanium:			
Ore and concentrate	r 134,224	277,033	Norway 141,278; Australia 19,948.
Oxides	r 40,053	41,233	West Germany 17,784; France 8,782; Netherlands 6,145.
Metal including alloys, all forms	1,737	1,973	Austria 707; United States 458; U.S.S.R. 411.
Tungsten:			
Ore and concentrate	175	277	Australia 104.
Metal including alloys, all forms	r 68	90	NA.
Uranium metal	14	8	Mainly from United States.
Vanadium oxide and hydroxide	923	588	West Germany 475.
Zinc:			
Ore and concentrate	227,005	300,794	Canada 79,758.
Ash and residue containing zinc	4,915	2,715	Switzerland 1,617.
Oxide and hydroxide	5,025	4,321	France 1,302; West Germany 1,103; Netherlands 578.
Metal including alloys:			
Scrap	4,641	45,021	West Germany 11,906; Belgium-Luxembourg 9,229.
Blue powder	1,632	1,613	Belgium-Luxembourg 907; West Germany 318.
Unwrought	r 61,412	22,532	United States 6,197.
Semimanufactures	r 5,956	4,930	Belgium-Luxembourg 2,831.
Zirconium:			
Ore and concentrate	36,127	32,858	Australia 27,531.
Metal including alloys, all forms kilograms	r 67,454	108,700	NA.

See footnotes at end of table.

Table 3.—Italy: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
METALS—Continued			
Other:			
Ore and concentrate	r 18,126	9,230	Canada 5,210; Turkey 2,300.
Ash and residue containing nonferrous metals, n.e.s	r 23,090	5,877	United States 792; France 617.
Oxides and hydroxides	r 2,164	4,498	Cuba 2,475; West Germany 592.
Metals including alloys, all forms:			
Metalloids	117	82	NA.
Alkali, alkaline earth, rare-earth metals, n.e.s	6,783	6,075	West Germany 4,562.
Pyrophoric alloys	9	17	NA.
Base metals including alloys, all forms, n.e.s	45	6	NA.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, etc	r 1,769	3,210	NA.
Dust and powder of precious and semiprecious stones value, thousands	$7,054	$6,324	Zaire $1,944; United States $1,833; Netherlands $771.
Grinding and polishing wheels and stones	r 3,813	11,499	France 1,806; West Germany 1,459.
Asbestos	60,183	66,164	Republic of South Africa 28,857; Canada 23,363.
Barite and witherite	36,041	24,840	Spain 6,200; Tunisia 5,530; France 5,218.
Boron materials:			
Crude and natural borates	r 106,783	167,401	Turkey 141,312.
Oxide and acid	r 1,048	272	NA.
Cement	59,336	690,854	Libya 244,007; Israel 186,206; Yugoslavia 115,593.
Chalk	7,607	11,808	France 10,799.
Clays and clay products:			
Crude clays, n.e.s.:			
Bentonite	r 25,892	26,842	Greece 18,319; West Germany 4,290.
Kaolin	r 635,484	736,478	United Kingdom 352,111; United States 159,321; France 87,598.
Other	r 655,457	861,536	West Germany 279,474; France 273,539; United States 123,008.
Products:			
Refractory	141,542	86,308	Argentina 16,066; West Germany 10,904; France 8,713.
Nonrefractory	33,681	1,148,000	France 293,255; West Germany 212,466; Switzerland 133,712.
Cryolite and chiolite	471	403	Denmark 358.
Diamond:			
Gem, not set or strung value, thousands	$16,088	$23,683	Belgium-Luxembourg $9,812; Thailand $2,564; Israel $2,401.
Industrial do	r $3,287	$4,467	Belgium-Luxembourg $3,358.
Diatomite and other infusorial earth	5,545	6,606	West Germany 1,480.
Feldspar	r 22,073	21,099	Norway 5,775; West Germany 3,957; Portugal 3,779.
Fertilizer materials:			
Crude thousand tons	1,847	2,155	Morocco 1,372; United States 523.
Manufactured:			
Nitrogenous	69,894	85,580	West Germany 38,463; France 13,904.
Phosphatic	178,103	152,280	France 46,549; Tunisia 34,203; Belgium-Luxembourg 32,315.
Potassic	315,174	363,788	Israel 99,492; France 96,977; U.S.S.R. 88,870.
Other	186,736	94,305	West Germany 30,315; United States 18,135; Algeria 16,470.
Ammonia	7,170	42,087	Netherlands 33,372.
Fluorspar	37,457	67,465	Mexico 23,417; France 20,266; Tunisia 17,352.
Graphite, natural	4,796	5,475	West Germany 3,261.
Gypsum and plasters	2,761	3,710	United States 1,706.
Lime	r 103	20	NA.
Lithium ore	1,073	378	NA.
Magnesite	r 57,080	76,693	Greece 32,664; Yugoslavia 15,453; Ireland 14,676.
Mica:			
Crude, including splittings and waste	1,148	1,458	India 317.
Worked, including agglomerated splittings	279	415	France 105; Belgium-Luxembourg 80.

See footnotes at end of table.

Table 3.—Italy: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

Commodity	1973	1974	Principal sources, 1974
NONMETALS—Continued			
Pigments, mineral, iron oxides	r 23,926	29,078	West Germany 17,429; France 3,823.
Precious and semiprecious stones, except diamond:			
Natural value, thousands	$673	$569	NA.
Manufactured kilograms	r 21,019	20,588	Mainly from Switzerland.
Pyrite, gross weight thousand tons	301	293	U.S.S.R. 228; Cyprus 51.
Salt	200,041	49,589	France 13,856.
Sodium and potassium compounds	r 34,766	98,615	France 51,263; West Germany 26,040.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous, including marble	r 161,748	172,119	Portugal 41,583; Yugoslavia 38,332.
Slate	2,904	2,003	NA.
Other	r 154,766	196,430	Republic of South Africa 52,329; Norway 26,708.
Worked, all forms	3,991	2,741	West Germany 1,082; Belgium-Luxembourg 475; France 455.
Dolomite	r 2,045	2,214	NA.
Gravel and crushed rock	r 10,664	12,692	France 6,141.
Limestone (except dimension)	484	1,103	Republic of South Africa 377.
Quartz and quartzite:			
Piezoelectric crystal kilograms	r 30	35	Belgium-Luxembourg 18; Netherlands 12.
Other	r 114,433	94,550	Switzerland 38,018; Portugal 19,753.
Sand, excluding metal bearing thousand tons	1,052	1,301	Belgium-Luxembourg 584; France 542.
Sulfur:			
Elemental, all forms	r 419,082	766,257	Canada 368,982; Poland 103,785.
Sulfur dioxide	123	--	
Sulfuric acid	76,568	52,956	United Kingdom 16,486; Poland 7,133; Spain 5,679.
Talc, steatite, soapstone, pyrophyllite	r 20,277	25,357	Austria 14,307; France 5,949.
Other:			
Slag, dross, and similar waste, not metal bearing	r 26,238	42,047	Austria 9,480; Yugoslavia 8,015; France 7,291; Bulgaria 6,683.
Oxides and hydroxides of strontium, barium and magnesium	4,531	2,989	West Germany 1,278; United States 667; France 452.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s	24,482	26,267	Austria 6,248; France 5,017.
MINERAL FUELS AND RELATED MATERIALS

COMMODITY REVIEW

METALS

Aluminum.—Domestic output of aluminum was dependent on imported bauxite. Metal production was below demand and imports of aluminum were essential for the Italian manufacturing industry. Most of the aluminum output came from plants of Alumetal S.p.A. at Bolzano, Mori, and Venice-Fusina. Other producers of primary aluminum were Società Aluminio Veneto per Azioni S.p.A. (SAVA) at Fusina, Porto Marghera, and Alcan Aluminio Italiano, a Canadian subsidiary, at Borgo Franco. About two-thirds of total aluminum supply was used by the automobile manufacturing, construction, and appliance industries.

Antimony.—During 1975 no major events were reported in the antimony-producing industry of Italy. Antimony ore was mined at the Tafone mine near Grosseto. Domestic and imported stibnite ores were processed to regulus at the Azienda Minerali Metallici Italiane S.p.A. (AMMI) operated smelter near Manciano.

Copper.—Construction continued on a 100,000-ton-per-year copper rod manufacturing plant near Avellino. The plant is a joint venture of three companies, namely Società Metallurgica Italiana, S.p.A. (SMI), Industriale Pirelli, S.p.A., and Trafileria Laminati di Metali S.p.A. SMI, a State-controlled agency, will manage the new facility.

During 1975 there was a small mine production of copper in Italy. The copper-processing industry of Italy was largely dependent on imports of copper to meet the demand.

Iron and Steel.—During 1975 Italy remained dependent on imports of iron ore, scrap, and some pig iron to meet the demand of its steel industry, which was among the largest in Europe. However, production of all sectors was lower than in 1974. Domestic iron ore, averaging about 44% iron, was produced in mines on Elba Island, operated by Italsider S.p.A. In comparison with consumption, domestic output was not significant (3.3% of annual consumption).

Steel producers operated at about 80% of installed capacity during 1975. Italsider, headquartered in Genoa and with plants in Taranto, Bagnoli, Cornigliano, Campi-Corso, Novi Ligure, Trieste, Maghera, San Giovani Valdarno, Lovere, and Savona, remained the principal producer of iron and steel in Italy. Dalmine of Milan and Fiat S.p.A. of Turin were other leading producers. Salient statistics for iron and steel are shown in table 4.

Lead and Zinc.—Complex sulfide ores mined in Sardinia and the northeastern part of Italy remained the principal source of mine production of lead and zinc in the country. Output of lead concentrates decreased. Production of concentrate assaying 52% zinc metal increased somewhat over output in 1974. Declining output of lead metal, however, was apparently due to increased labor costs, decreasing grade of ore mined, and removal of the protective tariff. At the Salafossa mine, operated by Pertusola in the Province of Belluno, an increase in production of zinc resulted from introduction of sublevel caving (mining method). In addition, a new pumping station, completed during 1975 in the Inglesiente Basin in Sardinia, lowered the water table and eliminated water-caused delays in production.

Manganese.—During 1975 manganese production ceased when reserves at Italy's only producer, the Gambrosa mine near Genoa, were exhausted.

Mercury.—Italy ranked second to Spain among producers of mercury in West Europe. Low world price and low demand did not affect production rates at Italy's mercury mines. End of mine production would create political and social problems in mining areas. Consequently, stocks of mercury increased.

A decline in ore reserves and increasingly higher labor costs have made Italian mercury production less competitive on world markets. The 1975 employment at five operations totaled 1,013 workers. The Bagnore and Mt. Labbro mines were closed in early 1975 and were expected to remain on maintenance and/or development status during most of the year. Increase of output resulted from modernization of mines under the corporate management of Società Mercurifiera Monte Amiata, a subsidiary of Ente Autonomo di Gestione Per le Aziende Minerarie Metallurgiche (EGAM). New mechanization and new mining methods were introduced during 1975. At the Marone mine exploration disclosed important new reserves of cinnabar ores. Quantities of new reserves were not made public at yearend.

The United Kingdom and East Germany remained the leading importers of Italian mercury. Mercury stocks were equal to about 4 years of production at the 1975 rate.

Titanium.—Discovery of a rutile deposit located at Pianpadulo, in the Province of Savona, was announced. The Società Mineraria Italiana and Talco-Grafite Val Chisone S.p.A. started work on a 1-million-ton-per-year open pit mine and construction of a titanium extraction plant. The new plant will produce 20,000 tons per year of 95% TiO_2 ilmenite concentrates. Operations of the plant are based on a process developed and patented by Talco-Grafite. Proven reserves reportedly amount to 31 million tons of ore with an average content of 6% TiO_2, and probable reserves amount to 21 million tons.

Uranium.—Plans for introduction of nuclear energy on a large scale included development of domestic uranium deposits. Azienda Generale Italiani Petroli S.p.A. (AGIP) started work on the Novazza uranium deposit near Valgoglio. Land was purchased and construction of a mining and milling facility having a capacity of approximately 250,000 pounds of uranium oxide annually was underway. Total minable uranium ore reserves were estimated in excess of 3.1 million pounds of recoverable uranium oxide.

A new deposit of uranium ore, containing an estimated 10,000 tons of uranium oxide, was reportedly discovered by AGIP in the Lazio region. Development of the deposit was scheduled for the early 1980's.

NONMETALS

Asbestos.—Most of Italy's chrysotile asbestos came from the San Vittore open pit mine and mill operated by Società Amiantifera di Balangero S.p.A. near Turin. During 1975 about 130,000 tons of fiber was produced at San Vittore. In addition, small tonnages of tremolite were produced from two operations at Sondrio and Aosta in the Lake Como area. The product consisted of long-fiber materials.

Cement.—Italy's cement industry ranked second to the U.S.S.R. among European countries. The industry comprised 120 plants with an annual capacity of 72 million tons, one-half of which were in northern Italy. Reduced demand for cement in construction was reflected in lower production when compared with the output before the economic slowdown.

Clays.—*Bentonite.*—During 1975 Società Mineraria Isole Pontine S.p.A. (SA-

MIP) continued exploration and development of a large bentonite deposit estimated at 10 million tons near Isili, Sardinia. Sardinia was the chief source of bentonite in Italy.

Feldspar.—The economic slowdown did not affect demand for feldspar in Italy, mostly because of increased use in the ceramic industry and stable export markets. The Giustino mine operated by Società Maffai Feldspato S.p.A. remained the largest producer of feldspar during 1975. The Società Esercizo Cave Feldspato S.p.A. mined feldspar from the Tremenico pegmatite deposit south of Legnone.

Fertilizer Materials.—*Phosphates.*—Construction continued on a plant to produce phosphoric acid and a range of phosphate compounds at Monfalcone, near Trieste. The facility, built by Fosfitalia S.p.A., will have a designed capacity of 250,000 tons of phosphoric acid annually.

Italy depends entirely on importation of phosphates for its requirements. In 1975 Morocco was the principal supplier.

Potash.—Output came from mines near Palo, Racalmuto, Pasquasia, and Corvillo, in central Sicily. Montedison operated a processing facility at Campofranco, Sicily. Virtually all potassium ore production (1.8 million tons) was processed into chemical fertilizers. In the Pasquasia mine in Sicily, production shifted to kainite layers because sylvinite and carnalite were exhausted.

Fluorspar.—Italy's fluorspar industry was dominated by two companies, Montedison and Società Mineraria Silius S.p.A. The fluorspar mines in Sardinia accounted for more than 55% of the nation's output. Mines in northern Italy Trentino-Alto Adige also were important producers.

During 1975 Fluormina S.p.A., owned 50% each by EGAM and Montedison, was organized and started operations. At yearend, production began in a 12,000-ton-per-year fluorspar pelletizing plant located near Brescia, operated by Fluormina. The plant used fluorspar flotation concentrates from Fluormina's domestic operations.

Pyrite.—The Boccheggiano mine in Tuscany Province operated by EGAM was closed because of exhaustion of ore reserves. In the Gavorrano mine, improved mining methods and introduction of heavy mining equipment resulted in higher output. EGAM started preliminary work on development of a deposit in the Campiano area, Tuscany Province, containing an estimated 30 million tons of pyrite at a depth ranging from 1,500 to 3,000 feet. The mine was planned to produce at an annual rate in excess of 1 million tons of pyrite from which 500,000 tons of iron pellets and 1 million tons of sulfuric acid will be manufactured. Completion of development was expected by 1977 with production beginning in 1979.

Montedison's Scarlino plant continued processing pyrite concentrate to iron pellets and sulfur. Installation of new equipment and change in processing technology proved to be effective in lowering pollution.

Italy continued to rank second to Spain among Western European countries in the production of pyrite. Although output was close to 1 million tons, imports were necessary. The U.S.S.R. was the principal supplier of the imported pyrite.

Salt.—The 1975 output of salt totaled over 3 million tons. Sicilian plants produced about one-third of the nation's output. Decline in output reflected slowdown in the chemical industry.

Società Industria del Salgemma S.p.A. started expansion of its rock salt processing and mining facility near Petralia, Sicily. At completion of the project, employment was expected to increase to 650 workers from the 430 currently employed.

Stone.—*Marble and Ornamental Stone.*—Production of marble and ornamental stone (about 2.5 million tons) remained an important segment of the mining industry of Italy. Slightly over 3,000 quarries, employing 49,000 persons, were in production at yearend. However, stone-plant utilization was low, about 68%, reflecting the general economic slowdown. Mining and processing of ornamental stone was carried on both in large producing basins (with many quarries) formed by considerable deposits of rocks with uniform chromatic, technological, and commercial qualities; and in isolated quarries. The most important of the large production basins follow: Marbles at Botticino (Lombardy), Aurisina and Repen (Eastern Venetia), Alpi Apuane (Tuscany), Trani and Apricena (Apulia), and Trapani (Perlato de Sicilia); granite at Lago Maggiore (Piedmont) and Sardinia; and travertine at Tivoli and Rapolano. A large number of individual locations produced ornamental stone throughout Italy, of which the most important were green marbles at Val d'Aosta and Val di Susa, rose- and gold-colored marbles near Lago Maggiore, black marbles at Lago Iseo, red marble at Asiagio, and travertine at Ascoli Piceno.

Sulfur.—During 1975 most of the sulfur production came from mines in Lazio, Calabria, and Campania. Sulfur ore also was mined at five small mines in Sicily. During the year six mines were closed and production from two other mines will be terminated in 1977.

MINERAL FUELS

Petroleum, mostly imported, remained the principal source of energy in Italy, supplying 80% of the total. Domestic output (approximately three-fourths natural gas, one-fifth hydroelectric power, and the rest petroleum, coal, and fuelwood) accounted for about 12% of the nation's energy supply. Crude oil, 90% of Italy's fuels imports, imposed a heavy burden on the economy and on the foreign trade balance of the country. Plans were pursued in 1975 to introduce nuclear power generation into the country on a large scale, in order to lower Italy's dependence on imported crude oil.

Coal.—Domestic production of coal and lignite was a minor part (0.3%) of the total energy supply of Italy. Production of the Seruci mine in Sardinia (Sulcis coal basin) dropped to 2,050 tons, about 45% below 1974 figures. Production of lignite, 2 million tons, was the same as during 1975 despite the closing of a mine in the Province of Potenza.

The coal deposits in the Sulcis Basin are low in thermal quality and high in sulfur and ash content. However, because of the sharp increase in crude oil costs, the Government was studying the feasibility of reopening closed mines. Reportedly, an investment of $130 million in modern mining equipment would be adequate to sustain a profitable annual production of 2 million tons of coal. Proven coal reserves in the basin were given as a total of 150 million tons.

Imports of high-rank coals and coke (about 12 million tons) were necessary to meet the demand of the country's coking plants and other metallurgical installations. The United States was the principal source of imports.

Nuclear Energy.—During 1975 the Italian Ministry of Industry and Commerce was preparing an energy plan for Italy. Highest priority and emphasis was placed on nuclear energy in this plan. According to the plan, a total new capacity of 25,500 megawatts electric should be brought into operation between 1975 and 1982. Most of the planned plants would be of 1,000-megawatt capacity. An additional 40 units, also 1,000 megawatts each, were planned to become operational between 1990 and 2000.

Table 5.—Italy: Supply and apparent consumption of energy-producing materials for 1973 and 1974
(Million tons of standard coal equivalent) [1]

	Total energy	Coal and coke	Petroleum and refinery products	Natural gas	Fuelwood	Hydro-electric power and nuclear
1973:						
Production	28.2	0.7	1.6	20.4	(2)	5.5
Imports	196.2	10.8	182.6	2.4	(2)	.4
Exports	40.4	.5	39.6	(2)	(2)	.3
Apparent consumption	184.0	11.0	144.6	22.8	(2)	5.6
1974:						
Production	28.0	.7	1.6	20.3	(2)	5.4
Imports	198.5	12.4	180.1	5.5	(2)	.5
Exports	32.5	.7	31.6	(2)	(2)	.2
Apparent consumption	194.0	12.4	150.1	25.8	(2)	5.7

[1] 1 ton of standard coal equivalent (SCE).=7,000,000 kilocalories.
[2] Less than ½ unit.

Source: United Nations (New York). World Energy Supplies, 1950–1974. Statistical Papers, Series J, No. 19, 1976, p. 326.

Petroleum and Natural Gas.—Domestic natural gas and petroleum contributed 14% and 77%, respectively, to the total energy supply of Italy. Imports of natural gas, mostly from the Netherlands, the U.S.S.R., and Libya, and crude oil, mostly from Saudi Arabia, Iran, and Iraq, were essential to meet the demand. Shipments of liquefied gas (about 230 million cubic feet per day) to Italy were resumed by Esso Libya. Deliveries had been suspended in the fall of 1974.

Natural gas was produced from fields in the Po Valley, from offshore Ravenna, at Ferrara, and in southern Italy. Offshore natural gas production was 50% of the total country output. Petroleum was produced in the oilfields of Gela and Ragusa.

At yearend 1975 there were 36 refineries in operation, with a total installed annual capacity of 200 million tons. Italy ranked first among EEC nations in crude oil refinery capacity. The refinery capacity was double the country's domestic consumption.

Ente Nazionale Idrocarburi (ENI), a state-owned concern, remained the principal Italian entity in the petroleum and natural gas industry. ENI was active, through its subsidiaries, in all aspects of the industry. In the fall of 1975, ENI unveiled a 5-year investment program providing for allocations totaling an equivalent of about $10 billion. The fund will be used for exploration for oil and gas in Italy and abroad and for developing alternate energy sources. About two-thirds of the total will be spent in Italy.

During 1975 exploration for liquid and gaseous hydrocarbon was conducted onshore and offshore in Italy.

ENI's natural gas exploration division announced that the exploratory well at Turbigo in the Province of Novara, about 30 kilometers west of Milan, showed traces of natural gas. Depth of the new discovery was at 6,200 meters. The new discovery was in Triassic rock that is older than the Melossa rock (also Mesozoic) where previous discoveries were made. Consequently, what seems to have been discovered could be a new structure underlying the Melossa.

Another ENI exploratory well, about 2 kilometers east of Cape Colonna near Crotone, discovered gas at a depth of 1,700 meters. This was the second discovery in the same general area. As a result of the latest find, ENI may increase its offshore drilling in the Ionian Sea.

The evaluation of a gas discovery near Rimini continued during 1975. Results confirmed capacity of 500,000 cubic meters per day.

Except for difficulties in selling high-sulfur crude oil from the Gela Field and the continuing slow downtrend of crude oil output, production of crude oil was uneventful. Construction continued on two refineries, one at Melilli and one at Porto Gruaro. The Melilli facility is jointly owned by ENI and a group of private investors. The Porto Gruaro facility is jointly owned by Azienda Nacionale Indrogenazione Combustibili (ANIC) and ENI.

About 300 kilometers of pipeline was completed in Italy during 1975, bringing the total length of the pipeline network to about 12,000 kilometers.

The Mineral Industry of Japan

By E. Chin [1]

Stemming primarily from the world oil crisis of 1973, Japan suffered from inflation, recession, and a worsening of the deficit in balance of payments in 1974. During 1975, the economy not only experienced a second year of recession, but also faced high unemployment and fiscal crisis at national and local levels. Unemployment increased to around 1 million or about 2% of the work force and was continuing upward, an unusual situation for Japan in which lifetime employment is an established practice. Inflation curtailed per capita spending resulting in a sharp fall in personal consumption. Corporate profits diminished and it was estimated that one out of three companies were operating at a loss.

In an attempt to restore an equilibrium in the balance of payments and to arrest inflation, there was a slowdown in economic growth. From an annual average growth rate of 10% during 1960–72, the real growth rate in Japan fell to 6.1% in 1973, minus 0.2% in 1974, and to 2.6% in 1975. Tightening of the economic reins by the Government in monetary and fiscal policy was allegedly responsible for the steep decline in growth in 1974. In an attempt to push up the growth rate, the Government's austerity program was relaxed in 1975. However, personal consumption had markedly declined, and with depressed exports and business capital investments, coupled with inventory buildups, the recession gained momentum.

The Japanese metals and minerals industry experienced a serious business slump in 1975 in the midst of a prolonged recession. To improve the deteriorating conditions caused by decreased demand, the industry curtailed production to reduce inventory, and attempted to renegotiate delivery of minerals and ores under long-term contracts, stabilize wages, and raise prices of finished products.

Production cutbacks were carried out in major industries and as a consequence about one-quarter of the manufacturing capacity was held idle. The automobile and home electric appliance industries were the two major areas enjoying brisk sales, while the steel and petrochemical had poor sales records. Production of steel was kept at about 30% below the normal output throughout 1975 to cope with a slackening of domestic demand and with decreases in exports. The profitability of the steel and petrochemical industries was also undermined because markup of prices of their products was restrained under the guidance of the Ministry of International Trade and Industry (MITI). While price adjustments occurred in steel and petrochemical products, the increases were smaller than necessary to absorb the cost increases arising from the higher price of crude oil. Additionally, the industries were enduring the pressure of inventories which were not diminishing appreciably despite the cutback in production.

The foreign exchange yen (Y) quotation was stable from February through October 1973, ranging from 264 to 266 against the U.S. dollar ($1.00). However, the rise of crude oil prices drove the yen to a rate of 301 by yearend 1974. The yen was strongest in February 1975 where it was quoted around 287. However, the foreign exchange quotations of the yen started to sag around midyear and at the end of 1975 it was Y305 to $1.00. Factors contributing to the new exchange rate were the drop in exports and a dwindling of foreign investments in Japanese securities.

Japan's overseas investments in fiscal

[1] Physical scientist, International Data and Analysis.

year 1974 (April 1974–March 1975) declined 31% to Y2,396 million from Y3,497 million in the preceding year. Although investments declined in almost all sectors those in the mineral industry rose to Y743 million. Investments for oil development in Indonesia and Peru accounted for 63% of overseas mineral industry investment, indicating a strong intention for securing energy resources.

MITI completed preparation of bills to be submitted to the Diet for reorganizing the Japan Copper Development Fund into the Japan Nonferrous Metals Stockpiling Association for stockpiling aluminum, copper, lead, and zinc and another group for rare metals including nickel, chromium, cobalt, and tungsten. The nonferrous stockpiling agency was to be formed in fiscal year 1976 with government financial aids raching Y30,000 million. Eighty percent of the financing was reportedly earmarked for copper, 10% for aluminum, and 5% each for lead and zinc. The Government would provide Y369 million in interest subsidy to enable the corporation to borrow at 6.5% interest. The rare metals stockpiling corporation would receive a small subsidy of Y52 million from the Government. Other funds will be provided by 20 participating investing firms.

Consideration of stockpiling schemes began during 1973 as an insurance against short supplies resulting from strikes, political upheavals, or possible cartel-like actions in supplying countries. By financing the stockpile program of the minerals imported under long-term contracts, the Government hoped to stabilize sources, to maintain cordial relations with supplying countries, and to moderate the extremes of price swings.

PRODUCTION

Japan's industry endured the longest and deepest recession since 1945 according to Nihon Keigai Shimbun, a respected economics publication. The recession, lasting for more than 2 years since 1973, was severe in that the level of mining and manufacturing production plunged more steeply than during any recession in the past. Industrial output in 1975 was 5% below the 1974 level. The utilization rate of production capacity in the manufacturing industry was estimated to have remained around 75% throughout 1975.

Due to the sluggish demand in domestic and foreign markets, production of minerals and metals were generally reduced across the board to avoid an excessive buildup of inventory. Crude steel production totaled 102.3 million tons, down 12.6% from 1974. Aluminum metal production was 9.6% lower than the prior year's output. However, Japan continued to be a major world producer of aluminum, coke, copper, lead, steel, and zinc despite the reduced economic activity. Japan is much more important as a metal producer and consumer than as an ore producer. In mine output, Japan is only of some significance in construction raw materials, coal, zinc, and copper.

Table 1.—Japan: Production of mineral commodities

(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975 p
METALS			
Aluminum:			
Alumina, gross weight	1,987	1,801	1,565

e Estimate. p Preliminary. r Revised. NA Not available.
[1] Includes (but not limited to) ferromolybdenum, ferrotungsten, ferrovanadium, and silicochromium.
[2] Includes aplite as follows in thousand tons: 1973—497; 1974—490; 1975—324.
[3] Nitrogen content of fertilizer for year ended June 30 of that stated.
[4] Includes native sulfur as well as byproduct sulfur from sulfide ores and the petroleum industry.
[5] Includes a small amount of natural coke.
[6] Includes output from gas mines and coal mines.

TRADE

Japan's foreign trade in 1975 totaled about $113,616 million. Total exports recorded a marginal gain of 0.3% to $55,753 million, the smallest gain in the past 12 years. Imports decreased 6.6% to $57,863 million, the first drop in 13 years.

The United States, the largest single market for Japanese products, received about 20% of total exports. Shipments to the United States were about 13% less than in 1974, principally due to increased demand for steel products. The 10 largest export markets for Japan in 1975 were the United States, Liberia, People's Republic of China, Republic of Korea, Iran, Indonesia, Taiwan, Australia, Saudi Arabia, and the Federal Republic of Germany, in that order.

Fuels, metals, and minerals continued to be important trade items for Japan. The leading metal export was iron and steel products, accounting for almost 75% of the value of all mineral exports and nearly 20% of total commodity exports. Iron and steel exports in 1975 totaled 29.5 million tons, valued at $10,176 million. Imports of important mineral commodities in 1975 were as follows with value in million dollars: Crude oil, 19,644; coal, 3,454; iron ore, 2,198, and nonferrous metal ores, 1,763.

Potassic	2	(6)	6	All to Thailand.
Other, including mixed	166	74	125	Thailand 59; Indonesia 8; Sri Lanka 5.
Ammonia ---- tons	119,919	144,738	279,702	Philippines 113,781; United States 23,352.
Graphite, natural ---- do	440	418	860	Taiwan 127; Pakistan 90; Indonesia 86.
Gypsum and plasters ---- do	2,546	2,843	2,584	Taiwan 1,236; Republic of Korea 643; Philippines 255.
Iodine ---- do	6,265	6,717	5,116	United States 3,094; France 837; United Kingdom 717.
Kyanite and related materials ---- do	10,676	20,768	8,592	Taiwan 12,515; Brazil 3,500; Republic of Korea 2,383.
Lime ---- do	23,317	31,484	81,364	Bismarck Archipelago 28,874; Indonesia 2,318.
Magnesite ---- do	100	1,134	324	Taiwan 682; Thailand 240.
Mica ---- do	171	257	2,068	Republic of Korea 106; Thailand 63; Taiwan 33.
Pigments, mineral, iron oxides, processed ---- do	5,248	12,342	5,746	United States 4,350; Taiwan 2,068; West Germany 1,572.
Precious and semiprecious stones, except diamond:				
Natural ---- thousand carats	222,873	325,231	4,210,384	Republic of Korea 194,804; Taiwan 76,370.
Manufactured ---- do	72,742	112,917	107,606	Republic of Korea 37,628; Netherlands 31,196; West Germany 19,347.
Pyrite (gross weight) ---- tons	3,209	--	--	
Salt and brine ---- do	533	1,120	1,858	Bismarck Archipelago 618; Malagasy Republic 258; Indonesia 111.
Sodium and potassium compounds, n.e.s.:				
Caustic soda	185	331	365	Australia 233; Venezuela 23; United States 19.
Caustic potash, sodic, potassic peroxides	3	4	5	People's Republic of China 1; Australia 1; United States 1.
Stone, sand and gravel:				
Dimension stone ---- tons	1,714	1,529	330	North Korea 1,099.
Dolomite, chiefly refractory grade ---- do	3,193	6,025	7,284	Philippines 5,455; Taiwan 436.
Gravel and crushed rock ---- do	1,922	1,199	1,348	Taiwan 355; Thailand 222; Singapore 156.
Limestone (except dimension)	1,442	1,469	1,439	Australia 1,398.
Quartz and quartzite ---- tons	256	1,165	219	Thailand 463; Taiwan 424; Philippines 172.
Sand, excluding metal bearing ---- do	3,452	1,575	1,134	Taiwan 542; Republic of Korea 351; Philippines 243.
Sulfur:				
Elemental:				
Other than colloidal ---- do	45,051	62,986	117,267	Republic of Korea 53,232; Indonesia 7,114.
Colloidal ---- do	2,421	114	831	Republic of Korea 82; South Vietnam 12.
Sulfur dioxide ---- do	180	181	108	Australia 173.
Sulfuric acid ---- do	176	289	59,871	Indonesia 127; Republic of Korea 49; Guam 31.
Talc and steatite ---- do	829	746	454	Taiwan 329; Malaysia 172; Philippines 81.
Other nonmetals, n.e.s.:				
Crude	5	7	7	Republic of Korea 1; Taiwan 1; Philippines 1.
Slag, dross and similar waste, not metal bearing	25	39	37	Mainly to Republic of Korea.

See footnotes at end of table.

Table 2.—Japan: Exports of mineral commodities [1]—Continued
(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975	Principal destinations, 1974
NONMETALS—Continued				
Other nonmetals, n.e.s.—Continued				
Oxides, hydroxides and peroxides of magnesium, strontium, and barium (including magnesia clinker)	94	82	168	Australia 20; Poland 11; Netherlands 11.
Fluorine and bromine kilograms	1,175	8,090	300	People's Republic of China 8,000.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural tons	--	11	--	Brazil 6; Taiwan 5.
Carbon black and gas carbon:				
Carbon black	16	14	21	Singapore 2; Republic of Korea 2; Thailand 2.
Gas carbon kilograms	--	2,551	--	Thailand 2,500.
Coal, all grades, including briquets	24	132	26	Taiwan 109; Republic of Korea 22.
Coke and semicoke	564	656	733	Peru 188; Venezuela 142; Taiwan 81.
Gas, manufactured only tons	1	(7)	2	Mainly to Caroline, Marshall, and Mariana Islands.
Hydrogen, rare gases (helium, neon, krypton, xenon) do	563	442	425	Republic of Korea 139; Thailand 66.
Petroleum:				
Crude and partly refined thousand 42-gallon barrels	258	16	4	All to Republic of Korea.
Refinery products:				
Nonbunker:				
Gasoline do	576	26	110	Republic of Korea 26.
Kerosine and jet fuel do	2,398	1,062	66	Indonesia 760; Hong Kong 302.
Distillate fuel oil do	945	495	47	Hong Kong 423.
Residual fuel oil do	1,496	12,574	8,415	Republic of Korea 1,932; Sweden 1,772; Thailand 1,601.
Lubricants do	2,229	4,496	1,828	Republic of Korea 2,839; Taiwan 523; Indonesia 425.
Other:				
Liquefied petroleum gas do	336	85	92	Hong Kong 84.
Naphtha do	647	1,162	677	Venezuela 843; United States 319.
Mineral jelly and wax do	410	315	237	Australia 63; Brazil 51; Republic of South Africa 40.
Bitumen do	128	245	136	Republic of Korea 143; Burma 76.
Unspecified do	229	248	297	West Germany 64; Italy 50; Republic of Korea 48.
Bunker: [8]				
Kerosine and jet fuel do	13,137	NA	NA	NA.
Distillate fuel oil do	10,216	NA	NA	NA.
Residual fuel oil do	111,270	NA	NA	NA.
Other do	428	NA	NA	NA.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	31	51	51	Republic of Korea 22; Netherlands 9; Taiwan 8.

r Revised. NA Not available.
[1] Excludes exports under Japanese-United States Mutual Defense Agreement or for account of U.S. military forces.
[2] Reported in value only: 1974—$3,894.
[3] Reported in value only: 1974—$3,922.
[4] Excludes mosaic tile valued at (thousand yen): 1973—26,471,496; 1974—25,684,534; 1975—12,861,072.
[5] Includes exports of following amounts of urea containing more than 45% nitrogen: 1973—2,454,379 tons; 1974—2,249,275 tons; 1975—2,205,265 tons.
[6] Less than ½ unit.
[7] Reported in value only: 1974—$2,393.

Table 3.—Japan. Imports of mineral commodities [1]

(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975	Principal sources, 1974
METALS				
Aluminum:				
Bauxite and concentrate	5,615	5,311	4,600	Australia 3,155; Indonesia 1,293; Malaysia 780.
Oxide and hydroxide	452	647	561	Australia 633.
Fused aluminum (artificial corundum) tons	565	2,615	598	United Kingdom 1,759; United States 326; France 300.
Metal including alloys:				
Scrap	48	25	29	United States 14; Canada 4; Hong Kong 3.
Unwrought	476	479	378	New Zealand 82; Bahrain 82; Canada 74.
Semimanufactures	28	44	22	United States 17; West Germany 7; Belgium-Luxembourg 5.
Antimony:				
Ore and concentrate tons	13,959	10,857	9,012	Bolivia 6,216; People's Republic of China 1,994; Thailand 907.
Metal including alloys, all forms do	1,248	589	453	People's Republic of China 509; Bolivia 51.
Arsenic:				
Natural sulfides do	5	40	20	All from People's Republic of China.
Trioxide, pentoxide and acids do	1,971	1,082	906	People's Republic of China 575; France 349; United States 102.
Beryllium metal including alloys, all forms kilograms	8,696	3,139	1,922	All from United States.
Bismuth metal including alloys, all forms tons	2	5	2	United States 5.
Cadmium metal including alloys, all forms kilograms	3,984	9,118	1	North Korea 9,000.
Chromium:				
Ore and concentrate	1,164	1,155	1,269	Republic of South Africa 424; India 311; Philippines 127.
Oxide and hydroxide tons	2,016	1,645	1,088	West Germany 937; U.S.S.R. 430; United States 198.
Cobalt:				
Oxide and hydroxide do	944	820	252	Belgium-Luxembourg 807.
Metal including alloys, all forms do	4,657	3,716	1,581	Zaire 2,916; Belgium-Luxembourg 389; United States 157.
Columbium and tantalum:				
Columbium (niobium) ore and concentrate do	2,207	1,900	2,350	Nigeria 1,066; Brazil 550; United States 98.
Tantalum:				
Ore and concentrate do	84	109	62	Australia 42; Zaire 20; Rwanda 10.
Metal including alloys, all forms do	49	66	21	United States 62.
Copper:				
Ore and concentrate	2,973	3,124	2,605	Canada 1,130; Philippines 886; Bismarck Archipelago 381.
Matte, cement copper and native copper	17	16	--	All from Chile.
Copper sulfate tons	152	[2]1,629	242	Peru 697; U.S.S.R. 336; Hungary 243.
Metal including alloys				
Scrap	68	35	39	United States 27; Taiwan 2; Canada 1.
Unwrought	410	303	184	Zambia 148; Chile 61; Australia 21.
Semimanufactures tons	12,355	16,664	1,729	United States 8,833; Yugoslavia 1,598; West Germany 1,500.

See footnotes at end of table.

Table 3.—Japan: Imports of mineral commodities [1]—Continued

(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975	Principal sources, 1974
METALS—Continued				
Germanium:				
Dioxide ---------- tons --	15	17	4	Belgium-Luxembourg 9; U.S.S.R. 6; West Germany 2.
Metal including alloys, all forms ---------- kilograms --	918	1,029	5	Czechoslovakia 799; U.S.S.R. 220; Belgium-Luxembourg 10.
Indium metal including alloys, all forms ---------- do ----	1,424	7,787	4	U.S.S.R. 3,743; Canada 1,360; United States 1,096.
Iron and steel:				
Ore and concentrate, except roasted pyrite ----------	134,724	141,951	131,749	Australia 99,436; Brazil 19,523; India 17,407.
Roasted pyrite ---------- tons --	--	68	4,173	Portugal 68.
Metal:				
Scrap ----------	5,409	3,559	3,093	United States 2,546; Australia 566; U.S.S.R. 171.
Pig iron including cast iron --	1,547	1,291	355	Australia 312; Republic of South Africa 241; East Germany 129.
Sponge iron, powder and shot -	15	22	9	Sweden 13; United States 7; Italy 1.
Ferroalloys ----------	143	187	90	Republic of South Africa 74; France 23; Norway 20.
Steel, primary forms ----------	142	133	61	Australia 126; Republic of Korea 3; United States 3.
Semimanufactures ----------	85	107	221	Republic of Korea 28; United States 16; Sweden 7.
Lead:				
Ore and concentrate ----------	243	r 218	201	Canada 143; Peru 44; Australia 9.
Oxides ---------- tons --	1,241	2,586	201	Mexico 1,627; Bulgaria 450; United States 360.
Metal including alloys:				
Scrap ---------- do ----	7,928	1,677	1,103	United States 765; South Vietnam 270; Hong Kong 205.
Unwrought ---------- do ----	64,483	36,554	17,202	United States 10,220; North Korea 8,967; Australia 7,542.
Semimanufactures --- do ----	12	13	11	United States 8; West Germany 3; United Kingdom 2.
Magnesium metal including alloys, all forms ---------- do ----	6,593	13,426	4,805	U.S.S.R. 6,444; United States 5,817; Norway 739.
Manganese:				
Ore and concentrate [8] ----------	3,364	9,908	3,740	Republic of South Africa 1,685; India 826; Australia 653.
Oxides ---------- kilograms --	119	5	24	All from West Germany.
Mercury ---------- 76-pound flasks --	15,794	7,687	2,567	Algeria 4,032; Mexico 1,770; Spain 899.
Molybdenum:				
Ore and concentrate ----- tons --	16,613	17,778	12,128	United States 9,393; Canada 5,793; Chile 2,398.
Trioxide ---------- do ----	447	520	90	United States 302; Netherlands 182; Republic of Korea 35.
Metal including alloys, all forms ---------- do ----	289	147	124	United States 88; Austria 28; West Germany 26.

See footnotes at end of table.

Table 3.—Japan: Imports of mineral commodities [1]—Continued

(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975	Principal sources, 1974
METALS—Continued				
Nickel:				
Ore and concentrate	3,539	4,218	3,397	New Caledonia 3,363; Indonesia 792.
Matte, speiss, similar materials	30	40	27	Australia 17; Canada 17; New Caledonia 5.
Metal including alloys:				
Scrap tons	1,225	1,436	1,535	United Kingdom 567; Taiwan 356; United States 300.
Unwrought do	15,238	16,699	8,639	U.S.S.R. 4,757; Canada 3,644; Republic of South Africa 3,380.
Semimanufactures do	2,369	4,125	1,656	United Kingdom 977; United States 970; West Germany 305.
Platinum-group metals:				
Waste and sweepings value	--	$9,407	$46,061	All from Taiwan.
Metal including alloys, all forms:				
Platinum thousand troy ounces	1,337	1,194	1,563	U.S.S.R. 454; Republic of South Africa 436; United States 147.
Palladium troy ounces	869,846	678,361	441,973	U.S.S.R. 634,244; United States 23,817; Republic of South Africa 15,299.
Rhodium do	17,619	24,574	45,038	U.S.S.R. 22,768; United States 869; United Kingdom 574.
Iridium, osmium, and ruthenium do	21,516	7,715	13,076	United States 3,807; Republic of South Africa 2,921.
Alloys do	30,447	27,514	29,581	United States 12,034; West Germany 10,087; United Kingdom 3,996.
Rare-earth metals:				
Oxides and crude chlorides tons	2,375	2,157	713	India 1,347; United States 296; Brazil 220.
Metal (yttrium, scandium and intermixtures) kilograms	10,190	26,141	1,452	West Germany 20,000; Brazil 6,000.
Selenium, elemental do	4,384	5,493	2,870	Republic of Korea 3,258; Canada 1,450; United States 785.
Silicon tons	11,327	12,241	3,343	Norway 3,867; Canada 1,914; Sweden 1,534.
Silver:				
Ore and concentrate tons	3,770	3,050	3,450	All from Republic of Korea.
Waste and sweepings value	$10,165	$135,286	$15,620	United States $94,635; Republic of Korea $33,615.
Metal including alloys, all forms thousand troy ounces	34,273	30,989	17,053	Peru 12,072; Mexico 9,963; North Korea 2,662.
Tellurium kilograms	4,188	4,005	2,518	U.S.S.R. 3,999.
Tin:				
Ore and concentrate tons	10	3	--	Australia 3.
Oxide do	10	15	13	Australia 7; West Germany 6; United States 1.
Metal including alloys, all forms do	35,831	31,240	22,763	Malaysia 19,255; Indonesia 6,019; Thailand 4,749.
Titanium:				
Ore and concentrate	494	681	444	Canada 165; Malaysia 164; Australia 164.
Slag	78	46	49	All from Canada.
Oxide tons	13,420	9,975	2,363	West Germany 3,614; United States 2,911; France 1,084.
Tungsten:				
Ore and concentrate do	4,563	3,818	2,027	Republic of Korea 1,161; Portugal 499; Thailand 494.
Metal including alloys, all forms do	246	336	22	United States 172; West Germany 100; France 48.

See footnote at end of table.

Table 3.—Japan: Imports of mineral commodities [1]—Continued

(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975	Principal sources, 1974
METALS—Continued				
Uranium and thorium:				
Ore and concentrate	32	31	30	All from Zaire.
Oxides (compounds of thorium or uranium depleted in U–235) kilograms	61,593	23,839	3,521	United States 10,522; India 10,300; France 3,000.
Metal including alloys, all forms do	315	[4] 4,212	4,440	All from United States.
Vanadium pentoxide tons	2,632	3,099	2,876	Republic of South Africa 1,917; West Germany 933.
Zinc:				
Ore and concentrate	1,205	1,216	946	Canada 378; Peru 317; Australia 227.
Oxide tons	994	3,768	884	United States 1,104; Republic of Korea 855; U.S.S.R. 621.
Metal including alloys, all forms	28	25	22	North Korea 11; U.S.S.R. 5; United States 5.
Zirconium ore and concentrate (including zircon sand) tons	138,013	119,469	85,389	Australia 1,049; Malaysia 5,192; India 2,800.
Other:				
Ore and concentrate of base metals, n.e.s do	1,586	267	114	Brazil 150; Australia 98; India 19.
Ash and residue containing nonferrous metals do	9,499	11,507	13,082	Australia 3,837; India 999; Indonesia 693.
Oxides, hydroxides and pentoxides of metals, n.e.s.[5] do	2,878	3,112	1,977	United States 1,380; U.S.S.R. 634; West Germany 621.
Metal including alloys, all forms:				
Metalloids [6] do	12,166	15,122	5,884	United States 7,052; U.S.S.R. 5,470; Canada 2,482.
Alkali and alkaline-earth metals [7] do	52	223	36	U.S.S.R. 200; United States 21.
Pyrophoric alloys (ferrocerium) do	10	11	9	Australia 3; United Kingdom 2; France 2.
Base metals including alloys, all forms, n.e.s do	612	1,171	770	United States 503; U.S.S.R. 377; United Kingdom 264.
NONMETALS				
Abrasives, naturals, except diamond, n.e.s.:				
Crude do	2,991	5,489	1,284	United States 2,289; India 1,286; People's Republic of China 1,099.
Dust and powder of precious and semiprecious stones kilograms	19,175	17,160	8,975	All from West Germany.
Grinding and polishing wheels and stones tons	456	1,200	524	Taiwan 358; Singapore 308; United States 271.
Asbestos	342	352	253	Canada 137; Republic of South Africa 124; U.S.S.R. 65.
Barite and witherite	42	50	11	People's Republic of China 36; India 8; Thailand 5.
Boron materials:				
Crude natural borates	43	56	18	Turkey 52.
Oxide and acid	17	19	14	United States 12; U.S.S.R. 4; Turkey 2.
Cement	348	77	2	Republic of Korea 72; United States 4.

See footnotes at end of table.

Table 3.—Japan: Imports of mineral commodities [1]—Continued
(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975	Principal sources, 1974
NONMETALS—Continued				
Clays and clay products:				
Crude clays, n.e.s.:				
Kaolin	342	351	284	United States 193; Republic of Korea 107; U.S.S.R. 34.
Kyanite, andalusite and sillimanite	25	29	24	Republic of South Africa 19; India 7; United States 3.
Other	344	427	283	Republic of Korea 176; United States 132; People's Republic of China 81.
Products:				
Refractory (including nonclay bricks) tons	7,447	15,608	9,099	United States 5,123; People's Republic of China 4,804; West Germany 2,372.
Nonrefractory do	15,537	17,194	13,017	Italy 6,571; Republic of Korea 5,795; Taiwan 1,211.
Cryolite and chiolite do	2,038	1,027	149	Greenland 874; Denmark 153.
Diamond:				
Gem, not set or strung thousand carats	689	562	648	Israel 190; Belgium-Luxembourg 108; India 81.
Industrial stones do	1,157	823	421	United States 228; Belgium-Luxembourg 187; United Kingdom 157.
Powder and dust do	9,936	8,121	7,485	United States 4,600; Ireland 1,534; United Kingdom 933.
Diatomite and other infusoral earth tons	4,442	4,582	4,151	United States 4,511; Denmark 60.
Feldspar, leucite, nepheline and nepheline syenite do	9,881	20,633	5,091	People's Republic of China 16,858; India 1,450.
Fertilizer materials:				
Crude:				
Nitrogenous (natural sodium nitrate) do	209	223	--	All from People's Republic of China.
Phosphatic	3,190	3,845	2,904	United States 2,162; Morocco 660; Sahara 327.
Potassic tons	--	781	--	All from West Germany.
Manufactured:				
Nitrogenous	37	36	6	Chile 31; Netherlands 4.
Phosphatic	20	9	6	All from United States.
Potassic	1,322	1,520	1,369	Canada 717; U.S.S.R. 317; West Germany 167.
Mixed	97	121	78	United States 106; Canada 10.
Ammonia tons	2	8	8	All from United States.
Fluorspar	574	541	363	Thailand 188; People's Republic of China 179; Republic of South Africa 127.
Graphite, natural	66	86	58	Republic of Korea 53; North Korea 20; U.S.S.R. 7.
Gypsum and plaster	207	111	15	Mexico 61; Australia 32; Morocco 15.

(Thousand metric tons unless otherwise specified)

Commodity	1973	1974	1975	Principal sources, 1974
NONMETALS—Continued				
Pigments, mineral, including processed iron oxides ------ tons --	3,950	3,297	2,370	West Germany 2,226; United States 390; India 100.
Precious and semiprecious stones, except diamond:				
Natural ---------------- do ----	1,506	1,173	1,144	Brazil 755; India 159; Republic of South Africa 78.
Manufactured ----------- do ----	19	27	49	United States 25.
Pyrite (gross weight) ------- do ----	25,867	65,535	55,887	Philippines 65,516.
Salt ------------------------------	7,275	7,749	6,302	Australia 3,612; Mexico 3,319; People's Republic of China 817.
Sodium carbonate, natural --- tons --	5	--	--	
Sodium and potassium compounds, n.e.s.:				
Caustic soda ------------ do ----	75,037	39,954	23,544	United States 19,052; Italy 6,427; West Germany 5,673.
Caustic potash, sodic and potassic peroxides ------------- do ----	r 2,252	124	(8)	United States 88; Sweden 24; West Germany 12.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked ----	462	489	259	Republic of South Africa 136; Republic of Korea 105; India 76.
Worked --------------------	27	33	19	Republic of Korea 13; Italy 7; Taiwan 4.
Dolomite, including agglomerated dolomite ----------------------	19	28	93	Republic of Korea 26.
Gravel and crushed rock ---------	68	153	71	Taiwan 125; France 11; Republic of Korea 10.
Limestone --------------- tons --	282	405	249	France 385; United States 20.
Quartz and quartzite -----------	170	296	166	Republic of Korea 231; People's Republic of China 23.
Sand, excluding metal bearing ---	535	640	428	Australia 598.
Sulfur:				
Elemental:				
Other than colloidal - tons --	46,409	35,761	--	Canada 22,576; Mexico 13,185.
Colloidal ----------- do ----	323	446	296	United States 347; West Germany 98.
Sulfuric acid ----------- do ----	60,086	51,870	14	Taiwan 29,807; Australia 19,913.
Talc, steatite, soapstone, pyrophyllite -	277	299	236	People's Republic of China 203; North Korea 40; Republic of Korea 30.
Other nonmetals, n.e.s.:				
Crude:				
Meerschaum, amber and jet ------ kilograms --	--	15	40	Poland 12; West Germany 3.
Unspecified ------------------	283	709	228	Republic of South Africa 413; Republic of Korea 142; Philippines 81.
Slag, dross and similar waste and ash, including kelp, not metal bearing ----------------------	164	212	83	United States 104; India 66; Republic of Korea 33.
Oxides, hydroxides, and peroxides of magnesium, strontium and barium --------------- tons --	221	304	122	United States 171; West Germany 91; Ireland 35.
Bromine and iodine ------ do ----	1,187	195	7	Israel 195.
Fluorine ---------- kilograms --	60	26	97	All from United States.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural --------	3	3	2	United States 2; Trinidad 1.
Carbon black -----------------------	8	17	4	United States 11; United Kingdom 2.

Unspecified do	1,472	728	239	United States 480; Republic of Korea 132.
Mineral tar and other coal–, petroleum–, or gas–derived crude chemicals	54	89	83	Republic of Korea 59; United States 30.

[r] Revised.
[1] Excludes imports under Japanese-United States Mutual Defense Agreement or for account of U.S. military forces.
[2] Includes zinc sulfate.
[3] Includes ferruginous manganese and manganese dioxide.
[4] Partial figure; value of reported quantity is $77,096. An additional unreported quantity valued at $747 was also imported.
[5] Includes lithium hydroxide, beryllium oxide, mercury oxide, antimony trioxide, cuprous oxide, hydroxides and peroxides n.e.s., and silicon dioxides.
[6] Includes phosphorus, boron, and arsenic.
[7] Includes lithium, sodium, alkali-metals n.e.s., and alkaline-earth metals.

COMMODITY REVIEW

METALS

Aluminum.—Australia continued to be the principal supplier of bauxite for Japan's aluminum industry. In 1975, shipments of bauxite from Australia totaled 2.9 million tons. Close to 1 million tons of bauxite was imported from Indonesia and about 600,000 tons was supplied by Malaysia. Total imports of bauxite were 4.6 million tons in 1975 compared with 5.3 million tons in 1974.

Production of alumina by four companies in 1975 was 1.6 million tons, down 13.1% from the output in 1974. Output of alumina by company was as follows in tons (figures in parentheses represent shipments during the year): Nippon Light Metal Company, Ltd., 576,259 (595,232); Showa Denko K.K., 459,570 (456,286); Sumitomo Chemical Co., Ltd., 359,088 (402,378); and Mitsui Alumina Co., Ltd., 170,124 (178,070). The largest decline in output was 26.7% by Sumitomo Chemical, followed by Nippon Light Metal, 13.5%, and Mitsui Alumina, 7.8%. Production by Showa Denko was off only slightly from its 1974 level.

Production of primary aluminum metal by 13 smelters of 5 companies was 1.013 million tons in 1975, down 9.3% from that of 1974. Mitsui, with its single smelter at Miike, was the only company that showed a production increase. The remaining four companies reported decreases ranging from 5.7% to 16.7%. Output of metal in 1975 by company was as follows in tons (figures in parentheses indicate output in 1974): Nippon Light Metal, 295,291 (313,237); Showa Denko, 194,651 (209,690); Sumitomo Chemical, 242,777 (273,994); Mitsubishi Chemical Industries Limited, 203,508 (244,552); and Mitsui Aluminium Co., Ltd., 77,032 (76,901). Because of sluggish demand, smelters operated at around 70% capacity throughout the year. Shipments totaled 878,226 tons, down 6.9% from that of 1974, and down 21.9% from peak shipments in 1973. Stocks at yearend were 377,271 tons, 5.6 times that in 1973.

To alleviate the depressed market conditions for the industry, MITI urged a 50% cutback in the production rate beginning in 1976. However, as a compromise the producers agreed to cut back total industry production to an average rate of about 61.5% in an attempt to reduce producers' stocks to 270,000 tons by June 1976. Production rate curtailments by company were proposed as follows beginning in 1976: Nippon Light Metal, 43%; Showa Denko, 34.8%; Sumitomo Chemical, 37.3%; Mitsubishi Chemical Industries, 38.3%; and Mitsui Aluminium, 43.3%.

Production of superpurity aluminum was only 2,966 tons in 1975 compared with 5,630 tons in 1974. Nippon Light Metal suspended operation at its Kambera refinery due to low demand and high inventory. The other producer, Sumitomo Chemical, reduced its operation by closing down eight electrolytic cells to balance its production and shipment of superpurity metal.

Throughout 1975, the aluminum industry was faced with a downturn in demand and a large increase in cost for electric power. It was estimated that 15,000 kilowatt-hours were required to reduce alumina to produce 1 ton of metal ingot. Presently the industrial electric power supplied in Japan costs as much as Y8 per kilowatt-hour, four to eight times the United States and Canadian equivalent of Y1 to Y2. In July 1975, the aluminum smelters proposed a markup of Y46,000 to raise the ingot price to Y326,000 per ton. However, the major industrial users resisted the proposed markup. Additionally, domestic ingot prices continued to be undercut by lower priced imports. The aluminum industry, however, managed to raise the ingot price about Y15,000 per ton. Japanese ingot prices still were higher than the Western equivalents even at the Y15,000 per ton raised level.

Because the Japanese smelters were not price competitive in international trade, smelting ventures abroad, where cheap hydroelectric power is available, were considered desirable. In July 1975, the five primary aluminum producers, a group of Japanese trading companies, and the Indonesian Government concluded an agreement to launch a joint hydroelectric power generation and aluminum smelting venture in northern Sumatra. The Asahan project calls for a hydroelectric powerstation with a maximum capacity of 513,000 kilowatts and an aluminum smelter having an initial annual capacity of 225,000 tons of aluminum.

The Japanese primary aluminum producers and Companhia Vale do Rio Doce (CVRD) of Brazil agreed to construct a 1.3-million-ton alumina plant and a 640,000-ton aluminum reduction plant in Bera de Conde, and a 1.85-million-kilowatt hydroelectric plant in Tucurui on the lower reaches of the Amazon River. With strong urging by the Brazilians, the Japanese Government and the industrial interests concerned decided not to delay the venture despite Japan's recessionary difficulties.

Mitsui Mining & Smelting Co., Ltd., submitted plans to the Solomon Islands Government for mining bauxite and producing alumina on Renell Island. The plans called for the establishment of a joint venture owned 25% by the local government and the balance by Mitsui and its affiliated firms. Bauxite deposits on the island were estimated at nearly 60 million tons. The Government hoped to develop the deposit as a major source for earning foreign exchange.

Copper.—Production of refined copper metal was 818,000 tons, about 178,000 tons below the output in 1974. Domestic shipments amounted to 734,000 tons, an increase of about 15% over those in 1974. However, shipments for export plummeted from 344,000 tons in 1974 to 21,000 tons in 1975. Mitsubishi Metal Corporation ranked first in sales of copper metal with over 190,000 tons, followed by Nippon Mining Co., Ltd., Mitsui Mining & Smelting, Sumitomo Metal Mining Co., Ltd., The Dowa Mining Company, Ltd., Furukawa Mining Co., Ltd., and Toho Zinc Co., Ltd., in that order. Industry stocks at yearend were 166,800 tons, which was equivalent to approximately 2-months' production. In comparison, stocks held at yearend 1974 were 87,000 tons.

During 1975, Japan's modern copper smelting industry was plagued with financial difficulties resulting from over capacity, low copper prices, increased energy and labor costs, and decreased domestic consumption. Nippon Mining cut its monthly production rate to 15,000 tons from its monthly capacity of 27,000 tons in May. Mitsubishi Metal Corporation, Sumitomo Metal Mining, The Dowa Mining, Mitsui Mining & Smelting, and Furukawa Mining were expected to maintain their production curtailment rate of 35% to 40%. Additionally, poor demand for sulfuric acid by the fertilizer industry compounded the difficulties faced by the copper smelters. It was expected that an oversupply of sulfuric acid would also force copper producers to further restrain metal production.

Copper producers were expected to curtail production capacity at their smelter facilities up to 1979. Nippon Mining was expected to totally suspend smelting operations at its Hitachi refinery from October 1976 through March 1978 and concentrate operation at its Saganoseki facility. However, operation of flash furnace No. 1 was expected to be resumed in 1976 at Saganoseki. Smelting operations at Saganoseki have been confined to the No. 2 furnace since December 1974. Mitsubishi Metal Corporation was expected to operate its Naoshima refinery at 65% capacity for the next 3 years. Sumitomo Metal Mining disclosed its decision to keep the capacity of its Toyo refinery unchanged despite an expansion program previously set for fiscal year 1977. Similar reductions in production were made at the Tamano refinery of Hibi Joint Refining Co. and at the Onahama refinery of Onahama Refining Co.

In May 1975, Mitsubishi Metal Corporation resumed commercial operation of its continuous copper smelting process at the Naoshima smelter. This operation had been suspended in January 1975 due to an industrywide production cutback caused by decreased demand for copper. The Mitsubishi process features a multifurnace system which optimizes the oxidation reaction in two stages. Concentrates of copper sulfide ore are first smelted with lance injection of air and fuel to produce the matte and slag, followed by converting the matte by oxidation of the iron and sulfur to produce copper blister. Other features of the Mitsubishi process were as follows: Furnaces were all stationary type; molten products were transferred by gravity to the next furnace through a launder; and the molten products were continuously overflowing through the furnace outlet hole. Reportedly, the advantages of this process over conventional smelting included: (1) High sulfur recovery; (2) compact facilities; (3) low fuel requirements; and (4) elimination of slag flotation.

Agreements were reached between six Japanese copper smelters and three major suppliers of copper ore to raise the treatment charge and refining cost to $0.18

per pound of contained copper in the ore to be shipped in fiscal year 1976. Bougainville Copper Mine of Papua New Guinea, Lornex Copper Mine of Canada, and the Ertsberg Mine in Indonesia annually ship 90,000 tons, 50,000 tons, and 50,000 tons, respectively, of copper ore in terms of copper ingot to Japan under long-term contracts. Similar negotiations are being held with other supply resources which ship ore under individual contracts. Black Mountain of the Philippines which supplied 5,000 tons of copper in terms of copper metal in 1975 agreed to the raise for shipments in the next year. Even with the markup, the Japanese smelters would purportedly still operate at a deficit. Additionally, the $0.18 treatment charge and refining cost rate compared unfavorably with the $0.20 to 0.25 per pound granted to German smelters. Accordingly, the Japanese were expected to continue negotiations to increase the rate.

Mitsui & Co., Ltd., with a 20% interest in the Société Minril de Tenke Fungmel and the Zaire Mining Co. of Japan formed the Zaire Mining Industry Development Co. to develop copper deposits at Musosi and at Kinsenka in Zaire. Nissho-Iwai, a trading firm, was presently cooperating in railway construction between Matadi and Banana.

Mitsui & Co. and Mitsubishi Metal Corporation extended a $70 million loan to Nchanga Consolidated Copper Mines, Limited, for developing the Nchanga open pit copper mine at Chingola, Zambia. Included in the terms of the 10-year contract, which will expire in 1987, were shipments of 100,000 tons of copper ore per year to Japan. Nchanga Consolidated operates copper mines at Chingola and Konkola and has a refinery at Rokana. Mitsubishi Heavy Industries, Ltd., entered into a technical aid agreement with Nchanga Consolidated for the construction of a sulfuric acid plant to recover sulfurous acid gas generated at the Rohana refinery.

Furukawa and Mitsui completed the construction of an electrolytic copper refinery at Ilo, Peru, which was subsequently transferred to Empresa Minera del Perú (Minero Perú). Annual output of metal capacity was rated at 150,000 tons. The Peruvian Government reportedly will expand the Y9,277 million plant to a capacity of 300,000 tons per year.

Iron and Steel.—Japan's steel production of 102.3 million tons in 1975 was 12.6% lower than that of 1974. As the world's third largest steel producer, Japan followed the U.S.S.R. and the United States with 142.0 million tons and 106.0 million tons, respectively. However, Japan continued to be the world's foremost exporter of steel with around 29.5 million tons in 1975.

Japan has 6 of the 10 largest blast furnaces in the world. The other large blast furnaces were located in France, the Netherlands, Italy, and West Germany. The largest is Nippon Steel's Kimitsu Works No. 4, capable of producing more than 11,000 tons of pig iron per day.

As of yearend 1975, Japan's 10 largest blast furnaces were as follows:

Company and blast furnace	Cubic meters	Startup date
Nippon Steel's Kimitsu Works No. 4	4,930	October 1975.
Nippon Kohan's Fukuyama Works No. 5	4,617	November 1973.
Kawasaki Steel's Mizushima Works No. 4	4,323	April 1973.
Nippon Kokan's Fukuyama Works No. 4	4,197	April 1971.
Nippon Steel's Oita Works No. 1	4,158	April 1972.
Sumitomo's Kashima Works No. 2	4,080	March 1973.
Nippon Steel's Kimitsu Works No. 3	4,063	September 1971.
Kobe Steel's Kagogawa Works No. 2	3,850	January 1973.
Nippon Steel Yawata Works Tobata No. 4	3,799	June 1972.
Kawasaki Steel's Mizushima Works No. 3	3,367	October 1970.

Four Japanese steel companies were among the world's top 10 producers in 1975, headed by Nippon Steel Corporation with output of 32.5 million tons. In comparison, United States Steel Corp. produced 23.9 million tons and British Steel Corp., 15.9 million tons. The next three ranking steel producers were the Japanese firms Nippon K.K., 14.7 million tons; Sumitomo Metal Industries Ltd., 13.4 million tons; and Kawasaki Steel Corporation, 13.3 million tons. August Thyssen Huette A.G. of West Germany with 12.2 million tons, Italy's Finsider Enterprises with 11.5 million tons, and the Netherland-West Germany joint venture ESTEL N.V. with 9.6 million tons rounded out the first 10 companies.

In calendar year 1975, Japan also produced 86.6 million tons of pig iron, 76.8 million tons of hot-rolled ordinary steel, and 7.9 million tons of hot-rolled special steel.

A breakdown of Japan's crude steel output in 1975 is as follows, in million tons: Basic-oxygen furnaces—84.4; electric furnaces—16.7; and open-hearth furnaces—1.1. Output was down from the previous year by 10.9%, 20.1%, and 26.7%, respectively.

Shipments for export during 1975 were 29.9% lower in quantity and 7.9% in value from the previous fiscal period. Of the total shipments, ordinary steel items accounted for 25.1 million tons; special steel items, 1.2 million tons; and others, 4.7 million tons. Among the major destinations, shipments to the United States were first with 5.8 million tons, down 17.4% from that of 1974. The People's Republic of China was second with 3.9 million tons, followed by Iran with 2.4 million tons.

Due to the decline in steel demand, increased inventory, and unsuccessful negotiations for higher prices, the steel industry proposed further cutbacks in production late in the year. Nippon Steel Corporation lowered the operating rate of its blast furnaces to 74%. Operation of the No. 2 blast furnace at the Tobata Works with an internal capacity of 1,906 cubic meters was suspended for repairs and improvements. The operation of blast furnace No. 1 at its Sakai Works was scheduled to be shutdown in February 1976. The startup operation of blast furnace No. 5 of the Oita Works with a capacity of 5,000 cubic meters was expected to be postponed until October 1976.

Kawasaki Steel Corporation postponed the resumption of operation of blast furnace No. 3 at the Mizushima Works to early 1976. Sumitomo decided to postpone the resumption of operation of blast furnace No. 2 at its Wakayama Works by more than 2 months and also announced the suspension of operation of blast furnace No. 1 at Wakayama. Kobe Steel, Ltd., suspended operation of blast furnace No. 1 at its Kobe Works late in 1975.

Nisshin Steel Co., Ltd., began operating No. 1 blast furnace at the Kure Works which had been repaired and remodeled at a cost of Y20,000 million. Its internal capacity is 2,040 cubic meters (originally 1,540 cubic meters). Nisshin spent Y1,700 million in installing air pollution control equipment and Y700 million in water contamination control equipment.

Nippon Kokan continued the construction of its Ogishima Steel Works which was scheduled for completion at yearend 1978. The facility will include two blast furnaces each with an internal capacity of 4,000 cubic meters; two plants each for sintering furnaces and coke ovens; three plants for steel furnaces; plants for blooming, continuous casting, billet, plate, hot rolling, cold rolling; and large-caliber pipe mills. The No. 1 blast furnace was scheduled for completion in March of 1976. Total cost of the complex was estimated at Y850,000 million.

On October 3, Nippon Steel Corporation began operation of the No. 4 blast furnace at the Kumitsu Works. The blast furnace, reportedly the largest in the world, has an internal capacity of 4,930 cubic meters and a production capacity rated at 11,000 tons per day of pig iron. It has a floor diameter of 14 meters. The proposed heat of blast was 1,300° C and the pressure at the top of the furnace was rated at 3 kilograms per square centimeter.

Expansion work on the Kokura Works of Sumitomo Metal Industries was proceeding at a total cost of Y60,000 million and was 60% completed. It is expected that the expansion work will be completed by the end of March 1976. The expansion work includes a new blast furnace with an internal capacity of 1,400 cubic meters. When the complex is completed, the annual production capacity will be 2.7 million tons of crude steel.

Nippon Steel Corporation was completing the present phase of its expansion of the Oita Works which was scheduled for completion near yearend 1976. Blast furnace No. 2 was being installed with an internal capacity of 5,000 cubic meters (output capacity of 12,000 tons per day of pig iron). A sintering furnace, two coke ovens, one converter, two units for continuous casting, and a heavy plate mill were also included in the expansion project. Total cost for the expanded facility was estimated at Y300,000 million.

In late 1975, MITI approved the organization of a Steel Export Cartel to the European Economic Community (EEC). The Cartel, comprised of Nippon Steel, Nippon Kokan, Kawasaki Steel, Sumitomo Metal Industries, Kobe Steel, and Nisshin Steel, represents companies which constitute 90% of Japan's total steel exports to the EEC. The Cartel will function only for the 1976 calendar year and will regulate the export quantity of all steel items, limited to 1.22 million tons, to the EEC. Exports of pig iron and ferroalloys are excluded.

In late 1975, the major steel producers notified overseas suppliers of their option rights to reduce iron ore imports to Japan for fiscal year 1976. Under contracts for fiscal year 1976, a total of 143.8 million tons of iron ore was scheduled for shipment to Japan, as follows, in million tons: Australia, 69.9; Brazil, 23.4; India and Goa, 20.9; Africa, 12.2; and other areas, 17.5. Import shipments had averaged at the 80% to 90% level on volume contracts in the prior years. The import shipments of iron ore were estimated to be about 106 million tons in 1975, 32 million less than 138 million tons imported in fiscal year 1974.

Japan's large iron ore suppliers continued to be mainly Hammersley Iron Pty., Ltd., Mount Newman Iron Ore Co., Mount Goldworthy Mining Ltd., Robe River Mines, Ltd., and The Broken Hill Pty., Ltd., Co. of Australia CVRD and Mineracoes Brasileiras Reunidas of Brazil; and the Mineral and Metal Trading Corporation of India from mines in Goa, Bailadila, and Kiriburu.

C. Itoh & Co. entered into an agreement with Apex Exploration and Mining Co. of the Philippines to import 2.55 million tons of iron sand for a period of 8.5 years beginning in 1977. The iron sand reportedly will be delivered to Nippon Steel Corporation and Kawasaki Steel Corporation. Feasibility studies of the Gonzaca Iron Mine in northern Luzon Island confirmed deposits of 2.9 million tons of iron sand containing 59% iron and 4.5% titanium. A shipping port to be constructed by the Philippine Government at Casabarangan will facilitate shipment of the ore.

After the nationalization of the Marcona Mine operation in Peru, shipments of iron ore to Japan were suspended in July 1975. However, a provisional agreement was made between the Government of Peru and the Marcona Mining Company of the United States for compensation of the mining operation. Minero Perú, a State-owned company, was designated to handle sales of the Marcona iron ore and was expected to begin negotiations with Japanese steel producers for resuming iron ore shipments. In prior years, shipments to Japan of Marcona iron ore totaled between 5 million and 6 million tons annually.

The Industrial Structure Deliberation Council approved a 8.4% capital investment cutback planned by 1,866 industrial companies in fiscal 1975. One hundred and one steel companies have reduced their capital investments by 3.4% or Y46,100 million from their original Y1,346,500 million to Y1,300,000 million based on the construction work started in 1975.

Lead and Zinc.—Japan has been a significant world producer of zinc. Its domestic mine production supplies about one-fourth of the total smelted primary raw materials, and its refined metal output ranks first in the world. Mitsui Mining and Smelting Co., the world's foremost metallic zinc producer with about one-third of Japan's smelting capacity and the famous Kamioka mine, maintained its special role in the zinc economy. However, zinc metal production of roughly 702,000 tons in 1975 was well below the annual output recorded during 1971–74. Zinc exports fell drastically from 133,000 tons in 1974 to 59,000 tons in 1975. Domestic demand was weakened by reduced consumption of zinc for galvanizing. In 1975, only 296,000 tons of zinc was consumed for galvanized coatings compared with 453,441 tons and 400,761 tons in 1973 and 1974, respectively.

Throughout the year, producers curtailed their monthly output and operated generally around 73% of their production capacity. Due to the slump in sales, producers' stocks at yearend were 217,435 tons, equivalent to almost a 3-month production of metal. Additionally, stocks held by consumers and distributors totaled over 35,000 tons.

MITI estimated at the current rate of production and consumption, zinc would be about 125,000 tons in oversupply in the next fiscal year. Hence, the smelters were expected to maintain their production curtailment rate of 30% into 1976 to reduce producer's inventory to the level of 70,000 tons.

To maintain this reduced production

level, Japanese zinc producers held negotiations with foreign zinc ore producers to reduce shipments of ore accordingly. Mount Isa Mines Ltd., of Australia agreed to a 25% reduction of its ore shipment to Japan. Texasgulf of Canada also agreed to reduce its zinc ore shipments to average about 38% for 1976. Negotiations are continuing with Anvil Mining Corp. of Canada to reduce its shipments from 215,000 tons to 150,500 tons in 1976. Despite these drastic cutbacks, total shipment of zinc ore to Japan was expected to be reduced only by 18% for the full year.

In 1975, Nippon Mining, Mitsubishi Metal Corporation, Mitsui Mining & Smelting, Sumitomo Metal Mining Co., The Dowa Mining, and Toho Zinc produced 194,000 tons of lead. Shipments of metal were 208,300 tons, a nominal 1% over 1974. In the second half of 1975, demand for lead began to increase for the manufacture of storage batteries reflecting a rise in automobile production. Also, producers of inorganic chemicals who had all but suspended purchases of lead early in the year began to place orders to replenish stocks. Lead producers were expected to curtail their output by 15% to 20% of total industry capacity. At this rate, industry stocks would probably fall to one-half month production level by yearend, approximately 10,000 tons.

Magnesium.—Production of magnesium metal by Furukawa Magnesium Co., Ltd., and Ube Industries Ltd., in 1975 totaled 8,538 tons, down 4% from the prior year's output. Recovery of secondary metal was 9,227 tons. Forty-six percent of the magnesium consumed was in the production of titanium and zirconium metals. Magnesium used for aluminum alloys constituted 14% of total consumption.

Showa Denko constructed a pilot plant at Chichibu, Saitama, to test a patented thermal magnesium process. The plant was planned to have a capacity of 440,000 pounds per year of metal. Startup of the plant began in midyear.

Manganese.—Although Japan mined about 160,000 tons of low-grade manganese, virtually all the requirements for high-grade manganese ores were met by imports. Japan ranked second to the United States as a producer of electrolytic manganese and manganese oxide. Output of electrolytic manganese in 1975 was 8,265 tons. Producers of electrolytic manganese were Tekkosha Co., Ltd., and Chuo Denko Kogyo, comprising a total capacity of 14,000 tons. Mitsui Mining & Smelting and Daiichi Carbon produced 41,516 tons of manganese oxide. Mitsui Mining & Smelting completed the construction of a manganese dioxide plant at Cork, Ireland. The plant with a 1,000-ton-per-month capacity of manganese dioxide was expected to begin full operation in the spring of 1976. Total cost of construction was estimated at Y7,000 million.

Molybdenum.—Japan imported 12,094 tons of roasted molybdenum concentrates in 1975 compared with 12,280 tons in 1974. Domestic production remained nominal and was 206 tons in 1975. Consumption during the year was 12,491 tons of which 87% was used in the production of briquet and ferromolybdenum.

Nickel.—For lack of indigenous resources, Japan imports all of its nickel needs. During 1975, 8,451 tons of nickel metal (2,168 tons from the U.S.S.R., 2,512 tons from Canada, 1,979 tons from the Republic of South Africa, and 1,792 from Australia, Finland, Norway, and the Philippines); 93 tons of nickel alloy ingot (89 tons from the United States and 4 tons from the United Kingdom); 3,397,000 tons of 1.8% to 2.5% nickel ore (2,492,000 tons from New Caledonia, 872,000 tons from Indonesia, and 26,000 tons from Australia, New Zealand, and the Philippines); 27,442 tons of matte and speiss (16,931 tons from Australia, 8,633 tons from Canada, and 1,878 tons from New Caledonia) were imported. Japan also imported 1,148 tons of semifabricated nickel and alloy products. Japan has a 13% tariff on imported nickel ingot, but ores are not subject to tariff.

Nickel production during the year was 13,019 tons, while ferronickel production was 58,914 tons of contained nickel. Production of nickel and ferronickel dropped 38% and 20%, respectively, from the 1974 output.

Pacific Metals Co., Ltd., Nippon Yakin Kogyo Co., Ltd., Nippon Mining Co., Sumitomo Metal Mining Co., and Shimura Kako Co., Ltd., were the five companies (with six plants) which produced ferronickel. The combined annual capacity of the five companies totaled about 100,000 tons of nickel in ferronickel. Approximately

98% of the sales of ferronickel, as in the past, was consumed in the production of specialty steel.

Measured in quantity of contained nickel, ferronickel supply was close to five times as important as nickel metal. However, nickel as metal is used in much more diverse applications. The major uses for nickel other than steel alloying were plating, 24%; nonferrous alloying, 13%; fabricated products, 5%; and coinage, 5%.

Japan has two nickel refineries, totaling about a 21,000-ton-per-year capacity—Sumitomo Metal Mining's Niihama plant and Shimura Kako's Tokyo plant. The Matzusaka plant of Tokyo Nickel, Ltd., and the Tsuruga plant of Nippon Nickel Co., Ltd., produced nickel oxide. Shimura Kako announced it will construct a 10,000-ton-per-year nickel refinery in Kikkaido. When completed at yearend 1977, the company's Tokyo refinery would be closed down. The Kakkaido refinery will use advanced technology under license from Inco. Nippon Mining Co. completed the construction of a small refinery at Hitashi to recover 3,000 tons of nickel and 1,000 tons of cobalt annually from mixed cobalt-nickel sulfide ore imported from Australia. Pacific Metals Co.'s plans to erect an 18,000-ton-per-year ferronickel plant at Niigata was postponed for 2 years. The company reportedly invited Nippon Mining, Sumitomo Metal Mining, Shimura Kako, and Nippon Yakin Kogyo to participate in this smelter project.

Because of the weak demand for nickel, the smelters attempted to reduce imports inasmuch as industry stocks were approaching 1.0 million tons at yearend, which was equivalent to about 4-month production. Discussions were held to reduce ore imports from Indonesia's Aneka Tabang by 50,000 tons to 600,000 tons in fiscal year 1976 and also to reduce ferronickel shipments from the Sulawesi smelter from the contracted tonnage of 4,000 to 1,400 tons in the same period. Plans were also being made to reduce imports of New Caledonian nickel by at least 10% to 2 million tons in 1976.

Titanium.—Production of titanium sponge in 1975 was by Osaka Titanium Co., Ltd., Toho Titanium Co., Ltd., and New Metals Industries Company. Despite the removal of consumption controls on oil and power in mid-1974, production of sponge metal in 1975 was 1,331 tons below that of 1974. Exports of sponge metal as in prior years were mainly to the United States. Titanium metal is used primarily for its corrosion-resistant properties. While consumption of titanium was on the upturn during 1972–74, demand slackened in 1975 due to protracted orders in equipment for desalination, petrochemical, and caustic soda plants. Fabricators of titanium metal were Kobe Steel, Nippon Stainless Steel Co., Ltd., and Furukawa Metal Co., Ltd.

Japan has also been prominent as a world producer and exporter of titanium dioxide (titania) and synthetic rutile, using up to 0.5 million tons of imported ilmenite as raw material. There were six titania producers capable of producing about 180,000 tons of TiO_2 per year. The demand for pigments, the primary market for titanium, was hard pressed by sluggish domestic and foreign demand and excessive inventory, and production of titanium was sharply curtailed in early 1975.

Shin-Nanyo Titanium Co., Ltd., a joint venture of Sakai Chemical Industry Co., Ltd., (55%) and Toyo Soda Manufactring Co., Ltd., (45%), agreed to commercialize the production of titanium dioxide by the chloride process developed by Kerr-McGee Corp. A plant facility designed to produce 32,000 tons of titanium per year was to be constructed at Nanyo, Yamaguchi Prefecture.

Klöckner-Sakai, capitalized at Y100 million by Sakai Trading Co., Ltd. of Osaka, Klöckner Werke AG of West Germany, and local Malaysian interests, planned to develop ilmenite deposits in northeast Malaysia. The deposits have been estimated to contain between 2 million and 3 million tons of ilmenite. During the first year of operation, the newly formed company estimated that 10,000 tons of ilmenite would be produced, and beginning with the second year of operation, 50,000 tons would be exported principally to Japan and the balance to Southeast Asia countries.

Tungsten.—Japan produced 1,330 tons of tungsten concentrate in 1975. Awamura Metal Industry Co., Ltd., continued to be the principal domestic ore producer. Imports measured in gross weight of concentrate totaled 2,027 tons in 1975 and 3,818 tons in 1974. Consumption of tungsten fell sharply in 1975 and was estimated at 3,549 tons, down 1,785 tons from 1974. Awamura was the sole ferrotungsten producer, and output in 1975 was only 637 tons. The remainder of the tungsten consumed was 767 tons for calcium tungstate, 2,134 tons for elemental metal, and 10 tons for miscellaneous uses.

Other Metals.—During 1975, Japan produced 1.1 million troy ounces of gold and 8.6 million troy ounces of silver. Output of gold, derived mainly from smelting of imported nonferrous ores, was roughly 1% lower than in 1974. Output of silver was the same as in 1974 and recovery was about one-third from domestic ores. The Dowa Mining Company, at its newly built Kosaka smeltery, started test operations to recover silver from waste sludge generated in the manufacture of photographic film. It was estimated that up to 10 tons of silver could be recovered monthly. Domestic production of platinum and palladium has been nominal, less than 1,000 kilograms, and Japan has had to import these noble metals in one form or another.

Japan and the United States are the world's two leading producers of cadmium, a byproduct of zinc smelting. Japanese output in 1975 of 2,657 tons was 14% less than that of 1974. The three principal markets for cadmium were batteries, pigments, and as a stabilizer for polyvinyl chloride.

Japan produces only a small quantity of antimony ore and imports antimony in various forms. Output of metal in 1975 totaled about 2,500 tons of which 1,400 tons were produced by Hibino Metal Industrial Corporation, 650 tons by Nihon Mining and Concentrating, and 450 tons by Mikuni Smelting and Refining. Domestic consumption was 2,117 tons in 1975, a 21% decrease from that of 1974. The decreased consumption of antimony was due to the reduced demand from the manufacture of storage batteries, which accounts for about 60% of the total antimony demand. Additionally, battery manufacturers increased consumption of scrap metal in place of primary antimony. Production of antimony trioxide by four companies was 2,850 tons in 1975 compared with 4,400 tons in the previous year. Consumption of antimony trioxide was 2,765 tons, 24% lower than the previous year. Over 50% of the demand was for flameproofing in the electric appliances and automobile industries. Smaller amounts of antimony trioxide, around 840 tons, was used in glassmaking and plastics.

Output of primary and secondary mercury in 1974 was 551 flasks and 189 flasks, respectively. There was no primary production in 1975, and secondary recovery was reported at 3,298 flasks. Imports of mercury dropped from 7,687 flasks to 2,567 flasks in 1975. Consumption declined 21% in 1975 and was attributed mainly to reduced use of mercury in caustic soda manufacture and to reduced use in inorganic chemicals. Exports of mercury were 1,923 flasks, almost equivalent to 75% of total imports during the year.

Production of cobalt during the year totaled 48 tons. Most of the supply was from imports which comprised 1,581 tons. Consumption of cobalt metal has steadily declined; in 1973 consumption was reported as 3,924 tons; in 1974 as 2,806 tons; and in 1975 as 1,979 tons. Reduced demand for cobalt and high-speed steels, heat-resisting alloys, and magnetic alloys accounted mainly for the decline in consumption.

Japan was also an important world producer of other byproduct metals such as bismuth and selenium. Bismuth production and consumption declined; output was 671 tons during 1975 compared with 794 tons in 1974. Consumption of bismuth, estimated at about 350 tons, was primarily for metallurgical additives, ferrites, and alloys. Selenium production moved up 25% to 417 tons. The leading domestic selenium markets were glass, rectifiers, and pigments.

Presently, the only two producers of indium are Nippon Mining and Toho Zinc and output in 1975 was around 550,000 troy ounces. Because of the increase in price for the metal, The Dowa Mining planned to produce indium by mid-1976. Mitsui Mining & Smelting, which suspended production of indium in 1972, reportedly may resume production.

Japan also produced other metals, usually of high purity and generally in quantities prominent by world standards. Output for some of these metals, mostly from imported materials, during 1975 in tons was as follows: Chromium, 2,739; germanium metal, 13; germanium oxide, 12; lanthanum oxide, 21; silicon, 231; and tantalum, 12. Production figures were generally lower than the previous year owing to the worldwide economic recession.

NONMETALS

Cement.—Japan ranks with the United States and the U.S.S.R. as the foremost producers of cement in the world. The Japanese cement industry's capacity increased 6.8 million tons in 1975 to the level of 110 million tons. However, total output of cement during the year was only about 60% of rated capacity. Moreover, production was down 16% from the 73 million tons produced in 1974. Production cutbacks and the increased price of fuel oil pushed up the industry's production cost of cement. Due to curtailments in private plant investments and slackening investments by local governments in public work projects, the cement manufacturers formed a production cartel in November 1975, which would provide temporary production adjustments. Additionally, the cartel was expected to mollify sales competition inasmuch as the producers were loaded with surplus capacity.

Although a series of antirecession measures were enforced by the Government, domestic sales in 1975 totaled 62.8 million tons, a drop of 10% from that of 1974. To make up for sluggish domestic demand, producers began an aggressive program for foreign sales. While shipments for exports remained nominal in terms of industry capacity, exports totaled 4 million tons in 1975, an increase of 88.7% over that in 1974. Exports during the year were primarily to the Middle East and Southeast Asia.

Fertilizer Materials.—Japan's chemical fertilizer industry, second largest in the world, has been highly export oriented. During 1971–74, shipments of nitrogenous fertilizers increased substantially as many countries moved to increase their agricultural production. In 1975, there was a significant turnabout with a sudden drop in exports. Southeast Asian countries, the chief export market for Japanese fertilizer, were suffering with overstocks. Indonesia and the Philippines temporarily refused deliveries of fertilizers during part of the year from Japan.

The People's Republic of China, Japan's single largest customer of chemical fertilizer, successfully negotiated a reduction in import prices. From July–December 1975, the fertilizer industry agreed to an export price of about Y50,000 per ton of urea shipped to China. This represented a reduction of more than Y25,000 from the comparable price for shipments during January to June 1975. Further reductions in price were being negotiated for 300,000 tons of urea and 150,000 tons of ammonium sulfate set for delivery during the first 6 months of 1976.

During 1975, production of various chemical fertilizers were estimated as follows, in thousand tons: Ammonium sulfate, 2,100; urea, 3,700; ammonium chloride, 950; calcium superphosphate, 520; fused magnesium phosphate, 500; and complex fertilizers, 3,900.

Gypsum.—Output of gypsum, primarily as a byproduct in the production of phosphoric acid, was about 2.5 million tons. At yearend, industry-held stocks were estimated at 1.6 million tons. According to MITI, stocks of gypsum were expected to increase annually by about 1.5 million tons mainly because of a rapid increase in recovery of byproduct gypsum in flue gas desulfurization. MITI planned to set up a conference to investigate means to reduce gypsum supply and expand demand.

Salt.—Japan's salt production was 1.01 million tons in 1975 as compared with imports of approximately 6.3 million tons. Breakdown of 1975 imports showed 3.5 million tons from Australia, 2.2 million tons from Mexico, and 0.6 million tons from the People's Republic of China. Aside from salt for human consumption, salt is needed in Japan mainly by the chlor-alkali industry. Consumption of industrial salt in 1975 was estimated at about 5.6 million tons. During the year, Japan produced approximately 2.9 million tons of caustic soda, 1.2 million tons of soda ash, 0.4 million tons of liquid chlorine, and about 0.68 tons of hydrochloric acid (35% grade).

During 1975, Mexico suspended Mitsubishi's salt mining concession on the Baja Peninsula which had been in operation for 10 years. In essence, all exploration and export of salt to Japan was stopped until an accord was reached on a new price agreement. In October, the Japanese industry agreed to a 40% increase in the price of Mexican imports which raised the price from $4.98 to $7.00 per ton.

In December, the Australian Government increased the export price of salt from $6.11 to $7.56 per ton. A further increase to $8.13 per ton was to be levied on January 1, 1976, but a compromise was reached to defer the raise until February. The five salt companies in Western Australia have reportedly suffered accumulated losses totaling about $25 million and claimed the additional increase was needed to make a reasonable profit.

Sulfur.—Production of elemental sulfur from indigenous ores accounts for less than 10% of overall supply. Sulfur recovered from petroleum refining increased about 4% to 749,013 tons in 1975. Japan's large nonferrous metal mining companies and smelters were very prominent in sulfuric acid production. Total production capacity of 56 plants belonging to 41 companies was 10,736,000 tons per year of sulfuric acid in 1975. Due to the decline in demand, producers curtailed output and production totaled 6,000,211 tons. Sulfuric acid is a low-price commodity and is not considered an economic export item. However, inventories were increasing beyond storage capacity and during 1975 about 60,000 tons of acid was shipped primarily to the Republic of South Africa and the Philippines. It was expected that exports of sulfuric acid in 1976 may approach 200,000 tons.

MINERAL FUELS

According to the Resources and Energy Agency of MITI, Japan's total energy supply during fiscal year 1974 (April 1974 through March 1975) reached 3,835.3 trillion kilocalories or 6,609,000 barrels per day in oil equivalents. Of the total energy supply, imported energy accounted for 88.5%, with the balance supplied by domestic energy sources. Japan's reliance on oil accounted for 74.39%. Following oil, in the order of their contribution to the energy supply, were coal, 16.58%; hydropower, 5.42%; and other, 3.16%.

Coal.—Japan's coal mining industry reached its peak in 1960 when output exceeded 55 million tons with about 660 collieries in operation. Subsequently, domestic coal production declined annually. By 1975, production of bituminous coal by eight companies was 18.9 million tons, down 6% from the 1974 output. Production by company in 1975 was estimated in million tons as follows: Mitsui Mining & Smelting Co., Ltd., 7.7; Hokkaido Colliery & Steamship Co., Ltd., 3.5; Taiheiyo Coal Mining Co., Ltd., 2.4; Mitsubishi Coal Mining Co., Ltd., 1.9; Sumitomo Coal Mining Company, 1.5; Matsushima Coal Mining Company, 1.2; Joban Coal Mining Co., Ltd., 0.4; and Kaijima Coal Mining Co., Ltd., 0.25.

Consumption of coal in steelmaking was much more important than for energy production. In 1975, about 60 million tons of coal was consumed by the steel industry of which 95% was provided through imports. During the year, Japan's total coal imports were 62.1 million tons and were primarily from the United States, Australia, and Canada. While imports were down 3% from 1974, the value of imports increased about 20%. Japan's coal import bill was estimated at $3.5 billion in 1975 compared with $2.9 billion in 1974 and $1.4 billion in 1973.

The Coal Mining Council, an advisory group to MITI, recommended that coal production be stabilized at 20 million tons annually. However, the decline in Japan's coal production in 1975 was largely due to the drop in Hokkaido's output. A series of floods, cave-ins, and an explosion during the summer and fall forced the suspension of operation at some of Hokkaido's larger mines. The most serious incident was a gas explosion at the Horonai mine in November; full production was not expected to be restored until March 1977.

To maintain production at the 20-million-ton-per-year level, the council noted that new mines must be developed as marginal ones were closed. In October, a survey team investigated the feasibility of opening new mines in Tempoku, Kushiro, Haboro, and Honbetsu. Preliminary findings revealed that coal was located at excessive depths at Haboro and Honbetsu. The Tempoku and Kushiro Fields contained substantial reserves, 69 million and 49 million tons, respectively. The Tempoku Field was considered attractive for development because its coal was located at shallow depths and suitable for strip mining operations.

In its report, the council also suggested that Japanese mining technology in cooperation with producing nations be used to develop overseas coal and thus provide alternative sources of energy for Japan's need. Additionally, Japan's coal policy should promote research on utilization technology.

Petroleum.—Japan's production of crude oil remained of little consequence, amounting to 4.4 million barrels in 1975, compared with exports of 1,594 million barrels, valued at $19.6 billion. Total industry refinery input during the year was 1,479 million barrels equivalent to 4,054,000 barrels per day input. The 10 largest companies were as follows with input of crude expressed in million barrels: Indemitsu Kosan Co., Ltd., 204; Nippon Petroleum Refining Co., Ltd., 153; Toa Nenryo Kogyo K.K., 121; Maruzen Oil Co., Ltd., 84; Showa Yokkaichi Sekiyu Co., Ltd., 82; Nippon Mining, 72; Koa Oil Co., Ltd., 66; Showa Oil Co., Ltd., 59; Mitsubishi Oil Co., Ltd., 59; and Daikyo Oil, 45. The remainder of crude input, during the year, 534 million kiloliters, was by refineries of 22 other companies.

As of December 31, 1975, Japan had 49 refineries owned by 31 companies, with a total atmospheric distillation capacity of 5,862,360 barrels per day. (Toyo Petroleum Refining Co., Ltd., merged with Nippon Petroleum Refining Co., Ltd., effective November 1, 1975.) Corresponding downstream capacities were as follows, in thousand barrels per day, except as otherwise indicated: Vacuum distillation, 1,805; catalytic cracking, 329; catalytic reforming, 593; middle distillates hydrodesulfurization, 1,195; fuel oil desulfurization, 1,200; hydrocracking, 13; lube oil solvent extraction, 71; lube oil solvent deasphalting, 49; lube oil solvent dewaxing, 61; sulfur recovery, 6,510 tons per day; and liquefied petroleum gas (LPG) recovery, 23,328 tons per day. There were 34 vacuum distillation units, 41 catalytic reforming units, and 19 catalytic cracking units. As of yearend, Japan also had 1,533,000 barrels per day of additional refining capacity under construction or in the planning stage.

Capacities of companies and refineries are as follows:

Company and refinery	Capacity, barrels per day	
	December 1974	December 1975
Asia-Kyoseki: Sakaide	100,000	150,000
Asia Sekiyu:		
Hakodate	25,000	25,000
Yokohama	100,000	100,000

Total	5,660,360	5,862,360

By the end of fiscal year 1974 (March 31, 1975), Japan's cumulative capital expenditures for the period 1967–75 for oil exploration and development totaled Y461,956 million and Y254,375 million, respectively. In fiscal year 1974, total exploration expenditures were Y158,260 million of which only Y3,475 million was spent on Japan's Continental Shelf. The bulk of the expenditures, Y154,785 million, was used in overseas exploration and were as follows: Middle East, Y107,193 million; Far East and Oceania, Y15,108; Africa, Y9,285 million; North America, Y280; and Central and South America, Y22,919 million. During the same period, the corresponding development expenditures were as follows: Middle East, Y46,340 million; Far East and Oceania, Y15,483 million; Africa, Y1,215 million; North America, none; Central and South America, Y4,126 million.

At yearend 1975, there were 51 Japanese companies involved in 61 exploration and development projects in overseas areas, compared with 11 companies searching for oil and natural gas on Japan's Continental Shelf. Ten companies were successful in finding oil or natural gas and were presently either producing or planning to start commercial production. After successful exploratory drilling in April 1974, United Petroleum Development Company started production of about 30,000 barrels per day at the El Bunduq offshore field on the border of Abu Dhabi and Qatar in December 1975. The other nine successful developers were Abu Dhabi Oil Co., Ltd., Arabian Oil Co., Ltd., C. Itoh Energy Development Co., Ltd., Idemitsu Exploration Co., Ltd. (Japan sea), Japan Low Sulfur Oil Co., Ltd., and Zaire Petroleum Co., Ltd.

Petroleum refinery output was as follows in million barrels (figures in parentheses represent sales of products during the year): Gasoline, 130 (161); naphtha, 166 (184); kerosine, 130 (140); jet fuel, 21 (13); distillate fuel oil, 215 (229); residual fuel oil, 690 (590); and lubricants, 13 (13). Production and sales by six companies represented close to 70% of Japan's total refinery output.

The Petroleum Stockpiling Law was enacted by the National Diet in 1975. Under the provisions of the law, it was mandatory for private petroleum companies to increase their oil stocks and to submit plans for stockpiling to MITI each year. The law called for a 5-year program to stockpile a 90-day emergency supply, of which the first year goal was to be a 70-day stockpile. The total amount of crude oil to be stockpiled in the next 5 years was estimated at 30 million kiloliters, depending upon the rate with which the demand for petroleum increases. Construction of an oil storage base in Oshima, Nagasaki Prefecture, was tentatively proposed. It would have a storage capacity of 18.9 million barrels if built.

In June 1975, the National Diet expanded the jurisdiction of the Japan Petroleum Development Corporation (JPDC). Amendments to the JPDC Charter included the following: (1) Investments in exploration for oil and natural gas would also include tar sand and oil shale overseas and would now include the Continental Shelf of Japan; (2) loans for exploration in overseas areas would be extended to include production and refining, provided that production loans be made only to foreign government agencies engaged in exploration and production in their own territories, that production be linked with the exploration, and that loans for production and refining be also applicable to exploration in the Continental Shelf of Japan; (3) JPDC would be able to acquire exploration rights in overseas areas provided that the rights be transferred to a third party within a certain period; and (4) JPDC would be able to invest money or extend loans for construction of facilities to increase the stockpile of oil.

Sakhalin Oil Development Corporation Company (SODECO), a joint Japanese Government-industry enterprise, was expected to participate in a U.S.S.R.-United States venture to develop undersea oil and natural gas around the coast of Sakhalin off the eastern coast of the U.S.S.R. Prospecting was expected to begin in 1976 and trial drilling in the following year. Natural gas deposits in the area were estimated at 37.5 billion tons in terms of oil and of this amount, between 2.3 billion and 4.5 billion tons were thought to be immediately tappable. Japanese investments in the prospecting phase reportedly were Y4,600 million, of which 70% would be funded by the JPDC.

The Mineral Industry of Kenya, Tanzania, and Uganda

By Janice L. W. Jolly[1] and David G. Willard[2]

KENYA[3]

Mineral development and exploration activity continued to increase in 1975 while Kenya's economy experienced the lowest growth rate in 10 years. Kenya's mineral industry contributed more than $42 million[4] (not including refined petroleum products) to the 1975 gross domestic product (GDP) of about $2,693 million at 1975 prices. Even though imported crude petroleum cost more in 1975, refined petroleum products were fast becoming one of Kenya's major exchange earners, contributing over 20% ($149 million) to trade revenues. Higher import costs, inflation, and stagnating agricultural production prevented the Kenyan economy from achieving more than a 1% GDP growth during 1975. The cost of living index increased 20%. Tightened Government import restrictions, limitations on Government spending, and slackened business activity kept import volume 19% below that of 1974, and the balance of payments deficit was reduced from the 1974 level. Total export value in 1975 was $601 million, and the import value $938.1 million, leaving a $337 million trade deficit. The 1975 import total was $219.6 million less than in 1974. Kenya devalued the shilling by about 15% in the last quarter of 1975.

To adjust to the new economic climate, the Government in mid-1975 modified its basic economic growth strategy by placing greater emphasis on those industrial projects that had low import requirements and high employment potential. Tight credit policies were also implemented, requiring commercial banks: To limit the increase of credit to the private sector to 12% per year and to give priority in granting credit to Government, export businesses, manufacturing, agriculture, and tourism; to give preference to small business needs and to provide no credit to foreign-controlled companies operating outside priority sectors; and to limit credit available to foreign-controlled companies operating mainly in priority sectors to 60% of the foreign exchange investment. Amendments to the Foreign Investment Protection Act, effective January 1976, introduced some uncertainty into the investment guarantee program offered by the Government. Specifically, the Government clarified its intent that the investor rather than Kenya must assume the foreign exchange risks for his investment. The amendments also clarified the Government's refusal to guarantee in advance the repatriation of capital gains realized upon liquidation of an investor's assets. This was not to be confused with guaranteed repatriation of original investment, which was a clear right. The schedule for repatriation of capital profits must be negotiated.[5]

More emphasis was placed on mineral resources in the past few years, resulting in increased mineral development and pros-

pecting activities. Exploration undertaken by the Mines and Geological Department of Kenya was becoming more aggressive, and a policy of encouragement was being pursued with respect to private companies engaging in mineral exploration. Canada was to provide the necessary expertise and equipment for expansion of the Kenya Government's mineral exploration program, under the terms of a $1 million contract signed between the two governments. Included were plans to prospect for lead-silver deposits in Kenya's coastal province and gold and base metals in western Kenya. The Austrian Government spent about $600,000 in the search for minerals; deposits of iron and copper were reportedly found. The Kenya Government has traditionally encouraged foreign investment and was actively seeking foreign partners in a number of projects. In 1975, U.S. business committed $25 million in new investments, bringing the total to $125 million. One of the largest U.S. investments was N-Ren Corp.'s $54 million fertilizer plant started in 1974.

The Kenya Government, in conjunction with the United Nations Development Program (UNDP), initiated an investigation of geothermal resources in the Rift Valley in 1971 and appointed the East African Power and Lighting Co. (EAPLC) as its agent to undertake the work. Since then about $4.1 million has been spent on the investigation of geothermal sources around Naivasha where five holes have been drilled. According to a UNDP report, the presence of sufficient steam for a generating plant was confirmed in the area around Olkaria, some 120 kilometers northwest of Nairobi. As a result, EAPLC was investigating the possibility of installing a pilot atmospheric exhaust turbine plant to produce 1,000 to 1,500 kilowatts of electricity.

Kenya and Sudan agreed to build a highway and railroad that would give the southern Sudan direct access to Mombasa, completely bypassing Uganda because of security risks over the present road through Uganda. The proposed road, to be used for petroleum and explosive supplies, was to join Kitali in Kenya with Juba in southern Sudan and traverse the narrow 100-mile strip of border between the two countries west to Lake Turkana (formerly Lake Rudolph).

PRODUCTION AND TRADE

Production increases were noted for some mineral commodities, such as lime, and fluorite. Fluorite production increased from 38,500 tons produced in 1974 to 54,600 tons in 1975, valued at about $3 million. Hydraulic cement production decreased 0.03%, and was valued at approximately $23.6 million. Calcite, mined in the Kajiado area, was valued at $88,560 for the 150 tons produced in 1975, down from the 300 tons produced in 1974. The entire calcite production was consumed by the domestic ceramics industries for manufacturing eating utensils. Production of magnetite for use in cement decreased from 19,780 tons in 1974 to 16,800 tons in 1975. Other minerals produced included barite, diatomite, gold, guano, galena, salt, soda ash, vermiculite, wollastonite, and gem stones. Less than 10 tons of magnesite were mined since 1973, while mine operators were being changed.

Mineral export values (excluding cement, soda ash, and petroleum refinery products) increased during 1975 to approximately $3.6 million.[6] Fluorite exports were valued at almost $1.8 million, and lead-silver exports were nearly $1.2 million. Total exports in 1975 increased 8%, approximately 45% of manufactured goods was exported to African nations. Among the African countries importing Kenyan refined petroleum products were Burundi, Rwanda, Seychelles, Somalia, Sudan, Zaire, and Zambia. Singapore, Poland, Taiwan, Egypt, Italy, Japan, and the United Kingdom also imported fuel oil from Kenya. Crude oil imports (19.8 million barrels) decreased slightly in 1975 and came mainly from Iran, Saudi Arabia, and Iraq. Internal consumption of all types of fuel also declined throughout 1975, by as much as 20% in the case of industrial diesel oil.

Uganda and Tanzania ranked first and second among Kenya's export markets, although Kenya's trade with these fellow East African Community (EAC) States fell 2% in 1975, a reflection of deteriorating economic conditions in all three states and of a general decline in relative importance of EAC interstate commerce. The fate of the EAC and its 1967 treaty was under a yearlong review by a high-level tristate com-

[6] Mining Annual Review. Kenya, 1976, p. 448.

mittee. Petroleum products accounted for 30% of the exports to these two countries.

Exports to the United States declined in volume in 1974 and 1975, although the value increased. Imports from the United States included $1.4 million of ore-crushing equipment.

COMMODITY REVIEW

Metals.—*Chrome and Nickel.*—Chromite and garnierite occur on the slopes of Sekker Mountain in the Sigor Division of the West Pokot District, Rift Valley Province. The chromite deposit at Telot on the southern flank of Sekker Mountain was prospected by trenching and shallow diamond drilling by the Kenyan Mines and Geological Department in 1975. It was estimated that ore reserves were in excess of 59,000 tons with an average grade of 49% Cr_2O_3. The chrome-to-iron ratio was given as 3:1.

[7] 100 metric tons credited to Uganda were removed from Kenya leaving a negative balance.
[8] Includes limestone flux and similar stone used for the manufacture of lime or cement.
[9] 55 metric tons credited to Uganda were removed from Kenya leaving a negative balance.

The chromite at Telot is associated with nickel silicate (garnierite).[7] The Mines Department indicated 5.3 million tons of probable reserves with 1% nickel and 14.4 million tons of possible reserves with 0.7% nickel. In 1975, a consortium of Japanese companies (C. Itoh & Co., Nikkon, and Kokan Mining Co.) was granted a license for the chromite-nickel deposits at West Pokot. The license also included precious or semiprecious stones.

Gold.—Small-scale gold mining by the Wananchi people continued in Western Kenya. Four gold mining cooperatives were licensed in 1975 in the Narok, South Nyanza, Bondo, and Kakamega Districts. The United Nations mineral survey of western Kenya completed in the 1960's had recommended that small gold deposits could be worked profitably by local people but did not justify investment by large mining companies. The recommendation was accepted by the Government, and the workings were legalized so that the Wananchi already working the areas could benefit from the advice of technical officers of the Mines and Geological Department. The gold could then be channeled into the country's economy either by export or by sale to local goldsmiths. Licensed Wananchi dealers buy the cooperative's production. There was also some prospecting for gold along the Turkwell River. A small mine also produced some gold on the Nandi Escarpment at Kibigori.

Lead and Silver.—Lead and silver were produced from the Kinagonia mine and valued at nearly $1.2 million for 1975. The mine experienced some technical difficulties and difficult mining ground.[8]

Magnetite.—Magnetite mining continued at Ikutha in the Machakos District and supplied the Bamburi portland cement plant.

Nonmetals.—*Cement.*—The Bamburi Portland Cement Co. was planning an extension to its Mombasa installation to bring the capacity from 800,000 tons per year to more than 1.2 million tons per year. An investment of $23 million was visualized. Foreign orders exceeded 80% of the production capacity in 1975. To export this amount, the company was expanding its fleet of ships. A new ship of 15,000 tons was to start in service transporting clinker to Reunion and returning loaded with coal.[9]

Ceramic Minerals.—Industrial minerals produced by Ceramic Industries of East Africa Ltd., were making ceramics production almost self-sufficient with local materials.

Fluorite.—The Fluorspar Co. of Kenya was established in 1971 by the Industrial and Commercial Development Corp., (ICDC), in partnership with Bamburi Portland Cement Co. and the Continental Ore

[7] Inside Kenya Today (Nairobi, Kenya). West Pokot's Sleeping Bonanza. No. 30, December 1975, pp. 38–39.
[8] Work cited in footnote 6.
[9] Industries et Travaux D'Outremer (Paris). Kenya. V. 24, No. 271, June 1976, p. 483.

Corp. of New York, to develop the fluorite deposits of the Kerio Valley. In 1974. the firm began erecting a new milling facility at a cost of $5 million to process acid-grade fluorite by flotation. The United Kingdom firm, Foster Power Piping Ltd., undertook structural and mechanical construction, while the Nairobi-based Construction and Engineering Building Workers did the sewer construction. The flotation mill was to produce 400 tons of 97.50% acid-grade fluorite every 24 hours, with an operating crew of not more than 10 per shift. Power for the plant was supplied from the EAPLC station at Lessos. The average mill power consumption cost per month was given as about $2,100, depending upon production. Water for the project was pumped from the Mong stream; approximately 6,000 gallons of water circulate through the mill every hour. The tailings were pumped through an 8-inch-diameter pipe to a pond impounded by earthern dikes. Construction was completed in early 1975, and the mill was operated with the help of four Mexican technicians. The company also had an intensive training program to train local staff. An initial 60 workers were undergoing on-the-job training. In 1974, Kenya signed a joint agreement with Japan to supply 250,000 tons of metallurgical and acid-grade fluorite. The company planned to expand the 150,000-ton-per-year mill to double its production by yearend 1977.[10]

The fluorite deposits[11] occur in the Musgut-Kimwarer area of the Kerio Valley in isolated areas within the Basement System of the Mozambique Belt. The deposits are both vein and replacement type. The fluorite bodies were introduced during Miocene volcanic activity as fluorine permeated older sediments and replaced limestone, and rock fragments in fault breccias. Fluorite veins also extend into the overlying younger rift volcanics. Four varieties were reported, including colorless, yellow-brown, dark-gray, and violet fluorite. The colorless variety is dominant. In the region, 11 million tons with an average grade of 50% fluorite were estimated.

Mineral Fuels.—*Coal.*—Exploration for coal by Utah International Co. continued under an exclusive prospecting license, but drilling had not revealed any deposits of consequence in 1975. Further drilling was planned for 1976.

TANZANIA[12]

Mineral production declined in Tanzania in 1975, partly owing to the country's economic difficulties. A severe foreign exchange shortage caused a reduction in imports of fuels and spare parts for the mining industry, resulting in some loss of output and a depressed domestic market for minerals. Diamond again was the leading mineral product, and declines in output of both rough and cut diamonds were responsible for the drop in total value of mineral production. However, revenues from diamond exports increased owing to higher world prices.

As part of its foreign exchange control program, the Government suspended repatriation of all foreign business capital, earnings, and fees beginning in June 1974. No changes in this or other regulations affecting private business occurred during 1975.[13]

The official opening of the Tanzania-Zambia Railway (TAZARA), which had been scheduled for mid-1975, was postponed until 1976 for unannounced reasons. Some traffic, notably Zambian copper, was moving over the line in late 1975. The new rail line was expected to stimulate development of the southwestern part of Tanzania, where deposits of coal, iron, gold, and mica were reported. However, additional export traffic generated by the railway already was creating congestion at the port of Dar es Salaam.[14]

During 1975, mineral exploration and development activity was carried on by the Tanzanian Government, foreign governments, the United Nations, and private industry. Among the more important programs were: Investigations of coal and iron deposits along the TAZARA route by teams

from the People's Republic of China to determine the feasibility of establishing an iron and steel industry there; studies sponsored by a consortium of Japanese companies that could lead to the possible development of a soda ash industry at Lake Natron; and joint Tanzanian-Romanian operation of a pilot plant processing metal-bearing beach sands near Dar es Salaam. The State Mining Corp. and the United Nations Development Program also examined deposits of gold, limestone, nickel-cobalt, asbestos, bauxite, and tin and continued a program of geologic mapping. Exploration for diamond was conducted in the Mwadui and Mwanza areas, and the search for petroleum continued offshore.[15]

An agreement establishing an East African Mineral Resources Development Center was reached by representatives of Botswana, Ethiopia, Kenya, the Malagasy Republic, Somalia, Tanzania, and Uganda at a meeting in Addis Ababa, Ethiopia, in February 1975. The agreement had to be ratified by at least three of the signatory Governments in order to become effective. If established, the center, which would be located at Dodoma, Tanzania, would provide assistance in exploration and development studies, laboratory analyses, training, and the collection and publication of mineral statistics.[16]

PRODUCTION

Diamond again dominated mineral production in Tanzania in 1975, accounting for about 90% of the value of all minerals produced. A decline in diamond output caused a drop in total mineral production value of about 15%, reversing the small gain which occurred in 1974. Output of several other commodities also declined, including gem stones other than diamond, and lime. The only major commodity showing a gain was salt, production of which increased 30% in quantity and 62% in value.

Table 4 shows mineral production in Tanzania for 1973–75.

TRADE

Reduced exports and imports of crude petroleum caused a decline in Tanzania's mineral trade in 1975. Crude oil imports fell 55% in quantity and 52% in value; there were no reexports in 1975, whereas 6 million barrels was reexported in 1974. These decreases were largely responsible for reductions of 15% and 31% in the total values of mineral exports and imports, respectively, in 1975 as compared with 1974.

Balances of mineral and nonmineral trade for 1973–75 are shown in the following tabulation, in million dollars:

	1973	1974	1975
Exports:			
Mineral	$60.9	$57.7	$49.2
Nonmineral	301.4	342.9	326.3
Total	362.3	400.6	375.5
Imports:			
Mineral	121.9	246.2	169.6
Nonmineral	365.3	490.2	604.0
Total	487.2	736.4	773.6
Balance of trade:			
Mineral	−61.0	−188.5	−120.4
Nonmineral	−63.9	−147.3	−277.7
Total	−124.9	−335.8	−398.1

Statistics on Tanzania's mineral trade for 1973 and 1974 are given in tables 5 and 6.

COMMODITY REVIEW

Metals.—*Gold and Silver.*—Gold production increased 86%, but only a minor amount of byproduct silver was obtained. The continued high price of gold stimulated further exploration by the State Mining Corp. and the United Nations Mineral Resources Division. A small gold deposit was discovered at Buck Reef in the Geita District near Mwanza, and a mine was planned which was to produce 300 kilograms (9,600 troy ounces) of refined gold annually. Gold content of the ore was estimated at 10 grams per ton. Alluvial deposits along the Sira River in the Lupa goldfield near Chunya were also investigated and were believed to be capable of producing 200 kilograms (6,400 troy ounces) of refined gold per year. Diamond drilling of gold deposits was conducted at Saza, also in the Chunya District, and at Rwamagaza and Imweru in the Southwest Mwanza goldfield.

e Estimate. p Preliminary. r Revised.

[1] Exports.

[2] Less than ½ unit.

[3] Estimates based on reported total diamond output and best available information on ratio of gem to industrial stones in total output.

[4] Exports, including transfers to Kenya and Uganda.

Pitting and trenching were carried out at the Sekenke goldfield near Singida.

Iron Ore.—Prospecting teams from the People's Republic of China continued their assessment of iron ore deposits near the TAZARA route in southwestern Tanzania. The Government planned to develop an iron and steel industry in that area based on iron ore deposits at Chunya and Liganga and local coal resources. The Chunya deposits were considered preferable for that purpose. A previously reported $75 million loan from China was to finance the investigation.[17]

Metal-bearing Sands.—Beach Sands Mining Co. Ltd., a joint venture of the Governments of Tanzania and Romania, began operating a pilot plant to process beach sands containing ilmenite, rutile, and zir-

r Revised.
1 Includes transfer from Kenya and Uganda.
2 Excludes quantity valued at $1,166.
3 Includes limestone flux, and similar stone used for the manufacture of lime or cement.
4 Less than ½ unit.
5 Quantity for 1973 not available; quantity for 1974, 150 tons.

con. The plant was located at Silversands, near Dar es Salaam. Preliminary studies were made of other metal-bearing sands deposits at Mpiji Ndege, also near Dar es Salaam, at Mtwara, and on Pemba Island.

Nonmetals.—*Cement.*—Production of cement was down 10% from the 1974 level, apparently owing to a decline in Government-sponsored construction activity. Projects to expand the Wazo Hill plant and to build new plants at Tanga and Mbeya were expected to be included in the 1976–81 5-year plan. These plants would relieve the cement shortage that has periodically occurred in recent years, when Tanzania has imported an average of 15% of its annual requirements.[18]

Diamond.—Diamond production decreased 4% in quantity and 8% in value in 1975. Two mines accounted for all diamond output: The Mwadui mine, with 92% of the total, and the adjoining New Alamasi mine. Reduced production was partly due to the mining plan at Mwadui, under which lower grade ores were being exploited in order prolong the life of the mine. Reportedly, delays in obtaining replacement parts for the cutting plant at Iringa were also re-

18 U.S. Embassy, Dar es Salaam, Tanzania. State Dept. Airgram A-065, Apr. 28, 1975, p. 1.

sponsible for a drop in the output of cut diamonds, and a stockpile of uncut stones worth about $110 million had accumulated at the plant.

A program of investigating kimberlite deposits in the Mwadui concession area had been initiated by Williamson Diamonds Ltd., the former mine owner, and was carried on by the State Mining Corp. Reconnaisance surveys in 1975 in that area and in the Mabuki area southeast of Mwanza failed to locate any significant diamond occurrences.

Gem Stones.—Production of gem stones declined sharply for the second consecutive year. Most of the production was from mines at Merelani and Longido. The lowered output was attributed mainly to marketing problems experienced by Tanzania Gemstones Industries Ltd., the country's only dealer in precious and semiprecious stones. Exports of gem stones decreased 29% in value and fell from second to third rank in terms of export value among domestically produced minerals. The leading categories in export value were beryl and emerald, garnet and rhodolite, zoisite (tanzanite), and amethyst.[19]

Salt.—Output of salt increased 30%, while exports of salt grew by only 7%. However, the value of salt exports was up 29%, and and salt replaced gem stones as Tanzania's second most important mineral export. All production for export again was from the Uvinza saltworks of Nyanza Salt Mines Ltd. east of Kigoma. An expansion program at the solar-evaporation-type facility was not completed as scheduled in 1975, causing production to fall short of the expected level. Coastal saltworks near Tanga and Mtwara, producing salt for domestic consumption, increased output 51%. A saltworks near Lindi was to be expanded by 69 acres at a cost of about $130,000.

Soda Ash.—A study team from the Japan International Cooperation Agency conducted preliminary studies of the proposed Japan-Tanzania soda ash project at Lake Natron. The agency planned to send another team in 1976 to carry out a feasibility study. Soda ash content of the deposit was estimated to be 100 million tons. Preliminary plans included a refining plant on the lake with an output of 30,000 tons per year and construction of road and railway connections to a port, either at Mombasa, Kenya or Tanga, Tanzania. Total investment was estimated at $340 million. Membership in the joint venture consisted of five Japanese companies and the Tanzanian Government.[20]

Mineral Fuels.—*Coal.*—China and the State Mining Corp. continued to investigate coal deposits in the Songwe-Kiwira and Ruhuhu Fields near the Uhuru Railway in southwestern Tanzania. These deposits were expected to be used in the iron and steel plant proposed for that area. An additional use was under consideration in 1975 when officials of the East African Railways Corp. concluded that the quadrupled cost of imported fuel oil might justify reverting to steam locomotives. These coal deposits were believed to be of suitable quality for locomotive fuel.

Petroleum.—Rising costs and the country's foreign exchange problem caused a drastic curtailment in Tanzania's supply of crude petroleum and refinery products in 1975. Imports of crude oil declined 55%, and exports dropped from 6 million barrels in 1974 to none. Reduced throughput at the country's refinery and a slight increase in exports resulted in a decline in the domestic supply of refinery products.

Exploration for petroleum continued, but no discoveries were made. Azienda Generale Italiani Petroli (AGIP) S.p.A. operator for a combine including the Tanzania Petroleum Development Corp. (TPDC) and American Oil Co., abandoned one offshore well in the Songo Songo Island area and was drilling another at yearend. AGIP also collected seismic and gravity data. TPDC signed a preliminary agreement with the Oil and Natural Gas Commission of India under which the latter may also drill in the Songo Songo Island area. Oceanic Exploration Co. obtained a 15,000-square-mile concession in deep water off the northern coast of Tanzania and began collecting seismic data.[21]

UGANDA [22]

Mining activity in Uganda appeared to have declined in 1975, continuing a downtrend that began in 1970. Information was not available on many sectors of mining or other economic activity in the country, necessitating considerable use of estimates. Data that were obtained indicated a contraction of economic activity during the year.

Copper remained the country's dominant mineral product in 1975, despite a continuing decline in output. Small-scale production of several other metals continued, although the only production reported was of cassiterite (tin ore). Output of cement dropped, and output of other nonmetallic minerals was estimated to be lower than in 1974 owing to problems encountered in maintaining mining and industrial production.

Mining and industrial production are believed to have been increasingly restricted by shortages of trained manpower and replacement parts. Government decrees in 1972 required the replacement of nonindigenous supervisory personnel by indigenous personnel in all industries and the expulsion of certain nonindigenous groups from the country. Because these nonindigenous groups included many persons having managerial, technical, and maintenance skills, a shortage of these skills resulted; and it is believed that these shortages continued to exist in 1975. In addition, reduced imports of raw materials and replacement parts, which were attributed to a shortage of foreign exchange, are believed to have caused an increased rate of equipment breakdown and a reduction in industrial output in 1975.[23]

PRODUCTION

Statistical data on production were available for only certain minerals in 1975. Production of copper declined 10%, as measured by smelter output of blister copper. Production of cement decreased 2%, and tin production was down 41%. Reported data on the output of other minerals were not available, but it was estimated that shortages of skilled manpower, replacement parts, and transportation had caused a decrease in the production levels of most mines. A decline in exports of mineral commodities in 1975 was further evidence of reduced production, since the majority of the country's mineral output is not consumed domestically.

TRADE

Uganda's total mineral trade rose in 1974 but declined drastically in 1975, according to figures published by the EAC, of which Uganda is a member. Exports of copper

increased slightly in 1974 but fell sharply in 1975. On the import side, purchases of petroleum refinery products rose moderately in 1974 and declined slightly in 1975, but higher prices boosted the 1975 outlay above that of 1974. Imports of other mineral commodities increased in 1974 and declined steeply in 1975.

Copper remained the country's principal mineral source of foreign exchange, accounting for 84% of the total value of mineral exports in both 1974 and 1975. The value of copper exports declined 46%, amounting to $17.7 million in 1974 and $9.5 million in 1975. Earnings from all other mineral exports—the most important of which were manufactured fertilizers, tungsten, and tin—dropped from $3.5 million in 1975. Imports of petroleum refinery products decreased in 1975, but sharply higher prices raised their total cost to $45.6 million, 43% above the 1974 cost of $32.0 million. Expenditures for other mineral commodity imports totaled $13.4 million in 1974 and $7.2 million in 1975.

The increased total outlay for imported petroleum, combined with lower mineral export revenues, resulted in a sharp increase in the negative balance of mineral trade in 1975. Mineral exports covered 21% of mineral imports in that year, compared with 47% in 1974, and the mineral trade deficit increased 71%. Exports of nonmineral commodities, chiefly coffee, gave the country a positive overall trade balance. Balances of mineral commodity trade and total commodity trade for 1973 through 1975 are shown in the following tabulation, in million dollars:

	1973	1974	1975
Exports:			
Mineral	$18.9	$21.2	$11.3
Nonmineral	290.0	305.3	257.3
Total	308.9	326.5	268.6

COMMODITY REVIEW

Metals.—*Copper-Cobalt.*—Copper remained the country's dominant mineral product despite a continuing downtrend in output of the mine at Kilembe, which declined 27% in 1975, its sixth consecutive annual decrease. Smelter production of blister copper was down 10%, implying the use of accumulated stocks to provide part of the smelter feed. Operations at both the mine and the smelter were affected by the industrial production problems described earlier.

The two private owners of the Kilembe mine and its associated smelter at Jinja—Kilembe Copper Cobalt Ltd. (the majority owner) and Commonwealth Development Corp.—sold their interests to the Government in March 1975, giving the Government 100% control of the copper operation.

In 1971 the Government announced plans to establish a processing plant to recover cobalt from a stockpile of cobaltiferous pyrite which had been accumulating at the Kilembe mine. As one of the terms for renewal of the mine lease which expired on December 31, 1973, the Government required that a cobalt plant be constructed by December 31, 1976, but the lessees refused to accept a lease containing that stipulation. Work on a feasibility study for a cobalt extraction unit at Lasese, 8 miles from Kilembe, was reported in 1974. There have been no subsequent reports indicating whether the Government has taken any further action in regard to a cobalt plant.[24]

Other Metals.—Small quantities of beryl, bismuth, columbite and tantalite, cassiterite, and wolframite have been produced by privately-owned mines. These mines are believed to have continued operating on a small scale. The only reported production was of tin (from cassiterite), which declined in 1975 after registering an increase in 1974.

Plans had been announced by the Government in 1971 to investigate ways to expand mineral exploitation in western Uganda, where most metal mines are located, but no developments of this type have since been reported.

Nonmetals.—*Cement.*—Hydraulic cement production decreased 2% in 1975 after increasing 7% in 1974. No explanation was given for the decline, but it was presumed to have resulted from reduced Government investment expenditures.

The Mineral Industry of North Korea

By E. Chin [1]

In 1971, the Democratic People's Republic of Korea launched an ambitious 6-year plan to promote economic construction. To reach its goal of "juche" (self-sufficiency), 60% to 70% of the raw materials required by domestic industry was to be met from indigenous resources to build an independent economy. The mining, metal, and chemical sectors would be key bases for the program. During 1971–74, industrial output reportedly increased 17% per year on the average. In early 1975, the Government advanced the completion date of the plan by 1 year to coincide with the celebration of the 30th anniversary of the Korean Workers' Party. To attain the target levels as set forth in the 6-year plan, the country was reportedly working at "chollima" (flying horse) speed. Late in the year, the Government announced that the targets for electric power generation and coal and chemical fertilizer production had been reached, and that the targets for cement and steel capacity were fulfilled by October 10, the anniversary date. Official announcements further claimed that all targets of the 6-year plan were met, and some were purportedly achieved 16 months ahead of schedule. The value of gross industrial output reportedly had increased 2.2 times over that of the previous plan's final year, 1970. Estimated production, targets of the current plan, and proposed objectives of the next plan for the mineral industry were as follows, in million tons:

Commodity	Output (per year)			Goal (ending year)	
	Prior plan (1970)	Current 6-year plan		Current 6-year plan (1975–76)	Future plan
		(1971)	(1975)		
Steel ingot and castings	2.2	2.4	3.0	3.8–4.0	12
Nonferrous metals	.16	.18	.2	.45	1
Coal	27.5	30.5	45.0	50–53	100
Cement	4.0	4.8	6.5	7.5–8.0	20
Chemical fertilizers	1.5	1.4	2.5	2.8–3.0	5

The primary objectives for 1976, the last year of the current 6-year plan, were to reinforce and maintain the goals achieved thus far and to prepare a new long-term plan. Additionally, the Presidential New Year's address of 1976 stated the following:

"We must exert our efforts for the ferrous metallurgical and cement industries; we must make the maximum use of their existing production capacities and complete the construction projects now under way at the earliest possible date and thus victoriously attain the goals of steel and cement production under the 6-year plan.

"Giving definite priority to the extractive industries is a pressing task in giving full scope to the processing industries, whose productive potentialities have increased radically in recent years and in continuously advancing the nation's econ-

[1] Physical scientist, International Data and Analysis.

omy at a fast rate. In the extractive industries it is imperative to bring about a big upswing in the production of coals and ores; this will be effected through stepping up geological prospecting, giving precedence to tunnelling and earth scraping and quickly completing the comprehensive mechanization of pit work. This year especially great efforts should be directed to the development of the Komdok Mine to increase the output of nonferrous ores markedly."

PRODUCTION

North Korea produced a variety of mineral commodities in 1975, with coal, iron ore, lead, zinc, tungsten, barite, graphite, magnesite, and talc considered to be significant by world production standards. Gold, copper, nickel, pyrite, apatite, and other minerals also were produced. Although North Korea possesses diverse mineral resources, petroleum and natural gas have not been discovered. Official announcements regarding minerals and metals production were vague and no actual output figures were given, only percentage increases over that of the prior plan's goals. The level of production for coal, cement, and chemical fertilizers appeared to have approached the 1976 target.

p Preliminary. r Revised.
[1] In addition to the items listed, a number of other mineral commodities apparently are produced, but information is inadequate to make reliable estimates of output levels. These include (but are not limited to) antimony, arsenic (in arsenopyrite), asbestos, beryl, bismuth, boracite, china clay (kaolin), chromium, cobalt, columbite, germanium, indium, lithium minerals (lepidolite), manganese ore, mica (phlogopite), molybdenite, monazite, selenium, tellurium, titanium minerals (ilmenite and rutile), zircon, and a variety of construction materials including miscellaneous clays, glass sand, building sand, stone, and gravel.
[2] Includes granulated iron.
[3] Includes lower-rank coal including lignite.

TRADE

North Korea's cumulative foreign trade debt at yearend 1975 was estimated around \$2.1 billion. Moreover, payments in arrears were reportedly about \$250 million, distributed as follows, in million dollars: Japan, 109.5; United Kingdom, 51.0; Singapore, 38.9; France, 20.6; West Germany, 16.1; Australia, 8.0; Sweden, 4.2; Hong Kong, 1.5; and India and Italy, each with 0.4. The country's balance-of-trade position was strained mainly due to the large expansion in purchases of capital goods and machinery to implement the 6-year plan. In 1975, the trade gap reportedly was widened by the decrease in value of minerals and metals exported by North Korea. Furthermore, North Korea's position in world trade was severely hampered by its mounting trade debt. In April 1975, Sweden claimed that \$4 million was overdue out of total contracts amounting to \$132.5 million and that payments were to be made prior to further shipments. By May, \$3.3 million was reportedly paid. Subsequently, Hermes Export Credit Insurance Co. of West Germany announced that it would no longer insure North Korean purchases. Japan, which supplied a $500 million steel mill located near P'yŏngyang and textile machinery, announced that prior approval would be required by its government for certain future transactions with North Korea.

By 1975, North Korea had established diplomatic relations with 83 countries. During the year, trade protocols were signed with Albania, Bangladesh, Egypt, Iran, Libya, Morocco, Romania, Syria, and Zambia. A trade mission was opened in Lima, Peru, and agreements for economic and technical cooperation were signed with Malta and the Congo (Brazzaville).

COMMODITY REVIEW

METALS

Iron Ore and Steel.—Production of iron ore and concentrate in 1975 was estimated at around 9.4 million tons. Almost one-half of the total production was from the Musan mine in North Hamlgyŏng Province, which reportedly has an annual output capacity of 5.5 million tons. Most of the remainder of iron ore production was from the Chaeryŏng, Unyul, and Hasŏng mines in South Hwanghae Province, and the Tŏkhyŏn mine in North P'yongan Province. There was purportedly some production from the new mines at Toksung and Sŏhae-ri, and from mines at Songnam, Yongwon, and Kaech'on.

A 98-kilometer hydraulic pipeline to transport slurried iron ore concentrate from the Musan mine near the Yalu River to the Kimchaek iron and steel works in Chongjin was completed late in the year. The pipeline was built across a mountain ridge more than 1,500 meters above sea level. Transport processes to adjust the hydraulic pressure were automated and were maintained by remote control. Musan is one of the world's largest known iron ore deposits, with reserves estimated at around 1.5 billion tons of high-grade magnetite. Output of the mine was to be expanded further to 6.5 million tons per year. The construction of the pipeline augments the existing railway, and it has become possible to supply larger quantities of ore to the Kimchaek works.

Production of pig iron during the year was about 3.0 million tons. Under the goals of the 6-year plan, output was to be expanded to 3.5 million to 3.8 million tons by 1976. North Korea, which has imported steel sheets, heavy plates, tubes, and other forms from Japan, U.S.S.R., and other countries, hoped to begin exporting steel in 1976.

North Korea's production of steel rose from around 2.2 million tons in 1970 to an estimated 3.0 million tons in 1975. Steel production was from the Ch'ongjin steel plant, Hwanghae iron and steel complex, Kangson steel complex, and the Kimchaek iron and steel works. Plans to increase production to 10 million tons of steel per year by 1980 were progressing through expansion programs and new construction. The Kimchaek expansion, the largest iron and steel complex in North Korea, included the installation of a continuous sintering furnace and a continuous casting bay, a fourth coking furnace, and a mill to produce hot- and cold-rolled products. The Hwanghae iron and steel complex was equipped with an automation and remote control system in its production processes. A telecommunications system was installed to monitor the blast furnaces and to operate the crane for the hot metal ladle. Reportedly the steel shop, screening center, reduced pellet shop, and the sintering facility were entirely automated. The Kangson steelworks, with an annual output capacity of 700,000 tons, was equipped with continuous casting facilities. Construction continued on the steel plant designed by the Japanese at Nampo, which will have an initial production capacity of 1 million tons of steel per year and will subsequently be expanded to 3 million tons.

Nonferrous Metals.—Lead and zinc were the principal nonferrous metals produced in North Korea. In 1975, estimated outputs of lead and zinc metal were 95,000 tons and 138,000 tons, respectively. Gold, silver, copper, nickel, cadmium, and tungsten were also produced although in much smaller quantities.

A lead mine and smelting facility was being built in the Tanchon area on the east coast. Additionally, the lead smelters at Haeju and Munp'yong were being expanded, and extraction circuits to recover precious metal byproducts were being installed. The mine at Songch'on was purportedly being expanded to increase output of lead-zinc ore. The Komdok mine was specifically cited in the New Year's address to increase the production of lead ore.

In 1975, about 13,000 tons of refined copper were produced from indigenous ore. North Korea also imported about 50,000 tons of copper concentrates containing almost 30% copper from Peru during the year for domestic refining. A copper deposit at Hyesan, near the China border, was reportedly being developed. The smelter at Nampo on the west coast was being expanded to increase the production capacity for copper and associated precious metals. A mine was being developed near Sohung purportedly for recovering gold values in the area.

During the year, three small aluminum remelt facilities were in operation at Chinampo, Hungnam, and Tasado. Construction of an aluminum smelter of about 20,000 tons per year capacity was reportedly nearing completion. The plant site was not disclosed.

NONMETALS

Cement.—The drive for industrial construction created a heavy demand for cement. Existing production facilities were being expanded, and new works were planned. Production of cement in 1975 was estimated at 6.0 million tons. Almost half of the output was from the Sunchon cement works in South P'yŏngan Province. The remainder of the production was from the Pongsan, Komusan, Majong, Haeju, Sunghori, Kusong, and the 8th of February works. The Sunchon works, completed in 1973, was undergoing expansion to double its present capacity to 6 million tons per year. A new cement facility in the Chonnae area with an annual capacity of 5.0 million tons was scheduled for completion in 1976. Expansion of the Haeju cement works on the west coast to 3.0 million tons per year was nearing completion with the installation of large kilns. A small cement works with an annual capacity of 200,000 tons was being constructed in Changang Province. When completed, the cumulative capacity of the expanded works and new plants would exceed the 1976 production level target of 8.0 million tons.

Fertilizer Materials.—Production of chemical fertilizers in 1975 was probably around 2.5 million tons, of which nearly one-half was produced by the Hungnam fertilizer complex, and most of the remainder by the Chongsu chemical plant and the Suchon nitrolime fertilizer factory. Medium and small-scale phosphate fertilizer plants were located in almost all of the provinces. Construction continued on the Youth chemical plant in the western region, which included a 360,000-ton-per-year unit to produce urea. Status on the construction of the urea plant Ch'ongnyon was not reported.

Magnesite.—North Korea continued to be the world's largest producer of magnesite. Mine output in 1975 was estimated at 1.7 million tons, all from the Yongyang area of South Hamgyŏng Province. Crude magnesite was beneficiated and sintered at plants in Tanch'on, Songjin, and Ch'ongjin. Production of magnesium oxide clinker was around 1.1 million tons. The Korea Equipment Import Corp. ordered a 200,000-ton-per-year magnesite beneficiation and sintering plant from a West German-Austrian consortium composed of Klockner-Humboldt-Deutz Industrie-Analagen, A.G. (Cologne), Krauss-Maffei A.G. (Munich), and Siemens-Osterreich and Waagner-Biro A.G. (both of Vienna), The plant, which will be sited at Ch'ongjin, was scheduled for delivery to meet a planned 1977 startup deadline. Estimated cost of the entire plant purchase was $51 million.

Other Nonmetals.—North Korea continued to be one of the world's largest producers of graphite. Output in 1975, estimated around 75,000 tons, was mostly low-grade amorphous material. Production of other significant nonmetallic minerals were estimated as follows, in tons: Barite, 120,000; fluorspar, 30,000, and talc-group minerals, 130,000.

MINERAL FUELS

Coal.—North Korea's major mineral is coal with output in 1975 estimated at about 40.0 million tons, approaching the target set in the 6-year plan. The Chollima Sinchang coal mine, the Nation's largest producer, and other large collieries at Anju, Aoji, Choyang, and Kowon, were expanded and worked with modern mining equipment. Coal deposits in Kangdong, Kangso, and Tokchon were recently developed, and two new mines at Kukdong and Yangjong in North Hamgyŏng Province were reportedly opened in 1975. Production from other existing mines included Chiktong, Chonsong, Huknyŏng, Kaechon, Komdok, Musan, Taedaeri, Toksong, Yongdae, and Yongnun.

During 1975, a 10-kilometer cableway to transport coal was installed between the Kangso colliery and the Kangsŏn iron and steel complex near P'yŏngyang. Belt conveyors, to load the coal into conveyor buckets and to unload coal at storage terminals, were fully automated. Use of the cableway reportedly increased the transport of coal 2.5 times over that of the operation which formerly required 50 heavy-duty trucks. The second stage of the project to triple the coal transport capacity was being planned.

In addition, a second cable transport project was reported to have been completed between the Taedaeri mine and the Nampo industrial complex. The announcement regarding this installation was vague and only added that the cableway extended "scores of ri" (a "ri" is equivalent to 2.44 miles).

Petroleum.—There are no known occurrences of oil in North Korea, and domestic demand for petroleum has been met through imports, principally from the People's Republic of China and the U.S.S.R. Late in the year, a pipeline to transport crude oil from the Taching oilfield in China, northwest of Harbin, to North Korea was completed. This source would provide the country with an estimated 1.5 million to 2.0 million tons of oil per year. A refinery and petrochemical complex was reportedly being built in the western part of the country. However, no information was available regarding the status of this project.

The Mineral Industry of the Republic of Korea

By E. Chin [1]

During the third 5-year economic development plan, the economy of the Republic of Korea was projected to grow at an average annual rate of 8.6% between 1972 and 1976. In current prices, the 1975 gross national product (GNP) was estimated at 9,052 billion won, or U.S. $18.7 billion.[2] By sectors, mining and manufacturing accounted for 29% of the GNP in 1975, compared with 26% for agriculture, forestry, and fishery, and 45% for trade, construction, transportation and other components of the national aggregate.

By value of mine output, the mining industry grew by 12% in current prices in 1975, compared with 6% in 1974.[3] During the year, production of anthracite increased by 15% over the mine output of 15.3 million tons in 1974. The principal mining sectors reporting increased outputs were fluorspar, graphite, iron ore, kaolin, clays, lead, sand and gravel, talc and related materials, and zinc. Producers of cement, fertilizers, petroleum products, iron and steel, and nonferrous smelter products also reported increased output.

Production indexes (1970 = 100) for the major components of the mining and mineral processing sector for the last 2 years follow:[4]

	1974	1975
Anthracite	123	142
Tungsten mining	141	138
Other metal mining	106	112
Nonmetal mining	150	166
Cement	153	174
Petroleum products	188	152
Industrial chemicals	152	199

Inflation continued upward in 1975; wholesale prices were generally 20% higher than in 1974. The wholesale price index (1970=100) for all commodities increased 26% to 238; in 1974 the increase was 42%. Wholesale price increases for selected commodity groups follow: Industrial chemicals, 28.6%; metals and metallic products, 3.3%; machinery, 16.2%; and fuels and electricity, 18.3%. Consumer prices increased about 25% in 1975, compared with 26% in 1974. The consumer price index in 1975 was 204 (1970=100), up 25% over that of 1974.

On August 29, 1975, a ground-breaking ceremony was held at Onsan for the Republic of Korea's first zinc refinery. The Koryo Zinc Co., a joint venture of Young Poong Mining Co., Ltd., and Toho Zinc Co. Ltd. of Japan, began construction of a zinc refinery with an annual capacity of 80,000 tons of metal to be completed by yearend 1977. The Tongyang Cement Manufacturing Co., Ltd. completed the expansion of its Samcheon facility. Additionally, the Asia Cement Manufacturing Co., Ltd. and the Hanil Cement Manufacturing Co., Ltd. were about 70% complete in their expansion program to increase the annual production capacity of cement.

During the year, a 35,000-ton, high-

[4] Korea Annual 1976. V. 13, Hapdong News Agency, Seoul, Korea.

density polyethylene plant and a 5,000-ton polypropylene glycol plant were dedicated at the Ulsan petrochemical complex. Also, the construction of a 330,000-ton methanol plant was completed at Yosu, bringing the number of petrochemical plants to 15 in the Republic of Korea.

Progress continued on the expansion projects at the integrated steel facility at Pohang. The annual capacity to produce crude steel at Pohang was to be increased from 1.0 million tons to 2.6 million tons. The Hyundai Shipbuilding and Heavy Industries Co., Ltd. expanded the annual capacity of its shipyard at Ulsan from 0.8 million tons to 2.0 million tons, thereby bringing the Nation's total annual shipbuilding capacity to 2.4 million tons at yearend 1975.

Low-sulfur oil was reportedly discovered near Pohang City at a depth of 1,800 meters, and the Ministry of Commerce and Industry subsequently set up a special committee to coordinate further drilling in the area. Royal Dutch/Shell, Texas, and the Gulf Oil Co. were granted contracts by the Government for oil prospecting on the Continental Shelf.

In 1975, the Ministry of Commerce and Industry revised the Government's long-term energy supply-demand program, which was originally drafted in 1973. The annual rate of increase in the demand for energy in the Republic of Korea was reduced from 11.3% to 9% for 1977–81. Revised projections for energy demand in 1981 were as follows, in million tons: Charcoal, 6.0; coal, 30.8; oil products, 47.5; and output of hydropower and nuclear power in terms of coal, 6.0. During the plan period, the Government of Korea expects to spend 355.9 million won in the development of the coal industry, 287.9 million won for oil refining, and 2.4 million won for electrical generation. In addition to government spending, foreign exchange funds to be used for the overall energy program during the period were reportedly around $876.5 million.

PRODUCTION

In terms of value, the mining of anthracite dominated the mineral economy of the Republic of Korea. In 1975, 17.6 million tons of anthracite valued at $233 million was produced. Production of limestone was around 17 million tons and was used primarily in cement manufacture. Total output of portland cement during the year was 10.1 million tons. Mine production of zinc ore was 45,667 tons; about one-half was smelted domestically, and the remainder was exported. Production of tungsten ore was 2,403 tons and constituted about 6% of the world's output. Production of amorphous graphite decreased 56% to 44,893 tons. However, the Republic of Korea continued to be one of the world's leading producers of graphite.

Minerals and metals with increased production in 1975 were clays, copper, fluorspar, iron and steel, and lead. Little change in output for aluminum metal and pyrite was reported, while production of asbestos, bismuth, and feldspar declined.

Output from petroleum refining operations showed an increase over that during 1972–74. Production of residual fuel oil was up 6%, and production of distillate fuel oil up 13%. Jet fuel and kerosine production increased 5% and 60%, respectively, while that of gasoline decreased 5%.

TRADE

Overall trade for the Republic of Korea in 1975 totaled about $12.4 billion; exports were $5.1 billion and imports $7.3 billion. Exports of minerals and related products during the year comprised about 8% of the value for all exports, while mineral imports were about 29% of all imports. The leading mineral export was iron and steel, which accounted for nearly three-fifths of the value of all mineral and metal exports. Iron and steel exports in 1975 were around 1 million tons, valued at $231 million.

The most important minerals imported in 1975 follow, with values in million dollars: Fuels, 1,387; iron and steel products, 345; iron ore, concentrates, and scrap metal, 127; and fertilizers, 53.

COMMODITY REVIEW

METALS

Aluminum.—Production of aluminum metal by Aluminium of Korea, Ltd. (Koralu) at Ulsan remained at the 1974 level. Koralu, a joint venture of the Korean Industrial Bank and Péchiney Ugine Kuhlmann, uses alumina imported from Japan and electrical energy supplied by Korea Electric Co., Ltd. Feasibility studies to expand smelter capacity fourfold to 72,000 tons per year by 1979 were underway. Additionally, the Government was considering plans to establish a smelter at Onsan, capable of producing 100,000 tons of ingot per year, as part of the programs to be included in the fourth 5-year economic development plan (1977–81).

Copper.—The Kumpuk copper mine at Kyunsang Namdo accounted for the bulk of the Nation's copper output in 1975. About 15,000 tons of electrolytic copper was produced by the Chanhang copper smelter owned by Korea Mining & Smelting Co., Ltd. In 1975, Noranda Inc., and Furukawa Denki withdrew their participation in the plans for constructing a 100,000-ton-per-year copper refinery at Onsan. Reportedly, Sybetra SA (Belgium), Davy Powergas, Ltd. (U.K.), and Outokumpu Oy (Finland) have expressed interest in participating in the proposed copper smelter-electrolytic refinery facility, which would be part of the nonferrous metals industrial complex being developed at Onsan.

Iron and Steel.—The Yangyang iron mine and the Pochon mine accounted for the bulk of the country's output of iron ore. Production amounted to about 524,000 tons in 1975, compared with 493,000 tons in 1974. Pig iron production, all by the Pohang Iron and Steel Co., Ltd. (Pohang), was 1.2 million tons. Plans were being considered to double the output capacity of pig iron to 2.6 million tons at Pohang. About 70% of Pohang's iron ore requirements is met by imports. Moreover, 100% of Pohang's coking coal requirements is supplied from imports. Total steel ingot production in 1975 was around 2.0 million tons.

Lead.—Young Poong Mining, which operated the Yeonhua, Boonpyong, and Ulgin mines, accounts for virtually all of the country's lead mine output. The lead content of the ore ranges between 3% and 10%, and there is a high silver concentration. During the year, about 24,000 tons of concentrate, grading 50% lead, was produced. Output of pig lead was about 6,000 tons, all by the Korea Mining and Smelting Co. Young Poong Mining was planning a 50,000-ton-per-year smelter, to be built at Onsan by 1980. Capitalization was estimated at $12.5 million.

Tungsten.—The Sangdong mine of the Korea Tungsten Mining Co. Ltd., produced most of the country's tungsten output. Total production of scheelite tungsten concentrate, averaging 70% WO_3, was 4,403 tons. The Nation's production of tungsten constitutes about 6% of the total world's output. About 600 tons of ammonium paratungstate and 350 tons of tungsten powder and carbide were produced in 1975. Production of tungsten metal was not reported.

Zinc.—The three mines of the Young Poong Mining Co. account for the Nation's total production of zinc. Output from the Yeonhua mines account for about 78% of the zinc mined in 1975.

On August 29, 1975, a ground-breaking ceremony was held at Onsan for the construction of a 80,000-ton-per-year zinc refinery. The zinc refinery, a joint venture project between Young Poong Mining and Toho Zinc Co., Ltd., will also produce 150,000 tons of sulfuric acid and 432 tons of cadmium as byproducts annually. Estimated cost of the project was $71.3 million, of which $39.0 million would be provided by foreign capital and the remainder by domestic funds.

Other Metals.—A little over 100 tons of bismuth metal was recovered as a valued byproduct of tungsten mining and processing at Sandong. Silver, recovered from copper and lead operations, totaled close to 47 tons. Production of manganese ore of 35% grade totaled 3,160 tons, while that of gold was 11,864 troy ounces.

NONMETALS

Cement.—Cement production by nine plants of seven companies totaled 10.1 million tons. During 1975, the Tongyang Cement Manufacturing Co., Ltd., expanded the production capacity of its Samcheong plant by 1.6 million tons per year to 2.6 million tons per year. The expansion programs at the Asia Cement

Manufacturing Co., Ltd., and the Hanil Cement Manufacturing Co., Ltd., were reportedly 69% completed at yearend. Total cement manufacturing capacity was 11.9 million tons at yearend 1975, distributed as follows, in thousand tons:[5]

Asia, Jecheon	785
Hanil, Danyang	1,385
Hyundai, Danyang	400
Korea:	
Jangseng	660
Mun-gyeong	480
Ssangyong:	
Donghai	2,900
Yeongweol	1,700
Sungsin, Danyang	1,000
Tongyang, Samcheong	2,550

Five cement manufacturers plan to raise their production capacity by an additional 9.1 million tons. Upon completion of these plans in 1977, the Nation's cement production capacity will be around 21 million tons annually, of which about one-third will be made available for export.

Fertilizer Materials.—Chinhae Chemical Co., Ltd., Hankook Fertilizer Co., Ltd., Yong Nam Chemical Co., Ltd., and Korea General Corporation were the Nation's producers of urea, with a total combined capacity of 968,000 tons per year. Compound fertilizers were produced by Chinhae Chemical Co., Ltd., and Yong Nam Chemical with a combined annual capacity of 361,000 tons. Kyunki Chemical Co., Ltd., and Pungnong Chemical Co., Ltd. produced fused phosphate fertilizers and calcium cyanamide. Ammonium sulfate was produced by the Hankook Caprolactam Corp., and as a byproduct by the Pohang Iron & Steel Co., Ltd.

Namhai Chemical Co., a subsidiary of the Korea General Chemical Corp., plans to construct a large-scale compound fertilizer plant in Yeocheon, Jeonnam Province. This facility is to have an annual production capacity of 700,000 tons of urea and 330,000 tons of compound fertilizer. Additionally, the plant is to produce sulfuric acid, phosphoric acid, nitric acid, and ammonium nitrate. The plant was scheduled for completion in 1977.

Other Nonmetals.—Limestone production totaled close to 17 million tons and was used principally in the manufacture of cement. Production of other nonmetallic minerals during 1975 follows, in tons: Marine salt, 665,000; kaolin, 298,000; talc and related minerals, 290,337; quartzite, 265,000; and silica sands, 262,000. Production of graphite was 47,233 tons, of which 95% of the total was the amorphous type. Production of feldspar and fluorspar was 20,138 and 16,935 tons, respectively.

MINERAL FUELS

Coal.—*Anthracite.*—Output of anthracite in 1975 was 17.6 million tons, valued at $233 million. Virtually all of the production was domestically consumed, primarily for space heating. The recoverable reserves of coal in the Republic of Korea were estimated in 1974 at 545 million tons, of which 58% are located in the Samchong and Chungnam coalfields. Other major coalfields are Danyang, Gangreung, Heongseon, Mun-gyeong, and Pyeongchang.

The Government-owned Dae Han Coal Corp. produces about one-third of the country's anthracite output. Dae Han's largest mine is Chang Song, which is 600 meters deep. The leading private company is San Chang Coal Co., Ltd., which operates the Samchuk mine. A number of private companies produce the remainder of the country's output of anthracite.

The Ministry of Commerce and Industry estimated that the domestic demand for coal would reach 31 million tons by 1981. Under the long-term energy supply-demand program, 355.9 million won, in addition to $152.3 million in foreign exchange funds, will be invested in the development of the coal industry. The Government's basic policy was to complete geological surveys of all coalfields to locate deep seams and to mine hitherto undeveloped coal seams.

Petroleum.—The Republic of Korea imports all of its oil requirements, mostly in the form of crude petroleum. In 1975, approximately 15.3 million tons of crude oil was imported, valued at $1.3 billion. In 1975, the domestic demand for oil products was estimated at close to 110 million barrels. Consumption by product type follows, in million barrels: Gasoline, 4.6; kerosine, 3.6; light oil, 19.8; heavy oil, 3.1; bunker oil, 58.1; jet fuel, 4.1; naphtha, 10.7; solvents, 0.6; propane gas, 0.7; and asphalt, 1.4.

Three oil refineries with a daily refinery capacity of 215,000 barrels were operated by the Korea Oil Corporation, the Honam Oil Refinery, and the Kyung In Energy

[5] Korea's Economy Past and Present. May 1975.

Co., Ltd. Kyung In Energy plans to expand its daily oil refining capacity by 60,000 barrels by 1977. A new oil refinery, with a daily refining capacity of 60,000 barrels scheduled for 1978, is to be built by the Ssangyong Business Group at Onsan.

Late in 1975, an oil find was made on the southern coast near Pohang. Oil was extracted from one of three exploratory[6] holes drilled to 1,500 meters as part of a wildcat program by the National Institute for Science and Technology. Confirmation drilling will be done by foreign experts. Earlier in the year, Shell reported oil and gas deposits at 2,800 meters below seabed at 80 kilometers east of Cheju Island. However, commercial prospects for development were not considered high.

The Mineral Industry of Kuwait and Saudi Arabia

By John L. Albright [1]

CONTENTS

The former Kuwait-Saudi Arabia Neutral Zone has been partitioned into two equal administrative areas since December 1969; the northern half has been administered by Kuwait and the southern half by Saudi Arabia. Petroleum has been the only marketable mineral obtained both onshore and offshore in the partitioned zone, and the two countries have shared the revenue from the production of crude oil. During 1975, three oil companies worked concessions in the partitioned Neutral Zone: Arabian Oil Co., Ltd. (AOC), American Independent Oil Co. (Aminoil), and Getty Oil Co. AOC was the concessionaire for both Kuwait and Saudi Arabia offshore operations, Aminoil was the onshore concessionaire for Kuwait, and Getty was the onshore concessionaire for Saudi Arabia. AOC and Aminoil activities will be discussed under Kuwait, and Getty activities will be discussed under Saudi Arabia, although many Getty facilities were located in the Kuwait-administered area.

KUWAIT

Kuwait's gross national product (GNP) reached $10.7 billion[2] in fiscal year 1975, an increase of 64% over that of 1974. The petroleum and natural gas industries were the most important contributors to that noteworthy gain, despite dwindling production and sales, and the country continued to enjoy a favorable balance of trade. Several billion dollars will be invested in industrial and transportation projects during the next 5 years in Kuwait, and large investments will be made outside the country.[3] Important investment ventures were negotiated during 1975 with Brazilian, Japanese, and Mauritanian companies. Kuwait signed an agreement with Brazil forming the Arab-Brazilian Investment Co. with an initial capital of $40 million. The new firm will direct its investments mainly to petroleum and other mineral industries in Brazil. A Kuwaiti-Japanese firm, the International Marine Construction Co., was organized in Kuwait to conduct engineering and construction work related to the petroleum industry in the Middle East. Marine Contracting and Services Co. of Kuwait owned 51% of the new venture, and the remaining interests were held by five Japanese companies including the Nippon Steel Corp. Kuwait and Mauritania established the jointly-owned Arab Co. for Mining and Industry that will produce iron ore in Mauritania. Early in 1975, the Kuwaiti Government also announced that it would

[1] Mineral specialist (petroleum), Division of Petroleum and Natural Gas.

[2] Where necessary, values have been converted from Kuwaiti dinars (KD) to U.S. dollars at the rate of KD1.00=US$3.45.

[3] U.S. Department of State. Foreign Economic Trends and Their Implications for the United States, 76–057, Kuwait, May 1976, pp. 1–8.

extend financial assistance to Yugoslavia. The Kuwaiti loan, valued at $125 million, will help finance the construction of a 283-kilometer crude oil pipeline from the Adriatic coast to refineries in Yugoslavia, Hungary, and Czechoslovakia.

In 1975, the Government took over the Kuwait Oil Co., Ltd. (KOC), and planned to further develop the country's oilfields, petroleum processing, and marketing facilities. During the year, Kuwait also reached a tentative agreement with Saudi Arabia for the settlement of a long-standing dispute regarding the demarcation of the northern offshore boundary between Kuwait and the partitioned Neutral Zone.

Kuwait's oil revenues rose to $8.2 billion during fiscal year 1974–75, an increase of more than 300% from the 1973–74 oil revenues, according to the 1974–75 Annual Report of the Kuwait Central Bank.[4] This significant increase in revenues resulted from higher oil prices instituted by the Organization of Petroleum Exporting Countries (OPEC) late in 1973. The State budget for fiscal year 1975–76 was approved by the National Assembly in July 1975. Revenues from the petroleum industry (income taxes, royalties, and crude oil sales) were set at $5.8 billion for fiscal year 1975–76, or 97% of the total revenue.

The Kuwait Petrochemical Industries Co. (KPIC) developed plans to establish plants, probably at Shuaiba, to produce aromatic hydrocarbons and ethylene. KPIC will probably build the facilities in partnership with several foreign companies, and the projects may be operational by 1980.[5]

PRODUCTION

In 1975, Kuwait was one of the world's largest oil producers, and it was the fourth largest in the Middle East. More than four-fifths of the oil production came from KOC's fields in Kuwait proper, and the remainder was produced by Aminoil and AOC from fields in the partitioned Neutral Zone. About two-thirds of Kuwait's share of oil production from the Neutral Zone came from AOC's offshore wells.

Kuwait's oil production capacity exceeded the rate of 4 million barrels per day in 1975. However, total oil output averaged only 2.1 million barrels per day during the first 8 months of the year, increased to 2.7 million barrels per day in September, and then dropped to the yearly low of 1.7 million barrels per day in December. For 1975, oil production for Kuwait including its share of the output from the partitioned Neutral Zone averaged 2.1 million barrels per day, down 0.5 million barrels per day from 1974. The country's oil output has fallen steadily since its peak of 1,201 million barrels (averaging 3.3 million barrels per day) recorded in 1972. Kuwait's diminishing rate of oil output reflected reduced world demand and the Kuwaiti Government's policy of maintaining its oil prices and controlling the rate of production.

AOC's production came from two fields offshore the partitioned Neutral Zone. During 1975, the output from the Hout Field averaged 41,350 barrels of oil per day and the production from the Khafji Field averaged 263,650 barrels of oil per day. The company planned to increase its production from the two fields in 1976 to average 51,550 barrels per day from the Hout Field and 333,390 barrels per day from the Khafji Field.

TRADE

Kuwait's trade in mineral commodities was dominated by the activities of the petroleum industry. The Government maintained basically a free trade policy, but prohibited exports to Israel, Rhodesia, and the Republic of South Africa. During the year, Kuwait severed its links with the U.S. dollar for trade purposes and tied the dinar to several foreign currencies, including the U.S. dollar.

In 1975, several major international trade agreements were negotiated. Kuwait agreed to furnish petroleum products to Abu Dhabi [6] and Japan, and negotiated crude oil sales contracts with Brazil, Japan, and Taiwan. Kuwait agreed to sell crude oil to Brazil at the rate of 60,000 barrels per day in 1975, rising to 120,000 barrels per day in 1976. Maruzen Oil Co., Ltd., of Japan contracted to buy Kuwaiti crude oil for a 3-year period beginning in 1975 at a rate of at least 10,000 barrels per day; Idemitsu Kosan Co., Ltd., also of Japan, signed an agreement to lift a minimum of 50,000 barrels per day of Kuwaiti crude oil for a period of 3 years also beginning in 1975. The agreement with Taiwan called for crude oil liftings by the Chinese Petroleum Corporation at rates of up to 40,000 barrels per day in 1976, reaching 50,000 barrels per day in 1977. The Royal Dutch/Shell Group signed an agreement to purchase 100,000 barrels per day of Kuwaiti crude oil in the first half of 1975, reaching 400,000 barrels per day in October 1975. Deliveries were to continue at that rate for an undisclosed period of time.

Shipments from the Aminoil terminal totaled 26.3 million barrels of crude oil and refined petroleum products (including bunkers) by 105 ships during 1975, compared with shipments of 29.8 million barrels of petroleum in 122 ships during 1974.

[6] Middle East Economic Survey (Beirut, Lebanon.) ADNOC Purchases Petroleum Products from KNPC. V. 18, No. 29, May 9, 1975, p. 9.

COMMODITY REVIEW

Natural Gas.—Contracts were awarded to several foreign firms for projects under the Government's Kuwait Gas Utilization Project, which was inaugurated in 1974. A large plant to process natural gas will be built near Shuaiba to produce more than 5 million tons per year of natural gas liquids. Four U.S. companies will supply turbine and compression units for the main plant,[7] which is to be built by Kellogg International Corp. of the United Kingdom.

Reserves of natural gas in Kuwait were estimated to total 37,778 billion cubic feet at yearend 1975, down 0.9% from the 38,139 billion cubic feet of reserves at yearend 1974. In the partitioned Neutral Zone, reserves of natural gas were estimated to total 19,749 billion cubic feet at yearend 1975 (including the Aminoil, AOC, and Getty fields), down 0.4% from the reserves of 19,838 billion cubic feet at yearend 1974.[8]

Petroleum.—BP (Kuwait) Ltd. and Gulf Kuwait Co. had shared the ownership of KOC, but relinquished the controlling 60% interest in the company to the Government in 1974. Lengthy negotiations were carried out during 1975 between the parties for the Government's takeover of the remaining shares in KOC, and agreements were finally reached in December. Under the terms of the agreements, the Government would become the sole owner of all KOC's assets, retroactive to March 5, 1975, including oilfields, pipelines, refinery, and export terminal facilities. Compensation was set at $50.5 million, and the two companies were given long-term crude oil supply contracts at discount prices. BP may lift Kuwaiti oil at an average rate of 450,000 barrels per day during the period January 1, 1976 to April 1, 1980, and Gulf may purchase Kuwaiti oil at an average rate of 500,000 barrels per day during the same period. Then, during the following 5 years, each will have the opportunity to purchase a further 400,000 barrels of oil per day. Sales will be at market prices, less a discount of 15 cents per barrel. BP and Gulf further agreed to provide technical services and personnel to Kuwait on commercial terms, and they are obliged to transport unspecified quantities of their liftings in Kuwaiti tankers and to purchase a certain proportion of their bunker fuels from Kuwait.[9] The Government did not take any action during the year to take over the operations of Aminoil and AOC in the partitioned Neutral Zone, but announced its intentions to take over the remaining private interests in the Kuwait National Petroleum Co. (KNPC), operator of the Shuaiba petroleum refinery.

The Government of Kuwait announced in 1975 that future Kuwaiti crude oil sales contracts would include provisions giving preference to transport by the Kuwait Oil Tanker Co. (KOTC) or the Arab Maritime Petroleum Transport Co. (AMPT). AMPT was established in November 1975 by Bahrain, Egypt, Iraq, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates.

KOTC took delivery of the supertanker *Al-Andalus* during the year from a Spanish shipyard.

Kuwait was served by three petroleum refineries during 1975 with a combined daily throughput capacity of 612,000 barrels of oil: Mina al Ahmadi (KOC), Mina Abdullah (Aminoil), and Shuaiba (KNPC); and the 30,000-barrel-per-day AOC refinery operated at Ral al Khafji, in the partitioned Neutral Zone. The KOC and KNPC plants, representing more than 75% of the refining capacity in Kuwait proper and owned and operated by the Government, operated at only 37% capacity during 1975, when the throughput of the two averaged only 176,188 barrels of oil per day. Coincidentally, during the year KNPC raised the capacity of its Shuaiba plant to 180,000 barrels per day and awarded a $70 million contract to Foster Wheeler, a U.S. firm, to further increase the refinery's throughput capacity. KNPC will expand the hydrocracking facilities at the Shuaiba refinery. The project includes installing a 42,000-barrel-per-day isocracking processing unit and a hydrogen production facility by 1977.[10]

The Aminoil refinery processed 30.2 mil-
