Madison, Wisconsin: Wisconsin Engineering Journal Association,  
[s.d.]

<https://digital.library.wisc.edu/1711.dl/7P3DBZ6M5SIJV8I>

<http://rightsstatements.org/vocab/InC/1.0/>

The libraries provide public access to a wide range of material, including online exhibits, digitized collections, archival finding aids, our catalog, online articles, and a growing range of materials in many media.

When possible, we provide rights information in catalog records, finding aids, and other metadata that accompanies collections or items. However, it is always the user's obligation to evaluate copyright and rights issues in light of their own use.

# GO WESTINGHOUSE, YOUNG MAN!

Where a world-full  
of projects abound

There was once a college senior named Al Addin who yearned for his place in the sun.

However, at graduation time so many companies offered him a job, Al didn't know which one to accept.

Then he met a Mr. Greeley, the recruiter from Westinghouse. Mr. Greeley was a kindly man with a warm smile. He described to Al how at Westinghouse young men have their choice of six operating groups\* and work in friendly, tight-knit little teams on the world's most exciting projects.

"Go Westinghouse, young man," Mr. Greeley urged.

And Al Addin did. He wanted to be part of Westinghouse efforts to help the nation rebuild cities, so he joined the corporation's Construction Group — supplier of the world's widest range of products for the construction market.

One day, while Al was polishing a Westinghouse lamp, a Jeanie appeared. This pretty, warmhearted, intelligent Jeanie was an engineer with the Elevator Division. (Women are welcome at Westinghouse, an equal opportunity employer.) As the daughter of one of the richest men in America, Jeanie was in a position to grant Al Addin three wishes.

Al's first wish — to help Westinghouse build a municipal complex of apartments, offices, stores and parks within an established metropolitan area.

Al's contribution to the project was to help develop a *computerized environmental analysis technique* — an ingenious system for precalculating the heating and cooling needs of all the buildings in the complex. Grateful architects and consulting engineers voted Al the year's most calculating supplier.

Al's second wish — to help develop a total transportation system for a new housing area being built.

Transportation for the new project would consist not only of a remote-controlled mass transit system, taking commuters to and from their places of business . . . but it would also include sophisticated elevator and electric stairway systems to be installed within the project's terminal and living areas.

Al's third and last wish — to marry Jeanie.

She consented on the condition that he let her join him on other major projects and urban systems assignments undertaken by Westinghouse throughout the world.

Al Addin agreed . . . and they lived happily ever after. **MORAL:** All your wishes for a prosperous career can be granted if you join Westinghouse, where awaiting you are challenges, hard work, building block education, travel, adventure, and yes, even romance.

You can be sure if it's Westinghouse

For further information, contact the Mr. Greeley from Westinghouse who will be visiting your campus during the next few weeks or write: L. H. Noggle, Westinghouse Educational Center, Pittsburgh, Pennsylvania 15221.

\*The Westinghouse Operating Groups: Consumer Products; Industrial; Construction; Electronic Components & Specialty Products; Atomic, Defense & Space; Electric Utility.

# Opportunities at Anaconda

in mining and metallurgy here and abroad, at Anaconda American Brass Co., Anaconda Wire & Cable Co., and Anaconda Aluminum Co.

## Extractive metallurgy is a key to more metal

The metallurgical bubble bath above is a flotation cell in a new Anaconda concentrator. Although it may seem crude and simple to a layman, the process involves complex combinations of colloidal and surface chemistry, crystallography, physics, and special grinding methods adapted to the ores at each individual mine. It represents one way Anaconda's metallurgical research is helping make more metal available for our growing economy.

At Butte, Mont., such research, in raising recovery of metal from low-grade ores, is making today's submarginal material part of tomorrow's ore reserves.

As Anaconda's intensified geological research and exploration turns up new prospective mineral deposits, the need for metallurgical research and development grows. Each deposit must be analyzed to determine the feasibility of recovering its metal. And as research develops more efficient extraction processes, lower grade and more complex deposits can become mines.

To accomplish this, Anaconda is establishing a central extractive metallurgical research center at Tucson, Arizona. It is carefully planned and is being superbly equipped. It is near a large university staff, which can be consulted as needs arise, thus offering a stimulating environment for progressive research and development. In turn, this means attractive new openings for a variety of engineering talents—not only in metallurgy, but also in chemistry, physics, and mechanical engineering.

## Dynamic test yields new data on copper-metal springs

Copper metals are among the most useful spring materials known to man. The role of modulus of elasticity in this application was studied at the Research and Technical Center of Anaconda American Brass for more precise data and to make possible predicting spring performance at various ambient temperatures.

Modulus of elasticity can be determined by physical testing in tension or compression. But Anaconda found the dynamic method (below) easier to perform and just as accurate.

Results are of prime importance to designers of spring devices. The significantly lower modulus of elasticity for copper metals means that at the same level of stress, copper alloy components will deflect or extend almost twice as far as components made of steel—usually with no sacrifice of maximum stress. This can mean more sensitive controls—or “softer” action in the absorption of energy.

This is but one way Anaconda is refining and broadening knowledge of the many useful properties of copper met-

**The talents and skills of technically qualified men and women will always be needed by Anaconda in important positions in exploration, mining, extractive metallurgy, manufacturing, scientific research, sales, and administration.**

**If you would like more information about Anaconda or wish to apply for employment, write to: Director of Personnel, The Anaconda Company, 25 Broadway, N.Y., N.Y. 10004.**

An Equal Opportunity Employer

als. Such research opens vast new opportunities for growth—career opportunities at Anaconda American Brass for college graduates in all fields of engineering, in business administration, and sales.

## Bright future for a bright metal

How do you make containers to hold motor oil or citrus concentrates at lower costs? How can you package airline in-flight meals to enable reconstituting of foods at very high temperatures for fast serving—and retain quality and flavor? These are typical questions asked and answered in the Packaging Development Laboratory of Anaconda Aluminum.

A growing factor in the aluminum industry, Anaconda Aluminum is particularly strong in packaging—with plain foil, laminated foil and rigid foil container products. And it has developed several firsts in the aluminum industry. One is the patented foil-fibre container for motor oil and for citrus concentrates. Another is foil containers (see above) for better airline service in the jet age. Now frozen and refrigerated meals can be heated rapidly and served quickly. Anaconda Aluminum has an outstanding record of developments which have had a tremendous impact on the packaging industry.

Anaconda Aluminum is also a producer of primary aluminum. To meet the growing demand for the metal in packaging, transportation, electrical, and building products, Anaconda Aluminum has been steadily increasing its output—is currently expanding its primary ingot capacity by two-thirds. This expansion involves an investment of \$50,000,000.

Anaconda Aluminum is growing, and will become an increasingly important factor in the bright future of the bright metal. For this it needs people—not only for its packaging laboratory and foil operations, but also for its other fabricating plants and reduction operations. This means growing opportunities for metallurgists, chemical engineers, industrial engineers, plant engineers, and system engineers. 66125

Left: Dynamic test for modulus of elasticity. Oscillator changes frequency until test bar begins to vibrate. From natural frequency shown on oscilloscope, “dynamic modulus” can be computed.

# Isotropic\* steel for improved performance

Isotropy is what the designer of this highly-stressed 335-pound tractor yoke had in mind when he specified *cast-steel*.

Not taken in by the shopworn "fiber" or "flow line" argument, he knew that road-building equipment is subjected to shock loads of high magnitude—in several different directions—so that he could not gamble with a construction where toughness, impact and fatigue properties are not uniform in all directions.

*Cast-steel* also allowed the designer of this tractor yoke plenty of engineering flexibility . . . He didn't have to worry about fitting

together cumbersome wrought shapes, and he could put metal precisely where he wanted it for load-carrying ability, to avoid possible areas of stress concentration . . . And he could choose the steel composition which would give him optimum strength/cost ratio.

Want to know more about *cast-steel*? We're offering individual students free subscriptions to our publication "CASTEEL" . . . Clubs and other groups can obtain our sound film "Engineering Flexibility." Write Steel Founders' Society of America, Westview Towers, 21010 Center Ridge Road, Rocky River, Ohio 44116.

\*Isotropic: Equal properties in all directions.

Mechanical Engineer, Electrical Engineer,  
Civil Engineer or MBA (with technical undergraduate):

**3 OPPORTUNITIES  
YOU'LL NEVER RUN  
SHORT OF AT AMOCO**

**CHALLENGE  
ADVANCEMENT  
GROWTH**

You're looking for a job where you can put your particular technical talents to the test . . . one that offers good growth potential. Take a long look at Amoco.

Amoco Chemicals Corporation was founded in 1957 as the wholly-owned petrochemical subsidiary of Standard Oil Company (Indiana). Amoco is a leading supplier of basic chemical building blocks and specialized intermediates for the chemical industry.

Amoco is definitely a company on the grow! Because of this, there is every opportunity for you—as a technical graduate—to move ahead with Amoco in a responsible position for which you've been trained.

For instance, we now have immediate openings in Chicago and Joliet, Illinois; Houston, Texas; Decatur, Alabama; Whiting and Seymour, Indiana. These positions, in plant operations, project engineering, research and marketing are the stepping-stones to supervisory responsibility at Amoco.

So, be sure to consider the Amoco opportunity. Our recruiter will visit your school

**March 16**

Contact your Engineering Placement Office *NOW* to secure some background information on Amoco and to set up a definite interview time.

Impossible to make a date with the Amoco recruiter? Then just drop a line to:

## EDITORIAL

### THE MAKINGS OF A GOOD PROFESSOR

WHAT makes a good professor? Is it that he knows the material, or that he makes his course interesting, or that he picks a good text? Those are all true, but there must be something more. To me, a good professor feels his subject is so essential that he must teach on a level for everyone's understanding and not for just a smattering of "A" students. If he can do this the other qualities must follow.

You might ask why this is worth mentioning in an editorial—after all, teachers won't revamp their ways because of a few comments. You're perfectly right. The reason we bring it up is something along the lines of "a job well done deserves credit". Several of the staff have been privileged to take a course from Professor Wu, Statistics 110, and we feel that he is one of the few professors to make us feel that his subject was something we *had* to learn.

Professor Wu believes that basic courses *must* be taught for the average students, the "C" students, in short the majority . . . so that this majority has a firm basis on which to become excellent. He seems to have the feeling for the way an engineer thinks. Accordingly, he teaches mainly through examples that you, as an engineer, may someday encounter, and leaves the complicated proofs to the "A" students (on their own time). In short, he isn't concerned that you can derive the Poisson distribution, but that you know which industrial problems can be solved with it . . . a far cry from the many proof-happy engineering basics.

We would venture the thought that because of his theories and method of teaching, Professor Wu has inspired an interest in Statistics in many otherwise-bored students. So, going back to our original question—What makes a good Professor?—my answer is simply: There is no *specific* list of good qualities, but we of the Wisconsin Engineer would point to Professor Wu as *our* answer to the question.

Mary E. Ingeman →

(Editor's note: Though not a common editorial subject, the staff and myself felt that Prof. Wu deserved this tribute to an excellent job of teaching.)

● *the word Career implies*

## A course of continued advancement — you get it at Dunham-Bush

We don't have to promise advancement opportunity and job security at Dunham-Bush—it's **built in!**

Stop and consider the business we're in—air conditioning, refrigeration, heating—it's a business of **continued** advancement. The needs are endless—the opportunities unlimited.

In food processing and preservation alone, the need for refrigeration is never satisfied. And you are certainly aware of the growth of air conditioning in stores, restaurants, hotels, office buildings, supermarkets, hospitals, warehouses—you name it.

Growth opportunities like this have made

our industry one of the most dynamic in the history of man.

Interested in a career in this exciting, exploding field? The first step is to write for our brochure, "Careers at Dunham-Bush." Next step is to talk to us. You'll learn that the words **continued advancement** are more than Webster's definition of the word CAREER.

Write Director of Technical Services, Dunham-Bush, Inc., West Hartford, Conn. Plants in West Hartford, Connecticut • Michigan City, Indiana • Marshalltown, Iowa • Riverside, Calif. • Weston, Ontario • Portsmouth, England.

MANUFACTURERS OF THE WORLD'S MOST COMPLETE LINE OF REFRIGERATION • AIR CONDITIONING • HEATING EQUIPMENT

## Which degree counts most?

Besides a B.S., M.S., M.B.A., Ph.D.—or what have you—there are other degrees vital to your future. The degree of imagination. Ambition. Responsibility.

If you have them in good measure, we know of no company better able, or more disposed, to reward them. Handsomely. In terms of professional recognition, intellectually stimulating environment, and material reward.

We're big. But we're still young and growing. And plan to keep on. In 1965, for example, our sales rose 23%. To over \$860 million. And 516 million in the first half of '66.

We need top-notch people who can grow with us. People who are well trained in chemistry, physics, chemical, electrical, or mechanical engineering, marketing or finance.

And who have that extra degree.

Talk it over with your faculty and Placement Officer. And regardless of your military commitments, be sure to see our representative when he is on your campus. Or write to: John B. Kuhn, Manager of University Recruitment, Celanese Corporation, 522 Fifth Avenue, New York, N. Y. 10036.

Returns by popular demand . . .

## DEAN'S DESK:

DEAN RATNER

## Responsibilities

An attractive young lady recently came into my office, introduced herself as Mary Ingeman, editor of the *Wisconsin Engineer*, and commented that the *Engineer* has been doing a series on the various aspects of the College of Engineering Administration, and would I please write a short article about the duties and responsibilities of my office. Well, I was doubly flattered and eagerly accepted Miss Ingeman's

invitation to write a brief article, although I wasn't sure who would be interested in reading it.

She next asked if I had a picture. Finding one that looked more like a mug shot than a studio photograph I handed it to her and said that this was the best that I could do, and hoped that it would be all right. She murmured, "Well, it doesn't flatter you" (this I took to be a compliment), and then she said, "Why don't Deans ever smile?" To this I had no ready reply. One that did occur to me was, "We do, but then students think that we are showing our fangs." However, this did not seem appropriate and probably not true, so I mumbled something inane. Nevertheless, the question, a perfectly legitimate one, bothered me and made me wonder if no one else had discovered what I had when I became an Assistant Dean in 1964, and that is that Deans are human and much like anyone else. I made a similar discovery about professors when I first started teaching some 17 years ago and I was equally amazed then.

Enough of this introspection, and on to my duties and responsibilities in the College of Engineering. In general, you could say that my primary responsibilities are for the College's operations insofar as they relate to instruction, as differentiated from research. This means fiscal budgetary responsibilities in the areas of salaries, capital expenditures and supplies and expense. It means assisting in budget development for three or four months prior to the new fiscal year beginning July 1 and budget control during the ensuing year. When you consider that we are talking about 300 full and part-time academic personnel and 100 full and part-time classified personnel and an instruction budget that is several millions of dollars, you can see why this activity does consume an appreciable amount of time.

Because of this financial responsibility, I am also assigned to various College of Engineering committees in which there are apt to be fiscal problems considered, among these are the building committees. Probably my contributions to the various committees are not monumental, but the meetings are time-consuming and part of the job. Some "concrete" evidence of the building committees' activities

will soon be seen in our parking lot when construction begins in May on the addition to the Minerals and Metals Engineering building and later in the spring on the Engineering Research building.

With regard to student-related activities, I teach one course, so I have this contact with students. In addition, as a Dean I have the opportunity to see students who have a variety of problems—personal, academic, and otherwise. These contacts are valued by Deans because at this point one is operating at the interface between the student's present life and his later life and career, and this is the time when the Dean can make a significant contribution to a student's future.

Another service of this Dean's office is the administration of the College of Engineering student loan funds. Usually the funds have been established from contributions in memory of a particular individual. The most recent fund established was the Dan Drescher Loan Fund, an Electrical Engineering student who was fatally injured in a tragic accident last summer. Loans made from these funds have few restrictions. If repaid by their due date, the loans are interest free. For most of them there is no scholastic requirement and no waiting period. Because the total value of the funds is relatively small, loans are for short terms (3–6 months; in exceptional situations one year) and for relatively small amounts (\$250 the usual maximum). The fact that we loaned almost twice the total value of the funds for each of the past two years shows the need for this type of fund and the use that is made of it.

Finally, I come to an activity in the College of Engineering which is my responsibility insofar as a faculty adviser can be responsible: the Engineering Exposition, to be held this year April 7–9. As you may know this tremendous undertaking is completely planned and executed by College of Engineering students with selected members of the faculty as advisers. As advisers we more or less sit on the sidelines until our assistance is needed or wanted and then at the end we are privileged to share in the reflected glory of the students who have made the Exposition a success, as it always is. In the process of assisting we share also the opportunity of becoming better acquainted with the many fine students who have made the Exposition a success, the Executive Committee for the Exposition and the many student exhibitors and committeemen.

The idea for the Exposition evolved from the annual feud over St. Pat's occupation—was he an engineer or a lawyer? When the contests between the two claimants of St. Pat began to get out of hand, the engineers decided to use their talents in a more constructive celebration; the result was the 1940 Engineering Exposition. A second Exposition was presented in 1941. Then came World War II and a temporary end to Exposition plans.

Under the sponsorship of the Polygon Board, the Expositions were resumed in 1953 on a triennial basis with the last being held in March of 1965. The principal purpose of the Exposition is to provide the public with a better understanding of the rapidly-developing field of engineering and by so doing to provide encouragement and enlightenment for the development of future engineers. Secondly the Exposition also serves to inform other students and faculty within the University of what is being done in the College of Engineering. After the last Exposition, the student committee that planned it decided that interest in the Exposition was so great and technology changing so rapidly that the Exposition should be held more often—every other year rather than every third year.

The general chairman for the 1967 Exposition is Dick Schwarte. On his committee are: Jeff Flack, John Strader, Wayne Miller, James Ferrell, John Foltz, Elric Saaski and Dick Friede. If you want to know more about the Exposition or want to help in some way, contact any of the foregoing or contact me. The Exposition deserves the support of every engineering student and faculty member, please stop in and discuss it with me.

A large, abstract graphic consisting of numerous thin, black, curved lines that sweep across the page from the top right towards the bottom left, creating a sense of motion and depth. The lines are arranged in a way that they appear to be part of a larger, curved structure, possibly representing a lens or a piece of glass.

## **dimensions in opportunity**

Solid growth, sound diversifications, and emphasis on individual development at PPG are dimensions worth considering by the engineering graduate seeking opportunity.

Engineering graduates at all degree levels find immediate challenge and long-range growth opportunity in Research and Development, Manufacturing, and staff engineering departments at PPG. This variety of fields and the diversity of PPG's Glass, Chemical, Fiber Glass, and Coatings and Resins Divisions means a breadth of career openings rivaled by few.

Individually tailored on-the-job training, educational assistance, a dynamic management development program, and a firm policy of promotion-from-within, provide avenues of personal and professional growth for you.

Through careful selection, placement, and a well-planned program of individual development, PPG employs engineers to help meet today's challenges and provide managerial leadership for the future. If you think you can grow and contribute in this environment, see your Placement Officer for the date PPG's representatives will visit your campus or write to: **Manager, College Relations, Pittsburgh Plate Glass Company, One Gateway Center, Pittsburgh, Pa. 15222.**

AN EQUAL OPPORTUNITY EMPLOYER

# Fifty years ago we only made 'aeroplanes'.

(See what's happening now!)

New Boeing 747

Boeing Supersonic Transport design

USAF Minuteman II

NASA Lunar Orbiter

Boeing-Vertol Helicopter

USN Hydrofoil Patrol Craft

Boeing 727 Trijet

Boeing 737 Twinjet

NASA Saturn V

In 1916 The Boeing Company's career was launched on the wings of a small seaplane. Its top speed was 75 mph.

Now, half a century later, we can help you launch your career in the dynamic environment of jet airplanes, spacecraft, missiles, rockets, helicopters, or even seacraft.

Pick your spot in applied research, design, test, manufacturing, service or facilities engineering, or computer technology. You can become part of a Boeing program-in-being, at the leading edge of

aerospace technology. Or you might want to get in on the ground floor of a pioneering new project.

You'll work in small groups where initiative and ability get maximum exposure. And if you desire an advanced degree and qualify, Boeing will help you financially with its Graduate Study Program at leading universities and colleges near company facilities.

Often it will be sheer hard work. But we think you'll want it that way when you're

helping to create something unique—while building a solid career. See your college placement office or write directly to: Mr. T. J. Johnston, The Boeing Company, P.O. Box 3707, Seattle, Wash. 98124. Boeing is an equal opportunity employer.

# CONSTRUCTION

## THE ARMY CORPS OF ENGINEERS

offers you a challenging civilian career with:

■ The world's foremost and largest engineering organization in the construction field, pioneering new and advanced engineering practices and concepts.

■ An organization whose work embraces virtually the entire range of modern engineering in the construction field. Projects include research into basic science, engineering investigations and regional planning; design, construction, operations, maintenance, and management of hydro-electric power dams, flood control facilities, harbors and navigable streams; design, construction and maintenance of family housing, runways, hangars, roadways, hospitals, and nuclear power installations; and construction of intercontinental ballistic missile and space launching sites. In addition are the allied fields of cartography, geodesy, mathematics, and engineer intelligence.

■ An organization that recognizes each engineer as an individual, providing well-rounded career development programs with on-the-job training; courses at government expense in colleges, universities, and seminars as necessary to assure steady progression to top professional and managerial levels; encouragement and assistance in attaining professional registration and recognition; and an opportunity to win national and international awards.

■ An organization with offices and projects in nearly every one of the 50 States and in many foreign countries that encourages employees to further their development by accepting new and challenging assignments.

■ An organization which provides excellent rates of pay with liberal fringe benefits, including generous retirement annuity, complete health and life insurance coverage, paid vacation leave, military training leave with pay, generous sick leave; and special pay awards for outstanding performance and suggestions that improve operating efficiency.

If you're thinking this all too good to be true, you're wrong! All of the above is available to you in a civilian engineer career with the U. S. Army Corps of Engineers. If you are interested, you can get further information from the Chief of Engineers, Department of the Army, Washington, D.C. 20315.

## COVER STORY:

# THE QUEUEING THEORY

## *theory on the human line*

By GRANT BELL

Figure 2 Block Diagram of a Single-channel System.

EVERYONE experiences congestion at one time or another. Whether it is when waiting at a supermarket checkout counter or in making a deposit at a crowded bank, we must queue, or line up, to be served.

This waiting time is wasted time, yet to eliminate it completely would obviously require an infinite number of service facilities. Queue-

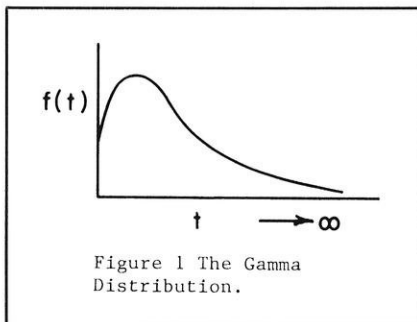

Figure 1 The Gamma Distribution.

ing theory, or the theory of waiting lines, is intended to help maximize the efficiency of a system by showing how well the customers fit the service facility.

Since queueing theory is less than ten years old, not many people outside the field of Operations Research have much knowledge of it. This article is intended to be an introduction to the theory of queueing.

Queueing theory provides a premise for calculating the amount of congestion for many different systems. It is a modelling process wherein each system is set up as a mathematical model to be solved analytically. This model is as close an approximation to the real world as its assumptions will allow.

One recognizes that as the complexity of the system grows, so do the assumptions made in describing its operation. It is evident, then, that a simple, very general, model will apply better to a small system than to a more complicated one. Therefore, we use the general model as a simulation for the simple system and a first approximation for the complex system.

If the model's conclusions are not indicative of the actual operating characteristics of the complex system, then a more specific, more costly model is set up. The more complex models will not be discussed here, though it is sufficient to mention that they sometimes employ a unique form of mathematics called, quite appropriately, the Q-calculus.

Also dependent on the complexity of the model, and the desired accuracy of the solution, is the form of the arrival and servicing

distributions used to describe movement into and within the system. While we will be working with the negative exponential, a more advanced distribution such as the Gamma could be used.

The Gamma distribution requires its own development of the effectiveness parameters which are entirely separate from the ones developed here for the negative exponential distribution. They are more involved than the parameters we will develop, but the more involved distribution is available for the higher degrees of accuracy of solution.

### Single-Channel Queues

The simplest form of queueing model is the single-channel queueing system. Here there is a waiting line and service facility which is independent of any others. This is shown in Figure 2. For a specific system, the time period between arrivals (Block A) must be formulated mathematically. The frequency distribution of servicing time (Block C) must also be known. We will see later how in an actual situation a fitting analytical description of interarrival time and service time is the negative exponential distribution:

# QUEUEING THEORY

$F(t) = 1 - e^{-\lambda t}$  for  $t \geq 0$ .  
The associated density function is  $f(t) = \lambda e^{-\lambda t}$ , which integrates to  $F(t)$ .

By convention, the probability distribution of interarrival times is called  $\lambda e^{-\lambda t}$ , and the probability distribution of servicing times is  $\mu e^{-\mu t}$ ; where  $\lambda$  is called the interarrival rate and  $\mu$  is the servicing rate. Their ratio is called the servicing factor:

$$\frac{\lambda}{\mu} = \rho = \text{servicing factor}$$

where  $\rho < 1$ .

The stipulation that  $\rho$  is less than one is needed because otherwise the waiting line would grow to infinite length.

## Measures of Operational Effectiveness

A first consideration is the level of congestion that the system attains. One parameter to measure this is the average number of individuals in the system  $T$ .

$$T = \frac{\rho}{1 - \rho}$$

For a single-channel service system the number of individuals being serviced,  $S$ , is either one or zero. Since the system is empty with the probability  $P_0 = 1 - \rho$ , servicing is being done with the probability  $1 - (1 - \rho) = \rho$ . Therefore, the average number being serviced is  $S = \rho$ .

Then it follows from

$$T = S + Q$$

that

$$Q = \frac{\rho}{1 - \rho} - \rho = \frac{\rho^2}{1 - \rho}$$

All of these measures of operational effectiveness ( $T, S, Q$ ) have been concerned with average numbers of individuals. Sometimes one would like to know the time a customer spends in waiting for service. Two measures of this are:

1. Average waiting time,  $W$
2. Average waiting time for a person who must wait,  $W^*$

The difference in these is that sometimes upon arrival the customer finds the system empty and he does not have to wait.

When a customer enters the system, he finds a number of individuals already waiting for service.

(This includes zero individuals). These must be processed before he is served. Therefore his waiting time is

$$[\text{number in the system}] \times [\text{service time}].$$

From this we can conclude that the average waiting time is

do not wait at all. To find the average waiting time for those who must wait we see that

$$W = 0 \cdot \text{Prob}[\text{No one in the system}] + \left. \begin{matrix} \text{Someone} \\ \text{being} \\ \text{served} \end{matrix} \right\} W^* \cdot \text{Prob}$$

$$= 0 \cdot P_0 + W^* (1 - P_0)$$

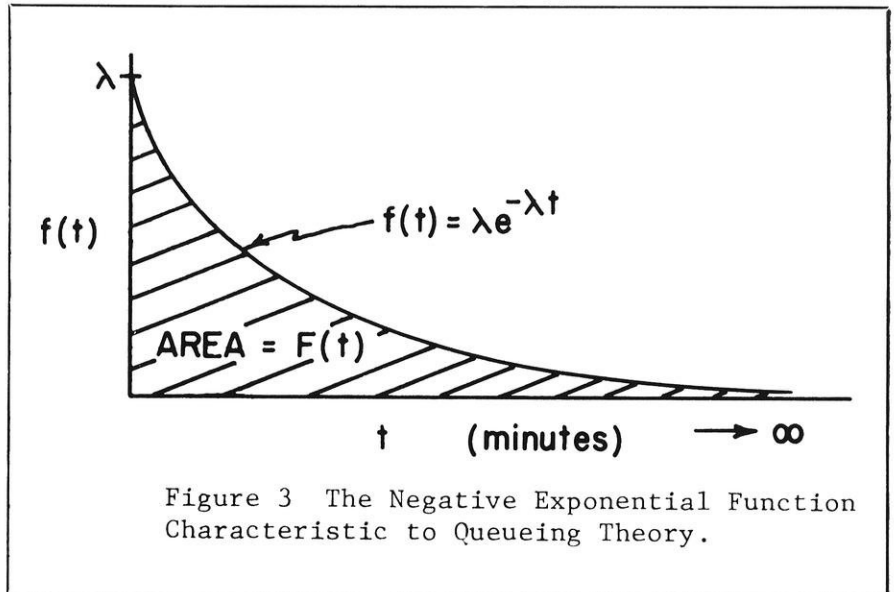

Figure 3 The Negative Exponential Function Characteristic to Queueing Theory.

$$[\text{average number in the system}] \times [\text{average service time}]$$

where  $P_0$  probability that there is no one in the system.

Table 1. Measures of Operational Effectiveness for the Single-channel system.

|                               |                                       |
|-------------------------------|---------------------------------------|
| $\lambda$                     | interarrival rate                     |
| $\mu$                         | service rate                          |
| $\rho = \frac{\lambda}{\mu}$  | servicing factor                      |
| $T = \frac{\rho}{1 - \rho}$   | number in the system                  |
| $Q = \frac{\rho^2}{1 - \rho}$ | number in the queue                   |
| $S = \rho$                    | number being serviced                 |
| $W = \frac{T}{\mu}$           | waiting time                          |
| $W^* = \frac{W}{\rho}$        | waiting time for person who must wait |

or

$$W = [T] \times \left\{ \frac{1}{\mu} \right\} = \frac{T}{\mu}$$

$W = \frac{\text{number of individuals in the system}}{\text{number serviced per minute}} = \text{minutes of waiting time.}$

The average waiting time per individual includes customers who

$$W^* = \frac{W}{1 - P_0} = \frac{W}{\rho} = \frac{\text{average waiting time}}{\text{servicing factor}}$$

These measures of operational effectiveness can be illustrated by an example:

Arrivals at a phone booth are considered to be Poisson, with an

# INTERESTED IN A REWARDING CAREER IN AEROSPACE/ELECTRONICS?

You can **go forward, go fast, go far** . . . at Hughes Field Service & Support Division.

If you are seeking a stimulating assignment where you can get in on the ground floor of the rapidly-expanding aerospace/electronics field, capitalize immediately on your background and training, and progress quickly toward your career goals—Hughes Field Service & Support Division in Southern California will welcome your inquiry.

Some of our current fields of interest include:

## DESIGN ENGINEERING

Openings exist for Electrical and Mechanical Design Engineers in the development of Trainers & Simulators and in the design of checkout and test equipment for large missile and aerospace systems. These responsible positions require interest and/or experience in such design areas as: analog circuits, digital logic, switch/relay logic, electromechanical packaging, infrared testing, inertial guidance and Command/Control systems. Responsibilities will include all phases of development from concept to final fabrication and evaluation. B.S. degree is required in E.E., M.E. or Physics.

## FIELD ENGINEERING

The Field Engineer's job ranges from complete contractor maintenance of electronic systems to technical assistance. His primary function is to help the customer become self-sufficient. Responsibilities include: providing maintenance, operational and technical assistance; formal and informal on-the-job training; logistic assistance and the investigation and solution of equipment problems experienced in the field. Domestic and overseas field assignments are available. Requirements include: B.S. degree in E.E. or Physics and experience with military fire control, radar or communications systems.

## TECHNICAL TRAINING

Hughes Technical Training prepares both civilian and military personnel to efficiently operate and maintain advanced electronic systems. Technical Instructors conduct training classes at Hughes California sites and domestic field locations . . . and work directly with customers to evolve special training devices, plan field training programs and prepare courses for use at customer bases. Requirements include: B.S. degree in E.E. or Physics and experience in preparing and presenting technical electronics material in the classroom and laboratory.

## ENGINEERING WRITING

Specialists in printed communications convert complex engineering data into simple, accurate, illustrated support publications, including technical manuals, orders, brochures, sales proposals, etc. Fields of interest include: digital computers, digital and voice communications systems . . . and many others. Requires a B.S. degree in E.E. or Physics.

## CAMPUS INTERVIEWS

March 1

For additional information on the career opportunities available at Hughes Aircraft Company—and to make arrangements for a personal interview appointment with representatives of our Technical Staff, please contact your College Placement Office or write: Mr. B. P. Ramstack, Hughes Aircraft Company, P.O. Box 90515, Los Angeles, Calif. 90009.

How do you make coin material — without silver — that a vending machine can't tell from a conventional silver quarter? How do you make a piece of wire with the electrical conductivity of copper and the tensile strength of steel? How can you provide a wearing surface equivalent to diamond at a small fraction of the price? These are the kinds of material problems you might work on at Texas Instruments. Materials scientists solve problems like these by cladding dissimilar metals together to form a new material that has properties unattainable with any monolithic alloy. Applied to such products as thermostats and controls, TI metallurgical skills solve problems like knowing when to turn off your coffee pot or when to stop a large industrial motor. Creative skills in materials and many other technologies have helped TI double in size about every three years for the past two decades. You might be interested in other TI technologies, a few of which are illustrated here. All have as a common bond a high level of innovation... by creative people working in a creative environment. TI's growth and diversity offer exceptional opportunities for outstanding college graduates at all degree levels and in many disciplines. For information about metallurgical materials at Texas Instruments — or any other technology illustrated here — write Jack Troster, indicating your area of interest. To obtain information about current professional openings, consult your college placement director, or send your confidential resume to Jack Troster, Dept. C-482, P. O. Box 5474, Dallas, Texas 75222. An equal opportunity employer.

## THERE'S A REVOLUTION (JET) IN THE MAKING

Stop for a minute and think about the supersonic revolution in air travel that will take place in 1971. Then give some more thought to the revolution itself. The new jets and the speeds they will travel. The passenger and freight terminals that must be expanded to handle the huge loads that will descend from the giant transports.

Where does TWA fit into this revolution? Leading the innovators. We were the first airline to order U.S.-built supersonic transports when they were still on the drawing boards. Our new fully automated cargo terminals are already planned to circle the globe.

Be a part of this revolution, and make a contribution to the dynamic changes under way right now.

Right from the beginning, you'll be thrown into hardware-oriented engineering in many ways tougher than its design and research cousins. Problems like analyzing stresses in aircraft structures, evaluating power plant and aircraft performance, developing new maintenance and overhaul procedures,

designing tools and specifying equipment requirements, designing plant layouts—all demanding activities. Not "ivory tower" problems, but rewarding in equal measure, for you'll see your ideas in action.

Begin to see what we have to offer?

The next generation of jets can further speed your TWA career. And as you move ahead, you'll soon see that time isn't all that flies.

BS and MS degree candidates in mechanical, electrical, aeronautical and industrial engineering are invited to arrange for campus appointments through their placement office, or write directly to Mr. C. S. Loughran.

## University students after years of soot covered snows, speak out against • • •

PAUL M. KRONBERG

**A**IR pollution receives the daily attention of the news media, and much of the blame for this increasing nuisance has been placed on coal-burning power plants. Unfortunately, the justification for this blame is not well founded. Automobiles, coal and oil home furnaces, incinerators and other "insignificant" contributors to the problem produce far more contaminating substances than power plants on a basis of pollution per unit of fuel used. Statistics show that less than 6% of all pollution originates from power plant installations.

Air pollution has been shown to be detrimental to human health, harmful to the growth of vegetation, and corrosive and dirtying to the surroundings. Thus, the need for control of pollutants entering our atmosphere is obvious.

Pollutants from power plants burning coal are essentially of two types: gaseous and particulate. Prime components of the gaseous contaminants are sulfur dioxide, nitrogen dioxide, and, to a lesser extent, carbon monoxide. Particulate matter is emitted in the form of flyash, small cinders, or, in general, dusts.

The gaseous pollutants mentioned form acidic vapors when mixed with the water vapor formed in combustion and the natural water vapor of the air. These acid vapors are known to be corrosive to building materials and paints and, in large concentrations, to mankind.

Particulate matter yields the common problem of dirty surroundings. As the solid particles precipitate from the atmosphere, laundry, autos, draperies, etc., become rapidly soiled.

These then are the problems associated with pollution from coal-fired power plants and all other sources of atmospheric contamination. The need for corrective action is obvious, and the problem of removing or reducing the emission

of pollutants from power plants will be considered in the remainder of this article.

### Methods of Removing Gaseous Pollutants

Many methods exist for removing gaseous pollutants from the flue gas of a power house. The problem at this time is not so much getting the contamination out of the flue gas as finding a way to do it economically.

*Sulfur Oxides.* Removal of sulfur from the coal before burning is the most logical first step towards controlling the emission of sulfur oxides from the flue gases, and this method has been attempted in many instances. The sulfur found in coal, however, is of two types: pyritic or free sulfur, and bonded sulfur, intimately associated with the carbon atoms.

Pyritic sulfur found embedded in layers between the carbonaceous material can be rather easily removed by crushing the coal and passing the pulverized mixture through an air separator. The finely broken sulfur is removed along with some of the finest carbon particles. The disadvantages of this method are the loss of desirable fuel and the fact that the remaining fuel is pulverized. For cyclone burning boiler furnaces, pulverized coal is very desirable, but for the stoker type of furnace, the pulverized coal cannot be handled or burned satisfactorily.

Organically-bonded sulfur in coal is much more difficult to remove than the pyritic sulfur. The method of removal incorporates rather drastic chemical reaction processes in an effort to break the very strong sulfur-carbon bonds. The process is quite complex and very costly in comparison to other methods of dealing with the overall sulfur pollution problem and will therefore receive no further discussion here.

Industrial groups in Europe (particularly Germany) have experimented with several new methods of removing gaseous sulfur oxides from the flue gases of power houses. In the Reinluft process, flue gases at approximately 300° F are fed upward through a bed of activate charcoal. Sulfur trioxide (the stable sulfur oxide at

# A I R P O L L U T I O N

## AIR POLLUTION

this temperature) is adsorbed by the charcoal bed as the flue gas is cooled to nearly 220° F. At this lower temperature the sulfur dioxide present is oxidized to sulfur trioxide, and it then combines with the water vapor in the flue gas to form dilute sulfuric acid.

The charcoal, laden with the sulfuric acid, is then fed to a regenerator where the sulfuric acid is vaporized by product gas at 700° F. The dissociated acid vapors react with some of the carbon inherently present in the absorbent to form a concentrated mixture of sulfur dioxide and carbon dioxide. These gases are then passed to a conventional contact acid plant where sulfuric acid is produced at a concentration of approximately seventy percent.

Two commercial installations of this Reinluft process are presently under construction in Germany, and the by-product sulfuric acid is expected to be sold commercially in an effort to amortize the initial equipment costs and the operating and maintenance costs of the process.

An outgrowth of another European process is under development by the Pennsylvania Electric Company. This catalytic sulfur oxide removal process also yields sulfuric acid of nearly seventy percent concentration as a salable by-product. The chemistry of the process is quite involved and will not be treated here; however, several problems are being investigated with a pilot plant operation.

The purpose of the pilot plant is to determine limiting conditions of the process and to obtain an economic evaluation of the process for the power industry. A deactivating effect of flue gas on the absorbent, along with fouling problems due to particulate matter in the flue gas stream, is being studied. In addition, reaction rates, pressure losses, and acid removal methods are being closely checked in order to make appropriate data available for sizing of the necessary process equipment. This data should be available within the near future.

A third new process for eliminating sulfur oxides from flue gas emissions has been developed and placed in pilot plant operation by the United States Bureau of Mines.

The process is dependent on the adsorption of sulfur oxides on alkalized alumina, which occurs at approximately 625° F. The alumina is then regenerated with producer gas, or reformed natural gas, in a second vessel at a temperature of 1200° F. Regenerator product gas is then fed to a sulfur recovery plant where elemental sulfur is produced as a salable by-product.

The pilot plant for this process is being used to study optimum conditions for time and temperature of operation for both the adsorption and regeneration cycles. The main advantages of the process appear to be the low pressure drop across the adsorbent, the very high temperature of operation and the production of the elemental sulfur.

Older methods of sulfur oxide removal almost invariably consisted of some type of scrubbing of flue gases. Solutions used for the scrubbing ranged from water to various chemical solutions, some of a very exotic nature. Although some of these processes are still in use, they are being phased out due to the several complications involved.

Primary disadvantages of scrubbers are the cooling effects on the flue gases, the supersaturated plume emitted from the smoke stack, the reduced buoyancy of the gases and the relative ineffectiveness of lowering local sulfur oxide pollution concentrations. Although a large percentage of the sulfur oxides are removed by the processes, the saturated plume and reduced buoyancy cause the remaining oxides to stratify near the ground in the immediate area of the power plant. Thus, while overall pollution problems are improved the problem on a local basis is not improved, and in many cases has been found to worsen.

These then are the primary methods of handling sulfur-caused air pollution. Other methods exist, but most are merely modifications of these processes, or ineffective in controlling the problem. An optimum solution is not available at this time, and much more research and experimentation will be necessary before adequate data are available for installation of ap-

propriate sulfur-removal equipment.

*Nitrogen oxides.* The removal of nitrogen oxides from flue gases has been primarily accomplished with the scrubbing processes discussed above. The same problems affecting sulfur removal apply, causing the same disadvantages. It has been shown, however, that the contribution of nitrogen oxides from coal-fired power plants to the pollution problem is quite insignificant. For this reason, little development is in progress for new processes and nitrogen oxides will not be discussed further.

### Methods of Removing Particulate Pollutants

The most obvious pollution problem is that of particulate matter, for it can usually be seen readily in the vicinity of a power house, and the effects of particulate matter in the air are readily felt financially through increased cleaning costs. Particulate pollution is interpreted by most laymen as the entire source of the pollution problem, but this interpretation is far from sound.

Particulate matter can be grouped into two categories on the basis of particle size. Matter ten microns in size when introduced to the air is essentially in a permanent suspension. These particles then, do not settle out of the air, but remain airborne to form haze or smog, and present the most difficulty to a pollution control system.

The larger-sized particles, on the other hand, tend to settle out of the air, and the larger the particle, the faster this precipitation occurs. As the velocity of the plume decreases above the smoke stack, the particles begin traveling with the prevailing air currents, eventually settling out of the air in the vicinity of the power plant. These particles are relatively easy to remove from flue gases. The problem arises in disposing of the ash particles once they have been collected.

*Control in the boiler furnace.* Two methods exist for reducing the amount of particulate (flyash) emission from the boiler furnace itself. Probably the most elementary method involves selection of

a properly sized coal. In general, the smaller the coal size, the greater the flyash problem will be. It would appear from this statement that the solution would be to burn larger sizes of coal. However, to obtain efficient combustion and to reduce gaseous emissions it is necessary to increase the surface area of the coal to be burned by decreasing the size. The smallest size in which coal is used, and, therefore, the most efficient combustion, is obtained from the cyclone furnaces which burn a finely powdered coal.

No one size of coal is best for all boiler furnaces. Thus the proper coal size depends on the fuel feed system (i.e., stoker, chain grate, pneumatic, etc.) and the size of the furnace.

The second method of reducing the flyash problem in the furnace is to introduce only part of the required air for combustion below the fire bed. This reduces the velocity of the air through the bed and thus reduces the amount of ash lifted from the fire bed into the furnace gases. Since the combustion will be incomplete at this stage, the remainder of the required air for combustion is introduced above the furnace fuel bed. This air must be added at relatively low velocity for the same reasons as indicated for the air through the fuel bed. The combustion is then completed above the fuel bed and the combustion area in the furnace is increased. Slightly lower combustion efficiency results, but the flyash reduction can be considerable.

*Control in the ducts and smoke stack.* Again, two basic methods may be defined for removal of flyash in the ducting between the furnace and the smoke stack and from the smoke stack. Scrubbing processes have the same limitations that were indicated for the gaseous vapor scrubbers, and will therefore not be discussed. Various filtering methods have been employed for flyash removal, and filtering processes appear to be the best solution to the flyash problem.

Cyclone, centrifugal, and venturi filters are all constructed from the same principle, that of accelerating these particles in a rotary

motion and causing the particles to be forced to the outer radius of the container, while the gases are free to traverse axially through the rotating device. Flyash is then collected at the outer limit of the precipitating device by means of small openings in the outer wall or by gravity collection at the bottom of the device. These filters operate fairly efficiently for large sized flyash (in excess of fifty microns), but the overall efficiency is generally less than 75 or 80 percent.

The various filtering methods used for the removal of flyash all depend on a low velocity pass of the flue gases through a finely woven fabric. The particles carried by the gas at high velocity are allowed to precipitate and the smaller particles are trapped by the fabric fibers. The greatest problem associated with the fabric filtering material is the large pressure drop across the filter and the rapid increase in pressure drop as the fabric becomes bound with the ash particles. Frequent cleaning of the fabric is necessary, and this cleaning is hampered by moisture in the gases collecting on the fabric. This tends to cake the particulate matter on the fabric, making drastic vibration or reverse air flow necessary for adequate cleaning.

Early fabrics could not withstand the acidic vapors in the flue gases or the repeated cleaning operations. In addition, the characteristic high temperature of the gases during the filtering process led to rapid degradation of the filter. The required size of the early filtering devices necessary to reduce the gas flow velocity was a very limiting factor in their use. Recent technology has alleviated this problem to a large extent.

Of all the filtering processes in use today, two are considered to be the most desirable and efficient. The filterhouse method using flue gas additives and the electronic precipitator both offer flyash removal efficiencies of greater than 99% when properly sized. This is well in excess of the accepted industrial standard of 95 percent flyash removal for tolerable pollution.

The bag filterhouse method of flyash removal uses many large

filter "bags" installed in compartments. The individual bags are usually one to two feet in diameter and approximately thirty feet in length. The problems of high temperature operation were recently eliminated with the development of a siliconized glass-fiber cloth which is capable of withstanding both the acidic vapors in the flue gas and the gas temperatures in the range of 500°F. The addition of alkaline additives further improves the air pollution control capabilities of the process by removing the acidic vapors and the associated sulfur oxides from the flue gases. Thus, this process seems to be a high-efficiency, all-purpose solution to the problem of air pollution.

Experience with pilot plant operations indicates that while the filterhouse must be very large, and the filters must be cleaned very frequently (every thirty minutes for one pilot plant operation) the results obtained are quite significant.

A filter ratio is defined for bag filterhouse design as the cubic feet per minute of flue gas to be filtered divided by the square feet of filtering fabric. Recommended designs indicate that the filtering system should be set up with a filter ratio of 3:1, but that operation should be maintained at a filter ratio of 1:1 to reduce cleaning frequency and difficulty.

A further advantage of the bag filterhouse is that appreciable quantities of water vapor are condensed in the filter. Since these vapors may cause a visible plume which is interpreted as pollution by the layman, removal of the water eliminates this situation and thus can improve community public relations considerably.

Of the same efficiency as the filterhouse, the electronic precipitator has been used very frequently in series with previously mentioned mechanical precipitators. The effect is to get the large flyash out of the effluent stream before the electronic precipitator removes the smaller particles. The electronic device has the best effect on smaller particles and can remove much of the flyash in the ten micron and less sizes.

The principle of operation involves passing the flue gases

# AIR POLLUTION

through an electrically charged grid to impart a negative charge to the flyash particles. The gases move upward toward positively charged plates where the electronic attractions precipitate the particles on the plates. Frequent cleaning is required, however, and the operational costs are quite high. Power consumption is thirty to fifty kilowatts per hour of direct current for an average installation. Insulated heaters must be placed in the gas stream ahead of the electronic precipitator to raise the temperature of the effluent above the dew point and thus prevent arcing between the grid and the plates. Temperatures must be kept thirty-five to fifty degrees Fahrenheit above the effluent dew point.

## Basis for Choice of Pollution Control Methods

*Types of pollutants and required removal effectiveness.* To design air pollution control equipment, as to design any other kind of equipment, conditions of use must be known. The particle sizes, rate of

pollution emission and type of pollutant must be known. If flyash is the important problem, one would not choose a system to remove gaseous matter.

The problem of the required effectiveness demands additional consideration. The cost of pollution control equipment will eventually come from the public, whether it be in the form of taxes for governmental operations or increased prices from commercial plants or both.

What, then, constitutes the degree of control required? There are many factors, including population of the area affected, other industry in the area, local laws governing pollution, and the prevailing wind directions. Large population centers will generally have a high degree of pollution from various sources and thus the additional contribution from a specific powerhouse must be limited. Similar reasons dictate extremely effective control in localities harboring many industrial plants. Local laws governing pollution control must be

consulted and industry must conform.

Prevailing wind directions can be either a great benefit or a total hindrance to a pollution-control system. Assuming a prevailing westerly wind, a plant located on the east side of a population center with relatively little population to the east would need to worry very little about complaints of pollution. In areas of relatively stable wind direction this factor has been used to good advantage. The reverse situation, with prevailing winds from the west and the plant located on the western boundary of a population center would demand that the plant employ highly effective pollution control equipment.

*Obtainable by-products and their value.* The elemental sulfur and seventy percent concentration sulfuric acid from the sulfur oxide control processes are obviously salable by-products. The flyash collected by the mechanical filtering devices has also been found salable in certain areas of the country.

AN EQUAL OPPORTUNITY EMPLOYER

## Vic Lechtenberg

President  
Anchor Construction Co.  
Omaha, Nebraska

# "Sewers built with Dickey Coupling Pipe stay built...long after they are paid for."

"Any contractor has to make a profit to stay in business. But, he can go out of business while he's making a profit (for lack of work) if he doesn't do a good job and use quality material. That's why I use Dickey Coupling Pipe. It's the one sure way to build durable sewers and make a profit, too. This pipe in the ground, is out of sight—out of mind."

Vic Lechtenberg said this . . . and he said more. "Taxpayers certainly don't want to pay for doing the job all over again in 10 to 15 years because the pipe failed. As far as I'm concerned, there's only one way to avoid this.

Build sewers with the kind of pipe you people make . . . clay. And that new urethane Coupling you've come out with is the finest factory-made joint I've ever worked with."

Mr. Lechtenberg is right . . . Dickey Coupling Pipe is the finest material available for sanitary sewers. It can't rust, rot, corrode or disintegrate. It handles any kind of normal wastes . . . residential or industrial. The Coupling, like the pipe, is resistant to acids, alkalis, solvents, gases and micro-organisms normally found in sewers.

Be sure to select Dickey Coupling Pipe. It takes the gamble out of sewer construction.

# You don't have to be an ag engineer to make a splash with International Harvester

We need talented graduates with many varied backgrounds. We not only make the go-anywhere International Scout, illustrated; but we're in a broad range of industries from agriculture to aerospace. We're big in earthmoving equipment, even bigger in motor trucks. We're an important steel producer. We fabricate metals for rockets, missiles and jet aircraft. All this in addition to being a leading farm equipment producer.

You bet we need agricultural engineers. But we also need mechanical, industrial, metallurgical, general, civil and electrical engineers with many diverse interests in machines. At IH the product is POWER. Providing mechanical power for an endless variety of jobs is what International Harvester is all about. POWER is a two-billion-dollar-a-year business with us. We offer you a chance to be a vital part. We provide you with an ideal combination of opportunity, responsibility and individual treatment. Think about POWER. Think about IH.

**International Harvester puts power in your hands**

Interested? Contact your Placement Officer now for a date to see an IH representative when he visits your campus. Or write directly to the Supervisor of College Relations, International Harvester Company, 401 N. Michigan Avenue, Chicago, Illinois 60611.

AN EQUAL OPPORTUNITY EMPLOYER

## SOPHISTICATION IN APPROACH, DIVERSITY IN PROGRAMS

**Creative scientists and engineers with advanced degrees are invited to investigate career opportunities with one of the nation's foremost research and technical service organizations**

Booz, Allen Applied Research has enjoyed conspicuous success in solving complex, non-routine problems and developing new products and processes for industry, government and the armed forces. So much success, in fact, that we are in need of new talent to meet new and still greater challenges in:

### **APPLIED RESEARCH AND ANALYSIS**

Operations Research — Operations Analysis — Systems Analysis — Applied Mathematics — Mathematical Analysis — Statistical Analysis — Environmental Analysis — Communication Studies — Technical Program Planning — Reliability — Computer Applications.

### **PRODUCT DESIGN AND DEVELOPMENT**

Electronic and Mechanical Product Development — Industrial Design — Commercial Service Products and Equipment.

### **CHEMICAL TESTING AND DEVELOPMENT**

Problem Solving in Chemistry—Bacteriology — Toxicology — Pilot Plant De-

sign and Development—Chemical Marketing Research—Synthetic Resins—Protective Coatings—Detergents—Organic Synthesis—Physical Testing—Chemical Analysis—Food Technology—Cosmetics—New Product Development.

We seek creative scientists and engineers with advanced degrees—individuals with a bent for **both** the practical and the theoretical, who can come to grips with projects which freely cross disciplinary boundaries.

What do we offer in return? A constant flow of diversified, intellectually stimulating assignments, which you may pursue individually and/or as a member of interdependent teams. Attractive remuneration and broad career benefits including encouragement of advanced study. A wholly professional working environment combining the best elements of the industrial and the academic. Most important, a future limited only by the bounds of your own capabilities. For further information, please send your resume to Mr. Robert Flint, Director of Professional Appointments.

# QUEUEING THEORY (continued from page 14)

average time of ten minutes between arrivals. The length of a phone call is assumed to be exponentially distributed with a mean of three minutes.

- (a) What is the probability that a person arriving at the booth will have to wait?

$$P(\text{waiting}) = 1 - P(\text{no one in the system}) = 1 - P_0$$

since  $P_0 = 1 - \rho$

$$P(\text{waiting}) = \frac{\rho}{1 - \rho} = \frac{0.3}{1 - 0.3} = \frac{0.3}{0.7} = 0.43$$

- (b) What is the average length of the queue?

$$Q = \frac{\rho^2}{1 - \rho} = \frac{(0.3)^2}{0.7} = 0.13 \text{ persons}$$

- (c) The telephone company will install a second booth when convinced that an arrival would expect to have to wait (on the average) three minutes for the phone. By how much must the flow of arrivals be increased to justify a second booth?

$$W = \frac{T}{\mu} = \frac{P/1 - \rho}{\mu} = \frac{\lambda}{\mu(\mu - \lambda)}$$

$$3 = \frac{\lambda}{\mu(\mu - \lambda)}$$

Therefore,  $\lambda = 1/6$  or interarrival time would have to increase to 6

Figure 5 Block Diagram of the Engineering Computer Laboratory as a Queueing System.

minutes from the original 10 minute interarrival time.

### Multiple-Channel Queues

Up to this point we have considered service facilities which handle only one person at a time. There are many systems which can

channel system is shown in Figure 4. With this model in mind, the same parameters of operational effectiveness as for the single-channel system can be found.

Another model used is where the service facilities offer different services for a specific population,

**GRADUATES**

# Continued expansion of our military and commercial business provides openings for virtually every technical talent.

As you contemplate one of the most important decisions of your life, we suggest you consider career opportunities at Pratt & Whitney Aircraft. Like most everyone else, we offer all of the usual "fringe" benefits, including our Corporation-financed Graduate Education Program. But, far more important to you and your future, is the wide-open opportunity for professional growth with a company that enjoys an enviable record of stability in the dynamic atmosphere of aerospace technology.

And make no mistake about it . . . you'll get a solid feeling of satisfaction from your contribution to our nation's economic growth and to its national defense as well.

Your degree can be a B.S., M.S. or Ph.D. in: **MECHANICAL, AERONAUTICAL, CHEMICAL, CIVIL (structures oriented), ELECTRICAL, MARINE, and METALLURGICAL ENGINEERING • ENGINEERING MECHANICS, APPLIED MATHEMATICS, CERAMICS, PHYSICS and ENGINEERING PHYSICS.**

For further information concerning a career with Pratt & Whitney Aircraft, consult your college placement officer—or write Mr. William L. Stoner, Engineering Department, Pratt & Whitney Aircraft, East Hartford, Connecticut 06108.

Take a look at the above chart; then a good long look at Pratt & Whitney Aircraft—where technical careers offer exciting growth, continuing challenge, and lasting stability—where engineers and scientists are recognized as the major reason for the Company's continued success.

**SPECIALISTS IN POWER . . . POWER FOR PROPULSION—POWER FOR AUXILIARY SYSTEMS. CURRENT UTILIZATIONS INCLUDE MILITARY AND COMMERCIAL AIRCRAFT, MISSILES, SPACE VEHICLES, MARINE AND INDUSTRIAL APPLICATIONS.**

## Pratt & Whitney Aircraft

A**

An Equal Opportunity Employer

# QUEUEING THEORY (continued from page 27)

less the arrival and servicing rates can be closely approximated.

To show, that in an actual situation, the arrival and service rates actually do follow the Poisson function, study was made of the Engineering Computing Laboratory where servicing is single-channel.

Arrival rate was recorded for 50 consecutive customers while, their time on the computer was also logged which is shown in Table 2.

From Table 2,

$$\frac{1}{\lambda} = \frac{\Sigma \text{ interarrival times}}{\text{number of observations}}$$

$$= \frac{201}{56} = 3.6 \text{ minutes/student}$$

$\lambda = 0.28$  students per minute arrival rate.

$$\frac{1}{\mu} = \frac{\Sigma \text{ service times}}{\text{number of observations}}$$

$$= \frac{110}{55} = 2 \text{ minutes/student}$$

$\mu = 0.50$  students per minute service rate.

These data are plotted in Figures 6 and 6, along with  $\lambda e^{-\lambda t}$  and  $\mu e^{-\mu t}$ , to show how closely the observations come to falling on the line of the function used to model the system.

After seeing how closely the actual points come to what we thought they should be, we can find the parameters of operational effectiveness.

With

$$\lambda = 0.28$$

$$\mu = 0.50$$

we see

$$\rho = \frac{\lambda}{\mu} = 0.56$$

$$W = \frac{T}{\mu} = \frac{\rho/1-\rho}{\mu} = 2.5 \text{ minutes}$$

$$Q = \frac{\rho^2}{1-\rho} = \frac{(0.56)^2}{0.44} = 1.37 \text{ persons.}$$

With this information, a decision maker has a good idea of the situation and what changes may have to be made. Possibly a waiting time of  $2\frac{1}{2}$  minutes is uneconomical, so that an additional computer may have to be secured. He is probably best able to justify his decision to management with these conclusions of queueing theory.

Convincing management of your conclusions is probably the most powerful use for queueing theory. With these models, and others where appropriate, the real system can be illustrated by its measures of operational effectiveness.

## Latest Uses for Queueing Theory

Out of the need for speed of operation and complexity of the models, digital computer techniques have been developed, and stock programs have been written for very large systems.

A program simulating airport operation as a queueing model has recently been devised by B. L. Marks and described in *Operations Research Quarterly*. He has taken a large airport and modelled it in an extremely realistic manner. His program includes provisions for the effects of emergency landings, changes in weather conditions, and differences in operation when various sizes of airplanes are served.

The technique used to model this airport could be used in the queueing of auto traffic. It is not inconceivable that in the future whole cities of traffic flow may be simulated in the same way as this airport. In this manner, changes in arterial routing can be included to study the effect on traffic flow.

Actually, the speed of operation acquired through the use of the digital computer in simulation has opened the door to queueing models which are beyond conception today.

Figure 7 Distribution of Servicing Times.

**“Business is for  
the birds!”  
Who says so?**

Lots of people do. Some right on your campus. And for rationale, they point an accusing finger at business and say it lacks “social commitment.”

Social commitment? We wish they could visit our Kearny, N. J. plant, where we make cable and apparatus for your Bell telephone company. But we have time for other thoughts, other talents.

Like the situation in nearby Newark.

With civic and business leaders, we began buzzing with ideas. “Let’s teach higher skills to some of the unemployed and under-employed. Say, machine shop practice. They could qualify for jobs that are going begging—and help themselves as well.”

We lent our tool-and-die shop, evenings. We found volunteer instructors. A community group screened applicants. Another supplied hand tools. The Boys Club donated classroom facilities. Another company sent more instructors.

Some 70 trainees enrolled. Their incentive? Self-improvement. Results to date? New people at better jobs. Happier.

And this is only one of dozens of social-minded projects at Western Electric plants across the country, where our first job is making communications equipment for the Bell System.

So, you don’t give up ideals when you graduate. If anything, at a company like, say, Western Electric, you add to them. And it’s not just a theory. It’s practice. Satisfying. Come on and find out. And watch a feathered cliché fly out the window.

**Western Electric**  
MANUFACTURING & SUPPLY UNIT OF THE BELL SYSTEM

*Sundstrand systems serve a world in motion*

The challenge of supersonic transport at Sundstrand includes development of a broad range of projects. *Constant speed drive systems*, hydromechanical transmission systems to convert variable jet engine speed to constant speed requirements of a-c electrical generators; *hydraulic pumps*, for functional flight control service actuation; *accessory drive systems*, sophisticated transmissions to supply power for various aircraft accessories.

**Sundstrand offers excellent career opportunities.** Sundstrand engineers work on a variety of projects under excellent working conditions, enjoy definite project responsibility and follow-through. Our consistent emphasis on engineering results in a sizable investment in research and development; when completed in 1967, our multimillion-dollar, 88-acre R&D center in Rockford, Illinois, will provide an additional 400,000 square feet for new product development, project management and testing. We employ nearly 6000 people, enjoy approximately \$100 million annual sales—a medium-sized company, *on the move*.

**Consider a career at Sundstrand.** SST, high-performance turbine design, thermodynamics, undersea propulsion, solid-state electronics, isotope power for space vehicles, computer programming, petrochemical handling, hydrostatic transmissions for vehicle propulsion—these are the tomorrow-oriented fields we investigate. *Join us!*

## Take off on SST at Sundstrand

Now that you know something about us, how about letting us know something about you?

Talk with the Sundstrand Employment Manager when he visits your campus on March 16.

Or, send your resume in confidence to  
**SUNDSTRAND PERSONNEL CENTER**

- Hydraulic pump development
- Vehicle transmission design
- Industrial engineering
- Metallurgy
- Electronic packaging
- Test equipment
- Application engineering

## Engineers/Scientists

**Is there hope for 26  
of the world's  
most misunderstood  
characters?**

Although graphic communications of all kinds is our business, making ideas matter is our main concern. Since this encompasses every alphabet, numerical system and other graphic means known to man, the possibilities are endless.

For example, LDX (Long Distance Xerography) has already begun to demonstrate its immense potential as a graphic way to put any idea across continents or oceans . . . in seconds and with great fidelity.

We think it likely that LDX will do for facsimile transmission and reproduction what our 914 copier did for office copying. Revolutionize it.

And, we expect that, as with the 914, the revolution will come quietly. Suddenly a world of people will have ready access to documents that can help bridge the communications gap. To press this revolution forward we are concentrating on exciting corollary concepts like 3-dimensional imaging, color xerography and the global transmission of images through computer systems.

But even as we extend ourselves to explore and develop the potentialities of LDX-type systems—such as may print the morning paper at your breakfast table some day—we're simultaneously giving a lot of thought to a range of related possibilities. Not least is the creation of potent, low cost educational concepts and techniques.

Your degree in Engineering, Science, Statistics or Mathematics can qualify you for some intriguing openings at Xerox, in fundamental and applied research, engineering, manufacturing, programming and marketing/sales.

See your Placement Director or write directly to Mr. Stephen G. Crawford, Xerox Corporation, P.O. Box 1540, Rochester, New York 14603. An Equal Opportunity Employer.

# XEROX

LDX, 914 AND XEROX  
ARE TRADEMARKS OF XEROX CORPORATION

Flyash is primarily useful as a filler in various construction materials. The ash waste of the power plant is sold to concrete producers to be used in manufacturing lightweight concrete, lightweight brick, concrete block, and bituminous concrete and asphalt. In addition, abrasives can be made from the flyash, binder for highway bases are made, and soil conditioners can be developed from the pollution elements removed from the power plant effluent. The United States Bureau of Mines is presently investigating the use of flyash as a coagulating agent for water treatment systems.

Thus, the products of pollution control can be sold in some instances to help defray the installation and operation costs of control equipment. Before selecting a method or methods of air pollution control on the basis of salable by-products, however, a thorough investigation must be made to reveal the production rates of these materials and the local market demand for them.

*Installation and operation costs.* Initial equipment and installation costs for a typical coal-fired power house are shown below on a per kilowatt of capacity basis for the various pollution control processes. Annual operational costs are shown on the same basis.

| Process                  | Initial Cost per Kilowatt Capacity (approximate) | Annual Operating Cost per Kilowatt Capacity (approximate) |
|--------------------------|--|---|
| Reinluft                 | \$20.00  | \$4.00  |
| Pennsylvania Electric    | 22.00  | 2.10  |
| Bureau of Mines          | 11.00  | 2.75  |
| Electronic Precipitators | 10.00  | .80   |
| Mechical Filters         | 8.00   | .60   |
| Bag Filterhouse          | 10.00  | 1.00  |

It should be noted that all costs shown are approximate and that the costs for a given installation may be expected to vary considerably from the data shown. By-product value must, of course, be evaluated for each marketing situation and power plant capacity.

## Analysis of Available Methods of Pollution Control

Present pollution control methods are costly to install and to operate, and the ability to eliminate these costs is non-existent in most applications. The methods under development at this time show promise for an economical solution to the pollution control problem, but the development of these processes for commercial-size installations is not in the near future.

Additional research is necessary for both pollution control processes and for new and better uses for the by-products. The United States Bureau of Mines is presently sponsoring limited research in this field. The need for this type of research is hard pressing as evidenced by viewing industrial areas from the air. But, response to the plea has been slow in coming. The Clean Air Act passed recently by Congress may provide the necessary impetus for extensive work on the air pollution control dilemma.

*University of Wisconsin Heating Plant.* The new power house of the University of Wisconsin has three Babcock-Wilcox boilers, and a fourth boiler from the same manufacturer is being installed at this time. The pollution control equipment now consists of four American Blower two-stage cyclone dust collectors. Expected efficiency of these collectors as published by the manufacturer is ninety-three percent; however, data from the power house superintendent, Mr. R. F. Warock, places the actual efficiency near eighty percent. The remainder of the flyash dust is discharged through the smoke stack with the sulfur oxides.

As might be expected from the performance data above, complaints of dust, odors and corrosion are numerous. Since the start-up of the new plant in 1958, the only corrective measure taken to reduce the pollution was to employ the over-fire air as previously described. The effects of this have been negligible.

Peak consumption for the plant is expected to be approximately four hundred and fifty tons of coal per day or nearly nineteen tons per hour when the fourth boiler is

placed in operation. Analysis of the Southern Illinois coal burned follows:

| Ultimate Analysis Southern Illinois Coal | Percent |
|--|---------|
| Carbon                                   | 68.5    |
| Hydrogen                                 | 5.3     |
| Oxygen                                   | 14.2    |
| Sulfur                                   | 2.0     |
| Ash—solid                                | 6.0     |
| Ash—flyash                               | 4.0     |
| Total                                    | 100.0   |

Using this data, it can be predicted that the plant under maximum capacity is producing eighteen tons of flyash, twenty-seven tons of solid ash and burning nine tons of sulfur per day. Considering the necessary production rates to provide a market for the by-product sulfuric acid or the flyash, these supply rates do not indicate any economic advantage to be found by salvaging the possible products.

The present boilers cannot utilize pulverized coal due to the stoker and grate equipment. Therefore, removal of sulfur before burning must be eliminated as a solution to the sulfur oxide pollution problem.

The remaining choices, then, are mechanical dust collectors similar to those now in use, electrostatic precipitators, scrubbers, or filtering devices. Since the expected efficiency of eighty to ninety percent for mechanical dust collectors is so close to the efficiency already observed for the present dust removal system, further investment in this type of equipment would not be practical. Also, since the electrical power for the University is purchased from the Madison Gas and Electric Company, installation of electronic precipitators would increase the utility bill for the plant. These operating costs, not to mention the costs of obtaining and installing the equipment, would then be prohibitive.

As previously noted, scrubbers yield many undesirable plume characteristics and some increased pollution problems. These devices then, will not be considered for the heating plant.

The only remaining solution which appears to be feasible is the bag filterhouse system. While installation costs are high, operating

costs are lower than like costs of most systems, and thus, the system appears to be the most economically sound.

#### **Recommendations for the University of Wisconsin Heating Plant**

In deciding on a method of air pollution control for the University, it must be realized that the prestige of the school is a predominant factor. Since research work for air pollution control and support for air pollution programs are coming from the University, it cannot settle for a second rate control for its own facilities. The University must educate by example, and this will be a deciding factor in the equipment choice. The problem then, is to remove pollutants and not necessarily to do this as economically as possible.

The bag filterhouse system provides the exceptional control which the University desires. The added advantage of this system is the removal of the sulfur oxides as well as the fine dusts which pass the mechanical filters. This equipment can be expected to improve the dust collection efficiency to ninety-nine plus percent and to remove essentially all of the sulfur oxides from the smoke stack gases.

The present method of ash disposal (trucking to areas for fill) should continue to be used unless a buyer for the limited amount of ash can be found. The acidic nature of the ash, however, makes its desirability as a salable product doubtful.

As the discharge rate of gases for the plant will be approximately three hundred thousand standard cubic feet per minute (scfm), the size of the installation should be one hundred sixty thousand square feet of filter. The estimated values were obtained by using recommended data given by A. E. Goselin, Jr. The estimated cost for the equipment and installation is roughly six hundred thousand dollars, while operating costs should be nearly forty thousand dollars per year.

These cost figures indicate clearly the reason for industry's objection to legislated air pollution programs at this time. Experience

of power plants using methods yielding salable by-products shows that profit from the control of pollution is non-existent at this time. The only help derived from by-products is a slight reduction in operating costs.

Industry and governmental researchers, therefore, are attempting to find new and better means of air pollution control. Their success or failure is dependent upon public approval and support. The elimination of the pollution problem in this country can most readily be accomplished by informing the public of pollution sources and methods of eliminating these many "small" contributions to the overall problem. Once the public is fully aware of the causes of air pollution, the country will be well on its way toward eliminating this problem.

#### **University of Wisconsin Department of Buildings and Grounds Steam Generating Plant and Pumping Station**

The University of Wisconsin Steam Generating plant is located in the block bounded by Charter, Mills, Dayton and Spring Streets. The plant supplies steam for all of the heating and hot water demands for about 170 campus buildings, in addition to the steam required for the various laboratories, sterilizers, cooking equipment, clothes dryers, stills and dishwashers. The Mechanical Engineering Department uses an appreciable amount of steam for testing purposes in engines and turbines. The Pumping Station pumps most of the lake water with steam-turbine driven pumps. It is estimated that during the heating season, 70% of the steam is required for heating, with the remainder required for miscellaneous purposes.

Steam is generated at 600 psig and 720°F. A typical winter day will require production of about 4,800,000 pounds of steam to satisfy the demands, and in the process will consume 250 tons of coal. The peak daily coal consumption was recorded January 10, 1962, at 310.4 tons of coal. Steam production on this day was 5,247,000 pounds. Even an average summer

day requires about 800,000 pounds of steam, using 40 tons of coal.

The mechanical equipment for this plant was originally the property of the Hudson Division of American Motors, in Detroit, Michigan. It was purchased by the University in 1957 when American Motors suspended its Detroit operations. The equipment was initially installed for American Motors in 1953.

The total cost of dismantling the plant in Detroit and re-erecting it in Madison was \$2,501,360. This did not include the cost of the land, site preparation and the piping necessary to connect the new plant to the steam distribution system.

Steam is generated with 3-Babcock and Wilcox, two-drum Stirling boilers. The boilers have 9228 square feet of heating surface, the economizers on each boiler have 5200 square feet. The nominal capacity of each boiler is 100,000 pounds per hour but they are capable of short-period overloads to 120,000 pounds per hour. This gives a total capacity of 360,000 pounds per hour. The guaranteed efficiency of these boilers is 85.3%.

The boilers are equipped with two methods for blowdown. One is a continuous blowdown and the other is manual. Daily blowdown is regulated according to concentration of dissolved solids as determined by test. The blowdown discharge is into a vented, selfcleaning catch basin, from which it goes to the sewer.

Forced and induced draft is supplied by American Blower fans, driven by Elliott turbines. The overfire air fans are driven by electric motors. Each boiler has an individual glass lined steel stack. The outlet of the stacks is about 105 feet above grade. Stokers are Westinghouse Electric Company (now merged with Detroit Stoker Company), 10,450 pound-per-hour coal. The boilers are equipped with American blower 2-stage cyclone dust collectors having an expected efficiency of 93%.

The coal burned is a bituminous 12,500 Btu per pound. At present 1962, it is estimated that it will take 50,000 tons of coal per year to fulfill steam demands. Cost of coal

PROPOSED FILTRATION SYSTEM SURROUNDING THE SMOKE STACK

is \$8.87 per ton delivered on track. The stockpile contains 15,000 tons. This is about a 45 day supply of coal during peak demands.

The plants' coal handling system consists of a double railroad track into the plant site. However, there is only a track hopper on one track. A second hopper, called a reclaim hopper, is located in the storage yard to facilitate moving coal from the pile directly into the conveying system. Ordinarily, coal is unloaded directly from the railroad car into the trackhopper. The coal is conveyed from the hopper on a belt conveyor, and a bucket elevator to the top of the plant and into the coal bunkers. The coal conveying equipment has a capacity of 75 tons per hour. The bunkers have a capacity of 900 tons of coal.

Coal is fed by gravity from the bunkers through Richardson coal scales. The scales self dumping and recording for each 200 pounds. The coal is then directed to each stoker by means of distributing hoppers.

The coal handling system includes an underbunker conveyor, Fairfield, by means of which, coal from any part of the bunker may be transferred to any boiler. This gives full utilization of the bunker capacity to any boiler. It also removes coal from any "dead" spots in the bunker so as to reduce the possibility of fires due to spontaneous combustion in the coal. The coal handling system includes two car pullers and one car shaker.

An automatic vacuum ash conveyor removes collected flyash, as well as bottom ash to a storage bin. Here a rotary, dustless, unloader discharges it to trucks for final disposition. The vacuum conveyor is made by United Conveyor Company with a capacity of 15 tons of ash per hour.

The boiler feed pump turbines and large turbine generator and the Worthington turbine driven air compressor use steam at 600 psi. The remainder of the auxiliaries use steam at 175 psi. Exhaust from

the 175 psi drives is to the low pressure steam line that serves the campus. This pressure is maintained between 5-10 psig.

The piping system consists of a conduit that joins the new plant to a valve room located directly in front of the Service Building on University Avenue. The steam lines leaving the plant are 20" and 18" for the low and high pressure steam lines, respectively. Condensate is returned in an 8" stainless steel condensate return line. There is also a 3" high pressure air line, 90 psi. In front of the Service building the distribution system becomes a loop system branching out from the old plant in East and West tunnels traversing approximately 2 miles of tunnels and 4 additional miles of conduit. The principal pipes in the tunnels are the 170 psig main steam line, the 10 psig heating line, the condensate return line, and the compressed air line. The return lines have booster pumps installed in the buildings or

# AFRAID TO RIDE A SUBWAY?

Subways aren't for sleeping. Alertness counts in the underground world of city transit systems. Move quickly, stay awake, and be careful.

A robbery, an accident, a train breakdown can cause panic. Today, with Motorola's 2-way transit radio systems, help is just a button push away.

Subway police can now wear Handie-Talkie portable radios on their Sam Browne belts—speaker on the shoulder strap close to the ear, hands free. Trouble on a train? Word is flashed from Control Center to the nearest patrolman. He's there when the train pulls in.

Problems? In rush hour, some subways run as many as 120, ten-car trains spaced at two-minute intervals. Delay, jam-up, too many sardines trying to get in one car? When the train is equipped with Motorola Transit Dispatcher Radios, the motorman advises the trainmaster. Adjustments are made; other trains notified.

Safety, speed, and security—all part of up-to-date transit system communications and part of Motorola's efforts to help get people where they want to go. Closed circuit TV and radio keep traffic flowing through city tunnels. Motrac 2-way radios route cabs and busses. Special radio systems for railroads get important messages through.

On the go? Comforting, isn't it, when Motorola's along for the ride.

TRUST THIS EMBLEM

WHEREVER YOU FIND IT

# MOTOROLA

in some cases building groups forcing the condensate back to the feedwater system where it comprises 87% to 92% of the feed. Pipes in the tunnels have an expansion joint every 150 feet, gate valves every block to isolate sections, nearly 200 steam traps, and about 40 branch lines in conduits which serve individual buildings or groups of buildings. Typical installation of this type are the take-off lines to Wisconsin General Hospital which uses about 3% of the total steam produced. The branch lines are a four-inch main steam, a ten-inch heating line, and a four-inch return. In addition to the steam piping, the tunnels are crossed by city water mains, lake water mains and also contain electrical conduit, telephone lines, and a drainage system. Sump pumps are located at regularly-spaced intervals and emergency use, steam siphons have been installed. In each branch of the high pressure line going into the East and West tunnels there has been installed a motor operated quick-closing valve which can be closed in 15 seconds.

A furnace draft controller operates independently of the other controllers, maintaining the draft at the desired value for maximum combustion efficiency.

Water for boiler feed is supplied from a 6" lake water main in Charter Street. This water is about 186 ppm hardness. There is a cross connection to the city distributional system but this is not a solid connection and would require about one hour to install. As a general rule the water pressure in the mains is sufficient for service in the plant, but booster pumps are installed to raise the pressure in case it is insufficient. The water is treated in a hot-lime-zeolite system with 125 gpm of outlet capacity. The zeolite softeners are in duplicate so one can be in service while the other is regenerated. Make-up water constitutes 8%-20% depending on losses in the plant and on the campus. The return water is returned to the plant to a hot well. It is mixed with make-up water in the deaerating heater, heated in a

second stage heater and pumped into the boilers.

In addition a Worthington non-condensing turbine drives a 300 KVA, 3 phase, 60 cycle, generator that supplies emergency power for all the electric drives in the steam generating station. The starting of this unit will be controlled from the panel board with the steam valve operated with a direct current motor, operated from emergency batteries.

#### Plant Description of University Pumping Station

The University Pumping Station is located on Lake Mendota several hundred feet west of Park Street. From this building is pumped 60% of the total water used on the campus. This is an average daily consumption of 1.5 million gallons with an annual total of 660 million gallons.

In the fall of 1959 a new intake was constructed into Lake Mendota. This is a 24" diameter concrete that extends 600 feet into the lake.

# FREEDOM OF SHAPE...

## One of the outstanding advantages of Malleable Iron Castings

Casting is the simplest and most direct way of creating form and shape with metal. Casting offers almost unlimited freedom to the designer. A cast design is not restricted by sizes or shapes of mill stock, accessibility of tools, withdrawal allowances for dies, or other limitations. Complex shapes, interior cavities, and streamlined contours, which would be difficult or impossible to create with other methods, are simple with a casting.

For instance, consider the complexity of creating the dozens of teeth, lugs, holes and collars on this pipe repair clamp. It

would be prohibitively expensive to produce by any method other than casting. By using the casting process for economy,

and Malleable iron for strength and ductility, these clamps combine service and value.

The design freedom made possible by

casting also helps to make parts stronger. Metal components tolerate loads better if they are designed to distribute stresses efficiently. Sharp corners or other abrupt sectional changes tend to restrict the uniform distribution of these stresses. The corner thus becomes a logical site of fatigue failure. In a casting, it is a simple matter to round out corners, blend sections and taper connecting members to achieve a design which will distribute stresses.

The illustration shows how stresses "set up" at sharp corners. A much smoother transfer of stresses was achieved when this part was switched to a Malleable casting (shown on the right).

Choosing  
a company is like  
choosing a professor  
...and the stakes are  
just as high.

A good prof's classes are quickly filled, because students get more for their effort and time. As a student, you go where your interest and abilities are applied to best advantage. Choose your employer the same way.

Your opportunities for increased responsibilities and rewards will be greatest in an expanding company of an expanding industry. Alcoa, leader of the aluminum industry, offers such opportunities. But that's just one reason why many outstanding graduates join us. Professional fulfillment and excellent starting salaries are others.

We employ engineers, scientists, mathematicians, business administrators, English majors, economists, journalists and others. Join the change for the better with Alcoa. Write to: Manager of Professional Employment, Aluminum Company of America, 1601-B, Alcoa Building, Pittsburgh, Pa. 15219.

# Put yourself in our place.

Step right into the picture on a research project in photo-elastic stress analysis. Or into the design of one of the biggest nuclear power plants to be built in America.

Tomorrow, who knows? You could be on the B&W team that launches an entirely new product.

We're big enough (\$480 million last year) to take on some pretty exciting projects. But small enough to give you a challenging job, not just desk space.

Come grow with us at Babcock & Wilcox.

We started in boilers and steam generation, then moved on to atomic power stations, nuclear marine propulsion, refractories, specialty steel, computers and control systems, closed circuit TV and specialty machine tools. (We still make the best boiler in America.)

Want to talk about the future? Your future? See your placement officer. Or write to Manager, College Recruiting, The Babcock & Wilcox Company, 161 East 42nd Street, New York 10017. A good place to work and grow.

**Babcock & Wilcox**

**Welcome  
to the cold,  
cruel world.**

Of course, if your father's a millionaire, or you're about to marry an heiress, then you have no problems. But, if not, then there's only one sensible thing to do. Come to work at Allison Division of General Motors.

There's nothing cold or cruel here. Just the opposite. Particularly if you're an engineer with big ideas. Aerospace projects? Allison's got them. Turbofan. Turbojet. Turboprop. Turboshaft. Military and commercial applications right across the board.

Maybe you're more down-to-earth. Fine. Some of Allison's advanced motor vehicle projects will be more your cup of tea. Like the new M551 General Sheridan, for instance. The powershift transmission, of course, is our specialty, and even the gun launcher is an Allison brainchild.

There's more. And you can be part of it. Take your time. Check them all. But don't forget Allison. Remember: life can be beautiful . . . even without an heiress.

For the complete story, send for Allison's new brochure: Destination Tomorrow. Write Ken Friedlein, Scientific Placement, Dept. 400, Allison Division of General Motors, Indianapolis, Indiana 46206.

**Allison**

Drawing shows projected descent of the LEM (Lunar Excursion Module) for the Apollo Mission to the Moon. LEM will descend from the CSM (Command and Service Module) to the lunar surface, land, and return to the CSM. Two central components of the LEM system which control the descent to, and ascent from, the moon are the Attitude and Translation Control Assembly and the Descent Engine Control Assembly. RCA has designed and produced these systems in addition to other critical electronics systems, necessary to the success of the mission.

## RCA Knows How *in Aerospace and Defense*

The LEM programs are only a small sample of the many advanced and diverse activities underway in the five RCA divisions of Defense Electronic Products.

With RCA you could be working on these programs so vital to national defense and space exploration.

EE, ME and IE opportunities exist for all degree levels in every phase of research, design and development, information systems, manufacturing, and computer marketing.

With RCA everyone has the opportunity to join graduate education programs, training programs, and in-house courses—all designed to further individual development.

You owe it to yourself to find out more about the great range of activities at RCA. Aerospace and defense are only one phase of our continuous drive to pioneer new areas of electronics. See your college placement director, or write to College Relations, Radio Corporation of America, Cherry Hill, New Jersey 08101.

Whatever your field of interest—we would like to hear from you.

*An Equal Opportunity Employer*

# Twenty-five hundred dollars in cash awards to engineering and metallurgy students.

The Forging Industry Educational and Research Foundation announces a \$2,500 award competition for the best paper on the subject "How Mechanical and Physical Properties of Impression Die Forgings Are Best Utilized in Designing Forgings for New Applications." First prize, \$1,000, plus eight other awards totaling \$1,500.

Competition is open to senior and graduate engineering and metallurgy students. Length of the paper, 3,000 to 3,500 words. Deadline for completed paper: May 10, 1967.

Winner and his faculty advisor will also receive an all-expense-paid trip to White Sulphur Springs, West Virginia, where the award presentation will be made at the 1967 meeting of the Foundation.

For full details fill in and mail the coupon or write:

# PRAY FOR SNOW

THE BYRD B.S. '69

The Byrd sends to you the warmest of greetings on that holiday to end all holidays—St. Pat's Day. This month's puzzlers are short enough to read while refilling your glass with that green beer, and hard enough to confuse you mug after mug after mug. . .

\* \* \*

Now to get down to business. A large circular table is pushed into the corner of a room so that it touches both walls. A beer stain on the very edge of the table, on the side nearest the wall, is known to be exactly 8 inches from one wall and 9 inches from the other. What is the diameter of the table?

\* \* \*

A conical glass of  $60^\circ$  included angle is 3 inches high. What is the radius of a ball bearing which will displace the maximum amount of wine in the glass without spilling and which will bring the level of the wine to the rim of the glass? What is the original level of the wine?

\* \* \*

Three persons are to divide among themselves 21 casks of equal size, 7 of which are full, 7 are half full, and 7 are empty. How can an equal division be made without pouring any wine from one cask into another and in such a way that each of the three receives an equal amount of wine and the same number of barrels?

\* \* \*

Two candles of equal length are lit at the same time. One candle will burn for 4 hours and the other for 5 hours. At a particular instant one candle was 4 times the length of the other. How long had they been burning?

\* \* \*

A farmer has a square piece of property, which in his will, he left to his wife, daughter, and three sons. The will specified that the wife should receive  $\frac{1}{4}$  of the area in the form of a square. The balance was to be equally divided between the four children, each receiving identically shaped areas. Furthermore, the daughter's section could not border or touch the outer perimeter of the original area. How was the land divided?

\* \* \*

There are four flies on the four corners of a square. Each one faces the fly next to him, in a clockwise direction. Each one starts walking at a certain instant, always walking directly towards the fly he was originally facing. All walk at the same speed. When they meet at the center, how far has each walked?

\* \* \*

For those of you interested in the solution to the problem created by last month's buggy botanists and their box elder grove, the trees were arranged thusly:

\* \* \*

Any readers who think they have a solution to any of this month's problems (with the help of the luck of the Irish) can send them in to the Byrd c/o the Wisconsin Engineer.

**We've got the best facilities, the finest benefits, and blah, blah,**

# blah!

Sure, you've heard it before – probably from so many companies it's lost its meaning for you.

So we'll skip the story about our having the best, or the most, or the finest of anything. Even if we think privately that it's true, it still remains for you to be convinced.

We do have a booklet about our facilities, the work we do, the places where we work, the cities and towns we live in.

And if you've got the maturity to know that a man gets ahead on his own demonstrated ability

to handle a job, you're the kind of man Collins would like to talk with.

We suggest you see your college placement officer for details. If he happens to be out of Collins Career books, write to Manager of Professional Employment, Collins Radio Company, in Cedar Rapids, Iowa; Dallas, Texas, or Newport Beach, California.

Then, contact the Collins representative when he visits the campus. You'll get straight talk about careers at Collins.

# Ten reasons She will want you to take a job at **MCDONNELL**

**1.** McDonnell is a "name" in aerospace . . . a name earned by solid engineering achievement in the current decade. The engineering leadership exemplified by successes in Gemini Spacecraft and the Phantom Fighters lifts your career and shoves it toward success.

**2.** Stability and security sometimes seem unimportant to young engineers just starting a career. But they are essential and you would be unwise to ignore them. McDonnell has never had a major decline in engineering and professional employment. The Company has grown rapidly in every one of its product areas. It presently has a backlog of more than a billion dollars in production contracts, and yet research is one of the fastest growing activities in the Company.

**3.** St. Louis is America's "City on the Go". In civic progress, in entertainment, in stores and homes, in industry, in sports and recreation, in education, in construction, in human involvement, St. Louis is the city with a "future" in the center of America.

**4.** You can best "change the world" by living in a world of change. The climate of St. Louis offers the mental and physical stimulation of four distinct seasons. How can you enjoy a warm fire without a new snowfall for comparison? What other natural phenomena than spring brings such a lift to your spirits? Who has failed to enjoy the comfort of a summer morning or the crisp smell of an autumn afternoon?

**5.** McDonnell's suburban location allows you to choose from the total spectrum of living locations. You may like the pace of apartment life at the heart of this 2½ million person metropolis. Or you might like the nearby suburbs with small city atmosphere and tree-lined streets. Just as convenient are rural areas, where you can live apart from the hustle yet be close enough to enjoy city-living advantages.

**6.** Naturally you want to earn your way and you want all you can earn. McDonnell wages are competitive with that of other industries. But being competitive isn't enough after you begin to show your mettle. Then, it is corporate policy to recognize the unique and individual efforts of those who strive for and achieve engineering excellence. Success will stem from a combination of inspiration and perspiration . . . probably 10% of the former and 90% of the latter. But if you're willing to work, you'll never need to worry about your economic and organizational progress at McDonnell.

**7.** Facilities at McDonnell are second to none in space, advanced aircraft and automation. You'll find organizational and physical working conditions that complement your skills and education. McDonnell testing and development facilities range from man-rated space chambers to Mach 28 wind tunnels, laboratories from microbiology to optics, computers from analog through hybrid to digital. You will find McDonnell is a team organization and nowhere is teamwork as essential as in the aerospace industry. Team organizations keep you from becoming a desk-bound engineer and stimulate the exchange of experience and knowledge so necessary to the development of wisdom.

**8.** The Gateway to Space is in St. Louis. You'll be working with the experienced men at McDonnell who designed the aircraft and spacecraft that have, for a decade, dominated aerospace technology. McDonnell is strongly oriented toward government contracting. It has demonstrated the talent that provides exceptional national service while returning worthwhile earnings to investors. As the fastest growing segment of our national economy, the Government provides a stable and continuing marketplace for those companies whose organization is oriented toward effectively serving the Nation's needs.

**9.** You may feel you've had enough education, but you'll soon decide to seek more. The McDonnell College Study Plan encourages self development and offers economic assistance plus adjusted work week benefits for advanced degree studies directly related to your job responsibilities. Many private and public colleges and universities in the area offer applicable programs.

**10.** Nowhere in industry can a young engineer find more job satisfaction than in contributing to national advancements in air and space. At McDonnell, pride in workmanship is a habit nurtured by the national acclaim that is the reward for success.

An Equal Opportunity Employer

# You've spent 4 years (or more) preparing for a job. How many will you spend finding the right one?

You don't need to waste a single year "exploring." Talk to the Allied Chemical interviewer—now. You'll find he does what most other interviewers don't.

He tries his level best to place you where you *want* to be. The right work...on the right product...and, if he can, in the right location.

It isn't always easy, but most times it works out fine. For Allied Chemical is a large company whose various operating divisions embrace over 100 plants...12 research and development centers...and a coast-to-coast network of sales offices. Our product list exceeds 3,000. Our interviewer will try to help you find a job within this vast complex that suits your talents, inclinations, and college training. One you'll want to stick with and grow in.

Ask your placement office when our interviewer will be on campus. Come prepared with all the questions you can think of and ask for information. You'll get it—and more. If you can't meet with him, write to: Director of Placement, Allied Chemical Corp., 40 Rector Street, New York, N.Y. 10006. An equal opportunity employer

# HUMOR:

## FILEABLES

### CONTINUED . . .

Judge: "So they caught you with this bundle of silverware? Whom did you plunder?"

Thief: "Two fraternity houses, your honor."

Judge: "Call up the downtown hotels, sergeant, and distribute this stuff."

\* \* \*

An entrant in a long distance swimming contest in the English Channel was a girl from Italy. She amazed everybody by outswimming, all the top athletes from the rest of the world." Questioned by reporters on her background, she explained the formula for success: "I was a street walker in Venice for two years."

\* \* \*

Journalism Prof's exam question: "Coleridge was a drug addict, Poe was an alcoholic, Marlowe was killed by a man whom he tried to stab, Chatterton killed himself, Byron was accused of incest. Do you still want to be a writer and if so why?"

\* \* \*

The maharajah of an interior Indian province decreed that no wild animals could be killed by the populace. Soon the country was overrun by man-eating tigers, lions, panthers, elephants and boars. The people could stand it no longer and gave the maharajah the heave-ho. This was the first instance on record where the reign was called on account of game.

\* \* \*

The weird scientist looked over reports on his life-preserving tonic. "HMMMMMM . . ." he mused, "I see where my elixir has had its first failure—a ninety-eight year old woman. Ah, but what's this? They saved the baby."

Advice to exhausted students: When wine, women and song become too much for you, give up singing.

\* \* \*

The reason today's coeds will do things their mothers wouldn't think of doing is that their mothers didn't think of doing them.

\* \* \*

The messenger had just caught sight of Birnam Wood descending upon Dunsinane. He turned to Macbeth and shouted: "Your majesty, cheese it, the copse!"

\* \* \*

Theta: "I finally consulted Doctor Jones about this craving I have for kisses every time I have a few drinks."

M.E.: "Good, what did he give you?"

Theta: "A few drinks."

\* \* \*

"Halt, who goes there?"

"American."

"Advance and recite the second verse of the 'Star Spangled Banner'."

"I don't know it."

"Proceed, American."

\* \* \*

The salesman's knock was answered by something beautiful.

"Oh, good morning, Madam. May I speak to your husband?"

"Sorry, he's gone away on business and won't be back for a week."

He took another long look, sighed, and asked, "May I come in and wait?"

\* \* \*

The eager relatives gathered for the reading of the will. It contained one sentence: "Being of sound mind, I spent every damn cent I had."

"Wanna sell that horse?"

"Sure I wanna sell the horse," the farmer replied.

"Can he run?"

"Are you serious? Watch."

The farmer reached over and slapped the horse on his posterior and the animal went galloping away. As the horse reached full speed, he ran smack into a tree.

"Is he blind?" the buyer gulped.

"Hell no," the farmer said easily, "he just don't give a damn."

\* \* \*

"I take the next turn, don't I?" asked the driver of the car.

The muffled reply from the back seat: "Like hell you do!"

\* \* \*

Did you hear about the millionaire who had his swimming pool full of martinis? It was impossible to drown—the deeper you sank, the higher you got.

\* \* \*

We've heard that poultry has gone up a nickel, but pigeons continue to drop a little.

\* \* \*

You unattached?

No, I'm just put together pretty sloppy.

\* \* \*

Mother: "Well, children, what have you been doing while I've been shopping?"

Child: "Oh, Mommy, we've been having so much fun! We've got Granny's hearing aid up to 50,000 watts—and you should see her nose glow!"

\* \* \*

Chief: "When anything goes wrong around the house I always fix it."

Wife: "Oh, yeah? Since you fixed the clock, the cuckoo backs out and asks 'What time is it?'"

# FILEABLES

A medium, giving a seance, was bringing back people from the other world. A nine-year-old boy was among those present.

"I want to talk to Grandpa," he said.

"Quiet! Quiet! hushed the medium.

"I want to talk to Grandpa," repeated the kid.

"Very well, little boy," conceded the medium, making a few hocus-pocus passes. "Here's your Grandpa."

"Hello, Grandpa, what are you doing up there? You ain't dead."

\* \* \*

An astronaut set his rocket down on a strange planet. The moment he stepped off the rocket, a number of little furry animals came running to him. "Take me to your leader," the astronaut requested. A little furry took him by the hand and led him to a large glass building. Sitting majestically on a throne was a large furry with a long pointed needle on his head. "Why do you have the needle on your head?" asked the puzzled astronaut. "Why, I'm the furry with the syringe on top!" was the reply.

\* \* \*

The little boy wanted \$100 so badly he decided to pray for it. He prayed several weeks with no results. So he wrote God. The post office finally forwarded the letter to the White House. The President chuckled and ordered \$5 sent to the boy. The lad, delighted that his prayers had been answered, in part at least, wrote a thank-you note to God, but added this P.S.: "I notice you routed my letter through Washington and, as usual, the damn bureaucrats deducted 95%."

\* \* \*

Two duck hunters were sitting behind the blind, one drinking from a thermos bottle of coffee, the other from a jug of whiskey. After some hours of sipping they spotted a lone duck winging through the sky. Taking aim, the coffee drinker rose, left fire, and missed. The whiskey drinker rose, let fire, and brought the duck down. His companion, properly amazed, complimented him on the shot. He replied, "Aw, it's nothing. I usually get five or six out of a flock like that."

A jealous husband returned home early from a business trip and found his wife in the undress.

"There's a man in the house," he said searching every room. When he went into the bathrom he discovered a shadow behind the shower curtain. Immediately he opened it and found a man standing in the tub. The man jerked the curtain closed again. "Please," he said, "I haven't finished voting yet!"

\* \* \*

An elderly man approached a small boy and asked: "Teil me young man, do you have a fairy godfather?"

"No," replied the little boy, "but I have an uncle we're all a little suspicious of."

\* \* \*

A young school teacher said to her best student, aged seven, "Tommy, if I lay one egg on the table and two on the chair, how many will I have altogether?"

"Personally," answered Tommy, "I don't think you can do it."

\* \* \*

A Ch.E. was experimenting with new formulas for beer. He labored on his various theories for over a year, and when finally hitting upon what he thought was a revolutionary process, he sent the formula to a laboratory to be analyzed.

The reply came back, "Your horse has diabetes."

\* \* \*

Victims of an accident in Scotland were still lying on the road. Along came a native and said to a man lying on his back: "Has the insurance man been 'roon yet?"

"No," was the reply.

"Ah, weel," said the Scot, "I'll just lie doon aside ye."

\* \* \*

Definition of Robot—A girl an engineer can make.

\* \* \*

At a recent convention of the American Institute for the Preservation of Wooden Toilet Seats it was decided that the organization's name was too long. Consequently they named it the Birch John Society.

\* \* \*

"Use a bottle opener, granny. You'll ruin your gums."

## LIFE OF A JOKE

1 minute: Freshman thinks of a joke and tells it one night to his girl friend.

1 day: Joke circulates through the women's dorm and senior engineer overhears it.

1 week: Senior sends jokes in to humor editor, claiming origination to himself. Humor editor thinks joke is miserable, but since deadline has been set up one day and he is desperate for five more lines he decides to use it.

1 month: Joke appears at bottom of gag page. Humor editor is forced into exile.

1 year: Joke circulates through every engineering college magazine from Alabama to Canada, and from New York to Washington.

2 years: Gag writer for a radio program finds local college magazine on a bus and sees joke therein. Joke appears on next week's program. Gag writer loses union card.

2½ years: Reader's Digest prints joke from radio program.

4 years: College professor finally gets around to reading the issue of Reader's Digest and laughs heartily at joke.

5-30 years: College professor uses joke to start off his lectures at beginning of each term.

35 years: Joke passes on as does college professor.

\* \* \*

A wedding ring is like a tourniquet: it stops circulation.

OUR NEW OFFICE FURNITURE →

## The world's foremost center of industrial engineering could be Building 56.

**There it is. Would you like to work there?**

"Industry has gone a long way toward satisfying those human needs which can be reached through money, benefits, and security. The future points to the job itself through improved job design as a source of increased performance and satisfaction."

That's what we say in a new paper coming out of Building 56. It relates the job design function of the industrial engineer to the sciences that study human behavior. Such a paper would not have come out of a company where top management is less than sold on the benefits of leading the field in applying the most advanced concepts in industrial engineering no less than in chemical, mechanical, or electrical engineering. We have a balance sheet to prove that our management knows which way is up.

Industrial engineers can come into Building 56 either from college, from graduate school, from military service, or from a well-reasoned decision that their present employment is not what they want for the long haul.

Once in and with a little time gone by, choice confronts a good industrial engineer. Does he want to

remain an industrial engineer and enjoy a status in his profession that may be more difficult to attain for industrial engineers who practice under conditions less favorable than prevail at Kodak? Or do multiple regression technique and mathematical model building and behavioral research mean less to him than swinging over to one of Building 56's intramural clients and there starting his way up to where the whole mighty, fascinating, and gloriously diversified ship is steered?

The fact that parallel choices have to be made by those who join us as chemical, mechanical, or electrical engineers will not be mentioned here for lack of space.

We'd be honored to have a note about yourself. Write Business and Technical Personnel Department, EASTMAN KODAK COMPANY, Rochester, N. Y. 14650.

An equal-opportunity employer offering a choice of four locations: Rochester, N. Y., Kingsport, Tenn., Longview, Texas, and Columbia, S. C.

**like beautiful cities**

A technical career at General Electric can put you in the position to help beautify our cities.

Inquisitive minds in research and advance development at G.E. are evolving many concepts to give our cities a clean, all-electric look. Design engineers are translating concepts into components and systems, while manufacturing engineers are developing the methods and machines that bring designs into being as useful products.

Technical marketing specialists are working with electric utilities and city planners to give mushrooming urban landscapes like Phoenix, Atlanta and Chicago, a bright, all-electric face.

Urban living has already begun to change as a result of the contributions made by General Electric engineers and scientists, contributions like air and water purification systems, underground power equipment to preserve nature's beauty, all-electric heating facilities, rapid-transit systems, and a hundred more.

You can help develop new products and concepts, new facilities, processes, and manufacturing systems, or new applications and markets in your technical career with General Electric. For more information write: D. E. Irwin, Section 699-20, Schenectady, New York 12305.
