FOREWORD

The record of developments and trends in the mineral industry of the United States in 1939 is set forth with statistical detail and analysis in the 1940 edition of Minerals Yearbook, presented by the Bureau of Mines herewith for the information and guidance of industry, Government, and the general public. The current volume is the latest product of a program of voluntary cooperation of industry with Government that was inaugurated more than 70 years ago and has been maintained upon an annual basis without interruption for 60 years. It includes the economic and statistical data essential for effective planning of future operations of the mineral industry and for the formation of Government policy with respect to the irreplaceable mineral resources of the country. The value to industry of maintaining comprehensive and cumulative economic data on production, consumption, sources, prices, and stocks of mineral commodities is a fact of common understanding and application. In pursuing its policy of supplying the mineral industries with useful and timely data, the Bureau of Mines during 1939 established a quarterly survey of consumption and dealer and consumer stocks of iron and steel scrap. Thus, for the first time industry has available reliable current information on inventories and rate of use of this important raw material.

The value of statistical and economic data for Government use was strikingly illustrated in 1939 when the Army and Navy Munitions Board called upon the Bureau to supplement its annual statistics with monthly reports on the strategic minerals required for industrial preparedness. Further expansion of its basic fact-finding activities is needed to provide necessary data for the national defense program.

The course of mineral production during the year under review represented an encouraging measure of recovery from the depressed levels of 1938. After the first quarter the rise in volume of production was steadily upward through September and was characterized by reaction thereafter as domestic production overtook demand and the impetus of the outbreak of war in Europe was not sustained. Although the effect upon domestic mineral markets of the existing military conflicts in Europe and the Far East is at present obscure, domestic demand contains encouraging elements sustained by prospective needs for a comprehensive program of national preparedness that promises to require some years for completion. In plans for the development of both foreign and domestic outlets for its products the mineral industry of the United States will find of major value the record of past performances preserved in the current Minerals Yearbook and its predecessors. The present emergency has emphasized the need for more detailed and, in some instances, more frequent statistical surveys. To meet this need the Bureau of Mines plans, should additional funds be provided, to expand and expedite its surveys of the more important commercial minerals, thereby providing producers and consumers of mineral products with the means for following short-time changes in conditions of supply and demand of the leading mineral commodities. Thus, the Bureau of Mines would materially enhance its service of providing the earliest and most complete official data covering the fundamental economic phases of the mineral industry.

R. R. SAYERS, *Director*.

JUNE 25, 1940.

CONTENTS

INTRODUCTION

Although the trend of business for the first 5 months of 1939 was downward, the year as a whole showed a marked improvement over 1938. The index of the volume of industrial production of the Federal Reserve Board, generally accepted as the most reliable business indicator, was 106 for 1939, an advance of 23 percent from 86 in 1938. This index, adjusted for seasonal variation, was 101 in January but dropped to 92 in April and May. Beginning in June it started a steady rise indicative of substantial improvement in virtually all lines of business. In the last quarter, under the impetus of actual and anticipated war orders, the index remained above 120 and actually reached an all-time peak of 128 in December. This spurt was short-lived, for the index slumped sharply for the first 4 months of 1940 before turning upward in May.

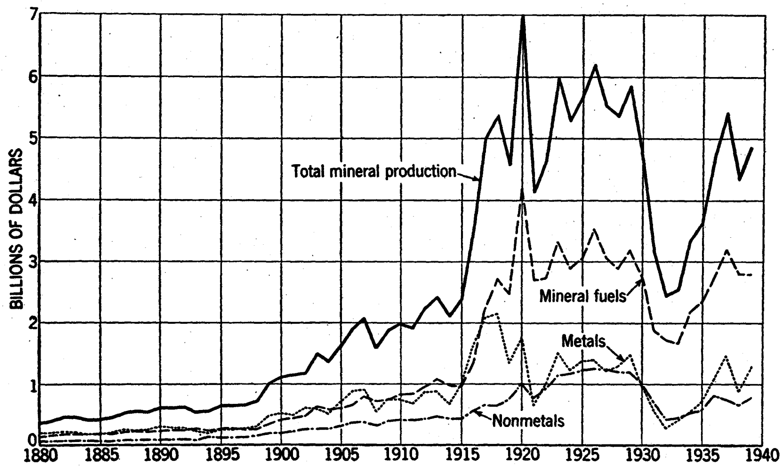

FIGURE 1.—Mineral production of the United States, 1880–1939.

Mineral production did not advance as rapidly in 1939 as business in general, although the index for the year was 108, 2 points higher than that for all industrial activity. In 1938 the spread was quite pronounced—99 for minerals and 86 for industrial activity. The preliminary total value of mineral production in the United States in 1939, as reported to the Bureau of Mines by producers, was $4,874,000,000, an increase of 12 percent from $4,362,900,000 in 1938. Metals, as a group, led with a rise of 45 percent in value, followed by nonmetals (other than fuels) with 18 percent; fuels decreased 0.06 percent.

The steel industry paced the industrial advance of the closing months of 1939, with production rising to a peak of 94.4 percent of capacity for the week ended December 2. Output of pig iron in 1939 was 84 percent above that in 1938. The greater activity in all phases of the iron and steel industry of course was reflected in sharply increased demand for iron ore, alloying metals, coke, fluorspar, fluxing stone, refractories, molding sand, and other lesser materials. The nonferrous metals—copper, lead, zinc, aluminum, and others—also were produced at a rate substantially above that for 1938. Gold output continued its steady advance of the past several years.

Production of the principal fuels—bituminous coal, anthracite, petroleum, and natural gas—was higher than in 1938, but the increases were relatively small compared to those of the metals. The building materials group—cement, sand and gravel, stone, clay products, gypsum, and lime—likewise achieved only moderate increases in 1939, quite in line with an 11-percent rise in construction contracts awarded. Production of virtually all other nonmetals was higher than in 1938.

Strategic minerals.—The Strategic Materials Act (Public, No. 117—76th Congress, chapter 190, 1st session) which was signed by the President on June 7, 1939, authorized the expenditure of $100,000,000 over a 4-year period for the purchase of strategic materials. Only $10,000,000 was appropriated in the Third Deficiency Bill, approved August 2, 1939 (Public, No. 361—76th Congress, chapter 633, 1st session), and purchases were restricted largely to the high-priority mineral commodities on the strategic list—manganese, chromium, tungsten, tin, and quartz crystals. The act also provided for the investigation of domestic sources of strategic minerals by the Bureau of Mines and the Geological Survey, and this work has been carried on actively since July 1, 1939. Information regarding progress in building stock piles, as well as the search for domestic sources, is supplied in the chapters on the various strategic minerals in this volume.

International production and trade statistics.—Anticipation of the conflict that began on September 1 influenced adoption earlier in 1939 of foreign trade control and domestic conservation measures by nearly all European countries and their colonies. However, soon after the outbreak of war, the belligerents and their overseas possessions as well as many European neutrals adopted more stringent systems of control over their foreign trade. In some instances these wartime measures comprised licensing regulations applicable to each prospective transaction. These controls of Great Britain and France have operated to curtail importations of many raw materials from sources outside their own dominions and to increase importations from elsewhere of commodities essential for the war economy. They also have hindered by delays in issuance of export licenses, reductions in export quotas, etc., the ability of neutrals as a group to purchase their requirements of certain minerals. Although Great Britain adopted the policy of purchasing raw materials from within the Empire whenever possible to conserve its foreign exchange, the United States as a neutral encountered relatively little difficulty, under trade regulations of the Emergency Powers (Defense) Act of August 1939 or later legislation, in acquiring essential materials, such as tin, chromite, and mica available in British Dominions. The French trade restrictions likewise failed to interfere seriously with purchases by American consumers. Despite unavoidable delays at first in obtaining licenses for export to the United States of graphite from Madagascar and mica from British India, owing to wartime restrictions, by the end of 1939 consumers in the United States were able to obtain from British, French, and nonbelligerent sources tonnages of strategic and critical materials adequate to satisfy domestic requirements.

As the war advanced numerous revisions and additions to the control measures were adopted by the belligerents and neutrals and were made known promptly throughout the trading world. However, suppression by a large majority of European countries of all details regarding the importation and exportation of mineral commodities as well as production data, effective in September or October 1939, has made impossible any analysis of world mineral production and trade during the year. Consequently no chapter on the subject appears in this volume of the Yearbook.

Minerals Yearbook series.—Minerals Yearbook, 1940, carries the progress made in Minerals Yearbook, 1939, in presenting final data for the year under review one step farther by including complete final statistics for coke. In this volume only the chapters on bituminous coal, petroleum, natural gas, and natural gasoline are based upon preliminary data for 1939.

The practice of issuing preprints of separate chapters in advance of the bound volume has met with widespread favor and is being continued this year; 46 chapters have been printed and distributed. This procedure was adopted with some misgiving because of its potential effect in lowering sales of the bound volume. This apprehension proved to be unfounded, for the sales edition of each of the past two volumes was exhausted long before the succeeding volume was available.

Acknowledgments.—By act of Congress the collection of production statistics of the bituminous-coal industry, previously conducted by the Bureau of Mines, was transferred to the National Bituminous Coal Commission July 1, 1937. Through the cooperation of this agency and its successor, the Bituminous Coal Division, United States Department of the Interior, the statistical record of the industry, maintained by the Geological Survey and the Bureau of Mines since 1880, remains unbroken. The cooperation of the Bituminous Coal Division in contributing the chapter on Bituminous Coal in this volume is gratefully acknowledged.

Presentation of data on imports and exports in Minerals Yearbook is made possible through the cooperation of the Bureau of Foreign and Domestic Commerce.

The statistical program of the Bureau of Mines depends entirely on the good will and voluntary cooperation of those interested in mining. It is a pleasure to acknowledge the generous support of thousands of individual mine operators, distributors, and consumers, as well as the many public officials and agencies that have returned questionnaires or otherwise supplied information. In addition, the Bureau is indebted to a large number of trade associations for liberal contributions of data and advice.

In several States the Bureau of Mines receives the formal cooperation of the State geologist or comparable State official in collecting mineral statistics. This arrangement eliminates duplication of canvasses by the State and Federal Governments and, through field contacts of the State officials, tends to improve the accuracy and coverage of the production data. State agents cooperating in the 1939 canvass were: Stewart J. Lloyd, acting State geologist, Univer-

sity, Ala.; Herman Gunter, State geologist, Tallahassee, Fla.; Garland Peyton, director, division of mines, mining, and geology, Department of Natural Resources, Atlanta, Ga.; M. M. Leighton, chief, and Walter H. Voskuil, mineral economist, State geological survey division, Urbana, Ill.; A. C. Trowbridge, director, Iowa Geological Survey, Iowa City, Iowa; Raymond C. Moore, State geologist, Lawrence, Kans.; Edward B. Mathews, State geologist, Baltimore, Md.; R. A. Smith, State geologist, Lansing, Mich.; H. A. Buehler, State geologist, Rolla, Mo.; Meredith E. Johnson, State geologist, Trenton, N. J.; H. J. Bryson, State geologist, Raleigh, N. C.; Robert H. Dott, director, Oklahoma Geological Survey, Norman, Okla.; E. P. Rothrock, State geologist, Vermillion, S. Dak.; E. H. Sellards, director, bureau of economic geology, Austin, Tex.; Arthur Bevan, State geologist, and Linwood H. Warwick, chief clerk, Virginia Geological Survey, Charlottesville, Va.; Harold E. Culver, supervisor, division of geology, department of conservation and development, Pullman, Wash.; and E. F. Bean, State geologist, Madison, Wis. In addition, Walter W. Bradley, State mineralogist, San Francisco, Calif., assisted in the compilation of statistics for California.

In addition to preparing the statistical summary of mineral production each year Martha B. Clark has been largely responsible for the maintenance of continuity of data and uniformity of statistical presentation throughout the Minerals Yearbook volumes.

Elva T. Shuey served as editorial associate in reviewing and checking chapters. Max Abel assisted in the administrative details of the Yearbook program, and Cecilia W. Justice helped in many phases of the work. The illustrations for the volume were prepared in the graphic section of the Bureau under the direction of Louis F. Perry. Mabel E. Winslow supplied helpful suggestions for improving individual contributions and, in collaboration with Eleanor C. Reid and Estelle R. Templeton, was responsible for the editing of the entire manuscript.

PART I. SURVEY OF THE MINERAL INDUSTRIES

STATISTICAL SUMMARY OF MINERAL PRODUCTION

(GENERAL UNITED STATES SUMMARY AND DETAILED PRODUCTION BY STATES)

By MARTHA B. CLARK

SUMMARY OUTLINE

INTRODUCTION

This report continues the series of annual statistical summaries published in previous years as chapters of Mineral Resources and Minerals Yearbook.

UNIT OF MEASUREMENT

The unit of measurement used by the Bureau of Mines for each mineral product in reports on the mineral resources is that common to the industry concerned, and the variation in these units makes it impracticable, if not impossible, directly to combine and compare the different minerals except as to value. Although most of the products are measured by weight, some are measured by volume and some by number of "pieces," etc.; for some no total quantity figures are available.

ELIMINATION OF DUPLICATION

In the totals for the United States, shown in the following "general" tables, duplication has been eliminated wherever practicable, and in the State totals given in the State tables virtually all duplication has been eliminated. For instance, in both general and State tables the output of coke is shown but its value is not included in the totals, as the value of the coal used in its manufacture enters into the value of the coal production which is included in the totals. For asphalt, both native and oil are shown in the general tables, but the value of the oil asphalt is excluded from the totals as it duplicates that of the petroleum from which it is manufactured. For the clay industries, no figures are available for total clay produced. For years before 1936, the total value of clay products is included in both general and

State totals as representing the first marketable form of the greater part of the clay produced; the quantity and value of the clay mined and sold in the raw state by miners to users of clay are shown separately also, but the value is not included in the totals as it is duplicated largely in that for clay products. For years beginning with 1936, as the Bureau of Mines believes that a closer approach to the value of domestic clay in its first marketable form results from the inclusion of the value of clay sold by producers and of clay products other than pottery and refractories, the United States and State totals include such values for the clay industries. This change in practice should be borne in mind when comparing the values beginning 1936 with those for earlier years.

United States totals.—In the general tables both iron ore and pig iron are shown, but the value of the pig iron rather than the iron ore is included in the United States totals, as that is considered the better means of presenting the statistics for iron in its first marketable form. For gold, silver, copper, lead, and zinc the value of "smelter output" is included in the general totals, and to account more fully for the value of the ores treated these smelter figures are supplemented by the value of the byproduct sulfuric acid. The value of pigments (white lead, red lead, lithopone, litharge, and orange mineral) manufactured from metals is not included in the general tables, as the base from which they are made is included in the output of lead or zinc, whereas the value of sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide is included, as these are made in large part direct from the ores and do not enter into the lead or zinc totals, which represent smelter output.

State totals.—In the State tables also iron ore and pig iron are both shown. As blast-furnace products cannot be traced to the States in which the ore is mined, the value of the ore is used in the State totals. For ores of gold, silver, copper, lead, and zinc no values are shown, and in fact none are recorded; instead, for each of these metals the recoverable content of the ores is used as the basis of valuation. The value of the zinc and lead pigments is not included in the State total, as the recoverable zinc and lead content of the ores from which the products were made is included under zinc or lead. The value of the sulfuric acid produced as a byproduct of copper and zinc smelting and zinc roasting is not included in the State total, as tracing this product back to the State producing the ore has not been possible.

GENERAL TABLES

Mineral products of the United States, 1937–39 [1]

Product	1937		1938		1939	
	Quantity	Value	Quantity	Value	Quantity	Value
METALLIC						
Aluminum ... pounds	292,681,000	$55,609,000	286,882,000	$56,659,000	327,090,000	$64,600,000
Antimonial lead ... short tons (2,000 pounds)	[2] 27,524	(2)	[2] 24,123	(2)	[2] 21,995	(2)
Antimony:						
Metal ... do	4,057	(3 4)	(3 4)	(3 4)	(3 4)	(3 4)
Ore and concentrates ... do	4,250	137,600	2,730	61,500	3,174	37,200
Bauxite ... long tons (2,240 pounds)	420,232	2,444,686	311,354	1,812,545	375,301	2,166,236
Cadmium ... pounds	3,995,739	4,555,000	3,753,323	2,815,000	4,141,242	2,236,000
Chromite ... long tons	2,321	14,888	812	10,730	3,614	46,892
Copper,[5] sales value ... pounds	1,669,322,278	201,988,000	1,124,656,539	110,216,000	1,425,349,488	148,236,000
Ferro-alloys ... long tons	970,651	86,140,492	464,112	42,459,513	841,162	76,156,588
Gold [6] ... troy ounces	4,804,540	168,158,900	5,089,811	178,143,400	5,611,171	196,391,000
Iron:						
Ore [4] ... long tons	72,347,785	[4] 207,828,213	26,430,910	[4] 74,322,405	54,820,589	[4] 158,511,338
Pig ... do	35,224,347	731,139,435	18,202,354	356,875,369	32,091,485	626,824,690
Lead (refined),[5] sales value ... short tons	443,142	52,291,000	331,964	30,541,000	420,967	39,571,000
Magnesium (new ingot) ... pounds	4,539,980	(7)	4,819,617	(7)	10,650,121	(7)
Manganese ore (35 percent or more Mn) ... long tons	40,241	1,062,399	25,321	681,679	29,307	794,746
Manganiferous ore (5 to 35 percent Mn) ... do	1,340,972	3,857,768	308,860	858,356	709,247	2,148,321
Mercury:						
Metal ... flasks (76 pounds net)	16,508	1,488,691	17,991	1,357,781	18,633	1,936,714
Ore ... short tons	(8)	(9)	(8)	(9)	(8)	(9)
Molybdenum ... pounds	30,122,000	20,571,000	25,727,000	17,977,000	32,415,000	22,157,000
Nickel ... short tons	219	(7)	416	(7)	394	(7)
Ores (crude), old tailings, etc.:						
Copper ... do	61,640,000	(9)	37,871,000	(9)	(10)	(9)
Dry and siliceous (gold and silver) ... do	17,355,000	(9)	18,038,000	(9)	(10)	(9)
Lead ... do	5,670,000	(9)	4,103,000	(9)	(10)	(9)
Lead-copper ... do	2,000	(9)	1,000	(9)	(10)	(9)
Zinc ... do	12,693,000	(9)	7,873,000	(9)	(10)	(9)
Zinc-copper ... do			33,000	(9)	(10)	(9)

Mineral products of the United States, 1937–39—Continued

Product	1937		1938		1939	
	Quantity	Value	Quantity	Value	Quantity	Value
SUMMARY						
Total value:						
Metallic		$1,468,200,000		$892,400,000		$1,291,000,000
Nonmetallic:						
Fuels		3,200,500,000		2,820,300,000		2,818,600,000
Other		744,700,000		650,200,000		764,400,000
Grand total approximate value of mineral products		5,413,400,000		4,362,900,000		4,874,000,000

[1] In this general statement certain of the figures represent shipments rather than quantity mined, and some of the figures for 1939 are subject to revision. For details see following chapters of this volume.
[2] Figures represent antimonial lead produced at primary refineries from both domestic and foreign primary and secondary sources; no figures for value of antimonial lead available. Estimate of value of primary antimony and lead contents of antimonial lead from domestic sources included in total value of metallic products.
[3] Largely from foreign ore; Bureau of Mines not at liberty to publish figures.
[4] Value not included in total value. [5] Product from domestic ores only.
[6] According to Bureau of the Mint. Valued at $35 per ounce.
[7] Value included in total value of metallic products; Bureau of Mines not at liberty to publish figures.
[8] Figures not available. [9] Figures showing values not available.
[10] Figures for 1939 not yet available. [11] According to Bureau of the Mint.
[12] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.
1937: Bismuth, iron ore sold for magnets (2 long tons), and iron ore sold for paint (8,375 long tons, $48,005).
1938: Bismuth, iron ore sold for magnets (2 long tons), and iron ore sold for paint (9,694 long tons, $44,249).
1939: Bismuth and iron ore sold for paint (12,235 long tons, $66,817).
[13] Figures obtained through cooperation with Bureau of the Census. Figures for 1939 not yet available; estimate of value included in total value of nonmetallic products.
[14] Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.
[15] According to Bituminous Coal Division.
[16] Value is estimated from various sources and includes selling expenses.
[17] Value included in total value of nonmetallic products; Bureau of Mines not at liberty to publish figures.
[18] No canvass. Estimate of value included in total value of nonmetallic products.
[19] Figures cover fiscal year ended June 30 of year stated.
[20] Largely for use in manufacture of pigments. Figures for quantity of pigment not available.
[21] Canvass discontinued after 1915. Figures for iron ore sold for paint given in footnote 12.
[22] Sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide.
[23] Equivalent as K_2O.
[24] Figures for soapstone used as dimension stone included in figures for stone.
[25] From copper and zinc smelters and zinc roasters and from roasting of high-sulfide gold and silver concentrates.
[26] Figures not yet available; estimate of value included in total value of nonmetallic products.
[27] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.
1937: Natural sulfonated bitumen, chats (5,976,040 short tons, $624,111), flint lining for tube mills, optical fluorspar (50 pounds, $120), pebbles for grinding, silica sand and sandstone (ground) (328,156 short tons, $1,996,528), and sulfur ore (221 long tons, $2,296).
1938: Natural sulfonated bitumen, chats (2,836,700 short tons, $414,300), flint lining for tube mills, optical fluorspar (5 ounces, $5), pebbles for grinding, and silica sand and sandstone (ground) (237,167 short tons, $1,425,445).
1939: Aplite, natural sulfonated bitumen, chats (2,237,000 short tons, $314,200), flint lining for tube mills, optical fluorspar (undetermined quantity, $25), pebbles for grinding, silica sand and sandstone (ground) (310,512 short tons, $1,930,301), and sulfur ore (79 long tons, $743).

Value of mineral products of the United States, 1880–1939 [1]

Year	Metallic	Nonmetallic			Grand total
		Fuels [2]	Other	Total	
1880 [1]	$190,881,000	$120,241,000	$56,341,000	$176,582,000	$367,463,000

1933	417,065,000	1,683,400,000	454,635,000	2,138,035,000	2,555,100,000
1934	548,934,000	2,233,300,000	543,166,000	2,776,466,000	3,325,400,000
1935	733,130,000	2,330,000,000	586,870,000	2,916,870,000	3,650,000,000
1936	1,081,600,000	2,759,200,000	716,000,000	3,475,200,000	4,556,800,000
1937	1,468,200,000	3,200,500,000	744,700,000	3,945,200,000	5,413,400,000
1938	892,400,000	2,820,300,000	650,200,000	3,470,500,000	4,362,900,000
1939 [3]	1,291,000,000	2,818,600,000	764,400,000	3,583,000,000	4,874,000,000
Grand total	44,731,627,000	80,773,252,000	27,846,410,000	108,619,662,000	153,351,289,000

[1] Figures for earlier years not available.
[2] Coal, natural gas, natural gasoline, petroleum.
[3] Subject to revision.

The sum of the following State totals does not reach the total for the United States given in the preceding table partly because figures for certain of the products included in the United States total are not available by States of origin. This fact is brought out in the opening text of this chapter and in the second table following.

In addition, there are many factors (the more important discussed in the opening text) that account for the disagreement between the sum of the State totals and the grand total for the United States, by products. Chief among these are: (1) The use of iron ore values in State totals and pig iron values in United States total; (2) the use of mine figures for gold, silver, copper, lead, and zinc in the State totals and mint and smelter figures (supplemented by the value of byproduct sulfuric acid from copper and zinc smelting and zinc roasting and the value of zinc and lead pigments made in large part direct from ores) in the United States total; and (3) the inclusion of estimates in the United States total for a few products for which no canvass has been conducted for many years and for which no estimate by States is made.

Many other less important differences are involved, but both State and United States totals are as complete and definite as seems possible with the data available. The practice is consistent from year to year, and it is believed that the reader can determine readily just what minerals are covered by the total concerned.

In every table each mineral produced is listed, and all figures are shown except those that the Bureau of Mines is not at liberty to publish.

Value of mineral products of the United States, 1936–38, by States[1]

State	1936	1937	1938
Alabama	$44,752,688	$53,518,993	$46,296,293
Alaska	23,737,714	27,927,958	27,664,146
Arizona	60,532,996	94,564,494	60,756,253
Arkansas	21,296,783	25,578,393	29,395,086
California	437,565,809	476,880,603	489,948,802
Colorado	56,214,827	67,338,548	60,369,440
Connecticut	3,317,494	3,689,554	3,059,688
Delaware	444,093	397,362	320,621
District of Columbia	547,576	522,687	568,717
Florida	12,973,243	13,811,958	12,866,981
Georgia	11,756,592	12,584,060	11,598,421
Idaho	29,965,964	40,633,119	31,738,606
Illinois	117,916,128	133,437,554	130,155,083
Indiana	52,281,539	54,886,756	47,892,364
Iowa	28,359,140	26,941,350	24,794,058
Kansas	121,689,562	154,376,403	129,675,438
Kentucky	113,435,307	127,423,680	106,654,903
Louisiana	153,358,397	182,118,905	172,306,761
Maine	3,423,353	4,129,391	3,548,638
Maryland	11,157,550	10,634,854	9,407,723
Massachusetts	7,559,253	7,813,345	6,666,281
Michigan	100,646,492	119,167,573	81,380,602
Minnesota	94,568,991	152,107,070	51,425,289
Mississippi	3,846,104	4,821,950	5,209,547
Missouri	41,350,860	52,446,272	39,560,739
Montana	65,569,150	82,086,815	48,602,547
Nebraska	3,843,562	4,837,809	4,028,712
Nevada	32,693,129	38,871,816	27,031,281
New Hampshire	1,182,055	1,219,869	1,146,606
New Jersey	24,421,046	31,467,931	24,408,545
New Mexico	45,942,006	72,855,745	63,568,953
New York	71,647,775	77,665,874	73,217,430
North Carolina	9,955,519	11,160,444	14,959,228
North Dakota	2,902,453	2,873,011	2,653,473
Ohio	122,684,043	131,025,104	104,812,531
Oklahoma	305,191,649	367,444,222	272,860,078
Oregon	7,080,975	6,609,710	7,536,091
Pennsylvania	599,457,486	599,817,364	472,773,327
Rhode Island	929,103	862,710	911,599
South Carolina	3,432,662	4,022,325	4,364,034
South Dakota	23,221,620	23,472,873	23,583,359
Tennessee	31,121,865	34,893,847	32,428,512
Texas	638,643,488	813,290,605	740,147,465
Utah	61,209,302	105,652,422	59,236,355
Vermont	6,225,396	7,042,547	6,439,552
Virginia	37,295,168	46,019,085	42,370,169
Washington	22,921,456	26,658,257	21,167,004
West Virginia	271,501,941	306,590,947	254,995,309
Wisconsin	13,277,983	15,239,524	10,636,741
Wyoming	34,498,261	41,087,908	37,364,363

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis. State totals for 1939 not yet available.

Mineral products of the United States and principal producing States in 1938

Rank in value	Product	Principal producing States [1]	
		In order of quantity	In order of value
14	Aluminum	New York, Tennessee, North Carolina	Rank same as for quantity.
(2)	Antimonial lead	Not separable by States	Not separable by States.
80	Antimony ore	Idaho, Alaska, California, Nevada	Alaska, Idaho, California, Nevada.
61	Arsenious oxide	Montana, Utah, Idaho	Rank same as for quantity.
69	Asbestos	Vermont, Arizona, Maryland	Do.
	Asphalt:		
35	Native	Kentucky, Texas, Alabama, Oklahoma	Kentucky, Utah, Texas, Oklahoma.
18	Oil	Not separable by States	Not separable by States.
38	Barite (crude)	Missouri, Georgia, California, Tennessee	Rank same as for quantity.
39	Bauxite	Arkansas, Alabama, Georgia	Do.
53	Bismuth	Not separable by States	Not separable by States.
90	Bitumen (natural sulfonated)	Utah	Rank same as for quantity.
32	Borates	California	Do.
28	Bromine	North Carolina, Michigan, California, West Virginia	Do.
36	Cadmium	Not separable by States	Not separable by States.
57	Cadmium compounds	do	Do.
48	Calcium-magnesium chloride	Michigan, West Virginia, Ohio	Rank same as for quantity.
7	Cement	Pennsylvania, California, Michigan, Texas	Pennsylvania, California, Texas, Michigan.
59	Chats	Oklahoma, Missouri, Kansas	Rank same as for quantity.
86	Chromite	California	Do.
	Clay:		
10	Products (other than pottery and refractories).		Ohio, Pennsylvania, California, Illinois.
26	Raw (sold by producers)	Georgia, Pennsylvania, California, Ohio	Georgia, Pennsylvania, California, Missouri.
2	Coal:		
	Bituminous	West Virginia, Pennsylvania, Illinois, Kentucky	Rank same as for quantity.
	Pennsylvania anthracite	Pennsylvania	Do.
6	Coke	Pennsylvania, New York, Ohio, Alabama	Pennsylvania, New York, Ohio, Indiana.
9	Copper	Arizona, Utah, Montana, Michigan	Rank same as for quantity.
47	Diatomite	California, Oregon, Washington, Nevada	California, Oregon, Washington, New York.
52	Feldspar (crude)	North Carolina, South Dakota, Colorado, New Hampshire	North Carolina, New Hampshire, South Dakota, Colorado.
15	Ferro-alloys	Pennsylvania, New York, Ohio, West Virginia	Pennsylvania, New York, West Virginia, Ohio.
88	Flint lining for tube mills	Minnesota	Rank same as for quantity.
42	Fluorspar	Illinois, Kentucky, New Mexico, Nevada	Do.
40	Fuller's earth	Georgia, Texas, Illinois, Florida	Georgia, Texas, Florida, Illinois.
72	Garnet (abrasive)	New York, North Carolina, New Hampshire	New York, New Hampshire, North Carolina.
(3)	Gems and precious stones	No canvass for 1938	No canvass for 1938.
5	Gold	California, Alaska, South Dakota, Colorado	Rank same as for quantity.
85	Graphite:		
	Amorphous	Nevada	Do.
	Crystalline	New York, Georgia	Do.
70	Grindstones and pulpstones	Ohio, West Virginia, Washington	Do.

33	Gypsum (crude)	New York, Michigan, Iowa, Texas	New York, Michigan, Iowa, Nevada.
77	Helium	Texas	Rank same as for quantity.
67	Iodine (natural)	California	Do.
	Iron:		
13	Ore	Minnesota, Alabama, Michigan, Pennsylvania	Minnesota, Michigan, Alabama, Pennsylvania.
4	Pig	Pennsylvania, Ohio, Alabama, Indiana	Pennsylvania, Ohio, Indiana, Illinois.
55	Sinter	Tennessee	Rank same as for quantity.
(4)	Kyanite	No figures available	No figures available.
19	Lead	Missouri, Idaho, Utah, Oklahoma	Rank same as for quantity.
21	Lime	Ohio, Pennsylvania, Missouri, West Virginia	Ohio, Pennsylvania, Missouri, Virginia.
81	Lithium minerals	South Dakota, California	California, South Dakota.
56	Magnesite (crude)	Washington, California	Rank same as for quantity.
49	Magnesium	Michigan	Do.
43	Magnesium salts (natural)	Michigan, Nevada, California, Washington	Michigan, California, Nevada, Washington.
58	Manganese ore	Montana, Tennessee, Georgia, Arkansas	Montana, Tennessee, Arkansas, Georgia.
54	Manganiferous ore	Minnesota, Michigan, New Mexico, Arkansas	Rank same as for quantity.
78	Manganiferous zinc residuum	New Jersey	Do.
	Marl:		
82	Calcareous	West Virginia, Virginia, Nevada, Wisconsin	Do.
73	Greensand	New Jersey	Do.
45	Mercury	California, Oregon, Texas, Nevada	Do.
60	Mica	North Carolina, Virginia, California, South Dakota	North Carolina, Connecticut, Virginia, New Hampshire.
	Scrap	do	North Carolina, Virginia, Connecticut, South Dakota.
	Sheet	North Carolina, Connecticut, New Hampshire, Georgia	Rank same as for quantity.
89	Millstones		Virginia, New York.
24	Mineral paints (zinc and lead pigments)	Pennsylvania, Kansas, Illinois, Indiana	Pennsylvania, Illinois, Kansas, Indiana.
(3)	Mineral waters	No canvass for 1938	No canvass for 1938.
23	Molybdenum	Colorado, Utah, Arizona, New Mexico	Rank same as for quantity.
3	Natural gas	Texas, California, Louisiana, Oklahoma	Texas, California, West Virginia, Louisiana.
11	Natural gasoline	Texas, California, Oklahoma, Louisiana	California, Texas, Oklahoma, Louisiana.
66	Nickel	Not separable by States	Not separable by States.
74	Oilstones, etc	Ohio, New Hampshire, Indiana, Arkansas	Ohio, Arkansas, New Hampshire, Indiana.
(4)	Olivine	No figures available	No figures available.
(5)	Ores (crude), etc.:		
	Copper	Arizona, Utah, Nevada, Michigan	Value not available.
	Dry and siliceous (gold and silver)	Alaska, California, Nevada, South Dakota	Do.
	Lead	Missouri, Idaho, Utah, Nevada	Do.
	Lead-copper	New Mexico, Arizona, Colorado	Do.
	Zinc	Oklahoma, Kansas, Tennessee, New Jersey	Do.
	Zinc-copper	Arizona	Do.
	Zinc-lead	Oklahoma, Kansas, Idaho, Virginia	Do.
65	Peat	New York, New Jersey, Michigan, California	Rank same as for quantity.
87	Pebbles for grinding	California, Minnesota	Minnesota, California.
1	Petroleum	Texas, California, Oklahoma, Louisiana	Rank same as for quantity.
25	Phosphate rock	Florida, Tennessee, Montana, Idaho	Florida, Tennessee, Idaho, Montana.
46	Platinum and allied metals	Alaska, California, Oregon	Rank same as for quantity.
27	Potassium salts	New Mexico, California, Maryland, Utah	Do.
63	Pumice	Kansas, California, Nebraska, Oklahoma	Kansas, California, New Mexico, Nebraska.
41	Pyrites	Tennessee, Virginia, New York, California	Tennessee, Virginia, California, New York.

[1] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output.
[2] Separate figures for antimonial lead from primary sources not available. [3] No canvass for 1938. [4] No figures available. [5] Value not available.

Mineral products of the United States and principal producing States in 1938—Continued

Rank in value	Product	Principal producing States: In order of quantity	Principal producing States: In order of value
22	Salt	Michigan, New York, Ohio, Louisiana	Michigan, New York, Louisiana, Kansas.
12	Sand and gravel	New York, Illinois, California, Michigan	California, New York, Pennsylvania, Illinois.
50	Sand-lime brick	New York, Massachusetts, Minnesota, Michigan	New York, Massachusetts, Michigan, Minnesota.
68	Selenium	Not separable by States	Not separable by States.
77	Silica (quartz)	Wisconsin, Ohio, California, Tennessee	Wisconsin, California, Ohio, North Carolina.
44	Silica sand and sandstone (ground)	Illinois, New Jersey, Pennsylvania, Ohio	Illinois, New Jersey, West Virginia, Ohio.
17	Silver	Idaho, Utah, Colorado, Arizona	Rank same as for quantity.
30	Slate		Pennsylvania, Vermont, New York, Virginia.
29	Sodium salts (other than NaCl) (natural)	California, Texas, Wyoming, Utah	Rank same as for quantity.
8	Stone	Pennsylvania, New York, Ohio, Illinois	Do.
20	Sulfur	Texas, Louisiana, California, Utah	Do.
31	Sulfuric acid from copper and zinc smelters and roasters and from roasting of high-sulfide gold and silver concentrates.	Pennsylvania, Illinois, Tennessee, Arizona	Do.
37	Talc and ground soapstone [6]	New York, Vermont, California, North Carolina	New York, California, Vermont, North Carolina.
84	Tantalum ore	South Dakota, New Mexico, Wyoming	Rank same as for quantity.
83	Tellurium	Not separable by States	Not separable by States.
76	Tin	Alaska, South Dakota	Rank same as for quantity.
	Titanium ore:		
75	Ilmenite	Virginia	Do.
64	Rutile	Virginia, Arkansas	Do.
62	Tripoli	Illinois, Missouri, Oklahoma, Arkansas	Missouri, Illinois, Oklahoma, Arkansas.
34	Tungsten ore	Nevada, California, Washington, Colorado	Rank same as for quantity.
51	Uranium and vanadium ores	Arizona, Colorado, Utah, Nevada	Colorado, Utah, Arizona, Nevada.
71	Vermiculite	Montana, Colorado, Wyoming, North Carolina	Rank same as for quantity.
16	Zinc	Oklahoma, New Jersey, Kansas, Idaho	New Jersey, Oklahoma, Kansas, Idaho.

[6] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

States and their principal mineral products in 1938 [1]

State	Rank	Principal mineral products in order of value
Alabama	20	Coal, iron ore, cement, stone.
Alaska	27	Gold, copper, coal, silver.
Arizona	14	Copper, gold, silver, lead.
Arkansas	26	Petroleum, coal, natural gas, bauxite.
California	2	Petroleum, natural gas, gold, natural gasoline.
Colorado	15	Coal, molybdenum, gold, silver.
Connecticut	45	Stone, clay products, sand and gravel, lime.
Delaware	50	Clay products, stone, sand and gravel, raw clay.
District of Columbia	49	Clay products, stone.
Florida	34	Phosphate rock, cement, stone, sand and gravel.
Georgia	35	Stone, raw clay, clay products, cement.
Idaho	25	Silver, lead, zinc, gold.
Illinois	7	Coal, petroleum, stone, cement.
Indiana	19	Coal, cement, stone, clay products.
Iowa	29	Do.
Kansas	8	Petroleum, natural gas, zinc, coal.
Kentucky	9	Coal, natural gas, petroleum, stone.
Louisiana	6	Petroleum, natural gas, sulfur, natural gasoline.
Maine	44	Stone, sand and gravel, cement, lime.
Maryland	37	Coal, sand and gravel, cement, clay products.
Massachusetts	39	Stone, sand and gravel, lime, clay products.
Michigan	11	Petroleum, iron ore, copper, cement.
Minnesota	17	Iron ore, stone, sand and gravel, cement.
Mississippi	41	Natural gas, sand and gravel, clay products, raw clay.
Missouri	22	Lead, cement, coal, stone.
Montana	18	Copper, gold, natural gas, petroleum.
Nebraska	43	Cement, sand and gravel, stone, clay products.
Nevada	28	Gold, copper, silver, tungsten ore.
New Hampshire	47	Stone, clay products, sand and gravel, feldspar.
New Jersey	30	Zinc, clay products, stone, sand and gravel.
New Mexico	13	Petroleum, natural gas, potassium salts, copper.
New York	12	Natural gas, stone, petroleum, cement.
North Carolina	33	Stone, bromine, clay products, sand and gravel.
North Dakota	46	Coal, sand and gravel, clay products, natural gas.
Ohio	10	Coal, clay products, natural gas, stone.
Oklahoma	4	Petroleum, natural gas, natural gasoline, zinc.
Oregon	38	Gold, stone, cement, sand and gravel.
Pennsylvania	3	Coal, petroleum, natural gas, cement.
Rhode Island	48	Stone, sand and gravel, clay products, lime.
South Carolina	42	Stone, clay products, raw clay, gold.
South Dakota	31	Gold, stone, cement, sand and gravel.
Tennessee	24	Coal, cement, stone, phosphate rock.
Texas	1	Petroleum, natural gas, sulfur, natural gasoline.
Utah	16	Copper, gold, coal, silver.
Vermont	40	Stone, slate, sand and gravel, lime.
Virginia	21	Coal, stone, cement, zinc.
Washington	32	Coal, cement, sand and gravel, gold.
West Virginia	5	Coal, natural gas, petroleum, stone.
Wisconsin	36	Stone, sand and gravel, iron ore, cement.
Wyoming	23	Petroleum, coal, natural gas, natural gasoline.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis.

Prices of gold, silver, copper, lead, and zinc, 1932–39 [1]

Yaer	Gold [2]	Silver [3]	Copper [4]	Lead [4]	Zinc [4]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1932	[5] $20.67+	$0.282	$0.063	$0.030	$0.030
1933	25.56	.350	.064	.037	.042
1934	34.95	[6] .646+	.080	.037	.043
1935	35.00	.71875	.083	.040	.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[6] .646+	.098	.046	.048
1939	35.00	[7] .678+	.104	.047	.052

[1] Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ per fine ounce. For table of prices for silver, copper, lead, and zinc from 1850 to 1931, by years, see Mineral Resources, 1931, pt. 1, p. A115.

[2] 1932: Legal coinage value; 1933–34: Yearly average weighted Government price; 1935–39: Price under authority of Gold Reserve Act of Jan. 31, 1934.

[3] 1932–33: Average New York price for bar silver; 1934 and 1938–39: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[4] Yearly average weighted price of all grades of primary metal sold by producers.

[5] $20.671835. [6] $0.64646464. [7] $0.67878787.

STATE TABLES

Mineral production of Alabama, 1937–38

Product	1937 Quantity	1937 Value	1938 Quantity	1938 Value
Asphalt (native)...short tons..	(1)	(1)	(1)	(1)
Bauxite...long tons..	(1)	(1)	(1)	(1)
Cement...barrels..	2 4,403,459	2 $6,165,974	2 4,548,079	2 $6,114,246
Clay:				
Products (other than pottery and refractories)...		3 2,077,606		3 1,487,067
Raw (sold by producers)...short tons..	76,584	99,730	25,871	41,885
Coal...do....	4 12,440,322	5 29,857,000	4 11,061,493	5 26,769,000
Coke...do....	4,259,771	6 13,275,098	3,378,044	6 9,888,292
Copper...pounds..	7,000	847		
Ferro-alloys...long tons..	20,470	6 1,455,967	19,446	6 1,707,736
Gold...troy ounces..	2,460	86,096	41	1,435
Iron:				
Ore...long tons..	6,350,316	10,747,967	4,281,332	7,341,620
Pig...do....	2,528,785	6 42,188,993	1,990,342	6 29,190,091
Lime...short tons..	176,085	964,400	151,937	911,033
Manganese ore...long tons..	289	8,448	202	3,030
Manganiferous ore...do....	428	2,884	356	2,797
Mineral waters...gallons sold..	(7)	(7)	(7)	(7)
Ore (dry and siliceous) (gold and silver)..short tons..	20,173	(8)	300	(8)
Sand and gravel...do....	1,489,131	695,858	3,110,183	782,131
Silver...troy ounces..	457	353	4	3
Stone...short tons..	9 1,500,860	9 1,573,890	1,326,160	1,809,379
Miscellaneous 10...		1,237,940		1,032,667
Total value, eliminating duplications...		53,518,993		46,296,293

1 Value included under "Miscellaneous."
2 Exclusive of puzzolan, value for which is included under "Miscellaneous."
3 Figures obtained through cooperation with Bureau of the Census.
4 According to Bituminous Coal Division.
5 Value is estimated from various sources and includes selling expenses.
6 Value not included in total value for State.
7 No canvass.
8 Not valued as ore; value of recoverable metal content included under the metals.
9 Exclusive of dimension limestone, value for which is included under "Miscellaneous."
10 Includes minerals indicated by "1", "2", and "9" above.

Mineral production of Alaska, 1937–38

Product	1937 Quantity	1937 Value	1938 Quantity	1938 Value
Antimony ore (concentrates)...short tons..	(1)	(1)	(1)	(1)
Arsenic...do....	(2)	(2)	(2)	(2)

[4] Exclusive of dimension unclassified stone, value for which is included under "Miscellaneous."
[5] Includes minerals indicated by "1" and "4" above.

Mineral production of Georgia, 1937–38

Product	1937		1938	
	Quantity	Value	Quantity	Value
Barite ... short tons	71,944	$400,687	64,304	$315,329
Bauxite ... long tons	(1)	(1)	(1)	(1)
Cement ... barrels	(1)	(1)	(1)	(1)
Clay:				
Products (other than pottery and refractories)	------------	[2] 2,118,952	------------	[2] 1,980,943
Raw (sold by producers) ... short tons	506,232	3,548,559	434,632	3,339,918
Coal ... do	(1 3)	(1 4)	(1 3)	(1 4)
Copper ... pounds	------------	------------	70	7
Fuller's earth ... short tons	(1)	(1)	(1)	(1)
Gems and precious stones	------------	(5)	------------	(5)
Gold ... troy ounces	743	25,995	872	30,520
Graphite, crystalline ... pounds	------------	------------	(1)	(1)
Iron ore ... long tons	14,593	19,130	9,221	11,375
Kyanite ... short tons	(6)	(6)	(6)	(6)
Lime ... do	7,964	62,196	7,046	54,150
Manganese ore ... long tons	689	11,423	3,058	46,443
Manganiferous ore ... do	9,537	28,459	2,807	12,057
Mica:				
Scrap ... short tons	(1)	(1)	(1)	(1)
Sheet ... pounds	(1)	(1)	(1)	(1)
Mineral waters ... gallons sold	(5)	(5)	(5)	(5)
Ore (dry and siliceous) (gold and silver) ... short tons	1,406	(7)	841	(7)
Sand and gravel ... do	429,122	211,026	395,758	207,048
Silver ... troy ounces	49	38	71	46
Slate	------------	(1)	------------	(1)
Stone ... short tons	1,737,760	3,597,039	1,465,680	3,581,319
Talc ... do	11,984	148,177	15,117	130,595
Miscellaneous [8]	------------	2,412,379	------------	1,888,671
Total value, eliminating duplications	------------	12,584,060	------------	11,598,421

[1] Value included under "Miscellaneous."
[2] Figures obtained through cooperation with Bureau of the Census.
[3] According to Bituminous Coal Division.
[4] Value is estimated from various sources and includes selling expenses.
[5] No canvass.
[6] Figures not available.
[7] Not valued as ore; value of recoverable metal content included under the metals.
[8] Includes minerals indicated by "1" above.

Mineral production of Idaho, 1937–38

Product	1937		1938	
	Quantity	Value	Quantity	Value
Antimony ore (concentrates)......short tons..	3,295	(1)	(1)	(1)
Arsenious oxide......do....	(1)	(1)	(1)	(1)

Mineral waters gallons sold	(7)	(7)	(7)	(7)
Natural gas M cubic feet	1,040,000	533,000	1,169,000	616,000
Natural gasoline gallons	2,567,000	153,000	2,436,000	124,000
Ore (lead and zinc) short tons	(8)	(8)	(8)	(8)
Petroleum barrels	7,499,000	9,970,000	24,075,000	30,100,000
Pyrites long tons	10,220	(6)	(6)	(6)
Sand and gravel short tons	14,333,482	7,486,610	12,538,469	5,648,601
Sand and sandstone (ground) do	96,329	575,251	66,583	418,881
Silver troy ounces	887	686	576	372
Stone short tons	[9] 9,887,260	[9] 8,383,931	[9] 8,528,440	[9] 7,335,844
Sulfuric acid (60° Baumé) [10] do	142,206	[5] 1,326,782	143,343	[5] 1,305,855
Tripoli do	11,647	151,154	8,141	117,107
Miscellaneous [11]		479,163		2,754,664
Total value, eliminating duplications		133,437,554		130,155,083

[1] Exclusive of natural cement, value for which is included under "Miscellaneous."
[2] Figures obtained through cooperation with Bureau of the Census.
[3] According to Bituminous Coal Division.
[4] Value is estimated from various sources and includes selling expenses.
[5] Value not included in total value for State.
[6] Value included under "Miscellaneous."
[7] No canvass.
[8] No ore milled in Northern Illinois; lead output of Southern Illinois is byproduct of fluorspar milling.
[9] Exclusive of sandstone, value for which is included under "Miscellaneous."
[10] From zinc smelting.
[11] Includes minerals indicated by "1", "6", and "9" above.

Mineral production of Indiana, 1937–38

Product	1937		1938	
	Quantity	Value	Quantity	Value
Cement barrels	(1)	(1)	(1)	(1)
Clay:				
Products (other than pottery and refractories)		[2] $4,670,619		[2] $4,088,658
Raw (sold by producers) short tons	41,369	65,017	16,941	31,864
Coal do	[3] 17,764,774	[4] 28,601,000	[3] 14,758,484	[4] 23,968,000
Coke do	5,467,061	[5] 32,655,355	2,904,779	[5] 18,278,201
Iron, pig long tons	3,694,360	[5] 77,990,597	1,807,808	[5] 37,025,980
Lime short tons	94,053	552,243	102,054	581,922
Marl, calcareous do	(1)	(1)

PART II. METALS

GOLD AND SILVER

By Chas. W. Henderson

SUMMARY OUTLINE

The steadily increasing gold production of the world is of especial significance to the United States in view of the large accumulation of that metal in this country, amounting, according to the Federal Reserve Bulletin (May 1940) to 61 percent of the total known world monetary supply at the end of 1939 and to 64 percent by April 24, 1940. Countries at war in Europe continued to ship large quantities of gold to the United States in May 1940, and by June 1 stocks had risen to approximately 66 percent of the world total. On May 3, 1940, the Secretary of the Treasury in a public address told the National Institute of Government that the continued acceptance of gold by the United States Treasury is "the only sound course of action open to us."

The mine production of recoverable gold in the United States (Territories included) in 1939 totaled 5,672,485 fine ounces, a 10-percent increase over the previous record high annual output in 1938. Although final figures on the total output of gold in the world in 1939 are not yet available, preliminary data indicate that the world output increased 6 percent over 1938 to approximately 39,818,000 fine ounces, the highest in history. The principal gold-producing countries in 1939 were, in order, the Union of South Africa, United States (including Territories), U. S. S. R. and Canada; these four countries produced approximately 72 percent of the total world output of gold. Silver production in the United States in 1939 was 65,565,024 fine ounces, a 4-percent increase over 1938. Approximately 69 percent of the total world output of silver in 1939—estimated at 265,977,000 ounces—came from Mexico, United States, Canada, and Peru, listed in order of quantity produced.

DOMESTIC REFINERY PRODUCTION

The figures in the following table were obtained through cooperation between the United States Bureau of the Mint and the Bureau of Mines and were agreed upon after conference and adjustment between the two Bureaus.

The State totals are based upon bullion deposits in the United States mints and assay offices and upon returns to the Bureau of the Mint from smelting and refining companies. The State distribution is adjusted further by the Bureau of Mines from its geographical records of sources and production, both historical and current, from the producing mines and is tabulated for the mine reports discussed later. The data for the total production and in part for the distribution are obtained from records of (1) the unrefined domestic gold and silver deposited in the United States mints and assay offices; (2) the domestic gold and silver in fine bars reported by private refineries, supplemented by data of content of unrefined mattes, blister copper, copper anodes, and lead bullion; and (3) the unrefined domestic gold and silver contained in ore and matte exported for reduction. The last item is small.

Gold and silver produced in the United States, 1935–39, and approximate distribution of source, by States and Territories, in 1939

[Refinery figures supplied by U. S. Bureau of the Mint]

State or Territory	Gold [1]		Silver [2]	
	Fine ounces	Value	Fine ounces	Value
1935	3,609,283	$126,324,900	45,924,454	$33,008,201

[1] Gold valued at $35 per fine ounce.
[2] Silver valued as follows: 1934, $0.646+ per fine ounce; 1935, $0.71875; 1936, $0.7745; 1937, $0.7735; 1938, $0.646+; 1939, $0.678787+.

The quantity of gold reclaimed in 1938 from old jewelry, dental waste, scrap, and other material received at private refineries and the United States mints and assay offices was 870,881 ounces and that sold for industrial use 861,622 ounces, the difference (9,259 ounces) representing the net return from the arts and industries during the year. From 1932 to 1936, inclusive, the quantity of gold returned from industrial to monetary use exceeded that issued for industrial use by 3,367,400 ounces; in 1937, however, the quantity absorbed by the industries was 91,840 ounces more than that returned to monetary use. Secondary silver recovered in 1938 from silverware, photographic film, and other sources totaled 18,438,847 ounces and that issued for the industrial arts 38,620,473 ounces, indicating that 20,181,626 fine ounces of new silver were required for industry.

Gold and silver produced in the United States, 1792–1939

[From Report of the Director of the Mint. The estimate for 1792-1873 is by R. W. Raymond, commissioner of mining statistics, and since then by the Director of the Mint]

Period	Gold		Silver	
	Fine ounces	Value [1]	Fine ounces	Value [2]
1792–1847	1, 187, 170	$24, 537, 000	309, 500	$404, 500
1848–72	58, 279, 778	1, 204, 750, 000	118, 568, 200	157, 749, 900

[1] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto at $20.67+ per fine ounce. Dollar figures are rounded.
[2] Silver valued in 1934 and thereafter at Government's average buying price for domestic product: In 1934 and 1938 at $0.64+ per fine ounce, in 1935 at $0.71875, in 1936 at $0.7745, in 1937 at $0.7735, and in 1939 at $0.678787+.

The average commercial value per fine ounce of silver for the total recorded domestic production is $0.773.

PRICES OF GOLD AND SILVER

Gold.—Under the Gold Reserve Act of 1934 the value of gold was fixed by Presidential proclamation on January 31, 1934, at $35 per fine troy ounce and has remained at that figure through 1939. From January 18, 1837,[1] through 1932, the price was $20.67+ per ounce, and in 1933 the legal coinage value was continued at $20.67+. The average weighted price per fine ounce in 1933, as computed by the Bureau of Mines, was $25.56 and in 1934, $34.95. A complete account of regulations pertaining to gold and silver in 1933–34 is given in the chapter on Gold and Silver in Minerals Yearbook, 1934 (pp. 25–46), issued by the Bureau of Mines.

Silver.—The Government price for newly mined domestic silver was maintained throughout 1938 and to June 30, 1939, at $0.64646464 per fine ounce. The act of Congress approved July 6, 1939, fixed the price of domestic silver mined after July 1, 1939, at $0.711+ per ounce. The annual average prices [2] used for domestic silver from

[1] For Congressional acts with reference to coinage from Apr. 2, 1792, to Jan. 31, 1934, see Minerals Yearbook, 1937, p. 113; for gold prices in London, 1931–36, p. 114.
[2] For highest, lowest, and average price of silver in New York, 1874-1935, see Minerals Yearbook, 1937, p. 115; for ratio of silver to gold, 1687–1935, p. 121.

1932 to 1939 are as follows: 1932, $0.282; 1933, $0.350; 1934, $0.64646464; 1935, $0.71875; 1936, $0.7745; 1937, $0.7735; 1938, $0.64646464; 1939, $0.67878787.

The following table, copied from the Annual Report of the Director of the Mint for the Fiscal Year Ended June 30, 1939, shows the price of silver in London and in New York in 1938 and the first half of 1939.

Price of silver in London and in New York, 1938–39

Sweden	218		
Canada	211	Total 52 countries [4]	25,733

[1] Data from Federal Reserve Board. Figures for some countries are preliminary.
[2] Stabilization funds and central reserves in some countries not reported. The following are reported at infrequent intervals or on delayed basis: United Kingdom, Exchange Equilization Account (reported September 1939) held $2,690,000,000; France, Exchange Stabilization Fund and Rentes Fund (May 1939), $477,000,000; United States, Exchange Stabilization Fund (December 1939), $156,000,000; and Belgium, Treasury (December 1939), $17,000,000.
[3] National Bank $519,000,000; B. I. S. $10,000,000.
[4] Stabilization funds upon basis of last reports raise total reserves of the 52 countries to approximately $29,073,000,000.

IMPORTS AND EXPORTS[3]

DOMESTIC SUPPLY

The domestic supply of new gold comes chiefly from dry and siliceous ore and from placer gravel. These two sources yielded 90 percent of the domestic gold (excluding Philippine Islands and Puerto Rico) in 1915, 80 percent in 1930, 87 percent in 1931, 93 percent in 1932, 1933, and 1934, 91 percent in 1935, 88 percent in 1936, 85 percent in 1937, 90 percent in 1938, and 88 percent in 1939. The proportionate output of gold from copper ore was 7 percent in 1915, 16 percent in 1930, 10 percent in 1931, 4 percent in 1932, 5 percent in 1933 and 1934, 7 percent in 1935, 10 percent in 1936, 12 percent in 1937, 8 percent in 1938, and 10 percent in 1939. These sources represented 96 to 98 percent of the gold supply in 1915 and 1930–39.

In 1915 dry and siliceous ore yielded 36 percent of the total silver; copper ore, 26 percent; lead ore, 27 percent; and zinc-lead ore, 9 percent. In 1938 dry and siliceous ores yielded 52 percent and in 1939, 47 percent; copper ore, 26 and 29 percent; lead ore, 5 and 5 percent; and zinc-lead ore, 17 and 19 percent. The rounded percentage figures for both 1938 and 1939 include some silver (less than 0.8 percent in each instance) from zinc ore, mixed base-metal ores, and placer gravel.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

WORLD PRODUCTION OF GOLD AND SILVER

According to the Bureau of the Mint the world output of gold and silver from 1493 to 1938 is 1,294,974,282 fine ounces of gold valued at $29,103,425,879 and 16,714,819,121 fine ounces of silver valued at $15,254,018,861.

The following tables show the world output of gold and silver from 1935 to 1939.

World production of gold, 1935–39, by countries, in fine ounces [1]

MINE REPORT

METHOD OF COLLECTING STATISTICS

The first table in this report presents the official refinery figures for production of gold and silver in the United States from 1935 to 1939, as agreed upon by the Bureau of the Mint and the Bureau of Mines. These figures record the output of gold and silver bullion from domestic ore in marketable form as metals, either refined or unrefined.

To trace the gold and silver produced back to its source by States, counties, and mining districts, the Bureau of Mines systematically investigates the "mine production" of ores containing gold and silver and the output of the placer mines, the total being classified by methods of production and by kinds of ore, as well as by mining districts. The resulting figures form the basis of the mine reports.

Of the two systems for ascertaining the production of gold and silver, one is a measure of the metallurgic industry and the other of the mining industry; one reports the metal actually recovered in marketable form and the other the mine output and its recoverable content. The two methods will not produce identical results, but data for a period of years long enough to compensate for overlap or lag should agree within allowable limits of error.

Gold and silver produced in the United States, 1905–39, in fine ounces, according to mint and mine returns, in terms of recovered metals

Year	Mint		Mine	
	Gold	Silver	Gold	Silver
1905–34	101,453,517	1,716,350,359	101,096,635	1,705,292,736
1935	3,609,283	45,924,454	3,688,832	48,840,669
1936	4,357,394	63,812,176	4,405,118	61,647,455
1937	4,804,540	71,941,794	4,834,062	72,128,397
1938	5,089,811	62,665,335	5,170,743	62,873,450
1939	5,611,171	65,119,513	5,672,485	65,565,024
	124,925,716	2,025,813,631	124,867,875	2,016,347,731

Compared with the mine reports, the mint reports for the 35 years show a total excess of gold of 57,841 ounces (a difference of 0.05 percent) and a total excess of silver of 9,465,900 ounces (a difference of 0.47 percent).

UNITS OF MEASUREMENT

All tonnage figures are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated upon the basis of recovered and recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced. Prices of gold and silver are discussed in a preceding section of this report.

MINES PRODUCING

LEADING GOLD PRODUCERS

The output of the 30 largest gold producers in the United States (Philippine Islands and Puerto Rico excluded) in 1939, none of which produced less than 19,900 ounces, was 2,346,407 fine ounces (50 percent of the total). Five of the companies, working placer mines with floating connected-bucket dredges, recovered 440,285 ounces of gold; the rest of the output of the largest producers came from lode mines. The total output of lode mines and placers producing less than 19,900 ounces each was 2,326,635 ounces.

Largest producers of gold in the United States in 1939, in order of output [1]

Rank	Operator	State	Mining district	Source of gold
1	Homestake Mining Co	South Dakota	Whitewood	Dry and siliceous ore.
2	United States Smelting, Refining & Mining Co.	Alaska	Fairbanks and Nome	Dredging gravel.
3	Utah Copper Co	Utah	West Mountain	Copper ore.
4	Golden Cycle Corporation [2]	Colorado	Cripple Creek, etc	Dry and siliceous ore.
5	Alaska Juneau Mining Co	Alaska	Juneau	Do.
6	Phelps Dodge Corporation	Arizona	Ajo, Copper Mountain, Verde, Warren.	Copper ore.
7	Empire Star Mines Co., Ltd	California	Grass Valley - Nevada City, Bear Valley, Browns Valley.	Dry and siliceous ore.
8	Idaho Maryland Mines Corporation.	do	Grass Valley - Nevada City.	Do.
9	Yuba Consolidated Gold Fields.	do	Callahan, Oroville, Snelling, Yuba River.	Dredging gravel.
10	Natomas Co	do	Folsom	Do.
11	Getchell Mine, Inc	Nevada	Potosi	Dry and siliceous ore.
12	Howe Sound Co	Washington	Chelan	Copper ore.
13	Consolidated Coppermines Corporation.	Nevada	Robinson	Do.
14	Central Eureka Mining Co	California	Mother Lode	Dry and siliceous ore.
15	Lava Cap Gold Mining Corporation.	do	Grass Valley-Nevada City.	Do.
16	Black Mammoth Consolidated Mining Co.	Nevada	Silver Peak	Gold ore.
17	Capital Dredging Co	California	Folsom	Dredging gravel.
18	Bald Mountain Mining Co	South Dakota	Trojan	Dry and siliceous ore.
19	Mammoth - St. Anthony, Ltd	Arizona	Old Hat	Do.
20	United States Smelting, Refining & Mining Co.	Utah	West Mountain and Tintic.	Zinc-lead ore, lead ore, dry and siliceous ore.
21	Carson Hill Gold Mining Corporation.	California	Mother Lode	Dry and siliceous ore.
22	Alaska-Pacific Consolidated Mining Co.	Alaska	Willow Creek	Do.
23	Nevada Consolidated Copper Corporation.	Nevada	Robinson	Copper ore.
24	United States Smelting, Refining & Mining Co. (Gold Road).	Arizona	San Francisco	Dry and siliceous ore.
25	London Mines & Milling Co	Colorado	Mosquito	Do.
26	New Jersey Zinc Co., Empire Zinc Division.	do	Battle Mountain	Copper ore.
27	Veta Mines, Inc	do	Upper San Miguel	Dry and siliceous ore.
28	Golden Queen Mining Co	California	Mojave	Do.
29	Argonaut Mining Co., Ltd	do	Mother Lode	Do.
30	Manhattan Gold Dredging Co	Nevada	Manhattan	Dredging gravel.

1 Philippine Islands excluded.
2 Custom mill. Includes mainly ore from Cresson, Portland, Ajax, Vindicator, and other mines in Cripple Creek district, Colo., but also from other districts in Colorado.

The Benguet Consolidated Mining Co. (including the Balatoc mine, controlled by Benguet stockholders) in the Philippine Islands ranked between the Homestake Mining Co. and the United States Smelting, Refining & Mining Co. Alaska operations.

LEADING SILVER PRODUCERS

The output of silver from the 43 leading silver-producing companies in 1939, none of which produced less than 200,000 ounces, was 50,552,212 ounces—79 percent of the total mine output of the United States (Philippine Islands and Puerto Rico excluded); the remaining 13,643,634 ounces (placer production excluded) came from 5,316 lode mines, many of which derive a substantial net income from the silver content.

Largest producers of silver in the United States in 1939, in order of output

Rank	Operator	State	Mining district	Source of silver
1	Sunshine Mining Co.	Idaho	Evolution	Dry and siliceous ore.
2	New Jersey Zinc Co., Empire Zinc Division.	Colorado	Battle Mountain	Copper ore.
3	Anaconda Copper Mining Co.	Montana	Summit Valley or Butte.	Copper ore, zinc-lead ore.
4	Phelps Dodge Corporation	Arizona	Ajo, Copper Mountain, Verde, Warren.	Copper ore.
5	United States Smelting, Refining & Mining Co.	Utah	West Mountain, Tintic.	Zinc-lead ore, lead ore, dry and siliceous ore.
6	Tintic Standard Mining Co.	do	Tintic	Dry and siliceous ore, lead ore.
7	Bunker Hill & Sullivan Mining & Concentrating Co.	Idaho	Yreka	Zinc-lead ore, dry and siliceous ore.
8	Utah Copper Co.	Utah	West Mountain	Copper ore.
9	Federal Mining & Smelting Co.	Idaho	Hunter, Lelande, Yreka.	Zinc-lead ore.
10	American Metal Co. (Presidio mine).	Texas	Shafter	Dry and siliceous ore.
11	Snyder Mines, Inc.	Idaho	Warm Springs	Zinc-lead ore, dry and siliceous ore.
12	Polaris Mining Co.	do	Evolution	Dry and siliceous ore.
13	Hecla Mining Co.	do	Lelande	Zinc-lead ore, lead ore.
14	Silver King Coalition Mines Co.	Utah	Uintah	Do.
15	Desert Silver, Inc.	Nevada	Silver Peak	Dry and siliceous ore.
16	Park City Consolidated Mines Co.	Utah	Blue Ledge	Zinc-lead ore.
17	Magma Copper Co.	Arizona	Pioneer	Copper ore, zinc-copper ore.
18	Cactus Mines Co.	California	Mojave	Dry and siliceous ore.
19	Eagle-Picher Mining & Smelting Co.	Arizona	Oro Blanco	Zinc-lead ore.
20	International Smelting & Refining Co.	Utah	Ophir	Dry and siliceous old tailings.
21	Anaconda Copper Mining Co. (Flathead mine).	Montana	Hog Heaven	Dry and siliceous ore, lead ore.
22	Emperius Mining Co.	Colorado	Creede	Dry and siliceous ore.
23	Lessees of the Tonopah Mining Co. of Nevada.	Nevada	Tonopah	Do.
24	Blackhawk Consolidated Mines Co.	New Mexico	Mogollon	Do.
25	Basin Montana Tunnel Co.	Montana	Cataract	Zinc-lead ore.
26	Chief Consolidated Mining Co.	Utah	Tintic	Dry and siliceous ore, lead ore, zinc-lead ore.
27	Philipsburg Mining Co.	Montana	Flint Creek	Dry and siliceous ore.
28	Ground Hog Unit, American Smelting & Refining Co.	New Mexico	Central	Zinc-lead ore.
29	Veta Mines, Inc.	Colorado	Upper San Miguel	Dry and siliceous ore.
30	Golden Queen Mining Co.	California	Mojave	Do.
31	Combined Metals Reduction Co. (Park-Bingham group).	Utah	West Mountain	Dry and siliceous ore, zinc-lead ore.
32	Graham Loftus Oil Corporation.	California	Calistoga	Dry and siliceous ore.
33	Veta Mines, Inc.	Arizona	Ash Peak	Do.
34	Montana Silver Queen Mining Co.	Montana	Montana (Neihart)	Do.
35	Lava Cap Gold Mining Corporation.	California	Grass Valley-Nevada City.	Do.
36	Shattuck Denn Mining Corporation.	Arizona	Warren	Copper ore.

Largest producers of silver in the United States in 1939, in order of output—Con.

Rank	Operator	State	Mining district	Source of silver
37	Combined Metals Reduction Co.	Nevada	Pioche	Zinc-lead ore.
38	Iron King Mining Co	Arizona	Big Bug	Dry and siliceous ore.
39	Coeur d'Alene Mines Corporation.	Idaho	Evolution	Do.
40	Shenandoah-Dives Mining Co.	Colorado	Animas	Do.
41	East Camp Exploration Syndicate.	New Mexico	Steeple Rock	Do.
42	Contact Mines Corporation	Montana	Flint Creek	Dry and siliceous ore, zinc-lead ore.
43	New Park Mining Co	Utah	Blue Ledge	Zinc-lead ore.

NUMBER OF MINES

The following table indicates the number of mines that produced gold and silver in 1938 and 1939. The placers are those in which gold and silver in natural alloy and, in a few placers, platinum are recovered from gravel and sand, whether by hand washing, sluicing, hydraulicking, drifting (in frozen ground or ancient buried river channels), or dredging. The lode mines are those yielding gold and silver from ore as distinguished from gravel, mainly from underground workings, and include those that yield ore mined chiefly for copper, lead, or zinc but that contribute the precious metals as by-products. In addition to the producing mines enumerated here many properties were being prospected and developed, and many other mining claims were being held by assessment work only.

The enumeration of placer mines is less satisfactory than that of lode mines, because some are operated only temporarily and are individually small. As far as possible the unit, as for lode mines, is not the operator but the mining claim or group of claims.

Number of mines in the United States producing gold and silver, 1938–39, by States[1]

State	Lode		Placer		Total

MINE PRODUCTION

SUMMARY

The following table gives the mine production of gold and silver in 1938 and 1939, by States, in terms of recovered metals, as calculated by the Bureau of Mines from reports from the producing mines. The annual percentage gains in gold production in the years following the 69-percent increase in the price of gold are as follows: 1934 over 1933, 19 percent; 1935 over 1934, 18 percent; 1936 over 1935, 19 percent; 1937 over 1936, 9 percent; 1938 over 1937, 7 percent; and 1939 over 1938, 10 percent. The total gain in 1939 over 1933 was 116 percent. The output of silver increased 4 percent in 1939 over 1938 and was 181 percent above that in 1933.

Mine production of gold and silver in the United States, 1938–39, by regions and States, in terms of recovered metals

Region and State	Gold: Fine ounces 1938	Gold: Fine ounces 1939	Gold: Increase or decrease (percent)	Gold: Value (at $35 per ounce) 1938	Gold: Value (at $35 per ounce) 1939	Silver: Fine ounces 1938	Silver: Fine ounces 1939	Silver: Increase or decrease (percent)	Silver: Value 1938 (at $0.64646+ per ounce)	Silver: Value 1939 (at $0.67878+ per ounce)

[1] Gold valued per fine ounce as follows: Prior to 1933, $20.67; 1933, $25.56; 1934, $34.95; 1935–39, $35.

ORE PRODUCTION, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

The best index of lode mining is the quantity and metallic content of ore mined rather than the number of mines or operators. The following tables give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that produced gold and silver in the United States (excluding the Philippine Islands and Puerto Rico) in 1939. The individual State chapters from which these tables were compiled contain additional tables and text on the subject and may be found elsewhere in this volume.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and smelter recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in recovery of metals and the lowering of grade of complex ores treated, accomplished by improved mill concentration processes. A "dry" ore is one that carries so little lead or copper that by itself in quantity it would not satisfy the requirements for the smelter charge in lead smelting or copper smelting, respectively. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present), or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; an ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) range from 16 to 45 percent zinc; zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated. The smelter classification applies to concentrates.

Siliceous (silica [4] in excess of iron) gold, gold-silver, and silver ores containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed ores are called "dry" ores regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes its name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry and siliceous ores" thus, by elimination, include both dry siliceous and irony, but chiefly siliceous, ores valuable for their gold and silver content, regardless of method of treatment, and dry fluxing ores carrying considerable quantities of iron and manganese oxides, or iron sulfide, and very small quantities of gold and silver. Dry and siliceous gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made arbitrarily on a basis of value, using the rule that the metal of lower value is not used in the bimetal classification unless its value is equal to or over one-quarter of the combined value of gold and silver.

The lead, zinc, and zinc-lead ores in most districts in the Eastern and Central States carry no appreciable quantity of gold or silver; such ores are excluded from this report.

[1] Illinois, Michigan, Missouri, Philippine Islands, and Puerto Rico excluded.
[2] Includes magnetite-pyrite-chalcopyrite ore from Pennsylvania yielding copper concentrates carrying gold and silver.
[3] Includes 145,638 tons of slag fumed.
[4] Less than 0.001 per ton.
[5] Includes zinc-lead-copper ore from 1 mine in Utah. Bureau of Mines not at liberty to publish figures. Zinc-copper ore from Arizona.
[6] Zinc ore yielded no gold or silver.
[7] Figures cover New York and Virginia.

Mine production of gold in the United States in 1939, by States and sources, in fine ounces, in terms of recovered metals [1]

[1] Philippine Islands and Puerto Rico excluded.
[2] Less than 0.005 percent.

PLACERS

Dredging.—Placer gold is obtained largely from gravels handled by connected-bucket floating dredges, which recovered approximately 59 percent of the total output from placers in the United States (Philippine Islands and Puerto Rico excluded) in 1939 and 62 percent in 1938. The quantity of gold recovered by dredges from the inception of the industry as a commercial factor in 1896 to the end of 1939 is recorded as 16,610,669 ounces, originating by States as follows: California, 10,419,552 ounces; Alaska 4,246,303 (including some gold by hydraulicking); Montana, 586,944; Idaho, 482,040; Colorado, 425,075; Oregon, 396,323; and other States, 54,432. The output in 1939 was 787,731 ounces from 114 dredges, of which California produced 370,264 ounces from 47 dredges; Alaska, 304,995 from 44 dredges; Idaho, 28,973 from 8 dredges; Montana, 33,815 from 7 dredges; Oregon, 25,028 from 5 dredges; and Colorado 4,688 from 2 dredges.

Gold produced in the United States by connected-bucket floating dredges, 1935–39, in fine ounces

Year	Dredges	California	Alaska	Other States [1]	Total
1935	91	236,404	216,560	53,324	506,288
1936	103	276,324	255,803	63,993	596,120
1937	105	322,961	255,568	65,614	644,143
1938	115	375,296	278,442	82,686	736,424
1939	114	370,264	304,995	112,472	787,731

[1] Colorado, Idaho, Montana, Oregon, and Nevada.

Other placer-mining methods.—From 1932 through 1939 dragline and power-shovel excavators operated in connection with dry-land and floating amalgamating and sluicing plants have been widely used in placer mining. In 1939 approximately 30 percent of the total output of placer gold, including that of Alaska and excluding that of the Philippine Islands, was recovered at these plants, and 11 percent was produced by old-established mining methods, such as hydraulicking, drift mining, sluicing, and rocking.

Additional information on placer-mining methods may be found in the State reviews in the Minerals Yearbook and Mineral Resources series.

PRODUCTION IN PHILIPPINE ISLANDS

The value of the gold produced in the Philippine Islands from 1907 to 1939, inclusive, is computed at $190,584,406. The gold production in 1939 was 999,408 ounces valued at $34,979,280 compared with 903,265 ounces valued at $31,614,275 in 1938, an increase of 11 percent. The annual value of the output from 1930 to 1939 was as follows:

Mine production of gold in the Philippine Islands, 1930–39

Year	Gold (fine ounces)	Value [1]	Year	Gold (fine ounces)	Value [1]
1930	179,220	$3,704,800	1935	451,818	$15,813,630
1931	182,008	3,762,433	1936 [2]	621,968	21,768,880
1932	244,298	5,050,084	1937 [2]	716,967	25,093,845
1933	325,039	8,308,009	1938 [2]	903,265	31,614,275
1934	340,314	11,893,975	1939 [3]	999,408	34,979,280

[1] Gold valued per fine ounce as follows: Prior to 1933, $20.67; 1933, $25.56; 1934, $34.95; 1935–39, $35.
[2] Division of Statistics, Department of Agriculture and Commerce, Manila.
[3] Refinery receipts.

The largest producers of gold, in approximate order of output in 1939, included: Benguet Consolidated Mining Co., Balatoc Mining Co., Itogon Mining Co., Philippine Smelting Co. (custom smelter), Masbate Consolidated Mining Co., Antamok Goldfields Mining Co., I. X. L. Mining Co., Coco Grove, Inc., Baguio Gold Mining Co., Suyoc Consolidated Mining Co., Atok Gold Mining Co., and Demonstration Gold Mines, Ltd., each of which produced over 20,000 ounces of gold; in all, they produced about 820,000 ounces; two floating connected-bucket dredges, each equipped with approximately 110 buckets of 8-cubic-foot capacity, were operated at Paracale, Camarines Norte, by Coco Grove, Inc.; and one 7-cubic-foot connected-bucket dredge by Tambis Gold Dredging Co., Inc., at Lianga, Surigao.

The output of silver from the Philippine Islands in 1939 was 1,191,739 ounces, all produced as a byproduct of gold mining.

COPPER

By H. M. MEYER

SUMMARY OUTLINE

The world copper industry was geared to high speed in the latter part of 1939; and the threat of hostilities in Europe, which had been the principal spur to record-breaking consumption in foreign countries for a number of years, terminated in declaration of war on Germany by Great Britain and France in September.

The recent records for world consumption have been made in contradistinction to a depressed state of consumption in the United States. Indications point to a new record in 1939 resulting from a maintained high rate of consumption abroad in preparation for war and to improved consumption in the United States, owing to greater industrial requirements during the year and to exaggerated demands in the latter months because of fears of a shortage of supplies in consequence of the war. Domestic withdrawals were the largest since the period of industrial overexpansion in the late twenties and were surpassed only in 1916, 1918, 1926, 1928, and 1929. Consumption outside of the United States is believed to have been at approximately the record level of 1938.

World production in 1939, with the exception of that in 1937, was the highest on record. Outside of the United States output was slightly above that in 1938 and was exceeded only in 1937. Production in the United States, although 27 percent higher than in 1938, had been surpassed in 1937, in every year from 1923 to 1929, and in 1916, 1917, and 1918.

Monthly data released by the Copper Institute indicate that domestic deliveries of copper in the United States from January to July 1939 averaged 27 percent above the monthly average for 1938. This increase was due largely to improvement in industrial demand. The publication of monthly data was discontinued after July, but 5-month totals were released early in 1940. The average of monthly deliveries of copper for August to December was 79 percent over that for the first 7 months and substantially more than double the average for 1938. Undoubtedly, the main part of gains in the latter part of 1939 can be attributed to purchases because of the war, owing partly to actual increased needs, partly to fears that heavy world demands such as accompanied the World War would create a shortage of metal, and partly to speculative buying.

Monthly statistics covering world deliveries, production, and stocks were discontinued with the July statement, because it became impossible to obtain the necessary data. Statistics for the first 7 months reveal that only in June were deliveries as much or more than the average for 1938. It appears likely that deliveries in the last months more than made up for this deficiency.

Producers' stocks of refined copper in the United States fell 47 percent in 1939 and were the smallest since the end of 1928. The inroads into stocks took place in the last months of the year, for at the end of July they were 9 percent higher than at the beginning of the year. The foreign stock position at the end of 1939 is not known. At the end of July stocks were slightly higher than at the beginning of the year.

Self-sufficiency of European belligerents.—Not long after the declaration of war on Germany it became apparent that the experiences of the World War would be of little use as a guide to developments in the new war. As pointed out in Minerals Yearbook, 1939, page 93, one of the salient features of recent copper history has been the remarkable growth of the British Empire in production to a point where it now has an exportable surplus. Examination of the statistics reveals that possibly the surplus is large enough to supply a large part of the needs of its ally, France. In 1913 the British Empire produced 98,000 short tons and its consumption approximated 170,000 tons. In 1925 the Empire produced only 83,000 tons, but the rapid development of deposits in Northern Rhodesia and Canada was responsible for the jump in production to 587,000 tons in 1937 and 611,000 tons in 1938. Copper Cartel production restrictions kept output of copper in Rhodesia in 1938, while record breaking, far below actual production capacity. It is reported that all production restrictions were discontinued at the outset of the present war. The British Empire was reported to have consumed 422,000 short tons in 1937 and 366,000 in 1938, and this consumption rate obviously includes large tonnages for war preparation. Adequate copper for all emergencies seems available to the British Empire, and the problems in connection with supplies appear to revolve principally around ocean transportation and electrolytic refining capacity. The British Government made far-reaching agreements with the Dominions at the beginning of the war for its wartime supplies.

France, on the other hand, must depend for its copper requirements on supplies from outside its political confines. In 1913 it required 113,000 short tons of copper, in 1937 took 132,000 tons, and in 1938 about 120,000 tons. The recent statistical record of France appears to allow less leeway for the building of a war reserve than do those of other important contestants. Developments in 1939 and 1940, when

France entered the market on more than one occasion for substantial quantities of metal, add weight to the belief that it may not have been adequately supplied with metal at the outbreak of the war.

The available statistical record of Germany gives evidence that an apparent reserve, probably of large proportions, was being built during the several years preceding the present war. Germany, too, must obtain the principal part of its copper needs from beyond its political boundaries. In 1913 Germany and Austria-Hungary produced 34,000 short tons of copper and consumed 329,000 tons between them. In 1937 and 1938 Germany produced 30,000 and 33,000 tons and with Austria and Czechoslovakia consumed 306,000 and 439,000 tons.

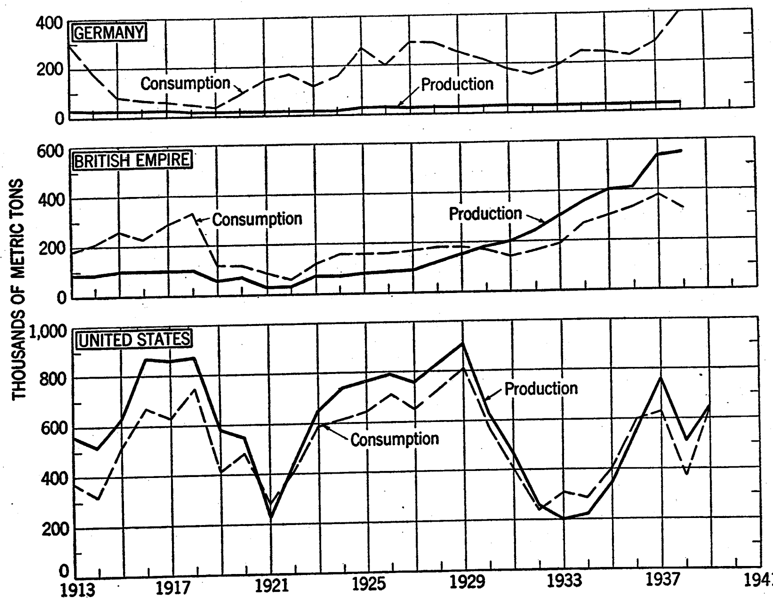

FIGURE 1.—Production and consumption of copper in Germany, the British Empire, and the United States for 1913–38 and in the United States for 1939. Germany includes Austria-Hungary for 1913–14 and Austria for 1919–38; no output was reported for Austria for 1915–18. Consumption and available production data for Czechoslovakia also are included under Germany. The British Empire, as shown here, includes Canada, Great Britain, India, Northern Rhodesia, Union of South Africa, and Australia.

The average consumption for this group for the 5-year period 1934–38 amounted to 308,000 short tons compared with 219,000 in 1929–33 and 266,000 in 1924–28.

Figure 1 shows the relationship of production to consumption in Germany, the British Empire, and the United States.

Market dislocations.—British and French attempts to blockade Germany have extended to rationing of the quantities of copper permitted through the blockade to such countries as Belgium and Netherlands, to prevent the excess over domestic requirements in those nations from reaching Germany. The blockade measures have caused considerable hindrance to the ordinary flow of copper to consuming nations, noncontestants as well as contestants. Chile normally disposes of most of its output in Europe. Because of the blockade and of the contracts between the British Government and Empire producers for its war requirements for copper, Chile was cut off from most of its principal markets when war developed. Thus, production from the largest, lowest-cost mines in the world was temporarily without adequate outlet. This situation was eased by large orders placed by the French Government in November 1939 for copper, principally from Chile and Belgian Congo, with the Cerro de Pasco Copper Corporation and the International Nickel Co. participating. These orders were purported to be on the basis of an annual total of 300,000 tons, and the copper was to be shipped from United States ports. The failure of France to draw on the British Empire for needed metal doubtless was a precautionary measure to safeguard Allied supplies and probably was due also to the deficient Empire production of electrolytic copper.

Large exports of copper from the United States to U. S. S. R., beginning November 1939, drew attention of the Allies because of the possibility that this copper might find its way to Germany. As indicated in Minerals Yearbook, 1939, page 114, U. S. S. R. has been unsuccessful thus far in its attempts to increase output to the point where it can supply its own needs; at present, therefore, the alliance with that country fails to help Germany solve its problems with regard to future supplies. Other available copper output in Europe, could Germany seize it all, would be inadequate to fill the Reich's war demands.

Transactions on the London Metal Exchange were discontinued at the outbreak of war, and this move naturally diverted business formerly handled there to New York. This business is exclusive of Empire needs, however; as already stated, wartime needs of the Empire were cared for by contracts between the Government and Dominion producers.

Domestic changes since World War.—From a domestic standpoint, as well as from that of the British Empire, conditions have changed greatly since the World War of 1914–18, although in a different direction. In 1913 the United States produced 57 percent of total world output compared with 25 percent in 1938 and 30 percent in 1939. Production from domestic ores totaled 612,000 short tons in 1913, rose to an average of 954,000 tons for 1916–18, then declined to 562,000 in 1938 and 713,000 in 1939. Domestic consumption was 33 percent of the world total in 1913, 54 percent in 1929, and 24 percent in 1938. About 406,000 short tons were consumed in 1913, an average of 756,000 tons for 1916–18, 407,000 in 1938, and 715,000 in 1939. With domestic mines producing more than half of the world supply at the beginning of the World War, huge demands for copper resulted in record domestic production tonnages. The records achieved in 1916–18 were surpassed only once since then—in 1929—when industrial activity was at an abnormally high level.

Mines in Northern Rhodesia and Canada were developed chiefly at the expense of production in the United States. The threat of invasion of domestic markets by this new copper led to demands for protection, and in 1932 a tariff of 4 cents a pound was placed on imports. Exportation of larger quantities of domestic copper in 1938 and 1939 is believed to have been due partly to conditions brought about by the cartel group, which restricted production outside the United States, and in periods of sharp buying pressure, common to the copper industry and accentuated by war fears and the war itself, foreign producers were unable to increase output quickly enough to accommodate demands. The principal increase in use of United States copper abroad as a result of the war probably will be in products manufactured in the United States from domestic copper.

Salient statistics of the copper industry in the United States, 1925–29 (average) and 1936–39, in short tons

	Average (1925-29)	1936	1937	1938	1939
New copper produced—					
From domestic ores, as reported by—					
Mines	885,826	614,516	841,998	557,763	728,320
Ore produced:					
Copper ore	59,505,871	[1] 38,514,245	[1 2] 61,513,148	[1 2] 37,794,938	(3)
Average yield of copper, percent	1.44	1.54	1.29	1.34	(3)
Smelters	892,730	611,410	834,661	562,328	712,675
Percent of world total	51	32	32	25	30
Refineries	890,767	645,462	822,253	552,574	704,873
From foreign ores, matte, etc., refinery reports	317,287	177,027	244,561	239,842	304,642
Total new refined, domestic and foreign	1,208,054	822,489	1,066,814	792,416	1,009,515
Secondary copper recovered from old scrap only	347,512	382,700	408,900	267,300	(3)
Copper content of copper sulfate produced by refiners	4,601	4,642	5,855	4,978	4,868
Total production, new and old and domestic and foreign	1,560,167	1,209,831	1,481,569	1,064,694	(3)
Imports (unmanufactured) [4]	391,212	190,339	279,875	252,164	336,297
Refined [4]	59,236	4,782	7,487	1,802	16,264
Exports of metallic copper [5]	522,616	259,032	346,229	421,012	427,517
Refined (ingots, bars, rods, etc.)	482,868	236,091	310,396	385,223	396,406
Stocks at end of year	307,200	305,500	393,000	414,000	355,500
Refined copper	86,100	110,000	179,000	181,000	95,500
Blister and materials in solution	221,100	195,500	214,000	233,000	260,000
Withdrawals from total supply on domestic account:					
Total new copper	778,123	656,179	694,906	406,994	714,873
Total new and old copper	1,288,700	1,141,000	1,227,000	767,000	(3)
Price, average.......cents per pound	14.7	9.2	12.1	9.8	10.4
World smelter production, new copper	1,761,000	1,895,000	2,585,000	2,247,000	[6] 2,414,000

[1] Includes old tailings.
[2] Exclusive of Alaska, figures for which the Bureau of Mines is not at liberty to publish.
[3] Figures not yet available.
[4] Data include copper imported for immediate consumption plus material entering the country under bond.
[5] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufactures of copper," for which figures of quantity are not recorded.
[6] Approximate.

Domestic demand in 1939 was sporadic, and sales were concentrated in short periods of heavy buying. Domestic sales were only 15,500 tons in January; rose almost continuously to 66,400 tons in June and jumped to new high record monthly sales of 183,200 tons in July; declined to 38,300 tons in August; and, spurred by the advent of war in September, reached another new record of 183,700 tons in that month. Realization of the effect of changes in world sources of supply since the World War of 1914–18 evidently contributed to the drastic drop in sales to 29,600 tons in December.

In June the 4-cent excise tax on copper imported into the United States was extended to July 1941. The domestic producers have received little benefit from the duty in respect to price advantage over world markets. Undoubtedly, however, the tariff has been responsible for preventing large quantities of foreign copper from entering consumption channels in the United States.

Proposed trade agreement with Chile.—Reduction in the copper tax to Chile was one of the principal factors considered when the possibilities of a trade agreement with that country were being examined late in the year. Companies that have domestic mines only and one whose foreign holdings are proportionately slight filed vigorous briefs against the reduction, and Michigan and western Congressmen strongly opposed the move, some claiming that the Reciprocal Trade Act gave the President authority to cut tariffs only, whereas the tax on copper was an excise tax imposed originally under a provision of the Revenue Act of 1932. Although claiming full authority to decrease the tax to 2 cents a pound, if found desirable, the Government decided against the cut, and negotiations for a trade agreement with Chile were discontinued later.

T. N. E. C. investigation.—During the latter part of January 1940 the copper industry was questioned by the Temporary National Economic Committee (T. N. E. C.), under the chairmanship of Senator O'Mahoney, in its study of monopolies. The investigation was principally concerned with cooperative group action and called only upon those domestic mine producers that have large foreign interests and were members of the Copper Cartel.

First, Dr. Theodore J. Kreps, economic consultant of the committee, testified at length on cartels, tracing the development of these organizations abroad.

Charts prepared by T. N. E. C. showed that the Anaconda Copper Mining Co., Phelps Dodge Corporation, and Kennecott Copper Corporation produced about 26 percent of domestic mine output in 1915 and that the proportion supplied by them had grown to nearly 80 percent by 1937. The most phenomenal gain among these companies was made by Kennecott, whose share rose from less than 1 to 36 percent of the total during that period.

Cornelius F. Kelly, president of Anaconda Copper Mining Co., stated that both the Copper Export Association, Inc., 1919–23, and Copper Exporters, Inc., 1927–32—the latter including foreign as well as domestic members—were formed under the Webb-Pomerene Act permitting combinations of domestic producers to fix prices, for export trade only, to meet concentration of foreign buying power abroad effectively. Copper Export Association aided in the orderly liquidation after the World War of a copper pool of 200,000 tons against which a loan of $40,000,000 was obtained, secured by debentures that were retired as the copper was sold. The purpose of Copper Exporters, Inc., was to try to eliminate speculation in copper abroad. Kelly estimated that 70 percent of primary fabrication is controlled by producing companies.

E. T. Stannard, president of Kennecott Copper Corporation, testified that the copper industry had been unable to agree on a code under N. R. A. and that it was dissatisfied with the one imposed upon it. His testimony indicated that the International Cartel Agreement of 1935 was between subsidiaries of Anaconda and Kennecott in South America and Mexico; Mufulira, Roan Antelope, and Rhokana in Rhodesia; Rio Tinto in Spain; Katanga in Belgian Congo; and Bor in Yugoslavia. All told, these companies controlled about 50 percent of foreign copper production. The purpose of the agreement was to help stabilize production, distribution, and marketing of copper outside of the United States. A quota system allotted production curtailment based upon standard tonnages for each producer which did not represent production capacity. There was no price fixing, he stated, and no allocation of markets. In pointing out the harm done by speculators, Stannard stated that his company had sold almost no copper on the London Metal Exchange in a number of years, except about 5,000 tons on the rising market in 1937 in an attempt to discourage the exaggerated movement. He understood that during the boom of 1937 speculators on the exchange bought 100,000 to 150,000 tons of copper.

Both Kelly and Stannard suggested that the Government afford the copper industry some sort of cooperation, under Government supervision, such as that accorded agriculture under the Capper-Volstead law.

Francis H. Brownell, chairman of the board of the American Smelting & Refining Co., represented custom smelters. He stated that the problems of his organization differed greatly from those of the mining companies, particularly those that operated fabricating subsidiaries. In general, a custom smelter must sell each day an amount equivalent to its intake of metal. Differences between the lead and copper industries which, he thought, caused wider fluctuations in prices of copper were that it is sold 4 months ahead compared with 1 month for lead and that mining-company ownership of fabricating subsidiaries, prevalent in the copper industry, is not common in the lead industry.

Arthur Notman, consulting mining engineer, testified on economic phases of the copper industry. He pointed out that differentials between prices for electrolytic copper and certain fabricated products had increased considerably from 1909–12 to 1935–38. His figures showed that the difference between electrolytic copper, f. o. b. refinery, and copper wire was 1.38 cents a pound in 1909–12 and 3.5 cents in 1935–38; between electrolytic copper and sheet copper it was 4.73 and 7.85 cents; and between electrolytic copper and high brass sheets it was 0.4 cent and 5.95 cents. The later higher-differential period coincided with the ownership of fabricating subsidiaries by copper producers. Notman expressed the view that integration of production and fabricating facilities was unwise for all concerned and that cooperative undertakings to stabilize the industry had always resulted in higher prices for copper.

A résumé of the hearings is published in the Engineering and Mining Journal of February 1940.[1]

DOMESTIC PRODUCTION

Statistics on copper production may be compiled on a mine, smelter, or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better for showing the actual recovery of metal and are fairly accurate for showing the source of production; and refinery statistics give precise information regarding metal recovery but indicate only in a general way the source of crude materials treated. The chapter on Copper in Mineral Resources of the United States, 1930, contains a discussion of the differences among the three sets of figures.

[1] Engineering and Mining Journal, vol. 141, No. 2, February 1940, pp. 110 and 118.

Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1935–39, in pounds

Year	Mine	Smelter	Refinery
1935	760,979,802	762,587,340	676,642,866
1936	1,229,030,719	1,222,819,396	1,290,924,195
1937	1,683,996,000	1,669,322,278	1,644,505,129
1938	1,115,525,160	1,124,656,539	1,105,148,323
1939	1,456,639,000	1,425,349,488	1,409,745,816

PRIMARY COPPER

Smelter production.—The recovery of copper by United States smelters from ores of domestic origin totaled 1,425,349,488 pounds in 1939, a 27-percent increase over 1938. Smelter domestic output constituted 51 percent of world production from 1925–29. The proportion dropped sharply in the succeeding years until 1934, when it represented only 17 percent. From then it increased until it reached 32 percent in 1936 and 1937, declined to 25 percent in 1938, and rose again to 30 percent in 1939.

The figures for smelter production in 1939 are based upon confidential returns from all smelters handling copper-bearing materials produced in the United States. For Michigan the sum of furnace-refined copper and copper cast into anodes for electrolytic refining is included. The figures for blister represent the fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production. Metallic and cement copper recovered by leaching is included in smelter production.

The precise quantity, in pounds, of copper produced by smelters in the United States and its value are shown by years for 1845–1930 in the Copper chapter of Mineral Resources of the United States, 1930.

Copper produced in the United States from domestic ores, 1935–39

[Smelter output, in pounds fine]

State	1935	1936	1937	1938	1939
Alabama	10,061	14,293	18,820	----------	----------

Copper produced (smelter output) in the United States, 1935–39, and total, 1845–1939

[Values rounded]

Year	Short tons	Value
1935	381,294	$63,295,000
1936	611,410	112,499,000
1937	834,661	201,988,000
1938	562,328	110,216,000
1939	712,675	148,236,000
Total, 1845–1939	26,589,394	8,046,567,000

Mine production.—The figures for mine production are based upon reports supplied to the Bureau of Mines by all domestic mines that produce copper. Details of the method of collecting the statistics and reasons for the discrepancy between mine-, smelter-, and refinery-production figures are given in the Copper chapter of Mineral Resources of the United States, 1930.

Mine production is more accurate than either refinery or smelter production for showing the distribution of domestic production by States and districts. It also indicates the production by calendar years more exactly, because additional time is required for smelting and refining. Mine production in 1939 was 1,456,639,000 pounds, an increase of 31 percent over that in 1938 but 18 percent below the average for 1925–29.

Production by States and districts.—The following tables show mine and smelter production by States for 1938 and 1939 and by districts for 1935–39. In 1939 Arizona, Utah, and Montana led in production, with 70 percent of the smelter total compared with 72 percent in 1938. If the output of Nevada and Michigan is added to the above, 89 percent of the output of the country is represented compared with 87 percent in 1938. Arizona's proportion of the total dropped from 37 percent in 1938 to 33 in 1939. Utah's rose from 20 to 23 percent, and Montana's remained unchanged at 14 percent. Nevada's proportion of the total increased from 8 to 13 percent while Michigan's share dropped nearly 1 point to 6 percent. Of the most important copper-producing States, Arizona supplied the same percentage for 1939 as for 1845–1939. Utah and Nevada made excellent showings with 23 and 13 percent in 1939 compared with 12 and 5 percent, respectively, in 1845–1939. On the other hand, Montana and Michigan supplied only 14 and 6 percent of the total for 1939 compared with 22 and 17 percent, respectively, for 1845–1939.

Copper produced in the United States, according to smelter and mine returns, by States, 1938–39, and 1845–1939, in short tons

[1] Included under "Undistributed"; figures not separately recorded.
[2] Included under "Undistributed"; Bureau of Mines not at liberty to publish figures.
[3] Less than 1 ton.
[4] Approximate production through 1928. Figures for 1929–39 are confidential and are included under "Undistributed."
[5] Less than 0.01 percent.
[6] Includes Tennessee for 1929–39.

The Bingham (Utah) district again produced more copper than any other in 1939, followed, as in 1938, by Butte, Mont. The Globe-Miami (Ariz.) district stood third in 1939, having replaced Bisbee, Ariz., which held that position in 1938.

Details of mine production, by districts and companies, in 1939 are available in other chapters of this volume dealing with the production of gold, silver, copper, lead, and zinc in the various States.

[1] Districts producing 1,000 short tons or more in any year of the period, 1935–39.
[2] Not listed in order of output.
[3] Includes a small quantity produced elsewhere in Alaska.
[4] Negligible.
[5] Bureau of Mines not at liberty to publish figures.

Quantity and estimated recoverable content of copper-bearing ores.—The following tables list the quantity and estimated recoverable copper content of the ore produced by United States mines in 1938; figures for 1939 are not yet available. Of the total copper produced from copper ores in the United States in 1938, 79 percent was obtained from ores concentrated before smelting and 18 percent from direct-smelting ore. Included in ore concentrated in 1938 were 3,443,247 tons treated by combined leaching and flotation. In addition to the above, 1,380,212 tons of copper ore were treated by straight leaching. The percentages for 1938 are to be compared with 85 percent obtained from concentrated ore and 15 percent from direct-smelting ores in 1937.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that the estimated recoverable tenor is close to the actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only those that contain 2.5 percent or more copper but also those that contain less than this percentage if they are valuable chiefly for copper. Mines report considerable copper from ores mined primarily for other metals. These include siliceous gold and silver ores, lead and zinc ores, and pyritic sulfur ores.

Copper ore, old tailings, etc., sold or treated in the United States [1] in 1938, with copper, gold, and silver content in terms of recovered metals

State	Ore, old tailings, etc., sold or treated (short tons)	Copper produced		Gold produced (fine) ounces)	Silver produced (fine ounces)	Value of gold and silver per ton of ore

[1] Includes old tailings, etc.
[2] Exclusive of a small quantity from California, which the Bureau of Mines is not at liberty to publish.
[3] Exclusive of Alaska, figures for which the Bureau of Mines is not at liberty to publish.

REFINERY PRODUCTION

The refinery output of copper in the United States in 1939 was made by 10 plants; 8 of these employed the electrolytic method and 2 the furnace process on Lake Superior copper.

There are five large electrolytic refineries on the Atlantic seaboard, three lake refineries on the Great Lakes, and three refineries west of the Great Lakes—one at Great Falls, Mont.; one at Tacoma, Wash.; and one at El Paso, Tex. Of the above plants, the lake refinery of the Quincy Mining Co. has been idle since 1933.

In addition to the plants mentioned above that at Inspiration, Ariz., is equipped to make electrolytically refined copper direct from the liquors obtained from leaching operations; this copper is shipped as cathodes to other refineries, where it is melted and cast into merchant shapes. The Inspiration plant was idle during 1933 and 1934, but operations were resumed during the latter part of 1935.

The above 12 plants constitute what commonly are termed "regular refineries." Of these plants, 9 employ the electrolytic process and 3 the furnace process. The electrolytic plants have a rated capacity of 1,572,000 tons of refined copper per annum. As they produced but 1,084,000 tons in 1939, only 69 percent of the electrolytic refining capacity was utilized.

The following tables show the production of refined copper at regular refining plants, classified according to source, grade, and form in which it is cast.

Primary and secondary copper produced by regular refining plants in the United States and imported, 1935–39, in pounds

	1935	1936	1937	1938	1939

	1,770,000,000	100.00	2,252,000,000	100.00

In addition to the regular refineries, numerous plants throughout the country operate on scrap exclusively, producing metallic copper and a great variety of alloys. The output of these plants is not included in the statements of refined-copper production in the preceding tables but is included in the following statement of secondary-copper production.

Copper sulfate.—The production of hydrous copper sulfate or bluestone by copper refineries in the United States was 38,219,447 pounds having a copper content of 9,735,000 pounds in 1939 compared with 39,081,407 pounds having a copper content of 9,955,000 pounds in 1938.

The output of copper sulfate by plants other than the regular primary refineries was 48,312,400 pounds with a reported copper content of 12,290,000 pounds in 1939 compared with 49,819,375 pounds containing 12,565,000 pounds in 1938.

SECONDARY COPPER

Secondary copper includes material recovered from remelting old copper and copper scrap and from the treatment of copper alloys or alloys treated without separation of the copper. The following table summarizes the production of secondary copper during 1934–38. The scope of Bureau of Mines work on secondary nonferrous metals was broadened considerably in 1939, and completion of data for that year was necessarily delayed. Statistics for 1939 were not available when this report was written. Further details appear in the chapter on Secondary Metals—Nonferrous.

Secondary copper produced in the United States, 1934–38, in short tons

	1934	1935	1936	1937	1938
Copper as metal	220,400	270,000	260,000	285,600	192,400
Copper in alloys	157,000	178,900	224,600	246,500	167,400
Total secondary copper	377,400	448,900	484,600	532,100	359,800
From new scrap	66,500	87,200	101,900	123,200	92,500
From old scrap	310,900	361,700	382,700	408,900	267,300
Percent of domestic mine output	159	118	79	63	65

CONSUMPTION AND USES

New supply.—The total available supply of new copper consists of the total output of primary copper by refineries plus the imports of refined copper; in 1939 it was 2,051,558,000 pounds, a 29-percent increase from 1938. If this figure is reduced by the quantity of refined copper exported and adjusted for changes in stocks at refineries the quantity of new copper made available for domestic consumption may be estimated. This computation is made in the table that follows. It should be noted, however, that exports and stocks include some refined secondary copper that cannot be determined separately and that actual consumption of new copper would differ from the figures shown in the table by the changes in consumers' stocks, on which data are not available.

244615—40——7

New refined copper withdrawn from total year's supply on domestic account, 1935–39, in pounds

	1935	1936	1937	1938	1939
Total supply of new copper	1,213,753,468	1,654,540,642	2,148,602,618	1,588,434,754	2,051,558,228
Stock at beginning of year	569,000,000	350,000,000	220,000,000	358,000,000	362,000,000
Total available supply	1,782,753,468	2,004,540,642	2,368,602,618	1,946,434,754	2,413,558,228
Copper exported [1]	550,012,320	472,182,922	620,791,029	770,446,945	792,812,995
Stock at end of year	350,000,000	220,000,000	358,000,000	362,000,000	191,000,000
	900,012,320	692,182,922	978,791,029	1,132,446,945	983,812,995
Withdrawn on domestic account	882,741,148	1,312,357,720	1,389,811,589	813,987,809	1,429,745,233

[1] Includes refined copper in ingots, bars, rods, or other forms.

As shown in the foregoing table, the quantity of new copper withdrawn on domestic account in 1939 was 76 percent larger than in 1938 but 20 percent less than in the record year 1929.

Industrial use of copper.—The American Bureau of Metal Statistics estimates the actual consumption of new and old copper in the United States by uses. Data for the past 5 years are shown in the accompanying table.

Estimated use of copper in the United States, 1935–39, in short tons

Use	1935	1936	1937	1938	1939
Electrical manufactures [1]	128,000	164,000	212,000	150,000	185,000
Telephones and telegraphs	18,000	26,000	40,000	30,000	39,000
Light and power lines [2]	55,500	72,000	83,000	62,000	67,000
Wire cloth	5,600	6,500	6,800	6,000	8,000
Other rod and wire [3]	48,000	90,000	102,000	60,000	95,000
Ammunition	13,700	11,900	14,100	12,500	14,500
Automobiles [4]	95,000	108,000	112,000	55,000	85,000
Buildings [5]	49,000	71,000	70,500	67,500	89,000
Castings, n. e. s.[6]	36,000	39,000	40,000	31,000	33,000
Clocks and watches	2,400	3,400	4,000	3,000	3,600
Copper-bearing steel	2,300	3,900	4,600	2,600	4,200
Radiators, heating	1,100	2,000	2,100	2,000	3,600
Radio receiving sets	16,000	24,000	23,100	21,000	27,000
Railway equipment [7]	1,800	4,000	7,100	1,700	2,700
Refrigerators [8]	15,400	15,000	13,500	6,700	10,000
Shipbuilding [8]	1,100	5,000	6,400	6,000	8,500
Air conditioning [8 9]	4,800	6,400	7,200	6,000	6,000
Other uses [10]	51,500	65,300	66,600	46,200	68,000
Manufactures for export	29,500	31,600	45,000	38,800	51,000
	574,700	749,000	860,000	608,000	801,000

[1] Generators, motors, electric locomotives, switchboards, light bulbs, etc.
[2] Transmission and distribution wire and busbars, accounting only for the public-utility companies.
[3] Includes industrial wire and cable, wire in buildings, railway cars and ships, radio broadcasting, railway and municipal signaling, railway electrification, trolley wire, rod and wire for Government projects, blasting wire, flexible cord, and sundries.
[4] Does not include starter, generator, and ignition equipment.
[5] Excludes electrical work.
[6] Bearings, bushings, lubricators, valves, and fittings.
[7] Includes air conditioning.
[8] Excludes electrical equipment.
[9] Other than railway.
[10] Includes condenser tubes, oil-burner tubing, welding rod, screw-machine products, nickel-silver and phosphor bronze products, rivets and burrs, toilet pins, eyelets and grommets, electrotyping and engraving sheet, spark plugs, inner-tube valve stems, jar tops and rouge boxes, flashlight tubes, kerosene lamps, kitchen utensils, kitchen-range boilers, linotype matrices, safety razors, blasting caps, asbestos textiles, water meters, thermostats, soldering coppers, yacht fittings, coinage, washing machines, household water heaters, fire extinguishers, pumps, engines, and sundry machinery, etc., all reckoned in terms of copper content.

The foregoing table shows that the estimated quantity of copper going into use in 1939 was 32 percent larger than in 1938, but in comparison with consumption in 1929 a decline of 31 percent was indicated. Of the more important uses, light and power lines gained only 8 percent in 1939, while other rod and wire rose 58 percent, the largest percentage increase; other rod and wire made one of the best showings compared with 1929, having decreased only 11 percent from that year. Automobiles took 55 percent more copper in 1939 than in 1938, but dropped 38 percent from 1929; refrigerators rose 49 percent in 1939 but were 42 percent below 1929; telephones and telegraphs gained 30 percent over 1938 but made the poorest showing in relation to 1929, having fallen 76 percent from that year. The most important use of copper is for electrical manufactures, which took 23 percent more than in 1938 and 29 percent less than in 1929. Castings gained only 6 percent over 1938 and were 58 percent below 1929. The only important uses that improved over both 1938 and 1929 were buildings, with increases of 32 and 51 percent, respectively; radio, with 29 and 74 percent; and ammunition, with 16 and 110 percent. The consumption of copper in manufactures for export rose 34 percent over 1938 but was 31 percent lower than 1929. The use of copper as measured in pounds per person was 12.21 in 1939, 9.34 in 1938, and 19.08 in 1929.

STOCKS

The following table gives domestic stocks of copper as reported by primary smelting and refining plants. Stocks of blister copper in transit from smelters to refineries are included under blister copper.

Stocks of copper in the United States, Jan. 1, 1936–40, in pounds

Year	Refined copper	Blister and materials in process of refining	Year	Refined copper	Blister and materials in process of refining
1936	350,000,000	472,000,000	1939	362,000,000	466,000,000
1937	220,000,000	391,000,000	1940	191,000,000	520,000,000
1938	358,000,000	428,000,000			

At the end of 1939 inventories of refined copper were 47 percent lower than at the close of 1938. The drop, as will be shown in the subsequent paragraph, was due to acceleration of demand in the latter part of the year, particularly in the final quarter. On the other hand, stocks of blister and anode copper at smelters, in transit to refineries, and blister and unfinished materials in process of refining at refineries increased 12 percent so that total stocks at smelters and refineries were only 14 percent less than at the end of 1938.

Figures compiled by the Copper Institute and published in the press show that domestic stocks of refined, duty-free copper were 289,755 tons at the end of 1938 and rose monthly until the end of May, when they reached the highest level of 1939—337,155 tons. There was a sharp gain in deliveries beginning in July, and notable inroads were made in inventories. Statistics for August to December were published as totals for the period only, so that the month-to-month movements are not clear. Year-end refined-copper stocks stood at only 159,485 tons, so the trend during those months was steeply downward, although, with rapidly advancing domestic production, it probably was arrested in December. During the latter part of the year expanded exports contributed to the downtrend of metal on hand. The Copper Institute reported that blister stocks gained 18,082 tons in 1939. The trend of refined stocks abroad was similar to that in the United States. They were 167,413 tons at the end of 1938 and advanced to reach the highest level of 1939—190,209 tons—in April. They then declined monthly until they were 173,876 tons at the end of July. Foreign data were discontinued after July owing to inability of the Copper Institute to obtain the necessary information.

Copper Institute figures for the United States presumably include some metal held by consumers or at some secondary plants, as reports to the Bureau of Mines from primary refineries indicate that stocks of refined copper at refineries, shown in the foregoing table, were 95,500 tons at the end of 1939 and 181,000 at the end of 1938 (compared with 159,485 and 289,755 tons).

Data for consumers' stocks are not available.

PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 910,000 short tons of copper were delivered to domestic and foreign purchasers in 1939 at an average price (f. o. b. refinery) of 10.4 cents a pound compared with 9.8 cents in 1938 and 12.1 in 1937.

Fluctuations in copper prices were relatively narrow in 1939, particularly in view of the startling world events. The small changes were noteworthy also because sales of copper were highly concentrated into short periods during the year. The tendency to concentrate purchases, however, is rather characteristic of the copper-consuming industry.

In the first 2 months of the year sales continued at the abnormally low rate of November and December 1938, and the domestic price stood at 11.025 cents a pound for electrolytic copper, f. o. b. refinery. This price, incidentally, was the highest level attained in 1938, and was due to the momentum from activity early in the final quarter of that year. A high rate of production continued into the first months of 1939 and with lowered demand resulted in a period of rising inventories. Nevertheless, the price held at 11.025 cents until early April, when the pressure of increasing stocks caused a break of ½-cent a pound. Stocks gained until they reached the highest point of the year at the end of May; the price trended downward until late in April and held at that level, with virtually no change, until it reached 9.775 cents early in July. Meanwhile, consumption in the United

States began to improve, export demand picked up, and stocks turned downward in June. As conditions improved it soon became evident that consumers had again refrained from purchasing their needs at declining prices, and they rushed into the market in midyear. Monthly domestic sales in the first half of 1939 ranged from 15,507 tons in January to 60,004 in April and 66,381 in June. Sales aggregated 182,576 tons in July, fell to 38,276 tons in August and reached a new all-time high record of 183,626 tons in September. War rumors contributed to the rush of buying in July, when purchases by France were reported to have touched off the buying movement. The declaration of war by Great Britain early in September, accompanied by the memory of the World War of 1914–18, was responsible for the enormous sales in that month. Realization of changes in conditions of supply since the previous war, however, was followed by a drop in sales to 51,591 tons in November and to 29,592 tons in December. The major price changes of the year were the jump of 1 cent a pound on September 6, following the spectacular purchases made just after the outbreak of the war, and the further increase of ½ cent on October 5. These gains brought the price to 12.275 cents, the highest level of the year, where it continued throughout the remainder of the year.

Transactions on the London Metal Exchange were suspended at the outbreak of the war, and this action had the effect of increasing activity on the New York market. From January through April the domestic price, f. o. b. refinery, was higher than the London price, and for the next 4 months the London price exceeded the domestic one. Coincident with the price advantage on the London market, exports of copper rose. For the first 8 months of the year the domestic price averaged 10.398 cents and the London price 10.066 cents. This price differential is to be compared with the tariff of 4 cents a pound on copper imported into the United States.

When war was declared the British Government made contracts with Dominion producers for its copper requirements for the war period. Maximum prices fixed by the British authorities in September on the various forms of copper were:

Refined copper unwrought, £46, ex warehouse.
Refined copper, unwrought, in ingots, bars, etc., £49 10s., c. i. f.
Electrolytic copper, unwrought, wire bars, ingot bars, or in any other form, £51, c. i. f.
Copper billets, £55, c. i. f.
Copper cakes, £51 12s. 6d., c. i. f., English ports.
Copper cathodes, £50 10s., c. i. f., Engish ports.
Copper-wire rods, £55, delivered.

During December the British Ministry of Supply increased the maximum buyers' prices on copper—mainly, it is understood, to offset increased freight and insurance charges—and at the end of the year the price for electrolytic copper delivered was £62 and for fire-refined copper was £61 10s.

Average monthly quoted prices of electrolytic copper for domestic and export shipments, f. o. b. refineries, United States, and for spot copper at London, 1938–39, in cents per pound

FOREIGN TRADE [2]

United States imports and exports of copper constitute a well-balanced trade through which the smelting, refining, and manufacturing facilities of this country are utilized to treat foreign raw materials and to return refined copper and manufactures of copper abroad. Ninety-four percent by weight of the copper imported in 1939 was contained in ore, concentrates, and unrefined furnace products, 5 percent was refined copper, and the remainder consisted of ingots to be remelted and recast in the United States. Increased receipts of refined metal in 1939 were due to disruption of ocean transportation caused by the European war in September. By contrast, 96 percent of the exports comprised refined copper and primary manufactures therefrom.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

The United States has long had an exportable surplus of copper and for many years exported more copper than it imported. In 1930–32 imports exceeded exports, and a tariff of 4 cents a pound was placed on copper in 1932. Exports have exceeded imports since that time, and the principal part of imports has been for smelting, refining, and export.

Separation of total exports to show the quantity of domestic copper shipped from the United States is not possible. Data at hand, however, indicate that exports of domestic copper declined from the quantities shipped in 1938. Excess of total exports over imports of unmanufactured copper fell from 340,000,000 pounds in 1938 to 183,000,000 in 1939. In addition to the copper shown in the accompanying tables, an unrecorded quantity of metal is exported in manufactures, such as electrical machinery, automobiles, and similar equipment.

Imports.—The principal changes were increases in refined imports from 3,603,025 pounds in 1938 to 32,527,473 in 1939, and in imports of unrefined blister and converter copper from 353,596,562 pounds to 490,260,671. Imports of ore were mainly from Chile and Cyprus, those from the former declining while those from the latter rose. Canada, Newfoundland and Labrador, Cuba, and Mexico were the sources of the principal part of receipts of concentrates. Of this group a large decrease was indicated in receipts from Cuba; Mexico also was lower, while there were increases for the other two countries. Large increases were noted in imports of unrefined copper from Chile, British Africa, Mexico, and Turkey. Imports from Peru, Canada, and Yugoslavia, other large sources of unrefined copper, slumped somewhat in 1939. Virtually all refined copper entered is from Chile, and this class increased sharply in 1939.

Copper (unmanufactured) imported into the United States in 1939, in pounds [1]

Country	Ore (copper content)	Concentrates (copper content)	Regulus, black or coarse copper, and cement copper (copper content)	Unrefined black blister and converter copper in pigs or converter bars	Refined in ingots, plates, or bars	Old and scrap copper, fit only for remanufacture, and scale and clippings

Copper (unmanufactured) imported[1] into the United States, 1935–39

Year	Pounds	Year	Pounds
1935	514,364,526	1938	504,327,779
1936	380,677,700	1939	672,594,122
1937	559,749,133		

[1] Data include copper imported for immediate consumption plus material entering the country under bond.

Exports.—Exports of all classes of copper totaled 855,157,653 pounds in 1939—a 1-percent increase over 1938—and were the largest since 1929. The principal class—refined, bars, ingots, or other forms—was virtually unchanged from 1938, while rods, the second-ranking class in 1939, made a substantial gain. Exports of scrap copper declined in 1939. It is noteworthy that France increased its share of exports of refined ingots, etc., by 137 percent, while Sweden gained 34 percent, Italy 28 percent, and Japan 14 percent; U. S. S. R., which took only 110,359 pounds of this class in 1938, received 45,496,194 pounds in 1939. Exports of ingots, bars, etc., to Germany were 71 percent lower than in 1938. Actually, the decrease was more severe, for data covering parts of Czechoslovakia were included under Germany after March 18 or 19, 1939.

Copper exported from the United States in 1939,[1] in pounds

Country	Ore, concentrates, composition metal, and unrefined copper (copper content)	Refined: Bars, ingots, or other forms	Refined: Rods	Old and scrap	Pipes and tubes	Plates and sheets	Wire (except insulated)	Insulated wire and cable	Other copper manufactures

[1] Changes in table in Minerals Yearbook, 1939, p. 111, are as follows: Old and scrap exported to British India should read, 210,088 pounds; Other countries, 140,465 pounds. Insulated wire and cable exported to Brazil should read 522,297 pounds; Sweden, 18,492 pounds; U. S. S. R., 188 pounds; Other countries, 7,123,960 pounds.

[2] For statistical purposes trade with the Sudeten area, as far as ascertainable, is included with Germany, while trade with the other Czechoslovak provinces occupied by Germany, Hungary, and Poland has been included with these countries since March 18 or 19, 1939. After November 16, 1939, trade with Danzig and that part of Poland occupied by Germany has been included with Germany, and trade with that part of Poland occupied by U. S. S. R. has been included with U. S. S. R.

WORLD ASPECTS OF COPPER INDUSTRY

International cooperation.—At the beginning of 1939 foreign producers who are members of the Copper Cartel were operating at 100 percent of their agreed production capacities—far below actual capacities. The rate was cut to 95 percent effective March 1, but owing to increased demands in anticipation of war it was raised to 105 percent effective August 16. It is stated that all restrictions were removed at the outbreak of the war.

World production.—Mining and smelting of copper in the world are concentrated in the United States, Chile, Canada, Northern Rhodesia, Belgian Congo, U. S. S. R., and Japan. The United States predominates in copper refining by a much wider margin than in mining or smelting and is followed in importance by Chile, Germany, Canada, Belgium, and Great Britain. World smelter production increased 7 percent in 1939 and except for 1937 was the highest ever recorded. Outside United States production was at its highest levels except for 1937, while output in the United States for 1939 (although 27 percent above 1938), had been exceeded in 1937, in every year from 1923 to 1929, and in the World War years, 1916–18. Of the important copper-producing nations in 1939, Canada again surpassed previous mine and smelter records. Northern Rhodesia may also have made a new mine record in 1939, although totals for the year are not yet available. Its smelter output lagged slightly behind the previous record established in 1938. Chile's mine and smelter totals declined 3 and 4 percent, respectively, from production in 1938, while smelter output in Belgian Congo dropped by 2 percent. Production data strongly favor the Allies from the point of view of available supplies. The British Empire is considerably more than self-sufficient in regard to copper and can help to supply France from its surplus. Germany, on the other hand, must import the principal part of its requirements. The countries recently annexed by Germany—that is, Austria, Czechoslovakia, and Poland—add to Germany's problems in regard to copper supplies. U. S. S. R. and Italy, which cooperate with Germany, at present must import copper to meet their requirements, U. S. S. R. to supplement output from its own mines and reduction plants. U. S. S. R. has been making strenuous efforts to raise production to the point where it will not only fill home needs but supply a substantial exportable surplus, and the prospects are that this plan will be accomplished some time in the future. Italy's efforts have been directed toward reducing its consumption of copper.

World mine and smelter production of copper, 1937–39, in metric tons

[1] Copper content of blister produced.
[2] Smelter output from domestic and foreign ores, exclusive of scrap. The production from domestic ores only, exclusive of scrap, was as follows: 1937, 757,188 tons; 1938, 510,133 tons; 1939, 646,524 tons.
[3] Copper content of exports.
[4] Figures represent blister copper only. In addition to blister copper, Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from the Belgian Congo and would therefore duplicate output reported under the latter country.
[5] Data not yet available. [6] Approximate production. [7] Exclusive of material from scrap.
[8] Smelter output from ores. [9] Output from U.S.S.R. in Asia included under U. S. S. R. in Europe.
[10] Smelter product. [11] Exports of ingots and slabs. [12] Less than 1 ton.
[13] Approximate production based on the output of the countries shown, which in 1938 contributed about 95 percent of the total world output.

World consumption.—Inability to obtain statistics for many countries covering imports and exports in the latter part of 1939 has made it impossible to calculate world consumption, so that the usual discussion of American Bureau of Metal Statistics data cannot be presented. Indications are that a new high record was attained in 1939, in consequence of a maintained high rate of use abroad in preparation for war and of improved consumption in the United States, owing to greater industrial requirements and to exaggerated demands in the latter part of the year because of fears of a shortage of supplies as a result of the war.

Data for the first 6 months of 1939 indicate that apparent consumption of copper in Great Britian and Italy was at rates approximately 5 and 30 percent, respectively, over the annual rate for 1938, while that in France and Germany was about 5–10 and 30 percent, respectively, below.

REVIEW BY COUNTRIES

Belgian Congo.—Production of copper in Belgian Congo amounted to 121,498 metric tons compared with 123,943 in 1938 and 150,588 in 1937. During the first 8 months of 1939 production was regulated by the Copper Cartel and ranged from 95 to 105 percent of nominal capacity (considerably below actual capacity), but after the opening of hositilities between the Allies and Germany in September, apportionment of production was abandoned temporarily. After war started the Allies began to ration quantities of copper permitted through their blockade to neutrals, to prevent Germany from receiving the excess over consumption in such countries. This practice interfered with the free movement of copper from Belgian Congo to Belgium. In November it was announced in the press that copper for Belgian consumption would continue to be refined at the Hoboken plants at Oolen near Antwerp and that the remainder of Belgian Congo copper would be treated on the spot at the Panda works or shipped to North America for refining. A Belgian news letter, quoted in the Metal Bulletin, London, of January 16, 1940, stated that the Allies had liberalized embargo restrictions on copper for Belgium, that Union Minière du Haut Katanga probably would produce 80,000 tons in the first half of 1940, and that raising the output to a basis of 250,000 tons a year was prevented only by a hesitancy to make the necessary capital expenditure in the face of uncertain conditions. This company has opened offices in New York, Johannesburg, Cape Town, and Lisbon. It shared in large purchases of the French Government late in 1939 and early in 1940, which eased the situation caused by the Allied blockade.

Development work at the new Ruwe and Kolwezi copper deposits is reported to have been promising, and Union Minière is building a 1,500-ton concentrator at Kolwezi. The concentrates will be transported by rail to other works of the company for further treatment.

Canada.—The breaking of copper-production records is beginning to be an annual accomplishment in Canada, and 1939 marked another forward step. Mine output totaled 304,051 short tons compared with 285,625 in 1938, the previous record year, and smelter production amounted to 252,838 tons compared with 237,806 in 1938, the previous record year.

An outstanding feature of the year was the agreement between the Imperial Government and large base-metal producers by which the producers were to supply the Imperial Government with copper, lead, and zinc at prices that prevailed shortly before the outbreak of the war. As in past years, more than half of the copper produced—54 percent in 1939—came from the nickel-copper mines of the Sudbury district, Ontario. The principal producer is the International Nickel Co. of Canada, Ltd., which refines the major part of the copper it produces in the company refinery at Copper Cliff and exports the remainder as matte. At the Copper Cliff smelter 185,578 tons of bessemer matte and 165,129 tons of converter copper were produced. Some plant expansion is planned to provide smelter capacity for increased output at the concentrator. The refinery received 165,129 tons of molten converter copper from the Copper Cliff smelter and produced 150,541 tons of refined copper. A second electric furnace was brought into operation in January 1939, and the year's operation was featured by increased electric furnace activity and decreased use of reverberatory furnaces for producing refined shapes. The Falconbridge Nickel Mines, Ltd., exports its matte to Norway for refining. The Noranda Mines, Ltd., with a smelter at Noranda, Quebec, is the largest producer in Quebec; this Province supplied 19 percent of the country's total. Noranda blister is shipped to the Canadian Copper Refiners, Ltd., at Montreal East, in which it owns the principal interest. An article [3] on smelting practice at Noranda was published in 1939. Late in the year it was reported that the Waite-Amulet mill was handling more than 600 tons of ore daily and planned further plant increases to an eventual total of 1,000 tons by the spring of 1940. Noranda has a controlling interest in this company and smelts its concentrates. The Normetal Mining Corporation, Ltd., operated throughout the year and shipped its concentrates to Noranda. Concentrates produced by the Aldermac Mines, Ltd., were exported to the United States for smelting. The Eustis mine of the Consolidated Copper & Sulphur Co. in Quebec, reported to have produced for 74 years, was closed in midyear owing to exhaustion of ore reserves. The output of Manitoba and Saskatchewan Provinces was from the Flin Flon mine of Hudson Bay Mining & Smelting Co., Ltd., and the Sherritt Gordon mine of the Sherritt Gordon Mines Co., Ltd. The Hudson Bay smelter treats ore from both properties. The two principal copper-producing mines in British Columbia are the Britannia mine at Howe Sound and the Copper Mountain mine of Granby Consolidated Mining, Smelting & Power Co. Concentrates from these two properties are exported. Early in 1940 it was reported that Granby had extended for 3 years the contract for the shipment of all its concentrates to Japan. The new contract can be canceled by either party as of June 30, 1941.

Copper produced (mine output) in Canada, 1938–39, by Provinces, in pounds

[3] The Mining Journal, London, Recent Smelting Practice at Noranda: August 26, 1939, vol. 206, No. 5427, pp. 793–4.

Canada exports most of its copper and in 1939 shipped 60,750 tons of copper in ore, matte, regulus, etc.; 15,556 tons of blister; 165,819 tons of ingots, bars, etc.; 29,370 tons of rods, strips, etc.; and 3,465 tons of old and scrap copper to foreign countries. Of the ore exported 31,973 tons went to the United States and 17,022 tons to Japan. The United Kingdom was the destination of 125,917 tons of the refined ingots and bars exported.

Chile.—In 1939 smelter production of copper in Chile amounted to 324,591 metric tons compared with 337,508 in 1938 and 396,444 in the record year 1937. Mine production totaled 339,170 tons compared with 351,443 in 1938 and 413,282 in 1937. Chile normally disposes of most of her copper in Europe. When war was declared between Great Britain and France and Germany considerable disruption to Chilean export copper trade was caused owing to contracts entered into between Great Britain and its dominions for its copper requirements for the war period and to attempts of the Allies to throw an economic blockade around Germany, which included rationing of quantities permitted through the blockade to neutrals in order that there would be no excess commodities for reshipment to Germany. Large orders from France late in 1939 and early in 1940 for Chilean and Belgian Congo metal eased the situation.

The Chilean Government raised the income-tax rate from 18 to 33 percent as of January 1, 1939.

Exports of electrolytic copper totaled 156,852 metric tons in 1939 compared with 184,200 in 1938. Of the 1939 total, 47,586 tons were shipped to the United States, 26,417 to Belgium, 23,148 to Sweden, 21,148 to Great Britain, 18,870 to France, and 15,740 to Italy. Blister exports totaled 155,393 tons in 1939 compared with 165,120 tons in 1938. The United States was the principal destination of the exports of blister in 1939; 85,218 tons went to that country while 39,367 went to Great Britain, 7,682 to France, and 7,011 to Italy. Exports of ore and concentrates rose from 6,088 tons in 1938 to 12,867 in 1939.

The Chile Copper Co. produced 139,300 metric tons of copper in 1939 compared with 148,100 in 1938, and Andes Copper 55,100 tons compared with 55,200. These two companies are subsidiaries of Anaconda Copper Mining Co. Braden Copper Co. (subsidiary of Kennecott Copper Corporation) produced 118,400 tons of copper in 1939 compared with 119,800 in 1938. During 1939, 6,962,687 short (6,316,410 metric) tons, assaying 2.15 percent copper, were mined and treated.

An extensive report on the mining industries of Chile, by Charles Will Wright,[4] was recently published by the Bureau of Mines. This report describes the principal copper-mining and reduction operations in Chile and contains general information regarding labor organizations, marketing of ores and concentrates, and other matters. According to this report, the erection of a smelter for copper and gold ores and concentrates, which would be financed by the Government, is being considered. The purpose of this action would be not only to encourage increased output from the small mines but to obtain additional foreign exchange, estimated at $1,000,000. The annual output of the proposed plant probably would be only about 10,000 tons of

[4] Wright, Charles Will, The Mining Industries of Chile, Their Production and Future Possibilities: Bureau of Mines Foreign Minerals Quart., vol. 3, No. 2, April 1940, 80 pp.

copper, which is small in comparison with Chile's total. The problems connected with carrying out such a project, principally concerned with an adequate supply of ores and fluxes to assure continuous operation, are being studied by Government engineers. The technical difficulties include the high silica and aluminum content and the deficiency in iron and sulfur in Chilean ores; the latter characteristics contribute to their salability in the United States, where they are mixed with ores high in iron and sulfur.

Wright states that copper companies operating in Chile and controlled by United States capital supply 57.4 percent of the mineral exports and furnish 45.7 percent of the total exports from Chile, and that these companies have invested about $350,000,000 in mine plants and in the development of low-grade copper deposits. Besides paying a profits tax of 33 percent, the companies are obliged to convert their dollars for pay rolls and purchases in Chile at 19.37 pesos to the dollar instead of at the export rate of 25 pesos. They also pay the workmen the highest wages and supply them with better living conditions than any of the other industries.

Germany.—For many years the output of copper from domestic ores has averaged less than 30,000 metric tons. During these years Germany has taken turns with the United Kingdom as the second-largest consuming nation in the world, with an average annual apparent consumption of 162,000 tons for 1913–38; for 1934–38 the average was 237,000 tons. These figures exclude consumption in Austria and Czechoslovakia, which increase Germany's dependence on outside sources for copper. The difference between mine output and consumption has been filled by imports of ore, metal, and scrap material. During the past few years apparent consumption is believed to have been considerably above real consumption, and large stocks of copper probably were accumulated in preparation for war. Strenuous efforts to increase mine output and to decrease consumption in order to become more nearly self-sufficient as regards this commodity have failed to make Germany independent, except for a period during which available stocks could be used.

The following tables indicate the principal sources of crude and refined imports of copper during the past 5 years. It is notable that the largest quantities of ore are credited to France, British possessions in the Mediterranean, Netherlands, Belgium, Denmark, and the United Kingdom; and of ingots, bars, etc., to Rhodesia, Chile, the United States, and Belgian Congo. Obviously, the outbreak of hostilities between Germany and the United Kingdom and France in September, and the attempted placing of a blockade around Germany, had the effect of cutting off most of the copper from these sources. Prospects for Germany obtaining her requirements from European sources appear to be entirely out of the question, for it would take almost the combined continental output; even U. S. S. R., the largest producer, at present must import metal to meet its own requirements. Other smaller producers dispose of the principal part of their production but sell to various countries. Increased receipts of copper from European producers, such as Yugoslavia, Spain, Norway, and Finland, however, would tend to increase the life of Germany's stock pile. The fact that the Bor mine in Yugoslavia and the Rio Tinto mine in Spain, principal producers in those countries, are owned by French and British capital complicates the task of obtaining larger supplies from those sources, but does not present an insuperable problem.

Imports of copper into Germany in ingots, bars, etc., 1935–39, by countries, in metric tons

Country	1935	1936	1937	1938	1939 (7 months)
Rhodesia		39,124	52,001	76,500	28,668

Other countries	22,670	19,020	24,113	49,071	23,886
	400,538	482,471	555,578	653,931	413,214

1 Not separately reported so some ore from these countries may be included under "Other countries."

Imports of copper scrap for the first 7 months of 1939 were 12,107 tons compared with 27,308 tons in all of 1938 and 32,703 tons in 1937. Exports of ore totaled 4,773 tons in the first 7 months of 1939 compared with 5,625 in all of 1938 and 4,559 in 1937, while exports of bars were 182, 355, and 7,157 tons, respectively; those of rods, sheets, etc., were 9,884, 11,795, and 16,555 tons; of wire were 3,487, 4,572, and 4,961 tons; and of tubes were 3,409, 4,976, and 4,928 tons, respectively.

According to a report from Consul Sydney B. Redecker, Frankfort on the Main, June 7, 1939, exploratory work was in progress at what were purported to be extensive copper deposits in Lower Silesia. When fully developed, it was reported, these deposits will yield 2,500 to 3,000 metric tons of copper annually. They are reported to resemble the copper ore deposits of the Mansfeld district in many respects but to be more extensive and of considerably lower grade. As in the case of the Mansfeld deposits, production is expected to be possible only as a result of substantial Government subsidies.

Mexico.—Smelter and mine outputs of copper were virtually the same in 1939—44,300 and 44,380 metric tons—compared with 37,100 and 41,851 metric tons, respectively, in 1938.

244615—40——8

Difficulties in connection with operations in Mexico are shown by the following items. In midyear the Mazapil Copper Co. petitioned the Mexican Government for permission to suspend operations temporarily, owing to the fact that the company was operating at a heavy loss. It is reported that the petition was refused. Later in the year, however, the property was turned over to approximately 600 employees to conduct on a cooperative basis under a 10-year lease; during the first year the company was to recover 5-percent royalty and during the remaining years 8 percent. Early in 1940 it was reported that Asarco had started a court presentation in Mexico City to prove that it cannot comply with the orders of the Federal Board of Conciliation and Arbitration that it must continue to operate its copper smelter at Matehuala, San Luis Potosi. The company presented proofs of its contention that this plant cannot continue operation owing to a lack of crude material. In its annual report the American Smelting & Refining Co. states that on account of existing conditions in Mexico the company is pursuing the policy of making no new investments there and is avoiding expenditure upon its plants for more than the amount necessary to keep them in efficient operating condition. In the year ended June 30, 1939, the smelter of Compagnie du Boleo produced 7,695 metric tons of copper compared with 8,285 tons in the previous year.

Northern Rhodesia.—Smelter output totaled 215,065 metric tons and was slightly below the record production of 216,450 tons in 1938. A new record may have been established for mine production in 1939, but statistics thereon are not yet available.

In the fiscal year ended June 30, 1939, Roan Antelope Copper Mines, Ltd., extracted and milled 2,816,000 short (2,514,000 long) tons of ore, averaging 3.25 percent copper compared with 3,126,100 short (2,791,000 long) tons in the year immediately preceding. Blister production was 68,262 long tons in the year ended June 30, 1939, and 75,253 long tons in the earlier year; and the average cost, not including reserve for depreciation, was £21.322 per long ton of blister compared with £22.151. Total costs, including all but taxation, amounted to £24.252 in the year ended June 30, 1939, and £24.809 in the year immediately preceding. Revenue from copper sales amounted to £44.129 and £45.469, respectively, in the 2 years. Ore reserves were reported as 110,426,774 short (98,595,000 long) tons, containing 3.428 percent copper, at the end of June 1939, an increase of 26,988,102 short (24,097,000 long) tons over the reserve previously reported. The increase was due to the finding by drilling and underground exploration of additional ore in the eastern section of the Roan Antelope Extension area and by the addition of the pillar of ore under the Luansbya River for which a method of mining has been devised. Progress was reported in construction and in other work necessary to permit a monthly output of over 11,000 short tons when required.

The Rhokana Corporation, Ltd., produced 50,810 long tons of blister copper and 31,691 tons of electrolytic copper, a total of 82,501 tons, in the fiscal year ended June 30, 1939, compared with 76,275 tons in the year immediately preceding. The average cost of blister production was £22 17s. 3d. and of electrolytic copper was £25 16s. 8d. In the previous year costs were £22 7s. 5d. and £24 4s. 3d., respectively. A total of 2,817,500 short (2,516,000 long) tons of ore was mined from the Nkana and Mindola sections and 2,830,000 short (2,527,000 long) tons containing 3.625 percent copper were concentrated. Corresponding figures for the previous year were 2,801,500 short (2,501,000 long) tons and 2,796,500 short (2,497,000 long) tons, respectively. The differential flotation of copper and cobalt was practiced until the end of May 1939, when it was stopped to conduct a new segregation experiment in the smelter. Ore reserves at the end of June 1939 were reported as follows: Nkana North Ore Body, 22,755,250 short tons containing 3.55 percent copper; Mindola Ore Body, 76,070,542 tons containing 3.52 percent; and Nkana South Ore Body, 15,181,000 tons containing 2.79 percent—a total of 114,006,792 tons averaging 3.43 percent copper. The company owns a 32.303-percent interest in Mufulira Copper Mines, Ltd.

Considerable work was reported done toward equipping and opening the Nchanga Consolidated Copper mine and draining the syncline. As a result of development work it has been estimated provisionally that the ore available for mining above the 470-foot level amounts to approximately 3,000,000 short tons averaging 6.86 percent copper, of which 2.29 percent is sulfide and 4.57 percent oxide. The pilot plant for experimental treatment of the ore was reported to have given encouraging results. In April 1940 it was reported that the plant at the Nchanga mine was to be extended to produce concentrates equivalent to 5,000 tons of copper a month.

The Mufulira Copper Mines, Ltd., produced 59,616 long tons of blister copper in the fiscal year ended June 30, 1939, compared with 52,436 tons in the previous year. The production cost, including reserve for replacements but excluding taxation, was £25.707 per long ton compared with £28.608 per ton in the year ended June 30, 1938.

Peru.—In 1939 the Cerro de Pasco Copper Corporation produced 74,878,473 pounds (33,965 metric tons) of copper, 12,168,901 ounces of silver, 79,557 ounces of gold, 52,896,176 pounds of lead, and 21,087 short tons of zinc concentrates. Production of this company in 1938 totaled 78,458,979 pounds (35,588 metric tons) of copper, 12,396,991 ounces of silver, 74,063 ounces of gold, 57,329,999 pounds of lead, and 21,379 short tons of zinc concentrates. Descriptions of the Cerro de Pasco district, its history, and ore reserves and of the Northern Peru Mining & Smelting Co. and other copper mines are given in a report by Wright.[5]

U. S. S. R.—Brief notes on the copper deposits and plants in U. S. S. R. are included in the chapter on copper in Minerals Yearbook, 1939.

The Mining Journal (London) of August 19, 1939, in a report from an occasional correspondent, states that a powerful nonferrous-metal industry has been built in U. S. S. R.; that during the Second 5-year Plan (1933–37) the Soviet Union doubled its output of copper and that by 1942 output of copper would be three times that for 1937. Mine data are not available for 1937, but smelters produced 94,250 metric tons, which was increased to 114,552 tons in 1938 but fell to 108,000 tons in 1939.

As previously stated in Minerals Yearbook reports, efforts of the Government not only to become self-sufficient in regard to copper but to produce a large exportable surplus have thus far fallen far short of

[5] Wright, Charles Will, Mineral Resources, Production, and Trade of Peru: Bureau of Mines Foreign Minerals Quart., vol. 3, No. 1, January 1940, pp. 24–33.

plans. Numerous reports are to the effect that mine development and plant construction lack the desired efficiency. In any event, the U. S. S. R. still must import large quantities of copper to supply home requirements. A development of possible significance was the sudden shipment of large quantities of refined copper from the United States to the U. S. S. R. In the first 10 months of 1939 no such exports were reported, but in November 5,200 metric tons of refined copper were shipped there, December 15,500 tons, January (1940) 24,100 tons, February 5,800 tons, March 5,100 tons, and April none. Rumor stated that much of this copper was ultimately for German consumption, and in the early months of 1940 the Allies are reported to have interrupted shipments destined for Vladivostok. Further rumors claimed that the U. S. S. R. later had copper up for resale in the United States market.

A recent report [6] states that the Moscow "Pravda" of November 17, 1939, contains an article describing the construction of the Sreduralmedzavod (Central Ural copper-refining plant), near Sverdlovsk. The following quotation is of possible interest:

> The ore, ground first coarse then fine in crushers and ball mills, passes into the flotation baths, from which it comes in a moist mass, where the copper is mixed only with pyrites tailings. Here the drier takes up the task of eliminating the 10 to 12 percent of moisture, which at present increases the weight of concentrates shipped to the refineries. The drier conveyors and drums are now installed and ready to operate; a start is scheduled for January next.
>
> The complete working of the recovery process is still, it is felt, hampered by the lack of facilities to recover the sulfur gases released in roasting. At the present a chimney 150 meters high is supposed to release these gases so high up as to prevent injury to vegetation in the vicinity. But it would be much more profitable if the authorities erected a chemical factory to recover and utilize the sulfur, estimated at 100 metric tons daily under full operation of the refinery, instead of wasting them.
>
> The output of concentrate has been steadily rising, and for 10 months of this year was 61 percent higher than for all of 1938; the proportion of metal recovered from the ore has also risen, from about 75 percent to 82 to 84 percent.
>
> The present management of this plant is weak, and much engaged in futile paper work. In 10 months of 1939 a total of 729 orders were issued by the chief engineer's office, ranging from the purchase of a pair of pliers to some important production process. The engineers attempt to limit their efforts to actual production, but are constantly assigned to other work. There must be a change of system here, to secure greater efficiency when the plant is in full operation.

Yugoslavia.—This country has been successful in sharply increasing its mine output in recent years. For 1939 a record production of 63,000 metric tons was reported compared with 49,500 in 1938, 42,300 in 1937, and an annual average of 35,000 metric tons for 1932–36. Smelter production totaled 41,658 tons in 1939, 41,993 in 1938, and 39,410 in 1937; the average annual smelter output for 1932–36 was 38,700 tons. The Mines de Bor, operated under French control, is responsible for virtually the entire production. In January 1940 it was reported [7] that this company had arranged with the Government to sell part of its output to the State and to have the remainder available for its free disposal. Naturally, efforts were being made to prevent shipments of any Bor copper to Germany. An electrolytic refinery was completed and opened on July 2, 1938. Exports of crude copper began to fall when the new refinery was assured. Imports into the United States of unrefined copper from Yugoslavia fell from 17,300 tons in 1936 to 14,600 in 1937, 9,600 in 1938, and 8,600 in 1939.

LEAD [1]

By E. W. Pehrson and H. M. Meyer

SUMMARY OUTLINE

Conditions that affected the lead industry were considerably improved in 1939; production and consumption increased, prices were higher, and stocks were reduced. Production of refined primary lead from domestic ores increased 27 percent in 1939 and was, except for that in 1937, the highest on record since 1930. Production from foreign ores and base bullion increased 22 percent in 1939. Imports of lead ore decreased, but there was a marked increase in imports of base bullion. Exports of refined pig lead were the highest since 1928. Production exceeded demand during the first half of 1939 and stocks increased slightly, but domestic shipments increased rapidly after July and by the end of the year stocks had declined to the lowest year-end inventory since 1929. Prices remained fairly constant near 4.80 cents per pound at New York from January to July, but increases during the third quarter of the year raised the price to 5.50 cents a pound, which held for the remainder of the year. The average for the year was 5.05 cents a pound compared with 4.74 cents in 1938. Quotations on the London Metal Exchange were discontinued in September; for the first 8 months of 1939 the average differential between New York and London prices was 1.74 cents a pound.

[1] This report deals primarily with the smelting, refining, and consuming phases of the industry. For full details of mining operations see separate reports issued for the various States.

Salient statistics of the lead industry in the United States, 1925–29 (average) and 1935–39, in short tons

	1925–29 (average)	1935	1936	1937	1938	1939
Production of refined primary lead:						
From domestic ores	660,525	310,505	387,698	443,142	331,964	420,967
From foreign ores and base bullion	123,104	14,055	11,458	24,175	51,705	63,068
	783,629	324,560	399,156	467,317	383,669	484,035
Recovery of secondary lead:						
As pig lead	126,600	156,800	137,500	154,500	119,400	(1)
In alloys	153,400	113,600	125,400	120,600	105,500	(1)
	280,000	270,400	262,900	275,100	224,900	(1)
Total production of pig lead (primary and secondary)	910,229	481,360	536,656	621,817	503,069	(1)
Imports: [2]						
Lead in base bullion	95,747	2,692	312	1,800	15,296	48,902
Lead in ore	40,096	20,025	20,713	34,103	45,370	30,842
Exports of refined pig lead	98,048	6,982	18,313	20,091	45,866	74,392
Refined primary lead available for consumption	690,916	318,900	383,433	449,464	339,708	415,031
Estimated consumption of primary and secondary lead	900,250	538,900	633,550	678,700	546,000	667,000
Prices:						
New York:						
Average for year cents per pound	7.47	4.06	4.71	6.01	4.74	5.05
Quotation at end of year do	6.25	4.50	6.03	4.75	4.85	5.50
London average do	5.87	3.12	3.91	5.15	3.33	[3] 3.09
Mine production of recoverable lead	664,230	331,103	372,919	464,892	369,726	413,979
World smelter production of lead	1,850,000	1,524,000	1,629,000	1,851,000	1,874,000	1,874,000

[1] Data not yet available.
[2] Data include lead imported for immediate consumption plus material entering the country under bond.
[3] Average for 8 months; London Metal Exchange dealings suspended in September.

Figure 1 shows trends in the domestic lead industry since 1900.

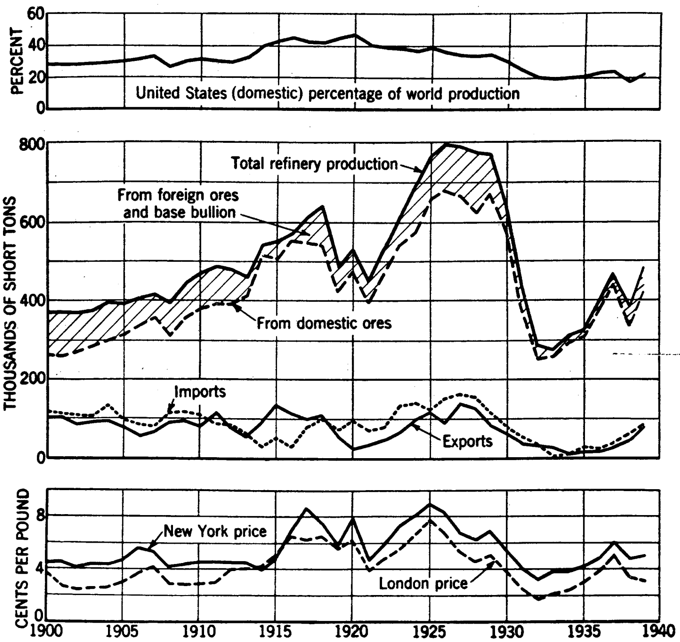

FIGURE 1.—Trends in the lead industry in the United States, 1900–1939. Imports include lead in ore, base bullion, pig lead, and scrap; exports include pigs, bars, and scrap lead exported in manufactures with benefit of draw-back.

World smelter production of lead was approximately the same in 1939 as in 1938. Production outside the United States declined 5 percent in contrast to the 22-percent increase in the United States. Output decreased in Mexico, Canada, Belgium, Burma, Italy, and Spain. Australia increased its output, and German production was virtually unchanged. Data on world consumption in 1939 are not available. Some foreign producers operated part of the year under the 10-percent reduction program agreed upon in 1938. After the outbreak of war in September lead prices in the United Kingdom were fixed by the British Ministry of Supply, and the British Government contracted for Empire supplies.

DOMESTIC PRODUCTION

Refined pig lead produced in the United States is derived from three main sources—domestic ore, foreign ore and base bullion, and secondary materials. The following table lists the production from each of these sources from 1935 to 1939:

Total pig lead produced in the United States, 1935–39, in short tons

Year	From domestic ores and base bullion	From foreign ores and base bullion	From secondary materials	Total
1935	310,505	14,055	156,800	481,360
1936	387,698	11,458	137,500	536,656
1937	443,142	24,175	154,500	621,817
1938	331,964	51,705	119,400	503,069
1939	420,967	63,068	(1)	(1)

1 Data not yet available.

PRIMARY LEAD

Refinery production.—Production of refined primary lead in 1939 increased 26 percent but was only 62 percent of the 1925–29 average. Production from domestic ores increased 27 percent in 1939, whereas that from foreign ores and base bullion increased 22 percent. Production from foreign materials was the largest since 1930 but represented only 51 percent of the 1925–29 average; it comprised only 13 percent of the total output of refined primary lead.

Refined primary lead produced in the United States, 1935–39

Year	Production by—							Value	
	Classes (short tons)				Sources (short tons)				
	Desilverized lead [1] [2]	Soft lead [3]		Total production [1]	From domestic ores and base bullion	From foreign ores	From foreign base bullion	Average per pound	Total
		Desilverized	Undesilverized						
1935	192,544	35,233	96,783	324,560	310,505	13,659	396	$0.040	$25,965,000
1936	239,944	47,462	111,750	399,156	387,698	11,401	57	.046	36,722,000
1937	272,051	55,317	139,949	467,317	443,142	23,393	782	.059	55,143,000
1938	243,891	31,986	107,792	383,669	331,964	32,862	18,843	.046	35,298,000
1939	280,356	65,349	138,330	484,035	420,967	24,652	38,416	.047	45,499,000

1 The lead content of antimonial lead is excluded. 2 Desilverized soft lead is excluded.
3 Includes lead derived from Missouri ores and other nonargentiferous ores.

Source of primary lead.—Of the total refined lead produced in 1939, 87 percent was derived from domestic ores and 13 percent from foreign ores and base bullion, the same proportion as in 1938. Production from foreign ores decreased 25 percent in 1939. Refining of foreign bullion was resumed on a large scale in 1938, chiefly because of the closing of one Mexican refinery during the latter part of the year, which diverted bullion to domestic plants. Output of lead from this source more than doubled in 1939, amounting to 38,416 tons, or the largest quantity since 1929. Details of the sources of lead from domestic ores are given in the section on Mine Production.

Refined primary lead produced in the United States, 1935–39, by sources, in short tons

Source	1935	1936	1937	1938	1939
Domestic ore	310,505	387,698	443,142	331,964	420,967
Foreign ore:					
Australia		172	3,088	7,320	7,580
Canada	1,039	2,277	5,343	3,562	4,763
Europe	1,086	1,133	388	14	188
Mexico	5,809	1,486	3,836	9,745	227
South America	2,872	3,883	8,497	9,887	8,869
Other foreign	2,853	2,450	2,241	2,334	3,025
	13,659	11,401	23,393	32,862	24,652
Foreign base bullion:					
Mexico	396	57	782	18,268	37,463
South America					9
Other foreign				575	944
	396	57	782	18,843	38,416
Total foreign	14,055	11,458	24,175	51,705	63,068
Grand total	324,560	399,156	467,317	383,669	484,035

Antimonial lead.—Antimonial or hard lead is an important by-product of the refining of base bullion, but the quantity derived from this source is only a small part of the country's yearly production. The major part is obtained from the smelting of antimonial-lead scrap, and some is produced by mixing metallic antimony with refined soft lead.

Several lead-smelting plants handle scrap materials exclusively. A large quantity of hard-lead scrap also is treated at primary smelters and refineries, and the production of antimonial lead at these plants is shown in the table that follows. Further information in secondary antimonial lead in 1939 is given in the chapter in this volume on Secondary Metals—Nonferrous.

Antimonial lead produced at primary lead refineries, 1935–39

Year	Production (short tons)	Antimony content		Lead content by difference (short tons)			
		Short tons	Percent	From domestic ore	From foreign ore	From scrap	Total
1935	16,384	1,729	10.6	4,685	491	9,479	14,655
1936	23,230	2,162	9.3	7,442	696	12,930	21,068
1937	27,524	2,579	9.4	7,833	1,721	15,391	24,945
1938	24,123	2,809	11.6	6,759	3,385	11,170	21,314
1939	21,995	2,031	9.2	4,117	3,189	12,658	19,964

SECONDARY LEAD

A large number of plants operate exclusively on scrap and other secondary materials. The following table summarizes production of secondary lead at such plants during the years 1934–38. The scope of Bureau of Mines work on secondary metals was broadened considerably in 1939; as a result, completion of data for that year was necessarily delayed. Statistics for 1939 were not available at the time this report was written. Further details on secondary lead appear in the chapter on Secondary Metals—Nonferrous.

Secondary lead recovered in the United States, 1934–38

[Compiled by J. P. Dunlop]

Year	Pig lead (short tons)			Lead in alloys (short tons)	Total recovered lead		
	At primary plants	At secondary plants	Total		Short tons	Value	Ratio to domestic refined primary lead (percent)
1934	33,557	90,943	124,500	83,900	208,400	$15,421,600	70
1935	44,748	112,052	156,800	113,600	270,400	21,632,000	87
1936	34,556	102,944	137,500	125,400	262,900	24,186,800	68
1937	29,986	124,514	154,500	120,600	275,100	32,461,800	62
1938	24,800	94,600	119,400	105,500	224,900	20,690,800	68

LEAD PIGMENTS

Lead pigments manufactured in 1939 contained 215,561 tons of lead, a 23-percent increase from 1938. Of this total, 200,390 tons were derived from refined pig lead; litharge comprised 42 percent, white lead 39 percent, red lead 18 percent, and sublimed lead and orange mineral 1 percent. Leaded zinc oxide and sublimed lead are the principal pigments in which the lead content is derived from ores. Details of production and consumption of lead pigments are given in the chapter in this volume on Lead and Zinc Pigments and Zinc Salts.

Lead in pigments, 1935–39, by sources, in short tons [1]

Year	Lead in pigments from—				Year	Lead in pigments from—			
	Domestic ore [2]	Metal	Scrap	Total		Domestic ore [2]	Metal	Scrap	Total
1935	12,109	185,151	144	197,404	1938	12,025	[3] 163,815		[3] 175,840
1936	15,062	204,997	37	220,096	1939	15,171	200,390		215,561
1937	17,363	204,961	127	222,451					

[1] Includes also lead recovered in zinc oxide and leaded zinc oxide.
[2] No pigments from foreign ore.
[3] Revised figures.

MINE PRODUCTION

The output of recoverable lead from domestic mines in 1939 increased 12 percent over that in 1938 but was 11 percent less than in 1937. Lead from the Central States increased nearly 40,000 tons in 1939 and that from the Western States 6,261 tons, but lead from the Eastern States decreased 1,616 tons. Lead from Southeastern Missouri rose 34,652 tons (29 percent) in 1939, as output was increased during the last quarter of the year. Lead from Oklahoma also was greater than in 1938, but that from Kansas declined. Idaho was again the leading lead producer in the Western States group, followed in 1939 by Utah and Montana. Lead from Idaho decreased slightly in 1939, as there were decreases in output in both the Coeur d'Alene region in Shoshone County and in the Warm Springs district in Blaine County. Lead from Utah increased about 2,000 tons as gains in the Park City region (owing to reopening in May of the Silver King Coalition and Park Utah Consolidated mines) and in the Ophir district more than offset losses in the Bingham and Tintic districts. Lead from Montana increased 7,228 tons in 1939. Most of the gain was in the Butte district and was due to reopening of the zinc-lead properties of the Anaconda Copper Mining Co., but gains also were reported at the slag-burning plant at East Helena, at the Flathead mine in the Hog Heaven district, and at the Comet mine in Jefferson County. Lead in Arizona was about the same as in 1938, but that from Colorado decreased, as the Sunnyside property in San Juan County was idle throughout 1939. Lead from New Mexico increased slightly, as gains in Grant County more than offset the loss in San Miguel County owing to the closing of the Pecos mine in May 1939. Decreases in lead were also noted in the Pioche district, Nevada, and in the Metaline district, Washington. Additional details of production by mines, districts, and States can be found in the State chapters in this volume.

Mine production of recoverable lead in the United States, 1925–29 (average) and 1935–39, in short tons

STOCKS

Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in the following table. Stocks of refined and antimonial lead include metal held by all primary refiners and by most refiners of secondary material who produce common lead. Foreign lead refined in the United States and entered for domestic consumption is included.

Lead stocks at end of year at smelters and refineries in the United States, 1935–39, in short tons

	1935	1936	1937	1938	1939
Refined pig lead	215,595	165,159	119,837	102,489	52,783
Antimonial lead	6,711	6,697	9,294	13,413	5,994
	222,306	171,856	129,131	115,902	58,777
Lead in base bullion:					
At smelters and refineries	15,072	9,187	10,959	18,693	10,337
In transit to refineries	1,860	1,070	2,219	2,339	3,521
In process at refineries	16,233	14,100	14,413	16,690	15,958
	33,165	24,357	27,591	37,722	29,816
Lead in ore and matte and in process at smelters	58,562	50,098	52,081	56,332	59,486
	314,033	246,311	208,803	209,956	148,079

In the first half of 1939 the excess of output over shipments for virtually every month resulted in increasing inventories. Stocks of refined and antimonial lead at refineries totaled 115,900 tons at the end of 1938 and had reached 129,600 tons by the end of June. Accelerated demand as a result of industrial improvement, in anticipation of war, and more largely because of actual opening of hostilities in September, caused a reversal of early conditions in the latter half of the year, and stocks declined monthly from June until they reached the lowest level of the year at the end of November, when they stood at 58,100 tons. A slight excess of production in December carried stocks to 58,800 tons at the end of the year. These were the smallest year-end inventories on hand since the end of 1929 and only a little more than half the amount on hand as the year began. Stocks of lead in ore and matte and in process at smelters, and base bullion at smelters and refineries, in transit to refineries, and in process at refineries, were 5 percent lower at the end than at the beginning of the year.

DOMESTIC CONSUMPTION

New supply.—The following table shows the refined primary lead available for consumption from 1935 to 1939. The figures do not consider variations in producers' stocks, and as these have changed considerably during the past 5 years the quantities stated do not indicate the true trend in actual consumption of new lead. The supply available for consumption in 1939 was 22 percent higher than in 1938 but was equivalent to only 60 percent of the 1925–29 average. The total consumption of lead, as indicated by the second table following, also rose 22 percent in 1939.

Refined primary pig lead available for consumption in the United States, 1935–39, in short tons

	1935	1936	1937	1938	1939
Supply:					
Imports	[1] 1,322	[1] 2,590	2,238	1,905	5,388
Production	324,560	399,156	467,317	383,669	484,035
	325,882	401,746	469,555	385,574	489,423
Withdrawn: Exports	[2] 6,982	18,313	20,091	[3] 45,866	74,392
Supply available for consumption	318,900	383,433	449,464	339,708	415,031

[1] Includes small quantities of old, reclaimed, and scrap lead.
[2] Includes small quantities of foreign lead reexported.
[3] Includes a small quantity, not separable, of "sheets."

Consumption by uses.—Owing to the return of large quantities of secondary lead in discarded and obsolete articles and from the lead-consuming industries, the total consumption of pig lead greatly exceeds the supply of new lead available. The following table gives the American Bureau of Metal Statistics estimate of the total consumption of lead by industries, 1935–39.

Lead consumed in the United States, 1935–39, in short tons [1]

Purpose	1935	1936	1937	1938	1939
White lead	80,000	85,500	86,000	71,000	75,000
Red lead and litharge	47,500	54,000	57,000	43,000	57,200
Storage batteries	175,000	191,000	192,000	167,000	198,000
Cable covering	38,900	61,400	90,000	60,000	74,400
Building	32,000	40,000	45,000	36,000	50,000
Automobiles	10,000	11,100	12,000	6,000	8,900
Ammunition	29,200	32,500	39,500	31,200	42,300
Terneplate	4,700	6,200	6,400	4,300	5,400
Foil	15,900	28,500	21,700	22,000	21,800
Bearing metal	13,000	16,500	15,000	9,000	12,800
Solder	20,000	22,000	22,000	15,000	20,000
Type metal	15,000	17,000	17,000	12,000	14,000
Calking	12,000	13,500	15,000	12,000	16,000
Castings	5,000	5,750	6,000	6,000	7,500
Other uses	40,700	48,600	54,100	51,500	63,700
	538,900	633,550	678,700	546,000	667,000

[1] American Bureau of Metal Statistics. These estimates are for the total consumption of lead irrespective of whether its origin is primary or secondary. Antimonial lead is included.

The principal use of lead is in the manufacture of storage batteries, and in most recent years 30 percent or more of the total lead requirements have been for that purpose. Consumption in storage batteries during 1939 was 19 percent higher than in 1938 and made a good showing in relation to the record year, having declined only 6 percent from 1929. As pointed out in Minerals Yearbook, 1939, lead used in storage batteries returns quickly to the trade in the form of scrap and therefore noticeably curtails the need for newly mined metal. White lead is regularly the second-largest use for lead. Consumption for this purpose is welcomed by producers because it is dissipative. The amount of lead consumed in the manufacture of white lead increased 6 percent over 1938 but lagged 37 percent behind 1929. In 1929, the year of record consumption, and again in 1930 cable covering ranked as the largest use for lead. Since 1929 the tonnage sold for that purpose has dropped 66 percent, although in 1939 it was 24 percent above 1938. It required 23 percent of the total lead used in 1929 and 27 percent in 1930 but fell to 11 percent in 1938 and 1939. The failure of the utility industry to purchase its proportionate share of total lead requirements of the country has been a depressing influence on the lead industry. The building industry has also lagged behind most others in respect to lead consumption. This industry has been on the upgrade in recent years and used 39 percent more lead in 1939 than in 1938, but it was 48 percent below 1929. Red lead and litharge—exclusive of quantities used in storage batteries—took nearly 9 percent of the total lead used in 1939, which is nearly three times the proportion for that purpose in 1929. This use consumed 33 percent more lead than in 1938 and 91 percent more than in 1929. Among the smaller uses for lead, ammunition took 36 percent more in 1939 than in 1938. It was one of the three uses indicated by the foregoing table to have been higher than in 1929, having been 3 percent larger than in that year.

PRICES

The two major markets for lead in the United States are New York and St. Louis; much of the lead produced in the United States is sold at prices based upon quotations in these markets. The New York quotations are influenced to some extent by the lower prices usually prevailing on the London market, so that the New York price seldom exceeds the St. Louis price by as much as the freight differential, which normally is 0.35 cent a pound.

In view of the startling world events in 1939, prices for lead were remarkably steady, fluctuating less than those for other common nonferrous metals. The average monthly quoted price for pig lead at New York, outside market, was 4.83 cents a pound in January. In the first half of the year the monthly average varied only 0.1 cent a pound. The average for July was 4.85 cents. In the first half of the year monthly refined production exceeded shipments, except in March, when a virtual balance was temporarily established. After June, however, the situation was reversed and, as a result of improving demand, shipments began to rise while output held at former levels. The declaration of war between Germany and France and Great Britain in September was the signal for sharply increased demands. Shipments, which averaged 40,000 tons for the first 8 months of the year, rose to 60,000 tons in September and 66,000 in October, then declined slightly to 64,000 in November and 45,000 in December. Weekly domestic sales of lead reached a new high record in the week ended September 9, when they amounted to more than 42,000 tons. In all of September transactions aggregated 104,000 tons, the largest monthly total on record. In an endeavor to discourage excessive purchases, producers assured consumers that no shortage was likely, but with little apparent success. They maintained a conservative price policy in the face of spectacular sales during the latter part of the year, and price advances were proportionately far less than requirement gains. Production trended upward in the final quarter but failed to equal shipments until an approximate balance was attained in December. The average price at New York for August was 5.04 cents; it rose to 5.45 cents in September and was at the highest levels of the year—5.50 cents a pound—throughout the final quarter.

Average monthly and yearly quoted prices of lead at St. Louis, New York, and London, 1937–39, in cents per pound [1]

[1] St. Louis: Metal Statistics, 1940, p. 455. Average daily quotations of soft Missouri lead, f. o. b. St. Louis (open market), as reported daily in the American Metal Market.
New York: American Metal Market, daily issues. Pig lead, New York (outside market), prompt shipment from West.
London: Metal Statistics, 1940, p. 459. Average price of foreign lead. Price per long ton, as published in Metal Statistics, converted to cents per pound at average exchange rate reported by the Federal Reserve Board.
[2] London Metal Exchange dealings suspended for duration of the war.
[3] London quotations in pounds sterling per long ton, as follows: 1937, £23.3250; 1938, £15.2667; 1939 (8 months), £14.7083.
[4] Average for 8 months: Comparable average for New York was 4.83 cents.

There were narrow movements in the London market also in 1939. In January the average price (United States exchange basis) was 3.03 cents; it rose to 3.20 cents in February and then declined in April to the low point for the year—3.00 cents. A slow rise carried the price to 3.30 cents in August. Quotations on the London Metal Exchange were discontinued at the outbreak of war in September. The differential between selling prices in New York and London was notably higher in 1939 than in 1938, continuing the gains indicated for that year. The differential in 1939 ranged from 1.60 to 1.80 cents, the low point occurring in February and the high in January; the average for 8 months was 1.74 cents. In 1938 New York monthly prices ranged from 0.94 cent to 1.77 cents higher than those for London, and the average for the year was 1.41 cents higher. In 1937 the average difference was 0.86 cent, and in 1936 was 0.80 cent.

In September 1939 it was announced that the British Ministry of Supply had established the maximum price of Empire lead at £17 per long ton ex ship and of foreign lead at £16 12s. 6d. ex ship. In December control prices for Empire and foreign lead were raised to £25 per long ton, duty paid, delivered.

FOREIGN TRADE[2]

Although imports of lead in ore, matte, and bullion increased 31 percent in 1939 compared with 1938 and exports of pig lead showed a 62-percent increase for the same period, the total of pig lead exported in 1939 approximated the lead in ore, matte, and bullion imported; domestic exports of pig lead for some years have comprised principally crude material imported for smelting and refining in bond and earmarked for export.

Imports.—Aside from the significant increase in total imports of unrefined lead in 1939, a noticeable feature was the 84-percent decrease in imports from Mexico of lead in ore and matte and a compensating 232-percent increase in imports of lead bullion from the same country. Although Mexico, for years the principal source of unrefined lead imports, contributed 65 percent of the total tonnage imported in 1939, Canada's imports of ore and matte increased 77 percent in 1939 compared with 1938; however, Chile and Peru supplied less unrefined lead in 1939 than in 1938, the total decrease for both countries being 22 percent.

Total lead imported into the United States, 1935–39, by classes, in short tons [1]

Year	Lead in ore and matte	Lead in base bullion	Pigs, bars, and old	Total lead content

1939	136	45	96,492	380	321	38,491

Exports.—Most significant during 1939 was the 1600-percent increase in pig-lead exports to Europe, which rose from 1,950 short tons in 1938 to 33,152 in 1939. There was a sharp 663-percent increase in purchases by Germany, but of note also is the fact that the combined exportations to Belgium, Denmark, Hungary, Netherlands, Norway, and Sweden jumped from 51 tons in 1938 to 13,249 in 1939. Although there was a fourfold increase in exports to Japan in 1938 compared with 1937, purchases by that country in 1939 increased only 15 percent over those in the preceding year. Exports to the United Kingdom increased noticeably from 78 short tons to 9,411. The only decrease of importance during the year was in exports to Mexico, due possibly to refining of bullion in that country rather than shipment of the material to the United States for refining and reexport.

WORLD ASPECTS OF LEAD INDUSTRY

International cooperation.—The Lead Producers Association, representing 60 to 75 percent of the lead produced outside the United States, agreed on November 1, 1938, to a 10-percent reduction in output; this action represents the first positive step toward control of the lead market since 1932. The output of lead during the first 6 months of 1939, however, was higher than for the same period of 1938.

Early in September, after the outbreak of hostilities in Europe, dealings on the London Metal Exchange were suspended, and metal supplies and prices were placed under supervision of the Nonferrous Metals Control created under the Defense Act.

World production.—Lack of adequate production data precludes any reliable estimate of world lead output during 1939. According to the American Bureau of Metal Statistics, lead in ore production in 1938 was 1,772,012 metric tons. Of this total North America produced 836,702 tons (47 percent); in 1939 the American Bureau of

Metal Statistics reported North American production at 792,368 metric tons. In 1938 South American output was 95,569 metric tons —5 percent of the total; in 1939 it was reported as 88,019 metric tons. The mine production of lead in the Western Hemisphere, which in 1938 was slightly over half of the total world output, decreased in 1939 and may indicate a lower world production in 1939.

Smelter production of lead in 1939 is estimated at 1,700,000 metric tons. Output of the United States increased from 330,963 tons in 1938 to 404,257 tons in 1939, representing 24 percent of the world production for the latter year. Australian production increased considerably, whereas Mexican output showed a marked decline.

World production of lead, 1935–39, in metric tons [1]

[1] By countries where smelted but not necessarily refined.
[2] Data not yet available. Estimate included in total.   [3] Approximate production.
[4] Exclusive of secondary material (Metallgesellschaft, Frankfort on the Main).
[5] Figures cover lead refined from domestic and foreign ore; refined lead produced from foreign base bullion not included.

World consumption.—Owing to disturbed world conditions the total consumption of lead in 1939 cannot be estimated. The American Bureau of Metal Statistics reported world consumption of lead in 1938 as 1,638,100 metric tons.

REVIEW BY COUNTRIES

Argentina.—The Compania Minera Aguilar S. A., a subsidiary of the St. Joseph Lead Co., supplied 94 percent of the Argentine output of lead in 1938. During 1938 the flotation plant at Tres Cruces treated 174,445 metric tons of ore containing an average of 14.07 percent lead, 11.94 percent zinc, and 325 grams of silver per ton. In 1938, 29,836 tons of concentrates were produced, and in 1939 the output of concentrates amounted to 36,728 tons.

The Pumahuasi mines, operated by a subsidiary of the National Lead Co., produced 1,418 tons of concentrates in 1938. The National Lead Co. operates a smelter at Puerto Vilelas with a capacity of 15,000 tons of refined lead a year. In 1938 this smelter produced 9,051 tons of lead, of which 7,025 tons was derived from domestic concentrates and 2,026 tons from imported Bolivian concentrates.

Australia.—Smelter production in Australia increased from 226,155 metric tons in 1938 to 252,383 in 1939. Output of the Mount Isa Mines, Ltd., during 1939 amounted to 44,659 metric tons, representing a slight increase compared with 1938. Production at the Port Pirie smelter was not reported for 1939. During the year mining and milling problems were overcome by the Lake George Mining Corporation, and by the end of 1939 production was at the rate of 500 tons of ore per day. The equipment at this plant is reported to have cost about £1,000,000 and the company employs approximately 300 miners.

Effective February 11, 1939, an agreement with affiliated unions that will continue in force until June 30, 1942, was entered into at Broken Hill. Wages were advanced slightly, and provisions were made for further advances if living costs in the Broken Hill area increase. The 40-hour-week aboveground and 35-hour-week underground provisions were continued. In the 1939 agreement the bonus provision of the previous agreement was altered somewhat but does not advance the limitation of combined basic wage and lead bonus.

To assist in prosecution of the war Broken Hill mining companies entered into contracts with the British Government, and prices were fixed approximately at those prevailing on the London Metal Exchange at the outbreak of the war. These prices were made subject to adjustment in accordance with rises or declines in the costs of production. On December 19, 1939, the maximum price for Australian lead was advanced to £A20 17s. 3d. On February 8, 1940, the maximum price was established at £22, which was £9 5s. less than the London rates expressed in Australian currency.

Belgium.—Production of electrolytic lead in Belgium at the rate of about 100 to 200 tons per month began at the Dumont plant, Sclaigneaux, early in 1939. The process enables impure ores not otherwise usable to be employed.

Imports by Belgium of 109,302 metric tons of lead ore represent only a slight increase over the preceding year. The Belgian Congo supplied only 605 metric tons in 1939 compared with 6,364 in 1938. Pig-lead imports of 13,131 metric tons in 1939 represent a decrease of over 50 percent compared with 1938. The decline in imports of pig lead from Mexico was notable, amounting to 11,061 metric tons in 1939 compared with 22,849 in 1938. Exports of crude or pig lead in 1939 increased to 70,270 metric tons as compared with 67,097 in 1938.

Bolivia.—Present production of lead in Bolivia gives no indication of potentialities, as there are large known deposits that, under favorable conditions, unquestionably will be developed. At present most of Bolivia's output is derived from small mines in the La Quiaca region. The concentrates are exported to smelters in Argentina.

Brazil.—Lead deposits are distributed throughout Brazil, but the principal deposits are in the States of São Paulo and Paraná. Present production is negligible.

Bulgaria.—Active development of Bulgarian resources by foreign capital was reported in 1939. Early in the year an agreement was reached whereby the Bulgarian concern Granitoid and a German group comprised of the Cologne concerns Felten & Guilleaume Carlswerk A. G. and Otto Wolff were to take over 50 percent of the shares of the Bergwerks A. G. Pirin in Sofia from the Bulgarian firm. Lead and zinc deposits of the Rhodope Mountains are to be exploited. Another group comprising the "Metallochemia" Hutten—Chemische Industrie & Metallhandels A. G. of Budapest organized the Rodopsky Metall A. G. in Sofia for the purpose of operating mines in southern Bulgaria and shipping ore to Hungary for smelting. It is reported that lead-zinc deposits near the city of Kirdschalü, southern Bulgaria, will be in production by the close of 1940.

Burma.—The Burma Corporation, Ltd., produced 76,000 long tons of refined lead and 1,180 of antimonial lead in 1939 compared with 78,900 and 1,200 tons, respectively, in 1938. In 1939, 6,175,000 ounces of refined silver were recovered compared with 5,920,000 in 1938. Monthly data covering the quantities of lead concentrates produced were not released after July.

Canada.—Mine production in Canada in 1939 totaled 176,165 metric tons compared with 190,021 in 1938. The Sullivan silver-lead-zinc mine in British Columbia furnished 97 percent of the total Canadian output. The Mayo district, Yukon Territory, produced 3,422 metric tons, the Stirling mine in Nova Scotia 1,154 metric tons, and the Algoma district of Ontario 18 metric tons. Considerable development work on Calumet Island in the Ottawa River, Ontario, by Calumet Mines, Ltd., is reported to indicate reserves of 1 million tons of ore averaging 2.15 percent lead, 8.6 percent zinc, and 5.76 ounces of silver per ton.

Refined lead output during 1939 at Trail, B. C., was less than the 1938 production figure owing to the 10-percent reduction agreement of the Lead Producers Association.

After the outbreak of war in Europe in September 1939 Canadian producers negotiated contracts with the British Government for the delivery of lead at fixed prices. At the beginning of 1939 unsold stocks of lead were larger than average, but by the end of the year no stocks were unsold.

In 1939 exports of lead in ore totaling 3,721 metric tons represent a slight increase over the preceding year. Pig-lead exports in 1939 likewise advanced to 163,960 metric tons from 140,551 in 1938. Shipments to Japan increased greatly, amounting to 43,018 metric tons in 1939 compared with 15,768 in 1938. However, shipments to Great Britain decreased somewhat, amounting in 1939 to 100,286 metric tons compared with 108,481 in 1938.

China.—The National Resources Commission, the Yunnan Provincial Government, and the Fu Tseng Bank are reported to have organized the Southwest Lead Export Corporation to increase the lead output of China. It is reported that a lead refinery will be built at Kunming, the provincial capital of Yunnan.

France.—France depends almost entirely on imports for its large consumption of lead. A total of 86,100 metric tons was reported used in 1938 compared with an annual average of 129,000 tons for 1929–33 and of 99,000 tons for 1934–38. Data for 6 months of 1939 indicate that 36,200 tons were used during that period.

Lead ore imported into France during the first 7 months of 1939 totaled 43,756 tons, of which 50 percent was from Morocco, 24 percent from Yugoslavia, and 8 percent from Peru. Imports of pig lead in the same period totaled 24,800 tons, of which Tunis supplied 52 and Belgium 32 percent. Exports of ore totaled 4,400 tons and of pig lead 8,100 tons in the first 7 months of 1939.

Germany.—Germany ranks as the third largest lead-consuming nation in the world, following the United States and the United Kingdom. Production of lead from mines in Germany is inadequate for home needs, as the total for 1932–38 amounted to 449,600 metric tons or only a little more than one-third of apparent total requirements for that period—1,281,600 tons. Doubtless, however, part of apparent consumption in recent years has gone toward the building of a stockpile. In this connection it is noteworthy that the average annual apparent consumption was 175,000 metric tons in 1924–28, 155,000 in 1929–33, and 204,000 in 1934–38; the total for 1938 was 246,500 tons. Figures for all of 1939 are not available, but totals for 6 months amounted to about half of the quantity for all of 1938.

Smelter output of lead in Germany, including Austria, was 181,440 metric tons in 1939, about the same as in the preceding year. Imports of pig lead amounted to 42,511 tons in the first 7 months of 1939 compared with 75,327 tons in all of 1938. Mexico supplied 23 percent of the amount shown for 1939, Belgium 21 percent, and the United States 20 percent Lead ore imported in the first 7 months of 1939 totaled 78,424 tons compared with 141,288 in all of 1938. Yugoslavia supplied 31 percent of the quantity shown for 1939, and Newfoundland furnished 22 percent. Germany exported 730 tons of pig lead and 556 tons of lead sheets during the first 7 months of 1939.

The drive for expansion of domestic production and restriction of home use continued in 1939.

Hong Kong.—The Lin Ma Hang mine, situated about 30 miles north of Hong Kong and managed by the Hong Kong Mines, Ltd., produced 3,765 metric tons of lead in ore during 1939, silver content unknown, compared with 4,336 tons in 1938 having a silver content of 111,070 ounces. It was expected that a smelter would be in operation by February 1940.

Italy.—Under Government stimulus mine output of lead in Italy has been increasing; it amounted to 39,500 metric tons in 1938 compared with 35,200 tons in 1937 and 30,200 in 1936. Although consumption totaled 51,900 tons in 1938, 50,400 in 1937, and 45,200 in 1936, indicating that the country must rely on imports to supplement domestic output, Italy is more nearly self-sufficient with regard to lead than most other metals. Available statistics for 1939 indicate that Italian consumption during the first 6 months was 9 percent below the monthly rate for all of 1938. Imports of 4,638 tons of pig lead in the first 7 months of 1939 were largely from Canada and Germany.

Mexico.—Mine production in Mexico during 1939 amounted to 219,506 metric tons of lead in ore, representing a notable decrease from the 282,369 tons produced in 1938. Exports of lead in all forms in 1939 totaled 207,199 metric tons compared with 250,868 tons in 1938. The destination of approximately 50 percent of the exports in 1939 was the United States; most of the European countries purchased the remainder in tonnages not exceeding 13,000 tons in any instance.

On August 31, 1939, the export duty was raised. In November 1939 it was reported that the then-existing export tax on lead ore was abolished, and the arbitrary value placed for tax purposes on concentrates, bullion, and refined lead was reduced about 29 percent because of export difficulties traceable to the European war and consequent accumulation of stocks.

In October 1939 the major mining organizations and most of the important independent miners whose ores were treated at the smelter in Chihuahua pooled their sales through the New York office of the American Smelting & Refining Co. This arrangement provided for payments to pool members at regular intervals, and the plan appears to be encouraging operation of small mines.

Newfoundland.—In Newfoundland about 425,167 metric tons of ore were milled during 1939, providing 37,332 metric tons of lead concentrates containing 21,223 metric tons of lead. In 1938, 416,396 metric tons of ore were milled furnishing 42,745 tons of concentrates with a lead content of 24,817 tons.

Peru.—The principal lead and zinc deposits are situated in central Peru. During the last few years large reserves have been developed in the Cerro de Pasco district. About half the total lead ore produced is refined at the Oroya smelter and the remainder exported as ores and concentrates to foreign smelters. The Cerro de Pasco Copper Corporation operates the only lead smelter in Peru. In 1939, the lead mines produced 26,098 metric tons of lead concentrates containing 60 percent lead and 8,997 tons of ore carrying 45.60 percent lead. Antimonial lead production during the year was 18 metric tons containing 86 percent lead; bismuth-lead bullion amounted to about 41 metric tons containing approximately 8 tons of lead.

Spain.—Little information is available regarding reconstruction of the Spanish lead industry following conclusion of the Spanish civil war in April 1939. Spanish lead production, which reached a total of 175,000 tons in 1914, declined to 66,000 tons in 1935 and is estimated at 27,000 tons in 1939.

After civil strife ended in 1939 the Government established an agency (Rama del Plomo) in the Ministry of Industry in which lead producers, consumers, and dealers are represented. The purpose of this agency is to rehabilitate and develop the lead industry within Spain. The damage to the mines during the civil war was severe, but mines and plants gradually have been repaired and output increased. It is reported that no stocks of lead were on hand at the end of 1939.

U. S. S. R.—Official statistical information concerning the lead industry, as of all metallic industries, in the U. S. S. R. is meager. It is estimated that about 25 percent of the country's requirements of pig lead is imported. The estimated production of pig lead in 1938 totaled 80,000 metric tons, and the planned annual output by 1942, as established by the third Five-year Plan, was set at 134,000 metric tons.

Yugoslavia.—Mine production in Yugoslavia in 1939 was reported to be 775,000 metric tons of ore containing 69,000 metric tons of lead compared with a total of 878,000 tons in 1938 with a lead content of 77,700 tons. However, smelter production in 1939 is reported as 10,624 metric tons compared with 8,646 in 1938.

ZINC [1]

By E. W. PEHRSON

SUMMARY OUTLINE

The zinc industry experienced a more favorable year in 1939 than in 1938. Domestic production and consumption increased, prices were higher, and stocks were reduced. However, producers did not reap the full benefit of the larger domestic market, owing to a sharp increase in receipts of foreign zinc. Net imports were the highest on record, exceeding the previous peak established in 1937. Imports of zinc ore and slab zinc rose sharply in 1939 as a consequence of the 20-percent reduction in the tariff on zinc, which became effective at the beginning of the year, and the dislocation of shipping and foreign markets caused by the outbreak of war in Europe. Ore and metal, chiefly from the Western Hemisphere, that ordinarily would have gone elsewhere, were diverted to the United States, particularly during the latter part of the year. Exports of slab and rolled zinc also were higher in 1939 than in 1938 but gained in smaller proportion than imports. Increased receipts of ore came largely from Mexico, although there were sharp gains in receipts from Argentina and Canada. Mexico also was responsible for the greater part of the tonnage increase in imports of slab zinc, but shipments from Canada nearly trebled.

During the first quarter of the year, production and shipments were at virtually the same level; but shipments dropped in the second quarter, and the decline was not offset by a reduction in output. Hence, producers' stocks rose and at the end of June were at the highest level of the year—about 7 percent above inventories on January 1. Shipments increased sharply in the latter part of the year while production advanced more slowly, with the result that stocks were little more than half as large at the end as at the beginning of the year.

[1] This report deals primarily with the smelting branch of the industry. Full details of zinc mining are given in the various State reports. Some zinc ore is used directly in the manufacture of zinc pigments. (See chapter on Lead and Zinc Pigments and Zinc Salts.)

The apparent consumption of primary slab zinc in 1939 was 62 percent above that of 1938 and the highest ever recorded. This rise is considerably above that in general industrial activity and that in output of many zinc products. The use of zinc in galvanizing, for instance, advanced 39 percent, and rolled-zinc production increased only 35 percent. Although brass-making used 72 percent more zinc in 1939 than in 1938, this industry normally consumes less than 30 percent of the total. The disparity between the rates of increase in actual use and apparent consumption in 1939 indicates that consumers' stocks increased substantially during the year.

Salient statistics of the zinc industry in the United States, 1925–29 (average) and 1935–39

[1] Average for 8 months; London Metal Exchange dealings suspended in September.

The quoted price for Prime Western zinc at St. Louis remained at 4.50 cents a pound from January 1 until July 27, 1939, when it advanced to 4.60. As industrial activity advanced and the European crisis approached the price continued upward and late in September reached 6.50 cents, where it held through December 1. In December the quotation fell, reaching 5.75 cents as the year ended. The average quoted price for 1939 was 5.12 cents compared with 4.61 cents in 1938 and 6.52 in 1937. London quotations for the first 8 months of 1939 ranged from a low monthly average of 2.8 cents a pound in April to a high of 3.0 cents in August. After war was declared London Metal Exchange quotations were suspended on September 3, and subsequently the British Metal Control established fixed prices. The maximum price for foreign zinc was fixed at £15 a long ton, ex-ship, duty for buyers' account, in September, but in December was increased to £25 15s., delivered, duty paid.

Figure 1 shows trends in the domestic zinc industry since 1900.

Statistical data on the zinc industry abroad during 1939 are incomplete because publication of official figures ceased in many countries. World smelter production outside the United States is estimated to have increased only 2 percent. The Allied blockade diverted shipments of ore from Belgium, the Netherlands, and Norway, which rely almost entirely on imported ores, and these countries reported reduced smelter activity. Acquisition of Polish smelters and mines placed Germany far in the lead among European countries and made it more than self-sufficient in zinc. As mine production exceeded smelter output there were large accumulations of zinc ore stocks during 1939. World consumption of zinc probably advanced, but the extent of the increase cannot be estimated owing to lack of data. An attempt was made to revive the International Zinc Cartel during

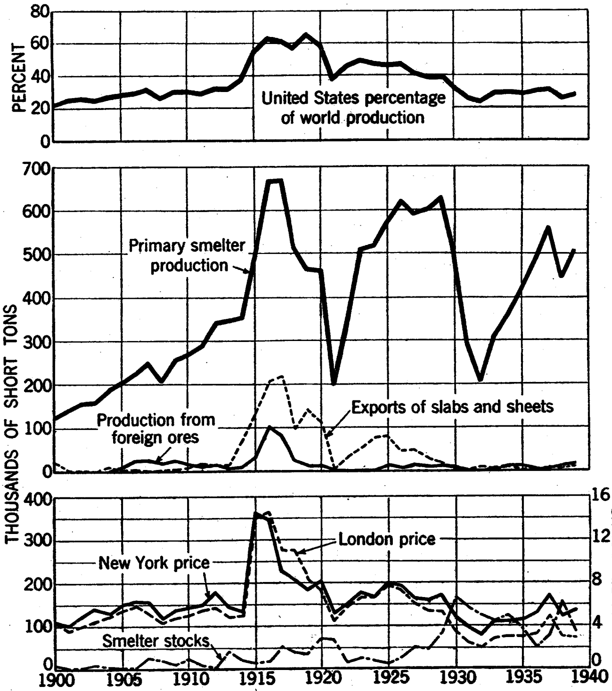

FIGURE 1.—Trends in the zinc industry in the United States, 1900–1939. Imports of slab and sheet zinc are not shown. Before 1936 they seldom exceeded 500 tons annually, but in recent years they have increased, amounting to 37,439 tons in 1937, 7,456 tons in 1938, and 31,138 tons in 1939.

the year, but owing to the tense political situation in Europe no success was achieved.

Reduction in tariff.—On January 1, 1939, the 20-percent reduction in import duties on zinc, established by the Canadian Trade Agreement signed November 17, 1938, became effective. Under the revised schedules the tariff on slab zinc was reduced from 1.75 to 1.40 cents a pound and that on zinc contained in ore from 1.50 to 1.20 cents a pound.

As stated in Minerals Yearbook, 1939, this reduction aggravated the already unfavorable competitive position of the domestic zinc industry that has resulted from overproduction of zinc in foreign countries during recent years. The depressed state of the foreign market is illustrated by the decline in London prices from 5.40 cents in 1929 to 3.05 cents in 1938 and 2.89 cents during the first 8 months of 1939, despite large increases in consumption abroad. Because of this decline, the domestic tariff on zinc has been virtually 100 percent effective since 1935 so that any reduction in the import duty under normal conditions would affect domestic prices adversely. After announcement of the terms of the Canadian Trade Agreement the latter part of November 1938, the St. Louis quotation for prime western zinc dropped from 5.05 to 4.50 cents and was maintained at this level until late July 1939, when markets moved upward owing to improved industrial activity in the United States and accelerated buying in anticipation of the outbreak of war in Europe.

Complications arising from the war make it difficult to appraise the net result of the tariff reduction on the domestic zinc industry during 1939. In the first half of the year the trade was in a depressed state because of the low price and low rate of consumption. Some plants were closed, and there were rumors of wage cuts or shut-downs at others. The condition was reversed, however, the latter part of the year, as the price rose to 6.50 cents from September to November. The high rate of demand coupled with the higher price brought a measure of prosperity to the industry, although from the long-range view this situation could be considered only temporary. While the war was playing an important role in stimulating demand and forcing prices upward it was also creating other conditions that ultimately may have unfavorable effects on markets. The Allied blockade of Germany greatly reduced the flow of zinc and zinc ores to Europe; consequently, producers sought other outlets. Because of its enormous demand for zinc the United States was the logical market for these products, and their sale to domestic consumers has been facilitated to a considerable extent by the lower import duties now prevalent. This situation is reflected in the figures for net imports of zinc into the United States in 1939, which were the highest on record. Significant also was the announcement by an official of a large producer in Mexico in March 1940, that, owing to scarcity and high cost of freight to Belgium, zinc ores were being diverted to the United States, "where there is surplus smelting capacity and a deficiency between domestic production and consumption of zinc." [2]

The war has brought about large increases in world stocks of zinc not only in various forms of metal stored for military purposes but also as ore accumulated in producing countries. For the past few years zinc concentrate inventories abroad have increased rapidly, notwithstanding successive new records in foreign zinc consumption. Mine output persistently has exceeded demand. According to the American Bureau of Metal Statistics stocks of concentrates held by the Electrolytic Zinc Co. of Australasia were 236,000 short tons on June 30, 1939, and at the end of the year there were 220,000 tons on hand in North and South America, making a total of 456,000 tons. With inventories of this magnitude hanging over the market it is evident that the present price level under which the domestic industry is operating profitably involves considerable hazard and that eventually the excessive stocks will be liquidated, possibly at distress prices.

During 1939 the zinc-producing industry requested the United States Government to take action toward restoring the former import duties under procedures provided in the Canadian Trade Agreement. The State Department was studying the problem carefully, but nc decision had been announced by the end of the year.

DOMESTIC PRODUCTION

Production of primary and secondary slab zinc.—Production of primary slab zinc from both domestic and foreign ores in 1939 was 14 percent greater than in 1938 and was equivalent to 84 percent of the average yearly output in the 5 years 1925–29. Both domestic and foreign ores contributed to the increase, as production from the former advanced by 13 percent and that from the latter by 57 percent.

A substantial increase in the production of secondary slab zinc is indicated by the 60-percent gain in the output of redistilled metal. Figures for the output of remelted secondary zinc are not yet available.

Primary and secondary slab zinc produced in the United States, 1935–39, in short tons

Year	Primary			Secondary			Grand total
	Domestic	Foreign [1]	Total	Redistilled	Remelted	Total	
1935	412,184	8,450	420,634	28,650	(2)	(2)	(2)
1936	491,803	329	492,132	42,209	(2)	(2)	(2)
1937	551,165	5,739	556,904	51,554	12,986	64,540	621,444
1938	436,007	10,334	446,341	31,613	10,657	42,270	488,611
1939	491,058	16,178	507,236	50,428	(3)	(3)	(3)

[1] All foreign zinc smelted in the United States in 1935–36 was derived from Mexican ores; in 1937–38, most of it originated in Peru; in 1939, it came from Mexico, Peru, and Argentina.

[2] Figures in process of revision. [3] Data not yet available.

Distilled and electrolytic zinc.—Of the primary zinc produced in 1939, 75 percent was distilled and 25 percent electrolytic. For 1938 the corresponding figures were 79 percent and 21 percent, respectively. The substantial gain in production of redistilled secondary zinc virtually recouped the loss in 1938 and restored the 1937 level of output.

Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1935–39, in short tons

APPORTIONED ACCORDING TO METHOD OF REDUCTION

Year	Electrolytic primary	Distilled primary	Redistilled secondary [1]		Total
			At primary smelters	At secondary smelters	
1935	118,476	302,158	13,439	15,211	449,284
1936	127,175	364,957	22,142	20,067	534,341
1937	117,511	439,393	24,131	27,423	608,458
1938	93,272	353,069	14,003	17,610	477,954
1939	127,056	380,180	23,471	26,957	557,664

APPORTIONED ACCORDING TO GRADE

Year	Grade A (High Grade)	Grade B (Intermediate)	Grades C and D (Brass Special and Selected)	Grade E (Prime Western)	Total
1935	155,516	49,118	49,909	194,741	449,284
1936	183,841	59,879	65,728	224,893	534,341
1937	196,052	67,132	72,993	272,281	608,458
1938	140,256	58,128	73,724	205,846	477,954
1939	162,345	66,591	86,274	242,454	557,664

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

Production of primary slab zinc by States.—Pennsylvania continued to be the leading zinc producer in the United States, a distinction held without interruption since1934. Next in order of importance as producers were Montana, Oklahoma, and Illinois, retaining respectively their relative positions of 1938. All producing States made substantial gains, except Arkansas and the West Virginia-Texas group. As in the preceding year, Montana and Idaho produced electrolytic zinc only in 1939, and the other States shown produced distilled zinc only.

Primary slab zinc produced in the United States, by States, 1935–39, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Other States [1]	Total	
								Short tons	Value
1935	10,147	12,448	67,348	106,028	58,612	119,452	46,599	420,634	$37,016,000

[1] Texas and West Virginia.

Secondary zinc.—In addition to the redistilled and remelted secondary slab zinc (unalloyed) already reported herein, a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in the chapter of this volume on Secondary Metals—Nonferrous.

Byproduct sulfuric acid.—Sulfuric acid made from the sulfur dioxide gases produced in the roasting of zinc blende is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consume large quantities of sulfur in addition. The production of sulfuric acid at zinc blende roasting plants from 1934 to 1938, inclusive, is shown in the following table. Data for 1939 are not yet available.

Sulfuric acid (60° B. basis) made at zinc blende roasting plants in the United States, 1934–38 [1]

Year	Made from zinc blende		Made from sulfur		Total		
	Short tons	Value [2]	Short tons	Value [2]	Short tons	Value [2]	
						Total	Average per ton
1934	[3] 406,984	$3,215,173	89,162	$704,380	496,146	$3,919,553	$7.90
1935	[3] 443,476	3,756,242	90,884	769,787	534,360	4,526,029	8.47

[1] Figures for 1939 not yet available.
[2] At average of sales of 60° acid.
[3] Includes acid from small quantity of foreign blende.

Rolled zinc.—The output of rolled zinc in 1939 was 35 percent greater than in 1938. The average value remained the same, at $0.086 a pound. Some mills that manufacture their rolled zinc into various products, other than those shown in the accompanying table, remelt and reroll the resulting scrap. The scrap thus treated in 1939 was 12,916 tons, a 38-percent increase over the 1938 figure. The zinc lost in such waste products as skimmings, drosses, and pot losses totaled 1,644 tons in 1939—equivalent to about 3 percent of the net production of rolled zinc. Zinc purchased for rolling in 1939 consisted of 39 percent Brass Special, 24 percent Prime Western, 19 percent Selected, 14 percent High Grade, and 4 percent Electrolytic and Intermediate grades. Stocks of slab zinc on hand at zinc rolling-mills were about 6,600 tons (revised figure) at the beginning and 7,800 tons at the end of the year.

Rolled zinc produced and quantity available for consumption in the United States, 1938–39

	1938			1939		
	Short tons	Value: Total	Value: Average per pound	Short tons	Value: Total	Value: Average per pound
Production:						
Sheet zinc not over 0.1 inch thick	12,219	$2,503,000	$0.102	15,599	$3,282,000	$0.105

Value of slab zinc (all grades)			.048			.052
Value added by rolling			.038			.034

[1] Figures represent net production. In addition, 9,392 tons of strip and ribbon zinc in 1938 and 12,916 tons of strip and ribbon zinc in 1939 were rerolled from scrap originating in fabricating plants operated in connection with zinc rolling-mills.
[2] Includes some slab zinc; not separately recorded.

Zinc dust.—Production of zinc dust in 1939 increased 45 percent over 1938 and was the largest on record. The zinc content of dust produced ranged from 94.0 to 98.5 percent and averaged 97.0 percent. Almost all of the zinc dust produced since 1931 has been from redistillation of zinc drosses and slab zinc.

Zinc dust [1] produced in the United States, 1935–39

Year	Short tons	Value: Total	Value: Average per pound	Year	Short tons	Value: Total	Value: Average per pound
1935	12,453	$1,574,259	$0.063	1938	11,609	$1,542,511	$0.066
1936	14,425	1,957,300	.068	1939	16,835	2,367,861	.070
1937	15,242	2,587,577	.085				

[1] All produced by distillation.

Zinc pigments and salts.—The principal zinc pigments are zinc oxide, leaded zinc oxide, and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinciferous materials—ores, metal, and secondary substances. Details of the production of zinc pigments and salts are given in the chapter on Lead and Zinc Pigments and Zinc Salts.

Mine production.—Mine production increased 13 percent in 1939 owing to gains in output of 18 percent in the Western States, 17 percent in the Central States, and 5 percent in the Eastern States. Tonnage advances were largest in the Central States, followed by the western and eastern groups. New Jersey leads in production in the Eastern States and ranks second in importance in the country. Output in New Jersey gained 3 percent and in New York 20 percent in 1939. Tennessee's output also rose, but that in Virginia declined.

In the Western States the most spectacular gain was that for Montana, where output rose from 8,844 tons in 1938 to 34,799 in 1939. Reopening early in the year of the Orphan Girl mine and other zinc-lead properties owned by the Anaconda Copper Mining Co. resulted in large gains in output from Butte, and production from the slag fuming plant at East Helena was expanded. Idaho, the largest zinc-producing State in the western group, increased 8 percent in production in 1939, while Utah, third in importance, gained 3 percent. The output from the Bingham and Tintic districts was less in 1939 than in 1938, but production from the Park City area increased following reopening of the Silver King Coalition and Park Utah Consolidated properties. New Mexico's total increased 4 percent in 1939, although the State's largest producer—the Pecos mine—was closed permanently May 31, 1939, because ore was exhausted. Output in Nevada fell 30 percent and in Colorado 60 percent. Colorado's drop was due largely to the idleness throughout 1939 of the Sunnyside mine, San Juan County.

Zinc produced in the Central States represented 40 percent of the country's total in 1939. Production was stimulated late in the year by increased prices for zinc, and many of the mines and mills of the area were running at capacity at that time. Oklahoma is the principal zinc-producing State in the region and in the country, with an output that represented 24 percent of the country's total in 1939. Production in Oklahoma rose 24 percent in 1939 and that in Missouri 48 percent, while output in Kansas dropped 6 percent.

Further details of zinc mining will be found in the various State reports in this volume.

[1] Bureau of Mines not at liberty to publish figures.

STOCKS

Stocks of zinc at primary reduction plants fell 47 percent during 1939 from the unusually high stocks carried over from the preceding year. Stocks at secondary distilling plants increased 33 percent. Total stocks declined 46 percent. Of the total stocks on hand at the end of the year, 34,334 tons were of the higher grades of zinc (A and B) and 51,949 tons of the lower grades (C, D, and E) compared with 75,864 and 83,562 tons, respectively, at the end of 1938.

According to the American Zinc Institute, stocks of slab zinc declined moderately in the first quarter, increased materially in the second quarter, and reached the peak for the year at the end of June, declining steadily thereafter to the end of November as shipments to consumers increased. During December zinc stocks increased slightly, but the year-end figure was little more than half that at the beginning of the year.

Stocks of zinc on hand at zinc-reduction plants in the United States at end of year, 1935–39, in short tons

	1935	1936	1937	1938	1939
At primary reduction plants	90,539	55,500	79,144	157,511	83,728
At secondary distilling plants	1,151	626	1,969	1,915	2,555
	91,690	56,126	81,113	159,426	86,283

Stocks of zinc ore (60 percent concentrates) in the Tri-State district at the beginning of 1939 totaled 8,400 tons. In January 1940 production exceeded shipments, and early in February stocks increased to 12,100 tons. A reduction to 5,500 tons on July 1 was followed by an advance to over 10,000 tons early in September. Sharp increases in shipments from September 16 through October reduced stocks to 5,100 tons on November 4, but a subsequent increase in output and a decline in demand reversed the trend, and by December 23 stocks had risen to 13,200 tons—the peak for the year. At the close of the year 12,000 tons of ore were on hand.

Data on stocks of zinc outside the United States are not available, but some authorities estimate that there was little change in the stock situation during 1939. Estimates of world stocks of slab zinc at the end of 1938 ranged from 425,000 to 470,000 tons. The disruption of international trade in zinc ore caused by the war has increased inventories of ore at producing centers. The Electrolytic Zinc Co. of Australasia reports that its stock of ore as of June 30 has increased from 117,000 short tons in 1936 to 203,000 in 1938 and 236,000 in 1939. The American Bureau of Metal Statistics states that stocks in North and South America at the end of the year rose from 118,000 tons in 1936 to 190,000 in 1938 and 220,000 in 1939.

DOMESTIC CONSUMPTION

New supply.—The supply of new slab zinc available for consumption in 1939 increased 62 percent over 1938 and established a record, exceeding the previous one of 1928 (578,060 tons) by 5 percent and the 1925–29 average (548,472 tons) by 11 percent. By comparison supplies of copper, lead, and pig iron increased 76, 22, and 70 percent over 1938, respectively. Larger production from both domestic and foreign ores and a substantial reduction in producers' stocks during the year explained the record supply of zinc available in 1939. However, it is believed that consumers' stocks increased appreciably, particularly during the latter part of the year. The American Bureau of Metal Statistics estimates the industrial consumption of primary and redistilled secondary zinc at 626,000 tons, which is nearly 32,000 tons below the supply of new zinc available plus the production of redistilled secondary zinc as reported by the Bureau of Mines. Domestic shipments during the last third of 1939 averaged 65,157 tons a month compared with 42,293 tons during the first 8 months, according to the American Zinc Institute. This 54-percent increase in deliveries to consumers probably is far above the rise in actual consumption, supporting the assumption that consumers were accumulating stocks during the latter part of the year. Sheet galvanizing operations, for instance, were only about 30 percent higher in the last 4 months of 1939 than in the preceding 8 months; and automobile production, where large quantities of zinc die castings are used, increased only 15 percent.

Primary slab zinc available for consumption in the United States, 1935–39, in short tons

	1935	1936	1937	1938	1939

Available for consumption	457,705	538,794	570,219	375,004	607,464

[1] Not separately recorded; estimated.

Industrial use of slab zinc.—In addition to the new supply of zinc shown in the preceding table, a large supply of secondary zinc is available for consumption each year. The estimated industrial use of both primary and secondary zinc, as calculated by the American Bureau of Metal Statistics, is shown in the following table:

Estimated industrial use of zinc in the United States, 1935–39, in short tons [1]

Purpose	1935	1936	1937	1938	1939
Galvanizing:					
Sheets	110,000	132,000	139,000	108,500	147,500
Tubes	25,000	36,000	37,000	29,300	43,000
Wire	25,000	30,000	33,000	23,600	30,900
Wire cloth	5,000	6,000	7,000	5,600	7,000
Shapes [2]	30,000	38,000	40,000	31,000	46,600
	195,000	242,000	256,000	198,000	275,000
Brass making	124,000	165,000	169,000	102,000	175,000
Rolled zinc	56,500	55,000	58,000	46,000	62,000
Die castings	55,500	72,000	88,000	48,000	84,000
Other uses [3]	42,000	48,000	39,000	27,000	30,000
	473,000	582,000	610,000	421,000	626,000

[1] Year Book, American Bureau of Metal Statistics, 1939.
[2] Includes pole-line hardware, hollow ware, chains, and all articles not elsewhere mentioned.
[3] Includes slab zinc used for manufacture of French oxide, zinc for wet batteries, slush castings, the desilverization of lead, wire for metalizing, etc., and sundries.

The quantity of zinc used by industry in 1939 was 49 percent higher than in 1938 and totaled 99 percent of the record amount consumed in 1929. All four of the principal uses increased in 1939—galvanizing 39 percent, brass making 72 percent, rolled zinc 35 percent, and die castings 75 percent. The largest use—galvanizing—took 44 percent of the total tonnage in 1939 compared with 47 percent in 1938. This item includes zinc used in electrogalvanizing and that used in sheradizing. The former increased from 3,978 tons in 1938 to 5,740 in 1939 and the latter from 264 tons to 511.

Zinc used in rolled products in 1939 (1938 figures in parentheses) included 21,670 tons (15,300) in battery cans, 20,000 (15,000) in glass jar tops, 1,000 (2,000) in automobile manufacture, 5,000 (4,000) in photoengraving sheet, 1,100 (830) in boiler plate, 340 (270) in brake lining, and 250 (300) in electric refrigerators. The remaining tonnage was used in miscellaneous other uses or exported. The chief item in "Other uses" is the slab zinc employed in making French-process zinc oxide, which totaled about 17,000 tons in 1939 compared with 16,000 in 1938.

PRICES

The spot price of zinc did not change during the first half of 1939 but advanced consistently throughout the greater part of the latter half. At the beginning of the year the St. Louis price of Prime Western zinc stood at the 4.50-cent level in effect since November 29, 1938. This quotation held throughout the first half of the year and until July 26, when it reached 4.55 cents. As demand improved, production of slab zinc was accelerated but failed to meet the rapidly expanding market. As a result, stocks trended downward, and prices responded with a consistent rise to 4.60 cents on July 27 and 4.75 cents on August 7, and a rapid advance from then through September. The outbreak of war in Europe added a stimulus to normal demand. After reaching the year's peak of 6.50 cents on September 27—apparently this figure reflected an overestimate of demand for the near future—the price fell to 6.00 cents on December 4 and was 5.75 cents at the end of the year, with an average of 5.12 cents for the year compared with 4.61 cents in 1938, an 11-percent increase.

London Metal Exchange dealings were suspended at the outbreak of the war, and zinc market quotations in London are available only for the first 8 months of 1939. The monthly average price fluctuated from 2.85 cents in January to a low of 2.81 cents in April, from which it advanced steadily to 3.01 cents in August—about 3 percent above the average price for August 1938. For the 8-month period the 1939 average price was 2.89 cents—about 6 percent below the January-August average of 1938. For the first 8 months of the year the New York price averaged 2.03 cents higher than the London price, the monthly differential ranging from 2.04 cents in January to a low of 1.94 cents in July and a high of 2.10 cents in August.

On September 8 the Nonferrous Metal Control for the United Kingdom fixed the price of zinc at £15 ex-ship and £15 12s. 6d. ex-warehouse, duty for buyers' account for foreign metal, and £17 5s. ex-ship and £17 17s. 6d. ex-warehouse for domestic and Empire metal. On December 18 prices were raised sharply to £25 15s., delivered consumers, duty paid for foreign zinc and £26 10s. for domestic metal.

Price of zinc and zinc concentrates, 1935–39

	1935	1936	1937	1938	1939
Average price of common zinc at—					
St. Louis (spot) cents per pound	4.33	4.90	6.52	4.61	5.12
New York do	4.70	5.28	6.87	4.99	5.51
London do	3.08	3.31	4.91	3.05	[1] 2.89

[2] London Metal Exchange dealings suspended for duration of war.
[3] Average for 8 months; comparable average for St. Louis was 4.53 cents.

Average price of zinc received by producers, 1935–39, by grades, in cents per pound

	1935	1936	1937	1938	1939
Grade A (High Grade) [1] } Grade B (Intermediate) }	4.55	5.15	6.65	5.03	5.34
Grades C and D (Select and Brass Special) [1]	4.31	4.91	6.47	4.73	5.00
Grade E (Prime Western)	4.32	4.89	6.44	4.71	5.08
All grades	4.4	5.0	6.5	4.8	5.2
Prime Western; spot quotation at St. Louis	4.3	4.9	6.5	4.6	5.1

[1] American Metal Market quotes average prices of High Grade and Brass Special as follows: High Grade (f. o. b. New York), 1935, 5.33 cents; 1936, 5.90 cents; 1937, 7.76 cents; 1938, 5.74 cents; 1939, 6.16 cents; Brass Special (f. o. b. East St. Louis), 1935, 4.41 cents; 1936, 4.98 cents; 1937, 6.62 cents; 1938, 4.71 cents; 1939, 5.22 cents.

ZINC-REDUCTION PLANTS

Zinc smelters.—There were no changes during 1939 in the number of active and idle zinc smelters; as in the previous year, there were 17 active and 2 idle plants. Of the active plants, 13 operated exclusively with horizontal retorts, 1 with both horizontal and vertical retorts, 2 with large vertical retorts exclusively, and 1 with electrothermic furnaces. At the active plants, 69,180 horizontal retorts were available, the same as in 1938, but the number in use at the end of the year increased from 33,949 in 1938 to 49,151 in 1939. In addition, 50 of the 52 installed vertical retorts were in operation at the close of 1939.

Many primary smelters treat scrap as well as ore. Horizontal-retort plants at Beckemeyer and Sandoval, Ill., and large graphite-retort plants at Trenton, N. J., Philadelphia, and Bristol, Pa., Wheeling, W. Va., Tottenville, N. Y., and Fairfield, Ala., handle scrap exclusively. The Torrance (Calif.) plant of the Pacific Smelting Co., Ltd., contains small clay retorts as well as large graphite retorts for treating secondary materials.

Electrolytic plants.—Three electrolytic zinc plants were in operation during 1939. The enlarged Kellogg (Idaho) plant of the Sullivan Mining Co. was operating at capacity at the end of 1939, as was the Great Falls (Mont.) plant of the Anaconda Copper Mining Co., but the plant of the latter company at Anaconda was operating only at half capacity at the end of the year. The plant of the Evans-Wallower Zinc Co. at East St. Louis remained idle during 1939. At the 3 active plants, 1,904 cells out of a total of 2,192 were in use at the end of 1939, compared with 1,460 at the end of 1938.

FOREIGN TRADE[3]

Imports.—The following tables give zinc imports into the United States, 1935–39, inclusive, and a record of bonded-warehouse inventories.

Zinc ores (zinc content) imported into the United States, 1935–39, in short tons[1]

Year	Canada	Mexico	Other countries	Total	Year	Canada	Mexico	Other countries	Total
1935		10,520		10,520	1938		7,253	[2] 11,330	18,583
1936		172		172	1939	1,613	23,221	[2] 11,266	36,100
1937	84	338	[2] 8,390	8,812					

[1] Data include ore imported for immediate consumption plus material entering the country under bond.
[2] Includes 8,373 tons imported from Peru in 1937, all from Peru in 1938, and 9,722 tons from Peru in 1939.

Zinc[1] *remaining in warehouse in the United States, December 31, 1935–39*

Year	Pounds	Year	Pounds
1935	13,840,586	1938	51,058,373
1936	10,690,832	1939	20,295,817
1937	24,904,405		

[1] Includes zinc ore (zinc content), zinc blocks, pigs, old, and sheets.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Imports of zinc ore in 1939 advanced 94 percent over 1938 owing to continued large increases in shipments from Mexico. More than 64 percent of the ore imported in 1939 came from Mexico and 27 percent from Peru; most of the remainder came from Canada and Argentina. Imports of slab zinc increased from 7,230 tons in 1938 to 30,960 in 1939. Imports of slab zinc in 1939 (1938 figures in parentheses) included 16,506 tons (3,346) from Mexico, 6,402 tons (2,332) from Canada, 4,790 tons (286) from Belgium, 1,456 tons (none) from Norway, and 806 tons (1,210) from Poland and Danzig.

Zinc imported for consumption in the United States, 1935–39

Year	Blocks, pigs, or slabs		Sheets		Old, dross, and skimmings [1]		Zinc dust		Value of manufactures	Total value
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value		
1935	4,444	$270,350	112	$9,423	29	$979	40	$2,486	$1,149	$284,387
1936	11,660	770,496	242	23,077	16	769	57	3,647	540	798,529
1937	37,208	3,852,884	231	30,398	678	70,460	69	6,169	828	3,960,739
1938	7,230	480,169	226	25,989	96	8,944	64	5,074	463	520,639
1939	30,960	1,890,236	178	21,166	203	14,067	41	3,388	1,545	1,930,402

[1] Includes dross and skimmings: 29 tons valued at $974 in 1935; 15 tons valued at $721 in 1936; 560 tons valued at $59,635 in 1937; and 30 tons valued at $1,918 in 1939. None reported in 1938.

Exports.—The total value of the 1939 exports of zinc ore and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) was $2,075,000, an increase from $1,271,000 in 1938. Most of the increase in exports was in plates, sheets, pigs, and slabs; there were slight increases in zinc dust and zinc ore. In addition to the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. The American Bureau of Metal Statistics estimates that 14,900 tons of zinc were exported in galvanized products in 1939. Export data on zinc pigments and chemicals are given in the chapter in this volume on Lead and Zinc Pigments and Zinc Salts. Much of the zinc used in the manufacture of these products is of foreign origin, and when it is exported a draw-back of 99 percent of the import duty is paid. In 1939 draw-back was paid on 16,213 tons of zinc, of which 10,625 tons had been imported as slabs and 5,588 tons as ore. The totals for previous years were: 1938, 11,550 tons; 1937, 9,253 tons; 1936, 8,909 tons; 1935, 7,297 tons; and 1934, 4,139 tons.

Zinc ore and manufactures of zinc exported from the United States, 1935–39

[2] Less than 1 ton.

WORLD ASPECTS OF ZINC INDUSTRY

Cartel activities.—Political conditions in Europe in 1939 were not conducive to international cooperation in economic matters. Consequently no progress was made toward reconstituting the International Zinc Cartel, which collapsed in 1934. A meeting of British, Belgian, and French interests was reported to have been held in Paris in June to discuss the possibilities of an agreement but achieved no success.

World smelter production.—There were no material changes in output of zinc in the principal producing countries of the world during 1939. Exclusive of the United States, where production of slab zinc during the year increased 14 percent, total world production increased only 2 percent above the figure for 1938. Such countries as Belgium, Norway, and the Netherlands, in which the customs smelters depend on imported concentrates, reported reductions in output for 1939. This condition may be attributed in part to the depreciated franc and pound sterling.

Dislocation of the zinc industry throughout Europe followed the outbreak of war in September. Acquisition of the Polish smelters, which were in operating condition when confiscated, placed Germany far in the lead among European producers and renders the nation self-sufficient in this nonferrous metal.

World smelter production of zinc, 1935–39, by countries where smelted, in metric tons [1]

[Compiled by R. B. Miller]

Country	1935	1936	1937	1938	1939
Australia	68,752	71,641	70,869	70,941	72,363

[1] Statistical data derived in part from the Yearbook of the American Bureau of Metal Statistics.
[2] Includes the following tonnages of electrolytic zinc: 1935, 1,800 tons; 1936, 6,366 tons; 1937, 7,830 tons; and 1938, 8,670 tons. Data not available for 1939. Production of electrolytic zinc began in August 1935.
[3] Estimate included in total. [4] Some secondary material included. [5] Approximate production.

World consumption.—World consumption of slab zinc during 1939 cannot be estimated accurately, as all belligerent countries suspended publication of certain essential data immediately after outbreak of the European war. It is reasonable to assume that there was some increase in consumption above the 1,489,800 metric tons reported for 1938 by the American Bureau of Metal Statistics. According to this authority, consumption in the United States increased 59 percent. Larger consumption also was indicated in Canada and other American countries and India, but data for other foreign countries are not complete enough for comparisons.

REVIEW BY COUNTRIES

Argentina.—Argentina produced 41,300 metric tons of zinc concentrates in 1939. The St. Joseph Lead Co. shipped lead and zinc concentrates to Europe from the Aguilar mine, Province of Jujuy.

Australia.—The Electrolytic Zinc Co. of Australasia, Ltd., received zinc concentrates at its Risdon electrolytic plant from mines at Broken Hill and Roseberry in excess of its requirements and during the first part of 1939 shipped 55,000 long tons of concentrates to the United Kingdom for emergency use. Subsequently, the concentrates were sold to the Imperial Smelting Corporation, Ltd.

The Zinc Corporation, Ltd., completed the new main shaft which is to serve its mine and that of the adjoining New Broken Hill Consolidated, Ltd. The flotation mill, which has a capacity of 10,000 tons of ore weekly, also was completed. The two companies will equip and operate their adjoining properties together in order to reduce the cost and time required in bringing the New Broken Hill mine into production. Estimated ore reserves in the North Broken Hill mine were increased to 5,084,000 tons as of June 30, 1939. Cessation of operations at the Central mine, Broken Hill, belonging to the Sulfide Corporation, Ltd., again was postponed during the year.

For the year ended June 30, 1939, Mt. Isa made a profit of £18,798 compared with £19,742 in the previous year. Ore treated during the last fiscal year totaled 575,884 tons containing 9.0 percent zinc, 9.2 percent lead, and 7.4 ounces silver per ton. The zinc concentrate output (44,700 tons) was 10,500 tons less than that in the preceding year and was caused by a 2-month stoppage of production following a coal strike. Milling equipment added in February 1940 increased capacity 20 percent and permitted 15,000 tons of ore to be treated weekly. Estimated ore reserves totaled 10,167,100 tons.

Australia produced about 410,000 tons of zinc concentrates in 1939 (392,000 in 1938). On February 8, 1940, the National Security (Prices) Regulations increased the maximum lead and zinc prices to £22 a long ton, which was considerably less than the London rates expressed in Australian currency.

Belgium.—Zinc ore imports into Belgium totaled 402,700 metric tons in 1939, 25 percent less than that in 1938. Mexico supplied 26 percent of the total. Receipts decreased from all the principal sources, including Australia, Canada, and Newfoundland, Sweden, Burma, Yugoslavia, and Italy. Slab zinc exports continued to decline—from 129,850 to 117,100 tons. Zinc sheet and wire exports dropped from 37,600 to 36,200 tons. The depreciation of sterling and the franc and the suspension of zinc quotations on the London market in September made it difficult for the Belgian, as well as the Dutch and Norwegian custom smelters, to compete in the world market, thus reducing exports. Slab zinc imports remained the same as in 1938, at 14,000 tons. Vieille Montagne zinc production was 110,500 tons in 1939, or about the same as in 1938. The company also produced 35,048 tons of rolled zinc and 15,496 tons of zinc white. The war affected its regular supply of ore during the last 4 months of 1939 as limited shipping facilities caused freight rates to advance five times over pre-war levels and war-insurance premium rates often were prohibitive. At the end of 1939 a number of furnaces were shut down. The Société Anonyme de Rothem produced 18,000 tons of zinc ingots in 1939.

Burma.—The production of zinc concentrates in Burma totaled 59,500 long tons in 1939 compared with 60,700 tons in 1938. Exports of zinc, chiefly concentrates, totaled 44,831 long tons (64,651 in 1938). Of these exports, 13,900 tons went to Belgium. The Burma Corporation, Ltd., produced 59,300 long tons of zinc concentrates averaging less than 58 percent zinc in 1939. The British Government officially requested the corporation to discontinue publication of production figures early in 1940. On June 30, 1939, ore reserves totaled 3,608,000 tons. During the fiscal year 1938–39 the company mined 485,115 tons of ore, the second largest output in the history of Bawdwin mines, but the grade was the lowest produced in any year and contained approximately 5 percent less lead and zinc and 8 percent less silver than in the previous year. In 1939 British India imported 23,000 tons of slab zinc (21,200 in 1938).

Brazil.—Zinc ores are found at the Morro do Bule mine, Ouro Preto, and at Januaria, State of Minas Geraes, and at Iporanga, State of São Paulo.

Bulgaria.—German and Bulgarian interests plan to complete development by the end of 1940 of an ore deposit in the Rhodope Mountains containing 15 to 23 percent Pb, 6 to 9 percent Zn, and 0.4 to 0.7 percent Cu, and 100 to 230 grams of silver per ton.

Canada.—In 1939 Trail and Flin Flon supplied three-fourths and one-fourth, respectively, of Canada's production of metallic zinc. The latter milled 1,721,783 short tons of ore (a new record), which averaged 4 percent zinc, 2 percent copper, 1.6 ounces silver, and 0.1 ounce gold per ton. The creation of an electrolytic zinc custom plant in Canada is still under consideration. In 1939 zinc concentrates were exported from Canada by the Normetal, Waite Amulet, Stirling (mine idle), and Consolidated mining companies. The Waite Amulet mines shipped 19,258 tons of zinc concentrates averaging 54 percent zinc produced in 1937 and 1938 but made no recovery of zinc concentrates in 1939. The company placed a new mine surface plant and mill in operation, and at the end of 1939 its total zinc ore reserves were estimated at 3,727,100 tons. In Ontario a large, low-grade zinc deposit was discovered 4 miles from Renfrew, and over 1,000,000 tons of ore averaging 8 percent zinc, 2 percent lead, and some gold and silver were indicated by diamond drilling on Calumet Island. Canadian zinc ore exports decreased from 22,900 to 20,600 short tons, most of which continued to go to Belgium. Slab zinc exports in 1939 aggregated 156,000 tons (132,000 in 1938), of which the United Kingdom took 121,700 and British India 22,600 tons, 1.2 and almost 4 times as much, respectively, as in 1938.

France.—During the first 7 months of 1939 France imported 90,800 metric tons of zinc ore compared with 116,200 tons during the same period in 1938; the 1939 imports included 27,700 tons from Mexico, 15,800 from Turkey, 12,200 from Australia, 11,200 from Sweden, 9,000 from Yugoslavia, and 7,500 from Italy. Zinc ore exports during the period, chiefly to Norway, totaled only 10,300 tons (25,700 in previous period). Slab-zinc imports, chiefly from Belgium and Norway, totaled 16,800 tons (15,500 in the previous period).

Germany.—The capture of the Polish zinc mines and smelters in good working order early in the fall of 1939 made Germany largely self-sufficient in zinc. Germany now should be able to produce more than 300,000 tons of zinc annually without importing foreign ore, which is adequate to cover all reasonable demands unless the substitution of zinc for copper and other imported metals should be increased further. The use of zinc has been promoted for all purposes where other more abundant material could not suitably be employed, but at the same time there have been certain restrictions upon its use. Many new zinc alloys have been placed on the market, chiefly with additions of copper and aluminum. German consumption of zinc totaled almost 270,000 metric tons in 1938, in which year it produced 192,000 tons and Poland 108,000 tons. Zinc output in Germany has been greatly expanded by extension of the Magdeburg electrolytic zinc plant which serves the Upper Silesia zinc-mining district and by rehabilitation of the Oker and other works. Lead-zinc production probably increased in 1939 from the Bleiberger Bergwerks Union properties in Kärnten, Austria, and those recently acquired in the Inn Valley of the Northern Tyrol. During the first 7 months of 1939 German zinc ore imports totaled 91,341 metric tons (123,966 in 7 months of 1938), exports 34,045 tons (32,155). Spelter imports totaled 41,684 tons (43,853) and exports 6,844 tons (4,263).

Indochina.—The Compagnie Minière et Métallurgique de l'Indo-Chine produced 12,500 metric tons of zinc concentrates averaging 45 percent zinc in 1939 (11,300 in 1938) which were shipped to the smelter at Quang Yen, Tonkin.

Italy.—Lead and zinc ores usually are found together in Italy, and to increase the lead output and compensate the producer for the overproduction of zinc (exported at a loss with the low prices prevailing earlier in 1939) the Government granted a bonus of 350 lire per ton on excess quantities produced in 1939. The three largest zinc plants—at Porto Marghera, Vado Ligure, and Crotone—have an annual capacity of nearly 50,000 metric tons. Italy expects to use zinc alloys in place of copper, as is done in Germany. The plant at Porto Marghera is now producing zinc alloys.

Japan.—The Nippon K. K. expected to complete the construction of an electrolytic zinc plant of 1,000 metric tons monthly capacity by the end of 1939.

Mexico.—Mine production of zinc in Mexico totaled 134,000 metric tons in 1939 compared with 172,000 in 1938. Smelter output aggregated only 38,000 tons in 1939, leaving about 93,000 tons (186,000 tons of 50-percent concentrates) available for export after allowance for smelter losses on ores treated in Mexico. Mexican export figures do not report shipments of zinc ore or concentrates separately. However, reported receipts of Mexican ore in 1939 were: Belgium, 105,800 tons, the United States approximately 46,000, France (7 months) 27,700, the Netherlands 13,300, and Germany (7 months) 2,700. The European war and the Government-controlled metal market and legislation seriously affected mining, and until the spring of 1940 substantial quantities of zinc concentrates formerly refined in Europe were stored by the larger companies. The San Francisco Mines of Mexico temporarily terminated its contract for shipping zinc concentrates to the Belgian Société Genérale des Minerais and diverted them to smelters in the United States.

Netherlands.—Zinc ore imports into the Netherlands totaled 45,200 metric tons in 1939 (45,400 in 1938) of which 13,300 tons were from Mexico, 9,300 from Canada, and 8,500 from Belgium. Zinc ingots and sheets imported totaled 11,600 tons. Exports included 15,400 tons of ingots.

Newfoundland.—Zinc concentrates produced in Newfoundland totaled 105,600 short tons in 1939 (122,000 in 1938). The 1939 product contained 54,600 tons of zinc and 397,700 ounces of silver. Lead and copper concentrates contained an additional 11,000 tons of zinc. Exports of zinc concentrates dropped from 121,000 to 61,000 tons, indicating a substantial increase in producers' stocks during 1939.

Peru.—The Cerro de Pasco Copper Corporation produced 19,000 metric tons of zinc concentrates in Peru in 1939. Zinc concentrates exported in 1939 totaled 29,000 tons (25,000 in 1938).

Poland.—The Polish zinc mines and smelters fell into German hands early in the fall of 1939. Further details are given in the discussion under Germany.

Turkey.—Zinc ore and concentrates exported from Turkey in 1939 totaled 20,500 metric tons. The producers of lead and zinc concentrates include the Balya-Karaaydin mine, the operation of which apparently is subsidized by the Government.

United Kingdom.—On May 26, 1939, the Import Duties Advisory Committee of the United Kingdom approved the increased tariff protection proposed by the Imperial Smelting Corporation, Ltd., whereby the import duty paid by Empire zinc producers (chiefly in Australia and Canada) was raised from 12s. 6d. to 30s. per long ton. The producers also agreed to pay the corporation on behalf of the National Smelting Co., Ltd., a subvention of 10s. for every ton of zinc they import and sell. The corporation agreed to restrict its zinc output to 60,000 long tons, although its annual capacity is 85,000 tons. Another part of the arrangement grants a rebate to British manufacturers on the increased duty paid on zinc imported for export. The United Kingdom agreed to purchase all the export surplus of refined zinc in Australia. According to the British Metal Corporation, Ltd., the United Kingdom imported 96,500 tons and produced 23,000 tons of slab zinc during the first half of 1939. Exports, including reexports, totaled 3,400 tons. Stocks of zinc in official warehouses at the end of June 1939 totaled 21,500 tons. Of the 109,000 tons consumed during the half-year period, 46,500 were used for galvanizing (24,500 for sheet and 22,000 for other galvanizing), 27,500 for brass, 15,000 for oxide, 10,000 for rolled products, 6,000 for die casting, and 4,000 for miscellaneous uses. Of the total consumption of slab zinc, 89 percent was imported. The "Anderson" air-raid shelter program caused a heavy demand for heavy-gage galvanized steel until August, when other uses probably found more urgent requirements for steel.

Yugoslavia.—For the year ended September 30, 1939, Trepca Mines, Ltd., treated 616,073 metric tons of ores from the Stantrg mine (655,892 tons the year before), which resulted in the production and sale of 65,561 tons of lead concentrates, 53,182 tons of zinc concentrates, and 77,117 tons of pyrite. A strike of workmen at the mine suspended operations from July 19 to September 3. Development work, but no production, was carried on at the company Kopaonik or Vojetin mine during the year. At the Zletovo or Dobrevo mine underground work was suspended July 15, and the mill treated experimentally 5,082 tons of lead-silver ore. Revaluation of ore reserves at the Stantrg mine was delayed by the strike, but the estimated reserves of Kopaonik totaled 750,000 tons averaging 9 percent lead, 6.5 percent zinc, and 3.7 ounces silver, and those of Zletovo totaled 948,000 tons, averaging 11.5 percent lead, 1.7 percent zinc, and 3.5 ounces silver per ton. Preparations of Topionica Cinka A. D., a subsidiary, for construction of an electrolytic zinc plant at Sabac were delayed by the European war. The war also caused difficulties in connection with the exportation of concentrates from Yugoslavia and the remittance of funds to that country. The final settlement resulted in Trepca's suspension of its former arrangement with the Government until June 30, 1940, during which time a proportion of production will be sold on the basis of whatever may be considered the world price of metals to the Yugoslav State or on its behalf for payment in dinars. The geology, development, and history of the Mezica lead-zinc mines in the Karawanken Alps of northern Yugoslavia, now operated by the Central European Mines, Ltd. (British), are well-described by Loch.[4] The run-of-mine ore averages about 13.5 percent lead and 5 percent zinc, and the zinc content appears to be increasing in depth at the Moreing shaft. The flotation plant produces about 16 tons of zinc concentrates averaging 50 percent zinc in 8 hours.

LEAD AND ZINC PIGMENTS AND ZINC SALTS

By H. M. Meyer and A. W. Mitchell

SUMMARY OUTLINE

Lead and zinc pigment manufacturers reported some improvement in 1939 over 1938, owing to gains by industries that are the principal consumers of pigments, namely the paint, automobile, rubber, floor covering, paper, and other trades.

In general, activity in pigments, as measured by monthly sales, increased until it reached the highest levels of the year in the third quarter, then receded somewhat in the final months of the year. Quoted prices for white lead were higher than in 1938 but remained unchanged from the levels established in November 1938. Producers reported that they received 12 and 25 percent higher average values for the two grades of white lead than in 1938. In general, quotations for the other lead pigments rose with those for pig metal, but producers apparently did not receive the full benefits of the increases indicated. Prices for various grades of zinc oxide and zinc sulfate were stationary throughout the year, but those for lithopone and zinc sulfide showed a declining tendency. These prices reflected producers' values but seemed to be influenced little by the movements of the metal.

Although sales of lead pigments increased only 14 percent in total quantity whereas those of zinc pigments increased 23 percent, lead pigments fared better inasmuch as they gained 25 percent in total value compared with 24 percent for zinc pigments. In relation to 1925–29 averages, however, zinc pigments made the best showing, as their total value in 1939 represented 70 percent of the average for 1925–29, while that for lead pigments was only 59 percent. The popularity of leaded grades of zinc oxide continued to grow in 1939, and sales for the year established a new high record. Sales of leaded zinc oxide in 1939 were 60 percent above the 1925–29 average, whereas those of the lead-free grades were 26 percent below the average for that period. It is noteworthy that owing to recently improved technique white lead paints are now available in colors.

The total value of imports of lead and zinc pigments and zinc salts changed little from 1938 to 1939, but the value of exports virtually doubled in 1939.

Salient statistics of the lead and zinc pigments industry of the United States, 1925–29 (average) and 1935–39

	1925–29 (average)	1935	1936	1937	1938	1939
Production (sales) of principal pigments:						
White lead (dry and in oil) short tons	154,483	96,831	118,407	98,213	[1] 100,213	98,429

Value of imports	931,000	468,000	375,000	414,000	285,000	280,000
Export balance	2,535,000	434,000	579,000	765,000	554,000	1,350,000

[1] Revised figures.

Titanium pigments again absorbed a larger share of the market for white pigments than in previous years. It was estimated [1] that production of titanium pigments approached 165,000 tons in 1939. According to this report, one of the largest paint manufacturers completed and put into successful operation a pilot plant using a recently developed process.

PRODUCTION

In this chapter sales are used as being more significant than production, for no account is taken of stocks on hand at the beginning and end of the year. The quantities consumed by the producers in manufacturing products at their own plants are included under sales. Production figures are used only in calculating the metal content of pigments and salts in the section of this report on Raw Materials Used in the Manufacture of Lead and Zinc Pigments and Zinc Salts.

The total value of sales of lead and zinc pigments rose from $51,652,000 in 1938 to $64,279,000 in 1939, which was 63 percent of the average for 1925–29. The increase in 1939 was caused by greater sales of lead oxide pigments and all zinc pigments and by higher average values received by producers for several items.

Lead pigments.—Increased quantities of red lead, orange mineral, and litharge were sold in 1939. Sales of white lead (dry) were slightly higher, and sales of white lead in oil and basic lead sulfate declined. Changes in sales from 1938 to 1939 ranged from a decline of 5 percent for basic lead sulfate to increases of 30–32 percent for litharge and red lead. The average values received by producers for all lead pigments

[1] Chemical and Metallurgical Engineering, vol. 47, No. 2, February 1940, p. 76.

except orange mineral were higher in 1939 than in 1938. Quotations for red lead, litharge, and orange mineral advanced during the year, but those for white lead were stationary at the level established in November 1938. The figures given in this report for basic lead sulfate are exclusive of the amounts used in the manufacture of leaded zinc oxide. For statistical purposes and to avoid duplication of tonnages, basic sulfate so used is reported under leaded zinc oxide only. This use of basic lead sulfate has expanded rapidly in recent years and totaled about 7,700 tons in 1939. Litharge was the only lead pigment of which a higher tonnage was sold in 1939 than the average for 1925–29, the advance being 6 percent.

Lead pigments sold by domestic manufacturers in the United States, 1938–39

Pigment	1938			1939		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average
Basic lead sulfate or sublimed lead:						
White	5,030	$555,203	$110	4,688	$585,616	$125
Blue	771	88,873	115	850	111,272	131

1939	30,509	67,920	4,688	850	39,976	131	89,518

[1] Revised figures.

Zinc pigments and salts.—Sales of leaded zinc oxide established a new high record in 1939, being 6 percent above the previous record tonnages of 1936 and 1937 and 60 percent above the annual average for 1925–29. Sales of zinc oxide and lithopone were 45 and 14 percent higher than in 1938, but amounted to only 74 and 80 percent of the 1925–29 averages. Average quoted prices for the various grades of lead-free zinc oxide were unchanged throughout 1938 and 1939, and the average values reported by producers were identical for the 2 years. Prices of leaded zinc oxide were somewhat higher in 1939 than in 1938, and producers reported an advance of 7 percent in the average value they received. On the other hand, lithopone quotations were lower in 1939, the top of the price range for 1939 coinciding with the bottom of the range for 1938.

244615—40——11

Large quantities of basic lead sulfate now used in making leaded zinc oxide are included as part of the leaded zinc oxide total and, to avoid duplication, are not shown as basic lead sulfate.

Complete data covering the production of zinc chloride in recent years are not available owing to the refusal of one large producer to supply an accurate report.

Sales of zinc sulfate in 1939 almost equaled the high record established in 1937.

Zinc pigments and salts sold by domestic manufacturers in the United States, 1938–39

Pigment or salt	1938			1939		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)

[1] Data not available.

CONSUMPTION BY INDUSTRIES

White lead.—Prices received by producers for white lead were higher in 1939 than in 1938, and the increased values per ton were responsible for the improvement in this industry for the year. Tonnage data showed relatively little change in sales of dry white lead and a drop of 4 percent in sales of white lead in oil. Normally 95 percent of the white lead made is used in the manufacture of paint. As stated in Minerals Yearbook, 1939, the Lead Industries Association began a 3-year promotion campaign in 1939 designed to increase the use of white-lead paint. Early in 1940 it was announced that white-lead paints were now available in colors. Previously white lead was generally available only in paste form, and it was mixed with linseed oil on the job and tinted to taste or specification.

Late in 1939 a Canadian article called attention of the lead industry to the thousands of gallons of white paint being used on the roads and curbs of England in preparation for "black-outs." A market summary on page 7 of the Metal Bulletin, London, January 16, 1940, pointed out that paint makers—at any rate, those of the lead-paint section—had suffered a sharp decline in business. The summary stated that it might have been expected that Government construction work and camouflaging would have offset the slack in building but that most camouflage and road paints contain no lead.

In March it was stated that the Federal specification on white lead would be revised, and a preliminary draft was issued. Later in the year, however, the Technical Committee on Paint decided that no change should be made. The specification for white lead, TT-W-251A-White Lead, Basic Carbonate, Dry, Paste-in-Oil and Semi-paste containing Turpentine, was dated November 6, 1934, and the latest amendment (Amendment 2) was made June 25, 1938.

Distribution of white-lead (dry and in oil) sales, 1935-39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Paint	91,297	113,363	93,580	[1] 95,018	92,380
Ceramics	1,834	2,653	2,506	1,918	1,767
Other	3,700	2,391	2,127	3,277	4,282
	96,831	118,407	98,213	[1] 100,213	98,429

[1] Revised figures.

Basic lead sulfate.—The outstanding use of basic lead sulfate is in the manufacture of paint, 93 percent of the sales reported for 1939 being for that purpose. Increasing quantities of this pigment are being used annually in making leaded zinc oxide. The amounts so used are included in the totals for leaded zinc oxide and excluded from the totals for basic lead sulfate to avoid duplication in reporting lead tonnages. In 1939, 7,700 tons of basic lead sulfate were used in making leaded zinc oxide compared with 7,000 tons in 1938 and 5,500 in 1937.

Distribution of basic lead sulfate sales, 1935-39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Paints	7,770	8,124	8,255	5,024	5,170
Rubber	155	126	213	91	140
Storage batteries		28	6	3	4
Other	374	144	148	683	224
	8,299	8,422	8,622	5,801	5,538

Red lead.—Total sales of red lead gained 32 percent over 1938, faring better in relation to that year than sales of other lead pigments. The principal use of red lead is in the manufacture of storage batteries, and 62 percent of the 1939 total was sold for that purpose. Paints consume the second largest quantity of red lead, and sales for this outlet gained in the same proportion as those for storage batteries.

Distribution of red lead sales, 1935-39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Storage batteries	17,657	20,323	20,275	19,057	24,709
Paints	8,721	11,786	10,440	8,698	11,421
Ceramics	867	807	854	655	1,123
Other	1,531	1,980	2,362	1,773	2,723
	28,776	34,896	33,931	30,183	39,976

Orange mineral.—Ink manufacture and color pigments have alternated as leading consumers of orange mineral. Ink manufacture led in 1939 and used 49 percent of the total sales reported.

Distribution of orange mineral sales, 1935–39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Ink manufacture	85	71	76	20	64
Color pigments	125	77	51	94	40
Other	42	100	79	13	27
	252	248	206	127	131

Litharge.—Sales of litharge made a good showing in 1939; they were 30 percent higher than in 1938 and 6 percent higher than the annual average for 1925–29. Leaded zinc oxide was the only other pigment covered in this report that exceeded its 1925–29 average in 1939. All uses of litharge showed noteworthy increases in 1939 except varnish and linoleum, which remained virtually stationary. Storage batteries, the principal use, took 44 percent of the total in 1939. Black oxide or suboxide of lead used by battery manufacturers reached a new peak of 45,000 tons compared with the previous record of 42,000 tons in 1937. Sales of black oxide are not included in Bureau of Mines totals for litharge. The preparation of lead oxide for use in storage batteries was the subject of a new patent issued in December (U. S. Patent 2,182,479). Since 1931 insecticides have been the second most important use of litharge. Sales for this purpose rose 40 percent in 1939 but were 10 percent below the record tonnage in 1937. The ceramics industry attained third place as a consumer of litharge in 1939, having displaced the oil-refining industry.

Distribution of litharge sales, 1935–39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Storage batteries	36,067	38,700	32,228	32,514	39,754
Insecticides	14,665	14,662	18,242	11,736	16,435
Ceramics	6,751	7,762	7,577	5,889	8,679
Chrome pigments	6,617	6,662	7,330	4,590	7,815
Oil refining	7,869	7,259	8,311	6,411	7,619
Varnish	1,610	4,247	3,366	2,449	2,428
Rubber	3,171	2,147	1,659	880	1,404
Linoleum	220	254	264	231	226
Other	2,960	4,553	4,925	4,011	5,158
	79,930	86,246	83,902	68,711	89,518

Zinc oxide.—Sales of zinc oxide advanced 45 percent in 1939—the greatest percentage gain of any of the lead and zinc pigments. Sales of this product, however, were only 74 percent of the annual average for 1925–29. The rubber industry takes most of the zinc oxide sold, and this use comprised 61 percent of the total in 1939. Consumption of zinc oxide in rubber rose 52 percent compared with increases of 21 and 34 percent, respectively, in paints and ceramics. Floor coverings and textiles regained part of the ground lost in 1938, when sales fell 66 percent, as consumption advanced 86 percent in 1939. Of the zinc oxide produced in 1939, 59 percent was made by the American process and 41 percent by the French process compared with 62 and 38 percent, respectively, in 1938. The proportion of French-process oxide made from scrap zinc rose sharply in 1939 to 49 percent of the total compared with 32 percent in 1938 and 25 percent in 1937. A large quantity of zinc oxide is used in the manufacture of leaded zinc oxide. This tonnage is included in the totals for leaded zinc oxide and is excluded from zinc oxide totals to avoid duplication in reporting zinc tonnages. The rubber and ceramic industries were introduced to a new pelleted type of zinc oxide during the year.[2]

Distribution of zinc oxide sales, 1935–39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Rubber	57,734	72,885	67,061	46,266	70,187
Paints	25,289	33,149	27,987	20,884	25,334
Ceramics	4,028	6,102	5,216	4,908	6,572
Floor coverings and textiles	7,179	7,178	9,019	3,030	5,641
Other	5,467	7,486	5,369	4,041	6,818
	99,697	126,800	114,652	79,129	114,552

Leaded zinc oxide.—The manufacture of paint uses virtually all (97 or more percent) of the leaded zinc oxide made. This pigment has become increasingly popular in recent years, and sales were at a record high level in 1939, exceeding the previous records established in 1936 and 1937 by 6 percent. The total for 1939 includes about 7,700 tons of basic lead sulfate used to increase the lead content of this product; this tonnage is excluded from basic lead sulfate totals to avoid duplication in reporting metal tonnages.

Distribution of leaded zinc oxide sales, 1935–39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Paints	29,632	40,156	39,584	37,348	41,519
Rubber	36	32	97		1
Other	308	324	662	868	1,164
	29,976	40,512	40,343	38,216	42,684

Lithopone.—Lithopone statistics are reported on the basis of the regular lithopone content of high-strength lithopone plus normal lithopone sold as such. Before 1936 the figures were on the basis of standard-strength plus high-strength product. The manufacture of paint, varnish, and lacquer has consumed about 80 percent of the total lithopone sold in recent years. Sales of lithopone gained 14 percent in 1939, but the quantities employed for paint and for floor coverings and textiles, the two largest uses, advanced proportionally less than the total. On the basis of somewhat incomplete information, separation of the quantities shown in the following table for floor coverings and textiles indicates that 14,000 tons were for linoleum and felt-base floor coverings and the rest for coated fabrics and textiles (oilcloth, shade cloth, artificial leather, and similar products). Other uses in 1939 included 2,407 tons for paper and 712 tons for printing ink. It was reported in midyear that a new lithopone plant of 12,000 tons capacity had been completed recently at Kutais, U. S. S. R., the second plant of the type in the country.

[2] Chemical and Metallurgical Engineering, vol. 47, No. 2, February 1940, p. 76.

Distribution of lithopone sales, 1935–39, by industries, in short tons

Industry	1935	1936	1937	1938	1939
Paints, etc	124,615	122,461	122,915	101,924	113,995
Floor coverings and textiles	19,440	23,085	20,194	15,400	17,429
Rubber	4,435	4,908	4,383	3,148	3,189
Other	10,996	7,865	7,279	5,274	8,146
	159,486	158,319	154,771	125,746	142,759

The use of ordinary-strength lithopone in the manufacture of titanated lithopone, which usually contains 15 percent TiO_2, has increased rapidly since the output of this product was begun. It declined, however, in 1938 and fell rather sharply in 1939, when 13,700 tons were used for this purpose compared with 17,000 tons in 1938 and 19,400 in 1937. These figures are included in Bureau of Mines totals for lithopone.

Zinc sulfide.—Production of zinc sulfide was reported by four plants in 1939, as in 1938, but since one producer dominates the industry, the Bureau of Mines cannot publish representative statistics. Most of the zinc sulfide is mixed with regular lithopone to make high-strength lithopone. Two patents on zinc sulfide were issued recently: United States Patent 2,175,273, purported to be an improved process for production of zinc sulfide, and United States Patent 2,187,130, which claims that zinc sulfide-containing pigments are rendered stain resistant by incorporating in them a minor quantity of relatively insoluble metallic thiosalt, such as thiocyanate, thiosulfate, and xanthate.

Zinc chloride.—Complete data on sales of zinc chloride are not reported to the Bureau of Mines, but returns from producers responsible for more than two-thirds of the output indicate the following distribution of sales by uses in 1939:

	Percent		*Percent*
Soldering flux	33	Oil refining	4
Dry-cell batteries	22	Others	9
Wood preserving	19		
Vulcanized fiber	13		100

Zinc sulfate.—The trend in sales of zinc sulfate was upward from 1932 to 1937, and a new high record was established in 1937. Sales fell in 1938 but in 1939 virtually equaled the record of 1937. Of the total sales in 1939 (10,157 tons), 3,897 tons were reported as sold to the rayon industry, 2,168 tons for agricultural purposes, 1,309 tons for chemical manufacture (including the medicinal trade), 583 tons to paint and varnish manufacturers, 556 tons to electrogalvanizers, and 172 tons for glue manufacture; 1,472 tons were undistributed. A break-down of the 1,472 tons under "undistributed" undoubtedly would increase the tonnages under some or all of the uses itemized.

RAW MATERIALS USED IN MANUFACTURE OF LEAD AND ZINC PIGMENTS AND SALTS

Lead pigments and zinc pigments and salts are manufactured from a variety of materials, including ore, refined metal, and such miscellaneous secondary materials as scrap and waste from various industrial processes. In 1939, 93 percent of the lead in lead pigments was derived from pig lead and 7 percent from ore. The proportions for zinc pigments in 1939 were 64 percent from ore, 13 percent from slab zinc, and 23 percent from secondary materials.

Metal content of lead and zinc pigments produced by domestic manufacturers, 1938–39, by sources, in short tons

Source	1938		1939	
	Lead in pigments [1]	Zinc in pigments	Lead in pigments [1]	Zinc in pigments
Domestic ore	12,025	68,168	15,171	83,829
Metal	[2] 163,815	15,760	200,390	17,169
Secondary material [3]		18,718		30,138
	[2] 175,840	102,646	215,561	131,136

[1] Includes also lead recovered in zinc oxide and leaded zinc oxide.
[2] Revised figures.
[3] Zinc ashes, skimmings, drosses, and old metal.

The following tables give the source of the metal used in the manufacture of each pigment and salt. Pig lead is employed exclusively, either directly or indirectly, in the manufacture of white lead, litharge, red lead, and orange mineral and is used also in the manufacture of basic lead sulfate. Zinc oxide is the only pigment in which considerable slab zinc is used. Ore is employed in the manufacture of zinc oxide, leaded zinc oxide, lithopone, zinc sulfate, and basic lead sulfate. A substantial proportion of the zinc in lithopone and zinc chloride made in the United States is derived from secondary material. There has been a decided increase in the quantity of secondary zinc consumed in the manufacture of zinc oxide since 1933. This material has displaced slab zinc in the manufacture of French process oxide.

Lead content of lead and zinc pigments produced by domestic manufacturers, 1938–39, by sources, in short tons

PRICES

The total values reported by producers for lead and zinc pigments and zinc salts are given in the tables in the first part of this report. The average values received for all important lead pigments increased from 1 percent for litharge to 25 percent for white lead in oil. On the other hand, while the average value for leaded zinc oxide rose 7 percent, that for zinc oxide remained unchanged and that for lithopone dropped 8 percent. The range of market quotations, as reported by the Oil, Paint and Drug Reporter, appears in the following table. Quoted prices for white lead were unchanged from November 1938 throughout 1939. Quotations for other lead pigments in general followed price changes in pig lead, moving upward after the middle of the year and standing at their highest levels at the end of the year. Prices for zinc pigments apparently were not influenced by price changes for the metal. Quotations for lead-free zinc oxide were stationary throughout 1938 and 1939; those for the 5–35 percent leaded grade ranged from 6.25 to 6.38 cents in 1939 compared with 5.90 to 6.38 cents in 1938. Quotations for lithopone and zinc sulfide showed a downward trend in the latter part of the year against the trend for most commodities. The average value reported by producers for zinc sulfate in 1939 was unchanged from 1938, but quotations for this product had a narrower range in 1939, both the low and high quotations coming between the extremes reported for 1938.

Range of quotations on lead pigments and zinc pigments and salts at New York (or delivered in the East), 1936–39, in cents per pound

Product	1936	1937	1938	1939
Basic lead sulfate, or sublimed lead, less than carlots, barrels	6.25- 6.75	6.50- 8.75	5.50- 6.50	6.25- 6.50

FOREIGN TRADE [3]

Imports of lead and zinc pigments remained virtually stationary, and exports almost doubled in value in 1939. The excess value of exports over imports amounted to $1,351,508 and was a little more than half the annual average for 1925–29. The value of imports of lead and zinc salts gained 16 percent in 1939, while the value of exports of lead arsenate, the only salt reported separately, increased 68 percent.

The following table shows the value of various pigments and salts imported and exported in 1938 and 1939.

Value of foreign trade of the United States in lead and zinc pigments and salts, 1938–39

	1938		1939	
	Imports	Exports	Imports	Exports
Lead pigments:				
White lead	$3,979	$190,795	$2,108	$275,311

Grand total	344,089	944,490	345,967	1,800,703

[1] Data not available.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Lead pigments and salts.—Imports of these commodities are insignificant. The most important item is the group of lead compounds, which include lead acetate, lead nitrate, and others, and imports of these compounds rose from 85 short tons in 1938 to 104 in 1939. Imports of suboxide of lead increased from 16 tons in 1938 to 20 in 1939.

Lead pigments and salts imported for consumption in the United States, 1935–39

Year	Short tons					Total value
	Basic carbonate white lead	Red lead	Litharge	Orange mineral	Lead compounds	
1935	6	1		2	302	[1] $38,228
1936	32	2	1	5	185	[1] 37,878
1937	34	1	(2)	5	213	[1] 53,984
1938	20	1	1	2	85	[1] 22,644
1939	11	2		1	104	[1] 28,248

[1] Includes also—1935: Lead pigments, n. s. p. f., $478 (4,405 pounds); 1936: Lead pigments, n. s. p. f., $19 (33 pounds), sublimed lead (basic sulfate) $9 (15 pounds), and suboxide of lead, n. s. p. f., $5,264 (39,010 pounds); 1937: Lead pigments, n. s. p. f., $8 (100 pounds), sublimed lead (basic sulfate), $2 (10 pounds), and suboxide of lead, n. s. p. f., $9,396 (55,453 pounds); 1938: Lead pigments, n. s. p. f., $198 (2,330 pounds), and suboxide of lead, n. s. p. f., $5,335 (31, 834 pounds); 1939: Lead pigments, n. s. p. f., $690 (5,270 pounds), and suboxide of lead, n. s. p. f., $6,620 (40,445 pounds).
[2] Less than 1 ton.

The principal exports are white lead and litharge, and these two items made proportionately large gains in 1939. Exports of red lead and lead arsenate also rose in 1939. The total value for exports of the items listed was $875,235 in 1939 compared with $605,075 in 1938. Exports of white lead, red lead, and litharge comprised 3 percent or less of domestic sales of these pigments.

White lead was exported principally to the Netherlands, Philippine Islands, and Canada, whereas the principal recipients of red lead and litharge were Canada, the Philippine Islands, and Argentina.

Lead pigments and salts exported from the United States, 1935–39

Year	Short tons				Total value
	White lead	Red lead	Litharge	Lead arsenate	
1935	2,337	750	1,280	578	$606,734

[1] Less than 1 ton.

Zinc pigments and salts.—Imports of zinc oxide and zinc chloride increased in 1939, while those of lithopone and zinc sulfate fell. Lithopone ranks as the most important zinc pigment imported, although imports of this commodity represented only 2 percent of domestic sales in 1939. Imports of zinc oxide (dry and in oil) totaled 1,551 tons, a gain over the 645 tons received in 1938.

Zinc pigments and salts imported for consumption in the United States, 1935–39

Year	Short tons						Total value
	Zinc oxide		Lithopone	Zinc sulfide	Zinc chloride	Zinc sulfate	
	Dry	In oil					
1935	1,932	59	4,603	16	564	135	$508,476
1936	694	96	4,781	30	520	385	425,493
1937	680	95	5,601	113	667	593	488,116
1938	579	66	3,932	12	272	392	321,445
1939	1,485	66	2,641	7	399	325	317,719

Exports of zinc oxide trebled in 1939 and were 3 percent of sales of lead-free zinc oxide by domestic producers. Shipments went principally to Canada, Brazil, and the Philippine Islands. Exports of lithopone jumped from 1,734 tons in 1938 to 4,845 tons in 1939 and amounted to 3 percent of sales of domestic manufacturers. More than half the total was shipped to Canada and smaller amounts to Mexico, Cuba, Chile, and other scattered nations.

GOLD, SILVER, COPPER, AND LEAD IN ALASKA

(MINE REPORT)

By Chas. W. Henderson

SUMMARY OUTLINE

Gold recovered from Alaska ores and gravels in 1939 totaled 676,737 fine ounces valued at $23,685,795, an increase of 2 percent over the 664,973 ounces valued at $23,274,055 in 1938, due to increased output from placer mines. The value of the gold in 1939 was 99 percent of the total gross value of the gold, silver, copper, and lead produced. Copper was produced in 1939 only as a byproduct of gold mining, and the output of recovered metal fell to 256,000 pounds from 29,098,000 pounds in 1938, when it came mostly from copper mines.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4].646+	.098	.046	.048
1939	35.00	[5].678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

[5] $0.67878787.

The following tables show the mine production of gold, silver, copper, and lead in Alaska in 1935–39 and 1880–1939 in terms of recovered metals; the output of gold and silver in 1939, by types of operation; and the output of gold, silver, copper, and lead from amalgamation and cyanidation mills (with or without concentration equipment) in 1939, by regions.

Mine production of gold, silver, copper, and lead in Alaska, 1935–39, and total, 1880–1939, in terms of recovered metals

Year	Gold (lode and placer)		Silver (lode and placer)	
	Fine ounces	Value	Fine ounces	Value
1935	469,495	$16,432,325	286,848	$206,172
1936	540,580	18,920,300	484,306	375,095
1937	627,940	21,977,900	494,340	382,372
1938	664,973	23,274,055	479,853	310,208
1939	676,737	23,685,795	201,054	136,473
1880–1939	23,700,593	542,535,357	19,179,467	13,643,173

Year	Copper		Lead		Total value
	Pounds	Value	Pounds	Value	
1935	15,500,000	$1,286,500	1,340,000	$53,600	$17,978,597

[1] Bureau of Mines not at liberty to publish details of copper production.

Gold.—The value of the gold output of Alaska in 1939 was 99 percent of the total gross value of the gold, silver, copper, and lead produced. The source of gold has been divided in this report into only three types of operations—placers using floating connected-bucket dredges; other placer operations, large and small; and lode mines. The output from dredges was by far the largest, followed in order by lode mines and by other placer mines. The increased output from floating connected-bucket dredges was due directly to the higher tenor of the gravel washed in 1939; gold recovered per cubic yard increased from 49 cents in 1938 to 54 cents in 1939. The yardage handled was virtually the same in both years. The output of gold from lode mines was 24,852 ounces less than in 1938; although three more mines were producing, the decline in output from three of the largest producers was great enough to effect a decrease in total production of lode gold. The steady increase in use of mechanical equipment—such as draglines, slackline scrapers, bulldozers, portable washing plants, pumps, and hydraulic machinery—caused the output from placer mines other than bucket dredges to increase 10,063 ounces over 1938. The wider use of mechanical moving equipment has lengthened the operating season for hydraulic miners by allowing them to prepare ground in advance by removing overburden formerly hydraulicked, by transferring some of the gold-bearing gravel into position for hydraulicking, and by removing tailings. Thus they can make more efficient use of available water, whether seasonal rain or run-off.

Silver.—All the silver produced in Alaska in 1939 was a byproduct of gold mining.

Copper.—The output of recoverable copper in Alaska in 1939 was negligible compared with that in 1938; the decline is attributable to abandonment in 1938 of the copper mines at Kennecott by the Kennecott Copper Corporation, owing to exhaustion of the ore bodies. The copper produced in 1939 was a byproduct of production at the gold lode mines.

Lead.—The bulk of the recovered lead output of Alaska in 1939 came from lead concentrates produced at the flotation mill of the Alaska Juneau Gold Mining Co. at Juneau.

MARKETS AND METALLURGY

More than 94 percent of the gold and nearly 50 percent of the silver produced from Alaska ores and gravels in 1939 were obtained in the form of gold-silver bullion, which was sold finally to the Seattle Assay Office and the San Francisco Mint. As there are no smelters or refineries in Alaska, all the remaining gold and silver produced and all the lead and copper were obtained from high-grade ore and concentrates shipped to smelters and refineries in the States, largely to the Tacoma (Wash.) and Selby (Calif.) smelters.

More than 175,000 ounces of fine gold were handled in 1939 by banks and bullion buyers throughout the Territory. The gold-silver bullion was either sent direct to the mints or cast into bars for shipping; in many instances the banks acted merely as agents for the lode and placer operators. The six largest purchasers (or agents) of bullion (handling over 165,000 fine ounces of gold) were: The First National Bank of Fairbanks, Fairbanks; the Miners and Merchants Bank of

Alaska, Nome; the Miners and Merchants Bank of Iditarod, Flat; the First National Bank, Anchorage; and the Northern Commercial Co. and the Seattle First National Bank, Seattle, Wash.

Sixty-three mines in Alaska in 1939 were equipped with amalgamation or cyanidation plants, ranging in daily capacity from 1 ton to 12,000 tons; of these, 22 were equipped also with flotation, table, or jig concentrators. Seven properties were equipped with straight concentration mills, chiefly flotation. Virtually all the lead concentrates produced in 1939 were obtained from concentration by flotation of the dry gold ore of the Alaska Juneau Gold Mining Co. property at Juneau. Most of the copper came from copper concentrates produced by the Alaska Gold and Metals Co. in Southeastern Alaska. Concentrates obtained from the amalgamation-concentration and cyanidation-concentration mills averaged 8 ounces of gold and 23 ounces of silver to the ton and were shipped chiefly to the Tacoma (Wash.) plant; concentrates from the straight concentration mills averaged 7 ounces of gold and 14 ounces of silver to the ton. Dry gold ore shipped direct to smelters averaged 6 ounces of gold and 1 ounce of silver to the ton. Mill heads averaging more than 1 ounce of gold to the ton were not uncommon.

The United States Assay Office at Seattle, Wash., reports the following receipts from Alaska in 1939.

Bullion of Alaskan origin deposited at United States Assay Office, Seattle, Wash., during year ended December 31, 1939, in fine ounces

District	Gold	Silver	District	Gold	Silver
Circle	17,652.677	1,764.97	Kuskokwim	26,139.579	3,110.06
Cook Inlet	50,255.140	5,273.77	Nome	96,702.422	10,741.95
Copper River	5,140.968	684.69	Southeastern Alaska	119,597.820	24,180.40
Eagle	6,243.471	1,177.67	Tanana [1]	228,437.485	36,658.44

Koyukuk	1,600.159	179.02		605,274.556	91,650.60

[1] Includes mainly Bonnifield, Fairbanks, Hot Springs, Kantishna, and Tolovana districts in the Yukon Basin region.

REVIEW BY REGIONS

Cook Inlet-Susitna region.—The Cook Inlet-Susitna region—comprising the Prince William Sound, Valdez Creek, Willow Creek, and Yentna-Cache Creek districts—produced 19 percent of the total gold output from Alaska lode mines in 1939.

Again, in 1939, the Alaska-Pacific Consolidated Mining Co. at Wasilla, operating the Independence and Martin mines, was the largest producer of lode gold in the Cook Inlet region and second-largest in Alaska. The company 100-ton amalgamation-flotation mill has been operated continuously since its completion in 1937. The mill and 110-hp. Diesel power plant are on the west branch of Fish-Hook Creek 26 miles west of Wasilla. The ore is brought to the mill from the mine by a ¼-mile aerial tram; 23,808 tons of crude ore averaging 1.12 ounces of gold to the ton were milled in 1939. Of the total gold produced during the year, 86 percent was obtained in the form of gold amalgam, which was retorted and sent to the Seattle Assay Office; the remainder was contained in 485 tons of gold concentrates averaging 7.05 ounces of gold to the ton. The over-all recovery in the mill was 95.44 percent. Development work consisted of 7,500 feet of drifts, 2,000 feet of tunnel, 400 feet of shaft, and 1,961 feet of diamond drilling. A 1,000-cubic foot compressor, a 100-kw. generator and motor, a 40-ton ball mill, and two Diesel power units were installed in 1939, bringing the total power available at the operation to 335 hp.

The Conwest Exploration Co., operating the Willow Creek mines in the Willow Creek district, was the second-largest producer of lode gold in the Cook Inlet-Susitna region in 1939. A ½-mile aerial tram brings the crude ore (carrying free gold, pyrite, and arsenopyrite) from the mine to the 40-ton amalgamation-flotation-cyanidation mill. During the year 10,526 tons of ore averaging 0.71 ounce of gold to the ton were separated into jig and flotation concentrates; the jig concentrates were amalgamated, and the flotation concentrates were cyanided. The tailings (averaging 1.25 ounces of gold to the ton) from the cyanide operation were shipped to the Tacoma (Wash.) smelter. Much development work was done. A new level, called the 725th, was opened up; several new shoots of ore were opened on the strike of the vein.

Rapp & Till continued in 1939 to re-treat impounded tails from the old Gold Bullion mine of the Willow Creek Mines Co. in the 35-ton cyanide plant erected on the property in 1938. The precipitates were refined at the mill, and bullion was shipped to the Seattle Assay Office.

Among the other leading lode producers in the Cook Inlet-Susitna region making notable output in 1939 were: The Fern Gold Leasing Co., the Gold Cord Development Co., Mabelle Mines, Inc., and Donan Mines, Inc., all operating in the Willow Creek district.

There were no floating connected-bucket dredges operating in the Cook Inlet-Susitna region during 1939. Several operators using hydraulic giants, dragline excavators, and portable washing plants made sizable production. Gravels from streams and benches in the Yentna-Cache Creek district yielded most of the placer gold output. One of the leading operators using mechanical equipment in the mining of placer gravels was the Spokane Peters Creek Co., placering on Peters Creek in the Yentna-Cache Creek district. A Bucyrus dragline equipped with a 1½-cubic yard bucket was used as the prime mover of the prethawed gold-bearing gravel. About 100,000 cubic yards of gravel were washed during the 60 days of active operation, and the gold was concentrated in a portable washing plant. Other placer operators using mechanical equipment and making production worthy of note were: The Dutch Creek Mining Co., hydraulicking stream gravels on Dutch Creek in the Yentna-Cache Creek district; and C. A. Devault, placering on Pass Creek in the Fairview district.

Copper River region.—The value of the gold, silver, copper, and lead produced in the Copper River region—including the Chistochina, Nabesna, Nelchina, and Nizina districts—showed the largest decrease in any region of Alaska in 1939. The value of copper production was negligible compared with 1938, owing to abandonment of the copper properties of the Kennecott Copper Corporation at Kennecott and the greatly curtailed output of the Nabesna Mining Corporation properties at Nabesna. In 1938 the tonnage of copper concentrates shipped from the Nabesna mine to Tacoma for treatment contained nearly half of the gold production of the region, but in 1939 such output was less than half of that in 1938. The Yellow Band Gold Mines, operating the Yellow Band group of lode claims in the Nizina district, carried on development and test milling work during the year; roads, a transmission line, and a cable tramline from the mine to the mill were among the improvements.

There were no floating connected-bucket dredges operating in the Copper River region in 1939. Gold recovered from placer gravels came from hydraulic, sluicing, and dragline operations throughout the region. One of the leading producers of gold from gravels was Joshua Green Associates, operating a hydraulic plant on Dan Creek about 20 miles south of McCarthy in the Nizina district; between May 19 and September 20 six hydraulic giants sluiced 172,000 cubic yards of gravel and recovered 1,365 ounces of gold about 0.903 fine. Among other principal producers were: The Slate Creek Placers, Inc., working on Slate Creek in the Chistochina district; Chititu Mines, hydraulicking on Chititu Creek in the Nizina district; and A. C. Baldwin, lessee of claims on Rex Creek in the Nizina district.

Kenai Peninsula region.—In the Kenai Peninsula region—including the Girdwood, Moose Pass-Hope, and Nuka Bay districts—lode mines contributed the bulk of the gold and silver output in 1939. Gold recovered from lode operations was chiefly in the form of gold-silver bullion shipped to the Seattle Assay Office; some high-grade dry gold concentrates were shipped to the Tacoma smelter from the amalgamation-concentration mills. The leading producers from lode mines were: The Crown Point Mining Co., operating the Crown Point mine; United Mining & Development Co., operating the Gilpatrick lode; and R. B. McEachern, operating the Alaska Oracle—all in the Moose Pass-Hope district; and the Crow Creek Gold Corporation, operating the Monarch mine in the Girdwood district.

There were no floating connected-bucket dredges in the region in 1939. The placer output came from small placers throughout the region; production was slightly less than the lode output.

Kodiak Island region.—The output of metals from Kodiak Island during 1939 came almost entirely from small placer operations on beaches and streams.

Kuskokwim region.—Placer gravels handled by three floating connected-bucket dredges yielded most of the gold and silver produced in 1939 in the Kuskokwim region, which includes the Goodnews Bay, Nixon Fork, and Tuluksak-Aniak districts. Operations began about June 1 and ended about November 15.

The dredge operated by the Bristol Bay Mining Co. on Watamuse Creek in the Goodnews Bay district made the largest output of gold in the region in 1939; the W. W. Johnson Co. manufactured the dredge, which is fuel oil-powered and equipped with sixty-four 2½-cubic foot buckets. Dredging operations began June 2 and ended November 11; during this period 331,000 cubic yards of gravel averaging $1.23 per cubic yard in recovered gold were washed.

In the Tuluksak-Aniak district the New York Alaska Gold Dredging Co., second-largest producer of gold in the region in 1939, operated its two floating connected-bucket dredges (one 2-cubic foot and one 4-cubic foot), handling approximately 882,000 cubic yards of gravel.

Nearly 1,000,000 cubic yards of platinum-bearing gravel were dredged by the Goodnews Bay Mining Co. in 1939. The dredge, with ninety-two 8-cubic foot buckets and powered by a Diesel electric plant, has been in operation two full seasons. The platinum output from the dredge and from a 1¼-cubic yard Bucyrus dragline owned and operated by the same company was slightly less than in 1938.

The recovery of gold from placer operations using mechanical equipment other than floating connected-bucket dredges was maintained in 1939 at virtually the same level as in 1938. Three of the largest operations in the region recovered approximately 6,860 fine ounces of gold from about 400,000 cubic yards of gravel. The season began May 15 and terminated about October 15.

Among other large placer operators making notable output in 1939 were: The Marvel Creek Mining Co., on Marvel Creek and Solomon River in the Tuluksak-Aniak district, which used a Bucyrus 1¼-cubic yard dragline, a D–8 caterpillar bulldozer, and six hydraulic giants as excavators and washed 150,000 cubic yards of gravel; the Goodnews Bay Mining Co., on a stream and bench deposit in Snow Gulch, tributary of the Arolic River, which was equipped with a portable washing plant and excavated with a 1¼-yard Bucyrus Diesel-powered dragline and bulldozer; and the Kow Kow Mining Co., which recovered gold from a stream deposit on Kow Kow Creek 35 miles north of Goodnews Bay with a washing plant, supplied with gold-bearing gravel by a 1¼-yard P & H dragline.

Gold production from lodes was less in 1939 than in 1938 and was small compared with that from placers. The leading producer from lode deposits was Mespelt & Co., operating the Nixon Fork mine in the Nixon Fork district.

Northwestern Alaska region.—Mining in the Northwestern Alaska region—comprising the Kiana and Shungnak districts and covering the area of the Kobuk River Valley—was confined almost entirely to small placer operations in 1939.

Seward Peninsula region.—In the Seward Peninsula region, comprising all the area of the Seward Peninsula, floating connected-bucket dredges were the leading producers of gold and silver in 1939; of the total output of gold from dredges in Alaska during the year, the 21 dredges in the Seward Peninsula produced 26 percent and increased their output by 2,617 fine ounces over 1938. The average tenor of the gold-bearing gravel handled in 1939 increased 5 cents per cubic yard to an average of 47 cents in value of recovered gold. One less dredge was active than in 1938, but the higher tenor of the gravel resulted in a slightly increased output of gold. The active dredging season started during the latter part of May and, in rare instances, lasted until November 15. Preparation of the ground for active dredging was carried on by most of the operators well in advance of the dredges; in some instances this preparatory work was continuous throughout the year.

The United States Smelting, Refining & Mining Co. in the Nome district, operating three electrically powered Yuba dredges (one with 112, one with 103, and one with 78 9-cubic foot buckets) was the largest producer in 1939 in the Seward Peninsula region. The open dredging season began May 28 and lasted through November 16, during which time more than 3,100,000 cubic yards of gravel were washed. The gold output from these three dredges was slightly greater than in 1938, owing to the higher grade of the gravel handled, as the total quantity of gravel was about 400,000 yards less than in 1938. Preparatory work on additional tracts of land was carried on in advance of actual dredging. The Thirty-fourth Annual Report of the United States Smelting, Refining & Mining Co. for the year ended December 31, 1939 (dated March 14, 1940), says—

> At Nome, Alaska, dredge No. 2 started on May 28, 1939, and all three dredges were in operation by June 17, continuing until about the middle of November, an aggregate of 483 dredging days compared with 468 in 1938. Yardage dredged was a little less than in 1938 but value per yard slightly more, the net result being a small increase in the amount of gold recovered. Plans for the installation of a fourth deep-digging dredge are completed, and this dredge will be ordered in 1940 for operation in 1941.

On Candle Creek in the Fairhaven district the Arctic Circle Exploration, Inc., operated two dredges, each with seventy 4-cubic foot buckets (one dredge electrically powered and one Diesel-powered) and was the second most important producer of placer gold in 1939. Active dredging began June 19 and continued through October 6, during which time 733,030 cubic yards of gravel were washed and 13,509 crude ounces of gold about 0.856 fine were recovered. The total output of gold was 1,648 fine ounces more than in 1938. Preparatory work on the 5,000 acres of placer ground owned or controlled by the company was kept well in advance of actual dredging operations.

In the Kougarok district of the Seward Peninsula two dredges were active during the 1939 season. The more productive was the Diesel-powered Yuba dredge equipped with fifty-four 3-cubic foot buckets, owned by the Fox Bar Dredging Co., which dredged 302,540 cubic yards of gravel averaging 40 cents per cubic yard in recovered gold between June 28 and October 11. The Kougarok Consolidated Placers, Inc., operated a Washington Iron Works Diesel-powered dredge equipped with eighty 2¼-cubic foot buckets from June 20 to September 1.

In the Koyuk (Saint Michael) district the Ungalik Syndicate, using a Diesel-powered dredge equipped with seventy-five 3½-cubic foot buckets, handled 200,000 cubic yards of gravel in 1939 during the open dredging season of approximately 100 days; this dredge was the most productive in the district. The Dime Creek Dredging Co., operating a gasoline-powered flume dredge equipped with twenty-nine 1½-cubic foot buckets, washed about 10,000 cubic yards of gravel averaging $1.26 in recovered gold per cubic yard; the dredge was active only 45 days.

Among the other operators of floating connected-bucket dredges in 1939, the following made production worthy of note: The Alaska Placer Dredging Co. (formerly the North Star Dredging Co.), operating in the Council district; Alaska Sunset Mines, Inc., in the Nome district; Casa de Paga Gold Co., operating a fuel oil-powered dredge equipped with fifty-two 1¼-cubic foot buckets, in the Nome district; Bartholomae Oil Corporation, operating with thirty-one 2¾-cubic foot buckets, in the Port Clarence district; and Lee Brothers Dredging Co., operating on Solomon River in the Solomon district.

General increases in 1939 in gold output by placer operators using equipment other than floating connected-bucket dredges were noted throughout most of the districts in the Seward Peninsula region. Rainfall was about normal, thus permitting regularity in hydraulic operations; owing to the steadily increasing use of draglines and bulldozers the seasonal rainfalls are losing their importance as a major factor in determining the length of the mining season. In most operations using draglines, bulldozers, and slackline scrapers the season is from break-up to freeze-up. The average length of the season for operators not using floating connected-bucket dredges was about 120 days for all mines mechanically equipped, except for hydraulic miners, whose average was from 10 to, in some instances, 30 days less.

The Arctic Circle Exploration, Inc., operating in the Fairhaven district, hydraulicked 178,000 cubic yards of gravel between June 1 and October 1 and recovered 43 cents in gold per yard; 100,000 yards of tailings were removed during the same period by a 1½-yard Diesel-powered Northwest dragline.

In the Kougarok district three hydraulic plants sluiced 351,496 cubic yards of gravel in 1939, recovering 84 cents per yard in gold; draglines were used to remove the tailings from the sluicing operation.

In the Nome district operators of two drift mines received $27,428 in 1939 for gold obtained from sluicing approximately 8,250 cubic yards of gravel.

Lode mining in the Seward Peninsula region in 1939 yielded less than 1,500 ounces of fine gold.

Southeastern Alaska region.—Southeastern Alaska—covering the Admiralty Island, Chichagof Island, Hyder, Juneau, Ketchikan, and Windham Bay districts—produced 70 percent of the total output of lode gold from Alaska in 1939 and most of the silver, copper, and lead. During the year there were 21 active or developing mines in operation; by far the largest producer of gold, silver, and lead was the Alaska Juneau Gold Mining Co. at Juneau. The Twenty-fifth Annual Report of this company for the year ended December 31, 1939 (dated February 29, 1940), says—

The gold assay value of the ore mined in the year 1939 was less by 16 cents per ton than the corresponding figure for the preceding year. This falling off in gold content reduced the operating profit before deduction for depreciation and depletion to $1,565,169.22. The first 6 months of the year made the poorest showing, for during this time operations in the Perseverance section were being tied in and coordinated with the operations as a whole. While the temporary dislocation in the smoothness of operation was being overcome, and passed, each succeeding quarter of the year showed improvement over the preceding quarter. The Perseverance section is now producing about 50 percent of the total tonnage output, and the expectations are for an improvement in the gold content of the total ore mined and milled during the coming year.

During the past 4 years, the exploratory, development, and preparatory mining work in the Perseverance section has brought the production from that section up from 1.37 percent in 1936 to 43.67 percent of the total mine output in 1939. At present six stopes in the Perseverance are producing, and preparatory work for six additional stopes is under way or programmed. Exploratory work is also planned for the easterly portion of the area of which there is little knowledge at this time.

Work done in the deep levels was routine, no change of importance occurring there. Work for bringing in three additional stopes is well under way and exploratory work continues for delimiting the ore laterally and in depth; however, there is now little evidence that further work below the present bottom level is justified.

In the annual report for the year 1932 there appeared a statement showing developed ore reserves sufficient for about 13 years' operations at the present rate of production. After 7 years have elapsed there are still about 10 years of developed reserves in those portions of the mine where development and exploration work is more or less complete.

Development work and stope preparation were carried on during the year at the same rate as in the previous year; 4,648,060 tons were trammed from mine to mill in the year 1939, of which 2,029,920 tons or 44 percent came from the Perseverance section.

Four days regular operating time were lost on account of a rock and mud slide, caused by continued wet weather and heavy rains. This slide took out some track and snowshed between the mine and the mill and necessitated stopping tramming and milling until the slide was cleared away and the track was repaired. The amount of damage done, other than lost time, was not large.

Development and preparatory work in the Perseverance section was continued at about the same rate as in the previous year. A compressor of 1,500-cubic-foot capacity was installed at the bottom of the Perseverance Shaft to supplement the compressed-air supply in this part of the mine.

Owing to the fact that the ore zone is not as wide in the Perseverance section as in the Alaska Juneau South Orebody, the cost of development and preparatory work per ton mined will be more; and the production per unit of development and preparatory work will be somewhat less.

The first half of the year was spent in further outlining the ore on the Nos. 11, 12, and 13 levels in the vicinity of 53 winze. In the last half of the year a pilot drift was driven on No. 13 level to a point under the Main Shaft, and raising to connect with the Main Shaft was begun. When this raise is connected to the Main Shaft, the shaft will be enlarged to its full size to a point below the No. 13 level, which is 1,500 feet vertically below the Gold Creek Tunnel level. While the Main Shaft is being constructed, preparatory work in the orebody between No. 12 level and No. 10 level in the vicinity of 53 winze will be carried on from 53 winze so that when the shaft and haulageway on No. 13 are completed a stope will be ready for production.

During the year 440,450 pounds of powder were used in blasting powder drifts, 28,300 pounds were used in blasting long hole drill stations, making a total of 468,750 pounds of powder for primary breaking, or 0.10 pound per ton trammed. Total powder consumption for mining was 0.32 pound per ton trammed as against 0.36 pound in 1938 and 0.40 pound in 1937.

Mill.—Experimental work on flotation of rougher table tailings, mentioned in last year's report, was carried to a point where it was demonstrated that it was not practicable to treat the coarser portion of the tailings without regrinding. Additional tube mills have been installed so that the rougher middlings may be reground. At the present time the mill is so equipped that approximately one-half of the ore milled will be treated by flotation, either as slimes or reground middlings.

During the year 634,419 tons of slimes and 275,975 tons of reground middlings were treated by flotation, while 286,590 tons of slimes were discarded as thickener overflow. The installation of the regrinding mills was not completed until shortly after the end of the year.

The fine tailings pumping plant installed in 1937 continues to work satisfactorily. During the current year some money was spent in relocating the public road so that the full use of this plant and its accompanying flume may be had.

As during the past few years, there was an abundance of unskilled labor available. The number of skilled miners applying for work was, however, limited.

Last year's adjustment of wages to conform with the Wage-Hour law continued in effect until October of this year, when an adjustment was again made. The average wage per day was $6.63 in 1939 as against $6.55 in 1938.

Except in a few cases of isolated power-plant operators and hoistmen, where it is not practical to continually change, the men worked 6 days per week, overtime being paid in accordance with the Wage-Hour law. The men who work 7 days per week are also paid overtime for all time in excess of 42 hours per week.

The over-all cost per man per day was $11.22, which is the same figure as for the previous year.

Power plants.—Maintenance of plants and transmission lines together with some minor improvements continued as usual. Owing to the lateness of the summer season, progress on moving the Annex Creek line was not as great as had been expected. Material progress was made on this item, however. The work will be continued in the summer of 1940.

While no large items of improvement are contemplated at this time, the six hydroelectric plants and the connecting power lines have been installed for 25 years or more, and the cost of repairs and renewals from now on will be greater than in the years following their installation.

Gold content of ore from Alaska Juneau mine, 1935–39, and total, 1893–1939

Year	Rock to mill from mine (tons)		Gold (ounce)				
			Recovery per ton fine-milled		Losses per ton of tailings		Content of rock from mine to mill
	Ore fine-milled	Coarse tailings rejected	In bullion	In galena concentrates	Fine	Coarse	
1935	2,091,475	1,638,185	0.0533	0.0035	0.0108	0.0078	0.0413
1936	2,462,046	1,904,754	.0544	.0061	.0089	.0069	.0422

[1] Lost in tailings.

The Hirst-Chichagof Mining Co., operating the Hirst-Chichagof mine in the Chichagof Island district, was the second-largest producer of gold and silver in the region in 1939. About two-thirds of its output was in the form of gold-silver bars shipped to the Seattle Assay Office; the remainder came from dry gold concentrates (of which it was the largest producer in the region) shipped to Tacoma.

Copper concentrates from gold-palladium ore mined by the Alaska Gold and Metals Co. yielded most of the copper output of Alaska in 1939; the concentrates were shipped to the Tacoma smelter.

Other important producers from lode mines in the region in 1939 were: The Chichagof Mining Co., shipping dry gold concentrates from ores of the Chichagof mine in the Chichagof Island district; Nelson & Tift, working the N & T mine in the Ketchikan district; the Flagstaff Mining Co., operating the Treasurer group in the Ketchikan district; and the Alaska Empire Gold Mining Co., working the Williams mine in the Admiralty Island district.

Yukon River Basin region.—The Yukon River Basin—comprising the Bonnifield, Chandalar, Chisana, Circle, Eagle, Fairbanks, Fort Gibbon, Fortymile, Hot Springs, Iditarod, Innoko, Kantishna, Koyukuk, Marshall, Rampart, Richardson, Ruby, and Tolovana districts—yielded 66 percent of the total output from connected-bucket dredges in Alaska during 1939. It ranked second in gold recovered from other placers and third in that from lode mines.

Nineteen floating connected-bucket dredges were active in the region in 1939. During the open season, which began about March 15 and terminated December 1, approximately 12,851,000 cubic yards of gold-bearing gravels were washed, with an average recovery in gold of 55 cents per cubic yard, an increase of 3 cents over 1938. Preparatory work was done in some instances throughout the entire year.

The United States Smelting, Refining & Mining Co., operating six floating connected-bucket dredges in 1939 in the Fairbanks district—two 10-cubic foot electrically driven Bethlehem dredges (with 111 and 93 buckets, respectively), three 6-cubic foot electrically driven Bethlehem dredges (with 78, 78, and 68 buckets, respectively), and one shallow-digging 3-cubic foot Yuba dredge (with 68 buckets)—was by far the largest producer of gold and silver in the Yukon Basin region. These six dredges handled a slightly greater yardage of gravel than in 1938 and of approximately the same grade, resulting in a slight increase in recovered gold in 1939. Especially worthy of note are the new installations brought into use during the 1939 season for clearing large tracts of land for future dredging. The principal items of this installation include an enormous walking dragline of the Bucyrus type; a belt-conveyor system 1 mile or more long; and a large movable and self-propelling loading plant that receives material from the 8- and 12-cubic yard buckets of the dragline and delivers it in a steady stream to the belt-conveyor system. This installation is being used at the company open pit on Cripple Creek. The Thirty-fourth Annual Report of the United States Smelting, Refining & Mining Co. for the year ended December 31, 1939 (dated March 14, 1940), says—

At Fairbanks, Alaska, dredging operations started for the season on March 15, 1939, and continued until about the first of December. The six dredges aggregated 1,462 dredging days, compared with 1,453 in 1938, and handled a slightly greater yardage of gravel of approximately the same grade. On the new area mentioned in previous reports the installation of the dragline and conveyor was completed and the removal of the upper barren gravels commenced during the latter part of the season. A new dredge is being erected and should be ready to start work on the underlying pay gravels in this area about the middle of the 1940 season. Another newly acquired small dredge will start work on an outlying area during 1940.

At both the Fairbanks and Nome fields preparation of ground has been actively carried on with the result that at the present there is a greater yardage of thawed ground ahead of the dredges than has been the case in any previous year. Acquisition and development of additional dredging ground has been going on steadily, and the known gold reserves at the end of 1939 are greater than at any time in the past.

In the Circle district more than 1,000,000 cubic yards of gravel were washed by three floating connected-bucket dredges, making this district second in importance in the region in recovery of placer gold in 1939. Gold Placers, Inc., recovered the largest quantity of gold in the district, using a W. W. Johnson Co. type of Diesel-powered dredge equipped with sixty 4-cubic foot buckets; 393,700 cubic yards of gravel were handled between May 30 and October 15. The second-largest quantity of recovered gold came from operations of the steam-driven flume-type dredge equipped with sixty 3-cubic foot buckets and operated by the C. J. Berry Dredging Co. on its Mammoth Creek properties; during the open season (May 15 to October 18) 271,000 cubic yards of gravel were dredged. Dredging was carried on at Woodchopper Creek by Alluvial Golds, Inc., which used a W. W. Johnson

Co. type of Diesel-powered dredge equipped with seventy-two 4-cubic foot buckets.

The American Creek Operating Co., Inc., mining on American Creek, operated the only dredge active in the Hot Springs district in 1939. Dredging began June 10 and ended October 1; during this period the Diesel-powered Yuba dredge, equipped with 2½-cubic foot buckets, handled 187,038 cubic yards of gravel from which 4,002 ounces of fine gold were recovered.

In the Iditarod district the North American Dredging Co., operating a fuel oil-powered dredge equipped with sixty-one 3½-cubic foot buckets, and the J. E. Riley Investment Co., using a Diesel-powered dredge of Union type, equipped with fifty-eight 3½-cubic foot buckets, washed more than 550,000 cubic yards of gravel during the 5 months of open season beginning about June 1.

A new type of floating dredge was installed by the Triple X Placers Co. and was engaged actively during the 1939 season in recovery of gold in the Bonnifield district near Ferry. Instead of the conventional bucket line, a single dipper similar in type to that of a power shovel is employed for excavating. The dipper is mounted on a steel framework at the digging end of the dredge in such a manner as to permit it to be elevated to an angle that allows the gold-bearing gravel to be discharged into a trommel screen on the floating washing plant. The washing plant and stacker unit are similar to those used on light-weight dredges. The output of recovered gold during 1939 compared favorably with recoveries by floating connected-bucket dredges using up to 3½-cubic foot buckets.

Among other floating connected-bucket dredges in the region recovering quantities of gold in 1939 worthy of note were: The Holky Dredging Co. and Nels J. Vibe, both in the Innoko district; the Nome Creek Mining Co., in the Circle district; the Boundary Dredging Co., operating on Canyon Creek, in the Fortymile district; and North American Mines, Inc., dredging on Jack Wade Creek, also in the Fortymile district.

The second most productive source of gold in the Yukon Basin region in 1939 was the many placer mines—other than floating connected-bucket dredges—throughout the area. In most of the region water supplies in the early part of the open season were inadequate to insure continuous work for all operators; later, seasonal rains relieved this situation. Additional draglines, hydraulic giants, bulldozers, slack-line scrapers, and water pumps were installed in most of the districts of the region, especially in the Fortymile, Fairbanks, Innoko, Koyukuk, Ruby, and Tolovana districts. The open season, beginning about May 1 to 15 and lasting in some rare instances to December 1, was about normal. Most of the gold recovered from small placer operations in the region was shipped by bullion buyers, principally the First National Bank of Fairbanks, either as agents or purchasers.

In the Bonnifield district three hydraulic operators washed about 60,000 cubic yards of gravel in 1939 with an average recovery of 34 cents in gold per cubic yard; hydraulicking began about May 2 and continued intermittently until about September 15.

In the Chisana district two hydraulic plants, beginning work about May 15 and ending about September 1, washed about 26,000 cubic yards of gravel, with an average in recovered gold of 55 cents per cubic yard.

Among the principal producers in the Circle district in 1939 was the Mastodon Mining Co., which operated a hydraulic plant, with a Bucyrus Diesel-powered 1½-cubic yard dragline and two RD-8 tractors as auxiliary equipment; 259,960 cubic yards of gravel were hydraulicked during the open season, May 29 to September 29. Johnston, Blondo & Co., using a Diesel-powered dragline and an overhead sluice, washed approximately 84,000 cubic yards of gravel which netted $76,284 in gold-silver bullion during 84 days of operation; two hydraulic giants also were employed in this operation.

In the Fairbanks district three operators, using hydraulic, dragline, and bulldozing equipment in 1939, washed approximately 100,000 cubic yards of gold-bearing gravel which netted $88,656 in recovered gold. The Deadwood Mining Co., sluicing gravels on Deadwood Creek near Circle Springs, employed two N. W. fuel oil-powered draglines with 1½- and 2¼-yard buckets.

L. McGee, owner of 1,600 acres of placer ground 21 miles east of Hughes on Utopia Creek in the Fort Gibbon district, used a 1¼-cubic yard dragline and three caterpillar bulldozers, all Diesel-powered, in recovering 1,383 fine ounces of gold from about 142,000 cubic yards of gravel in 1939.

The Central Development Syndicate, working in 1939 on Jack Wade Creek in the Fortymile district, removed 97,000 cubic yards of muck, sluiced 73,200 cubic yards of gold-bearing gravel during the open season, and recovered gold which netted $65,777. Prime movers of the gold-bearing gravel and the muck were two Diesel-powered caterpillar bulldozers; the gravel was treated in a washing plant.

In the Hot Springs district three operators sluiced 45,333 cubic yards of material in 1939, recovering gold for which $29,026 was received; hydraulic giants, bulldozers, and draglines were used in moving the gravel.

In the Innoko district 3 draglines (two 1¼-cubic yard and one 1-cubic yard), a slackline scraper (one 1-cubic yard bucket), 6 bulldozers (Diesel-powered caterpillar tractors), and 17 hydraulic giants, owned and operated by four different partnerships, removed overburden and allowed sluicing in 1939 of 342,730 cubic yards of gold-bearing gravel averaging 57 cents per cubic yard in recovered gold. Three Miners, Inc., controlling 440 acres of placer ground on the Innoko River, recovered 1,361 ounces of fine gold from 112,730 yards of gravel from May 21 to October 23; equipment comprised a Bucyrus-Erie Diesel-powered dragline, a fuel oil-powered caterpillar tractor bulldozer, a fabricated hydraulic giant, and a washing plant.

The operation of N. R. Hudson on Olive Creek in the Tolovana district is typical of the wide use to which bulldozing tractors and draglines are put in the recovery of gold from placer gravels. During the 1939 season (May 1 to the latter part of September) approximately 76,000 cubic yards of gravel averaging about $1 per cubic yard in recovered gold were handled by two bulldozers (International–40), a ½-yard gasoline-powered dragline, and four 3-inch hydraulic giants; the bulldozers were used for general utility work, and the dragline was used to dispose of the tailings from the sluice boxes. An International pumping unit run by a 100-hp. motor supplied or added to the necessary head or water pressure on the giants.

Other placer operators in the region recovering quantities of gold in 1939 worthy of note were: The Berry Holding Co., hydraulicking on

Eagle Creek in the Circle district; Alder Creek Mining Co., operating on Alder Creek in the Fairbanks district; Cleary Hill Mines Co., operating on Tofty Creek in the Hot Springs district; Northland Development Co., working on Willow Creek in the Iditarod district; Olson & Co., operating on Happy Creek in the Iditarod district; Eric Hard and partners, on Ophir Creek in the Innoko district; Awe Mining Co., Peter Miscovich, and the Moore Creek Mining Co., all with headquarters at Flat; Long Creek Mining Co., working on Long Creek in the Ruby district; and Wilbur Mines, operating on Wilbur Creek in the Tolovana district.

The Yukon Basin region ranked third in importance in Alaska in 1939 in output of lode gold; it produced 19,572 fine ounces of gold and 5,514 fine ounces of silver, principally in the form of gold-silver bullion shipped finally to the Seattle Assay Office; some high-grade dry gold concentrates were shipped to the Tacoma smelter. The leading producers from lode mines in the region were: The Cleary Hill Mines Co., operating the Cleary Hill mine; the Hi Yu Mining Co., with a 50-ton amalgamation-flotation mill at the Hi Yu mine; and the United States Smelting, Refining & Mining Co., operating the old McCarty property—all in the Fairbanks district; and the Red Top Mining Co., operating the Red Top mine in the Kantishna district.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN ARIZONA

(MINE REPORT)

By T. H. Miller and Paul Luff

SUMMARY OUTLINE

The total value of the recoverable metal output from mines in Arizona was $72,616,408 in 1939 compared with $58,358,401 in 1938, an increase of more than 24 percent. The value for 1939 has been exceeded in only two years during the past decade — in 1930 ($81,042,416) and in 1937 ($90,855,462). Both quantity and total value of each metal in 1939 increased; the total value of the gold was $399,350 greater than in 1938, silver $475,831, copper $13,203,084, lead $39,942, and zinc $139,800. The several metals recovered from copper ore were valued at $62,227,585 in 1939, or 86 percent of the State total. Copper has long been the most important metal resource and mineral product of Arizona, hence the increase in 1939 in the average sales price of the metal to 10.4 cents a pound caused increased output of copper ore in all the copper-producing districts. The rise in the average sales price of silver, lead, and zinc resulted likewise in stimulating activity in the silver-lead-zinc districts.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in Arizona, 1935–39, and total, 1860–1939, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1935	904	1,197	6,770,050	241,754.60	$8,461,411	6,601,280	$4,744,670
1936	847	787	13,819,838	322,408.20	11,284,287	8,386,043	6,494,990
1937	888	376	20,976,359	332,694.00	11,644,290	9,422,552	7,288,344
1938	885	329	14,203,164	305,043.00	10,676,505	7,479,153	4,835,008
1939	976	142	18,793,260	316,453.00	11,075,855	7,824,004	5,310,839
1860–1939			(1)	9,564,090.00	222,238,305	254,114,563	189,518,409

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value

[1] Includes placer sands treated by dry concentration plants.
[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[3] Figures for sluicing include those for drift mining.

Gold.—The output of recoverable gold in Arizona in 1939 was 316,453 fine ounces, a gain of 4 percent over 1938. Gold from siliceous ores (chiefly dry and siliceous gold ore) increased 8,027 ounces owing to marked increases in gold ore treated by concentration followed by cyanidation in the Old Hat district and in gold ore treated by direct cyanidation in the Weaver district and the Katherine section of the San Francisco district. Gold from copper ore increased 6,118 ounces, but gold from zinc-lead ore declined 4,741 ounces owing to the large decrease in output of zinc-lead ore from the Tennessee mine at Chloride. Gold from placers increased 1,424 ounces; 64 percent of the total placer gold was recovered by dragline dredging at a property on Lynx Creek in Yavapai County and by drift mining at a property near Quartzsite in Yuma County. The Copper Queen (Bisbee) branch of the Phelps Dodge Corporation was, as usual, the leading gold producer in Arizona, and the United Verde (Jerome) and New Cornelia (Ajo) branches of the company ranked second and third, respectively; there was a marked increase in gold output from the New Cornelia, but a decrease from the United Verde; and the total output of gold from these three properties represented 38 percent of the State total. Other large gold producers in 1939 were the Mammoth-St.

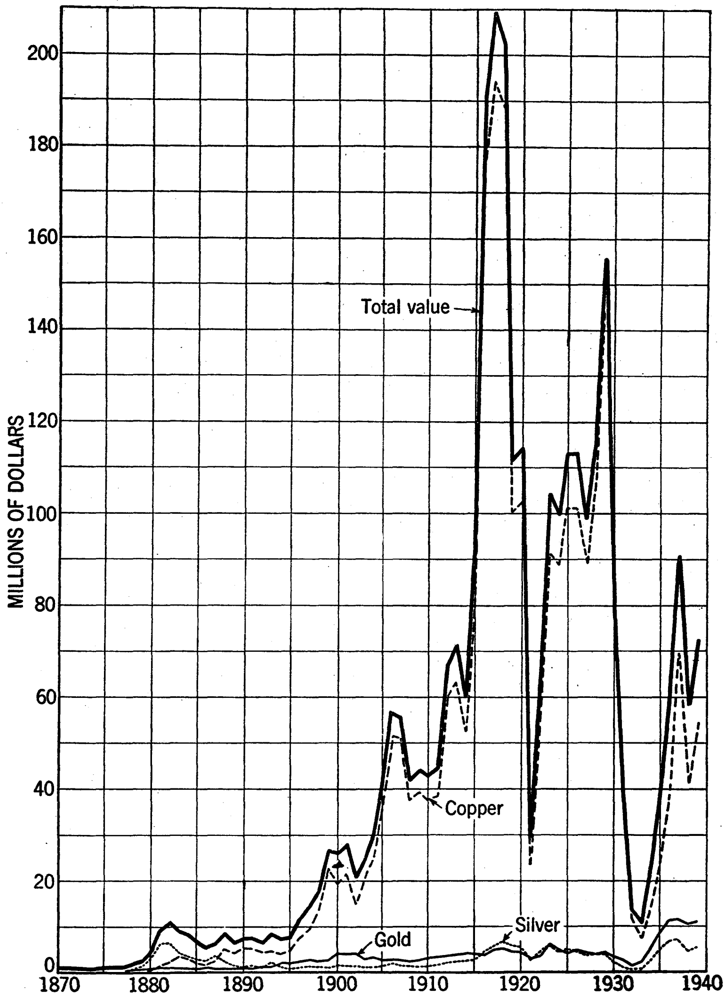

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1939. The value of lead and zinc has been less than $2,000,000 annually, except in a few years.

Anthony Limited property in Pinal County, the Goldroad mine (United States Smelting, Refining & Mining Co.) in Mohave County, the Octave mine (American Smelting & Refining Co.) in Yavapai County, the Iron King mine in Yavapai County, the Gold Standard Mines Corporation in Mohave County, and the Montana mine (Eagle-Picher Mining & Smelting Co.) in Santa Cruz County. Siliceous ore yielded 50 percent of the State total gold, copper ore 44 percent, and zinc-lead ore 3 percent. The chief gold-producing districts in Arizona were the Warren (mostly copper ore), San Francisco (mostly gold ore), Verde (mostly copper ore), Ajo (copper ore), Old Hat (gold ore), and Weaver (Yavapai County) (gold ore).

Silver.—The output of recoverable silver in Arizona in 1939 was 7,824,004 fine ounces, a gain of 5 percent over 1938. Silver from copper ore increased 295,034 ounces, that from zinc-lead ore 139,891 ounces, and that from zinc-copper ore 118,955 ounces, but silver from siliceous ores declined 207,816 ounces and that from lead ore decreased slightly. Copper ore yielded nearly 62 percent of the State total silver, siliceous ores 25 percent, zinc-lead ore 10 percent, zinc-copper ore 2 percent, and lead ore 1 percent. The Phelps Dodge Corporation continued as the chief silver producer in Arizona, although its output was 2 percent less than in 1938; the company's three properties (Copper Queen, United Verde, and New Cornelia) produced 51 percent of the State total. Other large silver producers in 1939 were the Magma, Montana, Ash Peak, Shattuck Denn, and Iron King mines. Silver output decreased substantially in the Ash Peak (Duncan), Wallapai (Chloride), and Eureka (Hillside) districts but increased sharply in the Verde (Jerome), Harshaw (Patagonia), Big Bug (Humboldt), Pioneer (Superior), Black Canyon (Cleator), and Ajo districts.

Copper.—The output of recoverable copper in Arizona in 1939 was 524,224,000 pounds, a gain of 24 percent over 1938; there was a general increase in each of the seven chief copper-producing districts, as follows: Globe-Miami district increased 35,745,031 pounds; Warren (Bisbee) district, 14,197,289 pounds; Verde (Jerome) district, 17,566,496 pounds; Ajo (New Cornelia) district, 13,382,587 pounds; Mineral Creek (Ray) district, 13,107,102 pounds; Copper Mountain (Morenci) district, 9,459,464 pounds; and Pioneer (Superior) district, 1,572,510 pounds. These seven districts contributed 99 percent of the State total copper, and the Globe-Miami district was the leading producer. Copper ore and its products yielded 519,923,639 pounds of copper, as follows: 13,542,200 tons of copper ore treated by concentration yielded 51 percent, 1,812,177 tons of copper ore shipped crude to smelters 32 percent, and 2,114,407 tons of copper ore leached and 21,330 tons of cement copper (from mine-water precipitates and underground leaching operations) 17 percent. The New Cornelia property continued to be the largest copper producer in Arizona; its output was 15 percent greater than in 1938, and it was followed in order by the Copper Queen, United Verde, Miami, Inspiration, Ray (Nevada Consolidated Copper Corporation), Magma, and Morenci (Phelps Dodge Corporation).

Lead and zinc.—The output of recoverable lead in Arizona in 1939 was 21,542,000 pounds, an increase of 2 percent over 1938; the output of recoverable zinc was 13,422,000 pounds, an increase of 15 percent. About 55 percent of the State total lead and 51 percent of the zinc came from Santa Cruz County, 19 percent of the lead and 30 percent of the zinc from Pinal County, and 12 percent of the lead and 7 percent of the zinc from Yavapai County; the remainder of the lead came chiefly from Mohave and Cochise Counties, and nearly all the rest of the zinc from Mohave County. More than 60 percent of the total lead and nearly 68 percent of the total zinc came from zinc-lead ore; nearly all the rest of the lead came from siliceous ores and lead ore, and nearly all the rest of the zinc from zinc-copper ore. The Montana mine of the Eagle-Picher Mining & Smelting Co. at Ruby in Santa Cruz County continued to be the chief producer of both lead and zinc in the State; the Magma mine at Superior ranked second in zinc and was followed by the Trench, Tennessee, and Hillside mines. Other large producers of lead were the Trench, Mammoth-St. Anthony, Iron King, Hillside, Tennessee, and Golden Turkey properties. The marked increase in output of lead and zinc from the Trench mine more than offset decreases from the Montana and Tennessee mines.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1939, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Cochise	44	7	59, 321	$2, 076, 235	2, 695, 001	$1, 829, 334

[1] Includes placer sands treated by dry concentration plants.
[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a 'dry-land dredge."

MINING INDUSTRY

The increase in sales price of copper, silver, lead, and zinc in 1939 resulted in substantial improvement in the mining industry of Arizona, especially in the mining of copper ore. Arizona has seven large copper-producing districts—Ajo, Globe-Miami, Verde (Jerome), Warren (Bisbee), Mineral Creek (Ray), Pioneer (Superior), and Copper Mountain (Morenci)—and the output of copper ore from each was much greater than in 1938. The 20,000-ton concentrator at Ajo, the 9,000-ton ferric sulfate leaching plant at Inspiration, the 18,000-ton concentrator and 3,000-ton leaching plant at Miami, the 1,600-ton concentrator at Clarkdale, the 12,000-ton concentrator at Hayden, the 850-ton concentrator at Superior, and the 1,500-ton test concentrator at Morenci were operated continuously on copper ore in 1939 at an increased rate over 1938. Copper-smelting plants at Douglas (5,000-ton), Clarkdale (5,000-ton), Hayden (1,000-ton), Miami (1,500-ton), and Superior (500-ton) were operated throughout the year. Nearly half of the total gold and more than half of the total silver produced in Arizona are recovered usually from copper ore;

consequently, when the price of copper rises or falls it affects the State production of gold and silver. Maintaining the price of gold at $35 an ounce continued to stimulate operations at gold properties, as evidenced by the large increase in number of gold producers in 1939 and the marked increase in output of gold ore. The output of zinc-lead-silver ore also increased owing to the gain from mines in the Harshaw district, Santa Cruz County.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Arizona in 1939, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	619	803, 816	135, 943	253, 778	555, 401	4, 151, 510	
Dry and siliceous gold-silver ore	63	153, 289	20, 766	896, 106	731, 385	2, 127, 224	220, 500
Dry and siliceous silver ore	86	84, 899	1, 689	789, 433	158, 105	172, 186	
	[1] 756	1, 042, 004	158, 398	1, 939, 317	1, 444, 891	6, 450, 920	220, 500
Copper ore	136	17, 468, 926	139, 527	4, 820, 469	[2] 519, 923, 639	116	
Lead ore	109	9, 778	1, 240	84, 208	61, 616	2, 073, 050	
Lead-copper ore	5	30	6	1, 634	2, 329	8, 601	
Zinc ore	4	670	148	4, 030	2, 553	10, 354	103, 173
Zinc-copper ore	1	67, 074	661	182, 800	2, 252, 500		4, 000, 000
Zinc-lead ore	8	204, 778	10, 064	790, 855	536, 472	12, 998, 959	9, 098, 327
Total, lode mines	[1] 976	18, 793, 260	310, 044	7, 823, 313	[2] 524,224.000	21, 542, 000	13, 422, 000
Total, placers	142		6, 409	691			
	1, 118	18, 793, 260	316, 453	7, 824, 004	[2] 524,224,000	21, 542, 000	13, 422, 000
Total, 1938	1, 214	14, 203, 164	305, 043	7, 479, 153	[3] 421,594,000	21, 142, 000	11, 628, 000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[2] Includes 86,058,553 pounds recovered from ore leached and mine-water precipitates.
[3] Includes 61,739,674 pounds recovered from ore leached and mine-water precipitates.

METALLURGIC INDUSTRY

The output of ore of all classes treated in Arizona increased from 14,203,164 tons in 1938 to 18,793,260 tons in 1939, and that of copper ore from 13,047,356 to 17,468,926 tons. Nearly 93 percent of the total in 1939 was copper ore, 4 percent gold ore, and the rest principally zinc-lead ore, gold-silver ore, silver ore, and zinc-copper ore.

Gold ore treated at amalgamation mills decreased from 11,177 tons in 1938 to 5,000 tons in 1939, but siliceous material treated at cyanidation plants increased from 605,367 to 733,943 tons. Cyanidation plants were operated continuously in 1939 at the Goldroad, Tom Reed, Gold Standard, Producers Mines, Inc., Vivian, Congress, Octave, Mammoth-St. Anthony, and Alvarado properties. Cyanidation plants used 207,920 pounds of sodium cyanide, 590,998 pounds of "Aero Brand" calcium cyanide, 100,000 pounds of zinc dust, 3,050,000 pounds of lime, 331 pounds of ferric sulfate, and 200 pounds of lead acetate.

Ore treated at concentration plants increased from 10,546,807 tons in 1938 to 14,017,765 tons in 1939; the ore concentrated in 1939 comprised 24,271 tons of gold ore, 119,058 tons of gold-silver ore, 58,593 tons of silver ore, 13,542,200 tons of copper ore (compared with 10,118,757 tons in 1938), 1,351 tons of lead ore, 628 tons of zinc ore, 67,074 tons of zinc-copper ore, and 204,590 tons of zinc-lead ore.

Copper ore from the Miami property (4,870,684 tons) was treated by a combination of leaching and concentration, and this tonnage is included in figures for ore treated at straight concentration plants. Ore from the Inspiration mine in 1939 was treated by straight leaching, but 147,693 tons of slimes discarded from the leaching-plant feed were concentrated.

The following tables give details of the treatment of all ores produced in Arizona in 1939.

Mine production of metals in Arizona in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Ore and old tailings amalgamated	5,000	1,087	308			
Ore and old tailings cyanided	733,943	77,823	144,713			
Concentrates smelted	668,141	109,671	3,028,737	269,134,268	19,282,374	13,338,249
Ore smelted	1,922,003	121,463	4,649,538	169,031,179	2,259,626	83,751
Copper precipitates smelted	21,330		17	[1] 35,357,650		
Copper ore leached	[2] 2,114,407			50,700,903		
Placer		6,409	691			
		316,453	7,824,004	524,224,000	21,542,000	13,422,000
Total, 1938		305,043	7,479,153	421,594,000	21,142,000	11,628,000

[1] Distributed as follows: Cochise County, 1,758,050 pounds; Gila County, 116,800 pounds; Greenlee County, 23,000,000 pounds; Pinal County, 9,713,400 pounds; and Yavapai County, 769,400 pounds.
[2] Treated by straight leaching at 1 plant in Gila County.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Arizona in 1939, by types of mills and by counties, in terms of recovered metals

[1] Ellsworth district lies in both Maricopa and Yuma Counties.

COCHISE COUNTY

California district (Hilltop).—Nearly all the output of the California district in 1939 was first-class lead ore from the Hilltop, Blackwell, and Columbia mines; the Hilltop was the chief producer.

Cochise (Dragoon) district.—In 1939 a little copper ore from the Centurion mine at Dragoon was shipped to a smelter.

Dos Cabezas and Tevis district.—Production of gold from the Dos Cabezas and Tevis district declined in 1939 owing to suspension late in 1938 of operations at the Dives mine and to decrease in output of placer gold from Inspiration Placers. Most of the output was gold ore shipped to smelters from the Golden Eagle, Good Luck, and Busenbach properties and lead-gold ore from the Cowboy mine. The most important placer operation in the district was the dry-land four-bowl washing dredge of Gould & Cross at Inspiration Placers.

Hartford (Huachuca Mountains) district.—A little ore was marketed in 1939 from the Comet, Dewey, and Western claims, and placer gold was recovered chiefly from the Gold Nugget property.

Swisshelm district (Webb, Elfrida).—Nearly all the output of the Swisshelm district in 1939 was lead ore (concentrated) from the Scribner mine.

Tombstone district.—The Tombstone (Bunker Hill) property was in 1939, as usual, the most important producer in the Tombstone district, but its output of gold-silver-lead ore was 27 percent less than in 1938. Lessees operated the property throughout the year and shipped 6,530 tons of ore to the smelter at El Paso, Tex. Lessees also operated the Tombstone Extension mine and shipped about 850 tons of lead ore. The remainder of the district output was principally silver ore from the Bonanza (Mellgren) and San Pedro mines.

Turquoise district (Courtland, Pearce, Gleeson).—Lessees operated the Silver Bill-Mona-Dragoon group in 1939 and shipped about 1,500 tons of silver-lead ore to a smelter. The rest of the Turquoise district output was chiefly zinc ore from the McLendon property and silver ore from the Elsicor mine.

Warren district (Bisbee, Warren).—The value of the metal output of the Warren district was $15,146,435 in 1939, a gain of 18 percent over 1938. The chief producer was, as usual, the Copper Queen branch of the Phelps Dodge Corporation; more than 900,000 tons of copper ore were shipped to a smelter, or 7 percent more than in 1938. The property also yielded several hundred tons of lead ore and a little zinc-lead ore, continued as the largest producer of gold and silver in the State, and again ranked second in copper. The Shattuck Denn Mining Corporation worked its property continuously and shipped 117,547 tons of copper ore to the smelter at El Paso, Tex., an increase of 45,517 tons over 1938. The McKenna Lease operated the Czar property of the Phelps Dodge Corporation in 1939 and shipped 6,995 tons of copper ore.

COCONINO COUNTY

Jacob Canyon district.—The Mackin property owned by the Los Angeles Exploration & Metals Corporation was operated by lessees in 1939, and 462 tons of carbonate copper ore were shipped to a smelter in Utah.

Ryan (Warm Springs) district.—In 1939 a small lot of rich copper ore was marketed from the Black Beauty claim.

White Mesa district.—The Coconino Copper & Chemical Co. operated its property in 1939, shipped several lots of carbonate copper ore to a smelter, and manufactured and sold copper sulfate to various consumers.

GILA COUNTY

Banner and Dripping Springs district.—The large gain (about 1,700 ounces) in output of gold in the Banner and Dripping Springs district in 1939 resulted from increased shipments of gold ore from the Columbia and Gold Queen-Gold Nugget properties, and the increase (736,646 pounds) in copper was due to resumption of operations at the Christmas copper property. Lessees reopened the Christmas mine in January and during the year shipped 24,790 tons of copper ore to the smelter at Hayden. The rest of the district output was principally gold ore from the Arizona-Apex, Standard, Gold Slope, and Gold Stone properties; the output of lead was small in 1939, as the "79" mine was idle.

Globe-Miami district.—In 1939 the Globe-Miami district was the chief copper-producing area in Arizona owing to increased output of copper ore from the Miami and Inspiration properties. The Miami Copper Co. treated 4,870,684 tons of copper ore—a gain of 46 percent over 1938—by leaching and concentration and recovered 72,894,493 net pounds of copper. The Inspiration Consolidated Copper Co. treated 2,262,100 tons of copper ore—a gain of 52 percent—chiefly by straight leaching and recovered 51,576,333 net pounds of copper. According to the printed annual report of the Miami Copper Co. for the year ended December 31, 1939, 431,652 pounds of molybdenite were recovered from the copper sulfide concentrates. Mine development comprised 31,139 feet of drifting, 22,770 feet of raising, and 473 feet of shaft sinking; in addition, 34,941 feet of drifts and raises were driven. Ore reserves as of January 1, 1940, were estimated to be 2,306,877 tons of mixed ore containing an average of 1.614 percent copper and 67,520,231 tons of sulfide ore containing an average of 0.887 percent copper. Lessees operated the Old Dominion mine in 1939 and shipped 8,934 tons of gold-silver ore. The rest of the district output was principally gold ore from the Gibbons, Golden Eagle, Camp Bird, and Ralston mines; silver ore from the Silver Plume, Rescue, and New Dominion mines; copper ore from the Porphyry Reserve, September Morn, and Schulze mines; and lead ore from the Albert Lee and Ireland mines.

Green Valley district (Payson).—The output of the Green Valley district in 1939 was chiefly gold ore from the Gowan (Verde Falls), Rodeo, Squatter, Blue Goose, Tornado, and Packard properties.

Pioneer (Pinal Mountains) district.—Copper ore was produced from the Marland (Stigall) and Bolder mines in 1939, silver ore chiefly from the Pioneer mine, and gold ore from the Little Four mine.

Roosevelt district.—In 1939, as in 1938, all the output of the Roosevelt district was gold ore from the Christmas Gift & Good Luck property.

Rye Creek district.—A little silver-copper ore from the Silver Crown mine was sold in 1939.

Summit district.—The entire output of the Summit district in 1939 was copper ore from the Arizona-Globe, Chatryn, Gibson, and Ritchard properties.

GRAHAM COUNTY

Virtually all the output of Graham County in 1939 was lead ore from mines near Klondyke in the Aravaipa district. Of the total ore, 94 percent was lead ore (concentrated) from the Grand Reef property; the remainder was chiefly lead ore shipped to a smelter from the Head Center mine.

GREENLEE COUNTY

Ash Peak district (*Duncan*).—Production of gold and silver in the Ash Peak district in 1939 was much less than in 1938 owing to the decline in output of silver ore from the Ash Peak property of Veta Mines, Inc.; about 50,400 tons of silver ore were concentrated in 1939 compared with a total output of 70,269 tons in 1938. The property was closed November 15 and the lease surrendered.

Copper Mountain district (*Morenci*).—The chief output of the Copper Mountain district in 1939 was copper concentrates and copper precipitates from the Morenci branch of the Phelps Dodge Corporation; the production of copper increased 42 percent in 1939 owing chiefly to treatment of 438,169 tons of copper ore in the test mill (no ore was treated by concentration in 1938). However, most of the copper produced in 1939 was recovered from leaching old caved stopes in place. The principal work at the Morenci branch was stripping overburden material in developing a large open pit. The stripping proceeds at the rate of 25,000 tons a day, and the minimum required to uncover the ore body and develop the pit will be 43,000,000 tons. The estimated ore reserve is 230,000,000 tons, averaging 1.06 percent copper. The company plans to construct in 1940 a new 25,000-ton concentration plant and smelter at the mouth of Morenci Canyon 2 miles from the open pit. The rest of the district output was chiefly gold ore shipped to a smelter from the Keating and Gold Belt properties.

Granville district.—Gold-lead ore from the Lady Mary and Rozell mines was sold in 1939.

Mayflower district.—A little copper ore from the Providencia claim was shipped in 1939 to the smelter at Miami.

Metcalf (*Greenlee*) *district.*—The output of the Metcalf district in 1939 comprised 80 tons of gold ore from the Gray Mare mine and 148 tons of zinc-lead ore from the Lime Cap group.

San Francisco district.—A little placer gold was recovered in 1939 by sluicing at various claims along the San Francisco River near Clifton.

MARICOPA COUNTY

Big Horn district.—The chief output of the Big Horn district in 1939 was old tailings (gold) cyanided from the Tiger property, gold ore from the Alice (Pump) mine, and placer gold principally from the Sweeney and Tiger claims.

Cave Creek and Camp Creek district.—Lessees operated the Blue Bird mine on Camp Creek in 1939 and shipped 3,412 tons of gold ore to the smelter at Miami. About 1,200 tons of copper-silver ore from the Red Rover mine, also on Camp Creek, were concentrated, and 353 tons of similar ore were shipped to a smelter. The rest of the district output was largely gold ore from the Maricopa, Portmanteau, and King-Virginia property on Cave Creek.

Ellsworth (Harqua Hala) district.—A little copper ore was produced in 1939 from the Copper Belt, Copper Prince, and Crystal claims and gold ore from the Golden and Golden Relief properties.

New River district.—All the output from the New River district in 1939 was copper ore, chiefly from the Orizaba mine on Moors Gulch; the Allied Mining & Smelting Corporation operated the mine and constructed a small copper smelter, which ran a short time.

Osborn district.—The output from the Osborn district in 1939 comprised 5,970 tons of old tailings (gold) and 641 tons of gold ore from the Belmont-McNeil property and 50 tons of copper ore from the Morning Star mine.

Salt River Mountains district.—The Delta mine continued to be the chief producer in the Salt River Mountains district, and about 1,800 tons of gold ore were shipped from the mine in 1939. Other producers of gold ore were the North Delta and Josephine properties.

San Domingo district.—In 1939, as in 1938, the entire output of the San Domingo district was placer gold and silver recovered by several small-scale operators along San Domingo Wash.

Sunflower district.—The Golden Rule Mining Co. operated the Little Daisy mine in 1939 and treated about 700 tons of gold ore by amalgamation and concentration.

Vulture district.—The Vulture mine was in 1939, as usual, the most important producer in the Vulture district. In January about 700 tons of gold ore from the property were treated by amalgamation and concentration; it was nonproductive from February to October 16, when construction of a new 150-ton cyanide plant was completed; and during the remainder of the year 5,068 tons of gold ore and 3,020 tons of old tailings were treated in the new plant. The rest of the district output was mostly old tailings (treated by cyanidation) from the Last Chance property and gold ore from the Sunrise mine.

Webb (Gila Bend Mountains) district.—A little gold ore was produced in 1939 at two prospects near Arlington.

Winifred district.—About 2,000 tons of old tailings (gold) from the Hartman (Jack White) mill dump were treated by cyanidation in 1939, and gold ore from the Oro Fino, Union, and Red Dog properties was shipped to a smelter.

MOHAVE COUNTY

Cedar Valley district.—The chief output from the Cedar Valley district in 1939 was tungsten ore from the Boriana mine and gold ore from the San Francisco mine, all treated by concentration. A few tons of copper concentrates were recovered at the Boriana mill and shipped to the smelter at Superior.

Chemehuevis district.—Small lots of gold ore were produced in 1939 from various claims in the Chemehuevis district; placer gold was recovered chiefly from the "49," Chief, and Prentice Gulch properties.

Cottonwood district.—The only production in the Cottonwood district in 1939 was a little gold ore from the North Star claim.

Gold Basin district.—Approximately 2,930 tons of gold ore from the O. K.-Excelsior group were treated by concentration in 1939; the property and 25-ton flotation plant were operated by the Malco Gold Mining Co. Other fairly important gold producers were the Gold Hill, M. O., Narrow Gauge (Fry), Bear Cat, and Golden Link properties.

Greenwood district.—Small lots of gold ore were produced in 1939 from the Burro, Lucky Strike, and Waldey claims.

Indian Secret (White Hills) district.—All the ore (1,188 tons) produced in the Indian Secret district in 1939 was treated in the custom cyanide mill of Producers Mines, Inc. The output comprised 703 tons of gold-silver ore from the Accident, G. A. R., Silver Hills, and White Hills properties and 485 tons of silver ore from the Hulda mine.

Maynard and McConnico district.—Lessees continued to operate the Bimetal (McGuire) mine and in 1939 shipped 791 tons of gold ore to various custom mills. The remainder of the district output was principally gold-silver ore from the Democrat mine.

Minnesota district.—In 1939, as in 1938, the chief output of the Minnesota district was gold ore from the Pope mine 40 miles north of Chloride; 3,219 tons of ore were treated in the custom cyanide mill of Producers Mines, Inc. Other producers included the Blue Rock, Horn Silver, Van Diemon, and Yellow Aster properties.

Music Mountain district.—Production of gold in the Music Mountain district was greater in 1939 than in 1938 owing to increased output of gold ore from the Roosevelt and North Star mines. Gold ore was produced also from the Newell, Neilson, and Butler properties and from various small prospects.

Owens (McCracken and Potts Mountain) district.—Most of the output in the Owens district in 1939 was gold-copper ore from the New England, North Star, and Cleopatra mines; gold ore from the Gold Leaf mine; and lead ore from the Lead Pill claim.

San Francisco (Oatman, Goldroad, Katherine, Vivian) district.—Production of gold in the San Francisco district in 1939 was 44,757 fine ounces, or 6 percent less than in 1938. The largest decrease was in output of gold ore from the Tom Reed mine at Oatman. The Goldroad mine of the United States Smelting, Refining & Mining Co. again was the largest producer of gold in Mohave County; the company operated its 300-ton cyanide plant continuously and treated 121,574 tons of gold ore and 20,044 tons of old tailings.

The output of gold ore and old tailings from 36 properties at Oatman and Goldroad was 224,499 tons in 1939, which yielded 37,403 ounces of gold and 26,525 ounces of silver, compared with 203,706 tons in 1938, which yielded 42,457 ounces of gold and 32,438 ounces of silver. The Tom Reed Gold Mines Co. operated its 300-ton cyanide plant at Oatman on company and custom ores until November 8, when the mill was closed. The output of gold ore from the Tom Reed mine declined from 25,171 tons in 1938 to 3,900 tons in 1939, but 29,563 tons of old tailings were treated. The Tom Reed Gold Mines Co. and Johnston & Witcher Mines continued leasing operations at the Big Jim mine, and a total of 17,946 tons of gold ore was treated in the Tom Reed mill. Lessees also continued to operate the Pioneer group and trucked 4,768 tons of gold ore to various custom mills. About 19,350 tons of gold ore from the United Western mine were treated by concentration and cyanidation; the mine was operated throughout the year by the Vivian Mining Co. Various lessees worked in the Vivian-Lelande group in 1939, and 1,630 tons of gold ore were treated in the Vivian custom mill. Other large producers of gold ore at Oatman were the Gold Dust, Telluride, Carter, and Crown City properties.

The output of gold ore from 12 properties in the Katherine section of the San Francisco district was 59,871 tons in 1939, which yielded 7,354 ounces of gold and 15,961 ounces of silver, compared with 36,715 tons in 1938, which yielded 4,975 ounces of gold and 45,888 ounces of silver. The gain in output of ore and gold was due chiefly to the large increase in output of gold ore from the Tyro mine, and the decline in silver resulted from the decrease in output of gold-silver ore from the Arabian mine. The Gold Standard Mines Corporation operated the Tyro and Katherine mines continuously and treated 48,959 tons of ore from the Tyro and 9,555 tons from the Katherine in the 300-ton cyanidation plant at Katherine. Other important producers of gold ore were the Frisco, Philadelphia, Burt, Minnie, and Escondido properties.

Wallapai district (Cerbat, Chloride, Mineral Park, Stockton Hill).—The output of ore and each of the five metals in the Wallapai district decreased from 1938, owing chiefly to the closing of the Tennessee mine at Chloride in January 1939; however, the mine was reopened in October and 11,588 tons of zinc-lead ore were treated by concentration during the year, compared with 54,092 tons in 1938. Production of gold-silver ore was maintained at the Diana group by the Arizona Magma Mining Co.; about 21,000 tons of ore were treated by concentration. The Alpha-Keystone Mines, Inc., operated the Keystone and Summit groups most of the year and treated 8,190 tons of silver ore from the Keystone and 2,679 tons of gold-silver ore from the Summit. Various lessees worked in the White Eagle mine and shipped a total of 3,539 tons of rich gold-silver ore to the smelter at El Paso, Tex. From the Oro Plata group about 2,800 tons of gold ore were concentrated, 1,055 tons of similar ore were cyanided, and 400 tons of zinc ore were concentrated. The Grand View Mining Co. operated the Rainbow property the first 5 months of the year and treated 3,600 tons of gold ore by concentration. Old tailings (5,058 tons), containing chiefly gold and lead, from the Elkhart dump were treated by concentration. Other fairly important producers in the district in 1939 were the Golden Eagle-Bobtail, Golden Gem, O'Brien-Blunket, Juno, Ark-San Antonio, Golconda, Congress & Home, Mohawk, Rico, Minnesota-Connor, Nighthawk, and Tintic mines.

Weaver (Mocking Bird, Pilgrim, Portland) district.—Production of both gold and silver from the Weaver district in 1939 was less than in 1938, owing chiefly to the large decline in output of gold ore from the Portland mine; 8,636 tons were treated by cyanidation in 1939 compared with 25,419 tons in 1938. The mine was operated by the Gold Standard Mines Corporation until August 15, when it was closed. There was substantial increase in output of gold ore from the Pilgrim and Klondyke mines, both operated by Producers Mines, Inc.; 25,221 tons of gold ore and 4,634 tons of old tailings from the Pilgrim property and 20,822 tons of gold ore from the Klondyke mine were treated by cyanidation. Other large producers of gold ore were the Dixie Gold, Dixie Queen, Pershing, and Scout properties. Most of the ore in the district was treated in the 300-ton cyanide plant of Producers Mines, Inc., near Chloride.

PIMA COUNTY

Ajo district.—Production of gold, silver, and copper from the Ajo district in 1939 was considerably greater than in 1938 owing to the large increase in output of copper ore from the New Cornelia mine. The mine and 20,000-ton concentrator were operated continuously by the Phelps Dodge Corporation; about 6,107,200 tons of copper ore were treated, a gain of 23 percent over 1938.

Arivaca district.—The chief output of the Arivaca district in 1939 was gold ore from the Cotton Tail mine and gold-silver ore and silver-lead ore from the Tunquepata mine. Numerous small lots of gold ore and silver ore from prospects in the district were sold to an ore buyer in Nogales.

Baboquivari district.—Lessees operated the Allison mine in 1939 and treated about 150 tons of gold ore by amalgamation and shipped 136 tons of gold-silver ore to a smelter. The rest of the district output was chiefly silver-copper ore and lead-copper ore from the Papago Chief claim.

Cababi (*Comobabi*) *district.*—Nearly all the output of the Cababi district in 1939 was gold ore from the Jaeger group and silver-copper ore from the Picacho mine.

Cimarron Mountains district.—A little gold ore was produced in 1939 from the Monte Cristo claim.

Empire district.—Small lots of silver-lead ore were sold in 1939 from the Total Wreck and State of Maine properties.

Greaterville district.—The output of the Greaterville district in 1939 was principally lead ore from the Arizona Comstock group and placer gold recovered by various small-scale operators.

Helvetia (*Rosemont*) *district.*—Copper ore was produced in 1939 from the Narragansett Bay, Old Dick, Half Moon, and Silver Dollar properties and silver ore from the Blue Jay mine.

Meyer district.—Small lots of gold ore were marketed in 1939 from the Hadsell & O'Brien and Sunset properties.

Old Hat district (*Oracle*).—All the output from the Old Hat district in Pima County in 1939 was copper ore, chiefly from the Leatherwood (Geesaman) mine operated by Control Mines, Inc.

Pima (*Sierritas, Papago, Twin Buttes*) *district.*—Gold-copper ore was produced in 1939 from the Cat's Paw mine, gold-silver ore from the High Hill group, and silver-lead ore from the Paymaster, Schell, and Vivienne properties.

Quijotoa district.—The output of the Quijotoa district in 1939 was chiefly placer gold from the Mariposa, Right Spot, New Deal. and Sunshine claims.

Roskruge and Waterman district.—Virtually all the output from the Roskruge and Waterman district in 1939 was silver ore from the St. Jude mine.

Santa Rosa district.—Gold ore was produced in 1939 from the Ludlam claim, silver ore from the Grubstake mine, and silver-copper ore from the Little Horn claim.

PINAL COUNTY

Astraya district.—Lessees operated the Astraya mine a short time in 1939 and shipped copper ore to a smelter.

Bunker Hill district (Copper Creek).—The output of gold, silver, and copper in the Bunker Hill district was much less in 1939 than in 1938 owing to suspension of operations at the Childs mine late in 1938 by the Arizona Molybdenum Corporation. Lessees operated the mine in 1939, treated 3,900 tons of copper ore by concentration, and shipped 77 tons of similar ore to a smelter; the output in 1938 was 44,203 tons of ore and 35,130 tons of old tailings.

Casa Grande district.—Most of the output from the Casa Grande district in 1939 was gold ore shipped to smelters from the Greenback, Turning Point, Hillside, and Mammon properties and silver ore from the Orizaba and Reward mines.

Cottonwood and Black Mountain district.—Nearly all the output from the Cottonwood and Black Mountain district in 1939 was first-class gold ore from the Betty Jane, Hot Boy, and Bulldog mines.

Goldfields district.—The entire output of the Goldfields district in 1939 was old tailings (cyanided) from the Bulldog property.

Hackberry district.—A little copper ore and gold ore were produced in 1939 from the Last Chance claim.

Martinez Canyon district.—Lessees operated the Silver Bell mine in 1939 and shipped 2 cars of silver-lead ore to a smelter.

Mineral Creek district (Ray).—The value of the metal output of the Mineral Creek district was $4,584,768 in 1939, a gain of 53 percent over 1938; the chief output was copper ore from the Ray mine. The Nevada Consolidated Copper Corporation operated the mine and 12,000-ton concentrator throughout the year and treated 1,425,228 tons of copper ore yielding 77,174 tons of copper concentrates; it also shipped 5,555 tons of copper precipitates to a smelter; and the output of copper increased 43 percent over 1938. Lessees operated the Broken Hill mine in 1939 and shipped 2,364 tons of gold ore to a smelter. The remainder of the district output was mostly lead ore from the Ray Silver-Lead property.

Mineral Hill district.—Gold ore was produced in 1939 from the Sunset, Little May, Troxel, and Hornet mines.

Old Hat district (Oracle, Mammoth).—Mammoth-St. Anthony, Ltd., continued in 1939 to be a large producer of gold-molybdenum-lead ore; its output was 38 percent greater than in 1938, and it was the largest producer of gold and lead in Pinal County. During the year the company treated 191,892 tons of ore, including 13,697 tons from the adjoining New Year-Mohawk group, which was purchased by Mammoth-St. Anthony, Ltd., in May. Lead concentrates (4,471 tons) containing considerable gold were smelted in the company 20-ton lead furnace; lead bullion, gold bullion, molybdenum, and vanadium were shipped to eastern markets. The rest of the district output was principally gold ore shipped from the Old Gold Camp and Golden Slipper properties.

Picacho district.—Low-grade gold ore was shipped in 1939 from the Better Pay property and a prospect near Wymola.

Pioneer district (Superior).—The value of the metal output of the Pioneer district was $4,887,607 in 1939, a gain of 12 percent over 1938. The Magma Copper Co. was, as usual, the most important producer in Pinal County; the company treated 236,991 tons of copper ore and 67,074 tons of zinc-copper ore in the concentrator and in addition produced 60,829 tons of copper ore sent direct to the smelter. According to the company printed annual report the metal output of the Magma mine, after deduction of all losses including refining, was 11,610 ounces of gold, 599,588 ounces of silver, 34,065,869 pounds of copper, and 4,261,616 pounds of zinc. The average net cost of producing copper after deduction of gold, silver, and zinc values was 7.5 cents a pound. Mine development in 1939 comprised 10,017 feet of drifting, 4,349 feet of raising, 2,826 feet of crosscutting, and 816 feet of sinking. The 850-ton copper concentrator and 450-ton copper smelter were operated continuously, except for the usual summer shut-down (July 1 to August 16). Lessees continued to work the Superior & Arizona group of the Magma Copper Co. and shipped 6,112 tons of gold ore to the Magma smelter. Wm. J. Forbach continued operations at the Reymert mine and shipped 19,766 tons of silver ore to smelters. The rest of the district output was principally gold-silver ore from the Belmont mine and silver ore from the Magma Chief and Magma Apex mines.

Ripsey district.—The output of the Ripsey district in 1939 comprised 2,000 tons of gold-silver ore from the Norman group (Old Ripsey) and 394 tons of silver ore from waste dumps of the Florence Lead & Silver property.

Riverside district.—A little gold ore was sold in 1939 from the Arizona Gold and Lucky Strike claims and copper ore from the Buckeye claim.

Sacaton Mountains and Blackwater district.—Gold ore was produced in 1939 from the Lucky Strike claim and lead-silver ore from the Santa Rosa claim.

Saddle Mountain district.—Most of the output from the Saddle Mountain district in 1939 was gold ore from the Hoosier and Columbia mines and gold-silver ore from the Adjust property.

SANTA CRUZ COUNTY

Harshaw district.—The value of the metal output of the Harshaw district was $492,490 in 1939 compared with $49,977 in 1938. This large gain resulted chiefly from the increase in output of zinc-lead-silver ore from the Trench mine. The American Smelting & Refining Co. completed construction of a new 200-ton flotation plant at the mine in May 1939 and treated a total of 33,660 tons of zinc-lead-silver ore during the last 7 months of the year; the property ranked second in production of lead in Arizona in 1939 and third in zinc. Lessees operated the American mine and shipped 1,880 tons of silver ore to a smelter. The rest of the district output was mostly zinc-lead ore and silver-lead ore from the Flux mine and silver ore from the World's Fair, Salvador, and Black Eagle mines.

Nogales (Gold Hill) district.—The chief output of the Nogales district in 1939 was gold ore and gold-lead ore from the Uncle Sam mine and gold ore from the Clyne claim.

Oro Blanco district (Ruby).—Production of zinc-lead-silver-gold-copper ore from the Montana mine at Ruby was maintained throughout 1939, but the yield of gold, silver, copper, lead, and zinc was less than in 1938; about 136,600 dry tons of ore were concentrated, or 3 percent more than in 1938. The mine again was the largest producer of lead and zinc in the State. The rest of the district output was chiefly gold ore from the Old Glory & Sargent, Margarita, Austerlitz, Grubstake, Oro Fino, and Golden Pen mines; silver ore from the Brick mine; and gold-silver ore from the Pitchburg mine.

Palmetto district.—Nearly all the output from the Palmetto district in 1939 was copper ore from the Three R property shipped to a smelter.

Patagonia (Washington, Duquesne) district.—One car of lead ore was shipped by a lessee from the Mowry mine in 1939, and small lots of ore from prospects were sold to an ore buyer in Nogales.

Redrock district.—The chief output of the Redrock district in 1939 was silver-copper ore from the Copper and Silver Ridge-Silver Queen groups.

Wrightson district.—Nearly all the output from the Wrightson district in 1939 was silver-lead ore from the Blabon property.

YAVAPAI COUNTY

Ash Creek district.—The Gold Coin mine was operated a short time in 1939, and 1 car of gold ore was shipped to a smelter. A small lot of gold ore was marketed from the Golden Crown claim.

Big Bug district.—The output of each of the five metals in the Big Bug district increased decidedly in 1939, owing chiefly to the gain in output of gold-silver-lead ore from the Iron King mine at Humboldt. The Iron King Mining Co. operated the mine continuously, treated 69,620 tons of gold-silver-lead ore by concentration, and shipped 603 tons of gold-silver ore to a smelter; in addition to gold-silver-lead concentrates, the mill produced a few cars of zinc concentrates. Gold-copper ore and gold-lead ore were produced from the Hackberry mine. The chief producers of gold ore were the Union-Jessie, Boggs, Belcher, and Four Boys properties. The output of placer gold in the district dropped to 448 ounces in 1939, owing to suspension late in 1938 of dry-land dredge operations at the Lawson group by the Hassayampa River Mining Co.; most of the placer gold was recovered by dry-land dredging at the Savoy & Shanks property and by sluicing operations at the Hill, Johnson, and Caywood properties.

Black Canyon district.—The value of the metal output of the Black Canyon district increased to $306,145 in 1939, owing chiefly to resumption of operations at the Golden Belt mine near Cleator. The mine and 50-ton flotation plant were taken over in June 1939 by the Golden Turkey Mining Co., and during the rest of the year about 5,500 tons of gold ore were treated by concentration. The Golden Turkey mine, adjoining the Golden Belt, continued to be the most important producer in the district; it was operated throughout the year, and about 21,500 tons of gold-silver-lead ore were treated in the Golden Turkey flotation mill. The rest of the district output was chiefly gold ore concentrated from the Richinbar property.

Black Rock district.—Nearly all the output from the Black Rock district in 1939 was crude gold ore shipped to a smelter from the Unida and Turtle mines.

Blue Tank district.—Lessees operated the Orogrande mine a short time in 1939 and treated 100 tons of gold ore by amalgamation. A little gold ore was produced from the Quartz mine.

Bullard (Pierce) district.—There was a substantial increase in output of gold and copper in the Bullard district in 1939, resulting chiefly from the shipments of gold-copper ore from the Bullard mine near Aguila. The Bullard Gold Mines, Inc., was organized late in 1938 to operate the mine, and during 1939 the company shipped 2,758 tons of gold-copper ore to various smelters. The rest of the district output was mostly old tailings (gold) from the Gold Leaf (Rush) property treated by cyanidation.

Castle Creek district.—The output of the Castle Creek district in 1939 comprised gold ore from the Jack Pot, Bennet, and Swallow properties; small lots of copper ore from various claims; and placer gold from a claim on Buckhorn Creek.

Cherry Creek district.—Virtually all the output in the Cherry Creek district in 1939 was crude gold ore shipped to smelters; the chief producers were the Sitting Bull, Gold Pick, Gold Eagle, Gold Bullion, Dove, Etta, Little Dora, and Sugar Bowl properties.

Copper Basin district.—Small lots of rich gold ore were marketed in 1939 from the McNary and Flower Gold claims, and a little gold-copper ore was produced from the Plymouth mine. Most of the placer gold recovered came from the Smith & Roby, Queen of Sheba, and Stupe properties.

Eureka district.—There was a sharp decline in output of gold, silver, and lead in the Eureka district in 1939, owing chiefly to the drop in output of ore from the Hillside mine, the most important producer in the district; the decline in output of copper resulted from decreased production of copper ore from the Bagdad mine. There was, however, a substantial increase in production of zinc, as the mill at the Hillside mine produced more zinc concentrate than in 1938. Hillside Mines, Inc., operated its mine and concentrator until October 13, when both were closed temporarily; it concentrated 21,744 tons of gold-silver-zinc-lead ore compared with 38,850 tons in 1938. The Bagdad Copper Corporation resumed operations November 1 and during the last 2 months of the year treated 14,196 tons of copper ore in its 275-ton flotation plant. The rest of the district output was principally crude gold ore shipped to smelters from the Belle, Mammoth, Crosby, and Dunlap mines. Comstock-Dexter Mines, Inc., and the Santa Maria Mining Corporation, both fairly large producers of gold ore in 1938, were idle in 1939.

Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) district.—Production of gold from the Hassayampa district totaled 1,772 ounces in 1939, or 34 percent more than in 1938; however, there was no individual large producer. Most of the output was gold ore from the Oro Flame, Alma, Home Run, Forest & Forlorn Hope, Nevada, Infanta, Sacramento, Empire, Big Chief, Great Divide, Railroad, Jim Crow, and Evergreen properties; gold-silver ore from the White Spar and Davis-Dunkirk mines; and gold-copper ore from the Porphyry mine. Numerous small lots of ore and placer gold from various prospects in the district were sold to buyers of ore and placer gold in Prescott.

Humbug district.—The chief output from the Humbug district in 1939 was gold ore from the Little Joseph and Humbug Gold Mines properties and placer gold recovered by various small-scale operators working on Cow, French, and Humbug Creeks.

Lynx Creek district.—The output of the Lynx Creek district in 1939 was, as usual, placer gold and silver recovered chiefly from property operated by the Lynx Creek Placer Mine Co. The company worked its two draglines and its floating washing plant continuously from February 15 to December 31 and treated 542,815 cubic yards of gravel; it remained the largest producer of placer gold in Arizona, and its output was 20 percent greater than in 1938. The Rock Castle Placer Mines was organized in September 1939 to work bench gravel above the ground being dredged by the Lynx Creek Placer Mine Co.; during the last quarter of the year about 12,000 cubic yards of gravel were handled by a dry-land dredge equipped with four bowl-amalgamators. Other placer producers included the Federal, Flynn, and Granite Fraction claims.

Martinez (Congress) district.—Production of gold in the Martinez district increased to 5,415 ounces in 1939, owing chiefly to the increase in treatment of old tailings and waste-dump ore from the Congress property; 99,645 tons of old tailings and 3,337 tons of waste-dump ore were treated by cyanidation by The Congress Mining Corporation. The rest of the district output was principally crude gold ore of smelting grade from the Golden Key and Blue Bird mines.

Mineral Point district.—Gold ore was produced in 1939 from the Buster, Golden Daisy, and Golden Chance properties.

Oak Creek district.—A little placer gold was marketed in 1939 from the Gotcher and Trimplex claims.

Peck district.—The output of the Peck district was small in 1939, as the Swastika mine, a producer of rich silver ore in 1937 and 1938, was idle.

Pine Grove district (Crown King).—Production of gold ore from the Gladiator-War Eagle group was maintained throughout 1939, and the property again was by far the most important producer in the Pine Grove district; about 4,200 tons of gold ore containing some silver and copper were shipped to a smelter. The Golden Crown Mining Co. operated its 75-ton flotation plant a few months and treated 1,680 tons of gold-silver-copper ore. The rest of the district output was mostly gold-silver ore from the Union & Eagle group and gold ore and gold-lead ore from the Del Pasco mine.

Silver Mountain district (Wagoner).—The output of the Silver Mountain district in 1939 comprised silver-lead ore and silver ore from the Little Joker mine, gold ore from the Silver Dollar mine, and placer gold from the C. B. C. and Silver Mountain claims.

Thumb Butte district.—Nearly all the output from the Thumb Butte district in 1939 was crude gold ore shipped to a smelter from the Last Chance Extension mine.

Tiger district.—Gold ore was produced in 1939 from the Fortuna, Oro Belle, Southern Belle, Violet & Snowdrift, and Wink properties.

Tip Top district.—Lessees operated the "76" mine in 1939 and shipped 19 tons of rich silver ore to a smelter; other producers of rich silver ore were the La Fortuna and Humming Bird properties. Placer gold was recovered chiefly from the Badger Springs and Rock Springs claims.

Turkey Creek district.—Most of the output from the Turkey Creek district in 1939 was old tailings (gold-silver) and gold ore of smelting grade from the Parker property near Cordes.

Verde district (Jerome).—The value of the metal output of the Verde district was $10,156,737 in 1939, a gain of 27 percent over 1938. The United Verde mine was, as usual, the chief producer in the district, and its output of copper ore was 26 percent greater than in 1938. The property ranked second in the State in production of gold and silver and third in copper. The open-pit and underground sections of the mine and the 1,600-ton concentrator were operated continuously by the Phelps Dodge Corporation; 694,716 tons of copper ore and 491 tons of copper precipitates were smelted, and 294,933 tons of copper ore were concentrated. A. B. Peach continued to operate the Iron King-Equator group and shipped 6,729 tons of gold-silver ore to the smelter at Clarkdale. The remainder of the district output comprised 1,126 tons of copper ore from the Daisy (United Verde Extension) mine dump and 1,519 tons of copper cleanings from the United Verde Extension smelter dump.

Walker district.—There was a substantial increase in output of gold, silver, and copper in the Walker district in 1939 owing to the larger output of gold-silver-copper ore from the Sheldon mine and to the gain in output of gold ore from several properties; about 2,000 tons of crude ore from the Sheldon mine were shipped to a smelter. The chief producers of gold ore were the Alturas Extension, Virgin Mary, Mohawk, Last Chance, Chance, and Alturas properties. Placer gold and silver were recovered by various small-scale operators working on Lynx Creek near Walker.

Walnut Grove district.—Nearly all the output of the Walnut Grove district in 1939 was gold ore from the Big Rebel, Portland, and Moyer mines and placer gold, chiefly from the Maggie Moyer property. The Gallup Gold Mining Co., a fairly large producer of gold ore in 1938, was idle.

Weaver district (Octave).—Production of gold in the Weaver district was 17,847 ounces in 1939, a gain of 3,369 ounces over 1938; more than 95 percent of the total was produced from two properties—the Octave and the Alvarado. The Octave mine, operated throughout the year by the American Smelting & Refining Co., continued to be the most important producer in the district; 29,334 tons of gold ore were treated by concentration and cyanidation. The Alvarado mine was operated continuously by Liberty Hill Gold Mines, Ltd., and 31,652 tons of gold ore were cyanided, or more than double the tonnage in 1938. The Yarnell mine was operated a short time in 1939, and 1,200 tons of gold ore were treated by concentration; the 50-ton flotation plant was removed during the year, and a new cyanidation plant was built in its place. Other producers of gold ore included the Hosford, Dora, Laurella, May Queen, Leviathan, Hayden, and Sunny Slope properties. Production of placer gold in the district was less than in 1938 owing to suspension late in 1938 of operations at the Thunder Bird claim; the chief producers were the Longerot, Johns, Lucero, McIntosh, and Merrill properties.

White Picacho district.—In 1939, 204 tons of crude gold ore were shipped from the Young mine; the rest of the district output was mostly silver-lead ore from the Independence claim.

YUMA COUNTY

Castle Dome district.—Nearly all the output from the Castle Dome district in 1939 was gold ore of smelting grade from the Big Eye and Southern Extension mines and silver-lead ore from the Haack property.

Cienega district.—A little gold ore was produced in 1939 from the Baker and Sue claims and copper ore from the Black Hill mine.

Ellsworth district (*Salome*).—The chief output of the Ellsworth district in 1939 was gold ore from the Hercules, Desert, Blue Eagle, Alaskan, Why Not, Fieldness, Red Bird, and Red Rose properties and gold-copper ore from the Critic and Centroid mines. Numerous small lots of gold ore from prospects were sold to an ore buyer in Wickenburg.

Fortuna district.—Production of gold in the Fortuna district was much greater in 1939 than in 1938, owing to operation of the Fortuna mine, which had been idle for several years. H. C. & C. F. Burton operated the mine throughout 1939 and treated 1,427 tons of gold ore by amalgamation and 450 tons of old tailings by cyanidation. A few hundred tons of old tailings (gold) from the Graham property were treated by cyanidation.

Kofa district.—Virtually all the output of the Kofa district in 1939 was gold ore from the Sheep Tanks mine shipped to various smelters.

Laguna district.—A little gold ore from the Las Flores mine was cyanided in 1939, and placer gold and silver were recovered by various small-scale operators working in the Laguna Dam and Las Flores areas.

La Paz and Middle Camp district.—The output of the La Paz and Middle Camp district in 1939 comprised 3,800 tons of old tailings (gold) from the Goodman property, which were cyanided; 44 tons of low-grade gold-copper ore from the Copper Bottom mine; 17 tons of rich gold ore from the Ah-Ve-Aha claim; and placer gold and silver recovered chiefly by drift mining at the Golden Anchor (Jones), Middle Camp & Oro Fino, Gold Buckle, Cave Creek, and Ferrar Gulch properties.

La Posa (*Copper Mountains*) *district.*—A little gold-copper ore was produced in 1939 from the Betty Lee and Frisco mines.

Muggins district.—The output of the Muggins district in 1939 was placer gold recovered by various small-scale operators.

Plomosa and La Cholla district.—Production of gold in the Plomosa and La Cholla district was much greater in 1939 than in 1938, owing to the large increase in output of placer gold from the La Cholla Placers (Arizona Drift). The property was operated continuously by drift mining by the La Posa Development Co.; 15,033 cubic yards of gravel were handled, and the company became a large producer of gold. Other producers of placer gold included the Can Do & Crown, N. R. A., Sore Thumb, and Virginia properties. Most of the lode output of the district was gold-copper ore from the Little Butte mine and gold ore from the Julius mine.

Santa Maria (*Planet, Bill Williams*) *district.*—The Townsend mine was the only producer in the Santa Maria district in 1939; 1 car of copper ore was shipped to a smelter, and about 45 tons of lead ore were concentrated.

Welton Hills district.—The Poorman mine was operated a short time in 1939, and 2 cars of gold ore were shipped to a smelter.

Yuma district.—In 1939, 367 tons of gold ore from the Jude-Silverfields group were cyanided in the Burton custom mill near Yuma.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN CALIFORNIA

(MINE REPORT)

By Charles White Merrill and H. M. Gaylord

SUMMARY OUTLINE

The total value of the gold, silver, copper, lead, and zinc recovered from ores, old tailings, and gravels in California in 1939—$52,918,012—was greater than in any year since 1856; it exceeded that in 1938 by more than 5 million dollars, or nearly 11 percent. Although most of the increase may be ascribed to the advance in gold production, the output of each of the other four metals was larger in both quantity and value than in 1938.

Gold increased 9 percent in both quantity and value, silver increased slightly in quantity and 5 percent in value, copper 419 percent in quantity and 450 percent in value, and lead 6 percent in quantity and 9 percent in value; 12,000 pounds of zinc were produced in 1939, but none was reported recovered in 1938. Of the total value of the five metals in 1939, gold represented 95 percent, silver 3 percent, copper almost 2 percent, and lead and zinc combined less than 0.1 percent.

Nevada County, despite a 2-percent decline in total value of production in 1939, continued to be the largest contributor to the metal-mining output of California; it supplied 22 percent of the State total value of the five metals, 22 percent of the total gold, and 37 percent of the lode gold. Sacramento County (largely from gold dredging) contributed 10 percent of the total value of the five metals; Amador County (about 70 percent from gold ore and 30 percent from placer gravels), 8 percent; Kern County (largely from gold and gold-silver ores), 7 percent; Calaveras County (about equally from gold ore and placer gravels), 7 percent; Yuba County (largely from gold dredging), 6 percent; Eldorado County (about 80 percent from gold ore and 20 percent from placer gravels), 5 percent; Plumas County (largely from gold and copper ores), 4 percent; Butte County (largely from placer gravels), 4 percent; and Merced County (all from placer gravels), 3 percent. Thus, the foregoing 10 of the 43 counties producing the metals in California in 1939 supplied over 75 percent of the State total value.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in California, 1935–39, and total, 1848–1939, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1935	1,112	1,487	3,337,773	890,430	$31,165,050	1,191,112	$856,112

[2] Figures not available. [3] Short tons.

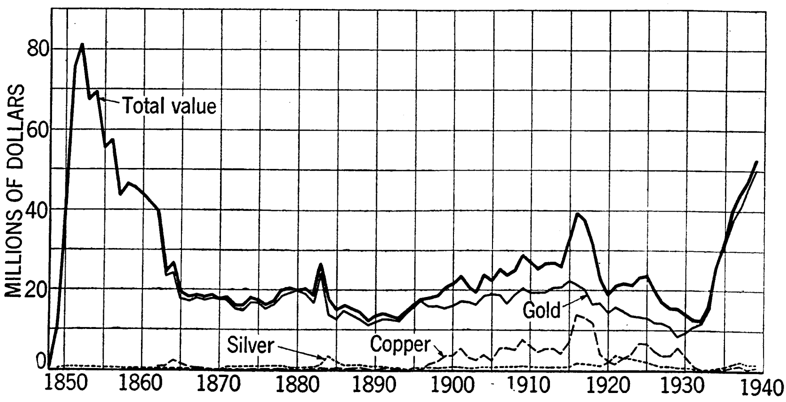

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in California, 1848–1939. The value of lead and zinc has exceeded $1,000,000 in only a few years.

Gold.—Since 1929, when the value of the California gold output reached a low of $8,526,703, the value of production has expanded almost sixfold; the gain in 1939 over 1938 was equivalent to more than half the total value of the output in 1929. In quantity the 1939 gold output was greater than in any year since 1862, and in value it was greater than in any year since 1856. During the last 3 years there have been the following gains over the immediately preceding years: 1939, 9 percent; 1938, 12 percent; and 1937, 9 percent. Thus, the yearly increase has averaged 10 percent over the period.

Although data for gold production in California before 1901 do not segregate placer and lode gold, it appears certain that the output of lode gold was larger in 1939 in both quantity and value than in any year in the history of the State. The quantity and value of placer gold produced are known to have been higher in 1939 than in any year since 1900. Moreover, the value of the output of placer gold in 1939 exceeded that of lode and placer gold combined in any year from 1865 to 1882 and from 1884 to 1900.

The 25 leading gold-producing mines in California in 1939, listed in the following table, yielded 54 percent of the total gold output of

Twenty-five leading gold-producing mines in California in 1939, in order of output

Rank	Mine	District	County	Rank in 1938	Operator	Source of gold
1	Idaho Maryland	Grass Valley-Nevada City.	Nevada	2	Idaho Maryland Mines Corporation.	Gold ore.
2	Empire Star mines	do	do	1	Empire Star Mines Co., Ltd.	Do.
3	Natomas Co.	Folsom	Sacramento	3	Natomas Co.	Dredge.
4	Yuba Unit	Yuba River	Yuba	4	Yuba Consolidated Gold Fields.	Do.
5	Central Eureka and Old Eureka.	Mother Lode	Amador	7	Central Eureka Mining Co.	Gold ore.
6	Lava Cap	Grass Valley-Nevada City.	Nevada	6	Lava Cap Gold Mining Corporation.	Do.
7	Capital dredges	Folsom	Sacramento	5	Capital Dredging Co.	Dredge.
8	Carson Hill	Mother Lode	Calaveras	8	Carson Hill Gold Mining Corporation.	Gold ore.
9	Golden Queen	Mojave	Kern	9	Golden Queen Mining Co.	Do.
10	Argonaut	Mother Lode	Amador	17	Argonaut Mining Co., Ltd.	Do.
11	Butte Unit	Oroville	Butte	22	Yuba Consolidated Gold Fields.	Dredge.
12	Alhambra-Shumway.	Mother Lode	Eldorado	(1)	Alhambra-Shumway Mines, Inc.	Gold ore.
13	Yellow Aster	Randsburg	Kern	15	Anglo American Mining Corporation, Ltd.	Do.
14	Snelling	Snelling	Merced	12	Snelling Gold Dredging Co.	Dredge.
15	Iron Mountain	Iron Mountain	Shasta	13	The Mountain Copper Co., Ltd.	Gold ore.
16	Merced Unit	Snelling	Merced	10	Yuba Consolidated Gold Fields.	Dredge.
17	Ohio Point	Rich Bar	Plumas	32	Virgilia Mining Corporation.	Gold ore.
18	Sheepranch	East Belt	Calaveras	16	St. Joseph Lead Co.	Do.
19	Sliger	Mother Lode	Eldorado	66	Middle Fork Gold Mining Co.	Do.
20	Alabama	Ophir	Placer	30	Alabama California Gold Mines Co.	Do.
21	Cactus Queen	Mojave	Kern	11	Cactus Mines Co.	Gold-silver ore.
22	Walker	Genesee	Plumas	100	Walker Mining Co.	Copper ore.

25	San Joaquin dredge.	Snelling	Merced	23	San Joaquin Mining Co.	Dredge.

1 Production began Mar. 14, 1939.

the State in that year. Newcomers to the list in 1939 were six lode mines, which displaced four connected-bucket dredges and two lode mines; all of them had substantial output in 1938 except the Alhambra-Shumway, which began production March 14, 1939, after a long exploration campaign. Of the leading mines, 16 yielded gold from gold ore, 7 from dredging gravel, and 1 each from gold-silver ore and copper ore. The mines ranking first, second, and sixth are in the Grass Valley-Nevada City district of Nevada County.

Silver.—Most of the silver output of California in 1939 was more centralized than that of the gold; the 10 leading silver-producing mines, listed in the following table, yielded 83 percent of the State total recoverable silver in that year. Newcomers to the list in 1939 were the Walker mine in the Genesee district, Plumas County, and the Alabama mine in the Ophir district, Placer County, which displaced the Silverado-Kentuck in the Mount Patterson district, Mono County, and the Idaho Maryland mine in the Grass Valley-Nevada City district, Nevada County. The two newcomers were substantial producers in 1938; the Idaho Maryland ranked eleventh in 1939, but the Silverado-Kentuck, leading silver producer for several years before 1938, was idle in 1939. Of the 10 leading mines in 1939, 5 yielded silver from gold ore, 4 from gold-silver ore, and 1 from copper ore. Only 42,132 ounces of silver came from straight silver ores in 1939. In addition to the mines listed, some silver was reported recovered from almost every lode and placer mine operating in the State in 1939.

Ten leading silver-producing mines in California in 1939, in order of output

Rank	Mine	District	County	Rank in 1938	Operator	Source of silver
1	Cactus Queen	Mojave	Kern	1	Cactus Mines Co	Gold-silver ore.
2	Golden Queen	do	do	5	Golden Queen Mining Co.	Gold ore.
3	Grigsby (Palisade)	Calistoga	Napa	6	Graham Loftus Oil Corporation.	Gold-silver ore.
4	Lava Cap	Grass Valley-Nevada City.	Nevada	2	Lava Cap Gold Mining Corporation.	Gold ore.
5	Starlight	Mojave	Kern	3	Lodestar Mining Co	Do.
6	Walker	Genesee	Plumas	11	Walker Mining Co	Copper ore.
7	Kelly	Randsburg	San Bernardino.	4	F. Royer and lessees	Gold-silver ore.
8	Empire Star mines	Grass Valley-Nevada City.	Nevada	8	Empire Star Mines Co., Ltd.	Gold ore.
9	Standard	Bodie	Mono	9	Roseklip Mines Co	Gold-silver ore.
10	Alabama	Ophir	Placer	13	Alabama California Gold Mines Co.	Gold ore.

Copper.—The discontinuance of a production-curtailment program at the Walker mine in the Genesee district, Plumas County, was the outstanding feature of the California copper-mining industry in 1939; this mine produced over 96 percent of the copper output of the State.

Lead.—Almost two-thirds of the small production of lead in California in 1939 came from Riverside County; Inyo County was the second-largest producer.

Zinc.—Production of zinc in California in 1939 was valued at only $624.

Gold produced at placer mines in California, 1935–39, by classes of mines and by methods of recovery

Class and method	Mines producing [1]	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average per cubic yard

1938	676	149,864,000	572,513.00	20,037,955	.134
1939	[6] 749	162,335,000	636,045.00	22,261,575	.137

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] In 1935 there were 36 connected-bucket dredges in operation; in 1936, 40; in 1937, 46; in 1938, 48; and in 1939, 47.
[3] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant. In 1939, as a result of the moving of dragline dredges, 142 mines were worked by 109 dredges; corresponding data for earlier years are incomplete.
[4] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge." In 1939, as a result of the moving of nonfloating washing plants, 114 mines were worked by 101 plants; corresponding data for earlier years are incomplete.
[5] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[6] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

MINING INDUSTRY

The tonnage of material treated from lode mines in California in 1939, compared with 1938, increased 20 percent and the yardage at placer mines 8 percent; the output of lode gold rose 8 percent and that of placer gold 11 percent. Thus, the average grade of lode material declined, whereas the average gold content of gravels rose. Of the State total gold in 1939, 56 percent was from lode mines and 44 percent from placers.

Dredges of the connected-bucket type handled 75 percent of the gravel mined, and they recovered 58 percent of the State total placer gold in 1939; the quantity of gravel handled by such dredges increased, but the total value of the gold recovered decreased compared with the preceding year for the first time since 1930.

The second most important method of placer mining—dragline dredging—continued in 1939 its spectacular rise as a means of recovering gold. The first dragline dredge production in the United States was reported in California in 1933, when two outfits began work late in the year and recovered less than 100 ounces of gold. In 1939, 142 properties were worked by 109 dragline dredges. It will be noted that the average gold recovery by dragline dredges reversed a downward trend and rose to 19.1 cents a cubic yard in 1939. Many dragline operators appear to find that moving to smaller and smaller bodies of gravel is profitable, provided the recoverable gold content is substantially higher than the material available in larger bodies. During 1939 dragline dredges treated 19 percent of the State total placer gravels and recovered 27 percent of the total placer gold.

Nonfloating washing plants to which gravel was delivered by mechanical means showed a very large gain over 1938 in yardage handled and gold recovered, and the average gold recovery per cubic yard of gravel treated rose from 22.8 to 26.5 cents. Equipment was moved from one property to another, as was the practice with dragline dredges, and 114 mines were worked by 101 plants. Some of these nonfloating washing plants are stationary; others are built to move on skids, wheels, or tracks, or by other means. Dragline excavators, power shovels, slackline excavators, trucks, bulldozers, and other machines were used to deliver gravel to these washing plants.

Gold production by hydraulicking, small-scale hand methods, and drift mining was lower in 1939 than in 1938.

Consumption of quicksilver at California placer mines was 19,617 pounds in 1939. The following quantities of gold were recovered per pound of quicksilver used: Connected-bucket dredging, 41 ounces; dragline dredging, 29 ounces; nonfloating washing plants with mechanical gravel handling, 31 ounces; hydraulicking, 21 ounces; small-scale hand operation, 13 ounces; and drift mining, 26 ounces.

ORE CLASSIFICATION

Of the 5,577,853 tons of ore (including 637,891 tons of old tailings) sold or treated in 1939, 91 percent was dry gold ore and old tailings, 7 percent copper ore, and most of the remainder dry gold-silver ore.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in California in 1939, with content in terms of recovered metals

METALLURGIC INDUSTRY

During 1939, as in former years, most of the ore and virtually all the old tailings were treated at amalgamation and cyanidation mills (with or without concentrating equipment); 91 percent of the total ore and old tailings was treated at such mills in 1939. Almost all the remaining ore and all the rest of the old tailings were treated at concentrating mills. Only 11,078 tons of crude ore were shipped for direct smelting. Smelters received 53,340 tons of flotation concentrates and 2,672 tons of gravity concentrates from California mine operators in 1939. Comparing 1939 with 1938, there was an increase of 36 percent in ore and a decrease of 35 percent in old tailings treated at amalgamation and cyanidation mills; ore and old tailings combined increased 20 percent. The quantity of material treated at concentrating mills rose 29 percent, and the quantity of crude ore smelted declined 13 percent. The increase in quantity of concentrates shipped in 1939 for smelting was due largely to expanded production at the Walker mine in Plumas County, which made very large shipments of copper concentrates.

Quicksilver consumption at California amalgamation mills was 13,125 pounds in the treatment of 2,902,583 tons of material to recover 342,296 ounces of gold and 63,720 ounces of silver in 1939. In the treatment of 1,409,777 tons of ore, 262,445 tons of old tailings, and 10,648 tons of concentrates to recover 175,086 ounces of gold and 838,056 ounces of silver, cyanide consumption was 778,579 pounds of 91-percent sodium cyanide and 775,426 pounds of commercial calcium cyanide (50-percent NaCN equivalent); in terms of 98-percent NaCN the consumption was 1,118,592 pounds, or 0.66 pound per ton. A substantial part of the cyanide was consumed at custom mills.

Companies producing most of California's lode gold in 1939 owned and operated their own metallurgical plants, but a number of custom mills were active and served small-scale miners principally. The leading operators of metallurgical plants receiving custom material were: Burton Bros., Inc., Rosamond, Kern County; Golden Queen Mining Co., Mojave, Kern County; Mineral Reduction Co., Benton, Mono County; Gold Crown Mining Co., Ltd., east of Twentynine Palms, San Bernardino County; and Keeler Gold Mines, Inc., Keeler, Inyo County. All these mills were cyanidation plants and accepted ore and old tailings. The Idaho Maryland Mines Corporation, Grass Valley, Nevada County, discontinued custom work on ore and concentrates during 1939, except for a few lots. The largest metallurgical custom plant in California continued to be the State's only smelter—the Selby lead plant of the American Smelting & Refining Co., at Selby, Contra Costa County.

Mine production of metals in California in 1939, by methods of recovery, in terms of recovered metals

[1] Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 17 and their output included under "Other counties and districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 2,543,008 ounces from lode mines and 56,131 ounces from placers.

[4] East Belt district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[5] Mother Lode district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[6] Output from property not classed as a "mine."

[7] Camanche district lies in Amador, Calaveras, and San Joaquin Counties.

[8] West Belt district lies in Calaveras and Eldorado Counties.

[9] Included under "Other counties and districts."

[10] Exclusive of placer output, which is included under "Other counties and districts."

[11] Chidago district lies in Inyo and Mono Counties.

[12] Slate Range district lies in Inyo and San Bernardino Counties.

[13] Randsburg district lies in Kern and San Bernardino Counties.

[14] Exclusive of lode output, which is included under "Other counties and districts."

[15] Dale district lies in Riverside and San Bernardino Counties.

[16] Santa Rosa district lies in Orange and Riverside Counties.

[17] Includes following: Camanche district in Amador County; Golden Summit in Butte County; Sycamore in Fresno County; Cargo Muchacho (placer) in Imperial County; Coso (placer) and Modoc in Inyo County; Randsburg (placer) in Kern County; Monterey County (Los Burros district); Orange County (Lucas and Santa Rosa districts); Butcher Ranch (lode) and Damascus in Placer County; Genesee (placer) and Gold Lake in Plumas County; Paradise in San Bernardino County; Iron Mountain, North Cow Creek, Redding (lode), and Shasta (placer) in Shasta County; Pike in Sierra County; Jenny Lind in Stanislaus County; New River (lode) in Trinity County; Ventura County (Snowey district); and Bear Valley, Browns Valley, Challenge (lode), and Yuba River in Yuba County.

ALPINE COUNTY

Monitor district.—The Zaca Mining Corporation, which operated the Zaca mine, was the principal producer in Alpine County in 1939.

AMADOR COUNTY

Camanche district.—The Comanche Gold Dredging Co. was consolidated with the Gold Hill Dredging Co. during 1939, and dredging by the Comanche boat was continued under the Gold Hill name. The dredge had sixty-two 7-cubic foot buckets.

East Belt district.—Garibaldi Bros. operated a nonfloating washing plant about one-half mile east of Volcano intermittently during 1939. E. A. Kent operated a dragline dredge on the South Branch of Sutter Creek one-half mile south of Volcano from January 1 until June 6; the dragline excavator had a 2½-cubic yard bucket. Lessees carried on hydraulic operations at the Union Flat mine from February 1 to July 1. The Fort Ann Mining Co. worked the Fort Ann mine from March 1 to June 1 and treated its ore by amalgamation and concentration.

Ione district.—The Arroyo Seco Gold Dredging Co. worked a property 3 miles west of Ione throughout 1939; the company's connected-bucket dredge had eighty-six 6-cubic foot buckets and was powered by electricity. The Lancha Plana Gold Dredging Co. operated a connected-bucket dredge on Jackson Creek almost continuously during the year; the electric-powered dredge was of Yuba type, with sixty-five 4½-cubic foot buckets. H. G. and H. H. Kreth hydraulicked gravel on the Horton claim at Buena Vista on Jackson Creek from the first of the year until May 12. E. L. Lilly operated a dragline dredge with a 2¼-cubic yard bucket on the Lorentz property from January 1 to August 21. The San Andreas Gold Dredging Co. moved one of its dragline dredges from Calaveras County to a property near Ione and began operations on September 21; the dragline excavator was Diesel-powered and used a 1½-cubic yard bucket. E. A. Kent operated a dragline dredge on Sutter Creek 5 miles west of the town of Sutter Creek; the dragline excavator had a 2½-cubic yard bucket. The Universal Dredging Corporation and the Humphreys Gold Corporation carried on dragline dredging.

Mother Lode district.—The Placeritas Mining Co. operated a dragline dredge on Indian Creek throughout 1939 except for a 6-week shut-down during August and September; the dragline excavator had a 1¼-cubic yard bucket. The River Pine Mining Co. worked a dragline dredge. Two dragline dredges operated on the Hingston ranch part of the year. The dredge formerly operated by Wolin, Hall, & Wackman was worked during the early months of the year by Wolin-Hall; the plant was sold May 6 to T. M. Hingston, who optioned the dredge to Searcy and Poole on November 6. E. L. Lilly began work on the same property with a larger dragline dredge August 27 and continued until the end of the year; his dragline excavator was equipped with a 2¼-cubic yard bucket. A large number of other placer operators, including many snipers, were reported in the Mother Lode district. The Argonaut Mining Co., Ltd., operated the Argonaut mine throughout 1939; the company gold ore was treated by amalgamation and flotation, and the concentrates were shipped to a smelter. In addition to operations at the Argonaut mine, the company started work June 1 on the tailings pile at the Plymouth mine and continued production until the end of the year; for this operation the company built a flotation and cyanidation plant with a daily capacity of 500 tons. The tailings pile contained approximately 750,000 tons when operations began. The Central Eureka Mining Co. operated the Central Eureka and Old Eureka mines throughout the year. According to the company printed annual report for the year ended December 31, 1939, 50,242 tons of ore were treated, from which the mill recovered $25.13 per ton; except for a small quantity of silver, the product was gold and totaled $1,262,395.86; 86 percent was recovered by amalgamation and 14 percent by cyanidation of flotation concentrates. During the year $270,000 was paid in dividends. The Delta Tailings Co. continued to cyanide material derived from a deposit of old tailings collected as a delta on one of the streams draining a section of the Mother Lode district. The Fremont Gover Co. continued operations at the Fremont Gover group of claims; part of the work at the property was reopening of old workings. The Kennedy Mining & Milling Co. operated the Kennedy mine throughout 1939; gold ore was treated by amalgamation and flotation, and old tailings were treated in the company 1,000-ton cyanide plant. The Keystone Mine Syndicate worked the Keystone mines throughout the year; 65,291 tons of ore were treated in the company 225-ton amalgamation-flotation mill; and gold recovery was 3,610 ounces in bullion and 3,752 ounces in concentrates sent to a smelter.

BUTTE COUNTY

Forbestown district.—Clean-up of the Midas mill site by a lessee, after the Idaho Maryland Corporation had dismantled its mill at the property, resulted in a small production of gold and silver in 1939.

Golden Summit district.—The Table Mountain Dredging Co. worked a dragline dredge at Thompson's Flat during the early months of 1939.

Magalia district.—Wilder and Cornell worked the Evers mine with gasoline shovel and Ainlay bowls from January 1 to June 1, 1939.

Merrimac district.—Piombo Bros. & Co. moved its dragline dredge to French Creek and on June 15, 1939, started operations that continued until the end of the year.

Oroville district.—The Amo drift placer mine treated 987 cubic yards of gravel in 1939, from which 167 ounces of gold and 14 ounces of silver were recovered; the company developed a special gravity-concentration method for saving very fine gold. Baker and McCowan operated a dragline dredge on the Farnan ranch near Palermo, using a 1½-cubic yard dragline excavator from August 1 until the end of the year. The Golden Feather Dredging Co. operated a dragline dredge on the Feather River near Oroville from October 14 to 28; gravel was dredged with a 6-cubic yard dragline excavator. Lord & Bishop worked a dragline dredge on the Gianella ranch from January to March. The Gibson Mining Co. operated a dragline dredge on the Miller property. William Richter & Sons operated a dragline dredge using a dragline excavator with a 1½-cubic yard bucket throughout the year. The Gold Hill Dredging Co. operated a dredge of the connected-bucket type on the east side of the Feather River 7 miles south of Oroville the entire year; the dredge used electric power and had seventy-four 9-cubic foot buckets. Yuba Consolidated Gold Fields operated two electrically powered dredges of the connected-bucket type on land adjoining the Feather River throughout the year; one had eighty-four and the other eighty-nine 9-cubic foot buckets. A very large quantity of gold was reported by gold buyers as having originated from small-scale hand-operated mines in the Oroville district.

Yankee Hill district.—The Morris Ravine Mining Co. treated 1,100 cubic yards of gravel from its drift mine on Table Mountain and recovered 119 ounces of gold and 11 ounces of silver in 1939. Hoefling Bros. worked the Surcease mine throughout the year and treated the ore in a 70-ton flotation and cyanidation plant; the flotation tailings were classified and cyanided, and the concentrates were shipped to a smelter.

CALAVERAS COUNTY

Camanche district.—The Wallace Dredging Co. operated its electrically powered connected-bucket dredge with sixty 3-cubic foot buckets from January 1 to October 11, 1939, on land bordering Bear Creek southeast of Wallace; the dredge was idle the rest of the year. The Lancha Plana Gold Dredging Co. operated the Lancha Plana Dredge No. 2 on gravel along the Mokelumne River throughout the year; the dredge used electric power and had eighty-four 6-cubic foot buckets. At the Merhten Bros. property along the Mokelumne River gravel was delivered to sluice boxes by a carry-all drawn by a tractor.

Campo Seco district.—The Pacific Placers Engineering Co. operated its nonfloating washing plant in 1939 on several properties near Valley Springs.

Copperopolis district.—The Jumbo Consolidated Mining Co. worked the Mt. King mine in the Madam Felix section of the Copperopolis district during 1939; ore was treated in a 250-ton flotation-amalgamation mill, and the concentrates were shipped to a smelter. Ore from the Royal mine, reported as in production throughout the year, was treated in a stamp mill with plate-amalgamation and flotation; concentrates were smelted.

East Belt district.—A lessee operated the Continental mine throughout 1939; 413 tons of gold ore were treated in a stamp mill using amalgamation plates followed by flotation, and 126 ounces of gold were shipped as bullion and 87 ounces were contained in concentrates shipped to a smelter. The St. Joseph Lead Co. worked the Sheepranch mine throughout the year and treated the ore in the company 150-ton amalgamation-flotation mill.

Jenny Lind district.—The California Gold Dredging Co. operated its connected-bucket dredge in the Jenny Lind district (Calaveras County) in 1939 from the first of the year until March 6, when the county line was crossed; the remainder of the year was spent dredging gravels in Stanislaus County. A small connected-bucket dredge was operated on the Dickhart ranch. The Pacific Placers Engineering Co. operated its nonfloating mechanical placer equipment on several properties in the district. The Milton Gold Dredging Enterprise operated its dragline dredge from the first of the year until August 29. The General Dredging Corporation used a dragline dredge on San Antonio Creek from January 1 to August 23; the dragline excavator had a 1½-cubic yard bucket. The General Dredging Corporation took over the dragline dredge operated by the General Gold Corporation (formerly South Gulch Placers) September 1; the dragline excavator had a 2-cubic yard bucket. The former company had operated on South Gulch since May 5, 1939. The Thompson dredge operating east of Linden was converted November 1 from a connected-bucket dredge with twenty-seven 1-cubic foot buckets to a dragline dredge.

Mother Lode district.—The San Andreas Gold Dredging Co. operated a dragline dredge on the Airola and Costa properties from January 2 to February 25, 1939, the dragline excavator using a 1½-cubic yard bucket; this dredge worked the Carrie Rivara property from February 26 to March 5, the Cademartori property from April 6 to 17, the Costa de Martini property from April 18 to May 16, the Drury property from May 7 to July 6, and the Calaveras Cement Co. property from July 7 to August 26; it was then moved to the Ione district of Amador County. On September 9, 1939, the San Andreas Gold Dredging Co. purchased a dragline dredge with a Diesel-powered dragline excavator and a 1-cubic yard bucket from Houston, Houston & Bever; this dredge worked the Bonnie, Bowling Green, and Batten properties the rest of the year. C. E. Gruwell operated a dragline dredge on the Calaveras Central and Vallecito Western properties and worked gravel on Coyote and French Creeks. E. A. Kent worked a dragline dredge on San Antonio Creek 7 miles northeast of Angels Camp from February 21 until March 26, the dragline excavator having a 1¾-cubic yard bucket; this dredge was moved to Coyote Creek 6 miles east of Angels Camp and operated from June 3 to the end of the year. The R. & M. Mining Co. operated a dragline dredge with a dragline excavator equipped with a 1-cubic yard bucket on Coyote Creek throughout the year. Houston Bros. (Houston, Houston, & Bever) treated 500,000 cubic yards of gravel on Coyote Creek between January 1 and September 7 and recovered 4,022 ounces of gold; this dredge was sold to the San Andreas Gold Dredging Co. The Calaveras Land Co. worked the Lloyd drift mine on the Central Hill Channel throughout 1939. In addition to the gold recovered by dragline dredging on the Vallecito Western property, a lessee recovered 274 ounces of gold and 31 ounces of silver from 687 cubic yards of gravel obtained by drift mining. C. E. Gruwell operated the Big Springs quartz mine at Angels Camp throughout the year. The Carson Hill Gold Mining Corporation operated the Carson Hill mine throughout 1939, and 396,114 tons of ore were treated in the company 1,100-ton amalgamation-concentration-cyanidation plant; after amalgamation and concentration the concentrates were reground and returned to the circuit for cyanidation. Amalgamation accounted for the recovery of 12,419 ounces of gold and 1,207 ounces of silver, and cyanidation for 13,751 ounces of gold and 6,611 ounces of silver; 7 tons of concentrates smelted contained 155 ounces of gold and 37 ounces of silver. This company mined a larger tonnage than any other lode property on the Mother Lode. Gold ore was treated by amalgamation and gravity concentration at the Comet mine throughout 1939. The LeRoi Mines, Inc., operated the Easyz Bird mine throughout the year and treated a large tonnage of ore by flotation; most of the recovered gold came from the concentrates shipped to a smelter.

ELDORADO COUNTY[1]

East Belt district.—In 1939 a lessee on the C. G. Woodburn drift mine 2 miles east of Fairplay mined 301 cubic yards of gravel from which 92 ounces of gold and 22 ounces silver were recovered. Work at the Cooley drift mine yielded 87 ounces of gold and 11 ounces of silver from 2,500 cubic yards of gravel. The Rocky Bar mine on the Middle Fork of Cosumnes River 5 miles east of Fairplay yielded 1,042 ounces of gold and 308 ounces of silver from the treatment of 40,000 cubic yards of gravel; in addition, 15,000 cubic yards of overburden were removed. The mine was worked with a 1¼-cubic yard gasoline shovel loading 5-ton dump trucks, which hauled the material to a stationary washing plant. The Cosumnes Mines, Inc., operated the Middle End mine near Grizzly Flat.

Mother Lode district.—The General Dredging Corporation worked the bed of the American River in 1939 near the point where James W. Marshall made his historic gold discovery in 1848; the company operated a dragline dredge which had a dragline excavator with a 1½-cubic yard bucket. Sills Bros. worked the Coolridge and Marr property on Greenwood Creek with a dry-land washing plant from April 1 to July 31. Hoosier Gulch Placers operated a dragline dredge, using an electric dragline excavator with a 3-cubic yard bucket, on Logtown Ravine from June 1 until December 27. The Stuchara Mining Co. worked the Skinner property 1½ miles south of Pilot Knob from May 15 to August 1; gravel was excavated with a ⅜-cubic yard gasoline shovel and the gold recovered in a stationary washing plant. Alhambra-Shumway Mines, Inc., which had been exploring the Alhambra-Shumway mine near Kelsey since 1937, uncovered a high-grade ore shoot during the early months of 1939; production began March 14, and before the end of the year 4,043 tons of ore had been mined, from which 17,572 ounces of gold and 2,401 ounces of silver were recovered by amalgamation and in gravity concentrates. During the year the company paid $268,826.20 in dividends. The Beebe Gold Mining Co. treated 9,482 tons of ore and 982 tons of old tailings in 1939 from the Beebe-Eureka mine, from which 1,752 ounces of gold and 474 ounces of silver were recovered before the mine and mill were closed June 22. Ore from the Black Oak mine was treated by amalgamation and flotation. H. H. Smith treated 500 tons of ore mined at the Funny Bug mine and recovered bullion containing 33 ounces of gold and 11 ounces of silver and concentrates (27 tons) containing 22 ounces of gold, 30 ounces of silver, and 6,713 pounds of copper. The Lode Development Co. worked the Rozecrans mine from January 1 until mine operations were suspended July 31; the mill treated ores from other mines later in the year. The Middle Fork Gold Mining Co., one of the leading producers in Eldorado County, worked the Sliger mine in the Spanish Dry Diggings section of the Lode throughout 1939; the company reported good headway in sinking its new shaft. A pocket at the Stuckslager mine 10 miles west of Placerville yielded 50 tons of ore containing 267 ounces of gold and 46 ounces of silver. The Lode Development Co. operated the Taylor mine from April 1 to October 1; the ore was treated at the Rozecrans mill.

[1] *See also* Logan, C. A., Mineral Resources of Eldorado County, Calif.: Jour. Mines and Geol., State Min. Rept., vol. 34, No. 3, 1938, pp. 206–280.

West Belt district.—The Big Canyon Dredging Co. operated a dragline dredge using a Diesel-powered dragline excavator with a 3½-cubic yard bucket on Big Canyon Creek throughout 1939; 3,735 ounces of gold and 451 ounces of silver were recovered from 710,000 cubic yards of gravel. A dragline dredge using a dragline excavator with a 1½-cubic yard bucket was operated from April 1 until the end of the year by the Horseshoe Dredging Co. on Weber Creek; 225,350 yards of gravel were treated and 1,298 ounces of gold recovered. The Lemroh Mining Co. treated 100,762 cubic yards of gravel on Weber Creek 10 miles west of Placerville by dragline dredging and recovered 663 ounces of gold; operation was begun October 21 and continued until the end of the year. The dragline excavator was electrically powered and had a 1-cubic yard bucket. A dry-land dredge mounted on four wheels and fed by a dragline excavator with a 1½-cubic yard bucket was used at the Muir mine on Sweetwater Creek 7 miles west of Rescue; 34,680 cubic yards of gravel were treated and 289 ounces of gold recovered. The Mountain Copper Co., Ltd., worked the Big Canyon mine throughout 1939; the ore was treated in the company 300-ton flotation mill, and the concentrates were shipped to a smelter. The El Dorado Crystal mine was operated throughout the year, and the ore was treated by cyanidation.

FRESNO COUNTY

Friant district.—The Grant-Service Rock Co. recovered more than $5,000 in gold in 1939 as a byproduct at its Rockfield sand and gravel plant on the San Joaquin River.

HUMBOLDT COUNTY

China Flat district.—The Frederick Gold Mining Corporation operated a nonfloating washing plant and an electrically powered excavator at its mine on Willow Creek in 1939.

Orleans district.—Hydraulicking of 4,000 cubic yards of gravel at the Nichols mine on Red Cap Creek yielded 84 ounces of gold and 9 ounces of silver in 1939. Cleaning bedrock at the Pearch hydraulic mine on the Klamath River northwest of Orleans yielded 154 ounces of gold and 23 ounces of silver.

IMPERIAL COUNTY

Cargo Muchacho district.—In 1939 the Desert Gold & Aluminum Corporation used a power shovel for delivering gravel to stationary sluice boxes. The American Girl mine was operated by O'Brien Mines, Inc., from the first of the year until April 30, when the company was consolidated with Gold Diggers, Inc. The new organization, Allied Mines, Inc., worked the property until August 7, when operations were suspended owing to lack of profitable ore; 33,345 tons of ore were treated in the company 160-ton flotation mill, and 888 tons of copper concentrates shipped to smelters contained 4,815 ounces of gold, 1,863 ounces of silver, and 71,605 pounds of copper. This operation was in process of liquidation at the end of the year. The Holmes & Nicholson Mining & Milling Co. worked the Cargo Muchacho Group comprising the Madre, Padre, Madre No. 2, Cargo Muchacho, and Cargo Muchacho No. 3 claims; the gold ore was hauled to the company 80-ton cyanide mill 12 miles from the mine and 4 miles west of Winterhaven. This mill also accepted custom ore. The Sovereign Development Co. worked the Sovereign mine in the same district; all the ore, except a small quantity shipped for direct smelting, was treated by cyanidation. The principal product was gold. A small quantity of Tumco old tailings was treated by cyanidation.

INYO COUNTY [2]

Carbonate district.—Gold ore from the Ashford and Golden Treasure mines was shipped to a custom cyanide plant and to a smelter in 1939.

Cerro Gordo district.—Ore and old tailings from the Monte Carlo mine were treated early in 1939 in the 75-ton countercurrent decantation-cyanidation plant of Keeler Gold Mines, Inc.; this plant also treated custom ore, principally from the Skidoo section of the Wildrose mining district.

Coso (Darwin) district.[3]—A number of old mines in the Coso district were explored during 1939, and several small shipments of gold and gold ore were reported.

Echo Canyon district.—A number of shipments of gold ore were made from the Inyo mine to a custom cyanidation mill in 1939.

Fish Springs district.—Several kinds of ore were shipped from the Montezuma mine in 1939—25 tons of gold-silver ore shipped to a custom cyanide plant yielded 3 ounces of gold and 193 ounces of silver; from 33 tons of zinc-lead ore shipped to a selective-flotation custom mill concentrates were made, containing 2 ounces of gold, 260 ounces of silver, 6,435 pounds of lead, and 7,914 pounds of zinc; and 70 tons of lead ore shipped to a smelter contained 6 ounces of gold, 629 ounces of silver, 164 pounds of copper, and 15,075 pounds of lead.

Sherman district.—The Argus Mining Co. operated the Orondo mine throughout 1939; the ore was crushed, and gold and silver were extracted by cyanide leaching. Burton Bros., Inc., cyanided 18,117 tons of ore from its Ruth mine and recovered 2,930 ounces of gold and 651 ounces of silver; the ore was very porous and after crushing was treated by cyanide leaching in a 5-day cycle.

South Park district.—Banta Mines produced 239 tons of gold ore at the American Eagle and Suitcase mines during 1939; the ore was treated by amalgamation and cyanidation and yielded 168 ounces of gold and 147 ounces of silver. The Gem Mines, Inc., operated a flotation mill at the Gem mine in the Jail Canyon section of the South Park district. Lessees worked the Gold Bug mine.

Union district.—Ore was shipped to custom cyanidation plants from the Reward (Brown Monster) mine during 1939.

Wildrose district.—Lessees operated the Del Norte mine in the Skidoo section of the Wildrose district during 1939; the ore was shipped to custom cyanidation mills for treatment. P. H. Greer Co., Inc., worked the Gold King mine for 8 months and shipped 1,273 tons of ore to a custom cyanidation mill; 726 ounces of gold and 3 ounces of silver were recovered.

KERN COUNTY

Agua Caliente district.—Gold ore was treated by amalgamation and gravity concentration at the Aunt Rosa mine in 1939.

Cove district.—The Kern Mines, Inc., worked the Big Blue and Lady Belle groups throughout 1939 and treated 34,259 tons of ore by amalgamation and flotation in its 150-ton mill; the product was 2,178 ounces of gold and 887 ounces of silver, recovered as bullion, and 481 tons of concentrates which contained 5,724 ounces of gold, 5,611 ounces of silver, 1,314 pounds of copper, and 11,900 pounds of lead.

Mojave district.—Lindgren and Ryder shipped 240 tons of ore from the New Bob-Tail mine to a custom cyanidation mill in 1939; 139 ounces of gold were recovered. The Cactus Mines Co. operated the Cactus Queen mine in the Middle Butte section of the Mojave district throughout the year; gold-silver ore was treated in the company 125-ton cyanidation and flotation mill, and the resulting concentrates were shipped to a smelter. This mine was the State's leading silver producer in 1939, as in 1938. Gold ore was shipped to a custom cyanidation plant from the Eureka mine in 1939. Lessees shipped 6,722 tons of ore to a custom cyanide plant from the Fairview mine in the Rosamond section of the Mojave district; 1,334 ounces of gold and 5,270 ounces of silver were recovered. Four sets of lessees at the Four Jacks mine mined 2,481 tons of ore, which was shipped to custom cyanide mills and yielded 765 ounces of gold and 13,995 ounces of silver. The Pride of Mojave Mining Co. worked the Four Star mine. The Golden Queen Mining Co. operated the Golden Queen mine the entire year; in addition to treating a large tonnage of company ore in its 425-ton cyanidation mill, it did a substantial custom-mill business. The Lodestar Mining Co. worked the Lodestar mine throughout the year and shipped gold ore to the Golden Queen mill for treatment. Lessees worked the Middle Butte mine. Burton Bros., Inc., operated the Tropico mine both on company account and through lessees; 15,226 tons of ore cyanided yielded 4,877 ounces of gold and 15,674 ounces of silver. In addition to treating company and lessee ore, the organization handled custom ore for more than 350 shippers. As a pioneer in California custom milling east of the Sierra Nevada Mountains, Burton Bros., Inc., has been an important factor in the development of mineral resources within a radius of many miles. Owing to good roads and cheap truck transportation, ore has been sent to this mill from mines more than 100 miles away. Whitmore Mines, Inc., and lessees shipped 1,573 tons of gold-silver ore to custom cyanide mills; 444 ounces of gold and 12,690 ounces of silver were recovered. Lessees shipped gold ore to custom cyanide mills from the Yellow Dog mine throughout 1939.

Pioneer district.—A lessee on the Mammoth property in the Keysville section of the Pioneer district cyanided old tailings in 1939.

Randsburg district.—The Big Dyke mine was operated intermittentlyd uring 1939. Ore and old tailings were treated by amalgamation at the Black Hawk mine. The Butte Lode Mining Co. worked the Big Butte property. Ore and old tailings were treated by amalgamation at the King Solomon mine. Ore was shipped to custom mills from the Lucky Boy mine; 302 tons of ore yielded 336 ounces of gold and 93 ounces of silver. At the Operator mine ore was amalgamated and old tailings were cyanided. The Anglo American Mining Corporation, Ltd., operated the Yellow Aster mine [4] and old tailing pile from the first of the year until December, when a labor strike caused suspension of operations. According to the company printed annual report for the year ended December 31, 1939, 852,438 tons of ore were mined from the open pit and dumps, of which 845,654 tons were crushed and screened; the undersize—271,413 tons—was milled and the oversize discarded as waste; 266,907 tons were cyanided. The average content of the ore in place was valued at 72 cents per ton, the average of cyanide-plant tailings at 28 cents per ton, and the average of oversize discarded at 26 cents per ton. Ore was mined with power shovels and delivered to the crushing plant in trucks. In addition to the ore sent to the cyanide plant, 156,243 tons of old tailings were cyanided. When the labor strike was settled March 26, 1940, the pit was not reopened, but cyanidation of old tailings was resumed. This company handled more than a million tons of ore and old tailings and ranked higher in tonnage worked than any lode mine in the State during 1939.

LOS ANGELES COUNTY

Cedar district.—The Governor mine operated by the Governor Mine Co. was the leading producer of gold in Los Angeles County in 1939.

MADERA COUNTY

Potter Ridge district.—A lessee worked the Enterprise mine throughout 1939. A 35-ton cyanide leaching plant treated old tailings at the Nogi Extension mine from January 1 to September 20; 4,102 tons of old tailings yielded 159 ounces of gold and 43 ounces of silver.

MARIPOSA COUNTY

East Belt district.—The Bandarita Mining Co. worked the Bandarita mine in the Red Cloud section of the East Belt district throughout 1939 and treated 1,228 tons of ore by amalgamation and flotation; 179 ounces of gold and 22 ounces of silver were recovered in bullion, and 125 ounces of gold, 150 ounces of silver, and 254 pounds of copper were contained in 73 tons of concentrates. A lessee operated the Marble Springs mine during 1939 and treated 466 tons of ore by amalgamation to recover 124 ounces of gold and 32 ounces of silver. Operation of the Nutmeg mine in the Whitlock section of the district from January 1 to November 1 resulted in the production of 425 tons of ore yielding 394 ounces of gold and 92 ounces of silver by amalgamation; the property was sold November 1 to an organization that prepared for expanded production by building a powerline to the property, installing a 25-ton mill, and deepening the shaft 130 feet. The San Juan Ramsey Co. worked the Original and Ferguson mine throughout the year; 7,573 tons of ore treated by amalgamation and flotation yielded bullion, containing 1,911 ounces of gold and 510 ounces of silver, and 81 tons of concentrates, containing 256 ounces of gold and 141 ounces of silver. Amalgamation of 665 tons of ore at the Our Chance mine yielded 344 ounces of gold and 58 ounces of silver.

[4] *See also* Frolli, A. W., Open-pit Mining and Milling Methods and Costs at the Yellow Aster Mine, Randsburg, Calif.: Bureau of Mines Inf. Circ. 7096, 1940, 46 pp.

Hunter Valley district.—The Cotton Creek Mining Co. worked the Cotton Creek mine during 1939. The Mount Gaines Mining Co. operated the Mount Gaines mine in the Quartzburg section of the Hunter Valley district throughout the year; 19,341 tons of ore treated by amalgamation and flotation yielded bullion, containing 3,793 ounces of gold and 1,189 ounces of silver, and 445 tons of concentrates, containing 3,527 ounces of gold, 1,332 ounces of silver, 1,758 pounds of copper, and 324 pounds of lead. The Mariposa-Washington Mining Co. worked the Washington mine, also in the Quartzburg section of the district, from August 1 to the end of the year and built a 75-ton concentrating mill. A lessee on the Ruth Pierce property in the Hornitos section of the district cyanided 3,181 tons of old tailings and recovered 176 ounces of gold and 149 ounces of silver; the tailings were given a 72-hour leach.

Mother Lode district.—A bulldozer was used to move 10,000 cubic yards of gravel to sluices at the Five Aces mine on the North Fork of Merced River; 105 ounces of gold and 11 ounces of silver were recovered in 1939. The Trebor Corporation operated a dragline dredge on Agua Fria Creek for 9 months; the dragline excavator had a 2-cubic yard bucket. The Bondurant Mining & Milling Co. worked the Bondurant mine. Madden and Goulter worked the Goldbug, Miocene No. 2, and Miocene No. 3 claims from May until the end of the year; 138 tons of ore amalgamated yielded 595 ounces of gold and 122 ounces of silver. The Buckeye Mining Co. worked the Granite King mine throughout the year and produced 396 tons of ore from which 285 ounces of gold and 91 ounces of silver were recovered by amalgamation. Operation of the Hasloe mine yielded 211 tons of ore, from which 199 ounces of gold and 76 ounces of silver were recovered by plate-amalgamation and barrel-amalgamation of gravity concentrates. The Boston California Mining Co. operated the Malvina mine. The Pacific Mining Co. worked the Pine Tree and Josephine mines throughout the year and treated ore in the company 150-ton flotation mill; jig concentrates were amalgamated and flotation concentrates shipped to a smelter. This company was the largest gold producer in Mariposa County in 1939. A partnership worked the Red Banks mine from March 15 to October 15 and treated 12,796 tons of ore by amalgamation and flotation; 206 ounces of gold and 70 ounces of silver were recovered as bullion; and 1,340 ounces of gold, 6,822 ounces of silver, and 481 pounds of copper were contained in concentrates.

MERCED COUNTY

Snelling district.—The B & W Mining Co. operated a dragline dredge 1 mile west of the town of Merced Falls from August 15, 1939, until the end of the year, and 120,000 cubic yards of gravel yielded 879 ounces of gold and 102 ounces of silver; the washing plant used electric power, and the dragline excavator (2-cubic yard bucket) burned stove oil. The Merced Dredging Co. operated an electrically powered dredge, with sixty 9½-cubic foot buckets, 1 mile west of Snelling throughout the year. The San Joaquin Mining Co. operated an electrically powered dredge, with sixty-four 9½-cubicfo ot buckets, 3 miles west of Snelling. The Snelling Gold Dredging Co. operated two electrically powered dredges—one with sixty-six and the other with seventy-seven 7-cubic foot buckets; both dredges operated the full year. Four miles east of Snelling the Yuba Consolidated Gold Fields operated throughout the year two electrically powered dredges—one with seventy-two 9-cubic foot buckets and the other with seventy-one 5¾-cubic foot buckets.

MONO COUNTY

Blind Springs district.—Several small mines were active in the Blind Springs district during 1939. The most important development, however, was the building of a cyanidation and flotation custom mill by the Mineral Reduction Co. By the end of the year more than 75 shippers had taken advantage of the mill and nearly 4,000 tons of ore had been treated; treatment of a much larger tonnage in 1940 was expected. Ore was shipped from many points in the Owens Valley and from Nevada, and a substantial revival of mining, particularly at small gold and silver properties, seemed probable.

Bodie district.—The Roseklip Mines Co. operated its 300-ton cyanidation mill on dump ore from the Standard mine throughout 1939. A small cyanide leaching plant treated 1,500 tons of old tailings at the Syndicate mine between July 12 and November 8 and recovered 164 ounces of gold and 379 ounces of silver.

Chidago district.—Lessees operated the Casa Diablo mine and shipped gold-silver ore to a cyanidation custom mill in 1939. The Gold Crown mine also was active.

Mammoth Lakes district.—The Monte Christo Co. worked the Monte Christo mine from October 10 to December 23, 1939; 257 tons of ore shipped to a custom cyanidation plant yielded 168 ounces of gold and 2,981 ounces of silver.

May Lundy district.—The Simpson (Log Cabin) mine was operated during 1939.

White Mountain district.—Molini Bros. operated the Green Monster mine and shipped silver ore to a smelter in 1939.

MONTEREY COUNTY

Los Burros district.—An exploration and development campaign was carried on at the Last Chance property in 1939; new ore was developed in the old mine, and a 25-ton flotation plant was built during the year.

NAPA COUNTY

Calistoga district.—The Graham Loftus Oil Corporation operated the Grigsby (Palisade) mine throughout 1939; the ore was treated by flotation, and the concentrates were shipped for smelting.

NEVADA COUNTY

French Corral district.—The Climax Dredging Co. operated a dragline dredge on the H. C. Black property on Deer Creek from November 10, 1939, until the end of the year. The dragline excavator had a Diesel engine and a 1-cubic yard bucket.

Grass Valley-Nevada City district.—The Atlas Gold Dredging Corporation operated a dragline dredge on several properties, including the Dawson City and the Larsen-Klein, during the first half of 1939. The Innis Dredging Co. treated 750,000 cubic yards of gravel and recovered 5,557 ounces of gold with a dragline dredge during 1939; the dragline excavator had a 2-cubic yard bucket. The Calneva Mining Co. worked gravel on the Martell ranch with a dragline dredge. J. C. Pantle operated a dry-land dredge equipped with Ainlay centrifugal bowls on the Gleason and Robinson ranches on Clear Creek 4 miles south of Rough and Ready; 107,138 cubic yards of gravel treated at the Robinson ranch yielded 563 ounces of gold, and 95,000 yards of gravel treated at the Gleason ranch yielded 303 ounces of gold. William Richter operated a dragline dredge on Scotts Flat Creek from October 25 until the end of the year; the dragline excavator had a 1½-cubic yard bucket. The Grass Valley Bullion Mines, Inc., operated throughout 1939; the ore was trucked to the Idaho Maryland Mines, Inc., mill at Grass Valley for treatment by amalgamation, flotation, and concentrate-cyanidation. Empire Star Mines, Ltd., operated the Empire, North Star, and Pennsylvania mines at Grass Valley; the Murchie mine at Nevada City; the Zeibright mine in Bear Valley; and the Pennsylvania mine at Browns Valley, Yuba County. During the year known bodies of ore at the Murchie mine were exhausted, but exploration work was continued. Early in 1940 a flood on the Bear River washed out the Zeibright tailings pond and caused a cessation of operations until a new tailings-disposal method could be worked out. Cooley Butler operated the Golden Center mine throughout 1939. The Great Northern Mines, Inc., worked the Hoge mine throughout the year; gold ore and old tailings were treated by amalgamation and flotation. A lessee worked the Green Mountain mine at Nevada City. The Idaho Maryland Mines Corporation operated the Idaho Maryland-Brunswick Group throughout 1939. According to the company printed annual report for the year ended December 31, 1939, 115,001 ounces of gold were recovered from 410,411 tons of ore compared with 117,267 ounces of gold recovered from 331,406 tons in 1938. In 1939, 30 percent of the production came from development headings. In addition to company ore, 23,815 tons of custom ore from Grass Valley Bullion Mines, Inc., and 218 tons of custom concentrates were treated in the company metallurgical plant. Dividends declared and paid in 1939 totaled $1,066,285.80. This mine had the largest gold output of any mine in California in 1939. The Lava Cap Gold Mining Corporation operated the Lava Cap mine throughout the year; 116,380 tons of ore were treated by amalgamation and flotation, and the resulting concentrates were shipped for smelting. Recovery was as follows: By amalgamation, 2,285 ounces of gold and 596 ounces of silver; in flotation concentrates, 32,580 ounces of gold, 265,319 ounces of silver, 10,486 pounds of copper, and 17,712 pounds of lead. Development work was continued by the Spring Hill Gold Mines Corporation throughout the year.

Washington district.—The Bradley Mining Co., operator of the Spanish mine, ended in 1939 its long record as the largest producer in the Washington district; the mine was on a production basis until March, on a development basis from April to August, and on a small-production basis by lessees the rest of the year.

You Bet district.—The Pilot Dredging Co. operated a dragline dredge on the Alpha Stores property during 1939. Minnis & Moody worked the Little York placer 3 miles west of Dutch Flat from May 1 to December 1; a ¾-cubic yard gasoline shovel and trucks were used for delivering 18,000 cubic yards of gravel to a stationary washing plant; and 525 ounces of gold were recovered. F. R. Croft operated a dry-bank plant on the Shorty Jefferies mine from January 1 to June 15; a bulldozer and ⅜-cubic yard gasoline shovel were used in delivering gravel to a stationary washing plant; and 351 ounces of gold were recovered.

ORANGE COUNTY

Santa Rosa district.—The Blue Light Silver Mines Co. operated the Silverado or Blue Light mine in Silverado Canyon from May 15, 1939, until the end of the year; 800 tons of ore were treated by flotation, and a bulk concentrate containing 9 ounces of gold, 4,095 ounces of silver, 10,476 pounds of lead, and 9,549 pounds of zinc was shipped to another mill for selective flotation.

PLACER COUNTY

Auburn district.—The Gaylord La Valle drift mine was operated in 1939 (in succession) by Swinburn & Associates, Jose Oro Mining Co., J. A. Conner, and Conner and Swinburn; 1,975 cubic yards of gravel yielded 326 ounces of gold.

Butcher Ranch district.—The Monarch Syndicate cyanided ore from the Monarch mine during the early months of 1939.

Damascus district.—The Lost Camp Mining Co. worked the Lost Camp hydraulic mine in Blue Canyon for 45 days in 1939.

Dutch Flat district.—The Canyon Mines Corporation treated ore from the Rawhide mine throughout 1939 in the company 100-ton amalgamation and concentration mill.

Foresthill district.—The Volcano Mining Co., Ltd., worked the Volcano drift mine throughout 1939; 1,400 cubic yards of gravel yielded 271 ounces of gold and 35 ounces of silver.

Lincoln district.—Pantle Bros. operated a dry-land dredge on the Stevens, Clark, and Ahart ranches and in Auburn Ravine in 1939; in all, 329,000 cubic yards of gravel were excavated with a 1-cubic yard gasoline dragline excavator and delivered to a dry-land washing plant carrying four Ainlay bowls. Fay Placer mine operated a dragline dredge on the Guilford ranch throughout the year; the dragline excavator had a ½-cubic yard bucket. W. K. Jansen treated 245,162 cubic yards of gravel on the Jones and Finney ranches; a dragline excavator with a 1½-cubic yard bucket was used to deliver gravel to a dry-land washing plant. The Midland Co. operated a dragline dredge intermittently during 1939 and treated 250,000 yards of gravel yielding 715 ounces of gold and 104 ounces of silver; the dragline excavator had a 1¼-cubic yard bucket. Four miles east of Lincoln the Jasper-Stacy Co. operated throughout the year an electrically powered dragline dredge using a dragline excavator with a 2-cubic yard bucket. The gravels of this district carry zircon, which was produced as a byproduct at plants using jigs; no market has yet been developed for this product.

Ophir district.—The Panob Gold Dredging Co. operated a nonfloating washing plant, using a dragline excavator with a 1¼-cubic yard bucket, on the F. E. Kayo and the G. E. Stoll properties near Loomis in 1939. The Gold Hill Dredging Co. operated an electrically powered connected-bucket dredge with eighty-seven 8½-cubic foot buckets on the Chabot property 2 miles east of Loomis from January

1 to May 14. F. O. Bohnett operated a dry-land plant on several properties during the year. The Alabama California Gold Mines Co. worked the Alabama mine throughout 1939 and treated 74,539 tons of ore in the company 300-ton amalgamation and flotation mill to yield bullion, containing 10,157 ounces of gold and 3,266 ounces of silver, and 652 tons of concentrates, containing 3,231 ounces of gold, 39,530 ounces of silver, 5,771 pounds of copper, and 26,826 pounds of lead. The Oro Fino Consolidated Mines operated the Oro Fino mine. The Burm Ball Mining Co. operated the Sisley mine throughout the year.

PLUMAS COUNTY

Crescent Mills district.—A. A. Merritt and F. Humphrey, under the name of "Cherokee Mine", produced 8,635 tons of ore from the Cherokee mine between January 16, 1939, and the end of the year; the ore was treated in a 100-ton amalgamation and flotation mill (built during the year) and yielded 165 ounces of gold and 40 ounces of silver in bullion and 1,046 ounces of gold, 277 ounces of silver, and 904 pounds of copper in 35 tons of flotation concentrates. The North Canyon Mines, Inc., worked the Droege and New York mines in 1939. The Indian Valley Mining Co., Inc., worked the Standart mine from January 1 until February 27, when a fire destroyed the 150-ton mill built in 1938; a new 250-ton amalgamation and flotation mill was built and placed in operation August 16, and 24,000 tons of ore treated yielded 1,410 ounces of gold and 347 ounces of silver.

Genesee district.—The Walker mine of the Walker Mining Co. (affiliate of the Anaconda Copper Mining Co.) has been the outstanding mine in Plumas County for many years and was the State's principal copper producer in 1939. According to the company printed annual report for the year ended December 31, 1939, 367,041 tons of ore were milled and 17,342 tons of concentrates produced. Shipments consisted of 17,056 tons of concentrates, lime scale, and precipitates, with a net recovery of 8,010,226 pounds of copper, 180,039 ounces of silver, and 11,777 ounces of gold.

Granite Basin district.—The Robinson mine was operated in 1939 from May until November 10; ore was treated in the 50-ton amalgamation and flotation mill on the property.

Quincy district.—The Imperial mine was active during 1939.

Rich Bar district.—Lord & Bishop operated a dragline dredge at Grays Flat during the early months of 1939. The Virgilia Mining Corporation continued operations at the Ohio Point Group during 1939.

RIVERSIDE COUNTY

Dale district.—A large number of small operations in 1939 were reported in the Riverside County part of the Dale district.

Eagle Mountain district.—The Imperial Smelting & Refining Co. treated 7,903 tons of ore in the 100-ton flotation mill at the Black Eagle mine in 1939; 1,195 ounces of gold, 16,451 ounces of silver, 88,220 pounds of copper, and 676,180 pounds of lead were contained in the concentrates produced. The company contributed 62 percent of the total lead produced in the State in 1939.

Pinacate district.—The Ida Leona Mine & Milling Co. worked the Ida Leona mine throughout 1939.

SACRAMENTO COUNTY

Cosumnes River district.—The Cosumnes Gold Dredging Co. operated a connected-bucket dredge with sixty-three 12-cubic foot buckets 7 miles southwest of Sloughhouse during 1939. The Hoosier Gulch Placers worked bodies of gravel throughout the year on Hoosier Gulch, Katesville Gulch, Lagoon Gulch, and Ohio Gulch with an electrically powered dragline dredge; the dragline excavator used a 2-cubic yard bucket.

Folsom district.—The Capital Dredging Co. operated two connected-bucket dredges in 1939 at its property 5 miles south of Folsom; both dredges were electrically powered—one having 88 and the other 100 18-cubic foot buckets. Cutter & Mueller treated 17,492 cubic yards of gravel on a property 2 miles east of Fair Oaks on the American River from May until December, using a gasoline shovel with a ¾-cubic yard dipper in connection with a dry-bank washing plant; 150 ounces of gold and 8 ounces of silver were recovered. The General Dredging Corporation operated a dragline dredge on two properties on the American River; one dragline excavator had a 1¼-cubic yard bucket and the other a 3-cubic yard bucket. The Natomas Co. operated a fleet of seven dredges, all electrically powered, on its property near Natoma. The number and size of buckets per dredge were: No. 1 dredge, 62 16-cubic foot buckets; No. 4, 67 15-cubic foot buckets; No. 5, 105 12-cubic foot buckets; No. 6, 106 11-cubic foot buckets; No. 7, 98 9-cubic foot buckets; No. 8, 105 12-cubic foot buckets; and No. 10, 83 15-cubic foot buckets.

SAN BERNARDINO COUNTY

Calico district.—A lessee on the Zenda mine in 1939 recovered 8,329 ounces of silver and 2 ounces of gold by treating old tailings in a 12-ton leaching plant; in addition, 107 tons of ore shipped for smelting contained 3,291 ounces of recoverable silver.

Dale district.—The Camco Mining Co. operated the Carlyle mine during 1939. The Gold Crown Mining Co., Ltd., worked the Gold Crown mine throughout the year; in addition to treating company ore, the mill handled a large quantity of custom material. This new outlet for ore helped to reopen many small mines nearby in both San Bernardino and Riverside Counties.

Holcomb Valley district.—The Holcomb Valley Placer Co. operated a dry-bank plant in 1939 from February 5 to November 27. The Santa Fe Gold Mining Corporation worked the Santa Fe mine the latter part of the year.

Ord Mountain district.—The Ramsey Mining Co. worked the Ramsey or Wheeler mine throughout 1939.

Randsburg district.—In 1939 a lessee on the property of Atolia Rand Placers, Inc., 1 mile west of Atolia in the part of the Randsburg district extending from Kern into San Bernardino County, treated 1,309 cubic yards of gravel obtained by trenching and drifting, which yielded 148 ounces of gold and 27 ounces of silver. Lessees working the Kelly mine shipped gold-silver ore to a smelter. The mill at the property was rehabilitated during the year as a cyanidation and flotation plant; treatment of ore began January 1, 1940. In addition to ore from the Kelly mine, custom material is solicited.

Silver Mountain district.—A number of operations in 1939 reported small outputs in the Silver Mountain district; much of the ore produced was shipped to a custom cyanide plant.

Solo district.—The Korfist Mining Co. worked the Aero Trust mine during 1939; most of the ore was shipped to a smelter.

SAN FRANCISCO COUNTY

Small-scale placer miners worked the Pacific Ocean beach sands near the San Francisco-San Mateo County line in 1939 and recovered 224 ounces of gold and 18 ounces of silver.

SAN DIEGO COUNTY [5]

Julian district.—Development work and some production during 1939 were reported at the Ranchito mine.

Pine Valley district.—Ore was shipped to a custom cyanide plant and a smelter from the Eagles Nest Group in Long Valley; the property was discovered in April 1939.

SAN JOAQUIN COUNTY

Linden district.—A. G. Watkins & Sons operated a dragline dredge throughout 1939.

SHASTA COUNTY [6]

French Gulch district.—The Lincoln Gold Dredging Co. treated 198,163 cubic yards of gravel in 1939 and recovered 544 ounces of gold and 61 ounces of silver by dragline dredging on Clear Creek near French Gulch; the dragline excavator had a 1¼-cubic yard bucket. Operations at the Mad Ox mine produced 1,327 tons of ore which yielded 211 ounces of gold and 5 ounces of silver. The J. H. Scott Co. worked the Washington mine throughout the year; 8,174 tons of ore were treated by amalgamation and flotation to yield 2,561 ounces of gold and 574 ounces of silver in bullion and 2,200 ounces of gold, 742 ounces of silver, and 4,000 pounds of lead in 330 tons of concentrates.

Igo district.—R. S. Olson operated a dragline dredge on China Gulch, using a dragline excavator with a ¾-cubic yard bucket, throughout 1939. The Clear Creek Dredging Co. operated a dragline dredge from May 1 to the end of the year; the dragline excavator, with a 1½-cubic yard bucket, used Diesel power. Lord & Bishop operated a dragline dredge during 1939. Baker & McCowan operated a dragline dredge with a dragline excavator and a 1½-cubic yard bucket on Dry Creek from January 1 to June 17. Cinco Mineros Co. operated a dragline dredge near Gas Point from January 1 until May 15; the dragline excavator had a 1½-cubic yard bucket. Piombo Bros. & Co. operated a dragline dredge on Dry Creek from January 1 to June 15; the dragline excavator used gasoline-engine power and had a 1½-cubic yard bucket. The Pioneer Dredging Co. operated an electrically powered dragline dredge with a 3-cubic yard bucket in the Happy Valley section of the Igo district. The El Oro Dredging Co.

[6] *See also* Averill, Chas. Volney, Mineral Resources of Shasta County, Calif.: Jour. Mines and Geol., State Min. Rept., vol. 35, No. 2, 1939, pp. 108–191.

worked a dragline dredge on the Rice property. The Roaring River Gold Dredging Co. operated a connected-bucket dredge with seventy-two 3-cubic foot buckets on Roaring River near Gas Point.

Iron Mountain district.—The Mountain Copper Co. Ltd.,[7] largest mineral producer in Shasta County, worked the Iron Mountain mine throughout 1939; the ore was mined by the open-cut method and cyanided in a 500-ton sand-leaching plant and a 200-ton counter-current slime plant.

Old Diggings district.—Walker Mines, Consolidated, worked the Walker mine in 1939 from April until the end of the year; 9,770 tons of ore were cyanided and yielded 984 ounces of gold and 495 ounces of silver.

Redding district.—A sand and gravel plant on the Sacramento River north of Redding recovered 152 ounces of gold and 14 ounces of silver in 1939 as a byproduct in the preparation of 75,000 tons of sand and gravel.

Shasta district.—Treatment of 430 tons of ore in a 600-ton ball mill in the Hopeso mine yielded 159 ounces of gold and 23 ounces of silver by amalgamation in 1939.

SIERRA COUNTY

Alleghany district.—Gamble & Wilson operated the Kenton mine from the beginning of 1939 until December 1. The Dickey Exploration Co. worked the Oriental mine from September 1 until the end of the year; the old stamp mill on the property was rebuilt as a flotation plant so that sulfide ores could be treated. Original Sixteen to One Mine, Inc., largest gold producer in Sierra County, was active throughout the year. After consolidation of O'Brien Mines, Inc., former operator of the Plumbago mine, with Gold Diggers Syndicate, control of the property passed to Allied Mines, Inc., on April 30; 9,854 tons of ore treated by amalgamation and gravity concentration yielded bullion, containing 1,329 ounces of gold and 215 ounces of silver, and 162 tons of concentrates, containing 521 ounces of gold.

Downieville district.—The Ruby mine on Rock Creek near Goodyears Bar was operated throughout 1939 and was the most productive drift placer in the State.

Pike district.—The Sierra Alaska mine was the leading producer in the Pike district in 1939.

Sierra City district.—A lessee on the Colombo property mined 1,200 tons of ore during 1939, most of which was shipped direct to smelters; settlement was made for 1,147 ounces of gold and 40 ounces of silver. The Sierra Buttes Tailing Co. treated 1,311 tons of old tailings by cyanide leaching and gravity concentration and recovered 95 ounces of gold and 28 ounces of silver, in bullion, and 20 tons of concentrates, containing 146 ounces of gold and 46 ounces of silver

SISKIYOU COUNTY

Callahan district.—Yuba Consolidated Gold Fields operated a connected-bucket dredge with seventy-two 9-cubic foot buckets on Scott River north of Callahan throughout 1939.

[7] *See also* Averill, Chas. Volney, The Mountain Copper Co., Ltd., Cyanide Treatment of Gossan: Jour. Mines and Geol., State Min. Rept., vol. 34, No. 3, 1938, pp. 312–330.

Greenhorn district.—The Cal Oro Dredging Co. operated a connected-bucket dredge on Greenhorn Creek north of Yreka intermittently in 1939; the company reported that 1,000,000 cubic yards of gravel were treated, with a recovery of 1,653 ounces of gold and 281 ounces of silver. The Yreka Gold Dredging Co. operated a connected-bucket dredge, with sixty-seven 6-cubic foot buckets, 2 miles north of Yreka.

Humbug district.—William Von der Hellen Mines operated a stationary washing plant on the Klamath River in 1939 from April 12 to the end of the year; two shovels, one of 1½ and the other of 1¼ cubic yards capacity, and six trucks were used in excavating and delivering the gravel to the washing plant.

Klamath River district.—The Lincoln Gold Dredging Co. operated two dragline dredges on Klamath River near Happy Camp in 1939 from March 15 to September 13; one dragline excavator had a 2-cubic yard bucket and the other a 1¼-cubic yard bucket, and 485,910 cubic yards of gravel yielded 3,776 ounces of gold and 454 ounces of silver. Larsen Bros. and Harms Bros. operated a dragline dredge at the Scandia mine on Horse Creek throughout the year; the dragline excavator had a 2½-cubic yard bucket. Merriam Mining Merger worked the Buzzard Hill quartz mine.

Liberty district.—Hydraulicking 20,000 cubic yards of gravel at the Banner mine in 1939 from January 1 to July 10 yielded 117 ounces of gold and 18 ounces of silver. Hydraulicking, drifting, and small-scale hand methods were used at the Joubert mine. A lessee worked the S. T. S. mine on Eddy's Gulch by hydraulicking from January to July. The King Solomon Mines Co. operated the King Solomon mine throughout the year; the ore was mined by the open-cut method and treated by amalgamation in a 300-ton mill.

Salmon River district.—Sacchi & Spellenberg operated a dragline dredge in 1939 on the South Fork of Salmon River near Forks of Salmon from February to the end of the year; the dragline excavator used Diesel power and had a 1½-cubic yard bucket.

Scott Bar district.—A lessee worked the Quartz Hill mine during 1939.

STANISLAUS COUNTY

Jenny Lind district.—The California Gold Dredging Co. operated a connected-bucket dredge, with eighty-one 6-cubic foot buckets, throughout 1939. The Placer Properties Co. operated a dragline dredge on the Stanislaus River near Oakdale from July 18 to the end of the year.

La Grange district.—The La Grange Gold Dredging Co. operated a connected-bucket dredge with sixty-two 9½-cubic foot buckets on the Tuolumne River, and the Tuolumne Gold Dredging Corporation operated a connected-bucket dredge with 100 12-cubic foot buckets throughout 1939.

TEHAMA COUNTY

Bend district.—The Midland Co. operated a dragline dredge in the Bend district for a short time in 1939. The Tehama Dredging Co. operated a dragline dredge on the Evans mine from May 10 to the end of the year; the dragline excavator had a ½-cubic yard bucket.

TRINITY COUNTY

Hayfork district.—The Cinco Mineros Co. operated a dragline dredge, equipped with a dragline excavator using a 1½-cubic yard bucket, near Hayfork in 1939 from May 19 to the end of the year. The Hayfork Gold Dredging Co. operated a dragline dredge during the early months of the year, after which the plant was dismantled and shipped to Sonora, Mexico.

Helena district.—A lessee operated the Enterprise mine throughout 1939 except during June and July; from 560 tons of ore treated by amalgamation and flotation 270 ounces of gold and 59 ounces of silver were recovered in bullion, and 41 ounces of gold and 31 ounces of silver were contained in 41 tons of concentrates.

Junction City district.—The Bergin hydraulic mine was operated 3 months in 1939. Canyon Placers, Inc., worked the Canyon Placers in Canyon Creek 8 miles from Junction City from the first of the year until May 19. The Junction City Mining Co. operated an electrically powered connected-bucket dredge, with seventy-two 10-cubic foot buckets, on Trinity River near Junction City throughout the year. The Goldfield Consolidated Mines Co. worked the Red Hill mine from January 1 to June 1 and from December 9 to 31. The Golden Gravel Mining Co. operated a dragline dredge intermittently on the Sourdough Group on Trinity River 8 miles west of Junction City.

Lewiston district.—Interstate Mines, Inc., operated a dragline dredge during 1939. The Lincoln Gold Dredging Co. moved a dragline dredge, with a dragline excavator using a 2-cubic yard bucket, to the Leas & Lowden, Adrian, and Lunden properties late in the year; the treatment of 55,435 cubic yards of gravel yielded 269 ounces of gold and 31 ounces of silver. The Lewiston Gold Dredging Co. operated a connected-bucket dredge from January 1 until the boat was sunk on December 9. The company reported that work would not be resumed. T. D. and C. R. Harris operated a connected-bucket dredge on Trinity River 4 miles above Lewiston throughout the year; the dredge used electric power and had forty-two 11-cubic foot buckets. The Brown Bear lode mine produced from dumps and mill clean-up. The property was worked by E. E. Erich from January until May, when F. E. Yocum, operating as the Mines Exploration Co., took over the lease; during August a 1,000-ton test run was made on dump ore.

New River district.—Johnston Bros. operated the Hazel D property during 1939, and the ore was treated in a 25-ton amalgamation mill.

Salyer district.—The Swanson Mining Corporation hydraulicked a small yardage of high-grade gravel on the South Fork of Trinity River, working intermittently between January 1 and May 29, 1939.

Trinity Center district.—The Carrville Gold Co. operated its connected-bucket dredge through its agent, Yuba Consolidated Gold Fields, from September 15, 1939, to the end of the year.

Weaverville district.—The General Utility Corporation operated a dragline dredge in 1939 on Redding Creek near Douglas City from January 1 to March 18; the Diesel-power dragline excavator had a 1½-cubic yard bucket. The Viking Dredging Co. operated a dragline near the confluence of Redding Creek and Trinity River throughout the year; a dragline excavator with Diesel power and a 2-cubic yard bucket was used. The Sound Gold Co., Inc., operated a dragline washing plant from October 21 to the end of the year; 12,000 cubic yards of gravel yielded 114 ounces of gold and 17 ounces of silver. The Weaver Dredging Co. operated a dragline dredge, using a dragline excavator with a 2½-cubic yard bucket, on Weaver Creek throughout 1939; 1,161,254 cubic yards of gravel yielded 4,263 ounces of gold and 372 ounces of silver. The Oro Trinity Dredging Co. operated a dragline dredge, with a dragline excavator using a 1½-cubic yard bucket, near Weaverville throughout the year.

TUOLUMNE COUNTY

East Belt district.—Moccasin Mines operated a dragline dredge on Moccasin Creek from January 1 to March 15, 1939, when the property was turned over to H. Hellwig, who operated it until August 21; the dragline excavator was equipped with Diesel power and a 2-cubic yard bucket. Under the Hellwig management 438,223 cubic yards of gravel were handled and yielded 2,506 ounces of gold and 431 ounces of silver. The Densmore Gold Mines, Inc., which had been financed by the Reconstruction Finance Corporation, turned the Densmore mine over to a group of lessees on April 1, 1939. The Shoe String Mining Co. operated the Experimental mine during 1939; 350 tons of ore yielded 147 ounces of gold and 20 ounces of silver by amalgamation. The La Guria Gold Mining Co. operated the Liguira mine throughout the year; a 30-ton cyanide mill was installed, but failure of the slimes to leach resulted in discontinuance of the operation. A lessee worked the Ryan mine. The Bald Mountain Mines, Inc., worked the Sugarman mine from May 11 to the end of the year; 150 tons of ore yielded 140 ounces of gold and 8 ounces of silver.

Mother Lode district.—The Barker Corporation operated a dragline dredge on Tuolumne River in 1939 from October 21 to December 31. E. A. Kent operated two dragline dredges (No. 1 and No. 3) in Tuolumne County. Dredge No. 1 worked Curtis Creek 5 miles south of Jamestown from the first of the year until February 7; a dragline excavator with a 1¾-cubic yard bucket was used. Dredge No. 3, equipped with a 1½-cubic yard bucket, operated on Woods Creek from June 16 to August 10, when it was closed down owing to lack of water; operations were resumed October 9 and continued until December 6. Hemming Bros. worked the Alameda mine 2½ miles northwest of Jamestown. The Eagle-Shawmut mine was the largest gold producer in Tuolumne County in 1939; operations began in May and continued to the end of the year. The Delgold Corporation worked the Erin-go-Bragh mine. Gold Diggers Syndicate, operator of the Heslep, App, Dutch, and Sweeney mines, was taken over by Allied Mines, Inc., May 1, and mill operations which had been discontinued in March were resumed October 1 and continued to the end of the year; 6,609 tons of ore, treated by amalgamation and flotation, yielded 161 ounces of gold and 40 ounces of silver in bullion and 563 ounces of gold and 342 ounces of silver in 232 tons of concentrates.

YUBA COUNTY

Bear River district.—The Far West Dredging Co. operated a dragline dredge on Bear River during 1939.

Browns Valley district.—Empire Star Mines Co., Ltd., continued operations at the Pennsylvania mine in 1939.

Smartville district.—The Calmich Mining Co. conducted an exploration campaign at the Blue Point mine and produced some gold in 1939 by drift mining. The Williams Bar Dredging Co. operated a connected-bucket dredge throughout the year on the Mammoth, Archimedes, Montclair, and Forbes properties in the bed of Yuba River near Smartville. A large number of snipers, camped along Yuba River, worked gravel by small-scale hand methods.

Strawberry Valley district.—The Poverty Hill hydraulic mine was active in 1939, and production was reported from the Mount de Oro quartz mine.

Yuba River district.—Yuba Consolidated Gold Fields operated a fleet of six dredges at its property in the Yuba River Basin near Hammonton. All the dredges were equipped with 18-cubic foot buckets and electric power; two of them had 87 buckets each, two had 100 buckets each, one had 126 buckets, and one had 135 buckets.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN COLORADO

(MINE REPORT)

By Chas. W. Henderson and A. J. Martin

SUMMARY OUTLINE

Gold production in Colorado in 1939 varied little (0.2-percent decrease) in quantity and value from that in 1938, but the total value of the recovered gold, silver, copper, lead, and zinc increased (1 percent) to $22,319,041, the highest value in any year since 1918. Silver production increased for the seventh consecutive year, but copper, lead, and zinc each decreased from 1938. As silver ranks next to gold as a source of revenue from Colorado ores, the Act of Congress approved July 6, 1939, dealing with the coinage of silver and authorizing a 10-percent increase in payments for newly mined domestic silver, helped materially to stabilize employment in the industry and furnished the incentive for the expansion that followed in some sections of the State. Moreover, the stimulus afforded by the $35 price for gold continued, and several large-scale development operations were in progress during the year, notably in the Cripple Creek, San Juan, and Leadville areas.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.

Annual figures for the 5 years ended with 1939 and total production from 1858 to 1939 are given in the table that follows. Colorado has produced more silver in the past than any other State and ranks second in total recorded output of gold.

Mine production of gold, silver, copper, lead, and zinc in Colorado, 1935–39, and total, 1858–1939, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1935	870	842	1,770,984	349,280.80	$12,224,828	4,696,064	$3,375,296
1936	714	601	2,151,849	366,607.00	12,831,245	5,902,776	4,571,700
1937	655	490	2,068,619	368,905.00	12,911,675	6,260,693	4,842,646
1938	669	592	1,996,095	367,468.00	12,861,380	7,932,095	5,127,819
1939	758	583	1,914,593	366,852.00	12,839,820	8,496,488	5,767,313
1858–1939			(1)	37,549,390.00	808,105,614	700,938,158	546,383,465

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1935	14,654,000	$1,216,282	11,345,000	$453,800	2,403,000	$105,732	$17,375,938
1936	17,730,000	1,631,160	14,534,000	668,564	2,344,000	117,200	19,819,869
1937	21,868,000	2,646,028	19,572,000	1,154,748	8,494,000	552,110	22,107,207

[1] Dragline and power-shovel excavators with sluices or special amalgamators.
[2] Figures for sluicing and hydraulic include those for drift mining.

Gold.—In total value gold was the leading metal produced in Colorado from 1858 to 1939, but in annual value it was surpassed by silver from 1874 to 1896 and by molybdenum from 1937 to 1939. The principal gold-producing districts in 1939, in order, were: Cripple Creek, Teller County; Mosquito, Park County; Upper San Miguel, San Miguel County; Red Cliff, Eagle County; Gold Hill, Boulder County; Empire, Clear Creek County; Animas, San Juan County; Summitville, Rio Grande County; and Sneffels, Ouray County. The largest gold-producing properties, in order, were the United Gold Mines and Cresson at Cripple Creek, London in the

Mosquito district, Eagle in the Red Cliff district, and Smuggler Union at Telluride. Important gains in gold production were made in San Miguel, Boulder, Eagle, and Park Counties; the largest decreases were in Teller, San Juan, Rio Grande, Gilpin, and Lake Counties. Dry and siliceous ores yielded 87 percent of the total gold; copper ore 6 percent; lead, lead-copper, zinc, and zinc-lead ores slightly more than 1 percent; and placers nearly 6 percent.

Silver.—Silver production in Colorado has increased annually since 1932, when the output (1,860,408 ounces) was the lowest in 59 years; the output in 1939 (8,496,488 ounces, in terms of recovered metal) was the highest since 1914. Eagle County contributed 71 percent of the total in 1939, Mineral County 7 percent, San Miguel 7 percent, San Juan 3 percent, and other counties (chiefly Pitkin, Ouray, Lake, and Clear Creek) 12 percent. The principal silver-producing properties were: Eagle mine, Eagle County; New York-Pittsburg-Last Chance-Del Monte group, Mineral County; Smuggler Union group,

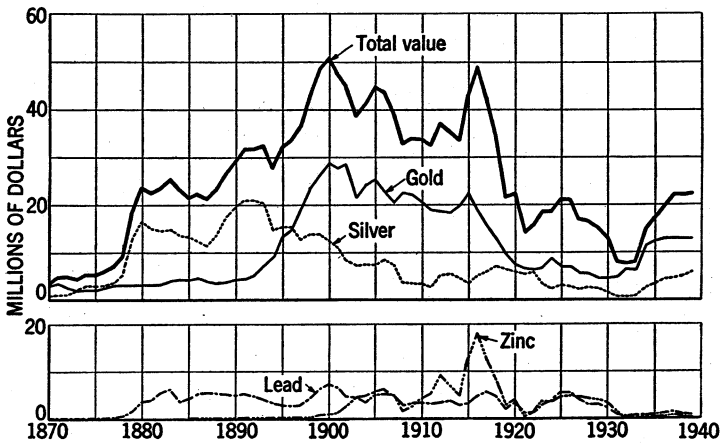

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1939. The value of copper has been less than $2,000,000 annually, except in a few years.

San Miguel County; Shenandoah-Dives-Mayflower group, San Juan County; and Butterfly group, San Miguel County. Copper ore yielded 72 percent of the total silver; dry and siliceous ores 23 percent; and other types of ore, together with a very small quantity of silver from placer mines, 5 percent.

Copper.—In 1939 the mine output of recoverable copper in Colorado decreased 7 percent from the record annual output of 28,342,000 pounds in 1938. Eagle County produced 90 percent of the State total; the remainder came chiefly from San Juan, Ouray, Saguache, Clear Creek, and San Miguel Counties. The only sizable copper producer in the State was the Empire Zinc Division (Eagle mine) of the New Jersey Zinc Co. at Gilman, Eagle County, which shipped copper-iron-silver-gold-lead ore direct to the copper smelter at Garfield, Utah.

Lead.—Although the total recorded production of lead in Colorado from 1858 through 1939 was more than 10 times that of copper, the annual recovered output from 1932 to 1939 was less than that of copper; the average over the 8 years was 12,292,750 pounds for lead and 17,172,875 pounds for copper. Of the 16,444,000 pounds of lead recovered in 1939, 54 percent was contained in concentrates made from dry and siliceous gold, gold-silver, and silver ores, mostly from San Miguel, San Juan, Park, Clear Creek, Ouray, Mineral, and Pitkin Counties; 9 percent was in concentrates from zinc-lead ore, mostly from Dolores County; and the remainder was recovered principally from copper and lead ores shipped from Eagle and Lake Counties direct to smelters.

Zinc.—Of the 3,660,000 pounds of zinc recovered from Colorado ores in 1939, Dolores County contributed 47 percent, San Juan 32 percent, Lake 10 percent, and Summit 5 percent; Pitkin, Ouray, San Miguel, Gunnison, and Hinsdale Counties together contributed 6 percent. The principal producers of zinc were the Rico Argentine Mining Co. at Rico, Dolores County, which began treating zinc-lead-silver-copper ore in its new 135-ton flotation mill in September; and the Shenandoah-Dives Mining Co. at Silverton, San Juan County, a large producer of dry and siliceous gold-silver ore containing some lead, copper, and zinc and a buyer of custom complex lead and zinc-lead ores for treatment in its 750-ton selective-flotation mill.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1939, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

[1] Dragline and power-shovel excavators with sluices or special amalgamators.

MINING INDUSTRY

The output of dry and siliceous gold, gold-silver, and silver ores from mines and dumps in Colorado in 1939 increased 1 percent over 1938 and copper ore 3 percent; lead ore decreased 25 percent, zinc-lead ore 88 percent, and the total for all classes of ore 4 percent. The Sunnyside mine in San Juan County, the only important producer of zinc-lead ore in Colorado in 1938, was closed June 30 of that year and very little zinc-lead ore was mined in the State during the next 15 months; in September 1939 the Rico Argentine Mining Co. began producing zinc-lead-silver-copper ore at Rico, Dolores County, and mined and treated about 100 tons daily to the end of the year. Nearly all the large producers of gold and silver ores that were active in 1938 continued operations throughout 1939. The statutory requirement that assessment work be done on claims held by location (suspended annually from 1933 to 1938 by acts of Congress) was in effect again in 1939 and apparently caused the increase over 1938 in the number of producing lode mines, as the aggregate of small lots of ore reported mined and shipped while assessment work was being done did not materially affect the total tonnage output of the State.

The quantity of gravel handled in 1939 by 2 floating connected-bucket dredges, 1 dragline floating dredge, and 26 dry-land dredges was approximately 2,430,964 cubic yards; specific data on yardage handled at small-scale placer operations are not obtainable because of lack of knowledge by the operators of the quantity of gravel sluiced.

On April 2, 1940, the Wage and Hour Division of the United States Department of Labor declared the open-cut mining of placer gold in

Colorado to be an industry of a seasonal nature and thus entitled to certain exemptions under the wage-hour law. Figures supplied by the Bureau of Mines showed that approximately 80 percent of the placer gold output of Colorado in 1938 and 81 percent in 1939 were produced between May 1 and November 1.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Colorado in 1939, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	1,224,849	299,907	736,547	871,830	5,476,230	9,000
Dry and siliceous gold-silver ore	242,178	19,204	516,653	1,162,445	3,102,540	1,098,000
Dry and siliceous silver ore	75,208	820	731,974	20,380	1,295,575	176,000
	1,542,235	319,931	1,985,174	2,054,655	9,874,345	1,283,000
Copper ore	342,499	22,653	6,114,224	24,169,380	2,332,545	
Lead ore	14,700	3,712	320,657	37,545	2,407,465	
Lead-copper ore	1,464	445	26,670	93,705	266,435	
Zinc ore	344	16	8,078	800	7,000	160,000
Zinc-lead ore	13,351	276	37,560	73,915	1,556,210	2,217,000
	372,358	27,102	6,507,189	24,375,345	6,569,655	2,377,000
Total, lode mines	1,914,593	347,033	8,492,363	26,430,000	16,444,000	3,660,000
Total, placers		19,819	4,125			
	1,914,593	366,852	8,496,488	26,430,000	16,444,000	3,660,000
Total, 1938	1,996,095	367,468	7,932,095	28,342,000	18,910,000	9,106,000

METALLURGIC INDUSTRY

Ore treated in 1939 by all mills in Colorado handling ores of gold, silver, copper, lead, and zinc totaled 1,511,792 tons, of which 920,834 tons were treated in company mills at mines; 545,323 tons by the Golden Cycle custom roast-amalgamation-cyanidation-flotation mill at Colorado Springs; and 45,635 tons by custom flotation mills in or near the mining districts (some of which also treated company ore included above), comprising the following: Boston mill at Ward in Boulder County; Clear Creek-Gilpin, Clear Creek Consolidated, Dumont, Hoosac, Ruth, and Silver Leaf in Clear Creek County; Creede Mills in Mineral County; Banner American in Ouray County; Shenandoah-Dives in San Juan County; and Smuggler Union mill in San Miguel County. All these custom mills except the Shenandoah-Dives treated only gold, gold-silver, silver, or silver-lead-gold-copper ores. Zinc-lead ore containing gold and silver from Dolores, Gunnison, Hinsdale, Lake, Ouray, San Juan, San Miguel, and Summit Counties was shipped to custom mills at Midvale, Tooele, and Bauer, Utah. The samplers at Boulder and Idaho Springs each operated about 5 months during the year.

Direct-smelting ores comprised 21 percent of the State total output of ore in 1939. The Arkansas Valley lead bullion-leady copper matte smelter at Leadville purchased most of the gold, silver, and gold-silver-lead-copper ores and concentrates shipped to smelters during the year. Some ores and concentrates (containing appreciable amounts of copper) from Boulder, Clear Creek, and Gilpin Counties were smelted in the 25-ton Forks copper smelter in Gilpin County, built in 1939 and operated 53 days beginning about October 1. Ore and concentrates were shipped to smelters in other States, as follows: Zinc-lead sulfide and zinc-lead carbonate ores from Lake County to Coffeyville, Kans.; zinc concentrates from Dolores, Pitkin, and San Juan Counties to Amarillo, Tex.; copper-iron-silver-gold ore from Eagle County, copper-silver ore from Montrose County, and gold-silver-lead-copper ores and concentrates from the San Juan region to Utah smelters; and copper-gold-silver concentrates from San Juan County to El Paso, Tex.

Mine production of metals in Colorado in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and concentrates amalgamated [1]	780,064	72,095	27,684	----------	----------	----------
Ore, old tailings, concentrates, sands, and slimes cyanided [2]	[3] 636,969	135,813	78,181	----------	----------	----------
Concentrates smelted	62,389	102,600	1,690,469	2,159,530	10,570,435	3,179,000
Ore smelted	401,310	36,525	6,696,029	24,270,470	5,873,565	481,000
Placer [1]	----------	19,819	4,125	----------	----------	----------
Total	----------	366,852	8,496,488	26,430,000	16,444,000	3,660,000
1938	----------	367,468	7,932,095	28,342,000	18,910,000	9,106,000

[1] Quicksilver purchased (which is close to quantity used) by amalgamation mills was 3,870 pounds. Placer mines used approximately 400 pounds.
[2] Cyanide (in terms of 96- to 98-percent NaCN) used was 1,140,514 pounds.
[3] Comprises 350,800 tons of sands and slimes from ore and iron concentrates first roasted and amalgamated, 194,218 tons of tailings from ore first floated, 42,280 tons of tailings from ore first treated by jigging, and 49,671 tons of combined flotation concentrates, crude ore, and old tailings cyanided direct.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Colorado in 1939, by counties, in terms of recovered metals

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal

ADAMS COUNTY

Sand and gravel handled in the washing plant of the Brannan Sand & Gravel Co. on Clear Creek north of Denver yielded gold as a by-product in sluices operated throughout 1939 by a lessee. Individuals working intermittently with sluices and pans at other points on Clear Creek in Adams County produced small lots of dust, most of which were sold to dealers in Denver.

ARAPAHOE COUNTY

Sluicing on Platte River and Cherry and Dry Creeks south of Denver recovered small lots of placer gold in 1939.

BOULDER COUNTY

Boulder County recorded a gain of 26 percent in 1939 over 1938 in output of gold, the chief metal in value produced in the county in both years; although part of the gain resulted from an increase in quantity of dump ore shipped, the output from newly mined ore also increased substantially. Boulder, as usual, had more producing lode mine operations than any other county in the State; however, many of those counted are prospects and dumps, inactive mines under investigation, and others producing in general less than 25 tons of ore. Space does not permit mention of these operations or of small placer mines in the following review by districts.

Central (Jamestown) district.—The Wano mine was operated throughout 1939 by the owner and several sets of lessees, who continued to ship the ore to the Golden Cycle mill at Colorado Springs. Associated Metal Mines, Inc., drove 175 feet of drifts and a 50-foot winze at the John Jay mine and shipped 149 tons of gold ore; by consolidation with the Acme Mining & Milling Co. as of December 31, 1939, the company acquired the 40-ton flotation mill adjacent to the mine. Lessees at the Alice, Black Rose, Gray Eagle, Monitor, and Rip Van Dam mines and the owner of the Gold Leaf mine were the other principal shippers from the Central district.

Gold Hill district.—In 1939 Gold Hill was again the largest gold-producing district in Boulder County. The Slide-Klondike group of mines, operated continuously by Slide Mines, Inc., ranked first among the individual properties of the district and county in production of gold, silver, copper, and lead. The ore was treated in the company mill by combined gravity and flotation concentration; free gold caught on burlap tables between the classifier and Wilfley tables was amalgamated, retorted, and sold to the Denver Mint, and the concentrates were shipped to smelters. Mining Associates, Inc., operated its flotation mill at Salina from February 28 to September 2 on ore from a leased section of the Sunshine mine; the company operated at the mine throughout the year, shipping part of the ore to the Golden Cycle mill. Other lessees at the Sunshine also shipped considerable ore. The Sunshine mine ranked second in the Gold Hill district in gold production; the Emancipation group, also operated continuously by lessees, ranked third; the American-Interocean, fourth; and the Melvina, fifth. They were followed by the Ingram, Cash (mine and dump), Golden Harp, Atchison, Cold Spring, St. Joe, King, Fisk, Richmond, and Myrtle. These 15 mines and dumps produced 95 percent of the district total gold in 1939; the remainder came from 48 small lode operations and 2 placers.

Grand Island district.—A lessee worked the St. Louis mine from April 1 to December 31, 1939, and shipped 586 tons of ore to custom plants. Lessees operated the Amy Paul mine throughout the year and shipped 215 tons of ore. Other producers included the Cross and Enterprise-Mogul groups.

Magnolia district.—The American X, Ben C. Lowell, Cash-Rebecca, India, Keystone, Senator Hill, Pickwick, Poorman, Rusty Dime, and Sac and Fox-Dunraven groups comprised those producing 25 tons or more of mine and dump ore in the Magnolia district in 1939. All the ore was shipped to the Golden Cycle mill at Colorado Springs or the sampler at Boulder, except 1,000 tons of dump material treated in the 50-ton flotation- and gravity-concentration mill at the Keystone mine.

Sugar Loaf district.—The Poorman mine, worked throughout 1939 by lessees, continued to be the principal producer of gold in the Sugar Loaf district; the bulk of the ore was shipped to the Golden Cycle mill. The Yellow Pine group, which yielded silver ore containing some lead, gold, and copper, produced most of the district output of silver. At the Logan mine a 75-ton flotation mill, equipped with carpeted launders in the ball mill-classifier circuit to recover free gold, was built; it treated 2,300 tons of ore during the year. The 25-ton Orphan Boy amalgamation-flotation mill was operated intermittently. Other important producing mines included the Alpine Horn, Empress, Grand Republic, Nancy, and Wood Mountain. A dragline and sluicing plant operated on the Giggy and Colby placers from April 1 to May 30 produced nearly all the district output of placer gold.

Ward district.—Kissell & Co. drove 500 feet of development drifts in 1939 at the B & M mine and continued to ship part of the ore produced from underground operations to the Golden Cycle mill; the remainder of the ore and 3,775 tons of dump material were treated by flotation in a leased mill near Ward. The other principal producers of gold in the Ward district were, in order of output, the Utica group, Boston, Golden Queen, Humboldt (mine and dump), Rose, Columbia-Big Five, and Brock No. 5. Most of the ore was sold to the Golden Cycle mill.

CHAFFEE COUNTY

Brown Canyon district.—A placer miner sluicing on the Kelly ranch on the Arkansas River recovered a little gold in 1939.

Chalk Creek district (*Romley, St. Elmo*).—Lessees continued to work the Mary Murphy mine on a small scale in 1939 and shipped gold-silver-lead-copper-[zinc] ore to the Leadville smelter. A few lots of smelting ore were shipped from the Allie Bell group, Philip Carey Mining & Milling Co. group, and Flora Bell claim.

Granite district (*see also Lake County*).—The Granite Tunnel property, which has been under development for several years and which was equipped with a 50-ton flotation mill in 1939, was the only producer of more than 4 tons of ore in the Chaffee County part of the Granite district during the year; the mill was run part of 1939 and produced gold-silver-copper concentrates, which were sold to the Leadville smelter. Wolfe and Hesser operated a ¾-cubic yard power shovel and screening and sluicing plant on the Driscoll Construction

Co. placer ground in Lost Canyon from July 12 to October 8 and handled 20,000 cubic yards of gravel from which were recovered 186 fine ounces of gold and 28 fine ounces of silver. Len Savage operated his placer in Lost Canyon from June 15 to November 20, using a hand sluice part of the time and a power shovel and screening-sluicing plant the rest. The Independent placer, also in Lost Canyon, was worked during the open season with a small placer machine. Individuals sluicing on the Arkansas River near Granite recovered a little gold.

La Plata district.—Lessees at the Meta mine shipped 5 tons of silver ore to the Leadville smelter in 1939.

Monarch district.—The output of the Monarch district in 1939 comprised chiefly lead-silver-gold ore from the Garfield and Hawkeye mines and lead-copper-silver ore from the Lilly group, all shipped to the Leadville smelter.

Riverside district.—The Victory Mining Co. shipped 16 tons of gold ore in 1939 from the Big Chief claim to the Golden Cycle mill at Colorado Springs.

Trout Creek district.—A lessee prospecting at the Nelly Bly claim shipped two small lots of gold ore in 1939.

Turret district.—Three truckloads of gold ore were shipped in October 1939 from the Monongahela group to the Golden Cycle mill.

CLEAR CREEK COUNTY

Alice district (Yankee, Lincoln).—Porphyry Mines, Inc., did 321 feet of churn drilling in 1939 at the Alice group, an important producer of gold, silver, and copper from 1935 until it was closed October 22, 1938; the only output in 1939 came from a clean-up of the mill. The Glacier Gold Mining Co. operated the Reynolds group part of the year and treated some ore in the stamp-amalgamation mill on the property. At the San Juan mine 50 tons of ore were treated by amalgamation. Lessees at the Gold King mine shipped several hundred tons of ore to the Golden Cycle mill.

Argentine district.—Lessees working the Santiago and Waldorf groups on a small scale in 1939 shipped ore to custom plants in Clear Creek County and to the Leadville smelter.

Empire district.—In 1939 Minnesota Mines, Inc., operated continuously its consolidated group of claims in the area north of Empire; since 1935 this company has been the largest producer of gold in Clear Creek County. The ore is treated in the 250-ton mill at the mine by concentration on mats in launders and by flotation followed by cyanidation of the flotation concentrates. After being treated the flotation concentrates, containing chiefly iron sulfide, are sold to the General Chemical Co. of Denver; the mat concentrates, containing mostly free gold, are amalgamated. Three Leasers worked the Conqueror group under a sublease from the Viking Gold Mines Corporation throughout 1939 and continued to ship the ore to the Golden Cycle mill until September, after which they had it treated in the Clear Creek-Gilpin mill adjacent to the sampler at Idaho Springs. Lessees operated the Tenth Legion-Gold Dirt-Sprankel-Empress Tunnel group throughout the year; part of the ore produced was sold to the Golden Cycle mill at Colorado Springs, part was treated in local custom mills, and part in the Gold Dirt mill which was reconditioned during the year. Other producers in the Empire district included the Gold Bug, Gold Fissure (or Badger), Mint, Omaha No. 2, and Pioneer.

Geneva Creek district.—In 1939 the Twin Basin Mining & Milling Syndicate built a small cyanide plant at the Sill mine and treated a little ore to test the equipment.

Griffith (*Georgetown-Silver Plume*) *district.*—The Capital Tunnel group was operated part of 1939 by J. M. O'Connor, who shipped the ore to custom mills for treatment. Ore from the Corry City dump was treated in the Silver Leaf mill. Lessees at the Lebanon mine treated some ore from the mine and dump in the Lebanon mill. Direct-smelting ore was shipped from the Johnny Bull, St. George, and a few other mines and dumps in the Griffith district.

Idaho Springs district.—The Alma-Lincoln Mining Co. operated its group of mines continuously in 1939 and treated 35,115 tons of ore by mat concentration and flotation in the company mill. The old Lincoln adit and 450-foot interior incline shaft on the Lincoln vein were cleaned out and reconditioned, and considerable ore was extracted from stopes on this vein. A large part of the ore, however, continued to come from the South Lincoln-Barber Elliott veins. During the year the company installed four slushers for underground loading of chutes. The Dixie mine on Ute Creek was a substantial producer of gold; the ore was treated in the Ruth custom mill at Idaho Springs. This mill was operated continuously and received ores from both Clear Creek and Gilpin Counties. The Williams Mining Co., operating the Williams mine, was a steady shipper throughout the year to the Golden Cycle mill. Ore from the Metropolitan group was treated in the Hoosac mill. Colorado Silver Mines, Inc., operated the Bald Eagle mine under lease from June 15 to December 31, treating the ore in the company mill near Blackhawk, Gilpin County. Other sizable producers of ore shipped to custom plants were the Castleton, Golden Edge, Idaho Bride, Santa Fe, Stephens Placer, and Shafter mines. The Clear Creek-Gilpin sampler at Idaho Springs was operated from April to September; it purchased ore, mostly in small lots, from mines and prospects in the Idaho Springs and nearby districts. Placer gold was recovered by individuals sluicing on Clear Creek.

Montana district (*Lawson, Dumont*).—From January 1 to June 9, 1939, the Clear Creek Consolidated Mining Co. operated the Brown-Jenks-Equinox group of claims opened by the Clear Creek and Gilpin adit just east of Dumont and treated 6,742 tons of gold-silver-copper-lead ore in the company mill by amalgamation, flotation, and tabling; the mine was inactive the remainder of the year, but the mill was used to treat custom ore from the Eagle and Red Elephant mines in the Montana district and the Badger, Capital Prize, Lord Byron, Stanley, and Stephens properties in nearby districts. The Red Elephant group was operated continuously by Red Elephant Metals, Inc., and yielded 2,460 tons of silver-lead ore. Other producers included the Earl of Kent, Franklin D, and Milton claims. The Dumont mill was run as a custom plant most of the year and treated 4,116 wet tons of ore from 20 mines in Clear Creek County and 1 mine in Gilpin County.

Trail Creek district.—The Lamartine-Falcon group of mines on Trail Creek 5½ miles southwest of Idaho Springs, which has been under development by Lamartine Mines, Inc., since 1937, was the third-largest producer of gold in Clear Creek County in 1939. Before its mill was completed in July the company shipped 517 tons of ore to the Golden Cycle mill; the company mill began operating on July 31 and from that time until December 31 treated 10,672 tons. Treatment was by flotation supplemented by jigs in the ball mill-classifier circuit to extract free gold for amalgamation. Lessees worked part of the Freeland group intermittently and treated some ore in the Freeland mill. The Phoenix-Trail Mining Co. operated the Phoenix mine part time; the ore produced was concentrated in the Dumont mill. Ore was shipped to local custom plants and to the Golden Cycle mill from the Donaldson (Wheatland)-Little Champion group, Empress, Diamond Mountain, Freeland Extension, Lone Tree, Mendic, Miller Tunnel, and Oneida groups.

COSTILLA COUNTY

Sluicing in Grayback Gulch on the property of the Drum Estate and on the Griffith and one other placer in Costilla County recovered small lots of placer gold in 1939.

CUSTER COUNTY

Hardscrabble district (Westcliffe, Silver Cliff).—Intermittent small-scale operations in 1939 at the Defender, Little Annie, and other mines and prospects in the Hardscrabble district resulted in the shipment of a few lots of lead-silver and copper-lead-silver ore to the Leadville smelter. Shore, Kettle, Henning & Stroehlke operated their 10-ton cyanide plant at Silver Cliff on material trucked 8 miles from a tailings dump on the Nemaha-William property; gold-silver precipitates produced were shipped to the Midvale (Utah) refinery.

DENVER COUNTY

Individuals sluicing on Platte River and Cherry Creek in Denver recovered a little placer gold in 1939.

DOLORES COUNTY

Pioneer district (Rico).—The Rico Argentine Mining Co., which carried on a development campaign at its property in 1937, 1938, and 1939 and constructed a 135-ton selective-flotation mill, began mining and treating ore in September 1939 and maintained production at an average of 100 tons of ore daily to the end of the year. The products of the mill were copper-iron-silver concentrates (carrying some lead and zinc and a little gold) shipped to the Garfield (Utah) smelter; lead-silver concentrates (containing some zinc and copper and a little gold) shipped to the Leadville smelter; and zinc concentrates (carrying also silver, lead, copper, and a little gold) shipped to the Amarillo (Tex.) smelter. Other output from Rico included zinc-lead-silver and copper-gold-silver ores from the Falcon, Gold Anchor, Nora Lilly, and Pigeon claims and Rico Townsite shipped to custom flotation plants and smelters in Utah. The St. Louis Smelting & Refining Co. did development work at its property during part of the year and shipped several cars of zinc-lead-silver ore.

DOUGLAS COUNTY

Individuals sluicing and drift mining on Cherry and Dry Creeks and Newlin, Russellville, and other gulches near Parker and Franktown in 1939 recovered small lots of gold dust, most of which were sold to dealers in Denver; two lots sold to the Denver Mint averaged 0.993 fine in gold.

EAGLE COUNTY

Burns-McCoy district.—Sluicing on Colorado River near Burns recovered a little placer gold in 1939.

Holy Cross district.—Thos. E. Knight worked his Glengarry claim 30 days in August 1939 and shipped two 1-ton test lots of lead-copper-silver-gold ore to the Leadville smelter.

Mount Egley district.—Lessees on the Norgaard property produced placer gold in 1939.

Red Cliff district (*Battle Mountain*).—The Red Cliff or Battle Mountain district contributed the bulk of the Colorado output of silver and copper in 1939 and ranked first among the districts of the State in combined value of gold, silver, copper, and lead. The chief producer, as usual, was the New Jersey Zinc Co. Empire Zinc Division, which continued to ship large quantities of copper-iron-silver-gold sulfide ore from its Eagle mine at Gilman to the Garfield (Utah) smelter. The company 600-ton underground flotation mill in Eagle Canyon, used in 1930–31 to treat zinc-lead ore (large reserves of which are also developed in the mine), was idle from 1932 to 1939, inclusive. The Ben Butler Corporation continued to ship gold-silver-copper ore to the Garfield smelter from the Ben Butler mine and installed an ore washing and sorting plant. Other producers included the Evening Star, Golden Comet-Pacific group, Groundhog, Star of the West, and Tip Top.

ELBERT COUNTY

A floating "pony dredge" using 23 buckets (7 by 7 by 12 inches) was run 4½ months in 1939 on the Crail ranch on Ronk Creek near Elizabeth and handled 3,000 cubic yards of gravel, which yielded 22.23 fine ounces of gold. A small lot of placer gold was recovered by an individual sluicing on Gold Run Creek.

EL PASO COUNTY

GOLDEN CYCLE MILL

The Golden Cycle custom mill at Colorado Springs recovered 44 percent of the total Colorado output of gold from lode mines in 1939. It treated 545,323 tons of ore averaging 0.31216 ounce of gold to the ton, of which 477,464 tons were gold-[silver]-sulfotelluride ores from the Cripple Creek district (Teller County) and 67,859 tons comprised miscellaneous gold, gold-silver, and gold-silver-lead ores from other districts, mainly in Boulder, Clear Creek, and Gilpin Counties. Ores purchased vary in character and grade; therefore, all are not treated by the same methods. Average-grade Cripple Creek ores, comprising most of the mill feed, together with iron concentrates made from low-grade ores treated by flotation, are roasted, amalgamated,[1]

[1] Free gold saved on lightweight canton-flannel blankets and amalgamated in iron arrastre.

and cyanided. Miscellaneous ores containing appreciable quantities of base metals are treated by selective flotation. The tailings from all operations are separated into sand and slime fractions and cyanided. In 1939 the mill recovered more than 98 percent of its total gold output in the form of gold-silver bullion; the remainder was contained in lead-copper concentrates shipped to the Leadville smelter. The revised schedule of gold payments and treatment and freight rates, effective December 1, 1938, proved successful in stimulating production of low-grade ore, and the total tonnage treated in 1939 was the highest in any year in the history of the mill. Among the additions to the plant equipment in 1939 is a Cottrell electric dust-precipitation system.

The Mill Tailings Recovery Co. installed an 80-ton cyanide plant at the old Portland mill tailings dump near Colorado Springs and began treating the tailings in April 1939; the plant, most of which is outdoors, was run until the open season ended in December. The output from this dump is included in the figures for the Cripple Creek district (Teller County), where the material originated.

FREMONT COUNTY

A 2-ton lot of gold ore was shipped from the Little Rose prospect in the Whitehorn district to the Golden Cycle mill in 1939. A little placer gold was recovered by sluicing at the old Dorcas millsite at Florence.

GARFIELD COUNTY

Rifle Creek district.—The lessee at the Gray Eagle mine 8½ miles from New Castle continued to ship gold-silver-copper sulfide ore to smelters in 1939.

GILPIN COUNTY

Southern districts (Blackhawk, Central City, Nevadaville, Russell Gulch).—Frontenac, Inc., operated the Frontenac-Aduddell group in Russell Gulch continuously in 1939 and was the leading lode producer of gold, silver, lead, and copper in Gilpin County. About half the ore produced was sold to the Golden Cycle mill; part was treated in the Gold Ridge mill and part in the Ruth mill (at Idaho Springs, Clear Creek County); and part was shipped crude to the Leadville smelter. The New Brunswick mine and 15-ton stamp amalgamation-table concentration mill were operated throughout the year. Lessees at the Mineral, Powell, Carr, Granite, Mammoth West, and Phoenix claims in the consolidated group owned by the California-Hidden Treasure Mines Co. shipped several hundred tons of ore. Material from dumps on this company's property at Nevadaville was treated by the Continental Mining Co., lessee, which rebuilt the old Monmouth-Kansas mill and installed equipment for amalgamation and flotation; the new plant has a capacity of about 175 tons daily and treated 2,377 tons during the year. The Monmouth-Kansas mine was worked from April 15 to December 31 by lessees who shipped 1,092 tons of ore containing 749 ounces of gold and 2,928 ounces of silver. The Gold Ridge Mining Co. operated its 75-ton flotation mill the first few months of the year on ore from the Clay County group. The Old Town Mining Co. erected a 50-ton flotation mill at the Old Town group and operated it several weeks after July. Ore was shipped to custom plants, chiefly the Golden Cycle mill at Colorado Springs, from other mines, prospects, and dumps in the southern districts; the principal producers were the Champion, Chase, Druid, Federal, Golden Dollar-Stewart, Lotus, National, Pewabic group, and War Dance.

The Manion Placer Co. operated a 1¼-cubic yard dragline and portable land dredge on the Eugene placer 223 days in 1939. The Dunfield-James partnership ran a ¾-cubic yard dragline and portable washing plant from May 1 to July 1 on placer ground in Russell Gulch, and the Johnson Mining Co. operated similar equipment on the Pot O'Gold placer from May 1 to September 10. A lessee worked the Missions Mines Co. placer in Russell Gulch with a ⅝-cubic yard power shovel, sand pump, and concentrating table. Individuals continued sluicing and panning during the open season on North Clear Creek.

Northern districts.—Lessees operated the We Got Em and Cowboy group during November and December 1939 and treated 1,000 tons of ore in the flotation mill on the property. The Dalham Leasing Co. worked the Dirigo mine from February 15 to April 15 and shipped several cars of ore to the Golden Cycle mill. A lessee at the Lone Star group shipped 297 tons of ore. Several claims in the Perigo group were worked intermittently by lessees who shipped part of the ore produced to the Golden Cycle mill and treated part in the mill at the mine. Other small lode producers included the Golden Flint, Long John, and Victoria properties.

The Cooley Gravel Co. worked the Pactolus placer near Pinecliff with a rated 2,000- to 2,500-cubic yard floating dredge fed by a 1½-cubic yard dragline for its third season, which lasted from April 4 to November 30. The yield from 348,718 cubic yards of gravel handled was 1,950 fine ounces of gold and 178 fine ounces of silver. The company exhausted the gravel in 1939 and removed its equipment. Individuals recovered some gold by sluicing in Gamble and Lump Gulches.

GRAND COUNTY

The Wolverine Syndicate shipped 25 tons of lead-silver-gold ore to the Leadville smelter from the Wolverine group, about 22 miles north of Granby, which was operated 1 month in 1939. Owners operated the La Plata claim 18 miles west of Empire 60 days and shipped 16 tons of silver-gold-lead ore. Placer gold was recovered by sluicing at the Jerry claim on Broncho Creek.

GUNNISON COUNTY

Box Canyon district.—J. C. Ternahan worked the Independent mine 6 miles south of Pitkin under lease throughout 1939 and produced 347 tons of ore, which he treated in his 10-ton stamp-amalgamation mill on the nearby Northern Light claim.

Elk Mountain district.—Superior Metal Mines, Inc., operated the Shakespear-North Pole group from June 8 to October 8, 1939, and shipped 112 tons of copper-silver ore to the Garfield (Utah) smelter. A few lots of ore were shipped to smelters from the Kebler Creek property and the Little Willie and White Star claims. A little gold was recovered from placers in Washington Gulch.

Gold Brick district.—The Carter Mines Co. continued operations at its mine and mill on Gold Creek. The mine is opened by an 8,800-foot adit, a 1,200-foot vertical four-compartment raise, and numerous drifts. Water from Gold Creek furnishes power to run the mill. During the past few years the ore has been treated by amalgamation and gravity concentration, although the mill is equipped with flotation machines; in 1939 flotation was used in combination with tables following amalgamation, and about 6,000 tons of ore were treated. On April 3 Burleson Mines, Inc., began work at the Raymond group under a lease and continued operations to the end of the year. The old tunnel was extended 1,000 feet, making it 4,200 feet long, and 600 feet of drifts were driven. A 65-ton mill—comprising a crusher, ball mill, jig, classifier, conditioner, six-cell flotation machine, and table—was installed in an old mill building on the property and operated 28 shifts (8 hours each) late in the year; it treated 569 tons of ore. Small tonnages of ore were amalgamated at the Chicago-Climax, Idoline, and Wayne properties, and 4 tons were shipped from the Gold Pink claim.

Goose Creek district.—A 9-ton lot of lead-silver ore mined while assessment work was being done on a claim southwest of Iola was shipped to the Leadville smelter in 1939.

Green Mountain district.—Development work was done and some ore produced in 1939 at the Lulu-Lucky Strike group, which is equipped with a small mill.

Taylor Park (Tin Cup) district.—Individuals sluicing on Illinois Creek and other streams in Taylor Park in 1939 recovered some placer gold.

Tomichi district.—Twenty tons of dry silver ore were shipped in 1939 from the Little Dick claim to the Leadville smelter.

HINSDALE COUNTY

Galena district.—The M. B. Burke Mining & Investment Co. operated the Ute and Ulay group and flotation mill on a small scale from May 17 to December 23, 1939. From the Mill placer material containing zinc, lead, gold, silver, and copper was shipped to the custom concentrator at Midvale, Utah.

Lake district.—Golden Mammoth Mines, Inc., shipped 63 tons of gold ore from the Golden Wonder group to the Leadville smelter in 1939.

JACKSON COUNTY

Lessees worked the Pure Gold placer on Independence Mountain in 1939 with a small placer machine to which the gravel was hauled by truck. Lack of water prevented operation for more than a few weeks.

JEFFERSON COUNTY

Placer miners worked gravel bars along Clear Creek intermittently in 1939 and recovered many small lots of dust, which were sold to dealers and to the mint in Denver. The Tate Sand & Gravel Co. property near Arvada yielded the largest individual output.

LAKE COUNTY

LEADVILLE DISTRICT

The Arkansas Valley lead bullion-leady copper matte custom smelter of the American Smelting & Refining Co. at Leadville was operated continuously (one furnace) in 1939. Receipts of ore and concentrates totaled 111,526 tons (all but 50 tons from Colorado mines) compared with 107,423 tons (including 88 tons from outside the State) in 1938.

The largest mining enterprise in the Leadville district was that of the Resurrection Mining Co., which carried on an extensive development campaign at the Resurrection and adjacent properties; much of the ore shipped by the company was removed in development. Lessees continued to ship ore from the Ibex group. The H. G. N. mill was remodeled and operated for a period on ore from the Garbutt, Fanny Rawlings, and Maid of Erin dumps. Treatment was by crushing, grinding, jigging, tabling, and amalgamating the high-grade concentrates; the other concentrates were sold to smelters. The London Deep Mines Co. operated the First National mine and 100-ton mill part of the year. The California Gulch Milling Co. erected a 75-ton flotation- and gravity-concentration mill in California Gulch near Leadville and operated it from November 10 through December on ore trucked from the Venir dump. Zinc-lead ore from the North Moyer and South Moyer dumps was shipped to the Ozark pigment plant at Coffeyville, Kans. Some ore from the Triumph and Highland Chief mines was sent to the Golden Cycle mill, but most of the district output was sold to the Leadville smelter. Other producing mines and dumps included the Adelaide, Black Prince, Breece, Chippewa, Commerce, Dolly B, Highland Mary, Humboldt and Flagstaff dumps, Lilian, Little Sliver dump, New Monarch, Ollie Reed, President dump, St. Louis Tunnel, Tenderfoot, Triumph, and Valley. Placer gold was recovered in California and Buckeye Gulches.

OTHER DISTRICTS

Alicante district.—The Alicante and John Reed mines were worked as one unit by lessees about 6 months in 1939 and yielded zinc-lead-gold-silver-copper ore, of which part was sold to the Leadville smelter and part to the custom concentrator at Midvale, Utah.

Granite district (*see also Chaffee County*).—Burns Mines, Inc., shipped about a car of gold ore from its property in 1939. The Raeanna Mining Co. worked the Oregon placer in Long Gulch west of Granite 40 days with draglines and washing plants. Individuals continued small-scale sluicing on the Arkansas River.

Lackawanna Gulch district.—The lease of the Eureka Saturday Night Mining Co. on the Eureka-Saturday Night group was canceled in May 1939, and the only output from the property during the year was a few tons of gold concentrates shipped to the Leadville smelter. A lessee at the Mt. Champion mine shipped some gold ore.

St. Kevin-Sugar Loaf district.—Several lots of ore were shipped to the Leadville smelter in 1939 from the Amity, Dinero, and Griffen mines.

Tenmile (*Climax, Fremont Pass*) *district.*—The Climax Molybdenum Co. at Climax, 13 miles north of Leadville, operated its 12,000-ton flotation mill continuously in 1939 (averaging 9,400 tons of ore daily for the year) and produced molybdenum sulfide concentrates containing 21,796,116 pounds of elemental molybdenum.

Tennessee Pass district.—Testing with sluice boxes at the Wye placer yielded a little gold in 1939.

Twin Lakes district.—The Brown Brothers Mining Co. shipped 58 tons of lead-gold-silver-copper ore from the Gordon-Tiger group in 1939, and a lessee at the Columbine recovered a little gold by amalgamation and shipped 1 ton of lead-gold-silver ore. The dry-land dredge of the Mt. Elbert Mining Corporation on the Derry Ranch placers 12 miles south of Leadville was operated from April 15 to December 26.

LA PLATA COUNTY

The American Smelting & Refining Co. lead bullion-leady copper matte smelter at Durango, which was closed November 30, 1930, remained idle in 1939.

California (or La Plata) district (Hesperus, La Plata).—The May Day mine and flotation mill were operated on a small scale in 1939. Two lessees worked part of the Gold King group from April to October and shipped ore to the Leadville smelter. Miscellaneous lots of ore were shipped to smelters from the Bessie G, Bonner, Durango Girl, Non Pariel, and Sara S properties, and test lots were shipped to the Golden Cycle mill at Colorado Springs from the White Diamond group.

MINERAL COUNTY

Creede district.—Silver production in the Creede district increased 30 percent in 1939 over 1938, following an increase of 42 percent in 1938 over 1937. The principal market for the ore continued to be the custom flotation mill of Creede Mills, Inc., at Creede. During the year the mill treated 34,748 tons of ore averaging 0.031 ounce of gold and 17.2 ounces of silver to the ton and 2.71 percent lead. The ratio of concentration was 26 tons into 1, and the concentrates averaged 0.478 ounce of gold and 309 ounces of silver to the ton and 18.7 percent lead; they were shipped to the Leadville smelter. Besides running its custom mill the company operated several leased mines in 1939; it took over the Amethyst and Creede Mines group early in February and part of the Pittsburg group later in the year. The Emperius Mining Co., operating the Del Monte-New York-Last Chance-Pittsburg group under a sublease from Morgan & Sloan, was the largest individual shipper of custom ore to the mill. The company also shipped rich silver ore direct to the Leadville smelter. Other producing mines included the Commodore-Bachelor, Corsair, Manitoba, and Monon.

MOFFAT COUNTY

Fourmile (or Timberlake) district.—The Gooldy group of placers 29 miles north of Craig was worked by Eldorado Gold Placer Mines during the early summer of 1939 and by Paul J. Kruesel and A. T. Willett later in the year. The equipment used included a gasoline-powered dragline excavator and dry-land dredge. Sluicing was done at other placers in the Fourmile district.

MONTEZUMA COUNTY

In 1939 the Red Arrow Gold Corporation built a 20-ton amalgamation-flotation mill at its Red Arrow mine in the East Mancos River area and treated 724 tons of ore averaging 0.869 ounce of gold and 13.88 ounces of silver to the ton; in addition, the company shipped some high-grade ore to the Leadville smelter. Development work done in the mine during the year totaled 1,000 feet of drifts and tunnel. The Outwest Mining Co. worked its mine adjoining the Red Arrow on a small scale from May to December and shipped high-grade gold ore to smelters. The Barr-Menefee Mining Co., lessee on the Stafford group, shipped 8 tons of gold-silver-copper-lead ore.

MONTROSE COUNTY

La Sal district.—Lessees at the Cashin and Independence No. 7 claims shipped copper-silver ore to the Garfield (Utah) smelter in 1939. The Hardscrabble and Red Canon placers on Dolores River were worked with bulldozers and sluices part of the year and produced most of the output of placer gold from the La Sal district.

Naturita district.—Individuals sluicing on San Miguel River in 1939 recovered small lots of placer gold.

Paradox Valley district.—The United States Vanadium Corporation operated its vanadium mines and roasting and leaching plant at Uravan throughout 1939 at the rate of approximately 240 tons of ore daily. The company extracts its own salt in the vicinity and owns and operates its own coal mines.

OURAY COUNTY

Red Mountain district.—San Juan Metals, Inc., operated its flotation mill at the Treasury Tunnel group about 15 days early in 1939 and then closed the mine and mill; they were taken over later in the year by the Idarado Mining Co., which worked about 2 months getting the property in shape for further development. Ore from the Yankee Girl group was treated in the Banner American (G. A. Franz) mill near Ouray. Several lots of zinc-lead ore from the Dauntless and copper ore from the Kentucky Giant and Paymaster claims were shipped to custom plants at Midvale, Utah.

Ridgway district.—Sluicing at small placers on Uncompahgre River near Ridgway recovered a little gold in 1939.

Sneffels district.—King Lease, Inc., operated the Camp Bird mine and the King Lease 75- to 100-ton amalgamation-flotation mill continuously in 1939. The expansion of the company mining operations (until 1938 confined to the upper levels of the mine) to include the lower levels resulted in important changes in the conduct of operations at the end of 1939. The third level, the main haulage adit to the King Lease mill in Imogene Basin, was connected by shafts and raises with the lower adit 1,450 feet below the third level, and equipment was installed to lower the ore from the upper levels to the lower adit, through which it will be transported about 11,000 feet to the old Camp Bird, Ltd., camp for treatment. A new 100- to 125-ton amalgamation-flotation mill was built within the old Camp Bird stamp-mill building and made ready for operation in 1940. With the new transportation system, employees can live in the Camp Bird, Ltd., camp at a lower altitude than the other camp in Imogene Basin. Lessees worked the Atlas mine from May to December and shipped some ore to the Midvale (Utah) smelter. The New Trust Ruby Mining & Milling Co. treated 900 tons of ore from the Trust Ruby mine in a 15-ton amalgamation mill.

Uncompahgre district.—Lessees at the Syracuse Tunnel group continued to ship ore, containing chiefly silver and lead, to smelters and had 1,511 tons concentrated in the Banner American 100-ton flotation mill. The mill was operated intermittently in 1939, part of the time by G. A. Franz Mines and part by G. A. Franz, Inc.; it also treated company ore from the Pony Express group and some ore from the Yankee Girl (Red Mountain district). The McCullough lease continued to ship gold-silver-copper ore to the Leadville smelter from the American Nettie and Wanakah groups, worked as a unit, and treated 1,000 tons of old tailings from the Wanakah mill dump in the 30-ton flotation mill on the property. Ore was shipped to smelters in Utah from the Senorita group, to the Shenandoah-Dives mill at Silverton (San Juan County) from the Columbo claim, and to the Leadville smelter from a clean-up of the old Munn sampler.

PARK COUNTY

Alma Placers district.—Most of the output from the Rhodes property in 1939 came from blocks of ground worked by the Alplaco Mining Co., R. L. & W. Co., and Snelling lease. All three operators used central sluicing plants, to which gravel dug from open pits by power shovels was hauled by trucks. The London Extension Mining Co. placer adjoining the Rhodes property on the east was worked by the Placer Operating Co. with a dry-land dredge fed by a 1¾-yard dragline.

Beaver Creek district.—The Timberline Dredging Co. operated its electric floating connected-bucket dredge on Beaver Creek near Fairplay from April 4 to December 31, 1939, and handled 776,000 cubic yards of gravel yielding 4,252 fine ounces of gold and 900 fine ounces of silver; the dredge is equipped with 84 buckets, each with a capacity of 7½ cubic feet. Small-scale sluicing was done by individuals on upper Beaver Creek.

Buckskin district.—A few lots of ore were shipped to the Leadville smelter from the Golden Era, Home Sweet Home, and Wyandotte-Apex groups in 1939. Seven tons of ore extracted while a tunnel was being driven at the Funston-Lucky Strike group were amalgamated at the mine. Sluicing in Buckskin Gulch recovered a little placer gold.

Consolidated Montgomery district.—The Magnolia Gold Mining Co. operated the Magnolia mine and 50-ton flotation mill at the rate of about 400 tons of ore monthly from January to June 1939. Production was interrupted early in July when the mill was struck by lightning and burned, but rebuilding was nearly completed before the year ended; meanwhile, some ore was shipped crude to the Leadville smelter. Small lots of smelting ore were shipped from the Columbia, Nova Zembla, and Wheeler claims. A placer miner recovered some gold in Montgomery Gulch.

Fairplay district.—Miles O. Deatherage worked placer ground on the west bank of Platte River with a 1-cubic yard gasoline shovel, two trucks, and a central sluicing plant from June to October 1939; water was obtained from a ditch reaching to Sacramento Gulch 3 or 4 miles away. Gow, Burton, and Walley operated a power shovel and central sluicing plant on Platte River about 4 months. A small caterpillar shovel and sluice were used intermittently at the Snowstorm placer. Other operators produced some gold from placers, mostly by sluicing.

Hall Valley district.—A lessee at the Ypsilanti claim shipped test lots of ore to the Ruth mill in Clear Creek County and the Leadville smelter in 1939.

Mosquito district.—The London Mines & Milling Co. operated its consolidated group of mines on London Mountain continuously in 1939. The mine workings are reached through the 4,400-foot London Extension tunnel, and the ore is sorted before being treated in the company 200-ton flotation- and gravity-concentration mill. Besides gold, the concentrates contained some silver, a little copper, and considerable lead and zinc; they were sold to the Leadville smelter. The London-Butte Gold Mines Co. worked the Butte mine throughout 1939 and treated 17,881 tons of ore in the company 100-ton flotation mill. From heads averaging 0.2547 ounce of gold and 0.137 ounce of silver to the ton, 0.04 percent lead, and 0.02 percent zinc the mill made 1,438 tons of concentrates containing 4,322 ounces of gold, 2,463 ounces of silver, 140,607 pounds of lead, and 71,889 pounds of zinc. The Chicago Mines Co., operating the Record mill for the third season, treated 28,036 tons of ore from the South London mine dump and 1,769 tons of custom ore from the American mine. The American was operated by W. A. Ellis, Inc., owner, which continued to ship high-grade gold ore to the Leadville smelter. Some ore was shipped also from the Evening Star, Good Samaritan, Little Fool, and other mines and prospects in the Mosquito district. Ore from the Ophir mine was treated in a small mill erected by lessees.

Tarryall district.—The Peerless Mining Co. operated its gasoline-powered 1¼-cubic yard shovel and portable four-bowl washing machine in 1939 for the sixth consecutive season in Park Gulch. The equipment was run on the Hogg placer from April 19 to November 12 and handled 104,120 cubic yards of gravel, from which were recovered 499 fine ounces of gold and 35 fine ounces of silver. The Sterling Mining Co. also worked on the Hogg placer from July 15 to October 30, using a dragline and sluicing plant. Individuals sluicing on Tarryall Creek recovered small lots of placer gold. A little ore was shipped from the Black Butterfly lode claim and an unidentified prospect.

PITKIN COUNTY

Lincoln Gulch district.—A 5-ton lot of gold-silver-lead ore was shipped to the Leadville smelter from the Three Brothers claim in 1939.

Roaring Fork district (Aspen).—About half of the silver output of Pitkin County in 1939 came from lime fluxing material, carrying 4 to 10 ounces of silver to the ton (averaging 6.61 ounces) and some lead, shipped to the Leadville smelter from the Smuggler, Spar Consolidated, and other groups under the management of D. P. Rohlfing; in general, payment for lime in this material exceeds that for silver. The Midnight Mining Co. operated the Midnight group continuously 6 days a week. The ore mined (7,500 tons) was treated in the company 50-ton flotation mill. Besides lead-silver concentrates, which are the main product of the mill and are sold to the Leadville smelter, some byproduct zinc concentrates were produced and shipped to the Amarillo (Tex.) zinc smelter. Lessees treated 350 tons of ore from the Mollie Gibson dump with jigs and tables, and a car of lead-silver ore was shipped from another property in the Roaring Fork district.

RIO GRANDE COUNTY

Summitville district.—Summitville Consolidated Mines, Inc., operated its consolidated group of mines and 125- to 150-ton mill at Summitville continuously in 1939. During the past 3 years the company has mined substantial quantities of ore during the summer months by the glory-hole system from veins uncovered in development work carried into new ground. It operates three groups of underground workings which, together with the glory holes, furnish enough ore to keep the mill running throughout the year. The ore is ground in a ball mill with cyanide solution to minus 100-mesh. A jig between the ball mill and classifier removes coarse high-grade gold-silver-pyrite concentrates, which are shipped to the Leadville smelter. The classifier overflow goes to primary thickeners to remove pregnant solution; the primary thickener underflow goes to agitators and from them to three stages of countercurrent decantation. The pregnant solution is precipitated in Merrill-Crowe units, and the precipitates are acid-treated and reduced to bullion for shipment to the Denver Mint.

ROUTT COUNTY

Individuals recovered some gold and silver in 1939 from placers in the Hahns Peak area.

SAGUACHE COUNTY

Blake district.—The Tripple-T Mining Co. drove 250 feet of tunnel at the Copper Head group of claims in 1939 and shipped a test lot of ore to the Midvale (Utah) smelter. Other work included the building of roads and installation of mill machinery and power units.

Crestone district.—Sublessees on the Independent, Alamosa, and Fanton claims, in a group on the mineral section of Baca Grant No. 4 under lease to the Luis Maria Baca Mining & Development Co., shipped several lots of ore to the Golden Cycle mill in 1939.

Kerber Creek district (Bonanza).—Rawley Mines, a limited partnership, continued to work the Rawley mine from January 1 to April 19, 1939, when it surrendered the lease; most of the ore was shipped to the copper smelter at Garfield, Utah, and the remainder to the Leadville smelter. Other lessees at the Rawley group shipped some ore during the year. Other producers of occasional lots of ore shipped to the Leadville smelter included the Essie group, Joe Wheeler, Jupiter, and Warwick. A little ore was treated by table concentration at the Paragon-Michigan group.

SAN JUAN COUNTY

Animas district.—The Shenandoah-Dives Mining Co. continued operations at its Mayflower Tunnel group on King Solomon Mountain and 750-ton selective-flotation mill on Animas River near Silverton from January 1 to June 15, 1939, when a strike of company employees caused a shut-down of both mine and mill until September 5. An agreement between the company and the men resulted in the reopening of the property on September 7 and continuous operation of it the remainder of the year. As the Shenandoah-Dives mill treats custom ore as well as company ore, the shut-down caused a decrease in the output from other mines in the vicinity. Company ore treated in 1939 totaled 195,006 tons and yielded 5,722 tons of combined lead, lead-copper, copper, and zinc concentrates, containing in all 14,867 ounces of gold, 240,003 ounces of silver, 1,968,193 pounds of lead (wet assay), 1,132,012 pounds of copper (wet assay), and 1,838,311 pounds of zinc; the lead and lead-copper concentrates were shipped to the Leadville smelter, the copper concentrates to the El Paso (Tex.) smelter, and the zinc concentrates to the Amarillo (Tex.) smelter. The custom ore treated amounted to 3,241 tons; most of it came from the Bandora, Champion, Highland Mary, Little Fannie-Philadelphia, Mystery, and North Star-Sultan groups—all in the Animas district except the Bandora, which is in the Ice Lake Basin district. Other small producers included the Coming Wonder, Copper Bell group, Molas-Senior Warden group, Silver Ledge, and Sylvanite. The American Smelting & Refining Co. continued development of the Silver Lake group.

Eureka district.—The Sunnyside mine and 1,000-ton selective-flotation mill at Eureka, closed June 30, 1938, remained idle throughout 1939. Shipments of ore from the Brooklyn group 8 miles northwest of Silverton to the Leadville smelter totaled 253 tons containing 724 ounces of gold, 5,539 ounces of silver, and some lead, copper, and iron. The other producers of small tonnages of ore were the Lead Carbonate mine, Lucky Jacks group, and St. Paul. Development work was continued at the Sandiago-Golden Fleece-Scotia group.

Ice Lake Basin district.—In 1939 the Blanco Mining Co. continued to ship ore from the Bandora group to the Shenandoah-Dives mill and the Leadville smelter. Two tons of silver ore were shipped from an unidentified property, presumably a prospect.

SAN MIGUEL COUNTY

Iron Springs district (Ophir).—Butterfly Consolidated Mines, Inc., continued developing the Butterfly-Terrible-Silver Bell group of mines and increased the daily capacity of the mill (formerly 100 tons) to 250 tons. In 1939 the mill treated 23,000 tons of ore, which yielded 2,470 tons of combined table and flotation concentrates containing 1,101 ounces of gold, 172,865 ounces of silver, 554,531 pounds of lead (wet assay), 101,056 pounds of copper (wet assay), 77,225 pounds of zinc, and 1,348,640 pounds of iron. The concentrates were shipped to the Midvale (Utah) smelter. J. M. Belisle shipped several cars of zinc-lead-gold-silver-copper ore from the New Dominion mine to the custom concentrator at Midvale, Utah. Small lots of ore were shipped to smelters from the Carbonero mine and Sulphurette dump. A little placer gold was produced at the Waterfall placer.

Klondyke district.—In 1939 the owner of the Hidden Treasure group shipped 5 tons of material containing copper and silver to the smelter at Tooele, Utah.

Lower San Miguel district (Sawpit, Vanadium).—Placer miners recovered some gold in 1939 by sluicing at the Little Donnie, Southern Boy, and other placers along San Miguel River and its tributaries.

Mount Wilson district.—The Chindey-Special Sessions group, Shenandoah claim, and Silver Pick group were worked on a small scale during the summer of 1939 and yielded small lots of high-grade gold ore which were shipped to the Midvale (Utah) smelter.

Upper San Miguel district (*Telluride*).—The Smuggler Union group, operated since December 15, 1936, by Veta Mines, Inc., was the largest producer of gold in the San Juan region in 1939 and ranked fifth in the State. While increasing production steadily, the company has carried on an extensive program of development below the Pennsylvania or fifteenth level, the former lowest workings, which has resulted in opening additional productive ground. In 1939 mining on the new sixteenth level was continued, and development of the seventeenth level was begun. The combined output of ore from the upper and lower levels was treated in the company amalgamation-flotation mill, recently enlarged and equipped to handle 500 tons daily; the average for 365 days in 1939 was 375 tons compared with 188 tons in 1938. The mill feed in 1939 included 44 tons of custom ore from the Tomboy mine and 30 tons from four other properties. A new project undertaken by the company in 1939 is the driving of a crosscut from the Pennsylvania Tunnel to heretofore unexplored ground under the old workings of the Montana claim in the Tomboy group. The company nearly completed the driving of a 1,500-foot tunnel under Blue Lake at an elevation of 12,500 feet to tap the lake 120 feet below the surface in order to develop a year-round supply of water with which to run the power plant. Alta Mines, Inc., continued production from the Alta-St. Louis group throughout 1939. The mine is developed by a tunnel 6,650 feet long on the Alta vein. The ore is treated in the company 150-ton mill by jig, flotation, and table concentration; the jig concentrates are amalgamated, and the flotation and table concentrates are shipped to the Leadville smelter. Lessees on the Gold Run placer concentrated old tailings with screens, jigs, and mat-lined launders. Old tailings and dirt were cleaned up around the Cimarron mill and treated in a small stamp mill. A little gold was recovered by hand methods at the Wasatch claim. Individuals sluicing along San Miguel River recovered small quantities of placer gold.

SUMMIT COUNTY

Breckenridge district.—Small-scale operations only were carried on at lode mines in the Breckenridge district in 1939, and most of the ore produced was shipped direct to the Leadville smelter. Producing mines included the Bullion King, Cross Mountain, Dunkin, Fredonia, Jumbo, Laurium (Blue Flag), Mountain Mary, and Royal Tiger group (Greenwood, Jessie, and Sallie Barber claims). Part of the output from the Royal Tiger group was zinc-lead ore, shipped to the custom concentrator at Midvale, Utah.

The Blue River Co. operated its floating connected-bucket dredge at Breckenridge from May 9 to August 6, 1939; the dredge is equipped with eighty-eight 9-cubic-foot buckets, screens, jigs, sluices, ball mill, and mechanical amalgamator. Power shovels, trucks, and central sluicing plants were used to work the Bemrose-Bostwick and Louis D placers. Other placers along French Gulch and on Blue and Swan Rivers were worked by sluicing and hydraulicking.

Montezuma district.—Lessees at the Florado-Sts. John group treated ore, mostly from the dump, by jigging during part of 1939; the concentrates produced and some crude ore were shipped to the Leadville smelter. The Bullion mine was operated by a lessee during June and July; part of the ore produced was shipped direct to the Leadville smelter, and part was concentrated in a small gravity-concentration mill near the mine before shipment. A few lots of smelting ore were shipped from the Pennsylvania group, Silver King, Tip Top, and other properties.

Ten Mile (Kokomo, Robinson) district.—A lessee of the Wilfley mine and mill treated 1,200 tons of material from the dump by table concentration in 1939. Small lots of smelting ore were shipped from the Boston and three unidentified properties. A little gold was recovered from a placer near Dillon.

Wilkinson district.—Walter McDaniel operated his Big Four claim on Green Mountain 250 days in 1939 and continued to ship silver-lead-zinc-gold-copper ore, part of which was sold to the Leadville smelter and part to the Combined Metals Reduction Co. at Bauer, Utah.

TELLER COUNTY

CRIPPLE CREEK DISTRICT

Cripple Creek is the leading gold-producing district in Colorado. From 1891, when gold was discovered in that area, through 1939 it has yielded a total of 18,053,874 fine ounces valued at $385,460,527, or 48 percent of the State total output of gold from 1858 to 1939, inclusive. In 1939 the district produced 134,003 ounces (37 percent of the State total) compared with 145,215 ounces (40 percent) in 1938. The decrease in 1939 resulted from a decline in the average grade of the ore, as the number of producing mines and dumps was about the same as in 1938 and the total tonnage of ore handled was larger. The quantity of ore shipped to the Golden Cycle mill at Colorado Springs (operations reviewed under El Paso County) decreased slightly, but the increased tonnage treated locally by flotation in the Cameron mill in its first full year of operation, together with the usual tonnage treated in the Kavanaugh cyanide leaching plant, raised the total output of ore from mines and dumps in the district proper to 522,538 tons, an increase of 24,181 tons over 1938. Other output credited to the Cripple Creek district in 1939 is 15,600 tons of tailings from the old Portland mill dump at Colorado Springs, treated in the Mill Tailings Recovery Co. cyanide plant. This dump is composed entirely of tailings from ore shipped from the Cripple Creek district many years ago. Cripple Creek ores generally contain gold as the only commercial metal, but some silver ore has been shipped from two or three veins in the district; a small quantity of silver is recovered annually in bullion produced from the gold ores.

MINES REVIEW

The Golden Cycle Corporation operated its Ajax and Anchoria Leland groups of mines throughout 1939 and in December purchased the Index group. Less ore of better-than-average grade was produced from the Ajax group in 1939 than in 1938 owing to temporary suspension of operations below the 2,000-foot or Roosevelt drainage tunnel level pending completion of the new 6-mile Carlton drainage tunnel (for the driving of which the corporation on March 27 authorized the expenditure of not to exceed $1,000,000). Some of the benefits expected from the tunnel, the remarkable progress made after actual driving was begun in July, and the production of the Ajax and Anchoria Leland properties are shown in the following extract from the corporation annual report to stockholders for the year ended December 31, 1939:

The new Carlton Tunnel is the most important mining operation now being carried on by the Golden Cycle Corporation. This tunnel will be 32,000 feet in length and will give 1,100 feet of additional drainage to the Cripple Creek district. The Roosevelt Tunnel, which was completed in about 1918, permitted the mining of millions of tons of ore that could not have been profitably mined had it been necessary to pump the water which this tunnel drained. It is hoped that the new Carlton Tunnel will prove to be as successful and be the means of maintaining the tonnage of ore the mill must have to operate successfully.

The Portland, Vindicator, Ajax, and Cresson have all worked below the present water level of the district, and all have had the same experience with the water problem. That is, the heavy expense of pumping has rendered mining below the Roosevelt Tunnel unprofitable and unsatisfactory in every way. When this tunnel is completed and drainage takes place it will be permanent. This will result in far more development work in depth than could ever be accomplished under pumping operations. The driving of the Carlton Tunnel by the Golden Cycle Corporation was a step that had to be taken if tonnage was to be maintained in the future. The Carlton Tunnel will permit the development of the deeper areas, in the most productive territories in the Cripple Creek district, and it is in this area that I believe we must look for the greater part of the future tonnage for the mill. We do know that there is a considerable amount of ore now under water that can be mined when drainage takes place.

The monthly progress and average footage per day is as follows:

Month	Monthly	Average daily	Total distance
	Feet	*Feet*	*Feet*
July	345	21.5	345
August	1,201	38.7	1,546
September	1,367	48.8	2,913
October	1,534	49.5	4,447
November	1,474	49.1	5,921
December	1,387	47.8	7,308

The average, over-all costs per foot of tunnel driven is $29.925. In this is included $4.035 depreciation on buildings, equipment, road work, and all other preliminary expense.

The Ajax shipped 32,512 tons of an average value of $16.41 per ton. This operation showed a net profit of $18,439.43 before income taxes. 9,485 feet of development was done, by both company and lessees, during the year. The pumps were pulled from the 2,600 level on July 1, and all levels below the 2,000 were allowed to flood. The lower levels can be worked, without the heavy expense of pumping, when drained by the Carlton Tunnel.

The new washing plant finished in March 1939 is working very satisfactorily. At the present time the ore-house dump is being handled through this plant, with good results. Some development work is being carried on by the company on the 2,000 level, in hopes of finding ore in undeveloped territory; and every effort is made to encourage leasing on the upper levels in order to maintain some production until the tunnel is completed and the deeper workings are drained.

At the present time, considerable repair work is being done to the buildings and shaft, and we are also removing some large wooden structures that constitute a big fire hazard.

The Anchoria Leland mine shipped 7,568 tons of an average value of $13.64 per ton. This operation showed a net profit of $16,948.49 for 1939 before income taxes. Development work by both company and lessees amounted to 2,260 feet. Two new ore bins were erected in order to take care of more lessees' ore, and increase production, if possible.

The main shaft on the Index property, which was very recently acquired by the Golden Cycle Corporation, is being repaired and it is hoped that underground operations will be started in a short time. This property has not been worked extensively for a great many years, and I feel that it has good possibilities.

The largest producers of gold in the Cripple Creek district and in the State in 1939 were the United Gold Mines Co., an operating and holding company for property scattered throughout the district, and the Cresson Consolidated Gold Mining & Milling Co., operating the Cresson, Dante, and Gold Sovereign mines.

The annual report of the United Gold Mines Co. for the year ended December 31, 1939 (dated February 15, 1940), includes a report of the mine superintendent, which gives the following details on operations at individual mines:

The Vindicator, Portland, and Rose Nicol Groups are the three largest operations of the United Gold Mines and account for approximately 70 percent of the total ore shipped. The greater part of this ore was produced by lessees. The company operated seven working shafts, mainly for the accommodation of split-check lessees. Some development work was done on company account, mainly on the Portland and Rose Nicol mines.

On the 1,700-foot level of the Portland No. 2 shaft an ore body, some 75 feet long, has been discovered in undeveloped territory. Preparations are now being made to mine this ore, and at this date it looks very promising.

Portland No. 1 ore house was completely destroyed by fire, of undetermined origin, in January 1940. We were very fortunate in not losing the head frame and other structures. This ore house is being replaced by a steel structure, and it is planned eventually to handle the ore from both Portland No. 1 and No. 2 shafts through the new steel ore house. No. 2 shaft is of the utmost importance to the United Gold Mines at this time, on account of the driving of the New Carlton Drainage Tunnel, which will provide 1,100 feet of additional drainage deeper than is now afforded by the Roosevelt Tunnel. This increased depth of drainage is of importance to the Portland and Vindicator, in that the ultimate depth of profitable mining will be increased. Portland No. 2 shaft is the deepest shaft in the Cripple Creek district.

The Carlton Tunnel will be 32,000 feet in length. The portal is situated 8½ miles south of Cripple Creek and Victor; from that point it is being driven directly toward a point under Portland No. 2 shaft. This should completely drain the Portland to the new tunnel level and permit mining operations to be carried on 1,100 feet deeper than we are now working. While there is no known ore existing below the present water level on the Portland, some of the best territory in the district, for development work at depth, is located on this property and new ore bodies should be opened.

The Golden Cycle Corporation is financing the tunnel until it reaches the Portland. In order to drain the Vindicator it will be necessary for the United Gold Mines Co. to drive a 5,000-foot lateral from the Portland to the Vindicator.

Production of company ore by United Gold Mines Co. in 1939

Mine	Net tons	Gross value	Company ore cash receipts	Average gross value per ton
Vindicator	8,270	$34,906.39	$10,890.58	$4.22
Rose Nicol	2,010	43,993.51	30,670.90	21.89
	10,280	78,899.90	41,561.48	7.68

Production of lessee ore of United Gold Mines Co. in 1939

Group	Net tons	Gross value	Royalties received	Lessees' receipts	Average gross value per ton
Vindicator	36,157	$306,770.47	$69,901.31	$98,602.46	$8.48
Rose Nicol	8,603	93,804.38	23,805.28	31,545.07	10.90
Theresa	8,476	105,687.56	34,801.21	32,269.28	12.47
W. P. H. lessees	545	6,045.60	730.46	2,672.04	11.10
Deadwood group	32,293	287,757.60	28,819.15	125,361.50	8.91
Londonderry group	2,954	20,672.80	1,323.61	7,224.36	7.00

Portland lessees	21,599	280,015.31	74,909.20	96,583.44	12.96
Last Dollar lessees	10,773	84,100.38	21,973.10	20,329.88	7.81
Hull City	3,951	31,813.75	8,751.83	8,070.00	8.05
	132,098	1,289,280.10	270,431.22	455,950.22	9.76

Production of properties of United Gold Mines Co. before and after organization of the company (May 15, 1902) to Dec. 31, 1939

	Net tons	Gross value
Ore mined before consolidation	26,310	$456,806.19
Production under operation of United Gold Mines Co	1,885,280	20,481,282.18
Total to Dec. 31, 1939	1,911,590	20,938,088.37

The annual report of the Cresson Consolidated Gold Mining & Milling Co. for the 12 months ended December 31, 1939 (dated February 15, 1940), says—

The following is a summary of the development work for the 12 months ending December 31, 1939:

Development

	Feet	Feet
Drifts and crosscuts:		
Company	3,310	
Lessees	1,692	
		5,002
Raises and winzes:		
Company	892	
Lessees	1,784	
		2,676
		7,678

Tonnage of ore and waste, hoisted through the Cresson shaft, kept the plant running to full capacity during the year. When it is considered that the Cresson shaft has only one hoisting compartment and it is necessary to handle all men and supplies through this shaft, the amount of both ore and waste that is handled by one skip is phenomenal.

Development work was maintained throughout the year, and some ore bodies of various sizes discovered. However, the main ore-bearing zone above the present drainage tunnel level is beginning to be pretty well prospected, and if production is to be maintained in the future it will probably have to come from the area that is now under water.

The driving of the new Carlton drainage tunnel, by the Golden Cycle Corporation, is of the utmost importance to the Cresson mine. The main tunnel will be 32,000 feet in length, to a point under the Portland No. 2 shaft of the United Gold Mines Co. From this point, after connection is made with this shaft, it will probably be necessary for the Cresson Co. to drive a lateral of some 4,000 feet, in order to afford complete drainage of the Cresson area to the new tunnel level. However, it is expected, when the main tunnel cuts the water courses it will encounter in the last 5,000 feet, some drainage will begin to take place on the Cresson mine.

The Carlton Tunnel will afford 1,100 feet of additional drainage to the district and will be 700 feet below the twentieth level of the Cresson mine. The 18th, 19th, and 20th levels, which are below the present drainage tunnel, were abandoned some 11 years ago, due to the heavy pumping expense.

Plans are being made to do some development on the Hart group of claims, which this company recently acquired. These claims are entirely undeveloped and lie in a very favorable territory on the North Slope of Bull Hill.

The average cost per ton shipped by company and the lessees during 1939 was $2.755 on a total of 128,404 tons.

1903 to Dec. 31, 1939			14.98	10.12	[1] 13,284,072.50

[1] Represents 31.14 percent of gross value and 46.09 percent of net value.

During the year the Golden Cycle Corporation and other Carlton companies operating in the Cripple Creek district and the Stratton-Cripple Creek Mining & Development Co., another large owner of mining properties in the district, acting to remove one of the common causes of litigation and to stimulate mining, entered into agreements under the terms of which the boundaries of claims, instead of the apex of the veins, determine the ownership of the ore; and royalties on low-grade ore mined by lessees on the properties involved are reduced.

The principal producers in 1939 among the Stratton properties were Block 107, American Eagles, Orpha May, Logan, Longfellow, Favorite, and Geneva; the other producers comprised Blocks 47, 140, and 219, Colorado King, Globe Hill, Los Angeles, Pikes Peak, and Matoa dump. Development work done at all mines on the Stratton Estate in 1939 totaled 9,989 feet.

The Free Coinage group, operated by lessees, continued to be an important producer in 1939. The Lark Mining Co. maintained a steady output of ore from the Queen group until it surrendered the lease on September 30 and from the Forest Queen group until October 19. The Elkton, Jerry Johnson, New Gold Dollar, Empire Lee, Acacia, Doctor Jack Pot, Atlas (Midget Bonanza King), and Joe Dandy groups were substantial producers. Gold Producers, Inc., continued operations at the Victor mine on the Smith Moffat property under lease and the company-owned El Paso group. The Tenderfoot Mining Co. continued developing the Mollie Kathleen, Sangre de Cristo, and other groups on Tenderfoot Hill and shipped considerable ore. Cameron Mines, Inc., operated its flotation mill at the Cameron shaft throughout the year on ore from the Cameron and Pinnacle groups, which were consolidated into a one-unit operation. The mill has a capacity of 100 tons of ore per 24 hours, but owing to a drought which hindered operation it was run only two shifts for several months and three shifts for the remainder of the year. The concentrates were shipped to the Leadville smelter. Some of the other producing mines and dumps in the Cripple Creek district in 1939 were the Ben Hur, Bogart-Blue Flag (Twin Sisters shaft), Buckeye, Cardinal-Great West, Delmonico, Economic Dump, Friday, Gold King, Golden Swan, Hiawatha, Irving Howbert (Ethel Louise), Le Clair (Mary McKinney), Mary Nevin, Prince Albert, Rainbow, School Section, Strong, and Teutonic.

Placer gold and high-grade specimen ore from the district, sold to assayers, refiners, and the Denver Mint in 1939, yielded 44 fine ounces of gold.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN THE EASTERN AND CENTRAL STATES

(MINE REPORT)

By J. P. Dunlop and H. M. Meyer

SUMMARY OUTLINE

There were no outstanding developments in mining and milling in the Eastern States in 1939, unless the brief furore in the Dahlonega district of Georgia could be termed significant. The total output of gold was 2,514 fine ounces less than in 1938, notwithstanding an increase of 2,152 ounces in South Carolina; production in each of the other Eastern States except Pennsylvania declined. There was little change from 1938 in output of silver or copper, but shipments of galena decreased considerably. The output of recovered zinc increased 8,454 short tons, but this rise was proportionately much smaller than that in the Tri-State region and in some districts in the Western States.

The dominating events in the Central States in 1939 were the greatly augmented production of lead concentrates in southeastern Missouri, the increase in shipments (not production) of galena from the Tri-State region, and the publicity given to health and living conditions prevailing in the latter region (actually the situation probably is no worse than in mining or industrial areas elsewhere).

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in the Eastern and Central States in 1939, by States, in terms of recovered metals

State	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Zinc		Total value
		Fine ounces	Value	Fine ounces	Value	Pounds	Value	Short tons	Value	Short tons	Value

[1] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[2] New York and Virginia included under Tennessee; Bureau of Mines not at liberty to publish separate figures.
[3] Excludes value of lead, which is included under Tennessee.
[4] North Carolina and Pennsylvania included under Tennessee; Bureau of Mines not at liberty to publish separate figures.
[5] Excludes value of copper, which is included under Tennessee.
[6] Ore is magnetite-pyrite-chalcopyrite, flotation copper concentrates from which yielded gold, silver, and copper; Bureau of Mines not at liberty to publish figures for ore and copper.
[7] Virginia included under Tennessee; Bureau of Mines not at liberty to publish separate figures.
[8] Includes also value of copper from North Carolina and Pennsylvania, lead from New York and Virginia, and zinc from Virginia.
[9] Excludes value of lead and zinc, which is included under Tennessee.
[10] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.
[11] No figures available for small quantity of ore treated in Arkansas, Illinois, or Kentucky.

Number of lode and placer mines producing and yield of gold and silver in the Eastern States in 1939, by States

State	Number of mines		Gold (fine ounces)		Silver (fine ounces)	
	Lode	Placer	Lode [1]	Placer	Lode [1]	Placer
Alabama	1		3			
Georgia	8	17	277	393	23	35
Maryland	3		71		2	
New Jersey	2					
New York	2				37,250	
North Carolina	13	4	488	7	3,961	
Pennsylvania	1		1,815		13,558	
South Carolina	5	1	13,825	8	5,480	
Tennessee	8		163		31,994	
Virginia	4	2	359	5	1,780	
	47	24	[1] 17,001	413	[1] 94,048	35
Total, 1938	51	26	[1] 19,261	667	[1] 94,906	39

[1] 1939: Dry and siliceous gold ores (120,274 tons) yielded 14,949 ounces of gold and 6,023 ounces of silver; copper ore (528,710 tons) yielded 237 ounces of gold and 35,073 ounces of silver; magnetite-pyrite-chalcopyrite ore yielded 1,815 ounces of gold and 13,558 ounces of silver; zinc ore (1,787,404 tons) yielded no gold or silver; and zinc-lead ore (973,231 tons) yielded 39,394 ounces of silver.
1938: Dry and siliceous gold ores (88,671 tons) yielded 17,441 ounces of gold and 4,813 ounces of silver; copper ore (615,403 tons) yielded 375 ounces of gold and 42,470 ounces of silver; magnetite-pyrite-chalcopyrite ore yielded 1,422 ounces of gold and 9,360 ounces of silver; zinc ore (1,530,295 tons) yielded no gold or silver; and zinc-lead ore (925,511 tons) yielded 23 ounces of gold and 38,263 ounces of silver.

Gold.—The production of gold in the Eastern States totaled 17,414 fine ounces in 1939, or 2,514 ounces less than in 1938. The output from siliceous ores decreased from 17,441 to 14,949 ounces and that from placer mines from 667 to 413 ounces; that from the refining of copper bullion increased from 1,797 to 2,052 ounces. Fewer lode mines and placers were operated in 1939 than in 1938, and only two of the placers yielded more than 100 ounces of gold. The estimated output of gold in the Southern Appalachian States from 1799 to 1939, inclusive, is recorded as 2,548,375 fine ounces valued at $53,649,210.

Of the 120,274 tons of siliceous ores (from mines in Alabama, Georgia, Maryland, North Carolina, South Carolina, Tennessee, and Virginia) treated in 1939, 120,047 tons went to gold and silver mills. Gold concentrates (95 tons) shipped to smelters yielded 173 fine ounces of gold, whereas bullion from gold milling plants yielded 14,656 ounces. Ore amalgamated (5,437 tons) yielded in bullion 945 ounces of gold, and ore cyanided (114,610 tons) yielded 13,711 ounces. The 227 tons of dry and siliceous ores shipped crude to smelters yielded 120 ounces of gold.

Copper concentrates shipped to smelters in 1939 yielded 1,976 ounces of gold.

The only output of gold reported from the Central States for 1939—4 fine ounces valued at $140—was from small placer prospecting in Vigo County, Ind.

Silver.—Of the silver (94,083 fine ounces) produced in 1939 in the Eastern States, 35 ounces came from placer bullion, 5,696 ounces from bullion recovered at gold and silver mills, 84,480 ounces from concentrates smelted, and 3,872 ounces from ore shipped crude to smelters. Siliceous ores yielded 6,023 ounces of the silver; zinc-lead ores from New York, Virginia, and Tennessee 39,394 ounces; copper ore 35,073 ounces; and copper concentrates recovered by flotation from magnetite-pyrite-chalcopyrite ore 13,558 ounces.

The production of silver in the Central States in 1939 was 315,953 ounces. The output of Illinois (675 ounces) came from galena concentrates recovered in milling fluorspar, that of Missouri (213,400 ounces) from the refining of lead bullion, and that of Michigan (101,878 ounces) from copper ore.

Copper.—The mine production of recoverable copper in the Eastern States was 21,295,000 pounds valued at $2,214,680 in 1939 compared with 21,079,160 pounds valued at $2,065,758 in 1938. The output from Tennessee was considerably less than in 1938 and that from Pennsylvania increased nearly 40 percent, but the Bureau of Mines is not at liberty to show the copper production of each State. Copper ore yielded about 0.0004 ounce of gold and 0.07 ounce of silver to the ton of crude ore. Copper concentrates from the magnetite-pyrite-chalcopyrite ore mined at the Cornwall mine in Pennsylvania contained about 25 percent copper and 0.10 ounce of gold and 0.78 ounce of silver to the ton.

The copper output of the Central States in 1939 came entirely from Michigan copper mines. The State output of refined copper decreased from 93,486,000 pounds in 1938 to 87,970,000 pounds in 1939 and the average recovery per ton of rock from 24.9 to 19.1 pounds.

Lead.—The recoverable lead produced from mines in the Eastern States in 1939 came from zinc-lead ores from the Austinville mine in Virginia, the Balmat mine in New York, and the Embree mine in Tennessee. Shipments of galena or lead carbonate concentrates totaled 9,953 tons and yielded 6,284 tons of lead, or 1,616 tons less than in 1938.

Lead recovered from shipments of lead ore and concentrates in the Central States increased from 158,873 tons in 1938 to 198,481 tons in 1939, owing mainly to the increase in shipments from southeastern Missouri (the largest lead-producing region in the United States) from 118,870 to 153,522 tons. Mines in the Tri-State or Joplin region shipped 57,941 tons of lead concentrates in 1939 compared with 51,751 tons in 1938.

Zinc.—The recoverable zinc in ore and concentrates shipped from mines in the Eastern States totaled 180,955 tons valued at $21,100,174 in 1939 compared with 172,501 tons valued at $19,211,235 in 1938. Mines in New Jersey yielded 88,716 tons as metal or in oxide.

[N. B.—The value of the zinc in New Jersey is the estimated smelting value of the recoverable zinc content of the ore after freight, haulage, smelting, and manufacturing charges are added.]

The output of recoverable zinc from New York mines rose from 29,896 tons in 1938 to 36,014 tons in 1939; it was derived from zinc ore and zinc-lead ore. Zinc sulfide ores yielded all the zinc produced in Tennessee except that from zinc-lead carbonate ore of the Embree mine and copper ore of the Tennessee Copper Co. The recovered zinc content of sphalerite concentrates shipped from mines in Virginia may not be disclosed, but the total from concentrates shipped from Tennessee and Virginia in 1939 was 56,225 tons; the output of Tennessee increased about 2,565 tons.

Zinc concentrates shipped from mines in the Central States had a recoverable zinc content of 231,716 tons in 1939 compared with 198,721 tons in 1938. Mines in the Tri-State region shipped ore and concentrates yielding 224,446 tons of zinc, Oklahoma contributing 62.5 and Kansas 30.7 percent of the total. Stocks of sphalerite were negligible at the end of 1939. The recoverable zinc in shipments from Missouri mines increased from 10,226 to 15,096 tons; in 1939, as in 1938, the entire output came from southwestern Missouri.

MINE PRODUCTION IN THE EASTERN STATES

Alabama.—Gold production in Alabama from 1830 to 1939, inclusive, has totaled 49,453 fine ounces. The output in 1939 was only 3 ounces, recovered in prospecting at the Blue Hill mine in Tallapoosa County; the Gold Log and Hog Mountain mines were not operated.

Georgia.—From 1830 to 1939, inclusive, Georgia is reported to have produced 869,207 fine ounces of gold. In 1939, 17 placers and 8 lode mines yielded 670 ounces of gold and 58 ounces of silver. Of the 393 ounces of placer gold produced, 61 ounces came from mines near Dahlonega and Auraria in Lumpkin County; 316 ounces from mines near Sautee, Helen, and Nacoochee in White County; and the rest (16 ounces) from mines in Dawson, Hall, and Cherokee Counties. The larger producers of placer gold were the Ferey Gold Mining Co., Loud Gold Mines Co., and Dixie Gravel Co., all in White County. Gold recovered from 730 tons of siliceous ore amounted to 277 ounces and came mainly from the Hamilton mine in McDuffie County, operated by W. T. Fluker. The 5-stamp amalgamation-concentration mill was operated throughout the year on ore taken from two shafts; development work totaled about 150 feet. The Ferey Gold Mining Co. at Nacoochee, White County, operated its mine steadily by means of a dragline, trommel screen, and sluice boxes. Various properties at Dahlonega controlled by Dr. Craig R. Arnold were reported under lease or option for development in 1940. The Simmons prospect near Buford in Gwinnett County was not worked, but some old tailings were treated by G. D. McKay. The Dixie Gravel Co. made a good output from the Dukes Creek placer by means of a hydraulic elevator. The Loud Gold Mines Co. operated its placer at Helen in White County. Gold bullion was shipped to the mint by the Rex Mining & Development Co., Southern Mining & Development Co., J. S. Speer, T. F. Christian, and J. P. McDonald from various small placer operations in Lumpkin and Dawson Counties. R. H. Stumann shipped bullion purchased from small placer operations in Cherokee County. The Turkey Hill 5-stamp mill at Dahlonega was operated by A. H. Head on a small quantity of ore extracted in sinking a 110-foot shaft. Small shipments of crude ore were made to the Tennessee Copper Co. from the Hartman and the Cherokee mines at Holly Springs.

Considerable publicity was given to the Dahlonega district in Lumpkin County in November 1939 by the discovery of a pocket of free gold at the Calhoun mine. Ore was reported as averaging $60,000 to $200,000 to the ton. Naturally such news on the front pages of many newspapers revived speculative interest in the old district. The discovery of rich pockets of gold in Georgia, Maryland, and other Southern States has not been unusual, but the discovery at the Calhoun mine had superlative press notices. No report was made to the Bureau of Mines regarding the quantity of gold recovered in 1939, and none of the bullion was received by the Bureau of the Mint.

Maryland.—The total gold production of Maryland to the end of 1939 is estimated at 6,102 fine ounces. The Maryland mine in Montgomery County was worked only 3 months in 1939. It is equipped with a 200-foot three-compartment shaft, and ore is mined at the 150- and 200-foot levels and treated at the 10-stamp amalgamation mill; the 30-ton ball mill and concentrating table were not used in 1939. Prospecting and development work was done by Kirk & McNamara at the Harrison and Sawyer mines and other prospects, also in Montgomery County. Two shafts were sunk, and some open-cuts were made. The property is equipped with a 10-stamp mill, and bullion was sent to the Philadelphia Mint. No work was done at any of these mines in 1939 after October.

New Jersey (see also second table of this chapter, footnote 1).—The production of zinc ore in New Jersey in 1939 was 606,504 tons containing 88,716 tons of recoverable zinc as metal or in oxide. The producing properties were the Sterling and Mine Hill mines; they were operated about 280 days in 1939 and have a much larger potential output.

New York.—The quantity of zinc ore mined and treated in New York rose from 105,000 tons in 1938 to 115,000 tons in 1939 and that of zinc-lead ore from 280,600 to 305,000 tons. The total concentrates shipped yielded 36,014 tons of zinc and nearly 2,400 tons of lead; the lead concentrates from the Balmat mine contain considerable silver also. The Balmat mine near Sylvan Lake produces zinc-lead ore, is equipped with a 1,000-ton all-flotation concentration plant, and has an inclined shaft 1,300 feet deep. The Edwards mine has a vertical shaft 1,500 feet deep and an inclined shaft from the 1,500- to the 2,100-foot level. The all-flotation plant has a capacity of 500 tons. It is reported that the Universal Exploration Co. continued drilling and exploration near Hyatt in St. Lawrence County.

North Carolina.—The gold output of North Carolina from 1799 to 1939, inclusive, is recorded as 1,155,172 fine ounces. The yield in 1939 was 495 ounces—488 ounces from 13 lode mines and 7 ounces from 4 placers. The output of silver was 3,961 ounces, of which 134 ounces came from dry gold ores and the remainder from copper ore. The Fontana copper mine in Swain County, the only producer of copper, the largest producer of silver, and the second-largest producer of gold in the State in 1939, was operated steadily by the North Carolina Exploration Co.; the high-grade copper ore was shipped to the Tennessee Copper Co. at Copperhill, Tenn. The crude ore is mined through a 2,600-foot inclined shaft. The largest producer of gold in North Carolina was the Capps mine in Mecklenburg County; about 44 percent of the State total in 1939 came from this mine and the 125-ton cyanide plant near Charlotte, although the property was operated only a few months early in the year and later was reported idle and in the hands of a receiver. The old Silver Hill mine in Davidson County, which yields a lead-zinc ore containing copper, gold, and silver and which was reopened in 1938, was idle in 1939. It is equipped with a 10-stamp mill and Deister slime tables. Flotation should be added to the plant. The Tribro mine in Halifax County was worked 98 days by Passavant Bros. by means of an open-cut, and the ore was treated at a 3-ton amalgamation mill. Some small producing properties were the East Hill in Union County, the Sedberry in Montgomery County, and the Calhoun in Gaston County. The Sobel Mining

Co. operated a small mill on its property near Union Mills in Rutherford County; bullion was shipped to the Philadelphia Mint and concentrates to Carteret, N. J. The Mary B. mine near Essex in Halifax County was prospected by open pits, and a small quantity of ore was treated. Payne & Stepp shipped a small carload of ore from a prospect in Swain County to Copperhill, Tenn. Shipments of small lots of crude ore were made to Carteret, N. J., by Mrs. Gordon Wilfong from a prospect in Catawba County, by George V. Patterson from the Ferguson mine in Gaston County, and by R. M. Hutchinson from a prospect near Kings Mountain. A few tons of crude ore were shipped by B. M. Nicholson of Enfield, Halifax County, to Perth Amboy, N. J. The meager production of placer gold came from prospects in Burke, Guilford, Stanly, and Wilkes Counties.

Pennsylvania.—The Cornwall mine and mill in Lebanon County were operated at capacity in 1939; the mine has an open-cut and three inclined shafts 1,300 feet deep. The ore (magnetite-pyrite-chalcopyrite) is treated by magnetic separation and the tailings from the iron concentrates go to the 2,000-ton flotation plant; the copper concentrates, which contained about 25 percent copper and 0.10 ounce of gold and 0.78 ounce of silver to the ton, were shipped to the Nichols Copper Co.

South Carolina.—From 1829 to 1939, inclusive, mines in South Carolina produced 282,246 fine ounces of gold. In 1939 the output from five lode mines and one placer was 13,833 ounces, of which only 8 ounces came from the placer. Gold milling plants recovered 13,754 ounces of gold and 5,475 ounces of silver; concentrates shipped to smelters yielded 34 ounces of gold and 5 ounces of silver; and 54 tons of ore were shipped crude to smelters. The old Haile mine, with the reputation of having been the largest gold producer in the Southern Appalachian States, was worked throughout the year; its output in 1938 and 1939 was largely responsible for the notable increase in that region in each year. In 1939 it yielded 13,551 fine ounces of gold and 5,452 ounces of silver.

Haile Gold Mines, Inc., operated its mines and countercurrent-decantation cyanide plant throughout 1939. The daily capacity of the mill is 400 tons, and the ore (about 113,700 tons milled in 1939) is a mixture of quartz and pyrite. Ore from the old pits and 55,885 tons from the recently developed Red Hill pit were cyanided, and good recoveries were made from the low-grade ore (of which reserves are ample) developed by geophysical exploration and drilling. The history of the Haile mine and its development and operation by the present owners have been described by Brodt and Newton.[1]

The Dorothy mine in York County was operated by W. K. Hunter, and 2 cars of crude ore were shipped in 1939 to the Tennessee Copper Co. at Copperhill, Tenn. The Ross-Carroll mine in York County was operated by W. E. Tummon by means of a 70-foot shaft, and the ore was treated at a small mill; bullion recovered was sent to the Philadelphia Mint and concentrates were shipped to Carteret, N. J. Other production included a small output of gold from the old Hegeler mine in Lancaster County and from prospects in Chesterfield County operated by A. M. Miller of Jefferson. The small output of placer gold came from the Brewer mine in Chesterfield County, operated by the Wandelyn Mining Co.

[1] Brodt, H. H., and Newton, Edmund, Gold Mining at the Haile Mine in South Carolina: Min. Cong. Jour., vol. 24, No. 10, October 1938, pp. 20–27.

Tennessee.—Mines in Tennessee produced 19,638 fine ounces of gold from 1831 to 1939, inclusive; almost the entire output since 1906 has come from copper ore, and copper bullion was the source of 161 ounces in 1939. The quantity of silver recovered in 1939 was 31,246 ounces from copper ore and 748 ounces from zinc-lead ore. The Embree Iron Co., the only producer of lead in Tennessee, shipped lead carbonate concentrates. The production of copper from Tennessee mines decreased about 835 tons from 1938, but that of zinc increased about 2,565 tons.

The total output of copper from mines in Tennessee, Pennsylvania, and North Carolina was 10,648 tons in 1939 compared with a total of 10,540 tons from the Eastern States in 1938; production in Pennsylvania increased about 1,250 tons. The total lead recovered from mines in Virginia, New York, and Tennessee was 6,284 tons in 1939 compared with 7,896 tons in 1938. The total zinc recovered from mines in Tennessee and Virginia was 56,225 tons in 1939 compared with 56,766 tons in 1938. The Bureau of Mines is not at liberty to publish figures for the foregoing States separately.

The Tennessee Copper Co. ran its 1,200-ton (daily) flotation plant and its smelter in 1939, but not at capacity, on ore from the Burra Burra, Eureka, and Isabella mines in Tennessee and on sulfide ore from the Fontana mine in Swain County, N. C.; about 136 tons contained in six shipments of ore were received from other States. Some 48-percent zinc concentrates were produced at the mill and shipped to Donora, Pa., and the copper bullion was sent to the Nichols Copper Co. The Mascot mine and 2,800-ton concentrating plant of the American Zinc Co. of Tennessee were operated steadily in 1939; the mine is opened by a 520-foot shaft and an inclined shaft from the 520-foot level to the maximum depth of 850 feet. The output was larger in 1939 than in 1938. The company also worked the Grasselli mine, where operations were conducted at the 350-foot level. The crude ore from both mines was treated at the Mascot mill, which is equipped with a differential-tension density cone that considerably increases the capacity of the plant. The Universal Exploration Co. worked steadily in 1939 at both the mine and 800-ton all-flotation mill, but the plant for treating zinc carbonate ore was idle throughout 1939. Two shafts were used in 1939. The average grade of the sphalerite shipped in 1939 was 64.329 percent zinc, which is considerably higher than that from any other mine in the United States. The Embree Iron Co. in Washington County shipped some zinc carbonate concentrates and increased its shipments of lead carbonate slightly. A log washing plant was used to treat the crude ore.

Virginia.—Mines in Virginia produced 166,557 fine ounces of gold from 1828 to 1939, inclusive, but only 7,440 ounces have been produced during the last 29 years. In 1939 the output of the State was 364 ounces of gold and 1,780 ounces of silver from four lode mines and two placers. Shipments of lead and zinc concentrates decreased, but the Bureau of Mines is not at liberty to publish figures for lead and zinc output, as the Austinville mine of the New Jersey Zinc Co. is the only producer of zinc-lead ore in Virginia. The mine and 2,000-ton concentration-flotation mill were operated throughout the year.

The Vaucluse mine near Wilderness in Orange County, which has a 325-foot shaft and is equipped with a 75-ton all-flotation plant, was idle in 1939; the only shipment during the year was a few tons of concentrates that had been made in 1938. The Red Bank mine near Virgilina, Halifax County, operated by Joseph Hamme, was the largest producer of gold in Virginia in 1939; the property is equipped with a small amalgamation mill. Amos V. Pankey operated the London and Virginia gold mine near Dillwyn in Buckingham County; bullion was shipped to the Philadelphia Mint and concentrates to Carteret, N. J. The ore was obtained from an open pit and was milled at the Booker mill, but plans have been made for a new milling plant in 1940. The Nassog copper prospect in Floyd County was not worked in 1939 but is to be developed in 1940. The output of placer gold in Virginia in 1939 came mainly from the Bertha and Edith mines in Goochland County operated by H. H. Walton, of Pendletons.

MINE PRODUCTION IN THE CENTRAL STATES

Quantity and tenor of ores.—One basis for comparing the relative magnitude of mining in different States is the quantity of crude ore or "dirt." The metal content of the ores of the several mining regions and States exhibits marked differences; therefore, comparison of tenor of the ores is interesting and significant. Virtually all the ore from the Central States is of such low tenor as to require concentration. In Kentucky and southern Illinois most of the lead and zinc concentrates are recovered as byproducts in the concentration of the fluorspar that they accompany, and the metal content of the crude ore raised cannot be calculated. In Arkansas very little ore has been mined for several years, and the average tenor calculated from the output of ore during these years would not offer accurate comparison with that during a period of active mining.

Quantity and tenor of copper, lead, and zinc ores, old tailings, etc., produced in the Central States, 1937–39, by States

State [1]	1937		1938		1939	
	Ore, etc.	Metal content [2]	Ore, etc.	Metal content [2]	Ore, etc.	Metal content [2]
	Short tons	*Percent*	*Short tons*	*Percent*	*Short tons*	*Percent*
Kansas	5, 607, 900	1. 90	3, 751, 300	2. 58	3, 701, 300	2. 45
Michigan	4, 197, 881	1. 13	3, 757, 705	1. 24	4, 603, 751	. 96
Missouri	5, 992, 731	3. 07	4, 148, 000	3. 28	5, 650, 800	3. 12
Oklahoma	10, 432, 000	1. 77	7, 321, 400	1. 71	8, 802, 900	2. 00
Wisconsin	285, 000	3. 41	58, 700	4. 46	213, 400	3. 26
	26, 515, 512		19, 037, 105		22, 972, 151	

[1] No figures available for small quantity of ore treated in Arkansas, Illinois, or Kentucky.
[2] The percentages represent the metal content of the ore insofar as it is recovered in the concentrates. In Michigan the metal so recovered is copper; in other Central States the metals are lead and zinc combined, the relative proportions of which are shown in the second table of this chapter and in the tables of tenor of ore given in the sections devoted to the respective States.

Production of lead and zinc by regions.—The report of this series for 1930 (chapter of Mineral Resources of the United States, 1930, pt. I) gives the areas included in the seven lead- and zinc-producing regions of the Central States. Mineral Resources, 1914, contains brief reviews of the history of lead and zinc mining in the Central States, the yearly production of each State from 1907 to 1914, inclusive, and historical notes and estimates of the total production of lead and zinc in each

State before 1907. Subsequent records may be found in annual issues of Mineral Resources and Minerals Yearbook.

Of a total of 412,190 tons of blende concentrates produced in 1939 in the Tri-State region 72,931 tons, or 12,944 tons more than in 1938, were derived from old tailings.

Mine production of lead and zinc in the Central States in 1939, by regions

Region	Lead [1]		Zinc [2]		Total value
	Short tons	Value	Short tons	Value	
Concentrates:					
Joplin or Tri-State	57,941	$3,399,068	413,139	$14,199,263	$17,598,331
Southeastern Missouri	210,526	12,339,360			12,339,360
Upper Mississippi Valley [3]	567	29,327	[4] 10,169	355,915	385,242
Kentucky-southern Illinois	657	25,589	2,832	67,430	93,019
Northern Arkansas			382	5,800	5,800
	269,691	15,793,344	426,522	14,628,408	30,421,752
Total, 1938	216,244	11,759,610	366,647	11,242,633	23,002,243
Metal:					
Joplin or Tri-State	44,176	4,152,544	224,446	23,342,384	27,494,928
Southeastern Missouri	153,522	14,431,068			14,431,068
Upper Mississippi Valley [3]	388	36,472	5,904	614,016	650,488
Kentucky-southern Illinois	395	37,130	1,243	129,272	166,402
Northern Arkansas			123	12,792	12,792
	198,481	18,657,214	231,716	24,098,464	42,755,678
Total, 1938	158,873	14,616,316	198,721	19,077,216	33,693,532

[1] Includes galena and a small quantity of lead carbonate concentrates.
[2] Includes sphalerite and a small quantity of zinc carbonate and zinc silicate concentrates.
[3] Includes Iowa, northern Illinois, and Wisconsin.
[4] The zinc concentrates shipped in 1939 were a flotation product. No raw concentrates were shipped in 1939; about 32,360 tons were produced.

REVIEW BY STATES

Arkansas.—Most of the small mines in Arkansas were inactive in 1939 until fall, and little development was done. Higher prices in September brought about the reopening of mines in various districts, but all operations were on a very small scale and there was no shipment of galena. A total of 382 tons of zinc carbonate was shipped from about 11 mines in Arkansas in 1939; the recoverable zinc content was 123 tons. None of the mines gave any data for 1939 on their shipments, but the smelters that purchased the concentrates gave the information. Shipments of zinc carbonate were made from the Edith, Yellow Rose, Philadelphia, McIntosh, Silver Hollow, Monte Cristo, and Red Cloud mines in the Rush district; the Brewer, Eleventh Hour, and Bonanza mines in Newton County; and the Jack Pot mine near Zinc. Virtually all the zinc concentrates obtained in small lots by L. A. Watkins, of Harrison, Ark., were sold to the Ozark Smelting Co. at Coffeyville, Kans.

Illinois.—Most of the lead and zinc produced in southern Illinois is recovered from fluorspar-lead-zinc mining, and shipments of galena and blende concentrates were much larger in 1939 than in 1938. The shipments of galena were mainly from properties of the Aluminum Ore Co., Hillside Fluor Spar Mines, and Mahoning Mining Co. and amounted to 529 tons having an average lead content of 59.4 percent; 308 tons of lead and 675 fine ounces of silver were recovered from these shipments compared with 175 tons of lead and 576 ounces of silver in 1938. The Mahoning Mining Co. operated its property near

Cave in Rock, Hardin County; two shafts were used. The ore mined contains more lead and zinc than is normally found with fluorspar, and tests showed that the crude ore is amenable to treatment.[2] The 200-ton all-flotation plant built at Rosiclare was put in operation in June 1939; lead concentrates, blende concentrates, and fluorspar were shipped. The galena averaged 45 percent lead and the sphalerite 61 percent zinc. The crude ore from the mine is trucked 18 miles to the concentrating plant, which has direct rail facilities.

Indiana.—Four fine ounces of gold valued at $140 were recovered in 1939 from small placer prospecting in Vigo County.

Kansas.—Shipments of galena concentrates from mines in Kansas in 1939 totaled 17,845 tons with a recovered lead content of 13,697 tons compared with 19,909 and 15,239 tons, respectively, in 1938. Shipments of sphalerite concentrates amounted to 126,235 tons with a recovered zinc content of 68,971 tons compared with 133,546 and 73,024 tons, respectively, in 1938. About 530,900 tons of Kansas crude ore were concentrated at mills in Oklahoma and yielded 41,402 tons of sphalerite concentrates and 3,601 tons of galena concentrates. In all, about 30 mines and 23 mills were operated in Kansas in 1939.

No output for 1939 was reported from the Lawton or Crestline camps, and scrapping only was done at Galena. The Peacock mine at Badger-Peacock was operated throughout the year by L. W. Goings & Co. Production in the Kansas part of the Waco district was from tailings and ore from the Acme and Butte Kansas properties of the R. H. & G. Mining Co. The total output of the Waco area in 1939 was 56 tons of galena and 6,627 tons of sphalerite, of which properties in Kansas yielded 44 tons of galena and 4,713 tons of sphalerite. Considerable development work was done by the St. Louis Smelting & Refining Co. at Waco, but the 800-ton mill was not operated until early in January 1940. Mines and mills near Baxter Springs shipped 4,039 tons of galena and 17,774 tons of sphalerite. The St. Louis Smelting & Refining Co. (various mines and the Ballard mill) was much the largest producer of both lead and zinc, and the Sunflower mine also had a large output. Ore was mined and milled or shipped to custom mills from the Robob, Bilharz, Wade, and Iron Mountain mines. Mines and mills in the Blue Mound-Treece area shipped 13,492 tons of galena and 103,447 tons of sphalerite. Mines in Kansas that shipped ore to the Central mill at Cardin, Okla., included the Mid-Continent, Wright, Bendelari, Big John, Black Eagle, Chubb, Robob, and Kansouri. The Muncie and the Jarrett mines and mills of the Federal Mining & Smelting Co. were operated and made large shipments of concentrates. Other large producers in this area were the Vinegar Hill Zinc Co. (Barr mine), J. P. Dines Mining Co., Eagle-Picher Mining & Smelting Co. (Wilbur and Webber mills), Kansas Explorations, Inc. (Robinson and Jarrett mills), Oklahoma Interstate Mining Co. (Cherokee mine), and New Blue Mound Mining Co. The five large producers of sphalerite from old tailings were the Captain Milling Co., J. L. Smith Chat Co., Youngman & Youse, C. Y. Semple, and Youngman Milling Co. These five tailing mills treated about 1,922,000 tons of material and shipped 262 tons of galena and 17,622 tons of sphalerite.

[2] Clemmer, J. B., Duncan, W. E., DeVaney, F. D., and Guggenheim, M., Flotation of Southern Illinois Lead-zinc-fluorspar Ores: Bureau of Mines Rept. of Investigations 3437, 1939, 31 pp.

Mine shipments of lead and zinc in Kansas, 1935–39

Year	Lead concentrates		Zinc concentrates		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1935	14,301	$579,690	102,078	$2,948,509	10,892	$871,360	54,110	$4,761,680
1936	14,789	765,746	149,095	5,473,457	11,409	1,049,628	79,017	7,901,700
1937	20,559	1,454,507	151,646	6,476,064	16,008	1,888,944	80,300	10,439,000

Sphalerite concentrates	30.60	33.22	34.39	32.11

Kentucky.—Six mines in Kentucky shipped 612 tons of zinc carbonate, 1,614 tons of sphalerite, and 128 tons of galena in 1939. The zinc carbonate sold was shipped mainly by Avery H. Reed of Marion, C. F. Lester of Princeton, and the Hickory Cane Mining Co. of Marion; the sphalerite came from the Eagle Fluor Spar Co. property. Most of the lead concentrates were shipped by Roberts & Frazer (Kentucky Fluor Spar Co.) and the National Fluorspar Co. The galena averaged about 69 percent lead and the sphalerite about 47 percent zinc. The recovered content of the concentrates shipped was 87 tons of lead and 909 tons of zinc. The Reed shipments were from a 150-foot shaft on land owned by the K–K–Mining Co. in Crittenden County. The Eagle Fluor Spar Co. is near Salem in Livingston County and is equipped with a concentrating plant; the concentrates shipped in 1939 came from stocks, as the property was idle. The Hickory Cane Mining Co. shipments were derived from development done at the 250-foot level.

Michigan.—Production of copper in Michigan declined to 87,970,000 pounds in 1939 from 93,486,000 pounds in 1938, or 6 percent. The drop was due to the closing in October of the famous Conglomerate lode of the Calumet and Hecla Consolidated Copper Co. owing to exhaustion of ore reserves. This mine has produced almost continuously since 1866, when operations began, and has been responsible for the principal part of Calumet and Hecla's total output. The company states that over a period of 73 years the mine contributed more than 3,275,000,000 pounds of copper to the country's total. As a result of the shut-down of the Conglomerate mine a considerably larger proportion of Calumet and Hecla's production in 1939 was from tailings, and the yield of copper from Michigan ore and tailings (0.96 percent) was the smallest since 1918 and one of the lowest on record. The proportion of copper from tailings to copper from ore in the State in 1939 is believed to have been the highest in Michigan's history.

Copper was produced in 1939 from the same mines as in 1938, that is, Calumet and Hecla, Copper Range Co., Quincy Mining Co., and Isle Royale Copper Co. The property of the Peninsula Copper Co. (formerly known as the Seneca mine) was optioned to Calumet and Hecla, and its production was covered by the report for the latter company.

Output of silver in Michigan in 1939 (101,878 fine ounces) was the highest recorded since 1933, when 125,926 ounces were produced, and except for 1933 was larger than in any year since 1926. In 1916, however, silver production totaled 716,640 ounces.

Mine production of gold, silver, and copper in Michigan, 1935–39 [1]

Year	Gold (fine ounces)	Silver (fine ounces)	Copper [2]			Concentrate ("mineral") [3]		Ore ("rock") (short tons) [4]
			Pounds	Yield				
				Pounds per ton of ore ("rock")	Percent	Pounds	Yield (percent copper)	
1935		4,219	64,108,689	46.6	2.33	95,509,256	67.1	1,376,803
1936			95,968,019	29.8	1.49	141,166,376	68.0	3,225,600
1937	51.44	25,454	94,928,000	22.6	1.13	148,172,000	64.1	[5] 4,197,881
1938		93,634	93,486,000	24.9	1.24	144,964,890	64.5	3,757,705
1939		101,878	87,970,000	19.1	.96	136,771,339	64.3	4,603,751

[3] Includes "mineral" from sands.
[4] Includes sands.
[5] Excludes 600 tons of siliceous ore.

Value of silver and copper produced in Michigan mines, 1935–39

Year	Silver	Copper		Total	Year	Silver	Copper		Total
		Total	Per ton of ore ("rock")				Total	Per ton of ore ("rock")	
1935	$3,032	$5,321,021	$3.86	$5,324,053	1938	$60,531	$9,161,628	$2.44	$9,222,159
1936		8,829,058	2.74	8,829,058	1939	69,154	9,148,880	1.99	9,218,034
1937	19,689	11,486,288	2.74	11,505,977					

The following data are abstracted from reports of the companies to their stockholders.

Production of copper by the Calumet and Hecla Consolidated Copper Co. in 1939 totaled 28,915,000 pounds at an average cost sold (excluding depreciation and depletion) of 8.81 cents a pound. The Lake Linden and Tamarack reclamation plants worked throughout the year under normal conditions and treated sand below the average grade of reserves. Together they recovered 23,400,000 pounds of copper at an average cost sold (excluding depreciation and depletion) of 6.19 cents a pound. In 1938 the mines produced 48,264,000 pounds at an average cost of 7.37 cents a pound and the reclamation plants 16,619,000 pounds at 6.86 cents. The average price received advanced from 10.03 cents in 1938 to 10.81 cents in 1939. This small increase was largely offset by increased mining costs.

Of the 1939 recovery 7,269,000 pounds were from table treatment following grinding, 12,909,000 pounds from leaching, and 3,222,000 pounds from flotation. At the current rate of recovery the remaining Conglomerate sands should last 4 to 4½ years. Mining at the Conglomerate lode was continued through October, by which time all the commercial rock had been mined. Active mining was begun on this lode in 1866 and has continued almost uninterruptedly for 73 years, during which time the lode has produced more than 3,275,000,000 pounds of copper. At the Calumet mill at Lake Linden 164,526 tons of Conglomerate rock were stamped. The mill and its auxiliary grinding plant ceased operations with the closing of the Conglomerate mine, but for the present they are being maintained in serviceable condition. At the Ahmeek mill 759,301 tons of Kearsarge amygdaloid rock from the Ahmeek mine and 30,996 tons from the Peninsula Copper Co. area were stamped. The mill is operating at its best metallurgical efficiency but at only about 50 percent of capacity. The smelter received 43,716 tons of concentrates, smelted 42,429 tons, and produced 54,187,766 pounds of refined copper. Copper oxide totaling 1,855 tons and containing 2,832,335 pounds of copper was shipped to customers. Results of exploration in the Mass-Michigan area in Ontonagon County were generally unfavorable, and exploration was abandoned in December. Exploration work in Houghton and Keweenaw Counties was generally discouraging.

Operations at the Calumet and Hecla reclamation plants at Lake Linden and Hubbell in 1939 and for the entire period of their operation

	1939	Since beginning
Quantity treated ... short tons	2,574,000	33,672,000
Assay headings ... percent	0.548	0.657
Assay tailings ... do	.092	.125
Refined copper produced ... pounds	23,400,000	357,343,000
Refined copper produced per ton treated ... do	9.09	10.61

The mine production of copper by the Copper Range Co. was 17,856,237 pounds, and copper produced at the tailings recovery plant amounted to 253,172 pounds, a total of 18,109,409 pounds. Of the copper produced, 1,075,582 pounds were from the Globe mine and the remainder from the Champion mine. The company expects that production at the Globe mine will show substantial improvement in 1940. Ore reserves at the Champion mine were reported to be about 10 percent below those on hand at the beginning of the year, but minable areas were more spotty and scattered. These conditions made mining more difficult and costs higher. The tailings recovery plant operated on an experimental basis 1½ months. It was hoped that operations at the plant would be resumed in the spring of 1940. The average cost of production for the company rose from 9.50 cents a pound in 1938 to 10.12 cents in 1939, and as the average selling price advanced from 9.80 to 10.81 cents there was a slight increase in net realization per pound. Concentrates treated at the smelter totaled nearly 26,800 tons, or 16 percent more than in 1938. The rise was due to the handling of larger quantities of custom material. Operations of the company for 5 years are shown in the following table:

Copper produced by the Champion mine of the Copper Range Co., 1935–39

Year	Rock stamped	Copper produced	Yield per ton	Cost per pound [1]	Price received
	Short tons	*Pounds*	*Pounds*	*Cents*	*Cents*
1935	280, 500	16, 759, 889	57. 56	8. 26	8. 68
1936	320, 815	17, 486, 019	54. 51	8. 87	9. 59
1937	[2] 306, 075	16, 131, 277	[3] 51. 59	11. 45	12. 375
1938 [4]	[5] 333, 190	18, 066, 891	[3] 54. 06	9. 50	9. 80
1939 [4]	[6] 330, 605	18, 109, 409	[3] 54. 01	10. 12	10. 81

[1] Excludes depreciation and depletion.
[2] Excludes 133,594 tons of tailings treated.
[3] Yield from ore only.
[4] Includes Globe mine.
[5] Excludes small unstated quantity of tailings treated.
[6] Excludes 85,842 tons of tailings treated.

Missouri.—The following tables show the shipments of lead and zinc in southwestern Missouri, which is part of the Tri-State region, and in southeastern Missouri. The tenor of the crude ore and concentrates is given for each area.

Mine production of lead and zinc in southwestern Missouri, 1935–39

Year	Lead concentrates				Zinc concentrates				Metal content [1]			
	Galena		Carbonate		Sphalerite		Silicate		Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1935	490	$19, 600	345	$10, 350	13, 020	$371, 980	1, 400	$20, 561	552	$44, 160	7, 263	$639, 144

Average zinc content of sphalerite concentrates percent		45.0	51.6		
Average value per ton of sphalerite concentrates		$18.00	$30.00		

The value of the silver, lead, and zinc shipped from Missouri mines was $16,405,251 in 1939 compared with $12,396,948 in 1938. The silver in 1939 (213,400 fine ounces) was recovered from lead refining. Lead ore yielded no copper. The quantity of recovered lead increased from 122,027 to 156,281 tons and that of recoverable zinc from 10,226 to 15,096 tons.

Shipments of lead concentrates from Missouri mines were 214,200 tons in 1939 compared with 167,734 tons in 1938; of the total, 210,526 tons were shipped from mines in southeastern Missouri compared with 163,500 tons in 1938, of which the recovered lead content was 153,522 and 118,870 tons, respectively. No sphalerite was shipped from southeastern Missouri in either year. Shipments of lead concentrates from southwestern Missouri mines in 1939 comprised 3,674 tons of galena, most of which came from mines in the Spring City, Oronogo, and Webb City camps.

The total value given for all concentrates is based on actual receipts by the sellers and not on quoted prices. In 1939, as in 1938, the quoted price was that paid for medium quantities or carlots; small lots brought less. The quoted prices of all sphalerite concentrates in 1939 ranged from \$29 to \$44 a ton. The opening quotations were \$29; in the eleventh week the price increased to \$30, which held for 18 weeks. Early in July the price advanced to \$31 and early in August to \$31.50. During the second week of August it jumped to \$40 a ton, in the third week of September to \$42, and in the last week of September to \$44, the highest quotation of the year. This price held steadily until the second week of December, when there was a sharp break to \$39.50. This price prevailed until the end of 1939. No prices were quoted in 1939 for zinc silicate or lead carbonate. The price quotation for 80-percent galena concentrates for the first 3 weeks of 1939 was \$54.38 a ton; early in February it fell to \$52.94. There were only slight changes in weekly price from March until June. The price in July was \$55.18 and in the first week of August jumped to \$58.06, where it was steady for 5 weeks. The highest price of the year (\$64.54) was reached in the second week of September, and it held until the end of December. The average price paid for zinc silicate in 1939 was about \$17.60 a ton.

The foregoing quoted prices apply to all mines in the Tri-State or Joplin region of Kansas, Missouri, and Oklahoma.

Of the 413,139 tons of zinc concentrates shipped from the Tri-State region in 1939, it is estimated that flotation concentrates comprised 199,249 tons; flotation lead concentrates are estimated at 11,500 tons. The extension of flotation has increased the zinc content of the sphalerite concentrates, but the average grade of galena concentrates has decreased. Most of the galena from jigs and tables has a lead content of 80 percent (and above), but the flotation galena does not average as much as 70 percent lead. The small quantity of galena produced at tailing mills is generally of low grade for Missouri type, the lead content averaging 35 to 69 percent. About 43 large and small mines were worked in southwestern Missouri in 1939; only 13 mills were operated.

Until about September 1939 small mine development and churn drilling were handicapped by low prices for ore and scarcity of capital for investment. Few ore bodies of consequence were located, and most of the ore treated came from old mines that had been reopened. Drilling at Aurora was not very successful, and little ore came from the Alba-Neck City camp. Old mines were reopened at Racine, Seneca, and Duenweg. Mines near Oronogo and Stark City yielded a large part of the concentrates from southwestern Missouri. The Eagle-Picher Mining & Smelting Co. continued shipments from Stark City to the Central mill at Cardin, Okla., and a new shaft was sunk on the Dungy land. Operations were continued at the old Oronogo Circle open pit by means of power shovels and trucks. The mining was done by the Oronogo Mutual Mining Co., and the crude ore was milled at the American mill (800 tons daily). Other shipments to this mill were made from the Wingfield, Red Dog, Lucky Tiger, and Hickam mines. The Oronogo Circle, in addition to sending ore to the American mill, moved more than 125,000 tons of waste from the open pit where operations were limited to about the 100-foot level. Eventually operations will extend to the old workings below 220 feet. The F and M Mining Co. operated several shafts and its 200-ton mill throughout 1939. The Playter custom mill at Waco received crude ore from various camps, in addition to the mines at Waco. Other producers of lead or zinc concentrates in 1939 were the Burton Mining Co., Boulder Lead & Zinc Co., Eunamar Mining Co., Little Six Mining Co., and Deer Park Mining Co., all near Joplin; the Mary Arnold Mining Co. at Ozark; L. Eakins (custom mill) at Webb City; Midwestern Mining & Milling Co. at Wentworth; Ritter Mining Co. at Waco; Pilant & Ogle and R. Nunn & Co. at Granby; and Lemons Mining Co. at Seneca. About 66,000 tons of crude ore from Missouri mines were shipped to the Central mill in Oklahoma in 1939.

The lead ore (5,127,000 tons) mined in southeastern Missouri in 1939 yielded 4.11 percent in galena concentrates averaging 74.4 percent lead. The quantity of ore mined and milled was 1,458,600 tons more than in 1938 but the recovery slightly less. The mines and mills of the St. Joseph Lead Co., with a daily capacity of 20,500 tons, were operated at a much higher rate than in 1938, and the Mine La Motte Corporation mill treated 33 percent more ore than in 1938. The Annapolis mine and mill in Iron County were worked part of the year by the Basic Metals Mining Co. The Ozark Lead Co. on the Fleming tract at Fredericktown had a much larger output than in 1938; its crude ore is treated at the Clark & Hallock mill. Of the 210,526 tons of concentrates made in southeastern Missouri, 94,488 tons were flotation galena concentrates compared with 73,884 tons in 1938. No sphalerite or zinc carbonate concentrates were shipped from southeastern Missouri in 1939, and less than 300 tons of galena were purchased and shipped by buyers of small lots recovered in shallow workings.

Oklahoma.—Events in 1939 of greatest importance to Oklahoma mine operators and others in the Tri-State lead and zinc region were the war in Europe, which caused prices of sphalerite concentrates to advance rapidly in September; the realization in December that Europe had no urgent need of imported zinc metal or concentrates; and the increase in imports of metal concentrates from Mexico and South America fostered by the lower import tariff on zinc and by lack of facilities to ship zinc to its normal market, which especially affected the Tri-State region.

Operators of mines in the Tri-State area have long been aware that health and housing conditions in the region are not perfect, although much improvement has been made in recent years. The mine management had studied various phases of health and safety in the mines and plants and had complied with regulations as well as with procedures beyond the requirements of law in protecting the health and safety of the workers in mines and mills. However, the operators have very little control over housing conditions but have contributed liberally to improvement of health and hospital facilities. Undoubtedly some dust disease still exists in the region, but most of the cases of silicosis originated under conditions of 20 or more years ago, and few new cases occur with modern equipment and rules. The operators do not believe that dust from tailing piles or other sources has caused silicosis to workers above ground or to travelers on highways; moreover, they think that while some poor housing facilities can be found, this condition exists in almost every community, large or small, and they are very willing to assist in every way Federal, State, and local authorities to remedy all objectionable features.

Several reports on silicosis have been published, including a recent article by H. C. Chellon.[3]

Nearly all the tailings treated at mills in the Tri-State region (7,274,000 tons in 1939) are moved by truck; in addition, a large part of the crude ore is transported by truck, including part of that treated at custom or central mills. The average truck haul is said to be 2 miles, and the cost, of course, varies with the distance the material is moved. Some data relating to the increased quantity hauled by truck in the Tri-State area have been published by Netzeband.[4]

About 23 mills of various sizes were operating in Oklahoma at the end of 1939. At least 100 operators, large and small, did not mill their crude ore but shipped it to custom mills or central mills. The Tri-State Zinc & Lead Ore Producers Association reported at the end of the year that stocks at mines in the Tri-State region totaled 12,022 tons of sphalerite and 491 tons of galena. Stocks of sphalerite increased 3,600 tons compared with December 31, 1938, but stocks of galena decreased nearly 8,000 tons.

A large part of the blende concentrates from the tailing mills and from the central mills is a flotation product, but the tailing mills produce only a small quantity of low-grade galena. The proportion of flotation sphalerite at the large central mills has shown a substantial increase. Except at a few large mills there has been no great increase in flotation galena concentrates.

About 1,871,000 tons more old tailings than crude ore were treated in Oklahoma in 1939, and the tailings yielded about 21 percent of the total sphalerite.

There was no production from the Peoria or Davis camps in 1939 or 1938. Mines near Commerce were operated part of the year, and the Midas, Mispah, Crabapple, and Lost Trail leases produced concentrates at small mills or shipped crude ore to custom mills. The shippers in the Sunnyside-Quapaw area were the Atlas Milling Co., Century Zinc Co. (Scott), and St. Louis Smelting & Refining Co. (No. 4).

In the central part of the Oklahoma section of the Tri-State region, the Lawyers Lead & Zinc Co. and Skelton Lead & Zinc Co. ran partly on ore in 1939 and partly on old tailings. The following mills ran tailings only: Rialto Mining Corporation, Cardin Mining & Milling Co. (Nos. 2 and 3), Eagle-Picher Mining & Smelting Co.

[3] Chellon, H. C., Dust Count Technique in Tri-State Mines: Eng. and Min. Jour., December 1939, pp. 29–33.

[4] Netzeband, W. F., Truck Transport Serves Tri-State Mining: Eng. and Min. Jour., January 1940, p. 34.

(Beaver), Britt Mining Co., Tri-State Zinc, Inc. (Sooner and Ottawa), Cortez King Brand Mining Co. (New York), and C. Y. Semple (Martin).

The Eagle-Picher Mining & Smelting Co. treated more crude ore in 1939 than any other Tri-State operator; among company-operated mines shipping to the Central mill were the Admiralty, Blue Goose, Crystal, Grace Walker, How-bah-wah-tah 1, 2, and 3, La Salle, Southside, See Sah, and Swift. Other large shippers to the Central mill were the Davis Big Chief Mining Co., Craig Mining Co., Cameron & Henderson, J. Dryer, Childress Mining Co. (Acme), Romo Mining Co., Gray Wolf Mining Co., Needmore Mining Co., Carpenter Mining Co., Commerce Tulsa Mining Co., Imperial Mining Co., W. H. Mining Co., and Ottawa Mines Corporation. The Bird Dog 800-ton mill received ore from many of the old Commerce leases but has since been used to crush crude ore for the Central mill. Other large operations in Oklahoma included Evans Wallower Zinc, Inc. (4 and 7), Oklahoma Interstate Mining Co. (Woodchuck and Townsite mines), United Zinc Smelting Corporation, Kansas Exploration Co. (Ritz), Guaranty Mining & Royalty Co., Indian Mining & Milling Co., Lulu Belle Mining Co., Baird Mining Co., Blue Ribbon Mining Co., Lavrion Mining Co., Federal Mining & Smelting Co. (Gordon), and Mission Mining & Royalty Co. The Guaranty mill treated ore from the Sherida, Sante Fe, and Blue Ribbon mines; the Gordon mill, from seven or eight mines of the Federal Mining & Smelting Co.; and the Beck No. 2 mill, from numerous mines but principally from the Dobson, Pioneer, and St. Louis No. 10 mines.

The total quantity of crude ore milled at the Central mill in 1939 was 1,881,079 tons, and the total ore milled at the See Sah, Bird Dog, and Blue Goose mills was 567,100 tons. About 72 percent of the sphalerite and 36 percent of the galena milled at the Central mill were flotation products. Numerous improvements were made at the Central mill in 1939, and the plant operates smoothly with a capacity up to 10,000 tons daily. A large cone crusher has been installed at the foot of the tailings conveyor to reduce the size of the cone-plant tailings product to meet commercial demands, which are mainly for the smaller sizes of material. Some of the old Commerce mills may be operated occasionally, but most of the Eagle-Picher Mining & Smelting Co. crude ore will be treated at its Central mill.

Mine shipments of lead and zinc in Oklahoma, 1935–39

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1935	30,790	$1,329,656	246,131	$7,047,052	23,405	$1,872,400	129,763	$11,419,144
1936	34,833	1,735,732	244,740	7,628,448	25,427	2,339,284	129,175	12,917,500

[1] Including Quapaw and Sunnyside.

Wisconsin.—The output of galena concentrates in Wisconsin in 1939 was 74 tons more than in 1938; shipments of sphalerite increased substantially, and the recovered zinc rose 3,831 tons. All the low-grade concentrates made were re-treated at flotation plants. The Vinegar Hill Zinc Co. worked only the Winskill-Petersen mine. Low-grade concentrates were made at the Winskill mill and then sent to the all-flotation plant. Small lots of ore and concentrates were shipped to these plants from at least 50 small mines near Shullsburg, New Diggings, Linden, Leadmine, Platteville, Highland, Hazel Green, Dodgeville, Cuba City, and Benton; the shippers included the McKinley Mining Co., which did not operate its mill in 1939. The Badger mine at Linden was operated part of the year by W. E. Faithorn, and lead and zinc concentrates were made at the flotation plant built several years ago by the Badger Zinc Co.

Mine production of lead and zinc in Wisconsin, 1935–39

Year	Lead concentrates		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value

Average lead content of galena concentrates ... do	73.3	72.2	70.1	67.0	70.0
Average zinc content of sphalerite concentrates percent	34.6	27.0	24.0	18.5	20.2
Average value per ton:					
Galena concentrates	$42.62	$48.08	$68.85	$42.70	$51.72
Sphalerite concentrates	11.48	10.47	11.99	[3] 31.11	[4] 35.00

[1] The zinc concentrates shipped in 1938 (3,895 tons) were a flotation product or raw concentrates roasted at Cuba City, Wis. No raw concentrates were shipped in 1938; about 13,000 tons, averaging 18.5 percent zinc, were produced.
[2] All sphalerite shipped in 1939 (10,169 tons) was a flotation product. No raw concentrates were shipped in 1939; 32,360 tons, averaging 20.2 percent zinc, were produced.
[3] Value is that of roasted or flotation concentrates shipped. No value can be assigned for zinc concentrates prior to roasting or re-treatment by flotation.
[4] Value is that of flotation concentrates shipped, which averaged 60 percent zinc.

The sphalerite concentrates averaged before treatment by flotation about 20.2 percent zinc, and the finished product shipped in 1939 to smelters (10,169 tons) averaged about 60 percent zinc. The flotation lead concentrates made totaled 318 tons.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN IDAHO

(MINE REPORT)

By T. H. Miller and Paul Luff

SUMMARY OUTLINE

The total value of the metal output from mines in Idaho was $29,794,144 in 1939 compared with $29,028,103 in 1938, an increase of nearly 3 percent. The total value of each metal except silver increased; zinc increased $718,216 and gold $460,215, but silver declined $588,404. Production of gold in Idaho in 1939 (116,662 fine ounces) was the largest since 1895; the gain over 1938 was due to increased output from lode mines as the output from placers declined. The quantity of silver decreased 9 percent and that of lead 1 percent; copper increased 18 percent in quantity and zinc 8 percent. Most of the decrease in total output of silver was at the Sunshine mine, and most of the increase in that of zinc was at the Morning mine, both in the Coeur d'Alene region, chief metal-producing area in Idaho.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in Idaho, 1935–39, and total, 1863–1939, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[2] Figures for sluicing and hydraulic include those for drift mining.

Gold.—The output of recoverable gold in Idaho was 13 percent greater in 1939 than in 1938; it was the largest since 1895, when 125,517 ounces were produced. The output of gold from lode mines increased 37 percent over 1938 and was the largest since 1901; most of the increase came from gold ore and gold-silver ore. The output of gold from placers declined 10 percent, owing to the decreased output of gold from dredging. Nearly 54 percent of the State gold output in 1939 came from siliceous ore and 37 percent from all types of dredging operations. Eight floating (bucket) dredges treated 6,626,356 cubic yards of gravel and recovered 28,973 ounces of gold, a decrease of 2,261 ounces from 1938; 6 dragline dredges and 17 dry-land dredges treated 2,094,600 cubic yards of gravel and recovered 14,051 ounces of gold, a decrease of 3,397 ounces. Of the total placer gold, 85 percent came from the Boise Basin, Warren, Newsome, Carson, Elk City, Pierce, Orogrande, and Riggins districts where dredges were operated. Of the total lode gold, 89 percent came from the Warm Springs, Middle Boise, Burgdorf-Marshall Lake, Yellow Pine, Mineral Hill, Carson, Boise Basin, Ramey Ridge, Ten Mile, and Yankee Fork districts and the Coeur d'Alene region. Substantial increases in output of gold were recorded in the Warm Springs, Burgdorf-Marshall Lake, Middle Boise, Yellow Pine, Yankee Fork, and Mineral Hill districts and the Coeur d'Alene region, but large decreases in the Boise Basin, West View (Montour), Ten Mile, and Carson districts.

Snyder Mines, Inc., operating lode property near Ketchum, was the largest gold producer in Idaho in 1939. It was followed by the Fisher-Baumhoff Co., which operated two bucket dredges near Centerville; the Golden Anchor mine at Burgdorf; the Boise-Rochester property at Atlanta; the Warren Dredging Co. at Warren; the Yellow

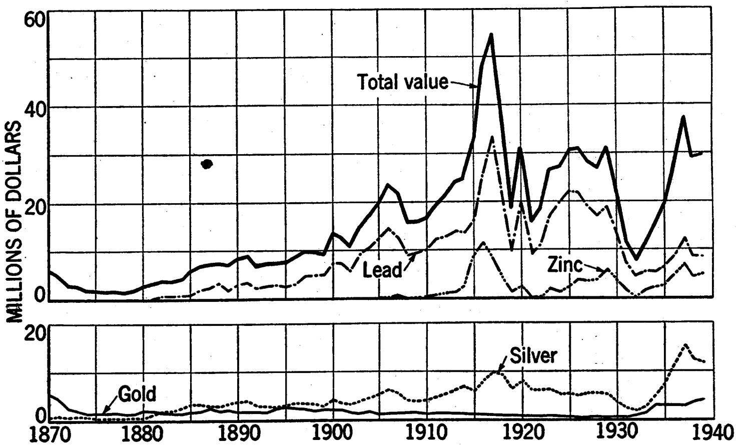

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1939. The value of copper has been less than $2,000,000 annually except in a few years.

Pine mine at Stibnite; Newsome Creek Placers near Golden; Idaho Canadian Dredging Co. (formerly Moores Creek Dredging Co.) at Idaho City; Consolidated Gold Mines, Inc., at Murray; De Lamar Milling Corporation at De Lamar; and Gold Producers, Inc., at Shoup.

Silver.—The output of recoverable silver in Idaho was 17,222,370 fine ounces in 1939, a decrease of 9 percent from 1938. Production from the Sunshine mine declined from 11,352,154 to 9,414,514 ounces; there were also large decreases in silver output from the Polaris, Hecla, and Crescent mines, but increases were reported at the Morning and Mineral Point properties. The Coeur d'Alene region produced 88 percent of the State total silver in 1939; the rest came chiefly from the Warm Springs, Bayhorse, Carson, Port Hill, Pend d'Oreille, Blue Wing, Burgdorf-Marshall Lake, and Boise Basin districts. Silver ore yielded 65 percent of the State total silver; zinc-lead ore, 24 percent; lead ore, 5 percent; and gold-silver ore, 4 percent. The yield of silver from silver ore decreased 2,358,552 ounces and that from lead ore also declined, but the output from zinc-lead ore increased 508,520 ounces and that from gold-silver ore, 632,251 ounces.

Nine mines—the Sunshine, Bunker Hill & Sullivan, Triumph, Polaris, Morning, Hecla, Crescent, Page, and Mineral Point—produced 92 percent of the silver output of the State in 1939. All these mines, except the Triumph, are in the Coeur d'Alene region.

Copper.—The output of recoverable copper in Idaho was 5,032,000 pounds in 1939, an increase of 18 percent over 1938. The gain resulted chiefly from increased output of silver-copper ore from the Mineral Point mine and from shipments of copper ore from the Empire (Mackay Metals) mine. Silver ore (chiefly from mines in the Coeur d'Alene region) yielded nearly 67 percent of the State total copper; zinc-lead ore, 20 percent; gold ore, 6 percent; and copper ore and lead ore together, 7 percent.

The Sunshine mine produced nearly half of the total copper output of the State in 1939; most of the remainder came from the Mineral Point, Polaris, Copper Queen, Hecla, Bunker Hill & Sullivan, Triumph, Morning, and Empire properties.

Lead.—The output of recoverable lead in Idaho was 181,962,000 pounds in 1939, a decline of 1 percent from 1938, but the total value increased slightly in consequence of the higher average sales price. The marked decrease in output of lead from the Hecla, Triumph, and Bunker Hill & Sullivan mines more than offset an increase of about 12,000,000 pounds in lead from the Morning mine. Nearly 90 percent of the State total lead came from the Coeur d'Alene region and 6 percent from the Warm Springs district; considerable lead was produced also in the Port Hill, Bayhorse, Texas, and Pend d'Oreille districts. Zinc-lead ore from the Coeur d'Alene region and the Warm Springs district yielded 87 percent of the State total lead; lead ore, chiefly from the Coeur d'Alene region, yielded 11 percent. Lead recovered from lead ore decreased 23,515,438 pounds, but that from zinc-lead ore increased 18,770,583 pounds.

The combined lead output in 1939 of the three largest producers—Morning, Bunker Hill & Sullivan, and Hecla—was 135,073,600 pounds (134,740,600 pounds in 1938), or 74 percent of the State total; other large producers were the Page, Triumph, Star, Blackhawk, Idaho-Continental, Jack Waite, Gold Hunter, and Clayton properties.

Zinc.—The output of recoverable zinc in Idaho was 95,098,000 pounds in 1939, an increase of 8 percent over 1938. The gain was due entirely to increased output of zinc from mines in the Coeur d'Alene region, as production in the Warm Springs district declined 9,213,480 pounds. The largest increase (8,593,700 pounds) in zinc output was recorded from the Morning mine, but substantial increases were made also at the Hecla and Bunker Hill & Sullivan properties. More than 84 percent of the State total zinc in 1939 came from the Coeur d'Alene region, and nearly all the remainder came from the Warm Springs district. Zinc-lead ore concentrated yielded virtually all the zinc in 1939; only 78,114 pounds of recoverable zinc came from crude ore shipped to smelters.

Three mines—the Morning, Bunker Hill & Sullivan, and Triumph—produced 73 percent of the State total zinc in 1939; the rest came chiefly from the Star, Hecla, Page, and Frisco mines.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1939, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[2] Recovered from 2,094,600 cubic yards of gravel treated by 6 dragline and 17 dry-land dredges.
[3] Recovered from 6,626,356 cubic yards of gravel treated by 8 connected-bucket dredges.

MINING INDUSTRY

Increased activity at gold properties in Idaho in 1939, which was centered chiefly at mines near Burgdorf, Atlanta, Stibnite, Shoup, Murray, and De Lamar, resulted in the largest output of gold in the State since 1895 and the largest output of gold from lode mines since 1901. However, production of silver and lead declined, despite gains in average sales price of both metals in 1939. The average sales price of zinc increased from 4.8 to 5.2 cents a pound, resulting in a gain of 8 percent in quantity and 17 percent in total value of zinc output over 1938. Production of copper rose 18 percent in quantity and 25 percent in total value. There was a substantial increase in output of zinc-lead ore from mines in the Coeur d'Alene region, but a decrease from the Triumph property near Ketchum in the Warm Springs district.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Idaho in 1939, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	223	245,001	48,646	159,570	316,470	181,006	
Dry and siliceous gold-silver ore	23	88,044	13,261	722,943	13,544	3,101,003	
Dry and siliceous silver ore	39	451,381	633	11,241,260	3,355,093	1,332,657	
	[1] 276	784,426	62,540	12,123,773	3,685,107	4,614,666	
Copper ore	11	1,416	600	44,278	226,600	17,277	
Lead ore	68	125,964	661	824,618	122,971	19,150,421	
Zinc ore	3	144	6	1,754	1,448	4,443	78,114
Zinc-lead ore	21	1,196,495	4,192	4,213,072	995,874	158,175,193	95,019,886
Total, lode mines	[1] 362	2,108,445	67,999	17,207,495	5,032,000	181,962,000	95,098,000
Total, placers	465		48,663	14,875			
	827	2,108,445	116,662	17,222,370	5,032,000	181,962,000	95,098,000
Total, 1938	768	1,999,147	103,513	18,993,676	4,278,000	184,354,000	88,060,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

Of the 2,108,445 tons of ore produced in 1939 in Idaho, 1,919,136 tons (91 percent) were treated at concentration plants, 121,898 tons (6 percent) were treated at amalgamation and cyanidation mills, and 67,411 tons (3 percent) were shipped crude to smelters.

Ore treated at concentration plants in 1939 comprised 120,940 tons of gold ore, 45,393 tons of gold-silver ore, 446,656 tons of silver ore, 109,652 tons of lead ore, and 1,196,495 tons of zinc-lead ore.

Ore treated at straight amalgamation mills in 1939 comprised 2,594 tons, yielding 737 ounces of gold and 313 ounces of silver. Ore treated at combined amalgamation and concentration plants comprised 108,886 tons, yielding 17,271 ounces of gold and 9,508 ounces of silver in amalgamation bullion and 1,572 tons of concentrates yielding 9,912 ounces of gold and 84,330 ounces of silver. About 700 pounds of quicksilver were consumed at amalgamation plants in Idaho.

Ore (10,418 tons) treated at straight cyanidation plants in 1939 contained 1,790 ounces of gold and 4,000 ounces of silver, indicating cyanide extraction of 87 percent of the gold and 77 percent of the silver; the plants used about 24,000 pounds of sodium cyanide (91-percent grade), 3,500 pounds of zinc dust, 117,800 pounds of lime, and 185 pounds of lead acetate.

The lead smelter and refinery of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley were operated continuously in

1939 on ore and concentrates, chiefly from the Bunker Hill & Sullivan, Hecla, Sunshine, Polaris, and Crescent mines. During the fall the company began construction of an antimony-bismuth plant designed to handle ores and concentrates from the "Dry-Belt" section of the Coeur d'Alene region, eliminating these metals from the regular lead-smelting operations; the new plant was put in operation early in 1940. The electrolytic zinc plant of the Sullivan Mining Co. near Bradley operated throughout the year at a normal rate, chiefly on zinc concentrates from the Bunker Hill & Sullivan, Hecla, and Star mills.

Details of the treatment of all ores produced in Idaho in 1939 are given in the tables that follow.

Mine production of metals in Idaho in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*

ADA COUNTY

Black Hornet district.—Virtually all the output from the Black Hornet district in 1939 was gold ore from the Adelmann mine treated by amalgamation.

Highland (Boise River) district.—The entire output of the Highland district in 1939 was recovered by sluicing, chiefly at the Pick & Shovel, Pinto, Sheep Gulch, and Stout placers.

Snake River district.—Dry-land washers were operated in 1939 at the Osborn and Hot Shot properties near Grand View on the Snake River. The Gold Flour Mining Co. operated the Osborn claim, by far the largest producer.

ADAMS COUNTY

Rock Flat (Thorn Creek) district.—Placer gold and silver were recovered in 1939 by hydraulicking at the Victory placer on Thorn Creek.

Seven Devils district.—The metal output of the Seven Devils district in 1939 came from 372 tons of gold ore from the Placer Basin mine and 29 tons of copper ore from the Helena claim.

Snake River district.—Placer gold was recovered in 1939 by sluicing at various bars along the Snake River in Adams County.

BENEWAH COUNTY

The entire output of Benewah County in 1939 was placer gold recovered from stream gravel from Tyson Creek.

BLAINE COUNTY

Little Wood River district.—A small lot of silver-lead ore was shipped from the Idaho Muldoon dump in 1939.

Mineral Hill and Camas district.—The value of the metal output from the Mineral Hill and Camas district in 1939 was nearly double that in 1938, owing to increased output of gold recovered from old tailings at the Daisy dump, from which 6,600 tons of old tailings were treated in a 100-ton cyanide plant by the Gold Recovery Co. The rest of the district output comprised gold ore from the Bellevue, Champlain, Gold Bottom, Happy Day, Jumbo, Golden Arrow, Treasure Vault, and Walla Walla properties; lead ore from the Eureka and Clearwater & Wolverine properties; silver ore from the Liberty, Bullion-Ophir, and Kelley mines; and zinc ore from the Red Elephant mine.

Sawtooth district.—The Vienna mine was the chief producer in the Sawtooth district in 1939; several cars of siliceous ore were shipped by a lessee to smelters in Utah.

Warm Springs district.—Nearly all the output from the Warm Springs district in 1939 was that from the Triumph-North Star-West Shore groups operated by Snyder Mines, Inc., which comprised about 65,000 tons of zinc-lead ore shipped to the flotation plant of the Combined Metals Reduction Co. at Bauer, Utah, and 41,461 tons of gold-silver ore and 682 tons of lead ore shipped to the smelter at Tooele, Utah. This company was the largest producer of gold in Idaho in 1939 and ranked third in output of zinc, fourth in silver, and fifth in lead. Other producers in the Warm Springs district included the Valley Creek No. 2, Mascot, and Homestake mines. A little placer gold was recovered from claims on Placer Creek.

BOISE COUNTY

Banner district.—A lessee shipped 166 tons of silver ore in 1939 from the Edna mine near Idaho City. Placer gold was recovered from stream gravel from Gold Fork and Edna Creeks.

Boise Basin district (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—In 1939 the Boise Basin district again was the chief gold-producing area in Idaho, but its output was 21 percent less than in 1938. Nearly 87 percent of the gold was recovered from placer operations, mostly by bucket dredges. Four bucket dredges treated 4,346,382 cubic yards of gravel in 1939 and recovered 17,787 ounces of gold compared with 18,549 ounces in 1938. The Fisher-Baumhoff Co. continued to operate two bucket dredges (one 2½-cubic foot and one 6-cubic foot) near Centerville and was the largest producer of placer gold in Idaho. The Idaho-Canadian Dredging Co. (formerly the Moores Creek Dredging Co.) operated its 7½-cubic foot bucket dredge at Idaho City throughout the year. Considerable gold was also recovered by the 4-foot bucket dredge at Pioneerville operated by The Grimes Co. Other important sources of placer gold were the Gold Hill, Leary-Brogan, Lucky Boy, and Elk Creek properties. The Lord & Bishop Co., a large producer of placer gold in 1938, suspended operations on Fall Creek late in that year and moved its dragline equipment to a property in California. Most of the lode production of the district in 1939 was gold ore from the Mayflower mine; the Texas-Owyhee Mining & Development Co. operated the mine continuously and treated 12,818 tons of gold ore in the 150-ton flotation plant. Rich gold-silver ore from the Come Back property at Pioneerville was shipped to a smelter, and lessees treated by concentration several hundred tons of gold ore from the Gold Hill & Iowa dumps. Most of the remainder of the district lode output was gold ore from the Black Eagle, Illinois, Enterprise, Golden Age, Twin Sister, and Native Missourian properties.

Eight Mile Creek district.—The Birthday Consolidated Gold Mines, Inc., treated 264 tons of gold ore in 1939 in a small concentration plant built during the year and shipped 5 tons of high-grade gold ore to a smelter.

Garden Valley district.—The entire output of the Garden Valley district in 1939 was placer gold from the Wash Creek and Gold Dollar claims.

Grimes Pass district.—Gold ore from the Golden Eagle and Homestake properties was concentrated in 1939, and gold ore from the Grandview group was amalgamated and concentrated. The Grandview property was operated by the Buckhorn Mining Co. and was the chief producer.

North Fork district.—A little silver ore from the Packer John claim and from a prospect was shipped to a smelter in 1939.

South Fork of Payette River district.—Placer gold and silver were recovered by sluicing in 1939 at properties near Grimes Pass and Lowman.

Summit Flat district.—Gold ore from the Golden Cycle, Jessie, King, and Rock Creek properties was treated by amalgamation in 1939.

BONNER COUNTY

Lakeview district.—Several cars of silver-lead ore from the Keep Cool dump and a small lot of zinc concentrates from former milling operations were marketed in 1939.

Pend d'Oreille district.—The Hope (Elsie K.) and Whitedelf properties near Clark Fork again were the chief producers in the Pend d'Oreille district; several thousand tons of silver-lead ore from each property were treated by flotation in 1939. Rich silver ore from the Brown Bear, Katherine, and Keystone claims was shipped to a smelter.

BONNEVILLE COUNTY

Placer gold was recovered by hydraulicking in 1939 at the Rosana, James, Lottie, and McCoy Creek properties in the Mt. Pisgah district.

BOUNDARY COUNTY

Moyie Yahk district.—Gold ore from the Buckhorn mine was treated by concentration in 1939, and lead ore from the Regal and Midas properties was shipped to a smelter.

Port Hill district.—The Idaho-Continental mine, operated by the Idaho-Continental Mining Co., was the only producer in the Port Hill district in 1939; 15,630 tons of silver-lead ore were treated by flotation in 1939, compared with 4,000 tons in 1938.

BUTTE COUNTY

Antelope Creek district.—A little copper ore from the Copper Queen claim was shipped to a smelter in 1939.

Lava Creek district.—Virtually all the output from the Lava Creek district in 1939 was gold-silver ore from the Hornsilver mine near Arco, operated by the Era Mining & Development Co., Inc.

CAMAS COUNTY

Beaver Creek (Mineral Hill) district.—Lessees shipped several cars of gold ore from the Princess mine in 1939.

Little Smoky and Carrietown district.—The decrease in output of gold from the Little Smoky and Carrietown district in 1939 resulted from suspension of dredging operations by the Baumhoff-Fisher Co. Most of the district output was silver ore and lead ore from the Silver Star property and gold ore from the Five Points mine.

Skeleton Creek district.—Gold ore was produced at the El Oro, Red Horse, Gold Mountain, and Tip Top properties in 1939.

CANYON COUNTY

J. R. Rhodes operated a ⅜-cubic yard power shovel and stationary washer in 1939 from March 24 to October 12 at a placer on the Snake River near Wilder and treated 32,178 cubic yards of gravel.

CASSIA COUNTY

A little lead ore was produced at the Alice & Badger group in the Stokes district in 1939.

CLEARWATER COUNTY

Burnt Creek district.—A little placer gold was recovered in 1939 from stream gravel by small-scale operators near Elk River.

Clearwater River district.—Various placer operators on the Clearwater River near Orofino and Greer recovered small lots of gold and silver in 1939.

Moose Creek and Independence Creek district.—The entire output of the district in 1939 was placer gold and silver recovered chiefly from the Lilly, Simplex, First Chance, and White Diamond claims.

North Fork of Clearwater River district.—Small-scale operators recovered a little placer gold and silver from stream gravel near Dent in 1939.

Pierce district.—The output of gold in the Pierce district in 1939 was more than double that in 1938 owing to operation of a new 2½-cubic foot bucket dredge by the Quartz Creek Dredging Co. The dredge was active from July 8 to the end of the year and handled 495,639 cubic yards of gravel. The Dividend Placer Mining Co. placed a 1½-cubic yard dragline and floating washer on the American property, but operations were suspended after a short run. Small-scale placering was continued on various creeks. The Silver Creek Gold Mining Co. was the only lode operator in the district; 2,758 tons of gold ore were treated by cyanidation.

CUSTER COUNTY

Alder Creek district.—Most of the increase in the value of the metal output of the Alder Creek district in 1939 was due to reopening of the Empire property by the Mackay Exploration Co.; 996 tons of copper ore were shipped. The remainder of the district output was principally silver-lead ore from the Bluebird, Horseshoe, and White Knob properties.

Bayhorse district.—The Clayton Silver Mines was in 1939, as usual, the chief producer in the Bayhorse district. The company operated its mine and 100-ton flotation plant throughout the year and shipped rich silver-lead concentrates to a smelter in Utah; 38,900 tons of silver-lead ore were milled, about the same quantity as in 1938. The rest of the district output was chiefly copper ore and lead ore containing considerable silver from the Ramshorn mine operated by lessees.

Boulder district.—Several cars of silver-lead ore were shipped from the Livingston mine in 1939.

East Fork (Washington Basin) district.—A little gold ore from the Dewey claim and a small lot of silver-lead ore from the Fuller prospect were marketed in 1939.

Rough Creek district.—Placer gold and silver were recovered in 1939 by sluicing operations at the Grubstake claim near Stanley.

Seafoam district.—The metal output of the Seafoam district in 1939 came from siliceous ore from the Greyhound mine and silver-lead ore from the Mountain King and Josephus Lake properties.

Stanley and Stanley Basin district.—A ¾-cubic yard dry-land excavator was operated a short time in 1939 at Stanley Creek Placers by the Stanley Basin Placer Mining Corporation; equipment for recovering the gold includes a vibrating screen, riffles, and special amalgamators. Other placer producers were the Lucky Strike, Golden Rule & Hot Stuff, Progressive, Bessie, and Nip & Tuck claims.

Yankee Fork district.—The chief output from mines in the Yankee Fork district in 1939 was rich gold ore from the General Custer-Lucky Boy group and copper ore rich in gold and silver from the Why Not mine. Other lode producers included the Jordan, Peak, Yankee Fork, Fourth of July, Snowdrift, P. & G. No. 2, and Fuller properties. Most of the placer output came from the Horse Trail property.

ELMORE COUNTY

Bear Creek district.—The Avalanch-Richmond, Passover, and Empire lode properties were the chief producers in the Bear Creek district in 1939; most of the output was gold ore amalgamated and concentrated. Other producers of gold ore included the Vishnue, Daly, and Black Ribbon mines. A little placer gold and silver was produced from various claims near Rocky Bar.

Boise River district.—Most of the placer output from the Boise River district in 1939 came from the Five Bars and Sunflower properties near Twin Springs.

Middle Boise (Atlanta) district.—The increase of $206,186 in value of metal output in the Middle Boise district in 1939 resulted from the large gain in output of gold ore from the Boise-Rochester property. Talache Mines, Inc., operated the property throughout the year and treated 41,634 tons of gold ore and 6,000 tons of old tailings in a 150-ton amalgamation and flotation plant. The Last Chance Mining Co., operating Atlanta Mines (Monarch), continued to be a large producer of gold ore; about 8,500 tons of ore were treated by amalgamation and concentration, and 273 tons of rich gold ore were shipped to a smelter. The property was acquired by Talache Mines, Inc., in November. The remainder of the district output was nearly all placer gold recovered chiefly from the Boise Bar, Buck Creek, McKibbin, Honey Bee, and Rex properties.

Neal district.—Small amounts of placer and lode gold were produced from various properties in the Neal district in 1939.

Pine Grove district.—Small lots of gold ore were produced in 1939 at the Elk Horn and Owens claims at Pine.

Snake River district.—Stationary washers were operated for a short time in 1939 at the Mathis placer property near Bruneau and at the Rose claim near King Hill; nearly all the gold output from the district was recovered from these two properties.

GEM COUNTY

West View district.—The total value of the metal output of the West View district declined from $144,736 in 1938 to $7,040 in 1939, owing to suspension late in 1938 of dragline operations at the Gatfield & Montour property by Ralph Davis, Inc.; a little gold was recovered by hydraulicking at the property in 1939. Most of the output of the district was siliceous ore from the Lulu mine near Pearl.

GOODING COUNTY

Most of the placer output from properties on the Snake River near Hagerman in 1939 came from the Lucky Strike and Padgett claims.

IDAHO COUNTY

American Creek (Bully, Mill, and Castle Creeks) district.—Small amounts of placer gold and silver were recovered in 1939 by sluicing operations at the Holmes, Golden Eagle, and John's Creek properties.

Burgdorf-Marshall Lake district.—There was a large increase in output of gold and silver in the Burgdorf-Marshall Lake district in 1939 owing to a gain in output of gold ore from the Golden Anchor mine; the property was operated throughout the year by the Golden Anchor Mining Co., and 16,301 tons of gold ore were treated in the 50-ton amalgamation and concentration mill. The rest of the district output was chiefly placer gold recovered by hydraulic and sluicing operations at the Golden Rule and Laughing Water properties and gold ore from the Leadville and Old Kentuck mines.

Camp Howard (Salmon River) district (White Bird).—Green & Kuney operated a power shovel and stationary washer at the Large Bar in 1939 from January 15 to April 10, when work was suspended, and was by far the most important producer in the Camp Howard district. Other placer producers included the Rosebud, Burgund, White Bird, and Snure properties.

Clearwater River district.—Small amounts of placer gold and silver were recovered in 1939 by sluicing operations at the Lindgren claim near Pardee.

Dixie district.—The output of gold in the Dixie district increased 325 ounces in 1939, owing to the gain at the Dixie and Alpha properties. About 65,000 cubic yards of gravel were handled by the ¾-cubic yard dragline and stationary washer at Dixie Placers, and it was by far the most important producer in the district. The rest of the district output was principally gold ore from the Ontario mine and placer gold from the Capitol claim.

Elk City district.—The 1½-cubic yard dragline and floating washer of the American River Mining Co. handled 246,500 cubic yards of gravel in 1939 and accounted for most of the gain in the Elk City district; other placer producers included the Lucky Coin (power shovel and dry-land dredge), Little Million (power shovel and stationary washer), Columbus, and Gold Hill properties. The lode output of the district was chiefly gold ore from the Blue Ribbon, Mary K., Black Lady, Buster, Stickner Quartz, and Last Chance mines.

Florence and French Creek district.—Most of the placer gold produced in 1939 was recovered by the dragline and floating washer at the Sterling property on Sand Creek and by sluicing operations at various claims on Salmon River near French Creek. The chief producers of lode gold were the Gold Bug, Golden Dyke, and Waverly mines.

Kitchen Creek district.—A little placer gold was recovered in 1939 by sluicing operations at the Kitchen Creek claim.

Lolo Creek district.—Small lots of placer gold were marketed in 1939 from the Alice and Lolo claims.

Lower Salmon River district.—Most of the output from placers along the Salmon River in 1939 came from drift mining and sluicing operations at the Frank Hatke, Grubstake, and Sunshine properties.

Maggie and Pete King Creeks district.—In 1939 a little gold-silver ore from the Selway mine was shipped to a smelter, and a little placer gold was produced from the Nugget and Sunnyside claims.

Newsome district.—The Newsome Creek Mining Co. continued dredging operations on Newsome Creek in 1939 and again was a large producer of gold. The company operated its 3-cubic yard dragline and floating washing plant from March 25 to December 31 and treated 841,901 cubic yards of gravel; at the end of the year the property was acquired by the Ferris Mining Co.

Orogrande district.—The Mount Vernon Mining Co. was the largest producer of gold in the Orogrande district in 1939; the company operated the 2-cubic foot bucket dredge on Crooked River from April 14 to November 22 and treated 218,335 cubic yards of gravel. The Orogrande-Frisco Gold Mines, Inc., largest producer of gold in the district in 1938, was idle in 1939. The lode output of the district was chiefly gold ore from the Penman mine treated by flotation.

Ramey Ridge district.—The Snowshoe property, by far the most important producer in the Ramey Ridge district, was operated throughout 1939 by the Pierce Metals Development Co., and 4,125 tons of gold ore were treated in a 25-ton concentration plant. In January a fire destroyed the compressor building and power plant, but the building was rebuilt and new equipment installed.

Riggins (Salmon River) district.—The Shorts Bar Mining Co. operated a 2½-cubic yard dragline and floating washing plant on property 3 miles above Riggins on the Salmon River in 1939 and treated 360,000 cubic yards of gravel from July 10 to December 23.

Robbins (Buffalo Hump) district.—Nearly all the output from the Robbins district in 1939 was gold ore from the St. Louis mine; a new 25-ton flotation plant, erected by a lessee, was operated a short time during the last quarter of the year.

Salmon River (Shoup) district.—Placer gold and silver were recovered in 1939 by drift mining and sluicing operations at claims along the Salmon River west of Shoup; most of the output came from the Paradise Bar, Leyrer, Rutherford, and Willoughby properties.

Selway River district.—A little placer gold was recovered in 1939 by sluicing operations at the Happy Day and Maytag claims.

Simpson (Salmon River) district (Lucile).—Various small-scale placer operators continued to work bars along the Salmon River near Lucile. The chief producers in 1939 were the Katie B., Butcher Bar, and Betty Jean properties.

Snake River district.—Gold was recovered by sluicing operations in 1939 at the Bonanza placer.

South Fork of Clearwater River district.—A little placer gold was recovered in 1939 from stream gravel near Stites.

Ten Mile district (Golden).—The output of gold from both lode and placer properties in the Ten Mile district decreased in 1939. The decline in output of gold ore from the Blackbird mine, operated by the Clearwater Mining Co., accounted for most of the loss at lode mines, and the drop in placer production was due to suspension in August 1938 of dragline dredging at the Lena B-Komo property. The Lone Pine mine continued to be the largest producer of gold in the district; about 6,150 tons of gold ore were treated by amalgamation and concentration. Other fairly large producers of gold ore were the Center Star, Blackbird, and Shamrock properties. Most of the placer gold produced in the district was recovered by hydraulic and sluicing operations at the Key claim.

Warren district.—Bucket dredging continued in 1939 to be the chief source of gold in the Warren district. The Warren Dredging Co. operated its 3½-cubic foot bucket dredge throughout the year and treated 1,134,000 cubic yards of gravel; it was the largest producer of placer gold in Idaho County. The Baumhoff-Fisher Co., also a large producer of placer gold, operated its 3½-cubic foot bucket dredge from March 21 to August 6 and treated 432,000 cubic yards of gravel; the dredge was moved late in the year and will operate in 1940 on Moose Creek near Salmon City in Lemhi County. Most of the remainder of the district output in 1939 was gold ore from the Rescue, Gold King, Little Giant (Unity), Harding, and Silver King properties and placer gold from the Poorman, Buck Diggins, and Smith Gulch claims.

JEROME COUNTY

In 1939, as usual, the entire metal output of Jerome County was placer gold and silver recovered by various sluicing operations along the banks of the Snake River near Jerome, Murtaugh, and Hansen.

LATAH COUNTY

Placer gold was recovered in 1939 from claims in the Gold Creek, Hoodoo, and Moscow Mountain districts.

LEMHI COUNTY

Blackbird district.—The output of the Blackbird district in 1939 comprised gold ore from the Meadow property and copper ore from the Uncle Sam mine.

Blue Wing district.—The Ima Mines Corporation in 1939 again was the only producer in the Blue Wing district. The company treated 38,778 tons of tungsten ore by flotation and magnetic separation; several hundred tons of silver-lead-copper concentrates were shipped to the smelter at Midvale, Utah, and tungsten concentrates were shipped to eastern markets.

Boyle and Carmen Creeks district.—The metal output from the Boyle and Carmen Creeks district rose in 1939 owing to increased output of low-grade gold ore from the Silver Star-Contact group by the Gibbonsville Mining & Exploration Co.

Eldorado district.—A small lot of gold ore was produced from the Gold Bond mine in 1939, and a little placer gold was recovered from a claim on Bohannon Creek.

Eureka district.—About 200 tons of gold ore from the Queen of the Hills mine were treated by amalgamation in 1939; other producers of gold ore included the Tendoy, Lynch, and Poorman's Luck properties. Most of the placer gold was recovered by sluicing operations at the Greenhorn claim.

Gibbonsville district.—The North Fork Placers, operating four hydraulic giants at the Sundown property, was the most important producer in the Gibbonsville district in 1939; about 520 ounces of gold were recovered from 100,000 cubic yards of gravel. Hydraulic giants were operated at the Sheep Creek property by the Golden Dawn Mining Co. The district output of lode gold was considerably less than in 1938; the chief producers were the Bingham, Cross, and Providencia properties.

Indian Creek district.—About 100 tons of gold ore were produced in 1939 from the old Kittie Burton & Ulysses property operated by the Good Hope Mining Co., Inc., and 400 tons of old tailings from the Kittie Burton dump were amalgamated by the Idaho Gold Recovery Corporation.

Kirtley Creek district.—Small-scale placer operations in 1939 were reported at several properties on Kirtley Creek.

McDevitt district.—In 1939, as in 1938, the entire output of the McDevitt district was gold ore from the Copper Queen mine near Tendoy. The Tendoy Copper Queen Syndicate operated the property throughout the year and treated about 15,500 tons of ore by amalgamation and concentration.

Mackinaw district.—Most of the metal output of the Mackinaw district in 1939 was placer gold recovered by hydraulicking and sluicing and by dragline dredging. The output from lode mines in the district comprised lead ore from the Ringbone Cayuse claim and gold ore from the Shoo Fly and P. M. & B. properties. The chief production from hydraulicking and sluicing came from the K. G. W., Mae Belle, Big Jureano, Last Chance, and Best Bet properties. Dragline excavators and dry-land dredges were operated at the Camp Creek and Richardson properties.

Mineral Hill district.—Production of gold from the Mineral Hill district in 1939 increased about 1,300 ounces over 1938, owing chiefly to the gain in output of gold ore from the Grunter and Gold Hill properties at Shoup. The Grunter mine, operated throughout the year by Gold Producers, Inc., was by far the largest gold producer in Lemhi County; 24,947 tons of gold ore were treated by concentration. A lessee treated about 5,500 tons of gold ore from the Gold Hill mine by amalgamation and concentration. Other producers of gold ore were the Monolith and Billy Boy properties. Most of the district output of placer gold was recovered from the Cove Creek and Rattlesnake claims.

Pratt and Sandy Creeks district.—Fire destroyed the milling plant of the Goldstone Mining Co. early in 1939, resulting in a substantial decrease in the gold output of the district; the company shipped only 5 tons of high-grade gold-lead concentrates. Other producers were the Sick Horse and Dictator claims.

Salmon River district.—Small-scale placer operations in 1939 were reported at several properties along the Salmon River from Shoup to the county line.

Spring Mountain district.—Lessees shipped a little silver-lead ore from the Red Warrior and South Gilmore properties in 1939.

Texas district.—The value of the metal output of the Texas district was $82,462 in 1939, a gain of $49,064 over 1938, caused by increased shipments of silver-lead ore from the Latest Out mine at Gilmore. A little silver-lead ore was shipped also from the Allie and Snow Slide properties.

Yellow Jacket district.—The Condor Gold Mining Co. operated the Yellow Jacket property near Forney and treated several hundred tons of gold ore in a flotation plant in 1939, an increase over 1938. Gold ore was produced also from the Bryan and Tin Cup claims and placer gold from the Yellow Jacket Placers.

LEWIS COUNTY

Several placer operators worked stream gravel along the Salmon River in Lewis County in 1939.

NEZ PERCE COUNTY

In 1939, as in 1938, the metal output of Nez Perce County was placer gold and silver recovered by small-scale placer operations along the Salmon and Snake Rivers.

OWYHEE COUNTY

Carson district (Silver City, De Lamar).—Production of gold from placer properties in the Carson district declined in 1939, but that from lode mines increased. The decrease in placer gold resulted from suspension in December 1938 of bucket dredging at De Lamar by Jordan Creek Placers, largest producer of gold in Owyhee County from 1936 to 1938. The gain in output of lode gold and silver resulted from the treatment of a large tonnage of old tailings (gold-silver) by the De Lamar Milling Corporation; about 45,200 tons were treated in a 200-ton flotation plant, and the company was the largest producer of gold and silver in Owyhee County. Several cars of rich gold ore were shipped from the Adelaide-Empire group by the Ymir Consolidated Mining Co., and gold-silver ore from the Addie mine was amalgamated and concentrated. Other producers of gold ore included the Pauper, South Central, Tango, Dewey, and Gold Bug mines. The De Lamar Placers operated its dragline and floating washer at property on Jordan Creek 6 months in 1939 and treated 250,000 cubic yards of gravel. The Morrison-Knudsen Co., Inc., a new operator in the district, worked the Lewis group near Silver City and treated 47,000 cubic yards of gravel with a power shovel and dry-land washer.

Castle Creek district.—Nearly all the output from the Castle Creek district in 1939 was rich silver ore from the Silver Rock mine and gold ore from the Overall-Lucky Boy group.

Snake River district.—Considerable placer gold was recovered in 1939 from gravel along the Snake River near Hammett and Grand View. Most of the output came from dry-land dredging at the Gray, Dollar, and Grand View (Murphy) properties by J. R. Rhodes and Grand View Mines.

Steele district.—Most of the output from the Steele district in 1939 was gold ore from the Morning Glory mine near Triangle.

POWER COUNTY

The metal output of Power County in 1939 was, as usual, placer gold from small operations along the Snake River near American Falls.

SHOSHONE COUNTY

COEUR D'ALENE REGION

The value of the metal output of the Coeur d'Alene region increased 2 percent in 1939, chiefly as a result of the gain in production of zinc. The output of silver dropped more than 2,100,000 ounces owing to marked decreases at the Sunshine and Polaris mines, and the output of lead also declined. Large decreases in output of lead at the Hecla and Bunker Hill & Sullivan properties more than offset a substantial increase at the Morning mine. However, the output of zinc from the region increased 25 percent owing to large gains at the Morning, Hecla, and Bunker Hill & Sullivan mines; the output of gold increased nearly 2,000 ounces owing to increased output of gold ore from the Golden Chest mine at Murray; and the output of copper also rose. About 70 percent of the material produced in Shoshone County in 1939 was zinc-lead ore, 26 percent silver ore, and 3 percent lead ore. There was a marked increase in output of zinc-lead ore but a decided decline in output of lead ore.

The following table gives production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region in 1938 and 1939 and the total for 1884 to 1939.

Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1938–39, and total, 1884–1939, in terms of recovered metals

Year	Lode mines	Placers	Ore	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
			Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*

1 Figures not available. 2 Short tons.

Beaver district.—The Interstate Lease operated the Interstate-Callahan group in 1939 and shipped 3,200 tons of zinc-lead ore to the Golconda custom mill near Wallace. Most of the remainder of the Beaver district output was placer gold recovered chiefly from the Big 4 group by a dragline and dry-land dredge.

Coeur d'Alene district.—In 1939 a little gold ore from the Mountain Lion mine was treated by amalgamation; placer gold and silver were recovered from the Grove Walker, Old Dunn, Badger, Joe Gandy, Beehive Bar, Tiger Bar, and Nelson properties.

Eagle district.—Zinc-lead ore and lead ore from the Jack Waite mine continued in 1939 to be the chief output of the Eagle district. The American Smelting & Refining Co. worked the mine throughout the year, treated 10,352 tons of zinc-lead ore by flotation, and shipped 298 tons of high-grade lead ore to a smelter.

Evolution district.—The value of the metal production of the Evolution district was $7,698,489 in 1939, a decrease of $1,043,254 from 1938. The loss was caused by a substantial decline in output of silver from both the Sunshine and Polaris properties. However, the Sunshine Mining Co. remained the largest producer of silver in the United States; the company treated 320,990 tons of silver ore in its flotation plant compared with 321,605 tons in 1938, and the output of silver fell from 11,352,154 to 9,414,514 ounces. The Polaris Mining Co. operated its mine throughout the year, but production of silver ore dropped from 64,405 to 48,815 tons and that of silver from 1,583,721 to 1,085,023 ounces. The Coeur d'Alene Mines Corporation, operating the Mineral Point mine near Osburn, became a large producer of silver-copper ore in 1939; about 17,500 tons of ore were treated in the Hercules custom mill. The rest of the district output comprised

4,068 tons of silver ore from the Silver Dollar property and 47 tons of lead ore from the Western Union mine.

Hunter district (*Mullan*).—The value of the metal output of the Hunter district was $5,756,396 in 1939, a gain of $1,509,747 over 1938, due to a substantial increase in output of zinc-lead ore from the Morning mine and to resumption of operations in September at the Star mine, a large producer of zinc and lead. The Morning mine was operated continuously by the Federal Mining & Smelting Co.; 363,122 tons of zinc-lead ore were treated by flotation (compared with 262,329 tons in 1938), 601 tons of first-class silver-lead ore were smelted, and about 14,000 tons of old tailings (zinc-lead) were shipped by lessees to the Golconda custom mill. The property was the largest producer of lead and zinc in the State. The Sullivan Mining Co. operated its 800-ton flotation mill the last quarter of the year and treated 48,860 tons of zinc-lead ore from the Star mine. Lessees continued to operate the Gold Hunter and Golconda properties; 34,500 tons of silver-lead ore from the Gold Hunter and 5,471 tons of zinc-lead-silver ore from the Golconda were concentrated. Nearly all the rest of the district output was old tailings (zinc-lead) treated in the Golconda custom mill.

Lelande district (*Burke, Mace, Frisco*).—The Hecla mine, by far the most important producer in the Lelande district, was operated continuously in 1939 by the Hecla Mining Co.; 200,175 tons of zinc-lead ore were treated in the company flotation plant, and 9,066 tons of first-class silver-lead ore were shipped to a smelter. The Hull Leasing Co. continued to work the Frisco property and treated 23,708 tons of zinc-lead ore in its 100-ton flotation plant. The rest of the district output comprised 3,996 tons of silver-lead ore from the Sherman mine, 1,100 tons of zinc-lead ore from the Mace mine, and 5,340 tons of old tailings (zinc-lead) from deposits along Canyon Creek.

Placer Center district.—The value of the metal output of the Placer Center district increased 26 percent in 1939 owing to steady operations at the Tamarack and Dayrock properties. The Tamarack & Custer Consolidated Mining Co. worked the Tamarack mine throughout the year and shipped 10,974 tons of zinc-lead ore to the Hercules custom mill at Wallace. The company began to construct a 300-ton flotation plant at the mine in October. The Dayrock mine was operated continuously by the Dayrock Mining Co., and 6,208 tons of silver-lead ore were shipped to the Hercules mill. Most of the remainder of the district output was zinc-lead ore from the Success mine.

St. Joe district.—Placer gold was recovered in 1939 from the Gold Producer, Haystack, Grizzly-Cooley, and Iron Hill properties.

Summit district (*Murray*).—Production of gold from the Summit district increased to 3,291 ounces in 1939, owing to the large gain in output of gold ore from the Golden Chest mine operated by Consolidated Gold Mines, Inc.; 12,190 tons of ore were treated by flotation. The rest of the district output was principally zinc-lead ore from the Anchor group and placer gold and silver recovered by various operators working property owned by the Coeur d'Alene Placer Mining Co.

Yreka district (*Kellogg*).—The value of the metal output of the Yreka district was $5,811,087 in 1939, a gain of 3 percent over 1938. As usual, zinc-lead ore from the Bunker Hill & Sullivan property was the most important product in the district; 343,019 tons were concentrated in 1939 compared with 347,315 tons in 1938. The property ranked second in output of silver, lead, and zinc in Idaho in 1939. The Bunker Hill & Sullivan Mining & Concentrating Co. continued operations at the Crescent group, treated 16,503 tons of silver ore by flotation, and shipped 2,740 tons of rich silver ore to a smelter; the total output of ore was much less than in 1938. The Page and Blackhawk properties were operated continuously by the Federal Mining & Smelting Co., and 71,852 tons of zinc-lead ore from the Page and 15,950 tons of similar ore from the Blackhawk were treated in the Page flotation plant; the total output of ore from the two properties in 1938 was 82,895 tons. The rest of the district output in 1939 was chiefly silver ore and lead ore from the Caledonia mine.

TWIN FALLS COUNTY

In 1939, as in 1938, the output of Twin Falls County was placer gold and silver recovered by sluicing at various properties along the Snake River.

VALLEY COUNTY

Big Creek district.—A little lead ore containing considerable gold was produced in 1939 from the Sunday claim, and placer gold was marketed chiefly from the Smith Creek, Freezeout, and Blue Monday properties.

Deadwood Basin district.—Nearly all the output from the Deadwood Basin district in 1939 was old tailings (gold) from the Merry Blue property treated by cyanidation.

Lake City (McCall) district.—Placer gold and silver were recovered in 1939 by hydraulic and sluicing operations at the Neely Hill and New Deal Queen claims.

Pistol Creek district.—Operations continued at the Lucky Boy mine in 1939, and rich gold-lead ore was shipped to smelters in Utah.

South Fork of Salmon River district.—Several small-scale placer operators sluiced stream gravel in 1939 along the South Fork of Salmon River near Warren.

Thunder Mountain district.—Production from the Thunder Mountain district in 1939 was mostly gold recovered by the sluicing of eroded-vein material from the Sunnyside property, operated by lessees; the mine was formerly worked by the Thunder Mountain Mining & Milling Co., but operations by the company were suspended late in 1938.

Yellow Pine district.—The Yellow Pine mine was in 1939, as usual, the only producer in the Yellow Pine district. The Bradley Mining Co. operated the property continuously and treated 56,074 tons of antimony-gold ore by flotation, a substantial increase over the 35,880 tons treated in 1938; the concentrates, containing considerable antimony, were shipped to the smelter at Midvale, Utah.

WASHINGTON COUNTY

Monroe Creek (Weiser) district.—A little gold ore was produced in 1939 from the Blue Dog claim.

Snake River district.—Placering in 1939 was reported at several properties along the Snake River in Washington County.

Washington district.—Operations continued at the Silver Still mine near Mineral in 1939, and several cars of silver ore containing lead and copper were shipped to smelters in Utah.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN MONTANA

(MINE REPORT)

By T. H. Miller and Paul Luff

SUMMARY OUTLINE

The total value of the output of recoverable metals in Montana in 1939 increased $12,841,124, or 46 percent, over 1938. Substantial gains were recorded in both quantity and value of each of the five metals; the value of copper increased $5,214,268, zinc $2,770,072, gold $2,130,100, silver $2,028,598, and lead $698,086. The gain of $9,376,536 in Silver Bow County (from $18,300,823 in 1938 to $27,677,359 in 1939) represented 73 percent of the total State gain and was made possible by reopening of the zinc mines and increased output from the copper mines of the Anaconda Copper Mining Co. at Butte. There were important increases in output of siliceous ores, chiefly gold ore, from several counties. The gain from placer mines was notable.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in Montana, 1935–39, and total, 1862–1939, in terms of recovered metals

Year	Mines producing: Lode	Mines producing: Placer	Ore (short tons)	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value

(1) A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

Gold.—The output of gold in Montana increased to 264,173 fine ounces in 1939—the largest output since 1887, when 289,212 ounces were produced. Gold from lode mines increased 41,209 ounces and that from placers 19,651 ounces. Gold from Jefferson County increased 11,804 ounces, from Madison County 11,505 ounces, and from Lewis and Clark County 10,997 ounces; substantial gains were recorded also in Broadwater, Deer Lodge, Granite, and Silver Bow Counties. Most of the gain from placer mines came from the new bucket dredges of the Winston Bros. Co. and the Perry-Schroeder Mining Co., which were placed in operation late in 1938. Large gains in output of gold were reported at the Southern Cross, Victoria, Ohio Keating, and Golden Sunlight mines and at the Butte properties of the Anaconda Copper Mining Co. Siliceous ores yielded 72 percent of the State total gold in 1939 and placers 21 percent. Ore treated at amalgamation and cyanidation mills yielded 31 percent of the gold, crude ore shipped direct to smelters 33 percent, and ores treated at concentration mills 15 percent. The output of gold ore increased to 815,949 tons in 1939 (compared with 756,223 tons in 1938); it comprised 82,359 tons treated at amalgamation plants, 490,429 tons treated at cyanidation plants, 148,138 tons treated at concentration plants, and 95,023 tons shipped crude to smelters.

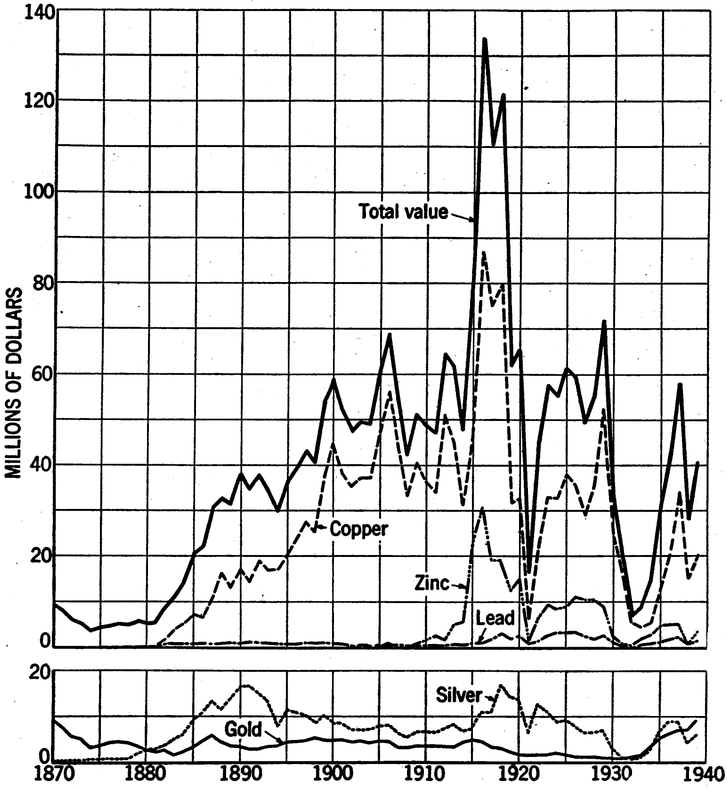

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Montana, 1870–1939.

The West Mayflower property (Madison County) of the Anaconda Copper Mining Co. in 1939 again was the largest gold producer in Montana; it was followed by the Winston dredge near Clancey, the Ruby Gulch mine at Zortman, the Victoria mine at Silver Star, the Butte Highlands mine in Silver Bow County, the Butte properties of the Anaconda Copper Mining Co., the Porter dredge at Helena, the Jardine mine in Park County, the Golden Messenger mine in Lewis and Clark County, and the Southern Cross mine in Deer Lodge County. These 10 properties yielded 105,665 ounces of gold in 1939.

Silver.—The output of recoverable silver in Montana was 9,087,571 fine ounces in 1939 compared with 6,403,962 ounces in 1938 and 11,812,093 ounces in 1937. Most of the gain in 1939 was in Silver Bow County (6,114,455 ounces produced in 1939 compared with 4,018,192 ounces in 1938) and was due to reopening of the zinc mines and to increased output from the copper mines of the Anaconda Copper Mining Co. The production of silver from Jefferson, Cascade, and Granite Counties also increased substantially. Copper ore yielded 52 percent of the State total silver in 1939, zinc-lead ore 20 percent, and silver ore 18 percent. Nearly 79 percent of the silver came from ores treated by concentration and 19 percent from ore sent direct to smelters. Silver from zinc-lead ore increased 1,331,843 ounces and that from copper ore 838,344 ounces. The output of silver ore increased 26,962 tons and that of gold-silver ore 48,172 tons.

The Anaconda Copper Mining Co. was in 1939, as usual, the chief silver producer in Montana—the copper and zinc units at Butte and the Flathead mine yielding nearly 70 percent of the State total. Other important silver producers included the Comet mine near Basin, the Granite Bimetallic and Silver Prince mines near Philipsburg, the Big Seven and Florence mines at Neihart, the Hecla mine in Beaverhead County, and the West Mayflower mine in Madison County.

Copper.—Copper ore, the most valuable mineral product of Montana, yielded recoverable gold, silver, and copper valued in all at $23,621,484 in 1939, or 58 percent of the total value of the metal output of the State. The Anaconda Copper Mining Co. was, as usual, the only important producer of copper in Montana; the output of recoverable copper from company mines at Butte increased 27 percent over 1938, owing to increased rate of operations during the last 4 months of 1939, but it was considerably less than the output in 1937. The company shipped 2,197,863 tons of copper ore to the mill at Anaconda compared with 1,561,186 tons in 1938 and 3,068,665 tons in 1937.

Lead and zinc.—The Anaconda Copper Mining Co. resumed production of zinc-lead ore from the zinc mines at Butte in March 1939, after a shut-down of more than a year; zinc shipments were resumed in December at the Emma mine, leased by the company. As a result, the output of zinc-lead ore in Montana increased to 320,248 tons in 1939 from 114,769 tons in 1938, with proportionate increases in production of all five metals. There was a decrease in zinc-lead ore from the Jack Waite mine, but an increase from the Comet mine. Zinc-lead ore from Granite County increased slightly but was much less than in 1937, as no zinc-lead ore was produced at the Trout property. Concentrates smelted yielded 60 percent of the State total lead and 64 percent of the zinc in 1939, crude ore smelted yielded 32 percent of the lead, and slag fumed yielded nearly 8 percent of the lead and 36 percent of the zinc. There was an increase in lead from crude ore smelted, chiefly from the Flathead mine in Flathead County and the Glendennin property in Judith Basin County.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Montana in 1939, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[2] Figures for sluicing and hydraulic include those for drift mining.

MINING INDUSTRY

Reopening of the zinc mines and increased output from the copper mines of the Anaconda Copper Mining Co. at Butte accounted for most of the gains in metal output in Montana in 1939; however, increases were reported in gold ore treated at amalgamation and cyanidation mills, and there was a marked increase in crude gold ore shipped direct to smelters.

Gold recovered at placer mines in Montana increased 19,651 fine ounces over 1938. Seven connected-bucket dredges were in operation during 1939 and handled 7,435,147 cubic yards of gravel yielding 33,815 ounces of gold and 6,723 ounces of silver; the recovered gold was valued at $1,183,525, indicating an average value of 15.9 cents to the cubic yard of gravel treated. Dragline or power-shovel excavators with dry-land or floating washing plants were reported in operation at 49 properties; the plants treated 4,377,813 cubic yards of gravel, which yielded 18,901 ounces of gold and 4,659 ounces of silver; the gold recovered was valued at $661,535, indicating an average value of 15.1 cents to the cubic yard.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Montana in 1939, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	379	815, 949	179, 610	448, 893	172, 622	848, 853	
Dry and siliceous gold-silver ore	36	55, 620	5, 491	287, 304	94, 266	142, 512

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[2] Includes 4,004,361 pounds recovered from precipitates.
[3] Includes 145,638 tons of current slag fumed.
[4] Includes 5,563,800 pounds recovered from precipitates.

METALLURGIC INDUSTRY

Lode mines in Montana produced 3,792,780 tons of ore and old tailings in 1939 compared with 2,724,466 tons in 1938. The output in 1939 comprised 82,359 tons treated at amalgamation mills, 490,429 tons treated at cyanidation mills, 2,836,478 tons treated at concentration plants, 237,876 tons shipped crude to smelters, and 145,638 tons treated at a slag-fuming plant.

Two combined cyanidation and concentration mills and 19 straight cyanidation mills were operated in Montana in 1939; the ore and old tailings treated increased from 433,233 tons in 1938 to 490,429 tons in 1939. The material treated in 1939 contained 79,132 ounces of gold and 223,654 ounces of silver and the bullion and concentrates produced yielded 68,349 ounces of gold and 126,153 ounces of silver, indicating average recoveries of 86 percent of the gold and 56 percent of the silver. Fifteen of the mills, treating 464,412 tons of material, reported the consumption of 286,302 pounds of 91-percent sodium cyanide, 69,876 pounds of calcium cyanide, 80,560 pounds of zinc dust (including zinc shavings used at one plant), and 3,725,537 pounds of lime; in addition, two plants used 1,103 pounds of lead acetate and one plant used 5,270 pounds of manganese dioxide.

Ore treated at straight concentration plants increased from 1,976,828 tons in 1938 to 2,836,478 tons in 1939. The 1939 total comprised 148,138 tons of gold ore, 43,600 tons of gold-silver ore, 125,262 tons of silver ore, 2,197,863 tons of copper ore, 300 tons of lead ore, 1,067 tons of zinc ore, and 320,248 tons of zinc-lead ore.

Details of the treatment of all ores produced in Montana in 1939 are given in the tables that follow.

Mine production of metals in Montana in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Ore amalgamated	82,359	9,354	2,042

BEAVERHEAD COUNTY

Argenta district.—The value of the metal output from mines near Argenta decreased $50,817 in 1939, owing chiefly to a decrease of nearly 1,000 ounces in gold from the Ermont property. The mine and 100-ton cyanidation mill were operated regularly by Ermont Mines, Inc.; 33,163 tons of gold ore were milled, but the gold content was considerably lower than 1938. Despite the smaller output of gold, the mine was again the chief producer in Beaverhead County. Shipments of gold ore from the Shafer mine were continued, but the output was much less than in 1938. Other producing lode mines in the Argenta district (all producing ore shipped crude to smelters) included the Goldfinch, Ground Hog, Iron Mountain, Jack & Rosemont, Lookout, May Day, Midnight, Oro Fino, Pay Day, Pine Tree, and Silver Horn. The placer output of the district came from sluicing about 400 cubic yards of gravel at the Watson Gulch property.

Bald Mountain district.—In 1939 lessees operating the Faithful group shipped gold ore to a custom cyanidation mill at Bannack and gold ore and lead ore to smelters.

Bannack district.—There was an increase in gold from placer operations in the Bannack district in 1939, but this gain was more than offset by decreased output from lode mines. The Golden Messenger Corporation surrendered its lease on the Sleeping Princess (I. B.) property of the New York-Montana Mines Co. at the end of 1939; the output during the year comprised 305 tons of gold ore shipped to smelters and 570 tons treated in the cyanidation mill, but the output of gold decreased more than 1,300 ounces. The Bannack-Apex Mining Co. operated the Hendricks (Graeter) property the entire year and treated 3,975 tons of ore in the 50-ton cyanidation mill; the mill also handled custom ore from several mines in the area. Other producing lode mines in the Bannack district included the Garnet, Gold Bug, Gold Crown, and Wallace. The Ralph E. Davis Syndicate operated the dragline and floating washing plant on Grasshopper Creek from April to December, treating 1,125,000 cubic yards of gravel; the equipment used comprised a 5-cubic yard dragline and a 1¼-cubic yard dragline and two electric-powered washing plants with a combined capacity of 7,000 cubic yards a day. Nearly 2,000 ounces of gold were produced in 1939, a marked increase over 1938, but the gravel handled was of unusually low grade, as about 75 percent of the 1939 yardage was old dredge tailings. A small hydraulic plant at the Dark Horse placer washed about 20,000 cubic yards of gravel. Placer gold was recovered also from small-scale sluicing operations at two properties on Grasshopper Creek.

Big Hole district.—In 1939 lessees operating the Star property on Meadow Creek 3 miles west of Wise River shipped 200 tons of gold ore to the smelter at Anaconda; crude ore was shipped to smelters from the Dark Horse and S. S. & R. mines; and a little gold ore from the North Star mine was amalgamated. Small-scale placer operations were reported at the Carlin, Pierce Arrow, Rabbit Gulch, and Cherry Blossom properties.

Blue Wing district.—The entire output from the Blue Wing district in 1939 was siliceous silver ore shipped to smelters from the Blue Wing, Del Monte (Bonaparte), Ingersoll, New Departure, and Randall properties.

Bryant district.—The Hecla mine west of Melrose was in 1939, as usual, the only producer in the Bryant district; the output comprised 13,350 tons of silver ore and 171 tons of lead ore shipped to smelters, a marked increase over 1938.

Elkhorn district.—A car of copper ore was shipped from the Old Elkhorn mine in 1939, and a test lot of silver ore was produced at the Up Two property.

Horse Prairie Creek district.—Several hundred cubic yards of gravel were treated in a power loader and stationary washing plant at the Golden Leaf placer late in 1939.

Vipond district.—Lessees at the Lone Pine & Argyle Silver property of the Quartz Hill Mining Co. shipped 712 tons of silver ore in 1939 to the smelter at Anaconda; silver ore was shipped also from the Monte Cristo and Triangle mines.

BROADWATER COUNTY

Backer district.—The value of the metal output from the Backer district increased $76,802 in 1939; most of the gain was in gold from placer mines. The Fair Play Placers, Inc., was the chief placer producer in the district; the company operated a 2½-cubic yard dragline and floating washer, having a daily capacity of 4,000 cubic yards, at property in Confederate Gulch from March 1 to December 23 and treated about 600,000 cubic yards of gravel. The Empire Gulch Mining Co. (formerly Charles L. Sheridan) operated a 2½-cubic yard dragline and dry-land washing plant at the Boulder Bar placer from April 10 to September 10 and treated 100,000 cubic yards of gravel. Other producing placers in the district included the Antler, Armstrong, Boulder, Bourbon, Eldorado Bar, Homestead, Magpie Gulch, North Star, Rattlesnake Bench, Rose, and Tenderfoot properties. Most of the output from lode mines in the district came from the Superior mine, where unusually rich gold ore was treated in a small amalgamation plant; gold ore was shipped to smelters from the Cooper, Harriett, and Satellite mines.

Beaver district.—Lessees continued to operate at the Custer mine near Winston in 1939; the output of gold from crude ore and from concentrates from the 60-ton flotation plant was more than double that in 1938. The rest of the Beaver district output was crude ore shipped to smelters; it comprised gold ore from the Black Tail, Chicago, East Pacific, Edna, Iron Age, Martha Washington, Midas, Mystery, Stolen Sweets, Triumph, and Vosburg mines and lead ore from the Monte Cristo and Stray Horse mines.

Cedar Plains district.—The value of the metal output from mines in the Cedar Plains (Radersburg) district in 1939 increased $183,077 over 1938, owing chiefly to marked increase in gold from the Ohio Keating mine; the property was operated the entire year by the M & M Mining Co., and 25,321 tons of gold ore were treated in the rebuilt (80-ton) flotation plant. The C. G. Gold Corporation continued regular operations at the Keating group; the output comprised 3,473 tons of concentrates (from 23,301 tons of gold ore treated in the 100-ton flotation plant) and 2,210 tons of crude gold ore shipped to smelters. Other producers in the district included the Apex, Black Friday, Comstock, Cyclone, Emma, Gopher, and Spar mines.

Park district.—The Marietta mine in 1939 again was the chief producer in the Park, or Indian Creek, district; the mine was operated by lessees, and the output comprised 257 tons of gold ore and 502 tons of lead ore shipped to smelters. At the Blacksmith property 504 tons of gold ore were treated in the 25-ton amalgamation and concentration mill, and 218 tons of gold ore were shipped direct to smelters. As in 1938, gold ore from the Speculator mine was treated in a small amalgamation mill. Other producing lode mines in the district included the Crosscut, Don L., Independent, Iron Mask, Justice, Little Giant, Mississippi, Monarch, Silver Wave, Sparrow, W. A. Clark, and West Park & Venezuela properties. Poston Bros. operated a 2-cubic yard dragline and stationary washer and tested about 1,500 cubic yards of gravel from properties along Indian Creek during October; small-scale sluicing was reported at several placers in the district, including the Whip-poor-will property.

CARBON COUNTY

Testing operations at bars along the Clark Fork River near Belfry yielded a small lot of placer gold in 1939.

CASCADE COUNTY

Montana district.—The total value of the metal output from mines in Cascade County in 1939 increased $139,815 over 1938, owing chiefly to larger output of silver ore from the Big Seven property; the mine and 50-ton flotation mill were operated the entire year by the Montana Silver Queen Mining Co., and the output comprised nearly 600 tons of rich silver concentrates from the mill and nearly 300 tons of crude silver ore shipped to the smelter at East Helena. Output of silver ore from the Florence mine also increased. Silver ore was treated also in small flotation mills at the Benton and Hartley properties, and a little lead ore was milled by the New London Mining Corporation. The remainder of the district output comprised zinc-lead ore shipped to the zinc mill at Anaconda from the Minute Man property, and crude ore shipped to smelters from the Commonwealth, Lucky Strike, Peabody, Silver Belt, and Star mines. In addition, a test lot of lead ore was shipped from the Silver Dyke property; however, no work was done at the property by the Silver Dyke Mining Co., and the milling plant, formerly the largest mill in the Neihart area, was dismantled.

DEER LODGE COUNTY

Georgetown district.—The marked increase in output of gold from mines in the Georgetown district in 1939 was the result of increased output of gold ore from the Southern Cross mine; the property, owned by the Anaconda Copper Mining Co., was operated under lease by the Quarry Mining Co., and shipments of gold ore to the smelter at Anaconda increased to 7,721 tons containing 6,588 ounces of gold. Thomas H. Sheridan operated the full year at the Holdfast property, but the output of gold ore treated in the 50-ton cyanidation mill decreased slightly to 13,866 tons. The Gold Coin Mines Co. continued operations at the Gold Coin mine and amalgamation mill throughout the year, and in addition, during the summer months, the cyanidation plant treated old tailings; the combined output of the two plants, however, was considerably less than in 1938. Other producing mines in the district included the Cable, Hub, and Revenue properties.

Oro Fino district.—Crude ore was shipped to smelters in 1939 from the American, Cashier, Grizzly Bear, and Independence mines.

Silver Lake district.—A lessee operating the Silver Reef mine 13 miles west of Anaconda shipped 342 tons of silver ore to smelters in 1939. A test lot of silver ore was shipped from the Chloride Silver property.

FERGUS COUNTY

Cone Butte district.—Small lots of gold ore were shipped to smelters in 1939 from the Golden Armells and Golden Jack properties.

North Moccasin district.—The North Moccasin Mines Syndicate continued operations in 1939 at the Barnes-King mine 20 miles north of Lewistown; ore treated in the 150-ton cyanidation mill increased over 1938, and the output of gold increased more than 300 ounces. Small lots of placer gold were recovered by sluicing at three properties; most of it came from the Grubstake placer in Iron Gulch.

Warm Springs district.—All the output from mines in the Warm Springs district in 1939 was crude ore shipped to smelters; it comprised gold ore from the Maginnis group, silver ore from the Argentite, Bay Horse, and Silver Queen mines, and a little lead ore from the Globe property.

FLATHEAD COUNTY

Hog Heaven district.—The Anaconda Copper Mining Co. continued regular operations in 1939 at the Flathead mine south of Kila; the output of silver ore decreased slightly (from 15,797 tons in 1938 to 13,447 tons in 1939), but the output of crude lead ore sent to the East Helena smelter increased from 4,997 to 13,201 tons. A little silver ore was shipped to the smelter at Tacoma, Wash., from the Eudora property and from prospects.

GALLATIN COUNTY

A test lot of gold ore was sent in 1939 to the East Helena smelter from the Beacon mine, a little lead ore was shipped from the Last Chance mine, and a little gold was recovered by sluicing at the Jewel placer. No production in 1938 was reported from mines in Gallatin County.

GRANITE COUNTY

Alps district.—A car of gold ore from the Alps group south of Clinton was shipped to the East Helena smelter in 1939.

Boulder district.—Most of the increase in gold from the Boulder district in 1939 resulted from shipments of gold ore from the Gold King & Gold Mountain mine, where the output comprised 354 tons of ore containing 346 ounces of gold. Crude ore from the Blue Bird, Brooklyn, Golden Summit, Moonlight, and Sunday mines was shipped to smelters, and ore from the Royal Gold property was treated in a small amalgamation and concentration mill. Most of the placer output came from drift mining at the Montana-Tonopah placer.

Dunkleberg district.—Small lots of crude ore were shipped to smelters in 1939 from the Murrial, Ruth, and Standby properties.

First Chance district.—The entire output from lode mines in the First Chance (Garnet) district in 1939 was crude gold ore shipped to smelters. Most of it came from leasing operations of the Mitchell-Mussigbrod group (including the Fairview, Fourth of July, Free Coinage, International, Lead King, Red Cloud, Robert Emmett, and San Jose claims). Other producers included the Fluker, Forest, Hobo & Gold Leaf, Grant & Hartford, Laddy Buck, Lynx, Peggy Ann, Sierra, Sunrise, and Tiger mines.

During 1939 the Star Pointer Exploration Co. completed the erection of a 6-cubic foot connected-bucket dredge at the mouth of Bear Creek near Bearmouth; the dredge is electric-powered and equipped with 88 buckets. The new plant was placed in operation October 29 and dredged 349,131 cubic yards of gravel before the end of the year. Small-scale sluicing was reported at the Alma (Cave Gulch), Dixie, Little Dick, and Ten Mile placers.

Flint Creek district.—The total value of the metal output from mines in the Flint Creek (Philipsburg) district in 1939 increased $261,529 over 1938 owing to increased output by the Philipsburg Mining Co. Operations at the Granite-Bimetallic mine and 165-ton flotation plant were suspended in September, after producing 841 tons of rich silver concentrates and 388 tons of crude silver ore that were shipped to smelters. During the summer, however, a plant was built to treat the old tailings dumps near Philipsburg. The tailings were accumulated from the treatment of several hundred thousand tons of Granite-Bimetallic ore in the old chloridizing-roast, pan-amalgamation mill. Considerable experimentation preceded construction of the new 300-ton mill, which is essentially a desliming plant using jigs and classifiers. The deslimed, highly siliceous product was shipped to the Tacoma smelter under a special freight and treatment schedule; the mill handled about 43,000 tons of tailings after it was put in operation in August.

The Contact Mines Corporation operated throughout 1939 at the Silver Prince property at Philipsburg; its output comprised 6,716 tons of silver ore shipped to smelters and 6,589 tons of zinc-lead ore sent to the mill at Anaconda, a marked increase over 1938. The Taylor-Knapp Co. (Taylor, Nelson & Knapp, Inc., before June 1939) shipped 2,345 tons of crude silver ore and 1,023 tons of zinc-lead ore from the Two Percent mine during the year. The Trout Mining Division of American Machine & Metals, Inc., shipped 3,567 tons of crude silver ore from the Trout & Algonquin group in 1939, but no zinc-lead ore was produced. The remainder of the output from the Flint Creek district was crude ore shipped to smelters, chiefly from the Headlight, Hobo, and Shannon mines.

Gold Creek district.—Gold ore was shipped to smelters in 1939 from the Clear Grit and Yaller Boy properties, and gold ore was amalgamated at property operated by Schmuck & Whitty. Most of the placer output from the Gold Creek district came from a power shovel and stationary washing plant operated by the Master Mining Co. at the Tibbits & Fowler property; the Triangle and Willow Creek placers also were operated in 1939.

Henderson district.—H. J. Schneider & Bros. operated a ½-cubic yard dragline and stationary washer at the New Deal placer in 1939 and treated about 12,000 cubic yards of gravel. Gold ore was shipped to a smelter from the Sunrise group.

Maxville district.—Siliceous ore was shipped to smelters in 1939 from the Copper Queen, Hoffman (Goldonna), and White Horse properties.

Moose Lake district.—A little gold ore was shipped from the Moose property in 1939, and a test lot of silver ore was shipped from the Mahoney mine.

Red Lion district.—There was a marked decrease in gold from the Red Lion district in 1939, as the output from the Hidden Lake mine was less than in 1938. The mine was operated until May 25 by Hidden Lake Venture, Inc., and later by the Red Lion Mining Co.; the total output comprised 12,612 tons of ore treated by cyanidation in 1939 compared with 24,139 tons in 1938. A small lot of gold ore was shipped to a smelter from the Olympic property.

Rock Creek district.—Nearly 1,700 tons of gold ore were shipped to a smelter in 1939 from the Ella (MacDonald) property, a new producer in the Rock Creek district; siliceous ore was shipped to smelters also from the Mountain Ram, Ozark, and Shakespeare mines. Most of the placer output of the district came from sluicing operations at the Basin and Quartz Gulch properties.

JEFFERSON COUNTY

Amazon district.—Crude ore was shipped to smelters in 1939 from the Adolphus, Amazon & Deadwood, Boulder, Schevers, and Wilbur Silver mines.

Bigfoot district.—Small lots of gold ore were shipped from the Bald Eagle and State properties in 1939.

Boulder district.—Crude ore was shipped in 1939 from several mines near Boulder, including the Baltimore, Ida, Davis-Eureka, Molly McGregor, and Red Eagle properties. A scraper and dry washer were used in treating 7,350 cubic yards of gravel from the Boulder placer.

Cataract district.—The value of the metal output from the Cataract district in 1939 increased $246,508 over 1938 owing to increased output of zinc-lead ore at the Comet property; the mine and flotation mill were operated the entire year by the Basin Montana Tunnel Co., and the ore mined increased from 38,170 to 59,420 tons; small lots of custom ore from several mines in the district were also milled, including ore from the Buckeye & Boston, Crystal, Golconda, and Sylvan mines. In addition to the zinc-lead ore sent to the Comet mill, lessees shipped 1,515 tons of siliceous ore from the Comet mine to smelters. Basin Goldfields, Ltd., operated the Boulder mine from January through September and shipped 1,141 tons of gold ore to the Anaconda smelter. Ore was also shipped to smelters from the Basin Bell, Blue Bird, Congo, Crescent, Dickerson, Mae Lilly, Mayflower, Mantle, Minneapolis, Morning, Saturday Night, and Sirius mines. Gold ore was treated by amalgamation and concentration at the Gray Lead and Hope & Katie (Jib) properties. Small-scale sluicing was reported at several placers near Basin, including the Big Rock, Gold Hill, Nancy, and Park & Anderson properties.

Clancey district.—The output of gold from the Clancey (Prickly Pear Creek, Montana City, etc.) district in 1939 increased 5,526 ounces over 1938, owing to increased output by Winston Bros. Co., largest placer producer in Montana, whose new 6-cubic foot floating dredge (put in operation in August 1938) operated during the entire year 1939 and handled 1,787,413 cubic yards of gravel. In addition, the company operated the 4-cubic yard dragline and floating washer on Prickly Pear Creek from January until June 24, 1939, when the plant was closed and dismantled after all available ground had been dredged; the dragline plant handled 353,643 cubic yards of gravel. The Holmes Gulch Mining Co. produced several hundred ounces of gold at a dragline and dry-land washer in Holmes Gulch. The Dutton Ranch dragline and dry-land washer operation of O. A. Barnes produced a little placer gold before the equipment was moved to Marysville in Lewis and Clark County in May. A dragline and dry-land washing plant were operated for 20 days in July at the Weber placers on Buffalo Creek. The output from lode mines in the Clancey district was crude ore shipped to smelters, chiefly from the Eagle's Nest and Liverpool properties.

Colorado district.—The Alta property near Wickes in 1939 again was the chief producer in the Colorado district; the property was operated throughout the year by Eathorne & Fox, and the output comprised 48,632 tons of old tailings treated in the 200-ton flotation plant and 218 tons of crude lead ore shipped direct to a smelter. A small lot of zinc-lead ore from the Bunker Hill mine was trucked to the Comet mill. Silver tailings at the Frohner property were treated in a small jig mill. The rest of the district output was crude ore shipped to smelters from the Arogon, Blizzard, Blue Bird, Buckeye, Gregory, Henna, Minah, Minnesota, Mount Washington, Offset, and Pen Yan properties.

Elkhorn district.—The Center Reef mine was operated during 1939 by lessees, who shipped 159 tons of gold ore to a smelter and treated about 200 tons of ore in a small amalgamation plant. A little gold ore from the Klondyke mine was amalgamated. Siliceous ore was shipped to smelters from the C & D, Golden Curry, Hard Cash, Little Goldie, Moreau, New Elkhorn, Queen, and Wildcat properties.

Golconda district.—A lessee shipped small lots of gold ore from the Wonder mine to a smelter in 1939.

Homestake district.—Small lots of gold ore were shipped to smelters in 1939 from the Golden Valley, Martha, and Sleeping Beauty mines.

Lowland district.—Kit Carson Placers operated the dragline and dry-land washer equipment on Lowland Creek from April 20 to October 31, 1939, and treated about 630,000 cubic yards of gravel, a marked increase over 1938. A little gold ore from the Infinite property was treated in 1939 in a small amalgamation mill.

McClellan Creek district.—Small lots of silver ore were shipped in 1939 from the Shaw mine to the East Helena smelter.

Mitchell district.—E. A. Studer & Son operated a ½-cubic yard power shovel and stationary washing plant at the Lewis placer in Mitchell Gulch from June to November 1939 and treated about 25,000 cubic yards of gravel. The John & Jim group of the Economy Mines Co. was operated by lessees in 1939, and 298 tons of gold ore were shipped to a smelter. A small lot of gold ore mined at the Haystack Butte mine in 1938 was shipped to a smelter in 1939.

Warm Springs district.—The value of the metal output from the Warm Springs district decreased from $76,260 in 1938 to $8,374 in

1939 owing to the closing of the mill at the Fleming property of the Newburg Mining & Milling Co. late in 1938; the property was idle in 1939, and one small lot of clean-up material was shipped to a smelter. The Alhambra Gold Mines, Inc., operated the Katie & Pilot group throughout 1939 and shipped 160 tons of gold ore to the East Helena smelter. Gold ore was also shipped to smelters from the Badger, Green Leaf, and Iron King mines.

Whitehall district.—The value of the metal output from the Whitehall district in 1939 increased $124,293 over 1938 owing to the larger output of gold ore from the Golden Sunlight mine; the property was operated by the A. O. Smith Corporation and various sublessees, and the output of ore shipped to smelters increased from 3,425 to 9,621 tons. Other shipments from the district comprised gold ore from the Claxton, Gold Star, Jack Benny, Lone Eagle, Lucky Hit, Maid of Erin, Morning Glory, New Year, Pay Day, and Sunnyside mines and lead ore from the Blue Bell, Carbonate, Mary Lucile, Midnight, and Surprise properties.

Willow Creek district.—The Callahan (Deer Horn) mine of the Golden Age Mining Co. was operated only a short time in 1939, and the output of gold ore treated in the amalgamation and concentration plant decreased to 310 tons.

JUDITH BASIN COUNTY

Barker district.—Thorson Bros. continued leasing operations in 1939 at property of Glendennin Mines, Inc., in the Barker district; the output comprised 2,659 tons of crude lead ore shipped to a smelter and 54 tons of zinc-lead ore shipped to the mill at Midvale, Utah. A test lot of lead ore was shipped from the Champion mine.

Running Wolf Creek district.—One lot of lead ore from the Morro mine south of Stanford was shipped to the East Helena smelter in 1939.

LEWIS AND CLARK COUNTY

Dry Gulch district.—The Golden Messenger Corporation operated throughout 1939 at the mine and 130-ton cyanidation plant at York; the mill treated 46,268 tons of ore, which yielded 8,234 ounces of gold and 8,168 ounces of silver in cyanide bullion. The rest of the Dry Gulch district output comprised gold ore shipped to a smelter from the Blue Bird mine and small lots of placer dust from small-scale sluicing operations at several properties, including the Franklin, Maude, and Oro placers.

Greenhorn district.—A lessee operated a 1-cubic yard dragline and dry-land washer in 1939 at the Austin Mountain placer and treated about 10,000 cubic yards of gravel. Sluicing was reported at the Con Kelly and Potter placers. Small lots of lead ore were shipped from the Humboldt and King Tut lode mines.

Heddleston district.—Lessees shipped nearly 1,400 tons of siliceous ore to smelters in 1939 from the dump at the Anaconda property at the head of the Blackfoot River 35 miles northwest of Helena.

Helena district.—The Montana Consolidated Mines Corporation resumed production at the Spring Hill mine in March 1939, after completion of the new 30-ton concentrate-cyaniding plant. In 1939 the company treated about 56,000 tons of ore in the 300-ton straight-flotation plant; the flotation concentrates were treated by cyanidation in the new 30-ton plant, and the cyanide tailings were re-treated by flotation to recover lead concentrates. The output of gold from the property decreased more than 800 ounces compared with 1938. Other producing lode mines in the Helena district included the Court House, Eula, Little Wonder, Lockey, Lone Star, Old Dominion, San Juan, Sky, and Whitlatch properties. The Porter Bros. Corporation operated the 6-cubic foot dredge north of Helena throughout the year and treated 1,805,983 cubic yards of gravel, about the same yardage as in 1938, but the output of gold decreased more than 600 ounces. Placer production was reported at six other properties near Helena.

Jefferson Gulch district.—One small lot of gold ore was shipped by a lessee in 1939 from the Wiggins property 8 miles northeast of Finn.

Lake Helena district.—Lessees shipped small lots of gold ore in 1939 from the Lake Shore (Violet Jane) group north of Lake Helena.

Lincoln district.—The Lincoln Metals Co. shipped 40 tons of gold ore from the Margarets property 6 miles northwest of Lincoln in 1939. Most of the placer output of the Lincoln district came from a dragline and dry-land washer operation at the Stonewall property; a small dragline and dry-land washer were operated at the Blue Cloud property; and sluicing was reported at the Bloom & Old Billy Williams, Blue Bird, Harvey, and Liverpool placers.

Marysville district.—The value of the metal output from mines in the Marysville district increased from $211,213 in 1938 to $412,457 in 1939; gold from lode mines increased 1,295 ounces and that from placer mines 3,806 ounces. The gain from placers was chiefly the result of operations by Ralph Davis, Inc.; the 3½-cubic yard dragline and floating washer were put in operation April 15, 1939, and handled about 705,000 cubic yards of gravel from the Silver Creek placer during the rest of the year; the property was the largest gold producer at Marysville. O. A. Barnes moved the 1-cubic yard dragline and floating washing plant, previously operated at the Dutton Ranch property near Clancey in Jefferson County, to the Esperanza placer in Empire Gulch in May 1939; the plant handled 10,660 cubic yards of gravel at the Marysville location from August 1 to November 15. Other producing placers near Marysville in 1939 included the Chevallier, Deadman Gulch, and Trus-to-luck properties. The Rex Mining Co., operating the Empire group, again was the largest lode producer at Marysville; the company treated 14,065 tons of gold ore in the 50-ton concentration plant and shipped 459 tons of rich gold-lead concentrates to a smelter. The Martin Mining Co. treated more than 11,000 tons of tailings from the Eck property in a new 120-ton roasting and cyanidation mill. The J. C. Archibald Co. operated its cyanide mill from June 1 to October 31 and treated about 10,000 tons of Bald Butte tailings; in addition, lessees shipped nearly 1,200 tons of crude gold ore from the Bald Butte mine to smelters. Gold ore from the Big Ox and Albert Brown properties was treated by cyanidation. Lessees at the Drumlummon property shipped 1,720 tons of gold ore, a decrease from 2,430 tons in 1938. Crude ore was also shipped to smelters from the Belmont, Big Ox, Climax, Eureka, Excelsior, Mount Pleasant, Carbonate, Penobscot, Piegan-Gloster, Shannon, and Three M mines.

Missouri River district.—The 6-cubic foot dredge of the Perry-Schroeder Mining Co., which was put in operation in November 1938, operated throughout 1939 and treated 1,459,010 cubic yards of gravel from the Eldorado property 15 miles northeast of Helena. The Duclo Mining Co. operated a dragline and dry-land washer at the Gruell Bar. Production was also reported at the Golden Ring & Sunset, Howe, and Mable (Easterly) placers.

Rimini district.—All the output from lode mines near Rimini in 1939 was crude ore shipped to smelters; most of it was lead ore from the Anna May & Broadway property, shipped by lessees. Other lode producers included the Aurora, Johnny Tunnel, Lone Pine, Peerless Jennie, and Sunset mines. Most of the placer output came from the Black Eagle and Gould properties.

Scratch Gravel district.—Most of the output from the Scratch Gravel district in 1939 was gold ore shipped to smelters from the Ajax and Franklin mines. Crude ore was also shipped from the Gold Crown, Nettie, Silver Coin, and Umatilla properties.

Smelter district.—The fuming plant of the Anaconda Copper Mining Co., treating slag from the lead smelter of the American Smelting & Refining Co. at East Helena, operated throughout 1939, and the output of zinc-lead fume sent to Great Falls was double that in 1938. The value of the metal output increased $795,123 over 1938 and represented most of the gain in Lewis and Clark County.

Stemple district.—The Standard Silver-Lead Mining Co. operated throughout 1939 at the Gould property near Wilborn; 29,053 tons of ore (about the same quantity as in 1938) were treated in the 80-ton cyanidation plant, but the output of gold decreased from 6,265 to 5,652 ounces. Gold ore from the Prize mine was treated by cyanidation by Granite Butte Mines, Inc., and a car of crude ore was shipped to a smelter. The North Gould Mining Co. treated ore from the American Boy group by amalgamation. Small lots of gold ore were shipped to smelters from the Little Dandy and Red Star mines. A little placer gold was recovered by sluicing at the Diamond & Gem placer on Virginia Creek.

LINCOLN COUNTY

Libby district.—The Davis & White Mining Co. operated a 1-cubic yard power shovel and dry-land washing plant from June 1 to October 20, 1939, and treated about 33,000 cubic yards of gravel from the Liberty placer on Libby Creek. Other producing placers near Libby in 1939 included the Big Cherry Creek, Horsehoe, Last Chance, Libby (Brophy), and Logan (Nugget) properties. Gold ore was shipped to a smelter from the Golden West group.

Sylvanite district.—The Morning Glory Mines, Inc., operated the Sylvanite (Keystone) mine in 1939 and treated more than 14,000 tons of gold ore by amalgamation and concentration; the output of gold decreased slightly from that in 1938. Small lots of crude lead ore were shipped to smelters from the Black Diamond and Grouse Mountain properties.

Ural district.—L. C. Curtis & Sons operated a ⅜-cubic yard dragline and stationary washing plant during December 1939 and treated about 1,100 cubic yards of gravel from the Pioneer placer on the Kootenai River.

MADISON COUNTY

Cherry Creek (Havana) district.—Siliceous ore was shipped to smelters in 1939 from the East Riverside, New Havana, and September Syndicate mines, all on Cherry Creek east of Norris.

Norris district.—The Revenue mine in the Upper Hot Springs section was the largest producer in the Norris district in 1939; the mine and 80-ton cyanidation mill were operated the entire year by Revenue Mine Developing Group, Inc. The new mill, which was placed in operation in October 1938, treated 26,280 tons of ore from the Revenue mine in 1939 (compared with 6,400 tons in 1938), and the output of gold recovered in cyanide bullion increased to 3,997 ounces; in addition, the company shipped 302 tons of gold ore to a smelter; and the total output of gold was 4,180 ounces compared with 1,885 ounces in 1938. Gold produced from the Boaz mine 5 miles east of Norris decreased to 2,511 ounces in 1939, as the output of crude ore shipped to smelters decreased from 1,788 to 775 tons; however, a 60-ton cyanidation plant erected at the mine during 1939 was put in operation late in the year and treated about 1,500 tons of ore before the end of the year. Lessees operating the Lexington mine 5 miles southwest of Norris shipped 644 tons of gold ore to a smelter and sent 1,586 tons of ore to the Revenue mill, but the total output of gold decreased more than 500 ounces. The rest of the output from lode mines in the district was crude gold ore shipped to smelters from the Arctic, Boyles, Betty May, Billy, Bi-Metallic, Black Chief, Devil's Dream, Eldorado, Emperor, Erma & Lucky Strike, Fortuna, Galena, Gold Bug, Golden Link, Grubstake, Headlight, Josephine, Mascot & Pony, Monitor, Montida, New York Belle, Pulverizer, Rosebud, Santa Christo, Valdez, and Water Lode mines; most of it came from the Billy, Emperor, and Montida mines. Homer Wilson operated the 5-cubic foot dredge at the Norwegian placer from March 27 to December 22, 1939, and treated 239,805 cubic yards of gravel; the output of gold increased nearly 500 ounces.

Pony (Mineral Hill) district.—The Liberty Montana Mines Co. operated throughout 1939 at the Mammoth property and treated 28,324 tons of ore in the 120-ton mill compared with 30,862 tons in 1938, but the output of gold (in copper concentrates shipped to a smelter) decreased 1,115 ounces. The Montana Southern Mining Co. treated 36,317 tons of ore from the Atlantic-Pacific mine in the 100-ton flotation plant and produced 3,164 ounces of gold (almost the same quantity as in 1938) in gold concentrates shipped to a smelter. Crude ore was shipped to smelters from the Ben Harrison Fraction, Bozeman, Fraction, Galena, Katie, Keystone-Strawberry, Lone Wolf, McVey, Moonlight, Ridgeway, Whip-poor-will, White Pine, Whiterock, and Wolftone mines; most of it was gold ore from the Bozeman mine.

Renova (Bone Basin) district.—The West Mayflower Mining Co. (Anaconda Copper Mining Co.) in 1939 again was the largest gold producer in Montana; the company shipped 21,308 tons of gold ore, containing 19,734 ounces of gold and 113,084 ounces of silver, to the Anaconda smelter. Gold ore was also shipped to smelters from the Blue Bird, Colorado, Gold Hill, Lakewater, Last Chance Fraction, and Little Nugget properties.

Rochester (Rabbit) district.—The Lively Mining Co. treated 1,411 tons of gold ore in 1939 from the Hidden Treasure mine in a 12-ton amalgamation and concentration mill and shipped 38 tons of crude ore to a smelter. The Commonwealth Lead Mining Co. shipped 198 tons of lead ore from the Calvin mine to the East Helena smelter. Crude ore was also shipped to smelters from the Cooper, Gold Crown, Red Wing, Sandy, Shoemaker, and Struggler mines.

Sheridan district.—The Sheridan Gold Mining & Milling Co. shipped 417 tons of gold ore from the Homestake & Uncle Sam property in 1939 compared with 338 tons in 1938, but the output of gold decreased 340 ounces. The output from the Fairview group (operated by Fairview Gold Mines, Inc.) comprised 188 tons of gold ore and 33 tons of lead ore, a decrease from 457 tons of gold ore in 1938. Other producing lode mines in the Sheridan district included the Compipius, Cousin Jack, Cousin Jennie, Ella Jay, Gold Point, Goldsmith, Jonquil, Klondike, Lake Shore, Leiter, Lone Tree, Noble, North Star, Red Bird, Red Pine, Sage Hen, Silver Bullion, Sunbeam, and Tamarack mines. Most of the placer output came from drift mining at the Cash Boy & Lost Boy property; other producing placers included the Aurum, Blue Bird, Comet, Halloran, and Wisconsin Creek properties.

Silver Star district.—The value of the metal output of the Silver Star district increased from $231,850 in 1938 to $475,022 in 1939, owing chiefly to increased output of gold from the Broadway (Victoria) property operated by Victoria Mines, Inc. The company treated 32,991 tons of ore in the 100-ton cyanide mill (about the same quantity as in 1938), and the output of crude ore shipped direct to smelters increased from 193 to 5,314 tons. The Green Campbell Mining Co. operated the Green Campbell mine the entire year and treated several thousand tons of ore in the 25-ton amalgamation and flotation plant; the output of gold from the property increased 1,200 ounces. The Golden Rod Mining Co. continued to ship rich gold ore from the Golden Rod mine, but the output was less than half that in 1938. Gold ore was also shipped to smelters from the Aurora, Broomtree, Edgerton, Iron Rod, Moonlight, Ohio, Silver King, Stansell, and Wheal Clifford properties.

Tidal Wave district.—Most of the increase in metal output from the Tidal Wave district in 1939 was in gold ore shipped to smelters from the B & H property operated by the Inspiration Gold Mining Co. A little gold ore from the Agitator mine was amalgamated. Crude ore was shipped to smelters from the Corncracker, Hemmingway (Eleanora), Ella, High Ridge, Last Chance, Keynote, Lone Eagle, Lone Pine, Lottie, Pollinger, Silver Dollar, and Smith properties.

Virginia City district.—The value of the metal output of the Virginia City district in 1939 increased $89,941 over 1938, as the output of crude ore shipped to smelters increased. Lessees operating the Bartlett mine shipped 2,525 tons of gold ore to smelters, a marked increase over 1938; there was also an increase at the Mapleton property, as lessees shipped 3,614 tons of gold-silver ore to smelters. Crude ore was also shipped from the Alameda, Apex, Atlas Extension, Bamboo Chief, Bull Frog, Easton Pacific, El Fleda, Hansen, High Up, Homestake, Marietta, Oro Cache, Prospect, Randolph, R. B. P., St. John, Virginia City, and Winnetka properties. Gold ore from the Alder Gulch, Mountain Flower, and Valley View properties was treated in small amalgamation mills, and ore from the Easton Pacific mine was treated by flotation. Most of the placer output came from the Alder Gulch and Chambers properties.

Washington district.—All the placer output from the Washington district in 1939 was recovered by the 4½-cubic foot dredge operated by the Gold Creek Mining Co. at the Washington Bar property. Lessees operating the Missouri-McKee property treated 1,538 tons of gold ore by amalgamation and concentration and shipped 135 tons of gold ore to a smelter. Crude ore was also shipped to smelters from the Diamond Cross, Highland Lady, and Snowslide properties.

Willow Creek district.—The Buena Vista Mining Co. shipped a little silver ore from the Silver Mountain property 21 miles south of Alder to the Anaconda smelter in 1939.

MEAGHER COUNTY

Atlanta Creek district.—A little placer gold was recovered in 1939 from the ground-sluicing of 200 cubic yards of gravel at the Atlanta & Fox property.

Beaver Creek district.—Most of the output from the Beaver Creek district in 1939 came from operation of a 1-cubic yard power shovel and dry-land washing plant, which treated 29,786 cubic yards of gravel from a placer operated by the T. C. Mines. Other producing placers in the district included the Barton Gulch, Benton, and Watson properties.

Castle Mountain district.—A little copper ore was shipped in 1939 from the Bell of Castle mine on Hensley Creek, and a little lead ore was shipped from the Great Eastern prospect.

Thompson Gulch district.—A ¾-cubic yard power shovel and dry-land washer were operated from April 15 to June 15, 1939, and treated 1,050 cubic yards of gravel from the Little Buck property. A little placer gold came from the Camp Robber and Cornerstone properties.

MINERAL COUNTY

Cedar Creek district.—Superior Mines, Inc., operated a 1½-cubic yard power shovel and dry-land washer from April 12 to November 24, 1939, and treated about 90,000 cubic yards of gravel from the Cedar Creek property. Other producing placers in 1939 included the Alibi & Hungary, C. B. & Q., Dakota, Dr. Eddy & Nugget, Golden Sunset, Henrietta & Success, Lost Gulch, Lucky Boy, McFarland, Meadow Creek, No Name & Buck Tail, Oregon, Stemwinder, Stockholm, Sunlight, and Windfall properties. A car of gold ore was shipped from the Last Chance mine to the smelter at Anaconda.

Gold Mountain district.—The Gold Mountain Mines, Inc., treated a little gold ore in a 50-ton flotation- and blanket-concentration mill in 1939.

St. Regis district.—Small lots of gold ore were shipped to smelters in 1939 from the Gold Chrome and Jack mines.

MISSOULA COUNTY

Coloma district.—Gold ore from the Dandy and Mountain View properties was treated in small amalgamation and concentration mills in 1939; gold ore was shipped to smelters from the Clemantha, Dandy, Dixie, I. X. L., Mammoth, Northern Star, and Portia mines.

Elk Creek district.—The yield of placer gold from the Elk Creek district in 1939 increased 849 ounces over 1938, owing to increased output by the Norman Rogers Mining Co.; the company operated a dragline and dry-land washer from April 27 to December 16 and treated about 200,000 cubic yards of gravel. A dragline and floating washer were operated at the Piegan placer by W. S. Grubbs & Co. Other producing placers included the Betty Ann, Bob Cat, and Depression properties.

Nine Mile district.—The Ellis Gold Mines Co. operated a 1¼-cubic yard power shovel and dry-land washer from August 23 to December 23, 1939, and treated about 60,000 cubic yards of gravel from the Boyd placer on Eustache Creek. Other producing placers in the Nine Mile district included the Barrette, Crysalis, Hard Chance, Imperial, Kennedy Creek, Little Marion, Marion Creek, Oro, and The Bench properties. Several cars of gold ore were shipped from the San Martina lode mine.

Wallace district.—Crude copper ore from the Hidden Treasure mine was shipped to the smelter at Anaconda in 1939, and small lots of lead ore were shipped from the Adalin and Conflict properties.

PARK COUNTY

Crevasse district.—The Snowshoe Mining Co. operated its property from June 25 to October 1, 1939, and treated 1,165 tons of gold ore in the 25-ton amalgamation and concentration mill.

Emigrant Creek district.—Small-scale sluicing was continued in 1939 at placers on Emigrant Creek; most of the output came from the treatment of about 5,000 cubic yards of gravel from the Hefferlin property.

New World district.—The Irma Mines, Inc., treated several hundred tons of silver ore from the Irma & Republic property by flotation in 1939 and shipped rich silver-lead concentrates. A lessee shipped a small lot of gold ore from the Homestake mine.

Sheepeater (Jardine) district.—The Jardine Mining Co. operated throughout 1939 at the Jardine property 6 miles north of Gardiner; 51,130 tons of gold ore were treated in the 185-ton amalgamation and concentration plant, and 111 tons of crude gold ore were shipped to the smelter at Anaconda.

PHILLIPS COUNTY

Little Rockies district.—The Ruby Gulch Mining Co. continued regular operations in 1939 at the Ruby Gulch property at Zortman. The output comprised 82,369 tons of ore treated in the 300-ton cyanidation mill and 804 tons of gold ore shipped direct to smelters; the output of gold decreased nearly 600 ounces from 1938. The Little Ben Mining Co. treated 46,612 tons of ore from the August group in the 150-ton cyanidation plant compared with 53,581 tons in 1938; the output of gold decreased slightly. Most of the output of placer gold from the Little Rockies district came from the Big Slide and Dorothy & Snowball properties.

POWELL COUNTY

Big Blackfoot district.—The Hilda Gold Mining Co. operated the Blackfoot property 10 miles northeast of Helmville from April 5 to November 10, 1939, and shipped 217 tons of gold ore to the East Helena smelter. A little gold ore from the Hill Top mine was shipped also to East Helena. A test lot of gold ore from the Sweepstake group was amalgamated. Most of the placer output came from the Blue Jay and Gold Dust properties.

Nigger Hill (Elliston) district.—Ore from the Big Dick mine was treated by flotation in 1939 by Big Dick Mines, Inc., and nearly 500 tons of rich gold-lead concentrates were shipped to the East Helena smelter. Crude ore was shipped to smelters from the Carbonate Boy, Hattie M. & Annie R., Hub Camp, Kierstead, Little Blackfoot Queen, Ontario, Orphan Boy, and Speck mines. Most of the placer gold came from sluicing at the Blackfoot and Little Bear properties.

Ophir district.—In 1939 lessees hydraulicked about 20,000 cubic yards of gravel at the Levi Davis (Harpole) placer in Ophir Gulch.

Pioneer district.—In 1939 the 9-cubic foot dredge of the Pioneer Placer Dredging Co. was operated from January 1 to August 10 and from October 1 to December 31 and treated 1,114,505 cubic yards of gravel from property on Gold Creek; in 1938 the dredge operated the entire year and treated 1,866,840 cubic yards of gravel. The output of gold decreased more than 2,800 ounces. Other producing placers in the Pioneer district included the Cold Springs, Gold Star, Irwin, Murray Patent, Nellie B, and Orphan Boy properties. Gold ore from the Pike's Peak group was treated in a small amalgamation plant.

Race Track district.—Small lots of gold ore were shipped to smelters in 1939 from the Amazon and Dark Horse properties on Race Track Creek.

Washington Gulch district.—The Washington Gulch Leasing Co. and other lessees worked intermittently in 1939 at the Eldorado placer in Washington Gulch; about 42,000 cubic yards of gravel were treated in the dragline and dry-land washer during the year. Other producing placers in the Washington Gulch district included the Beatrice, Gold Bar, Good Luck, New Deal, Old Shoe, Rietz, Toole (Jefferson Creek Placers), and Whitetail properties. Most of the output from lode mines was gold ore from the Grey property. Small lots of crude ore were shipped from the Mascot property and from a prospect.

Zozell (Emery) district.—The entire output of the Zozell district in 1939 was crude ore shipped to smelters, chiefly from the Emery and Bonanza properties; other producers included the Blue Eyed Maggie, Emma Darling, and Hidden Hand properties.

RAVALLI COUNTY

Curlew district.—There was a marked decrease in the value of the metal output of the Curlew district, as the 100-ton flotation plant, which treated nearly 18,000 tons of old tailings from the Curlew dumps in 1938, was not operated in 1939; the district output in 1939 comprised siliceous ore and lead ore from the Curlew mine shipped to smelters and a small lot of silver ore from the Pleasant View mine.

Overwich district.—Placer gold and silver were recovered at the Hogue and Hughes Creek properties in 1939. Gold ore from the Baker-Brickley and Washington mines was amalgamated.

SANDERS COUNTY

Eagle district.—A decrease of $109,271 from 1938 was recorded in the value of the metal output of the Eagle district in 1939, as the output of zinc-lead ore from the Jack Waite mine dropped from 43,390 to 36,028 tons; the property, which extends over the State line into Shoshone County, Idaho, was operated the entire year by the American Smelting & Refining Co. The milling ore was treated in the flotation plant at Duthie, Idaho. In addition, the company shipped 1,013 tons of rich lead ore in 1939, compared with 1,278 tons in 1938.

Revais Creek district.—In 1939 the Green Mountain Mining Co. shipped 287 tons of rich copper ore from the Drake property on Revais Creek near Dixon to the smelter at Anaconda.

Trout Creek district.—The Gold Lode Mining Co. treated a little ore from the Golden Reef mine in a small amalgamation and concentration mill in 1939. Other producers in the Trout Creek district included the Ambassador, Heidelberg, and Montana Standard properties.

Vermillion district.—All the output from the Vermillion district in 1939 came from sluicing at the Mammy Lou & Driftwood and Ogoma placers on the Vermillion River.

SILVER BOW COUNTY

The total value of the metal output from mines in Silver Bow County in 1939 increased $9,376,536 over 1938, as the output of both copper ore and zinc-lead ore from mines at Butte increased. The following table gives the output of mines in Silver Bow County, which includes the Butte or Summit Valley district, in 1938 and 1939 and the total from 1882 (the first year for which detailed records are available) to the end of 1939.

Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1938–39, and total, 1882–1939, in terms of recovered metals

Year	Mines producing	Ore	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1938	55	1,642,491	15,147	4,018,192	153,709,857	414,978	1,883,417	$18,300,823
1939	57	2,498,922	22,036	6,114,455	194,533,471	9,415,341	40,032,288	27,677,359
1882–1939	--------	(1)	1,898,219	500,017,146	[2] 5,753,806	[2] 198,247	[2] 1,435,922	2,333,039,695

[1] Figures not available. [2] Short tons.

Butte or Summit Valley district.—The output of copper ore from the Butte mines of the Anaconda Copper Mining Co. increased in 1939 owing to increased rate of operations during the last 4 months of the year. The output comprised 2,197,863 tons of ore sent to the copper concentrator at Anaconda (compared with 1,561,186 tons in 1938) and 54,075 tons of crude ore sent direct to the smelter (compared with 45,161 tons in 1938); the output of cement copper from the mine-water precipitation plants decreased slightly. Operations were resumed at the Butte zinc properties of the company in March 1939 after a shutdown of more than a year; during the remainder of the year 200,036 tons of zinc-lead ore were shipped to the zinc concentrator at Anaconda, a marked increase from the output (2,638 tons) in 1938. The output of recoverable metals (from all classes of materials) increased greatly in 1939—gold increased more than 4,900 ounces, silver more than 2,000,000 ounces, copper nearly 41,000,000 pounds, lead about 8,400,000 pounds, and zinc nearly 36,000,000 pounds. Mine development at the copper mines in 1939 comprised 237 feet of shaft sinking, 147,953 feet of drifting, and 8,537 feet of diamond drilling; at the zinc properties 17,775 feet of drifting and 1,939 feet of diamond drilling were reported. Mining of zinc-lead ore was resumed in December 1939 at the Emma mine (owned by the Butte Copper & Zinc Co. but operated under lease by the Anaconda Copper Mining Co.); the mine had been closed since January 1938. The output in 1939 comprised 5,741 tons of zinc-lead ore sent to the mill at Anaconda; in addition, the company produced 6,199 short tons of manganese ore. Other producers of zinc-lead ore shipped to mills included the Amy Silversmith, Amy X, Green Copper, Josephine, Magna Charta, Minnie Jane, Wappello, and Wild Pat properties. The rest of the output from the Butte district was crude ore shipped to smelters from the Alice, Amy Silversmith, Black Rock, Bluebird, Brophy, Eveline & Twilight, Fayal, Green Copper, Illinois, Josephine, Lavena, Lexington, Magna Charta, Margaret Ann, Pittsmont, Quarter Moon, Sailor's Dream, Sunny Dell, Valdemere, and Wild Pat properties.

Divide Creek district.—Siliceous ore was shipped to smelters in 1939 from the Gallinipper, Homestead, Margaret, and Queen of the Hills properties.

German Gulch district.—Most of the output from the German Gulch district in 1939 came from sluicing operations at the Beal placer.

Highland district.—The Butte Highlands Mining Co. operated throughout 1939 at the Highlands property 20 miles southwest of Butte; 19,504 tons of ore were treated in the cyanidation mill, and the output of gold increased to 9,936 ounces from 8,849 ounces in 1938. The rest of the Highland district output comprised crude ore shipped to a smelter from the Highland Queen and North Highland properties and small lots of placer gold from several prospects.

Independence district.—In 1939 lessees shipped 622 tons of silver ore from the Goldflint mine to the smelter at Anaconda.

SWEET GRASS COUNTY

Independence district.—A little gold ore from the Daisy property on Basin Creek 55 miles south of Big Timber was treated in a small table-concentration mill in 1939, and a car of crude gold ore was shipped direct to a smelter.

TOOLE COUNTY

Gold Butte district.—There was a decrease in gold from Toole County in 1939 owing to suspension of operations at Gold Butte Placers late in 1938; the 1939 output came from the Banner, Cummings, Gopher, and Small placers.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEVADA

(MINE REPORT)

By Charles White Merrill and H. M. Gaylord

SUMMARY OUTLINE

In 1939 copper displaced gold as Nevada's most valuable mineral product, but neither the quantity nor the total value of the copper output reached the mark set in 1937. Gold production exceeded in quantity that in each year since 1916 and in value since 1912. The total value of the gold, silver, copper, lead, and zinc (each calculated in terms of recovered metal) produced in Nevada in 1939—$30,480,-870—exceeded that in each year (except 1937) since 1929. Comparing 1939 with 1938, gold increased 22 percent in both quantity and total value, silver decreased 1 percent in quantity but increased 4 percent in value, copper increased 44 percent in quantity and 53 percent in value, lead decreased 9 percent in quantity and 7 percent in value, and zinc decreased 30 percent in quantity and 25 percent in value. The total value of the five metals was 30 percent greater than in 1938; of the total, copper comprised 45 percent, gold 42 percent, silver 10 percent, zinc 2 percent, and lead 1 percent.

White Pine County continued in 1939 to be the largest contributor to the mineral output of the State; it ranked first in both copper and gold and fourth in silver. Esmeralda County was the leading producer of silver and Lincoln County the leading producer of both zinc and lead.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in Nevada, 1935–39, and total, 1859–1939, in terms of recovered metals

Year	Mines producing[1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1935	706	149	4,392,819	188,031	$6,581,085	4,393,426	$3,157,775
1936	661	119	6,584,138	286,370	10,022,950	5,068,786	3,925,775
1937	682	117	7,565,466	281,332	9,846,620	4,864,750	3,762,884
1938	795	130	5,880,021	296,434	10,375,190	4,355,471	2,815,658
1939	891	104	6,894,999	361,518	12,653,130	4,316,029	2,929,668
1859–1939[2]			(3)	24,025,110	519,440,526	569,700,164	526,451,794

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1935	74,266,000	$6,164,078	25,352,000	$1,014,080	31,072,000	$1,367,168	$18,284,186
1936	141,392,000	13,008,064	21,424,000	985,504	26,954,000	1,347,700	29,289,993
1937	149,206,000	18,053,926	18,694,000	1,102,946	28,472,000	1,850,680	34,617,056
1938	92,338,000	9,049,124	9,358,000	430,468	17,888,000	858,624	23,529,064
1939	133,194,000	13,852,176	8,472,000	398,184	12,456,000	647,712	30,480,870
1859–1939[2]	[4] 1,308,129	384,140,922	[4] 499,837	53,261,461	[4] 231,877	31,702,976	1,514,997,679

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] Compiled by Chas. W. Henderson, supervising engineer, field offices, Denver, Colo. From 1904 (when first satisfactory annual canvass of mine production was made) to 1939, inclusive, the output was as follows: Gold, 12,198,233.51 ounces, valued at $274,957,293; silver, 281,287,315 ounces, $189,293,571; copper, 1,306,203 short tons, $383,494,294; lead, 262,046 short tons, $30,624,899; zinc, 231,877 short tons, $31,702,976; total value, $910,073,033.

[3] Figures not available.

[4] Short tons.

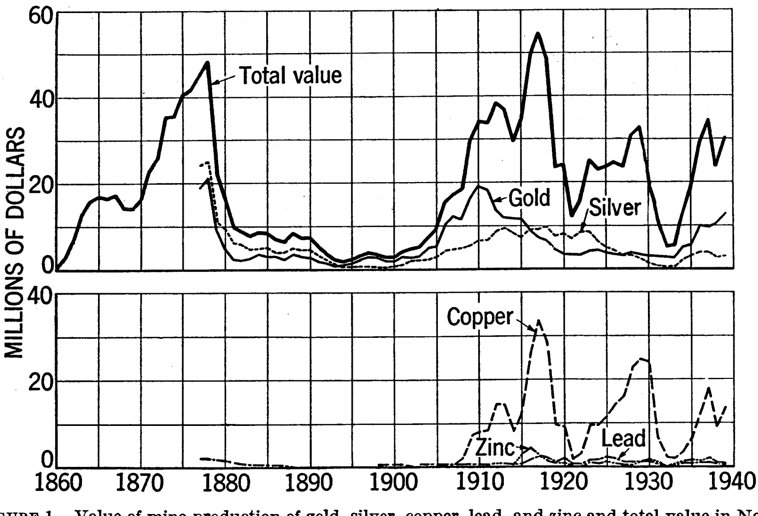

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Nevada, 1860–1939.

Gold.—Almost three-fourths of the recoverable gold output of Nevada in 1939 was derived from dry ores, chiefly gold ore, and virtually all the gold from base-metal ores came from copper ore. Placer gold comprised 9 percent of the State total, and the output was more than twice that in 1938. Five companies produced 47 percent of the State total gold, and the 10 leading mines, listed in the following table, supplied 56 percent.

Ten leading gold-producing mines in Nevada in 1939, in order of output

Rank	Mine	District	County	Rank in 1938	Operator	Source of gold
1	Getchell	Potosi	Humboldt	3	Getchell Mine, Inc	Gold ore.
2	Emma Nevada	Robinson	White Pine	2	Consolidated Coppermines Corporation and lessees.	Copper ore.
3	Mary	Silver Peak	Esmeralda	1	Black Mammoth Consolidated Mining Co. and Prescott Lease.	Gold ore.
4	Ruth and Copper Flat Pit.	Robinson	White Pine	4	Nevada Consolidated Copper Corporation.	Copper ore.
5	Manhattan dredge	Manhattan	Nye	(1)	Manhattan Gold Dredging Co.	Dredge.
6	Chiquita	Yellow Pine	Clark	7	Chiquita Mining Co., Ltd	Gold ore.

8	Penelas	Phonolite	Nye	9	Penelas Mining Co	Do.
9	Emma E	Cortez	Eureka	16	Greenan & Co., Inc	Do.
10	Silver Hill	Comstock	Storey	14	Silver Hill Mining Co	Do.

1 Operation began November 15, 1938; no regular clean-up made until 1939.

Silver.—The 10 leading silver-producing mines in Nevada in 1939, listed in the following table, produced 54 percent of the State total recoverable silver; the first 3 yielded more than one-third of the total. As in preceding years, most of the silver output was a byproduct of ore mined chiefly for other metals.

Ten leading silver-producing mines in Nevada in 1939, in order of output

Rank	Mine	District	County	Rank in 1938	Operator	Source of silver
1	Nivloc	Silver Peak	Esmeralda	1	Desert Silver, Inc	Silver ore.
2	Mizpah	Tonopah	Nye	2	Lessees of The Tonopah Mining Co. of Nevada.	Gold-silver ore.
3	Pioche Nos. 1 and 2	Pioche	Lincoln	4	Combined Metals Reduction Co.	Zinc-lead ore.

10	Nevada Wonder	Wonder	Churchill	17	Various lessees	Do.

Copper.—Over 98 percent of the recoverable copper output of Nevada in 1939 came from mines operated by the following companies: Nevada Consolidated Copper Corporation, working the Ruth mine at

Ruth and the open pit at Copper Flat (in the Robinson district, White Pine County); the Consolidated Coppermines Corporation, working the Emma Nevada mine at Kimberly (also in the Robinson district); and the Mountain City Copper Co., working the Mountain City mine at Mountain City (in the Cope district, Elko County). During 1938 a curtailment program was in effect at all these mines, but during 1939 output was expanded.

Lead.—Lincoln County produced over three-fourths of the total recoverable lead output of Nevada in 1939, most of which came from the Pioche district. Three-fifths of the State total lead was derived from zinc-lead ore mined at the Pioche Nos. 1 and 2 mines by the Combined Metals Reduction Co., affiliate of the National Lead Co. Small quantities of lead were reported from many districts, including the Jack Rabbit (Lincoln County), Yellow Pine (Clark County), and Delano, Merrimac, and Spruce Mountain (Elko County).

Zinc.—Over nine-tenths of the recoverable zinc output of Nevada in 1939 was produced by the Combined Metals Reduction Co. from zinc-lead ore mined at the Pioche Nos. 1 and 2 mines in the Pioche district of Lincoln County. The Yellow Pine district of Clark County was the only other area in the State that produced a substantial quantity of zinc.

MINING INDUSTRY

Expansion of production at the three large copper mines in Nevada in 1939 resulted in the increased tonnage of ore treated compared with 1938. Increases were as follows: Copper ore, 22 percent; dry ores, 7 percent; and old tailings, 14 percent. Output of zinc-lead ore decreased 29 percent. The connected-bucket dredge of the Manhattan Gold Dredging Co. in the Manhattan district, Nye County, completed its first full year of operation in 1939; the output of this dredge was the principal cause of the 151-percent increase in yield of placer gold in the State in 1939. Quicksilver consumption at placer mines totaled 871 pounds.

ORE CLASSIFICATION

The following table classifying ores produced in Nevada in 1939 shows that nearly 72 percent of the tonnage of ore (including old tailings) sold or treated was copper ore, 22 percent gold ore, 4 percent gold-silver ore, nearly 2 percent silver ore, and the remainder (less than 1 percent) zinc-lead, lead, lead-copper, and zinc ores.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Nevada in 1939, with content in terms of recovered metals

Source	Ore and old tailings treated		Gold	Silver	Copper	Lead	Zinc
	Ore	Old tailings					
	Short tons	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*

Total, 1938	5,334,330	545,691	296,434	4,355,471	92,338,000	9,358,000	17,888,000

METALLURGIC INDUSTRY

Of the 6,894,999 tons of lode material sold or treated in 1939 in Nevada 72 percent was ore sent to concentrating mills, 16 percent was ore sent to amalgamation and cyanidation mills, 9 percent was old tailings sent to amalgamation and cyanidation mills, and 3 percent was ore (including small quantity of old tailings) sent to smelters. The only changes from 1938, aside from a general increase in State total tonnage, was a small gain in the proportion treated in concentrating mills and an attendant loss in the proportion treated in amalgamation and cyanidation mills. In 1939, as in 1938, flotation was employed at concentration mills to the virtual exclusion of gravity concentration. A much larger tonnage of material was cyanided than amalgamated, and cyanidation was used in treating old tailings almost to the exclusion of other methods. Of the gold recovered as bullion, cyanidation accounted for 83 percent and amalgamation 17 percent; of the silver recovered as bullion, 97 percent was derived by cyanidation and 3 percent by amalgamation. The total quantity of crude ore shipped to smelters increased 11 percent over 1938; there was little change in the quantity of dry ores shipped to smelters, but there were substantial increases in copper ore and lead ore. The 500-ton cyanide plant constructed by the

Standard Cyaniding Co. in the Imlay district, Pershing County, was an outstanding addition to the metallurgical equipment of the State; production at this plant began November 7.

Quicksilver consumption in Nevada in 1939 at mills using amalgamation was 5,691 pounds in the recovery of 33,050 ounces of gold and 44,458 ounces of silver from 307,959 tons of material treated.

Data obtained on cyanide consumption in 1939 at Nevada mills are nearly complete. In the treatment of 691,931 tons of the ore and 606,661 tons of the old tailings, 872,668 pounds of 91-percent sodium cyanide and 45,000 pounds of commercial-grade calcium cyanide (50-percent NaCN equivalent) were used, with a recovery of 123,443 ounces of gold and 1,182,347 ounces of silver; in terms of 98-percent NaCN, the consumption was 833,294 pounds, or 0.64 pound per ton of material treated.

Custom mills were operated in various parts of Nevada during 1939. Those of importance were at Silver City, Lyon County; Westgate, Churchill County; Gold Point, Esmeralda County; and Nelson, Clark County. Most of the custom mills obtained part of their mill feed from mines worked by the mill operators. Large quantities of ore and concentrates were shipped out of the State, principally to lead and copper smelters in the Salt Lake Basin. The Bauer (Utah) plant of the Combined Metals Reduction Co. treated all the company zinc-lead ore mined at Pioche, Lincoln County. The McGill copper smelter at McGill in White Pine County, operated by the Nevada Consolidated Copper Corporation, continued in 1939 to be the only smelter and the most important metallurgical plant in the State; the concentrator (18,000 tons daily capacity), operated by the same company, was the largest mill in the State.

Mine production of metals in Nevada in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 9 and their output included under "Combined districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of total silver as follows: 4,305,886 ounces from lode mines and 10,143 ounces from placers.
[4] Eagleville district lies in both Churchill and Mineral Counties.
[5] Output from property not classed as a "mine."
[6] Central and Sawtooth districts lie in both Humboldt and Pershing Counties.
[7] Included under "Combined districts."
[8] Exclusive of lode output, which is included under "Combined districts."
[9] Includes following districts: Desert in Churchill County; Silver Glance in Douglas County; Hornsilver in Esmeralda County; Florence and National in Humboldt County; Talapoosa in Lyon County; Rosebud (lode) in Pershing County; and Granite Range and Stateline Peak, in Washoe County.

CHURCHILL COUNTY [1]

Operation of a custom cyanide mill by the Westgate Mining & Milling Corporation was an important factor in reviving metal production in Churchill County. In 1939 this company handled over 5,000 tons of ore from more than 65 shippers.

Dixie Valley district.—The Comstock-Keystone Mining Co. cyanided old tailings at the Dixie mine during 1939.

Eastgate district.—Gold ore was shipped from the Gold Ledge mine to a custom cyanide plant in 1939.

Fairview district.—Lessees on the Blue Eagle mine in 1939 shipped to a custom cyanide plant 150 tons of gold-silver ore yielding 45 ounces of gold and 1,612 ounces of silver. Lessees shipped lead ore from the Chalk Mountain mine for smelting. Several groups of lessees worked the Nevada Hills mine and shipped ore to a custom cyanide plant and a smelter.

Holy Cross district.—Lessees working the Pyramid Group shipped 29 tons of lead smelting ore in 1939; the ore contained 36 ounces of gold, 9,898 ounces of silver, and 7,302 pounds of lead.

Sand Springs district.—The Summit King Mines Co. purchased the Dan Tucker mine March 1, 1939, and shipped 293 tons of smelting ore containing 198 ounces of gold, 10,291 ounces of silver, and 178 pounds of copper; a 70-ton cyanide plant was under construction at the end of the year.

Wonder district.—The Jack Pot mine was worked by a lessee from January 1 to April 30, 1939; 27 tons of silver ore shipped to a custom cyanide plant yielded 2 ounces of gold and 575 ounces of silver, and 42 tons shipped to a smelter yielded 5 ounces of gold and 1,749 ounces of silver. The Nevada Wonder mine, largest producer of gold and silver in Churchill County in 1939, was operated by lessees. E. S. Price worked the Queens and July No. 1 claims from April 1 to August 30; 52 tons of ore shipped to a custom cyanide plant contained 4 ounces of gold and 819 ounces of silver, and 57 tons shipped to a smelter contained 4 ounces of gold and 1,871 ounces of silver.

CLARK COUNTY [2]

Crescent district.—Lessees of the Paden mine in 1939 shipped to a smelter 129 tons of ore which contained 11 ounces of gold, 5,427 ounces of silver, and 4,636 pounds of lead.

Eldorado Canyon district.—The Diamond Gold Mining Co. worked the Jubilee and Techatticup mines throughout 1939; most of the ore was treated in the company 70-ton flotation mill, but small shipments were made to a custom cyanide mill and a smelter. The Oro Plata mine was active. The El Dorado Rover Mining Co. operated the Rand, Bell, and Rover groups and also treated some custom ore in its 100-ton cyanide plant; 27,375 tons of company ore yielded 4,560 ounces of gold and 93,492 ounces of silver. W. W. Hartman operated the Wall Street mine throughout the year; the ore was treated in a 50-ton amalgamation and flotation mill on the property.

Gold Butte district.—The Lakeshore Gold Mining Co. worked the Utah mine in 1939.

[2] *See also* Vanderburg, William O., Reconnaissance of Mining Districts in Clark County, Nev.: Bureau of Mines Inf. Circ. 6964, 1937. 81 pp.

Searchlight district.[3]—A lessee on the Duplex mine in 1939 shipped 29 tons of smelting ore which contained 147 ounces of gold, 92 ounces of silver, 1,098 pounds of copper, and 2,746 pounds of lead. The Calumet Gold Mines Co. worked the Quartette mine from January 1 to November 1; several small-scale lessees were also reported as active on the property.

Yellow Pine district.—The Chiquita Mining Co., Ltd., operated the Chiquita mine throughout 1939 and treated 31,604 tons of ore in the company 100-ton cyanide mill; slimes were cyanided, and concentrates removed by jigging were tabled and amalgamated; and recovery was as follows: By amalgamation, 1,050 ounces of gold and 83 ounces of silver; by cyanidation, 5,806 ounces of gold and 311 ounces of silver; and in concentrates, a content of 161 ounces of gold, 18 ounces of silver, and 539 pounds of copper. The Barefoot Lease operated the Keystone-Barefoot mine throughout the year; 7,908 tons of ore were treated in a 40-ton amalgamation-flotation mill and yielded 1,215 ounces of gold and 123 ounces of silver as bullion and 349 tons of concentrates containing 2,033 ounces of gold, 167 ounces of silver, 2,429 pounds of copper, and 174 pounds of lead; and a small quantity of crude ore was shipped to a smelter. Lead ore and zinc-lead ore were shipped from the Milford No. 2 mine. Lessees shipped zinc-lead ore from the Root Zinc mine. The Yellow Pine Lease worked the Yellow Pine mine from February 8 to December 31; shipments totaled 209 tons of lead-copper ore and 722 tons of zinc-lead ore with a metal content of 3 ounces of gold, 1,946 ounces of silver, 24,722 pounds of copper, 277,792 pounds of lead, and 494,785 pounds of zinc.

ELKO COUNTY

Centennial district.—The Bull Run mine was productive in 1939.

Cope district.—The Mountain City Copper Co., third-largest producer of copper in Nevada, was active throughout 1939. Part of the ore was treated in the company 450-ton flotation mill, and high-grade ore was shipped for direct smelting. The Protection mine was operated from April 1 to the end of the year; 530 tons of ore shipped to a smelter contained 49 ounces of gold and 7,801 ounces of silver, and 414 tons of old tailings cyanided yielded 11 ounces of gold and 1,329 ounces of silver.

Cornucopia district.—The Par Mining Co. shipped to a smelter 1,956 tons of old tailings containing 220 ounces of gold and 15,655 ounces of silver.

Delano district.—During 1939 a lessee and a sublessee shipped from the Cleveland mine to a smelter 134 tons of lead ore containing 4,915 ounces of silver, 474 pounds of copper, 49,375 pounds of lead, and 1,277 pounds of zinc. The Delno Mining & Milling Co. shipped lead ore from the Net Group.

Gold Circle district.—The Esmeralda Gold Mines, Ltd., operated the Esmeralda mine approximately 10 months of 1939 and treated the ore in a 30-ton cyanide mill on the property. The Gold & Silver Circle Mines, Inc., and lessees worked the Gold Circle Group during

[3] *See also* Callaghan, Eugene, Geology of the Searchlight District, Clark County, Nev.: U. S. Geol. Survey Bull. 906–D, 1939, pp. 135–188.

the year. Lessees on the Queen mine treated 425 tons of ore by amalgamation to recover 120 ounces of gold and 69 ounces of silver.

Jarbidge district.—The Kookaburra mine was worked between April 6 and November 1, 1939.

Lime Mountain district.—The Lime Mountain Consolidated worked the Lime Mountain mine throughout 1939 and shipped to a smelter 3,358 tons of ore containing 1,258 ounces of gold, 4,102 ounces of silver, and 107,427 pounds of copper.

Mardis district.—During 1939 a lessee shipped gold ore to a smelter from the Virginia mine.

Merrimac district.—The Rip Van Winkle Mining Co. made a number of shipments of silver ore containing lead and zinc during 1939.

Railroad district.—A lessee shipped copper ore from the Sweepstakes mine in 1939.

ESMERALDA COUNTY

Divide district.—The Tonopah Divide Mining Co. operated the Tonopah Divide mine in 1939 on the leasing system; smelter shipments totaled 685 tons of ore containing 560 ounces of gold and 19,292 ounces of silver.

Goldfield district.—Lessees worked the Combination Fraction throughout 1939 and shipped their output to smelters. The Goldfield Deep Mines Co. leased its Florence claims; smelter shipments totaled 512 tons of ore containing 3,001 ounces of gold, 230 ounces of silver, and 2,265 pounds of copper. The Goldfield Consolidated Mines Co. operated underground on the leasing system throughout the year. The company tailings pile was worked from March 1 to December 16 by the Bradshaw Syndicate, Inc.; 379,000 tons of old tailings hydraulicked and pumped to a 1,400-ton cyanide plant yielded 4,248 ounces of gold and 3,790 ounces of silver.

Hornsilver district.—The Gold Bug mine was operated under lease to McCarty and Wilson from January to June 1, 1939, when the lease was turned over to the Nevada Minnesota Mining Co.; 324 tons of ore treated in the neighboring Ohio Mines Corporation cyanide mill yielded 113 ounces of gold and 165 ounces of silver, and 98 tons of smelting ore contained 87 ounces of gold, 154 ounces of silver, and 2,163 pounds of lead. The Ohio Mines Corporation worked the Ohio mine throughout the year.

Lone Mountain district.—The Weepah Nevada Mining Co. suspended operations in 1939 after cyaniding 32,277 tons of old tailings, from which 1,773 ounces of gold and 4,560 ounces of silver were recovered as bullion.

Silver Peak district.—E. L. Cord (Prescott lease) and the Black Mammoth Consolidated Mining Co. worked the Mary mine throughout 1939. The lease operated a 350-ton flotation and cyanide sand-leaching plant, and the company operated a 150-ton all-slime cyanide plant. Desert Silver, Inc., operated a 200-ton cyanide plant at the Nivloc mine throughout the year; 70,403 tons of ore yielded 3,507 ounces of gold and 833,234 ounces of silver. This property was the largest silver producer in the State in both 1939 and 1938. The Oro Monte mine (Gold Wedge Divide Mining Co.) and the Sentinel mine were productive.

EUREKA COUNTY [4]

Buckhorn district.—In 1939 a lessee shipped gold ore to a smelter from the Buckhorn mine.

Cortez district.—The Cortez Metals Co. shipped silver ore to a smelter from the Cortez mine during 1939. Greenan & Co., Inc., operated the Emma E mine and mill in the Mill Canyon section of the Cortez district throughout the year and treated 12,220 tons of ore in a 35-ton cyanide plant to recover 5,957 ounces of gold and 1,618 ounces of silver as bullion. Gold ore was shipped to a smelter from the Ventura mine.

Diamond district.—The Silver Ledge Mines, Inc., shipped silver ore to a smelter from the Wynona mine in 1939.

Eureka district.—In 1939 the Eureka Corporation, Ltd., shipped gold-silver ore to a smelter from the Cyanide Group and gold ore from the Oswego and Richmond-Eureka mines. The Eureka Prospect Co. operated the Diamond Excelsior mine on the leasing system throughout the year and shipped gold-silver ore to a smelter. Cardinalli & Frank, lessees of the Eureka-Croesus mine, shipped lead ore to a smelter.

Lynn district.—Gold ore was shipped to a smelter from the Lynn Big Six mine in 1939. A number of productive small-scale placer operations were reported.

Safford district.—The Modarelli Mining Co. operated the Morning Glory mine in Safford Canyon 7 miles west of Palisade from January 15 to October 15, 1939, and shipped silver ore to a smelter.

HUMBOLDT COUNTY [5]

Awakening (Slumbering Hills) district.[6]—Wadley & Hunt, holders of a lease and option on the Jumbo mine in 1939, ceased operations August 30; the property reverted to the Austin Bros. Gold Mining Co., which resumed operations later in the year. The Morning mine was active during 1939.

Barrett Springs district.—The West Coast Mines Co. shipped gold-silver ore from the Pansy Lee mine to a smelter in 1939.

National district.—The P. H. O'Neil Corporation worked the National mine under the leasing system throughout 1939.

Potosi district.—Getchell Mine, Inc., operated the Getchell mine throughout 1939; this property, which has been in production only since March 1, 1938, attained first place in 1939 among Nevada gold producers. Oxidized ore was treated by agitation of slimes and leaching of sands in the company 700-ton cyanide plant; sulfide ore containing a large percentage of arsenic was roasted and treated in the cyanide slime plant. During the year the company paid $570,000 in dividends, bringing the total dividend disbursements during less than 2 years of production to $720,000.

Rebel Creek district.—The Ohio Eagle Mines Co. shipped silver ore in 1939 from the Ohio mine for smelting.

Warm Springs district.—The Curley Luck Gold Corporation operated the Ashdown mine throughout 1939; ore was treated in the com-

[4] *See also* Vanderburg, William O., Reconnaissance of Mining Districts in Eureka County, Nev.: Bureau of Mines Inf. Circ. 7022, 1938, 66 pp.

[5] *See also* Vanderburg, William O., Reconnaissance of Mining Districts in Humboldt County, Nev.: Bureau of Mines Inf. Circ. 6995, 1938, 54 pp.

[6] *See also* Calkins, Frank C., Gold Deposits of Slumbering Hills, Nev.: Univ. Nevada Bull., vol. 32, No. 3, 1938, 26 pp.

pany 30-ton amalgamation and concentration mill. The Homer Verne Mining Co. operated the Homer Verne mine in the Boyd Basin section of the Warm Springs district a few months; 1,075 tons of ore were treated in a 40-ton stamp mill, and 385 ounces of gold and 122 ounces of silver were recovered as bullion.

LANDER COUNTY [7]

Battle Mountain district.—In 1939, as in former years, lessees at the numerous small mines in the Battle Mountain district produced most of the ore shipped to smelters. The Copper Canyon Mining Co., which operated mines of the Copper Canyon group and Copper Basin group, was the leading producer in the district; part of its property was operated on company account and part through lessees; in all, 7,356 tons of copper ore containing 1,705 ounces of gold, 14,869 ounces of silver, and 805,199 pounds of copper were shipped to smelters. A lessee operated the Gold Cash mine from February to the end of the year and shipped to a smelter 1,046 tons of ore containing 300 ounces of gold and 431 ounces of silver. Reid & Reid operated the Honeycomb group under lease from the Buffalo Valley Mines Co. continuously in 1939, and the gold ore produced was shipped to a smelter. A group of lessees on the San Miguel (Iron Canyon claim) mine shipped 4,015 tons of ore containing 2,304 ounces of gold, 8,659 ounces of silver, 9,729 pounds of copper, and 36,055 pounds of lead. Between August 1 and December 3 a group of lessees on the Silver King mine shipped to a smelter 172 tons of ore containing 115 ounces of gold and 691 ounces of silver. Other active lode mines in the district included the Bailey Day, Big Bertha, Big Florence, Billie Day, Blue Eagle, Buena Vista, Buzzard, Cleveland, Good Chance, Independence, Jake, Plumas, and Ridge. F. C. Madsen worked the Box Canyon Placers property (Pay Day, Gold Eagle, and Duckey claims) with a dry concentrator; 3,545 cubic yards of gravel yielded 112 ounces of gold and 12 ounces of silver. J. O. Greenan recovered 386 ounces of gold and 51 ounces of silver while testing the Dahl placers. During the first 2 weeks of the year Chase & Caldwell produced 120 ounces of gold from 1,300 cubic yards of old tailings and 360 cubic yards of virgin gravel obtained in drift mining. On November 28 the property was leased to the Natomas Co., a leading connected-bucket dredge operator of California.

Bullion district.—The treatment of 10,500 tons of ore by cyanidation at the Goldacres property in 1939 resulted in the production of 1,717 ounces of gold and 151 ounces of silver; the ore was crushed to minus-2-inch size and given a cyanide leach in a 35-ton plant. The Gray Eagle Mining Co. operated the Gray Eagle mine; part of the ore was treated in the company concentrator, and part was shipped crude to a smelter. The Little Gem Mining Co. worked the Little Gem mine; ore was treated in the company flotation plant, and small lots of copper ore were shipped for direct smelting. The Mill Gulch Placer Mining Co. operated a dragline dredge on the Blue Sky No. 8 and Yellow Streak claims in the Camp Raleigh section of the Bullion district from January 1 to April 3; the dragline excavator used Diesel power and had a 1¾-cubic yard bucket. Before operations were sus-

[7] *See also* Vanderburg, William O., Reconnaissance of Mining Districts in Lander County, Nev.: Bureau of Mines Inf. Circ. 7043, 1939, 83 pp.

pended, 101,382 cubic yards of gravel had been treated to yield 800 ounces of gold and 93 ounces of silver.

Gold Basin district.—Gold ore was shipped to a custom cyanide plant from the Farnsworth, Gold Annie and Greenback Gold, Gold Park, and May-be-so properties during 1939.

Kingston district.—A lessee operated the Kingston mine from January 5 to December 5, 1939; 637 tons of smelting ore contained 228 ounces of gold and 1,201 ounces of silver.

New Pass district.—Smith and Snyder treated by amalgamation 276 tons of ore from the Thomas W. mine in 1939 and recovered 130 ounces of gold and 22 ounces of silver.

LINCOLN COUNTY

Caliente district.—Lessees working the Caliente Cobalt mine in 1939 shipped to a smelter 156 tons of ore containing 169 ounces of gold, 1,339 ounces of silver, 314 pounds of copper, and 3,748 pounds of lead.

Comet district.—The Prince Consolidated Mining Co. operated the Prince mine on the leasing system throughout 1939, and ore and old tailings were shipped to a smelter.

Eagle Valley district.—The Andesite Mining Co. shipped gold ore to a smelter during 1939.

Ferguson (Delamar) district.[8]—The Caliente Cyaniding Co. operated a 500-ton all-slime cyanide plant on Delamar old tailings during 1939 and treated 168,966 tons to recover 3,798 ounces of gold and 16,216 ounces of silver. Lessees shipped gold ore from the Delamar Exploration Co. property.

Jack Rabbit district.—The Bristol Silver Mines Co., leading operator in the Jack Rabbit district during 1939, shipped a large tonnage of silver ore to a smelter.

Pioche district.[9]—From the Apex mine in 1939 W. A. Free & Sons shipped to a smelter 1,707 tons of lead ore containing 178 ounces of gold, 95,390 ounces of silver, 1,650 pounds of copper, and 901,218 pounds of lead. The Hodges Cook Mercantile Co. shipped 853 tons of lead smelting ore from the Highland King mine; the ore contained 151 ounces of gold, 6,286 ounces of silver, 2,565 pounds of copper, and 143,982 pounds of lead. The Combined Metals Reduction Co., affiliate of the National Lead Co., worked the Pioche Nos. 1 and 2 mines throughout the year and was the largest producer of both lead and zinc in the State. Virtually all the ore was shipped to the company 600-ton selective-flotation mill at Bauer, Utah, where gold (iron) concentrate, lead concentrate, and zinc concentrate were made.

LYON COUNTY

Silver City district.[10]—Lessees operated the Buckeye mine in 1939 and shipped the ore to amalgamation and cyanidation custom mills. The Dayton Consolidated Mines Co. operated the Dayton mine throughout the year both on company account and through lessees;

[8] *See also* Callaghan, Eugene, Geology of the Delamar District. Lincoln County, Nev.: Univ. Nevada Bull., vol. 31, No. 5, 1937, 72 pp.

7,914 tons of ore yielded 2,392 ounces of gold and 8,801 ounces of silver by cyanidation. In addition to ore from the Dayton mine, the company treated ore obtained from mines it operated in the Comstock district of Storey County and custom ore from more than 200 shippers. The company mill was an important factor in production at small mines in the Silver City district and in other districts within trucking distance of the plant. Ore mined at the Haywood property was shipped to a custom cyanide mill. Several lessees on the Montezuma property shipped to a custom cyanide mill 390 tons of ore from which 121 ounces of gold and 680 ounces of silver were recovered. Various lessees operated the Oest mine and shipped ore to custom amalgamation and cyanidation mills in the district. Smith and Crow worked the Silver Queen mine and shipped ore to the Trimble custom amalgamation mill. A large number of lessees and sublessees worked the property of South Comstock Gold Mines, Inc.; their product was shipped to custom amalgamation and custom cyanidation mills. Lessees also worked the Sutro dump. A number of lessees shipped gold ore from the Vivian mine to custom amalgamation and custom cyanidation mills. The Dayton Douglas Cyanidation Co. operated its 100-ton cyanide leaching plant from April 1 to December 1 and treated 17,819 tons of old tailings yielding 736 ounces of gold and 9,449 ounces of silver. The Oro Neva Dredging Co. began work with a dragline dredge 1½ miles northwest of Dayton at the end of 1939, using a dragline excavator with a 2½-cubic yard bucket. Contractors Corporation operated a nonfloating washing plant at the Rose mine from September 1 to the end of the year; 49,000 cubic yards of gravel delivered by truck loaded by a 1½-cubic yard power shovel yielded 638 ounces of gold and 310 ounces of silver.

Talapoosa district.—The Talapoosa Tailings Treatment Co. operated a 40-ton cyanide leaching plant in 1939 on old tailings from the Talapoosa mine; a lessee on the property shipped ore to a custom cyanide plant. The Loranger & Myler Lease worked the Virginia Hills property.

MINERAL COUNTY [11]

Aurora district.—The Spring Valley Milling Co. began operating a flotation plant at Aurora May 16, 1939, and worked dump material on a royalty basis the rest of the year; concentrates were shipped to a smelter.

Bell district.—Lessees worked the Olympic (Omco) mine during 1939; 411 tons of ore shipped to a custom cyanide plant yielded 353 ounces of gold and 326 ounces of silver.

Candelaria district.—Shipments of ore from the Georgine, Lucky Hill, Hecla-Climax, Protection, Silver King, and Silver Surprise mines in the Candelaria district during 1939 were reported. Most of the ore went to smelters, but some was sent to custom cyanide plants.

Garfield district.—The New Eldorado Mines Co. shipped crude smelting ore from the Garfield mine in 1939. The West End Consolidated Mines Corporation shipped 188 tons of lead ore to a smelter from the Mabel mine; the ore contained 213 ounces of gold, 20,974 ounces of silver, 2,104 pounds of copper, and 20,968 pounds of lead.

[11] *See also* Vanderburg, William O., Reconnaissance of Mining Districts in Mineral County, Nev.: Bureau of Mines Inf. Circ. 6941, 1937, 79 pp.

Hawthorne district.—Silver ore was shipped to a smelter from the Lucky Boy mine by the Lucky Boy Consolidated Mines Co. in 1939. The Borealis Mines Trust Estate cyanided ore from the Silent Partner mine.

Regent district.—In 1939 lessees worked the Heckla mine and shipped ore to a custom cyanide mill.

Silver Star district.—Production by lessees on the Fortuna mine in 1939 was recorded. Five sets of lessees worked the Mary Ann mine, and most of the ore was shipped to custom cyanide mills.

NYE COUNTY

Athens district.—Ore from the Warrior mine was treated at the Dayton cyanide mill in 1939.

Bullfrog district.—Gold ore was shipped to a smelter from the Polaris mine during 1939. The Senator Stewart mine was operated by lessees from June 1 to the end of the year; 181 tons of ore yielded 198 ounces of gold and 175 ounces of silver when treated by cyanidation at a custom plant.

Ellendale district.—Gold ore from the Ellendale mine was shipped to a smelter during 1939.

Manhattan district.—In 1939 more than 3,000 tons of ore from the Indian Camp and Jumbo group were treated by amalgamation. A lessee worked the property of the Manhattan Consolidated Mines Development Co. from January to December; gold ore was treated by amalgamation and concentration, and the resulting concentrates were shipped to a smelter. Lessees worked the Union No. 2 mine owned by the Nevada Coalition Gold Mines Co. A lessee operated the Sunday mine throughout the year and treated in a 5-ton stamp mill 1,250 tons of ore which yielded 1,216 ounces of gold and 795 ounces of silver. The Reliance Mining Co. operated the Verden mine throughout 1939; in July the property was opened to leasers. The White Caps Gold Mining Co. and lessees mined 2,826 tons of ore at the White Caps mine; 726 tons of ore yielded 67 ounces of gold and 2 ounces of silver by amalgamation, and 2,100 tons of ore shipped to smelters contained 2,345 ounces of gold and 64 ounces of silver. Lessees operated the Arizona No. 3 drift mine from April 4 to the end of the year; 1,408 cubic yards of gravel yielded 159 ounces of gold and 60 ounces of silver. Lessees sluiced gravel from the Little Grey mine between May 1 and the end of the year. The Manhattan Gold Dredging Co., largest producer of placer gold in Nevada in 1939, operated a connected-bucket dredge the entire year.

Northumberland district.—The Northumberland Mining Co. began construction work at the Northumberland mine in April 1939 and production on November 16; ore was mined with a power shovel in an open pit and delivered to the new company 300-ton cyanide plant. A total of 4,029 tons of ore was treated and yielded 540 ounces of gold and 539 ounces of silver.

Phonolite district.—The Penelas Mining Co. worked the Penelas mine throughout 1939; 18,069 tons of ore, yielding 6,347 ounces of gold and 13,883 ounces of silver, were treated in the company 50-ton countercurrent cyanide plant.

Quartz Mountain district.—A lessee shipped lead ore from the San Rafael mine to a smelter during 1939.

Round Mountain district.—Lessees worked the Gold Hill mine from May 15 to November 30, 1939; 1,670 tons of ore treated in a cyanide plant on the property yielded 444 ounces of gold and 1,077 ounces of silver. The Monte Cristo mine was active during the year. Dodge Construction, Inc., operated a stationary washing plant at the Round Mountain mine of the Nevada Porphyry Mining Co. Sluicing was carried on at the Shoshone Fraction property from April 28 to November.

Tonopah district.—The Tonopah Belmont Development Co. operated the Tonopah Belmont mine on the leasing system from January to October 31, 1939, when a fire destroyed the timber in the working shaft and much of the surface equipment. Before the fire, 3,979 tons of ore containing 1,574 ounces of gold and 145,549 ounces of silver had been shipped for smelting. The Tonopah Mining Co. of Nevada worked its property on the leasing system throughout the year; all ore was shipped crude to smelters. The West End Consolidated Mines Corporation operated the West End mine through lessees; 3,072 tons of ore containing 688 ounces of gold and 58,075 ounces of silver were shipped to a smelter.

Tybo district.—R. R. Redenbaugh and E. Vassar shipped 660 tons of silver ore to a smelter from the Ramona mine; the ore contained 13 ounces of gold, 15,441 ounces of silver, 646 pounds of copper, and 9,064 pounds of lead. Lessees on the 2–G mine shipped 2,644 tons of smelting ore which contained 209 ounces of gold and 28,396 ounces of silver. The Dimmick lease working the Tybo mine shipped 2,793 tons of smelting ore containing 228 ounces of gold, 32,445 ounces of silver, and 19,263 pounds of lead.

PERSHING COUNTY [12]

Antelope district.—The Lambert lease worked the North Star claim in the Scossa section of the Antelope district in 1939 and treated 450 tons of ore in a 3-stamp mill equipped with amalgamation plates and table concentrators; 120 ounces of gold and 115 ounces of silver were recovered as bullion, and 11 ounces of gold and 10 ounces of silver were contained in 3 tons of concentrates sold to a smelter.

Central district.—In 1939 lessees at the Keystone mine shipped 370 tons of smelting ore containing 11 ounces of gold, 11,341 ounces of silver, 424 pounds of copper, and 31,638 pounds of lead.

Haystack district.—The Jungo Star Gold Mines Co. worked the Jungo Star mine throughout 1939 and shipped ore to a custom cyanide mill and smelter.

Imlay district.—The Standard Cyaniding Co. built a 500-ton cyanidation plant in 1939 to treat ore mined at the Gold Standard and Lally claims; production from the company open pit was begun November 7.

Rochester district.—The Looney mine was active during 1939.

Rosebud district.—Nelson, Mullen & Webster, Inc., installed a dry-bank plant on the Janke claims and operated from January 4 to November 24, 1939. The Rio Seco Mining Co. operated a dry-land placer plant on the Rio Seco mine from April to the end of the year; 84,603 cubic yards of gravel yielded 728 ounces of gold and 82 ounces of silver. Many small-scale placer miners were active in the Rosebud district.

[12] *See also* Vanderburg, William O., Reconnaissance of Mining Districts in Pershing County, Nev.: Bureau of Mines Inf. Circ. 6902, 1936, 57 pp.

Seven Troughs district.—Several lessees worked the Portland mine in 1939. A group of properties owned by the Nevada State Gold Mines Co. was operated on the leasing system.

Sierra district.—The White Bear Mining Co. worked the Black Hole mine throughout 1939. A lessee treated old tailings at the property in a 20-ton cyanide leaching plant.

STOREY COUNTY

Comstock district.—In 1939 the Adriatic mine was operated by the Adriatic Mining Co. from January 1 to May 18, when operation was turned over to Adriatic Mines, Inc., which continued work until December 16; 5,101 tons of ore were treated by flotation to produce 46 tons of concentrates containing 195 ounces of gold, 1,163 ounces of silver, 1,679 pounds of copper, and 317 pounds of lead. Several lessees on the Chollar-Potosi mine shipped gold-silver ore to a custom cyanidation plant. The Consolidated Virginia Mining Co. worked the Consolidated Virginia mine, both on company account and under lease; gold ore was shipped to a custom cyanidation plant. Sutro Tunnel Coalition, Inc., operated the Crown Point mine during the year; the output of gold-silver ore was treated in the company cyanidation plant. The Hartford mine was worked by the Hartford Mining Co. The Dayton Consolidated Mines Co. worked the Justice mine and shipped the output to the company cyanidation mill at the Dayton mine in Lyon County. The Keystone mine was operated by the Dayton Consolidated Mines Co. and several lessees; 22,278 tons of ore shipped to the Dayton cyanide mill in Lyon County yielded 7,005 ounces of gold and 30,375 ounces of silver. The Storey County Mines, Inc., worked the Overland mine during the first part of 1939; the company was reported in bankruptcy late in the year. The Consolidated Chollar Gould & Savage Mining Co. operated the Overman mine in the Gold Hill section of the Comstock Lode throughout 1939; 96,098 tons of ore treated in the 300-ton flotation-cyanidation plant (remodeled during the year as a 400-ton all-cyanide plant) yielded 5,250 ounces of gold and 129,367 ounces of silver. Sierra Nevada, Ltd., worked the Sierra Nevada mine near the north end of the Lode; ore was treated by amalgamation and flotation, and the resulting concentrates were shipped to a smelter. The Silver Hill mine was operated by the Silver Hill Mining Co.

WASHOE COUNTY

Granite Range district.—The Burm Ball Mining Co. began production from the Mountain View mine January 26, 1939, and continued operations until the end of the year.

White Horse district.—The Renegade mine was worked throughout 1939. Lessees operated the Texas No. 2 mine and treated 67 tons of ore which yielded amalgam containing 115 ounces of gold and 45 ounces of silver.

WHITE PINE COUNTY

Cherry Creek district.—During 1939 shipments of 1,007 tons of old tailings from the Cherry Creek district to the McGill smelter to be used as siliceous flux contained 75 ounces of gold and 4,936 ounces of silver. The Egan mine was operated on the leasing system; 3,037 tons of ore shipped to a smelter contained 545 ounces of gold and 22,554 ounces of silver. Silver ore was shipped to a smelter from the

Exchequer mine. The Nevada Standard Mining Corporation shipped gold-silver ore to a smelter. Gold-silver ore was shipped by lessees from the Mary Ann mine.

Granite district.—Lessees shipped gold ore to a smelter from the Stinson mine during 1939.

Osceola district.—The Gilded Age Mining Co. worked the Gilded Age mine in 1939. The Golden Eagle Leasing Co. and another lessee shipped gold ore from the Golden Eagle mine to a smelter. Venture Gold Syndicate carried on a development campaign at the Lassie Jean mine and built a 15-ton amalgamation-concentration mill during the year. Placers Recovery Co. hydraulicked gravel at the Ghost Walk and Transit mines.

Robinson district.—The Chainman Leasing Co. shipped 9,691 tons of smelting ore from the Chainman mine during 1939; contents were 1,009 ounces of gold and 19,629 ounces of silver. The Consolidated Coppermines Corporation, second-largest copper producer in Nevada in 1939, was active the entire year. Copper ore mined on company account was shipped to McGill for concentration and smelting; siliceous ore was produced and shipped by lessees. During the year the company developed plans for building its own concentrator, but after negotiations with the Kennecott Copper Corporation a contract was signed to continue shipping ore to the McGill concentrator. Terms of the new contract reduced the basic charges for freight and milling 8 cents a ton beginning October 1, 1940, and raised the maximum daily tonnage to be treated from 6,000 to 9,000 tons. The contract runs until December 31, 1975, but contains clauses to permit its earlier termination. According to the company printed annual report for the year ended December 31, 1939, 2,327,922 tons of ore were produced, which yielded on the basis of smelter settlements 47,690,894 pounds of copper, 26,374 ounces of gold, 89,264 ounces of silver, 26,786 pounds of lead, and 84,164 pounds of zinc. Copper ore was mined by the company and shipped to the McGill concentrator; siliceous ores were mined by lessees and sent to the McGill smelter; and small outputs of lead and zinc ores were shipped to other smelters. Gold-silver ore was shipped from the Hayes mine. Shipments of 2,312 tons of ore from the Jupiter mine to a smelter contained 373 ounces of gold and 1,233 ounces of silver. A lessee on the Matilda claim shipped 1,356 tons of smelting ore which contained 318 ounces of gold and 1,898 ounces of silver. Silver ore was shipped from the Midnight mine. Gold ore was shipped to a smelter from the Revenue property. The Nevada Consolidated Copper Corporation, operating subsidiary of the Kennecott Copper Corporation and largest industrial company in Nevada, worked the Ruth mine at Ruth and the open pit at Copper Flat throughout the year; it handled more ore and produced more copper than any other operation in the State. In addition to its mining activities, the company operated the McGill copper smelter (only smelter in the State) and the McGill flotation concentrator (18,000 tons daily capacity); both of these plants did some custom work. The smelter operated 263 days and the concentrator 293 days during the year. A lessee operated the Saxton claim from April through December and shipped gold ore to a smelter. Lessees shipped 1,016 tons of smelting ore from the Turkoy (Nevada Consolidated Copper Corporation property) mine 2 miles north of Ruth; contents were 219 ounces of gold and 910 ounces of silver.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEW MEXICO

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

SUMMARY OUTLINE

The mine output of recoverable gold, silver, copper, lead, and zinc in New Mexico in 1939 surpassed in total value that in each year since 1929; the increase over 1938 was $5,928,753, or 63 percent. Copper, the bulk of which came from the Chino open-pit mine at Santa Rita, Grant County, showed the largest relative gain in both quantity and value, and its value represented 62 percent of the total for the five metals. Gold was the only one of these metals to show a decrease from 1938. Zinc production in the Central district, Grant County, increased materially and more than offset the decrease in San Miguel County caused by the closing on May 31 of the Pecos mine, which during the preceding 12 years and 5 months was the largest producer of zinc, lead, gold, and silver in New Mexico and a substantial producer of copper. Mining operations in most of the other principal mining districts of the State continued at a rate of output equal to or higher than in 1938.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4].646+	.098	.046	.048
1939	35.00	[5].678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.

The following table shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc, and their annual output of ore and metals from 1935 to 1939; also the total production from 1848 to 1939. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent records year by year may be found in annual issues of Mineral Resources and Minerals Yearbook.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1935–39, and total, 1848–1939, in terms of recovered metals

Year	Mines producing: Lode	Mines producing: Placer	Ore (short tons)	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value
1935	150	234	440,799	33,435	$1,170,225	1,061,902	$763,242
1936	136	169	514,966	33,037	1,156,295	1,163,255	900,941
1937	159	160	4,191,092	41,171	1,440,985	1,243,766	962,053
1938	166	164	2,414,857	43,050	1,506,750	1,229,860	795,061
1939	214	168	4,977,375	36,979	1,294,265	1,400,878	950,899
1848–1939	--------	--------	(1)	2,084,992	46,308,913	62,540,420	49,204,495

Year	Copper: Pounds	Copper: Value	Lead: Pounds	Lead: Value	Zinc: Pounds	Zinc: Value	Total value
1935	4,505,000	$373,915	14,578,000	$583,120	44,252,000	$1,947,088	$4,837,590
1936	6,332,000	582,544	13,252,000	609,592	41,336,000	2,066,800	5,316,172
1937	64,106,000	7,756,826	13,024,000	768,416	47,854,000	3,110,510	14,038,790

[1] Figures not available. [2] Short tons.

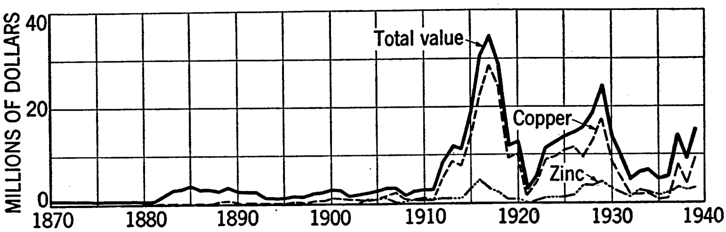

FIGURE 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1939. The value of gold, silver, and lead produced annually has been relatively small.

Gold and silver produced at placer mines in New Mexico, 1935–39, in terms of recovered metals

Year	Gold: Fine ounces	Gold: Value	Silver: Fine ounces	Silver: Value	Total value	Year	Gold: Fine ounces	Gold: Value	Silver: Fine ounces	Silver: Value	Total value
1935	3,554	$124,404	302	$217	$124,621	1938	2,626	$91,910	167	$108	$92,018
1936	3,378	118,230	235	182	118,412	1939	3,474	121,590	209	142	121,732
1937	3,027	105,945	203	157	106,102						

Gold.—The principal gold-producing districts in New Mexico in 1939 were: Mogollon, Catron County, which contributed 21 percent of the State total recoverable output of gold; Willow Creek (Pecos mine), San Miguel County, 15 percent; Central, Grant County, 13 percent; Steeple Rock, Grant County, 12 percent; Lordsburg, Hidalgo County, 11 percent; Las Animas, Sierra County (mostly from placers), 8 percent; and Mount Baldy, Colfax County, 8 percent. The most important gold-mining districts of the State are described in Information Circular 6987, issued by the Bureau of Mines.[1] Dry and siliceous ores yielded 48 percent of the State total gold in 1939; copper ore nearly 26 percent; zinc-lead ore 16 percent; and placers, together with a small quantity from lead, zinc, and lead-copper ores, slightly more than 10 percent.

Silver.—The mine production of recoverable silver in New Mexico in 1939 (the largest since 1916) was 14 percent above that in 1938. The Central district contributed 30 percent of the State total silver, Mogollon 27 percent, Steeple Rock 17 percent, Willow Creek 12 percent, and Lordsburg 9 percent. Dry and siliceous ores yielded 48 percent of the total silver; copper ore 27 percent; zinc-lead ore 22 percent; and zinc, lead-copper, and lead ores, together with a small quantity of silver from placers, 3 percent.

Copper.—Copper production in New Mexico in 1939 increased 126 percent in quantity and 140 percent in value over 1938. The opening of the new Chino copper smelter of the Nevada Consolidated Copper Corporation at Hurley on May 2 was an outstanding event, as the State had been without a smelting industry for many years. The smelter treated concentrates from the adjacent 17,500-ton Chino concentrator, operated on ore from the Nevada Consolidated open pits at Santa Rita which produced most of the State copper. The company smelter also treated siliceous mixed copper sulfide and oxide ores from its own ore bodies, as well as copper precipitates from mine waters. The only other important producers of copper in the State during the year were the Banner Mining Co., producing copper-gold-silver ore from the Bonney mine near Lordsburg, and the American Smelting & Refining Co., operating the Ground Hog group near Hanover and producing zinc-lead-silver ore and copper-lead-silver ore. Copper ore and mine-water precipitates yielded 98 percent of the total copper and zinc-lead ore nearly 2 percent.

Lead.—Although the Pecos mine (which produced 86 percent of the total lead output from New Mexico in 1938) was operated only 5 months in 1939, other lead-producing mines in the State, among which the largest was the Ground Hog near Hanover in Grant County, made an increased production, and the State total output of recoverable lead increased 9 percent in quantity over 1938. Zinc-lead ore yielded 74 percent of the total lead, copper ore 14 percent, lead ore 4 percent, and other types of ore 8 percent.

Zinc.—The output of recoverable zinc from mines in New Mexico increased 4 percent in quantity in 1939 over 1938. A substantial increase in production in the Central district, Grant County, which resulted in part from the resumption of mining at the Ground Hog group, more than offset the decrease in San Miguel County caused by the closing of the Pecos mine. The other principal producers of zinc

[1] Metzger, O. H., Gold Mining in New Mexico: Bureau of Mines Inf. Circ. 6987, 1938, 71 pp.

in the State were the Empire Zinc Co. Hanover group and the Pewabic group, both in the Central district. Zinc-lead sulfide ore was shipped from several mines in Grant and Socorro Counties to the Ozark pigment plant at Coffeyville, Kans.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1939, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Catron	12		7,708	$269,780	381,013	$258,627
Colfax	7	5	2,800	98,000	1,196	812
Dona Ana	8		70	2,450	392	266
Eddy	1				3	2
Grant	81	42	10,369	362,915	671,045	455,497
Hidalgo	35		4,406	154,210	135,982	92,303

[1] Dragline and power-shovel excavators with sluices or special amalgamators.

MINING INDUSTRY

The output of ore from mines in New Mexico producing gold, silver, copper, lead, and zinc totaled 4,977,375 tons in 1939, the largest in any year on record and 2,562,518 tons more than in 1938. Most of the ore in 1939, as in 1938, was copper ore mined with power shovels from the Chino open-pit mine of the Nevada Consolidated Copper Corporation at Santa Rita, Grant County. Underground mining was done at the other principal mines of the State, comprising, in order of output and by types of ore, the Empire Zinc Co. Hanover group and the Pewabic group in Grant County (Central district), producing zinc ore; the Bonney mine in Hidalgo County, copper-gold-silver ore; the Ground Hog group in Grant County (Central district), zinc-lead-copper-silver ore; the Pecos mine in San Miguel County, zinc-lead-copper-gold-silver ore; and the Black Hawk Consolidated Mines Co. (Mogollon Operations) in Catron County, the Aztec mine in Colfax County, and the East Camp group in Grant County (Steeple Rock district), siliceous gold-silver ores.

In yardage handled at placer mines the John I. Hallett Construction Co. in the Hillsboro district, Sierra County, ranked first and was followed by the Universal Placer Mining Corporation near Cerrillos, Santa Fe County; William Little in the Pittsburg district, Sierra County; and the Bear Creek Mining Co. (including yardage handled by the Ryan Mining Corporation, initial operator on the property) and the Texas Placer Co., both in the Pinos Altos district, Grant County. These operators handled 535,462 cubic yards of gravel with draglines and land washing plants and recovered 84 percent of the State total placer gold.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in New Mexico in 1939, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	33,278	5,699	15,897	79,322	33,676	
Dry and siliceous gold-silver ore	77,455	12,176	643,670	22,657	254,407	
Dry and siliceous silver ore	469	10	8,012	4,601	8,881	
	111,202	17,885	667,579	106,580	296,964	
Copper ore	4,517,429	9,426	381,875	[1]90,272,599	1,465,208	
Lead ore	1,431	319	7,461	4,652	400,555	
Lead-copper ore	1,102	11	8,503	64,062	235,482	
Zinc ore	217,517	55	27,298	220,825	378,500	41,450,000
Zinc-lead ore	128,694	5,809	307,953	1,615,282	8,007,291	17,262,000
	4,866,173	15,620	733,090	[1]92,177,420	10,487,036	58,712,000
Total, lode mines	4,977,375	33,505	1,400,669	[1]92,284,000	10,784,000	58,712,000
Total, placers		3,474	209			
	4,977,375	36,979	1,400,878	[1]92,284,000	10,784,000	58,712,000
Total, 1938	2,414,857	43,050	1,229,860	40,878,000	9,898,000	56,472,000

[1] Includes 3,237,257 pounds of copper recovered from mine-water precipitates.

METALLURGIC INDUSTRY

The following six flotation mills treated 96 percent of the total New Mexico output of ore in 1939: Chino at Hurley, Empire Zinc at Hanover, Banner near Lordsburg, Peru near Deming, Pecos in San Miguel County, and Combination near Hanover. Two percent was treated by the Little Fanney cyanidation mill at Mogollon, the Aztec amalgamation-flotation mill in Colfax County, and scattered small concentration and amalgamation mills; and 2 percent was shipped crude to smelters outside the State. The Chino concentrates produced after March 22 were treated in the new Chino smelter at Hurley; the remainder of the concentrates produced in the State were shipped to smelters in other States, mentioned in the following review by counties and districts.

Mine production of metals in New Mexico in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	24,703	658	179			
Ore cyanided [1]	63,750	7,647	377,816			
Concentrates smelted	215,947	16,614	519,616	[2] 88,074,425	7,798,121	57.178,000
Ore smelted	87,020	8,586	503,058	4,209,575	2,985,879	1,534,000
Placer		3,474	209			
		36,979	1,400,878	92,284,000	10,784,000	58,712,000
Total, 1938		43,050	1,229,860	40,878,000	9,898,000	56,472,000

[1] Cyanide used was approximately 192,800 pounds of Aero Brand calcium cyanide, approximately 48 to 49 percent NaCN.
[2] Includes 3,237,257 pounds of copper recovered from smelting of mine-water precipitates.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in New Mexico in 1939, by counties, in terms of recovered metals

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal

[1] District lies in both Grant and Hidalgo Counties.

CATRON COUNTY

Mogollon district.—In 1939 the Black Hawk Consolidated Mines Co. operated continuously the Consolidated group (comprising the Andrew Jackson Consolidated, Lexington Contention, and Lexington Gunboat claims on the Queen vein) and the Little Fanney 200-ton cyanide mill, both under lease from the Lehigh Metals Co. This group was the largest single producer of gold and silver in the State during the year. The mill treated 55,137 tons of ore and 1,075 tons of old tailings on company account and 5,028 tons of custom ore, of which the bulk came from the Maud S, Last Chance, Little Fanney, and Pacific groups, all worked by lessees. The rest of the custom ore came from the Bearup, Champion, Hardscrabble, Joy, and Oakton properties. Some of the ore produced at the Last Chance and Maud S groups and a few lots of ore from the Homestake and Sheridan claims were shipped crude to the El Paso smelter and to ore buyers at Silver City and at Douglas, Ariz.

COLFAX COUNTY

Mount Baldy district (*Baldy, Elizabethtown, Eagle Nest*).—The Aztec mine group, owned and operated by the Maxwell Land Grant Co., continued in 1939 to be the principal producer in the Mount Baldy district. The ore was treated in the company 140-ton mill by jigging in the ball mill-classifier circuit, followed by flotation. The products were gold-silver-copper concentrates, shipped to the El Paso smelter, and gold-silver bullion, sold to the Denver Mint. Other mines owned by the Maxwell Land Grant Co. and worked by lessees on a small scale included the Montezuma and Gold Dollar. The Deep Tunnel Mining Co. built a 40-ton cyanide plant at the Moreno-Red Bandana group 2 miles northeast of Elizabethtown and operated it from July 8 to September 19 on company and custom ore. The custom ore came from the Ajax, Black Tail, and a claim owned by the Maxwell Land Grant Co., all in the Mount Baldy district, and the Memphis and Black Copper groups in the Red River district, Taos County. Placer miners continued to recover some gold by sluicing on streams in the Mount Baldy district.

DONA ANA COUNTY

Organ district.—The Donalco Mining Co. worked the Mormon mine 1½ months in November and December 1939 and the Rock of Ages 2 months beginning in September. The company shipped several lots of gold-silver-copper ore from each property to the El Paso smelter. A few small lots of smelting ore were shipped from other claims in the Organ district.

EDDY COUNTY

The Ammann Mining Co. shipped 4 tons of copper-silver ore to the El Paso smelter from its claim 11½ miles northwest of Carlsbad.

GRANT COUNTY

Burro Mountain district (*Tyrone*).—Strong & Harris worked the Virtue claim under lease 2 months in 1939 and shipped 88 tons of gold-silver ore to the El Paso smelter. Lessees at the Casino and Sunset claims each shipped some copper-silver ore.

Central district (*Bayard, Fierro, Georgetown, Hanover, Santa Rita*).—The Nevada Consolidated Copper Corporation, Chino Mines Division, continued producing throughout 1939 from its open-pit mine at Santa Rita. The ore is mined with electric shovels and transported 10 miles over the Atchison, Topeka & Santa Fe Ry. to Hurley, where it is concentrated in the company mill, the daily capacity of which has been increased during the past 2 years from 15,000 to 17,500 tons. The concentrates produced before March 22, 1939, were shipped to the El Paso smelter for treatment under contract; those produced after that date were smelted in the new company smelter adjacent to the concentrator, which was put in operation on May 2. The copper concentrates carry a low content of gold and silver to the ton. Molybdenite concentrates are recovered in the mill as a byproduct. The Twenty-fifth Annual Report of the Kennecott Copper Corporation, dated March 16, 1940, contains the following paragraphs regarding operations at the Chino property in 1939:

A total of 27,558,108 tons of ore having a calculated average of 1.02 percent copper was treated at the four domestic properties of the Corporation. Copper production amounted to 502,570,103 pounds, or about 50 percent more than the 1938 production of 334,816,884 pounds. In addition to the ore mined, approximately 36,573,000 tons of noncommercial overburden were removed at the power-shovel properties in Utah, Nevada, and New Mexico, this tonnage being equivalent to 1.40 tons overburden per ton of ore sent to the respective concentrating mills.

Copper production at the Chino property was continued at a comparatively low rate for the first half of the year but was stepped up to full capacity during the last 4 months. Orders for seven electric locomotives and other equipment necessary for the partial electrification of pit haulage were placed and preparatory track and line work commenced toward the close of the year. At Hurley a dust-collecting system was installed in the primary crushing plant. At the power plant a new 10,000-kilowatt turbogenerator and one high-pressure, high-superheat boiler were ordered and will be installed during the year 1940 to provide adequate generating capacity and permit more efficient utilization of reverberatory waste heat steam. The new smelter, which embodies in its design the latest developments in smelting practice, has proven satisfactory in every way since placed in service early in May and has effected a very material reduction in the cost of smelting.

Molybdenite production amounted to 12,055,554 pounds, including 111,561 pounds produced in an experimental way at the Braden plant in Chile. The molybdenite content of the ore treated at the Utah and New Mexico properties averaged 0.0354 percent and the recovery 71.31 percent. In contrast the 1938 recovery was 60.08 percent and in 1937, the first full year of operation, 43.41 percent. The demand for molybdenite was seriously curtailed upon the outbreak of war and largely as a result thereof the entire production was not sold. Since December the market has been narrowed even more, and there has been a further accumulation of unsold product.

The Empire Zinc Co. operated its Hanover mine group and 300-ton selective-flotation mill continuously in 1939. The products of the mill were zinc concentrates, shipped to the American Zinc Co. plant at East St. Louis, Ill., and the New Jersey Zinc Co. plants at Depue, Ill. (Mineral Point Zinc Division), and Palmerton, Pa.; and lead-copper concentrates, shipped to the El Paso smelter. The Pewabic zinc mine at Hanover and the Peru 500-ton mill near Deming were operated by the Callahan Zinc-Lead Co. under lease from January 1 to February 15 and were then inactive until June 5, when they were reopened by the same company and continued producing to the end of the year. Besides ore from the Pewabic mine, the mill treated some zinc ore produced by lessees from the Republic claim in the Union Hill group of the Hanover-Bessemer Iron & Copper Co. The concentrates produced in the mill in January and February were shipped to the Illinois Zinc Co. smelter at Dumas, Tex. This smelter was closed March 25 and did not reopen during the year; the concentrates produced from June to December went to the American Smelting & Refining Co. plant at Amarillo, Tex. The Callahan Zinc-Lead Co. returned the property to the Peru Mining Co., owner, as of January 1, 1940.

The American Smelting & Refining Co. operated the 200-ton Combination mill near Hanover under lease from March 1 to December 31, 1939, treating mostly company zinc-lead-copper-silver ore from the Ground Hog group but also custom ore of somewhat similar type from the Peerless, Grandview (Swartz district), Gold Frog group, September group, Silver Hill (Pinos Altos district), and two other properties in the Central district. The zinc concentrates produced in the mill were shipped to the Amarillo (Tex.) smelter and the lead-copper concentrates to the El Paso smelter. Part of the output from the Ground Hog was copper-lead-silver ore, shipped direct to the El Paso smelter; part of that from the Peerless and September groups was zinc-lead ore, shipped to the Ozark pigment plant at Coffeyville, Kans.; and 80 tons from the Gold Frog group was gold-silver-lead ore, shipped to the El Paso smelter.

A few cars of smelting ore were shipped from other mines in the Central district, including the Union Hill group and the Cash and Gold Spot claims. A placer miner in the Central district recovered a little gold.

Chloride Flat district.—A lessee on the Baltic claim shipped 2 tons of lead-silver ore in 1939.

Gold Hill district (see also Hidalgo County).—Small lots of gold-silver ore from the Ellandell, God's Tenth No. 1, Reservation, and Yellow Queen claims and 6 tons of lead-silver ore from the World's Fair claim were sold to the Ira L. Wright assay office at Silver City.

Lone Mountain district.—A little silver ore was shipped from the My Chance claim in 1939.

Pinos Altos district.—Lessees operated the Calumet 20-ton flotation- and table-concentration mill as a custom plant part of 1939. The ore treated came chiefly from the Ohio, Silver Hill, and Alaska mines and the Wild Horse dump. The products of the mill were lead-copper-gold-silver concentrates, sold to the El Paso smelter, and zinc-gold-silver-copper-lead concentrates, sold to the Amarillo (Tex.) smelter. Most of the ores produced from other mines and dumps in the Pinos Altos district were shipped to the El Paso smelter, the Ira L. Wright assay office at Silver City, and to Hawley & Hawley at Douglas, Ariz. Producers of 25 tons or more of ore included the Cleveland, Golden Rule-Campo Santo group, Hazard, Houston Thomas, Iron Clad, Lupita group, Mountain Key, Mina Grande, and Waggoner dump.

The Ryan Mining Corporation built a dam to collect water and installed a dragline, washer, and sluices on the Sunny Spot placer on Bear Creek 3 miles north of Pinos Altos in the summer of 1939; digging and washing continued about 2 months, when interrupted by heavy cloudbursts. The operation was later taken over by the Bear Creek Mining Co., which ran the equipment from November 1 to December 31. The Texas Placer Co. operated a dragline and portable screening plant, with a jig as a concentrator, on its claims on Bear

Creek from early summer to December 31. These two operations produced most of the placer gold from the Pinos Altos district in 1939. Individuals continued to recover some gold with sluices and pans.

Steeple Rock district.—The East Camp Exploration Syndicate operated the East Camp group continuously in 1939. It sank the vertical shaft an additional 550 feet to a total depth of 850 feet and drove 1,000 feet of drifts. Production totaled 10,248 tons of ore averaging 0.34 ounce of gold and 22.02 ounces of silver to the ton; the ore was shipped crude to the International Smelting & Refining Co., Miami, Ariz. The Carlisle group was operated by Veta Mines, Inc., from January 1 to February 15, when the company surrendered its lease; other lessees at the property shipped some ore and old tailings during the year. The other producing mines in the Steeple Rock district comprised the Homestake, Laura, Norman King, Frazier Brothers group, and Thanksgiving-Alberta property. The ore was shipped crude to smelters in Arizona and Texas. The Willmont Mining Co. erected a 30-ton cyanide plant at the Laura mine and began operating it in January 1940.

Swartz (or Carpenter or Camp Monarch) district.—The Black Range Development Co. operated the Grandview group throughout 1939 and produced 2,998 tons of ore, of which about half was zinc-lead ore sold to the Ozark pigment plant at Coffeyville, Kans.; the remainder was mostly zinc-lead-copper-silver ore and was shipped to the Combination mill near Hanover for treatment.

White Signal district.—Small lots of gold ore from the Apache Trail and Reward claims and a 4-ton lot of gold-silver-copper ore from the Combination claim were shipped to the Ira L. Wright assay office at Silver City in 1939. Testing operations on placer ground of Sunset Gold Fields, Inc., and sluicing by individuals in Gold Gulch recovered a little placer gold.

HIDALGO COUNTY

Apache district.—The output from the Apache district in 1939 comprised chiefly silver-copper-lead-gold ore shipped to the El Paso smelter from the Apache and Chappo groups.

Gold Hill district (see also Grant County).—A few truckloads of gold ore and lead-silver-gold ore from the Bob Cat, Martha Greer, Mary Florence, and Oro Grande prospects were sold to ore buyers at Silver City and at Douglas, Ariz., in 1939. Sweet & Wallace shipped 14 tons of lead-silver ore from another property to the El Paso smelter.

Lordsburg district.—The Banner Mining Co. operated the Bonney mine and 350-ton flotation mill 6 miles south of Lordsburg continuously in 1939. The vertical main shaft was sunk an additional 193 feet to a total depth of 1,213 feet, 3,138 feet of development drifts were driven, and 864 feet of diamond drilling were done. The product of the mill is copper-gold-silver-[iron] concentrates, which are sold to the El Paso smelter. Individuals working small mines, prospects, and dumps intermittently shipped newly mined and sorted dump ore to the El Paso smelter and to Hawley & Hawley at Douglas, Ariz. The producers included the Blas Noche property, Henry Clay, Homestake, Needmore, and Silver King. The Miser's Chest Mining & Milling Co., Inc., repaired 300 feet of the 400-foot 73° incline shaft at the Miser's Chest group and drove 400 feet of drifts.

San Simon district (Steins).—The Bob Montgomery group was worked on a small scale throughout 1939 by the owner, who shipped 64 tons of lead-silver ore to the El Paso smelter. A few lots of gold-silver ore were shipped from another property in the San Simon district.

Sylvanite district.—Lessees at the Buckhorn-Barney-Woods group 16 miles southwest of Hachita shipped four cars of gold-silver ore to the El Paso smelter in November and December 1939. A lessee at the Hardscrabble group shipped several cars of gold-silver-copper smelting ore. Some gold-silver ore was shipped from the Last Chance claim and another property in the Sylvanite district.

LINCOLN COUNTY

Jicarilla district.—Placer miners continued to recover gold in 1939 by rocking and sluicing in the Jicarilla Mountains southeast of Ancho.

Nogal district.—In 1939 the owner of the Silver Plume group shipped 1 ton of silver ore.

White Oaks district.—The Big Four Gold & Tungsten Mines drove a 100-foot incline shaft and 75 feet of drifts on its property 14 miles north of Carrizozo in 1939 and shipped 100 tons of gold-silver ore to the El Paso smelter.

LUNA COUNTY

Cooks Peak district.—Small-scale prospecting and mining at the Ethel-"85" group, the Big Lead & Silver property, and the Lookout claim yielded lead-silver ore, which was shipped to the Ira L. Wright assay office at Silver City. The Lookout claim also yielded 19 tons of zinc-lead ore, shipped to the Ozark pigment plant at Coffeyville, Kans. The owners of the Copper claim shipped 19 tons of copper-silver ore to the El Paso smelter.

Deming.—The Peru 500-ton selective-flotation mill at Wemple near Deming was operated most of 1939 under lease by the Callahan Zinc-Lead Co. and continued to treat ore from the Pewabic mine (see Central district, Grant County).

Victorio district.—Shanks Carpenter shipped oxidized gold-silver-lead-[zinc]-iron-lime ore to the El Paso smelter throughout 1939 from the Victorio group 4 miles south of Gage. The mine is developed by a 300-foot vertical shaft, a 700-foot adit, and over 4,000 feet of drifts.

OTERO COUNTY

Orogrande district.—The Garnet mine (opened by a 250-foot shaft and 200 feet of drifts) and three prospects in the Orogrande district each produced in 1939 a little copper ore containing gold and silver, all of which was sold to the El Paso smelter. The placer gold credited to Otero County for 1939 in this report was recovered from the Orogrande placer in 1938 but was not sold until 1939.

Sacramento district.—A sample lot of copper-silver ore from the La Luz No. 1 claim was trucked to the El Paso smelter in 1939, and 20 tons of copper-lead-silver ore were shipped from another property near High Rolls.

RIO ARRIBA COUNTY

Headstone district.—The Badger-Hidden Treasure group, operated for a period in 1938 under lease, reverted to the Amarillo Gold Mining

Co., owner, which operated the mine and mill part of 1939. The product of the mill was gold-silver-lead-copper concentrates, sold to the Leadville (Colo.) smelter. Small lots of placer gold were recovered from the Columbine and other placers in the Headstone district.

SANDOVAL COUNTY

Cochiti (Bland) district.—Lessees worked the Lone Star-Crown Point-Iron King group several months in 1939 and shipped gold-silver ore to the El Paso smelter. Some gold and silver were recovered from a clean-up of the old Cossak cyanidation mill.

SAN MIGUEL COUNTY

Willow Creek district (Tererro).—The American Metal Co. of New Mexico continued production from its Pecos mine on Willow Creek until May 31, 1939, when the mine was closed owing to exhaustion of ore. Part of the equipment, which includes a 12-mile aerial tram and the machinery in the 600-ton flotation mill in Alamitos Canyon, was sold in 1939 and 1940. The total output of the mine from its first production on January 20, 1927, to the date of closing in 1939 was 2,299,082 dry tons of ore containing 243,474 ounces of gold, 7,748,006 ounces of silver, 185,514,389 pounds of lead (wet assay), 35,835,807 pounds of copper (wet assay), and 595,355,840 pounds of zinc. The ore, treated by selective flotation, yielded 193,751 tons of lead-copper concentrates—containing 162,338 ounces of gold, 4,536,216 ounces of silver, 146,061,551 pounds of lead (wet assay), 16,491,992 pounds of copper (wet assay), and 46,342,538 pounds of zinc—and 473,606 tons of zinc concentrates—containing 25,922 ounces of gold, 1,642,360 ounces of silver, 13,497,879 pounds of lead (wet assay), 10,855,170 pounds of copper (wet assay), and 504,824,696 pounds of zinc. The aggregate smelter gross value of the combined concentrates before deductions for freight and treatment was $35,325,554, and the net value after deductions was $18,007,048.

SANTA FE COUNTY

Ortiz Mountains district (Cerrillos).—From March 27 to December 31, 1939, the Universal Placer Mining Corporation operated a 2½-cubic yard dragline and a land dredge, using a dry-separation method, on a part of the Ortiz grant known as the Old Placers about 6 miles south of Cerrillos and was the principal producer of placer gold in Santa Fe County during the year. Individuals continued to recover gold at small placers in the Ortiz Mountains, using sluices and dry washers. Some copper-gold-silver smelting ore was shipped from a lode claim.

San Pedro or New Placers district.—Lessees at the San Pedro (or Copper) mine, owned by John J. Raskob, continued to ship copper-gold-silver ore to the El Paso smelter in 1939. Raskob Interests, Inc., did considerable development work at the property and built a 150-ton flotation mill which was set going early in 1940. Gold was recovered in a Huntington mill at the Old Timer group and by hand methods at the Candelari, La Santa Fe, Live Oak, and Mascot claims. The Ortiz Gold Mining Co. shipped 6 tons of gold ore to the Leadville (Colo.) smelter. The Lazarus and another placer near Golden produced some gold.

SIERRA COUNTY

Chloride (Apache, Cuchillo Negro) district.—The Bald Eagle group was under development in 1939 by the Empire Mines & Metals Co., which shipped a test lot of lead-silver ore to the El Paso smelter and began installing equipment for a mill. Small lots of smelting ore were shipped from the Alta Vista No. 1, Fortuna, and other claims in the Chloride district. Andrew B. Stewart operated the Grand Republic group under lease from April to December and treated 650 tons of ore by jig and table concentration; the jig concentrates were amalgamated and the table concentrates shipped to the El Paso smelter.

Kingston district.—Silver ore containing a little lead, copper, and gold was shipped to smelters in 1939 from the Virginian and one other property in the Kingston district.

Lake Valley district.—Three cars of silver ore were shipped to the El Paso smelter from the Lake Valley district in 1939.

Las Animas district (Hillsboro).—The John I. Hallett Construction Co. continued operations throughout 1939 at the leased Gold Dust, Graf Von Luxemburg, Bunker Hill, and other placers in a group about 8 miles east of Hillsboro. The equipment consists of two gasoline-powered dragline excavators of 1 and 1¼ cubic yards capacity, a Coulter-Ainlay bowl recovery plant mounted on wheels, water-storage tanks, and pumps. Sluicing and panning at other placers in the Hillsboro district recovered some gold.

Lessees at the Wicks lode mine shipped copper-gold-silver ore to the El Paso smelter steadily throughout 1939. Small-scale operations at the Biglow, Bonanza, Duke, El Oro, M. K. T., Mocassin, Ready Pay-Apex, and other properties yielded ore aggregating 149 tons, of which part was sold to the El Paso smelter, part to Hawley & Hawley at Douglas, Ariz., and part to the Ira L. Wright assay office at Silver City.

Pittsburg district.—From February 1 to December 31, 1939, William Little operated a ¾-cubic yard dragline and centrifugal bowl washing plant on placer ground of the Pittsburg Placer Mining Co. Individuals continued sluicing and panning at placers in the Pittsburg district; they sold the gold recovered to the Myers Co. general store at Hatch.

Tierra Blanca district.—In 1939 L. E. Cleveland shipped 5 tons of gold-silver ore from his Silver Bell claim.

SOCORRO COUNTY

Good Fortune district (40 miles west of Tularosa).—A lessee worked the Belle Vista prospect 2 months in 1939 and shipped a car of copper-silver ore to the El Paso smelter.

Hansonberg district (17 miles southeast of Carthage).—The Globe Mining Co. shipped 9 tons of lead-silver ore from Bingham in 1939.

Magdalena district.—The Ozark Smelting & Mining Co. operated its Waldo group from September 18, 1939, to the end of the year, producing zinc-lead ore for shipment to the Ozark pigment plant at Coffeyville, Kans. A lessee operating the Kelly group also shipped zinc-lead ore to this plant and lead-copper-silver ore to the El Paso smelter. The Oro Alto Mining Co. shipped gold-silver-lead-copper ore from a property south of Kelly. Small tonnages of smelting ore were shipped from other properties in the Magdalena district.

Mockingbird district.—Small lots of lead-silver ore were shipped from two properties in the Mockingbird district in 1939.

San Mateo Mountains district.—A lessee operated the Panky group from January to April 1939 and mined about 480 tons of ore, which was treated in the flotation mill at the mine. The yield was 12 tons of high-grade gold-silver concentrates shipped to the El Paso smelter. Bishop & Warren worked the Victorio claim 1 month and shipped 15 tons of gold-silver ore.

Silver Mountain (or Water Canyon) district.—Test runs made in 1939 on ore from the Open Cut mine in the gravity-concentration mill on the property yielded some gold and silver. Other small producers in the Silver Mountain district were the Rose Quartz and La Plata claims.

TAOS COUNTY

Red River district.—The Black Copper and Memphis mines were operated on a small scale several months in 1939; each yielded some ore, which was sent to the small custom cyanide mill of the Deep Tunnel Mining Co. near Elizabethtown, Colfax County, for treatment. Scavarda Brothers worked their Neptune claim from June 17 through December and shipped 31 tons of gold-silver ore to the El Paso smelter. A little gold was recovered from a placer claim near Red River.

The Molybdenum Corporation of America continued to produce molybdenum ore from the Phyllis group on Sulphur Creek. The ore is treated in the company 40-ton (per 24 hours) flotation mill at the junction of Sulphur Creek and Red River above Questa.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN OREGON

(MINE REPORT)

By Charles White Merrill and H. M. Gaylord

SUMMARY OUTLINE

The total value (in terms of recovered metals) of the gold, silver, copper, and lead produced in Oregon in 1939—$3,350,950—exceeded that in each year since mining was begun in 1852 and represents a 14-percent increase over 1938. It was divided among the metals as follows: Gold, over 97 percent; silver, 2 percent; and copper and lead combined, less than 0.5 percent. No recovery of zinc was reported for the year. Baker County continued as the leading metal producer and contributed 48 percent of the State total value; Grant County yielded 34 percent, Jackson County 9 percent, Josephine County 7 percent, and the other 14 producing counties only 2 percent.

The principal shift in production between counties in 1939, compared with 1938, was an increase in importance of Grant County and a sharp decline in that of Josephine County; the increase in Grant County resulted mainly from activities of lessees working the Independence Cougar mine, and the decline in Josephine County was caused primarily by suspension of dredging on Grave Creek by the Rogue River Gold Co. late in 1938.

Cornucopia Gold Mines, which worked the Cornucopia mine in the Cornucopia district of Baker County, not only was the largest producer of lode gold in Oregon in 1939 but also led in output of total gold and of silver, copper, and lead.

Another feature in the mining industry of the State in 1939 was the record output of gold by dragline dredges, which exceeded that by connected-bucket dredges for the first time and more than counterbalanced losses by some of the other placer methods.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050

1939	201	13,322,000	60,779.00	2,127,265	.160

[1] Beginning with 1936, excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.
[3] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[4] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc.
[5] None reported for 1935–37, inclusive.
[6] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

Gold.—Production of gold in Oregon in 1939 increased 14 percent over 1938; the output from placers increased 12 percent and that from lode mines 19 percent. Of the total placer gold, 43 percent was recovered by dragline dredges, 41 percent by connected-bucket dredges, 7 percent by small-scale hand methods, 4 percent each by hydraulicking and nonfloating washing plants with mechanical excavators, and 1 percent by drifting. All the lode gold was derived from dry ores and virtually all from gold ore. Although 317 properties produced in 1939, the bulk of the gold came from relatively few mines; the following 10 properties supplied 72 percent of the total.

The 10 leading gold producers in Oregon in 1939, in order of output, were: Cornucopia Gold Mines (gold ore), Sumpter Valley Dredging Co. (connected-bucket dredge), Ferris Mining Co. (formerly Ferris & Marchbank) (dragline dredge), Western Dredging Co. (connected-bucket dredge), Porter & Co. (connected-bucket dredge), Independence Cougar Lessees (gold ore), Oroplata Mining Co. (dragline dredge), H. F. England Co. (dragline dredge), Consuelo Oregon Mines (dragline dredge), and Little, Harris & Wolfinger (dragline dredge).

Silver.—Silver production in Oregon in 1939 increased 5 percent in quantity and 10 percent in value over 1938. Of the State total silver, Baker County contributed 85 percent (76 percent coming from the Cornucopia mine in the Cornucopia district) and Grant County 12 percent; dry gold ore yielded 88 percent and placer gravels 10 percent. Nearly 88 percent of the total lode silver was recovered by concentration followed by smelting of the resulting concentrates.

Copper, lead, and zinc.—More than 92 percent of the copper produced in Oregon in 1939 was a byproduct of gold production at the Cornucopia mine. Lead production in the State totaled only 30,000 pounds. No zinc was reported recovered.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, and lead in Oregon in 1939, by counties, in terms of recovered metals

County	Mines producing [1]		Gold						Silver (lode and placer) [2]

Umatilla					1,124
Union					772
Wallowa					141
Wheeler					70
	96,000	9,984	30,000	1,410	3,350,950
Total, 1938	76,000	7,448	46,000	2,116	2,935,053

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Source of total silver as follows: 1939, 94,794 ounces from lode mines and 10,594 ounces from placers; 1938, 92,206 ounces from lode mines and 8,301 ounces from placers.
[3] Output from property not classed as a "mine."

MINING INDUSTRY

Of the 65,261 tons of ore sold or treated in Oregon in 1939, 65,174 tons were dry gold ore and 87 tons dry gold-silver ore; in addition, 3,764 tons of old tailings, of value principally in gold, were treated. The following figures give a measure of the large increase in output from Oregon mines during recent years: Tonnage of ore and old tailings sold or treated in 1939 was 13 times and quantity of lode gold produced was nearly 9 times that at the low point reached in 1932; and quantity of placer gold produced was 10 times and total value of gold, silver, copper, and lead produced was 11 times that at the low point recorded in 1928. Three-fourths of the lode gold produced in Oregon in 1939 came from the Cornucopia mine in the Cornucopia district of Baker County and the Independence Cougar mine in the Granite district of Grant County. Half of the placer gold output of the State was produced by the following four companies: The Sumpter Valley Dredging Co. (connected-bucket dredge), Sumpter district, Baker County; Ferris Mining Co. (dragline dredge), Canyon district, Grant County; Western Dredging Co. (connected-bucket dredge), Canyon district, Grant County; and Porter & Co. (connected-bucket dredge), Granite district, Grant County. These six operators supplied 58 percent of the total gold produced in Oregon in 1939.

Reports on the use of quicksilver at Oregon placer mines indicate that 1,400 pounds were consumed during 1939. All the connected-bucket dredges used quicksilver, and they averaged 53 ounces of gold recovered per pound consumed. The average consumption of quicksilver by all dragline dredges was 1 pound per 42 ounces of gold recovered, but several of the dredges did not amalgamate; those that did use quicksilver consumed 1 pound per 16 ounces of gold saved.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Oregon in 1939, with content in terms of recovered metals

Source	Material sold or treated		Gold	Silver	Copper	Lead
	Ore	Old tailings				
	Short tons	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*
Dry and siliceous gold ore	65, 174	3, 764	32, 518	93, 268	96, 000	30, 000
Dry and siliceous gold-silver ore	87		75	1, 526		
Total, lode mines	65, 261	3, 764	32, 593	94, 794	96, 000	30, 000
Total, placers			60, 779	10, 594		
	65, 261	3, 764	93, 372	105, 388	96, 000	30, 000
Total, 1938	61, 278	13, 658	81, 729	100, 507	76, 000	46, 000

METALLURGIC INDUSTRY

Of the 69,025 tons of ore (including 3,764 tons of old tailings) sold or treated in Oregon in 1939, Baker County produced 38,632 tons (including 1,275 tons of old tailings), or 56 percent; Josephine County, 15,889 tons (including 2,284 tons of old tailings), or 23 percent; and Grant County 11,222 tons (ore), or 16 percent. Of the State total ore and old tailings, 56 percent was treated in concentrating mills, most of which used flotation; 32 percent was treated in amalgamation and cyanidation mills, with or without concentration equipment; and 12 percent was shipped crude to smelters. Sixty-four percent of the total lode gold was recovered ultimately by the smelting of concentrates; 20 percent by direct smelting of ore; 10 percent as bullion by cyanidation of ore, concentrates, and old tailings; and 6 percent by amalgamation of ore and old tailings. All material requiring smelting was shipped out of the State, as Oregon has no smelters.

Data furnished by operators of gold and silver mills show that 2,389 pounds of 91-percent sodium cyanide were consumed in recovering 303 ounces of gold and 161 ounces of silver from 3,439 tons of old tailings, and 156 pounds of quicksilver were used in the recovery of 1,971 ounces of gold and 383 ounces of silver from 4,422 tons of ore.

Mine production of metals in Oregon in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*
Ore and old tailings amalgamated	4, 747	2, 048	516		
Ore, concentrates, and old tailings cyanided	17, 468	3, 087	400		
Concentrates smelted:					
Flotation	2, 030	20, 549	82, 398	88, 400	13, 700

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 13 and their output included under "Combined districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 94,794 ounces from lode mines and 10,594 ounces from placers.

[4] Output from property not classed as a "mine."

[5] Greenhorn district lies in both Baker and Grant Counties.

[6] Mormon Basin district lies in both Baker and Malheur Counties.

[7] Mount Reuben district lies in both Douglas and Josephine Counties.

[8] Desolation district lies in both Grant and Umatilla Counties.

[9] Included under "Combined districts."

[10] Exclusive of lode output, which is included under "Combined districts."

[11] Greenback district lies in both Jackson and Josephine Counties.

[12] Exclusive of placer output, which is included under "Combined districts."

[13] Includes following districts: Homestead (all placer) in Baker County; Susanville (lode) in Grant County; Elk Creek (lode) in Jackson County; Althouse (lode), Illinois River (lode), and Lower Applegate (placer) in Josephine County.

BAKER COUNTY [1]

Connor Creek district.—Lessees working the Connor Creek placer mine in 1939 produced 138 ounces of gold and 20 ounces of silver from 1,850 cubic yards of gravel.

Cornucopia district.[2]—The Cornucopia mine, operated by Cornucopia Gold Mines, was the outstanding producer in Oregon in 1939. The content of its output of concentrates and smelting ore was 19,579 ounces of gold, 80,613 ounces of silver, 90,080 pounds of copper, and 19,675 pounds of lead. The mine was the principal source of each of these four metals and, in terms of recovered metals, supplied 60 percent of the lode gold produced in the State, 21 percent of the total gold, 76 percent of the total silver, 92 percent of the copper, and 39 percent of the lead. The company sent 32,870 tons of gold ore to its 150-ton flotation mill and shipped 1,666 tons of copper concentrate and 20 tons of crude ore to a smelter. An extensive construction campaign resulted in the building, during the year, of workmen's houses, a substation, bunk houses, a recreation hall, and a change house. The company announced the acquisition of the Queen of the West group of 13 quartz claims and the Panter group of 3 claims in 1939. The Forest Queen mine was worked from July until the end of the year. Among the placers in operation along Pine Creek in the Cornucopia district were the Boulder Creek, Lillard (formerly Ingram), Pebble, and Cold Springs mines.

Cracker Creek district.—The dragline dredge of Consuelo Oregon Mines was the largest gold producer in the Cracker Creek district in 1939. A small quantity of gold ore derived from dumps and clean-up work in old mills at the E and E and North Pole mines was shipped for smelting. An examination and sampling campaign covering the North Pole, E and E, Tabor Fraction, and Columbia mines, undertaken by the Campbell Oregon Gold Mining Corporation in 1938, was terminated September 30, 1939, without production, and the lease surrendered in October.

Greenhorn district.—The Snow Creek lode mine was the principal producer in the Greenhorn district in 1939. Some changes were made in the mine flotation mill, but most of the output came from direct smelting ore.

Mormon Basin district.—The Oregon Mining Co. operated a dragline dredge on Burnt River 5 miles below Bridgeport during 1939 and produced 457 ounces of gold and 74 ounces of silver. Small shipments of smelting ore recovered from the clean-up of old mills and dumps were made from the Humboldt, Rainbow, and Sunday Hill mines.

Rock Creek district.—Lessees of the Elkhorn mine in 1939 treated 125 tons of gold ore by amalgamation and concentration and shipped 20 tons of concentrates for smelting; 43 ounces of gold were recovered by amalgamation and 40 ounces by smelting of concentrates. Mill cleanings were shipped from the Highland mine.

Sparta district.—Lessees working the Macy mine in 1939 treated 969 tons of gold ore by amalgamation and recovered 446 ounces of gold and 72 ounces of silver.

Sumpter district.—The Sumpter Valley Dredging Co., the largest producer of placer gold in Oregon in 1939, treated 3,291,663 cubic yards of gravel and recovered 11,289 ounces of gold and 2,523 ounces of silver; the company dredge was of the connected-bucket electric-power type with seventy-two 9-cubic foot buckets. Little, Harris & Wolfinger worked a dragline dredge with a 1½-cubic yard bucket throughout the year and recovered 3,083 ounces of gold and 748 ounces of silver from 590,149 cubic yards of gravel. The Nutting Dredging Co., which began operations April 6, 1939, with a 1¾-cubic yard bucket dragline, handled 501,144 cubic yards of gravel during the remainder of the year to recover 2,472 ounces of gold and 584 ounces of silver.

Virtue district.—Work at the Columbian mine in 1939 yielded 623 tons of smelting ore containing 338 ounces of gold and 99 ounces of silver.

CURRY COUNTY

China Diggings district.—Operations begun August 15, 1939, at the Robert E mine continued during the rest of the year; cyanidation of 180 tons of old tailings yielded 49 ounces of gold and 11 ounces of silver.

GRANT COUNTY[3]

Canyon district.—Ferris & Marchbank became the Ferris Mining Co. November 1, 1939. The organizations operated a dragline dredge equipped with a 4-cubic yard Diesel-electric dragline excavator and handled 1,943,200 cubic yards of gravel during 1939 to recover 6,747 ounces of gold and 697 ounces of silver. This is one of the largest (if not the largest) dragline-dredge projects in the world. The hydraulicking of 10,000 cubic yards of gravel at the Quartz Gulch mine resulted in the production of 70 ounces of gold and 10 ounces of silver. The Western Dredging Co. operated its connected-bucket dredge on the John Day River near John Day throughout the year; the dredge was equipped with seventy-two 6-cubic foot buckets.

Granite district.—The Oroplata Mining Co. worked the Milwaukee Placers in the Ten Cent section of the Granite district throughout 1939; the site of Lawton, an abandoned mining town, formed part of the area dredged. The company used a Diesel-powered washing plant and a dragline excavator with a 2½-cubic yard bucket and washed 940,000 cubic yards of gravel to recover 3,661 ounces of gold and 901 ounces of silver. Porter & Co. operated an electric dredge with sixty-two 4½-cubic foot buckets; the company property lies on Bull Run, Clear, Granite, Olive, and Crane Creeks. Work was begun at the Bellevue mine October 1, and 87 tons of ore containing 75 ounces of gold and 1,526 ounces of silver were shipped before the end of the year. The Constitution mine was worked throughout 1939; part of the ore was treated at the company flotation mill, and the remainder was shipped direct to a smelter. The mill burned November 2. The Independence Cougar mine, which had only a small output

[3] *See also* works cited in footnote 1.

in 1938, made a production in 1939 that ranked it as the second-largest lode gold and third-largest silver producer in Oregon. Lessees on the property completely rebuilt the old metallurgical plant as a flotation mill with a daily capacity of 75 tons. Approximately 4,000 tons of ore were treated by flotation to produce 290 tons of concentrates; the concentrates, containing 789 ounces of gold and 773 ounces of silver, and 5,049 tons of crude ore, containing 3,820 ounces of gold and 2,812 ounces of silver, were shipped to a smelter.

Quartzburg district.—The H. F. England Co. operated throughout 1939 a dragline dredge, using a dragline excavator with a 1½-cubic yard bucket, on Dixie Creek, 2 miles from Prairie City.

Susanville district.—The Timms Gold Dredging Co., which had operated since November 1933 on the Middle Fork of John Day River near Galena, worked out its dredgeable ground in 1939 in about 2 months. The company spent much of the year testing beds of gravel and rebuilding the dredge.

JACKSON COUNTY

Ashland district.—Development work was continued at the Ashland mine throughout 1939; the resulting gold ore was treated by amalgamation and concentration. A small output of gold ore was reported from the Free Gold mine.

Elk Creek district.—Production was resumed at the Buzzard mine by Al Sarena Mines, Inc., November 15, 1939; the ore was treated by table concentration.

Foots Creek district.—William von der Hellen Mines abandoned operation of the Lance mine March 24, 1939, after washing 29,494 cubic yards of gravel to recover 335 ounces of gold and 44 ounces of silver in a stationary washing plant to which the gravel was delivered from an open-cut by power shovel and trucks.

Gold Hill district.—The Lucky Bart mine, following lessee operation during the early months of 1939, was taken over by the Lucky Eagle Mining Co. May 1; production for the year was 122 ounces of gold and 33 ounces of silver recovered by amalgamation. Gold Hill Placers operated a washing plant, mounted on caterpillar treads, on Sardine Creek from April 20 until the end of 1939. The Pleasant Creek Mining Corporation operated a sluice-type connected-bucket dredge and produced a substantial quantity of gold during the year.

Upper Applegate district.—The B-H Co. continued to operate its dragline dredge on West Fork of Forest Creek in 1939, except for a shut-down from September 3 until November 1. A dragline dredge was worked for 5 months by the Crescent Pacific Mining Co. on the Applegate River. From June 1 until September 1 M. C. Lininger & Son operated a stationary washing plant fed by a gasoline shovel and trucks and washed 25,360 cubic yards of gravel to recover 195 ounces of gold. The Glide Foundation operated a Diesel-powered dragline dredge with a 1¼-cubic yard bucket on Poorman's Creek from January 1 until May 1.

JOSEPHINE COUNTY

Galice district.—The Lewis Investment Co. operated the Benton mine throughout 1939 and was the third-largest producer of lode gold in the State. The ore was treated in a cyanide plant having a daily capacity of 50 tons. A new road, completed by the Civilian Conservation Corps from a point near Galice to the mine, makes year-round trucking possible.

Grants Pass district.—A lessee hydraulicked a substantial quantity of gravel at the Forest Queen mine and Boulder claim on Louse Creek during 1939.

Greenback district.—P. B. Wickham, lessee of the Greenback mine, reopened the property and rebuilt the mill during 1939; the only output from the property resulted from operations by other lessees who cyanided old tailings to recover 74 ounces of gold and 85 ounces of silver. From January 10 to April 15, while water was available, 20,000 cubic yards of gravel were hydraulicked at the Blue Channel mine. Gold was produced at the Columbia mine by hydraulicking when water was sufficient for operation.

Lower Applegate district.—The Powell Creek Mining Co. worked the Bonanza mine from May 1, 1939, until the end of the year. Including lessee output, 139 tons of gold ore were treated by amalgamation and concentration at the nearby Humdinger mill to recover 40 ounces of gold by amalgamation and 2 tons of concentrates. The concentrates, containing 14 ounces of gold, and 20 tons of crude ore, containing 61 ounces of gold, were shipped to a smelter. The Humdinger mine was operated intermittently during 1939; 53 tons of ore amalgamated yielded 30 ounces of gold and 6 ounces of silver.

Waldo district.—At the Esterly mine 75,000 cubic yards of gravel were hydraulicked to recover 421 ounces of gold and 25 ounces of silver during 1939. A substantial quantity of gold was produced by hydraulicking at the Platurica (Plataurica) mine.

LANE COUNTY

Bohemia district.—A small shipment of smelting gold ore was made from the Helena mine in 1939.

MALHEUR COUNTY[4]

Malheur district.—A dragline dredge was operated on Quartz Gulch three-fourths mile south of Malheur City during 1939.

OTHER COUNTIES

Small outputs in 1939 were reported also from Coos, Crook, Douglas, Harney, Linn, Marion, Morrow, Umatilla, Union, Wallowa, and Wheeler Counties.

Details of production by counties and districts are given in the preceding table.

[4] *See also* works cited in footnote 1.

GOLD, SILVER, COPPER, AND LEAD IN SOUTH DAKOTA

(MINE REPORT)

By Chas. W. Henderson and A. J. Martin

SUMMARY OUTLINE

Metal mining in South Dakota is confined to a small area comprising parts of Custer, Lawrence, and Pennington Counties in the group of mountains known as the Black Hills. Gold is the chief metal produced and gold mining the principal mineral industry of the State. Gold was first discovered in South Dakota on French Creek, Custer County, in 1875. In 1939 the recovered output of gold in the State was the highest for any one year during the period 1876–1939; it totaled 618,536 fine ounces valued at $21,648,760, an increase of 4 percent over 1938, the former record year. Besides gold, South Dakota in 1939 produced 167,584 fine ounces of byproduct silver valued at $113,754. No recoverable copper has been produced in the State since 1918 and no lead since 1935. As the record gold production of 1939 indicates, operations at the principal producing mines were maintained at close to capacity throughout the year. The Homestake mine at Lead, Lawrence County, the largest producer of gold in the United States, yielded 92 percent of the State output of gold; other mines in Lawrence County—chiefly the Bald Mountain Mining Co. group at Trojan, the Maitland in the Maitland district, and the Gilt Edge in the Bear Butte district—contributed most of the remainder. The only sizable producer outside of Lawrence County was the Golden Slipper mine in the Hill City district, Pennington County. The output of gold and silver from Custer County came from placer mines on French Creek.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.

Except for a slight drop in 1937 from 1936, gold production in South Dakota has increased annually over the 5 years ended with 1939. The quantity of silver recovered varied somewhat in proportion to the gold produced in the individual years but also increased over the period.

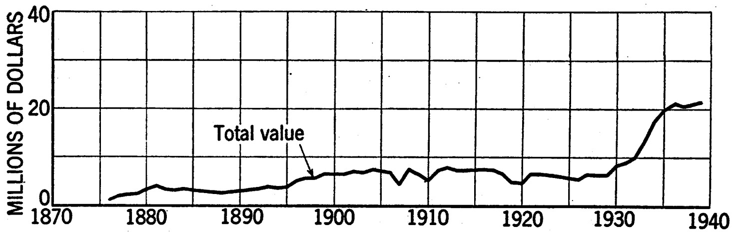

FIGURE 1.—Total value of mine production of gold and silver in South Dakota, 1876–1939.

Mine production of gold, silver, copper, and lead in South Dakota, 1935–39, and total, 1876–1939, in terms of recovered metals [1]

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1935	15	199	1, 487, 235	567, 230. 20	$19, 853, 057	151, 047	$108, 565
1936	12	130	1, 549, 146	586, 353. 40	20, 522, 369	144, 448	111, 875

MINING AND METALLURGIC INDUSTRY

The total ore mined and treated by producers of lode gold and silver in South Dakota in 1939 was 1,632,778 tons yielding in recovered metals 617,914 fine ounces of gold and 167,537 fine ounces of silver compared with 1,586,181 tons yielding 593,778 ounces of gold and 162,213 ounces of silver in 1938. An analysis of methods of treatment shows that 1,400,015 tons were treated by amalgamation followed by cyanidation of sands and slimes; 170,270 tons by cyanidation only or by roasting followed by cyanidation; 47,860 tons by jigging, amalgamation of the jig concentrates, and all-slime cyanidation of the remaining pulp; 508 tons by amalgamation only; 12,900 tons by amalgamation and flotation concentration (101 tons of concentrates containing 348.40 ounces of gold and 67 ounces of silver were shipped to smelters); 1,143 tons by flotation followed by cyanidation of the concentrates; and 82 tons (containing 1,250.90 ounces of gold and 443 ounces of silver) were shipped crude to smelters. Operating details at both lode and placer mines are given in the following review by counties.

METALLURGIC RECOVERY

Gold and silver bullion produced at mills in South Dakota by amalgamation, 1935–39

Year	Ore treated	Gold in bullion	Silver in bullion	Quicksilver used
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*
1935	1,382,774	335,553.97	75,858	15,550
1936	1,393,450	330,052.08	66,585	15,093
1937	1,414,772	329,975.10	66,640	10,178
1938	1,430,391	328,044.50	32,602	7,744
1939	1,461,283	336,424.93	64,710	9,221

Gold and silver bullion produced at mills in South Dakota by cyanidation, 1935–39

Year	Material treated				Gold in bullion product	Silver in bullion product	Sodium cyanide used [1]
	Crude ore	Concentrates	Sands and slimes	Total			
	Short tons	*Short tons*	*Short tons*	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*
1935	104,431		1,380,128	1,484,559	230,653.47	73,558	686,625

1939	170,270	[2] 61	1,443,548	1,613,879	279,889.77	102,317	[3] 887,888

[1] In terms of 96- to 98-percent strength.
[2] From 1,143 tons of ore treated by flotation.
[3] Actually 1,675,500 pounds of calcium cyanide (48- to 49-percent strength) and 53,995 pounds of sodium cyanide (91-percent strength); all reduced to equivalent of 96- to 98-percent strength to conform with earlier use of figures for high-strength NaCN and KCN.

REVIEW BY COUNTIES

CUSTER COUNTY

The Sterling Mining Co. operated its 1½-cubic yard dragline and screening and sluicing plant on the Durst ranch on French Creek 1 mile west of Custer from April to June 1939. Harry E. Mosher worked the Rhodes placer ground on French Creek 1 mile east of Custer from May 1 to October 15, using a ¾-cubic yard dragline and sluices. Drift mining was done at the Plaza Bar on French Creek 2¼ miles above Custer, operated intermittently by Max Husaboe from April 13 to October 30. Other placer miners sluicing and panning along the creek recovered some gold. No production was made from lode mines in Custer County during the year.

LAWRENCE COUNTY

Homestake mine.—The Homestake mine has been producing almost continuously since 1876 and has been operated since 1877 by the Homestake Mining Co., which at first owned only the Homestake and Golden Star claims but has since acquired and consolidated into one group numerous other claims which, with the first two, now constitute the Homestake mine. Development of the mine from the 3,200- to the 5,000-foot level has been in progress since 1932, and two shafts equipped for an ultimate depth of 5,000 feet are being sunk to replace other shafts, one of which was still in use in 1939. One of the new shafts, the Ross, has been in operation since 1934 and had been completed to the 4,100-foot level at the end of 1938; the other, the Yates, was begun in 1938. The annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1939, says—

Operations during 1939 were normal in all departments. Ore production from the mine was 1.62 percent higher than in 1938 and the gross income for gold and silver produced was 3.31 percent higher. It is expected that production for 1940 will be slightly lower than in the past year.

Operating expenses exclusive of taxes were slightly higher than in 1938. This resulted largely from certain nonrecurring costs. Total taxes were $3,132,512.11, which is slightly higher than in 1938. This amounted to $2.24 per ton of ore mined.

There are 196,913 tons of broken ore remaining in shrinkage stopes.

The reserve of developed ore is 18,395,991 tons. Of this reserve 7,653,400 tons are in the new ledge which has been under development for the past 3 years. This ore is materially lower in grade than that in the main ledges. Production from this ledge began in 1939 and will be substantially increased in 1940. It is expected therefore that the grade of ore produced in 1940 will be slightly lower than that for 1939.

The mine, treatment plants, and other surface plants are in excellent condition. All changes resulting from reconstruction of Cyanide sand plant No. 1 are completed. Improvements in the metallurgical plants which began with the construction of Cyanide sand plant No. 3 in 1933 have resulted in material economies in treatment cost.

Yates shaft construction has made excellent progress. In the shaft, 3,426 feet of pilot raises are completed of which 1,714.5 feet have been stripped to full size and timbered. The hoist building, head frame, and crusher house are nearly completed and installation of equipment is under way. It is expected that the shaft will be ready for operation soon after the middle of the year.

The winze from the 4,100-foot level was sunk to the 4,550-foot level and 543 feet of level development completed on the 4,550-foot level.

Precipitation was again below normal and power output from the hydroelectric plants was the lowest on record.

A new sawmill was authorized and construction is under way. With recent improvements in log-hauling equipment it was deemed advisable to locate the sawmill out of the forest, and a site at Spearfish, about 20 miles from Lead, was selected. The new mill will probably be in operation in July 1940.

Ore milled, receipts, and dividends, Homestake mine, 1935–39 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1935	1,379,163	$19,191,013.19	$13.9150	$14,064,960
1936	1,383,929	19,506,534.78	14.0950	9,041,760
1937	1,394,773	19,304,076.45	13.8403	9,041,760
1938	1,377,314	19,284,459.67	14.0015	9,041,760
1939	1,400,015	19,922,964.60	14.2300	9,041,760

[1] From 1876 to 1939, inclusive, this mine yielded bullion and concentrates that brought a net return of $379,997,979 and paid $124,187,482 in dividends.

Interesting data regarding the extensive mining operations at the Homestake mine, published by the Homestake Mining Co. in 1938, include the following: In the mining of approximately 1,400,000 tons of ore annually approximately 600,000 tons of porphyry or waste rock must be handled to "back-fill" the stopes from which the ore is taken. To mine this ore, 1,554,117 pounds of 40-percent dynamite and approximately 773 miles of fuse are used; over 1,000,000 blasts were set off in 1937, and 11,000 feet of crosscut and 25,000 feet of main drift were run at a cost of $15 per foot through waste rock never brought to the surface. In addition, 2 miles of diamond drilling were done. There were 490 drilling machines in service in the mine, and approximately 500,000 pounds of drill steel were required. In hauling the ore from the stopes to the shafts 73 miles of narrow-gage railroad track and 36 compressed-air locomotives were used. In 1937 the amount paid for labor alone was $4,081,193.

In the course of mining and development in 1939 the company sank 1,714 feet of shaft, drove 33,592 feet of drifts and 11,744 feet of raises, and did 39,930 feet of diamond drilling. Surface treatment plants operated (besides the primary crushing plants at the hoists) comprised the South mill (the main secondary crushing, grinding, and amalgamating plant, with a capacity of 3,900 tons per 24 hours), cyanide sand plant No. 1, cyanide sand plant No. 3, and the refinery—all at Lead; and the slime plant at Deadwood. Silver is parted from the gold in the refinery, and virtually pure metals are shipped to the mint, the gold bars ordinarily ranging in fineness from 0.996 to 0.998 and the silver from 0.985 to 0.995. The mine produced more gold in 1939 than in any other year in its history.

Other mines.—The Bald Mountain Mining Co., the second-largest producer of gold and silver in South Dakota in 1939, operated its consolidated group of mines and cyanide mill at Trojan at an average rate of 336 tons of ore daily for 365 days. The 110-ton gas-fired rotary hearth furnace, installed in 1938 to treat the refractory sulfide ores not amenable to treatment by straight cyanidation, was reported to be working satisfactorily. The yield in recovered metals from 122,524 tons of ore treated in the mill and 74 tons of high-grade ore shipped to smelters was 29,279 fine ounces of gold and 37,132 fine ounces of silver, which together brought a net return of $1,040,982 after deductions for transportation and mint and smelter charges. The ore treated in 1939 came from the Portland, Clinton, Empire, Two Johns, and Dakota claims and was brought to the mill by rail tramway and trucks. The company did 9,911 feet of development work in the mine during the year.

At the Maitland group 5½ miles northwest of Deadwood the Canyon Corporation continued operations at capacity throughout 1939, producing an average of 101 tons daily of refractory sulfide ores (commonly known as blue ores) for treatment in its 100-ton roast-cyanide mill. Besides gold and silver, the ores contain pyrite, silica, dolomite, and some undetermined arsenic mineral. The recovery was 11,820 fine ounces of gold worth $413,700 and 2,012 fine ounces of silver worth $1,366. Mine development work done totaled 4,090 feet and prospecting 3,463 feet. The mine is opened by a vertical shaft 600 feet deep and by drifts and winzes.

The Gilt Edge-Dakota Maid group in the Bear Butte district was operated continuously in 1939 by Gilt Edge Mines, Inc. The mine is developed by two vertical shafts, 120 and 400 feet deep, and by 8,500 feet of drifts and tunnels. The ore is treated in the company 150-ton mill by jaw crushing, ball-mill grinding, classification, and jigging followed by continuous countercurrent decantation-cyanidation. The jig product, containing about 30 percent of the recoverable gold, is tabled and treated in an amalgam barrel, and the amalgam recovered is melted with the precipitate.

The Black Hills Tin Co. treated 1,143 tons of ore from its property near Tinton in a 100-ton flotation mill, equipped with a cyanide unit to treat the concentrates, built in 1939 and operated from September 13 to November 30. The Frerichs Mining Co., operating a group of claims in Whistler Gulch 1½ miles from Deadwood, recovered some gold during the year from ore treated in a 50-ton cyanide mill on the property. Gold, Inc., operated the Minnesota group 4 miles northeast of Rochford on Gimlet Creek part of 1939 and shipped to the Denver Mint several lots of gold recovered by amalgamation. The property was taken over during the year by the G. F. G. Corporation, which continued developing the mine and did construction work on a new mill. Other small lode-gold producers in Lawrence County comprised the Golden Bottle and Ragged Top properties. Individuals cleaning up the soil underlying the old melting furnace and assay office at the Monarch mine recovered 34 fine ounces of gold.

The Driskill Co. handled about 8,400 cubic yards of gravel on the Little Tom placers on Potato Creek 2 miles east of Tinton with a

⅜-cubic yard power shovel and land dredge and recovered 36 fine ounces of gold and 2 fine ounces of silver. Sluicing at small placers near Deadwood and Tinton yielded some gold.

PENNINGTON COUNTY

Empire Gold Mines, Inc., operated its Golden Slipper mine and amalgamation-flotation mill 5 miles east of Hill City about 10 months in 1939, treating 40 to 50 tons daily. The Yellow Bird Mining & Milling Association completed a 50-ton flotation mill at the Yellow Bird group 4½ miles southwest of Rochford in the spring of 1939 and operated it intermittently until July 19, when operations were suspended owing to lack of ore. Inca Gold Mines, Inc., produced some gold from test runs of ore in its flotation mill on the Bessie B claims a short distance northwest of Mystic. Other producing lode properties, equipped with small amalgamating mills, included the Burlington and Gold Lode, 7 and 5 miles, respectively, northwest of Hill City; the Western Bell and James, south of Hill City; and the Shellerud, in the Hornblende district.

The Anchor Gold Mining Co. worked the Matt placer on Gold Run Creek from April 15 to June 15, 1939, with a 1½-cubic yard dragline and a portable land dredge on skids and handled 6,000 cubic yards of gravel. Individuals sluicing, drift mining, and panning, principally on Battle, Castle, Rapid, and Spring Creeks, continued to recover small lots of gold dust, most of which was sold to dealers or traded for groceries at stores in the vicinity.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN TEXAS

(MINE REPORT)

By Chas. W. Henderson and A. J. Martin

SUMMARY OUTLINE

From 1885 through 1939 silver has been the principal metal produced in Texas, and most of the output has come from the Presidio mine at Shafter, Presidio County. Recovery of some gold and lead with the silver has made this mine the largest producer of these metals also in the State. The other producers of more than 1,000 ounces of silver in 1939 were the Hazel mine in Culberson County and the Sancho Panza and Plata Verde mines in Hudspeth County; silver-copper ores from these three mines yielded 98 percent of the copper produced in the State during the year. Silver production decreased 6 percent in quantity from 1938 but only 2 percent in value owing to an increase of 10 percent in the Government price of newly mined domestic silver by an act of Congress approved July 6, 1939. As the new price of $0.711+ per ounce was in effect for only the last 6 months of 1939, the increase in the average price (formerly $0.646+) for the year was only 5 percent. The output of gold and lead decreased in both quantity and value, but that of copper increased. No zinc has been recovered from ores mined in Texas since 1917.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver: 1938–39: Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464. [5] $0.67878787.

MINE PRODUCTION

The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1935 to 1939, as well as the total metal production from 1885 to 1939.

Mine production of gold, silver, copper, lead, and zinc in Texas, 1935–39, and total, 1885–1939, in terms of recovered metals

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1935	72,222	518	$18,130	1,000,960	$719,440
1936	104,990	613	21,455	1,361,459	1,054,450
1937	120,145	562	19,670	1,325,660	1,025,398
1938	131,002	439	15,365	1,433,008	926,389
1939	141,795	324	11,340	1,341,945	910,896
1885–1939	(1)	7,423	193,750	30,091,579	21,151,856

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1935	28,000	$2,324	1,043,000	$41,720			$781,614
1936	53,000	4,876	935,000	43,010			1,123,791
1937	320,000	38,720	790,000	46,610			1,130,398
1938	32,000	3,136	684,000	31,464			976,354

[2] Short tons.

Mine production of gold, silver, copper, and lead in Texas in 1939, by counties, in terms of recovered metals

County	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)
Culberson	1	1,742		32,690	24,000	
Hudspeth	5	1,119	1	5,507	44,000	1,400
Presidio	1	138,934	323	1,303,748		452,600
	7	141,795	324	1,341,945	68,000	454,000
Total, 1938	7	131,002	439	1,433,008	32,000	684,000

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Texas in 1939, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)
Dry and siliceous silver ore	5	141,132	323.90	1,339,609	35,830	452,855
Copper ore	2	657		2,209	32,170	160
Lead ore	1	6	.10	127		985
	[1] 7	141,795	324.00	1,341,945	68,000	454,000
Total, 1938	7	131,002	439.00	1,433,008	32,000	684,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

SMELTING AND REFINING PLANTS IN TEXAS

In 1939 the American Smelting & Refining Co. continued to purchase gold, silver, copper, and lead ores and concentrates from operators in the Western States for reduction in its lead and copper smelters at El Paso. The copper and lead furnaces were in operation only part of the year owing to a sharp drop in receipts as a result of the termination on March 22, 1939, of the company contract under which it had treated the copper concentrates from the 15,000-ton Chino concentrator at Hurley, N. Mex., and of the closing on May 31, 1939, of the Pecos zinc-lead mine and 600-ton flotation mill in San Miguel County, N. Mex., formerly an important shipper of lead-copper-gold-silver concentrates to the plant. In addition to the lead and copper furnaces the plant contains a unit for the recovery of arsenic. The Nichols electrolytic copper refinery at El Paso, a unit of the Phelps Dodge Corporation, continued to treat copper anodes produced at the corporation Arizona smelters. The Illinois Zinc Co. smelter at Dumas treated concentrates from the Peru mill at Deming, N. Mex., from January 1 to March 25, 1939, when it was shut down; it remained idle the rest of the year. The American Smelting & Refining Co. zinc smelter at Amarillo was operated continuously on zinc ores and concentrates purchased from operators in Arizona, Colorado, Nevada, New Mexico, and Utah.

MINE REVIEW BY COUNTIES

Culberson County.—Ore from the Hazel mine northwest of Van Horn, worked under lease by A. P. Williams throughout 1939 except for 2 weeks in July, yielded all the metal output from Culberson County during the year. The ore contained principally silver, with a small content of copper, and was shipped crude to the El Paso smelter.

Hudspeth County.—A lessee began operating the Sancho Panza mine northeast of Allamoore on a small scale about September 1, 1939, and to the end of the year shipped silver-copper ore to the El Paso smelter. The Texas-Arizona Mining Co. shipped a few cars of silver ore containing a little copper from the Plata Verde mine southwest of Van Horn. Small quantities of copper and silver-copper ore from two prospects in the Allamoore district, one of which was called the Sancho Panza No. 2, and 6 tons of lead-silver ore from a property near Sierra Blanca were shipped to the El Paso smelter during the year.

Presidio County.—The American Metal Co. of Texas operated its Presidio silver mine and gravity concentration-cyanidation mill at Shafter continuously at capacity in 1939. The maximum quantity of ore the mill can handle in 24 hours is 400 tons and the average treated was 381 tons compared with 350 tons in 1938. However, the average grade of ore was lower in 1939 than in 1938, and the total quantity of silver recovered decreased slightly. The mine is developed by two vertical shafts, one 400 and one 700 feet deep; three underground subshafts, one 100, one 250, and one 450 feet deep; and nine levels with stopes, raises, and other openings totaling more than 50 miles of underground workings. Development work in 1939 totaled 7,884 feet of drifts and raises and 30,319 feet of diamond drilling. The minerals contained in the ore are argentite, cerargyrite, galena, anglesite, and cerussite. The ore is transported 1¼ miles by rail and aerial tramways from the shafts to the mill. It is crushed to one-quarter-inch size and then slimed to 65 percent minus 200-mesh in ball mills, grinding in cyanide solution. Minus-6-mesh material is screened out before grinding and tabled for lead-silver concentrates. Part of the ball-mill circulating load is also passed over tables. The pulp is agitated in Pachuca tanks and then passes through a series of thickeners for washing and decantation. The last thickener underflow is filtered before going to waste. The silver-bearing solutions are clarified and precipitated, using zinc dust. In 1939 the mill produced 636 tons of table concentrates averaging 0.04 ounce of gold and 321.29 ounces of silver to the ton and 35.18 percent lead (wet assay). The concentrates and precipitates were shipped to the Carteret (N. J.) smelter. Electric power for the mine and mill is obtained from a 1,200-horsepower Diesel plant.

Production of silver from the Presidio mine,[1] 1885–1939 [2]

Period	Mill heads treated (short tons)	Silver content of mill heads (ounces)		Recovery of silver	
		Per ton	Total	Percent	Ounces

GOLD, SILVER, COPPER, LEAD, AND ZINC IN UTAH

(MINE REPORT)

By T. H. Miller and Paul Luff

SUMMARY OUTLINE

The total value of the output of gold, silver, copper, lead, and zinc from mines in Utah, in terms of recoverable metals, was $62,725,551 in 1939 compared with $43,745,902 in 1938, an increase of 43 percent. There was a gain in total value of each of the five metals, notably in copper which increased $14,560,424; the total value of gold rose $2,699,235, that of silver $1,043,302, that of lead $317,152, and that of zinc $359,536. Most of the gain in copper and gold was in the Bingham district and was due to a larger output of copper ore by the Utah Copper Co. There was a substantial increase in production of zinc-lead ore from the Park City region, but this gain was partly offset by decreased output of zinc-lead ore from other sections of the State.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in Utah, 1935–39, and total, 1864–1939, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1935	203	31	7,771,596	184,759.80	$6,466,593	9,206,329	$6,617,049

1864–1939	[2] 3,147,824	924,114,309	[2] 4,012,517	432,208,528	[2] 703,819	84,017,989	2,112,680,011

[1] 1864–1901: Figures not available; 1902–39: 361,473,820 tons produced. [2] Short tons.

Gold.—The output of gold in Utah increased 77,121 ounces in 1939—gold from copper ore increased 61,553 ounces and that from siliceous ores 15,228 ounces. Copper ore yielded 57 percent of the total gold, siliceous ores 31 percent, and zinc-lead ore 10 percent. Ore of all classes treated at concentration mills yielded 67 percent of the total gold, crude ore smelted 27 percent, and ore cyanided nearly 6 percent. There was a gain of 61,165 ounces in gold from the Bingham or West Mountain district, owing to increased output of copper ore from the Utah Copper property, and the district yielded nearly 69 percent of the State total gold. There were marked increases in gold from Tooele County and the Tintic district and a slight increase from Park City. The Utah Copper Co. was, as usual, the largest gold producer in Utah; it was followed by the Con Mercur, United States & Lark, Tintic Bullion, and Mammoth mines.

Silver.—The output of silver from Utah mines increased 11 percent in 1939. There was a gain of more than 600,000 ounces in Tooele County, owing to greater production from the Ophir Hill and Hidden Treasure properties; there were increases also at Bingham and Park City, but there was a decrease of nearly 282,000 ounces in the Tintic district. Zinc-lead and zinc-lead-copper ores yielded 44 percent of the total silver, siliceous ores 32 percent, copper ore 14 percent, and lead ore nearly 10 percent. Concentrates of all classes yielded 62 percent of the total silver and crude ore smelted nearly 38 percent. Silver from copper ore gained nearly 600,000 ounces, owing to increased output of copper ore at Bingham; silver from siliceous ores increased more than 320,000 ounces. The United States & Lark property again was the leading silver producer in Utah, followed by the Tintic Standard, Utah Copper, Silver King Coalition, Park City Consolidated, and Ophir Hill properties; these six properties produced 69 percent of the State total.

Copper.—The output of recoverable copper in Utah increased 127,528,000 pounds in 1939, owing to the increased rate of operations by the Utah Copper Co. The open-cut mine at Bingham and the mills at Magna and Arthur were operated at a record high in November and December, and the output of copper ore from the mine increased from 11,704,900 tons in 1938 to 19,310,200 tons in 1939 but was much less than the record of 23,119,800 tons established in 1937. Copper ore and mine-water precipitates yielded more than 96 percent of the State total copper in 1939, and most of the remainder came from siliceous ores shipped for smelting and from zinc-lead ore treated by flotation. Other important copper producers included the United

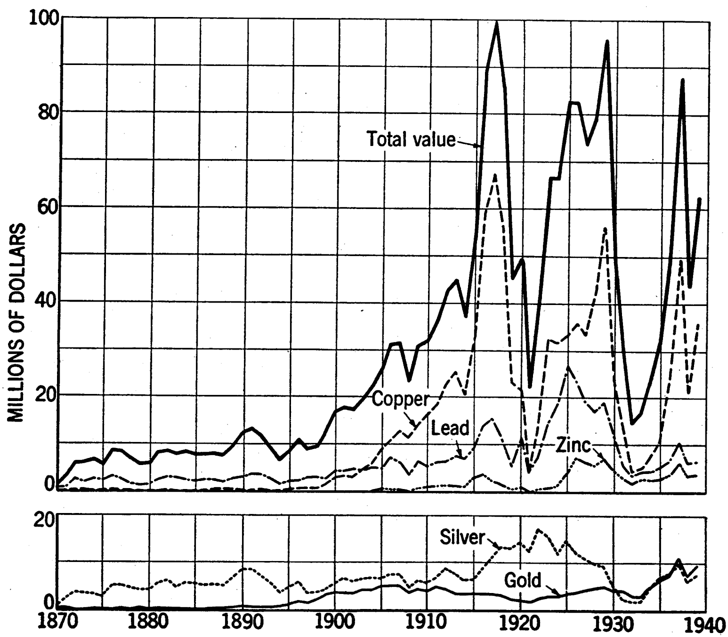

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Utah, 1870–1939.

States & Lark property at Bingham, the Ophir Hill and Hidden Treasure mines in Tooele County, and the Ohio Copper and Boston Consolidated mines at Bingham.

Lead.—There was a 3-percent gain in production of recoverable lead in Utah in 1939. The output from the Park City region and from Tooele County increased, but that from the Bingham and Tintic districts declined. Most of the gain was from siliceous ores, as lead from lead ore decreased and that from zinc-lead ore was about the same as in 1938. Zinc-lead and zinc-lead-copper ores yielded 70 percent of the total lead, lead ore 17 percent, and siliceous ores 11 percent. Reopening the Silver King Coalition and Park Utah Consolidated mines in May 1939 resulted in increased output of lead from Park City, but there were decreases from the United States & Lark mine at Bingham and from the Tintic Standard mine in the Tintic district; substantial increases were made by the Ophir Hill and Hidden Treasure mines in Tooele County. The United States & Lark mine again was the largest lead producer in Utah, followed by the Silver King Coalition, Tintic Standard, Ophir Hill, Park Utah Consolidated, and West Calumet properties; these six mines produced 74 percent of the State total.

Zinc.—The output of recoverable zinc in Utah increased slightly in 1939, owing to the increase in the Park City region; zinc from Bingham decreased nearly 4,500,000 pounds, and there were slight decreases in the Tintic district and in Tooele County. Nearly all the zinc recovered came from zinc-lead ore treated by flotation at four plants; zinc-lead ore shipped for smelting yielded 191,504 pounds of recoverable zinc. The United States & Lark mine at Bingham again was the chief zinc producer, followed by the Silver King Coalition and Park Utah Consolidated at Park City and the West Calumet and Hidden Treasure in Tooele County; these five mines produced 85 percent of the State total.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Utah in 1939, by counties, in terms of recovered metals

County	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] Includes 145 ounces of placer gold distributed as follows: Garfield County, 7 ounces; Grand County, 70 ounces; Millard County, 19 ounces; San Juan County, 21 ounces; and Uintah County, 28 ounces.
[2] Includes 148 ounces of placer gold.

MINING INDUSTRY

The output of copper ore from the Utah Copper mine at Bingham was increased markedly during the fall of 1939, and by the end of the year the property was producing recoverable copper at the rate of nearly 40,000,000 pounds a month, the highest rate in the history of the company; the resulting increase for the full year in tonnage of copper ore carrying also a low content of gold and silver accounted for nearly all the gain in copper output in Utah in 1939 and contributed much of the increase in both gold and silver. The output of zinc-lead ore from the Park City region was materially higher than in 1938 but was considerably below a normal average, as the properties of both the Silver King Coalition Mines Co. and the Park Utah Consolidated Mines Co. were operated only about 8 months in 1939 (these mines were reopened in May after a year's shut-down). The production of both lead and zinc from Bingham decreased in 1939, owing to the decrease in zinc-lead ore mined at the property of the United States Smelting, Refining & Mining Co. There was a marked increase in value of metal output in Tooele County in 1939; most of the gain in gold was due to increased activity at mines in the Camp Floyd (Mercur) district, and the increased output at the Ophir Hill and Hidden Treasure properties was responsible for the gain in output of silver, copper, and lead.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Utah in 1939, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	41	385,500	63,507	419,534	2,090,687	1,052,405	
Dry and siliceous gold-silver ore	24	133,029	17,582	894,471	1,322,736	3,357,471	
Dry and siliceous silver ore	30	320,368	4,405	2,081,651	3,169,613	10,354,617	
	95	838,897	85,494	3,395,656	6,583,036	14,764,493	
Copper ore	15	19,602,472	159,653	1,514,899	[1] 331,374,061	22,873	
Lead ore	77	77,072	5,043	1,048,887	649,545	23,380,971	
Lead-copper ore	1	4,951	41	81,490	385,239	1,915,212	
Zinc-lead ore; Zinc-lead-copper ore[2]	30	570,705	27,375	4,717,700	4,788,119	95,184,451	69,052,000
Total, lode mines	[3] 175	21,094,097	277,606	10,758,632	[1] 343,780,000	135,268,000	69,052,000
Total, placers	11		145	25			
	186	21,094,097	277,751	10,758,657	[1] 343,780,000	135,268,000	69,052,000
Total, 1938	205	13,248,660	200,630	9,682,732	[4] 216,252,000	131,314,000	67,316,000

[1] Includes 7,923,790 pounds recovered from mine-water precipitates.
[2] Zinc-lead-copper ore all from 1 mine; Bureau of Mines not at liberty to publish figures.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 10,220,878 pounds recovered from mine-water precipitates.

METALLURGIC INDUSTRY

The 21,094,097 tons of ore produced in Utah in 1939 comprised 230,224 tons treated by cyanidation (no ore amalgamated in Utah in 1939) compared with 190,312 tons cyanided and 7,624 tons amalgamated in 1938; 20,393,488 tons treated at concentration plants, a decided increase from 12,597,042 tons in 1938; and 470,385 tons shipped crude to smelters compared with 453,682 tons in 1938.

All the ore cyanided was treated at the plants of two companies at Mercur, each of which treated considerable custom as well as company ore. The 230,224 tons cyanided contained 21,805 ounces of gold and 3,800 ounces of silver; the cyanide bullion produced yielded 15,651 ounces of gold and 1,967 ounces of silver, indicating an average recovery of 72 percent of the gold and 52 percent of the silver.

Ten concentration plants were operated in Utah in 1939. Three plants (Arthur, Magna, and Ohio Copper) treated 19,601,000 tons of copper ore and old tailings; four mills (Bauer, Midvale, Silver King, and Tooele) treated 570,187 tons of zinc-lead ore and zinc-lead-copper ore; one mill (Ophir Hill) treated 222,178 tons of silver tailings; and two small gravity-concentration plants in Tooele County treated 123 tons of lead ore.

The following tables give details of treatment for all the ore produced in Utah in 1939.

Mine production of metals in Utah in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Ore cyanided	230, 224	15, 651	1, 967

[2] Tintic district lies in both Juab and Utah Counties.

BEAVER COUNTY

Beaver Lake district.—A car of silver-lead smelting ore was shipped in 1939 from the Beaver Lake mine northwest of Milford.

Bradshaw district.—Two cars of silver smelting ore were shipped in 1939 from the Honey Boy mine 10 miles southeast of Milford. A test lot of gold ore was produced at the Cave property.

Granite district.—A test lot of lead ore was shipped in 1939 from the Beaver View property 5 miles north of Adamsville.

Pine Grove district.—All the output from the Pine Grove district in 1939 was silver-lead ore shipped to smelters from the Revenue property, 22 miles west of Frisco, operated by the Wah Wah Mining Co.

San Francisco district.—The value of metal output from the San Francisco district increased $105,149 in 1939, owing to the increase at the Horn Silver mine near Frisco; the mine was operated on a block-leasing system, and the output comprised 8,821 tons of gold-silver ore and 1,609 tons of lead ore shipped to smelters and 120 tons of zinc-lead ore sent to the flotation plant at Midvale—a total of 10,550 tons compared with 4,811 tons in 1938. The rest of the district output comprised small lots of smelting ore from the Cactus, Quadmetals, and Club properties.

Star and North Star district.—Lessees continued shipments of zinc-lead ore and lead ore from the Moscow Silver property in 1939; a car of zinc-lead ore was shipped also from the Harrington-Hickory mine by the New Majestic Mining Co.; and a test lot of gold ore was shipped from the Gold Bar property.

BOX ELDER COUNTY

Ashbrook district.—A lessee shipped 160 tons of silver ore from the Vipont mine in 1939, an increase from 30 tons in 1938.

Crater Island district.—A test lot of copper ore was shipped from the Copper Blossom property in 1939 by a lessee.

Park Valley district.—The Little May Mining Co. mined a little gold ore at the Raft River property in 1939.

GARFIELD COUNTY

A test lot of copper ore was shipped in 1939 from the Bromide & Mount Hillyer property in the Henry Mountains district. A little placer gold was recovered at two properties in the Imperial (Crescent Creek) district.

GRAND COUNTY

The entire output from Grand County in 1939 came from operations at three placers along the Colorado River; most of it originated at the Rio Grande group 2 miles north of Moab, where about 25,000 cubic yards of gravel were handled by a tractor-scraper unit.

IRON COUNTY

Stateline district.—The value of metal output from Iron County (all from the Stateline district) in 1939 was more than double that in 1938, owing to increased shipments of gold ore to smelters from the Gold Hill and Creole mines; the rest of the district output was crude ore shipped to smelters from several properties, including the Wonder, Buck & Winner, Helen, and Beaver Empire mines.

244615—40——30

JUAB COUNTY

Detroit district.—Lessees continued to ship gold ore from the Ibex mine 35 miles west of Delta, but the output in 1939 decreased sharply from that in 1938.

Fish Springs district.—Small lots of rich silver-lead ore were shipped in 1939 from the Carnation, Galena, and Utah mines (all east of Callao), but the value of the metal output of the Fish Springs district declined $11,844.

Mount Nebo district.—Small lots of lead ore were shipped in 1939 from the Liberty Lead and Earl properties near Santaquin.

Tintic district.—The Tintic district lies in both Juab and Utah Counties, and the mines in both sections are reviewed here. The table that follows gives the metal production in each section in 1939, a comparison of the total with that for 1938, and the total output of the district from 1869 to 1939. The table indicates increases in output of gold and copper but decreases in silver, lead, and zinc. The value of the output from the western section (Juab County) increased $212,293, but that from the eastern or Utah County section decreased $127,764.

Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1938–39, and total, 1869–1939, in terms of recovered metals

	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc	Total value
1939		*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
Juab County	22	159.426	21,723	1,021,101	1,104,500	5,470,979	426,904	$1,847,619
Utah County	13	135,202	19,357	2,206,707	1,720,933	11,765,639	1,276,000	2,973,695
	35	294,628	41,080	3,227,808	2,825,433	17,236,618	1,702,904	4,821,314
Total, 1938	25	293,428	36,148	3,509,632	2,353,970	19,209,239	1,842,458	4,736,785
Total, 1869–1939		(1)	2,435,607	247,760,072	232,247,447	1,766,091,359	38,702,024	367,955,105

1 Figures not available.

In 1939 the Chief Consolidated Mining Co. continued to operate at the Chief No. 1, Gemini, Eureka Hill, and Plutus mines in Juab County, but no work was reported at the Apex Standard property in Utah County. According to the company printed annual report the output in 1939 was considerably larger than that in 1938. It comprised 25,613 tons of siliceous ore, 1,250 tons of lead ore, and 2,155 tons of zinc-lead ore from the Chief No. 1 mine; 2,947 tons of siliceous ore and 456 tons of lead ore from the Gemini mine; 3,768 tons of siliceous ore and 35 tons of lead ore from the Eureka Hill mine; and 4,100 tons of siliceous ore and 13 tons of lead ore from the Plutus mine—a total of 40,337 tons of ore of all classes yielding 3,601 ounces of gold, 345,788 ounces of silver, 117,569 pounds of copper, 919,847 pounds of lead, and 367,460 pounds of zinc. In addition, lessees shipped old tailings from the Eureka Hill dumps and residue from the Chief Consolidated volatilization plant at Eureka, which has been idle for many years. The company reported a total of 2,132 feet of development and 485 feet of diamond drilling at the Juab County properties in 1939. The United States Smelting, Refining & Mining Co. in 1939 continued to operate at the Centennial-Beck, Victoria, and Eagle & Blue Bell properties; all the output was by lessees and comprised about 39,000 tons of siliceous ore and about 2,700 tons of lead ore, indicating slight decreases compared with 1938. The Mammoth Mining Co. operated regularly in 1939 at the property near Mammoth and produced 40,801 tons of smelting ores (chiefly siliceous gold ore), about the same as in 1938; no new development other than stoping was reported, and dividends paid totaled $59,298. Crude ore was shipped to smelters by lessees from the Dragon, Empire Star, Swansea, Treasure, and Victor groups, all owned or controlled by the International Smelting & Refining Co.; most of the output was siliceous gold-silver ore from the Dragon and Empire Star units. Leasing operations at the Godiva property were continued in 1939, and the output comprised 3,651 tons of ore (gold ore, lead ore, and zinc-lead ore) shipped to smelters. The output of siliceous ore from the Grand Central mine of the American Smelting & Refining Co. decreased from more than 28,000 tons in 1938 to about 1,700 tons in 1939; the entire output in 1939 was from lessees' operations, as no production was made on company account. The remainder of the output from the Juab County section of the Tintic district was crude ore shipped to smelters from several properties, including the Joe Daily, Showers, Sunbeam, and Undine (Windrige) mines.

The printed annual report of the Tintic Standard Mining Co. and subsidiary companies gives the following details of production in 1939 from properties in the Utah County section of the Tintic district, owned or controlled by the company: Tintic Standard mines (including the Iron Blossom mine), 65,317 tons of siliceous ore and 21,440 tons of lead ore; Eureka Standard mine, 3,357 tons of siliceous ore and 9,886 tons of zinc-lead ore; Eureka Lilly mine, 2,876 tons of siliceous ore; Colorado Consolidated mine, 10,491 tons of siliceous ore; and Sioux mine, 168 tons of siliceous ore. Ore of all classes from all mines totaled 113,535 tons containing 7,236 ounces of gold, 2,064,563 ounces of silver, 1,107,694 pounds of copper, 13,600,146 pounds of lead, and 1,747,563 pounds of zinc. The company reported 8,526 feet of development for 1939, chiefly in drifting and raising in the Tintic Standard mine. Producing mines in the Utah County section of the Tintic district, owned or controlled by the International Smelting & Refining Co. and its subsidiaries, included in 1939 the Eureka Bullion, May Day (Mountain View), North Lily, Tintic Bullion, and Yankee properties; the output from the North Lily mine declined, but there was a sharp increase in gold from the Tintic Bullion property as a result of the opening of a new body of rich gold ore in the mine during 1939. The remainder of the district output was crude lead ore shipped to smelters from the Zuma mine.

West Tintic district.—Crude ore was shipped to smelters in 1939 from four properties in the West Tintic district, including the Copper Prince, Orient, and Scotia mines.

MILLARD COUNTY

Detroit district.—The Detroit district lies in both Juab and Millard Counties; the output from the Millard County section in 1939 was gold ore shipped to smelters from the King Tut group.

Sawtooth Mountains district.—Placer gold was produced at the Amasa and New Klondike placers in 1939.

PIUTE COUNTY

Gold Mountain district.—The mill of the Annie Laurie property was not operated in 1939, but lessees shipped nearly 400 tons of gold ore from the mine for smelting. Gold ore was shipped also from the General Connor mine.

Mount Baldy district.—Lessees continued operations at the Deer Trail mine during 1939, and the output of gold ore shipped to smelters increased.

Ohio district.—Gold ore was shipped to smelters in 1939 from the Bully Boy, Gold Strike, Tusher, and Wedge properties. A test lot of lead ore was shipped from the Salt Gap prospect.

SALT LAKE COUNTY

Big and Little Cottonwood districts.—Lessees continued operations in 1939 at the Cardiff property in the Big Cottonwood district; the output was about the same as in 1938 and comprised copper ore, lead ore, and zinc-lead ore shipped for smelting and zinc-lead ore shipped to Midvale for milling. Other producers in the district included the Wasatch Gold Mines property and the Tar Baby mine.

All the output from the Little Cottonwood district in 1939 was crude smelting ore shipped; producing mines included the Alta United, Columbus, Columbus Rexall, Michigan-Utah, and Toledo properties.

Bingham (West Mountain) district.—The Bingham district is by far the most important mining area in Utah. In 1939 mines in the district produced recoverable gold, silver, copper, lead, and zinc valued in all at $50,013,034, or 80 percent of the State total. The value of the district output increased $16,305,116 (48 percent) and represented 86 percent of the State total gain. Most of the district gain was in copper, the output of which increased 123,614,375 pounds (58 percent); there were also substantial increases in gold and silver, but the quantity of lead and zinc declined. The following table gives the production from mines at Bingham in 1938 and 1939 and the total from 1865 to 1939.

Mine production of gold, silver, copper, lead, and zinc in Bingham or West Mountain district, Salt Lake County, Utah, 1938–39, and total, 1865–1939, in terms of recovered metals

Year	Mines producing	Ore	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1938	14	12,507,863	129,388	3,671,794	212,098,500	82,668,239	46,192,937	$33,707,918
1939	14	20,039,432	190,553	4,120,296	335,712,875	73,684,979	41,721,903	50,013,034
Total, 1865–1939		(1)	3,939,250	112,378,401	(2) 2,932,709	(2) 1,347,994	(2) 349,937	1,214,636,982

(1) Figures not available. (2) Short tons.

All the increase in output of gold, silver, and copper from Bingham in 1939 was caused by the increased rate of operations by the Utah Copper Co. The open-cut mine at Bingham and the mills at Magna and Arthur were operated continuously in 1939, and the output of copper ore was 19,310,200 tons compared with 11,704,900 tons in

1938; the output, however, was much less than the record of 23,119,800 tons established in 1937. According to the printed annual report of the Kennecott Copper Corporation the output of recoverable copper from Utah operations ranged from an average of about 23,000,000 pounds a month from January through August to a high of nearly 40,000,000 pounds a month in November and December. In addition to copper concentrates and other products from the mills, the company also shipped several million pounds of cement copper from the mine-water precipitation plant at Copperton. The molybdenite units in the mills operated regularly in 1939, and the over-all recovery of molybdenite was increased markedly. The American Smelting & Refining Co. operated the full year at the Boston Consolidated property of the Utah Copper Co.; the output, comprising nearly 40,000 tons of gold ore and lead ore shipped to smelters and about 700 tons of zinc-lead ore sent to Midvale for milling, was slightly less than in 1938.

The United States Smelting, Refining & Mining Co. operated continuously at the United States & Lark property at Bingham in 1939, but the quantity of zinc-lead ore sent to the mill at Midvale was nearly 24,000 tons less than in 1938 and the output of crude ore shipped to smelters also declined, resulting in decreases in output of all five metals. Most of the decrease in lead and zinc output from the Bingham district was caused by smaller production at the United States & Lark mine. Other properties at Bingham operated in 1939 by the United States Smelting, Refining & Mining Co. were the Bingham Metals, Montana-Bingham Consolidated, Niagara, and Utah Metal & Tunnel.

The Apex-Delaware group of the National Tunnel & Mines Co. was operated continuously in 1939 by lessees and on company account; the output—about the same as in 1938—comprised gold ore and lead ore shipped to smelters and zinc-lead ore sent to the mill at Tooele. Work on the Elton tunnel was continued, and early in 1940 the bore was reported to have reached the midpoint of its projected length of 23,000 feet.

The Ohio Copper Co. treated 290,800 tons of old tailings in its 1,000-ton mill during 1939, a decrease from the quantity milled in 1938, but the output of copper increased considerably; copper precipitates and a little crude ore also were shipped from the property.

The production of all five metals from the Bingham (Lavagnino) property of the Combined Metals Reduction Co. rose in 1939, as the output of both crude ore shipped to smelters and zinc-lead ore shipped to the mill at Bauer increased; the yield of gold from the property was 70 percent greater than in 1938.

Other production from the Bingham district in 1939 included copper ore from the Bingham Congor mine and gold ore from the Ophir group.

SAN JUAN COUNTY

Colorado River district.—Placer bullion was recovered in 1939 by sluicing at the Dorothy and Red Canyon properties on the Colorado River.

La Sal district.—A test lot of copper ore was shipped in 1939 from the Lisbon Copper group south of Moab.

SEVIER COUNTY

Henry district.—The B. W. & H. property, chief producer in Sevier County in 1938, was idle in 1939. A test lot of gold ore was shipped from the Independence property.

SUMMIT AND WASATCH COUNTIES

PARK CITY REGION

The value of metal output from mines in the Park City region increased $1,131,072 (41 percent) in 1939, owing chiefly to reopening of the Silver King Coalition and Park Utah Consolidated properties. The following table gives the production from the Park City region in 1938 and 1939 and the total since 1870.

Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1938–39, and total, 1870–1939, in terms of recovered metals

Year	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc	Total value
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1938	12	149, 113	5, 678	1, 962, 576	530, 041	14, 515, 652	11, 356, 855	$2, 732, 259
1939	11	182, 344	6, 548	2, 229, 645	824, 673	23, 262, 127	18, 107, 866	3, 863, 331
Total, 1870–1939		(1)	436, 338	220, 063, 813	60, 524, 513	2, 210, 261, 434	517, 504, 911	321, 766, 897

1 Figures not available.

The mine and 800-ton flotation plant of the Silver King Coalition Mines Co. at Park City were reopened on May 8, 1939, ending a shut-down that began in April 1938. According to the company printed annual report the 1939 output comprised 66,876 tons of milling ore and 243 tons of crude lead ore shipped for smelting; the products sold contained 1,308 ounces of gold, 924,874 ounces of silver, 447,098 pounds of copper, 14,746,345 pounds of lead, and 10,180,823 pounds of zinc. Mine development in 1939 totaled 11,944 feet, including 373 feet of shaft sinking at the new Thaynes shaft which was completed to a depth of 1,752 feet. This shaft has improved ventilation in the entire mine and provides a new outlet for mine waste. Dividends declared in 1939 amounted to $305,117.

The Park Utah Consolidated Mines Co. resumed work on a part-time basis at the Judge (City unit) property in May after a shut-down of about a year. The rate of production was increased during the fall and was on a normal basis at the end of the year. The output comprised 29,303 tons of zinc-lead ore sent to the mill at Tooele and 5,888 tons of smelting ore (silver ore and lead ore). According to the company printed annual report the 35,191 tons of ore contained 722 ounces of gold, 244,901 ounces of silver, 25,759 pounds of copper, 7,097,906 pounds of lead, and 8,911,940 pounds of zinc. Operations were resumed also at the Liberty property near Keetley by the Park City Utah Mines Co. (affiliate of the Park Utah Consolidated Mines Co.) after a shut-down of several years owing to litigation; the output in 1939 comprised 2,551 tons of zinc-lead ore and 2,038 tons of lead ore. The Daly Mining Co. (subsidiary of the Park Utah Consolidated Mines Co.) shipped 331 tons of silver ore from the Daly dumps.

According to the printed annual report of the Park City Consolidated Mines Co. the output from the Roosevelt group comprised 55,631 tons of ore in 1939 compared with 74,650 tons in 1938. The 1939 output, shipped to the flotation plant at Midvale for treatment, contained 2,744 ounces of gold, 845,607 ounces of silver, 105,873 pounds of lead, and 2,728,974 pounds of zinc. The New Park Mining Co. operated the full year at the Park Galena property, producing 15,845 tons of zinc-lead ore—about the same as in 1938. The company extended the Mayflower tunnel about 3,000 feet, undercutting the Park Galena ore body in December; mining of this ore body will be greatly facilitated with completion of raises from the tunnel level. The United States Smelting, Refining & Mining Co. reported 2,884 feet of drifting and raising at the Park City unit (Star) during 1939; several cars of zinc-lead ore produced during development were shipped to Midvale for milling. Lessees operating property of the Park Flag Mines Co. shipped about 3,700 tons of siliceous smelting ore in 1939.

The rest of the output from the Park City region in 1939 included old tailings from Silver Creek shipped for smelting and a little zinc-lead ore from the New Quincy property sent to Tooele for milling.

TOOELE COUNTY

The total value of metal output from mines in Tooele County increased $1,355,829 (60 percent) in 1939, as substantial gains were recorded in the Ophir and Camp Floyd districts.

Camp Floyd district.—The output of gold from Mercur continued to increase in 1939, and the output was 31,282 ounces compared with 23,001 ounces in 1938 and 14,016 ounces in 1937. The Con Mercur property, operated by Snyder Mines, Inc., again was the largest producer in the district; the output comprised 43,493 tons of gold ore shipped to smelters and 21,240 tons of ore treated by straight cyanidation. The Snyder cyanidation mill also handled nearly 38,000 tons of ore from the West Dip property operated by the Ophir Development Co., and custom ore was received also from five other mines in the district. The Geyser Marion Gold Mining Co. continued operations at the Geyser Marion and Sacramento properties; more than 150,000 tons of gold ore were treated in the enlarged cyanidation units, a marked increase over 1938. Other producers at Mercur in 1939 were the Boston Sunshine, Herschel, Saratoga (McCornick), Rover, and Silver Lode properties.

Clifton (Gold Hill) district.—All the output from Gold Hill in 1939 was crude ore shipped for smelting; it comprised lead ore from the Rube and Spotted Fawn mines and silver ore from the Success and Rose properties.

Columbia district.—A car of lead smelting ore was shipped from the Benmore group near Vernon in 1939.

Dugway district.—Zinc-lead ore from the Four Metals mine was shipped in 1939 to Tooele for milling.

Erickson district.—A lessee shipped silver smelting ore from the property of the O. K. Silver Mining & Milling Co. in 1939.

Free Coinage district.—Lead smelting ore was shipped from the Humdinger and Utah-Bunker Hill properties in 1939.

Lakeside district.—The Georgia Lyn Mining Co. treated a little lead ore in a small gravity-concentration plant and shipped lead concentrates, together with crude lead ore, to the Murray smelter in 1939. Lessees shipped crude lead ore from the Monarch mine of the Lakeside Monarch Mining Co., but the flotation mill on the property was idle.

North Tintic district.—Lessees shipped small lots of lead smelting ore from the Scranton property in 1939.

Ophir district.—The total value of metal output from mines in the Ophir district increased from $551,189 in 1938 to $1,676,297 in 1939, owing to increased output from both the Hidden Treasure and Ophir Hill mines. The United States Smelting, Refining & Mining Co. operated the entire year at the Hidden Treasure mine, and the output comprised lead-copper ore shipped to smelters and zinc-lead-copper ore sent to the mill at Midvale. The complex milling ore was treated in a separate circuit of the Midvale concentrator, making copper concentrates, lead concentrates, zinc concentrates, and iron concentrates; the increase in output of copper was noteworthy. The new 700-ton flotation plant of the International Smelting & Refining Co., which was put in operation in November 1938, was operated throughout 1939, treating 222,178 tons of old tailings from the Ophir Hill dumps; lead-copper concentrates were trucked to the smelter at Tooele for treatment. Underground mining at the Ophir Hill property was continued by the Ophir Development Co., and the output comprised nearly 2,300 tons of zinc-lead ore sent to Tooele for milling; the Ophir Development Co. also operated property of the Ophir Coalition Mines Co. and shipped crude lead smelting ore. The remainder of the district output in 1939 was lead ore and silver ore shipped to smelters from the Kearsarge, Ophir, Queen of the Hills, Tintic Ophir, Wandering Jew, Madison, Hullinger, Cowan, Silver Eagle, and Silver Prince properties.

Rush Valley district.—The Combined Metals Reduction Co. continued operations in 1939 at the Cyclone (Bluestone), Honerine (Bullion Coalition), and West Calumet properties. Most of the production came from company and lessee operations at the West Calumet mine, which produced 32,738 tons of zinc-lead ore sent to the mill at Bauer and 461 tons of lead ore shipped for smelting. The output from the Honerine group comprised 709 tons of crude lead ore and 48 tons of zinc-lead ore, and that from the Cyclone property 3,919 tons of lead ore. The rest of the district output was crude lead ore shipped for smelting, chiefly from the Commodore, Muirbrook, and Salvation-Hercules mines.

Silver Islet district.—A test lot of silver ore was shipped from the Silver Island mine in 1939.

Third Term district.—A little lead ore was treated in a small table-concentration plant in 1939 by the Metal Queen Mining Co.

Willow Springs district.—Most of the output from the Willow Springs district in 1939 was lead ore shipped by lessees from the Oro Del Rey mine. A little gold ore was shipped from the Depression property.

UINTAH COUNTY

The output from Uintah County in 1939 comprised placer gold and silver from sluicing operations at the Big Ben and Big Lizard placers on Green River, a test lot of copper ore from the Dyer mine in the Carbonate district, and a little lead ore from a prospect near Vernal.

UTAH COUNTY

American Fork district.—Lessees continued operations at the Yankee property of the American Smelting & Refining Co., but the output in 1939 declined to 431 tons of gold ore shipped for smelting and 65 tons of zinc-lead ore sent to Midvale for milling. A car of zinc-lead milling ore was shipped also from the Dutchman mine. The remainder of the output comprised small lots of crude lead ore from the Blue Rock, Miller, Silver Dipper, and Silver Dollar properties.

Tintic district.—Mines in the Utah County section of the Tintic district are reviewed under Juab County.

WASHINGTON COUNTY

A small lot of copper ore was shipped by a lessee in 1939 from the Dixie property of the Utah Southern Mining Co., and small lots of crude ore were shipped from the Hidden Canyon and Silver Peak properties, all in the Tutsagubet district. A little gold ore was produced at a prospect in the Bull Valley district.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN WASHINGTON

(MINE REPORT)

By T. H. Miller and Paul Luff

SUMMARY OUTLINE

The total value of the gold, silver, copper, lead, and zinc recovered from Washington ores and gravels was $6,739,467 in 1939 compared with $5,510,440 in 1938, an increase of 22 percent. Substantial gains were recorded in output of gold, silver, and copper but losses in lead and zinc. The total value of the copper produced increased 59 percent and that of the gold and silver each 22 percent; the total value of lead declined 11 percent and that of zinc 4 percent. Except for a brief shut-down during the summer, the Holden mine and mill of the Howe Sound Co. in Chelan County were operated regularly in 1939, and gains at this property accounted for the increases in total output of gold, silver, and copper in the State. The closing of the Azurite plant in February caused a decrease in gold from Whatcom County, but there was a gain in gold from Okanogan County owing to operation of the Alder group near Twisp by the Methow Gold Corporation. Production of gold from the Republic district, Ferry County, increased slightly in 1939, but that from Stevens County decreased as the First Thought cyanide mill was idle. The output of lead and zinc from Pend Oreille County declined slightly as the mine and mill of the Metaline Mining & Leasing Co. were closed in March.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464. [5] $0.67878787.

Mine production of gold, silver, copper, lead, and zinc in Washington, 1935–39, and total, 1860–1939, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1935	63	172	32,187	9,739.60	$340,886	52,338	$37,618

1939	2,261.00	79,135	358	243	79,378

Gold.—The output of recoverable gold in Washington in 1939 increased 22 percent over 1938, owing chiefly to the larger output of copper ore in Chelan County. Gold from copper ore increased 17,414 ounces, but that from gold ore decreased 1,890 ounces. Gold ore treated at cyanidation plants declined in Ferry, Stevens, and Whatcom Counties, but that shipped to smelters increased markedly in Ferry and Okanogan Counties. The output of gold from Ferry County increased slightly, as the gain in gold from crude smelting ore more than offset the decrease from gold ore cyanided. Production of gold in Okanogan County increased sharply as a result of operations at the Alder group near Twisp. Idleness of the cyanidation mill at the Orient property in 1939 was the cause of decreased output of gold from Stevens County, and closing of the Azurite mill in February resulted in a marked decline in the output of gold from Whatcom County. The Holden property in Chelan County was again by far the largest gold producer in Washington, contributing in 1939 more than half of the State total. Other important producers included the Aurum, Knob Hill, Mountain Lion, Quilp, and Republic properties in Ferry County; the Alder property in Okanogan County;

and the Azurite mine in Whatcom County. The State total output of gold ore was 261,651 tons in 1939 compared with 271,557 tons in 1938; it comprised 6,421 tons amalgamated, 161,551 tons cyanided, 2,600 tons concentrated, and 91,079 tons shipped direct to smelters. Production of gold from placer mines increased from 1,575 ounces in 1938 to 2,261 ounces in 1939; as usual, most of it came from operations on bars along the Columbia River in Ferry and Stevens Counties. Mechanical placer equipment (draglines, power shovels, tractor scrapers, etc.) was used at 15 properties and treated 276,325 cubic yards of gravel which yielded 1,876 ounces of gold and 316 ounces of silver, a total recovery of 24 cents per cubic yard.

Silver.—The output of recoverable silver in Washington in 1939 increased 16 percent in quantity over 1938. Silver from copper ore and gold ore increased, but that from silver ore and zinc-lead ore decreased. Copper ore yielded 43 percent of the total silver, gold ore nearly 38 percent, silver ore nearly 15 percent, and lead ore and zinc lead ore 3 percent. Production of silver increased sharply in Chelan and Ferry Counties but decreased markedly in Okanogan County. The Holden mine in Chelan County was again the chief silver producer in Washington, followed by the Aurum and Knob Hill mines at Republic and the Arlington mine in Okanogan County.

Copper.—The output of recoverable copper in Washington increased 50 percent in quantity in 1939 to a new record and, as in 1938, nearly 98 percent of it came from the Holden property of the Howe Sound Co. in Chelan County; the company treated 596,967 tons of gold-copper-silver ore in its 2,000-ton flotation plant and was again by far the largest producer of gold, silver, and copper in the State. Other copper producers included the Sunset and Florence Rae mines in Snohomish County, the Alder and Arlington mines in Okanogan County, the Royal property in Chelan County, and the Chinto mine in Stevens County.

Lead and zinc.—The output of recoverable lead in Washington decreased 13 percent in quantity in 1939 and that of zinc 11 percent. Production of zinc-lead ore, chiefly from two mines in Pend Oreille County, rose slightly, but the grade was lower and less lead and zinc were recovered than in 1938. The 700-ton mill of the Pend Oreille Mines & Metals Co. was operated the entire year, but the 400-ton plant of the Metaline Mining & Leasing Co. was operated only 3 months. A little zinc-lead ore was treated at a test mill in Stevens County. Most of the remainder of the lead output came from the Electric Point mine and other properties in Stevens County.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Washington in 1939, by counties, in terms of recovered metals

MINING INDUSTRY

The increased output of gold, silver, and copper in Washington in 1939 was due chiefly to normal operations at the Holden property of the Howe Sound Co. The 2,000-ton flotation mill treated 596,967 tons of ore, compared with 371,800 tons in 1938. As a result, the output of both gold and copper established new records for the State. There was a decrease in gold from ore cyanided, but this loss was more than offset by gains in gold from ore smelted and ore concentrated. The Azurite mill in Whatcom County was closed in February 1939 and the First Thought mill in Stevens County was idle all of 1939, but the Knob Hill plant at Republic operated at capacity the entire year. The output of lead and zinc declined slightly owing to the closing of one of the plants at Metaline Falls in March.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Washington in 1939, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	55	261,651	39,979	167,388	134,417	4,165	
Dry and siliceous gold-silver ore	1	68	30	1,672	595	2,991

	172	1,124,564	90,420	442,063	17,996,000	7,436,000	20,262,000
Total, 1938	157	901,689	74,175	380,938	12,034,000	8,568,000	22,804,000

METALLURGIC INDUSTRY

The total output of ore from mines in Washington in 1939 was 1,124,564 tons and comprised 6,421 tons treated at amalgamation mills, 161,551 tons treated at cyanidation mills, 864,151 tons treated at concentration plants, and 92,441 tons shipped crude to smelters.

Amalgamation plants.—Five straight amalgamation plants and four combined amalgamation and concentration plants were operated in Washington in 1939 and treated 6,421 tons of gold ore; the chief producers were the Bodie mine in Okanogan County and the Boundary Red Mountain property in Whatcom County.

Cyanidation plants.—The 400-ton straight cyanidation plant of Knob Hill Mines, Inc., at Republic, Ferry County, operated throughout 1939 on ore from the Knob Hill, Mountain Lion, and Quilp mines; and the 100-ton cyanidation and blanket-concentration mill at the Azurite mine in Whatcom County operated 30 days on Azurite ore. The two plants treated 161,551 tons of ore and reported the consumption of 20,043 pounds of sodium cyanide (91-percent grade), 220,800 pounds of calcium cyanide, 34,997 pounds of zinc dust, and 876,093 pounds of lime.

Concentration plants.—The 864,151 tons of ore treated at 14 straight flotation plants comprised 597,127 tons of copper ore treated at 2 plants, 259,350 tons of zinc-lead ore treated at 3 plants, 5,074 tons of silver ore treated at 7 plants, and 2,600 tons of gold ore treated at 2 plants.

Details of the treatment of all ore produced in Washington in 1939 are given in the following tables.

Mine production of metals in Washington in 1939, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*

ASOTIN COUNTY

The output of placer gold from Asotin County increased in 1939 owing to the operation of four small dragline and washer plants on bars along the Snake River; the rest of the county output was obtained by small-scale sluicing operations.

BENTON COUNTY

The placer output from bars along the Columbia River near Richland and Paterson decreased slightly in 1939, as the output from the Gone Busted property was less than in 1938.

CHELAN COUNTY

Chelan Lake district.—The Chelan Division of the Howe Sound Co. continued regular activity at the Holden property during 1939, except from July 6 to August 17 when the property was strike-bound. The company mined and milled 596,967 tons of gold-copper-silver ore and was again the leading producer of gold, silver, and copper in Washington. The ore was treated in the 2,000-ton flotation plant, and copper concentrates rich in gold and carrying considerable silver were shipped to Tacoma for smelting. The company reported that mine development in 1939 comprised 13,440 feet of drifts, 5,176 feet of raises, and 21,991 feet of diamond drilling. The 57-percent increase ($1,317,806) in total value of metal output in the Chelan Lake district was greater than the net gain ($1,229,027) in the State total value in 1939.

Columbia River district.—A little placer gold was produced in 1939 at two properties on the Columbia River near Malaga.

Leavenworth district.—A car of copper concentrates was shipped to Tacoma in 1939 from the property of the Royal Development Co., 48 miles northwest of Leavenworth and only 8 miles in a direct line over the mountain from the Holden mine; the Royal property is equipped with a 350-ton flotation mill. It was an important producer of copper from 1935 to 1937 but has been idle since March 1, 1937.

Peshastin Creek district.—Small lots of gold ore were shipped to smelters in 1939 from the Black & White, Blewett, and Apex lodes; a little placer gold was reported recovered from two properties.

Wenatchee River district.—Shipments of ore from the Gold King & Macbeth (Keegan Mining & Development Co.) property near Wenatchee ceased early in 1939, after the contract with the Tacoma smelter terminated. From August 16, 1938, to April 17, 1939, the property produced 19,842 tons of highly siliceous low-grade gold ore which was used as flux at Tacoma; the ore was mined from an opencut and contained 1,358 ounces of gold and 4,164 ounces of silver. Placer gold was reported recovered from three properties on the Wenatchee River near Cashmere and Dryden.

CLALLAM COUNTY

Small-scale sluicing operations on beach sands near Ozette were continued in 1939; most of the gold came from the Yellow Bank property.

COLUMBIA COUNTY

A little placer gold was recovered by sluicing at a bar on the Snake River north of Dayton in 1939.

DOUGLAS COUNTY

The output of gold from placer operations on Columbia River bars in Douglas County increased considerably in 1939 owing to the operation of a bulldozer and sluicing plant on the Hopkins property near Alameda.

FERRY COUNTY

Columbia River district.—Gold production from placer properties along the Columbia River in Ferry County increased markedly in 1939 as the result of work by the Newton Construction Co.; the company used two tractor-scraper units in hauling 90,000 cubic yards of gravel to a washing plant and was the largest placer producer in Washington. Others in the district included small dragline operations at the Fish and Plumb Bar properties and several small-scale sluicing operations.

Danville district.—Shipments of gold ore from the Morning Star mine decreased in 1939. Small lots of copper ore were shipped from the Grand Forks and Gold Cup mines.

Enterprise district.—Small lots of crude ore from the Lucky Boy, Stemwinder, and Tyler properties near Inchelium were shipped in 1939 for smelting.

Republic district.—Mines in the Republic district produced metals valued at $1,106,722 in 1939, an increase of $133,818 over 1938. The entire output from lode mines was siliceous gold ore and comprised 156,176 tons treated by cyanidation and 68,176 tons shipped direct to smelters. The ore cyanided came from the Knob Hill and Mountain Lion properties operated by Knob Hill Mines, Inc., and from the Quilp property of the Eureka Mining & Milling Co.; it was treated in the 400-ton cyanide plant at the Knob Hill mine. Most of the crude smelting ore came from leasing operations on property of the Aurum Mining Co.; other producers of smelting ore included the California, El Caliph, Flag Hill, Knob Hill, Morning Glory, Quilp, Republic, Seattle, Valley, Klepinger, and Anecia properties. The Aurum property was the largest gold producer in the district in 1939, followed by the Knob Hill, Mountain Lion, Quilp, and Republic. A little placer gold was recovered by sluicing at the Marcella property on Granite Creek.

GRANT COUNTY

Most of the output of Grant County in 1939 came from the small power-shovel operation of Miller Bros. at Chinaman Bar on the Columbia River; gold was also recovered at three small sluicing operations along the river.

KING COUNTY

Miller River district.—Gold ore from the Apex mine was treated in 1939 in the 75-ton flotation plant of Apex Gold Mines, Inc. A small quantity of gold ore was shipped from the Coney Basin mine for smelting.

KITTITAS COUNTY

Fish Lake district.—A little gold ore was mined at the Silver Creek property north of Cle Elum in 1939.

Swauk district.—Producing placers near Liberty in 1939 included the Black Bar, Deer Gulch, Gold Bar, and Sunny Bar properties. Small lots of gold ore were produced at the North Star and Sonny Brown mines.

LINCOLN COUNTY

Small-scale sluicing operations in 1939 were reported at two properties on the Columbia River north of Wilbur.

OKANOGAN COUNTY

Cascade district.—The entire output of the Cascade district in 1939 was gold ore from the Bodie mine north of Wauconda and was treated by amalgamation and concentration; the property was operated part of the year by the Northern Gold Corporation and later by the Toroda Gold Mines Corporation.

Columbia River district.—The Gold Bar Mining Co. operated a bulldozer and washing plant in 1939 at the Gold Bar on the Columbia River near Kartar, treating 10,045 cubic yards of gravel from April 11 to November 6. Sluicing was reported at the Funk, Gove, Hill, and Lucky Strike properties.

Conconully district.—Silver ore was treated by flotation at two properties near Conconully in 1939—the Sonny Boy mine operated by the Ruby Mountain Mining Co. and the Mineral Hill group operated by Central Mines, Inc.; lead concentrates were produced at both plants.

Methow district.—The value of the metal output of the Methow district increased from $8,443 in 1938 to $247,196 in 1939 and accounted for most of the gain in Okanogan County. Operations at the Alder group near Twisp were begun April 22 by the Methow Gold Corporation; the output comprised nearly 13,000 tons of gold ore, containing considerable silver and copper, and copper concentrates from several hundred tons of ore treated in the Red Shirt mill and shipped to Tacoma for smelting. Other producers in the district included the Highland Light, Mazama Pride, Mazama Queen, Mid Range, Gold Crown, and Hyde properties.

Myers Creek and Mary Ann Creek district.—Gold ore was shipped in 1939 for smelting from the Gray Eagle, Mother Lode, Poland China (Overtop), and Harris lode mines. Small-scale sluicing operations were reported at the Ottia May and Davey placers.

Palmer Mountain district.—The value of the metal output of the Palmer Mountain district decreased $38,271 in 1939, owing chiefly to the closing of the Arlington mine and mill on April 30; the quantity of silver ore treated at the 75-ton flotation plant was only one-third of that in 1938. Other producers in the district included the Four Metals, Grand Summit, John Judge, Golden Zone, Monto Oro, Owasco, and Ruby mines.

Similkameen River district.—Small-scale sluicing operations in 1939 were reported at five placers along the Similkameen River.

PEND OREILLE COUNTY

Metaline district.—The value of the metal output from Pend Oreille County decreased from $1,473,116 in 1938 to $1,391,570 in 1939 as the output of both lead and zinc declined. The Pend Oreille Mines & Metals Co. operated the mine and 700-ton flotation plant the entire year and treated 241,624 tons of zinc-lead ore compared with 214,120 tons in 1938, but the output of lead and zinc decreased slightly; the company reported mine development in 1939 comprising 50 feet of shaft, 1,500 feet of drifts, 1,000 feet of tunnel, and 10,000 feet of diamond drilling. The Metaline Mining & Leasing Co. suspended production March 15, 1939, after 17,696 tons of zinc-lead ore had been treated in the 400-ton flotation mill (in 1938 the mill treated 35,064 tons of ore); the company reported 9,174 feet of diamond drilling during the year. A little placer gold was recovered by sluicing at two properties on the Pend Oreille River.

SKAMANIA COUNTY

A little gold ore was amalgamated in 1939 at the Camp Creek property in the Niggerhead district.

SNOHOMISH COUNTY

Index district.—The Sunset Copper Co. was idle in 1939, but lessees shipped 514 tons of crude copper ore from the Sunset mine to Tacoma for smelting.

Sultan district.—Four lots of copper ore were shipped to Tacoma in 1939 by the Florence Rae Mining Co., and a small lot of gold ore was shipped from a prospect. Sluicing operations were reported at three placers on the Sultan River.

STEVENS COUNTY

Bossburg district.—Lessees shipped a test lot of silver-lead ore from the Silver Trail mine north of Colville in 1939 for smelting.

Chewelah district.—The Chinto Mining Co. shipped 130 tons of silver-copper ore in 1939 to Tacoma from the Chinto mine on Eagle Mountain; the company reported 700 feet of drifts and tunnels and 1,500 feet of diamond drilling done during the year. A test lot of silver-lead ore was shipped from the Jay Gould mine.

Columbia River district.—The placer output from bars along the Columbia River in Stevens County in 1939 was about the same as in 1938; most of the 1939 output came from power-shovel or tractor-scraper operations at the Gibson Bar, B & W, Grover, and Valbush placers. Sluicing was reported at eight placers.

Colville district.—A car of silver-lead ore was shipped to the Bunker Hill smelter from the Old Dominion mine in 1939, and a little zinc-lead ore was treated by flotation in a small test mill at the Middleport mine.

Kettle Falls district.—The Silver Queen property of the Ark Mines Co. was operated by lessees about 5 months in 1939, and the quantity of silver ore treated in the 40-ton flotation plant decreased from about 1,700 tons in 1938 to 250 tons in 1939; silver-lead-copper concentrates were shipped to the Bunker Hill smelter. The remainder of the output of the Kettle Falls district in 1939 was gold ore shipped from two properties.

Northport district.—The output of lead from the Northport district decreased in 1939 as shipments of crude lead ore from the Electric Point mine declined. Crude lead ore was also shipped from the Gladstone Mountain, Lead Trust, and W. J. Bryan mines to the Bunker Hill smelter, and a little silver ore from the Burrus mine was treated in a small flotation mill.

Orient district.—The metal output of the Orient district decreased sharply in 1939 owing to the closing of the 50-ton cyanidation mill of the First Thought Mine Corporation; no ore was milled in 1939 (in 1938 the mill treated 11,668 tons), but considerable development at the mine was reported. The district output in 1939 comprised small lots of gold ore shipped to Tacoma from the Gem and Gold Stake mines.

Springdale district.—The metal output of the Springdale district increased in 1939 as the Deer Trail mine near Fruitland was reopened; the mine and 100-ton flotation plant were operated several months by the Metals Development Co., and silver concentrates and crude silver ore were sent to the Bunker Hill smelter. The remainder of the district output was crude ore shipped from the Cleveland, Double Eagle, and Lucky Boy mines for smelting.

WHATCOM COUNTY

Mount Baker district.—The Boundary Red Mountain mine was idle in 1939, but material cleaned up from former operations was treated by amalgamation and gold valued at more than $12,000 was recovered. The placer output came from sluicing operations on Ruby Creek.

Slate Creek district.—The value of the metal output of the Slate Creek district dropped from $429,823 in 1938 to $96,548 in 1939, owing to the closing of the Azurite mine and mill in February 1939; the mill treated only 5,375 tons of ore in 1939 compared with 36,515 tons in 1938. The mine has been operated under lease by the American Smelting & Refining Co. since 1936. A 100-ton cyanidation and corduroy-table concentration plant was built and placed in operation in November 1936 and since that time it has treated 72,998 tons of gold ore. The remainder of the district output in 1939 comprised gold ore from the Allen Basin group, shipped to Tacoma, and from the Newlight mine, treated by amalgamation and concentration.

WHITMAN COUNTY

A little placer gold was recovered in 1939 by sluicing at a bar on the Snake River near Almota.

GOLD, SILVER, COPPER, AND LEAD IN WYOMING

(MINE REPORT)

By Chas. W. Henderson and A. J. Martin

SUMMARY OUTLINE

The bulk of the 583 fine ounces of gold and 75 fine ounces of silver recovered from Wyoming ores and gravels in 1939 came from placer mines in the Atlantic City district, Fremont County. No recoverable copper or lead was produced in the State during the year, and only 57 tons of gold and gold-silver ores were shipped from lode mines and prospects. Other activities reported at mines in the State include about 1,000 feet of development work at 14 properties in Albany, Carbon, Fremont, and Johnson Counties; construction of a new mill building at the property of the Powder River Corporation in Johnson County; and reconditioning of the old stamp mill at the Keystone mine in Albany County.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1935–39

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1935	$35.00	$0.71875	$0.083	$0.040	$0.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1935–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–39: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787.

The following table shows the annual output of ore from lode mines producing gold, silver, copper, and lead and the quantity and value of the metals recovered from both lode and placer mines in Wyoming from 1935 to 1939; it also gives the total metal production from 1867 to 1939. About three-fourths of the total recorded value of the four metals is in copper, most of which was mined before 1924 in the Encampment district in Carbon County and the Hartville district in Laramie County.

Mine production of gold, silver, copper, and lead in Wyoming, 1935–39, and total, 1867–1939, in terms of recovered metals

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total value
		Fine ounces	Value	Fine ounces	Value	Pounds	Value	Pounds	Value	
1935	4,190	3,715.00	$130,025	1,152	$828	1,000	$83	5,000	$200	$131,136
1936	344	1,964.40	68,754	1,113	862	--------	--------	--------	--------	69,616
1937	17	1,776.00	62,160	203	157	--------	--------	--------	--------	62,317

REVIEW BY COUNTIES AND DISTRICTS

ALBANY COUNTY

Douglas Creek district (*Holmes, Keystone*).—The Landrith Co. repaired the old stamp mill at the Keystone mine in 1939 and shipped 5 tons of clean-up material containing gold to the Leadville (Colo.) smelter. A 7-ton lot of gold-silver ore was shipped to the Garfield (Utah) smelter from an unidentified claim, presumably in the Douglas Creek district. Some development work was done at the Gold Crater group. Individuals sluicing on Douglas and Little Beaver Creeks recovered small lots of placer gold.

BIG HORN COUNTY

George E. Frame worked his placer ground along Big Horn River approximately 7 miles north of Kane from July 10 to October 10, 1939, using equipment consisting of steel wash boxes, a 4- by 3-inch pump driven by an automobile engine, hose with a 2-inch nozzle, ¼-inch grizzly screen, and sluices. The gravel was shoveled by hand into the wash boxes, from which it was carried by water over the screen and sluices. The gold recovered totaled 5.40 fine ounces.

CARBON COUNTY

Encampment or Upper Platte district.—Development work was continued at the Golden Clover property, from which a car of gold ore containing a little silver was shipped to the Garfield (Utah) smelter in 1939.

Spring Creek district.—The Saratoga Mining Co. operated its 1-cubic yard dragline and screening and sluicing plant on North Spring Creek about 11 weeks in April, May, and June 1939. Sluicing was done from April 20 to September 10 at the Betty No. 1 placer on Savery Creek west of the Spring Creek district.

CROOK COUNTY

Hurricane district.—Small lots of placer gold, one of which ran 0.882 fine in gold and 0.088½ fine in silver, were recovered in 1939 from the Baker placer on Sand Creek.

FREMONT COUNTY

Atlantic City district.—In 1939 the E. T. Fisher Co. operated its 1¼-cubic yard dragline and portable traction screening and sluicing plant for the seventh consecutive season on placer ground in the vicinity of Atlantic City. The company production of gold was a little higher than in 1938 but was much less than the peak of approximately 2,700 ounces recovered in 1934. None of the other individual operations in the Atlantic City district produced more than 10 fine ounces of gold in 1939. The Wyoming Mining Co. operated a ½-cubic yard dragline and a washing plant consisting of two 5-foot concentrating tables and sluices from June 15 to August 10 on placer ground in Poorman Gulch; the recovery amounted to 10.75 crude ounces of dust and buttons averaging 0.906½ fine in gold. Individuals sluicing at the Badger-Fox-Coyote, Blue Bird, Hester, and other placers near Atlantic City and South Pass City recovered small lots of placer gold, part of which was sold to the Smith-Sherlock Co. at South Pass City and part to the Denver Mint.

The B & H Gold Mining Co. shipped 8¼ tons of gold-silver ore to the Garfield (Utah) smelter from the Ellen Mc lode mine group, operated only during the period required for assessment work. Other lode claims from which a little gold was recovered by hand methods in 1939 included the Bouncing Dollar, Jack Rabbit, and Snowbird. The Iron Duke Mining Co. sank 50 feet of shaft and drove 25 feet of drift and 40 feet of crosscut at the Iron Duke mine but shipped no ore during the year. The Diana Mining Co. drove 200 feet of development drifts and tunnel at the McGrath or "1914"-Sullivan property. Some development work was done at the Independent, Lone Star, and R. J. Reynolds groups.

JOHNSON COUNTY

In 1939 the Powder River Corporation shipped a test lot of ore from its property in sec. 20, T. 47 N., R. 85 W., sixth principal meridian. A mill building was constructed on this property during the year.

PARK COUNTY

A little placer gold was recovered in 1939 on Clark Fork in Tps. 57 and 58, R. 101 W., sixth principal meridian.

TETON COUNTY

Two individuals working placers in the Snake River area, one using a shaking machine and the other a sluice, recovered small quantities of placer gold in 1939.

SECONDARY METALS—NONFERROUS

By James S. Earle

SUMMARY OUTLINE

In recognition of the need for additional facts on consumption of the more common nonferrous secondary metals and in order to present information of interest to both suppliers and consumers, the Bureau of Mines revised and enlarged the scope of its nonferrous secondary metal survey in 1939. To satisfy the growing demand for quantitative data on items of nonferrous scrap consumed and to make a separation between "new" and "old" scrap, schedules used in the 1939 canvass were designed to include stocks (by items) on hand at the beginning and end of the year, as well as receipts of purchased scrap and quantities used or resold.

Companies reported the weight of each metal recovered in pure or elemental form apart from the items of scrap used. In compiling the data recoverable metal contents were calculated from assay values assigned to each item of scrap used; in this manner, each metal recovered in alloyed form was determined after allowance had been made for that recovered in pure or unalloyed form.

To avoid duplication of figures, data were assembled only from consumers of purchased secondary metals that are equipped to produce finished products. Returns from remelters, smelters, and refiners were tabulated apart from those from manufacturers and foundries. Thus, two large groups that use scrap as a source of metal supply were included in the survey, whereas metal dealers and those producing "percentage metals" and similar products requiring further metallurgical treatment were excluded.

The canvass of remelters, smelters, and refiners included all metal companies in the United States that produce refined and alloyed products for sale to consumers, whereas the canvass of manufacturers and foundries included all companies that consumed purchased scrap for use in the manufacture of finished products.

Schedules mailed to remelters, smelters, and refiners differed from those mailed to manufacturers and foundries in that no information on plant scrap was requested; manufacturers and foundries were requested to report inventories of plant scrap on hand at the beginning and end of 1939.

The tables for 1939, except for the table showing tin recovered at detinning plants and the tables on imports and exports, do not include comparisons with 1938 because details reported for 1939 are not on a basis comparable with those reported in previous years. It should be stated, however, that the total tonnages recovered in 1939 appear to be approximately comparable to the recoveries revealed by past surveys. A historical table showing nonferrous secondary metals recovered during the 10-year period 1929–38 is included in this report.

Secondary metals of certain classes recovered in the United States, 1929–38, in short tons

	1929	1930	1931	1932	1933
Copper, including that in alloys other than brass	417,600	332,800	261,000	187,700	247,100
Brass scrap re-treated	298,500	192,000	122,800	86,400	130,000
Lead as metal	138,500	129,000	128,800	128,000	131,800
Lead in alloys	172,500	126,800	105,900	70,300	92,700
Zinc as metal	65,400	49,300	34,800	20,000	48,100
Zinc in alloys other than brass	11,600	7,700	7,400	6,300	7,600
Tin as metal	7,400	5,600	5,500	4,650	7,250
Tin in alloys and chemical compounds	26,900	20,600	14,300	10,100	14,850
Aluminum as metal	25,850	19,700	15,200	12,200	14,500
Aluminum in alloys	22,550	18,900	15,100	11,800	19,000
Antimony as metal and in alloys	11,131	8,082	7,900	6,450	7,400
Nickel as metal	850	500	270	200	300
Nickel in nonferrous alloys and salts	3,500	2,400	1,800	1,250	1,350
Total quantity	1,202,281	913,382	720,770	545,350	721,950
Total value	$331,028,900	$193,255,100	$110,674,600	$65,022,800	$101,268,800

	1934	1935	1936	1937	1938
Copper, including that in alloys other than brass	292,500	364,300	365,300	387,600	252,700
Brass scrap re-treated	121,300	120,800	170,400	206,400	153,100
Lead as metal	124,500	156,800	137,500	154,500	119,400
Lead in alloys	83,900	113,600	125,400	120,600	105,500
Zinc as metal	29,300	55,400	68,000	64,540	42,270
Zinc in alloys other than brass	8,200	8,950	11,500	11,150	6,400
Tin as metal	8,250	9,600	7,250	8,270	4,900
Tin in alloys and chemical compounds	16,650	18,300	20,770	22,030	18,710
Aluminum as metal	21,000	23,500	20,900	29,360	16,700
Aluminum in alloys	25,400	27,900	30,600	33,200	22,100
Antimony as metal and in alloys	7,550	9,600	9,900	12,340	8,500
Nickel as metal	550	700	855	917	850
Nickel in nonferrous alloys and salts	1,300	1,250	1,110	1,483	1,450
Total quantity	740,400	910,700	969,485	1,052,390	752,580
Total value	$127,286,100	$155,036,800	$174,183,300	$239,130,800	$137,915,800

Although reports were not received from all consumers, the final tables include data covering 154 plants of remelters, smelters, and refiners, and 1,367 plants of manufacturers and foundries that consumed purchased scrap in 1939. In previous years returns were received from approximately 400 companies. The term "purchased scrap" includes all crude scrap metal received from metal dealers or other sources of supply, as well as all scrap items returned from customers for reworking on a toll basis or conversion agreement.

Stocks of "plant scrap" shown at plants of manufacturers and foundries include all scrap on hand at the beginning and end of the year that was produced within the plant reporting. Typical examples of plant scrap are sprues, gates, risers, butts, croppings, clippings, borings, turnings, and defective products produced as a result of manufacturing operations.

"New scrap" is defined as the refuse produced during the manufacture of articles for ultimate consumption, including all finished and semifinished articles that are to be reworked. Typical examples of new scrap are defective castings, clippings, punchings, turnings, borings, skimmings, drosses, and slags. Finished and semifinished articles frequently are received as scrap because of excess inventory, faulty manufacture, or change in design or other causes of obsolescence, and the metal content of all such articles is included as new scrap.

"Old scrap" is defined as scrap derived from metal articles that have been discarded after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, automobile crankcases, cocks and faucets, and lithographers plates.

In presenting these new data the Bureau of Mines believes that a decided advance has been made that will help to clarify the recovery of metals from secondary sources. It has long been recognized that the return of metals from use exerts a profound effect upon the mining industry, and the revised canvass has been designed to demonstrate the real significance of secondary metals and to assemble basic data of value to the expanding secondary-metals industry. Because of difficulties occasioned by revision of the canvass and the complex nature of secondary scrap metals, results of the first year's canvass on the new basis are not exact. The Bureau of Mines will welcome suggestions for improving the accuracy of the data and is aware that time will be required to present all details satisfactorily.

The figures on recoveries of metals from secondary sources in 1939 were derived from consumption data on the following items of scrap:

Aluminum:
- Pure clippings
- Pure wire and cable
- Castings
- Clean sheet
- Painted sheet
- Dural sheet and clippings
- Borings and turnings
- Foil
- Drosses and skimmings

Antimony:
- Battery lead plates
- Hard lead
- Common babbitt
- Genuine babbitt
- No. 1 babbitt
- No. 1 pewter
- Cable lead
- Type metals
- Battery mud

Copper:
- No. 1 wire
- No. 2 wire
- No. 1 heavy
- Mixed heavy
- Light
- Composition or red brass
- Railroad car boxes
- Cocks and faucets

Copper—Continued.
- Heavy yellow brass
- Yellow brass castings
- Light brass
- Old rolled brass
- Brass clippings
- Brass pipe
- No. 1 Red composition turnings
- No. 1 Yellow rod-brass turnings
- No. 1 Yellow brass turnings
- Auto radiators (unsweated)
- Electrotype shells
- Aluminum-base alloys
- Bronze
- Manganese-bronze
- Aluminum-bronze
- Nickel-silver
- Bell metal
- Secondary blister
- Copper oxide
- Buffings
- Grindings
- Washings
- Brass ashes
- Brass skimmings
- Slags
- Residues
- Miscellaneous copper-bearing materials

Lead:
- Soft lead
- Hard lead
- Cable lead
- Battery lead plates
- Common babbitt
- Solder
- Type metals
- Dross
- Battery mud
- Copper-base alloys
- Type-metal dross
- Solder dross
- Solder joints
- Lead oxide
- Slag

Nickel:
- Nickel clippings, anodes, hangers, etc.
- Monel metal
- Stainless steel
- Nickel-silver
- Secondary blister copper
- Nichrome wire
- Nickel-steel
- Nickel-iron

Tin:
- New tin-plate clippings
- Old tin-coated containers
- Block tin pipe
- Tinfoil
- Tin scruff and dross
- No. 1 pewter
- Genuine babbitt
- No. 1 babbitt
- Residues
- Copper-base alloys
- Lead-base alloys

Zinc:
- Clippings
- Sheet
- Skimmings
- Dross
- Die castings
- Flue dust
- Residues
- Zinc ashes
- Remelt zinc
- Die-cast slabs
- Castings
- Copper-base alloys

GENERAL SUMMARY

The value of the more common nonferrous metals recovered from secondary sources as metal and in alloys and chemical products totaled $199,856,800 in 1939. Metals recovered from market scrap produced as a result of manufacturing operations (new scrap) accounted for $81,868,200 of the total value, whereas metals returning from use (old scrap) accounted for $117,988,600.

Salient statistics of nonferrous secondary metals recovered in the United States in 1939

Metal	New scrap		Old scrap		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
Aluminum	15,100	$5,964,500	34,900	$13,785,500	50,000	$19,750,000
Antimony	150	37,100	9,660	2,387,900	9,810	2,425,000
Copper	212,800	44,262,400	286,900	59,675,200	499,700	103,937,600
Lead	30,700	2,885,800	210,800	19,815,200	241,500	22,701,000
Nickel	1,910	1,337,000	1,010	707,000	2,920	2,044,000
Tin	12,300	12,349,200	16,860	16,927,400	29,160	29,276,600
Zinc	144,540	15,032,200	45,100	4,690,400	189,640	19,722,600
		81,868,200		117,988,600		199,856,800

The general improvement in nonferrous-metal markets in 1939 created widespread activity in the secondary-metals industry. The gain over 1938 followed increases in consumption, production, and prices and the downward trend of primary stocks of nonferrous metals. The secondary-metals industry was slightly more active in the first half of 1939 than in the latter half of 1938; however, substantial advances did not get under way until July, when demand increased in sympathy with the improved rate of industrial operations. The outbreak of war in Europe on September 1 precipitated a rush by domestic consumers to increase metal inventories in anticipation of war orders. As a result of the sudden gain in demand, scrap supplies became momentarily frozen because many dealers hesitated to dispose of their scrap stocks on a bullish market. The situation eased as soon as primary metals attained some stability at moderately higher levels. By October many dealers in secondary metals realized that early hopes of tremendous orders for materials from belligerent countries were not materializing, and as domestic consumers had covered their needs fairly well early in September, domestic demand also subsided. Activity relaxed toward the end of the year.

SECONDARY ALUMINUM

The quantity of secondary aluminum recovered in 1939 totaled 50,000 short tons valued at $19,750,000. The value was computed at 19.75 cents a pound of weight recovered.

Aluminum recovered from secondary sources in 1939 included 2,900 short tons of pure metal (98+ percent) and 47,100 tons of aluminum alloys. The aluminum content of the recovered alloys was approximately 43,900 tons (93 percent).

Secondary aluminum recovered in the United States in 1939, in short tons

	1939
Aluminum as metal	2, 900
Aluminum alloys produced and recovered from aluminum scrap	47, 100
	50, 000
From new scrap	15, 100
From old scrap	34, 900

Of the 50,000 tons of aluminum recovered in 1939, remelters supplied 39,700 tons (79 percent) and manufacturers and foundries 10,300 tons (21 percent). The 39,700 tons recovered by remelters included 11,600 tons (29 percent) derived from new scrap and 28,100 tons (71 percent) from old scrap. The 10,300 tons reported by manufacturers and foundries included 3,500 tons (34 percent) obtained from new scrap and 6,800 tons (66 percent) from old scrap. Thus, the 50,000 tons of secondary aluminum produced included 15,100 tons (30 percent) recovered from new scrap and 34,900 tons (70 percent) from old scrap.

The principal sources of aluminum recovered from scrap in 1939 were alloy castings and various items of soft and hard sheet. Of the total aluminum recovered, 50 percent came from castings, 27 from sheet, 7 from borings and turnings, 6 from new aluminum clippings, 2 from aluminum wire and cable, and 8 from miscellaneous materials comprising mainly drosses and skimmings. Of the aluminum recovered at plants of remelters, 40 percent was obtained from alloy castings, 34 from various classes of sheet scrap, 8 from borings and turnings, 4 from new aluminum clippings, 2 from wire and cable, and 12 from miscellaneous materials. Of the aluminum recovered at plants of manufacturers and foundries, 79 percent came from alloy castings, 11 from new aluminum clippings, 7 from various classes of sheet scrap, and 1 each from wire and cable, borings and turnings, and miscellaneous materials.

Stocks of unmelted aluminum scrap at remelting plants increased 15 percent from 3,900 tons at the beginning of 1939 to 4,500 at the end of the year. Stocks of purchased aluminum scrap at manufacturing and foundry plants decreased 17 percent from 2,300 tons to 1,900. Total stocks of purchased scrap on hand at all plants advanced from 6,200 tons to 6,400, a net gain of 3 percent. In addition, stocks of plant scrap at manufacturing and foundry plants increased from 2,800 tons at the beginning of the year to 3,000 at the end of the year, a 7-percent rise.

Dealers' buying prices for scrap cast aluminum in New York averaged 7.47 cents a pound in 1939 compared with 7.58 cents in 1938. Average monthly quotations in 1939 ranged from 6.87 cents for May, June, and July to 9.50 cents for November and December.

The average price of new aluminum clippings in New York was 13.90 cents a pound in 1939 compared with 13.18 cents in 1938. Prices had a spread of 2.38 cents a pound in 1939, ranging from 13.12 cents in January to 15.50 cents in December.

SECONDARY ANTIMONY

A total of 9,810 short tons of secondary antimony valued at $2,425,000 was recovered in 1939. The value in 1939 was computed at 12.36 cents a pound, the average price for ordinary brands of American-grade antimony.

Antimony recovered in lead-base alloys (in oxide and as metal) totaled 9,520 tons in 1939 and that recovered in tin-base alloys 290 tons.

Secondary antimony recovered in the United States in 1939, in short tons

	1939
In lead-base alloys [1]	9,520
In tin-base alloys	290
	9,810
From new scrap	150
From old scrap	9,660

[1] Includes antimony recovered as metal and in oxide and other compounds; 923 tons of antimony were recovered in antimonial lead produced at primary lead refineries.

Remelters, smelters, and refiners furnished 7,430 tons (76 percent) of the 9,810 tons of antimony recovered in 1939 and manufacturers and foundries 2,380 tons (24 percent). Of the 7,430 tons recovered by remelters, smelters, and refiners, 120 tons (1.6 percent) came from new scrap and 7,310 tons (98.4 percent) from old scrap. Of the 2,380 tons recovered by manufacturers and foundries, 30 tons (1.3 percent) were obtained from new scrap and 2,350 tons (98.7 percent) from old scrap. Thus, it may be seen that by far the greater part of the secondary antimony was recovered from old scrap metals. Only 150 tons (1.5 percent) of the 9,810 tons came from new scrap, whereas 9,660 tons (98.5 percent) came from old scrap.

Discarded lead storage batteries, the principal source of secondary antimony, were the source of 58 percent of the antimony recovered in 1939. Other scrap lead alloys, including hard or antimonial lead, common babbitt, type metals, and drosses, supplied 39 percent and scrap tin alloys 3 percent.

As all the recovered antimony comes from lead- and tin-base alloys, stocks of scrap containing antimony are shown under the headings "Secondary lead" and "Secondary tin."

SECONDARY COPPER AND BRASS

Copper recovered from scrap metals, including that in alloys, totaled 499,700 short tons valued at $103,937,600 in 1939. The value in 1939 was computed at 10.4 cents a pound, the average price of all merchantable grades of new metal.

A total of 151,370 tons of copper was recovered in 1939 as essentially pure metal, of which the larger part was refined electrolytically. Alloys other than brass yielded 182,730 tons and brass alloys 162,400 tons. In addition to the copper recovered as metal and in alloys, 3,200 tons of copper were recovered from scrap metals in the form of chemicals.

Secondary copper recovered in the United States in 1939, in short tons

	1939		1939
As metal:		Brass scrap remelted (gross weight):	
At primary plants	116,613	New scrap	[1] 170,900
At other plants	34,757	Old scrap	80,200
	151,370		251,100
In brass	[1] 162,400	In brass scrap:	
In alloys other than brass	[1] 182,730	New scrap	[1] 111,600
In chemicals	3,200	Old scrap	50,800
	499,700		162,400
In new scrap (not including brass)	[1] 101,200	Total secondary copper (including copper in brass scrap):	
In old scrap (not including brass)	236,100	From new scrap	[1] 212,800
	337,300	From old scrap	286,900
			499,700

[1] Includes some plant scrap at brass mills.

Brass and copper scrap imported into and exported from the United States, 1938–39, in short tons

	1938	1939
Brass scrap imported	------	------
Scrap copper imported	(1)	132
Brass scrap exported	15,988	5,338
Scrap copper exported	21,811	17,643

[1] 190 pounds, gross weight.

Of the 499,700 tons of copper recovered in 1939, remelters, smelters, and refiners accounted for 237,700 tons (48 percent), and manufacturers and foundries 262,000 tons (52 percent). The 237,700 tons recovered by remelters, smelters, and refiners included 43,000 tons (18 percent) derived from new scrap and 194,700 tons (82 percent) from old scrap. The 262,000 tons reported by manufacturers and foundries included 169,800 tons (65 percent) obtained from new scrap and 92,200 tons (35 percent) from old scrap. Thus, the 499,700 tons of copper included 212,800 tons (43 percent) recovered from new scrap and 286,900 tons (57 percent) from old scrap.

Various items of brass scrap were the principal source of the copper reclaimed from scrap in 1939, although the amounts recovered from items of scrap copper and composition and bronze alloys also comprised a large part of the total. The copper recovered in brass scrap and alloys other than brass, reported by certain brass mills that were unable to report purchased and plant scrap separately, is included in new scrap. The quantity of copper in new scrap is therefore somewhat higher by an indeterminable amount than that actually recovered. Of the total copper recovered, 43 percent came from brass-scrap items, consisting mainly of light and heavy yellow brass; 28 percent from items of copper scrap, including No. 1 wire, No. 2 wire, No. 1 heavy, and mixed heavy and light copper; 23 percent from composition and bronze alloys, including automobile radiators; and 6 percent from miscellaneous items. Of the copper recovered at plants of remelters, smelters, and refiners, 42 percent was obtained from items of copper scrap, 29 percent from brass, 24 percent from composition and bronze (including automobile radiators), and 5 percent from miscellaneous items. Of the copper recovered at plants of manufacturers and foundries, 18 percent came from items of copper scrap, 53 percent from brass scrap, 22 percent from composition and bronze (including automobile radiators), and 7 percent from miscellaneous items.

Stocks of purchased copper scrap at remelting, smelting, and refining plants rose from 38,100 tons at the beginning of 1939 to 41,000 at the end of the year, a gain of 8 percent. Stocks of purchased copper scrap at manufacturing and foundry plants decreased 9 percent from 56,000 tons to 50,800. Total stocks of purchased scrap on hand at all plants declined from 94,100 tons to 91,800, a net loss of 2 percent. Stocks of plant scrap at manufacturing and foundry plants decreased 2 percent from 17,300 tons at the beginning of the year to 17,000 at the end of the year.

Dealers' buying prices for heavy copper scrap in New York averaged 7.80 cents a pound in 1939 compared with 6.81 cents in 1938. Average monthly prices in 1939 ranged from 6.86 cents a pound for May to 9.31 cents for November.

No. 1 composition averaged 7.04 cents a pound in 1939 compared with 6.36 cents in 1938. Prices in 1939 ranged from a low of 6.11 cents, the average for May, to a high of 8.25 cents in November.

SECONDARY GOLD AND SILVER

Mints and refineries reported the recovery of 895,096 fine ounces of gold and 24,972,260 fine ounces of silver from waste or discarded material in 1939 compared with 870,881 ounces of gold and 18,438,847 ounces of silver in 1938.

SECONDARY LEAD

Secondary lead recovered in 1939 totaled 241,500 short tons, or 50 percent of the total production of refined lead from domestic and foreign sources in the United States. The value of lead recovered as metal and in alloys was $22,701,000 in 1939, computed at 4.7 cents a pound.

Lead recovered as metal from secondary sources in 1939 amounted to 86,900 short tons. Antimonial lead accounted for 113,050 tons, other lead alloys 22,100 tons, alloys other than lead alloys (principally copper alloys) 13,650 tons, and chemical products 5,800 tons.

Secondary lead recovered in the United States in 1939, in short tons

	1939
As metal:	
At primary plants	29,011
At other plants	57,889
	86,900
In antimonial lead	[1] 113,050
In other lead alloys	22,100
In alloys other than lead alloys	13,650
In chemical products	5,800
	241,500
From new scrap	30,700
From old scrap	210,800

[1] Includes 12,658 tons of lead recovered from secondary sources at primary plants.

By far the greater part of the lead reclaimed in 1939 was recovered by remelters, smelters, and refiners, who accounted for 206,900 tons (86 percent); scrap lead and lead in alloys recovered by manufacturers and foundries totaled 34,600 tons (14 percent). Of the 206,900 tons recovered by remelting, smelting, and refining processes 24,800 tons (12 percent) came from new scrap and 182,100 tons (88 percent) from old scrap. Of the 34,600 tons recovered at plants of manufacturers and foundries, 5,900 tons (17 percent) was obtained from new scrap and 28,700 tons (83 percent) from old scrap. Thus, the 241,500 tons of secondary lead comprised 30,700 tons (13 percent) from new scrap and 210,800 tons (87 percent) from old scrap.

Worn-out automobile batteries, the principal source of secondary lead, supplied 51 percent of the total lead recovered in 1939. Recoveries of lead from other secondary sources were as follows: 13 percent from soft lead, 9 percent from cable lead, 8 percent from drosses and residues, 6 percent from alloys other than lead, 4 percent from common babbitt, 3 percent each from solder, hard lead, and type metals.

Stocks of purchased lead scrap at remelting, smelting, and refining plants decreased 11 percent from 24,700 tons at the beginning of 1939 to 21,900 at the end of the year. Stocks of purchased lead scrap at manufacturing and foundry plants increased 7 percent from 6,100 tons to 6,500. Total stocks of purchased scrap on hand at all plants dropped 8 percent from 30,800 tons to 28,400. Plant scrap at manufacturing and foundry plants rose 10 percent from 2,000 tons at the beginning of the year to 2,200 at the end of the year.

Dealers' buying prices for heavy scrap lead in New York averaged 4.19 cents a pound in 1939 compared with 3.86 cents in 1938. Buying prices for battery plates ranged from 2 to 2.38 cents a pound during the first 7 months of 1939; in August prices advanced steadily and in September reached 2.75 to 3 cents, remaining at this level for the balance of the year. Battery-plate smelting charges were quoted at $16 to $17 per ton throughout the year.

SECONDARY NICKEL

The secondary nickel recovered in 1939 totaled 2,920 short tons valued at $2,044,000. The value was computed at 35 cents a pound, the spot delivery price of electrolytic nickel, including duty.

Nickel recovered as metal from secondary sources amounted to 45 tons in 1939. The quantity recovered in 1939 also included 2,180 tons of nickel in nickel-copper alloys, 330 tons in nickel-iron alloys, 315 tons in Monel metal, and 50 tons in stainless steel.

Secondary nickel recovered in the United States in 1939, in short tons [1]

	1939
As metal	45
In Monel metal	315
In copper alloys	2,180
In stainless steel	50
In iron alloys	330
	2,920
From new scrap	1,910
From old scrap	1,010

[1] Exclusive of nickel recovered from secondary copper treated at electrolytic refineries.

Of the 2,920 tons of nickel recovered in 1939, remelters, smelters, and refiners produced 525 tons (18 percent), and manufacturers and foundries 2,395 tons (82 percent). The 525 tons recovered by remelters, smelters, and refiners included only 25 tons (5 percent) derived from new scrap and 500 tons (95 percent) from old scrap. Of the 2,395 tons recovered by manufacturers and foundries, 1,885 tons (79 percent) came from new scrap, whereas only 510 tons (21 percent) came from old scrap. Thus, of the total 2,920 tons of secondary nickel recovered, 1,910 tons (65 percent) was derived from new scrap and 1,010 tons (35 percent) from old scrap.

Nickel-silver scrap is by far the largest source of secondary nickel, having contributed 60 percent of the nickel recovered in 1939. Nickel was recovered from other secondary sources as follows: 15 percent from clippings, nickel anodes, hangers, baskets, etc., 12 percent from iron alloys, 11 percent from Monel metal, and 2 percent from stainless steel.

Stocks of purchased nickel scrap at remelting, smelting, and refining plants decreased 38 percent from 470 tons at the beginning of 1939 to 290 at the end of the year. Stocks of purchased nickel scrap at plants of manufacturers and foundries dropped 28 percent from 920 tons to 660. Total stocks of purchased scrap on hand at all plants declined from 1,390 tons to 950, a net loss of 32 percent. Stocks of plant scrap in the hands of manufacturers and foundries increased 7 percent from 1,390 tons at the beginning of the year to 1,490 at the end of the year.

Dealers' buying prices (nominal) in New York for new nickel clippings stood at 27 cents a pound throughout the first 11 months of 1939 but advanced to 31 to 31.5 cents in December. The quotation for Monel clippings (14.5 to 15 cents a pound early in January) dropped to 12 to 13 cents before the end of that month and did not change until August, when it increased slightly to 13 cents; this level was held until early in December, when prices advanced to 15 to 15.5 cents for the remaining weeks of the year.

SECONDARY TIN

Secondary tin recovered in 1939 totaled 29,160 short tons valued at $29,276,600. The value was computed at 50.20 cents a pound, the average price of Straits tin in New York for the year.

Metallic tin recovered from secondary sources amounted to 4,460 short tons in 1939. The greater portion of the metallic tin recovered in 1939 (4,089 tons) came from tin-plate scrap, whereas other sources contributed only small amounts (371 tons). Tin recovered in alloys and chemical compounds accounted for 24,700 tons in 1939. The quantity recovered in 1939 also included 12,420 tons of tin in copper alloys, 6,925 tons in lead alloys, 4,675 tons in tin alloys, and 680 tons in chemical compounds.

Secondary tin recovered in the United States in 1939, in short tons

	1939
As metal:	
At detinning plants	4,089
At other plants	371
	4,460
In copper alloys	12,420
In lead alloys	6,925
In tin alloys	4,675
In chemical compounds	680
	29,160
From new scrap	12,300
From old scrap	16,860

Remelters, smelters, and refiners produced 13,410 tons (46 percent) and manufacturers and foundries (including detinning plants) 15,750 tons (54 percent) of the 29,160 tons of tin recovered in 1939. The 13,410 tons recovered by remelters, smelters, and refiners included 4,910 tons (37 percent) derived from new scrap and 8,500 tons (63 percent) from old scrap. Of the 15,750 tons recovered by manufacturers and foundries, 7,390 tons (47 percent) were obtained from new scrap and 8,360 tons (53 percent) from old scrap. Thus, the 29,160 tons of tin recovered included 12,300 tons (42 percent) derived from new scrap and 16,860 tons (58 percent) from old scrap.

The largest recovery of tin in 1939 was made in scrap-copper alloys, the source of 43 percent of the total. Other sources contributed the following recoveries: 16 percent from new tin-plate clippings (including 0.3 percent from old containers), 16 percent from solder, 9 percent from tin scruff and drosses, 5 percent from common babbitt, 3 percent from No. 1 babbitt, 2 percent each from block-tin pipe, genuine babbitt and No. 1 pewter, type metals, and miscellaneous items.

Stocks of purchased tin-base scrap at remelting, smelting, and refining plants rose from 375 tons at the beginning of 1939 to 550 tons at the end of the year, a 47-percent increase. Stocks of purchased tin-base scrap at manufacturing and foundry plants (not including detinning plants) increased 150 percent from 50 tons to 125. Total stocks of purchased tin-base scrap on hand at all plants advanced 59 percent from 425 tons to 675. Stocks of plant scrap in the hands of manufacturers and foundries declined 24 percent from 340 tons at the beginning of the year to 260 at the end of the year.

Dealers' buying prices for block-tin pipe in New York in 1939 remained at 35 to 36 cents a pound until late in April, when they rose to 41 to 42 cents. In August prices eased to 39 to 40 cents but advanced sharply following the outbreak of war in Europe on September 1. Prices became nominal, but by the last week of September were holding at 44 to 45 cents and remained at this level until the middle of December, when quotations dropped to 42 to 43 cents for the remainder of the year.

The price of automobile babbitt in 1939 followed the pattern of changes in the price of block-tin pipe. For the first 3 months quotations were 21 to 22 cents a pound, rising to 24 to 25 cents the latter part of April. In September prices became nominal, and quotations were not resumed until early in December, when they were 27 to 28 cents.

Detinning plants.—The quantity of new tin-plate clippings treated at detinning plants established a record of 248,676 long tons in 1939, exceeding the 209,474 tons treated in 1938 by 39,202 tons (19 percent). Old tin-coated containers treated in 1939 totaled 6,429 long tons compared with 3,059 tons in 1938. Tin recovered as metal and in chemical products, 4,769 short tons, also established a new high, exceeding the 3,923 tons recovered in 1938 by 846 tons (22 percent). Tin reclaimed was equivalent to 37.70 pounds per long ton of new tin-plate clippings treated in 1939 compared with 37.05 pounds in 1938.

Secondary tin recovered at detinning plants in the United States, 1938–39

	1938	1939
Scrap treated:		
Clean tin plate .... long tons	209,474	248,676
Old tin-coated containers .... do	3,059	6,429
	212,533	255,105
Tin recovered as metal:		
New tin-plate clippings .... short tons	2,492	4,007
Old tin-coated containers .... do	42	82
Tin content of tin tetrachloride, tin bichloride, tin crystals, tin oxide, and sodium stannate produced .... short tons	1,389	680
	3,923	4,769
Weight of tin tetrachloride, tin bichloride, tin crystals, tin oxide, and sodium stannate produced .... short tons	2,757	1,195
Average quantity of tin recovered per long ton of clean tin-plate scrap used .... pounds	37.05	37.70
Average delivered cost of clean tin-plate scrap .... per long ton	$11.42	$15.06

For the past few years, almost wholly because of the disappearing demand for tin tetrachloride in the silk industry, the quantity of pig tin produced from tin-plate clippings has increased while that recovered in chemicals has decreased. The ratio of tin reclaimed as pig tin to that reclaimed in chemical products increased sharply in 1939. This ratio, which stood at 0.5:1 in 1935, had increased to 1.8:1 by 1938 and reached 5.9:1 in 1939.

The average cost of new tin-plate clippings delivered at detinning plants, which follows roughly the changes in price of No. 1 heavy-melting steel, advanced to $15.06 per long ton in 1939, a gain of 32 percent over the average of $11.42 in 1938.

Imports of tin-plate scrap into the United States, largely from Canada, totaled 12,633 long tons valued at $126,518 in 1939 compared with 10,444 tons valued at $81,685 in 1938.

Exports of tin-plate scrap, waste—waste, circles, strips, cobbles, etc., from the United States amounted to 25,888 long tons valued at $1,121,153 in 1939 compared with 24,216 tons valued at $902,607 in 1938. Exports of tin-plate scrap or that portion which is subject to export licensing (Public, No. 448, 74th Cong.) amounted to 10,204 long tons valued at $186,393 in 1939 compared with 12,495 tons valued at $227,874 in 1938.

Export allotments of tin-plate scrap.—Export allotments totaling 13,636 long tons of tin-plate scrap, subject to license, were assigned during the calendar year 1939. The Department of State issued 172 licenses in 1939 authorizing the exportation of 10,699 tons of tin-plate scrap valued at $200,497.52. All licenses issued in 1939 named Japan as the country of destination.

The rules of procedure governing issuance of licenses during 1940 were released by the Department of State on December 5, 1939. The allotments in 1940 will be based upon the individual producer's request therefor, with the provision that no allotment of more than 25 long tons shall exceed 20 percent of the producer's output of tin-plate scrap during the calendar year 1938. No allotment to any producer shall exceed 2,000 tons. Export quotas for 1939 were based upon 20 percent of the 1937 production.

SECONDARY ZINC

Zinc recovered from secondary sources totaled 189,640 short tons valued at $19,722,600 in 1939. The value was computed at 5.2 cents a pound, the average selling price of all grades.

Zinc recovered as metal in 1939 from distillation and remelting of purchased secondary materials totaled 35,970 short tons; moreover 98,879 tons of zinc were recovered in copper alloys, 16,429 tons in zinc oxide, 1,674 tons in zinc sulfate, 6,686 tons in zinc chloride, 16,293 tons in zinc dust, and 13,709 tons in lithopone.

Secondary zinc recovered in the United States in 1939, in short tons

	1939
As metal:	
By distillation	[1] 33,135
By remelting	2,835
	35,970
In copper alloys	[2] 98,879
In chemical products:	
Zinc oxide	16,429
Zinc sulfate	1,674
Zinc chloride	6,686
Zinc dust	16,293
Lithopone	13,709
	189,640
From new scrap	144,540
From old scrap	45,100

[1] In addition, 17,293 tons of zinc were recovered by redistillation of plant scrap. Total output of redistilled secondary zinc was 50,428 tons.
[2] Includes some plant scrap at brass mills.

Of the 189,640 tons of zinc recovered in 1939, remelters, smelters, and refiners supplied 91,800 tons (48 percent) and manufacturers and foundries 97,840 tons (52 percent). The 91,800 tons recovered by remelters, smelters, and refiners included 58,500 tons (64 percent) derived from new scrap and 33,300 tons (36 percent) from old scrap. The 97,840 tons reported by manufacturers and foundries included 86,040 tons (88 percent) obtained from new scrap and 11,800 tons (12 percent) from old scrap. Thus, the 189,600 tons of zinc recovered included 144,540 tons (76 percent) derived from new scrap and 45,100 tons (24 percent) from old scrap.

The principal source of zinc recovered in 1939, secondary copper alloys contributed 45 percent of the total, and zinc drosses and skimmings 42 percent. Recoveries from other secondary sources were as follows: 5 percent from die castings, 2 percent from clippings and sheet, 2 percent from flue dusts, and 4 percent from miscellaneous sources.

Stocks of purchased zinc scrap on hand at remelting, smelting, and refining plants decreased 12 percent from 18,200 tons at the beginning of 1939 to 16,100 at the end of the year. Stocks of purchased zinc scrap on hand at manufacturing and foundry plants increased 20 percent from 540 tons to 650. Total stocks of purchased scrap on hand at all plants declined 11 percent from 18,740 tons to 16,750. Stocks of plant scrap at manufacturing and foundry plants advanced from 600 tons at the beginning of the year to 765 at the end of the year, a rise of 28 percent.

Dealers' buying prices for new zinc clippings in New York in 1939 remained at 2.75 to 3 cents a pound until late in April, when they rose to 3 to 3.25 cents. This level was held until the first week of September when quotations increased sharply to 4.5 cents, and by the end of September they stood at 4.875 to 5 cents. The first week in December prices dropped to 4.50 to 4.75 cents and again the middle of December to 4.375 to 4.50 cents, closing the year at this level.

Old-zinc quotations ranged from 2.25 to 2.50 cents a pound during the first 8 months of 1939 but increased to 3.25 cents in the first week of September; this level was held until the first week of December, when prices weakened slightly to 3.125 to 3.25 cents.

CLASSIFICATION OF OLD METALS

The standard classification of old metals (Circ. M), effective since March 16, 1932, was revised by the Secondary Metal Institute, a division of the National Association of Waste Material Dealers, Inc., at the association's convention in March 1940. The revised classifications (Circ. O) provided that changes become effective June 1, 1940.

The revisions apply principally to various items of secondary aluminum. The item of "scrap-aluminum castings" (Circ. M, item 33) is now divided into five separate groups, four of which cover automotive castings. Other changes include substitution of "scrap sheet and sheet utensil aluminum" (Circ. O, item 31), for "painted sheet aluminum" and "old scrap sheet aluminum" (Circ. M, items 31 and 32), and substitution of "aluminum borings and turnings" for "aluminum borings" (Circs. O and M, item 34).

Complete specifications for various grades of nickel scrap have been added to the classification.

The revised classification, as shown in Circular O, follows:

STANDARD CLASSIFICATION FOR OLD METALS, EFFECTIVE FROM JUNE 1, 1940

1. *Delivery.*—(*a*) Delivery of more or less on the specified quantity up to 1¼ percent is permissible.

(*b*) If the term "about" is used, it is understood that 5 percent more or less of the quantity may be delivered.

(*c*) Should the seller fail to make deliveries as specified in the contract the purchaser has the option of canceling all of the uncompleted deliveries or holding the seller for whatever damages the purchaser may sustain through failure to deliver and if unable to agree on the amount of damages, an Arbitration Committee of the National Association of Waste Material Dealers, Inc., appointed for this purpose, to determine the amount of such damages.

(*d*) In the event that buyer should claim the goods, delivered on a contract are not up to the proper standard and the seller claims that they are a proper delivery, the dispute shall be referred to an Arbitration Committee of the National Association of Waste Material Dealers, Inc., to be appointed for that purpose.

(*e*) A carload, unless otherwise designated, shall consist of the weight governing the minimum carload weight at the lowest carload rate of freight in the territory in which the seller is located. If destination of material requires a greater carload minimum weight, buyer must so specify.

(*f*) A ton shall be understood to be 2,000 pounds unless otherwise specified. On material purchased for direct foreign shipment a ton shall be understood to be a gross ton of 2,240 pounds unless otherwise specified.

(*g*) If, through embargo, a delivery cannot be made at the time specified, the contract shall remain valid, and shall be completed immediately on the lifting of the embargo, and terms of said contract shall not be changed.

(*g*–1) When shipments for export for which space has been engaged have been delivered or tendered to a steamship for forwarding and through inadequacy of cargo space the steamship cannot accept the shipment, or where steamer is delayed in sailing beyond its scheduled time, shipment on the next steamer from the port of shipment shall be deemed a compliance with the contract as to time of shipment.

(*h*) In case of a difference in weight and the seller is not willing to accept buyer's weights, a sworn public weigher shall be employed and the party most in error must pay the costs of handling and reweighing.

(*i*) When material is such that it can be sorted by hand, consignees cannot reject the entire shipment if the percentage of rejection does not exceed 10 percent. The disposition of the rejected material should then be arranged by negotiations; no replacement of the rejected material to be made.

Upon request of the shipper, rejections shall be returnable to the seller on domestic shipments within 1 week and on foreign shipments within 30 days from the time notice of rejection is received by them, and upon payment by them of 1 cent a pound on material rejected to cover cost of sorting and packing; the seller to be responsible for freight both ways.

2. *No. 1 copper wire.*—To consist of clean untinned copper wire not smaller than No. 16 B. & S. wire gage. To be free from burnt copper wire which is brittle and all foreign substances.

3. *No. 2 copper wire.*—To consist of miscellaneous clean copper wire which may contain a percentage of tinned wire and soldered ends but to be free of hair wire and burnt wire which is brittle; the tinned wire not to be over 15 percent of the total weight.

4. *No. 1 heavy copper.*—This shall consist of untinned copper not less than one-sixteenth inch thick, and may include trolley wire, heavy field wire, heavy armature wire, that is not tangled, and also new untinned and clean copper clippings and punchings, and copper segments that are clean.

5. *Mixed heavy copper.*—May consist of tinned and untinned copper, consisting of copper clippings, clean copper pipe and tubing, copper wire free of hair wire, and burnt and brittle wire, free from nickel-plated material.

6. *Light copper.*—May consist of the bottoms of kettles and boilers, bathtub linings, hair wire, burnt copper wire which is brittle, roofing copper and similar copper, free from radiators, brass, lead and solder connections, readily removable iron, old electrotype shells and free of excessive paint, tar, and scale.

7. *Composition or red brass.*—May consist of red scrap brass, valves, machinery bearings and other parts of machinery, including miscellaneous castings made of copper, tin, zinc, and/or lead, no piece to measure more than 12 inches over any one part or to weigh over 60 pounds, to be free of railroad boxes, and other similarly excessively leaded material, cocks and faucets, gates, pot pieces, ingots and burned brass, aluminum composition, manganese, and iron.

8. *Railroad bearing.*—Shall consist of railroad boxes or car journal bearings; must be old standard used scrap, free of yellow boxes, also iron-backed boxes, and must be free of babbitt, also free of excessive grease and dirt.

9. *Cocks and faucets.*—To be mixed clean red and yellow brass, free of gas cocks and beer faucets, and to contain a minimum of 35 percent red.

10. *Heavy yellow brass.*—May consist of heavy brass castings, rolled brass, rod brass ends, chandelier brass, tubing, not to contain over 15 percent of tinned and/or nickle-plated material; no piece to measure more than 12 inches over any one part and must be in pieces not too large for crucibles. Must be free of manganese mixture, condenser tubes, iron, dirt, and excessive corroded tubing. Must be free of aluminum brass containing over 0.20 percent aluminum.

11. *Yellow brass castings.*—Shall consist of brass castings in crucible shape, that is, no piece to measure more than 12 inches over any one part; must be free of manganese mixtures, tinned and nickel-plated material, and must be free of visible aluminum brass.

12. *Light brass.*—May consist of miscellaneous brass, tinned or nickel-plated, that is too light for heavy brass; to be free of gun shells containing paper, ashes or iron, loaded lamp bases, clockworks, and automobile gaskets. Free of visible iron unless otherwise specified.

13. *Old rolled brass.*—May consist exclusively of old pieces of sheet brass and pipe free from solder, tinned and nickel-plated material, iron, paint and corrosion, ship sheathing, rod brass, condenser tubes, and Muntz metal material.

14. *New brass clippings.*—Shall consist of the cuttings of new sheet brass to be absolutely clean and free from any foreign substances and not to contain more than 10 percent of clean brass punchings to be not smaller than one-quarter inch in diameter.

15. *Brass pipe.*—Shall consist of brass pipe, free of nickel-plated, tinned, soldered, or pipes with cast-brass connections. To be sound, clean pipes free of sediment and condenser tubes.

16. *No. 1 Red composition turnings.*—To be free of railroad-car box turnings and similarly excessively leaded material, aluminum, manganese, and yellow brass turnings; not to contain over 2 percent free iron; to be free of grindings and foreign material especially babbitt. Turnings not according to this specification, to be sold subject to sample.

17. *No. 1 Yellow rod brass turnings.*—Shall consist of strictly rod turnings, free of aluminum, manganese, composition, Tobin, and Muntz metal turnings; not to contain over 3 percent free iron, oil, or other moisture; to be free of grindings and babbitts; to contain not more than 0.30 percent tin and not more than 0.15 percent combined iron.

18. *No. 1 Yellow brass turnings.*—Shall consist of yellow brass turnings, free of aluminum, manganese and composition turnings; not to contain over 3 percent of free iron, oil, or other moisture; to be free of grindings and babbitts. To avoid dispute, to be sold subject to sample.

19. *Auto radiators (unsweated).*—All radiators to be subject to deduction of actual iron. The tonnage specification should cover the gross weight of the radiators, unless otherwise specified.

20. *No. 1 pewter.*—Shall consist of tableware and soda fountain boxes, but in any case must test 84 percent tin. Siphon tops to be treated for separately.

21. *Zinc.*—Must consist of clean sheet and cast zinc, also cast batteries to be free of loose oxide and dross, sal ammoniac cans, and other foreign materials.

22. *Zinc dross.*—Must be unsweated in slabs and must contain a minimum of 92 percent of zinc.

23. *Tin foil.*—Shall consist of pure foil free of lead compositions and other foreign ingredients and matters.

24. *Electrotype shells.*—Must be hand-picked and free of loose dross and chunks of dross.

25. *Scrap lead.*—Should be clean, soft scrap lead.

26. *Battery lead plates.*—(*a*) Shall consist of dry battery lead plates, moisture not to exceed 1 percent, allowance to be made for wood, rubber, and paper and excess moisture, or

(*b*) Lead plus antimony content, dry basis, less a treatment charge.

Note: Contracts covering this item should specify which method is to be used as a basis of settlement.

27. *New pure aluminum clippings.*—Shall consist of new, clean, unalloyed sheet clippings and/or aluminum sheet cuttings. Must be free from oil, grease, and any other foreign substance. Also to be free from punchings less than one-half inch square.

28. *New pure aluminum wire and cable.*—Shall consist of new, clean, dry, unalloyed aluminum wire or cable, free from iron, insulation, and any other foreign substance.

29. *Old pure aluminum wire and cable.*—Shall consist of old, unalloyed aluminum wire or cable containing not over 1 percent free oxide or dirt and free from iron, insulation, and any other foreign substance.

30. *Alloy sheet aluminum.*—To be sold on specification and sample.

31. *Scrap sheet and sheet utensil aluminum.*—Shall consist of clean, old, unalloyed sheet and utensils and unalloyed manufactured sheet aluminum, free from alloy, iron, dirt, or any other foreign substance and to be free of hub caps, radiator shells, airplane sheet, foil, and bottle caps.

32. *Aluminum crank cases.*—Shall consist of automobile and/or airplane crank cases, transmission cases and oil pans, free of iron, brass, babbitt bushings, brass bushings, and any other foreign materials. Oil and grease shall not exceed 2 percent.

33. *Aluminum cylinder heads.*—Shall consist of all types of aluminum automobile cylinder heads, free of iron, brass, and any other foreign materials. Oil and grease shall not exceed 2 percent.

34. *Aluminum borings and turnings.*—To avoid dispute, should be sold subject to sample.

35. *Aluminum foil.*—Shall consist of pure aluminum foil, free from paper and any foreign ingredients.

36. *Aluminum die castings.*—Shall consist of auto steering wheels, brake shoes, and all castings made by the die-casting or pressure-casting process, free of iron, brass, and any other foreign materials. Oil and grease shall not exceed 2 percent.

37. *Aluminum pistons.*—(*a*) Clean aluminum pistons—shall be free from struts, bushings, shafts, iron rings, and any other foreign materials. Oil and grease shall not exceed 2 percent.

(*b*) Aluminum pistons with struts—shall consist of clean, whole aluminum pistons with struts, free from bushings, shafts, iron rings, and any other foreign materials. Oil and grease shall not exceed 2 percent.

38. *Aluminum industrial castings.*—Shall consist of all other aluminum castings except cylinder heads, die-cast aluminum, pattern metal, and hat blocks, and free of iron, babbitt, brass, and all other foreign materials. Castings shall not have over 4 percent zinc content. Oil and grease shall not exceed 2 percent.

39. *Mixed common babbitt.*—Shall consist of lead-base bearing metal containing not less than 8 percent tin, free from Allens metal, ornamental, antimonial, and type metal.

40. *High tin-base babbitt.*—To have a minimum of 78 percent tin.

41. *Block tin.*—Shall consist of tin pipe and soda-tank lining, free from solder and brass connections, pewter, pump strips, and pot pieces.

DOMESTIC CLASSIFICATION OF NICKEL—NICKEL ALLOYS AND NICKEL BEARING MATERIALS

42. *Nickel clippings.*—Shall consist of new nickel clips—plate and skeleton material. Minimum nickel contents 98½ percent, maximum copper contents 0.50 percent.

43. *New nickel.*—Shall consist of forgings, flashings, punchings, new pipe, tubes, new bright wire, or screen, bar, rod, angles, or other structural rolled stock. Each grade to be packed and sold separately. Minimum nickel contents 98½ percent, maximum copper contents 0.50 percent.

44. *Carbonized nickel.*—Packed and sold separately. Minimum nickel contents 95 percent, maximum copper contents 0.50 percent.

45. *Old nickel scrap.*—Shall be of 98–99 percent purity, maximum 0.50 percent copper. All rolled stock should come under this classification such as sheet, pipe, tubes, bars, rods. Same to be free of soldered, brazed, or welded alloyed material. It shall also be free of trimmed seams that have been sweated. Soldered, brazed, welded, and sweated material shall be packed and sold separately. All painted materials shall be packed and sold separately.

46. *Old nickel wire-screen cloth.*—To be packed and sold separately. Samples should be submitted for quotations.

47. *Nickel castings.*—To be packed and sold separately and sold on analysis or sample.

48. *Manganese nickel.*—To be sold separately and/or by sample.

49. *Cupro nickel.*—Describe the physical characteristics and send representative samples for quotations.

50. *Nickel turnings.*—To be sold separately by analysis or according to sample. When submitting a sample of turnings containing oil, same shall be submitted in oilproof containers.

51. *Nickel anodes.*—Cast and rolled, each to be hard anodes free of soft, carbonized, and crusty material. Hooks to be cut off as close as possible to the anode. Substitutions not permitted.

52. *Clean nickel peelings and strippings.*—Sold on sample or analysis.

53. *Copper-nickel peelings or strippings.*—Sold on sample submitted or analysis.

54. *Nickel baskets.*—Hooks, racks, and hangers. Since this material varies to a great extent in alloys and deposits of various metals, representative samples should be submitted for quotation.

55. *New Monel metal clips.*—Should consist of new Monel clippings, skeleton, plate, of the standard grade of Monel. Alloyed Monel to be packed and sold separately. No used or cut old bright sheet Monel will be acceptable. Monel punchings to be sold separately.

56. *Clean old Monel sheet.*—Shall be of the standard grade of Monel, free of alloyed Monel. No sweated material of any kind acceptable. Free of welded, brazed, or soldered material, other metals, and alloy attachments.

57. *Soldered Monel sheet.*—To be the whole or part of a sheet. Free of trimmed seams or sweated trimmed seams. May include Monel welded sheet where a good portion of the piece is attached to the weld.

58. *Soldered Monel wire, screen, and cloth.*—To be sold separately. Must be free of filled filter cloth and asbestos-containing material.

59. *Clean Monel wire, screen, and cloth.*—Must be free of solder. Sweated material packed and sold separately.

60. *Monel turnings.*—Should contain a minimum of 60 percent nickel. To be free of other metals. Should the material contain oil, sample should be submitted in oilproof containers for a quotation.

61. *Monel castings.*—To be guaranteed minimum 60 percent nickel. All other alloys of Monel castings are to be packed and sold separately.

62. *Nickel-silver clips.*—Sold on nickel content specifications such as 10 percent, 12 percent, 15 percent, 18 percent, 20 percent. Leaded nickel-silver clips should be packed and sold separately. A description as to its physical characteristics should be made in offering all nickel-silver material. It should also be free of chrome-plated material and any other metal or alloy content material.

63. *Old nickel-silver.*—Shall consist of old nickel-silver sheet, pipe, rod, tubes, wire, screen, soldered or unsoldered. Must not be trimmed seams alone, and it is also to be free of foreign substances, iron-rimmed material, or other metals.

64. *Nickel-silver castings.*—To be packed and sold separately.

65. *Nickel-silver turnings.*—To avoid misunderstanding, to be sold by sample or analysis. Samples should be submitted in oilproof containers when the sample contains oil.

66. *Ferronickel chrome iron.*—Ferronickel chrome-iron materials whether castings, forgings, pipe, rod, tubes, wire screen, ribbon or in any other form, should be sold on analysis basis. Physical description should accompany each inquiry. Approximate weight of pieces should accompany the inquiry. Copper content up to one-half percent to be acceptable.

67. *Ferronickel iron alloy.*—Shall consist of alloys containing nickel and iron only. Physical description should accompany each inquiry and, in the case of larger pieces, approximate weight should be mentioned. Copper content in the alloy up to one-half percent to be acceptable. Material containing chrome should always be packed separately.

68. *New stainless steel.*—18–8 type graded as new clippings, 0.10 and under in carbon.

69. *Stainless steel.*—18–8 type. Shall consist of new and old sheet, pipe, rod, tubes, forgings, and flashings. Sold with no carbon guarantee, but to be free of all other metals and alloys.

70. *Stainless-steel castings.*—Submit analysis, size of pieces, and physical description.

71. *Stainless-steel turnings.*—Submit sample.

72. *Edison A and Edison B batteries.*—To be sold by type and to be free of crates and liquid.

73. *Packages.*—Shall be good strong packages suitable for shipment, and each package shall be plainly marked with separate shipping marks and numbers and with the gross and tare weights so that the packages may reach their destination and their weights can be easily checked.

IRON AND STEEL SCRAP[1]

By James S. Earle and Harold E. Carmony

SUMMARY OUTLINE

The iron and steel scrap industry in 1939 was characterized by sharp increases in consumption, exports, and prices and a slight rise in consumers' stocks of scrap. There was a sharp decrease in stocks of pig iron. Reflecting the 66-percent rise in steel ingot production in 1939, the use of ferrous scrap increased 52 percent over that in 1938 but was 15 percent below the tonnage consumed in 1937. During the first half of 1939 the rate of consumption was fairly stable and approximated the levels established in the last quarter of 1938, but with the outbreak of war in Europe demand improved as steel production soared to record proportions in the closing months of the year. The consumption of scrap probably reached an all-time peak in November 1939.

The proportion of purchased scrap used in open-hearth furnaces—the largest consumers of purchased scrap—has, in general, trended downward for a number of years. Again in 1939 the ratio of scrap to pig iron decreased and the proportions of both home and purchased scrap dropped slightly. The decline in the proportion of purchased scrap used in 1939 was accentuated by the quickened demand for steel and resulted in an increased amount of steel produced from duplexing operations following the outbreak of war in September. The sharp increase in steel production to record heights created an abnormal demand for scrap, and for a short period the price of scrap exceeded that of pig iron. During October and November many consumers were obliged to increase the amount of pig iron used because of the high cost of scrap. The higher prices offered for scrap developed an abundant supply, and the high levels were soon reduced; in consequence, the price structure and furnace proportions assumed a more normal aspect before the end of the year.

[1] Minerals Yearbook, 1939, p. 513, gives definitions of the various scrap terms used in this report.

The total consumption of ferrous scrap and pig iron in 1939 increased 60 percent over that in 1938. Of the 63,892,174 gross tons used, 51,681,886 tons were charged to steel-making furnaces and 12,210,288 to iron furnaces. In making the average ton of steel in 1939 less scrap and more pig iron were used than in 1938; the relative consumption of both home and purchased scrap declined in 1939 from 1938. In iron furnaces, moreover, the relative use of both home and purchased scrap decreased while that of pig iron increased.

Exports of ferrous scrap from the United States in 1939 increased 20 percent over 1938 and were second only to the record shipments of 1937, in both tonnage and value. Consignments to Japan comprised 56 percent of the total and exceeded those of any previous year, while those to the United Kingdom, Canada, and Poland were greater than in 1938. Shipments to Italy in 1939 were slightly lower than in 1938, while those to the Netherlands and Germany were reduced drastically early in the year and disappeared when the Allied blockade of Germany was established. Several bills and resolutions that would directly or indirectly impose restrictions on scrap exports from the United States were introduced during the first session of the Seventy-sixth Congress, but the session adjourned without passing any of the proposed legislation.

Immediately after the declarations of war in September the International Scrap Convention—a centralized buying agency for European consumers—suspended operations. Italy and certain Balkan countries continued to buy independently, but the United Kingdom and Germany withdrew from the domestic market. Coincident with the increased production of iron and steel and the abrupt rise in the price of scrap, agitation for legislation to restrict exports of iron and steel scrap from the United States was resumed in the last 4 months of 1939, and additional measures to accomplish this were introduced in the third session of the Seventy-sixth Congress, which opened in January 1940.

Prices for scrap fluctuated widely in 1939. The quotation for No. 1 Heavy-melting steel scrap at Pittsburgh, according to Iron Age, ranged from a low of $14.25 per gross ton the second week in May to a high of $24.25 the first week in October. The average for 1939 was $17.17 compared with $14.02 in 1938 and $18.86 in 1937. Scrap prices received little support in the first quarter of 1939 from either domestic or foreign markets; however, a strong foreign demand early in the second quarter stabilized prices at a time when domestic markets were depressed because of labor difficulties in the coal-mining industry. Following the settlement of the labor disputes prices trended upward in sympathy with the quickened rate of steel production. The price of basic pig iron remained stationary in 1939 until the last week of September, when the price at Valley furnaces increased 10 percent and held at the higher level for the remaining months of the year.

The unprecedented rise in steel production during the latter half of 1939 precipitated an abnormal and unexpected demand for scrap that dealers and brokers found difficult to meet. This occasioned considerable alarm as to the depleted condition of domestic stocks of iron and steel scrap. At the request of trade organizations representing both dealers and consumers of scrap the Bureau of Mines undertook to survey the stock situation as of September 30, 1939.[2] The results of the canvass of suppliers and consumers indicated inventories exceeding 7,111,701 gross tons, which was equivalent to a 10-week supply at the September rate of consumption. Some authorities interpreted this as representing an adequate supply. Another survey as of December 31, 1939,[3] revealed stocks exceeding 7,400,000 tons. Consumers' stocks of scrap increased from 4,596,094 tons at the beginning of 1939 to 4,741,159 at the close of the year.

Salient statistics of ferrous scrap and pig iron in the United States, 1938–39

Figure 1 shows the consumption of purchased scrap and output of pig iron and steel ingots and castings from 1905 to 1939, inclusive.

PRICES [4]

The undertone of scrap prices in 1939 was generally firm, except for the period of coal-mine labor difficulties during the second quarter. Quotations for No. 1 Heavy-melting steel and No. 1 Cast cupola scrap, which had averaged $15.75 and $15.50 per gross ton (Pittsburgh), respectively, in December 1938, eased off, with No. 1 Heavy-melting steel dropping to $14.25 in the second week of May and No. 1 Cast cupola scrap dropping to $15.25, the low point of the year, in the second week of April. However, this weakness was short-lived, and there was a gradual uptrend in prices until September, when the advent of war in Europe disrupted the price structure. Quotations for scrap reached the high point of the year during the first week of October, when No. 1 Heavy-melting steel and No. 1 Cast cupola scrap reached $24.25 per ton. The increase in the average price of No. 1

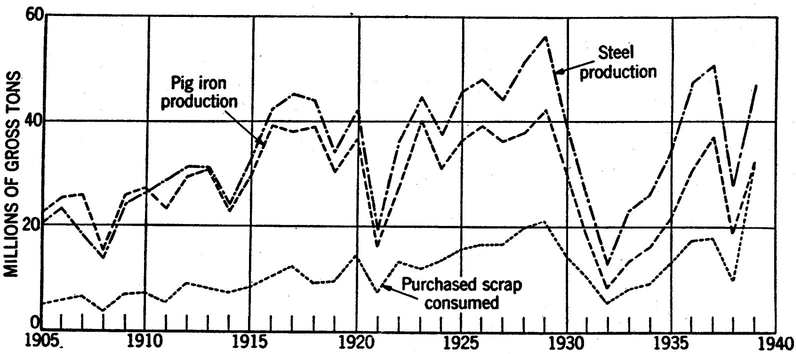

FIGURE 1.—Consumption of purchased scrap and output of pig iron and steel in the United States, 1905–39. Figures on consumption or purchased scrap for 1905–32 are from *State of Minnesota* vs. *Oliver Iron Mining Co. et al.*, Exhibits, vol. 5, 1935, p. 328; those for 1933–34 are estimates by authors; and those for 1935–39 are based upon Bureau of Mines reports. Figures on output of pig iron and steel are as given by the American Iron and Steel Institute.

Heavy-melting steel during the first month of the renewed Allied and German hostilities was the most rapid rise since June 1917. The average price in October of $23.05 for No. 1 Heavy-melting steel was exceeded in recent years only by that of $23.15 in March 1937; while the October average of $22.95 for No. 1 Cast cupola scrap was the highest on record since June 1923. In the closing weeks of 1939 prices gradually eased off to an average of $18.50 per ton for No. 1 Heavy-melting steel and $19.38 for No. 1 Cast cupola scrap. The high rate of ingot production in the last quarter of 1939 reduced suppliers' stocks but did not create an acute shortage of scrap as many expected. Higher prices widened the area from which supplies were drawn and stimulated collections of old scrap, while increased industrial activity produced greater amounts of home scrap.

In contrast to the rather wide fluctuations in scrap prices in 1939 the price of basic pig iron, established at $20.50 per gross ton at Valley furnaces late in September 1938, remained unchanged until

[4] Pittsburgh price quotations from The Iron Age.

the third week of September 1939, when it rose to $22.50 and held at this level during the rest of the year.

Export scrap prices in 1939, as indicated by the declared value of exports, averaged $15.40 a gross ton for the year and were only slightly above the 1938 average of $15.11. In the first 3 months of 1939 prices were supported by the fair volume of loading against old contracts, but in the second quarter they declined as a result of the general market weakness. The average value of exports in June—$14.11—represented the low monthly average for the year. Even lower averages probably would have prevailed had it not been for the steadying effect of new orders and increased loading for export at this time. Exports continued at an accelerated rate in the second half of the year and, together with increased domestic demand, caused a rise in the export price. After the outbreak of war in Europe the rapidly increased demand for scrap in the inland steel districts was the dominant factor in the domestic market and was reflected in the upward trend of export prices. Average export values advanced steadily through the latter part of 1939 and reached $19.45 a ton in December.

LEGISLATION

Several new bills [5] and resolutions [6] calling for the licensing or restricted embargoing of iron and steel scrap were introduced during the first session of the Seventy-sixth Congress. Moreover, Senator Schwellenbach's bill (S. 2025, 75th Cong.) to restrict foreign shipments of ferrous scrap was reintroduced (S. 651, 76th Cong.) without change. Some of the more recent proposals provide for the embargoing of pig iron as well as of iron and steel scrap. Resolutions by Senator Pittman (S. J. Res. 123, 76th Cong.) and Senator Schwellenbach (S. J. Res. 143, 76th Cong.) designed to prohibit exports of certain commodities, articles, and materials (including iron and steel scrap) to countries that are parties to the Nine-power Treaty and violate the rights of American citizens in China were of outstanding interest. Senator Pittman's resolution makes provision for the embargo to go into effect 30 days after proclamation by the President without any action by Congress, and Senator Schwellenbach's resolution would have such an embargo go into effect 60 days after proclamation by the President if not disapproved by concurrent resolution of Congress. Congress adjourned, however, without acting on any of the bills or resolutions, deferring further consideration to the 1940 session of the Seventy-sixth Congress.

STOCKS

Beginning in 1939 the regular annual canvass of consumers of iron and steel scrap and pig iron was expanded to include stocks of home scrap, purchased scrap, and pig iron on hand at the beginning and end of the year. In addition, to complete the data on total visible supplies of iron and steel scrap in the United States, a separate canvass

[5] H. R. 979. A bill to prohibit the exportation of pig iron, scrap iron, and scrap steel except under license from the Secretary of Commerce.
H. R. 3419. A bill to prohibit the exportation of pig iron, scrap iron, and scrap steel to China and Japan.
H. R. 7159. A bill to prohibit the exportation of articles in violation of existing treaties to which the United States is signatory.

[6] H. J. Res. 42. A joint resolution providing for an embargo on scrap iron and pig iron under Public Resolution No. 27 of the Seventy-fifth Congress.

of suppliers (including scrap-iron dealers, automobile wreckers, and selected lists of railroads and manufacturers) was begun on a quarterly basis in September 1939. The final results of the annual survey indicate that total consumers' and suppliers' stocks of iron and steel scrap totaled 7,301,847 gross tons on December 31, 1939, or 98,153 tons less than the 7,400,000 tons previously published as a result of the quarterly survey. Comparable figures for December 31, 1938, are not available as far as suppliers' stocks are concerned, inasmuch as the quarterly surveys did not begin until September 1939.

Consumers' stocks.—Consumers' stocks of home and purchased scrap were slightly greater at the end of 1939 than at the beginning of the year. Supplies of 1,729,228 gross tons of home scrap and 3,011,931 tons of purchased scrap on hand December 31, 1939, represented increases of 2 and 4 percent, respectively, above the 1,687,609 tons of home scrap and 2,908,485 tons of purchased scrap on hand at the beginning of the year. Thus, stocks of scrap totaling 4,741,159 tons at the year end were 3 percent greater than the 4,596,094 tons on hand at the beginning of the year.

In contrast to consumers' stocks of scrap, stocks of pig iron totaling 3,369,136 tons at the end of the year had decreased 23 percent from the 4,359,484 tons on hand at the beginning of the year.

Suppliers' stocks.—In appraising stocks, insofar as suppliers are concerned, it should be noted that the coverage of the canvass is unknown. However, the data assembled include virtually complete returns from the larger suppliers, as well as a representative number of returns from others, and the figures shown probably reveal a substantial part of the total visible supplies of iron and steel scrap in suppliers' hands.

Stocks held by dealers, automobile wreckers, railroads, and manufacturers rose from 2,463,701 gross tons (reported by 3,018 concerns) on September 30, 1939, to 2,560,688 tons (reported by 4,680 concerns) on December 31, 1939. This increase was due to inclusion in the survey of a representative number of the larger industrial plants that produce scrap for sale and to the larger number of reports received in December from small dealers who did not reply in the September survey. Stocks in the hands of the larger suppliers were 22 percent lower at the end of the year than at the end of September, and railroad inventories declined 14 percent for the period. Although the number of concerns canvassed in December was increased only 5 percent over the number canvassed in September, the average of replies received increased from 44 percent in September to 65 in December. This increase in replies resulted in only a 4-percent rise of stocks in suppliers' hands. Nineteen States, which embraced approximately 47 percent of the total 4,680 replies received in the December canvass, showed actual declines in stocks reported, notably Pennsylvania, Ohio, Illinois, and Michigan, all of which contain large scrap-consuming areas.

[1] Includes 1,724 dealers, 1,227 automobile wreckers, and 67 railroads in September; and 2,580 dealers, 1,832 automobile wreckers, 66 railroads, and 202 manufacturers in December.
[2] Includes 107,562 tons in transit to yards or to shipping point for export and at docks awaiting export in September; and 105,955 tons in December.

CONSUMPTION

In the canvass of consumers of ferrous scrap and pig iron, data are obtained only on that portion of scrap used in remelting processes. To simplify the annual canvass, no details are sought regarding the ordinary trade classifications of scrap consumed, and no attempt is made to obtain data on its value or cost at consumers' plants. Statistics are compiled to show the consumption of scrap and pig iron by districts and States and by types of furnace. To avoid disclosing details concerning individual plants reporting it is necessary in some instances to combine figures for some States. All such combinations are made with a view to revealing details of consumption by types of furnace rather than by geographic subdivisions.

The importance of scrap from the standpoint of conservation is illustrated by the relative quantities of scrap and ore used in the domestic iron and steel industry. The total scrap consumed in 1939 was equivalent to 121 percent of the iron content of all domestic and foreign iron and manganiferous ores used in blast furnaces, and purchased scrap alone equaled 56 percent of the iron content of the ores; in 1938 the comparable percentages were 132 and 62.

Scrap constitutes by far the greater part of the ferrous raw materials used in iron and steel plants in the Southwestern, Pacific Coast, and New England districts. These regions, however, used only slightly more than 5 percent of the total scrap consumed in 1939. Except for the Southwestern district, proportionately less scrap was used in all areas in 1939 than in 1938, although most of the decreases were relatively small.

Ferrous scrap and pig iron consumed in the United States and percentage of total derived from home scrap, purchased scrap, and pig iron, 1938–39, by districts

[1] Includes data for 2 Brackelsberg furnaces.

Open-hearth steel furnaces use by far the largest quantities of ferrous scrap and pig iron. They consumed 70 percent of the total scrap in 1939 (68 percent in 1938), 73 percent of the home scrap (70 percent in 1938), 67 percent of the purchased scrap (66 percent in 1938), and 76 percent of the pig iron (74 percent in 1938).

Cupolas, the second largest consumers of scrap, took 21 percent of the purchased scrap in 1939 compared with 24 percent in 1938. Their relative consumption of home scrap did not change from 1938, when the percentage was 15; however, their consumption of pig iron decreased to 10 percent in 1939 from 13 percent in 1938.

Open-hearth and cupola furnaces together consumed 88 percent of both home and purchased scrap and 86 percent of the pig iron in 1939. Bessemer converters used 10 percent of the pig iron consumed in 1939 but only relatively small quantities of scrap (0.61 percent of the total). Although electric furnaces consumed only 5 percent of the total scrap in 1939, 98 percent of the total charge to this type of equipment was home and purchased scrap.

[1] Includes some pig iron used in making direct castings.
[2] Where 2 or more separate departments, such as blast-furnace, open-hearth, foundry, etc., are situated at the same place and are operated by 1 establishment, each appears as 1 plant in the total.

CONSUMPTION BY DISTRICTS AND STATES

All 48 States, the District of Columbia, and Alaska contain plants consuming ferrous scrap or pig iron. The greatest consumption, however, is concentrated in the steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas include the 8 largest consuming States, which used 82 percent of the total scrap, 92 percent of the pig iron, and 88 percent of the total scrap and pig iron charged into furnaces in 1939. These States, the relative position of which did not change from 1938, and the percentage of the total ferrous scrap and pig iron each consumed in 1939 were as follows: Pennsylvania 26, Ohio 21, Indiana 11, Illinois 8, Michigan 7, Alabama 5, New York 5, and Maryland 5.

CONSUMPTION BY TYPE OF FURNACE

Open-hearth furnaces.—The total ferrous scrap and pig iron consumed in open hearths in 1939 was 46,747,374 gross tons, a 65-percent increase over 1938. Of the 1939 total home scrap comprised 27 percent, purchased scrap 22 percent, and pig iron 51 percent; in 1938 the percentages were 28, 24, and 48, respectively. The use of home scrap increased 60 percent, purchased scrap 51 percent, and pig iron 74 percent.

Charges to open-hearth furnaces in 1939 consisted of 49 percent total scrap and 51 percent pig iron compared with percentages in 1938 of 52 and 48, respectively. Of the total scrap consumed in open hearths in 1939, 44 percent was purchased scrap compared with 46 percent in 1938 and 47 percent in 1937. Higher proportions of purchased scrap are used in areas remote from pig-iron-producing centers, but the practice of using scrap exclusively is relatively rare. In 1939 only 5 plants out of a total of 136 operated on a 100-percent scrap basis; they consumed only 303,651 tons, less than 1 percent of the total consumption of ferrous raw materials in open hearths.

Pennsylvania, the leading steel producer, outranked all other States in 1939 in the consumption of ferrous scrap and pig iron in open hearths followed by Ohio, Indiana, and Illinois.

Bessemer converters.—The consumption of ferrous scrap and pig iron in bessemer converters in 1939 totaled 3,413,686 gross tons, a 66-percent increase over 1938. The proportion of scrap consumed in converter practice is low (amounting to only 5.8 percent in 1939), and virtually the entire quantity was home or plant scrap. Almost all of the small tonnage of purchased scrap consumed in converters was used in small steel-foundry plants.

Ohio was the principal consumer of scrap in bessemer converters in 1939.

Electric steel furnaces.—Ferrous scrap and pig iron consumed in electric furnaces in 1939 totaled 1,520,826 gross tons, a 60-percent increase over 1938. Pig iron comprised less than 2 percent of the total ferrous raw materials used in electric furnaces in 1939. Of the 267 active plants reporting in 1939, 99 operated exclusively on scrap and consumed 447,810 tons—about 29 percent of the total scrap and pig iron used.

Ohio led all States in 1939 in the consumption of scrap in electric furnaces, followed by Pennsylvania, Illinois, Michigan, and New York.

Cupola furnaces.—Consumption of ferrous scrap and pig iron in cupola furnaces in 1939 totaled 8,717,760 gross tons, a 32-percent increase over 1938. Use of home scrap increased 47 percent, purchased scrap 30 percent, total scrap 37 percent, and pig iron 24 percent. Thus, the proportion of purchased scrap more than held its own, although the relatively low prices of scrap during the first 9 months of the year were an important factor.

Charges to cupola furnaces in 1939 consisted of 29 percent home scrap, 37 percent purchased scrap, and 34 percent pig iron; in 1938 the percentages were 26, 37, and 37, respectively. Many cupola plants operate on 100-percent scrap charge; a total of 472 plants reported the use of 700,566 tons of ferrous scrap without the use of pig iron in 1939 compared with 421 plants that reported the use of 595,090 tons in 1938.

The relative position of States that are large consumers of scrap in cupola furnaces was not changed in 1939. Michigan continued as the principal consumer, followed in order by Ohio, Pennsylvania, Illinois, and New York.

[1] Includes some pig iron used in making direct castings.

Air furnaces.—Ferrous scrap and pig iron consumed in air furnaces in 1939 amounted to 781,681 gross tons, a 28-percent increase over 1938. The use of home scrap increased only 6 percent, while the use of purchased scrap rose 35 percent and that of pig iron 58 percent. Thus, equipment of this type used relatively more pig iron than total scrap in 1939, although there was an increase of 1 point in the proportion of purchased scrap used. Only nine operators of air furnaces reported exclusive use of scrap in 1939, the quantity consumed amounting to 33,812 tons.

Ohio led all States in 1939 in the consumption of scrap in air furnaces, followed by Pennsylvania, Indiana, Illinois, Michigan, and Wisconsin.

Blast furnaces.—Ferrous scrap constitutes only a small proportion of the metal-bearing materials consumed in blast furnaces. The other materials used in 1939 were 53,422,383 gross tons of iron and manganiferous iron ores, 3,735,132 of cinder and scale, and 1,737,000 of flue dust. Total consumption of scrap in 1939, as reported by 77 plants operating blast furnaces, was 1,725,851 tons, a 62-percent increase over 1938. Of the 1939 total, 58 percent was home scrap and 42 percent purchased scrap.

The proportion of scrap used in blast furnaces again declined in 1939, amounting to 5.6 percent of the pig iron produced in 1939 compared with 5.7 percent in 1938 and 6.6 in 1937. Purchased scrap was equivalent to 2.3 percent of the pig iron produced in 1939 compared with 1.6 percent in 1938 and 2.5 in 1937.

Blast furnaces in Ohio continued to consume more scrap in 1939 than those in any other State, using 52 percent more than Pennsylvania, the second ranking State; in 1938 Ohio furnaces consumed 30 percent more than Pennsylvania furnaces.

FOREIGN TRADE [7]

Imports.—Imports of iron and steel scrap into the United States, which are unimportant, totaled 29,492 gross tons valued at $301,513 in 1939 compared with 24,451 tons valued at $281,240 in 1938. Of the 1939 total, 27,208 tons came from Canada, 1,219 tons from Mexico, 937 tons from Europe, and only 128 tons from other countries. In addition, 12,633 tons of tin-plate scrap were imported in 1939, largely from Canada, compared with 10,444 tons in 1938 and 12,916 tons in 1937.

Exports.—Ferrous scrap exports (all types) from the United States in 1939 exceeded those of 1938 by 20 percent in tonnage and 22 percent in value, being outdistanced in tonnage and value only by the record shipments of 1937. A total of 3,584,439 gross tons valued at $55,911,516 was exported in 1939 compared with 2,998,591 tons valued at $45,829,533 in 1938. The shipments included 25,888 tons of tin-plate scrap, waste—waste tin plate, tin plate strips, cobbles, etc., valued at $1,121,153 in 1939 compared with 24,216 tons valued at $902,607 in 1938. The following table shows the principal countries to which shipments of scrap were consigned during the 5-year period 1935–39.

[7] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Ferrous scrap exported from the United States, 1935–39, by countries, in gross tons

Country	1935	1936	1937	1938	1939
Canada	96,128	63,712	185,571	92,217	175,496

Other countries	179,922	122,119	268,738	113,601	226,434
	2,103,959	1,936,132	4,101,549	2,998,591	3,584,439
Total value	$22,949,070	$24,684,084	$79,387,459	$45,829,533	$55,911,516

Of the total exports of ferrous scrap from the United States in 1939, 2,000,940 gross tons cleared through customs districts on the Atlantic coast (1,769,611 tons in 1938), 876,976 tons from districts bordering the Gulf of Mexico (779,613 tons in 1938), 544,554 tons from districts along the Pacific coast (368,842 tons in 1938), and 161,969 tons from other customs districts (80,525 tons in 1938).

Exports were drawn largely from seaboard areas where the cost of transportation from the point of origin to the port of exportation is relatively low and where the cost of transportation to domestic iron and steel plants not within the area is often prohibitive.

WORLD ASPECTS

The increase in world steel production in 1939, owing in a large measure to the turbulent state of affairs among the powerful foreign nations, resulted in expansion of the use and demand for iron and steel scrap compared with 1938. According to Metal Statistics 1940, world production of steel in 1939 totaled 131,800,000 gross tons, a 24-percent increase over the 1938 production of 106,000,000 tons and only 500,000 tons below the 1937 record (132,300,000 tons). The United States supplied 71 percent of the world increase, and all other countries contributed 29 percent. However, world production of steel in 1939, excluding the United States, established an all-time record of 85,050,000 tons, a 10-percent increase over the 1938 figure (77,650,000 tons) and a 4-percent increase over the 1937 record (81,731,000 tons). Steel production in the United States increased 66 percent over 1938.

World production of pig iron (including ferro-alloys) in 1939 totaled 100,389,000 gross tons, an increase of 18,803,000 tons over the 1938 production of 81,586,000 tons but a loss of 2,166,000 tons from the previous 1937 record of 102,555,000 tons. The United States supplied the greater part of the increase in world pig-iron production in 1939, as indicated by the fact that production of the rest of the world totaled 68,578,000 tons, an increase of 6,169,000 tons over the 1938 production of 62,409,000 tons.

The increased spread between the production of pig iron and steel in 1939 compared with 1938 indicates a pronounced rise in the world use of iron and steel scrap during 1939.

Cartel activities.—In the first 8 months of 1939 the British Iron and Steel Federation, acting for the International Scrap Convention, made two purchases of iron and steel scrap in the United States that totaled about 850,000 gross tons. Immediately after the outbreak of war in September the International Scrap Convention suspended operations, although no formal liquidation took place.[8] In the remainder of 1939 each European nation bought independently. Italy and the Balkan States made additional purchases totaling about 100,000 tons, but the United Kingdom, which had a large share in the earlier purchases made for the cartel, ceased buying. As in former years, the extensive purchases of scrap made by Japan in the United States during 1939 were negotiated by the several large mercantile houses of that nation.

REVIEW BY COUNTRIES

Germany.—Steel production in Germany proceeded at a feverish rate to meet the 1939 military requirements. New records were established, and the German output of steel ingots and castings continued to exceed the combined production of the United Kingdom and France. The productive capacity of Germany was augmented by conquests of Czechoslovakia and Poland, although these acquisitions furnished little additional raw-material supplies and the rate of steel production remained very largely dependent on imports of iron ores from the Scandanavian Peninsula. Germany adopted stringent measures to conserve its domestic supplies of iron and steel scrap. The use of pig iron produced from low-grade domestic ores and high-grade imported ores was continued. German imports of scrap from the United States were reduced drastically in 1939 and, 2 months before the outbreak of war, shipments from the United States to Germany had ceased. Figures showing the consumption of scrap in Germany in 1939 are not available, but it is estimated that the consumption in 1938 totaled 11,000,000 metric tons compared with 10,000,000 in 1937 and 9,700,000 in 1936.[9]

Italy.—Steel production in Italy reached new high levels in 1939, although the increase over previous years was relatively small. Italian production of pig iron also set a new record in 1939, but the iron and steel industry remains dependent by a wide margin on foreign raw materials. Italian imports of pig iron are surpassed by those of iron and steel scrap; and, although imports of scrap from the United States, whence Italy has received more than half its imports of this commodity in recent years, were slightly lower in 1939 than in 1938, the decrease may be attributed to a lack of shipping facilities occasioned by the outbreak of Allied and German hostilities. Italy is keenly aware of the vulnerability of her steel industry and, to minimize demand for raw materials from foreign sources, has by Royal Decree Laws issued stringent regulations regarding the use of scrap.[10] Restrictive measures also have been taken to curtail certain uses of iron and steel, and these materials may no longer be employed for enclosures, divisions of land, gardens, villas, etc., including barbed wire and fencing of any metal.[11]

Japan.—The Japanese steel industry, which has maintained a spectacular growth during the past decade, established new production records in 1939. The problem of raw materials is still difficult, as evidenced by the fact that steel production, which has almost tripled

[11] Iron and Steel Fortnightly, vol. 1, No. 14 (N. S.), July 20, 1939, p. 94.

since 1930, has not been accompanied by proportionate increases in the output of pig iron. Consequently the maintenance of present production rates depends entirely on imports of pig iron and iron and steel scrap. Although sources of scrap within the empire are not large, strict Government control is exercised over all available supplies. A new iron and steel industrial policy provides for the unification, purchase, and distribution of scrap iron and the establishment of prices for materials based on the efficiency of various plants.[12]

The announced abrogation of the Treaty of Commerce and Navigation between the United States and Japan and the outbreak of war in Europe caused no little disturbance within Japanese iron and steel circles during the last 5 months of 1939. Apprehension regarding these matters was based on Japanese dependence on iron and steel scrap imports from the United States, on iron ore brought in from colonial possessions of belligerent countries, on securing plant equipment from Germany, and on the importation of special and alloy steels required for the aircraft, automobile, and machine-tool industries.[13]

Poland.—At the outset of 1939 it appeared that Poland, because of the seizure of the Trans-Olzan area from Czechoslovakia, had accomplished self-sufficiency in steel-making and was capable of meeting the needs of national defense. However, in the spring of 1939 the demand for armament became very great, and Poland entered world scrap markets, placing large orders in France and the United States. Consignments of scrap from the United States to Poland, which totaled approximately 15,000 gross tons for the first 4 months of 1939, increased to over 26,000 tons in May and continued at higher rates in June, July, and August. However, they dropped to less than 9,000 tons in September and disappeared after the German military conquest of Poland.

United Kingdom.—Scrap was an extremely significant factor in the all-time records of steel production established in the United Kingdom during 1939. Excess supplies of iron and steel scrap that depressed markets during 1938 disappeared rapidly following the increased production rate of the first quarter of 1939. Imports of scrap from the United States were resumed in March and established new highs during the third quarter; however, the trend was sharply downward throughout the remaining months of the year. House-to-house collection campaigns for scrap were inaugurated as early as March 1939, and some 150,000 firms were requested to assist by contributing whatever scrap was in their possession.[14] Later, following the outbreak of war, collection campaigns were intensified and extended to include dumps to assemble as much scrap as possible at home with a view toward reducing the number of ships involved in the scrap trade. The steel industry undertook to use higher ratios of pig iron in furnace charges, hoping to abate the demand for scrap.[15] Nevertheless, figures for 1939 indicate that a larger proportion of scrap was used than during any of the years immediately preceding.

IRON ORE, PIG IRON, FERRO-ALLOYS, AND STEEL

By Robert H. Ridgway and H. W. Davis [1]

SUMMARY OUTLINE

War-geared international economy drove world production of iron and steel to record or virtually record levels in 1939. Although other nations expanded their near-capacity activities of 1938, the major part of the world increase in 1939 was due to the gain in American output, which rose precipitously during the latter half of the year. Relatively small quantitative increases established new production peaks in Germany, Italy, Japan, the U. S. S. R., and the United Kingdom. Some of the gain in Germany, the second largest world producer and the largest producer in Europe, was due to territorial accession during 1939; but production in that country, even as formerly constituted, advanced despite some slowing down in certain Saar works during the first stages of the war. As a result of hostilities, output of iron and steel in several of the principal countries is under strict control and is oriented to armament and munitions, with little attention to civilian requirements. World production of pig iron (including ferro-alloys) and steel increased 23 percent and 24 percent, respectively, compared with 1938; domestic production of each increased 66 percent, and output of each in the rest of the world rose 10 percent. Of the total world output of pig iron and steel in 1939 the United States furnished about 32 and 35 percent, respectively, compared with the 23 and 27 percent in 1938. Since the depression the United States has been supplying a smaller proportion of the total world iron and steel production than formerly.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

As iron and steel manufacture the major implements of war, unsettled conditions in Europe and Asia dominated the iron-ore industry in 1939 and disturbed the usual routes of flow. Faced with problems of restricted imports and national self-sufficiency, certain European powers in recent years have focused their attention on development and treatment of low-grade ore bodies within their national boundaries. These activities were accelerated in 1939, particularly in Germany and the United Kingdom; even so, both countries still depend heavily on foreign ore supplies. The supply of raw materials, especially iron ore in Germany and England and to a smaller extent coal in France and Italy, is of utmost importance in maintaining the steel-production rate. The present international situation is furnishing further impetus to the nationalistic spirit of self-sufficiency, particularly as to iron and steel, in other nations.

In the first half of 1939 the domestic iron and steel industry maintained the gain of the last half of 1938, and steel operations were about 53 percent of capacity or slightly below those during the last quarter of 1938. During the latter half of 1939, however, production increased rapidly, amounting to nearly 5,500,000 tons in November or more than 93 percent of capacity compared with 62 percent in November, the peak month for 1938. Slightly more than one-third of the 1939 output was made in the final 3 months, when the production rate for steel ingots rose to new heights. At the close of 1939, activities were off a little but were still at a high rate (86 per-

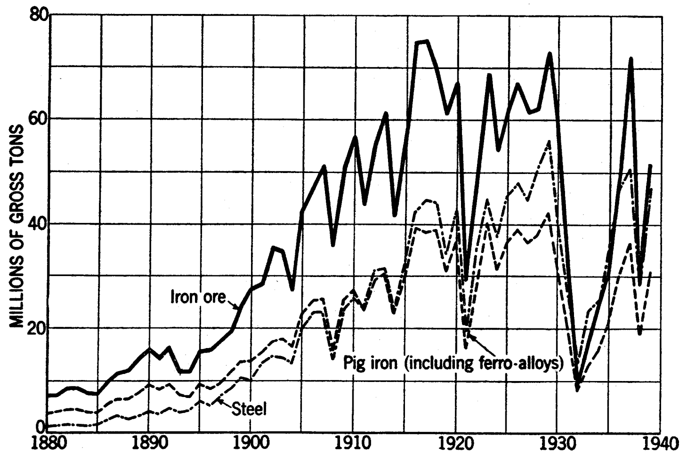

FIGURE 1.—Trends in production of iron ore, pig iron, and steel in the United States, 1880–1939.

cent of capacity for December); the average rate of production in the last quarter of 1939 was 89 percent compared with 51 percent in the second quarter. The average operating rate during 1939 was 64 percent compared with 40 percent in 1938. The producers of such mineral products as iron ore, manganiferous iron ore, fluorspar, fluxing stone, and coke, which depend on iron and steel furnaces for their chief market, felt the increased demand during the last half of 1939. Domestic production of iron ore, the principal raw material, increased 82 percent over 1938 but still was 21 percent under the 1925–29 average. Figure 1 shows the trends in domestic production of iron ore, pig iron, and steel for more than half a century.

A factor in the rise of domestic steel output in 1939 was the decision of consumers to change their inventory position. The advent of war in Europe created uncertainties that caused consumers of steel to rush to build up stocks of raw material. The automobile industry, with a strong fourth-quarter demand, was the largest consuming outlet for steel, taking about one-sixth of the total. Production of automobiles in 1939 increased 44 percent over 1938 and amounted to

3,577,058 units—still somewhat below the 5-million car year 1929. Although the farmer's cash income rose about 5 percent in 1939, the quantity of steel moving into this outlet was lower than in 1938. Exports of steel in 1939 increased over 1938 and were more than treble the quantity moving into agriculture. The relative quantity of steel used in containers, the third largest consuming outlet, was about the same in 1939 as in 1938.

The capital-goods industries expanded in 1939, and more steel was consumed in this outlet. Buying of equipment by the railroads rose sharply in September, and they participated in the business expansion of the fall when full utilization of capacity was approached. The problem of insufficient capacity of railroad equipment owing to the small outlays for new rolling stock during the last decade was brought into focus by the 1939 peak carloadings and heavy railway traffic. Recent replacements of rolling stock are designed for increased speed and efficiency, both for passenger and freight service. New freight cars made of low-alloy, high-strength steels increase capacity and lighten dead weight. Thus less steel may be used as a new unit replaces an old one. Large expenditures, however, will be necessary to correct the accumulated obsolescence.

The shipbuilding industry revived in 1939, and at the end of the year the total tonnage under construction in American shipyards was the highest since 1920. Activity increased in both private and Government yards on merchant and naval ships. The shipbuilding industry was bolstered by the acceleration of the building program of the Maritime Commission in September.

The construction industry had a better year in 1939 than in 1938, as activities continued to advance for the sixth consecutive year. Both public and private work contributed to the increase, with residential building especially active. Industrial and commercial building were only moderately higher in 1939 than in 1938, but increases were more pronounced after conditions changed in September. Despite the increase, total expenditures for construction in 1939 were less than three-quarters of those in the peak years 1926 to 1929; however, the physical volume and consumption of raw material, including steel, undoubtedly were greater as construction costs have changed during the last decade.

Continuing the movement of 1938, the price of steel products dropped during the first half of 1939 as demand weakened and the upturn of production late in 1938 flattened and receded. Price reduction during the first half of 1939 on nearly all steel products brought down the composite price of finished steel, as compiled by Iron Age, to 2.236 cents per pound in June from 2.286 cents at the beginning of the year. Recovery followed, and before the year ended there was frenzied buying of many products as consumers sought to fill their needs in advance because of fears that war would cause higher prices and delayed deliveries. At the beginning of the last quarter of 1939 the mills were generally sold out for the rest of the year, and prices advanced, the Iron Age average rising to 2.242 cents for November and 2.261 cents for December. The average for the year was 2.257 cents a pound. Pig-iron prices followed somewhat the same pattern, but buying during the earlier months was restricted by hold-over contracts. September saw a big "pick-up" in demand as prices advanced $1 to $2 a ton on most grades. The Iron Age composite pig-iron price, which was $20.61 a long ton until the end of August, advanced $1 a ton in September and $1 more in October; it held the October level the rest of the year. Scrap prices, which had been fairly steady until September, rose 44 percent by early October but were off several dollars per ton during the rest of the quarter. The price of ferromanganese at seaboard was reduced $12.50 a ton, in January, but in September it was raised to $100 a ton. Spiegeleisen, which had been quoted at $28 during the year, also increased in price in September, that of the 19–21 percent manganese grade advancing to $32. The quotations on Lake ores for the 1939 season were unchanged from 1938.

Figure 2 gives trends in prices of iron ore, pig iron, steel, and steel scrap since 1890.

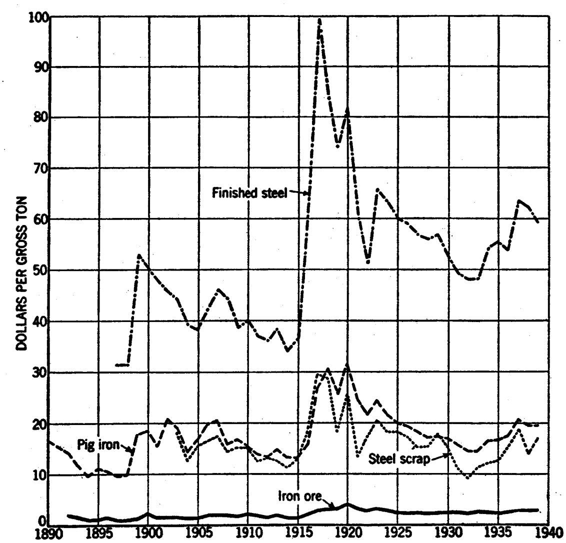

FIGURE 2.—Trends in prices of iron ore, pig iron, finished steel, and steel scrap, 1890–1939. The prices of iron ore and pig iron are the averages f. o. b. mines and furnaces, respectively, as reported to the Bureau of Mines; the price of finished steel is an average composite computed by American Metal Market; that of steel scrap is an average at Pittsburgh of No. 1 Heavy Melting, computed by Iron Age.

Employer-employee relationships, which have been receiving increased attention in recent years, were better in 1939 than in 1938 as employment rose to a higher level. As operations at plants increased there were steady gains in employment and earnings of wage earners during the year. According to the American Iron and Steel Institute average hourly earnings were 84 cents, the highest for any year in the history of the industry. Total pay rolls in the industry in 1939, according to the same source, were $810,000,000 compared with $600,000,000 in 1938. The contract entered into in March 1937 between the steel-manufacturing subsidiaries of the United States Steel Corporation and representatives of the Steel Workers Organizing Committee, one of the affiliates of the Congress of Industrial Organizations, as the collective bargaining agency for employees who were members of the Amalgamated Association of Iron, Steel, and Tinworkers of America, expired in February 1938. The agreement was renewed subject to change upon 10 days' notice from either party and to termination if changes are not agreed to within 20 days of the notice. This affords an opportunity for adjustment of operations to varying economic conditions. Apparently, the agreement is working out satisfactorily to the parties concerned, as there have been no changes since the signing. There were no major strikes in the iron and steel industries in 1939, although the Bureau of Labor Statistics, United States Department of Labor, lists 57 strikes that began in 1939, which involved 14,466 workers and resulted in 212,760 man-days idle during the year; however, all of the strikes were minor in extent. The wages-and-hours law, which provided for a change from 25 to 30 cents in the hourly rate and a reduction of the workweek from 44 to 42 hours effective October 24, 1939, had little or no effect on the iron and steel industry.

The record rate of activity in the steel industry during the closing months of 1939 brought production to near capacity. As the rise was abrupt, little time was available for expansion, and problems of immediate production were paramount. Present steel making and finishing capacity can take care of any reasonable demands, and little new capacity was added in 1939. War orders might serve as an incentive to increase capacity; but industry, recalling events of the last war, is chary of making investments on this basis. Three blast-furnace stacks were remodeled during the year, and four stacks were dismantled, resulting in a decrease in blast-furnace capacity. Only one open-hearth furnace (Alton, Ill.) was added to capacity in 1939. Considerable capacity was added to finishing operations of the steel processes, thereby rounding out activities of various producers.

Imports of iron ore into the United States in 1939 increased 14 percent over 1938 and were equivalent to 5 percent of the domestic production. Imports of pig iron rose 27 percent but were equivalent to only 0.1 percent of the domestic output. Imports of ferro-alloys also increased owing to much larger receipts of ferromanganese and spiegeleisen, the latter having more than doubled the 1938 figure. Imports of iron and steel manufactures, although relatively small, gained 19 percent over the low total for 1938. Exports of iron and steel products, which are much higher than imports, likewise advanced, topping those of 1938 by 16 percent. Exports of pig iron amounted to 177,024 long tons and were much lower than in 1938, whereas exports of iron ore, largely to Canada, increased 79 percent. Exports of ferro-alloys were higher than in 1938 but still did not represent much tonnage. Although exports of scrap increased 20 percent over 1938, they were 13 percent below the 1937 total.

Import duties on a few minor iron and steel products were lowered in 1939 under the Trade Agreements Act of June 12, 1934. These changes, which were provided for in the new trade agreement with Canada signed November 17, 1938, became effective January 1, 1939, and superseded the agreement signed November 15, 1935. There were also some changes, including a reduction in the duty on low-phosphorus (0.04 percent and under) pig iron from $1.125 to $0.75 per long ton, in the trade agreement with the United Kingdom, which likewise was signed November 17, 1938, to become effective January 1, 1939. Chromite was bound on the free list in the Turkish Agreement signed April 1, 1939, to become effective May 5, 1939.

In connection with its studies on the concentration of economic power, the Temporary National Economic Committee held hearings on various phases of the iron and steel industry late in the year. Testimony was taken from men in the industry with a view to developing information on the competitive position of different factors of the industry.

CONSUMPTION OF FERROUS SCRAP AND PIG IRON

Data on the consumption of ferrous scrap and pig iron, formerly included in this chapter, will be found in the chapter on Iron and Steel Scrap. Data on the consumption of pig iron will be found in the pig-iron section of this chapter.

IRON ORE

Production and shipments.—Mining of iron ore in the United States experienced the second best year since 1930. Production amounted to 51,721,369 gross tons, a gain of 82 percent over 1938 but 21 percent under the 1925–29 average. Output in 1939 came from 208 mines (this figure does not include an undetermined number of small operations whose aggregate output is only a fraction of 1 percent of the total), of which 11 produced more than 1 million tons each compared with 172 mines having only 4 in the million-ton class in 1938. Sixteen States were active producers in 1939 as well as in 1938. Minnesota, with 31,547,701 tons, supplied 61 percent of the domestic total, and Michigan, with 9,159,222 tons or 18 percent, was the second largest producer. These two States and Wisconsin (972,685 tons or 2 percent) constitute the Lake Superior region, which furnished 81 percent of the domestic total. Of the 1939 total, about three-fifths came from open-pit operations compared with about one-half in 1938. Shipments of iron ore likewise were much larger in 1939, amounting to 54,820,589 gross tons, an increase of 107 percent over 1938 but 18 percent less than the 1925–29 average. The greater part of the iron ore mined in the United States is used in the manufacture of iron and steel, but 56,763 tons of domestic ore were shipped in 1939 for other uses as follows: Cement, 33,140 tons; paint, 12,235 tons; ferromagnesite, 3,000 tons; flux at nonferrous smelters, 6,640 tons; and other industries, 1,748 tons.

The quantities of iron ore shown in the following tables include ore that was beneficiated—that is, treated in any way—as well as ore that did not require treatment. Although included in the figures on production, the iron ore sold for the manufacture of paint—12,235 tons in 1939 valued at $66,817 ($5.46 a ton) compared with 9,694 tons in 1938 valued at $44,249 ($4.56 a ton)—is not included in shipments from mines. The output of manganiferous ore that contained 5 to 35 percent manganese also is not included; 709,247 tons, valued at $2,148,321, were shipped in 1939 compared with 308,860 tons, valued at $858,356, in 1938. Moreover, the statistics do not include iron sinter recovered from the roasting of domestic pyrites concentrates in Tennessee.

Principal mines.—The importance of large mining units in the iron-mining industry is shown by the fact that 11 yielding more than 1,000,000 tons each produced about half the entire output in 1939. In years of heavy demand this situation is more pronounced, thus concentration of production was greater in 1939 than in 1938, when 13 mines yielding more than 500,000 tons each furnished about half the output. Of the eleven 1-million-ton producers in 1939, 9 were in Minnesota (all on the Mesabi range), with 1 each in Alabama and Pennsylvania. Only 4 contributed a million tons or more in 1938. Of the 11 principal producers in 1939, 7 were open pits; 1 was operated by underground methods, and 3 were combinations. Except for 1 mine that produced magnetite, all principal mines produced hematite.

Iron-ore mines of the United States in 1939, by size of output

Output of 10 [1] mines producing between 400,000 and 500,000 tons each					[1] 5,945,198
Output of 10 mines producing between 300,000 and 400,000 tons each					3,340,130
Output of 11 mines producing between 200,000 and 300,000 tons each					2,762,501
Output of 28 mines producing between 100,000 and 200,000 tons each					4,181,991
Output of 17 mines producing between 50,000 and 100,000 tons each					1,216,178
Output of 104 [2] mines producing less than 50,000 tons each					625,667
Grand total of United States (208 [2] mines)					51,721,369

[1] Output of 1 mine producing more than 500,000 tons included with mines producing between 400,000 and 500,000 tons each.
[2] Excludes an undetermined number of small pits. The output of these pits is included in the tonnage given.

Beneficiation.—Beneficiation of iron ore was reported at 51 mines in 8 States compared with 43 mines in 7 States in 1938. At many mines the ore is crushed and screened to improve its structure, but ore so improved is not included in the statistics on beneficiated ore. Some iron ore is recovered in the form of dust from blast furnaces; data on ore so recovered, however, have been accounted for previously in shipments from mines.

Beneficiated ore shipped from domestic mines in 1939 increased 95 percent over 1938 and comprised 17 percent of the total shipments in 1939 compared with 18 percent in 1938.

Beneficiated iron ore shipped from mines in the United States, 1938–39

[Exclusive of ore containing 5 percent or more manganese and of ore sold for paint]

State	Variety	1938		1939	
		Gross tons	Value	Gross tons	Value
Alabama	Brown ore	263,766	$605,226	471,054	$995,860

		4,836,435	13,995,055	9,419,298	26,461,493

The quantity of crude ore beneficiated in the Lake Superior district (all in Minnesota) in 1939 totaled 10,194,506 gross tons and the beneficiated ore recovered 6,170,779 tons—a ratio of 1.652 to 1. In 1938 the crude ore treated totaled 5,112,485 tons and the beneficiated ore recovered therefrom 2,999,464 tons—a ratio of 1.704 to 1. Most of the concentration in this district is done by washing, but a few plants are equipped with jigs. Processes have been described by Zappfe and Hunner.[2] Most of the concentrated ore shipped from Minnesota is obtained in the treatment of wash ores from the western end of the Mesabi range which yield 65 percent concentrates and 35 percent tailings containing about 22 percent iron. Preliminary tests of a limited number of samples indicate that wash ore tailings are amenable to concentration by flotation[3] and that a merchantable commodity can be produced.[4] Improved concentration of low-grade ores is being given increased attention.

In recent years a process has been developed on the Mesabi range for roasting ore to the magnetic state and concentrating it on magnetic separators.[5] More recently heavy-density separation has been developed by Butler Bros. at the Harrison plant on the Mesabi range. The aim is to make a high-grade concentrate rather than a clean tailing. Finely ground ferrosilicon is used as a suspension medium in two 7½-foot-diameter cone separators that have a surprisingly large capacity. The material treated passes 1¼-inch but is retained on 4-mesh.[6] The ferrosilicon adhering to the concentrate and tailing is washed off on screens, thickened, passed through a magnetizing coil, and recovered by Crockett magnetic separators; it is then demagnetized and reused. The rated capacity of the plant is 160 tons of feed per hour to each cone, or a total of 320 tons per hour.[7] Experiments are being conducted on heavy-medium concentration of materials finer than 4-mesh.

The first concentration plant to be erected on the Vermilion range is under construction. The plant will treat ore left in underground workings by earlier operators.

Wet magnetic methods will replace dry magnetic machines in the new mill in the Mineville-Port Henry district of New York. In the Birmingham (Ala.) district the Tennessee Coal, Iron & Railroad Co. has under way a central ore conditioning and sintering plant. The Bureau of Mines continued its work on milling of the red iron ores and ferruginous sandstones of the Birmingham area by scuffing. Results indicate possible commercial application, and plans were materializing rapidly for installation of a plant incorporating this innovation.[8] Application of this principle to ferruginous sandstones that are low in phosphorus may result in production of a commodity useful in acid steel processes.

Beneficiated ore comprised a slightly smaller part of the total shipments in 1939. As pressure for production increases, a relatively larger proportion of the total comes from direct shipping ores. Thus in 1939 the percentage of beneficiated ore was about the same as in 1937, a year of very high production. Furthermore, in 1939, the immediate need for a high tonnage late in the year also favored production of the more easily obtainable direct shipping ores. Data for recent years are shown in the following table, and corresponding statistics for 1914 (the first year for which they were gathered) to 1929 are given in Mineral Resources, 1930. Data for 1930 to 1934, inclusive, are given in Minerals Yearbook, 1935.

Iron ore shipped from mines in the United States, 1925–29 (average) and 1935–39, in gross tons, and percentage of beneficiated ore compared to the total shipped

[Exclusive of ore containing 5 percent or more manganese and of ore sold for paint]

Year	Beneficiated	Total	Percentage of beneficiated to total	Year	Beneficiated	Total	Percentage of beneficiated to total
1925–29 (ave.)	8,653,590	66,697,126	13.0	1937	12,350,136	72,347,785	17.1
1935	6,066,601	33,426,486	18.1	1938	4,836,435	26,430,910	18.3
1936	9,658,699	51,465,648	18.8	1939	9,419,298	54,820,589	17.2

Average value.—The average value per gross ton of iron ore at the mines was $2.89 in 1939 compared with $2.81 in 1938.

The table that follows gives the average value at the mines of the different classes of iron ore in 1938–39 for each of the producing States or groups of States, except where there are fewer than three shippers of a certain variety of ore in a State and permission was not given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately, as not all reports are comparable. Some evidently include mining costs only; others contain, in addition, the cost of selling and insuring the ore; others include an allowance for a sinking

[8] Dean, R. S., Annual Report of the Metallurgical Division. Progress Report 34: Bureau of Mines Rept. of Investigations 3480, January 1940, pp. 67–69.

fund; and still others comprise only costs charged against blast furnaces. None of the reports, however, is supposed to include freight charges.

Average value per gross ton of iron ore at mines in the United States, 1938–39

[Exclusive of ore containing 5 percent or more manganese and of ore sold for paint]

State	Hematite		Brown ore		Magnetite

[2] 1938: California, New Mexico, Tennessee, Utah, Virginia, Washington, and Wyoming; 1939: California, Tennessee, Utah, Virginia, Washington, and Wyoming.

Consumption.—The production of 31,075,914 gross tons of pig iron in 1939 required 53,422,383 tons of iron and manganiferous iron ores, 3,735,132 tons of mill cinder and roll scale, and 721,286 tons of purchased scrap, an average of 1.862 tons of metalliferous materials (exclusive of home scrap and flue dust) per ton of iron made.

The greater part of the iron ore used in Alabama furnaces in 1939 was hematite, chiefly from mines in Jefferson County, but some came from Etowah and St. Clair Counties. Considerable brown ore, iron sinter, pyrite ash, and imported iron ore and manganese ore and small quantities of domestic manganese-bearing ores were used. The brown ore originated chiefly in mines of the Birmingham and Russellville districts, Alabama. In addition to the iron sinter (sintered pyrite ash) from Tennessee, considerable pyrite ash was shipped to Birmingham in 1939 from acid plants in other Southern States. The pyrite from which the ash was made was of both domestic and foreign origin. The domestic manganese-bearing ores came chiefly from Alabama, Arkansas, Georgia, and Tennessee. Imported manganese-bearing ores came from Cuba. In 1939 Alabama furnaces consumed an average of 2.440 tons of ore in making 1 ton of pig iron, the highest average for any State.

Maryland furnaces consumed considerable domestic ore in 1939, in addition to ores from Africa, Australia, Brazil, Chile, Cuba, and Sweden. These furnaces used an average of 1.544 tons of ore per ton of pig iron; however, they used proportionately more cinder, scale, and scrap than furnaces in any other State except Minnesota.

Illinois, Indiana, Kentucky, Michigan, Minnesota, and West Virginia blast furnaces handled Lake Superior iron ore and manganiferous iron ore exclusively. Kentucky furnaces had the lowest consumption of metal-bearing material per ton of iron.

In New York the furnaces in the Buffalo district used ore chiefly from the Lake Superior district, as well as considerable magnetite from New York, and the furnace at Standish consumed magnetite from the Chateaugay mine at Lyon Mountain, N. Y.

Blast furnaces in Ohio consumed considerable magnetite from New York, hematite and brown ore from Missouri, and some ore from Africa, in addition to ore from the Lake Superior district.

Virtually all the ore consumed in western Pennsylvania furnaces came from the Lake Superior district. Those in the eastern part of the State used some Lake ores; magnetite ores from Pennsylvania, New Jersey, and New York; and considerable ore from Africa, Australia, Chile, Cuba, Sweden, and the U. S. S. R.

The Pueblo (Colo.) blast furnaces handled hematite from the Sunrise mine in Wyoming and manganese-bearing ores, chiefly from Colorado and New Mexico.

The Provo (Utah) furnace treated chiefly semialtered magnetite from the Iron Mountain mine near Cedar City, Utah, and manganese-bearing ores from Idaho and Utah.

The Tennessee furnace used Tennessee brown ore and iron sinter.

Iron ore and other metallic materials consumed and pig iron produced in 1939, by States, in gross tons

New York	16,571	13,255		7,611,048	4,746,507

Foreign trade.—Imports of iron ore in 1939 increased 14 percent over 1938. Chile continued to be the chief source of imports into this country, furnishing 66 percent of the 1939 total, while Cuba and Sweden supplied 11 percent each. In addition to the figures in the following table, 266 tons of dross or pyrites ash were imported from Canada in 1939.

Iron ore imported for consumption in the United States, 1937–39, by countries, in gross tons

Country	1937		1938		1939	
	Gross tons	Value	Gross tons	Value	Gross tons	Value

Exports of iron ore from the United States totaled 1,057,304 gross tons valued at $3,578,086 ($3.38 a ton) in 1939 compared with 591,524 tons valued at $1,954,287 ($3.30 a ton) in 1938. Of the 1939 total. 1,032,635 tons went to Canada.

Mining in Cuba.—Shipments of iron ore from Cuba to the United States increased 84 percent in 1939 over 1938. The 1939 total of 279,133 gross tons included 164,210 tons of hematite carrying (dried) 54.90 percent iron and 72,204 tons of siliceous ore carrying (dried) 31.05 percent iron from the Daiquiri-Juragua mines on the southern coast and 42,719 tons of nodulized brown ore carrying (dried) 54.52 percent iron from the Mayari mines near the northern coast. The Mayari mine was nonproductive in 1939.

The total stock of ore reported on hand was 164,059 gross tons at the end of the year compared with 170,044 at the end of 1938.

The following table shows shipments of iron ore from Cuba since the mines were opened in 1884. The statistics on shipments of Cuban iron ore are collected by the Bureau of Mines.

Iron ore shipped from mines in the Province of Oriente, Cuba, 1884–1939, in gross tons

Year	Juragua (hematite and magnetite), Daiquiri (hematite and a little magnetite)	Sigua (hematite)	Mayari (brown ore)	Guamá (hematite)	El Cuero (hematite)	Total
1884–1937	[1] 21,784,498	20,438	3,847,577	41,241	903,103	26,596,857
1938	141,212		10,887			152,099
1939	236,414		42,719			279,133
	22,162,124	20,438	3,901,183	41,241	903,103	27,028,089

[1] Of this quantity, 5,932 tons were sent to Pictou, Nova Scotia, and 64,228 tons to other ports outside of the United States.

REVIEW OF LAKE SUPERIOR DISTRICT

Production and shipments.—Activities in the Lake Superior district (the principal producing district) were at a much higher rate, particularly during the closing months of 1939. The season began at about the level of 1938, but the quick rise in iron and steel output during the latter half of the year caused much greater demand for iron ore. Over three-fourths (81 percent in 1939) of the domestic output comes from the Lake Superior region, where in the third quarter of 1939 mine schedules were revised upward on short notice and immediately available lake transportation capacity was pressed into service. Monthly shipments down the Lakes, the main artery of iron-ore movement, reached high levels. As much of the lake ore comes from the Mesabi range (71 percent in 1939) where open-pit operations predominate, great flexibility in output is attained and increases of considerable magnitude are possible on short notice. The mild fall weather and the late closing of navigation permitted revised requirements to be filled from a lake movement of 45,000,657 tons of iron ore and manganiferous iron ore compared with 19,263,886 tons in 1938. More ore could have moved if the season had been longer, but the tonnage shipped was sufficient to raise combined stocks at furnaces and lower Lake ports at the end of the season above those on hand at the end of the 1938 season, notwithstanding the fact that consumption was at a much higher rate. Shipments of ore from the Lake Superior district totaled 44,849,573 gross tons (44,197,610 gross tons of iron ore and 651,963 tons of manganese-bearing ores containing 5 percent or more manganese) compared with 19,546,835 tons (19,254,171 tons of iron ore and 292,664 tons of manganese-bearing ore containing 5 percent or more manganese) in 1938. The iron-ore-shipment figures given above include 872 tons of paint ore in 1939 and 147 tons in 1938.

Production in the Lake Superior region in 1939 increased 96 percent over 1938 but was considerably below the record. The district furnished 81 percent of the United States total compared with 75 percent in 1938, thereby regaining part of the ground lost to other districts, particularly the Birmingham district, in 1938. Several ranges contributed to the district total. The Mesabi was the largest producer, furnishing 71 percent of the district output and 57 percent of the United States total. The output by ranges is shown in the following table. After 1905 the figures do not include manganiferous iron ore containing 5 percent or more manganese.

Iron ore mined in the Lake Superior district, 1854–1939, by ranges, in gross tons

[Exclusive after 1905 of ore containing 5 percent or more manganese]

Year	Marquette	Menominee	Gogebic	Vermilion	Mesabi	Cuyuna	Total
1854–1937	194,940,914	181,565,297	206,589,891	64,802,561	1,030,463,863	25,170,759	1,703,533,285
1938	2,686,713	1,283,563	2,888,830	932,505	13,256,605	260,194	21,308,410
1939	3,906,195	1,921,704	4,304,008	1,400,341	29,522,227	625,133	41,679,608
	201,533,822	184,770,564	213,782,729	67,135,407	1,073,242,695	26,056,086	1,766,521,303

In 1939, 69 percent of the ore produced on the iron ranges of the Lake Superior district came from open-pit mines. A large part of the open-pit production originates in operations on the Mesabi range, which in 1939 supplied 65 percent of the open-pit ore mined in the district. There is no open-pit mining in Wisconsin and relatively little in Michigan. In addition to the output on the Mesabi range, there is some open-pit production in Minnesota on the Cuyuna range.

Recent years have witnessed significant changes in open-pit mining practice in the iron country.[9] The use of small tractor shovels, tractors, wagons, scrapers, scraper hoists, heavy trucks, and conveyors continued to expand in 1939. In May 1939, six trucks were received at the Mahnomen mine on the Cuyuna range to replace railroad haulage. These trucks [10] are four-wheeled, with 13.50-inch by 24-inch dual tires on the rear and 12-inch by 24-inch tires on the front. The gross load capacity is 62,000 pounds and the payload capacity 36,000 pounds. The average load per truck was 12.9 long tons in 1939. The 9-cubic yard water-level-capacity body is carried over the rear axles, is rear dump and scoop-ended, and is raised and lowered by a horizontal double-acting hydraulic cylinder through rocker arms. The oil-burning engine delivers 185 horsepower, and the trucks move 8 to 10 miles per hour up an 8-percent grade when loaded. The average haul at the Mahnomen mine was 0.73 mile loaded and 0.70 mile empty; the ore was elevated an average of 206 feet. For the 304,168 tons hauled during 1939 the total ton-mile cost was \$0.0644.[11]

Of interest in 1939 was the shipments from the Michipicoten range in Ontario, Canada. Although this output is not included in Bureau production figures, it enters the same commercial channels. The ore came from the old Helen mine of the Algoma Steel Corporation,

[11] Data from unpublished manuscript by F. A. Kelley, general supt., Pickands, Mather & Co., Crosby, Minn.

which in August 1939 began production from new open-pit operations and shipments for the first time since 1922. A total of 111,307 tons of sinter, made from the carbonate ores, was shipped during the season. Other Canadian production in the lake region of Ontario will come from the Steep Rock Lake some 150 miles west of Port Arthur, where large reserves of high-grade hematite are reported to have been developed. The Ontario Government is encouraging production of iron ore by a bonus of 2 cents per unit of iron.

Analyses.—The following table, compiled by the Lake Superior Iron Ore Association, summarizes the average analyses of the total tonnages of all grades of ore shipped and shows the remarkable uniformity maintained during the past 5 years. This uniformity does not mean, of course, that the average grade of available Lake Superior ore is not declining. The grade of shipments has been maintained partly by beneficiation and partly by mixing ores from different deposits. The method of sampling and grading Lake Superior iron ores has been described by Bayer [12] and the method of classification and sampling by Murray.[13]

Average analyses of total tonnages (bill-of-lading weights) of all grades of iron ore from all ranges of Lake Superior district, 1935–39

Year	Gross tons	Iron (natural)	Phosphorus	Silica	Manganese	Moisture
		Percent	*Percent*	*Percent*	*Percent*	*Percent*
1935	28,214,056	51.44	0.093	8.93	0.79	10.75
1936	44,745,754	51.45	.091	8.62	.81	10.92
1937	61,972,823	51.53	.091	8.27	.82	11.31
1938	19,353,497	51.90	.089	8.25	.81	10.13
1939	44,983,754	51.75	.085	8.27	.76	10.73

Stocks at Lake Erie ports.—At the close of navigation in 1939, according to the Lake Superior Iron Ore Association, 5,216,496 gross tons were in stock at Lake Erie ports compared with 5,290,294 tons on the corresponding date in 1938. At the opening of navigation in May 1940, 2,950,752 tons were in stock at these ports, a decrease of 1,534,215 tons from the figure on May 1, 1939. Withdrawals from docks were therefore 2,265,744 tons during the winter of 1939–40.

Prices of Lake Superior ore.—The prices established May 4, 1939, for the four standard grades of Lake Superior ore were the same as in 1937 and 1938 but were 45 cents a ton more than the price that had been maintained from 1929 to 1936. The unit prices for 1937, 1938, and 1939 for base ore of the various grades quoted at Lake Erie ports were as follows: Old-range bessemer, 10.194 cents; Mesabi bessemer, 9.903 cents; old-range nonbessemer, 9.903 cents; and Mesabi nonbessemer, 9.612 cents. The prices that correspond to these unit prices are, respectively, $5.25, $5.10, $5.10, and $4.95 a gross ton. The base of the four standard grades for 1925–39 is an iron content of 51.5 percent natural. For the bessemer grades the phosphorus con-

[12] Bayer, E. P., Sampling and Grading Mesabi Iron Ore: Min. and Met., vol. 18, No. 372, December 1937, pp. 547–548.
Bayer, E. P., Grading Lake Superior Iron Ores: Eng. and Min. Jour., vol. 139, No. 3, March 1938, pp. 50–51.

[13] Murray, C. B., Classification and Sampling: Lake Superior Iron Ores, chap. 4, Lake Superior Iron Ore Assoc., Cleveland, 1938, pp. 69–72.

tent is 0.045 percent (dry), and for the nonbessemer grades the phosphorus content ranges from 0.045 to 0.18 percent. Ores containing more than 0.18 percent phosphorus are classed as high-phosphorus ores, whereas those containing 18 percent or more silica are classed as siliceous ores.

Reserves.—Estimates of ore reserves for Minnesota, furnished by the Minnesota Tax Commission, and for Michigan, furnished by the Michigan Board of Tax Commissioners, are shown in the following tables. These estimates reveal decreases from 1938 of 9,581,775 gross tons in Minnesota and 6,097,470 tons in Michigan. Reserves in Wisconsin have been estimated recently at 5,500,000 tons.

Unmined iron-ore reserves in Minnesota, May 1, 1935–39, in gross tons

Range	1935	1936	1937	1938	1939
Mesabi	1,163,087,457	1,164,802,947	[1] 1,172,908,376	[2] 1,143,339,871	1,132,513,348
Vermilion	13,307,031	13,074,509	13,943,325	13,599,025	13,631,484
Cuyuna	46,709,113	63,066,428	61,922,739	60,690,596	61,902,885
	1,223,103,601	1,240,943,884	1,248,774,440	1,217,629,492	1,208,047,717

MINING BY STATES

Alabama.—Production of iron ore in Alabama during 1939 increased 39 percent over 1938. About 91 percent of the 1939 production came from underground mines and the remainder from open-cuts. Hematite represented 91 percent of the 1939 total, and much of this red ore contained enough or nearly enough lime to be self-fluxing. The hematite is derived chiefly from underground mines on Red Mountain near Birmingham in Jefferson County, where in 1939 Raimund Nos. 1 and 2, Red Mountain group (comprising the Muscoda, Wenonah, and Ishkooda groups), Sloss Nos. 1 and 2, and Woodward No. 3 mines were producers. Several smaller mines (open-pit and underground) in Etowah, Jefferson, and St. Clair Counties contributed to the total output of hematite ore. The iron content of the hematite produced in 1939 averaged (natural) 35.40 percent, manganese 0.15 percent, phosphorus 0.31 percent, and lime 16.12 percent. The Red Mountain group, with 3,350,184 tons, was the second largest producer in the United States in 1939.

Limonite (brown ore) is mined from a number of widely scattered deposits in Alabama, but production is not nearly so large as that of red ore. In 1939 the output of brown ore comprised 9 percent of the

Alabama total. Brown ores, however, are of higher grade and usually have been subjected to beneficiation, although some operations are rather crude. The brown ore mined in 1939 averaged (natural) 47 percent iron and 0.67 percent manganese. Brown ore is mined from open-cuts and was produced chiefly from the Russellville mines in Franklin County, the Champion mine in Blount County, and the Martaban, Reno, and Woodstock mines in Tuscaloosa County.

California.—Production in California in 1939 was small and came from four mines, two producing magnetite (one in Santa Cruz County and one in Inyo County) and two producing hematite (one in San Bernardino County and one in Inyo County). The magnetite averaged 64 percent iron; the hematite, which averaged 56 percent iron, was absorbed chiefly by the cement industry.

Georgia.—Production of iron ore in Georgia increased to 26,333 gross tons in 1939 from 9,221 tons in 1938. Ten mines—three in Bartow County, one each in Dade, Haralson, and Polk Counties, and four in Walker County—furnished the output in 1939. The output from Georgia in 1939 comprised 18,219 tons of brown ore containing (natural) 41 to 47 percent iron and 0.13 to 3 percent manganese; 7,867 tons of hematite containing (natural) 45 to 60 percent iron and 0.15 to 1 percent manganese; and 247 tons of magnetite averaging (natural) 64.76 percent iron, 0.1 percent manganese, and 0.03 percent phosphorus. Shipments of iron ore comprised 19,643 tons to blast furnaces, 6,203 tons to cement plants, and 487 tons to paint manufacturers.

Michigan.—Output from Michigan comes from three ranges—the Marquette, the Menominee, and the Gogebic. All ranges increased their production in 1939, the Gogebic showing the largest tonnage gain. Production in Michigan rose 53 percent in 1939 over 1938 and totaled 9,159,222 gross tons. Of the 1939 total, 86 percent came from underground mines; the Negaunee mine, an underground producer on the Marquette range, was the largest producer. The iron content (natural) of the ore mined in Michigan in 1939 averaged 51.68 percent compared with 52.23 percent in 1938.

Iron-ore reserves in Michigan at the end of 1939 totaled 143,657,427 gross tons, a decrease of 6,097,470 tons during the year.

A report of the iron-ore mines of Michigan for 1939, published by the Geological Survey Division of the Michigan Department of Conservation,[14] shows that the average number of men employed was 5,818 (5,633 in 1938), the average number of days worked 206 (157 in 1938), the average daily wage $7.07 ($7.59 in 1938), the average yearly earning $1,457.12 ($1,192.29 in 1938), and the average tons of ore mined per man per day 6.63 (5.32 in 1938).

The data in the following table on average per-ton costs of mining ore at underground mines and at siliceous open pits have been abstracted from statistics published in much greater detail by the Geological Survey Division of Michigan.

[14] Pardee, F. G., and Eddy, G. E., General Statistics Covering Costs and Production of Michigan Iron Mines: Michigan Dept. of Conservation, Geol. Survey Div., Lansing, 1940.

Average per-ton costs of mining iron ore at underground mines and at siliceous open pits in Michigan in 1939

Item	Underground				Siliceous open pits
	Gogebic	Marquette	Dickinson and Iron	Total	
Cost of mining	$1.5481	$1.6936	$1.6611	$1.6359	$0.4447
Deferred mining cost	.2032	.0731	.1230	.1296	.0394
Taxes	.3042	.2824	.2016	.2750	.0470
General overhead	.2299	.2533	.1750	.2294	.1005
Transportation	1.8208	1.4959	1.6324	1.6480	1.5211
Marketing	.0550	.0904	.0775	.0756	.0798
Royalty	.4008	.2960	.2497	.3228	.0967
Interest on borrowed money	.0001	.0133	.0125	.0086	.0014
Total ore cost	4.5621	4.1980	4.1328	4.3249	2.3306
Lake Erie value per ton	5.3086	5.2377	5.0370	5.2218	2.4791
Gross ore profit [1]	.7465	1.0397	.9042	.8969	.1485

[1] This figure does not represent true profit, as much ore is sold below the Lake Erie price.

Minnesota.—More than 1 billion gross tons (1,166,434,188) of iron ore have been produced in Minnesota. In 1939 output increased 118 percent over that in 1938. Three ranges contribute to Minnesota's production—the Cuyuna, the Mesabi, and the Vermilion. The Mesabi range supplies a large part of the Minnesota total and in 1939 produced 29,522,227 tons. Output from open-pit mines in 1939 furnished 88 percent of the total compared with 77 percent in 1938 and 88 percent in 1937. Of the 11 domestic mines producing more than 1 million tons each in 1939, 9 were in Minnesota; of these 7 were open pits, and 2 used combination open-pit and underground methods. Of the 65 mines in Minnesota active in 1939 (55 in 1938), 45 (29 in 1938) yielded more than 100,000 tons each. The iron content (natural) of the ore mined in 1939 averaged 52.43 percent compared with 52.31 percent in 1938.

According to the annual report of the mine inspector of St. Louis County, the average number of men employed in iron mines in St. Louis County was 4,589 in 1939 (3,773 in 1938), and the average daily wage was $6.61 ($6.60 in 1938) for 8 hours. In 1939, 3,098,991 cubic yards of overburden were removed compared with 3,762,318 yards in 1938.

According to the annual report of the mine inspector of Itasca County, the average number of men employed in iron mines was 2,567 in 1939 (2,132 in 1938), and the average daily wage was $6.08 ($5.82 in 1938) for 8 hours. In 1939, 4,555,471 cubic yards of overburden were removed compared with 3,807,920 yards in 1938.

Unmined iron-ore reserves in Minnesota on May 1, 1939, totaled 1,208,047,717 gross tons, a decrease of 9,581,775 tons from 1938.

Missouri.—An undetermined number of small mines in Butler, Carter, Crawford, Dent, Franklin, Howell, Iron, Madison, Phelps, Pulaski, Ripley, St. Francois, Shannon, and Wayne Counties supplied the iron-ore output of Missouri in 1939. The ore, which averaged 52.51 percent iron, comprised both hematite and brown ore, was mined by open-pit and underground methods, and was shipped to paint and steel plants as well as nonferrous smelters.

New Jersey.—Output of iron ore in New Jersey increased in 1939 over 1938 and totaled 399,289 tons. The ore, all magnetite and all produced from underground operations, came from three mines in Morris County and one mine in Warren County in the northern part of the State. New Jersey ores are crushed and concentrated before shipment. Most of the concentration is done magnetically, although some nonmagnetic martite is recovered by gravity methods and some hand sorting is practiced, principally to recover high-grade lump used in open-hearth steel furnaces. The concentrates produced in 1939 averaged (natural) 63.32 percent iron. The largest output came from the Scrub Oaks mine. Other producers were the Mt. Hope, Richard, and Washington mines.

New York.—The iron ore produced in New York during 1939 was chiefly magnetite from underground operations at the Harmony and Old Bed shafts in Essex County and the Chateaugay mine in Clinton County. Some hematite was mined for paint in Oneida and Wayne Counties. Shipments from New York in 1939 included sinter averaging 68 percent iron, lump averaging 61 percent iron, and concentrates averaging 68 percent iron.

The largest producer was the Republic Steel Corporation, which operates properties at Mineville near Port Henry and at Lyon Mountain. The Chateaugay mine at Lyon Mountain was acquired by the corporation on August 1, 1939.

Pennsylvania.—Pennsylvania is the most important source of magnetite in the United States. The output comes from the Cornwall mine in Lebanon County, where the ore is extracted by both open-pit and underground methods. In addition, some carbonate ore for use in paint was mined in Carbon County in 1939. Hickok [15] has summarized the history of iron-ore production in Pennsylvania and the changing economic conditions that affect the industry and control its history; he also discusses the geological environment, mode of origin, and future reserves of the various types of iron ore.

South Dakota.—A small quantity (300 gross tons) of brown iron ore was mined at a property in Pennington County and shipped to paint plants in 1939.

Tennessee.—The output of iron ore (brown ore and hematite) in Tennessee in 1939 came from two mines (one in Hickman County and one in Lewis County) and an undetermined number of small surface workings in Hamilton County; it contained 46.41 percent iron and was shipped to blast-furnace and paint plants.

In addition, considerable sintered pyrite ash was made at the plants of the Tennessee Copper Co. in Ducktown Basin. This sinter, which contained 67.4 percent iron and 0.005 percent phosphorus in 1939, moved largely to the blast furnaces in the Birmingham district, where it was added to the blast-furnace burden. Such sinter is not included in iron-ore production or shipment figures for the United States.

Utah.—Two operators in Iron County supplied the Utah total in 1939. By far the larger output came from the Iron Mountain mine, while a relatively small quantity came from the Great Western mine. The ore, principally semialtered magnetite, contained (natural) 53.14

[15] Hickok, W. O., IV, Iron Ores of Pennsylvania: Pennsylvania Geol. Survey Bull. M 18-B, 4th ser., 1939, 21 pp.

percent iron and moved largely to the blast furnace at Provo, Utah, although small quantities went to steel and cement plants.

Virginia.—The output of iron ore in Virginia is small. The entire 1939 production was brown ore from Botetourt County and averaged (natural) about 53 percent iron. The ore was used in the manufacture of hydrogen gas.

Washington.—Two open-pit mines and one underground mine produced the total output of Washington in 1939. Two mines—the Napoleon in Stevens County and the Keystone in Pend Oreille County—yielded hematite averaging (natural) 35.10 percent iron, which was used for cement manufacture, and the Neutral mine in Okanogan County yielded magnetite averaging (natural) 68.73 percent iron, which was used in making ferromagnesite.

Wisconsin.—The Montreal underground mine in Iron County was the larger producer of iron ore in Wisconsin, contributing 808,973 gross tons of the 972,685 produced in 1939. The ore—hematite—averaged (natural) 52.88 percent iron, 1.17 percent manganese, and 0.057 percent phosphorus. The Cary underground mine, also in Iron County, was the other producer in 1939 and furnished 163,712 tons of hematite containing (natural) 53.98 percent iron, 0.62 percent manganese, and 0.048 percent phosphorus. Shipments from Wisconsin mines totaled 1,173,828 tons in 1939.

Wyoming.—The output of iron ore from Wyoming in 1939 came from the Sunrise mine and comprised 587,892 gross tons of hematite containing (natural) 53.22 percent iron, 0.07 percent manganese, and 0.066 percent phosphorus. Much of the ore is a red, earthy hematite similar to Mesabi ore. Production came from both open-pit and underground operations.

[1] In addition there is an undetermined number of small pits. The output of these pits is included in the tonnage given.
[2] Undetermined number of small pits. The output of these pits is included in the tonnage given.

MEN EMPLOYED AND OUTPUT PER MAN AT MINES

Although complete information on employment at iron-ore mines in 1939 is not yet available, incomplete figures indicate that about 22,000 men working about 39,000,000 man-hours were required to produce 51,721,369 tons of merchantable ore, an average of 1.326 tons per man-hour. Thus, the total man-hours worked in 1939 advanced 27 percent over 1938, whereas the output of merchantable ore increased 82 percent; in consequence, output per man-hour increased 43 percent. The gain in output per man-hour in 1939 compared with 1938 was due mainly to a shift in the production of ore from underground to open-pit mines and to nearer-capacity operation of large units. Specifically, about three-fifths of the output came from open-pit mines in 1939 compared with about one-half in 1938, and 11 mines produced more than 1 million tons each in 1939 compared with 4 in 1938.

Figure 3 shows trends in employment and output at iron-ore mines in the United States from 1923 to 1938.

During 1938, the last year for which complete statistics are available, the low level of iron-ore output resulted in a decrease in labor at the mines. The average number of men decreased, as did the average number of days and total man-hours worked. In 1938, 19,788 men working 30,625,760 man-hours produced 28,447,282 tons of merchantable ore, an average output of 0.929 ton per man-hour, whereas in 1937, 25,945 men working 51,416,193 man-hours produced

72,093,548 tons of merchantable ore, or 1.402 tons per man-hour. Thus, although the output of merchantable ore declined 61 percent from 1937 to 1938, the number of men, total man-hours worked, and output per man-hour decreased only 24, 40, and 34 percent, respectively. The output per man-hour in 1937 exceeded that for any year since records have been compiled and undoubtedly was greater than in any other year. The relatively larger labor requirements in 1938 than in 1937 resulted from several factors—the proportionately smaller output of open-pit mines and of direct shipping ore, the partial-capacity production of operating units, and the stripping of proportionately more overburden in preparation for future mining.

The number of man-hours of labor decreased in all districts in 1938 from 1937, but the decrease was relatively more in the Lake Superior and Northeastern districts than in the Southeastern and Western districts. In the Lake Superior district, the principal producing

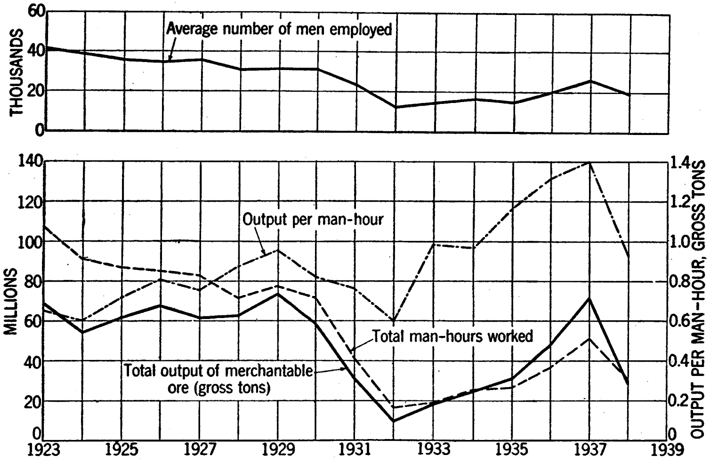

FIGURE 3.—Trends in number of men employed at iron-ore mines, output of merchantable ore, man-hours worked, and output per man-hour in the United States, 1923–38

region, output of merchantable ore decreased 65 percent in 1938 from 1937, but this decrease was more pronounced than the decline in labor requirements, as the total man-hours worked dropped only 42 percent. Much of the Lake Superior output comes from Minnesota, where open pits furnished 77 percent of the State total in 1938. Because of this preponderant production from open pits, output per man-hour in Minnesota is greater than in any other State or district and in 1938 amounted to 1.390 tons. Output per man-hour in 1938, however, was substantially less than in 1937 (2.479 tons) owing to the smaller proportion of ore from open-pit mines and to partial-capacity operations. Although, as was pointed out in Minerals Yearbook, 1934 (p. 322), the improved performance in mining iron ore has been closely related to advances in mechanization, better mining methods, operation of larger units, and more efficient management of mines, the gain in the 6-year period 1933–38 compared with the 10-year period 1923–32 was due chiefly to expansion of open-pit operations in Minnesota. For example, whereas about 75 percent of the merchantable ore produced in Minnesota from 1923 to 1932 came from open-pit mines, 85 percent was so produced in 1933–38. The significance of this shift can be appreciated when it is recalled that Minnesota contributed 61 percent of the total merchantable ore produced in 1923–38 and that during this period the output of men at open-pit mines averaged 2.019 tons per man-hour compared with only 0.699 ton per man-hour for workers at underground mines.

The greater output per man-hour in recent years also was due partly to the stripping of proportionately less overburden in Minnesota in 1933–38 than in 1923–32, in preparation for future mining. In 1933–38 about one-fourth cubic yard of overburden was removed for each ton of merchantable ore mined in Itasca and St. Louis Counties, Minn., whereas in 1923–32 about one-half cubic yard of overburden was re-

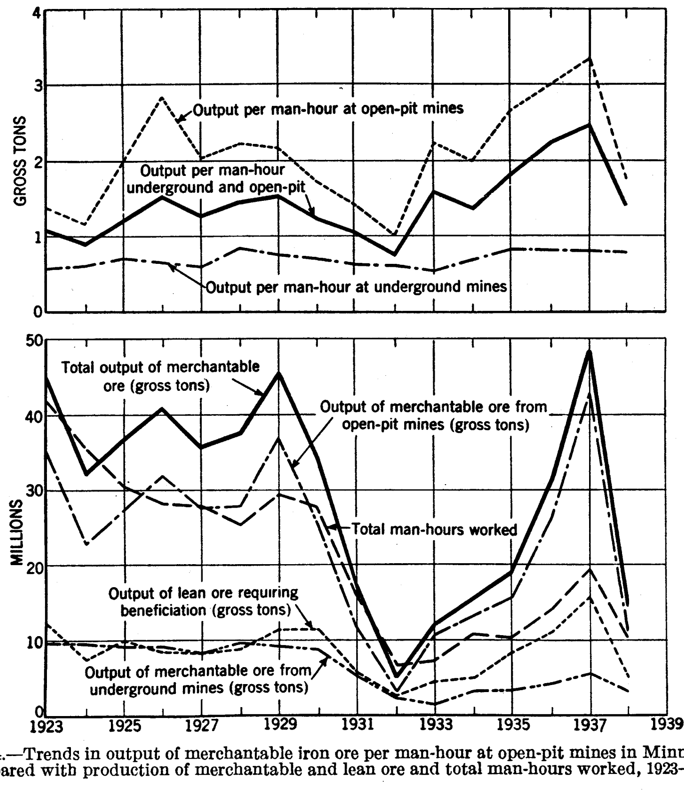

FIGURE 4.—Trends in output of merchantable iron ore per man-hour at open-pit mines in Minnesota compared with production of merchantable and lean ore and total man-hours worked, 1923–38.

moved for each ton of merchantable ore mined. Any material shift in the labor force used for direct mining of the ore at the expense of that used in stripping will result in a much higher output per man-hour for any year. This is illustrated strikingly in figure 4, which shows that in 1926, 1933, 1935, 1936, and 1937, when only about one-fourth cubic yard of overburden was removed for each ton of merchantable ore mined at both open-pit and underground mines, the output per worker increased substantially, whereas in the other years, when one-third to four-fifths cubic yard of overburden was removed for each ton of ore mined, the output per worker decreased.

Another factor that affects the output per man-hour is the tendency to mine leaner ore. Proportionately more lean ore requiring beneficiation has been mined in Minnesota in recent years than during the period 1923–32. In 1933–38, for instance, beneficiated ore represented 21 percent of the total merchantable ore compared with an average of only 16 percent in 1923–32.

Most of the ore mined in the Southeastern district—the second largest producing region—is obtained from underground operations. Output of merchantable ore per man-hour in this area increased slightly to 0.631 ton in 1938 from 0.624 ton in 1937. The largest and most consistent producing mines in the Southeastern district are in Jefferson County, Ala., where 3,803 men working 6,058,805 man-hours in 1938 produced 3,970,604 tons of merchantable ore, equivalent to an average output of 0.655 ton per man-hour. Virtually all ore produced in Jefferson County comes from underground mines. In comparing the man-hour cost of mining ore in Jefferson County, Ala., with that at underground mines in the Lake Superior district one should remember that whereas the ore in the Lake Superior district is considerably richer in iron the ore from the Jefferson County mines contains enough

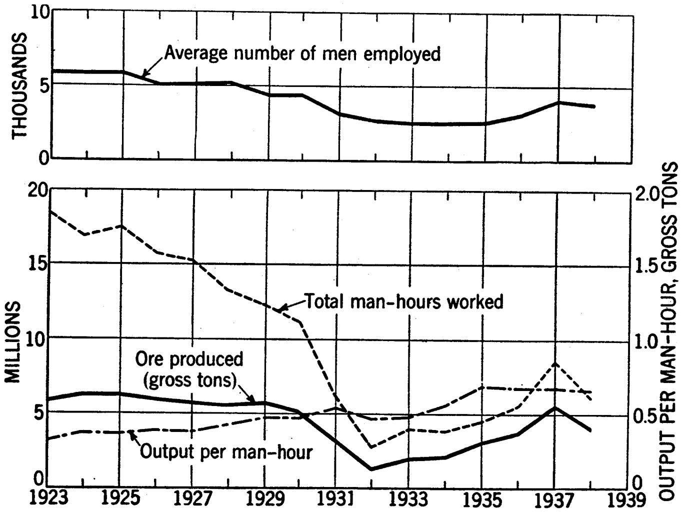

FIGURE 5.—Trends in production, man-hours worked, output per man-hour, and number of men employed at iron-ore mines in Jefferson County, Ala., 1923–38.

or almost enough lime to make it self-fluxing. Thus, the lower iron content is partly offset by the self-fluxing nature of the ore, although it is impossible to show this important characteristic in the productivity figures.

Figure 5 shows trends in production and employment at iron-ore mines in Jefferson County, Ala., 1923–38.

In the Northeastern district the average output of merchantable ore per man-hour increased to 0.735 ton in 1938 from 0.523 ton in 1937. The gain in productivity was due partly to the fact that proportionately more ore was produced in 1938 than in 1937 from the Cornwall open pit, where a relatively high output per man-hour is attainable.

The following table shows employment at iron mines and beneficiating plants, quantity and tenor of ore produced, and average output per man by districts and States in 1938. Corresponding statistics and supplementary data are given in Minerals Yearbook, 1934 to 1939, inclusive.

Employment at iron-ore mines and beneficiating plants, quantity and tenor of ore produced, and average output per man in 1938, by districts and States

WORLD PRODUCTION

The following table shows the production of iron ore by countries from 1935 to 1939, insofar as statistics are available. Although complete returns for 1939 are not yet available it is evident that world production was considerably greater than in 1938. Output in the latter year amounted to 162,000,000 metric tons, of which the United States supplied only 18 percent, compared with 211,000,000 tons in 1937, of which the United States supplied 35 percent.

World production of iron ore, 1935–39, by countries, in metric tons

[1] In addition to the countries listed, China, Finland and Madagascar report production of iron ore, but complete data are not available.
[2] Data not available.
[3] Production of Tofo Mines.
[4] Estimate included in total.
[5] Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese.
[6] Russia in Asia included with Russia in Europe.
[7] Exclusive of bog ore, which is used mainly for the purification of gas.
[8] Estimated.

PIG IRON

Production and shipments.—Domestic production of pig iron, exclusive of ferro-alloys, increased 67 percent in 1939 over 1938 and was the second best year since 1929. The output in 1939 comprised 31,031,973 gross tons using coke and 43,941 tons using charcoal as fuel. Pennsylvania was the largest producer of pig iron in 1939, with 28 percent of the total; Ohio ranked second, with 23 percent. Of the pig iron manufactured in 1939, it is calculated that 1,360,174 tons valued at $23,141,343 were made from 2,262,043 tons of foreign ores, including ore from Africa, Australia, Brazil, Chile, Cuba, Newfoundland, Palestine, Sweden, and the U. S. S. R., indicating an average yield of 60.13 percent from imported ore. Domestic ore (51,160,340 tons) and cinder, scale, and purchased scrap (4,456,418 tons) totaling 55,616,758 tons were reported as used in the manufacture of 29,715,740 tons of pig iron, indicating an average pig-iron yield of 53.43 percent from domestic materials. In addition, 1,004,565 tons of home scrap and 1,737,000 tons of flue dust were consumed in making pig iron in 1939.

Shipments of pig iron, exclusive of ferro-alloys, were 76 percent above 1938 in both quantity and value in 1939. The values given represent the approximate amounts received for the iron f. o. b. furnaces and do not include freight costs, selling commissions, and other items that are figured in some of the market prices for pig iron published by trade journals.

Value at blast furnaces.—The average value of all kinds of pig iron given in the accompanying table is based upon reports of manufacturers to the Bureau of Mines. The figures represent the approximate values f. o. b. blast furnaces and do not include the values of ferro-alloys. The general average value for all grades of pig iron at the furnaces was $19.53 a gross ton in 1939—only 8 cents less than in 1938.

Average value per gross ton of pig iron at blast furnaces in the United States, 1935–39, by States

State	1935	1936	1937	1938	1939
Alabama	$14.67	$15.01	$16.68	$14.67	$16.16
Illinois	17.58	18.24	21.11	20.33	20.18
Indiana	17.78	18.14	21.11	20.48	20.19

Foreign trade.—Imports of pig iron for consumption in 1939 increased 27 percent over 1938 owing to larger receipts from Canada and British India. British India supplied 64 percent of the 1939 total.

Pig iron imported for consumption in the United States, 1935–39, by countries, in gross tons

Country	1935	1936	1937	1938	1939

Consumption.—Consumption of pig iron rose 70 percent in 1939 over 1938. Pig iron, a product of the blast furnace, is a semiraw material and, except for the small quantity used in direct castings, moves to other type furnaces for further refining or mixture with other required ingredients. In general, it goes to steel-making or iron-making furnaces. By far the larger part is taken to steel-making furnaces (open-hearth, bessemer, and electric) for refining and processing into steel. In 1939, 86.5 percent of the pig iron was consumed in steel making. Direct castings took 3 percent of the 1939 total, and the remaining 10.5 percent was consumed in iron-making furnaces, of which the cupola is by far the most important. The consumption of pig iron by types of furnace for 1936 to 1939 is shown in the following table. Typically, the quantities of pig iron used in these furnaces are supplemented by the addition of ferrous scrap. The proportion of pig iron to scrap used in steel furnaces increased in 1939 compared with 1938, whereas the proportion of pig iron in cupola furnaces decreased.

Consumption of pig iron in the United States, 1936–39, by type of furnace

Type of furnace or equipment	1936		1937		1938		1939	
	Gross tons	Percent of total	Gross tons	Percent of total	Gross tons	Percent of total	Gross tons	Percent of total

[1] Some pig iron used in making direct castings included in cupola. [2] Less than 0.05 percent.

The consumption of pig iron in this country is widespread, and plants using pig iron are situated in all 48 States, the District of Columbia, and Alaska. As expected from the nature of its use, consumption is concentrated largely in the iron- and steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas in 1939 used 98 percent of the pig iron, Pennsylvania (the leading consumer) taking nearly 29 percent of the total and Ohio (the second largest consumer) 21 percent. Of the chief consuming areas in 1939 the Middle Atlantic district made the largest gain over 1938—85 percent compared with 65 percent in the North Central district and 53 percent in the Southeastern district, including the Birmingham district of Alabama. The following table shows the distribution of pig-iron consumption by States from 1936 to 1939.

Consumption of pig iron in the United States, 1936–39, by States and districts

World production.—World production of pig iron (including ferro-alloys) in 1939 increased 23 percent over 1938 to 102,000,000 metric tons and was 19 percent above the 1925–29 average. The United States supplied 32 percent of the 1939 total compared with 23 percent in 1938. Thus, while American production increased 66 percent, that for the rest of the world increased only 10 percent.

World production of pig iron (including ferro-alloys), 1935–39, by countries, in metric tons

[1] In addition to countries listed, pig iron is produced in Chile and the Philippine Islands, but production figures are not available.
[2] Year ended June 30.
[3] Approximate production as published by Steel, vol. 196, No. 1, January 1940, p. 269.
[4] Estimated production.
[5] Beginning with March 1935, production of the Saar is included with that of Germany. Production of the Saar in January and February 1935 amounted to 302,196 metric tons.

FERRO-ALLOYS

Production and shipments.—The production of ferro-alloys was 735,171 gross tons in 1939 compared with 584,724 in 1938, an increase of 26 percent. In 1939 ferro-alloys were made at 13 blast-furnace plants, 16 electric-furnace plants, and 3 aluminothermic plants; in addition 3 plants made ferrophosphorus and 2 plants made ferrosilicon as a byproduct. Of the 1939 total, 486,098 tons were made in blast furnaces and 245,236 tons in electric furnaces.

Shipments of all classes of ferro-alloys in 1939 rose 81 percent in quantity and 79 percent in total value over 1938. Compared with the 5-year average for 1925–29 (715,250 tons), 1939 shipments increased 18 percent.

Ferro-alloys shipped from furnaces in the United States, 1938–39, by varieties

Variety of alloy	1938		1939	
	Gross tons	Value	Gross tons	Value
Ferromanganese	223,720	$19,144,884	296,631	$24,137,211
Spiegeleisen	24,939	[1] 728,830	84,739	2,484,042
Ferrosilicon (7 percent or more silicon)	163,775	7,999,661	343,822	16,850,356
Ferrophosphorus	6,593	469,940	13,320	898,471
Ferrotungsten	484	1,453,227	1,609	4,846,386

[1] Revised figures.
[2] Ferroboron, ferrochromium, ferrocolumbium, ferromolybdenum and calcium-molybdenum compounds, ferrotitanium, ferrovanadium, ferrozirconium, silicomanganese, silicospiegeleisen, and zirconium ferrosilicon.

Ferromanganese.—Shipments of ferromanganese in 1939 increased 33 percent over 1938 but were 2.4 percent below the 5-year average for 1925–29 (303,883 gross tons). The average value per ton, f. o. b. furnaces, reported for ferromanganese was $81.37 in 1939 compared with $85.58 in 1938.

The production of ferromanganese in 1939 increased 11 percent over 1938 and was made at seven blast-furnace plants and one electric-furnace plant in both 1938 and 1939. In both years most of the output was made in blast furnaces.

Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1935–39

Year	Ferromanganese produced			Materials consumed (gross tons)				Manganese ore used per ton of ferromanganese made (gross tons)
	Gross tons	Mn contained		Manganese ore (35 percent or more Mn, natural)		Iron and manganiferous iron ores	Cinder, scale, and purchased scrap	
		Percent	Gross tons	Foreign	Domestic			
1935	214,290	79.41	170,168	401,846	4,286	9,195	8,921	1.895
1936	316,000	79.09	249,933	595,114	5,987	12,467	2,821	1.902
1937	376,443	79.54	299,425	698,052	9,444	17,511	6,017	1.879
1938	242,994	78.65	191,104	416,738	22,548	9,696	8,462	1.808
1939	270,111	79.24	214,040	502,986		8,324	6,250	1.862

The tonnage of manganese ore used per ton of ferromanganese produced increased slightly in 1939. As shown in the following table all manganese ore used in making ferromanganese in 1939 came from foreign sources.

Quantity and tenor of manganese ore used in manufacture of ferromanganese in the United States, 1938–39

Source of ore	1938		1939	
	Gross tons	Manganese content (percent, natural)	Gross tons	Manganese content (percent, natural)
Africa	152,698	48.99	129,227	48.14
Brazil	64,060	41.44	58,284	43.75
Chile			856	48.16
Cuba	36,295	48.07	58,999	48.16
India	55,965	49.24	86,309	49.84
U. S. S. R.	107,720	47.61	169,311	47.54
United States	22,548	53.20		
	439,286	47.72	502,986	47.72

Spiegeleisen.—Shipments of spiegeleisen from domestic furnaces in 1939 rose 240 percent over 1938. The average value per ton at the furnaces was $29.31 in 1939 compared with $29.22 (revised figure) in 1938. The entire production, which increased to 91,491 tons in 1939 from 11,311 tons in 1938, was made in blast furnaces. Output in 1939 averaged 20.18 percent manganese. Most of the spiegeleisen was manufactured from domestic ores in 1939, only 206 tons of foreign manganese ore being used.

Ferrosilicon.—Shipments of ferrosilicon in 1939 increased 110 percent over 1938. The production of ferrosilicon in 1939 totaled 279,964 gross tons, including 144,948 tons made by blast furnaces, 134,844 tons by electric furnaces, and 172 tons as a byproduct in the manufacture of artificial abrasives in electric furnaces. The silicon content of the production in 1939 ranged from 7 to 95 percent but averaged 24 percent. Most of the raw material used in making ferrosilicon was of domestic origin.

Ferrophosphorus.—Production of ferrophosphorus decreased slightly to 15,465 gross tons containing 24.37 percent phosphorus in 1939 from 15,842 tons containing 24.14 percent phosphorus in 1938, but shipments from furnaces increased 102 percent. Most of the 1939 output was made in electric furnaces, and all of it was manufactured from domestic materials.

Ferrotungsten.—Shipments of ferrotungsten gained 232 percent in quantity and 233 percent in total value over 1938. The 1939 shipments contained 78.43 percent (2,827,282 pounds) tungsten and were valued at $1.71 per pound of contained tungsten. Production totaled 1,586 gross tons containing 78.45 percent tungsten (2,786,686 pounds). In addition to domestic ores (chiefly from California, Colorado, and Nevada), foreign ores from China, the Malay States, Mexico, and South America were used. All ferrotungsten was made in electric furnaces.

Foreign trade.—Imports of all alloys of the rarer metals are not recorded separately but are grouped as shown in the following table. Ferromanganese and spiegeleisen comprised most of the imports in both 1938 and 1939. Imports of ferromanganese for consumption (chiefly from Norway and the Netherlands) were 41,227 gross tons—57 percent more than in 1938. Imports of spiegeleisen for consumption (chiefly from Canada) were 38,264 tons, an increase of 122 percent over 1938. The duty on ferrosilicon containing 8 percent but less than 30 percent silicon was cut from 1½ cents to 1 cent per pound of silicon content, effective January 1, 1939, in the new trade agreement with Canada. That country supplies most of the imports of this material.

Exports of ferro-alloys, which are relatively unimportant in tonnage, rose in 1939 over 1938. Exports of ferromanganese and spiegeleisen in 1939 were 2,923 gross tons and of other ferro-alloys 4,042 tons.

Ferro-alloys and ferro-alloy metals imported for consumption in the United States, 1938–39, by varieties

Variety of alloy	1938			1939

[1] Less than 1 ton.
[2] For statistical purposes, trade with the Sudeten area, as far as ascertainable, is included with Germany, while trade with the other Czechoslovak Provinces occupied by Germany and Poland has been included with these countries since March 18 or 19, 1939. After November 16, 1939, trade with Danzig and that part of Poland occupied by Germany has been included with Germany.

Ferro-alloys and ferro-alloy metals exported from the United States, 1938–39, by varieties

Variety of alloy	1938		1939	
	Gross tons	Value	Gross tons	Value
Ferromanganese and spiegeleisen	247	$18,799	2,923	$247,798
Other ferro-alloys [1]	1,197	1,171,869	4,042	1,024,826

[1] Includes ferrosilicon, ferrotungsten, ferrovanadium, and other ferro-alloys.

STEEL

Production.—The domestic steel industry operated at 53 percent of capacity in the first half of 1939, maintaining production at the level of the latter half of 1938. During the second half of 1939, however, the operating rate increased progressively from 52.4 percent of capacity in July to 93.3 percent in November but dropped to 85.6 percent in December. Slightly more than one-third of the 1939 output of steel was made in the final 3 months, when the production rate rose to an all-time high. The average operating rate was 64 percent in 1939 compared with 40 percent in 1938. The following figures covering the output of steel were compiled by the American Iron and Steel Institute. Production of steel ingots and castings in 1939 totaled 47,141,709 gross tons, 4 percent below the 1925–29 average but an increase of 66 percent over 1938.

Of the 1939 total, 91.7 percent was made in the open hearth, 6.4 percent in bessemer converters, 1.9 percent in electric furnaces, and only 831 tons in crucible furnaces. The bulk (42,704,197 tons) of the total open-hearth output in 1939 was made in basic furnaces.

Of the total output of steel ingots and castings, 46,908,428 gross tons were ingots in 1939 compared with 28,210,841 tons in 1938.

A large part of the steel production comes from the contiguous States Pennsylvania and Ohio. In 1939 these two States produced about 50 percent of the total steel, 49 percent of the open-hearth steel, and 76 percent of the bessemer steel.

Open-hearth steel ingots and castings manufactured in the United States, 1935–39, by States, in gross tons

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

Steel electrically manufactured in the United States, 1935–39, in gross tons

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

Year	Ingots	Castings	Total	Year	Ingots	Castings	Total
1935	521,818	19,674	541,492	1938	468,610	36,414	505,024
1936	704,213	68,242	772,455	1939	849,573	69,237	918,810
1937	814,310	31,227	845,537				

The steel-production figure for 1939 includes 2,867,817 gross tons of alloy-steel ingots and castings, which represent 6 percent of the total. This figure includes steels in which the minimum of the range specified in any of the elements named exceeds the following percentages: Nickel, 0.40 percent; chromium, 0.30 percent; copper, 0.50 percent; manganese, 1.65 percent; silicon, 0.50 percent; molybdenum, 0.10 percent; vanadium, tungsten, cobalt, titanium, and zirconium, any percent. The output of alloy steels in 1939 increased 94 percent and that of total steel 66 percent over 1938. Of the total alloy-steel output in 1939, 72 percent came from basic open hearths, 5 percent from acid open hearths, 23 percent from electric furnaces, 206 tons from crucible furnaces, and 3,113 tons from bessemer furnaces.

Production of alloy-steel ingots and castings, 1935–39, by processes, in gross tons

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

Process	1935	1936	1937	1938	1939
Open hearth, basic	1,633,541	2,239,885	2,285,000	1,052,706	2,055,601
Open hearth, acid	73,400	115,766	146,835	91,151	139,804
Bessemer				12	3,113
Crucible	154	209	241	4	206
Electric	412,563	527,762	600,550	332,475	669,093
	2,119,658	2,883,622	3,032,626	1,476,348	2,867,817

From the foregoing tables it will be seen that most of the steel made in electric furnaces (73 percent in 1939) is alloy steel. Typically, steels with higher alloy content are made in electric furnaces and steels with lower alloy content by the open-hearth process.

Foreign trade.—Although exports of iron and steel products (excluding scrap) in 1939 did not approach the high figure established in 1937, they were 16 percent above 1938 and surpassed those in any other year since 1929. Because of unsettled conditions and expanded armament activities foreign producers have been unable to meet demands in their own countries, and buyers have turned to the United States for supplies. Shortage of necessary raw materials, inadequate smelting capacity, and finishing and fabricating facilities insufficient to meet expanded demands in other nations have caused abnormal exports in a wide range of semimanufactured and manufactured American products. The situation abroad, however, is being rectified by the construction and equipment of new plants and the search for and development of sources of raw material. The success of these programs may make other nations more important factors in export markets, with a consequent lower demand in this country. Barter methods now being used may make competition difficult for American producers.

Exports of iron ore, pig iron, and ferro-alloys are covered in other sections of this report. All important items in the 1939 movement of iron and steel products, except pig iron and rails, registered gains. Exports of iron and steel scrap (including tin-plate scrap), although lower than the unprecedented total of 4,101,549 tons in 1937, amounted to 3,584,439 tons. Of the 1939 scrap exports 83 percent went to three countries—Japan (57 percent), United Kingdom (14 percent), and Italy (12 percent).

Although exports of American iron and steel products in 1939 reached most of the world markets, seven countries took 52.6 percent of the total—Canada 15.6 percent, Japan 8.1 percent, the United Kingdom 6.5 percent, Brazil 6.0 percent, Sweden 5.9 percent, the Philippine Islands 5.8 percent, and the Netherlands 4.7 percent.

Iron and steel exported from the United States, 1938–39

All other tools		9, 356, 596		11, 923, 674

Imports for consumption of iron and steel (exclusive of scrap) in 1939 were 19 percent greater than in 1938. The import trade was much lower than the export trade. Ferromanganese, pig iron, and spiegeleisen accounted for most of the increase in 1939, as manufactured and unmanufactured articles gained only 4 percent. Imports came principally from European countries, Canada, and British India. Imports of scrap in 1939 were only 29,492 long tons (21 percent above 1938), and 92 percent of the 1939 total came from Canada.

Iron and steel imported for consumption in the United States, 1938–39, by commodities

Commodity	1938		1939

MANGANESE AND MANGANIFEROUS ORES

By Robert H. Ridgway and H. W. Davis [1]

SUMMARY OUTLINE

The outbreak of war in Europe in September and the sudden increase in steel-plant activities in this country during the last quarter of the year were the principal factors influencing the manganese industry in 1939. The low rate of steel activity, the large stocks on hand, and active selling programs weakened the market during the first half of the year, and domestic quotations which opened the year at $0.30 a long-ton unit (before duty) declined, continuing the slump of 1938. Developments in Europe during the second half of the year increased demand, restricted shipping, and caused large increases in ocean-freight and war-risk-insurance rates. Meanwhile the domestic consuming industry revived sharply, with the result that prices jumped to $0.50 per unit before duty. The situation eased slightly at the close of the year. Restrictions placed on supplies from a number of sources may have hampered exports.

Despite the increase in imports for consumption, stocks in bonded warehouses increased, reaching a new year-end peak, according to data of the Bureau of Foreign and Domestic Commerce. As most of the domestic consumption is supplied by imports, the apparent consumption of manganese ore paralleled the 30-percent gain in imports for consumption. Stimulated by higher prices and possible Government purchases, activity at domestic manganese operations increased, but production was still small and the increase of little significance. Much new activity, however, was reported.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Salient statistics of the manganese industry in the United States, 1925–29 (average) and 1935–39, in long tons

	1925–29 (average)	1935	1936	1937	1938	1939
Manganese ore:						
Total shipments containing 35 percent or more Mn	59,312	26,428	32,119	40,241	25,321	29,307
Shipments of metallurgical ore	[1] 41,892	16,679	18,557	26,419	16,989	18,580
Shipments of battery ore	17,420	7,264	7,747	6,447	4,959	7,767
Imports for consumption	600,000	383,500	813,362	911,919	483,586	627,131
Stocks in bonded warehouses at end of year	304,000	418,302	366,381	681,290	842,048	903,561
Indicated consumption (35 percent or more Mn)	659,000	413,286	848,491	954,503	509,930	656,438
Ferro-alloys:						
Production of ferromanganese	306,360	214,290	316,000	376,443	242,994	270,111
Imports of ferromanganese [2] [3]	[4] 50,590	21,830	30,593	23,888	21,118	33,414
Production of spiegeleisen	95,463	60,018	95,137	([5])	11,311	91,491
Imports of spiegeleisen [2]	7,298	32,384	52,011	16,841	17,248	38,264
Exports of spiegeleisen and ferromanganese	3,769	131	466	1,725	247	2,923
Stocks of ferromanganese in bonded warehouses	[3] [4] 7,765	5,796	9,902	11,788	8,392	4,253

[1] Includes small quantity of miscellaneous ore.
[2] Imports for consumption.
[3] Manganese content.
[4] Includes small quantity of other manganese alloys.
[5] Bureau of Mines not at liberty to publish figures.

The process for making electrolytic manganese, developed and patented by the Bureau of Mines, has been installed in a small commercial plant at Knoxville, Tenn., by the Electromanganese Corporation, Rand Tower, Minneapolis, Minn. The Bureau is now investigating new uses for the metal.[2] Tests of samples of low-grade or complex ores from nine localities in Alabama, California, Colorado, Idaho, Missouri, Nevada, and New Mexico showed that the manganese occurred in mineralogic forms that would not permit high-grade concentrates to be produced by usual ore-dressing methods. The application of roasting and leaching, however, to the production of manganese by the electrolytic process was indicated in most of the samples.[3]

The trend in imports and domestic production of manganese ore is shown graphically in figure 1.

Emergency stock pile.—The Strategic Materials Act (Public, No. 117, 76th Cong., ch. 190, 1st sess.), which was signed by the President on June 7, 1939, authorized the expenditure of $100,000,000 over a 4-year period for the purchase of strategic materials. Only $10,000,000 was appropriated in the Third Deficiency Bill, approved August 2, 1939 (Public, No. 361, 76th Cong., ch. 633, 1st sess.), and purchases were restricted largely to the high-priority mineral commodities on the strategic list. Of all strategic mineral commodities, manganese ore is required in the largest quantities.

Only high-grade ore suitable for the manufacture of ferromanganese, the form in which manganese is usually added in steel manufacture, has been designated as strategic. Specifications for this type of material were drawn in three grades as follows:

[2] Dean, R. S., Anderson, C. T., Moss, C., and Ambrose, P. M., Progress Reports—Metallurgical Division. 33. Manganese and Its Alloys: Bureau of Mines Rept. of Investigations 3477, 1939, pp. 1–47.
[3] Engel, A. L., and Shelton, S. M., Progress Reports—Metallurgical Division. 36. Ore-dressing Studies, 1938–39: Bureau of Mines Rept. of Investigations 3484, 1940, pp. 3–12.

Specifications for ferrograde manganese ore, percent

Item	Grade A	Grade B	Grade C
Manganese (minimum)	48	48	48
Iron (maximum)	7	[1] 7	7
Silica (maximum)	9	[2] 10	7
Phosphorus (maximum)	.12	.18	.15
Alumina (maximum)	3	6	6
Zinc (maximum)	1	1	1

[1] Iron content to be not less than 1 percent.
[2] For each additional percent of manganese content over 48 percent an additional 0.2 percent silica content is allowable.

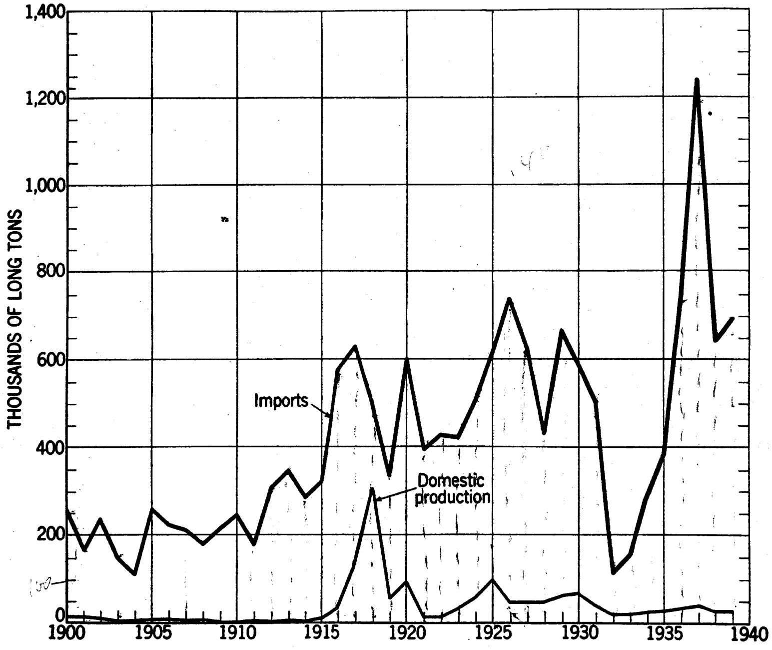

FIGURE 1.—Imports and domestic production of manganese ore, 1900–1939. Statistics on imports shown in the graph represent "general imports" for the period 1900–1933; beginning with 1934 data classified as "general imports" were not available, and the figures plotted for 1934–39 represent imports for consumption adjusted for changes in stocks in bonded warehouses and are closely comparable with the record for earlier years.

It was further provided that all ore should pass a 6-inch screen and that not more than 12.5 percent should pass a 20-mesh screen.

Proposals for supplies (S–1 and S–2), for opening October 19, 1939, were sent out September 19, 1939. In all, 15 bids were received, of which 7 proposed to furnish ore from domestic deposits and 8 from foreign sources. On October 30, 1939, two contracts were awarded, both on Grade B ore. One for 25,000 long tons at $0.612 per unit, c. i. f. Baltimore, Md., was awarded to the Cuban-American Manganese Corporation, which proposed to furnish nodulized concentrates from Cuba; Cuban manganese ores are not dutiable. Delivery on this contract was begun late in 1939 and was completed early in 1940. The other contract, which called for 5,000 tons at $0.75 a unit, f. o. b. Army Ordnance Depot, Curtis Bay, South Baltimore, Md., was awarded to the Greenbrier Mining Co. The bidder proposed to supply ore from an undeveloped property in West Virginia, but the contract was later canceled as the bidder failed to provide performance bond. Further proposals (S–13) for bids were issued December 1, 1939, for opening on December 19, 1939. No satisfactory bids were received, and no awards were made. The third proposals (S–17) were issued February 1, 1940, for opening February 20, 1940. Eighteen bids were received. Ten proposed to furnish ore from domestic deposits and eight from foreign sources. On March 5, 1940, five contracts were awarded—three on Grade B ore and two on Grade A ore. Derivatives, Inc., and Tonerde, Inc., New York, were awarded two contracts on Grade B ore, one for 2,000 tons at $0.49 per unit, exclusive of duty, c. i. f. Baltimore, and one for 11,000 tons at $0.53 per unit, exclusive of duty, c. i. f. Baltimore. This ore will come from India, South Africa, and Brazil. Two contracts were let on Philippine ore—one for 2,000 tons of Grade A ore at $0.628 per unit, c. i. f. Baltimore, to C. Tennant & Sons, New York, acting as agents for Fernadez Hermanos, and the other to L. W. Lambert for 18,000 tons of Grade B ore at $0.65 per unit, c. i. f. Baltimore. Philippine ores are not dutiable. The fifth contract was awarded to the Commercial Engineering Co. of Washington, D. C., for 8,000 tons of Grade A ore from Canada (Nova Scotia) at $0.60 per unit, exclusive of duty, c. i. f. Baltimore. The contract was not accepted by the bidder as price was based upon supplying 20,000 tons. On March 16 a further award was made to L. L. Patrick for 5,000 tons of domestic Grade B ore at $0.62, f. o. b Army Ordnance Depot, Ogden, Utah.

On February 18, 1940, proposals (S–18) for opening March 6 were issued for 5,000 tons of Grade B ore to replace a canceled contract on a previous letting. Nine bids were received, four on domestic ore and five on foreign ore. On March 16, 1940, a contract was let to L. W. Lambert (at $0.65 per unit, c. i. f. Baltimore, with an allowance of 75 cents a ton for unloading), who proposed to supply Philippine ore. The total awards involve about 68,000 long tons of ore and have obligated approximately $2,000,000, exclusive of handling and storage charges.

Government exploration.—Under section 7 of the Strategic Materials Act the Bureau of Mines and the Geological Survey undertook to search for and appraise ore deposits containing metals that have been designated as strategic by the Secretaries of War, Navy, and the Interior upon advice of the Army and Navy Munitions Board. The bill authorized the expenditure of $500,000 a year, $350,000 by the Bureau of Mines and $150,000 by the Geological Survey, for each of the fiscal years ending June 30, 1940, 1941, 1942, and 1943. The geologists of the Survey and engineers of the Bureau are cooperating closely to accomplish the objectives of the act.

The Bureau of Mines, in carrying out its part [4] of the program, seeks to determine (1) the extent and quality of the ore, (2) the most suitable method of mining and beneficiating it, and (3) the cost at which it may be produced.

An investigation of the deposits on the Olympic Peninsula of Washington was begun in 1939. Although the deposits in this area have been developed relatively little in the past, one mine made a

[4] Finch, John W., Strategic Minerals Investigations—Procedure Followed by the Bureau of Mines. Bureau of Mines Inf. Circ. 7097, 1939, pp. 1–5.

rather substantial production of good-grade ore. Some 4,000 feet of diamond drilling at the Crescent mine disclosed a small body of high-grade ore. Three deposits on the peninsula have been selected for probable project work during the coming fiscal year. One-ton samples were taken from several deposits in Colorado, Idaho, Nevada, and Utah and sent to the Bureau laboratories for ore-dressing tests.

Under the strategic minerals program, the Geological Survey completed its survey in the Little Florida Mountains area in Luna County, southwestern New Mexico. A report has been prepared which is now in process of publication. The program also added impetus to work on the detail survey of the Artillery Peak region in Mohave County, Ariz. Work continued in the Olympic Mountains, but this is a large area and conditions are difficult; the following is a published abstract of a report [5] on the results of the geological investigations to date.

The Olympic Peninsula, Wash., is bordered on the northern, eastern, and southern parts by a thick sequence (30,000 feet) of volcanic rocks, argillites, graywackes, and limestones of lower Eocene age. These rocks are much deformed, and dips of less than 45° are uncommon. The less competent strata, particularly the limestones and limy argillites, are much contorted, both as a result of the mountain-building processes and of the pouring out of lava on the limy muds of the sea bottom. Chocolate-red limestone that contains as much as 10 percent of finely divided hematite is of special interest, as it forms the common host rock for the manganese. The limestones are associated with lavas, particularly pillow basalts. They underlie and overlie the lava, form the matrix between pillows or agglomerate fragments, and in some places form beds at the edges of lava flows. * * * In a few places the manganese minerals have replaced lava, as indicated by remnants of pillow structures. The manganiferous bodies are generally small and contain from a few to a few hundred tons of ore, but some bodies are considerably larger. At the Crescent mine about 25,000 tons (16,000 tons—corrected figure) of high-grade hausmannite (Mn_3O_4) have been mined. Exploration, however, has been for the most past superficial and insufficient to determine the limits of the ore bodies.

The mineral composition of the ores is unique, in that the ore consists of hausmannite and a fine-grained mixture of manganese silicates commonly called "bementite." Small quantities of cinnabar and native copper are widely distributed throughout the deposits. The hausmannite deposits, notably of the Crescent mine, are low in silica. Other deposits contain small amounts of oxides and are chiefly manganese silicates. Still other bodies contain only manganese silicates and jasper and grade into bodies of bright-red jasper that may or may not contain small amounts of manganese silicates.

The manganese ore deposits at Philipsburg, Mont., were resurveyed, and an appraisal of the manganese-ore situation at Butte was undertaken. Minor geologic investigations were made in the Lake Creek district, Jackson County, Oreg.; in the Piedmont region, Va.; in northeastern Arizona; and in San Miguel County, Colo. Some preliminary work was done on the tungsten-bearing manganese deposits in the Golconda district and East Range area, Humboldt County, Nev., as well as the Sodaville area in Mineral County, Nev. All the projects undertaken in connection with the strategic-minerals program will be covered by brief economic reports, including maps, of the localities investigated.

Tables of domestic shipments of manganese ore, imports of manganese ore and ferromanganese, and apparent consumption of manganese, from 1910 to 1938, which present the historical background for a study of the strategic position of manganese ore, are given in Minerals Yearbook, 1939 (pp. 579–580).

[5] Park, Charles F., Jr., Manganese Deposits in the Olympic Peninsula, Wash.: Soc. Econ. Geol. (abs. of paper to be presented at 20th annual meeting), vol. 34, No. 8, December 1939, pp. 944–945.

DOMESTIC PRODUCTION

The domestic production (shipments from domestic mines) of manganese ore increased 16 percent over 1938. Of the manganese ore shipped to metallurgical plants in 1939, 5,708 long tons contained (natural) 48 percent or more Mn.

Manganiferous raw materials shipped by producers in the United States, 1935–39, in long tons

Year	Metallurgical ore (ferrous metallurgy only)				Battery ore	Miscellaneous manganese ore
	Manganese ore (35 percent or more Mn)	Ferruginous manganese ore (10 to 35 percent Mn)	Manganiferous iron ore (5 to 10 percent Mn)	Manganiferous zinc residuum		
1935	16,679	93,291	430,893	113,997	7,264	2,485
1936	18,557	98,962	841,557	124,288	7,747	5,815
1937	26,419	151,955	1,189,017	115,998	6,447	7,375
1938	16,989	33,620	275,240	39,079	4,959	3,373
1939	18,580	239,544	469,703	129,238	7,767	2,960

Shipments of the various grades of manganese ore during the last 5 years are given, by States, in the following tables. In addition, battery-grade ores were produced in Montana; manganiferous zinc residuum was produced from New Jersey zinc ores; and miscellaneous manganese ores came from Alabama, California, Montana, Tennessee, Virginia, and West Virginia.

[1] Included under "Undistributed."
[2] 1 producer each in Montana, Tennessee, and Virginia shipped both metallurgical and miscellaneous ore.
[3] Mills through which all ore was shipped; producers not counted.

Alabama.—Shipments of manganese ore from Alabama in 1939 were made by J. B. Bynum, who operates the Walnut Grove mine at Walnut Grove, Etowah County, and by the Manganese Corporation, which buys ore from small operators chiefly in Calhoun and Cleburne Counties. Shipments comprised 103 long tons averaging (natural) 35.09 percent Mn to metallurgical plants and 84 tons averaging (natural) 70.18 percent MnO_2 for miscellaneous uses. Shipments of ferruginous manganese ore came from Calhoun and Etowah Counties and averaged (natural) 30.83 percent Mn.

Arkansas.—Two shippers, Walter H. Denison Manganese & Contracting Co. and Arkansas Manganese Co., supplied the Arkansas total (5,365 long tons) of manganese ore in 1939 from operations in the Batesville-Cushman district of Independence County. The ore averaged (dried) about 48 percent Mn. In addition, 1,970 tons of ferruginous manganese ore averaging (dried) 32.25 Mn were shipped.

California.—The Pacific Coast Manganese Corporation shipped 6 tons of ore containing 70 percent MnO_2 in 1939 from the Daisy mine in the Paymaster district, Imperial County.

Colorado.—No manganese ore was shipped from Colorado in 1939, but 7,516 long tons of ferruginous manganese ore, containing (natural) 17.06 percent Mn and 22.79 percent Fe, were shipped by the Chrysolite Co. from the Allright, Chrysolite, and Fairview claims in Lake County.

Georgia.—Manganese ore shipped from Georgia in 1939 amounted to 2,646 long tons, of which the White Manganese Corporation and Knight & Beatty supplied the larger part. The ore averaged (natural) 39.15 percent Mn and came from the Cartersville district in Bartow County. Shipments of ferruginous manganese ore totaled 7,156 tons averaging (natural) 14.25 percent Mn. Aside from a small quantity from the Gibson mine in Floyd County, all ferruginous manganese ore shipped from Georgia came from the Cartersville district. No manganiferous iron ore was shipped from Georgia in 1939, but shipments of iron ore that contained less than 5 percent Mn were continued in 1939.

Idaho.—The Lava Manganese Mining Co., operating the Vanza mine in Bannock County, shipped 163 long tons of ferruginous manganese ore in 1939 containing (natural) 32.6 percent Mn and 7.1 percent iron.

Massachusetts.—Shipments of ferruginous manganese ore from Massachusetts in 1939 came from the Taconic mine in Hampshire County.

Minnesota.—All shipments of manganese-bearing ores, that is, ore containing 5 percent or more Mn (natural), came from the Cuyuna range in Crow Wing County. The ferruginous manganese ore averaged (natural) 11.69 percent Mn and 35.93 percent iron and came from the Allstead-Hillcrest, Louise, and Merritt mines. The manganiferous iron ore shipped in 1939 contained 7.21 percent Mn and 36.67 percent iron and came from the Hopkins, Louise, Sagamore, and Mahnomen mines.

Montana.—Shipments of manganese ore from Montana in 1939 were 7 percent less than in 1938. Of the 1939 total, one-fifth was nodulized rhodochrosite from the Emma mine in Butte, which averaged (dried) 58.85 percent Mn, and 70 percent was battery-grade concentrates from the Philipsburg district, which averaged (dried) about 70 percent MnO_2. Rhodochrosite was also shipped from the Emma mine to several miscellaneous consumers. Shipments of ferruginous manganese ore comprised 1,192 long tons of ore and 929 tons of tailings from operations at the Trout mine in the Philipsburg district.

New Mexico.—Shipments of manganese ore from New Mexico in 1939 came from Luna County and averaged (natural) 43 percent Mn and 3 percent iron. Most of the shipments came from the Manganese Valley mine operated by Edwin A. Stone; W. T. Blackwell shipped 1 car from the American Mining Co. mine in the Little Florida Mountains. Shipments of ferruginous manganese ore consisted of 31,379 long tons containing (natural) 13 percent Mn and 38 percent iron from the Boston Hill mine near Silver City in Grant County and 620 tons containing (natural) 31 percent Mn and 9 percent iron from the Lake Valley mine in Sierra County.

North Carolina.—One producer (Weber, Magann & Co.) shipped 1 car of ore containing (natural) 35 percent Mn from the North Cove mine in McDowell County and 1 car of ferruginous manganese ore containing (natural) 31 percent Mn. These 2 cars constituted the total shipments from North Carolina in 1939.

Tennessee.—Operations in four counties—Hamilton, Johnson, Monroe, and Unicoi—supplied the total output of Tennessee in 1939, which comprised 7,306 long tons averaging (natural) 35.05 percent Mn shipped to metallurgical plants and 529 tons averaging (natural) 70 percent MnO_2 shipped to chemical plants. The largest production came from the Embree Iron Co. in Unicoi County near Embreeville. The remainder was supplied by N. T. Dixon, W. E. Michael, and J. L. Akus. Shipments of ferruginous manganese ore, which averaged (natural) 22.11 percent Mn, came chiefly from Unicoi County.

Utah.—Two small carloads, one containing (natural) 35.4 Mn and 4.5 percent iron from the Kramer mine in Tooele County and the other containing (natural) 41 percent Mn and 1 percent iron from the Last Chance and Desert Rock mines in Grand County, constituted the total manganese-ore shipments from Utah in 1939. Shipments of ferruginous manganese ores, which averaged 28 percent Mn and 1 percent iron, were made by producers in Juab, Grand, and Tooele Counties.

Virginia.—Shipments of manganese ore from Virginia in 1939 were lower than in 1938 and comprised 475 long tons of metallurgical ore containing (natural) 45 percent Mn and 1,186 tons of miscellaneous ore averaging (natural) 44 percent Mn. The manganese ore originated in Appomattox, Augusta, Bland, Campbell, Smyth, and Tazewell Counties. Shipments of ferruginous manganese ores in 1939 came from Augusta, Bland, and Pulaski Counties and averaged (natural) 25 percent Mn.

Washington.—A trial lot of 10 tons of manganese ore from the Coon Creek mine in Grays Harbor County constituted the 1939 shipments from Washington.

West Virginia.—One small carload of manganese ore containing (natural) 43 percent Mn and 2 percent iron was shipped from the Sweet Springs mine in Monroe County. A new mill was completed on the property early in 1940.

Puerto Rico.—No manganese ore was shipped from Puerto Rico in 1939.

IMPORTS OF MANGANESE ORE

Imports for consumption of manganese ore containing 35 percent or more manganese increased 30 percent in 1939 over 1938. Decreases in receipts from Cuba and the U. S. S. R., two of the largest sources of supply, were more than balanced by increases from Brazil, Gold Coast, and British India, other important sources. Gold Coast, with an increase of 91 percent over 1938, supplied the largest quantity—39 percent of the total. In addition to the 1939 imports shown in the following table, 30,684 long tons of ore containing 8,452 tons of manganese (28 percent Mn) came from the Union of South Africa.

Manganese ore (35 percent or more Mn) imported for consumption in the United States, 1937–39, by countries

Country	Manganese ore (long tons)			Mn content (long tons)			Value		
	1937	1938	1939	1937	1938	1939	1937	1938	1939
Brazil	77,987	29,698	42,713	35,505	13,307	19,499	$597,413	$220,328	$366,597
Cuba	122,937	131,422	105,936	56,385	61,534	51,719	2,185,800	2,242,425	1,689,547
Gold Coast	254,547	126,857	242,924	130,147	63,890	122,769	2,942,430	1,500,813	3,019,368
India, British	70,380	25,480	89,545	36,523	13,121	45,556	679,232	236,945	1,054,718
Philippine Islands		4,002	6,966		1,600	3,483		44,075	89,784
Union of South Africa	209		3,401	119		1,697	3,125		45,716
U. S. S. R.	383,949	166,042	135,243	186,736	80,673	68,882	3,959,955	2,661,557	2,204,304
Other countries	1,910	85	403	1,019	43	206	83,647	13,254	28,016
	911,919	483,586	627,131	446,434	234,168	313,811	10,451,602	6,919,397	8,498,050

General imports (containing 35 percent or more Mn), which represent the movement of ore into this country, were greater than imports for consumption, and totaled 698,490 long tons containing 341,816 tons of manganese. Of this quantity, 200,781 long tons came from the U. S. S. R., 155,123 from Gold Coast, 108,984 from British India, 105,936 from Cuba, 103,526 from Brazil, and 24,140 from other sources. In addition, 30,684 long tons of ore containing 8,452 tons of manganese (28 percent Mn) were imported from the Union of South Africa.

STOCKS

Stocks of manganese ore in bonded warehouses rose for the third consecutive year and according to figures of the Bureau of Foreign and Domestic Commerce reached a peak of 903,561 long tons containing 441,806 tons of Mn at the end of 1939. This abnormally high level of stocks resulted from low activity in the domestic steel industry and overbuying in recent years.

PRICES

Prices of manganese ore according to grade and origin, as quoted by the various trade journals, apply to imported ore and (except for battery ore) are on a unit basis. The unit is 1 percent of a long ton, or 22.4 pounds of contained manganese. Prices of battery-grade ore are quoted on a per-ton basis, with a minimum requirement of manganese dioxide.

The quotations in the following table are from the Engineering and Mining Journal.

Domestic prices of metallurgical manganese ore in 1939, in cents per long-ton unit

[C. i. f. North Atlantic ports, cargo lots, exclusive of duty]

	Beginning of year	End of year		Beginning of year	End of year
Brazilian, 46–48 percent Mn	$0.27	$0.45	South African:		
Chilean, 47 percent Mn	.28	.45	50–52 percent Mn	$0.28	$0.49
Indian, 50 percent Mn	.30	.48	44–48 percent Mn	.25	.45
Caucasian, 52–55 percent Mn	.30	.50			

According to the Engineering and Mining Journal, the prices for chemical (battery-grade) ores per long ton in carlots at the end of 1939 were as follows: Domestic, containing 70 to 72 percent manganese dioxide, $45; and foreign, containing 80 to 85 percent MnO_2, $50 to $70. Foreign quotations increased $5 to $10 a ton during the year.

CONSUMPTION OF MANGANIFEROUS RAW MATERIALS

The following table shows the indicated consumption of manganiferous raw materials in the United States in 1939. The table does not consider differences in consumers' stocks at the beginning and end of the year. As such stocks are largely imported ore and the import figure used in the table is that for imports for consumption it is thought that the change in stocks would not be great because the manganese ore may be kept in bond until withdrawn for consumption. The duty is then paid, and the ore is reported as imports for consumption.

Indicated consumption of manganiferous raw materials in the United States in 1939

	Ore containing 35 percent or more Mn		Ore and residuum containing 10 to 35 percent Mn		Ore containing 5 to 10 percent Mn	
	Long tons	Mn content (percent)	Long tons	Mn content (percent)	Long tons	Mn content (percent)
Domestic shipments	29,307	42	368,782	13	469,703	7.2
Imports for consumption	627,131	50	30,684	28	[1] 62,757	8.7
Total available for consumption	656,438	50	399,466	14	532,460	7.4

[1] Estimated.

Besides the material shown in the foregoing table, 652,900 long tons of ore containing 2 to 5 percent Mn were used, presumably in the manufacture of manganiferous pig iron, in 1939 compared with 358,200 tons in 1938. Figures are not available for imports of ore of this class.

METALLURGICAL INDUSTRY

Although some manganese is used in both the ferrous and nonferrous metallurgical industries the bulk is consumed in the manufacture of iron and steel. Most of the ore entering this industry is used in the manufacture of ferromanganese and spiegeleisen, the forms in which manganese usually is added to steel.

Chief manganese alloys imported into and made from domestic and imported ores in the United States, 1938–39, in long tons

	1938		1939

[1] Estimated.

Ferromanganese.—The domestic output of ferromanganese in 1939, which increased 11 percent over 1938, was produced at the following plants:

Bethlehem Steel Co., Johnstown, Pa.
Carnegie-Illinois Steel Corporation, Etna, Pa.
Electro Metallurgical Co., Alloy, W. Va.
Jones & Laughlin Steel Corporation, Aliquippa, Pa.
E. J. Lavino & Co., Reusens, Va., and Sheridan, Pa.
Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.
Tennessee Coal, Iron & Railroad Co., Ensley, Ala.

In addition to the above plants, shipments were made by the Colorado Fuel & Iron Corporation, Pueblo, Colo., and the Pittsburgh Metallurgical Co., Niagara Falls, N. Y.

The larger part of the ferromanganese produced in this country is made from foreign ores, as shown in the following table.

Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1935–39

Year	Ferromanganese produced			Materials consumed (long tons)				Manganese ore used per ton of ferromanganese made (long tons)
	Long tons	Manganese contained		Manganese ore (35 percent or more Mn, natural)		Iron and manganiferous iron ores	Cinder, scale, and purchased scrap	
		Percent	Long tons	Foreign	Domestic			
1935	214,290	79.41	170,168	401,846	4,286	9,195	8,921	1.895
1936	316,000	79.09	249,933	595,114	5,987	12,467	2,821	1.902
1937	376,443	79.54	299,425	698,052	9,444	17,511	6,017	1.879
1938	242,994	78.65	191,104	416,738	22,548	9,696	8,462	1.808
1939	270,111	79.24	214,040	502,986	----------	8,324	6,250	1.862

The sources of the foreign ore used in the production of ferromanganese are shown in the following table.

Foreign manganese ore used in manufacture of ferromanganese in the United States, 1935–39, in long tons

Source of ore	1935	1936	1937	1938	1939
Africa	69,857	199,143	150,112	152,698	129,227
Brazil	47,663	86,032	112,238	64,060	58,284
Chile	2,941	832	186	----------	856
Cuba	56,411	32,317	60,012	36,295	58,999
India	76,983	105,289	62,199	55,965	86,309
Philippine Islands	520	----------	----------	----------	----------
U. S. S. R.	147,471	171,501	313,305	107,720	169,311
	401,846	595,114	698,052	416,738	502,986

Shipments of ferromanganese in 1939 increased 33 percent over 1938. The record of shipments during the past 5 years is as follows:

Ferromanganese shipped from furnaces in the United States, 1935–39

Year	Long tons	Value	Year	Long tons	Value
1935	194,627	$16,374,328	1938	223,720	$19,144,884
1936	322,353	24,088,298	1939	296,631	24,137,211
1937	359,842	30,696,748			

Although there is a small export trade in ferromanganese, the quantity manufactured in the United States is supplemented by imports. Ferromanganese imported for consumption in 1939 included 1,017 long tons containing not over 1 percent carbon, 14,136 tons containing over 1 but less than 4 percent carbon, and 26,074 tons containing not less than 4 percent carbon.

Ferromanganese imported into and exported from the United States, 1935–39

Year	Imports for consumption			Exports [1]	
	Gross weight (long tons)	Mn content (long tons)	Value	Gross weight (long tons)	Value
1935	27,240	21,830	$1,731,411	131	$10,389
1936	37,953	30,594	2,251,951	466	26,540
1937	29,559	23,888	2,163,616	1,725	72,502
1938	26,258	21,118	1,770,948	247	18,799
1939	41,227	33,414	2,935,214	2,923	247,798

[1] Includes spiegeleisen; not separately classified.

Norway supplied 59 percent of the imports in 1939. Distribution of imports by countries is shown in the following table:

Ferromanganese imported for consumption in the United States, 1938–39, by countries

Country	1938		1939	
	Mn content (long tons)	Value	Mn content (long tons)	Value
Canada			(1)	$50
Czechoslovakia	3,043	$211,356	2,050	162,091
France	1,137	152,068	846	100,905
Germany [2]			391	24,622
Japan	308	37,118		
Netherlands	5,843	403,561	7,974	561,509
Norway	10,547	953,045	19,563	1,909,610
Poland and Danzig [2]			1,598	118,015
Sweden			22	3,356
Yugoslavia	240	13,800	970	55,056
	21,118	1,770,948	33,414	2,935,214

[1] Less than 1 ton.
[2] For statistical purposes, trade with the Sudeten area, as far as ascertainable, is included with Germany, while trade with the other Czechoslovak Provinces occupied by Germany and Poland has been included with these countries since March 18 or 19, 1939. After November 16, 1939, trade with Danzig and that part of Poland occupied by Germany has been included with Germany.

Customs districts through which imported ferromanganese entered in 1938 and 1939 are as follows:

Manganese content of ferromanganese imported for consumption in the United States, 1938–39, by customs districts, in long tons

Customs district	1938	1939	Customs district	1938	1939
Buffalo	389	892	New York	1,090	934
Chicago	1,585	3,434	Ohio		2,497
Connecticut	163	362	Oregon	334	249
Galveston		425	Philadelphia	3,526	2,773
Los Angeles	96	257	San Francisco	160	296
Maryland	12,157	18,079	Washington (State)	131	118
Massachusetts	39	243			
Michigan	322	1,773		21,118	33,414
New Orleans	1,126	1,082			

Stocks of ferromanganese in bonded warehouses at the end of 1939 were 4,253 long tons containing 3,603 tons of Mn compared with 8,392 tons containing 6,971 tons of Mn at the end of 1938.

The quoted prices of ferromanganese dropped $5.25 per long ton in February but increased $10 a ton in September and $10 a ton in October, as shown in the following table.

Prices per long ton of ferromanganese in the United States, 1937–39 [1]

[80 percent—delivered at Pittsburgh]

Month	1937	1938	1939	Month	1937	1938	1939
January	$84.79	$107.49	$90.58	July	$107.29	$97.77	$85.33
February	84.79	107.49	85.33	August	107.29	97.77	85.33
March	92.29	107.49	85.33	September	107.29	97.77	95.33

[1] Steel, vol. 106, Jan. 1, 1940.

Spiegeleisen.—Shipments of spiegeleisen in 1939 increased 240 percent over 1938.

Spiegeleisen produced and shipped in the United States, 1935–39

Year	Produced (long tons)	Shipped from furnaces		Year	Produced (long tons)	Shipped from furnaces	
		Long tons	Value			Long tons	Value
1935	60,018	54,793	$1,303,574	1938	11,311	24,939	[2] $728,830
1936	95,137	92,336	2,249,217	1939	91,491	84,739	2,484,042
1937	(1)	134,983	3,969,822				

[1] Bureau of Mines not at liberty to publish figures. [2] Revised figures.

Spiegeleisen was manufactured at the following plants in 1939:

Carnegie-Illinois Steel Corporation, Duquesne, Pa.
E. J. Lavino & Co., Sheridan, Pa.
New Jersey Zinc Co., Palmerton, Pa.
Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.
Tennessee Coal, Iron & Railroad Co., Ensley, Ala.

In addition to these plants the Keokuk Electro-Metals Co., Keokuk, Iowa, and E. J. Lavino & Co., Reusens, Va., made shipments from stock.

Most of the spiegeleisen produced in the United States in recent years has been made from domestic raw materials, but 206 long tons of foreign ore containing 49.55 percent Mn were consumed in 1939 in the manufacture of spiegeleisen.

Imports of spiegeleisen for consumption in 1939 increased 122 percent over 1938. Canada, with 37,470 long tons, furnished 98 percent of the supply, while the remaining tonnage came from Norway and the Netherlands.

Spiegeleisen imported for consumption in the United States, 1935–39

Year	Long tons	Value	Year	Long tons	Value
1935	32,384	$915,134	1938	17,248	$625,480
1936	52,011	1,404,983	1939	38,264	1,329,814
1937	16,841	589,766			

The quoted prices of spiegeleisen at producers' furnaces increased $2 a long ton in September and $2 a ton in October, remaining at $32 a ton the rest of the year.

Manganiferous pig iron.—Precise data are not available on the consumption of manganiferous ores in the production of manganiferous pig iron; however, 469,703 long tons of domestic ore containing 5 to 10 percent Mn and 652,900 tons containing 2 to 5 percent Mn were shipped in 1939. Foreign manganiferous iron ore (62,757 tons) also was consumed in the manufacture of pig iron. The sources of the foreign ores for the past 3 years are given in the following table. Import figures are not available on ore containing 2 to 5 percent Mn.

Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1937–39, in long tons

Source of ore	Ferruginous manganese ore			Manganiferous iron ore

BATTERY INDUSTRY

Shipments of manganese ore to battery makers by domestic producers in 1939 totaled 7,767 long tons. No ore was shipped from Puerto Rico in 1939. Imported manganese ore also was consumed in the battery industry, but no figures are available on such imports.

Manufacturers of dry cells apparently use two grades of material.[6] Although not less than 70 percent MnO_2 was required for one grade it is expected that the MnO_2 content would average 72 percent, and individual shipments as low as 70 percent would not be rejected. The ore should be free from particles bearing lead in any concentrated form. Not more than 1 gram of easily recognizable iron pyrite should be present in 100 pounds of ore.

[6] Engel, A. L., and Shelton, S. M., Progress Reports—Metallurgical Division. 36. Ore-dressing Studies, 1938–39, Ore-testing Studies of the Ore-dressing Section: Bureau of Mines Rept. of Investigations 3484; 1940, pp. 31–34.

Specifications for manganese ore used by various dry-cell manufacturers

Constituent	Percent

N	.005	.005					
CO_2	2.0	.50					

[1] Computed from available oxygen content. [2] Peroxidation not less than 93 percent.

MISCELLANEOUS INDUSTRIES

Certain manganese ores with peculiar physical or chemical properties are required for the manufacture of special articles in the chemical, ceramic, and glass industries. The glass and paint industries require an ore containing about 85 percent MnO_2 and not more than 1 percent iron. Low iron content is especially desirable in ores for the glass industry, and uniform quality is particularly sought.[7]

WORLD PRODUCTION

The following table shows, insofar as statistics are available, the world production of manganese ores from 1935 to 1939 and their average manganese content. Most of the figures are from official statistics of the countries concerned; they are supplemented by data from semiofficial and other sources.

Manganese ore produced in principal countries of the world, 1935–39, in metric tons

[Compiled by R. B. Miller]

Country [1]	Percent Mn	1935	1936	1937	1938	1939
North America:						
Canada (shipments)		91	200	77		359
Costa Rica				100	304	(2)
Cuba	36–50+	35,269	48,471	131,299	123,844	102,415
Mexico	40+	3,217	3,377	17	117	27
United States:						
Continental (shipments)	35+	26,852	32,635	40,887	25,727	29,777
Puerto Rico (exports)	48–51	3,412	3,058	2,381	1,039	
South America:						
Argentina	35–38	[3] 439	[3] 443	606	437	(2)
Bolivia	50					[3] 500
Brazil	38–50	41,767	156,201	253,661	221,961	192,956
Chile (exports)	40–50	4,370	5,180	13,014	19,967	12,550
Peru				157	24	4,024

[1] In addition to the countries listed, Belgium is reported to produce a small quantity of manganese ore, but statistics of output are not available. Czechoslovakia reports a production of manganese ore, but as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in the table.
[2] Data not available.
[3] Shipments by rail and river.

[2] Data not available.
[4] Estimate included in total.

Brazil.—Production in Brazil was at a lower rate in 1939 than in 1938, but exports were higher—189,003 metric tons and 136,843 tons, respectively. Shipments of ore from the mines to the ports were reduced in September and October owing to coal shortages that curtailed train schedules. European coal had been used, but the outbreak of hostilities early in September suddenly reduced supplies. In November the situation was relieved somewhat, as coal was obtained from other sources. The export tax on manganese ore, which had been reduced during the first quarter of 1939, was increased again during the second quarter. Although the tax rate was not changed the official value was increased considerably, thereby increasing the tax payable. The tax on ore containing 45.01 to 46 percent manganese—the grade constituting the bulk of the exports—was raised from 2.633 milreis per metric ton in the first quarter to 6.400 in the second quarter compared with 3.240 in 1938.

Cuba.—All the manganese ore from Cuba comes from the Province of Oriente. Output by the Cuban-American Manganese Corporation, the principal producer in Cuba, totaled 102,415 metric tons (dried) in 1939, of which 96,779 tons were nodulized concentrates containing 51 percent Mn; the remainder was jigged ore containing 42 percent Mn or sorted ore containing 49 percent Mn. Exports by the company were 104,361 metric tons, of which 90,177 tons were nodulized concentrates and 14,184 tons washed or jigged ore averaging 38 percent Mn. Operations have been described by Norcross.[8] The company also buys ore offered by small producers. Other Cuban shipments amounted to 2,102 metric tons. Activities were reported near Baire, La Maya, Guisa, Los Negros, El Trumfo, and Maffo in Oriente, but independent producers exported only about 100 tons.

Gold Coast.—The African Manganese Mines Co., Ltd., which operates at Nsuta near Tarkwa, Wasaw district, Western Province, is the only producer of manganese ore in Gold Coast Colony. Exports were prohibited without license by proclamation on September 3, 1939.

India, British.—Water-borne exports from India, normally the second largest producer in the world, increased from 526,661 metric tons in 1938 to 664,893 in 1939. These figures do not include exports through Mormugao, which were 132,491 metric tons in 1938. A 3-percent ad valorem special armament tax on all exported mineral substances was imposed in November 1939. Export licenses have been required on movement of manganese ore from India since September 1939.

Union of South Africa.—Output in the Union of South Africa in 1939 was lower than in 1938. Virtually the entire production came from deposits north of Postmasburg in Griqualand West, Cape Province. All Cape ore is exported; exports in 1939 totaled 332,702 metric tons compared with 319,049 in 1938. The renewal of the Clearance Agreement with Germany, the largest buyer of South African ores, near the end of 1938 was a bright spot in an otherwise dull market during the first half of 1939. Several grades of ore containing 28 to more than 50 percent Mn are shipped, but a large part of the shipments contain less than 45 percent Mn. Small quantities (227 metric tons in 1939) of wad, together with some high-grade pyrolusite and psilomelane, are produced in the Krugersdorp district, Transvaal, for local consumption only.

U. S. S. R.—Data showing production in 1939 are not available. Of the 1937 production, 57 percent came from the Chiaturi deposits in Gruzia, 33 percent from the Nikopol deposits in the Ukraine, and the other 10 percent from the Republics of Russia, Bashkiria, and Krasnoyar. Virtually all the Chiaturi ore is exported, while Nikopol supplies the bulk of the domestic consumption. The Chiaturi deposits furnish a large proportion of the imports of manganese ore into the United States. Typically, the composition of washed Caucasian manganese ore is as follows:

Analysis of Caucasian washed manganese ore, percent

Mn	51 –52	$BaSO_4$	0.3 –0.5
SiO_2	6.8– 9.5	P	.155– .170
Fe	.4– 1.5	CaO	.90 –1.20
Al_2O_3	1.6– 2.5	MgO	.15 – .40

CHROMITE

By Robert H. Ridgway

SUMMARY OUTLINE

The first half of 1939 was uneventful in the chromite industry. The quiet condition of the market established in 1938 continued, as the domestic industrial rate showed little change. After midyear, however, the abrupt rise in the domestic steel-making rate to 93 percent of capacity in November, together with threats of an advent of war in Europe, were bullish demand factors. This increase in demand was offset somewhat by the scarcity of ship bottoms and the high ocean-freight and war-risk-insurance rates. Another factor hampering international flow during the last quarter of 1939 was application of various forms of export licenses, embargoes, and taxation by the producing countries. With international movement restricted by lack of demand during the first half of the year and by shipping difficulties during the second half, it is doubtful whether world production equaled that in 1938 or reached 1,000,000 long tons. Output in Turkey, one of the principal producers, held up well, while that in Southern Rhodesia and the Union of South Africa, other large producers, declined.

Owing to the tightening of supplies, quotations increased in October and again in December, but consumers' stocks cushioned the effect of the sharp increase in demand. Most of the increase in prices was due to increased transportation charges and did not revert to the producers.

Imports into the United States during the last half of 1939 were more than double those during the first half and would have been greater had conditions permitted. Higher prices and unsettled world conditions focused attention on the development of domestic production. Although output was small (a few thousand tons), known deposits and promising areas were being examined by private concerns and Government agencies. California, Oregon, Montana, Washington, and Wyoming were the scene of much of this activity. So far, however, exploration has revealed no extensive deposits of high-grade metallurgical ore but has developed deposits suitable for the refractory and chemical industries. The largest output in 1939 came from California, where the principal producer is planning operations at the Pilliken mine in Eldorado County that will yield 750 to 1,000 tons of concentrates a month beginning in March 1940.

The following table compares the salient statistics of the chromite industry during the last 5 years with the yearly average from 1925 to 1929.

Salient statistics of the chromite industry in the United States, 1925–29 (average) and 1935–39

[1] Originated in Southern Rhodesia and Union of South Africa.
[2] Principally from the Philippine Islands.
[3] Figures not yet available.

Figure 1 shows trends in consumption, prices, and domestic shipments during the past 15 years.

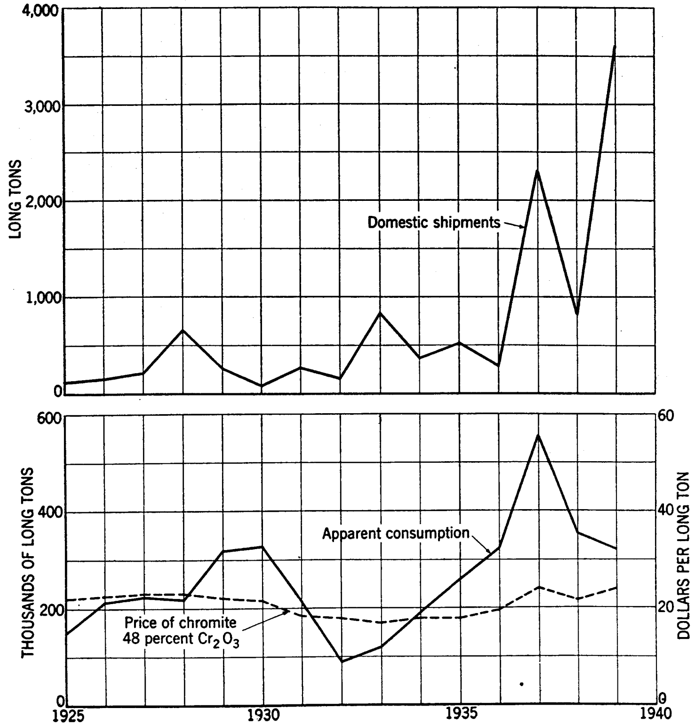

FIGURE 1.—Trends in consumption, prices, and domestic shipments of chromite, 1925–39.

Emergency stock pile.—On June 7, 1939, the President signed the Strategic Materials Act (Public, No. 117, 76th Cong., ch. 190, 1st sess.) which authorized the expenditure of $100,000,000 over a period of 4 years for the purchase of stock piles of strategic materials. Only $10,000,000 was appropriated in the Third Deficiency Bill, approved August 2, 1939 (Public No. 361, 76th Cong., ch. 633, 1st sess.), however, and purchases were restricted largely to the high-priority mineral commodities on the strategic list. Chromite is one of the four mineral commodities comprising the first priority class for stock-pile reserves. Its importance is appreciated more readily when it is realized that the steel industry is charged with three-fourths of the domestic consumption.

The following specifications were drawn for high-grade metallurgical lump ore:

Cr_2O_3 (minimum)	48 percent.
Fe (maximum)	⅓ of Cr content.
S (maximum)	0.50 percent.
P (maximum)	0.20 percent.

The specifications also provided that all lumps shall pass a 6-inch screen and that not more than 10 percent shall pass a ½-inch sieve.

Proposals for supplies (S. 3 and S. 4) dated September 20, 1939, for opening October 20, 1939, were sent to a large number of bidders, but only two offers were received. The disturbed conditions in ocean shipping at the time were not without effect on the ability of possible suppliers to guarantee delivery on a contract price. As neither bidder met the conditions of the proposal no awards were made, and under dates of October 30 and 31, telegrams were sent to five recognized handlers and potential suppliers requesting bids on 5,000 to 40,000 long tons of ore. Three offers were received, and two contracts were awarded. On November 20, a purchase order was issued to Dorothea Reddy Maroney for 25,000 tons of chromite at $33.744 per long ton, delivered New Cumberland, Pa. The bidder proposed to furnish ore from undeveloped properties on the Kenai Peninsula in Alaska. At this writing no ore has been received. The other bid was let to the Mutual Chemical Co. for 20,000 tons of ore at $26.50, c. i. f. Philadelphia. This concern proposed to supply the chromite from deposits in Turkey; the ore is of known good grade and very acceptable to consumers in this country. Delivery on this contract was begun early in 1940.

Earlier in the year 1,801 short tons of chromite from Southern Rhodesia was purchased by the Navy Department at $20.74 per short ton. The ore, delivered in June, was supplied by E. J. Lavino & Co. This purchase covered a previous contract on chromite from domestic sources that was canceled because of nondelivery.

Government exploration.—Under section 7 of the Strategic Materials Act the Geological Survey and the Bureau of Mines undertook to search for and appraise ore deposits containing metals that have been designated as strategic by the Secretaries of War, Navy, and the Interior upon advice of the Army and Navy Munitions Board. The bill authorized the expenditure of $500,000 a year, $350,000 by the Bureau of Mines and $150,000 by the Geological Survey, for each of the fiscal years ending June 30, 1940, 1941, 1942, and 1943. Close cooperation of the geologists of the Survey and engineers of the Bureau will be necessary to accomplish the objectives of the act.

The Bureau of Mines, in carrying out its part [1] of the program, seeks to determine (1) the extent and quality of the ore, (2) the most suitable method of mining and beneficiating it, and (3) the cost at which it may be produced.

Three exploration projects were set up on chromite. Deposits in Sweetgrass and Stillwater Counties, Mont., Casper Mountain, Wyo., and near John Day, Oreg., were investigated and drilled by the Bureau in 1939. In one area there is definite indication of a large tonnage of ore that will concentrate to about 42 to 45 percent Cr_2O_3 with a Cr-Fe ratio of 1.7 to 1. In another area, although the proved tonnage is not so large, the results of the work indicate that the tonnage possibilities have by no means been fully tested. The results of exploration on both areas have been so encouraging that the Bureau feels that further exploratory work is justified and is definitely planning additional work on one area during the next fiscal year. The metallurgical problem in connection with utilization of these ores is being investigated by the Bureau, and some encouraging results have been obtained. Indications are that these ores would supplement supplies in an emergency.

Under the strategic minerals program, the Geological Survey investigated chromite in Wyoming, Montana, Oregon, and California. A magnetometric survey of the Casper Mountain (Wyo.) deposit was completed in the early summer. Detailed geologic mapping of the chromite zone in the Stillwater basic complex east of the Stillwater River, Mont., was completed. The principal chromite deposits in the eastern half of the serpentine belt on the north slope of the Strawberry Mountains in Grant County, Oreg., were mapped in detail. Geologic maps were completed of the Sourdough area, Curry County, and the Sordy area, Josephine County, Oreg. The High Plateaus area, Del Norte County, and the Pilliken area of disseminated chromite, Eldorado County, Calif., were mapped. Additional work in Montana, Oregon, and California is planned for the field season of 1940.

DOMESTIC PRODUCTION

Domestic production, as measured by shipments from the mines, increased to 3,614 long tons in 1939 from 812 tons in 1938 and was the largest since 1919. Except for 100 tons from Oregon, the entire output was from California. The bulk of the chromite came from the Pilliken mine where operations during 1939 were conducted by the United States Chrome Mines, Inc. The concentrates, all of which were shipped but not consumed, contained about 46 percent Cr_2O_3, 21 percent FeO, and 6 percent SiO_2. The Rustless Mining Co. took over this property on November 1, 1939, immediately dismantled the mill, and is installing new equipment. Production was expected to begin early in 1940, and plans called for a monthly output of 750 to 1,000 tons of concentrates. Much smaller shipments came from Calaveras, Del Norte, Placer, Plumas, Siskiyou, and Tuolumne Counties, Calif., and from Grant County, Oreg.

Chromite (ores and concentrates) shipped from mines in the United States, 1935–39

[All from California except in 1937 and 1939, as indicated]

Year	Ore containing 45 percent or more chromic oxide		Ore containing 35 to 45 percent chromic oxide		Total	
	Long tons	Value	Long tons	Value	Long tons	Value
1935	74	(1)	[2] 441	(1)	[2] 515	[2] $6,163
1936	(3)	(3)	[3] 269	[3] $2,978	269	2,978
1937	[4 5] 2,006	[4 5] $11,568	[2 5] 315	[2 5] 3,320	[2 4] 2,321	[2 4] 14,888
1938	[5] 812	[5] 10,730	(5)	(5)	812	10,730
1939	3,056	(1)	[6] 558	(1)	[6] 3,614	46,892

1 Included in total value; Bureau of Mines not at liberty to publish figures separately.
2 Includes a small quantity of ore containing less than 35 percent chromic oxide.
3 Ore containing 45 percent or more chromic oxide included with ore containing 35 to 45 percent.
4 Includes 288 long tons of ore valued at $880 shipped from mines in Oregon, a small part of which contained 35 to 45 percent chromic oxide.
5 A small quantity of ore containing 35 to 45 percent chromic oxide included with ore containing 45 percent or more.
6 Includes 100 tons of ore from Oregon.

Although chromite has been produced in Wyoming the work at Casper Mountain by the Geological Survey and the Bureau of Mines attracted attention during the year. No official statement has been made regarding this area, but in 1939 Beckwith [2] described the deposits as follows:

> The chromite of Casper Mountain occurs disseminated, and in bands or lenses in tremolite-chlorite-talc schist, originally on ultrabasic rock. The best ore would require concentration to meet market requirements. Some laboratory concentrates contain sufficient Cr_2O_3 for the manufacture of ferrochromium; others contain an excessive amount of iron.

The utilization of domestic chromite has interested the Bureau of Mines for some time. In connection with work on the matte smelting of chromium,[3] [4] attempts were made in 1939 to desulfurize such mattes by treating them with metallic manganese.[5] Preliminary work also was done on the production of chromium and chromium alloys by electrolysis in fused electrolytes. The results of gravity-concentration tests on a sample of lower-grade California ore indicated that recovery would be low—about 70 percent.[6] The Bureau has also developed a novel laboratory technique for the production of pure sponge chromium from chromite of lower grade than that now required by industry.

IMPORTS [7]

Imports of chromite in 1939 decreased 10 percent from the 1938 total, owing principally to a large decrease in shipments from Africa. Of the principal suppliers, only Cuba showed an increase. Shipments to this country were slow during the first half of the year, less than

7 Figures on imports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

one-third of the year's total being received in this period. With the upturn in general business conditions and the outbreak of war in Europe, shipments increased materially and doubtless would have been greater but for the uncertainty of shipping and high ocean freight rates. The chromite imported in 1939 contained only 42 percent Cr_2O_3. The low average content was due to a drop in receipts from Africa whose chromite, particularly that from Rhodesia, is high grade. Of the principal imports in 1939, those from New Caledonia had the highest content of chromic oxide (53 percent) and those from Cuba the lowest (33 percent).

Crude chromite imported into the United States, 1935–39, by countries

Country	1935 (long tons)	1936 (long tons)	1937 (long tons)	1938 (long tons)	1939		
					Long tons		Value

Containing less than 3 percent carbon (chromium content)		66	164	121	127
Chrome or chromium metal	49	57	78	39	41

[1] 60 pounds.

CONSUMPTION

Owing to lack of data on consumers' stocks, it is impossible to estimate accurately the total consumption of chromite in the United States. However, the apparent available supply decreased because imports were lower.

Domestic sales, imports, and apparent available supply of crude chromite in the United States, 1935–39, in long tons

Year	Sales from domestic mines	Imports	Apparent available supply	Year	Sales from domestic mines	Imports	Apparent available supply
1935	515	259,063	259,578	1938	812	352,085	352,897
1936	269	324,258	324,527	1939	3,614	317,511	321,125
1937	2,321	553,916	556,237				

The steel industry consumes more than three-fourths of the supply of chromite either as a refractory or as a raw-material source of an important alloying element. The improvement in the steel industry, particularly the precipitous rise in operations during the last quarter of the year, increased the demand for chromite and resulted in a rise in price. The domestic automobile industry, one of the important users of alloy steel and chromium plating, expanded its output from 2,489,635 units in 1938 to 3,577,058 in 1939. The construction industry uses stainless steel for decorative purposes and large quantities of chromium-plated plumbing fixtures. Activity in this field, which has been increasing since 1933, improved over 1938 but was only about three-fourths of the average annual volume of the peak years 1926 to 1929, inclusive.

USES

Industrial uses of chromite fall into three groups—metallurgical, refractory, and chemical.

Metallurgical.—Chromium is one of the principal elements used in the manufacture of alloy steel. For this purpose most of the chromite is converted into ferrochromium in the electric furnace before it is added to the steel bath, although one domestic concern makes chromium-alloy steels in the electric furnace directly from alloy-steel scrap, mild-steel scrap, and chromite. Standard grades of ferrochromium contain 60 to 70 percent chromium, and a lower content generally is not acceptable. Ferrochromium is made in two grades, depending on the carbon content; the high-carbon grade contains 4 to 6 percent carbon, while the low-carbon grade contains less than 2 percent. High-carbon ferrochromium is made by smelting chromite in a single-phase electric furnace with coke as a reducing agent. Recovery is approximately 65 percent.[8] Low-carbon grades are produced by smelting the high-carbon alloy with SiO_2 and coke to produce a ferrochrome-silicon low in carbon which is then smelted in a Heroult-type furnace. Ores containing 48 to 50 percent Cr_2O_3 and as little iron as possible are required in this process; the chromium-iron ratio

[8] Udy, Marvin J., The Utilization of High-iron Chrome Ores: Trans. Canadian Inst. Min. and Met., vol. 41, 1938, p. 204.

should be at least 3:1 as, if the ratio is less, the melt will not yield a 60- to 70-percent chromium content in the ferro even if the ore contains as much as 50 percent Cr_2O_3.

Although chromium is used in many alloy steels, its largest and best-known use is in the manufacture of stainless steels. Increasing quantities are being used also in the field of low-alloy, high-strength steels where chromium imparts strength and adds to corrosion resistance. In recent years chromium plating has had a wide field of uses and become important industrially, but the amount of raw material consumed is small owing to the thinness of the layer of metal deposited. The nature of hard-chromium deposits and the many uses for hard-chromium plating, including files, gages, bearing surfaces, cutting tools, and molds, have been described by Goodsell.[9]

Refractory.—Chromite with certain physical and chemical properties is used for refractories. Lump and ground chromite and chromite cements are used in bricks and in building and patching furnaces. The possible use of chromite in open-hearth roofs continued to attract attention in 1939.

The domestic trade-journal quotation for chromite brick in 1939 was steady at $47 per short ton at producers' plants.

Chemical.—In addition to the chromite used in the manufacture of chromic acid for electroplating, considerable chromite is consumed in chemicals employed principally in the dyeing, tanning, and pigment industries. In recent years increasing quantities of chromium chemicals have also been used in pickling solutions in the nonferrous-metals industry.

The entire domestic production of chromium chemicals, made by only five companies, is from foreign ores. The results of a study conducted by the Federal Bureau of Mines and the State College of Washington of methods for producing chromates and dichromates from domestic ores and estimates of the economic possibilities of the methods have been given by Doerner [10] and others.

PRICES

Prices of chromite quoted in the domestic trade journals cover imported ore and are given in dollars per long ton, c. i. f. North Atlantic ports. The quotations are largely nominal, and the market was weak during the first half of the year. However, the rise in steel operations increased the demand for chromite; and the outbreak of war in Europe, which resulted in a scarcity of ship bottoms, higher ocean freight rates, and higher insurance rates, brought about a rise in the price of chromite during the latter half of the year. The possibility of a shortage of supply due to interruption of shipping also tended to increase the price but was offset somewhat by the trade knowledge regarding stocks on hand. According to Steel, chromite containing 48 percent Cr_2O_3 opened the year at $23 to $24 per ton. In October the quotation rose to $25 to $26 and in December to $26 to $28. Ore with a lower chromic oxide content usually brings a lower price.

WORLD PRODUCTION

Complete data are not yet available on world output of chromite in 1939. The sharp drop in the output of Southern Rhodesia and the Union of South Africa, two of the principal producers, undoubtedly resulted in a lower world output in 1939 than in 1938 despite gains in some other countries. Excluding the U. S. S. R., for which no recent data are available, Turkey was the largest producer in 1939 followed by Southern Rhodesia and the Union of South Africa.

World production of crude chromite, 1935–39, by countries, in metric tons [1]

[1] In addition to countries listed, chromite mining was reported in Albania in 1938; no production figures are available.
[2] Data not yet available.
[3] Imports into the United States.
[4] Estimate included in total.

WORLD TRADE

Except for the U S. S. R., the principal producing countries consume only small quantities of chromite, and the major consuming countries produce only a small fraction of their requirements. Most of the chromite produced thus enters international trade. World exports in 1939 declined for the second successive year from the record figure established in 1937. Turkey, Southern Rhodesia, and the Union of South Africa were the principal exporters.

Figures on imports of chromite into consuming countries are not yet complete, but available data indicate that the three principal importing countries, in order of quantity, were the United States, Germany, and France.

A brief summary of the activities in the principal chromite producing and consuming countries follows.

Albania.—It was reported during the year that large deposits of chromite had been discovered in several localities in the region of Pogradek, near Lake Okrida, in the vicinity of Memlichte and Kukes. Several hundred tons were mined during 1938, and the chromite is reported to average about 48 percent Cr_2O_3 with a silica content not exceeding 9 percent. Production is expected to increase considerably

244615—40——39

in 1939; unofficial figures indicate an output of 3,000 tons. The deposits are being developed by the Azienda Minerali Metallici Italiani (Italian Metallic Minerals Concern), of Rome, which hopes to supply all of Italy's needs.

Canada.—Chromite production in Canada is small and is confined to the Thetford-Black Lake area of the Eastern Townships of Quebec. No commercial production was reported in 1938 or 1939. Ferrochromium is made in Canada by the Electrometallurgical Co. at Welland, Ontario; and Chrom X, a chromium compound that may be used to introduce chromium into the melt, is made by the Chromium Mining & Smelting Corporation, Ltd., at Sault Ste. Marie, Ontario. Imported ores are used by these companies. Imports of chromite into Canada in 1939 were given as 15,055 metric tons valued at $232,851. It was reported during the year that chromite had been discovered in the Arrow Lake district north of Nelson, British Columbia.

Cuba.—The entire Cuban production is shipped to the United States; imports into the United States from Cuba in 1939 were 67,061 metric tons compared with 40,163 tons in 1938. Cuban ores have a low content of Cr_2O_3 and are used in the refractory industry.

Cyprus.—The concentrating plant of the Cyprus Chrome Co., Ltd., at Ayios Nikolaos, which was completed about the middle of 1937 but because of technical difficulties did not begin full operation until the end of the year, worked satisfactorily during 1938. Approximately 15,740 metric tons of ore were treated and 9,161 tons of concentrates produced. In 1938 exports totaled 7,561 tons of concentrates averaging 50.4 percent Cr_2O_3, and during the first 6 months of 1939 exports were 1,118 tons. Shipment to ports other than British was prohibited without license in September 1939. A later order required bond, pending certificate of arrival at a country of destination.

France.—France depends on foreign sources for its domestic requirements. Imports during the first 7 months of 1939 were 32,632 metric tons, of which 9,713 tons came from French colonies, compared with 27,650 tons, of which 3,301 tons came from colonies, in the same period of 1938. Data for the closing months of 1939 are not available; total imports in 1938 were 40,178 tons, of which 3,305 tons came from French colonies. New Caledonia is the only French colony where any appreciable amount of chromite is found.

Germany.—Germany does not produce chromite. Imports were 136,434 metric tons during the first 7 months of 1939 compared with 78,948 tons during the same period in 1938; in 1939, 62 percent came from Turkey and 20 percent from the Union of South Africa. Although Turkey replaced the Union of South Africa as the principal source of German imports during the first part of 1939, the Russian-German trade pact, announced about midyear, may foster the movement of Russian chromite to Germany.

Greece.—Exports of chromite from Greece were 52,360 metric tons in 1939 compared with 35,661 tons in 1938. Of the 1939 total, 22,278 tons went to Germany compared with 18,160 tons in 1938. Exports to the United States were 14,080 tons in 1939 compared with 5,600 tons in 1938. Since September 1939 exports have been subject to ministerial permission. The principal mines are those of the Société Union Minière at Xinia, northwest of Lamia, and of A. Apostolides at Tsagli, west of Volos.

India.—Chromite is mined in Baluchistan, Mysore, the Singhbhum district of Bihar, and Seraikela State. Production data for 1939 are not available, but in 1938 the output in Baluchistan was 22,244 metric tons; in Mysore, 17,241 tons; in Bihar, 5,277 tons; and in Seraikela State, 96 tons. The chief mines in Baluchistan are near Hindubagh in the Zhob Valley. Water-borne exports during the first 11 months of 1939 were 19,083 tons. A 3-percent ad valorem special armament tax on all exported mineral substances was imposed in November 1939. Export licenses have been required on chromite shipped from India since September 1939.

Italy.—No chromite has been produced in Italy, and no imports have been recorded in the official statistics. Necessary supplies are imported usually in the form of alloys, but data regarding the small imports of chromium alloys have been combined with those of other alloys in statistical publications.

New Caledonia.—Preliminary figures show that exports of chromite from New Caledonia in 1939 were 39,394 metric tons compared with 42,263 in 1938. A large part of the New Caledonia ore comes from two mines, the Tiebaghi mine operated by British interests and the Fantouche mine operated by American interests. New Caledonia ores are high grade, the Tiebaghi ore running 55 to 56 percent Cr_2O_3. Effective November 1, 1939, an armament tax on the export of chromite amounting to 12½ percent of the official valuation was established for a period of 2 years. Previously, certain export restrictions had been decreed.

Norway.—Imports of chromite into Norway in 1939 decreased to 19,580 metric tons from 50,022 tons in 1938. Much of the chromite sent to Norway is smelted into ferrochromium, because of the available electric energy, and exported. Exports of ferrochromium increased to 15,689 tons in 1939 from 11,605 tons in 1938. Shipments abroad were prohibited (except by license for individual consignments) by Provisional Decree of August 28, 1939.

Philippine Islands.—In recent years the Philippine Islands has become an important producer of chromite. Most of the output in 1939 came from the following operators: The Benquet Consolidated Mining Co., operating the Consolidated mine in Zambales Province and the Florannie mine in Camarines Sur; the Acoje Mining Co. and the Zambales Mining Co., both operating in Zambales Province; and the Dinagat Mines Co. and the Tagobomar Development Co., operating on Dinagat. The following are analyses of the ore shipped by these producers:

Analyses of Philippine chromites

Producer	Cr_2O_3	SiO_2	Al_2O_3	Fe
Consolidated Mines, Inc	33.60	3.66	30.16	11.54
Acoje Mining Co	51.13	2.92	(1)	13.63
Florannie Mining Co	51.72	3.72	11.38	11.61
Zambales Mining Co	48.22	3.69	(1)	13.75
Dinagat Mines Co	47.44	1.18	(1)	11.30

[1] Data not available.

Commercial or potentially commercial quantities of chromite have been found in Zambales, Camarines Sur, and Ilocos Norte Provinces, Luzon; in Antique Province, Panay; in southern Samar; on Homonhon

Island; on the northern end and eastern side of Dinagat Island; on Ambil Island; and in Misamis Oriental and Surigao Provinces, Mindanao. Zambales Province is the most outstanding reserve area. The largest single chromite deposit known in the Philippines occurs about 24 kilometers east of Masinloc and is reported[11] to contain 10,000,000 tons of ore. The ore, however, is low grade but finds an outlet in the refractory industry. The Florannie ore, which was used in the metallurgical industry, was exhausted in 1939 and the operation closed.

The following paragraph concludes an excellent article[12] on Philippine Chromite by Dean Frasche.

> In the Philippines there are large areas of widely scattered chrome-bearing ultrabasic rocks which are principally confined to two belts along the eastern and western borders of the islands. Geographically the eastern belt rises in Camarines Sur, trends southeast into Samar, Homonhon Islands, Dinagat Island, and terminates in Surigao Province, Mindanao; while the western belt commences in Ilocos Norte, trends southward through Zambales Province, the Lubank Island group, northern Mindoro, western Panay, and ends in north central Mindanao. The known commercially important chromite deposits have been discovered in the more easily accessible areas within these belts, but only an insignificant part of the chrome-bearing areas have been systematically prospected. Because of poor transportation facilities and lack of development work, little information is available concerning many localities in which chrome ores are known to exist. With the remaining large areas yet to be explored and the known existence of undeveloped chrome deposits, it is not unreasonable to assume the Philippine Islands will become more important as a source of chromite in the future.

Rumania.—Development of chromite deposits in the Severin Mountains near the Danube River is being contemplated by newly formed Rumanian-German companies. The ore is reported to contain 30 to 50 percent Cr_2O_3 and 15 to 30 percent iron oxide. It has been estimated that the rich strata in the Banat may yield 10 million tons of chrome ore.

Southern Rhodesia.—The output of chromite in Southern Rhodesia during 1939 was lower than in 1938, continuing the rate attained by the sharp drop in December 1938. Production during 1939 was 139,083 metric tons compared with 186,019 tons during 1938. Output increased materially in December.

Present output comes from two districts (the Selukwe district and along the Great Dike). Foremost among the Rhodesia deposits are those in the Selukwe district where three mines are now producing.[13] These mines are the Railway Block, the Selukwe Peak, and the Iron Peak, 1½, 8, and 4 miles, respectively, from Selukwe. Most of the ore mined from underground workings is extracted by top slicing. The bulk of the chromite is shipped after hand sorting and blending. Only a small proportion is treated; ore is concentrated by classifiers, jigs, and tables. Much of the Rhodesia output is controlled by a British syndicate. Exports were prohibited without license by proclamation of September 4, 1939.

Sweden.—Imports of chromite into Sweden for the first 9 months of 1939 were 33,608 metric tons compared with 40,657 tons for the same period in 1938. Exports of ferrochromium from Sweden were 11,250 tons in 1938. Licenses were required for exports by decree dated August 26, 1939.

[13] Musgrave, J., Chrome Mining at Selukwe, Southern Rhodesia: Trans. Inst. Min. and Met., Nov. 17, 1938, pp. 1–16.

Turkey.—Exports of chromite from Turkey during 1939 were 192,832 metric tons compared with 208,055 tons in 1938.

Chromite deposits are distributed widely in Turkey, and this country is rapidly reestablishing itself as the world's largest producer. In the past most of the production has come from deposits in the western part of the country in the Marmaris, Eskisehir, and Dag Ardi districts. Since 1936, however, increasing quantities of ore have been mined from the Guleman and other newly developed deposits in Elazig Province, eastern Anatolia. This district is rapidly becoming one of the most important chromite-mining centers of the world. Output now comes from the Guleman mines, where the ore is extracted by open-cut methods. The product from the various workings is assembled at the head of an aerial tram which connects with the Ergani-Diyarbekir Railway at Erganimaden some 20 miles distant. From Erganimaden the chromite moves by rail to the port of Mersin, 630 kilometers away, where it is lightered to steamers for export. The ore is lumpy and of good metallurgical grade. Typical analyses have been given by Perkins [14] as follows:

Analyses of Guleman ore shipped into the United States

Cr_2O_3	Fe	SiO_2	Cr : Fe ratio	Cr_2O_3	Fe	SiO_2	Cr : Fe ratio
50.42	10.86	2.21	3.18:1	51.74	11.20	------------	3.147:1
49.83	10.87	2.79	3.13:1	51.74	10.91	------------	3.245:1
50.08	10.97	3.17	3.12:1	51.74	10.91	------------	3.245:1
52.32	11.13	2.18	3.29:1	51.77	11.17	2.63	3.17 :1
49.60	10.63	2.11	3.19:1	51.78	11.17	2.62	3.17 :1
52.06	10.82	------------	3.29:1				

The tax on chromite exported from Turkey ranges from 116.7 piasters per ton for an ore containing 40 percent Cr_2O_3 to 253.8 piasters per ton on an ore containing 54 percent Cr_2O_3 for companies operating under final concessions. Companies operating on research permits are limited to exports of 200 tons, and the tax is 20 percent of the export value. The law passed in 1933, which provided a refund of part of the export tax should the yearly exports of a company be higher than those during 1932, apparently was canceled in 1937. Exports also are subject to license control.

Union of South Africa.—Output in the Union of South Africa was lower in 1939 than in 1938; production increased materially after midyear. Exports, however, were 150,482 metric tons in the first 9 months of 1939 compared with 117,562 tons in 1938.

The available ores are generally friable, only a small quantity of hard, lumpy ore being recovered from time to time. Demand in recent years has resulted in the opening of new deposits, particularly in the Rustenburg district which contains large and easily minable occurrences. This activity resulted in the development of deposits where limited quantities of higher-grade and hard, lumpy ores were revealed. The iron content in most ores is high, ranging from 20 to 27 percent FeO, while the Cr_2O_3 content ranges from 42 to 48 percent. Ores containing 43 to 46 percent Cr_2O_3 are available in large tonnages, but some time will be required before production of higher-grade ores can be accelerated.

[14] Perkins, Enoch, Turkey and Its Chrome Ore: Eng. and Min. Jour., vol. 140, No. 6, June 1939, pp 29–34.

U. S. S. R.—The U. S. S. R. is one of the largest producers of chromite. Output is reported to have reached 217,000 metric tons in 1936, but no subsequent data are available. The deposits are in the Ural Mountains, and the most important district is Saranovskoye, where reserves are said to be adequate to maintain current production for many years. Exports are small or nonexistent, as the output is consumed in the domestic industries.

United Kingdom.—Imports of chromite into the United Kingdom in 1938 were 38,242 metric tons, of which 80 percent came from members of the British Empire. The imports are used in the chemical and refractory industries, as no ferrochromium is made in the United Kingdom. Imports of ferrochromium, largely from Norway and Sweden, were 10,654 tons in 1938 compared with 18,432 tons in 1937.

Yugoslavia.—Production of crude chromite in Yugoslavia in 1939 was 44,097 metric tons. The Allatini Mines, Ltd., the principal producer, operates the mines at Orasje, 26 kilometers northwest of Skoplje. Deposits of chromite were reported to have been discovered in 1939 in the Ozreh Mountains, between Maglaj and Sprece, Yugoslavia. Exports of chromite are controlled by permits issued by the National Bank of Yugoslavia.

NICKEL AND COBALT

By H. W. Davis [1]

SUMMARY OUTLINE

NICKEL

The great improvement in the heavy industries in the United States and Canada and the general speeding up of industry in Europe and other parts of the world to augment the production of necessary war supplies were outstanding, and these helped to raise world production and consumption of nickel to all-time highs in 1939. The increase in consumption over 1938 centered largely in the United States, although there were substantial gains in the British Empire. Precise data on domestic consumption of nickel are not available, but the 1939 total may be estimated roughly at 52,000 short tons, an increase of 136 percent over 1938. As usual, domestic production of primary metal was insignificant (394 short tons). Figures on output of secondary nickel are not yet available for 1939; however, such production is small, averaging only 2,100 tons annually during the 5 years 1934–38. Domestic quotations for electrolytic nickel remained unchanged at 35 cents a pound throughout 1939.

Salient statistics for nickel, 1937–39

	1937	1938	1939
United States:			
Production (all byproduct of copper refining) short tons	219	416	394
Secondary production do	2,400	2,300	(1)
Imports [2] do	54,438	29,546	64,796
Exports [3] do	4,473	6,581	10,167
Price per pound [4] cents	35	35	35
Canada:			
Production short tons	[5] 112,453	105,286	113,053
Imports do	491	491	697
Exports do	111,385	98,852	117,391
World production (approximate) do	132,000	127,000	(1)

[1] Figures not yet available.

[3] Excludes "Manufactures"; weight not recorded.
[4] Price quoted by International Nickel Co. of Canada, Ltd., for electrolytic nickel at New York, in 2-ton minimum lots.
[5] Excludes small quantity produced in British Columbia.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

The steel industry continued to absorb over half of the world output of nickel. Although some of the increase in consumption of nickel in 1939 undoubtedly can be attributed to the accelerated rate of naval construction and armament production, the major portion of the nickel used for steel continued to be absorbed in constructional steel for the automotive industry, in nickel-chromium stainless steels, and in nickel-alloy steels for a wide variety of other industrial purposes.

Canada furnished about 85 percent of the world's nickel. The International Nickel Co. of Canada, Ltd., alone supplied 82 percent of the total nickel used in 1939.

Search for commercial deposits of nickel in the United States was continued in 1939. The Cobalt Gold Mining Co. did 2,518 feet of diamond drilling at its property near Gold Hill, Colo. According to Goddard and Lovering:[2]

> Numerous samples of the primary ore taken by the company yielded from 0.41 to 6 percent nickel, 0 to 0.60 percent cobalt, and small amounts of copper. Samples of supergene ore contained from 1.32 to 13.02 percent nickel, 0.22 to 6.22 percent cobalt, and 0.05 to 31.60 percent copper. There appear to be several thousand tons of ore in sight that contain from 2 to 5 percent nickel. The deposit seems to be comparatively small, but the ore-bearing beds are so dislocated by the diorite stock and by pegmatite dikes that it is impossible to project their extensions far beyond the mine workings. The ore is probably genetically related to the pre-Cambrian diorite stock. There are several copper deposits of this general type in other parts of the Front Range, but the only other known nickel-bearing deposit lies about 120 miles to the south.

The nickel deposits of Jackson County, N. C., are discussed in a recent article.[3]

A study has been completed on the treatment of a precious-metal-bearing nickel-copper ore from a deposit in the Bunkerville district of Clark County, Nev., and a paper[4] containing the results of this investigation shows how combined electrothermal and electrolytic methods may be used to recover the nickel, copper, and precious metals from ore containing these elements.

The various phases of the nickel industry are discussed by Roush.[5]

PRODUCTION

Domestic production of nickel includes only minor quantities of secondary metal recovered from scrap-nickel anodes, nickel-silver, and copper-nickel alloys (including Monel metal) and small quantities of primary metal recovered in copper refining, as listed in the following table. Further details on the production of secondary nickel will be found in the chapter on Secondary Metals.

FOREIGN TRADE

The principal nickel imports of the United States are metallic nickel and nickel alloys, matte (containing approximately 55 percent nickel and 25 percent copper), and nickel oxide. All the oxide and matte and 98 percent of the metallic nickel and alloys were obtained from Canada in 1939; Europe supplied the remaining metallic nickel and alloys. The matte is refined to Monel metal and other products at the plant of the International Nickel Co., Inc., Huntington, W. Va. Imports of nickel in 1939 were the largest on record.

Exports comprise largely products manufactured from imported raw materials; Europe is the principal market.

Nickel imported for consumption in the United States, 1937–39, by classes

Class	1937		1938		1939	
	Pounds	Value	Pounds	Value	Pounds	Value
Unmanufactured:						
Nickel ore and matte	25, 085, 947	$3, 258, 221	14, 579, 441	$1, 939, 888	28, 433, 530	$3, 749, 992

[1] Quantity not recorded.

WORLD ASPECTS

World production.—World production of nickel in 1939 may be estimated roughly at 121,000 metric tons, or about 5 percent more than in 1938. Canada increased its output 7 percent and supplied about 85 percent of the total. The output in New Caledonia, the second largest producer, apparently declined.

World production of nickel (content of ore), 1935–39, by countries, in metric tons

[Compiled by R. B. Miller]

Country	1935	1936	1937	1938	1939
Australia				20	(1)

1 Data not yet available.
2 Excludes small quantity produced in British Columbia.
3 Less than 1 ton.
4 Estimated.
5 Byproduct in electrolytic refining of copper.

World consumption.—World consumption of nickel in 1939, estimated at 128,000 short tons compared with 102,000 tons in 1938, attained a new peak.[6] Figures are not available on consumption by countries, but most of the increase over 1938 occurred in the United States and the British Empire.

REVIEW BY COUNTRIES

Brazil.[7]—The nickel mines and rights of the Empreza Commercial do Goyaz S. A., a Brazilian corporation, formerly owned by a German group, have been bought by a Japanese organization. The mines are in the State of Goyaz, municipality of Sao José de Tocantins, 1,000 miles from the port of Santos. Ten trucks have been purchased for transporting the ore to the railway station, 210 miles away. The nickel reserves of Tocantins are the largest in Brazil. There are 2.2 million tons containing about 5 percent nickel; some samples contained 14 percent. However, the long distance to the railway station and the transportation difficulties of four railway systems to the port of Santos aggravate economic operation of the mines, although the cost of production is low on account of the low wages and easy accessibility of the ore, which is only 5 to 10 meters below the surface.

Burma.—The nickel produced in Burma is derived from a nickel-bearing speiss made by the Burma Corporation, Ltd., at Namtu in the

6 International Nickel Co. of Canada, Ltd., Annual Report, 1939.
7 Mining Journal (London), vol. 206, September 2, 1939, pp. 812–813.

Northern Shan States. The speiss contains approximately 30 percent nickel, 8 percent copper, and 7 percent cobalt, as well as 17 ounces of silver to the ton.

Canada.—Virtually the entire Canadian output is derived from the copper-nickel ores of the Sudbury district, Ontario; and two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Production in Canada was 113,053 short tons valued at $50,920,305 in 1939 compared with 105,286 tons valued at $53,914,494 in 1938.

The International Nickel Co. of Canada, Ltd.,[8] operated continuously at or near capacity during 1939. Four mines—Frood (4,722,563 tons), Creighton (1,298,752 tons), Levack (926,908 tons) and Garson (325,612 tons)—produced 7,273,835 short tons of ore. The open-pit department of the Frood mine had an initial production of 1,521,694 tons in 1939, and plans have been made to increase the output to 12,000 tons a day. A program of open-pit mining is under way at the Stobie mine, where there is a large body of low-grade ore. Proved ore reserves at all Canadian mines of the company were 224,594,000 tons containing 7,214,000 tons of copper and nickel on December 31, 1939, compared with 212,368,000 tons containing 6,806,000 tons of copper and nickel on December 31, 1938.

The concentrator treated 5,876,501 tons of ore in 1939. Plans have been approved to increase its capacity to 20,000 tons a day to treat additional tonnages of ore from the open-pit operations. The Port Colborne nickel refinery produced 65,865 tons of refined nickel in 1939. Sales of nickel in all forms were 105,097 tons in 1939 (82,189 tons in 1938).

Falconbridge Nickel Mines, Ltd.,[9] operated at a higher rate than in 1938 and treated 576,801 tons of ore (490,938 tons in 1938) comprising 332,724 tons of milling ore and 244,077 tons of smelting ore. The ore, which averaged 1.78 percent nickel and 0.93 percent copper in 1939, is smelted in Canada and the matte shipped to Norway for refining. Ore reserves were 7,502,000 tons averaging 1.80 percent nickel and 0.94 percent copper on December 31, 1939, compared with 6,881,000 tons averaging 1.80 percent nickel and 0.97 percent copper on December 31, 1938.

Finland.[10]—Work on the mine and smelter of the Petsamon Nikkeli O/Y at Kolosjoki continued until the invasion of Finland in November. Before the outbreak of hostilities the indications were that the mine would come into production not later than the early months of 1941.

Germany.—Nickel-ore imports into Germany were 34,215 metric tons in 1938 (19,990 tons in 1937), of which 16,572 tons came from Netherland India, 13,368 tons from Canada, and 3,306 tons from Burma. Nickel-metal imports were 3,984 metric tons in 1938 (3,365 tons in 1937), of which 1,273 tons came from Great Britain, 949 tons from the United States, 924 tons from Norway, and 652 tons from Canada.

Greece.—It is reported, but not confirmed so far, that output of nickel at the Karditsa mine in Thessaly, northern Greece, has been suspended.[11] The mine is controlled by Krupp.

The first shipments of nickeliferous iron ore from Greece to Italy took place recently, and a regular business is expected in the future.[12] Hitherto all this ore has gone to Germany.

It is said that the production of nickeliferous ore containing a minimum of 2.25 percent nickel plus cobalt has been sold to Italy but that Germany is strenuously endeavoring to obtain the output of grades running from 1.5 to 2.25 percent nickel plus cobalt, which will, it is anticipated, total fully 150,000 tons a year.[13]

Italy.[14]—The mining and concentration of nickel ore have been resumed in the Alps and Sardinia. In the Alps the group of mines (Doccio, Vocca, and Sella Bassa) nearest Varallo are being worked. The deposits in this region contain pyrrhotite, pentlandite, chalcopyrite, and traces of cobalt. These ores are treated at a washing plant at Varallo Sesia. In Sardinia work has been resumed at the old mines of Perdas S'Oliu and Perdas de'Fogu, where new veins of considerable interest have been found. The ores are niccolite and smaltite, rich in nickel but rather difficult to treat, especially as they are mixed with silver, galena, blende, chalcopyrite, and marcasite. The nickel ores from the Sardinian mines are washed to obtain rich nickel concentrates for smelting, in which process cobalt, silver, and arsenic also are recovered.

Japan.[15]—The Showa Kogyo Kaisha is producing ferronickel in a pilot plant from nickel ore mined in Oye-yama. It is proposed to adopt the Krupp process for making ferronickel. The original intention of producing metallic nickel has been abandoned temporarily owing to lack of technical knowledge.

Netherland India.[16]—At the annual meeting of the Oost-Borneo Maatschappij it was stated that the concern is to increase its participation in the nickel-mining enterprise of Bonitolo. The other partner is Fried. Krupp A. G. The erection of a treatment plant at the mine is being considered.

New Caledonia.—The new Yamato nickel mine at Kua has been opened; it is 4 kilometers from the Oulie-Oulié mine.[17] It is stated that the Société le Nickel has completed huge smelting works at Doniambo and that at Noumea wharves were being built for the company and the municipality.[18]

During the first 6 months of 1939, exports of ore (4 to 6 percent nickel content) were 20,301 metric tons, of which France took 15 percent, Germany 34 percent, and Japan 51 percent; exports of matte were 5,022 metric tons, of which 23 percent went to Belgium and 77 percent to France.

Norway.—The Falconbridge refinery at Kristiansand operated steadily throughout 1939 but was hampered somewhat by delayed shipments of matte at the beginning of the war. It operated on matte from the Falconbridge smelter near Sudbury, Ontario, Canada, and custom matte. The refinery produced 9,233 short tons of nickel in 1939 (8,013 tons in 1938). In 1939, sales of nickel were 9,337 short tons (7,142 tons in 1938).

18 Doyle, A. M., American consul, Sydney, Australia, April 3, 1939.

Southern Rhodesia.—It was stated that the Noel nickel mine at Gwanda had ceased production.[19] In July ore valued at £7,380 was produced.

United Kingdom.—The Clydach nickel refinery of the Mond Nickel Co., Ltd., produced 23,830 short tons of nickel in pellets in 1939 (21,981 tons in 1938) and 901 tons of nickel in salts (1,224 tons in 1938).

Yugoslavia.—Rich nickel deposits have been discovered in the ore-bearing region between Caak and Valjevo.[20]

COBALT

Consumption of cobalt in the United States in 1939, as indicated by imports, increased substantially; as in the past, the demand was supplied entirely by imports, as there was no domestic output. Total imports measured by cobalt content, which established an all-time high, increased about 113 percent over 1938. Probably as a result of higher shipping costs and war-risk insurance, domestic quotations for 97 to 99 percent metal in lots of 100 pounds or more were advanced during the latter part of October to $1.50 a pound from $1.36 and black oxide (70 to 71 percent grade) in lots of 350 pounds or more to $1.84 a pound from $1.67.

World production may be roughly estimated at 6,000 metric tons in 1939 compared with 4,500 tons in 1938. Output in Northern Rhodesia was two and one-half times that in 1938.

PRODUCTION

There was no marketed production of cobalt from domestic deposits in 1939. A western electrolytic-zinc plant recovered 27 short tons of residue containing 3.11 percent cobalt, but no shipments were made.

The United States, a large consumer of cobalt, has thus far failed to develop substantial supplies, but search for commercial deposits and experiments on the recovery of cobalt from iron ore mined at Cornwall, Pa., were continued in 1939. In Graham County, Ariz., cobalt prospects have been under development, and ore estimated to contain about 14,000 pounds of cobalt has been mined; the ore is reported to average about 2 percent cobalt. Near Salmon City, Idaho, a deposit said to contain cobalt, gold, copper, and nickel is being developed. Samples of the primary ore taken from the property of the Cobalt Gold Mining Co. near Gold Hill, Colo., yielded 0 to 0.6 percent cobalt, and samples of supergene ore contained 0.22 to 6.22 percent cobalt. The nickel-cobalt deposits in Cottonwood Canyon, Churchill County, Nev., which are reported to have yielded about 500 tons of high-grade nickel-cobalt ore in the eighties, were studied by Ferguson.[21]

FOREIGN TRADE

Imports of cobalt into the United States in 1939 established an all-time record and total imports of cobalt, measured by cobalt content, increased about 113 percent over 1938. Imports of ore gained 36 percent, metal 127 percent, and oxide 82 percent. Exports of cobalt

Other salts and compounds	186	277	45	187	56	98	1,374	3,405

USES

As a result of extensive research the use of cobalt continues to expand, consequently world production has increased greatly. Cobalt oxide is used in the ceramic industry; cobalt salts in the preparation of driers for use in paints, varnishes, and linoleums and as a catalyst; and cobalt metal in various types of high-grade steels (especially metal-cutting and magnet steels), as a catalyst, and in electroplating.

The importance of cobalt as a fertilizer for granite soils has been the subject of experiment in Nelson and Auckland Provinces, New Zealand, and investigations are being extended to cobalt-deficient areas in the Waikaremoana district in the center of the North Island.[22] In the United States there is a serious deficiency of cobalt in sections of Florida, and experimental work has been done by the Florida Experiment Station of the Department of Agriculture. A good discussion of the problem has been presented by Neal and Ahmann.[23]

WORLD PRODUCTION

Lack of statistics on the production of cobalt in the Belgian Congo, one of the chief producers, and in several smaller producing countries precludes an accurate statement of total world output. However, such

[1] In addition to the countries listed, Chile, China, Finland, Germany, Italy, Japan, and Mexico produce cobalt, but production data are not available.
[2] Data not available.
[3] Less than 1 ton.
[4] Year ended June 30 of year stated.
[5] Average cobalt content estimated at 11 percent.

Belgian Congo.—The Belgian Congo is one of the largest producers of cobalt, but accurate details are not available. However, as the cobalt-producing capacity of the country has been increased considerably by the discovery of further reserves of rich cobalt minerals and as a fourth electric furnace for the treatment of cobaltiferous minerals was installed at the Jabotville-Panda works, production probably increased in 1939. Moreover, imports of cobalt (content) into the United States from Belgium, where Belgian Congo cobalt is refined, increased 229 percent; receipts of metal advanced to 1,910,580 pounds (617,088 pounds in 1938) and oxide to 242,900 pounds (22,050 pounds in 1938).

Preliminary work has begun at the Kabolela cobalt mine, and a concentrator is under construction.[24] At Lubumbashi and Shituru the roasting and electrolytic plants were extended.

Burma.—Cobalt is produced in Burma largely as a byproduct of lead-zinc mining at the Bawdwin mines of the Burma Corporation, Ltd. A nickel speiss obtained at the lead smelter contains about 7 percent cobalt.

Canada.—Canadian output, including cobalt in ores exported, in oxides sold, and in metal made at Deloro, Ontario, totaled 732,561 pounds valued at $1,137,599 in 1939 compared with 459,226 pounds valued at $790,913 in 1938. In the Cobalt camp, Ontario, silver has been mined in close association with cobalt for many years, and the drop in the price of silver about midsummer 1939 adversely affected the output of cobalt. The O'Brien mine, the last major producer in the camp, ceased operations early in 1940.[25]

Cobalt Products, Ltd., a newcomer in the Cobalt camp, is now the main producer in Canada.[26] Late in 1938 a concentrating unit of 100 tons capacity was built and is now functioning smoothly. The

[24] South African Mining and Engineering Journal, vol. 50, pt. 1, August 12, 1939, p. 749.
[25] Dominion Bureau of Statistics, Preliminary Report on the Mineral Production of Canada during the Calendar Year 1939: Ottawa, 1940.
[26] Mining and Metallurgy, vol. 21, January 1940, pp. 10–11.

ore is obtained from various surface dumps and from underground operations at the Agaunico property. Flotation concentrate carrying 10 to 18 percent cobalt either is sold directly or treated in a cupola to produce cobalt-silver matte.

Chile.—Exports of cobalt from Chile (all to the United States) in 1939 comprised 6.9 metric tons of ore and 10.2 metric tons of concentrates.

Finland.—Figures are lacking on output in Finland. Imports of cobalt metal into the United States from Finland declined to 219,716 pounds in 1939 from 240,575 pounds in 1938, but imports of oxide increased to 118,300 pounds from 89,250 pounds in 1938.

Italy.[27]—Italian production of ores containing nickel and cobalt has increased greatly during the past 2 years as a result of Government stimulation. It is predicted that the domestic production soon will be adequate to supply the greatest part of the country's requirements of nickel, estimated at 2,500 tons a year, while the production of cobalt will then afford a surplus for exportation. The production of nickel and cobalt ores in 1937 amounted to 7,591 metric tons containing 0.9 to 15 percent nickel and 0.7 percent cobalt. In 1938 the output had increased to 13,421 tons, of which 130 tons contained 14 to 16 percent nickel and 2 to 6 percent cobalt. Cobalt is also said to be obtained through electrolysis of certain zinc ores that average 50 grams of cobalt per ton. The principal deposits of ores containing nickel and cobalt appear to occur in the Piedmont district of northwestern Italy. The principal localities in which nickel- and cobalt-bearing minerals now are being recovered are Val di Sesia, Valle Strona, and Valle del Toce. Plants for the concentration of these minerals are at Varallo. The richer ores are found in Sardinia, which produced 130 tons containing 14 to 16 percent nickel and 2 to 6 percent cobalt in 1938.

Morocco, French.—Production of cobalt ore in French Morocco was 2,880 metric tons during the first 6 months of 1939 and exports were 3,833 metric tons. In 1938 the output of ore was 6,541 metric tons and exports were 5,300 metric tons.

The producing mines are about 155 miles west of Agadir in the Atlas Mountains; cobalt occurs on the surface in the form of erythrite, a hydrous cobalt arsenate, and at depth in the form of smaltite, a cobalt diarsenide.[28] From 1932 to 1938 the output of concentrate contained a minimum of 13.25 percent cobalt and 3 percent nickel, but in 1939 the output contained 10.5 percent cobalt and 4.9 percent nickel. Most of the cobalt is exported to Belgium for refining.

Northern Rhodesia.—The Rhokana Corporation, Ltd., sold 1,124 short tons of cobalt in alloy and refined products during the year ended June 30, 1939, compared with 831 tons during the corresponding year 1938. During the fiscal year ended June 30, 1939, the cobalt plant produced 4,511 short tons of alloy containing 1,761 tons of cobalt compared with 2,854 tons of alloy containing 1,183 tons of cobalt during the corresponding fiscal year 1938.[29] The third electric furnace was operated continuously. The differential flotation of copper and cobalt was practiced until the end of May 1939, when it was stopped to permit a new segregation experiment to be conducted

[27] Sholes, W. H., American consul general, Milan, Italy, September 20, 1939.
[28] Bureau of Foreign and Domestic Commerce, Minerals Circ. 21, December 29, 1939, pp. 32-33.
[29] Rhokana Corporation, Ltd., Directors' Report and Statement of Accounts for the Year Ended June 30, 1939.

in the smelter. Until differential flotation ceased 73,152 short tons of concentrates had been produced, averaging 2.62 percent cobalt, of which 53.22 percent was recovered. At the end of May 1939 a new experiment was begun for recovery of cobalt from the converter slags. The results obtained to date are most encouraging, and the experiment is being continued.

According to the Rhodesia Chamber of Mines, production of cobalt in Northern Rhodesia was 3,947 short tons during the calendar year 1939 compared with 1,610 tons during the calendar year 1938.

MOLYBDENUM, TUNGSTEN, AND VANADIUM

By Robert H. Ridgway and H. W. Davis[1]

SUMMARY OUTLINE

MOLYBDENUM

The phenomenal rise in molybdenum production was checked in 1939, when world output declined about 9 percent. Although production dropped, shipments from the mines increased over 1938, resulting in a new all-time high. Extensive armament activities in foreign countries, together with the abrupt rise in steel operations in this country during the last quarter of 1939, created demands that were met not only by upward revision of operating schedules during the latter part of the year but also by withdrawals from producers' stocks. Thus in this country—the predominant producer—shipments of molybdenum in the form of concentrates exceeded output by 2 million pounds.

Of the world output of 33,000,000 pounds of molybdenum in 1939 the United States supplied 30,324,000 pounds (92 percent). The relatively small amount produced by other countries came mainly from Mexico and Norway; Norwegian production was less in 1939 than in 1938, while Mexican output maintained about the same level. Recovery of molybdenum was inaugurated at the Braden operations in Chile during 1939.

Molybdenum is one of the few ferro-alloying elements of which this country has ample supplies for its own needs. Much of the domestic production is exported; in 1939 exports of concentrates were 43,554,310 pounds valued at $14,066,501. Movement during the first half of the year was sluggish but increased during the last 6 months, reaching nearly 8.5 million pounds in October.

The Climax mine of the Climax Molybdenum Co., Colorado, is the principal producer of molybdenum, having supplied about 66 percent

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

of the world output and 72 percent of the domestic output in 1939. Of particular interest in 1939 was the large increase in output of molybdenite concentrates as a byproduct from copper operations at Bingham, Utah; Chino, N. Mex.; and Miami, Ariz. Output from these sources comprised nearly one-fourth of the domestic output and was more than double that in 1938. A small production—the first ever reported—was made in Wisconsin in 1939.

Salient statistics of the molybdenum industry in the United States, 1937–39

	1937	1938	1939
Concentrates:			
Production .... short tons..	30,357	36,157	32,347
Molybdenum contained:

[1] Estimated by Bureau of Mines. [2] Not separately recorded.

Moral embargo.—Following the President's statement of December 2 regarding exports of airplanes and materials essential in airplane manufacture to nations guilty of unprovoked bombing of civilian populations from the air, the State Department on December 15 addressed a letter to all producers of molybdenum, including this metal on the embargo list. Molybdenum steels have been widely employed in aircraft construction during the last decade.

PRICES

Prices for molybdenite concentrates carrying 90 percent MoS_2 were quoted nominally by the Engineering and Mining Journal at 45 cents per pound of contained MoS_2 throughout 1939; this is equivalent to 75 cents per pound of contained Mo. Although the London quotations, in shillings per long-ton unit, remained steady throughout most of the year, the effect of the exchange rate was to reduce the quotation in equivalent dollars. For example, in January the quotation of 43 shillings per long-ton unit was equivalent to 44.83 cents per pound of contained MoS_2, whereas in December the quotation jumped to 50 shillings per long-ton unit but was equivalent to only 43.82 cents per pound of contained MoS_2 owing to the lower rate of exchange.

DOMESTIC PRODUCTION

Arizona.—Three mines in Arizona produced 4,395 short tons of molybdenum concentrates containing 752,539 pounds of molybdenum in 1939 compared with five mines producing 4,784 tons of concentrates containing 1,139,593 pounds of molybdenum in 1938. The reduction in 1939 was due to the closing of operations by the Arizona Molybdenum Corporation, the largest producer in Arizona in 1938. The company, however, continued to make shipments from stocks, which were exhausted during 1939.

Molybdenum was recovered as a byproduct at operations in Arizona during 1939. The Miami Copper Co. increased the recovery and shipment of molybdenite concentrates resulting from the re-treatment of copper sulfide concentrates at Miami, Gila County. Recovery of molybdenum at this property was begun in August 1938 and totaled 431,652 pounds of molybdenite in 1939. The process [2] involves treatment of the limed copper concentrate with live steam for about 80 minutes in a series of three agitators. From the last agitator the pulp is passed to a Hunt-type flotation machine, which produces a cut of froth for making a final molybdenite concentrate. The finished flotation concentrate is made in a Denver Sub-A machine and is at least 90 percent MoS_2 and 2 to 3 percent copper. The reagents used are kerosene distillate, an alcohol frother, and sodium silicate. The final market product is made by a leaching process, which further reduces the copper to a low figure. The other output was oxide concentrates from the mill of the Mammoth-St. Anthony, Ltd., where gold, silver, lead, molybdenum, and vanadium are recovered by selective flotation. In addition to treating ore from its Mammoth mine, the company continued during part of the year to treat similar ore from the oxide zone of the nearby Mohawk and New Year claims of the Molybdenum Gold Mining Co., a subsidiary of the Molybdenum Corporation of America. The Mohawk and New Year mines, however, were acquired by the Mammoth-St. Anthony, Ltd., early in the year and closed on May 15, 1939. A head frame, ore bins, and a 1,200-foot aerial tram were completed at the Mammoth mine in 1939.

California.—There was a small production of molybdenite concentrates from a tungsten operation in Inyo County in 1939.

Colorado.—The Climax Molybdenum Co., the world's largest producer of molybdenum, has a rated milling capacity of 12,000 tons of ore daily. From January to about midyear the flotation plant operated at about 7,500 tons daily and later in the year at capacity. In all, 3,430,952 short tons of ore containing 0.576 percent MoS_2 were mined and milled from which 20,485 tons of concentrates containing 21,796,116 pounds of molybdenum were recovered compared with 4,344,734 short tons of ore containing 0.606 percent MoS_2, from which 27,591 short tons of concentrates containing 28,242,085 pounds of molybdenum were recovered in 1938. Shipments exceeded production, resulting in lowering of stocks.

Molybdenum (element) contained in concentrates produced from the Climax deposit, Colorado, 1934–39

	Pounds		*Pounds*
1934	8, 378, 683	1937	22, 750, 368
1935	10, 168, 635	1938	28, 242, 085
1936	15, 216, 806	1939	21, 796, 116

There was also a small production (but no shipments) from the F. R. M. mine near Cowdrey, Jackson County, in 1939. The United States Molybdenum Corporation was doing development work on its property near Empire, Clear Creek County.

[2] Engelmann, E. W., Ore Concentration and Milling: Min. and Met., vol. 21, No. 397, January 1940, p. 38.

Nevada.—There was no production or shipments from Nevada during 1939, but the Freeport Sulphur Co. was prospecting and drilling the Elm Gulch property near Goldfield, Esmeralda County.

New Mexico.—The Molybdenum Corporation of America continued to operate its mine and mill some 7 miles east of Questa along the Red River. The ore is relatively high grade and the tonnage treated comparatively small. Development work on lower levels is reported to have given encouraging results.

Molybdenite concentrates also were produced by the Nevada Consolidated Copper Corporation at the Chino property incident to the treatment of copper ores.

Utah.—All production in 1939 came from the Utah Copper Co., where molybdenite is recovered as a byproduct in the concentration of copper ores and re-treatment of molybdenum-bearing concentrates. As the molybdenum content of the ore is very low the molybdenite concentrates are entirely byproduct, and production fluctuates with the output of copper; thus output was greater in 1939 than in 1938. Shipments, however, were not as large as production, resulting in an accumulation of stocks.

Further steps [3] were taken by the Utah Copper Co. in 1939 to reduce the copper and insoluble matter in the molybdenite concentrate. The improvement consists of an additional heat treatment of what formerly was the finished flotation concentrate in a small roaster at temperatures approximating 400° to 500° F., followed by grinding in a 4-foot by 5-foot 4-inch ball mill and cleaning in three more flotation cells. The first cleaner cell is used to remove a small amount of insoluble material by means of an alcohol frother. The two following cells are used to clean the molybdenite further. This supplementary treatment lessens the difficulty of removing the copper in the finished molybdenite concentrate to the desired point.

Washington.—The Deertrail Monitor Mines Co. mined about 2,000 short tons of ore containing 0.5 percent MoS_2 at its Monitor mine on Adams Mountain 6 miles east of Fruitland, Stevens County. About 2,000 tons were milled in the 40-ton flotation mill, and the concentrates (10 tons) were stored at the mine.

Wisconsin.—The Wisconsin Molybdenum Corporation produced and shipped a small quantity of concentrates from a property near Middle Inlet, Marinette County.

IMPORTS AND EXPORTS

Exports of molybdenum, principally in the form of concentrates, provide an important outlet for the domestic molybdenum industry. Shipments of concentrates abroad during the latter half of 1939 were more than three times as large as during the first half. Exports by countries of destination are shown in the following table for 1939, the first year for which such data are available.

[3] Engelmann, E. W., Ore Concentration and Milling: Min. and Met., vol. 21, No. 397, January 1940, p. 38.

Molybdenum concentrates exported from the United States in 1939, by countries

Country	Pounds	Value	Country	Pounds	Value
Belgium	621,116	$55,560	Mexico	2,000	$60
Canada	188,828	84,433	Netherlands	2,734,211	707,368
Czechoslovakia [1]	42,262	14,800	Norway	2,357	1,107
France	2,960,543	792,000	Sweden	766,294	310,186
Germany [1]	134,960	51,532	U. S. S. R.	18,142,378	6,832,104
Hungary [1]	37,089	16,216	United Kingdom	7,556,560	1,049,488
India, British	112	58			
Italy	1,004,440	409,701		43,554,310	14,066,501
Japan	9,361,160	3,741,888			

[1] For statistical purposes, trade with the Sudeten area, as far as ascertainable, has been included with Germany, while trade with the other Czechoslovak Provinces occupied by Germany and Hungary has been included with these countries since March 18 or 19, 1939.

Imports of molybdenum or molybdenum compounds are small.

Molybdenum ore and concentrates, ferromolybdenum, molybdenum metal and powder, calcium molybdate, and other compounds and alloys of molybdenum imported for consumption in the United States, 1935–39

Year	Molybdenum content (pounds)	Value	Year	Molybdenum content (pounds)	Value
1935	68,758	$40,721	1938	25	$81
1936	49	213	1939	26,347	32,327
1937	7,707	13,491			

In addition to the quantity shown in the above table, 87,232 pounds of ore and concentrates containing 49,613 pounds of molybdenum valued at $34,192 were imported for smelting, refining, and export in 1939, of which 10,232 pounds containing 5,541 pounds of molybdenum valued at $3,638 came from Mexico, 44,000 pounds containing 22,440 pounds of molybdenum valued at $17,710 came from Morocco, and 33,000 pounds containing 21,632 pounds of molybdenum valued at $12,844 came from Turkey.

USES

Molybdenum is used principally in the iron and steel industry for making special alloy steels. Continued research is broadening the field of applications both in new outlets and as a substitute for and in addition to other alloying elements. Molybdenum may be used alone to impart certain desired properties to iron and steel, but more frequently it is employed with one or more of the other ferro-alloying elements. During the past decade the use of molybdenum high-speed steel has been increasing. The most popular analysis at present is: Carbon 0.72 to 0.81, silicon 0.20 to 0.45, manganese 0.30 maximum, chromium 3.50 to 4.00, tungsten 1.30 to 1.80, vanadium 0.90 to 1.30, and molybdenum 8.00 to 9.50.[4] Molybdenum steels are used extensively in the automotive, oil, and aircraft industries.

For most purposes molybdenite (MoS_2), the principal raw material, is converted before using to ferromolybdenum (a product carrying 60 to 65 percent molybdenum) or to calcium molybdate (a compound

[4] Breeler, Walter R., Development in Molybdenum High-speed Cutting Steels: Trans. Am. Soc. Metals, vol. 27, No. 2, June 1939, p. 289.

containing 35 to 45 percent molybdenum and resulting from the roasting of molybdenite with lime). The latter is the cheaper method of preparing molybdenum for industrial applications. Molybdenum oxide briquets also are used in making additions of molybdenum to iron and steel.

Molybdenum compounds find limited use in chemical and ceramic industries, but consumption is not large.

WORLD PRODUCTION

World production of molybdenum comes from a small but increasing number of mines. Operations in Mexico, Norway, and the United States furnish most of the world requirements. The search for new sources was intensified in 1939; but, as far as is known, there were no significant developments.

World production of molybdenum ores and concentrates, 1935–39, in metric tons

[1] In addition to countries listed, molybdenum ore is also produced in China, but data of production are not available.
[2] Less than 1 ton.
[3] Data not available.

Canada.—The only commercial shipment of molybdenite reported in 1939 (1 long ton of concentrates) came from operations of the Molybdenite Corporation of Canada in Abitibi County, Quebec. Molybdenite concentrates also were produced in the Michipicoten district of Ontario by the Regnery Metals, but statistics relating to output are not yet available. Prospecting and development work were widespread; other properties under exploration included the Moss mine (leading world producer during the World War) in Onslow Township, Quebec; Kindale mine, Masham Township, Gatineau County, Quebec; Puritan, North American, and Zenith mines, Renfrew County, Ontario; and Powell River and Endako, British Columbia. An association known as the Molybdenum Institute of Canada was formed by interested parties in August 1939 to foster and encourage molybdenum production in Canada.

Chile.—The recovery of molybdenite concentrates from the copper operations of the Braden Copper Co. at Sewell was inaugurated in 1939, when 111,561 pounds of molybdenite were produced in an experimental plant. Exports totaled 40 metric tons in 1939 and were shipped to Great Britain.

Mexico.—Output in Mexico, which in 1939 was about the same as in 1938, comes principally from the Greene Cananea Copper Co., where molybdenite concentrates are recovered as a byproduct in the treatment of copper ores. Exports during the first 10 months of 1939 amounted to 690 metric tons.

Morocco, French.—French Morocco is the largest producer in Africa, and output may have reached 250,000 pounds of molybdenum in 1939. Much of the output comes from the mine of the Société de Molybdène near Azegour.

Norway.—The Knaben Mölybdan Gruber was the chief producer in Norway in 1939. The Laxadalen Mölybdängruber, which installed a mill at its property near Gildeskal, northern Norway, produced about 65 metric tons in 1939. Exports of molybdenum concentrates in 1939 were 676 metric tons compared with 796 in 1938.

Peru.[5]—Molybdenum is of growing importance in Peru's export trade. From an output of 13 metric tons in 1935 production of molybdenum concentrates jumped to an output of 239 tons in 1939. Molybdenum prospects are reported to occur in the Provinces of Huarochiri and Cajatambo in the Department of Lima, in the districts of Bolognesi, Recuay, Ticapampa, and Conchucos in the Department of Ancash, and near Solceantay in the Urubamba district of Cuzco. The principal producing mine, however, is that of the "Peru Molibdeno" near Ricran in the Department of Junin.

TUNGSTEN

World production of tungsten increased slightly in 1939. Lessened demand related—in part, at least—to the low rate of steel operations maintained in this country during the first 8 months of the year. The abrupt increase in domestic industrial activity during the closing months of 1939, together with the outbreak of war, caused unusual demands that resulted in increased prices in this country, but as the revival occurred late in the year its effect is not apparent in the production data for 1939. Conditions in the Far East continued to hamper the Chinese tungsten industry, which normally furnishes a large part of the world's supply. Major producing areas in Kwangtung were reported still in Chinese hands and are being worked extensively. Although the tungsten-producing area held by the invader is small and not yet pacified, the Japanese control the main routes of outflow, namely, via Shanghai or Canton. Adequate supplies, however, are reaching Hong Kong by devious routes, but the fear that Chinese supplies might be cut off undoubtedly had had some influence on the market.

The United States is now one of the principal producers of tungsten, and shipments from domestic mines in 1939 were the highest of any before and since the war years 1916–18, when exorbitant prices and shortage of supplies stimulated a country-wide search for strategic minerals. Although shipments from domestic mines increased, production declined 10 percent, resulting in reduced stocks at mines or

[5] Wright, C. W., Mineral Resources, Production and Trade of Peru: Bureau of Mines Foreign Minerals Quarterly, vol. 3, No. 1, January 1940, p. 38.

mills. Further impetus was added to the development and reequipment of properties in our Western States by conditions during the closing quarter of 1939. Governmental purchases for strategic stockpile purposes provided an additional incentive.

Tables of domestic shipments, imports, exports, and apparent consumption of tungsten in the United States from 1910 to 1938, which present the historical background for consideration of the strategic nature of tungsten, are given in Minerals Yearbook, 1939, p. 621.

Salient statistics of the tungsten industry in the United States, 1938–39

	1938		1939	
	Short tons	Value	Short tons	Value
Production (60 percent WO_3)	4,000	(1)	3,603	(1)
Concentrates shipped (60 percent WO_3)	3,044	$3,161,498	4,287	$4,402,182
Imported for consumption (W content)	81	138,693	743	997,971
Stocks in bonded warehouses, Dec. 31:				
Ore (W content)	325	202,371	843	1,357,219
Metal (W content)	10	26,664	6	14,975

1 Figures not available.

Emergency stock pile.—The Strategic Materials Act (Public No. 117, 76th Congress, ch. 190, 1st sess.) which was signed by the President on June 7, 1939, authorized the expenditure of $100,000,000 over a 4-year period for the purchase of strategic materials. Only $10,000,000 was appropriated in the Third Deficiency Bill, approved August 2, 1939 (Public No. 361, 76th Congress, ch. 633, 1st sess.), and purchases were restricted largely to the high-priority mineral commodities on the strategic list, including tungsten concentrates.

The following specifications were drawn up as to chemical analysis of high-grade tungsten concentrates:

Tungsten trioxide (WO_3)	percent minimum	60.0
Tin (Sn)	percent maximum	1.0
Copper (Cu)	do	.05
Phosphorus (P)	do	.035
Arsenic (As)	do	.50
Antimony (Sb)	do	.05
Bismuth (Bi)	do	.12
Molybdenum (Mo)	do	.40
Sulfur (S)	do	.50

Proposals for supplies (S–5) to be opened Friday, October 20, 1939, were issued on September 20, 1939. The proposals called for delivery, f. o. b. cars, United States Army General Depot, Columbus, Ohio. Four bids were received, two proposing to supply material from domestic sources and two from foreign sources. The ore from domestic sources was eliminated because the material the bidders offered was not up to specification. On October 26, 1939, a contract was awarded to the Wah Chang Trading Corporation of New York for about 425 short tons of concentrates from China at $15.82 per short-ton unit, exclusive of duty. Deliveries on the contract were well under way at the year end.

As a result of competitive bids opened September 14, 1939, the Navy Department on September 25, 1939, purchased about 245 short tons of tungsten concentrates with the small appropriation it received to provide for stock piles of strategic commodities. The contract, at \$25 per short-ton unit, Brooklyn, N. Y., was let to the Metal & Ore Corporation of New York City, which proposed to supply ore from mines in Nevada, Arizona, and California. Delivery on this contract was under way in 1939.

Government exploration.—Under section 7 of the Strategic Materials Act, the Bureau of Mines and the Geological Survey undertook to search for and appraise ore deposits containing metals that have been designated as strategic by the Secretaries of War, Navy, and the Interior upon advice of the Army and Navy Munitions Board. The bill authorized the expenditure of \$500,000 a year, \$350,000 to the Bureau of Mines and \$150,000 to the Geological Survey, for each of the fiscal years ending June 30, 1940, 1941, 1942, and 1943. Close cooperation by the geologists of the Survey and the engineers of the Bureau of Mines will be necessary to accomplish the objectives of the act.

The Bureau of Mines, in carrying out its part [6] of the program, seeks to determine (1) the extent and quality of the ore, (2) the most suitable method of mining and beneficiating it, and (3) the cost at which it may be produced.

A tungsten project was completed in 1939 in the Nightingale district of Nevada, exploring the possibility that a large amount of high-cost tungsten could be obtained in an emergency from various contact deposits of the kind that are known to occur in the Western States. Exploration consisted of trenching, diamond drilling, and sampling of underground workings. Although the deposit was not delimited entirely, additional ore, mostly marginal, was indicated, and some commercial ore was found. A number of other deposits of similar geologic occurrence in California, Nevada, and Arizona were examined with a view to initiating other project work.

As part of its program of investigation of strategic mineral deposits the Geological Survey made detailed geologic maps of several tungsten districts in California and Nevada. In California, field work on the Atolia district was completed, and mapping of several districts near Bishop—Pine Creek, Tungsten Hills, and Black Rock—is well advanced and scheduled for completion during 1940. A 2-year program of mapping was begun in the Eugene Mountains, Nev., in which the Mill City district is situated. A small area near Rose Creek was mapped, and further study was made of the Nightingale district; all three districts are in Pershing County. In addition, three deposits of tungsten-bearing manganese ore were examined near Golconda, Humboldt County; in the East Range, Pershing County; and near Sodaville, Mineral County.

Several tungsten deposits in Arizona were examined briefly, notably those in the Little Dragoon Mountains, Cochise County.

PRICES

The quotations on tungsten ore or concentrates continued to decline during the first 8 months of 1939. The market moved in a desultory fashion despite the constant threat of stoppage of Chinese concentrates, owing to expanding Japanese control over transportation routes.

[6] Finch, John W., Strategic Minerals Investigations—Procedure Followed by the Bureau of Mines: Bureau of Mines Inf. Circ. 7097, December 1939, pp. 1–5.

London prices for Chinese wolframite concentrates containing 65 percent WO_3, as given by the Mining Journal (London), were 59s.–61s. per long-ton unit at the beginning of the year. The quotations declined steadily until August, when they reached 47s.–48s. With the advent of the European War the quotations jumped sharply, reaching 55s.–60s. per unit in September; subsequent prices were nominal. Domestic quotations followed the same pattern, but the post-war rise was more pronounced owing to the control scheme adopted by the British and French Governments. Thus quotations on domestic scheelite of good analysis, which opened the year at \$16 to \$19 per short-ton unit, declined to \$15 to \$17 in August but rose to \$25 in September, from which there was a slight weakening at the year end. During most of the year some western buyers were paying \$12 a unit at the mines; later this was increased. The average price for the 1939 production as reported to the Bureau of Mines was \$17.11 per short-ton unit of WO_3.

DOMESTIC PRODUCTION

Activities in the domestic tungsten-producing industry in 1939 continued at the higher level maintained in 1937 and 1938. Relatively slack demand curtailed operations during the early months of the year, but the abrupt rise in price in September brought new producers into operation. Although production of concentrates dropped 10 percent from 1938, shipments in 1939 increased 41 percent, reducing materially the stocks at the mills. Output in 1939, amounting to 3,603 tons of concentrates (reduced to an equivalent of 60 percent WO_3), came from a number of widely scattered operations in Arizona, California, Colorado, Idaho, Montana, Nevada, Utah, and Washington. Developments in the domestic tungsten-producing industry in recent years are tending to make the United States more nearly self-sufficient in this strategic mineral commodity at prices that have held. This situation, however, depends on the tariff, which at present amounts to \$7.931 per short-ton unit of WO_3 in ore and concentrates.

Tungsten ore and concentrates shipped from mines in the United States, 1935–39

Year	Quantity		Reported value f. o. b. mines		
	Ore and concentrates, 60 percent WO_3 (short tons)	Tungsten content (pounds)	Total	Average per unit of WO_3	Average per pound of tungsten
1935	2,395	2,279,369	\$1,921,017	\$13.37	\$0.84
1936	2,612	2,485,893	2,323,818	14.83	.93
1937	3,500	3,331,020	4,094,000	19.50	1.23
1938	3,044	2,897,036	3,161,498	17.31	1.09
1939	4,287	4,080,024	4,402,182	17.11	1.08

Arizona.—Shipments of tungsten concentrates from Arizona operations totaled 88 short tons containing 68.38 percent WO_3 in 1939 compared with 35 tons containing 63.09 percent WO_3 in 1938. Output comprised scheelite, wolframite, huebnerite, and ferberite concentrates. The largest output came from the Boriana mine in Mohave County, which was idle during the first 9 months of the year. J. J. Seeman shipped 27 short tons of scheelite concentrates containing 72.42 percent WO_3 from the Tungsten Reef mines in Cochise County in 1939. Scattering shipments came from other deposits in Mohave and Cochise Counties, as well as in Pima County.

California.—Shipments of tungsten concentrates (all scheelite) from California amounted to 1,250 short tons containing 60.63 percent WO_3 in 1939, compared with 770 tons containing 65.44 percent WO_3 in 1938. The largest producer—the Atolia Mining Co. near Atolia in San Bernardino County—shipped 470 short tons of concentrates containing 52.70 percent WO_3. The company treated 4,979 short tons of ore containing 1.98 percent WO_3 and 16,107 tons of tailings containing 1.40 percent WO_3. Eleven other producers—5 in Inyo, 1 in San Bernardino, 2 in Mono, 1 in Kern, 1 in Tulare, and 1 not placed—contributed to the California total. Inyo was the largest producing county. Activities there continued to increase in the region around Bishop. The tungsten deposits of Inyo County have been described by Tucker and Sampson.[7]

Colorado.—Output of tungsten in Colorado was higher in 1939 than in 1938. Total shipments were 617 short tons of concentrates averaging 46.59 percent WO_3. All shipments were ferberite concentrates from Boulder County, the largest coming from operations of the Wolf Tongue Mining Co. near Nederland, where the Illinois shaft was sunk to the 400-foot level. The mill treated 1,603 short tons of ore containing 4.78 percent WO_3 in 1939. The Vanadium Corporation of America shipped 204 short tons of concentrates containing 50.66 percent WO_3 from the Conger mine near Nederland in 1939. The mine was reopened late in 1938, and a new mill was built which in 1939 treated 12,115 short tons of ore containing 1.20 percent WO_3.

The following is an abstract of a paper by Lovering [8] regarding the genesis of Boulder County ores.

> The wall-rock alteration adjacent to the tungsten veins shows a narrow sericitized casing surrounding the vein, giving away abruptly to an argillized envelope extending to as much as 50 feet from the vein. The argillitic alteration indicates attack by early acid solutions, and the narrow sericitized sheath shows a change to neutral and alkaline solutions at a late stage. In the gold telluride veins the sericitic alteration is dominant, and the argillitic envelope is generally lacking. The early vein quartz shows that the clay minerals and marcasite immediately preceded the deposition of contemporaneous pyrite and ferberite. Hypogene brown iron oxide is later than the ferberite and is followed by barite and adularia. This mineralogy indicates a progressive change from acid to alkaline solutions and harmonizes with the evidence of wall-rock alteration. Ferberite was apparently precipitated in slightly acid solutions, but galena, tetrahedrite, chalcopyrite, sphalerite, and miargerite are later and were presumably precipitated in alkaline solutions. Gold telluride is still later in the normal sequence and also is believed precipitated in alkaline solutions. Field evidence suggests that the source rock was a biotite latite heavily charged with volatiles and represented by dikes of latite and latitic explosion breccia. It is suggested that emanations from the underlying magma rose through the hot porous explosion breccia with little change in character, but soon dropped their load above the upward termination of the breccia in the overlying fissures where they reacted with the wall rock and became neutralized and finally alkaline through the acquisition of bases from the quartz monzonite that makes up the country rock of the deposit.

Idaho.—The Ima mine on Patterson Creek about 11 miles east of May was the only producer in Idaho in 1939. The mill treated 38,778 short tons of ore containing 0.6 percent WO_3, from which 226

[7] Tucker, W. B., and Sampson, R. J., Mineral Resources of Inyo County: California Jour. Mines and Geology, Division of Mines, Dept. of Natural Resources, State of California, vol. 34, No. 4, October 1938, pp. 462–467.

[8] Lovering, T. S., The Genesis of the Ferberite and Gold Telluride Ores of Boulder County, Colo.: Soc. Econ. Geol. (abs. of paper to be presented at the 20th annual meeting), vol. 34, No. 8, December 1939, p. 939.

tons of huebnerite concentrates averaging 66 percent WO_3 were recovered. The mill also makes a sulfide concentrate carrying silver, copper, lead, and zinc. The ore minerals are huebnerite, tetrahedrite, scheelite, galena, sphalerite, chalcopyrite, and molybdenite. New flotation equipment, slime tables, screen classification, and all auxiliaries were being installed late in 1939. A new 700-foot haulage level was completed and put into operation during 1939. Mining is accomplished by a filled square-set system of stoping, and the tungsten values are recovered from the ore by gravity methods following by roasting to remove the sulfur and then by magnetic separators.[9]

Montana.—The Jardine Mining Co., the only producer in Montana in 1939, shipped 20 tons of scheelite concentrates averaging 68.2 percent WO_3 from operations at the Jardine mine in Park County. The principal output is gold, and tungsten is produced entirely as a byproduct.

Nevada.—Nevada retained its position as the principal domestic tungsten producer in 1939; shipments of concentrates (virtually all scheelite) totaled 2,091 short tons reduced to an equivalent 60 percent WO_3. A large part of the output was scheelite concentrates from the mines of the Nevada-Massachusetts Co. near Mill City. The ore comes from three mines, the Stank, the Humboldt, and the Sutton. The Stank shaft has been sunk 1,325 feet, and the lower level has been prepared for mining. It was reported that the grade of ore is about the same as it had been on the upper levels. At the Humboldt mine the shaft is being sunk from the 1,225- to the 1,350-foot level. The Sutton mine is a new development and is down only about 150 feet. New discoveries of ore have been reported at the Sutton and Humboldt mines. The average grade of ore at Mill City is 1 percent WO_3, while the concentrates average 75 percent WO_3.[10] There was no production from company operations at Mina in Mineral County in 1939. The Tungsten Metals Corporation, which enlarged its milling capacity near Ely, White Pine County, produced from three mines and was the largest of several other small producers that contributed to the Nevada total in 1939.

Utah.—Shipments from Utah in 1939 were only 3 short tons of scheelite concentrates averaging 58 percent WO_3 from Tooele and Box Elder Counties.

Washington.—Virtually all shipments of tungsten concentrates from Washington in 1939 came from the Germania mine near Fruitland, Stevens County. Shipments from the Germania mine comprised 56 short tons of wolframite concentrates averaging 65 percent WO_3 and 165 tons of wolframite jig concentrates averaging 14 percent WO_3. The concentrates came from surface workings and reworking of tailings. The only other shipment from Washington was 1 ton of scheelite concentrates, also from Stevens County.

FOREIGN TRADE

Domestic supplies of tungsten are supplemented by imports, principally of concentrates but also in other forms. Imports of ore and concentrates for consumption (tungsten content) increased from 162,744 pounds in 1938 to 1,485,157 in 1939. China supplied 61 per-

9 Barton, W. P., and Arentz, S. S., Jr., Mining and Milling Tungsten at the Ima Mine: Min. Cong. Jour., vol. 25, No. 8, August 1939, pp. 16–19.
10 Mining World, America's Largest Tungsten Mine: Vol. 1, No. 4, October 1939, pp. 2–6.

cent of the 1939 total. The distribution of imports for consumption is shown in the following table for 1938 and 1939.

Tungsten ore and concentrates imported for consumption in the United States, 1938–39, by countries

General imports of tungsten ore or concentrates, which represent the movement of ore to this country, amounted to 5,894,995 pounds containing 3,111,629 pounds of tungsten in 1939. Of the total general imports of tungsten China supplied 45 percent, Bolivia 24 percent, Australia 8 percent, Argentina 8 percent, Mexico 5 percent, Peru 3 percent, Burma 3 percent, Portugal 2 percent, and British Malaya and Chile 1 percent each.

In addition 589,828 pounds of tungsten in concentrates were imported for smelting, refining, and export in 1939 compared with 828,660 pounds in 1938. There is no record of any exports of tungsten ore or concentrates from this country.

Imports of tungsten and tungsten carbide, and of tungstic acid and other compounds of tungsten, increased in 1939.

Tungsten in metal and compounds imported for consumption in the United States, 1938–39, by countries

[1] Includes combinations containing either metal or carbide.
[2] Austria included with Germany beginning May 6.

USES

The principal quantitative use of tungsten is in the manufacture of tools for metal cutting. For this purpose it is employed either in certain types of steel known as high-speed tool steels (the more common one containing 18 percent tungsten, 4 percent chromium, and 1 percent vanadium) or in cemented carbides, either alone or with other elements. Tungsten finds important application in electric-light and radio-tube filaments, but the quantities used are not large. Tungsten salts are used in the chemical, pigment, and tanning industries.

WORLD PRODUCTION

World production apparently was at a slightly higher level in 1939 than in 1938, which was somewhat below the record figure established in 1937. Although complete figures are not available, preliminary data indicate that world production in 1939 may have reached 34,000 metric tons.

[2] Data not available. [4] Exclusive of Japan.

Argentina.—Argentina is the second-largest producer of tungsten in South America. All tungsten produced is exported, and shipments abroad have trebled since 1934. Since September 1939 exports have moved to the United States; previously the ore was shipped to European countries. Output comes principally from the Provinces of San Luis and Cordoba; much smaller amounts are produced in San Juan and Catamarca. The Sominar, Sociedad Minera Argentina, S. A., is the largest producer, supplying about 50 percent of the Argentine total. It has recently completed a modern concentrating plant that will increase output.

Bolivia.—Bolivia is the largest tungsten producer in South America. The tungsten mines are found throughout the tin belt, usually in separate deposits and rarely associated with tin ores. The principal mines are in the Departments of La Paz and Oruro, with smaller producers in the Departments of Cochabamba and Potosí. Transportation is the foremost problem, and there are still inaccessible areas with important ore deposits that will not be productive until roads or railroads are built. With enough capital for mine and mill-plant installations, together with competent technical advice, it would be possible to increase present Bolivian output substantially. A report giving information on the ore deposits, descriptions of mines, cost, and other data will be found in Mineral Trade Notes.[11]

The new mining decree of June 7, 1939, provides that—

> The State constitutes itself as the only "reseatador" or middleman buyer of minerals of all kinds, the respective operations to be carried out by the Banco Minero de Bolivia. The mineral buyers operating in the country shall liquidate their operations within 120 days and shall place the minerals which they fail to liquidate and retain in their warehouses at the disposal of the Banco Minero.

This portion of the new decree does not affect the large mining companies who produce tungsten concentrates and export their product direct to foreign smelters. Much of the export in recent years has gone to Belgium for transshipment to Germany.

Burma.—Burma is the most important producer of tungsten in the British Empire. Output comes principally from the Hermyingyi

[11] Bureau of Mines Mineral Trade Notes, Tungsten, Bolivia: Vol. 9, No. 3, September 20, 1939, pp. 13–24.

mine near Tavoy and the Mawchi mine in the southern part of Karenni State. Exports of tin-tungsten concentrates during 1939 were 12,212 metric tons compared with 10,602 in 1938. Exports were prohibited without license after October 9, 1939; licenses are granted only to the United Kingdom and France.

The mineralization at Mawchi has been described by Dunn,[12] while the mining and milling operations have been described by Denyer and Heath.[13] Dunn [14] has also described the mineralization at the Hermyingyi mine.

China.—The Sino-Japanese hostilities continued to handicap the movement of tungsten ore from China, the largest world source. Exports of tungsten concentrates were lower in 1939 (11,580 metric tons) than in 1938 (13,387 tons), and a larger part of the movement passed through Hong Kong, owing partly to the establishment in Hong Kong of the Foreign Trade Office of the Chinese National Resources Commission, which has general charge of the sales of minerals in behalf of the Chinese Government. An exclusive sales agency was granted in 1939 to the Pekin Syndicate, Ltd., a British concern, for the sales rights on tungsten produced in Kiangsi, Hunan, and Kwantung. This agency has little or no control over export prices or production, which are handled by the commission. Sales from other Chinese sources also are handled by the commission. The reported wolframite monopoly in South China, granted by the Japanese army to three Japanese firms, apparently was ineffective, as the army does not control sources of production.

The tungsten-producing area in the hands of the Japanese is small and not yet pacified. Producing mines, particularly in Kwangtung, were being worked extensively, and with the routes to Shanghai and Canton under Japanese control ores were reaching Hong Kong and other export points by devious routes through parts of South China not in Japanese hands, as well as through Indochina or Burma.

Exports of tungsten concentrates from Hong Kong during 1939 were 7,741 metric tons, of which 478 tons went directly to the United States. Apparently sales to Germany stopped with the outbreak of the war, while shipments were being made to the U. S. S. R. under the Sino-Soviet barter agreement.

Cuba.—Activities were reported in 1939 aimed at production of commercial quantities of tungsten ore on the Isle of Pines by the Pan American Tungsten Corporation. No shipments were made in 1939, but a mill for the recovery of wolframite concentrates was erected which is expected to be in production early in 1940.

India, British.—There is little or no production of tungsten in India. Output previously credited to India came from Burma, which was split from India as a separate State as of April 1, 1937.

Malay States.—The Kramat Pulai mine near Ipoh is the principal producer in the Malay States. The ore body is composed almost entirely of scheelite and fluorite. The scheelite is of good quality, but the reserves are limited, which explains declining production in recent years. Exports from the Malay States in 1939 were 661 metric tons, of which 220 tons were scheelite and 441 tons wolframite.

[14] Dunn, J. A., Tin-tungsten Mineralization at Hermyingyi, Tavoy District, Burma: Records, Geol. Survey India, vol. 73, part 2, 1938, pp. 238–246.

Exports were prohibited without permit to all ports and destinations abroad other than British.

Portugal.—Output in Portugal, the largest European producer, in 1939 increased 37 percent over 1938. The Beralt Tin & Wolfram, Ltd., with properties at Panasqueira in the Province of Beira Baixa, district of Castello Branco, was the largest producer. Exports were 3,142 metric tons in 1939 compared with 2,450 in 1938 and have been subject to license since October 1939.

Southern Rhodesia.—The African Continent produces little tungsten; the principal output comes from Southern Rhodesia, where production decreased to 270 metric tons in 1939 from 329 metric tons in 1938. Exports were prohibited without license after September 4, 1939.

VANADIUM

Vanadium output in 1939 exceeded the high level reached in 1937 and 1938. The world supply comes from a limited number of operations, principally in four countries, of which Peru and the United States are now the most important. Production in Peru, all from the Minasragra mine, was 23 percent higher in 1939 than in 1938. The revival of the domestic producing industry continued, as shipments from the mines also recorded a 23-percent increase. New deposits were being explored and developed during the year, and it was reported that activities were being revived in the Rifle district, Garfield County, Colo. Production in Northern Rhodesia was increased slightly in 1939, while that in South-West Africa dropped 8 percent. World sources of vanadium may be supplemented in future by the recovery of vanadium from the treatment of pig iron made from vanadium-bearing iron ores at ferrous smelters in Germany. The process involves the treatment of converter slags, which, it is claimed, may run as high as 10 percent V. Enough vanadium to supply one-third of Italy's annual requirements is recovered from the caustic soda solution employed in the Bayer process of refining bauxite.[15] Vanadium is also recovered from the boiler and stack soot of ships burning Venezuelan and Mexican oil for fuel. Other byproduct sources are being investigated for recovery of vanadium.

Despite the increase in domestic production, imports for consumption into this country increased. Purely nominal quotations for vanadium ore were unchanged throughout 1939 at 27½ cents per pound of contained V_2O_5.

[15] Light Metals, Light Alloys and the Light-metal Industries in Italy: Vol. 3, No. 27, April 1940, p. 103.

DOMESTIC PRODUCTION

United States production (as measured by shipments) of vanadium contained in all types of ores from which it was recovered totaled 1,984,068 pounds in 1939 compared with 1,613,155 in 1938. Output came from Arizona, Colorado, and Utah.

Arizona.—Vanadium was produced from operations of the Molybdenum Gold Mining Co. and the Mammoth-St. Anthony, Ltd., near Mammoth, where complex ores containing recoverable values in gold, silver, lead, molybdenum, and vanadium are treated in the flotation mill operated by the latter company. The mines of the Molybdenum Gold Mining Co. were acquired by the Mammoth-St. Anthony, Ltd., early in the year and were closed on May 15, 1939. New facilities were installed at the Mammoth mine during 1939.

Colorado.—The production of vanadium in Colorado in 1939 amounted to 1,755,489 pounds in vanadium and carnotite ores. The roasting and leaching plant of the United States Vanadium Corporation, the largest producer, at Uravan, Montrose County, was run throughout the year, treating an average of 240 tons of ore daily. The ore runs about 2 percent V_2O_5; and the vanadium is recovered as V_2O_5 by roasting the ore with salt, leaching the sodium vanadate with water, and precipitating the V_2O_5 with acid. The precipitate is then sintered to a product containing about 88 percent V_2O_5. The company produces from its own properties, the coal and salt used in treating the ore and in addition to treating its own ores purchases small quantities from minor producers in the district.

The new mill erected near Gateway, Mesa County, by the Gateway Alloys, Inc., was not put into operation until the latter part of October 1939.

Utah.—Vanadium-bearing ores were produced from a number of rather widely scattered places in Utah. Shipments, which were higher than in 1938, totaled 189,902 pounds of contained V_2O_5 in 1939 and originated in Grand and San Juan Counties in the southeastern part of the State. The largest shipment came from the Shumway property near Blanding, San Juan County, and amounted to 1,400 short tons of ore containing 2.45 percent V_2O_5. The Harbro mines near Cisco, Grand County, made substantial shipments of concentrates containing carnotite.

FOREIGN TRADE

Imports of vanadium ores in 1939, all from Peru, totaled 15,694 short tons containing 3,808,122 pounds of V_2O_5 (2,132,548 pounds of V). Data on exports are not given by the Bureau of Foreign and Domestic Commerce. No exports were reported by producers in 1939.

USES

The principal use of vanadium is in the manufacture of special alloy steels and irons. A minor quantity is employed as a catalyst in the manufacture of sulfuric acid in the form of ammonia metavanadate and in the nonferrous, glass, ceramic, and color industries. The importance of vanadium as one of the principal alloying elements of ferrous metallurgy today is as great or greater than 10 years ago.

There have been numerous changes in its application during the last decade, both in tool and in constructional steels.[16]

WORLD PRODUCTION

World output in 1939 exceeded that in 1938 owing to larger production from most of the principal sources. Output in Peru comes from the Minasragra mine of the Vanadium Corporation of America. The richer ore from the mine goes to the sorting floor, where a shipping product containing about 11 percent V_2O_5 is sorted out, while the low-grade ore and discarded material from the sorting floor goes to the calcining plant, where it is first crushed to under a quarter inch and then burned in a furnace to eliminate the carbonaceous matter, leaving an ash with about 22 percent V_2O_5. This product is then sacked and shipped to Bridgeville, Pa., for reduction to ferrovanadium in the electric furnace.[17] Exports from Peru in 1939 comprised 11,601 metric tons of ore and 2,726 tons of concentrates, all of which moved to the United States. Three mines—the Abenab and Baltika of the Southwest Africa Co., Ltd., and the Nageib of the Otavi Minen und Eisenbahn Gesellschaft—contributed to the total in the Territory of Southwest Africa. All the ore, which runs about 19.75 percent V_2O_5, is exported to England and Europe. Production in Northern Rhodesia was fused vanadic oxide from operations of the Rhodesian Broken Hill Development Co., Ltd., which also produces zinc. The main source of supply of vanadium at present is surface dumps, which will soon be exhausted. Experiments are being conducted on the recovery of vanadium from the ores by selective flotation in order that production of vanadium can be continued.

World production of vanadium in ores and concentrates, 1935–39, in metric tons

BAUXITE AND ALUMINUM

By HERBERT A. FRANKE AND M. E. TROUGHT [1]

SUMMARY OUTLINE

Production of aluminum in the United States in 1939 shattered all previous records, and consumption equaled the peak reached in 1937. Exports and total sales of metal by the Aluminum Co. of America were the largest in history. These achievements were abnormal in that the demand for aluminum was enhanced by preparations for national defense and the wars abroad. The aviation industry consumed twice the quantity of aluminum it did in 1937, the previous peak. Another noteworthy year for the metal is predicted for 1940 as war demands continue and uses for aluminum products widen. Domestic aluminum production in 1939 was 14 percent above that for 1938 and exceeded the previous high attained in 1937 by 12 percent. Primary producers withdrew 56 percent of the metal added to stocks in 1938, and apparent domestic consumption increased 87 percent. Imports of crude and semicrude aluminum rose 62 percent and exports were almost 6 times those in 1938 (3 times the previous record year, 1918). The quoted price of primary aluminum remained unchanged throughout 1939, but on March 25, 1940, the price was reduced from 20 to 19 cents per pound.

Domestic shipments and imports of bauxite likewise advanced in 1939. The larger demand came chiefly from the aluminum industry, but the abrasive, chemical, and other industries also increased their use of bauxite during the year. The greater production (shipments) of bauxite from Arkansas mines sufficed to increase the total for the United States 21 percent over that in 1938. Imports of bauxite exceeded those of any other year, increasing 14 percent over those in 1938. Exports (dried-ore basis) declined 4 percent. Apparent consumption increased 19 percent over that of 1938 and 7 percent over that of 1937, the previous peak. The domestic output was equivalent

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

to 45 percent and net imports to 55 percent of total consumption. The quoted range of prices for bauxite was slightly less than that in 1938.

[1] Dried bauxite equivalent. [2] Revised figures. [3] As shipped. [4] Estimated.
[5] New York: 99 percent plus, pure virgin ingot, according to Metal Statistics 1940, published by American Metal Market. [6] Figures not yet available.

Although official data on world bauxite and aluminum production and trade are more incomplete than heretofore on account of hostilities in Europe and Asia, new high records are believed to have been established again in 1939. Estimated world output of aluminum increased 12 percent over 1938. The United States probably remained second to Germany as the largest producer of aluminum. Of the total world output, it is estimated that Germany contributed 28 percent, the United States 23 percent, Canada 12 percent, the U. S. S. R. 8 percent, and France 8 percent. The world race for supremacy in the air explained the outstanding demand for metal as consumption broke all previous records. Larger quantities of aluminum also were used in other transportation industries, in electric transmission lines, in many other established fields, and in new industrial uses developed by the industry's active research laboratories.

World bauxite output kept pace with aluminum production in 1939, increasing an estimated 14 percent. France's large output was followed by that of Hungary, Surinam, British Guiana, Italy, the United States, and Yugoslavia. The United States ranked sixth in importance and produced about 9 percent of the total.

BAUXITE

PRODUCTION

Bauxite production (mine shipments) in the United States increased 21 percent in quantity and 20 percent in value in 1939 compared with 1938 (fig. 1). Arkansas mines were responsible for all the increase as shipments from Alabama and Georgia decreased. Of the total domestic output, Saline and Pulaski Counties, Ark., contributed 96 percent, of which an estimated 60 percent came from underground mines and 40 percent from open-pit mines. Barbour and Henry Counties, Ala., and Sumter County, Ga., supplied the remaining 4 percent of the output, chiefly from open-pit operations.

Bauxite shipped from mines in the United States, 1935–39, by States

State and year	Long tons					Value f.o.b. mine, as shipped
	Crude	Dried	Calcined	Total		
				As shipped	Dried bauxite equivalent	
Alabama and Georgia:						
1935	100	14,021		14,121	[1] 14,114	$91,293
1936	91	16,971		17,062	[1] 17,056	109,327

[1] Revised figures. [2] Includes small quantity of activated. [3] Includes sintered.

The quantities in the foregoing and succeeding tables under the heading "As shipped" show the actual tonnage of material moved. Bauxite is shipped in several forms—crude, dried, activated, calcined, and sintered—in which the moisture content varies considerably; therefore all shipments must be converted to a common unit to permit correct interpretation of the statistical trend and more accurate comparisons of domestic production and shipments with imports and foreign production. This is accomplished by reducing all shipments to a "dried-bauxite equivalent," also listed in the tables.

Mine shipments which are used throughout this report to indicate production, formerly were classified according to use. These data, however, did not picture the true consumption in any particular year accurately, because of the large fluctuations in inventories held by some consumers who operate large processing plants near the mines to convert crude ore received from the mines into more concentrated products for delivery direct to places of ultimate consumption. The table showing shipments by uses has been modified this year to include bauxite shipped direct from the mines to ultimate consumers and that shipped from intermediate processing plants to final consumers. The variations in stocks held by processing plants thus have been eliminated, thereby giving a more accurate annual statement of consumption of domestic bauxite.

The dried bauxite shipped from Arkansas mines usually contains 55 to 60 percent Al_2O_3, 4 to 6 percent SiO_2, 2 to 4 percent Fe_2O_3, 2.5 to 3 percent TiO_2, and 27 to 30 percent combined moisture. The crude or undried ore normally contains 12 to 18 percent free moisture. The calcined bauxite contains about 80 to 84 percent Al_2O_3, 4 to 6 percent SiO_2, 5 to 8 percent Fe_2O_3, and 3.5 to 5 percent TiO_2. Ore shipped from Alabama and Georgia usually contains slightly less alumina and iron oxide and more silica than that from Arkansas. Stocks of bauxite on hand at all mines and processing plants on December 31, 1939, totaled 149,377 long tons of crude ore and 9,367 tons of processed ore compared with 99,800 tons of crude ore and 7,880 tons of processed ore on December 31, 1938.

Except for the Pulaski Bauxite Co., all bauxite producers and processing plants active in the United States in 1938 (Minerals Yearbook, 1939, p. 635) again operated mines and plants in 1939.

In Arkansas the American Cyanamid & Chemical Corporation developed the Heckler property, adjoining the Rauch mine, Pulaski County, and the Ozark No. 24 property, a few miles northeast of the Ozark No. 28 mine, Saline County. A bauxite-sintering plant was placed in operation at the Ozark No. 28 mine during the summer of 1939. Its equipment includes a crusher, screens, a standard Dwight-

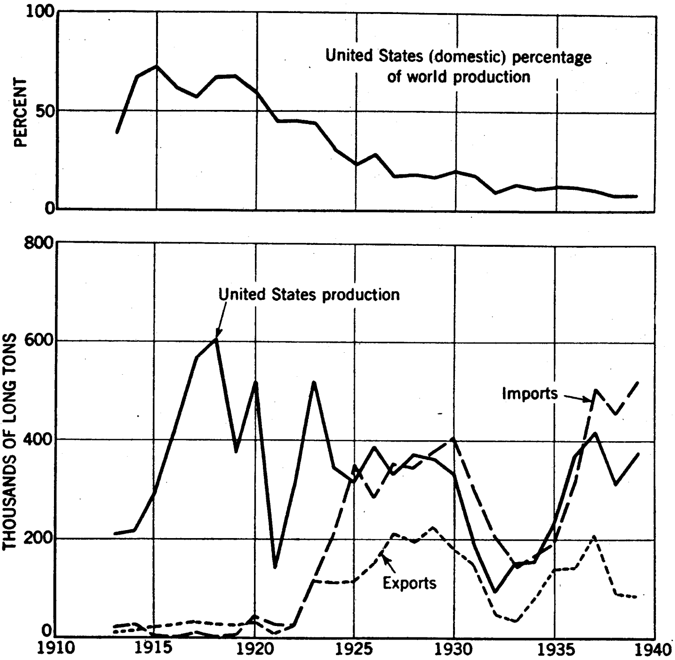

FIGURE 1.—Trends in production, imports, and exports of bauxite, 1913–39.

Lloyd sinter machine, and storage silos. The product is comparable in analysis and suitable for the same purposes as calcined bauxite. In the spring of 1939 the Porocel Corporation, owned jointly by the company and the Attapulgus Clay Co., began to produce activated bauxite at Berger, Ark., using a new dry process.

In 1939 the Arkansas Bauxite Corporation operated its McDonald mine and developed its Townsend property, both in Saline County. Operations ceased at the company Standard mine in April 1939 and at the Bizzell mine early in 1938. The company employs a special wet process at its activated bauxite plant at West Bauxite, which is owned jointly with Max B. Miller & Co., Inc. The Consolidated Chemical Industries, Inc., temporarily abandoned its Alexander No. 1 mine (Rogers Tract) near Bryant, Ark., in the fall of 1938 and began to produce bauxite from its No. 2 mine (Gates lease) near Mount

Olive early in 1939. The Crouch Mining Co., Inc., continued to operate the England mine, Pulaski County, in 1939, but planned to begin production in 1940 at the Young property, Saline County. The Dixie Bauxite Co., Inc., and the Republic Mining & Manufacturing Co. (the largest producer) produced ore in 1939 from the same properties operated in 1938. In Arkansas the Republic Co. mined bauxite from open-pit as well as from underground operations, while all other companies produced only from underground.

In Alabama, the Republic Co. continued to produce bauxite from various pocket deposits in the Eufaula district, Barbour and Henry Counties. The Floridin Co. also mined ore in this district, shipping it undried to its activated-bauxite plant at Quincy, Fla. In Georgia the American Cyanamid & Chemical Corporation shipped ore which had been mined in 1936 and 1937 from its drying plant, and Benjamin Easterlin installed a rotary drying kiln.

CONSUMPTION

Apparent consumption figures shown in the following tables differ from those published in previous reports of this series, inasmuch as they are based on shipments from mines and intermediate processing plants to ultimate consumers rather than shipments from mines irrespective of destination. Net imports (imports minus exports) comprised 55 percent of the apparent bauxite consumption in 1939 compared with 56 percent in 1938 and only 41 percent in 1937. (See fig. 1.) Canada takes most of the bauxite and alumina exported and uses a substantial quantity of it to manufacture crude abrasives, which are returned to the United States for final manufacture and consumption.

Data on production, imports, exports, and apparent consumption of bauxite in the United States from 1910 to 1938 were published in Minerals Yearbook, 1939, p. 636. These historical figures, however, as explained in the preceding paragraph, are not exactly comparable with those in the following table.

Shipments, imports, exports, and apparent consumption of bauxite in the United States, 1935–39, dried-bauxite equivalent, in long tons

Year	Domestic shipments to industry [1]			Imports	Exports	Apparent consumption
	From Arkansas	From Alabama and Georgia	Total

[1] From mines and processing plants. [2] Revised figures.

BY INDUSTRIES

Shipments of domestic bauxite to ultimate consuming industries from mines and processing plants are listed in the following table according to the condition actually shipped and the dried-bauxite equivalent. Detailed information is not available on the consumption, by industries, of bauxite imported. Unless otherwise noted, all mention of production and consumption in the discussion that follows is in terms of dried bauxite.

Bauxite shipped from mines and processing plants in the United States, 1935-39, by consuming industries, in long tons

Industry	1935		1936		1937		1938		1939	
	As shipped [1]	Dried-bauxite equivalent	As shipped	Dried-bauxite equivalent	As shipped [1]	Dried-bauxite equivalent	As shipped [1]	Dried-bauxite equivalent	As shipped [1]	Dried-bauxite equivalent
Aluminum	112,154	112,154	194,764	194,764	209,476	209,476	144,208	144,208	161,008	161,008

Total value	$1,715,927		$2,282,301		$2,722,403		$1,823,307		$2,448,038	

[1] Includes crude, dried, and calcined, 1935-39: also activated, 1938-39, and sintered, 1939.
[2] Small quantity of bauxite shipped to makers of refractories probably included under "Abrasive."

Principal bauxite consumers [1] in the United States in 1939

Chemical manufacturers:
- Activated Alum Corporation, Baltimore, Md.
- Aluminum Ore Co., subsidiary of Aluminum Co. of America, Gulf Building, Pittsburgh, Pa.
- American Cyanamid & Chemical Corporation, 30 Rockefeller Plaza, New York, N. Y.
- American Phosphate & Mfg. Co., Sand Springs, Okla.
- Blockson Chemical Co., Joliet, Ill.
- Brown Co., Berlin, N. H.
- Brush Beryllium Co., Lorain, Ohio.
- Calco Chemical Division, American Cyanamid Co., Bound Brook, N. J.
- Consolidated Chemical Industries, Inc., Petroleum Building, Houston, Tex.
- Charles Cooper & Co., Newark, N. J.
- Davison Chemical Corporation, Rouse Building, Baltimore, Md.
- Diamond Alkali Co., Koppers Building, Pittsburgh, Pa.
- E. I. du Pont de Nemours & Co., Incorporated, 1007 Market Street, Wilmington, Del.
- Gaylord Container Corporation, Bogalusa, La.
- General Chemical Co., 40 Rector Street, New York, N. Y.
- Gulf Oil Corporation, Gulf Building, Pittsburgh, Pa.
- Hercules Powder Co., Wilmington, Del.
- Hilton-Davis Chemical Co., Langdon Farm Road & Pa. R. R., P. O. Box 8, Pleasant Ridge Station, Cincinnati, Ohio.
- Hooker Electrochemical Co., Niagara Falls, N. Y.
- William F. Jobbins, Incorporated, Aurora, Ill.
- Kalunite, Incorporated, 81 Navajo Street, Salt Lake City, Utah.
- Kimberly-Clark Corporation, Neenah, Wis.
- Charles Lennig & Co., Incorporated, 222 West Washington Square, Philadelphia, Pa.
- Mallinckrodt Chemical Works, St. Louis, Mo.
- Mineral Products Corporation, Marysvale, Utah.
- Monsanto Chemical Co., Everett, Mass.
- National Aluminate Corporation, 6216 West 66th Place, Chicago, Ill.
- Natural Products Refining Co., Jersey City, N. J.
- Niagara Chlorine Products Corporation, Box 96, Lockport, N. Y.
- Ohio Apex, Inc., Nitro, W. Va.
- Pennsylvania Salt Manufacturing Co., Widener Building, Philadelphia, Pa.
- Southwest Chemical Corporation, Little Rock, Ark.

[1] Some of the companies may consume aluminous raw materials other than bauxite. The list excludes oil-refining companies (chiefly in Pennsylvania and Mid-Continent fields), municipal water-treatment plants, and steel concerns that use bauxite.

Stauffer Chemical Co., 624 California Street, San Francisco, Calif.
S. D. Warren Co., Cumberland Mills, Maine.
Westvaco Chlorine Products, Incorporated, Carteret, N. J.

Other manufacturers:

Abrasive Co., Philadelphia, Pa.
Atlas Lumnite Cement Co., Chrysler Building, New York, N. Y.
The Carborundum Co., Niagara Falls, N. Y.
The Exolon Co., Blasdell, N. Y.
Federal Abrasives Co., Anniston, Ala.
General Abrasive Co., Inc., Niagara Falls, N. Y.
General Refractories Co., Philadelphia, Pa.
Harbison-Walker Refractories Co., Pittsburgh, Pa.
Laclede-Christy Clay Products Co., St. Louis, Mo.
Massillon Stone & Fire Brick Co., Massillon, Ohio.
Norton Co., Worcester, Mass.

Aluminum.—Shipments of bauxite from Arkansas to the aluminum industry in 1939 comprised 46 percent of the total domestic ore shipments. This quantity was relatively small, however, as almost three-fourths of the industry's bauxite requirements were imported from Surinam.

Abrasive.—In 1939, shipments of domestic bauxite to American and Canadian abrasive plants increased 10 percent from 1938, and amounted to 24 percent of the total tonnage. Technical advances made in the manufacture of abrasives have been very important in today's mass-production methods. Crystalline or fused aluminum oxide and silicon carbide are two standard abrasives that are hard enough to grind almost every material commonly used in the arts.[2]

Chemical.—Domestic bauxite consigned to the chemical industry increased 26 percent in 1939 and represented 23 percent of the total ore shipments. Shipments of aluminum salts advanced 20 percent and of alumina 3 percent. Returns from producers of primary aluminum salts and alumina show the consumption in 1939 of approximately 178,000 long tons of dried bauxite (58 percent domestic, 42 percent foreign), 8,546 short tons of alumina, 1,587 tons of aluminum, and a small quantity of clay, alunite, and chromite residue. Of the alumina shipped, 28 percent was used in the manufacture of aluminum salts.

Aluminum salts and alumina produced in the United States, 1938–39

Oil refining, refractory, and other.—The consumption of activated bauxite in the percolation filtration of paraffin-base oils continued to increase in 1939. The term "activated bauxite" refers to a product that has undergone more careful crushing, screening, sizing, beneficiating, and drying steps than most bauxite. There is no other specific treatment of the product that must have particular physical rather than chemical properties. The granular activated bauxite marketed usually contains 5 to 10 percent combined water and may be furnished in 20/60, 30/60, or some other special mesh grade, in bulk or in 100- or 125-pound bags. It is sold under the trade names Porocel, X-Yte, and Florite, at prices ranging upward from $33 per ton, f. o. b. Arkansas plants.

The very small percentage of bauxite reported shipped to the refractory industry probably is too low, as some products classed as abrasives are used chiefly because of their refractory properties. Aluminous refractories are fused electrically and cast economically in large blocks, and although particularly sensitive to thermal shocks, high-density fused refractories have great chemical resistance at high temperatures.[3] These dense products are rigid and relatively brittle and do not withstand heat shock, therefore they are not widely applicable in the steel industry. Imported bauxite, chiefly from Greece, continued to be used in the domestic production of calcium aluminate cement. In 1939 small quantities of domestic dried and calcined bauxite were consumed by the steel industry as a fluxing material.

PRICES

In 1939 the average selling price, f. o. b. mines and processing plants, was $4.35 per long ton for crude (undried) bauxite; $5.36 for crushed dried bauxite; $12.48 for calcined bauxite; and $37.08 for activated bauxite. The average value for all grades of domestic ores as shipped by mine producers was $5.77 per ton ($5.82 in 1938).

Quotations on domestic and foreign bauxite are nominal, and a definite price per ton can be ascertained only by direct negotiation between the buyer and seller. The open market for bauxite is relatively small because some of the larger consumers operate their own mines and others obtain supplies on a contract basis. Quotations given in the following table are from Engineering and Mining Journal Metal and Mineral Markets.

Range of quotations on bauxite, 1937–39

Type of ore	Chemical specifications (percent)		Prices during year		
	Al_2O_3	SiO_2	1937	1938	1939
Domestic ore (per long ton):					
Chemical, crushed and dried [1]	55–58	(2)	$6.00–$7.50	$6.00–$7.50	$6.00–$7.00
Other grades [3]	56–59	5–8	6.00– 7.50	6.00– 7.50	6.00– 7.00
Pulverized and dried [3]	56–59	8–12	10.00–12.00	9.00–12.00	9.00–11.00
Abrasive grade, crushed and calcined [3]	78–84	(4)	12.50–15.00	12.00–15.00	12.00–14.00
Foreign ore (per metric ton):					
Dalmatian [5]	50–55	1–3	4.50– 7.50	6.00– 7.50	6.00– 8.00
Greek [5]	56–58	3–5	7.50– 8.50	7.00– 8.50	7.00– 8.00
French [5]	56–59	2–4	5.50– 9.00	7.00– 9.00	7.00– 8.00

[1] F. o. b. Alabama and Arkansas mines.

[3] F. o. b. Arkansas mines.
[4] Not specified.
[5] C. i. f. Atlantic ports.

FOREIGN TRADE

Imports of bauxite (chiefly dried ore) in 1939 were the highest ever recorded (fig. 1), exceeding those received in 1938 by 14 percent and in 1937 (the previous peak) by 3 percent. Exports (dry equivalent) declined 4 percent compared with 1938. Of the 1939 imports Surinam supplied 477,094 long tons, British Guiana 29,586, Greece 8,190, France 5,280, and Netherland India 29. Imports, by custom districts, were as follows: 255,708 tons to Mobile, 189,341 to New Orleans, 40,104 to Philadelphia, 17,365 to Massachusetts, 8,190 to Chicago, 6,145 to Florida, 3,297 to Sabine, and 29 to New York. In addition to bauxite, 11 long tons of alumina were imported.

[3] Kraner, Hobart M., Alumina and Silica Refractories: Iron Age, vol. 145, Nos. 3 and 4, January 18 and 25, 1940, pp. 25–30 and 34–39.

Of the exports in 1939, 45,168 long tons were classified as bauxite and other aluminum ores, 6,372 tons as other bauxite concentrates, and 95 tons as alumina of which Canada was consigned 45,136 tons, 4,963 tons, and 93 tons, respectively. Of the remainder of "other bauxite concentrates," 900 tons went to Norway, 488 to Japan, 20 to Mexico, and 1 to Denmark.

Bauxite imported into and exported from the United States, 1935–39

Year	Imports for consumption [1] [2]		Exports (including bauxite concentrates) [3]		Year	Imports for consumption [1] [2]		Exports (including bauxite concentrates) [3]	
	Long tons	Value	Long tons	Value		Long tons	Value	Long tons	Value

[1] Also "alumina" as follows: 1935, 67 long tons valued at $7,680; 1936, 117 tons, $11,618; 1937, 182 tons, $16,461; 1938, 64 tons, $5,464: 1939, 11 tons, $850.
[2] Chiefly dried ore.
[3] As shipped.

ALUMINUM

PRODUCTION

Primary.—Primary aluminum production in the United States in 1939 increased 14 percent in quantity and value over that in 1938 and was the largest on record (fig. 2). Output would have been greater had it not been for the unusually low rainfall in certain areas, which reduced the amount of power available. The value of aluminum produced averaged 19.75 cents per pound in 1939, the same as in 1938. Of the total output, 41 percent was made at Alcoa, Tenn.; 35 percent at Massena, N. Y.; 13 percent at Badin, N. C.; and 11 percent at Niagara Falls, N. Y.

Aluminum produced in the United States, 1935–39

[1] Based on average price of primary aluminum as reported to Bureau of Mines.
[2] Figures not yet available.

In 1939 the Aluminum Co. of America completed a $26,000,000 expansion program begun in 1937 and later announced the beginning of other developments to cost $30,000,000. A new aluminum-reduction plant to be finished about January 1, 1941, at Vancouver, Wash., will utilize Bonneville power and alumina shipped from existing plants, and it will be capable of producing 30,000 short tons of metal annually. This plant, together with a 20-percent increase in capacity of the Alcoa works, will enable the company to produce more than 215,000 tons of aluminum annually. In addition to the development of reduction works, the new program will include: A bauxite beneficiating and drying plant at Paranam, Surinam, of 450,000 tons annual capacity; acquisition of additional ore-carrying vessels by the Ocean Dominion Steamship Co. to take care of increased bauxite shipments from South America; additions to the alumina works at Mobile, Ala., and East St. Louis, Ill.; hydroelectric station improvements along the Little Tennessee River; improved laboratory facilities; and enlarged manufacturing capacities at Alcoa, Tenn., Cleveland, Ohio, Lafayette, Ind., Los Angeles, Calif., Massena, N. Y., and New Kensington, Pa.

Early in 1940 the company began operating a powerful testing machine at New Kensington, Pa., capable of exerting a force of 3,000,000 pounds in compression and 1,000,000 pounds in tension at speeds as high as 36 inches per minute. To meet the increasing demand for aluminum from the aircraft industry, the company installed new production equipment and accumulated stocks in standard aircraft products. A 500-ton hammer for forging propellers, crankcases, and landing gears and a large corrugating press for the manufacture of airplane wings and other aluminum products were put in service. Other domestic fabricators of aluminum products also considerably expanded manufacturing facilities.

For the first time under the present capitalization, holders of common stock of the Aluminum Co. of America were paid a cash dividend in 1939 ($6.00 per share and a stock dividend on December 27). A second cash dividend was paid in 1940 ($1.00 per share on April 15). The consolidated net income of the company was $36,633,389 in 1939 compared with $15,563,145 in 1938.

Until June 1, 1939, the Government continued to present testimony (in District Court of the United States for the Southern District of New York) in support of its suit (filed April 23, 1937) asking dissolution of the Aluminum Co. of America, charging that it is a monopoly in violation of the antitrust laws. The court adjourned until June 21, when the company began to present its testimony which continued the rest of the year, except for the recess period ordered by Federal Judge Francis G. Caffey from August 4 to November 8, 1939. On September 13, 1939, the United States of America, through the Department of Justice, filed another suit against the company and two of its subsidiaries in the Federal District Court, New Orleans, La. This petition charges conspiracy to offset freight rates on bauxite from New Orleans to East St. Louis, Ill., in violation of the Elkins Act. This suit did not come to trial in 1939. On August 9, 1939, the Securities and Exchange Commission announced that the company and certain power subsidiaries were exempt from registration under the holding-company act on the ground that they were not public utility concerns.

On November 16, 1939, the Aluminum Co. of America signed 2-year contracts with two unions of the Congress of Industrial Organizations, which provide for some changes in working conditions and seniority ratings and affect plants at Alcoa, Tenn.; Edgewater, N. J.; New Kensington, Pa.; Detroit, Mich.; and Garwood, N. J. There are no company unions at any plants; and at Massena, N. Y., and East St. Louis, Ill., the unions of the American Federation of Labor are the bargaining agents. The company inaugurated a paid-vacation plan for employees in 1939 which will be continued in 1940.

Because of the interest in aluminum as a strategic material, historical data on production, imports, exports, and apparent consumption of primary aluminum and production of secondary aluminum were included in Minerals Yearbook, 1939, pp. 642–643. Figures on production of primary aluminum are given from 1893 to 1938, other data from 1910 to 1938.

Secondary.—In 1939 the Bureau of Mines began revising its statistical canvass of the secondary-metal industries; owing to the extra

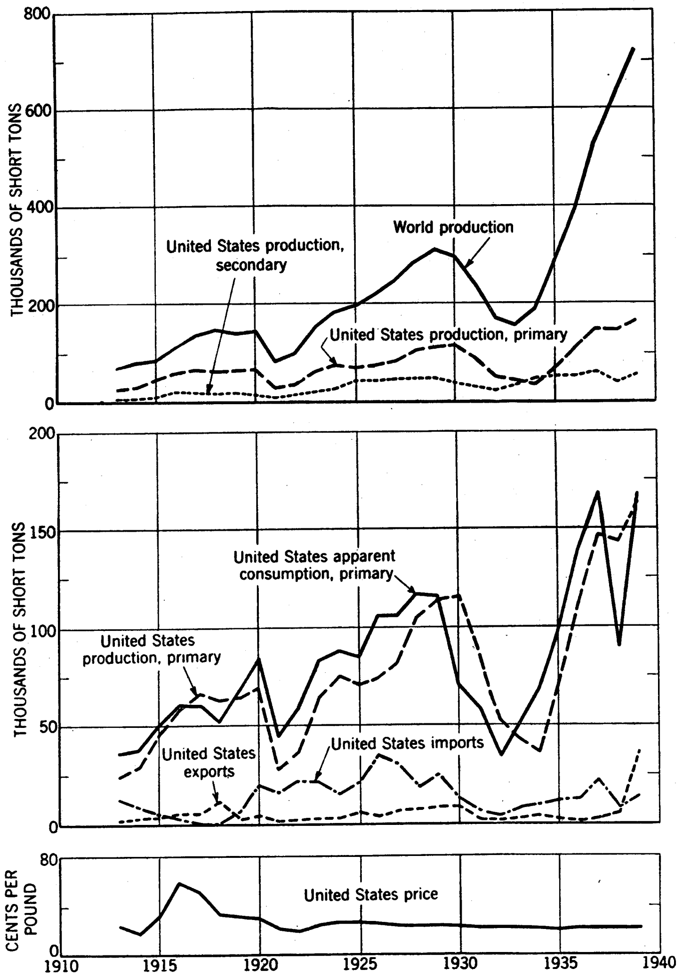

FIGURE 2.—Trends in production, imports and exports, apparent consumption, and average quoted prices of aluminum, 1913–39. Price is for No. 1 virgin 98–99 percent at New York through 1929, thereafter for 99 percent plus virgin ingot, as reported by American Metal Market.

time necessary for this revision, data on the output of secondary aluminum were not available when this report was prepared. It is believed, however, that the recovery of alloyed and unalloyed aluminum in 1939 approached the record high of 1937. Further details on secondary aluminum in 1939 are given in the chapter on Secondary Metals—Nonferrous, Minerals Yearbook, 1940.

CONSUMPTION

The apparent domestic consumption of primary aluminum in 1939 increased 87 percent over that in 1938 and was about the same as that in 1937, a record year (fig. 2). Secondary-aluminum consumption also increased substantially.

The abnormally large demand for aluminum in 1939 was attributable directly to the high rate of activity in the aircraft and other industries stimulated by military preparedness as well as hostilities abroad. Aluminum alloy comprises more than 60 percent of the structural or net weight of an airplane, and in 1939 the aviation industry consumed twice the quantity of aluminum that it did in 1937, the previous peak year. Consumption in this field is expected to set an even greater record in 1940.

The quantity of aluminum used for truck bodies in 1939 was double that of 1938, and that used for windows, spandrels, and other architectural purposes was 80 percent higher than in the previous year. Further progress is expected in use of the metal in the transportation, architectural, and numerous "borderline" fields as a result of the March 1940 price reduction, which gives aluminum a better price relationship with competing materials.

Production, imports, exports, and apparent consumption of primary aluminum and production of secondary aluminum in the United States, 1935–39, in pounds

Year	Primary aluminum				Secondary aluminum (production)
	Production	Imports	Exports	Apparent consumption[1]	
1935	119,295,000	[2] 21,291,235	3,970,347	191,645,888	102,800,000
1936	224,929,000	[2] 25,562,571	1,605,753	275,443,818	103,000,000
1937	292,681,000	[2] 45,178,069	5,383,516	335,958,553	125,120,000
1938	286,882,000	[2] 17,740,281	12,618,078	179,045,203	77,600,000
1939	327,090,000	18,579,940	73,218,080	335,337,860	(3)

[1] Data not available on fluctuations in consumers' stocks. Withdrawals from producers' stocks totaled 55,030,000 pounds in 1935, 26,558,000 in 1936, 3,483,000 in 1937, and 62,886,000 in 1939; additions to producers' stocks totaled 112,959,000 pounds in 1938.
[2] Crude and semicrude, some of which may be secondary aluminum.
[3] Figures not yet available.

The electrical conductor industry continued in 1939 to be second only to transportation as a major consumer of aluminum. The total mileage of aluminum cable, steel-reinforced, in the United States increased to 850,000 miles. More than 100,000 miles of cable were used in rural electrification, and over 1,000 miles of large-diameter cable were shipped for use in construction of the 220,000-volt power lines on the Bonneville Dam project. The strength of aluminum-alloy trains was tested in the severe wreck of the Union Pacific Railroad streamliner "City of San Francisco," when only 3 out of 17 cars were damaged enough to require replacement. Wider recognition of the permanence and insulating value of aluminum foil[4] resulted in its increased use, and in 1939 it was adapted to insulation of locomotive boilers. A single-purpose aluminum house paint was placed on the market, and aluminum-alloy automotive bearings were developed.

[4] Wilkes, Gordon B., Reflective Insulation: Ind. Eng. Chem., vol. 31, No. 7, July 1939, pp. 832–838.

From 1933 to 1938, inclusive, the percentage of aluminum used in various industries in the United States was approximately as follows: Transportation (land, air, and water), 29 percent; machinery and electrical appliance, 15; cooking utensil, 14; electrical conductor, 10; building construction, 8; food and beverage, 6; chemical, 5; iron and steel metallurgy, 5; miscellaneous foundry and metal working, 4; and general miscellaneous, 4.

PRICES

Throughout 1939 open-market quotations in New York for 99-percent-plus pure virgin ingot aluminum, delivered, remained unchanged at 20 cents a pound, carload lots. However, on March 25, 1940, the base price was reduced to 19 cents a pound for 10,000 pounds or more by the Aluminum Co. of America, which attributed the reduction to lowered production costs resulting from its extensive research and expansion program. Quotations for smaller lots down to 1 ton demand a ½-cent premium and for less-than-ton lots a 1-cent premium. The 1940 reduction also included a downward adjustment in prices of fabricated products. European quotations for aluminum ingot on December 30, 1939, were (converted into American money): 19.4 cents per pound in the United Kingdom, 24.2 cents in Germany, 15.6 cents in France, and officially 25.2 cents in Italy (actually 41 to 46 cents was the open-market price). According to Metal Statistics 1940, dealers' 1939 buying prices per pound in New York for principal grades of domestic aluminum scrap averaged 7.47 cents for cast aluminum and 13.90 cents for new-aluminum clips. The average selling price of remelted metal, 98½ to 99 percent grade, was 19.38 cents, and of No. 12 alloy, No. 2 grade, 13.28 cents.

FOREIGN TRADE

Crude and semicrude aluminum exports were nearly six times higher in 1939 than in 1938 and three times the previous peak reached in 1918 (12,068 short tons). The large increase in exports is attributed to defense and wartime demands and the abandonment by Canada of some of its world markets to the United States so that it could better supply the United Kingdom. In the middle of December 1939 the Government added aluminum, because of its use in the manufacture of aircraft, to the list of metals morally embargoed to countries for unprovoked bombing and machine-gunning of civilians. This measure chiefly affects Japan and the U. S. S. R. Of the exports of crude in 1939 (28,121 short tons), 9,933 tons went to the United Kingdom, 8,143 to France, 4,503 to Japan, 1,790 to the U. S. S. R., 1,378 to Belgium, and 551 to Germany; of scrap (476 tons), 364 tons went to Japan; and of semicrude (8,488 tons), 5,533 tons went to the United Kingdom, 1,721 to France, 366 to Canada, 359 to China, 146 to Japan, and 145 to Australia.

Aluminum imported for consumption in the United States, 1937–39, by classes

Class	1937		1938		1939	
	Pounds	Value	Pounds	Value	Pounds	Value
Crude and semicrude:						
Crude form, scrap, alloy, etc	44, 701, 669	$6, 770, 400	17, 511, 819	$2, 430, 828	[1] 28,060,094	[1] $3,251,484

	(2)	1, 682, 419	(2)	1, 572, 256	(2)	2, 759, 334
Grand total	(2)	2, 943, 214	(2)	5, 484, 047	(2)	23, 630, 885

[1] Includes 951,662 pounds of scrap valued at $160,283; not separately classified before 1939.
[2] Quantity not recorded.

Imports of crude and semicrude metal were 62 percent higher than in 1938 but for the first time since 1918 were less than exports. Imports (exclusive of scrap) comprised only 6 percent of the apparent consumption of primary aluminum in 1939. Of the imports of crude

(8,984 tons), 3,766 tons came from Canada, 2,083 from Norway, 1,666 from France, and 1,125 from Switzerland; of scrap (5,046 tons), 3,475 tons came from the United Kingdom and 1,167 from France; and of semicrude (306 tons), 225 came from the United Kingdom and 75 from Switzerland. The value of aluminum manufactures exported increased 76 percent and of those imported 56 percent.

TECHNOLOGIC DEVELOMENTS

An outstanding development during 1939 was the successful brazing of aluminum alloys. Brazing differs from welding primarily in that no substantial quantity of the parent material is melted. Although the strength of brazed and torch-welded joints is about the same the cost is reduced, neater joints are provided requiring less finishing, and thinner parts can be joined by brazing.[5] Furnace-, torch-, and dip-brazing methods have been devised, which use filler materials (aluminum-base alloys) and fluxes melting and flowing at temperatures (1,050° to 1,185° F.) below that of the parent material.

A new aluminum-base die-casting alloy (Alcoa 218) containing 8 percent magnesium is said to have high strength and resistance to corrosion.[6] Alclad (72S)3S, a comparatively new wrought product, is particularly suited for combating localized corrosion and perforation.

Some of the other recent technologic developments in regard to aluminum include work on anodic coating and electroplating of aluminum alloys (Travers process),[7] aluminum-coated steel,[8] and the property of aluminum of restricting grain growth in steel metallurgy.[9]

WORLD BAUXITE AND ALUMINUM INDUSTRIES

BAUXITE PRODUCTION

World production of bauxite continued to increase and in 1939 established another new record. Output is estimated as 4,400,000 metric tons, a 14-percent increase over 1938. The principal producing countries, in the probable order of importance, were: France, Hungary, Surinam, British Guiana, Italy, United States, Yugoslavia, U. S. S. R., and Netherland India. Reports indicate that in 1939 the Unfederated Malay States increased bauxite output approximately 67 percent, Surinam 34 percent, British Guiana 27 percent, United States 21 percent, Hungary 18 percent, France 17 percent, and Italy 16 percent, while Yugoslavia decreased production 21 percent.

ALUMINUM PRODUCTION

World aluminum production continued to rise and in 1939 reached a new peak despite the general shortage of hydroelectric power in much of the Northern Hemisphere. Production is estimated as approximately 650,000 metric tons, an increase of 12 percent over 1938. Germany is believed to have remained the principal producer, accounting for an output 21 percent greater than that of the United States. Estimates for 1939 indicate that Japan increased its metal output 35 percent, Italy 16 percent, Canada, the U. S. S. R., and the United States each 14 percent, France 10 percent, and the United Kingdom and Norway each 7 percent.

[1] Estimate included in total.

ALUMINUM CONSUMPTION

According to the Metallgesellschaft, world consumption of aluminum in 1938 totaled 515,100 metric tons, a 3-percent increase over 1937. Of the total, Germany accounted for 34 percent and all of Europe for 74 percent. The absence of complete official production and foreign trade statistics does not permit a reliable estimate of apparent consumption by countries for 1939, but it is safe to say that an all-time record was established, chiefly because of the military demand for the metal. The apparent primary consumption of the United States in 1939 totaled 152,100 metric tons (152,400 in 1937 and 81,200 in 1938), 14 percent less than that consumed by Germany in 1938 (176,600 tons). During recent years world aluminum-consuming countries have tended to become more self-sufficient in regard to metal output but more dependent on foreign sources for bauxite.[10]

REVIEW BY COUNTRIES

When hostilities were begun in Europe and Asia, many countries ceased to publish statistical information and therefore only incomplete and estimated data for 1939 regarding production, trade, and developments are available for some nations. Official foreign trade statistics, however, are available on the European belligerents for the first 7 or 8 months of 1939. Since the outbreak of the wars both neutral and belligerent countries have issued various restriction decrees, particularly in regard to exports of strategic materials. Permits or licenses are necessary to export bauxite, alumina, or aluminum from the United Kingdom and France and their possessions (including Canada, Australia, British Guiana, Unfederated Malay States, and British India), and from Germany, Greece, Italy, Japan, Norway, Yugoslavia, and other countries.

British Guiana.—Bauxite production in 1939 aggregated 477,693 metric tons of ore containing 60 percent or more Al_2O_3 and 82,932 tons containing 30 to 50 percent Al_2O_3. Exports, chiefly to Canada, the United Kingdom, and the United States, totaled 483,652 tons in 1939 (382,409 in 1938). The Demerara Bauxite Co. extended mining operations to both banks of the Demerara River, and an investigation was made of bauxite occurrences in the Essequibo and Northwest districts of British Guiana.

Canada.—Production and exports of aluminum broke all previous records in 1939. Of the 1939 exports (64,028 metric tons), 35,342 tons went to the United Kingdom, 19,089 to Japan, 2,629 to Germany, 1,800 to the United States, 1,500 to France, 1,078 to China, and 818 to Poland and Danzig. Of the bauxite imported in 1939 (459,924 tons), 405,214 tons came from British Guiana and 54,693 from the United States. Alumina (89 tons) came from the United States and the United Kingdom and cryolite (3,128 tons) from Greenland and the United States.

In the summer of 1939 the Aluminum Co. of Canada, Ltd., began a $7,000,000 expansion program to be completed by May 1940, which included a 15-percent increase in reduction capacity at Arvida and Shawinigan Falls, Quebec (apparently bringing total annual capacity to 100,000 tons). Other recent construction includes a new fabrica-

[10] Anderson, Robert J., Primary Aluminium: Mining Mag. (London), vol. 60, No. 4, April 1939, pp. 206–209.

tion plant near Kingston, Ontario, and a plant at Arvida for the manufacture of Alpaste, an aluminum paint pigment. Early in 1940 the British Government contracted for the entire exportable surplus of aluminum in Canada during 1940 and 1941, or about 90 percent of the output. Apparently, the Government also agreed to finance a further expansion of the aluminum industry. Permits and licenses are required for the exportation of bauxite, alumina, aluminum, and artificial abrasives from Canada.

France.—French bauxite production in 1939 is estimated as 800,000 metric tons. During the first 7 months of 1939 France exported 237,438 tons of bauxite, of which 166,069 were to the United Kingdom, 46,368 to Germany, 14,168 to Sweden, 5,365 to the United States, and the remainder to others. Alumina exports for the same period totaled 19,023 tons, of which 9,762 went to Norway and 9,246 to Switzerland. For the same period in 1938 France exported only 171,259 tons of bauxite and 9,970 tons of alumina.

Germany.—Decrees issued in the fall of 1939 restrict the consumption of light metals and their alloys and limit the expansion of the aluminum industry in Germany. Both decrees probably were influenced by difficulties experienced in obtaining enough electric energy because of the shortage of hydroelectric power in Bavaria and Austria and the inadequate supplies of coal at steam power plants and the limited equipment available for plant extensions. Thus handicapped, it is believed that German and Austrian output of aluminum in 1939 totaled only about 180,000 metric tons instead of the planned 200,000 tons. If land and Danube River transport facilities are available and high prices are no hindrance, the German aluminum industry should not lack adequate supplies of bauxite because of the British-French blockade, as large reserves of aluminum ore are available in Hungary and the Balkans. Despite apparent interruptions in Yugoslav and Greek shipments in 1939, it is estimated that German bauxite imports exceeded 1,100,000 tons. During the first 7 months of 1939 Germany imported 645,149 tons of bauxite, 4,940 tons of crude aluminum, and 2,749 tons of aluminum scrap. Of the bauxite imported, 223,445 tons came from Hungary, 201,555 from Yugoslavia, 63,617 from Greece, 57,570 from Netherland India, 47,678 from France, 45,542 from Italy, and 5,742 from Denmark (probably cryolite).

Recent German expansions include an alumina and aluminum-reduction works (Lippewerk) at Lünen, Westphalia, with an annual capacity of 40,000 tons of metal, and an 8,000-ton alumina plant at Lautawerk which decomposes German clay with sulfurous acid.[11]

Greece.—Of 178,811 metric tons of bauxite exported in 1939 (139,245 in 1938), 89,622 tons went to Germany, 34,074 to Norway, 23,959 to Japan, and 19,335 to the United Kingdom. The Hellenic-Hydro-Electric Metallurgical Co. (American) plans to construct an alumina and aluminum-reduction plant in Greece, using power transmitted from the Acheloos River Falls to Hea. Despite low production costs Greece reports difficulty disposing of all its bauxite output, and large stocks accumulated in 1939.

[11] Metall und Erz (New Methods of Light-metal Production): Vol. 36, No. 3, 1939, pp. 63–72; also vol. 35, No. 19, 1938, pp. 499–510.
Singer, F., Methods of Extracting Alumina from Clay: Brick and Clay Record, vol. 94, No. 6, June 1939, pp. 54–58.

Hungary.—In 1939 bauxite exports (probably all to Germany) totaled 570,170 tons. The new aluminum-reduction plant of the Hungarian United Coal Mining Co., Ltd., at Tatabanya (Totis) began operating early in 1940, and a third Hungarian plant is proposed by the Hungarian Bauxite Trust and the Vereinigte Glühlampen und Elektrizitäts A.-G. for the Bakony district.

Italy.—Although the bauxite reserves of Italy (in Istria and in central and southeastern parts) are estimated to exceed 34,000,000 metric tons, two-thirds of this quantity is high in silica and unsuitable for the Bayer alumina process.[12] Montecatini recovers vanadium from the caustic soda solution in the Bayer process and uses a portion of the red mud in the production of pig iron by means of sintering and the electric arc furnace.[13]

Japan.—Productive capacity of the six established Japanese aluminum companies at the end of 1938 was about 27,000 metric tons. On the basis of reported and estimated exports from Netherland India, Unfederated Malay States (Johore), Greece, Palao Island, and British India, Japanese bauxite imports approached 300,000 tons in 1939. Japanese interests have developed bauxite deposits on Palao Island, though shallow in depth, and on Hainan Island, which were rejected previously by British interests because of their low grade. Most of the older Japanese aluminum companies have ceased to experiment with unsuitable low-grade ore (alunite, shale, etc.) and have turned to imported bauxite despite the Government subsidy recently granted those using Empire raw materials. Under the recently enacted national policy bill, new firms are accorded preferred financing methods, certain tax exemptions, and free import privileges, but the Government controls production through licensing and can require plant experimental work.[14] So far, national expansion of the industry has been much slower than desired because of the shortage of coal, hydroelectric power, and coke, as well as slow equipment deliveries. In 1939 more than 28,000 tons of aluminum were exported to Japan from Canada, the United States, Norway, and Switzerland compared with approximately 21,500 tons in 1938.

Netherland India.—Bauxite exports in 1939 totaled 217,630 metric tons, of which 168,428 tons went to Japan and 49,072 to Germany. The N. V. Billiton Maatschappij began constructing a hydroelectric plant on the Asahan River, Sumatra, below Toba Lake, and later alumina (20,000-ton capacity annually) and aluminum-reduction works (5,000-ton capacity) will be built at Tandjong Balei, Sumatra.

Norway.—In 1939 imports of bauxite totaled 32,697 metric tons (25,942 in 1938) and of alumina, 45,639 tons (43,737 in 1938). Crude aluminum exports decreased from 28,577 tons in 1938 to 24,084 in 1939, of which 3,420 tons went to Japan, 2,799 to the United Kingdom, 2,242 to Sweden, 1,800 to Poland and Danzig, 1,727 to France, 1,775 to the U. S. S. R., 1,669 to Denmark, 1,600 to Switzerland, and 1,437 to the United States.

Surinam.—The N. V. Billiton Maatschappij has abandoned its plans to mine bauxite in Surinam.

Sweden.—The A. B. Swenska Aluminium Kompaniet will erect an alumina plant, using a corundum type of ore found at the Boliden gold mines or imported bauxite, and has increased capacity of its reduction plant at Månsbo 80 percent.

U. S. S. R.—The hitherto unsatisfactory progress of the Russian aluminum industry is attributed to a shortage of electrical power, obsolete equipment, high sulfur content (2.5 percent) in the alumina produced as blast-furnace slag,[15] and other difficulties.[16] Except for a few deposits in the Urals, most of the Russian bauxite reserves,[17] estimated at 53,000,000 tons, consist of low-grade ore. Bauxite from Turinsk is employed in the new Bayer alumina and the aluminum-reduction plant at Kamensk in the Urals, which produced its first half ton of metal in September 1939. During the fall of 1939 the first unit of the alumina plant at Kirovsk, Kola Peninsula, was scheduled to begin utilizing nepheline tailings from apatite ore. This alumina is to be shipped to the enlarged Volkhov reduction works.

Thermic silumin, an aluminum-silicon alloy, is to be produced direct from the ore in Miguet furnaces at the Dnepr reduction plant as soon as higher-grade raw material (kaolin, kyanite, etc.) is available and the iron content of the alloy can be reduced. In 1940 the U. S. S. R. plans to complete the Sosnovets reduction works south of Kandalaksha and to produce 90,000 tons of metal. Metal output is estimated as only 50,000 tons in 1939.

Switzerland.—In 1939 exports of virgin aluminum ingots, etc., totaled 14,930 metric tons (21,814 in 1938) and of bars, sheets, stampings, etc., 3,299 tons. Aluminum-alloy ingots, etc., exported aggregated 5,450 tons, and other aluminum fabrications comprised 6,942 tons. Of the 14,930 tons of new metal exported, 10,885 tons were consigned to the United Kingdom, 1,090 to Belgium, 789 to Germany, 670 to Japan, and 600 to the United States. The Aluminium Industrie A.-G., Neuhausen, regrouped all its affiliated companies early in 1940 because of the European hostilities and became a holding company for financing its subsidiaries.

Unfederated Malay States: Johore.—Three open-pit mines—the Bukit Pasir and Sri Medan mines near Batu Pahat and the Sungei Kim Kim mine near Pulau Nanas—produced bauxite in 1939.[18] Virtually all the 85,745 metric tons of washed, undried ore exported in 1939 went to Japan through the ports of Batu Pahat and Penggerang. The Pasir ore contains 53 to 61 percent Al_2O_3, 2 to 4 percent SiO_2, 6 to 16 percent Fe_2O_3, 1 percent TiO_2, and 27 to 30 percent combined water, while the average Kim Kim ore contains 55.5 percent Al_2O_3, 6.5 percent SiO_2, 9 percent Fe_2O_3, 0.25 percent TiO_2, and 29 percent combined water.[19]

United Kingdom.—Early in 1940 the British Government apparently agreed to finance aluminum production and fabrication facilities in addition to those completed by the British and Canadian industries during 1939. To satisfy the strong demand for aluminum by the air-

craft and other war industries, orders were placed with Canada, the United States, Switzerland, and Norway. Soon after war was declared against Germany in September 1939, the Ministry of Supply assumed control of supplies and prices of aluminum, invoking a licensing system and prohibiting delivery of metal except in fulfillment of Government or existing written contracts. Export licenses were required from the Board of Trade; on October 10 imports of aluminum were added to the free list, and on February 1, 1940, imports became subject to license. On November 24 the Ministry of Supply became the sole vendor of aluminum; it raised the price on primary metal from £94 to £110 per long ton, delivered, and withdrew the maximum price control on aluminum scrap.

Foreign trade statistics are available only for the first 8 months of 1939, and imports during this period totaled 35,412 metric tons of crude aluminum and its alloys; 8,004 metric tons of sheets, plates, circles, bars, etc.; and 231,443 long tons of bauxite. Of the crude and alloy aluminum imported, 24,461 tons came from Canada, 10,123 from Switzerland, and 539 from Norway.

MERCURY

By H. M. Meyer and A. W. Mitchell

SUMMARY OUTLINE

World events in 1939 had a marked influence on the mercury industry in the United States and, combined with conditions within the industry itself, caused sharp fluctuations in price. Political tension abroad plus uncertainty as to the selling policy of the Franco government after its victory in the Spanish Civil War combined to increase prices early in the year. In May, resumption of combined selling of Spanish and Italian metal by Mercurio Europeo brought a drop in price, signaling an effort by the Cartel to dispose of as much metal as possible rather than to run up the price. On September 5, following declaration of war by the United Kingdom, the price jumped $20 a flask to $110 and continued up sharply until it reached $165 on September 18, with the prices quoted as nominal during the period. This abrupt rise undoubtedly was brought about in part by factors other than the anticipated increase in consumption for war requirements. Mercury had been imported into the United States at a very low rate since late in 1937, whereas in 8 of the 10 years preceding 1938 imports represented 24 to 68 percent of new supply available for consumption. Domestic production had not risen to meet the drop in imports, and presumably consumers had been drawing on their stocks. Consumers undoubtedly feared that competition for mercury among the nations at war or preparing for war threatened supplies. Added to the above, war-risk insurance greatly increased shipping costs. Despite these conditions, however, the increase in prices apparently was temporarily overdone, and prices dropped to $132 late in November.

From September to November price gains abroad lagged greatly behind those in the United States. For example, the average monthly price in New York had been $6 to $11 above the London quotation for the first 8 months of the year, but in September the differential skyrocketed to $49, largely because of the decline in the exchange rate of the pound. Late in December, however, these conditions were reversed; supplies in the United States were more plentiful because of increased domestic output, larger receipts of metal from abroad, and lowered rate of domestic consumption. The situation abroad, on the other hand, became more acute, and price conditions became so confused that at times it was difficult to learn the exact quotation on mercury. The sharp upward price trend continued at an accelerated pace in the first 2 months of 1940. An advance of $50 in one day was purported to be due to an Allied order for 10,000 flasks, to be delivered over a 3-month period. The domestic price policy during this period was conservative. The price was unable to withstand the tremendous pressure from foreign influences, however, and advanced, although it failed to reach the dizzy heights attained by the foreign price. Notwithstanding the domestic tariff of $19, and insurance rates that totaled about $5 (according to Metal and Mineral Markets), the domestic price was $178 to $182 a flask during most of February 1940, while that of the Cartel was $200 a flask f. o. b. Spanish and Italian mines. Late in February the Cartel price was quoted as $205, c. i. f. New York, duty unpaid.

During the early part of 1940 it was rumored that Spain and Italy were producing at a high rate. Past production records for these countries give evidence that they should be able to supply world industrial and war requirements amply, provided mining operations are not impeded. Spain, for example, produced approximately 72,000 flasks in 1927 and in 1929, and there is every reason to believe that she can at least duplicate that record. Italy must be recovering metal at not less than the record rate of 67,000 flasks in 1937. When the output from the United States, the third largest producing country, is added, a total of about 160,000 flasks of mercury seems assured. This total will be supplemented by the outputs of smaller producing nations. For many years before and including the World War period the world output failed to exceed 121,000 flasks.

It is reasonable to assume, therefore, that artificial factors were responsible for the hectic rise in prices abroad late in 1939 and early in 1940. The concentration of production control and possible lack of inventories in some important consuming nations may have accentuated fears regarding supplies, led to excessive orders, and paved the way for abuses in regard to price.

Salient statistics of the mercury industry in the United States, 1935–39

[Flasks of 76 pounds]

	1935	1936	1937	1938	1939
Production ... flasks	17,518	16,569	16,508	17,991	18,633
Number of producing mines	90	87	101	91	107
Average price per flask:					
New York	$71.99	$79.92	$90.18	$75.47	$103.94
London	$60.74	$64.33	$69.65	$66.92	$88.26
Imports for consumption:					
Pounds	593,904	1,374,652	1,437,712	179,522	265,944
Equivalent flasks	7,815	18,088	18,917	2,362	3,499
Exports:					
Pounds	(1)	19,980	34,485	54,161	91,789
Equivalent flasks	(1)	263	454	713	1,208
Apparent new supply ... flasks	25,200	34,400	35,000	19,600	20,900
From domestic mines ... percent	69	47	46	88	83
Stocks in warehouses (bonded) at end of year ... flasks	3,582	2,513	4,286	553	3,110

[1] Not separately classified for 1935.

London ceases to be sales center.—Beginning with January 1, 1940, Spanish and Italian mercury was to have been sold by a Belgian agency rather than in London, obviously in order to have the metal marketed in neutral territory. This plan ran into difficulties, and London continued to market the metal until it was announced in February that the Cartel was selling its mercury directly.

World trade trends.—Available statistics for foreign countries indicate some mystery concerning events abroad. Despite preparations for war, the United Kingdom failed to maintain a high average surplus of imports and, as a matter of fact, barely showed an excess of imports in the first 8 months of 1939, with total imports of 24,154 flasks and re-exports of 23,220 flasks. The destination of these re-exports has not been disclosed. A report early in the year that the French Government would take 11,000 flasks of metal from the United Kingdom did not explain the large movement from London, inasmuch as imports into France for the first 7 months of 1939 totaled only 3,997 flasks. Presumably Japan was the destination of the larger part of exports from the United Kingdom, but there are no statistics to substantiate this assumption.

Germany's rate of importation declined from the high rate attained in 1938, the total for the first 7 months being 13,915 flasks compared with 32,881 flasks in all of 1938—a decline of 27 percent in the monthly rate. As in 1938, virtually all the imported metal originated in Italy.

Italy's exports for 7 months of 1939 totaled 25,602 flasks, indicating a monthly rate 18 percent below that for all of 1938 and 35 percent below the record rate established in 1937. Production totaled 38,639 flasks in the first 7 months of 1939 compared with 41,307 flasks in the corresponding period of 1938.

Monthly compilations.—The strategic nature of mercury made it desirable for the Bureau of Mines to obtain current data covering production and stocks, and monthly canvasses of producers, dealers, and consumers were begun in September 1939. The original list covered mines that supplied more than 95 percent of domestic production in 1938, virtually all dealers and importers, and nearly 500 consumers. Large new mines are added to the list from time to time, whereas many of the smaller dealers and consumers have been dropped. In all, the canvasses probably cover more than 95 percent of these phases of the industry. Owing to the excellent cooperation received from virtually all of the companies approached, the results obtained are believed to be accurate. These monthly figures indicate that extensive enlargements at present mines and new developments have borne fruit and that the monthly rate of output has advanced from 1,500 flasks in September and October 1939 to 2,500 in March 1940. Results of the canvasses are shown in the following table.

Monthly production, consumption, and stocks of mercury in the United States, September 1939 to March 1940, in flasks of 76 pounds

	Production	Consumption	Stocks	
			Consumers	Dealers
1939:				
September	1,500	2,900	9,900	3,000
October	1,500	3,100	8,900	2,400
November	1,600	2,400	8,700	2,400
December	1,750	1,700	9,900	2,700
1940:				
January	1,800	2,300	10,900	2,100
February	2,200	2,000	9,900	1,200
March	2,500	1,800	9,300	1,500

Stock-pile provisions.—The $10,000,000 appropriated by Congress for the purchase of strategic materials in the fiscal year 1940 were expended without provision for any mercury. This omission coincides with the knowledge that the deficiency with regard to mercury in the United States is not as great as it is for some other commodities. Moreover, several other strategic materials have a higher order of priority. For 1941 both the Senate and the House of Representatives have agreed on expenditure of $12,500,000 for strategic minerals, and the Committee has accepted a compromise that would make $3,000,000 available immediately. Both houses must approve the conference report before the bill goes to the President.

Preliminary examinations were made at a number of mercury properties in the United States in 1939 by the Mining Division of the Bureau of Mines, and present plans call for carrying on exploratory work at one of these properties in 1940.

The Geological Survey has laid the groundwork for extensive studies of mercury deposits in the Western States and has undertaken detailed examination of several districts. In 1938 the principal active mercury mines in and near Lake County, Calif., were studied, and a report thereon is in preparation. In the summer of 1939, 28 districts in Washington, Oregon, Nevada, California, and Arizona were visited to get a perspective on the industry. Data obtained in 1939 in the small but important Mount Diablo district near San Francisco have been assembled in a report that should soon be ready for publication. The Bottle Creek and Buckskin districts in northwestern Nevada were studied in 1939, and reports on both are in preparation. Extensive field work in and near San Luis Obispo County, Calif., is still in progress and is resulting in substantial contributions to our knowledge of an area that contains such well-known mines as the Oceania, Klau, and Rinconada.

PRICES

The average monthly price for mercury in New York was slightly higher in January 1939 than the annual average for 1938—$77.44 compared with $75.47. In the early months of the year the price was strengthened by war fears abroad and by uncertainty over the sales policy of Spanish and Italian producers, should the Spanish Civil War terminate in favor of Franco. Franco won the war in the spring, and Mercurio Europeo resumed combined selling for properties formerly represented by that Cartel. The average for April was $90.80; and the price eased, instead of rising, following the renewing of Cartel activity. By August the monthly average was down to $84.41. Following declaration of war between Germany and Great Britain and France in September, the price situation assumed an entirely different aspect. The domestic price advanced to $110 on September 5, $120 on September 7, $135 on September 8, $135–$140 on September 12, $145 on September 15, and $165 on September 18, then eased during the remainder of the month. The average for September was $140 and for October $145.60. An understandable reaction carried the monthly average to $134.98 for November and $141.20 for December.

In general, London prices followed those in the United States for the first 8 months of 1939, the differential in favor of marketing in New York ranging from $6.47 to $10.75. As outlined in the opening statement of this report, the decline in the rate of importation of mercury into the United States for several years, combined with a static domestic production during that period, paved the way for increases in price and, with the current drop in the exchange rate of the English pound, led to a sharp increase in the price differential to $49.22 in September. The differential dropped to $37.60 in October, to $25.23 in November, and—as conditions of supply reversed themselves—to only $5.20 in December, the lowest for the year. The December trend continued into 1940, and in the early months of this year it was to the producers' advantage to sell abroad.

Mercurio Europeo did not renew its contract to sell metal in London at the end of 1939 but, owing to difficulties in arranging for a new agent, continued to sell metal there for several weeks in 1940, after which it began to sell directly to consumers from Spain and Italy.

Average monthly prices per flask (76 pounds) of mercury at New York and London and excess of New York price over London price, 1937–39

Month	1937			1938			1939		
	New York [1]	London [2]	Excess of New York over London	New York [1]	London [2]	Excess of New York over London	New York [1]	London [2]	Excess of New York over London
January	$90.25	$69.52	$20.73	$79.24	$64.31	$14.93	$77.44	$70.97	$6.47
February	91.00	69.98	21.02	76.46	64.54	11.92	85.23	75.21	10.02
March	91.78	70.43	21.35	72.44	63.61	8.83	87.28	77.81	9.47

[2] Mining Journal (London) prices in terms of pounds sterling converted to American money by using average rates of exchange recorded by the Federal Reserve Board, through August, after which prices were quoted in American money.

CONSUMPTION AND USES

Statistics covering apparent consumption of mercury in the United States, as shown in the following table, indicate that there was an increase in 1939 over 1938. The data undoubtedly are incomplete, however, because in both years metal was recovered in the United States from concentrates received from Mexico, which are not included in import figures. These imports of concentrates added about 2,000 flasks to the total for 1939 and 2,400 flasks for 1938. In addition, consumers' stocks probably were depleted during both years, although there are no figures to substantiate this assumption.

The civilian and military uses of mercury are, to a large extent, indispensable. Its military uses are principally in the manufacture of fulminate for detonating high explosives, drugs (calomel, corrosive sublimate, etc.), dental amalgam, antifouling paint for ship bottoms, storage batteries, and barometers. Its civilian uses, in addition to the above, include the generation of power (mercury boilers), mercury vapor lamps, and the manufacture of felt.

Supply of mercury in the United States, 1935–39

[Flasks of 76 pounds]

Year	Production (flasks)	Imports for consumption (flasks)	Exports (flasks)	Apparent new supply		
				Total (flasks)	From domestic mines (percent)	Imported (percent)
1935	17,518	7,815	(1)	[2] 25,200	69.0	31.0
1936	16,569	18,088	263	34,400	47.4	52.6
1937	16,508	18,917	454	35,000	46.0	54.0
1938	17,991	2,362	713	19,600	88.0	12.0
1939	18,633	3,499	1,208	20,900	83.3	16.7

[1] Not separately classified for 1935. [2] Estimated by Bureau of Mines.

An article on mechanical engineering in power stations [1] contains the following notes on mercury boilers:

Some years ago, when the efficiency of steam stations was of the order of 20 percent to 22 percent, with heat-consumption rates of 17,000 B. t. u. to 15,500 B. t. u. per kilowatt-hour, attempts were made to utilize other systems and much attention was paid to the binary fluid mercury cycle, especially in the United States. Plants utilizing this cycle were, in fact, installed in more than one area. It is known, however, that these have not been altogether satisfactory in practice. Considerable trouble has been experienced with the boilers installed at Kearney and Schenectady, and the former has been completely replaced. The new boiler has only one drum, and "porcupine" tubes with internal cores and close clearances have been eliminated. The convection surface, instead of being completely filled with a liquid, carries a mixture of liquid and vapor, so that the amount of mercury required per unit of heating surface is much reduced, although, by reason of the elimination of tube cores, the total quantity of mercury in the boiler is somewhat increased. In spite of various improvements, the boiler retains a number of complications, and, as Sir Leonard points out, its adoption is being retarded by the steady improvements which have taken place in the steam cycle. Heat rates of 11,000 B. t. u. per kilowatt-hour have, in fact, been obtained on certain steam plants, and even lower figures are contemplated for new stations at present under consideration.

Wehrly [2] summarized mercury uses as follows:

In this country about 45 percent of the total mercury consumed is used in the preparation of mercurial salts—calomel, corrosives, oxides, organic mercurials, and other chemical compounds. In this class—the chemical uses—is also placed the production of fulminate, taking normally about 6 percent; vermilion, 6 percent; acetic acid, 2½ percent; and dyestuffs, slightly over 1 percent. The total for this class is over 60 percent. Mechanical adaptations calling for a total of about 13 percent comprise meters, measuring instruments such as barometers, hydrometers, thermometers, and gages; thermostats, vacuum tubes and pumps and pressure-control instruments. Of these, meters consume the most—about 6½ percent. In the electrical field, using a little over 8 percent, are such applications as battery zincs, diffusion lamps, cells for the preparation of caustic soda and chlorine, and arc rectifiers. Batteries and lamps take about equal quantities—2.7 percent. These uses total about 81 percent. Of the remainder, the most important use is in the preparation of hatters' felt, using over 10 percent of the total. Others are gold amalgamation, about 2 percent; dental amalgams, over 2½ percent; thermostatic and plating alloys, ½ percent; and laboratory use, about 2 percent.

In the chemical field the use is slightly decreasing; substitutes are available in the case of vermilion and fulminate. As a war measure, however, the use of ful-

[1] Engineering (London), Mechanical Engineering in Power Stations: Vol. 149, No. 3869, March 8, 1940, pp. 256–257.

[2] Wehrly, Chas. S., Mercury: Columbia University Bull. Information, 40th ser., No. 25, June 1, 1940, pp. 57–61.

minate would expand so greatly as to require more than is normally used even with this possibility of substitution. In the mechanical field all the uses are increasing with replacements, either as raw material or as finished products, practically nil. Electrical uses are increasing at a still greater rate, with substitution possible in but a minor part. In the manufacture of felt, however, there is definitely a move to replace mercury by other chemicals.

REVIEW BY STATES

The surprising thing about mercury production in the United States is that under varying conditions during the past 6 years, with numerous changes in the number of operating properties, with old-established mines closing and with new ones making good records, the output for the country has ranged only from 15,445 flasks in 1934 to 18,633 in 1939. This variation did not mark a continuous uptrend, however, for output in 1935 was 17,518 flasks; in 1936, 16,569; in 1937, 16,508; and in 1938, 17,991. In the years noted the price was between \$70 and \$80 in 1934, 1935, 1936, and 1938; a little over \$90 in 1937; and just under \$104 in 1939. The number of producing mines was approximately 90 in all years but 1937 and 1939, when it was 101 and 107, respectively. During these years a relatively few mines have dominated the picture, but there have been changes among the principal producers, particularly in 1938 and 1939. The Oceanic and Cloverdale mines, for example, were important producers in 1938, but both were closed at the end of the year. The Horse Heaven mine assumed importance in 1935 and the Mount Diablo mine in 1936–37; the Bonanza mine jumped to prominence in 1938 and was the second largest producer in 1939; and the Idaho Almaden mine, discovered in 1936, became one of the leading producers in 1939. The Bretz mine, Oregon, was one of the four largest producers in 1934 but failed to produce in 1939. Output at Texas mines declined during the period. The principal producing mines in 1939 were as follows:

Arkansas—Pike County, Valley mine.

California—Contra Costa County, Mount Diablo mine; Lake County, Great Western, Mirabel, and Sulphur Bank mines; Napa County, Oat Hill mine; San Benito County, New Idria mine; San Luis Obispo County, Klau mine; Santa Clara County, New Almaden mine.

Idaho—Washington County, Idaho-Almaden mine.

Nevada—Humboldt County, Wootan and McCown mine.

Oregon—Douglas County, Bonanza mine; Jefferson County, Horse Heaven mine; Lane County, Black Butte mine.

Texas.—Brewster County, Chisos and Rainbow mines.

These 16 mines produced 88 percent of the country's total compared with 91 percent by the 16 principal mines in 1938.

Mercury produced in the United States, 1936–39

Year and State	Producing mines	Flasks of 76 pounds	Value [1]
1936:			
California	51	8,693	$694,744
Nevada	11	211	16,863

	107	18,633	1,936,714

[1] Value calculated at average price at New York.

Arizona.—Mercury was reported produced at the Sunflower mine, Sunflower district, Maricopa County, in 1939, and there was some activity at other properties in Gila, Maricopa, Pinal, and Yavapai Counties looking toward possible future output.

Arkansas.—The output of 364 flasks of mercury in Pike and Clark Counties was reported in 1939. This came from the properties that have produced in the past—that is, the Valley, Mid-Continent, and Parker Hill—and from the new producers—United States Mercury Co. and Jack-Fork Quicksilver Mining Co. United States Mercury Co. reported having recovered 104 flasks of metal in retorts from ore averaging about 4 percent. The company plans to install a new rotary furnace. Mid-Continent Mercury Producers, Inc., anticipates some plant changes, including a concentrating table for fines and new retorts to handle fines from the table. A new Cottrell rotary furnace is being installed at the Big-Six mine.

California.—As usual, California was the most important mercury-producing State in 1939, but her proportion of the country's total was lower than in 1938. Whereas output in 1939 was from a greater number of mines and operations were expanded at some properties that were active also in 1938, the total for the State was only 11,127 flasks compared with 12,277 in 1938. The decline is explained largely by the shut-downs at the Oceanic and Cloverdale mines, although output at three of the other large producers—the Great Western, New Idria, and Klau—was curtailed somewhat. Expansion of productive operations, particularly at Sulphur Bank and Mirabel, together with output from some newly opened properties, offset in part the reductions noted above. Production in 1939 came from the following 18 counties: Contra Costa, Fresno, Inyo, Kern, Kings, Lake, Mono, Monterey, Napa, San Benito, San Luis Obispo, Santa Barbara, Santa Clara, Siskiyou, Solano, Sonoma, Trinity, and Yolo. Except for the addition of Mono County, these are the same as in 1938. The New Idria mine, San Benito County, again was the largest producer not only in California but in the United States as well. Other large producers were Mount Diablo mine, in Contra Costa County; Sulphur Bank, Mirabel, and Great Western mines, in Lake County; Oat Hill mine, in Napa County; Aurora mine, in San Benito County; Klau mine, in San Luis Obispo County; Guadalupe and New Almaden mines, in Santa Clara County; and Contact and Culver-Baer mines, in Sonoma County.

The California State Division of Mines, Department of Natural Resources, issued a comprehensive map in 1939 showing the situation of all known quicksilver deposits in the State, together with marginal data covering output for California and the world, some geologic notes, and other items. This map is entitled "Economic Mineral Map of California, No. 1, Quicksilver."

The Mount Diablo mine, Contra Costa County, operated by the Bradley Mining Co., produced 1,423 flasks of mercury in 1939 from approximately 12,000 tons of ore and was one of the largest producing properties in the country. A 40-ton rotary kiln and ¼-ton D retort for soot are used at this mine.

Ben Byles reported production in retorts at the Archer mine, Fresno County.

There was some activity again in the Coso district, Inyo County, and a reduced quantity of mercury was produced.

The Walabu Mining Co. operated the Cuddeback mine, Kern County, for part of the year and increased its output over 1938.

Production was reported for the Dawson, Kings, and Canyon mines in Kings County. Retorts were used at all three properties.

In 1939 Lake County produced 4,132 flasks of mercury (22 percent of the country's total), which gave it first rank among the mercury-producing counties in the United States. As usual, the principal properties were the Sulphur Bank and Great Western mines of the Bradley Mining Co. and the Mirabel mine of the Mirabel Quicksilver Co. A 20-ton Herreshoff furnace is in use at the Great Western mine, a 50-ton rotary furnace with a double D retort for the treatment of soot at the Sulphur Bank, and a 25-ton rotary furnace at the Mirabel. Early in 1940 an electric hoist was to replace the air hoist in the main shaft at Great Western. Three new stainless-steel pipes in the condenser system were being tested at Mirabel. Production was reported also for the Anderson Springs, Bullion, Helen, and Abbott mines in Lake County. Development work was being carried on at some other mines in the county, and the installation of some new furnace and retort equipment was under way or in prospect.

A little mercury ore was retorted at the Ishtar Cinnabar Co. property in Mono County, but principally assessment work was done.

A small amount of mercury was reported produced in Monterey County in 1939 at the Franciscan and G. W. D. mines.

In Napa County 680 flasks of mercury were recovered, and the principal producing mine was the Oat Hill, where a 4-by 60-foot rotary furnace was in use. The mine was operated until June 1 by Humboldt Mercury Mines and thereafter by Oat Hill Mine, Inc. The Aetna, Ivanhoe, James Creek Placer, La Joya, Manhattan, Oat Hill Extension, and Toyon mines also produced in 1939. At the end of the year preparations were reported under way for reopening the Knoxville mine, idle except for dump operations since 1932. Furnaces were used for reducing metal at Aetna and La Joya, and retorts were employed at the other mines. A new 10-ton rotary furnace, however, was planned for the Manhattan mine, where 33 flasks of mercury were recovered from 66 tons of ore. The Knapp Construction Co. was experimenting with new concentrating equipment late in the year.

A dozen mines in San Benito County were reported to have produced mercury in 1939, the famous New Idria property being outstanding. In all, 3,815 flasks were recovered, and the county ranked second only to Lake County in output in the United States. The New Idria mine again ranked as the leading producer in the country. Trade reports indicated that 135 men were employed at the property in September and that extensive development work was under way on the 300-foot level in the adjoining San Carlos property, which is being operated in conjunction with the New Idria mine. The concentrating plant outside of No. 3 tunnel at New Idria was reported to have been improved and in September to have had a capacity of 400 tons daily. Mining for this mill is done by means of a dragline, using a Sullivan electric hoist. The material is sized to 5 inches by means of grizzlies, then screened and washed to one-half inch. The oversize is sorted on a belt, which acts both as a sorter and as a waste conveyor. The minus-one-half-inch material is run through a Bendelari jig and a drag washer. Nearly all water is recovered by means of a Wemco 14-foot thickener. Two 100-ton furnaces were in operation during most of the year. The second-largest producer in San Benito County was the Aurora mine, which changed hands in December. Production was made in the 25-ton rotary furnace. Other producers included the Florence Mac, Stayton, Valley View, and Wonder mines.

A marked decrease was noted in production of mercury in San Luis Obispo County during 1939, when 253 flasks were recovered compared with 1,111 flasks in 1938. The decline was due mainly to the fact that the Oceanic mine, the largest producer in 1938, was closed during all of 1939; in addition, output at the Klau mine decreased in 1939. Nevertheless, the Klau mine was the principal producer during 1939 and recovered mercury in a 3- by 40-foot Gould rotary furnace. Development work included sinking of a winze below the lowest old workings, together with development drifts and crosscuts on this level. The Buena Vista or Mahoney, Deer Trail, La Libertad, and Little Bonanza mines also produced in 1939.

Production of mercury was reported in 1939 for the Falcon (Santa Ynez), Lion Den, and Los Prietos mines in Santa Barbara County. Retorts were used at Lion Den and furnaces at the other properties.

Santa Clara County supplied 293 flasks of California's total. The mercury was from newly mined ore retorted at Guadalupe and from mined ore and dump material retorted by several lessees at the New Almaden mine. Early in 1940 a new company—the New Almaden Corporation—was formed to acquire and operate properties formerly comprising the New Almaden mine. If this corporation succeeds in financing the project, the various leases presumbly will be operated as a unit.

Small quantities of mercury were recovered from old workings at the Great Northern mine, Siskiyou County, and from clean-up operations at the St. Johns mine, Solano County, in 1939.

The sharp contraction in output in Sonoma County was due to the failure of the Cloverdale mine to produce. Operations at the Cloverdale mine were described by Burr.[3] The Contact mine was the principal producing property in 1939, followed by the Culver-Baer. Press reports indicated that the Contact mine was preparing to install a 40-ton furnace. No information is available regarding the Wyatt furnace reported to have been constructed there in 1938. Production was on record also for the Jumbo property and the Sonoma Quicksilver group. The entire output of the county was from retort operations. Indications were that the Mount Jackson mine, adjoining the idle Great Eastern and itself idle for many years, changed hands late in the year and that preliminary work anticipating resumption of mining was under way early in 1940.

The Altoona mine in Trinity County produced mercury in 1939 in its 50-ton rotary furnace.

A small quantity of mercury was recovered from dumps at the Reed mine in Yolo County, said in the press to have been idle since 1880, and production was also indicated for the Harrison mine. A new rotary furnace was reported under construction at the Harrison mine in the latter part of the year, but production in 1939 was from a retort. Press reports claimed that a large output was anticipated at this property.

Idaho.—The Idaho Almaden mine, situated 17 miles west of Weiser, Washington County, was discovered in 1936. It began to produce in May 1939 and in the remaining months of the year made an important contribution to the country's total, which ranked it as the seventh largest producing mine in the United States. Ore is crushed in a jaw crusher and delivered to the 50-ton rotary furnace at approximately minus 1 inch. A short description of the property was published in 1939.[4]

Nevada.—There was considerable activity in mercury development and mining in Nevada in 1939, new production coming particularly from Humboldt County, and plans are under way for greater expansion at a number of properties. The State produced 828 flasks of metal (compared with 336 flasks in 1938) from Elko, Esmeralda, Humboldt, Lander, Mineral, Nye, Pershing, and Storey Counties. Five counties—Esmeralda, Humboldt, Mineral, Nye, and Pershing—produced the total for 1938.

No production was reported for Churchill County in 1939, but a a 2-by 24-foot Gould rotary furnace was being installed in December at the Wild Horse mine near Fallon, located by Clyde Garrett early in the year. Production was begun early in 1940.

The Rand Co. acquired an option on the Mayflower and Wildhorse claims in the Ivanhoe mining district, Elko County, and produced mercury in 1939.

Production for Esmeralda County was from newly mined ore at the Red Rock mine and from clean-up operations at the B and B mine. The furnaces at both properties were idle, as the metal produced was from retorts.

Production in Humboldt County totaled 404 flasks in 1939, or more than four times that for 1938; thus, the prophecy of larger output of

[3] Burr, Geo. H., Mining and Treating Low-grade Quicksilver Ores at the Cloverdale Mine: Min. Cong. Jour., vol. 25, No. 6, June 1939, pp. 15–17.
[4] Mining World, Idaho Almaden, Gem State's First Quicksilver Mine: Vol. 1, No. 4, October 1939, pp. 9–11.

mercury in the Bottle Creek district was fulfilled in part in 1939, and greater expansion in 1940 was anticipated. Four retorts were reported to be in operation at the Blue Can, Bottle Creek (Scossa), Blue Bird, and Wootan and McCown mines. A furnace was reported installed at the Scossa property, and one or two others are in prospect in the district. The retort capacity at the Wootan and McCown mine was increased during the year, and approximately 350 tons of ore were treated to recover 165 flasks of mercury. Niebuhr, who owns the Blue Can mine which is leased to Greenan interests, reported a new claim in the Jackson Mountains northwest of Winnemucca. A retort was reported under construction at this property early in 1940. A small rotary furnace was constructed late in 1939 at the Cahill mine in the Paradise Valley district. Prospects were reported to be good for installing a large reduction plant at the McCormick-Dermody property on Buckskin Mountain.

The Hot Springs mine, Lander County, produced 3 flasks of mercury from 10 tons of ore retorted in 1939.

Production of mercury in Mineral County was reported for the Red Wing, Reward, Allen, Lost Steers, and Crystal Quick mines and was entirely from retorts; the total reported for the county was 26 flasks. Press reports indicated that some expansion was in prospect in 1940, with particular reference to acquisition of the Mina Mercury mine by new interests late in 1939 and reconditioning of reduction equipment there.

In Nye County the Van Ness, Mercury, Cinnabar, and Senator mines, and one other property, reported production of mercury in 1939. At the Van Ness mine 32 flasks were recovered from 160 tons of ore treated in retorts and at the Mercury mine 83 flasks from 630 tons of ore retorted. These two properties produced by far the major part of the county total. Prospects for expansion of output in this county included leasing of the Nevada Quicksilver (Doonan) mine at Ione and preparation of the mine for output early in 1940. A 30-ton furnace was reported to have been installed at the mine.

Mercury production in Pershing County increased in 1939, when metal was reported recovered at the Goldbanks, Miner's Dream, Red Bird, and one other mine. Melvin McCoy treated 320 tons of ore in a retort at Goldbanks and produced 80 flasks of mercury. Alvin Guthrie had a lease on this mine for part of the year and produced an additional quantity. The Miner's Dream mine was reported in the press to have been discovered in 1928. The Goldbanks mine was described by Dreyer [5] in a cooperative publication of the Nevada State Bureau of Mines and the Federal Geological Survey.

In 1939 the American Quicksilver Corporation was reported to have put the furnace at the Castle Peak mine, Storey County, in condition for treating 40 tons of ore a day, and the property was operated after being idle since 1935. Early in 1940 the company stated that it had relinquished its lease.

Oregon.—Oregon's output of mercury was relatively the same in 1939 as in 1938 (4,592 flasks compared with 4,610), despite the sharp increase in output at the Bonanza mine, Douglas County, which assumed second place in 1939 among the principal mercury-producing mines of the country. Production at the Horse Heaven and Black

[5] Dreyer, Robt. M., Goldbanks Mining District, Pershing County, Nev.: Univ. of Nevada Bull., vol. 34, No. 1, January 15, 1940, pp. 30-36.

Butte mines, in Jefferson and Lane Counties, the other most important producers in the State, declined from 1938. Monthly production in Oregon advanced rapidly in the early months of 1940, owing mainly to expanded activity at Bonanza. In addition to the mines already mentioned properties in Clackamas, Crook, Jackson, and Malheur Counties contributed to the total output in 1939. The counties are the same as in 1938, except for the addition of Jackson County.

Two properties—the Oak Grove and the mine of D. E. Kiggins—reported all the mercury produced in Clackamas County in 1939. Production was made in small furnaces at both mines.

The Oregon Department of Geology and Mineral Industries has issued a geologic map and description of the Round Mountain Quadrangle east of Prineville. Cinnabar is the principal important economic mineral in the area.

Six properties produced mercury in Crook County during 1939—almost as many as in the remainder of the State—but none was outstanding. At the Mother Lode mine 266 tons of ore were treated in a furnace to recover 35 flasks of mercury. The company reported that the plant was in operation only 30 days. Reports indicate that two or three new plants were completed recently or were under construction in the Prineville district early in 1940.

As already stated the Bonanza mine east of Sutherlin, Douglas County, increased its production greatly in 1939 so that it became the largest producer in the State and the second largest in the United States. During the year a 50-ton Herreshoff furnace was in operation, but in the late months a 70-ton Gould rotary furnace was under construction to supplement the output at the original plant. Press reports stated that with completion of the new plant early in 1940 the operating crew was raised from 20 to 45 men and that before the new installation the mine had been producing about 10 flasks of metal daily.

Mercury was recovered from dumps at the War Eagle mine, Jackson County. A new Johnson-McKay retort was reported under construction early in 1940.

The Horse Heaven mine, Jefferson County, was the second largest producer in the State and ranked fifth in the country. The Nichols-Herreshoff furnace at the mine had a daily capacity of 20 tons. It was reported in the press that two additional hearths, with a rating of 30 tons a day, were installed late in the year and that no change was required in the condenser system. A shut-down of only 5½ days was required for the addition, and plant capacity was raised to 45–50 tons.

The Black Butte mine, operated by the Quicksilver Syndicate, at Blackbutte, 17 miles south of Cottage Grove, produced 540 flasks of mercury in 1939 from treating 17,456 tons of ore. There are two 75-ton rotary furnaces at the property. A short description of operations at this property was published in the Mining World.[6]

The Bradley Mining Co. produced 12 flasks of mercury from 32 tons of ore and 23 flasks from furnace soot in retorts at the Opalite mine in 1939. Option on the Bretz mine again was taken up by the company late in the year. These two mines are 20 and 12 miles, respectively, west of McDermitt, Nev., across the border in Malheur County, Oreg.

[6] Mining World, Black Butte Quicksilver: Vol. 2, No. 1, January 1940, pp. 17–19.

Texas.—As usual, mercury was produced in Texas at the Chisos and Rainbow properties 90 miles south of Alpine or Marathon, Brewster County. No other production was reported for the State. The mercury deposits of the Terlingua region, where the Chisos and Rainbow mines occur, were described by C. P. Ross in a paper read before the Nineteenth Annual Meeting of the Society of Economic Geologists in New York in February 1939.

FOREIGN TRADE [7]

During the first 10 months of 1939 imports of mercury for consumption in the United States continued at the sluggish rate that characterized 1938. Buying interest increased with the advent of war between Great Britain and Germany, prices rose sharply, and in November imports jumped. In that month 1,111 flasks were entered for consumption and in December 1,776 flasks, a total of 2,887 flasks for the 2 months or 83 percent of the total of 3,499 flasks imported in 1939. With resumption of the operations of Mercurio Europeo the United States again began to receive an overwhelmingly large proportion of its total imports of mercury from Spain. The latter country supplied 2,601 flasks, Italy 336, and Mexico 562 in 1939. In addition to the mercury imported from Mexico as metal about 2,000 flasks were produced in the United States from antimony-mercury concentrates received from Mexico. Statistics covering this class of imports are not shown separately in customs statistics. After the beginning of 1940 the price of mercury abroad was higher than that for metal imported into the United States, plus the duty of $19 a flask. It is not surprising, therefore, that imports in January and February 1940 were only 147 and 3 flasks, respectively.

Mercury imported into the United States, 1935–39, by countries

Country	1935		1936		1937		1938		1939	
	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value

All classes of mercury compounds imported increased over 1938 except vermilion reds; but the totals, except mercury oxide, were smaller than in 1937. An upward trend of possible significance was indicated early in 1940, however. Imports of mercurous chloride from Italy alone totaled 18,710 pounds in February compared with 6,700 in all of 1939; of oxide (red precipitate) 9,000 and 18,200 pounds, respectively; and of mercury preparations (not specially provided for) 14,700 pounds in February and 15,000 in all of 1939.

[7] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Mercury compounds imported for consumption in the United States, 1938–39

Compound	1938		1939	
	Pounds	Value	Pounds	Value
Chloride (mercuric) (corrosive sublimate)			300	$174
Chloride (mercurous) (calomel)	265	$358	6,850	5,011
Mercury preparations (not specifically provided for)	11,786	7,604	15,061	8,755
Oxide (red precipitate)	1,011	815	18,200	14,948
Vermilion reds (containing quicksilver)	33,884	30,243	22,624	19,755
		39,020		48,643

Exports of mercury totaled 1,208 flasks in 1939, the largest quantity since 1931 and except for that year the largest since 1920. Of the total, 304 flasks were consigned to Canada, 206 to the United Kingdom, 177 each to Japan and South America, 75 to Australia, and the remainder in small lots to roughly 3 dozen scattered countries throughout the world. At the end of the year the European price favored exportation of mercury from the United States, for it was higher than that for metal imported into the United States plus the duty of $19 a flask.

WORLD PRODUCTION

The following table shows available data on world production of mercury, by countries, from 1935 to 1939.

World production of mercury, 1935–39, by countries

[Compiled by R. B. Miller]

[1 metric ton=29.008 flasks of 76 pounds]

[1] Data not yet available. [2] Exports. [3] Estimated.
[4] Production less than 1 flask or 0.1 metric ton.
[5] Production figure published by Metallgesellschaft.

Algeria.—According to the Metal Bulletin of March 12, 1940, page 6, the Ras-el-Ma quicksilver mine has recently been re-equipped. It was reported to be expected to produce a high proportion of a normal

French consumption of 130 tons during the first year of operations. In recent years, production in Algeria has averaged little over 100 flasks a year, but in 1931 and 1932 output was somewhat over 1,000 flasks annually.

Canada.—Of particular interest, because the British Empire is at present completely deficient in regard to mercury, is the report that a mercury property at Pinchi Lake in the Omineca mining division of British Columbia is now being developed by the Consolidated Mining & Smelting Co. An article[8] in The Miner states that the deposit was first observed in 1937, examined by Consolidated in June 1938, and optioned to that company in the following November. It reported also that a 50-ton reduction plant of simple design will be constructed at the mine.

As pointed out in the chapter of this series for 1939, a mercury deposit on Mud Creek in Bridge River Valley produced a small quantity of metal late in 1938.

Italy.—In 1939, for the third successive year, Italy dominated the world mercury situation. This dominance is traced partly to dislocation of the Spanish industry by the civil war, which terminated in the spring of 1939, for over a long period these two countries have taken turns in world supremacy. Too, available data regarding size and grades of reserves place Spain above Italy in terms of the future. For the first 7 months of 1939—the latest data available—output was 38,639 flasks compared with 41,307 in the similar period of 1938, when the total for the year was 66,748 flasks. Mercury production was at a record level during 1937 and 1938, and under the conditions of increased demand incident to the opening of hostilities between Great Britain and France and Germany in September there is little reason to believe that output in 1939 was less than in the record years.

Exports for the first 7 months of 1939 totaled 25,602 flasks compared with 30,218 in the similar period of 1938 and 44,707 in that of 1937. The 12-month total for 1938 was 53,352 flasks and for 1937, 67,075 flasks. Of the total for 7 months of 1939, 43 percent went to Germany, 23 to Japan, 10 to Great Britain, and 8 to France compared with 60 percent to Germany in all of 1938, 12 to Japan, 4 to Great Britain, and 6 to France.

In February 1940 the production of mercury was placed under special control for the duration of the war, or for not less than 2 years, according to a report from Consul Lester L. Schnare, Milan, Italy, dated March 1. Under the control established, the exportation of mercury ores and their derivatives to foreign countries is prohibited, except under special export licenses, and taxes amounting to 2,000 lire on each flask of mercury and to 50 lire on each kilogram of mercury contained in the ores extracted from the mines have been instituted. The taxes are to be paid when the metal is produced, regardless of the purpose for which it is destined, but the Ministry of Finance is authorized to modify them should developments in the international prices for mercury appear to justify such modification. Heavy penalties are provided for violations of the act.

According to continental advices, quoted in the Metal Bulletin of February 13, 1940 (p. 14), despite rapid advances in the export quotation of the Italo-Spanish Quicksilver Cartel since the beginning of the war, the Italian home price of 1,040 lire a flask remained unchanged

[8] The Miner, Development of the Empire's Largest Mercury Producer: Vol. 13, No. 4, April 1940, p. 37.

until Ministry of Corporations recently raised it to 1,400 lire ($71). This price still bore little relation to the export price ($200). The spread between domestic and export prices would seem to give Italian producers of mercurials a marked advantage in world markets. As a possible substantiation of this assumption, imports of mercurials into the United States trended upward early in 1940.

The annual report of Soc. Stabilimento Minerario del Siele (Leghorn) stated that copper sulfate for use in the vineyards can be replaced by certain quicksilver compounds. Such a trend would aid Italy, which now must import large quantities of copper sulfate.

Mexico.—Production of mercury in Mexico was 6,989 flasks in the first 11 months of 1939 compared with 8,519 flasks in all of 1938. Exports during the first 11 months of 1939 were 6,799 flasks compared with 8,274 flasks in the full year 1938. As in previous years, the United States and the United Kingdom were the principal recipients of metal exported from Mexico. Mercury consigned to the United States in the early part of 1939 is believed to have been diverted largely to the United Kingdom.

The Huitzuco mine treated 39,858 short tons of ore in its mill from January 1 to November 4, 1939, and produced concentrates containing 146,886 pounds of mercury. In the entire year 1938, 50,881 tons were treated, and concentrates contained 197,486 pounds of mercury. Concentrates shipped during the period covered for 1939 contained 156,999 pounds of mercury compared with 201,119 pounds in all of 1938. Reports received late in 1939 said that 1,814 flasks of mercury were recovered from January 1 to November 4, 1939, compared with 2,430 flasks in all of 1938. Concentrates from the Huitzuco mine are shipped to Los Angeles, Calif., for the production of mercury and antimony.

Spain.—It continued to be virtually impossible to obtain authentic information on mercury production in Spain. The civil war, which interfered with mining operations at the famous Almaden mine and caused the cessation of reports from Spain, ended in the spring of 1939, and the mines were transferred to the rebel government under Franco. After the war terminated, Italian and Spanish producers resumed the combined selling of mercury under Mercurio Europeo, with sales headquarters in London. The declaration of war on Germany by the United Kingdom and France in September 1939 made it desirable to revise marketing arrangements, so that the metal would be disposed of in neutral territory; therefore, the contract to sell mercury in London was not renewed at the end of 1939. A plan to sell in Belgium proved impractical, and London continued to market the metal during the first weeks of 1940, after which Mercurio Europeo began to sell its metal directly. Reports of the proposed establishment of a Mercurio Europeo sales office in Switzerland came from London in March 1940.

There were rumors that the Almaden mines produced at a high rate late in 1939, some estimates running as high as 12,000 flasks for December. A source believed to be reasonably accurate stated that at the end of 1939 output was proceeding at a rate of 40,000 flasks annually. Operations were reported hampered early in the year by the condition in which the Franco Government found the property, and no stocks were reported at the mine at the end of the Spanish war. Future production should be able at least to reach levels attained in the past, so that an output of 72,000 flasks probably can be anticipated. This rate has been attained twice in the past—in 1927 and in 1929. Hewett [9] stated that output at the Almaden mine probably began about 400 B. C.; that the record of production since 1500 is known and showed an almost constant rise to a peak in 1888, except for temporary declines during the Napoleonic wars; and that the deposits have been owned by the State for 600 years and exploited by it for nearly 400 years. A new peak was reached in 1927, when output totaled 72,316 flasks; this production was almost matched by the record of 71,832 flasks for 1929. The long history of production and the known and probable reserves of the Almaden mine justify its position as the greatest mecury mine now known. The grade of ore produced—approximately 8 percent, of which approximately 6 percent is recovered—is several times as high as that in ores from Italy, the other of the two leading sources of mercury. Tenor of ores in the United States, the third-ranking world producer, averages less than 0.5 percent.

Roura & Forgas, selling agents for Almaden metal until the end of 1939, reported that exports from Spain totaled 53,441 flasks in 1939 compared with 36,000 flasks in 1938.

A commercial agreement between the French and Spanish Governments was reached early in 1940. This agreement included the delivery of 672 metric tons (almost 20,000 flasks of mercury) to France by the end of 1940 and, it is stated, cannot be denounced by either party.

United Kingdom.—Combined selling of mercury by Mercurio Europeo, which includes the principal world producers in Spain and Italy, was resumed in May following termination of the Spanish Civil War. Headquarters of this agency had been in London; but in September the outbreak of war between Great Britain and France and Germany caused some difficulties in former marketing arrangements, and the contract to sell in London was not renewed at the end of the year. A plan to use Brussels as a center was discarded as impractical, and London continued to market the mercury for the first few weeks of 1940. Then Mercurio Europeo began to sell metal direct to consuming companies and governments. Statistics covering imports into and re-exports from the United Kingdom indicated that consumption in 1938 was large. Although war was closer in 1939 and hostilities actually were begun in September, statistics on foreign trade for the first 8 months of the year barely indicated an import surplus. Imports during that period were 24,154 flasks and re-exports 23,220 flasks, whereas in all of 1938 the figures were 44,317 and 15,535 flasks, respectively, and in 1937, 49,894 and 28,127 flasks.

Roura & Forgas, London agents for Mercurio Europeo, reported that mercury stocks in London were 17,804 flasks at the end of 1938 and only 900 flasks at the end of 1939.

Mercury and mercurials were placed under control by the Government late in 1939 and dealings in quantities exceeding 7 pounds permitted only under license. Maximum prices were established. Mercury is one of the few commodities for which the British Empire virtually depends completely on foreign sources of supply. Some efforts are being made in the Dominions to exploit occurrences of mercury ores.

TIN

By E. W. Pehrson and John B. Umhau

SUMMARY OUTLINE

The most important event affecting the tin industry during 1939 was the declaration of war by England and France against Germany. Although this tragedy created many factors that influenced statistical and economic trends in the tin industry, the most significant development was the threat to the industrial economy and national defense of the United States through the tin shortage this war will make possible.

As stated in Minerals Yearbook, 1939 (p. 673), tin ranks high among our deficient strategic materials because of the essential usefulness of the metal industrially, the lack of domestic deposits, and our almost total dependence on supplies from relatively few overseas sources, the most important of which is southeastern Asia.

The importance of this region as a source of tin and other raw materials was emphasized by Secretary of State Hull in April 1940 as follows:

> I have noted with interest the statement by the Japanese Minister for Foreign Affairs expressing concern on the part of the Japanese Government for the maintenance of the *status quo* of the Netherlands Indies.
>
> Any change in the status of the Netherlands Indies would directly affect the interests of many countries.
>
> The Netherlands Indies are very important in the international relationships of the whole Pacific Ocean. The islands themselves extend for a distance of approximately 3,200 miles east and west astride of the Equator, from the Indian Ocean on the west far into the Pacific Ocean on the east. They are also an important factor in the commerce of the whole world. They produce considerable portions of the world's supplies of important essential commodities such as rubber, tin, quinine, copra, et cetera. Many countries, including the United States, depend substantially upon them for some of these commodities.
>
> Intervention in the domestic affairs of the Netherlands Indies or any alteration of their *status quo* by other than peaceful processes would be prejudicial to the cause of stability, peace, and security not only in the region of the Netherlands Indies but in the entire Pacific area.

An important step toward ameliorating the dangers inherent in our dependence on distant sources of supply for tin and other essential raw materials, was taken in 1939 when Congress passed the Strategic

Materials Act. This law provides for the purchase of stock piles of these commodities for use in a national emergency. It also authorizes an investigation of domestic deposits of strategic minerals with a view to determining the extent to which domestic resources can be relied upon in time of stress. Although this action is somewhat belated as respects the present situation, it is reassuring to note that the importance of strategic minerals to national defense has received official recognition and that a stock pile of tin actually is being accumulated. Details of Government activity since the passage of the bill are given later in this chapter.

Keeping pace with increased industrial activity in the United States during 1939, apparent domestic consumption of tin rose 38 percent over 1938. Leading the advance in the use of tin in 1939 was the tin-plate industry, which increased production 56 percent in consequence of the building up of inventories by can manufacturers, a small gain in the food pack, and a 92-percent advance in exports of tin plate. The use of tin in solder, babbitt, and bronze was substantially higher in 1939 than in 1938, but there was little change in demand from the collapsible-tube and foil trade. Consumers' stocks of virgin pig tin rose 21 percent during the year, and visible inventories, including metal afloat, rose 72 percent. Total stocks at the end of 1939 were equivalent to a 6.5-month supply at the average rate of consumption during the year. The New York quotations for Straits tin, prompt delivery, averaged 50.20 cents per pound in 1939 compared with 42.26 cents in 1938. Following the outbreak of war in Europe, fears of a domestic shortage of tin precipitated a buying wave; as a result the New York price broke away from parity with London and advanced to a peak of 75.00 cents on September 13. It is believed that no large tonnage changed hands during the panic. Meanwhile the International Tin Committee had removed virtually all restrictions on exports, and by the end of the year the domestic price settled to 49.00 cents. Imports of tin totaled 70,102 long tons in 1939 (80 percent came from Asia and 19 percent from Europe). Receipts from Europe were proportionately greater in 1939 than in 1938. Domestic mine production of tin in 1939, as in previous years, was insignificant. Late in the year it was announced that two large mining companies were planning to smelt Bolivian ores in the United States.

Salient statistics for tin in the United States, 1925–29 (average) and 1935–39

	1925–29 (average)	1935	1936	1937	1938	1939

[1] Subject to revision.
[2] Data not available.
[3] Figures for 1935–39 cover foreign only; domestic not separately recorded.

Full statistical data covering the last 5 months of 1939 are not available for other countries than the United States. However, the International Tin Research and Development Council estimates that apparent consumption of tin declined 5 percent abroad. Presumably most of the decline was due to curtailment of shipments by the Allied blockade of Germany and the countries over which Germany now has military control. World mine production increased 13 percent over 1938. Production in countries signatory to the International Tin Control Scheme was 17 percent higher, whereas that elsewhere was 4 percent lower than in 1938. The European War has diverted most of the ore which formerly went to continental European smelters to plants in the United Kingdom and the Straits Settlements. To meet the unexpected demand for tin in the last 4 months of 1939, the International Tin Committee raised export quotas for the third quarter from 45 to 120 percent retroactively, and for the fourth quarter from 60 to 100 percent. On September 18 the British Ministry of Supply fixed tin prices on the London Metal Exchange at £230 per long ton, but as world quotations rose considerably above this level pressure was exerted to remove the restrictions. They were removed on December 11, whereupon the price rose abruptly to £272 and declined again to about £248 at the close of the year. Apparently the Buffer Pool stock was used in an endeavor to stabilize prices in 1939, but official data are not available on this activity.

Government stock-piling program.—Although the Strategic Materials Act (Public No. 117, 76th Cong.) was approved by the President on June 7, 1939, funds for carrying out the provisions of the act were not made available until the Third Deficiency Appropriation Act was signed on August 9. The Executive Branch of the Government requested that $25,000,000 be appropriated for stock-pile purchases during the fiscal year 1939–40, but Congress reduced the sum to $10,000,000. The first and second proposals on tin, which were issued by the Procurement Division of the Treasury Department on October 4 and November 13, respectively, called for bids on three grades of tin, specifications for which were designed to meet the requirements of manufacturers of various products. Owing to the custom of the tin trade of buying tin almost exclusively on the basis of brand and the general reluctance of dealers to obligate themselves to deliver tin with narrow tolerances on composition, only a few offers were received. In the third proposal, issued December 15, the specifications were changed, and the following brands were considered as qualifying: Chempur, Pyrmont, Straits Trading, O. T. Lempriere & Co., E. S. Coy (Penang), Billiton, Mellanear (guaranteed 99.9 percent pure), Hawthorne Refined, Banka, Union Minière du Haut Katanga, and any other brand that will meet specifications. These specifications stipulate that all tin shall be new metal, free from scrap or remelted metal; that the tin content shall be not less than 99.80 percent; and that maximum impurities, in percent, shall be as follows: Antimony 0.040, arsenic 0.050, lead 0.050, bismuth 0.015, copper 0.040, iron 0.015, silver 0.001, cadmium 0.001, nickel plus cobalt 0.010, and sulfur 0.010. Tin meeting these requirements is suitable for the manufacture of tin plate, which requires a high-purity metal and is considered as one of the most essential uses of tin. Tin offerings increased under the revised specifications.

244615—40——44

Awards made under the three proposals issued in 1939 totaled approximately 3,680 long tons, and the net purchase price f. o. b. New York averaged 47.8 cents per pound.

The Navy Department has acquired a small reserve of tin under the strategic material stock-piling program authorized in the Navy Appropriation Bills for the fiscal years 1938, 1939, and 1940.

Licensing of exports of tin-plate scrap.—According to the Fourth Annual Report of the National Munitions Control Board, 172 licenses for the export of tin-plate scrap were issued in 1939 (187 in 1938), involving 10,699 (13,237 in 1938) long tons of scrap valued at $200,498 or $18.74 per ton, based upon values stated in the applications for license. All licenses issued in 1939 named Japan as the country of destination. The maximum export quota authorized by the board was 15,000 tons. Allotments requested totaled 22,225 tons and allotments granted, 13,636 tons. Licenses were applied for on 13,413 tons, and actual exports, as reported by the Bureau of Foreign and Domestic Commerce, were 10,204 tons. Imports of tin-plate scrap totaled 12,633 tons in 1939.

The National Munitions Control Board estimates the production of tin-plate scrap in the United States at 251,000 tons in 1937 and 215,000 tons in 1938, and receipts at detinning plants for the respective years were 250,000 and 213,000 tons. Thus, the net effect of the tin-plate export licensing act has been to reserve the equivalent of virtually all domestic scrap production for the detinning industry. Data are not available for 1939, but as imports of tin-plate scrap exceeded exports, the detinning plants probably received more scrap in 1939 than was produced domestically. For the 4 years 1935 to 1938, the Board estimates total receipts by domestic detinning plants at 885,000 tons, which checks closely reports to the Bureau of Mines of 879,000 tons treated at detinning plants during the same period.

An attempt was made in 1939 to restrict exports of other forms of tin scrap. H. R. 61, introduced in the House of Representatives January 3, 1939, would have included "other scrap containing tin together with drosses" by amending the Faddis-Barbour Act licensing the export of tin-plate scrap; and H. R. 5840, which passed the House of Representatives May 1, 1939, proposed amending the same act by including "other scrap, drosses, or residues, the tin content of which is in excess of 10 percentum in which the copper content does not exceed the tin content." H. R. 2644, introduced January 16, 1939, also proposed a similar amendment to the same act to include "other scrap, drosses, or residues, the tin content of which is in excess of 1 percentum (instead of 10 percentum as in H. R. 5840) in which the copper content does not exceed the tin content." Official data on exports of these scrap items are not available, but from inquiries in the trade it is not believed that the quantity of tin so exported would exceed 2,000 tons in a peak year. None of the proposals has yet been enacted into law.

H. Res. 275, introduced July 26, 1939, provides for an investigation of the extent to which the United States depends on foreign nations for its supply of tin. It was referred to the House Committee on Rules, which recommended (Report 1680) February 26, 1940, that the resolution pass. Further action had not been taken by May 1940.

Investigation of domestic resources.—The investigation of domestic resources of deficient strategic minerals has been emphasized in the

Bureau of Mines program of technologic research in recent years. The chapter on tin in Minerals Yearbook, 1939, called attention to several Bureau reports on tin. In 1939 Information Circular 7069, entitled "Tin Deposits of the Black Hills, S. Dak.," by E. D. Gardner, was issued. Tin occurs in two areas in the region—in the Southern Hills and near Tinton. Gardner summarizes the possibilities for production in these districts as follows (pp. 47 and 71):

About 230,000 pounds of tin has been produced in the Southern Hills section of the Black Hills, and the known tin-bearing dikes were extensively developed by the early operators. The ore bodies so far found are small and widely scattered, therefore individual mining operations are necessarily on a small scale.

If a custom treatment plant was available in the district and the price of tin were high enough, an intermittent daily production of about 50 tons of ore containing up to 1 percent tin could be expected. * * *

About 148,000 short tons of ore assaying 7.5 pounds of tin per ton (about 500 long tons of metallic tin) has been partly blocked out on the Rough & Ready claim of the Black Hills Tin Co.; an additional 50 long tons of tin is contained in ore partly blocked out on other claims in the district. If it is assumed that the ore zones on the Rough & Ready continue downward, and of the same grade, each 100-foot vertical interval would contain 840 long tons of metallic tin. If the block that contains 4.1 pounds per ton is included, the total tin content per 100 feet would be 1,102 tons. The apparent average daily consumption of new tin in the United States in 1937 was 237 long tons.[1]

The partly blocked out ore on the Rough & Ready claim would run the 150-ton mill on the ground for about 3 years. For profitable operation, however, the price of tin would have to be higher than in normal times. A small production of tin also could be expected from other claims in the area if the price of tin were high enough.

Government work in this field was accelerated in 1939 by the passage of the Strategic Materials Act, section 7a of which provides $500,000 annually to the United States Department of the Interior for investigation of domestic resources of deficient minerals. The Bureau of Mines is allotted $350,000 and the Geological Survey $150,000 of the annual appropriations. During 1939 the Bureau of Mines conducted extensive investigations of tin occurrences at Tinton, S. Dak., and in Catron County, N. Mex., and made a preliminary survey of deposits in Alabama. The tin property at Majuba Hill, Nev., was reexamined. At Tinton sampling of surface outcrops and old underground workings and about 4,000 feet of diamond drilling were completed. A small tonnage of low-grade ore was indicated which might be workable under war prices. The work in New Mexico included sampling of placer deposits by trenches and test pits, several hundred feet of underground work, and underground and surface sampling of deposits in place.

The Geological Survey investigated deposits at Tinton, S. Dak.; Catron County, N. Mex.; Irish Creek, Va.; Lincolnton and Gaffney, in the Carolinas; and Majuba Hill, Nev.

Domestic tin smelters.—Of unusual interest in 1939 was the announcement late in the year that the Phelps Dodge Corporation and the American Metal Co., Ltd., were establishing plants for treating Bolivian and other available tin ores. Presumably these companies have been investigating the smelting of refractory Bolivian ores for some time, so that the ventures did not result entirely from war conditions, although events in the last 4 months of the year undoubtedly were a factor in the determination to begin commercial produc-

[1] Miller, R. B., Tin: Bureau of Mines Minerals Yearbook, 1938, p. 616.

tion. Commenting on these new projects in a lecture on tin at Columbia University on November 20, Tuthill[2] stated:

> To some extent, ore contracts have already been entered into, and several thousand tons will be arriving here shortly. It is only a matter of 2 or 3 months' time before we shall be once more turning out American refined tin mostly from refractory ores. And the good thing about it is that this strategically important industry is to stand on its own legs, without benefit of subsidy. Test runs indicate that the quality of this domestic refined tin, to be produced by new and more efficient methods, will be entirely acceptable to American consumers. Output, as now contemplated, will not be large—we shall still have to import the bulk of our metal requirements—but it is a vital and most interesting step toward self-sufficiency.

Although no commercial production was recorded in 1939, in December the American Metal Co., Ltd., was awarded a contract to supply the Government with 100 short tons of domestically refined high-grade tin at 47.22 cents per pound, subject to delayed delivery. This contract was made as part of the stock-pile purchasing program authorized by the Strategic Materials Act.

DOMESTIC PRODUCTION

Primary tin.—Only 34 long tons of tin were produced in 1939, a decline of 64 percent from 1938. Alaska again supplied virtually all the output.

According to the Federal Geological Survey (Bull. 917–A, p. 90):

> The principal producing tin properties in Alaska lie in the extreme western part of Alaska near the western tip of Seward Peninsula. In addition to a few small one- and two-man camps that are fairly widely distributed in this general region the main tin-mining activity is on the property of the American Tinfields, Inc., near Tin City. The tin-bearing placers occur around the eastern border of Cape Mountain, a granite mass that forms the westernmost limit of the North American Continent and has been intruded into a country rock consisting of limestones and slates that had been much metamorphosed even before the intrusion of the granite. The tin minerals have been found in place in the contact zone of the granite, and attempts have been made in the past to develop some of the richer areas as lode mines.

Early in 1940 it was reported that prospect drilling at the properties of the American Tinfields, Inc., failed to disclose substantial new deposits, and at the present rate of production commercial gravels would be exhausted within 4 or 5 years.[3]

In addition to Alaska, small shipments were reported from South Dakota, Montana, and New Mexico in 1939. Producers included W. C. Driskill and the Dakota Tin & Gold Co., both near Tinton, S. Dak.; George A. Mayer, near Basin, Mont.; and Paul Bellamy, Taylor Creek district, Catron County, N. Mex.

The Bear Creek mine near Tinton, S. Dak., operated by the Fansteel Mining Corporation in 1938, was idle in 1939. Martin T. Anderson and associates sunk 28 test pits in the Squaw Creek placer, Taylor Creek mining district, New Mexico, which disclosed tin-bearing gravel (grade not given) ranging from 4 to 18 feet in thickness. No production was reported.

During 1939 there was considerable discussion regarding the possibility of tin production in the vicinity of Marquette, Mich. In response to an inquiry from the Bureau of Mines, United States

[2] Tuthill, Marshall W., Tin: Columbia Univ. Bull. of Information, The School of Engineering, 1940, p. 65.
[3] Mining World, Tin Mining at America's Farthest West: Vol. 2, No. 3, March 1940, pp. 18–20.

Department of the Interior, the Geological Survey Division of the Michigan Department of Conservation replied as follows:

We have investigated the rumors of tin ore deposits in Marquette County, Michigan, and have found no facts to substantiate these reported discoveries.

A historical table of mine production of tin in the United States, by States, from 1910 to 1938, inclusive, was published in Minerals Yearbook, 1939, page 679.

Mine production of tin (content) in the United States, 1935–39, by States

Year	Long tons				Value
	Alaska	South Dakota	Other States [1]	Total	
1935	44.1	0.4		44.5	$50,200
1936	101	(2)		101	105,000
1937	166	.8	1.6	168.4	205,300
1938	94	1		95	90,000
1939	[3] 33	.5	.5	[3] 34	[3] 38,000

[1] Montana, New Mexico, and Wyoming. [2] Less than 0.1 ton. [3] Subject to revision.

Secondary tin.—Complete statistics on the recovery of secondary tin in 1939 were not available when this summary was written. The Bureau of Mines annual survey has been delayed because of revisions adopted to obtain detailed information on the flow of various types of tin scrap and to segregate the recovery of tin from old and new materials. A very large part of the secondary tin produced in the United States is recovered from industrial or new scrap, and curtailment in consumption of virgin tin is reflected immediately in secondary-tin production figures. Because of these facts, the significance of secondary tin from the standpoint of national defense frequently has been overemphasized. Should foreign sources of tin be cut off, the quantity of secondary tin available would soon shrink to small proportions. Although the reclamation of tin is highly desirable as a conservation measure it should be borne in mind that it is not to be depended upon for large tonnages of metal in an emergency. Most of the uses of tin are dissipative, and there is no great store of metal in use that could be tapped should regular imports stop. Additional information on secondary tin is given in the chapter on Secondary Metals—Nonferrous.

Secondary tin recovered in the United States, 1925–29 (average) and 1935–39 [1]

Year	Tin recovered at detinning plants			Tin recovered from all sources			
						Total	
	As metal (long tons)	In chemicals (long tons)	Total (long tons)	As metal (long tons)	In alloys and chemicals (long tons)	Long tons	Value
1925–29 (average)	900	2,000	2,900	7,500	23,100	30,600	$38,034,120
1935	1,100	2,200	3,300	8,600	16,300	24,900	27,498,200
1936	2,300	1,500	3,800	6,500	18,500	25,000	25,621,500
1937	2,500	1,500	4,000	7,400	19,700	27,100	32,124,100
1938	2,200	1,300	3,500	4,300	16,700	21,000	19,284,600
1939	3,600	600	4,200	(2)	(2)	(2)	(2)

[1] Figures compiled by J. P. Dunlop and James S. Earle, of the Bureau of Mines.
[2] Data not yet available.

CONSUMPTION

Apparent consumption.—Apparent consumption of primary pig tin is determined by adding domestic smelter production to net imports. As there was no smelter output from 1925 to 1939, inclusive, apparent consumption for this period was equivalent to net imports. This computation does not consider fluctuations in dealer and consumer stocks, information on which is not always available; consequently the figures do not reveal the actual trend in consumption. Nevertheless, statistics on apparent consumption are useful in determining long-time trends. A table giving these data from 1910 to 1938 was published in Minerals Yearbook, 1939, page 680.

Apparent consumption of primary tin in 1939 was 68,105 tons, a 38-percent increase over the 49,494 tons recorded for 1938 but 22 percent below the all-time peak of 87,802 tons established in 1937. The figure for 1937 exaggerates actual consumption, however, as there were large accretions to consumers' stocks in that year. Actual consumption reached a peak in 1929.

Consumption by uses.—The following tables show actual consumption of primary and secondary tin as reported to the Bureau of Mines. Figures for 1939 were not available when this manuscript was prepared. The items included in the table of consumption by uses represent the products of the first cycle of manufacture; for the purpose of this canvass, any virgin tin emerging from this stage as scrap is considered secondary metal. The figures thus understate consumption of primary tin, and much of the secondary tin listed duplicates data on the virgin metal because it is metal reclaimed from such byproducts as tin-plate clippings and virgin drosses from tinplate and tinning mills and other plants consuming virgin tin. In 1938, for example, domestic consumers purchased 48,551 tons of virgin metal, of which 165 tons were added to inventories and 48,386 tons processed. Of the tin processed, 46,712 tons emerged from the first stage of manufacture in the products shown in the accompanying tables and 1,674 tons were sold as scrap, lost, or added to stocks of metal in process.

Consumption of primary and secondary tin in the United States, 1936–38, in long tons

	1936	1937	1938
Stocks on hand Jan. 1	14,981	17,978	25,984
Net purchases during year [1]	89,232	101,354	59,811

	68,232	14,818	83,050	72,928	17,202	90,130	46,712	11,563	58,275

[1] Includes small quantity of pig tin derived from detinning operations; Bureau of Mines not permitted to publish separate figures.
[2] Small quantity included under "Miscellaneous."
[3] In 1936 pure tin tubing required 1,476 tons and tin-lined tubing 7 tons; in 1937, 1,286 and 10 tons, respectively; not reported separately after 1937.

Tin is employed principally in the manufacture of tin plate. Normally this industry consumes approximately half the virgin tin used in the United States. Production of tin plate increased 56 percent in 1939 compared with 1938. This was attributed to the building up of inventories by can companies, a small increase in the total food pack, and the large increase (92 percent) in exports of tin plate.

According to the American Bureau of Metal Statistics, the use of virgin tin in various other products increased as follows in 1939: Solder, 29 percent; babbitt, 34 percent; and bronze, 32 percent; collapsible tubes and foil decreased 2 percent.

FOREIGN TRADE [4]

The principal items in the foreign trade of the United States in tin are imports of pig tin, which supply virtually all the domestic tin requirements, and exports of tin plate. Of minor importance are the import and export trade in tin-plate scrap; exports of tin-plate circles, strips, cobbles, etc.; and exports of waste—waste tin plate. There is also an appreciable export of miscellaneous tin manufactures, tin-plated hollow ware, and tin compounds. Virtually all the trivial domestic output of tin ore is exported, and a small quantity of ore is imported annually.

Metallic tin imported for consumption in 1939 increased 41 percent over 1938 but was 20 percent below the all-time record established

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

in 1937. Eighty percent of the total imports came from Asia, 19 percent from Europe, and 1 percent elsewhere. Receipts from Asia increased only 31 percent in 1939, whereas shipments from Europe more than doubled owing to much larger purchases from the United Kingdom. Imports of tin concentrates although small were the largest since 1923. They came largely from Bolivia and were consigned chiefly to the plants experimenting with tin smelting.

Foreign trade of the United States in tin and tin concentrates, 1935–39

Year	Imports				Exports of tin (metal)[1] (long tons)
	Tin (metal)		Tin concentrates (tin content)		
	Long tons	Value	Long tons	Value	
1935	64,258	$69,815,287	178	$106,078	2,292

1938	19,453	2,064,515	865	172,467
1939	20,106	1,098,140	5	204,362

[1] Includes tin manufactures, n. s. p. f.; tin foil; tin powder, flitters, and metallics.
[2] Includes tin dross and tin-bearing scrap material other than tin-plate scrap.

Exports of tin plate, etc., increased 92 percent in 1939, regaining much of the loss sustained in 1938. Shipments to virtually all markets participated in the general improvement. Japan was a notable exception, having received only 287 tons in 1939 compared with 12,799 tons in 1938 and 42,689 in 1937. The export movement was exceptionally heavy in the last 4 months of the year after the outbreak of war in Europe.

[1] Includes all exports not exceeding $250,000.

PRICES

The average price of Straits tin for prompt delivery in New York in 1939 was 19 percent above that in 1938 but 7 percent below the 1937 average. At the beginning of 1939 the quotation was 46.40 cents a pound, having dropped 0.25 cent over the New Year holidays. The weakness in the London market was evidenced by the gradual decline in the New York price to 45.00 cents on February 15, which proved to be the low for the year. Thereafter, improvement in domestic demand, particularly from the tin-plate trade, was largely responsible for a rise in price to 49.25 cents about the first of May. From May through August minor fluctuations paralleled the trend in the London market and changes in the dollar exchange value of sterling. After the outbreak of war between Germany and the United Kingdom and France on September 1, domestic consumers became apprehensive of a possible shortage and quickly absorbed available spot supplies. As a result, the New York market broke away from parity with London and rose abruptly to 75.00 cents on September 13, the high for 1939. To meet the increased demand for tin and to allay fears of a real shortage the International Tin Committee removed virtually all restrictions on production. This action promptly affected quotations for future deliveries, and by the close of the year the price of spot tin had declined to 49.00 cents.

In London monthly average prices for standard tin, spot delivery, in 1939 ranged from £213.91 per long ton in February to £248.97 in December; the average for August was £229.87. On September 1 the London Metal Exchange was closed temporarily because of the war emergency, but on September 6 quotations were resumed at no appreciable change from August levels. On September 18 the Ministry of Supply for the United Kingdom fixed the maximum price of tin at £230, London and Singapore, but London Metal Exchange quotations continued below this level until October 9, when the fixed price was adopted. On October 16 the Ministry of Supply announced that British firms could sell tin abroad above the maximum price of £230; however, this level was maintained as the official exchange quotation through December 8. Following the removal of all Government restrictions on tin prices on December 11, quotations rose abruptly to £272 but gradually settled to £247.75 at the close of the year.

STOCKS

Total stocks of virgin tin on hand in the United States at the end of 1939, including metal afloat, increased 38 percent over 1938. Stocks in licensed warehouses were reduced considerably by the sharp demand for spot metal following the outbreak of war in Europe, but tin afloat to the United States and stocks at landings registered substantial gains. Total visible supplies rose 72 percent and consumers' stocks 21 percent during the year. Total stocks on hand at the end of the year, including metal afloat, were equivalent to only a 6.5-month supply at the average rate of consumption in 1939.

World visible supply, exclusive of consumers' stocks, decreased 3 percent in 1939, as the accompanying table shows. These data do not include stocks of metal accumulated by various countries as war reserves.

[1] Metal Statistics, 1940, pp. 401 and 403. In this table figures for world stocks 1935–39 include carry-over in the Straits Settlements (on lighters and warrants) and carry-over at principal European smelters.

WORLD ASPECTS OF TIN INDUSTRY

International Tin Control Scheme.—During the first quarter of 1939 countries signatory to the production-control scheme were operating under quotas representing 35 percent of standard tonnages. An additional 10 percent was alloted for contributions to the Buffer Pool Scheme described in the Tin chapter in Minerals Yearbook, 1939. At the end of March allotments for the Buffer Pool were terminated. Production quotas for the second quarter were established at 40 percent. On June 14, quotas for the third quarter were fixed at 45 percent, but owing to the sharp increase in demand occasioned by the war the quotas were increased retroactively to 60 percent on September 1, to 80 percent on September 12, to 100 percent on September 18, and to 120 percent on October 11.

Despite the availability of mine stocks previously accumulated in some countries, producers were unable to step up exports fast enough to meet the greatly enlarged permissible quotas. In the third quarter of the year permissible exports for the seven major signatory countries totaled 62,391 long tons, whereas actual exports were only 40,274 tons, leaving an underexport for the 3 months of 22,117 tons. This situation was partly rectified in the fourth quarter, when production schedules overtook export quotas, permitting an overexport of 12,640 tons. For the entire year there was an underexport of 7,456 tons. Nigeria, Netherland India, and Thailand (Siam) more than met their export allotments, but Malaya, French Indochina, Bolivia, and the Belgian Congo fell behind. With a permissible total of 34,944 tons, Bolivia exported 27,215 tons of tin.

Quotas for the final quarter of 1939 originally had been fixed at 60 percent on September 1, raised to 70 percent on October 11, and advanced to 100 percent on November 1. On this date it was agreed that the quota for the first quarter of 1940 should be not less than 60 percent. On December 1 the quota was established at 100 percent but on December 28 it was changed to 120 percent.

The initial stock of 15,000 tons for the Buffer Pool Scheme was completed in March 1939. This stock was to be used to stabilize the price of tin between £200 and £230 per long ton. As the price of tin in London did not go below £208.75, presumably there was no reason for market support from the Pool organization; however, in February the spread between quotations for "spot" and "3-month" tin began to widen, and there was agitation for action by the Buffer Pool. In May it was announced that the Pool was lending tin to the London Metal Exchange to keep the backwardation in check, and in June the Pool actually began selling as the price for spot tin reached £230. In August accumulated sales of the Pool were estimated at more than 3,000 tons. During most of the last 4 months of the year the London price of tin was subject to Government control, and apparently the activity of the Pool was greatly curtailed. On October 16 it was announced that owing to the temporary shortage of tin the Buffer Pool had arranged to sell a small daily quota (25 tons) on the London Metal Exchange.

E. Baliol Scott,[5] editor of the Mining Journal of London, has commented on the International Tin Control Scheme as follows:

> As a price-stabilizing factor international control of tin was as unsuccessful as ever. Owing to the war, it is difficult to say what the range of prices actually was, and on a superficial view it will doubtless be said that the war and not the Control should be blamed for prices reported to have run up in the United States to 70 cents per pound, or say £390 a ton for Straits. But if the situation be examined more closely, it will be realized that this rush to buy tin, after the outbreak of war, was due principally to the United States shortage of supply caused by the belief that the Buffer Pool would keep prices at, or below, £230 per ton for standard. As usual, the I. T. C. delayed the increase of quota too long.

The International Tin Research and Development Council, which consists of delegates appointed by the governments of the principal tin-producing countries, reorganized its activities in 1939. Formerly research was financed at widely dispersed institutions especially equipped to handle special problems. This arrangement did not meet the growing needs for research, and a program of centralization was adopted. In 1939 permanent headquarters were built near London, which contain administrative, laboratory, and library facilities. A research organization also was established at the Battelle Memorial Institute to study general problems and problems peculiar to the tin-consuming industry in the United States. The statistical office of the Council remains at The Hague, Netherlands.

World mine production.—World mine output of tin in 1939 is estimated at 181,000 tons, an increase of 13 percent over 1938 but 13 percent below the record established in 1937. Production in the countries participating in the International Tin Control Scheme in 1939 was 17 percent higher than in 1938, whereas that elsewhere was 4 percent lower. The output of the unrestricted producers comprised 16 percent of the total in 1939 compared with 19 percent in 1938, 15 percent in 1937, and 11 percent from 1925 to 1929. The Malay States continued to be the largest producer and contributed 30 percent of the 1939 total. Netherland India ranked second with 17 percent, Bolivia third with 15 percent, Thailand (Siam) fourth with

[5] Scott, E. Baliol, Tin: Eng. and Min. Jour., vol. 141, No. 2, February 1940, p. 47.

9 percent, and Nigeria fifth with 6 percent. All these countries increased production substantially in 1939. China, which ranked fifth in 1938, produced 10 percent less tin in 1939. There were no outstanding new producers in 1939.

World smelter production.—As considerable tin enters world trade in the form of ore, geographical data on world smelter output differ materially from those on mine output. For example, virtually all ore from Bolivia and Nigeria is smelted in Europe. An appreciable part of the tin ore from Netherland India normally is smelted in the Netherlands, and the product of Siam and Indochina is smelted in British Malaya. The only commercial tin-ore smelter in the Western Hemisphere is in Argentina, and its output has increased somewhat in recent years.

The European War has altered the flow of tin ores to some extent. The smelter at Arnhem, Netherlands, was partly shut down in September, and the ore from Netherland India, formerly smelted at this plant, has been diverted to smelters in British Malaya. Some Bolivian ore formerly was smelted in Germany, but the Allied blockade has stopped this flow. The greater part of the Bolivian output now moves to the United Kingdom, although small tonnages come to the United States, where two new tin-smelting ventures were announced late in 1939. Smelting facilities in the Belgian Congo are to be increased to treat local ores that formerly were shipped to Belgium.

World smelter production of tin, 1925–29 (average) and 1935–39, by countries, in long tons

World consumption.—Apparent world consumption of tin in 1939 increased 10 percent over 1938, according to a preliminary estimate of the International Tin Research and Development Council. The figures released by this authority indicate that apparent consumption in the United States advanced 39 percent, whereas that in the rest of the world declined 5 percent. A substantial increase is noted for the United Kingdom, and estimates for 11 months indicate that Japan's apparent consumption was well-maintained in 1939. Data for Germany, France, and Italy are available only for part of the year. If it is assumed that France and possibly Italy had full access to available tin supplies after the Allied blockade was established in September, the decline in apparent consumption of tin outside the United States must be due largely to curtailment of supplies to Germany and the countries over which Germany now has military control. Figures for 7 months indicate a substantial decline in consumption in the U. S. S. R. during 1939.

Apparent tin consumption of the world, 1926–29 (average) and 1935–39, by countries, in long tons [1]

Country	1926–29 (average)	1935	1936	1937	1938	1939
Belgium	1,231	1,250	1,336	1,520	1,618	(3)

REVIEW BY COUNTRIES

The outbreak of hostilities in Europe during the latter part of 1939 resulted in the establishment of many additional barriers to the international flow of minerals. Various prohibitions, restrictions, and control measures were adopted by belligerents and neutrals. The reader is referred to the chapter entitled "World Production of Minerals and Economic Aspects of International Mineral Policies" for details of this aspect of the tin industry in 1939.

Argentina.—Argentine exports of tin concentrates decreased from 988 metric tons during the first 6 months of 1938 to 534 tons for the same period of 1939. Further reduction is expected, as more of the ore will be smelted locally to meet domestic requirements because of the difficulties of obtaining a supply from Europe. Tin smelted in Argentina contains a high percentage of lead.

Belgian Congo.—Increased smelter production of tin in the Belgian Congo is indicated by the announcement that Geomines is expanding its smelting facilities to treat custom tin ores previously shipped to the smelter at Hoboken, Belgium. Transportation difficulties resulting from the war prompted this action.

Bolivia.—Bolivia again failed to produce its quota of tin allowable under the International Tin Control Scheme. Permissible exports for 1939 totaled 34,944 long tons, whereas actual exports were only 27,211 tons. The failure of Bolivia to produce its assigned quotas in recent years has been ascribed chiefly to the shortage of labor resulting from casualties in the Chaco War.

In an excellent summary of the Bolivian tin industry, C. W. Wright,[6] foreign mineral specialist of the Bureau of Mines, makes the following statement on Bolivia's capacity for production:

> Bolivia's tin production is mostly from narrow-vein deposits, and the production costs are in general considerably higher than those in the large-scale dredging operations of the principal tin-producing countries.

[6] Wright, C. W., The Tin-mining Industry and Future Problems: Bureau of Mines Foreign Minerals Quarterly, vol. 2, No. 4, October 1939, 67 pp.

Were it not for the International Tin Cartel which controls and allocates production of the world's tin producers and in which Bolivia has a quota amounting to 23.6 percent, it is doubtful if the Bolivian producers would be able to compete on an open market. Present production capacity is estimated at 3,000 tons of tin a month, but with a somewhat higher price for tin, and mining laws that will encourage mine developments as well as expenditures on plant improvements, it is believed that the monthly output of tin could be increased to 4,000 tons, Under the influence of high prices that prevailed during the Great War, and again from 1926 to 1929, small mines were brought into production.

Various unsuccessful attempts have been made in the past to smelt tin ores in Bolivia. Failures have been ascribed to the refractory nature of the Bolivian ores, the lack of cheap fuel within the country, or the lack of cheap power. The electrochemical plant (Lamy process) started by Mauricio Bony at Oruro, mentioned in previous editions of Minerals Yearbook, apparently has not been successful. It has been reported [7] that after the expenditure of $200,000 work was suspended owing to financial difficulties, and the plant never was completed. It is also reported that the Bony plant will be taken over by G. B. Cobb, of Toronto, who proposes to install six electric furnaces, each capable of producing 10 tons of tin daily. The total cost of the plant is estimated at $350,000, the capital to be supplied by North American interests. According to Cobb, smelting costs will not exceed $40 per ton of tin. Electric power probably will be obtained from the plants of the Bolivian Power Co., Ltd., on the Miguilla River 70 miles north of Oruro. As the present price for power is 2 cents per kilowatt-hour, the possibility of electrosmelting tin economically has been questioned.[8]

A process for distilling tin from low-grade sulfide concentrates, recovering the tin as oxide and reducing the oxide by electrolytic methods, is being studied by the Hochschild group. Late in 1939 it was announced that two companies in the United States were contemplating the smelting of Bolivian tin ores, as was done on a large scale during the World War of 1914–18.

Political events continue to play an important role in the Bolivian tin industry. On June 7, 1939, the administration of President German Busch issued a decree establishing more rigid regulation of the tin industry and imposing 100-percent control over the foreign-exchange realizations on tin exports. The decree was greatly ameliorated by the government that succeeded President Busch upon his death in August.

Dr. Friedrich Ahlfeld, of the Bolivian Bureau of Mines and Petroleum, divides the Bolivian tin deposits into three groups—those associated with plutonic rocks, designated as the normal type; those associated with porphyritic rocks; and alluvial deposits. Deposits of the normal type are the source of 38.4 percent of the total production and constitute 41.1 percent of the reserves, whereas those of the porphyry types represent 58.7 and 57.2 percent, respectively. The alluvial deposits are relatively unimportant, contributing only 2.9 percent of the productive capacity and 1.7 percent of the reserves. The monthly productive capacity of the larger mines is 2,925 metric tons of tin and that of the smaller mines 275 tons, a total of 3,200 tons. The total visible and probable reserve is 520,000 tons of tin, of which the larger mines produce 489,450 tons. Allowing for a 40-percent

[7] Wright, C. W., Work cited in footnote 6.
[8] Wright, C. W., Work cited in footnote 6.

loss in mining and milling and assuming a yearly production of 25,000 tons, reserves will last about 12 years.[9]

British Malaya.—The standard quota for Malaya under the Tin Control Scheme was 77,335 long tons of tin in 1939. Including Buffer Stock, Malaya's permissible quota for 1939 was 58,968 tons, but only 55,963 tons were exported, leaving an underexport of about 3,000 tons. Nevertheless, exports rose about 30 percent in 1939 in contrast to the 44-percent decline in 1938. Employment conditions were better toward the end of the year as a result of increased activity, which began in September. The number of tin miners employed increased from 46,639 at the end of August to 72,954 at the end of December.

The sudden demand for tin, starting in September, was met largely by increasing the dredge output. In August, dredges operating in Perak (Kinta Valley) and Selangor recovered only 11,652 piculs of ore (29 percent of the total), but in September, output in the region increased to 110,139 piculs (47 percent of the total) as a result of bringing 22 idle dredges into operation.

Ores imported in 1939 for smelting in Straits smelters included 22,961 tons from Siam, 10,775 from Netherland India, 4,863 from Burma, 2,166 from French Indochina, and 659 from other countries, a total of 41,424 tons.

The report[10] of Sir Lewis Fermor, who was engaged to study the various problems of the mining industry of Malaya, was published in 1939. It is decidedly critical of the Government land policies that have been restricting the development of mining in recent years. Fermor states that far too much blame has been thrown on the mining industry for damage done to agriculture and estimates that soil losses resulting from the clean weeding on rubber plantations greatly exceed those resulting from mining. Moreover, the total area set aside for mining at the end of September 1938 was only 206,433 acres in contrast to 1,623,045 acres for rubber and 4,861,440 acres for Reserved Forests. He estimates that, as a result of the most generous mining policy, further discoveries of mining land in the Federated Malay States will not exceed 200,000 acres, so that the maximum probable withdrawal from agricultural lands, forest and other reserves, and State lands for mining purposes probably will not exceed 2 percent. He therefore recommends a more sympathetic attitude toward mining in considering problems relating to land use, drainage, and irrigation.

The Fermor report also recommends encouragement of private prospecting and Government surveys so that the total mineral reserves of Malaya may be determined. No new estimate of tin reserves is given. The estimate of 1,000,000 tons of tin in existing leaseholds, made in 1937 by H. G. Harris, Senior Warden of Mines, is used as a basis for discussion, to which Fermor adds a "guess" of 500,000 tons for reserves in unleased lands. The report recommends that Malaya should participate in a Fourth International Tin Control Scheme in 1942 but that every effort should be made to obtain an increase in quota commensurate with Malaya's capacity for production. As the tin industry is depleting a valuable national asset, Fermor urges that a portion of the revenues accruing annually from

[9] Ahlfeld, Friedrich, Systematics and Ore Reserves of the Bolivian Tin Deposits: Abstract of report presented at 8th Am. Sci. Cong., May 1940, Washington, D. C., 2 pp.

[10] Fermor, Lewis Leigh, Report upon the Mining Industry of Malaya: Federated Malay States Government Press, Kuala Lumpur, 1940, 240 pp.

the export tax on tin be set aside to build up an amortization fund of $200,000,000, the interest on which will be a source of revenue to the Government after the tin-ore deposits are exhausted.

The report apparently was not received enthusiastically by some Government officials, and recent press dispatches suggest that no official action on Fermor's recommendations will be taken until the war is over.

Burma.—A substantial part of the Burmese tin output comes from tin-tungsten ores. The largest producer is the Mawchi mine, whence tin-tungsten concentrates are shipped to Rainham, England, for treatment by Murex, Ltd.; 5,078 tons of concentrates were produced during 11 months of 1939. During 1939 Mawchi Mines, Ltd., renewed its lease to December 3, 1970. Estimated ore reserves at the Mawchi mine, as of April 30, 1938, were 643,380 tons of 3.24-percent tin and tungsten. The Burmese Government proposes increasing the scale of royalties payable on tin produced in Burma and has submitted the matter to producers for consideration.

Lenya Mining Co. recently launched a new electric dredge for recovering alluvial tin in the mangrove swamps at Yomone, Lower Burma.[11]

China.—The output of tin in Yunnan is about 10,000 tons a year, with little likelihood of a substantial increase for many years, according to S. B. Archdeacon, technical adviser to the Yunnan Provincial Government.[12] Modern methods have been introduced at the mines to some extent, but primitive methods still predominate. The National Resources Commission of the Chinese National Government plans modernization and increased production at the less-advanced mines operated by the Government near Kochiu. About 100 mining companies at Kochiu employ 80,000 to 100,000 miners.[13]

Government control has affected operations at Hong Kong refineries. Restrictions on exports from Yunnan during the last 6 months of 1939 appear to have brought about the closing of the Fung Tang and Sing Lee refineries, as the Chee Hing, Tin Hing, and Wing Hong plants were reported to be the only ones operating early in 1940.[14] Some tin ore from Yunnan is refined in Indochina, but the quantity appears to have declined during the latter part of 1939. Shipments of tin from Kochiu through Indochina for treatment at Hong Kong likewise decreased during that period. Official trade statistics of Burma do not indicate the movement of tin ore over the Burma-Yunnan Highway in 1939.

The tin deposits of Kiangsi, Kwangsi, and Kwangtung Provinces, which in the past contributed about 13 percent of the total annual output of China, are now under Japanese control.

The United States Export-Import Bank has extended a $20,000,000 credit to the Chinese Government to be repaid from proceeds of sales of tin and other materials imported into this country. The transaction does not contemplate the acquisition of tin by the United States Government.

France.—France consumes approximately 9,000 long tons of tin annually, virtually all of which comes from foreign sources. Esti-

[14] American Metal Market, vol. 57, No. 29, February 10, 1940, p. 3.

mated apparent consumption during the first 7 months of 1939 was about 4,600 tons.

Germany.—Statistical details of Germany's tin situation in 1939 are incomplete. Imports of metallic tin for the first 6 months of 1939 were 4,693 long tons compared with 5,816 tons for the same period of 1938. Imports of tin ore for the respective periods were 2,592 tons and 3,513 tons. Apparent consumption (including figures for Austria) for the first 7 months of 1939 was estimated by the International Tin Research and Development Council at 6,649 tons compared with 13,774 tons for the entire year 1938.

Germany's conquest of Czechoslovakia and Poland has increased her dependence on foreign tin, as these two countries in recent years have consumed more than 3,000 tons annually. According to press reports Germany is making every effort to develop production from low-grade deposits within her borders. The Allied blockade greatly reduced receipts of ore and metal from overseas. Wartime control of metal prices was established on October 14, 1939, and the price of pig tin was fixed at 300 marks per hundred kilos.

Italy.—Italy's tin requirements are supplied largely by imports. Apparent consumption totaled 4,618 long tons in 1938 and 2,650 tons in 7 months of 1939. The small domestic output declined in 1939.

Japan.—Japan's consumption of tin, which has increased rapidly in recent years, totaled 9,685 long tons in 11 months of 1939 compared with 10,963 tons in 1938, showing the effect of recent large imports. The Metal Bulletin (London) of February 2, 1940, questions whether these receipts truly reflect Japan's consumption, stating:

> In view of the fact that Japanese consumption is not believed to be equal to these large shipments, it is thought that some of the tin may have been reexported to Europe.

Netherland India.—The permissible export quota of Netherland India for 1939 was 29,779 long tons, including contributions to the Buffer Stock. Actual exports, however, exceeded this figure and amounted to 31,281 tons. Netherland India's share in the Buffer Stock was 2,930 tons, of which the Billiton Co. was allotted 1,196 tons. Banka's production in 1939 totaled 17,544 tons of fine tin and that of Billiton and Singkep, 12,690 tons.

Interest in the proposed merger of the Banka and Billiton operations was revived in 1939. Early in 1937 a bill designed to effect the merger was voted down by the People's Council of Netherland India, the chief objections being the proposed distribution of profits, the financial basis of the merger, and the suggested establishment of the controlling office in the Netherlands. After restudy of the situation, the Colonial Minister in 1939 drafted a new proposal modified to meet in part the Council's objections. The Government share in the new enterprise is to be increased from 90 to 91 percent and will be increased further to 92 percent if the average price of tin during the next 6 consecutive years falls below 1,360 guilders per long ton (32.4 cents per pound at the average 1939 exchange rate of 53.335 cents). In some quarters it was predicted that the new proposal would be approved in 1940, but with the turn of events in Europe in May 1940 official action probably will be postponed indefinitely.

Modernization of operations at Banka continued in 1939. In November it was announced [15] that as a result of further mechanization it will be possible to reduce the number of Chinese employees and substitute Javanese workers with resultant savings in labor costs. Heretofore the Javanese have not proved to be satisfactory industrial laborers because of their inclination to work only for short periods and then lay off to spend their earnings. The Chinese are steady workers, but it has been necessary to import them at considerable expense and under long-term contracts necessitating payment during periods of idleness. Usually 1,000 Chinese are recruited annually in China, but the number is expected to be reduced to 600 in 1940.

The large new Karimata dredge, which was dredging unsuccessfully for ancient lost treasure in the North Sea in 1938, finally arrived at Billiton the latter part of 1939.

Shortly after the outbreak of war in Europe it was reported [16] that the smelters of the Banka organization in Netherland India were capable of treating all Banka ores; however, Banka ores were diverted to smelters in the Straits Settlements after activities at the Arnhem works in the Netherlands were curtailed sharply in the last quarter of the year. Receipts of Banka, Billiton, and Singkep ores in the Straits Settlements in 1939 totaled 10,775 tons, virtually all of which arrived after September 1.

Netherlands.—Smelter production of tin declined sharply in 1939 owing to the drastic reduction in operations at the Arnhem smelter soon after the war started. This resulted from the ban on exports of tin promulgated by the Government in September, and the sharp curtailment of imports of ore from Netherland India and Bolivia caused by the Allied blockade. The Arnhem smelter is situated close to the German border.

Nigeria.—In 1939 Nigeria exceeded her permissible export quota of 8,304 long tons by 2,551 tons. Shipments were greatly accelerated during the last quarter of the year, and the overexport doubtless was due to orders given by the Nigerian Government in the middle of September to ship all available stocks at the earliest possible opportunity.[17] The principal producer is the Amalgamated Tin Mines of Nigeria, Ltd., a 1939 consolidation of Associated Tin Mines of Nigeria, Ltd., and the London Nigerian Tin Mines, Ltd. This company produced 6,121 tons of concentrates in 1939. A possible shortage of gasoline as a result of the war constitutes a threat to tin mining in Nigeria because motor vehicles are used for transportation between mines and railheads. The question of establishing reserve supplies was under consideration in the latter part of the year. In 1938 Nigeria imported 191,000 barrels of gasoline, of which 127,000 barrels were from the Netherland West Indies and 61,000 barrels from the United States.

United Kingdom.—Most of the tin produced in Great Britain is smelted from ores imported chiefly from Bolivia and Nigeria; 36,200 long tons were produced in 1938. In addition to ores, various forms of metallic tin and its alloys are imported, largely from Netherlands and British Malaya. Approximately 2,000 tons of tin are obtained annually from mines and old dumps in Cornwall.

[15] Metal Bulletin (London), June 16, 1939, p. 5.
[16] Metal Bulletin (London), October 13, 1939, p. 5.
[17] Mining Journal (London), vol. 207, No. 5440, November 25, 1939, p. 1000.

Complete statistical data for 1939 are not available, as publication of official figures on foreign trade was discontinued at the outbreak of the war in September. However, the International Tin Research and Development Council estimates apparent consumption at a new peak of 27,279 tons in 1939, an increase of 49 percent over 1938 and 5 percent over the previous record established in 1937. This large gain resulted from the sharp rise in demand for tin plate, production of which advanced 47 percent during the first 8 months of 1939 compared with a similar period in 1938, and the increase in munitions manufacture. In the latter part of the year available supplies of spot tin reached a very low point, causing suspension of all export licenses in October.

The United Kingdom ranks second among the world producers of tin plate, most of which it usually exports. Some tin plate is used in the domestic canning industry, but the domestic pack does not provide enough canned goods to meet home requirements, particularly for fruits. The United States is the principal supplier of canned fruits and shipped about 6,500,000 cases to the United Kingdom in 1939. The first continuous hot-strip mill in the United Kingdom began operations in 1939 at the tin-plate plant of Messrs. Richard Thomas & Co. at Ebbw Vale, South Wales. The plant can produce about 600,000 base boxes of tin plate a week.

Early in March 1939 five large tin-plate manufacturers in Carmarthenshire undertook to work out a program for dealing with excess capacity as a move toward stabilization of the industry. Under one proposal £1,000,000 was to be subscribed for the purchase of obsolete plants; however, many works in South Wales that had been idle as long as 20 years were reopening to meet the demand for tin plate for military purposes and canned goods for storage. Tin-plate production quotas were suspended on June 14 to permit the industry to take care of this extra internal demand. Export quotas remained in force.

During the first 8 months of 1939 the United Kingdom imported 32,071 tons of tin ore and concentrate, of which 21,544 tons came from Bolivia and 4,260 tons from Nigeria. Imports of blocks, ingots, and bars during this period totaled 3,260 tons, of which 1,100 tons were reexported. Exports of tin during the 8 months ended August 31, 1939, totaled 13,345 tons, of which 7,084 tons went to the United States, 589 tons to Canada, and 850 tons to the U. S. S. R. In the same period of 1938 exports were 7,584 tons, of which only 382 tons went to the United States, 476 tons to Canada, and 2,945 tons to the U. S. S. R.

On October 12 it was announced that a trade agreement had been signed with the U. S. S. R. to exchange Soviet timber for British rubber and tin. The tin is to be the product of Cornish mines.[18] The United States proposed to barter its surplus agricultural products for tin and rubber, but the final agreement involved only an exchange of United States cotton and British rubber.

U. S. S. R.—Until recent years production of tin in the U. S. S. R. was negligible. Although reliable statistics have not been available, it has been reported that production began in 1935 and has increased steadily. A recent press dispatch states that about 5,000 tons were produced in 1937 and some 7,000 tons in 1938. Reserves are reported

[18] Mining Journal (London), vol. 207, No. 5434, October 14, 1939, p. 901.

to have been doubled in 1938 as a result of developments in eastern Siberia, the Far East, Ukraine, Caucasus, Urals, Kazachstan, and Kirgisia. These discoveries are said to make it possible for the U. S. S. R. to achieve self-sufficiency in tin. Heretofore it was generally believed that tin deposits in the U. S. S. R. were relatively low grade and refractory from a metallurgical standpoint. New processes are reported to have been worked out for treating the complex ores. The same dispatch described present and proposed tin operations in the U. S. S. R.[19]

In October consummation of an agreement to exchange Russian timber for British tin and rubber was announced.

[19] American Metal Market, vol. 46, No. 245, December 23, 1939, p. 3.

ARSENIC AND BISMUTH

By Herbert A. Franke [1]

SUMMARY OUTLINE

ARSENIC

Production of white arsenic in the United States in 1939 was the highest on record, exceeding that in 1938 by 34 percent and that in 1924 (the previous peak) by 11 percent. Total domestic consumption was the second highest on record (being surpassed only in 1937), but the sale and use of arsenic from domestic sources were greater than ever before. Net imports comprised only 34 percent of the total consumption, as the European war stopped the increasing flow of foreign material. Exports of domestic white arsenic and calcium and lead arsenate, destined chiefly to South and Central America, also broke previous records. The selling price reported by domestic producers of arsenic was the lowest in history, although at New York the official quotations for white arsenic remained at 3 cents per pound in 1939, the same as in 1938. Federal and State Governments fighting grasshopper, Mormon-cricket, and white-fringed beetle invasions and the fruit-spraying industry consumed the largest proportion of white arsenic. Farmers in the South used less calcium arsenate in dusting cotton fields than in recent years.

World production and consumption of arsenic also increased in 1939 over that in 1938.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Salient statistics for arsenic in the United States, 1925–29 (average) and 1936–39

[1] Includes sales by domestic producers for export.
[2] Adjusted for exports by domestic producers.
[3] Complete data not available.
[4] 10,467 pounds in 1925 and 200 pounds in 1929; no imports from 1926 to 1928, inclusive.
[5] Average for 1928–29; exports of calcium arsenate and lead arsenate not separately recorded by Bureau of Foreign and Domestic Commerce prior to 1928.

PRODUCTION

Increased smelter activity in the United States in 1939 effected a 34-percent gain in production of white arsenic (As_2O_3).

The American Smelting & Refining Co. shipped flue, baghouse, and Cottrell dusts, speiss, and other smelter-refinery byproducts containing arsenic for refinement to its Tacoma (Wash.), Murray (Salt Lake City, Utah), and El Paso (Tex.) plants. The Anaconda Copper Mining Co. produced byproduct white arsenic in the treatment of copper ores at its Anaconda (Mont.) smelter, and the United States Smelting, Refining & Mining Co. produced arsenic at Midvale, Utah. In recent years these smelters and refineries have recovered more arsenic per ton of ore treated and more finely divided arsenic than ever before. The increase in recovery is attributed to improvements in plant flue-dust recovery systems and to the higher price received for gold, which permitted the mining of lower-grade gold ore high in arsenious oxide. The finer grain of the product is the result of fine-ore grinding and flotation concentration.

Crude and refined white arsenic produced and sold by producers in the United States, 1935–39

Year	Crude			Refined			Total		
	Production (short tons)	Sales		Production (short tons)	Sales		Production (short tons)	Sales	
		Short tons	Value [1]		Short tons	Value [1]		Short tons	Value [1]
1935	7,583	6,985	$204,681	6,654	5,685	$292,777	14,237	12,670	$497,458
1936	9,937	8,755	266,113	5,442	6,826	352,713	15,379	15,581	618,826
1937	9,936	10,903	290,733	6,878	6,733	250,822	16,814	17,636	541,555
1938	12,619	9,428	264,004	4,066	3,732	129,018	16,685	13,160	393,022
1939	17,499	17,070	343,000	4,842	5,369	152,500	22,341	22,439	495,500

[1] Partly estimated.

Production, as reported by the Bureau of Mines, is measured after the low-grade flue dusts containing 20 to 30 percent As_2O_3 are subjected to a roasting or preliminary refining process. This crude arsenic usually contains 97 to 98 percent As_2O_3. Most of the crude arsenic and a small quantity of better-grade arsenic obtained in certain parts of smelter flue systems are marketed without further refining. Some crude arsenic is refined further. Bureau of Mines statistics on refined arsenic include only products containing 99 percent or more As_2O_3. The arsenic reported as a refined product is not duplicated in the crude arsenic statistics.

CONSUMPTION

Sales of domestic white arsenic advanced 71 percent in 1939, but at a sacrifice in price. Arsenic imported for consumption, however, increased only 3 percent. Apparent consumption (sales plus imports minus approximate exports) of white arsenic in the United States in 1939 totaled 33,913 short tons compared with 25,098 in 1938 and 34,692 in 1937. Net imports represented only 34 percent of consumption in 1939 compared with 48 percent in 1938. However, in addition to white arsenic, other arsenic products were imported for consumption; details are shown in the table of salient statistics at the beginning of this chapter.

Of the domestic arsenic sold, 76 percent was crude and only 24 percent refined. Since 1934 sales of crude arsenic have gained at the expense of the refined product. This condition is attributed to demands by consumers for the lowest-price usable product and to keener competition among producers, who have improved their recovery processes to the point where 97 to 98 percent instead of 93 to 95 percent As_2O_3 is the first crude product. Consumers have become as particular concerning the physical as the chemical specifications, and those outside of the glass industry usually demand a screened product of 200-mesh or finer. The distribution in sales of domestic arsenic in 1939 by uses was approximately as follows: Insecticides, 66 percent; weed killer, 14; glass manufacture, 3; wood preservative, 2; and miscellaneous (including arsenical drugs), 1. Exports comprised 14 percent.

The sale of imported white arsenic by uses was canvassed for the first time in 1939, and reports received from importers accounting for about 47 percent of the imports show that 88 percent of that sold was employed in insecticides, 6 percent in glass, 3 percent in weed killer, 2 percent in wood preservative, and 1 percent in gas-refining, pharmaceutical, and other miscellaneous uses. Minor quantities of foreign arsenic were used in disinfectants and polishing and cleaning soaps; chemical intermediates; colors and printing inks; paints; and steel and other metal manufactures. A third of the arsenic imported contained 99 percent and the remainder 97 to 99.5 percent As_2O_3. Most of the arsenic was consumed by manufacturers on the Atlantic and Pacific seaboards and in Hawaii and a smaller quantity in the Southern States.

No definite data are available on the domestic consumption of arsenical insecticides in 1939. Calcium arsenate consumption is believed to have been below normal (which is about 30,000,000 pounds), because the boll-weevil infestation was severe only in the eastern half of the Southern States and intensive leaf-worm control was necessary only in eastern Texas. Consumption of lead arsenate probably remained about the same as in recent years (about 50,000,000 pounds). Substitution of the rotenone-bearing root poisons and sodium fluoaluminate slightly affected the use of arsenical insecticides, especially those employed on truck crops and to a limited extent on fruit trees. The severe winter of 1939–40 is generally believed to have killed many insects; in consequence, less calcium arsenate should be used in the cotton fields in 1940. Some fruit-growing sections of the United States did not experience a severe winter, and consumption of lead arsenate probably will be about normal.

Federal and State agencies in 1939 extended their war against the grasshopper and Mormon-cricket invasions west of the Mississippi River and the white-fringed beetle menace in the South. The Department of Agriculture bought grasshopper-bait ingredients and shipped them to selected centers, where they were mixed and distributed through State and local agencies to farmers to be spread over their fields. Each ton (2,000 pounds) of grasshopper bait included bran, sawdust, and 10 gallons of liquid sodium arsenite containing 32 percent As_2O_3 or 4 pounds of white arsenic per gallon. Arsenicals used in 1939 by Federal and State agencies totaled 1,536,000 gallons of liquid sodium arsenite for grasshoppers and 84,000 gallons for white-fringed beetles, 338,000 pounds of dry sodium arsenite for Mormon crickets, and 420,000 pounds of calcium arsenate, also for white-fringed beetles. The congressional appropriation for control of incipient or emergency outbreaks of insect pests or plant diseases was reduced from approximately $5,000,000 for the fiscal year 1940 to $2,500,000 for 1941, as an unobligated balance and some insecticidal material remained from the previous year. Although the grasshopper attacks are not expected to be as serious in 1940 as they were in 1939, the Mormon crickets and white-fringed beetles are expected to offer a greater menace than before. It is estimated that in 1940 Federal and State agencies will use 1,170,000 gallons of liquid sodium arsenite in grasshopper bait, 420,000 pounds of dry sodium arsenite in destroying Mormon crickets, and 800,000 pounds of calcium arsenate and 100,000 gallons of liquid sodium arsenite in fighting white-fringed beetles.

Free arsenical drugs distributed by State and Territorial health departments to private physicians and clinics for the control of venereal diseases increased from 2,799,110 doses in the fiscal year 1938 to 4,677,757 in 1939, a gain of 67 percent. Arsenical drugs administered to clinic patients increased 71 percent—from 1,854,735 to 3,166,342 doses.[2] Manufacturers and distributors sold 12,390,837 doses of arsenical drugs in the United States during the calendar year 1939.

Until recently the Army and Navy Munitions Board classed arsenic as an essential material, and it still keeps arsenic under surveillance. Although arsenic is consumed chiefly in insecticides and weed killers, it is used also in the manufacture of "chilled shot," toxic gases, and various alloys. Owing to the present interest in national defense, it seems appropriate to give the following table on production and consumption of white arsenic since 1910.

PRICES

Although domestic quotations for white arsenic at New York remained at 3 cents per pound, packed in barrels, in carlots, throughout 1939, producers actually received much less for their product than heretofore. Sales increased 71 percent in quantity but only 26 percent in value. The average selling value was 1.00 cent per pound for crude and 1.42 cents for refined arsenic, a reduction of 29 and 18 percent, respectively, from 1938. The lower price is attributed to more severe competition existing in a limited market adequately supplied with both domestic and foreign arsenic and to increased deliveries of arsenic in bulk instead of in costly barreled containers. The following table shows the range in prices of various arsenical compounds.

Range of quotations on arsenic and its compounds at New York (or delivered in East), 1938–39, in cents per pound [1]

	1938	1939
Arsenic metal, lump, cases	40.00–41.00	40.00–60.00
White arsenic (As_2O_3), domestic, kegs, carlots	3.00	3.00
Red arsenic (As_2S_2), imported, cases	15.75–16.50	15.75–20.00
Calcium arsenate, wholesale, drums, carlots	6.75– 7.25	6.75– 7.25
Lead arsenate, wholesale, drums, carlots	11.00–13.00	10.00–11.50
Sodium arsenate, wholesale, drums	8.00	8.00
Sodium arsenite, dry, works, drums, white	9.00–13.00	9.00–11.00
Sodium arsenite, dry, works, drums, gray	7.50– 9.50	7.50– 9.50

[1] As reported by Oil, Paint, and Drug Reporter.

The minimum quotations given in the table often are dealers' prices and in some instances were in effect in 1939 only during the first half of the year. Delivered prices for most arsenicals vary in different sections of the United States. The price for arsenic metal rose from 40 to 60 cents (nominal) in September, after which prices ceased to be quoted. Part of the last half of the year no prices were quoted for red arsenic. Both commodities are imported from Europe (no domestic output) and doubtless became scarce as the war affected shipping conditions. In March 1940, a price war between domestic insecticide manufacturers developed, and minimum prices dropped from 11 to 8.5 cents per pound for lead arsenate and from 6.75 to 6 cents for calcium arsenate.

London quotations for white arsenic soared after the outbreak of European hostilities, rising from £12 per long ton to £22 in October 1939 and to £31 in December for Cornish brands (99 percent As_2O_3). Prices for Mexican (99 percent As_2O_3) and Swedish (99.5 percent As_2O_3) grades of arsenic increased from £10 5s–£10 15s. to £18–£20 in October and to £29–£30 in December.

FOREIGN TRADE

Imports of white arsenic in 1939 increased 3 percent over those in 1938 but were 24 per cent less than those received during the peak year 1937. Of the 1939 total, Mexico supplied 55, Sweden 18, France 15, Japan 7, Canada 3, and Belgium 2 percent. Imports from Mexico and Sweden declined 4 and 7 percent, respectively, whereas those from France increased 87 percent. After war was declared in Europe, the increasing flow of arsenic from France stopped, and shipments from Sweden became scarce.

White arsenic imported for consumption in the United States, 1935–39, by countries

Country	1935		1936		1937		1938		1939	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
Australia	56	$2,334	690	$30,500						
Belgium	129	4,450	1,000	30,433	708	$20,373	565	$16,100	323	$10,098
Canada	1,068	65,540	378	25,908	599	48,896	689	29,854	471	24,760
France	2,354	65,609	44	1,419	828	18,838	1,176	30,843	2,200	50,224
Germany	10	906	23	2,213	7	663	112	5,656	(1)	4
Japan	1,058	42,866	887	41,957	798	37,380	482	17,199	963	30,079
Mexico	9,274	525,140	8,174	426,590	11,500	556,097	8,422	415,180	8,124	377,568
Sweden	1,126	30,524	6,390	182,204	4,816	138,617	2,792	93,197	2,593	69,304
	15,075	737,369	17,586	741,224	19,256	820,864	14,238	608,029	14,674	562,037

[1] Less than 1 ton.

Arsenical compounds other than white arsenic appear in the table of salient statistics. Imports of arsenic metal more than doubled those of 1938 but were much less than those of 1937 and the average for 1925–29. Germany supplied 96 percent and France (a new exporter) 4 percent of the metal. Increases in imports also were recorded for the following products: Arsenic sulfide, 172; arsenic acid, 282; calcium arsenate, 307; lead arsenate, 100; and sheep dip, 82 percent. Imports of paris green and London purple decreased 56 percent and of sodium arsenate 37 percent. The 656,498 pounds of arsenic sulfide imported included 336,217 pounds from Belgium, 166,277 from Germany, and 146,386 from France. Of the larger imports of calcium arsenate (1,627,193 pounds), 1,214,050 pounds came from Japan, 260,043 from Belgium, and 153,100 from France.

Domestic producers indicate that about 3,200 tons of white arsenic were sold for export in 1939 compared with 2,300 tons in 1938. Official export data thereon are not available. Exports of calcium and lead arsenate increased 35 percent in 1939 and were larger than ever before. This increase is attributed to larger purchases by South and Central American countries whose European sources of supply were restricted by the war. Of the 6,731,103 pounds of calcium arsenate exported (28 percent more than in 1938), 4,867,580 went to Peru, 653,106 to Mexico, 444,109 to Canada, 286,860 to Brazil, 279,894 to Argentina, 62,936 to Salvador, and 40,000 to Colombia. Of the 1,712,583 pounds of lead arsenate exported (68 percent more than in 1938), 567,845 went to Brazil, 235,050 to Argentina, 200,912 to Chile, 184,352 to the Union of South Africa, 81,710 to New Zealand, 72,305 to Cuba, 60,442 to Canada, 50,724 to Colombia, 47,932 to Australia, 47,549 to Mexico, and 46,725 to Switzerland.

TECHNOLOGIC DEVELOPMENTS

Adding 0.1 percent arsenic has brought about substantial improvements in the lead-tin type wiping solder used to connect joints of lead-sheathed telephone cables. The arsenic-bearing solder forms much less dross and has a finer and more uniform texture than ordinary lead-tin solder.[3]

The production of sodium arsenate from sodium arsenite by electrolysis has been found simple, safe, and economical under certain conditions.[4]

A continuous process for manufacturing arsenic acid (H_3AsO_4) with arsenious oxide (As_2O_3) [5] reduces the consumption of nitric acid. A patent issued to two Swedish inventors [6] simplifies and cheapens the method of manufacturing calcium arsenate, which is usually produced by the reaction of arsenic acid with slacked lime in a suspension in water. In the process covered by the invention, calcium nitrate, the oxidizing agent, and calcium oxide are mixed and heated with arsenious oxide to produce calcium arsenate of any desired composition.

WORLD PRODUCTION AND CONSUMPTION

World output of marketable white arsenic in 1939 is estimated at 58,000 metric tons, a 5-percent increase over that estimated for 1938 (55,000 tons). The increase is attributed to intensified smelter activity, except in Mexico, where production dropped because of depressed mining conditions influenced by Government legislation. Accurate world-production data are not available, because some countries fail to record arsenic statistics and others report only sales or exports.

United States	12,916	13,952	15,253	15,136	20,267
	54,900	55,700	(2)	(2)	(2)

1 Arsenic is also believed to be produced in Czechoslovakia, Peru, Rumania, Turkey, and the U. S. S. R. Production figures are not available for these countries.
2 Data not available. 3 Data not available. Estimate included in total.
4 Arsenic content of ores mined is as follows: 1935, 24,418 tons; 1936, 23,312 tons; 1937, 20,954 tons; and 1938, 21,480 tons.

World consumption of arsenic is estimated to average 55,000 tons annually,[7] of which the larger part is consumed by the insecticide industry. The continued extensive use of arsenic as an insecticide has become endangered by the substitution of certain organic compounds that are less toxic to man than arsenicals (particularly poisonous lead arsenate used on fruit). Consuming countries that import large quantities of arsenic and its compounds include the United Kingdom, Peru, Argentina, Italy, Algeria, Netherland India, the Union of South Africa, Uruguay, and British India. Belgium and Germany, outstanding exporters, import substantial quantities of arsenic-bearing ore. Sweden, Mexico, France, the United States, Japan, and Canada also export considerable white arsenic and arsenical compounds.

Belgium.—The Belgochimie, S. A., 36 rue Ravenstein, Bruxelles, Belgium, produced metallic arsenic in 1939, and the Metallo-Chemical Corporation, 117 Liberty Street, New York, N. Y., was agent for the product in the United States. In 1939 Belgium's imports of arsenic metal totaled 7.6 metric tons (all from Germany) and its exports 5.1 tons. Of the 3,332 tons of white arsenic exported (2,706 in 1938), 1,365 went to the United Kingdom, 549 to the United States, 297 to Brazil, 296 to Argentina, and 253 to Germany.

Canada.—Canada produced 790 metric tons of arsenic (not otherwise specified) in 1939 (987 in 1938) and exported 411 tons (625 in 1938). White arsenic imports totaled 234 tons (91 in 1938). The United States received the 411 tons exported and shipped virtually all of the arsenic imported.

France.—Imports of metallic arsenic during the first 7 months of 1939 totalled 5.2 tons and exports 7.3 tons. Exports of white arsenic during the period totaled 2,494 tons.

7 Roskill & Co., Ltd., O. W., World Economic Review of Insecticides and Allied Products: London, June 1939, p. 41.

Germany.—Of the 1,608 tons of white arsenic imported during the first 7 months of 1939, 1,295 came from Sweden and the rest from Belgium and France. Of the exports in the same period (1,337 tons), 188 tons went to Brazil, 186 to the Netherlands, 169 to Spain, 148 to Hungary, and 118 to Turkey. During the year the Government made available to farmers 5,000 tons of calcium arsenate to fight the potato-beetle menace in western Germany.

Italy.—The S. A. Stabilimenti di Rumianca of Turin, on behalf of the Italian War Ministry, completed a new white-arsenic plant in the spring of 1940. The new works, together with the smaller plant at Pieve Vergonte, will be able to supply all Italian arsenic requirements. Arsenical pyrite from the Val d'Ossola is the raw material.

Mexico.—In 1939 Mexico produced 7,063 metric tons of white arsenic (8,894 in 1938) and exported 6,985 tons (8,854 in 1938). All exports in 1939 were shipped to the United States.

Sweden.—The Bolidens Gruv A.-B. has established several arsenic-salt timber-impregnation plants in Sweden and has begun tests in various parts of the world to prove the advantages of arsenic over creosote in wood preservation.

United Kingdom.—In recent years Cornish tin mines have produced less than 200 tons of white arsenic annually, and it has been necessary to import most of the British requirements (chiefly from Sweden, Belgium, and Mexico). After war was declared, consumers found it difficult to obtain adequate supplies, and arsenic prices more than doubled.

BISMUTH

Consumption of bismuth in the United States is believed to have increased substantially in 1939. Lack of complete data on production, sales, exports, and stocks makes it impossible to determine domestic consumption of bismuth accurately. Ordinarily, output of byproduct bismuth exceeds consumption by the pharmaceutical and alloy industries, but in 1939 greater demand forced producers to withdraw metal from their ample stock piles. Although imports of bismuth gained 98 percent, receipts of bismuth compounds and salts declined 85 percent. After the outbreak of the European war in September 1939 publication of unofficial data on bismuth exports ceased. During the first 8 months of 1939, however, exports gained almost 40 percent over those in all of 1938. The New York and world price for the metal rose in March 1939 from $1.05 to $1.10 per pound and in October 1939 to $1.25. Manufacturers of certain bismuth compounds and salts advanced their prices accordingly in October.

The general increase in smelter activity in 1939 brought about an increase in world production of bismuth. Demand for bismuth in Europe showed marked improvement during the last half of 1939, and world consumption is estimated to have risen about 30 percent. Part of the increased demand abroad probably can be ascribed to the stocking of metal for national defense and against possible further advances in price. The price increase in October is attributable to differences in the world monetary exchange, to the greater demand for bismuth, and to wartime shipping conditions which made some supplies unavailable. After European hostilities began, it is probable that German production, consumption, and exportation of bismuth were severely curtailed. The loss of export trade was advantageous to English, French, and American salt makers, who acquired a large share of the world business.

PRODUCTION

As heretofore, there were three domestic producers of bismuth in 1939. The American Smelting & Refining Co. produced bismuth-lead alloy at its Selby (Calif.), Perth Amboy (N. J.), and Monterrey (Mexico) plants for refinement at Omaha, Nebr. The Kroll-Betterton process [8] employed in lead debismuthization uses calcium, magnesium, and sometimes antimony. The Anaconda Copper Mining Co. obtained bismuth from Montana copper and Utah lead ores. However, the final bismuth recovery was made by the International Smelting & Refining Co. at East Chicago, Ind., which refined Tooele lead-bismuth bullion by the Parkes and Sperry methods and recovered bismuth from the slimes by a process involving various patents. The United States Smelting, Refining & Mining Co. shipped a lead-bismuth bullion from Midvale to the United States Smelting Lead Refinery, Inc., at East Chicago, Ind., where slimes from the Betts electrolytic process were treated for their bismuth content. The Cerro de Pasco Copper Corporation also supplied a substantial part of domestic bismuth requirements in 1939, importing metal derived from copper-lead ore in Peru.

In March 1940 the Bunker Hill & Sullivan Mining & Concentrating Co. began operating a new $500,000 plant for the production of bismuth and antimony, which was added to the lead smelter-refinery at Kellogg, Idaho. The installation was necessitated by impairment of the quality of lead produced by the former pyrometallurgical process, which failed to remove all the bismuth. By means of the new Lee-Muir process hydro-, pyro-, and electro-metallurgy are used to separate the silver, copper, antimony, and bismuth in the tetrahedrite ore from the Big Creek silver belt of the Coeur d'Alene district.

CONSUMPTION

Domestic consumption of bismuth is believed to have advanced in 1939 to approximately 500,000 pounds. Probably 90 percent of the metal was used by manufacturers of pharmaceutical and medicinal compounds, salts, and mixtures and the rest by the metallurgical industry.

The principal bismuth compounds employed by the pharmaceutical trade included bismuth subcarbonate, used in antiacid or stomach remedies and in preparing patients for X-ray examinations; bismuth subnitrate, used in antiacid compounds, dusting powder, and in treating venereal diseases; bismuth subgallate, used to soothe intestinal disorders; and bismuth subsalicylate, used in treating venereal diseases and intestinal troubles. Other compounds included bismuth citrate, nitrate, sulfide, trioxide, betanaphthol, etc. In 1939 a stable alkali metal bismuth saccharate solution was invented (U. S. patent 2,178,126, issued on October 31, 1939, to C. W. Sondern and G. O. Doak) for intramuscular injection in conjunction with the treatment of syphilis.

The outstanding metallurgical characteristic of pure bismuth metal is its property of expanding 3.32 percent in cooling from the liquid to the solid state. This property, together with its low melting point and the even lower melting point of the alloys of which it forms a part, constitutes the basis for important industrial uses.[9] Low-melting-point and nonshrinking bismuth alloys have numerous applications, and in 1939 the use of bismuth in the metal-products-manufacturing industry continued to advance slowly but steadily. Fusible boiler, sprinkler, and other safety plugs and devices, low-melting solders, dental models, and tempering baths for small tools and parts employed bismuth alloyed with lead, tin, cadmium, mercury, or antimony. An alloy containing 55.5 percent bismuth and 44.5 percent lead changes very little in volume and was used extensively for duplicating patterns, for making master patterns in foundries, and for proof-casting forging dies. Bismuth alloys were employed as thin-walled tube fillers for bending and forming work; as castings for use in making molds for plastics, rubber, seamless hollow objects, and die castings; as matrices for the accurate location and setting of parts of complex punches and dies for forming and cutting operations and for similar machine- and stamping-shop accessories; and as oil-, air-, and water-tight seals between dissimilar materials, such as glass and copper or brass. The Ekko process, developed by the United States Rubber Co. for producing dies or molds in which a photographic likeness can be transferred to iron by the electroforming method, is expected to provide a larger outlet for the bismuth-lead alloy "cerrobase." The use of bismuth in low-melting solders is expected to increase further as a result of experimental work.

PRICES

In March 1939 the New York quoted price for bismuth metal was increased from $1.05 to $1.10 per pound for ton lots, and in October 1939 the price was advanced further to $1.25 per pound, according to Engineering and Mining Journal Metal and Mineral Markets. At the same time, London quotations per pound increased from 4s. 3d. to 4s. 6d. and then to 6s. 3d. for 5-hundredweight lots. According to the Oil, Paint, and Drug Reporter, the minimum price for bismuth subcarbonate increased from $1.53 per pound at the beginning of 1939 to $1.73 (fiber drums) at the end of the year, subnitrate from $1.33 to $1.48, and subgallate from $1.58 to $1.68, but the price for subsalicylate remained at $2.35 until January 1940, when it advanced to $2.50.

FOREIGN TRADE

Imports of bismuth metal in 1939 were the greatest since 1912 (182,840 pounds) and exceeded those of 1938 by 98 percent. The entire 182,832 pounds imported were from Peru. Imports of compounds, mixtures, and salts of bismuth declined 85 percent, indicating the effect of the war on Germany, normally the largest exporter to the United States. France shipped the largest quantity in 1939, supplying 250 pounds valued at $107, but imports from Germany continued highest in value, totaling 28 pounds valued at $406. Bismuth also is imported as lead-bismuth alloy and possibly in other

intermediate metallurgical products, statistical data for which are not available.

Official export data on bismuth are not separately recorded, but until the outbreak of European hostilities in September the Oil, Paint, and Drug Reporter published shipments from Atlantic and Gulf ports. For the first 8 months of 1939 these shipments totaled about 314,100 pounds, an increase of almost 40 percent over those reported for all of 1938 (225,600 pounds). Bismuth exports probably set a new high record in 1939. Most of the bismuth exported is destined to British and French ports.

Bismuth and "compounds, mixtures, and salts of bismuth" imported for consumption in the United States, 1935–39

Year	Bismuth		Compounds, mixtures, and salts of bismuth	
	Pounds	Value	Pounds	Value
1935	102,051	$78,061	871	$4,798
1936	113,443	86,722	564	4,807
1937	67,225	54,007	3,145	9,117
1938	92,298	74,583	2,004	3,387
1939	182,832	154,339	297	649

WORLD PRODUCTION AND CONSUMPTION

Lack of data makes it difficult to estimate accurately world production and consumption of bismuth. As a result bismuth statistics are somewhat confused. Another factor to be considered in connection with production of bismuth metal is the intermittent operation of bismuth-refining plants. Bismuth residue or concentrates recovered in lead and copper smelters or as byproducts in other nonferrous-metal plants often are not refined the same year but are held until metal stocks become low. Thus, the official data on bismuth production that are available do not necessarily present the actual trend in output by years. Increased smelter output resulted in greater world production of byproduct bismuth in 1939—possibly in excess of 3,000,000 pounds. Of this production, the United States, Peru, Canada, and Mexico supplied almost 90 percent. The rest came from Bolivia, Spain, Argentina, Japan, Belgium, France, Germany, and other countries. Production of bismuth ore from scattered operations in China and elsewhere was handicapped by unfavorable shipping conditions caused by the wars.

European consumption of bismuth is estimated at 1,500,000 pounds in 1938 and 2,000,000 pounds in 1939 and world consumption at about 2,600,000 pounds (2,000,000 in 1938). Perhaps part of the gain in world demand in 1939 was due to stocking for national defense and against a possible increase in price. Substantial quantities of bismuth were withdrawn from producers' stocks in 1939; however, it is believed that with the increased output the large stocks that have accumulated were only slightly reduced. The industry wishes to maintain adequate stocks to prevent a "run-away" price market, such as occurred during the World War. The stabilization of bismuth prices in recent years is due largely to the World Bismuth Cartel and has resulted in a slow but steady increase in world consumption of bismuth, especially its alloys. A great advance in price not only would decrease use of the metal but also would foster output from sources other than the present smelter byproduct production, which now is greater than consumption. Considerable metal doubtless could be obtained from ores valued chiefly for their bismuth content, such as those in Bolivia. However, it is believed that metal cannot be recovered from these ores at the present price level, which must be maintained if consumption is to advance.

North America.—In 1939 Mexico produced 360,859 pounds of bismuth (409,612 in 1938). In Canada the Consolidated Mining & Smelting Co. at Trail, British Columbia, produced 409,449 pounds of bismuth in 1939. The output of Canada in 1938 was only 9,516 pounds. Canadian imports in 1939 included 10,252 pounds of bismuth metal (only 297 in 1938), all of which came from the United States.

South America.—In Peru the Cerro de Pasco Copper Corporation produced 886,320 pounds of refined bismuth (482,382 in 1938), 89,820 pounds of bismuth-lead bullion (containing 71,620 pounds of bismuth), and 79,180 pounds of eutectic alloy (containing 43,940 pounds of bismuth). Peru exported 848,182 pounds of refined bismuth in bars (454,657 in 1938) and 171,385 pounds of bismuth in lead (49,955 in 1938). The metal content of Bolivian bismuth concentrates exported in 1939 totaled 28,660 pounds (42,316 in 1938). Bismuth concentrates containing 40 to 48 percent bismuth were shipped from the Province of Cordoba, Argentina. Pegmatite dikes worked at São José de Brejaúba, Municipality of Ferros, Minas Geraes, Brazil, for their semiprecious stones (beryl and aquamarine) contained isolated bodies of metallic bismuth and bismuth carbonate. Bismuth occurs in the copper-ore deposits in the Pedra Branca region, Paraíba, and Rio Grande do Norte, Brazil.
