Thorazine* and one-half the usual amount of obstetrical premedication **“produced good amnesia-analgesia without deleterious effect on mother and baby in all 290 cases studied.”**

—Schaffer, A.L.: Am. J. Obst. & Gynec. 71:1247 (June) 1956.

In obstetrics ‘Thorazine’ reduces apprehension and excitement; reduces the amounts of premedicaments, thus minimizing the risk of narcotized babies; and controls vomiting in all stages of labor. A smoother labor and delivery results.
