FOREWORD

This annual publication of the Bureau of Mines is more than a mere compilation of economic and statistical information. It is a measure of the basic strength of the Nation's industrial structure, for the ebb and flow of mineral commodities through a country's economic arteries are reliable indications of its industrial vigor and progress.

The year 1946, the first postwar year, was a time of transition—a period of reconversion—when the inordinate requirements of war gave way to the pent-up demands of domestic consumers. This changeover from a wartime to a peacetime economy is reflected in the statistics presented in each of the individual commodity chapters.

The Minerals Yearbook for 1946 chronicles in detail this first year of transition and provides information which is of value to America's businessmen, labor leaders, educators, Government executives and legislators, and others who share in charting our national course.

The Bureau of Mines deeply appreciates the assistance of the minerals industry in providing information for this volume and also wishes to acknowledge the help of the many State geologists who cooperated in compiling production data.

JAMES BOYD, *Director.*

INTRODUCTION

Compilation of Minerals Yearbook, 1946, was carried on in conformity with standards adopted for preceding issues in the series. A few changes in make-up will be noted, particularly the alphabetization of chapters, the substitution of more readable Sans Serif type for Century type in principal headings, and the use of bolder type in side headings and table headings. Publication of the bound volume was delayed by arbitrary reductions in staff and by an increased number of special assignments, particularly in regard to Marshall Plan and Munitions Board studies.

The entire volume was assiduously reviewed for statistical accuracy and consistency by John Hozik, statistical editor, who in addition authored the keystone chapter—Statistical Summary of Mineral Production. Mabel E. Winslow, of the Office of Minerals Reports, with the assistance of Anna B. Brown, edited the entire manuscript (particularly for grammar and style), applied type specifications, and prepared the exhaustive index. Louis F. Perry, of the Office of Minerals Reports, and Adelaide B. Palmer, of the Economics and Statistics Division, were responsible for preparation of the charts. K. Joyce D'Amico rendered considerable assistance to the statistical editor in reviewing manuscripts and preparing statistical tables.

Development and execution of the publishing program were greatly facilitated by the friendly and competent advice of H. D. Keiser, former editor of Minerals Yearbook, and by John H. Ady, Chief of Publications of the Interior Department and liaison officer between the Department and the United States Government Printing Office. Review of the Uranium and Thorium chapter by J. H. Rush, secretary, Federation of American (Atomic) Scientists, is much appreciated.

Minerals Yearbook can be published only as a result of the detailed information supplied by mining companies, trade associations, business magazines, scientific journals, Government agencies, and countless individuals. Notable is the cooperation received from the United States Department of Commerce, which provided data on foreign trade; the United States Department of State, which supplied information on foreign production; and the various States that have executed cooperative agreements with the Bureau. Under these agreements, producers and consumers of minerals complete but one set of inquiries, and the State officials are given the detailed information supplied to the Bureau of Mines by respondents in their respective States. State agents cooperating in the 1946 canvass were:

Alabama: Walter B. Jones, State geologist, University.
Florida: Herman Gunter, director, Florida Geological Survey, Tallahassee.
Georgia: Garland Peyton, director, Division of Mines, Mining and Geology, Atlanta.
Illinois: M. M. Leighton, chief, and Douglas F. Stevens, research associate, State Geological Survey Division, Urbana.
Iowa: A. C. Trowbridge, director, Iowa Geological Survey, Iowa City.
Kansas: Raymond C. Moore, director, and John C. Frye, assistant director, State Geological Survey of Kansas, Lawrence.

Maryland: Joseph T. Singewald, Jr., director, Department of Geology, Mines and Water Resources, Baltimore.
Michigan: Gerald Eddy, State geologist, Geological Survey Division, Lansing.
Missouri: Edward L. Clark, State geologist, Rolla.
New Hampshire: T. R. Myers, geologist for State Planning and Development Commission, Durham.
New Jersey: Meredith E. Johnson, State geologist, Trenton.
New York: John G. Broughton, acting State geologist, Albany.
North Carolina: Jasper L. Stuckey, State geologist, Raleigh.
Oklahoma: Robert H. Dott, director, Oklahoma Geological Survey, Norman.
South Dakota: E. P. Rothrock, State geologist, Vermillion.
Texas: John T. Lonsdale, director, Bureau of Economic Geology, Austin.
Utah: Aaron W. Tracy, chairman, State Department of Publicity and Industrial Development, Salt Lake City.
Virginia: William M. McGill, State geologist, and Linwood H. Warwick, junior executive, Virginia Geological Survey, Charlottesville.
Washington: Sheldon L. Glover, supervisor, Division of Mines and Mining, Olympia.
West Virginia: Paul Price, State geologist, Morgantown.
Wisconsin: E. F. Bean, State geologist, Madison.

In addition, B. D. Stewart, Department of Mines, Juneau, Alaska, and Walter W. Bradley, State mineralogist, San Francisco, Calif., assisted in the compilation of statistics for Alaska and California, respectively.

It is desirable to acknowledge the work of the statistical analysts and others in the Economics and Statistics Division who were of major assistance to authors in compiling the statistics appearing in various chapters. Those engaged on such work in the Washington, D. C., offices of the division were Charlotte R. Buck, Leon W. Geyer, Annie L. Marks, Robert C. Morris, Virginia M. Oliver, Carribel Rockwell, and Virginia E. Wrenn; in the Los Angeles, Calif., office, Edward T. Knudsen; in the San Francisco, Calif., office, Opal Y. Sharman; in the Denver, Colo., office, Helen G. Post, Florence H. Scott, and Tressa B. Westall; in the College Park, Md., office, Edith E. den Hartog and Helen P. Mackall; and in the Salt Lake City, Utah, office, Alice Feltch, Virginia Halverson, LaRu T. Shepherd, and Edna P. Wolfgramm.

MINERAL production in the United States attained a record value of $8,859,000,000 in 1946. The volume of production was third only to that in 1944 and 1945 and was kept from an all-time high by work stoppages in key industries during the spring. Consumption of petroleum, fertilizers, and building materials was at high levels, but usage of the metals in 1946 declined as compared with 1945. The average increase in prices of minerals during 1946 was 10 percent, which was less than for most other commodities. The availability of manpower in the mineral industries in 1946 equaled demand for the first time in several years. The safety record receded during the year, but the fatality rate was the lowest on record.

The Congress enacted two significant laws that have important effects on the mineral industry: Strategic and Critical Materials Stock-Piling Act (July 23, 1946) and the Atomic Energy Act of 1946 (August 1). Government allocation controls were maintained during 1946 on only four mineral products—steel, tin, antimony, and uranium. Government price controls on minerals were relaxed progressively during the first 10 months of the year and were removed entirely November 10, 1946.

[1] In this volume the term "billion" is equivalent to 1,000,000,000.

PRODUCTION

Value of Production.—Mineral output in the United States in 1946 reached a record value of $8,859,000,000, an increase of 9 percent over 1945 and 5 percent over the previous peak of 1944. The record comprised a 10-percent increase in value of mineral fuels in 1946 compared with 1945 and an 8-percent decline in metals that was more than offset by a 37-percent increase in nonmetallic minerals (other than fuels). Of the three major groups in 1946, fuels were valued at $5,725,000,000 (65 percent of the total), other nonmetallics $1,311,000,000 (15 percent), and metals, $1,823,000,000 (20 percent).

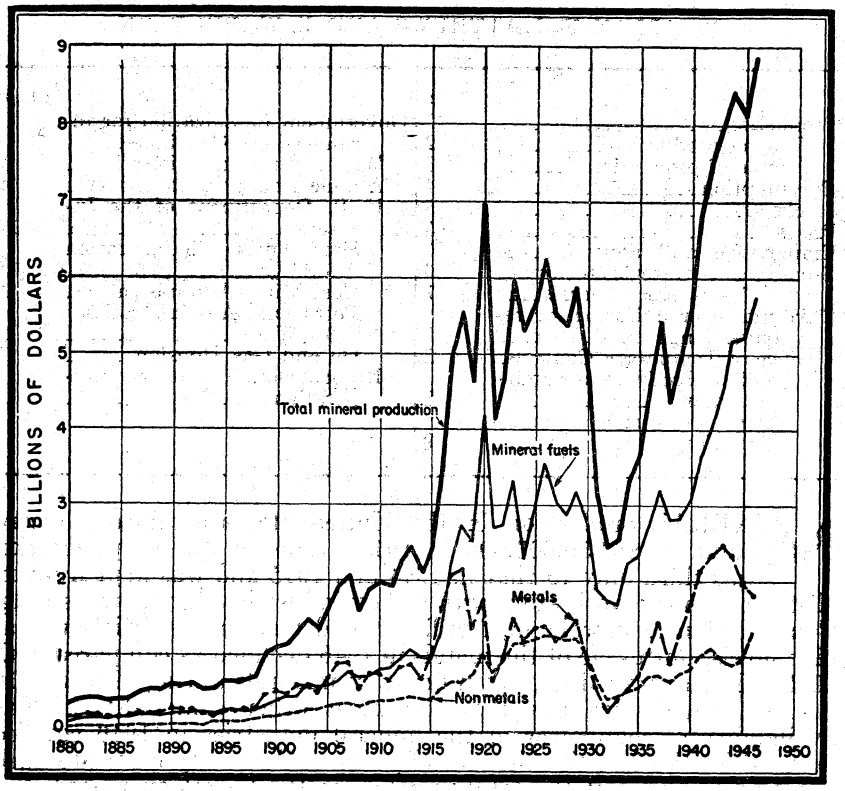

FIGURE 1.—Trends in value of mineral production in the United States, 1880–1946.

The 9-percent increase in value of mineral output in 1946 compares with a 14-percent increase in gross farm income, a 4-percent decrease in gross national product, and a 3-percent decrease in national income. This comparison is based on Bureau of Agricultural Economics reports on gross farm income ($25,432,000,000 in 1945 and $28,933,000,000 in 1946) and on Bureau of Foreign and Domestic Commerce reports on gross national product ($213,120,000,000 in 1945 and $203,679,000,000 in 1946) and national income ($182,808,000,000 in 1945 and $178,204,000,000 in 1946). Of the 178-billion-dollar national income in 1946, 3.1 billion (as computed by the Bureau of

Foreign and Domestic Commerce) was contributed by the mining industry, 5.9 billion by iron and steel, and 4.7 billion—in three approximately equal shares—by nonferrous metals, products of petroleum and coal, and stone, clay, and glass products.

Volume of Production.—Declines in the physical volume of production in 1946 compared with 1945 were 2 percent for minerals, 1 percent for agricultural products, and 16 percent for industrial products (manufactures and minerals), according to the Federal Reserve Board. The Board's index of mineral production (1935–39=100) was 134 in 1946—exceeded only by 137 in 1945 and 140 in 1944. The annual average for 1946 was held to 134 principally as a result of the concurrence of coal, iron-ore, and nonferrous-smelter strikes in April and May, causing the monthly index to drop to 104 and 115, respectively. The average of the other 10 months of the year was 141—a higher level than any yearly average to date. Furthermore, a record monthly high of 146 was reached in July and September 1946, surpassing the previous peak of 143 in May and September–November 1944.

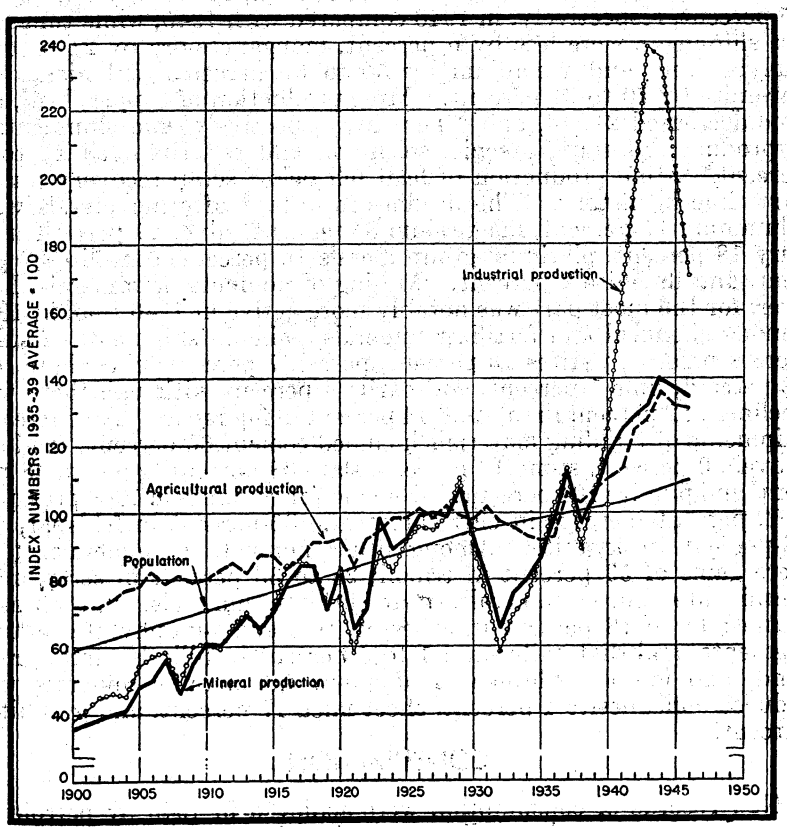

FIGURE 2.—Comparison of growth of physical volume of mineral production with that of agricultural and industrial production and population, 1900–46.[2]

[2] The following indexes have been used: Volume of farm production, U. S. Department of Agriculture; mineral production, 1900–1918, Warren Persons' Forecasting Business Cycles; mineral production of 1919–46 and industrial production, Federal Reserve Board; total population of the United States, Bureau of the Census.

Notwithstanding a decline in total production of minerals, new output records were established in 1946 by a number of nonmetallic minerals. Of the fuels, new peaks were recorded for petroleum, natural gas, natural gasoline, and fuel briquets. The chemical and fertilizer minerals sulfur, potash, and phosphate rock and the ceramics minerals clay, feldspar, aplite, olivine, and zircon also reached new highs in 1946, as also did carbon black, slate, talc and pyrophyllite, barite, rutile, and peat.

The volume of bituminous coal produced in 1946 declined 8 percent from that of 1945 as a result of strikes, but the output of anthracite increased 10 percent, crude petroleum 1 percent, natural gas 4 percent, and natural gasoline and related products 3 percent. Production of all ores and metals declined in 1946, except for increases in zinc-lead ore of 3 percent, dry and siliceous gold and silver ore 51 percent, gold 57 percent, beryl 156 percent, and rutile 3 percent. Even these gains (except for rutile) were largely restitutions of decreases in 1945 from 1944. Iron ore, pig iron, and ferro-alloys output declined 20, 16, and 15 percent, respectively, in 1946 compared with 1945, while tungsten-ore shipments were less by 6 percent, manganese-ore by 21 percent, molybdenum and vanadium by 50 to 57 percent, and nickel and chromite by 70 to 71 percent. Mine production of copper, lead, and zinc decreased 21, 14, and 6 percent, respectively, and shipments of byproduct cadmium, arsenic, selenium, and tellurium fell 23 to 50 percent. Mine production of lead fell below scrap recovery for the first time in history. The declines in output of other metals were: Aluminum 17 percent, magnesium 84 percent, silver 27 percent, mercury 18 percent, platinum-group metals 10 percent, tantalite 37 percent, and ilmenite 8 percent. Mining of nonmetallic minerals, however, for the most part was notably more active in 1946 than in 1945. Among chemical and fertilizer minerals, gains in shipments of sulfur were 8 percent, pyrites 13 percent, potash 7 percent, phosphate rock 18 percent, lime 1 percent, and barite 4 percent, although there were declines of 2 percent in salt and 14 percent in fluorspar. The increased shipments of building materials included cement 60 percent, sand and gravel 30 percent, stone 17 percent, slate 38 percent, gypsum 48 percent, and pumice 104 percent. Demand for ceramics in 1946 prompted a 62-percent increase in clay shipments, 36-percent in feldspar, and 38-percent in kyanite. Among other nonmetallic minerals, there were gains of 59 percent in tripoli; 23 to 33 percent in scrap mica, vermiculite, boron minerals, peat, lithium minerals, and abrasive garnet; 14 to 18 percent in asbestos, talc and pyrophyllite, natural pigments, and diatomite; and 1 to 4 percent in fuller's earth, greensand, and iodine. Shipments of a few nonmetallic minerals were reduced—magnesite 4 percent, sheet mica 17 percent, and graphite 9 percent.

CONSUMPTION

New records of consumption were achieved in 1946 by petroleum, natural gas, natural gasoline, potash, phosphate rock, titanium, barite, and carbon black. Consumption of bituminous coal declined 11 percent in 1946 compared with 1945, but that of anthracite increased 4 percent, crude petroleum 1 percent, natural gas 5 percent, and natural gasoline (including liquefied petroleum gases) 3 percent.

Industrial consumption of gold gained 41 percent and of titanium 5 percent, but usage of other principal new metals declined—pig iron 15 percent, copper 2 percent, lead 17 percent, zinc 6 percent, aluminum 42 percent, magnesium 78 percent, silver 31 percent, and molybdenum 54 percent. Consumption of cement and clay in 1946 increased about 60 percent, sand and gravel 30 percent, stone 17 percent, phosphate rock 15 percent, potash 7 percent, and lime 1 percent. Indicated consumption of sulfur and salt, on the other hand, dipped 2 percent.

STOCKS

Producers increased their stocks of anthracite 93 percent, phosphate rock 43 percent, and potash, lead, and molybdenum 11 to 15 percent during 1946, whereas they decreased stocks of aluminum 64 percent, copper 26 percent, zinc 31 percent, cement 33 percent, and sulfur 6 percent. Producers and consumers of pig iron depleted their inventories 26 percent. Consumers of bituminous coal, copper, and zinc built up their stocks 3, 9, and 28 percent, respectively, but lead consumers used up 59 percent of their stocks during 1946. Government holdings of strategic minerals by the Office of Metals Reserve were largely liquidated—partly by sales to industry and partly by transfers to the Bureau of Federal Supply in accordance with the Strategic and Critical Materials Stock-Piling Act.

PRICES

Mineral prices advanced 10 percent in 1946, according to the Bureau of Mines index of producers' realizations on 24 minerals that represented about 96 percent of the total value of United States mineral production. As a group, fuels showed the greatest price increase—12 percent; metals were up 9 percent, and nonmetallics (other than fuels) 6 percent. Of the 24 major minerals, average prices were lower in 1946 than in 1945 for natural gasoline, ferro-alloys, and clays, and they were essentially unchanged for sulfur (domestic sales), aluminum, magnesium, gold, and molybdenum. The most pronounced increases in average prices were 27 percent for lead, 20 percent for copper, about 15 percent for petroleum, anthracite, and silver, and some 10 percent for bituminous coal, pig iron, lime, and phosphate rock. The average value of anthracite at mines in 1946 was the highest on record, as also was the New York price of lead at the end of the year. The price of copper rose above that of aluminum for the first time in history

Weighted average price index of 24 major mineral commodities, 1941–46

[1940=100]

	1941	1942	1943	1944 [1]	1945 [1]	1946 [2]
Minerals (all groups)	109.4	114.7	119.7	122.7	125.3	138.0
Metals [3]	109.2	114.2	117.1	118.0	120.9	132.0
Mineral fuels	110.7	116.2	122.6	126.9	129.5	144.4
Nonmetals (other than fuels)	103.1	108.8	112.0	113.7	115.4	122.2

[1] Revised figures.
[2] Subject to revision.
[3] Includes bonus payments on copper, lead, and zinc after 1941.

in November 1946, and by the end of the year stood about 30 percent higher. Even the price of secondary aluminum exceeded (in December) the price of virgin aluminum!

The Bureau of Labor Statistics index (1926=100) of wholesale prices for all commodities rose 14 percent from 105.8 in 1945 to 121.1 in 1946, and for farm products alone 16 percent from 128.2 to 148.9. The indexes for various minerals and mineral products in 1945 and 1946, respectively, were as follows: Bituminous coal, 123 and 133; coke, 133 and 140; anthracite, 99 and 109; petroleum and products, 64 and 68; gas, 78 and 81; iron and steel, 99 and 110; structural steel, 107 and 118; nonferrous metals, 86 and 100; fertilizer materials, 82 and 87; cement, 99 and 104; brick and tile, 112 and 123; paint and paint materials, 107 and 119.

The inflationary trend of increasing prices in 1946 was checked to some extent by Government price control during the first 10 months of the year. However, price control on all commodities (except sugar and rice) was terminated effective November 10, 1946, by retroactive order of Paul A. Porter, Price Administrator, dated November 12.

EMPLOYMENT AND SAFETY

Supply of manpower in the mineral industries in 1946 equaled the demand for the first time since 1942. Average employment increased from 636,475 in 1945 to about 674,700 in 1946 (exclusive of workers in the petroleum and natural-gas industries). Of the 1946 total shown, 68 percent represents men in coal mines, 13 percent in quarries and other nonmetal mines, 10 percent in metal mines, 6 percent in metallurgical plants, and 3 percent in coke plants.

Despite the 6-percent increase in average number of men working in 1946 compared with 1945, there was a 7-percent decrease in man-hours worked, reflecting work stoppages—principally at coal and metal mines and coke and metallurgical plants. The average number of days worked by the mineral industries was 273 in 1945 and 244 in 1946. The only departure from the general trend among major groups was by quarries, which were worked 264 days in 1945 and 270 in 1946. The average length of shift in the extractive industries was 8.42 hours in 1945 and 8.29 hours in 1946.

The safety record of the mineral industries receded in 1946, and the frequency of injuries increased from 52.6 per million man-hours of work in 1945 to 55.4 in 1946. Fatality experience was improved, however; both the total of 1,161 fatalities and rate of 0.85 per million man-hours in 1946 were the lowest on record. The number of nonfatal injuries—74,425—was lower; but, owing to the reduced worktime, these injuries occurred at a somewhat higher rate. A principal factor in the retrogression of mine safety during 1946 was incomplete training in safe job methods for the experienced men shifted into new occupations and for the new and inexperienced workers hired as the labor force was expanded.

GOVERNMENT STRATEGIC STOCK PILE

During the first half of 1946, Government strategic stock-piling activities were confined entirely to the transfer of surplus materials to the stock pile. The transfers were made pursuant to Surplus

Property Administration Regulation 17 (November 16, 1945), implementing Section 22 of the Surplus Property Act of 1944. Expenditures during the first half totaled $227,782, of which $197,926 was for the transfer of surplus materials, $9,681 for handling previously purchased materials, and $20,175 for administration.

Activities during the second half were determined largely by passage of the Strategic and Critical Materials Stock-Piling Act July 23, 1946. (The text of the act was quoted in its entirety in Minerals Yearbook, 1945, pages 14–17.) Expenditures during the second half of 1946 totaled $1,270,938, of which $440,540 was expended for materials, $768,512 for freight, handling, storage, and inspection, and $61,886 for administration.

As of August 1946, the stock-piling program included 31 materials—mineral, animal, and vegetable. Procurement plans at that time omitted 9 materials because relatively large quantities were already in the stock pile or anticipated as a result of transfer of surplus property. An additional 23 materials were omitted because procurement at the time would have interfered with the concurrent needs of industry.

Strategic and critical materials are defined by the Munitions Board as "those materials required for essential uses in a war emergency, the procurement of which in adequate quantities, quality, and time is sufficiently uncertain for any reason to require prior provisions for the supply thereof." The strategic list, determined by the Munitions Board as of the end of 1946, included the following mineral products in group A—those strategic and critical materials for which stock-piling is deemed the only satisfactory means of insuring an adequate supply for a future emergency:

Antimony
Asbestos:
  Chrysotile
  Amosite
Bauxite
Beryl
Bismuth
Cadmium
Celestite
Chromite:
  Metallurgical grade
  Refractory grade:
    Rhodesian origin
    Other origin
Cobalt
Columbite
Copper
Corundum
Diamonds, industrial
Graphite:
  Amorphous lump
  Flake
Iodine
Jewel bearings:
  Instrument jewels (except V jewels), sapphire and ruby V jewels, watch and timekeeping device jewels
Kyanite
Lead
Manganese ore:
  Battery grade
  Metallurgical grade
Mercury
Mica:
  Muscovite block and film (good stained and better)
Mica—Continued
  Muscovite splittings
  Phlogopite splittings
Monazite
Nickel
Platinum-group metals:
  Iridium
  Platinum
Quartz crystals
Rutile
Sapphire and ruby
Talc, steatite, block or lava
Tantalite
Tin
Tungsten
Vanadium
Zinc
Zirconium ores:
  Baddeleyite
  Zircon

Group B mineral products—"practicable for stock-piling, but recommended for acquisition only to the extent available for transfer from Government agencies because adequacy of supply can be insured either by stimulation of existing North American production or by partial or complete use of available substitutes"—on the strategic list at the end of 1946 were: Aluminum, barite, English chalk, chemical-grade chromite, natural cryolite, diamond dies, emery, acid-grade and

metallurgical-grade fluorspar, crystalline graphite fines, magnesium, muscovite block (stained and lower) and phlogopite block mica, molybdenum, platinum-group metals—osmium, palladium, rhodium, and ruthenium—selenium, and ground steatite talc.

Group C mineral products—not now recommended for stock-piling—on the strategic list at the end of 1946 were: Canadian chrysotile asbestos, optical glass, iron ore, petroleum and petroleum products, radium, iron and steel scrap, and uranium. Uranium had been omitted from previous strategic lists for reasons of security; it was added to group C rather than group A because it was not entirely clear which Government agency would be responsible for its stock-piling.

GOVERNMENT ORGANIZATION FOR RECONVERSION

Office for Emergency Management.—Within the framework of the Executive Office of the President was established in 1940 the Office for Emergency Management, which subsequently embraced most of the war agencies. At the end of 1946 the Office for Emergency Management was comprised of the following agencies: Office of Temporary Controls, War Assets Administration, Office of Defense Transportation, Office of Scientific Research and Development, and Philippine Alien Property Administration.

OFFICE OF TEMPORARY CONTROLS

The Office of Temporary Controls was established within the Office for Emergency Management by Executive Order 9809 of December 12, 1946, consolidating into one agency the Office of War Mobilization and Reconversion, Office of Economic Stabilization, Civilian Production Administration, and Office of Price Administration. John R. Steelman was appointed in June 1946 to succeed John W. Snyder as Director of OWMR. The functions of OES were transferred to OWMR September 20, 1945, and remained there during 1946 (except for a period of reestablished independence February 21 to July 25).

Civilian Production Administration.—As of fall 1946, the members of the Civilian Production Administration dealing with policy or administration affecting the mineral industries were as follows:

Administrator	John D. Small
Deputy Administrator	Philip F. Maguire
Deputy Administrator	John C. Houston, Jr.
Deputy Administrator	Frank R. Creedon
Deputy Administrator for Small Business	Laurence F. Arnold
General Counsel	Harold L. Price
Office of Labor Requirements, Director	Ralph Hetzel
Office of Economic Review and Analysis, Director.	Robert E. Johnson
Office of Information, Director	Karl Keyerleber
Bureau of Industry Operations, Director	Fred Glover
Metals and Minerals Division, Director	Frank H. Hayes
Deputy Director	John J. Croston
Premium Price Quota Committee:	
Chairman	John J. Croston
Secretary	Landon F. Strobel
Steel Branch, Chief	Patrick J. Treacy
Copper Branch, Chief	D. L. Forrester
Tin, Lead, and Zinc Branch, Chief	Erwin Vogelsang
Aluminum and Magnesium Branch, Chief	Robert L. Sebastian
Cork, Asbestos, and Fibrous Glass Branch, Chief.	Ray H. Coultrap
Miscellaneous Minerals and Mining Branch, Chief.	Fred G. Rockwell

Office of Price Administration.—Price controls on minerals were relaxed during the first 10 months of 1946 and were removed entirely on November 12 (effective November 10). As of fall 1946, the Office of Price Administration included the following officials:

Administrator	Paul A. Porter
Industrials Price Division, Director	Frederick C. Holder
Metals Price Branch, Price Executive	Warren M. Huff
Assistant Price Executive	Addison T. Cutler
Building and Construction Price Division, Director.	Allen Coe
Building Materials Price Branch, Price Executive.	Julian A. Littau

WAR ASSETS ADMINISTRATION

Executive Order 9689 of January 31, 1946, effective March 25, established the War Assets Administration and transferred to it the surplus property functions of the Reconstruction Finance Corporation. The staff of WAA, as of December 1, 1946, included the following:

Administrator	Robert M. Littlejohn
Associate Administrator	Robert M. Field, Acting
Office of General Disposal, Deputy Administrator.	Morton M. Boyd
Sales Group II	H. W. Cornell
General Industrial Equipment	John H. Williams, Acting
Metal Sales Division	Wm. H. Kelley
Materials and Supplies	Roland P. Brown, Acting
Metal-Working Equipment	C. A. Barrett, Acting
Office of Real Property Disposal, Deputy Administrator.	John J. O'Brien
Industrial	E. J. Ellingson
Office of Aircraft Disposal, Deputy Administrator.	John H. Carey, Acting
Maintenance and Salvage Sales	R. G. Lockwood

ATOMIC ENERGY COMMISSION

The Atomic Energy Act of 1946 (Public Law 585, 79th Congress), approved August 1, provided for the establishment of an Atomic Energy Commission with very broad powers of control over both the military and industrial production and utilization of atomic energy. An abstract of the Act is contained in the Uranium and Thorium chapter of this volume. The five members of the AEC were appointed by President Harry S. Truman October 28, 1946, and held their first formal meeting November 13 at Oak Ridge, Tenn. At the end of 1946 the organization of the Commission was as follows:

Members	David E. Lilienthal, Chairman
	Robert F. Bacher
	Sumner T. Pike
	Lewis L. Strauss
	William W. Waymack

793065—48——2

General Advisory Committee	J. Robert Oppenheimer, Chairman
	James B. Conant
	Lee A. DuBridge
	Enrico Fermi
	Isidor I. Rabi
	Hartley Rowe
	Glenn T. Seaborg
	Cyril S. Smith
	Hood Worthington
General Manager	Carroll L. Wilson
Division of Research, Director	James B. Fisk
Division of Production, Director	Walter J. Williams
Organization and Personnel, Director	G. Lyle Belsley
General Counsel	Herbert S. Marks
Military Liaison Committee	Lt. Gen. Lewis H. Brereton, Chairman
	Maj. Gen. Lunsford E. Oliver
	Col. John H. Hinds
	Rear Adm. Thorvald A. Solberg
	Rear Adm. Ralph A. Ofstie
	Rear Adm. William S. Parsons

UNITED STATES DEPARTMENT OF THE INTERIOR

Solid Fuels Administration for War.—Executive Order 9847 of May 6, 1947, provided for termination of the Solid Fuels Administration for War, effective June 30. The executive heads of the principal units of SFAW in March 1947 were as follows:

Administrator	Julius A. Krug
Deputy Administrator	Dan H. Wheeler
Assistant Deputy Administrator	Harlen M. Chapman
Assistant Deputy Administrator	N. O. Wood, Jr.
Assistant Deputy Administrator (heads Bituminous Distribution Division).	Walter P. Neekamp
Assistant Deputy Administrator (heads Anthracite Distribution Division).	Thomas G. Valleau
General Counsel (heads Legal and Compliance Division).	Thomas J. O'Brien
Production, Conservation and Information Division.	William J. Dougherty
Field Office Division	William B. Roberts III
Budget and Administrative Services Division	Mabel S. Bush
Personnel Division	Julia Carpin

Coal Mines Administration.—The Coal Mines Administration functioned from July 1943 to August 1944, after which its duties were assumed by SFAW. However, Executive Order 9728 of May 21, 1946, reestablished the Coal Mines Administration to direct the operation of those bituminous-coal mines that the Government took possession of to maintain maximum production. On May 29 Secretary of the Interior Julius A. Krug, as Coal Mines Administrator, and the United Mine Workers of America entered into an agreement covering the terms and conditions of employment for the period of Government

possession. The Coal Mines Administration, as of March 1947, was staffed largely by the United States Naval Reserve and included the following:

Administrator	Capt. N. H. Collison
Executive Officer	Comdr. E. D. Doyle
General Counsel	W. Randall Compton
Labor Relations Division	Burr Dailey
Production and Operation Division	Lt. Comdr. Charles M. Stull
Statistical Division	Lt. Comdr. Harold F. Hayes
Medical Survey Group, Director	Rear Adm. J. T. Boone
Administrative Aide to Director	Comdr. J. H. Balch
Fiscal Division	Lt. Comdr. J. N. Franz
Administration and Records	Lt. Erma H. Nash

Petroleum Administration for War. Oil and Gas Division.—The Petroleum Administration for War, an emergency agency established outside of the executive departments but with the Secretary of Interior as Administrator ex officio, was terminated by Executive Order 9718 of May 3, 1946, effective May 8. In its place the Oil and Gas Division, United States Department of the Interior, was established under authority of a letter from President Harry S. Truman dated May 3, 1946, and order of Secretary of the Interior Julius A. Krug dated May 6, 1946. The Division is authorized to coordinate and unify Federal petroleum policy and administration with a view to the conservation of the petroleum and natural-gas resources of the Nation and the achievement of petroleum security. Ralph K. Davies, Deputy Petroleum Administrator of PAW, was Acting Director of the Oil and Gas Division until December 23, 1946. The principal officials at the end of the year were:

Director	Max W. Ball
Assistant Director and Chief Counsel	Robert E. Friedman
Assistant Director	Edward B. Swanson
Administrative Officer	E. J. Skidmore

RECONSTRUCTION FINANCE CORPORATION

The Reconstruction Finance Corporation, together with such agencies as the U. S. Commercial Company and the War Damage Corporation, compose the Federal Loan Agency, of which Charles B. Henderson was Acting Administrator during 1946. The RFC is authorized to make loans to mines and smelters, to deal in strategic materials (purchases of minerals limited largely to tin concentrates after passage of the Stock-Piling Act July 23, 1946), to terminate war contracts, and to declare Government war plants surplus and available for disposal. These functions were being supervised by the following RFC officials at the end of 1946:

Board of Directors	Charles B. Henderson, Chairman
	Henry T. Bodman
	John D. Goodloe
	Harvey J. Gunderson
	Henry A. Mulligan

Secretary	Alfred T. Hobson
General Counsel	James L. Dougherty
Treasurer	William C. Beck, Jr.
Special Assistant to the Board of Directors	George F. Buskie
Controller	Harold W. H. Burrows
Statistical and Economic Division, Chief	David C. Elliott
Small Business Division, Acting Chief	Chauncey Y. Dodds
Division of Information, Chief	Arthur B. Merritt
Office of Metals Reserve, Executive Director	Morris Levinson
Deputy Directors	George S. Jewett
	Severt H. Petterson
	Jesse C. Johnson
Chief Counsel	Harold W. Sheehan
Office of Defense Supplies, Executive Director	Stuart K. Barnes
Associate Director and Chief Counsel	George B. Stoner
Deputy Directors	Henry D. Brite
	Charles A. Jostes
Office of Defense Plants, Executive Director	Frank T. Ronan
Associate Director	James L. Kelehan
Deputy Director in Charge of Engineering	Adolphus W. Greely
Deputy Director in Charge of Plant Servicing	Herbert R. Rutland
Chief Counsel	James G. Boss

Statistical Summary of Mineral Production

(General United States Summary and Detailed Production by States)

By JOHN HOZIK[1]

	PAGE		PAGE
Statistical procedure	13	General tables—Continued.	
General tables	15	States and principal mineral products	28
Production, by minerals	15	Prices of gold, silver, copper, lead, and zinc	29
Production, by mineral groups	19	State tables	30
Production, by States	20		
Mineral products and principal producing States	21		

THIS statistical summary corresponds in form and content with those presented in preceding editions of Minerals Yearbook. The tables showing the principal States producing each mineral product and listing the leading mineral products of each State have, for the first time, been made contemporaneous with the rest of the volume; to preserve the continuity of that series, data are presented for 1945 as well as for 1946. The fuel figures for 1946, except for Pennsylvania anthracite, are preliminary.

STATISTICAL PROCEDURE

Coverage.—Statistics used in this chapter to derive total mineral production of the United States and of individual States represent primary products only. Insofar as practicable the figures pertain to production exclusively from domestic mines. Geographically, the figures represent the 48 States, the District of Columbia, the Philippine Islands (through 1945 only), and the Territories of Alaska, Hawaii, and Puerto Rico. Data for United States possessions such as the Canal Zone, Guam, and Virgin Islands are not compiled.

Units of Measurements.—In expressing quantities of minerals, the Bureau of Mines has adopted the weight units (or in some instances, the volume or piece units) commonly employed by each individual industry. The unit of value is the United States dollar. No adjustment is made for variations in the purchasing power of the dollar.

Stage of Production Measured.—Measuring the total mineral production of the United States and individual States at the crude ore stage (rather than at the refined stage) would provide statistics most indicative of mine and well output. However, totals have not been

[1] K. Joyce D'Amico assisted considerably in the preparation of this chapter.

derived strictly for the crude stage alone, largely because of the impracticality of obtaining meaningful values for ores of gold, silver, copper, lead, and zinc. Instead, the State totals in this chapter represent each mineral at the earliest stage of production for which a value is reported. The United States totals are on the same basis, except that they include iron, ferro-alloy metals, and aluminum valued at the smelter rather than at the mine.

Relationship of United States Totals to State Totals.—The total of United States mineral production differs from the sum of those of the 48 States, the District of Columbia, and Alaska in that the former include: (1) Pig iron valued at the smelter instead of iron ore at the mine; (2) aluminum and ferro-alloy metals valued at the smelter and regardless of whether from foreign or domestic ores; (3) gold, silver, copper, lead, and zinc mint and smelter production rather than mine output; (4) certain lead and zinc pigments—sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide—and certain smelter and refinery byproducts, such as arsenic, bismuth, cadmium, minor metals, and sulfuric acid, whose States of origin are not reported, and (5) data for Hawaii, the Philippine Islands (through 1945), and Puerto Rico.

Elimination of Duplication.—In numerous instances in the tables of this chapter, production is shown both in the crude and in the refined stages, but in virtually every instance duplication is eliminated by including in the totals the value of each mineral at one stage only. For example, the values of coke made from coal, oil asphalt from petroleum, and lead and zinc pigments from metal are excluded from the totals. Likewise (but in these instances discounting the crude material rather than the refined product), the values of clay used in making heavy clay products or cement and of limestone used in making lime or cement are excluded from the totals.

GENERAL TABLES

Mineral products of the United States, 1944–46 [1]

Product		1944		1945		1946	
		Quantity	Value	Quantity	Value	Quantity	Value
METALLIC							
Aluminum	short tons (2,000 pounds)	776,446	$222,416,000	495,060	$140,864,000	409,630	$115,812,000
Antimonial lead	do	[2] 57,902	[2]	[2] 56,495	[2]	[2] 50,480	[2]
Antimony:							
Metal	do	[3]	[3]	[3]	[3]	[3]	[3]
Ore and concentrates	do	13,501	563,296	14,966	561,630	13,962	797,715
Bauxite (dried equivalent)	long tons (2,240 pounds)	2,823,724	14,402,497	981,009	5,591,084	1,072,825	6,709,164
Beryllium concentrates	short tons	388	56,135	39	6,133	100	17,787
Cadmium:							
Metal	pounds	8,551,424	6,435,124	7,988,658	6,106,992	6,180,265	6,094,572
In compounds	do	285,203	213,902	451,050	347,308	270,789	267,033
Chromite	short tons	45,629	1,668,299	13,973	532,382	4,107	105,041
Copper [4]	do	1,003,379	[5] 236,797,000	782,726	[5] 184,723,000	599,656	[5] 172,701,000
Ferro-alloys	do	1,860,956	246,014,039	1,661,657	210,509,657	1,551,624	176,273,655
Gold [6]	troy ounces	1,022,238	35,778,330	928,893	32,511,255	1,462,354	51,182,390
Iron:							
Ore [7]	long tons	95,135,675	[7] 256,885,512	88,136,715	[7] 243,760,986	70,090,410	[7] 215,006,427
Pig	short tons	60,995,977	1,278,981,313	53,265,353	1,172,435,165	45,075,890	1,103,928,986
Lead (refined) [4]	do	394,443	[5] 50,489,000	356,535	[5] 45,636,000	293,309	[5] 49,276,000
Magnesium (new ingot)	do	146,585	60,141,437	43,496	17,874,418	8,916	3,654,164
Manganese ore (35 percent or more Mn)	do	247,616	9,014,875	182,337	7,320,309	143,635	4,811,068
Manganiferous ore (5 to 35 percent Mn)	do	1,487,612	3,855,946	1,522,854	3,513,666	1,171,183	3,126,711
Mercury:							
Metal	flasks (76 pounds net)	37,688	4,460,752	30,763	4,149,621	25,348	2,490,188
Ore	short tons	[8]	[9]	[8]	[9]	[8]	[9]
Molybdenum	pounds	39,428,000	27,999,000	32,524,000	23,107,000	16,304,000	11,167,000
Nickel	short tons	988	[10]	1,155	[10]	352	[10]
Ores (crude), old tailings, etc.:							
Copper	do	91,064,000	[9]	76,856,000	[9]	61,741,000	[9]
Dry and siliceous (gold and silver)	do	2,620,000	[9]	1,984,000	[9]	2,995,000	[9]
Lead	do	6,805,000	[9]	6,730,000	[9]	5,651,000	[9]
Lead-copper	do	123,000	[9]	168,000	[9]	144,000	[9]
Zinc	do	16,470,000	[9]	16,308,000	[9]	14,895,000	[9]
Zinc-copper	do	943,000	[9]	812,000	[9]	654,000	[9]
Zinc-lead	do	15,418,000	[9]	12,355,000	[9]	12,730,000	[9]
Zinc-lead-copper	do	19,000	[9]	12,000	[9]	12,000	[9]
Platinum metals (refined) (value at New York City)	troy ounces	33,021	1,481,000	33,592	1,543,000	30,237	1,802,000

See footnotes at end of table.

Mineral products of the United States, 1944–46 [1]—Continued

Product	1944		1945		1946	
	Quantity	Value	Quantity	Value	Quantity	Value
METALLIC—continued						
Selenium ..... pounds	423,906	[10]	604,445	[10]	405,226	[10]
Silver [11] ..... troy ounces	35,651,049	$25,351,855	29,063,255	$20,667,205	21,103,269	[12] $17,051,441
Tantalum and columbium concentrates ..... pounds	10,412	24,234	6,649	13,653	3,475	8,793
Tellurium ..... do	45,323	[10]	60,328	[10]	38,523	[10]
Tin (metallic equivalent) ..... short tons	6	6,200				
Titanium concentrates:						
Ilmenite ..... do	280,791	7,371,279	308,518	7,359,170	282,708	4,878,917
Rutile ..... do	6,770	1,088,112	6,837	869,920	7,514	996,989
Tungsten concentrates (60 percent WO_3 basis) ..... do	10,283	14,407,143	5,534	7,692,691	5,193	6,283,413
Vanadium ..... pounds	3,527,054	1,689,578	2,963,913	1,766,500	1,272,148	710,582
Zinc [4] ..... short tons	574,453	[8] 98,806,000	467,084	[8] 80,338,000	459,205	[8] 81,738,000
Other metallic [13]		2,570,783		2,942,953		2,188,299
Total value of metallic products (approximate)		2,340,000,000		1,974,000,000		1,823,000,000
NONMETALLIC						
Arsenious oxide ..... short tons	34,472	1,696,819	24,810	1,197,061	12,476	678,419
Asbestos ..... do	6,667	380,334	12,226	446,045	14,075	504,764
Asphalt:						
Native ..... do	789,516	3,691,279	703,873	3,816,471	845,898	4,262,886
Oil (including road oil) [7] ..... do	6,408,766	[7] 70,310,623	6,311,815	[7] 68,930,149	7,056,882	[7] 82,910,877
Barite (crude) ..... do	518,617	3,558,489	696,062	5,348,652	724,362	5,242,755
Boron minerals ..... do	277,586	6,579,587	325,935	7,635,365	430,689	9,575,866

Phosphate rock	long tons	5,376,643	20,856,429	5,806,723	23,951,077	6,860,713	31,043,821
Potassium salts	short tons	[21] 817,892	29,487,413	[21] 870,370	30,313,919	[21] 928,374	32,175,716
Pumice	do	88,757	704,110	157,011	1,051,037	319,883	1,585,753
Pyrites	long tons	788,530	2,598,000	722,596	2,700,000	813,372	3,228,000
Salt (sodium chloride)	short tons	15,717,171	43,715,492	15,394,141	43,914,406	15,132,145	44,912,586
Sand and gravel:							
Glass sand	do	4,443,031	8,227,502	4,681,920	8,374,218	4,848,602	9,541,405
Sand (molding, building, etc.) and gravel	do	190,340,000	116,936,000	190,842,000	120,463,000	249,282,000	161,845,000
Silica (quartz)	do	82,379	286,478	57,764	236,803	73,179	293,852
Slate	do	477,840	5,004,195	551,890	5,658,913	759,770	8,844,106
Sodium salts (carbonates and sulfates) (natural)	do	353,749	4,447,225	372,241	4,559,277	414,406	5,122,499
Stone [22]	do	155,579,580	175,642,157	153,405,210	179,307,902	178,852,360	234,339,486
Sulfur	long tons	3,519,083	56,300,000	3,833,294	61,300,000	4,128,212	66,100,000
Sulfuric acid (60° Baumé) (byproduct) [23]	short tons	1,160,023	10,415,587	1,084,891	10,136,598	922,127	8,226,751
Talc, pyrophyllite, and ground soapstone [22]	do	398,863	5,017,462	398,384	5,407,235	457,066	6,445,344

See footnotes at end of table.

Mineral products of the United States, 1944–46 [1]—Continued

Product		1944		1945		1946	
		Quantity	Value	Quantity	Value	Quantity	Value
NONMETALLIC—continued							
Tripoli	short tons	18,425	$301,863	18,247	$306,829	28,955	$549,099
Vermiculite	do	54,116	541,744	64,808	648,077	86,390	867,973
Other nonmetallic [24]			4,511,391		4,224,387		4,636,078
Total value of nonmetallic products (approximate)			6,077,000,000		6,166,000,000		7,036,000,000
SUMMARY							
Total value:							
Metallic			2,340,000,000		1,974,000,000		1,823,000,000
Nonmetallic:							
Fuels			5,178,000,000		5,212,000,000		5,725,000,000
Other			899,000,000		954,000,000		1,311,000,000
Grand total approximate value of mineral products			8,417,000,000		8,140,000,000		8,859,000,000

[1] In this general statement certain of the figures represent shipments rather than quantity mined, and some of the figures for 1946 are subject to revision. For details see following chapters of this volume.

[2] Figures represent antimonial lead produced at primary refineries from both domestic and foreign primary and secondary sources; no figures for value of antimonial lead available. Estimate of value of primary antimony and lead contents of antimonial lead from domestic sources included in total value of metallic products.

[3] Largely from foreign ore; value not included in total value.

[4] Product from domestic ores only.

[5] Value does not include premiums paid to miners by the Government. Total overceiling payments for copper, lead, and zinc amounted to approximately $83,000,000 in 1944, $79,000,000 in 1945, and $77,000,000 in 1946.

[6] According to Bureau of the Mint. Valued at $35 per ounce.

[7] Value not included in total value.

[8] Figures not available.

[9] Figures showing values not available.

[10] Value included in total value of metallic products; Bureau of Mines not at liberty to publish figures.

[11] According to Bureau of the Mint.

[12] Calculated by Bureau of Mines at $0.808 per fine ounce, based on Treasury buying price for newly mined silver in 1946 as follows: January 1 to June 30, $0.71111111; July 1 to December 31, $0.905.

[13] Includes value of following products; figures are shown wherever Bureau of Mines is at liberty to publish them: Bismuth, cobalt (556,687 pounds in 1944), germanium, indium (1944—82,427 troy ounces, $391,973; 1945—57,434 ounces, $146,139; 1946—9,667 ounces, $16,618), thallium, and zircon.

[14] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.

[15] 1944: Sold or shipped; 1945–46: Sold or used—value of clay used in cement and heavy clay products not included in total value for State.

[16] Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.

[17] Value included in total value of nonmetallic products; Bureau of Mines not at liberty to publish figures.

[18] No canvass. Estimate of value included in total value of nonmetallic products.

[19] Figures cover fiscal year ended June 30 of year stated.

[20] Includes sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide except that in 1946 data for sublimed blue and white lead are excluded from this grouping; however, the value is included in the total value of nonmetallic products.

[21] Equivalent as K_2O.

[22] Figures for soapstone used as dimension stone included in figures for stone.

[23] From copper, lead, and zinc smelters and zinc roasters.

[24] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.

1944: Andalusite, crude aplite, natural sulfonated bitumen, calcite (Iceland spar) (5,748 pounds, $57,480), corundum, dumortierite, flint lining for tube mills (2,063 short tons, $38,833), pebbles for grinding (8,012 short tons, $172,418), quartz crystal (3,934 pounds, $23,769), silica sand and sandstone (ground) (558,606 short tons, $3,989,981), strontium minerals (3,005 short tons, $48,165), sulfur ore (1,639 long tons, $8,950), industrial topaz, and wollastonite.

1945: Andalusite, crude aplite, dumortierite, flint lining for tube mills (1,982 short tons, $45,933), pebbles for grinding (8,615 short tons, $201,806), silica sand and sandstone (ground) (533,656 short tons, $3,709,597), strontium minerals (2,784 short tons, $27,840), sulfur ore (1,426 long tons, $12,170), industrial topaz, and wollastonite.

1946: Crude aplite, flint lining for tube mills (2,375 short tons, $44,247), pebbles for grinding (4,652 short tons, $102,043), perlite (4,206 short tons, $23,133), silica sand and sandstone (ground) (575,888 short tons, $4,125,398), strontium minerals (243 short tons, $3,726), sulfur ore (6,344 long tons, $95,531), industrial topaz, and wollastonite.

Value of mineral products of the United States, 1880–1946 [1]

Year	Metallic	Nonmetallic			Grand total
		Fuels [2]	Other	Total	
1880 [1]	$190,881,000	$120,241,000	$56,341,000	$176,582,000	$367,463,000
1881	192,663,000	149,798,000	60,659,000	210,457,000	403,120,000

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis. Comparable totals for years before 1911 not available.

Mineral products of the United States and principal producing States in 1945

Rank in value	Product	Principal producing States [1]	
		In order of quantity	In order of value
12	Aluminum	Washington, Tennessee, New York, Arkansas	Rank same as for quantity.
98	Andalusite	California	Do.
(2)	Antimonial lead	Not separable by States	Not separable by States.
70	Antimony ore	Idaho, Oregon, Nevada	Rank same as for quantity.
82	Aplite (crude)	Virginia	Do.
60	Arsenious oxide	Utah, Montana	Do.
74	Asbestos	Vermont, Arizona, North Carolina, Georgia	Vermont, Arizona, California, North Carolina.
	Asphalt:		
46	Native	Texas, Kentucky, Oklahoma, Utah	Utah, Kentucky, Texas, Oklahoma.
16	Oil	Not separable by States	Not separable by States.
43	Barite (crude)	Arkansas, Missouri, Georgia, California	Arkansas, Missouri, Georgia, Tennessee.
41	Bauxite	Arkansas, Georgia, Alabama, Virginia	Rank same as for quantity.
97	Beryllium concentrates	South Dakota, New Hampshire	Do.
59	Bismuth	Not separable by States	Not separable by States.
35	Boron minerals	California	Rank same as for quantity.
29	Bromine	Texas, North Carolina, Michigan, California	Texas, Michigan, North Carolina, California.
39	Cadmium	Not separable by States	Not separable by States.
54	Calcium-magnesium chloride	Michigan, West Virginia, California	Michigan, California, West Virginia.
11	Cement	Pennsylvania, California, Texas, Michigan	Rank same as for quantity.
71	Chromite	California, Oregon	Do.
	Clay:		
14	Products, heavy clay (other than pottery and refractories).		Ohio, Pennsylvania, Illinois, California.
21	Raw (sold or used by producers)	Ohio, Pennsylvania, Illinois, Missouri	Georgia, Pennsylvania, Ohio, Missouri.

See footnotes at end of table.

Mineral products of the United States and principal producing States in 1945—Continued

Rank in value	Product	Principal producing States [1]	
		In order of quantity	In order of value
2	Coal:		
	Bituminous	West Virginia, Pennsylvania, Illinois, Kentucky	West Virginia, Pennsylvania, Kentucky, Illinois.
	Pennsylvania anthracite	Pennsylvania	Rank same as for quantity.
58	Cobalt	Missouri, Pennsylvania	Do.
5	Coke	Pennsylvania, Ohio, Indiana, New York	Do.
9	Copper	Arizona, Utah, Montana, New Mexico	Do.
48	Diatomite	California, Oregon, Nevada, Washington	Do.
101	Dumortierite	Nevada	Do.
88	Emery	New York	Do.
53	Feldspar (crude)	North Carolina, South Dakota, New Hampshire, Virginia	Do.
7	Ferro-alloys	Pennsylvania, New York, Ohio, West Virginia	Pennsylvania, New York, West Virginia, Alabama.
90	Flint lining for tube mills	Minnesota, North Carolina, Wisconsin	Rank same as for quantity.
31	Fluorspar	Illinois, Kentucky, Colorado, New Mexico	Do.
50	Fuller's earth	Texas, Georgia, Florida, Illinois	Georgia, Texas, Florida, Illinois.
75	Garnet (abrasive)	New York, Idaho	Rank same as for quantity.
[2]	Gem stones	No canvass for 1945	No canvass for 1945.
99	Germanium	Not separable by States	Not separable by States.
22	Gold	Utah, California, Colorado, Nevada	Rank same as for quantity.
77	Graphite:		
	Amorphous	Rhode Island	Do.
	Crystalline	Texas, Alabama	Do.
72	Grindstones and pulpstones	Ohio, West Virginia	Do.
38	Gypsum (crude)	Michigan, New York, California, Iowa	New York, Virginia, California, Michigan.
63	Helium	Texas, Kansas	Kansas, Texas.
85	Indium	Not separable by States	Not separable by States.
67	Iodine (natural)	California	Rank same as for quantity.
	Iron:		
6	Ore	Minnesota, Michigan, Alabama, New York	Minnesota, Michigan, New York, Alabama.
3	Pig	Pennsylvania, Ohio, Indiana, Illinois	Rank same as for quantity.
80	Kyanite	Virginia	Do.
19	Lead	Missouri, Idaho, Utah, Arizona	Do.
18	Lime	Ohio, Pennsylvania, Missouri, West Virginia	Do.
78	Lithium minerals	California, North Carolina, Colorado, South Dakota	Do.
52	Magnesite (crude)	Washington, Nevada, California, Texas	Washington, California, Nevada, Texas.
28	Magnesium	Texas, Ohio, Michigan, Connecticut	Rank same as for quantity.
32	Magnesium compounds (natural)	Texas, California, Michigan, Nevada	Texas, California, Michigan, New Jersey.
37	Manganese ore	Montana, Virginia, Washington, Arkansas	Montana, Washington, Virginia, Arkansas.
49	Manganiferous ore	Minnesota, New Mexico, Arkansas, Montana	Rank same as for quantity.
66	Manganiferous zinc residuum	New Jersey	Do.
	Marl:		
84	Calcareous	Virginia, Indiana, Michigan, West Virginia	Virginia, West Virginia, Nevada, Michigan.
73	Greensand	New Jersey	Rank same as for quantity.
45	Mercury	California, Nevada, Oregon, Alaska	Do.

56	Mica	North Carolina, California, Colorado, South Dakota	North Carolina, South Dakota, New Hampshire, Idaho.
	Scrap	do	North Carolina, Colorado, South Dakota, Georgia.
	Sheet	North Carolina, New Hampshire, Connecticut, South Dakota	North Carolina, South Dakota, New Hampshire, Idaho.
93	Millstones		North Carolina, New York, Virginia, Minnesota.
	Mineral pigments:		
33	Natural pigments and manufactured iron oxide pigments.	Pennsylvania, Illinois, New Jersey, Virginia	Pennsylvania, New Jersey, Illinois, Virginia.
24	Lead and zinc pigments	Pennsylvania, Illinois, Kansas, Ohio	Rank same as for quantity.
(3)	Mineral waters	No canvass for 1945	No canvass for 1945.
26	Molybdenum	Colorado, Utah, New Mexico, Arizona	Rank same as for quantity.
4	Natural gas	Texas, Louisiana, California, Oklahoma	Texas, California, Louisiana, West Virginia.
8	Natural gasoline and allied products:		
	Natural gasoline and cycle products	Texas, California, Louisiana, Oklahoma	Rank same as for quantity.
	Liquefied petroleum gases	Texas, California, Oklahoma, Louisiana	Texas, California, Louisiana, Oklahoma.
68	Nickel	Not separable by States	Not separable by States.
81	Oilstones, etc	Arkansas, Ohio, New Hampshire, Indiana	Rank same as for quantity.
69	Olivine	North Carolina	Do.
(4)	Ores (crude), etc.:		
	Copper	Arizona, Utah, New Mexico, Michigan	Value not available.
	Dry and siliceous (gold and silver)	Colorado, South Dakota, Idaho, Nevada	Do.
	Lead	Missouri, Idaho, California, Utah	Do.
	Lead-copper	Missouri, Idaho, Arizona	Do.
	Zinc	Oklahoma, Kansas, Tennessee, Missouri	Do.
	Zinc-copper	Washington, California, Arizona, Colorado	Do.
	Zinc-lead	Idaho, Oklahoma, Kansas, Missouri	Do.
	Zinc-lead-copper	Arizona, Colorado	Do.
65	Peat	Maine, New Jersey, Florida, Ohio	Ohio, New Jersey, Michigan, California.
83	Pebbles for grinding	North Carolina, Minnesota, Wisconsin, Texas	Rank same as for quantity.
1	Petroleum	Texas, California, Oklahoma, Louisiana	Do.
25	Phosphate rock	Florida, Tennessee, Montana, Idaho	Do.
57	Platinum metals	Alaska, California, Oregon	Do.
23	Potassium salts	New Mexico, California, Utah, Maryland	Do.
62	Pumice	California, Kansas, Idaho, Nebraska	California, New Mexico, Kansas, Nebraska.
51	Pyrites	Tennessee, Virginia, California, Montana	Tennessee, Virginia, California, New York.
20	Salt	Michigan, New York, Ohio, Louisiana	Michigan, New York, Louisiana, Ohio.
13	Sand and gravel	California, Illinois, Michigan, Texas	California, Illinois, Ohio, Texas.
61	Selenium	Not separable by States	Not separable by States.
79	Silica (quartz)	Washington, California, Wisconsin, North Carolina	North Carolina, Washington, California, Wisconsin.
47	Silica sand and sandstone (ground)	Illinois, New Jersey, Pennsylvania, Ohio	Illinois, New Jersey, Ohio, Pennsylvania.
27	Silver	Idaho, Utah, Montana, Arizona	Rank same as for quantity.
40	Slate		Pennsylvania, Vermont, New York, Georgia.
44	Sodium salts (carbonates and sulfates) (natural)	California, Texas, Wyoming	Rank same as for quantity.
10	Stone	Pennsylvania, Michigan, Ohio, Illinois	Pennsylvania, Ohio, Illinois, New York.
92	Strontium minerals	Texas, California	Rank same as for quantity.
17	Sulfur	Texas, Louisiana	Do.
30	Sulfuric acid from copper, lead, and zinc smelters and zinc roasters.	Pennsylvania, Illinois, Tennessee, Indiana	Pennsylvania, Illinois, Tennessee, Utah.
96	Sulfur ore	Texas, Colorado	Rank same as for quantity.
42	Talc, pyrophyllite, and ground soapstone [5]	New York, North Carolina, California, Vermont	New York, California, Vermont, North Carolina.
94	Tantalum and columbium concentrates	New Mexico, North Carolina, South Dakota	Rank same as for quantity.

See footnotes at end of table.

Mineral products of the United States and principal producing States in 1945—Continued

Rank in value	Product	Principal producing States [1]	
		In order of quantity	In order of value
87	Tellurium	Not separable by States	Not separable by States.
91	Thallium	do	Do.
	Titanium concentrates:		
36	Ilmenite	New York, Florida, Virginia, North Carolina	Rank same as for quantity.
64	Rutile	Florida, Virginia	Do.
95	Topaz (industrial)	South Carolina	Do.
76	Tripoli	Illinois, Missouri, Pennsylvania	Do.
34	Tungsten concentrates	Idaho, Nevada, California, Colorado	Do.
55	Vanadium	Colorado, Idaho, Utah, Arizona	Do.
69	Vermiculite	Montana, South Carolina, Wyoming, Colorado	Do.
100	Wollastonite	New York	Do.
15	Zinc	Idaho, New Jersey, Oklahoma, Kansas	Idaho, Oklahoma, New Jersey, Kansas.
86	Zircon	Florida	Rank same as for quantity.

[1] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output.
[2] Separate figures for antimonial lead from primary sources not available.
[3] No canvass for 1945. [4] Value not available. [5] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

Mineral products of the United States and principal producing States in 1946

Rank in value	Product	Principal producing States [1]	
		In order of quantity	In order of value
14	Aluminum	Washington, Tennessee, New York, Alabama	Rank same as for quantity.
(3)	Antimonial lead	Not separable by States	Not separable by States.
62	Antimony ore	Idaho, Washington, Nevada, Oregon	Rank same as for quantity.
83	Aplite (crude)	Virginia	Do.
67	Arsenious oxide	Montana, Utah	Do.
72	Asbestos	Vermont, Arizona, North Carolina, Georgia	Vermont, Arizona, California, North Carolina.
	Asphalt:		
45	Native	Texas, Oklahoma, Kentucky, Utah	Utah, Kentucky, Texas, Oklahoma.
15	Oil	Not separable by States	Not separable by States.
40	Barite (crude)	Arkansas, Missouri, Georgia, Tennessee	Missouri, Arkansas, Georgia, Tennessee.
36	Bauxite	Arkansas, Georgia, Alabama, Virginia	Rank same as for quantity.
93	Beryllium concentrates	South Dakota, New Hampshire	Do.
58	Bismuth	Not separable by States	Not separable by States.

30	Boron minerals	California	Rank same as for quantity.
33	Bromine	Texas, Michigan, California, West Virginia	Do.
38	Cadmium	Not separable by States	Not separable by States.
53	Calcium-magnesium chloride	Michigan, West Virginia, California	Michigan, California, West Virginia.
6	Cement	Pennsylvania, California, Texas, New York	Rank same as for quantity.
84	Chromite	Oregon, California	Do.
	Clay:		
10	Products, heavy clay (other than pottery and refractories).		Ohio, Pennsylvania, Illinois, California.
18	Raw (sold or used by producers)	Ohio, Pennsylvania, Illinois, Missouri	Georgia, Pennsylvania, Ohio, Missouri.
2	Coal:		
	Bituminous	West Virginia, Pennsylvania, Kentucky, Illinois	Rank same as for quantity.
	Pennsylvania anthracite	Pennsylvania	Do.
75	Cobalt	Pennsylvania, Missouri	Do.
5	Coke	Pennsylvania, Ohio, Indiana, New York	Do.
12	Copper	Arizona, Utah, Montana, New Mexico	Do.
44	Diatomite	California, Oregon, Nevada, Washington	Do.
88	Emery	New York	Do.
51	Feldspar (crude)	North Carolina, South Dakota, New Hampshire, Colorado	North Carolina, New Hampshire, South Dakota, Virginia.
11	Ferro-alloys	Pennsylvania, New York, Ohio, West Virginia	Pennsylvania, New York, West Virginia, Alabama.
90	Flint lining for tube mills	Minnesota, Wisconsin, North Carolina	Rank same as for quantity.
31	Fluorspar	Illinois, Kentucky, Colorado, New Mexico	Do.
47	Fuller's earth	Texas, Georgia, Florida, Illinois	Georgia, Texas, Florida, Illinois.
68	Garnet (abrasive)	New York, Idaho	Rank same as for quantity.
(4)	Gem stones	No canvass for 1946	No canvass for 1946.
91	Germanium	Not separable by States	Not separable by States.
19	Gold	California, South Dakota, Alaska, Utah	Rank same as for quantity.
81	Graphite:		
	Amorphous	Rhode Island	Do.
	Crystalline	Texas, Alabama, Pennsylvania	Do.
71	Grindstones and pulpstones	Ohio, West Virginia, Washington	Do.
27	Gypsum (crude)	Michigan, New York, Texas, California	Do.
73	Helium	Texas, Kansas	Do.
94	Indium	Not separable by States	Not separable by States.
63	Iodine (natural)	California	Rank same as for quantity.
	Iron:		
8	Ore	Minnesota, Michigan, Alabama, Utah	Minnesota, Michigan, Alabama, New York.
3	Pig	Pennsylvania, Ohio, Indiana, Illinois	Rank same as for quantity.
79	Kyanite	Virginia, Georgia, California	Do.
21	Lead	Missouri, Idaho, Utah, Arizona	Do.
20	Lime	Ohio, Pennsylvania, Missouri, West Virginia	Do.
77	Lithium minerals	California, South Dakota, New Mexico, Colorado	Do.
54	Magnesite (crude)	Washington, Nevada, California, Texas	Do.
48	Magnesium	Texas, Michigan, California	Do.
34	Magnesium compounds (natural)	Michigan, California, Nevada, New Jersey	Michigan, California, New Jersey, Texas.
43	Manganese ore	Montana, Washington, Virginia, New Mexico	Montana, Washington, New Mexico, Nevada.
50	Manganiferous ore	Minnesota, New Mexico, Nevada, Utah	Minnesota, New Mexico, Utah, Nevada.
65	Manganiferous zinc residuum	New Jersey	Rank same as for quantity.

See footnotes at end of table.

793065—48——3

Mineral products of the United States and principal producing States in 1946—Continued

Rank in value	Product	Principal producing States [1]	
		In order of quantity	In order of value
	Marl:		
82	Calcareous	Virginia, Indiana, West Virginia, Michigan	Virginia, West Virginia, Indiana, Nevada.
74	Greensand	New Jersey	Rank same as for quantity.
52	Mercury	California, Nevada, Oregon, Idaho	Do.
57	Mica	North Carolina, California, Colorado, South Dakota	North Carolina, South Dakota, New Hampshire, Colorado.
	Scrap	do	North Carolina, South Dakota, Colorado, Georgia.
	Sheet	North Carolina, New Hampshire, Connecticut, South Dakota	Rank same as for quantity.
95	Millstones		New York, North Carolina, Virginia.
	Mineral pigments:		
29	Natural pigments and manufactured iron oxide pigments.	Pennsylvania, Illinois, Virginia, New Jersey	Pennsylvania, Illinois, New Jersey, Virginia.
23	Lead and zinc pigments	Pennsylvania, Illinois, Kansas, Ohio	Rank same as for quantity.
(4)	Mineral waters	No canvass for 1946	No canvass for 1946.
28	Molybdenum	Colorado, Utah, New Mexico, Arizona	Rank same as for quantity.
4	Natural gas	Texas, Louisiana, California, Oklahoma	Texas, California, Louisiana, West Virginia.
9	Natural gasoline and allied products:		
	Natural gasoline and cycle products	Texas, California, Louisiana, Oklahoma	Rank same as for quantity.
	Liquefied petroleum gases	Texas, California, Oklahoma, Louisiana	Texas, California, Louisiana, Illinois.
76	Nickel	Not separable by States	Not separable by States.
78	Oilstones, etc	Arkansas, Ohio, Indiana, New Hampshire	Arkansas, Ohio, New Hampshire, Indiana.
87	Olivine	North Carolina, Washington	Rank same as for quantity.
(4)	Ores (crude), etc.:		
	Copper	Arizona, Utah, New Mexico, Nevada	Value not available.
	Dry and siliceous (gold and silver)	South Dakota, Colorado, California, Nevada	Do.
	Lead	Missouri, Idaho, California, Illinois	Do.
	Lead-copper	Missouri, Utah, Arizona, Idaho	Do.
	Zinc	Oklahoma, Kansas, Tennessee, Missouri	Do.
	Zinc-copper	Washington, California, Arizona	Do.
	Zinc-lead	Oklahoma, Idaho, Kansas, Missouri	Do.
	Zinc-lead-copper	Arizona	Do.
59	Peat	Maine, New Jersey, Florida, Ohio	Ohio, New Jersey, Michigan, California.
85	Pebbles for grinding	Minnesota, Wisconsin, North Carolina, Texas	North Carolina, Minnesota, Wisconsin, Texas.
92	Perlite	Arizona, Maryland, California	Rank same as for quantity.
1	Petroleum	Texas, California, Louisiana, Oklahoma	Do.
25	Phosphate rock	Florida, Tennessee, Idaho, Montana	Do.
55	Platinum metals	Alaska, California	Do.
24	Potassium salts	New Mexico, California, Utah, Maryland	Do.
56	Pumice	Idaho, California, New Mexico, Kansas	California, New Mexico, Idaho, Kansas.
49	Pyrites	Tennessee, Virginia, California, Montana	Tennessee, California, Virginia, New York.
22	Salt	Michigan, New York, Ohio, Louisiana	Michigan, New York, Louisiana, Ohio.
13	Sand and gravel	California, Illinois, Michigan, Wisconsin	California, Illinois, Ohio, Pennsylvania.
64	Selenium	Not separable by States	Not separable by States.

80	Silica (quartz)	Washington, North Carolina, California, Wisconsin	North Carolina, California, Washington, Oregon.
46	Silica sand and sandstone (ground)	Illinois, New Jersey, Pennsylvania, Ohio	Illinois, Ohio, New Jersey, Pennsylvania.
26	Silver	Idaho, Utah, Montana, Arizona	Rank same as for quantity.
32	Slate		Pennsylvania, Vermont, New York, Georgia.
41	Sodium salts (carbonates and sulfates) (natural)	California, Texas, Wyoming	Rank same as for quantity.
7	Stone	Pennsylvania, Ohio, Illinois, Michigan	Pennsylvania, Ohio, Illinois, New York.
99	Strontium minerals	California	Rank same as for quantity.
17	Sulfur	Texas, Louisiana	Do.
35	Sulfuric acid from copper, lead, and zinc smelters and zinc roasters.	Pennsylvania, Illinois, Tennessee, Indiana	Do.
86	Sulfur ore	Texas, California, Colorado, Nevada	Do.
37	Talc, pyrophyllite, and ground soapstone [5]	New York, North Carolina, California, Vermont	New York, California, North Carolina, Vermont.
98	Tantalum and columbium concentrates	New Mexico, South Dakota	Rank same as for quantity.
89	Tellurium	Not separable by States	Not separable by States.
97	Thallium	do	Do.
	Titanium concentrates:		
42	Ilmenite	New York, Florida, Virginia, North Carolina	New York, Florida, North Carolina, Virginia.
60	Rutile	Florida, Virginia	Rank same as for quantity.
96	Topaz (industrial)	South Carolina	Do.
70	Tripoli	Illinois, Missouri, Pennsylvania	Do.
39	Tungsten concentrates	Nevada, California, Idaho, North Carolina	Do.
66	Vanadium	Colorado, Idaho, Utah, Arizona	Do.
61	Vermiculite	Montana, Wyoming, South Carolina, Texas	Montana, South Carolina, Wyoming, Texas.
100	Wollastonite	New York	Rank same as for quantity.
16	Zinc	Idaho, Oklahoma, New Jersey, Kansas	Do.
69	Zircon	Florida	Do.

[1] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output.
[2] Separate figures for antimonial lead from primary sources not available.
[3] No canvass for 1946. [4] Value not available. [5] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

States and their principal mineral products in 1945 [1]

State	Rank	Percent of total value for United States	Principal mineral products in order of value
Alabama	15	1.60	Coal, iron ore, cement, stone.
Alaska	37	.15	Sand and gravel, gold, coal, stone.
Arizona	16	1.43	Copper, zinc, lead, gold.
Arkansas	24	.92	Petroleum, coal, natural gas, bauxite.
California	3	9.00	Petroleum, natural gas, natural gasoline, cement.
Colorado	21	1.12	Coal, molybdenum, zinc, petroleum.
Connecticut	45	.05	Stone, clay products, sand and gravel, magnesium.
Delaware	50	(2)	Clay products, sand and gravel.
District of Columbia	49	(2)	Clay products, raw clay.
Florida	31	.36	Phosphate rock, stone, cement, sand and gravel.
Georgia	34	.29	Raw clay, stone, clay products, fuller's earth.
Idaho	26	.64	Zinc, lead, silver, tungsten concentrates.
Illinois	5	4.81	Coal, petroleum, stone, sand and gravel.
Indiana	18	1.30	Coal, cement, petroleum, stone.
Iowa	30	.36	Coal, cement, stone, clay products.
Kansas	9	3.02	Petroleum, natural gas, zinc, coal.
Kentucky	8	3.99	Coal, natural gas, petroleum, stone.
Louisiana	7	4.26	Petroleum, natural gas, natural gasoline, sulfur.
Maine	46	.04	Sand and gravel, cement, stone, slate.
Maryland	35	.22	Coal, sand and gravel, cement, stone.
Massachusetts	41	.08	Stone, sand and gravel, lime, clay products.
Michigan	12	2.03	Iron ore, petroleum, salt, natural gas.
Minnesota	11	2.42	Iron ore, manganiferous ore, sand and gravel, stone.
Mississippi	32	.32	Petroleum, natural gas, sand and gravel, clay products.
Missouri	23	1.08	Lead, coal, cement, stone.
Montana	22	1.10	Copper, petroleum, natural gas, coal.
Nebraska	43	.07	Sand and gravel, cement, stone, petroleum.
Nevada	27	.45	Copper, zinc, gold, tungsten concentrates.
New Hampshire	47	.01	Feldspar, sand and gravel, mica, stone.
New Jersey	29	.45	Zinc, sand and gravel, stone, iron ore.
New Mexico	14	1.72	Petroleum, potassium salts, natural gas, copper.
New York	17	1.33	Petroleum, iron ore, salt, cement.
North Carolina	36	.21	Clay products, bromine, stone, sand and gravel.
North Dakota	44	.07	Coal, sand and gravel, natural gas, clay products.
Ohio	10	2.85	Coal, natural gas, clay products, stone.
Oklahoma	6	4.29	Petroleum, natural gas, natural gasoline, zinc.
Oregon	38	.14	Sand and gravel, cement, stone, clay products.
Pennsylvania	2	13.55	Coal, petroleum, natural gas, cement.
Rhode Island	48	.01	Stone, sand and gravel, graphite.
South Carolina	42	.07	Stone, raw clay, clay products, sand and gravel.
South Dakota	40	.10	Gold, stone, raw clay, sand and gravel.
Tennessee	25	.85	Coal, zinc, stone, phosphate rock.
Texas	1	19.68	Petroleum, natural gas, natural gasoline, sulfur.
Utah	13	1.87	Copper, coal, gold, zinc.
Vermont	39	.12	Stone, slate, talc, copper.
Virginia	19	1.19	Coal, stone, zinc, cement.
Washington	28	.45	Coal, cement, sand and gravel, stone.
West Virginia	4	8.44	Coal, natural gas, petroleum, natural gasoline.
Wisconsin	33	.32	Stone, sand and gravel, zinc, iron ore.
Wyoming	20	1.17	Petroleum, coal, natural gas, natural gasoline.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis.
[2] Less than 0.01 percent.

States and their principal mineral products in 1946 [1]

State	Rank	Percent of total value for United States	Principal mineral products in order of value
Alabama	15	1.52	Coal, iron ore, cement, clay products.
Alaska	38	.16	Gold, coal, platinum metals, sand and gravel.
Arizona	14	1.53	Copper, zinc, lead, gold.
Arkansas	24	.90	Petroleum, coal, bauxite, natural gas.
California	3	9.03	Petroleum, natural gas, natural gasoline, cement.
Colorado	22	1.01	Coal, petroleum, zinc, molybdenum.
Connecticut	45	.07	Clay products, stone, sand and gravel, lime.
Delaware	50	.01	Clay products, sand and gravel, stone.

See footnote at end of table.

States and their principal mineral products in 1946—Continued

State	Rank	Percent of total value for United States	Principal mineral products in order of value
District of Columbia	48	.01	Clay products, raw clay.
Florida	32	.40	Phosphate rock, stone, cement, sand and gravel.
Georgia	33	.39	Raw clay, stone, clay products, cement.
Idaho	26	.58	Zinc, lead, silver, phosphate rock.
Illinois	5	4.61	Coal, petroleum, stone, clay products.
Indiana	17	1.40	Coal, cement, petroleum, stone.
Iowa	29	.45	Cement, clay products, stone, coal.
Kansas	10	3.15	Petroleum, natural gas, zinc, cement.
Kentucky	8	3.74	Coal, natural gas, petroleum, stone.
Louisiana	6	4.44	Petroleum, natural gas, natural gasoline, sulfur.
Maine	46	.06	Cement, stone, sand and gravel, slate.
Maryland	35	.28	Coal, sand and gravel, cement, stone.
Massachusetts	41	.13	Stone, sand and gravel, clay products, lime.
Michigan	12	1.90	Iron ore, petroleum, cement, salt.
Minnesota	11	2.02	Iron ore, stone, sand and gravel, manganiferous ore.
Mississippi	28	.46	Petroleum, natural gas, sand and gravel, clay products.
Missouri	20	1.13	Lead, cement, coal, stone.
Montana	25	.89	Copper, petroleum, natural gas, coal.
Nebraska	43	.09	Cement, sand and gravel, clay products, stone.
Nevada	27	.46	Copper, zinc, tungsten concentrates, gold.
New Hampshire	47	.02	Sand and gravel, feldspar, stone, clay products.
New Jersey	30	.43	Zinc, sand and gravel, stone, clay products.
New Mexico	13	1.67	Petroleum, potassium salts, natural gas, copper.
New York	16	1.40	Petroleum, cement, stone, salt.
North Carolina	36	.26	Stone, clay products, sand and gravel, feldspar.
North Dakota	44	.07	Coal, sand and gravel, natural gas, clay products.
Ohio	9	3.16	Coal, clay products, natural gas, stone.
Oklahoma	7	4.22	Petroleum, natural gas, zinc, natural gasoline.
Oregon	40	.15	Sand and gravel, cement, stone, clay products.
Pennsylvania	2	14.13	Coal, petroleum, cement, natural gas.
Rhode Island	49	.01	Stone, sand and gravel, graphite.
South Carolina	42	.11	Stone, raw clay, clay products, sand and gravel.
South Dakota	37	.24	Gold, stone, cement, sand and gravel.
Tennessee	23	.91	Coal, cement, stone, phosphate rock.
Texas	1	19.67	Petroleum, natural gas, natural gasoline, sulfur.
Utah	18	1.25	Copper, coal, zinc, lead.
Vermont	39	.16	Stone, slate, copper, talc.
Virginia	19	1.19	Coal, stone, sand and gravel, zinc.
Washington	31	.43	Cement, coal, sand and gravel, stone.
West Virginia	4	8.20	Coal, natural gas, petroleum, stone.
Wisconsin	34	.37	Stone, sand and gravel, iron ore, zinc.
Wyoming	21	1.13	Petroleum, coal, natural gas, natural gasoline.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation and for other metals mine production (recoverable content of metals) is the basis.

Prices of gold, silver, copper, lead, and zinc, 1937–46 [1]

Year	Gold [2]	Silver [3]	Copper [4]	Lead [4]	Zinc [4]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1937	$35.00	$0.7735	$0.121	$0.059	$0.065
1938	35.00	[5] .646+	.098	.046	.048
1939	35.00	[6] .678+	.104	.047	.052
1940	35.00	[7] .711+	.113	.050	.063
1941	35.00	[7] .711+	.118	.057	.075
1942	35.00	[7] .711+	.121	.067	.093
1943	35.00	[7] .711+	.130	.075	.108
1944	35.00	[7] .711+	.135	.080	.114
1945	35.00	[7] .711+	.135	.086	.115
1946	35.00	[8] .808	.162	.109	.122

[1] For data on prices prior to 1937, see Minerals Yearbook, 1945, p. 40.
[2] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[3] 1937: Yearly average weighted Treasury buying price for newly mined silver. 1938–46: Treasury buying price for newly mined silver.
[4] Yearly average weighted price of all grades of primary metal sold by producers. Beginning 1942, price includes premiums paid to miners by the Government.
[5] $0.64646464.
[6] $0.67878787.
[7] $0.71111111.
[8] Jan. 1 to June 30, 1946: $0.71111111; July 1 to Dec. 31, 1946: $0.905.

STATE TABLES

Mineral products of the United States, 1944–46, by States

ALABAMA

Product		1944		1945		1946	
		Quantity	Value	Quantity	Value	Quantity	Value
Aluminum	short tons	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)
Asphalt (native)	do	(1)	(1)	(1)	(1)	(1)	(1)
Bauxite (dried equivalent)	long tons	(1)	(1)	(1)	(1)	(1)	(1)
Cement	barrels	[3] 4,553,664	[3] $6,777,741	[3] 5,682,692	[3] $8,359,286	[3] 8,071,979	[3] $13,120,084
Clay:							
Products, heavy clay (other than pottery and refractories)			[4] 1,970,000		[4] 2,515,068		[4] 4,419,000
Raw	short tons	[5] 155,717	[5] 230,186	[5] 735,504	[5] 715,274	[5] 1,064,000	[5] 1,073,052
Coal	do	18,752,165	74,389,893	18,236,539	76,404,636	15,780,000	72,588,000
Coke	do	5,727,612	[2] 32,057,495	5,400,925	[2] 33,448,229	4,665,939	[2] 32,669,886
Ferro-alloys	do	128,729	[2] 11,609,967	145,377	[2] 14,636,471	137,042	[2] 14,510,937
Gold	troy ounces			5	175	1	35
Graphite, crystalline	pounds	(1)	(1)	(1)	(1)	(1)	(1)
Iron:							
Ore	long tons	6,808,111	17,684,154	6,038,631	14,547,223	5,993,800	17,458,295
Pig	short tons	3,936,471	[2] 68,239,438	3,588,863	[2] 65,991,229	3,145,303	[2] 66,517,978
Lime	do	333,414	2,004,391	315,559	2,076,768	294,654	2,164,209
Manganese ore	do	49	(1)	32	(1)		
Mica:							
Scrap	do	63	1,036			338	6,621
Sheet	pounds	1,387	7,173	420	1,629	289	74
Mineral waters	gallons sold	(6)	(6)	(6)	(6)	(6)	(6)
Ore (dry and siliceous) (gold and silver)	short tons			400	(7)		
Petroleum	barrels	43,000	(1)	181,000	(1)	380,000	(1)
Quartz crystal	pounds	(8)	(8)				
Sand and gravel	short tons	2,019,272	1,172,969	2,541,769	1,580,687	2,923,240	1,937,576
Silver	troy ounces			1	1		
Stone	short tons	2,542,210	3,385,801	2,238,740	3,326,753	1,874,330	3,385,892
Miscellaneous [9]			16,573,667		12,223,870		10,819,325
Total value, eliminating duplications			109,149,000		110,360,000		117,764,000

[1] Value included with "Miscellaneous."
[2] Value not included in total value for State.
[3] Exclusive of puzzolan, value for which is included with "Miscellaneous."
[4] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[5] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[6] No canvass.
[7] Not valued as ore; value of recoverable metal content included with the metals.
[8] Figure not available.
[9] Includes minerals indicated by "1" and "3" above.

ALASKA

Antimony ore (concentrates)	short tons	73	$6,465				
Arsenic	do	(1)	(1)	(1)	(1)	(1)	(1)
Asbestos	do	(2)	(2)				
Chromite	do	1,845	64,456				
Coal	do	348,375	2,239,684	297,644	$1,868,592	368,000	$2,359,000
Copper	pounds	4,000	540	10,000	1,350	4,000	648
Gem stones					(3)		(3)
Gold	troy ounces	49,296	1,725,360	68,117	2,384,095	226,781	7,937,335
Lead	short tons	44	7,040	11	1,892	115	25,070
Mercury	flasks (76 pounds)	(2)	(2)	(2)	(2)	699	68,670
Ores (crude), etc.:							
Copper	short tons			6	(4)		
Dry and siliceous (gold and silver)	do	381,574	(4)	6,506	(4)	8,979	(4)
Lead	do					1,819	(4)
Platinum metals (crude)	troy ounces	33,616	(2)	26,505	(2)	22,882	(2)
Sand and gravel	short tons	712,496	499,269	(2)	(2)	(2)	(2)
Silver	troy ounces	13,362	9,502	9,983	7,099	41,793	33,769
Stone	short tons	(2)	(2)	(2)	(2)	(2)	(2)
Tungsten concentrates (60-percent WO_3 basis)	do	19	(2)			19	(2)
Miscellaneous [5]			2,350,309		5,910,704		2,005,241
Total value, eliminating duplications			6,903,000		10,174,000		12,430,000

[1] Figure not available.
[2] Value included with "Miscellaneous."
[3] No canvass.
[4] Not valued as ore; value of recoverable metal content included with the metals.
[5] Includes minerals indicated by "2" above.

ARIZONA

Arsenious oxide	short tons	(1)	(1)	(1)	(1)	(1)	(1)
Asbestos	do	696	$158,272	1,273	$63,736	(2)	(2)
Barite	do					(2)	(2)
Bismuth	pounds	(1)	(1)	(1)	(1)	(1)	(1)
Clay:							
Products, heavy clay (other than pottery and refractories)			(2 3)		(2 3)		[3] $479,000
Raw	short tons	(2 4)	(2 4)	[4] 124,166	[4] 204,680	[4] 168,081	[4] 230,703

See footnotes at end of table.

Mineral products of the United States, 1944–46, by States—Continued

ARIZONA—Continued

Product	1944		1945		1946	
	Quantity	Value	Quantity	Value	Quantity	Value
Manganese ore—short tons	8,519	$223,926	1,093	$45,521		
Manganiferous ore—do	320	6,941	56	(2)		
Mercury—flasks (76 pounds)	548	64,861	(2)	(2)	95	$9,333
Mica:						
Scrap—short tons			(2)	(2)		
Sheet—pounds	(2)	(2)	(2)	(2)		
Molybdenum—do	856,565	624,336	635,572	472,760	(2)	(2)
Ores (crude), etc.:						
Copper—short tons	35,288,865	(6)	30,644,470	(6)	30,386,149	(6)
Dry and siliceous (gold and silver)—do	129,086	(6)	19,506	(6)	53,094	(6)
Lead—do	27,101	(6)	21,340	(6)	13,441	(6)
Lead-copper—do			2	(6)	1,066	(6)
Zinc—do	2,468	(6)	8,914	(6)	13,233	(6)
Zinc-copper—do	96,603	(6)	81,123	(6)	63,854	(6)
Zinc-lead—do	337,940	(6)	480,061	(6)	515,047	(6)
Zinc-lead-copper—do	18,578	(6)	11,488	(6)	12,295	(6)
Perlite—do					1,725	9,488
Quartz crystal—pounds	(1)	(1)				
Sand and gravel—short tons	586,164	342,038	528,059	442,959	1,098,791	974,347
Sand and sandstone (ground)—do			(2)	(2)		
Silica (quartz)—do	(2)	(2)	(2)	(2)	(2)	(2)
Silver—troy ounces	4,394,039	3,124,650	3,558,216	2,530,287	3,268,765	2,641,162
Stone—short tons	7 116,670	7 105,662	404,170	376,200	7 191,430	7 269,279
Sulfuric acid (60° B.) [8]—do	(2 9)	(2 9)	(2 9)	(2 9)	(2 9)	(2 9)
Tungsten concentrates (60-percent WO_3 basis)—do	29	42,763	97	(2)	20	27,080
Vanadium—pounds	13,382	10,883	(2)	(2)	(2)	(2)
Zinc—short tons	29,077	6,629,556	40,226	9,251,980	43,665	10,654,260
Miscellaneous [10]		791,934		707,383		633,805
Total value, eliminating duplications		115,592,000		98,574,000		118,055,000

[1] Figure not available.
[2] Value included with "Miscellaneous."
[3] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[4] 1944: sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metals.
[7] Exclusive of granite and sandstone, values for which are included with "Miscellaneous."
[8] From copper smelting.
[9] Value not included in total value for State.
[10] Includes minerals indicated by "2" and "7" above.

Aluminum	short tons	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)
Barite	do	159,686	$1,045,546	260,660	$1,934,098	288,286	$1,844,982
Bauxite (dried equivalent)	long tons	2,695,317	13,679,027	910,049	5,196,927	1,019,118	6,394,570
Cement	barrels	(1)	(1)	(1)	(1)	(1)	(1)
Clay:							
Products, heavy clay (other than pottery and refractories)			3 530,000		3 794,498		3 1,276,000
Raw	short tons	4 32,727	4 33,177	4 279,397	4 427,038	4 388,606	4 712,906
Coal	do	1,972,441	9,220,773	1,853,926	9,365,577	1,540,000	9,024,000
Gem stones			(5)		(5)		(5)
Gypsum (crude)	short tons	(1)	(1)	(1)	(1)	(1)	(1)
Iron ore	long tons	76	(1)				
Lead	short tons			1	172	2	436
Lime	do	(1)	(1)	(1)	(1)	(1)	(1)
Manganese ore	do	7,109	241,055	6,663	228,476	1,101	28,237
Manganiferous ore	do	14,755	134,473	14,806	(1)	1,964	(1)
Mercury	flasks (76 pounds)	191	22,607	(1)	(1)	11	1,081
Mineral waters	gallons sold	(5)	(5)	(5)	(5)	(5)	(5)
Natural gas	M cubic feet	46,453,000	5,824,000	46,600,000	6,145,000	43,000,000	6,020,000
Natural gasoline and allied products:							
Natural gasoline	gallons	43,701,000	2,190,000	53,832,000	2,585,000	50,198,000	2,021,000
Liquefied petroleum gases	do	31,835,000	800,000	32,109,000	833,000	33,882,000	881,000
Oilstones and whetstones	short tons	(1)	(1)	(1)	(1)	(1)	(1)
Ores (crude), etc.:							
Lead	do					2	(6)
Zinc	do	800	(6)	14,891	(6)	4,300	(6)
Petroleum	barrels	29,418,000	30,890,000	28,613,000	30,720,000	28,375,000	35,400,000
Quartz crystal	pounds	(7)	(7)				
Sand and gravel	short tons	2,665,688	1,805,699	2,688,622	1,930,780	8 2,203,647	8 1,821,423
Slate			6,102		50,000		(1)
Stone	short tons	730,310	790,271	9 932,320	9 926,763	995,720	1,135,856
Titanium concentrates: Rutile	do	(1)	(1)				
Tripoli	do	(1)	(1)				
Zinc	do	19	4,332	303	69,690	85	20,740
Miscellaneous 10			20,570,751		13,405,590		9,794,737
Total value, eliminating duplications			68,681,000		63,256,000		69,881,000

1 Value included with "Miscellaneous."
2 Value not included in total value for State.
3 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
4 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
5 No canvass.
6 Not valued as ore; value of recoverable metal content included with the metals.
7 Figure not available.
8 "Commercial." Value of "Government-and-contractor" included with "Miscellaneous."
9 Exclusive of sandstone, value for which is included with "Miscellaneous."
10 Includes minerals indicated by "1," "8," and "9" above.

Peat	do	5,849	96,141	6,185	85,877	8,137	105,242
Pebbles for grinding	do	(1)	(1)	(1)	(1)	74	927
Perlite	do					886	4,873
Petroleum	barrels	311,793,000	330,800,000	326,482,000	347,330,000	315,179,000	393,300,000
Platinum metals (crude)	troy ounces			43	(1)	67	(1)
Potassium salts	short tons	(1)	(1)	(1)	(1)	(1)	(1)
Pumice	do	31,409	245,898	75,238	481,664	89,181	755,570
Pyrites	long tons	(1)	(1)	(1)	(1)	(1)	(1)
Quartz crystal	pounds	(3)	(3)				
Salt (sodium chloride)	short tons	712,558	3,138,185	694,609	3,424,711	729,092	3,358,060
Sand and gravel	do	24,228,499	15,171,652	21,599,950	15,176,259	27,220,849	18,396,460
Sand and sandstone (ground)	do	(1)	(1)	(1)	(1)	(1)	(1)
Silica (quartz)	do	(1)	(1)	(1)	(1)	(1)	(1)
Silver	troy ounces	778,936	553,910	986,798	701,723	1,342,651	1,084,862
Slate			80,959		(2)		(1)
Sodium salts (carbonates and sulfates) (natural)	short tons	288,012	3,566,183	(1)	(2)	(1)	(1)
Stone	do	[8] 9,909,680	[8] 9,987,362	9,636,810	8,554,461	[8] 8,950,320	[8] 8,452,083
Strontium minerals	do	(1)	(1)	(1)	(1)	243	3,726
Sulfuric acid (60° B.)[9]	do	(1 2)	(1 2)	(1 2)	(3 2)	(1 2)	(1 2)
Sulfur ore	long tons					757	11,835
Talc, pyrophyllite, and ground soapstone	short tons	65,191	1,054,312	67,321	1,254,143	78,170	1,434,978
Tin (metallic equivalent)	do	2	1,970				
Tungsten concentrates (60-percent WO_3 basis)	do	3,027	4,558,545	1,073	1,488,289	1,262	1,117,855
Zinc	do	8,455	1,927,740	9,923	2,282,290	6,877	1,677,968
Miscellaneous [10]			43,704,640		23,312,132		25,336,529
Total value, eliminating duplications			607,370,000		621,308,000		696,997,000

[1] Value included with "Miscellaneous."
[2] Value not included in total value for State.
[3] Figure not available.
[4] No canvass.
[5] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[6] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[7] Not valued as ore; value of recoverable metal content included with the metals.
[8] Exclusive of marble, value for which is included with "Miscellaneous."
[9] From lead smelting.
[10] Includes minerals indicated by "1" and "3" above.

Mineral products of the United States, 1944–46, by States—Continued

COLORADO

Product	1944		1945		1946	
	Quantity	Value	Quantity	Value	Quantity	Value
Arsenious oxide short tons	(1)	(1)	(1)	(1)	(1)	(1)

Sand and gravel—short tons	12,317,626	8,922,068	12,613,555	8,606,155	16,771,242	11,458,969
Sand and sandstone (ground)—do	158,673	1,098,275	144,212	1,003,273	144,753	1,061,046
Silver—troy ounces	2,437	1,733	2,198	1,563	2,302	1,860
Stone—short tons	10,680,640	10,700,140	10,950,940	11,384,625	15,635,470	16,891,933
Sulfuric acid (60° B.) [7]—do	234,245	[3] 2,328,395	216,482	[3] 2,186,468	187,082	[3] 1,825,920
Tripoli—do	12,031	205,732	11,144	184,189	15,631	321,600
Zinc—do	7,262	1,655,736	8,310	1,911,300	8,798	2,146,712
Miscellaneous [8]		6,036,014		5,288,334		6,088,950
Total value, eliminating duplications		330,961,000		332,052,000		355,578,000

[1] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[2] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[3] Value not included in total value for State.
[4] Value included with "Miscellaneous."
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metals.
[7] From zinc smelting.
[8] Includes minerals indicated by "4" above.

Mineral products of the United States, 1944–46, by States—Continued

INDIANA

Product	1944		1945		1946	
	Quantity	Value	Quantity	Value	Quantity	Value
Cement—barrels	(1)	(1)	(1)	(1)	(1)	(1)
Clay:						
Products, heavy clay (other than pottery and refractories)		[2] $2,800,000		[2] $3,405,844		[2] $7,845,000
Raw—short tons	[3] 88,397	[3] 99,625	[3] 434,530	[3] 429,868	[3] 983,669	[3] 1,004,877
Coal—do	27,961,883	62,917,512	25,182,611	58,337,026	21,818,000	55,418,000
Coke—do	8,821,021	[4] 74,079,053	7,814,247	[4] 68,458,007	6,651,567	[4] 59,312,827
Ferro-alloys—do	([1 4])	([1 4])	([1 4])	([1 4])		
Iron, pig—do	6,857,453	[4] 153,676,643	5,981,937	[4] 138,253,310	4,823,257	[4] 122,786,881
Lime—do	(1)	(1)	(1)	(1)	(1)	(1)
Marl, calcareous—do	12,400	4,064	22,705	8,766	38,175	19,080
Mineral paints (zinc and lead pigments)—do	([1 4])	([1 4])	([1 4])	([1 4])	([1 4])	([1 4])
Mineral waters—gallons sold	([5])	([5])	([5])	([5])	([5])	([5])
Natural gas—M cubic feet	1,014,000	794,000	1,543,000	1,223,000	2,010,000	1,568,000
Peat—short tons			514	2,545	676	3,124
Petroleum—barrels	5,118,000	7,080,000	4,868,000	6,890,000	6,726,000	10,750,000
Pyrites—long tons	(1)	(1)	(1)	(1)	(1)	(1)
Rubbing stones and whetstones—short tons	(1)	(1)	(1)	(1)	(1)	(1)
Sand and gravel—do	6,885,125	3,985,239	6,947,958	4,115,842	8,752,267	5,656,047
Stone—do	4,102,140	4,562,399	4,187,110	6,293,019	5,767,430	9,950,338
Sulfuric acid (60° B.)[6]—do	([1 4])	([1 4])	([1 4])	([1 4])	([1 4])	([1 4])
Miscellaneous [7]		10,653,975		12,303,176		18,169,228
Total value, eliminating duplications		90,465,000		89,856,000		107,800,000

[1] Value included with "Miscellaneous."
[2] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[3] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[4] Value not included in total value for State.
[5] No canvass.
[6] From zinc-roasting operation.
[7] Includes minerals indicated by "1" above.

IOWA

Cement—barrels	3,408,616	$5,677,787	3,527,838	$6,220,991	6,145,326	$11,312,627

Stone	do	910	48,000	3,760	93,089	68,530	385,828
Miscellaneous [6]			322,483		458,150		884,624
Total value, eliminating duplications			1,164,000		802,000		1,451,000

[1] Value included with "Miscellaneous."
[2] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[3] Sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[4] No canvass.
[5] "Government-and-contractor." Value of "Commercial" included with "Miscellaneous."
[6] Includes minerals indicated by "1" and "2" above.

NEW JERSEY

Aluminum	short tons	[1 2]	[1 2]				
Clay:							
Products, heavy clay (other than pottery and refractories)			[3] $3,500,000		[3] $1,808,723		[3] $3,780,000
Raw	short tons	[4] 98,903	[4] 600,331	[4] 252,664	[4] 794,564	[4] 488,161	[4] 1,296,358
Coke	do	1,022,917	[1 2]	1,284,020	[1 2]	1,258,854	[1 2]
Ferro-alloys	do	[1 2]	[1 2]	[1 2]	[1 2]	[1 2]	[1 2]
Iron ore	long tons	498,799	3,455,213	428,747	2,956,510	419,274	3,052,831
Lime	short tons	[1]	[1]	[1]	[1]	[1]	[1]
Magnesium oxide (magnesia)	pounds	[1]	[1]	[1]	[1]	[1]	[1]
Manganiferous residuum	short tons	247,402	[1]	224,331	[1]	205,786	[1]
Marl, greensand	do	4,908	505,651	4,986	477,919	5,140	424,900
Mineral paints (zinc and lead pigments)	do	[1 2]	[1 2]	[1 2]	[1 2]	[1 2]	[1 2]
Mineral waters	gallons sold	[5]	[5]	[5]	[5]	[5]	[5]
Ore (zinc)	short tons	543,007	[6]	522,177	[6]	413,755	[6]
Peat	do	15,025	116,511	[1]	[1]	20,902	127,550
Sand and gravel	do	[7] 4,514,374	[7] 5,081,861	4,506,379	4,652,938	5,123,324	5,404,206
Sand and sandstone (ground)	do	[1]	[1]	[1]	[1]	105,985	649,828
Silica (quartz)	do	[1]	[1]	[1]	[1]		
Stone	do	2,211,690	3,321,978	[8] 2,261,750	[8] 3,498,182	3,419,210	5,239,342
Zinc [9]	do	80,288	14,080,644	81,392	14,299,032	64,454	11,701,346
Miscellaneous [10]			15,521,134		14,496,937		15,260,706
Total value, eliminating duplications			33,828,000		31,267,000		33,518,000

[1] Value included with "Miscellaneous."
[2] Value not included in total value for State.
[3] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[4] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metal.
[7] "Commercial." Value of "Government-and-contractor" included with "Miscellaneous."
[8] Exclusive of dimension basalt, value for which is included with "Miscellaneous."
[9] Value reported for zinc in New Jersey is estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[10] Includes minerals indicated by "1," "7," and "8" above.

Mineral products of the United States, 1944–46, by States—Continued

NEW YORK—Continued

Product		1944		1945		1946	
		Quantity	Value	Quantity	Value	Quantity	Value
Petroleum	barrels	4,697,000	$15,640,000	4,648,000	$17,470,000	4,863,000	$18,650,000
Pyrites	long tons	(1)	(1)	(1)	(1)	(1)	(1)
Salt	short tons	2,925,675	9,899,580	2,862,224	10,327,013	2,813,782	10,153,274
Sand and gravel	do	7,049,583	4,308,390	7,477,628	5,049,905	12,079,249	8,907,100
Silver	troy ounces	25,238	17,947	14,271	10,148	15,786	12,755
Slate			791,093		(1)		1,160,404
Stone	short tons	7,454,160	8,073,778	7,900,560	9,133,781	9,939,440	12,086,748
Talc	do	(1)	(1)	(1)	(1)	(1)	(1)
Titanium concentrates: Ilmenite	do	216,253	(1)	240,090	(1)	209,009	(1)
Wollastonite	do	(1)	(1)	(1)	(1)	(1)	(1)
Zinc	do	35,541	8,103,348	24,978	5,744,940	32,515	7,933,660
Miscellaneous [8]			64,911,555		46,310,583		37,604,558
Total value, eliminating duplications			87,638,000		91,968,000		108,270,000

[1] Value included with "Miscellaneous."
[2] Value not included in total value for State.
[3] Exclusive of natural cement, value for which is included with "Miscellaneous."
[4] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[5] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[6] No canvass.
[7] Not valued as ore; value of recoverable metal content included with the metals.
[8] Includes minerals indicated by "1" and "3" above.

NORTH CAROLINA

Aluminum	short tons	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)
Asbestos	do	(1)	(1)	(1)	(1)	(1)	(1)
Barite	do	(1)	(1)	(1)	(1)		
Beryllium concentrates	do	(1)	(1)				
Bromine	pounds	(1)	(1)	(1)	(1)		
Clay:							
Products, heavy clay (other than pottery and refractories)			[3] $2,700,000		[3] $3,471,219		[3] $6,241,000
Raw	short tons	[4] 25,663	[4] 423,821	[4] 525,506	[4] 783,220	[4] 914,999	[4] 1,178,030
Copper	pounds	(1)	(1)				
Feldspar (crude)	long tons	122,857	778,007	148,493	863,740	230,367	1,200,638
Flint lining for tube mills	short tons	(1)	(1)	(1)	(1)	(1)	(1)
Gem stones			(5)		(5)		(5)
Gold	troy ounces	21	735				
Lime	short tons	(1)	(1)	(1)	(1)		
Lithium minerals	do	(1)	(1)	(1)	(1)		

Mica:							
Scrap	do	29,774	750,285	30,682	709,334	39,100	887,901
Sheet	pounds	814,874	1,530,625	563,990	243,058	424,791	135,505
Millstones			(1)		(1)		(1)
Mineral waters	gallons sold	(5)	(5)	(5)	(5)	(5)	(5)
Olivine	short tons	3,270	35,207	(1)	(1)	6,249	(1)
Ores (crude): Copper	do	6,438	(6)				
Pebbles for grinding	do	(1)	(1)				
Quartz crystal	pounds	(7)	(7)	3,644	116,300	(1)	(1)
Sand and gravel	short tons	2,535,601	1,405,917	2,394,089	1,517,203	4,213,795	2,933,711
Sand and sandstone (ground)	do	(1)	(1)				
Silica (quartz)	do	(1)	(1)	(1)	(1)	(1)	(1)
Silver	troy ounces	1,461	1,039				
Stone	short tons	4,659,540	5,975,951	[8] 2,297,670	[8] 2,965,458	4,505,880	6,835,448
Talc, pyrophyllite, and ground soapstone	do	69,892	645,156	78,369	682,510	87,718	976,524
Tantalum and columbium ores: Columbium ore	pounds	(1)	(1)	(1)	(1)		
Tin (metallic equivalent)	do	100	50				
Titanium concentrates: Ilmenite	short tons	16,333	(1)	17,216	(1)	17,852	(1)
Tungsten concentrates (60-percent WO_3 basis)	do	186	(1)	132	(1)	307	(1)
Vermiculite	do	(1)	(1)	(1)	(1)	(1)	(1)
Miscellaneous [9]			17,221,581		12,668,510		7,685,377
Total value, eliminating duplications			22,199,000		14,766,000		20,428,000

[1] Value included with "Miscellaneous."
[2] Value not included in total value for State.
[3] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[4] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metals.
[7] Figure not available.
[8] Exclusive of marble and sandstone, values for which are included with "Miscellaneous."
[9] Includes minerals indicated by "1" and "8" above.

NORTH DAKOTA

Clay:							
Products, heavy clay (other than pottery and refractories)			(1 2)		(1 2)		(1 2)
Raw	short tons	(1 3)	(1 3)	[3] 6,026	[3] $4,450	(1 3)	(1 3)
Coal	do	2,366,092	$3,535,000	2,522,319	3,924,000	2,691,000	$4,655,000
Mineral waters	gallons sold	(4)	(4)	(4)	(4)	(4)	(4)
Natural gas	M cubic feet	200,000	65,000	217,000	80,000	315,000	126,000
Sand and gravel	short tons	2,127,029	733,340	1,769,086	523,163	2,304,694	726,422
Miscellaneous [5]			60,024		50,514		90,680
Total value, eliminating duplications			4,393,000		4,578,000		5,587,000

[1] Value included with "Miscellaneous."
[2] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[3] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[4] No canvass.
[5] Includes minerals indicated by "1" above.

Miscellaneous 9		17,756,962		11,230,845		6,535,529
Total value, eliminating duplications		9,657,000		9,463,000		11,783,000

1 Value included with "Miscellaneous."
2 Value not included in total value for State.
3 Figure not available.
4 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
5 1944, sold or shipped, 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
6 No canvass.
7 Not valued as ore; value of recoverable metal content included with the metals.
8 Exclusive of sandstone and unclassified stone in 1945 and granite and dimension basalt in 1946, values for which are included with "Miscellaneous."
9 Includes minerals indicated by "1," and "8" above.

See footnotes at end of table.

Mineral products of the United States, 1944–46, by States—Continued

TEXAS—Continued

Product		1944		1945		1946	
		Quantity	Value	Quantity	Value	Quantity	Value
Sulfur	long tons	2,874,478	$45,991,648	3,069,815	$49,117,040	3,188,086	$51,009,372
Sulfuric acid (60° B.) [9]	short tons	(14)	(14)	(14)	(14)	(14)	(14)
Sulfur ore	long tons	1,550	7,750	1,300	6,500	(1)	(1)
Tungsten concentrates (60-percent WO_3 basis)	short tons					1	(1)
Vermiculite	do					(1)	(1)
Zinc	do					44	10,736
Miscellaneous [10]			36,998,659		22,443,374		7,662,705
Total value, eliminating duplications			1,319,266,000		1,359,603,000		1,518,111,000

[1] Value included with "Miscellaneous."
[2] 1944: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945–46: Figures obtained through cooperation with Bureau of the Census.
[3] 1944, sold or shipped. 1945–46, sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[4] Value not included in total value for State.
[5] No canvass.
[6] Figure covers fiscal year ended June 30 of year stated.
[7] Not valued as ore; value of recoverable metal content included with the metals.
[8] Exclusive of basalt and dimension unclassified stone, values for which are included with "Miscellaneous."
[9] From zinc smelting.
[10] Includes minerals indicated by "1" and "8" above.

Employment and Injuries
in the Mineral Industries

By FORREST T. MOYER

	PAGE		PAGE
General summary	74	Quarries	85
Coal mines	79	Coke plants	88
Metal mines	82	Metallurgical plants	89
Nonmetal mines	85		

GENERAL SUMMARY

LABOR supply in the mineral industries was no longer a serious problem in 1946, and the average number of men working daily increased to 674,700. The labor shortage, which had become progressively more acute in the extractive industries throughout the war years, apparently was eased rapidly after the downtrend in employment was reversed shortly after the end of the war in the latter part of 1945. However, labor-management relations in 1946 were unsettled and widespread, and extended work stoppages occurred in several important segments of the mineral industries. In addition, strikes in certain mineral-consuming industries had pronounced adverse effects on employment in some of the extractive industries. As a result, total worktime dropped to about 1⅓ billion man-hours in 1946 or 7 percent below 1945. Total man-hour data on the mineral industries for 1931–43 are revised in this chapter to include estimated time required for travel and lunch in bituminous-coal mines.

The safety record of the extractive industries receded in 1946, and the over-all frequency of injuries increased from 52.59 per million man-hours of work in 1945 to 55.43 in 1946. Fatality experience

Salient statistics of employment and injury experience in the mineral industries in the United States, 1942–46, by mineral industry groups

	1942	1943	1944	1945	1946 [1]
Average number of men working daily: [2]					
Coal mines	530,861	486,516	453,937	[3] 437,000	457,500
Metal mines	99,769	88,039	70,480	61,470	65,500

Total	55.45	53.01	51.57	51.71	54.58

[1] Preliminary figures based on average of 83 percent coverage.
[2] Average number of men at work each day mine was active. Because absenteeism and labor turn-over are taken into consideration, this number is lower than number of men available for work as measured by a count of names on pay roll.
[3] Preliminary figure based upon 75 percent coverage of the industry.
[4] Average in which operating time of each mine is weighted by average number of workers in mine.
[5] Totals of man-days and man-hours are additions of the rounded subtotals and may differ slightly from totals obtained before rounding.
[6] Data included for bituminous-coal mines are on portal-to-portal basis. See accompanying table "Employment and injury experience at bituminous-coal mines in the United States, 1930–46, on working time and portal-to-portal bases."
[7] Data included for anthracite mines are revised.

was improved in 1946, and both the total of 1,161 fatalities and the rate of 0.85 per million man-hours were lower than in 1945. The number of nonfatal injuries—74,425—was lower than in 1945; but, owing to the reduced worktime, these injuries occurred at a rate of 54.58 per million man-hours compared with 51.71 in 1945.

A principal factor in the retrogression of mine safety during 1946 was incomplete training in safe job methods for the experienced men shifted into new occupations and for the new and inexperienced workers hired as the labor force was expanded. An analysis of 2,547 detailed descriptions of injuries in 26 scattered coal mines in 1946 reveals that 588 injuries happened to men with 6 months or less experience in the mining occupation at which they were injured. These 588 injuries comprised 5 fatal and 583 nonfatal cases, which were, respectively, 15 and 23 percent of the 34 fatal and 2,513 nonfatal injuries comprising the total sample. The imperative need for training in safe work-procedures also was emphasized by the experience of the portland-cement industry, which has an outstanding record in accident prevention. Classification of 10 fatal- and 456 nonfatal-injury descriptions [1] in cement quarries and plants during 1946 shows that 7 of the fatalities and 217 of the nonfatal injuries involved men with 6 months or less experience in the occupation at which they were injured. The higher proportion of injuries (48 percent) to inexperienced men in the cement industry compared with the corresponding 23 percent in coal mining may be correlated with the difference in expansion of the labor force in 1946. In cement, the number of workers increased 24 percent, whereas the gain in coal was only 5 percent.

Labor-management relations in the conversion from wartime to peacetime operating and working conditions floundered throughout 1946. Disputes centering principally on questions of wages and hours of work resulted in 566 work stoppages in the mining and quarrying industries and 134 in the nonferrous smelting, refining, and alloying industries, according to the United States Department of Labor. In mining and quarrying the strikes caused a loss of 21,417,900 man-days of work, and in nonferrous smelters and refineries the loss was 4,280,000 man-days. As in 1945, most of the stoppages and loss of time during 1946 were in the coal industries. In bituminous-coal mines, 485 strikes caused a loss of 19,500,000 man-days of work, and in anthracite mines 34 stoppages caused 649,000 man-days of idleness. The total of 1,190,000 man-days of work lost in 18 work-stoppages in metal mines affected principally the Lake Superior iron-mining district and the copper mines in the Western States. There were two major strikes in bituminous-coal mines. In the first, which began April 1, labor and management could not reach agreement, and the Federal Government entered the controversy by seizing the struck mines on May 22. Mine safety was a first consideration in the negotiations of this dispute from its start. The Government-union agreement reached on May 29 provided, among other stipulations, for a Federal mine safety code and a health and welfare fund financed by a 5-cent royalty on each ton produced for use or sale. Government operation of the mines continued through 1946. The

[1] Portland Cement Association, Accident Round Table, 1946.

second bituminous-coal strike began November 21 and was ended December 7 by the union on instructions contained in an injunction obtained by the Government. An industry-wide stoppage of 8 days duration in anthracite mines was ended early in June by a labor-management agreement which contained provisions for a Federal mine safety code and a health and welfare fund supported by a 5-cent royalty on each ton produced for use or sale.

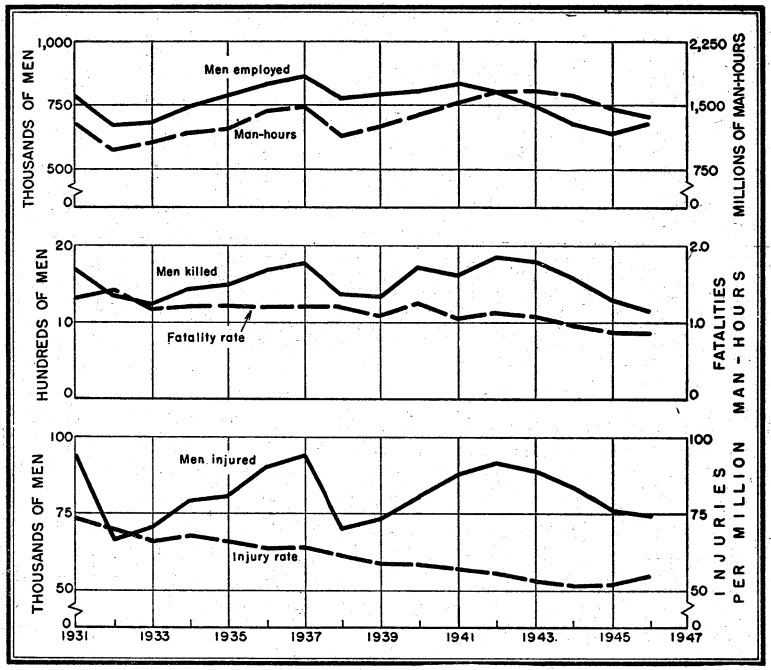

FIGURE 1.—Trends in employment and injury experience in the mineral industries of the United States, 1931–46.

The average number of men working in 1946 was higher in all major branches of the mineral industries but coke and metallurgical plants. However, the totals of man-days and man-hours of work were well below 1945 in each of these segments with the exception of nonmetal mines and quarries. The 7-percent drop in total worktime in the mineral industries resulted from declines in coal and metal mines and coke and metallurgical plants, each of which was affected seriously by work stoppages. No strikes were reported at coke plants in 1946, but the coal and steel strikes had adverse effects upon worktime at the coke operations. Man-hours of work were higher than in 1945 in nonmetal mines and the quarry industries only. Operating activity in each of the quarry industries, as measured by man-hours of work, increased sharply in 1946, owing primarily to the revived demand for quarry products in the construction industry, which recovered from its wartime slump.

The average employee in the extractive industries worked only 244 days in 1946 or 29 less than in 1945. The average length of shift

Employment and injury experience of the mineral industries of the United States, 1931–46

Year	Men working daily	Average active days	Man-days worked	Man-hours worked [1]	Number of injuries		Injury rates per million man-hours

[1] Data for 1931–43 are revised by including estimated time required for travel and lunch in bituminous coal mines. This places man-hours of bituminous-coal mines on a portal-to-portal basis.
[2] Data for 1931–42 are revised by changes that affected only the Pennsylvania anthracite industry. See Injury Experience, Exposure-to-Hazard, and Productivity at Coal Mines in the United States in 1943 Bureau of Mines H. S. S. 353, June 19, 1946, pp. 5 and 14.
[3] Revised for 1931–43 as affected by changes in man-hours and nonfatal injuries.
[4] Preliminary in part.
[5] Preliminary.

was 8.29 hours compared with 8.42 in 1945, and the worktime per man-year totaled 2,021 man-hours or 278 less than in 1945. The decline in worktime in the mineral industries in 1946 is traceable directly to the work stoppages during the year.

The total of 1,161 fatal injuries in 1946 was lower than in any other year since complete fatality statistics in the mineral industries first were compiled in 1911. The number of fatalities was reduced from 1945 in coal mines, metal mines, quarries, and coke plants; was unchanged in metallurgical plants; and was higher only in nonmetal mines. However, owing to the sharp reductions in man-hours of work, fatality experience in 1946, as measured by the frequency rate, was improved over 1945 only in the metal-mining, quarrying, and coking industries. In coal mines the rate of occurrence of fatalities was unchanged from 1945, and in nonmetal mines and metallurgical plants the frequency was less favorable.

Nonfatal-injury experience receded in 1946 and the frequency of occurrence of these injuries was higher than in 1945 in each of the mineral industries. Although the number of nonfatal injuries was reduced from 1945 in coal mining and in metallurgical plants, the rate of occurrence per million man-hours of work in these groups was higher in 1946 owing to the lower total work-time. In other groups of the extractive industries, both the number of nonfatalities and the frequency of occurrence were higher in 1946 than in 1945.

There were 2 major disasters—those in which 5 or more lives were lost in a single accident—in the mineral industries in 1946. Both major disasters were coal-mine explosions, which caused a total loss of 27 lives. In 1945, there were 5 disasters, all in coal mines, in which 68 men were killed.

COAL MINES

Fewer men were killed in coal mines in 1946 than in any other year since complete fatality statistics first were compiled in 1910. The 1946 total of 974 represented 105 fewer fatalities than in 1945 and was appreciably below the 1,064 fatal injuries in the depression year 1933, which had the next lowest annual total in statistical coal history. The frequency of occurrence remained unchanged from 1945 at 1.10 per million man-hours in 1946, owing to the reduction in total worktime. On a tonnage basis, the fatalities occurred at a rate of 1.64 per million tons of coal mined compared with 1.71 in 1945. The number of nonfatal injuries was reduced by 2,550 to a 1946 total of 56,800. These injuries occurred at rates of 64.25 per million man-hours and 95.90 per million tons compared with corresponding rates of 60.32 and 93.87 in 1945. Employment gained in 1946, but man-days and man-hours of work were appreciably lower than in 1945 owing to work stoppages. Coal mines were active an average of 230 days or 32 less than in 1945. The average length of shift was 8.41 hours, and the total worktime per man-year was 1,932 hours or 320 less than in 1945.

BITUMINOUS COAL

Employment.—The average number of men working daily in bituminous-coal mines advanced to 380,000, a 5-percent gain over 1945. Results of a monthly canvass of bituminous-coal operations showed an irregular month-to-month uptrend (in months of no strikes) in employment from 372,000 in January to 381,000 in June. During April, when the industry was nearly shut down, the average number of men working daily fell to 62,000, and many of these men were performing only maintenance or supervisory work. During the 2-week

[4] Revised.

truce period in mid-May, the mines had approximately a normal working force in all States except Pennsylvania, where relatively few of the striking miners returned to work. As a result, the number of men working in the industry was only 299,000 men during May. The level of employment held at approximately 380,000 from June through September and increased through October to a November total of 385,000 men. In December the average declined to 382,000 men, owing probably to absenteeism over the holidays. Because of the widespread strikes in the spring and early winter of 1946, the mines were active an average of only 221 days, or 40 less than in 1945. Hence, despite the enlarged labor force, total worktime (on a portal-to-portal basis) dropped to 730 million man-hours or 13 percent below 1945 and production declined to a total of 532 million tons in 1946. The average miner worked an average shift of 8.70 hours (on portal-to-portal basis) and had a total work-year of only 1,921 man-hours—396 hours lower than in 1945.

Injuries.—In all, 800 men were killed at work in bituminous-coal mines in 1946, the lowest number in any year since complete fatality statistics were begun in 1910. This was 136 fewer fatal injuries than in 1945 and 33 less than in 1933, when the next lowest number of men lost their lives. The 1946 fatalities occurred at rates of 1.10 per million man-hours and 1.50 per million tons of coal mined, both of which were the lowest in the statistical history of the industry. Comparable frequencies in 1945 were 1.11 per million man-hours and 1.62 per million tons. The tonnage rate in 1946 was the lowest in a history extending back to 1874.

The total of 44,000 nonfatal injuries was 3,750 less than in 1945, but as worktime was sharply lower in 1946 these injuries occurred at a rate of 60.27 per million man-hours compared with 56.78 in 1945. As pointed out in the General Summary, incomplete training of new employees and of experienced workers transferred into new occupations as the labor force was expanded was an important factor in the unfavorable injury experience. The tonnage rate of nonfatal injuries in 1946 was 82.71 per million tons and in 1945 was 82.67.

Two major disasters, both mine explosions, occurred in 1946 and caused a loss of 27 lives. The first explosion was on January 15 in a West Virginia mine and killed 15 men. The second was on April 18 in a semianthracite mine in Virginia and killed 12 men. The loss of life in major disasters in 1946 was the third lowest in the statistical series on coal-mine accidents, and lower totals were recorded only in 1933 and 1934—respectively 7 and 22.

Of the total fatalities, 734 occurred in underground workings, 44 in surface works associated with deep mines, and 22 in strippings. In underground workings, falls of roof and face caused 445 fatalities, haulage 164, explosions (major and local) 30, machinery 27, and electricity 24 fatal injuries.

Conversion to Portal-to-Portal Base.—Man-hour data on bituminous-coal mines for 1930–46 are converted from a working time to a portal-to-portal basis for the first time in this chapter. In the 1943 wage agreement, which became generally effective in November 1943, the portal-to-portal length of shift for underground workers was made 9 hours, of which 8¾ hours was paid time (actual work or face time

plus travel time plus 15 minutes of lunch time staggered so as not to interfere with production) and ¼ hour was lunch time for which no pay was received. The April 1945 wage contract made total portal-to-portal time (a 9-hour shift) the pay basis for underground men by eliminating lunch time through staggering it so as not to interfere with production. Bituminous-coal producers in 1944 reported data on man-hours of exposure, average travel time, and lunch time to the Accident Analysis Division, Bureau of Mines. Consideration of all reported data permitted an accurate determination of working or face time and portal-to-portal time for underground employees in each mine. These data yielded an average of 1.0033 hours per man-day as the time spent for travel and lunch by underground employees in the industry in 1944. However, in 1944 most bituminous-coal mines had only ¼ hour of lunch time for which no pay was given, whereas in 1943 and earlier years nearly all mines had one-half hour for lunch without pay. Hence the conversion factor of 1.0033 per man-day underground in 1944 was increased by one-quarter hour to reach a factor of 1.2533 hours per man-day of underground work in 1943 and earlier years. The factor 1.2533 was applied without change to the reported underground man-days of work for each year back to 1930. The resulting man-hours required for travel and lunch were added to the company-reported data on man-hours at the face to obtain an estimated man-hour total on a portal-to-portal basis for each year. The conversion from working time to portal-to-portal time is not projected beyond 1930, as this was the first year for which coal producers reported man-hours of exposure for accident-statistics data.

Data in the accompanying table show total man-hours of exposure for the bituminous-coal industry on both working-time and portal-to-portal bases. The differences in the injury rates, which also are shown on the two bases, are noteworthy. The conversion to portal-to-

Employment and injury experience at bituminous-coal mines in the United States, 1930–46, on working-time and portal-to-portal bases

[1] Preliminary data

portal time results in average reductions of 12 percent in both the fatal- and nonfatal-injury rates from 1930 through 1943. In 1944 the differences in the rates were 9 percent or a reduction of smaller proportions than in earlier years owing to the differences between lunch times in 1944 and earlier years for which no pay was received.

Injuries to underground men while traveling in or out of the mine or while eating lunch always have been reported by the producers to the Bureau of Mines. Combination of this count of injuries with the portal-to-portal man-hours yields true injury-frequency rates for bituminous-coal mines.

Inasmuch as the bituminous-coal industry represents a large proportion of the total mineral industry, conversion to a portal-to-portal base has an appreciable effect on the over-all man-hour and injury rates for mineral industries. The revised aggregate data on mineral industries are listed in the second table in the General Summary.

ANTHRACITE

Employment.—Employment at anthracite operations gained 5 percent over 1945 to a total of 77,500 men in 1946. Despite an 8-day work stoppage at the end of May and the beginning of June, the anthracite operations were worked an average of 274 days, or 7 more than in 1945. As a result, the enlarged labor force worked 154 million man-hours in 1946, or 8 percent above the 1945 worktime. Production from underground mines, strippings, culm banks, and dredges increased to 60,282,000 tons. This tonnage excludes "bootleg" coal purchased and prepared by recognized producers. The average employee in 1946 worked a 7.26-hour shift and performed 1,987 man-hours of work, or 55 hours more than in 1945.

Injuries.—Injury experience at anthracite operations was less favorable in 1946 than in 1945, and both the numbers and frequencies of fatal and nonfatal injuries were higher. The 174 fatalities occurred at frequency rates of 1.13 per million man-hours and 2.89 per million tons of clean coal in 1946; whereas the respective rates were 1.00 and 2.62 for the 143 fatalities in 1945. The total of 12,800 nonfatal injuries in 1946 had frequencies of 83.12 per million man-hours and 212.34 per million tons compared with a total of 11,600 injuries at corresponding rates of 81.12 and 212.17 in 1945.

At anthracite operations, 153 of the fatal injuries happened in underground workings, 12 in surface works, and 9 in strippings. Falls of roof and face caused 104 fatalities or 68 percent of the total in underground workings. There were no major disasters in the anthracite industry during the year, and up to the close of 1946 only one such disaster had occurred in 8½ years.

METAL MINES

Injury experience in metal mines was less favorable in 1946 and the total injury-frequency rate (fatal and nonfatal) rose to 55.58 per million man-hours from 49.68 in 1945. The safety record was moderately to sharply worse in 1946 in each of the metal-mining groups except in lead-zinc mines, for which a moderately improved record was indicated. Employment gained to an average of 65,500 men who

worked a total of 131,010,000 man-hours or 8 percent below 1945. In 1946 these men worked an average 8.07-hour shift for 248 days and had an average workyear of 2,000 man-hours compared with an average 8.00-hour shift on 288 days for a total of 2,306 man-hours during 1945.

IRON

Employment.—The average number of men at work daily in iron mines increased about 1,000 over 1945 to a total of 24,500 in 1946. Owing principally to extensive work stoppages in the Lake Superior district in the early months of 1946, the mines were operated an average of only 226 days, whereas in 1945 the average was 286 days. As a result, man-hours and man-days of work each declined 17 percent from 1945. The average employee worked an 8.01-hour shift and had 1,812 hours of work in 1946 compared with 2,294 hours in 1945.

Employment and injury experience at metal mines in the United States, 1944–46, by industry groups [1]

	Men working daily	Average active mine-days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours	
					Fatal	Non-fatal	Fatal	Non-fatal
Iron mines:								
1944	25,852	282	7,299,664	58,557,525	39	1,412	0.67	24.11
1945	23,443	286	6,696,157	53,781,487	36	1,326	.67	24.66

1946	3,000	267	802,000	6,420,000	--------	610	--------	95.02

[1] Data for 1946 are preliminary.
[2] Revised figures.
[3] Includes antimony, bauxite, chromite, cobalt, manganese, mercury, molybdenum, pyrite, titanium, tungsten, and vanadium-uranium mines.

Injuries.—The number of fatal and nonfatal injuries in iron mines decreased to 25 and 1,200, respectively, from 36 and 1,326 in 1945. However, owing to the reduced man-hours of exposure, the fatality rate was improved only slightly over 1945, and the nonfatality rate of 27.03 lost-time injuries per million man-hours in 1946 was well above the 24.66 rate in 1945.

COPPER

Employment.—Employment at copper mines declined 6 percent from 1945 to a total of 13,600 men working daily in 1946. The decline resulted primarily from lower employment reported for Michigan and Montana operations. Owing in part to local labor-management disputes at several large mines, the weighted average days active for all mines fell from 305 in 1945 to 275 in 1946. As indicated by reported man-hours of work, the activity of open-pits was about one-fifth and of underground mines about one-tenth below 1945. Total man-hours at all copper mines were 16 percent less than in 1945. In 1946 the average shift was 8.00 hours and the average work-year per man 2,199 man-hours, or 240 less than in 1945.

Injuries.—Although the injury record for copper mines had improved sharply in 1945, all of the improvement was lost in 1946. Injury rates in 1946 were 0.77 fatal and 52.32 nonfatal injuries per million man-hours compared with 0.65 and 43.16 in 1945. In 1946 injuries occurred more frequently in both open-pit and underground operations. Despite the marked reduction in total time of exposure, there were as many fatalities and slightly more nonfatal injuries in 1946 as in 1945.

LEAD-ZINC

Employment.—Available reports indicate that employment in lead-zinc mines advanced over 1945 to a total of 16,200 men in 1946. However, the total man-hours worked in these mines were slightly lower than in 1945 because the mines were operated an average of 257 days in 1946 or 35 less than in 1945. The average employee worked an 8.11-hour shift for a total of 2,085 man-hours in 1946, or 248 hours below 1945.

Injuries.—The more favorable injury record of lead-zinc mines in 1946 resulted from an improvement in nonfatal-injury experience. A total of 29 fatal injuries in 1946, the same as in 1945, occurred at a rate of 0.86 per million man-hours of exposure to hazard. Nonfatal injuries totaled 2,830 in 1946 and had a frequency of 83.78 per million man-hours in 1946, or slightly lower than in 1945.

GOLD AND SILVER LODE

Employment.—The average number of men at work in gold and silver lode mines during 1946 totaled 4,500, a gain of 13 percent over 1945. Although the mines were worked an average of 31 days less than in 1945, the enlarged labor force had a total worktime 5 percent greater than in 1945. Each employee worked an average shift of 7.94 hours and had a workyear of 2,056 man-hours in 1946—160 hours below 1945.

Injuries.—Injury experience in 1946 was considerably worse than in 1945. The number of fatalities doubled to a total of 8 in 1946, and these occurred at a frequency of 0.86 per million man-hours. Nonfatal injuries increased to 765 in 1946, or 209 more than in 1945. The nonfatal frequency rate of 82.70 in 1946 was appreciably higher than in 1945.

GOLD PLACER

Employment.—Employment at gold placers doubled in 1946 to a total of 3,700 men, who worked an average of 222 days or 47 days

more than in 1945. Man-hours worked in placers during 1946 nearly tripled the 1945 total. The average length of shift was 8.85 hours, and the average hours worked per man-year totaled 1,962, or 487 man-hours more than in 1945.

Injuries.—The number of nonfatal injuries increased sharply to 225 in 1946 owing to the greater time of exposure. These injuries occurred at a rate of 30.99 in 1946 compared to 23.85 in 1945. There was 1 fatality in 1946 and none in 1945.

MISCELLANEOUS METAL

Employment.—The labor force of 3,000 men in 1946 was virtually the same as in 1945 in the mines of this group, which includes antimony, bauxite, chromite, cobalt, manganese, mercury, molybdenum, pyrite, titanium, tungsten, and vanadium-uranium operations. However, the mines were operated an average of 12 days less than in 1945, so that the total man-hours of work declined slightly in 1946. The average length of shift was 8.00 hours and the average workyear per man was 2,140 hours, or 100 hours below 1945.

Injuries.—No fatalities were reported during 1946 at any of the mines in this group, whereas 4 occurred in 1945. However, the number of nonfatal injuries increased in 1946 more than 100 to a total of 610, which occurred at a frequency of 95.02 per million man-hours, or well above the 1945 rate.

NONMETAL MINES

Employment.—The average number of men at work daily increased 16 percent over 1945 to a 1946 total of 12,000 men in this group of mines, which comprises barite, feldspar, fluorspar, gypsum, magnesite, mica, phosphate rock, rock salt, sulfur, and miscellaneous nonmetallic-mineral operations. As these mines were worked an average of only 4 days less than in 1945, the total man-hours of work gained appreciably in 1946. The average man worked a 7.99-hour shift and a total of 2,290 hours during the year.

Injuries.—The safety record of nonmetal mines was less favorable than in 1945, and both fatal and nonfatal injuries occurred more frequently in 1946. The 24 fatalities were 8 more than in 1945, and the frequency of 0.87 per million man-hours was well above the 1945 rate. There were 245 more nonfatal injuries in 1946 than in 1945, and the total of 1,390 occurred at a rate of 50.58 compared with 46.52 in 1945.

QUARRIES

Over-all injury experience in the quarry industries in 1946 was changed only slightly from 1945. The rate of occurrence of fatal injuries was reduced in 1946 but this improvement was compensated for by a slightly less favorable frequency of nonfatal injuries. The combined rate of fatal and nonfatal injuries was 33.42 in 1946 compared with 32.83 in 1945. Operating activity in each of the quarry industries increased in 1946 and the total man-hours worked in all quarries was 28 percent greater than in 1945. The increased activity resulted in a sharp gain in employment to a total of 73,500 men or 26 percent above 1945. Also, the average days of operation of all quar-

ries was increased to 270 in 1946. The average worker had an 8.17-hour shift and had a total of 2,209 man-hours of work during the year compared with an 8.27-hour shift and 2,186 hours of work in 1945.

CEMENT

Employment.—Employment in cement quarries and mills gained sharply over 1945 to a total of 25,800 men who worked an average of 311 days in 1946 or 26 days more than in 1945. As a result, man-hours of worktime were nearly one-third above 1945. The average length of shift was 7.92 hours, and the work-year per man in 1946 was 2,462 hours—157 hours longer than in 1945.

Employment and injury experience at nonmetal mines and quarries in the United States, 1944–46, by industry groups [1]

[1] Data for 1946 are preliminary.
[2] Includes barite, feldspar, fluorspar, gypsum, magnesite, mica, phosphate rock, rock salt, sulfur, and miscellaneous nonmetallic-mineral mines.
[3] Includes burning or calcining and other mill operations.

Injuries.—The longer time of exposure to hazard in 1946 was accompanied by an increase in the number of both fatal and nonfatal injuries. The 11 fatalities in 1946 occurred at a rate of 0.17 per million man-hours, a slight improvement over 1945. The frequency of nonfatalities was less favorable, and the rate of occurrence of these injuries rose to 13.30 in 1946 compared with 12.48 in 1945.

LIMESTONE

Employment.—The average number of men at work daily in limestone operations advanced to 22,600 in 1946; these men worked an average of 226 days for 43,270,000 man-hours, or 23 percent more than in 1945. The average length of shift was 8.47 hours, and each employee worked an average of 1,915 hours during the year.

Injuries.—The preliminary totals of 26 fatal and 2,015 nonfatal injuries were higher than in 1945 and occurred at respective frequencies of 0.60 and 46.57 per million man-hours. The rate of fatalities improved slightly in 1946; but for nonfatal injuries the rate was considerably less favorable than in 1945, when the frequency was 39.25.

LIME

Employment.—Employment at lime plants and associated quarries increased to 9,000 men in 1946; and, as the plants were active an average of 2 days longer, the total man-hours of work were 10 percent greater than in 1945. The average worker in the lime industry had a shift of 8.01 hours and a workyear of 2,400 hours, which was virtually the same as in 1945.

Injuries.—Fatality experience in 1946 was improved sharply; the 3 fatal injuries occurred at a rate of 0.14 per million man-hours, whereas in 1945 the 8 fatalities had a frequency rate of 0.41. The estimated total of 1,055 nonfatal injuries was higher than in 1945; but, owing to the increased time of exposure, the rate of occurrence remained at the same level in 1946.

MARBLE

Employment.—Reports indicate that 2,700 men were working daily in marble operations in 1946, a sharp gain over 1945 which resulted in a similar increase in the total man-hours worked. The average length of shift in 1946 was 8.60 hours, and the average number of hours per man-year was 2,200.

Injuries.—The industry was free of fatal accidents in 1946 compared with 2 fatalities in 1945. The nonfatal-injury rate was reduced appreciably—from 43.24 in 1945 to 30.30 per million man-hours in 1946.

GRANITE

Employment.—Employment in 1946 increased appreciably to a total of 5,700 men who worked an average of 250 days for a total worktime that was more than one-third above 1945. The average man had a shift of 8.41 hours and a workyear of 2,100 hours.

Injuries.—Despite the greater time of exposure, the number of fatalities was reduced in 1946 to 3, a frequency of 0.25 per million man-hours, or less than one-third the rate in 1945. The 510 nonfatal injuries occurred at a rate of 42.61, which was well below the 1945 frequency.

TRAPROCK

Employment.—The number of men working at traprock quarries increased to 2,900, who worked an aggregate of 5,590,000 man-hours, or 35 percent more than in 1945. The average employee worked an 8.38-hour shift and had a total worktime of 1,928 hours during the year.

Injuries.—There were 3 fatalities in the industry in 1946, whereas in 1945 none occurred. Although the number of nonfatal injuries was greater in 1946, the rate of occurrence—45.62 per million man-hours—was moderately below the 1945 rate.

SLATE

Employment.—An average of 1,300 men worked in slate quarries in 1946, a marked gain over 1945. The quarries were operated an average of 19 days longer in 1946, and the aggregate total worktime increased sharply over 1945. The average shift was 9.20 hours, and the average hours per man-year were 2,554, or 225 hours more than in 1945.

Injuries.—The preliminary totals of 2 fatalities and 180 nonfatalities in 1946 occurred at frequencies of 0.60 and 54.22 per million man-hours of work. These rates were less favorable than the corresponding frequencies in 1945.

SANDSTONE

Employment.—Employment at sandstone quarries advanced to a total of 3,500 men who worked an average of 253 days for an aggregate of 7,110,000 man-hours, 31 percent above 1945. The average employee had a shift of 8.02 hours and a man-year total of 2,031 hours.

Injuries.—Injury experience was improved markedly in 1946, and the frequencies of both fatal and nonfatal injuries were well below the 1945 rates. The 2 fatal and 335 nonfatal injuries occurred at respective rates of 0.28 and 47.12 per million man-hours of work in 1946.

COKE PLANTS

The fatality record of coke plants was improved sharply in 1946, but the nonfatality experience was less favorable than in 1945. Total employment declined in 1946, because fewer men were working in byproduct plants, more than compensating for the gain in employment at beehive plants. Apparently the byproduct plants during the extensive coal and steel strikes in 1946 worked on a longer than ordinary coking cycle and hence required fewer men in these periods.

BYPRODUCT COKE

Employment.—The average number of men working in byproduct-coke plants declined 9 percent from 1945 to a total of 18,700 men, who had a total worktime in 1946 10 percent below 1945. The reduced labor force and worktime were caused by the long work stoppages in the steel and bituminous-coal industries, which apparently forced parts of byproduct plants into a standby condition and/or lengthened the coking cycle; each of these would lower employment and worktime. The average length of shift in byproduct coke plants in 1946 was 8.03 hours and the average man-year 2,853 hours.

Injuries.—The 8 fatalities in 1946 were less than half as many as in 1945, and these occurred at a rate of 0.15 per million man-hours. Despite the shorter worktime, the number of nonfatal injuries increased to 685 in 1946, and occurred at a frequency of 12.84 compared with 10.91 in 1945.

Employment and injury experience at coke plants in the United States, 1944–46 [1]

	Men working daily	Average active plant-days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours	
					Fatal	Nonfatal	Fatal	Nonfatal
Byproduct ovens:								
1944	21,586	363	7,839,149	62,848,032	12	752	0.19	11.97
1945	20,454	356	7,290,410	59,292,507	17	647	.29	10.91
1946	18,700	355	6,641,000	53,350,000	8	685	.15	12.84

1944	3,180	267	848,183	6,742,049	3	236	.44	35.00
1945	2,533	247	625,031	5,082,575	1	188	.20	36.99
1946	2,800	201	562,000	4,550,000		170		37.36

[1] Data for 1946 are preliminary.

BEEHIVE COKE

Employment.—Employment at beehive plants advanced to a total of 2,800 men in 1946. However, the plants were active 46 days less than in 1945, owing to the coal and steel strikes, so that the total man-hours of work declined 10 percent from 1945. In 1946 the average worker had an 8.10-hour shift and a 1,625-man-hour work-year, 382 hours less than in 1945.

Injuries.—No fatal injuries were reported for beehive plants in 1946, whereas in 1945 there was 1. The preliminary total of 170 nonfatal injuries in 1946 had a frequency of 37.36 per million man-hours of work or relatively the same rate as in 1945.

METALLURGICAL PLANTS

Injury experience at metallurgical plants was slightly less favorable in 1946 than in 1945, and the frequency rates of both fatal and nonfatal injuries were slightly higher. Employment declined 4 percent from 1945, but total worktime fell 17 percent, owing primarily to extensive strikes in nonferrous smelters and refineries in the first half of 1946. The average length of shift was 7.91 hours, and the average work per man-year totaled 2,259 man-hours, or 356 less than in 1945.

ORE-DRESSING PLANTS AND AUXILIARY WORKS

Plants or mills in this group are those in which ores of all metals are processed by the various methods of treatment.

Employment.—The average number of men working in all metal mills in 1946 declined slightly to a total of 15,400 men, owing to decreased employment in each group except gold-silver mills. In the last group, employment increased sharply, but the gain offset the declines in the other groups only in part. The decrease in total worktime was in much greater proportion than in employment, owing doubtless to work stoppages in the mills as well as in the associated mines and smelters. The average employee worked 7.95 hours per shift and 2,084 hours during the year, or 342 hours less than in 1945.

Employment and injury experience at metal mills in the United States, 1944–46, by metals [1]

	Men working daily	Average active mill-days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours	
					Fatal	Non-fatal	Fatal	Non-fatal

[1] Includes crushers, grinders, washers, ore concentration, sintering, cyaniding, leaching, and all other metallic ore-dressing plants and auxiliary works. Data for 1946 are preliminary.
[2] Includes antimony, bauxite, mercury, manganese, tungsten, chromite, vanadium, molybdenum, and other metals.

Injuries.—The over-all safety record of metal mills was less favorable than in 1945, and both the fatality and nonfatality rates were slightly higher in 1946. Fatality experience was improved only in copper mills and was less favorable in iron, lead-zinc, and miscellaneous metal mills. There have been no fatalities in gold-silver mills since 1943. Nonfatal-injury experience was improved in varying degrees in each group of metal mills except copper mills, for which the frequency of nonfatal injuries increased from 20.86 in 1945 to 30.56 per million man-hours in 1946.

SMELTERS, REFINERIES, REDUCTION PLANTS, AND AUXILIARY WORKS

Plants in this classification are engaged in the primary extraction of nonferrous metals from ores and concentrates and include, among others, smelters, refineries, and reduction, roasting, electrolytic, and retort plants. Iron and steel plants are excluded.

Employment.—Employment in each group of plants in this classification was slightly lower in 1946, and the total dropped to 29,300 men, or 4 percent below 1945. Man-hours of work in 1946 fell 17 percent below 1945, owing principally to widespread and prolonged work stoppages during the first half of 1946. The plants were active an average of 298 days in 1946, or 44 less than in 1945. The average shift was 7.90 hours and the worktime per man-year was 2,351 hours in 1946 compared to 2,712 hours in 1945.

Employment and injury experience at primary nonferrous smelters, refineries, and reduction plants in the United States, 1944–46, by metals [1]

1946	29,300	298	8,721,000	68,890,000	10	1,915	.15	27.80

[1] Includes smelters, refineries, and reduction, roasting, electrolytic, retort, and all other nonferrous metal reduction plants. Data for 1946 are preliminary.
[2] Includes mercury, antimony, tin, and magnesium plants.

Injuries.—Although the number of fatalities was the same and nonfatalities lower than in 1945, the frequency of both fatal and nonfatal injuries was higher in 1946, owing to the lower total worktime. The rate of fatalities in 1946 in copper smelters was nearly double and in zinc refineries nearly quadruple the corresponding rates in 1945. There were no fatal injuries in lead, silver-lead, or miscellaneous metal smelters in 1946—favorable records compared with 1945. Nonfatal-injury experience was improved sharply in miscellaneous metal smelters but was less favorable in each of the other groups of smelters.

PART II. COMMODITY REVIEW

Abrasive Materials

By ROBERT W. METCALF AND A. B. HOLLEMAN

Pumice and pumicite	101		

GENERAL SUMMARY

THE OUTPUT of ground sand and sandstone, diatomite, and pumice and pumicite established new highs in 1946. Production of natural abrasives in 1946 rose to 1,205,497 short tons valued at $11,150,959, an increase of 23 percent in quantity and 14 percent in value over 1945. Artificial abrasives (silicon carbide, aluminum oxide, and metallic abrasives), however, declined 12 percent in tonnage and 8 percent in value compared with 1945. Natural abrasive products in 1946 comprised 80 and 36 percent, respectively, of the total tonnage and value of artificial and natural abrasives combined, as against 74 and 31 percent in 1945. Marketed output of garnet was the highest since 1925. Production of tripoli, quartz, grindstones, and tube-mill liners were substantially higher in 1946 than in 1945. Contrary to the trend of the other artificial abrasives, output of silicon carbide showed a large gain. Sales of grinding pebbles dropped sharply, and emery output also declined.

The total value of imports of natural abrasive materials in 1946 rose 14 percent to $15,320,284. The major part of this increase was due to the 10-percent rise in value of bort (glaziers' and engravers' diamonds, unset, and miners') although accompanied by a large decrease in caratage compared with 1945. Other diamond-import classifications showed large increases in both quantity and value. Emery ore (all from Turkey) and Italian pumice were imported for the first time since 1940. Garnet imports increased substantially. Imports of "flint, flints, and flintstones, unground" were the largest since 1939. Corundum-ore receipts decreased by one-third. The value of exports of natural abrasive products in 1946 totaled $2,426,853, 16 percent higher than in 1945. Grindstone exports were valued at $285,799, the highest since 1929.

Salient statistics of the abrasives industries in the United States, 1945–46

	1945		1946		Percent of change in 1946

[1] Average annual figure for 1942–44. Bureau of Mines not at liberty to publish 1945 and 1946 data.
[2] Data included in total; Bureau of Mines not at liberty to publish figures.
[3] Data for oilstones and related products not included in totals; Bureau of Mines not at liberty to publish figures.
[4] Tonnage of millstones not recorded.
[5] Includes Canadian production.
[6] Weight cannot be reported because of varying units.

This chapter includes data for most of the materials used chiefly as abrasives, although certain clays, oxides, carbides, and other substances mentioned later under Miscellaneous Mineral Abrasive Materials are not included in the statistics presented herein. On the other hand, certain of the abrasive products for which figures are shown also have important nonabrasive uses.

A summary of the improvements and outstanding developments in the abrasive field has been published.[1] The importance and relative usefulness of natural and manufactured products in modern industry is stressed. Various applications and technological advances, including the growing use of manufactured abrasives and the cemented carbides, are discussed. Many applications of natural abrasive materials are cited. Lesser [2] studied the composition and comparative polishing effect of metal polishes in liquid, paste, powdered, and cake, brick, or block form. Resources of grinding pebbles, diatomite, abrasive and other polishing materials, including abrasive sands in Texas [3] and

pumice and the volcanic materials in New Mexico,[4] were outlined and their commercial possibilities appraised.

Recommendations for grinding and polishing plastics, including kinds of abrasives employed, wheel speeds, and methods of operation were reported.[5] Wells presented a brief survey of the buffing and polishing industries.[6] Useful methods for quick and reliable analysis and accurate sizing of abrasive particles, including emery and corundum powders, used in the grinding and polishing of glass have been developed.[7] Advantages and disadvantages of the great variety of fats and oils used as suspending mediums for abrasives were outlined by Steinitz.[8]

Coating abrasive grains to increase glue adherence has been in use for many years. A low-melting molybdenum-bearing frit, with subsequent application of an inert pigment to produce the rough or mat surface required for good adherence of the glue to the grain, has been applied commercially to sizes as small as No. 180 and experimentally to No. 500 abrasive grain. Grain coated in this manner tends to fracture rather than pull out, resulting in longer life and cooler, faster cutting. It is claimed that the abrasive properties of both fused alumina and silicon carbide grain are improved by this coating material.[9] Heat treatment of coated abrasive products toughens them and imparts greater resistance to heat and less sensitivity to high humidities.[10] Descriptions of the various types of industrial sandpapers and their composition and uses were published.[11]

The National Bureau of Standards Simplified Practice Recommendation R 89–46 for Coated Abrasive Products, issued in 1946, lists grade numbers, recommended sizes and type of coating and backing for 1,737 "standard" items of coated products, classified according to kind of abrasive employed. European practice in the manufacture of abrasive papers was presented in considerable detail.[12] The principal abrasives used are glass, flint, emery, alumina, and silicon carbide. Adhesives and the weight, composition, and characteristics of the paper used were discussed.

NATURAL SILICA ABRASIVES

Diatomite.—The Bureau of Mines has not been at liberty to publish annual production statistics on diatomite since 1926. Total output (sales) for 3-year periods, however, may be shown. Total sales for the three most recent such periods were as follows: 1936–38, 279,645 short tons valued at $4,377,353; 1939–41, 360,502 tons valued at $5,746,216; and 1942–44, 524,872 tons valued at $9,894,534. high level of output indicated in the 1942–44 period was exceeded in 1945 and again by a considerable margin in 1946.

The chief producing States in 1946 were California, Oregon, Nevada, and Washington, with minor amounts from Arizona and New York. California is the largest producer in the United States. California, Nevada, and Washington each showed large increases over 1945, whereas Oregon's output remained at approximately the same level as in 1945. Although precise statistics of uses of diatomite cannot be shown, it may be stated that filtration accounted for somewhat over half of the total shipments; fillers took about one-fifth of sales, and insulation about one-eighth. Miscellaneous uses, including small amounts for fine abrasives, comprised the rest.

Quotations on diatomite in 1946, as reported in E&MJ Metal and Mineral Markets, were as follows: Per ton f. o. b. mill, Nevada, crude, in bulk, dried, nominal; 98 to 100-mesh, $25; low-temperature insulation, $25; high-temperature insulation, $40; fine abrasive, 2 to 3 cents per pound. (Bags are extra.) California filtration grades were quoted at $20 to $50 per ton f. o. b. mill.

The development of diatomite for water filtration in place of sand for both military and industrial purposes was described, and the possibilities for wider utilization were evaluated.[13] Filtration of sugar liquors through special Monel cloth, using diatomite as the filtering medium, resulted in more efficient operation and less frequent cleaning of filters.[14] The manufacture of an insulating block containing large proportions of diatomaceous earth was described.[15]

A study of the Monterey formation in California includes a description of the large diatomaceous earth and shale deposits in this area and a discussion of their origin.[16] A detailed description of diatomite recovery operations of the Dicalite Division, Great Lakes Carbon Corp., was presented by Green.[17] Mention was made in the trade press of the lightweight aggregate manufactured from diatomite, "Airox," which was used in the building of concrete ships and barges.[18]

Occurrence and utilization of diatomite in northeastern Brazil were described by Leonardos.[19] Efforts to develop the Scottish diatomite deposits, especially those on the Isle of Skye, for use in industrial insulation are being continued.[20] Native sources of supply of materials (including diatomaceous earth) suitable for mineral fillers in the Australian rubber industry were outlined by Whitworth.[21] The relative heat conductivity of granulated vermiculite and diatomite

and diatomite brick fired in a reducing atmosphere were determined in Russian experiments.[22] The use and manufacture of diatomite in the wartime German ceramic industry were described.[23]

Tripoli.—Output of tripoli, amorphous silica, and rottenstone in 1946 rose 59 percent in quantity and 79 percent in value over 1945, to 28,955 short tons valued at $549,099. This represented the highest tonnage since 1941 and the highest realization since 1928. Production in Illinois increased 40 percent in quantity and 75 percent in value compared with 1945. Other States producing these materials for sale in 1946 were Missouri and Pennsylvania.

The principal uses of tripoli are as abrasives, chiefly as an ingredient of polishing and buffing compounds, and as filler. Tonnages reported sold for abrasive use in 1946 were 91 percent greater than in 1945, and sales for fillers increased 12 percent. Tripoli sold for "other uses", including foundry facings, rose 4 percent. A short study of the mining, milling, and marketing of tripoli was published.[24]

Tripoli (including Pennsylvania rottenstone) sold or used by producers in the United States, 1942–46

Year	Illinois		Missouri and Pennsylvania [1]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1942	12,575	$203,390	4,961	$69,038	17,536	$272,428
1943	10,203	168,758	4,709	75,607	14,912	244,365
1944	12,031	205,732	6,394	96,131	18,425	301,863
1945	11,144	184,189	7,103	122,640	18,247	306,829
1946	15,631	321,600	13,324	227,499	28,955	549,099

[1] Includes Arkansas in 1942–44 and Oklahoma in 1943. Missouri and Pennsylvania figures in 1945 and 1946 were as follows: 1945–Missouri, 6,542 tons, $114,188; Pennsylvania, 561 tons, $8,452. 1946–Missouri, 12,180 tons, $211,244; Pennsylvania, 1,144 tons, $16,255.

Tripoli (including Pennsylvania rottenstone) sold or used by producers in the United States, 1944–46, by uses

Use	1944		1945		1946	
	Short tons	Value	Short tons	Value	Short tons	Value
Abrasives	13,218	$210,592	11,113	$188,262	21,206	$406,620

ground, through 110-mesh, rose or cream, $16; air-floated, through 200-mesh, $26. Quotations on rottenstone in 1946, as given in Oil, Paint and Drug Reporter, remained unchanged compared with 1945 and 1944: Carlots, in bags, at mines, $25.50 per short ton; less than carlots, $37.50 per ton.

Firms actively producing tripoli, amorphous silica, and rottenstone in 1946 were the same as in 1945: Illinois (amorphous silica)—Tamms Silica Co., 228 N. LaSalle St., Chicago, Ill., with plant at Olive Branch, and Ozark Minerals Co., Cairo; Oklahoma (mine) and Missouri (mill)—Barnsdall Tripoli Corp., Seneca, Mo.; and Pennsylvania (rottenstone)—Penn Paint & Filler Co., Antes Fort, and Keystone Filler & Mfg. Co., Muncy.

Quartz.—Sales of crude, crushed, and ground quartz from pegmatite veins or dikes and from quartzite in 1946 increased 27 percent in tonnage and 24 percent in value compared with 1945. Sales of crude quartz rose 58 percent.

Crushed quartz rose only slightly, and sales of ground material increased 15 percent. The average value per ton of all quartz sold in 1946 dropped to $4.02 compared with $4.10 in 1945.

Quartz (crude, crushed, and ground) [1] sold or used by producers in the United States, 1942–46

Year	Crude		Crushed		Ground		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1942	2,043	$7,937	45,747	$144,808	18,088	$178,749	65,878	$331,494

	82,379	286,478	57,764	236,803	73,179	293,852

[1] To avoid duplication, the ground material included is only that ground by the original producers of the crude quartz or by grinders who purchase from small miners not reporting their production.
[2] Included with "Other States."
[3] 1944: Maryland, New Jersey, North Carolina, Tennessee, and Wisconsin; 1945: Maryland, New Jersey, North Carolina, South Dakota, Virginia, and Wisconsin; 1946: Maryland, North Carolina, South Dakota, Tennessee, and Wisconsin.

Sales of quartz in 1946 were reported in 10 States, 2 less than in 1945. States not listed as producers in 1946, but which had some output in 1945, were Maine, New Jersey, and Virginia. Tennessee which had no output in 1945 reported production in 1946. Increases in sales largely were in Western States. Quotations on ground "hard quartz" silica in 1946, as reported in Oil, Paint and Drug Reporter, were the same as in 1945: 325-mesh (99½ percent grade), carlots in bags, $15.50 per ton, and less than carlots, $18.50; 140-mesh (99½ percent grade), carlots in bags, $11 per ton, and less than carlots, $16.

Ground Sand and Sandstone.—Sales of ground sand and sandstone in 1946 totaled 575,888 short tons, valued at $4,125,398 (a new high), 3 percent greater in both quantity and value than in the former record year (1944). Sales in 1946 were 8 percent higher than in 1945. Average value per ton rose from $6.95 per ton in 1945 to $7.16, or slightly above that in 1944 ($7.14). Sales in Illinois, one of the larger producing States, were virtually the same in 1946 as in 1945. Output in California-Washington in 1946 was nearly twice that in 1944 (1945 data not comparable), and Ohio-Virginia-West Virginia gained 20 percent in 1946 compared with 1945. The principal producing States other than Illinois were New Jersey, Ohio, and Pennsylvania.

Distribution of sales of ground sand and sandstone by uses, as reported by firms producing 90 percent of the total sales, indicated that in 1946 the chief consumers of these products, in the order of total quantity consumed, were the pottery, porcelain, and tile industries (40 percent of the tonnage for which uses were reported), makers of cleaning and scouring compounds or other abrasive products (20 percent), foundries (14 percent), and glass manufacturers (11 percent). Filler, enamel, and miscellaneous uses account for the remaining tonnage for which data are shown.

Ground sand and sandstone sold or used by producers in the United States in 1946, by uses [1]

Use	Short tons	Value	
		Total	Average per ton
Abrasive:			
Cleansing and scouring compound	103,247	$626,158	$6.06

Total reported by uses	521,056	3,782,839	7.26

[1] Data represent 90 percent of the industry.

Abrasive Sands.—Natural sands with a high silica content are employed for sandblasting, stone polishing, glass grinding, coating sandpaper, or other abrasive use. Sales of such grinding and polishing sand in 1946 totaled 906,889 short tons valued at $1,379,954, or an increase of 41 percent in quantity and 34 percent in value over 1945. Included in the 1946 data were 292,899 tons of blast sand valued at $736,819. Information with respect to tonnages produced in each State, where these figures may be published, appears in the Sand and Gravel chapter of this volume.

SPECIAL SILICA-STONE PRODUCTS

Grindstones and Pulpstones.—Sales of grindstones in 1946 increased 16 percent in quantity and 25 percent in value, compared with 1945 and represented the highest level in tonnage and value since 1942 and 1929, respectively. A small quantity of pulpstones was produced in Washington. As in 1945, grindstones were produced in Ohio and West Virginia.

Oilstones and Related Products.—In 1946 sales of natural sharpening stones, including oilstones, whetstones, scythestones, and rubbing stones, were higher than in 1945, but the Bureau of Mines is not at liberty to publish the figures. Producing States in 1946, and type of abrasive stone reported from each, were: Arkansas—oilstones and whetstones; Indiana—rubbing stones and whetstones; New Hampshire—scythestones; and Ohio—scythestones, whetstones, rubbing stones, and "other" sharpening stones, including lathestones.

Grindstones and pulpstones sold by producers in the United States, 1942–46

Year	Grindstones		Pulpstones		
	Short tons	Value	Quantity		Value
			Pieces	Equivalent short tons	
1942	12,763	$422,763	528	1,918	$116,976
1943	10,732	392,296	323	1,891	95,909
1944	9,373	356,106	(1)	(1)	(1)
1945	10,033	399,565	(1)	(1)	(1)
1946	11,605	501,444	22	72	3,880

[1] Bureau of Mines not at liberty to publish figure.

Millstones.—The value of sales of millstones and chasers in 1946 decreased slightly compared with 1945. Marketed production of millstones and chasers in 1946 was reported by George Coddingham and Henry Lawrence, both of Accord, N. Y., with deposits in Ulster County, and of millstones by Gardner Granite Works, Salisbury, N. C., with deposit in Rowan County, and Interstate Millstone Co., Christiansburg, Va., with deposit in Montgomery County.

Value of millstones and chasers sold by producers in the United States, 1942–46[1]

Year	Number of producers	Value	Year	Number of producers	Value
1942	5	$10,391	1945	4	$15,018
1943	4	9,240	1946	4	14,780
1944	3	9,700			

[1] New York, North Carolina, and Virginia; in addition, Minnesota in 1945.

Grinding Pebbles and Tube-Mill Liners.—Sales of grinding pebbles and tube-mill liners combined dropped 34 percent in quantity and 41 percent in value in 1946, compared with 1945. Sales of grinding pebbles in 1946 declined 46 percent in quantity, whereas tonnage of tube-mill liners sold increased 20 percent, although the value declined slightly. Grinding pebbles and tube-mill liners in 1946 were produced in the following States: Grinding pebbles in California, Minnesota, North Carolina, Texas, Washington, and Wisconsin, and tube-mill liners in Minnesota, North Carolina, and Wisconsin.

Grinding pebbles and tube-mill liners sold or used by producers in the United States, 1942–46

Year	Grinding pebbles		Tube-mill liners		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1942	15,487	$245,794	2,576	$49,967	18,063	$295,761
1943	9,924	157,778	2,585	46,071	12,509	203,849
1944	8,012	172,418	2,063	38,833	10,075	211,251
1945	8,615	201,806	1,982	45,933	10,597	247,739
1946	4,652	102,043	2,375	44,247	7,027	146,290

In 1946 the following firms produced for sale the products indicated: John T. Momand, Carlsbad, Calif., beach pebbles; Jasper Stone Co., Sioux City, Iowa, quartzite liners and artificially rounded grinding pebbles (quarries at Jasper, Minn.); Southern Products & Silica Co., Lilesville, N. C., silica grinding pebbles; Harris Granite Quarries Co., Salisbury, N. C., granite liners and rounded cubes; Peeler & McCombs, Faith, N. C., granite liners and rounded cubes; Dezendorf Marble Co., Austin, Tex., flint pebbles; Mineral Products Co., Seattle, Wash., grinding pebbles; and Baraboo Quartzite Co., Baraboo, Wis., quartzite pebbles and liners.

The use of massive quartzite from the Sioux formation of South Dakota as tube mill liners [25] and of quartzite pebbles from southwestern Saskatchewan as grinding media [26] was described.

NATURAL SILICATE ABRASIVES

Pumice and Pumicite.—The output of pumice and pumicite (volcanic ash) again rose to a new high in both quantity and value in 1946 and totaled 319,883 short tons valued at $1,585,753, or 104 percent in tonnage and 51 percent in value above 1945, the previous record year. This phenomenal increase was due almost solely to the greatly expanded use of pumice and pumicite in building operations in Western States.

Pumice and pumicite sold or used by producers in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	126,522	$706,199	1945	157,011	$1,051,037
1943	85,150	611,495	1946	319,883	1,585,753

[25] Blackburn, A. R., Massive Quartzite—Refractory Material for Handling Molten Iron and Steel: Ohio State Univ. Studies, Eng. Exper. Sta. Bull. 124, 1945, 34 pp.; Chem. Abs., vol. 40, No. 13, July 10, 1946, p. 3862.

[26] Furnival, G. M., Cypress Lake Map-Area, Saskatchewan: Can. Dept. Mines and Resources, Geol. Survey, Pub. 2475, 1946, 161 pp.; abs. in Jour. Am. Ceram. Soc., vol. 30, No. 2, Feb. 1, 1947, p. 43.

Production was reported in nine States in 1946, the same as in 1945, but with the addition of a small output from Colorado. Idaho became the principal producer, with virtually all of its output used for aggregate. California in 1946 had the second highest production, followed by New Mexico and Kansas. Decreases of 25 and 29 percent were reported for Kansas and Nebraska. All other States, however, had large gains in 1946 compared with 1945.

Pumice and pumicite sold for concrete admixture and concrete aggregate in 1946 totaled 248,247 short tons, 241 percent above 1945 and more than 4½ times that used for abrasive purposes. Consumption for acoustic plaster also increased, as well as for "other uses," which in 1946 included insecticides, insulation, paint filler, and absorbents.

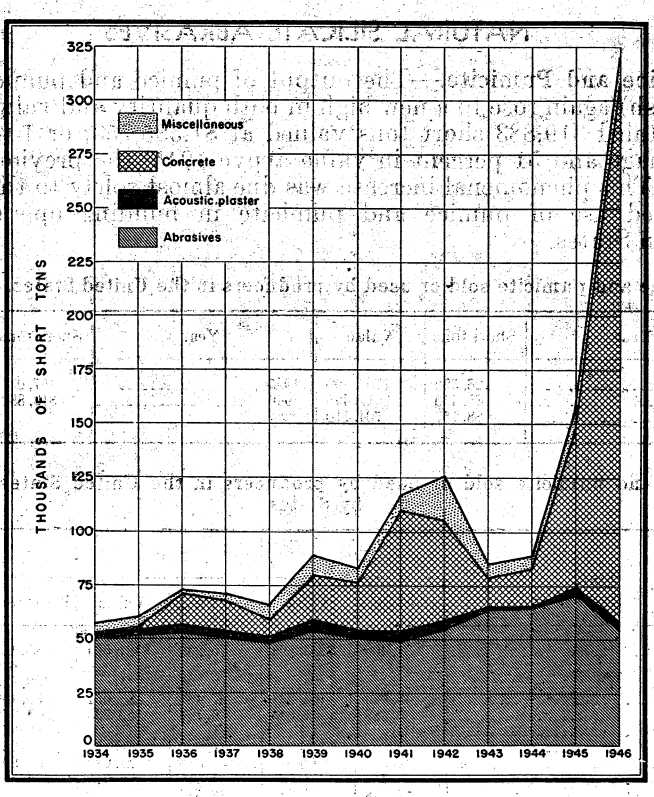

FIGURE 1.—Trends, by uses, of pumice and pumicite sold or used in the United States, 1934–46.

As given in E&MJ Metal and Mineral Markets, pumice quotations in 1946 were the same as in 1945 and 1944 (f. o. b. New York or Chicago, in barrels): Lump, 5 to 7½ cents per pound, and powdered, 2½ to 4½ cents per pound.

To serve the expanded market for lightweight aggregate using pumice, Basalt Rock Co., Napa, Calif., has built a new plant near Stockton, Calif., to make lightweight concrete masonry from pumice

Pumice and pumicite sold or used by producers in the United States, 1944–46, by uses

Use	1944		1945		1946

Total	88,757	704,110	157,011	1,051,037	319,883	1,585,753

[1] Insecticide, insulation, brick manufacture, filtration, solvents, plastics, paint filler, absorbents, and unspecified.

aggregate and portland cement.[27] The officers of this same company also have formed a new firm to manufacture another type of pumice containing the lightweight aggregate "Rocklite" at Ventura, Calif.[28]

Expansion of operations mining or making use of pumice and pumicite as an aggregate material were reported from California,[29] Colorado,[30] Oregon,[31] and Utah.[32] Experiments with volcanic ash as the major ingredient of ceramic glazes indicated its value for this purpose.[33] The operations of a large west coast producer of lightweight concrete using pumice as aggregate were detailed.[34]

A description of Italian pumice deposits, including preparation, classification, and marketing, was published.[35]

Garnet.—Production of garnet in 1946 increased to 7,743 short tons valued at $570,186, a gain of 23 percent in quantity and 52 percent in value compared with 1945. This was the largest tonnage sold since 1925 and the highest reported value since 1927. The trend in output (sales) of garnet since 1920 is shown in figure 2. Producers of garnet reporting to the Bureau of Mines in 1946 were: Garnet Mines, Inc., Fernwood, Idaho; Idaho Garnet Abrasive Co., P. O. Box 1452, Spokane 6, Wash. (deposit at Fernwood, Idaho); Barton Mines Corp., North Creek, N. Y.; and Estate of John Burnham, Essex, N. Y. Separation of garnet from hornblende by the Barton Mines Corp., North Creek, N. Y. was described.[36] An Alaskan garnet field is being mapped by the United States Geological Survey.[37]

Quotations on domestic garnet in 1946 as given in E&MJ Metal and Mineral Markets were unchanged from 1945 and immediately preceding years: New York Adirondack garnet concentrates, grain—$85 per short ton.

NATURAL ALUMINA ABRASIVES

Corundum.—Corundum, a natural alumina abrasive, Al_2O_3, was especially needed during the war for use in snagging wheels by firms manufacturing tanks, guns, and other military equipment and for polishing highly essential precision lenses. Efforts to establish and foster a domestic corundum industry in North and South Carolina and Montana resulted only in a small, almost negligible output, which was consumed largely for experimental purposes. Similar exploration and tests of corundum in Douglas County, Nev., also proved unproductive.[38]

Most of the corundum consumed in the United States for many years originated in the Union of South Africa, particularly in the Transvaal. In normal years, this source furnished a fairly steady supply despite the handicaps of distance and transportation. Production in South Africa during the war was stimulated by the Foreign Economic Administration and other agencies. An account of the situation existing in the African producing areas was published.[39] Improvements have been made in the Pietersburg plant. Boulder shipments virtually ceased at the beginning of 1946, and crystal output also declined markedly. The South African producing company plans the erection of a new mill to manufacture optical and wheel grain and to recover corundum schist, which can be used in a polishing compound for metals and plastics.[40]

Although imports for consumption in the United States rose considerably during the war years, the receipts were scarcely adequate to satisfy the greatly enlarged demand for production of optical apparatus and heavy equipment required by the Army and Navy. The supply of corundum still is short of possible consumption. After the high level of imports in 1944 and 1945, receipts in 1946 dropped 33 percent under 1945, to 4,207 short tons, the lowest figure since 1940. Supplementing imports from the Union of South Africa, shipments from other countries occasionally have been received, including Canadian material recovered from tailings dumps of mines inactive since World War I. Detailed description of this operation, including cost data, flow sheet, operating methods, and recovery results, were published during 1946.[41] The results of field concentration tests on corundum with a Harz jig were described in detail in the South African press.[42] Deposits of corundum in Brazil and possibilities for development were outlined.[43]

World production of corundum in recent years as far as statistics are available appears in the accompanying table.

World production of corundum, 1937–46, by countries, in metric tons [1]

Country [1]	1937	1938	1939	1940	1941	1942	1943	1944	1945	1946
Australia (New South Wales)	------	------	------	------	------	------	------	------	[2] 10	([3])
Belgian Congo	------	------	------	------	------	------	------	[4] 5	([3])	([3])
Brazil	------	------	------	------	------	------	------	100	([3])	([3])
Canada	------	------	------	------	------	------	------	[5] 157	[5] 1,195	[5] 1,080
French Equatorial Africa	------	------	------	------	------	------	------	------	140	46
India	------	------	1	([6])	56	135	110	349	299	([3])

Swaziland	------	------	------	------	------	15	141	------	------	------
Tanganyika	------	------	------	------	------	------	5	------	------	------
Union of South Africa (sales)	2,237	1,397	2,381	3,820	6,119	6,723	4,270	3,536	4,374	1,854
United States (sales)	------	------	------	------	------	------	([7])	([7])	------	------
Total [8]	2,264	1,432	2,387	3,820	6,175	6,954	6,105	5,630	6,562	3,372

[1] In addition to countries listed, corundum probably is produced in U. S. S. R., but output data are not available.
[2] Reported as corundum and emery (believed to be largely emery).
[3] Data not available.
[4] Imports into United States.
[5] Recovered from tailings dumps.
[6] Less than 1 ton.
[7] Bureau of Mines not at liberty to publish figure.
[8] Totals represent only those countries for which statistics are shown.

Quotations on crude corundum imported in the United States are not given in domestic trade journals. Corundum grain throughout 1945 and 1946 was quoted in E&MJ Metal and Mineral Markets as follows: Per pound, sizes 8 to 60, inclusive, 8¾ cents; 70 to 275, inclusive, 9¾ cents; 500, 30 cents; 850 to 1000, inclusive, 45 cents; 1200 to 1600, inclusive, 60 cents; and 2600, 70 cents.

Emery.—Sales of domestic emery in 1946 declined 21 percent in quantity and 18 percent in value from the high level in 1945. Production, however, was considerably higher than in any recent year prior to 1943. The entire output, as in other recent years, was mined in and near Peekskill, N. Y., by Joe DeLuca and DiRubbo & Ellis. Emery is shipped largely as crude rock to manufacturers of grinding wheels, abrasive sticks, polishing compositions, and similar materials. It also is marketed as grain to other makers of abrasive products. Considerable amounts are employed as a nonslip, wear-resistant component in concrete floors.

According to E&MJ Metal and Mineral Markets, quotations on crude domestic emery ore remained unchanged in 1946, compared with 1945: $10 per short ton for first-grade ore, f. o. b. New York. Grain emery was quoted in the same publication as follows (per pound, in 350-lb. kegs, f. o. b. Pennsylvania): Turkish and Naxos, 7 cents; and American, 5 cents. The emery deposits of Turkey were studied by De Lapparent,[44] who also discussed the deposits on the Grecian Islands of Naxos and Samos.

Emery sold or used by producers in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	5,277	$49,413	1945	7,856	$75,977
1943	6,666	63,195	1946	6,188	62,099
1944	6,940	64,858			

NATURAL CARBON ABRASIVES[45]

Abrasive or Industrial Diamonds.—Consumption of industrial diamonds during the past few years has increased greatly, owing to their high efficiency and the low price maintained during the war. However, since the end of hostilities, prices have been increased somewhat. Obviously, high prices eventually may limit the use of industrial diamonds, but the demand was still very active in 1946.

Description of deposits in the Tanganyika field,[46] developed during the war, and reports of new discoveries in Brazil[47] were published. Information with respect to Russian diamond deposits also appeared in the trade press.[48]

British experience in the use of diamond tools in fine boring was detailed,[49] and the employment of diamond tools in the processing of plastics was described.[50] In the size-grading of diamond powders, a gelatin solution was found to give the most satisfactory dispersing action.[51] Problems solved in the development of vitrified-bonded

diamond grinding wheels [52] and the growing use of tungsten carbide-tipped tools as a competitor of diamond bits in rock drilling [53] were discussed in the technical press. An investigation of the methods of producing diamond dies was undertaken during the war by the National Bureau of Standards under the sponsorship of the War Metallurgy Committee of the National Academy of Sciences.[54]

ARTIFICIAL ABRASIVES

Production of artificial abrasives (silicon carbide, aluminum oxide, and metallic abrasives) totaled 307,445 short tons valued at $20,212,880, or a decrease of 12 percent in quantity and 8 percent in value compared with 1945. Output of aluminum oxide and shipments of metallic abrasives in 1946 both showed substantial declines. Production of silicon carbide, however, rose 19 percent in tonnage and 29 percent in value, to 63,849 short tons valued at $5,457,903, the highest figure since 1943. Operation of silicon carbide plants reached 89 percent of capacity, whereas activity in aluminum oxide and metallic abrasives was about 57 and 53 percent of reported capacity, respectively. Similarly, stocks of silicon carbide in 1946 showed a large increase over 1945, and stocks of aluminum oxide and metallic abrasives were considerably lower than in 1945.

Crude artificial abrasives sold, shipped, or used from manufacturing plants in the United States and Canada, 1942–46

Year	Silicon carbide [1]		Aluminum oxide [1]		Metallic abrasives [2]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1942	61,681	$4,904,309	183,633	$12,719,337	106,442	$5,618,913	351,756	$23,242,559
1943	69,706	5,912,590	217,425	13,202,270	124,954	7,083,141	412,085	26,198,001
1944	56,291	4,717,675	185,573	11,668,838	144,540	8,441,505	386,404	24,828,018

1946	63,849	5,457,903	132,084	8,367,158	111,512	6,387,819	307,445	20,212,880

[1] Production: Bureau of Mines not at liberty to publish data for United States separately. Figures include material used for refractories and other nonabrasive purposes.
[2] Shipments from United States plants only.

Production of silicon carbide and aluminum oxide is concentrated largely in the Niagara Falls region of Canada and the United States; some aluminum oxide, however, also is manufactured in Quebec, Canada, and in Alabama. The same companies that produced aluminum oxide and silicon carbide in 1945 and other recent years were active in 1946, except that Abrasive Company of Canada, Arvida, Ltd., became Simonds Canada Abrasive Co., Ltd. Included in the total for aluminum oxide in 1946 were 12,853 short tons of "white high-purity or special material" valued at $1,412,950, a decrease of 32 percent in both quantity and value from the figures re-

ported in 1945. Silicon carbide consumed in refractory or other nonabrasive uses in 1946 was estimated at 43 percent of the total output, and aluminum oxide used for similar purposes in 1946 was estimated at 3 percent.

Stocks of crude artificial abrasives and capacity of manufacturing plants, as reported by producers in the United States and Canada, 1942–46, in short tons

Year	Silicon carbide		Aluminum oxide		Metallic abrasives [1]	
	Stocks at end of year	Capacity	Stocks at end of year	Capacity	Stocks at end of year	Capacity
1942	4,806	61,681	20,707	179,214	4,278	142,026
1943	9,384	70,938	28,360	222,602	2,524	169,500
1944	8,916	71,850	32,402	234,000	3,388	191,289
1945	4,347	72,000	31,933	233,300	10,433	209,360
1946	5,339	71,679	27,072	232,889	6,524	211,407

[1] Figures pertain to United States plants only.

Statistics for metallic abrasives cover steel shot and grit but not steel wool. In 1946, as in 1945 the principal producing States, in order of magnitude of shipments, were Ohio, Michigan, and Pennsylvania. Other States in which metallic abrasives were manufactured in 1946 were Illinois, Massachusetts, New Hampshire, and New York. Sixteen firms with 17 plants reported shipments in 1946, compared with 15 companies and 16 plants in 1945. The new company reporting shipments of steel shot and grit in 1946 was Metallic Abrasives, Inc., 1217 Second St., N. E., Canton, Ohio. A new firm in California reported a small output for experimental purposes only.

A new type of aluminous grain abrasive has been produced directly in the electric furnace, obviating crushing and milling, according to reports published in the trade press.[55] The grains have highly irregular surfaces, which provide cooler, faster, and more efficient cutting. The abrasion-resistant qualities of aluminous oxide were utilized in the manufacture of a nonslip cement for tile, safety treads, shower curbs, and similar uses.[56] A finely ground synthetic SiO_2–Al_2O_3 catalyst was found to produce greater quantities of light hydrocarbons for making alkylate and hydropolymer and a better aviation base stock than the natural SiO_2–Al_2O_3.[57] The preparation and properties of boron carbide were described briefly.[58] A study of the characteristics and properties of artificial sapphire was published.[59]

MISCELLANEOUS MINERAL ABRASIVE MATERIALS

In addition to the natural and manufactured abrasive materials for which data are included herein, many other mineral substances are used for abrasive purposes. Various oxides, such as tin oxide, magnesia, rouge, crocus, cerium oxide, chromium oxide, and manganese oxide, are utilized as polishing agents. Among products used for abrasive properties or because of extreme hardness or durability are the carbides, such as boron carbide and the cemented carbides, which include tungsten carbide, tantalum carbide, and titanium carbide. Other substances with abrasive applications include finely ground and calcined clays (china clays, ball clays, fire clays), lime, talc, ground feldspar, river silt, slate flour, whiting, and other materials.

FOREIGN TRADE [60]

Imports.—The total value of imports of abrasive materials in 1946 increased 14 percent compared with 1945, the largest increase in value being for bort. However, this classification, comprising largely what are known as industrial grades, showed a sharp drop in caratage imported. Statistics for other types of diamonds for which 1946 import data are shown indicated large gains in quantity and value.

Abrasive materials imported for consumption in the United States, 1944–46, by kinds

Kind	1944		1945		1946	
	Quantity	Value	Quantity	Value	Quantity	Value
Burrstones: Bound up into millstones short tons	13	$854	22	$1,406	13	$1,099

[1] Emery included with corundum; not separately classified.

[60] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Imports of crude or unmanufactured pumice and "flint, flints, and flintstones, unground," which includes grinding pebbles, were reported in substantial quantities for the first time since 1940. Until 1946, no imports of emery ore and wholly or partly manufactured pumice had been received in the United States since 1940. Shipments of "flint, flints, and flintstones, unground" originated chiefly in Denmark, Belgium, and France, and those of emery ore were from Turkey. Corundum ore receipts were 33 percent less than in 1945. The quantity and value of imports of corundum and emery grain and corundum- or emery-coated paper and cloth were considerably higher in 1946 than in 1945. Garnet showed a large increase.

The average value (foreign market value) per specified unit of physical volume of imports of corundum ore, corundum, and emery-coated paper and cloth, "flint, flints, and flintstones, unground," and all classifications of diamonds increased substantially in 1946 compared with 1945.

Exports.—The total value of exports of natural abrasive products in 1946 totaled $2,426,853, or 16 percent greater than that reported in 1945. The export value of grindstones ($285,799) was 13 percent above 1945, the highest figure since 1929. Emery and corundum wheels increased 51 percent in 1946 compared with 1945, and "all other" natural abrasives showed a substantial gain over 1945.

Value of abrasive materials exported from the United States, 1942–46

Material	1942	1943	1944	1945	1946
Grindstones	$224,998	$213,170	$155,048	$252,293	$285,799
Abrasive wheels, emery and corundum	3,665,386	1,295,011	342,215	144,589	218,961
All other natural abrasives, whetstones, hones, etc.	2,793,968	2,002,988	1,594,412	1,690,716	1,922,093
	6,684,352	3,511,169	2,091,675	2,087,598	2,426,853

Aluminum

By C. E. NIGHMAN AND MARY E. TROUGHT

GENERAL SUMMARY

FOR THE first time in history, in November 1946, with the revocation of price ceilings, the price of copper rose above that of virgin aluminum, and at the year end it stood about 30 percent higher. On the other hand, the price of aluminum has never advanced since 1925 but has shown a consistent decline, whereas the general price level has trended upward and sharply so since 1938.

Partial disposal in 1946 of Government-owned reduction facilities has gone far toward the attainment of the Government's goal of free competition in the industry. After midyear, metal production was divided between the Aluminum Co. of America, Permanente Metals Corp. (a Kaiser Co., Inc., subsidiary), and the Reynolds Metals Co. Of the privately owned or leased capacity (649,000 short tons) operative in December, Alcoa controlled nearly 51 percent, Reynolds 29 percent, and Kaiser 20 percent. In addition, about one-third more (234,000 tons) remained in Federal ownership.

A notable betterment in the domestic aluminum industry also characterized 1946, the first full year after the end of the active hostilities of World War II. Although primary aluminum production was 17 percent below that of 1945, it exceeded the immediate prewar (1935–39) average by 227 percent. In the first half year, output averaged about 25,000 tons monthly, then increased uninterruptedly through December, when it surpassed a 600,000-ton annual rate that prospective 1947 demand seemed likely to maintain.

Salient statistics of the aluminum industry, 1942–46

	1942	1943	1944	1945	1946
Primary production.....short tons..	521,106	920,179	776,446	495,060	409,630
Value.....	$151,371,000	$265,380,000	$222,416,000	$140,864,000	$115,812,000
Quoted price per pound.....cents..	[1] 15.0	[1] 15.0	[1] 15.0	[1] 15.0	15.0

Imports.....	$37,147,891	$41,817,044	$30,322,653	$99,348,667	$13,066,252
Exports.....	$26,943,686	$67,216,832	$89,796,339	$9,866,306	$20,284,053
World production.....short tons..	1,525,800	2,145,000	1,915,000	978,000	827,000

[1] Ceiling price. Control lifted Aug. 31, 1945.

Indicated or apparent consumption of virgin metal in 1946 was 42 percent below that reckoned for the preceding year. Actual consumption, however, was substantially higher. The failure of production to meet needs resulted in a heavy draft on primary metal stocks, both producers' and Government, exceeding 140,000 tons. Of the

year-end residual Government stocks (71,760 tons), virtually all was set aside by the Civilian Production Administration for industrial use. In addition, the War Assets Administration disposed of a substantial tonnage of mill products. Further, recoverable aluminum in aluminum-bearing scrap appears to have been absorbed.

Prices of standard grades of primary aluminum remained unchanged throughout the year at the levels reached in 1942. Late in the year fractional cent increases became effective for most of the major aluminum-base alloys in response to advances in the cost of alloy metals. There was a considerable range in quoted secondary metal prices, and at the year end some grades commanded premiums over corresponding primary grades.

World production declined to an estimated 750,000 metric tons in 1946 from 887,000 tons in 1945.

Aluminum ores, alumina, and aluminum salts are discussed in the Bauxite chapter of this volume.

PRODUCTION

Primary.—Domestic virgin aluminum production (409,630 short tons in 1946) was 17 percent less than in 1945 and only 45 percent of the 1943 peak. Nevertheless, this output was indicative of aluminum's greatly enhanced position as an engineering and constructional metal. For a quarter century through 1939, the average annual rate of production increase was less than 5,000 tons. From the depression low in 1934 through the first war year, 1939, the apparent rate of increase was 20,000 tons a year—a rate then greatly surpassed to 1946. The recent accelerated growth of the aluminum industry is perhaps more

[1] Monthly data 1941–July 1946 from producers' reports to War Production Board and its successor, Civilian Production Administration. Monthly data August–December 1946 and final annual figures 1941–46 from reports to Bureau of Mines.

clearly shown by comparison with growth in industrial production.[1] The index of production for 1939 was 109 and that for 1946, 170, an increase of about 56 percent. With the average production of aluminum for the same base period as 100, the index for 1946 is 328, an increase of 228 percent or closely four times that of industrial output as a whole.

[1] Federal Reserve Bank indexes of physical volume of industrial production, 1935–39=100, are used herein.

After termination of active warfare in 1945, the output rate had dropped to the 1941 level and remained there for the first half of 1946 owing to a combination of circumstances. (See accompanying table of production by months, 1941–46.) These included: Technical problems connected with a change-over to classes and types of products fitted to civilian use; the overhanging threat of great stocks of metal in various forms, estimated to have been over a million tons; and, at the beginning of the year, the unsolved problem of disposal of Government-owned plants, some of which were among the country's low-cost producers and others noncompetitive primarily because of excessive power costs. Further retardants were strikes within the aluminum industry and particularly the coal and steel strikes.

War-spurred technologic advances made many new alloys available; new production and application techniques were developed, and many thousands of workers were trained therein, while a multitude of fabricators and consumers became conversant with the properties and characteristics of the metal and its alloys and found them adaptable to a great diversity of products. Not the least in importance were the growing availability of the basic material, primary aluminum (accompanied by serious shortages of other nonferrous metals) and its relative price decline. (See section on Prices following.) The surplus stock threat was greatly relieved when it was found impracticable to return much of the crashed or obsolete aircraft scrap from the zones of military operations. Obviously, however, that potential source of usable material will restrain world primary production until absorbed. Further, the massive Government stocks have been released substantially as markets developed. Industrial reconversion had so far advanced by late spring that aluminum demand grew rapidly, but output did not pace it. Until October, when raised to 85 percent, only 60 percent of soda-ash needs could be met, and power supply became inadequate in some regions. In addition, mill capacity, notably for sheet, was insufficient to satisfy the demand. Despite the many hindrances, virgin-metal production was above a 550,000-ton annual rate in the last quarter of 1946 and in December topped a 600,000-ton rate. Production in 1947 is expected to be in that range.

The year 1946 was also notable for a reconstitution—economic and geographic—of the aluminum industry that grew out of the antitrust proceedings instituted in 1937 against the Aluminum Co. of America. The courts freed the company of other charges but adjudged it guilty of a monopoly of primary ingot production as late as 1940. In 1939 annual aluminum-reduction capacity, all Alcoa, was estimated at 175,000 tons. In 1940 the Reynolds Metals Co.—already an outstanding foil roller—entered the reduction field, adding about 80,000 tons capacity, and early in 1941 first cast ingots. At the same time Alcoa embarked on a 300-million-dollar self-financed expansion program which at completion raised its ingot capacity to about 330,000 tons. In 1941 and in 1942 the Government through the Defense Plant Corporation instituted plant-construction programs that originally called for additional primary capacity of about 625,000 tons. Subsequent plant expansions and improved performance of potlines brought the total United States capacity, according to the War Assets Administration, in 1944 to slightly less than 1,164,000 tons, of

which about 57 percent or 668,000 tons was in DPC plants. From completion to their closure by the end of October 1945, the nine Government- and privately-owned plants were operated by Alcoa, Reynolds, and Olin Corp., whose operating shares of total capacity in 1944 were respectively 91.3, 6.9, and 1.8 percent.

Under the terms of the Surplus Property Act and rulings of the Attorney General, Alcoa was prohibited from acquiring any of the eventual surplus Government plants that would tend to perpetuate its adjudged monopoly. Attempts to induce other companies to

[1] Data from WAA First Supplementary Report to Congress on Aluminum Plants and Facilities, Feb. 12, 1947, except for aluminum ingot capacity of Aluminum Co. of America and Reynolds Metals Co. furnished by those respective companies.

[2] Entire plant under lease option to Reynolds Metals Co. Option exercised for one-half only because of power shortage. Option on remainder may be taken up in 1947.

[3] Placed in standby condition in September 1944; now used as a warehouse. Some equipment transferred to Troutdale and Spokane. It was announced in February 1947 that Asarco Aluminum Co. had submitted a bid to operate 32,000 short tons (2 pot lines) of the plant's annual capacity.

[4] Placed in standby condition October 1944. Currently used for storage. Lack of cheap power prevents manufacture of aluminum.

[5] Plant closed October 1944. Some electrical equipment removed to Troutdale and Spokane. Aluminum Co. of America has option to lease and in February 1947 was reported to have submitted a bid to purchase.

[6] In addition there were Government-financed high-cost plants at Queens (Maspeth), N. Y. (144,000 tons) and Burlington, N. J. (54,000 tons), now largely dismantled.

enter into competition were unsuccessful until January 1946, when Alcoa granted royalty-free licenses to use its patented combination process for the treatment of low-grade (high-silica) bauxite. It further agreed to furnish alumina and bauxite, respectively, to Reynolds and to the Permanente Metals Corp., a newcomer in the industry (Olin Corp. withdrew when the Government-owned plants were closed). Between January 4 and August 16 all DPC plants were declared surplus; and by May 29, 1946, the most economic plants, except one, having over 40 percent of the Government total capacity were disposed of to Alcoa competitors, generally on a lease-purchase basis. The accompanying table shows the distribution of both alumina and ingot capacities at the end of 1946.

It is to be noted that there are now three large integrated companies in the field and that Alcoa owns but half of the virgin-metal facilities. There remains, subject to later disposal, about 234,000 tons capacity in modern plants. A fourth company, Asarco Aluminum Co., had made unaccepted offers for alumina and reduction plants and early in 1947 proposed to acquire a part—two potlines—of the Los Angeles (Torrance) DPC plant. A striking element of the accomplished industry redistribution is the geographical transition. Before the war virtually all facilities lay east of the Mississippi. Now approximately 40 percent of metal capacity is concentrated in Washington and Oregon, about 5 percent may be added in California, and about 5 percent is in Arkansas, leaving approximately one-half in its former location. A good share of fabrication has shifted westward, and it is expected that alumina plants will soon show a like trend.

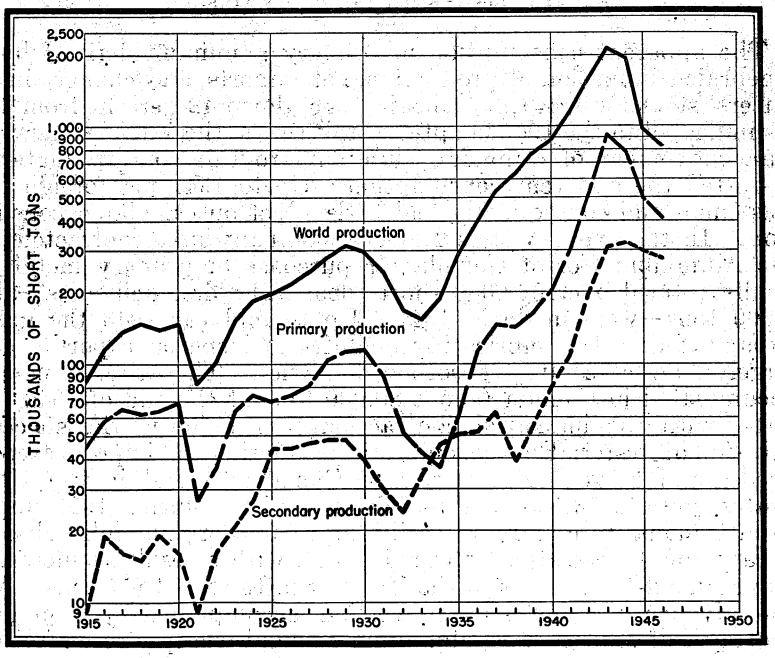

FIGURE 1.—Trends in domestic primary and secondary production and world production of aluminum, 1915–46.

Secondary.[2]—The dearth of primary metal that developed during 1946 markedly influenced secondary operations. Although total recovery of secondary aluminum was 278,073 short tons compared with 298,387 tons in 1945 and the peak output of 325,645 tons in 1944, production of remelt aluminum ingot was large and in October reached a near record level of 21,000 tons. Worthy of note was the exceptionally high ratio of secondary to primary output of about two-thirds, whereas in the 5- and 10-year periods ending with 1939 the ratio was about 40 to 45 percent—a ratio likely again soon to be approached, as the wrecked aircraft and other scrap supply has diminished greatly and other sources of old scrap were well cleaned up during the war.

Recovery comprised 2,075 tons of pure metal (98.5 percent), 274,068 tons in aluminum alloys, 597 tons in brass and bronze, 504 tons in zinc-base alloys, 266 tons in magnesium alloys, and 563 tons in chemical compounds. Secondary ingot production was 207,574 tons compared with 198,426 tons in 1945. Purchased-scrap consumption in 1946 was 344,472 tons, an increase of 6 percent above that in 1945. Of the quantity used, 143,836 tons or 42 percent was old scrap (10 percent in 1945), and 200,636 tons or 58 percent was new scrap (90 percent in 1945). Notable compared with 1945 were declines in consumption of alloy sheet (45,866 tons or 34 percent) and borings and turnings (69,355 tons or 67 percent) and a 563-percent (89,105 tons) rise in aircraft scrap. Remelters, smelters, and refiners used 69 percent of the scrap; primary producers, 29 percent; and foundries and other manufacturers, 2 percent. Additional information is given in the chapter of this volume, Secondary Metals—Nonferrous.

CONSUMPTION AND USES

The apparent consumption of primary aluminum derived by the algebraic summation of production, net imports, and changes in producers' stocks was 461,877 tons in 1946, down 42 percent from 1945. As indicated in the 1945 chapter of this series, the extraordinary wartime movement of Canadian aluminum to this country materially distorted the apparent consumption. Up to 1941 net foreign trade was small and consequently had little effect on calculated consumption. In that year Metals Reserve Company first contracted with the Aluminum Co. of Canada for purchase of primary metal that finally totaled over 680,000 short tons. The first deliveries—about 8,000 tons—were made in 1941. Up to midyear 1943 the greatly expanded domestic fabricating facilities and special export needs—largely lend-lease—fully absorbed deliveries. Thereafter some stock accumulated in Canada (about 80,000 tons at the end of 1943). In 1944, with the industrial contraction that followed the successful invasion of western Europe, domestic production and imports exceeded needs, and Government stocks of Canadian metal in the United States grew to 73,555 tons by the year end. During 1945 imports from Canada were extraordinarily large but were not fully absorbed because of the cessation of war demand, with a resulting increase in Government-held stocks in the United States to 173,857 tons. With the advance in industrial reconversion, accompanied by pronounced shortages of other metals, aluminum demands sharply rose after mid-

[2] All figures for 1946 are preliminary.

year 1946. They were met in part by allocations of 113,990 tons from Government stocks, leaving 71,760 tons for future disposal. The Civilian Production Administration as early as May 1946 reported a civilian deficiency of 35,000 tons and by October estimated it at 190,000 tons, with only about 119,000 tons then available for allocation; hence, it is expected, that the year-end inventory will be depleted early in 1947. If adjustments are made corresponding to the above-named Government stock changes, apparent consumption for 1944–46 would be, respectively, 671,072, 696,918, and 575,687 tons. (See modified curve on accompanying chart.)

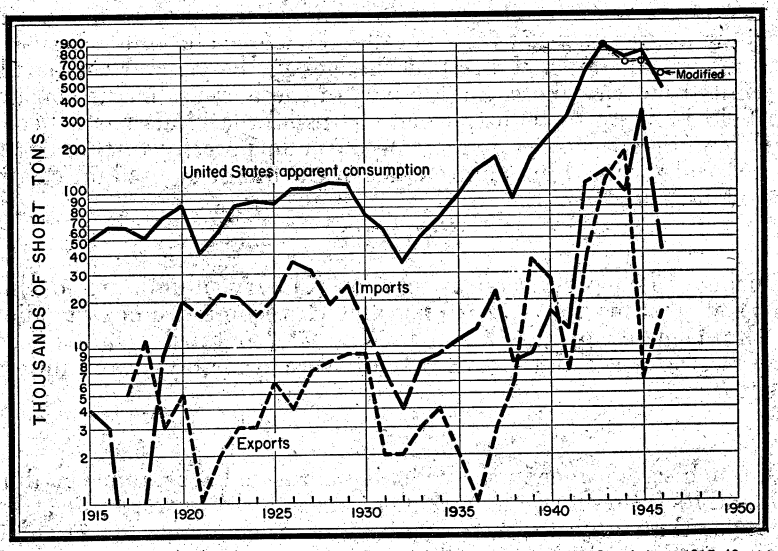

FIGURE 2.—Trends in imports, exports, and apparent consumption of aluminum, 1915–46.

Production, imports, exports, and apparent consumption of primary aluminum and production of secondary aluminum in the United States, 1942–46

Year	Primary aluminum					Secondary aluminum

	Short tons	Value					
1942	521,106	$151,371,000	112,112	38,747	588,969	196,464	$57,446,074
1943	920,179	265,380,000	135,581	117,624	877,349	313,961	90,546,352
1944	776,446	222,416,000	100,969	188,108	744,627	325,645	93,264,728
1945	495,060	140,864,000	334,125	5,741	797,220	298,387	85,297,005
1946	409,630	115,812,000	42,607	16,694	461,877	278,073	78,639,044

[1] Data not available on fluctuations in consumers' stocks. Withdrawals from producers' stock totaled 55,320 tons in 1944 and 26,334 in 1946 additions to producers' stocks totaled 5,502 tons in 1942, 60,787 in 1943, and 26,224 in 1945.
[2] Based upon average price of primary aluminum as reported to Bureau of Mines.

During 1946 the consumption pattern of aluminum was indicative of a substantial shift to peacetime from war applications that at their peak were estimated to be about 85 to 90 percent in the field of trans-

port, with the bulk to airplanes. It may be noted, however, that the present pattern reflects an invasion of application fields of competing materials that may be lost in part when they again become freely available. This was marked in home and building construction. The Aluminum Co. of America has compiled, especially for the Bureau of Mines, the following percentage industry distribution of orders for 1946, with comparable immediate prewar period averages [3] shown in parentheses: Transportation (air, land, and water), 9 (29); machinery and electric appliances, 10 (15); cooking utensils, 13 (14); electrical conductors, 8 (10); building construction, 29 (8); foundry and metal working, 19 (4); food and beverage, 3 (6); chemical, 2 (5); ferrous-nonferrous metallurgy, 3 (5); and miscellaneous 4 (4). The foregoing figures may not fully parallel the whole aluminum industry's distribution but do show marked changes in the general use pattern. As pointed out elsewhere, a large part of the increase in the construction field is likely to be lost when the usual materials again become available. That, however, may be offset in part by further growth in electrical uses and by maintenance of the quantity used for castings and extrusions.

STOCKS

During 1946 producers' stocks of primary aluminum declined 26,334 short tons to 14,722 tons, and Government stocks available for allocation dropped 113,990 tons to 71,760 tons. Data on consumers' stocks are not available but were probably near minimum inventories.

PRICES

Of much significance in the widening industrial acceptance of aluminum and its future hold on markets has been its downward price trend. For more than 20 years there has been no price increase. At the beginning of World War II (1939), the base price for 99.0–99.5 percent primary aluminum ingot stood at 20 cents a pound delivered, but four price reductions brought it to 15 cents a pound by October 1, 1941. This became a maximum under the General Maximum Price Regulation of April 1942. It remained effective throughout 1946, although Office of Price Administration had suspended control August 30, 1945. A price differential of 1 cent in favor of pig was set by the principal producer late in 1942. This became the OPA ceiling early in 1943. This price course and current stability stand in marked contrast to the general price level that has risen sharply since 1940 and strikingly so to the trend of other nonferrous metal prices in the latter half of 1946. As regards copper, with which aluminum was increasingly competitive, there was a notable reversal in position when in November, for the first time in history, its pound price exceeded that of aluminum. Up to the time this chapter was prepared—April 1947—the disparity continued to be accentuated. Inasmuch as about half the demand for aluminum is elastic and there is little evidence of an early return to prewar price relationships, aside from other favorable factors, it appears probable that the growth in demand for aluminum may continue to be more rapid than before the war.

[3] See Minerals Yearbook, 1940, Review of 1939, p. 650.

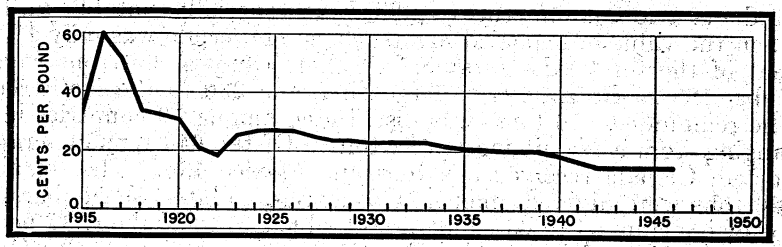

FIGURE 3.—Trend in average quoted prices of aluminum, 1915–46. Price is for No. 1 virgin 98–99 percent at New York through 1929. Thereafter for 99-percent-plus virgin ingot, as reported by American Metal Market.

FOREIGN TRADE [4]

In 1946 foreign trade in aluminum and products approached, but still remained substantially above, the 1935–39 average level. Imports of crude and semicrude metal (excluding scrap) were slightly more than one-eighth the peak receipts of 1945. Canada furnished 41,623 tons, of which about 18,500 tons were for Office of Metals Reserve account, and brought the wartime commitments to an end. The remainder was received from the United Kingdom. Scrap receipts were by far the highest of any year since separate reporting was begun in 1939 and, in fact, exceeded the total imported in 1939–45, Much of the material was wrecked aircraft scrap. Canada was the source of 6,100 tons; the United Kingdom, 6,755 tons; Italy, 1,310 tons; and seven other countries the remainder, 328 tons.

[1] Leaves: 12,735,571; equivalent in pounds not recorded.
[2] Quantity not recorded.

Exports of crude and semicrude aluminum (excluding scrap) were nearly three times as large as in 1945 but were less than one-tenth those of the record year 1944. As usual, much of the imported material, predominantly metal and alloys, reappears for export as mill

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

products and manufactures. This was especially notable in 1946, when the value of exported ingots, slabs, and crude was only 1½ percent of the total export value. Of these exports, 144 tons went to Cuba, 133 to Brazil, 124 to Argentina, and 330 to the Netherlands. The remainder, 376 tons, was distributed among 19 countries in lots ranging from a few pounds to 82 tons. Of the 640 tons of scrap exported, Canada received 379 tons and Mexico 135. The remaining 126 tons were divided among 11 countries. Plates, sheet, bars, and rods were shipped to 63 countries, of which 15 took about 87 percent of the total, as follows: Canada, 1,515 tons; Mexico, 1,038; Guatemala, 698; Honduras, 426; Costa Rica, 697; Cuba, 704; Colombia, 359; Venezuela, 2,600; Peru, 307; Chile, 436; Brazil, 497; Philippine Republic, 2,860; China, 357; British East Africa, 536; and Union of South Africa, 504.

Aluminum exported from the United States, 1944–46, by classes

INDUSTRIAL DEVELOPMENTS

Much of the technologic progress reported in 1946 was an outgrowth of wartime developments induced by the exacting demands of airplane designers. In general, they related to enhanced mechanical properties and bettered fabrication processes that have furnished materials and techniques adaptable to a broader range of applications than was considered possible a few years ago.

The wider use of continuous-billet casting has made possible the production of larger and stronger rolled, forged, or extruded sections. Die casting expanded at the expense of sand casting, furnishing products to close tolerances that reduced or, in some instances, even eliminated machining. Likewise there was a marked growth in production of extrusions, not only of aluminum alloys but of pure aluminum-clad alloys.

The shortage of the usual materials for building construction, especially for housing, brought forth new composite materials in which

aluminum sheet was the surface element; or, in the form of foil, an insulator. A wide range of decorative or protective coatings—in color and enamel as well as electroplated chrome or nickel—were made available for architectural or structural use. Although developed just before the war, aluminum-coated continuous steel strip was first produced commercially in 1946; the material appears likely to displace galvanized sheet in some uses, such as for ducts. New aluminum paints also appeared, and production of nails grew rapidly. Aluminum electric transmission cable was in strong demand. Aluminum electric wire for house and building installation entered the market, having received Underwriters Laboratories, Inc., approval in September.

In the transportation field aluminum greatly extended its use, especially in marine applications, such as in boats and as superstructure, funnels, lifeboats, ladders, interior trim, and furniture for large vessels. The Aluminum Co. of America had designs made for 7,780 and 10,280-ton all-aluminum bauxite-ore carriers and put into service three medium-size passenger-freight vessels having aluminum upper works. Another striking unique use of the metal was the construction of a 100-foot-span railroad bridge near Massena, N. Y. New bearing alloys suited to high temperatures and heavy pressures were reported, as were high-strength, heat-resistant alloys for use in jet turbine engines. Aluminum-copper-beryllium heat-treatable alloys and similar alloys with cobalt were developed. For secondary metal recovery, the Reynolds Metals Co. developed an improved sloping-hearth furnace capable of taking large airplane wing or body sections and producing high-quality ingot from unsegregated scrap.

WORLD REVIEW [5]

World output in 1946 was about 14 percent below that in 1945 and approximately 40 percent of the peak reached in 1943. In that year the Axis and the Axis-dominated countries accounted for more than a quarter of the world's total—equivalent to roughly two-thirds of the world output in 1946. In 1946 Germany and Japan no longer appeared as primary metal producers and henceforward their share may be fully dissipated, with plant and equipment distributed among the principal victors. A new world-production pattern thus emerged.

For the first time since 1939 close evaluation of world production has been made possible through receipt of official statistics. The revisions shown in the accompanying table show that total output moderately exceeded estimates for the war years, to a large extent attributable to the high production levels attained in the Axis countries.

Australia.—The Australian Aluminum Production Commission in its first report covering a 14 months' survey ended June 30, 1946, concluded that the Commonwealth's resources justified establishment of an aluminum industry. An alumina plant with reduction works is to be erected in Tasmania, according to the Commission. Australian annual postwar aluminum requirements were estimated at 6,000 tons. The proposed plant would have an equal excess capacity.

Austria.—Although a small reduction plant (Swiss-owned) was built at Lend in Upper Austria in 1897 and a second one at Steeg during

[5] Unless otherwise noted, metric tons used throughout this section.

World production of aluminum, 1940–46, by countries, in metric tons

[Compiled by B. B. Mitchell]

	1940	1941	1942	1943	1944	1945	1946

the First World War, their combined capacity was only 4,700 metric tons when Austria was incorporated in the Third German Realm in 1938. Internal demand was never large; and most of the production, which reached a prewar peak of 4,428 tons (1938), was exported mainly to Germany. The period 1939–46 is considered under the section on Germany.

Brazil.—Attempts to develop aluminum-ingot production in Brazil have been unsuccessful so far, although modest mill facilities were expanded during the war. Eletro-Quimica Brasiliera, S. A., near Ouro Preto, Minas Gerais, poured the first South American ingot in March 1945 but ceased operation in 1946. The annual rated capacity was about 2,500 tons, but the maximum production was 3.5 tons a day. The operation was uneconomic because of high capital charges and heavy transport charges on bauxite. It was announced about the year end that Aluminium, Ltd., and Brazilian capitalists had formed a joint enterprise, Aluminio do Brasil, S. A., with assets over $10,000,000. It was proposed to erect an integrated plant with high-speed rolling mill and other equipment at Moze das Cruzes about 90 km. from São Paulo. Brazilian aluminum consumption was about 5,500 tons in 1946 but is expected to reach 15,000 tons in the near future.

Canada.—As in the United States, aluminum production slumped to about 40 percent that of the peak war year, 1943; this, however, was about double the 1939 rate, when then existing facilities were working close to their capacity. In 1946, notwithstanding the strong internal demand, the Aluminum Co. of Canada, Ltd., reported domes-

tic sales of only about 14 percent of its production, leaving about 86 percent for export. This company is reputed to have the world's lowest production costs and through its parent organization, Aluminium, Ltd., has representation or related subsidiaries engaged in various phases of a fully integrated operation in more than 50 countries. It is, consequently, in a highly favorable position with respect to foreign trade, especially within the British Empire. Shipments to the United Kingdom, which, except during the war has been the principal market, were nearly half the year's exports, with about 20 percent to the United States and the remainder to 46 other countries. In the spring of 1946 a contract was made to deliver 215,000 metric tons to Great Britain by the end of 1947. At about the same time the price in Canada was cut to 13.25 cents a pound delivered and though raised in November to 14 cents—partly compensating for the July dollar revaluation—represents a drop of about 30 percent since the beginning of the war despite wage increases of about 50 percent. Considerable plant modernization or expansion was under way during the year, and largely took the form of sheet- and foil-rolling, wire-drawing, and extrusion facilities.

China (Formosa).—The former Japanese plants at Kaohsiung and Hualien were placed under the management of the Taiwan Aluminium Co., an organization set up by the National Resources Commission of China. Both plants were seriously damaged during the war. Cost of rehabilitation is estimated to be US$12,000,000. The first-named plant, erected in 1936, had a capacity of 12,000 tons yearly. Operation ceased in March 1945. The Hualien plant that had a capacity of 8,000 tons annually was closed in August 1944.

France.—Primary metal output rose sharply near midyear and averaged closely 165 tons a month above that of the last prewar year, 1938. Output was hampered, especially in the first quarter, by power shortages and to some extent by limited fuel supply. Exportation was resumed, but the short supply held it in the first 7 months to about 20 percent of the 1938 rate. According to Revue d'Aluminium, the percentage distribution of consumption in 1938 was as follows: Transportation, 59.8 (aircraft alone, 36.3); electrical industry, 18.8; household goods, 10.2; and miscellaneous, 11.2.

Germany.[6]—Except for a small Swiss-owned plant constructed at Rheinfelden, Baden, in 1897, Germany was not an aluminum producer until the First World War. Its early recognition of the value of the light metal in warfare and as a substitute for scarce copper then made it an important factor in world aluminum production. Its real ascendancy began with Hitler's rise to power in 1933. In that year its (Altreich or pre-World War II Germany) virgin aluminum capacity exceeded 47,000 metric tons. Production, greatly affected by the then world-wide depression, was scarcely 19,000 tons; but it was nearly one-half that of the United States and put Germany, with 13 percent of world output, in second place among producing countries. At the outbreak of World War II in September 1939, its productive capacity had risen to 204,000 tons plus 5,000 tons in Austria. Its output in 1939 then reached 195,000 tons, tenfold that of 1933, with

[6] Most of the data have been derived from Economic Survey of Germany, The Metal Industries, prepared by the Economic Advisory Branch, Foreign Office and Ministry of Economic Warfare, London, September 1944, and from German Aluminum and Magnesium Industries, Office of Military Government for Germany U. S.), (FIAT) Final Rept. 501, November 1945.

an added 4,000 tons from former Austria, and with 28 percent of world production (about 710,000 tons) superseded the United States, whose output was only four times that of 1933, as the premier producer. Plant expansion and new construction were continued almost to the end of the war; and near the close of 1944 capacity of Altreich plants was about 256,000 tons, with about 74,000 tons more in former Austria where, at Engerau, a 20,000-ton plant was under construction. Production of virgin metal, however, reached a peak in 1942, comprising 227,000 tons in old Germany and nearly 37,000 tons in the Austrian area, together less than 20 percent of world production. In 1944 Austria's share had increased to 52,000 tons, whereas in Germany proper, as Allied air attacks became more successful, production dropped to 190,000 tons. In the final year of the war, as Germany itself became the battleground, production virtually ceased.

War damage to plants appears to have been moderate; but parts, at least, of some were soon removed, and others are about to be dismantled or distributed as reparations. At the time of the Allied occupation about 45 percent of the capacity was in the Russian zone, 22 percent in the British, about 17 percent in the United States, and 16 percent in the French zones. In the Austrian area all operating plants are in the Western Powers' zones but the partly completed Engerau plant is in the Russian-controlled section. The location, capacities, and peak output, in thousands of metric tons, of the various virgin metal plants are shown in the accompanying listing.

Primary aluminum plants, location, capacities, and peak output in Greater Germany, in thousands of metric tons

Plant and location	Capacity		Maximum reported output and year	Occupation zone
	June 1942	End 1944		
1. Bitterfeld, Saxony	38.4	38.4	38.0 (1941)	Russian.
2. Aken, Saxony	11.0	11.0	11.3 (1943)	Do.
3. Lauta, Saxony	62.8	62.8	56.8 (1941)	Do.
4. Lünen (Lippewerk) Westphalia	32.5	32.5	33.8 (1943)	British.
5. Grevenbroich (Erftwerk)	23.0	23.0	24.2 (1938)	Do.
6. Mundenheim, Palatinate	.5	.5	.4 (1942)	French.
7. Rheinfelden, Baden	29.0	39.0	25.8 (1942)	Do.
8. Töging, Bavaria	45.0	45.0	45.0 (1940)	American.
9. Ranshofen (Mattigwerk) Austria	32.4	64.8	38.0 (1943)	Austrian.
10. Steeg, Austria	2.2	2.2	2.1 (1941)	Do.
11. Lend, Austria	8.0	8.0	7.9 (1942)	Do.
Total Greater Germany	284.8	327.2	264.0 (1942)	

In addition to the foregoing, there were aluminum-silicon alloy plants at Lauta, 3,500 tons (aluminum content), and at Horrem, Westphalia, 2,600 tons. The latter was to have been removed to Schärding, Austria, in 1944. There were 13 large and nearly as many smaller secondary recovery plants, all in the Altreich, whose distribution and approximate capacities in 1944 were as follows: Russian zone, 7 plants (66,000 tons); British zone, 12 (56,000 tons); and United States zone, 5 (22,000 tons). Their prewar (1938) output was about 35,000 tons compard with less than 6,000 tons in 1933 and a maximum of 163,000 tons in 1944. Secondary recovery in Austria was usually negligible but was perhaps 2,500 tons late in the war period.

Primary plants (numbered 3–5 and 8–9 in the accompanying table) having 70 percent of the total capacity in 1944, were owned or operated by the Vereinigte Aluminium Werke (VAW), a concern organized in 1917 with half State and half private capital. Of the others, 1 and 2 were controlled and operated by I. G. Farbenindustrie and 7 by the Swiss Aluminium Industrie, A. G. Of the reclaim works two (27,000 tons) were in the hands of VAW and one (18,000 tons) was owned by I. G. Farben.

In October 1946 it was announced that 85 nonferrous metal plants in Germany proper were approved for reparations by the Allied Control Council in Berlin. Allocation will be made between the Inter-Allied Reparation Agency and the U. S. S. R. Those given the first group will be partitioned between 18 western nations. About 45 of the plants had been partly or fully engaged in the manufacture of alumina, primary and secondary metal, alloys, or wrought and cast products. Primary plants numbered 4–5 and 7–8 are included. Of plant 7, only the part built since 1933 was subject to allocation.

Consumption and other data are given in the accompanying table.[7] Estimated distribution of primary metal consumption, by use, in 1936 was as follows: Transportation, 19 percent; military use, 3 percent; electrical machinery, 7 percent; other machinery, 8 percent; wire and cable, 18 percent; household goods, 7 percent; foil, 9 percent; other fabricators, 12 percent; and miscellaneous, 17 percent. Even roughly comparable figures are not available for the war years. The large proportion going to wire and cable was striking. In 1943–44 it

[5] Estimated by chapter author.
[6] Partly estimated.
[7] Not available.
[8] Distribution between Altreich and Austria not available after 1937.
[9] Includes exports.

[7] Figures given in the original documents were compiled from various official and industry sources after the war. The several series were not, as pointed out by the authors, always comparable or continuous and showed some simple arithmetical errors and in part contained some estimates. Up to 1942–43 the data were not fully adequate; thereafter an attempt made to standardize and improve statistical procedures removed most of the conflicting series. The reported figures may not be accurate but are believed to be representative. In view thereof and as figures contained herein were taken from numerous original tables, minor discrepancies between text and tables, or therein, remain unreconciled.

accounted for 12 to 14 percent of the primary aluminum used for semimanufactures and between 14 and 19 percent of the total aluminum (primary and secondary) so used. Use or allocations for the armed forces in 1940–43 appear to have been within the range 74 to 81 percent of the total consumption or supply. About 4 to 5 percent was for export and the remainder for civilian use, but much of that indirectly benefitted the military forces.

On the whole, German processing methods did not differ widely from those in use in the United States. There may have been greater relative use of Soderberg electrodes, and continuous billet casting was more widely employed. An interesting alternating use of a wire mill for drawing copper and aluminum was noted. Considerable experimentation on methods of raising the quality of secondary metal recovered from alloy scrap were carried out. The three-layer refining process used at the Grevenbroich plant produced, it was claimed, 90 tons monthly of 99.99 percent aluminum. Similar refining cells were being installed at Ranshofen. Other methods using zinc, mercury, or lead for alloying with the scrap followed by distillation were also tested but were not applied on a commercial scale. In the zinc process the first major separation of the alloy components is accomplished by filtration.

Hungary.—Since Hungary was occupied by Soviet armies and has become, at least de facto, a satellite of the U. S. S. R., information on aluminum production has been scant. For the first 5 months of 1946 production was said to have been 687 tons, compared with a reported bauxite output of 18,000 tons.

India.—The first consequential metal production was in 1943 by the Aluminium Co. of India, Ltd., an associate of the Aluminum Co. of Canada, from the reduction works near Alwaye, Travancore, with rolling mill and fabricating plant at Belur near Calcutta. Capacity was about 1,500 tons yearly and was said to have met India's needs. Consumption has increased greatly, and the plant is to be increased to a 5,000-ton annual level as soon as power is available. Alloys will be made. A wire mill—the first in India—also is to be set up in Travancore. The Aluminium Corp. of India, Ltd., had constructed an alumina plant at Asansol, Bengal, by 1941, but was unable to complete a reduction works owing to the war. It, however, came into operation in 1946 at about a 1,000-ton yearly rate, with further expansion planned.

Italy.—Except for moderate damage to pot lines and electric installations at Porto Marghera (Swiss-owned), Italian metal plants suffered little during the war. The Mori and Bolzano plants of the Montecatini group resumed production, as did the smallest at Borgofranco (Aluminium, Ltd.). Output in 1946 was 8,000 tons, compared with 2,600 tons in 1945.

Japan.—Under current plans aluminum-reduction works in the Japanese home islands having a rated capacity of about 138,000 tons are to be dismantled or distributed among the four major war victors as partial reparations. The ultimate distribution has not been made public. Scrap-treatment plants may be permitted to operate.

Norway.—The Norwegian Parliament decided to complete construction of the aluminum works near Aardal, western Norway, originally undertaken during the war by the Germans. The State

will participate to the extent of 60 percent, with the remainder taken up by private capital. Power is now available. Production costs have been estimated at slightly more than £70 a ton. The initial annual capacity of 12,000 tons, to be operative in 1947, subsequently will be increased to 24,000 tons. This will double Norway's prewar capacity of about 30,000 tons; nearly all will be available for export, as internal consumption is about 4,000 tons. In 1946 exports were approximately 10,500 tons, of which 4,000 tons went to France, 2,200 tons to the United Kingdom, and 1,900 tons to Denmark.

U. S. S. R.—Press reports state that the aluminum industry is expanding rapidly in the Urals. Sections of the Bogoslovsk plant are in operation, and by 1950 it is scheduled to produce one and a half times as much as the whole country's prewar output. The Volkhov Aluminium Zavod has resumed production, but present capacity is believed to be not more than half that of the prewar figure of about 15,000 tons. Considerable progress also has been made in rehabilitating power sources damaged or destroyed during the war.

United Kingdom.—Consumption of aluminum in 1946 set a new peacetime record, roughly 20 percent above that of 1945 and (for primary metal) 265 percent of the 1938 use. The major shortage was in rolled products, largely induced by the allocation to the extensive Government-fostered aluminum house-building program. In this industry phase, sheet and strip production exceeded the peak wartime rates, 40 percent going to housing. In 1945 orders for 54,000 temporary aluminum houses were placed with five former aircraft manufacturers. The program was slow in getting under way, but by late November 10,000 had been erected. Production rate was then about 500 weekly and was expected to reach 1,200 in February 1947. About 2.6 tons of aluminum, much of it secondary, are required per house, and the present cost is £1,365; both elements are substantially above original estimates. The Government now proposes to extend the application to permanent two-story residences, prototypes of which have been erected, and to schools.

Although the Ministry of Supply lifted controls on purchase and consumption of aluminum and light alloys as of August 1, 1946, it remained the sole distributor of virgin metal. Price changes by the Ministry have occasioned considerable comment. Reflecting the cost of Canadian aluminum purchased in 1945, the British price was cut to £85 a long ton (15.27 cents a pound). According to an official statement, sales at that price involved a loss to the Treasury, as it was below cost of purchases under earlier arrangements and the price then paid for British supplies. In April 1946, after the new Canadian contract was made, the price was dropped to £67 (12.04 cents a pound), which was raised to £72¾ (13.09 cents) in September, corresponding to the upward revaluation of the Canadian dollar. The Ministry admitted that this was considerably below the cost of domestic metal. It was estimated that, at the 1946 production level, the subsidy to the domestic producers was £500,000 or more (about 2.7 cents a pound).

In 1946 primary production was 32,051 metric tons and secondary 49,370 tons. Approximate consumption of virgin metal was 120,900 tons and of secondary 39,600 tons.

Antimony

By RICHARD H. MOTE

GENERAL SUMMARY

THE DOMESTIC antimony industry in 1946 was characterized by a marked upturn in prices during the latter part of the year and a general decline in new supplies. The price of domestic antimony metal in less than carlots remained at 15.84 cents a pound until the removal of Office of Price Administration ceilings November 9, after which the price rose to 29.62 cents in two successive increases. Imports of antimony ore slumped 60 percent to the lowest level since 1935, owing to exhaustion of U. S. Government-owned stocks in South America accumulated during the war years. A threefold increase in metal imports and a 30-percent rise in the over-all antimony content of domestic ore production failed to offset the drop in ore imports. As a result, private and Government stocks were drawn upon to meet consumer demands. At the end of 1946 stocks of antimony ores and concentrates held by smelters and manufacturers were up slightly; but both Government and mine stocks had dropped precipitously, making a net stock decline of 37 percent from the end of 1945. Domestic consumption of primary antimony dropped 32 percent in 1946.

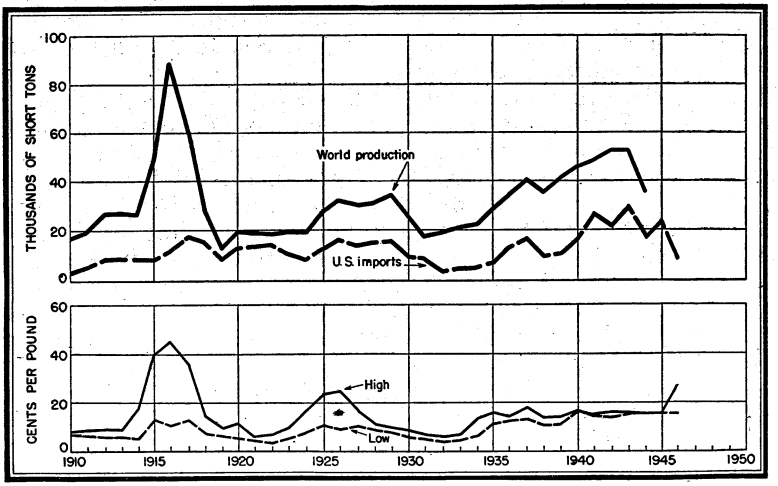

FIGURE 1.—Trends in world production, 1910–44, and United States imports and range in New York price of antimony, 1910–46.

[2] Primary antimony available for consumption; data not strictly comparable with figures for subsequent years.
[3] American Metal Market.

Antimony remained one of the few metals under Government allocation, as the provisions of War Production Board General Preference Order M–112 were continued through 1946. Details of Order M–112 and amendments can be found in the Antimony chapters of Minerals Yearbook, 1942 through 1945.

DOMESTIC PRODUCTION

MINE PRODUCTION

Six mines are known to have produced ores in 1946 from which antimony was recovered compared with 8 in 1945 and 11 in 1944. Although the production of ore and concentrates dropped 7 percent to 13,962 tons, the antimony content increased 30 percent above the 1945 level. Only 42 tons or 2 percent of the antimony content of all ores and concentrates produced in 1946 were from ores mined solely for antimony, the remainder being contained in ores mined partly for other metals.

Antimony-bearing ores and concentrates produced in the United States, 1942–46, in short tons

Year	Gross weight	Antimony content		Year	Gross weight	Antimony content	
		Quantity	Average percent			Quantity	Average percent
1942	6,980	2,944	42.2	1945	14,966	1,930	12.9
1943	16,785	5,556	33.1	1946	13,962	2,505	17.9
1944	13,501	4,735	35.1				

Idaho.—The mines of Shoshone and Valley Counties yielded 98 percent of the total domestic mine output of antimony in 1946. The Yellow Pine mine of the Bradley Mining Co. in Valley County, by far the most important producer, recovered antimony from a low-grade antimony-gold ore assaying 1.25 percent antimony and 0.08 ounce gold and 0.6 ounce silver per short ton. During 1946 the Yellow

Pine flotation mill was modernized—including the installation of a 300-ton-per-hour crushing plant—and converted from tungsten-ore milling to antimony-gold-ore milling. Mill capacity at the end of 1946 was approximately 2,400 tons of ore per day. Other Idaho antimony producers in 1946 were the Sunshine Mining Co. Sunshine mine and the Coeur d'Alene Mines Corp. Mineral Point mine, both in Shoshone County.

Nevada.—Tony Romano shipped antimony ore to a smelter from his mine in Lander County during 1946.

Oregon.—S. J. and E. P. Merrick operated their Jay Bird mine in Jackson County and produced 10 tons of ore containing about 50 percent antimony.

Washington.—Zenith Mines, Inc., shipped several cars of antimony ore to Midvale, Utah, from its mine in Stevens County.

SMELTER PRODUCTION

Primary.—In 1946 primary antimony smelters consumed 13,029 tons of antimony in raw materials, including 12,801 tons in ores and concentrates, and produced antimony metal, oxide, and sulfide containing 12,457 tons of antimony, a decline of 41 percent from 1945. The Bureau of Mines is not at liberty to publish individual statistics on these three intermediate primary products.

Ores and concentrates consumed at smelters and manufacturers' plants in 1946 contained 17,685 short tons of antimony—4,164 in sulfide concentrates, 3,886 in metallurgical-grade sulfide ore, 3,656 in chemical-grade sulfide ore, and 5,979 in mixed or oxide ore.

Antimony metal, alloys, and compounds produced in the United States, 1942–46, in short tons

Year	Primary metal, oxide, and sulfide (antimony content)	Antimonial lead produced at primary lead refineries						Alloys (antimony content) produced at secondary smelters and by remelters
		Gross weight	Antimony content					
			From domestic ores [1]	From foreign ores [2]	From scrap	Total		
						Quantity	Percent	
1942	[3]	51,762	2,396	871	257	3,524	6.8	18,200
1943	20,624	63,515	1,591	494	1,286	3,371	5.3	15,483
1944	20,000	57,902	2,015	842	1,813	4,670	8.1	15,886
1945	21,000	56,495	1,749	243	2,156	4,148	7.3	17,148
1946	12,457	50,480	1,231	226	1,828	3,285	6.5	19,115

[1] Includes primary residues and small quantity of antimony ore.
[2] Includes foreign base bullion and small quantity of foreign antimony ore.
[3] Figure not available for publication.

The Texas Mining & Smelting Co., Laredo, Tex., continued to be the principal producer of antimony in the United States. The Texas plant, which operates almost exclusively on oxide and mixed oxide-sulfide ores imported from Mexico, was purchased on December 31, 1946, by the National Lead Co.

Harshaw Chemical Co. continued to produce oxide and metal at its El Segundo, Calif., plant. During 1946 the capacity of the smelter

was increased to 1,000 tons of antimony concentrates (50-percent grade) per month.

Production of antimonial lead in 1946 at domestic primary lead refineries declined 11 percent from the 1945 output. The 1946 production contained 3,285 tons (6.5 percent) of antimony derived as follows: From domestic ores 37 percent, from foreign ores 7 percent, and from scrap 56 percent. A detailed discussion of antimonial lead production is contained in the Lead chapter of this volume.

Secondary.—Recovery of antimony in antimonial lead and other alloys from scrap at secondary smelters and by remelters in 1946 totaled 19,115 tons, an increase of 11 percent over the 17,148 tons similarly recovered in 1945. Plates, grids, and sludge from discarded storage batteries continued to be the main source of secondary antimony. A detailed review is contained in the Secondary Metals—Nonferrous chapter of this volume.

CONSUMPTION AND USES

Primary antimony consumed in the manufacture of metallic products declined 7 percent in 1946, whereas the quantity used for nonmetallic products dropped 56 percent, thus markedly changing the use pattern of approximately equal consumption in these categories that existed during the war years. Cancellation of Government war contracts for flameproofed textiles was largely responsible for the sharp decline in antimony consumption in nonmetallic products. Antimony used in the production of porcelain enamel frits and sodium antimonate was approximately double the quantity consumed in 1945. The use of antimony in type metal and solder continued to increase during 1946.

Industrial consumption of primary antimony, 1943–46, in short tons [1]

Product	1943	1944	1945	1946
Metal products:				
Antimonial lead	2,889	5,287	5,920	4,827

[1] Compiled from monthly applications filed with War Production Board and Civilian Production Administration by approximately 400 consumers requesting allocation of antimony raw materials.

STOCKS

Stocks of the antimony raw materials—ores, concentrates, metal, oxide, and sulfides—held as mine stocks, by industry, and in Government stock piles declined 37 percent from 21,958 to 13,943 short tons of contained antimony.

Stocks of antimony in ores and concentrates held by smelters and manufacturers on December 31, 1946, were 21 percent greater than at the end of the previous year. Government stocks and mine stocks, however, decreased 78 and 96 percent, respectively. Antimony content of oxide on hand decreased 17 percent.

Stocks of primary and intermediate raw materials in the United States at year end, 1945–46, in short tons of contained antimony

Raw materials	Dec. 31, 1945				Dec. 31, 1946			
	Industry	Government	Mine	Total	Industry	Government	Mine	Total
Ores and concentrates	4,246	7,592	3,364	15,202	5,139	1,703	146	6,988
Metallic antimony	1,636	2,554	-------	4,190	1,975	2,929	-------	4,904
Antimony oxide	2,277	91	-------	2,368	1,967	-------	-------	1,967

	3,890	3,157	3,044	4,246	5,139

[1] Includes 50 tons in tetrahedrite concentrates.

PRICES

The Office of Price Administration New York price of domestic brands of antimony, 99.5 percent minimum, in less than carlots remained at 15.84 cents a pound until the removal of ceiling prices November 9. On November 12 the quotations jumped to 24.88 cents, and on December 17 the price advanced to 29.62 cents. Likewise the price of domestic metal in bulk, f. o. b. Laredo, Tex., rose from 14.50 cents to 23.50 cents per pound on November 12 and again on December 17 to 28.25 cents. The London price of metal, 99 percent minimum, remained at £105 a long ton.

Average monthly quoted prices of antimony, prompt delivery at New York for less than carlots, 1942–46, in cents per pound

[1] From American Metal Market, nominal.
[2] Metal Statistics, 1947, p. 577.

Quotations for antimony ores and concentrates, according to E&MJ Metal and Mineral Markets, remained at $2.10 to $2.20 a short-ton unit for the 50- to 55-percent grade; $2.15 to $2.20 for 58 to 60 percent; and $2.20 to $2.30 for 60 to 65 percent until November, after which the prices advanced in two successive increases to $3.60 to $3.80, $3.80 to $4.15, and $4.00 to $4.35 for the respective grades at the end of the year. The London price for 60-percent sulfide ore, which was 13s. 6d. a long-ton unit at the beginning of the year, rose to 15s. 6d. in May and closed at 17s. 6d. following a further advance in September.

FOREIGN TRADE[1]

Imports of antimony ore declined 60 percent in 1946 to the lowest level since 1935. Antimony metal imports, however, were the largest since the record year 1941 and 314 percent greater than in 1945.

Antimony imported for consumption in the United States, 1942–46

Siam	31	21	5,074		
	19,744	5,905	1,324,117	2,593	824,698

[1] Data include antimony imported for immediate consumption plus material entering the country under bond.
[2] Imports shown from Chile probably mined in Bolivia or Peru and shipped from a port in Chile.

The gross weight of domestic antimony materials exported in 1946 was 462 tons, of which 3 tons were ores and concentrates and 459 tons metal and alloys.

Reexports of foreign materials included 139 tons of metal and alloys (gross weight) and 16 tons of ores and concentrates.

Foreign antimony (regulus or metal) exported from the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	(1)	$181	1945	463	$141,301
1943	(1)	200	1946	139	43,197
1944	18	5,445			

[1] Less than 1 ton.

WORLD REVIEW

World production of antimony in recent years, insofar as data are available, is shown in the accompanying table.

World production of antimony, 1939–46, by countries, in metric tons [1]

[Compiled by B. B. Mitchell]

Country	1939	1940	1941	1942	1943	1944	1945	1946

[1] Approximate recoverable metal content of ore produced, exclusive of antimonial lead ores; 92 percent of reported gross content is used as basis for calculations in nearly every instance. Burma produces antimony, but data on production are not available.
[2] Estimate.
[3] Data not available; estimate included in total.
[4] Includes antimony content of antimonial lead.
[5] Includes Northern Territories and Sub-Carpathia; in addition beginning in 1941 includes Eastern Hungary and Transylvania; and beginning in 1942 includes Southern Territories.
[6] Data represents areas designated as Free China during the period of Japanese occupation.
[7] January to June, inclusive.
[8] Fiscal year ended Mar. 20 of year stated.
[9] Preliminary data for fiscal year ended Mar. 31 of year following that stated.
[10] April to September, inclusive.
[11] Estimated by the author of chapter.

Bolivia.—Total exports of antimony concentrates from Bolivia in 1946 were 7,676 metric tons compared with 6,102 tons in 1945.

China.—Data on antimony production in China are withheld under strict Government control of the industry. Output is believed, however, to have increased sharply under the impetus of Government subsidies. A recent report on the mineral resources of China [2] estimates Chinese antimony reserves as follows:

Province:	*Antimony metal (metric tons)*
Hunan	3,723,040
Kueichow, Kwangsi, Kwangtung, Yunnan, and Anhui	500,000
Total	4,223,040

[2] Juan, Vei Chow, Mineral Resources of China: Econ. Geol., vol. 41, No. 4, pt. 2, June-July, 1946, pp. 444–447.

France.—All antimony ores obtained from French mines in 1946 were used in the manufacture of antimony oxide. About one-half the domestic demand for antimony metal was met by imports, and the remainder of the metal used was smelted from ores imported from Algeria and French Morocco.

Honduras.—The El Quetzal mine near San Augustin de Copan, which shipped antimony to the United States during the war, ceased production in September 1946 because of high transportation costs.

A shipment of 15 long tons of antimony ore assaying 64.95 percent antimony is reported to have been made late in 1946 from a claim near La Union, Department of Olancho.

Spanish Morocco.—Cia. Espanola de Beni—Mesala produced 110 metric tons of antimony concentrates during the first half of 1946, all of which were exported to Spain for treatment.

Turkey.—Antimony concentrates produced in 1946 totaled 123 metric tons (containing an estimated 50 percent antimony).

Union of South Africa.—During the first 9 months of 1946, a total of 3,428 short tons of antimony concentrates was produced, and virtually all was exported.

United Kingdom.—During 1946 the United Kingdom imported 10,474 long tons of antimony concentrates. Domestic consumption of antimony metal totaled 5,623 tons, of which 1,300 tons were used in battery manufacture, 438 tons in other antimonial lead alloys, 646 tons in bearings, 2,590 tons in oxides and compounds, and 649 tons in miscellaneous uses. Consumption of antimony metal scrap totaled 3,199 tons, 64 percent of which was used in antimonial alloys.

Arsenic

By RICHARD H. MOTE

GENERAL SUMMARY

PRODUCTION of white arsenic in the United States declined to the lowest level in 20 years, principally the result of prolonged labor strikes at nonferrous smelters where virtually all domestic arsenic is recovered as a byproduct. Imports of white arsenic and metallic arsenic increased 5 and 79 percent, respectively, but did not offset the sharp drop in domestic output. Thus, in order to meet the consumer demand, industry stocks were reduced by 80 percent and Government stocks of nearly 2,000 short tons were entirely consumed by the end of March 1946. Heavy infestations of cotton-leaf worms, white-fringed beetles, and soybean caterpillars created a demand for calcium arsenate insecticide substantially in excess of supply. A similar supply problem in lead arsenate insecticides would have occurred had not the demand been materially reduced by killing spring frosts, which caused widespread damage to the domestic fruit crops. Price ceilings on white arsenic and arsenicals were removed in mid-1946, and quotations on all compounds had increased by the end of the year.

Salient statistics for white arsenic in the United States, 1942–46

	1942	1943	1944	1945	1946

[3] Apparent consumption.
[4] Producers' shipments, shipments from Government stocks, plus imports. Total not comparable with 1945.

DOMESTIC PRODUCTION

The domestic arsenic output is largely a byproduct of the smelting and refining of complex copper and lead ores, and the quantity of arsenic produced is directly related to the outputs of these metals. Of the five smelters that recovered byproduct white arsenic during 1946, four were closed by labor strikes during most of the first half of the year; as a result, domestic production slumped 58 percent below the 1945 output to the lowest level since 1926. Producers of arsenic in 1946 included the American Smelting & Refining Co. at Tacoma, Wash., El Paso, Tex., and Murray, Utah; Anaconda Copper Mining Co. at Anaconda, Mont.; and the United States Smelting, Refining &

Mining Co. at Midvale, Utah. No white arsenic was produced by Jardine Mining Co., Jardine, Mont., from its arsenic-gold-tungsten ores in 1946, but a stock pile of several hundred tons of material averaging about 75 percent As_2O_3 remained on hand during the year. Sodium arsenite solution for weed killer was produced directly from Canadian cobalt-nickel concentrates by the Shepherd Chemical Co., Cincinnati, Ohio.

White arsenic produced and sold by producers in the United States, 1942–46

Year	Crude			Refined			Total		
	Production (short tons) [1]	Sales		Production (short tons)	Sales		Production (short tons)	Sales	
		Short tons	Value [2]		Short tons	Value [2]		Short tons	Value [2]
1942	25,658	27,981	$1,198,424	3,023	3,057	$161,942	28,681	31,038	$1,360,366
1943	26,269	27,588	1,251,790	4,933	4,835	267,916	31,202	32,423	1,519,706

[1] Excludes crude consumed in making refined. Includes crude white arsenic equivalent of compounds made directly from ores, flue dust, and speiss as follows: 1942, 290 tons; 1943, 172 tons; 1944, 443 tons; 1945, 112 tons; 1946, 180 tons.
[2] Partly estimated.

CONSUMPTION AND USES

Apparent consumption of white arsenic in the United States in 1946 was approximately one-third less than in 1945. More than half of the arsenic consumed is utilized in insect-pest control of food and fiber crops. Lead arsenate is used primarily to protect apple trees against the codling moth and other fruit orchards, home gardens, and ornamental trees against various chewing insects. Calcium arsenate is utilized principally to combat the boll weevil in cotton fields, but a little is used with paris green in controlling potato bugs and cabbage "worms."

Data are not available on the total domestic consumption of the various arsenic insecticides and fungicides in 1946. The general demand for these products greatly exceeded the available supply, however. Although the boll-weevil infestation in the cotton-growing areas of the Southern States was not as severe as in former years, the abundance of other cotton insects, such as cotton-leaf worms and white-fringed beetles, created a demand for calcium arsenate that exhausted farmers' and dealers' stocks. The critical supply situation was partly relieved by the transfer of calcium arsenate stocks in the Northern States to the infested cotton areas. Calcium arsenate was extensively used in 1946 for the control of soybean caterpillars.

Lead arsenate requirements for the fruit industry in 1946 were below normal, due in part to the increasing use of DDT as a substitute for lead arsenate and in part to the widespread killing frosts in the late spring, which prevented fruit crops from ripening and thus eliminated the necessity of pest control during the 1946 growing season.

A new British insecticide, benzine hexachloride, according to American field tests,[1] is more effective than calcium arsenate in the

[1] Science News Letter, vol. 49, No. 13, Mar. 30, 1946, p. 203.

control of cotton boll weevil. Results of the tests suggested, however, that benzine hexachloride is not as effective as calcium arsenate or DDT for the control of bollworms.

Sizable quantities of arsenic are utilized in the preparation of weed killers, large quantities of which are used on railroad rights-of-way. Organic compounds are competitive when selective weed killing is required.

Arsenic is also used in the manufacture of glass, lead-base alloys, dyestuffs, cattle and sheep dips, wood preservatives, and poison bait and in the Thylox purification of industrial gases. Demand for arsenical pharmaceuticals has declined with the advent of the penicillin treatment for venereal diseases. A new arsenical drug, p-arsenosophenylbutyric acid, has been developed for use in curing African sleeping sickness.[2] Early cases of the disease have been reportedly cured in 1 week of treatment. Flexible telephone cables made of an improved arsenical lead alloy containing small quantities of tin and bismuth were introduced for general use in 1946.[3]

Production of arsenical insecticides, consumption of arsenical wood preservatives, and production of arsenical drugs in the United States, 1942–46

Year	Production of insecticides (short tons) [1]			Consumption of wood preservatives (pounds) [2]		Production of drugs (pounds) [3]

STOCKS

The last of the Government stocks of arsenic and unprocessed material were disposed of in March 1946. Stocks of white arsenic held by producers dropped 80 percent during the year; and stocks of arsenates, particularly calcium arsenate and paris green, are believed to have declined similarly.

PRICES

The quoted price for white arsenic, according to Oil, Paint, and Drug Reporter, remained at 4 cents a pound until Government control of prices was relinquished in midyear, after which the price increased to 5 cents in August and again to 6 cents in early December. Price ceilings were removed from lead arsenate and other arsenicals in July. Increases in quotations from midyear to year end were as follows (cents per pound in carlots): Calcium arsenate, 7 to 8½; lead arsenate, 11 to 17½; and paris green 20 to 26.

FOREIGN TRADE [4]

Imports.—White arsenic imports in 1946 increased 5 percent over 1945 but continued considerably below 1937, when imports were the highest ever recorded. Of the total 1946 imports, Mexico supplied 74 percent, Peru 17 percent, Sweden 5 percent, and Canada and U. S. S. R. each 2 percent. Importation of arsenic from Russia was the first ever recorded, and for the first time in several years arsenic was received from Sweden. Imports of metallic arsenic in 1946, largely from the United Kingdom, were the greatest since 1937.

Exports.—Exports of arsenicals were 63 percent larger than in 1945. Calcium arsenate was exported principally to France (45 percent) and Peru (38 percent) and lead arsenate to Brazil (25 percent), Argentina (22 percent), Cuba (20 percent), and Union of South Africa (11 percent). Statistics on white arsenic and paris green exports were not separately classified in 1946.

White arsenic (As_2O_3 content) imported for consumption in the United States, 1942–46, by countries

Country	1942 [1]		1943		1944		1945		1946	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value

[1] Arsenic is also believed to be produced in Czechoslovakia, Hungary, Iran, New Zealand, Spanish Morocco, Turkey, and U. S. S. R., but data are not available.
[2] Data not available; estimate included in total.
[3] Arsenic (As) content of ore mined.
[4] Estimate.
[5] Exports.
[6] Preliminary data for fiscal year ended March 31 of year following that stated.
[7] Incomplete data.
[8] Estimated by author of chapter; excludes estimates of countries listed in footnote 1.

Canada.—The output of white arsenic in Canada during 1946 totaled 745,000 pounds, valued at C$39,100, compared with 2,045,730 pounds, valued at C$130,909 in 1945. Of the 1946 production, 420,000 pounds came from Quebec and 325,000 pounds from Ontario.

China.—Arsenic is produced in China mainly as a byproduct of tin mining and subordinately from deposits of realgar and orpiment. In Hunan and Kwangsi the arsenopyrite ores recovered from tin-arsenic veins are distilled locally to arsenic oxide and sold chiefly for production of insecticides. Approximately two-thirds of the arsenic consumed in China comes from this source.[5]

Mexico.—Mexico ranks among the world's leading producers of arsenic. Arsenical flue dust is recovered in Cottrell units at lead smelters of the American Smelting & Refining Co. at San Luis Potosi and the American Metal Co., Ltd., at Torreon. Companies manufacturing arsenical insecticides from white arsenic all located in Mexico, D. F., include Fertilizantes de Mexico, S. A.; Cromo Industrial, S. A.; Productos Quimicos Mexicanos, S. A.; and General Electroquimica, S. A.[6]

Sweden.—Exports of arsenicals, which were prohibited in 1941 as a wartime measure, were resumed in 1945. White arsenic containing a minimum of 99 percent As_2O_3 is produced in Sweden by the Boliden Mining Co. from crude arsenic containing 70 percent As_2O_3. The crude arsenic is obtained as a byproduct in roasting of ore from the Boliden mine. In addition to copper, gold, and silver, the ore averages 7 percent arsenic.

Asbestos

By G. W. JOSEPHSON AND DOROTHY I. MARSH

GENERAL SUMMARY

IN 1946 the demand for asbestos far exceeded the supply. Construction and other consuming industries were booming, and they could have absorbed more asbestos products than manufacturers were able to furnish. Consequently, old plants were expanded and many new ones built. Part of this expansion program was undertaken with insufficient consideration of the availability of raw asbestos.

Domestic production of asbestos, principally from Vermont, totaled 14,426 short tons in 1946, 6 percent more than in 1945. Domestic mines furnished only 3 percent of the asbestos consumed in the United States in 1946. Imports reached a record tonnage.

Most of the chrysotile consumed in the United States is imported from Canada. Smaller quantities come from Africa and Russia. The imports from Africa were of the longer grades. Before the war Russia exported a substantial tonnage of chrysotile, but at present her sales to other countries are very small. All of the Russian asbestos received in 1946 was classified as crude.

All of the amosite used in this country for molded and other insulation products was imported from South Africa. Virtually all of the blue asbestos (crocidolite) used in asbestos-cement pipe came from South Africa; a small tonnage came from Australia. The unfavorable location of the Australian deposits limits their ability to compete.

Domestic production of tremolite asbestos for filtering was reported from California only. Limited quantities of amphibole asbestos were produced in several States.

Salient statistics of the asbestos industry in the United States, 1945–46

	1945		1946	
	Short tons	Value	Short tons	Value
Domestic asbestos—				
Produced:

[1] Figure not available.
[2] Revised figure.
[3] Quantity sold or used by producers, plus imports, minus exports.

Among the minerals that will be stock-piled by the Army and Navy Munitions Board are some grades of amosite and long-fiber grades of chrysotile that ordinarily are obtained from Africa. Funds were appropriated by the Congress in 1946; but the purchase program remained relatively inactive, owing to the shortage of supply. Stocks of asbestos accumulated by the Government during the war were being sold to industry and at the end of the year were nearly depleted.

In accord with the general trend, prices of raw asbestos increased in 1946.

Salient statistics for asbestos in 1945 and 1946 are summarized in the preceding table.

The following table shows domestic output of asbestos during recent years according to varieties.

Asbestos sold or used by producers in the United States, 1942–46, by varieties

Year	Chrysotile		Amphibole		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1942	13,373	$480,245	2,108	$18,612	15,481	$498,857
1943	3,900	302,289	2,114	32,526	6,014	334,815
1944	6,275	373,112	392	7,222	6,667	380,334
1945	11,986	[1] 442,056	240	3,989	12,226	[1] 446,045
1946	13,645	499,260	430	5,504	14,075	504,764

[1] Revised figure.

REVIEW BY STATES

Alaska.—Small quantities of tremolite and chrysotile asbestos have been produced in the Kobuk River district in recent years by the Arctic Circle Exploration Co., Candle, Alaska, but no output was reported for 1946.

Arizona.—The Arizona Chrysotile Asbestos Co. of Globe was again the largest producer in the State. Arthur Enders of Globe purchased, milled, and resold asbestos but did not mine in 1946. The Globe Asbestos Co. operated the Fiber King mine in Gila County. Total sales of Arizona fiber were somewhat lower than in 1945. All the asbestos produced in Arizona was chrysotile. The mill of the Globe Asbestos Co. was operated part of the last 2 months of 1946.

California.—The Powhatan Mining Co. (Woodlawn, Baltimore, Md.) produced tremolite asbestos near Castella, Shasta County. Homer Fenn of Hazel Creek reported production of tremolite from the Loma Blanca mine in Shasta County. Production of amphibole asbestos was reported also by H. Zimdars and J. Delume of Foresthill, Placer County.

Georgia.—The only asbestos production in Georgia in 1946 came from an amphibole mine near Dillard, Rabun County, operated by Powhatan Mining Co. of Woodlawn, Baltimore, Md.

North Carolina.—Powhatan Mining Co. was also the only producer of asbestos in North Carolina in 1946. The mine is near Dillard, Ga., but is across the State line in Macon County, N. C.

Vermont.—The Vermont Asbestos Mines Division of the Ruberoid Co. (500 Fifth Ave., New York 18, N. Y.) operated its mill, near

Eden, three shifts a day. Construction of additional mill capacity is being considered, but no major equipment was installed in 1946. The company obtains some exceptionally long fiber from its nearby mine; but it has not been adapted to spinning uses, and the entire output is milled to nonspinning grades. Production was substantially greater than in 1945.

TRENDS IN CONSUMPTION

The accompanying table shows the domestic consumption of unmanufactured asbestos and the value of asbestos products exported during the past 10 years. Statistics of asbestos products manufactured in the United States have not been compiled by the Bureau of the Census since 1939.

Raw asbestos consumed in and asbestos products exported from the United States, 1937–46

Year	Raw asbestos—apparent consumption (short tons)	Asbestos products—exports (value)	Year	Raw asbestos—apparent consumption (short tons)	Asbestos products—exports (value)
1937	316,263	$3,047,078	1942	433,919	$5,116,919
1938	187,150	2,533,916	1943	445,902	4,877,864
1939	255,547	3,354,920	1944	389,241	5,614,243
1940	262,199	3,473,248	1945	377,875	7,264,087
1941	438,741	4,835,194	1946	459,752	9,263,092

Asbestos is widely used in industry in such products as pipe covering, packing, gaskets, and friction materials; and the building industry provides a large market for asbestos-cement products, floor tile, insulation, and other uses. The correlation between activity in construction, general industrial production, and asbestos consumption during the past 27 years is shown in figure 1.

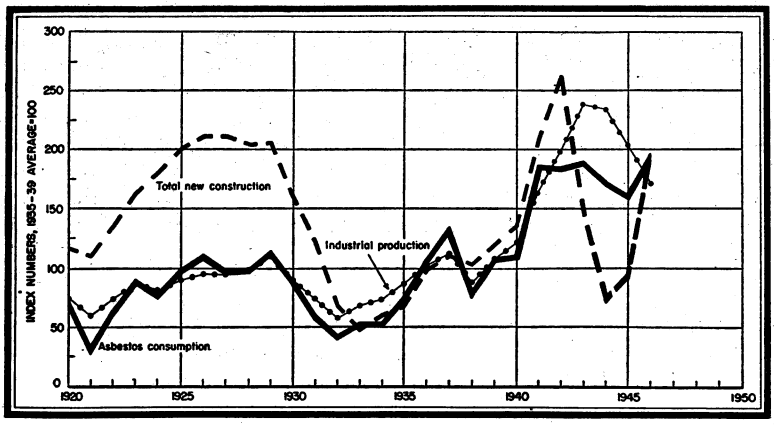

FIGURE 1.—Consumption of asbestos compared with total new construction and industrial production, 1920–46. Units are reduced to percentages of the 1935–39 average. Statistics on value of construction from Bureau of Foreign and Domestic Commerce and on industrial production from Federal Reserve Board.

MARKET CONDITIONS

Demand for asbestos increased in virtually all consuming countries in 1946, and a world-wide shortage developed. European and Asiatic factories that were cut off from the major sources of supply during the war were in the market for large tonnages of raw asbestos. In the past few years, eight asbestos-cement plants have been built in Latin America.[1] Similarly the American asbestos-products industry has grown. In 1946 the demand for products was so great that virtually all plants could have operated at capacity, but not enough raw material was available. The most acute shortage was of the grades of fiber suitable for the manufacture of asbestos-cement products, and there was also a severe deficiency in groups 6 and 7. Prolonged strikes in the factories of some of the principal manufacturers made available a substantial quantity of raw asbestos to the others, but this afforded only minor relief. At their present rate of expansion, there is little prospect that the mines will be able to satisfy the demand in the coming year. As Russian exports of raw asbestos are now very small, the burden of supplying the world market has fallen on Canada and Africa.

PRICES

The prices of asbestos, in common with most other commodities, increased during 1946. As quoted in the magazine Asbestos, the prices per short ton of Canadian fiber, f. o. b. mines, in January were as follows, in United States currency: Group 1 (Crude No. 1), $650–$750; group 2 (Crude No. 2, Crude Run-of-Mine and Sundry), $165–$385; group 3 (Spinning or Textile Fiber), $124–$260; group 4 (Shingle Fiber), $62.50–$90; group 5 (Paper Fiber), $44–$53; group 6 (Waste, Stucco, or Plaster), $33–$35; and group 7 (Refuse or Shorts), $14.50–$30.

Prices of Canadian asbestos increased after June, and in December these figures were quoted: Group 1 (Crude No. 1), $800; group 2 (Crude No. 2, Crude Run-of-Mine and Sundry), $275–$495; group 3 (Spinning or Textile Fiber), $155–$286; group 4 (Shingle Fiber), $75–$102.50; group 5 (Paper Fiber), $52.50–$59; group 6 (Waste, Stucco, or Plaster), $39; and group 7 (Refuse or Shorts), $17.50–$34.

The prices per short ton of Vermont asbestos quoted in January 1946 were: Shingle Stock Fibers, $62.50–$65.50; Paper Stock Fibers, $44–$54; Waste, $33; Floats, $19.50; and Shorts, $14.50–$28.50. By December they were: Shingle Stock Fibers, $75–$83; Paper Stock Fibers, $52.50–$59; Waste, $39; Floats, $24; and Shorts, $18.50–$35.

NEW DEVELOPMENTS

Many new or improved asbestos products, such as spray-coated insulation for corrugated sheets, asbestos ash trays, ironer pads, and wine and sugar filters, attracted attention in 1946, but of greater immediate significance was the growth of some established products. In past years there has always been a surplus of the very short fibers that are not suited for use in asbestos-cement or paper. However,

[1] Asbestos, Acute Shortage of Shingle Fiber Revealed by Survey: Vol. 28, No. 5, November 1946, pp. 2–4

this material is satisfactory for floor tile and consequently its status has changed unexpectedly. Floor-tile production capacity has increased so rapidly that not enough short asbestos is being recovered to satisfy the need. Equipment is being installed in the mills to increase recovery of these waste shorts, and it is expected that the trend in milling practice will be toward finer grinding.

With the shortage of asbestos has come a growth of interest in new deposits. There have been several reports of discoveries or development of known deposits. From South Africa came a statement that Stoltzburg Asbestos Holdings, Ltd., was preparing to open a mine on farm Stoltzburg No. 202 in the Carolina district.[2] A mill has been erected by Australian Blue Asbestos, Ltd., at Wittenoom, Western Australia, to produce blue fiber.[3] A large deposit of amosite is said to have been found in Wadi Hafafit in Baramia district of Upper Egypt. A deposit that may have practical interest to American consumers has been found in the Lewis Brook area on the west coast of Newfoundland. It has been examined by geologists and is believed to be of commercial size.

The growing desire of foreign countries to develop asbestos-products plants may have a considerable effect both on our export market and on the demand for raw asbestos. American companies have indicated a willingness to furnish technical and other assistance on such projects.

Interest in substitutes has also increased. The blending of fibrous glass and asbestos tends to relieve the shortage and also often yields a product having better properties than either material alone could achieve.[4] A fireproof wallboard consisting of cement and treated wood fibers is reported to have been developed for interior walls.

Some companies are interested in the possibility of producing asbestos synthetically. The Germans claim to have made a low-quality amphibole by crystallization from a vapor. Although the venture was not a commercial success, the fact that a fibrous product was made may have significance for the future.

FOREIGN TRADE [5]

More asbestos was imported into the United States in 1946 than in any previous year. Most of it came from Canada, but minor quantities of fiber came from Africa, Russia, and elsewhere. Receipts from U. S. S. R. totaled about the same as in 1945, but imports from South Africa declined sharply. The following table shows imports of unmanufactured asbestos into the United States during the past 2 years.

[6] Statistics compiled by B. B. Mitchell.

CANADA

In 1946, output of asbestos in the Province of Quebec, Canada, attained a new record, 15 percent higher than the one established in 1941 and 17 percent more than the tonnage reported in 1945.

To meet the great demand for Canadian chrysotile, the capacities of mines and mills are being rapidly increased. When its present program of mill expansion and development of underground mining is completed, Canadian Johns Manville Co., Ltd., will have increased its capacity by 50 percent. The new mine and mill of Flintkote Mines, Ltd., 4 miles northeast of the city of Thetford Mines, went into production in June 1946.

The statistics in the accompanying table of Canadian sales of asbestos were supplied by the Department of Mines of the Province of Quebec.

Sales of asbestos in Canada, 1945–46, by grades

	1945			1946 [1]		
	Short tons	Value		Short tons	Value	
		Total	Average per ton		Total	Average per ton
Grade:						
Crudes	981	$415,203	$423.24	741	$334,646	$451.61
Fibers	219,767	16,628,467	75.66	228,234	17,174,712	75.25

[1] Preliminary.

AFRICA

Southern Rhodesia.—In the mineral production of Southern Rhodesia, the value of asbestos ranks second only to gold. Some is sold to the United States, but most of the exports go to other consumers. In 1945 the United Kingdom took 17,499 short tons; Australia, 8,192; India 5,115; Belgium, 4,680; France, 3,078; the United States, 2,281; Argentina, 2,700; and Sweden, 2,100. Production statistics for recent years are shown in the accompanying table.

Asbestos produced in Southern Rhodesia, 1941–46

Year	Short tons	Value	Year	Short tons	Value
1941	44,134	£910,041	1944	58,293	£1,674,467
1942	55,803	1,488,052	1945	56,348	1,788,386
1943	58,146	1,673,025	1946	55,872	1,676,503

Swaziland.—As shown in the table of world production, output of chrysotile asbestos in Swaziland has increased rapidly since 1939. In 1946, production was nearly as great as in the record year 1944.

Union of South Africa.—Since 1943, asbestos output in the Union of South Africa has declined steadily, and data covering the first 9 months indicate that this trend continued in 1946. Available statistics on production and exports, by Provinces, are shown in the following table.

Asbestos produced in and exported from the Union of South Africa, 1942–46 [1]

Year	Production (short tons)				Exports [2]	
	Transvaal	Cape Province	Natal	Total	Short tons	Value
1942	27,278	7,281	(3)	34,559	30,169	£731,408
1943	27,768	7,888	(3)	35,656	35,940	880,019
1944	26,747	7,835	(3)	34,582	28,174	672,941
1945	20,016	8,200	(3)	28,216	22,005	591,124
1946 [4]	9,052	5,383	(3)	14,435	13,186	339,000

[1] Data from Union of South Africa, Department of Mines, Quarterly Report.
[2] Revised. (Data previously listed included manufactures.)
[3] Data not available.
[4] January to September, inclusive.

Output of all the four varieties of asbestos that are regularly marketed in South Africa were reported in 1946. However, the production of amosite was much lower than in recent years. The following table shows the tonnage of each variety produced, by Provinces, during the past 5 years.

Asbestos produced in the Union of South Africa, 1942–46, by varieties and sources in short tons [1]

Variety and source	1942	1943	1944	1945	1946 [2]
Amosite (Transvaal)	24,924	23,189	22,848	16,737	6,889
Chrysotile (Transvaal)	1,917	2,034	2,014	1,765	1,256
Blue (Transvaal)	360	2,456	1,831	1,471	877
Blue (Cape)	7,281	7,888	7,835	8,200	5,383
Anthophyllite (Transvaal)	77	89	54	43	30
	34,559	35,656	34,582	28,216	14,435

[1] Data from Union of South Africa, Department of Mines, Quarterly Report.
[2] January to September, inclusive.

OTHER COUNTRIES

In addition to those previously mentioned, the only other country known to have a substantial asbestos production is Russia. In 1938 its output was reported to have been 86,000 metric tons, but no production statistics have been released for subsequent years. As shown in the world table, relatively minor but locally significant tonnages of asbestos are produced in many countries.

Output of asbestos fiber in Italy is gradually recovering.

An asbestos mill owned by Campañía Minas de Cemento de Tinaquilla has gone into operation at Tinaquilla, State of Cojedes, Venezuela.

Asphalt and Related Bitumens

By A. H. REDFIELD

GENERAL SUMMARY

DOMESTIC demand for petroleum asphalt was 13 percent higher and export demand 83 percent higher in 1946 than in 1945. Export demand, however, was only 5 percent of the total demand, domestic and foreign, so that the total demand increased 15 percent in 1946 over 1945. To meet the greater demand, petroleum refineries in the United States enlarged their output 15 percent from 1945 to 1946. But less petroleum and lake asphalt was imported, and more petroleum asphalt was drawn from stocks in 1946 than in 1945. In numerical terms, an increase of 895,702 short tons in domestic demand and of 175,801 tons in export demand, as well as a rise in inventories of 9,300 tons during 1946, could be met by an increase of 1,039,000 tons in refinery production and a rise of 66,500 tons in stocks during 1945. On the other hand, imports of petroleum and lake asphalt decreased 24,697 tons from 1945 to 1946.

Bituminous rock was manifestly affected by the increased activity in highway construction and maintenance. Sales of bituminous sandstone and limestone were 21 percent larger in 1946 than in 1945, but prices were lower, and the sales value increased only 11½ percent from 1945 to 1946. Gilsonite sales increased 12 percent in tonnage and value from 1945 to 1946. Exports of natural asphalt (unmanufactured) were 44 percent lower in 1946 than in 1945.

NATIVE ASPHALT AND BITUMENS

Bituminous Rock.—As a result of increased activity in highway construction and maintenance in 1946 over 1945, sales of bituminous sandstone and limestone by producers in the United States increased from 642,600 short tons valued at $2,565,925 in 1945 to 777,467 tons valued at $2,861,591 in 1946. The increases occurred chiefly west of the Mississippi River. Sales by producers in Texas and Oklahoma increased from 413,021 tons in 1945 valued at $1,054,380 to 532,634 tons valued at $1,197,395 in 1946. Sales were larger in Utah and in Missouri in 1946 than in 1945, but smaller in California. East of the Mississippi River, sales of bituminous rock by producers in Kentucky and Alabama increased from 192,381 tons valued at $1,235,928 in 1945 to 194,742 tons valued at $1,287,099 in 1946.

Gilsonite.—Sales of gilsonite by producers in northeastern Utah increased from 61,273 short tons valued at $1,250,546 in 1945 to 68,407 tons valued at $1,400,229 in 1946. The average sales value per ton at the mine or railhead increased only slightly—from $20.41 in 1945 to $20.47 in 1946.

Wurtzilite.—Sales of wurtzilite amounted to 24 short tons valued at $1,066 in 1946. None was sold in 1945.

MANUFACTURED OR PETROLEUM ASPHALT

Production.—Production of asphalt by petroleum refineries in the United States increased 15 percent from 1945 to 1946. The increase was all east of the Rocky Mountain foothills; California produced 15.7 percent less petroleum asphalt in 1946 than in 1945, and the Rocky Mountain refining district 15.5 percent less. The greatest increases, both in tonnage and in percentage, were in the East coast district and in the Indiana, Illinois, Kentucky, etc., district. The next greatest increases, both quantitative and proportional, were in the Gulf coast districts of Texas and Louisiana.

Stocks.—Stocks of petroleum asphalt held at refineries were little more than 1 percent higher on December 31, 1946, than on December 31, 1945. The national increase was due chiefly to larger stocks in the Rocky Mountain district, in California, and in the Indiana, Illinois, Kentucky, etc., district. On the other hand, these increases in inventories were largely offset by decreases in stocks held in the East coast, Appalachian, and Oklahoma-Kansas-Missouri districts and in Arkansas and inland Louisiana.

Production, receipts, stocks, consumption, transfers, losses, exports, and domestic sales of asphalt (exclusive of road oil) at petroleum refineries in the United States in 1946, by districts, in short tons

District	Production	Receipts [1]	Stocks		Consumption by producers, transfers, losses, and exports	Sales to domestic consumers
			Beginning of year	End of year		
East Coast	2,102,400	182,100	125,300	107,800	191,100	2,110,900
Appalachian	372,000	27,900	35,300	23,300	16,300	395,600
Indiana, Illinois, Kentucky, etc	1,884,600	107,300	140,500	161,300	474,700	1,496,400

[1] Receipts from interindustry refinery transfers, addition of other petroleum products blended to make cut-back asphalts, imports, and transfers from stocks formerly not classed as asphalt.

Sales.—Sales of petroleum asphalt to domestic consumers increased 11 percent in quantity and 19 percent in value from 1945 to 1946. The average value at the refinery increased from $11.51 per short ton in 1945 to $12.34 in 1946.

Of the total sold, 20 percent was manufactured from foreign petroleum (imported chiefly from Venezuela, Colombia, and Mexico) in 1946, compared with 16 percent in 1945. Although runs of foreign crude to stills increased 15 percent from 1945 to 1946, sales of petro-

leum asphalt from this source increased 43 percent. Of the foreign crude processed, 8 percent was converted to asphalt in 1945 and 10 percent in 1946. East coast refineries sold all of the asphalt made in the United States from foreign crude both in 1945 and in 1946.

Sales of asphalt (exclusive of road oil) at petroleum refineries to domestic consumers in the United States, 1945–46, by districts

District	1945		1946	
	Short tons	Value	Short tons	Value
East Coast	1,643,569	$22,621,332	2,110,922	$29,932,829

Highway and street construction and airport-runway surfacing (in the form of paving asphalt, paving flux, cut-back asphalts, and asphalt emulsions) used 64 percent of the total asphalt sold to domestic consumers by petroleum refineries in 1945 and 60 percent in 1946. Street and road contracts exceeding $25,000 in 1945 and $40,000 in 1946, according to Engineering News-Record, showed an increase of 239 percent in value—from 227.3 million dollars in 1945 to 769.4 million dollars in 1946—and of 183 percent in indicated volume, if the values are adjusted by the Engineering News-Record index of construction costs. The increases were general, but were greatest in the 14 States west of the Mississippi River and east of the Rocky Mountains and in the 10 Southeastern States east of the Mississippi River and south of the Ohio and Potomac Rivers and including Louisiana.[1] Smaller increases occurred in the 5 Middle Atlantic States north of the Potomac River and in the 7 Pacific and Rocky Mountain States.[1] Total expenditures for maintenance and construction of highways by States, counties, and municipalities, as calculated by the American Association of State Highway Officials, increased from 1,341 million dollars in 1945 to 1,589 million dollars in 1946.

Although available statistics indicate greater activity in highway construction and maintenance in 1946 than in 1945, sales of paving asphalt used for high-type surfacing increased only 5 percent—from 1,904,002 short tons in 1945 to 1,994,621 tons in 1946. Sales of cut-back asphalts suitable for surfacing lighter-type highways were 2½ percent higher in 1946 than in 1945. The popularity of medium-curing cut-backs declined again; 11 percent less of this type of cut-

[1] States grouped according to Engineering News-Record.

Asphalt and asphaltic material (exclusive of road oil) sold at petroleum refineries to domestic consumers in the United States in 1946, by varieties

back was sold in 1946 than in 1945, but sales of rapid-curing cut-backs were 26 percent larger.

The quantity of emulsified asphalt sold in 1946 was less than in 1945, but the value was higher. Petroleum refineries sold 69,943 short tons (16,479,935 gallons) valued at $711,770 in 1945 and 56,917 tons (13,410,755 gallons) valued at $643,006 in 1946. In addition, 68,704,092 gallons or 291,589 short tons (revised figure) valued at $6,493,043 in 1945 and 67,367,106 gallons or 285,914 short tons valued at $7,235,122 in 1946 were sold by major industrial companies that purchased asphalt from petroleum refineries and manufactured it into emulsions. Accordingly, total known sales of emulsified asphalts and fluxes decreased 5 percent in quantity—from 85,184,027 gallons (revised figure) in 1945 to 80,777,861 gallons in 1946—but increased 9 percent in value—from $7,204,813 in 1945 to $7,878,128 in 1946.

Roofing manufacture made the second-largest demand for asphalt, absorbing 30 percent of the total sales to domestic consumers in 1945 and 34 percent in 1946. Although shipments of prepared roofing reported to the Bureau of the Census increased 24 percent—from 49,156,000 squares in 1945 to 60,865,000 squares—domestic sales of roofing asphalt and flux combined increased 25 percent—from

2,049,685 short tons in 1945 to 2,568,827 tons in 1946. These figures do not include roofing asphalt and flux consumed by the companies in factories of prepared roofing owned by themselves or by affiliated companies.

APPARENT CONSUMPTION

The apparent average monthly domestic consumption of petroleum asphalt (including small quantities of imported lake asphalt and grahamite) increased 13 percent—from 583,258 short tons in 1945 to 657,902 tons in 1946.

The period of high demand that had characterized 1940–45 continued into 1946. In terms of the long-term trend, apparent consumption was 38 percent above expected consumption for 1945 and 52 percent above that for 1946; that is, if the national demand had continued the average growth it manifested from 1908 to 1944, it would have averaged 423,173 short tons a month in 1945 and 657,902 tons in 1946. If these averages are used as a standard of comparison, apparent consumption of 583,258 tons a month in 1945 was 138 percent of the expected consumption (423,167 tons, revised figure) in 1945, and apparent consumption of 657,902 tons a month in 1946 was 152 percent of the expected consumption (434,315 tons).

Relation of indicated asphalt demand to basic trend, multiplied by seasonal factors, 1945–46, by months

Months	1945			1946

[1] Total based upon 1908–1945 trend. Monthly figures obtained by applying seasonal factor based upon actual monthly distribution in 1925–46.
[2] Revised.

The downward trend in demand (relative to the long-term trend modified by seasonal indexes, on a monthly basis) that had been manifested in the second and fourth quarters of 1945 gave way to a definite rise in 1946. In the first quarters of both 1945 and 1946 demand averaged 47 percent above the expected figures. In the second quarter of 1946, however, demand was 44 percent above the expected figure, compared with 37 percent above expected in the corresponding months of 1945. From July to September 1946, demand was 53 percent higher than the calculated level, compared

with 41 percent above the calculated in the third quarter of 1945. In the last 3 months of 1946 demand averaged 62 percent over the trend figure, compared with 28 percent above the trend in the final quarter of 1945.

DISTRIBUTION BY RAIL

The tonnage of asphalt (natural, byproduct, or petroleum) terminated by class I railroads in the United States increased from 5,379,418 short tons in 1945 to 6,344,544 tons in 1946, according to freight-commodity statistics compiled by the Interstate Commerce Commission. Of the total deliveries, 54 percent in 1945 and 56 percent in 1946 were set down in the populous area north of the Ohio and Potomac Rivers and east of the Mississippi River, although this area comprises only 14 percent of the area of continental United States. In this area, terminations of asphalt rail shipments were 22 percent larger in 1946 than in 1945. In the States lying south of the Potomac and Ohio Rivers and east of the Mississippi River, 3 percent less asphalt was delivered by rail in 1946 than in 1945. Between the Mississippi River and the Rocky Mountains, railroad terminations of asphalt were generally larger in 1946 than in 1945. In the Mountain States the pattern of increases and decreases was spotty. On the

Asphalt (natural, byproduct, and petroleum) terminated by class I railroads in the United States, 1945–46, by States, in short tons

Pacific coast a decline in rail deliveries in California offset increases in Washington and Oregon. It may be noted, however, that railroad terminations of asphalt were equivalent to only 77 percent of the total indicated demand for asphalt in the United States in 1945 and 80 percent in 1946, and that considerable quantities of asphalt were delivered to consumers by water and by minor railroads and motor trucks. Accordingly, these figures do not present a complete picture of the consumption of asphalt by States.

FOREIGN TRADE[2]

Imports.—Imports of natural asphalt and bitumen into the United States in 1946 totaled 4,449 short tons valued at $92,419, compared with 5,148 tons valued at $122,207 in 1945. Imports of lake asphalt from Trinidad decreased from 4,926 short tons valued at $116,219 in 1945 to 3,943 tons valued at $82,625, but imports of grahamite from Cuba increased from 222 short tons valued at $5,927 in 1945 to 315 tons valued at $8,106 in 1946.

Imports of solid petroleum asphalt decreased from 142,802 short tons valued at $798,667 in 1945 to 97,204 tons valued at $536,697 in 1946. Virtually all of the 1945 and 1946 imports came from the Netherlands West Indies.

In addition, 22,161 barrels (4,029 short tons) of liquid petroleum asphalt valued at $43,028 were imported in 1945 and 140,959 barrels (25,629 tons) valued at $234,491 in 1946. The Netherlands West Indies supplied virtually all the liquid petroleum asphalt imported into the United States in 1945. Of the 1946 imports, 60,377 barrels (10,978 tons) valued at $101,433 came from Mexico and 80,556 barrels (14,646 tons) valued at $132,900 from the Netherlands West Indies.

Exports.—The tonnage of natural asphalt, unmanufactured, exported from the United States decreased from 47,094 short tons valued at $1,207,147 in 1945 to 26,588 tons valued at $974,404 in 1946. The most marked decreases were in exports to Australia and New Zealand, to India, and to parts of Africa where war construction had gone on. Europe was the principal foreign market for natural asphalt in 1946, absorbing 81 percent of the total exports. Shipments to northern, western, and Mediterranean Europe increased in spite of a decline in exports to Scandinavia. Shipments to Canada and to east coast countries of South America were greater in 1946 than in 1945.

Exports of petroleum asphalt from the United States in 1946 were 83 percent larger than in 1945 and were the largest since 1930. The most marked increase was in shipments to Europe, which in 1946 were nearly four times the 1945 shipments. With the exception of Sweden, all European countries listed received more asphalt from the United States in 1946 than in 1945. Increased shipments to China and southern Asia more than offset the sharp decline in exports of asphalt to India. In Africa, reduced shipments to the Union of South Africa, Mozambique, and Belgian Congo were more than counterbalanced by increased shipments to other parts of the continent. In Oceania, a sharp drop in exports to Australia was not compensated for by greater shipments to New Zealand. In general, these shifts indicate a change in emphasis from wartime activities to postwar reconstruction.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Petroleum asphalt exported from the United States, 1944–46, by countries

ROAD OIL

Reported sales of road oil by petroleum refineries in the United States increased 96 percent in quantity—from 2,567,000 barrels in 1945 to 5,034,000 barrels in 1946—and 150 percent in value—from $3,561,000 in 1945 to $8,894,000 in 1946. This marked increase in road-oil sales was due not so much to higher demand resulting from greater activity in highway construction and maintenance during 1946 as to the release of official controls on the use of petroleum residues and the greater availability of this low-cost material for surfacing highways for light traffic.

In 1946 four refining districts—Indiana, Illinois, Kentucky, etc.; Oklahoma-Kansas-Missouri; Rocky Mountain; and California—together made 92 percent of all road-oil sales in the United States The same districts in 1945 accounted for 72 percent of the national total.

Production, receipts, stocks, consumption, transfers, losses, exports, and domestic sales of road oil in the United States in 1946, by districts, in thousands of barrels

GENERAL SUMMARY

BARITE production attained a new record of 725,223 short tons in 1946. Recent growth of the industry is shown by the fact that both 1944 and 1945 were themselves record years. The United States has been the world's leading producer of barite since 1940, having surpassed Germany in that year. Although increases were noted in shipments to nearly all of the customary consuming industries, oil-well drilling stands far to the fore as the major patron of the domestic barite industry. This use has been increasing ever since the early twenties, when barite was first added to rotary drilling mud in high-pressure areas to prevent blow-outs. In 1938 this use overtook shipments to lithopone plants to become the major use.—

Arkansas, with its two large flotation mills, produced more than any other State, shipping 288,286 short tons. Almost all went to well drillers, with a minor amount to glassmakers. Missouri, with its 23 washers, supplied the second greatest quantity, followed by Georgia.

The term "Primary barite" as used in this chapter applies to barite as first offered to the trade, whether lump, crushed, or ground. Such figures thus include ground barite from Malvern, Ark.; El Portal, Calif.; and Mesa, Ariz.; and lump barite from open pits and underground workings. Where ground barite has been reported to the Bureau of Mines as original production, an estimate of the value of the lump equivalent of the ground has been assigned to such tonnage.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[1] F. o. b. mine shipping point.
[2] Declared value f. o. b. foreign market.
[3] Barite sold or used by producers plus imports.
[4] Although all barite is crushed before use in chemicals, barite used in chemicals is not included in the 1945 and 1946 totals. In 1944 and prior years small quantities of crushed barite used by chemical producers are included.
[5] Revised figure; see table "Barium chemicals produced and used or sold by producers in the United States, 1942–46."
[6] Less than 1 ton.
[7] Exclusive of cadmium lithopone.

BARITE—PRIMARY

PRODUCTION AND CONSUMPTION

Spasmodic shipments of barite have been made from Arizona in the past, the last year of any substantial activity being 1938. In 1946 a determined bid for business in the southwestern and California oil fields was made by a new firm, the Arizona Barite Co.[2] The mine is at Coon Bluff, 22 miles northeast of Mesa, and the mill a short distance south of Mesa on the Southern Pacific Railway. The ore is mined underground, crushed, and wet-ground to 200-mesh with no attempt at concentration other than some hand sorting in the mine. The final product analyzes 94 percent barium sulfate with a specific gravity of 4.0 or better. Production is stated to be 100

tons a day. The ore occurs in a series of fissure veins in a volcanic conglomerate. In addition to the main vein, which is being worked, seven additional veins have been partly explored. The main vein is about 15 feet wide and 3,000 feet long and has been opened to a depth of 140 feet by a steeply inclined development shaft. The company expects to mine by shrinkage stoping when full-scale operations are reached.

Waste heaps of barite washer tailings have been accumulating in Georgia, Tennessee, and Missouri for many years. In 1945 the Paga Mining Co., a barite producer in the Cartersville, Ga., area, erected a flotation mill and recovered barite fines from their washer tailings. The process has been described in detail by Avery.[3]

At Magnet Cove, Ark., where the Magnet Cove Barium Corp. and the National Lead Co. have been mining barite since 1941 and 1942, respectively, the increasing depth of the barite vein has forced both operators to abandon or modify their simple open-cut operations. The Magnet Cove Barium Corp. is resorting to underground mining, and the National Lead Co. proposes to strip off the overburden.

Requests for tariff reductions on barite asked by the Netherlands and Cuba were opposed by the domestic producers at public hearings held before the Committee for Reciprocity Information, Tariff Commission, on January 20, 1947. During the course of the testimony some rather interesting statements were made regarding costs, investments, exploratory work, and other phases of the barite industry. Walter Hester, of the National Lead Co., discussing reserves, stated that the National Lead Co. owns in fee simple 16,500 acres of land in Washington County, Mo., and leases it to barite washers on a royalty basis of 50 cents a ton of recovered barite. This acreage contains 2,000,000 tons of barite, and other barite-bearing land in the county brings the total to 20,000,000 tons, according to Hester's estimate. The National Lead Co. and Magnet Cove Barium Corp. have together proved 9,000,000 tons of reserves in the Hot Spring, Ark., area. Only 50,000 tons are left in the El Portal, Calif., deposit, but National Lead has blocked out three new deposits at Battle Mountain, Nev., with estimated reserves of 2,500,000 tons, and will

[1] Includes some crushed barite.

continue shipments to the West coast oil well drillers from that source. Reserves at National Lead's Spanish mine in Nevada County, Calif., were estimated at 200,000 tons, some of which might not be minable. National Lead's mining costs in Missouri averaged $7.46 a short ton, not including administrative costs and taxes, according to Hester. The average selling price is $8.74. National Lead's net profit was estimated at 60 cents a ton. Another witness, Judge E. Eversole, estimated the average profit for most of the Missouri producers at 30 to 40 cents a ton, and stated that the investment in a Missouri washer ranged from $30,000 to $75,000. Gordon Young, testifying for the Magnet Cove Barium Corp., stated that the investment of his firm in plant and equipment was $650,000. M. C. Tarver, representing Georgia producers, said that the cost of mining a long ton of barite in that State was $8.51 ($7.60 a short ton) and that the higher cost over Missouri mining was accounted for by the necessity of removing extensive overburden before the shovel could start digging barite-bearing clay. The reserve position of the United States with respect to barite is probably better today than at any time during the past 10 years. According to testimony given before the committee obout 40,000,000 tons of commercial-grade barite have been blocked aut (at least roughly) by producers.

The distribution of consumption of barite in the United States in 1946 was reported as follows (1945 in parentheses): For well drilling, 372,610 short tons (407,871); for lithopone, 154,166 (139,288); for chemicals, 102,439 (99,173); for glass, 29,181 (25,761); for paint filler, 26,000 (21,000); for rubber filler, 20,000 (10,000); and for other purposes, including grinding losses, 17,677 (17,810); total, 722,073 (720,903). These figures include both foreign and domestic barite and are therefore more comprehensive than data published by the Bureau of Mines each quarter on domestic barite only.

PRICES

There was no immediate reaction when the Office of Price Administration removed price ceilings on crude and ground barite on November 9, 1946. Price ceilings in Georgia had ranged up to $11.50 a long ton for chemical-grade material, and on the whole these levels were maintained for the remainder of the year. Similarly, no change was reported in the Missouri price, which has been $8.50 a short ton, premium-penalty basis, since July 1944.

FOREIGN TRADE

[1] In addition to the countries listed, barite is produced in Czechoslovakia, Greece, Mexico, Norway, U. S. S. R., and Yugoslavia, but data on production are not available.
[2] Data not available.
[3] Estimate.
[4] Exports.
[5] Official figures which, it is reported, cover only output of mines included under the mining law.
[6] Preliminary data for the fiscal year ended Mar. 31 of year following that stated.
[7] Includes witherite.

Canada.—Since 1941 Canadian Industrial Minerals has been mining barite at Walton, Nova Scotia, on the Bay of Fundy. For the first few years, oil-well drillers in Trinidad and South America were the largest outlets for production. In 1942, and again in 1944 and 1945, however, sizable shipments were made to the barium chemicals industry in the United States. In 1945 Canada asked for a reduction on the United States tariff to expand the United States markets for Canadian barite still further, and at the hearings on January 20, 1947, the proposed cut was protested by domestic producers. Nova Scotia barite can be landed in Grasselli, N. J., for less than $14 a short ton, including duty, whereas Georgia barite costs $10.25 per short ton at Cartersville, plus $5.89 freight to Grasselli; total, $16.14 delivered at Grasselli. Production at Walton was about 114,000 short tons in 1946, approximately the same as in 1945. The company has completed the sinking of a vertical shaft for the purpose of developing the ore body below the present quarry-floor levels.[4]

Growth of the Canadian barite industry is shown in the accompanying world production table. Almost all the output is accounted for by Canadian Industrial Minerals.

Woodhall Mines, Ltd., in the Nighthawk Lake area of the Porcupine mining district (northern Ontario) began shipments in May 1946. The barite is white; the f. o. b. mine price was stated to be $10 a long ton, with costs of production $3.50 a ton. Two veins, one 4¾ feet and the other 6½ feet wide, are reported on the property. The present proved depth of 450 feet indicates a minimum of 275,000 tons in a 500-foot length of the No. 1 vein. Geological investigations indicate that the depth of the veins may exceed 1,000 feet.[5]

The remainder of the Canadian barite output comes from a small mine at Parson, B. C.

Brazil.—In his testimony before the Committee for Reciprocity Information, Tariff Commission (see above), Walter Hester of the National Lead Co. announced that his firm and the Thompson-Weinman Co. of Cartersville, Ga., had formed a partnership to recover barite on the island of Camamu, off the coast of Brazil, 80 miles south of Salvador, Baía. The plant, which grinds and bags barite for the well-drilling trade in Venezuela, Colombia, and Trinidad, opened January 27, 1946.[6] Reserves are estimated at a million tons or more. Material produced in March 1946 analyzed 92.5 percent barium sulfate, 0.25 percent moisture, and the remainder silica, iron oxide, and alumina. Average specific gravity is 4.3, and 97.5 percent of the ground product passes a 300-mesh screen. Plant capacity is rated at 42,000 tons a year. The barite is quarried at the rate of 120 metric tons a day. About 200 workmen are employed at the quarry, mill, and docks. In 1944, 282 tons and 617 tons in 1945, were sold from the deposit. From February 1 to May 1, 1946, 3,300 tons were mined, milled, and bagged.

Italy.—For many years modest amounts of barite have been produced as a paint filler in Italy; but the industry, which employed some 700 people, ceased operations entirely during the 1943 invasion.[7]

[6] Work cited in footnote 5.
[7] Bureau of Mines, Mineral Trade Notes: Vol. 22, No. 2, February 1946, pp. 26–28.

In January 1946 it was reported that stocks were negligible and reserves virtually undetermined. However, it was believed that the mines could resume operations at prewar levels within 6 months if fuel and supplies were made available. The year of greatest recorded production was 1939, with 53,893 metric tons, of which the Trento mining district, comprising three mines, supplied over half. Other contributing districts, in the order of importance, were the Iglesias, Milano, Padova, and Carrara. After Sardinia was captured by Allied forces, the possibility of obtaining barite from this island was investigated. However, Don Kingery's reports [8] described the workings as primitive and located mostly in isolated, inaccessible areas.

Japan.—The Natural Resources Section, Supreme Commander for the Allied Powers, issued Report 67, Barite Resources of Japan, in February 1947. According to the report, a peak output of 15,642 metric tons was reached in 1943, though prior to 1935 nearly all needs, which were of the order of 10,000 tons annually, were imported, mostly from Korea. Two mines in barite-quartz veins contributed about 90 percent of production. Mines and mills were small and methods crude.

Union of South Africa.—A new deposit of barite in Swaziland is now being worked by Swaziland Barytes, Ltd.[9] Reserves are estimated at over 200,000 tons, of which 1,000 have been mined, and some exported. An unusual feature of the beneficiation is the removal of a crust of iron oxide from the "ore" surface with a sand blast.

United Kingdom.—The British barite and witherite industries were described by Dunham, Dines, and others.[10] During the 5-year period 1939–43, an average of 86,000 long tons of barite and witherite was produced annually in England and Wales. The prewar (1936) price of crude barite was 27.3 shillings per long ton, at mine, which compares with a wartime high of 70 shillings. Six barite mines operate in the Northern Pennine ore field, extending from the Tyne Valley (Northumberland) southward to the Craven district of West Yorkshire, including parts of Durham, Cumberland, and Westmoreland. Two producers of barite are in the Northumberland and Durham coal field, and deposits are being worked in various other districts of England and Wales. Witherite is less widespread, being found in the Tyne Valley near Haydon Bridge in the Durham coal field and near Alston, both in northeast England.

BARITE—GROUND (AND CRUSHED)

SALES

As usual, the major use of ground barite was in oilwell drilling. This outlet took 82 percent of production, compared with 86 percent in 1945. Among the smaller uses of ground and crushed barite, increased shipments to the rubber industry were noted—1946 sales being double those of 1945.

Ground (and crushed) barite produced and sold by producers in the United States, 1943–46 [1]

Year	Plants	Production (short tons)	Sales	
			Short tons	Value
1943	18	215,464	208,252	$3,743,919
1944	19	344,377	344,757	5,455,835
1945	20	473,749	468,939	7,519,759
1946	23	456,327	455,240	7,208,193

[1] Barite used in chemicals, although crushed before use, is not included in 1945 and 1946 totals. In 1944 and prior years small quantities of crushed barite used by chemical producers are included.

Much of the ground barite reported for use in paint and rubber is bleached; it is also used as a white filler in wall paper, printing ink, and plastics. Unbleached, or "off-color," ground barite is used in linoleum, phonograph records, dark paints, and other products where color is immaterial.

Ground (and crushed) barite sold by producers, 1944–46, by consuming industries [1]

Industry	1944		1945		1946	
	Short tons	Percent of total	Short tons	Percent of total	Short tons	Percent of total
Well drilling	277,792	80	407,871	87	372,610	82
Paint	23,000	7	21,000	4	26,000	6
Glass	24,153	7	25,761	6	29,181	6
Rubber	10,000	3	10,000	2	20,000	4
Undistributed	9,812	3	4,307	1	7,449	2
	344,757	100	468,939	100	455,240	100

[1] Barite used in chemicals, although crushed before use, is not included in 1945 and 1946 totals. In 1944 and prior years small quantities of crushed barite used by chemical producers are included.

In the accompanying table, figures for consumption of ground barite in "Paint," "Rubber," and "Undistributed" have been estimated partly by the grinders and partly by the Bureau of Mines.

An average of 5 tons of barite is used per 1,000 feet of oil wells drilled in high-pressure formations. The barite eventually is lost because the mud acquires too much clay cuttings, which raises viscosity and lowers density, and the whole is discarded. From the West coast is reported a possible method of recovering a good portion of barite from well-drilling muds.[11] The mud is diluted with water to reduce viscosity and gel strength, and the mass is centrifuged. The light mud can thus be separated. Efficiency is said to be 85 to 95 percent.

PRICES

Price ceilings on ground and crushed barite were removed by the Office of Price Administration on July 26, but little change was noticed in quotations during the rest of the year. Glass-grade barite was quoted generally at $15.50 a short ton, bulk, with $2 a ton extra

[11] Lindsay, C. A., Recovery of Barite from Rotary Drilling Mud by Centrifugal Separation: Oil and Gas Jour., vol. 45, No. 23, October 12, 1946, p. 91.

for packing in 100-pound bags. Well-drilling grades of ground barite averaged $15.15 a short ton, bulk, f. o. b. mine, according to reports of grinders to the Bureau of Mines.

According to the Oil, Paint and Drug Reporter, ground bleached barite was quoted at $31.10 a short ton in bags, carlots, St. Louis, Mo.—an increase of $3.45 over the 1945 price of $27.65.

FOREIGN TRADE

Data on imports of ground barite are shown in the Foreign Trade portion of the Primary Barite section of this chapter.

WITHERITE

In 1946 increased quantities of witherite were imported from Great Britain, the world's sole commercial source, for use in brick descumming and steel carburizing. Witherite is not produced in the United States, except as it may be mined mixed with barite.

Witherite, crude, unground, imported for consumption in the United States, 1942–46

[Value at port of shipment]

Year	Short tons	Value	Year	Short tons	Value
1942	3,066	$60,824	1945	896	$26,736
1943	448	9,452	1946	1,107	31,599
1944					

According to Oil, Paint and Drug Reporter, witherite, 99 percent through 200-mesh, bags, carlots, works, was quoted at $43 a short ton in 1946, the same as in 1945.

BARIUM CHEMICALS

PRODUCTION

Production and sales of all the principal barium chemicals showed notable increases in 1946 as compared with 1945. Production of barium carbonate was up 7 percent, chloride 9 percent, hydroxide 30 percent, oxide 4 percent, and sulfate 11 percent. The reconversion problems of the industry were solved during the year, and the industry served expanding peacetime markets. The carbonate is now used mostly in brick descumming and oil-well drilling rather than as an intermediate for other barium chemicals used in flares and explosives. Barium nitrate, used almost exclusively in war materials, was made by one firm only, and production cannot be shown separately. The oxide is used mostly in ceramics. Barium sulfate is a well-known paint extender and is also used in photographic paper, printing inks, and as a filler in linoleum, oil cloth, wallpaper, and other materials.

This chapter for 1945 carried a table showing consumption (partly estimated) of the three principal barium chemicals—the carbonate, chloride, and sulfate.

Like other pigment trends, lithopone output was up in 1946. It is used mostly in paints, as may be noted in the accompanying table.

Barium chemicals produced and used or sold by producers in the United States, 1942–46, in short tons

Chemical	Plants	Produced	Used by producers [1] in other barium chemicals [2]	Sold by producers [3]

Bauxite

By HUBERT W. DAVIS AND MARY E. TROUGHT

GENERAL SUMMARY

DOMESTIC mine production of crude bauxite in 1946 reversed a 2-year downward trend and increased to 1,316,395 long tons (1,072,825 tons, dried equivalent), a gain of 15 percent over 1945. Arkansas supplied 95 percent of the total domestic output in 1946.

Imports of bauxite were larger for the second consecutive year and totaled 852,005 tons in 1946, also a 15-percent gain over 1945. Surinam was the source of 94 percent of the imports in 1946. Exports of bauxite dropped for the third successive year and totaled 97,788 tons in 1946, a decline of 22 percent from 1945. Canada continued to be the largest recipient of the exports.

Consumption of bauxite in the United States decreased 22 percent to 1,889,156 tons (dried equivalent) in 1946, compared with 2,433,412 tons in 1945. Of the 1946 total, the alumina industry used 80 percent.

Salient statistics of the bauxite industry in the United States, 1943–46

	1943	1944	1945	1946
Production (crude ore) [1]—long tons	6,232,883	2,823,724	981,009	1,072,825
Value of production [2]	$30,659,900	$14,402,497	$5,591,084	$6,709,164
Imports [2]—long tons	1,547,854	560,461	739,581	852,005
Exports (including concentrates) [2]—do	417,186	146,638	126,077	97,788
World production [2]—do	13,914,000	7,024,000	3,642,000	3,937,000

[1] Dried equivalent of mine production.
[2] As shipped.

Stocks of bauxite (dried equivalent) at mines and processing plants were 448,790 long tons on December 31, 1946, an 11-percent increase over those at the end of 1945, but consumers' stocks dropped 40 percent to 252,977 tons. Stocks of bauxite held by the Office of Metals Reserve on June 30, 1946, were declared surplus and transferred to the Bureau of Federal Supply.

World production of bauxite is estimated at 4,000,000 metric tons in 1946, an 8-percent gain over 1945. About 70 percent of the 1946 world total is estimated to have been mined in the United States and the Guianas.

Aluminum metal is discussed in the Aluminum chapter of this volume.

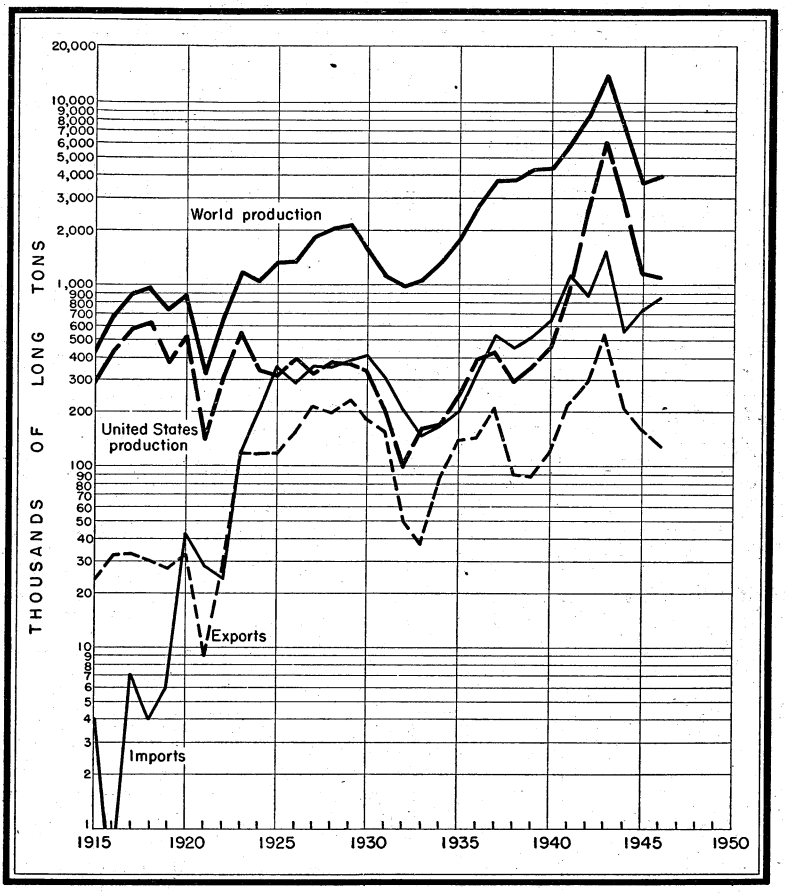

FIGURE 1.—Trends in domestic production, imports, exports, and world production of bauxite, 1915–46.

PRODUCTION

Despite a decline of 17 percent in the output of aluminum, a 92-percent drop in shipments of bauxite to the Office of Metals Reserve, and a larger excess of imports over exports, domestic mine production of crude bauxite reversed a 2-year downward trend and increased to 1,316,395 long tons (1,072,825 tons, dried equivalent) in 1946, a gain of 15 percent over 1945. Production in Alabama, Arkansas, and Virginia was 7, 18, and 234 percent, respectively, greater than in 1945, but output in Georgia was 41 percent smaller.

Alabama.—The Alcoa Mining Co. and the D. M. Wilson Bauxite Co. produced bauxite from deposits in the Eufaula district, Barbour and Henry Counties, in 1946. The mines of the Alcoa Mining Co. are served by a drying plant, from which dried bauxite was shipped chiefly to the chemical and refractory industries in 1946. The D. M. Wilson Bauxite Co. shipped crude bauxite to Quincy, Fla., where the Floridin Co. has an activating plant; the activated bauxite was shipped chiefly to petroleum refining industries.

Production and shipments of crude bauxite from mines in the United States, 1942–46, by States, in long tons

Arkansas.—Production of bauxite at the Drury mine near Sweet Home, Pulaski County, operated by the Alcoa Mining Co., tripled that of 1945. About one-fourth of the output was sold to the nearby Drury calcining plant of its affiliate, Aluminum Ore Co., which calcined the ore for sale to the abrasive industry; the remainder of the production was sold to other local processors. At its mines in Saline County the Alcoa Mining Co. produced 2 percent less bauxite than in 1945. Numerous underground and open-pit mines were operated by the company in the vicinity of Bauxite, where it has facilities for drying and calcining ore which is sold to alumina, chemical, abrasive, and other plants.

The Crouch Mining Co. mined high-grade ore from its Young mine in Saline County and processed the entire output in its drying and calcining plant near Bauxite. Production was 16 percent less in 1946 than in 1945; the output was shipped to abrasive plants.

The Berger No. 100 was the only mine worked by the American Cyanamid Co. in Arkansas in 1946. The ore from the Berger No. 100 mine, together with ore from stock at its inactive Rauch Leased and Heckler mines in Pulaski County and Townsend mine in Saline County and some purchased ore, was dried at the company rotary, gas-fired plant near Berger and the dried bauxite shipped to the chemical and petroleum-refining industries. Production of ore by the company in Arkansas was 76 percent less than in 1945 but shipments of dried bauxite were only 14 percent smaller.

The Norton Co. produced 4 percent less bauxite in 1946 than in 1945. This ore, together with purchased ore, is calcined for the abrasive industry. Shipments of calcined bauxite were 12 percent smaller than in 1945.

In 1946 the Dulin Bauxite Co. operated the Penzel-Coe, Dixie, and Vinson-Hoffman mines and its calcining plant near Sweet Home, Pulaski County; it shipped calcined bauxite to the abrasive and other industries and ore to the Office of Metals Reserve. Shipments of calcined bauxite were 13 percent less than in 1945, but those of ore were 7 percent more.

The Pulaski Mining Co. at its Rummell mine in Pulaski County made a small output, two-thirds of which was sold to a local processor and the remainder to the chemical industry.

The Reynolds Mining Corp. operated the Fletcher, Hurricane Creek, Covington Whitley, and Stuckey mines in Saline County and the Buzbee mine in Pulaski County in 1946. Production by the company was 64 percent larger than in 1945. The entire output was sold to its affiliate, Reynolds Metals Co.

The Porocel Corp. operated its plant at Berger, Pulaski County, where bauxite is milled, activated, and purified by magnetic separation; it also operates a plant at the same location where activated bauxite is impregnated with chemicals for use as a catalyst. The company purchases almost all of its requirements of bauxite from local producers.

The beneficiation of low-grade Arkansas bauxites has been described by Runke and O'Meara.[1]

Georgia.—The American Cyanamid Co. and Alcoa Mining Co. continued to operate mines and drying plants in Georgia in 1946. The former company worked the Hatton and Thig Pen mines in the Andersonville district, Sumter County; output was 29 percent less than in 1945. The Alcoa Mining Co. operated mines in the Hermitage area of Floyd County until March, when operations were discontinued; output was 92 percent smaller than in 1945. All ore was shipped to the alumina and chemical industries in dried form.

Virginia.—The Alcoa Mining Co. worked the Lightner, Allen, and Harris mines near Spottswood, Augusta County, in 1946. Output was more than double that of 1945 and was shipped to the chemical and refractories industries in crude form. These mines were closed on December 31, 1946.

1943—3,384,874 tons (2,852,773 dried equivalent).
1944—1,594,487 tons (1,332,673 dried equivalent).
1945—400,096 tons (339,052 dried equivalent).
1946—33,382 tons (28,375 dried equivalent.)
[3] Small quantity of bauxite shipped to makers of refractories probably included under "Abrasive."

RESERVES

The following information on reserves was prepared by Josiah Bridge, of the Geological Survey, and John B. Dorsh and John H. Weitz, of the Bureau of Mines, and has been taken from an unpublished report, The Mineral Position of the United States.

Reserves of high-alumina materials, exclusive of anorthosite, considered in 1944 as potential ores, totaled 3 billion tons containing 356 million short tons of recoverable aluminum. Of the latter quantity, only 3 percent, or about 11 million tons, was in material considered ore in 1944. In 1943 the United States actually used approximately 750,000 short tons of aluminum. A little over 2 percent, or 8 million tons, is in high-iron bauxite; 0.15 percent, or about 500,000 tons, in alunite; and 95 percent in low-grade bauxite, bauxitic clay, and high-alumina clay. The United States has very small reserves of grade I bauxite (not more than 7 percent SiO_2; not more than 3 percent FeO) which was used exclusively in this country for the production of aluminum before the war. Recent technologic advances probably have made grade II (not more than 15 percent SiO_2; not more than 6 percent FeO; not less than 40 percent Al_2O_3; and not less than 32 percent available alumina) bauxite commercially available, but known reserves are not large in terms of long-range national requirements. The Nation's aluminum resources in the lower-grade bauxites and clay are enormous, but it probably will be cheaper to import high-grade foreign ores than to extract alumina from low-grade domestic material. However, it provides an emergency source of supply that could be used

if supplies of the higher-grade bauxites are cut off at any time in the future. In an emergency, it could supply the entire national requirement for a considerable period if the increased cost of processing is not a controlling factor.

CONSUMPTION

Consumption of bauxite (dried equivalent) totaled 1,889,156 long tons in 1946 compared with 2,433,412 tons in 1945. The consumption figures for both years include calcined bauxite shipped for export to American-owned abrasive plants in Canada for the manufacture of crude abrasives, which are returned to the United States for final manufacture and consumption. Consumption of bauxite as shipped totaled 1,879,425 tons in 1946 and consisted of 461,052 tons of crude ore, 1,285,440 tons of dried ore, 124,222 tons of calcined ore, and 8,711 tons of activated ore. Of the bauxite consumed (dried-equivalent basis) in 1946, 52 percent was domestic and 48 percent foreign. Of the foreign ore consumed in 1946, the alumina industry used 92 percent and the chemical, abrasive, cement, and other industries absorbed the remaining 8 percent.

Bauxite consumed in the United States, 1945–46, by consuming industries, in long tons

[Dried-bauxite equivalent]

Industry	1945			1946		
	Domestic	Foreign	Total	Domestic	Foreign	Total

	1,716,621	716,791	2,433,412	983,766	905,390	1,889,156

[1] Includes some bauxite used in making chemicals and other products.

Alumina.—Bauxite consumption by the alumina industry in 1946 totaled 1,515,602 long tons (684,074 tons from domestic mines and 831,528 tons from foreign sources) compared with 2,053,083 tons in 1945. Of all the bauxite consumed in 1946, the alumina industry used 80 percent compared with 84 percent in 1945. The alumina industry employed crude and dried ore, chiefly from Arkansas, Georgia, Surinam, and British Guiana. Not all bauxite consumed by the alumina industry is destined to emerge finally as aluminum metal, since some of the alumina is used by the chemical, abrasive, and refractory industries and some of it is processed into special products, such as activated and tabular aluminas for use in the petroleum-refining and ceramic industries.

Chemical.—Bauxite consumption by producers of aluminum salts and alumina (nonmetallurgical) was 262,275 long tons (169,009 tons of domestic and 93,266 tons of foreign) in 1946 compared with 258,205 tons (211,273 tons of domestic and 46,932 tons of foreign) in 1945. In addition to bauxite, producers of aluminum salts reported consuming 19,882 short tons of aluminum trihydrate, 11,977 tons of secondary aluminum, 73,883 tons of clay, and a quantity of alunite and bichromate residues in 1946. The bauxite requirements for the chemical

industry were supplied chiefly from Alabama, Arkansas, Georgia, Virginia, Surinam, and British Guiana.

Production and shipments of aluminum salts increased 4 percent each in quantity and 2 percent in total value in 1946 over 1945. Output of alumina (aside from that used in making aluminum) increased 9 percent, and shipments gained 10 percent. Of this alumina, 28 percent was consumed by aluminum salts producers; the remainder was used by manufacturers of abrasives, refractories, petroleum products, spark plugs, glass, rubber, paints, and various other commodities.

Aluminum salts and alumina produced and shipped in the United States, 1945–46

[1] Revised figure.
[2] Excludes alumina produced for use in making aluminum; includes activated, calcined, crude, light and heavy hydrate, converted to a calcined alumina equivalent.

Abrasive and Refractory.—Manufacturers of crude aluminous abrasive pigs in Canada and the United States and manufacturers of bauxite refractories in the United States used 205,380 tons (11 percent) of all the foreign and domestic bauxite consumed in 1946, a 2-percent increase over the 201,182 tons used in 1945. Except for a relatively small quantity from British Guiana, all the ore requirements of the industry were supplied from Alabama, Arkansas, and Virginia.

Other.—Consumption of bauxite in the cement, steel, ferro-alloy, and petroleum-refining industries decreased 36 percent in 1946 from 1945.

STOCKS

Stocks of bauxite (dried equivalent) on hand at mines and processing plants on December 31, 1946, totaled 448,790 long tons, compared with 403,268 tons on December 31, 1945. Stocks at consumers' plants decreased from 422,863 tons at the end of 1945 to 252,977 tons at the end of 1946. Government-owned stocks of bauxite held by Office of Metals Reserve were declared surplus on June 30, 1946, and transferred to the Bureau of Federal Supply.

PRICES

In 1946 the average selling price, f. o. b. mines and processing plants, was $5.10 a long ton for crude (undried) bauxite, $6.98 for crushed dried bauxite, $15.43 for calcined bauxite, and $48.81 for activated bauxite. Prices in 1945 were as follows: $4.49 for crude, $5.93 for dried, $14.29 for calcined, and $53.80 for activated. The weighted average price for all grades of domestic ore as shipped was $7.01 a long ton in 1946 ($6.93 in 1945). Nominal market quotations remained static throughout 1946 for all grades of domestic bauxite. Quotations on foreign bauxite ore have not been published in domestic trade journals since February 6, 1941.

Range of quotations on domestic bauxite, 1944–46, per long ton

[E&MJ Metal and Mineral Market Reports]

[4] SiO_2 not specified; Fe_2O_3, 1.5–2.5 percent.

FOREIGN TRADE [2]

Imports of bauxite increased for the second consecutive year and totaled 852,005 long tons in 1946, a gain of 15 percent over 1945. Of the 1946 imports, Surinam supplied 802,288 tons, British Guiana 40,595 tons, Curaçao 4,121 tons. Brazil 3,501 tons, and Jamaica 1,500 tons. By customs districts in the United States, 652,951 tons were received at Mobile, 133,263 at New Orleans, 33,325 at Philadelphia, 13,935 at New York, 10,152 at Maryland, 4,878 at Massachusetts, and 3,501 at Sabine. The duty on bauxite is $1 a long ton.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Bauxite and aluminum compounds imported into the United States, 1942–46

Year	Bauxite			"Alumina"		Aluminum compounds	
	As imported (long tons)	Dried bauxite equivalent (long tons)	Value	Long tons	Value	Short tons	Value
1942	884,217	884,217	$5,952,451	21,711	$1,570,377	(1)	$4
1943	1,547,854	1,541,929	10,860,149	12,372	1,108,104	3	941
1944	560,461	555,647	3,844,310	(2)	1		
1945	739,581	737,081	5,273,122	179	10,940		
1946	852,005	851,148	5,965,124	4	2,607	2	654

[1] 50 pounds.
[2] Less than 1 ton.

Exports dropped for the third successive year and totaled 97,788 long tons in 1946, a decline of 22 percent from 1945. Of the 1946 exports, 91,466 tons were classified as bauxite and other aluminum ores and 6,322 tons as bauxite concentrates (including alumina). Canada was the largest recipient of the exports; virtually all of the bauxite and other aluminum ores and 97 percent of the bauxite concentrates (including alumina) were shipped to that country in 1946. Most of the bauxite exported to Canada is used to manufacture crude abrasives, which are returned to the United States for final manufacture and consumption. Otherwise, the exports to Canada consisted almost entirely of activated bauxite destined for use in petroleum refineries.

Bauxite and aluminum compounds exported from the United States, 1942–46

Year	Bauxite (including bauxite concentrates), long tons			Aluminum sulfate		Other aluminum compounds	
	As exported	Dried bauxite equivalent	Value	Short tons	Value	Short tons	Value
1942	260,600	294,176	$5,086,695	44,428	$1,103,340	2,384	$354,397

WORLD REVIEW

Greatly increased outputs of bauxite in British Guiana, France, and Hungary were largely responsible for a slight gain in world production in 1946 over 1945. About 70 percent of the total world production is estimated to have been mined in the Western Hemisphere in the United States and the Guianas in 1946, compared with 64 percent in 1945.

Australia.—The Australian Aluminum Production Commission was investigating bauxite deposits in Australia to determine which will be used as raw material for the proposed alumina plant and reduction works (capacity, 12,000 long tons) to be erected in Tasmania. Commercial bauxite deposits are known to occur in New South Wales,

Queensland, Tasmania, Victoria, and Western Australia. Consumption of bauxite in Australia heretofore has been small and virtually all has been supplied by Victoria and New South Wales.

World production of bauxite, 1940–46, by countries, in metric tons

[6] Croatia only; estimate for rest of Yugoslavia included in total.

Brazil.—Attempts to develop aluminum-ingot production in Brazil so far have been unsuccessful. The Eletro-Quimica Brasiliera, S. A., which, on March 29, 1945, began the production of primary aluminum at Ouro Preto, Minas Gerais, ceased operations in 1946 because of high capital charges and heavy transport costs on bauxite. The estimated output of aluminum during the period of operation was only 525 metric tons. Thus, the expected increase in production of bauxite as a result of the birth of Brazil's aluminum industry did not materalize. Exports of bauxite from Brazil were only 1,161 metric tons in 1946, compared with 7,060 tons in 1945.

British Guiana.—Bauxite production in British Guiana expanded stupendously following the outbreak of war in 1939; exports during the 7 years, 1939–45, were 6,803,958 long tons compared with 1,110,137 tons during the preceding 7 years. Record exports of 1,901,393 tons were made in 1943. The Demerara Bauxite Co., Ltd., controlled by the Aluminum Co. of Canada, was the major producer during the war and shipped virtually all its output to Arvida, Quebec, Canada, for the production of alumina. The Berbice Bauxite Co., the only other producer, which made its initial output in 1942, accounted for only 7 percent of the 1,116,463 tons exported in that

year. The company suspended operations in 1943, but they were resumed on a limited scale during the last quarter of 1945. Total exports from British Guiana were 1,120,015 long tons in 1946—the second highest on record—compared with 738,544 tons in 1945. Of the 1946 exports, 92 percent were destined to Canada, 6 percent to the United States, 1 percent to the United Kingdom, and the remainder to Argentina and Sweden.

France.—Production of bauxite in France increased to 478,242 metric tons in 1946 from 252,416 tons in 1945. Deliveries to local mills during 1946 exceeded those of prewar years, whereas exports, which averaged 24,000 tons monthly in 1938, were smaller.

Haiti.[3]—Work was continued in 1946 on the construction of an access road to the Ste. Croix bauxite concession of Reynolds Mining Corp;. 6 miles have been completed, and the remaining 4 miles were expected to be finished by late spring.

Hungary.—Hungaro-Russian Bauxite-Aluminium Corp., formed in May 1946 following negotiations between the Hungarian and Soviet Governments, has taken over all the chief Hungarian bauxite deposits and aluminum plants; scheduled production of bauxite was 400,000 metric tons for 1946, 500,000 for 1947, and 700,000 for 1948.[4] However, output was only 100,760 metric tons in 1946, compared with 35,402 and 758,299 tons, respectively, in 1945 and 1944.

Italy.—Rehabilitation of alumina plants in Italy resulted in a sharp rise in output of bauxite during the last 5 months of 1946, during which time 90 percent of the total (65,447 metric tons) was produced. Production was only 2,584 tons in 1945. As a result of the Italy-Yugoslavia border settlement, the bauxite production in Venezia Giulia, the source of about 80 percent of Italy's requirements before the war, has been lost; but it may be partly offset by the development of new sources in southern Italy, where the three principal mines are the San Giovanni Rotondo, Monte Nutria, and Il Cavone. Proved reserves of the three mines are estimated at about 3,000,000 metric tons. Numerous prospects are found near these mines and in the Lecce area.

The San Giovanni Rotondo mine, about 6 miles south of San Giovanni Rotondo, Province of Foggia, has been the chief producer. Prospecting for bauxite began in mid-1938, the main deposit was discovered in 1939, and outputs of 146,443, 128,000, and 170,772 metric tons, respectively, were made in 1940, 1941, and 1942. Ore reserves have been estimated by the producer at 2,000,000 tons and by the Italian Government at "not less than 10,000,000 tons." The commercial-grade ore is divided into two grades; the first grade, containing 54 to 55 percent Al_2O_3 and 3.5 percent SiO_2, comprises 30 percent of the total ore, and the second grade, containing 50 to 53 percent Al_2O_3 and 4 percent SiO_2, comprises 70 percent of the total.

Malaya[5].—Bauxite is probably of widespread occurrence in Malaya, but deposits have been worked only in Johore and Malacca. Several of the bauxite occurrences in Johore have resulted from the weathering of ancient volcanic rocks, but some appear to have been derived from shale. Production of bauxite in Malaya was begun in 1936, when the

[4] Chemical Age, vol. 55, No. 1416, Aug. 17, 1946, p. 205.
[5] Richardson, J. S., Jr. (American consul, Singapore), Bauxite in Malaya: Ms. Rept., July 16, 1947, 7 pp.

Ishihara Sangyo Koshi commenced mining a deposit at Bukit Pasir Mas near Batu Pahat. In 1937 the Perigi Achih mine was opened, and exports from Sri Medan mine started in 1938. These three mines, all in south Johore, were the only ones in operation up to 1941.

During Japanese occupation, the Malacca (Telok Mas) and Nangan mines were worked. The Malacca area was prospected by the Japanese in 1939, but no mining license was issued. The Japanese Military Administration ordered work to commence in May 1942. Most of the equipment was brought from the Sri Medan (Higashiyama) mine, but some machinery was also obtained from Japan. Work commenced in August 1943, and up to October 1944 about 100,000 tons of ore were shipped to Japan. Lack of transport prevented further shipments. It is estimated that about 200,000 tons of ore are still deposited in the Bukit Lintan section of the mine, and 70,000 tons of produced ore were stored on the property. The ore is stated to average 52 percent Al_2O_3, 4 percent SiO_2, 1 percent TiO_2, and 10 percent Fe_2O_3.

The Nangan mine is situated around Bukit Simon about 10 miles east of Kampong Pengerang, and the deposit of bauxite covers a large area. Bauxite was found in 1935 but no proprietary rights were issued. The area was estimated to contain about 10,000,000 tons of bauxite, and a development project envisaging a production of 500,000 tons annually was inaugurated. Nonarrival of machinery from Japan caused the plan to be discontinued, although equipment from the Kemaman iron mine, Trengganu, was transferred to the area. One shipment of 3,450 tons was made to Japan in July 1944, and about 42,000 tons of ore on the property remained unshipped. The average grade of the ore was 56 percent Al_2O_3, 4 percent SiO_2, 0.7–0.8 percent TiO_2, and 6–7 percent Fe_2O_3.

Netherlands East Indies.—The only producer of bauxite in Netherlands Indies is the N. V. Billiton Maatschappij, which owns mines on the island of Bintan. After the Netherlands Indies had been overrun by the Japanese in 1942, production of bauxite was resumed by the Japanese Furukawa Co., Ltd. According to reports found after the liberation of the Netherlands Indies, the invaders exported 1,385,827 tons of bauxite during the three years 1942–44. After the liberation, the drying kiln was found dismantled, the mining equipment removed or worn out, and the aerial ropeway for transporting the bauxite to the loading station in need of repair. Rehabilitation of the equipment has been in progress by the Billiton Co., which expected to resume production in the latter part of 1947.

Surinam.—Despite a short strike of workers at the mines and docks and the prolonged strikes of maritime workers in the United States and Trinidad, exports of bauxite from Surinam advanced for the second consecutive year and were 48 percent greater than production; they totaled 844,292 long tons in 1946 compared with 673,185 tons in 1945. The Surinaamsche Bauxiet Maatschappij, which operates mines at Paranam and Moengo, and the N. V. Billiton Maatschappij, which operates a mine at Onverdacht, accounted for the exports in both years. Early in 1947 calcining equipment was installed at the Paranam plant of the Surinaamsche Bauxiet Maatschappij.

793065—48——13

In Minerals Yearbook, 1945, it was erroneously stated that the bauxite deposits of the N. V. Billiton Maatschappij were too small to warrant construction of processing plants and that the company might cease operations in the near future. According to a letter to the author from the N. V. Billiton Maatschappij:

> After continuously producing bauxite in three shifts during the war years, production was temporarily stopped in Surinam from the middle of April 1945 until the middle of July 1945 for complete overhaul of the plant. Thereafter production has been regularly continued in two shifts at the rate of approximately 20,000 tons of bauxite monthly. Recently same has been stepped up to about 25,000 tons. At present a calcining kiln is being erected at the mine and production is being expected to start within the near future at an initial yearly capacity of approximately 30,000 tons of calcined bauxite. Ore reserves in Surinam are estimated at over 30 years at present rate of production. The mine is situated at Onverdacht * * * and has its own boatloading station at Smalkalden on the Para River (loading capacity about 500 tons per hour). A complete ore processing plant and a drying kiln are situated near the boatloading station. The open-pit production is highly mechanized by means of diesel draglines and bulldozers. Transportation of the ore from the mine to the plant and boatloading station takes place by means of a railroad. Modern living quarters, recreation facilities, and free medical service have been established by Billiton at Onverdacht for its employees.

The interest of two new American companies in bauxite deposits in Surinam may presage an expansion in production. The Reynolds Metals Co. has had engineers in Surinam to search for bauxite deposits, but no action had been taken by the Government on its application for a concession. The Permanente Metals Corp. (Kaiser Co., Inc., subsidiary) has likewise had engineers investigating deposits on an option along the Marowijne River near the French Guiana border.

Bismuth

By RICHARD H. MOTE

GENERAL SUMMARY

DOMESTIC refinery production of metallic bismuth declined sharply in 1946 compared with 1945, but was partly offset by a 27-percent increase in imports, a 19-percent drop in consumption, and a net reduction of 176,283 pounds of metallic bismuth in Government stocks. The prices of bismuth metal and salts increased following removal of ceiling prices in July 1946.

DOMESTIC PRODUCTION

Refined metallic bismuth produced in the United States is recovered entirely as a byproduct in the smelting of domestic and foreign lead and copper ores, whose primary value in bismuth is negligible, and in the refining of Mexican bismuth-lead bullion. Prolonged labor strikes at domestic lead smelters and refineries during the first half of 1946 sharply curtailed the output of refined lead; this in turn cut the bismuth recoveries, resulting in a 38-percent drop in the production of refined bismuth in 1946 as compared with 1945. The Bureau of Mines is not at liberty to publish statistics showing the domestic production of bismuth. Domestic producers (smelters and refineries) in 1946 continued to be the American Smelting & Refining Co., Anaconda Copper Mining Co., and the United States Smelting, Refining, & Mining Co. The world's largest producer of bismuth, and the principal domestic importer and consumer, is the Cerro de Pasco Copper Corp., New York, which refines large quantities of bismuth in Peru.

CONSUMPTION AND USES

Domestic bismuth consumption was approximately 1,330,000 pounds in 1946, a decline of 19 percent from 1945 and 47 percent from the apparent consumption of 2,500,000 pounds in the peak year 1942.

The manufacture of bismuth pharmaceuticals—which comprise principally antisyphilitic drugs, antiacid or stomach remedies, and cosmetic powders—consumed about 831,900 pounds (63 percent) of bismuth in 1946, approximately the average quantity consumed for that purpose during the last decade.

Metallurgical uses represented 37 percent of the bismuth consumption in 1946 compared with 49 percent in 1945, 55 percent in 1942–44, and about 25 percent in the middle 1930's. Bismuth is used with cadmium, tin, and lead in the manufacture of low-melting alloys for fire alarms, sprinklers, and other fire-fighting apparatus. Similar alloys are employed in bending thin-walled tubing and in making patterns,

particularly in the aircraft industry. Other bismuth alloys are used as solders, coatings for selenium rectifiers, and safety fuses in electrical circuits and compressed-gas cylinders.

Bismuth consumed in the United States, 1944–46, by uses

[Figures compiled by Civilian Production Administration]

Use	1944		1945		1946	
	Pounds	Percent of total	Pounds	Percent of total	Pounds	Percent of total
Pharmaceuticals	585,193	40	839,458	51	831,882	63
Fabricating alloys	426,894	29	371,334	23	306,891	23

Total consumption	1,465,640	100	1,635,293	100	1,330,268	100

[1] Principally rectifier coating, nucleonics, and commercial solders.

STOCKS

Stocks of bismuth metal held by producers, distributors, and consumers declined 21 percent in 1946. Bismuth-metal inventories of Government-owned Office of Metals Reserve gradually diminished from 762,829 pounds on January 1, 1946, to 586,546 pounds on December 31, a decline of 23 percent. The Government held no stocks of bismuth ore or concentrates during 1946.

PRICES

On July 8, 1946, the New York quoted price for bismuth metal increased from the maximum ceiling price of $1.25 a pound, ton lots—at which level it had been since October 1939—to $1.60 a pound. A further advance in price to $1.80 a pound became effective December 2.

The London price of bismuth ore, 50 percent, c. i. f., per pound of contained Bi, was quoted at 3s. 0d. until April when the price advanced to 4s. 0d. at which level it remained for the rest of the year. Metallic bismuth, 99.95 percent, 5-cwt. lots, which sold for 6s. 8d. through March, advanced to 9s. in April and again to 10s. in December. The price per pound of bismuth matrix and bending alloys was raised from 4s. 6d. and 5s., respectively, in January to 4s. 9d. and 5s. 5d. in February. Matrix alloy was further advanced to 6s. 1d. in April.

FOREIGN TRADE [1]

Imports.—Of the 422,336 pounds of refined metallic bismuth imported in 1946, 392,306 pounds came from Peru and 30,030 pounds from Canada. All entries of refined metallic bismuth in 1941–45 were from Peru. Almost the entire Mexican bismuth output (see world production table) is imported in the form of bismuth-lead bars for refining in the United States.

[1] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Bismuth imported for consumption in the United States, 1942–46

Year	Bismuth ore[1]			Refined metallic bismuth		Bismuth compounds and mixtures	
	Pounds		Value	Pounds	Value	Pounds	Value
	Gross weight	Bi content					
1942	(1)	(1)	(1)	(2)	(2)	7	$22
1943	138,600	48,800	$52,400	[3] 430,874	[3] $442,301	13	53
1944	118,739	51,349	60,878	363,980	345,796	40	352
1945				333,231	316,135		
1946	(1)	(1)	(1)	422,336	464,922		

[1] Figures from Foreign Economic Administration. Those for 1942 and 1946 not available.
[2] No "imports for consumption"; general imports of 222,684 pounds were reexported.
[3] An additional 71,236 pounds (valued at $43,498) reported by the U. S. Department of Commerce as "bismuth" is ore and is covered by that category in this table.

Exports.—Exports of bismuth metal and alloys in 1946, principally to United Kingdom, France, and Italy, increased 32 percent over 1945.

Bismuth exported from the United States, 1944–46, by classes

Class	1944		1945		1946	
	Pounds	Value	Pounds	Value	Pounds	Value
Matte	46	$74			93,960	$8,629

WORLD REVIEW

World production of bismuth approximated 940,000 kilograms (2,072,000 pounds) in 1946. The principal producers were United States, Peru, Canada, and Mexico.

World production of bismuth, 1940–46, by countries, in kilograms [1]

[Compiled by B. B. Mitchell]

Country [1]	1940	1941	1942	1943	1944	1945	1946

[1] Bismuth is believed to be produced also in Brazil, Burma, Chile, Norway, Rumania, Sweden, Uganda, U. S. S. R., United Kingdom, and Yugoslavia. Production figures are not available for these countries, but estimates by author are included in total.
[2] Data not available. Estimate by author included in total.
[3] Estimate.
[4] Partly estimated. Excludes content of some bismuth-tungsten concentrates.
[5] Excludes bismuth content of tin concentrates exported.
[6] Incomplete preliminary data for year ended Mar. 31 of year following that stated.
[7] Production included in total; Bureau of Mines not at liberty to publish separately.

Bolivia.—The principal producers of bismuth ore in 1946 continued to be the Compagnie Aramayo de Mines en Bolivia and Fabulosa Consolidated.

Canada.—In 1946 the total Canadian production was derived from treatment of lead-silver ores by the Consolidated Mining & Smelting Co., Ltd., at Trail, B. C.

China.—Bismuth production in China is entirely a byproduct of tungsten mining. Bismuthinite is the chief ore mineral, but native bismuth and bismuth ocher also occur.

Peru.—According to official figures, bismuth exports from Peru since 1938, in metric tons, were as follows:

Year	1938	1939	1940	1941	1942	1943	1944	1945	1946
Exports	219	438	383	520	346	484	446	272	[1] 400

[1] Estimated.

Spain.—The Valle de las Perdoches mine in Cordoba Province produced 47 metric tons of bismuth concentrates in 1945 compared with 48 tons in 1944.

United Kingdom.—Imports of bismuth metal were 486,708 pounds in 1946 compared with 381,878 pounds in 1945.

Cadmium

By RICHARD H. MOTE

GENERAL SUMMARY

CADMIUM supplies continued inadequate to meet total consumer demands in 1946. Domestic output of cadmium, like that of all the nonferrous byproduct metals, was restricted during the year by labor strikes and manpower shortages; as a result, primary cadmium production declined 23 percent to the lowest level since 1940. During 1946 inventories were drawn upon to supplement the declining output, with the result that stocks dropped 35 percent. The apparent consumption of cadmium in all forms also dropped from the 1945 level owing to the reduction in supply.

Government control of cadmium use was reinstated early in 1946, accompanied by tightened inventory restrictions. Government regulation continued until the removal of cadmium from price control on July 26.

Prices advanced twice in 1946—from 90 cents a pound for commercial sticks and 95 cents for patented shapes at the beginning of the year to $1.50 and $1.55, respectively, at the year end.

Salient statistics of the cadmium industry in the United States, 1942–46, in pounds of contained cadmium

	1942	1943	1944	1945	1946
Production (primary)	7,370,969	8,466,963	8,779,856	8,383,629	6,471,187
Imports (metal)	53,298	48,891	66,627	28,724	17,415
Exports (metal)	251,059	156,844	548,015	102,199	140,385
Consumption	7,659,000	7,381,000	8,865,000	[1] 8,642,799	[1] 6,954,957

[1] Apparent consumption.

GOVERNMENT REGULATIONS

Cadmium continued under Government control during part of 1946. At the beginning of the year control was limited to consumers' inventories of cadmium, which were restricted to 45 days' requirements or a minimum working inventory, whichever was smaller. As a result of expanding consumer demand, limited supply, and a sharp reduction of Government stocks, the Civilian Production Administration on February 1 reinstated control on the consumption of cadmium through provisions of Conservation Order M–389 (wartime control of cadmium consumption had been relinquished August 20, 1945, when General Preference Order M–65 was revoked). Order M–389 limited the manufacturers' use of cadmium metal to 90 percent of their consumption in 1941. The limitation on inventories was reduced on February 1 to 30 days' supply by an amendment to table 1 of Priorities Regulation 32. A continued shortage of cadmium necessitated the establishment of a list of essential consumers, and on March 22 the CPA revoked Order M–389 and simultaneously established a specific list of products on which ratings were to be issued for procurement of the metal. Facing a sharp reduction in output of metal because of strikes at zinc smelters producing byproduct cadmium, the CPA on May 3 ceased to make further allocations from the Government stock pile, except for emergency use. No additional regulations were issued until July 26, when all Government controls

on cadmium were terminated with the removal of cadmium from price control.

TARIFF

In accordance with the Canadian Trade Agreement of 1939, the tariff on cadmium metal remained at 7½ cents per pound. Cadmium contained in flue dust remained duty free.

DOMESTIC PRODUCTION

The entire supply of domestic primary cadmium is recovered concurrently with the treatment of ores of other metals—notably those of zinc and lead—both imported and mined in the United States. As no mines are operated solely for the cadmium content of their ores and as many reduction plants participating in the recovery of cadmium treat both domestic and foreign materials without determining the cadmium content of either, the origin of the metal produced at United States plants is a matter of conjecture. Thus the data presented as domestic cadmium production in this chapter are not comparable to those given in other chapters for metals like copper, lead, and zinc. Most of the metal is extracted from Cottrell and baghouse dusts, the next important source being the sludges precipitated from zinc solu-

Cadmium produced and shipped in the United States, 1942–46, in pounds of contained cadmium

Total value	5,802,030	6,679,390	6,649,026	6,454,300	6,361,605

[1] Excludes compounds made from metal.
[2] Bureau of Mines not at liberty to publish figures separately for secondary cadmium compounds.
[3] Value of metal contained in compounds made directly from flue dust or other cadmium raw materials (except metal).

tion preliminary to the electrolytic recovery of zinc. Secondary metal is recovered from old bearings and other alloys but constitutes no great part of the total cadmium supply.

The domestic output of primary metallic cadmium declined 23 percent in 1946 to the lowest level since 1940. The output of cadmium contained in primary compounds also dropped, but the recovery of secondary metal increased. Labor strikes and manpower shortages at zinc-reduction plants were largely responsible for the drop in primary cadmium output.

A list of plants producing cadmium metal in the United States in 1946 follows:

Primary metallic cadmium

Colorado: Denver—American Smelting & Refining Co.
Idaho:
Bradley—Bunker Hill & Sullivan Mining & Concentrating Co.
Kellogg—Sullivan Mining Co.
Illinois: Fairmont City—American Zinc Co. of Illinois.
Missouri: Herculaneum—St. Joseph Lead Co.
Montana: Great Falls—Anaconda Copper Mining Co.
Oklahoma:
Bartlesville—National Zinc Co., Inc.
Henryetta—Eagle-Picher Mining & Smelting Co.
Pennsylvania:
Donora—American Steel & Wire Co.
Josephtown—St. Joseph Lead Co.
Palmerton—New Jersey Zinc Co.
Texas: Corpus Christi—American Smelting & Refining Co.

Secondary metallic cadmium

Arkansas: Jonesboro—Arkansas Metals Co.
Michigan: Detroit—Aetna Smelting & Refining Co.
New York: Whitestone—Neo-Smelting & Refining, Inc.

The total output of cadmium oxide and sulfide increased 51 percent in 1946 to 1,543,447 pounds of contained cadmium. Data for the production of other cadmium compounds are not available for 1946.

Cadmium oxide and cadmium sulfide produced in the United States, 1942–46, in pounds

Year	Oxide		Sulfide [1]		Year	Oxide		Sulfide [1]	
	Gross weight	Cd content	Gross weight	Cd content		Gross weight	Cd content	Gross weight	Cd content

1944	571,366	499,507	1,312,263	466,794					

[1] Includes cadmium lithopone and cadmium sulfoselenide.

CONSUMPTION AND USES

The apparent consumption of cadmium in all forms in the United States dropped 20 percent in 1946 but remained well above the prewar level. The principal use of cadmium metal is as a protective coating for steel and, to a much smaller extent, for copper alloys. Consumption for this purpose is estimated at approximately 4,000,000 pounds in 1946. The manufacture of bearing alloys is also a large use of cadmium metal. Cadmium-base bearings are generally of two types, the cadmium-nickel bearing composed of 98.65 percent cadmium and 1.35 percent nickel and the cadmium-silver bearing containing 0.2–2.25 percent silver and 0.25–2 percent copper in place of the nickel. Such bearings are used principally in automotive engines for service under high pressures and at high speeds.

Another use of cadmium metal, although not involving any great tonnage, is in the manufacture of low-melting-point alloys for special solders and fusible alloys for sprinkler apparatus, fire-detector systems, and valve seats for high-pressure gas containers.

Cadmium is also consumed in the production of cadmium compounds, the most important of which are cadmium sulfide and cad-

mium oxide. Cadmium sulfide and sulfoselenide are standard agents for producing yellow and red colors, respectively, in paints, ceramics, inks, rubber, and leather. Cadmium oxide, hydrate, and chloride are used in electroplating solutions; and cadmium bromide, chloride, and iodide are used in the preparation of special photographic films.

Apparent consumption of cadmium in the United States, 1945–46, in pounds

Total stocks [3]	1,556,096	167,716	1,723,812	1,006,836	110,236	1,117,072

[1] Figures partly revised.
[2] Comprises principally 6 largest dealers.
[3] Excludes consumers' stocks, which were about 1,000,000 pounds at the end of 1944.

PRICES

The quoted price for cadmium remained at 90 cents a pound for commercial sticks and 95 cents a pound for patented shapes until Government control of prices was relinquished in midyear, after which the price increased to $1.25 and $1.30, respectively, on July 8 and again to $1.50 and $1.55, respectively, on December 2. The average price of domestic metal, as reported to the Bureau of Mines by primary producers, was 99 cents a pound in 1946, compared with 77 cents in 1945, 75 cents in 1944, 79 cents in 1943 and 1942, and 78 cents in 1941.

FOREIGN TRADE [1]

In 1946 total imports for consumption of metallic cadmium and of cadmium contained in flue dust decreased 25 percent in weight and 37 percent in value. Exports of cadmium decreased 32 percent in value.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Imports.—Imports of flue dust were substantially below the 1945 rate; Mexico continued to be the main source of dust, but a small quantity was received from the Netherlands. Metallic cadmium imports from Belgian Congo declined 74 percent in 1946. A sharp increase in imports from Canada and Peru and a reappearence of imports from Belgium—the first since 1940—were somewhat compensatory, however. Although the accompanying table of imports shows only metal and dust, a very considerable additional quantity of cadmium enters the United States in zinc ores and concentrates produced in several foreign countries, including Mexico, Canada, Peru, and Bolivia. Much of this cadmium is recovered in the reduction of these imported materials.

Cadmium metal and flue dust imported for consumption in the United States, 1944–46, by countries

Country	1944		1945		1946	
	Pounds	Value	Pounds	Value	Pounds	Value
Metallic cadmium						
Belgian Congo	53,082	$50,699	25,798	$22,997	6,700	$5,444
Belgium and Luxembourg					2,240	5,366
Canada			672	793	3,568	5,459
Italy	8,656	7,790				
Peru	4,889	4,495	2,254	2,029	4,907	7,629
	66,627	62,984	28,724	25,819	17,415	23,898
Flue dust (Cd content)						
Mexico	1,689,322	835,615	2,192,685	992,286	1,609,366	598,494
Netherlands					43,539	19,397
	1,689,322	835,615	2,192,685	992,286	1,652,905	617,891
	1,755,949	898,599	2,221,409	1,018,105	1,670,320	641,789

Exports.—The total value of cadmium exported in 1946 was almost one-third less than that of the previous year due to a 77-percent drop in the value of cadmium exported in drosses, flue dusts, residues, and scrap. The value of cadmium-metal exports increased 63 percent over 1945.

Cadmium exported from the United States, 1944–46, gross weight, by kinds

Kind	1944		1945		1946

[1] Exports.
[2] Data not available; estimate included in total.
[3] Beginning in October 1939, including Upper Silesia.
[4] Preliminary data for fiscal year ended March 31 of year following that stated.
[5] April to September, inclusive.
[6] November to December, inclusive.
[7] Cadmium content of flue dust exported for treatment elsewhere; represents in part shipments from stocks on hand. To avoid duplication of figures, data are not included in the total.
[8] Estimated figure.

Australia (Tasmania).—The Electrolytic Zinc Co. of Australasia, Ltd., operating mines and a milling plant at Rosebery, on the west coast, and a smelter at Risdon, near Hobart, Tasmania, produced 226 long tons of cadmium metal in the fiscal year ending June 30, 1946 from zinc concentrates, calcines, and flue dusts. About one-third of the material treated comes from company operations on the island of Tasmania and the remainder from the three largest mines in the Broken Hill district of New South Wales on the Australian mainland.

Canada.—Canadian output of refined metallic cadmium is derived from the zinc and lead ores of British Columbia and the zinc-copper ores of Saskatchewan and Manitoba. The Consolidated Mining & Smelting Co. of Canada, Ltd., at Tadanac (Trail), British Columbia, and the Hudson Bay Mining & Smelting Co., Ltd., at Flin Flon, Manitoba, produced about 79 and 21 percent, respectively, of the total Canadian output. A considerable quantity of cadmium of Canadian origin also is extracted at plants in the United States from imported zinc ores and concentrates.

Mexico.—Exports of cadmium contained in flue dusts recovered from ores of Mexican origin declined 32 percent in 1946. This material is recovered at the reduction works of the American Smelting & Refining Co. and the American Metal Co., Ltd., and all of it is exported for treatment—mostly to the United States. In addition to the cadmium contained in flue dust, an undeclared quantity of the metal is exported in zinc ores and concentrates. It is probable that, on a mine-output basis, Mexico is second only to the United States as a producer of cadmium.

Carbon Black

By F. S. LOTT AND H. BACKUS

GENERAL SUMMARY

FURTHER expansion in demand for carbon black raised production and sales to new heights in 1946. Production of 1,244,421,000 pounds was 18 percent above 1945 but was surpassed by sales that increased 24 percent to 1,269,740,000 pounds. The demand for contact blacks exceeded the supply, and producers' stocks were progressively depleted to minimum working levels at the end of the year. The decline in total stocks during 1946 from 102,005,000 pounds to 76,228,000 resulted from the drop of 47,950,000 pounds in the pro-

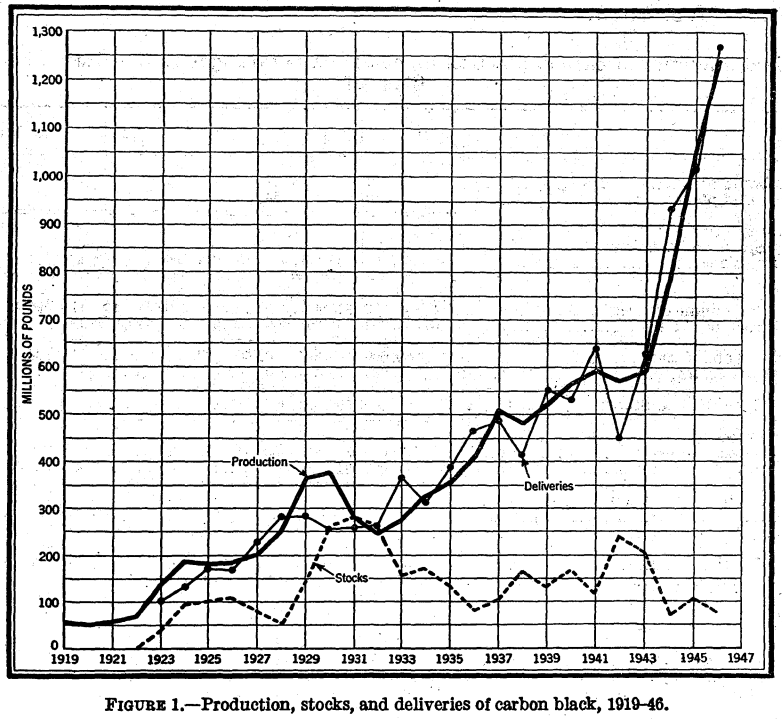

FIGURE 1.—Production, stocks, and deliveries of carbon black, 1919–46.

ducers' inventory of contact blacks and the addition of 22,173,000 pounds to stocks of furnace types.

Continuing the rapid growth that characterized the war period, the output of furnace (including thermal) blacks increased 22 percent over 1945 to 625,312,000 pounds and exceeded for the first time that of contact-type blacks—619,109,000 pounds. There is much evidence that the rise of the furnace group to the leading position in production volume foreshadows future dominance of the industry. However,

demand for channel black in early 1947, at prices above those commanded by the principal furnace grades, promises to tax the available facilities for production for several months at least.

Sales to rubber companies increased 17 percent over 1945 to a new record of 941,464,000 pounds, amounting to 94 percent of all domestic sales, compared with 95 percent in 1945. As an indication of the effect of synthetic rubber and new techniques upon the market for carbon black, it is interesting to note that the increase in sales to rubber companies in 1946 over 1941 was about 3.5 times the proportional increase in consumption of virgin rubber in the United States. More specifically, carbon-black sales for rubber in 1946 were 114 percent greater than in 1941, and rubber consumption (natural and synthetic) was only 33 percent greater.

Sales to ink and paint manufacturers increased to new records of 29,561,000 and 9,312,000 pounds, respectively, and miscellaneous trades absorbed 18,318,000 pounds of carbon black, a gain of 57 percent over 1945.

[1] Principally channel.

[2] Figure not available.

Insistent demand from foreign countries caused exports to rise to a new high of 271,085,000 pounds, in spite of export controls upon shipments of channel blacks. Prior to 1946, the largest total export was 203,828,000 pounds in 1939.

CURRENT TRENDS AND PROSPECTS

Several factors that will have an important bearing on the future of carbon black have become less obscure in the past 2 years. In the matter of costs of the dominant raw material—natural gas—a strong upward trend is evident, particularly with respect to channel plants for which supplies have been relatively cheap. This trend acts cumulatively to the detriment of channel-type production relative to that of the furnace type.

For example, assuming a yield of 1.5 pounds of carbon black per thousand cubic feet of gas burned for a channel plant and a gas cost of 3.0 cents per thousand cubic feet, the cost of gas alone per pound of product would be 2.0 cents. With the same gas cost and a yield of 8 pounds per thousand cubic feet for a furnace-type plant, the cost of gas per pound of product would be 0.375 cent, or 1.625 cents below that for the channel plant. If the cost of gas is raised to 5.0 cents per thousand cubic feet at both plants, other conditions remaining the same, the advantage of the furnace plant becomes 2.708 cents in gas cost per pound of product.

Reflecting urgent demand and cost factors, the average price of standard channel black has advanced since 1944 from a position below the prices of important grades of furnace blacks to a premium of one or more cents a pound above them. The probability of higher costs for channel black in the future indicates that the maintenance of large sales volume will depend upon quality factors. Suggestive of increasing competition from furnace blacks are recent announcements by two large producing companies of the development of new grades that are regarded as equal or superior to channel black for important applications. The opinion has been expressed that improved furnace blacks will gradually replace channel types in rubber processing.

World crude-rubber consumption in 1946 has been estimated by the London Rubber Secretariat at 1,455,000 tons, including 540,000 tons of natural. Of these totals, 1,039,000 tons, including 278,000 tons of natural rubber, were consumed in the United States. These figures indicate that over 60 percent of the foreign and about 27 percent of the United States consumption was natural rubber. A moderate increase in world rubber consumption has been forecast for 1947.

The use of natural rubber in the United States increased almost threefold in 1946 over 1945, and in foreign countries a sharp gain was also indicated. The return of natural rubber to world commerce has stimulated greatly the demand for channel blacks, although current practice in this country is to use materially less channel black than formerly per automotive tire manufactured. However, total loading with black per pound of rubber is now definitely higher than was the prewar custom. This factor will sustain the demand for carbon blacks at a higher ratio to rubber consumption than in former peacetime years, whether used in natural, synthetic, or blends of the two types of rubber.

In the early months of 1947, record sales of carbon black accompanied extremely active operations in the rubber-processing industry which reported a rate of output of automotive tire casings exceeding 100 million per year. Rubber trade expectations of reduced production schedules in the second half of 1947 suggest the current formation of a peak in domestic demand for carbon black. Export shipments have averaged about 26 million pounds a month in early 1947 and promise to continue at a high rate, unless restricted by scarcities in foreign exchange.

A plentiful world supply of crude rubber at moderate prices seems assured for an indefinite period, assuming continued operation of one-third or more of the synthetic-producing capacity in the United States and the absence of serious political dislocations. The effects of stability in rubber prices, in contrast to the prewar gyrations, may be important in expanding the future use of rubber and hence demand for carbon black.

Beginning in mid-1946, the Government permitted gradual increases in the use of natural rubber by processors, the proportional amounts varying with specific product types. By the first quarter of 1947, the rubber industry was reported to be using about 35 percent natural and 65 percent synthetic rubbers.

No long-term policy with respect to the United States synthetic rubber plants has been defined by the Congress, but the strategic value of the industry from both commercial and national defense points of view is widely understood. It, therefore, seems generally agreed that a material portion of the productive capacity will be retained in an operating or stand-by condition. Continued use of important amounts of synthetic rubber will tend to increase sales of carbon black over the amount required for natural rubber processing and to strengthen the position of furnace blacks relative to channel.

PRODUCTION

By States.—Texas production increased 15 percent over 1945 to 830,850,000 pounds, amounting to 67 percent of the United States total in 1946, compared with 69 percent in 1945. Rapid expansion in districts other than the Panhandle continued in 1946 owing in large part to the Government-built channel-type plants that utilize large quantities of gas produced with oil. Output in these districts of 234,172,000 pounds of carbon black in 1946 was 30 percent above 1945 and over four times that of 1942.

Production increased in all other producing States, except California, record output being reported in Kansas, Louisiana, New Mexico, and Oklahoma.

By Months.—The adjacent table showing monthly production of carbon black in 1946 has been prepared on a similar basis to those published for 1941 and earlier years, with the addition of a separation between the contact and furnace (including thermal) types of black. The Bureau of Mines annual totals are prorated on the basis of the monthly figures supplied through the courtesy of the National Gas Products Association. These data are compiled from reports submitted to the association by carbon-black producing companies.

Carbon black produced from natural gas in the United States in 1946, by States and by major producing districts

[1] Includes carbon black made from liquid hydrocarbons.
[2] Excludes data for some producers.
[3] Monthly figures estimated by allocating the Bureau's annual total proportionately to the association's monthly data.

Methods and Yields.—An average yield in 1946 of 2.44 pounds of carbon black of all grades compared with 2.32 pounds in 1945, prolonging the upward trend that has been caused by the growing importance of furnace black. The furnace plants consumed 62,741 million cubic feet of natural gas and over 20 million gallons of liquid hydrocarbons in 1946. Their indicated yield of black from natural gas exceeded 8.5 pounds per thousand cubic feet consumed.

The contact-type plants used 415,608 million cubic feet of natural gas in 1946, with an average yield of 1.49 pounds per thousand cubic

feet, compared with 1.42 pounds in 1945 and 1.32 pounds in 1944. Recent higher yields are doubtless related to less emphasis upon production of the easy-processing grades than in 1944 and 1943. The principal sources of contact-type blacks are the Texas Panhandle, West Texas, and New Mexico.

Number and Capacity of Plants.—The number of operating plants increased from 59 in 1945 to 60 in 1946, of which 42 were contact types and 18 furnace. Two new furnace plants began operations—(1) at Hickok, Grant County, Kans., owned by the Columbian Carbon Co., and (2) at Brazoria, Brazoria County, Tex., owned by the Jefferson Lake Sulphur Co. One channel plant, of the Texas Elf Carbon Co. at Eliasville, Stephens County, Tex., did not operate.

Six Government-owned channel plants, in Texas (3), New Mexico (2), and Oklahoma (1), were offered for sale or lease by the War Assets Administration on May 1, 1947. The aggregate cost to the Government of these plants was $20,282,000, and their total rated capacity 126 million pounds of black a year.

Total United States		43	16	42	18	3,633,600	3,658,400

[1] One plant in both Carson and Hutchinson Counties tabulated under Hutchinson County.

The productive capacity of all producing plants in 1946 amounted to 3,658,400 pounds per day compared with 3,633,600 pounds in 1945, a net gain of less than 1 percent. Furnace plant capacity increased from 1,863,000 to 1,953,000 pounds per day, but that of contact plants declined from 1,770,600 to 1,705,400 pounds. Except for the plants built with Government funds, installed capacity to produce channel black had changed little during the war. The investment of private money in new productive facilities has been directed toward furnace-type processes. Production in 1946 equaled 93 percent of total reported capacity at the end of the year, compared with 79 percent in 1945.

Producers.—The Jefferson Lake Sulphur Co. was added to the list of producers in 1946, raising the total to 22 from 21 in 1945.

DOMESTIC DEMAND—SALES

Actual consumption can be only approximated because of the lack of data on consumers' inventories, but sales by carbon-black producers in the United States doubtless correlate rather closely with consumption, in the absence of large production abroad. Such sales, amounting in the first full postwar year (1946) to 1,270 million pounds were 24 percent above 1945 and exceed 1946 production by 25 million pounds. They probably provided for some accumulation of working inventory by processing industries, particularly in foreign countries that had been deprived of carbon black for several years. Sales for export increased sharply (56 percent) to record levels with the resumption of peacetime manufacturing in many foreign countries, accounting for 21 percent of total deliveries in 1946 compared with 17 percent on 1945.

The indicated sales of contact (channel) process blacks were 667 million pounds and those of furnace blacks, 603 million pounds. The demand for channel blacks in 1946 and through the early months of 1947 apparently exceeded the capacity of the industry to produce. Demand for furnace blacks was below productive capacity in 1946 but expanded in early 1947 to approximate the level of reported capacity.

All types of users contributed to the 18-percent gain in domestic deliveries in 1946 to a new high of 998,655,000 pounds of carbon black.

The rubber industry absorbed 941,464,000 pounds or 17 percent more than in 1945, but its share of domestic sales declined to 94 percent from 95 percent in 1944 and 1945. Although total sales to rubber companies in 1946 were greater than in any previous year, they were about 10 percent less per ton of crude rubber consumed than in 1945. This decline may be attributed to the shift away from production of military items to civilian goods, such as the smaller sizes of tires, and to the increasing use of natural rubber by the processing companies.

With the removal of Government controls on inks and carbon black, sales to ink companies increased to 29,561,000 pounds in 1946 from 22,824,000 pounds in 1945. Similarly, an increase in the apparent consumption of newsprint in the United States to 4,296,268 short tons in 1946 from a revised total of 3,481,302 short tons in 1945, was reported by the American Newspaper Publishers' Association. Paint companies' requirements, influenced by growing markets for

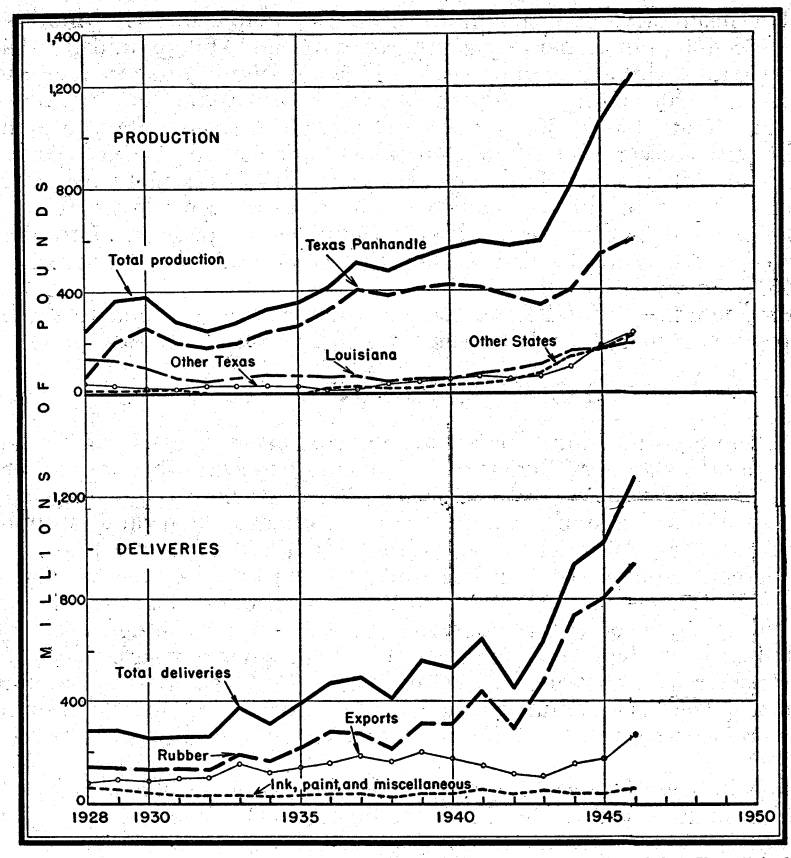

FIGURE 2.—Production and deliveries of carbon black 1928-46. Production in "Other Texas" includes Oklahoma and Wyoming in 1932-35.

automotive and other coatings, expanded 25 percent over 1945 to 9,312,000 pounds.

Sales to miscellaneous users of 18,318,000 pounds of black were 57 percent greater than in 1945 but below the record volume taken in 1943, when an abnormal amount of carbon black was used for military purposes.

STOCKS

The increase in producers' inventory of contact blacks that had continued through the latter half of 1945 was reversed early in 1946, and thereafter a declining trend persisted through the end of the year, when stocks amounted to only 17,006,000 pounds (less than 2 weeks' supply)—the lowest total in over 20 years.

Stocks of furnace blacks did not change significantly during the first 2 quarters of 1946 from the opening level of 37,049,000 pounds. They were built up to about twice this level in the third quarter and then declined to 59,222,000 pounds on December 31 as sales increased.

PRICES

The increase in average value of carbon black at the plants from 4.02 cents a pound in 1945 to 4.82 cents in 1946 was related primarily to higher prices for channel black made possible by relaxation of price controls.

The average value at the plants of contact-type blacks increased from 4.11 cents a pound in 1945 to 5.49 cents in 1946; similarly, furnace-black values were 3.93 and 4.15 cents for the same years. The average value of contact blacks relative to the furnace types has risen from 0.34 cent a pound less than the furnace average in 1944 to 1.34 cents above it, thus reversing the economic position of the two major classes of carbon black.

Early in August the Office of Price Administration suspended price controls on the principal grades of channel black, and the price of standard channel at the plants advanced from 5.0 to 5.5 cents a pound for carload shipments in bulk, in the form of pellets or beads. Another increase to 6.0 cents a pound became effective on January 1, 1947. All grades of channel black were released from control on October 9, 1946. Prices of the principal grades of furnace black were unchanged during 1946.

FOREIGN TRADE[1]

Exports.—The resumption of rubber processing in many European countries in 1946 stimulated exports of carbon black to the record volume of 271,084,780 pounds, 56 percent above 1945. In the European region, 15 countries received 167,023,695 pounds of carbon black from the United States in 1946. Shipments to France increased from less than 4 million pounds in 1945 to 47 million pounds in 1946. Most of the Latin American countries imported more carbon black than in 1945 or prewar years.

Export shipments were at a high rate throughout 1946, except in the August–October period when they were curtailed by widespread strikes in United States ports. The average value of the carbon black exported was 6.67 cents a pound in 1946 compared with 5.66 cents in 1945.

Because of the lower railroad freight costs from producing points to tidewater, the great bulk of ocean-borne exports clears through Gulf ports, led by those of the Galveston customs district, which handled more than half of total exports in 1946.

Imports.—With disappearance of wartime requirements, the import movement of "gas black and carbon black" from Canada shrank to 22,932 pounds valued at 10.4 cents a pound in 1946 from the peak of 1,526,758 pounds in 1945. Imports of 440 pounds from Mexico and 40 pounds from the United Kingdom were also reported. Imports of acetylene black from Canada also felt the lack of war stimulus in 1946, declining to 3,945,836 pounds valued at 10.2 cents a pound from 7,583,370 pounds in 1945 valued at 9.76 cents.

[1] Figures on exports and imports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

GENERAL SUMMARY

PRODUCTION and demand for cement in 1946 increased sharply over the previous year's total and were far above estimates made at the beginning of the year. Total production of 166,538,862 barrels of hydraulic cements was 60 percent higher than in 1945 and only 10 percent lower than the 1942 record volume of 185,341,609 barrels. The gains were shared by all types (portland cement and the group of all other hydraulic cements—natural, masonry, puzzolan, and hydraulic-lime). The portland-cement industry operated at 68 percent and the "all other" group at 72 percent of productive capacity in 1946. Mill shipments of portland cement, which totaled 169,567,593 barrels, were 59 percent above that reported in 1945. Shipments of the "all other" group gained 71 percent. Stocks of all hydraulic cements at mills on December 31, 1946, were 11,063,262 barrels, 33 percent less than at the close of 1945.

The average net mill realization per barrel of portland cement increased 9 cents from the 1945 price, reaching $1.72 per barrel. "All other hydraulic cements," as a group, reported a gain of 22 cents a barrel to $1.64.

The long-term trend, as shown by the moving 12-month total of production of finished portland cement, continued the upswing that started in April 1945 and by the end of 1946 had reached a point comparable to that of July 1943, only 10 percent below the all-time high of 182,652,000 barrels reached in 1942.

Monthly production of cement diverged from the normal peacetime trend as well as from the previous year's pattern. February production was only 385,000 barrels below the January total. March and April output follow the normal trend, but a slight decrease occurred in May in contrast to the usual continued rise during the spring

months. From June to September, the peak month, the monthly increase was above the normal rate.

The accompanying table presents the principal statistics of the cement industry over a 5-year period.

Salient statistics of the cement industry in the United States, 1942–46 [1]

[1] Includes Hawaii.
[2] Compiled from monthly reports by producers.
[3] Value received f. o. b. mill, excluding cost of containers.
[4] Revised figure.
[5] Subject to revision.

Monthly shipments from mills in 1946, with the exception of February and June, followed essentially the prewar trend but at a much higher volume level, increasing steadily, with the exception of a slight decline in June, from a January total of 7,391,000 barrels to a peak of 17,955,000 barrels in August, followed by a decline in September, a slight increase in October, and a sharp decline to 11,494,000 barrels in December.

Consumption trends of portland cement in 1946, as shown in figure 1, varied little from the previous year. The over-all change was only 0.5 percent from the 1945 totals.

The Middle States in 1946 were again the leading consuming region.[1]

A vigorous program of rehabilitation and expansion of cement plants was started in 1946, and the industry seems to be divided between plans of expansion and efforts to increase the efficiency of the present equipment. Despite fuel shortages, strikes, and difficulties in

[1] The States comprising each region are found in Bureau of Mines Minerals Yearbook, 1945, p. 1222.

obtaining materials, shortages that developed during the year were local, and the general supply situation was not critical.

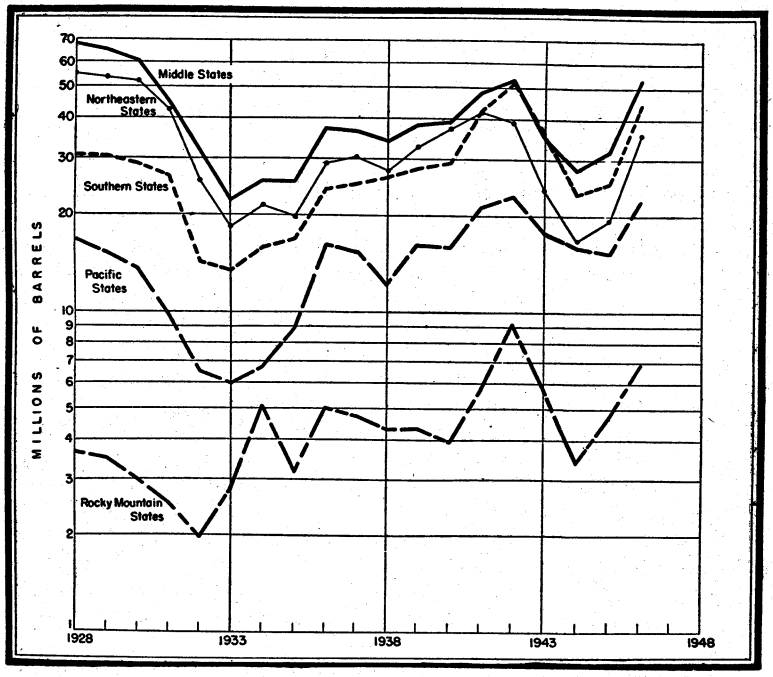

FIGURE 1.—Trends of indicated consumption of portland cement in continental United States, 1928–46, by regions.

The United States Circuit Court of Appeals on September 20, 1946, vacated the Federal Trade Commission antitrust order affecting a group of cement-producing companies and thus upheld the producers' right to absorb freight costs where necessary to meet the prices of competitors located nearer a particular market.

Maximum Price Regulation Order–224 of the Office of Price Administration was amended six times during 1946. Two of these were added only to clarify previous amendments. Increases of 30 cents a barrel were allowed in Arizona, that part of California south of and including Santa Barbara, Kern, Inyo, and Mono Counties, and Clark and Lincoln Counties in Nevada, effective April 22, 1946. Effective June 15, 1946, a ceiling was set on cement in bulk, f. o. b. mill, in districts as listed by the Bureau of Mines in 1941; effective July 26, 1946, an increase of 5 cents per barrel was granted to cement manufacturers in Texas, when the cement is sold in containers and the destination of shipments is within the State of Texas; effective November 1, 1946, an increase not to exceed 15 cents per barrel was granted to producers in California, north of but not including Santa Barbara, Kern, Inyo, and Mono Counties, and that part of Nevada north of but not including Clark and Lincoln Counties, if the destination of shipment is within the area defined.

PORTLAND CEMENT

PRODUCTION, SHIPMENTS, AND STOCKS

The production of portland cement constituted 99 percent of the total output of hydraulic cements in 1946.

Portland cement was manufactured at 152 plants in 1946, and shipments were made from 153 plants in 34 States, Hawaii, and Puerto Rico. However, the plant in Hawaii closed at the end of 1946 and is being dismantled. One plant shipped from stock. The leading States, in order of production, were Pennsylvania, California, Texas, Michigan, and Ohio.

Production in 1946 was higher in all Bureau of Mines districts than in 1945. In continental United States the increases ranged from 19 percent in the Virginia-Georgia-Florida-Louisiana district to 117 percent in the western Pennsylvania-West Virginia district.

Shipments in 1946 were also greater in all districts than in 1945. The gains range from 27 percent in California to 111 percent in the western Pennsylvania-West Virginia district.

Stocks of finished cement were 33 percent lower on December 31, 1946, than on the same date in 1945. Decreases occurred in all districts except New York and Maine, which showed an increase of 5 percent, and Puerto Rico, which reported an increase of 56 percent. The decreases ranged from 14 percent in western Pennsylvania and West Virginia to 66 percent in Iowa. Stocks of clinker in 1946 followed essentially the normal trend of an increase from January through March and a decline from March to the year's low in November.

[2] Includes Hawaii.
[3] Subject to revision.

DOMESTIC CONSUMPTION

The following table shows that the indicated consumption of portland cement in 1946 gained in all States. Ten States—Connecticut, Delaware, Georgia, Maine, Mississippi, New Hampshire, North and South Carolina, Tennessee, and Vermont—reported an increase of more than 100 percent over the previous year's total. Forty-three percent was consumed in seven States—California, New York, Texas, Pennsylvania, Ohio, Illinois, and Michigan.

Destination of shipments of finished portland cement from mills in the United States, 1944–46, by States

Destination	1944 (barrels)	1945 (barrels)	1946	
			Barrels	Percentage of change from 1945
Continental:				
Alabama	1,193,825	1,912,267	2,744,143	+43.5

[1] Shipments by producers to foreign countries and to noncontiguous Territories of the United States (Alaska, Hawaii, Puerto Rico, etc.), including distribution from Puerto Rican and Hawaiian mills.

LOCAL SUPPLIES

An indication of the surplus or deficiency in the quantity of cement locally available is shown in the following table. The comparison is based on shipments from mills and on consumption as shown by State receipts of mill shipments. In 1946 deficiencies occurred in two States, Hawaii, and four districts, compared with one State, Hawaii, and three districts in 1945. As shipments from mills in 1946 were greater in all States and districts than in the previous year, this is another indication of the high demand during the past year.

The total surplus of producing States in 1946 was distributed as follows: 22,538,241 barrels to non-cement-producing States and Alaska; 4,582,499 barrels to destinations outside continental United States (excluding local consumption of Puerto Rican and Hawaiian production); and 36,397 barrels to unspecified destinations.

Estimated surplus or deficiency in local supply of portland cement in cement-producing States, 1945–46, in barrels

TRANSPORTATION

The quantity and proportion of cement shipped by each of the major methods of transportation for the 1944–46 period are given in the following table. The proportions shipped by railroad, truck, and boat in 1946 were essentially the same as in 1944 and 1945. Railroads carried most of the shipments, accounting for 81 percent of the total.

Although the quantity of cement shipped in bulk and in cloth and paper bags increased in 1946 over the previous year's total, the per-

centage moved in each of these various types of containers changed little. Bulk shipments were essentially the same, cloth bags continued their steady decline, and paper bags showed a slight increase.

Shipments of portland cement from mills in the United States (including Puerto Rico), 1944–46, in bulk and in containers, by types of carriers

[Barrels of 376 pounds]

[1] Includes steel drums and iron and wood barrels.
[2] Includes cement used at mills by producers as follows—1944: 112,593 barrels; 1945: 217,968 barrels; 1946: 584,224 barrels.
[3] Less than 0.05 percent.
[4] Includes mill in Hawaii; product shipped in paper bags by truck and railroad in 1945 and by truck only in 1946.

MILL VALUES

The average net mill realization of all portland cement shipped from mills in 1946 advanced to $1.72 per barrel from $1.63 in 1945. This gain is attributed largely to increases in ceiling prices granted in areas to which reference has been made on a preceding page.

The composite wholesale price of portland cement, f. o. b. destination, according to the Bureau of Labor Statistics index (1926=100), was 104.1 in 1946; in 1945 it was 99.4.

Average mill value per barrel, in bulk, of portland cement in the United States, 1942–46

1942	$1.53	1945	$1.63
1943	1.57	1946	1.72
1944	1.59		

CAPACITY OF PLANTS

The aggregate annual capacity of all portland-cement plants in 1946 was essentially the same as reported in 1945.

The over-all rate of operation in 1946 was at 68 percent of total capacity. As shown in the following table, the percentage of capacity utilized gained in all districts. The increases in percentage points ranged from 12 in the Virginia-Georgia-Florida-Louisiana district, to 38 in Kansas. The percentage of capacity used in each month of 1946 was higher than in the corresponding months of 1945 and—with the exception of a slight drop in May—followed the normal seasonal trend of low rates in January, February, and March and a steady increase to a peak in September, with a decline through the last quarter.

Portland-cement-manufacturing capacity of the United States, 1945–46, by producing districts

District	Estimated capacity (barrels)		Percent of capacity utilized	
	1945	1946	1945	1946
Eastern Pennsylvania and Maryland	42,567,325	42,537,325	34.1	62.3

June	45	73	39	54	December	48	71	43	68

Total capacity of wet-process mills, as shown in the accompanying table, increased slightly each year in the 1944–46 period, in contrast to dry-process plants whose capacity declined. The percentage of total cement produced by the wet-process mills during this period, however, has declined somewhat.

A grouping of the cement plants based on their estimated annual capacity is shown in the following table.

Distribution of portland-cement plants in the United States in 1946, according to annual capacity

Estimated annual capacity, barrels:	*Number of plants*
Less than 1,000,000	37
1,000,000 to 1,999,000	85
2,000,000 to 2,999,000	21
2,999,000 to 10,000,000	11

[1] Includes Puerto Rico and Hawaii.

CLINKER PRODUCTION

The production of clinker, the intermediate product of the industry, was 61 percent greater in 1946 than in 1945. Peak production was reached in October, and stocks reached their peak in March. Stocks on December 31, 1946, were 13 percent below those reported for December 1945.

Production and stocks of portland-cement clinker at mills in the United States in 1946, by months and districts, in thousands of barrels

PRODUCTION ACCORDING TO RAW MATERIALS

The predominant raw materials for making portland cement in the United States since 1908, as shown in the following table, have been limestone and clay or shale. In 1946, 68 percent of the output was made from this combination compared with 71 percent in 1945. Cement rock and pure limestone, which before 1908 was the leading raw material, is now of secondary importance and supplied 24 percent of the raw materials in 1946 compared with 20 percent in 1945. Marl and clay, which was used in substantial quantities before 1906, declined thereafter and supplied only 2 percent of the raw material utilized by the cement industry in 1946. The combination of blast-furnace slag and limestone supplied 6 percent of the output in 1946 compared with 7 percent in 1945.

Production and percentage of total output of portland cement in the United States, 1898–1914, 1926, 1929, 1933, 1935, and 1941–46, according to raw materials

Year	Cement rock and pure limestone		Limestone and clay or shale [1]		Marl and clay		Blast-furnace slag and limestone

[1] Includes output of 2 plants using oystershells and clay in 1926; 3 plants in 1929, 1933, and 1935; 4 plants in 1941–45; and 5 plants in 1946.

RAW MATERIALS

The tonnages of raw materials (exclusive of fuels and explosives) required for the production of portland cement during recent years are given in the following table. Limestone, cement rock, and clay and shale make up 93 percent of the total materials consumed. All types of raw material consumed showed large increases in 1946 over the previous year's totals.

Raw materials used in producing portland cement in the United States, 1944–46

Raw material	1944	1945	1946
	Short tons	*Short tons*	*Short tons*
Cement rock	5,119,318	5,656,390	10,781,078
Limestone [1]	19,958,151	22,747,654	34,579,673

[1] Includes oystershells.
[2] Includes bentonite, diatomaceous shale, fuller's earth, and other clays.
[3] Includes silica and quartz.
[4] Includes iron ore, pyrite cinders and ore, and mill scale.
[5] Includes diatomite, fluorspar, pumicite, flue dust, pitch, red mud and rock, hydrated lime, tufa, cinders, calcium chloride, sludge, grinding aids, and air-entraining compound.

FUELS AND POWER

In accordance with the increased output of cement in 1946, consumption of all types of fuel increased. The annual consumption of coal in 1946 increased 67 percent over that reported in 1945; fuel oil and natural gas showed gains of 31 and 48 percent, respectively; and byproduct gas a gain of 153 percent. The large increase in byproduct gas is due to the fact that this type of fuel was not used in cement plants before April 1945. Thus, 1946 represents the first year for which a 12 months' total is available.

Coal stocks in October and November reached the million-ton mark for the first time since July 1942. Although this represents a peak tonnage, the stocks were only sufficient for 1½ months' supply at the October-November rate of production.

As shown in an accompanying table, the number of portland-cement plants using electric energy in the production of cement and the quantity of this energy consumed increased in 1946 over the 1945 total. The percentage of electricity generated also increased, and the quantity purchased declined.

Finished portland cement produced and fuel consumed by the portland-cement industry in the United States, 1945–46, by processes

Process	Finished cement produced			Fuel consumed [1]		
	Plants	Barrels of 376 pounds	Percent of total	Coal (short tons)	Oil (barrels of 42 gallons)	Natural gas (M cubic feet)
1945						
Wet	81	57,192,688	55.6	2,126,895	1,828,788	26,340,213

TYPES OF CEMENT

A break-down of total production of portland cement by various types for the 1942–46 period is given in the following table. The output of all types increased in 1946 over that reported in the previous year. The quantity of air-entrained cement produced and shipped, first reported separately to the Bureau of Mines in 1945, is also shown in the table. The increase in 1946 output over the 1945 figure is more apparent than real, because some producers did not keep separate statistics on the quantities of this type of cement produced in 1945. The large increase in sales of sulfate-resisting, type V, and portland-puzzolan is noteworthy.

Prepared Masonry Mortars.—Production of these mixed materials in 1946 was reported by 82 plants and totaled 8,596,244 barrels. Shipments reached 8,632,601 barrels, valued at $15,729,380, an average mill realization of $1.82 per barrel. These data are not included in the statistical tabulations in this chapter, but the portland cement used in producing the mixtures is included.

Portland cement produced and shipped in the United States, 1942–46, by types

Kind and year	Active plants	Production (barrels)	Shipments		
			Barrels	Value	
				Total	Average
General use and moderate heat (types I and II):					
1943 [1]	153	123,490,667	118,347,297	$182,682,614	$1.54
1944 [2]	151	83,576,685	86,933,387	135,564,313	1.56
1945 [3]	145	89,922,894	93,379,480	148,653,647	1.59
1946 [3]	153	139,355,317	144,212,386	244,331,033	1.69
High-early-strength (type III):					
1942	87	7,523,647	7,065,700	13,683,665	1.94

TECHNOLOGIC DEVELOPMENTS

Blast-furnace cement, now being produced in the United States, consists of a mixture of not less than 30 percent clinker and not more than 65 percent of properly granulated slag. This should not be confused with the inferior slag cements made during the 1914–18 period—from granulated slag, hydrated lime, and an alkali or sulfate accelerator—which were irregular and unreliable and are no longer manufactured. The Germans, French, Belgians, and Japanese have been producing blast-furnace cements for some time. The product can be produced at a lower cost than can standard portland cement, and as it can be utilized for many uses for which portland cement is now specified, it seems probable that the market for this type cement in the United States may increase.

Several types of mass-production masonry houses utilizing cement were reported in 1946. The R. G. Le Tourneau Co. has developed a machine that lays a 24- by 30-foot concrete house. The Peerless Construction Co. of New York City casts walls, with provisions for

doors and other openings, of high-early-strength concrete in light-gage steel decking, spanning curved strut rockers; the rockers are positioned on the basement floor so that the walls, when hardened, swing into an upright position by gravity.

Federal and American Society for Testing Materials specifications for cement were revised during 1946, setting limitations on chemical composition that serve to increase control measures on proportioning raw materials and their flow through grinding mills, storage silos, and kilns. General acceptance of air entrainment, as improving the quality of concrete for some uses, is increasing and the United States Public Roads Administration has approved three such admixtures in its highway specifications.

A new process of manufacturing cement includes improvements which comprise reducing the raw materials used in manufacturing cement to a fine powder so that at least 90 percent will pass 100-mesh and blowing the powder continuously with enough gas to maintain the powder in a fluid condition. The temperature of the fluid is raised progressively by passing a heating gas in countercurrent flow to the fluidized powder at a velocity adjusted to maintain the powder in the form of a dense turbulent body. The dense materials are maintained in contact with heating gas long enough to drive off first the moisture, then the carbon dioxide, and finally to clinker the finely divided material. This process is covered by United States Patent 2,409,707, October 22, 1946.

It is also reported that the English have successfully used anhydrite in the manufacture of cement clinker and sulfuric acid. Anhydrite is substituted for limestone in the kiln feed, and carbon in the form of coke is used as the reducing agent. The sulfate is reduced to a sulfite, and lime is released. The sulfur dioxide formed is drawn off under suction and utilized in the manufacture of sulfuric acid.[3]

NATURAL, MASONRY (NATURAL), AND PUZZOLAN CEMENTS

Nine cement plants in 1946, as in the previous year, produced hydraulic cements other than portland. Output and shipments in 1946, however, were, respectively, 67 and 71 percent greater, and stocks were 34 percent lower than in 1945. Producers reported a consumption of 32,273 short tons of coal and of gas equivalent to approximately 2,167 short tons of coal.

Natural, masonry (natural), and puzzolan (slag-lime) cements produced, shipped, and in stock at mills in the United States, 1942–46

Year	Production		Shipments		Stocks on Dec. 31
	Active plants	Barrels (376 pounds)	Barrels (376 pounds)	Value	Barrels (376 pounds)
1942	11	2,560,425	2,508,324	$3,668,169	253,307
1943	10	1,830,266	1,846,803	2,357,112	227,152
1944	9	1,246,703	1,320,274	1,638,892	166,889

FOREIGN TRADE[3]

Imports.—As shown in the following table, imports of cement have been small during recent years and for the most part represent purchases from Canada. Imports of all hydraulic cements except white nonstaining portland cement, 1944–46, are listed by country of origin in the second following table. Imports of white nonstaining cement in 1946 totaled 139 barrels valued at $468.

Hydraulic cement imported for consumption in the United States, 1942–46

Year	Barrels	Value	Year	Barrels	Value
1942	644	$2,020	1945	323	$700
1943	13,658	55,560	1946	3,734	15,531
1944	169	418			

Roman, portland, and other hydraulic cements imported for consumption in the United States, 1944–46, by countries[1]

Country	1944		1945		1946	
	Barrels	Value	Barrels	Value	Barrels	Value
Belgium and Luxembourg					2	$4
Canada	169	$417	320	$685	2,498	8,124
Chile			(2)	2		
Dominican Republic			3	13		
Guatemala	(2)	1				
United Kingdom					1,091	6,922
	169	418	323	700	3,591	15,050

[1] Excludes "white, nonstaining, and other special cement."
[2] Less than 1 barrel.

Exports.—Exports of slightly more than 5 million barrels of cement to foreign countries in 1946, although less than the previous year's figure, was still far greater than the average prewar total. As shown in an accompanying table, shipments to Venezuela, Mexico, and Brazil accounted for 55 percent of total exports. The quantities shipped to these countries were, respectively, 21, 20, and 14 percent of the total. Substantial quantities were also exported to the Dominican Republic, Canada, Colombia, and Cuba.

Hydraulic cement exported from the United States, 1942–46

Year	Barrels	Value	Percent of total shipments from mills
1942	1,100,826	$2,707,217	0.6
1943	1,731,956	4,654,862	1.3
1944	4,040,405	10,044,838	4.2
1945	6,476,333	15,570,610	6.0
1946	5,163,362	13,484,933	3.0

Shipments of hydraulic cements to noncontiguous Territories of the United States, 1944–46, are shown in the following table. With the exception of the Virgin Islands, which showed a slight decrease in 1945, the trend in shipments to all of the Territories during the 1944–46 period has been upward. The upswing in 1946 was particularly sharp.

WORLD REVIEW

Figures on the output of cement in many of the cement-producing countries of the world have again become available, and it is believed that a reasonable estimate of world production can again be made. Available statistics on world production in the 1941–46 period are given in the following table.

World production of hydraulic cements, 1941–46, by countries, in metric tons [1]

[1] Data cover all hydraulic cements.
[2] Data not available; estimate included in total.
[3] Estimate.
[4] Beginning in 1943, white cement is included.
[5] Excludes portland-cement data, which are not yet available.
[6] Slovakia only.
[7] Includes Sudetenland.
[8] Excludes Russian zone of occupation.
[9] January to June, inclusive.
[10] June to December, inclusive.
[11] April to December, inclusive.
[12] Data represent area designated as Free China during the period of Japanese occupation, and Manchuria.
[13] South Korea only.
[14] Cement is also produced in Queensland and South Australia, but data are not available.
[15] Estimated by senior author of chapter.

LATIN AMERICA

The building and construction boom which swept the United States in 1946 was also apparent in Latin America. New mills are being built or have been completed in Cuba, Ecuador, Peru, and Chile, and one is being planned in Bolivia by a Chilean firm.

Argentina.—The Republic of Argentina has 11 portland-cement plants, 3 of which also produce white cement. Because of wartime shipping difficulties, cement was not imported during 1944 and 1945. Restrictions on fuel oil were removed early in 1946; but because of the heavy backlog of orders demands were far ahead of production, and thus the import market is good. However, this condition is thought to be temporary, as the plants in existence are adequate for all requirements when fuel is available. Government-sponsored programs to construct additional plants are also being considered.

Brazil.—The cement industry in Brazil like that in Argentina has been handicapped by fuel shortages. The rated capacity of the six operating plants is 950,000 tons, but actual production has not exceeded 825,000 tons. One new plant at Belo Horizonte, with an annual capacity of 50,000 tons, was completed in 1946, and an additional kiln was added to the plant in São Paulo. Because of the fuel shortages, imports of cement in Brazil have averaged about 200,000 tons annually for the past few years. Imports are expected to remain at about this level for a few more years. The consumption of white portland cement has increased since 1942 because of its wide use in plaster facings for new buildings. Brazilian production of white portland cement started in 1943.

Chile.—Production of cement in Chile in 1946 reached 579,800 metric tons compared with 411,088 tons in 1945. In view of the plant improvements during 1946, it is expected that cement production in 1947 will continue to increase.

Mexico.—Seventeen cement plants were operating in Mexico in 1946, and 4 more are either under construction or in the planning stage. The Marquette Cement Manufacturing Co. of Chicago, Ill., is supplying designing, construction, technical, and operating services for new plants at Atoyac, near Orizaba, in the State of Veracruz and in the city of Chihuahua, State of Chihuahua. The Universal Atlas Cement Co. of New York is financially interested in a mill at Irapuato between Mexico City and Guadalajara in the State of Jalisco. The Compania de Cemento Portland S. A. at Tolteca, State of Hidalgo, has announced plans to erect a new plant, adjacent to the present operations, that will be in production by the end of 1947.

Panama.—This country has depended on the United States and South America for its supplies of cement, and under normal conditions these sources have been adequate. However, as early as 1939 effects of the impending war were becoming evident. Plans were made to erect a cement plant, and contracts for equipment were let in 1944 to an American firm, but because of priority difficulties the material did not begin to arrive until 1945. The plant is on the Quebraucha River near Chilibre, and is a wet-process plant having two 200-foot rotary kilns fired by oil. Plant capacity is to be 300 metric tons (1,760 barrels) per 24-hour day.

793065—48——16

Venezuela.—The Government recently granted a subsidy equivalent to $1,250,000 to the National Cement Co. to enable this new firm to erect factories. Although some cement is being made, most of it is imported from the United States. Two new plants at Maracaibo and Barquismeto are nearing completion, and it is reported that an American company will build another plant at Chichirivichi.

EUROPE

Demands for cement in the devastated countries of Europe are great, but one of the chief difficulties is that of obtaining the required quantity and quality of coal to produce the clinker. Considerable success has been obtained by successful substitution of blast-furnace slag cement, which requires less fuel than portland cement.

Belgium.—The results of experiments in fine grinding of clinker, which have been in process over a number of years in Belgium, have recently been released.[4] Using a charge filling from 30 to 40 percent of the mill volume and using 20-mm. balls followed by 25-mm. balls gives the best yield of finished cement.

Beginning with June 1945 the production of cement in Belgium increased rapidly and reached a total of 646,900 metric tons for the year.[5] Production in 1946 was 1,889,800 metric tons, and Belgium reentered the export market, shipping cement to Latin America.

France.—A process has been invented in France to manufacture portland cement without using coal; it involves the use of the calcareous or argillaceous waste from coal mines and the soot, dross, and clinker emanating from coal combustion.[6] A supersulfated slag cement is also being produced in this country and Belgium under the trade name "Sealithor." It has good resistance to chemical agents and high mechanical strength and compressive strength comparable to high-early-strength portland cement; it is being utilized currently in the reconstruction of French and Belgian harbors.

Germany.—The dry process of raw-mix preparation predominates strongly over the wet method in this country. Raw mix, mesh sizes, were relatively coarse with the emphasis on output and low power consumption. Vertical kilns are still used in many plants, and most all finish grinding is done in open circuit. An excellent article has recently been published reviewing the cement industry in Germany.[7] The substitution of blast-furnace slag cement, made by grinding 30 to 65 percent of granulated blast-furnace slag with portland-cement clinker and a small quantity of gypsum, for straight portland at a reduction in cost has been successful in Germany. A high-early-strength cement has also been developed which can be poured with safety down to —7° C. It cannot be mixed with portland cement, however, because the heat given off in setting will break down portland cement. It is also about three times as costly as portland and thus is economical only where the special characteristic of quick strength is needed.

Spain.—Coal shortages in 1946 restricted the output of Spain's 25 cement plants and further increased the backlog of orders arising from wartime shortages and the postwar construction boom. As Spain now is reduced to using almost entirely relatively poor-grade native coals, methods have been devised to get the maximum performance from these low-grade fuels.

Sweden.—A cement and concrete research institute was opened in May 1945 in Sweden, with its principal purpose a study of the manufacture and properties of cement, the structural constitution of concrete, and ways and means to use it more rationally. The Skansha Cement Co., at Koping, has recently put into operation a new plant which features a 478-foot kiln and is manufacturing clinker by the wet process, with a heat consumption of 850,000 B. t. u. per barrel. This company's output (practically the national total) was 743,000 tons in 1945 and is expected to increase by about 160,000 tons in 1946. Plans have also been made to construct an additional plant of 320,000 tons annual capacity south of Stockholm in the near future.

Switzerland.—Large quantities of cement are required to build new hydroelectric plants and to enlarge those already in operation. The Government, therefore, released 450,000 tons of cement for such purposes. It is believed that only 70,000 tons will be available for new dwellings. Government controls on imports were released in 1946, but the relatively high prices prevailing in the surrounding countries deter foreign purchases.

U. S. S. R.—Recent exhibits of the Soviet cement industry include colored cements in white, blue, cream, light green, and pink. A new plant to be built in the Donbass (Ukraine) will feature these cements, and another new plant to be erected soon in the vicinity of Stolinsk (Kuzvetsk Basin) reportedly will make portland cement from blast-furnace slag and limestone found in the Gurevsk area. The first cement plant in the Karelo-Finnish S. S. R. is under construction at Letnyaya. Annual output will be on the order of 10,000 metric tons with production beginning near the end of 1946.

ASIA

Ceylon.—A Government cement plant is being constructed as a part of the industrialization program of Ceylon. The new plant is in the northern peninsula of the island and will have an annual capacity of 100,000 tons. The price of cement produced here is expected to compare favorably with that in India.

China.—During the 8 years of war with Japan, China was blockaded from the outside world, and as all cement plants were located in the coastal Provinces, they were under Japanese control. Inland the Chinese constructed eight new plants, but only two had rotary kilns. At the cessation of hostilities, seven of the plants under Japanese control, with a combined annual output of 4,470,000 barrels, were again available to the Chinese. However, internal troubles in China are delaying production further. A new plant is under construction at Hankow and is expected to get into production in 1947. The plant when completed will be a wet-process operation with a daily capacity of 6,000 barrels. Some of the plants in Manchuria, built by the Japanese, are expected to be made available to China, but the condi-

tion and quantity of machinery available at these plants are not known.

India.—It is believed that the potential capacity of the cement industry in India at the end of 1946 was 3,000,000 tons. Under the proposed expansion program of the present plants and the construction of new plants in Southern Bengal, Wardha, Sirmur, Gangpur, Bhapal, and Tehri Garhival, annual capacity is expected to increase at the rate of 1,150,000 tons per year for the next 5 years.

Japan.—Cement is one of the few commodities in which Japan is self-sufficient. Thirty-five plants were in operation in 1946. Portland cement is the major product although four other types are manufactured. These are high-early-strength portland, silica, blast-furnace slag and nonconstructive cements. Production in 1946 was hampered not only by the shortage of coal but further by the inability of the cement companies to obtain deliveries of coal with the necessary B. t. u. to produce good portland-cement clinker. Labor troubles in coal mines was an additional factor which restricted cement production in Japan. Silica cement, as manufactured in Japan, consists of about 70 percent portland-clinker and 30 percent volcanic ash or silicious clay, and blast-furnace slag consists of equal portions of portland-clinker and silicious slag. The advantages reported for silica cement are low-heat while setting and a very dense product after setting.

Korea.—There are seven cement plants in Korea, four of which have three rotary kilns each, and three have one kiln each. Five of the seven plants are in North Korea (north of the 38th parallel), and one of the two plants below that line obtains its raw materials in the northern part. Production of cement reported for 1946 represents the output of the plant at Sanchoku, formerly owned and operated by the Onado Cement Co. of Japan. This plant has one rotary kiln and a rated annual capacity of 150,000 metric tons. Total annual capacity of the cement industry in Korea before the recent war was 1,700,000 metric tons. This had declined to 1,200,000 tons at the cessation of hostilities in August 1945.

Chromium

By EDWIN K. JENCKES

GENERAL SUMMARY

THE outstanding feature of the domestic chromite industry in 1946 was the deficiency in supply of metallurgical-grade ore, the consumption of which totaled 125 percent of imports. The decline in availability of metallurgical-grade ore occurred in spite of the apparently satisfactory over-all statistical position of chromite, which indicated a small addition to total stocks of ore in the United States. This anomalous situation has arisen because imports of chemical- and refractory-grade chromite have exceeded current consumption.

Salient statistics of chromite in the United States, 1945–46

	1945		1946	
	Short tons	Value	Short tons	Value
New supply:				
Domestic production (shipments)	13,973	$532,382	4,107	$105,041
Imports for consumption	914,765	17,530,293	757,391	11,459,121
Total	928,738	18,062,675	761,498	11,564,162
Distribution:				
Consumption by industry	808,120	(1)	734,759	(1)
Exports	12,366	342,114	2,158	80,958
Additions to stocks [2]	108,252	(1)	24,581	(1)
Total	928,738	18,062,675	761,498	11,564,162

[1] Data not available.
[2] Calculated to strike a balance.

A survey of the relation of production to total supply for 5-year periods from 1891 to 1943 is given in Minerals Yearbook, 1943 (p. 632). The details, in tonnages, for 1942–46 are shown in the accompanying table.

Total supply, imports for consumption, domestic production, and consumption of chromite, 1942–46, in short tons

	1942	1943	1944	1945	1946
Total supply	1,094,483	1,088,696	894,019	928,738	761,498
Imports for consumption	981,607	928,576	848,390	914,765	757,391
Domestic production	112,876	160,120	45,629	13,973	4,107
Consumption by industry	891,952	964,600	848,449	808,120	734,759

In 1946, the first full postwar year, the decline in domestic production continued for the third successive year. A similar, although quantitatively less abrupt, decrease occurred at the close of World War I. There was nothing in 1946 to indicate an arrest of the downward trend in domestic production, which may be expected to descend to a level below 1,000 tons a year unless technological advances in methods of beneficiation and utilization make the domestic product competitive with imported ores.

The total new supply of all grades of chromite available to industry in 1946 was 18 percent less than in 1945; the supply from domestic mines decreased 71 percent, and imports dropped 17 percent. Exports of chrome ore declined 83 percent.

The accompanying table shows the growth and decline in the production of domestic chromite during the two World War periods.

Chromite shipped from mines in the United States, 1913–21 and 1938–46

Year	Short tons	Year	Short tons
1913	286	1938	999
1914	662	1939	4,048
1915	3,675	1940	2,982
1916	52,680	1941	14,259
1917	48,973	1942	112,876
1918	92,322	1943	160,120
1919	5,688	1944	45,629
1920	2,802	1945	13,973
1921	316	1946	4,107

GOVERNMENT REGULATIONS

Civilian Production Administration and Office of Temporary Controls.—Order M–21 authorizing CPA to exercise controls over alloy steel and ferro-alloying materials (see Minerals Yearbook 1945, p. 608) continued in effect during 1946, but no active controls were instituted.

During 1946, CPA and its successor OTC certified that there was a deficiency of metallurgical chromite for industrial uses and allocated ore from the holdings of the Office of Metals Reserve under the authority of Priorities Regulation 34 and its amendments (of December 17 and 27).

Office of Price Administration.—Amendment 26 to Supplementary Order 129, issued and effective June 12, 1946, suspended price controls under Maximum Price Regulation 258 covering chrome ores, and under MPR 407 governing ferrochrome, chromium metal, and chromium alloys. All materials except sugar and rice were exempted from price control by Supplementary Order 193, issued November 12, 1946, and effective retroactively November 10.

DOMESTIC PRODUCTION

The output of domestic chromite, measured by shipments from mines, in 1946 declined to the lowest point since 1940. Production of chromite in the United States since 1880 has totaled 619,149 tons.

In 1946, as in 1945, only California and Oregon shipped chromite. Two producers mined ore in California, and one in Oregon. The average Cr_2O_3 content of the ore shipped was 44 percent as compared to 46 percent in 1945 and 44 percent in 1944.

Chromite production (shipments) in the United States, 1942–46 by States, in short tons, and number of producers in 1946

State	1942	1943	1944	1945	1946			
					Number of producers	Cr_2O_3, percent		Total
						45 or over	35 to 45	
Alaska		5,569	1,845					
California	44,873	62,495	34,715	9,607	2	[1] 1,335	[1] 2,772	[1] 4,107
Idaho	25

Oregon	2,683	16,363	7,818	4,366	1	(1)	(1)	(1)
Texas		2						
Washington	57							
	112,876	160,120	45,629	13,973	3	1,335	2,772	4,107

[1] California and Oregon production combined. Bureau of Mines not at liberty to publish separate State totals for 1946.

California.—Two counties, Del Norte and San Luis Obispo, furnished all the chromite shipped from California in 1946. Approximately three-fourths of the tonnage came from the French Hill mine in Del Norte County, operated by the Tyson Chrome Mines, Ltd. The San Luis Obispo production was from the Trinidad mine, north of San Luis Obispo, operated by Henry C. Dalessi.

Oregon.—The chromite shipped from Oregon was all from the Oregon Chrome mine, Josephine County, operated by William S. Robertson. Shipments averaged 44½ percent Cr_2O_3 and 11 percent FeO.

EXPLORATION AND DEVELOPMENT

In 1946 the Bureau of Mines published four Reports of Investigations [1]—one on the examination of a chromite deposit, two on the beneficiation of chromite, and one summarizing work on the production of pure chromium metal.

Three articles relating to chrome descriptive of work done during the war years by members of the Geological Survey were published in 1946.[2]

CONSUMPTION AND USES

In 1946 the total consumption of chromite was 734,759 short tons, a decrease of 73,361 tons (9 percent) from the 1945 figure, and marked the third successive year of decline from the all-time high of 1943. As compared to 1945, the consumption of metallurgical ore dropped 12 percent and that of refractory ore 10 percent, while the use of chemical ore increased 2½ percent. The accompanying table presents the total consumption of chromite and the tenor of ore consumed by primary consumer groups for 1940–46.

Consumption of chromite and tenor of ore used by primary consumer groups in the United States, 1940–46, in short tons

Year	Consumption		Tenor of ore (percent Cr_2O_3)		
	Gross weight (short tons)	Average tenor (percent Cr_2O_3)	Metallurgical	Refractory	Chemical
1940	562,915	45.0	50.5	35.8	47.2
1941	800,290	44.3	50.1	34.8	46.3
1942	891,952	43.2	48.5	34.0	44.8
1943	964,600	43.8	48.5	34.0	44.7
1944	848,449	44.1	49.4	34.2	45.7
1945	808,120	43.8	49.1	34.2	45.0
1946	734,759	43.2	48.3	33.9	44.9

The outstanding feature of the industry in 1946 was the shortage of metallurgical-grade chromite. The relation of consumption of chromite to imports in 1946, by grades, in percent, was as follows:

Grade of ore:	*Consumption percent of imports*
Metallurgical	125
Refractory	76
Chemical	87
Total chromite	97

Inasmuch as domestic production accounted for only 0.5 percent of the new supply in 1946, the importance of imports of chromite ore in meeting demand is evident. The deficiency in imports of metallurgical grade was made up partly by sales of ore by the Office of Metals Reserve (as authorized by CPA and OTC) and partly by the substitution of high-grade chemical ore for metallurgical uses.

The consumption of metallurgical-grade chromite in 1946 declined 12 percent from that in 1945, whereas the production of alloy steel dropped 30 percent. The relatively smaller decrease in the consumption of metallurgical chromite is explained by the fact that the production of stainless steel (the main consumer of ferrochrome) in 1946 virtually equaled that in the previous year.

The metallurgical uses for chromium comprise stainless steels, corrosion- and heat-resisting alloys, high-temperature—high-strength alloys, high-speed steel, tool steels, engineering steels, alloy cast iron, and light-metal alloys. Chromium is added to light-metal alloys to prevent intergranular corrosion; this use is a recent development.

The chemical uses for chromium are given in Minerals Yearbook, 1944 (p. 610).

The use of chrome refractories in lining metallurgical furnaces, particularly the basic open hearth, has long been common practice. A new use for chrome and chrome-magnesite brick in the acid open hearth has been described.[3]

OFFICE OF METALS RESERVE STOCKS

On December 31, 1946, the Office of Metals Reserve had in its possession in the United States, subject to allocation, 635,685 short tons of chromite of all grades, held in central stock piles, at purchase depots, and by agents. The accompanying table shows gross weight and average analyses of the ore by points of origin and by use and grade classification.

Stocks of chromite held by Office of Metals Reserve in the United States in central stock piles, at purchase depots, and in hands of agents, by grades, points of origin, and average analysis, on December 31, 1946

	635,685			

[1] Calculated from Cr_2O_3 content and Cr:Fe ratio.

The over-all decrease in OMR stocks available for allocation in 1946 was 368,984 short tons. Stocks on hand on January 1, 1946 were 1,004,669 tons. Stocks of imported ores dropped 165,929 tons and of domestic ore 203,055 tons. The decreases in the various grades of chromite were as follows; Metallurgical grade, 183,993 tons; chemical grade, 81,191 tons; refractory grade, 43,817 tons; and unclassified domestic ore, 59,983 tons.

Ore is distributed from OMR stocks either through allocations to industry by CPA; or by certification that it is surplus, in which case it is transferred to the national stockpile under the provisions of the Surplus Property Act of 1944 (Public Law 457, approved October 3,

1944) and of the Strategic and Critical Materials Stock Piling Act (Public Law 520, approved July 23, 1946.)

PRICES

OPA price regulations (Minerals Yearbook, 1942, p. 633) governing chromite, chromium alloys, and chromium metal were suspended June 12, and the orders in which they were included were terminated November 10, 1946.

The accompanying table gives the prices quoted during 1946 by the E&MJ Metal and Mineral Markets.

Price quotations for various grades of chromite in 1946, per long ton

[E&MJ Metal and Mineral Markets]

	Cr_2O_3 percent	Cr:Fe ratio	Prices		
			Jan. 1–Oct. 3	Oct. 10–Dec. 10	Dec. 17–Dec. 31

Refractory ore			36.50	36.50	36.50

[1] Less $7.00 per ton freight allowance.

Low-carbon ferrochromium was quoted (Metal and Mineral Markets) at 19½ to 54 cents a pound (of Cr contained), dependent on grade and size, during 1946. High-carbon ferrochromium was priced at 13 to 14½ cents from January 1 to June 20, at 14½ to 16½ cents between June 27 and December 12, and at 15.6 to 17.6 cents during the remainder of the year. The price of metallic chromium (generally sold as "chrome metal") was 89 cents a pound for spot transactions and 84 cents on contract.

FOREIGN TRADE[4]

Imports of chromite in 1946 were 757,391 short tons, a decline of 17 percent from 1945. The major countries showing declines were Cuba, New Caledonia, Southern Rhodesia, Turkey, and U. S. S. R. Countries showing substantial increases were India, Philippine Islands, Sierra Leone, and Union of South Africa. Imports of chromium products comprised 1,460 tons of ferrochromium and 1 ton of chromates and dichromates—all from Canada. Exports included 2,510 tons of ferrochrome (valued at $732,221); 2,158 tons of ore ($80,958); and 22 tons of chromium metal, chromium alloys, and chrome-bearing scrap ($31,063).

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

WORLD REVIEW

Of the major chromite-producing countries, the accompanying table presents figures from 1939 through 1946 for Cuba, New Caledonia, Southern Rhodesia, Turkey, and Union of South Africa. The record for the Philippines is complete except for 1945 and that of India except for 1946.

Brazil [5]—A new chromite deposit has been found in Piracanjuba, Goias, the tonnage of which has been estimated at 20,000 tons. The Cr_2O_3 content is reported to be 35–42 percent.

Reserves of the Campo Formosa district have been estimated at 4 million tons of 35-percent ore; those of the Santa Luzia district at 100,000 tons of 36–42-percent ore; and those of the Boa Vista district at 20,000 tons of 30- to 35-percent ore.

Japan.[6]—The current productive capacity of Japan, estimated at 52,000 metric tons a year, exceeds any immediately predictable domes-

[7] Planned production.
[8] Exports.

tic demand. With an assumed steel production of 3 million tons a year, requirements for chromite for all uses are estimated at 40,000 metric tons. In 1944, the year of peak production, the output of chromite in Japan was 71,000 tons. Reserves are estimated to be 452,000 tons of "proved, probable, and possible" ore and 275,000 tons of "speculative" ore. Production has been from four groups of mines—the Tottori-Okayama area, Honshu; the Hidaka-Iburi area, Southern Hokkaido; the placer deposits in Northern Hokkaido; and scattered small deposits. Imports were from New Caledonia (1933–40) and the Philippine Islands (1935–45).

Japanese production of ferrochrome 1925–45 totaled 167,570 metric tons. The peak production was in 1943, when the output was 31,932 tons. High-carbon ferrochrome was produced in the electric furnace, using limestone as a flux and coke as a reducing agent. The low-carbon alloy was made in three steps—the production of high-carbon ferrochrome; the conversion of the high-carbon alloy into a high silicon ferrochrome by smelting in a second furnace with silica and coke; and

finally the production of the low-carbon alloy by smelting the high-silicon alloy with ore in a third electric furnace, which is chromite-lined and has low-carbon ferro-chrome electrodes.

Southern Rhodesia.[7]—The total exports of chromite from Southern Rhodesia and exports of Rhodesian chromite to the United States 1939–46 have been:

Year	Total exports from Southern Rhodesia (metric tons)	Rhodesian exports of chromite to the United States (metric tons)	Percent exports to United States
1939	107,707	52,848	49
1940	279,818	212,247	76
1941	313,308	218,667	70
1942	348,051	310,302	89
1943	266,273	195,388	73
1944	271,624	173,009	64
1945	207,722	137,952	66
1946	151,956	86,694	57
Total	1,946,459	1,387,107	71

Imports of Rhodesian chromite into the United States for the same period (1,389,519 metric tons) agree with the reported Rhodesian export figure to 0.8 percent.

The current output from Southern Rhodesia originated as follows: 58 percent from the Gwelo district, 33 percent from the Salisbury district, and 9 percent from the Victoria district. In the last two areas the chromite is found along the Great Dyke of norite. In the summer of 1946 stocks of ore at the mines totaled over 320,000 tons. The unsatisfactory condition of the railroad from the mines to the port of Beira, described in previous chapters of this series, showed no improvement in 1946.

Diamond drilling of a new deposit at Selukwe Peak has revealed an ore body estimated to contain 700,000 tons of metallurgical-grade ore. Preparations are being made to begin mining operations at this deposit.

Sweden.[8]—Mining of chromite was resumed in Sweden in 1942, when 80 tons were produced. The output in 1943 was 224 tons, and in 1944 it declined to 127 tons. A previous production of 31 tons in 1910 is reported in Mineral Resources of the United States, 1913, part 1, p. 30.

United Kingdom.[9]—British imports of chromite and ferrochromium 1945–46 (in tons) were:

	1945	*1946*
Chrome ore:		
Union of South Africa	8,537	5,325
Southern Rhodesia	37,584	51,408
India	4,161	758
Other	105	9,443
	50,387	66,934
Ferrochrome	3,199	3,809

Clays

By G. W. JOSEPHSON AND A. LINN[1]

GENERAL SUMMARY

THE FULL effect of postwar demand was apparent in the clay industry in 1946. Output in all classes was greater than in 1945, and several new records were established. Over all, 62 percent more clay was produced in 1946 than in 1945.

Stimulated by a demand that was backed by both legislative encouragement and large private funds, building construction reached boom proportions. Consequently, the production of common clays for use in heavy-clay products and cement—two of the largest clay-consuming industries—nearly doubled.

High activity in the ceramic, paper, and rubber industries enabled new records to be set for the output of kaolin and of ball clay.

As usual, a new record was also established for bentonite, principally owing to increased sales to oil-well drillers.

The production of refractories and heavy-clay products required more fire clay in 1946 than in 1945. Refractories output was at a very high level, although not as high as the wartime record.

Fuller's earth registered a small increase, owing to a gain in sales for oil filtering and decolorizing, which offset a loss in absorbent uses.

Salient statistics of the clay industry in the United States, 1945–46

	1945		1946	
	Short tons	Value	Short tons	Value
Domestic clay sold or used by producers:				
Kaolin or china clay	939,988	$9,072,927	1,322,303	$13,553,767

Fire clay	94,602	630,751	97,941	657,905
Other clay (including fuller's earth)	77,436	1,494,479	100,598	2,283,326
	184,440	2,256,207	214,417	3,139,910

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

In harmony with most other commodities, the prices of clay and clay products trended upward during 1946.

Foreign trade in clay increased considerably in 1946, but the tonnage was relatively modest when compared with movements recorded in prewar years. A measure of the decline in the dependence of the United States on high-grade foreign clays is seen in the following total import figures: 1925–29 average—420,310 tons; 1930–34 average—181,615 tons; 1935–39 average—168,518 tons; 1946—116,359 tons. On the other hand, our exports have developed as follows: 1925–29 average—109,344 tons; 1930–34 average—108,687 tons; 1935–39 average—149,071 tons; 1946—214,417 tons.

CONSUMPTION AND USES

The clay-consumption statistics in the accompanying table were compiled from producers' reports. These figures are comparable with similar statistics published in Minerals Yearbooks covering 1945 and 1944, and those of kaolin, ball clay, bentonite, and fuller's earth are comparable for previous years as well. Some of the fire-clay and miscellaneous clay figures are not comparable with those published prior to 1944, owing to exclusion of captive tonnage in the earlier years. The relationship is outlined in greater detail in the Clays chapter of Minerals Yearbook, 1944.

The principal consuming industries in 1946 were as follows: Heavy-clay products (57 percent of the total), refractories (17 percent), cement (16), paper (2), rotary drilling mud (1), pottery (1), and filtering and decolorizing (1).

Clay sold or used by producers in the United States in 1946, by kinds and uses, in short tons

Use	Kaolin	Ball clay	Fire clay and stoneware clay	Bentonite	Fuller's earth	Miscellaneous clay including slip clay	Total

[1] Comprises following: Mineral oils, 202,722 tons; vegetable oils, 24,366 tons.

CHINA CLAY OR KAOLIN

In 1946, output of kaolin attained a new record—22 percent above the previous high established in 1941. As is shown on the accompanying chart, kaolin production was well-maintained during the war, and the high level of postwar industrial activity has increased demand to a record level.

Kaolin has a substantial market in the pottery industry, but even greater tonnages are consumed in the paper, rubber, and refractories industries. In 1946, 53 percent of the total was used as paper filler and coating, 12 percent in rubber, 10 percent in refractories, and 8 percent in pottery.

The postwar demand for high-quality paper has been extremely great; consequently, paper kaolin sales increased 27 percent over the tonnage sold in 1945.

During the war, the use of kaolin in rubber declined because synthetic rubber compounding requires less kaolin than does natural and production of mechanical goods was restricted. When the war was

over, the demand for rubber clay boomed as output of mechanical goods increased, more natural rubber became available, and greater emphasis was placed on color and sales appeal of rubber products. Consequently, sales of rubber clay in 1946 were 48 percent greater than in 1945.

The tonnage of kaolin reported as used in the production of refractories increased to 132,708 tons in 1946 but was below the record of 159,886 tons set in 1942.

Consumption of kaolin in the pottery industry was 51 percent greater than in 1945.

Kaolin prices were increased somewhat during the year. Trade-journal prices ranged from as low as $2.50 per ton for sagger clay, through $6–$30 for most processed types. A few specialties sell as high as $40. The national average value, as reported by producers to the Bureau of Mines, increased from $9.65 in 1945 to $10.25 in 1946. At the end of the year the ex dock price of imported china clay was $20–$22 lump bulk, carload; and $45 for powdered, casks, l. c. l., ex warehouse.

Imports of kaolin increased from 57,497 tons in 1945 to 89,233 tons in 1946 but were still considerably below the prewar average. A total of about 31 tons came from Canada, Brazil, Argentina, and Czechoslovakia and 89,202 tons from England. Continuation of the fuel and labor shortage in Great Britain has handicapped the efforts of producers in England to recapture their prewar markets in the United States. English china clay still is in demand in the United States, but the beneficiation of American kaolin has progressed so far that foreign clays find it difficult to compete in many uses. China clay is produced in England with relatively simple equipment and methods that have been in use for a long time. During the past year a committee from England studied American practice to determine the feasibility of improving their production methods.

Kaolin sold or used by producers in the United States, 1945–46, by States

State	Sold by producer		Used by producer		Total	
	Short tons	Value	Short tons	Value	Short tons	Value

Exports of kaolin are reported by the United States Department of Commerce to have totaled 15,878 short tons valued at $198,679 in 1946, a slight increase over the 12,402 tons valued at $130,977 reported for 1945.

BALL CLAY

Reflecting increased activity in the American pottery industry, the record output of ball clay established in 1941 was exceeded by 23 percent in 1946.

As in former years, most of the output in 1946 came from the Tennessee-Kentucky area. These two States furnished 95 percent of the total tonnage. Tennessee contributed 54 percent of the total, Kentucky 41, and Maryland and New Jersey together the remaining 5 percent.

Prices of domestic ball clay quoted in trade journals ranged from $3 to over $18 per ton according to grade. The average value reported by producers to the Bureau of Mines increased from $9.11 per ton in 1945 to $9.85 in 1946.

As shown in the use table, small quantities of ball clay are consumed in such products as refractories, cement, enamelware, linoleum, terra cotta, and tile, but the bulk (89 percent of the total in 1946) is used in pottery and stoneware.

Imports of "common blue and ball clay" increased to 22,683 short tons valued at $270,472 in 1946. All except 231 tons, which entered from Canada, came from the United Kingdom. The imported clay had a foreign market value, exclusive of freight and other charges, of almost $12 per ton in 1946, whereas in 1941 the value was approximately $9 per ton. Imports now provide only about 9 percent of the ball clay consumed in the United States.

FIRE CLAY

Owing to the high demand for refractories and building materials, output of fire clay in 1946 was 30 percent greater than in 1945 and was close to the record set in 1942.

As there is a large tonnage of low-grade fire clay that is used mainly in Ohio in the manufacture of heavy-clay products, the building boom accounts for much of the rise in fire-clay output in 1946. Consumption in this use almost doubled. There was also a noteworthy increase of 11 percent (almost 500,000 tons) in consumption in refractory uses. As shown in the table in the Consumption and Uses section of this chapter, 63 percent of the total tonnage was consumed in refractories, 33 percent in heavy-clay products, and the remainder in a variety of other uses.

Fire clay is widely distributed, but, as quality varies greatly and the large markets are in the Midwest and East, much of the output comes from a few States. In 1946, Ohio supplied 30 percent of the total, Pennsylvania 19, and Missouri 15. Other producing States are shown in the accompanying table.

The average value of fire clay sold on the open market in 1946 was $2.64 a short ton as compared with $2.52 in 1945. The average value of all fire clay, including both captive and open market output, was $2.63, somewhat higher than the $2.56 reported in 1945.

Exports of fire clay totaled 97,941 short tons, only slightly higher than in 1945. Of this, 75 percent was shipped to Canada, 9 percent to Mexico, and the remainder in comparatively small lots to 47 other countries. No imports of fire clay were reported in 1946.

BENTONITE

In 1946, for the eighth consecutive year, a new bentonite-production record was set. Output exceeded the 1945 total by 5 percent. The principal uses of bentonite are as a bond for foundry sand (27 percent of the total in 1946), for filtering and decolorizing oils (24 percent), and in rotary-drilling mud for suspension of drill cuttings and control of gas pressure (38 percent). The remainder went into a wide variety of applications as indicated in the use table. In 1946 the quantity of bentonite used in foundries and in filtering and decolorizing was within a few thousand of the 1945 tonnage. On the other hand, sales for drilling mud increased by 68,834 tons (42 percent).

As in 1945, the Wyoming-South Dakota area furnished 66 percent of the total; 35 percent was produced in Wyoming, 31 percent in South Dakota. Texas furnished 4 percent. The bulk of the remainder came from Mississippi and Arizona and minor tonnages from Montana, California, Utah, Colorado, Nevada, and Oklahoma.

Bentonite sold or used by producers in the United States, 1944–46, by States

State	1944		1945		1946

[1] Included with "Undistributed."
[2] Includes Arizona, Mississippi, and Utah; in addition, Colorado and Montana in 1945–46 and California, Nevada, and Oklahoma in 1946.

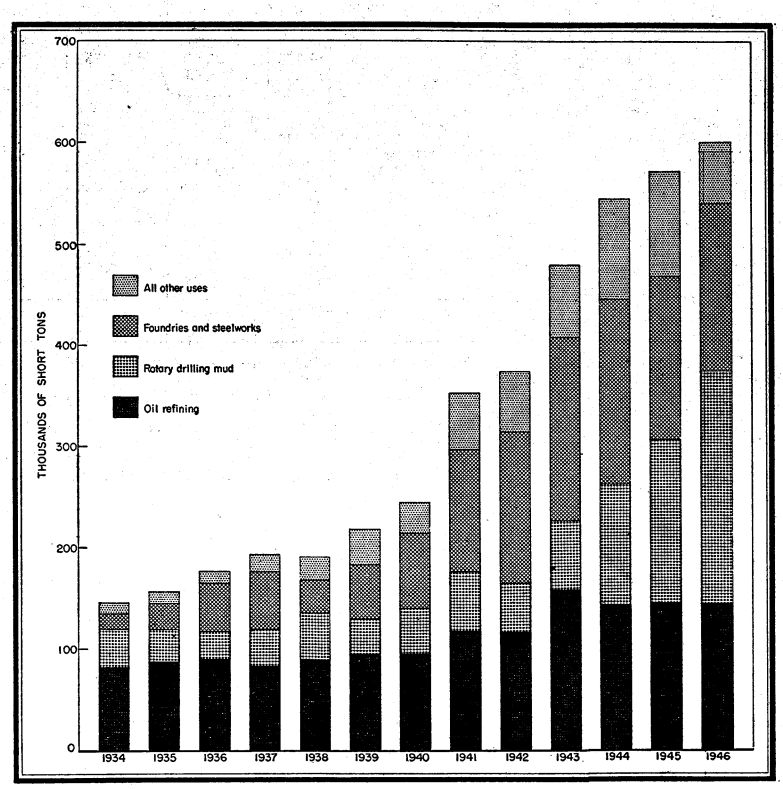

FIGURE 2.—Bentonite sold or used by domestic producers for specified uses, 1934–46.

Bentonite prices quoted in trade journals in 1946, as in the previous year, were: Dried and crushed, in bulk, $7.50; pulverized, 200-mesh, bagged, $9.50 to $11; pulverized, 325-mesh, bagged, $16. However, prices probably advanced somewhat, as the average value reported by producers to the Bureau of Mines increased from $6.57 per ton in 1945 to $7.25 in 1946.

No imports of bentonite were reported by the United States Department of Commerce in 1946. Exports of bentonite are not recorded separately; but producers reported to the Bureau of Mines that they exported about 25,000 tons, most of which went to Europe and countries in the Western Hemisphere. This figure does not include dealer exports or acid-treated bentonite shipped to foreign oil refineries.

FULLER'S EARTH

As shown in the accompanying chart, the output of fuller's earth has increased substantially in recent years. Since reaching a low in 1940, gains have been registered nearly every year, although the rate of increase has been very small during the past 2 years. As in 1945, output rose 1 percent in 1946.

The principal market for fuller's earth is in the oil industries. Producers reported sales of 202,722 tons (68 percent of the total) for filtering and decolorizing mineral oils and 24,366 tons (8 percent) for vegetable and animal oils. Consumption in the oil industry declined greatly during the nineteen thirties under the pressure of competition from acid-treated bentonite and other processed bleaching materials; but after 1940 demand increased, and during the past few years sales have been relatively stable at somewhat over half the tonnage shipped in 1930.

During the war, the outstanding market development in the industry was the successful application of fuller's earth as an absorbent on oily floors. The product was welcomed in machine shops and other industrial plants and sales increased rapidly to 57,700 tons in 1945. Producers reported that the market declined to about 49,000 tons in 1946.

In 1946 the Georgia-Florida district furnished 48 percent of the total tonnage and 57 percent of the value. Texas, with 37 percent of the total, reported more output than any other State.

The value of fuller's earth varies widely according to quality and preparation. In 1946, the average value reported by producers was $10.46 a short ton for Texas and $14.57 for Georgia-Florida. These compare with $9.04 and $14.43, respectively, in 1945. Prices quoted in trade journals during 1946 were as follows: Georgia and Florida, 30- to 60-mesh, $14.50 per short ton; 15- to 30-mesh, $14; 200-mesh up, $10; and 100-mesh up, $7.

Imports of fuller's earth are very small. In 1946, 194 short tons valued at $3,639 were imported into the United States. Exports of fuller's earth are not classified separately, but producers reported to the Bureau of Mines that they shipped 17,748 short tons valued at $223,185 to Western Hemisphere and European countries.

MISCELLANEOUS CLAYS

The various types of clay in the foregoing sections of this chapter are classified according to a practical pattern of composition and use that has grown up over a period of years. There remains a very large tonnage of clay and shale of uncertain or divergent specifications that is used in making heavy-clay products and portland cement. With these are grouped, in this "Miscellaneous" section, relatively minor quantities of slip clay, oil-well drilling mud, pottery clay, and small tonnages that find other special uses.

As a result of the boom in construction, the output of miscellaneous clays in 1946 nearly doubled the 1945 tonnage. Approximately 73 percent of the total was used in the manufacture of heavy-clay products and 24 percent in cement production.

Most of this material was captive tonnage mined by the companies near the processing plants and first entered the market as brick, cement, tile, etc. That portion of the miscellaneous clay sold as raw clay by the producer had an average value of $1.79 per ton in 1946 (some of the specialties sold for over $10). The value of the captive clay, most of which is produced in relatively well mechanized mines, is compiled from individual estimates that generally are $1 or less per ton.

As shown in the accompanying table, production of miscellaneous clays was reported from nearly every State. California, Illinois, Michigan, New York, Ohio, Pennsylvania, and Texas were the leading States, each producing more than a million tons in 1946.

[1] Includes the following: 1945—slip clay from Michigan and New York, 2,958 tons, $32,859; 1946—slip clay from Michigan, New York, and Pennsylvania, 3,384 tons, $36,184. Purchases of common clay and shale by cement companies: 1945—348,073 tons, $261,055 (estimated); 1946—438,335 tons, $328,751 (estimated).

[2] Includes the following: 1945—Common clay and shale used by producer in cement manufacture, 2,796,474 tons, $1,398,240 (estimated); 1946—4,334,575 tons, $2,167,288 (estimated).

[3] Included with "Undistributed."

[4] Figures include District of Columbia, Florida, Idaho, Maine, Minnesota, North Dakota, Puerto Rico, South Dakota, Vermont, Wyoming, and States indicated by footnote 3.

[5] Figures include Delaware, District of Columbia, Nevada, North Dakota, Puerto Rico, South Dakota, Vermont, and States indicated by footnote 3.

CLAY PRODUCTS

The long-heralded building boom became a reality in 1946, and for the first time in many years the clay-products industry was prosperous. As shown in the accompanying table, the output of many products nearly doubled. Prices advanced rapidly, and demand was so high that buyers often were willing to pay a premium over list to obtain delivery. As the unsatisfied need and available purchasing power appeared to be sufficient to maintain demand at a high level for several years, old plants were brought into production as rapidly as possible, and new capacity was added. Total output of structural clay products, according to reports of the Bureau of the Census, was valued at about $179,000,000.

During the past year, many people have become interested in entering the clay-products industry. Of interest to such people is a booklet, recently issued by the United States Department of Commerce, outlining technical practices and economic conditions in the industry.[2]

Quantity and value of shipments of the principal classes of structural clay products in the United States, 1944–46 [1]

	1944		1945		1946

[1] Compiled from information furnished by the Bureau of the Census, U. S. Department of Commerce.
[2] Figure not available.

During the war years, the production of refractories rose to record levels and then declined somewhat. However, during the past year the down trend was reversed as the metal, glass, and other industries that use high-temperature equipment operated near-capacity rates. The accompanying tables show statistics, compiled in part by the Bureau of Mines and in part by the Bureau of the Census, of refractories production for 1941–46.

Other clay refractories, including kiln furniture and laboratory refractories (except porcelain).	47	do	77,063	77,739	2,918
Nonclay refractories, total	89				68,786
Silica brick and shapes	28	1,000 9-in. equiv.	266,033	270,830	18,476
Magnesite and magnesite-chrome brick and shapes.	4	do	16,691	16,642	6,405
Chrome and chrome-magnesite brick and shapes.	4	do	30,537	30,384	9,688
Graphite and other carbon crucibles and retorts.	8	Short ton	12,837	12,781	5,288
Other graphite and carbon refractories	3	do	1,281	1,291	497
Kiln furniture (saggers, posts and slabs, etc)	7	do	4,738	4,841	1,601
Laboratory refractories (muffles, crucibles, tubes, trays, etc.).	4	do	197	198	286
Other nonclay brick and shapes (of such material as silicon carbide, fused alumina, sillimanite, mullite, kyanite, forsterite, and zirconia).	16				7,091
High-temperature bonding mortars	20	Short ton	26,018	26,052	1,431
Plastic refractories (including ramming mixtures).	15	do	89,088	88,930	4,358
Cast and castables (hydraulic setting)	8	do	4,888	4,855	91
Dead-burned dolomite [2]	17	do		1,187,334	10,614
Nonclay refractory materials, sold in lump or ground form except dead-burned magnesia or magnesite.	16	do	66,840	66,325	2,169
Other nonclay refractories	11	do	8,644	8,896	791

[1] Data revised. Data are excluded for dead-burned magnesia or magnesite to avoid duplication; a large part of such materials was shipped during 1945 to refractory-products manufacturing plants and was later incorporated in the refractory products covered in this report (such as magnesite brick and shapes). Data are also excluded for crude and prepared clays sold for refractory purposes.

[2] Represents dead-burned dolomite sold in 1945, as reported by the Bureau of Mines.

Production, shipments, and stocks of refractories in the United States, by kind, in 1946 [1]

[Bureau of the Census]

Plastic refractories (including ramming mixtures).	21	do	1,427	55,131	55,195	3,155	1,390
Cast and castables (hydraulic setting).	7	do	23	2,380	2,303	133	100
Dead-burned dolomite [4]	18	do			1,077,983	10,102	
Other nonclay refractories	24	do		142,797	143,517	4,412	

[1] Data are excluded for dead-burned magnesia or magnesite to avoid duplication; a large part of such materials was shipped during 1946 to refractory-products manufacturing plants and was later incorporated in the refractory products covered in this report (such as magnesite brick and shapes). Data are also excluded for crude and prepared clays sold for refractory purposes.

[2] Up to 7 percent of the totals shown for this product were estimated on the basis of 1945 reports for 2 plants that reported incomplete data for 1946.

[3] Represents principally special shapes such as radiants, backwalls, and other shapes which were not reported in terms of 9-inch equivalent.

[4] Represents dead-burned dolomite sold in 1946, as reported by the Bureau of Mines.

TECHNOLOGIC DEVELOPMENTS

Between the nineteen twenties and the end of the war the heavy-clay-products industry was depressed by low volume, excess capacity, and low prices. Under these conditions the funds necessary to maintain adequately production equipment and improve it were seldom available. Consequently, some of the equipment and methods became obsolete. However, many operators made an effort to revamp their plants in preparing for the expected construction boom, and when it became certain that the boom was materializing the movement became general. The adoption of more efficient and labor-saving equipment was stimulated by the shortage of labor and high wages in 1946. Prominent among the equipment used in modernizing plant operations are: Fork trucks, tunnel kilns, improved driers, and conveyor belts.

An account of the improvement in the methods of producing dinnerware was published in 1946.[3]

Lightweight aggregates, which have been made of bloated clay for many years, are attracting increasing attention. The demand for lightweight aggregates, especially for use in concrete block, has multiplied since the war. Clays vary widely in bloating characteristics; consequently, many promising market areas must be neglected for lack of suitable raw material. Obviously, the discovery of a suitable admixture and technique that would allow the use of any clay would be a fundamental advance in the technology of this industry. Research projects with this object in view are now in progress.

During the war considerable progress was made in developing processes that will extract alumina from clay; some of them were tried out in plants of commercial size. By 1946, however, these processes were not yet able to compete commercially with the older methods using bauxite; and, as the wartime desire for self-sufficiency was no longer a strong influence, the Government owned alumina-from-clay plants were closed.

SURVEY OF THE BITUMINOUS-COAL AND LIGNITE INDUSTRY IN 1946

THE production of soft coal in 1946—an estimated output of 532,000,000 net tons [2]—declined 8 percent from the 577,617,327 tons produced in 1945. This decline was not due to lower demand but to strikes. The soft-coal industry suffered two major strikes in 1946 and intermittent wildcat strikes throughout the entire year. The estimated loss of production during the two major strikes alone amounted to 107,000,000 tons. According to the Bureau of Labor

[1] Data for 1946 are preliminary; detailed statistics with final revisions will be released later. Data for 1945 are final.

[2] Throughout this chapter, "tons" refers to net tons of 2,000 pounds, unless otherwise indicated.

Statistics, there were 485 strikes in soft-coal mines in 1946, with 834,000 workers involved and 19,500,000 man-days lost (an average of 23 days per man). Although the war was over, the shortage of coal continued and Government controls were retained.

Production.—There was practically no seasonal decline in production in 1946, due to the shortage of coal. Throughout most of the year production was over 12,000,000 tons per week, except when output was reduced because of strikes or holidays.

Consumption.—All major classes of consumers except cement mills used less coal in 1946 than in 1945. The total consumption in 1946 was approximately 59,000,000 tons less than in 1945. Table 5 shows trends in consumption for the major classes of consumers.

Changes in Stocks.—The reserve supply of bituminous coal and lignite in the hands of industrial consumers and retail coal yards increased from 45,665,000 tons at the beginning of 1946 to 47,157,000 tons at the close. The days' supply of stocks increased from 27 to 32. Stocks on the upper Lake docks increased 530,587 tons from January 1 to December 31, 1946.

Distribution.—Shipments of bituminous coal and lignite during 1946 decreased in most distribution channels compared with 1945. Table 10 shows trends in distribution of bituminous coal and lignite for 1940–46. Changes in the monthly volume of the more important movements are shown in figure 9.

Mechanization.—The quantity of coal loaded mechanically at underground mines in the United States continued to advance during 1946. Mechanical loading increased from 56 percent of the total underground output in 1945 to an estimated 58 percent in 1946. Sales of underground loading equipment, in terms of capacity, were 20 percent greater in 1946 than in 1945.

Mechanical Cleaning.—The total capacity of mechanical-cleaning equipment sold for use at bituminous-coal mines in 1946 was estimated at 18,000 tons of cleaned coal per hour, an increase of 78 percent over the previous year.

Trend of Employment.—The average number of men employed at bituminous-coal and lignite mines in 1946 increased to 405,000 men from 383,100 in 1945.

Index to Capacity.—The potential output upon a 308-day basis (6-day week, full-time capacity) was 682,000,000 tons in 1945. Since it is not possible for all mines to operate 308 days per year, the more conservative figure of 280 days was suggested some years ago by the coal committee of the American Institute of Mining and Metallurgical Engineers (see Minerals Yearbook, 1935, pp. 631–632). The average output per day worked in 1945 was 2,213,093 tons, which (if applied to 280 days) gives an annual potential output of 620,000,000 tons compared with the actual total production of 577,617,327 tons. For purposes of historical comparison, a capacity of 261 days, based on the 5-day week, is also shown in figure 4 and table 14.

Trend of Fuel Efficiency.—For many years before 1942 there was a steady trend toward increased fuel efficiency. During the period 1942–46 the various components of this trend were arrested or reversed. All industries shown in table 6 exhibited decreased fuel efficiency in 1946 compared to 1945 except electric public-utility power plants, which reported no change.

793065—48——18

Competition with Oil and Gas.—Soon after the close of the war, increased competition between the fuels developed, with numerous reports of conversion from coal to fuel oil.

Electric power utilities consumed 4 percent less bituminous coal, 79 percent more fuel oil, and 6 percent less gas in 1946 than in 1945.

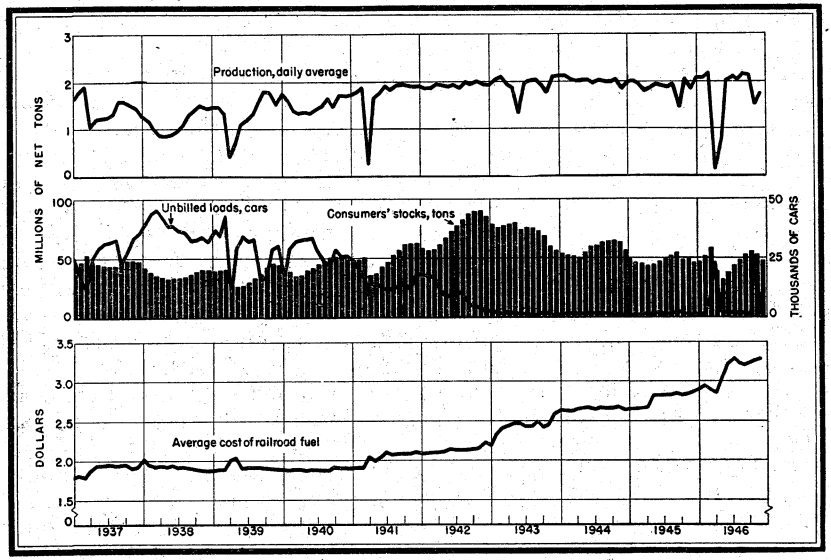

FIGURE 1.—Trends of production, stocks, and prices of bituminous coal and lignite in the United States, 1937-46.

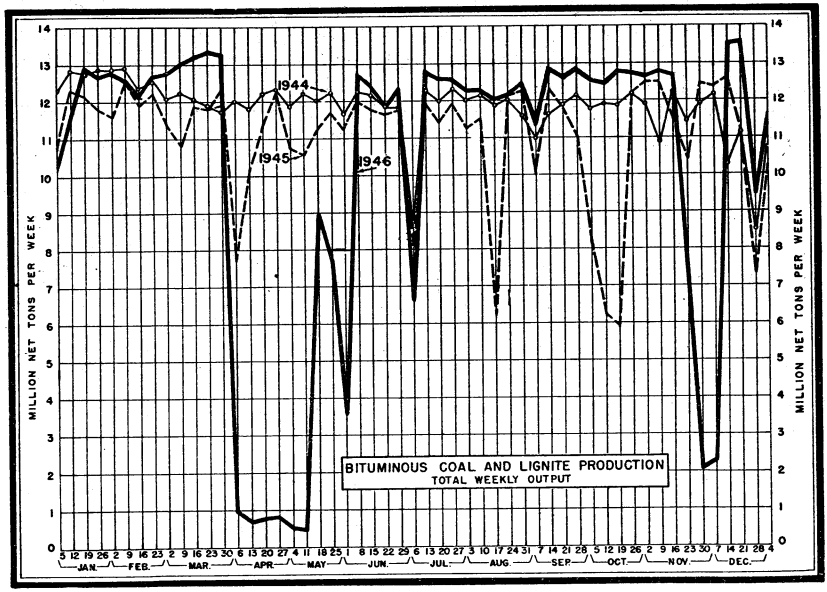

FIGURE 2.—Production of bituminous coal and lignite in the United States, by weeks, 1944-46.

Class I railroads decreased their consumption of coal 12 percent in 1946, and their purchases of fuel oil decreased from 1945 purchases by the same proportion.

The manufacture of domestic coal-burning equipment is reflected in statistics published by the Bureau of the Census. Factory sales of domestic stokers for burning bituminous coal increased from 89,522 in 1945 to 164,304 in 1946. Shipments of domestic oil burners, boiler-burner units, and furnace-burner units increased from 139,611 in 1945 to 499,009 in 1946.

SOURCES OF DATA

Bituminous-coal- and lignite-production statistics for 1946 are preliminary estimates based upon (1) weekly or monthly reports of railroad carloadings of coal and beehive coke by all the important carriers, (2) shipments by river as reported by the United States Army Engineers, (3) direct reports from a number of mining companies, and (4) monthly production statements compiled by a number of local operators' associations and State mine departments. In the estimates for 1946, allowance has been made for commercial truck shipments, local sales and colliery fuel, and small trucking or wagon mines producing over 1,000 tons a year.

Data for 1945 are final and are based upon detailed annual reports of production and mine operation furnished by the producers. As in previous years, all but a small percentage of the output was covered by the reports submitted. For the remaining output not directly reported—consisting chiefly of small mines—it has been possible to obtain reasonably accurate data from the records of the State mine departments, which have statutory authority to require such reports, or in a few instances from railroad carloadings.

Final employment figures obtained from the annual canvass of production, as shown in this report for 1945, differ slightly from the estimated total of employment based on the monthly canvass of accidents at mines accounting for approximately 75 percent of the total bituminous-coal output, as published in the chapter from Minerals Yearbook, 1945, entitled "Employment and Injuries in the Mineral Industries." According to the annual canvass, the average number of men employed amounted to 383,100, whereas the monthly canvass indicated that the total average number working was 363,000. The major cause of this slight discrepancy was that the figure determined by the annual canvass represented the average number of men on the rolls per pay period while the other represented the average of men working daily.

In accordance with the practice followed by the Bureau of Mines in previous years, the statistics in this report relate to mines having an output of 1,000 tons a year or more and do not attempt to include the many small mines producing less than 1,000 tons a year that sell their output by wagon or truck.

These data include, for convenience and historical comparison, the small output of anthracite and semi-anthracite produced outside Pennsylvania and the production of lignite.

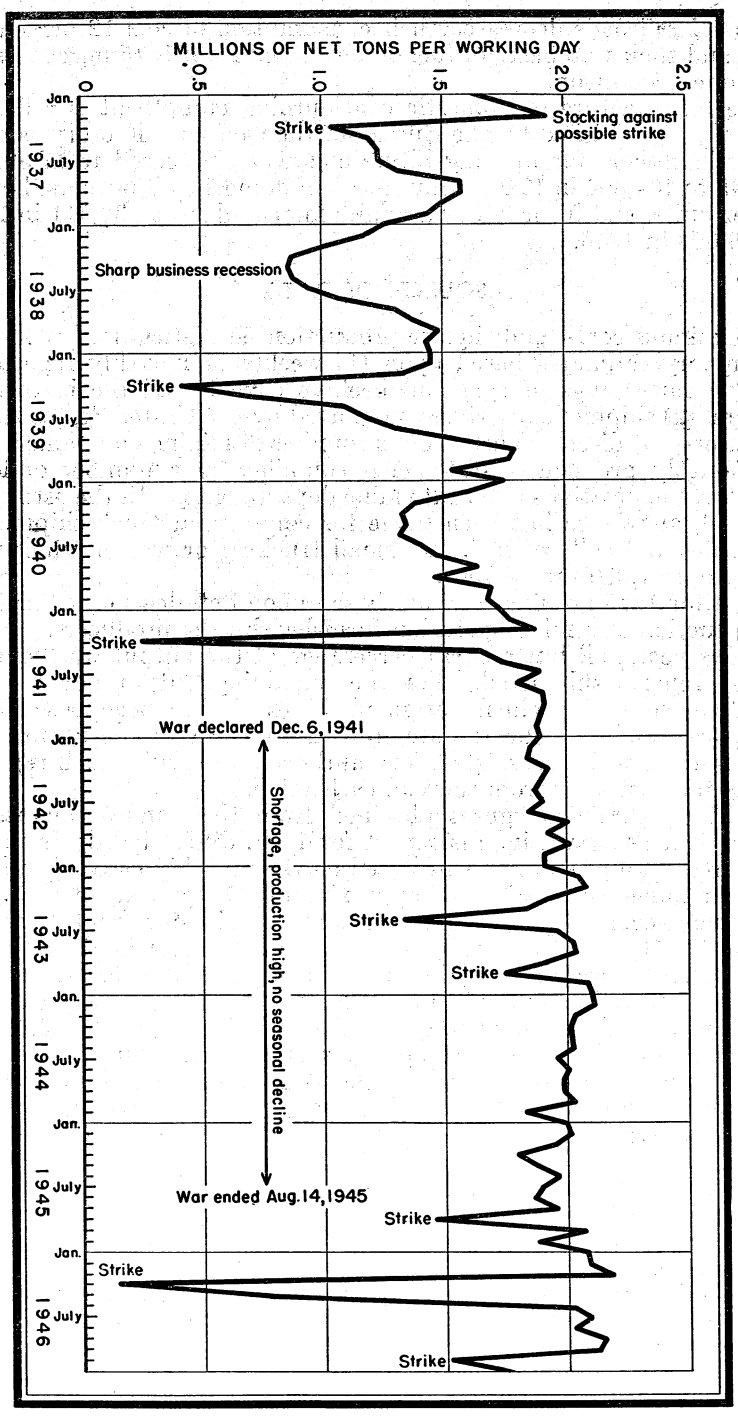

FIGURE 3.—Average production of bituminous coal and lignite in the United States per working day in each month, 1937–46.

SALIENT STATISTICS

TABLE 1.—Salient statistics of the bituminous-coal and lignite industry in the United States, 1945–46

[All tonnage figures represent net tons]

	1945	1946 (preliminary)	Change in 1946
			Percent
Production	577,617,327	532,000,000	−7.9
Consumption in the United States [1]	559,567,000	500,352,000	−10.6
Stocks at end of year:			
Industrial consumers and retail yards	45,665,000	47,157,000	+3.3
Stocks on upper Lake docks	5,049,242	5,579,829	+10.5
Unbilled loads, at mines or in classification yards [2]	37,050	46,200	+24.7
Price indicators (average per net ton):			*Cents*
Average cost of railroad fuel purchased, f. o. b. mines [3]	$2.78	$3.11	+33
Average cost of coking coal at merchant byproduct ovens [4]	$5.90	$6.48	+58
Average retail price—35 cities [5]	$10.49	$10.95	+46
Average railroad freight charge per net ton [6]	$2.20	$2.26	+6
Underground loading machinery sold: [7]			*Percent*
Mobile loading machines (number)	349	490	+40.4
Scrapers (number)	6	3	−50.0
Conveyors, including those with duckbills (units)	738	838	+13.6
"Mother" conveyors (units)	137	183	+33.6
Surface stripping	109,986,865	109,000,000	−.9
Mechanically loaded underground	262,512,729	246,000,000	−6.3
Mechanically cleaned	147,885,936	140,000,000	−5.3
Average number of men employed at mines operating [8]	383,100	405,000	+5.7
Fuel efficiency indicators:			
Pounds of coal per kw.-hr. at electric power plants [9]	1.30	1.30	
Pounds per 1,000 gross ton-miles—railroads [10]	116	116

[10] Interstate Commerce Commission; includes coalequivalent of fuel oil consumed.

PRODUCTION BY WEEKS AND MONTHS

The following tables summarize the preliminary statistics of weekly and monthly production of bituminous coal and lignite in 1946. The figures are estimates based upon daily and weekly statements of cars of coal and beehive coke loaded by the principal railroads and of shipments over the more important originating rivers. Allowance has been made for commercial truck shipments, local sales, and colliery fuel. The estimates given are based upon the latest information available and differ in some instances from the current figures previously published in the Weekly Coal Reports.

For the method used in counting holidays, see the chapter on Coal in Mineral Resources of the United States, 1930, page 631.

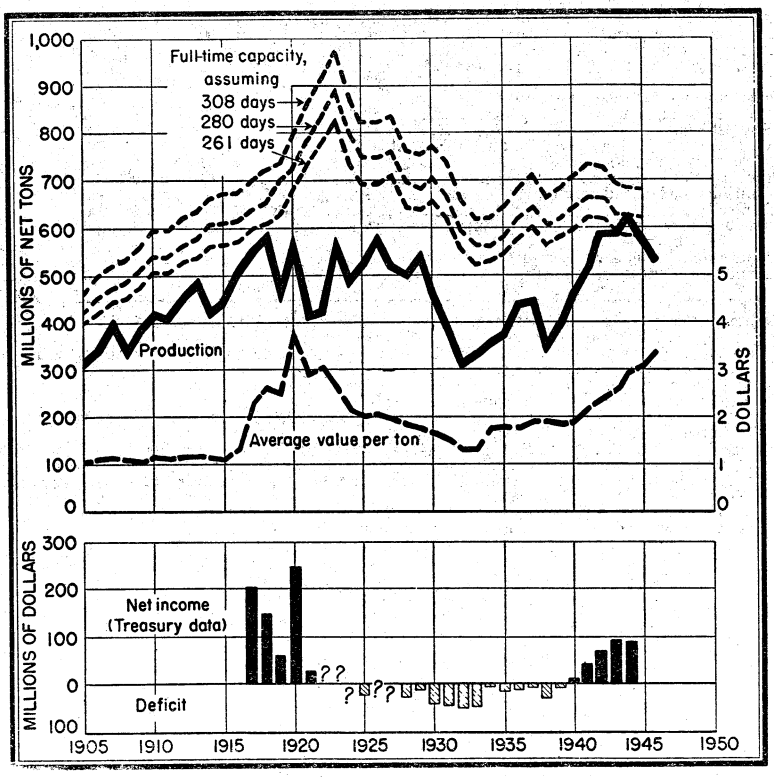

FIGURE 4.—Trends of bituminous-coal and lignite production, realization, mine capacity, and net income or deficit in the United States, 1905–1946.

[1] Figures represent output and number of working days in that part of week included in calendar year shown. Total production for week ended January 5, 1946, was 10,263,000 net tons; week ended January 4, 1947, 11,489,000 net tons.

[2] Average daily production for entire week and not for working days in calendar year shown.

TABLE 3.—Estimated monthly production of bituminous coal and lignite in the United States, by States, and number of working days and average production per day in 1946

[Production figures in thousands of net tons]

[Bituminous-coal and lignite figures are preliminary estimates based on railroad carloadings and river shipments of coal and beehive coke, supplemented by direct reports from a number of mining companies, local coal operators' associations, and detailed monthly production statistics compiled by the State Mine Departments of Colorado, Illinois, Pennsylvania, Washington, and West Virginia. In making the estimates, allowance is made for commercial truck shipments, local sales, and colliery fuel, and for small trucking mines producing over 1,000 tons a year. The estimates here given differ in a few cases from the monthly figures previously published in the Weekly Coal Reports]

[1] Federal Power Commission. Represents bituminous coal and lignite consumed by public-utility power plants in power generation, including a small quantity of coke amounting to approximately 100,000 tons annually.
[2] U. S. Bureau of Census.
[3] Association of American Railroads. Represents consumption of bituminous coal and lignite by class I railways for all uses, including locomotive, powerhouse, shop, and station fuel. The Interstate Commerce Commission reports that in 1945 consumption for all uses by class I line-haul railways, plus purchases for class II and class III railways, plus purchases by all switching and terminal companies combined, was 129,315,950 tons of bituminous coal and lignite. Similar data from the Interstate Commerce Commission are not yet available for 1946.
[4] Includes small amount of anthracite.
[5] Estimates based upon reports collected by the Solid Fuels Administration for War from a selected list of representative manufacturing plants and retail dealers. Truck shipments from mines included in "Retail dealer deliveries" in Minerals Yearbook, 1945, for the years 1939–45 have been restored to the classification "Other industrials" as in Minerals Yearbook, 1944, and preceding volumes.
[6] Included in "Other industrials."
[7] Subject to revision.

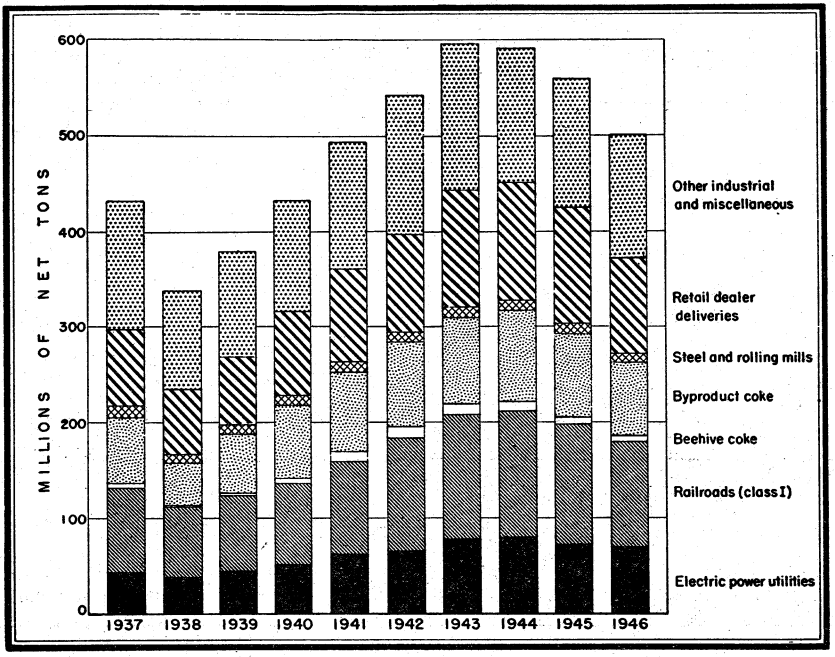

FIGURE 5.—Consumption of bituminous coal and lignite, by consumer class, with retail deliveries in the United States, 1937–46.

FUEL EFFICIENCY

TABLE 6.—Indicators of effect of fuel economy on consumption of coal in the United States per unit of performance since World War I

	Pounds	Reduction from base period (percent)
Steam railroads:		
Pounds per 1,000 gross ton-miles freight service:		
Average:		
1919–20	170	
1945	116	31.8
1946	116	31.8
Pounds per passenger-train car-mile:		
Average:		
1919–20	18.5	
1945	14.9	19.5
1946	15.2	17.8
Electric public-utility power plants:		
Pounds per kilowatt-hour:		
1919	3.2	
1945	1.3	59.4
1946	1.3	59.4
Iron and steel plants:		
Pounds coking coal per net ton of pig: [1]		
1918	3,194	
1945	2,656	16.8
1946	2,706	15.3
Coke manufacture: Savings of heat values through recovery of gas, tar, light oils, and breeze by extension of byproduct in place of beehive coking, 1913–14, expressed as percent of coal used for all coke in 1946 [2]		18.1

[1] Includes only savings through higher yields of merchantable coke per ton of coal charged and lower consumption of coke per ton of iron and ferro-alloys. Excludes economies through recovery of byproducts, which are covered in next item.

[2] These byproducts are used in part for boiler fuel, in part for metallurgical purposes, in part for domestic heating and cooking, and to a small extent for automotive fuel.

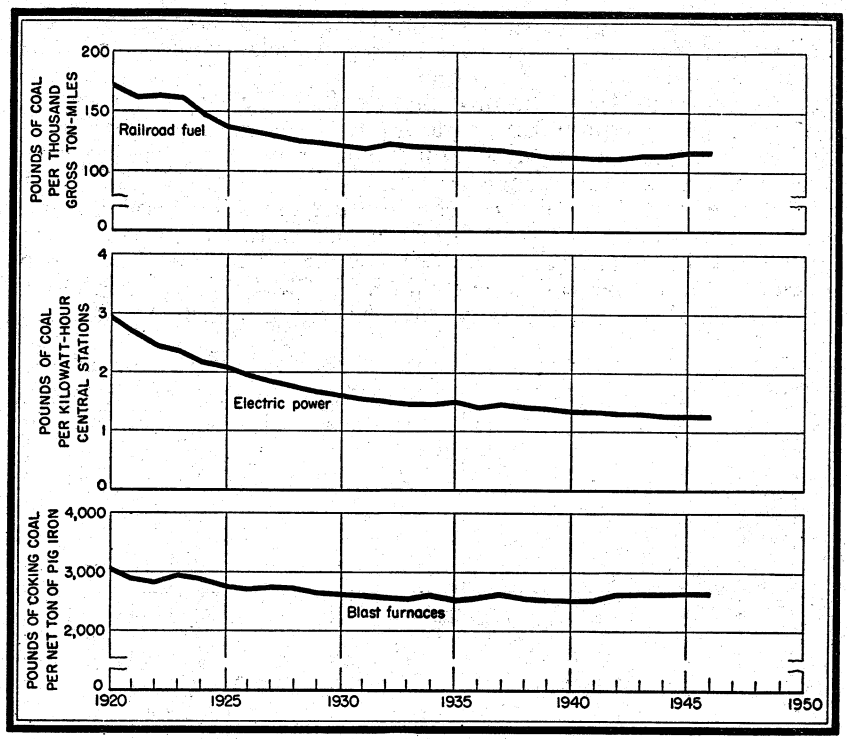

FIGURE 6.—Trends in fuel efficiency in the United States, 1920–46.

RELATIVE RATE OF GROWTH OF COAL, OIL, AND WATER POWER, 1889–1946

The total supply of available energy in the form of coal, oil, natural gas, and water power in 1946 was 35,977 trillion B.t.u.—an 0.4-percent increase over 1945 (see fig. 7).

The figures are expressed in British thermal units because some common denominator is necessary for such unlike quantities as tons of coal, barrels of oil, and cubic feet of gas. Table 7 summarizes the equivalent of each of the fuels in trillions of British thermal units. Water power is represented by the equivalent fuel required to perform the same work. The table covers the years since 1936. Details for 1889 and 1899 to 1935 are given in Minerals Yearbook, 1937, page 807, and Minerals Yearbook, 1938, page 703.

In converting water power to its fuel equivalent, two alternative assumptions have been made. The first, as in previous issues of these tables, assumes a *constant* fuel equivalent of 4.02 pounds of coal for each kilowatt-hour of water power produced throughout the entire period from 1889 to 1946. This factor was selected because it represents, in round numbers, the average efficiency of all central stations generating steam-electric power in 1913, the base period used. The usefulness of the *constant* factor lies in showing the rate at which water power is being developed. It permits direct comparison between the relative increase (in kilowatt-hours of water power) and the corresponding increase or decrease (in tons of coal, barrels of oil, or cubic

feet of gas produced). On the other hand, the *constant* factor makes no allowance for the fact that coal and other fuels produced today are used more efficiently than formerly.

To show the influence of improving fuel efficiency, a second computation of the energy equivalent of water power has therefore been made. This assumes a *prevailing* fuel equivalent, diminishing year by year, which represents the average performance of all fuel-burning central electric stations for the year in question. This average had declined from about 7.05 pounds of coal per kilowatt-hour in 1899 to 1.30 pounds in 1946. (The *prevailing* factor is thus much above the *constant* factor in 1899 and much below it in 1946). The *prevailing* fuel equivalent indicates more nearly the quantity of fuel that would have

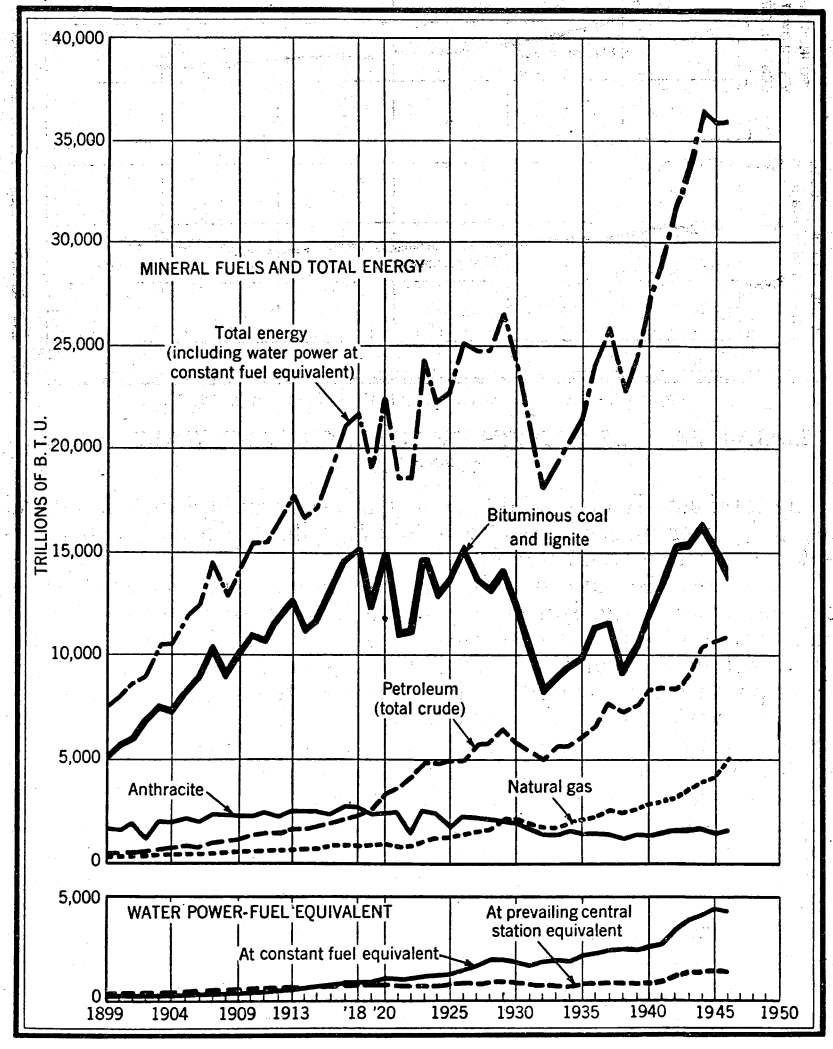

FIGURE 7.—Annual supply of energy from mineral fuels and water power in the United States, 1899–1946.

been needed in any one year to generate the same power in a steam-electric station. It should be noted, however, that the ultimate uses to which the water power generated is put often displace fuel burned much less efficiently than in central stations and that in any instance no other important branch of fuel consumption has made advances in fuel efficiency approaching that of the central stations.

As these tables attempt to determine the total energy from all fuels and from water power, the ideal factor for converting water power into fuel equivalent would be the average efficiency of all forms of fuel consumption in each year. No basis for determining such an all-embracing average exists at present, but enough is known to make certain that it would show much less reduction from 1899 to 1946 than do the central stations. For the present, a just comparison of the changing contributions of water power and of fuel to the national energy supply would lie somewhere between the results shown by the *constant* equivalent and the *prevailing* central-station equivalent in these tables.

As in earlier issues of these tables, the figures for oil and natural gas represent the entire production of crude petroleum and of gas. Most of this production does not come into direct competition with coal.

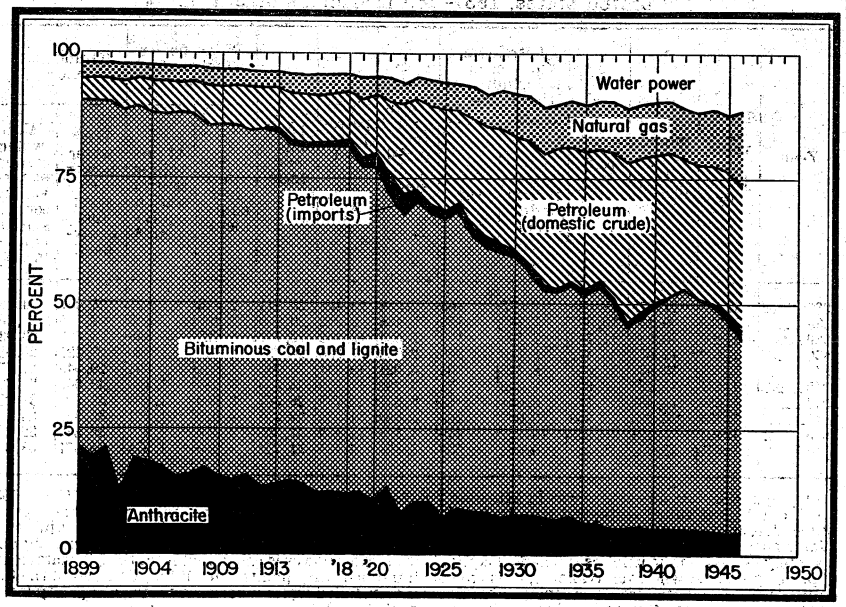

FIGURE 8.—Percentage of total B. t. u. equivalent contributed by the several sources of energy in the United States, counting water power at constant fuel equivalent, 1899–1946. If water power is counted at the prevailing fuel equivalent of central stations in each year, its proportion is 3.2 percent in 1899 and 4.2 percent in 1946, and the proportions of the other sources of energy are affected accordingly.

Much of the supply of both oil and gas is used in regions of the country, such as California and portions of the Southwest, where coal is available only at unusually high cost because of heavy transport charges. Nearly half of the natural gas is used in the field for drilling or operating oil and gas wells and pipe lines or for the manufacture of carbon black. More than half the oil is used in the form of gasoline, kerosine, and lubricants, for which purposes coal cannot well compete, except at very much higher levels of oil prices. Even these refined products, however, involve a certain measure of indirect competition with coal, for the energy market of the country is becoming more fluid and competitive, and a demand that cannot be met by one source of supply tends to fall back on the others.

The subject of interfuel competition is exceedingly complex, and an elaborate analysis and the accumulation of data not now available would be required to determine even approximately how much of any one fuel actually has been displaced either by other fuels or by water power. The present tables do not permit determination of such displacement; their purpose is rather to measure the long-time trends in the total demand for energy.

TABLE 7.—Annual supply of energy from mineral fuels and water power in the United States, 1937–46,[1] in trillions of B. t. u.[2]

Year	Pennsylvania anthracite	Bituminous coal and lignite	Total coal	Petroleum (total crude, including that refined)		Natural gas (total production)	Total petroleum and natural gas	Total mineral fuels	Water power (fuel equivalent)		Grand total energy	
				Domestic production	Imports				At constant fuel equivalent[3]	At prevailing central station equivalent[4]	With water power at constant fuel equivalent	With water power at prevailing central station equivalent
1937	1,410	11,673	13,083	7,675	165	2,588	10,428	23,511	2,446	871	25,957	24,382
1938	1,255	9,132	10,387	7,286	158	2,468	9,912	20,299	2,466	866	22,765	21,165

1941	1,533	13,471	15,004	8,413	304	3,024	11,741	26,745	2,804	934	29,549	27,679
1942	1,641	15,267	16,908	8,320	74	3,282	11,676	28,584	3,485	1,136	32,069	29,720
1943	1,650	15,463	17,113	9,034	83	3,671	12,788	29,901	3,999	1,304	33,900	31,205
1944	1,733	16,233	17,966	10,067	269	3,989	14,325	32,291	4,029	1,301	36,320	33,592
1945[5]	1,494	15,134	16,628	10,267	445	4,166	14,878	31,506	4,336	1,401	35,842	32,907
1946[5]	1,651	13,938	15,589	10,401	535	5,199	16,135	31,724	4,253	1,374	35,977	33,098

[1] Comparable data for earlier years in Minerals Yearbook, 1937, p. 807 and Minerals Yearbook, 1938, p. 703.

[2] The unit heat values employed are: Anthracite, 13,600 B. t. u. per pound; bituminous coal and lignite, 13,100 B. t. u. per pound; petroleum, 6,000,000 B. t. u. per barrel; natural gas, 1,075 B. t. u. per cubic foot. Water power includes installations owned by manufacturing plants and mines, as well as Government and privately owned public utilities. The fuel equivalent of water power is calculated from the kilowatt-hours of power produced wherever available, as is true of all public-utility plants since 1919. Otherwise, the fuel equivalent is calculated from the reported horsepower of installed water wheels, assuming a capacity factor of 20 percent for manufacturers and mines for the years 1936 to 1943.

[3] Assuming 4.02 pounds per kilowatt-hour, which is the average of central electric station practice in 1913, the base period used.

[4] Assuming the average central-station practice for each of the years for which data are available, which declined from about 7.05 pounds per kilowatt-hour in 1899 to 1.30 pounds in 1946.

[5] Subject to revision.

FINAL BITUMINOUS-COAL AND LIGNITE STATISTICS FOR 1945

Tables 12 to 55 give the final detailed statistics of bituminous-coal- and lignite-mine operations in 1945. The subjects covered include production, number and size of mines, employment, value, mechanization, exports, and world production.

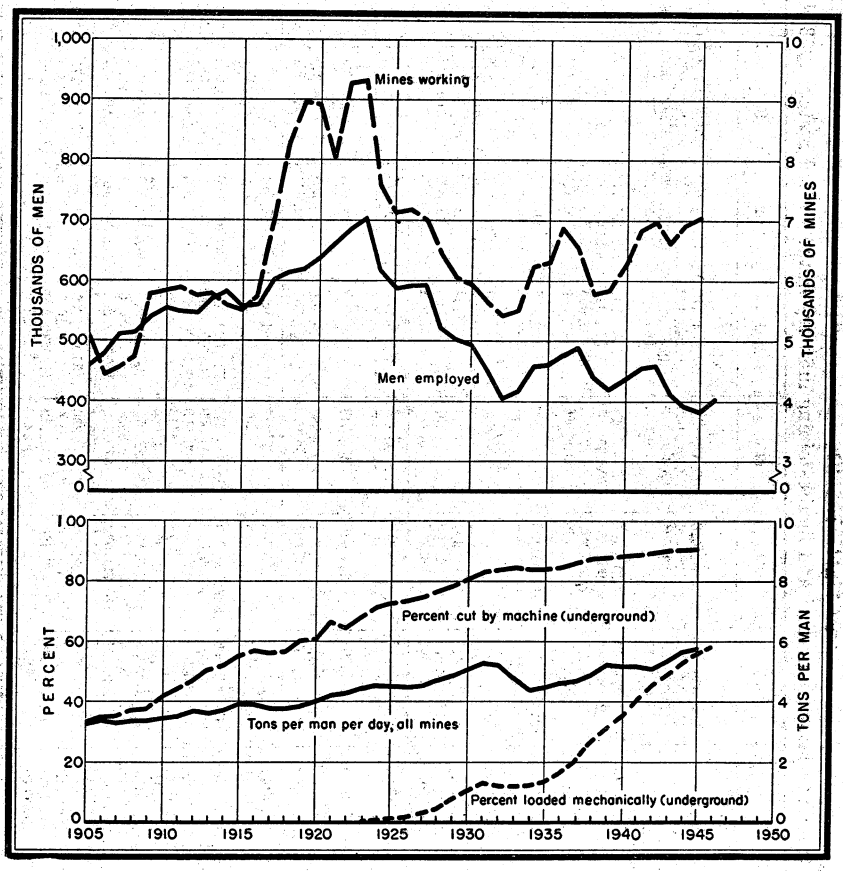

FIGURE 10.—Trends of employment, mechanization, and output per man at bituminous-coal and lignite mines in the United States, 1905–46.

SALIENT TRENDS

TABLE 12.—Salient trends in bituminous-coal and lignite-mining industry in the United States, 1938–45

	1938	1939	1940	1941	1942	1943	1944	1945
Production:								
Loaded at mine for shipment by rail—net tons	295,336,027	331,189,620	380,387,674	425,184,319	482,814,042	495,863,581	527,135,489	490,471,988
Loaded at mine for shipment by water—do	16,902,969	22,229,364	29,493,058	30,240,489	34,018,025	30,188,093	31,518,334	27,547,679
Shipped by truck or wagon—do	25,592,058	29,533,824	35,540,476	40,055,638	45,154,432	42,432,667	40,123,023	41,477,428
Taken by locomotive tenders at tipple—do	606,857	826,556	939,058	1,099,582	920,213	779,154	807,679	694,555
Shipped by conveyor or tram to point of consumption—net tons	4,221,671	4,317,465	5,887,994	6,067,697	7,121,116	7,476,717	7,206,392	6,416,327
Used by mine employees—do	2,032,289	1,901,408	2,035,201	1,872,026	2,180,077	2,549,775	2,545,343	2,660,039
Used at mines for power and heat—do	2,493,017	2,565,276	2,442,989	2,488,950	2,708,312	2,701,828	2,713,073	2,442,398
Made into beehive coke at mines—do	1,359,876	2,089,475	4,045,050	7,140,544	7,776,720	8,185,254	7,526,907	5,906,913
Total production—do	348,544,764	[1] 394,855,325	460,771,500	514,149,245	582,692,937	590,177,069	619,576,240	577,617,327
Number of active mines of commercial size:								
Class 1 (200,000 tons or more)—number	526	577	636	730	811	855	828	753
Class 2 (100,000 to 200,000 tons)—do	402	404	432	437	484	464	559	591
Class 3 (50,000 to 100,000 tons)—do	415	387	371	402	445	481	540	629
Class 4 (10,000 to 50,000 tons)—do	1,042	1,065	1,157	1,305	1,492	1,544	1,776	1,920
Class 5 (1,000 to 10,000 tons)—do	3,392	3,387	3,728	3,948	3,740	3,276	3,225	3,140
Total number over 1,000 tons—do	5,777	5,820	6,324	6,822	6,972	6,620	6,928	7,033
Average number of men employed at mines active:								
Underground—men	370,004	353,476	365,013	376,765	374,654	326,763	301,461	290,091
Surface:								
In strip pits—do	7,877	8,791	8,983	10,861	12,893	16,643	21,035	23,261
All others—do	63,452	59,521	65,079	69,355	74,444	72,601	70,851	69,838
Total—do	441,333	421,788	439,075	456,981	461,991	416,007	393,347	383,100
Average number of days mines operated—days	162	178	202	216	246	264	278	261
Capacity of active mines with existing labor force:								
Per year of 308 days—net tons	663,000,000	683,000,000	703,000,000	733,000,000	730,000,000	689,000,000	686,000,000	682,000,000
Per year of 280 days—do	602,000,000	621,000,000	639,000,000	666,000,000	663,000,000	626,000,000	624,000,000	620,000,000
Per year of 261 days—do	562,000,000	579,000,000	595,000,000	621,000,000	618,000,000	583,000,000	582,000,000	578,000,000
Output per man per day—do	4.89	5.25	5.19	5.20	5.12	5.38	5.67	5.78
Output per man per year—do	790	936	1,049	1,125	1,261	1,419	1,575	1,508
Underground output cut by machine—do	278,315,365	313,969,394	369,227,277	408,510,296	462,344,719	461,051,743	469,458,349	424,726,432
Percent of underground output cut by machine—percent	87.5	87.9	88.4	89.0	89.7	90.3	90.5	90.8
Underground output mechanically loaded—net tons	85,092,836	110,711,970	147,870,252	186,667,250	232,902,920	249,805,214	274,189,132	262,512,729
Percent of underground output mechanically loaded—percent	26.7	31.0	35.4	40.7	45.2	48.9	52.9	56.1
Quantity mined by stripping—net tons	30,406,855	37,722,583	43,167,336	55,071,609	67,202,663	79,685,175	100,898,376	109,986,865
Percent mined by stripping—percent	8.7	9.6	9.4	10.7	11.5	13.5	16.3	19.0
Quantity cleaned by wet or pneumatic process [2]—net tons	63,454,588	79,429,426	102,269,753	117,539,522	142,187,346	145,575,849	158,727,129	147,885,936
Percent cleaned by wet or pneumatic process [2]—percent	18.2	20.1	22.2	22.9	24.4	24.7	25.6	25.6

[1] Includes 202,337 tons of coal reported as net changes in stocks at mines, Jan. 1, 1939 to Jan. 1, 1940.
[2] Includes central washeries operated by consumers.

TABLE 13.—Coal produced in the United States, by States, 1935–45, with production of maximum year and cumulative production from earliest record to end of 1945, in thousands of net tons

State	Maximum production		Production by years											Total production from earliest record to end of 1945
	Year	Quantity	1935	1936	1937	1938	1939	1940	1941	1942	1943	1944	1945

1944	278	[2]	[2]	5.67	1,575	90.5	52.9	25.6	16.3
1945	261	[2]	[2]	5.78	1,508	90.8	56.1	25.6	19.0

[2] Data not available.
[3] Percentages for 1890 to 1913, inclusive, are of total production, as separation of strip-mine and underground production is not available for those years.
[4] For 1906 to 1926, inclusive, percentages are exclusive of coal cleaned at central washeries operated by consumers; after 1926, when data became available on the tonnage cleaned by consumer-operated plants, percentages include total tons cleaned at mines and at consumer-operated washeries.
[5] One-half day or less.

TABLE 15.—Growth of strip mining at bituminous-coal and lignite mines in the United States, 1914–45

Year	Production (thousands of net tons)			Percent of total production mined by stripping	Average tons per man per day			Average value per ton, f. o. b. mine			Number of strip mines	Number of power shovels and draglines
	Strip mines	Underground mines	Total all mines		Strip mines [1]	Underground mines [2]	Total all mines	Strip mines [1]	Underground mines [2]	Total all mines		
1914	1,281	421,423	422,704	0.3	5.06	3.71	3.71	(3)	(3)	$1.17	[4] 35	48

[1] Includes power strip pits proper and excludes horse stripping operations and mines combining stripping and underground in same operation for 1914–42, inclusive. 1943, 1944, and 1945 include data on all strip mines.
[2] Computed by deducting "Strip mines" data from "Total all mines."
[3] Data not available.
[4] Exclusive of horse stripping operations.

TABLE 16.—Growth of mechanical loading at underground bituminous-coal and lignite mines in the United States, 1923–45

[Production in thousands of net tons]

Year	Underground production mechanically loaded								Total underground production	Percent of underground production mechanically loaded	Number of mechanical loading units in actual use					
	Loaded by machines				Handled by conveyors			Total mechanically loaded			Mobile loading machines	Scrapers	Conveyors equipped with duckbills or other self-loading heads	Pit-car loaders	Hand loaded conveyors	Total all types
	Mobile loading machines	Scrapers	Conveyors equipped with duckbills or other self-loading heads	Total	Pit-car loaders	Hand loaded conveyors	Total

[1] Data not available.
[2] Exclusive of tonnage "Handled by conveyors."

SUMMARY BY STATES AND DISTRICTS

TABLE 17.—Number of mines, production, value, employment, days active, man-days, and output per man per day at bituminous-coal and lignite mines in the United States, by States, in 1945

[Exclusive of mines producing less than 1,000 tons]

State	Number of active mines	Disposition of coal produced (net tons)								Average value per ton [3]	Average number of employees				Average number of days mines were active	Number of man-days worked	Average tons per man per day
		Loaded at mine directly into railroad cars or river barges	Hauled by truck to railroad siding for shipment by rail and to waterway for shipment by water [1]	Shipped by truck or wagon (excluding coal used by mine employees)	Taken by locomotive tenders at tipple	Shipped by conveyor or tram to point of consumption	Used by mine employees	Used at mines for power and heat and made into beehive coke at mines [2]	Total quantity		Underground	Surface					
												In strip pits	All others	Total

[1] Includes coal hauled by truck to waterway for shipment by water in following States in 1945: Illinois, 129,422 tons; Ohio, 110,808; Pennsylvania, 232,685; Tennessee, 115,164; and West Virginia, 808,014—a grand total of 1,396,093 tons.

[2] Includes coal made into beehive coke at mines in following States in 1945: Colorado, 129,837 tons; Kentucky, 124,153; Pennsylvania, 4,960,378; Utah, 7,889; Virginia, 284,785; and West Virgnia, 399,871—a grand total of 5,906,913 tons.

[3] Value received or charged for coal f. o. b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked [not coke] as estimated by producer, at average prices that might have been received if such coal had been sold commercially.)

[4] As it is necessary to conceal certain items in the lignite break-down of disposition of coal, the figures are shown here in column where greater part of concealed tonnage is included.

TABLE 18.—Number of mines, production, value, employment, days active, man-days, and output per man per day at bituminous-coal and lignite mines in the United States, by districts, in 1945

[See Mineral Market Report 1468 for additional data by districts. Districts as defined in the Bituminous Coal Act of 1937 and modifications thereto. Exclusive of mines producing less than 1,000 tons]

Minimum price area and producing district	Number of active mines	Disposition of coal produced (net tons)								Average value per ton [3]	Average number of employees				Average number of days mines were active	Number of man-days worked	Average tons per man per day
		Loaded at mine directly into railroad cars or river barges	Hauled by truck to railroad siding for shipment by rail and to waterway for shipment by water [1]	Shipped by truck or wagon (excluding coal used by mine employees)	Taken by locomotive tenders at tipple	Shipped by conveyor or tram to point of consumption	Used by mine employees	Used at mines for power and heat and made into beehive coke at mines [2]	Total quantity		Underground	Surface		Total			
												In strip pits	All others

[1] Includes coal hauled by truck to waterway for shipment by water in following districts in 1945; District 2, 232,685 tons; district 3, 646,388; district 4, 110,808; district 6, 59,071; district 8, 102,555; district 10, 129,422; and district 13, 115,164—a grand total of 1,396,093 tons.

[2] Includes coal made into beehive coke at mines in following districts in 1945: District 1, 239,420 tons; district 2, 4,720,958; district 3, 223,286; district 7, 55,146; district 8, 530,377; district 17, 129,837; and district 20, 7,889—a grand total of 5,906,913 tons.

[3] Value received or charged for coal f. o. b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked [not coke] as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

[4] Includes Maryland and Grant, Mineral, and Tucker Counties, W. Va.

[5] Includes Colfax County, N. Mex.

[6] Includes Arizona and California, but excludes Colfax County, N. Mex. No production was reported for California.

[7] Includes Idaho. No production was reported for Idaho.

[8] As it is necessary to conceal certain items in the lignite break-down disposition of coal, the figures are shown here in column where greater part of concealed tonnage is included.

[9] Includes Oregon.

[10] For purposes of historical comparison and statistical convenience, figures include output of lignite and of anthracite and semianthracite outside of Pennsylvania.

PRODUCTION BY WEEKS AND MONTHS

TABLE 19.—Bituminous-coal and lignite production (final figures) in the United States in 1945, with estimates by weeks

Week ended—	Production (net tons)	Number of working days	Average production per working day (net tons)	Week ended—	Production (net tons)	Number of working days	Average production per working day (net tons)

May	49,620,000	26.5	1,872,000	December	46,955,000	25	1,878,000
June	51,137,000	26	1,967,000				
July	47,362,000	25	1,894,000	Total	577,617,000	305.5	1,891,000

TABLE 21.—Coal production in the United States, in 1945, by States (final figures), with estimates by months, in thousands of net tons

[Totals for year are based on final complete returns from all operators known to have produced more than 1,000 tons a year. Apportionment of known yearly total among the 12 months is based upon best information available; in some States upon direct tonnage reports by operators to State mine departments; in most cases upon current records of railway carloadings and waterway shipments]

State	January	February	March	April	May	June	July	August	September	October	November	December	Total

793065—48—20

AVERAGE VALUE

Before the Bituminous Coal Act of 1937 was passed, the most valuable single index of the trend of prices at the mines was the "average value per ton, f. o. b. mines," as given in the familiar annual coal reports of the Bureau of Mines, United States Department of the Interior. This series was referred to in Bureau of Mines reports as representing "bituminous coal," and it covered all coal (other than Pennsylvania anthracite) produced in the United States. It represented the bituminous-coal industry as the term ordinarily was used in the trade and included the lignite of the Dakotas, Texas, and Montana, as well as any small tonnages of hard coal produced outside of Pennsylvania.

With the passage of the Coal Act, the Bureau of Mines relinquished the collection of statistics relating to bituminous coal, effective June 30, 1937,[1] though continuing to compile data regarding lignite and Pennsylvania anthracite. Effective the same date, the Coal Commission became responsible for the compilation of data on bituminous coal, though not attempting to collect data regarding lignite, which was specifically exempted by the Act. The records of the Commission (later the Bituminous Coal Division, United States Department of the Interior) relate to all coal other than Pennsylvania anthracite, Virginia semianthracite, and lignite.

To permit comparison of the old and new series, therefore, it is necessary to separate the lignites from the bituminous coals, though the combined average for the two is continued in a form as nearly comparable as possible to the old series (see table 23).

A more important change in the two series relates to the treatment of selling expenses. The old Bureau of Mines series of "value at the mines" excluded the selling cost. Reporting operators were asked to state the "Amount received at the mines f. o. b. cars less the selling expense." No details were asked regarding the items included in the value, and no systematic effort was made to follow up the exclusion of selling expenses. It was realized at the time that some producers might find it impractical to exclude selling costs and that some part of the selling expenses of the industry might be included in the results. Nevertheless, the reports were checked for consistency from year to year, the questions were retained in the same form without change, and the results are believed to have been comparable from one year to the next. The new series of the Coal Commission represents the total or gross realization on all coal produced and specifically includes the selling cost.

The two sets of data may not be precisely comparable with respect to coal produced but not sold on the commercial market. In the Bureau of Mines series reporting operators were instructed that the "value of coal not sold but used by producer, also mine fuel and coal made into coke, should be estimated at average prices that might have been received." The instructions of the Coal Commission regarding such items were in effect similar, though given in greater detail.

A comparison of the two series is possible for 1936. In that year, the average value per ton on the old (Bureau of Mines) basis amounted to $1.761 per ton for bituminous coal, excluding lignite. The average gross realization, according to data collected by the Coal Commission, was $1.831 per ton. The difference amounts to $0.07 per ton—an

amount somewhat less than the average selling expenditure computed per ton of all coal produced, as reported to the Coal Commission. The comparison confirms previous indications that the great majority of operators reporting in earlier years had followed instructions and omitted selling expenses in computing the average value but that some of them had included the selling expense. The change in method of reporting should be kept in mind in comparing the two sets of data. As the reports to the Commission were submitted on a detailed accounting return and made under oath, they are to be accepted. The returns of earlier years, upon a voluntary basis and not in all instances uniform as to treatment of selling costs, seem to have been thoroughly comparable from one year to the next and afford the best available index to the rise and fall of the mine prices received by operators down to 1936.

TABLE 23.—Trend of average value in the United States of bituminous coal and lignite per ton, f. o. b. mines, 1929–45

Year	Bituminous coal (subject to regulation under 1937 Act)[1]	Lignite [2]	Total
Average value per ton less selling cost:			
1929	$1.782	$1.548	$1.781
1930	1.702	1.556	1.701
1931	1.542	1.410	1.541
1932	1.313	1.313	1.313
1933	1.337	1.188	1.336
1934	1.751	1.387	1.749
1935	1.772	1.120	1.767
1936	1.761	1.061	1.756
Average gross realization, selling cost not deducted:			
1936	1.831	[3] 1.061	1.826
1937	1.946	[3] 1.080	1.939
1938	1.955	[3] 1.071	1.947
1939 [4]	1.850	1.158	1.845
1940	1.913	[3] 1.156	1.908
1941	2.194	1.237	2.189
1942	2.363	1.364	2.358
1943	2.691	1.490	2.685
1944	2.929	1.487	2.923
1945	3.068	1.553	3.061

[1] Includes all coal produced other than Pennsylvania anthracite and lignite included in second column.
[2] North Dakota, South Dakota, and lignite counties of Montana and Texas.
[3] Figures for 1936–38 and 1940 exclude selling cost as before.
[4] Producers were asked to exclude selling cost in reporting value, but a number of them included such costs.

LABOR STATISTICS

Men Employed.—An average of 383,100 men was employed at bituminous-coal and lignite mines in 1945, a 2.6 percent decrease from the total of 393,347 for 1944 (see fig. 10).

The method used here in calculating employment gives an accurate measure of the working force in the coal industry but does not consider the time lost by men on the rolls through intermittent operations. To measure the influence of intermittency upon employment the factor of mine activity as indicated by the average number of days of plant operation was recorded separately. The average number of men on the rolls when the mines were in operation was then used, in conjunction with the average number of days of operation, as a measure of the total volume of employment in the industry.

Days Operated.—The average number of days of operation at bituminous-coal and lignite mines in 1945 was 261. This represents a decrease from the average of 278 days for 1944. All statistics on days of mine operation included in this report are weighted averages, in which the operating time of each mine has been weighted by the number of its employees. Several coal-mining States publish series on the number of days worked that are simple averages of the figures for each reporting mine, regardless of size. As these unweighted averages are likely to be unduly depressed by small mines, which generally operate fewer days than the larger ones, they tend to understate the working time of a typical mine employee.

Man-Days of Labor.—Man-days have been computed by multiplying the number of workers employed by the number of operating days. Although these computations were made for each individual mine, the combined total is necessarily only an approximation.

Data for 1945 indicate that bituminous-coal and lignite-mine employees performed 99,866,901 man-days of labor during the year. Table 17 gives a summary record of men employed, days operated,

[1] Includes mines where the day was more than 9 or less than 7 hours or was irregular.

and output per man per day at bituminous-coal and lignite mines, by States, in 1945. Details by counties for 1945 are shown in table 44.

Length of Working Day.—Table 24 summarizes the replies of mine operators to the question, "Number of hours operated per shift."

The established working day does not of itself measure the length of time that men actually work or the time that they are underground, because of the possibility of overtime, because the mine may sometimes shut down before the full day is over, because the miner may go home before the mine stops, and because he spends a considerable time going to and from his place of work underground. These figures represent the operator's statement of the nominal operating day for the mine. They do not purport to represent the time actually worked by the men. On the one hand, they make no allowance for tonnage or piece workers who leave early; on the other hand, they make no allowance for tonnage men who continue at work after the mine as a whole is shut down, or who go into the mine to work on days when the tipple is idle.

It was found that 77 percent of the men employed were in 8-hour mines and that the weighted average working shift was 7.9 hours.

BITUMINOUS COAL AND LIGNITE LOADED FOR SHIPMENT BY INDIVIDUAL RAILROADS AND WATERWAYS

Shipped by truck or wagon		41,477,428	41,477,428
Taken by locomotive tender at tipple		694,555	694,555
Shipped by conveyor or tram to point of consumption		6,416,327	6,416,327
Coal used by employees		2,660,039	2,660,039
Used at mine for power and heat		2,442,398	2,442,398
Made into beehive coke at mine		5,906,913	5,906,913
Total production		577,617,327	577,617,327

[1] Includes coal loaded at mine directly into railroad cars or river barges, hauled by truck to railroad siding for shipment by rail, and hauled by truck to waterway for shipment by water. In general, figures show quantity of bimuminous coal and lignite originated for each railroad and waterway as reported by mine operators. It must be noted that in one year an operator may report coal loaded on subsidiary railroad and in another year same operator may report coal loaded on parent railroad system.

METHODS OF RECOVERY

MECHANICAL LOADING

The quantity of bituminous coal and lignite mechanically loaded in underground mines increased from about 2 million tons, or 0.3 percent of the total underground output, in 1923 to more than 262 million tons, or 56 percent, in 1945. (See table 16.)

Mechanical loading equipment used in underground bituminous-coal and lignite mines is divided into two types: Devices that practically eliminate hand shoveling (known as mobile loaders, scrapers, and self-loading conveyors or duckbills) and those that greatly reduce the labor in hand shoveling (known as hand-loaded face conveyors and pit-car loaders). Devices in the first category are designated as "machines" and those in the second category as "conveyors."

Sales of Mechanical Loading Equipment in 1946.—The estimated capacity of mechanical loading equipment sold for underground use in all coal mines was 20 percent more in 1946 than in 1945. Table 31 shows the sales reported, by type of equipment, and the number of manufacturers reporting for 1939–46.

Sales of conveyors to bituminous-coal and lignite mines in 1946 totaled 838 units. The figures for 1942–46 exclude duckbills, which were included in all previous years. Therefore, these sales are not comparable with those for 1941 or earlier years.

The number of mobile loaders, scrapers, and conveyors shipped into the various States and groups of States in 1946 and the number of units in actual use in 1945 are shown in table 33.

Statistics on Mechanical Loading in Bituminous-Coal and Lignite Mines in 1945.—During 1945 the approximate percentage of the tonnage loaded by each type of equipment was as follows: Mobile loaders, 76; hand-loaded conveyors, 15; duckbills, 8; and pit-car loaders and scrapers combined, 1.

Mobile loaders handle more coal than all other types of mechanical loading devices combined. Where coal is loaded by mobile loaders it is more commonly loaded directly into mine cars, but some tonnage is loaded into shuttle cars or onto conveyors. During 1945, 73 percent of the bituminous coal and lignite handled by mobile loaders was loaded directly into mine cars, 23 percent into shuttle cars, and 4 percent onto conveyors.

During 1945, in underground bituminous-coal and lignite mines 2,950 mobile loaders handled 198,668,462 net tons, an average of 67,345 tons per mobile loader per year; scrapers averaged 14,389; pit-car loaders, 6,942; duckbills, 15,550; and hand-loaded face conveyors, 11,847, per year per unit for the same period. (See tables 32 and 34.)

Mechanical Loading by States.—West Virginia has been the leading producer of mechanically loaded coal since 1939. During 1945, West Virginia produced 78,358,267 tons of mechanically loaded coal, followed by Illinois with 48,997,059, Pennsylvania with 44,554,921, Kentucky with 24,773,383, and Ohio with 12,937,079 tons. These five States produced 80 percent of the total output of underground mechanically loaded bituminous coal in the United States in 1945.

Detailed data, by States, on the number of mines and machines and the production of mechanically loaded coal compared with the total production at mines using mechanical loading devices are given in table 35. Comparative changes in underground mechanical loading in 1944–45, by States, are shown in table 36.

Table 37 shows bituminous-coal and lignite tonnage mined by stripping compared with underground hand-loaded and machine-loaded tonnage, by States, for 1945.

TABLE 31.—Units of mechanical loading equipment sold to bituminous-coal and lignite mines for underground use in the United States, as reported by manufacturers, 1939–46

	1939	1940	1941	1942	1943	1944	1945	1946	Change, 1946 from 1945 (percent)
Type of equipment:									
Mobile loaders	292	233	367	352	234	282	349	490	+40.4
Scrapers [1]	18	36	8	15	13	20	6	3	−50.0
Conveyors [2]	1,095	1,573	1,800	1,167	798	580	738	838	+13.6
Pit-car loaders	2	3	10	2	1	------	(3)	(3)	----------
Total, all types	1,407	1,845	2,185	1,536	1,046	882	1,093	1,331	+21.8
Number of manufacturers reporting	31	32	32	28	24	22	25	24	----------

[1] Reported as scrapers or scraper haulers and hoists.
[2] Includes hand-loaded conveyors and those equipped with duckbills or other self-loading heads. Sales of both loading heads and shaker conveyors were counted for years 1939–41, inclusive; but figures for 1942–46, inclusive, do not include loading heads separately.
[3] Discontinued canvass of sales of pit-car loaders in 1945.

TABLE 32.—Units of mechanical loading equipment in use in underground bituminous-coal and lignite mines in the United States, 1940–45

Type of equipment	1940	1941	1942	1943	1944	1945	Change, 1945 from 1944 (percent)
Mobile loaders	1,720	1,985	2,301	2,525	2,737	2,950	+7.8
Scrapers	116	109	93	83	87	87	----------
Pit-car loaders	697	607	481	321	241	142	−41.1
Conveyors equipped with duckbills or other self-loading heads	656	788	1,062	1,226	1,331	1,383	+3.9
Hand-loaded conveyors	2,263	2,807	3,041	3,191	3,236	3,385	+4.6
Total, all types	5,452	6,296	6,978	7,346	7,632	7,947	+4.1

TABLE 33.—Comparison of mechanical loading equipment and "mother" conveyors in actual use in bituminous-coal and lignite mines in the United States in 1945 with sales reported in 1946, by States and regions

State and region	Mechanical loading equipment						"Mother" conveyors [2]	
	Mobile loaders		Scrapers		Conveyors [1]			
	In use in 1945	Sales in 1946	In use in 1945	Sales in 1946	In use in 1945	Sales in 1946	In use in 1945	Sales in 1946
Northern Appalachian States:

MECHANICAL CLEANING

The percentage of the total production of bituminous coal that was mechanically cleaned increased from 5.3 in 1927, the first year complete data were collected, to 25.6 in 1944 and remained at 25.6 during 1945. (See table 14.)

In the following tables coal cleaned at consumer-operated plants was tabulated in State where the plant was located. All coal cleaned at plants other than consumer-operated plants was included in State from which the coal was mined.

Tables 38, 39, 42, and 43 include mechanical cleaning data on all coal mined in the United States except Pennsylvania anthracite. Tables 40 and 41 are on the same basis but do not include consumer-operated plants. There are no mechanical cleaning plants at lignite mines.

Consumer-operated plants include plants owned by steel companies which receive coal from various mines (but usually from affiliated companies), clean it, and then consume it directly at the plant.

Table 38 compares bituminous coal cleaned in 1942–45 by method of cleaning. Both wet and pneumatic methods decreased in 1945 from 1944.

Mechanical Cleaning by Types of Equipment.—The tonnage of bituminous coal cleaned by wet-washing methods was 130,469,739

net tons in 1945—a decrease of 6 percent from 1944. The quantity cleaned by pneumatic methods was 17,416,197 net tons—a decrease of 13 percent.

Table 39 compares the number of cleaning plants and the net tons of cleaned coal, by types of equipment, for 1944 and 1945. During 1945, 412 wet-washing and 83 pneumatic cleaning plants were in operation. Fifty-six tipples used both wet and dry methods at the same plant; deducting these duplications gives a net total of 439 plants that cleaned coal in 1945—the same number as in 1944.

Wet methods of cleaning coal include piston- or common-type jigs, Baum-type jigs, concentrating tables, launders and upward-current classifiers, and any combinations of these four methods. Baum-type jigs cleaned approximately 42 percent of the total coal cleaned by wet methods during 1945.

Pneumatic methods of coal cleaning include air tables, air flow, air sand, and any combinations of these three methods. During 1945, air tables cleaned approximately 59 percent of the total coal cleaned by pneumatic methods.

Mines served by cleaning plants, exclusive of those that ship to washeries operated by steel companies, produced a total of 214,258,070 tons, or 37 percent, of the total bituminous output in 1945. In this same group of mines, 138,834,782 tons were mechanically cleaned; therefore, 65 percent of the coal produced at mines with cleaning plants in 1945 was cleaned at the mine. The remainder of the output from these mines (35 percent) presumably represents the larger sizes commonly picked by hand.

Table 40 shows total production of coal at mines with cleaning plants by methods of preparation in 1944 and 1945.

Coal Cleaning by States.—The following States led in volume of of coal mechanically cleaned in the United States in 1945: Pennsylvania, 22.2 percent of total; West Virginia, 21.4; Illinois, 20.8; Alabama, 9.4; and Indiana, 7.5 percent. These five States accounted for 81.3 percent of the total mechanically cleaned coal in 1945. Table 42 shows the number of plants in operation, tons of clean coal, and percentage of State output mechanically cleaned in 1944 and 1945.

Relation Between Raw Coal, Clean Coal, and Refuse.—For every 100 tons of raw coal cleaned during 1945 at the mines, 85 tons of clean merchantable coal, on an average, were obtained, and 15 tons of refuse were discarded. Table 43 shows total production of mines with cleaning plants and results of cleaning operations, by States.

Methods of Mining at Mines Served by Cleaning Plants.—Mechanical loading, both in underground mines and strip pits, appears to be closely related to mechanical cleaning. Table 41 shows the mining methods at mines having cleaning plants. Production of coal from strip mines in 1945 was 109,986,865 tons (see table 37), of which 35,910,050 tons (33 percent) came from strip mines having mechanical cleaning tipples. Underground coal loaded mechanically in 1945 totaled 262,512,729 tons, of which 129,733,226 tons (49 percent) passed through tipples equipped with mechanical-cleaning devices. Hand-loaded underground coal production in 1945 totaled 205,117,733 tons, of which 24 percent passed through tipples equipped with cleaning plants.

TABLE 38.—Bituminous coal mechanically cleaned by wet and pneumatic methods, in the United States, in net tons of clean coal, 1942–45

Method of cleaning	1942	1943	1944	1945	Change 1945 from 1944 (percent)
By wet methods:					
At mines	111,210,109	114,467,591	128,390,547	121,418,585	−5.4
At consumer-operated cleaning plants	10,789,749	9,967,184	10,272,142	9,051,154	−11.9
Total wet methods	121,999,858	124,374,775	138,662,689	130,469,739	−5.9
By pneumatic methods	20,187,488	21,201,074	20,064,440	17,416,197	−13.2
Grand total	142,187,346	145,575,849	158,727,129	147,885,936	−6.8

TABLE 39.—Bituminous coal cleaned in the United States, by types of equipment in actual operation, 1944–45

[Coal cleaned and plants operated by consumers at central washeries in Colorado and Pennsylvania included]

Type of equipment	Plants in operation		Net tons of clean coal		Cleaned by each type (percent of total)	
	1944	1945	1944	1945	1944	1945
Wet methods:						
Jigs	216	219	74,174,424	68,608,875	46.7	46.4
Concentrating tables	11	13	2,752,612	2,594,085	1.8	1.8
Jigs in combination with concentrating tables	18	16	4,649,192	4,754,311	2.9	3.2
Jigs in combination with launders and upward-current classifiers	19	18	8,535,393	8,454,561	5.4	5.7
Launders and upward-current classifiers	146	146	48,551,068	46,057,907	30.6	31.1
Total wet methods	410	412	138,662,689	130,469,739	87.4	88.2
Pneumatic methods	82	83	20,064,440	17,416,197	12.6	11.8
Grand total	[1] 492	[1] 495	158,727,129	147,885,936	100.0	100.0

[1] Number of plants using both wet and pneumatic methods was 53 in 1944 and 56 in 1945.

TABLE 40.—Total production of all coal at bituminous mines in the United States, having cleaning plants, in net tons, 1944–45

[Does not include any estimate for mines that may ship to consumer-operated plants]

Type of equipment	1944	1945	Change 1945 from 1944 (percent)
Wet methods:			
Jigs	111,163,648	104,445,160	−6.1
Concentrating tables	2,026,953	2,018,364	−.4
Jigs in combination with concentrating tables	5,271,277	5,039,409	−4.4
Jigs in combination with launders and upward-current classifiers	13,026,722	12,394,420	−4.9
Launders and upward-current classifiers	87,864,211	79,567,648	−9.5
Total wet methods	219,352,811	203,465,001	−7.3
Pneumatic methods	54,578,526	47,386,413	−13.2
Grand total	273,931,337	250,851,414	−8.4
Less duplications [1]	40,995,557	36,593,344	−10.7
Net total	232,935,780	214,258,070	−8.0
United States, total production [2]	619,576,240	577,617,327	−6.8
Percent produced at mines having cleaning plants	37.6	37.1	

[1] Mines using both wet and pneumatic methods.

[2] For purposes of historical comparison and statistical convenience, figures include output of lignite and of anthracite and semianthracite outside of Pennsylvania. There are no mechanical cleaning plants at lignite mines.

TABLE 41.—Method of mining at bituminous-coal mines in the United States served by cleaning plants, 1942–45

[Does not include any estimate for mines that may ship to consumer-operated plants]

Method of mining in use	Total net tons produced from mines that move coal to cleaning plants				Change 1945 from 1944 (percent)
	1942	1943	1944	1945	
Mined from strip pits	28, 597, 289	30, 326, 426	32, 444, 227	35, 910, 050	+10. 7

West Virginia[3]	35,652,955	31,671,908	3,981,047	11.2	59,998,810
Total at mines only[4]	163,128,740	138,834,782	24,293,958	14.9	214,258,070
Consumer plants[5]	9,770,627	9,051,154	719,473	7.4	
Grand total	172,899,367	147,885,936	25,013,431	14.5	

[1] In Alabama (for example) for every 100 tons of raw coal cleaned in 1945, an average of 20.9 tons of refuse was discarded and 79.1 tons of clean marketable coal was obtained.
[2] Includes some coal mined in Pennsylvania and cleaned in Ohio.
[3] Includes some coal mined in West Virginia and cleaned in Ohio and Pennsylvania.
[4] Includes all mechanical cleaning other than washeries operated by consumer steel companies.
[5] Includes central washeries in Colorado and Pennsylvania operated by consumer steel companies.

DETAILED STATISTICS, BY STATES AND COUNTIES

Detailed production and employment statistics are given in table 44 for each coal-producing county in the United States from which three or more operators submitted reports for 1945. Statistics on counties with less than three reporting producers have been combined with data for other counties in the same State to avoid disclosing individual figures, unless permission to publish has been granted by the operators. Production of mines on the border between two States has been credited to the State from which the coal was extracted rather than to that in which the tipple was situated. If the coal is mined from lands in both States, the tonnage has been apportioned accordingly.

In this series the reported production is classified according to the principal methods of distribution or use. Beginning with 1932, the series was expanded to include data on the growing volume of coal moving from mine to consumer by truck. For 1933–36 this tonnage was shown as "Commercial sales by truck or wagon." In 1937 this tonnage was shown as "Truck deliveries, including local sales" (see Minerals Yearbook, 1939, p. 813). In 1938 the truck tonnage was shown as "Shipped by truck or wagon." The truck figures for 1933 to 1936, inclusive, and 1938 to 1945, inclusive, are reasonably comparable.

The data in the present report, as in those published for many years by the Bureau of Mines, relate only to mines with an annual output of 1,000 tons or more. That fact should be borne in mind when the statistics in this report are compared with similar data compiled by State mine departments. Differences arise largely from variations in coverage by State reports, some of which include data for all mines regardless of size, and others only data for mines employing more than a specified minimum number, ranging from 2 to 10 men.

Because of a change in method of reporting, statistics of average production per man per day for 1932 to 1936 and 1938 to 1941 are not precisely comparable with those for other years. For other years they were based upon the calculated number of man-shifts, obtained by multiplying the average number of men employed at each mine by the number of days worked at the mine. From 1932 to 1936 and 1938 to 1941 the operators were asked to make, if possible, a special report of the number of man-shifts actually worked. The number of operators able to furnish this information was small. These reports were utilized to improve the accuracy of the record. Otherwise, the man-shifts were calculated by multiplying the number employed underground and on the surface by the number of days worked by the mine and tipple, respectively.

TABLE 44.—Production, value, employment, days active, man-days, and output per man per day at bituminous-coal and lignite mines in the United States, by States and counties, in 1945

[Exclusive of mines producing less than 1,000 tons]

County	Disposition of coal produced (net tons)					Average value per ton [2]	Average number of employees				Average number of days mines were active	Number of man-days worked	Average tons per man per day
	Loaded for shipment by rail or water [1]	Shipped by truck or wagon (excluding coal used by mine employees)	Used by mine employees, taken by locomotive tenders at tipple, or other uses at mine [2]	Used at mine for power and heat or made into beehive coke at mine	Total quantity		Underground	Surface		Total			
								In strip pits	All others

[1] Includes coal loaded at mine directly into railroad cars or river barges, hauled by truck to railroad siding for shipment by rail, and hauled by truck to waterway for shipment by water.

[2] Includes coal transported from mine to point of use by conveyor or tram.

[3] Value received or charged for coal, f. o. b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked [not coke] as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

[4] No coal was "Made into beehive coke at mine."

[5] Includes 129,837 tons "Made into beehive coke at mine" in Las Animas County.

[6] Output obtained chiefly from strip pits and by use of mechanical loading devices, in which types of operations production per man per day is large.

[7] Output obtained chiefly from strip pits in which production per man per day is large.

[8] Includes coal "Made into beehive coke at mine" in following counties: Harlan, 3,975 tons; Pike, 120,178—grand total, 124,153 tons.

[9] In Montana and South Dakota some lignite included in "Shipped by truck or wagon" includes "Other uses at mine." In North Dakota some lignite made into briquets is included in "Other uses at mine."

[10] Includes coal "Made into beehive coke at mine" in following counties: Cambria, 5,424 tons; Fayette, 3,568,964; Indiana, 233,996; and Westmoreland, 1,151,994—grand total, 4,960,378 tons.

[11] Includes 7,889 tons "Made into beehive coke at mine" in Carbon County.

[12] Output is obtained chiefly by use of mechanical devices in which type of operation production per man per day is large.

[13] Includes 284,785 tons "Made into beehive coke at mine" in Wise County.

[14] Includes coal "Made into beehive coke at mine" in following counties: Fayette, 176,585 tons; Monongalia, 35,955; Nicholas, 19,635; and Preston, 167,696—grand total, 399,871 tons.

STATISTICS ON LIGNITE IN 1945 [3]

PRODUCTION

The output of lignite in 1945, exclusive of small mines producing less than 1,000 tons, totaled 2,668,310 net tons. As for many years, North Dakota was the chief producer, followed in order by Texas, Montana, and South Dakota. The North Dakota output comprised 95 percent of the total production and that of Texas, South Dakota, and Montana together totaled 5 percent.

The average value per ton was $1.55. Employees engaged in the production of lignite numbered 838 and the average output per man per day, based upon calculated man-days, was 14.26 tons. The output per man per day in the lignite industry is high when compared with other coal-mining operations in the United States because a large part of the total production (74 percent in 1945) is recovered from strip pits where the daily production per man is much greater than in deep mining. Lignite mines reporting an annual production of more than 1,000 tons in 1945 totaled 65.

According to the Federal Power Commission, the West North Central States consumed 668,636 tons of lignite in generating electric

TABLE 45.—Summary of production, value, men employed, days operated, man-days of labor, and output per man per day at lignite mines in the United States in 1945, by States [1]

	Montana [2]	North Dakota	South Dakota	Texas	Total
Production (net tons):					
Loaded at mines for shipment		2,023,257	5,360	79,051	2,107,668
Commercial sales by truck or wagon	[3] 41,597	430,445	[3] 19,085		491,127
Used by employees, taken by locomotives at tipple, and other uses	([3])	[4] 47,486	([3])	898	48,384

Surface (including strip pits)	9	530	11	26	576
Total employees: 1945	40	757	15	26	838
1944	55	826	28	36	945
Average number of days mines operated:					
1945	196	226	259	158	223
1944	173	213	177	198	209
Man-days of labor: 1945 [5]	7,828	171,251	3,881	4,096	187,056
Average output (tons) per man per day: 1945 [5]	5.31	14.73	6.30	19.52	14.26

[1] Exclusive of small mines producing less than 1,000 tons. In 1944 tonnage from such mines amounted to 22,644 net tons.
[2] Includes output from Custer, Dawson, McCone, Richland, Roosevelt, and Sheridan Counties.
[3] Some "Other uses" included in "Commercial sales by truck or wagon."
[4] Includes some lignite made into briquets.
[5] Based upon calculated man-days.

[3] Compiled by J. A. Corgan and M. I. Cooke.

energy during 1945; the West South Central States consumed 39 tons; and the Mountain States 338,130 tons, a large part of which was sub-bituminous.

This report was prepared by the Bureau of Mines from an annual canvass of operators of lignite properties included in the areas mapped as "lignite" in Geological Survey Professional Paper 100–A, The Coal Fields of the United States. Sub-bituminous coal is not included.

TABLE 46.—Production, value, men employed, days operated, man-days of labor, and output per man per day at lignite mines in the United States in 1945, by States and counties

[1] Based upon "calculated" man-days.
[2] Output is obtained chiefly from strip pits in which production per man per day is large.

METHODS OF RECOVERY

TABLE 47.—Lignite mined by different methods in the United States in 1945, by States, in net tons

	Montana	North Dakota	South Dakota	Texas	Total
From underground workings:					
Mined by hand		12,943			12,943
Shot off the solid	40,464	26,168	3,033		69,665
Cut by machines [1]		623,534			623,534
Total underground	40,464	662,645	3,033		706,142
From strip pits	1,133	1,859,674	21,412	79,949	1,962,168
Grand total production	41,597	2,522,319	24,445	79,949	2,668,310

[1] A total of 16 machines was used—13 "permissible" and 3 other types.

NUMBER AND SIZE OF MINES

The Bureau received reports for 1945 from 65 lignite mines (exclusive of mines producing less than 1,000 tons a year). Of the total output, 7 mines producing over 100,000 net tons each supplied 80 percent; 3 mines, with an output of 50,000 to 100,000 tons, 7 percent; 10 mines, with 10,000 to 50,000 tons, 8 percent; and 45 mines, producing less than 10,000 tons, 5 percent. North Dakota, with 53, had the largest number of lignite operations; Montana was next, with 7 mines; and South Dakota and Texas followed, with 4 and 1, respectively. The classification, by size of output, in the field as a whole is given in table 48.

TABLE 48.—Number and production of lignite mines in the United States in 1945, classified by size of output

Class	Mines		Production		
			Net tons		Percent of total
	Number	Percent	Total	Average per mine	
1 (100,000 tons and over)	7	10.8	2,122,778	303,254	79.6
2 (50,000 and under 100,000)	3	4.6	192,967	64,322	7.2
3 (10,000 and under 50,000)	10	15.4	203,146	20,315	7.6
4 (Under 10,000 tons)	45	69.2	149,419	3,320	5.6
Total	65	100.0	2,668,310	41,051	100.0

STRIPPING OPERATIONS

Of the total 1945 production, 74 percent, or 1,962,168 tons, was produced from strip pits. Most of the stripping—that is, 95 percent of all strip-pit production and 70 percent of the total tonnage produced by the entire lignite industry—was done in North Dakota, where 1,859,674 tons were produced by that method. The stripping output of operations in Texas, Montana, and South Dakota totaled only

102,494 tons. The number of men employed in stripping operations was 482, with an average output per man per day of 18.66 tons; the average number of days worked was 218.

Detailed statistics for stripping operations in the lignite industry in 1945 are given in table 49.

TABLE 49.—Summary of stripping operations that produced lignite in the United States in 1945, by States

	Montana	North Dakota	South Dakota	Texas	Total
Number of strip pits [1]	1	30	2	1	34
Number of shovels, dragline excavators, and coal-loading machines [2]	1	43	2	2	48
Coal produced by stripping	1,133	1,859,674	21,412	79,949	1,962,168
Total value at mines	$3,000	$2,841,000	$45,000	$68,000	$2,957,000
Average value per ton	$2.65	$1.53	$2.10	$0.85	$1.51
Number of employees:					
In strip pits	2	282	11	19	314
All others		161		7	168
Total	2	443	11	26	482
Average number of days mines operated	135	220	295	158	218
Man-days of labor [3]	270	97,573	3,241	4,096	105,180
Average tons per man per day [3]	4.20	19.06	6.61	19.52	18.66

[1] Includes some pits in which stripping is done by hand.
[2] In some cases the same equipment was used for stripping or excavating and for loading coal; this duplication has been eliminated. In some cases coal was excavated by machine and loaded by hand.
[3] Based upon calculated man-days.

[1] Coal is also mined in Italian East Africa, but production figures are not available.
[2] Estimate included in total.
[3] Data not yet available.
[4] In addition, the following quantities of asphaltite were produced and used as solid fuel in the years: 1939, 1,320; 1940, 9,117; 1941, 16,646; 1942, 56,387; 1943, 105,625 tons; data for later years are not available.
[5] Production of less than 1,000 tons.
[6] Estimate.
[7] May to December, inclusive.
[8] Western Germany.
[9] Includes Northern Territories and Sub-Carpathia; in addition, beginning in 1941, includes Eastern Hungary and Transylvania; and beginning in 1942 includes Southern Territories.
[10] Includes that part of Germany which is under Polish Administration (east of the Oder and Misse Rivers).
[11] Exports.
[12] January to September, inclusive.
[13] Estimated production of Croatia only.
[14] January to June, inclusive.
[15] Free China.
[16] Fiscal year ended March 20 of year stated.
[17] Preliminary and subject to revision.
[19] Production of Government mines only.

Coal—Pennsylvania Anthracite

GENERAL SUMMARY

PRODUCTION of Pennsylvania anthracite in 1946 totaled 60,506,873 net tons, a gain of 10 percent over the output in 1945. The increase in production is attributable to several factors: (1) A more plentiful supply of labor, (2) less costly labor disturbances in 1946 than in 1945, and (3) the lifting of Government restrictions on mining equipment, which enabled the operators to obtain necessary supplies more readily. Of the total production, 63 percent was obtained from deep mines, 21 percent from strip pits, 14 percent from culm banks, and 2 percent from the rivers and creeks draining the anthracite fields. The output of 12,858,930 tons from strip-pit operations was the highest on record, and tonnage of anthracite loaded mechanically underground reached a peak of 15,619,162 tons, both reflecting the ability of the producers to obtain equipment and supplies more readily. A strike of the anthracite miners in June caused a loss of 1,600,000 tons for the year, compared with a loss of 3,500,000 tons due to a strike in May 1945. The industry operated 271 days against 269 days in 1945. Exports reached a peak of 6,506,829 tons; the large increase over 1945 is due principally to the heavy shipments of Buckwheat Nos. 4 and 5 sizes to Europe.

Anthracite was distributed widely during the 1945–46 coal year. Of the total shipments from mines, 89 percent was destined to the New England and Middle Atlantic States, Maryland, Delaware, and the District of Columbia; other States received 4 percent. Shipments to Canada and other foreign countries accounted for 7 percent.

Statistical Trends.—Tables 1 and 2 present pertinent statistical data on the Pennsylvania anthracite industry.

TABLE 1.—Salient statistics of Pennsylvania anthracite industry, 1942–46

	1942	1943	1944	1945	1946
Production:					
Loaded at mines for shipment:					
Breakers—net tons	51,173,756	[1] 50,812,873	53,067,227	45,249,706	50,115,427
Washeries—do	1,957,926	[1] 2,401,065	3,492,187	2,551,426	3,106,521
Dredges—do	778,019	821,899	1,081,156	741,319	886,639
Sold to local trade and used by employees—net tons	4,059,403	4,233,732	3,765,641	4,273,864	4,435,536
Used at collieries for power and heat—net tons	2,358,625	2,374,051	2,295,152	2,117,594	1,962,750
Total production—do	60,327,729	60,643,620	63,701,363	54,933,909	60,506,873
Value at breaker, washery, or dredge	$271,673,000	$306,816,018	$354,582,884	$323,944,435	$413,417,070
Average sales realization per net ton on breaker shipments:					
Domestic:					
Lump and Broken	$6.03	$6.77	$7.47	$8.02	$9.23
Egg	$6.24	$6.96	$7.56	$8.13	$9.38
Stove	$6.26	$6.96	$7.57	$8.10	$9.40
Chestnut	$6.28	$6.97	$7.58	$8.12	$9.42
Pea	$4.85	$5.48	$6.11	$6.62	$7.79
Total domestic	$6.05	$6.76	$7.38	$7.93	$9.21
Steam:					
Buckwheat No. 1	$3.46	$4.00	$4.52	$4.79	$5.53
Buckwheat No. 2 (Rice)	$2.63	$3.12	$3.59	$3.91	$4.52
Buckwheat No. 3 (Barley)	$1.89	$2.25	$2.53	$2.65	$3.11
Buckwheat No. 4	$1.17	$1.55	$1.82	$1.85	$2.09
Other (including silt)	$0.83	$1.13	$1.39	$1.58	$1.90
Total steam	$2.58	$3.02	$3.42	$3.56	$4.08
Total all sizes	$4.79	$5.38	$5.91	$6.26	$7.25
Percent by sizes in total breaker shipments:					
Domestic:					
Lump and Broken	0.3	0.4	0.3	0.3	0.3
Egg	5.2	7.1	7.1	6.5	6.3

[11] Anthracite Committee. Represents coal in storage on nearest available date to the end of the month.
[12] Computed from weekly quotations from trade journals. Figures represent circular prices quoted on white ash by leading anthracite-producing companies.
[13] Bureau of Labor Statistics.

Anthracite Institute.—The Anthracite Institute expanded its research program on different phases of the utilization of anthracite at its new laboratory at Wilkes-Barre, Pa. (See details under Research.) Representatives of the institute appeared before various Government agencies in opposing the extension and infiltration of natural-gas lines into the anthracite markets. The Anthracite Institute Dealer Schools, suspended during the war, were resumed; subjects discussed included competitive fuels, draft and combustion, heating controls, air conditioning, merchandising, and public relations. The Anthracite Institute Weekly Bulletin presented ably, to the industry and public, discussions and comments on matters of interest to those concerned with anthracite.

A new era in the development of employer-employee relationship in the anthracite industry was ushered in with the inauguration of meetings of the supervisory forces of anthracite-producing companies and representatives of local offices of the United Mine Workers of America to discuss anthracite problems. The meetings were held at the institute building in Wilkes-Barre. Similarly, the formation of the Producer-Retailer Committee has promoted a closer in lustry marketing relationship between operators, wholesalers, and the coal merchants.

Anthracite Committee.—The Anthracite Committee, supported by producers representing a large percentage of the total anthracite output, kept the industry well informed on "bootleg" mining operations and compiled current data on production, employment, requirements, and other important phases of the industry. The standard anthracite size specifications issued by the committee, and effective January 14, 1946, are given in table 3 of the 1945 issue of this chapter.

Labor Relations.—Early in May 1946 the anthracite producers and the United Mine Workers of America convened to discuss a new wage agreement to supersede the one that was to expire at midnight May 30. An agreement was not reached on the expiration date, and in the absence of a contract the miners failed to report for work on May 31. A new contract was consummated on June 7, and all mine workers were directed to return to work on June 10.

The agreement represents a number of gains for the mine workers, among which were the following: Annual holidays were increased from six to eight, the additions being February 12 (Lincoln's birthday) and October 29th (Mitchell Day). Mitchell Day has been observed for a number of years, but previous contracts have not provided that it be a time and one-half holiday. In addition to the aforementioned holidays, January 1, May 30, July 4, Labor Day, Thanksgiving Day, and Christmas Day are recognized holidays, and when worked the employee shall be paid rate and one-half. Contract workers received an increase of $1.295 per start. Travel time for inside employees was increased from $1.132 for a 45-minute period to $1.339. Rates for strip-pit employees, outside men, inside company men, consideration miners, and laborers were increased 18½ cents per hour, or $1.295 for a 7-hour day. A health and welfare fund was provided by the assessment of 5 cents per ton on each ton of coal mined for sale or company use. In administering the fund the contract provides for three trustees, two of whom are to be appointed by the president of the United Mine Workers of America

and one by the operators. Vacation pay was increased from $75 to $100, with the 1946 vacation limited to 4 days, July 4 to 7, inclusive. The 6-day week agreement of voluntary work negotiated in January 1943 was rescinded; the basic work week is 7 hours 5 days a week, and the sixth day is a voluntary workday. The contract is an open one, and at any time after the date of execution either party may have the contract reopened by giving 10 days' written notice requesting a conference. At the end of 15 days, after the beginning of such negotiating conference, either party may give to the other notice in writing of termination of the agreement, to be effective 5 days after the receipt of such notice.

The anthracite industry, although not involved in the bituminous-coal strike of November 21–December 7, 1946, inclusive, did lose approximately 60,000 tons production in an unauthorized walk-out of 10,000 miners on November 21–22. The men thought that John L. Lewis, president of the United Mine Workers, had been jailed because of his dispute with the Government and, when this impression proved erroneous, returned to work.

Employment.—The pressing problem of employment in the anthracite industry, which began in 1942, was greatly relieved in 1946 when the average number of men employed totaled 78,145, compared with 72,842 men in 1945. These data do not include men working in "bootleg" holes; for employment in this type of mining see table 15. Statistics on employment in recognized operations are shown in tables 28 and 29.

Research.—The Anthracite Institute completed arrangements in 1946 for a research project that is expected to provide unprecedented facilities and personnel for experimentation with various phases of gasification, oxygenation, and pelletizing of small sizes of anthracite and anthracite fines. Plans are being made also to include pulverization and traveling-grate stokers in the scope of the program. This will be the first opportunity that research engineers have had for extended tests on a single grouping of these importantly interrelated subjects. Individually or in combination, the methods to be investigated will undoubtedly lead to improvement in utilization of anthracite fines and to upgrading of the small sizes of anthracite. The Anthratube, a new device employed to burn anthracite under an entirely new principle of combustion, was improved substantially. Great strides were made also in upgrading small anthracite fines by extrusion. Transactions of the Fifth Annual Anthracite Conference held at Lehigh University, Bethlehem, Pa., May 1947, give a detailed discussion of these subjects and other phases of anthracite research.

Investigative work, conducted by the Anthracite Flood Prevention Section of the Bureau of Mines, was directed toward obtaining data on anthracite reserves, subsidence and backfilling, underground water pools, barrier pillars, etc., that will aid in determining the ratio of flood-prevention costs to benefits and give economic justification for construction projects. Research and practical work on flood prevention are extremely important, as flood control is connected directly with the economic life of the anthracite industry.

Research on mechanical mining was continued by the Bureau. The principal objective is improved methods, thus reducing production costs. Several shearing and new-type mechanical-loading ma-

chines were brought from Germany and have been installed in various anthracite mines for experimentation, particularly in pitching seams. The expected erection of a Bureau of Mines research laboratory in the anthracite region in the near future would advance research greatly.

Research work at Pennsylvania State College, sponsored jointly by the Commonwealth of Pennsylvania and the Anthracite Institute, concerned itself chiefly with the gasification of anthracite, the preparation of activated carbon from anthracite, studies on the utilization of anthracite silt, and physical properties of anthracite under thermal shock. Work was continued on fundamentals of combustion with reference to the influence of mineral and volatile matter. The State College cooperated with various other organizations in connection with pelletizing anthracite fines.

Imports and Exports.—Exports of anthracite in 1946 reached an all-time high of 6,506,829 net tons, surpassing the previous record year (1917), when shipments from this country totaled 6,007,306 tons. From all indications, exports in 1947 will easily surpass those of 1946.

Shipments to Canada in 1946 totaled 4,513,637 tons and were greater than in any year since 1923. It is not generally realized that Canada is the anthracite industry's secondary market, and shipments to that country comprise approximately 7 percent of the total. In the 1945–46 coal year Toronto was exceeded only by New York City and Philadelphia in the quantity of anthracite received, and Montreal was the fourth largest consumer of anthracite in that coal year. During the same period, receipts of anthracite by Canada equaled shipments to Maine, Connecticut, New Hampshire, Rhode Island, Vermont, Delaware, Virginia, and the District of Columbia. The principal reasons for the increase in our exports to Canada are shortages of other space-heating fuels in that country, increased demand for fuels created by new housing, and the inability of Great Britain to export anthracite to Canada in quantities approaching its prewar levels. Before the war Great Britain shipped about 1,200,000 net tons of anthracite to Canada annually; in 1946, its total coal exports to that country were only 96,281 tons.

Exports of anthracite to Europe in 1946 were 1,927,845 tons, virtually all of which was Barley and smaller sizes. Shipments to Europe in 1947 should far exceed those of 1946. The heavy demand for anthracite in Europe is the result of the low production of coal in Great Britain and other European coal-producing countries compared with their prewar output. Details on imports and exports are given in tables 36 and 37.

OUTLOOK

The anthracite markets should readily absorb available supplies of anthracite in the 1947–48 coal year. In fact, it is quite probable that the over-all supply of anthracite will not be adequate to meet requirements, unless production during the latter part of the year shows a very substantial gain over that during the first part. It is true that many mines worked only 3, 4, or 5 days a week during the first part of the 1947–48 coal year because the markets would not absorb more production. This was due principally to the lack of buying by consumers who ordinarily purchase a substantial part

of their winter requirement of anthracite during the summer months. The efforts on the part of the industry to have these consumers purchase part of their winter requirements during the nonheating season should tend to alleviate acute demands during the winter months. Although large quantities of anthracite are being exported to Europe, most of this coal is the smaller sizes, and if it were not exported it would not be mined and thus would not add to our available supply. A number of factors account for the heavy potential demand for anthracite: (1) Large exports both to Canada and to European countries, (2) additional anthracite required in new housing, (3) the occupation and need for fuel to heat many houses that were vacant prior to the war, (4) high purchasing power of consumers, and (5) withdrawal of coke from the domestic market. To retain its markets subsequent to 1947–48 the industry will be obliged to work closely with builders, architects, and heating-equipment manufacturers to obtain a fair share of the fuel business created by the millions of new homes that will be built during the next 10 years; the installation of automatic coal-burning equipment for both home and industrial purposes will be encouraged; concentrated merchandising programs, the search for new markets, and research on new uses for anthracite and upgrading of fine sizes will be continued.

SOURCES AND ACKNOWLEDGMENTS

Final statistics of the Pennsylvania anthracite-mining industry are prepared from an annual canvass, by mail, of producers and shippers. About 98 percent of the tonnage is reported direct, and the remaining 2 percent is collected by personal visits or from reliable collateral evidence. The data on individual operations are furnished voluntarily by the producers and treated confidentially.

In assembling available detailed information, free use has been made of pertinent figures prepared by the Anthracite Institute, the Anthracite Committee, the Association of American Railroads, and the Pennsylvania Department of Mines; to all of these thanks are extended for their cordial and continued cooperation. Thanks are also due especially to the producers for reporting so promptly and so fully on their 1946 operations.

PRODUCTION

Production of Pennsylvania anthracite in 1946 totaled 60,506,873 net tons, compared with 54,933,909 tons in 1945. These statistics include deep-mined and strip-pit output, coal recovered from culm banks, anthracite purchased by the industry from "bootleggers," and river or creek coal recovered from the streams draining the anthracite fields. Also included is a small tonnage of semianthracite (107,089 tons in 1946) produced in Sullivan County. See tables 3 to 8 for production and shipments by fields, regions, sizes, and counties. Table 9 shows percentages, by regions, of various sizes in relation to total breaker product.

Before 1930 anthracite was produced only by companies who owned or leased the coal lands. During the depression in the early 1930's, unemployed miners commenced to mine anthracite in the Lehigh and Schuylkill regions from lands of the operating companies without per-

mission of the owners, transporting the coal to market by truck. Before 1941 this coal, generally referred to as "bootleg coal," was not included in the production statistics of the Pennsylvania anthracite industry by the Bureau of Mines. In 1941, however, the anthracite industry started to purchase run-of-mine coal from the so-called "bootleggers" for preparation and shipment to market. In 1946 these purchases totaled 352,112 net tons. As it has been ruled impractical to segregate the purchased anthracite from the output of the industry proper, it is included in the various production tables in the Minerals Yearbook chapters on Pennsylvania anthracite for 1941–46. As a result, the production statistics for the last 6 years are not exactly comparable with those of previous years. To compute the output per man per day for the anthracite industry, it was necessary to deduct the "bootleg" purchases from the total tonnage shipped by the recognized industry, because adequate data on man-days required to produce the "bootleg" coal are not available. Details on this procedure are discussed under Employment.

May	5,141	4,070	4,001	4,873	5,219	5,781	2,083	5,453
June	3,577	4,492	5,072	5,153	3,244	5,558	5,667	3,625
July	2,951	4,534	4,855	5,374	5,698	4,905	4,944	5,248
August	3,883	3,883	5,441	5,212	5,653	5,558	4,656	5,428
September	4,840	4,172	5,334	5,459	5,474	5,380	4,640	5,033
October	4,985	4,355	5,580	5,132	5,359	5,538	5,304	5,393
November	3,989	3,980	3,974	4,824	4,140	5,029	4,559	4,975
December	3,914	4,834	4,271	4,639	4,996	4,518	3,998	5,065
	51,487	51,485	56,368	60,328	60,644	63,701	54,934	60,507

[1] Production is estimated from weekly carloadings as reported by the Association of American Railroads and includes mine fuel, coal sold locally, and dredge coal. Includes in 1941–46 some "bootleg" coal purchased by legitimate operators and prepared at their breakers.

TABLE 12.—Culm-bank coal put through breakers, 1942–46, by fields, in net tons

Year	Northern	Eastern Middle	Western Middle	Southern	Total
1942	291,136	420,150	1,413,398	523,589	2,648,273
1943	[1] [2] 629,713	1,087,648	2,102,124	1,208,414	[1] 5,027,899
1944	[2] 1,156,489	743,867	2,528,221	1,699,875	6,128,452
1945	[1] [2] 996,037	[1] 698,876	2,335,200	2,206,187	[1] 6,236,300
1946	[2] 856,247	708,012	1,902,369	1,845,163	5,311,791

[1] Includes some washery coal.
[2] A small quantity of culm-bank coal was put through breakers in Sullivan County.

TABLE 13.—Statistical trends in the Pennsylvania anthracite industry, 1890–1946

Year	Production (net tons)	Value of production	Average value per net ton	Exports (net tons)[1]	Imports (net tons) (1)	Apparent consumption (net tons)[2]	Average number of employees	Average number of days worked	Average tons per man per day	Average tons per man per year	Quantity cut by machines (net tons)[3]	Quantity produced by stripping (net tons)[4]	Quantity loaded mechanically underground (net tons)[5]

[1] U. S. Department of Commerce.
[2] Prior to 1913 the figures of consumption take no account of producers' stocks, there being no data available for this item.
[3] Data first collected in 1911.
[4] Data first collected in 1915.
[5] Data first collected in 1929.
[6] As reported by the Commonwealth of Pennsylvania, Department of Mines.
[7] Data not available.
[8] Includes some "bootleg" coal purchased by legitimate operators and prepared at their breakers.
[9] Output per man per day calculated on legitimate tonnages only; "bootleg" purchases excluded.

Culm-Bank Coal.—The recovery of 8,431,092 tons of anthracite from culm banks in 1946 was a decline of 12 and 4 percent from the output of coal from this source in 1944 and 1945, respectively. With the urgent demand for coal during the war years, culm-bank production increased substantially, and even the 1946 tonnage was a large gain over prewar years. Much of the coal recovered from the culm banks is the smaller sizes of anthracite, and although output from this source may hold at a relatively high figure for a number of years, the quantity of anthracite recoverable from culm banks is limited. Tables 5, 6, and 12, give details on culm-bank output.

Historical Statistics.—Pertinent historical data on the Pennsylvania anthracite industry, 1890–1946, are given in table 13.

"Bootleg" Coal.—A survey by the Anthracite Committee in March 1947 revealed that 863 "bootleg" holes were being worked by 2,817 men, a substantial increase from 1,939 men working 526 holes disclosed by the committee's survey of March 1946. The production of "bootleg" coal was 1,448,529 net tons compared with 1,026,000 tons in 1945. The record production from this type of mining was 6,300,000 tons in 1941. Statistical details on "bootleg" mining for 1941–46 are given in tables 14 and 15.

TABLE 14.—Production, purchases by recognized operators, and fatalities at "bootleg" operations in the Pennsylvania anthracite industry, 1941–46

Year	Production (net tons) [1]	Purchased for preparation by recognized operations (net tons) [2]	Number of fatalities [1]	Year	Production (net tons) [1]	Purchased for preparation by recognized operations (net tons) [2]	Number of fatalities [1]

Oct. 14, 1943	791	2,725			

VALUE OF SALES

During 1946 substantial wage increases were granted to the mine workers, and in order to meet the higher labor costs and other increased mining costs it was necessary for the producers to advance anthracite prices materially. Because of these increases the average sales realization per net ton on breaker shipments increased from $6.26 in 1945 to $7.25 in 1946. (See table 16.) With the inclusion of washery

coal, colliery fuel, local sales, and dredge coal the average value per ton of the total 1946 production is $6.83, compared with $5.90 in 1945. (See table 17.)

The average realization figures in this study represent value at the breaker, washery, or dredge reported by the operating companies. The company is requested to "estimate value of the product not sold" and to "exclude selling expenses" in making its report. From this it will be seen that, when a producing concern sells its output to a separately organized sales company, the value reported will exclude the margin of the sales company and may therefore be somewhat less than the circular price at which the coal is placed on the general market. This fact should be borne in mind in considering the variations in value among different regions for the same sizes of coal, as shown in the tables.

TABLE 16.—Average sales realization per net ton on Pennsylvania anthracite shipments from breakers, 1944–46, by regions and sizes

[Value does not include margins of separately incorporated sales companies]

[1] Value given for shipments is value at which coal left possession of producing company and does not include margins of separately incorporated sales companies.

SHIPMENTS

The distribution data for the coal years 1944–45 and 1945–46 in tables 18 to 20 were compiled from reports submitted to the Bureau of Mines by producers and wholesalers of anthracite in the United States and Canada. The surveys for these 2 years were the third and fourth of a series, the first of which was for the 1942–43 coal year. The statistics in the first two surveys were used by the Solid Fuels Administration for War as an aid in its program for equitable distribution of anthracite and proved of such value to the anthracite industry that the Bureau was requested to continue the collection and publication of annual distribution data as a regular service.

As shown in table 19, 87 percent of the total shipments of anthracite to destinations in the United States and Canada were made to the New England and Middle Atlantic States. Shipments to Canada approximated 7 percent of the total distribution, while the Great Lakes region accounted for only 3 percent.

Data compiled from records of the Commonwealth of Pennsylvania Department of Mines show that anthracite shipments from the mines to destinations in the United States increased 8 percent in 1946 over 1945. Of the total United States shipments, 85 percent moved from the mines by rail and 15 percent by truck, whereas in 1945, 84 percent moved by rail and 16 percent by truck. Pennsylvania received 80 percent of the truck shipments in 1946; New Jersey and New York followed, with 9 percent each. Anthracite rail shipments, by destinations, for 1944–46 are shown in table 21 and truck movement in 1946, by months, and by States of destination, in table 22.

According to data compiled from records of the Massachusetts Division on the Necessaries of Life and the Anthracite Emergency Tidewater Bureau, rail receipts of Pennsylvania anthracite in New England increased 10 percent over 1945; tidewater receipts increased 20 percent. Details on anthracite movement to New England are given in table 23. Loadings at Lake Erie ports and receipts at the upper Lake docks each declined 10 percent from 1945. The substantial gain in Lake Erie loadings in 1944–46 over previous years is due largely to the increased use of the smaller steam sizes of anthracite by briquet manufacturers in the Great Lakes region.

TABLE 18.—Shipments of Pennsylvania anthracite, Apr. 1, 1944–Mar. 31, 1945, by States, Provinces, and countries of destination, in net tons

[1] Less than 0.005 percent.
[2] Includes Alabama, Louisiana, Tennessee, and Texas.
[3] Coal sold principally to over-the-road truckers for delivery outside the "local sales" area, and for which final destinations were not known.
[4] Includes Manitoba, Prince Edward Island, and Saskatchewan.
[5] Shipments reported to final Canadian destinations by American and Canadian wholesalers were as shown—3,901,097 net tons. American producers and wholesalers reported direct shipments to final Canadian destinations, as well as to Canadian wholesalers, in the amount of 3,900,702 net tons. This minor difference indicates almost complete reporting on the part of companies engaged in supplying the Canadian trade. Official data of the United States Department of Commerce shows total exports to Canada of 3,971,097 net tons during the coal year 1944–45.

[1] Includes "local sales."

[2] Total shipments to other States generally referred to as being in the South Atlantic area are included in "All other States."

[3] Shipments to Indiana are included in "All other States."

[4] Reported shipments by American producers and wholesalers to final Canadian destinations as well as to Canadian wholesalers were as shown—3,468,355 tons. The total shown for "Unknown destinations," 94,043 tons, represents tonnage on which final Canadian destinations were not supplied by Canadian wholesalers. Official data of the United States Department of Commerce show total exports to Canada of 3,529,042 tons during the 1945–46 coal year.

[5] Coverage on anthracite shipments to foreign countries, other than Canada, is not complete. United States Department of Commerce data show total exports to foreign countries, other than Canada, of 378,328 tons during the 1945–46 coal year.

[1] Commonwealth of Massachusetts, Division on the Necessaries of Life.
[2] U. S. Department of Commerce.
[3] Total receipts by rail and by tidewater less imports.
[4] Data not available.
[5] Less than 1,000 tons.

Shipments of anthracite from the Lehigh, Schuylkill, and Wyoming regions, 1850 to 1946, inclusive, are presented graphically in figure 1.

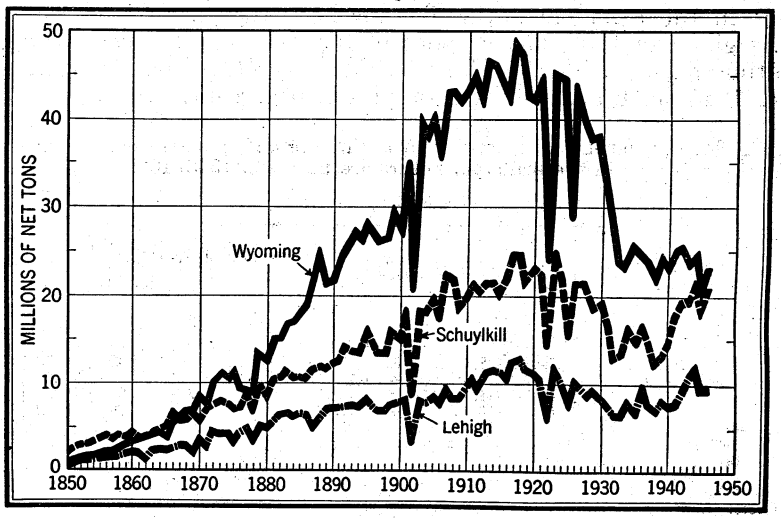

FIGURE 1.—Anthracite shipped from the Lehigh, Schuylkill, and Wyoming regions, 1850–1946.

CONSUMPTION

Consumption of anthracite in the United States in 1946, including colliery fuel and river coal, totaled 53,900,000 net tons compared with 51,600,000 tons in 1945. These data are based on production, imports, exports, and changes in producers' stocks but do not consider changes in stocks held by retail dealers, as data on stocks held by this group are incomplete. Consumption of anthracite by class 1 railroads amounted to 1,079,028 tons, an increase of 7 percent over 1945; electric power utilities used 3,453,326 tons, an increase of 11 percent over 1945. The fuel-briquet industry affords a large market for anthracite fines, and anthracite used in 1946 in the manufacture of briquets totaled 1,098,999 tons compared with 1,285,399 tons of bituminous coal used by that industry.

Competitive Fuels in the United States and Principal Markets.—Of the total shipments of anthracite to points in the United States, about 97 percent is destined to the New England and Middle Atlantic States, Maryland, Delaware, and the District of Columbia. Data on the consumption of all fuels in this market are not available; however, apparent consumption of anthracite, domestic coke, briquets, and heating and range oils, in terms of anthracite, totaled 80,111,000 net tons in 1945, a 6-percent decline from 1944. The decrease is attributable largely to decreased shipments of anthracite in 1945. Despite the decline in anthracite shipments, this fuel accounted for 56 percent of the consumption of these fuels in this area in 1945; oil 39 percent; and coke 5 percent. In addition to the recognized anthracite shipped, large quantities of "bootleg" coal, on which data are not available, are moved by truck to this area. Com-

plete data on these fuels for this market in 1946 are not available, but it is expected that total consumption will show a substantial increase over that of 1945. Details on consumption of competitive fuels in the principal anthracite markets are shown in table 24.

As given in table 25, supplies of fuels commonly used for space-heating purposes in the United States increased generally in 1946 over 1945, anthracite showing a gain of 6 percent.

[1] Pennsylvania Department of Mines; illicit coal not included.
[2] An important but undetermined part of anthracite shown as shipped to New Jersey is reshipped to New York City.
[3] Data not yet available.
[4] U. S. Department of Commerce.
[5] Less than 0.05 percent.
[6] Less than 1,000 tons.
[7] Converted to coal equivalent upon basis of 4 barrels of fuel oil equaling 1 ton of coal.
[8] Excludes bituminous coal.

TABLE 25.—Total supplies of fuels commonly used for space-heating purposes in the United States, 1937 and 1943–46

[Wherever available, figures represent quantity actually consumed for domestic heating or for space heating offices, apartments, hotels, schools, hospitals, etc. Where such figures are not available but where the fuel is known to be used chiefly for domestic or space-heating purposes, total production (or imports) is shown to indicate trend of growth]

Domestic use	193,325	208,397	215,157	[7]	[7]
House heating	45,200	83,686	84,766	[7]	[7]

[1] A considerable part of the smaller steam sizes is used by industries, railroads, and public utilities.
[2] U. S. Department of Commerce.
[3] Production plus imports less exports.
[4] Partly estimated.
[5] Data not available.
[6] An estimated one-half of total production shown is used for domestic purposes.
[7] Data not yet available.
[8] Exact data not available.
[9] Estimated.
[10] Includes all grades of fuel oil used for heating buildings.
[11] Includes gas used for heating offices, hotels, apartments, hospitals, stores, and other large buildings, as well as houses.
[12] American Gas Association.

Mechanical Stokers and Oil Burners.—According to the Bureau of the Census, United States Department of Commerce, factory sales of class 1 mechanical stokers for burning anthracite (capacity under 61 pounds of coal per hour) increased from 3,325 units in 1945 to 7,044 units in 1946. Sales of class 2 stokers (capacity 61 to 100 pounds of coal per hour) declined from 1,883 units in 1945 to 908 units in 1946. With the lifting of Government restrictions and greater availability of electric motors, shipments of oil burners for central heating plants and for industrial uses increased from 182,130 units in 1945 to 579,453 units in 1946. In 1941 shipments of oil burners totaled 303,869 units.

STOCKS

Producers' stocks, which reached a low point of 63,459 net tons in June, increased to a total of 251,168 tons in December, an increase of 93 percent over December 1945. Virtually all of the coal in storage was Buckwheat No. 2 and smaller sizes; very little tonnage of the domestic sizes was available at any time during the year. Stocks on the upper Lake docks declined 14 percent, while those held by public utilities and class 1 railroads increased 8 percent and 4 percent, respectively, over stocks held by these industries on December 31, 1945.

PRICES

The wage agreement of June 7, 1946, between the anthracite producers and the United Mine Workers of America added considerably to production costs; to compensate the operators for the additional costs the Office of Price Administration authorized, on June 25, for both producer groups 1 and 2, the following price increases: Broken, Egg, Stove, and Chestnut sizes, $1.15 per net ton; Pea, $1.00; Buckwheat No. 1, $0.70; Rice, $0.60; Barley, $0.50; and smaller than Barley sizes, $0.40 per net ton. With a few exceptions, group 1 prices were applicable to the nine larger anthracite-producing companies and group 2 to all other anthracite producers. The procedure of applying different prices to groups of producers was followed in World War I, when a number of the large companies were given lower prices than the other producers at that time. On November 9, 1946, the Price Administrator abolished virtually all price controls, including those on coal. At the end of the year the prices had not changed from those established by the Office of Price Administration effective June 25, 1946, as shown in table 27.

Retail prices of anthracite, bituminous coal, coke, and heating oils in selected cities, by months, in 1946 are shown in table 26. These prices were compiled from reports of the Bureau of Labor Statistics, United States Department of Labor.

[1] If sold for fuel, sintering, or the manufacture of calcium carbide, graphite, or activated carbon; includes (specifically but not exclusively) Buckwheat No. 4, river or dredge Barley, and smaller sizes.

EMPLOYMENT

The shortage of labor in the anthracite industry, which existed from 1942 to 1945, inclusive, was relieved in 1946 when the average number of men employed totaled 78,145—a gain of 7 percent over the 72,842 men employed in 1945. The increase in production of 10 percent in 1946 over 1945 can be attributed largely to the gain in employment.

The employment data in this chapter exclude workers in "bootleg" coal mines. According to the Anthracite Committee, 2,817 men were working 863 "bootleg" holes in March 1947. Although these workers are not included in the employment data, the coal produced by some of them was purchased (352,112 net tons in 1946) by the recognized industry for preparation and shipment to market, and coal so purchased is included in the production tables of this chapter. Complete employment data for the "bootleg" holes from which this coal was produced are not available. In calculating the output per man per day, therefore, the tons of "bootleg" coal purchased by the recognized industry were deducted from the total tonnage reported by the operators, and the resulting production was then used to calculate the output per man per day. It is true that part of the time of the

men employed at the preparation plants of the recognized companies was used to prepare this purchased coal for market; however, on a per ton basis this time is insignificant, and its omission will not detract materially from the validity of the result obtained. See tables 28 and 29 for details on labor statistics.

TABLE 28.—Men employed and days worked at operations producing Pennsylvania anthracite in 1946, by regions [1]

Luzerne	31,507	34,064			

[1] Counties producing dredge coal only.

MINING METHODS AND EQUIPMENT

Mechanical Loading.—The quantity of anthracite loaded mechanically, which decreased considerably in 1945 because of the inability of producers to obtain mechanical coal-loading equipment, increased sharply in 1946, and the output of 15,619,162 net tons is the highest on record. All of the net gain occurred in the Northern field, which is more adaptable to present-day mechanical-loading methods than are the pitching seams in the other three fields. Details on underground mechanically loaded coal are given in tables 30 to 32.

The trend of underground mechanical and hand loading and of strip-pit output in the Pennsylvania anthracite regions, 1928–46, is illustrated graphically in figure 2.

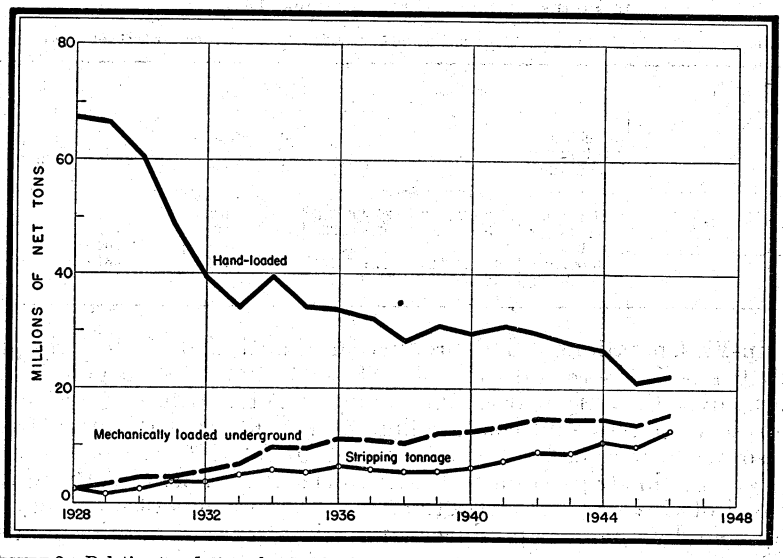

FIGURE 2.—Relative trend of mechanical loading, hand loading, and stripping of Pennsylvania anthracite, 1928–46.

Strip-Pit Operations.—The production of anthracite from strip pits in 1946 reached a record high of 12,858,930 net tons—a gain of 28 percent over the output from this source in 1945. Although recoverable reserves of strip-pit coal are limited, it is likely that output from this source will remain at a relatively high level for several years. The increase in strip-pit output in 1946 is attributable directly to the removal of Government restrictions on the purchases of strip-mining equipment by the coal producers, resulting in a substantial gain in the various kinds of equipment used in strip operations. Details of strip-pit operations are given in tables 33 and 34.

Figure 3 illustrates graphically the production of anthracite from strip pits by regions 1928–46.

[1] Data not available.

Cutting Machines.—Anthracite cut by machines increased from 1,210,171 net tons in 1945 to 1,232,828 tons in 1946; however, the machines in use decreased from 225 (189 "permissible" and 36 "all other types") in 1945 to 200 (177 "permissible" and 23 "all other types") in 1946.

Dredge Coal.—Anthracite has been recovered by dredging operations from the rivers and creeks draining the Pennsylvania anthracite region since about 1890. Most of the coal recovered is Buckwheat No. 4 and smaller sizes, and in recent years coal from this source aided considerably in alleviating shortages of fuel in the Middle Atlantic States. The production of 1,132,394 tons in 1946 was a decline of 6 percent from the 1945 output. Details are shown in table 35.

TABLE 35.—Pennsylvania anthracite produced by dredges in 1946, by rivers

Susquehanna	847,196	1,611,908	1.90
	1,132,394	2,091,324	1.85

FOREIGN TRADE[1]

Exports of anthracite in 1946 reached an all-time high. Shipments to Canada were the highest since 1923, and exports of 1,927,845 tons to Europe were unprecedented. The reason for our large exports to Europe was the inability of Great Britain to export coal to the continental countries in quantities approaching its prewar levels. Shipments to foreign countries in 1947 will doubtless exceed those of 1946. Details on imports and exports are given in tables 36 and 37.

CANADA

Coal and lignite production in Canada in 1946 increased 8 percent over 1945, and coke production declined 14 percent. Imports of anthracite, and bituminous and subbituminous coal increased 36 and 4 percent, respectively, over 1945. See table 38 for coal and coke statistics in Canada.

Cobalt

By HUBERT W. DAVIS

GENERAL SUMMARY

ALTHOUGH the demand for cobalt in 1946 was substantially less than during World War II, it was evident that the prewar peacetime upward trend in usage had projected itself into the first postwar year. In 1946, for example, industry probably consumed 60 percent more cobalt than in 1939. Because of the importance of cobalt in permanent magnets, high-temperature alloys, cutting tools, glass-metal seals, and ground-coat frit for porcelain enamel, as well as for other applications, it is expected that its peacetime demand will expand greatly. The production of cobalt before 1945 was relatively small; consequently, world output was insufficient to permit much expansion in use of this metal. During World War II, however, the capacity of mines to produce cobalt ore and of refining plants to provide metal, oxide, and other forms of cobalt was expanded phenomenally; as a result, industrialists interested in new applications are assured adequate supplies.

Taking the lead in the postwar demand for cobalt are permanent magnets and magnet steels, which took an all-time high of 1,456,522 pounds in 1946, or 10 percent more than in the previous record year 1944. Moreover, usage of cobalt for these purposes accounted for 35 percent of the total consumption in 1946. Concerning the importance of permanent magnets in modern industry, the following comment is of interest.[1]

> Probably no material has become more well known and widely used in a comparatively short period as have the Alnico series of permanent magnet alloys, produced by several concerns under license from the General Electric Co. Alnico magnets have been the means of thousands of improvements in the radio, electricity and electronics fields, and as components of machinery in a wide variety of industries and in household equipment. [General Electric Co. also produces Alnico magnets.]

The functions of permanent magnets have been grouped into four general classifications by the Indiana Steel Products Co., as follows:

1. Transformation of mechanical to electrical energy.
2. Transformation of electrical to mechanical energy.
3. Tractive effort.
4. Changing apparent characteristics of a material.

A review of permanent magnet steels, covering their metallurgy, engineering possibilities, physical qualities, and methods of fabrication, has been presented by Ruder.[2] A new permanent-magnet

[1] International Nickel Co., Inc., Nickel Steel Topics: Vol. 16, No. 1, February 1947, p. 6.
[2] Ruder, W. E., Permanent Magnet Steels: Iron Age, vol. 157, No. 19, May 9, 1946, pp. 65-69.

material—Vicalloy, an alloy of vanadium, iron, and cobalt—has been described by Nesbitt.[3] A new magnetic alloy—Hiperco, containing 35 percent cobalt, 64 percent iron, and 1 percent chromium—"that carries more magnetism than any other alloy practical for use in motors and generators and is tough enough to withstand intense vibration" has been announced.[4]

A major contribution to victory in World War II was the development of high-temperature alloys capable of maintaining strength at high operating temperatures and resisting wear, corrosion, and erosion. Informative articles on high-temperature alloys have been contributed by Knight[5] and Browne.[6] According to Knight, at least 40 high-temperature alloys, of which about 35 were designed to stand temperatures of 1,200° to 1,600° F., have been developed for various components of gas turbines, as well as in jet aircraft engines and turbosuperchargers. Of these high-temperature alloys, 13 contain cobalt ranging from 13 to 66 percent. Despite the fact that much less cobalt was employed in high-temperature alloys in 1946 than in recent years, because of their outstanding characteristics the peacetime potentialities of cobalt-base alloys appear promising. The following analyses of cobalt-base high-temperature alloys have been reported by Knight.

The quantity of cobalt employed in ground-coat frit and pigments increased sharply in 1946. The larger usage of cobalt in ground-coat frit may foretell an upward trend of substantial magnitude, inasmuch as the prefabricated-steel housing program will feature walls and built-in shelves and closets of porcelain enamel. Consequently, as the production schedule for these houses gains momentum, a corresponding increase in the demand for cobalt is anticipated.

Production of cobalt ore in the United States in 1946 declined substantially from the record established in 1945. Imports of cobalt in all forms were also much smaller than in 1945.

The consumption of cobalt contained in ore and alloy by refiners or processors in the United States was 58 percent less than in 1945, but consumption of cobalt products by industrial consumers declined only about 6 percent, owing mainly to the increased demand for cobalt for permanent magnets and magnet steel, ground-coat frit, pigments, and driers.

Effective June 12, 1946, price control over cobalt was removed by the Office of Price Administration. Despite this removal, however, metal containing 97 to 99 percent cobalt remained unchanged at the former ceiling price of $1.50 to $1.57 a pound on contract.

MINE PRODUCTION AND DEVELOPMENT

Despite the fact that the United States is the largest consumer of cobalt in the world, only a small part of its requirements is furnished by domestic ore, as is evident from the next table, which shows production and shipments for 1921–44; the Bureau of Mines is not at liberty to publish figures for 1945 and 1946.

Cobalt ore produced and shipped in the United States, 1921–44 [1]

[PARTLY ESTIMATED]

[1] Bureau of Mines not at liberty to publish figures for 1945 and 1946.

A complete record of the output of cobalt in the United States before 1921 is not available. Nevertheless, production has been small, and virtually all was from deposits near Fredericktown, Madison County, Mo., where a complex ore consisting of copper, lead, cobalt, and nickel has been mined sporadically. In fact, cobalt and nickel in small quantities were produced for many years preceding 1857 at the La Motte mine. Prior to 1921 attempts had been made by several companies to establish a regular production of cobalt in Missouri, and despite the fact that large sums were spent in these endeavors, none of the metallurgical processes developed for treating the complex ore proved entirely satisfactory; consequently, only spasmodic outputs were made. There was no commercial production of cobalt ore in Missouri during 1921–43. In July 1944, however, the St. Louis Smelting & Refining Co. began producing a cobalt-nickel concentrate at its property near Fredericktown and in 1945 was the chief producer in the United States. In September 1946, the company suspended the production of nickel-cobalt concentrate but is continuing to study the problem of making a successful recovery of separate products of nickel and cobalt.

Although cobalt has long been known to occur as a minor constituent of the iron ores at Cornwall, Pa., only during the past several years were experiments made on its recovery. The cobalt is contained in the sulfides that accompany the magnetite, and since 1940 there has been a regular production from this source by the Bethlehem Steel Co.

Aside from the cobalt ore produced in Missouri and Pennsylvania, there has been little other commercial production in the United States. About the middle of the nineteenth century, there was a small output

of arsenical cobalt-nickel ore in Connecticut. Oregon has been credited with spasmodic shipments of arsenical ore containing cobalt, gold, and silver; Idaho and Alabama have each produced a carlot; and Nevada has contributed 1 or 2 carlots. A small quantity of concentrate containing cobalt and nickel has been recovered as a byproduct of froth flotation of talc at Burlington, Vt. However, most of the output reported for 1921–39 represents cobalt contained in residues recovered at the electrolytic zinc plant of the Sullivan Mining Co., Kellogg, Idaho; none has been marketed.

Production and shipments of cobalt ore in the United States were much less in 1946 than in 1945; however, the Bureau of Mines is not at liberty to publish the figures for these years at this time.

The Bethlehem Steel Co. was the chief producer of cobalt ore in the United States in 1946, but its output and shipments were 20 and 1 percent, respectively, less than in 1945. The cobalt-bearing material (averaging 1.43 percent cobalt in 1946) is shipped to The Pyrites Co., Wilmington, Del., where it is processed to metal and other cobalt products.

In 1946 the St. Louis Smelting & Refining Co. produced some ore and recovered some calcines from earlier operations at its property near Fredericktown, Madison County, Mo. The cobalt material averaged 2.35 percent cobalt and was also shipped to The Pyrites Co., Wilmington, Del. Production of cobalt by the St. Louis Smelting & Refining Co. was suspended in September 1946. The company has dewatered the old workings of the mine of the Missouri Cobalt Co. near Fredericktown to determine what reserves may remain of lead and copper ores particularly but of cobalt and nickel ores as well.

The Sullivan Mining Co., Kellogg, Idaho, recovered 74 short tons of residues, containing 5,095 pounds of cobalt, at its electrolytic zinc plant in 1946. However, as in previous years, it made no shipments.

Development was continued in 1946 at the Blackbird mine near Salmon, Idaho, by the Calera Mining Co., a wholly owned subsidiary of the Howe Sound Co. Approximately 4,000 feet of drifting and crosscutting were done in 1946 with encouraging results. The ore carries copper and gold, as well as cobalt. According to the Howe Sound Co.:[7]

> Research to develop processes for the separation of the several metals included in the ore and for refining the cobalt progressed favorably. When this work is concluded a decision will be reached in regard to the size and type of plant which will be required.

CONSUMPTION

Refiners or Processors.—Consumption of cobalt contained in alloy and ore by refiners or processors was 2,009,018 pounds in 1946, a decrease of 58 percent from 1945.

Industrial Consumers.—Consumption of cobalt (exclusive of salts and driers) by industrial consumers was 3,220,027 pounds in 1946, a decrease of 13 percent from 1945. The quantity of salts and driers used is not known; but, measured by production, consumption was 958,480 pounds in 1946 compared with 728,596 pounds in 1945. Thus, it is apparent that consumption of cobalt by industrial consumers

[7] Howe Sound Co., Annual Report: 1946, p. 3.

Cobalt consumed [1] by refiners or processors in the United States, 1945–46

Cobalt material	Pounds of cobalt	
	1945	1946
Alloy and ore	4,808,825	2,009,018
Fines and granules	453,538	499,737
Hydrate	133,831	128,740
Rondelles	64,872	148,197
Carbonate	18,460	19,243

[1] The fines, granules, hydrate, rondelles, and carbonate consumed originated from alloy and ore; therefore, combining alloy and ore with these materials results in duplication.

Specified cobalt products [1] produced and shipped in the United States, 1945–46, in pounds

Product	Produced		Shipped (gross weight) [2]
	Gross weight	Cobalt content	
1945:			
January–September:			
Oxide	371,040	261,560	566,545
Hydrate	260,268	98,197	260,065

Other	12,810	2,666	13,902
Driers	5,767,754	376,166	5,343,962
July–December:			
Oxide	110,466	77,438	102,616
Hydrate	348,850	151,567	327,600
Salts	307,077	78,717	315,777
Driers	5,821,930	409,983	6,011,881

[1] In addition, cobalt metal (rondelles, granules, fines, and powder) was produced, but the Bureau of Mines is not at liberty to publish figures on production and shipments.
[2] Comprises shipments to customers, deliveries to Office of Metals Reserve, and consumption at producing plant. Excludes sales of imported products and sales by Office of Metals Reserve.

totaled 4,178,507 pounds in 1946 compared with 4,439,483 pounds in 1945. The largest use of cobalt in 1946 was for magnets and magnet steel, which accounted for 35 percent of the total quantity consumed; usage for these purposes, moreover, established a new high and was 32 percent greater than in 1945. The second-largest quantity of cobalt was employed in stellite and stellite-type alloys, but only one-third as much was used as in 1945. The third-largest amount was employed in ground-coat frit, which used almost 2½ times more than in 1945. Consumption of cobalt in pigments and other nonmetallic purposes also was substantially greater than in 1945. The quantities of cobalt employed in cemented carbides declined conspicuously, and much less was used also in high-speed steel.

Cobalt consumed in the United States, 1943–46, by uses [1]

[EXCLUSIVE OF SALTS AND DRIERS]

Use	Pounds of cobalt			
	1943	1944	1945	1946
Metallic:				
High-speed steel	399,736	361,437	335,059	224,049
Stellite and stellite-type alloys	2,041,409	1,757,673	[2] 1,387,796	496,090

	3,915,158	3,988,912	[2] 3,710,887	3,220,027

[1] Comprises metal, oxide, purchased scrap, and cobalt-nickel compound, and ore used directly in magnets and other industrial applications.
[2] Revised figure.

FOREIGN TRADE [3]

Imports—Imports of cobalt into the United States in 1946 were 27 percent less than in 1945 and the smallest since 1939. The Belgian Congo continued to be the chief source of imports; in 1946 it supplied 250,112 pounds of metal and 1,648,595 pounds of alloy containing 717,337 pounds of cobalt. Belgium supplied 1,685,470 pounds of metal and 1,073,980 pounds of oxide containing about 757,200 pounds of cobalt, chiefly from Belgian Congo alloy. Canada supplied 657,787 pounds of ore containing 73,892 pounds of cobalt and the United Kingdom 650 pounds (gross weight) of oxide and 350 pounds (gross weight) of salts and compounds.

The duty on cobalt oxide continued to be 10 cents a pound, on sulfate 5 cents a pound, linoleate 10 cents, and on other cobalt salts and compounds 30 percent ad valorem. Cobalt metal and ore entered the United States duty free.

Cobalt imported for consumption in the United States, 1942–46, by classes

Year	Alloy [1]			Ore [2]		
	Pounds		Value	Pounds		Value
	Gross weight	Cobalt content		Gross weight	Cobalt content	
1942	10,313,867	4,188,687	$3,971,056	834,797	91,597	$99,898
1943	10,110,879	4,357,335	(3)	10,556,042	1,268,788	1,620,869
1944	8,500,516	3,737,000	(3)	473,529	61,123	53,434
1945	8,397,145	3,616,000	(3)	859,940	109,112	91,554
1946	1,648,595	717,337	(3)	657,787	73,892	59,861

See footnotes at end of table.

[3] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Cobalt imported for consumption in the United States, 1942–46, by classes—Con.

Year	Metal		Oxide		Other salts and compounds	
	Pounds	Value	Pounds	Value	Pounds	Value
1942	148,304	$228,452			200	$448
1943	266,670	373,948	58,928	$95,463	56	164
1944	73,088	102,323	225,609	400,356	115	354
1945	946,475	1,582,670	120,672	215,563	224	700
1946	1,935,582	2,749,326	1,074,630	1,450,236	350	778

[1] Data for 1942 include 2,384,915 pounds of alloy, containing 980,000 pounds of cobalt and valued at $867,799, received in December 1942 but recorded as January 1943 by U. S. Department of Commerce. Data for 1943–46 reported by importer to Bureau of Mines; not separately classified by U. S. Department of Commerce.
[2] Data for 1943, 1944, and 1946 adjusted by Bureau of Mines to exclude alloy.
[3] Data not available.

Exports.—Exports of cobalt are small, as is evident from the accompanying table.

Cobalt exported from the United States, 1944–46, by classes

Class	1944		1945		1946	
	Pounds	Value	Pounds	Value	Pounds	Value
Ore and concentrates	5	$33	50	$95	1,509	$2,630

Salts and compounds	40,046	30,488	83,041	48,835	(1)	(1)

[1] Not separately classified by U. S. Department of Commerce.

WORLD REVIEW

Despite the fact that cobalt is produced in many countries, five—Belgian Congo, Northern Rhodesia, French Morocco, the United States, and Canada—have contributed virtually the entire world output in recent years, as is apparent from the accompanying table,

World production (partly estimated) of cobalt, 1939–46, by countries, in metric tons [1]

[COMPILED BY B. B. MITCHELL]

Country [1]	Cobalt content							
	1939	1940	1941	1942	1943	1944	1945	1946
Australia	13	12	13	14	15	9	10	11
Belgian Congo	1,080	2,301	2,256	1,656	2,061	1,877	3,500	(2)
Bolivia (exports)		2	2	(3)	(3)			
Burma	[4] 229	218	73	(2)	(2)	(2)	(2)	(2)
Canada	332	360	119	38	80	16	49	34
Chile	(2)	(2)	2	(3)	3	5	1	(2)
Japan			(3)	1	3	15	11	
Morocco, French	680	330	65	3	216	243	(2)	(2)
Northern Rhodesia [4]	1,598	1,223	650	914	1943	978	874	552
United States (shipments)		58	237	300	346	253	(5)	(5)
Total (estimate)	4,200	4,800	3,700	3,300	4,100	3,800	6,000	(2)

[1] In addition to countries listed, Brazil, China, Finland, Germany, Italy, Mexico, Spain, and Sweden produce cobalt, but production data are not available.
[2] Data not available.
[3] Less than 1 ton.
[4] Year ended June 30 of year stated.
[5] Bureau of Mines not at liberty to publish figures.

which shows world production by countries, 1939–46, insofar as statistics are available.

Belgian Congo.—The world's chief source of cobalt continues to be the Belgian Congo, where the Union Minière du Haut Katanga is the sole producer. Production of cobalt in Belgian Congo was begun in 1924, when 273 metric tons were produced; since that year, output has increased almost steadily and reached a peak of 3,500 metric tons in 1945. The company has a cobalt mine and a cobalt-concentrating plant at Kabolela and a cobalt mine and ore-treatment plant at Kamoto. At Jadotville it has six single-phase electric furnaces (monthly capacity, about 300 tons) for smelting the cobalt-bearing ores and slags. The cobaltiferous red alloy from the electric furnaces is refined in two rotary furnaces; and the resultant crude cobalt, which is cast into ingots, is shipped chiefly to the United States and to Belgium, where it is processed to metal, oxide, salts, and driers. The solutions used in the electrolytic plants contain cobalt, which is recovered by a special process of precipitation. The precipitates are treated by electrolysis in a refining plant (also at Jadotville) capable of producing about 225 tons a month of granules of high purity and very low carbon content.

Canada.—Production of cobalt (content) in Canada decreased to 74,902 pounds in 1946 from 109,123 pounds in 1945. The Silanco Mining & Smelting Corp., which operates a concentrator and mines cobalt-silver ore at the Agaunico and other properties in and about Cobalt, Ontario, was the chief producer in both years. The construction of a smelter by this company, noted in the chapter of this series for 1945, was not completed in 1946.

French Morocco.—Production of cobalt ore at the Bou Azzer and Graara mines was maintained at 200 tons monthly during the first half of 1946.[9] Several hundred tons of cobalt ore have been sent from Morocco to French processing centers.[10] Moroccan ore contains nickel and gold as well as cobalt, as indicated by the following partial analyses of some shipments made to the United States in 1943.

Cobalt (percent)	Nickel (percent)	Gold (ounces per ton)	Cobalt (percent)	Nickel (percent)	Gold (ounces per ton)
15.13	1.89	3.43	12.25	1.14	2.42
14.46	1.41	1.16	14.91	2.17	5.18
12.21	1.37	1.58	11.80	1.65	2.28

Northern Rhodesia.—The second-largest producer of cobalt in the world is Northern Rhodesia, where the mineral occurs associated with copper in certain ore found in the copper mines of the Rhokana Corp.[11] The output of alloy was 1,527 short tons containing 609 tons of cobalt in the year ended June 30, 1946, compared with 2,415 tons containing 963 tons in 1945.

GENERAL SUMMARY

THE COKE INDUSTRY, an important factor in the conversion of the Nation's heavy industries from war production to peacetime operations, encountered many obstacles in 1946, and the total coke output—58,497,848 tons—represents a decrease of 13 percent from 1945 and 21 percent from the 1944 peak. The decline was due to interruptions in coking operations because of labor difficulties in the steel and bituminous-coal industries. The 4-week steel strike beginning on January 21, 1946, caused the rate of coke production at oven plants connected with iron and steel works to decline from 82.1 percent of capacity in December 1945 to a low of 36.3 percent in February 1946. During this period beehive-coke ovens could not ship their coke to steel plants and in seeking other markets exported such large quantities that monthly exports in the first 2 months of 1946 were the highest on record. Nonfurnace or merchant oven plants were not directly affected by the stoppage and operated at 90 percent of capacity in this period. Settlement of the steel strike started the flow of coke to blast furnaces, and in March the average daily production of beehive and oven coke increased 64 per-

cent over the February figure; but, with stoppages in the bituminous-coal industry in April and May, the output of oven coke dropped sharply from the March rate, and beehive production declined to the lowest point since May 1939. Settlement of the coal strike on

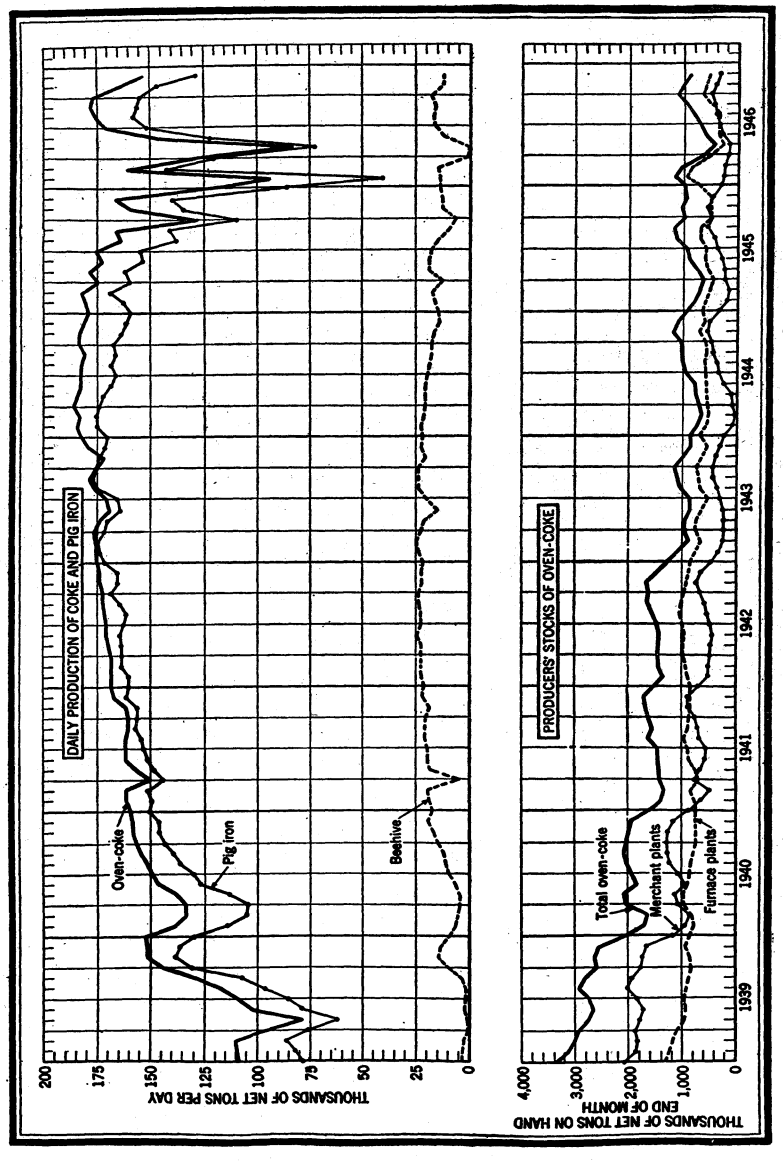

FIGURE 1.—Average daily production of beehive and oven coke and pig iron and producers' stocks of oven coke, 1939–46, by months.

May 29 caused production to increase steadily until November 21, when the bituminous-coal miners walked out again, forcing oven-coke operators to slow their coking schedules and practically closing all beehive plants until the strike ended on December 7.

These interruptions in plant operations necessarily reduced the consumption of coking coal, and 13 percent less was charged into the ovens than in 1945. Although requirements of coking coal in 1946 were lower than in the previous year, supplies of high-grade coking coals were extremely limited throughout the year. The Solid Fuels Administration, in order to distribute the available coal equitably and prevent the shut-down of essential industrial operations, issued a number of emergency distribution regulations and "freeze" orders in 1946. Coal was allocated widely during the coal and transportation strikes, and emergency regulations were used for the latest time during the coal strike in November-December. The Bureau of Mines cooperated closely with the Solid Fuels Administration in collecting and compiling statistical data relating to requirements, consumption, stocks, and days' supply of coking coal at individual oven-coke plants.

General increases in mining and transportation costs in 1946 caused the average value of coking coal delivered to coke plants to rise $0.45 per ton over 1945, a gain of nearly 9 percent. The average values of $5.77 and $3.59 per ton for coal delivered to oven- and beehive-coke plants, respectively, were the highest on record.

To meet the tremendous wartime demand for coke and coal-chemical materials, the oven-coke industry increased its annual coke capacity more than 11,700,000 tons, or 20 percent, between 1940 and 1946. The coke capacity of beehive ovens, which increased about 1 million tons a year during the early phases of the war in order to supplement oven-coke output, dropped sharply after the close of the war but increased in 1946 because of the extremely heavy demand for industrial coke. Indications in the first half of 1947 point to a substantial increase in capacity and production of beehive coke during 1947.

The disposal pattern of coke in 1946 followed, in general, that of 1945, blast furnaces accounting for 75 percent of the total consumption; iron foundries, 5 percent; the manufacture of producer gas and water gas, 7 percent; other industrial purposes, 4 percent; and domestic coke sales, 9 percent. Sales of coke for domestic heating declined greatly from 1945 and equaled only 62 percent of the 1940 figure.

According to data compiled by the Bureau of Mines from records of the United States Department of Commerce, exports of coke to foreign countries declined 17 percent from 1945. Although exports in the first quarter of 1946 during the steel strike were unusually high, shipments in the last three quarters dropped sharply in order that requirements in this country might be met. As in previous years, imports were small, representing less than 0.1 percent of the total consumption.

Coke prices in general followed the rise in coal and labor costs. The average increases in the price per ton of coke sold by producers (merchant sales) in 1946 were as follows: Furnace coke, $0.84; foundry coke, $1.03; coke used in the manufacture of water gas, $1.37; other industrial, $1.05; and domestic coke, $1.19.

Total year-end stocks of coke at producing plants in 1946 were 928,766 tons, a slight decrease from the 1945 total. Stocks of furnace coke increased 48,620 tons, but foundry and domestic coke reserves dropped 10,706 and 40,961 tons, respectively.

TABLE 1.—Salient statistics of the coke industry in the United States in 1946

	Vertical slot-type ovens	Beehive ovens	Total
Coke produced—			
At merchant plants:			
Net tons	12,388,485	(1)	(1)
Value	$122,963,480

Crude light oil and derivatives	$23,581,473		$23,581,473
Other coal-chemical materials [2]	$9,897,527		$9,897,527
Total value of coke and breeze produced and coal-chemical materials sold [3]	$623,005,548	$36,782,966	$659,788,514

[1] Not separable.
[2] Includes naphthalene, tar derivatives, and miscellaneous coal-chemical materials.
[3] Includes value of tar used by producer.

Preliminary data from the Bureau's annual survey of employment at coke plants revealed that, in 1946, 18,700 men were employed at oven-coke plants and worked 53,350,000 man-hours, reductions from 1945 of 1,754 men and 5,942,507 man-hours. The number of men

employed at beehive plants increased from 2,533 in 1945 to 2,800 in 1946 but the man-hours worked decreased from 5,082,575 to 4,550,000. Several plants that had been idle for some months resumed operations in the latter part of 1946, accounting for the increased number of men employed.

The effect of reduced output of coke was reflected all through the basic coal-chemical materials and further into the derivatives of tar and light oil. Production of crude tar decreased 14 percent from 1945; ammonia (NH_3 equivalent of all forms), 15 percent; crude light oil, 16 percent; and coke-oven gas, 13 percent. The total value realized through the sales of all coal-chemical materials at producing plants decreased only 9 percent from 1945 to $157,389,875 chiefly because of price increases for gas, tar, and ammonium sulfate. The value of all coke, breeze, and coal-chemical materials in 1946 was $659,788,514, a 6-percent decrease from 1945.

TABLE 2.—Statistical trends of the coke industry in the United States, 1937 and 1943–46

	1937	1943	1944	1945	1946
Production:					
Oven coke—net tons	49,210,748	63,742,676	67,064,795	62,094,288	53,929,447

GOVERNMENT REGULATIONS

The Solid Fuels Administration for War in February 1946 announced that after April 1, 1946, producers, distributors, and consumers of special-purpose coals would be free to make agreements and that the filing of contracts with the Administration was no longer required. The statement stipulated, however, that after April 1, 1946, SFAW would continue to exercise its authority to issue specific emergency directions under Regulation 1.

Work stoppages in the bituminuous-coal industry in the spring and fall of 1946 created a shortage of coal, and the SFAW issued certain specific "freeze" orders and emergency regulations in order to distribute equitably supplies of coal available. Following the end of the coal strike in December, SFAW modified its distribution rules in an interim direction, effective December 8, 1946, which, among other provisions, set up a preference listing of essential users of bituminous coal and domestic coke. Steel plants were not included in any of the preference groups.

The 4-week steel strike in the early part of 1946 curtailed the output of coke drastically at integrated coke and steel plants and intensified the shortage of coke. This condition prompted the Civilian Production Administration to issue Direction 10 to Priorities Regulation 32 on April 2, 1946. This direction limited coke inventories of any person (including a Government establishment) to a 20 days' supply. The coal strike in the fall forced coke operators to curtail their operations, and CPA again limited not only inventories but also deliveries of coke made from bituminous coal.

Ceiling prices on beehive and oven coke were raised in 1946 by the Office of Price Administration to compensate producers for increased manufacturing costs resulting from advances in coal prices and in wages. Adjustable pricing by producers of oven and beehive coke was authorized by OPA on May 16 and 31, respectively, in Order 21 to MPR 29 and Order 18 to MPR 77. This action was taken to permit producers to enter into price agreements until the effect on the price of coke of the new increases in coal prices and in wages could be determined accurately. Following completion of the study by OPA on the effects of the increased coal costs, maximum prices of oven coke were increased $1.35 per ton, effective June 28, 1946, and on August 22, 1946, beehive coke produced in the Connellsville district[1] were increased $1.35 per ton for hand-drawn coke and $1.25 per ton for machine-drawn coke.

On June 13, 1946, OPA issued Amendment 3 to MPR 447, which provided for an increase in the price of tar to producers where it could be shown that tar was being diverted from distillers and used as a fuel by the producer because of the price differential between fuel oil and tar.

All controls over prices on coal, coke, and related products were abolished by OPA Supplementary Order 193, effective November 10, 1946.

SCOPE OF REPORT

This chapter is based on data supplied to the Bureau of Mines by coke-plant operators in the United States. The terms designating certain kinds of coke and related products have been revised in this report to agree with terminology embodied in present-day trade practices. The term "oven coke" is used when referring to the solid material formerly called "byproduct coke" which is produced in high-temperature, vertical slot-type coke ovens; coke produced in beehive ovens is referred to as "beehive coke" and coke produced in coal-gas retorts as "retort coke." The gaseous and liquid materials formerly called "byproducts" are designated as "coal-chemical materials." These changes do not affect the statistical information in this report in any way, and it is therefore comparable to that issued in previous years. The statistics throughout the principal part of this report are confined to oven and beehive coke. Salient statistics on low- and medium-temperature carbonization are shown separately in table 4 and similar data for retort coke in table 5. Coke is also made by other processes not included in this report, including the refining of petroleum and of crude tar. Preliminary figures for 1946 indicate that the production of petroleum coke and coal-tar-pitch coke was 2,124,200 and 92,000 tons, respectively. The standard unit of measurement in the coke industry in the United States is the short or net ton of 2,000 pounds; unless otherwise specified, it is the unit employed throughout this chapter.

MEDIUM- AND LOW-TEMPERATURE COKE

TABLE 4.—Salient statistics of medium- and low-temperature carbonization plants in the United States in 1946

	Quantity	Value
Coke produced ..... net tons	131,194	$1,079,479
Screenings or breeze produced ..... do	14,490	21,011
Coal carbonized ..... do	230,797	689,803
Average per ton	----------	2.99
Average yield in percent of coal carbonized:		
Coke	56.84	----------
Breeze	8.75	----------

In operation December 31	1,205	[2] 582	1,787
Annual coal capacity, net tons	652,100	956,400	1,608,500
Coke used by producer:			
Net tons	168,449	212,632	381,081
Value	$1,381,901	$1,729,741	$3,111,642
Coke sold to other consumers:			
Net tons	120,950	267,395	388,345
Value	$1,139,256	$2,504,414	$3,643,670
Stocks on January 1, 1947:			
Coke, net tons	19,636	49,583	69,219
Breeze, do	4,395	14,407	18,802
Coal chemical materials:			
Tar:			
Production, gallons	5,555,805	11,908,587	17,464,392
Sales, do	6,202,302	12,134,739	18,337,041
Value of sales	$285,244	$599,077	$884,321
Stocks on January 1, 1947, gallons	1,219,058	1,338,598	2,557,656
Per ton of coal charged, do	12.17	15.20	14.08
Ammonia liquor (NH_3 content):			
Production, pounds		1,259,469	1,259,469
Sales, do		1,268,254	1,268,254
Value of sales		$31,703	$31,703
Stocks on January 1, 1947, pounds		110,238	110,238
Per ton of coal charged, do		3.52	3.52

[1] Additional data in Production of Coke and Coal Chemical Materials from Coal-gas Retorts in 1946, Bureau of Mines Mineral Market Report 1516, May 12, 1947.
[2] Includes 15 gas ovens.

OVEN AND BEEHIVE COKE AND COKE BREEZE

GROWTH OF INDUSTRY

TABLE 6.—Historical statistics of coke industry in the United States, 1880 and 1890–1946

Year	Production (million net tons): Oven coke	Beehive coke	Total	Percent of total production from slot-type ovens	Ovens in existence: Slot type	Beehive	Slot-type ovens under construction at end of year	Coal charged (million net tons)	Yield of coke from coal (percent)	Average value of coke per ton at plant	Total value at plant (million dollars): Beehive coke	Oven coke	All coal-chemical materials [1]	Total coke and coal-chemical materials
1880	------	3.3	3.3	------	------	12,372	------	5.2	63.7	$1.99	7	------	------	7
1890	------	11.5	11.5	------	------	37,158	------	18.0	63.9	2.02	23	------	------	23

[1] Value for tar up to and including 1917 represented that of tar "obtained and sold," which did not always include value of tar used by producer. Beginning with 1918, tar used by producer is specifically included. Value of breeze produced at over-coke plants is included for those years for which it was reported, namely, 1916, 1917, and 1919–46. For other coal-chemical materials, only value of those sold is included. Value of breeze produced at beehive plants is not included, as it has usually been much less than a million dollars.

[2] No accurate data on value of the coal-chemical materials available.

MONTHLY AND WEEKLY PRODUCTION

Tables 7 to 10 summarize weekly and monthly production of coke. Weekly production of beehive coke is estimated from records of carloadings received each week from all coke-carrying railroads. Monthly data on beehive and oven coke are based upon reports from producers. The weekly and monthly figures have been adjusted to the annual total ascertained by direct canvass of the producers.

TABLE 7.—Coke produced in the United States, 1937 and 1944–46, by months and average per day, in net tons [1]

Month	1937		1944		1945		1946

[1] Before 1941 daily average production of beehive coke was calculated by subtracting Sundays and holidays in each month; 1942–45 daily average has been calculated by dividing total monthly production by total number of days in month.

PRODUCTION BY FURNACE AND MERCHANT PLANTS

The terms "furnace" and "merchant" plants, as used in this report, apply to oven-coke plants only. When compared with the 1945 output, production at both groups of plants shows marked reductions. Production of coke at furnace plants in 1946 was affected not only by work stoppages in the bituminous-coal industry but also by the steel strike in January and February; as a consequence, output dropped 15 percent below that in 1945. Although production at merchant plants was not directly affected by the steel strike, curtailed operations at these plants during the two coal strikes reduced the output of this

group 8 percent from 1945. Because of the higher level of activity of the merchant plants during the steel strike, the proportion of the total oven-coke production from this group increased from 21.6 percent in 1945 to 23.0 percent in 1946. The number of active furnace plants remained the same as in 1945 because loss of the Sheffield Steel plant at Houston, Tex., was offset by the change in classification of the Morgantown, W. Va., plant from "merchant" to "furnace" following its lease from the War Department by the Sharon Steel Corp. in July. The decrease in number of merchant plants from 1945 was due (in addition to the above change) to the removal of the plant at Battle Creek, Mich., which suspended operation in July 1945. Tables 11 and 12 summarize statistics on production of both groups of plants.

TABLE 11.—Number and production of oven-coke plants connected with iron furnaces and of other plants in the United States, 1913, 1918, 1937, and 1944–46

Year	Number of active plants		Coke produced (net tons)		Percent of production	
	Furnace plants	Merchant plants	Furnace plants	Merchant plants	Furnace plants	Merchant plants
1913	20	16	9,277,832	3,436,868	73.0	27.0
1918	36	24	19,220,342	6,777,238	73.9	26.1
1937	43	42	36,134,209	13,076,539	73.4	26.6

PRODUCTION BY STATES AND DISTRICTS

With the exception of California and Minnesota, production of oven coke in all producing States in 1946 declined from 1945. Texas dropped from the list of producing States, as no coke was made at either of the two oven-coke plants in that State. States reporting the largest decreases in tonnage were: Pennsylvania, 2,460,416 tons from 1945; Indiana, 1,162,680 tons; Ohio, 954,130 tons; and New York, 747,300 tons. The decline in these four States accounted for 65 percent of the total decrease in oven-coke output in 1946. Pennsylvania maintained its position as the leading coke-producing State, supplying nearly one-fourth of the total oven-coke output. Following Pennsylvania, in order of production, were Ohio, Indiana, New York, and Alabama, which combined produced 46 percent of the total.

Production of beehive coke increased in two States and decreased in four when compared with 1945. Although production of beehive coke in Pennsylvania decreased 12 percent from 1945, it remained the leading producer and supplied 88 percent of the total beehive output. Production in West Virgina and Virginia—the second and third largest beehive-coke producing States—also dropped sharply, with decreases of 23 and 10 percent, respectively. For the third consecutive year, production increased in Kentucky, and Utah's output gained slightly over 1945.

NUMBER AND TYPE OF OVENS

Vertical Slot-Type Coke Ovens.—The only new coke ovens completed in 1946 were 1 battery consisting of 47 ovens built by the Citizens Gas and Coke Utility at Indianapolis, Ind., and 1 battery of 37 by the Public Service Electric and Gas Co., Camden, N. J. In addition, the Carnegie-Illinois Steel Corp. completely rebuilt and placed in operation 1 battery of 87 ovens at its Clairton, Pa., works. Failure of 18 ovens at various plants, the dismantling of 1 battery of 61 ovens at Aliquippa, Pa., by the Jones & Laughlin Steel Corp., and the abandonment of 21 ovens by the Central Illinois Electric & Gas Co. at Rockford, Ill., because of the substitution of natural gas in that area brought the total number of ovens abandoned to 100 in 1946. This caused a net loss of 16 ovens from 1945, and the annual coke capacity dropped from 71,399,100 tons to 71,112,600 in 1946. Of the 14,494 ovens reported in existence at the end of the year, 36 percent were Koppers, 40 percent Koppers-Becker, 13 percent Semet-Solvay, 10 percent Wilputte, and 1 percent of miscellaneous types. Information received by the Bureau of Mines from coke producers

indicated that 824 new ovens with an annual coke capacity of 4,453,800 tons were under construction on December 31, 1946. Virtually all additional capacity under construction is for steel plants, where existing facilities cannot meet current coke requirements.

Beehive Ovens.—The extremely heavy demand for industrial coke in 1946 directed attention to beehive ovens as a source of supply. Although the number of beehive ovens in blast during the year fluctuated widely, for reasons explained in the General Summary of this report, the number of ovens in blast increased each month after the settlement of the coal strike in May, reaching a peak of 10,181 in December. Total ovens in existence, as reported by operators on December 31, 1946, totaled 12,864, with an annual coke capacity of 8,427,000 tons, compared with 12,179 ovens and 8,094,850 tons capacity in 1945.

CAPACITY OF OVEN-COKE PLANTS

The basis upon which potential maximum capacity of a coke plant is established is the minimum coking time at which the ovens can be operated to produce coke with qualities suitable for the use for which it is intended. The operators are requested to report the potential maximum annual coke capacity of their ovens "of grades you aim to produce, that can be obtained with all conditions favorable and all ovens active." Potential maximum annual coke capacity, as thus stated, is subject to change from year to year, depending on the age and condition of ovens, character and quality of coal charged, and economic and labor conditions.

The annual coke capacity of all oven-coke plants in existence, both idle and active, decreased for the second consecutive year in 1946, and on December 31 was 286,500 tons below the 1945 figure. The annual capacity of furnace plants decreased 0.1 percent in spite of the change in classification of one plant from furnace to merchant, and the capacity of merchant plants declined 2 percent. The operating ratio in 1946 fluctuated widely between a low of 41.7 percent in

May to a high of 89.4 percent in September. The average rate of production for the year was 73.8 percent of capacity—10.5 points below the rate of production of 1945. Tables 19 and 20 show the potential maximum annual capacity of all ovens in existence (whether idle or active) and the relationship between capacity and production for 1937 and 1943–46.

TABLE 19.—Potential maximum annual coke capacity of all oven-coke plants in existence in the United States, 1937 and 1943–46

Year	Plants	Ovens	Potential maximum annual coke capacity (net tons)	Percent of change from 1937

[1] Capacity of all ovens in existence, whether active or idle, based upon maximum daily capacity times days in month.

QUANTITY AND COST OF COAL CHARGED

General conditions in the coke industry in 1946, referred to in earlier sections of this report, resulted in a decrease of 12,144,500 tons, or 13 percent, from 1945 in quantity of coal carbonized; consequently, consumption of coal in coke ovens totaled only 83,526,900 tons. The quantity of coal charged into vertical slot-type ovens accounted for 91 percent of the total consumption but was 13 percent below that used in 1945. Beehive ovens consumed over 7,000,000 tons of coal in 1946, a decrease of 12 percent from 1945 and of 44 percent from the World War II peak in 1942.

As in previous years, Pennsylvania led all States in coking-coal consumption, accounting for 30 percent of the Nation's total. Following Pennsylvania in order were Ohio, with 14 percent of the total; Indiana, 11 percent; New York, 9 percent; and Alabama, 8 percent.

Costs of coal for both slot-type and beehive-coke ovens soared to new peaks in 1946. The average cost of $5.77 per ton for coal delivered to oven-coke plants was $0.37 above the previous maximum established in 1920 and 9 percent higher than in 1945. An increase of $0.08 per ton over the 1945 peak was recorded in the coal costs for beehive ovens. The increased costs for coal were due largely to increases in mining costs resulting from the wage agreement con-

cluded between the miners and the Government in May 1946. Increases in freight rates granted to the railroads by the Interstate Commerce Commission in July were also a factor in raising the costs of coal delivered to oven-coke plants.

PREPARATION AND SOURCE OF COAL

Washed and Unwashed Coal.—In recent years more emphasis has been placed on the mechanical cleaning of coal used for the manufacture of coke. Mechanical loading of coal, although affording reductions in mining costs, often results in a large increase in the refuse content of the run-of-mine coal so that mechanical cleaning in many areas is essential for the production of satisfactory coke. One of the greatest advantages of clean coal, especially when used for the manufacture of metallurgical coke, is its greater uniformity in qualities, which are reflected in higher uniformity in the physical and chemical qualities of the coke. In 1946, 27 percent of the total tonnage of coal carbonized was washed before being charged into ovens. Both pneumatic cleaning and wet washing methods are employed to prepare the coal for use in coke ovens, in accordance with local conditions throughout the areas concerned with the problem. All coal mined in Colorado and used for the manufacture of coke was washed in 1946; most of Tennessee's and Alabama's and about one-third of Pennsylvania's was also washed before being charged into ovens. Data in table 25 include coal cleaned at the mines by coal producers as well as that cleaned at the coke plant by coke operators. Coal cleaned at the mines was used by 37 oven- and 6 beehive-coke plants in 1946; in addition, 7 oven plants charged coal that was cleaned in cleaning plants at the ovens.

Sources.—Since the establishment of the coke industry in the United States, the great source of coking coal has been the Appalachian region, extending from Alabama to Pennsylvania. States in this region supplied more than 96 percent of all coal purchased in 1946 for the manufacture of oven coke. In order of tonnages, the ranking States which shipped coal to oven-coke plants were West Virginia and Pennsylvania, each furnishing 36 percent of the total; Kentucky, 14 percent; Alabama, 8 percent; and Virginia and Tennessee combined, 2 percent. Other States that supplied significant tonnages of coking coal were Utah and Colorado, which together furnished 2 percent of the total. The best high-, medium-, and low-volatile coking coals are found in West Virginia, Eastern Kentucky, Western Virginia, Pennsylvania, and Alabama. The low-volatile coking coals, which are very important for improving the physical properties of metallurgical coke—especially its strength—come mostly from West Virginia and to some extent from Central Pennsylvania, Western Virignia, Oklahoma, and Arkansas. The expansion of the steel industry in the far West during the recent war has focused attention on the supply of coking coal for coke plants in that area. The present source of coking coal for the steel plants in Utah and California is the Sunnyside bed of Utah. The Bureau of Mines, through exploration, has discovered additional reserves of coking coal near Kemmerer,[2] southwestern Wyo., and in Gunnison County, Colo.[3]

Coke-plant operators reported that 59 percent of all coal purchased for the manufacture of oven coke was obtained from captive mines in 1946.

Blending.—In 1946, 72 of the 85 active plants carbonized coals of different volatile content. High- and low-volatile coals were carbonized by 46 plants; high-, medium-, and low-volatile by 20 plants; medium- and low-volatile by 3 plants; and high- and medium-volatile by 3 plants. Of the plants that did not carbonize coals of different volatile content, 10 used straight high-volatile and 3 medium-volatile. At plants where blending is practiced, the proportion of the different kinds of coals mixed before charging into ovens varies widely from plant to plant according to local conditions. A classification of all coal purchased for coking in slot-type ovens in 1946 indicated, however, that 66 percent was high-volatile, 13 percent medium-volatile, and 21 percent low-volatile.

[1] Computed by dividing production of breeze by coal charged at plants actually recovering.
[2] Included under "Undistributed."
[3] As reported; quantity produced but not used was undoubtedly greater. See Mineral Resources of the United States, 1922, pt. II, pp. 726–727.

SHIPMENTS BY RAIL, WATER, AND TRUCK

Tonnages of coke shipped by each of the major methods of transportation for 1946 are summarized in tables 31 and 32. The proportion of all coke shipped by rail, water, and truck in 1946 differed little from 1945. A large part of the oven-coke output is consumed close to the ovens and is not loaded for shipment outside the producing establishment. In 1946 shipments of oven coke represented less than 40 percent of the production. Railroads transported 86 percent of all oven-coke shipments, trucks 10 percent, and boats 4 percent. Nearly all beehive ovens are at the coal mines; consequently, the coke must be loaded for shipment to points of consumption. In 1946 shipments of beehive coke totaled 4,484,615 tons, equivalent to 98 percent of the total beehive output. Water-borne and truck shipments constituted but 2 percent, and the balance moved by rail.

TABLE 31.—Coke and breeze sold and loaded at plant for shipment in 1946, in net tons

DISTRIBUTION OF OVEN AND BEEHIVE COKE

Table 33 shows the quantity of coke and coke breeze distributed to each State in 1946, with a break-down of the large coke according to principal end uses. This summary was compiled from detailed information submitted by producing companies. It is believed that this distribution summary indicates the approximate size and nature of the market for coke in a given State.

Pennsylvania, the leading coke-producing State, likewise led in tonnage consumed, with 26 percent of the total. Ohio was next, using 16 percent; New York and Indiana followed, with 9 percent each; and Illinois and Alabama consumed 8 and 7 percent, respectively.

Furnace coke was used in 17 States in 1946; however, 78 percent of the total tonnage was used by 5 States—Pennsylvania, Ohio, Indiana, Alabama, and Illinois. Coke for foundry use was shipped into all States but Nevada and Wyoming during 1946. Coke was used in the manufacture of producer gas in 10 States and for producing water gas in 33. Other industrial needs indicated widespread usage throughout the country. Domestic coke was consumed in all but 9 States during 1946. New York, Massachusetts, and Michigan were the principal consumers and together accounted for 45 percent of the total used for this purpose.

An analysis of consumption by principal end uses in 1946 showed that 75 percent of all deliveries were destined to blast furnaces, 5 percent to iron foundries, 7 percent for the manufacture of producer gas and water gas, 4 percent for other industrial purposes, and 9 percent for domestic use.

TABLE 33.—Oven and beehive coke and breeze distributed to each State in 1946, in net tons

[Based upon reports from all United States producers showing destination of coke used by producer or sold in 1946. Does not include imported coke which totaled 52,188 tons in 1946]

CONSUMPTION OF COKE

The indicated consumption of coke in the United States in 1946—allowing for imports, exports, and changes in producers' stocks—decreased 13 percent from 1945 and was 21 percent below the record set in 1944. The drop in consumption in 1946 from the high level of 1944 occurred mainly in the usage of coke in iron blast furnaces and for domestic heating. According to figures compiled by the American Iron and Steel Institute, iron furnaces accounted for 75

percent of the Nation's consumption in 1946 compared with 77 percent in 1945. As shown in table 35 the consumption of coke per ton of metal produced in iron blast furnaces in 1946 increased substantially over the 1945 figures and was the highest since 1927. This increase has been due to a number of variable factors, including the increased ash content of the coke charged into the furnaces.

The quantity of coke consumed in other ways (in foundries, for manufacturing producer gas and water gas, for nonferrous smelting, for miscellaneous industrial and chemical processes, and for household heating) decreased 8 percent below the 1945 total, principally because of the decrease of more than 1,600,000 tons in the consumption of domestic coke. Statistics for the first quarter of 1947 indicate that consumption of coke in iron foundries and in the manufacture of water gas is increasing at the expense of domestic coke.

TABLE 34.—Coke consumed in manufacture of pig iron and for other purposes in the United States, 1913, 1918, 1937, and 1944–46, in net tons

Year	Total production	Imports	Exports	Net change in stocks	Indicated United States consumption [1]	Consumed by iron furnaces [2]		Remainder consumed in other ways

[1] Production plus imports minus exports, plus or minus net changes in stocks.
[2] American Iron and Steel Institute; figures include coke consumed in manufacture of ferro-alloys.
[3] Data not available. [4] Revised figure.

TABLE 35.—Coke and coking coal consumed per net ton of pig iron made in the United States, 1913, 1918, 1937, and 1944–46

Year	Coke per net ton of pig iron and ferro-alloys [1] (pounds)	Yield of coke from coal (percent)	Coking coal per net ton of pig iron and ferro-alloys (pounds calculated)	Year	Coke per net ton of pig iron and ferro-alloys [1] (pounds)	Yield of coke from coal (percent)	Coking coal per net ton of pig iron and ferro-alloys (pounds calculated)
1913	2,172.6	66.9	3,247.5	1944	1,840.6	70.3	2,618.2
1918	2,120.7	66.4	3,193.8	1945	1,870.0	70.4	2,656.3
1937	1,830.6	70.3	2,604.0	1946	1,894.0	70.0	2,705.7

[1] American Iron and Steel Institute; consumption per ton of pig iron only, excluding furnaces making ferro-alloys, was 2,172.6 pounds in 1913, 2,120.7 in 1918, 1,806.7 in 1937, 1,809.8 in 1944, 1,840.0 in 1945, and 1,868.0 in 1946.

Accompanying tables summarize the disposal of coke in 1946 by principal end uses. Statistics on the disposal of coke are indicative of market trends and are of value in planning future expansions in the industry. The pattern in 1946 shows the greatly increased demand for industrial coke and the consequent withdrawal of coke from the domestic market.

The smelting of iron in blast furnaces is the principal branch of consumption of coke in the United States; and, although the tonnage used by producers in integrated blast furnaces and sold for furnace use to affiliated plants and to other purchasers decreased 7,302,429 tons from 1945, the quantity consumed was equivalent to 75 percent of all deliveries. The increased production of steel castings in 1946 caused shipments of foundry coke to reach the highest point since 1926. A drop of 343,683 tons was registered in the coke used for all other industrial purposes (gas manufacture, nonferrous smelting, chemical processes, etc.). Coke grouped under this classification represented 11 percent of the total quantity disposed of in 1946. In 1940, the disposal for other industrial uses constituted only 6 percent of the total. The principal reason for this shift has been the substantial increase in the use of coke for making water gas. Sales of coke for domestic heating were the lowest since 1943 and represented a decline of 25 percent from 1945. Indications are that this downward trend will continue in 1947.

STOCKS OF COKE AND COKING COAL

Coke.—Year-end stocks of oven coke at producers' plants totaled 892,913 tons, a decrease of 34,086 tons from 1945. Stocks of furnace coke increased slightly, but the gain was offset by decreases in stocks of foundry, domestic, and other coke. Total reserves of oven coke at the end of the year were equivalent to but 5.8 days' production at the rate prevailing in December 1946. Producers' stocks of beehive coke, which normally are very small, increased 31,039 tons during the year and on January 1, 1947, totaled 35,853 tons, equivalent to only 2.8 days' production at the December rate.

Coal.—Stocks of coking coal at oven-coke plants in most of 1946 were at dangerously low levels. The highest reserves were 8,269,360 tons at the end of March, the lowest supply 2,565,010 tons at the end of May. Under normal operating conditions, the stocks on May 31 on an industry-wide basis were equivalent to a 10 days' supply. However, monthly reports received by the Bureau of Mines from coke producers indicated that on that date 13 plants (including some of the largest steel producers) had less than 5 days' supply, 22 less than 10

days' supply, and the balance over 10 days' supply. Although stocks increased steadily during the summer months, mine stoppages in November-December curtailed the flow of coal to oven-coke plants, and the tonnage on hand at the end of the year was far short of the reserves normally carried by the operators.

TABLE 38.—Summary of total stocks of coke on hand at all coke plants in the United States on Jan. 1, 1937 and 1943–47, in net tons

VALUE AND PRICE

The average realization figures used in this report represent the value of coke at the ovens, as reported by coke producers. The greatest part of the coke produced in the United States is made in ovens operated by corporations which not only mine the coal they use, but also operate blast furnaces that consume the bulk of the output of their ovens. Under such conditions, fixing a value for coal charged and for coke produced is purely arbitrary. For example, at some establishments the cost of coke to the furnace department equals the cost of production; at others a margin of profit is added; or the cost is considered to be the market value.

The total value of all coke produced, by States, is shown in table 3; it was 4 percent lower than in 1945. Pennsylvania led all States in dollar value and tonnage produced, accounting for one-fourth of the total value of the oven- and beehive-coke output.

The average receipts per ton of coke sold in 1946 increased sharply over those of the preceding year because of higher coal and labor costs. Receipts per ton of oven coke sold in 1946 increased over 1945 as follows: Furnace, $0.98; foundry, $1.14; domestic, $1.21; and other industrial, $1.23. Average sales realization for beehive coke showed the following price increases per ton over 1945: $0.73 for furnace; $0.87 for foundry; $0.66 for domestic; and $1.03 for other industrial.

TABLE 42.—Average value per net ton of coke produced and average receipts per net ton from coke sold in the United States, 1936–46

Year	Value per ton produced			Receipts per ton sold		
	Oven coke	Beehive coke	Total	Oven coke	Beehive coke	Total
1936	$5.06	$3.91	$5.02	$5.83	$3.92	$5.65

FOREIGN TRADE

Exports.—The demand for coke in virtually all foreign countries in 1946 exceeded the supply, and exports from the United States would have been much greater had more coke been available in this country. Exports of coke in 1946 totaled 1,231,327 tons valued at $12,635,593, a decrease of 17 percent in quantity but an increase of 0.3 percent in value. As in previous years, Canada was the principal

foreign market for American coke, receiving 71 percent of all exports. Exports to Canada, however, were 33 percent below the 1945 total, principally because of the decline in reclaimed beehive-coke shipments to that country and the increase in shipments of industrial coke to Europe. Shipments to Europe were made to alleviate acute shortages of coke in countries that depended on German coke before and during World War II. It is to be noted that shipments to Sweden exceeded those to any country other than Canada and amounted to more than a quarter of a million tons, most of which was shipped during the steel strike in this country.

Imports.—Imports of coke, all of which came from Canada, into continental United States increased only 224 tons over 1945. Coke imports supply but a minute part of the Nation's requirements and are restricted to a few localities. More than 77 percent of the total tonnage imported in 1946 entered through the Montana-Idaho customs district.

TECHNOLOGIC DEVELOPMENTS

Although no spectacular new developments were reported in coal carbonization during 1946, considerable scientific and technologic work was accomplished by Government and State agencies, coal-research laboratories, and individual companies.

The Bureau of Mines, which has conducted scientific and technologic investigations on coal and related products since its creation by Congress in 1910, continued its research work in these fields of endeavor in 1946. Information on processes and changes in equipment used in the Bureau of Mines-American Gas Association method for experimentally determining the carbonizing properties of American

coals was brought up to date and published.[4] Results of the work accomplished by the Bureau in 1946 on the composition and carbonizing properties of various American coals were described in various published reports.[5] A report summarizing the results of several surveys made by Bureau engineers during the war years on bulk density control of coke-oven charges were published in 1946.[6] An excellent summary of the outstanding technologic developments in the coke industry during World War II was prepared by Seymour[7] describing methods of determining the suitability of a coal for coke production, coal handling and preparation at oven-coke plants, and recent improvements in the design of coke ovens. A convenient method for ascertaining the free-swelling index of coal whose coke buttons do not conform to any of the standard profiles was described by Selvig and Ode[8] in a report released in 1946. This method has proved of value for obtaining information regarding the coking properties of coal on fuel beds but is not recommended for measuring the amount of expansion or contraction that takes place during carbonization of coal in coke ovens.

A method for recovery of pyridine bases—one of the most recent groups of coal chemicals to be recovered at coke plants—was developed by Herbert L. Stewart and described in United States Patent 2,410,906 issued November 12, 1946, and assigned to the Koppers Co., Inc.

WORLD PRODUCTION

The accompanying table gives available figures on production of coke in various countries in recent years and an estimate of the world total. The present lack of production statistics from some of the large coke-producing countries makes it impossible to prepare a completely accurate statement of world output.

[1] Gas-house coke not included.
[2] In addition to countries listed coke is produced in Mexico and New Zealand, but data are not available.
[3] Data not available.
[4] Exports.
[5] Data represents areas designated as Free China during the period of Japanese occupation.
[6] Beginning October 1939, Silesian production included.
[7] Coal year ended March 31 of year stated.
[8] In Great Britain production of gas-house coke, not included, is especially important and was 10,770,130 tons in 1938, and averaged 11,000,000 tons per year for 1940 to 1944, inclusive. Data for 1945 and 1946 are not available.
[9] Estimate.
[10] Preliminary data for fiscal year ended March 31 of year following that stated.
[11] South Korea only.
[12] Production of Siberia and Urals only. [13] Estimated by author of chapter. Excludes estimates for countries listed in footnote 2.

COAL-CHEMICAL MATERIALS

GENERAL SUMMARY

Coke-oven gas, tar, ammonia, and light oil are the principal groups of coal-chemical materials, but the term also includes fractions and individual compounds recovered from these groups. Technologic developments in recent years in the manufacture of plastics, synthetic rubber, aviation gasoline, explosives, dyes, pharmaceutical preparations, and synthetic drugs have broadened the range of application and markets for benzol, toluol, xylol, solvent naphtha, naphthalene, phenol, cresylic acid, and pyridine. The tendency in the coke industry is toward the production of the more highly refined and pure aromatic hydrocarbon products and the development of related and new compounds. A striking example is the shift from the manufacture of "motor benzol" to the 1° and 2° grades. In the year preceding

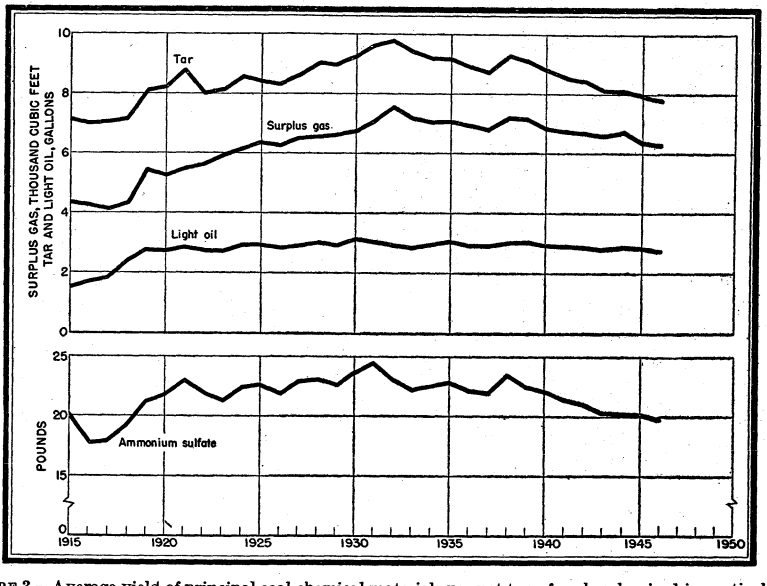

FIGURE 3.—Average yield of principal coal-chemical materials per net ton of coal carbonized in vertical slot-type ovens, 1915–46. Yields of light oil and ammonium-sulfate equivalent represent average for plants recovering these products.

World War II, more than 76 percent of the benzol produced at coke plants was "motor benzol," whereas only 20 percent of this grade was produced in 1946. The forerunnings from the distillation of crude light oil are now being processed by three producers for the manufacture of dicyclopentadiene. It is likely that production of this chemical compound will increase in future because of its many versatile uses. The pyridine bases are one of the most recent groups of coal chemicals to be recovered from coke-oven gas. In 1946, 32 plants were recovering pyridine bases. Recovery of these bases, in connection with ammonia recovery in sulfate saturators, has proved profitable, and their removal does not appreciably affect the quality of the gas. Ammonium thiocyanate is another compound that is being recovered

in concentrated solution at several coke plants by scrubbing the gas with a suspension of sulfur before it enters the saturators. The more efficient utilization of coal tar for the recovery of tar products is indicated by the decline in its use as fuel from 50 percent of the production in 1929 to 13 percent in 1946. Separation of the miscellaneous chemical compounds, such as phenol, cresols, and cresylic acid, from tar distillates at coke plants is increasing, but statistics cannot be published because less than three companies are currently involved.

Due to the increased demand for coal chemicals, coke-plant operators are placing more emphasis on their recovery, and efforts are being made to increase the financial returns from them. It is significant to note that the proportion of revenue obtained from sales of all chemical materials has not paced that received from coke. Total realization from sales of all coal-chemical materials in 1946 was equivalent to 35 percent of the value of oven coke produced, compared with 50 percent in 1941 and 64 percent in 1929. Table 47 summarizes statistics on the coal-chemical materials obtained from coke-oven operation in 1946, and figure 3 illustrates the trend in the yield of the various products.

Gas.—Production of coke-oven gas in 1946 decreased 13 percent from the 1945 output. Next to coke, gas is the most valuable product obtained in the carbonization process, and in 1946 it contributed more then 50 percent of the total revenue obtained from the sales of all coal-chemical materials. In addition to providing the fuel requirements of the ovens from which it is evolved, coke-oven gas supplies various other fuel needs. During 1946, 480,489,586 M cubic feet (61 percent of the 783,637,016 M cubic feet of gas produced) were sold or used for industrial purposes and for distribution through city mains. Of the 480,489,586 M cubic feet sold or used, 6 percent was used by producers under boilers, 55 percent in integrated metallurgical operations, 6 percent was sold to neighboring industries, and 33 percent was sold for distribution through city mains. The average unit value as reported by operators was $0.173 per M cubic feet—an increase of $0.015 over the 1945 figure of $0.158. This increase was due in part to general increases in the prices on gas sold or used for all purposes and also to the larger proportion of surplus gas distributed through city mains, as this gas always commands higher prices than that used or sold for industrial purposes.

Crude Coal Tar and Derivatives.—The yield of crude coal tar per ton of coal carbonized decreased in 1946 for the second consecutive year. The substantial drop in coal charged into coke ovens, coupled with the decreased yield, caused production of this coal product to decline 14 percent from 1945. The principal uses for tar are (1) as a raw material in manufacture of coal-tar products, (2) as a metallurgical fuel in steel making, and (3) as a fuel for boilers.

Before World War II, roughly 60 percent of the crude tar produced in coke plants was refined, and the balance was used directly as fuel, largely in steel-plant operations. The demand for coal-tar products during and since the war changed this practice greatly, and in 1946 the proportion of crude coal tar used as fuel was the lowest on record. Producers reported that 26 percent of the production was processed in integrated refining facilities and 61 percent was sold to other purchasers for refining. The substitution of fuel oil and residual tar and

pitches from tar-topping operations in recent years has been an important factor in lowering the consumption of crude tar in metallurgical operations.

The principal coal-tar product produced by coke-oven operators is creosote oil, a derivative used mainly for impregnating lumber. Although production of this material declined 16 percent from 1945, total realization from sales was equivalent to 54 percent of the total revenue received by coke-plant operators from the sale of all coal-tar products. Production and sales of tar-acid oil decreased 6 and 3 percent, respectively, from 1945. Pitch output also dropped markedly in 1946. The marketing of pitch produced at coke plants has not been developed extensively, and in 1946 approximately 99 percent of the output was used by the producers. The soft and medium pitches are cut back (usually with virgin tar) to the desired viscosity and used as metallurgical fuel, and the hard pitch produced at several plants is mixed with the coal before being charged into the ovens for improving coke quality. As stated in the previous discussion, statistics on cresols, cresylic acid, and phenol cannot be published because less than three producers are involved.

Ammonia.—Ammonia was recovered at 81 of the 85 active coke plants in 1946, 64 of which made ammonium sulfate and 21 ammonia liquor (4 plants produced both sulfate and liquor). The total production of ammonia (NH_3 equivalent of all forms) decreased 15 percent from 1945, a reduction resulting from decreases of 16 and 10 percent, respectively, in the output of sulfate of ammonia and ammonia liquor. As in previous years, approximately 87 percent of the total ammonia recovered was converted to ammonium sulfate, which was virtually all used as a fertilizer. Sales of ammonium sulfate followed production closely, decreasing 20 percent in quantity and 12 percent in value from 1945. The average unit value on sales as reported by operators was $0.014 a pound—an increase of $0.001 per pound over 1945. This was due to the increases granted to producers in all but 11 Western States by the Office of Price Administration on July 26, 1946, raising the price, f. o. b. point of production, from $28.00 per ton, bulk, to $30.00 per ton. Although price ceilings on ammonium sulfate were abolished in November by the OPA decontrol order, quotations reported in various trade journals indicated that prices did not increase during the remainder of the year.

Crude Light Oil and Derivatives.—In 1946 the output of crude light oil—a term used in the coke industry to designate the mixture of all those condensible products derived from the coking process whose boiling points do not exceed 200° C.—decreased 16 percent from 1945. The yield of crude light oil per ton of coal carbonized dropped from 2.84 gallons in 1945 to 2.77 gallons and was the lowest since 1933. The processing of crude light oil is widely practiced by coke-plant operators, and in 1946 fully 96 percent of the total quantity produced at coke plants was refined by the operators. Production of benzol (all grades), the principal constituent of light oil, decreased 12 percent from 1945 and was 17 percent below the record attained in 1944. The market for refined or pure benzol was extremely active throughout the year, and more than 77 percent of the total benzol output was "nitration"—or 1°—and "industrial pure"—or 2°—grades. The production of toluol declined sharply, with a drop of 39 percent. The

diminished demand for this chemical for explosives and the release of more than 17,000,000 gallons of the Government's surplus stock were contributing factors in reducing production. The average unit value of toluol at producers' plants dropped from $0.263 per gallon in 1945 to $0.205 in 1946, indicating a depressed market. Although production of xylol and solvent naphtha decreased 20 and 8 percent, respectively, from 1945, there was an active demand for these aromatic solvents throughout the year. Prices for both xylol and solvent naphtha did not change from the 1945 pattern. However, the decline in toluol prices was responsible for the decrease from $0.503 to $0.467 in the value of crude light oil and derivatives per ton of coke produced.

VERTICAL SLOT-TYPE COKE OVENS OWNED BY CITY GAS COMPANIES (PUBLIC UTILITIES)

The accompanying table compares statistics on the operations of coke plants operated by gas utilities with those plants not owned by city gas companies for 1945 and 1946. This classification is maintained by the Bureau of Mines in the interest of those who may want to obtain information on the coking operations of city gas works proper and also to show their relative value to the coke industry as a whole.

Oven-coke plants owned by city gas companies contributed 6 percent of the total production of oven coke in 1946, 7 percent of the gas, 7 percent of the tar, 3 percent of the light oil, and 5 percent of the ammonia. The number of operations in this group has been declining during the past 10 years because of the substitution of natural gas for coke-oven gas in certain areas; consequently, the number of active plants dropped from 21 in 1936 to 14 in 1946. Normally, maximum production of gas of proper analysis is the primary objective of these plants; however, the increased demand for industrial coke caused many operators to place more emphasis on coke, and in 1946 more than one-fifth of the foundry-coke requirements and a quarter of a million tons of blast-furnace coke came from this group of plants.

GENERAL SUMMARY

THE DOMESTIC copper industry in 1946 was featured by a reconversion demand exceeding most estimates made during 1945 and by mine production far below capacity. During 1944 and 1945 grave concern was expressed by well-informed observers that, with the termination of hostilities, war stocks augmented by a flood of copper from war-stimulated mines throughout the world would engulf the domestic mining industry and result in stagnation such as followed World War I. Through 1946, however, no evidence appeared of a satiation of demand to fulfill postponed need and to restock inventories in the peacetime channels of trade. Not only did demand exceed the expectations of many, but the supply from domestic sources fell far short of capacity, largely as a result of a difficult labor situation. Labor forces that had deteriorated during the war were not rebuilt promptly with the release of war-industry workers and the demobilization of the armed forces. Apparently copper mining was relatively unattractive compared with other kinds of available employment. In addition, a number of management-labor negotiations under way in the copper industry late in 1945 failed to produce acceptable working contracts, and very serious strikes in mines, smelters, refineries and fabricating plants were called. For example, at the Utah Copper mine—the largest copper producer in the United States—a strike caused a complete shut-down from January 21 to June 24. By midyear, however, the major strikes had been settled, and copper production rose sharply during the rest of the year; 61 percent of the year's output was credited to the last 6 months.

793065—48——30

Drilling at the San Manuel property near Tiger, Ariz., had developed enough ore by the end of 1946 to prove that a major copper ore body had been discovered. Thus, for the first time in a generation, a substantial addition had been made to United States copper reserves from a recently discovered ore body. According to the annual report to stockholders of the Magma Copper Co., which is developing the San Manuel Copper Corp. ore body, 211,500,000 tons of ore, averaging 0.77 percent copper, had been calculated as estimated reserves by December 31, 1946. This was classified as 66,600,000 tons of 0.70-percent oxide ore, 45,300,000 tons of 0.88-percent mixed oxide and sulfide ore, and 99,600,000 tons of 0.75-percent sulfide ore.

In 1946, as in 1945, domestic mines did not supply much more copper than did old scrap. Of the 1946 total from these two sources, 59 percent was new copper from mines and 41 percent secondary metal from old scrap. In addition, 397,093 tons of copper were recovered from new scrap in 1946.

A consumption record for peacetime years was established in 1946. The quantities of virgin copper and of all copper exceeded the earlier peace-year highs of 1940 and 1929 by wide margins. Even the war-year highs for 1941–45 had not absorbed copper in quantities very greatly in excess of this first full year of peace; the new refined copper withdrawn for domestic account in 1946 was only 15 percent less than the all-time high established in 1941. The tremendous demand for copper combined with reduced production, because of strikes and other factors, resulted in heavy withdrawals from stocks. At the beginning of 1946, nearly 600,000 tons of refined and unrefined copper were available for allocation by the Office of Metals Reserve, but by the end of the year this supply had been reduced to less than 100,000 tons. The projected accumulation of a strategic stock pile of copper under the Strategic and Critical Materials Stock-Piling Act, approved by the President July 23, 1946, made virtually no progress during the year because of a provision that industrial reconversion must not be retarded by withdrawal of supplies to stock piles. In approving the bill the President stated his reluctance because of the bill's reaffirmation of the application to stock-pile purchase of the provisions of the "buy American" act of 1933. He pointed out, however, that "the Act also provides that exceptions to this rule may be made when 'buy American' purchases are determined to be inconsistent with the public interest or the cost to be unreasonable, and that this provision clearly indicated that the stock-piling program should not be used as a means of generally subsidizing those domestic producers who otherwise could not compete successfully with other domestic or foreign producers."

During 1946 a free domestic copper market was reestablished after over 5 years during which the Office of Price Administration had controlled the situation with price ceilings. From a ceiling price of 12 cents a pound in effect at the beginning of the year, the free market price at year end had risen to 19½ cents, the highest since April 1929. The upward movement continued into 1947. Late in 1946 the price of copper exceeded that for aluminum for the first time in history, with the result that serious concern was expressed about the possibil-

ity of large-scale substitution of the light metal for copper in some important fields. The supplies of both metals were so short that price was not the primary factor in determining purchases, but a continuation of copper prices above those for aluminum into a period of plentiful supply would result in a considerable shift in the use patterns for both metals.

Salient statistics of the copper industry in the United States, 1942–46, in short tons

[1] Includes old tailings.
[2] Revised figure.
[3] Data include copper imported for immediate consumption plus material entering country under bond.
[4] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufactures of copper," for which figures of quantity are not recorded.
[5] Excludes rods.
[6] Exclusive of bonus payments of the Office of Metals Reserve.
[7] Estimated.

The low rate of production by domestic copper mines was paralleled abroad, where the output of foreign mines in 1946 was at little more than two-thirds of their aggregate capacity, as measured by recent peak-year data. Chile, Northern Rhodesia, and Canada were beset by labor strikes and shortages; in Northern Rhodesia and the Belgian Congo shortage of coal, caused largely by transportation difficulties, was a principal production handicap; in Chile a light snowfall resulted in inadequate hydroelectric power; and in Canada voluntary restriction of nickel production reduced supplies of the associated copper. The rising output at domestic mines in late 1946 was not paralleled at foreign properties as a whole.

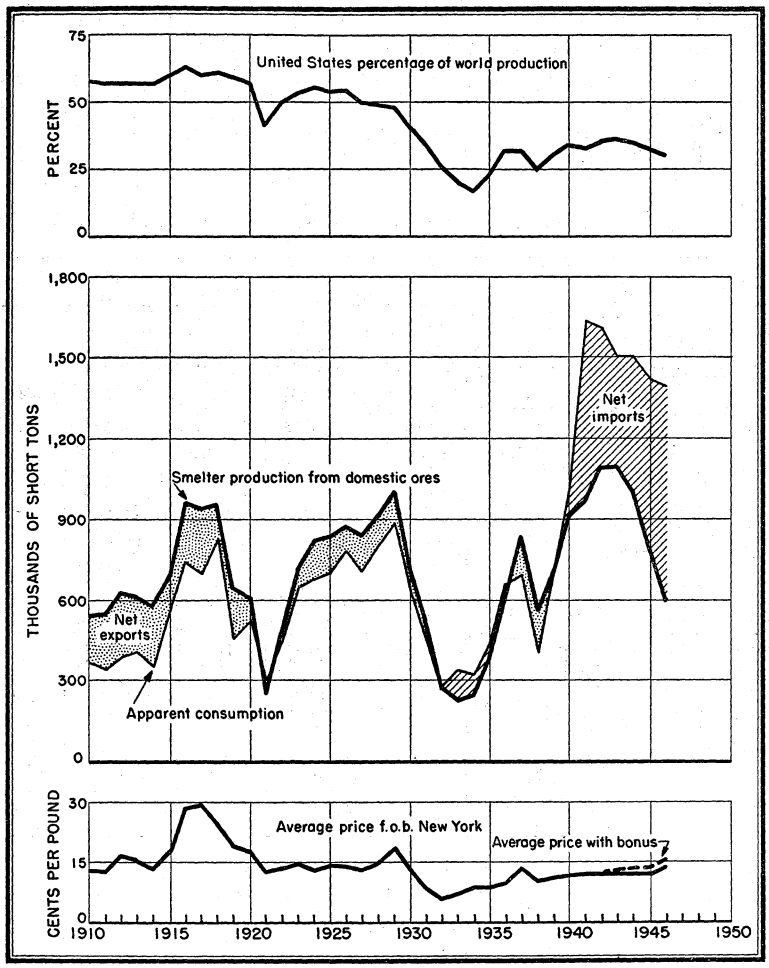

FIGURE 1.—Trends in production, consumption, and price of copper in the United States, 1910–46.

The following Reports of Investigations, published recently by the Bureau of Mines, cover properties examined almost entirely in World War II. The results of such examinations were available previously on a confidential basis only.

3873. Exploration at the Cline Mine, Cabarrus County, N. C.
3896. Exploration of the El Dorado Copper Mine, El Dorado County, Calif.
3914. Exploration of the Copper Butte Mine, Mineral Creek Mining District, Pinal County, Ariz.
3939. Exploration of the Moffet-Johnston Copper Property, Madison County, Mont.
3942. Exploration of the Copper-Sulfur Deposit, Khayyam and Stumble-On Properties, Prince of Wales Island, Alaska.

3950. Exploration of a Nickel-Copper-Cobalt Deposit at Funter Bay, Admiralty Island, Alaska.
3973. Exploration of the Queen Mary Copper Project, Missoula County, Mont.
4006. Old Reliable Copper Mine, Pinal County, Ariz.
4013. Apex Copper Property, Coconino County, Ariz.
4015. Sullivan Copper Mine, Cochise County, Ariz.
4016. Amargosa (Esperanza) Molybdenum-Copper Property, Pima County, Ariz.
4023. Zonia Copper Mine, Yavapai County, Ariz.
4026. Stauber Copper Mine, Guadalupe County, N. Mex.
4029. Atwood Copper Group, Lordsburg District, Hidalgo County, N. Mex.
4038. Bull Run Copper Prospects, Silver Bow County, Mont.
4046. Copper King Mine, Taos County, N. Mex.

Reports recently released by the Geological Survey are as follows:

Professional Paper 209. The Ajo Mining District, Arizona.
Bull. 947–E. Copper Bullion Claims, Rua Cove, Knight Island, Alaska.
Bull. 947–F. Copper Deposits of the Nizina District, Alaska.
Bull. 947–G. Copper Deposits of the Kotsina–Kushulana District, Alaska.

GOVERNMENT REGULATIONS

On January 29 the Reconstruction Finance Corporation announced that the Office of Metals Reserve was reestablishing the foreign public purchase program, discontinued in October 1945. On November 19 the purchase program was terminated again, subject to the fulfillment of commitments already made, owing to elimination of Office of Price Administration ceilings (discussed in the next paragraph).

In midyear the OPA announced the first increase in ceiling prices for copper since they were established on August 12, 1941. The price for electrolytic copper, delivered Connecticut Valley, was raised, effective June 3, to 14⅜ cents, contingent upon the completion of certain wage agreements. This action resulted in a two-price condition. Uncertainty attended the almost month-long interim (July 1–25) in the operation of OPA. The two prices were eliminated August 2, when 14⅜ cents was established for all sales. All price controls for copper were removed by the OPA order, effective November 10, that eliminated virtually all price controls. With OPA ceilings removed, RFC announced it would begin to pay as soon as practicable the 4-cent excise tax on foreign copper imported. When the ceiling price was increased, bonuses for copper under the Premium Price Plan were reduced by an identical amount, so that the Government, rather than producers under the plan, benefited. The Premium Price Plan was recessed along with OPA in July but retroactive provisions were made to bridge the gap. This plan continued on after most ceiling prices were discontinued.

Civilian Production Administration action was chiefly in the direction of channeling available copper, largely from Office of Metals Reserve inventories and copper and copperbase alloy scrap held by the Army, Navy, Maritime Commission, and War Assets Administration, to users in most critical need of the metal.

The Strategic and Critical Stock-Piling Bill, signed by the President July 24, was discussed in the opening section of this report.

DOMESTIC PRODUCTION

Statistics on copper production may be compiled upon a mine, smelter, or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better than mine figures for showing the actual recovery of metal, and more accurate than refinery figures for showing the source of production; and refinery statistics are best for showing metal recovery, but indicate only in a general way the source of crude materials treated. The chapter on Copper in Mineral Resources of the United States, 1930, part I, discusses differences among the three sets of figures.

Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1942–46, in short tons

Year	Mine	Smelter	Refinery
1942	1,080,061	1,087,991	1,064,792
1943	1,090,818	1,092,939	1,082,079
1944	972,549	1,003,379	973,852
1945	772,894	782,726	775,738
1946	608,737	599,656	578,429

PRIMARY COPPER

Mine Production.—The figures for mine production are tabulated from reports supplied by all domestic mines that produce copper. These data are classified geographically, by metallurgical methods, and by types of ore. Tables presenting the information in detail are to be found in the State chapters of this volume.

In 1946 Arizona continued to be the leading mine producer of copper, having taken the lead from Montana in 1907 and having ranked ahead of all other States thereafter, except in 1909, when Montana resumed first place for 1 year. Utah, where the largest domestic copper producer is located, continued in second place. These two States were followed in order by Montana, New Mexico, Nevada, and Michigan; there were 12 other producing States in 1946, 4 of which produced less than 10 tons each.

Accompanying tables cover mine production by States and list the leading copper-producing districts and mines.

A classification of production by mining methods shows that approximately 58 percent of the copper and 66 percent of the copper ore came from open pits in 1946. Most domestic copper ore was treated by flotation at or very near the mine of origin, and the resulting concentrates were shipped for smelting. Some copper ores were direct-smelted either because of their high grade or because of their fluxing qualities.

Mine production of recoverable copper in the United States, 1936–46, with production of maximum year, and cumulative production from earliest record to end of 1946, by States, in short tons

State	Maximum production [1]		Production by years											Total production from earliest record to end of 1946

Total	958,149	1,080,061	1,090,818	972,549	772,894	608,737

[1] Monthly data for 1941–44 were based largely on smelter receipts, whereas those for 1945 and 1946 represent actual mine output. All monthly figures have been adjusted to final annual mine-production totals.
[2] Monthly average for first quarter; actual monthly figures not available.

Although mine output of copper reached an annual peak in 1943, the peak monthly total was registered in December 1942. Throughout 1943 production was at capacity levels permitted by the available supply of labor, and lack of adequate labor prevented a higher production rate in 1944. Labor shortages and inefficiencies were almost entirely responsible for the declining production in 1945, whereas the poor showing in the first half of 1946 was due to labor strikes, aggravated by a continuing inadequate supply of labor.

Mine production of copper in the principal districts [1] of the United States, 1942–46 in terms of recovered copper, in short tons

District or region	State	1942	1943	1944	1945	1946

Twenty-five leading copper-producing mines in the United States in 1946, in order of output

Rank	Mine	District	State	Operator	Source of copper
1	Utah Copper	West Mountain (Bingham)	Utah	Kennecott Copper Corp	Copper ore.
2	Morenci	Copper Mountain (Morenci)	Arizona	Phelps Dodge Corp	Do.
3	Anaconda	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Copper, zinc, and zinc-lead ores.
4	Chino	Central	New Mexico	Kennecott Copper Corp	Copper ore.
5	New Cornelia	Ajo	Arizona	Phelps Dodge Corp	Do.
6	Inspiration	Globe-Miami	do	Inspiration Cons. Copper Co	Do.
7	Ruth and Copper Flat Pit	Robinson (Ely)	Nevada	Kennecott Copper Corp	Do.
8	Castle Dome	Globe-Miami	Arizona	Castle Dome Copper Co., Inc	Do.
9	Miami	do	do	Miami Copper Co	Do.
10	Consolidated Coppermines Group	Robinson (Ely)	Nevada	Consolidated Coppermines Corp	Do.
11	Ray Mines	Mineral Creek	Arizona	Kennecott Copper Corp	Do.
12	Calumet and Hecla Cons	Lake Superior	Michigan	Calumet and Hecla Cons. Copper Co	Do.
13	United Verde	Verde	Arizona	Phelps Dodge Corp	Do.
14	Magma	Pioneer	do	Magma Copper Co	Do.
15	Burra Burra, Eureka, Boyd, Calloway	Polk County	Tennessee	Tennessee Copper Corp	Copper-bearing pyrites.
16	Bagdad	Eureka	Arizona	Bagdad Copper Corp	Copper.
17	Holden	Chelan Lake	Washington	Howe Sound Co	Zinc-copper ore.
18	Copper Queen	Warren	Arizona	Phelps Dodge Corp	Copper, lead-copper, zinc-lead ores.
19	Isle Royale	Lake Superior	Michigan	Isle Royale Copper Co	Copper ore.
20	Elizabeth	Orange County	Vermont	Vermont Copper Co	Do.
21	Cornwall	Lebanon County	Pennsylvania	Bethlehem Steel Co	Magnetite-pyrite-chalcopyrite ore.
22	Quincy	Lake Superior	Michigan	Quincy Mining Co	Copper-ore tailings.
23	Hornet	Flat Creek	California	The Mountain Copper Co., Ltd	Zinc-copper ore.
24	Mountain City	Cope	Nevada	Mountain City Copper Co	Copper ore.
25	Apex-Delaware	West Mountain (Bingham)	Utah	National Tunnel and Mines Co	Copper, zinc-lead ores.

The first 5 mines listed produced 58 percent of the United States total; 10 produced 80 percent, and the entire 25 accounted for 96 percent.

Quantity and Estimated Recoverable Content of Copper-Bearing Ores.—The following tables list the quantity and estimated recoverable copper content of the ore produced by mines in the United States in 1945; complete details for 1946 are not yet available. Of the total copper produced from copper ores in the United States during 1945, 92 percent was obtained from ores concentrated before smelting, 5 percent from direct-smelting ores, and nearly 3 percent from ore treated by straight leaching. The percentages for 1945 compared with 90 percent obtained from concentrated ore, 7 percent from direct-smelting ores, and 3 percent by straight leaching in 1944.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that estimated recoverable tenor is close to actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only all those that contain 2.5 percent or more recoverable copper but also those that contain less than this percentage if they are valuable chiefly for copper, notably the "porphyry ores." Mines report considerable copper from ores mined primarily for other metals. These include siliceous gold and silver ores, lead and zinc ores, and pyritic ores.

Copper ore, old tailings, etc., sold or treated in the United States in 1945, with copper, gold, and silver content in terms of recovered metals

State	Ore, old tailings, etc., sold or treated (short tons)	Copper produced		Gold produced (fine ounces)	Silver produced (fine ounces)	Value of gold and silver per ton of ore
		Pounds	Percent

[1] Includes old tailings, etc.
[2] Includes ore from Washington classed as zinc-copper ore.

Smelter Production.—The recovery of copper by smelters in the United States from ores of domestic origin totaled 599,656 short tons in 1946, a decline of 23 percent from the total of 782,726 for 1945. Domestic smelter output constituted 51 percent of the world production during 1925–29 but dropped sharply in the succeeding years until 1934, when it was only 17 percent. From 1936 to 1940 it fluctuated between 25 and 33 percent, in 1942–44 it is believed to have been slightly above 35 percent, and in 1946 it stood at about 30 percent.

The figures for smelter production are based upon returns from all smelters handling copper-bearing materials produced in the United States. For Michigan the sum of furnace-refined copper and copper cast into anodes for electrolytic refining is included. The figures for blister copper represent the fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production. Metallic and cement copper recovered by leaching is included in smelter production.

The quantity, in pounds, of copper produced by smelters in the United States and its value are shown by years for 1845–1930 in the Copper chapter of Mineral Resources of the United States, 1930, part I.

Copper produced (smelter output) in the United States, 1942–46, and total, 1845–1946

Year	Short tons	Value [1]
1942	1,087,991	$256,766,000
1943	1,092,939	257,934,000
1944	1,003,379	236,797,000
1945	782,726	184,723,000
1946	599,656	172,701,000
Total, 1845–1946	33,031,241	9,588,934,000

[1] Excludes bonus payments of Office of Metals Reserve.

Refinery Production.—The refinery output of copper in the United States in 1946 was made by 11 plants; 8 of these employed the electrolytic method only, 1 the furnace process on Lake Superior copper, 1 the furnace process on western ores, and 1 both the electrolytic and the furnace methods.

Five large electrolytic refineries are on the Atlantic seaboard, three

Lake refineries on the Great Lakes, and three electrolytic refineries west of the Great Lakes—one at Great Falls, Mont.; one at Tacoma, Wash.; and one at El Paso, Tex. In 1942 fire-refined copper was produced for the first time at the Hurley, N. Mex., plant of the Kennecott Copper Corp., and all of the plant output was treated by this method in 1946. The El Paso plant of the Phelps Dodge Refining Corp. produced furnace-refined copper in addition to the usual electrolytic grade. Of the plants specified above, the Lake refinery of the Copper Range Co. was idle throughout 1946, and that of the Quincy Mining Co. has been idle since 1933.

In addition to the plants in the preceding paragraph, but included in the 11 active refineries noted, is the plant at Inspiration, Ariz., which is equipped to make electrolytically refined copper direct from the liquors obtained from leaching. Usually all of this copper is shipped as cathodes to other refineries, where it is melted and cast into merchant shapes. In 1946, however, more than one-third went directly to consuming plants.

The 13 plants indicated constitute what commonly are termed "regular refineries," and in 1946 the Inspiration plant should be added because it shipped direct to consumers. Of these plants, nine employ the electrolytic process, four the furnace process, and one both methods. The electrolytic plants, exclusive of the one at Inspiration, have a rated capacity of 1,546,000 tons of refined copper a year. They produced at the rate of 56 percent of capacity in 1946.

The accompanying tables show the production of refined copper at regular refining plants, classified according to source, grade, and form in which cast.

Primary and secondary copper produced by regular refining plants in the United States and imported, 1942–46, in short tons

	1942	1943	1944	1945	1946
Primary:					
Domestic: [1]					
Electrolytic [2]	963,177	938,727	837,089	669,705	475,571
Lake [2]	46,523	44,867	41,597	29,995	21,567
Casting	55,092	98,485	95,166	76,038	81,291
	1,064,792	1,082,079	973,852	775,738	578,429
Foreign: [1]					
Electrolytic	343,834	297,184	247,335	298,128	300,233
Casting and best select	5,935			34,733	
Refinery production, new copper	1,414,561	1,379,263	1,221,187	1,108,599	878,662
Imports, refined copper [3]	401,436	402,762	492,395	531,367	154,371
Total new refined copper made available	1,815,997	1,782,025	1,713,582	1,639,966	1,033,033
Secondary:					
Electrolytic [4]	83,079	114,259	78,402	[5] 84,044	[5] 97,615
Casting	2,064	8,205	7,996	12,618	7,957
	85,143	122,464	86,398	96,662	105,572
Grand total	1,901,140	1,904,489	1,799,980	1,736,628	1,138,605

[1] The separation of refined copper into metal of domestic and foreign origin is only approximate, as accurate separation at this stage of manufacture is not possible.
[2] Some copper from Michigan is electrolytically refined at eastern refineries and is included as electrolytic copper.
[3] Data include copper imported for immediate consumption plus material entering country under bond.
[4] Includes some secondary Lake copper.
[5] Copper from scrap at Lake refineries included under "casting" copper in 1945–46. Includes a little copper reported from foreign scrap in 1945–46.

Copper cast in forms in the United States, 1945–46

Form	1945		1946	
	Short tons	Percent	Short tons	Percent
Wire bars	467,000	38	502,000	51
Cakes	153,000	13	142,000	14
Cathodes	231,000	19	115,000	12
Ingots	213,000	18	102,000	10
Other forms	141,000	12	123,000	13
Total	1,205,000	100	984,000	100

In addition to the regular refineries, many plants throughout the country operate on scrap exclusively, producing metallic copper and a variety of alloys. The output of these plants is not included in the statements of refined-copper production in the preceding tables but is included in the following statement on secondary-copper production.

Copper Sulfate.—The production of hydrous copper sulfate or bluestone by copper refineries in the United States was 20,300 short tons, having a copper content of 5,070 tons in 1946 compared with 32,900 tons containing 8,237 tons in 1945. The output of copper sulfate by plants other than the regular primary refineries totaled 107,500 tons with a reported content of 26,886 tons in 1946, compared with 92,600 tons containing 23,154 tons of copper in 1945. Producers held 9,400 tons of copper sulfate at the beginning of 1946, total production was 127,800 tons, and shipments amounted to 124,700 tons. Some small purchases were made by producers during the year, and producers used a quantity equivalent to 3 percent of shipments. Inventories at the year end were 13,000 tons.

SECONDARY COPPER

Secondary copper includes material recovered from remelting old copper and copper scrap and from the treatment of copper alloys or alloys treated without separation of the copper. The following table summarizes the production of secondary copper during 1942–46. Further details appear in the Secondary Metals—Nonferrous chapter of this volume.

Secondary copper produced in the United States, 1942–46, in short tons

	1942	1943	1944	1945 [1]	1946
Copper recovered as unalloyed copper	114,647	137,883	102,135	112,856	136,909
Copper recovered in alloys [2]	813,108	948,164	848,807	893,660	666,637
Total secondary copper	927,755	1,086,047	950,942	1,006,516	803,546
From new scrap	500,633	658,526	494,232	509,421	397,093
From old scrap	427,122	427,521	456,710	497,095	406,453
Percentage equivalent of domestic mine output	86	100	98	130	132

[1] Revised figures.
[2] Includes copper in chemicals, as follows: 1942, 17,455; 1943, 13,019; 1944, 13,357; 1945, 18,666; 1946, 19,192.

CONSUMPTION

The following table gives figures on apparent consumption of copper in the United States, and data for a long period are available on this

basis. In estimating apparent consumption it has been assumed that copper used in the manufacture of primary fabrications of copper is consumed. Statistics compiled upon a different basis (for example, by taking consumption as including only copper made into automobiles, electrical equipment, ships, and other items) would show very different results. Much copper leaves the country as primary fabrications and considerably more in manufactured products containing copper. The method of calculating the quantity of copper available for consumption is shown in the following table. It should be noted that exports and stocks include some refined secondary copper that cannot be determined separately and also that actual consumption of new copper would differ from the figures shown in the table by the changes in the consumers' stocks.

New refined copper withdrawn from total year's supply on domestic account, 1942–46, in short tons

	1942	1943	1944	1945	1946
Total supply of new copper	1,815,997	1,782,025	1,713,582	1,639,966	1,033,033
Stock at beginning of year	77,500	84,000	68,500	81,000	130,000
Total available supply	1,893,497	1,866,025	1,782,082	1,720,966	1,163,033
Copper exported [1]	131,406	175,859	68,373	48,563	52,629
Stock at end of year	84,000	68,500	81,000	130,000	96,000
	215,406	244,359	149,373	178,563	148,629
Withdrawn on domestic account [2]	1,608,000	1,502,000	1,504,000	1,415,000	1,391,000

[1] Includes refined copper in ingots, bars, or other forms.
[2] Adjusted for Office of Metals Reserve stock changes. Data for 1942–45 are revised.

The Bureau of Mines began to compile figures on actual consumption of copper in 1945. The results of the first 2 years' canvasses are given in the following table. Unlike the foregoing table, which attempts to eliminate all but new copper from measurement, the following one does not distinguish between new and old copper. It covers copper consumed in refined form.

Refined copper consumed [1] in 1945–46, by classes of consumers, in short tons

Form	Wire mills	Brass mills	Chemical plants	Secondary smelters	Foundries and miscellaneous	Total
1945						
Cathodes	14	239,072	105	7,943	11,585	258,719
Wire bars	504,129	57,949			326	562,404

[1] Reported consumption.

STOCKS

The following table gives domestic stocks of copper as reported by primary smelting and refining plants. Stocks of blister and anode copper in transit from smelters to refineries are included under blister copper.

Stocks of copper at primary smelting and refining plants in the United States at end of year, 1942–46, in short tons

Year	Refined copper	Blister and materials in process of refining [1]	Year	Refined copper	Blister and materials in process of refining [1]
1942	84,000	235,500	1945	130,000	331,000
1943	68,500	241,000	1946	96,000	254,000
1944	81,000	311,000			

[1] Includes copper in transit from smelters in the United States to refineries therein.

Producers' (smelters and refineries) stocks of crude and refined copper dropped sharply in 1946, whereas fabricators' inventories of refined, "in process," and primary fabricated copper shapes gained; but industry stocks showed an over-all decline nonetheless.

At the end of 1946 the Office of Metals Reserve held 92,758 tons of electrolytic and fire-refined copper in cathodes, shapes, and "in process" copper, all of which was in the United States. The foregoing total represents a decrease of 84 percent from the 565,710 tons held at the end of 1945, a small part of which was in Canada. The foregoing stocks are upon an ownership basis and therefore duplicate, in part, stocks of refined and "in process" copper reported by the refineries, which are on a physical-plant basis. The Yearbook of the American Bureau of Metal Statistics, 1946 (p. 7), gave Metals Reserve stocks as 472,000 and 95,388 tons at the beginning and end of 1946. The last two figures apparently exclude the duplication mentioned.

Stocks of copper in fabricators' hands at end of year, 1942–46, in short tons

	Stocks of refined copper [1]	Unfilled purchases of refined copper from producers	Working stocks	Unfilled sales to customers	Excess stocks over orders booked
1942	414,668	135,481	340,547	613,005	−403,403
1943	353,948	90,807	299,796	465,258	−320,299
1944	334,017	53,538	289,160	285,654	−187,259
1945	375,618	44,100	268,490	362,436	−211,208
1946	408,943	59,421	286,418	526,628	−344,702

[1] Includes in-process metal and primary fabricated shapes. Also includes small quantities of refined copper held at refineries for fabricators' account.

Metal held by fabricators rose from 375,618 tons at the beginning of 1946 to 408,943 tons at the end. Unfilled sales to customers, however, gained for the second successive year and were the largest since the peak year-end total of 613,005 tons at the end of 1942. The excess of booked orders over stocks at the end of 1946, as a consequence, increased for the second successive year and was 344,702 tons, compared with 211,208 at the beginning of the year.

Figures compiled by the Copper Institute show that domestic stocks of refined, duty-free copper increased from 76,512 tons at the end of 1945 to 80,832 tons at the end of 1946. Inventory data of the Copper Institute and the Bureau of Mines are on different bases and,

as a result, never agree. Under usual conditions the differences are due, in part, to somewhat different coverage and in part to use by the Copper Institute of an arbitrary method, based on tariff practice, in designating the copper as domestic or foreign metal. Copper produced from foreign crude materials and held at refineries at the end of the year is included in Bureau of Mines inventory figures.

PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 608,000 short tons of copper were delivered to domestic and foreign purchasers (excluding deliveries of foreign copper to the Office of Metals Reserve) in 1946 at an average price (f. o. b. refinery) of 14.4 cents a pound, or 22 percent above the level prevailing for the years 1941–45. The averages for 1942–46 exclude bonuses paid for overquota outputs of individual mines, which were first applicable to February 1942 tonnages. The following table gives details covering bonus payments for 1943 to 1946.

Salient statistics covering bonus payments [1] of the Government, 1943–46

	1943		1944		1945		1946

[4] Average for 8 months; thereafter, London Metal Exchange dealings suspended.
[5] No quotations. See text for official maximum price changes.

The ceiling price limitations, placed on copper by the Office of Price Administration effective August 12, 1941, after remaining unchanged for almost 5 years, were raised, effective June 3, 1946, from 12 cents to 14⅜ cents per pound (electrolytic delivered Connecticut Valley), contingent upon the completion of certain wage agreements. On July 1 began a period of uncertainty between the termination of the OPA and the signing on July 25 of a bill extending it, effective July 26. On November 10 all price controls on copper were removed, and in the resulting free market the price rose immediately to 17.5 cents; by year end the price had advanced to 19.5 cents.

The Premium Price Plan, described in earlier chapters of this series, expired June 30, 1946, but was later extended to June 30, 1947, with benefits retroactive to the expiration date of the earlier legislation. The accompanying table presents details of the plan's operations, 1943–46.

Official maximum prices in the London market were unchanged from December 18, 1939, at £62 per long ton for electrolytic copper until April 8, 1946, when it was raised £10 to £72; subsequently the price was boosted to £84, effective July 1, to £98, effective November 13, and to £117, effective January 1, 1947, the upward movement being extended further in 1947.

FOREIGN TRADE[1]

The prewar movement of copper from producing to consuming centers was widely disrupted by the war. Before the war the United States, through its smelting, refining, and fabricating facilities, handled large quantities of foreign crude materials, which were subsequently exported in finished form for consumption abroad. Such copper was not subject to the United States import tax because the copper was not for ultimate consumption here. With the onset of World War II in 1939, United States needs for copper for its huge armament requirements absorbed all the copper that entered the country. The prewar flow was not resumed after the end of hostilities largely because of the enormous demand in the United States and the barriers to trade imposed by various governments.

IMPORTS

The unmanufactured copper entering the United States in each of the six classifications shown in the accompanying table declined in 1946 compared with 1945, and the total unmanufactured copper imports decreased over one-half. The decrease in unrefined black blister and converter copper, the second largest class in 1945, was small as compared with that in refined copper, with the result that this class was the most important source of imported copper in 1946. Much smaller imports from Africa accounted for the reduction. The sources of refined copper in ingots, plates, and bars in 1945, except the Union of South Africa, either sharply reduced shipments to the United States or sent nothing at all. Substantial shipments of regulus, black or coarse copper, and cement from Belgian Congo in 1945 were not continued into 1946. Imports in ore, concentrates, old and scrap copper fit only for remanufacture, and scale and clippings, though smaller in 1946 than 1945, did not constitute a principal source of imported copper in either year.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

1944	785,211		

[1] Data include copper imported for immediate consumption plus material entering country under bond.

EXPORTS

Much of the decline in copper exports in 1946 compared with 1945 was accounted for in the decrease in wire shipments, particularly insulated wire and cable. Despite the fact that the reduction in shipments to Russia was large enough to account for most of the decrease in wire, the U. S. S. R. continued to be the destination for much of the exports in 1946, receiving 44 percent of the insulated wire

and cable. Exports of refined copper, which in 1946 resumed its prewar place as the most important class of copper exports, rose slightly in quantity and substantially in value in 1946 compared with 1945. The United Kingdom—leading destination from 1941 to 1945 inclusive—dropped to third place in 1946. France and Sweden occupied the first two places. There was little change in the quantity and value of plates and sheets exported, but exports of pipes and tubes decreased sharply in quantity and value. Exports of old copper and scrap increased greatly but remained a small item compared to the other classes.

Copper exported from the United States, 1942–46

WORLD REVIEW

The sharp decline in world production of copper in 1946 was due largely to labor strikes, accompanied by a labor shortage, in the United States, causing a 21-percent drop in domestic mine output; but labor problems elsewhere and shortages of coal and hydroelectric power in some countries were contributory factors, as shown by the accompanying discussion.

World mine production of copper, 1940–46, in metric tons

[1] Copper content of blister produced.
[2] Smelter output from domestic and foreign ores, exclusive of scrap. Production from domestic ores only, exclusive of scrap, was as follows: 1940, 824,703 tons; 1941, 876,401; 1942, 987,004; 1943, 991,492; 1944, 910,245; 1945, 710,073; 1946, 543,996. The diversion during the war of Belgian Congo matte from its previous destination, Belgium, for resmelting in the United States resulted in some duplication. The movement ended in 1945.
[3] United States imports.
[4] Figures represent blister copper only. Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from Belgian Congo and would therefore duplicate output reported under the latter country.
[5] Data not available; estimate by authors of chapter included in total.
[6] Exclusive of material from scrap.
[7] Approximate production.
[8] Output from U. S. S. R in Asia included with U. S. S. R. in Europe.
[9] Data represent areas designated as Free China during the period of Japanese occupation.
[10] Preliminary data for fiscal year ended Mar. 31 of year following that stated.
[11] South Korea only.

Austria.—Chief copper deposits in Austria are at Mitterberg, Salzburg.[2] The only electrolytic refinery in Austria is at Brixlegg in the Tyrol. This plant has a reported capacity of 3,500 tons a year. Owing to heavy damages to equipment the plant did not operate in 1946 but was expected to resume in the spring of 1947.

Belgian Congo.—As was the case in the other chief copper-producing countries, output of copper declined in Belgian Congo in 1946. Except for Northern Rhodesia, where production fell only 6 percent, Belgian Congo's drop of 10 percent was the smallest decline among the main producers; 143,885 metric tons were produced in 1946 compared with 160,200 tons in 1945. The rate of output in the first half of the year, 13,000 tons, was only a little below the monthly average for 1945, but the rate in the latter half of the year was 18 percent less than the 1945 average. The drop in the second half of 1946 was due to shortages of hydraulic power and coal. Shipments of copper to Belgium, interrupted since 1940, were resumed in January 1945, according to information released at the annual meeting of Union Minière du Haut Katanga. The 1945 production, however, was sold chiefly to the United States Government. The British Government ceased purchases at the end of January 1945, when its contract terminated. Aggregate shipments to England in 5 war years exceeded 700,000 tons. At the end of 1945 all copper produced, as before the war, was going to Belgium and other European countries for direct delivery to buyers. Shipments to the United States ended in December 1945, although a quantity of unrefined copper, probably in transit at the year end, was recorded in United States imports for January, 1946. This series of reports has not previously reported the construction of a fire-refining plant at Lumbashi, Belgian Congo, completed in 1945. A series of

[2] Bureau of Mines, Mineral Trade Notes: Vol. 24, No. 5, May 1947, p. 5.

articles[3] describing the operations of Union Minière du Haut Katanga was published in 1945.

Belgium.—The February 4, 1947, issue of The Metal Bulletin (London) stated that the Oolen electrolytic copper refinery was working at virtually full capacity, using mainly Katanga blister. Capacity was said to be about 10,000 metric tons a month, and about 2,000 tons were reported scheduled to go to the British Ministry of Supply. At the annual meeting of the Société General Metallurgique de Hoboken it was reported that its Oolen plant had attained a normal rate of production, but that its Hoboken plant was operating at only a fraction of capacity because necessary crude materials for economic operation were unavailable.

Canada.—The year 1946 witnessed the smallest output of copper in Canada since 1934. The total was 22 percent less than in 1945 and 43 percent below the all-time peak in 1940; the decline has been uninterrupted since the peak year. The demand for nickel is a strong factor in determining the rate of copper production in Canada, inasmuch as the International Nickel Co. of Canada, Ltd., chief copper producer in the country, is the world's largest producer of nickel. The 1946 company report to stockholders stated that deliveries of nickel early in the year were curtailed by strikes in the major nickel-consuming industries. Zinc, gold, and silver are likewise important constituents in the ores of other large copper producers and play a part in determining the copper production of Canada. Producers in Canada continued to experience difficulties in obtaining a sufficient labor force in 1947 and also suffered from labor strikes, although to a much less extent than United States operators. Output in the last quarter of 1946 was little higher than in the first quarter, despite a marked gain at the International Nickel property, because of a strike at the property of Noranda Mines, Ltd.

The British Ministry of Supply contracted for most of Canada's exportable copper in 1946. According to reports[4] the Ministry purchased 140,000 short tons (said to be 75 percent of the exportable surplus) for 1947 delivery. The report stated that half of the tonnage was to be priced on the Engineering and Mining Journal daily average quotation for export copper f. a. s. Atlantic ports for the 6 calendar months prior to shipment. Of the remaining half, that part shipped in the first two quarters would be on the basis of 17.5 cents f. a. s. Atlantic ports, and agreement was to be reached subsequently regarding the remainder. Canadian manufacturers who use copper, lead, and zinc were favored by the price situation in Canada in 1946. By late November the controlled price for copper was about 6 cents under the "world" price of 17½ cents. Primary producers could export copper only after meeting domestic requirements. In November the Canadian Prices Board made arrangements whereby primary producers would participate in profits on manufactured metal articles sold in export markets. The official Canadian price for copper, delivered Toronto and Montreal, was increased from 11.5 cents a

pound to 16.625 cents on January 22, 1947. The United States export price at that time was 19.925 cents f. o. b. Atlantic seaboard refinery.

Copper produced (mine output) in Canada, 1942–46, by Provinces, in short tons

Province	1942	1943	1944	1945	1946 (preliminary)
British Columbia	25,008	21,111	18,152	12,876	10,359
Manitoba	23,798	19,008	21,939	20,563	20,000
Ontario	154,141	138,920	142,654	119,726	89,668
Quebec	70,456	65,582	54,027	51,342	35,016
Saskatchewan	28,391	42,974	36,757	32,950	30,500
Northwest Territories	37	----------	6	----------	----------
Total	301,831	287,595	273,535	237,457	185,543

More than half of Canada's copper production usually comes from the nickel-copper ores of the Sudbury district, Ontario, but in 1946 the proportion dropped to 48 percent. International Nickel, as already mentioned, was as usual the largest copper producer in Canada. Mining and smelting operations were at about 50 percent capacity in the first half of the year; they were increased in September and by the end of the year were up to 75 percent of the maximum wartime production. Copper sales totaled 74,889 short tons in 1946 compared with 107,862 tons in 1945 and 132,356 tons in 1944. Proved ore reserves at the year end stood at 217,142,000 short tons containing 6,861,000 tons of nickel-copper. Ore mined totaled 7,736,334 tons in 1946 compared with an annual average of 11,453,154 tons in 1943–45 and of 5,321,634 in 1936–38. The operations of the International Nickel Co., of Canada, Ltd., were described[5] in considerable detail in 1946. The Falconbridge Nickel Mines, Ltd., the other important producer in Ontario, hoisted 488,117 tons of ore and produced 2,845 tons of copper and 5,018 tons of nickel. Ore reserves were increased during the year and were estimated to be 8,296,500 tons containing 1.63 percent nickel and 0.85 percent copper at the year end.

Quebec as usual ranked second in production, copper coming from copper-gold, copper-zinc, and copper-pyrites ores in the western part of the Province. Noranda Mines, Ltd., is the outstanding producer in Quebec. A total of 953,437 tons of ore was hoisted at the Horne mine in 1946; 562,034 tons were milled, and 500,625 tons of ore and concentrates were smelted. The smelter treated 250,226 tons of custom material in addition. Copper output for the Horne mine was 13,763 tons of a total smelter output of 35,189 tons. In addition to copper, the Horne mine produced 155,197 ounces of gold and 317,997 ounces of silver. Developed ore reserves above the 2,975-foot level at the end of the year were 4,960,000 tons of sulfide ore averaging 7.14 percent copper, 14,692,000 tons of sulfide ore containing 0.67 percent copper, and some siliceous fluxing ore. Mining and smelting ceased on November 21 owing to a labor strike that continued into early 1947. The shortage of underground workmen reduced output of ore by Normetal Mining Corp., Ltd., to 511 tons a day, the smallest since 1940. At the end of 1946 ore reserves were

[5] Canadian Mining Journal, vol. 67, No. 5, May 1946, pp. 305–554.

estimated at 1,716,000 tons of ore, containing 3.68 percent copper and 7.28 percent zinc. Waite Amulet Mines, Ltd., treated 427,000 tons of ore in 1946 and at the end of the year had, with its subsidiary, 2,100,000 tons in reserve, compared with 2,500,000 at the end of 1945, no new ore having been discovered. Canadian Copper Refiners, Ltd., controlled by Noranda, produced 78,000 tons of copper in 1946.

The Hudson Bay Mining & Smelting Co., Ltd. (Flin Flon mine), and Sherritt Gordon Mines, Ltd., supply the copper output of Manitoba and Saskatchewan. A total of 1,837,472 tons of ore, averaging 2.39 percent copper and 5.0 percent zinc, was mined and milled at the Hudson Bay property. The smelter treated 387,477 tons of Hudson Bay concentrate and ore and 45,565 tons of custom concentrates. Production of refined metals for company account included 39,792 tons of copper, 141,486 ounces of gold, and 1,823,210 ounces of silver. At the Sherritt Gordon Mines, Ltd., property 558,836 tons of ore were milled (646,092 tons in 1945) and 10,774 tons of copper, 6,185 ounces of gold, 196,545 ounces of silver, and 17,291 tons of zinc concentrate produced. Exhaustion of the mine at Sherridon was reported by the company to be near, the East mine out of ore by the end of the year, and the West ore body down to 1,368,000 tons, averaging 2.60 percent copper and 2.12 percent zinc. Production of ore totaled 558,836 tons and of copper 10,774 tons in 1946. A total of 74,798 feet of diamond drilling was done on the company's nickel-copper property at Lynn Lake, 120 miles north of Sherridon. This ore body was estimated to contain 4,974,000 tons of ore, averaging 1.18 percent nickel and 0.60 percent copper, above the 1,000-foot level. Sherridon equipment will be moved to Lynn Lake as exhaustion of the West mine is reached and as required for equipping the new property.

Chief producers of copper in British Columbia are the Granby Consolidated Mining, Smelting & Power Co., Ltd., and Britannia Mining & Smelting Co., Ltd.

Exports in 1946 (comparison with 1945 in parentheses) were 101,414 (129,349) short tons of copper ingots, bars, and billets, 15,916 (7,281) tons of rods, strips, sheet, and tubing, 17,628 (19,295) tons of copper in ores, matte, regulus, etc., and 1,230 (1,438) tons of copper, old and scrap.

Chile.—Mine production of copper dropped 19 percent in 1946, from 446,398 metric tons in 1945 to 360,935 tons, and was the smallest since 1940. A 5-week labor strike at the Chuquicamata mine of the Chile Exploration Co., ending late in June, and one at the Braden mine of the Kennecott Copper Corp., beginning late in September and settled in December, were the principal deterrents to capacity operations, but other strikes lasting a few days each and a serious shortage of water at Braden were added adverse factors. The Kennecott Copper Corp. commented on the situation as follows:

* * * The new government which came into office on November 3 directed such great pressure against the company that it finally agreed to the arbitration of a number of points involved in the dispute. Production was resumed on December 11. The Arbiter's award, handed down on December 27, granted wage increases, additional vacation allowances, and certain changes in working regulations. As a result of the award and the agreements made earlier with the unions at the smelter, power plants and shops, wages at the end of December were approximately 22 percent higher than in June.

Loss of copper production from this prolonged strike and several others of a few days' duration was augmented by an acute water shortage resulting from a subnormal snowfall in 1945 followed by practically no snow at all during the Chilean winter of 1946. This unusual weather condition reduced the water available for hydro-electric power and concentrator operations throughout the year and will likewise adversely affect output in the first half of 1947. As compared with 1945, there was a decrease of 3,308,888 tons in the ore milled, the 1946 figure being 5,384,408 tons assaying 2.133 percent copper. Smelter production totaled 187,449,600 pounds, a decrease of 142,348,478 from that of the previous year. * * *

The Chuquicamata mine of the Chile Exploration Co. and the Andes mine of the Andes Copper Mining Co., subsidiaries of the Anaconda Copper Mining Co., produced 231,926 short (210,399 metric) and 69,509 (63,057 metric) tons, respectively, in 1946, decreases from 261,929 (237,617 metric) and 70,311 (63,785 metric) tons, respectively, in 1945.

The custom smelters at Chagres and Natalga were closed during the entire year, and very little production was contributed by small mines following cancellation of the United States Commercial Co. contracts in 1945.

Exports of the chief copper classes, by countries, are shown below in metric tons:

	Electrolytic	*Standard (furnace refined)*
United States	80, 812	88, 430
Great Britain	46, 363	23, 772
France	27, 986	9, 449
Italy	24, 967	8, 297
Sweden	17, 630	1, 600
Argentina	9, 066	------
Brazil	7, 649	3, 250
Netherlands	6, 601	------
India	5, 331	------
Poland	2, 720	------
Czechoslovakia	2, 267	------
Switzerland	1, 954	2, 647
Morocco	1, 798	------
Belgium	354	------
China	219	------
Norway	101	101
Bolivia	27	------
Uruguay	-------	430
Colombia	-------	190
Total	235, 845	138, 166

Exports of concentrates in 1946 were 3,367 tons, all of which went to the United States.

Finland.—The report of this series for 1945 pointed out that the capacity of the Outokumpu Copper Co. was recently enlarged by the construction of a modern smelting works at Harjavalta. Owing to the fact that the 12,000-ton smelter at Imatra was within range of artillery fire, it was shut at the beginning of July 1944.[6] All loose machinery was moved westward to Harjavalta and the capacity of the new plant increased to 24,000 tons. First copper was poured January 7, 1945, 5 months after the beginning of the construction, in smelter buildings without walls or roof and during freezing weather.

[6] Bryk, P., Levanto, K. I., Makinen, Eero, and Ryselin, John, Outokumpu's Copper Smelter Doubles Output During War: Eng. and Min. Jour., vol. 148, No. 1, January 1947, pp. 68–72.

The discovery of the Outokumpu ore in 1910 and the development of the property to a completely integrated concern with electrolytic copper and nickel refineries, rolling mill, and plant for the manufacture of tubes, rods, and profiles are described in the article cited. Ore reserves were said to be 17,000,000 tons averaging 3.5 percent copper. Ore reserves of the Ylojarvi mine, discovered in 1937 and also under ownership of the Outokumpu Co., were said not yet to be well-defined, but were estimated at 800,000 tons averaging 1 percent copper.

Germany.—The war operation of German smelting and refining plants is indicated in the following tables.

Smelter production of copper in Germany from ore, 1940–44 (yearly average)

Occupation zone and plant	Metric tons [1]
American:	
Kurhessische Kupferschieferbergbau, Richelsdorf, Sontra (Kreis Rotenburg) [2]	3,000

Total Russian	55,300	6,700
Total Germany	158,300	8,000

[1] Partly estimated.
[2] Production of electrolytic copper includes some fire-refined copper delivered in electrolytic quality.

A long list of German nonferrous smelters and refineries were declared by the Allied occupation authorities as available for reparations. The following copper plants were listed as surplus to the authorized industrial level and available for reparation or destruction:

Norddeutsche Affinerie, Hamburg:
Producer of electrolytic copper, lead, tin, nickel, bismuth, silver, gold, metallic powders, sulphate of copper, and arsenic. Annual capacity (tons): Copper, 90,000; lead, 12,000; nickel, 400; bismuth, 120.
(NOTE.—Copper smelter—capacity 40,000 tons—is to be retained.)
Zinnewerke Wilhelmsburg, Hamburg:
Copper and tin smelter. Capacity (tons): Copper, 48,000 annually; tin and byproducts 14,400.
Kupferhutte Ertel Bieber, Hamburg:
Copper precipitate, zinc oxide, iron concentrates. Annual capacity (tons): Copper precipitate, 2,000; zinc oxide, 2,000; iron concentrates, 100,000.
Metallhutte Kall, G. m. b. H., Kall (Eifel):
Copper, copper oxides, copper alloys. Capacity (tons): Copper, 6,000; oxides, 4,000; alloys, 4,800.

Of the 85 nonferrous metal smelting, refining, and fabricating plants shown in a subsequent report,[7] 26 listed copper as principal or subsidiary product, and 12 additional ones listed nonferrous materials without specification.

Many reports describing Germany's industrial plants and processes have been issued, a number [8] of which relate to copper mining, reduction, or fabrication.

Northern Rhodesia.—Production of copper was affected adversely by labor problems and inadequate supplies of coal, but the total for 1946 was only 6 percent below that for 1945 although 30 percent less than the all-time peak in 1940. The four big copper producers in Northern Rhodesia—Mufulira, Nchanga, Rhokana, and Roan Antelope—were closed for more than a month during 1946 by a strike of skilled workers beginning July 15. The union agreed to accept arbitration and the strikers returned to work August 21, but it was the end of October before arbitration proceedings were completed. Inadequate rail facilities led to coal shortages from time to time during the year and further restricted copper production. Rhodesian production for 1946 was contracted largely to the British Ministry of Supply. A significant event during 1946 was the formation of a company to take over and expand Rhodesian refining facilities. The Rhodesia Copper Refineries, Ltd., was formed by Rhokana Corp., Ltd., and Nchanga Consolidated Copper Mines, Ltd., in the latter

part of the year to purchase the refinery at Nkana from Rhokana and arrange to duplicate the plant immediately. The proposed extension will permit the refining of the entire estimated output of the forming companies up to the end of 1951. A further extension may be needed to refine the increased output from the Nchanga mine to become effective about 1952. The projected doubling of the plant would result in a refinery capacity of close to 140,000 short tons of electrolytic copper a year.

At the Roan Antelope mine 2,624,900 short tons of ore containing 2.59 percent copper were mined in the fiscal year ended June 30, 1946, or almost exactly the same as in the preceding 12 months. Ore reserves at the end of June were estimated as 100,316,041 tons averaging 3.28 percent copper. Ore handling at Roan Antelope was recently described.[9]

The Rhokana Corp., Ltd., produced 99,250 short tons of copper in the fiscal year ended June 30, 1946, compared with 107,597 tons in 1945. Of the 1946 total, 10,618 tons were Nkana blister, 21,784 tons were Nchanga blister, and 66,848 tons were Nkana electrolytic, compared with 20,001, 17,976, and 69,620 tons, respectively, in 1945. Ore reserves at the end of June 1946 totaled in the Nkana north ore body 23,957,700 short tons containing 3.34 percent copper, in the Nkana south ore body 20,165,000 tons containing 2.78 percent copper, and in the Mindola ore body 58,272,900 tons containing 3.68 percent copper.

The Nchanga Consolidated Copper Co. mined 561,084 short tons in the fiscal year ended March 31, 1946, and milled 558,300 tons containing 4.59 percent copper, of which 2.29 percent was in the form of oxide and 2.30 percent in the form of sulfide. Production capacity was raised to 30,000 short tons April 1, 1946. Sulfide concentrates will continue to be treated by Rhokana, and the carbonate concentrates will be treated in a backing plant to be built at Nchanga. Ore reserves were estimated as 141,117,000 tons.

Mufulira Copper Mines produced 56,045 short tons of copper in the fiscal year ended June 30, 1946, compared with 65,268 tons in the preceding year. Total ore reserves were 136,557,000 tons averaging 3.83 percent copper compared with an annual milling rate of less than 2,000,000 tons.

United Kingdom.—The United Kingdom easily ranked as the second-most important copper-consuming country in the world again in 1946. Figures released by the British Non-Ferrous Metals Federation indicate that 493,716 long tons of copper were consumed in 1946, of which 325,409 tons were virgin metal and 168,307 tons copper contained in scrap. These figures compare with 461,531, 288,613, and 172,918 tons, respectively, in 1945. Stocks of virgin metal were 92,300 tons at the end of 1946 compared with 123,100 tons at the beginning of the year.

The British Ministry of Supply continued bulk purchasing in 1946, taking preponderant shares of the copper exported from Northern Rhodesia and Canada, as well as smaller proportions from Belgian

[9] Goldick, M. R., Ore Handling at Roan Antelope: Mining Mag., vol. 74, No. 4, April 1946, pp. 209–214.

Congo, Chile, and other countries. Imports of the important copper classes in 1946, in long tons, were as follows:

Source:	*Electrolytic*	*Standard*
Northern Rhodesia	25, 950	98, 878
Canada	60, 415	(1)
Belgian Congo	[2] 28, 117	(1)
United States	3, 524	(1)
Other countries [3]	50, 777	23, 482
	168, 783	122, 360

[1] Not separately reported; if any, included with "Other countries."
[2] Apparently by reshipment; see discussions under Belgian Congo and Belgium.
[3] Apparently principally Chile.

The gross weight of copper ore imported was 13,004 tons. Exports in 1946 were as follows:

	Long tons
Copper ingots, etc	19, 221
Plates, sheets, etc	16, 938
Wire in coils	24, 622
Tubes	4, 606
Other manufactures	7, 988
Total	73, 375

Copper ingots aggregating 6,066 tons were reexported.

Copper sulfate production in 1946 amounted to 55,200 long tons containing 13,801 tons of copper.

Feldspar

By ROBERT W. METCALF AND A. B. HOLLEMAN

GENERAL SUMMARY

RECORD outputs of plate glass and glass containers and large increases in the demand for pottery and enamel products stimulated the feldspar industry in 1946 to new peaks in production for both crude and ground spar. The output of crude feldspar rose 36 percent in quantity and 28 percent in value and the output of ground spar increased 23 percent in tonnage and 26 percent in value compared with 1945, the former record year for both crude and ground material. Crude feldspar topped one-half million tons for the first time in history. Production of aplite also increased sharply to a new record output. Imports of Canadian crude feldspar increased 10 percent and were the highest since 1930. Receipts of crude nepheline syenite (all from Canada) again were higher than in any previous year.

Production of crude feldspar in all States reporting output in 1946 was higher than in 1945. North Carolina broke its previous record year—1945—by 55 percent. Virginia increased its output of crude spar by 13 percent. Large gains in production were shown in the New England States. Output in South Dakota—the second highest producing State—Wyoming, and Colorado in 1946 were 9, 20, and 42 percent, respectively, higher than in 1945. Ground feldspar sold from

[1] Less than 1 ton.

North Carolina and Tennessee mills in 1946 was 46 percent greater than in 1945. Sales of ground spar from Virginia showed a moderate increase. Output in New Jersey and Connecticut combined in 1946 was about one-sixth greater than in 1945. Arizona, Colorado, Maine, and New York showed large percentage gains over 1945. Feldspar ground in South Dakota and Tennessee in 1946, however, was less than that reported in 1945.

The greatly increased output of feldspar in 1946 was directly traceable to the higher level of industrial activity in that year, particularly in the ceramic industries. This is borne out by the 61-percent increase of active ceramic plants (those manufacturing pottery, porcelain enamel, glass, brick, and other ceramic products) over a period extending from December 1943 to June 1946, reported by the Department of Commerce.[1] Most of this expansion took place after the war.

With respect to individual segments of the ceramic field in which large quantities of feldspar are consumed, the production of glass containers in 1946 reached an all-time high of 116 million gross, or 10 percent higher than in 1945. Inventories of glass containers dropped 17 percent during 1946. Plate-glass output in 1946 also surpassed all previous records, totaling 210,006,188 square feet or 6 percent more than in 1936, the former high year, and more than double 1944's production. Manufacturers' sales of machine-made table, kitchen, and household glassware increased 46 percent compared with 1945, and both production and shipments of automatic tumblers were substantially higher in 1946 than in 1945. The higher level of residential and industrial construction resulted in a 66-percent gain in output of floor and wall tile in 1946 [2] and was chiefly responsible for the large gain in shipments of porcelain enameled products. Assuming no major recession, the outlook for a continued active market for feldspar seems favorable. The growing use of improved methods of beneficiation, such as froth flotation, is increasing the ability of the industry to satisfy all demands.

DOMESTIC PRODUCTION

Following the usual practice in the industry, crude feldspar is reported in long tons of 2,240 pounds and ground feldspar in short (net) tons of 2,000 pounds.

CRUDE FELDSPAR

Output of crude feldspar in 1946 again broke all existing production records in both quantity and value, surpassing the former high year —1945—by 36 percent in quantity and 28 percent in value. Production in 1946 topped 500,000 long tons for the first time, reaching 508,380 tons valued at $2,594,099, compared with 373,054 tons valued at $2,021,529 in 1945.

Output in all important producing States registered moderate to large gains in tonnage in 1946. The increases were especially pronounced in North Carolina and New England.

Crude feldspar sold or used by producers in the United States, 1942–46

Year	Long tons	Value		Year	Long tons	Value	
		Total	Average			Total	Average
1942	316,166	$1,546,702	$4.89	1945	373,054	$2,021,529	$5.42
1943	308,180	1,646,277	5.34	1946	508,380	2,594,099	5.10
1944	327,408	1,813,937	5.54				

Crude feldspar was produced in 1946 in 12 States, 1 less than in 1945. No output was reported in 1946 from California and Pennsylvania, while production in Georgia appeared for the first time since 1916. Output in North Carolina eclipsed the previous record year (1945) by 55 percent in tonnage and 39 percent in value, rising in 1946 to 230,367 long tons valued at $1,200,638. Production in Virginia rose 13 percent. Output in Maine increased 72 percent to the highest point since 1941; in New Hampshire, 30 percent more feldspar was mined in 1946 than in 1945; and production in Connecticut rose 41 percent to the highest level since 1940. South Dakota, with the second largest production, increased its output in 1946 by 9 percent compared with 1945, and Colorado's output rose 42 percent. Crude spar mined in Wyoming, which markets virtually all its tonnage to mills in Colorado, was 20 percent greater than in 1945. Tonnages increased moderately in Arizona, New York, and Texas.

[1] Includes Arizona, New Hampshire, New York, and Texas; and, in addition, California and Pennsylvania in 1944–45 and Georgia in 1946.

Studies of mineral resources and potential investment opportunities in Colorado [3] and North Carolina,[4] including references to feldspar deposits, were published.

GROUND FELDSPAR

Sales of ground feldspar by merchant mills in 1946 topped the former peak year 1945 by 23 percent in quantity and 26 percent in value, totaling 470,199 short tons valued at $5,346,107. Production in

[3] Prommel, H. W. C., Colorado's Potential Mineral Resources: Mines Mag., vol. 36, No. 6, June 1946, pp. 241–244, 276–277. Chem. Abs., vol. 40, No. 20, Oct. 20, 1946, p. 6188.

[4] Greaves-Walker, A. F., Investment Opportunities in North Carolina Minerals: North Carolina State Coll. Eng. Exper. Sta. Bull. 31, November 1945, 29 pp. Jour. Am. Ceram. Soc., vol. 29, No. 10, Oct. 1, 1946, p. 181.

California, South Dakota, and Tennessee was somewhat less in 1946 than in 1945; in all other States, however, increases were reported. North Carolina and Tennessee mills combined supplied 44 percent of the total sales of feldspar ground in the United States in 1946 compared with 37 percent in 1945 and 26 percent in 1942. Sales of feldspar of Canadian origin ground in merchant mills in the United States in 1946 were 64 percent greater than in 1945 but comprised only 3 percent of the total merchant sales. In addition, relatively small tonnages of Canadian origin are ground by consumers, principally pottery and cleanser manufacturers, who import their spar direct and whose figures are not included in these compilations.

Ground feldspar sold by merchant mills [1] in the United States, 1942–46

Year	Active mills	Domestic			Canadian			Total	
		Short tons	Value		Short tons	Value		Short tons	Value
			Total	Average		Total	Average		
1942	29	318,209	$3,339,462	$10.49	9,577	$185,507	$19.37	327,786	$3,524,969

[1] Excludes potters and others who grind for consumption in their own plants.

North Carolina in 1946 was by far the largest producer of ground feldspar, followed by South Dakota, Colorado, Tennessee, and New Hampshire. Ground spar produced in North Carolina and Tennessee combined in 1946 increased to 207,527 short tons—a new record. Output in New Jersey and Connecticut combined was 17 percent higher than in 1945; in Maine, 52 percent higher; and in Colorado, 33 percent higher. Most other producing States showed large percentage gains in 1946 compared with 1945.

Colorado Feldspar Co., formerly a subsidiary and now an integral part of Consolidated Feldspar Corp., Trenton, N. J., plans to erect

a $150,000 feldspar-processing mill at Parkdale, Fremont County, Colo., about 12 miles west of Canon City.[5] Grinding was scheduled to begin in the early part of 1947.

CONSUMPTION AND USES

Crude Feldspar.—Although a number of grinders mine their own feldspar, either themselves or through affiliated firms, most crude feldspar is mined by small operators and sold to merchant mills. Several mines or localities may contribute to their raw-material supply. The spar received by the mills, whether purchased or mined, is stock-piled according to grade and source, blended to obtain a desired composition in the finished product, ground to specified fineness, perhaps refined in magnetic separators, and sold to ultimate consumers. An increasing tonnage of feldspar or feldspar-containing rocks is being treated in flotation machines.

A few pottery and enamel manufacturers purchase as crude spar part or all the feldspar they require and grind it in their own mills. Certain makers of soap, cleansers, and sweeping compounds also mine or purchase crude feldspar, and after grinding or otherwise processing it utilize the spar in their products. Some Canadian crude feldspar is purchased direct by consumers in this country. Manufacturers of artificial teeth annually consume a small tonnage of very carefully selected crude material, which must be free from all grit and is sold at a considerable premium over No. 1 grade commercial feldspar.

Ground Feldspar.—Ceramic industries in 1945 and 1946 consumed 99 percent of the ground feldspar sold by merchant mills. Sales of ground spar to the glass industry in 1946 totaled 289,559 short tons, a new record, 16 percent above the former high reported in 1945. Sales to potteries were also the largest yet recorded—154,340 tons, or 38 percent higher than in 1945 and 21 percent greater than in the previous peak year 1941. Ground feldspar consumed in enamel manufacture in 1946 rose 64 percent compared with 1945 but was considerably under the 1941 level. Ground spar sold by merchant grinders for use in soaps, cleansers, and abrasives was 27 percent less in 1946 than in 1945. The remainder of the ground feldspar was consumed in miscellaneous ceramic applications.

[1] Included under "Other destinations"; separate figure for State not available.
[2] Includes Arkansas, Colorado, Connecticut, District of Columbia, Hawaii, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Oklahoma (1943–45), Puerto Rico, Rhode Island, South Carolina, Texas, and States receiving shipments that cannot be segregated; also small shipments to Belgium, Canada, England, and Mexico.

The application and use of feldspar in glazes [6] and in porcelain enamels [7] were reported.

Descriptions, characteristics and varieties of feldspar used as gems were reported by Pough.[8] Another account of the employment of feldspar as gem material was included in a compilation of data on birthstones.[9]

PRICES

Quotations on crude feldspar do not appear in the trade press. Average realizations by States, however, have been computed from the data reported to the Bureau of Mines each year by the operators. According to these returns, the average realization per long ton for crude spar in 1946 decreased 6 percent to $5.10 compared with $5.42 in 1945. Except for the preceding 3 years (1943–45), this was the highest realization since 1937. Increases in average value occurred in Virginia (1 percent), Maine (3 percent), and Wyoming (11 percent). All other States showed small to moderate decreases in realization. Averages per ton for certain States in 1945 and 1946 (1945 in parentheses) follow: North Carolina, $5.21 ($5.82); Virginia, $6.21 ($6.14); Maine, $5.83 ($5.68); Connecticut, $5.94 ($6.39); Colorado, $3.91 ($4); South Dakota, $4.02 ($4.60); and Wyoming, $4.10 ($3.68).

The average realization per short ton for ground feldspar rose to $11.37 in 1946 compared with $11.13 in 1945 and was the highest since 1938 ($11.50). The average value per ton in North Carolina-Tennessee declined 10 percent compared with the 1945 values, probably due to the greater proportion of glass spar marketed. In Maine and Connecticut-New Jersey the average value decreased

slightly. On the other hand, in Arizona, Colorado, South Dakota, and Virginia it rose 9 to 20 percent. Realizations per short ton for individual States ranged from $8.11 to $18.07. Average values for ground spar for selected States in 1946 follow: Colorado, $8.11; South Dakota, $9.58; North Carolina-Tennessee, $10.57; New Hampshire, $12.37; Maine, $15.90; and Connecticut-New Jersey, $18.07.

According to E&MJ Metal and Mineral Markets, prices of ground feldspar in 1946 were quoted at the same figures as in 1945 and immediately preceding years. Potash and soda feldspars, in bulk, f. o. b. North Carolina or Maine, 200-mesh, white, were listed at $17 and $19, respectively. Granular glass spar, f. o. b. North Carolina, 20-mesh, white, in bulk, was quoted at $12.50 per ton and semigranular glass spar at $11.75. Quotations on Virginia feldspar were: No. 1, 230-mesh, $18; 200-mesh, $17; glassmakers' spar No. 18, $12.50; and No. 17, $11.75. Ground feldspar for enamelers' use ranged from $14 to $16 per ton, f. o. b., on either a Spruce Pine, N. C., or Keene, N. H., basis.

FOREIGN TRADE [10]

Feldspar.—Crude feldspar imported for consumption in the United States in 1946 totaled 16,365 long tons valued at $127,654—10 and 11 percent larger in quantity and value, respectively, than in 1945 and the highest level of imports since 1930. All of the imports of crude spar originated in Canada, except for 2 tons from the United Kingdom. Imports of ground feldspar during the last few years have been very small.

Feldspar imported for consumption in the United States, 1942–46

Year	Crude		Ground		Year	Crude		Ground	
	Long tons	Value	Short tons	Value		Long tons	Value	Short tons	Value
1942	9,525	$69,798			1945	14,924	$114,917		
1943	10,758	83,073	41	$417	1946	16,365	127,654	(1)	$2
1944	11,686	95,956	10	203					

[1] Less than 1 ton.

Cornwall Stone.—Imports for consumption of unmanufactured Cornwall stone in 1946 totaled 456 long tons valued at $6,031. Imports of both unmanufactured and ground Cornwall stone have originated in United Kingdom.

NEPHELINE SYENITE

Nepheline syenite is a quartz-free crystalline rock consisting principally of nephelite (an alumina-potash-soda silicate) and albite and microcline feldspars. Often associated are the iron-bearing minerals, black mica and magnetite, and accessory minerals such as zircon and corundum. Its high alumina content (20 to 30 percent compared with 17 to 20 percent in most commercial feldspars) has made it especially desirable in the manufacture of glass. Continued research has broadened possible applications to other branches of ceramics, such as pottery, sanitary and electrical porcelain, floor and wall tile, and glazes. Its most active market, however, is in the manufacture of glass.

In recent years the nepheline syenite used in ceramics in the United States has originated almost wholly from the Blue Mountain deposits of American Nepheline, Ltd., near Lakefield, Peterborough County, Ontario. Diamond drilling in the original producing area has disclosed the existence of substantial reserves. Open-pit quarrying is to be replaced by underground mining.[11] At the end of 1946 a new 300-ton mill was being erected at the mine site at Blue Mountain.

Part of the crude ore is to be ground at the new mill principally for the glass trade, and the balance shipped to Rochester for finer grinding and processing at the company plant there. It is planned eventually to install fine-grinding mills at Blue Mountain.[12] Port Coldwell Mines & Metals, Ltd., with deposits on the northern shore of Lake Superior and in the Bancroft area in southern Ontario, engaged in diamond drilling during 1946. Further work in these areas, however, has been deferred temporarily.[13] The development of low-temperature multiple-flux bodies and glazes has been especially stressed in current research on the behavior of nepheline syenite incorporated into ceramic ware, at the Engineering Experiment Station, Ohio State University, Columbus, Ohio.[14]

In an investigation of the nephelite-bearing rocks in northwestern New Jersey, especially near Beemerville, it was found that the character and amount of mafic constituents apparently would not permit their use in ceramics, although they might be suitable for the manufacture of roofing granules or used locally for road ballast.[15]

The possibilities of using nepheline syenite from Arkansas as a constituent of ceramic ware are being studied by the Arkansas Resources and Development Commission.[16] Various methods of beneficiation, including flotation, were tested, to reduce the high-iron content. In addition to construction uses, another large outlet for Arkansas nepheline syenite would be in the manufacture of roofing granules.[17]

Imports for consumption of crude nepheline syenite into the United States in 1946 were slightly higher in both quantity and value than in 1945 and were the largest yet reported—51,852 short tons valued at $206,613. The tonnage of ground nepheline syenite imported totaled 1,018 tons valued at $11,137, only a little less than in 1945. All imports of both crude and ground material originated in Canada.

Nepheline syenite imported for consumption in the United States, 1942–46

Year	Crude		Ground		Year	Crude		Ground	
	Short tons	Value	Short tons	Value		Short tons	Value	Short tons	Value
1942	35,990	$120,688	4	$44	1945	51,785	$194,975	1,073	$11,461
1943	43,105	150,225	737	7,680	1946	51,852	206,613	1,018	11,137
1944	39,043	136,664	-------	-------					

Quotations on crude nepheline syenite are not reported in trade journals; however, average values per short ton (estimated foreign market value) of imports for consumption in the United States have continued to rise as indicated by the following data: 1941, $3.13; 1942, $3.35; 1943, $3.49; 1944, $3.50; 1945, $3.77; and 1946, $3.98. During 1946 and the two prior years, ground nepheline syenite was quoted in Oil, Paint and Drug Reporter as follows (per short ton in bulk, f. o. b. Rochester, N. Y.): Glass-grade, 24-mesh, $12 per ton; pottery-grade, 200-mesh, $15.50 per ton. Packed in bags, prices are $2 higher.

APLITE

Virtually the entire output of aplite is used in making glass, particularly for containers, with small quantities consumed in enamel plants. The greatly increased demand for these products in 1946 resulted in an increase of nearly 45 percent in sales of aplite compared with 1945 and established a new record. Figures, however, may not be shown, as to do so would reveal operations of individual companies. The effect of calcination on the grindability of aplite rock and certain of its constituents has been studied at Battelle Memorial Institute, Columbus, Ohio.[18]

Aplite is mined in Amherst and Nelson Counties, Va., by two firms: Dominion Minerals, Inc., Piney River, Va. (the first company to begin mining) and Carolina Mineral Co., Inc., Kona, N. C., a subsidiary of Consolidated Feldspar Corp., Trenton, N. J. Both firms operate mills near Piney River.

TECHNOLOGY

The depletion of known feldspar reserves, especially in Southern and Eastern States, has led to extensive prospecting in order to develop new deposits. Coupled with this exploration program has been an intensive investigation of mechanical and chemical means of making the large reserves of low-grade pegmatite feldspar available for com-

[18] Koenig, J. H., Report of Committee on Research: Bull. Am. Ceram. Soc., vol. 26, No. 6, June 15, 1947, pp. 192–198.

mercial exploitation. Of particular interest during 1946 was the increasing application of froth flotation as a means of achieving these objectives. The basic fundamentals of this method of recovery and its technical aspects as applied to the feldspar industry were discussed by Koenig.[19]

Comprehensive discussions of froth flotation, including a description of the Steffensen air-flotation machines and a listing and evaluation of the various types of oils and reagents available was published during 1946 in a series of articles by Barr.[20] Experiments with froth flotation of granite fines to recover mica, feldspar, and quartz concentrates as a byproduct of granite quarrying operations were reported at the Lithonia, Ga., plant of Consolidated Quarries Corp.[21]

WORLD REVIEW

The world output of feldspar in 1946 was estimated at 650,000 metric tons. This total does not include the output in several countries (Brazil, China, Czechoslovakia, and U. S. S. R.) where mining of feldspar is known, but for which no data are available upon which to base even an estimate.

In recent years the United States has produced approximately 75 percent of the estimated world output of feldspar. Other countries reporting sizable shares of the remainder in normal years were Australia, Canada, France, Germany (Bavaria), Japan, Norway, and Sweden. Small quantities in 1946 also were mined in many other parts of the world.

A discussion of the mineral occurrences near Parry Sound in Ontario included a description of the feldspar deposits in this area and a number of analyses.[22] A brief account of the clay, feldspar, and other deposits in British Columbia was given by Cummings.[23] The potash feldspar deposits of Scotland, particularly in South Harris, as well as in other parts of the country were described by Robertson.[24] Studies of the use of Swedish feldspar in glass compositions were published.[25] The importance of European feldspar deposits and their relation to the ceramic industry in that area was stressed by Dittler.[26] Analyses were published of Indian feldspars from Bihar and the Madras Presidency.[27]

[6] Exports.
[7] January to September, inclusive.
[8] Estimated by senior author of the chapter. No estimates are included for countries listed in footnote 1.

Ferro-Alloys[1]

By NORWOOD B. MELCHER

GENERAL SUMMARY

FERRO-ALLOY supply was generally easy during 1946 as a result of a 30-percent decline in the output of alloy steel. However, the production of stainless steel continued close to that of the record year 1945 and resulted in a peacetime peak in requirements for ferrochromium. With the exception of manganese and tungsten, the ferro-alloying materials closely follow the trend of alloy-steel production. Manganese, chiefly in the form of ferromanganese, is used in the manufacture of all grades of steel and therefore follows the trend in total steel production more closely than that of alloy steel. Tungsten finds its main use in the manufacture of cutting tools, and therefore the consumption of tungsten alloys (mainly ferrotungsten) is closely related to the combined production of alloy and carbon steel.

Except for molybdenum, silicon, and vanadium, the United States depends largely on foreign sources of ore for the manufacture of ferro-alloys. Imports continued at a high rate throughout 1946 and in the case of manganese established a record.

PRODUCTION AND SHIPMENTS

The production of ferro-alloys in 1946 totaled 1,480,975 net tons, compared with 1,732,423 net tons in 1945—a decrease of 15 percent. In 1946 ferro-alloys were made at 14 blast-furnace plants, 19 electric-furnace plants, and 2 aluminothermic furnace plants; in addition, 2 plants using electric furnaces produced ferrosilicon, and 5 produced ferrophosphorus as a byproduct. Shipments of all classes of ferro-alloys decreased 7 percent in quantity and 16 percent in value from 1945. Pennsylvania again was by far the largest producer and shipper of ferro-alloys in 1946, both in tonnage and value. Of the ferro-alloys shipped in 1946, Pennsylvania contributed 29 percent of the total tonnage and 33 percent of the value; New York was second, with 21 percent of the tonnage and 26 percent of the value. In addition, production and shipments of ferro-alloys were reported from Alabama, California, Iowa, New Jersey, Ohio, Oregon, South Carolina, Tennessee, Virginia, Washington, and West Virginia.

[1] In preceding issues of Minerals Yearbook ferro-alloys were discussed in the chapter Pig Iron, Ferro Alloys, and Steel.

Ferro-alloys produced and shipped from furnaces in the United States, 1945–46

Alloy	1945			1946

	1,732,423	1,661,657	210,509,657	1,480,975	1,551,624	176,273,655

[1] Silicomanganese, manganese briquets, ferrochromium, ferrocolumbium, ferroboron, zirconium-ferrosilicon, alsifer, grainals, and simanal.

Ferromanganese.—The ferromanganese produced in 1946 averaged 79 percent manganese and came from eight blast-furnace plants and three electric-furnace plants. Of the manganese ore used in 1946 for manufacture of ferromanganese, 90 percent was foreign. During 1946 steel producers used 12.6 pounds of metallic manganese as ferroalloys per ton of steel produced. Of this quantity, 11.1 pounds were in the form of ferromanganese; in addition to the 12.6 pounds, 0.1 pound was added directly to the steel in the form of manganese ore. A total of 501,260 tons of ferromanganese was consumed during the year—virtually all by the iron and steel industry. A detailed discussion of manganese alloys appears in the Manganese chapter of this volume.

Spiegeleisen.—Production and shipments of spiegeleisen in 1946 dropped 20 and 27 percent, respectively, from 1945. The output came from three blast-furnace plants and averaged 20.3 percent manganese. Shipments in 1946 totaled 114,982 tons valued at $3,793,673 f. o. b. furnaces, or $32.99 per ton compared with $32.38 in 1945 and $31.23 in 1944. Five-tenths pound of metallic manganese in the form of spiegeleisen was used per ton of steel produced in 1946.

Ferrosilicon.—Shipments of ferrosilicon from furnaces during 1946 accounted for 44 percent of the total tonnage of ferro-alloys during the year, and the value of shipments represented 22 percent of the total. Of the 614,422 tons of ferrosilicon produced, 38 percent or 231,187 tons were made in blast furnaces and 62 percent (383,235 tons) in electric furnaces. Included in the latter figure are 149 tons of ferrosilicon produced as a byproduct in the manufacture of artificial abrasives. The ferrosilicon made in blast furnaces is known as silvery pig iron, and the silicon content of this grade made in 1946 averaged 9.2 percent; electric furnace output—mostly ferrosilicon containing over 20 percent—averaged 37.8 percent Si. Shipments of all grades of ferrosilicon, including silvery pig iron, totaled 681,812 net tons valued at $38,965,488. Exports in 1946 totaled 3,163 net tons valued at $244,625. Imports for consumption were 12,598 tons containing 1,331 tons of silicon and were valued at $260,695.

In 1946 producers of steel ingots and castings consumed 22 percent of the silvery pig iron. Companies that produce steel castings but not steel ingots used 4 percent, and miscellaneous users—mainly gray-iron foundries—74 percent. In 1945 the latter group used only 50 percent, showing the increase in demand for silicon alloys by the foundry industry. This increase is largely the outcome of a heavy demand for the housing program, which requires a large percentage of castings high in silicon. The most important grade of ferrosilicon is the standard 50 percent, which is employed as a deoxidizer and solidifier in the manufacture of most grades of killed and semikilled steel. Only a small quantity of this alloy is used in foundries and other industries. Alloys containing 75 percent silicon and over are used in ladle additions in gray-iron foundries and in the manufacture of high-silicon steel for use in electrical equipment and high-silicon spring steel. The accompanying table shows the consumption of various grades of ferrosilicon according to major consuming industry groups.

Consumption of ferrosilicon, silicon metal, and miscellaneous silicon alloys in the United States in 1946, by industries, in net tons

Alloy	Steel ingots and castings [1]	Steel castings [1]	Miscellaneous	Total
Silvery pig iron:				
5–20 percent silicon	83,611	15,569	279,072	378,252
Ferrosilicon:				
50 percent silicon	111,205	14,398	11,566	137,169
75 percent silicon	35,885	211	1,828	37,924
Other grades [2]	22,534	377	32,890	55,801
	253,235	30,555	325,356	609,146

[1] Data for castings made by companies that also produce steel ingots are included with "Steel ingots and castings" and excluded from "Steel castings."
[2] Includes grades of ferrosilicon not listed separately, silicon metal, and miscellaneous silicon alloys.

Ferrophosphorus.—All ferrophosphorus in 1946 was produced in electric furnaces as a byproduct in the manufacture of phosphate fertilizers and other chemicals. Shipments from producing plants totaled 14,315 net tons valued at $832,408 compared with 10,358 tons valued at $623,791 in 1945. Exports of ferrophosphorus in 1946 totaled 1,228 net tons valued at $80,037.

Ferrotungsten.—A lessening in the requirements for ferrotungsten resulted in a drop in the production of this alloy from 4,107 net tons in 1945 to 1,350 tons in 1946. Shipments in 1946 amounted to only 1,491 tons, containing 1,149 tons of W and valued at $4,310,055. The ferrotungsten was produced in electric furnaces, mainly from foreign ores, but some domestic ore—mostly from California and Nevada—was used. In all, 2,400 net tons of tungsten concentrates (reduced to an equivalent of 60 percent WO_3) were converted to ferrotungsten in 1946. United States consumption of ferrotungsten totaled 1,474 tons containing 1,178 tons of W, compared with 3,622 and 2,887 tons, respectively, in 1945. Exports of ferrotungsten in 1946 were only 91 tons valued at $270,325.

Ferrochromium.—All of the ferrochromium output in the United States in 1946 was produced in electric furnaces, mainly from foreign ores. Domestic consumption of ferrochromium in 1946 totaled

122,562 net tons compared with 144,447 tons in 1945. Exports in 1946 increased 70 percent and amounted to 2,510 net tons valued at $732,221.

Ferromolybdenum.—The ferromolybdenum produced in 1946 was made by the aluminothermic process and in electric furnaces using domestic ores. This alloy was produced at Niagara Falls, N. Y., and Langeloth and Washington, Pa. A total of 218 tons worth $61,489 was exported during the year.

Molybdic Oxide, Calcium Molybdate, and Molybdenum Compounds.—As these compounds were used as alloying agents in the production of iron and steel, they are included with ferro-alloys. These materials are much less expensive than ferromolybdenum and consequently are used to a greater extent. As with ferromolybdenum, these compounds are made with virtually all domestic raw materials.

Ferrotitanium.—In 1946 most of the ferrotitanium was produced in electric furnaces, but a small quantity was made by the aluminothermic process. The ferrotitanium produced in 1946 averaged 19 percent titanium, and both foreign and domestic ores (ilmenite and rutile) were consumed in its manufacture. Ferrotitanium is used as a deoxidizer and scavenger in steel manufacture. When employed as a deoxidizer, ferrotitanium is charged in combination with silicon or some other deoxidizing agent, the titanium alloy being added as a final purifier. As an alloying agent, ferrotitanium prevents intergranular corrosion. Combined exports of ferrotitanium and ferrocarbontitanium in 1946 totaled 550 short tons valued at $63,723.

Ferrovanadium.—All ferrovanadium produced in 1946 was made in electric furnaces, and both foreign and domestic ores were used in its manufacture. The alloy averaged 43 percent vanadium in 1946 as in 1945. Fifty-seven tons valued at $161,289 were exported during the year.

Ferroboron.—Shipments of ferroboron in 1946 averaged 15.3 percent B. Ferroboron is used in special steels as a hardening agent, but it is also a highly efficient deoxidizer.

Ferrocolumbium.—Ferrocolumbium is used in stainless steels to prevent intergranular corrosion. It also reduces air hardening and oxidation at high temperatures in chromium steels. In 1946 the output of ferrocolumbium averaged 56 percent Cb and was produced in electric furnaces.

Zirconium-Ferrosilicon.—The zirconium-ferrosilicon produced in 1946 averaged 14 percent Zr. Zirconium, a powerful deoxidizer and scavenger, reduces age hardening and thereby improves deep drawing properties of sheet steel. It is used instead of ordinary ferrosilicon and is more effective.

Silicomanganese.—The silicomanganese produced in 1946 averaged 68 percent manganese as in 1945 and was made in electric furnaces.

Manganese Briquets.—The foundry industry is the principal user of manganese briquets, which are added to molten iron to overcome the harmful effects of sulfur and to act as a deoxidizer and scavenger. The briquets produced in 1946 averaged 58 percent manganese.

Producers of ferro-alloys in the United States in 1946

Producer	Plant	Alloy
American Agricultural Chemical Co.	South Amboy, N. J.	Ferrophosphorus (byproduct).
Bethlehem Steel Co.	Johnstown, Pa.	Ferromanganese.
Climax Molybdenum Co.	Langeloth, Pa.	Ferromolybdenum, calcium molybdate, molybdenum oxide, oxide briquets, molybdenum trioxide, sodium molybdate.
Electro Metallurgical Co.	Alloy, W. Va. Columbiana, Ohio Holcomb Rock, Va. Niagara Falls, N. Y. Portland, Oreg. Sheffield, Ala.	Ferromanganese, silicomanganese, manganese briquets, ferrosilicon, silicon briquets, zirconium-ferrosilicon, ferrochromium, chromium briquets, ferrotungsten, ferrovanadium, ferromolybdenum, ferrotitanium, ferroboron, ferrocolumbium.
General Abrasive Co., Inc.	Niagara Falls, N. Y.	Ferrosilicon (byproduct).
Globe Iron Co.	Jackson, Ohio	Silvery pig iron.
Hanna Furnace Corp.	Buffalo, N. Y.	Do.
Jackson Iron & Steel Co.	Jackson, Ohio	Do.
Keokuk Electro-Metals Co.	Keokuk, Iowa	Ferrosilicon, silvery pig iron.
E. J. Lavino & Co.	Reusens, Va. Sheridan, Pa.	Ferromanganese.
Metal & Thermit Corp.	Jersey City, N. J.	Ferrotitanium.
Molybdenum Corp. of America	Washington, Pa.	Ferrotungsten, ferromolybdenum, calcium molybdate, molybdenum oxide, ferroboron, manganese boride.
Monsanto Chemical Co.	Anniston, Ala. Columbia, Tenn.	Ferrosilicon (byproduct); ferrophosphorus (byproduct).
New Jersey Zinc Co.	Palmerton, Pa.	Spiegeleisen.
Ohio Ferro-Alloys Co.	Philo, Ohio Tacoma, Wash.	Ferrosilicon, simanal, ferrochromium.
Oldbury Electro-Chemical Co.	Niagara Falls, N. Y.	Ferrophosphorus (byproduct).
Permanente Metals Corp.	Permanente, Calif.	Ferrosilicon.
Pittsburgh Metallurgical Co.	Charleston, S. C. Niagara Falls, N. Y.	Ferrosilicon, silvery pig iron, ferrochromium, ferromanganese, silicomanganese.
Sloss-Sheffield Steel & Iron Co.	N. Birmingham, Ala.	Ferromanganese.
Southern Ferro Alloys Co.	Chattanooga, Tenn.	Ferrosilicon, silicon briquets.
Tennessee Products Corp.	Rockwood, Tenn.	Ferromanganese.
Tennessee Valley Authority	Muscle Shoals, Tenn.	Ferrophosphorus (byproduct).
Titanium Alloy Mfg. Co.	Niagara Falls, N. Y.	Ferrotitanium.
United States Steel Corp. subsidiaries	Ensley, Ala. Clairton, Pa. Duquesne, Pa. Etna, Pa.	Ferromanganese, spiegeleisen.
Vanadium Corp. of America	Niagara Falls, N. Y. Bridgeville, Pa.	Ferrosilicon, silicon briquets, alsifer, ferrochromium, ferrovanadium, ferrotitanium, grainals.
Victor Chemical Works	Mt. Pleasant, Tenn.	Ferrophosphorus (byproduct).

FOREIGN TRADE [2]

Imports and exports of the rarer ferro-alloys are not recorded separately but are grouped as shown in the following tables. Ferromanganese and ferrosilicon comprised most of the imports in 1946.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Ferro-alloys and ferro-alloy metals imported for consumption in the United States, 1945–46,[1] by varieties

Variety of alloy	1945			1946		
	Gross weight (net tons)	Content (net tons)	Value	Gross weight (net tons)	Content (net tons)	Value

Fluorspar and Cryolite

By HUBERT W. DAVIS AND GERTRUDE N. GREENSPOON[1]

FLUORSPAR

GENERAL SUMMARY

GREATLY reduced activity at steel mills, the chief consumer of fluorspar (owing chiefly to strikes at steel plants and coal mines), coupled with a decreased demand for hydrofluoric acid adversely affected the fluorspar industry in 1946.

Despite a 15-percent decline in consumption of fluorspar in 1946 compared with 1945, a peacetime record was established. Lessened use of fluorspar at steel and hydrofluoric-acid plants was partly offset by a gain in usage at glass plants.

Although production and shipments of fluorspar were 15 and 14 percent, respectively, less than in 1945, they also established peacetime records. Illinois maintained its rank as the premier producer of fluorspar in 1946 by supplying 56 percent of the total domestic shipments. Illinois and New Mexico were the only fluorspar-producing States to record increases in 1946.

Salient statistics of fluorspar in the United States, 1937–46, in short tons

Year	Shipments from domestic mines	Foreign trade		Consumption	Industry stocks at end of year		
		Imports for consumption	Exports		Consumers' plants	Domestic mines [1]	Total
1937	181,230	37,063	456	194,300	90,100	30,539	120,639
1938	80,403	19,622	788	115,100	71,800	34,996	106,796
1939	182,771	16,302	2,976	176,800	90,400	38,619	129,019
1940	233,600	11,873	8,432	218,500	102,100	43,866	145,966
1941	320,669	7,524	12,184	303,600	108,900	31,997	140,897

[1] Finished fluorspar only.
[2] Revised figure.

When the war with Japan ended, consumption of acid-grade fluorspar in the manufacture of hydrofluoric acid declined abruptly to an average of about 4,800 tons monthly in the last 4 months of 1945 and remained low in the first quarter of 1946. As a consequence

[1] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

of greatly increased demand for fluorine chemicals, however, consumption during the latter half of 1946 was at an annual rate of 100,000 tons. Liquefied fluorine was put on the market for the first time in 1946, and although production was on a limited commercial basis for experimental use, scientists predict a new field of chemistry in the development of fluorine compounds.[2] According to McBee: [3]

> Before the war fluorine was generated in gram quantities with difficulty. It could not be purchased at any price. Now fluorine can be produced at reasonable cost on a large scale. Already it has been used in major industrial fluorinations. In 1947 fluorine will probably be offered to the industry by several chemical companies.

Ceramic-grade fluorspar was in short supply during some periods of 1946 as a result of expanded demand by the glass and enamel trades. Usage of fluorspar by manufacturers of glass established an all-time high in 1946. Many makers of glass who heretofore had not used fluorspar began employing it in 1946. Enamelers consumed more fluorspar in 1946 than in any other year except 1941. The larger use of fluorspar in enamel may foretell an upward trend of substantial magnitude, inasmuch as the housing program features built-in shelves and closets of porcelain enamel. Consequently, should the production schedule for these houses gain momentum, a corresponding increase in demand for fluorspar would follow.

Deliveries of fluorspar to consumers in the United States totaled 298,367 short tons in 1946 (272,304 tons from domestic mines and 26,063 tons from foreign sources); in addition, 3,907 tons of finished fluorspar from domestic mines were delivered to the Government stock pile. In 1945, deliveries to consumers totaled 357,624 tons (313,092 tons from domestic mines and 44,532 tons from foreign sources); in addition, 9,449 tons of finished fluorspar from domestic mines were delivered to the Government stock pile. Total deliveries to steel plants in the United States declined to 154,614 tons (207,100 tons in 1945), and those to hydrofluoric-acid plants dropped to 84,190 (102,734 tons in 1945); sales to glass and enamel plants advanced to 47,483 tons (36,508 tons in 1945).

The average composite selling price ($32 a short ton) of all grades of fluorspar (both domestic and foreign) delivered to consumers in the United States was $1.28 more than in 1945.

The total quantity of fluorspar shipped in and imported into the United States from about 1870 through 1946 was approximately 7,955,000 short tons, comprising about 83 percent from domestic mines and 17 percent from foreign sources.

The high rate of extraction of domestic fluorspar in recent years (nearly 2,800,000 tons of finished fluorspar in the decade 1937–46) has been of much concern to many consumers and producers; as a consequence, there was much activity on the part of several large users and producers in acquiring additional reserves of this mineral in 1946.

[1] Imports Aug. 1 to Dec. 31, 1909, totaled 6,971 tons. Earlier imports not separately recorded but estimated at 150,000 tons and virtually all from United Kingdom.
[2] Argentina, Australia, Austria-Hungary, Belgium, China, Czechoslovakia, Italy, Netherlands, Norway, Tunisia, and U. S. S. R. in Asia.
[3] Figures, by years, for 1910–39 are given in Minerals Yearbook, Review of 1940, p. 1298.
[4] Less than 1 ton.
[5] Bureau of Mines has determined that 1,691 tons credited to Canada by the U. S. Department of Commerce originated in Newfoundland.

PRODUCTION AND SHIPMENTS

Production of finished fluorspar totaled 277,300 short tons in 1946, including 129,359 tons of flotation concentrates. However, the production also includes 5,700 tons of finished fluorspar recovered from milling about 11,400 tons of crude ore that had been mined before 1946. Thus, total mine production (expressed in terms of finished fluorspar) was 271,600 tons in 1946 compared with 341,500 tons in 1945. Of the mine production in 1946, 5 mines (producing over 10,000 tons each) supplied 93,300 tons or 34 percent, 12 mines (producing 5,000 to 10,000 tons each) supplied 85,000 tons or 31 percent, 24 mines (producing 1,000 to 5,000 tons each) supplied 64,300 tons or 24 percent, and 11 mines (producing 500 to 1,000 tons each) supplied 8,000 tons or 3 percent; thus, 52 mines produced 250,600 tons or 92 percent of the total. Of the remaining output (21,000 tons or 8 percent), some (in quantities ranging from a few tons to 500 tons) came from

an undetermined number of small mines and prospects, but much was derived from treating tailings from previous milling operations.

In 1946 mines operated by consumers produced 60,800 tons of finished fluorspar compared with 101,348 tons in 1945.

Fluorspar shipments from domestic mines in 1946 aggregated 277,940 short tons valued at $9,038,969, decreases of 14 percent in quantity and 9 percent in value from 1945. Of the 1946 total, 51,428 tons were shipped by river or river-rail for delivery to consumers as compared with 52,718 tons in 1945.

Illinois (55 percent) and Kentucky (23 percent) supplied 78 percent of the fluorspar shipped in 1946 compared with 75 percent in 1945. Shipments from Illinois and Kentucky were 10 percent less than in 1945 compared with a loss of 26 percent from other producing States.

The average value of all grades of finished fluorspar shipped in 1946 was $32.52 a short ton ($1.97 more than the 1945 average).

The accompanying table shows shipments of fluorspar, by States, in 1945 and 1946.

Fluorspar shipped from mines in the United States, 1945–46, by States

State	1945			1946		
	Short tons	Value		Short tons	Value	
		Total	Average		Total	Average
Arizona	1,126	$21,016	$18.66	389	$7,959	$20.46

Fluorspar shipments in 1946 comprised 140,975 tons of fluxing gravel (including 9,129 tons of flotation concentrates, which were blended with fluxing gravel) and foundry lump, 136,681 tons of ground and flotation concentrates, and 284 tons of acid lump. The bulk of the fluxing-gravel and foundry-lump fluorspar was shipped to steel plants and iron foundries; but a comparatively small tonnage moved to plants making cement, ferro-alloys, nickel, basic refractories, and fluxing compounds, to smelters of secondary metals, and to the Government stock pile. Of the ground and flotation concentrates shipped in 1946, hydrofluoric-acid plants took 58 percent and glass and enamel plants 35 percent; the remainder went chiefly to aluminum- and magnesium-reduction works, to manufacturers of steel, ferro-alloys, and welding rods, and to smelters of secondary metals. Except for 15 tons to a steel plant and 2 tons to a nonferrous smelter, all the acid-lump fluorspar was shipped to hydrofluoric-acid plants.

The accompanying table shows shipments of fluorspar, by grades and industries, in 1945 and 1946.

Fluorspar shipped from mines in the United States, 1945–46, by grades and industries, in short tons

Grade and industry	1945	1946	Grade and industry	1945	1946
Fluxing gravel and foundry lump:			Ground and flotation concentrates:

[1] Fluxing gravel includes (and flotation concentrates exclude) the following quantities of flotation concentrates blended with fluxing gravel: 1945, 4,182 tons; 1946, 9,129 tons.
[2] Includes pelletized gravel.

SHIPMENTS, BY USES

As is evident from the accompanying table and figure 1, the predominant purchaser of fluorspar is the steel industry, which also consumes substantial quantities of hydrofluoric acid and sodium fluoride, for which fluorspar is the basic material.

Fluorspar shipped from mines in the United States, 1945–46, by uses

Use	1945				1946			
	Quantity		Value		Quantity		Value	
	Percent of total	Short tons	Total	Average	Percent of total	Short tons	Total	Average

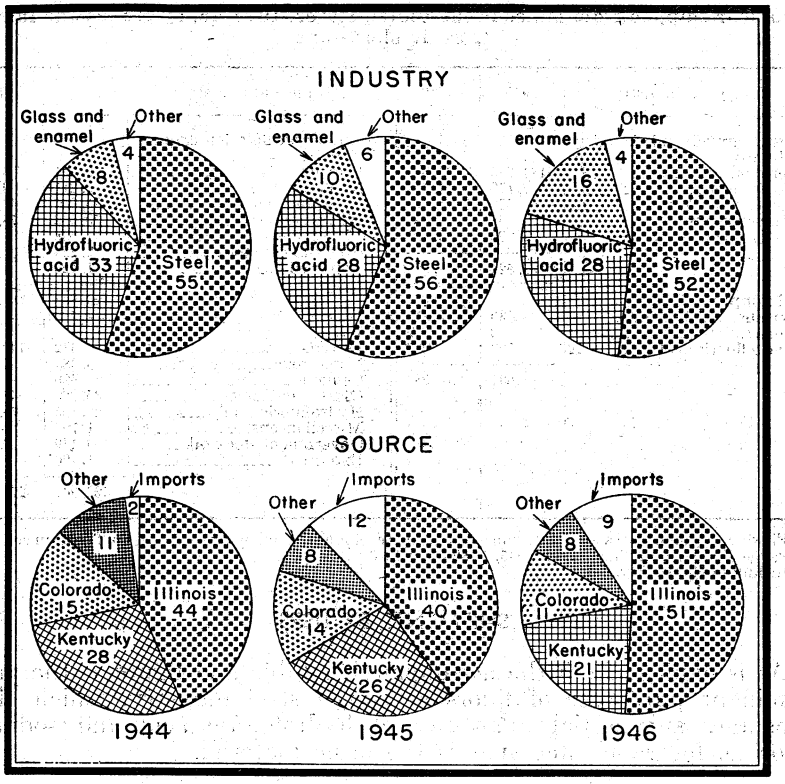

FIGURE 1.—Fluorspar sales (domestic and foreign) to consumers in the United States, 1944-46, by consuming industries and sources, in percent.

STOCKS AT MINES OR SHIPPING POINTS

According to the reports of producers, the quantity of fluorspar in stock at mines or shipping points at the close of 1946 totaled 87,299 tons, or 12 percent less than in 1945. These stocks comprised 18,957 tons of finished fluorspar and 68,342 tons of crude fluorspar (calculated to be equivalent to 34,000 tons of finished fluorspar).

Stocks of fluorspar at mines or shipping points in the United States, Dec. 31, 1945 and 1946, by States, in short tons

State	1945			1946		
	Crude [1]	Finished	Total	Crude [1]	Finished	Total
Arizona		[2] 28	[2] 28			
California	150		150	150		150

1938	77,600	18,900	10,500	4,000	2,800	1,300	115,100
1939	123,800	26,300	15,300	6,100	3,500	1,800	176,800
1940	155,500	37,000	13,400	5,500	4,600	2,500	218,500
1941	210,400	56,000	20,300	7,300	5,100	4,500	303,600
1942	242,600	81,600	18,500	3,100	7,800	7,200	360,800
1943	234,148	113,614	20,592	1,726	7,260	11,545	388,885
1944	230,201	129,553	27,315	2,547	7,815	12,739	410,170
1945	197,916	109,315	31,874	3,695	6,786	6,504	356,090
1946	160,735	83,901	39,852	6,739	6,969	4,994	303,190

Fluorspar was reported consumed in 38 States and the District of Columbia in 1946, but 3 States—Illinois, Ohio, and Pennsylvania—used 166,465 tons or 55 percent of the total consumption. Pennsylvania was again the chief consuming State; it ranked first in consumption of fluorspar in both steel and glass but dropped from second to fourth place in hydrofluoric acid. Illinois maintained its rank as the largest consumer of fluorspar in hydrofluoric acid in 1946.

The accompanying table shows, so far as possible without revealing the figures of individual companies, the consumption of fluorspar, by States, in 1945 and 1946.

Fluorspar (domestic and foreign) consumed in the United States, 1945–46, by States, in short tons

State	1945	1946	State	1945	1946
Alabama, Georgia	9,177	7,101	Kentucky, Maryland	7,381	5,858
Arkansas, Louisiana, Mississippi, North Carolina, Florida	3,894	16,491	Maine, Massachusetts, Rhode Island	1,294	1,346
California	10,416	6,755	Michigan	9,168	8,052
Colorado, Iowa, Utah	11,460	8,184	Minnesota, Wisconsin	1,507	1,632
Connecticut	497	420	Missouri	2,577	2,197
Delaware, District of Columbia, New Jersey	31,314	25,361	New York	16,386	12,625
Illinois	54,397	49,311	Ohio	59,232	46,493

Kansas, Nebraska, Wyoming	141	166	Oregon, Washington	1,692	1,501
South Dakota			Pennsylvania	85,996	70,661
			Tennessee	1,491	1,856
			Texas	11,042	4,572
			Virginia	157	94
			West Virginia	5,945	5,274
				356,090	303,190

PRICES

Prices fixed by the Office of Price Administration on July 1, 1943, effective until November 9, 1946, were $30 to $33 a short ton for metallurgical-grade fluorspar and $37 a ton for acid and ceramic grades. The average selling price of all grades of domestic fluorspar shipped in 1946 was $32.52 a short ton—a new peak, compared with $30.55 in 1945.

INDUSTRY IN 1946, BY STATES

Arizona.—Production in Arizona in 1946, totaling 361 short tons, came from Cochise and Maricopa Counties and was shipped to steel plants. The fluorspar from Cochise County was from the Lone Star mine operated by Cooper Shapley, Jr., and that from Maricopa County was from the Union Hill mine operated by Harry Hershkowitz and the Jumbo mine operated by Raymond Contreras. A small quantity of fluorspar, a byproduct of the Sonora lead mine in Yuma County, was shipped from stock to a steel plant in 1946.

California.—No fluorspar was reported produced in California in 1946. However, at the plant of Industrial Minerals & Chemical Co. at West Berkeley some Nevada fluorspar was ground on a toll basis for the Continental Ore Co. and Balfour, Guthrie & Co.

Colorado.—Production of finished fluorspar in Colorado decreased to 32,400 tons in 1946 from 52,200 tons in 1945. In addition, some crude ore equivalent to 400 tons of finished fluorspar was mined but not milled in 1946. Thus, production (expressed in terms of finished fluorspar) totaled 32,800 tons in 1946 compared with 52,400 tons in 1945. Output came from Boulder, Chaffee, Jackson, Mineral, and Park Counties.

Shipments from Colorado were 32,539 tons in 1946 compared with 52,437 tons in 1945. The 1946 shipments comprised 7,993 tons of metallurgical-grade fluorspar and 24,546 tons of flotation concentrates.

On March 15, 1946, Harry M. Williamson & Son sold its flotation mill near Jamestown to the Ozark-Mahoning Co. but continued to operate the mines and furnish ore for the plant. Finished fluorspar produced y both operators was 33 percent less in 1946 than in 1945. Output of flotation concentrates, however, was 35 percent greater. Except for 14 tons of development ore from the Afterthought mine, all the ore treated in the mill in 1946 came from the Argo and Emmett mines in Boulder County. The Ozark-Mahoning Co. also operates a flotation mill in Illinois.

Production of flotation concentrates at the mill (near Jamestown) of General Chemical Co. was 23 percent less than in 1945. The flotation-mill feed comprised ore from the company-operated Alice, Burlington, Chancellor, Upper Alice, and Yellow Girl mines in Boulder County; from development at the Dostal mine in Chaffee County; and some purchased ore. The mines of the American Fluorspar Corp. and the flotation mill of the Fluorspar Processing Co., all near Salida, were sold to the General Chemical Co. in January 1946. The Salida flotation plant did not operate. This company also has a flotation mill in New Mexico.

Colorado Fluorspar Mines, Inc., which operates a combination, flotation-jig mill and a mine near Salida, Chaffee County, produced 29 percent less finished fluorspar than in 1945. Virtually the entire output in 1946 was flotation concentrates, whereas in 1945 almost half of the production was fluxing gravel.

The mine and flotation mill of United States Fluorspar, Inc., near Salida, operated sporadically until September 1946, when operations ceased; on October 22 the company went into receivership.

The Wagon Wheel Gap mine, in Mineral County, of the Colorado Fuel & Iron Corp., produced 13 percent less fluorspar than in 1945.

The Crystal mine near Northgate, Jackson County, operated by the Crystal Fluorspar Mines Co., produced and shipped several carloads of metallurgical-grade fluorspar in 1946. Some ore was reclaimed from the Kramer dump, also in Jackson County, by M. P. Cloonan and shipped to a cement plant.

A small quantity of fluorspar was produced (but not shipped) by Luke E. Smith from a property near Jefferson, Park County.

The heavy-media plant of Western Fluorspar Corp. near Northgate, which was closed August 26, 1945, remained idle throughout 1946.

The fluorspar deposits of Boulder County have been described by Goddard.[4]

[4] Goddard, E. N., Fluorspar Deposits of the Jamestown District, Boulder County, Colorado: Proc. Colorado Sci. Soc., vol. 15, No. 1, 1946, 47 pp.

Illinois.—Despite the decreased demand and the coal strikes, Illinois maintained its premier position as a fluorspar-producing State. Production of finished fluorspar was 154,300 tons in 1946; about 99.7 percent came from Hardin County and the remainder from Pope County. However, the production includes 4,400 tons of finished fluorspar recovered from crude ore mined before 1946. Consequently, total mine production (expressed in terms of finished fluorspar) was 149,900 tons in 1946 compared with 151,400 tons in 1945. Some Kentucky fluorspar is milled in Illinois, and some Illinois fluorspar is milled in Kentucky; the finished fluorspar so recovered, as well as that shipped, is credited in the statistics to the State of origin. The Argo, Austin, Blue Diggings, Cave in Rock, Crystal, W. L. Davis No. 2, Deardorff, Fairview, West Green, Hawkins, Hillside, Knox, Lead Hill, Midway-North Boundary-Air Shaft, Minerva, Recovery Shaft, Rosiclare, Victory, and Wall properties supplied about 97 percent of the fluorspar produced in Illinois in 1946; most of the remainder came from many mines and prospects, including the Clay Diggings, Douglas, Eureka, East Green, Hill, Humm, Pell, Renfro, Rose Creek, Sheldon, Stewart, Stone Hill, Sun Beam, Twitchell, and Winn; some was recovered from tailings from previous milling operations.

Shipments of fluorspar from Illinois (154,525 tons) were 5 percent more than in 1945 and contributed 56 percent of the total domestic shipped. Of the 1946 total, 40,486 tons were shipped by river or river-rail to consumers compared with 30,327 tons in 1945.

The Aluminum Ore Co. produced 4 percent more flotation concentrates from domestic ore than in 1945. The heavy-media separation unit was completed and put into operation in October 1946. The mill feed in 1946 comprised ore from the company-operated Argo, Blue Diggings, and Fairview mines. Development was carried on at the 600- and 700-foot levels of the Argo mine. An electric hoist, replacing a steam hoist, and electric pumps were installed in the Blue Diggings shaft in 1946.

The Crystal Fluorspar Co. produced 62 percent more finished fluorspar at its Crystal mine in 1946 than in 1945. Its output in 1946 included 1,861 tons of flotation concentrates derived from 5,487 tons of log-washer fines treated at the Patton flotation mill. Near the "Wye", 6 miles from Rosiclare, the company is developing the Jefferson property by a 300-foot shaft, of which 208 feet had been sunk at the close of 1946.

The gravity-concentrating mill of Inland Steel Co. was inactive about 9 months in 1946, and its flotation mill was operated at a greatly reduced rate; consequently, production of gravel and flotation concentrates was 71 and 56 percent, respectively, less than in 1945. The mill feed comprised ore from the Hillside and Wall mines at Rosiclare, Ill., the Barnes and Guill mines near Marion, Ky., and some purchased ore. Production and shipments of finished fluorspar from the Barnes and Guill mines have been credited to Kentucky in the statistics. The Inland Steel Co. carried on much development at some of its mines; at its Keystone mine near Marion, Ky., the No. 30 shaft was deepened from the 400- to the 500-foot level, a new 450-foot shaft was completed at the Guill mine, and development was under way at the Rock Candy mine in Illinois.

The flotation mill of Ozark-Mahoning Co. (successor to Mahoning Mining Co. on December 1, 1946) produced 5 percent more fluorspar concentrates from domestic ore than in 1945. The mill feed in 1946 comprised ore from the W. L. Davis No. 2, Deardorff, East Green, and West Green mines near Cave in Rock, Ill., the Mineral Ridge and Delhi-Babb mines near Salem, Ky., and some purchased ore. Production of finished fluorspar comprised 83.4 percent acid-grade, 15.4 percent pelletized gravel, and 1.2 percent filter cake; most of the filter cake was sold to local producers for blending with fluxing gravel. Production and shipments of finished fluorspar from the Mineral Ridge and Delhi-Babb mines have been credited to Kentucky in the statistics. During 1946, the company acquired the Delhi-Babb mine near Salem, Ky., but its lease on the Klondike mine near Smithland, Ky., was surrendered.

The Rosiclare Lead & Fluorspar Mining Co. operated the Eureka, Hawkins, Midway-North Boundary-Air Shaft, Recovery Shaft, and Rosiclare properties in 1946, but the Rosiclare mine was the chief producing mine of the company. The ore from the company mines is mill feed for its heavy-media, jig, and flotation units. Production of finished fluorspar of all grades was virtually the same as in 1945 but shipments were 10 percent larger. This company, together with the Pigmy Corp., a subsidiary, was the largest producer of fluorspar in the United States in 1946. A new three-conductor, 5,000-volt electric power cable to serve the pumping station at the 600-foot level was installed in the main shaft of the Rosiclare mine, and two 1,000-gallon-a-minute pumps were also being added for protection against flooding.

The mine and flotation mill of Minerva Oil Co. were operated at an increased rate in 1946, and output of flotation concentrates from domestic ore was 14 percent greater than in 1945. Additional equipment was installed in the flotation mill to increase its capacity and to permit finer grinding of the ore. Leases on a substantial acreage in Livingston County, Ky., have been acquired by the company.

Kentucky.—Production of fluorspar in Kentucky continued the downward trend that began in 1942. Much of the decline in 1946 resulted from a lengthy strike at the mines of the United States Coal & Coke Co. Production of finished fluorspar was 63,300 short tons in 1946. In addition, some crude ore equivalent to 600 tons of finished fluorspar was mined but not milled in 1946. Thus, total mine production (expressed in terms of finished fluorspar) was 63,900 tons in 1946 compared with 94,400 tons in 1945. Shipments also declined; they were 63,143 tons—a 34-percent drop from 1945 and the smallest since 1938. Of the 1946 shipments, 10,942 tons were shipped to consumers by river or river-rail compared with 22,391 tons in 1945.

Output in Caldwell County in 1946 was slightly less than in 1945 and was chiefly from the Bright, Crowder, Hollowell & Hobby, Tyrie, and Williamson mines. The Fluorspar Corp. has been organized to take over the Senator mine and adjoining Meadows property. Electric equipment was being installed in the Senator mine, where the shaft will be sunk to 325 feet; a heavy-media-process plant was under construction at the close of 1946.

The major part of the 1946 output in Crittenden County came from a few mines—Big Four, Blue, Davenport, Krausse, Pigmy, and Tabb.

Most of the remainder came from many smaller producing mines (including the Bachelor, Barnes, Crystal, Delhi-Babb, Gilless, Hayshed, Hodge, Waddell, and Watkins) and from numerous prospects; some was recovered from tailings from previous milling operations.

Production and shipments of fluorspar in 1946 by the United States Coal & Coke Co., the largest producer in Kentucky in 1945, were adversely affected by a strike at its mines and mill which began on April 26 and ended on October 1. As a consequence, output and shipments of finished fluorspar were 60 and 55 percent, respectively, less than in 1945. Production came chiefly from the company-operated Tabb mines, but some was from the Big Four mine owned by the company but operated by Perry & Loyd. Output at the Big Four mine, however, was only 13 percent smaller than in 1945.

The Kentucky Fluor Spar Co. and affiliates shipped 12 percent less fluorspar and "fluorbarite" than in 1945. The company operates a mill at Marion and, through its mining division (Roberts & Frazer), operated the C. R. Babb, Carr, and Wright mines in Livingston County. Only about 42 percent of the supply came from company mines in 1946; most of it was from the Nancy Hanks, Krausse, Austin, and Humm mines and the flotation mills of Minerva Oil Co. and Minerals Flotation Corp.

The Pigmy mine of the Pigmy Corp. (subsidiary of the Rosiclare Lead & Fluorspar Mining Co.) produced 32 percent less fluorspar than in 1945.

For the fifth successive year, output from the Bachelor mine of the Delhi Fluorspar Corp. declined. However, the company purchased both finished fluorspar and milling ore from many producers; its shipments were 42 percent less than in 1945. The company sold its Delhi-Babb mine, which includes the Bachelor mine, to Ozark-Mahoning Co. in 1946.

L. Conyer, who operated a jig mill near Marion, shipped 18 percent less fluorspar than in 1945. He purchases both finished fluorspar and milling ore from many local producers and all of his shipments came from these sources in 1946.

Crider Bros. Fluorspar Co. worked the Blue mine near Mexico, reclaimed some fluorspar from the Blue and Haffaw dumps, and purchased some fluorspar from local producers. Its sales were about double those of 1945.

The flotation mill at Marion of Minerals Flotation Corp. was operated throughout most of 1946 and made a substantial production of concentrates from tailings accumulated over a period of years.

Alco Minerals, Inc., acquired the Summers property near Salem, rehabilitated the mill, and added a battery of flotation cells. The mill feed comprised tailings from the Klondike, Davenport, Blue, Franklin, and other mines.

The Eagle Fluor Spar Co., one of the older companies in the Western Kentucky district, discontinued mining in 1946 and sold its mines and mills to the Aluminum Ore Co., which has also acquired the Old Silver and Atwood mines near Smithland, Ky., as well as other properties in Kentucky.

In Livingston County most of the output came from the C. R. Babb, Carr, Guill, Lovelace, Mineral Ridge, Nancy Hanks, and

Wright mines and from reworking the C. R. Babb, Klondike, and other tailings.

Output at the Carr and Wright mines of Roberts & Frazer was greater than in 1945. Its C. R. Babb mine was sold in January 1946 to the Pennsylvania Salt Manufacturing Co., which made a small output in the remainder of the year.

Production of gravel fluorspar at the Nancy Hanks mine, operated by W. V. Haynes, Jr., and Tinsley & Loyd, was 38 percent less than in 1945, and recovery of sand spar was 36 percent smaller.

Butler & Moodie continued to reclaim fluorspar from Klondike tailings.

In the Central Kentucky district, production and shipments of fluorspar advanced to 4,235 and 3,786 tons, respectively (1,040 and 1,097 tons in 1945). Output from this district in 1946 came from the Faircloth and Haydon mines in Woodford County near Wilmore; the Gobel Dean, Twin Chimney, and Lone Oak mines in Mercer County near Harrodsburg; and the Britton mine also in Mercer County near Salvisa. The Lone Oak mine was operated by Albert Brauer in 1946, while the other mines were worked by Gilbert & Hageman Co. (succeeded by Hageman Properties, Inc., on February 1, 1947). In 1946 log washers were installed at the Haydon and Gobel Dean mines, and 50-ton gravity-concentrating mills were completed to serve the Faircloth and Twin Chimney mines. The known ore reserves in the Britton mine were exhausted, and the mine was closed in November.

Nevada.—Shipments of fluorspar from Nevada (6,234 short tons) declined for the third successive year; they were 11 percent smaller than in 1945. Most of the 1946 total went to steel plants, but some was shipped to hydrofluoric acid, cement, glass, and enamel plants and an iron foundry. The fluorspar moving to glass and enamel plants was ground at the plant of Industrial Minerals & Chemical Co. at West Berkeley, Calif.

New Mexico.—Chiefly because of resumption of operations by Zuñi Milling Co. (which operated almost entirely on Mexican ore in 1945) and the Government-owned heavy-media plant at Gila, production of finished fluorspar (17,500 short tons) in New Mexico was 22 percent greater than in 1945. However, the production includes 2,300 tons of finished fluorspar recovered from ore mined before 1946. Consequently, total mine production (expressed in terms of finished fluorspar) was 15,200 tons in 1946 compared with 28,600 tons in 1945. The 1946 output came from Grant, Luna, Sierra, and Valencia Counties.

Shipments of fluorspar from New Mexico likewise increased and totaled 17,584 tons, a gain of 22 percent over 1945.

The flotation mill of General Chemical Co. at Deming produced 8 percent more concentrates from domestic ore than in 1945. The mill feed comprised ore from the company Shrine mine in Grant County and purchased ore from local mines.

The flotation mill of Zuñi Milling Co. at Los Lunas resumed production on October 15, 1946, and during the balance of the month it milled some Mexican ore which had remained at the plant when it suspended operations in August 1945. The concentrate recovered

from Mexican ore, as well as that shipped, is not included in the statistics on production and shipments. In early November the mill began operating on ore from the company mines near Grants in Valencia County and purchased ore from local mines.

The Government-owned heavy-media plant at Gila, inactive since January 1945, resumed operation on October 8, 1946. The plant is being operated by the Shattuck Denn Mining Co. as agent for the Office of Metals Reserve to treat the accumulated stock of ore at the mill; the resultant concentrates will be shipped to a Government stock pile.

At the Burro Chief mine near Tyrone, Grant County, operated by H. E. McCray, the 400-foot level was opened and a jig plant to serve the mine was put into operation. Production of finished fluorspar was more than double that of 1945 but output of milling ore, which is sold to local mills, was only one-fourth as much.

The flotation mill of Indian Metals Co. of New Mexico at Lordsburg resumed production in April and was operated sporadically during the remainder of 1946.

The Grattan flotation mill at Deming was operated during March and April by I. S. James on purchased ore from the Burro Chief and Foster mines.

The fluorspar deposits of New Mexico have been described by Rothrock and others.[5]

Texas.—Production and shipments (933 and 1,118 short tons, respectively) were 73 and 67 percent less than in 1945. Production was from the Eagle Mountains mine in Hudspeth County near Van Horn, operated by the Western Fluorite Co. until August 1, when it was acquired by J & L Fluorite Co. Virtually the entire output in 1946 was flotation concentrates.

Utah.—George Spor & Son, operating the Spor mine in Juab County near Delta, was the only producer of fluorspar in Utah in 1946. Output in Utah was 2,340 short tons in 1946 compared with 2,918 tons in 1945.

Washington.—The Mitchem mine in Ferry County near Keller and the small heavy-media plant which serves it were not in operation in 1946. A small quantity (38 tons) of concentrates produced in 1945 was shipped to a steel plant in 1946.

MILL DEVELOPMENTS

The trend toward the heavy-media and flotation processes for treating fluorspar ores continued in 1946. With these processes lower-grade ore can be mined and treated than is economical with jigs, much higher recoveries of fluorspar are attained, and higher-grade concentrates produced. Employment of these processes makes it possible to produce many thousands of tons of concentrates from material that heretofore was considered waste. In fact, since flotation was applied to the treatment of fluorspar in the United States in 1929, a large tonnage of concentrates has been recovered from tailings resulting from other milling operations. Consequently, the growing use of these processes has done much to retard the rate of depletion—

[5] Rothrock, H. E., and others, Fluorspar Resources of New Mexico: New Mexico Bureau of Mines and Mineral Resources Bull. 21, 1946, 245 pp.

nearly 280,000 tons annually in the past decade—of this important national resource.

The heavy-media unit of the Aluminum Ore Co., Rosiclare, Ill., was completed and put into operation in October 1946. This unit is designed to treat 25 tons of crude ore per hour and by rejecting one-third to one-half of the coarse material will supply an enriched product for flotation feed.

In 1946 the Fluorspar Corp. had a heavy-media separation plant under construction near Princeton, Ky., to serve the nearby Senator and Meadows mines. The concentrates produced will be feed for the flotation plant at Marion, Ky., of Minerals Flotation Corp., a subsidiary of the Fluorspar Corp.

The productive capacity of the flotation mill of Ozark-Mahoning Co. near Jamestown, Colo., was increased by 6 additional cells, a 26-foot thickening tank, and other equipment. The company flotation mill at Rosiclare was being enlarged by additional cells, a new cooler, and a new kiln.

The flotation operation in Illinois of the Mahoning Mining Co. (now Ozark-Mahoning Co.) has been described by Duncan.[6]

The beneficiation of fluorspar from the mine of Minerva Oil Co. has been described by Fine and O'Meara.[7]

Alco Minerals, Inc., added a battery of flotation cells to the Summers mill, near Salem, Ky., which it rehabilitated and put into operation in 1946.

In the latter part of 1946, St. Lawrence Fluorspar, Inc., completed and put into operation at Wilmington, Del., a drying plant with a capacity of 60 to 65 short tons of dry fluorspar per 24 hours. Filter cake from the flotation plant of St. Lawrence Corp. of Newfoundland, Ltd., will be dried at this plant.

Output of flotation concentrates from domestic ore totaled 129,359 short tons in 1946 compared with 121,670 tons in 1945. In addition, flotation mills in the United States recovered 354 and 17,374 tons, respectively, from milling Mexican ore in 1946 and 1945.

FOREIGN TRADE

Imports.—Receipts of imported fluorspar into the United States were 29,488 short tons in 1946—a loss of 71 percent from 1945, which, however, was an all-time high.

Fluorspar imported for consumption in the United States, which represents the quantity on which the duty was paid, was 29,852 tons—a loss of 71 percent from 1945. The imports in 1946 comprised 6,621 tons containing more than 97 percent calcium fluoride and 23,231 tons of lower grade. They were valued [8] at $516,815. The value assigned to the higher-grade foreign fluorspar averaged $23.99 a ton in 1946 and that to the lower grade $15.41. The cost to consumers in the United States also includes duty, loading charges,

[6] Duncan, W. F., Concentrating Operations of the Mahoning Mining Co., Rosiclare, Ill.: Am. Inst. Min. and Met. Eng. Tech. Pub. 2040, 1946, 14 pp.

[7] Fine, M. N. and O'Meara, R. G., Laboratory Beneficiation of Fluorite Ore from the Minerva Oil Co., Eldorado, Ill.: Am. Inst. Min. and Met. Eng. Tech. Pub. 2055, 1946, 10 pp.

[8] As defined in sec. 402 of the tariff act of 1930: "The value of imported merchandise * * * is the foreign value or the export value, whichever is higher—that is, the market value or the price at which the merchandise, at the time of exportation to the United States, is offered for sale in the principal markets of the country from which exported, including the cost of containers or coverings and all expenses (including any export tax) incident to placing the merchandise in condition ready for shipment to the United States."

insurance, consular fee, and freight to consuming plants. The duty on fluorspar containing not more than 97 percent calcium fluoride continued at $5.625 a short ton and on fluorspar containing more than 97 percent calcium fluoride $3.75.

Unlike in 1943, 1944, and 1945, when the bulk of the imported fluorspar was delivered to Government stock piles, all foreign fluorspar received in 1946 was for use by domestic consumers.

Fluorspar imported for consumption in the United States in 1946, by countries of origin and United States customs districts of entry

Country and customs district	Containing more than 97 percent calcium fluoride		Containing not more than 97 percent calcium fluoride		Total

1945	10,275	254,800	92,858	1,901,658	103,133	2,156,458

The accompanying table, compiled from data supplied the Bureau of Mines by importers and by domestic companies milling foreign fluorspar, shows the quantities of imported fluorspar delivered to consumers in the United States in 1945 and 1946, irrespective of year of importation into the United States; it differs from the preceding table, which shows the quantity and grade imported into the United States in 1945 and 1946. The quantities in the accompanying table are based upon the actual outturn weights and include the finished fluorspar recovered from milling foreign ore and from drying filter cake, rather than the ore milled or wet filter cake.

Imported fluorspar delivered to consumers in the United States, 1945–46, by uses

Use	1945			1946		
	Short tons	Selling price at border, tidewater, or f. o. b. flotation mill in United States, including duty		Short tons	Selling price at border, tidewater, or f. o. b. flotation mill in United States, including duty	
		Total	Average		Total	Average
Steel	21,027	$555,530	$26.42	20,319	$485,592	$23.90

Exports.—Producers of fluorspar reported exports of 1,729 short tons of fluorspar valued at $63,797 in 1946 compared with 1,420 tons valued at $45,939 in 1945. The exports (all ceramic ground and flotation concentrates) by producers in 1946 comprised 700 tons to Canada; 480 tons to Peru; 496 tons to Belgium; 42 tons to Mexico; and 11 tons to Uruguay.

Fluorspar reported by producers as exported from the United States, 1942–46

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average			Total	Average
1942	9,016	$242,545	$26.90	1945	1,420	$45,939	$32.35
1943	9,044	246,973	27.31	1946	1,729	63,797	36.90
1944	1,980	65,909	33.29				

WORLD REVIEW

The accompanying table shows world production of fluorspar, by countries, in 1937, 1939, and 1942 to 1946, insofar as statistics are available.

World production of fluorspar, 1937, 1939, and 1942–46, by countries, in metric tons [1]

[Compiled by B. B. Mitchell]

Country [1]	1937	1939	1942	1943	1944	1945	1946

[5] January to September, inclusive.

Canada.—According to the Dominion Bureau of Mines, production of fluorspar in Canada was 6,853 metric tons [9] (all from Ontario) in

[9] 1 metric ton is equivalent to 1.10231 short tons.

1946 compared with 6,685 tons in 1945. In Canada output falls short of consumption, and the greater part of the deficiency is met by importations, chiefly from Mexico, Newfoundland, and the United States. However, small quantities of metallurgical-grade fluorspar are exported from Canada to the United States. Imports into Canada were 24,279 metric tons during the first 10 months of 1946 compared with 18,608 tons in the entire year 1945.

Mexico.—Chiefly as a result of demand by the United States, production of fluorspar (as measured by exports) in Mexico increased from an average of 11,907 metric tons annually during the 4 years 1940–43 to 56,450 and 50,251 tons, respectively, in 1944 and 1945. Exports in 1946 declined to 20,114 metric tons. Some Mexican fluorspar is used in local steel plants, and some is also exported to Canada.

Newfoundland.—The St. Lawrence Corp. of Newfoundland, Ltd., which has a gravity-concentrating mill and a flotation mill for treating ore from its mines, was the only producer of fluorspar in Newfoundland in 1946. Shipments were 11,617 metric tons in 1946 compared with 19,890 tons in 1945. Shipments were made to the United States and Canada. The product shipped to the United States in 1946 was acid-grade filter cake; a plant for drying it was completed in late 1946 at Wilmington, Del., by St. Lawrence Fluorspar, Inc., an affiliate of the St. Lawrence Corp. of Newfoundland, Ltd.

The mines of Newfoundland Fluorspar, Ltd. (a subsidiary of the Aluminum Co. of Canada, Ltd.), were not in production in 1946, but general prospecting and the required assessment work were done on various mineral claims held by the company. However, from a stock pile at its Director mine 13,103 metric tons of crushed fluorspar were shipped to Arvida, Quebec, and 546 metric tons were exported to Finland. The company is resuming development at its Tarefare mine in 1947.

CRYOLITE

Imports of cryolite were 10,200 long tons valued at $815,627 in 1946 compared with 17,952 tons valued at $1,349,678 in 1945. Except for 2 tons from Canada in 1945, the cryolite imported in 1946 and 1945 came from Greenland.

Exports of cryolite were 1,160 long tons valued at $285,110 in 1946 compared with 1,697 tons valued at $420,592 in 1945.

Cryolite occurs in commercial quantity and is mined at only one place—Ivigtut, Greenland. Gibbs [10] has described the mine at Ivigtut, the grades of ore produced, methods of processing and purification, and various uses of cryolite.

Artificial cryolite was manufactured in the United States in 1946 by the Aluminum Ore Co. at East St. Louis, Ill., and the Reynolds Metals Co., at Bauxite (Hurricane Creek), Ark.

The chief use of cryolite is in the reduction of aluminum; comparatively small quantities are used in glass, enamels, abrasives, and insecticides.

GENERAL SUMMARY

THE FUEL-BRIQUETTING industry has continued steady expansion of its production since 1938, exceeding 3,000,000 net tons in 1946. Packaged-fuel production dropped to 191,000 tons in 1946 from a peak of 285,000 tons in 1940.

The fuel-briquetting industry consists of a relatively few large plants (35 with an average annual output of 86,000 tons in 1946), producing a small, hard pillow-briquet suitable for shipment. The packaged-fuel industry consists of a larger number of small plants (70 with an average annual output of 2,700 tons in 1946), producing 3- to 4-inch, more or less friable cubes wrapped (6 or 8 to the package) in sturdy paper, suitable for local consumption but not as a rule for transportation over long distances. There are, however, some considerably larger plants in both the briquetting and in the packaged-fuel industries.

In 1940, packaged fuel amounted to 27 percent of the fuel-briquet production; by 1946 it had declined to 6 percent. The relative production of the two industries in the United States from the first year of record through 1945 is shown graphically in figure 1. The profound business depression in the early thirties and the increased

[1] Briquets made from charcoal, wood scrap, and fruit pits not included in Bureau of Mines review.

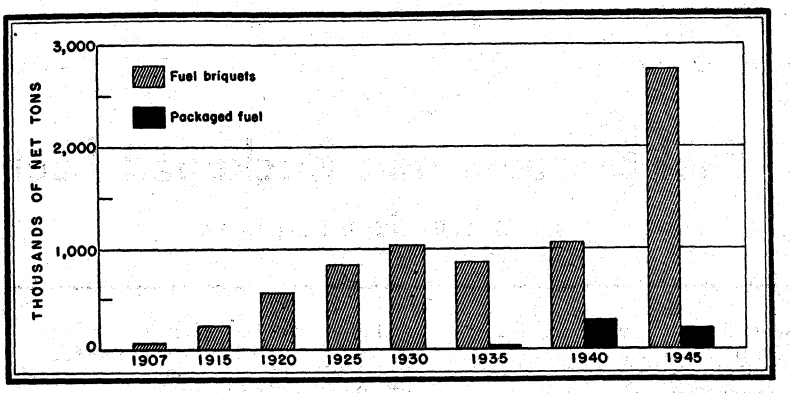

FIGURE 1.—Production of fuel briquets and packaged fuel in the United States from the first year of record to 1945.

fuel demands of World War II are reflected in the production of fuel briquets in the graph. The packaged-fuel industry, which had its inception about 1928 but has been canvassed only since 1935, rose spectacularly from 1935 to its peak in 1940, but war shortages and high costs of labor, raw fuels, and critical materials have since retarded its growth.

The total supplies of solid fuels commonly used for space heating in the United States in 1946 (see Coal—Pennsylvania Anthracite chapter of this volume, table 25) in order of their importance were as follows: Bituminous coal (including lignite) exact tonnage not available; Pennsylvania anthracite, 58,500,000 tons; coke (all kinds), 7,600,000; fuel briquets, 2,800,000; and packaged fuel, 191,000.

Wartime controls on solid fuels have ended. All allocation functions of the Solid Fuels Administration for War were terminated with the expiration of the applicable provisions of the Second War Powers Act March 31, 1947; all other SFAW functions were terminated by Executive order on May 6, 1947. All remaining price ceilings still in effect were lifted by the Office of Price Administration on November 10, 1946. All priority and urgency certificate assistance to obtain machinery for industry was discontinued January 8, 1947, by the Office of Temporary Controls (successor to Civilian Production Administration).

FUEL BRIQUETS

Salient statistics of the fuel-briquetting industry from 1942 to 1946 are summarized in table 1. Production and value from 1917 to 1946, inclusive, are shown graphically in figure 2.

TABLE 1.—Salient statistics of the fuel-briquetting industry in the United States, 1942–46

Year	Production				Imports	Exports
	Eastern States	Central States	Pacific Coast States	Total		
	Net tons					
1942	565,675	1,047,747	134,878	1,748,300	334	103,921
1943	544,786	1,493,368	125,844	2,163,998	198	174,973
1944	625,779	1,704,005	135,177	2,464,961	538	163,672
1945	637,740	1,991,733	132,731	2,762,204	722	174,107
1946	880,109	1,986,234	137,684	3,004,027	653	163,339

Year	Apparent consumption [1] (net tons)	Value of production	Plants in operation	Average value per net ton, f. o. b. plant		
				Eastern States	Central States	Pacific Coast States
1942	1,644,713	$11,266,041	30	$4.56	$7.04	$9.69
1943	1,989,223	15,148,109	28	5.04	7.44	10.26
1944	2,301,827	18,434,579	30	5.42	8.03	10.07
1945	2,588,819	21,678,886	32	5.65	8.40	10.04
1946	2,841,341	25,299,612	35	6.61	9.03	11.26

[1] Production plus imports minus exports.

PRODUCTION

The output of fuel briquets in 1946, rising steadily since 1938, reached a new high of 3,004,027 tons, valued at $25,299,612—a 9-percent increase in tonnage and a 17-percent increase in value over 1945. The increase was greatest in the Eastern States region (see table 2).

Briquets were made in 15 States in 1946, with production centered in Wisconsin (leading with 1,511,670 tons), followed by Pennsylvania, West Virginia, and Missouri, in that order. Production cannot be shown by States without revealing the operations of individual plants, except for Wisconsin, Pennsylvania, and Illinois, as there were less than 3 plants in each of the other 12 producing States. Production in Wisconsin in 1946, topping all previous years, increased 2 percent in quantity, with an increase of 7 percent in value over 1945. The 4 plants in Pennsylvania produced 469,958 tons, valued at $3,329,494 (a 65-percent increase in production and 97-percent increase in value over 1945); the large increase is due to the beginning of operations at 2 new plants of the Reading Briquet Co. at Locust Summit and St. Nicholas. Production at 3 plants in Illinois in 1946 amounted to 108,045 tons, valued at $569,200 (a decrease of 8 percent in production but an increase of 11 percent in value over 1945).

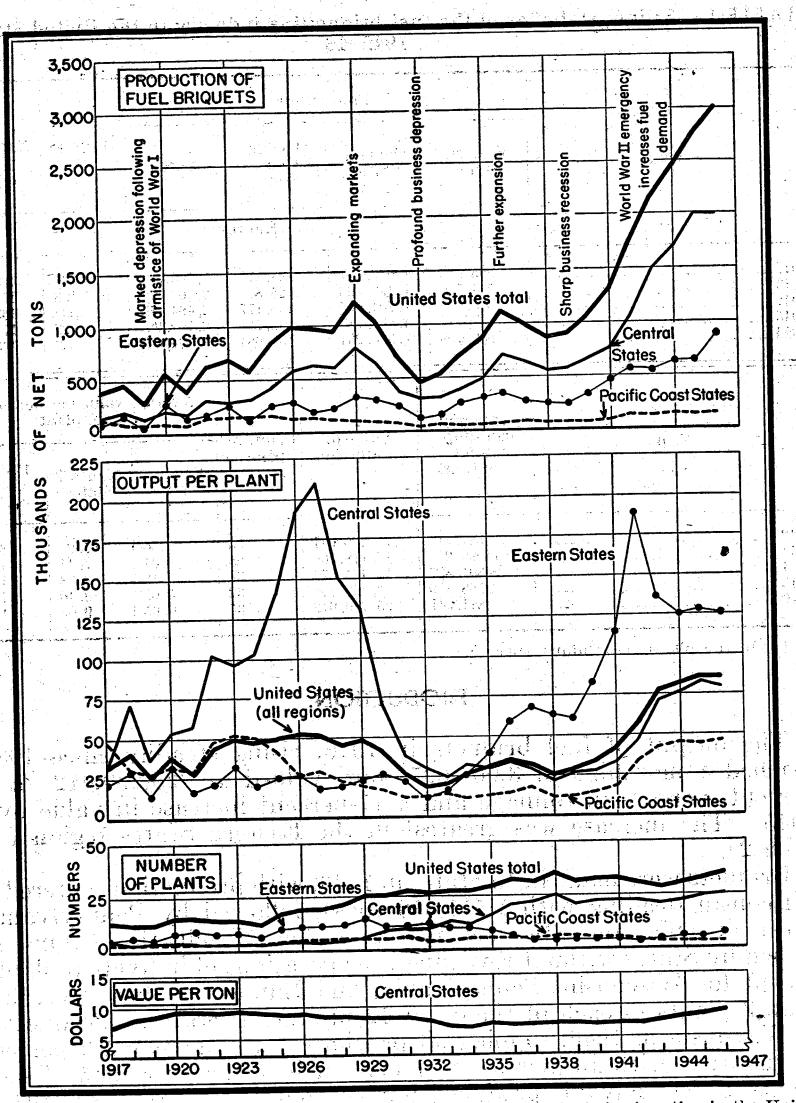

FIGURE 2.—Production of fuel briquets, output per plant, number of plants in operation in the United States (by regions), and average value per net ton, f. o. b. plant (Central States), 1917–46.

At the six new plants briquetting machinery was installed by the Briquetting Machinery Co., Rutherford, N. J. (one plant); Komarek-Greaves & Co., Chicago, Ill. (two plants); National Engineering Co., Girard, Kans. (one plant); and the Webb Corp., Webb City, Mo. (two plants). Three plants reported installation of additional machinery in 1946.

In 1946, 17 of the 35 active plants operated each month throughout the year. According to the Weather Bureau,[2] the winter of 1946

[2] Baldwin, J. L., The Weather of 1946 in the United States: U. S. Department of Commerce Monthly Weather Review, vol. 74, No. 12, December 1946, pp. 205–209

was unusually mild, the temperatures averaging higher than usual over practically the entire country, except in California and Oregon.

TABLE 2.—Production of fuel briquets in the United States, 1945–46

	1945			1946				
	Plants [1]	Net tons	Value	Plants [1]	Net tons	Value	Percent of change from 1945 in—	
							Tonnage	Value
Eastern States	5	637,740	$3,606,372	7	880,109	$5,817,639	+38.0	+61.3
Central States	24	1,991,733	16,739,912	25	1,986,234	17,931,641	−.3	+7.1
Pacific Coast States	3	132,731	1,332,602	3	137,684	1,550,332	+3.7	+16.3
	32	2,762,204	21,678,886	35	3,004,027	25,299,612	+8.8	+16.7

[1] 1945: 11 plants in Wisconsin; 3 each in Illinois and Missouri; 2 each in Michigan, Pennsylvania, and West Virginia; and 1 each in Arkansas, California, Massachusetts, Minnesota, Nebraska, North Dakota, Oregon, Washington, and Wyoming. 1946: 11 plants in Wisconsin; 4 plants in Pennsylvania; 3 in Illinois; 2 each in Arkansas, Kansas, Michigan, Missouri, and West Virginia; and 1 each in California, Massachusetts, Minnesota, Nebraska, North Dakota, Oregon, and Washington.

Number of Plants.—Thirty-five plants reported production in 1946; 29 of these were also active in 1945.[3] The 6 new briquetting plants which started commercial operations in 1946 were 2 plants of the Reading Briquet Co., Locust Summit and St. Nicholas, Pa.; Fort Scott Briquette Co., Inc., Fort Scott, Kans.; Acme Briquets, Inc., Kansas City, Kans.; Universal Briquet Co., Fort Smith, Ark.; and United Ice & Fuel Co., Flint, Mich. Two additional briquetting plants were reported under construction in 1946 to start operation in 1947—De Angelis Coal Co., Buena Vista, Calif. (utilizing California lignite), and Lake Coal Co., Inc., Syracuse, N. Y. (utilizing Pennsylvania anthracite). Of the 6 plants idle in 1946, 3 were active in 1945. Three plants went out of business in 1946.

Capacity.—The average annual capacity and average annual production per plant in the briquetting industry in the United States, by regions, in 1946, were as follows:

	Average capacity (net tons)	*Average production (net tons)*
Eastern States (7 plants)	220,000	126,000
Central States (25 plants)	114,000	79,000
Pacific Coast States (3 plants)	48,000	46,000
Total United States (35 plants)	130,000	86,000

Annual capacities of 100,000 tons or more were reported by 6 out of 7 plants in the Eastern States, by 9 out of 25 in the Central States, and by 1 out of 3 in the Pacific Coast States. The largest annual capacities as well as the largest productions in 1946 were reported by the Berwind Fuel Co. and the Stott Briquet Co., Inc., for their plants at Superior, Wis. Table 3 gives comparative data for the past 10 years on capacity and relative production for the United States as a whole and reveals the increase in utilization of the total capacity of the active briquetting plants during the recent war years, amounting to 66 percent in 1946.

[3] Years plants (active in 1946) started producing are given in the 1946 Fuel-Briquet Directory (which also shows type of raw fuels used), obtainable on request from the Bureau of Mines, Washington 25, D. C.

TABLE 3.—Annual capacity and production of briquetting plants in the United States, 1937–46

	Active plants		Production		
	Number	Annual capacity (net tons)	Net tons	Percent of—	
				Annual capacity	Annual production
1937	31	3,423,000	995,930	29.1	100.0
1938	35	3,112,000	871,260	28.0	100.0
1939	31	3,161,000	892,213	28.2	100.0

	35	4,533,300	3,004,027	66.3	100.0

[1] 4 of these plants started operations in last half of 1946.
[2] 3 of these plants started operations in last half of 1946.

Raw Fuels.—Table 4 shows the wide variety of raw fuels used in the manufacture of fuel briquets in 1946, and table 5 the types of briquets made from these fuels. The major raw fuels used are bituminous coal and Pennsylvania anthracite; the former, however, has decreased in the past 5 years from 65 percent of the total raw fuel used in 1942 to 45 percent in 1946, while the use of Pennsylvania anthracite has risen in this same period from 16 percent (used at 5 plants) in 1942 to 39 percent (at 15 plants) in 1946. The increased use of anthracite in the past 3 years is traceable to the program inaugurated in 1944 by the Solid Fuels Administration for War[4] for wider utilization of surplus anthracite fines when bituminous coal was in short supply; subsequently, many operators began combining considerable quantities of anthracite fines with bituminous coal. The resulting high-quality briquet, representing the major portion of the fuel briquets made in the United States since 1943, has been favorably received and is generally retailed for less than space-heating sizes of Pennsylvania anthracite (except buckwheat No. 1) in localities where both are available to the consumer.

In the Eastern States region, bituminous coal and anthracite fines were the raw fuels used by the plants near mines in West Virginia and Pennsylvania in 1946; and in the Central States region—with plants

[4] Solid Fuels Administration for War, P. N. 71018, SFA 254, Sept. 5, 1944.

in nine States and production concentrated in the Lake Dock territory—all the fuels except the residual carbons were used, their type depending upon their availability at the point of manufacture. In the Pacific coast region, the residual carbons from the manufacture of oil gas and the pyrolysis of natural gas were the raw fuels used in briquetting operations.

The most outstanding gain in the output of briquets in 1946 over 1945 occurred at plants near coal mines in the Eastern States, traceable to the additional output of the two new Reading Briquet Co. plants at Locust Summit and St. Nicholas, Pa.

TABLE 4.—Raw fuels used in making fuel briquets in the United States, 1946

Character of raw fuels used	Plants	Net tons	Plants using—	Plants	Raw fuels used (net tons)		
					Yard screenings	Other raw fuels	Total
Pennsylvania anthracite	15	1,098,999	Yard screenings exclusively (from own or other yards)	3	12,927		12,927
Arkansas hard coals	8	[1] 275,245					
Bituminous (low-volatile)	17	1,166,043					
Bituminous (high-volatile)	4	119,356	Raw fuels (other than yard screenings) exclusively	21		1,517,103	1,517,103
Semicoke (lignite char)	1						
Residual carbon from pyrolysis of natural gas	1	153,900					
Residual carbon from manufacture of oil gas	2		Both yard screenings and other raw fuels	11	272,711	1,025,855	1,298,566
Petroleum coke	3	15,053					
	[2] 35	2,828,596		35	285,638	2,542,958	2,828,596

[1] Includes relatively small tonnage of Oklahoma semianthracite.
[2] 17 plants used 1 kind of fuel only, 2 plants used 2 kinds (separately), and 16 used mixtures of 2 kinds; hence the sum of the items shown exceeds the total number of plants.

TABLE 5.—Classification of plants and production of fuel briquets in the United States, by kinds of raw fuel used, 1945–46

Raw fuel used	1945			1946		
	Plants	Briquets produced		Plants	Briquets produced	
		Net tons	Percent of total		Net tons	Percent of total
Pennsylvania anthracite	2			2		
Mixture of Pennsylvania anthracite and bituminous (low-volatile)	10	1,765,769	63.9	11	1,983,238	66.0
Mixture of Pennsylvania anthracite and bituminous (high-volatile)				2		
Semianthracite	4	303,423	11.0	6	296,968	9.9
Arkansas hard coals mixture	1			[1] 2		
Bituminous:						
Low-volatile	8	510,565	18.5	6	540,844	18.0
High-volatile	2			1		
Semicoke (lignite char)	1			1		
Residual carbon from pyrolysis of natural gas	1	156,448	5.7	1	166,715	5.6
Residual carbon from manufacture of oil gas	2			2		
Petroleum coke	4	25,999	.9	2	16,262	.5
Mixture of petroleum coke and bituminous (high-volatile)				1		
	[2] 32	2,762,204	100.0	[2] 35	3,004,027	100.0

[1] One of these plants also used a relatively small tonnage of Oklahoma semianthracite.
[2] In 1945, 3 plants made 2 kinds of briquets; in 1946, 2 plants made 2 kinds; hence the sum of the items shown exceeds the total number of plants active in the respective years.

TABLE 6.—Production of fuel briquets, grouped according to location of plants with reference to supply of raw fuel, 1945–46

Location of plant	1945		1946		Change in 1946	
	Plants	Production (net tons)	Plants	Production (net tons)	Net tons	Percent
Near Lake coal docks:						
Lake Superior	4	1,069,868	4	1,091,580	+21,712	+2.0
Lake Michigan	8	453,597	8	454,314	+717	+.2
Lake Huron	1		1			
	13	1,523,465	13	1,545,894	+22,429	+1.5
Near coal mines:						
Eastern States	4	637,353	6	879,463	+242,110	+38.0

	[1] 3	8,356	[2] 3	12,098	+3,742	+44.8
Total United States	32	2,762,204	35	3,004,027	+241,823	+8.8

[1] Fall River, Mass.; Jackson, Mich.; and Omaha, Nebr.
[2] Fall River, Mass.; Flint, Mich.; and Omaha, Nebr.

Binders.—Asphalt binders remain the preferred type in briquetting coal and coke and were used exclusively by 30 plants that produced 92 percent of the fuel briquets made in 1946. Three other plants used, respectively, asphalt and coal-tar pitch combined, asphalt and starch combined, and oil-gas tar pitch. In 1946, 2 plants used no binder; 1 of these briquetted the carbon residue from the manufacture of oil gas, and 1 used low-volatile bituminous coal (the latter has been in operation since 1936 and the entire production, relatively small, is consumed locally).

TABLE 7.—Classification of briquetting plants in the United States, 1945–46, by percentage of binder used

Percent of binder in briquet (by weight)	1945			1946		
	Plants	Production		Plants	Production	
		Net tons	Percent of total briquets		Net tons	Percent of total briquets
No binder	[1] 3	119,000	4.3	[1] 2	141,352	4.7
Less than 5 percent	4	41,333	1.5	3		
5 to less than 7 percent	16	2,083,292	75.4	16	2,180,090	72.6
7 to less than 9 percent	6	475,799	17.2	9	620,287	20.6
9 percent or more	3	42,780	1.6	5	62,298	2.1
	32	2,762,204	100.0	35	3,004,027	100.0

[1] In 1945, 2 plants used residual carbon from manufacture of oil gas and 1 used bituminous coal as raw fuel; in 1946, 1 used residual carbon from manufacture of oil gas and 1, bituminous coal.

Operators reported approximately 181,000 tons of asphaltic types and small quantities of starch, coal-tar pitch, and oil-gas tar pitch used as binders in 1946 in the manufacture of fuel briquets.

Seventy-three percent of the total production of fuel briquets in 1946 was made with binders ranging from 5 to 7 percent (percent of binder in briquet—by weight), as compared with 31 percent of the production in 1942, 38 percent in 1943, 70 percent in 1944, and 75 percent in 1945.

Weight and Shape.—Pillow-shaped briquets weighing less than 5 ounces (except for an 11-ounce, high-volatile bituminous pillow made by Coal Processing Corp., Buckner, Ill.) were made at 32 plants in 1946 and comprised approximately 77 percent of the total production. Cylindrical (barrel-shaped) briquets were made at 2 plants and 18- and 20-ounce cubes at 1 plant. Briquets weighing under 3 ounces represented 62 percent of the total production in 1946.

SHIPMENTS

In 1946 fuel briquets were shipped to 35 States and the District of Columbia and exported principally to Canada. States reporting the largest output in 1946 shipped their briquets as follows: From Wisconsin to 8 States and Canada; from Pennsylvania to 24 States, the District of Columbia, and Canada; and from West Virginia to 19 States, the District of Columbia, and Canada.

Shipments from each producing State cannot be shown because there are only one or two producers in each of the States except Wisconsin, Pennsylvania, and Illinois, and confidential data of individual operations would thus be revealed. However, a graphic presentation of the centers of production, with corresponding States of destination for 1936, was included in Minerals Yearbook, 1937, page 965; and since then markets have been extended still farther, particularly in the New England and other Eastern States.

TABLE 8.—Shipments of fuel briquets of domestic manufacture in the United States, 1945–46, by States of destination, as reported by producers, in net tons [1]

State of destination	1945	1946	State of destination	1945	1946
Arkansas	540	438	New Hampshire	3,868	10,686
California	15,343	11,577	New Jersey	16,241	27,734
Connecticut	7,738	15,302	New York	66,731	94,124
Delaware	3,147	3,537	North Carolina	13,985	19,080
District of Columbia	1,606	2,159	North Dakota	145,401	157,482
Florida	615	544	Ohio	53,385	74,391
Georgia	152	200	Oregon	89,901	95,688
Illinois	92,143	113,082	Pennsylvania	52,247	49,498
Indiana	47,321	63,552	Rhode Island	7,100	8,249
Iowa	150,815	124,271	South Carolina	4,057	5,723
Kansas	15,384	13,931	South Dakota	139,399	132,348
Kentucky	5,149	4,939	Vermont	1,697	5,864
Maine	11,155	17,924	Virginia	19,687	24,811
Maryland	10,028	21,049	Washington	7,709	6,923
Massachusetts	51,153	63,458	West Virginia	1,476	2,708
Michigan	131,455	187,452	Wisconsin	535,883	543,692
Minnesota	551,855	579,356	Wyoming	29	
Mississippi		97			
Missouri	276,471	245,903		2,585,091	2,784,662
Nebraska	54,225	56,890			

[1] For shipments outside the United States see export statistics, table 10.

The difference between production in 1946 (3,004,027 tons) and shipments within the United States (2,784,662) represents briquets exported, used at plants for power or heat, and variation in year-end stocks. Fuel briquets are used almost entirely for domestic space heating, but seven operators reported a total of 30,585 tons used for power or heat at their plants in 1946.

TABLE 9.—Direct shipments of fuel briquets by rail and truck, as reported by producers, 1945–46, in net tons [1]

Produced in—	1945			1946		
	Rail	Truck	Total	Rail	Truck	Total
Eastern States	617,222	19,558	636,780	860,786	19,463	880,249
Central States	1,606,405	380,581	1,986,986	1,617,462	475,753	1,979,027
Pacific Coast States	24,315	88,638	112,953			114,188
Total United States	2,247,942	488,777	[2] 2,736,719	2,478,248	495,216	[2] 2,973,464

[1] Includes shipments outside the United States.
[2] An additional 20,139 tons were used by 2 producers as fuel at their plants in 1945 and 30,585 tons by 7 producers in 1946.

VALUE

The total sales value of the fuel briquets manufactured in 1946 was $25,299,612 f. o. b. plant—an increase of $3,620,726 or 17 percent over 1945 (table 2).

As sales realizations on briquets in the scattered producing centers vary considerably, an average value per ton for the entire industry has doubtful significance, because of the different conditions under which briquets are manufactured and sold. The most important factors that influence the value per ton realized at any plant are cost of raw materials and labor and prices of competing fuels; hence, the trend of fuel-briquet values is indicated best in this review by the average values in the Eastern, Central, and Pacific Coast States (table 1 and figure 2). These are the values received by producers for the total product at the plant and should not be confused with retail prices, which may include transportation costs to markets and wholesalers' margins.

The average value per ton, f. o. b. plant, for the Eastern States in 1946 was $6.61, compared with $9.03 for the Central States and $11.26 for the Pacific Coast States. In the Eastern States nearly all the output comes from plants in the low-volatile coal fields of southern West Virginia and in the anthracite region of Pennsylvania, where the cost of raw fuel does not involve freight charges; as a result, the value f. o. b. plant is relatively low. In the Central States 78 percent of the production comes from plants at coal docks on the Great Lakes; the raw fuel for these plants involves a considerable freight charge, which is reflected in the higher value per ton f. o. b. plant. In the Pacific Coast States (representing but 5 percent of the national production in 1946), the average value per ton represents the highest value f. o. b. plant for fuel briquets in the United States.

FOREIGN TRADE[5]

Imports of briquets into the United States in 1946 totaled 653 tons valued at $4,486; all came from Canada. Exports of fuel briquets, principally to Canada, amounted to 163,339 tons, 4 percent less than in 1945.

TECHNOLOGIC DEVELOPMENTS

A plan to use Pennsylvania anthracite fines was sponsored by the Federal Government at the request of the Solid Fuels Administration for War[6] in 1944. Extensive experiments were made by the Bureau of Mines[7] to test the possibilities of the use of small anthracite as follows:

(*a*) The burning of mixtures of small anthracite and bituminous slack on stokers.

(*b*) Methods of producing and burning "packaged fuel" made from anthracite fines.

(*c*) The use of anthracite fines in the production of coke.

(*d*) The use of barley anthracite in gas producers.

[5] Figures on imports and exports compiled by M. B. Price of the Bureau of Mines, from records of the U. S. Department of Commerce.

Saward's Journal, Packaged Fuel—Bureau of Mines Study Indicates Marketing Possibilities Are Encouraging: Vol. 29, No. 13, June 29, 1946, p. 175.

In connection with the acute shortage of coal in Alaska, the Bureau of Mines during the war cooperated with the Coal Procurement Section, Alaska Department, United States Army, in investigating the possibilities of briquetting the subbituminous and lignite coals of Healy Creek Valley, Alaska, to make them suitable for stock piling and transshipment to the Aleutian bases. Tests indicated that satisfactory briquets could be obtained with the addition of one-third coking coal from the Matanuska district.[8]

In 1943 and 1944 the Bureau of Mines, in cooperation with the University of North Dakota, Grand Forks, N. Dak., and the Colorado School of Mines, Golden, Colo., made tests on lignite-char briquets which revealed that they were not suitable for gasification in the standard water-gas process because of disintegration and low efficiency caused by loss of fine carbon.[9]

The Illinois Geological Survey at Urbana continued experimental work during 1946 on the briquetting of Illinois coals by the Piersol[10] process and press, at room temperature without the addition of binder, at approximately 30,000 pounds pressure per square inch, followed by heat treatment at about 360° C. for various periods to determine the effect upon smokelessness, firmness, and weather resistance.

WORLD PRODUCTION

Table 11 includes official data received since the close of the war on the production of fuel briquets in other countries and now presents a fairly complete picture for 1939 to 1944, inclusive. During this period production in Germany—the principal briquet-producing country of the world—rose 31 percent; output in the United States more than doubled; but production dropped appreciably in the other larger briquet-producing countries—France, Netherlands, and Belgium. The United States, which ranked as fifth largest producer in 1939, was second largest in 1944.

PACKAGED FUEL

The rapid growth of the packaged-fuel industry from 1935 [11] through 1940 and its arrested development during the war years are illustrated in figure 3. The ending of remaining wartime controls by SFAW, OPA, and OTC is discussed in the General Summary at the beginning of this report.

"Packaged fuel" is the trade name applied by the industry to a combination of briquetting and packaging of screenings compressed into 3- or 4-inch cubes and wrapped (six or eight in a package) in sturdy paper and sealed with gummed tape. A study of the development of the packaged-fuel industry, from its beginning with the introduction of coal blocks made from slack in 1928 to the peak of packaged-fuel production in 1940, was made by V. F. Parry [12] of the

[11] First canvass of the packaged-fuel industry by the Bureau of Mines.
[12] Parry, V. F., Technical and Economic Study of Packaged Fuel: Bureau of Mines Rept. of Investigations 3757, 1944, 45 pp.

Bureau of Mines; this study includes operations involved in the manufacture of packaged fuel and analysis of costs in typical plants.

Experiments made by the Bureau of Mines on the use of anthracite in the manufacture of packaged fuel are discussed in the Fuel Briquets section of this chapter under Technologic Developments.

The anticipated success of packaged fuel in the Philadelphia area was of short duration. This fuel (made in Philadelphia by the White Glove Packaged Fuel Division, Blaw-Knox Co., of surplus Pennsylvania anthracite fines blended with a smaller quantity of bituminous coal and an asphalt binder) was introduced to the public in Philadelphia in Gimbel's Department Store in March 1945—when other domestic supplies were short. Thousands of householders placed orders for earliest possible delivery. However, when former domestic anthracite supplies became more plentiful in Philadelphia—the second largest anthracite-consuming city in the United States—the demand for packaged fuel dwindled, and the White Glove plant closed in October 1946. Details of the effort to place packaged fuel on the domestic market in Philadelphia were described [13] in various trade journals and Government publications.

TABLE 12.—Salient statistics of the packaged-fuel industry in the United States, 1942–46

Year	Production (net tons)			Value of production	Plants in operation	Average value per net ton, f. o. b. plant	
	Eastern and Pacific Coast States	Central States	Total			Eastern and Pacific Coast States	Central States
1942	7,583	245,465	253,048	$2,540,087	89	$10.74	$10.02
1943	[1] 4,970	210,635	215,605	2,366,733	72	[1] 11.55	10.96
1944	[1] 3,788	171,982	175,770	2,053,343	68	[1] 12.26	11.67

[1] Eastern States; no production in Pacific Coast States in 1943–46.

PRODUCTION

Continuing shortages of raw fuels, paper, and binder and inability to operate profitably under existing price ceilings [14] were reported as the principal causes of reduced production and idleness in 1946 by packaged-fuel operators.

[14] Sales of packaged fuel were exempted from price control by the Office of Price Administration, effective Sept. 25, 1946 (SO 166 Amdt. 2 Sept. 25, 1946).

The 70 plants active in 1946 produced 190,919 net tons of packaged fuel, with a value of $2,496,388. The national production decreased 8 percent from 1945, but the decrease in value was less than 1 percent. Production in the Central States was 5 percent less than in 1945, but its value was 3 percent more than in the previous year. The relatively large decrease in production in the Eastern States was due

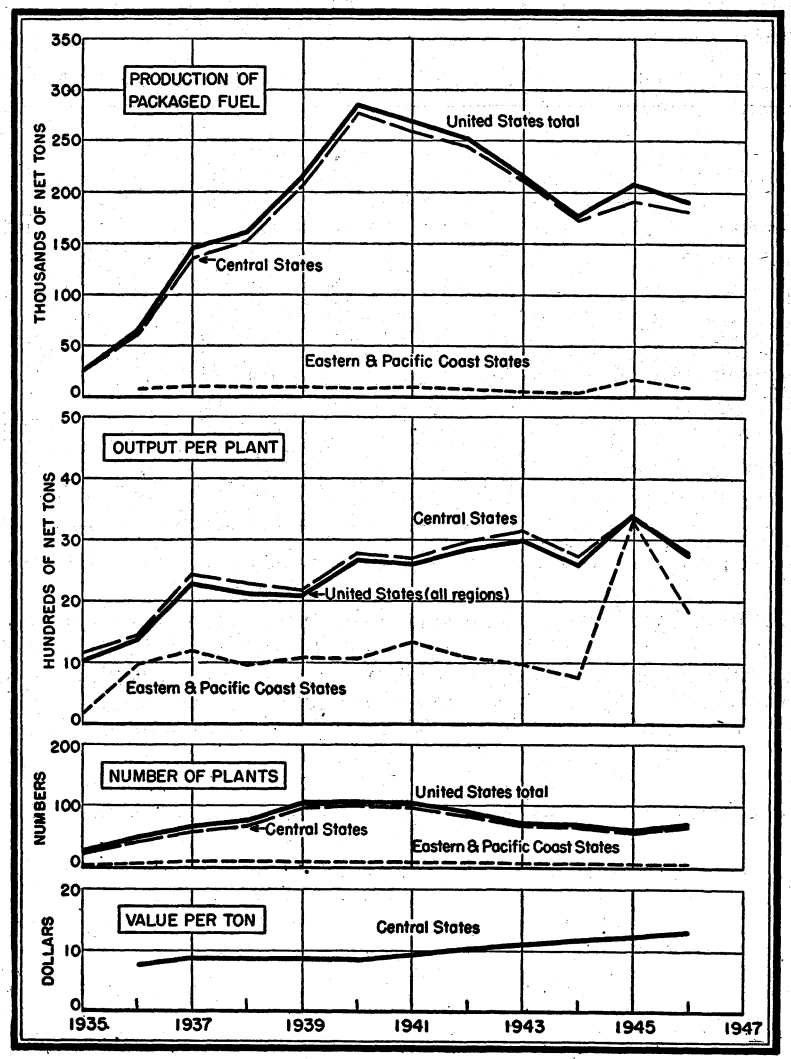

FIGURE 3.—Production of packaged fuel, output per plant, and number of plants in operation in the United States (by regions), and average value per net ton, f. o. b. plant (Central States), 1935–46. (No production in Pacific Coast States, 1943–46.)

principally to the closing down in October 1946 of the plant of the White Glove Packaged Fuel Division, Blaw-Knox Co., Philadelphia. There has been no production of packaged fuel in the Pacific Coast States since 1942.

Output declined in 7 of the 13 producing States and remained stationary or rose slightly in 5 States. Kentucky entered the packaged-fuel field with a new plant at Covington, starting production late in 1946. Michigan and Wisconsin again led in production, and the largest individual producers were the Cleveland-Cliffs Iron Co., Green Bay, Wis., and the Johnson Coal Cubing Co., Inc., Detroit, Mich. One plant reported a fire in 1946, resulting in idleness for 7 months.

[1] Maine, 1; Pennsylvania, 1; and Virginia, 3.
[2] Data which the Bureau of Mines is not at liberty to publish separately are included under "Undistributed."

Value of Production.—The values shown in table 14 represent the average per ton received by operators in 1945 and 1946 in States with three or more operators. The value at the plant comprises cost of coal at the mine, freight rate, direct and indirect manufacturing costs, and profit. Only 1 of the 13 producing States showed a decrease in average realization at the plant in 1946.

TABLE 14.—Average value received per net ton of packaged fuel in the United States, 1945–46, by States

[Includes only States with 3 or more plants in both years]

State	1945	1946	State	1945	1946
Michigan	$12.06	$13.27	Virginia	$10.66	$11.44
Minnesota	13.24	14.10	Wisconsin	11.65	12.49
Ohio	11.68	12.92			

Number of Plants.—The number of plants producing packaged fuel rose from 61 in 1945 to 70 in 1946; 27 of these were in the Detroit and Cleveland areas and contributed about one-third of the total production. Five plants began operations in 1946—2 in Detroit, Mich., and 1 each in Covington, Ky., Kansas City, Mo., and Columbus, Ohio. The number of idle plants dropped from 29 in 1945 to 18 in 1946. Eight plants went out of business in 1946.

Capacity.—The average annual capacity and average annual production per plant in the packaged-fuel industry in the United States, by regions, in 1946, are as follows:

	Average capacity (net tons)	*Average production (net tons)*
Eastern States (5 plants)	18, 560	1, 813
Central States (65 plants)	6, 738	2, 798
Total United States (70 plants)	7, 582	2, 727

Annual capacities of 25,000 tons or more were reported by one eastern plant and three Central States plants. The largest annual capacities in 1946 were reported for the plants of Johnson Coal Cubing Co., Inc., Detroit, Mich., and White Glove Packaged Fuel Division, Blaw-Knox Co., Philadelphia, Pa. (which closed in October 1946).

TABLE 15.—Annual capacity and production of active packaged-fuel plants in the United States, 1937–46

[1] One of these plants began operation in October 1946.

Processes.—No new processes were reported in use for 1946. Sixty-five of the 70 active operations in 1946 used the Eberling process; [15]

[15] Eberling, C. M., Packaged Fuel Produced by the Eberling Process (Cleveland, Ohio): Coal Heat, vol. 28, No. 1, July 1935, pp. 64–66.
Coal Heat, Time to Consider the Future: Vol. 48, No. 3, September 1945, p. 55.

3 used Glenn-Smith equipment;[16] and 2 used equipment designed by Johnson Coal Cubing Co., Inc.,[17] Detroit, Mich. No Leemon equipment was reported in use in 1946. (These processes are briefly discussed by V. F. Parry in his Report of Investigations 3757, previously cited.) Additional machinery was installed at 8 plants in 1946; the 5 new plants reported Eberling installations.

Raw Fuels.—Six kinds of raw fuels (table 16) entered into the manufacture of 8 types of packaged fuel in 1946 (table 17). Bituminous low-volatile coal at 67 plants (in the Eastern and Central States), used either alone or in combination with other fuels, accounted for 91 percent of the total raw fuels used in 1946. Petroleum coke (in

TABLE 16.—Raw fuels used in making packaged fuel in the United States in 1946

Character of raw fuels used	Plants	Net tons	Plants using—	Plants	Raw fuels used (net tons)		
					Yard screenings	Other raw fuels	Total
Bituminous low-volatile	67	171,116	Yard screenings exclusively (from own or other yards)	33	44,348	-------	44,348
Bituminous medium-volatile	1	2,009	Raw fuels (other than yard screenings) exclusively	15	-------	90,151	90,151

Petroleum coke	8	6,696					
	[1] 70	187,666		70	62,930	124,736	187,666

[1] 58 plants used 1 kind of fuel only, 8 used 2 kinds (separately), and 4 used mixtures of 2 kinds; hence the sum of the items shown exceeds the total number of active plants.

TABLE 17.—Classification of plants and production of packaged fuel in the United States, by kinds of raw fuel used, 1945–46

Raw fuel used	1945			1946		
	Plants	Packaged fuel produced		Plants	Packaged fuel produced	
		Net tons	Percent of total		Net tons	Percent of total
Bituminous low-volatile (exclusively)	57	167,309	80.4	63	165,734	86.8
Bituminous high-volatile (exclusively)	3	3,147	1.5	1	4,554	2.4
Mixture of bituminous low- and medium-volatile	-------			1		
Mixture of bituminous low- and high-volatile	-------			1		
Mixture of bituminous low-volatile and Pennsylvania anthracite	1	23,154	11.1	1	16,055	8.4
Mixture of bituminous low-volatile and petroleum coke	1			1		
Semianthracite (exclusively)	2			3		
Petroleum coke (exclusively)	7	14,533	7.0	7	4,576	2.4
	[1] 61	208,143	100.0	[1] 70	190,919	100.0

[1] In 1945, 3 types were made at 1 plant and 2 types at 8 plants; in 1946, 2 types were made at 8 plants; hence the sum of the items shown exceeds the total number of plants active in the respective years.

[16] Black Diamond, Briquetting Plant Solves Slack Problem: Vol. 98, No. 6, Mar. 13, 1937, p. 60. (Manufacturing and sales rights of briquetting machinery designed by Glenn Smith acquired in 1944 by Blaw-Knox Co., Pittsburgh, Pa.)
White Glove Packaged Fuel Division of Blaw-Knox Co. (Pittsburgh, Pa.), The Story of White Glove Packaged Fuel: Bull. 2085, 4 pp.

[17] Black Diamond, A Mammoth Package Fuel Plant: Vol. 102, No. 7, Apr. 8, 1939, p. 23. Black Diamond, Packaging Coal at the Johnson Plant at Detroit: Vol. 115, No. 2, July 21, 1945, p. 20.

Illinois, Minnesota, Ohio, and Wisconsin), Pennsylvania anthracite (in Pennsylvania), semianthracite (in Iowa, Missouri, and Nebraska), medium-volatile bituminous (in Ohio), and high-volatile bituminous (in Michigan) were the other raw fuels used.

Binders.—Percent of binder in packaged fuel, by weight, ranged from 0.5 to 5.0 percent. Starch, totaling 1,007 tons and averaging about 15 pounds per ton of packaged fuel produced, is the principal type of binder used and was employed exclusively by 65 plants, producing 138,697 tons, or 73 percent of the total output. Asphalt, totaling 2,211 tons and averaging 89 pounds per ton of packaged fuel produced, was employed exclusively by 3 plants (2 using bituminous low-volatile and 1, a combination of Pennsylvania anthracite and bituminous low-volatile). A combination of asphalt and starch in the manufacture of petroleum-coke cubes was used at 1 plant, and cement was used at 2 plants.

The Eberling and Johnson processes generally employ a starch binder. The Glenn Smith process uses an asphalt binder, making cubes which are also sold in bulk (unwrapped).

TABLE 18.—Classification of packaged-fuel plants in the United States, 1945–46, by type and percentage of binder used

Type of binder	Plants		Percent of binder in packaged fuel (by weight)	Plants	
	1945	1946		1945	1946
Starch	58	65	Less than 0.5 percent		
Starch and asphalt	1	1	0.5 to less than 1 percent	52	58
Asphalt	3	3	1 to less than 2 percent	6	8
Cement		2	2 to less than 3 percent		2
			3 to less than 5 percent	1	2
			5 percent or more	2	1
	[1] 61	[1] 70		61	[2] 70

[1] In 1945 and 1946, 1 plant making 2 types of packaged fuel used starch binder for 1 and starch and asphalt for the other; hence the sum of the items shown exceeds the number of active plants.

[2] In 1946, 1 plant making 2 types of packaged fuel used less than 1 percent binder for 1 and between 1 and 2 percent for the other; hence the sum of the items shown exceeds the number of active plants.

Gem Stones

By SYDNEY H. BALL

JEWELRY INDUSTRY IN 1946

JEWELRY sales in 1946 totaled some $1,709,000,000, an appreciable gain over the previous record year of 1945. For the first 6 months, sales by retail jewelers showed greater gains over those of the previous year than did those of other retailers. During the period many purchases of consequence were made, and the question of price was immaterial; thereafter sales dwindled, and in the last quarter the slight gain over the corresponding period of 1945 was due, not to volume, but to higher prices. The Christmas trade was slightly less than that of 1945, and high-priced goods—including fine diamonds—moved slowly. Customers were more discriminating and more interested in the quality of the goods offered. By the year end prices of mediocre diamonds were appreciably off. The more fashionable stores fared less well than the average. Sales by wholesalers showed greater gains than did those of the retailers, and in consequence retail jewelers' stocks increased during the year.

The 1946 prosperity of the industry was built on a high national income, full employment, an all-time high in marriages, and some drawing upon wartime savings.

On April 29, 1946, platinum was released for civilian use, and thereafter the industry had all the raw materials it needed. In the fall the last price controls were removed from jewelry merchandise.

In 1947 the jeweler will have more competition for the consumer dollar from durable goods, and his customers will seek better values than in 1946. Sales could dip appreciably, however, and the industry remain prosperous.

FASHIONS IN JEWELS

With the war behind us, formal functions are increasing in number; in consequence, there is a more lavish display of jewels, and many a fine gem has emerged from safety-deposit boxes. For evening wear, the white motif is dominant—platinum and diamonds or pearls. The latter have staged a slight come-back. Palladium is still being used, particularly in imposing earrings and clips, where its lightness is an advantage. Gold, often of several tones, is still widely worn, particularly with black gowns. Jewelry continues to gain in colorfulness; diamond pieces often are set with rubies, sapphires, or even less valuable colored gems. More women are acquiring jewelry especially designed to their taste.

Styles in the past year have changed little; but there is a tendency to abandon massive designs, and many of today's designs are lacy

and delicate, with fragile look. Motifs were myriad; flowers were dominant, but leaves, bowknots, snowflakes, sunbursts, and pinwheels were also popular.

Clips, pins and brooches, bracelets, earrings, necklaces, and rings held their popularity, while the use of jeweled hair ornaments grew. Bracelets and necklaces frequently were woven of flexible wire. Necklaces tended to be longer. Many had pendant jewels and others, attached clips. The vogue of pendants from earrings increased; other earrings were clips attached to the top and bottom of the ears.

Some women wore a number of matching clips of graduated size; others, two or more bracelets and even several necklaces. Ensembles of like gems and mountings, say, matching clips, earrings and bracelets are highly prized. Jewelry which can serve a double purpose—an imposing pin separable into two clips or a necklace which can be divided into bracelets—is serviceable and is gaining in popularity.

Although the double-wedding-ring ceremony has become normal, an attempt to induce men to wear more jewelry has been only slightly successful.

The demand for old jewelry, much of it Victorian, is tapering off.

Small cabochon rubies and sapphires replace melee diamonds in some jewelry. The diamond was, by far, the most popular stone, followed by the ruby, sapphire, pearls (both natural and cultured), the emerald, aquamarine and turquoise. Fine aquamarine, while rare and expensive, holds its popularity; turquoise is gaining, but citrine and topaz are losing ground.

The ever-insistent demand for diamonds caused colorless gems to be most popular, followed by blue and red gems; green, yellow, and purple gem stones were in less demand, in the order named.

DOMESTIC PRODUCTION

Plenty of gasoline and greater leisure have permitted the mineral hobbyist to collect more minerals, some of which warrant cutting. The lapidary industry, professional and amateur, in the Western States continues to expand markedly; and now that its best customer, the auto tourist, is again on the road, the demand for cut-gem stones has increased. The American costume-jewelry industry, shut off during the war from European sources of supply, is a second outlet for the product. In consequence, production of gem stones may have skyrocketed from an estimated value (at the source) of $40,000 in 1945 to some $325,000 in 1946, but these figures are at best, rough estimates.

Prices during the year increased considerably, warranting the producer in risking capital today that he would not have dared to do in prewar days.

Jade, followed by agate, turquoise, and then variscite, were the most important gem stones produced. Of the States and Territories, Wyoming led, followed by Oregon, Alaska, Washington, and Nevada.

The jade (nephrite) industry of the Kobuk River region, Alaska, is likely to employ a few miners and may employ some of the local Eskimos cutting for the tourist trade. Nephrite occurs as float and pebbles, also in place in the Jade and Cosmos Hills. Most of the

material is poor, but part is suitable for objets d'art and for tourist jewelry. The Arctic Circle Exploration Co. is the principal producer and fabricator. B. D. Stewart, Alaska Commissioner of Mines, informs the author that, in the summer of 1946, the company shipped 13¾ tons of jade and that a Fairbanks trader exported 100 pounds, some of which was of excellent quality. Some of the material in the rough is worth $5 a pound, and selected material is said to have brought $55 a pound.

Wyoming increased its production of nephrite from the Lander region, and at least one new occurrence of jade in place is reported. Many miners from outside the State visited the area in 1946. There are three lapidaries at Lander; in addition, some jade is exported to China, where it is cut. Some of the rough was sold for as much as $15 a pound. Most of the material is of more or less the quality of New Zealand jade, although some is said to be equal to that of Chinese Turkestan. Much of the jade land was located under the Placer Act, but apparently only in a few instances has enough work been done to hold them legally. Whether one buys or sells jade boulders, he gambles, for in no case is the value of the material known until it is cut.

After jade, agate and related quartz minerals, were the most important gem stones produced and are the principal materials cut by the large number of professional and amateur lapidaries in the West. Although some deposits have been worked out, the numerous agate prospectors have found deposits more than compensating for the exhaustion of the old deposits. Where virtually all of the float has been collected, underground work has started in several districts, a condition permitted by the higher price paid for the raw material. Dr. H. C. Dake, Portland, Oreg., believes that central Oregon is the chief producer. From a single pocket near Post, $8,000 worth of agate was recovered in 3 days, including a single mass weighing 186 pounds, which was sold for $1,000. Plume agates and other types of chalcedony are the principal products. Washington was perhaps the next most important producer.

The moss agate deposits of the flats of the Yellowstone River, Mont., are partly exhausted, but they still supply material to six professional lapidary shops and to scores of amateur lapidaries. A. Harrington reports that Idaho's production of moss agate increased in 1946 but that there were no new discoveries of importance. Owyhee County is one of the larger producers. The nodules called "thunder eggs" are in demand.

Gordon Bowser of San Luis Obispo, Calif., produced about a ton of moss agate worth $6,000. A little agate was also produced in San Bernardino County. Considerable plume agate was produced in south central Colorado, according to Richard M. Pearl, and from the Embargo mining district, Colo. T. D. Benjowsky reports that red jasper was mined near Hot Springs, Sierra County, N. Mex., and other agate species in Socorro and Catron Counties. A new source of dendritic chalcedony was discovered during the year near Fort Cummings, Luna County, N. Mex. When cut, it finds a ready market in the Southwest and in southern California.

Charles E. Hill reports finding a new agate locality in Yavapai County, Ariz., from which he mined some fine stones.

Agate nodules, weathering from lavas in Trans-Pecos, Tex., were collected in quantity in 1946 and sent to various lapidaries. Arizona produced some agate.

Alfred M. Buranek reports that the number of lapidary shops in Utah has grown remarkably during the year and that several new deposits of agate have been discovered. Agate was produced in the Dugway area, and moss agate and jasper from the Topaz, Jericho, and Beaver areas. So much material is being shipped to other States that the Mineralogical Society of Utah is preparing a bill to be presented to the legislature to prohibit nonresidents from shipping these minerals in quantity beyond the State boundaries.

In value, turquoise was probably the third most important American gem stone produced in 1946, although statistical data are scanty. Nevada was probably the leading producer. The Nevada Turquoise Co., of Mina, Mineral County, is said to have produced turquoise valued at more than $20,000. The Pedro claim of the Copper Canyon Mining Co. produced perhaps nearly as much. During the last 5 months of 1946, rough turquoise was recovered by the Castle Dome Copper Co., Inc., through the sorting of a small percentage of the ore broken in its routine mining operations, according to R. W. Hughes, general manager. The turquoise so recovered ranged in grade from thin, hard flakes with deep blue color through various degrees of hardness and shades of blue down to colorless chalky material.

The King turquoise mine at Manassa, Conejos County, Colo., leased by Horace and Wallace King, produced 2,000 pounds worth $30,000.

A "composite turquoise" (small fragments of Arizona turquoise in a matrix of black cement) is on the market and is rather attractive. Los Cerrillos, N. Mex., produced a little turquoise, largely by local labor near the mine. It was sold to lapidaries in the vicinity. The United Indian Traders Association has set up standards for hand-made Navajo and Pueblo jewelry and is prepared to license its mark.

Utah continues to produce some variscite. Alfred M. Buranek reports that the Clay Canyon deposits were worked, as was the Lucin (Box Elder County) on a somewhat smaller scale. Junius J. Hayes reports that collectors got some variscite from the Grantsville deposit in Tooele County.

Some geophysical work was done in the vicinity of the Murfreesboro, Ark., diamondiferous pipes. The main company is again in litigation. Some 40 years ago a few small, alluvial diamonds were reported to have been recovered at a gold placer near McCall, Idaho. Late in 1946 that ground was leased and some development work started.

Montana apparently produced no sapphire in 1946.

A considerable amount of "flowering" obsidian was mined in Utah. In Arizona some "marekanite" was produced. This is a semitransparent smoky glass nodule occurring in obsidian.

Kelley and Branson[1] describe small Tertiary pegmatite masses on the west slope of the Black Range, Grant County, N. Mex. The pegmatite consists largely of quartz and sanidine; the latter, which occurs in fair-size masses, "displays blue and white opalescence, giving rise to a moonstone of commercial quality." A little may have been produced in 1946.

[1] Kelley, V. C., and Branson, O. T., Bull. Geol. Soc. America, vol. 57, December 1946, p. 1255.

The Barton Mines Corp., North Creek, Warren County, N. Y., sells some of its garnets to lapidaries. The color is good, but the market is of limited scope. Valley and Adams Counties, Idaho, have garnet deposits, but as far as is known none was worked in 1946. In the extreme southeastern part of Utah pyrope garnets of good color, some over a half inch in diameter, occur in gold placers.

Other gem stones produced in small amounts in 1946 include agatized wood (Arizona and New Mexico); alabaster (South Dakota); amethyst (Dugway area, Utah); aquamarine (Deep Creek, Utah, and San Diego, Calif.); kunzite (San Diego, Calif.); kyanite (Upson County, Ga.); opal (17 miles south of Marsing, Idaho); opalized wood (central Washington); pipestone (Pipestone, Minn.); rock crystal (Crystal Mountain, Ark.); rose quartz (South Dakota); staurolite (Cherokee County, Ga.); topaz (Tarryall Mountains, Colo., and Topaz Mountain, Utah); and tourmaline (San Diego, Calif., and Mount Apatite, Maine).

GOVERNMENT REGULATIONS

A number of Government regulations enacted in 1946 affected the trade in precious stones. The majority of such measures were passed in the hope of increased revenue.

The United States removed control from all jewelry items, but apparently for some time to come is not to reduce the excise tax (20 percent). Maine in 1946 placed a 5-percent luxury tax on jewelry sales in addition to the 20-percent Federal tax. During the year, the United States also removed controls on the price and export of industrial diamonds and diamond-set tools.

Canada removed all controls from diamonds and gem stones on March 15, 1946, and India on July 29, 1946. Import duties on jewelry were increased by Argentina, Czechoslovakia, Mexico, and Paraguay. Luxury taxes on jewelry were established in China (50 percent), Spain (20 percent), and France (25 percent), and Mexico added a 5-percent sales tax on jewelry sold in the Federal district. Italy, permitted the purchase, sale, and transfer of jewelry and precious stones after April 26, 1946, but not their exportation. Egypt, while still prohibiting transit trade in gold and jewelry, now permits the importation of gold, provided it is reexported within 6 months. France no longer requires a license for exporting jewelry and precious stones. On the other hand, such commodities exported from Burma require a license granted by the Reserve Bank of India. As France received fewer industrial diamonds than its needs, the commodity was placed under Government control.

IMPORTS

The value of imports of precious and semiprecious, real and imitation stones, exclusive of industrial diamonds, as listed by the United States Department of Commerce, totaled $189,017,646—65 percent more than in 1945. Diamonds were over 88 percent of the total. Fine gem stones and pearls and cut imitation stones showed large increases.

Precious and semiprecious stones (exclusive of industrial diamonds) imported for consumption in the United States, 1945–46 [1]

Commodity	1945		1946	
	Carats	Value	Carats	Value
Diamonds:				
Rough or uncut (suitable for cutting into gem stones), duty free	893, 761	$43, 122, 622	1, 044, 517	$48, 668, 843
Cut but unset, suitable for jewelry, dutiable	377, 243	64, 185, 406	604, 638	117, 968, 206
Emeralds:				
Rough or uncut, free	1, 085	252	544, 711	579, 745
Cut but not set, dutiable	106, 684	181, 834	11, 902	210, 274
Pearls and parts, not strung or set, dutiable:				
Natural		352, 947		619, 463
Cultured or cultivated		155, 548		1, 280, 867
Other precious and semiprecious stones:				
Rough or uncut, free		134, 698		329, 552
Cut but not set, dutiable		5, 113, 937		8, 932, 862
Imitation, except opaque, dutiable:				
Not cut or faceted		3, 220		68, 108
Cut or faceted:				
Synthetic		805, 838		1, 640, 426
Other		242, 988		8, 044, 674
Imitation, opaque, including imitation pearls, dutiable		31, 136		298, 545
Marcasites, dutiable:				
Real		101, 140		344, 907
Imitation		3, 665		31, 174
		114, 435, 231		189, 017, 646

[1] In the corresponding table in Minerals Yearbook, 1945, p. 1548 and Minerals Yearbook, 1944, p. 1518 data for 1944 should be revised as follows: Diamonds, rough or uncut, $43,549,837; cut but unset, $29,003,536; emeralds, cut but not set, $70,924; pearls and parts, natural, $244,879; total value, $77,367,188.

DIAMOND

For mining companies, wholesalers, and retailers, 1946 was even a better year in the diamond industry than the previous record year, 1945. The cutters, on the other hand, had a far from satisfactory year.

Production was less by weight than in 1945 but greater in value. Output of gem stones in southern Africa and Tanganyika Territory increased, whereas the break-down of war-worn machinery cut deeply into Belgian Congo's production, which is dominantly of industrial grades.

Sales of rough by the principal wholesaler, the Diamond Corp., were £30,000,000, or 22 percent greater than those of the previous record year 1945. Production did not meet sales, and stocks were depleted further; the day when all sales must be made from current production approaches.

With the war over, the market for cut diamonds is broadening, but few countries are as yet able to pay for luxuries, although investment buying continues. The American retailer never sold so many cut diamonds, although demand weakened in the last quarter of the year.

The cutting industry alone was not prosperous. During and since the war the industry mushroomed, and its capacity to cut exceeds the rough now available. In consequence, unemployment, strikes, and lock-outs were common, and there was a tendency toward lower wages.

Prices of rough were raised moderately in gem grades and somewhat more so in industrials, which during the war sold at less than prewar prices. Prices of polished diamonds were slightly increased in the first half of the year but weakened in the last quarter, particularly prices of mediocre-quality stones.

As was to be expected, with the end of the war, fewer industrials were used. In 1946 the users were, however, importing stones of finer quality than those used during the war, hence the dollar value approached that of wartime imports.

Share Dealings.—The shares of the leading diamond mining companies on the London Stock Exchange, their principal market, gained about 17 percent. Quotations early in June 1946 were at practically an all-time high. Thereafter they fluctuated and declined slightly. All of the principal diamond-mining companies except Premier paid dividends in 1946.

Imports.—Imports of gem diamonds into the United States increased from $107,308,028 in 1945 to $166,637,049 in 1946—a gain of 55 percent.

The accompanying table shows comparative figures of imports during 1945 and 1946. The imports of rough in the latter year were greater by 17 percent, as to carats, and 13 percent, as to value. The gain in imports of cut was 60 percent, as to carats, and 84 percent as to value. The grade of the 1946 rough imports was poorer, and the grade of cut about the same.

[1] In the corresponding table in Minerals Yearbook, 1945, p. 1550 and Minerals Yearbook, 1944, p. 1521, data for 1944 should be revised as follows: Rough or uncut: Brazil, total value, $830,996; average value, $32.44. Grand total value, $43,549,837; total average value $48.58. Cut but unset: Brazil, total value, $4,014,301; average value, $160.37; U. S. S. R., total value, $147,604; average value, $102.79. Grand total value, $29,003,536; total average value, $171.52.

Cutting.—At the end of 1945 there were some 25,000 cutters in the world; at the end of 1946, some 35,000. Decreases in Brazil, the United States, Cuba, and Puerto Rico were more than offset by a large increase in Belgium and a smaller one in Palestine. Even in 1945 there was inadequate rough to insure full employment; and in 1946, as the supply was not much greater, there was a chronic shortage of rough, resulting in unemployment for the artisans and inadequate profits for the master cutters. Belgium is by far the largest cutting center, followed by Palestine, New York, and Cuba. Some of the war-born centers will disappear over the next few years, and others will be deflated. The best cutting of sizes is done in the United States and that of melee in Palestine, Belgium, and the United States.

World Production.—Accurate figures regarding diamond production still are not available for many countries, but the estimates in the following table are believed to be fairly reliable. World production (gems and industrials) in 1946 is estimated to have been 10,313,000 carats (2.27 short tons) worth at the mine about $81,400,000 which compares with 14,384,000 carats (3.17 short tons) in 1945. The quantity was 72 percent of that of 1945, but the value at the mine showed an increase of about 25 percent. The increase in value was

due to the increased production of gem grades (both as to carats and value) and the advance in the price of cuttables. By weight, about 1,228 pounds were gem stones and 3,315 pounds industrials.

Belgian Congo was the leading producer by weight (59 percent), although it represented only 11 percent of the value. On the other hand, the British Commonwealth, accounting for only 29 percent of the weight, represented about 70 percent of the value.

Union of South Africa, South-West Africa, Tanganyika Territory and Gold Coast showed gains, and Belgian Congo a loss. At Kimberley, the Dutoitspan and Bulfontein pipe mines continued to operate, and in a year or two Premier and New Jagersfontein will resume production.

The accompanying table shows available statistics and estimates of world production for the past 5 years.

World production of diamonds, 1942–46, by countries, in metric carats

[Including industrial diamonds]

Country	1942	1943	1944	1945	1946
Africa:					
Angola	791,853	794,990	799,120	803,887	[1] 808,000

Industrial Diamonds.—In the first year after World War II ended, the imports of industrial diamonds decreased markedly in carats but in dollar value compared favorably with all previous years except 1942–44. Consumption and production approached balance, but many grades were in short supply. Manufacturers of diamond-set tools must still be careful in using those industrial stones available.

From the spring of 1946 on, the principal wholesaler of industrial stones was Industrial Distributors (1946) Ltd.

On July 23, 1946, the Strategic and Critical Materials Stock Piling Act (Public Law 520, 79th Congress) was approved. All diamonds then in the hands of Government agencies were transferred to the stock pile, and additional industrials are to be purchased.

After World War II broke out, the price of crushing bort was halved and that of other grades remained steady during the war. In 1946

the price of crushing bort was raised 80 percent and that of other grades somewhat less.

The year saw many improvements, but few innovations, in the use of industrial diamonds.

Figure 1, originally prepared by Herbert Backman several years ago, shows the tremendous increase in use and the sharp decline in the price per carat of American imports in the past 28 years.

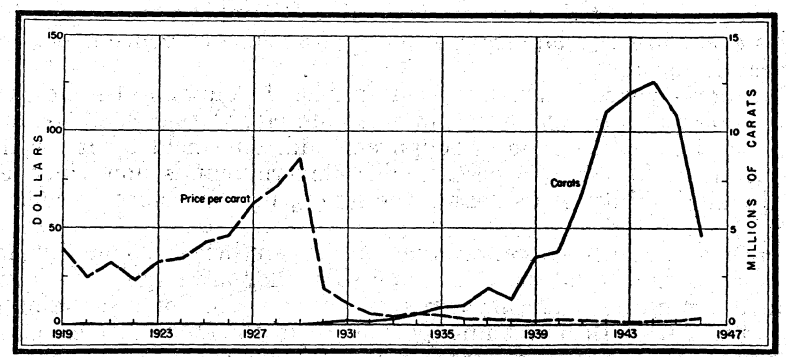

FIGURE 1.—United States imports and average price per carat of industrial diamonds, 1919–46.

Imports of industrial diamonds into the United States during the past 5 years were as follows:

Industrial diamonds (glaziers', engravers', and miners') imported for consumption in the United States, 1942–46

Year	Carats	Value		Year	Carats	Value	
		Total	Average			Total	Average
1942	11, 203, 704	$22, 057, 577	$1. 97	1945	10, 729, 869	$12, 810, 932	$1. 19
1943	12, 084, 133	21, 890, 568	1. 81	1946	4, 625, 282	14, 297, 536	3. 09
1944	12, 614, 507	22, 894, 244	1. 81				

RUBY, SAPPHIRE, AND EMERALD

Because of the dominant position of the diamond in the gem market and the fact that ruby, sapphire, and emerald deposits do not lend themselves to large-scale operations, gem mining by large companies is confined to the diamond. Fine rubies come from Burma; sapphires from Siam, Ceylon, Indochina, and Kashmir (according to rumor, the deposits in the latter two countries are practically exhausted), and emeralds from Colombia and U. S. S. R. Burma, Siam, and Indochina are none too peaceful at the moment, a condition scarcely conducive to large production. The Colombian emerald mines are not being operated, and the Ceylon sapphire production is still subnormal. Shipments from the mines are greater than in the past war years; but fine gems are in short supply, and jewelers' stocks and outmoded jewelry still contribute the major part of our supply.

793065—48——36

Fine gems are by no means modestly priced, and American buyers must compete with Oriental lovers of these gems.

Wadia and Fernando (see Bibliography) have written an interesting article on gem mining in Ceylon, an important producer of sapphire and many of the lesser gems.

Siam would welcome American capital in developing its gem resources, but so far there have been few candidates. Who will eventually own the sapphire deposits on the common boundary of Siam and Indochina is at the moment in doubt. Sapphires and even a few rubies occur in Brazilian gravels, but no known occurrence is of commercial importance.

During the year, the Bank of the Republic of Colombia (the Government hoping to interest tourists in emerald matrix) sold 828.75 carats of cut and 342,552 carats of rough emerald, long held by it for the Government, for 573,076 pesos. The Government is now considering the advisability of reopening the mines, inactive since December 1938.

Transvaal, South Africa, produces a few gem beryls, some of which are dark enough to be classed as emeralds; they are largely, however, of mediocre grade. The principal producer is the Somerset mine of the South Africa Beryl Mining Co. Most of the stones are exported to India. In the first quarter of 1946, 2,902 carats worth £1,433 (about $5,732, or $1.98 per carat) were sent to India.

It is reported that the American synthetics, "Chatham synthetic emeralds," are being improved in size, depth of color, and quality.[2]

LESSER GEMS

In 1946, there was a scarcity of desirable gem stones; due to this, plus higher cutting costs and good demand, prices advanced. In the last quarter of the year, prices softened, and particularly those of mediocre qualities fell.

In February 1946 new and rich opal fields were found at Coober Pedy, Central Australia, 1,200 miles from Adelaide.

Due to the inflation in China, the Chinese are investing in jade, and prices are 5 to 10 times those of prewar days. Shelves of the dealers are practically bare, and little is being exported to the United States. The jade centers of Peking and Canton are languishing, war having cut them off from the jadeite of Burma and the nephrite of Turkestan. As master cutters no longer receive imperial subsidies, the lapidary art is deteriorating.

The popularity of aquamarine continues to grow. The supply of fine Brazilian is inadequate, and prices still are rising. Late in October, an aquamarine weighing 56 pounds was flown from Brazil to New York. The stone was found near Resplendor, Minas Gerais. It is a rough, hexagonal prism, 11 inches high and 10 inches in diameter. The stone, it is claimed, was insured for $500,000, and the owners hope the cut stones from it will be worth $2,500,000. The Indian deposits of beryl have recently been described.[3] The Bisundni Mine, Rajputana, produces a little gem material of pale green color, as well as rose quartz,

[3] Bureau of Mines, Mineral Trade Notes: Vol. 22, No. 3, March 1946, pp. 4-9.

and the Vasanta Kalyani mica mine, Madras, some beryl suitable for gem purposes.

The precious stone industry of Brazil is, under government patronage, to create a Precious Stone Exchange. Among the objects are to assist diamond mining, protect cutters, reduce taxes on precious stones, and simplify exporting. Before World War II, Brazil exported most of its precious stones to the Idar district, Germany. During the war, lapidary shops sprang up in Brazil. Attempts are now being made to introduce modern methods in these shops.

Emerson I. Brown, minerals attaché at the United States Embassy in Rio [4] gives an interesting summary of the precious stone industry in Brazil. He states that supply exceeds demand, the American market being dull, although the European market is becoming active. Export prices are off as much as one-third.

Edward R. Swoboda describes the spodumenes of Brazil (see Bibliography). While most of the material is colorless, kunzite and yellow spodumene also occur, and rarely deep green spodumene.

Philip Lichtenberg [5] describes the mica-tourmaline deposit of Cruzeiro, Minas Gerais, which he says is the most important producer of tourmaline in Brazil.

Some fine olivines have appeared on the American market from stocks of the mining company that once operated the well-known deposit on Zebirget Island in the Red Sea.

The Soviet Government, under the current 5-year plan, is to increase notably the production of its lapidary trust, Russkie Samotsvety. Sverdlovsk and a town in the Altai are cutting centers, and the personnel is to be increased. The production of the lesser gems and ornamental stones is to be raised, and objets d'art and stones for jewelry cut.

The French are attempting to revive the gem-mining industry of Madagascar, an important producer of gems for jewelry as well as industrial applications. Mining taxes were reduced as of June 2, 1945. Madagascar produces a large number of gem stones, but the percentage suitable for cutting is small, most of them being used industrially.

E. Ruff [6] describes the large number of gem stones which occur in New Zealand. Jade (nephrite) alone is, however, of commercial importance.

Before World War II, South-West Africa was an important source of gem stones for the German lapidary industry. In 1939, the last year of export to Germany, the total value was but £1,132.

GENERAL SUMMARY

UNITED STATES mine production of gold in 1946 increased 65 percent compared with 1945; but, except for the war years, 1943–45 output was the smallest since 1885. Silver output declined 21 percent in 1946 and, except for 1932, was at the lowest point since 1872. The gold-mining industry had returned to unrestricted operations when War Production Board Order L–208 was rescinded, effective July 1, 1945; but many mines, productive in the prewar years, did not resume work or did so on a restricted scale only. Higher prices for equipment and supplies and higher wages, combined with the difficulties of recruiting efficient labor forces, made former operators reluctant to reopen mines with narrow profit margins before the war. Moreover, in many instances the years of idleness had resulted in deterioration in plants and mine workings which called for very large capital outlays for rehabilitation. Gold production also was reduced in 1946 by prolonged strikes at base-metal mines; byproduct gold from such mines had been an important factor in sustaining output during the war years. In 1945 slightly over half of the gold output was recovered from base-metal ores, but in 1946 base-metal ores accounted for 23 percent, placers 38 percent, and dry ores 39 percent.

The continued decline in silver output resulted largely from the long strike-enforced idleness at base-metal mines where most of the country's silver is derived as a byproduct. Labor strikes at copper and lead smelters, where much silver is recovered, were likewise adverse factors in silver production.

California regained first place as a gold producer from Utah, which sank to fourth place. Second and third places in 1946 were occupied

by South Dakota and Alaska, respectively; these and California supplied 57 percent of the United States output. The three leaders depended very largely on straight gold mines, both lodes and placers. The four leading silver States—Idaho, Utah, Montana, and Arizona—produced 75 percent of the domestic mine silver.

The recovery of gold was divided fairly evenly among placer methods, amalgamation-cyanidation mills, and smelting of crude ores and concentrates, only a very small part of which was recovered by the direct smelting of ore. Almost 82 percent of the domestic silver output was recovered by the smelting of concentrates and nearly all of the remainder by the direct smelting of ore.

Gold production outside the United States increased slightly in 1946 compared with 1945 largely because of estimates of Russian output reflecting a belief in postwar recovery there. Silver output outside of the United States declined proportionately less than in the United States. Labor difficulties, particularly in the Union of South Africa, hampered full operation. In that country, however, deep drilling at Odendaalsrust, 150 miles southwest of Johannesburg, cut very rich ore early in 1946. Predictions of greatly extended life for a large gold-mining industry were freely made, and a boom of major proportions in gold-mining shares developed.

Owing to restrictions on the international movement of gold and silver and the measures taken by governments to stabilize the exchange value of currencies, gold and silver lost much of their monetary significance. The eagerness of individuals to acquire the metals, however, appears to have increased, particularly where the monetary regulations were the most arbitrary. The press reported very high prices for both metals in a number of foreign markets. These prices were sustained, however, by various government regulations that restricted the movement of metals to markets and the conversion of proceeds of sales to the national currency of the seller. Moreover, some of the reported trading was conducted in black markets. Reports of high prices for gold led some domestic producers to advocate regulations under the Gold Reserve Act that would permit the free export of gold. Free export, however, would not insure profitable access to foreign markets because foreign gold import laws in most, if not all instances, provided that the gold be received by the foreign treasury or state bank; the price to be paid for it when exchanged was not to exceed $35 a fine ounce.

The Treasury buying price for gold continued at $35 per fine ounce throughout 1946; but the buying price for silver which had stood at $0.7111+ since July 1, 1939, was raised for metal produced domestically after July 1, 1946, to $0.905 where it remained for the remainder of the year. The price for silver that could not qualify for Treasury purchase was held at $0.7111+ by Office of Price Administration ceiling until July 1 and was placed under a ceiling of $0.905 shortly after OPA was reestablished late in July. By the end of the year, however, the New York "official" price for 0.999 fine silver had declined to $0.8375.

The outflows of gold since 1944 and of silver since 1943 were reversed in 1946, when the movements in these metals resulted in substantial gains in United States supplies.

Salient statistics of gold and silver in the United States,[1] 1942-46

	1942	1943	1944	1945	1946

LEGISLATION AND REGULATIONS

Silver was the subject of some new legislation and Government regulation during 1946, but gold was substantially unaffected. The Green Act, which permitted the sale of Treasury silver at 71.11+ cents an ounce for use in the arts and industries, expired December 31, 1945, and was not extended. The Office of Price Administration maintained the price ceiling at 71.11+ cents—the Treasury buying price for domestically mined silver. On July 1 the OPA expired, but a free market for silver was slow to develop. By July 26, when OPA was reestablished, the price of silver had reached 90⅝ cents. On July 31 the President approved an act amending the Silver Purchase Act of 1939 that raised the price paid by the Treasury for silver domestically mined after July 1, 1946, from 71.11+ to 90.5 cents an ounce. This act also provided for sales of Treasury silver for use in the arts and industries at prices not lower than 90.5 cents. The OPA raised its ceiling on silver price to permit sales at the higher price. Silver was freed from OPA price control by a Price Administrator order November 10, 1946.

INTERNATIONAL MONETARY AGREEMENTS

The agreements formulated by the representatives of 44 nations at Bretton Woods, N. H., in July 1944 had been ratified by enough governments during 1945 so that two of the most important institutions created—the International Monetary Fund and the International Bank for Reconstruction and Development—came into existence on December 27, 1945. During 1946 staffs were recruited and capital collected for these organizations. On December 18, 1946, the Fund took an important step toward world currency stability by announcing initial par values, in terms of United States dollars, of the currencies of 32 countries and 52 other areas. In fixing these exchange rates the Fund Agreement requires that "the par value of the currency of each member shall be expressed in terms of gold as a common denominator or in terms of the United States dollar of the weight and fineness in effect on July 1, 1944" (art. IV, sec. 1). The disturbed state of international finance is recognized in the following statement of the executive directors of the Fund, quoted from its First Annual Report:

> We recognize that in some cases the initial par values that are established may later be found incompatible with the maintenance of a balanced international payments position at a high level of domestic economic activity. * * * * When this occurs, the Fund will be faced with new problems of adjustment and will have to recognize the unusual circumstances under which the initial par values were determined. It is just at such times that the Fund can be most useful in seeing that necessary exchange adjustments are made in an orderly manner and competitive exchange depreciation is avoided.

The National Advisory Council Report on Participation of the United States in the Fund and International Bank to October 31, 1946, submitted to the Congress by the President, concludes:

> The Bank and the Fund have now concluded the preliminary phase of their work. The necessary machinery has been set up. The recruitment of staff on a broad international basis is progressing satisfactorily. The Executive Directors have chosen able men as President of the Bank and Managing Director of the Fund. The Bank has called for payment of the member subscriptions to its paid-in capital, and should soon be ready to float securities and make loans. The Fund has announced that it will shortly be in a position to begin exchange operations and has asked the members to communicate the par values of their currencies. It is expected that the Fund will reach agreement with most members on the initial par values of their currencies. In view of the difficult problems which the new organizations have had to face, they have made satisfactory progress in carrying out the plans formulated at Bretton Woods.
>
> From the point of view of the United States, the actions taken and policies adopted by the Bank and the Fund are, in the opinion of the National Advisory Council, satisfactory. On most issues there has been substantial unanimity on the part of the representatives of the member countries. Differences of view have been reconciled by agreement after full discussion in the Boards of Executive Directors. The United States representatives on the Bank and Fund Boards have kept the Council fully informed of all important matters, and have ably represented the American point of view in the international institutions. The good working relations between these representatives and the Council have assured effective implementation of the policies established by the Congress in the Bretton Woods Agreements Act.

DOMESTIC PRODUCTION

Production of gold and silver in the United States is measured at mines and at refineries. Both measures are tabulated by States of origin, but there is a small annual variation between them explained

largely by time lag. Over a period of years the deviations are found to be negligible. Compared with the mine reports compiled by the Bureau of Mines, the refinery reports compiled by the Bureau of the Mint in cooperation with the Bureau of Mines for the 42 years, 1905–46, show a total excess of gold of 186,841 ounces (a difference of 0.13 percent) and a total excess of silver of 11,666,933 ounces (a difference of 0.50 percent).

Gold and silver produced in the United States, 1905–46, in fine ounces, according to mint and mine returns, in terms of recovered metals

Year	Mint		Mine	
	Gold	Silver	Gold	Silver
1905–41	136, 905, 240	2, 167, 735, 394	136, 733, 836	2, 156, 655, 810
1942	3, 741, 806	56, 090, 855	3, 615, 836	54, 321, 962
1943	1, 394, 522	40, 900, 121	1, 377, 579	41, 486, 897
1944	1, 022, 238	35, 651, 049	998, 394	34, 473, 540
1945	928, 893	29, 063, 255	968, 062	29, 024, 197
1946	1, 462, 354	21, 103, 269	1, 574, 505	22, 914, 604
Total	145, 455, 053	2, 350, 543, 943	145, 268, 212	2, 338, 877, 010

MINE PRODUCTION

During the years 1943–45, for the first time on record, over one-half of the domestic gold output was recovered from base-metal ores, but in 1946 both dry ores and placer gravels exceeded base-metal ores in yield of gold. This shift in source of gold resulted partly from re-establishment of production at gold mines (1946 was the first full year of operation free of the restrictions of WPB Order L–208) and partly from prolonged labor strikes that suspended operations at a number of base-metal mines which supply much byproduct gold. WPB Order L–208 had been rescinded effective July 1, 1945, but revival of the gold-mining industry progressed slowly because of high wages, difficulties in recruiting labor forces, and high prices for equipment and supplies, whereas the price of gold remained unchanged. Production during 1946 was less than one-third of the all-time peak established in 1940.

Silver production, which had declined uninterruptedly during the war, reached a new low in 1946, when it dropped to 22,914,604 ounces or to less than in any year (except 1932) since 1872. The labor strikes at copper and lead mines and smelters, where much byproduct silver is recovered, were a major factor in the low output. An analysis of silver production by ores shows that over three-fourths was recovered from base-metal ores in 1946. Moreover, all of the silver recovered at placers and part of that produced from dry ores were byproducts of operations carried on chiefly for gold.

All tonnage figures used in this report are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. Figures in cubic yards used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before excavation. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated upon the basis of recovered and recoverable fine gold and silver shown by assays to be contained in

ore, bullion, and other material produced. Prices of gold and silver are discussed in a later section of this report.

Mine production of gold and silver in the United States, in 1946, by months, in fine ounces

	Gold	Silver		Gold	Silver
January	95,012	1,937,384	August	172,105	2,219,247
February	87,086	1,667,612	September	189,388	2,145,433
March	96,437	1,666,547	October	161,551	2,139,636
April	92,803	1,299,148	November	152,179	2,238,432
May	115,263	1,418,058	December	155,698	2,825,764
June	113,717	1,445,204			
July	143,266	1,912,139	Total	1,574,505	22,914,604

Mines are grouped into two main classes—placers and lodes. The placers are those in which gold and silver in natural alloy and, in a few placers, platinum are recovered from gravel. Except for such small-scale hand methods as those utilizing the gold pan, the rocker, or the dry washer, all recovery methods employ sluice boxes; methods are distinguished by the means used for delivering the gravel to the sluices. Those methods where gravel is delivered mechanically include connected-bucket dredging, dragline dredging, and treatment in non-floating washing plants of gravel delivered by power shovel, dragline excavator, truck, slackline scraper, or other mechanical means. In the hydraulic method the gravel is mined from the bank by a powerful jet of water; in some small-scale hand methods the gravel is shoveled into sluices; and in drift operations the gravel is mined underground and delivered to sluices at the surface. The lode mines are those yielding gold and silver from ore (as distinguished from gravel), mainly from underground workings and, in addition to those worked chiefly for one or both of the precious metals, include those that yield ore mined chiefly for copper, lead, zinc, or other metals, but contribute the precious metals as byproducts. As far as possible, the mine unit used is not the operator but the mining claim or group of claims.

PRINCIPAL MINING DISTRICTS AND LEADING MINES

One of the anomalies of the war economy was the emergence of a copper district—West Mountain (Bingham), Utah—as the leading gold producer in the United States, surpassing Lawrence County (Lead), S. Dak., in 1943, 1944, and 1945. In 1946, however, Lawrence County regained the lead. The prolonged labor strikes at the mines of the West Mountain district had as much to do with this exchange of places on the list of leading gold districts as did the progressively expanding production of the Lawrence County mines. More than one-third of the domestic mine output was mined in the three leading districts in 1946.

The leading silver districts for many years have included many more noted for base-metal output than silver yield, and this condition was unchanged in 1946.

Mine production of recoverable gold in the United States by districts that produced 10,000 fine ounces or more during any year, 1942–46, in fine ounces [1]

[1] Exclusive of Alaska.
[2] Bureau of Mines not at liberty to publish.

Of the 25 leading gold-producing mines, 9 were placers worked by connected-bucket dredges, 8 lode gold mines, and 5 base-metal mines; 3 produced more than one type of ore. The 3 leading mines contributed one-third of the total gold produced in the United States in 1946; the 9 leading mines accounted for over one-half; and the list of 25, 64 percent.

Only 4 of the 25 leading silver-producing mines depended exclusively on silver ore; ores valuable chiefly for copper, lead, zinc, and gold accounted for most of the silver production. The 5 leading mines contributed 26 percent of the total silver produced in the United States in 1946; the 10 leading mines, 39 percent; and the list of 25, 60 percent. As several operators worked more than one of the leading silver mines as well as smaller producers, the output of silver by companies was substantially more concentrated than by mines.

[1] Eastern States figures are peaks since 1896, except New York and Pennsylvania which are peaks since 1905. The Illinois figure is the peak since 1907. Alaska, California, Nevada, and Oregon are peaks since 1880.

[2] Revised figure.

[3] Includes a small quantity by New Hampshire.

ORE PRODUCTON, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

The following tables give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that yielded gold and silver in the United States (excluding the Philippine Islands and Puerto Rico) in 1946. These tables were compiled from the individual State chapters in this volume, in which more detailed data are presented.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and smelter recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in recovery of metals and the lowering of grade of complex ores treated, accomplished by improved mill concentration processes. A "dry" ore is one that carries so little base metal that by itself it would not satisfy the requirements for a smelter charge as in either lead or copper smelting. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present); or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; an ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) range from 16 to 45 percent zinc; zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated. The smelter classification applies to concentrates.

Ore produced in the United States and average recovery, in fine ounces, of gold and silver per ton in 1946 [1]

[1] Illinois, Missouri, Philippine Islands, and Puerto Rico excluded.
[2] Excludes gold and silver recovered from mill clean-up; no ore mined.
[3] Excludes pyritic ore used for acid manufacture and tungsten ore and gold and silver recovered from these materials.
[4] Includes 92,072 tons of lead smelter slag.
[5] Includes 55,458 tons of old lead smelter slag fumed and 232 tons of old lead smelter slag smelted.
[6] Includes 83,117 tons of zinc slag.
[7] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

Gold, gold-silver, and silver ores containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed ores are called "dry" ores regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly, the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes it name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry ores" thus, by elimination, include ores, chiefly siliceous, valuable for their gold and silver content and, in some instances, for their fluxing properties, regardless of method of treatment. Dry gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made on a basis of value, using the rule that the bimetal classification is not used unless the metal of lower value equals or exceeds one-quarter of the combined value of the gold and silver.

The lead, zinc, and zinc-lead ores in most districts in the Eastern and Central States carry no appreciable quantity of gold or silver; such ores are excluded from this report unless otherwise indicated.

[1] Illinois, Missouri, Philippine Islands, and Puerto Rico excluded.
[2] Includes gold and silver recovered from mill clean-up.
[3] Comprises 303,777 tons of sand and slimes from ore first roasted and amalgamated and 1,958 tons of selective-flotation tailings.
[4] Includes 1,110 tons of flotation concentrates cyanided.

PLACERS

Most of the placer gold output is obtained from gravels handled by connected-bucket floating dredges. In 1946 this method accounted for 80 percent of the total output from placers in the United States compared with 84 percent in 1945 and 83 percent in 1944. The quantity of gold recovered by dredges from the inception of the industry as a commercial factor in 1896 to the end of 1946 is recorded as 19,910,593 ounces, originating by States as follows: California, 12,031,837 ounces; Alaska, 5,386,617 (including the production from single-dipper dredges and some gold by hydraulicking); Montana, 739,034; Idaho, 631,312; Oregon, 484,602; Colorado, 473,182; other States, 164,009.

The accompanying table shows the gold produced in the United States by connected-bucket floating dredges in 1942–46.

Additional information on placer mining may be found in the State reviews in this volume.

Gold produced in the United States by connected-bucket floating dredges, 1942–46, in fine ounces

Year	Number of dredges	California	Alaska	Other States [1]	Total
1942	102	310,937	249,868	128,264	689,069
1943	21	66,999	18,554	24,373	109,926
1944	17	64,925	26,280	10,774	101,979
1945	36	88,318	34,885	31,269	154,472
1946	73	244,679	148,834	76,632	470,145

[1] Colorado, Idaho, Montana, Nevada, and Oregon.

REFINERY PRODUCTION

Figures in the following table were obtained through cooperation between the United States Bureau of the Mint and the Bureau of Mines. The State totals are based upon bullion deposits in the United States mints and assay offices and upon returns to the Bureau of the Mint from smelting and refining companies. The State distribution is adjusted further by the Bureau of Mines from its geographical records of sources and production (both historical and current) from the producing mines and is tabulated from the mine reports. The data for the total production and in part for the distribution are obtained from records of (1) the unrefined domestic gold and silver deposited in the United States mints and assay offices; (2) the domestic gold and silver in fine bars reported by private refineries, supplemented by data of content of unrefined mattes, blister copper, copper anodes, and lead bullion; and (3) the unrefined domestic gold and silver contained in ore and matte exported for reduction. The last item is small.

Gold and silver produced in the United States,[1] 1942–46, and approximate distribution of source, by States and Territories, in 1946, in fine ounces

[Refinery figures supplied by U. S. Bureau of the Mint]

State or Territory	Gold	Silver

Gold and silver produced in the United States, 1792–1946 [1]

Period	Gold		Silver	
	Fine ounces	Value [2]	Fine ounces	Value [3]
1792–1847	1,187,170	$24,537,000	309,500	$404,500
1848–1873	60,021,278	1,240,750,000	146,218,600	193,631,500
1874–1946	214,766,542	5,114,368,745	3,765,589,843	2,811,484,112
Total	275,974,990	6,379,655,745	3,912,117,943	3,005,520,112

[1] From Report of the Director of the Mint. The estimates for 1792–1873 are by R. W. Raymond, Commissioner of Mining Statistics, Treasury Department, and since then, by the Director of the Mint.
[2] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto, at $20.67+ per fine ounce.
[3] Silver valued in 1934 and thereafter at Government's average buying price for domestic product.

CONSUMPTION AND USES IN INDUSTRY AND THE ARTS

Monetary use has claimed by far the largest part of the gold and silver output through the years, but this use to a large extent takes the form of stock-piling in Government and private hoards which are available to industry and the arts without smelter or refinery preparation. In contrast, the gold and silver entering industry and the arts are consumed much as are other metals, any return as secondary metal requiring the usual channels of collection, smelting, and refining. The consumption of gold and silver in the arts antedates written history,

but industrial use of these two metals is a comparatively recent development.

Gold.—The arts require a much larger quantity of gold than does industry, but its corrosion-resistant and other properties have resulted in some industrial demand. Consumption in the arts increased rapidly during the war. A high marriage rate and widespread prosperity have increased the sale of jewelry, watches, and many luxury items made from gold.

A most interesting new use for gold was reported during 1946 in connection with spectrography. In spectrographic work the mercury lines have been widely used for reference, but because natural mercury is made up of six or seven isotopes the lines are not sharply defined. Recent atomic physics has effected the transmutation of gold to mercury; because native gold has no prominent isotopes, the mercury thus created is preeminently a single isotope, and its spectrographic lines are very sharp. The dream of the alchemists, but in reverse, thus has been realized in this boon to spectrographers.

Net industrial consumption of gold and silver in the United States, 1942–46

[U. S. Bureau of the Mint]

Year	Gold (dollars)			Silver (fine ounces)		
	Returned from industrial use	Issued for industrial use	Net industrial consumption	Returned from industrial use	Issued for industrial use	Net industrial consumption
1942	$28,447,685	$75,742,495	$47,294,810	30,020,529	131,419,224	101,398,695
1943	10,521,000	96,864,353	86,343,353	44,112,863	162,112,863	118,000,000
1944	25,678,940	122,977,223	97,298,283	56,189,409	176,289,409	120,100,000
1945	30,991,905	139,936,237	108,944,332	58,360,767	184,660,767	126,300,000
1946	45,999,837	199,686,837	153,687,000	36,646,860	123,646,860	87,000,000

Silver.—The 1946 consumption of silver in industry and the arts was well below that in the preceding war years but nevertheless was greatly above the prewar level. The consumption exceeded any annual output ever achieved by domestic mines. Moreover, consumption would probably have been larger had it not been for the difficulty in obtaining supplies during the first half of the year. Until its expiration, December 31, 1945, the Green Act made Treasury silver available to domestic silver consumers at the ceiling price set by the OPA of 71.11+ cents an ounce. When the Green Act was not renewed, the consumers had to enter a controlled market where the OPA barred transactions at prices exceeding the 71.11+-cent ceiling. Domestically produced silver was available at the ceiling price but could not supply much more than about a quarter of the demand. Foreign suppliers, foreseeing the possibilities of a higher price, withheld their silver. Very large purchases from the Treasury in November and December 1945 under the Green Act helped to meet the needs but some users were driven to the use of monetized silver at $1.29+ an ounce. Meanwhile, a contest developed in Congress between those advocating a reenactment of the Green Act and those who favored pricing silver at $1.29+ an ounce, the coinage value. The situation was resolved in an act requiring the Treasury to buy silver domestically mined after July 1, 1946, at 90.5 cents an ounce and permitting

the Secretary of the Treasury to sell silver for the domestic arts and industries at not less than 90.5 cents an ounce. With approval of the act, July 31, 1946, the situation immediately rearranged itself. The OPA raised its ceiling to 90.5 cents, and consumers were able to satisfy all needs from domestic silver mined before July 1 and from imported silver. Only 4,889 fine ounces were purchased from the Treasury under the act during 1946.

Widespread prosperity and a high marriage rate sustained the demand for sterling and plated silverware, jewelry, watch cases, church articles, pens, pencils, and other items largely in the luxury class. Consumption was large in photography, particularly for motion pictures. The industrial uses of silver had grown greatly during the war and continued to absorb much silver in 1946.

MONETARY STOCKS

Gold holdings of the United States rose $464,000,000 (2 percent) from $20,065,000,000 on January 1, 1946, to $20,529,000,000 on January 1, 1947, according to the Federal Reserve Bulletin. Total world reserves are not positively known, inasmuch as data are not available from some countries, including the United Kingdom, Germany, Italy, Japan, Australia, and U. S. S. R. Currency stabilization funds secretly held add to the difficulties in reaching an approximation. However, the Federal Reserve System estimates the total at about $35,000,000,000, of which almost 59 percent is held by the United States.

Foreign gold reserves increased rapidly after the United States entry into the war late in 1941, largely because United States war purchases abroad so greatly exceeded commercial exports in value. During the war period foreign reserves increased nearly $5,000,000,000, and United States reserves decreased over $2,500,000,000. Sharing prominently in the increase were Switzerland, Sweden, Turkey, Iran, Spain, Union of South Africa, and Latin American countries. In 1946, however, there was a reversal in the direction of the flow of gold; United States net imports for the year were one-third the world output.

United States Treasury silver holdings declined 54,662,096 fine ounces during 1946 to 1,950,520,136 ounces, principally because of large releases in the form of coin. Not included in the holdings are 410,814,344 ounces released under lend-lease agreements that provide for return of the silver.

PRICES

Since January 1934 the price of gold at the United States Mint has been $35 per fine troy ounce. The price of domestic silver mined after July 1, 1939, was fixed at $0.711+ per ounce on July 6, 1939; on July 31, 1946, the President approved an act (Public Law 579, 79th Cong.) which provided that the seigniorage to be deducted for silver mined after July 1, 1946, and delivered to the Treasury be reduced from 45 percent to 30 percent. The effect was to raise the price of domestically mined silver to 90.5 cents an ounce.

According to the Director of the Mint, the following prices for silver prevailed in London and New York (exchange-free-New York

on London, $4.030 in 1945 and $4.033 in 1946) in 1945 and 1946: London price, per ounce, 0.999 fine, January to August 1945, 25.5d. when the price became unsettled; on September 24 the London price was raised to 44.0d., which prevailed through August 5, 1946, when it was again raised to 55.5d. for the remainder of the year; New York price, per ounce, 0.999 fine, January to August 1945, 44.75 cents; September 1945 to June 1946, 70.75 cents; thereafter, because of the lapse of price control on July 1 followed by its revival July 26 and the passage of the new silver purchase act July 31, the price fluctuated widely. From July 31 until early in December the price (with one brief lapse on October 3) remained at 90⅞ cents. In December the price declined to 84 cents on December 26, where it remained for the rest of the year.

FOREIGN TRADE[1]

The excesses of exports over imports of both gold and silver in 1945 were replaced by excesses of imports over exports in 1946. The gains from imports plus the output from domestic mines greatly exceeded consumption in the arts and industries in the case of gold, and thus gold monetary stocks increased. Consumption of silver, however, was nearly twice the supply from mine output plus net imports, with the result that stocks were drawn upon.

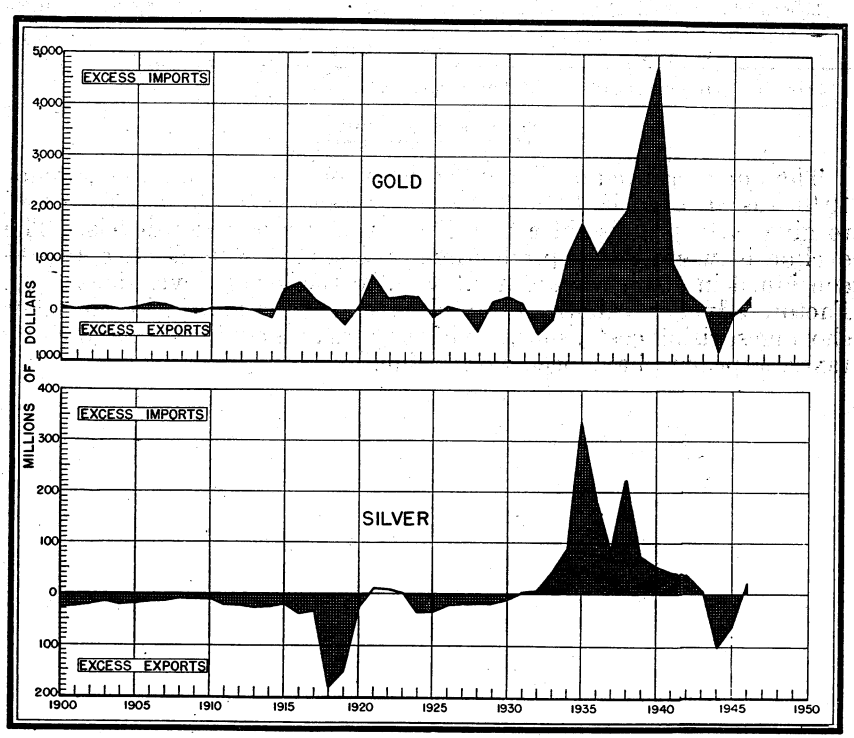

FIGURE 1.—Gold and silver imports and exports, with net movements, 1900–1946.

WORLD REVIEW

The uninterrupted decline in world output of gold in progress since 1940 was arrested in 1946, but the increase over 1945 was too small to give early promise of a return to prewar production levels. The decline in world silver production—also uninterrupted since 1940—continued in 1946, when output sank to the lowest level since 1889. Factors adverse to both gold and silver production, including labor shortages, rising costs, shortage of supplies and equipment, and rising taxes, appear to have been world-wide.

World total [1 5]	250,000,000	217,100,000	186,200,000	157,300,000	129,000,000

[1] Silver is also produced in British Malaya, Bulgaria, Greece, Hong Kong, Poland, Sarawak, Sierra Leone, South-West Africa, Turkey, U. S. S. R., and Yugoslavia; production data are not available, but estimates are included in totals for 1942–44.
[2] Excludes Republic of the Philippines.
[3] Imports into the United States. Scrap is included in this figure in many instances, most notably in the case of Cuba.
[4] Data not available; estimate included in total.
[5] Estimate.
[6] Data represent areas designated as Free China during the period of Japanese occupation.
[7] Preliminary data for fiscal year ended March 31 of year following that stated.
[8] South Korea only.
[9] Exports.
[10] Recovered from Nkana mine refinery slimes accumulated during the war.
[11] Includes New South Wales, Northern Territory, Queensland, South Australia, Tasmania, Victoria and Western Australia.
[12] Fiscal year ended May 31 of year stated.

CANADA

After an uninterrupted decline since 1941, Canadian gold production increased slightly in 1946 compared with 1945. Silver output, however, which had decreased annually since 1940, continued its downward trend, reaching 12,676,928 fine ounces in 1946. Silver production was the lowest since 1906. Output of gold in 1945 and 1946, distributed by Provinces, was as follows:

Province or Territory:	*1945 (fine ounces)*	*1946 (fine ounces)*
Alberta	7	105
British Columbia	186,854	123,348
Manitoba	70,655	78,732
Northwest Territories	8,655	19,738
Nova Scotia	3,291	4,579
Ontario	1,625,368	1,835,887
Quebec	661,608	586,231
Saskatchewan	108,568	112,000
Yukon	31,721	47,023
Total	2,696,727	2,807,643

MEXICO AND CENTRAL AMERICA

Mexico.—Mexico's long record as the world's leading silver producer continued in 1946, despite an uninterrupted decline in output since 1942 due largely to unstable labor conditions and a serious deterioration of rail facilities. Gold output in Mexico experienced a decline paralleling that for silver.

Honduras.—Honduras, the leading silver producer in Central America, derived most of its output in 1946 from the Rosario group near Tegucigalpa. Total production of both gold and silver declined in 1946 compared with 1945.

793065—48——38

Nicaragua.—Nicaragua continued to be the leading gold producer in Central America despite a substantial decline in output in 1946 compared with 1945.

SOUTH AMERICA

Brazil.—Gold output in Brazil in 1946, as for many preceding years, was centered in Minas Gerais, where the St. John d'El Rey Mining Co. was by far the most important producer.

Colombia.[2]—Higher operating costs and difficulties in obtaining machinery, particularly dredging equipment for the gold-platinum placers, have proved adverse factors in the Colombian gold industry, with the result that the decline in gold production begun in 1942 continued in 1946.

Peru.—Peru continued to produce over half the silver in South America. The local silversmithing industry based on Inca designs has expanded rapidly since 1941. Wrought silver was exported to Venezuela, the United States, Panama, the Canal Zone, Brazil, and many other countries.

AFRICA

Union of South Africa.—The level of gold output was nearly sustained in the Union of South Africa in 1946. Rising costs at Rand mines reduced profits and caused the suspension of some operations. The following data prepared by the Transvaal Chamber of Mines compare mining results in 1944, 1945, and 1946:

	1944	*1945*	*1946*
Ore milled (tons)	58, 504, 400	58, 897, 600	56, 927, 500
Gold recovered (fine ounces)	12, 277, 228	12, 213, 545	11, 917, 914
Gold recovered (dwt. per ton)	4. 039	3. 997	4. 024
Working revenue	£99, 623, 168	£101, 847, 382	£99, 249, 814
Working revenue per ton	34s 1d	34s 7d	34s 10d
Working cost	£66, 681, 942	£69, 941, 061	£72, 920, 881
Working cost per ton	22s 10d	23s 9d	25s 7d
Working cost per ounce	112s 11d	118s 10d	127s 4d
Working profit	£32, 941, 226	£31, 906, 321	£26, 328, 933
Working profit per ton	11s 3d	10s 10d	9s 3d
Dividends	£13, 617, 895	£13, 056, 263	£13, 406, 349

The figures for total gold recovered include 463,499 ounces in 1944, 443,641 ounces in 1945, and 455,634 ounces in 1946 from miscellaneous producers not embodied in other data. The dividend figures include intercompany payments; the net dividends were £13,058,422 in 1944, £12,505,386 in 1945, and £12,811,101 in 1946.

Labor difficulties were reported during 1946; several strikes occurred but none was extensive and prolonged. Increasing concern was expressed by local leaders in the industry about the future labor conditions both for white and colored workers. Against the discouraging outlook for labor and the exhaustion of old mines were the developments in the Far West Rand and the very rich diamond-drill core from a hole drilled near Odendaalsrust, 150 miles southwest of Johannesburg.

[2] Cathcart, James K. Résumé of Gold Mining in Colombia: Bureau of Mines Mineral Trade Notes, Special Suppl. 11, Dec. 20, 1946, 19 pp.

South of the Witwatersrand outcrops which pass through Johannesburg in an east-west direction and across the Vaal River in the Orange Free State is a large area where the older rocks, including the gold-bearing conglomerates of the Witwatersrand system, are covered unconformably by the younger flat-lying Karoo system. Before the outbreak of war in 1939 geophysical surveys had been carried on to determine where the Karoo cover was thin and where the underlying rocks showed the low density characteristic of the Witwatersrand system. A number of holes had been drilled, and gold-bearing conglomerate beds had been encountered.[3] With the end of hostilities, exploration was resumed, and in April 1946 an extremely rich strike was made. It was announced in the following official statement issued by the Anglo American Corp. on behalf of the Western Holdings and Blinkpoort Cos.:

> About five miles south-east of Odendaalsrust, Geduld Hole No. 1, situated on the boundary between Geduld No. 697 and Friedesheim No. 511, which is being drilled for joint account by Blinkpoort Gold Syndicate and Western Holdings, has intersected the Basal Reef at a depth of 3,922 ft., with a true width of 18.4 in. assaying 1,252 dwt. per ton, which is equivalent to 23,037 in.-dwt. Above this intersection, at a depth of 3,853 ft. 6 in., an upper reef was encountered which assayed 5.14 dwt. over 28 in., equivalent to 144 in.-dwt. In view of the special importance of this basal reef intersection the Boards of the two interested companies have decided to publish this result immediately.

A huge stock-market boom resulted from the latter developments. The Orange Free State drilling and development work, however, had not advanced by the end of 1946 to a point where substantial tonnages of ore are blocked out.

ASIA

Burma.—Reports from the Bawdwin mine, the leading silver producer of Asia in prewar years, indicated that substantial output would require several years for reestablishing transportation facilities, recruiting a labor force, and rehabilitating the mine and surface plant.

OCEANIA

Australia.—The decline in gold output of the Commonwealth of Australia in progress during the war was arrested in 1945, and in 1946 a substantial increase took place. High costs and labor shortages impeded the revival, however. Although gold-production data for New Guinea are not available, this area promises soon to regain its prominence as a source of gold.

[3] Frost, A., McIntyre, R. C., Papenfus, E. B., and Weiss, O., The Discovery and Prospecting of a Potential Gold Field Near Odendaalsrust in the Orange Free State, Union of South Africa: Jour. Chem. Met. and Min. Soc., South Africa, vol. 47, No. 3, September 1946, pp. 107–141.

Gypsum

By CHARLES L. HARNESS AND M. G. DOWNEY

GENERAL SUMMARY

TO SERVE reviving construction demands, the gypsum industry in the United States produced and imported 7,086,538 short tons of gypsum in 1946, a new record. Mine output reached 5,629,398 tons, nearly equal to the production record of 5,678,302 tons established in 1925. Imports were 1,457,140 tons. The total supply was 10 percent above the previous record set in 1926 and 64 percent above 1945.

Salient statistics of the gypsum industry in the United States, 1942–46

	1942	1943	1944	1945	1946
Active establishments [1]	90	85	77	75	80
Crude gypsum [2]—

Gypsum and gypsum products—					
Imported for consumption	$508,321	$304,154	$394,603	$548,697	$1,833,088
Exported	$977,863	$283,720	$489,980	$1,502,668	$1,065,248

[1] Each mine, plant, or combination mine and plant is counted as 1 establishment.
[2] Excludes byproduct gypsum.
[3] Made from domestic, imported, and byproduct crude gypsum.

The building industry was profoundly influenced by the Veterans Emergency Housing Act, Public Law 388 of the 79th Congress, passed May 22, 1946. Under this law the Housing Expediter was empowered to control the various types of construction, with preferential treatment for veterans of World War II. Wilson Wyatt, Administrator of the National Housing Agency and the first Housing Expediter, planned to allocate materials for 1,200,000 residential "starts" in 1946, comprising 700,000 conventional houses, 250,000

temporary units, and 250,000 permanent prefabricated houses. This was to be followed by 900,000 conventional houses and 600,000 prefabricated houses in 1947. Despite discouraging shortages of labor and of nearly all types of the common building materials, 1,003,600 starts were actually made in 1946. Government construction agencies had estimated that total requirements of gypsum board and lath, including that for residential use, would be 3,431 million square feet during the year. Output was only 8 percent lower.

Price problems affected the gypsum industry in various ways in 1946. In the early part of the year there was a severe shortage of plaster retarder, which is made from hair, hoofs, and other slaughterhouse waste, but after meat was decontrolled, the retarder situation gradually eased. The prewar sales ratio of lath to board was about 2:1. However, during the past few years the proportion has been reversed, principally owing to two factors: First, under ceiling prices wallboard is said to have been a better profit item for the manufacturers, and second, the contractor can erect a house faster and cheaper with "dry-wall" construction, using board, than with "wet-wall" construction, using lath and plaster. Consequently, new residential construction now uses a great deal more wallboard than in former years. Plasterers, however, point out that a plastered wall is more permanent and has a more pleasing appearance, and it is expected that the prewar lath:board ratio eventually will reassert itself. Sheathing output also was very low because of low profit margins. Similarly, a shortage of "merchant liner" paper for making gypsum board and lath was relieved after the Housing Expediter, under authority of the Veterans Emergency Housing Act, offered premiums to manufacturers of liner paper to encourage production of this commodity (Premium Regulation 3, June 1, 1946).

Contractors holding HH priority ratings (veterans' residential projects) complained during the summer of 1946 that they were unable to obtain gypsum board. On September 1, 1946, the Civilian Production Administration ordered distributors to set aside 85 percent of their board receipts for the veterans' housing program, and during the remainder of 1946 the board supply for this use was reported much easier.

Gypsum cement retarder became rather tight in the summer of 1946, but later in the year the shortage was relieved.

DOMESTIC PRODUCTION

CRUDE PRODUCTION

Every major producing State showed an increase in 1946 as compared with the preceding year. The rising availability of labor and materials, coupled with a pent-up demand of many years standing, combined to stimulate output almost to the record level of 1925.

Active operations totaled 52, including 21 underground mines, 23 open quarries, and 8 mine-quarry combinations.

CALCINED PRODUCTION

The calcined production in 1946 was obtained from 50 active plants distributed through 23 States. Active calcining equipment in

these plants comprised 195 units, as compared with 176 in 1945. The average mill value of calcined gypsum, as reported by producers, was $7.02 per short ton, an increase of $1.20 over the 1945 value.

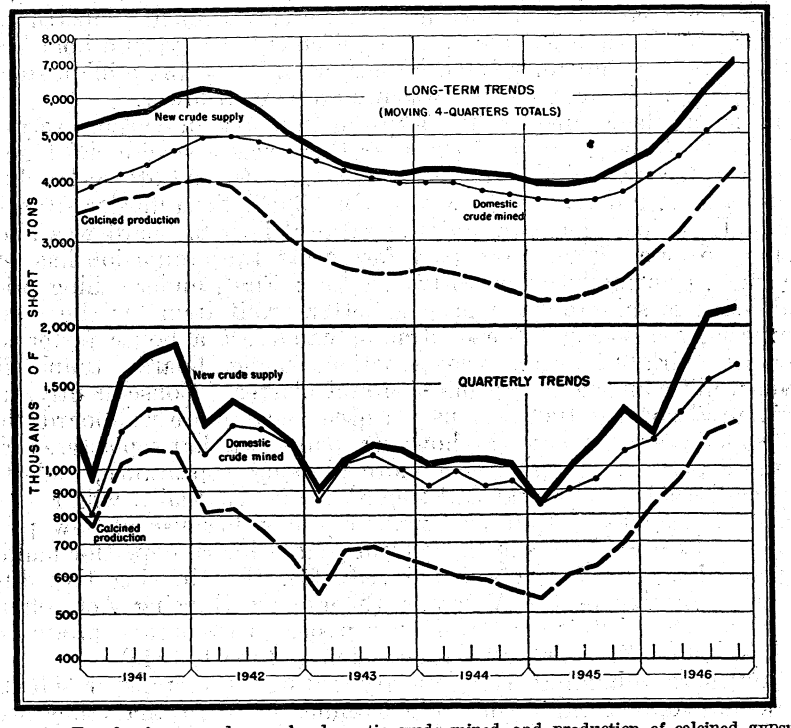

FIGURE 1.—Trends of new crude supply, domestic crude mined, and production of calcined gypsum, 1941–46, by quarters.

Crude gypsum mined in the United States, 1944–46, by States

[1] Includes rotary and beehive kilns, grinding-calcining units, and hydrocal cylinders.
[2] Calcining plants in 1944–46: 1 each in Connecticut, Indiana, Massachusetts, Oklahoma, and South Dakota; 2 each in Colorado, Kansas, Montana, Nevada, Ohio, Utah, and Virginia. In addition—1944: 1 each in Florida and Vermont, and 2 in New Jersey; 1945: 1 each in Georgia and New Jersey; 1946: 1 each in Florida, Georgia, New Hampshire, New Jersey, Pennsylvania, and Wyoming.

CONSUMPTION AND USES

Of the products sold, building materials made the largest gains. Portland-cement retarder was up 71 percent, base-coat plasters 135, and lath 91 percent. Large increases were also noted for the other plasters and boards, except sheathing and laminated board. Price difficulties inhibited sheathing sales, and demand for laminated board declined.

The market for agricultural gypsum for use on the alkaline soils of California and other West Coast States and on the peanut crops of the Southeastern States showed a slight increase.

Industrial plasters were also up. These are used in bedding plate glass for polishing, in making molds and patterns for pottery and for nonferrous castings, and in numerous miscellaneous applications in shop and factory. Dental and orthopedic plasters declined somewhat.

Figure 3 correlates sales of lath and other gypsum board with floor area of new construction. All showed increases.

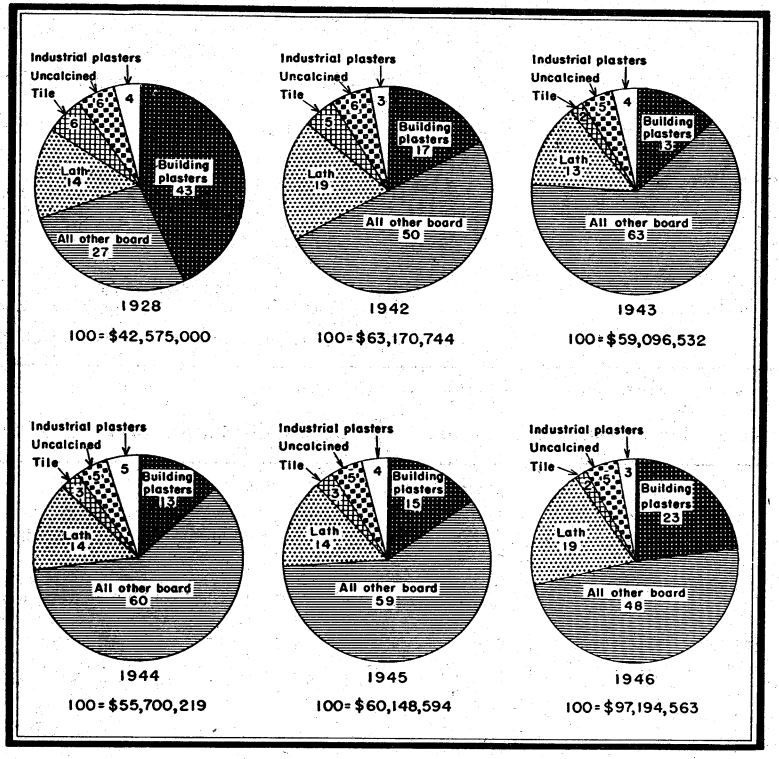

FIGURE 2.—Percentage distribution of total sales value, f. o. b. plant, of gypsum products in 1928 and 1942–46, by groups of products.

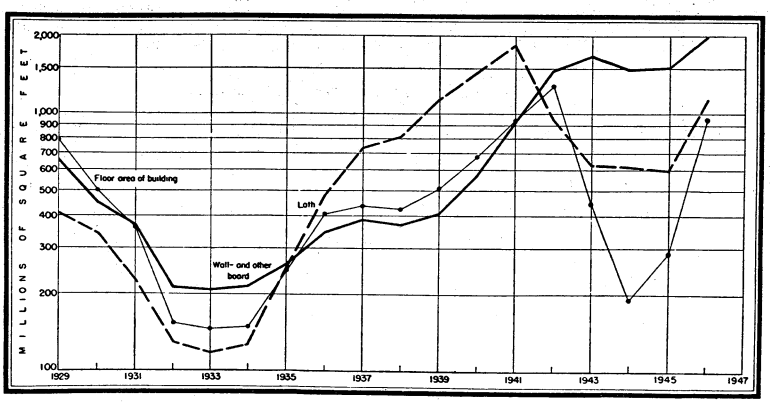

FIGURE 3.—Trends in sales of gypsum lath and wallboard and other board (includes wallboard, laminated board in terms of component board, and sheathing) compared with Dodge Corp. figures on floor area of residential and nonresidential building, 1929–46.

[1] Per M square feet, f. o. b. producing plant.
[2] Includes partition, roof, floor, soffit, shoe, and all other gypsum tiles and planks.
[3] Per M square feet, f. o. b. producing plant, of partition tile only.
[4] Reported as area of component board and not of finished product.

PRICES

The average value reported for crude gypsum mined was $2.21 per short ton ($1.83 in 1945). In the 1946 canvass producers were asked to estimate as closely as possible the theoretical market value of their material, even though they used it themselves. It is believed that in previous years the figures submitted have ranged from bare cost figures upward.

About three-quarters of the gypsum produced in the United States is calcined by the producer and does not enter the open market. The remainder is sold largely as portland-cement retarder and agricultural gypsum. The average value for retarder sales in 1946 was $2.60, as against $2.26 in 1945, and for agricultural sales $3.93, compared with $3.71 in 1945.

The Bureau of Labor Statistics reported that the average wholesale price of base-coat plaster, f. o. b. cars destination, was $13.74 per ton in January 1946, rising to $14.28 by December 1946. Plaster lath on a similar basis rose from $18.26 per thousand square feet in January to $19.89 in December. The cost of a square yard of installed plaster in Washington, D. C., was about $1.50 in 1946.

PLANT EXPANSIONS

The capacity of the gypsum industry to produce plaster and board has not been canvassed since 1941 (see Minerals Yearbook, 1941, pp. 1295–1297). In that year 36 board machines were reported having a capacity of 13 million square feet of ⅜-inch lath or 11 million square feet of ⅜-inch wallboard per 24-hour day, or over 4 billion square feet a year. (Needless to say, it is impossible to operate at 100 percent of capacity over any prolonged period of time.) There has been considerable variation in capacity because some plants were closed and the output of others increased, and the over-all effect seems to have been an increase to at least 4¾ billion square feet, in view of the fact that actual board output was at the annual rate of 4 billion square feet in the closing months of 1946. Capacity will be augmented further in 1947, when five new plants are placed in operation.

National Gypsum Co. is building at Baltimore, Md., a $6,000,000 plant which will have a capacity of 90 tons of plaster per hour and 120 feet of board per minute. It will calcine Canadian gypsum and make board and plasters.[1] This firm is also spending $1,000,000 to rehabilitate its calcining and board plants at Clarence Center, N. Y., where it got its start 21 years ago,[2] and $600,000 to expand its lath facilities at Niles, Ohio.[1] The Rotan, Tex., plant, to be completed in July 1947, will cost $1,000,000 and expansion of the Savannah, Ga., plant, $750,000.[1] This firm is also doubling capacity of mines and plants at Medicine Lodge, Kans.[3]

The Standard Gypsum Co., Long Beach, Calif., owned by Henry J. Kaiser & Associates, is building a board plant.

The United States Gypsum Co. was building three plants in 1946–47, at Plaster City, Calif.; Sigurd, Utah; and Berkley, Va. The Sigurd plant is 135 miles south of Salt Lake City on a 920-acre tract purchased in 1936. It will make all types of plaster and standard lath, board, and sheathing.[4] The Berkley plant, near Norfolk, will cost $670,000 and have a daily capacity of 350,000 square feet of ⅜-inch gypsum board.[5]

The full effect of these new plants and rehabilitation of old ones probably will not be felt until the latter part of 1947, or possibly not until 1948, as the bottleneck in paper liner is not expected to ease until late in 1947.

A new plaster producer, the Gulf States Gypsum Co., Houston, Tex., shipped its first car of wall plaster in November 1946. The plant is 4½ miles south of Hockley, Tex., and has two kettles with a total capacity of 200 tons of plaster daily.[6]

Among the new plants beginning production in 1946 was the plaster mill of the Union Plaster Co., at Phoenix, Ariz. Raw gypsum from the deposit at Winkleman, near Phoenix, is used.[7] The Arizona

Gypsum Corp., of Phoenix, also opened a new mine at Winkleman, Ariz.

Stripping has exposed a 25-foot thick gypsum deposit on property of the Certain-teed Products Corp., near Fort Dodge, Iowa. The deposit is believed to extend over 80 acres and to comprise 6 million tons of gypsum.[8]

TECHNOLOGIC DEVELOPMENTS

A new commercial type of gypsum plaster—alpha gypsum—heretofore isolated only in the laboratory, was described and recommended for molds and patterns.[9] The new material has low setting expansion, low water : plaster ratio, and a period of plasticity sufficient for trimming; molds made from it have dimensional stability during long storage.

Gypsum board lends itself easily to prefabricated construction, as it is resilient, nailable, and easily cut. It is reported that it is used in prefabricated steel houses.[10]

The labor shortage accentuated the trend toward mechanization of gypsum mines. Notable were the use of caterpillar-mounted loading machines with battery-operated, rubber-tired shuttle cars, and detachable steel and carboloy bits for drilling strata of varying hardness.[11]

ALABASTER

Alabaster mining was well under way again in 1946; and, according to incomplete returns, the following firms and persons offered commercial-grade alabaster in 1946: Alabaster Co. of America, Livermore, Colo.; Pioneer American Alabaster Co., Fort Collins, Colo.; J. Evan Roberts, Livermore, Colo.; and Elza Owen, La Junta, Colo.

According to a release by the Alabaster Co. of America:—

> The stone can be cut with the ordinary hand saw or hack saw. The hand saw, of course, must be sharpened often. Carborundum cutoff saws used in a power saw head are ideal for cutting small slabs for flat work * * *. Turning may be done on wood or metal lathes with either wood or metal cutting tools or any combination of them. The stone is best held in place on the lathe by a machine chuck, which may be either the three- or four-jaw type, independent or universal * * *. The articles may be dressed with emery cloth and finished with wet or dry sandpaper, and during sanding, the surface should be kept wet * * *. The stone is best polished on a buff wheel with abrasives such as those used on brass and silver.

The miners generally use care in mining alabaster. A typical method is channeling and wedging, supplemented by hydraulic lifts for breaking out sections of stone. When a new opening is started on a ledge, slow, coarse black powder may be used, and the inevitable fractured material is discarded.

From alabaster, artisans make attractive lamps, urns, vases, bowls, jars, pen stands, and numerous other useful items and novelties.

FOREIGN TRADE [12]

Of the 1,429,057 short tons of gypsum and anhydrite imported from Canada, 695,409 tons were landed in the New York customs district, 210,457 in the Georgia district, 118,162 in the Philadelphia district, 114,843 in the Massachusetts district, and 107,356 in the Maine and New Hampshire district. The remainder was brought in through the Florida, Virginia, Connecticut, Puerto Rico, Maryland, and Buffalo districts.

WORLD REVIEW

Global construction drew heavily on the gypsum industry of nearly every civilized region in 1946. Many deposits closed during the war years were reopened and new ones prospected. The United States has been the country of greatest production for some years, followed by the United Kingdom, Canada, Soviet Russia, and France, in approximately that order.

World production of gypsum, 1939–46, by countries, in metric tons [1]

[4] Production of one company only.
[5] Sales.
[6] Data represent areas designated as Free China during period of Japanese occupation.
[7] Estimate.
[8] Preliminary.
[9] Excludes estimates for countries listed in footnote 1.

Canada.—Sales of raw gypsum in 1946, as reported by the Dominion Bureau of Statistics, were 1,833,717 short tons. United States imports of Canadian gypsum for consumption were 1,429,057 short tons valued at $1,559,544.

Adequate shipping was available in 1946 to carry record loads of gypsum from Nova Scotia to board and plaster plants on the Atlantic seaboard of the United States. Quarrying operations in Nova Scotia were reviewed by McFarland.[13] Gypsum, Lime & Alabastine, Canada, Ltd., of Toronto, announced plans for improving its Montreal plant.[14]

GENERAL SUMMARY

PRODUCTION of iron ore in 1946 dropped to about four-fifths of the 1945 level largely as a result of strikes at iron and coal mines, steel plants, and in Lake Superior shipping. The strikes affecting iron-ore production occurred at the critical time of the year, when the Lake shipping season is usually getting under way. Consequently, production in March was about one-third the March 1945 level, and during April 1946 production amounted to only 2.2 million tons, compared with 8.2 million tons during April 1945, and consumers had to rely heavily on stocks at consuming plants and lower lake ports. Fortunately, however, stocks of iron ore at consuming plants considerably exceeded those of the previous year, and at no time were furnaces obliged to shut down for lack of iron ore. On May 1, 1946, the date when iron-ore stocks are normally lowest, the available tonnage was 40 percent higher than on the same date in 1945. All producing districts reported a drop in iron-ore output during 1946, but the resulting decrease in production from the Birmingham area was much less than in others. Consequently, the Birmingham district produced 8 percent of the United States total of usable ore during 1946, compared with 7 percent in 1945; output continued virtually unchanged. Several important mines in that area continued producing when many in other areas were strikebound. The Lake Superior district accounted for 15,000,000 of the 18,000,000-ton decline during the year and produced 84 percent of the total domestic iron ore, compared with 85 percent in 1945.

Value	$4,522,052	$3,855,946	$3,513,666	$3,126,711

Iron-ore imports continued to increase during 1946, with most of the net receipts originating in Chile, Cuba, and Sweden. Canada, although supplying more iron ore to the United States than any other country, was more than compensated by receipts from the United States. The Steep Rock mine, on the Atikokan range, Ontario, now supplies most of the imports of Canadian ore for United States consumption, but much of the Canadian iron and steel industry is dependent on receipts of iron ore from the United States.

The bulk of the imported ore during 1946 was consumed in blast furnaces at Sparrows Point, Md., but important shipments were made to eastern Ohio, the Buffalo, N. Y., district, and furnaces in eastern Pennsylvania. Canadian ore was also used in Michigan and West Virginia blast furnaces.

PRODUCTION AND SHIPMENTS

Domestic iron-ore mines produced crude ore totaling 84,194,481 gross tons and shipped 83,985,686 tons in 1946, decreases of 21 percent in both cases from 1945. Of the 1946 shipments, 36 percent was sent to beneficiating plants and 64 percent went direct to consumers, as in 1945. From the crude ore shipped to beneficiating plants, 13,799,046 tons of concentrates and 2,522,698 tons of sinter were produced. In addition, 506,903 tons of byproduct ore in the form of cinder and sinter were produced by the pyrites industry during the year. In all, 70,843,113 gross tons of usable iron ore were produced at mines and mills in 1946. Of this quantity, 54,014,466 tons were suitable for consumption as mined without requiring further treatment in the form of concentration. The output in 1946 came from 191 mines, of which 19 mined over 1,000,000 tons of crude ore each. In addition to the mines, one plant, treating tailings produced in previous years, contributed toward the total output of usable ore. Minnesota, with 49,290,807 tons, supplied 70 percent of the usable ore, as in 1945, and Michigan, with 8,688,604 tons, or 12 percent, was the second largest producer. These two States and Wisconsin, with 1,062,743 tons or 2 percent, constitute the Lake Superior region, which supplied 84 percent of domestic output. About three-fourths of the iron ore mined in 1945 and 1946 came from open-pit mines.

Shipments of usable ore from mines totaled 70,090,410 gross tons in 1946; of this quantity, 53,901,452 tons (77 percent) were direct-shipping ore for use in iron and steel furnaces. Total shipments also include 9,478 tons of ore for cement manufacture, 9,167 tons for paint, and 14,041 tons for miscellaneous purposes. Shipments of byproduct ore for use in iron and steel included in the total shipments amounted to 596,358 tons in 1946, valued at $2,787,305.

PRINCIPAL MINES

In this discussion, the size of a mine is determined by the quantity of crude ore excavated. Consequently, mines providing low-grade ores that require concentration will be comparable in size to mines producing similar quantities of direct-shipping ore. Nineteen mines, each yielding more than 1,000,000 gross tons of crude ore, produced 48 percent of the United States output in 1946. Of these producers, 13 were in Minnesota, 4 in Alabama, 1 in New York, and 1 in Pennsylvania; 13 were open-pit operations, 4 underground, and 2 combination mines. Except for two mines that produce magnetite, all the million-ton mines produced hematite in 1946. In 1945, 28 mines, producing more than 1,000,000 tons of ore each, produced 56 percent of the United States output.

There were 26 mines in 1946 that produced between 500,000 and 1,000,000 tons of crude ore each. These mines produced one-fifth of the United States total of crude ore, and two-thirds was obtained from mines with production of over half a million tons of crude ore. These mines are listed in detail in the following table.

Iron-ore mines in the United States in 1946, by size of crude output

SINTER

Domestic sintering plants in 1946 used 8,066,427 gross tons of iron ore, 4,031,125 tons flue dust, 627,907 tons pyrites cinder, and 171,097 tons of mill cinder and roll scale to produce 11,818,777 tons of sinter—a conversion yield of 92 percent.

Sinter production in 1946 came from plants at mines, blast-furnace plants, and custom mills. Of the sinter produced in the United States in 1946, 21 percent was made at mine plants in 4 States, and 79 percent was produced at blast-furnace plants and custom mills in 12 States.

Production and consumption of sinter in the United States in 1946, by States, in gross tons

State	Sinter produced	Sinter consumed	
		In blast furnaces	In steel furnaces
Alabama	1,251,318	1,436,841	54,979

REVIEW OF LAKE SUPERIOR DISTRICT

Production and Shipments.—Production of iron ore from mines and mills in the Lake Superior district in 1946 was 21 percent lower than in 1945, but the district retained its usual position as the major supplier of domestic ore, and 84 percent of the United States total was obtained from the area. The Mesabi, largest of the six producing ranges, supplied 79 percent of the district total and 66 percent of the United States total, as in 1945. In addition to the 59,042,154 gross tons of iron ore produced in the Lake district, 953,073 tons of manganiferous ore (containing 5 percent or more Mn) were produced, making a total output of all grades of 59,995,227 tons. The total shipments of 59,587,956 tons consisted of 957,720 tons containing over 5 percent manganese and 58,630,236 tons containing less than 5 percent. The ore produced in Wisconsin in 1946 was from the Gogebic range, which extends into Michigan. The ore came from the Montreal mine of Oglebay Norton & Co. and the Cary-Tilden operated by Pickands, Mather & Co. This ore is shipped to consuming points near the Great Lakes.

Production and shipments from Canadian mines in the Lake Superior district are not included in these statistics. Shipments from those mines in 1946 totaled 1,440,640 gross tons; of this quantity, 830,481 tons came from the Steep Rock mine, 552,056 tons came from the Helen and Victoria mines, and 58,103 from the Josephine.

The Lake Superior Iron Ore Association reported 59,587,730 tons of iron and manganiferous ore shipped to upper Lake ports from United States mines in 1946, a decrease of 20 percent from 1945. All-rail shipments totaled 1,491,856 tons in 1946, compared with 1,208.710 tons in 1945. The Lake shipping season opened unusually early (March 25 at Sault Locks), but no iron ore moved in March, and only 730,000 tons moved by the end of April because of the iron-ore strike, which had been in effect since February 8. This level of production during April was only about one-tenth that of April 1945, and it was not until May 25, when 11 companies, representing 93 percent of the annual shipping capacity of the Lake Superior region, had signed agreements with the Union, that output attained near-normal levels. The final cargo of Lake Superior iron ore for the 1946 season was loaded at Superior, Wis., on December 6, one day later than the final loading in the preceding year.

The railroads serving the iron-ore mines in the Lake Superior region applied to the Interstate Commerce Commission on April 15, 1946, for increases of 12 cents a ton in rail freight and 3 cents in dock charges on iron ore, both at upper and lower Lakes. After the hearings in May, the Commission granted temporary increases of 3 cents per ton in the upper Lake rates, 0.5 cent in the dock charges, and 2 cents in the lower Lake rates. However, after further hearings and considerations of the case, the Commission, on December 5, 1946, canceled the increases previously granted in June on the upper Lake rates and dock charges, but authorized a full 12 cents per ton increase in other rail charges on iron ore and 25 percent increase in dock handling and other charges. Lake vessel rates on iron ore also were increased effective July 1, 1946. The increase amounted to 10 cents a gross ton from the head of the Lakes and ranged down to 6 cents

increase on the shortest haul from Escanaba. The railroad rate increases changed the rate from Mesabi and Vermilion ranges to Duluth, Superior, and Two Harbors from 92 cents to $1.04 per ton, and a 10-cent increase in Lake shipping rates from upper Lake ports raised its charge from 94 cents to $1.04.

Iron ore produced in the Lake Superior district, 1854–1946, by ranges, in gross tons

[Exclusive after 1905 of ore containing 5 percent or more manganese]

Analyses.—The following table shows average analyses from the Lake Superior district.

Average analyses of total tonnages (bill-of-lading weights) of all grades of iron ore from all ranges of Lake Superior district, 1942–46

[Lake Superior Iron Ore Association]

Year	Gross tons	Iron (natural), percent	Phosphorus (percent)	Silica (percent)	Manganese (percent)	Moisture (percent)
1942	92,069,902	51.65	0.089	8.21	0.79	10.98
1943	85,116,347	51.58	.091	8.32	.82	11.06
1944	81,039,404	51.72	.088	8.42	.74	11.02
1945	75,206,781	51.69	.089	8.52	.72	10.96
1946	58,975,188	51.32	.087	8.83	.74	11.22

Reserves.—The accompanying tables show reserves of iron ore in Michigan and Minnesota. It should be borne in mind that these data represent only taxable and State-owned reserves and do not represent the total that may be expected to become available. Additional tonnages are added to the reserve figures each year, and undoubtedly ultimate production in the Lake Superior district will greatly exceed that indicated by present reserve tonnages.

The Wisconsin Department of taxation estimated reserves of iron ore in Wisconsin to be 6,000,000 tons on January 1, 1947.

Iron-ore reserves in Michigan, January 1, 1943–47, in gross tons

[Michigan Department of Conservation]

Range	1943	1944	1945	1946	1947

Total Minnesota (Lake Superior district)	1,149,067,765	1,120,813,826	1,094,835,139	1,034,299,678	995,488,026
Filmore County	250,000	259,859	231,393		
State ore (not taxable)	31,978,475	16,672,818	13,000,996	19,865,715	19,950,255
Total Minnesota	1,181,296,240	1,137,746,503	1,108,067,528	1,054,165,393	1,015,438,281

Stocks at Lake Erie Ports.—On December 1, 1946, just before navigation stopped, the Lake Superior Iron Association reported 4,856,537 gross tons of iron ore at Lake Erie ports, compared with 4,814,991 tons in 1945. At the opening of the 1947 season (May 1, 1947), 1,816,400 tons of ore were in stock at these ports, compared with 3,019,184 tons on May 1, 1946. Thus, withdrawals from stocks during this 5-month period in 1946–47 were about two-thirds greater than those of a year ago.

Prices of Lake Superior Ore.—The prices of Lake Superior ore at the beginning of the 1946 shipping season were higher than in 1945 by 10 to 20 cents per gross ton as a result of an increase granted by the Office of Price Administration on December 29, 1945. Following the strike at iron mines a further increase of 50 cents per ton was allowed (effective June 24, 1946), and the prices were then $5.05 for Mesabi non-Bessemer grade and $5.30 for Old Range non-Bessemer grade. The strike was settled at most mines between early March and May on the same basis as in the steel industry, with hourly wage increases of 18½ cents. Prices for Bessemer ores at the close of 1946 were $5.45 for Old Range and $5.20 for Mesabi ore. Old Range non-Bessemer was $5.30 and Mesabi non-Bessemer $5.05. High-phosphorus ore was also $5.05.

Mining Developments.—A recent trend in material handling in the Lake Superior region is toward greater use of conveyor belts with some lessening of truck haulage, but utilizing larger trucks with as high as double the capacity of the usual 15- or 20-ton trucks. One large 25-yard dragline excavator is being used for stripping, the overburden being piled entirely by means of conveyor belts. An underground mine in the Menominee district of Michigan has been equipped with a belt conveyor for main haulage in its deepest level, with lateral shaker conveyors to feed the ore to it. Shakers are also in use in other mines on the Menominee and the Mesabi. The trend in conveyor belts is toward longer units and to cotton- or steel-cord belts. At one Mesabi pit where a former rail hauling system is being replaced by a conveyor to deliver ore directly to the washing plant, tailing disposal is to be made through a 14-inch pipeline about 7,500 feet long.

To replace churn drillings, a new method, called fusion piercing, has a promising future.[1] In this process a blast hole is burned with a

[1] Blast Furnace and Steel Plant, Fusion Piercing Blasts Holes Ten Times Faster Than by Drilling: Vol. 35, No. 1, January 1947, p. 59.
Canadian Mining Journal, Fusion Piercing: Vol. 67, No. 11, November 1946, pp. 1043–1045.

rotating multiple-port blowpipe, and the debris is blown out by steam produced by water introduced behind the torch. With a field outfit in use for the first time in the fall of 1946, working on the extremely hard and tough magnetic taconite in the vicinity of Babbitt on the eastern Mesabi, progress of 4 to 17 feet an hour, as compared with 1 foot per hour for churn drills, was reported. Holes are chambered by retarding the advance of the torch. Experimental work on this project has been under way in the United States for some time by the Linde Air Products Co.

A symposium devoted to underground mining was held at Duluth in January 1946 with a view to reducing costs in underground mining and making the method more competitive with lower-cost open-pit operations. It was indicated that top slicing, with its high timber requirements, is yielding to sublevel caving methods, and block caving, which has not been used in the district since 1898, is about to be retried.

Research was continued through 1946 by private mining companies, the Minnesota Mines Experiment Station, and the Battelle Memorial Institute of Columbus, Ohio. At the close of the year plans were being made for the construction of two plants for the manufacture of high-grade concentrates from the magnetic taconites of the eastern Mesabi. A pilot plant to produce iron powder was being erected near Aurora on the eastern Mesabi. The latter project was sponsored by the State of Minnesota and was expected to be in production early in 1947. The plant was to treat 50 tons a day of low-grade iron carbonate ore to produce 5 or more tons of iron powder for commercial use.

Average costs, per gross ton, of mining iron ore at underground mines and at siliceous open pits in Michigan in 1946 [1]

Item	Underground				Siliceous open pits
	Gogebic	Marquette	Menominee	Average	
Cost of mining:					
Labor	$1.7467	$1.9427	$1.2996	$1.6781	$0.4029
Supplies	.7837	.7789	.5749	.7128	.2753

[1] Pardee, F. G., Kennedy, Bruce E., General Statistics Covering Costs and Production of Michigan Iron Mines: Michigan Dept. of Conservation, Geol. Survey Div., 1946, 9 pp.
[2] This figure does not represent true profit, as much ore is sold below the Lake Erie price.

MINING BY STATES

Alabama.—Production of crude ore in Alabama, the third largest producing State, dropped 4 percent in 1946 from 1945, whereas production for the United States as a whole fell 21 percent. Output of usable brown ore, all from open-pit operations, declined 14 percent, and that of hematite, mostly from underground mines, 1 percent.

Iron ore mined in the United States in 1946, by States and counties, in gross tons

[1] Includes output of 1 plant reprocessing tailings.

The Sloss-Sheffield Steel & Iron Co. mined hematite from open-pit operations at the Ruffner and Sadler Gap mines in Jefferson County. High-density separation was employed at the Ruffner mine as an essay in treating Alabama hematite. The Republic Steel Corp. shipped mostly sinter from its Spaulding operation in Jefferson County, but some direct ore and concentrate were shipped. In this operation, concentrates from the Spaulding mine and pyrites cinder from Pulaski, Va., are used to produce the sinter, but in recording the tonnage, the sinter made from pyrites cinder is deducted and credited as byproduct production from Virginia. The Tennessee Coal, Iron & Railroad Co. produced and shipped ore from its Red Mountain mines, composed of the Muscoda, Wenonah, and Ishkooda groups; some of the ore

was sintered before consumption, and the rest was crushed and blended and shipped direct to furnaces. Other hematite producers in the Birmingham district in 1946 were the Pyne and Woodward No. 3 mines of the Woodward Iron Co. in Jefferson County. The hematite shipped from Alabama in 1946 averaged (natural) 35.20 percent Fe, 0.15 percent Mn, 0.30 percent P, 16.00 percent SiO_2, 14.61 percent CaO, and 1.44 percent H_2O.

Brown ore was shipped from 3 mines in the Birmingham district, 5 mines in the Chattanooga district, and 3 other mines, 1 in Colbert County and 2 in Franklin County. The largest brown-ore operation in Alabama in 1946 was the Russellville No. 5 and 12, operated by the Sloss-Sheffield Steel & Iron Co. Brown ore shipped in 1946 averaged (natural) 44.6 percent Fe, about 0.5 percent Mn, 0.5 percent P, approximately 10 percent SiO_2, and 7 percent moisture.

California.—The production of iron ore in California in 1946 consisted of hematite from the Vulcan mine in San Bernardino County and magnetite from the Shasta and California mines in Shasta County. The ore from Shasta was used entirely as ballast, whereas the Vulcan ore was shipped to the Kaiser Co., Inc., Fontana. The latter ore averaged (natural) 50.44 percent Fe, 0.13 percent Mn, 0.046 percent P, 6.24 percent SiO_2, 4.00 percent CaO, and 0.50 percent H_2O. Most of the iron ore for the Fontana furnace was obtained from Utah.

The Kaiser Co., Inc., announced in May 1946 that it had acquired all outstanding rights and interests in the Eagle Mountain iron-ore mine in Riverside County.

The Shasta and California iron-ore deposits were described by Lamey.[2]

Colorado.—The Stiron Metals, Ltd., shipped hematite from the Bruce mine in Lake County to the Colorado Fuel & Iron Corp., Pueblo.

Georgia.—All of the output from Georgia in 1946 was brown ore from Bartow and Polk Counties. This ore, as mined, was very low-grade, and all was washed before shipping. Approximately 1,300,000 tons of material was mined and washed during the year. From this material, a total of 284,614 tons of usable ore was produced, or a ratio of nearly 5 tons of crude to 1 ton of usable. The Hodge Mining Co., operating in Bartow County, produced most of the ore, as in 1945.

Michigan and Minnesota.—See Review of Lake Superior District.

Missouri.—Most of the ore produced in Missouri in 1946 was hematite from the Iron Mountain mine in St. Francois County. This ore was concentrated by jigging, and the usable ore averaged (natural) 54.17 percent Fe. A small quantity of brown ore was shipped by Doane and Ives from the Kingsbury mine in Howell County. Some of this ore was used as lump ore in open-hearth furnaces, but most of it was used as flux in nonferrous smelter operations.

Nevada.—A. N. Bratton shipped magnetite for use in steel furnaces during 1946. This ore averaged (dry) 65.18 percent Fe and came from Pershing County.

[2] Lamey, Carl A., Shasta and California Iron Ore Deposits in Shasta County, Calif.: Iron Ore Reserves of California, Bull. 129, October 1946, 164 pp.

New Jersey.—All of the ore produced in New Jersey in 1946 was magnetite from underground mines in Morris and Warren Counties. The ore was concentrated by magnetic and gravity separation and averaged (natural) 63.67 percent Fe. Production in New Jersey was virtually at the 1945 level despite strikes, which prevented maximum operation during the first half of the year.

New York.—The Republic Steel Corp. shipped magnetite concentrates and sinter from its Chateaugay mine, Clinton County, and Fisher Hill and New Bed-Harmony-Old Bed group, Essex County. High-grade lump ore is hand-sorted from Old Bed, and the remainder is concentrated magnetically, and most of it sintered before shipping. The Jones & Laughlin Ore Co. shipped concentrate and sintered magnetite from the Benson mine in St. Lawrence County; the company purchased the concentrating and sintering plants at this mine from the Reconstruction Finance Corporation during the year. The Hanna Iron Ore Co. shipped from the Clifton mine in St. Lawrence County sinter averaging (natural) 62.68 percent Fe. The National Lead Co. shipped magnetite concentrates and sinter from the MacIntyre development in Essex County. This material is obtained as a byproduct in the recovery of ilmenite from titaniferous magnetite.

The hematite produced in New York came from the mine of Clinton Metallic Paint Co. in Oneida County.

Pennsylvania.—Except for the small tonnage of carbonate ore from Garbon County, the entire output consisted of magnetite from the Cornwall mine near Lebanon. The ore from Cornwall is shipped to Lebanon, where it is concentrated magnetically and treated further by flotation to remove chalcopyrite and other minerals. Some magnetite concentrate is sintered and some is shipped to consuming plants for sintering.

The Prince Manufacturing Co. mined the carbonate ore for use in paint from the Hazard and Little Gap mine.

Texas.—Peter M. Chamberlain, operating a property in Cass County under lease from the War Assets Administration, produced and shipped brown ore averaging (natural) 49.97 percent Fe to blast furnaces in the Birmingham area. Hematite lump ore was mined by Tillie B. Moss from the Moss mine in Llano County.

Utah.—Mines in Utah supplied semialtered magnetite to blast furnaces at Provo and Geneva, Utah; Pueblo, Colo.; and Fontana, Calif. The Iron Mountain mine supplied ore to the Utah furnaces, the Duncan mine shipped to Pueblo, and the Excelsior mine, operated by the Utah Construction Co., shipped ore to Fontana. Helene E. Beatty produced ore for open-hearth use from the Great Western mine. All of the ore was mined by open-pit methods and averaged (natural) 53.73 percent Fe.

Virginia.—All of the ore produced in Virginia in 1946 was used as a pigment and was obtained from Pulaski County.

Wisconsin.—See Review of Lake Superior District.

Wyoming.—The Colorado Fuel & Iron Corp. produced and shipped hematite for its Pueblo furnaces from the Sunrise mine in Platte County during 1946. The ore averaged (natural) 52.40 percent Fe.

CONSUMPTION

A total of 72,174,844 gross tons of iron ore was reported consumed in 1946. Of this, 84 percent was consumed in iron blast furnaces, 11 percent in sintering plants, 4 percent in steel furnaces, and less than 1 percent in ferro-alloy furnaces; manufacture of cement, ballast blocks, paints, and other items used small quantities. In addition to the iron ore used in blast and steel furnaces, blast furnaces consumed 10,569,202 tons of iron-ore sinter and steel furnaces used 687,179 tons of sinter.

Consumption of iron ore in the United States, in 1946, by States and uses, in gross tons

STOCKS

Stocks of usable iron ore at mines on December 31, 1946, increased 20 percent over 1945. Of the quantity in stock piles, 37 percent was at mines in Michigan, 31 percent in Minnesota, and 24 percent in New York. Including 3 percent at mines in Wisconsin, the Lake Superior district held 71 percent of the total stocks at the end of the year. Stocks of crude ore at mines totaled 3,096,426 gross tons on December 31, 1946, compared with 2,685,495 tons in 1945.

Stocks of iron ore at consuming plants totaled 33,661,856 gross tons on December 31, 1946, compared with 34,642,259 tons at the end of 1945.

Stocks of usable iron ore at mines, December 31, 1945–46, by States, in gross tons

PRICES

The average value per gross ton of iron ore at mines was $3.07 in 1946, compared with $2.77 in 1945.

The accompanying table gives the average value at mines of the different classes of iron ore in 1946 for each of the producing States or group of States except when there are fewer than three shippers of a certain class of ore in a State and permission has not been given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately. In general, the delivered cost less transportation costs to the consuming plant is given. In the Lake Superior district the mine value is the Lake Erie price less freight from mines to lower Lake ports. This value appears to be applied also to ore that is not sold on the open market.

Average value per gross ton of iron ore at mines in the United States, 1945–46

[Exclusive of ore containing 5 percent or more manganese]

[1] Included with average for all States.
[2] Includes New Mexico and South Dakota in 1945 and California, Colorado, Missouri, Nevada, Texas, Virginia, Wisconsin, and Wyoming in 1945 and 1946.
[3] Cinder and sinter obtained from pyrites treated in, but not necessarily mined in, States indicated.

FOREIGN TRADE [3]

Imports of iron ore were nearly double the quantity exported in 1946. Exports, of which virtually all went to Canada, totaled 1,505,854 gross tons valued at $5,492,549. Canada received 1,505,608 tons, valued at $5,487,348; very small quantities were exported to Mexico, Cuba, Netherlands Indies, and Australia. Imports by countries are given in the accompanying table. Notable among these data was the increase of receipts from Chile, which approximated those of the prewar years. Imports from Canada were high but were exceeded by United States exports to that country during the year. Receipts from Newfoundland were resumed after having been cut off during the war period, as were receipts of high-grade Swedish ore, which neared a quarter of a million tons in 1946. Receipts from Algeria dropped to about one-third the 1945 level.

Iron ore imported for consumption in the United States, 1944–46, by countries, in gross tons

[1] Includes pyrites cinder.

BENEFICIATION

Iron ore as mined may be classified broadly as direct-shipping and concentrating-grade ore. The direct-shipping ore is high enough in grade and otherwise suitable for smelting without further treatment. The concentrating-grade ore is usually low-grade and contains undesirable impurities and must be treated before being used. Such ore is

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

concentrated by washing, jigging, tabling, magnetic concentration, and high density separation to remove impurities, thereby improving its grade. Fine ores are often agglomerated or sintered into lumps, which are desirable in blast and steel furnaces because of their improved structure and grade. Sintering likewise has a beneficial effect by reducing the sulfur and moisture content. At some mines ore is crushed and screened to improve its physical characteristics, but ore known to be so improved is not included in the statistics as beneficiated ore because chemically, it is not improved. Of the direct-shipping ore, some is sintered later at consuming plants; this material is not considered beneficiated and is discussed in the Sinter section of this chapter.

Iron ore shipped from mines in the United States, 1925–29 (average), and 1942–46, in gross tons, and percentage of beneficiated ore compared to total shipped

[Exclusive of ore containing 5 percent or more manganese]

Year	Beneficiated	Total	Proportion of beneficiated to total (percent)	Year	Beneficiated	Total	Proportion of beneficiated to total (percent)
1925–29 (av.)	8,653,590	66,697,126	13.0	1944	20,303,422	94,544,635	21.5
1942	23,104,945	105,313,653	21.9	1945	19,586,782	87,580,942	22.4
1943	20,117,685	98,817,470	20.4	1946	15,588,763	69,494,052	22.4

In 1946, 16,321,744 gross tons of beneficiated ore were produced from 30,077,366 gross tons of crude ore. Beneficiation of iron ore was reported at 91 mines in 12 States in 1946, compared with 99 mines in 11 States in 1945. Beneficiated ore shipped from domestic mine plants in 1946 decreased 20 percent from 1945 and totaled 15,588,763 tons. Concentrates comprised 19 percent and sinter 4 percent of total usable ore shipments—unchanged from 1945.

The ratio of crude ore used to beneficiated ore produced was 1.843:1 in 1946, compared with 1.919:1 in 1945.

EMPLOYMENT

Complete data on employment in iron mines are not yet available. Preliminary figures indicate a 1-percent increase in the number of workers from 1945. The average number employed is estimated at 27,100 men working 48,480,000 man-hours to produce 71,289,283 tons of ore, an average of 1.47 tons per man-hour, or virtually unchanged from 1945. The above data and the table that follows include, in the Lake Superior district, manganiferous ore, which is treated by the trade as a special grade of iron ore.

Employment at iron-ore mines and beneficiating plants, quantity and tenor of ore produced, and average output per man in 1945, by districts and States [1]

District and State	Employment					Production									
		Time employed					Usable ore			Average per man (gross tons)					
				Man-hours				Iron contained		Crude ore		Usable ore			
	Average number of men employed	Average number of days	Total man-shifts	Average per shift	Total	Crude ore (gross tons)	Gross tons	Gross tons	Percent natural	Per shift	Per hour	Per shift	Per hour	Iron contained Per shift	Iron contained Per hour

[1] Includes manganese-bearing ore from the Lake Superior district; in 1945, all was from Minnesota.

WORLD REVIEW

Argentina.—The General Administration of Military Factories has completed a second phase of geological studies to determine the potentialities of the sedementary iron deposits that were discovered in the Province of Jujuy and that extend into the Province of Salta for a total length of 80 kilometers. Another survey recently has been made in Puesto Viejo, and ore reserves based upon these surveys, together with those that had been proven previously in the Cerro de Zapla anticline, raised the total reserve estimate to over 100,000,000 tons, which is believed sufficient to support a considerably expanded Argentine steel industry.

World production of iron ore, 1940–46, by countries, in metric tons [1]

[1] In addition to the countries listed Burma, Egypt, Eritrea, French West Africa, Madagascar, and South-West Africa report production of iron ore, but quantity produced is believed insufficient to affect estimate of world total.
[2] Estimate.
[3] Exports.
[4] Production of Tofo mines.
[5] Data not available; estimate included in total.
[6] Bohemia, Moravia, and Slovakia.
[7] Bohemia and Moravia only.
[8] Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese.
[9] Includes Northern Territories and Sub-Carpathia; in addition, beginning in 1941 includes Eastern Hungary and Transylvania; and beginning in 1942 includes Southern Territories.
[10] January to June, inclusive.
[11] June to December, inclusive.
[12] Spanish Morocco included with Spain.
[13] U. S. S. R. in Asia included with U. S. S. R. in Europe.
[14] Exclusive of bog ore, which is used mainly for purification of gas.
[15] Croatia only.
[16] Preliminary data for fiscal year ended March 31 of year following that stated.
[17] Includes iron sand production as follows: 1940–41, 134,000 tons; 1941–42, 233,000 tons; 1942–43, 368,000 tons; 1943–44, 427,000 tons; 1944–45, 858,782 tons; 1945–46, 235,094 tons.
[18] January to October, inclusive.
[19] Estimated by author of chapter.

Brazil.—The Hanna Exploration Co., a subsidiary of the M. A. Hanna Co. of Cleveland, Ohio, has disclosed plans for exploring iron-ore outcrops in the Brazilian Territory of Amata, north of the Amazon River, with a view to making the ore available to world markets.[4] It is indicated that the Amata deposits may be mined by open-pit methods and can be delivered to deep water with a relatively short rail haul.

Canada.—Mines producing iron ore in Canada during 1946 were the Helen, Victoria, and Josephine in the Michipicoten district and the Steep Rock on the Atikokan range. The Josephine mine was put into operation in 1946 and shipped 27,945 gross tons of lump ore and 97,010 tons of jigged concentrates. In the middle of October, all operations at the Josephine mine were closed down following a cave-in in the mine. Exploration was in progress in the Algoma area during 1946.[5]

Cuba.—Cuba re-entered the trade for United States imports of iron ore in 1946 after having been inactive for several years owing to shortages of shipping space. The iron ore mined during the year came chiefly from the Daiquiri mine in the Province of the same name, but a substantial tonnage came from the Estancia mine in Juragua. A small output of experimental Mayari ore was reported during the year.

Iron ore shipped from mines in the Province of Oriente, Cuba, 1884–1946 in gross tons

	Juragua, Daiquiri, and Estancia (hematite and magnetite)	Sigua (hematite)	Mayari (brown ore)	Guama (hematite)	El Cuero (hematite)	Total
1884–1944	22,503,074	20,438	3,988,790	41,241	903,103	27,456,646
1945			302			302
1946	148,480		848			149,328
	22,651,554	20,438	3,989,940	41,241	903,103	27,606,276

Germany.—The opening of the first iron mine in the Bremen Consular District between Damme and Holdorf in Oldenberg was announced late in 1946. The ore in these deposits is 260 meters below the surface, and the beds range in thickness from 1 to 6 meters. The Damme mine is beginning operations with 100 workers, but plans call for an eventual employment of 1,500 and an output of 4,000 tons per day.

Italy.[6]—The total estimated reserves of iron ore in Italy amounts to 33,000,000 tons, but the cost of producing Piedmont iron carbonate ore and Tyrrhenian shore magnetic sand is prohibitive. These deposits must be considered only as a possible emergency supply and eliminated from the reserves available to industry. The following table shows the iron-ore reserves of the various districts of Italy.

Iron-ore reserves of Italy

Location	Metric tons	Approximate percent iron	Remarks
Island of Elba	[1] 6,000,000	50	Hematite, less than 1 percent Mn.
Island of Sardinia	[2] 7,000,000	50	Hematite and oolitic ironstone less than 1 percent Mn.
Piedmont	[1] 5,000,000	52	Magnetite, 40 percent Fe as mined.
Lombardy	[2] 13,000,000	50	Siderite, before calcining 42 percent Fe, 2 to 5 percent Mn.
Tyrrhenian shore	[3] 2,000,000	100	Concentrated from magnetic sand containing 6 to 15 percent iron when mined.
	33,000,000		

[1] Positive.
[2] Indicated.
[3] Inferred, in terms of metallic iron.

Mexico.—A description of the iron-ore deposits in Mexico has been published recently; the total reserves were given as 212,550,000 metric tons.[7]

Newfoundland.—The No. 2 mine on Bell Island was opened in May, and there were then four Wabana mines being worked; it had been 4 years since as many mines were in operation. The average force

[6] Botsford, C. A., American Embassy, Rome, report of June 6, 1946.
[7] Inter-American Development Commission, Washington, D. C., The Coal and Iron Deposits of Mexico Undated, 30 pp.

working in 1946 was 2,000 men, and the average output was 5,700 tons of ore per day. Ore from these mines was being shipped to Canada, United Kingdom, and United States.

Norway.—At the close of 1946, construction was under way at a Government-owned iron and steel works at Mo i Rarna. Iron ore for the plant will come from mines in the far north and southern Norway. At a later period it is planned to utilize ore occurring around Mo, where it is estimated there are approximately 1,000,000,000 tons of available reserves. Pig iron-ore furnaces will be the largest electric furnaces in the world and will be designed for 24,000 kva., although immediate plans are to use only 18,000 kva. The largest electric pig-iron furnaces previously built were 13,000 kva.[8]

Sweden.—It was announced late in August 1946 that the Bethlehem Steel Corp. had arranged a contract for the purchase of 1,000,000 tons of Swedish iron ore.[9] Imports from Sweden totaled 232,887 gross tons by the close of 1946.

Union of South Africa.—C. J. N. Jourdan of Iscor has estimated reserves of iron ore in the Union of South Africa at 122,000,000 tons of high-grade ore, 5,900,000,000 of medium-grade, 2,140,000,000 of titaniferous ore, and 2,286,000,000,000 tons of low-grade potential ore.[10]

Iron and Steel[1]

By NORWOOD B. MELCHER

GENERAL SUMMARY

THE IRON and steel industry in 1946 experienced sharp declines in operating rates, especially in the first half, largely as a result of strikes in this and allied industries. A general steel strike, which was called January 14, 1946, and continued for approximately 1 month, reduced steel operations to the lowest point in the history of the industry and production to the lowest level in 53 years. In April, a strike by soft-coal miners resulted in a loss for the period of more than 750,000 tons of steel ingots during April and 2 million in May. A second work stoppage in soft-coal mines, beginning November 21 and continuing until December 9, decreased further the production of iron and steel during 1946.

Steel supplies grew increasingly short throughout 1946, as reconversion to the manufacture of civilian products proceeded after the war. The production of consumer durables by the latter half of the year approached and, in many instances, exceeded the prewar output. The automobile industry, in producing 2,154,924 passenger cars and 940,282 trucks, reached 50 and 89 percent, respectively, of the 1941 output. This industry used 13 percent of the total delivered steel products during 1946 and was second to the construction industry in tonnage used. Production of automobiles was retarded early in the year by strikes and was continuously handicapped by lack of steel products, especially sheet and strip, which were in heavy demand by the container and construction industries. Sheet and strip comprised 29 percent of the total steel output during 1946 and were rolled at a rate virtually equal to that of 1940. The production rate of the automobile industry during the fourth quarter of the year had established a postwar peak but was considerably below that of the record year 1929. The construction industry, although considerably less active than during the war years, used proportionately more steel. Seventeen percent of total steel products was shipped for construction and maintenance during 1946, compared with 15 percent in 1945 and 16 percent in 1939. The value of new construction in 1946 exceeded 10 billion dollars, or more than double that of 1945 and only about 25 percent below the record set in 1942. The housing shortage grew more acute throughout the year and resulted in the passage by Congress, in May, of the Veterans' Emergency Housing Act, which grants priority for the building of homes for sale or rent to veterans and imposes a $10,000 ceiling on new single-family residences. Under the authority of the Second War Powers Act, a housing expediter

[1] The chapter formerly designated "Pig Iron, Ferro-Alloys, and Steel" is separated in this volume into the present Iron and Steel chapter and a Ferro-Alloys chapter.

(appointed in January) announced a program to provide 2,700,000 housing units in the succeeding 2-year period; subsidy payments rather than price increases were used to stimulate production of building materials wherever possible. Because construction already begun before the effective date of restrictive regulations was permitted to continue, the value of private nonresidential building continued to rise throughout the year to a total of 4.5 billion dollars. Public and private residential building in 1946, although making large gains, totaled nearly a billion dollars less than nonresidential building for the year. At the end of the year, the construction industry was looking forward to completing 1 million privately financed residences during 1947.

Railroads consumed less tonnage in 1946 than during the previous year but used a greater percentage of the total than during any period since 1939, and the relative use was unchanged from 1945. The railroads' freight load approximated 632 billion net ton miles in 1946—a decline of 13 percent from the 1945 total. Deliveries of new freight and passenger cars totaled 49,905 and 1,364 units, respectively, during 1946. Shipbuilding became a minor consumer of steel products in 1946 and used only 290,000 tons, compared to over 3 million in 1945, and an average of nearly 10 million tons per year from 1941 to 1944, and was at a rate about half that of 1939. Shipments of steel to the agricultural industry and for export reverted to the prewar level, accounting for 3.5 percent and 6.3 percent, respectively, of the total. Deliveries of steel products to the machine-tool industry totaled 3,637,000 tons, which was more than 50 percent greater than the prewar year of 1940.

[1] American Iron and Steel Institute. Capacity figures Dec. 31 from A. I. S. I. Form 7.

During 1946, there were several amendments to Order M–21 pertaining to pig iron and steel. Directive 12, issued June 12, provided for certified orders for steel needed during the third quarter of 1946 to make products for highly critical programs, veterans' housing, and certain farm equipment. This directive covered ingots, shapes, tubing, sheet and strip, castings and forgings (rough), wheels, tires, axles, wire rod, and wire accessories. Directive 13, effective July 9, required certified orders for merchant pig iron and iron castings for veteran-housing and certain farm-machinery programs; minor modifications of this order were made effective August 1. Because of shortages in pig-iron production, an amendment to Directive 13, effective August 9, ordered that authorizations to purchase merchant pig iron in the southern area for the production of cast-iron pressure pipe be reduced 25 percent and for all other products (except cast-iron soil pipe) 10 percent, and certain furnaces in Pittsburgh, Buffalo, and eastern Pennsylvania that had received a disproportionate share of certified orders were directed to reduce each such order for August delivery by 10 percent. A September 6 amendment to Directive 13 reassigned assistance in obtaining iron castings to Priorities Regulation 28 and provided for continued allocation of merchant pig iron during the fourth quarter.

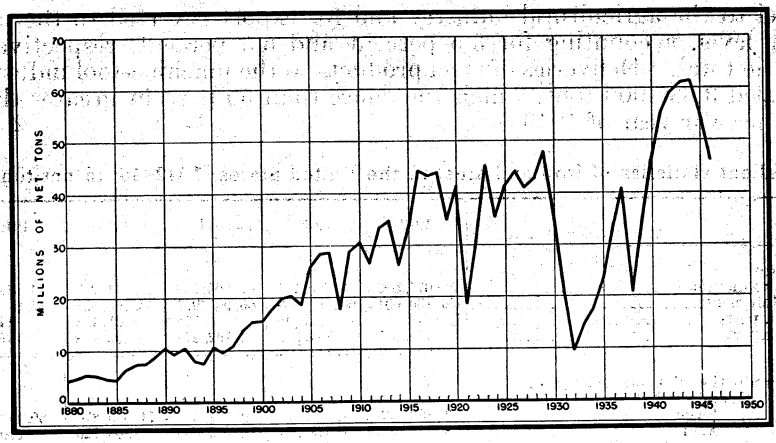

FIGURE 1.—Trend in production of pig iron in the United States, 1880–1946.

The production of pig iron decreased 16 percent in 1946 from 1945 entirely as a result of the drop in steel production. Thus, the decline in pig-iron output was mainly of the basic and Bessemer grades, which constitute most of the pig iron used in steel making. Foundry pig iron, used in making iron castings, increased 17 percent over 1945, and malleable production continued at approximately the 1945 rate. The pig-iron supply was generally tight during 1946, especially in the foundry and malleable grades, which were required for the housing program and upon which premium payments were made by the Government after August 31, 1946. The premium-payment plan announced by housing expediter Wilson W. Wyatt under the Veterans' Housing Act of 1946 called for payment by the Government of

$8 per gross ton for production above base-period quotas by operating furnaces and $12 per ton for production from plants that would be reopened. Payments were made on shipments on and after September 1, and the plan was scheduled to end June 30, 1947. Base period for determining quotas was January 1 to August 31, 1946. Price control on iron and steel and their products terminated November 10, 1946, when all price controls except those on sugar and rice were eliminated by order of Paul A. Porter, Price Administrator.

Both wages and prices increased throughout the steel industry during 1946. The average hours worked per week, based upon the 40-hour week, varied only slightly and averaged 38.7 hours at the close of the year. Average weekly earnings for this group, including workers at blast furnaces, steel works, and rolling mills, which amounted to $47.33 in December 1945, had increased to $50.72 a year later. The composite price of finished steel, as given by Iron Age, increased from 2.44104 cents per pound on December 31, 1945, to 2.83599 cents per pound on December 31, 1946. The composite price of pig iron increased from $25.37 to $30.14 per gross ton, and steel scrap had increased from $19.17 per gross ton to $31.17.

PRODUCTION AND SHIPMENTS OF PIG IRON

Domestic production of pig iron, exclusive of ferro-alloys, decreased 16 percent from 1945 and totaled 44,842,025 net tons, of which 44,809,893 tons were made using coke and 32,132 tons using charcoal as a fuel. Pennsylvania was the largest producer of pig iron in 1946, with 30 percent of the total; Ohio ranked next with 21 percent. Of the pig iron manufactured in 1946, it is calculated that 1,072,574 tons, valued at $27,451,968, were made from 1,822,838 tons of foreign ore from Africa, Canada, Chile, Cuba, Mexico, Newfoundland, and

[1] Data that may not be shown separately are combined as "Undistributed."

Sweden, indicating an average yield of 58.84 percent from foreign ore. Domestic ore (66,761,043 tons) and sinter (11,837,506 tons) and 6,809,241 tons of miscellaneous materials were reported as used in the manufacture of 43,769,451 tons of pig iron, indicating an average pig-iron yield of 51.25 percent from domestic materials. In addition, 1,168,590 tons of home scrap and 74,803 tons of flue dust were consumed in making pig iron in 1946.

Shipments of pig iron decreased 15 percent in quantity from 1945, but only 6 percent in value. The values given in the accompanying table represent the approximate amounts received for the iron f. o. b. furnaces and do not include freight cost, selling commissions, and other items normally included in market prices for pig iron as published by trade journals.

Metalliferous Materials Used.—The production of pig iron in 1946 required 80,421,387 tons of iron ore, sinter, and manganiferous iron ore, 2,621,570 tons of mill cinder and roll scale, 3,043,713 tons of open-hearth and Bessemer slag, 1,104,348 tons of purchased scrap, 38,101 tons of miscellaneous materials, an average of 1.945 tons of metalliferous materials (exclusive of home scrap and flue dust) per ton of pig iron made.

Alabama furnaces used red hematite from Jefferson County, Ala., and brown ore from Alabama, Georgia, and Texas. Manganese-bearing ores of domestic and Mexican origin and pyrite cinder from Virginia also were used. Because of the preponderance of relatively low-grade ore used in the Alabama furnaces, the consumption of ore per ton of pig iron is higher than in any other State.

The iron ore used at Fontana, Calif., furnaces came from the Vulcan mine in San Bernardino County, Calif., and the Walker Iron Mining Co. mine in Iron County, Utah. Some of the iron ore was sintered at Fontana before using. Manganese ore from Lower California, Mexico, was also used.

The blast furnaces at Pueblo, Colo., used hematite from the Sunrise mine in Platte County, Wyo., and the Duncan mine in Iron County, Utah. The manganiferous ore used came from the Boston Hill mine, Grant County, N. Mex.

The blast furnaces at Sparrows Point, Md., used Lake Superior ore and foreign ore from Africa, Chile, Cuba, and Sweden. Domestic manganiferous ore from the Lake Superior district and foreign ore from Africa also were used.

Blast furnaces in Illinois, Indiana, and Kentucky used Lake Superior iron ore and manganiferous iron ore exclusively. Furnaces in Michigan, Minnesota, and West Virginia used mostly Lake Superior ore, but a considerable tonnage from Canada also was used.

In New York, the furnaces in the Buffalo district used hematite from the Lake Superior district and Canada and magnetite from New York. The furnace at Troy consumed magnetite from the Chateaugay mine at Lyon Mountain, N. Y.

Ohio blast furnaces consumed magnetite sinter from New York and domestic and Canadian hematite from the Lake Superior district.

Virtually all of the ore consumed in western Pennsylvania furnaces came from the Lake Superior district. Furnaces in the eastern part of the State used some Lake ore, some magnetite ore from New Jersey, New York, and Pennsylvania, and ore from Africa.

Utah furnaces used semialtered magnetite from the Iron Mountain mine near Cedar City, Utah, and manganese-bearing ores from Nevada and Utah. The sinter used was produced at Geneva and Provo from Iron Mountain fine ore.

The blast furnace at Everett, Mass., used hematite from the Lake Superior district, magnetite from New Jersey, and foreign iron ore from Algeria and Newfoundland.

PRODUCTION OF STEEL

Steel production decreased 16 percent from 1945, and capacity decreased 4 percent. The drop in steel-making capacity was due to the dismantling of obsolete equipment used during the war when maximum steel production was required. Capacity at the end of 1946 totaled 91,890,560 short tons, compared with the record high of

95,505,280 at the end of 1945. Production of steel ingots and castings in the United States in 1946 was 66,602,724 tons. Of this total, 91.2 percent was made in open-hearth furnaces, 5.0 percent in Bessemer converters, and 3.8 in electric furnaces. Included in the last figure is a small production of steel in crucible furnaces, which is not available separately for 1946. In 1946, 90.9 percent of domestic steel output was made in furnaces in the Northeastern district, 4.6 percent in the Southern district, and 4.5 percent in the Western district, compared with 91, 4.6, and 4.4 percent, respectively, in 1945.

The data concerning steel production used by the Bureau of Mines are furnished by the American Iron and Steel Institute. The output from steel foundries that do not produce steel ingots is not included in the statistics.

Steel capacity, production, and percent of operations, 1942–46, in net tons [1]

Alloy Steels.—The steel output for 1946 includes 6,077,695 net tons of alloy-steel ingots and castings, which represent 9 percent of the total, as compared to 11 percent in 1945. This figure includes steels in which the minimum of the range specified in one or more of the elements named exceeds the following percentages: Copper, 0.60 percent; manganese, 1.65 percent; and silicon, 0.60 percent; or steels containing aluminum, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, and other alloying elements when added to steel to obtain desired alloying effects. The output of alloy steels in 1946 decreased 30 percent from 1945, whereas total steel decreased only 16 percent. Of the alloy steel produced in 1946, 71 percent came from basic open-hearth, 2 percent from acid open-hearth, and 27 percent from electric furnaces and crucibles; none was produced in Bessemer converters.

From the accompanying tables it will be seen that most of the steel made in electric furnaces (64 percent in 1946) is alloy steel. Typically, steels with higher alloy content are made in electric furnaces and steel with lower content by the open-hearth process.

Alloy-steel ingots and castings manufactured in the United States, 1942–46, by processes, in net tons [1]

[1] Includes only that portion of steel for castings produced in foundries operated by companies manufacturing steel ingots.

Metalliferous Materials Used.—During 1946, steel furnaces used 3,117,774 net tons of domestic iron ore and 446,611 tons of foreign ore, most of which came from Chile and Sweden, smaller quantities originating in Africa and Canada. In addition, open-hearth furnaces consumed 769,640 tons of sinter made from both foreign and domestic materials.

Both charge ore and feed ore are used in the basic open-hearth process. Charge ore is used to add oxygen to the charge before it is melted. This ore should be low in combined and uncombined moisture, silica, and fines. Ore with a high silica content requires large additions of limestone and consequently produces large volumes of slag, which reduces furnace efficiency. Iron-ore sinter has been found to be a good charge ore in open-hearth practices.

Feed ore, which is added to the heat during the working period, should be hard, dense, coarse, and low in moisture. Although moderately high-silica ore can be used as feed, it is undesirable, as in charge ore, because of the larger quantity of slag resulting. Lump ore, which is preferred as feed ore, is high-priced, and the supply is limited.

Metalliferous materials consumed in steel furnaces in the United States, 1943–46, in net tons

Year	Iron ore		Sinter	Manganese ore		Pig iron	Ferro-alloys	Iron and steel scrap

CONSUMPTION OF PIG IRON

Consumption of pig iron in 1946 decreased 15 percent from 1945. Pig iron, a product of the blast furnace, is a semiraw material and, except for a small quantity used in direct castings, moves to steel- or iron-melting furnaces, for further refining, alone or mixed with other ingredients. In 1946, 85 percent of the pig iron went to steel-making furnaces (open-hearth, Bessemer, and electric) to be processed into steel. Direct castings took 4 percent and the remaining 11 percent was consumed in iron-making furnaces, of which the cupola is the most important. Gray-iron foundries continued to use more pig iron in 1946. Consumption in cupolas increased 13 percent over 1945, whereas the use in all other important pig iron-consuming furnaces decreased during the year; cupolas used 10 percent of total pig iron in 1946, compared with 8 percent in 1945.

[1] Some pig iron used in making direct castings included in cupola.
[2] Less than 0.05 percent.

Plants using pig iron in 1946 were located in all 48 States and in the District of Columbia, but consumption is concentrated largely in the steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas together, in 1946, used 96 percent of the pig iron, Pennsylvania (the leading consumer) taking 29 percent of the total and Ohio (the second largest consumer) 20 percent.

PRICES

The average value of all grades of pig iron given in the accompanying table is compiled from reports of producers to the Bureau of Mines. The figures represent value f. o. b. blast furnaces and do not include the value of ferro-alloys. The general average value for all grades of pig iron at furnaces was $24.49 a net ton in 1946, compared with $22.01 in 1945.

Average value per net ton of pig iron at blast furnaces in the United States, 1942–46, by States

State	1942	1943	1944	1945	1946
Alabama	$17.30	$17.35	$17.34	$18.39	$21.15
Illinois	21.40	21.43	20.92	22.98	25.17
Indiana	22.17	22.39	22.41	23.11	25.46
Michigan	15.35	16.60	17.21	17.60	27.19
New York	19.63	20.20	19.96	22.83	22.82
Ohio	21.64	21.78	21.96	22.99	24.90
Pennsylvania	21.51	21.49	21.48	22.37	24.70
Western States [1]	19.09	18.59	19.04	19.49	21.25
Other States [2]		19.48	20.10	20.48	24.95
Average for United States	20.77	20.95	20.97	22.01	24.49

[1] 1942: Colorado and Utah; 1943–46: California, Colorado, and Utah.
[2] Comprises Iowa, Kentucky, Maryland, Massachusetts, Minnesota, Tennessee, Texas, Virginia, and West Virginia.

The average monthly prices of foundry, basic, and Bessemer pig iron at Valley furnaces and of foundry pig iron at Birmingham furnaces, according to published market quotations, are summarized in the following table.

Average monthly prices per net ton of chief grades of pig iron, 1945–46

[Metal Statistics, 1947]

Month	Foundry pig iron at Birmingham furnaces		Foundry pig iron at Valley furnaces		Bessemer pig iron at Valley furnaces		Basic pig iron at Valley furnaces	
	1945	1946	1945	1946	1945	1946	1945	1946
January	$18.20	$19.76	$21.43	$22.99	$21.88	$23.44	$20.98	$22.54

[1] Weighted average of Iron Age quotations on following steel items: Hot-rolled and cold-rolled strip, sheets, bars, plates, shapes, wire rods, rails and pipe. The composite was revised in 1941 to obtain greater sensitivity in reflecting price changes. (For details of revisions see Iron Age, Aug. 28, 1941, p. 92.) Prior to 1941, this index was computed on the basis of finished steel shipments in the 10-year period 1929–39. The 3 years, 1941, 1942 and 1943, are based on annual shipments for the year. Since 1944, the index has been based on quarterly shipments.

[2] Estimate.

FOREIGN TRADE [2]

Imports of pig iron for consumption in 1946 decreased 34 percent quantitatively from 1945, but the value of imports increased 12 percent. Mexico supplied 80 percent of United States receipts during the year.

Pig iron imported for consumption in the United States, 1942–46,[1] by countries, in net tons

Country	1943	1944	1945	1946
North America:				
Canada	49	5,778	21,433	1,287
Mexico				11,248

United Kingdom	560			1,528
Asia: India	500			
Oceania: Australia	336			
Total (net tons)	1,445	5,778	21,433	14,091
Value	$41,408	$116,408	$440,283	$492,519

[1] None imported in 1942.

Exports of pig iron from the United States increased 5 percent in quantity and 11 percent in value over 1945. Shipments went to at least 27 countries during the year, but Sweden and Italy were the main recipients, taking 25 and 18 percent, respectively, of the total.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

GENERAL SUMMARY

THE 16-PERCENT drop in the output of steel ingots and castings during 1946 was accompanied by consumption of iron and steel scrap below that for any year since 1940. This drop in steel output did not reflect decreased demand but resulted from a series of strikes in the steel and associated industries that began with a general steel strike called in January. Steel operations were thereby reduced to the lowest operating rate in the history of the industry and production to the lowest level in 53 years. Consequently, ferrous scrap was consumed at a greatly reduced rate during the first 2 months of 1946, although partly sustained by foundry operations; purchased-scrap stocks accumulated to 3,168,000 net tons at the end of March, the highest of the year. After March purchased-scrap stocks declined without interruption until the close of the year, when stocks were at the lowest level since data were first available in 1939. The steel strike was followed by another by soft-coal miners that found the steel industry with only a 40-day supply of coal and resulted in an estimated loss of 750,000 tons of steel ingots during April and 2,000,000 in May. Curtailment of steel production during May caused steel producers to reduce scrap and pig-iron consumption to such a degree that the quantity of ferrous material consumed was the smallest for any month following the steel strike. Another work stoppage at soft-coal mines from November 21 to December 9, 1946, reduced further the production of steel and requirements for iron and steel scrap.

Salient statistics of ferrous scrap and pig iron in the United States, 1945–46

	1945 (Short tons)	1946 (Short tons)	Percent of change from 1945
Stocks, December 31:			
Ferrous scrap and pig iron at consumers' plants:

[1] Includes open-hearth, Bessemer, and electric furnaces.
[2] Includes cupola, air, Brackelsberg, puddling, crucible, and blast furnaces: also direct castings.
[3] Includes rerolling, reforging, copper precipitation, nonferrous and chemical uses.
[4] Iron Age.

These strikes and others in steel-consuming industries resulted in an over-all loss of steel production during the year, estimated at 16,000,000 net tons. After settlement of the spring coal strike, operations in the steel industry recovered rapidly, until in October steel output reached the high point for the year, when virtually 7,000,000 tons of steel ingots and castings were produced. The average operating rate during that month was 89 percent of capacity. This level was attained by melting 8,677,000 gross tons of ferrous materials (of which 49 percent was pig iron)—the highest melt of any month in 1946. The high rate of scrap consumption during the latter months of 1946, with a lag in return of new (prompt) scrap from fabricating industries, resulted in a lowering of stocks in consumers'

yards to less than a 30-day supply at the end of the year. An increase in the return of old (obsolescent) scrap was noticeable during the third quarter of the year as a result of the scrap drive inaugurated on July 15, 1946, by the Office of War Mobilization and Reconversion; but consumers were unable to increase their inventories of purchased scrap until December, when an increase in the return of new industrial scrap enabled consumers to increase scrap by a small margin.

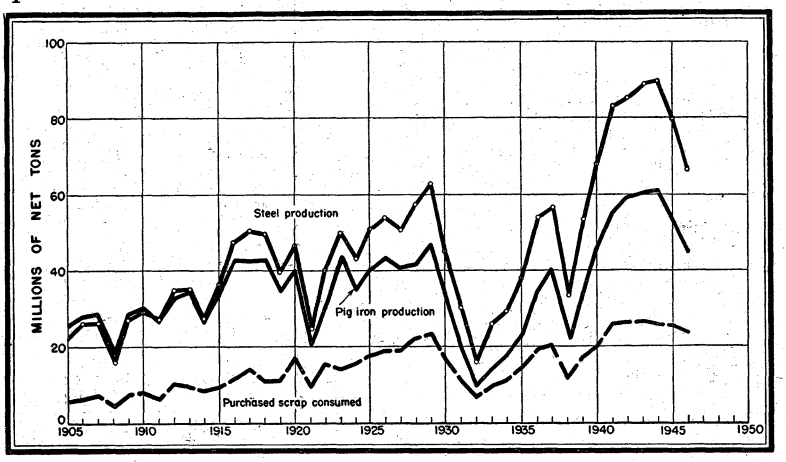

FIGURE 1.—Consumption of purchased scrap and output of pig iron and steel in the United States, 1905–46. Figures on consumption of purchased scrap for 1905–32 are from State of Minnesota vs. Oliver Iron Mining Co., et al., Exhibits, vol. 5, 1935, p. 328; those for 1933–34 are estimated by authors; and those for 1935–46 are based on Bureau of Mines reports. Data on output of steel are as given by the American Iron and Steel Institute.

The ferrous raw materials charged into steel-making furnaces during 1946 comprised 49 percent scrap and 51 percent pig iron compared with 48 percent and 52 percent, respectively, during 1945. However, the charge of scrap and pig iron used in iron foundries (mainly cupola furnaces) remained unchanged from 1945 and consisted of 64 and 36 percent, respectively. The apparent increase in the use of purchased scrap during the year was effected during periods of reduced steel production, when pig iron became very scarce, owing to shortages of coke for blast-furnace fuel. Thus, during August purchased scrap constituted 22 percent of the steel-furnace melt compared with 27 percent in June and 29 percent in May. The high rate of purchased scrap usage during the last quarter of 1946 was made at the expense of inventories in consumers' yards. The proportionately higher quantity of scrap used in all furnaces during 1946 resulted in a 20-percent decline in stocks of purchased scrap. Pig-iron stocks—the lowest since at least 1938 when this survey was inaugurated by the Bureau of Mines—were 26 percent less than at the end of 1945 and totaled 915,168 short tons.

In an effort to increase the supply of steel scrap available to consumers, a joint ship-breaking program was undertaken by the Navy, Maritime Commission, and War Assets Administration, and an increasing number of ships were declared surplus during 1946. To expedite the output of ship scrap from this program and move the product to the steel mills as quickly as possible, CPA established the

Office of Shipbreaking Consultant. During September, 14 Maritime Commission shipyards were made available for leasing by the War Assets Administration to companies which qualified as ship breakers. Of these, 3 were in New England, 5 on the Gulf coast, 3 in the Midwest, and 3 on the west coast. During October 8, additional Navy shipyards were made available. At the close of the year, 17 companies were engaged in the ship-breaking program, and 19 more had indicated an interest in entering the business. Several of the latter group had purchased ships but had not yet obtained facilities for breaking. In July 1946 it was estimated that steel scrap was being produced from ship breaking at a rate of 15,000 tons per month. This rate had increased to 33,000 tons in November and to 40,000 tons at the close of the year. In all, about 180,000 tons of scrap were produced by this program during 1946.

GOVERNMENT REGULATIONS

CIVILIAN PRODUCTION ADMINISTRATION

On October 22, 1946, the Civilian Production Administration issued an amended steel order M–21 in an effort to distribute equitably the dwindling supplies of iron and steel scrap. The regulation affected both consumers and dealers and closely followed an earlier plan approved by the Industry Advisory Committee for scrap. For consumers (including steel mills) inventories of usable scrap, whether prepared or unprepared and including both home and purchased scrap, were limited to a 45-day supply. Because of the greater scarcity of cast scrap, stocks of this material were limited to a 30-day supply. For scrap dealers and brokers the regulation stated that scrap could not be accepted which was not to be shipped in the following 2 months. To be effective January 5, 1947, and on the fifth of each succeeding month, a dealer or broker was to report to the CPA when his shipment in the 2 preceding calendar months was less than the tonnage required to be shipped to balance receipts for the third preceding month. Where such receipts and shipments did not balance as indicated above, a scrap dealer or broker was to furnish the following information to the CPA: (1) His receipts of scrap during the past 3 calendar months, by months; (2) the reason he was unable to balance his receipts for the third preceding calendar month, by his shipments during the past 2 months; (3) his current inventory. The order applied to each operating unit when a person or company maintained more than one.

OFFICE OF PRICE ADMINISTRATION

To prevent possible hoarding by speculators and to assure the maximum flow of iron and steel scrap to industry through normal channels, Paul A. Porter, Price Administrator, announced a six-point scrap program on September 10, 1946, that kept the current price ceilings unchanged, except for cast-iron scrap. The program: (1) Established ceiling prices for the first time on sales of unprepared scrap to scrap dealers from industrial or Government sources; (2) reduced ceiling prices on sales of unprepared scrap to consumers or their brokers 50 cents a ton, which gave dealers a differential to insure the flow of

scrap through this channel; (3) prohibited the purchase or sale of scrap on the condition that the buyer deliver any other commodity to the seller; (4) prohibited sale of electric-furnace and foundry grades of scrap at premium prices for use in basic open-hearth furnaces, unless the scrap had been allocated by the CPA; (5) provided incentive increases ranging from $2.50 to $7 per gross ton in the maximum prices of prepared grades of cast iron; (6) provided for increases in the Office of Price Administration staff of expert graders assigned to scrap and for a drive for criminal prosecution in appropriate cases of violators of OPA scrap regulations.

For the first time since April 3, 1941, iron and steel scrap (as well as other scrap and metals) was restored to a free market when the Price Administrator abolished wartime control, effective November 10, 1946. This action had an almost immediate effect upon the price of ferrous scrap. The composite price of steel-making scrap, as reported by the magazine Steel, increased from a ceiling of $19.17 per gross ton to $27.68 early in December and jumped to $30.75 on December 21 and $31.08 on December 28, 1946. No. 1 cast-iron scrap doubled in price from the $20 ceiling to $40 per ton by the end of the year.

CONSUMPTION

The large use of scrap as compared with that of pig iron, as in 1945, again was noticeable in the New England, Southwestern, and Pacific Coast districts in 1946. These districts together used 7 percent of the total scrap consumed in the United States but only 2 percent of the pig iron. The average ratio of scrap to pig iron in these three districts was 3.7:1, whereas for the United States at large it was 1.1:1.

Open-hearth steel furnaces are by far the largest consumers of ferrous scrap and pig iron. The proportions of the total scrap and pig-iron supply used in open-hearth furnaces have remained relatively constant, as the following data show: Open-hearth consumption accounted for 66 percent of the total scrap in 1946, 67 percent in 1945, and 67 percent in 1944; 69 percent of the home scrap in 1946, 73 percent in both 1945 and 1944; and 61 percent of the purchased scrap in 1946, 60 percent in 1945, and 57 percent in 1944.

Cupola-furnace consumption in 1946 increased as follows: Home scrap, 17 percent of the total compared with 12 percent in 1945 and 10 percent in 1944 and 1943; purchased scrap, 18 percent compared with 15 percent in 1945 and 1944; pig iron, 10 percent compared with 8 percent in 1945 and 6 percent in 1944 and 1943.

Bessemer converters consumed 8 percent of the pig iron in 1946 compared with 9 percent in 1945 and 1944 and 0.5 percent of the scrap compared with 0.6 percent in 1945.

Electric furnaces consumed 7 percent of the total scrap compared with 9 percent in 1945 and 10 percent in 1944 and 0.3 percent of the pig iron—unchanged from 1945.

In gathering data on the consumption of scrap in 1946, the practice of the past few years was continued, in that figures on the use of scrap in the production of ferro-alloys and for various miscellaneous uses

are included. Figures for some States are grouped to avoid disclosing the details of individual operations.

CONSUMPTION BY DISTRICTS AND STATES

In 1946 iron and steel scrap and pig iron were used in all 48 States and the District of Columbia; none was used in Alaska. As in 1945, the largest consuming districts in 1946 were the North Central, Middle Atlantic, and Southeastern. The New England district showed an increase over 1945 in total scrap consumed, but all other districts showed a decrease during the year. Pig-iron use increased in only the Pacific Coast district. The nine States having the largest consumption of scrap, together with the percentage consumed, were: Pennsylvania 24, Ohio 18, Indiana 10, Illinois 10, Michigan 7, New York 5, Alabama 4, Maryland 3, and California 3. This order varies slightly from 1945; Alabama and Maryland changed positions. Pennsylvania, Ohio, Indiana, and Illinois remained the leading States in iron- and steel-scrap consumption.

CONSUMPTION BY TYPE OF FURNACE

Open-Hearth Furnaces.—Ferrous scrap and pig iron consumed in open-hearth furnaces in 1946 totaled 67,049,578 short tons, a 16-percent decrease from 1945. The use of home scrap decreased 20 percent, purchased scrap 5 percent, total scrap 14 percent, and pig iron 17 percent. However, there was no change in the open-hearth furnace melt, which consisted of 48 percent total scrap and 52 percent pig iron. Of the total scrap consumed, 44 percent was purchased compared with 40 percent in 1945 and 36 percent in 1944.

Pennsylvania led in the use of scrap in the open-hearth in 1946, followed in order by Ohio, Indiana, and Illinois; this ranking was unchanged from 1945 and 1944.

Bessemer Converters.—The 3,965,331 short tons of ferrous raw materials used in Bessemer converters in 1946 represents a 22-percent decrease from the 1945 use of these materials. The proportion of scrap in the metal charges was 6 percent, of which 71 percent was home scrap.

Following the usual pattern, Pennsylvania was the principal consumer of scrap in converters in 1946.

Electric Steel Furnaces.—Shortages of suitable steel scrap, especially low-phosphorus grades for use in electric furnaces, together with a sharp drop in demand for alloy steel during 1946, resulted in an average operating rate for electric furnaces during 1946 of 47 percent of capacity compared with 64 percent in 1945. The sharp drop in electric-furnace production was reflected in the consumption of ferrous scrap in electric furnaces during the year. The total melt of ferrous scrap and pig iron used in electric furnaces in 1946 amounted to 3,811,063 net tons, a decrease of 27 percent from the 5,246,788 tons used in 1945. Decreases in the use of scrap and pig iron were apparent in all districts during the year.

Cupolas.—The gray-iron foundry industry was relatively unaffected by work stoppages during 1946, and shipments of castings increased 4 percent over 1945. Consequently, requirements for scrap and pig iron for cupola consumption increased during 1946. Cupola furnaces used 13,171,926 net tons of scrap and pig iron, an increase of 15 percent over the 11,427,858 tons used in 1945. The use of home scrap increased 20 percent, purchased scrap 13 percent, total scrap 17 percent, and pig iron 13 percent. In spite of this increased activity during the year, iron foundries were unable to fulfill their demands, and unfilled orders at the end of the year totaled 3.0 million tons compared with 1.9 million tons at the end of 1945.

Charges to cupolas consisted of 33 percent home scrap, 32 percent purchased scrap, and 35 percent pig iron, compared with 31, 33, and 36 percent, respectively, in 1945.

Michigan continued to be the largest consumer of cupola scrap in 1946, followed in order by Ohio, Illinois, Pennsylvania, New York, Alabama, and Indiana.

Air Furnaces.—Scrap and pig iron consumed in air furnaces (including 2 Brackelsbergs) in 1946 amounted to 1,367,540 short tons, a 9-percent decrease from the 1,503,877 tons melted in these furnaces in 1945. The use of home scrap decreased 6 percent, purchased scrap 4 percent, and pig iron 18 percent.

There was a change in the relative position of the principal consuming States; Indiana, which dropped to the sixth ranking State in 1945, advanced to the fifth position in 1946 ahead of Wisconsin. Ohio led in the use of scrap in air furnaces, followed in order by Illinois, Pennsylvania, Michigan, Indiana, Wisconsin, and New York.

[1] Includes 2 Brackelsberg furnaces, 1 each in Indiana and Ohio.

Crucible and Puddling Furnaces.—Crucible furnaces used 2,021 short tons of scrap and 985 tons of pig iron in 1946 compared with 797 and 552 tons, respectively, in 1945. Puddling furnaces used 17,741 tons of scrap and pig iron, a drop of 42 percent from 1945. Of the total puddling-furnace melt in 1946, 3,235 tons were scrap compared with 7,824 tons during the previous year. The bulk of the consumption was in Kentucky, whereas in 1945 Pennsylvania was the largest consuming State.

[1] Included with total for United States.

Blast Furnaces.—Materials other than scrap constitute by far the largest proportion of the blast-furnace charge and in 1946 consisted of 68,583,881 short tons of iron and manganiferous ores, 11,837,506 tons of sinter, 2,621,570 tons of mill cinder and roll scale, 3,043,713 tons of open-hearth and Bessemer slag, 74,803 tons of raw flue dust, and 38,101 tons of miscellaneous materials.

Total consumption of scrap in 1946, as reported by 68 plants operating blast furnaces, was 2,272,938 short tons, a 32-percent decrease from 1945. These figures do not include 8,242 tons of home and 10,039 tons of purchased scrap used in blast furnaces in the manufacture of ferro-alloys. The scrap charged to blast furnaces was divided into 51 percent home and 49 percent purchased, compared to 39 and 61 percent, respectively, in 1945 and 1944. The proportion of scrap used to pig iron produced was 5.1 percent compared with 6.3 percent in 1945; purchased scrap accounted for 2.5 percent and home scrap 2.6 percent in 1946.

[1] Does not include scrap used for the production of ferro-alloys.

USE OF SCRAP IN FERRO-ALLOY PRODUCTION

The production of ferro-alloys in 1946 consumed 275,850 short tons of scrap, a 12-percent decrease from 1945. Purchased scrap accounted for 94 percent of the quantity used and home scrap 6 percent—the same percentages as in 1945.

Twenty ferro-alloy plants used ferrous scrap in 1946 compared with 21 in 1945. Of the scrap consumed in this industry, 4 percent was used in blast furnaces and 96 percent in electric furnaces; and 253 tons were used in the aluminothermic process.

Of the 20 ferro-alloy plants which used iron and steel scrap in 1946, 3 operated blast furnaces and 17 employed electric furnaces. One of the latter group also used the aluminothermic process.

Consumption of ferrous scrap by ferro-alloy producers in the United States in 1946, by districts and States, in short tons

MISCELLANEOUS USES

As in 1945, slightly less than 2 percent of the 1946 consumption of scrap was for miscellaneous purposes, such as rerolling, in nonferrous metallurgy, and as a chemical agent. The quantity so used—977,703 short tons—was an increase of 2 percent over that used for these purposes in 1945. Of the quantity used, 94 percent was purchased and 6 percent home scrap.

[1] In addition, 1,191 tons of pig iron were consumed in miscellaneous uses in Montana during 1946.

STOCKS

Complete iron and steel-scrap stock figures covering 1946 year-end stocks are not available; producers (railroads and manufacturers) were not canvassed. Dealers and automobile wreckers reporting to the Bureau of Mines had 398,020 short tons of materials on hand December 31, 1946, compared with 720,201 short tons at the end of 1945, a decrease of 322,181 short tons or 45 percent. A special canvass of all dealers in October 1946 revealed that the dealers reporting regularly held approximately 78 percent of the stocks. The dealers not reporting regularly indicated that their stocks had shown a decline at that time. Therefore, it is evident that stocks of all suppliers decreased for the year. Total stocks of iron and steel scrap on hand December 31, 1946 (exclusive of producers), totaled 3,795,441 short tons, representing a decrease for the fourth consecutive year.

Most of the decrease in 1946 was due to the 45-percent drop in suppliers' stocks and a 20-percent decrease in consumers' stocks of purchased scrap. There was virtually no change in home-scrap stocks at the end of 1946 from those at the end of 1945, as most of this is recycled material which is recharged continuously.

Consumers' Stocks.—Consumers' stocks of home and purchased iron and steel scrap on December 31, 1946, totaled 3,397,421 short tons—a decrease of 526,782 short tons or 13 percent from the beginning of the year. Stocks of home scrap (1,230,276 tons) were virtually unchanged, but purchased scrap (2,167,145 tons) decreased 20 percent. Stocks of pig iron on December 31, 1946 amounted to 915,168 short tons, a 26-percent decrease from the 1,237,058 tons on hand December 31, 1945.

Suppliers' Stocks.—Stocks of iron and steel scrap in the hands of dealers (387,104 tons) and automobile wreckers (10,916 tons) totaled 398,020 short tons on December 31, 1946, compared with 720,201 tons on December 31, 1945—a drop of 45 percent.

Consumers' stocks of ferrous scrap and pig iron on hand in the United States on Dec. 31, 1945, and Dec. 31, 1946, by States and districts, in short tons

FOREIGN TRADE[1]

Imports.—Imports of iron and steel scrap in 1946 decreased 35 percent in quantity (30,228 short tons compared with 46,271 tons in 1945) and 52 percent in value ($266,733 compared with $555,471 in 1945). Of the 1946 imports, 10,512 tons came from Canada, 7,451 from Venezuela, 5,573 from Curaçao, 2,807 from Jamaica, 2,487 from Cuba, and the remainder in small tonnages from other countries. In addition, 27,473 tons of tin-plate scrap were imported (25,911 tons from Canada) compared with 20,240 tons in 1945.

Exports.—Exports of ferrous scrap from the United States in 1946 were 149,106 short tons valued at $3,384,514, a 56-percent increase in tonnage over 1945 and a 31-percent increase in value. Exports exceeded imports by 118,878 short tons (not counting 27,473 tons of imported tin-plate scrap). The tonnage exported amounted to 5 percent of the 5-year prewar average (for 1935–39) of 3,298,326 tons a year, compared with 3 percent during 1945. The high domestic requirement for scrap and the continued shortage of scrap are the reasons for the continued low level of exports. The 1946 exports included 12,826 tons of tin-plate scrap, circles, strips, cobbles, and waste and terne-plate clippings and scrap valued at $1,052,160. The same materials in 1945 amounted to 16,475 tons valued at $1,359,360. The accompanying table shows the principal countries to which scrap was exported during the period 1942–46.

WORLD REVIEW

Eire.—The small steel operations of the Irish Steel Co., Ltd., were not resumed until July 1946, when the first 35-ton open-hearth furnace was put into operation, and it was not until late in the year that indications showed that a substantial part of the capacity of 5,000 tons would soon be utilized.[2]

The scrap supply in Eire is protected by an export regulation which gives Irish industry the option of purchase on all scrap before it may be exported. Therefore, scrap producers must inform plants of scrap available, and if it is required by industry it cannot be exported. Opinions vary as to the quantity of scrap available in Eire. Some estimates are as high as 30,000 tons per year, while others indicate that Eire may have to import some scrap for future domestic requirements.

France.—It was reported in August that during the following 12 months France was to supply Belgium and Luxembourg with 15,000 tons of scrap iron from North Africa.[3]

Japan.—Previous to World War II, Japan used more than 50 percent scrap in its open-hearth furnaces. This requirement for scrap was covered by heavy imports from the United States and other countries. To make the Japanese industry less dependent on foreign sources for scrap the Japanese Government in 1937 and 1938 took steps to force the industry to increase the proportion of pig to scrap in the furnace charge. Consequently, the production of pig iron was increased from approximately 1,000,000 metric tons in 1932 to over 4,000,000 tons in 1942, and a goal was set for the use of 70 percent pig iron to 30 percent scrap in the furnace charge. The open-hearth mixture reached approximately 65 percent pig and 35 percent scrap by the end of the war.[4]

United Kingdom.—The supply of iron and steel scrap in the United Kingdom was adequate for most of 1946. However, during the last quarter of the year there were signs of a severe shortening of supplies. The Cleveland district, which had reported adequate supplies as late as October 1946, was having difficulty in supplying steel mills in the latter part of November and during December. Deliveries in South Wales also dropped off during the last 2 months of the year but had been satisfactory earlier. Suppliers seemed able to meet demands for scrap in the Birmingham district throughout the year. Consumers in the Midlands, Lancashire, and Yorkshire were using scrap as fast as it became available. The supply of the better grades of scrap in Scotland was becoming scarce at the close of the year.

GENERAL SUMMARY

LEAD production from domestic mines dropped 14 percent in 1946 and, for the first time on record, was exceeded by the smelter production of secondary lead. The supply of refined lead available for consumption continued to decline despite an advance in price to an unprecedented 12.55 cents per pound at the year's end. Domestic mine production of lead and refinery output from domestic ores and base bullion declined to the lowest levels since 1935 and 1933, respectively. Total output of refined lead at primary refineries fell 25 percent, and antimonial lead production decreased 11 percent. Imports of lead-bearing materials urgently needed to offset the decreasing domestic mine output dropped to the lowest level since 1939. Outstanding among the many factors that restricted production during the year were prolonged labor strikes at mines, mills, smelters, and refineries; continued labor shortages, which prevented capacity operations at many producing plants; uncertainty regarding extension of the Office of Price Administration and ceiling prices; and the consequent unstable price structure during the month when OPA was inoperative. The national railroad and coal-mine strikes in May, though lesser factors, further retarded domestic lead production.

In contrast to the slump in the domestic output of primary lead, the smelter production of secondary lead—always a substantial source of the heavy metal—increased 8 percent over the 1945 output. Secondary lead recovery in 1946 exceeded the total domestic refined primary lead production by 13 percent and surpassed the domestic mine output of recoverable lead for the first time on record. Consumption of refined lead, which declined 17 percent from 1945, was limited through provisions of Civilian Production Administration General Preference Order M–38 and the general inability of consumers to

[1] This report deals primarily with the smelting, refining, and consuming phases of the industry. For full details of domestic mining operations, see separate reports issued for the various States.

obtain full allocations as allotted by the Civilian Production Administration.

The Government stock pile of refined lead was reduced to 45,493 tons at the end of 1946, approximately two-thirds of the quantity available for allocation at the beginning of the year. Stocks at primary smelters and refineries (physical inventory) gained 9 percent during 1946. Consumers' inventories declined 59 percent from 1945.

Ceiling prices on virtually all commodities, including lead, were removed in November. Other Government controls of the lead industry that were revoked included removal of import restrictions (which had prevented public purchases of foreign lead), the 5-year-old General Preference Order M–38, Lead Chemical Order L–354, and Order L–355 pertaining to use of lead for manufacture of tetraethyl fluid.

Salient statistics of the lead industry in the United States, 1925–29 (average) and 1942–46, in short tons

[1] Data include lead imported for immediate consumption plus material entering the country under bond.
[2] Includes 3,874 tons of foreign lead reexported in 1942, 11,258 tons in 1943, less than 1 ton in 1944, 377 tons in 1945, and 103 tons in 1946, according to records of the U. S. Department of Commerce.

Figure 1 shows trends in the domestic lead industry since 1900.

LABOR PROBLEMS

Most significant among the many labor problems confronting operators during 1946 were the widespread labor strikes at principal mines, mills, smelters, and refineries that paralyzed the industry during the first half of the year. Work stoppages began in Utah on January 21, when approximately 1,300 workers at the mining and smelting operations of the American Smelting & Refining Co. and the United States Smelting, Refining & Mining Co. went on strike following collapse of negotiations for increased wages. Strike conditions spread rapidly; and on February 25 workers in virtually every lead-mining, milling, and smelting operation of the American Smelting & Refining Co. joined in the dispute. Lead-zinc mining and milling

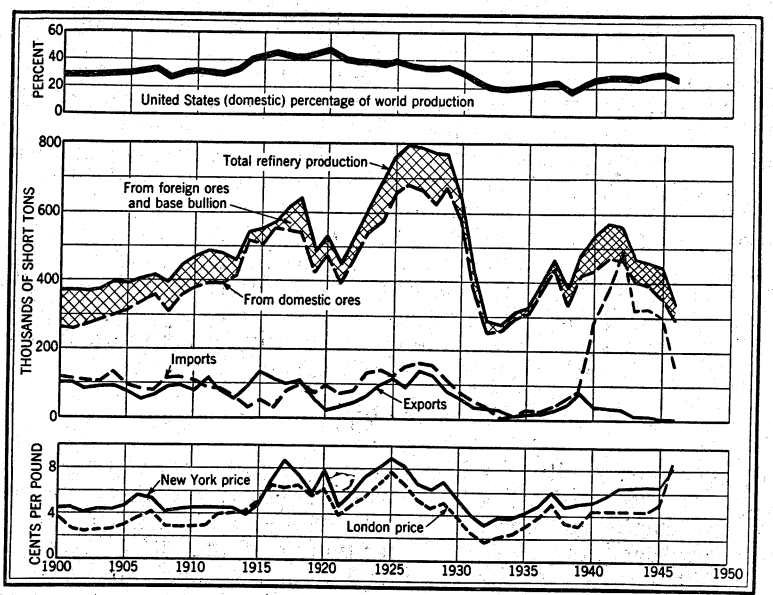

FIGURE 1.—Trends in the lead industry in the United States, 1900–46. Imports include lead in ore, base bullion, pig lead, and scrap; exports include pigs, bars, and scrap lead exported in manufactures with benefit of draw-back. Data on lead exported in manufactures with benefit of draw-back not available for 1945–46.

operations of the Phelps Dodge Corp. at Bisbee, Ariz., were closed by strike on March 20, along with certain of the corporation's Arizona, Texas, and New York copper mining and metallurgical operations. Although the smelter strikes did not materially affect the output of the Nation's large lead mines, many small operations with limited storage facilities and dependent upon prompt payment of smelter returns for operating expenses were forced to close. Virtually all strikes at lead mines, mills, smelters, and refineries were settled by the end of June, although one of brief duration occurred at the mines and mills of the St. Joseph Lead Co. in the Southeastern Missouri districts during the last week in October.

The shortage of mine and mill labor continued to be a potent factor limiting domestic mine output during 1946. The predicted return to the mines of former employees who migrated to the cities for high-paying wartime jobs fell far short of expectations. Likewise, a large percentage of the labor supply that entered the armed services during the war did not return to the mines and mills upon demobilization. The manpower supply problem, however, was considered by most operators to have improved somewhat by the end of 1946.

GOVERNMENT REGULATIONS

Lead continued under Government control during most of 1946 through provisions of Civilian Production Administration General Preference Order M–38. In operation, the order prohibited use of lead for certain purposes but permitted varying freedom in its consumption in essential uses. Several amendments were issued during the year changing quotas (usually to a lower level) of lead permissible

for certain uses. Upon almost unanimous recommendations of the lead producing and consuming industries, the Civilian Production Administration revoked Order M–38 on December 27, thus virtually ending the Government control of lead that began in October 1941.

CPA Limitation Order L–354, affecting the use of lead in the manufacture of lead chemicals, and Order L–355, limiting consumption of lead for tetraethyl lead, were operative until revocation December 27.

Government control on imports of lead as outlined in CPA General Import Order M–63 were eliminated, effective November 18.

Subsidy payments under the Premium Price Plan for overquota production were continued through June but collapsed with the expiration of OPA and ceiling prices June 30. Upon reestablishment of the OPA, provisions were made for retroactive premium payments to cover the period when no plan was in effect.

TARIFF

In accordance with the Mexican Trade Agreement of January 30, 1943, the tariff on lead-bearing ores, flue dust, and mattes remained at three-fourths cent per pound (lead content) and lead bullion, pigs, bars, scrap lead, etc., 1$\frac{1}{16}$ cents per pound during 1946. A provision of the agreement permits the increase in the tariff on lead-bearing ores, flue dust, and mattes to 1$\frac{1}{8}$ cents per pound (lead content), and lead bullion, pigs, bars, scrap lead, etc., to 1$\frac{7}{10}$ cents per pound 30 days after the war emergency is officially terminated.

DOMESTIC PRODUCTION

Statistics on lead output may be prepared on a mine or smelter and refinery basis. The mine-production data compiled on the basis of lead content in ore and concentrates and adjusted to account for average losses in smelting are the most accurate measure of production from year to year. The pig-lead output, as reported by smelters and refiners, presents a more precise figure of actual lead recovery but generally differs from the mine figure due to the overlap or lag between mine shipments and smelter receipts of ore and concentrates. These inequities, however, tend to balance over a period of years.

MINE PRODUCTION

The mine production of recoverable lead (including that made into pigments) from domestic mines in the United States and Alaska decreased 14 percent in 1946, was 32 percent under the war-period peak in 1942, and was 49 percent below the average production in the period 1925 through 1929. The domestic mine production of lead comes principally from three areas—Southeastern Missouri; the Tri-State area (Joplin region), embracing southwestern Missouri, southeastern Kansas, and northeastern Oklahoma; and the Western States (principally Idaho, Utah, Arizona, Colorado, and Montana). Of the total produced in the United States in 1946, about 67 percent came from the output of 25 mines. Missouri again ranked first in the production of lead, and the Southeastern Missouri district continued to be the largest lead-producing area, supplying 40 percent of the total domestic output. The St. Joseph Lead Co. continued,

as in the past, to produce the bulk of the output from its Bonne Terre, Desloge, Federal, and Leadwood groups of mines. Each mine is equipped with a mill; the four have a combined daily capacity of 21,400 tons of ore. The Tri-State area produced 7 percent of the total domestic output in 1946 compared with 6 percent in 1945. The Western States contributed 49 percent of the total domestic production despite a decline of 10 percent from 1945. Idaho continued to be the largest producer of lead in the Western States and second largest in the United States, notwithstanding a production decline of 12 percent and the smallest output of any year since 1899. About 94 percent of the State total lead came from the Coeur d'Alene region. Five properties in Idaho produced 52 percent of the State total lead, and of the total 82 percent came from zinc-lead ore and old tailings from the Coeur d'Alene region. Although lead output in Utah, the lowest since 1899, dropped 25 percent below the 1945 production, the State continued to rank second among the Western States. The United States & Lark property of the United States Smelting, Refining & Mining Co. in the West Mountain (Bingham) district remained first among the State lead producers. About 83 percent of the State total lead was recovered from zinc-lead ore. Lead production in Arizona was the largest in any year in the history of the State and 5 percent greater than in 1945. The Copper Queen mine of the Phelps

[1] Includes production from Smelter district in Utah; Bureau of Mines not at liberty to publish separate figures.

A study of the monthly mine-output figures since January 1941 discloses production trends that are obscure in the annual figures. Output from April through December 1941 remained fairly constant, with a stabilized price of 5.85 cents per pound, New York. Production increased sharply in January 1942, however, as a result of Government action January 13, which established the ceiling price of lead at 6.50 cents, New York. Peak monthly output of 45,305 short tons was reached in March. Labor shortages at mines, mills, and smelters developed rapidly thereafter owing largely to the lure of high wages at Government construction projects and expanded war industries and to the absorption of personnel by the armed forces. Despite an

Army furlough in October 1942 of 4,000 soldiers for service in the mines and the financial assistance available to producers through provisions of the Government's Premium Price Plan which became effective February 1, 1942, mine production declined steadily, almost without exception, through the remainder of 1942 and the following 3 years. Production declined even more precipitously during the first half of 1946 as a result of widespread labor strikes. Except for 1933, the domestic mine output in June was lower than the average monthly production of any year since the beginning of annual records in 1907.

Mine production of recoverable lead in the United States, 1941–46, by months, in short tons [1]

Month	1941	1942	1943	1944	1945	1946

[1] Monthly data for 1941–44 were based largely on smelter receipts, whereas those for 1945 and 1946 represent actual mine output. All monthly figures have been adjusted to final annual mine production totals.
[2] Monthly average for first quarter; actual monthly figures not available.

The 25 leading lead-producing mines in the United States in 1946, listed in the following table, yielded 67 percent of the total domestic lead output; the 6 leading mines produced 42 percent and the 9 leading mines 50 percent.

Detailed information on the production of mines and districts in the United States may be found in the chapters of this volume dealing with the mine production of gold, silver, copper, lead, and zinc in the various States.

SMELTER AND REFINERY PRODUCTION

Pig lead in the United States is derived from three main sources—domestic mine production, imports of foreign ore and base bullion, and secondary smelter output from scrap material—and is produced at primary plants that treat ore, base bullion, and small quantities of scrap and at secondary plants that process scrap exclusively. Of the eight primary smelters operating in the Western States, only two (Selby, Calif., and Bradley, Idaho) produce refined merchant lead. The other six plants produce only base bullion (containing approximately 98 percent lead plus gold, silver, and small quantities of impurities recovered from the ore smelted), which is shipped to refineries in the Middle Western and Eastern States for recovery of the gold and silver and purification of the lead to meet commercial requirements. Both primary and secondary smelting plants may make

refined lead or antimonial lead. Because of the large quantity of hard lead—such as battery scrap—melted at secondary smelters, the output from this type of operation is essentially antimonial lead alloys. Statistics on the production of refined lead and alloys at secondary plants are given in the Secondary Lead section of this chapter. The 16 primary smelters and refineries in operation in the United States in 1946 consumed 353,197 short tons (lead content) of ore and concentrates, 12 percent of which was of foreign origin, compared with 454,778 tons in 1945, 19 percent of which was foreign.

ACTIVE LEAD SMELTERS AND REFINERIES

Primary lead smelters and refineries operating in the United States in 1946 were as follows:

California: Selby—Selby plant, American Smelting & Refining Co. (smelter and refinery).
Colorado: Leadville—Arkansas Valley plant, American Smelting & Refining Co. (smelter).
Idaho: Bradley—Bunker Hill Smelter (smelter and refinery).
Illinois: Alton—Federal plant, American Smelting & Refining Co. (smelter and refinery).
Indiana:
East Chicago—International Smelting & Refining Co. (refinery). Purchased by the Eagle-Picher Co., September 27, 1946.
East Chicago—U. S. S. Lead Refinery, Inc. (refinery).
Kansas: Galena—Galena plant, Eagle-Picher Co. (smelter and refinery).
Missouri: Herculaneum—Herculaneum plant, St. Joseph Lead Co. (smelter and refinery).
Montana: East Helena—East Helena plant, American Smelting & Refining Co. (smelter).
Nebraska: Omaha—Omaha plant, American Smelting & Refining Co. (refinery).
New Jersey:
Barber—Perth Amboy plant, American Smelting & Refining Co. (smelter and refinery).
Carteret—United States Metals Refining Co. (refinery).
Texas: El Paso—El Paso plant, American Smelting & Refining Co. (smelter).
Utah:
Midvale—Midvale plant, United States Smelting, Refining & Mining Co. (smelter).
Murray—Murray plant, American Smelting & Refining Co. (smelter).
Tooele—Tooele plant, International Smelting & Refining Co. (smelter).

REFINED LEAD

Primary refineries in the United States in 1946 produced 346,210 short tons of refined lead, a decline of 25 percent from the 1945 output of 462,110 tons.

Of the 338,197 tons of primary lead produced in 1946, domestic ores and base bullion supplied 87 percent and foreign ores and imported base bullion 13 percent. In 1945 the origin was 80 percent domestic and 20 percent foreign. The quantity of refined lead produced from foreign base bullion has been negligible since 1943. The following tables give the production of refined lead by sources and by country of origin of the ore. Details of the sources of lead from domestic ores are given in the Mine Production Section of this chapter.

Refined lead produced at primary refineries in the United States, by sources, 1942–46, in short tons

ANTIMONIAL LEAD

Antimonial lead production at primary refineries dropped to 50,480 tons in 1946, 11 percent under the 1945 output. The distribution of the lead, according to source, is shown in the following table. The quantity of antimony contained in antimonial lead produced in 1946 dropped to 6.5 percent owing to a greater demand for low-percentage alloys for use in the manufacture of such items as type metal, cable covering, sheet and pipe, and collapsible tubes and foil. Although antimonial lead is an important byproduct of the refining of base bullion, the quantity derived from this source is only a small part of the annual domestic output. The major production is recovered from the smelting of antimonial lead scrap at secondary smelters. Production data from lead-smelting plants treating scrap materials exclusively are summarized in the following section and discussed in detail in the Secondary Metals—Nonferrous chapter of this volume.

Antimonial lead produced at primary lead refineries in the United States, 1942–46

Year	Production (short tons)	Antimony content		Lead content by difference (short tons)			
		Short tons	Percent	From domestic ore	From foreign ore	From scrap	Total

1946	50,480	3,285	6.5	11,196	2,149	33,850	47,195

SECONDARY LEAD

Some scrap lead is treated at primary smelters and refineries, but the greater part is received at a large number of plants that treat secondary materials exclusively. Secondary lead is recovered in the form of refined lead, antimonial lead, and other alloys. Recovery at primary and other plants in 1942–46 is shown in the following table. Secondary lead recovery in 1946 exceeded the total domestic refined primary lead production by 13 percent and surpassed the domestic mine output of recoverable lead for the first time on record. Further details appear in the Secondary Metals—Nonferrous chapter of this volume.

LEAD PIGMENTS

The principal lead pigments are litharge, white lead, red lead, sublimed lead, leaded zinc oxide, and orange mineral. These products are manufactured for the most part from metal, but some ore and concentrates are converted directly to pigments. Details of the production of lead pigments are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

CONSUMPTION AND USES

A survey of 575 plants in 1946 representing an estimated 98 percent of the consumers of refined lead indicated a total consumption of 530,588 short tons of refined lead, a decrease of 17 percent from 1945. Some secondary as well as primary refined lead is included in this

figure. Antimonial lead, unrefined scrap lead, and lead in alloys are excluded. Of the total consumed, 24 percent was used for making red lead and litharge; 13 percent for cable covering; 11 percent for storage batteries; 9 percent for tetraethyl fluid; 8 percent for white lead; 6 percent for solder; 5 percent for pipes, traps, and bends; 5 percent for sheet lead; 3 percent for ammunition; and 16 percent for a variety of products and uses shown in the following table. A distribution of the total consumed by related uses indicates 51 percent consumed for metallic products, 32 percent for pigments, 11 percent in chemical products, and 6 percent in miscellaneous uses, such as annealing, galvanizing, lead plating, and weights and ballast.

Reports to the Civilian Production Administration indicated a consumption of 956,476 tons of primary, antimonial, and secondary lead in 1946 compared with 1,051,602 tons in 1945.

Consumption of refined lead in the United States, 1942–46, by uses, in short tons

The following table shows the calculated apparent shipments of refined primary lead to domestic consumers. The apparent shipments of 477,686 tons in 1946 are probably more nearly correct than the actual receipts of 459,502 tons reported by consumers, because of incomplete coverage of the survey.

Apparent shipments of refined primary pig lead to domestic consumers, 1942–46, in short tons

[1] Estimate based upon American Bureau of Metal Statistics data.
[2] Revised figure.
[3] According to reports submitted to the Tin-Lead-Zinc Division of the Civilian Production Administration.
[4] Includes 3,874 tons of foreign refined lead reexported in 1942, 11,258 tons in 1943, less than 1 ton in 1944, 377 tons in 1945, and 103 tons in 1946, according to records of the U. S. Department of Commerce.

STOCKS

Producers' Stocks.—Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in the following table. Stocks of refined and antimonial lead include metal held by all primary refiners and by some of the refiners of secondary material who produce soft lead, plus foreign lead smelted and refined in the United States and entered for domestic consumption. According to monthly reports released by the American Bureau of Metal Statistics, stocks of refined lead and antimonial lead declined erratically from a high of 51,929 tons in February to a low of 31,396 tons in August, after which stocks advanced steadily to a year-end total of 48,499 tons—a net gain of 11 percent from January 1.

Lead stocks at end of year at smelters and refineries in the United States, 1942–46, in short tons

[American Bureau of Metal Statistics]

	1942	1943	1944	1945	1946
Refined pig lead	28,815	28,821	15,602	35,853	41,057
Antimonial lead	6,122	4,269	3,934	7,893	7,442

Lead in base bullion—					
At smelters and refineries	7,359	8,640	7,333	8,618	8,453
In transit to refineries	1,706	3,112	3,331	4,889	4,911
In process at refineries	13,925	16,020	14,473	15,097	16,042
Total	22,990	27,772	25,137	28,604	29,406
Lead in ore and matte and in process at smelters	59,247	68,678	80,461	89,462	111,836
Grand total	117,174	129,540	125,134	161,812	189,741

The Bureau of Mines annual survey of primary lead smelters and refiners indicated stocks of 37,691 tons (lead content) of refined lead at plants on January 1, 1946, and 40,963 tons on December 31, 1946. Primary antimonial lead stocks at these same plants decreased from 6,773 short tons (lead content) at the beginning of 1946 to 5,935 tons at the end of the year. In terms of lead content, stocks of ore at the 16 operating smelters and refineries increased 23 percent from 59,095 tons to 72,400 tons during the same period. The inventory of base bullion at refineries that receive base bullion as a raw material and at smelters that produce base bullion for shipment to refineries totaled 7,125 tons at the beginning of January and 7,581 tons at the end of December 1946. Stocks of "in process" base bullion or work lead at five combination smelter-refinery plants are not included in reports to the Bureau of Mines. No direct comparison can be made between these data and the figures of the American Bureau of Metal Statistics. Figures reported to the Bureau of Mines represent physical inventory at the plants, irrespective of ownership, and do not include material in process or in transit.

Consumers' Stocks.—Approximately 575 consumer plants reported stocks of 41,914 tons of domestic and foreign refined lead on hand December 31, 1946, a 59-percent decrease from the 102,937-ton inventory (revised figure) reported at the end of 1945.

Consumers' stocks of refined soft lead at the end of 1945 and 1946, by grades, in short tons

	Domestic and foreign					Foreign (all grades)
	Corroding	Chemical	Common	Other	Total	
Dec. 31, 1945 [1]	33,428	22,040	46,277	1,192	102,937	4,264
Dec. 31, 1946	10,593	9,856	18,777	2,688	41,914	2,986

[1] Revised figures.

Government Stocks.—Industry-owned stocks were augmented by a supply of Government-owned lead stored at strategic points throughout the United States for allocation to consumers as needed. According to reports submitted to the Civilian Production Administration, Government stocks of refined lead (all corroding grade) were 45,493 short tons on December 31, 1946, compared with 68,700 tons of refined lead on January 1, 1946. Of the 45,493 ton inventory at the end of 1946, about 8,400 tons were stored outside the continental United States and approximately 16,000 tons were enroute by boat to east coast ports.

PRICES

The two major markets for lead in the United States are New York and St. Louis; much of the lead produced domestically is sold at prices normally based upon quotations in these markets. Since suspension of trading on the London Metal Exchange in September 1939, the London market has had no direct influence on New York quotations, and the differential between St. Louis and New York prices has remained at 0.15 cent a pound, an amount approximating the freight charges between the two points.

Announcement by the Office of Price Administration May 29, 1946, of a higher ceiling price for lead, effective June 3, increased the long-established 6.50-cents-a-pound base price of lead, New York, to 8.25 cents. This new price level, although welcomed by the lead-mining industry, was considered by industry spokesmen to be somewhat below that necessary to effect a prompt relief of the prevailing lead shortage. A bill to extend the OPA in modified form was vetoed by the President on June 29, and on July 2 the price of lead advanced to 9.50 cents per pound, New York. With reestablishment of OPA by legislative action on July 25, the former ceiling price of 8.25 cents was restored and prevailed until November 10, the effective date of the Price Administrator's decontrol order, which included the removal of ceiling prices from all metals. The lead market, freed of price limitations and stimulated by brisk consumer bidding for a share of the inadequate supply, responded swiftly to decontrol, and on November 11 lead was quoted at 10.50 cents, New York. Following removal of lead import restrictions by the Civilian Production Administration on November 18, the price advanced to 11.80 cents, New York, which raised the market price to the prevailing import basis, plus freight and duty charges. On December 16 domestic producers advanced the price to 12.55 cents, New York, the highest level on record. The previous record high, which prevailed for a brief period in June 1917, was 12.25 cents, New York.

The general policy of the Quota Committee pertaining to the Premium Price Plan for overquota mine production of domestic lead (copper and zinc were also included) prevailed through June but collapsed with the expiration of OPA and ceiling prices on June 30. Upon reestablishment of the OPA in late July provisions were made for retroactive premium payments to cover the period when no plan was in effect. The Premium Price Plan was extended until June 30, 1947, under the same terms as in the past except that incorporated in the subsidy section of the bill extending the OPA was a provision that "adjustments shall be made to encourage exploration and development work and adequate allowances for depreciation and depletion." The bill further provided that all classes of premiums were noncancelable unless necessary in order to make individual adjustments of income to specific mines. With the abandonment of metal price ceilings on November 9, subsidies to mines financially aided by the Premium Price Plan were computed with average monthly market quotations as a base. A compilation of important data showing production of lead under the Premium Price Plan, 1943–46, at the various quota levels and the payments made is given in the accompanying table.

The official London maximum price of £30 per long ton, duty paid, for Empire and foreign soft lead, fixed by the British Ministry of Supply June 11, 1945, was advanced to £39 January 15, 1946. Subsequent price advances during the year occurred April 8 and July 1, when quotations rose to £45 and £55, respectively. The London price remained unchanged the balance of the year but was raised to £70 per long ton beginning January 1, 1947. Quotations of the London Metal Exchange, discontinued at the outbreak of the war in September 1939, were not resumed during 1946.

[2] Average price of foreign lead, converted to cents per pound with the pound sterling at $4.02½. Official maximum price raised on June 11, 1945; Jan. 15, 1946; April 8, 1946; and July 1, 1946.

FOREIGN TRADE [2]

Imports.—During 1946 imports of lead dropped to the lowest level since 1939 and were 68 percent below the record total of 1942. As in previous years, the greater part of the lead imported was in the form of pigs and bars, 48 percent of which came from Mexico and virtually all the remainder from Canada, Peru, Japan, and Australia. Receipts of lead in ore and matte, which constituted 28 percent of the total imports, were 37 percent under 1945, due largely to a sharp decline in imports from Australia, Peru, and Canada, which more than offset a moderate increase from Newfoundland. Imports of lead in ore and matte were principally from Newfoundland, Australia, Peru, Canada, and Bolivia, which together supplied 89 percent of these receipts. Imports of lead in base bullion—all from Peru—increased to 125 tons. Five countries supplied 88 percent of the total lead in all forms imported in 1946: Mexico 34 percent, Canada 18, Peru 13, Newfoundland 12, and Australia 11, compared with 54, 10, 16, 5, and 11 percent, respectively, for a total of 96 percent in 1945.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Total lead imported into the United States in ore, matte, base bullion, pigs, bars, and reclaimed, 1942–46, by countries, in short tons [1]

[1] In addition 3,874 tons of foreign lead were reexported in 1942, 11,258 tons in 1943, less than 1 ton in 1944, 377 tons in 1945, and 103 tons in 1946.
[2] Less than 1 ton.

WORLD REVIEW

Foreign production of lead was a subject of particular significance during 1946 in the light of the world-wide shortage in lead supplies. Data on lead output for 1946 outside the United States are fragmentary. It is believed, however, that production handicaps imposed by labor strikes, manpower shortages, and lack of fuel limited world output for 1946 to approximately 1,166,000 metric tons.

World production of lead, 1939–46, in metric tons [1]

[Compiled by B. B. Mitchell]

[1] By countries where smelted but not necessarily refined. Data derived in part from Statistical Year Book of the League of Nations and from the American Bureau of Metal Statistics (annual issue).
[2] Approximate production.
[3] Data not yet available; estimate by author of chapter included in total.
[4] Exclusive of secondary material. Beginning in October 1939 includes Upper Silesia. Data from Metallgesellschaft, Frankfort on Main.
[5] Includes Northern Territories and Sub-Carpathia; in addition beginning in 1941, includes Eastern Hungary and Transylvania; and beginning in 1942 includes Southern Territories.
[6] January to June, inclusive.
[7] Preliminary data.
[8] South Korea only.
[9] Figures cover lead refined from domestic and foreign ores; refined lead produced from foreign base bullion not included.
[10] Estimated by author of chapter.

Argentina.—Lead production in Argentina, though not large, has considerable importance, as it supplies domestic needs and affords a substantial surplus of lead concentrates for export. Because of the smelting facilities in Argentina, several thousand tons of high-grade lead ores are imported each year from Bolivia. At the National Lead Co. smelter at Puerto Vilelas, Bolivian ore is mixed with the lead concentrates from the Aguilar district, Province of Jujuy. The Compania Minera Aguilar, S. A., subsidiary of the St. Joseph Lead Co.,

supplied virtually all the Argentine mine output of lead in 1946 from its property at Tres Cruces in the Aguilar district. The mine operated at approximately 60 percent capacity during most of the year owing to a persistent shortage of railroad rolling stock, which prevented adequate shipments of fuel oil, mine timber, and miscellaneous supplies to the mine and the movement of concentrates therefrom. The production of lead concentrates at the Aguilar mine in 1946 was 22,031 metric tons compared with 22,022 tons in 1945.

Australia.—During 1946 the Zinc Corp., Ltd., treated 448,037 tons of ore, from which 79,313 tons of lead concentrates were recovered, compared with 425,542 tons and 81,490 tons, respectively, in 1945. At the New Broken Hill Consolidated property, adjoining the Zinc Corp. on the south and managed by that company, ore output was increased from 3,468 tons in 1945 to 41,723 tons in 1946. Lead concentrate production increased tenfold to 3,851 tons.

The Lake George Mining Corp., Ltd., at Captain's Flat, New South Wales, produced 135,244 tons of ore in 1946, from which 12,599 tons of lead concentrates were recovered. Ore reserves at the year's end were estimated at 1,382,753 tons assaying 1.1 dwt. gold and 1.44 ounces of silver per ton, 7.24 percent lead, 12.35 percent zinc, and 0.68 percent copper.

A shortage of skilled labor and lagging development work were named by the Electrolytic Zinc Co. of Australasia as the principal factors limiting mine output in the year ended June 30, 1946. Mine production totaled 118,343 tons assaying 1.96 dwt. gold and 6.89 ounces of silver per ton, 18.92 percent zinc, 5.64 percent lead, and 0.53 percent copper, from which about 7,400 tons of lead concentrates containing 59 percent lead were recovered.

Austria.—Lead-zinc ore averaging 11 percent lead and 5 percent zinc was produced at the Bleiberg mine, 30 miles west of Klagenfurt in Carinthia. No ore was produced in 1945 following the German surrender in May, but 34,000 metric tons were mined in 1946. The production of lead and zinc concentrates was estimated at 1,400 and 1,500 tons, respectively. Refined lead is produced at Bleiberg in quantities sufficient to meet normal domestic requirements.

Bolivia.—Exports of lead concentrates totaled 9,297 short tons in 1946, a decline of 11 percent from the quantity shipped in 1945.

Burma.—No production was recorded from the Bawdwin mine of the Burma Corp., Ltd., in 1946. The company proceeded with salvage operations and rehabilitation of installations destroyed during the Japanese occupation. The mill at Namtu was completely wrecked by the Japanese; but the smelter, also at Namtu, was only slightly damaged. The hydroelectric plant at Mansam Falls, about 25 miles from Namtu, one of four originally operated by the company, was restored to provide power for unwatering operations at the mine. Officials of the Burma Corp., Ltd., indicated late in 1946 that the possibility of full-scale production at the Bawdwin mine before mid-1949 appeared unlikely. Factors delaying the resumption of mining and smelting operations were the uncertain political situation in Burma; the limited ore reserves remaining at the property; current high cost of operations; and the major construction necessary to restore railway communications with Rangoon.

Canada.—Although lead production increased slightly in Canada in 1946, the level of output remained considerably below the wartime peak in 1942. At Trail, British Columbia, the Sullivan mine of the Consolidated Mining & Smelting Co., which operates the only Canadian lead smelter and electrolytic lead refinery, continued to be the principal source of Canadian lead production. Refined lead produced at the Trail smelter increased to 165,744 tons from 163,142 tons in 1945. Ore reserves at the end of the year showed a net increase of about 3 million tons, 25 percent of which was new ore and the remainder from recalculations of existing reserves made possible by a series of new geological studies. The company reports that ore reserves in 1946 were greater than in April 1940, when positive and probable ore reserves were estimated to be sufficient for more than 20 years' operation at the then existing rate of extraction. During 1946 construction was begun on a new underground crushing plant located near the center of the mine, a 4-mile haulageway to the concentrator (which will be used to return waste rock for back-fill), and an addition to the mill for preliminary treatment of the ore by the sink-float method. Completion of these projects, which are estimated to cost about $3,000,000, is anticipated by the summer of 1948.

Other producing mines in British Columbia, all of which were closed during a portion of the year by labor strikes, included the Base Metals Mining Corp., Ltd., which shipped lead and zinc concentrates from the Monarch and Kicking Horse mines at Field; the Santiago Mines, Ltd.; and the Zincton Mines, Ltd.

The New Calumet Mines, Ltd., at Calumet Island, Quebec, during 1946, milled 208,860 tons of ore, from which 3,725 tons of lead were recovered. All the lead concentrates produced during the year were sold to Belgian smelters. Ore reserves on September 30, 1946, were estimated at 944,964 tons, assaying 5.46 ounces of silver, 0.022 ounce of gold per ton, 2.7 percent lead, and 9.2 percent zinc.

France.—Although French lead output in 1946 was about 82 percent of that in prewar 1938, production was far short of the domestic requirements. The lack of coal and—to a lesser extent—shortage of manpower continued to limit output.

Hungary.—Lead production in Hungary dropped to the pre-1941 level as a result of a treaty signed in 1946 that restored Transylvania to Rumania. The increased output of lead in 1941–43 was accounted for by the annexation of Transylvania August 30, 1940.

Italy.—Zinc-lead mines in Italy in 1946, produced 206,115 metric tons of ore, from which 22,315 tons of lead concentrates, containing an average of 62 percent lead, were made. Production was curtailed, however, owing to inability of smelters to obtain sufficient coke to treat all ore produced.

Japan.—Since 1925 the Japanese lead industry has produced only 12 percent of the domestic lead requirements, and consumers were forced to rely heavily on imports of lead concentrates and refined lead. From the latter part of 1931 until the middle of 1945 the Japanese Government concentrated every effort on becoming self-sufficient in mineral supplies. Despite the urgency for expanded mine production following 1941, when virtually all sources of imports were cut off, Japanese lead mines were unable to produce more than 20 percent of the domestic

requirements. Partly refined lead from Korea and Manchuria filled another 20 percent of the needs, and the remainder was met by heavy withdrawals from stocks accumulated since 1934. Proved and probable ore reserves at the seven major zinc-lead producing mines, plus those of five other mines whose reserves are relatively large, total 18,660,000 metric tons averaging 1.4 percent lead and 6.5 percent zinc.

Salient statistics of the lead industry in Japan, 1940–45, in metric tons [1]

	1940	1941	1942	1943	1944	1945
Mine production of recoverable lead	16,649	16,409	18,334	20,058	16,100	4,660
Smelter production of refined lead	27,748	30,585	26,919	32,511	38,048	12,568
Imports:						
Crude lead and concentrates	10,593	14,182	7,031	10,831	21,092	4,426
Refined lead	92,091	78,532	950	4,393	2,586	182
Exports of refined lead	1,294					
Apparent domestic consumption	118,545	109,117	27,869	36,904	40,634	12,750

[1] Natural Resources Section Report 65, Zinc-Lead Resources of Japan. General Headquarters, Supreme Commander for the Allied Powers, Tokyo, 1947.

Mexico.—Labor strikes, poor railroad facilities, and high taxes were the principal factors limiting Mexican lead output in 1946. On December 31, 1945, a general strike of Mexican mine and smelter labor, originally scheduled for December 17, shut off lead output until the end of February 1946, when new wage scales were established and the workers returned to their jobs.

During the year an increasing proportion of Mexican lead production was shipped to destinations other than the United States. Because of the disruption of European markets during the war, large tonnages of Mexican production were exported to the United States. With the end of hostilities, however, European buyers were again bidding for Mexican lead at prices which, during most of 1946, were considerably higher than the ceiling price in the United States. Data on Mexican foreign lead trade for the first half of 1946 indicate that over 90 percent of the domestic production was exported, approximately 17 percent going to Europe, 5 percent to Brazil, and 78 percent to the United States.

Production at the Minas de Guerrero lead-zinc property in the Taxco Mining district owned and operated by Minas de Guerrero, S. A., a subsidiary of the Eagle-Picher Co., was virtually halted at the end of the year owing to depletion of ore reserves and shortage of labor. The company plans to dismantle the 800-ton selective flotation mill—erected in 1943—and move it together with all mining equipment to the Esmeralda mine in the Parral district, State of Chihuahua.

Exploration by the American Smelting & Refining Co. at the San Antonio mine in the Taxco district during mid-1946 reportedly disclosed a substantial tonnage of silver-lead-zinc ore. If certain contiguous claims can be acquired, the company will dismantle its flotation mill at Pedregal and rebuild it into a larger plant at San Antonio.

Newfoundland.—In Newfoundland about 384,000 short tons of ore were mined and milled during 1946, providing 39,727 tons of lead concentrates containing approximately 22,670 tons of lead.

Peru.—A continued shortage of labor and a cave-in at the Huaron mine were largely responsible for the decline in Peruvian lead production from 53,664 metric tons in 1945 to about 45,000 tons in 1946.

The 800-ton-per-day flotation plant of the Cerro de Pasco Copper Corp. treated copper ores exclusively until mid-1946, after which approximately equal tonnages of copper and zinc-lead ores were milled. Part of the lead concentrates produced was exported, and part was smelted at Oroyo.

The Compania Minero de Sayapullo, financed wholly by Peruvian capital, reopened the old mines at Sayapullo in the Department of Cajamarca. Exploration disclosed a substantial tonnage of lead-zinc-silver-cadmium ore sufficiently large to warrant construction of a 100-ton-a-day flotation mill, which was put into operation at the end of 1946.

The Banco Minero de Peru constructed a 100-ton-a-day flotation plant at Huachacolpa in the Department of Huancavelica designed to treat on a custom basis lead-zinc ores from a number of small mines in the district.

Exploration by the Picasso Bros. at the old Candalosa silver-lead property in the Castrovirreyna district of the Department of Huancavelica developed enough ore (including old dumps) to warrant construction of a 150-ton-a-day flotation mill.

Spain.—The mine production of lead concentrates in Spain from 1939 through 1946, in metric tons was as follows:

	1939	1940	1941	1942	1943	1944	1945	1946
Lead concentrates	31,700	57,800	46,300	45,000	46,200	48,400	37,050	53,600
Lead content	23,300	42,400	33,700	32,200	33,000	34,800	26,200	38,900

United Kingdom.—Consumption of pig lead (virgin metal) in the United Kingdom totaled 193,506 long tons in 1946 compared with 223,591 tons in 1945. Over-all consumption, including pig lead recovered from scrap, was 317,195 tons (294,104 tons in 1945), of which 27 percent was used in cable covering; 26 percent in sheet and pipe; 16 percent in batteries; 16 percent in white lead and oxides, excluding battery oxide; and 15 percent for miscellaneous purposes.

Stocks of refined lead in the United Kingdom on December 31, 1946, totaled 24,300 long tons. Government-owned stocks abroad (excluding quantities at port or in transit) were 20,100 tons.

U. S. S. R.—Virtually no official production figures have been available on the Russian lead industry during the past 7 years. Certain data, however, presented in the announcement March 1946 of the new 5-year plan indicated that lead output has been declining in recent years. Most of the lead smelted in the Soviet Union is produced in Kazakhstan.

Lead and Zinc Pigments and Zinc Salts

By HELENA M. MEYER AND ALETHEA W. MITCHELL

GENERAL SUMMARY

THE lead and zinc pigments industry had to contend in 1946 with a continuation of the unbalanced supply-demand relationship that prevailed in 1945 and several earlier years, despite the fact that 1946 was a full peacetime year. Demand for pigments as a whole was at near record levels; but shortages of essential crude materials, again notably lead and linseed oil, made it impossible for producers to fill a large segment of requirements. Labor strikes prevented the disparity from being even greater than it was. Strikes in chief pigment-consuming industries, such as the automobile industry, reduced potential demand by such industries, and steel and coal strikes interfered with construction and other activity that would have increased pigments requirements materially. Presumably the prospective demand cut off by strikes in 1946 was merely deferred, so that total pigment needs appear headed for new records in the near future. Various pigments probably will share unequally in supplying the demand, however. White lead production gains, for example, depend chiefly on improvement in over-all supplies of pig lead, whereas the present capacity output of titanium pigments will rise with the completion of plant expansion now in progress.

The stringent pigment-supply situation, accompanied by the removal of price controls in November, led to the highest prices in many years for pigments covered by this report—for lead pigments the highest prices ever recorded.

Shipments of the pigments and chemicals covered by this report were generally at higher levels in 1946 than in 1945. Noteworthy exceptions were litharge and red lead, which had fared better than other lead pigments in restriction orders of the recent past. As pointed out in the report of this series for 1945, white lead carbonate and sulfate bore the brunt of lead curtailment in that year. The fact that white lead (basic carbonate and basic sulfate) had larger percentage gains in 1946 than other pigments covered by this report, therefore, is not particularly significant, except as a reflection of partial relief from restriction. In 1945 shipments of white lead in oil, for example, were the smallest since considerably before the beginning of the present century, and shipments of basic sulfate were smaller than at any time since before the first figures were published in 1902.

Despite Government controls on the consumption of lead, stimulus to production through Government assistance in expediting equipment and supplies to producers, continued release to consumers of metal from Government inventories, and the continued payment of premiums for overquota production, as well as some liberalization of the plan, the lead shortage became more severe as the year progressed. This was due chiefly to mine and smelter strikes in the first half of the year, to labor shortages throughout the year, and to inadequate development work for several years. Receipts of crude and refined lead from abroad also dropped sharply in 1946. Supplies of zinc, on the other hand, were abundant as compared with those of lead; domestic production was less affected by strikes, and imports of crude and refined zinc compared much more favorably with those for 1945. Producers of pigments, however, were not always able to obtain metal when needed.

Shipments of the competitive titanium-pigments group established a new high record again in 1946 but were inadequate to supply demand. Plant capacity, in process of expansion, is the limiting factor in connection with this product.

Salient statistics of the lead and zinc pigments industry of the United States, 1941–46

	1941	1942	1943	1944	1945	1946
Production (sales) [1] of principal pigments:						
White lead (dry and in oil)—short tons	113,000	83,639	76,167	85,726	51,170	[2] 66,501

[1] Reported as shipments in 1945 and 1946.
[2] Data for basic lead sulfate in 1946 included under white lead; Bureau of Mines not at liberty to show separately.
[3] Less than $500.

Chief among the outlets for pigments are the paint, automobile, storage battery, and rubber industries. Sales of paint, varnish, and lacquer materials (figures for which are compiled by the U. S. Depart-

ment of Commerce) established a new high record in 1946 for the fourth successive year, being valued slightly below $800,000,000. The withdrawal of price controls in November and the consequent price advances in pigments and linseed oil to considerably higher levels by the end of December contributed to the record value of paint sales in 1946, although the total would have been much greater except for shortages, already mentioned, of essential raw materials. Automobile sales (passenger vehicles and trucks) in 1946 were 326 percent above the subnormal total for 1945 but 36 percent below 1941. Labor strikes in the steel industry and in the automobile industry itself were principal impediments to larger production in 1946. In January 1947 a General Motors executive stated [1] that output of cars and trucks may not reach 5,000,000 in 1947 (3,000,000 in 1946).

The distribution of lead and zinc pigments and zinc salts in 1946 presented a number of notable features. Ceramics, which take a relatively small share of the total pigments consumed, increased most in 1946, after making one of the poorest showings during war years. Litharge is shipped to ceramics makers in larger quantities than other pigments covered by this report; in 1946 shipments rose 14 percent and were the largest since 1941. The use of red lead in ceramics virtually doubled in 1946 and also was the highest since 1941. Zinc oxide shipments to ceramics makers established a new high record in 1946, advancing 78 percent above 1945. Zinc oxide's excellent performance in 1946, when total shipments had been exceeded only twice before (1928 and 1929), was due chiefly to the sharp advance in the quantities taken by the rubber industry. The availability and use of larger quantities of natural rubber were important factors in this movement. Zinc oxide, leaded zinc oxide, and lithopone sales to paint makers were notably above other recent years; leaded zinc oxide sales for paints were the second highest on record, of zinc oxide the greatest since 1930, and of lithopone the largest since 1941. The use of these pigments in paints has been stimulated by lead-pigment shortages, as previously indicated. Sales of white lead, carbonate, and sulfate for paints, whereas larger than in 1945, were not at a high rate in relation to earlier years. Storage-battery manufacture probably maintained the highest pigment-consumption rate of all uses during the war, but shipments of lead oxides, litharge, and red lead for this purpose declined in 1946. More zinc sulfate was used for agricultural purposes and by manufacturers of rayon in 1946 than ever before, accounting for the record shipments of that compound.

Government Controls.—In mid-December 1945 lead chemicals were incorporated under War Production Board lead order M–38. A new Civilian Production Administration lead chemicals order, L–354, established in April 1946, restricted consumers of lead for the pigments covered by this report (except that part of litharge and red lead used for battery manufacture, lead arsenate, and lead arsenite) to 38½ percent of the aggregate quantity each had put into process during the first 6 months of 1944, or 5,000 pounds, whichever was greater. Insecticides were restricted to 45 percent of the base period. Inventories were subject to the provisions of Priorities Regulation 32. The continuing acute lead-supply situation led to the establishment of com-

[1] Quoted in American Metal Market, vol. 54, No. 11, January 16, 1947, p. 1.

plete allocation control, under lead order M–38 at the beginning of July, over battery oxides (including litharge, black oxide, red lead, and basic lead sulfate) for use in the manufacture of storage batteries. A revision in the chemicals order, July 11, 1946, increased lead allotments for the production of lead chrome pigments, taking cognizance of the fact that production in the base period had been restricted by provisions for chrome rather than lead. A further curtailment to 35 percent was made in the October 8 revision of L–354 and cut the quantity to be used for insecticides for the period October 18 to December 31, except by special permission of the Civilian Production Administration. Under pressure on all sides to remove all controls, the Government removed those on the use of lead effective December 27, 1946. Inventory restrictions, however, were retained.

Zinc-consumption controls had been removed in 1945.

Office of Price Administration ceiling prices on pigments and pastes with a high lead content were increased effective June 7, 1946, following a rise in the ceiling price for lead—the first advance permitted since establishment of the General Maximum Price Regulation in 1942. During the almost month-long interim in the operation of OPA in July, producers raised prices for zinc oxide (lead-free and leaded) temporarily. Ceiling price advances on zinc oxide of 0.75 to 1 cent a pound were granted by OPA on October 14, 1946, the first official increase since 1942. All price controls on the products covered by this report were removed by order of the Price Administrator, effective November 10, and prices were at their highest at the year end.

Outlook.—Havey [2] discussed the outlook for zinc pigments, but his findings apply in large part also the lead group. He said,

* * * However, regardless of what the future may hold for business in all lines of consumer products, the soundness of the zinc pigment position lies in the essential character of the industries in which zinc pigments play a necessary part—rubber, paint, linoleum, glass, ceramics, pottery, oilcloth, etc., * * *.

Commenting on potentialities for the paint industry, a principal consumer of the products covered by this report, he said,

* * * The paint industry has potential capacity to produce considerably more paint than was made during the war years. The only thing which may handicap them in reaching their announced goal of $1,000,000,000 annual sales is the lack of raw materials, the principal ones being zinc oxide (lead-free and leaded), white lead (both carbonate and sulfate), zinc sulfide pigments (including lithopone), titanium dioxide and linseed oil. The available supply of these is far below present demand * * *.

European Drying-Oil Problems.—European manufacturers of paint, varnish, and lacquer, like those in the United States, only to a greater degree, suffered seriously from shortages of oils and natural resins. Eleven novel developments in the German paint, varnish, and lacquer industry were described [3] recently. The report outlined the organization and operation of the German paint industry, listed the raw materials available to the Germans and contained descriptions and formulas for general types of coatings. The conclusion was reached that American products in general, were superior to German products in working qualities, appearance, and durability; but that the Germans,

[2] Havey, M. L., Market Outlook for Zinc Pigments: Address presented at 29th annual meeting, Zinc Inst., Inc., Apr. 28, 1947, reprinted in the Am. Met. Market, vol. 54, No. 84, May 1, 1947, p. 9.
[3] Office of Military Government for Germany (US), Paint, Lacquer, and Varnish Industry of Germany: Fiat Final Report 681, 1946, 66 pp.

nevertheless, produced satisfactory paints, varnishes, and lacquers, despite wartime shortages in oils, natural resins, and certain pigments. In doing so they deviated considerably from American practices.

Great attention was given to the question of making paints and enamels without, or with minimum quantities of drying oils by a paint-making concern with factories in Belgium and France.[4] Residual gums obtained from the distillation of crude benzol and of light tar oils were tried. Three types of tar-oil distillation residues are resinol, resigum, and resilin. The article claimed that paints can be made with resigum without the addition of any natural drying oil but stated that such paints do not give as good a finish as normal paints.

The serious effect of shortages of crude materials, linseed oil in particular, on British exports of paints was pointed out in a recent report.[5] The report stated that the prewar value of Britain's export trade in paints, varnishes, and related products was about £4,000,000 a year. "Present" raw material restrictions were likely to cause a drop to £500,000 or less for 1946.

Devices practiced by the French paint industry during enemy occupation were outlined [6] in 1946.

PRODUCTION

Figures on sales have been used in this series of reports for many years as a better guide to activity in the pigments industry than production. Data on lead and zinc pigments produced from ores now are compiled by the Bureau of Mines on questionnaires for lead and zinc. Because lead and zinc schedules ask for shipments rather than sales, for uniformity the pigments schedule was changed to cover shipments. Available data made it appear that sales and shipments in 1945, the year of change, were little different. In reporting tonnages of pigments an attempt is made to avoid all duplication. One of the chief problems is that finished pigments frequently are blended to make another product. Basic lead sulfate and zinc oxide, for example, are blended to make leaded zinc oxide, and in this instance the pigment weights appear in the total for the last-named class only. Pigments consumed by producing companies to make products beyond those covered by this report—that is, paints, storage batteries, and other articles—are considered as shipments.

The value of lead and zinc pigments in 1946 totaled $87,790,000, a 16-percent increase over 1945. Lead and zinc pigments each represented 50 percent of the total compared with 55 and 45 percent, respectively, in 1939.

LEAD PIGMENTS

Total lead-pigments shipments declined 4 percent in quantity in 1946 despite the fact that white lead (carbonate and sulfate) showed substantial gains over the low tonnages shipped for 1945. Contrary to their war records, red lead and litharge dropped in 1946, the drops more than offsetting white-lead increases. All pigments were affected adversely by the inability of pigment manufacturers to obtain ade-

quate supplies of pig lead, and the demand for lead pigments was far from satisfied. The value of lead pigments rose 12 percent in 1946 owing to first the easing and then the removal of price controls (discussed under Government Controls); the 1946 value was 23 percent above that for 1939. Average values of all lead pigments increased substantially in 1946, and by the end of the year quoted prices were at high rates never before attained.

Lead pigments shipped by domestic manufacturers in the United States, 1945–46

Pigment	1945			1946		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average

ZINC PIGMENTS AND SALTS

The more favorable supply-demand relationship in zinc as compared with lead, pointed out in the chapter of this series for 1945, continued and was accentuated in 1946. As a consequence, shipments of leaded zinc oxide were second only to those for 1941, being only 1 percent less, and shipments of lead-free zinc oxide were second only to those in 1928 and 1929. Lithopone shipments were far below a record in 1946 but were at a relatively high rate, nonetheless. In total value, zinc pigments were 21 percent above 1945 and 53 percent above 1939. Average values for all products covered by this report were higher owing to the October increase in the OPA ceiling prices and to the removal of ceilings by the general Presidential order effective November 10.

Shipments of zinc chloride totaled 57,316 tons (50° B.), continuing at the high levels of the preceding 2 years. Zinc sulfate sales established a new high record for the second successive year.

Zinc pigments and salts shipped by domestic manufacturers in the United States, 1945–46

Pigment or salt	1945			1946		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average
Zinc oxide [1]	127,955	$17,708,795	$138	157,851	$22,660,450	$144
Leaded zinc oxide [1]	62,598	8,290,073	132	67,971	9,694,067	143
Lithopone	136,161	10,645,316	78	147,001	11,840,596	81
Zinc chloride, 50° B	56,230	2,828,474	50	57,316	3,133,891	55
Zinc sulfate	20,854	1,712,058	82	24,931	2,192,706	88

[1] Zinc oxide containing 5 percent or more lead is classed as leaded zinc oxide. In this table data for leaded zinc oxide include a small quantity containing less than 5 percent lead.

Zinc pigments and salts sold [1] by domestic manufacturers in the United States, 1942–46, in short tons

Year	Zinc oxide	Leaded zinc oxide [2]	Lithopone	Zinc chloride (50° B.)	Zinc sulfate
1942	99,677	48,128	137,320	52,374	14,331

1944	140,675	64,395	142,905	57,545	17,156
1945	127,955	62,598	136,161	56,230	20,854
1946	157,851	67,971	147,001	57,316	24,931

[1] Reported as shipped in 1945 and 1946.
[2] Includes a small quantity containing less than 5 percent lead, 1943–46.

CONSUMPTION BY INDUSTRIES

WHITE LEAD

As was to have been expected, shipments of white lead (dry and in oil) rebounded in 1946 from the low levels for 1945. Owing to the stringent provisions of War Production Board chemicals order M–384, through which white lead (carbonate and sulfate) was called upon to bear the brunt of curtailment in the use of lead in 1945 (discussed in the report of this series for 1945), shipments of white lead (dry) in 1945 were the smallest since 1934 and of white lead in oil the smallest since considerably before the beginning of the present century. In 1946, for the first time, the Bureau of Mines is not at liberty to show data on basic lead sulfate separately and must combine them with figures on white lead in order that lead pigments totals may be published. White lead and basic lead sulfate shipments gained more in 1946 than the other products covered by this report. The increased tonnages could not fill the large demand for white lead pigments, however, and inadequate pig-lead supplies interfered with greater production. Both white lead carbonate and sulfate are used chiefly in paints, and 92 percent of the combined tonnage was so used in 1946.

A better break-down of the "Other" class probably would increase the quantity shown under the "Paint" class. Use of white lead carbonate in ceramics in 1946 followed the uptrend in use of other pigments for this purpose.

The facilities of the International Smelting & Refining Co. at East Chicago, Ind., for the production of white lead and zinc oxide were purchased by the Eagle-Picher Co. in 1946.

Production of white lead (dry, including basic lead sulfate, amounted to 42,597 tons and of white lead in oil to 24,501 tons in 1946. In 1945, 26,329 tons of white lead (dry) and 23,194 tons in white lead in oil were produced.

Distribution of white lead (dry and in oil) sales [1] 1942–46, by industries, in short tons

Industry	1942	1943	1944	1945	1946 [2]
Paint	76,837	66,441	79,948	46,418	60,943
Ceramics	1,812	1,444	946	839	1,367
Other	4,990	8,282	4,832	3,913	4,191
	83,639	76,167	85,726	51,170	66,501

[1] Reported as shipments in 1945 and 1946.
[2] Data for basic lead sulfate in 1946 included under white lead; Bureau of Mines not at liberty to show separately.

BASIC LEAD SULFATE

Basic lead sulfate, along with lead carbonate, was affected seriously by the provisions of Order M–384, as pointed out in the report of this series for 1945. Figures for 1946 cannot be published separately and are included under White Lead (dry). The rise in shipments in 1946 was merely a gain over the smallest tonnage recorded since the first figures were published in 1902. This pigment is used chiefly in paints. The figures for shipments in the accompanying table exclude substantial tonnages used as an intermediate product in the manufacture of leaded zinc oxide. The basic lead sulfate used thus in blending is included in this report in the quantities shown for leaded zinc oxide and not in the figures for basic sulfate.

Distribution of basic lead sulfate sales,[1] 1942–46, by industries, in short tons

Industry	1942	1943	1944	1945	1946
Paints	7,733	4,802	5,496	3,009

[1] Reported as shipments in 1945 and 1946.
[2] Data for basic lead sulfate in 1946 included under white lead; Bureau of Mines not at liberty to show separately.

RED LEAD

The stringent supply situation in pig lead in 1946 was an important factor in the 31 percent drop in shipments of red lead, as demand for this pigment was far from met by supplies in that year. Sales of this

pigment had stayed at high levels throughout the war. Storage batteries and paints, by far the chief uses, both took much less red lead than in 1945, dropping 28 and 43 percent, respectively. Use of red lead in ceramics virtually doubled in 1946 and was at the highest rate since 1941, accounting, however, for only 4 percent of total shipments.

Production of red lead amounted to 29,874 tons in 1946 compared with 48,185 tons in 1945.

The value of red lead as a structural paint was recently described.[7]

See the discussion under Litharge for a recent report on German red lead practice.

Distribution of red lead sales,[1] 1942–46, by industries, in short tons

Industry	1942	1943	1944	1945	1946
Storage batteries	23,545	26,616	30,211	26,725	19,115

Other	28	22	23	16	27
	128	79	284	230	123

[1] Reported as shipments in 1945 and 1946.

LITHARGE

Shipments of litharge fell 4 percent in 1946 from the peak rate established in 1945 but exceeded all earlier years except 1945 and the slightly lower 1944. The serious shortage of lead in 1946 had an important bearing on the lowered rate of production and shipments of litharge in 1946, because manufacturers of litharge were unable to fill demand for their product. Storage batteries took 5 percent less litharge than in 1945, accounting for 57 percent of the total shipments; the quantity used for batteries was exceeded only by the previous year. In addition to the litharge used to make batteries, the storage-battery manufacturers themselves produce from pig lead a black or suboxide of lead which they use as a substitute for litharge. The quantity produced in 1946—46,000 tons—was 18 percent below 1945, marking a considerably greater drop than was registered by litharge. Black oxide figures are not included in the Bureau of

[7] Dunn, E. J., Jr., Physical and Chemical Phenomena That Account for Red Lead's Metal Protective Ability: Paint Industry Mag., vol. 56, No. 10, October 1946, pp. 340, 342, 344–348.

Mines totals for litharge. Insecticides, which have been dropping in the face of gains for other uses, fell 21 percent from 1945, or considerably more than the average. Shipments to makers of ceramics gained 14 percent in 1946 and were the largest since 1941. Use for oil refining and the manufacture of varnish and rubber also moved upward against the trend for total litharge. Chrome pigments, which ranked as the fourth most important use in 1946, declined 5 percent from 1945. Methods of producing certain grades of chrome yellow in Germany were recently discussed.[8]

Litharge production totaled 133,266 tons in 1946 compared with 141,258 tons in 1945.

Distribution of litharge sales,[1] 1942–46, by industries, in short tons

Industry	1942	1943	1944	1945	1946

[1] Reported as shipments in 1945 and 1946.

The manufacture of red lead and litharge in Germany was described in a recent report.[9]

ZINC OXIDE

Shipments of zinc oxide (lead-free) gained 23 percent in 1946, were the largest since 1929, and had been exceeded only in the boom years of 1929 and 1928. All classes of use, except chemical warfare, shared in the larger tonnage; as before the war, none was reported for chemical warfare in 1946. Consumption in rubber, the chief use, rose 32 percent and took 53 percent of the total, or the largest share since 1942, when it also took 53 percent. Paints gained 24 percent in 1946 and were the largest since 1930. Stringent supplies of white lead in the past 3 years, owing to inadequate and falling supplies of lead, have increased the calls for zinc oxide and other white pigments. Floor coverings and textiles made the smallest gain, rising 6 percent. A further break-down of this class was made in 1946, showing that rayon took 73 percent of it in that year. Ceramics rose more than any other use, as in 1945, gaining 78 percent over that year and establishing a new record. This use made the poorest showing during the war but, following the sharp gains in 1945 and 1946, accounted for the same percentage of the total as in the period 1937–40.

Production of lead-free oxide amounted to 142,567 tons compared with 139,374 tons in 1945. Of the total for 1946, 74 percent was made by the American process from ores and primary residues, 20 percent

[8] Office of Military Government for Germany (US), Chrome Yellow and Other Pigments at G. Siegel & Co.: Fiat Final Rept. 811, May 13, 1946, 10 pp.

by the French process from metal and scrap, and 6 percent by other processes, compared with 77, 17 (revised), and 6 (revised) percent, respectively, in 1945.

The facilities of the International Smelting & Refining Co. at East Chicago, Ind., for the production of white lead and zinc oxide, were purchased by the Eagle-Picher Co. in 1946.

According to a recent statement,[10] zinc pigments are now the most widely used of all white pigments and their use is increasing. The statement apparently refers to the United Kingdom or to some particular region, because titanium pigments rank first in the United States.

Distribution of zinc oxide sales,[1] 1942–46, by industries, in short tons

Industry	1942	1943	1944	1945	1946
Rubber	52,717	67,898	59,518	63,447	83,776

[1] Reported as shipments in 1945 and 1946.
[2] Of which 9,363 tons were for rayon.

LEADED ZINC OXIDE

Leaded zinc oxide shipments in 1946 were second only to those in 1941, being 1 percent below the peak year. It has been pointed out previously that this pigment's advantageous position during the war stemmed from the fact that it is made almost exclusively from ore rather than scarcer metal or scrap. Shipments of leaded zinc oxide for paint have been at high levels for several years, partly because of the diversion of business from other white pigments in smaller supply. This pigment continued to be used almost exclusively for paint. The figures for leaded zinc oxide include basic lead sulfate used in blending, as indicated under Basic Lead Sulfate.

Leaded zinc oxide production totaled 71,016 tons in 1946 compared with 62,519 tons in 1945. The totals can be broken down as follows (comparison with 1945 in parentheses): Over 5–35 percent lead, 59,564 (48,678) tons; over 35–50 percent, 7,150 (10,091 and a revised total of 10,057 for 1944) tons; and most of the remainder in 1946 was over 50 percent lead and in 1945 was 5 percent or less.

Distribution of leaded zinc oxide sales,[1] 1942–46, by industries, in short tons

Industry	1942	1943	1944	1945	1946
Paints	47,052	42,303	62,223	58,852	64,816

[1] Reported as shipments in 1945 and 1946.

[10] Metal Bulletin (London), No. 3142, November 5, 1946, p. 17.

LITHOPONE

The lithopone statistics in this report are given on the basis of ordinary lithopone sold as such plus the ordinary lithopone content of the high-strength product. This method of publication is used to conceal the operations of one company, which always dominates the output of the high-strength product and has been the only producer in some years. In 1946, as in 1945, two companies, operating three plants, produced high-strength lithopone. Shipments of lithopone increased 8 percent in 1946 and were the largest since 1941, but were insufficient to supply total demand. Sales to manufacturers of paints gained 13 percent—more than the total gain—whereas those to makers of floor coverings and textiles were slightly lower than in 1945. Rubber manufacturers took 64 percent more than in 1945 but accounted for only 1 percent of the total. Separation of the lithopone shipped for floor coverings and textiles shows that 7,626 tons were for coated fabrics and textiles and 7,541 for floor coverings, compared with 5,150 and 10,671 tons respectively, in 1945. Prior to 1946 the break-down of statistics on floor coverings and textiles was partly estimated; the actual break-down for 1945, therefore, may have been closer to that for 1946 than is apparent. The use of lithopone by paper manufacturers, which had been rising prior to 1945, continued at about the 1945 rate in 1946; it amounted to 3,011 tons compared with 3,086 tons in 1945 and contrasted with 6,488 tons in 1944. Shipments reported for use in ink manufacture likewise dropped in 1945 and continued relatively unchanged in 1946. The tonnages were 1,216 in 1944, 864 in 1945, and 830 in 1946. A tonnage sold for use in making ink is regularly shown by one manufacturer as not separable from that sold for paint, but the tonnages given here are for identical companies. Exports are included mainly under Other, but at least one company classifies part of its exports according to end use.

Plant capacity for the manufacture of lithopone was reported to total 157,000 tons in 1946.

Production of lithopone amounted to 148,926 tons in 1946 compared with 136,460 tons in 1945.

Distribution of lithopone sales,[1] 1942–46, by industries, in short tons

Industry	1942	1943	1944	1945	1946
Paints, varnishes, and lacquers[2]	109,216	103,860	108,800	109,398	123,279
Floor coverings and textiles	15,775	15,999	14,746	15,821	15,167
Rubber	1,047	1,078	726	977	1,607
Other	11,282	14,786	18,633	9,965	6,948
	137,320	135,723	142,905	136,161	147,001

[1] Reported as shipments in 1945 and 1946.
[2] Includes a quantity, not separable, used for printing ink.

Consumption of ordinary lithopone in the production of titanated lithopone has trended downward almost continuously since the peak, 19,400 tons, was used in 1937. In 1946, 6,350 tons were used for this purpose or slightly below one-third of the all-time high record. The

lithopone figures in the following table are included in the totals for ordinary lithopone in the preceding table.

Titanated lithopone produced in the United States and ordinary lithopone used in its manufacture, 1942–46, in short tons

Year	Titanated lithopone produced	Ordinary lithopone used	Year	Titanated lithopone produced	Ordinary lithopone used
1942	11,700	9,900	1945	9,200	7,800
1943	9,800	8,400	1946	7,500	6,350
1944	9,800	8,300			

ZINC SULFIDE

In 1946, as in several earlier years, only one company produced zinc sulfide, and the Bureau of Mines is not at liberty, therefore, to publish figures for this pigment.

ZINC CHLORIDE

Shipments of zinc chloride, in terms of 50° B. solution, totaled 57,316 tons in 1946 compared with 56,230 tons in 1945. These figures include the zinc chloride equivalent of zinc ammonium and chromated zinc chloride produced. Complete figures covering distribution of zinc chloride shipments by uses are not available.

Production amounted to 57,088 tons in 1946 and 56,793 tons in 1945.

ZINC SULFATE

Zinc sulfate shipments established a new high record in 1946, for the second successive year, rising 20 percent above 1945. The curve of zinc sulfate shipments has increased sharply during the past 10 years or more, the total for 1946 being 171 percent above the average for the 5-year period, 1935–39. Agriculture led other uses by a substantial margin in 1946, taking 43 percent of the total, and displaced rayon, with 31 percent, which stood first in 1945. Both uses established new peak records in 1946, the former gaining 63 percent over 1945 and the latter, 13 percent. Chemicals, flotation reagent, and paints all dropped in 1946, the last being only 7 percent of the quantity reported in 1943. If a more complete break-down of the chemicals classification were practicable, some of the other classifications probably would be increased. Electrogalvanizing and the manufacture of glue showed substantial gains in 1946, the former taking the largest tonnage since 1941.

The dry weight of zinc sulfate shipments, by uses, was reported for the first time in 1945. In compiling data for 1946, the 1945 figures were found to require revision and necessary changes are covered in the accompanying table.

In 1946, 25,004 tons of zinc sulfate were produced, compared with 21,362 tons in 1945.

Distribution of zinc sulfate sales,[1] 1942–46, by industries, in short tons

[2] Revised figures.

PRODUCERS AND PLANTS

The report of this series for 1945 contained a list of producers of lead and zinc pigments and zinc salts of their own manufacture, by classes of product. Since this list was prepared, the white lead and zinc oxide facilities of the International Smelting & Refining Co. at East Chicago, Ind., have been taken over by the Eagle-Picher Co.

RAW MATERIALS USED IN MANUFACTURE OF LEAD AND ZINC PIGMENTS AND ZINC SALTS

Figures covering the raw materials used in making pigments and salts were not available when the report of this series for 1945 was prepared. Data for 1945 are given below, and those for 1946 will appear in the next annual issue of this volume.

Lead pigments and zinc pigments and salts are manufactured from a variety of materials, including ore, refined metal, and such secondary materials as scrap. In 1945, 92 percent of the lead in pigments was derived from pig lead and 8 percent from ore. Of the lead in ore used to make leaded zinc oxide, about 9 percent was from foreign sources. The proportion for zinc pigments in 1945 was 76 percent from ore and concentrates, 9 percent from slab zinc, and 15 percent from secondary materials; about 20 percent of the ore used was foreign.

The following tables give the source of the metal used in the manufacture of each pigment and salt. Pig lead is employed exclusively, either directly or indirectly, in the manufacture of white lead, litharge, red lead, and orange mineral and is used also in the manufacture of basic lead sulfate. The lead content of leaded zinc oxide made from basic lead sulfate, which in turn was made from pig lead, is credited to pig lead in the table. Zinc oxide is the only pigment in which considerable slab zinc is used. Ore is employed in the manufacture of zinc oxide, leaded zinc oxide, lithopone, zinc sulfide, zinc sulfate, and basic lead sulfate. A substantial proportion of the zinc in litho-

pone (46 percent in 1945) and most of that in zinc chloride made in the United States are derived from secondary material. For a number of years before the United States entered World War II, there had been a large increase in the quantity of secondary zinc used in the manufacture of zinc oxide. The scarcity of supplies of both metal and scrap caused the proportion of the total oxide made by the French process, which uses only metal and scrap, to drop sharply in 1942 and to continue low in 1943–45, despite the fact that the percentage from metal and scrap rose in 1943 and continued upward in 1944 and 1945. The production of zinc oxide from metal and scrap accounted for the following percentages in relation to total production: 41 percent in 1939, 16 percent in 1942, 19 percent in 1943, 22 percent in 1944, and 25 percent in 1945.

Lead content of lead and zinc pigments produced by domestic manufacturers, 1944–45, by sources, in short tons

[1] These figures are higher than those shown in the report on Secondary Metals—Nonferrous because they include zinc recovered from byproduct sludges, residues, etc., not classified as purchased scrap material.
[2] Excludes zinc sulfide, data for which Bureau of Mines not at liberty to publish.

PRICES

Total and average values received by producers for lead and zinc pigments and zinc salts are given in the tables in the first part of this report. Average values for all pigments gained markedly in 1946. Following the raising of the ceiling price on pig lead, the OPA prices for pigments and pastes with a high lead content were increased, effective June 7, 1946—the first advance since maximum prices were established by the General Maximum Price Regulation in 1942. The changes represented an average increase over previous maximum prices of 20 percent, or about 1¼ cents a pound.

Producers raised prices for zinc oxide (lead-free and leaded) above ceilings in June 1946 during the almost month-long interim in the operation of the OPA. Ceiling prices at March and June 1942 levels were reestablished at the end of July and were increased by the OPA for the first time on October 14.

All price controls on the products covered by this report were removed by general order of the President, effective November 10. Immediate gains were 2¼ cents a pound for litharge, white lead, and red lead, 1 cent a pound for zinc oxide (lead-free), 1 to 1¾ cents a pound for the leaded grades of zinc oxide (depending on lead content), and less than ¾ cent for lithopone. Further gains were established before the end of the year, when prices for pigments covered by this report were at the highest rates for many years and for lead pigments the highest ever recorded.

Range of quotations on lead pigments and zinc pigments and salts at New York (or delivered in the East), 1943–46, in cents per pound

[1] Quotation was reduced to 3.65–4.40 cents per pound in Sept. 11, 1944, issue of the Oil, Paint and Drug Reporter, which added "works, freight allowed," to the description.

FOREIGN TRADE [11]

The total value of exports of lead and zinc pigments and salts in 1946 was 13 percent below 1945, accounted for in part by the dropping of several small items from that classification. The total for 1946

[11] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

was well in advance of any year in the 1929–41 period and also exceeded 1942 and 1944. The tonnages of zinc oxide and lithopone each exceeded any lead class several times, and the value of zinc pigments exported was 3.4 times that for the lead group. Zinc pigments exported rose 28 percent in value, while lead pigments declined 40 percent.

[1] Beginning Jan. 1, 1946, not separately classified.
[2] Data not available.

Lead Pigments and Salts.—Imports of lead pigments are of little consequence, red lead, amounting to 54 tons, being the chief item in 1946. All classes shown separately in the export group were shipped from the United States in smaller quantity in 1946 than in 1945; white lead, the chief class in 1945, with 4,079 tons, dropped to only 910 tons in 1946 or to the lowest level in many years. Litharge, lead arsenate, and red lead ranked above white lead in tonnage in 1946. Red lead exports amounted to 4 percent of total domestic shipments in 1946, or the highest proportion attained by any lead pigment.

Lead pigments and salts imported for consumption in the United States, 1942–46

Year	Short tons					Total value
	Basic carbonate white lead	Red lead	Litharge	Suboxide of lead	Other lead compounds	
1942		2	2	7	11	$5,841
1943		4	1	3		3,349
1944	(1)		1	10		5,962
1945	1		8	10	(1)	7,635
1946	1	54	15	11		[2] 13,038

[1] Less than 1 ton.
[2] Includes also lead pigments, n. s. p. f., $97 (522 pounds); lead arsenate, $5 (552 pounds).

Lead pigments and salts exported from the United States, 1942–46

Year	Short tons						Total value
	White lead	Red lead	Litharge	Orange mineral	Sublimed lead	Lead arsenate	
1942	2,249	1,391	1,999	7	95	296	$1,030,472

1946	910	1,355	2,180	(1)	(1)	1,398	1,184,872

[1] Beginning Jan. 1, 1946, not separately classified.

Zinc Pigments and Salts.—Zinc sulfate continued to be the chief item in the import class but amounted to only 415 tons. Exports of zinc oxide gained 54 percent in 1946 and were the largest since 1929, exceeding shipments of lithopone from the United States for the first time since 1937, when exports of these pigments were 2,953 and 2,671 tons, respectively. Lithopone exports were only half of the high record tonnage for 1941, having dropped almost continuously thereafter; the 1946 tonnage was the smallest since 1939. Zinc oxide and lithopone exports each amounted to 7 percent of the total shipments by domestic producers.

Zinc sulfate had been the chief zinc chemical compound exported until 1945, when it was surpassed in quantity and value by zinc chloride. Separate data on these compounds are not available after January 1, 1946.

Zinc pigments and salts imported for consumption in the United States, 1942–46

Year	Short tons						Total value

1944	5,511	11,551	2,194,203				

[1] Includes also—1942: Zinc sulfide $6,328 (37,691 pounds); zinc chloride, $42,674 (648,343 pounds); zinc sulfate, $53,624 (1,025,554 pounds); other zinc salts and compounds, $76,023 (519,458 pounds); 1943: Zinc sulfide, $29,523 (78,387 pounds); zinc chloride $57,390 (751,861 pounds); zinc sulfate $81,750 (1,830,508 pounds); other zinc salts and compounds, $22,087 (139,940 pounds); 1944: Zinc sulfide, $7,195 (40,223 pounds); zinc chloride, $47,133 (711,953 pounds); zinc sulfate, $83,566 (2,029,801 pounds); other zinc salts and compounds, $46,587 (167,474 pounds); 1945: Zinc sulfide, $25,399 (173,475 pounds); zinc chloride, $93,590 (1,499,755 pounds); zinc sulfate $62,199 (1,243,826 pounds); other zinc salts and compounds, $119,747 (750,108 pounds); 1946: Beginning January 1 none of the foregoing classes separately recorded.

Lime

By CHARLES L. HARNESS AND F. D. GRADIJAN

GENERAL SUMMARY

RECONVERSION to a peacetime economy caused a general shifting in the lime end-use pattern, with declines in sales to the refractory, chemical, and industrial markets and compensating increases in building and agricultural sales. Total lime sales in 1946—5,992,700 short tons—which exceeded those of 1945 by 1 percent, were 9 percent below the historical record set in 1943. Quicklime represented 72 percent and hydrated lime 28 percent of the total sales, compared with 77 and 23 percent, respectively, in 1945.

The prices of lime (except agricultural lime) were controlled by the Office of Price Administration under Maximum Price Regulation 592 until November 10, 1946, the effective date of removal of control by the Price Administrator. The average price per ton of quicklime advanced from $7.56 a short ton in 1945 to $8.27 in 1946; similarly, hydrated lime advanced from $8.43 to $9.15. The advance was due to numerous increases authorized by the OPA.

Salient statistics of the lime industry in the United States, 1925–29 (average), 1935–39 (average), and 1944–46

	1925–29 (average)	1935–39 (average)	1944	1945	1946

[1] Selling value, f. o. b. plant, excluding cost of containers.

In 1945 the labor shortage curtailed lime output. During 1946 labor was generally available, but the boxcar shortage hampered sales. Shipments of finishing lime were particularly short, owing partly to insufficient shipping space and partly to an exceptionally high demand.

During the war, building-lime sales, which generally follow the trend of total new construction, fell far below the curve owing to the small lime requirements for temporary construction. In 1946, however, building lime again followed the curve of new construction, as may be noted in figure 1.

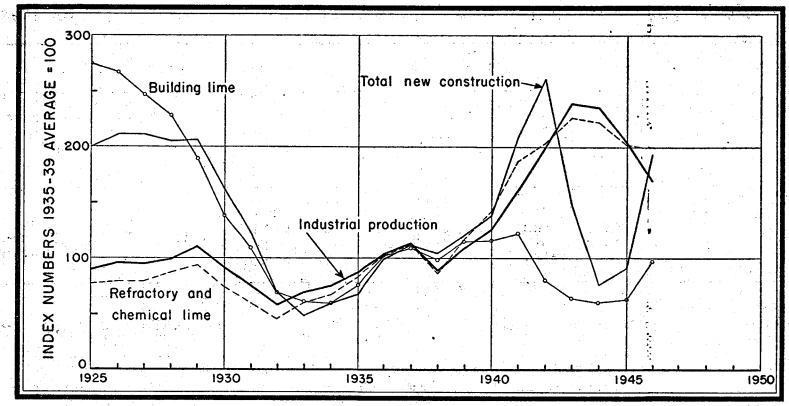

FIGURE 1.—Sales of refractory and building lime compared with total new construction and industrial production, 1925–46. Units are reduced to percentages of the 1935–39 average. Statistics on value of construction from the Bureau of Foreign and Domestic Commerce and on industrial production from the Federal Reserve Board.

Trends in sales of "open-market" lime for its principal uses during the past 22 years are indicated in figure 2. Sales of chemical lime and refractory lime (dead-burned dolomite) since 1925 have followed a course closely parallel. Building lime spurted upward. Agricultural lime was up 3 percent.

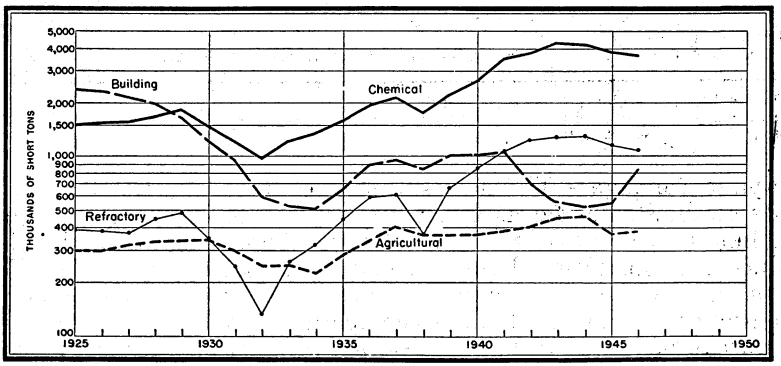

FIGURE 2.—Trends in major uses of lime, 1925–46.

PRODUCTION

Production (sales) of building and agricultural lime increased in 1946 over 1945, whereas chemical, industrial, and refractory uses were down.

As quicklime is a semiperishable commodity and most plants have negligible warehousing facilities, stocks held by producers are generally small. Thus, in this chapter the quantities of "open-market" lime sold or used are considered equivalent to production and are used interchangeably.

Lime sold by producers in the United States, 1945–46, by types and major uses

[1] Selling value, f. o. b. plant, excluding cost of container.
[2] Includes lime used by producers (captive tonnage) as follows—1945: 368,572 tons, valued at $2,216,373; 1946: 328,837 tons, valued at $2,216,551.

Captive Tonnage.—The lime statistics compiled by the Bureau of Mines are limited as far as possible to returns of operators who produce lime for sale to consumers. Captive tonnage of companies that produce lime for internal consumption is excluded, with only a few exceptions. Hence, the annual review figures are confined largely to "open-market" lime sold under competitive conditions. However, the Bureau of Mines attempts to obtain complete figures on the con-

sumption of lime in certain uses, irrespective of whether it was "open-market" or captive lime, and thus some captive tonnage appears in the sales figures. The accompanying data showing lime sold or used by producers in the United States in 1946 include 328,837 short tons of captive tonnage, as follows: 9,200 short tons for prepared masonry mortars and mason's lime, 208,186 tons for metallurgical uses (about equally divided between steel manufacture and ore concentration), 56,840 tons for miscellaneous chemical uses, and 54,611 tons of refractory lime. Total captive tonnage, including the above quantity, may be determined approximately by adding together all the figures in the limestone-use table (see the Stone chapter of this volume) that have the same use listing as the lime-use table, including "alkali," "calcium carbide," "glass," "magnesia," "paper," "refractory," and "sugar"; an allowance should be made, of course, for loss of weight when limestone is calcined to lime. In some of these uses, some limestone is used without calcining; so precise captive-lime data cannot be compiled.

Size of Plants.—The progressive decline in the number of plants operating continued in 1946. The 182 producers in 1946 contrast strikingly with the 450 in 1925, when production was only about three-fourths as great. The decline in the number of active plants is most pronounced in the groups of smaller operations, particularly in the group producing less than 1,000 tons a year.

Distribution of lime (including refractory) plants, 1944–46, according to size of production

PRODUCTION BY STATES

In 1946 "open-market" lime was produced in 34 States and 2 Territories. The leading producers were Ohio, Pennsylvania, Missouri, and West Virginia, which together supplied 61 percent of the total. Ohio alone contributed 25 percent.

Hydrated Lime.—Lime is sold either quick or hydrated. Sales of hydrated lime were reported by 120 plants in 1946 (125 in 1945) in 33 States and 2 Territories. Although the user must pay freight on 24 pounds of water for each 100-pound sack of hydrated lime he buys, for some uses lime hydrated at the mill with precision machinery and skilled workmen is far preferable to quicklime hydrated on the job by unskilled workmen. This is especially true when time is a factor, because for best results the lime should be allowed to slake a few days. Imperfectly slaked lime used in a wall plaster will gradually rehydrate within the plaster, and the volume change will cause pitting in the wall.

[1] Included with "Other States."

[2] Includes the following States and numbers of plants in 1946 (1945 same as 1946 unless shown differently in parentheses): Arizona 1, Arkansas 1, Colorado 1, Connecticut 1, Florida 1 (2), Indiana 1, Louisiana 1, Maine 2, Michigan 1 (2), Minnesota 1, Montana 1, Nevada 1, New Jersey 3, New York 3, North Carolina 0 (1), Oklahoma 1 (0), Oregon 0 (1), Puerto Rico 2, South Dakota 1, Utah 2, Vermont 2 (3), Washington 2, and Wisconsin 6. Massachusetts is included with "Other States" in 1945 (3) but shown separately in 1946.

SALES BY USES

Sales of lime for its varied uses in 1946 shifted from the wartime pattern of 1942–45 and approached a peacetime distribution. There were declines in some large industries, but the increases in customary civilian industries—especially construction—brought total shipments over the 1945 total.

[4] Includes flotation, cyanidation, bauxite purification, and magnesium manufacture.
[5] Includes mold coating and unspecified metallurgical uses.
[6] Includes acid neutralization, alcohol, calcium carbonate (precipitated), cement manufacture, polishing compounds, retarder, sulfur, textiles, and wool pullers; in addition, alkalies in 1945 and asphalts and other bitumens in 1946.
[7] Includes lime used by producers (captive tonnage) as follows—1945: 368,572 tons, valued at $2,216,373; 1946: 328,837 tons, $2,216,551.

Hydrated lime sold by producers in the United States, 1945–46, by uses

Use	1945			1946

[1] Included under "Other uses."

Liming Materials Used in Agriculture.—Owing to the increase in agricultural activity in 1946, the market for agricultural liming materials was exceptionally active. Lime lost more ground to limestone ("agstone"), production of which increased 31 percent over 1945. The output of crushed oyster shells declined greatly, and that of marl increased appreciably compared with 1945 production.

Agricultural lime and other liming materials sold by producers in the United States, 1945–46, by kinds

Kind	1945				1946			
	Short tons		Value		Short tons		Value	
	Gross weight	Effective lime content [1]	Total	Average	Gross weight	Effective lime content [1]	Total	Average
Lime:								
Quicklime	120,529	102,450	$827,920	$6.87	113,486	96,460	$899,677	$7.93
Hydrated lime	252,881	177,020	2,078,924	8.22	271,172	189,820	2,251,936	8.30
Oystershells (crushed) [2]	138,032	64,880	572,399	4.15	60,691	28,530	357,119	5.88

		[3]8,585,000	[3]29,559,871			11,111,880	36,240,169	

[1] Calculated upon basis of average percentages used by the National Lime Association, as follows: Quick lime (including lime from oystershells), 85 percent; hydrated lime, 70 percent; pulverized uncalcined limestone and oystershells, 47 percent; calcareous marl, 42 percent.
[2] Figures supplied by Fish and Wildlife Service.
[3] Revised figure.

Building Lime.—Building limes enjoyed the best year since 1941 and showed an increase of 54 percent over 1945 owing to increases in the types of construction requiring masonry mortars and finishing lime. In fact, the demand for finishing lime far exceeded the supply.

Chemical and Industrial Lime.—Sales in this class suffered from the reconversion of industry from war to peace but were nevertheless well-maintained in most categories. The metallurgical industries suffered from strikes and labor shortages, and sales of lime to these users dropped a little. The typically peacetime outlets, such as paper, water purification, insecticides, sand-lime brick, and paints, all showed increases. The greater tonnage of insecticides affected hydrated lime particularly. Further details are given in the accompanying table.

According to the National Lime Association, owing to the scarcity of gypsum in Sweden, it has proved economical to make high-quality dental and orthopedic gypsum by reacting lime with sulfuric acid wastes. The Association also reported that a large domestic paint manufacturer is formulating whitewashes containing lime and DDT. Preliminary tests under "synthetic dairy-barn" conditions appear promising, particularly with limes having a low content of heavy metals and silica.

APPARENT CONSUMPTION

Output exceeded apparent consumption in 16 of the 34 lime-producing States in 1946. Lime is a cheap commodity, widely available, and only a few States have large "export surpluses." In 1946 these States were Missouri, Ohio, Tennessee, and West Virginia.

Apparent consumption of lime in continental United States in 1946, by States, in short tons

State	Sales by producers	Shipments from State [1]	Shipments into State	Apparent consumption

As indicated in the accompanying table, small quantities of lime are shipped from continental United States to various island Territories.

Lime shipped to noncontiguous Territories of the United States, 1943–46

Territory	1943		1944		1945		1946	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
Hawaii	1,170	$17,528	511	$8,197	246	$4,555	406	$8,373
Puerto Rico	4	170	415	5,572	1,458	20,144	365	5,276
Virgin Islands	103	3,462	121	3,876	80	2,100	142	3,160

PRICES

The net mill realization (excluding container cost) per ton of lime sold in the open market in 1946 averaged $8.52, a gain of $0.76 over 1945 and $1.00 over 1944. Numerous price increases were allowed by the Office of Price Administration before November 9, and industry-initiated increases were made thereafter. In 1946 the largest price increase was in building lime, whereas in 1944 and 1945 the largest increase was in agricultural lime.

FOREIGN TRADE [1]

Imports.—Lime imports are confined principally to movements from Canada to points in the State of Washington.

Lime imported for consumption in the United States, 1942–46

Year	Hydrated lime		Other lime		Dead-burned dolomite [1]		Total	
	Short tons [2]	Value	Short tons [2]	Value	Short tons	Value	Short tons	Value
1942	655	$6,722	7,445	$66,893	449	$11,260	8,549	$84,875
1943	740	6,670	13,911	119,358	739	22,563	15,390	148,591

TECHNOLOGIC DEVELOPMENTS

The old question of which is the better, the shaft or the rotary kiln, received further attention in 1946. W. R. Cliffe offered a paper adhering to the latter view before the annual convention of the Canadian Institute of Mining and Metallurgy on April 10, 1946, as opposed to the stand of V. J. Azbe, who had recommended shaft kilns at the previous annual meeting. A. B. Searle attempted to reconcile the two views.[2]

Magnesium

By C. E. NIGHMAN AND MARY E. TROUGHT

GENERAL SUMMARY

MAGNESIUM has not found in peace the utility it had in war. Domestic output rose from zero to 142 short tons in World War I (1918), then subsided into relative insignificance and did not reach that level again for a decade. In the following 10-year period the rate of growth was large, but the output had risen only to 3,350 tons in 1939. It grew then enormously to the 183,600-ton peak of World War II (1943). Magnesium shipments (exports excluded) of one-third million tons from January 1942 through June 1945, according to War Production Board figures, comprised 44 percent for production of aircraft, 34 percent for incendiaries, 12 percent for other military uses (principally tracer and incendiary ammunition), and the remaining 10 percent largely for aluminum alloys. Thus consumption was roughly half for structural purposes and half for destruction.

Salient statistics of the magnesium industry in the United States, 1942–46

	1942	1943	1944	1945	1946
Production of primary magnesium [1]—short tons	48,963	183,584	157,100	32,792	5,317

[3] Magnesium metal, 1942 and 1946; metal and alloys, 1943–45.

In 1946, the first postwar year, domestic primary magnesium production was about one-sixth the 1945 output and less than one-thirtieth the wartime record. On the other hand consumption of primary metal and alloy was one-fifth of that in 1945 and is estimated to have been approximately five times the prewar average. Secondary recovery dropped 45 percent from 1945 but nearly equaled primary output in quantity. Estimated world production declined 76 percent from 1945 and was about 5 percent of the 1943 peak. The price of standard four-notch ingot remained at 20.5 cents a pound throughout the year.

PRODUCTION

Primary.—Compared with the various optimistic estimates that have been current, domestic production of primary metal in 1946 was highly disappointing. Output was only 16 percent of that in the preceding year and barely 3 percent of the wartime peak. It was,

however, about 60 percent above that of 1939, which was stimulated by war preparations.

A powerful depressant of primary production was the high secondary recovery, which receded only 45 percent from 1945 and in total nearly equaled virgin output. This ratio is extremely high—virtually double that of its companion light metal, aluminum—and probably would not exist normally. According to the Surplus Property Administration, at the end of 1945 the Office of Metals Reserve held about 25,000 tons of magnesium ingot. Under the terms of the Surplus Property Act this material was to be placed in permanent Government stocks. Another 25,000 tons in various forms was expected to be available from contract terminations and from several Federal agencies. In the light of the relatively small current requirements—shipments of castings and wrought products were 7,250 tons in 1946—the surplus constitutes a serious threat to the industry unless the orderly marketing recommended by the Surplus Property Administration is executed.

Since November 1945 the Dow Chemical Co. has been the only active producer. Its plant at Midland, Mich., was closed in the spring of 1946 and dismantled. Production is now concentrated at the Freeport, Tex., plant, which resumed operation in July. The Permanente Metals Corp. carried out experiments at its carbothermic reduction plant at Permanente, Calif., with a view to lowering operating costs, principally through conversion from batch to continuous distillation of the crude dust. At the year end the plant was not in commercial operation. With special permission of the Dow Chemical Co., the sole producer in 24 months, the accompanying table showing monthly domestic production of magnesium for the period 1941–46 has been made possible.

Disposal of Government-owned metal producing and fabricating facilities that had cost 400 million dollars progressed slowly in 1946. From the national security standpoint it had been estimated that capacity of 120,000 to 150,000 tons should be in condition to be operated if required. The six lowest-cost primary plants, with a

[1] Producers' reports to War Production Board, January 1941–August 1945, thereafter to Bureau of Mines. Monthly figures are preliminary and do not add to final totals derived from the Bureau's annual industry canvass.

[2] Excludes crystal equivalent of magnesium content of "goop"—919,000 pounds in 1943 and 12,945,000 pounds in 1944.

capacity of 97,000 tons, were so designated, and the other seven were to be disposed of for any purpose. In addition, there were 30,000 tons of privately owned plant capacity, of which, as noted heretofore, only 9,000 tons were in active operation at the year end. During the year the War Assets Administration offered for sale the plants of the first-named group. The Dow Chemical Co. acquired the Government-owned half (9,000 tons) of the Freeport, Tex., plant it had operated during the war and obtained a lease on the chemical portion of the 36,000-ton Velasco plant, contingent on maintenance of the

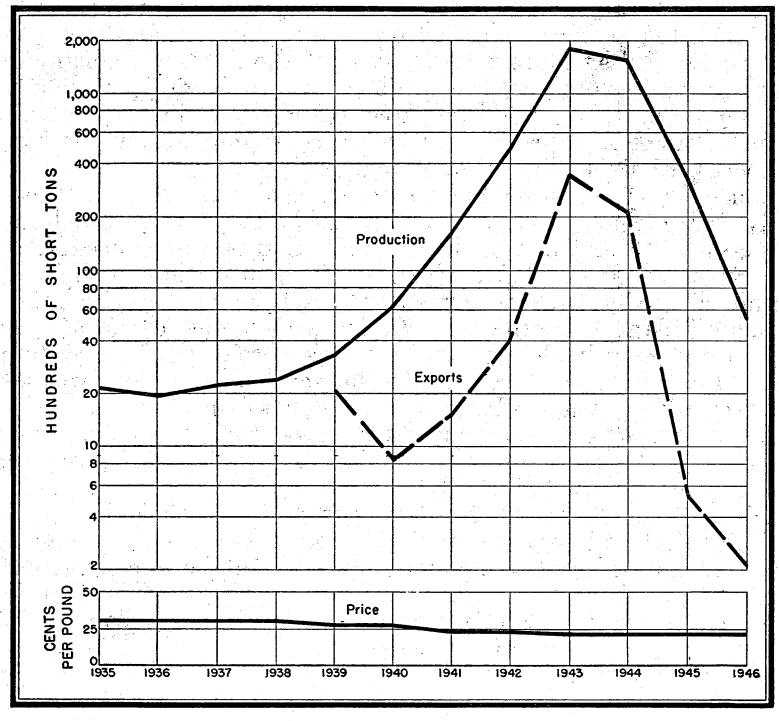

FIGURE 1.—Trends in production, exports, and quoted price of primary magnesium, 1935-46.

metal section. Of the Government-owned fabricating plants, only three were sold or leased for magnesium fabrication. Parts of others, and of metal plants as well, including the largest of all at Henderson, Nev. (56,000 tons), the plants at Marysville and Ludington, Mich. (36,000 tons), and the plant at Lake Charles, La. (27,000 tons), were leased or sold for a variety of purposes other than magnesium production.

Secondary.—Recovery of secondary magnesium, including alloying ingredients, totaled 5,117 short tons (including secondary magnesium incorporated in primary magnesium ingot) in 1946 (9,247 tons in 1945). This output was derived from 5,095 tons of magnesium scrap (76 percent of which was new) and from aluminum-base scrap. Of the quantity of magnesium recovered, 2,506 tons were as ingot; and 1,145 tons went into castings, 136 tons into magnesium-alloy shapes,

Production, sales, exports, and apparent consumption of primary magnesium in the United States, 1942–46, in short tons

	Production		Sales	Exports [1]	Apparent consumption [2]
	Raw, crude, and pure ingot	Ingot equivalent			
1942	[3]	48,963	47,420	4,045	43,375
1943	[4] 190,025	[4] 183,584	170,267	14,720	155,547
1944	[4] 161,935	[4] 157,100	146,585	4,830	141,755
1945	33,106	32,792	43,496	496	43,000
1946	5,317	5,317	8,916	207	8,709

[1] Primary metal only. Alloy exports in addition: 20,911 tons in 1943; 16,171 tons in 1944; 22 tons in 1945; and none in 1946; corresponding data for 1942 unavailable.
[2] Does not consider fluctuations in consumers' stocks and metal derived from scrap. Withdrawals from producers' stocks totaled 10,704 tons in 1945 and 3,599 in 1946. Additions to producers' stocks totaled 1,543 tons in 1942, 13,317 tons in 1943, and 10,515 tons in 1944.
[3] Not available.
[4] Does not include magnesium content of incendiary mixture produced direct.

1,218 tons into aluminum alloys, 6 tons into other alloys, and 106 tons into chemicals and incendiary products. Additional information on secondary magnesium will be found in this volume in the Secondary Metals—Nonferrous chapter.

CONSUMPTION AND USES

In comparison with estimates of postwar consumption that ranged from about 15,000 to 50,000 tons, the use of 9,873 tons of primary magnesium in 1946 was disappointing. Nevertheless it was more than three times the 1935–39 average production or sales rates (which were swollen by heavy export requirements) and consequently is indicative of an enhanced industrial acceptance.

The magnesium use pattern was tremendously altered in 1946. During the war the major use was for military purposes and almost

Actual domestic consumption of primary magnesium (ingot equivalent and magnesium content of magnesium-base alloys) in 1944–46, by uses, in short tons

exclusively so for about 3 years, with more than half the wartime output—of the United Kingdom as well as of the United States—going in incendiaries. Up to 1923 there was no important structural use for magnesium other than as a component of aluminum alloys. About 1927 foreign airplane makers began to apply it, but acceptance lagged in the United States; military agencies continued to be reluctant to employ it up to the outbreak of the war. It was estimated in 1940 that only 1.2 percent of the engines and about 1 percent of airframes and propellers were magnesium. In that year, 12,804 planes (6,019 of which were military, the remainder civilian) were constructed. The average airframe weight was 3,839 pounds, and about 80 pounds of magnesium was used per plane. In 1943, 85,898 planes (all military) with an average airframe weight of 7,621 pounds were built, and each contained about 1,100 pounds of magnesium; in the following year of peak plane output (96,318) the airframe weight had risen to nearly 10,000 pounds, and each contained about 1,000 pounds of magnesium. Although total plane output was large in 1946, the bulk was in small civilian planes that used little magnesium. Of the few military planes manufactured, many were relatively small, high-speed types, compared with the great number of heavy bombers [1] built during the war.

As a consequence of the loss of these major wartime outlets, primary magnesium consumption dropped 78 percent below that in 1945. Although affected by the increase in use of secondary metal, the drop in consumption was markedly in evidence in the quantity of virgin metal used for castings. This was only 5 percent of the 1945 use for these purposes and accounted for only 13 percent of total consumption in 1946, compared with nearly 63 percent in 1945. Powder output also showed the transition to peacetime uses, taking only 4 percent of that used in 1945 and was less than 2 percent of the total used in 1946. On the other hand, the use for wrought products rose in quantity, and relatively as well, indicative of new and wider ranges of application. They took 16 percent more new metal than in 1945 and comprised 48 percent of the total use compared with less than 9 percent in the preceding year. More secondary magnesium was consumed in aluminum-base alloy in 1946 than in 1945.

PRICES

The base price of virgin standard magnesium ingot remained throughout the year at 20.5 cents a pound, a price that has been in effect since January 1943. Prices of the principal casting alloys ranged from 23 to 25 cents, and extrusion billets from 26½ to 31 cents a pound, unchanged during the year. Secondary magnesium ingot (class A) was quoted by the American Metal Market at 15.75–16.25 cents a pound until October, when remelt ingot (without grade classification) was priced at 16–18 cents. In November it was listed at 17–18 cents and late in December at 18–18.50 cents a pound.

In Canada primary magnesium was priced at 23 cents a pound and in the United Kingdom at 1s.6d. to 2s.6d. a pound for metal during the first and at 1s.6d. to 2s.0d. in the second half year, or at the standard rate of exchange from 30 to 50 cents and 30 to 40 cents a

[1] In addition to the metal in the plane itself, the B–29 carried forty 500-pound bomb clusters.

pound, respectively. The French price was 66 francs a kilogram (25 cents a pound) for the first 5 months of 1946, 112 francs in June and July, 111 francs in August and September, and 116 francs (43.9 cents a pound) for the rest of the year. In 1945 the French price was equivalent to about 49.5 cents a pound.

FOREIGN TRADE [2]

Up to the First World War the United States had obtained its magnesium supplies from Germany. The development of a domestic metal industry in that period, with subsequent tariff protection, brought about virtual extinction of import trade. At least as early as 1928 there was an outward movement that was greatly accelerated during the 1930's as the continental nations began rearming, reaching a high point of about 2,100 tons in 1939. The outbreak of war slowed export, but it then leaped to 35,631 tons (including magnesium content of alloys) in 1943 and declined as precipitously to 1946, when at 207 tons it stood at the 1933 level. The accompanying table lists the principal foreign sales of the then sole producer, Dow Chemical Co., from 1928 to 1939, when the Department of Commerce began to report magnesium exports.

Major magnesium ingot and stick exports, 1928–39, in short tons [1]

Year	Belgium	France	Germany	Japan	Mexico	Netherlands	Poland	Sweden	U.S.S.R.	United Kingdom	Total
1928			2.5								2.5

[1] Dow and Magnesium, published by the Dow Chemical Co., Midland, Mich., 1944, 76 pp.
[2] Includes 50.5 tons for which distribution is not known.

In 1946 imports in all forms were 241 tons, an exceptionally high figure. Virtually all the material was reported as metal and scrap and came from Canada.

Exports of magnesium from the United States, 1945–46

Magnesium	1945		1946	
	Short tons	Value	Short tons	Value
Metal in primary form	[1] 518	$216,793	207	$85,382
Metal in other forms	140	292,430	87	48,892
Powder	720	579,736	12	6,104

[1] Includes 22 tons of magnesium-base alloy.

[2] Figures on imports and exports (unless otherwise stated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Exports of primary metal dropped 58 percent from 1945. Primary metal exports in 1946 were: 165 tons to Mexico, 17 to Canada, 15 to Switzerland, 7 to Argentina, 3 to Sweden, and a few hundred pounds each to three other countries. Ten tons of magnesium powder were shipped to Canada, and the remainder was distributed among seven countries. Of magnesium metal in other forms, Mexico received 51 tons, Venezuela 28, and 15 other countries the remainder.

TECHNOLOGIC DEVELOPMENTS

The war gave strong impetus to technical studies of magnesium now resulting in a voluminous literature [3] covering all phases from metal production from a wide range of raw materials to ultimate utilization. The manyfold disclosures suggest a strong upturn in magnesium's industrial uses in peace, in sharp contrast to its application in war as a powerful agent of destruction.

Although the lightest of commercially available metals and with virtually unlimited production possibilities, strong deterrents to its use have been its pronounced chemical reactivity, relatively weak physical characteristics, and high cost, particularly in cast- and wrought-product forms. Recent developments have tended to overcome many of the objections.

New melting and refining fluxes and improved operating procedures inhibit reactivity and provide metal freer of flux, gas, and contaminant inclusions. Highly purified magnesium has excellent noncorrosive qualities and with controlled alloy additions provides metal of improved strength characteristics. New alloys, notably with cerium and zirconium, bid fair to become important structural materials because of their enhanced physical properties, especially creep strength at elevated temperatures. On the mechanical side, continuous casting of billets is a material improvement over usual current practice. Hot chamber die casting, developed by a large German firm, offers much in cost reduction, possibly making products competitive with zinc. High-pressure forging methods, which were coming into

use in Germany, are being investigated; and, while a volume market does not yet exist, experiments on continuous rolling of sheet and strip indicate its feasibility.

From the cost standpoint, nothing comparable to the Dow seawater process has yet reached the production stage. Because of its common occurrence and high magnesium content olivine (essentially magnesium-iron silicate) has attracted much attention as a metal source. Wartime investigations of the Bureau of Mines [4] on production of magnesia or alternatively magnesium chloride from olivine by a hydrochloric acid digestion process present interesting possibilities. Not only may a high-quality product be made, but rough cost estimates were sufficiently favorable to warrant investigation on pilot-plant scale.

WORLD REVIEW

In 1946 estimated world output of 12,000 metric tons of primary magnesium dropped 76 percent from 1945 and was not as great as that of Germany a decade ago. In large part the prodigious decline resulted from the termination of war-engendered needs, accompanied by the exclusion of Germany and the Japanese Empire from the ranks of the producing nations. Although full data are not yet available, sufficient reports have been received to permit the revision of previous estimates as shown in the accompanying table.

Australia.—The 1,000-ton magnesium plant put into operation by Broken Hill Proprietary Co., Ltd., in 1941 ceased operation in 1944. Its production is shown in the subjoined table. Australian consump-

[1] Estimated by authors.
[2] January-February only. Planned production for March, 2,830 tons.
[3] Includes scrap.

tion of ingot and powder in metric tons was respectively as follows: 1942, 153 and 61; 1943, 266 and 60; 1944, 155 and 17; 1945, 62 and 12. The powder was imported from the United Kingdom, United States, and Canada.

Canada.—Production cut-back was relatively much greater than in the United States. Sales were largely from stocks. Shipments were made to Sweden, Belgium, Czechoslovakia, and Mexico. The Dominion Magnesium Co., Ltd., increased the casting facilities of its subsidiary, Light Alloys, Ltd., and was to resume operation at the Haley's Station, Ont., plant in January 1947, but principally for the production of calcium metal.

Germany.[5]—The first commercial production of magnesium began at Bitterfeld in 1896. Although there had been sporadic attempts at production in other countries both before and after that time, Germany was virtually the sole world supplier up to the First World War. Then magnesium production was expanded and structural alloys containing aluminum and zinc ("Elektron") that had been developed about 1909 found considerable application as substitutes for scarce copper and aluminum. These alloys commanded attention elsewhere, but as late as 1925 only the United States and France were its competitors. Although data are not fully available, Germany probably maintained production supremacy through the interwar period and until 1942, when surpassed by the United States.

At the outbreak of World War II production facilities were concentrated in central Germany. There was none in the annexed areas nor in Austria. Annual capacity of operating plants and other data are given in the following table:

Operator	Plant location	Occupation zone	Capacity (metric tons)	
			1938	1944 (Nov.)
I. G. Farbenindustrie, A. G	Aken	U. S. S. R	10,000	11,400
Do	Bitterfeld	do	3,900	3,900
Do	Stassfurt [1]	do	4,000	12,500
Do	Bitterfeld [2]	do	60	1,000
Wintershall, A. G	Heringen	U. S	1,000	6,800

[1] Expanded to 12,000 tons capacity in 1942.
[2] Originally an experimental ferrosilicon reduction plant. Output probably did not exceed 1,000 tons annually during the war.
