In contrast to the aluminum industry that depended on foreign ores and suffered severely from mounting transport difficulties as the war progressed, magnesium production using local raw materials was not heampred. The I. G. Farbenindustrie plants generally used waste magnesium chloride from potash plants in the vicinity with dolomite from the Harz Mountains and the Nurnberg district. The Wintershall company employed carnallite (potassium-magnesium chloride) from its nearby potash mine.

According to the German census for 1936, crude magnesium production was 13,311 metric tons (12,800 tons magnesium content),

[5] Most of the data have been derived from Economic Survey of Germany, The Metal Industries, prepared by the Economic Advisory Branch, Foreign Office and Ministry of Economic Warfare, London, September 1944; from German Aluminum and Magnesium Industries, Field Information Agency, Technical Final Report No. 501, Office of Military Government for Germany (U. S.), November 1945; and Metallurgical and Industrial Developments in Magnesium, FIAT Final Report 89, Joint Intelligence Objectives Agency.

and consumption was 12,742 tons. Scrap recovery was about 900 tons. Primary production in 1937 was estimated to be 12,000 tons and was reported at 13,200 tons in 1938 with 1,800 tons of secondary metal. The accompanying table compiled from various sources gives production and other data for the war period.

Salient statistics of magnesium in Germany, 1939–45, in metric tons

	1939	1940	1941	1942	1943	1944	1945
Primary production	[1] 14,000	17,720	24,000	30,000	32,400	33,600	[2] 4,225
Total production [3]	(4)	(4)	25,080	33,420	43,368	[5] 45,660	(4)
Imports: [6]							
Occupied countries		60	2,400	1,800	912	(4)	(4)
Others			180	960	840	(4)	(4)
Consumption [7]	[8] 13,000	15,900	27,800	32,700	44,600	39,370	(4)
Stocks end of year	4,985	6,485	6,365	9,845	10,565	12,855	(4)

[1] Estimated. Last 4 months 5,060 tons.
[2] January–February only. Planned production, March, 2,830 tons.
[3] Includes waste and scrap added to virgin metal for production of usable lower-grade alloys.
[4] Figure not available.
[5] Includes imports given as 1,500 tons in original report.
[6] Distribution by years and sources unlike in different reports but period totals in fairly close agreement.
[7] Includes virgin and secondary, alloyed and unalloyed metal.
[8] Estimated. Last 4 months, 4,500 tons.

Before the war it was estimated that 30 percent of the metal output was used for military purposes, 35 percent went to civilian use, and 35 percent was exported. During the war, distribution was controlled by the Air Ministry, which took about 90 percent for the air force, army, and navy; 2 to 3 percent was for export, and the remainder for civilian uses was largely for military needs. About one-half the military consumption was in explosives and incendiaries. Wartime requirements appear to have been underestimated. Civilian consumption was first restricted only a few days before the invasion of Poland on September 1, 1939. Shortly thereafter zinc die castings replaced magnesium in portable wireless sets and other military equipment; later aluminum displaced magnesium, especially in field-artillery uses, and by 1944 both were being supplanted by steel and wood in airplanes. Because of the shortage, domestic production was stimulated largely by increasing secondary recovery, and accomplished in part by increasing impurity tolerances, notably in silicon and copper, and by enlargement of domestic plant capacity, which was limited principally by inadequate power supply. Unsuccessful attempts were made to develop production outside Germany proper. In 1943 a seawater plant was completed at Heren, Norway, but was bombed the day it began operation; another at Diosgyr near Miskolc, Hungary, did not get into production; construction of a 12,000-ton plant at Mossbierbaum, about 40 miles west of Vienna, was undertaken but did not progress beyond the building-construction stage.

There were more than 20 fabricating plants. Of these the I. G. Farbenindustrie A. G. and three associated companies' works were the largest makers of castings (other than die), extrusions, and rolled products. All are in the Russian zone. The largest die caster was the Mahle K. G. and subsidiaries (largely in the American zone). This company was the pioneer in pressure die casting in Germany and developed the hot-chamber method and equipment. This is be-

lieved to be superior to the cold-chamber, higher-pressure method used elsewhere in Germany and other countries. The Wintershall company, a primary producer, also converted part of its output to forgings, castings, and extrusions. According to this company, in 1943–44, 60 percent of German magnesium consumption was for castings, and the remainder appeared as mill products. Other sources of information give as much as 75 percent for castings and 25 percent for wrought products including 8 percent for pyrotechnics.

During the war the use of magnesium for structural purposes was nearly confined to airplanes. Among the many parts were engine mounts, crankcases for radial air-cooled and liquid-cooled engines, bomb-bay doors, landing-gear struts and wheels, wing tips and engine cowling, and large cooling fans. Jet-engine housings and rotor and stator rings of turbocompressors were also fabricated from magnesium alloys. Although magnesium propellers had been used for commercial planes, they were not used for military planes because they were more easily bullet-shattered than aluminum alloy. Parts of the V–2 bombs were made of magnesium, as were large rocket shells. Automotive uses were virtually discontinued during the war. Before the war oil pumps were in quantity production, and it was planned to make many other parts such as crank cases, rear axle parts, and transmission cases therefrom. A successful application was in cast field-artillery wheels up to 5 feet in diameter. Magnesium foundry flasks were much used.

In the main, German wartime practices followed those described by Dr. Adolf Beck, of the I. G. Farben. organization, in his work "Magnesium und seine Legierungen," published in 1939.[6] They diverge from British and American practices in numerous respects and in some were superior or were claimed to be better than those in other countries. Among the latter were the increasing use of continuous-billet casting, hot-chamber die casting, and the use of 30,000- and 15,000-ton hydraulic presses for forging large structural elements, such as gun carriages. Anhydrous ferric chloride ($FeCl_3$) was employed for refining ("Elfinal" process) cast metal. Less superheat is required and removal of hydrogen and iron is improved. In general, the Germans had not recognized until late in the war the importance of high-purity magnesium as the base for alloying. Most of the materials used had much higher contaminant tolerances than customary in the United States or in England. On the other hand I. G. Farben. investigated and patented many magnesium-base alloys, some of which contained as many as six components. Among them, cerium and zirconium gave highly promising results. Cerium (added as Mischmetall) gave some grain refinement, reduction in microporosity, and higher creep resistance at elevated temperatures than other known alloys. Practical use of a nominal 6-percent cerium alloy was carried on for about a year in the supercharger impellers and rear cam-follower guides of the BMW–801 airplane engines, but production was discontinued because of the shortage in cerium. Zirconium alloys were also described by Beck, and some attempts were made to bring them to a production stage with most of the work on casting alloys. Results appear to have been only partly satisfactory. The

[6] An English translation by the staff of F. A. Hughes & Co., Ltd., and Magnesium Elektron, Ltd., originally an I. G. Farben associate, entitled The Technology of Magnesium and its Alloys, was published by the first named company in London, 1940.

pronounced grain-refining effect with increased strength and ductility given by zirconium additions indicate a wider field of application of magnesium-base alloys.

Japan.—Production of magnesium is said to have begun as early as 1919 but the earliest available records of production commence with 1931.[7] Although several companies were experimenting with production from various raw materials, the Riken Kinzoku Co., Ltd., an amalgamation of other companies, was the sole commercial producer from 1933 through 1936. Its output was in those years, respectively, 33, 142, 234, and 578 metric tons. It remained the principal supplier until 1942 and furnished about 45 percent of the total Home Islands output in 1933–45. There were three producers in 1937, which grew to eight in 1941. One then ceased production, with a second closed in 1943, leaving six in operation in 1945. In addition, beginning in 1938, six plants were in operation in Korea in 1945; one was in production in Formosa, 1941–45; and there were two in Manchuria, with a third large plant completed in July 1945. The peak rated capacity in Japan proper was 6,950 tons and in Korea 7,700 tons, but at the end of the war the former had dropped to 2,340 tons.

Plants that furnished about one-half the Home Islands metal for the most part used, as raw material, brines or byproduct bitterns resulting from extraction of salt from sea water, as did three of the Korean plants. The shortage of salt and of imported raw material in 1941 led the largest maker—the Riken company—to experiment with production from sea water. In 1944 about 25 percent of its product was so derived. Japan also lacked magnesite, and nearly half the industry used magnesia or magnesite imported from Korea or Manchuria. Part of the plants in those countries and in Formosa used the same basic materials. These plants employed the I. G. Farbenindustrie method of preparing electrolytic-cell feed. The Nippon Magnesium Co., Ltd. (later the Mittetsu Magnesium Co., Ltd.), employed the Hansgirg or carbothermic reduction method at the Konan, Korea, plant throughout its operation. The maximum output (1944) was about 1.5 tons daily. Data on consumption are not available, but it was estimated that aircraft took about 90 percent of the output in 1942–45.

United Kingdom.—Only since 1935 has the United Kingdom been a commercial producer of magnesium. In that year, Magnesium Electron, Ltd., constructed an electrolytic plant near Manchester, but the country remained largely dependent on metal imports. During the war the Government expended £6,100,000 for the erection of three other plants in the United Kingdom. The Minister of Supply reported that demand reached 100,000 tons a year during that period, but domestic plants turned out only 19,000 tons at the peak. Recorded exports from the United States were about 16,000 tons, while Canada furnished a few thousand tons. The total supply fell far below the estimated demand, but demand fell sharply after 1943 and again markedly at the end of the war, until in mid-1946 it was estimated to be less than 2,500 tons, most of which could be obtained from scrap.

[7] Minerals Yearbook, 1937, p. 729, states "Japanese magnesium production was 3,219 kilograms in 1931 24,018 in 1932, 104,812 in 1933, and 140,808 in 1934. All official data terminated after 1934 * * * ."

Magnesium Compounds and Miscellaneous Salines

GENERAL SUMMARY

MAGNESITE production declined further in 1946, amounting to 4 percent less than in 1945 and less than half the all-time peak of over 750,000 tons in the war year 1943. The drop from 1945 was caused mostly by smaller requirements of the steel industry for basic refractories. Caustic-calcined magnesias, on the other hand, showed a perceptible increase in sales, reflecting sustained markets in the fertilizer, oxychloride cement, rayon, rubber, and other industries. Calcium chloride, used in stabilizing dirt roads, set a new record. Bromine output fell drastically, owing to the peacetime drop in gasoline-antiknock sales. Iodine shipments were higher. The world shortage of soda ash gave natural sodium carbonate the best year in its history, and sodium sulfate sales also set a record in 1946. As export markets gradually reopened during the year, shipments of borates mounted to unprecedented heights, and production surpassed even the previous record year, 1937.

PART I.—MAGNESIUM COMPOUNDS

MAGNESITE

Output of crude magnesite was unusually high for a peacetime year—324,640 short tons, almost double the 1937–39 average of 166,000 tons. Production was only a little below that of the last war year, 1945. But for the steel and coal strikes in 1946, requirements for basic

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

refractories might have driven crude magnesite production even higher than in 1945. Fortunately the major users of magnesite had virtually no reconversion problems; and demand for magnesias of various grades, both refractory and caustic-calcined, was affected comparatively little by the change-over to a peacetime economy.

Salient statistics of the magnesite industry in the United States, 1942–46

	1942	1943	1944	1945	1946
Crude magnesite:					
Mined:					
Short tons	[1] 497,368	754,832	561,450	336,458	324,640

[1] Less than 1 ton.

The disagreement over the relative merits of the rammed basic open-hearth steel furnace and the burned-in magnesite hearth continued unabated in 1946, with articulate adherents to both points of view.[2] During the past several years, when furnaces have been rebuilt the tendency has been to ram in the bottom rather than burn it in. The trend has induced makers of magnesia refractories to modify the composition of their grain magnesia for ramming use. The quantity of basic refractories used per ton of ingot steel increased considerably during the war years, but whether this was due to the advent of the rammed hearth or to the sacrifice of the furnace to speed is difficult to determine.

The Bureau of Mines developed a laboratory method for obtaining magnesium oxide from olivine by means of hydrochloric acid digestion.[3]

A symposium on magnesian fertilizers was held at the September 1946 meeting of the American Chemical Society in Chicago; 10 papers were given.[4]

Gas-oxygen firing of open-hearth furnaces may or may not call for greater consumption of basic refractories.[5]

PRICES

The Office of Price Administration released dead-burned magnesite from price control July 19, 1946, and all other grades were decontrolled by OPA Supplementary Order 193 of November 12, effective November 10. According to E&MJ Metal and Mineral Markets, the price of maintenance-grade dead-burned magnesite remained at $22 during the year. The Westvaco Chlorine Products Corp. offered the following price schedule for its magnesias (carlots, f. o. b. California): Caustic-calcined magnesite, bulk—$61.50, powdered—$67.50; calcined (sea-water) magnesia, bulk—$54, powdered—$60; sea-water periclase, bulk, 85 percent—$39.50, 90 percent—$40 a short ton.

REVIEW BY STATES

California.—Johns-Manville Corp., 22 East Fortieth Street, New York 16, N. Y., recovered purified magnesium carbonate from magnesite at Redwood City for use in 85-percent magnesia insulation. Marine Magnesium Products Corp., South San Francisco, continued its output of specialty magnesias, using as raw materials lime, dolomite, and the waters of San Francisco Bay. The firm completed a plant to make magnesia from dolomite by a patented variation of the Pattinson process. The product has a purity of 99.5 percent, whereas sea-water magnesia rarely analyzes higher than 97.5 to 98 percent. The Permanente Metals Corp., Permanente, Calif., operated its magnesia-from-sea-water plant at Moss Landing, making refractory and caustic-calcined magnesias. Plant Rubber & Asbestos Works, 537 Brannan St., San Francisco, Calif., made 85-percent magnesia at its Emeryville and Redwood City plants. Westvaco Chlorine Products Corp., Newark, Calif., recovered, by hand selection, magnesite from its Western mine near Livermore and produced refractory and caustic grades of magnesia at Newark from sea-water bitterns. The firm also recovered magnesium chloride from sea-water bitterns at Chula Vista.

Georgia.—International Minerals & Chemical Corp., 20 North Wacker Drive, Chicago 6, Ill., produced epsom salt from serpentine and sulfuric acid at its Augusta plant but reported that the plant would not operate in 1947.

Illinois.—At its Waukegan plant the Johns-Manville Corp., 22 East Fortieth Street, New York 16, N. Y., produced precipitated magnesium carbonate by the Pattinson process for use in 85-percent magnesia insulation.

Michigan.—The Dow Chemical Co., Midland, Mich., continued its production of magnesium chloride and sulfate from well brines and dolomite. Michigan Chemical Corp., St. Louis, Mich., recovered

[4] Titles listed in Chemical and Engineering News, vol. 24, No. 15, Aug. 10, 1946, p. 2057. Abstracts published by the American Chemical Society, Washington, D. C.
[5] Steel, vol. 119, No. 11, Sept. 8, 1946, p. 140.

magnesia from dolomite and well brines. Morton Salt Co., 310 South Michigan Ave., Chicago 4, Ill., produced precipitated magnesium carbonate from lime and well brines at its Manistee plant. The synthetic magnesia produced by the Standard Lime & Stone Co. from Manistee well brines was described.[6] Waste brines are treated with dolomitic milk of lime, and the resultant precipitate of magnesium hydroxide is filtered and dried. Sufficient iron oxide, silica, and other "impurities" are deliberately added to give a finished analysis of magnesia 84.0, ferric oxide 5.5, silica 4.5, alumina 2.0, and lime 4.0 percent. The magnesia product is used in lining basic open-hearth steel furnaces.

Nevada.—Basic Refractories, Inc., mined brucite at Gabbs and shipped it to Narlo, Ohio, for calcining and manufacture into basic open-hearth dressings and ramming mixes. Sierra Magnesite Co., Newark, Calif., an affiliate of Westvaco Chlorine Products Corp. and Henry J. Kaiser and associates, continued to mine magnesite at Gabbs, all for "caustic-calcined" uses.

New Jersey.—Johns-Manville Corp., 22 East Fortieth Street, New York 16, N. Y., produced precipitated magnesium carbonate by the Pattinson process for use in 85-percent magnesia insulation at its Manville plant. Northwest Magnesite Co., 1800 Farmers Bank Building Pittsburgh 22, Pa., recovered refractory magnesia from raw sea water at its Cape May plant.

Pennsylvania.—Three firms in the Philadelphia area used the Pattinson process in making magnesium carbonate for 85-percent magnesia insulation and other purposes—the Philip Carey Manufacturing Co., 1935 Easton Boulevard, Lockland, Cincinnati 15, Ohio, plant at Plymouth Meeting, Pa., Ehret Magnesia Manufacturing Co., Valley Forge; and Keasbey and Mattison Co., Butler Avenue and Maple Street, Ambler. General Magnesite and Magnesia Corp., 705 Architects Bldg., Philadelphia 3, Pa., made magnesium oxide from purchased magnesium carbonate. The process used by this firm has been described.[7]

Texas.—Dow Chemical Corp., Freeport, recovered magnesium chloride and oxide from sea water, the former for reduction to metal and the latter for fertilizer. Gardner & Cates, Llano, made caustic-calcined magnesite for the fertilizer market.

Washington.—Northwest Magnesite Co., 1800 Farmers Bank Building, Pittsburgh, Pa., was the sole producer of refractory magnesite in 1946, as in 1945. This operation is by far the largest magnesite producer in the country.

West Virginia.—The Standard Lime & Stone Co. continued its recovery of refractory magnesia by leaching calcined dolomite at its Millville plant. Magnesium carbonate is also produced from dolomite by the Pattinson process at this location.

FOREIGN COUNTRIES

Information on magnesite in the principal foreign producing countries, including Austria, Manchuria, Czechoslovakia, Greece, and Soviet Russia, has been meager for a number of years. However,

[6] Iron Age, vol. 157, No. 18, May 2, 1946, p. 70.
[7] Smith, A. Q., Complex Processing Used for Light Magnesium Oxide: Chem. Eng., vol. 53, No. 10, October 1946, p. 119.

statistics in the following paragraphs throw some light on the European and Australian industries.

Australia.—Production during the period 1939–45 was reported as follows: 1939, 26,094 metric tons; 1940, 25,287 tons; 1941, 28,144 tons; 1942, 35,501 tons; 1943, 65,901 tons; 1944, 32,213 tons; and 1945, 23,453 tons.

Austria.—Production of magnesite in Austria has been relatively low since the end of hositilities. Output has been reported as: 1942, 482,397 metric tons; 1943, 494,428 tons; 1944, 480,564 tons; 1945, 94,948 tons; and 1946, 95,388 tons.

Greece.—As compared with prewar levels, output in recent years has been small. Production was reported as follows, in metric tons: 1943, 680; 1944, 950; 1945, 1,650; and 1946, 4,500.

DOLOMITE

The steel strike in 1946, with the subsequent furnace shut-down, adversely affected sales of dead-burned dolomite, and total shipments during the year were 9 percent lower than in 1945. There were no imports in 1946.

Dead-burned dolomite sold in and imported into the United States, 1942–46

Year	Sales		Imports [1]		Year	Sales		Imports [1]

1944	1,290,790	11,441,612	40	691					

[1] Reported as "Dead-burned basic refractory material."

A paper on the recovery of magnesia from dolomite on a pilot-plant scale was given at the annual meeting of the American Institute of Mining and Metallurgical Engineers in New York, March 1947.[8] Owing to the ready availability of dolomite in regions of greatest steel production, the process may offer attractive freight savings if developed on a commercial scale.

Additional information on dolomite is contained in the Stone chapter of this volume.

OTHER MAGNESIUM COMPOUNDS

Production of high-cost magnesias (as distinguished from the low-cost refractory and caustic-calcined grades) and magnesium salts offered a varied pattern in 1946. The high-cost magnesias enjoyed a good year owing to increased demands in the manufacture of synthetic rubber and medicinals. Precipitated magnesium carbonate, used mostly in 85-percent magnesia insulation, dropped, together with magnesium chloride. The latter salt has been declining in importance ever since cut-backs in the wartime magnesium metal program but probably was stabilized by the end of 1946. Further changes probably will be

[8] Pike, R. D., Process for Manufacture of Dead-burned Magnesite and Calcium Carbonate from Dolomite: Am. Inst. Min. and Met. Eng. Tech. Pub. 2155, March 1947, 11 pp.

increases. As only two producers reported magnesium sulfate production in 1946, figures for this salt may not be shown.

Owing to the difficulty of distinguishing light and extra-light magnesias statistically, the two have been combined in the accompanying table.

A new extinguisher for magnesium-metal fires consists of a mixture of talc, casein, and magnesium carbonate. It is shaken on the fire and fuses over it.[9]

Specified magnesium compounds produced, sold, and used by producers in the United States, 1945–46

Product	Plants	Produced (short tons)	Sold [1]		Used (short tons)
			Short tons	Value	
1945

[2] 50 pounds.
[3] 20 pounds.

[9] Science News Letter, vol. 50, No. 9, Aug. 31, 1946, p. 136.

Magnesium hydroxide, medicinal grade, according to Oil, Paint and Drug Reporter, was quoted at 29 to 30 cents a pound in 1946 (the same as in 1945); magnesium carbonate, technical grade, bags, carlots, northern Atlantic Coast States, 7¼ cents a pound; U. S. P. grade, 8 cents (as in 1945). Magnesium chloride, flake, barrels, carlots, works, was quoted at $37 a ton, an increase of $5 over 1945. Epsom salt, technical, crystals, bags, carlots, per 100 pounds, was listed at $2.05 per hundredweight.

PART II.—MISCELLANEOUS SALINES

CALCIUM CHLORIDE

Sales of natural calcium (and calcium-magnesium) chloride set a new record in 1946 of 262,147 short tons, an increase of 20 percent over 1945. The major use of calcium chloride is in stabilizing dirt-road surfaces, where it binds soil particles together with its hygroscopic action, keeps down dust, and minimizes the formation of chuckholes. In the East a great deal is used (as the mixed calcium-magnesium chloride) to prepare heavy-media solutions for coal washing. Other traditional uses are in coal dusting, spraying on ore shipments in winter to inhibit freezing to a monolithic mass, sprinkling on snow and ice-covered streets, and in cement mixes. The housing boom of the past year has accentuated the latter use, and much attention has been given to speeding concrete-block production with calcium chloride. It is claimed that calcium chloride offers the following advantages in concrete block: Higher early strength, shorter curing period, reduced cracks, and greater ultimate strength. If steam curing is used, it is said that kiln time is cut in half. The chloride is added so as to comprise 2 percent of the cement mix. In air-entraining cements, calcium chloride partly offsets the loss in strength introduced with the entrained air.

Calcium chloride and calcium-magnesium chloride from natural brines sold by producers in the United States, 1942–46

[In terms of 75 percent (Ca, Mg) Cl_2]

Year	Short tons	Value	Year	Short tons	Value
1942	224,527	$1,733,169	1945	218,320	$1,818,219
1943	199,796	1,549,565	1946	262,147	2,278,954
1944	200,964	1,621,227			

Calcium chloride imported for consumption in and exported from the United States, 1942–46

Year	Imports		Exports	
	Short tons	Value	Short tons	Value
1942	1,443	$18,926	8,336	$223,184
1943	8,000	102,080	12,725	434,933
1944	2,761	35,125	8,535	234,329
1945	4,040	51,409	6,871	188,141
1946	1,313	14,587	10,073	367,993

Ten plants produced calcium chloride in 1946, the same as in 1945. The following firms reported production of calcium chloride (and calcium-magnesium chloride) from natural brines in 1946: California Rock Salt Co., 2436 Hunter Street, Los Angeles 21, Calif., plant at Amboy, Calif.; J. Q. Dickinson & Co., Malden, W. Va.; Dow Chemical Co., Midland, Mich.; Great Lakes Chemical Corp., Filer City, Mich.; Hill Brothers Chemical Co., 2159 Bay Street, Los Angeles 21, Calif., plant at Amboy, Calif.; Michigan Chemical Corp., St. Louis, Mich.; National Chloride Co., Amboy, Calif.; Rademaker Chemical Corp., Eastlake, Mich.; and Westvaco Chlorine Products Corp., 405 Lexington Avenue, New York 17, N. Y., plants at Chula Vista, Calif., and South Charleston, W. Va.

BROMINE

Bromine production dropped sharply in 1946 to the lowest level since 1939. The drop is attributed to reduced purchases of gasoline antiknock by the armed services in 1946. This halogen is used mostly in making ethylene dibromide, which is mixed with tetraethyl lead to form Ethyl gasoline antiknock compound.

Bromine and bromine in compounds sold or used by producers in the United States, 1942–46

Year	Pounds	Value	Year	Pounds	Value
1942	65,880,935	$13,729,383	1945	79,709,857	$14,796,229
1943	94,085,937	19,107,065	1946	42,783,327	8,560,434
1944	102,112,462	19,712,819			

Bromine and bromides sold by primary producers in the United States, 1945–46

	1945			1946		
	Pounds		Value	Pounds		Value
	Gross weight	Bromine content		Gross weight	Bromine content	
Elemental bromine	2,157,820	2,157,820	$379,336	2,657,355	2,657,355	$423,353
Sodium bromide	1,203,398	938,650	242,758	1,796,557	1,401,315	339,579
Potassium bromide	3,152,080	2,111,894	626,255	2,596,680	1,739,776	512,056
Ammonium bromide	482,749	395,854	108,930	541,926	444,379	119,443
Other bromides, including ethylene dibromide	87,484,382	74,105,639	13,438,950	43,353,081	36,540,502	7,166,003
	94,480,429	79,709,857	14,796,229	50,945,599	42,783,327	8,560,434

A striking development was the transfer of the Ethyl-Dow plant at Wilmington, N. C., to Freeport, Tex., thus enlarging the facilities at the latter locality. The Wilmington plant was the original bromine-from-sea-water plant, erected in 1933 and had been the largest individual producer, by far, since that time.

The Dow Chemical Co., Midland, Mich., second-largest producer, recovered bromine from Michigan well brines as a byproduct of magnesium and calcium chlorides. American Potash & Chemical Corp..

Trona, Calif., recovered bromine from Searles Lake, and Westvaco Chlorine Products Corp., Newark, Calif., from sea-water bitterns. The following won bromine from well brines: Great Lakes Chemical Corp., Filer City, Mich.; Michigan Chemical Corp., St. Louis, Mich.; Morton Salt Co., Manistee, Mich.; Rademaker Chemical Corp., Eastlake, Mich.; and Westvaco Chlorine Products Corp., South Charleston, W. Va.

According to Oil, Paint and Drug Reporter, potassium and sodium bromides, U. S. P., granular, 500-pound barrels, works, were quoted at 25 cents a pound in 1946, the same as in 1945.

IODINE

Receipts of foreign iodine (all from Chile) rebounded sharply from the abnormally low levels of 1945, although large stocks were still held in the Staten Island warehouse of the sole importer, Chile Nitrate Sales Corp. The two domestic producers, Dow Chemical Co. and Deepwater Chemical Co., Ltd., continued their recovery of iodine from oil-well waste brines near Long Beach, Calif., and supplied a substantial fraction of the United States market. The latest year for which data on domestic production may be published is 1937, when 299,286 pounds valued at $242,422 were produced. Subsequent output has been considerably higher.

The United States Pharmacopoeia in 1946 changed the iodine content of tincture of iodine from 7 percent to 2. The new concentration is said to be just as effective and will be less likely to damage skin tissue. Iodine is also used (in the form of iodides) in photographic emulsions, in organic syntheses, and in salt and other foodstuffs to prevent goiter. In the latter connection a bill (H. R. 2717) was introduced in Congress in 1946 to amend section 301 of the Food, Drug, and Cosmetic act, so as to require a specified iodide content (80 to 160 parts per million) in table salt moving in interstate commerce.

Crude iodine imported for consumption in the United States, 1942–46

Year	Pounds	Value	Year	Pounds	Value
1942	951,243	$1,051,432	1945	220,526	$232,070
1943	2,744,930	3,041,609	1946	886,578	976,190
1944	1,204,303	1,321,274			

The Bureau of the Census reported production of resublimed iodine (from both domestic and imported crude iodine) as follows: 1943, 770,000 pounds; 1944, 612,000; and first 9 months of 1945, 497,000. A figure for the complete year 1945 is not available, as the canvass was discontinued in the fourth quarter.

The price of crude iodine was frozen by the Office of Price Administration during most of 1946 at $1.28¼ per pound in 150-pound kegs; but after the price ceiling was removed in the general decontrolling order of November 12, effective November 10, the price soon rose to $1.42½ a pound. Resublimed iodine in 5-pound bottles sold at $2 to $2.10 a pound during the year, the same as in 1945.

793065—48——48

SODIUM COMPOUNDS

Sodium Carbonate.—The world-wide shortage of soda ash spurred the four California producers of natural sodium carbonates to a new record, with 215,625 short tons, 11 percent over 1945, the previous record year. The soda-ash demand from west coast glass and cleanser industries was greater than producers could supply and reflected the extremely tight situation that prevailed over the whole country. Some glassmakers even changed their batch formulas, substituting borax and salt cake for soda ash, in an attempt to relieve the pinch. An official of the Solvay Sales Co. stated that the present soda-ash capacity in the United States was 4,500,000 short tons annually, 42 percent greater than in 1940. Of this quantity, 3,200,000 tons were available for sale, the remainder being converted to caustic soda output. It was estimated that present expansion programs would increase soda-ash capacity 500,000 tons by 1948. The official said[10] that the alkali situation was unusually feverish because more soda ash was being taken for such things as glass containers and aluminum than in 1939; and alkalies generally are entering the newer products like synthetic rubber, acrylic resin, insecticides, and pharmaceuticals as well as the older standard items. Both producers and consumers expect the deficit to vanish by 1948.

The following firms reported production of natural sodium carbonates in 1946: American Potash & Chemical Corp., Trona, Calif.; Natural Soda Products Co., 506 Central Tower Bldg., San Francisco 3, Calif., plant at Keeler; Pittsburgh Plate Glass Co., Columbia Chemical Division, Bartlett, Calif.; and West End Chemical Co., 608 Latham Square Building, Oakland 12, Calif., plant at Westend.

The American Potash & Chemical Corp. announced plans to expand its soda-ash unit at Searles Lake by 60,000 tons annually (an increase of 75 percent).[11] The Natural Soda Products Co., subsidiary of the Wyandotte Chemical Co., working the brines of Owens Lake, intends to double its soda-ash capacity. The Kaiser interests also announced their intention of building a soda-ash plant on Owens Lake to supply indirectly the Kaiser (Permanente Metals Corp.) alumina plant at Baton Rouge, La. It is reported that the Kaiser organization has made a contract with the State of California for a 20-year lease for the extraction of 100,000 tons of soda ash per year from Owens Lake brines and will supply west coast customers of an eastern soda-ash producer, which will in turn supply the Baton Rouge plant.[12] The Westvaco Chlorine Products Corp., 405 Lexington Avenue, New York, N. Y., went ahead with the erection of a $3,000,000 plant to utilize large strata of trona at Green River, Wyo. It was reported that trona probably would be offered to the trade in 1947 and soda ash in 1948. Drilling cores have indicated an unusually pure material.[13]

Production data for sodium carbonate produced by the ammonia-soda process (as distinguished from natural sodas) for the last 5 years, according to the Bureau of the Census, are: 1942, 3,788,583 short tons;

[10] Chemical and Engineering News, vol. 25, No. 17, Mar. 24, 1947, p. 884.
[11] New York Times, American Potash to Widen Output, Nov. 27, 1946, p. L–35.
[12] Iron Age, vol. 159, No. 4, Jan. 23, 1947, p. 84.
[13] Mining Congress Journal, vol. 32, No. 7, July 1946, p. 70.

1943, 4,407,600; 1944, 4,538,398; 1945, 4,375,017; and 1946, 4,284,231 tons.

The price of soda ash, light, calcined, bags, carlots, works, was quoted at $1.20 a hundredweight in 1946, according to Oil, Paint and Drug Reporter. The 1945 price was $1.05 to $1.18.

Sodium Sulfate.—Natural sodium sulfate also enjoyed a record year, with sales reaching the unpredecented high of 198,781 short tons. The salt is used principally in the manufacture of kraft paper and glass, in stock feeds, as a flux in metallurgy, and wherever possible as a substitute for scarcer soda ash. Substantial quantities were required in 1946 in a comparatively new use—soapless detergents.

Natural sodium sulfates and sodium carbonates sold or used by producers in the United States, 1942–46

Year	Sodium sulfates [1]		Sodium carbonates [2]	
	Short tons	Value	Short tons	Value
1942	169,870	$1,669,983	150,619	$2,145,289
1943	160,622	1,553,549	165,993	2,544,086
1944	168,923	1,577,982	184,826	2,869,243
1945	178,196	1,525,159	194,045	3,034,118
1946	198,781	1,695,413	215,625	3,427,086

[1] Tonnage figures for sulfates include Glauber's salt converted to 100 percent Na_2SO_4 basis. Figures for 1942 include some burkeite.
[2] Soda ash and trona.

The following firms reported production of natural sodium sulfates: American Potash & Chemical Corp., Trona, Calif.; Arizona Chemical Co., 30 Rockefeller Plaza, New York 20, N. Y., plant at Brownfield, Tex.; Dale Chemical Co., 4031 Goodwin Ave., Los Angeles 26, Calif., plant at Dale Lake, Calif.; Iowa Soda Products Co., Council Bluffs, Iowa, plant at Rawlins, Wyo.; Ozark-Mahoning Co., Chemical Division, P. O. Box 449, Tulsa 1, Okla., plant at Monahans, Tex.; and Wm. E. Pratt, P. O. Box 738, Casper, Wyo.

Production of sodium sulfate in the United States, 1941–46, in short tons

[U. S. Bureau of the Census]

Year	Glauber's salt (100 percent $Na_2SO_4 \cdot 10H_2O$)[1]	Salt cake (crude) [1]	Anhydrous, refined (100 percent Na_2SO_4)	Total
1941	164,067	531,488	56,922	752,477
1942	199,962	570,869	71,784	842,615
1943	212,067	564,941	76,608	853,616

1946	167,153	527,746	122,573	817,472

[1] Includes natural sodium sulfate as shown in preceding table.

Estimated consumption of sodium carbonate in the United States, 1942–46, by industries, in short tons

[Chemical Engineering]

Industry	1942	1943	1944	1945	1946
Glass	1,100,000	1,200,000	1,290,000	1,320,000	1,400,000
Soap	165,000	150,000	162,000	150,000	120,000
Caustic and bicarbonate	960,000	1,010,000	1,033,000	1,114,000	1,128,000
Other chemicals	840,000	950,000	1,025,000	960,000	910,000
Cleansers and modified sodas	80,000	85,000	100,000	110,000	125,000
Pulp and paper	145,000	155,000	170,000	175,000	190,000
Water softeners	80,000	95,000	110,000	100,000	90,000
Petroleum refining	18,000	20,000	22,000	24,000	20,000
Textiles	56,000	58,000	61,000	68,000	77,000
Nonferrous metallurgy	260,000	450,000	320,000	200,000	140,000
Exports	230,000	370,000	79,000	70,000	68,000
Miscellaneous			320,000	290,000	222,000
	3,934,000	4,543,000	4,692,000	4,581,000	4,490,000

Domestic salt cake was quoted at $15 a short ton, bulk, works; anhydrous sodium sulfate at $1.70 per hundredweight, works; and Glauber's salt at $1.05 to $1.45 per hundredweight in 1946, according to Oil, Paint and Drug Reporter. Natural salt cake generally sells at prices somewhat lower than list quotations.

Sodium sulfate imported for consumption in the United States, 1942–46

Year	Crude (salt cake)		Crystallized (Glauber's salt)		Anhydrous		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1942	93,661	$1,324,256	22	$711			93,683	$1,324,967
1943	32,790	466,272			7	$477	32,797	466,749
1944	31,305	446,935					31,305	446,935
1945	20,293	289,940					20,293	289,940
1946	22,446	352,407					22,446	352,407

Sodium Metal.—Sodium metal is produced by only two firms, Ethyl Corp., 405 Lexington Avenue, New York, N. Y., plant at Baton Rouge, La., and E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., plant at Niagara Falls, N. Y.; therefore production data cannot be published. The former firm uses its output almost exclusively in the manufacture of tetraethyl lead—the gasoline antiknock—and the latter sells its production for a wide variety of uses, mainly chemical. A nonconfidential unpublished list supplied by the Civilian Production Administration for a sample war year names the following uses in order of importance: Tetraethyl lead, sodium cyanide, sodium peroxide, "Lorol" (a compound used in making synthetic rubber), drugs and pharmaceuticals, refining metals, and miscellaneous, which includes (not necessarily in order of volume) removal of antimony and arsenic from lead-tin alloys, increasing wetting power of molten metals for hot dip coatings, as a heat-transfer medium in the range 400° to 800° C., and in descaling steel.

The price of sodium metal in 1946 was 15 cents a pound in blocks, carlots, works, the same as in 1945.

Some interesting facts concerning the German sodium-metal industry were published by the Office of Military Government.[14] By April 1, 1944, the plant of the I. G. Farbenindustrie at Gersthofen was producing 650 metric tons of sodium monthly, using the Castner process, and the Degussa plant at Knapsack, using the more efficient Downs process, was also making 650 tons a month. Stocks on that date were 2,000 tons. As in the United States, the main use of sodium was in making a lead-sodium alloy, which in turn was reacted with ethyl chloride to produce tetraethyl lead and waste sodium chloride. The first-named paper outlines German research directed at methods to produce a lead-sodium alloy directly, without having to make pure sodium first. Some promising solutions to the problem were developed, but the country was invaded before research advanced beyond the pilot-plant stage. The main line of experimentation involved the electrolysis of molten salt floating on a bath of molten lead, whereby a lead-sodium alloy formed within the lead cathode and recoverable chlorine was given off at the anode.

BORATES

Boron minerals production set a new historical record in 1946, surpassing 1937, the previous record year, by 7 percent (B_2O_3 basis).

Salient statistics of the boron-mineral industry in the United States, 1942–46

	1942	1943	1944	1945	1946

Gardiner, William C., Degussa Sodium Production Using Downs Cells: Field Information Agency Technical (FIAT) Final Rept. 820. June 20. 1946. 17 pp.

608 Latham Square Building, Oakland 12, Calif., plant at Westend, on Searles Lake.

The largest producer, Pacific Coast Borax Co., reported itself unable to meet the demand for borax, boric acid, and rasorite, despite the increased output in 1946. Further production increases were planned for 1947. The firm reported greatly increased consumption of boron products in porcelain enamels, glass containers, and heat-resistant glass. Increases were also noted in demands for boron in fertilizers, synthetic detergents, and textiles.

The American Potash & Chemical Corp. announced plans for building more borax capacity in 1947–48. The increase would be 30,000 tons, or 30 percent over 1945 capacity.[15]

The price of technical borax, 99½ percent, granular, bulk, carlots, freight allowed, was raised in 1946 to $44.50–$47.50 a short ton, compared to $41.50 in 1945.

Foreign Boron Minerals.—Production of borates in Argentina fluctuates but has averaged about 9,000 metric tons in recent years.[16]

The single Chilean boron-producing camp, Cebollar, Province of Antofagasta, was reported somewhat active early in 1946. Shipments in 1945 were estimated at less than 500 tons compared with about 2,500 tons in 1944. The boron occurs in dry lakes and salt sinks as ulexite, and the B_2O_3 content ranges up to 35 percent, or 45 percent when calcined. The high content of impurities, such as sodium chloride and sulfate and calcium sulfate and carbonate, prevents active competition with borates produced in the United States. Reserves of Chilean borates have been estimated at 20,050,000 metric tons in the Provinces of Antofagasta, Tarapaca, and Atacama.[17]

Manganese

By NORWOOD B. MELCHER [1]

GENERAL SUMMARY

IMPORTS of manganese ore into the United States established a record high in 1946, while consumption declined 23 percent from 1945 and was 29 percent less than in the peak year 1944. Domestic production, although high compared to the prewar level, dropped 21 percent from 1945; and fewer shippers were active than in any year since 1932, when less than 20,000 tons were shipped from domestic mines. The Government purchasing program inaugurated in 1940 (deliveries were begun in 1941) expanded during the war until, in the peak year 1943, 176 companies shipped manganese ore to Government stock piles. The program ended on December 31, 1945, when the last existing contracts were canceled. With the market restricted to private buyers, only 13 producers in the United States reported shipping ore to consumers during the calendar year 1946. Of these, 1 shipped both metallurgical and miscellaneous grades, 1 shipped battery-grade ore, 1 chemical only, and 10 metallurgical. Ninety percent of the total shipments was manganese nodules shipped by the Anaconda Copper Mining Co. from Anaconda, Mont. Because of the high grade of this material, it could be shipped many miles for use, and much was consumed in the Pittsburgh, Pa. area. This ore moved by rail to upper Lake ports and by steamer to Lake Erie ports.

Salient statistics of the manganese industry in the United States, 1925–29 (average) and 1942–46, in short tons

	1925–29 (average)	1942	1943	1944	1945	1946
Manganese ore:						
Total shipments containing 35 percent or more Mn	66,429	190,748	205,173	247,616	182,337	143,635
Shipments of metallurgical ore	[1] 46,919	177,966	195,096	241,170	174,295	134,381
Shipments of battery ore	19,510	12,377	9,973	6,224	8,042	[1] 8,295
Imports for consumption	672,000	1,583,024	1,511,630	1,315,677	1,311,346	1,514,544
Ferro-alloys:						
Production of ferromanganese	343,123	661,338	702,484	702,632	619,760	491,973
Imports of ferromanganese [2 3]	[4] 56,661	11,635	990	3,308	27,694	25,908
Production of spiegeleisen	106,919	186,026	149,036	165,530	139,039	111,696
Imports of spiegeleisen [2]	8,174	1,990	3,254	3,761	3,146	360
Exports of spiegeleisen and ferromanganese	4,221	7,223	12,824	802	3,209	10,464

[1] Includes small quantity of miscellaneous ore.
[2] Imports for consumption.
[3] Manganese content.
[4] Includes small quantity of other manganese alloys.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

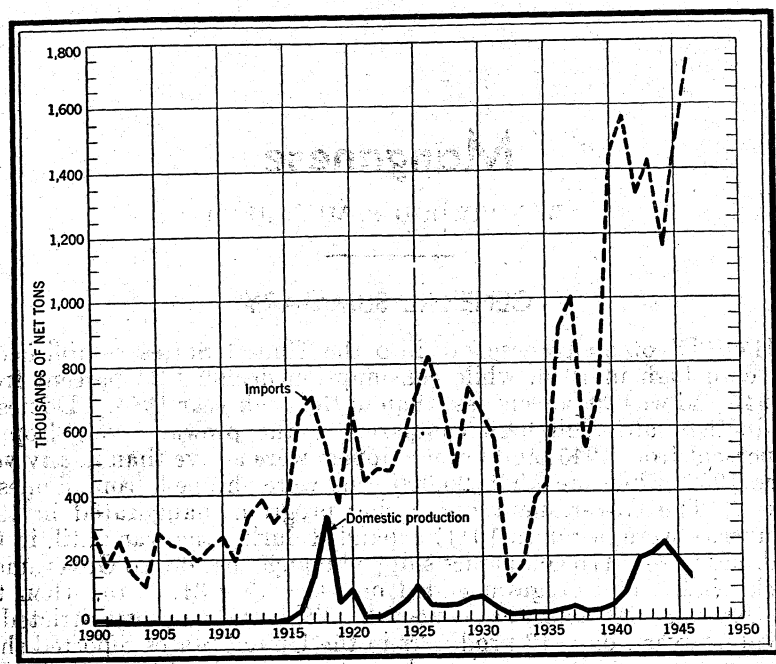

FIGURE 1.—Imports and domestic production (mine shipments) of manganese ore, 1900–46. Statistics on imports shown in the graph represent general imports for 1900–33, imports for consumption adjusted for changes in bonded warehouse stocks for 1934–39, and general imports for 1940–46.

The domestic output of manganese ore, as measured by shipments from mines, totaled 143,635 short tons in 1946 compared with 182,337 tons in 1945. The value of manganese ore shipped in 1946 totaled $4,811,068 ($33.50 per short ton) compared with $7,320,309 ($40.15 per short ton) in 1945. The reduction in average value of domestic shipments was a result of competition with imported ore, which was received at lower rates owing to elimination of war-risk insurance and accompanying lower freight rates; the import duty on foreign manganese ore remained unchanged. Only 7 States contributed to the total shipments in 1946 compared with 11 in 1945 and 13 in 1944. Shipments of ferruginous manganese ore (10 to 35 percent manganese) amounted to 100,489 tons and shipments of manganiferous iron ore (5 to 10 percent manganese) were 1,070,694 tons compared with 114,327 tons and 1,408,527 tons, respectively, in 1945.

The rate of receipts of foreign manganese ore in 1946 reached an all-time high, and 1,749,223 short tons of ore were imported. The largest supplier during the year was India, which increased its shipments to this country from 199,122 tons in 1945 to 371,753 tons in 1946. This increase was largely the result of improved shipping conditions to ports of embarkation. A critical shortage of railroad cars considerably retarded shipments from Indian mines during 1945. Shipments from Gold Coast and U. S. S. R. expanded during 1946

and receipts from Union of South Africa more than doubled. Notable among the countries that decreased their shipments to the United States was Cuba, from which receipts were only about one-half of the 1945 total. This decrease resulted from heavy depletion of reserves in that country during the war; and, unless new deposits are discovered, Cuba is destined to be only a minor supplier of manganese ore for United States consumption in the future. Chile, which was a negligible supplier of ore to the United States until recently, shipped 149,564 tons of ore during 1946 compared with 91,334 tons in 1945 and 4,289 tons in 1944.

Stocks of manganese ore held by the Office of Metals Reserve declined steadily throughout 1946. Adjusting the data reported by that agency to include an average of 4 percent moisture, 1,234,802 short tons were on hand at the end of the first quarter of 1946. At the end of the year this figure had been reduced to 1,095,427 tons.

During 1946 the Government again became a potential buyer of manganese ore when, under Public Law 663, signed by the President on August 8, 1946, Congress provided an initial appropriation of $100,000,000 for purchasing strategic and critical commodities. The Strategic and Critical Materials Division of the Procurement Division (Bureau of Federal Supply, after January 1, 1947) of the Treasury Department, under the direction of the Secretaries of War and Navy, was authorized under Public Law 520 (signed July 23, 1946) to make purchases for the stock-piling program. The Army and Navy Munitions Board announced a plan to complete the program within 5 years at a total cost of $2,100,000,000.[2] No statistical data have been published regarding tonnages secured or expenditures made under the stock-piling program.

Investigations of domestic manganese ore deposits and the utilization of domestic manganese have recently been made public.[3]

Naylor [4] studied the specific heats of manganese-copper alloys, and Kelley and others [5] studied the thermodynamic properties of manganese.

DOMESTIC PRODUCTION

The following table shows the various types of manganiferous materials shipped by domestic producers from 1942 to 1946.

Manganiferous raw materials shipped by producers in the United States, 1942–46, in short tons

Year	Metallurgical ore				Battery ore	Miscellaneous ore
	Manganese ore (35 percent or more Mn)	Ferruginous manganese ore (10 to 35 percent Mn)	Manganiferous iron ore (5 to 10 percent Mn)	Manganiferous zinc residuum		
1942	177,966	265,663	1,500,613	292,051	15,410	473
1943	195,096	468,862	1,251,275	270,328	12,704	104
1944	241,170	296,981	1,190,476	247,402	6,224	377
1945	174,295	114,327	1,408,527	224,331	8,042	----
1946	134,381	100,489	1,070,694	205,786	[1] 8,295	[1] 1,959

[1] A small quantity of miscellaneous ore is included with battery ore.

Shipments of various grades of manganese-bearing ores during the last 5 years are given by States in the following tables. In addition battery and miscellaneous ores were produced intermittently in California, Georgia, Montana, South Carolina, Tennessee, and Virginia, and manganiferous zinc residuum was produced from New Jersey zinc ores.

MINING BY STATES

Arkansas.—Manganese ore was shipped from Arkansas during 1946 from the Aydelotte mine by the Arkansas Manganese Co., the Southern Hill mine by R. B. Potashnick, the Polk Southard mine by the Polk Southard Mining Co., and C. C. Sims. Shipments totaled 1,101 short tons averaging 42 percent manganese. Ferruginous ore averaging 23 percent manganese was shipped by the Walter H. Denison Manganese & Contracting Co. and the Arkansas Manganese Co.

Michigan.—A total of 1,952 tons of ferruginous ore, containing (natural) 13.04 percent manganese, was shipped from Michigan. This shipment was made by the Oliver Iron Mining Co. from the Geneva mine on the Gogebic range.

Minnesota.—All of the manganiferous ore shipped from Minnesota during 1946 came from the Cuyuna range in Crow Wing County. Shipments totaled 1,070,694 tons, containing 6.31 percent Mn.

Montana.—The Anaconda Copper Mining Co. shipped 96 percent of the domestic metallurgical ore and 90 percent of the total domestic ore during 1946. All of the manganese-bearing material shipped by this company, except a very small tonnage of miscellaneous ore, was nodules from the Anaconda Reduction Works, Anaconda, Mont., averaging (natural) 60.28 percent Mn. The ore for nodulization (after concentration and calcining) came from the Emma and Travona mines at Butte. This ore (rhodochrosite) averaged approximately 20 percent Mn. All of the battery-grade ore produced in the United States during the year came from Montana and was produced by the Trout Mining Division of the American Machine & Metals, Inc., and the Taylor-Knapp Co., both in the Philipsburg district. Materials shipped from Montana during the year for battery use averaged (natural) about 67 percent MnO_2.

Nevada.—Manganese ore averaging (natural) 42 percent Mn was shipped by the Manganese Mining Co., from the Manganese Mining Co. mine, in White Pine County, Nev., during 1946. This ore was shipped to blast furnaces in the Birmingham, Alabama, district for consumption. Ferruginous ore averaging (dry) 29.91 percent Mn was shipped by the Charleston Hill National Mines Co., Golconda, Nev., and ore averaging (dry) 15.94 percent Mn was shipped from the Black Rock mine in Lander County by Western Alloys, Inc. All of the ferruginous ore was shipped to blast furnaces in Utah.

New Mexico.—The United Mining & Milling Co. shipped ore from its mill at Socorro, N. Mex., averaging (natural) 44 percent manganese during 1946. The Luck Mining & Construction Co. shipped ore from the Boston Hill mine, Grant County, to the Colorado Fuel & Iron Co., Pueblo, Colo. This ore averaged (natural) 12 percent Mn.

[1] Containing 35 percent or more manganese (natural).
[2] Value included in total; Bureau of Mines not at liberty to show separately.
[3] A small quantity of miscellaneous ore is included with battery ore.
[4] Containing 10 to 35 percent manganese (natural).
[5] Containing 5 to 10 percent manganese (natural).

South Carolina.—A small shipment of ore averaging 35 percent manganese was made from the Dorn mine in McCormick County by the Abernathy & Kahaya Co.

Utah.—All of the ore produced in Utah during 1946 was shipped by the Ward Leasing Co. from the Black Boy mine in Jaub County. It averaged 27 percent manganese.

Virginia.—The Dominion Manganese Corp. shipped concentrates from the Old Dominion mine in Augusta County during 1946; all of the ore was used for chemical purposes. Metallurgical ore averaging (natural) 39 percent manganese was shipped by the Miller Manganese Mining Co. from the Miller mine in Bland County. A small quantity of chemical ore averaging (natural) 34.04 percent manganese was shipped by George W. Wheatley from the Pkin mine in Augusta County.

Washington.—Hausmanite ore averaging (natural) 47.6 percent manganese was shipped by the Manganese Division of the Sunshine Mining Co. from the Crescent mine in Clallam County during 1946.

IMPORTS OF MANGANESE ORE

Imports of battery-grade ore totaled 92,758 short tons in 1946. Of this quantity 47,990 tons came from Gold Coast, 36,919 tons from U. S. S. R., 6,709 tons from India, 1,028 tons from Mexico, and 112 tons from Chile. The ore averaged 54.55 percent Mn or 86.29 percent MnO_2. Imports for consumption of battery ore amounted to 85,595 tons, of which 43,056 tons came from Gold Coast, 36,919 tons from U. S. S. R., 4,480 tons from India, 1,028 tons from Mexico, and 112 tons from Chile. The value of these receipts totaled $1,869,778, or $21.84 per short ton, f. o. b. foreign ports. There were no reported entries or imports for consumption of ore containing less than 35 percent manganese in 1946, although 257 tons of ferruginous manganese ore and 5,854 tons of manganiferous iron ore (both from Mexico) were used during the year.

Manganese ore (35 percent or more Mn) imported into the United States, 1945–46, by countries

[1] Comprises ore received in the United States during year; part went into consumption, and remainder entered bonded warehouses.

[2] Comprises receipts during year for consumption and ore withdrawn from bonded warehouses during year (irrespective of time of importation).

[3] Less than 1 ton.

CONSUMPTION AND STOCKS OF MANGANIFEROUS RAW MATERIALS

The consumption of manganese ore in 1946 decreased 23 percent from the total of 1,485,859 tons used in 1945. In 1946, 92 percent was of foreign origin compared with 90 percent in 1945. Industrial stocks of manganese ore on hand December 31, 1946, increased 71 percent over the 1945 total of 508,063 tons. The increase was due to the resumption of private purchases during 1946, whereas in previous years most ore was imported by the Government into stock pile and released to industry as necessity demanded.

The following table shows the actual tonnage of manganese ore (containing 35 percent or more manganese natural) and manganese alloys consumed during 1945 and 1946, by type of consumer, and stocks at the end of the year.

Consumption of manganese ore and manganese alloys in the United States, 1945–46, and stocks Dec. 31, 1946, gross weight in short tons

[1] Excluding Government stocks.
[2] Included under "Manufacturers of miscellaneous products."
[3] Includes only that part of castings made by companies that also produce steel ingots.
[4] Excludes companies that produce both steel castings and steel ingots.
[5] The greater part of the consumption of ore was used in the manufacture of ferromanganese and silicomanganese. Combining consumption of ore with that of ferromanganese and silicomanganese would result in duplication.

The following table shows ores available for consumption in the United States in 1946, without adjustment for changes in consumer or Government stocks.

Indicated consumption of manganiferous raw materials in the United States, in 1946

	Ore containing 35 percent or more Mn		Ore and residuum containing 10 to 35 percent Mn		Ore containing 5 to 10 percent Mn	
	Short tons	Mn content (percent)	Short tons	Mn content (percent)	Short tons	Mn content (percent)
Domestic shipments	143,635	58.5	306,275	14.8	1,070,694	6.3
Imports for consumption	1,514,544	48.9	[1] 257	34.8	[1] 5,854	([2])
Total available for consumption	1,658,179	49.7	306,532	14.8	1,076,548	6.3

[1] Estimated from consumption.
[2] Exact manganese content unknown.

METALLURGIC INDUSTRY

The use of manganese per short ton of steel produced dropped from 13.6 pounds in 1945 to 12.7 pounds in 1946 as a result of a decline in manganese steel production to virtually one-third of the 1945 level. Of the manganese used in steel during 1946, 11.1 pounds was in the form of ferromanganese, 0.5 pound as spiegeleisen, 1.0 pound as silicomanganese, and 0.1 pound as manganese ore used directly. In 1945 the consumption of manganese contained in ferromanganese, spiegeleisen, silicomanganese and manganese ore amounted to 12.0 pounds, 0.6 pound, 0.9 pound, and 0.1 pound, respectively per ton of steel. These data apply to consumption of manganese in the manufacture of steel ingots and that part of steel castings manufactured by companies that also produce steel ingots.

Electrolytic Manganese.—The Electro-Manganese Corp., Knoxville, Tenn., produced 2,120,943 pounds of electrolytic manganese, all from foreign ores, during 1946. This metal was used for a variety of purposes, ferrous and nonferrous. The Bureau of Mines at Boulder City, Nev., in furthering its research on the production and use of electrolytic manganese, produced 127,614 pounds during the year. The ore used in this operation was low-grade, averaging about 20 percent manganese, most of which came from the Three Kids mine, Clark County, Nev. Smaller quantities of ore from Chamberlain, S. Dak., Ladd mine, near Tracy, Calif., and Office of Metals Reserve stockpile ore containing material from Arizona, Arkansas, Montana, and New Mexico, were used successfully. This operation was discontinued May 29, 1946, and the plant was put in stand-by condition. Previous to 1946, 1,370,606 pounds of metallic manganese were produced at Boulder City. At the close of 1946 several companies other than Electro-Manganese Corp. had indicated an interest in the production of electrolytic manganese, but none of these was in commercial production.

Ferromanganese.—The domestic output of ferromanganese decreased 21 percent from 1945 and totaled 491,973 short tons. This alloy was produced at the following plants during the year: Bethlehem Steel Co., Johnstown, Pa.; Electro-Metallurgical Co., Alloy, W. Va., and Niagara Falls, N. Y.; E. J. Lavino & Co., Reusens, Va., and Sheridan, Pa.; The Pittsburgh Metallurgical Co., Charleston, S. C.; Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.; Tennessee Products Corp., Rockwood, Tenn.; Tennessee Coal, Iron & Railroad Co., Ensley, Ala.; and Carnegie-Illinois Steel Corp., Clairton and Etna, Pa. Of the 963,760 short tons of manganese ore used in the production of ferromanganese during 1946, 8 percent was of domestic origin compared with 10 percent in 1945. However, on a basis of the relative manganese content of foreign and domestic ore, 10 percent was made from domestic ore in 1946 compared with 12 percent in 1945. The recovery of manganese from ore in making ferromanganese was 85.01 percent in 1946 compared with 85.62 percent in 1945 and 85.76 percent in 1944. The average value, f. o. b. producers' furnaces, for ferromanganese shipped during 1946 was $124.25 compared with $129.28 in 1945. This decrease was made possible by a substantial drop in the delivered cost of manganese ore during 1946.

Ferromanganese and spiegeleisen imported into and made from domestic and imported ores in the United States, 1945–46, in short tons

	1945		1946	
	Alloy	Manganese content	Alloy	Manganese content

[1] Source of ore not reported by consumer.
[2] "Orient" reported by consumer as source of ore.

Shipments of ferromanganese in 1946 decreased 19 percent in quantity and 22 percent in value from 1945. The record of shipments for the past 5 years follows:

Ferromanganese shipped from furnaces in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	659,219	$82,726,298	1945	610,376	$78,907,189
1943	722,658	93,481,580	1946	493,808	61,355,778
1944	715,059	91,406,229			

Imports for consumption of ferromanganese declined slightly from 1945, as the accompanying tables show.

Ferromanganese imported into and exported from the United States, 1942–46

Year	Imports for consumption [1]			Exports	
	Gross weight (short tons)	Mn content (short tons)	Value	Gross weight (short tons)	Value
1942	14,772	11,635	$1,274,749	7,165	$976,923
1943	2,302	990	160,600	12,510	1,717,888
1944	4,199	3,308	394,641	600	101,445
1945	35,521	27,694	3,733,846	836	175,556
1946	32,130	25,908	4,493,056	2,951	381,194

[1] All from India in 1943; all from Canada in 1942 and 1944–46 except—1942: 8,319 tons (6,595 content), $620,530 from United Kingdom; 1944: 1,408 tons (1,076 content), $98,282 from India; 1946: 9,357 tons (7,595 content), $1,585,803 from Norway.

Spiegeleisen.—Production of spiegeleisen in 1946 decreased 20 percent from 1945; shipments decreased 27 percent in quantity and 26 percent in value. Spiegeleisen was manufactured at the following plants during 1946: New Jersey Zinc Co., Palmerton, Pa.; Tennessee Coal, Iron & Railroad Co., Ensley, Ala.; and the Carnegie-Illinois Steel Corp., Duquesne, Pa. Virtually all of the spiegeleisen manufactured in 1946 was made from domestic materials. However, a small quantity of ore (122 short tons) from Portuguese West Africa was used. Imports of spiegeleisen in 1946 amounted to only 360 tons, valued at $17,512—all from Canada. The value of spiegeleisen, f. o. b. domestic furnaces, was $32.99 per short ton compared with $32.38 in 1945.

Spiegeleisen produced and shipped in the United States, 1942–46

Year	Produced (short tons)	Shipped from furnaces		Year	Produced (short tons)	Shipped from furnaces	
		Short tons	Value			Short tons	Value
1942	186,026	186,163	$5,931,728	1945	139,039	157,774	$5,108,144
1943	149,036	150,136	4,827,954	1946	111,696	114,982	3,793,673
1944	165,530	155,325	4,851,490				

Spiegeleisen imported for consumption in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	1,990	$95,853	1945	3,146	$142,883
1943	3,254	140,247	1946	360	17,512
1944	3,761	153,032			

Manganiferous Pig Iron.—Pig-iron blast furnaces used 16,715 tons of manganiferous zinc residuum and 832,975 tons of domestic ore containing (natural) over 5 percent manganese in 1946. Of this ore, none contained 35 percent or more manganese, 223,153 tons contained (natural) 10 to 35 percent manganese, and 609,822 tons contained (natural) 5 to 10 percent manganese. In addition, 15,913 tons of foreign ore—of which 10,059 tons contained more than 35 percent manganese and 5,854 tons contained 5 to 10 percent manganese—were used during the year.

Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1943–46, in short tons

Source of ore	Ferruginous manganese ore				Manganiferous iron ore			
	1943	1944	1945	1946	1943	1944	1945	1946
Cuba	9,509	1,844

	9,509	1,844	800	257				5,854

BATTERY AND MISCELLANEOUS INDUSTRIES

During 1946 manufacturers of dry cells in the United States used 47,601 tons of manganese ore, of which 8,497 tons were of domestic origin, and 39,104 tons were imported. Chemical plants used 5,096 tons of domestic ore and 16,187 tons of foreign ore containing (natural) more than 35 percent manganese. Most of this ore was used in the manufacture of manganese sulphate for fertilizer and in the manufacture of hydroquinone.

Manganese ore for battery use should have a high content of available oxygen with minimum iron and be relatively free from such metals as arsenic, copper, nickel, and cobalt, which are electronegative to zinc. Chemical ore has a wide range of analyses.

PRICES

The elimination of price control on manganese ore, effective November 10, 1946, under OPA order, had little or no effect on the price of manganese ore in the United States, as the sale price had previously been considerably under the ceiling fixed by the Office of Price Administration. Prices quoted by E&MJ Metal and Mineral Markets, at the close of 1946, per long-ton unit, for ore containing 48 percent manganese, subject to premiums and penalties, ranged from 70 to 71 cents, including duty. Chemical-grade per ton coarse to fine minimum, 80 percent MnO_2, Brazilian or Cuban, $55 in carlots to $60 to $65 barreled; Javan or Caucasian, 85 percent minimum, $70 to $75; domestic 70 to 72 percent, $45 to $50 in carlots, f. o. b. mines.

The long-ton unit upon which the price of manganese ore is based is 1 percent of a long ton, or 22.4 pounds of contained manganese. Prices of chemical ore are given on a per-ton basis with a minimum requirement of manganese dioxide. A duty of one-half cent per pound of contained manganese is imposed on all ore imported except that from Cuba and the Philippine Islands and that purchased by the United States Government, which enter duty-free.

WORLD REVIEW

The accompanying table shows, insofar as statistics are available, the world production of manganese ores, 1940 to 1946, and their average manganese content. Official statistics of the countries are used, supplemented by data from semiofficial and other sources.

Chile.—On October 17, 1946, a decree was published in the Diario Oficial declaring that manganese ore was essential to the national ferromanganese industry and that the production and sales of this raw material were subject to regulation. The decree was issued to assure an adequate supply to the domestic industry. Chile in 1946 supplied 9 percent of the manganese ore received in the United States.

Manganese ore produced in principal countries of the world, 1940–46, in metric tons [1]

[Compiled by B. B. Mitchell]

Country [1]	Percent Mn	1940	1941	1942	1943	1944	1945	1946

[1] In addition to countries listed, Belgium, Costa Rica, and Spanish Morocco produce manganese ore, but data of output are not available. Czechoslovakia reports a production of manganese ore, but as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in the table.

Cuba.—At the close of 1946 the Cuban-American Manganese Corp. suspended the manganese nodules operations at its mine in Cuba owing to exhaustion of ore reserves. The corporation was dissolved and the assets distributed among its stockholders, the principal one being the Freeport Sulphur Co. The Cuban-American Manganese Corp. had produced virtually all of the Cuban manganese ore.

Egypt.—The three companies in Egypt producing manganese ore at present are the Sinai Mining Co., Alexandria; The Société Union de Misr, Cairo; and the Hamata Mining Co., Cairo. Most of the ore produced is "ordinary ore" averaging slightly less than 30 percent manganese and 25 percent iron. First- and second-grade ores, of which only small quantities are produced, run much higher in manganese and are reported to be satisfactory as metallurgical ore. Exports of all grades of manganese ore in 1945 are reported to have been 10,844 metric tons, of which 10,312 tons went to the United Kingdom; small quantities went to France, Palestine, and Syria.

Italy.—Manganese mines in the Province of Grosseto, about 90 miles northwest of Rome, are reported to be producing at capacity. These mines, owned by the Societa Anonima Mineraria Siderurgico of the Finalder group in prewar days, produced a small part of Italy's manganese supply, the total of which amounted to but 45 percent of its requirements. Output in March 1946 was 1,500 tons and a goal of 2,000 tons a month was announced. The ore from these mines goes to the iron industries of northern Italy and to blast furnaces at Naples.

Panama.—A contract was made public during 1946 between the Panamanian Government and Stuart St. Clair, New York, granting him a concession for mining manganese in the Province of Colon. Under the contract, the concessionaire must pay $5.00 annual tax on mining operations as covered by the fiscal code of the Republic, as well as 4 percent of the gross production of the mines to the Government. This can be paid in cash or in crude products at the option of the Government. He is exempted from paying national or municipal taxes on the capital employed in the exploration and from paying taxes on the operation of refining and on the importation of machinery and other necessary equipment. He also agrees to employ 75 percent Panamanian labor. St. Clair, accompanied by representatives of the Republic Steel Corp., visited the properties in Panama with the idea that Republic will enter into a contract for the exploration and extraction of manganese if the investigation proves favorable.

United Kingdom.—Consumers were reported to have received manganese ore in quantities sufficient to meet current demands. Selling prices were officially held at 1s. 2d. per unit c. i. f. on the basis of prewar freight and insurance rates. Buying prices are 1s. 2¾d. to 1s. 4¾d. on the same basis.[6] Electrolytic manganese was finding increased use in stainless steels made in the United Kingdom. Although about 50 percent more costly than metal produced by the thermic processes, it is found to produce a better surface to the steel and therefore to increase corrosion resistance.[7]

Mercury

By HELENA M. MEYER AND ALETHEA W. MITCHELL

GENERAL SUMMARY

THE oversupply of mercury in the latter half of 1945 and the resulting price weakness were accentuated during 1946; the condition in mercury contrasted with that in most other mineral commodities. Mercury filled a not unfamiliar role in reacting to changed economic conditions before other metals.

Domestic production dropped 18 percent from 1945 and amounted to slightly less than half of the peak for the twentieth century, established in 1943; output, however, was 45 percent above the prewar average for 1935–39. Consumption fell 50 percent from the all-time record for 1945, but was 15 percent above the 1935–39 average. The shrinking world markets for mercury, caused primarily by the collapse of two of the chief world consumers—Germany and Japan—put added pressure on the United States market. Surplus metal from the war, large stocks at some European mines, and newly mined foreign mercury, particularly from Italy, urgently sought outlets during the year. The 1945 contracts for Spanish metal, to supply the huge United States war battery needs, were absent in 1946, however, and general imports dropped 68 percent. Over 8,000 flasks from surplus war stocks were shipped to the United States from Belgium in the latter half of the year but were held for reexport, so did not enter the United States market. Receipts from Italy rose from none in 1945 to over 10,000 flasks in 1946 as that country sent metal to the United States for the first time since 1940. On the whole, general imports, although 68 percent below the all-time peak (established by a substantial margin) in 1945, were at a high rate in relation to other peace years, probably exceeding all other such years except 1926 and 1927. The result of the foregoing factors, of large supply from domestic and foreign sources and of reduced consumption, was that industry could not use all of the metal available; new supplies exceeded consumption by 55 percent, and stocks rose. Stock gains in 1946 were invisible, however, because consumers' and producers' stocks showed no appreciable change, while Office of Metals Reserve inventories actually fell nearly 43,000 flasks. The absorption of metal into the permanent stock pile explains this apparent anomaly.

Figure 1 shows trends in production, consumption, and price of mercury from 1915 to 1946.

Although 51 properties contributed some metal to the United States total in 1946, 18 accounted for 98 percent; in the final quarter of the year 9 mines produced 97 percent. Some of those 9 mines were not operating continuously. Rising costs and falling prices have closed most mines, and some of the present producers are believed to be operating at a loss.

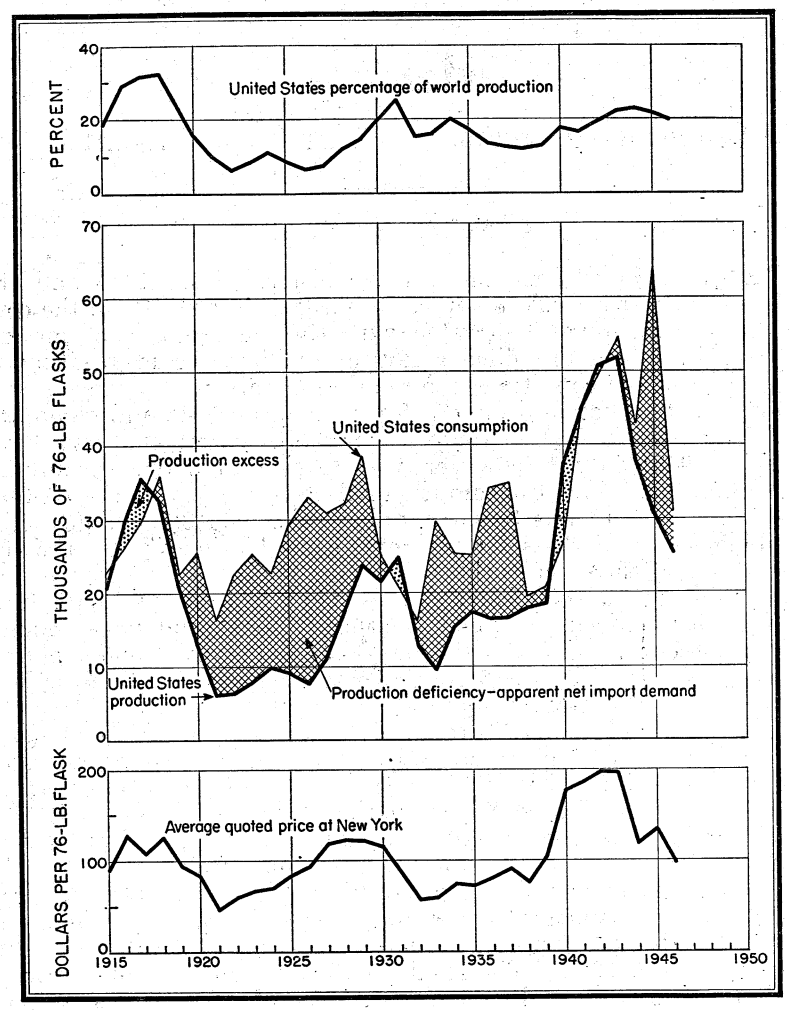

FIGURE 1.—Trends in production, consumption, and price of mercury in the United States, 1915–46.

The average monthly quoted price for mercury was $105 a flask in January and fell to $88 in December, the lowest monthly average since August 1939. Based on the Bureau of Labor Statistics index for all commodities, the December price was equivalent to only $56 in 1939 purchasing power.

The new-type cell, the increased consumption of which for peacetime purposes has been one of the chief hopes of the industry, did not fulfill the expectations of some observers in 1946. Production of the cells for several types of military batteries and for hearing-aid use was under way during the year, but manufacturers' efforts were directed largely to developing new designs and to more economical practice. A substantial consumption, although far less than in the last year of war, was claimed, by one authority, to be in prospect.

Salient statistics of the mercury industry in the United States, 1942–46

[Flasks of 76 pounds]

	1942	1943	1944	1945	1946

[1] Large quantities reexported in 1942 and 1943 are included in imports but not exports.
[2] Revised.

Output in all important mercury-producing countries except Italy was virtually the same or smaller in 1946 than in 1945, and the world total was only half of the all-time record for 1941. Italy, however, produced less in 1946 than in 1939, while Spain, the United States, and Mexico continued to exceed prewar levels. Italy's gain over 1945, in the face of reduced prices and shrinking world markets, was due to an urgent need for foreign exchange.

Efforts were made to reestablish the international mercury cartel, Mercurio Europeo, and several agents have been appointed. More details are given under World Review.

DOMESTIC PRODUCTION

Mercury production in the United States was maintained substantially above prewar output in 1946 despite the sharp contraction in consumption, the abundance of importable metal pressing for a market, and the falling price. A total of 25,348 flasks was produced, representing a decline of 18 percent from 1945 but a 45-percent increase over the prewar annual average for 1935–39, inclusive. The average quoted price of mercury at New York was $98.24 a flask in 1946 compared with $103.94 in 1939. According to the Bureau of Labor Statistics, the index for all commodities in 1939 was 77.1, whereas in 1946 it was 121.1. Thus, the 1946 average of $98.24 was equivalent to less than $63 in 1939 purchasing power. At the end of the year the price was $88–$92 a flask and continued downward in early 1947. The rate of output at the year end was not determined, but only a few mines were known to have been in operation at that time.

Declines of 16 and 47 percent in California and Oregon, respectively, were offset in part by gains of 5 and 38 percent in Nevada and Idaho. California's output was the smallest since 1939 and Oregon's since 1926, when none was reported. Production in Nevada was smaller than in the high years, 1929, 1940, and 1942 but was virtually at the level of 1943, the fourth highest year.

The principal producing mines in 1946 were as follows:

Alaska—Red Devil and Decoursey Mountain mines.
Arizona—Gila County, Ord mine.

California—Contra Costa County, Mount Diablo mine; Fresno County, Archer mine; Lake County, Abbott mine; Napa County, Knoxville mine; San Benito County, New Idria mine; Santa Clara County, Guadalupe mine and Almaden dumps; Sonoma County, Culver-Baer, Dewey-Geyser and Mount Jackson mines; Yolo County, Reed mine.
Idaho—Valley County, Hermes mine.
Nevada—Humboldt County, Cordero mine; Pershing County, Red Bird mine.
Oregon—Douglas County, Bonanza mine.

In 1946 those 18 mines produced 98 percent of the United States total; in 1945, 20 mines produced 97 percent, but in 1942, 34 mines produced only 89 percent. The leading producers in 1946 accounted for at least 95 flasks each. Very few properties were producing as the year ended. In the fourth quarter, for example, 9 mines—the Mount Diablo, Archer, New Idria, Guadalupe, Mount Jackson, Reed, Hermes, Cordero, and Bonanza—produced 97 percent of the United States total. Some of these mines were not operating continuously.

Mercury produced in the United States, 1940–45, by months, and 1946, by quarters, in flasks of 76 pounds

Month	1940	1941	1942	1943	1944	1945	1946

Oregon	6	1,326	130,266
	51	25,348	2,490,188

[1] Value calculated at average price at New York.

The average grade of ore treated in 1946 continued the uptrend of recent years. In 1946 the average grade was 0.6 percent (12-pound ore) compared with 0.54 percent (10.8-pound ore) in 1945, 0.47 percent (9.4-pound ore) in 1944, 0.31 percent (6.28-pound ore) in 1943, and 0.25 percent (5-pound ore) in 1942. In reviewing the quicksilver industry in 1946, Williston [1] stated:

> * * * If the average grades of ore mined in the western states were anything like the grades produced before the war the industry would be completely closed down. The only reason that any of the mines are able to continue to operate is the result of extensive new discoveries of large bodies of high grade ore, discovered and developed during the latter part of the war period. Increased costs and declining prices have already turned over half of these reserves from ore to waste and since they are marginal to the ores now extracted from the stopes, in all probability these reserves will be lost for all time. * * *

In addition to that produced at mines in 1946, almost 4,000 flasks of mercury were reported as produced from battery scrap and calomel. Additional unreported quantities are believed to have been recovered.

REVIEW BY STATES

Alaska.—Mercury was produced in 1946, as in 1945, by the Red Devil (New Idria-Alaska) and Decoursey Mountain mines, the former in a Gould rotary furnace and the latter in retorts. Developed reserves at the Red Devil were virtually worked out at the end of 1946, and further operations at the mine were reported to depend on higher prices.

Arizona.—At the Ord mine in the Brown district, Gila County, 760 tons of ore were produced and furnaced to recover 95 flasks of mercury. A 25-ton Foster furnace is used at this mine, which was the sole surviving producer of the seven that operated in 1942.

Arkansas.—Only two properties are reported to have mined and treated mercury ore in 1946, the Ajax and Hintze, both in Pike County, the former utilizing a Cottrell rotary furnace and the latter a home-designed retort. A total of 11 flasks was recovered. Considerable mercury was recovered from battery and other war scrap in the Hintze plant and in the 8-ton rotary furnace at the National mine, also in Pike County. The precise quantity thus recovered is not known.

California.—United States production of mercury continued to be dominated by California, which supplied 70 percent of the total, a reduction from the recent peak of 74 percent in 1944. Production dropped 16 percent in 1946 or slightly less than the decline for the United States as a whole. Thirteen counties contributed to the output in 1946, as follows: Contra Costa, Del Norte, Fresno, Kings, Lake, Napa, San Benito, San Luis Obispo, Santa Barbara, Santa Clara, Sonoma, Trinity, and Yolo.

The Bradley Mining Co. again treated ore in a 40-ton rotary furnace at the Mount Diablo mine, Contra Costa County, and in 1946 increased its output of mercury substantially over 1945, against the trend for most companies.

The Patricks Creek mine, Del Norte County, was operated by Oscar E. Hanno and produced mercury during part of the year. Hanno is reported to have sold his property.

[1] Williston, S. H., The Outlook for Quicksilver: Min. Cong. Jour., vol. 33, No. 2, February 1947, p. 95.

Mercury ore was produced at the Archer mine, Fresno County, and trucked to the New Idria plant, San Benito County, for furnacing. The Archer Mining Co. reported that 139 flasks were produced from 742 tons of ore.

A small production is believed to have come from the Kings mine, Kings County, in 1946.

Lake County has dropped sharply in importance as a mercury-producing county since 1944, when it ranked second only to San Benito among counties in the United States. A large decline in output at the Abbott mine, which resumed importance as a mercury producer during the war (standing third in the country in 1944), the sharply lowered rate of production at the Sulphur Bank mine, and the closing of the Mirabel mine were chiefly responsible for the drop. Seven mines contributed to the totals of 4,288 tons of ore and 633 flasks from ore and clean-up, compared with 9,556 tons and 1,447 flasks in 1945. The Abbott stood first in the county again in 1946; its ore was treated in a 40-ton rotary furnace. The mine was closed in August, but resumption of the development program was expected. Furnaces were used also at the other properties mentioned, except Mirabel, where output was from dismantling of the plant. Other producers were the Helen, Great Western, McGuire Peak and Baker mines, of which the first two named used furnaces. A new discovery was reported (100 yards from any workings) at the Helen mine.

The Sulphur Bank mine was described [2] in a recent report. The mine is said to have produced 126,285 flasks of mercury to the end of 1944. The report stated:

* * * Economic studies have shown that the mounting costs of open-pit mining demand a floor price of $200 per flask for continued successful operation, and even at this high price, no assured ore was in sight at the end of 1944. Indicated reserves total 18,420 flasks from about 115,000 tons of ore, and 15,750 flasks may be obtainable from 150,000 tons of inferred ore. * * *

Another report [3] described the Eastern Mayacmas district, part of which is in Lake County, stating that the entire Mayacmas district, which includes parts of Lake, Napa, and Sonoma Counties, has produced 455,000 flasks of quicksilver since 1864 and is the second most-productive quicksilver district in the United States. The report says that measured ore is negligible, because very little ore is developed in advance of mining, and estimates that the district, although past its zenith, is capable of producing 2,000 to 4,000 flasks annually for several years during periods of high prices.

Two operators at the Knoxville mine (Cerar, Carr & Truitt, and Hickox & Wilson) and the Oat Hill Extension mine produced all of Napa County's output in 1946. A 40-ton furnace was used at the Knoxville. One of the few county increases in the country was made in Napa County, largely because of larger output at Knoxville. Four small producers in 1945 did not report any output in 1946.

San Benito County stood preeminent among mercury-producing counties in the United States again in 1946, with an output of 37,504 tons of ore and 8,269 flasks of mercury, almost entirely because of the

[2] Everhart, D. L., Quicksilver Deposits at the Sulphur Bank Mine, Lake County, Calif.: California Jour. Mines and Geol., vol. 42, No. 2, April 1946, pp. 125–153.

[3] Yates, R. G., and Hilpert, L. S., Quicksilver Deposits of Eastern Mayacmas Dist., Lake and Napa Counties, Calif.: California Jour. Mines and Geol., vol. 42, No. 3, July 1946, pp. 231–286.

production of the New Idria mine, largest producer in the Western Hemisphere. In 1945 the county produced 45,855 tons of ore and 10,193 flasks of mercury (including a small quantity from clean-up and dumps); and the recent peak output was 14,187 flasks in 1943. Three small properties also contributed to the county total in 1946. Four Gould rotary furnaces and condensing systems are at the New Idria, but the plant operated at far below capacity in 1946. Other producers in 1946 were the North Star, Valley View, and one other mine.

Three small operations accounted for an output of 40 flasks of mercury in San Luis Obispo County in 1946 compared with three properties (not identical) and 873 flasks in 1945. The Buena Vista mine, which dominated output in 1945, was unproductive in 1946.

Mercury was produced in a retort at the Red Rock mine in Santa Barbara County in 1946; the plant was closed during the summer.

Larger production at the Guadalupe mine, Santa Clara County, placing it sixth in the United States, was inadequate to offset the failure of the New Almaden mine, largest in the county in 1945, to produce in 1946. At the Guadalupe mine in 1946 an 80-ton Gould rotary furnace and 8-tube retort were in use. Other producers were the Almaden dumps, Chaboya mine, two small properties, and a little plant clean-up from the New Almaden mine. The totals for the county were 863 flasks of mercury from 12,693 tons of ore and 340 flasks from dumps and plant clean-ups.

The Mount Jackson mine again dominated the output of Sonoma County by a substantial margin and once more ranked as the third largest United States producer. The county produced 37,519 tons of ore and 3,222 flasks of mercury, compared with 33,868 tons and 3,324 flasks in 1945. Mount Jackson is 3½ miles from Guerneville in the Guerneville district. Ore is treated in a Gould rotary furnace. Other producers in 1946 were the Culver-Baer mine, 25 miles south of Healdsburg, where a 20-ton rotary was used, and one other. The Western Mayacmas district was the subject of a report [4] published in 1946.

A small production is reported to have been made during the year at the Altoona mine, Trinity County.

The Reed mine, fourth in the country, as in 1945, was again the only producer in Yolo County; Reed's output gained 8 percent in 1946, against the trend at most properties in the United States.

Idaho.—Bonanza Mines, Inc., produced and treated 7,219 tons of ore at the Hermes mine in 1946 and recovered 868 flasks of mercury, an increase over the output in 1945. The mine is in the Yellow Pine district, Valley County; it was the only producer of mercury in Idaho in 1946, as in 1945. The mine is equipped with two 4- by 60-foot Gould rotary furnaces. A total of 1,500 feet of underground development work was reported as done during the year.

Nevada.—Output of mercury in Nevada was dominated again in 1946 by the Cordero mine, which was chiefly responsible for Nevada's rise of 5 percent against the downtrend for the United States as a whole. Nevada ranked second in production for the second successive year. Production in 1946 was virtually the same as in 1943, which ranked below only the high years 1929, 1940, and 1942.

[4] Bailey, E. H., Quicksilver Deposits of the Western Mayacmas Dist., Sonoma County, Calif.: California Jour. Mines and Geol., vol. 42, No. 3, July 1946, pp. 199–230.

L. V. Pangburn produced a small quantity of mercury in a retort at the Silver Fox mine, Ivanhoe district, Elko County.

W. F. Dunnigan produced and treated 100 tons of ore in a 30-ton Gould rotary furnace at the Red Rock mine, Fish Lake Valley district, Esmeralda County, and recovered 7 flasks of mercury.

In 1946 the Cordero mine, Opalite district, Humboldt County, maintained the second-place position gained in 1945. Production of the county, which rose slightly, was second only to that of San Benito County, Calif., owing to Cordero's performance. Production at Cordero is made in a 100-ton Herreshoff furnace. Two small operations in Humboldt County were also productive.

Melvin McCoy operated the Goldbanks mine, Goldbanks district, Pershing County, again in 1946, and produced, in a retort, 47 flasks from 200 tons of ore. Bratton and Blair operated the Red Bird mine in the Antelope Springs district.

Oregon.—Oregon remained the third most important mercury-producing State in 1946, having fallen in 1945 from second place, a position held since 1936. The Bonanza mine continued to dominate the State's output, having produced 95 percent of the total. The Oregon State Department of Geology and Mineral Industries issued a map in 1946 showing all known quicksilver deposits in Oregon.

Eickemeyer Bros. treated high-grade ore again in a retort at the Maury Mountain mine, Ochoco district, Crook County. A total of 6 tons of ore was produced and treated and 21 flasks of mercury recovered. The only other producer in the county was Frank S. Towner.

The Bonanza mine, operated by Bonanza Mines, Inc., was again, by a wide margin, the chief mercury-producing property in Oregon; it ranked fifth in the United States. The property is in the Sutherlin district, Douglas County. In 1946, 8,034 tons were produced and 8,188 tons treated in a Gould rotary furnace and 1,261 flasks of mercury recovered. Although Bonanza ranked fifth in 1946, the output in that year marked the sixth successive decline.

Officer Bros. produced one flask of mercury at the Snow Drift No. 1 mine, Harney County. A small output of mercury was made at the War Eagle mine in Jackson County.

The Bureau of Mines issued [5] a report on the Glass Buttes mercury deposit. The area has not been explored thoroughly, according to the report, and no mercury has been produced from any of its deposits.

Clean-up operations of the mill surface dumps at the Opalite mine, Opalite district, Malheur County, resulted in production in 1946.

Texas.—Exploratory work of the Bureau of Mines in Brewster and Presidio Counties was described [6] in a recent report. The report

[5] Reed, G. C., Exploration of Glass Buttes Mercury Deposit, Lake County, Oreg.: Bureau of Mines Rept. of Investigations 3926, 1946, 4 pp.

[6] Evans, A. M. and Traver, W. M., Terlingua Mercury Deposit, Brewster and Presidio Counties, Tex.: Bureau of Mines Rept. of Investigations 3995. 1947. 10 pp.

notes that both the Geological Survey and the Bureau of Mines concluded that, with but few exceptions, known ore bodies in the famous Chisos mine had been exhausted and that the area south and east of the mine workings was most favorable geologically for finding additional ore deposits. No production in Texas was reported in 1946.

CONSUMPTION AND USES

Mercury consumption in 1946 dropped to about half of the peak quantity for 1945, owing largely to the cancellation of war battery contracts in mid-1945. The use of mercury continued at higher than prewar levels, however, being 15 percent above the 1935–39 average. As stated in the opening section of this report, hopes that the new dry-cell would consume substantial quantities of mercury were not fulfilled in 1946. Several types of military batteries and hearing-aid batteries that use the new cell were in production during the year. Producers' efforts were concentrated on the development of new designs and more economical manufacture, and noteworthy progress was reported. A substantial future business was reported to be in prospect.

New effectiveness and economy in the control of slime in paper mills were forecast [7] by a manufacturer of pyridylmercuric acetate.

Special requirements of the chemical and petroleum industries, particularly for the measuring of flow of viscous liquids, may be met by a new electric meter body.[8]

A patent (United States 2,400,831) has been issued [9] for the use of frozen mercury as a material for patterns for the preparation of precision casting molds for the production of heat-resisting blades of jet aircraft engines.

Mercury consumed in the United States, 1945–46, in flasks of 76 pounds

Use	1945 [1]	1946 [2]	Use	1945 [1]	1946 [2]
Pharmaceuticals	11,166	4,093	Electrical apparatus	[3] 24,468	[3] 3,849

Catalysts	3,650	3,310			

[1] Revised.
[2] The items do not quite add to the total, which has been increased to cover approximate total consumption.
[3] A partial break-down of the "redistilled" classification for 1945 showed 53 percent was for electrical apparatus and 28 percent for instruments. The war battery program increased the proportion for electrical apparatus. Data for 1946 are not completed as yet but probably will show a return to the more normal relationship of approximately half for instruments.

[1] Revised; monthly items not adjusted to final total.

STOCKS

Production plus general imports of mercury exceeded consumption by more than 17,000 flasks, but visible stocks dropped substantially nonetheless. Consumers' and dealers' stocks were little changed but were actually higher at the end than at the beginning of 1946, as some consumers' metal was withdrawn into the permanent stock pile. Producers' inventories showed a small decline, but Office of Metals Reserve stocks dropped nearly 43,000 flasks. The latter change likewise involved an absorption into the permanent stock pile.

Stocks of mercury in hands of consumers and dealers, producers, and Office of Metals Reserve, 1942–46, in flasks of 76 pounds

End of year	Consumers and dealers	Producers[1]	Office of Metals Reserve	Total
1942	10,700	1,377	[2] 27,410	39,500
1943	13,200	3,457	[2] 69,852	86,500
1944	10,400	2,714	67,812	80,900
1945	17,000	3,243	63,638	83,900
1946	16,400	2,599	20,884	39,900

[1] Operators that account for roughly 95 percent of output.
[2] Total Government inventory.

PRICES

With the exception of a minor reaction in March, the price for mercury trended downward throughout 1946, a continuation of the general movement since March 1945. The ample domestic and world supplies of mercury, in contrast to the general commodity situation, has led to this weakening price structure. The average monthly price of $88 for December 1946 was the lowest on record since August 1939, the month before World War II began in Europe. The revised positions of Germany and Japan, no longer two of the chief mercury-consuming countries of the world as they were before World War II, have placed on mercury-exporting countries the burden of developing new or of expanding present markets for the metal. Surplus metal from record war production and accumulated mine stocks vie with new production for existing markets.

Average monthly prices per flask (76 pounds) of mercury at New York and London, and excess of London price over New York price, 1944–46

Month	1944			1945			1946

[1] Engineering and Mining Journal, New York.
[2] Mining Journal (London) prices in terms of pounds sterling are converted to American dollars by using average rates of exchange (official for January 1944 through June 1945 and free thereafter) recorded by Federal Reserve Board. Official prices were £68 10s. to £69 15s. until October 1945, when they were reduced to £30 to £31 5s; maximum prices were revoked in August 1946.
[3] New York excess.

The British Ministry of Supply revoked its maximum price order in August; but, continuing as sole importer and distributor, did not reduce the selling price. The official price was dropped £5, effective November 15, when control of imports was relinquished. By the end of the year the quoted price was £20 15s., having dropped from £31 5s. at the beginning of the year. In December the London price was below the New York price for the first month since May 1942. A New York excess is normal, however, owing to the United States tariff on mercury.

FOREIGN TRADE [10]

Imports of mercury receded sharply in 1946 from the record receipts in 1945, imports for consumption falling 80 percent. General imports remained at a very high rate in relation to prewar years, however, and probably were higher than in any other peace year except 1926 and 1927; general imports in 1946 fell short of the war years—1942, 1943, and 1945. The completion of contracts for Spanish metal to fill war battery needs and the upsurge of Italian interest in obtaining foreign credits are evident from comparison of imports for 1945 and 1946. The general import data show the changes more effectively than imports for consumption.

Of general imports of 23,062 flasks in 1946 (comparisons with 1945 in parentheses), 10,284 (none) flasks came from Italy, 6,669 (13,082) from Mexico, 5,559 (55,747) from Spain and 550 (751) from Chile; in 1945, in addition, 1,720 flasks came from Canada, 23 from Honduras and 185 from Peru. Seventy-five percent of the imports came into the country in the latter half of the year, about evenly divided between

[10] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

the third and fourth quarters. In addition to the quantities shown for 1946, over 8,000 flasks of mercury from surplus European stocks were purchased by a domestic consumer but held for reexport, not entering the United States market.

Imports for consumption, which are covered by the long-time record, were very different from general imports in 1946, amounting to only 13,894 flasks. Of the imports for consumption in 1946 (comparisons with 1945 in parentheses), 5,360 (10,853) came from Mexico, 5,038 (none) from Italy, 3,127 (55,391) from Spain, 369 (477) from Chile, and in addition in 1945, 1,720 from Canada, 153 from Peru, and 23 from Honduras.

Flasks	68,617		13,894	

[1] Includes the following quantities reexported and not separately classifiable by countries: 1942, 567,059 pounds (7,461 flasks); 1943, 1,128,727 pounds (14,852 flasks).

Imports of mercury compounds were negligible in 1946, compared with none in 1945 or 1944. Twenty-six pounds of mercuric chloride and 454 pounds of vermilion red were entered.

As usual, exports of mercury in small quantities went to a large number of countries. A total of 907 flasks was shipped from the country in 1946, only 4 percent of general imports, compared with 1,038 flasks in 1945. The chief countries of destination in 1946 (comparisons with 1945 in parentheses) were as follows: Brazil, 258 (62); Canada, 124 (26); Colombia, 86 (29); Sweden, 56 (600); Nether-

lands, 48 (13); Venezuela, 39 (33); Union of South Africa, 36 (23); Hong Kong, 25 (none); and 34 other countries, the remainder in quantities of less than 25 flasks each.

Mercury exported from the United States, 1942–46

Year	Pounds	Flasks of 76 pounds	Value	Year	Pounds	Flasks of 76 pounds	Value
1942	26,252	345	$76,448	1945	78,852	1,038	$121,713
1943	29,236	385	88,842	1946	68,932	907	113,817
1944	57,007	750	123,481				

Reexports of mercury aggregated 2,357 flasks in 1946, or 39 percent above the expanded quantity of 1,693 flasks for 1945. Reexports are items, previously imported, that are exported without change in form. Canada ranked first as a reexport destination in 1946, with 502 flasks; Brazil received 493 flasks; Sweden, 367 flasks; Switzerland, 353 flasks; Argentina, 193 flasks; China, 120 flasks; Belgium, 105 flasks; and 14 other countries the remainder in quantities of 50 flasks, or less, each.

Exports of mercury salts, separately classified beginning July 1941, were lost in a blanket classification beginning January 1, 1946. The quantities of equivalent metal represented by such salts were insignificant.

WORLD REVIEW

Supplies of mercury from a world standpoint caught up with and passed requirements for the metal by a wide margin long before a balance was reached in most commodities. Surplus war stocks and large mine stocks were held in Europe at the outset of 1946. All important mercury-producing countries, except Italy, had relatively maintained or reduced outputs in 1946, and Italian production was far below peak war rates. As a consequence, the world total in 1946 was 2 percent less than in 1945 (itself 14 percent below 1944) and was about half of the all-time high record for 1941.

Mercurio Europeo, the international mercury cartel, has been active in reestablishing itself and has appointed agencies to represent it all over the world. The agencies and areas covered by them are as follows:

Elder, Smith & Co., Ltd., 3, St. Helen's Place, London E. C. 3, England (British Empire, China, Japan, Palestine, Iraq, Iran, Trans-Jordan, Saudi Arabia, and Egypt).

Belgameric, Rue Montoyer 4, Brussels, Belg. (Belgium, Netherlands, Luxembourg, and respective colonies).

Scandinaviska Malm-Och Metallaktiebolaget, Postbox 16130, Stockholm 16, Sweden (Sweden, Norway, Denmark, and Finland).

Société Impex 9, Rue Boissy-d'Anglas, Paris 8, France (France and colonies).

"Patvag," Bahnhofstrasse, 12-Zürich, Switzerland (Switzerland, Austria, Poland, Czechoslovakia, Hungary, Balkan countries, and Turkey).

"Tecnar," San Martin 195, Buenos Aires, Argentina (South and Central America).

Chematar Inc., 40 Exchange Place, New York 5, N. Y. (Russia).

World production of mercury, 1939–46, by countries, in flasks of 34.5 kilograms (76 pounds)

REVIEW BY COUNTRIES

Canada.—In a discussion [11] in the House of Commons, Ottawa, it was brought out that no mercury was produced in Canada in 1946, that 1,721 flasks of mercury from the Pinchi Lake mine production remained unsold as of December 31, 1946, and that 2,009 flasks of mercury were imported into Canada in 1946. Reasons for closing the mine July 1944 were given as the accumulation of stock and lack of market at what the producer considered an economic price.

Germany.—Notes on German chlorine and caustic soda practice were published in the report of this series for 1945. The data were summarized [12] in greater detail later. Another report [13] pointed out possibilities of the use of mercury in a new-type storage battery. Still another report [14] discussed mercury oxide catalyst for acetaldehyde production.

Italy.—Italy was the only important mercury-producing country to increase output appreciably in 1946; production amounted to 49,314 flasks, a gain of 23 percent over 1945. Italy was the chief mercury-producing country in the world in 1946, but the expanded

[13] Matthias, Lynn H., Survey of a New Storage Battery: Off. of Military Govt. for Germany (US) FIAT Final Rept. 670, January 7, 1946, 3 pp. (Published by U. S. Department of Commerce.)
[14] Gardiner, William C., Electrolytic Mercury Oxide at Burghausen: Off. of Military Govt. for Germany (US) FIAT Final Rept. 822, May 17, 1946, 8 pp. (Published by U. S. Department of Commerce).

output in that year was only 74 percent of the average annual rate in 1937–39, when production was high, owing largely to the civil war in Spain and doubtless in part to anticipation of the world conflict that eventuated. Production in Italy can be expanded sharply (the 1946 total was only 52 percent of the all-time peak in 1941), but present world needs cannot support a higher rate. The Idria mine in the Province of Gorizia, however, is no longer under Italian control, having been ceded to Yugoslavia. Italy obtained control of this property from Austria following World War I. The shift in control of the Idria mine reduces Italy's production potentiality by possibly 8,500 flasks annually. According to the Metal Bulletin (London) of July 9, 1946, the Italian Finance Minister reduced the special sales tax on quicksilver from 2,000 to 500 lire a flask in midyear.

Japan.—Statistics recently made available indicate that Japanese output of mercury during World War II was higher than had been generally supposed. A peak of 6,808 flasks was produced in 1944, but output dwindled to 1,421 flasks in 1946. The Reconstruction Finance Corporation announced January 24, 1947, that 100 metric tons (2,900 flasks) were expected soon from Japan for disposition by the United States Commerical Company (RFC subsidiary). Of the total, 1,800 flasks were said to be Italian mercury and 1,100 flasks Japanese metal.

Mexico.—Mercury occurrences in Mexico were described in the report of this series for 1944. The geology of the Cuarenta district was the subject of a recent report.[15] With regard to the future of the district, the authors state:

> The mercury mines of the Cuarenta district are wrecked by gophering and pillar-robbing beyond any hope of reclamation. Mining stopped in the Cuarenta mercury district in August 1943. Good ore is said to remain under water in the bottom of the Foco mine, and the lower 2 or 3 meters of much of the conglomerate is said to constitute a large tonnage of low-grade ore, but whether this ore is real or imaginary must await proof by someone willing to spend the money necessary to sample it properly.

Livingstonite, the rare antimony-mercury sulfide, is the sole primary mercury ore mineral in the Huitzuco district, Guerrero, according to McAllister and Ortiz.[16]

United Kingdom.—The British Ministry of Supply revoked its maximum price on mercury in August; but inasmuch as the Ministry continued to be the sole importer and distributor, the price continued at £30 to £31 5s. a flask, according to quantity. The price in the United Kingdom thus was $25± a flask over that in the United States, where a tariff of $19 a flask is in force. The official United Kingdom price was reduced £5 a flask, effective November 15, and the British Board of Trade relinquished control of imports (which reverted to private hands) as of the same date. Forward offerings by a leading importer were then reported on the basis of £20 15s., pending the arrival of cheaper metal from producing countries. In December, Elder, Smith & Co., Ltd., of Australia and London, was reported to have been appointed the new and sole Mercurio Europeo selling agent

for the United Kingdom and the rest of the British Empire. Later it was learned that this company also would act for some independent Asiatic and African countries.

The new battery plant at Belfast, Ireland, mentioned in the report of this series for 1945, was said to be limiting output in 1946 almost entirely to military applications.

Yugoslavia.—According to the Metal Bulletin (London) of December 6, 1946, the Idria mine, which ceased to be a member of Mercurio Europeo on being ceded to Yugoslavia, now operates under the title Rudnik Ziveta Sreba. This mine was transferred to Italy after World War I.

Mica

By G. RICHARDS GWINN AND E. M. TUCKER

GENERAL SUMMARY

PRODUCTION of sheet and punch mica in 1946 decreased slightly from the total reported in 1945, but the output of ground mica reached an all-time high. The stimulus provided by the recent war period has increased substantially the output from South Africa and Argentina, and increased activity has also been reported in the mica fields of Tanganyika, Angola, and Kenya Colony. India and Brazil, however, are still the major mica-producing countries of the world. The output of phlogopite mica in Madagascar in 1946, as in the previous year, was low because of unsettled conditions in the labor market and fluctuations in the Metropolitan and Malagasy (Madagascan) francs.

There is a growing tendency in the foreign mica-producing countries to establish a mica-processing industry to sell the finished product, which brings a higher price than crude block or sheet. With the great wealth of manpower available and relatively low labor costs, this practice may affect the domestic processing trade. Domestic producers for the most part have returned to the prewar practice of offering only half-trim material for sale, with a consequent reduction in the value received. Muscovite sheet and film mica of certain sizes and qualities and some grades and sizes of muscovite and phlogopite splittings are included in the list of strategic minerals that must be stockpiled for national defense.

The National Bureau of Standards has developed a machine for the mechanical splitting of mica that appears to have commercial possibilities.[1] Reports on the exploration of mica deposits in Idaho,[2] New Mexico,[3] and Alabama [4] have recently been released.

The accompanying table of salient statistics summarizes domestic production and total supply of mica available in the United States for the 1942–46 period.

Value	$9,027,778	$14,854,066	$7,661,484	$6,338,759	$7,118,877
Exports (all classes of mica):					
Short tons	1,001	693	619	981	1,542
Value	$303,526	$653,889	$526,824	$377,473	$709,109

[1] Includes mica recovered from kaolin and mica schists as follows: 1942, 20,481 tons, $315,807; 1943, 24,113 tons, $314,851; 1944, 22,107 tons, $485,567; 1945, 15,046 tons, $324,515; and 1946, 15,197 tons, $290,540.
[2] Revised figure.

DOMESTIC PRODUCTION

Sheet Mica.—The quantity of sheet and punch mica produced in 1946 reached 1,078,867 pounds valued at $217,955, compared with 1,298,587 pounds valued at $737,342 in 1945. Although the quantity of mica produced in 1946 was only 17 percent below that reported in the previous year, the value was 70 percent less than the 1945 figure. This is attributed to revocation of the Government subsidized buying program on November 30, 1945, and the return by most of the mica producers in 1946 to half-trim preparation of sheet mica. Punch mica in 1946 accounted for 91 percent of the total sheet produced or 986,891 pounds valued at $126,039. In 1946 North Carolina supplied 34 percent of the punch, 92 percent of the sheet, and 73 percent of the scrap mica produced in the United States.

Production statistics on mica are obtained by the Bureau of Mines from schedules sent to individual miners. These totals are checked against similar schedules obtained from purchasers of mica. In 1946, however, many producers failed to report, and the Bureau of Mines was obliged to depend largely on reports from purchasers.

Mica sold or used by producers in the United States, 1935–39 (average) and 1940–46

Year	Sheet mica						Scrap mica and mica recovered from kaolin and schists		Total	
	Uncut punch and circle mica		Uncut mica larger than punch and circle		Total uncut sheet mica [1]

[1] Includes small quantities of splittings in certain years.
[2] Revised.
[3] Includes Alabama, Arizona, California, Colorado, Georgia, Maine, Massachusetts, Nevada, New Mexico, Pennsylvania, South Carolina, Virginia, and Wyoming.
[4] Includes Alabama, California, Colorado, Connecticut, Georgia, Maine, New Hampshire, New York, South Carolina, and Virginia.

Scrap Mica.—Production of scrap mica in 1946 reached 53,602 short tons valued at $1,041,423 compared with 41,060 tons valued at $812,322 in 1945. In addition to mine scrap, these figures include 15,197 tons valued at $290,540 of mica reclaimed as a byproduct of kaolin washing and feldspar flotation operations, and by milling mica schists. Feldspar flotation is a new source of reclaimed mica. At present the only producer is the Carolina Minerals Co., Kona, N. C.

Despite the large volume of domestic scrap mica produced, a shortage developed, and mica grinders had to import large quantities of scrap from Angola, Tanganyika, Portuguese East Africa, India, Peru, Canada, and Mexico.

The production of scrap and reclaimed mica for the 1941–46 period and the 1935–39 average are given in an accompanying table.

Scrap and reclaimed mica sold or used by producers in the United States, 1935–39 (average) and 1941–46

Year	Scrap		Reclaimed		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1935–39 (average)	13,582	$168,688	8,404	$116,824	21,986	$285,512
1941	16,917	257,303	15,583	185,486	32,500	442,789
1942	22,781	355,358	20,481	315,807	43,262	671,165
1943	22,025	423,174	24,113	314,851	46,138	738,025
1944	29,620	603,505	22,107	485,567	51,727	1,089,072
1945 [1]	26,014	487,807	15,046	324,515	41,060	812,322
1946	38,405	750,883	15,197	290,540	53,602	1,041,423

[1] Revised figures.

Ground Mica.—The output of ground mica in 1946 reached an all-time high of 62,113 short tons valued at $2,516,018, an increase of 20 percent over the 51,806 tons valued at $1,995,969 reported in 1945 and 18 percent above the previous record year of 1944.

The roofing industry in 1946, as in previous years, was the largest user of ground mica. The paint industry consumed substantial quantities of dry ground mica as well as the major part of the wet ground material. As shown in an accompanying table, the roofing

Ground mica (including mica from kaolin and schists) sold by producers in the United States to various industries, 1945–46

Industry	1945			1946		
	Quantity		Value	Quantity		Value

[1] Revised.
[2] Includes mica used for molded electric insulation, house insulation, Christmas-tree snow, manufacture of axle greases and oil, annealing, pipe-line enamel, textiles, oil-well drilling, welding, and other purposes.

and paint industries accounted for 72 percent of the quantity and 57 percent of the value of the 1946 output of ground mica. This high percentage is attributed to increased requirements for roofing and paint by the construction industries.

The history of the scrap and ground mica industries for the 1923–46 period is indicated in figure 1.

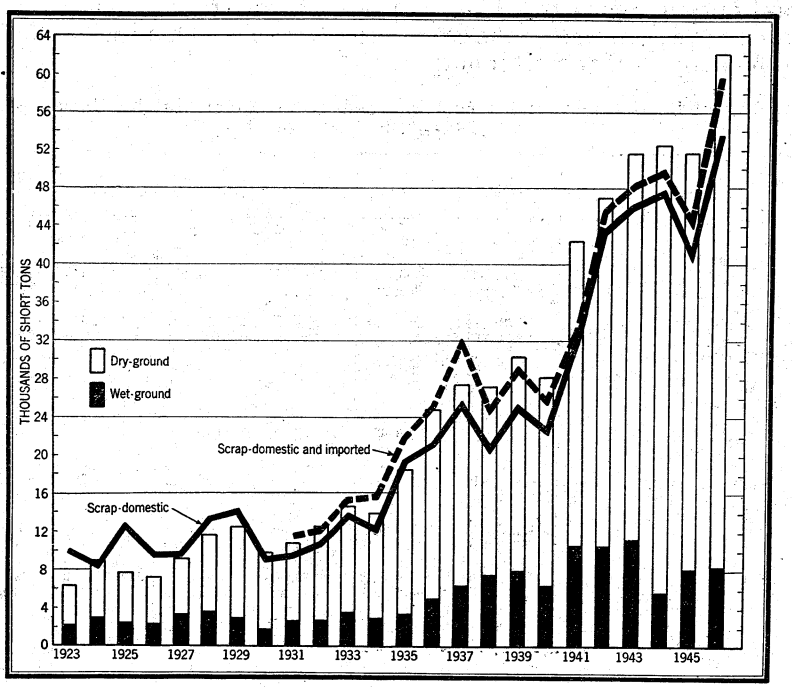

FIGURE 1.—Scrap and ground mica sold in the United States 1923–46.

[1] Revised figures.

An improvement in the manufacture of Mycalex products was patented by Guenther Bueckner (U. S. Patent 2,400,337, May 14, 1946) and assigned to the General Electric Co. Faster and improved methods of producing molded mica parts by the utilization of silicone oil as a mold-release agent have also recently been reported by the General Electric Co.[5]

[5] Chemical and Engineering News, Silicone Oil in Molding: Vol. 24, No. 18, Sept. 25, 1946, p. 2532.

Production of sheet, punch, and scrap mica in the United States for the 1942–46 period, by districts,[6] is given in the accompanying table. Because of the small number of miners reporting, figures for some classes of mica in several districts cannot be released. The Southeastern district in 1946 again was the principal producer of sheet and scrap mica contributing, respectively, 93 and 76 percent of the total output reported. The Northeastern district in 1946, as in the previous year, produced the largest quantity of punch mica, accounting for 62 percent of the total output.

Sheet, punch, and scrap mica sold or used by producers in the United States, 1942–46, by districts

CONSUMPTION

The decline in consumption of block and sheet mica which began in 1945 continued through 1946. The decrease is more apparent in 1946 because, although demands for the better grades of sheet mica

[6] Bureau of Mines Minerals Yearbook, 1945, p. 1502.

were reduced with the cessation of hostilities in August 1945, Government contracts in some instances continued through November of that year. The expanded use of substitutes and alternate materials for mica are also partly responsible for the decline. During 1946 the demand was largely for the lower grades of sheet mica for use in home appliances, such as toasters, waffle irons, hot plates, and similar products for civilian consumption that were not manufactured during the recent war period. Most of the domestic sheet produced was prepared as half trim suitable only for use in these products. Imports of the lower grades of sheet increased sharply in 1946 while the better grades declined.

Figure 2 summarizes graphically the situation with respect to imports of block mica and splittings and domestic production of sheet and punch.

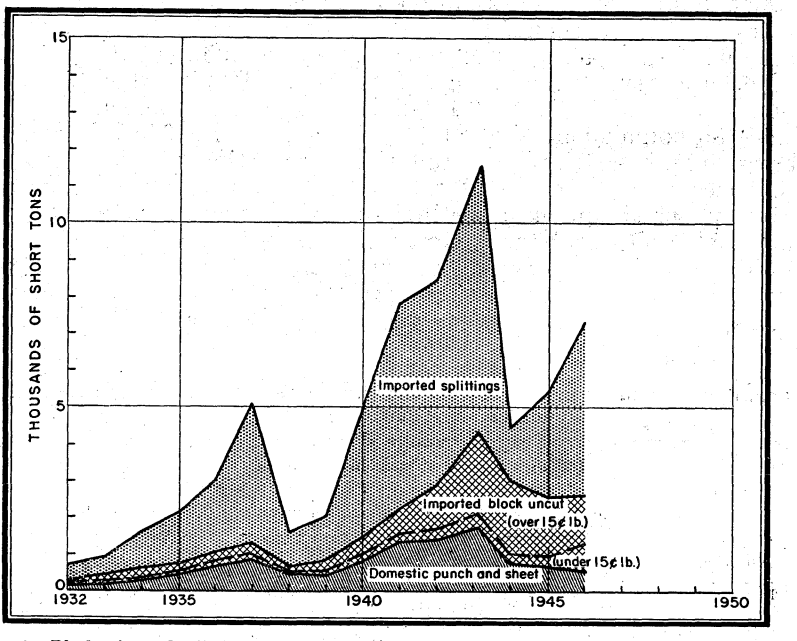

FIGURE 2.—Block mica and splittings imported for consumption in the United States and sales of domestic sheet and punch mica, 1932–46.

A summary of domestic production of sheet and punch mica and the apparent consumption of sheet, punch, and splittings for the 1935–46 period are given in an accompanying table.

Domestic production for the 1935–39 period averaged 1,140,724 pounds annually and yearly consumption about 5,037,000 pounds. Therefore, our self-sufficiency percentage was about 23 during that period. Comparable figures for the 1942–46 period are 2,022,162 pounds of domestically produced punch and sheet and 14,392,701 pounds consumed yearly, or a self-sufficiency of about 14 percent. Figures for the latter period reflect the inadequacy of domestic pro-

duction during the war years, even with premium payments, and our continued dependence on imports for the major part of our supplies.

Production of sheet and punch mica and apparent consumption of sheet and punch mica and mica splittings in the United States, 1935–46, in pounds

Year	Production	Apparent consumption	Year	Production	Apparent consumption [1]
1935	936,633	4,123,659	1941	2,666,453	12,040,476
1936	1,319,233	5,721,685	1942	2,761,844	12,888,273

[1] Revised figures.

Mica Splittings.—Consumption of mica splittings in the United States in 1946 reached 7,815,989 pounds valued at $4,259,478 compared with 7,897,402 pounds valued at $3,415,696 in 1945.

Stocks of splittings on December 31, 1946, reached 6,588,932 pounds valued at $3,615,731, an increase of 115 percent over the 3,064,589 pounds valued at $1,391,617 reported in 1945. Part of the change may be attributed to the lifting of wartime restrictions on the purchases of splittings and the subsequent increase in stocks by industry, which under peacetime conditions maintains from 3 to 9 months' supplies on hand. Government stocks remaining at the end of 1945 have become part of the stock pile for national defense and thus are out of the commercial market. Consumption and stocks of mica splittings for the 1942–46 period are shown in an accompanying table.

Consumption and stocks of mica splittings in the United States, 1942–46, by sources, as reported by consumers

Year	Indian		Canadian		Madagascan		Total

1943	4,031,849	1,708,096	138,564	85,893	215,639	139,797	[1] 4,517,211	[1] 2,032,758
1944	3,578,885	1,749,011	141,427	95,850	184,970	121,307	[2] 3,994,977	[2] 2,025,165
1945	2,684,848	1,145,176	143,102	91,115	193,763	130,661	[3] 3,064,589	[3] 1,391,617
1946	5,727,615	3,039,429	275,685	166,786	535,185	378,174	[4] 6,588,932	[4] 3,615,731

[1] Consumption includes 26,510 pounds of domestic splittings and 55,191 pounds of Mexican splittings, valued at $11,308 and $46,057, respectively; stocks include 2,200 pounds of domestic splittings and 128,959 pounds of Mexican splittings, valued at $1,009 and $97,963, respectively.

[2] Consumption includes 58,350 pounds of domestic and 76,729 pounds of Mexican splittings, valued at $23,862 and $55,282, respectively; stocks include 3,694 pounds of domestic and 86,001 pounds of Mexican, valued at $1,365 and $57,632, respectively.

[3] Consumption includes 94,716 pounds of domestic and 71,771 pounds of Mexican splittings, valued at $46,731 and $46,764, respectively; stocks include 7,000 pounds of domestic and 35,876 pounds of Mexican, valued at $3,430 and $21,235, respectively.

[4] Consumption includes 7,220 pounds of domestic and 55,413 pounds of Mexican splittings, valued at $1,651 and $35,223, respectively; stocks include 4,541 pounds of domestic and 45,906 pounds of Mexican, valued at $1,390 and $29,952, respectively.

Muscovite splittings in 1946, for the second straight year, made up the bulk of the combined stocks, accounting for 87 percent of the total. This is attributed largely to wider use of muscovite splittings, reduction in output from the Madagascar mines, and closing of the Mexican phlogopite splittings industry. Statistics on the consumption of splittings on a quarterly basis, by kind and size, are no longer available.

Built-Up Mica.—Consumption of built-up mica products in 1946 reached 6,486,555 pounds valued at $10,285,862, a figure 10 percent below the 7,194,909 pounds valued at $9,846,719 reported in 1945. The downward trend that began in 1945 thus continued through 1946. The decline is attributed to the increasing use of substitute and alternate material for mica, the decrease in domestic production of large-size low-quality sheet, and the continued shortage of wire, steel, and other necessary components of electrical appliances.

Built-up mica produced in the United States, 1944–46, by kinds of product [1]

Product	1944		1945		1946	
	Pounds	Value	Pounds	Value	Pounds	Value
Molding plate	1,792,052	$1,816,920	2,015,993	$2,096,267	1,742,835	$2,061,588

[1] Partly estimated.

PRICES

Prices for domestic sheet and punch mica in 1946 were based largely on negotiation between buyer and seller. Trade-journal price quotations shown in the accompanying table therefore are nominal. Although 1946 prices were substantially less than the premium prices paid during the recent war period, they were considerably higher than those reported for the prewar year 1939.

Prices for scrap mica in 1946 ranged from $15 to $17.50 per short ton f. o. b. mine in the Western States and $15 to $25 per ton in the

Trade-journal quotations and average sales value of domestic uncut sheet mica per pound in 1946

Size	Trade-journal quotations [1] Nov. 28, 1946	Average value [2]

[2] Calculated from sales by domestic producers as reported to the Bureau of Mines.

East. Prices on imported scrap, as reported by the mica grinders, ranged from $13 to $34 per ton. Prices for ground mica as quoted in the Oil, Paint and Drug Reporter were as follows: Dry-ground, per short ton 100 mesh f. o. b. mill in carlots $47.50, less than carlots $51 per ton, roofing grade 20 to 80 mesh $50 per ton; wet ground freight allowed, $100 to $125 per short ton in carlots and $110 to $140 per ton less than carlots, depending on mesh sizes.

MICA SUBSTITUTES

A synthetic resin having the trade name "Luvican" was produced by the Germans as a substitute for mica during the recent war period. Luvican is similar to the product marketed in the United States as Polectron. The German product was used primarily for high-frequency insulation and its electrical properties are comparable to polystyrene. It was only satisfactory for a few special purposes because of its brittleness. Peak production was approximately 5 tons per month.[7] Two investigators in the Netherlands have recently published a report on a product called "Scale Glass," which may be used as an alternate material for mica in radio tubes.[8]

The German research on synthetic mica which started during World War I had progressed to such a stage at the end of World War II that it should be possible to produce synthetically condenser-grade mica at a cost about 10 times that of imported natural mica.[9]

FOREIGN TRADE[10]

Imports.—In 1946 imports of all kinds of mica totaled 13,945 short tons valued at $7,118,877 compared with 9,405 tons valued at $6,338,759 in 1945, an increase of 48 percent in quantity and 12 percent in value. The increase in quantity was largely in the relatively low-cost items, scrap mica (waste and scrap) and low-grade block (other, valued not above 15 cents per pound), which increased respectively 74 and 157 percent. Imports of the better grades of block mica (valued above 15 cents per pound) were 17 percent lower than that reported in 1945. In 1946, as in the previous year, the United States imported larger quantities of block mica from Brazil than from India. Imports from Brazil and Mexico are complicated because of the circuitous route followed by the mica received. Although Brazil now has a domestic mica-splitting industry, most of the splittings exported to the United States represent block mica mined in Brazil, shipped to India for splitting, returned to Brazil, and then reexported as Brazilian splittings. Mica mining in Mexico ceased near the end of 1945, and the films and mica cut and stamped to dimensions received from that country in 1946 represent almost entirely mica purchased by United States companies in South America, brought to New York, reshipped to Mexico for preparation, and then reimported by the same companies. Further details on imports, by kinds and sources, may be found in the accompanying tables.

1945	6,470	5,601	1,771	3,627	319	821	382,466	11,042

Exports.—Exports of mica and mica products in 1946 totaled 1,542 short tons valued at $709,109, an increase of 57 percent in quantity and 88 percent in value over the 981 tons valued at $377,473 reported in 1945. The largest volume change was in ground mica. Canada, Belgium and Luxembourg, and the Union of South Africa were the chief foreign destinations. "Other manufactured products" accounted for the largest increase in value, and Italy, Canada, Venezuela, and Mexico provided the chief markets. Details of exports appear in the following table.

Mica and manufactures of mica exported from the United States in 1946, by countries

WORLD PRODUCTION

Information on world production has increased substantially in the past 2 years, and figures on the major producing countries are now available, as shown in the accompanying table.

World production of mica, 1940–46, in metric tons [1]

[1] In addition to the countries listed mica is also produced in China, Colombia, and U. S. S. R., but data on production are not available.
[2] Exports.
[3] Imports into United States.
[4] Includes following quantities recovered from kaolin and schists—1940: 8,776 tons; 1941: 14,137 tons; 1942: 18,580 tons; 1943: 21,875 tons; 1944: 20,055 tons; 1945: 13,649 tons; 1946: 13,786 tons.
[5] Data not available.
[6] Estimate.
[7] Less than 1 ton.
[8] Estimated by author of chapter; excludes countries listed in footnote 1.

Australia.—It is reported that the mica industry in Australia will remain under Government control through 1947. During the recent war period mica deposits were developed in Queensland, New South Wales, South Australia, Western Australia, and the Northern Territory. Most of the production, however, has come from the Northern Territory. A few tons of phlogopite mica were recovered from a deposit at Strangeways Range, about 30 miles northeast of Alice Springs, Northern Territory. Damourite, a fine-grained hydrous mica, is recovered from a deposit of china clay in South Australia and marketed as ground mica. The mica section of Mineral Resources of Australia Summary Report 4 has recently been reviewed by the Bureau of Mines.[11]

[11] Bureau of Mines, Mineral Trade Notes: Vol. 22, No. 1, January 1946, pp. 36–46.

Brazil.—It is reported that 1,148 metric tons of mica valued at 26,732,000 cruzeiros (about $1,336,600) were shipped from Brazil in 1946. It is believed that the annual output of the better grades of block mica, in the next few years, will be greater than that reported before World War II but much less than during the war.

Canada.—The bulk of the mica produced in Canada in 1946 was phlogopite. Muscovite sheet mica recovered during the recent war years was a relatively high-cost product which, it is believed, will not continue in production under peacetime conditions. Large quantities of phlogopite scrap were exported to mica grinders and built-up-mica manufacturers in the United States. A review of the Canadian mica industry's contribution to World War II and prospects for the future has recently been published.[12]

India.—The production of mica in India in 1946 was curtailed by unsettled political and labor conditions. The industry was also concerned about the proposed manufacture of synthetic mica and the disposal of surplus stocks of mica in Great Britain. An agreement was reached by the Indian and United Kingdom Governments whereby stocks of block and film mica of grades 4 and larger will be marketed over a period of 5 years and grades 5 and smaller block and film, stained and lower, and loose splittings over a 10-year period. Sales of this stock will be through normal trade channels by Mica Distributors, Ltd., which will act as the Government's agent. One outcome of the Report of the Mica Inquiry Committee, 1944–45, in India was the Mica Mines Labor Welfare Fund Act, 1946, passed April 1, effective July 26. The act provided for a cess or tax on all mica, in whatever state, exported from British India at rates not exceeding 6¼ percent ad valorem. The money collected is to be applied by the Central Government to a fund for financing activities to promote the welfare of mica miners. The rate fixed was 2½ percent.

Madagascar.—The mica industry in Madagascar in 1946 was hampered by the unstable condition of the French franc and by labor troubles. In January 1946 the Minister of the Colonies set new prices for block mica which were, respectively, 25 and 35 percent higher for ordinary block and splitting mica, and spark-plug quality, than that paid by the United States Commercial Company during the recent war period. Consumers refused to pay the new prices, and later in the year prices were reduced. However, as the Madagascar exporters were paid in Metropolitan French francs, which were devalued below the Malagasy (Madagascan) franc, they refused to quote a firm price for phlogopite mica. Thus sales fell off and many of the mica mines closed.

Molybdenum

By EDWIN K. JENCKES

GENERAL SUMMARY

THE progressive decrease in the domestic production of Molybdenite concentrates since 1943 continued for the third successive year in 1946. Measured in terms of molybdenum contained, the out-turn was 18,218,000 pounds—59 percent of that in the previous year and 30 percent of the all-time high in 1943. Consumption of concentrates, which increased slightly in 1945 as compared to 1944, declined markedly to 14,994,000 pounds in 1946, a drop to 46 percent compared with 1945. Stocks in the hands of producers and consumers on December 31, 1946, were 114 percent of those on hand at the close of 1945.

Imports (276,475 pounds of molybdenum contained) were 42 percent of the quantity brought into the country in 1945 and were, with the exception of 10 pounds from Mexico, entirely from Chile. The importations from Canada for refining and reexport to that country (noted in the 1945 chapter of this series) were entirely absent in 1946, as were importations from Peru.

The predominant use for molybdenum is as an additive to alloy steel, although the relative proportion of molybdenum entering into other uses is increasing.

Salient statistics of the molybdenum industry in the United States, 1942–46, in thousands of pounds of molybdenum contained in ore and concentrates

	1942	1943	1944	1945	1946
Production	56,942	61,667	38,679	30,802	18,218
Imports for consumption	756	1,789	3,499	665	276
Shipments (including exports)	66,437	53,955	39,423	32,524	16,304
Consumption	56,388	49,891	31,520	32,696	14,994
Stocks (producers' and consumers') Dec. 31	12,540	17,993	19,335	16,899	19,255

GOVERNMENT REGULATIONS

Civilian Production Administration.—Order M–21 (Minerals Yearbook, 1945, p. 638) authorizing CPA to exercise controls over alloy steel and ferro-alloying materials, continued in force during 1946, but no active controls were instituted.

Office of Price Administration.—Amendment 26 to supplementary Order 129, issued and effective June 12, 1946, suspended price controls under Maximum Price Regulation 489, covering tungsten, molyb-

denum, cobalt, and vanadium. Effective November 10, 1946, supplementary Order 193 was issued, exempting from price controls all commodities except sugar and rice.

DOMESTIC PRODUCTION

The total production of molybdenum concentrates in 1946 was 18,218,000 pounds (contained molybdenum). Stocks in the hands of producers and consumers on December 31, 1946, totaled 19,255,200 pounds molybdenum, which at the average rate of consumption for that year represents a 15 months' supply.

Domestic shipments for 1914–46 are shown in the accompanying table.

Molybdenum in ore and concentrates shipped from mines in the United States, 1914–46 [1]

Year	Pounds	Value [2]	Year	Pounds	Value [2]
1914–18	1,601,643	$2,070,213	1941	38,377,000	$25,996,000
1919–23 [3]	355,493	370,371	1942	66,437,000	47,275,000
1924–28	8,498,343	6,160,304	1943	53,955,000	38,500,000
1929–33	18,954,917	11,406,000	1944	39,423,000	27,999,000
1934–38	94,077,000	64,244,000	1945	32,524,000	23,107,000
1939	32,415,000	22,157,000	1946	16,304,000	11,167,000
1940	25,329,000	17,189,000			

[1] For shipments by years, 1914–38, see Minerals Yearbook, 1941, p. 629.
[2] Largely estimated by Bureau of Mines.
[3] No shipments in 1921 and 1922.

Total production declined 12,584,000 pounds of molybdenum (41 percent) in 1946 as compared to 1945. Production at straight molybdenum mines dropped 7,961,000 pounds (42 percent), while byproduct molybdenum decreased 4,623,000 pounds (39 percent). Byproduct molybdenum represented 39 percent of the total concentrates recovered in 1946, as compared to 38 percent in 1945 and 35 percent in 1944.

REVIEW BY STATES

Molybdenum was produced in six States in 1946, Colorado leading, followed in order by Utah, Arizona, New Mexico, Nevada, and California. The order was unchanged from that in 1945, except that Arizona and New Mexico exchanged places.

Arizona.—In 1946 there were two producers of molybdenite in Arizona, the byproduct recovery operations of the Miami Copper Co. at Miami, Ariz., and those of the Squaw Peak Copper Mining Co. at Camp Verde.

Diamond drilling on the San Manuel property by the Magma Copper Co. is reported to have developed 119 million tons of low-grade copper ore, of which 74.9 million tons is sulfide ore carrying 0.818 percent copper and a small but economically important quantity of molybdenum.[1]

California.—The sole producer of molybdenum in California is the United States Vanadium Corp. at Bishop, where the metal is recov-

[1] Mining Record, Another Great Copper Mine Discovered in Arizona: Vol. 57, No. 33, Aug. 15, 1946, p. 1.

ered as a byproduct of tungsten production. Molybdenum occurs as molybdenite and powellite.

Colorado.—Colorado continues to be the largest producing State and supplied virtually 60 percent of the domestic output in 1946.

Despite the enormous demands made by the war, the reserves of the Climax Molybdenum Co.,[2] the world's largest molybdenum company, increased. A drilling program was carried out during the war years which brought reserves of "proved or probable ore" to 260 million tons containing 1.6 billion pounds of molybdenum as compared with 145 million tons of ore containing 1.05 billion pounds of molybdenum recorded in 1935. It has been reported[3] that mining operations at Climax during World War II were confined to pulling broken ore reserves to achieve maximum production and that all ore breaking was suspended. A more balanced mining program was resumed late in 1946 with the hiring of 100 men to work a 5-day week.

The Urad mine of the Molybdenum Corp. of America at Empire, Colo., produced concentrates throughout 1946. Mining was curtailed pending the results of exploration by diamond drilling which was undertaken to define the limits and content of the ore body.[4]

Nevada.—The output from the Kennecott Copper Corp. at its McGill concentrator constitutes the only molybdenum production in Nevada. Ores from Kennecott's Ruth mine and Copper Flat open pit and from Consolidated Coppermines Corp.'s Emma Nevada group are milled at this concentrator.

New Mexico.—There are two producers of molybdenite in New Mexico, the Chino Mines Division of the Kennecott Copper Corp., Hurley, and the Molybdenum Corp. of America, Questa. At Hurley molybdenite has been recovered as a byproduct of copper operations since 1937. The Questa mine, which is operated for molybdenum only, has been a producer since 1919. The Questa mill, originally a 40-ton plant, has been enlarged to treat an additional 200 tons daily of accumulated tailings.[5]

Utah.—Utah continued to be the second-largest producing State because of the byproduct recovery of the Utah Copper Co. at Arthur and Magna. There was no other producer of molybdenum in the State.

EXPLORATION AND DEVELOPMENT

The Bureau of Mines has published reports[6] on three molybdenum-bearing properties: the Amargosa Molybdenum-Copper Property, Pima County, Ariz.; the Old Reliable Copper Mine, Pinal County, Ariz.; and the Bi-Metallic Molybdenum Deposit, Okanogan County, Wash.

Denton, Thomas C., Old Reliable Copper Mine, Pinal County, Ariz.: Bureau of Mines Rept. of Investigations 4006, 1947, 9 pp.

During 1946 the Geological Survey reported no exploration of molybdenum properties.

CONSUMPTION AND USES

The largest single use for molybdenum is as an alloying element in the manufacture of alloy steels, for which molybdenum oxide, calcium molybdate, ferromolybdenum, and molybdenum-bearing scrap are used. Molybdic acid, sodium molybdate, molybdenum metal, and special molybdenum alloys enter into electrical and electronic equipment, laboratory chemicals, dry-color lakes, and special alloys.

In 1946 the consumption of molybdenum products entering into alloy steel decreased 46 percent as compared to 1945, whereas the production of alloy steel (excluding stainless) declined 30 percent. The comparable declines in 1945 as compared to 1944 were 16 and 20 percent, respectively. The lower consumption of molybdenum per ton of alloy steel in 1946 is largely accounted for by reversion of the market from military to civilian uses in which steels of lower alloy content are specified.

Consumption of molybdenum products in the United States, 1942–46, in thousands of pounds of contained molybdenum

Year	Ferromolybdenum	Calcium molybdate	Molybdenum oxide[1]	Other[2]	Purchased scrap	Total
1942	10,673	5,501	27,824	414	1,252	45,664
1943	6,663	5,099	26,383	580	2,940	41,665
1944	4,617	2,351	21,303	631	2,777	31,679
1945	4,560	2,166	17,583	989	1,631	26,929
1946	2,807	1,058	9,344	631	716	14,556

[1] Includes also molybdenum trioxide and molybdic acid.
[2] Ammonium molybdate, sodium molybdate, molybdenum silicide, molybdenum metal, and alloys.

The addition of molybdenum to various grades of stainless steel increases resistance to most chemical attack.

Despite the large decline in the consumption of molybdenum compounds entering into other-than-steel uses (a 36-percent decline from the 1945 consumption), these applications have increased 52 percent over 1942.

The use of molybdenite as a die lubricant has been proposed and described.[7]

Molybdenum is finding an expanding market in the alloys used in jet propulsion engines, turbo superchargers, and gas turbines. For these uses, molybdenum has been described as the best additive for high-temperature strength.[8] The utility of molybdenum in alloys for these severe services has received the recognition of engineers

PRICES

During 1946, the published price of molybdenite held at 45 cents per pound of MoS_2 in 90-percent concentrates. This has been the published price since 1938. This is an open market price, and contracts probably can be obtained at a somewhat lower figure, depending on the quantity involved, terms of payment, etc.

London prices for molybdenite (85 to 90 percent concentrates) were quoted at 40s. to 42s. 6d. per long-ton unit from January 1 to November 28, on which date the price was raised to 45s. to 47s. 6d.

The following prices for molybdenum products, which were quoted in the trade journals during the year, conformed to the maximum prices established by the Office of Price Administration in Maximum Price Regulation 489, dated November 8, 1943.

Product:	*Price per pound contained molybdenum*
Ferromolybdenum	$0.95
Molybdic oxide, technical, (powder or briquets)	.80
Calcium molybdate	.80

No price change occurred when molybdenum was removed from price regulation on June 12, 1946.

FOREIGN TRADE [12]

Imports of molybdenum ore and concentrates into the United States are normally small, and the 1946 imports (276,475 pounds of contained molybdenum) show a decrease of 58 percent from those of the preceding year; 1946 records the second successive year of decline from the all-time high of 1944.

Of the 1946 imports, 276,465 pounds (molybdenum contained) were imported from Chile for reexport. No ferromolybdenum was imported in 1946.

Exports of molybdenum ore and concentrates were 564,924 pounds (contained molybdenum) valued at $371,024, a decrease of 80 percent in quantity from those in 1945.

Imports and exports of molybdenum ore and concentrates for 1945 and 1946 appear in the accompanying tables.

Molybdenum ore and concentrates imported for consumption in the United States, 1945–46, by countries

Country	1945			1946

WORLD REVIEW

Official production data on molybdenum have been published by several countries from which they were not available during World War II, notably Norway and French Morocco, and partial returns have been made by several other countries. All such data have been included in the accompanying table.

World production of molybdenum in ores and concentrates, 1938–46, by countries, in metric tons

[1] Molybdenum content estimated by the author from gross weight of ore and concentrates reported.
[2] Less than 1 ton.
[3] Data not yet available; estimate included in total.
[4] Estimate by the author.
[5] Exports to Japan Proper.
[6] Data represent areas designated as Free China during the period of Japanese occupation.
[7] Preliminary data for fiscal year ended March 31 of year following that stated.
[8] Estimate by the author for Greece, Rumania, and Yugoslavia included in the totals; in addition, molybdenum ore is produced in Burma, France, Sweden, and U. S. S. R., but data of production are not available or are incomplete.

Austria.[13]—In the first quarter of 1946, 225 tons of molybdenum ore were mined in British-controlled Carinthia.

Canada.—According to preliminary estimates, the 1946 exports of molybdenum concentrates were 751,197 pounds valued at (C) $350,032 compared to 978,117 pounds valued at (C) $411,663 in 1945.[14] Claveau has reported[15] the presence of molybdenite in the rocks along the north shore of the St. Lawrence River in the region between Havre St. Pierre and the Olomane River.

McKean has described[16] a process for producing satisfactory molybdenite concentrates from ores containing MoS_2, bismuth, and copper.

Chile.—Exports of molybdenite in the first half of 1946 were 1,256 metric tons, compared to 418 tons during the corresponding period in 1945.[17]

[17] Bureau of Mines, Mineral Trade Notes: Vol. 23, No. 3, September 1946, p. 20.

Finland.[18]—During 1944, 194 tons of molybdenite concentrates were produced, of which 20 to 30 tons were consumed in Finland; the remainder was exported.

Greece.[19]—The concentrating plant installed by the Krupp Co. at Gevgeli is still intact but has remained idle. The mines are held under trusteeship by the Government.

Japan.—The production of molybdenite concentrates in 1946 (calendar year) was 99 metric tons containing about 80 percent MoS_2.

Manchuria.—A rich molybdenum deposit has been reported in Manchura.[20] During the war 300 Japanese technicians and staff and 6,000 Chinese were employed. Early estimates of the extent of reserves have been questioned.[21]

Mexico.—During the first half of 1946, 1,118 metric tons of molybdenum concentrates were produced and shipped to the United States.[22]

Norway.—An official report published by the Central Bureau of Statistics states that during the first half of 1946 no export shipments of molybdenite were made. In the same period of 1945, 207,621 kilograms were exported.[23]

Peru.—The reserves of Peru Molibdeno, S. A., the only producer of any consequence, were large, but development work was suspended during the war years. The supply of minable ore became exhausted, and the mine was shut down early in 1945; in consequence, the United States Commercial Co. canceled its contract because of failure of deliveries. Peru Molibdeno, S. A., subsequently experienced financial difficulties and was finally liquidated to satisfy creditors. All mining, concentrating, and other equipment has been sold.[24]

Rumania.[25]—Although several deposits of molybdenum-bismuth ores are known, the deposit at Baita is the only one known to have been exploited.

GENERAL SUMMARY

RESPONDING to demands that were limited in some market areas only by the capacity of available facilities, the marketed production of natural gas in 1946 is estimated to have expanded 4 percent over the 1945 record, to 4,095 billion cubic feet. All major classes of consumers used more gas except the electric utility power plants, whose requirements declined 19 billion cubic feet.

Domestic consumption, stimulated by an unusual increase in house-heating installations, approximated 650 billion cubic feet, or 7 percent more than in 1945. The increases in consumption by carbon-black and portland-cement plants were above the national average, reflecting higher rates of production by these industries. The demand for natural gas for miscellaneous industrial purposes was well maintained, a small increase in 1946 contrasting with a decline in the Federal Reserve Board index of industrial production from 203 in 1945 to 170 in 1946.

The average value at the wells of natural gas is estimated to have risen from 4.9 cents per thousand cubic feet in 1945 to 5.1 cents in 1946 owing to increased prices in many producing fields and to production gains in a few important areas where the field price is above the national average.

Estimates of the average value at points of consumption indicate an increase from 21.4 cents per thousand cubic feet in 1945 to 21.6 cents in 1946. (See fig. 1.) Except for higher average prices of gas for carbon-black manufacture, rates to consumers changed little. The greater volume of deliveries to domestic and commercial customers, however, was a primary influence in supporting the average sales value of all gas.

The export of natural gas by pipe line to Mexico decreased from the 1945 record total of 18,016 million cubic feet to 17,475 million in 1946. Capacity to deliver gas to Monterrey, Mexico, from south Texas fields will be augmented by completion of a new pipe line in 1947. The movement of natural gas across the Niagara River at

Buffalo for distribution in Ontario, Canada, increased to about 200 million cubic feet in 1946 from 191 million in 1945.

The number of domestic meters increased from 10,959,000 in 1945 to about 11,300,000 at the end of 1946. Similarly, commercial meters increased from 889,000 to about 950,000.

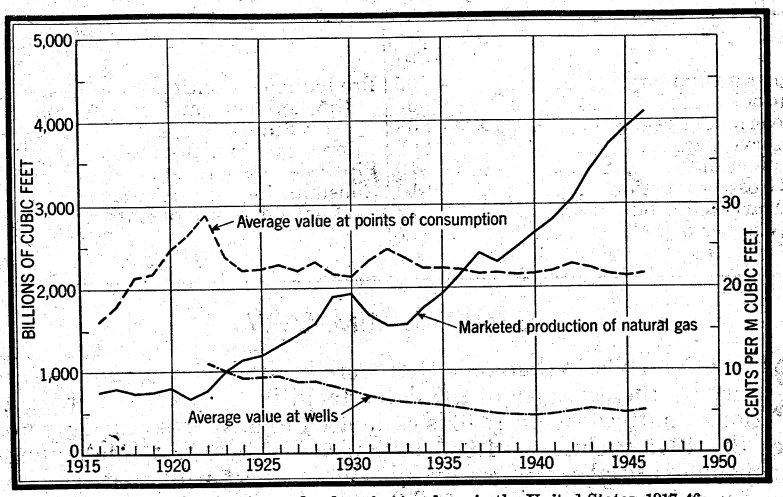

FIGURE 1.—Production and value of natural gas in the United States, 1917–46.

OUTLOOK

Two related factors—(1) the insistent public demand for greater supplies of natural gas and (2) the decline in cost of natural gas relative to other fuels in competitive geographic areas under the postwar price structure as compared to the immediate prewar years—have produced convincing evidence of a remarkable expansion in natural-gas transmission and sales for the next few years.

A large part of the demand for additional service is originating in areas where ample coal is available. The logic of the public urge for house heating with natural gas is attested, however, by trade reports that in parts of the northeastern States this fuel actually costs less under present rate structures than either coal or oil. The additions to the house-heating load are aggravating the problems of meeting peak-load requirements, particularly in the colder sections of the country. Of necessity, therefore, growing emphasis must be placed by distributing companies upon means of expanding effective peak capacities at points of consumption, such as underground storage, above ground storage, and supplemental standby capacity for manufactured gas or liquefied petroleum gases.

A number of companies now distributing manufactured or mixed gas may be expected to convert where possible to natural gas or to use a larger proportion of natural gas than currently, impelled by the rising unit costs of producing gas from coal or oil and by the desire to increase the effective capacities of their distribution systems without the need for large new capital investments. Selling a gas of materially higher B. t. u. value per cubic foot than at present would accomplish the latter objective.

[4] Exclusive of oil- and gas-field operators.
[5] Figure not yet available.

New and more efficient industrial applications of natural gas as a heat source, developed during and after the war, promise to maintain demand from many industries at high levels, as compared to prewar years. The important savings in labor cost and processing time often accomplished by use of gas compared to other fuels constitute under present economic conditions compelling reasons for its adoption as an aid to meeting competition.

The ability of the industry to satisfy fully the present and immediately prospective demands of consumers for natural gas will be retarded by delay in deliveries of the necessary pipe and equipment for large transmission facilities. Record demands for materials for

gas-line construction plus heavy requirements, worldwide, for crude-petroleum pipe lines of larger size than any built before the war will tax the capacity of pipe mills for many months—some reports indicate until 1950.

The period of vigorous expansion now in progress will continue to be based principally upon the vast available gas reserves of Texas and nearby States. These reserves, as at present defined, appear to be adequate to satisfy growing requirements for many years. Perhaps of greater significance for the future, however, is the evidence of rapid growth of available supplies in recent years and the promise of continuing large additions to the Nation's inventory as exploration and development continue.

GOVERNMENT REGULATIONS

Early in December 1946, the field price of natural gas in the Hugoton area of Oklahoma was fixed at 7 cents per thousand cubic feet on a pressure base of 14.65 pounds absolute by order of the Oklahoma Corporation Commission, about 3 cents above the local rates in commercial contracts. Legal action was begun shortly thereafter by purchasers of the gas to test the validity of this unusual order.

Acting in the interest of conservation of natural gas and petroleum, the Railroad Commission of Texas actively prosecuted a program of fact-finding and general inquiry into the problems involved in production and disposition of natural gas produced in many of the important oil fields in Texas. The purpose is to increase recoveries of crude petroleum and to reduce the waste of natural gas by requiring the use of more efficient methods of production. Coincident with these actions, a number of projects were commenced by the industry to construct facilities for processing natural gas to recover its contained liquids, and for marketing, or return to natural reservoirs, of the dry gas.

The Legislature of Louisiana, early in 1947, repealed the 1942 law that had placed restrictions upon the shipment of Louisiana-produced natural gas to other States that are adequately served by other fuels.

As an emergency measure to supplement supplies of natural gas to the Appalachian region during the winter of 1946–47, the War Assets Administration, on December 2, 1946, leased the two major war emergency pipe lines to a private corporation to carry Texas gas to Ohio and adjoining areas. Within a very few days, over 100 million cubic feet of gas daily were being delivered from these lines for distribution to consumers.

In 1946 the Federal Power Commission approved for construction pipe lines and related facilities for natural-gas transmission with an aggregate estimated cost of approximately $300,000,000. Applications were pending early in 1947 for authority to carry out additional construction at an estimated cost of over twice this amount.

RESERVES

The first of a planned series of annual estimates of the proved recoverable reserves of natural gas in the United States was reported by the Committee on Natural Gas Reserves of the American Gas

Association on October 7, 1946, and showed reserves as of December 31, 1945. A second report, as of December 31, 1946, indicating the changes, by States, during 1946 due to discoveries, extensions, revisions, and production, was released on February 28, 1947. The accompanying table summarizes the data in these reports.

Proved reserves of natural gas as defined by the committee "include the gas in both the drilled and certain undrilled portions of the fields. The undeveloped areas considered to have proved reserves are those so located with respect to the field geology and structure that production therefrom is practically assured. Recoverable reserves of natural gas are the reserves estimated to be producible under existing operating practices."

The three types into which gas reserves have been divided are defined as follows: 1. Nonassociated gas is free gas not in contact with crude oil in the reservoir. 2. Associated gas is free gas in contact with crude oil in the reservoir. 3. Dissolved gas is gas in solution in crude oil in the reservoir.

Estimated proved recoverable reserves of natural gas in the United States, 1945–46, in millions of cubic feet[1]

[1] Volumes are reported at a pressure base of 14.65 pounds per square inch absolute and at a standard temperature of 60° F.

[2] Reserves of *dissolved* gas were estimated jointly with American Petroleum Institute Committee on Petroleum Reserves.

[3] Net production equals estimated gross withdrawals less gas reinjected into underground reservoirs.

In connection with the study of natural-gas reserves, estimates were made also of the quantity of natural gas liquids contained in recoverable gas reserves and extractable by methods now in use. The term "natural gas liquids" is used to describe "those hydrocarbon liquids

that are gaseous in the reservoir but are obtainable by condensation or absorption." The estimated reserve of such liquids in the United States on December 31, 1946, amounted to 3,354 million barrels. Details of this estimate are shown in the Natural Gasoline and Liquefied Petroleum Gases chapter of this volume.

PRODUCTION

GROSS PRODUCTION

The total production of natural gas from oil and gas wells is estimated to have increased 5 percent over 1944, to 5,902,180 million cubic feet in 1945. Large gains in Texas and Oklahoma were influenced by greater demand from interstate transmission systems whose takings offset material declines in production in the Appalachian region and in Kansas. As a result of active development of dry-gas reserves and cycling in condensate fields, withdrawals from gas wells have increased from 57 percent of total gas production in 1940 to 66 percent in 1945.

The approximate rate at which the Nation's gas reserves are being depleted is indicated by subtracting from estimated gross production the quantities of gas returned to natural, underground reservoirs for purposes of repressuring, pressure maintenance, and storage. In 1945, a total of 4,814,894 million cubic feet of natural gas was removed from available gas reserves and consumed or otherwise dissipated, an increase of 2 percent over 1944. Compared with an indicated withdrawal of 2,396,421 million cubic feet in 1935, the 1945 rate shows an increase of 101 percent in 10 years. In the 11 years 1935–45, inclusive, approximately 38.3 trillion cubic feet of natural gas has been taken from underground reserves.

The largest element of growth in repressuring and pressure maintenance in recent years has been related to cycle-plant operations in which great quantities of gas are returned to condensate-type reservoirs after processing to recover liquid products. In Texas and Louisiana, where 85 percent of all gas returned to natural reservoirs for these purposes was reported in 1945, cycle plants are the dominant influence. In California, which accounts for another 10 percent of the total, these plants are also a factor.

The operation of storage reservoirs in 1945 involved the injection of 61,502 million cubic feet of natural gas and the withdrawal to meet peak demands of 36,167 million cubic feet, resulting in a net increase in stored gas during the year of 25,335 million cubic feet. In the West Virginia-Pennsylvania-Ohio area, larger supplies from southwestern fields facilitated the input to storage of a record volume of gas and a net gain of 15.5 billion cubic feet in inventories. The total volume of gas in storage fields in the Appalachian region on December 31, 1945, is estimated to exceed 70 billion cubic feet, excluding gas that is usually regarded as a "cushion" not readily available for market. The great value of integrated gas-storage facilities in important consuming districts is now widely recognized, not only as an economical means of increasing notably the effective capacity of a gas-transmission system to serve communities with pronounced variations in seasonal requirements, but also as a vital factor in pro-

Gross production and disposition of natural gas in the United States, 1944–45, by States, in millions of cubic feet

State	Estimated production [1]			Estimated disposition

[1] Marketed production plus quantities used in repressuring, stored in ground, lost, and wasted (see footnote 2).

[2] Includes gas (mostly residue gas) blown to the air and transportation losses but does not include direct waste on producing properties, except where data are available.

[3] Includes gas transported from other States.

[4] Florida, North Dakota, South Dakota, Tennessee, Utah, and Virginia.

moting continuity of service by minimizing the danger of interruptions to supply, particularly from sources far removed from the principal focuses of demand.

The indicated loss and waste of gas declined from 1,010,285 million cubic feet in 1944 to 896,208 million in 1945 owing primarily to material reductions in Texas, Louisiana, New Mexico, and Arkansas. Increased sales of residue gas to pipe lines and carbon-black manufacturers were factors contributing to this improvement, particularly in Texas and New Mexico.

MARKETED PRODUCTION

The quantity of natural gas produced and marketed again surpassed previous records, reaching 3,918,686 million cubic feet in 1945, a 6-percent increase over 1944. As in other recent years, the largest gains were in important producing States of the Southwest, led by Texas, Oklahoma, New Mexico, and Louisiana.

The average value at the wells of natural gas in these four States as a group was less than 3 cents per thousand cubic feet in 1945. They produced 69 percent of the marketed production of natural gas in the United States in 1945, compared with 66 percent in 1944.

On the other hand, material reductions in output were reported in all of the five producing States of the Appalachian region, except New York, where a small gain resulted from exploitation of a recently developed high-pressure field. The average well-head value of natural gas in these States exceeded 17 cents per thousand cubic feet in 1945. Collectively, they produced 10 percent of United States marketed production in 1945, compared with 12 percent in 1944.

The above conditions account, in large part, for the decline in average value at the wells of natural gas in the United States from 5.1 cents per thousand cubic feet in 1944 to 4.9 cents in 1945. The average for individual areas was higher in 15 States in 1945 and lower in 7.

Natural gas produced in the United States and delivered to consumers, 1941–45, by States, in millions of cubic feet

NUMBER OF WELLS

Fewer gas-well completions in Pennsylvania, Texas, Kentucky, and West Virginia in 1946 caused a reduction in the United States total to 3,090 from 3,235 in 1945. Among the Eastern States, Ohio experienced a notable increase in gas development. Intensive, continued drilling in the Hugoton area of Kansas and Oklahoma contributed to

important gains in gas completions in these States in 1946. Sharp increases over 1945 were reported also in Michigan, Montana, and New Mexico.

The number of producing gas wells increased 1,880 during 1945 to 60,660 on December 31. Of the total net increase, 1,110 were in the 5 principal southwestern gas-producing States and 650 in the 5 Appalachian States.

The total number of gas wells (net) abandoned or shut in during 1945 was 1,355. Of this number, 184 were in the 5 Southwestern States and 1,079 in the 5 Appalachian States.

Gas wells in the United States, 1944–46, by States

State	Producing Dec. 31, 1944	Drilled during 1945 [1]	Producing Dec. 31, 1945	Drilled during 1946 [1]
Arkansas	180		180	2
California	200	56	250	65
Colorado	20	1	20	1
Illinois	80	1	80	6
Indiana	810	28	820	25
Kansas	2,040	201	2,220	300

[3] Revised figure.

DEVELOPMENT AND PRODUCTION BY STATES

Arkansas.—Gas production from the controlled oil and condensate fields in south Arkansas declined from 58,085 million cubic feet in 1945 to 57,517 million in 1946, according to the Arkansas Oil and Gas Commission.

Because of a lack of market for the gas, the Columbia pool was shut in during 1946, and the Texarkana and Salem Church pools were shut in during the first half of the year. The dry-gas fields of north Arkansas produced 5,132 million cubic feet of gas in 1945 and 3,655 million in 1946.

No dry-gas discoveries were reported. The Warnock Springs field, Columbia County, was opened in December 1946 by a well that produced 50 barrels of condensate with 4.5 million cubic feet of gas daily from Smackover limestone below 7,400 feet.

California.—According to information from the California Department of Natural Resources and the Public Utilities Commission, three dry-gas fields were discovered in 1946 in the area north of the Rio Vista field. The Winters area in Solano County was opened by a well that produced 11 million cubic feet of gas per day from the Eocene formation at a depth of 5,200 feet. A well in the Dunnigan Hills area, Yolo County, produced 3,030 thousand cubic feet of gas daily through a ⅜-inch choke from sands at 2,400 to 2,520 feet, tentatively classified as Meganos (Lower Eocene). The third gas discovery, in the Durham area, Butte County, was made by a well that flowed 10,900 thousand cubic feet daily through a ⅞-inch choke from Eocene sands at 2,140 to 2,176 feet. Extensions to several fields in Sacramento, Solano, and Tehama Counties were reported.

In the south San Joaquin Valley district, indicated reserves of the

Trico gas field were greatly enlarged by a northwest extension of the First Mya zone and by discovery of a new zone of production 800 feet below it. The recoverable reserve of gas is estimated at 255 billion cubic feet.

An important pipe-line development was the return to natural-gas service in mid-1946 of the Standard-Pacific Gas line from Kettleman Hills to the San Francisco Bay area. As a war measure, this line had carried oil since 1942. The completion of a gas-line system to the same area from the Rio Vista-Cache Slough-Kirby Hills-Suison Bay-Honker Bay fields augmented supplies of gas from the Rio Vista and several other fields not previously connected to markets.

The known natural-gas reserves of California were estimated on January 1, 1946, to be 11,421 billion cubic feet, of which 6,838 billion consisted of oil-field (casinghead) gas and 4,583 billion dry gas in place or stored underground.

Net natural-gas withdrawals from formations were 554,486 million cubic feet in 1945 and 532,454 million in 1946, according to R. M. Bauer, Southern California Gas Co. Oil-well gas declined from 366,640 million cubic feet to 352,204 million, and dry-gas withdrawals from 187,846 million to 180,250 million. Production from the Rio Vista gas field was, in millions of cubic feet, 159,580 in 1945 and 148,883 in 1946. Gas used for repressuring, not included above, amounted to 105,524 million cubic feet in 1946.

Colorado.—J. R. Schwabrow, Federal Geological Survey, reported no gas discoveries in Colorado during 1946. One gas well was drilled in the East Hiawatha field. A deep test at Piceance Creek was unsuccessful at 12,019 feet; it was plugged back to production at 3,048–3,118 feet in the Green River-Wasatch contact zone. These two wells had an open flow of 7,240,000 cubic feet.

A pressure-maintenance project in the North Callum field returned 9,514 million cubic feet of carbon-dioxide gas to the sand, 18 million were used in the manufacture of dry ice, and 5,241 million were lost. Corrosion problems prevented further drilling or plant expansion. (These figures are not included in the natural-gas statistics.)

The Rangely field produced 2,738 million cubic feet of natural gas with oil, of which 1,917 million were used in the field and 821 million were lost. The Wilson Creek field produced 529 million cubic feet, 151 million being consumed in the field, 127 million recycled, and 251 million lost. In the Hiawatha field, 372 million cubic feet were used for pressure maintenance.

The Piceance Creek, White River, and Douglas Creek fields were shut in. Some of the gas may eventually be used at nearby towns, but long pipe-line connections do not seem practical as yet.

Metered production in Colorado, which has declined since 1942, increased 16 percent, from 4,247 million cubic feet in 1945 to 4,941 million in 1946. Powder Wash and Thornburg fields accounted for this increase as other fields registered declines. Production by fields, in millions of cubic feet, was: Powder Wash, 2,488; Hiawatha, 2,118; Thornburg, 299; Berthoud, 35; and Craig, 1.

Gross production was divided as follows: Marketed production, 4,941; repressured and recycled, 500; field use, 2,185; and losses, 1,076. Increases of 236 percent in field use and 140 percent in losses over 1945

records are due to increased oil production at Wilson Creek and increased drilling and oil production at Rangely.

Illinois.—The following information was contributed by A. H. Bell and D. H. Swann of the Illinois State Geological Survey.

There were six gas completions in Illinois in 1946. The wells were drilled in the Panama and Waverly gas pools discovered or named during the year. The pools have no outlets, and none of the gas was marketed. Sales of gas for domestic use from the Storms pool, discovered in 1939, began in October 1946.

Approximately 22,170 million cubic feet of gas were processed at gasoline plants during the year, compared with 21,000 million in 1945. It is estimated that 8,000 million cubic feet of residue gas were used for repressuring in 1946, 288 million marketed, 8,000 or 9,000 million used for plant or lease fuel, and about 100 million burned in flares.

Estimates of casinghead gas from pools with no gasoline plants or pipe-line connections indicate that the amount of gas flared has increased over that of previous years. Wells less than a year old produced from 15 to 20 billion cubic feet, of which not more than 10 percent was utilized. Of the 15 to 25 billion cubic feet produced by older wells, 50 to 75 percent was used for lease fuel and about 1 percent for pressure maintenance, the remainder being wasted.

It is estimated that approximately 60 billion cubic feet of gas were produced in Illinois in 1946, an increase of 10 billion over the 1945 estimate. About 60 percent of the 1946 output was utilized in some manner, and 40 percent was wasted.

Distributing companies marketed 336 million cubic feet of gas from the Russellville gas field, 16 from the Ayers gas field, 288 of residue gas from gasoline plants in the Louden field, and 10 from the Storms oil field. These figures indicate an increase of 36 percent over 1945 sales.

Indiana.—Gas-well completions declined from 36 in 1945 to 25 in 1946. The principal fields of activity, with the number of new gas wells in each, were Greensburg, 7; Trenton, 6; Iva, 4; and Union-Bowman, 3. A small discovery well was reported in Trenton limestone in Fayette County—in the southeastern part of the old Trenton field—and a shallow gas well was indicated in La Porte County in the northern part of the State.

Kansas.—Reported gas-well completions numbered 300 in 1946, compared with 201 in 1945, reflecting increased drilling in the Hugoton field, where 265 wells were completed in 1946, a gain of 84 over 1945. Several thousand acres were added to the productive area of this field around its northern portion. Production of gas declined about 1 percent to 122.6 billion cubic feet in 1946. Larger withdrawals from Hugoton failed to offset declines in other areas.

Six gas-field discoveries were reported in 1946, as follows: Producing from the Mississippi limestone, the Donald field in Barber County, the Lehigh field in Marion, and the Bartholomew field in Sedgwick; producing from the Viola limestone, the Stoops field in Pratt County; producing from a shallow Permian sand, a small well in Wyandotte County. An extension of the Boggs field, Barber County, produced gas from the Simpson formation. Much additional acreage beyond the limits of the Hugoton field was leased by operators during 1946.

Kentucky.—Drilling for gas apparently declined in eastern Ken-

tucky, as indicated by 112 gas-well completions in 1946, compared with 216 in 1945. In the western district, an increase from 5 in 1945 to 27 in 1946 resulted chiefly from development of the new Dixie field, where 17 gas wells were drilled.

Development of gas and oil production in the Big Six sand is expected to stimulate deeper drilling in many old areas producing from younger formations in the eastern part of the State. Three tests of the Knox dolomite drilled in 1946 in Clinton, Rowan, and Powell Counties found showings of oil or gas. These indications will probably lead to further deep exploration.

Discovery of two gas fields was reported. The Owensboro field, Daviess County, was opened in April by a well that produced 5.3 million cubic feet of gas per day from Waltersburg sand at 1,158–1,168 feet. The Dixie field, Henderson County, was discovered in January, when Pennsylvanian sand production of 1.5 million cubic feet of gas per day was found at a depth of 1,030 to 1,050 feet.

Louisiana.—Gas and condensate completions numbered 172 in 1946, compared with 147 in 1945. Of the 1946 total, 24 condensate and 93 gas wells were in the Northern district and 48 condensate and 7 gas wells in the Gulf district.

Discoveries included two condensate fields in the north, and in the Gulf area three condensate and one gas field ranging in depth from 6,580 to 11,400 feet. The new condensate fields were Killen's Ferry in Franklin Parish, Choudrant in Lincoln, Johnson's Bayou in Cameron, East Barataria Bay in Jefferson, and Big Point in St. Tammany. The gas discovery was at South Shuteston in St. Landry Parish. In addition, 16 new horizons were opened for condensate production and 4 for dry-gas production, most of which were in the Gulf district at depths below 8,000 feet.

The production of gas from oil wells declined from 178,846 million cubic feet in 1945 to 167,171 million in 1946, according to State reports. Production from gas and condensate wells declined also from 617,300 million cubic feet to 591,997 million cubic feet.

Michigan.—Information on gas developments in Michigan was taken from a report of the Michigan Department of Conservation.

Gas completions in the State increased from 63 in 1945 to 139 in 1946. Six gas fields were discovered and two were extended. The total number of producing wells increased from 675 at the end of 1945 to 766 at the end of 1946. Seventy-six of the latter were drilled in fields being prepared for gas storage or in old fields to facilitate the production of any remaining gas and do not add to gas reserves. They were located as follows: Austin, Mecosta County (used for storage since 1942), 19; Marion, Clare and Osceola Counties, 33; Reed City, Osceola and Lake Counties, 7; Goodwell, Newaygo County, 3; Lincoln, Clare County, 14. Marion, Reed City, and Goodwell fields are being prepared for storage.

Counties having the most completions were Clare 39, Isabella 15, Mecosta 31, and Osceola 27. The basin district in the central part of Michigan produced 91 percent of the reported output and accounted for 91 percent of new wells drilled. The largest discovery well was a distillate-gas well in the Freer field of Clare County. It was also the deepest at 5,038 feet.

Production totaled 23,774 million cubic feet in 1946, a 2-percent gain over the 1945 output.

Mississippi.—H. M. Morse, supervisor, Mississippi State Oil and Gas Board, states that there were no important gas discoveries in Mississippi during 1946. Eight gas wells were completed in the Gwinville field during the year and pipe-line connections were being made. A repressuring project was in operation in the Cranfield field. A total of 17,083 million cubic feet of gas was produced in 1946, more than twice the 1945 output. Sales from nine fields totaled 3,644 million, and 13,439 million were used for fuel and flared in various fields. Gas is valued at 6 to 6.25 cents a thousand cubic feet at the well.

Missouri.—Frank C. Greene, geologist, Missouri Geological Survey, reports only 4 gas wells (all in Jackson County) drilled in Missouri in 1946, compared with 17 in four counties in 1945. Gas production decreased 51 percent from 77.6 million cubic feet in 1945 to 37.9 million in 1946.

Montana.—According to J. R. Schwabrow, Federal Geological Survey, 83 gas wells were drilled in Montana during 1946, compared with 49 in 1945. Completions by fields were: Bowdoin, 33; Cedar Creek, 13; Cut Bank, 10; Kevin-Sunburst, 5; Hardin, 7; Devon, 4; and miscellaneous fields, 11.

A discovery of undetermined importance was made by a well 2,036 feet deep in the Kootenai formation at Apex in the Sweetgrass Hills area. Estimated production was 10 million cubic feet at 450 pounds pressure. A deep test was reported at Utopia in the Devonian sand with 10 million cubic feet production. The Hardin field was extended and 5 wells were drilled and shut in west of the southern part of the Cedar Creek field. The Bow and Arrow, Havre, and Kicking Horse fields were connected with pipe lines during the year.

Gas storage in the north end of the Cedar Creek field, which began in May 1945, was continued in 1946, when 186 million cubic feet were injected during the summer. Repressuring oil sands utilized 98 million cubic feet in the Cut Bank field in 1946. Of the four projects in the field, one, operated only 14 days in October 1945, arrested the decline of oil production and increased pressures; one of the three started in 1946 resulted in a 20-percent increase in production, and two showed no results.

Metered production totaled 31,136 million cubic feet in 1946, compared with 31,064 million in 1945. Production of major fields in millions of cubic feet was: Bowdoin, 5,885; Cedar Creek, 5,167; Cut Bank, 14,100; Dry Creek, 1,242; and Kevin-Sunburst, 2,225. Compared with the 1945 output, all fields registered decreases except Bowdoin and Dry Creek, which increased.

Gross production was 33,147 million cubic feet in 1946 (32,344 in 1945), as follows: Marketed production, 31,136; repressuring, 132; field use, 1,130; and losses, 749. The largest gains, in repressuring and losses, were largely due to increased oil production in the Elk Basin Tensleep pool.

New Mexico.—Information on gas developments in New Mexico was furnished by Foster Morrell, Federal Geological Survey.

In southeastern New Mexico, eight gas wells were drilled in Lea County and four in Eddy County in 1946, compared with six in Lea

and four in Eddy in 1945. A discovery well in Lea County opened the Justis pool, an area of undetermined importance. The well was plugged back to 4,933 feet in the Yeso formation of Permian age. Two other wells were drilled in the area in 1946.

In northwestern New Mexico, 25 wells were completed in the San Juan Basin, compared with 11 in 1945. A discovery well in the Blanco field was completed at a depth of 1,927 feet in the Farmington (Upper Cretaceous) formation. The Barker Creek dome field was established as one of the major gas fields in the State by the completion of two additional wells in the Paradox formation of Pennsylvanian age.

Two carbon-dioxide gas wells were drilled in Harding County in 1946, making a total of 12 commercial wells in that area. Three plants were in operation, and a fourth unit was under construction for making dry ice.

Natural-gas production in southeastern New Mexico increased from 108.7 million cubic feet in 1945 to 130.7 million in 1946. Natural-gasoline plants treated 110.8 million cubic feet in 1946. Residue gas from these plants was distributed as follows: domestic, commercial, and industrial markets 67.6 million, carbon black 25.7, gasoline-plant and lease fuel 10.7, vented 17.7, repressuring 2.6, and unaccounted for 6.4

In northwestern New Mexico, domestic and commercial markets took 6,396 million cubic feet in 1946, compared with 6,056 million in 1945.

New York.—John G. Broughton, Assistant State Geologist, New York State Geological and Natural History Surveys, reports only 5 successful wells out of 25 (mostly wildcats) drilled in New York in 1946. This compares with 6 out of 20 drilled in 1945. Completions were in Allegany, Steuben, Chautauqua, Cattaraugus, Tompkins, and Wyoming Counties. Their depth ranged from 1,722 feet in the northern part to 4,842 feet in the southern part of the State, and were mostly to the Oriskany sands. Three of the five producers were in the Tuscarora field, Steuben County, the best having 5,750,000-cubic feet initial daily capacity. Two completions in Chautauqua County had small flows of gas from the Medina sand. All other deep tests were unsuccessful. A deep test in Wyoming County begun in 1945 was abandoned in 1946 at 7,126 feet.

North Dakota.—A report of the North Dakota Geological Survey by Wilson M. Laird, State Geologist, indicated a 45-percent gain in natural-gas production in 1946 over 1945. Twelve wells were operated, compared with 13 in 1945. Gas is drawn from the Eagle sand and Pierre shale in Bowman County. Permits were granted to drill 15 wells in 1946, but not all have been put into production.

According to J. R. Schwabrow, Federal Geological Survey, seven gas wells and three dry holes were drilled in 1946 in the extreme southeastern end of the Cedar Creek anticline, probably defining the pool in that direction. A gross production of 345 million cubic feet was reported.

Ohio.—Information on gas developments in Ohio was supplied by K. C. Cottingham, chief geologist, Ohio Fuel Gas Co.

Gas completions increased from 429 in 1945 to 547 in 1946. Of these wells, 371 were in the Clinton sand, 88 in the Berea, 44 in the

Shallow, 21 in the Oriskany, and 23 in other sands. The largest was a Clinton well with an initial flow of 12,000,000 cubic feet from a depth of 4,604 feet. Stark County was the most active, with 139 wells drilled, followed by Muskingum with 50, Lorain with 45, and Ashland with 36. A deep test in Muskingum County found gas at 6,558–6,560 feet but was abandoned at 6,704 feet because of water.

About 4,400 acres were proved by new gas pools, compared with 7,000 in 1945. Older pools were extended approximately 17,000 acres, mostly in the Clinton field. Wells averaged 4,700 feet in depth with initial open flow of about 2,500,000 cubic feet each. Production increased from 51,724 million cubic feet in 1945 to 59 billion in 1946.

Oklahoma.—Elmer Capshaw, gas engineer, Oklahoma Corporation Commission, supplied the following information:

There were 38 wildcat wells and 333 wells drilled in old fields in Oklahoma during 1946; 94 over the 1945 record. A large number of new gas fields were discovered in the Anadarko Basin in western and northern Oklahoma, mostly in Garvin, McClain, and Grady Counties, but they have no pipe-line connections as yet. Drilling has been active in Texas County in the Hugoton field, where there are now over 400 producing wells connected to pipe lines.

Casinghead gas from the oil fields is being used more extensively than in former years. The amount of casinghead gas used in 1946 increased 15 percent over the 1945 record, and dry-gas production decreased 2 percent. A total of 403,500 million cubic feet of gas was recorded in 1946, compared with 385,900 million in 1945, an increase of about 5 percent.

Pennsylvania.—According to J. G. Montgomery, Jr., vice president, United Natural Gas Co., gas completions in the shallow-sand fields of Pennsylvania increased from 520 in 1945 to 592 in 1946.

The results of increased drilling activity emphasized the trend toward decreased productive capacity of wells. The new wells had a daily open-flow capacity of only 128,811,000 cubic feet, compared with 148,662,000 cubic feet developed in 1945. In the southwestern district the 64 million cubic feet developed was 35 percent below the 1945 level, even though completions numbered about the same.

New pools, probably of minor importance, were found in Allegheny, Fayette, Jefferson, and Potter Counties. Tests in the deep sands in 1946 were, for the most part, failures. A successful one in Georges Township, Fayette County, proved to be the largest drilled in several years in the northern Appalachian area. Its initial daily production was over 32 million cubic feet—from the Onondago chert. Two other producers were completed in the area during the year. One small producer was completed in Potter County and one in Westmoreland. An Oriskany pool was discovered in Erie County by a well having a production of 420,000 cubic feet a day with a rock pressure of 825 pounds. Other deep-sand tests in Beaver, Erie, Mercer, Westmoreland, Potter, and Crawford Counties were failures.

Additional quantities of Mid-Continent gas were made available in December 1946 through the lease of the War Emergency Pipe Line to the Tennessee Transmission & Gas Co.

South Dakota.—A report from J. R. Schwabrow, Federal Geological Survey, states that three small gas wells and four dry holes were drilled in the Ardmore area in western South Dakota in 1946.

Each well had an estimated open flow of about 250,000 cubic feet and a 35-pound pressure. Gross production from gas-water wells in the Pierre gas field was estimated at about 14 million cubic feet, of which 9 million were marketed and 5 million lost. This compares with 10 million sold in 1945.

Texas.—According to records of the Railroad Commission of Texas, gross production of natural gas in 1946 was 2,769 billion cubic feet, of which 2,102 billion were from gas and condensate wells and 667 billion from oil wells. Of the total, slightly more than 700 billion cubic feet were returned to underground reservoirs for pressure maintenance and repressuring, and 113 billion were lost or vented to the air.

Gas- and condensate-well completions declined from the extraordinary total of 714 in 1945 to 499 in 1946 owing to a reduction in Panhandle drilling from 341 gas wells in 1945 to 121 in 1946. New wells in the Carthage field increased from 92 in 1945 to 120 in 1946.

Discovery of 20 condensate-type fields was reported in 1946. Eighteen of these were in the Gulf area and two in eastern Texas. Eighteen gas fields were discovered. Four of these were in West Texas, four in Southwest, and four in Gulf districts. In 1945 and 1946, the large number of condensate and gas discoveries and extensions in the lower Gulf district have increased greatly the importance of this area as a source of these fuels for the future. Although new pipe-line construction is providing larger outlets for the gas, available supplies far exceed current needs.

A large expansion in markets for gas from eastern and Gulf Texas is being provided for the near future by the conversion of the large war-emergency pipe lines to gas use, by increased capacity of several major gas-transmission systems delivering fuel to Northern and Eastern States, and by projected new systems to serve these areas. The new line from west Texas to California is expected to provide this winter a new outlet for much gas from this district that at present is being blown to the air for lack of a buyer.

Utah.—J. R. Schwabrow, Federal Geological Survey, reported that there were no gas discoveries in Utah during 1946. The only gas completion was a deep test in the Farnham carbon-dioxide gas field, which was plugged back to the Coconino producing sand. Deep tests also were being drilled for oil or gas in the Pennsylvanian or other lower formations in the Clay Basin and South Last Chance gas fields.

Dry-ice manufacture utilized 152 million cubic feet of carbon-dioxide gas in 1946, compared with 140 million in 1945. (These figures are not included in the natural-gas statistics.)

Metered production from the Clay Basin field was 4,295 million cubic feet in 1946. In addition, 19 million were used in the field and 7 million were lost. Comparable figures for 1945 are 6,652, 18, and 1, respectively.

Virginia.—William M. McGill, assistant State geologist, Virginia Geological Survey, reported two wells drilled in the northwestern part of Rockingham County in 1946. The first encountered sulfur water at 2,570 feet and was abandoned. The second was abandoned at 2,753 feet after a slight show of gas was lost by shooting. Both reached the Oriskany sandstone. They were near the discovery

well drilled in 1941 that found about 60,000 cubic feet of gas in the Oriskany formation at 2,992 feet. There was no activity in the Early Grove area, from which present production is obtained.

West Virginia.—About 44,000 acres were added to proved gas territory in West Virginia in 1946, compared with about 58,000 in 1945. David B. Reger, consulting geologist, Morgantown, W. Va., reports that five gas pools were discovered during the year, or late in 1945, and that successful wildcats indicate additional areas to be proved in 1947.

Drilling activity centered in Wyoming County and led to new discoveries in that area. The discovery of Lower Devonian gas in the outer boundaries of the Charleston pool and in sharp mountain anticlines east and southeast of older producing areas was of special interest. The discovery of a new pool by a small Oriskany well and a large Huntersville well on a sharp mountain anticline in Preston County leads to the supposition that deep drilling may be profitable on many similar structures.

Of 33 wildcats drilled, 21 discovered gas. Total gas completions declined from 499 in 1945 to 467 in 1946. Forty-four old wells added 36,561 cubic feet daily to production when deepened. Counties of greatest activity and wells drilled were: Lincoln, 55; Wyoming, 51; Kanawha, 33; Wayne, 32; Putnam, 28; and Jackson, 25. Fifty Oriskany-sand completions drilled in 1946 were located as follows: Jackson County, 24; Kanawha, 25; and Putnam, 1.

The practice of a number of utilities of storing gas in depleted pools near large consuming centers was continued during the year. Increasing quantities of Texas gas were received, most of which was transported to Ohio, New York, and Pennsylvania. Production was estimated at 175 billion cubic feet in 1946, compared with 160,225 million in 1945.

Wyoming.—J. R. Schwabrow, Federal Geological Survey, reported 13 gas completions in Wyoming in 1946, as in 1945. Total open-flow capacity of new wells was 131,694,000 cubic feet in 1946 and 80,000,000 in 1945. The deepest well drilled, 12,887 feet, in 1946 had the deepest production in the Rocky Mountain region. It is thought to have opened a large condensate field—the Church Buttes. Two other wells were being drilled in the field at the end of the year. Other discoveries were the Table Rock field and a stray showing at South Douglas. A well drilled in the South Sand Draw either extended the Big Sand Draw or discovered a separate pool about a mile southeast of that area.

Carbon-dioxide gas was discovered in the Tensleep or Weber sandstone by a well at North Baxter Basin. It was plugged back to the Nugget sand and shut in. Litigation is pending to decide whether it should be called a gas or an oil well. Wells completed in proved acreage were Beaver Creek (2), North Baxter Basin (2), and one each in South Elk Basin, Middle Baxter Basin, Big Polecat, and Oil Springs.

Fields producing over a billion cubic feet in 1946 were Baxter Basin, 7,175 million; Big Sand Draw, 4,797; Garland, 3,125; Lance Creek, 2,987; Salt Creek, 2,749; Beaver Creek, 2,386; Little Buffalo Basin, 2,105; Oil Springs, 1,398; Elk Basin, 1,388; Hiawatha (Wyoming), 1,159; and Muskrat, 1,151. Baxter Basin field accounted for

14 percent of the State's output in 1946, compared with 19 percent in 1945. Oil Springs was added to the list of large producing areas.

Metered production declined 7 percent, from 36,357 million cubic feet in 1945 to 33,979 million in 1946. This decrease may be attributed partly to reduced industrial activity. Gross production was 49,725 million cubic feet, compared with 51,673 in 1945. Gas returned to the sands in eight fields totaled 11,847 million cubic feet in 1946, 11,736 million in 1945. Field use accounted for 1,083 million cubic feet in 1946 and 2,816 million were lost.

INTERSTATE SHIPMENTS AND EXPORTS

The interstate and export movement of natural gas increased 7 percent over 1944, to 1,105,760 million cubic feet in 1945, equal to 28 percent of total marketed production of the United States. Shipments from Texas and Oklahoma increased notably as new facilities for long-distance gas transmission to northern and eastern markets came into full use. Among other important "exporting" States, material declines were indicated for Kansas, Louisiana, West Virginia, and Kentucky. Operations in Louisiana were influenced by the State government policy of discouraging shipments to other States in which adequate supplies of other fuels were available. Gas shipments from the other three States were curtailed in some degree probably because of the larger supplies made available to their market areas of gas from Texas and Oklahoma.

States consuming the largest amounts of gas from outside sources in 1945, with the quantities involved in billions of cubic feet, were Ohio, 124.0; Illinois, 104.8; Kansas, 94.4; Pennsylvania, 92.1; and Missouri, 72.0.

Exports of gas to Mexico reached a new high of 18,016 million cubic feet in 1945, compared with 14,433 million in 1944.

PIPE-LINE DEVELOPMENTS

Although the mileage of new gas-transmission lines completed and placed in service in 1946 was less than in several previous years, a major expansion in capacity of the industry was indicated by projects in the course of construction and for which Federal Power Commission approvals had been obtained or applied for.

Progress was retarded by scarcity of materials, particularly large-diameter pipe, for which demand is expected to exceed the prospective supply for several years. Further large expansion of capacity of major transmission systems was completed or in progress to bring natural gas from the Hugoton-Panhandle field to Detroit, Minneapolis, Kansas City, and Chicago, and from Louisiana-Texas Gulf fields to St. Louis and the Appalachian region.

The largest new system on which construction was begun in 1946 was a 26- and 30-inch line to transport gas from west Texas and the Texas Panhandle to southern California, with a projected capacity of 305 million cubic feet daily. Several important lines were laid in south and east Texas and in Mississippi to connect additional gas reserves to pipe-line outlets.

In California, a pipe line from Kettleman Hills to the San Francisco Bay region, which had been converted from gas to oil as a war emergency measure, was reconverted for use as a gas line. Several gas fields in the northern district were provided with pipe-line outlets for the first time.

To alleviate a fuel shortage in the northeastern industrial region, the war emergency pipe lines "Big Inch" and "Little Big Inch" were placed in gas service in December 1946 under a temporary lease to

Tennessee Gas & Transmission Co. extending through April 30, 1947. These lines were sold in early 1947 to a new company, Texas Eastern Transmission Corp., which plans to become an important supplier of natural gas to markets from Indiana to New England.

In addition to projects already approved, applications on file with the Federal Power Commission on April 1, 1947, involved a proposed investment of approximately $825,000,000 in facilities for transportation of natural gas.

CONSUMPTION

Consumption of natural gas in the United States in 1945 amounted to 3,900,479 million cubic feet, compared with 3,696,463 million in 1944. All major classes of consumers except miscellaneous industrial contributed to the increase in demand. Measures to restrict consumption during cold periods of peak demand were again required in the Appalachian and other market areas that are dependent for supplies of gas, at least in part, on remote sources.

Domestic and commercial consumers used 8 and 4 percent, respectively, more gas in 1945 than in 1944, and industrial consumers 5 percent more, chiefly because of larger requirements for oil- and gas-field activities and for carbon-black manufacture.

Natural gas consumed in the United States, 1941–45

Treated for Natural Gasoline.—The volume of natural gas processed at natural-gasoline and cycle plants increased 11 percent in 1945 to a record of 3,653,870 million cubic feet, equal to 94 percent of total consumption. Since 1941, the gas throughput at plants has increased 32 percent. States reporting the largest gains in this period were Texas, Louisiana, California, and Arkansas, in all of which the processing of high-pressure gas from deep reservoirs of the condensate type is an important factor. Moderate declines in gas processing in the same period were general in the eastern producing States, in Kansas (where crude oil was produced at declining rates for several years), and in Oklahoma.

Domestic and Commercial.—The 8-percent increase in use of natural gas for household purposes in 1945 to 607,400 million cubic feet was accompanied by a gain of 3 percent in the number of meters connected to lines and an expansion in the indicated average gas use per meter from 52,700 cubic feet in 1944 to 55,400 cubic feet in 1945 (5 percent). An average of 341,266 domestic meters have been added (net) annually during the past 7 years to the systems of utilities distributing natural and mixed (natural and manufactured) gas. In the same period, the consumption per meter increased at the average rate of 1,786 cubic feet yearly.

Commercial consumption amounted to 230,099 million cubic feet in 1945, a gain of 4 percent over 1944. Commercial meters were 5 percent more numerous in 1945, but consumption per meter declined to 258,900 cubic feet from 261,200 cubic feet (1 percent) in 1944.

Ratio to total consumption	.99	.94	.89	.89	.94

[1] Partly estimated.

Field.—Gas consumed in field operations of the oil and gas industry increased 7 percent in 1945 to 916,952 million cubic feet. The principal gains were in Texas, Louisiana, California, New Mexico, and Arkansas, in all of which production of the natural-gasoline industry increased. A decline of 4.8 billion cubic feet in Oklahoma field-gas consumption was accompanied by a decline of 5 million gallons in output of natural-gas liquids.

Carbon Black Manufacture.—A record total of 431,830 million cubic feet of natural gas was used for manufacture of carbon black in 1945, compared with 355,770 million in 1944. The average value of gas at the plants increased from 1.6 cents a thousand cubic feet in 1944 to 2.3 cents in 1945 and 3.0 cents in 1946. The yield of carbon black per thousand cubic feet of gas consumed has increased progressively from 1.63 pounds in 1941 to 2.32 pounds in 1945, influenced by growing use of the high-yield furnace processes. The scarcity of cheap sources of dry gas in recent years has stimulated a larger use at carbon-black plants of casinghead gas from natural-gasoline plants.

Petroleum Refineries.—An increase of 7 percent over 1944 to 338,458 million cubic feet in 1945 was reported in use of natural gas as fuel at petroleum refineries, compared with an increase of 3 percent in crude oil processed at refineries. The principal gains in gas use, in billions of cubic feet, were in Texas, 14.1; California, 12.1; Kansas, 3.7; and Louisiana, 3.6.

Electric Public-Utility Power Plants.—Gas consumption at electric-power plants in 1945 was reduced 9 percent below the 1944 peak, to 326,190 million cubic feet, according to the Federal Power Commission, whose data include a small quantity of manufactured gas with the natural gas. The largest decline in use, 21.6 billion cubic feet, was reported in California as a result of a shift to fuel oil as the source of energy at generating plants in the central part of the State. Minor declines in Texas, Oklahoma, Louisiana, and many other States were related to the temporary shrinkage in business activity following the end of hostilities in August 1945. Among scattered small gains, the largest, 3.9 billion cubic feet, was in Missouri.

Domestic and commercial consumption of natural gas in the United States in 1945, by States [1]

[1] Federal Power Commission. These figures include natural and manufactured gas. However, Bureau of Mines figures on consumption of gas by electric public-utility power plants (combined with other industries under "Other industrial") comprise only natural gas.

[2] Gas used in portland-cement plants included under "Unclassified by States" for United States total and under "Other industrial" for State total to avoid disclosing figures of individual operators.

[3] Gas used in carbon-black manufacture included under "Unclassified by States" for United States total and under "Other industrial" for State total to avoid disclosing figures of individual operators.

[4] Maryland includes District of Columbia and Virginia.

[5] Less than $500.

[6] Utah includes North Dakota and South Dakota.

[7] Revised.

Portland-Cement Plants.—A recovery in cement production from the very low levels of 1944 caused an increase of 8 percent in natural-gas consumption in 1945, to 38,349 million cubic feet. Preliminary reports indicate a further sharp gain in natural-gas consumption in 1946 coincident with increased cement production.

Other Industrial.—The decline in natural-gas use by miscellaneous industrial plants from the revised total of 1,351,684 million cubic feet in 1944 to 1,337,391 million in 1945 was less than the decline in consumption by electric-power plants. Therefore, adjusting for this factor, the general industrial consumption of gas was slightly higher in 1945 than in 1944. Principal declines were in California, Arkansas, and Illinois, and gains were in New Mexico, Kansas, Texas, and Missouri.

Mixed Gas.—The volume of natural gas sold in mixtures with manufactured gas totaled 95,284 million cubic feet in 1945, compared with 89,645 million in 1944. The principal growth was in domestic sales. Industrial consumption declined about 2 percent. It is a relatively small factor in these sales because of the high unit prices prevailing in most areas where mixed gas is distributed.

Illinois and New York States are the largest factors in mixed-gas sales because of extensive marketing in the Chicago and Buffalo districts.

Consumption of natural gas used with manufactured gas in the United States in 1945, by States

State	Domestic		Commercial		Industrial (millions of cubic feet)	Total

TECHNOLOGIC DEVELOPMENTS

The experimental installation at main-line stations of large centrifugal compressors driven by electric motors, instead of the conventional reciprocating type, is planned by at least two major gas-transmission systems. If successful from technical and economic standpoints, this

new equipment may have an important place in new gas-moving installations.

After several years of service testing, gas-operated equipment for year-round air conditioning was actively promoted on a commercial scale in 1946 by a number of utility companies as a builder of gas markets. By its use in the warmer sections of the United States, the summer gas load for domestic and some commercial purposes may be maintained at a level comparable with that of the winter load.

A new departure in underground storage of natural gas was announced by a northern Illinois utility company, using a number of parallel sections of large-diameter pipe installed a few feet underground and filled with gas at a pressure of about 2,250 pounds per square inch. It is indicated that gas may be stored by this means near points of consumption at lower initial costs for equipment, operating, and maintenance expense than are required for gas holders of the types in common use.

Experience with large-diameter gas transmission lines carrying very great quantities of gas at high pressures has demonstrated the inadequacies of pipe-line flow formulas for measuring accurately such gas movements. Therefore, a cooperative research project was begun in 1946 by the Bureau of Mines and the American Gas Association to develop new data and formulas to satisfy the requirements of modern engineering practice.

Natural Gasoline

and Liquefied Petroleum Gases[1]

By F. S. LOTT AND A. T. COUMBE[2]

Review by States	842	Foreign trade	855
Yields, processes, and number of plants	843		

GENERAL SUMMARY

RECORD demand for its products in the second half of the year raised operations of the natural gasoline industry in 1946 to new heights. Total production of 4,836,412 thousand gallons of light products exceeded the 1945 peak by 3 percent. In the first 6 months of 1946, production—influenced by low market prices and indifferent demand—was below the comparable 1945 period. In the late summer and fall demand for major products revived dramatically, outstripping production at increasing rates to cause rapid depletion of stocks at plants. These trends were foreshadowed by firmer spot prices in the late spring and summer and caused pronounced market strength as they became generally apparent. The price of 26–70 grade natural gasoline, f. o. b. Breckenridge, Tex., advanced from a February-April low of 2.25 cents a gallon to close the year at 4.50 cents. The Mid-Continent (Group 3) price of this product followed similar trends, averaging 3.84 cents a gallon in 1946 and 4.56 cents in 1945.

Because of the depressed prices prevailing in the first half of 1946, the total value of products at the plants declined to $179,000,000 from the 1945 total of $187,564,000. Average value per gallon was 3.7 cents in 1946 and 4.0 cents in 1945. Liquefied petroleum gases represented 20 percent of the value of light products at the plants in 1946, contrasted with 11 percent in 1941.

An increase in total stocks during 1946 from 181,513 thousand gallons to 209,209 thousand gallons resulted from a gain of 34 million gallons at plants and terminals and a 6-million gallon decline in stocks at refineries. Texas stocks accounted for a large part of these changes.

A total of 3,739 billion cubic feet of natural gas was processed in 1946 at natural gasoline and cycle plants, 2 percent more than in 1945. Principal gains over 1945 were in West Virginia, New Mexico, Oklahoma, and Kansas, in that order.

[1] Data for 1946 are preliminary.

[2] Tables (except those on sales of liquefied petroleum gases) compiled by E. M. Seeley, Petroleum Economics Division.

Salient statistics of the natural-gasoline industry in the United States, 1942–46, in thousands of gallons

[1] Subject to revision.
[2] Included in shipments to refineries.
[3] Not available.
[4] For comparison with 1945.
[5] Estimated.

Export shipments of 177,959 thousand gallons of light products in 1946 were almost three times the 1945 total. Canada and the United Kingdom received 47 and 38 percent, respectively, of the 1946 exports.

OUTLOOK

The vigorous increase in demand for light products in the late months of 1946 affected, with particular force, deliveries of liquefied petroleum gases for fuel uses and natural gasoline to refineries.

Production of the liquefied gases doubled during the war in response to continuing expansion of normal markets and unusually large requirements of petroleum refineries for production of aviation gasoline. A drop in refinery demand after the war checked temporarily the pronounced growth trend in total demand for these materials, but the resurgence in sales to record levels late in 1946 signalized a resumption under peacetime conditions of the rapid gains that characterized the prewar period.

Of the total output of liquid products by the natural-gasoline industry, liquefied petroleum gases comprised 21 percent in 1941 and 29 percent in 1946. Further gains in relative importance appear to be indicated for the future by the promising growth of old markets and such applications of recent moment as stand-by industrial uses, peak-load shaving in gas-utility operations, new uses in agriculture, and use as raw material for chemicals manufacture. Because demand is approaching the productive capacity of existing facilities, higher prices are being obtained by producers than for many years past. Relatively satisfactory prices are probable so long as the demand for fuels generally remains strong. Confidence in the future is stimulating construction of new facilities for production and transport, particularly of propane, of which a large potential supply is available at existing plants. The added cost to consumers incident to a higher wholesale price structure may be mitigated to some degree by greater efficiency of retail distribution, particularly where cost pressure from competing fuels is felt. Delivery direct to consumer-owned storage rather than by distributor-owned steel cylinders offers, according to trade reports, possibilities of significant savings in distribution costs.

The production of natural gasoline has grown less rapidly than the industry as a whole because of increasing fractionation operations at plants to separate—from the raw liquid condensates—the liquefied gases, finished gasoline, and other products and to recover more of the light ends contained in process gas. The proportion of natural gasoline recovered declined from 65 percent of total liquids in 1941 to 57 percent in 1946.

Of the total shipments of natural gasoline from plants, 95 percent were taken by refineries in 1945 and 92 percent in 1946. The reduction in this ratio was caused by sharply higher shipments for export and to jobbers. Growing markets and factors related to conservation of natural gas and petroleum have prompted initiation of many projects for construction of new facilities to produce natural gasoline and other light products. Material increments to supply appear therefore to be assured over the next 2 or 3 years. A current attempt to enlarge the refinery market for natural gasoline and butanes by increasing the proportion used in motor fuel will, if successful, add significantly to total demand.

The importance of petroleum refineries in the market for products as reported by the natural-gasoline industry has declined from 77 percent of the total in 1941 to 66 percent in 1946. Shipments to refineries expanded 19 percent in that period as deliveries of products to other markets increased over 100 percent. Further rapid growth in outside sales seems clearly indicated, particularly with respect to liquefied petroleum gases. Progressive diversification of markets is expected to strengthen the position of the industry generally in dealing

with its customers by permitting the competitive forces originating in several consuming groups to bear more effectively upon the market structure. Thus a slackening in demand in one market sector may more readily be compensated by increased sales in another, tending to produce greater stability in product prices.

RESERVES

The Committee on Natural Gas Reserves of the American Gas Association released on February 28, 1947, the first estimate of the reserves of natural-gas liquids in the United States. The term "natural-gas liquids" is used to describe "those hydrocarbon liquids that are gaseous in the reservoir but are obtainable by condensation or absorption." Natural gasoline, condensate, and liquefied petroleum gases fall in this category.

The reserves have been divided into the following classes, conforming to those used for the reserves of recoverable natural gas in which they are contained:

(1) Nonassociated—Liquids recoverable from free gas not in contact with crude oil in the reservoir.
(2) Associated—Liquids recoverable from free gas in contact with crude oil in the reservoir.
(3) Dissolved—Liquids recoverable from gas in solution in crude oil in the reservoir.

Estimated proved recoverable reserves of natural-gas liquids in the United States as of Dec. 31, 1946, in thousands of barrels

[Committee on Natural Gas Reserves, American Gas Association]

State	Reserves as of December 31, 1946				1946 Production

Total	[3] 1,923,896	[3] 572,712	[2] [3] 857,279	[2] [3] 3,353,887	129,262

[1] Not allocable by types, but occurring principally in the column shown.
[2] Figure revised Mar. 11, 1947.
[3] Approximate total; see footnote 1.

Details of the committee's estimates of reserves of natural gas are shown in the Natural Gas chapter of this volume. On December 31, 1946, these reserves amounted to 160,575,901 million cubic feet. The comparable reserve of 3,353,887 thousand barrels of natural-gas liquids indicates an average content, extractable by methods now in use, of 0.87 gallon per thousand cubic feet of gas reserves. The average recoverable content of natural-gas liquids, in gallons per thousand cubic feet in each of the three types of natural-gas reserves—nonassociated, associated, and dissolved—are about 0.7, 0.9, and 2.0 respectively.

PRODUCTION

Production of all light products was at record levels in January–February 1946 but was below comparable 1945 rates during the spring and summer owing to the effects of inventory accumulations and a weak price structure. In the fourth quarter, production was stimulated by sharply higher demand and reached a new record of 14.2 million gallons daily in December, an increase of 8 percent over Decem-

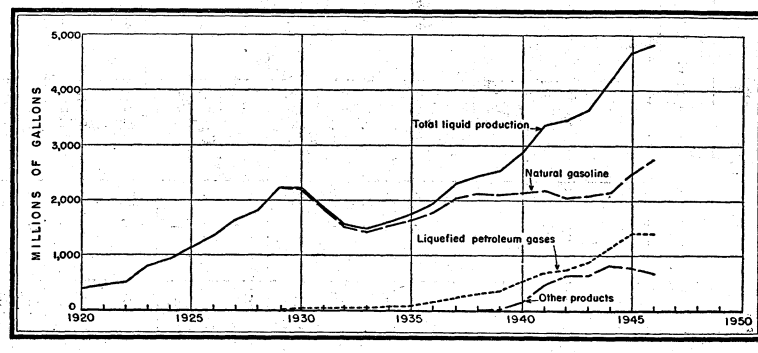

FIGURE 1.—Annual production of the natural-gasoline industry, 1920–46.

ber 1945. Total production in 1946 was 4,836,412 thousand gallons, a gain of 3 percent over 1945 that is attributable to larger output of natural gasoline.

Although the production of liquefied petroleum gases declined from 1,413,224 thousand gallons in 1945 to 1,400,877 thousand gallons in 1946, the rate of output accelerated rapidly in the fourth quarter to exceed the final quarter of 1945 by 21 percent. Declines in 1946 production of liquefied petroleum gases in Texas, Illinois, and Wyoming offset small increases in most other producing States.

REVIEW BY STATES

California.—Light-product production of the industry in 1946 increased 2 percent over 1945 to 910,469 thousand gallons because of higher output in the 1946 fourth quarter. Production of liquefied petroleum gases increased 18 million gallons (11 percent) over 1945, as a decline of 11 million gallons in natural-gasoline production was balanced by an equal gain in "other products" originating at cycle plants. These group changes were opposite in direction to those east of California, emphasizing economic differences between the two regions.

Production at Kettleman Hills declined from 171 million gallons in 1945 to 160 million in 1946; Ventura Avenue declined similarly from 88 million gallons to 86 million gallons.

Louisiana.—Total production in 1946 of 567,400 thousand gallons compared with 549,234 thousand gallons in 1945. Small gains were reported in both the Gulf and inland districts. Natural-gasoline production increased 72.4 million gallons (32 percent) over 1945.

Oklahoma.—After a 4-year decline, production in 1946 increased to 419.0 million gallons from 416.2 million gallons in 1945. Output of the Oklahoma City field increased from 64 to 66 million gallons, but Osage County decreased from 73 to 69 million gallons. The Seminole district produced 126 million gallons of light products in 1946, 1 million gallons less than in 1945.

Monthly production of natural gasoline and allied products in the United States, 1945–46, by States and districts, in millions of gallons

[1] Subject to revision.

Texas.—Continued expansion of operations raised total light-products output from 2,188 million gallons in 1945 to 2,273 million gallons in 1946, amounting to 47 percent of the United States total. Natural-gasoline production increased 19 percent over 1945, in contrast to declines of 4 and 14 percent in liquefied petroleum gases and other products, respectively.

Through the first 5 months of 1946 the production rate approximated that of the comparable 1945 period but trended upward through the balance of 1946 to record levels, as demand for light products expanded.

Other States.—Total production reached record levels in Kentucky and New Mexico, gaining 16 and 5 percent, respectively, over 1945. Materially higher output in 1946 in West Virginia and Kansas approached the largest totals of recent years in these States. Principal 1946 declines were in Illinois and Wyoming.

YIELDS, PROCESSES, AND NUMBER OF PLANTS

Cycle Plants.—Approximately 1,327 million gallons of liquid products were recovered at cycle plants in 1946 from 887 billion cubic feet of processed natural gas, an indicated yield of 1.50 gallons per thousand cubic feet. At individual plants, yields varied from less than 0.5 gallon to about 5 gallons per thousand cubic feet of gas treated. Currently, 20 percent or more of cycle-plant production consists of finished gasoline and naphtha.

Yields.—The average yield of all light products was 1.29 gallons per thousand cubic feet of natural gas processed (final figures) in 1945 and was unchanged in 1946 (preliminary figures). However, the yield of liquefied petroleum gases declined from 0.39 to 0.37 gallon owing to lower demand in 1946 for some of these materials. The yield of butanes at plants with suitable fractionating equipment is relatively high, in many instances approaching 100 percent of the available product. Propane yields range much lower, perhaps from 10 to 30 or 40 percent of the total available in process gas at specific plants, because market requirements in the past have not provided enough incentive for making the additional investment in equipment required for more complete recovery.

The average yield of natural gasoline increased from 0.68 gallon per thousand cubic feet in 1945 to 0.74 gallon in 1946, responding to higher demand from refineries, jobbers, and for export.

Production by Processes.—The reduction in the number of operating plants—from 610 in 1944 to 606 in 1945—was smaller than has been usual for many years. In the period 1935–45 the number of compression-type plants has decreased from 312 to 181, the absorption-type from 393 to 384, and charcoal-process from 10 to 3. The 38 cycle plants reported in 1945 represent a net gain since 1935, as none were in existence at that time.

Natural gasoline and allied products produced in the United States in 1945, by States and by methods of manufacture [1]

[1] Figures for 1946 not yet available.
[2] Includes 17 plants manufacturing liquefied petroleum gases.
[3] Includes combination of absorption process with compression and charcoal processes. Includes 188 plants manufacturing liquefied petroleum gases; and 3 charcoal plants in West Virginia with 1,461,000 gallons produced in 1945 and 3 charcoal plants with 3,770,000 gallons in 1944.
[4] Includes 26 plants manufacturing liquefied petroleum gases.
[5] Drip gasoline.

In 1935, States east of the Mississippi River had 38 percent of all plants in the United States, with only 4 percent of the total production of light products. In 1945, the number of plants in this area had declined to 28 percent, but their output amounted to 7 percent of the United States total. Thus, the increase in output of the Eastern States has been proportionately greater than in the West because of large gains in Illinois, Kentucky, and West Virginia.

From January 1, 1940, to January 1, 1946, the capacity of all plants increased 54 percent to 17,928,000 gallons of liquid products per day (6, 544 million gallons per year). During 1946 several large new plants began operations, among which three in the great Carthage gas and condensate field of eastern Texas added about 400,000 gallons daily of new capacity.

Technologic Trends.—The number of plants producing liquefied petroleum gases increased from 202 in 1944 to 231 in 1945. Responding to rapid growth in demand, the output of these products, amounting to 21 percent of the total for the natural-gasoline industry in 1941, expanded to 29 percent in 1946, the first full peacetime year.

The probable future enlargement in demand for liquefied petroleum gases, for established and new uses, suggests that production facilities of the natural-gasoline industry and those of petroleum refineries as well may be utilized at near-capacity rates for an extended period. The plants now planned for construction at Brownsville, Tex., and in southwestern Kansas, to produce liquid hydrocarbons from dry natural gas by synthetic chemical means, may also become a minor source of liquefied petroleum gases, according to trade reports.

Research is being conducted by the industry to determine the practicability of using relatively more natural gasoline and butanes in motor fuel. A favorable conclusion of this enterprise would broaden significantly the market for these materials.

MARKET DEMAND—SHIPMENTS

The demand for light products of natural gasoline and cycle plants continued in 1946 the upward trend that has persisted since 1934, reaching a total of 4,921,266 thousand gallons, 3 percent above 1945. Deliveries of natural gasoline were 9 percent higher than in 1945; but the liquefied petroleum gases and other products groups were 0.4 and 13 percent lower, respectively.

Shipments to Refineries.—The relative importance of shipments to refineries decreased from 74 percent of total demand on the industry in 1945 to 66 percent in 1946 as volume declined from 3,538,129 thousand gallons to 3,243,024 thousand gallons. The principal decline was in refinery takings of liquefied petroleum gases, which were 284,769 thousand gallons (43 percent) below 1945. The demand for isobutane only was well-maintained at levels above those in the late months of 1945. Shipments of condensate contracted 18 percent and of finished gasoline and naphtha 85 percent to negligible proportions late in 1946. The only gain was reported in the major product, natural gasoline, shipments of which reached the record total of 2,525,431 thousand gallons, 6 percent more than in 1945.

Supply and distribution at plants of natural gasoline and allied products in the United States, 1945–46, by months, in thousands of gallons

[1] Subject to revision.

The percentage of natural gasoline and allied products in refinery gasoline declined from 9.1 in 1945 to 8.4 in 1946, primarily because of the curtailed use of liquefied petroleum gases in refining operations in 1946.

"Direct" Sales.—Jobbers and other trade outlets purchased 401,912 thousand gallons of products of the natural-gasoline industry in 1946, an increase of 22 percent over 1945. Such sales trended upward during the year, reaching 41,929 thousand gallons in December, compared with 26,783 thousand gallons in December 1945. Finished gasoline and naphtha comprised 65 percent of 1946 sales, natural gasoline 32 percent, and condensate 3 percent.

Sales of liquefied petroleum gases for fuel were 28 percent greater than in 1945, amounting to 856,505 thousand gallons. Fourth-quarter sales, reflecting strong seasonal and growth factors, exceeded the comparable 1945 period by 39 percent. Sales of liquefied petroleum gases for chemical manufacture, including synthetic rubber, increased 25 percent over 1945 to 212,604 thousand gallons. The chemical industry utilizes also a large volume of liquefied gases from petroleum refining.

Percentage of natural gasoline and allied products in refinery gasoline in the United States, 1942–46, by districts

Year	East Coast	Appalachian	Indiana, Illinois, Kentucky	Oklahoma, Kansas, Missouri	Texas Inland	Texas Gulf Coast	Louisiana Gulf Coast	Arkansas and Louisiana Inland	Rocky Mountain	California	Total

SALES OF LIQUEFIED PETROLEUM GASES

Domestic deliveries of liquefied petroleum gases sold for fuel, chemical raw material, and synthetic rubber components increased from 1,276,766,000 gallons in 1945 to 1,705,282,000 in 1946—a gain of 34 percent compared with an expansion of 20 percent in 1945 over 1944 It is believed that the volume of domestic sales in 1946 would have been even greater had more pressure-tank cars and trucks been available for distribution purposes and had additional equipment for the use of these liquid gases been more readily obtainable. Exports of liquefied petroleum gases increased from 26,059,000 gallons in 1945 to 49,091,000 in 1946—a gain of 88 percent, according to the Bureau of the Census, United States Department of Commerce. The outstanding growth of this trade in 1946 compares with an increment of 79 percent in 1945 over 1944.

The totals for the different uses of liquefied petroleum gases rose sharply in 1946, except that for internal-combustion-engine fuel, which showed only a small gain, and the quantity for industrial fuel, which dropped slightly. Sales of liquefied petroleum gases for domestic or household fuel have more than doubled since 1943; the 1946 total of 766,150,000 gallons was 44 percent over the 1945 demand of 533,262,-

000, and this expansion compares with gains of 20 percent in 1945 and 29 percent in 1944. Deliveries of liquefied petroleum gases for domestic fuel made up 45 percent of the total for all uses in 1946, a slightly larger proportion than the 42 percent reported for both 1944 and 1945. The purchases of liquefied petroleum gases by manufactured-gas companies have mounted steadily in recent years and the volume reported for 1946—86,660,000 gallons—was 61 percent over the 1945 quantity of 53,849,000 and nearly double the 1944 total. Sales of liquefied petroleum gases credited to manufactured-gas companies represented 5 percent of all deliveries in 1946 in contrast to 4 percent of the total for both 1944 and 1945.

Sales of liquefied petroleum gases in the United States, 1942–46, by uses, methods of transportation, and regional distribution, in thousands of gallons

[1] Includes pentane as follows, in thousands of gallons: 1942, 4,452; 1943, 4,155. Corresponding figures for later years not available.
[2] Excludes synthetic rubber components (for comparison with earlier years).
[3] Includes material delivered for synthetic rubber components.
[4] Subject to revision.

Over a third of all sales of liquefied petroleum gases were sold for nonfuel uses in 1946. The quantity reported for synthetic rubber components increased from 208,787,000 gallons in 1945 to 289,442,000

in 1946, a 39-percent gain, while in addition the total indicated for chemical raw material of 307,655,000 gallons was 37 percent above the 1945 demand of 224,291,000 gallons and more than double 1944 requirements. It is believed that the demand for liquefied petroleum gases for use in the manufacture of synthetic rubber probably reached a "peak" volume in 1946, as the output of synthetic rubber is being curtailed as more natural rubber becomes available. It should be added, however, that the greater shrinkage in the demand for raw material going into synthetic rubber has been in the alcohols from agriculture sources because of their higher cost rather than in liquefied gases derived from petroleum and natural gas. The liquefied petroleum gases reported for chemical raw material in 1946 are believed to be below the actual demand by chemical plants as some of the other hydrocarbons such as ethane, pentane, hexane, and heptane are not included, and furthermore, it is also believed that some companies did not report all material moved to chemical plants by pipe lines.

The volume of sales of liquefied petroleum gases for internal-combustion-engine fuel has expanded very little in recent years, due both to wartime regulations and equipment shortages, and the 1946 quantity of 96,222,000 gallons is only 3 percent above the 1945 total of 93,340,000 gallons. Furthermore, the liquefied petroleum gases sold for motor fuel have declined from a 9-percent proportion of total deliveries for all uses in 1944 to a 7-percent share in 1945 and a 6-percent share in 1946. The use of liquefied petroleum gases for industrial fuel declined from 163,121,000 gallons in 1945 to 159,115,000 in 1946—a 3-percent shrinkage compared with a slight gain in 1945 over 1944. This lack of growth in the use of liquefied petroleum gases as an industrial fuel in recent years was largely the result of shortages of equipment for its handling and use. Diversion of supplies for competitive uses, especially for chemical raw material, was probably also a factor.

The proportion of butane in the total sales of liquefied petroleum gases has remained just below 26 percent in recent years, while some slight variations are noted in the shares for propane and butane-propane mixtures. The percentage for propane rose from 32 percent of total deliveries in 1944 to about 35 percent in 1945, but again dropped to slightly over 32 percent of the total in 1946. Butane-propane mixtures as reported declined from nearly 43 percent of total sales of liquefied petroleum gases in 1944 to 40 percent in 1945 and then turned upward to a 42-percent share of all deliveries in 1946.

Butane sold as liquefied petroleum gas increased from 325,140,000 gallons in 1945 to 438,439,000 in 1946—a gain of 35 percent compared with a 19-percent expansion in 1945 over 1944. All uses of butane showed gains in 1946 except quantities delivered for domestic and internal-combustion-engine fuels. Over 60 percent of the total butane was reported as sold for synthetic rubber components in 1946, and the quantity—268,946,000 gallons was 48 percent over the 1945 demand of 181,857,000 gallons. The use of butane in chemical manufacturing rose by 75 percent from 26,227,000 gallons in 1945 to 45,959,000 in 1946; however, the volume of this demand is not relatively important at the present time.

Butane delivered for domestic or household fuel has fluctuated from 27,565,000 gallons in 1944 to 52,866,000 in 1945 and then down by 14

percent to 45,285,000 gallons in 1946. The increasing pressure for butane as raw material used in the manufacture of motor fuel, synthetic rubber, and chemical products apparently has forced distributors to turn more to propane and butane-propane mixtures to satisfy the domestic fuel demand. The use of butane as industrial fuel rose from 42,043,000 gallons in 1945 to 48,100,000 in 1946—a 14-percent gain; however, the total is still below quantities reported during the war years.

Sales of butane to manufactured-gas companies increased noticeably from 15,637,000 gallons in 1945 to 25,682,000 in 1946—a 64-percent gain. The expansion in this demand in 1946 compares with a 5-percent increment in 1945 and a shrinkage by a third in 1944. A small quantity of butane is reported as fuel for internal-combustion engines, and the total has declined sharply from a peak demand of 18,799,000 gallons in 1941 to 4,467,000 in 1946, due to wartime restrictions, lack of equipment, and competitive demands for this liquid gas.

Reported deliveries of propane in 1946—548,827,000 gallons—were 23 percent over the 1945 demand of 444,581,000 gallons. Most of the propane is sold for domestic or household fuel, and this demand increased by 44 percent from 216,415,000 gallons in 1945 to 312,240,000 in 1946. A fairly important quantity of propane is also used as industrial fuel; however, the total declined from 105,040,000 gallons in 1945 to 91,033,000 in 1946, as this class of consumers used more butane and butane-propane mixtures to satisfy their requirements.

Manufactured-gas companies are using rapidly increasing quantities of liquefied petroleum gases in their operations, and nearly half of their requirements are for propane, the total of which nearly doubled from 22,323,000 gallons in 1945 to 41,199,000 in 1946. Very little propane is used as fuel in internal-combustion engines; however, the quantity is gradually increasing and the 1946 total of 8,297,000 gallons was 11 percent over the 1945 item of 7,453,000 gallons.

The nonfuel uses of propane are not relatively important up to the present time; however, quantities consumed as chemical raw material have jumped from less than 5,000,000 gallons in 1943 to 66,776,000 in 1945 and 76,412,000 in 1946, while propane going to synthetic rubber plants has fluctuated from 11,529,000 gallons in 1944 to 26,526,000 in 1945 and then down to 19,631,000 gallons in 1946.

Butane-propane mixtures reported to the Bureau of Mines increased from 507,045,000 gallons in 1945 to 718,016,000 in 1946—a 42-percent gain and a greater expansion in volume than that shown for either butane or propane. Most of these "mixtures" were delivered for domestic fuel, and this use increased by 55 percent from 263,981,000 gallons in 1945 to 408,625,000 in 1946. Important quantities of butane-propane mixtures are also used as raw material for the manufacture of chemicals, and the volume of this demand has expanded greatly from less than 40,000,000 gallons in 1943 to 131,288,000 in 1945 and 185,284,000 in 1946. Liquefied petroleum gases consumed as motor fuel are predominantly butane-propane mixtures. This particular demand showed a small decline in 1945 to 79,418,000 gallons; however, the 1946 quantity of 83,458,000 represents a new "peak" in the use of butane-propane mixtures as a motor fuel.

About 3 percent of the butane-propane mixtures sold is credited to manufactured-gas companies, and this demand has steadily increased in recent years to 19,779,000 gallons in 1946—a 25-percent gain over the 1945 total of 15,889,000 gallons. A similar proportion of "mixtures" is also used at present as fuel by industrial plants, and the 1946 quantity (19,982,000 gallons) compares with 16,038,000 under this classification in 1945. It should be added that much larger amounts (43,011,000 gallons in 1942) of butane-propane mixtures formerly were used as industrial fuel; however, lately there has been a shift to propane as competitive demands—domestic fuel and chemical raw material—have absorbed the supply. Butane-propane mixtures reported as synthetic rubber components are of minor importance in volume; however, the total increased from 404,000 gallons in 1945 to 865,000 in 1946.

The American Gas Association provided the following statistics regarding the distribution of liquefied petroleum gases by manufactured-gas companies:

Liquefied petroleum gas, as of May 1947, was being delivered through mains to 187,000 consumers in 306 communities by 157 companies in 36 states.

Butane-air gas and propane-air gas with heating value ranging from 520 to 1,600 B. t. u. per cu. ft. was supplied to 238 communities in 35 states.

A mixture of undiluted butane and propane gas with heating value of 2,800 to 3,000 B. t. u. per cu. ft. was supplied 17 communities in Arizona, California, and New Mexico.

Undiluted propane gas with heating value of 2,515 to 2,575 B. t. u. per cu. ft. was supplied 51 communities in Maryland, Massachusetts, Minnesota, Missouri, Nebraska, New Jersey, North Carolina, North Dakota, Virginia, and Wisconsin.

A survey covering sales of liquefied petroleum gases in the Pacific Coast marketing area (California, Oregon, Washington, Arizona, and Nevada) made by E. T. Knudsen of the Los Angeles office of the Bureau of Mines shows deliveries of 241,116,000 gallons in 1946—a gain of 29 percent over the 1945 quantity of 187,211,000 gallons. The liquefied petroleum gases marketed on the Pacific Coast made up about 14 percent of the national total in 1946 compared with a 15-percent share in 1945. Distributors operating in all other parts of the country sold 1,464,166,000 gallons of liquefied petroleum gases in 1946 or 34 percent over the 1945 volume of 1,089,555,000 gallons.

STOCKS

A rapid accumulation of total stocks from the opening level of 181,513 thousand gallons continued through the early months of 1946 to a peak of 308,385 thousand gallons on June 30. During this period product prices were relatively low and supply exceeded demand. The second half of 1946 was characterized by rising prices and growing demand accompanied by reduction of inventories to 209,209 thousand gallons at the year end.

Stocks at refineries were reduced 6 million gallons further in 1946 to the lowest level in recent years, an increase in natural gasoline being offset by declines in holdings of the other two groups of products.

An increase of 34 million gallons in stocks at plants and terminals resulted chiefly from the unusually large accumulation of natural gasoline in the first half of the year.

Stocks of natural gasoline and allied products in the United States, 1942–45, and 1946, by months, in thousands of gallons

PRICES

The Mid-Continent (Group 3) price of the 26–70 grade of natural gasoline declined rapidly from a January 1, 1946, level of 4.5 cents a gallon to 2.75 cents late in February. Gradual price improvement began in early May and continued through the remainder of the year to a closing price of 5.0 cents a gallon. The old ceiling price of 4.75 cents a gallon, eliminated in October with liquidation of the wartime Office of Price Administration, was penetrated for the first time late in November, when sales at 4.875 cents were reported. The yearly average price declined from 4.56 cents in 1945 to 3.84 cents in 1946.

The Oklahoma spot price of 73–75 octane motor gasoline declined from a January 1946 average of 5.72 cents a gallon to 5.50 cents in March and thereafter improved steadily to an average of 7.25 cents in December to average 6.31 cents a gallon for the year, compared with 5.89 cents in 1945. The 7-percent rise in this average in 1946 over 1945 contrasts with the 16-percent drop in average price of the related product—natural gasoline.

The marginal character of natural-gasoline markets is emphasized by the disparity in price trends between natural gasoline and motor fuel in Oklahoma in 1945 and 1946. Although the direction of change of the two series is usually the same, the relative magnitude of changes varies widely, the motor-fuel average tending to minimize declines in soft markets and to respond more promptly and vigorously to firmer market conditions.

The average value at the plants of light products, except liquefied petroleum gases, was 4.16 cents a gallon in 1946, compared with 4.42 cents in 1945. The average value of liquefied petroleum gases declined from 2.97 cents a gallon to 2.58 cents.

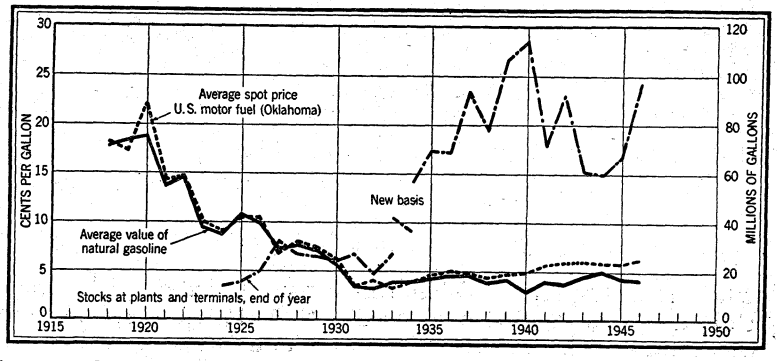

FIGURE 2.—Trends in average value of natural gasoline, spot price of gasoline, and stocks of natural gasoline, 1918–46.

FOREIGN TRADE [3]

Shipments to foreign countries, particularly of natural gasoline, increased abruptly after the first quarter of 1946 and were maintained at a high rate through December. Natural-gasoline exports increased 249 percent over 1945 to 128,868 thousand gallons valued at $7,507,000, compared with 36,912 thousand gallons valued at $2,293,000 in 1945. The quantities shipped in 1946 to principal countries of destination, in thousands of gallons were: United Kingdom 67,333, Canada 53,661, France 4,029, and Portugal 2,112.

Exports of liquefied gases, originating at plants of the natural-gasoline industry and at petroleum refineries, amounted to 49,091 thousand gallons valued at $3,319,000 in 1946 compared with 26,059 thousand gallons valued at $1,589,000 in 1945. The principal countries of destination in 1946 were Canada and Mexico, although France is shown to have received an initial item of 1,941 thousand gallons.

Nickel

By HUBERT W. DAVIS

GENERAL SUMMARY

DESPITE a 17-percent decline in consumption of nickel in the United States in 1946 compared with 1945, a peacetime record was established. Strikes in the steel and automotive industries were partly responsible for the smaller consumption in 1946. As a consequence of the lessened use of nickel in 1946, output in Canada was substantially less than in 1945; but production in Cuba, the second-largest source of supply for the United States, was at a rate slightly higher. Domestic output of nickel was, as heretofore, small in 1946.

Salient statistics for nickel, 1942–46

	1942	1943	1944	1945	1946
United States:					
Production:

[1] Excludes "All other manufactures of nickel"; weight not recorded.
[2] Excludes "Manufactures"; weight not recorded.
[3] Price quoted by International Nickel Co., Inc., for electrolytic nickel in carlots f. o. b. Port Colborne, Ontario, including duty of 2½ cents a pound.
[4] Not available.

The steel industry continued to be the chief consumer of nickel in the United States. The largest single outlet for nickel in the steel industry in 1946 was for chromium-nickel stainless steels, which used nearly 36,000,000 pounds. The triple-alloy steels containing nickel, chromium, and molybdenum, which came into prominence during the war, continued to absorb substantial quantities of nickel in 1946. Usage of nickel by electroplaters and in the production of nickel-silver was greater than prewar. In 1946 the United States resumed minting the 5-cent piece containing one-fourth nickel.

Imports of nickel in all forms were about 14 percent less than in 1945.

Effective November 25, 1946, the International Nickel Co., Inc., advanced its contract price for electrolytic nickel in the United States to 35 cents a pound, f. o. b. Port Colborne, Ontario, inclusive of the import duty of 2½ cents a pound; the previous price was 31½ cents a pound.

PRODUCTION

Domestic production of nickel is small and comprises metals recovered from scrap-nickel anodes, nickel-silver, and copper-nickel alloys (including Monel metal), and primary nickel recovered in copper refining and produced from ore and as a byproduct of talc production, as listed in the accompanying table. Domestic primary nickel was recovered in 1946 as a byproduct in copper refining at Baltimore, Md.; Carteret and Perth Amboy, N. J.; Laurel Hill, N. Y.; and Tacoma, Wash. Although all the nickel recovered as a byproduct of copper refining is credited to domestic production, some of it is recovered from imported blister copper. Missouri, a small producer in 1945, reported no commercial output in 1946.

Nickel produced in the United States, 1942–46

Year	Primary (short tons)[1]		Secondary [2]	
	Byproduct in copper refining [3]	Other [4]	Short tons	Value
1942	612	----------	4,142	$2,899,400

[4] Nickel content of concentrates and matte produced from ore and of concentrates produced as byproduct of talc.
[5] Production from "Other" included under "Byproduct in copper refining." Bureau of Mines not at liberty to publish figures separately.

CONSUMPTION AND CONSUMERS' STOCKS

The accompanying tables give data on consumption and consumers' stocks of nickel. The data cover all known consumers of nickel in the form of primary, secondary, and oxide. The figures for nickel salts, however, fall short of the total; nevertheless, they cover almost all of the larger and many of the smaller users of nickel in this form.

Nickel (exclusive of purchased and home scrap) consumed and in stock in the United States, 1945–46, by forms, in pounds of nickel

Form	1945			1946

FOREIGN TRADE[1]

The quantity of nickel imported into the United States in 1946 was 14 percent smaller than in 1945 and 25 percent less than in the peak year 1943. Imports comprised chiefly metallic nickel, matte, and oxide. As heretofore, Canada was the chief source of the imports; it supplied 141,433,524 pounds of metallic nickel, 38,092,080 pounds of Monel matte (averaging about 55 percent nickel and 25 percent copper), 1,352,021 pounds of oxide (averaging about 76 percent nickel), and 2,050 pounds of nickel-silver. At the plant of the International Nickel Co., Inc., Huntington, W. Va., the Monel matte was refined to Monel metal and other products. Refining of nickel pig at the Huntington works was discontinued early in 1946; consequently, only 74 short tons were produced from Canadian washed sulfide and oxide, and none was produced from New Caledonian matte. In 1946 Cuba furnished 27,689,919 pounds of oxide (averaging 77 percent nickel), the United Kingdom and Norway supplied 881,330 and 9,999 pounds, respectively, of metallic nickel, and Switzerland furnished 182 pounds of metallic nickel and 7,712 pounds of nickel-silver.

The nickel content of the unmanufactured nickel products imported into the United States is estimated at 184,272,000 pounds in 1946, compared with 214,866,000 pounds in 1945.

Exports of nickel comprise largely products manufactured from imported raw materials. Exports of alloys and scrap were 2½ times more than in 1945, those of nickel-silver nearly 8 times greater, and those of metallic nickel were 17 percent larger. Exports of nickel-chrome electric resistance wire were 16 percent less.

The United Kingdom (8,069,726 pounds), Canada (2,752,208 pounds), and France (471,084 pounds) were the chief markets for nickel, Monel metal, alloys, and scrap in 1946.

WORLD REVIEW

The accompanying table shows world production of nickel by countries, 1939–46, insofar as statistics are available. Despite the fact that nickel is produced in many countries, four—Canada, Cuba, New Caledonia, and the U. S. S. R.—account for about nine-tenths of world output, and one country—Canada—supplies 70 to 75 percent of the total.

World production of nickel (content of ore), 1939–46, by countries, in metric tons[1]

[3] Fiscal year ending Mar. 20 of year stated.
[4] Estimate.
[5] Preliminary data for fiscal year ended March 31 of year following that stated.
[6] Byproduct in electrolytic refining of copper. In 1941 includes also production from ore and as byproduct of talc; in 1944 and 1945 includes also production from ore.

Canada.—Virtually all the Canadian output is derived from copper-nickel ores of the Sudbury district, Ontario. Some nickel is also recovered as a byproduct from silver-cobalt ores of Cobalt and other areas in northern Canada. Two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Nickel production in Canada was 94,833 short tons in 1946, compared with 122,565 tons in 1945.

Sales of nickel in all forms by the International Nickel Co. of Canada, Ltd., were 201,103,234 pounds in 1946 compared with 201,572,987 pounds in 1945.[2] Ore mined was 7,736,334 short tons in 1946 compared with 10,136,350 tons in 1945. Mining and smelting operations were about 50 percent of capacity during the first half of 1946; but beginning in September they were progressively expanded, and by the year end the rate of production was 75 percent of the maximum wartime figure. Underground development totaled 48,673 feet in 1946, bringing the total footage to 1,184,718 at the year end. Proved ore reserves at the end of 1946 were 217,142,000 short tons containing 6,861,000 tons of nickel-copper, compared with 217,373,000 tons containing 6,866,000 tons of nickel-copper at the end of 1945. As a result of intensive research by the International Nickel Co. during recent years, nickel oxide sinter, a new product to be offered to steel manufacturers, is to be made at a plant under construction at Copper Cliff, Ontario. The operations and plants of the International Nickel Co. of Canada, Ltd., have been described in detail in the Canadian Mining Journal.[3]

[1] International Nickel Co. of Canada, Ltd., Annual Report: 1946, 15 pp.
[2] Canadian Mining Journal, vol. 67, No. 5, May 1946, pp. 309–554.

Falconbridge Nickel Mines, Ltd.,[4] operated only its smaller blast furnace from January 9 to December 18, 1946, with the larger furnace operating alone before and after that period. As a result of the reduced operations, only 486,516 short tons of ore were treated in 1946 (716,868 tons in 1945), and 12,780 tons of matte (19,470 tons in 1945) were produced. The matte averages about 53 percent nickel. Ore reserves were 14,205,500 tons averaging 1.73 percent nickel on December 31, 1946.

During 1946 much publicity was given to the nickel-copper discoveries in the Lynn Lake area of northern Manitoba, where Sherritt Gordon Mines, Ltd., began a program of exploration and development.

Cuba.—Despite equipment repairs and other adverse factors, production of nickel in Cuba by the Nicaro Nickel Co. was greater than in 1945. Output of oxide was 16,040 short tons (12,391 tons nickel content) in 1946 compared with 15,425 tons (12,015 tons nickel content) in 1945. Exports of nickel oxide from Cuba were 13,953 short tons (10,742 tons nickel content) in 1946 compared with 16,326 tons (12,625 tons nickel content) in 1945.

New Caledonia.—New Caledonia was surpassed by Cuba as a producer of nickel in 1945 and 1946. Production of ore was 107,944 metric tons (averaging 2.5 to 3.25 percent nickel) in 1946 compared with 123,643 tons in 1945. The 1946 output comprised 65,084 and 32,155 tons, respectively, from the Thio and Voh properties of Société le Nickel and 10,705 tons from the Good Luck concession at Mont Dore of Henri Lafleur. All ore extracted in 1946 was sent to the smelter of Société le Nickel at Noumea, where a matte containing 76 to 78 percent nickel is produced. In 1946 output of matte was 1,783 metric tons and exports were 3,025 tons. The matte was shipped to the company works at Le Havre, France, for refining.

Norway.[5]—The Falconbridge nickel refinery at Kristiansand was operated continuously during 1946 with gradually increasing production, and by the year end the accumulation of matte was reduced to about normal level. Output of nickel was 10,035,152 pounds in 1946.

Venezuela.—Sampling of nickel-ore deposits near Tinaquillo by engineers of International Nickel Co. has been completed, and the future of the region depends on results obtained by research metallurgists in treating the ore in a pilot plant.[6] The Venezuelan nickeliferous deposits, including those at Lomo de Hierro, have been described briefly by Davey.[7]

Nitrogen Compounds

By BERTRAND L. JOHNSON[1]

GENERAL SUMMARY

THE great military demand for nitrogen for munitions collapsed following the conclusion of major hostilities in 1945. Several Government-owned synthetic nitrogen plants were closed, and most were declared surplus. Agriculture and industry were unable to absorb the increased supplies of nitrogen compounds, and production trended downward toward domestic peacetime levels. However, recognition of a great world shortage in nitrogen soon caused a reversal of this trend. Demand from famine-threatened countries and from the Army for nitrogenous fertilizers for use in the occupied territories increased. Late in 1946 the Army reactivated its four remaining synthetic nitrogen plants and borrowed large quantities of ammonium nitrate from the domestic industry for immediate shipment abroad. Operation of inactive privately owned and leased Government plants was resumed. At the end of 1946 there was still a world nitrogen shortage. Estimated supplies for 1947 are expected to be over three-quarters of a million tons below needs, and it was anticipated that international allocation of world supplies of nitrogenous fertilizers would continue through the 1947–48 season. In the United States the production of chemical nitrogen is reported to have fallen short of domestic needs. Shortages appeared in the output of byproduct ammonium sulfate, and the imports of Chilean nitrate were below schedule.

Salient statistics of nitrogen compounds produced in the United States, 1944–46, in short tons

INORGANIC NITROGEN COMPOUNDS

NATURAL NITRATES

Domestic Nitrate Deposits.—Deposits of soluble nitrate minerals occur scattered throughout the United States, and many have been described (see Nitrogen Compounds chapter, Minerals Yearbook, 1942, p. 1522). However, none of the deposits has yet proved of sufficient size or grade to serve as a basis for a domestic nitrate industry; consequently little attention has been paid to them in recent years.

Chilean Nitrate.—Large quantities of natural sodium nitrate continue to be imported from Chile, but the amounts brought into this country in 1946 were much below those entering in 1945, because a large tonnage was diverted from the United States to other markets. Only a little over half a million tons were brought into the United States, the smallest quantity in several years. No Chilean sodium-potassium nitrate was imported into this country in 1945, but in 1946 a few thousand tons were received. The imports of these two commodities for 1942–46 are shown in the accompanying tables.

Prices of imported sodium nitrate (minimum nitrogen content, 16 percent) were covered, at the wholesale level, from January 1, 1946, to July 27, 1946, by Office of Price Administration Revised Maximum Price Regulation 205 and Amendment 4 to that regulation. The maximum delivered price at any destination continued at $30 per ton in bulk (carlot quantities, f. o. b. cars at Atlantic, Gulf, and Pacific ports) plus specified freight, truck loading, and terminal use charges. For nitrate of soda-potash (minimum nitrogen content 14 percent), the base maximum delivered price at any destination was $38 per ton in bulk, plus the same additions as for sodium nitrate. Amendment 12 to RMPR 205, effective July 27, 1946, increased the maximum price

of imported nitrate of soda to $35.50 per ton and nitrate of soda-potash to $43.50 per ton in bulk, f. o. b. cars at importer's port warehouse from which delivery is made. These increases of $5.50 per ton were made to meet the higher prices asked by Chilean suppliers because of removal of the subsidy and increased costs of production and transportation.

On November 10, 1946, imported sodium nitrate and nitrate of soda-potash were exempted from price control (OPA Supplementary Order 193, issued November 12, 1946, effective November 10, 1946).

It has been reported that installation of a solar evaporation process is to be started in the Chilean nitrate field in 1947 to permit recovery of a large tonnage of potassium nitrate and other products from leaching solutions now discarded. The operators believe that this by-product recovery will help the nitrate industry compete more successfully with the synthetic-nitrate producers.

Sodium nitrate and sodium-potassium nitrate imported for consumption in the United States, 1942–46 [1]

Year	Sodium nitrate		Sodium-potassium nitrate		Year	Sodium nitrate		Sodium-potassium nitrate	
	Short tons	Value	Short tons	Value		Short tons	Value	Short tons	Value
1942	899,150	$17,183,425	14,272	$377,703	1945	849,888	$18,558,959	------	------
1943	761,165	15,188,787	19,767	580,760	1946	529,677	11,448,232	4,400	$146,312
1944	713,004	15,346,426	9,407	278,534					

[1] All from Chile except sodium nitrate in 1942 as follows: Canada, 5 tons, $259; Mexico, 55 tons, $2,386.

SYNTHETIC NITROGEN COMPOUNDS

Ammonia and Its Compounds.—Early in 1945, 10 Government-owned synthetic ammonia plants—the 8 Ordnance plants and those of the Tennessee Valley Authority and the Defense Plant Corporation—and several private plants were producing synthetic ammonia. Following cessation of hostilities in that year, several Ordnance plants (Ohio River, Dixie, Buckeye, Jayhawk, Ozark, Cactus, and Morgantown) and the Defense Plant Corporation operation at Lake Charles, La., were declared surplus and advertised for sale or lease. The War Assets Administration disposed of 5 of the surplus synthetic ammonia plants in 1946—2 were sold and 3 leased. The Cactus and Ohio River plants were withdrawn from surplus and returned to the War Department. These 2 plants and the Missouri and Morgantown Ordnance plants were later operated by the Army (in coordination with nitric acid and ammonium nitrate facilities in the other Ordnance plants) to begin production of an expected total of 330,000 tons of nitrogen for fertilizers during 1946–47 for export to occupied areas.

Further data regarding these plants and the Ordnance plants producing nitric acid and ammonium nitrate are contained in recent reports.[2] According to the War Assets Administration—

[2] Anderson, Clinton P., Federally Owned Plants and Facilities: 79th Congress, 2d Sess., Senate Document 167, 1946, 93 pp.
War Assets Administration, The Disposal of Synthetic Ammonia Plants: 4th Suppl. Rept. to the Congress on Chemical Plants and Facilities, Oct. 31, 1946, 10 pp.

The total rated synthetic fixed nitrogen capacity of the United States now in private hands, including the five Government plants disposed of to private interests, is 797,100 tons. In addition, by-product nitrogen capacity of about 260,000 tons, together with net imports, production at TVA and other sources amounting to about 75,000 tons, bring the total potential domestic availability to approximately 1,238,000 tons.

Interest in the need for nitrogenous fertilizers for occupied areas appeared early in the spring of 1946, and the Army unsuccessfully attempted to obtain needed supplies in the civilian market. It thereupon obtained authorization to put some of the nitrate plants back into operation to produce the needed fertilizer. This program was put into effect in July 1946 by reactivating 4 Government-owned ammonia plants and 11 other facilities needed to produce solid ammonium nitrate. Several months were required to get the plants back into production, and the first ammonium nitrate was obtained from them in November 1946. By the end of the year, 11,000 tons of ammonium nitrate were reported to have been produced. Meanwhile, the Army borrowed 110,000 tons of ammonium nitrate (33,000 tons of contained nitrogen) from commercial sources for shipment to occupied areas. This was to be repaid in kind from the production of the munitions plants.

Synthetic Sodium Nitrate.—The synthetic sodium nitrate consumed in the United States in 1946 was produced domestically. There were no imports. The domestic production came from a single unit—the Hopewell, Va., plant of the Allied Chemical & Dye Corp. Little information is available regarding current production or utilization of domestically-produced synthetic sodium nitrate. The Civilian Production Administration, however, stated that the synthetic and by-product sodium nitrate delivered from July 1945 through January 1946 contained 18,800 tons of nitrogen. It was reported that domestic production of synthetic sodium nitrate in 1946 was hampered by a shortage of soda ash.

Prices of synthetic sodium nitrate continued under revised OPA Maximum Price Regulation 205. Amendment 12 of July 27, 1946, which permitted a rise in the price of imported sodium nitrate, did not change the price of the domestic product. Quotations remained at $27 per ton for crude in bulk, f. o. b. production point. On November 10, 1946, OPA decontrolled sodium nitrate prices, and on January 1, 1947, the Barrett Division, Allied Chemical & Dye Corp., announced new prices ($32 per ton in bulk, carlots, f. o. b. Hopewell, Va.) for the domestic "Arcadian" nitrate of soda.

ORGANIC MATERIALS

War Food Administration Order 105, Amendment 1, which controlled the acquisition of oilseed meals for fertilizer purposes during the first half of the year, was terminated August 5, 1946, by the United States Department of Agriculture; but, owing to a shortage of proteins for feeding purposes, restrictions upon the acquisition and use of edible oilseed meals for fertilizer purposes were continued by addition of Amendment 10 to War Food Order 9 as of that date. War Food Order 9, as amended, was terminated October 17, 1946.

Peat

By J. A. CORGAN AND GOLDEN V. CHIRIACO

GENERAL SUMMARY

PEAT production in the United States in 1946 totaled 140,707 short tons, according to reports received by the Bureau of Mines. This figure represents an increase of 31 percent over the estimated 1945 output of 107,000 tons (revised) and is substantially greater than the previous peak production of 107,261 tons recorded for 1918. The total value of the peat produced in 1946 was $1,006,231 compared with an estimated $821,000 (revised) in 1945.

Imports of peat moss, which have been steadily increasing since 1940, amounted in 1946 to 84,078 short tons, an increase of 7 percent over the 1939 prewar figure of 78,611 tons and 8 percent over imports in 1945. As in the past, no exports of peat were reported, making the quantity available for domestic consumption in 1946 224,785 tons. Approximately 95 percent of the peat sales in 1946 was for soil improvement and for manufacture of mixed fertilizers.

Reserves.—Peat, an integral part of the natural resources of the country, is found in about half of the States. An estimate of 13,827,000,000 tons has been calculated as air-dried peat.[1]

Minnesota, Wisconsin, and Michigan combined contain 75 percent of the reserves; 14 percent of the country's total is in Florida, and the rest is distributed through the New England and Pacific Coast States.

PRODUCTION

Fifty-nine producers operating in 20 States accounted for the 1946 production of 140,707 short tons. Although eight plants reported that they were closed down permanently in 1946, eight of those "inactive" in 1945 reported production for 1946. A number of plants still reported "idle," but some of these planned to reopen in 1947. High wages and inability to procure labor continued to be the principal reasons for plant inactivity, according to reports received from producers.

[1] Soper, E. K., and Osbon, C. C., The Occurrence and Uses of Peat in the United States: Geol. Survey Bull. 728, 1922, p. 92.

The average value per ton in 1946 was $7.15, a 7-percent decrease from the 1945 value of $7.67. Production and value for 1944–46 are shown in the accompanying table.

Peat produced in the United States, 1944–46

Year	Short tons	Value	
		Total	Average per ton
1944	[1] 97,000	[1] $878,000	$9.05
1945	[1] 107,000	[1] 821,000	7.67
1946	140,707	1,006,231	7.15

[1] Estimated. Revised to include estimates for producers reporting in 1946 but not in 1944–45.

Maine was the highest peat-producing State in 1946, followed, in order of output, by New Jersey, Florida, Ohio, Illinois, Michigan, California, New York, Minnesota, Connecticut, Georgia, Wisconsin, Iowa, Pennsylvania, Texas, Washington, Massachusetts, Indiana, Colorado, and New Hampshire.

Peat humus, produced in 12 States, comprised 38 percent of the total production in 1946; reed or sedge, produced in 12 States, 33 percent; and moss peat and other, produced in 13 States, 29 percent.

USES

Peat has been used most widely for many years in this country for soil improvement. Of the sales reported in 1946, 72 percent was used for soil improvement, 23 percent for mixed fertilizers, and 5 percent for other purposes, including litter for barns and poultry yards, improvement of lawns and golf courses, in nurseries and greenhouses, and as packing material for plants, fruits, vegetables, eggs, and other fragile articles. No sales of peat for fuel were reported for 1946. In some European countries peat is used extensively for fuel and power purposes; in this country, however, peat has not been able to compete successfully in the fuel market because of ample supplies of higher-grade fuels available at reasonable cost.

United States Government Specifications.—The Federal Government purchases a certain amount of peat, provided the peat meets required specifications. These specifications may be obtained from the Bureau of Federal Supply, United States Treasury Department, Washington 25, D. C.

IMPORTS [2]

Imports in 1946—all from Canada and the Netherlands—totaled 84,078 short tons valued at $2,704,803. Before 1939 most of the peat imported came from Germany. In 1938 Germany supplied 36,381 tons, valued at $525,564; in the same year the Netherlands and Sweden together supplied 21,836 tons valued at $348,252.

The average value per short ton of imported peat was $32.17 in 1946 compared with $30.81 in 1945.

Peat moss imported for consumption in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value

WORLD PRODUCTION

Unsettled economic conditions throughout the world make it difficult to obtain complete data on the production of peat in foreign countries. The latest available statistics are given in the accompanying table.

World production of peat, 1940–46, by countries, in metric tons [1]

[Compiled by B. B. Mitchell]

Country [1]	1940	1941	1942	1943	1944	1945	1946
Canada:							
Fuel	27	322	156	709	584	107	132
Peat moss	15,591	25,222	48,540	58,386	72,979	76,170	79,060
Denmark	2,500,000	4,700,000	4,800,000	6,200,000	5,800,000	5,685,000	3,700,000
Eire [2]	[3] 3,624,250	5,398,274	4,312,738	4,954,895	5,302,477	5,086,734	(4)
Finland	13,716	10,982	8,659	2,364	2,840	7,280	(4)

United States [8]	64,000	78,000	65,000	54,000	88,000	97,000	127,647

[1] In addition to countries listed, Argentina, Austria, Germany, and Poland produce peat, but data of production are not available.

[2] Figures for 1940–42 relate to production by holders of agricultural land only; those for 1943–46 cover total production.

[3] Fiscal year ended April 30 of year stated.

[4] Data not available.

[5] Estimate.

[6] January to June, inclusive.

[7] Excluding Estonia, Latvia, and Lithuania.

[8] Data for 1940–43 are as reported to the Bureau of Mines by producers and probably represent only about two-thirds of total production. Data for 1944–45 have been revised to provide estimates believed to represent, as does 1946, reasonably complete coverage.

GENERAL SUMMARY

THE outstanding feature of 1946 was the maintenance of total oil demand at a much higher level than had been expected. The shift from peak wartime operations to a full year of unrestricted civilian consumption was made with a decline of less than 1 percent in total demand—involving a sharp drop in exports that more than offset a small gain in domestic demand. Since domestic demand, as computed, includes all new domestic deliveries to our armed forces, the increase in 1946 indicated that the expansion in civilian requirements was more than adequate to offset the large decline in military takings. New records were set for domestic production and refinery operations, although the gains were relatively small. Appraisal of the trends shown in 1946 indicates that further large increases in demand may be expected in 1947 and that all existing facilities may be taxed to meet requirements.

The years 1941 and 1946 represent periods in which civilian consumption was supplied without restriction. In the intervening 4 years demand was distorted by war necessities. A comparison of 1946 with 1941 indicates an increase in daily crude-oil production from 3,842,000 barrels to 4,749,000—a gain of 907,000 barrels daily or almost 24 percent; daily crude runs to stills increased from 3,861,000 barrels to 4,740,000—a gain of almost 23 percent; daily total demand

[1] Data for 1946 are preliminary.

for all oils rose from 4,369,000 barrels to 5,321,000—an increase of almost 22 percent; and daily domestic demand increased from 4,071,000 barrels to 4,907,000—a gain of about 21 percent. These figures indicate that for the 5-year period the increase in normal demand had continued to approximate the prewar trends.

Among the principal factors of significance in 1946 were the upward trends in production and imports; the rebuilding of depleted stocks of refined products required by the shift from military to civilian demand; the tremendous drop in aviation-gasoline production, accentuated by negligible new military purchases due to liquidation of stocks in military custody; the rapid expansion in new heating-oil installations; and indication of the necessity for the prompt expansion of production, refining, and transportation facilities to meet a demand that promises to exceed all previous records.

Demand for all oils in the United States, 1937–46

[Millions of barrels]

Year	Domestic demand	Exports	Total demand	Year	Domestic demand	Exports	Total demand
1937	1,169.7	172.8	1,342.5	1942	1,449.9	116.9	1,566.8
1938	1,137.1	193.7	1,330.8	1943	1,521.4	150.0	1,671.4
1939	1,231.1	188.9	1,420.0	1944	1,671.3	207.6	1,878.9
1940	1,326.6	130.5	1,457.1	1945	1,772.7	183.0	1,955.7
1941	1,485.8	108.8	1,594.6	1946 [1]	1,791.0	151.2	1,942.2

[1] Subject to revision.

The new supply of all oils, including domestic production and imports, set a new daily record of 5,440,000 barrels in 1946—a gain of 119,000 barrels daily or 2.2 percent compared with 1945. Of this total, 119,000 barrels daily represented additions to stocks and left 5,321,000 barrels daily to supply the total demand for all oils. Total demand included exports and shipments of 419,000 barrels daily and a domestic demand in continental United States of 4,907,000 barrels daily. Compared with 1945, exports declined by 87,000 barrels daily and domestic demand increased 50,000 barrels daily.

The daily domestic production of all oils increased 1.2 percent in 1946 and averaged 5,070,000 barrels, including 4,749,000 barrels of crude petroleum and 321,000 of other oils. New records were established for both these sources. The record production, in spite of a small decline in total demand for all oils, was essential to rebuild depleted stocks during the year. The total production of all oils exceeded that of 1941 by 997,000 barrels daily or 24.5 percent.

Imports of all oils increased from 311,000 barrels daily in 1945 to 370,000 in 1946—a gain of 19 percent. Of the total increase of 59,000 barrels daily, crude petroleum showed a gain of 32,000 and refined products of 27,000. The total imports of crude oil in 1946 amounted to 86,066,000 barrels and included 115,000 barrels from the Persian Gulf imported in August. This initial shipment was for experimental purposes and may indicate a future trend to draw upon the immense reserves that have been developed in that area. Residual fuel oil represented 86 percent of the refined products imported and was primarily withdrawn from bond, free of duty, for use in bunkering ships engaged in foreign trade.

The total demand for all oils in 1946 amounted to 1,942.2 million barrels—a decline of 13.5 million barrels or less than 1 percent compared with the previous record year 1945. Compared with 1941, however, total demand gained almost 348 million barrels or about 22 percent. Compared with 1945, the relative changes, by products, were a 0.5-percent decline in total motor-fuel demand, a 9.9-percent decrease for residual fuel oil, a 4.9-percent gain for distillate fuel oil, and a 19.6-percent increase in total kerosine demand. The decline in total demand and the variation in changes, by products, reflected the sharp drop in exports as well as the shifts from military to civilian requirements.

Exports, including territorial shipments, declined from 183.0 million barrels in 1945 to 151.2 million in 1946. While crude-oil exports increased from 33.0 million barrels to 40.7 million, the export of refined products declined from 150.0 million barrels to 110.5 million. The most important change was the decline in motor-fuel exports from 88.1 million barrels in 1945 to 45.4 million in 1946. These figures include a decline in exports of aviation gasoline from 34.1 million barrels in 1945 to 2.3 million in 1946.

Salient statistics of crude petroleum, refined products, and natural gasoline in the United States, 1942–46

	1942	1943	1944	1945	1946 [1]
Crude petroleum:

[1] Final figures. [2] As reported to Bureau of Mines. [3] U. S. Department of Commerce. [4] Subject to revision.

The domestic demand for all oils in continental United States increased from 1,772.7 million barrels in 1945 to 1,791.0 million in 1946—a gain of 1 percent. This net gain was a balance between the sharp drop in new military purchases and the rapid expansion in civilian requirements. The changes in the domestic demand for the major products in 1946, compared with 1945, indicated a 5.5-percent gain for motor fuel, an 8.8-percent decline for residual fuel oil, a 7.5-percent increase for distillate fuel oil, and an 18.0-percent gain for kerosine.

The total domestic demand for motor fuel rose from 696.3 million barrels in 1945 to 734.8 million in 1946. The outstanding factors in the domestic demand for motor fuel were the decline in aviation-gasoline demand from 117.0 million barrels in 1945 to 12.9 million in 1946; and the increase in the highway use of gasoline, according to the Public Roads Administration, from 455.9 million barrels in 1945 to 610.7 million in 1946. The new military purchases of aviation gasoline in 1946 amounted to only about 1 million barrels, due chiefly to the heavy reduction in accumulated stocks in military custody.

Domestic demand for residual fuel oil declined from 523.4 million barrels in 1945 to 477.2 million in 1946—an 8.8-percent drop. The main factors in this decline were the sharp drop in naval requirements and reductions in railroad and vessel use from the war peaks. Consumption by gas and electric companies increased substantially as reconversions were made from coal back to oil after the war shortage of oil passed.

Domestic demand for distillate fuel oil rose from 226.1 million barrels in 1945 to 243.0 million in 1946—a 7.5-percent increase. With a probable decline of 15 to 20 million barrels in new military purchases in 1946, the increased available domestic supply provided for a gain of possibly 18 percent in heating-oil requirements and substantial increases in railroad and industrial uses. The necessity for a rapid expansion in new housing facilities should cause a very rapid gain in the demand for heating oils in the next few years.

The domestic demand for kerosine increased from 75.6 million barrels in 1945 to 89.2 million in 1946—an 18.0-percent gain. The rapid expansion in the demand for kerosine is due to its use as range oil and for small space-heating units. Continued rapid increase in use for these purposes may be expected.

The rise in domestic demand for miscellaneous oil products has been very rapid—from 12.5 million barrels in 1941 to 37.9 million in 1945 and 46.0 million in 1946. The major products in this group are liquefied gases used for fuel and for chemical and rubber production. In 1946, the domestic demand for liquefied gases totaled 39.7 million barrels or 86 percent of the miscellaneous group. If the present rate of increase continues, liquefied gases will soon rank next to kerosine in importance among the marketed products of the industry.

Comparison of quarterly trends of supply and demand in 1946 with 1945 is difficult because of the transition from war requirements to civilian demand and the lack of comparative data for appraising the changes involved.

Crude runs to stills rose from 4,609,000 barrels daily in the first quarter to 4,765,000 in the second quarter and 4,851,000 in the third quarter and dropped to 4,734,000 barrels daily in the fourth quarter.

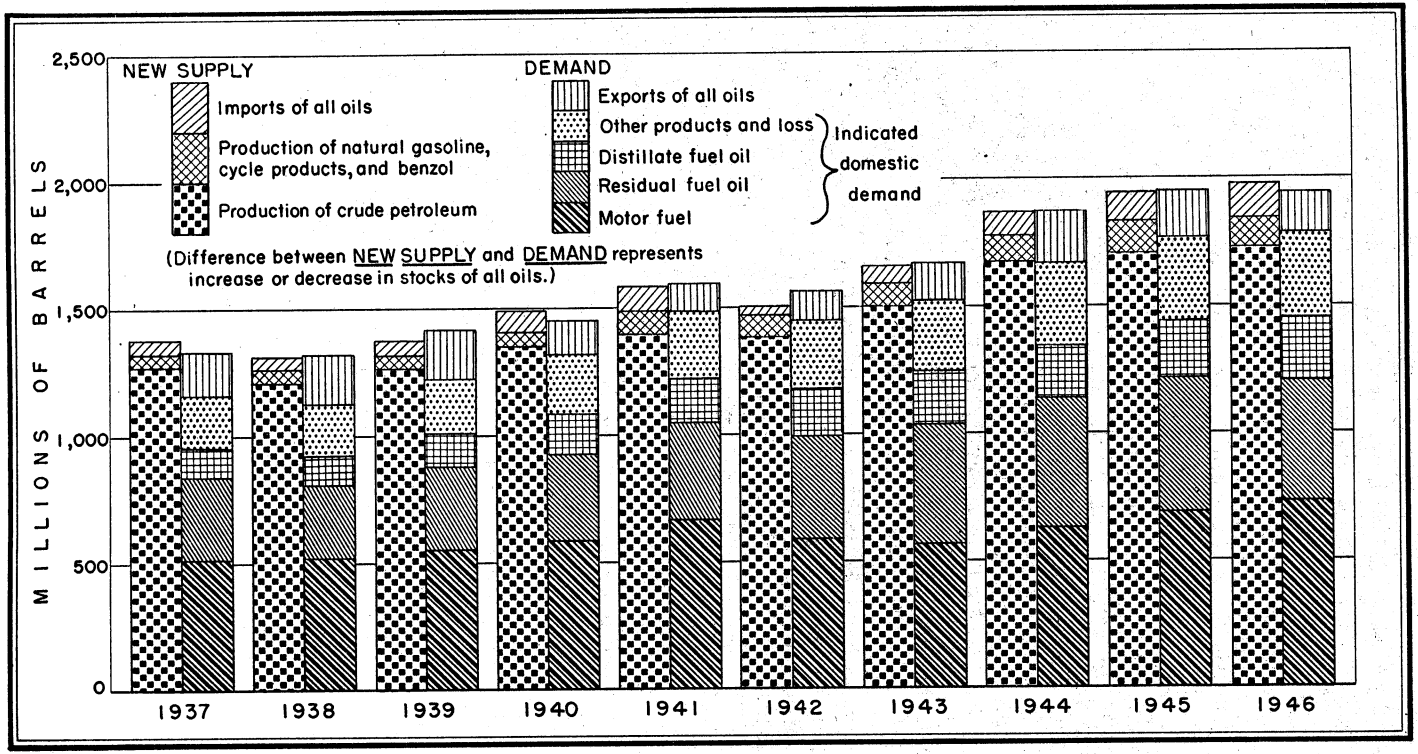

FIGURE 1.—Supply and demand of all oils in the United States, 1937-46.

The peak in the third quarter was due to a major increase in refined stocks amounting to 36.1 million barrels or 393,000 barrels daily. At the time, this large increase in stocks seemed more than ample, and consequently runs declined in the fourth quarter with the expectation that they might remain at a low level in the first quarter of 1947. However, demand expanded so rapidly in the last quarter of 1946 and in the first quarter of 1947 that the seasonal increase in stocks proved hardly adequate to meet requirements.

Domestic demand for all oils averaged 4,850,000 barrels daily in the first quarter of 1946, declined to 4,825,000 in the second and 4,722,000 in the third quarter, rose to 5,228,000 in the fourth quarter, and increased to 5,496,000 barrels in the first quarter of 1947. Domestic demand in the third quarter of 1946 was 1.7 percent less than in the same period of 1945 and 11.5 percent greater in the fourth quarter of 1946 than in the same period of 1945. The demand in the first quarter of 1947 exceeded that in the first quarter of 1946 by 13.3 percent.

The large relative gains in domestic demand in the last quarter of 1946 and the first quarter of 1947 set a new trend and resulted in sharp upward revisions in the forecasts for the succeeding quarters of 1947.

RESERVES

The Committee on Petroleum Reserves, American Petroleum Institute, estimated proved reserves of crude oil in the United States on December 31, 1946, at 20,874 million barrels compared with 19,942 million on December 31, 1945. Starting with 1945 the estimates have been revised to exclude condensate and to include crude petroleum only. These reserves include crude oil in known and proved fields recoverable under existing economic and operating conditions.

The increase in total reserves during 1946 was 932 million barrels. The largest gains in reserves were 812 million barrels for Texas, 93 million for Louisiana, 40 million for Colorado, 32 million for New Mexico, and 13 million for Mississippi. The greatest declines in reserves were 24 million barrels for California, 21 million for Arkansas, 12 million for Pennsylvania, and 11 million for Wyoming.

WORLD OIL SUPPLY

World production of crude petroleum again exceeded all previous records in 1946, increasing from 2,594 million barrels in 1945 to 2,750 million in 1946—a 6-percent gain. The total increase—156 million barrels—represented gains of 20 million in the United States (1 percent), 15 million in the U. S. S. R. (10 percent), and 61 million barrels in the Persian Gulf area (39 percent).

Comparing 1946 with 1941, the increase in the world production of crude petroleum amounted to 529 million barrels or almost 24 percent. Of this increase, 331 million barrels are credited to the United States and 198 million barrels to all other countries. The outstanding gains have been 160 million barrels in Venezuela, 158 million in the Persian

[1] From reports of Committee on Petroleum Reserves, American Petroleum Institute, of the amount of crude oil that may be extracted by present methods from fields completely developed or sufficiently explored to permit reasonably accurate calculations. The change in reserves during any year represents total new discoveries, extensions, and revisions, minus production.

[2] New basis; excludes condensate.

Gulf area, and 23 million barrels in Iraq. The principal declines were 74 million barrels in Russia, 52 million in the Netherlands Indies, and 9 million barrels in Rumania.

According to Bureau of Mines data for 1946, total oil exports from continental United States amounted to 151 million barrels compared with imports of 135 million, so that the net export was only 16 million barrels compared with a net export of 12 million in 1941. These figures indicate that the United States has reached a point where domestic demand approximates production.

The domestic demand for all oils in continental United States has increased from 1,486 million barrels in 1941 to 1,791 million in 1946—a gain of 305 million barrels or almost 21 percent. Considering the small net export from the United States, the supply of oil for the rest of the world closely approximates foreign crude production, which rose from 819 million barrels in 1941 to 1,017 million in 1946—a gain of 24 percent. Considering the material decrease in the foreign production of liquid fuels from coal and other sources since 1941, the total demand for all oils outside the United States probably has increased at a rate approximating that in the United States.

CRUDE PETROLEUM

SUPPLY AND DEMAND

The total demand for crude petroleum in the United States increased to the record level of 1,813 million barrels in 1946—a gain of 21 million barrels or over 1 percent compared with 1945. The demand for domestic crude petroleum rose from 1,718 million barrels in 1945 to 1,728 million in 1946—a gain of 10 million barrels. The demand for imported crude oil amounted to 85 million barrels in 1946—a gain of 11 million compared with 1945.

Compared with 1945, the production of domestic crude petroleum in 1946 increased 20 million barrels, imports of crude oil were 12 million barrels greater, and total stocks of crude oil gained 7 million barrels compared with a decrease of almost 4 million barrels for the previous year.

The principal changes in crude-oil demand were an increase of 11 million barrels in total runs to stills, a gain of 8 million barrels in crude exports, and an increase of over 2 million barrels in transfers of crude oil to fuel oils.

PRODUCTION

General.—Production of crude petroleum in the United States set a new record of 1,733,424,000 barrels in 1946—a gain of 20 million barrels compared with 1945. Production in 1946 was 331 million barrels or 24 percent greater than in 1941. This expansion in production since 1941 has taken place with only a small increase in proved reserves. The volume of shut-in production has been so reduced that an expanded program of exploration and drilling will be essential if the increasing demand for crude oil is to be met from domestic production.

The principal gains in production in 1946 compared with 1945 were 12 million barrels for Louisiana, 7 million for Colorado, 6 million for Texas, and 5 million for Mississippi. The largest declines were 11 million barrels for California and 5 million for Oklahoma.

Six States produced 88 percent of the crude petroleum output in 1946. Texas ranked first with 43.9 percent of the total and California was second with 18.2 percent. Louisiana was third with 8.3 percent, Oklahoma fourth with 7.8 percent, Kansas fifth with 5.6 percent, and Illinois sixth with 4.3 percent.

The East Texas field has been the largest producer in the United States and had an output of 120.6 million barrels in 1946—a decline of almost 11 million compared with 1945. In California, production in the Wilmington field increased 4 million barrels to a total of 40.2 million barrels in 1946, while production in the Coalinga field declined over 2 million barrels to 29.2 million in 1946. The West Edmond field in Oklahoma ranked fourth in 1946 with a production of 23.6 million barrels—a decline of 3 million compared with 1945.

BY STATES

Alabama.—Drilling declined sharply from 37 completions in 1945 to 16 in 1946 as development and exploration subsided. Three oil wells were completed in the Gilbertown area, and all of the 11 exploratory wells drilled were failures.

Production from Gilbertown, the only producing area was at stable rates during 1946, amounting to 380,000 barrels compared with 181,000 barrels in 1945.

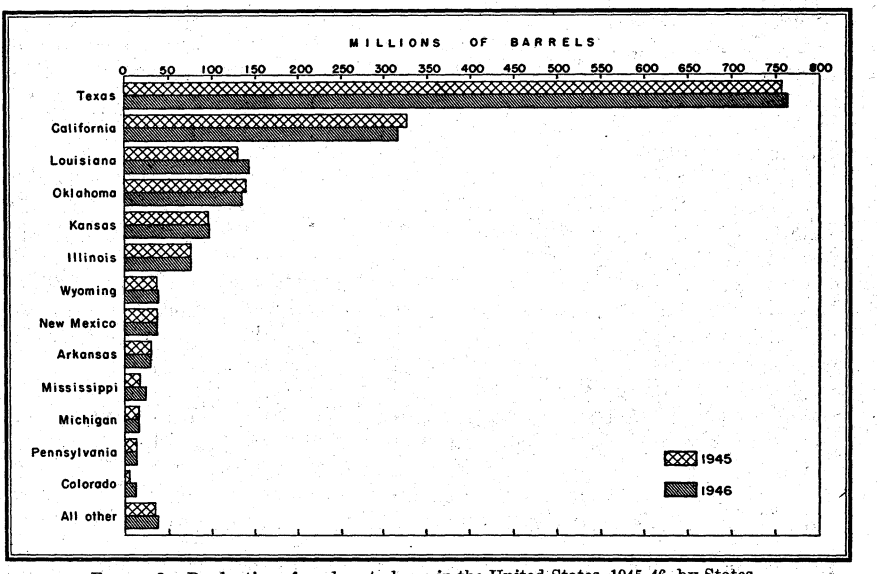

FIGURE 3.—Production of crude petroleum in the United States, 1945–46, by States.

Arkansas.—Production declined from 28,613,000 barrels in 1945 to 28,375,000 in 1946 but in the last quarter was above the rate of comparable 1945 months. Output of the Village and Atlanta fields gained materially to new highs, but elsewhere moderate declines were the rule.

[2] Includes oil consumed on leases and net change in stocks held on leases for entire State.
[3] Subject to revision.

Oil-well completions numbered 110, of which 9 were exploratory. The most active field was Wesson, a 1945 discovery, with 38 oil wells added. Other leading fields with oil completions were: Stephens 17, Village 11, and Gum Creek 9.

Five oil fields were discovered: East McNeil in Columbia County, West Lewisville and Spirit Lake in Lafayette (Lower Glen Rose), Willesville (Nacatoch) in Nevada, and Pace City (Hosston) in Ouachita. Spirit Lake and West Lewisville are reported to be most promising. Several producing zones were opened at Wesson and others at Buckner, Village, West Lewisville, and Rainbow City.

California.—Crude production declined 11.3 million barrels in 1946 from the record total of 1945 to 315,179,000 barrels, exceeding 1946 demand, however, by almost 5 million barrels. To maintain this level of output the State's fields, except for the Elk Hills Naval Reserve, produced at a higher rate than in 1945.

In the San Joaquin Valley a decline of 11.7 million barrels resulted from the cut-back of 12.1 million barrels at Elk Hills and gains chiefly at Edison and Cymric that offset declines in most of the leading fields.

Output of the Coastal district declined 2 percent to 52,586,000 barrels as withdrawals from the leading fields, Ventura Avenue and Santa Maria Valley, were reduced from 1945 peaks. Capitan, Elwood, and Ventura-Newhall recorded increased production.

The Los Angeles Basin district increased its production 1.7 million barrels over 1945 to 113,194,000 barrels because of a 4-million-barrel gain at Wilmington, the State's leading field, to 40,224,000 barrels.

Oil-well completions declined from 1,690 in 1945 to 1,375 in 1946. The most active fields, with completions in each, were: Wilmington 183, Cymric 108, Belridge South 83, Edison 72, and Newport 70.

Completion of 260 wildcat wells resulted in 14 oil-field discoveries, a number of new pools or extensions to older fields. As in 1945, Kern County was prospected most intensively, having 113 exploratory completions compared with the next most active counties—Los Angeles with 34, Orange with 22, and Ventura with 16. However, 9 of the new oil fields were in Los Angeles County and 5 in Kern. Early indications were that the Salt Creek field in Kern County and the East Los Angeles field may be the most significant of the discoveries. The principal new pool discoveries were at Cymric, Elk Hills, Newhall-Potrero, Ramona, Newport, and Potrero. Important extensions were reported at South Belridge, Elk Hills, Midway-Sunset and Wilmington.

According to estimates of the American Petroleum Institute, reserves of crude petroleum added in 1946 were slightly less than crude production.

Colorado.—Production of 12,016,000 barrels of crude petroleum in 1946 compared with 5,036,000 barrels in 1945 reflected expansion of the great Rangely field, whose output increased from 1,565,000 barrels to 8,314,000. Wilson Creek, second in importance to Rangely, increased its output 328,000 barrels to 2,381,000 in 1946. Changes in other fields were small. Further marked expansion in Rangely production is indicated by field conditions and by plans for a second pipe-line outlet running westward to Salt Lake City.

Oil-well completions in 1946 advanced to a record total of 148, of which 141 were at Rangely, 4 at Wilson Creek, and 3 elsewhere. Twenty-one exploratory wells were drilled, discovering 1 oil field and effecting 3 extensions to the Rangely field. The new oil field is Elk Springs in Moffat County, northeast of the Rangely field. The discovery well produced about 150 barrels daily from Weber (Pennsylvania) sand at a depth of 6,087–6,140 feet. This discovery is a result of the widespread exploratory effort directed to this region by the spectacular success of the Rangely development, which ranks as one of the largest reserves opened in recent years.

Production of crude petroleum in Colorado, 1942–46, by fields

[2] Subject to revision.

Florida.—Production from the State's only field, Sunniland in Collier County, increased from 30,000 barrels in 1945 to 57,000 in 1946. Two additional wells were completed in 1946 in the single producing formation, reported as the Young dolomite member of the Glen Rose formation.

Twenty-four exploratory wells were drilled in 1946—all unsuccessful.

Illinois.—After 5 years of decline, crude production increased from 75,094,000 barrels in 1945 to 75,297,000 in 1946, owing to a higher rate of production during the 1946 summer months. Changes in production by fields were relatively small, except at Mattoon, Coles County, which under intensive development produced about 4,200,000 barrels of oil in 1946 compared with less than 500,000 barrels in 1945.

Oil-well completions numbered 1,344 in 1946 and 1,060 in 1945, influenced by the drilling campaign in the Mattoon field, which was materially enlarged. Oil completions in the most active fields were: Mattoon 297, Clay City 122, Stokes-Brownsville 84, Marine 53, Calhoun 48, and Herald 47.

Thirty-one new pools were discovered and many extensions proved by step-out wells. Most new pools were relatively close to production. The more important of these appeared to be South Stanford and Hoosier in Clay County, Central Lancaster, North Friendsville, and North Maud in Wabash County, and East Covington in Wayne County. A total of 635 holes classed as exploratory resulted in 96 commercial oil wells. Wayne, White, and Clay Counties were the most active in exploration among many counties involved.

Most of the new oil, as well as developed production in Illinois, is from horizons in rocks of Mississippian age. However, some interest

is reported by Dr. A. H. Bell of the Illinois Geological Survey in testing for Silurian production along the western side of the Illinois Basin and for production in pre-St. Peter Ordovician and Cambrian strata on the Pittsfield-Hadley anticline in western Illinois.

Indiana.—Production of petroleum increased from 4,868,000 barrels in 1945 to 6,726,000 in 1946, reflecting increased development activity in the southwestern producing district. The leading fields, with 1946 production in thousands of barrels, were: Griffen 1,732, New Harmony South 1,204, Owensville North 739, New Harmony 415, and Mt. Vernon 373.

Oil-well completions tripled over 1945 to 330, with oil completions in most active fields as follows: New Harmony South 65, Mt. Carmel East 44, Owensville North 42, and Union-Bowman 26. Wildcat wells, of which there were 118, were concentrated chiefly in Posey (25) and Gibson (24) Counties; the remainder being widely scattered. Seventeen of these were completed as oil wells.

Production of crude petroleum in Indiana, 1942–46, by months

[Thousands of barrels]

[1] Subject to revision.

Among new pool discoveries the most promising appeared to be New Harmony East and Springfield in Posey County and Princeton North in Gibson. Extensions of Dodds Bridge, Troy, New Harmony South, and Griffen fields, among others, were reported.

Deep tests penetrated the Trenton limestone under Griffen field production, the Glenwood-St. Peter formation in Owen and Clay Counties, and the Mt. Simon sandstone (Cambrian) in Jasper County.

Kansas.—The production of Kansas oil fields has been relatively stable through the war period. Small declines in 1944 and 1945 were reversed by a 1-percent gain in 1946 to 97,218,000 barrels. Principal areas of higher production were Kraft-Prusa-Feltes and the leading Trapp-Sellens field.

Increased drilling, related to closer spacing of wells in proved areas, resulted in 1,055 oil-well completions in 1946, an increase of 217 over 1945. Development was widespread but most active, as indicated by oil-well completions in: Trapp 127, Kraft-Prusa 61, El Dorado 46, Chase 43, and Stoltenburg 33. In the Hugoton gas field, 265 gas wells were drilled.

In all, 307 wildcat wells were drilled in 1946—31 of these being successful oil wells. Prominent among the discoveries was Hickory Creek in Butler County, producing from Bartlesville sand. By the end of 1946, production had exceeded 120,000 barrels from 13 wells. The Boggs pool, Barber County, is expected to contain a considerable reserve of oil in Simpson sand. Except for a few scattered developments in counties to the east, the discoveries were roughly alined in the counties from Rooks and Ellis on the north to Pratt and Barber on the south. The majority of these areas found oil in the Arbuckle limestone; a few in the Lansing, Mississippi, and Viola limestones, and one in the Reagan sand (Rush County).

Near the year end, indications of important discoveries were reported in wells in Barber, Ellis, Harvey, and Kingman Counties.

Kentucky.—Crude-oil production in Kentucky continued an upward trend to set another record for the State in 1946. The total for 1946 was 10,578,000 barrels, compared with 10,325,000 in 1945. Western Kentucky continued to produce about 82 percent of the total; but there was a relative shift in the other areas as Eastern Kentucky dropped from a level of 16 percent to 13 percent and the South-Central producing area increased from a 2-percent contribution in 1945 to 5 percent of the total in 1946. Production in Henderson County recorded a marked gain for the year and the output in Union County declined but the combined total from these two counties accounted for 63 percent of the State total. In Southern Kentucky the only important increase in production came from Clinton County where the output rose above 400,000 barrels.

The number of oil wells completed in 1946 declined for both the Eastern and Western areas but increased for the Southern area. This increase in Southern Kentucky was due to the rapid expansion in Clinton County where over 95 percent of the drilling for this area took place. In this South-central area only five wells were drilled outside of Clinton County and all were dry holes. One of these, a well near McKinney in Lincoln County, attracted particular attention as the deepest well (6,117 feet) ever drilled in the State. The Uniontown pool, in Western Kentucky, which ranks first as a crude producer, was relatively quiet in 1946 with few tests drilled, while active drilling continued in Henderson County, particularly in the following pools: Pool, Smith Mills, and Henderson.

Seven oil pools were discovered, three in Henderson County, two in McLean County, and two in Daviess County. None of the new fields represented outstanding discoveries, but development drilling resulted in several important extensions to existing fields.

Louisiana.—A gradual upward trend in crude-oil production through 1946 raised the year's total to the record level of 143,303,000 barrels, compared with 131,051,000 barrels in 1945. A 3-year decline in production from Northern district fields was reversed abruptly by gains of 4.5 and 2.5 million barrels in output of the rapidly developing Delhi and Lake St. John fields, respectively, and 1.0 million barrels at Haynesville, where gas-pressure maintenance operations and a new pay zone were instrumental in halting a rapid decline.

In the Gulf district production increased 5 percent to 112,535,000 barrels aided by modest gains in most producing fields, among which Delta Farms, Egan, Good Hope, Tepetate, Vinton, and Bayou Sale were the leaders.

Oil-well completions numbered 363 in the Gulf district in 1946, a decline from 407 reported in 1945. Oil wells drilled in the most active fields were: Vinton 20, Egan and Golden Meadow 19 each, Delta Farms 17, Mamou 12, West Tepetate 11, and Bayou Sale 10. Major additions to oil reserves by extension or discovery of new producing zones were made at Weeks Island, Iberia Parish; Vinton, Calcasieu Parish; and Bayou de Fleur, a 1946 discovery in Jefferson and Plaquemines Parishes.

In the Northern district oil-well completions increased from 239 in 1945 to 450 in 1946 owing largely to intensive development at Delhi and adjacent new fields. At Big Creek 123 oil wells were drilled and at Delhi 88, during which the 2 fields merged into 1, over 17 miles in length, structurally a stratigraphic type reservoir skirting the south flank of the Monroe uplift. Other active fields, with the number of oil wells drilled, were: Caddo 107, Lake St. John 41, and Haynesville 14.

In the Gulf district 140 exploratory wells discovered 9 oil fields and 5 gas-condensate fields, ranging in depth from 7,680 feet to over 12,600 feet. A large number of new deep productive zones were opened, some of which encouraged the practice of flank drilling down the sides of domal structures. At Weeks Island, the deepest producing well in the world was completed at 13,780 feet in Miocene sand, flowing 550 barrels daily of 33° gravity oil through a small choke.

In the Northern district 114 wildcat wells discovered 5 oil and 2 condensate fields. The oil fields were: Plain Dealing in Bossier Parish, South Big Creek in Franklin, Ashland in Natchitoches, Lake End in Red River, and Negreet in Sabine. Condensate fields were at Killens Ferry, Franklin Parish, and Choudrant, Lincoln Parish. Notable extensions to productive areas were made at Big Creek, Delhi, and Lisbon.

Michigan.—Production in 1946 amounted to 17,074,000 barrels—a decline of 1 percent compared with decreases of 7 percent in 1945, 11 percent in 1944, and 5 percent in 1943. The major increases of about 1,000,000 barrels from the Deep River field and 600,000 from Coldwater failed to compensate for declines at Reed City, Fork, and other fields. Reed City continued as the leading producer, even after a 24-percent drop from the preceding year.

The total of 234 oil wells, completed in 1946, included 19 wildcats, but at present none of the discoveries appear very large. The more promising new fields are Brenner and Hawkhead, both in Allegan County and both producing from Traverse limestone. At the end of 1946, 16 wells had been drilled in developing the Brenner field and 13 in the Hawkhead field. Other intensively developed fields, with the number of oil wells completed in 1946, include: Deep River 40, Coldwater 19, Kawkawlin 14, and East Norwich 10.

Shallow-drilling exploration to determine the elevation of strata below the glacial drift was continued throughout the year, and 173 shallow tests were drilled.

Production of crude petroleum in Michigan, 1942–46, by fields, in thousands of barrels

[Michigan Department of Conservation]

Year	Adams	Cold-water	Deep River	East Norwich	Fork	Headquarters	Kawkawlin	Porter	Reed City	Winterfield	Other fields	Total
1942	1,030	-------	-------	3	53	2,321	492	891	9,102	1,259	6,603	21,754

Mississippi.—Petroleum production increased 27 percent in 1946 to 24,216,000 barrels in response to further development or recently discovered fields. Tinsley remained the largest producing field, but its output declined from 9.3 million barrels in 1945 to 8.1 million in 1946. Other leading fields, with 1946 production in thousands of barrels, were: Cranfield 4,473, Heidelberg 4,104, Baxterville 2,420, Eucutta 2,389, and Pickens 1,773.

Oil-well completions declined from the high level of 1945 (198) to 154 in 1946 as drilling in the leading fields of 1945, particularly Heidelberg and Eucutta, passed its peak. Oil wells added in active fields in 1946 were: Cranfield 31, Baxterville 22, Heidelberg 21, Brookhaven 19, Eucutta 17, and Guinville 8.

Of 79 wildcat wells drilled, only 2 found commercial oil production. These wells opened two fields in Adams County: Pine Ridge producing from Wilcox sand below 5,600 feet and La Grange producing initially from lower Tuscaloosa and, upon recompletion, from Wilcox sand. Significant additions to reserves were made by extension or opening of new productive zones in the Fayette, Brookhaven, Mallilieu, La Grange, and Tinsley (by deeper drilling) fields. Condensate reserves were added at Hub and Cranfield.

[1] Subject to revision.

Montana.—Larger output from the Montana portion of Elk Basin and from the Cat Creek field raised crude-oil production of the State from 8,420,000 barrels in 1945 to 8,801,000 barrels in 1946. The

Cut Bank field produced 4,546,000 barrels, about 300,000 less than in 1945, and Kevin-Sunburst declined 7 percent to 1,772,000 barrels. The Elk Basin produced 1,355,000 barrels in 1946 and Cat Creek 480,000 barrels, stimulated by the discovery of new production in the Ellis sand and the Madison formation.

A decline in drilling activity, particularly at Cut Bank, was reflected in the reduction in number of oil-well completions from 217 in 1945 to 159 in 1946. Completions by leading fields in 1946 were: Kevin-Sunburst 58, Cut Bank 57, Cat Creek 25, and Pondera 6.

Forty-seven wildcat wells were drilled, of which 11 found oil production—7 in Petroleum County, 3 in Glacier, and 1 in Toole. Two oil fields were discovered: Rattlesnake Butte in Petroleum County (Second Cat Creek sand) and West Kevin in Toole County producing from Ellis-Madison. New pay sands were found at East Utopia, Liberty County (Devonian gas), and at Cat Creek, east and west. Extension of Madison limestone production at Cut Bank probably added most significantly to crude reserves in 1946.

Nebraska.—Production in 1946 amounted to 265,000 barrels compared with 305,000 barrels in 1945 and 1,898,000 barrels in the peak year 1941. The Falls City field accounted for about 57 percent of the total, Barada about 33 percent, and Dawson and Shubert the remaining 10 percent. All producing fields are in Richardson County.

The number of completions totaled 3 in 1946 compared with 13 in 1945. Four of the six tests were exploratory and resulted in dry holes. The Barada field was extended a short distance by completion of an oil well that had an initial production of 60 barrels daily from the Hunton limestone.

New Mexico.—Further declines in most leading fields reduced production of crude petroleum from 37,351,000 barrels in 1945 to 36,860,000 in 1946. Offsetting part of the declines in older fields were increased withdrawals from the rapidly developing Drinkard, Paddock, and Brunson pools (parts of which overlap) in Lea County. The only important older field to show a production gain was Eunice, which produced 300,000 barrels more oil in 1946 than in 1945.

Oil-well completions increased from 279 in 1945 to 294 in 1946; of the latter, 286 were in the Southeast district and 8 in the Northwest. In the Southeast 38 wildcat wells resulted in 3 oil wells in Lea and 1 in Eddy County. Six wildcats in the Northwest were unproductive.

Oil completions in leading fields were: Drinkard 50, Paddock 34, Caprock 30, Grayburg-Jackson 29, and Square Lake 22.

The only new field discovery—Bitter Lake, Chaves County, producing from shallow San Andres limestone—was apparently of small importance. Large extensions of the important Drinkard, Paddock, and Brunson pools were made, and drilling at Caprock was revived by extension to the southeast.

A continuing trend toward deeper drilling was evident in Southeast New Mexico. Interest in the Delaware Basin was heightened by a deep well that revealed 12,000 feet of Permian sediments showing evidence of oil and gas in several zones.

In the San Juan Basin on the northwest, intensive exploratory and leasing activity progressed in 1946. Great interest was shown in two deep tests that were drilling at the end of the year.

New York.—Production of crude petroleum increased in 1946 for the first time since 1942—to 4,863,000 barrels from 4,648,000 barrels in 1945.

The rate of drilling increased over 1945, oil-well completions numbering 795 compared with 723 a year earlier. In all, 735 input wells were drilled in 1946 in connection with secondary-recovery operations.

No exploratory drilling for oil was reported.

Ohio.—In 1942–45 crude production in Ohio declined steadily from 3,543,000 barrels to 2,828,000. This declining trend was broken by a slight increase in production in 1946, when the total for the State was 2,908,000 barrels—a gain of 3 percent. The increased production of Pennsylvania Grade within the State compensated for the declines in production of other grades to produce the small net gain for the year. Almost 60 percent of the 1946 output was Pennsylvania Grade.

Oil-well completions in 1946 increased about 35 percent over 1945 for the largest gain in recent years. The year was marked by the relative increase in the number of oil-well completions to 26 percent of total wells drilled and by the percentage decline of dry holes from 37 in 1945 to 32 in 1946. Muskingum County recorded the largest number of oil-well completions, followed in order by Meigs, Perry, Monroe, Licking, and Washington.

About 65 exploratory wells were drilled in 1945, including 4 listed as oil wells, but no important discoveries of new oil resulted. However, a number of development wells resulted in extensions to existing fields in Perry, Muskingum, and Meigs Counties. In all, about 1,800 acres were added to Clinton territory and 1,000 acres to Berea.

Oklahoma.—With reversal of the upward trend of production from West Edmund, the State's greatest current source of oil, production in 1946 declined to 134,497,000 barrels from the 1945 total of 139,299,000 barrels. Material reductions in output of West Edmund, Oklahoma City, Pauls Valley, the Seminole district, and many other fields were not offset by the few scattered gains at Velma, Moore, Hewitt, and the old Glenn-Sapulpa area.

The upward trend in oil-well completions continued for the third successive year—1,654 new wells in 1946 comparing with 1,426 in 1945. New oil wells in the most active fields were: Cache Creek 180, Velma 74, West Edmund 72, Soldier Creek 48, Cement 43, and Lone Grove 31. Much of the new drilling was related to 1946 shallow-sand

discoveries in Cotton County, among which were Cache Creek and Soldier Creek.

Exploratory completions increased over 20 percent in 1946 to 573 of which 92 were successful oil wells. Most of the discoveries were in Seminole and adjacent Counties and southwestward from Seminole to Cotton County, which was the most active in exploratory drilling owing to discovery of prolific oil production from Pennsylvanian sand at depths approximating 1,400 feet. Deeper drilling in search of oil accumulations in the southeastern portion of the great Anadarko Basin was actively carried on—over 100 wildcat wells having been drilled in the Garvin-McClain-Stephens County area. Testing in the deeper parts of the basin in western Oklahoma resulted in gas production in Washita County (Springer sand); oil production in Major (Prue sand) and Garfield Counties ("Wilcox" sand); and a dry hole (12,610 feet) in Dewey County, which found a showing of oil and gas in Pennsylvanian sand probably below 9,000 feet. In all, 51 new oil fields were reported in Oklahoma in 1946 and numerous extensions and new productive zones in existing fields. Among the more important discoveries from the standpoint of reserves were: Southwest Antioch, Southwest Maysville, and Northeast Butterly in Garvin County, Soldier Creek and Cache Creek in Cotton County, and Coon Creek in Logan County.

Production of crude petroleum in Oklahoma, 1942–46, by fields, in thousands of barrels

[1] Includes Allen Deep only.

The Keyes area in eastern Cimarron County, a 1945 discovery, was extended in 1946 and had five wells at the end of the year. The producing formation is a Pennsylvanian sand at about 4,860 feet.

Pennsylvania.—Crude production in Pennsylvania had followed a downward trend since 1942 but changed in 1946 as the reported output rose to 12,996,000 barrels compared with 12,515,000 in 1945—a gain of 481,000 barrels or about 4 percent. About 80 percent of all crude production in the State came from the Pennsylvania portion of the Bradford field. The entire Bradford field, including the part in New York, supplied about 52 percent of the total Pennsylvania-Grade crude-oil production of the Appalachian area.

About 75 percent of all wells drilled in Pennsylvania are connected with secondary-recovery operations, and some well-completion series include part of these secondary-recovery wells as oil wells. In addition to the oil wells drilled as a part of these recovery projects, about 200 oil-well completions were recorded for new pools or extensions of old fields in 1946. Less than 20 percent of these completions were in the Southwestern area compared with over 80 percent of the total in McKean County. In this county, the most important development-drilling activity was in the Coryville pool in the northeastern part of the county. This pool was discovered in 1945 and in 1946 was extended to include approximately 1,800 acres. This development accounted for 163 of the total oil-well completions for the year. The greatest drilling activity in Southwestern Pennsylvania was the development of the Young pool in Washington County. This pool, discovered in 1945, was extended to include about 390 acres by the end of 1946. Continued secondary-recovery activity in the Bradford field was indicated by the drilling of 2,503 new wells, about half of which were water-intake wells compared with 2,351 in 1945.

Texas.—Production in the early months of 1946 remained below the level of a year earlier but increased to record levels in July and was maintained at a high rate for the balance of the year. The 1946 total—760,505,000 barrels—exceeded the 1945 record by 5.8 million barrels. The principal gain was in West Texas (16.6 million barrels) where output was limited by transportation facilities rather than capacity to produce at efficient rates. South and North Texas districts increased their production over 1945 5.8 and 2.9 million barrels, respectively. A reduction of 9.9 million barrels was reported in Gulf Coast production and 7.4 million barrels in the East Texas district. A decline of 10.1 million barrels in production of the East

[1] Subject to revision.
[2] Included with "Other Gulf Coast" in 1942 and 1943.
[3] Includes crude oil consumed on leases and net change in stocks held on leases for entire district.
[4] Joiner, Kilgore, Lathrop, and other pools in Cherokee, Gregg, Rusk, Smith, and Upshur Counties.
[5] Includes other fields in Falls, Freestone, Limestone, and Navarro Counties.
[6] Includes the fields in and between Wilbarger, Wichita, Clay, Montague, and Cooke Counties on the north and Runnels, Coleman, Brown, and Comanche Counties on the south.
[7] Includes crude oil consumed on leases and net change in stocks held on leases for East (exclusive of East Texas proper) Central, North, and South Texas.
[8] Carson, Gray, Hutchinson, Moore, and Wheeler Counties.
[9] Includes fields in Brooks, Duval, Hidalgo, Jim Hogg, Jim Wells, La Salle, Live Oak, McMullen, Starr, Webb, and Zapata Counties.
[10] Includes the part of Jordan pool in Crane County.

Texas field was partly offset by a gain of 2.4 million barrels from the Hawkins field.

Oil-well completions increased to 4,720 in 1946 from 4,036 in 1945, with much of the gain in drilling in the East and West Texas districts. Exploratory completions numbered 1,591 in 1946 and resulted in 247 oil discoveries and extensions to existing fields. Both totals are moderately above the 1945 experience. Gulf Coast, North Central, and West Texas lead other districts in the number of discoveries in both 1945 and 1946.

Moderately lower production was reported in most fields of the Gulf Coast district, including all the leading fields except Thompsons, which increased only 129,000 barrels. Other fields with greater output in 1946 included Fannette, Refugio, Livingston, and Saxet.

Oil-well completions increased from 1,013 in 1945 to 1,100 in 1946. The most active fields, with the number of oil wells drilled, were: Seeligson 76, Willamar 59, Tom O'Connor 58, Tijerina-Canales 47, Falls City 42, and Refugio, Bonnie View, and Agua Dulce 25 each. Most of the concentrated drilling was in the lower portion of the district, as activity declined in the Upper Gulf.

Of 375 exploratory wells drilled, 79 discovered new oil or condensate, or extended old fields. Numerous new productive formations were opened, but discoveries of new fields were fewer than in 1945. Many of the discoveries produced from the Frio sand. Perhaps the most significant revelation of 1946 drilling was evidence that several major fields in Nueces, Kleberg, and Jim Wells Counties may develop into a single tremendous field.

West Texas production continued the upward trend of recent years, gaining 9 percent over 1945 to 192,296,000 barrels. Although the two leading fields—Wasson and Slaughter—produced less oil in 1946, material gains in other fields were numerous, the largest being from Keystone, TXL, and Fullerton.

In 1946, 1,462 oil wells were completed, compared with 1,309 in 1945. Among many active fields, the following recorded the greatest number of new oil wells in 1946: Keystone 126, TXL 109, Fullerton 92, Sharon Ridge 86, Garza 81, Welsh 79, and Slaughter 69.

Of 224 wildcat wells drilled, 49 were classified as oil discoveries. Nineteen new fields and many new pay sands and extensions were opened. Of great interest from a geological standpoint were the discovery of oil in Pennsylvanian limestone in Coke County, development of Ellenburger limestone production in Kent County, and production for the first time of oil from Mississippian limestone. Active exploration revealed in 1946 an unusual quantity of new evidence offering promise of development of important new reserves of oil and gas in the West Texas district.

Production from the East Texas district in 1946—171,497,000 barrels—was 7.4 million barrels less than in 1945 owing to the decline of 10.1 million barrels from the East Texas field, whose output of 121,080,000 barrels was the lowest since 1931. In that year its development and production were increasing rapidly toward the peak of flush production. Hawkins field production increased 2.4 million barrels to a new high of 14,843,000 barrels, and the old Talco field gained 500,000 barrels after several years of decline. Persistent declines continued at Cayuga, Rodessa, and Sulphur Bluff.

Oil-well completions increased sharply over 1945 to 385, owing chiefly to the completion of 145 wells at Hawkins. Oil completions in other active fields were: East Texas 28, Talco 23, Smithland 19, Sand Flat 16, Merigale 15, and Pickton 14. One oil well was drilled in the Carthage gas and condensate field and 120 gas wells.

Exploration resulted in the discovery of 12 new fields—8 producing oil and 4 gas or condensate. The new oil fields were: North Gallatin (Woodbine sand) and William Wise (Woodbine) in Cherokee County, Norman Paul (Woodbine and Eagle Ford) in Wood County, Boynton (Paluxy) and Mt. Sylvan (Paluxy) in Smith County, Elysian Fields (Travis Peak) in Harrison County, Lassater (Travis Peak) in Marion County, and South Flynn (Woodbine-Eagle Ford) in Leon County. The gas fields were found in Rusk (two), Bowie, and Shelby Counties.

Central Texas production declined slightly in 1946 as output of the principal old fields contracted. The North Texas district continued the expansion of recent years, increasing its output almost 6 percent over 1945. Drilling was more active in 1946, with the trend of exploratory drilling to the west flank of the Bend Arch with deeper objectives. Discoveries were most numerous in Archer, Wilbarger, Jones, Young, Montague, and Cook Counties. Discoveries in Stephens (Caddo lime), Throckmorton, Haskell (Strawn), and Fisher (Canyon) Counties were considered important.

Panhandle production decreased 2 million barrels in 1946 to 29,716,000 barrels, coincident with a continued contraction in drilling for oil. New oil wells numbered 149 compared with 176 in 1945. All

wildcat wells, of which there were five in 1946, were dry holes, as in 1945. Exploratory activity in the northeastern (Anadarko Basin) section of the Panhandle has increased, influenced by developments in Oklahoma.

Virginia.—Crude petroleum was first produced in Virginia in the summer of 1942, when two small discovery wells were completed in Lee County. A third producing well was drilled in 1945. These wells, together with all holdings of the original company, were taken over by a new operator in 1946, and six new test wells were drilled before the end of the year. All of these wells were reported to be in the area of the original Rose Hill field, which is a small window in the Cumberland overthrust block.

Crude production amounted to 2,000 barrels in 1943, 3,000 barrels in 1944, 4,000 barrels in 1945, and 16,000 barrels in 1946.

West Virginia.—Crude petroleum production in 1946, amounting to 2,929,000 barrels, was 50,000 barrels above the 1945 total but 18 percent below that of 1942.

According to a report of David B. Reger, Morgantown, W. Va., oil-well completions were 87 in 1946 compared with 80 in 1945. Only 2 of the 33 wildcat wells were recorded as oil wells, and these were not important enough to add to the total oil reserves of the State. The most active counties and the number of new oil wells in each were: Calhoun 18, Ritchie 15, Wood 10, Kanawha 9, Pleasants 7, Roane 6, and Wirt 6.

Since the total number of oil wells abandoned in 1946 was larger than the total of oil-well completions, the list of operating wells at the end of 1946 was smaller than at the close of 1945.

Wyoming.—Production of crude petroleum increased further in 1946 to 38,304,000 barrels, a gain of 2.1 million barrels over 1945. The principal gains were at Elk Basin, Steamboat Butte, and Hamilton Dome. The last field obtained a pipeline outlet for the first time in 1946 after many years of developed production. The gradual upward trend in Wyoming production since 1933 has been strongly influenced by pipe-line construction, for many of its fields have remained shut in for extended periods for lack of a market. Beginning in 1935, when the line from Casper, Wyo., to Freeman, Mo., was returned to oil use from natural gas, facilities for marketing crude outside of the State have gradually increased. Pipe lines were laid successively to Denver, Colo., Salt Lake City, Utah, and Billings, Mont. The current high demand for petroleum and its products is encouraging the consideration of projects for increasing the transportation facilities to major market points and for improving the network of lines within the State to serve adequately its productive areas.

Oil-well completions declined from 162 in 1945 to 109 in 1946, as drilling in all the most active fields in 1945 declined materially. Oil completions in the most active fields in 1946 were: Big Muddy 8, Frannie 7, and Gebo and Oregon Basin 6.

Thirteen oil discoveries were made by the 54 exploratory wells drilled. Of these five were new fields, four new productive zones, and four field extensions. Apparently the most important of the new fields were: River Dome in Washakie County (Embar), Dubois in Fremont County (Embar), and Church Buttes in Uinta County (condensate and gas from Dakota). Production was opened at Elk Basin from the Madison and Dakota (gas) formation, at Black Mountain from the Madison, and at Bailey from Tensleep sand.

Extensions were reported to the following fields: Beaver Creek, Crooks Gap, Zimmerman Butte, and Big Muddy.

WELLS

The number of wells drilled in the United States, including oil and gas wells and dry holes, increased from 24,667 in 1945 to 26,991 in 1946. This represents a 9-percent increase in 1946 compared with a 7-percent increase in 1945.

Oil-well completions rose 11 percent from 14,297 in 1945 to 15,851 in 1946, dry holes increased from 7,471 in 1945 to 8,050 in 1946, and the number of gas wells increased from 2,899 in 1945 to 3,090 in 1946. The number of oil wells completed in 1946 represented 58.7 percent of the total wells drilled compared with 58.0 percent in 1945. Dry holes constituted 29.8 percent of the total wells drilled in 1946 compared with 30.3 percent in 1945. Gas wells completed were 11.5 percent of the total wells drilled in 1946 and 11.7 percent in 1945.

CONSUMPTION AND DISTRIBUTION

The total demand for crude petroleum amounted to 1,813 million barrels in 1946 compared with 1,792 million in 1945 and 1,472 million in 1941. Imported crude oil included in this demand amounted to 4.1 percent of the total in 1945 and 4.7 percent in 1946. About 95.4 percent of the crude oil consumed in 1946 was delivered for refining in the United States, and the remaining 4.6 percent represented crude oil exported, used for fuel, or lost.

Runs to Stills.—Total crude runs to stills amounted to 1,730 million barrels in 1946—a gain of 10 million barrels compared with 1945. Runs of foreign crude amounted to 84 million barrels, and runs of domestic crude were 1,646 million. The principal increases in crude runs, by refinery districts, were 22 million barrels in the Louisiana Gulf Coast and 21 million in the Texas Gulf Coast. The major decreases in crude runs were almost 29 million barrels in California, 6 million in the Arkansas–Louisiana Inland, and 6 million in the Texas Inland district.

Distribution.—The total demand for domestic crude petroleum rose from 1,718 million barrels in 1945 to a new record of 1,728 million in 1946—a gain of 10 million barrels. The demand was met by a crude production of 1,733 million barrels, of which 5 million barrels were added to stocks. The supply of domestic crude petroleum was supplemented by a gain in the imports of foreign crude oil from 74 million barrels in 1945 to 86 million in 1946. Imports of refined oils increased from 39 million barrels in 1945 to 49 million in 1946. Total stocks of refined oils increased 36 million barrels during the year compared with withdrawals of 10 million barrels in 1945.

Runs to stills of crude petroleum in the United States in 1946, by districts and months

Receipts of domestic and foreign crude petroleum at United States refineries totaled 1,737 million barrels in 1946 compared with 1,724 million in 1945. In 1946 receipts of foreign crude petroleum were 86 million barrels, or 4.9 percent of the total; interstate receipts of domestic crude were 645 million, or 37.2 percent of the total; and intrastate receipts were 1,006 million, or 57.9 percent of the total.

[1] Subject to revision.

Refinery receipts of crude petroleum in 1946, by methods of transportation, indicated that 74.3 percent of the total was delivered by pipe lines, compared with 79.4 percent in 1945; that 23.5 percent was delivered by boat, compared with 16.3 percent in 1945; and that 2.2 percent was delivered by tank car and truck, compared with 4.3 percent in 1945. The relative decline in pipe-line and tank-car movements and the increase in boat deliveries reflect the elimination of abnormal wartime movements and the resumption of the tanker movements from Gulf to East Coast ports.

The principal changes in the market demand for crude petroleum by States of origin (computed from production and changes in crude stocks by origin) in 1946 compared with 1945 were gains of 13 million barrels for Louisiana, 6 million for Colorado, 6 million for Mississippi, 4 million for Oklahoma, and 3 million for Illinois. Principal decreases were 19 million barrels for California and 5 million for Texas. Fourteen States had a market demand for crude exceeding 10 million barrels and contributed over 98 percent of the total demand for domestic crude.

Receipts of crude petroleum at refineries in the United States, 1942–46, by methods of transportation

[Millions of barrels]

Method of transportation	1942	1943	1944	1945	1946 [1]
By boat:

Interstate	116.3	138.2	96.5	59.1	17.8
Total by tank car and truck	134.3	153.9	113.0	74.3	37.9
Grand total	1,327.7	1,436.2	1,668.5	1,723.9	1,737.2

[1] Subject to revision.

The total demand for Texas crude oil declined from 763 million barrels in 1945 to 758 million in 1946. The record production during the year amounted to 761 million barrels—a gain of 6 million compared with 1946; however, 3 million barrels were added to crude stocks of Texas origin compared with withdrawals of 8 million barrels in 1945. The relative contribution of Texas to the national demand for domestic crude oil declined from 44.4 percent in 1945 to 43.8 percent in 1946. About 58 percent of the deliveries of Texas crude oil to refineries went to plants located within the State, and 43 percent was delivered to refineries in other States. About 168 million barrels were delivered to refineries in the East Coast district in 1946—representing 60 percent of the total receipts of foreign and domestic crude in that district. The largest shipments to other refinery districts were 93 million barrels to the Indiana-Illinois district, 36 million to the Louisiana Gulf, and 21 million to the Oklahoma-Kansas district.

California ranked second as a source of crude oil supply in the United States—supplying 18.0 percent of the total demand for domestic crude oil in 1946 compared with 19.2 percent in 1945. Production was 11 million barrels less than in 1945, and almost 5 million barrels were added to stocks compared with a withdrawal of 3 million barrels in 1945. Total demand in 1946 amounted to almost 311 million barrels, of which about 284 million barrels were run to stills by refineries within the State, 5 million were exported, and 22 million barrels represented crude used direct for fuel plus losses.

Louisiana was the third largest source of crude-oil supply in 1946. The demand for Louisiana crude oil has continued to increase in recent years and gained 13 million barrels in 1946. The percentage of the total demand for domestic crude rose from 7.7 in 1945 to 8.4 in 1946. Demand in 1946 amounted to almost 145 million barrels and included a reduction in stocks of over 1 million barrels. Over half of the total went to refineries within the State. The principal deliveries outside the State went to the Texas Gulf and East Coast refinery districts.

Daily average demand for domestic crude petroleum in the United States in 1945–46, by States of origin and by months

[1] Subject to revision.

[2] Includes Florida.

[3] Includes Virginia.

Oklahoma ranked fourth as a source of domestic crude oil in 1946. Production declined about 5 million barrels but was supplemented by 5 million barrels withdrawn from storage compared with an addition of 4 million barrels to stocks in 1945. Total demand in 1946 amounted to 140 million barrels, of which 55 million were delivered to refineries within the State. The largest outside markets were in Illinois, Ohio, and Indiana.

The demand for Kansas crude oil has declined from 106 million barrels in 1943 to about 97 million barrels in 1946, but current production shows an upward trend. In 1946, about 44 million barrels of Kansas crude oil were delivered to refineries within the State. The principal outside markets are in Indiana, Illinois, and Oklahoma.

STOCKS

The stocks of all oils amounted to 507.1 million barrels on December 31, 1946. The increase of 43.5 million barrels during the year included a gain of 6.9 million barrels in total crude stocks and of 36.6 million barrels in stocks of other oils.

Stocks of refined products amounted to 271.9 million barrels on December 31—about 22 million barrels less than on December 31, 1941. The principal gains during 1946 were 23.8 million barrels in stocks of distillate fuel oil, 9.9 million barrels in stocks of residual fuel oil, and 6.7 million barrels in stocks of kerosine. Stocks of finished gasoline, including aviation-gasoline stocks, declined 4.8 million barrels.

Stocks of crude petroleum, natural gasoline, and refined products in the United States at end of year, 1942–46

[1] Final figures.
[2] New basis comparable with succeeding years.
[3] Includes equivalents for wax, coke, and asphalt in barrels.

Stocks of refined products were increased in 1946 to replace depleted stocks during the war period and to service increased civilian demand. The large addition to distillate fuel-oil stocks was directly related to the rising civilian demand with termination of rationing in 1945 and the rapid increase in the number of heating-oil installations.

Stocks of crude petroleum in the United States in 1946, by States of location and by months [1]

[1] Excludes stocks of California heavy crude.

The increase in residual fuel-oil stocks reflected the rapid shift from military to civilian use, and the gain in kerosine stocks was due to the expansion of heating- and range-oil demand. The decline in finished-gasoline stocks was related to the decline in total aviation-gasoline demand and the liquidation of stocks in military custody not included in the stocks reported to the Bureau of Mines.

PRICES AND VALUE

Complete data on crude-oil values in 1946 are not yet available, but the preliminary estimate of the value of all crude produced in 1946 is $1.41 per barrel compared with $1.22 in 1945. These averages represent the value of crude at the well and include subsidy payments under the stripper-well compensatory adjustment program.

The first change in posted crude prices came on April 1, when the Office of Price Administration permitted an increase of 10 cents per barrel. This increase was general throughout all producing areas and did not affect stripper-well subsidy payments. The second increase came near the end of July. In California the increases varied from 10 to 30 cents per barrel, depending on the gravity of the crude—the high-gravity crude receiving the greater increase. In the other crude-producing areas, the price rise amounted to 25 cents per barrel, and the effective dates varied from July 25 to August 1. The posted prices for Pennsylvania-Grade crude advanced again in the first week of September. The amount of the increase varied by areas: 6 cents per barrel for Bradford crude, 20 cents for Southwest Pennsylvania crude, and 26 cents for Southeast Ohio and West Virginia crude. Posted crude prices advanced again about the middle of November in all producing areas except California and the Pennsylvania-Grade region. This increase amounted to 10 cents per barrel and was followed on December 1 by an advance of 14 cents per barrel in the postings for Pennsylvania Grade.

Effective with the increase of 25 cents per barrel in the last week of July, the rate of payment under the stripper-well subsidy plan was reduced by an amount equal to the increase in posted price. After this increase, all payments of 25 cents per barrel or less were eliminated, and the rate of 35 cents per barrel was reduced to 10 cents. As almost all of the Pennsylvania-Grade crude was included in the plan at a rate of 75 cents per barrel, the increases in the posted prices after the middle of the year did not represent actual gains for the producers of crude in this area. However, the total of all subsidy payments for crude production in 1946 amounted to less than 2 percent of the value of all crude, and the reduction of payments in the last 5 months did not affect the average value for the year by more than 1 cent per barrel.

REFINED PRODUCTS

GENERAL REVIEW

The demand for refined products in 1946 reflects a continuation of the shift from wartime operations to a postwar demand pattern. Wartime demand was marked by restricted civilian consumption and by military purchases and lend-lease exports. Since most of the military purchases and all of the lend-lease exports were lifted from ports on the east coast, Gulf coast, or California, the major wartime supply and transportation problems were related to the demands in these areas. The end of the war brought a rapid decline in military purchases and in lend-lease exports. Removal of most of the wartime controls was followed by a substantial increase in civilian consump-

tion. This shift from military and export demand to civilian demand created the first important postwar distribution problem—that of supplying areas of high civilian demand. The Gulf Coast area, with a surplus of both crude and refined products, could ship by tanker to the high-demand area on the east coast, and production in California could meet the needs of the west coast area; but no large surplus shipping capacity was available for the movement of crude and products into the North Central States. By the end of 1946, additional pipe lines were under construction, but a shortage of transportation into this area was indicated for 1947.

The small decline in total demand for all oils from 1,956 million barrels in 1945 to 1,942 million in 1946 was due to the sharp drop in exports of refined products. These exports decreased from 150 million barrels in 1945 to 110 million barrels in 1946—a 27-percent decline. Domestic demand for all oils (including military purchases of domestic-origin products and imports into continental United States for military consumption) rose from 1,773 million barrels in 1945 to 1,791 million barrels in 1946. The increases in civilian consumption compensated for the drop in military purchases and produced a net gain of 18 million barrels in domestic demand. Most of the military requirements for aviation gasoline in 1946 were supplied from surplus stocks in military custody at the end of the war. Since the stocks reported to the Bureau

Runs to stills and production at refineries in the United States of the various refined petroleum products, 1942–46

[1] Subject to revision.
[2] Conversion factors: 280 pounds of wax to the barrel, 5.0 barrels of coke to the short ton, 5.5 barrels of asphalt to the short ton, 3,600 cubic feet of still gas to the barrel.
[3] Negative quantity; represents net excess of unfinished oils rerun over unfinished oils produced.

of Mines do not include any products in military custody, the military requirements supplied by liquidation of military stocks were not part of the indicated demand for 1946. The domestic demand for 1946 would have been higher if all military requirements had been supplied from current production. The domestic demand for motor fuel in 1946 increased 38.5 million barrels, the demand for kerosine gained 13.6 million, distillate demand rose 16.9 million, and the domestic demand for residual fuel declined 46.3 million.

Salient statistics of the major refined petroleum products in the United States, 1942–46

[1] Subject to revision.
[2] New basis, to compare with following year.
[3] Negative quantity; represents net excess of unfinished produced over unfinished rerun.
[4] Figure not available.

Imports of refined products increased 9.7 million barrels in 1946. The major changes included an increase of 10.4 million barrels in imports of residual fuel, a small gain in distillate fuel, and a decrease of 1.8 million barrels in imports of motor fuel.

Crude runs to stills increased from 1,720 million barrels in 1945 to 1,730 million in 1946—a gain of 10 million barrels and a new record for total crude runs.

The changes in refinery yields from crude in 1946 reflect both a shift in product demand and an adjustment in product stock levels to match the postwar demand pattern. The decline in the export demand for motor fuel and the relatively high position of gasoline stocks at the end of 1945 resulted in a decline in the percentage yield

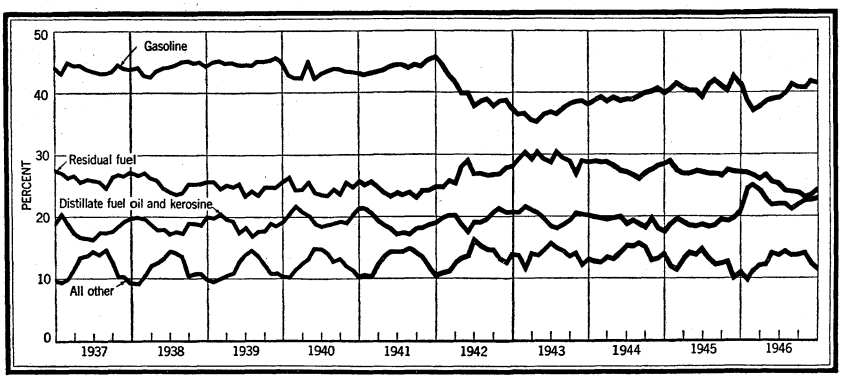

FIGURE 6.—Yields of principal products from crude oil run to stills in the United States 1937–46, by months.

of gasoline from 40.9 in 1945 to 39.6 in 1946. The very marked increase in the use of distillate fuels for heating and for Diesel engines, together with a stock program in 1946 to meet the needs of the 1946–47 heating season, required a change in the yield of distillate from 14.5 percent in 1945 to 16.6 percent in 1946. Both domestic and export demands for kerosine increased in 1946, and the percentage yield rose from 4.7 to 6.0. The postwar decline in the demand for residual fuel is reflected in the drop in the yield of this product from 27.3 percent in 1945 to 24.9 percent in 1946.

Percentage yields of refined petroleum products in the United States, 1937–46

[Computed on total crude runs to stills]

[4] Negative quantity (overage).

Stocks of refined oils at the end of 1946 amounted to 272 million barrels compared with 236 million on December 31, 1945. The principal changes in 1946 were an increase of 24 million barrels in the stocks of distillate, a gain of 10 million in residual stocks, an increase of 7 million in kerosine stocks, and a reduction of 5 million in the stocks of finished gasoline. Stocks may be expressed in terms of days' supply by a ratio of stocks to daily average demand for the succeeding month. The stocks of distillate at the end of 1941 represented 59 days' supply compared with a 35-day supply on hand at the end of 1945 and a 51-day supply on December 31, 1946. Stocks of residual fuel at the end of 1941 represented 66 days' supply; but because of the heavy wartime liquidation, particularly in California, the inventories of this product at the end of 1945 had declined to a 25-day supply. Residual stocks increased in 1946, and at the end of the year the inventories represented 30 days' supply.

Stocks of refined petroleum products in the United States, 1945–46, by months

Price increases of representative refined products in 1946 reflected the increases in crude-oil prices and the removal of price controls. Most of the major price adjustments came in the latter half of the year. The price of Regular Grade gasoline at Oklahoma refineries declined in the first quarter and increased in each of the remaining months of the year with the largest increase in August. The average price for December was 7.25 cents per gallon compared with 5.81 cents per gallon for December 1945. The tank-wagon price of kerosine at Chicago increased in January, July, and November. The price in December was 12.20 cents per gallon compared with 10.60 cents per gallon in December 1945. The average price of a selected bright stock at Oklahoma refineries remained at 22.75 cents per gallon for the first half of 1946, but increases in the latter half resulted in an average December price of 28.75 cents per gallon. The price of Bunker "C" oil at New York had dropped in the last quarter of 1945 to end the year at $1.51 per barrel. This price continued through January and February 1946. After small gains in March and April, the price did not change until July. The average for August was $1.97 per barrel, but this was followed by a slight decline in September to $1.92. The price remained at this level for the last 4 months of 1946.

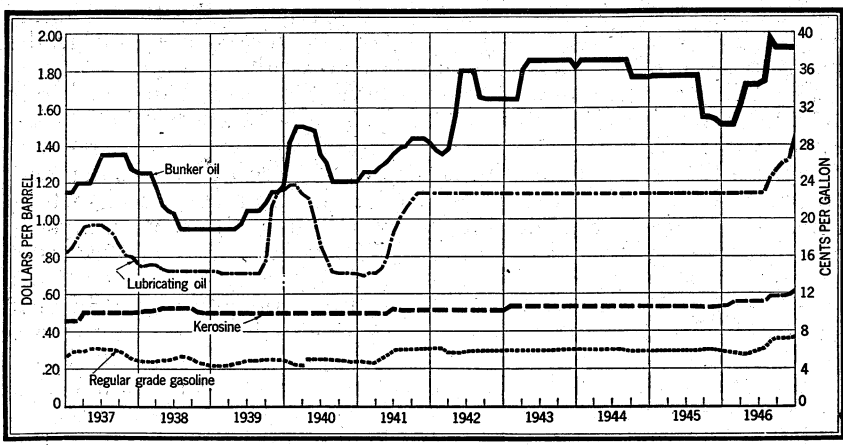

FIGURE 7.—Prices of Bunker "C" oil at New York, bright stock at Oklahoma refineries, tank-wagon prices of kerosine at Chicago, and Regular Grade gasoline at refineries in Oklahoma, 1937–46, by months.

Petroleum refinery capacity in the United States, January 1, 1942–47

AVIATION GASOLINE

Aviation gasoline is discussed separately because of special interest in this type of fuel, but all aviation-gasoline statistics are included in the statistics of total motor fuel and gasoline.

The total demand for aviation-grade gasoline in 1946 amounted to 15,199,000 barrels or only 10 percent of the demand in 1945 and 8 percent of the wartime peak demand in 1944. In addition to the decline of 136 million barrels in demand, there was a marked change in the demand for aviation gasoline by grades. The total demand for 100-octane gasoline in 1946 was only 4.6 percent of the 1945 demand for this grade, while the demand for other finished aviation grades was 48 percent of the 1945 demand for comparable grades.

The daily production of all grades of aviation gasoline dropped from 537,000 barrels in 1944 to 418,000 barrels in 1945 and to 70,000 barrels in 1946. This represents a production decrease of 83 percent in 1946 over 1945, compared with a drop of 90 percent in total demand. The variations in the percentage declines in production and in total demand are accounted for chiefly by the quantities of unfinished grades transferred to other products. This transfer item of 10,932,000 barrels was slightly smaller than the 1945 transfers of 11,162,000 barrels, but it represents 43 percent of the total production in 1946 compared with 7 percent of the 1945 production. When the war ended, the daily average aviation-gasoline production capacity in the United States amounted to about 600,000 barrels, compared with a postwar demand of less than 50,000 barrels. With this excess capacity available and confronted with a shortage of lead for the production of antiknock compounds, some refiners continued to produce aviation components and used the material in their automotive gasolines. A large part of the remaining capacity to produce aviation grades has been incorporated as parts of refineries producing automotive gasoline and other products.

Exports of all grades of aviation gasoline in 1946 totaled 6,299 barrels daily compared with a daily average of 93,471 barrels in 1945 and 156,148 barrels in 1944. The 1946 average was about the same as the average for the postwar portion of 1945 and about one-third of the export demand in 1941.

[1] Includes some 98 and 99 octane.

[2] Exports of 80–87 octane aviation gasoline (Census classification—medium octane aviation) have not been included for 1944, since the only available figures include indeterminate amounts of automotive gasoline.

[3] Subject to revision.

Domestic demand (including military purchases in continental United States) dropped from 117 million barrels in 1945 to 13 million in 1946. Since most of the military requirements in 1946 were supplied from inventories in the custody of the armed forces, the 13-million-barrel demand, for the most part, represented purchases for use in commercial and private planes. However, this may not represent the entire fuel demand for private and commercial aircraft, since it is believed that some of the smaller planes are using automotive types of gasoline. If most of the military stocks are depleted by the middle of 1947, statistics for the latter half of the year should furnish a good indication of the normal current demand for aviation grades of gasoline.

MOTOR FUEL

The total demand for motor fuel in 1946 declined only 4 million barrels from the 1945 wartime peak despite a very sharp postwar drop in exports. This 1946 demand for 780,222,000 barrels of motor fuel was 47 million barrels greater than the 1944 demand and almost 86 million barrels above the prewar high in 1941. Since the aviation-grade portion of total motor-fuel demand dropped almost 136 million barrels from 1945 to 1946, the indicated increase for grades other than aviation was about 132 million barrels. This increase in civilian consumption offset the declines in export demand and in military liftings.

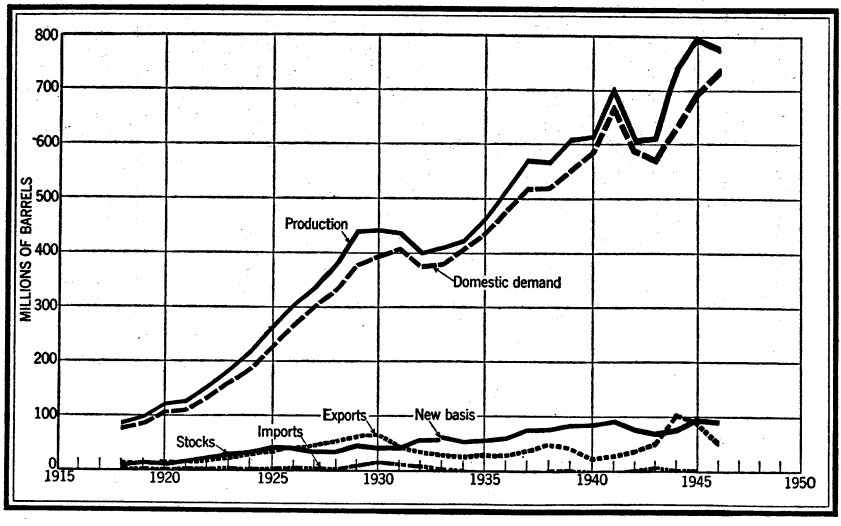

FIGURE 8.—Trends of production, domestic demand, exports, imports, and stocks of motor fuel in the United States, 1918–46.

[1] Subject to revision.
[2] Includes L. P. G. sales for fuel and chemical uses.

Production.—The total production of motor fuel in 1946 was 776,054,000 barrels compared with a revised total for 1945 of 798,194,000 barrels. The portion of the 1946 total produced from crude oil amounted to 685,550,000 barrels, comprising 390,208,000 barrels of cracked gasoline and 295,342,000 barrels of straight run. The net contribution from natural gasoline and cycle plants (after transfers and sales of liquefied gases for fuel and chemical purposes are deducted) was 88,434,000 barrels. The remaining 2,070,000 barrels was benzol. A break-down of production by quarters indicates a daily

[1] Subject to revision.

[2] Based on crude runs to stills.

average production in the last quarter that exceeds the daily average for the year by 3.5 percent. The highest rate of production came in August, when the daily average was 2,249,000 barrels compared with 2,337,000 barrels daily in July 1945. However, the 1945 peak month was in a period just before the end of the war, when the military demand was very large and when daily production included almost 600,000 barrels of aviation gasoline.

Yields.—The average refinery yields of gasoline from crude petroleum dropped from 40.9 percent in 1945 to 39.6 percent in 1946. In view of actual demand in the first quarter of 1946, stocks of gasoline were relatively high at the end of 1945 and stocks of fuel oil and kerosine were low, necessitating readjustment of percentage yields in the early part of 1946. This accounts for the drop in yields of gasoline from an average of 41.9 percent in November and December 1945 to 38.8 percent in January 1946 and 37.1 in February. The average yield for any month in 1946 did not exceed 40 percent until August, and the highest yield came in November—41.7 percent.

Domestic Demand.—The domestic demand for motor fuel in 1946 (including military purchases in continental United States) increased to 734,833,000 barrels to set another all-time high. This was 38,500,000 barrels or 5.5 percent above the previous peak, reached in 1945, and 67,328,000 barrels above the prewar record in 1941. During the period from 1920 through 1940, the average yearly increase in domestic demand for motor fuel was about 24 million barrels. The year 1940 is taken for the close of the prewar period, since wartime expansions contributed largely to the abnormal increase in 1941. Domestic demand for motor fuel in 1940 was a little above 589 million barrels. If this total for 1940 is projected, using the prewar average yearly increase of 24 million barrels, the indicated domestic demand for 1946 would be 733 million barrels compared with an actual demand of 735 million barrels.

A break-down of the 1946 domestic demand by quarters indicates a relative increase in winter consumption compared with summer demand. For 1935–41 the average daily demand in the first quarter of each year was 17 percent below the average for that year, but the daily average in the first quarter of 1946 was only 14 percent below the annual average. In the same prewar period the fourth-quarter average was less than 0.5 percent above the yearly average compared with a fourth-quarter demand in 1946 that was 2 percent above the daily average for the year. The daily average for the summer quarters in the prewar period was 8 percent above the yearly average, but in 1946 the demand in this season was only 6 percent above the daily average for the year.

Production and Consumption, by States.—The refinery production of gasoline in 1946 amounted to 748,411,000 barrels compared with 774,460,000 barrels in 1945. Production in Texas dropped from 234.7 million barrels in 1945 to 225.7 million in 1946, but this still represented 30 percent of the total production by all refineries in the United States. The California production (including some production in Washington) dropped from 121.1 million barrels in 1945 to 110.4 million in 1946 or to about the level of production in

1944. The greatest increase in production was recorded for Pennsylvania with a gain from 57.0 million barrels in 1945 to 60.7 million in 1946.

In the war period it was extremely difficult to compute the demand for gasoline by States because, in some instances, sales to the Government within a State represented gasoline that ultimately was moved to another State or was shipped abroad. Since military purchases in 1946 accounted for only a small percentage of the total domestic demand, the State totals for that year furnish a better indication of consumption by States than did the totals in the war years. If the consumption by districts in 1940 (based on State totals) is compared with the consumption in 1946, a relative shift in demand is indicated. In 1940 the consumption in district 1 (east coast States) represented 36 percent of the United States total, but in 1946 the demand in this district had dropped to 32 percent of the total. In the Midwest and North Central States the 1940 demand was 39.4 percent of the total compared with 37.9 percent in 1946. However, the refinery production of gasoline in this area had declined relatively from 33.4 percent of the total in 1940 to 29.7 percent in 1946. This change may be represented by a ratio of district production to district demand. The refinery production of gasoline in this district in 1940 amounted to 88.1 percent of the total consumption within the district, but in 1946 the production had dropped to 81.9 percent of demand. This decline in the ratio of production to demand required additional shipments into these States from the Gulf Coast area. District 5 (Arizona, California, Nevada, Oregon, and Washington) had the greatest relative increase in consumption between 1940 and 1946. The demand in this area in 1946 was 14.3 percent of the total for all States compared with 11.3 percent in 1940. The relative increase in the Gulf Coast States was from 10.3 percent of the total in 1940 to 12.6 percent in 1946, and the increase in the Rocky Mountain district was from 2.8 percent in 1940 to 3.0 percent in 1946.

Methods of Distribution.—The total quantity of motor fuel delivered from pipe lines in 1946 amounted to 218,756,000 barrels compared with 282,115,000 barrels in 1945. However, the 1945 total included operations of the 20-inch war-emergency products line for 8 months. The 1946 total represents about 29 percent of the total refinery production of gasoline compared with 36 percent of production delivered from pipe lines in 1945. Part of the wartime pipe-line movement was replaced by an increase in the normal shipments from the Gulf coast to the east coast. The tanker and barge shipments of gasoline from Louisiana and Texas to east coast ports (including the west coast of Florida) increased from 48,793,000 barrels in 1945 to 123,967,000 barrels in 1946. Barge liftings of gasoline in Arkansas, Louisiana, and Texas for Mississippi River ports increased from 20.7 million barrels in 1945 to 29.1 million in 1946. Several products pipe lines were under construction in 1946 and others were projected for 1947 to further serve some of the high-demand inland areas.

Stocks.—Stocks of finished gasoline at the close of 1945 totaled 89,360,000 barrels, or an all-time record for finished-gasoline inventories at the end of a year. This high level was due to abnormal stock increases in the last quarter of 1945. Since these stocks were relatively higher than the inventories of kerosine and fuel oils, a shift of yields was necessary to produce fuels to meet the demands in the first quarter of 1946. Stocks of finished gasoline increased only 5,826,000 barrels in this quarter. This increase, combined with a decline of 11,460,000 barrels in the second quarter, a drop of 4,878,000 barrels in the third, and a gain of 5,686,000 barrels in the fourth, produced a net decrease of 4,826,000 barrels for the year. Stocks of unfinished gasoline varied slightly over a million barrels between the high and low points in 1946 and closed at 8,208,000 barrels compared with 8,316,000 barrels on December 31, 1945. Stocks of natural gasoline and cycle products amounted to 4,322,000 barrels at the end of 1945 and increased each month in the first half of 1946 to reach 7,343,000 barrels at the end of June. Since the decline in the last half of the year was less than the gain in the first 6 months, stocks of light products at the end of 1946 were 659,000 barrels above the 1945 closing inventories.

Shipments of motor fuel by pipe lines in the United States in 1946, by months

[Thousands of barrels]

	1946						
	January	February	March	April	May	June	July
Motor fuel turned into lines	14,317	13,832	16,281	17,509	19,452	18,888	20,181
Motor fuel delivered from lines	15,593	13,066	16,128	18,293	19,498	18,801	20,687
Shortage	37	18	61	48	54	69	97
Stocks in lines and working tanks, end of month	9,290	10,038	10,130	9,298	9,198	9,216	8,613

	1946—Continued						1945
	August	September	October	November	December	Total	
Motor fuel turned into lines	19,657	19,819	20,263	19,233	18,742	218,174	281,551
Motor fuel delivered from lines	19,489	19,566	20,710	19,176	17,749	218,756	282,115
Shortage	89	65	53	64	106	761	957
Stocks in lines and working tanks, end of month	8,692	8,880	8,380	8,373	9,260	9,260	10,603

Stocks may be expressed in terms of days' supply by dividing the stocks at the end of a month by the daily average total demand for the succeeding month. Using this basis, the stocks of finished gasoline on December 31 represented 43.4 days' supply at the end of 1946 compared with 48.9 at the end of 1945.

All total stocks include inventories of gasoline held at refineries and bulk terminals and by pipe lines but do not include stocks in the smaller distribution plants or stocks that have passed into the custody of the armed forces.

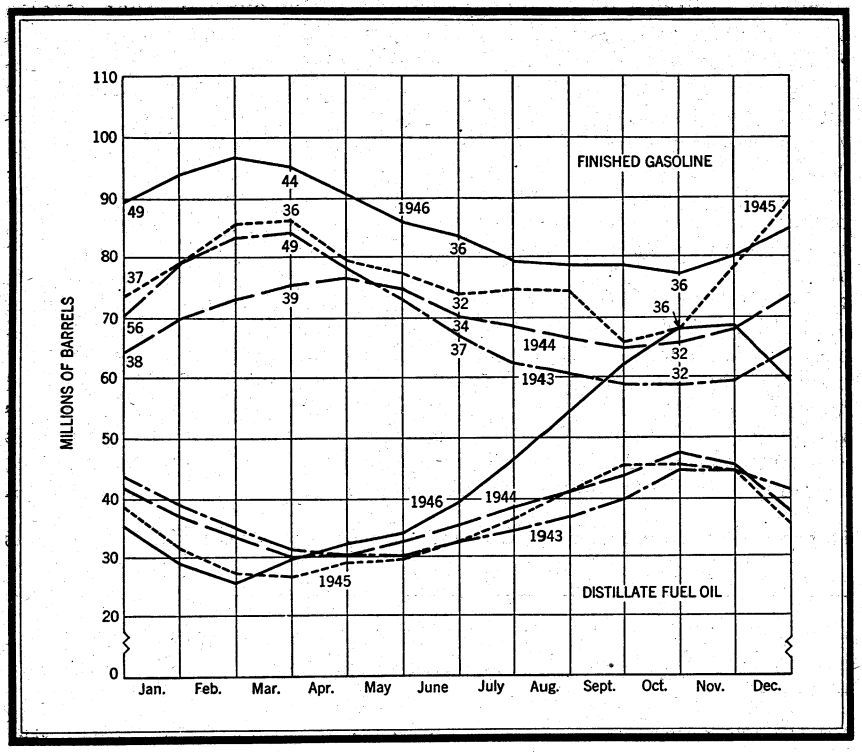

FIGURE 9.—Stocks of finished gasoline in the United States 1943–46, by months, with figures representing days' supply at certain periods; also stocks of distillate fuel oil, 1943–46, by months.

Days' supply of motor fuel on hand in the United States at end of month, 1944–46 [1]

[1] Includes stocks of finished gasoline at refineries, bulk terminals, and in pipe lines.

Prices.—The general downward trend of gasoline prices in the last quarter of 1945 continued for several months in 1946 or until the first general increase in the price of crude petroleum. This crude price increase came on April 1 and amounted to 10 cents per barrel. However, the average monthly refinery price of Oklahoma gasoline did not exceed the December 1945 level until June, prior to the July crude price increase. From September to the year end gasoline prices increased gradually until the average Oklahoma refinery price in December 1946 was 1.44 cents per gallon above the average in December 1945. The average dealers' net price (exclusive of tax) in 50 representative cities in the United States furnishes an index of gasoline prices at the wholesale level. On January 1, 1947, this average price, according to the American Petroleum Institute, was 11.27 cents per gallon compared with 10.07 cents per gallon on January 1, 1946, an increase of 1.2 cents per gallon in 12 months. In the same series the average service-station price, including all taxes (price at the consumers' level) increased from 20.24 cents per gallon at the first of 1946 to 21.73 cents at the end of the year, a gain of 1.49 cents per gallon. Based on net prices (exclusive of tax) these increases represented percentage gains of 11.9 at the dealer level and 10.5 at the consumer level. In general, these percentage increases in the prices of gasoline were smaller than the percentage gain in the prices of all commodities as shown by the combined index of wholesale prices published by the United States Department of Labor. This index rose from 107.1 for December 1945 to 140.9 for December 1946.

The average local tax rate in the 50-city series remained at 0.05 cent per gallon in 1946, and the Federal tax rate continued at 1.50 cents per gallon. The average State tax was 4.50 cents per gallon on January 1, 1946, increased to 4.52 cents on March 1, and rose to 4.54 cents on July 1. The average of all taxes for the year in these 50 cities was 6.08 cents per gallon.

Exports.—Exports of motor fuel (including shipments to noncontiguous Territories) averaged 124,000 barrels daily in 1946 compared with 275,000 barrels daily in 1944 and a daily average of 241,000 barrels in 1945. However, the exports in the first quarter of 1946 averaged 172,000 barrels daily, and the total for the 3-month period was about one-third of the total for the year. The daily average motor-fuel exports in the second, third, and fourth quarters were 104,000, 116,000, and 107,000 barrels, respectively. Countries receiving over 5 percent each of the 1946 motor-fuel exports from continental United States were: United Kingdom, 28 percent; France, 12 percent; and Canada, 10 percent. The combined shipments to all noncontiguous Territories were about 7.7 percent of the total.

KEROSINE AND RANGE OIL

The production of kerosine in 1946 was not only sufficient to satisfy an expanded domestic and export demand, but there was also enough made to add a considerable quantity to storage. No imports of kerosine were reported during the year.

Kerosine produced in 1946 totaled 104,385,000 barrels, another new record, and 29 percent over the 1945 output (81,024,000 barrels). The greatly increased production of kerosine in 1946 was due largely to a higher percentage yield (6.0 percent in 1946 compared with 4.7 percent in 1945) and to a lesser extent to increased runs of crude petroleum, the volume of which was only slightly (less than 1 percent) over the 1945 quantity. This is in contrast to what happened in 1945 when the gain in kerosine production was entirely the result of increased runs of crude at refineries, as there was no improvement in the percentage yield in that year. A higher percentage yield for kerosine became possible in 1946, as that for both motor fuel and residual fuel oil was lower.

All refinery areas except the Arkansas and Louisiana Inland district reported gains in the production of kerosine in 1946. The more important percentage increases were noted in the East Coast, Texas Gulf Coast, Louisiana Gulf Coast, and California refinery districts. The outstanding gain of the year was reported for the Texas Gulf Coast area, where the output of kerosine increased by 54 percent and the volume rose from 28 percent of the national total in 1945 to 34 percent in 1946. Other large increases in kerosine production were recorded for the Louisiana Gulf Coast district—a 31 percent gain—and for the East Coast district, where the 1946 total was about 29 percent over the comparative 1945 item. The Indiana-Illinois-Kentucky district produces about 15 percent of the national kerosine total, and there the 1946 output was 19 percent above that reported for 1945. It should be added that the Oklahoma-Kansas-Missouri group of States is also a source of relatively important quantities of kerosine and the production in the area increased by 13 percent in 1946 over 1945. Smaller amounts of kerosine are made in the other refining districts; however, the only one to show an outstanding gain was California, where the 1946 total was 36 percent over the 1945 production.

[1] Subject to revision.
[2] Figures not available.

Increases of 5 percent in the domestic demand for kerosine reported for both 1944 and 1945 jumped to an 18-percent gain in 1946, when indicated deliveries were 89,166,000 barrels compared with 75,573,000 in 1945. This expanded market for kerosine was also evident in early 1947, as the domestic demand in the first quarter was 14 percent above comparative 1946 requirements. The annual demand for kerosine cannot be presented by refinery districts, because data on shipments and receipts, as well as the imports and exports for each respective area, are not compiled.

Exports of kerosine have expanded noticeably in the past 2 years, as the 1946 total (8,559,000 barrels) was 39 percent over the corresponding foreign demand of 6,180,000 in 1945, which in turn was 26 percent above the 1944 level. The United Kingdom is credited with the larger share of the kerosine shipped out of the country; however, the quantity declined from 4,984,000 barrels in 1945 to 3,013,000 in 1946. Relatively less important quantities of kerosine go to many foreign countries; however, the 1946 totals for Canada, France, Sweden, the Netherlands, the Philippines, China, French Morocco, and Australia were well above 1945 requirements.

Stocks of kerosine, which dipped slightly in 1945, rose sharply in 1946, when the year-end total of 17,081,000 barrels was 64 percent above the 10,421,000 held in storage at the close of 1945. About 60 percent of kerosine stocks are reported at refineries, and these reserves increased by about 57 percent from 6,212,000 barrels in 1945

to 9,772,000 at the end of 1946, while supplies carried at bulk terminals rose from 4,209,000 barrels in 1945 to 7,309,000 in 1946, a 74-percent gain in contrast to a decline of over 20 percent in such stocks in 1945 compared with the closing inventory for 1944. The days of supply represented by kerosine held in storage at the year end dropped from 38 days for 1944 to 31 days for 1945; however, the greatly increased stocks for 1946 were sufficient for 41 days at the subsequent January rate of total demand.

All refinery districts, whether predominantly supply or consumption areas, showed increases in kerosine stocks in 1946. This differed from 1945 when, generally speaking, kerosine inventories piled up in producing districts due mainly to the lack of adequate transportation facilities and shrunk in areas of high consumer demand. Kerosine stocks reported for the East Coast district, a major market, doubled from 3,894,000 barrels at the end of 1945 to 7,806,000 for 1946. It should be added that the kerosine inventory for this important consuming area rose from 37 percent of the national total at the close of 1945 to a 46-percent share in 1946. Relatively large kerosine stocks are held in the Indiana-Illinois-Kentucky refinery district, and quantities there increased by 13 percent from 1,769,000 barrels in 1945 to 2,006,000 in December 1946; however, the relative amount of these reserves declined from 17 percent of the national total for kerosine in 1945 to 12 percent in 1946. About 17 percent of the kerosine is stored in the Texas Gulf Coast district, a supply area, and there the quantity increased by over 60 percent from 1,817,000 barrels in 1945 to 2,921,000 at the close of 1946. Kerosine held in the Louisiana Gulf Coast district, another supply area, rose from 999,000 barrels at the end of 1945 to 1,436,000 for 1946—a 44-percent gain. Relatively lesser amounts of kerosine stocks are reported from the remaining refinery districts, and the respective quantities all showed gains in 1946.

[1] Figures for 1946 by States not yet available.
[2] States are grouped according to petroleum-marketing territories rather than to conventional geographic regions.

Sales of kerosine in1945 (74,976,000 barrels) were 5 percent over the 1944 total (71,214,000) according to the annual survey of the Bureau of Mines, and repeated a similar percentage gain recorded for 1944. All marketing areas of the country reported a higher volume of kerosine deliveries in 1945, except the Pacific Coast region, where the turn-over declined for a second consecutive year. Sales of kerosine in the East Coast area, where nearly 60 percent of the national demand is located, increased by 5 percent from 41,458,000 barrels in 1944 to 43,537,000 in 1945. The larger share of these totals was reported from the New England States, and sales there of 19,892,000 barrels in 1945 were 3 percent over the 1944 total of 19,263,000 barrels. The Middle Atlantic States constitute a second important market for kerosine, and deliveries in the area increased by over 5 percent from 16,211,000 barrels in 1944 to 17,088,000 in 1945. Sales of kerosine in the remaining section of the Atlantic Coast area—the South Atlantic States—are relatively less important in volume; however, the 1945 quantity for the area was 10 percent above the 1944 demand. Dealers distrib-

uted 16,264,000 barrels of kerosine in the North Central States in 1945—an 11-percent gain over 1944 (14,697,000 barrels). Considerable quantities of kerosine are also consumed in the South Central States, and the increase in sales there in 1945 was about 2 percent. Very little kerosine is sold in the Rocky Mountain area; however, there was an 8-percent gain in demand for 1945, while deliveries on the Pacific coast dropped from 2,454,000 barrels in 1944 to 2,298,000 in 1945.

Sales of range oil in the United States, 1943–45, by States [1]

[Thousand of barrels]

State	1943	1944	1945	
			Total	Percent of total
Massachusetts	10,251	10,993	11,227	22.0

[1] Figures for 1946, by States, not yet available.

Nearly three-fifths of all kerosine sales are reported as range oil, and quantities sold for this purpose increased by 6 percent from 41,017,000 barrels in 1944 to 43,540,000 in 1945. Slightly less than 10 percent of all kerosine deliveries is used as tractor fuel, and the demand went from 6,143,000 barrels in 1944 to 6,747,000 in 1945. Sales of kerosine for various sundry uses, such as lamp fuel, insecticides, orchard heating, weed burning, tobacco curing, etc., rose from 24,054,000 barrels in 1944 to 24,689,000 in 1945.

The survey covering sales of kerosine, by uses, in 1946 is incomplete at present; however, it is estimated that deliveries for range fuel probably totaled 53,500,000 barrels, while tractor fuel (7,650,000 barrels) and all other uses (28,016,000 barrels) made up the balance of the indicated demand of 89,166,000 barrels noted in the monthly reports of the Bureau of Mines.

Representative kerosine prices were higher in 1946 than in 1945. The average quotation for 41°–43° gravity, water-white kerosine at refineries in Oklahoma—4.33 cents a gallon in December 1945—rose to 4.48 cents in January 1946 and then to 4.88 cents in February. The increase in January of ½ cent a gallon was allowed by the Office

of Price Administration so as to force more kerosine and other light fuel oils into the market. The price remained at that level through June and then edged upward through several changes to a December average of 5.77 cents a gallon, which brought the weighted average for 1946 to 5.10 cents a gallon compared with 4.37 cents for 1945. The average price of kerosine, including No. 1 fuel oil at New York Harbor, was maintained at 7.10 cents a gallon for the first 8 months of 1945 and then dropped to 5.60 cents a gallon when the War Shipping Administration, by its Rate Order 378, removed all surcharges on basic tanker rates. The quotation moved upward to an average of 5.78 cents for December 1945, and the weighted average for the year was 6.61 cents a gallon. A price of 6.10 cents a gallon was maintained through June 1946; then quotations rose by several stages to 7.00 cents late in December, making the average quotation for the year 6.38 cents a gallon.

The tank-wagon price of kerosine at Chicago was held at 10.60 cents a gallon throughout 1945, except for a dip to 10.30 cents from August 20–November 5 that lowered the weighted average for the year to 10.54 cents a gallon. There were mark-ups in January, July, and November 1946 to a final price of 12.20 cents a gallon and an average of 11.37 cents for the year. The dropping of surcharges in tanker rates in September 1945 forced down the tank-wagon price in New York from 10.30 cents a gallon to 8.80 cents. A quotation of 9.30 cents a gallon was established on December 21, and the average for the year was 9.82 cents a gallon. The price of 9.30 cents was maintained until July 27, 1946, when there was an advance to 10.00 cents a gallon. A second increase to 10.30 cents was posted on December 3 and the weighted average for all of 1946 was 9.62 cents a gallon.

DISTILLATE FUEL OIL

Substantially increased production of distillate fuel oil, including Diesel fuel, together with slightly higher transfers and imports and lower exports, enabled oil companies not only to satisfy an increased domestic demand in 1946 but to add a large surplus to storage. These salient factors differed from those prevailing in 1945, when a slightly inflated production combined with lower transfers and imports was not sufficient to meet a higher demand and a draft on stocks was necessary to make up the difference. The domestic demand of 242,965,000 barrels of distillate fuel oil in 1946 was 7.5 percent over 1945 requirements of 226,084,000 barrels, which in turn were 8 percent above the 1944 total. Foreign shipments of light-grade fuel oils have fallen since the ending of the war, as the 1946 total of 29,353,000 barrels was 12 percent below the 1945 item of 33,496,000 barrels, which in turn was 23 percent under the 1944 demand.

A review of the domestic demand in 1946, by quarters, shows that peak requirements of 74,618,000 barrels came in the first 3 months when the need for heating oils was a factor and that the total for the period was 9 percent over the corresponding item of 68,295,000 barrels in 1945. Usually the demand in the final quarter of any year is somewhat below the total for the first 3 months of the same year; however, in 1946 requirements of 73,691,000 barrels in the fourth quarter nearly equaled the indicated demand in the opening period, and fur-

[1] Figures represent crude oil used as fuel on pipe lines.
[2] Subject to revision.
[3] Figures not available.

thermore, the total was 15 percent above the comparative item of 64,081,000 barrels for 1945. It was warmer in the fourth quarter of 1946 than in the same months of 1945; besides, comparative prices for light fuel oils were higher in 1946 so these negative factors could not have inflated the volume of demand. However, greatly increased shipments of domestic oil burners in the second half of 1946, many of which were installed and operating at the end of the year, were probably the main reason for the expanded market. Delayed stocking of light fuel oils by both dealers and consumers was evidently another factor, as it is noticed that the demand in the third quarter of 1946 of 43,446,000 barrels is 3 percent below the corresponding total for 1945—44,712,000 barrels. The domestic demand for distillate fuel oil in the second quarter of 1946—51,210,000 barrels—is only 4.5 percent above the comparative item of 48,996,000 barrels for 1945 or well below the 7.5 percent gain indicated for the entire year. The fast-growing requirements for light heating oils and Diesel fuel is strongly evident in the opening quarter of 1947, when the domestic demand (96,260,000 barrels) was 29 percent above the total in the same 3 months of 1946.

A definite break-down of the domestic demand for distillate fuel oils, including Diesel fuel, in 1946 is not available, as the annual survey covering sales of fuel oil by the Bureau of Mines is incomplete at this time. There are, however, some monthly data and other information upon which estimates of the several demands for light fuel oils can be made. The records of the Interstate Commerce Commission show that the railroads purchased 13,314,000 barrels of Diesel fuel in 1946; and it is believed that the total demand, including other distillate fuel oils, probably was 16,500,000 barrels for the year. Monthly releases of the Bureau of the Census, United States Department of Commerce, indicate that 5,466,000 barrels of Diesel fuel were loaded at continental ports of the country on vessels engaged in foreign trade. This item does not cover other light fuel oils, including Diesel fuel, sold to boats operating in coastal or inland waters, and it estimated that the total vessel demand for distillate grades reached 13,000,000 barrels in 1946.

Sales of distillate fuel oil [1] in the United States, 1941–45, by uses [2]

[1] Includes Diesel fuel.
[2] Figures for 1946 not yet available.
[3] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government.

No figures are available showing the demand for light fuel oils by gas and electric power utilities; however, statistics released by the Federal Power Commission indicate a sharp upward trend in the demand for all grades of fuel oils in 1946, and it is possible that the light-fuel-oil total for both the gas and electric power industries expanded to 9,900,000 barrels for the year. The index of manufacturing for 1946 as computed by the Federal Reserve Board was 177compared with 214 in 1945. However, these indices reflect the need for fuels of all kinds by the manufacturing industries and not that for fuel oil alone. It is believed that the demand by industrial plants for distillate fuel oil, including Diesel fuel, continued to rise in 1946 to about 21,000,000 barrels, as all rationing regulations were off for the full year; burner equipment was more readily available, and besides there were interruptions in the coal supply due to strikes.

The number of domestic oil burners in use in 1946 indicates a demand of 138,000,000 barrels of light heating oil for the year, and it is believed that there was an additional market for approximately 9,000,000 barrels of No. 1 fuel oil for use in range burners. This latter quantity, plus an estimate of 53,500,000 barrels of kerosine sold for range fuel, makes a total of 62,500,000 barrels delivered for range-burner fuel in 1946.

Oil companies probably used about 1,200,000 barrels of distillate fuel oils in their operations in 1946, while the balance of the indicated domestic demand—34,365,000 barrels—must be credited to military and miscellaneous uses.

The changing demand for distillate fuel oils by various uses is shown graphically for 1937–45 in figure 10. All light fuel oils, Diesel fuel, and kerosine sold as range fuel are included.

A downward trend in exports of distillate fuel oils noticed in 1945 continued into 1946, when the total of 29,353,000 barrels for the year was 12 percent below foreign shipments of 33,496,000 barrels in 1945. Viewed in another way, 13 percent of the light-fuel-oil supply was credited to exports in 1945, while the proportion dropped to 10 percent in 1946. Exports of distillate fuel oil to the United Kingdom were drastically reduced from 26,913,000 barrels in 1945 to 14,399,000 in 1946, while shipments to some other countries gained noticeably; however, the quantities involved were not relatively important. Exports of light fuel oils to Canada, which showed a loss in 1945, rose to 1,649,000 barrels in 1946 or double the 1945 total of 826,000 barrels. Consignments of distillate grades of fuel oil to Mexico were 418,000 barrels in 1946 compared with 242,000 in 1945. Efforts in postwar reconstruction in Europe are reflected in American shipments of light fuel oil to the following countries: France, 699,000 barrels in 1945 and 2,234,000 in 1946; Sweden, 671,000 barrels in 1945 and 1,627,000 in 1946; Denmark, 99,000 barrels in 1945 and 720,000 in 1946; Netherlands, 48,000 barrels in 1945 and 744,000 in 1946; and Spain, nothing in 1945 and 225,000 in 1946. A sharp expansion in exports of distillate fuel oils to U. S. S. R. in recent years leveled off in 1946 to 1,075,000 barrels compared with 1,052,000 in 1945.

The production of distillate fuel oil in 1946—287,896,000 barrels—was about 16 percent over the 1945 total of 249,224,000 barrels, and this increase compares with a 4-percent gain for 1945 and a 13-percent expansion in 1944. It can be added that the distillate fuel oils pro-

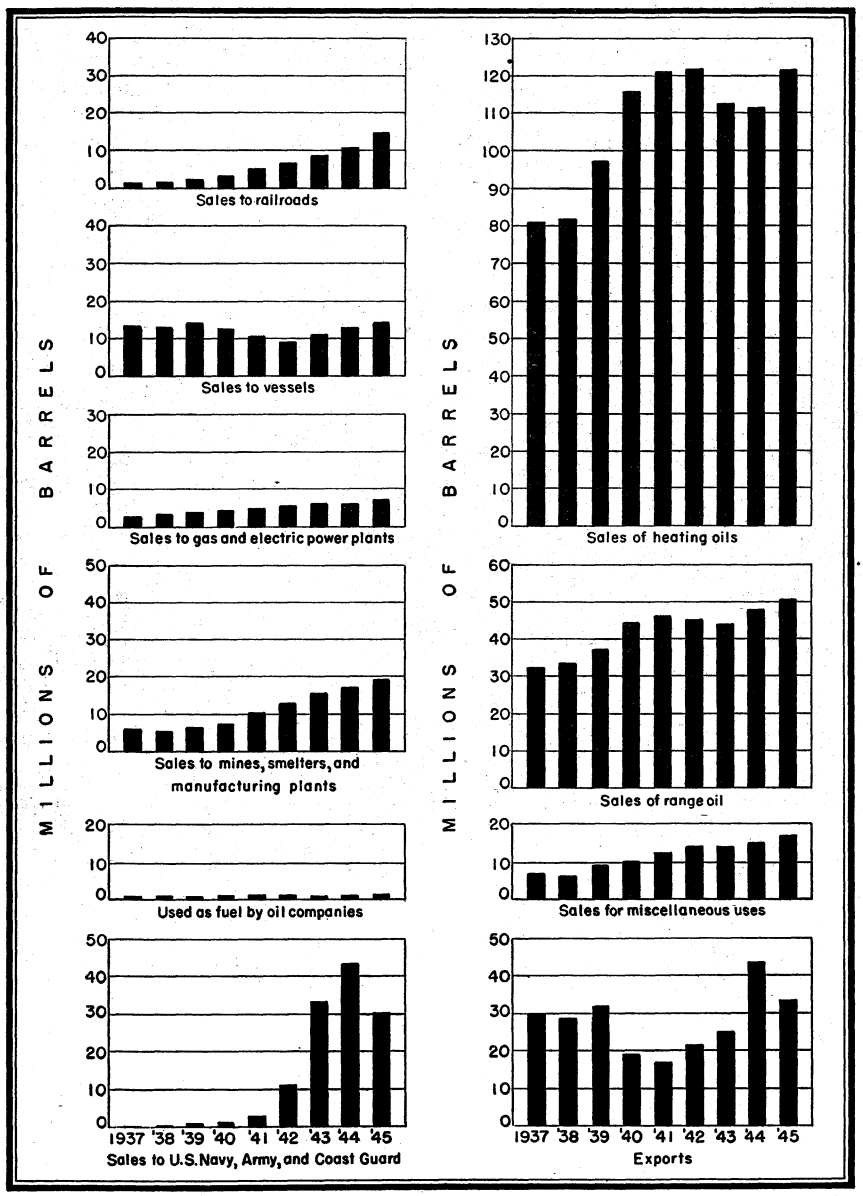

FIGURE 10.—Sales of distillate fuel oil, including Diesel fuel, and range oil in the United States, 1937–45, by uses.

duced in 1946 were sufficient to satisfy 97.2 percent of the total demand (domestic and foreign) including gains in year-end stocks, compared with a 96.0-percent share in 1945. The percentage yield for distillate fuel oils jumped from less than 15 percent in recent years (14.5 percent in 1945) to 16.6 percent in 1946. This gain in the percentage output of light fuel oils, was, however, at the expense of lower yields for both residual fuel oil (24.9-percent yield in 1946 compared with 27.3 percent in 1945) and motor fuel produced from crude petroleum—39.6 percent in 1946 against 40.9 percent in 1945.

[1] Includes Diesel fuel oil.

[2] Figures for 1946 not yet available.

[3] States are grouped according to petroleum-marketing territories rather than to conventional geographic regions.

[4] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government.

All refinery districts of the country reported increased production of distillate fuel oils in 1946, except the Appalachian, Texas Inland, and the Arkansas and Louisiana Inland areas, where the quantities produced are relatively small. Refineries operating in the Texas Gulf Coast district produce nearly a third of the distillate fuel oils, and there the total for 1946—86,469,000 barrels—was 17 percent above the 1945 total (73,677,000 barrels). This larger volume of light fuel oil for the area was the result of both a 5-percent increase in crude runs and a higher percentage yield—20.4 percent in 1946 compared with 18.3 percent in 1945. The East Coast district is the source of about 20 percent of the distillate fuel oils produced in the country, and the output expanded by 10 percent from 50,243,000 barrels in 1945 to 55,252,000 in 1946. The crude runs in the district in 1946 were only 1 percent over the 1945 throughput, so most of the expanded light-fuel-oil production must be credited to a stepped-up yield—20.0 percent in 1946 compared with 18.4 percent in 1945.

The Indiana-Illinois-Kentucky refinery district produced a 14-percent share of all distillate fuel oils in 1945, but only 13 percent of the total in 1946; however, the quantity rose from 34,601,000 barrels in 1945 to 36,861,000 in 1946—about a 7-percent gain. Here a higher yield—13.2 percent in 1946 against 12.5 percent in 1945—was probably the weightier factor in the higher production, as the runs in 1946 were only slightly above those in 1945. The outstanding increase in light-fuel-oil production in 1946 is found in the California refinery district, where the output jumped 39 percent from 29,702,000 barrels in 1945 to 41,150,000 in 1946; furthermore, the percentage share of the national total for the area went from 12 percent in 1945 to over 14 percent in 1946. This greater production of distillates in the California area was realized, even though crude runs to stills were lower by 9 percent in 1946, consequently the gain must be credited entirely to a much higher yield—14.4 percent in 1946 compared with 9.5 percent in 1945. This improved yield for the light grades of fuel oil was possible in 1946, as that for residuals declined sharply from 47.5 percent in 1945 to 41.8 percent in 1946 and furthermore the percentage yield for motor fuel made from crude petroleum was down fractionately.

An appreciable amount of light fuel oil originates in the Louisiana Gulf Coast refinery district—8 percent of the national total in 1945 and 9 percent in 1946—and the output for the area increased from 19,710,000 barrels in 1945 to 25,590,000 in 1946—a 30-percent gain compared with a 27-percent rise in 1945. A higher yield—21.1 percent in 1946 against 19.8 percent in 1945—and stepped-up crude runs (22 percent over 1945), repeating similar favorable factors prevailing in the district in 1945, made possible the greater production of distillate fuel oils in 1946. Production of distillates in the Oklahoma-Kansas-Missouri district in 1946 (21,457,000 barrels) was about 5 percent over the 1945 quantity (20,500,000 barrels). This small gain was entirely the result of a better yield—15.5 percent in 1946 compared with 14.7 percent in 1945—as crude runs for these States dropped slightly.

The remaining refinery districts do not produce large amounts of distillate fuel oil. The quantity reported for the Rocky Mountain area showed a big gain (29 percent) in 1946, while declines were indicated for the Appalachian (1 percent down), the Texas Inland (13

percent down), and the Arkansas and Louisiana Inland (8 percent down) districts.

Light crude petroleum used as fuel by pipe lines is reported as "transfers" to the distillate fuel oils; the quantities involved were 3,123,000 barrels in 1946 and 3,044,000 in 1945. Such "transfers" supply about 1 percent of the total demand for all light fuel oils. The larger shares of these items were credited to the Oklahoma-Kansas-Missouri and the Texas Inland refinery districts, and none at all was reported for the East Coast and Appalachian areas.

Imports of distillate fuel oils into continental United States declined from a wartime peak of 15,269,000 barrels in 1943 to 4,754,000 in 1945; however, there was an increase of 8 percent in 1946 to 5,141,000 barrels. Less than 2 percent of the total demand for light fuel oils is made up of supplies received from foreign countries. The larger share of the imported distillate fuel oil comes from Curaçao; however, several other countries, such as Venezuela, Trinidad, Mexico, and Canada, are credited with lesser amounts. Receipts of some light fuel oils from Saudi Arabia appear in the import statistics for the first time in 1946. This was an item of 113,000 barrels received in the San Francisco customs district, according to the Bureau of the Census, United States Department of Commerce.

Stocks of distillate fuel oils, which have dropped each year since 1941, turned upward to a record volume of 59,620,000 barrels for the year end of 1946, a quantity 67 percent above the comparative item of 35,778,000 for 1945. The light fuel oil in storage at the close of 1946 was equivalent to a 51-day supply at the subsequent January rate of total demand; this compares with a 35-day quantity available at the end of 1945 and 43 days for 1944. In 1945 the pressure for light fuel oils was so great that 1 percent of the total demand (2,555,000 barrels) was satisfied by supplies withdrawn from storage. Conditions were greatly changed in 1946, as 8 percent of the available supply (23,842,000 barrels) was surplus over the year's demand and therefore was added to storage.

Both refinery and bulk-terminal stocks of light fuel oils showed outstanding increases in 1946. Quantities reported as stored at refineries rose from 23,842,000 barrels at the end of 1945 to 38,708,000 for 1946—a 62-percent gain compared with a 5-percent shrinkage of these same stocks in 1945 and 10 percent in 1944. Distillate inventories at bulk terminals—20,912,000 barrels at the close of 1946—were 75 percent over the 1945 quantity (11,936,000 barrels), and this gain is in contrast to losses of 10 percent in 1945 and 5 percent in 1944 for these grades.

All refinery districts reported higher distillate-fuel-oil stocks at the end of 1946 compared with 1945 except the Appalachian area, where quantities held are relatively unimportant. Light-fuel-oil inventories nearly doubled or even more than doubled in several refinery districts in 1946. Supplies held in the important East Coast area jumped from 29 percent of the national total in 1945 to a 35-percent share in 1946, when the quantity at the end of the latter year (20,613,000 barrels) was 96 percent above the 1945 total (10,515,000 barrels). About a fifth of the light-fuel-oil stocks are found in the Texas Gulf Coast area, and there the total rose from 6,027,000 barrels in 1945 to 12,150,000 at the close of 1946. Quantities of distillates reported

from the Louisiana Gulf Coast region are relatively less in importance; however, they expanded from 1,766,000 barrels for 1945 to 3,942,000 in 1946.

The California refinery area reports a large inventory of distillate fuel oil (about one-fifth of the national total), and the volume of 12,241,000 barrels in December 1946 was about 56 percent over the 7,868,000 barrels held at the close of 1945. The quantity of light fuel oil stored in the Indiana-Illinois-Kentucky refinery district increased but slightly during 1946 (6,114,000 in December 1946 compared with 5,773,000 for 1945), and moreover the 1946 item represented only a 10-percent share of the national inventory compared with 16 percent at the end of 1945. Less than 5 percent of the distillate stocks are carried in the Oklahoma-Kansas-Missouri group of States; however, the total reported rose from 1,839,000 barrels in 1945 to 2,536,000 in 1946. Only small quantities of distillate-grade fuel oils are reported as held in the Appalachian, Texas Inland, Arkansas and Louisiana Inland, and Rocky Mountain refinery districts; and the year-end stocks all showed gains in 1946 over 1945, except for the Appalachian area.

There were no tanker movements of light fuel oil from California to eastern areas in 1945 or 1946. The West Coast marketing area (California, Oregon, Washington, Arizona, and Nevada) does, however, make some rail and truck shipments of distillates to other States, and the total covered in this trade was 870,000 barrels in 1946 compared with 636,000 in 1945 and 492,000 in 1944. The California refinery district also receives light fuel oils from other parts of the country, and these totaled 289,000 barrels in 1946 against 251,000 in 1945 and 275,000 in 1944.

Tanker shipments of distillate oil from the Gulf to the East Coast, which practically disappeared during the war years, shot up strongly in 1946 to a record total of 68,851,000 barrels compared with 28,175,000 in 1945. It should be added that the new level in this movement is well above similar prewar shipments, which reached a former "high" of 44,429,000 barrels in 1940. Texas is the source of the larger share (60,115,000 barrels in 1946 compared with 24,883,000 in 1945) of the light fuel oil moved in the Gulf-East Coast tanker traffic, while the balance (8,736,000 barrels in 1946 and 3,292,000 in 1945) originated in Louisiana.

There are some barge and tanker movements of distillate fuel oil from the Gulf Coast area to terminals on the Mississippi River; however, this traffic has varied greatly—from 2,881,000 barrels in 1944 to 4,352,000 in 1945, followed by a sharp drop to 1,879,000 barrels in 1946. Most of this light fuel oil is loaded at Louisiana ports; only a small fraction of it comes from Texas. Arkansas also ships some light fuel oils to points on the Mississippi River, and the volume of this trade has also shrunk drastically—from 3,398,000 barrels in 1944 to 2,980,000 in 1945 and down to 83,000 in 1946. These recent declines in the Mississippi River traffic reflect a change-over from wartime to normal peacetime conditions.

There were no changes in tanker rates in 1946 on No. 2 distillate fuel oil shipped from the Gulf to North Atlantic ports—not east of New York. A freight charge of 38 cents per barrel, effective October

15, 1945, was maintained throughout 1946. It should be added that the present transportation cost is actually figured at $2.85 a long ton (2,240 pounds) for all petroleum products; consequently the calculated rate per barrel varies with the average gravity of the different oils.

An upward trend in distillate-fuel-oil prices was evident in 1946 as crude oil and labor costs mounted and the demand for these fuels increased. The price of 3.63 cents a gallon for No. 2 Straw fuel oil at refineries in Oklahoma, dating from December 1942, was raised to 4.13 cents in January 1946. This advance of ½ cent a gallon was authorized by the Office of Price Administration on January 24 and was applicable to kerosine and heating oils sold for domestic consumption in P. A. W. Districts 1, 2, and 3. The increase in the price for these light products was intended to bring more of them into the market at the expense of an oversupply of gasoline. Further boosts in the Oklahoma refinery price followed during the year, and final December quotations ranged from 4.88 to 5.13 cents a gallon. A price of 5.4 cents a gallon for No. 2 fuel oil at New York harbor, effective late in December 1945, rose to 5.7 cents on January 28, 1946. The quotation ranged higher beginning in July and finally reached an average of 6.43 cents a gallon for the closing month of the year.

Diesel oil at shore plants around New York Harbor, selling at 5.2 cents a gallon, dating from September 1, 1945, was marked upward to 5.7 cents in January 1946, and this value held through July. There were additional advances in August and September for this grade of fuel and still another in early December to a year-end quotation of 6.6 cents a gallon. Ships loading Diesel oil for bunkers in New York Harbor paid $2.15 a barrel beginning September 1, 1945, when all wholesale prices for fuel oils were dropped in line with lower Gulf-East Coast tanker rates. The OPA allowed a mark-up to $2.36 a barrel for ships' Diesel oil in late January 1946, and subsequent advances resulted in a year-end quotation of $2.73 a barrel. Diesel oil for ships fueling at Gulf ports remained at $1.65 a barrel all during 1945; however, there was an advance to $1.86 a barrel in February 1946. The price of Diesel bunkers at Gulf ports followed the upward trend prevailing in other parts of the country in 1946 to a December average of $2.31 a barrel. Quotations for Diesel fuel for ships likewise advanced at San Pedro, Calif., from $1.45 a barrel in January 1946 to an average of $2.39 a barrel for August. This higher price declined to $2.20 in late August and remained at that level for the remainder of the year. Quotations at San Francisco for this same grade of ships' Diesel fuel in 1946 averaged 5 cents higher a barrel.

Representative retail prices for light fuel oils in 1946 followed the upward trend noted in wholesale quotations. Records of retail fuel prices for a number of cities, as published monthly by the Bureau of Labor Statistics, United States Department of Labor, list a quotation of 7.60 cents a gallon for No. 2 distillate fuel oil in New York for December 1945. There was an advance to 7.70 cents a gallon in January 1946 and then to 8.08 cents in February. In the second half of 1946 there were several increases to 8.97 cents a gallon in October and then a slight drop to 8.73 cents for November. This lower value did not hold and the closing quotation of the year was 9.04 cents a gallon. A retail posting for No. 2 distillate in Chicago of

Monthly average prices of distillate fuel oil and Diesel fuel in the United States, 1945–46

7.45 cents a gallon, dating from December 1945, held until February 1946, when there was an advance to 7.88 cents. The quotations were raised several times during the year until they reached 8.87 cents a gallon in December.

RESIDUAL FUEL OIL

The production of residual fuel oil declined in 1946; however, the smaller supply, supplemented by increased imports and "transfers," was not only adequate to satisfy a lower domestic and export demand, but there was a surplus to add to inventory. Conditions prevailing in 1946 differed somewhat from those in 1945, when part of the residual-fuel-oil supply had to be withdrawn from storage, as a slightly increased production, coupled with lower imports and "transfers," was not adequate to meet an increased demand. The indicated domestic demand for heavy fuel oils in 1946 (477,151,000 barrels) was 9 percent below 1945 requirements of 523,423,000 barrels, while exports continued the downward trend of recent years to 9,486,000 barrels in 1946 compared with foreign shipments of 11,669,000 in 1945—a 19-percent shrinkage.

The drop in demand for residual fuel oils in 1946 was evident throughout the year, as the total for each quarter was well below the corresponding period of 1945. However, the relative shrinkage in quarterly requirements in 1946 diminished as the year advanced or as military and other wartime demands faded with the change-over to peace conditions. The indicated domestic demand for heavy fuel oils in the first quarter of 1946 (126,527,000 barrels) was 13 percent below the comparative 1945 total (144,940,000 barrels) and 12 percent down in the second quarter—116,540,000 barrels in 1946 against 131,688,000 in 1945. However, in the third quarter of 1946, requirements for residual grades (108,168,000 barrels) were only 8 percent under the demand in the same 3 months of 1945 (117,324,000 barrels); by the final period, when the need for heavy heating oils was again a factor and when industrial activities were beginning to approach peacetime conditions, total deliveries of 125,916,000 barrels were within 3 percent of the 1945 comparative item (129,471,000 barrels). A rising market for residual fuel oil in 1947 was evident in the opening quarter, when the indicated demand (137,459,000 barrels) was 9 percent over corresponding 1946 requirements (126,527,000 barrels).

Sales of residual fuel oil [1] in the United States, 1941–45, by uses [2]

[1] Represents quantities used on leases and for general industrial purposes.
[2] Subject to revision.
[3] Figures not available.

Sales of heavy fuel oil by principal uses in 1946, as reported in the annual survey conducted by the Bureau of Mines, have not been released; however, estimates of the several requirements, based on available monthly figures and other information, have been made and are as follows: Railroads, 101,500,000 barrels; bunkering of vessels, 81,000,000 barrels, of which amount 55,340,000 barrels were loaded at continental ports of the United States on ships engaged in foreign trade, according to the Bureau of the Census, United States Department of Commerce; gas and electric power plants, 51,350,000 barrels; smelters, mines, and manufacturing plants, 95,000,000 barrels; heating oils, 49,000,000 barrels; oil-company fuel, 58,500,000 barrels; and military requirements and miscellaneous uses, 40,800,000 barrels.

The columns in figure 11 represent the fluctuating annual demand for residual fuel oils by principal uses in 1937–45. All heavy fuel oils, including Navy grade and crude petroleum used as fuel, are included.

A gradual decline in exports of residual fuel oil, evident in 1944, continued into 1946, when foreign shipments (9,846,000 barrels) were 19 percent below the 1945 total (11,669,000 barrels). There were no shipments of residual fuel oil to the United Kingdom in 1946 compared with 4,360,000 barrels in 1945, according to the Bureau of the Census, United States Department of Commerce; however, this loss in the overseas trade was partly offset by gains shown for other countries. Canada received 1,924,000 barrels of heavy fuel oil in 1946 compared with 734,000 in 1945, while shipments to Mexico rose from 583,000 barrels in 1945 to 836,000 in 1946. There was a slight increase in the requirements of Cuba from 1,005,000 barrels in 1945 to 1,137,000 in 1946, and exports of residual fuel oil to U. S. S. R. jumped noticeably from 159,000 barrels in 1945 to 874,000 in 1946. Various countries received the following quantities of American heavy fuel oil in 1946: Sweden, 134,000 barrels; Denmark, 187,000 barrels; Belgium, 168,000 barrels; and China, 211,000 barrels against no recorded receipts for those same countries in 1945.

The volume of crude runs through refineries in 1946 varied only slightly compared with 1945; however, the yield for residual fuel oils was cut from 27.3 percent in 1945 to 24.9 percent in 1946, to make more of the distillate grades. As a result the production of residuals dropped by 8 percent from 469,492,000 barrels in 1945 to 431,364,000 in 1946. The lower output of heavy fuel oil in 1946 is in contrast to a 2-percent gain in 1945 and an 11-percent gain in 1944. Residual fuel oil produced in 1946 made up 87 percent of the total available supply from all sources and compares with an 88-percent share in 1945.

Only three refinery districts—Indiana-Illinois-Kentucky, Texas Gulf, and the Rocky Mountain—reported small gains in the production of residual fuel oil in 1946. About 19 percent of the heavy fuel oil made in the country is credited to the East Coast States, and the quantity dropped 6 percent from 85,352,000 barrels in 1945 to 80,007,000 in 1946. The crude petroleum processed in the area was up slightly in 1946 compared with 1945; however, the yield for residual fuel oils was only 28.9 percent in 1946 against 31.2 percent in 1945 and hence the lower production. It should be added that runs of

[1] Includes some crude oil burned as fuel.
[2] Figures for 1946 not yet available.
[3] States are grouped according to petroleum-marketing territories rather than to conventional geographic regions.
[4] These totals involve some duplication due to rehandling of fuel oil initially sold to the Government.

foreign crude (usually of high residual fuel-oil content) in the East Coast district gained in volume in 1946 as it did in 1945, yet this favorable factor made no measurable difference in the lower yield reported.

The Texas Gulf Coast region is an important source of residual fuel oils, and the production (about a fifth of the national total) increased from 88,617,000 barrels in 1945 to 90,200,000 in 1946.

Increased runs (5 percent over 1945) in this district were sufficient to counteract a lower yield—21.2 percent in 1946 compared with 22.0 percent in 1945—hence the gain in the output of heavy fuel oils. California produces more residual fuel oil than any other area; however, the quantity declined by 20 percent—from 148,976,000 barrels in 1945 to 119,224,000 in 1946—due both to a 9-percent drop in crude runs and a greatly reduced yield—41.8 percent in 1946 compared with 47.5 percent in 1945.

The Indiana-Illinois-Kentucky refinery district is also the source of an important quantity of heavy fuel oil; and the total rose from 53,494,000 barrels in 1945 to 54,323,000 in 1946, mainly because of a small increase in crude runs, as the yield remained fixed at 19.4 percent for both years. A lower yield and smaller crude runs in the Oklahoma-Kansas-Missouri group of States resulted in a drop in the production of residuals from 24,764,000 barrels in 1945 to 23,406,000 in 1946. Similar operating conditions also prevailed in the Texas Inland district, and the heavy fuel oil realized fell off from 22,491,000 barrels in 1945 to 20,092,000 in 1946. Crude petroleum processed in the Louisiana Gulf area gained substantially (22 percent over 1945); however, as the yield for residual grades of fuel oil was lowered from 17.2 percent in 1945 to 14.1 percent in 1946, the output of 17,040,000 barrels in 1946 differed very little from the 1945 total of 17,062,000 barrels. The remaining refinery districts—Appalachian, Arkansas and Louisiana Inland, and the Rocky Mountain—do not produce large quantities of heavy fuel oils, and the Rocky Mountain area was the only one of this group to show a gain in 1946.

Considerable quantities of heavy crude petroleum are used directly as fuel on leases and for general industrial purposes. Such crude oils are credited to the fuel-oil account as "transfers" and totaled 23,142,000 barrels in 1946, a gain of 12 percent over the 1945 item of 20,727,000 barrels. This crude used as fuel represented about 5 percent of the total supply of heavy fuel oils in 1946 and approximately 4 percent in 1945. The larger share of the "transfers" are reported from the California refinery district—19,077,000 barrels in 1946 compared with 16,039,000 in 1945—while quantities in the other refinery areas declined from 4,688,000 barrels in 1945 to 4,065,000 in 1946. No "transfers" of this kind are made in the East Coast and Appalachian districts.

Imports of residual into continental United States, which dropped 13 percent in 1945, expanded to 42,067,000 barrels in 1946, a 33-percent gain over the 1945 total of 31,648,000 barrels. Heavy fuel oil received from foreign sources made up about 9 percent of the total supply in 1946 compared with a 6-percent share in 1945. Practically all of the residual fuel oil received from abroad in 1945 and 1946 came from Curaçao, Netherlands West Indies, while relatively smaller amounts were credited to a number of other countries, including Canada, Mexico, Venezuela, Trinidad, Colombia, and Rumania.

A lower domestic demand, together with increased imports and curtailed exports, were factors that resulted in an improved residual fuel-oil stock situation in 1946 compared with 1945, even though the production and percentage yield were unfavorable. The volume of year-end stocks of heavy fuel oils expanded from 37,158,000 barrels

793065—48——62

in 1945 to 47,094,000 in 1946—a 27-percent gain in contrast to a 26-percent loss in similar inventories in 1945. Stocks of residual fuel oil held at refineries, as well as those at bulk terminals, showed increases in 1946 instead of pronounced declines, as in 1945. Quantities reported at refineries rose from 28,749,000 barrels at the close of 1945 to 37,414,000 in 1946—a 30-percent gain—while those held at bulk terminals were up 15 percent from 8,409,000 barrels in 1945 to 9,680,000 in December 1946.

During 1945, 13,225,000 barrels of heavy fuel oil were withdrawn from storage to meet the demand, while in 1946 the supply situation was more favorable as there was an addition to inventory of 9,936,000 barrels. Expressed on a percentage basis, about 3 percent of the needed quantity of heavy fuel oils came from stocks in 1945; however, in 1946 there was a 2-percent excess, which was diverted to storage. Residual grades of fuel oil held at refineries and bulk terminals at the year end of 1946 were sufficient for 30 days of supply at the subsequent January rate of indicated total demand, and this volume compares with a 25-day supply at the close of 1945 and 29 days for 1944.

Nearly half of the residual fuel-oil stocks are carried in the California refinery district, and the quantity reported increased by 26 percent from 17,832,000 barrels in 1945 to 22,405,000 in December 1946. Important inventories of heavy fuel oil are also held in the East Coast and Texas Gulf Coast areas. Those in the East Coast account for about a fifth of the national total, and the quantity expanded by 19 percent from 7,057,000 barrels in 1945 to 8,399,000 for 1946, while in the Texas Gulf Coast, a supply area, the year-end totals were 5,051,000 barrels for 1945 and 6,935,000 in 1946. Heavy fuel-oil inventories in the Indiana-Illinois-Kentucky group of States rose from 2,587,000 barrels or 7 percent of the national total in 1945 to 4,200,000 or 9 percent of all stocks in 1946. The heavy fuel oil stored in the remaining refinery districts is not relatively important and represented only about 12 percent of the total supply in 1945 and 11 percent in 1946. Four of these areas—the Appalachian, Oklahoma-Kansas-Missouri, Texas Inland, and the Louisiana Gulf Coast—reported gains in residual stocks in 1946, while quantities in the Arkansas-Louisiana Inland and Rocky Mountain districts were lower at the end of 1946 compared with 1945.

No residual fuel oil was moved by tanker from the California refinery district to eastern areas in 1945 or 1946. However some little heavy fuel oil—91,000 barrels in 1946 compared with 158,000 in 1945 and 182,000 in 1944—was shipped out by rail and truck to other Western States. There were also some receipts of residual grades from other refinery areas—734,000 barrels in 1946 compared with 773,000 in 1945 and 571,000 in 1944.

The tanker and barge movement of residual fuel oil from the Gulf to East Coast ports is still well below the record volume of 75,923,000 barrels made in 1941; however, there was a substantial increase in this traffic in 1946 to 55,186,000 barrels—a gain of 48 percent over the 1945 total of 37,192,000 barrels. Texas is the source of most of this heavy fuel oil moved by tanker to the Atlantic coast—49,071,000

barrels in 1946 and 34,409,000 in 1945—while Louisiana supplies the balance—6,115,000 barrels in 1946 and 2,783,000 in 1945.

Petroleum refiners operating along the Gulf coast send some heavy fuel oil up the Mississippi River by barge; however, this movement has fallen under peacetime conditions from 1,182,000 barrels in 1944 to 1,042,000 in 1945 and down to 642,000 in 1946. Louisiana is credited with most of this oil, while a small portion comes from Texas.

There were no changes in tanker rates in 1946 for heavy fuel oil moved between the Gulf and East Coast ports, not east of New York. A charge of 43.8 cents a barrel for 10°–19.9° gravity fuel oil, effective October 15, 1945, was maintained all during 1946. The actual freight is based on a rate of $2.85 a long ton for all petroleum products, and the equivalent cost per barrel varies with the gravity of the oil shipped.

The price of representative grades of residual fuel oil moved upward in 1946. A quotation for No. 6 at refineries in Oklahoma (94 cents a barrel) held all during 1945 and until March 1946, when the monthly average rose to $1.03. An average value of $1.15 a barrel was maintained during the second quarter of the year and after several changes reached $1.28 a barrel in August 1946. The price was shaded several cents a barrel during the September-November period and then jumped to an average of $1.36 a barrel as the demand increased at the year end.

Market quotations on No. 5 fuel oil at New York Harbor averaged $1.90 a barrel from early October 1944 through August 1945 and then dropped to $1.68 in September with inauguration of postwar tanker rates. There was a 4-cent reduction per barrel in late November 1945, and the December average was $1.64 per barrel or $1.82 average for the year. There were no further changes until March 1946, when the quoted price was raised to $1.90 a barrel. Late July brought another increase, and by September 1946 the average cost of No. 5 fuel oil was $2.25 a barrel. This value was reduced slightly in the fall months; however, the December average reached $2.32 a barrel and the weighted price for all of 1946 was $1.99 a barrel.

Bunker "C" fuel oil at New York Harbor dropped from $1.77 to $1.55 a barrel on September 1, 1945, and then to $1.51 on November 28, when normal tanker rates were put into effect. Quotations for Bunker "C" followed the upward trend of other fuel-oil prices in 1946 and finally reached an average of $1.97 a barrel in August. This higher value did not hold and finally settled to $1.92 a barrel during the closing 4 months of 1946. A price of 97 cents a barrel for Bunker "C" at Gulf ports, effective in August 1944, was maintained all during 1945 and until March 1946, when it advanced to $1.06 a barrel. The quotation for this grade of ships' bunkers was raised during the summer months until it reached an average of $1.49 a barrel in August 1946. There was a temporary reduction until December, when it rose to an average of $1.54 a barrel. Bunker "C" for ships loading at San Pedro, Calif., was quoted at $1.10 a barrel all during 1945 and until March 25, 1946, when the price was raised to $1.25 and remained there for the balance of the year.

Monthly average prices of residual fuel oil in the United States, 1945–46

LUBRICATING OIL

The refinery production of lubricating oil amounted to 45,645,000 barrels in 1946 for a new all-time high. This represents an increase of 3,778,000 barrels or 9 percent over the production in 1945. The principal gains were in the East Coast and Texas Gulf Coast districts, where the percentage increases were 12 and 22, respectively. The production in these two districts was about 50 percent of the total. Production in the Appalachian district was 5,175,000 barrels in 1946 compared with 4,891,000 barrels in 1945.

The percentage yield of lubricating oil from crude rose from 2.4 in 1945 to 2.7 in 1946. This is just below the average yield for the prewar period from 1939 through 1941.

The total demand for lubricating oil increased from 41,909,000 barrels in 1945 to a new "record" of 45, 942, 000 barrels in 1946. This increase of 4,033,000 barrels comprised an increase of 4,483,000 barrels in exports and a decrease of 450,000 barrels in domestic demand. Domestic demand for lubricating oil in 1946 was 41 percent above domestic demand in 1940, compared with a 35-percent increase in the domestic demand for all oils in the same period. Exports in 1945 dropped to the lowest level in over 25 years, but the 68-percent increase in 1946 produced a total that was exceeded only by the exports in 1939.

OTHER PRODUCTS

Wax.—Refinery production of petroleum wax has increased each year since 1938. The production of 841 million pounds in 1946 represented an increase of 3 percent over 1945 and 64 percent over 1940. About 37 percent of the 1946 total was produced in the East Coast district, 15 percent in the Texas Gulf Coast district, and 13 percent in the Oklahoma-Kansas district. In the prewar years, imports of wax, chiefly from the East Indies, represented as much as 14 percent of the total new supply in the United States, but the major foreign source of supply vanished with the Japanese invasion of the East Indies producing area.

Domestic demand for petroleum wax declined from the all-time peak of 673 million pounds in 1945 to 636 million in 1946. However, this 1946 demand was 78 percent above the domestic demand in 1940. Exports in 1946 increased to 201 million pounds, but were still 3 percent below the average of exports in the 3-year period from 1938–40.

Coke.—The production of petroleum coke amounted to 2,124,200 short tons in 1946 compared with 2,023,000 tons in 1945. Exports increased from 209,200 tons in 1945 to 386,200 tons in 1946, but domestic demand declined 2 percent to 1,806,200 tons in 1946.

The principal refinery districts producing coke, in order of their importance in 1946, were the Indiana-Illinois, Texas Gulf Coast, Louisiana Gulf Coast, California, Oklahoma-Kansas, Texas Inland, and East Coast districts. The Illinois-Indiana district produced 49 percent of the total in 1946 compared with 56 percent in 1945.

Asphalt and Road Oil.—The domestic demand for asphalt increased from 6,972,800 short tons in 1945 to 7,909,700 tons in 1946—a gain of 13 percent. Imports declined from 147,100 tons in 1945 to 125,700 tons in 1946, while exports increased 59 percent to 372,300 tons in 1946. The wartime restrictions on the production and use of road oil resulted in a very low indicated demand for this product in 1944—1,560,000 barrels. This demand increased to 2,505,000 barrels in 1945 and to 5,939,000 barrels in 1946. However, the 1946 demand was still 34 percent below the demand in 1941.

Detailed statistics for asphalt and road oil appear in the Asphalt and Related Bitumens chapter of this volume.

Still Gas.—The production of still gas dropped from 372 billion cubic feet in 1945 to 317 billion cubic feet in 1946, with a decline in every refinery district. The Texas Gulf Coast district, with an output of 83 billion cubic feet, continued as the major producer in 1946. Other important producing districts were: Indiana-Illinois, East Coast, and California.

[1] Subject to revision.

Miscellaneous Oils.—The domestic demand for finished miscellaneous products increased from 37,857,000 barrels in 1945 to 46,026,000 barrels in 1946—a gain of 22 percent. The major products in this group are liquefied gases for fuel use and for chemical and rubber manufacture. In 1946, the domestic demand for liquefied gases amounted to 39,736,000 barrels, and the domestic demand for all other products in the miscellaneous group was 6,290,000 barrels. The supply of liquefied gases is derived from natural-gasoline and cycle plants and from refinery production. Transfers from natural-gasoline and cycle plants in 1946 amounted to 25,458,000 barrels, and refinery production of liquefied gases totaled 15,440,000 barrels. Refinery production of all other products in the miscellaneous group amounted to 7,099,000 barrels, but no detailed break-down of the output by products is available.

INTERCOASTAL SHIPMENTS [2]

Shipments of mineral oils, crude and refined, from Gulf coast ports to east coast ports more than doubled from 1945 to 1946. Crude petroleum was the largest single item in these 1946 shipments; it constituted 40 percent of the total shipments in 1946 compared with 36 percent in 1945. Gasoline occupied second place in importance; its shipments constituted 26 percent of the whole in 1946 compared with 24 percent in 1945. Intercoastal shipments of all varieties of mineral oils were considerably larger in 1946 than in 1945. The lowest rate of increase of all specified varieties—that of residual fuel oil—was 48 percent.

[2] Includes 1,711,000 barrels for export.

FOREIGN TRADE [3]

Imports of mineral oils, crude and refined, into continental United States increased 19 percent from 1945 to 1946. They constituted 6 percent of the total new supply in continental United States in 1945 and 7 percent in 1946.

Crude petroleum, residual fuel oil, and distillate fuel oil together made up 97 percent of the total mineral-oil imports into continental United States in 1945 and 99 percent in 1946. Virtually all these imports came from ports of the Caribbean Sea and the Gulf of Mexico. Venezuela supplied 48 percent of the total imports in 1945 and 53 percent in 1946; the Netherlands West Indies 41 percent in 1945 and 34 percent in 1946; Colombia 6 percent in 1945 and 7 percent in 1946; and Mexico 3 percent in 1945 and 4 percent in 1946.

Of the crude petroleum imported into continental United States, Venezuela furnished 77 percent of the total in 1945 and 81 percent in 1946, Netherlands West Indies 7 percent in 1945 and 6 percent in 1946, Colombia 11 percent in 1945 and 12 percent in 1946, and Mexico 3 percent both in 1945 and in 1946. Kuwait, a newcomer in the United States market, made an initial shipment of 115,000 barrels in 1946.

The Netherlands West Indies provided 97 percent of the residual fuel oil imported into continental United States and the noncontiguous Territories in 1945 and 95 percent in 1946. Minor amounts were imported in both years from Mexico, Venezuela, Trinidad, Canada, and Colombia.

[1] Imports of crude as reported to Bureau of Mines; imports of refined products compiled from records of U. S. Department of Commerce; figures may differ slightly from those used throughout other sections of this report.

[2] Subject to revision.

Caribbean countries and Mexico shipped 77 percent of the distillate fuel oil received in continental United States and the noncontiguous Territories in 1946, and Middle Eastern countries—Saudi Arabia, Bahrein Island, and Iran—23 percent. In 1945 Caribbean countries and Mexico had supplied 98 percent of these imports.

EXPORTS

Continental United States continued to be a net exporter of mineral oils. The excess of all petroleum exports over all petroleum imports decreased from 69 million barrels (revised figure) in 1945 to 16 million barrels in 1946. In crude petroleum, however, imports were larger than exports in both years. The excess of crude imports increased from 41 million barrels (revised figure) in 1945 to 45 million barrels in 1946. The principal decreases were in net exports of refined oils, notably of motor fuel (from 86 million in 1945 to 45 million in 1946), and of distillate fuel oil (from 29 million barrels in 1945 to 24 million in 1946). On the other hand, residual fuel oil has long been imported in greater quantities than exported. The excess of imports of residual fuel oil increased from 20 million barrels in 1945 to 33 million barrels in 1946. The net outward shipments of lubricating oils increased from 7 million barrels in 1945 to 11 million barrels in 1946, reflecting the resumption of manufacturing activities in Europe.

Exports and Territorial shipments of crude petroleum from continental United States increased 23 percent from 1945 to 1946; but the 40,750,000 barrels of crude petroleum exported and shipped to the Territories in 1946 was only 53 percent of the 77,273,000 barrels exported and shipped in 1938, the peak year for such outward shipments. There was a marked difference in the destinations of the crude exports in the two sample years. In 1938 Canada received 32 percent of the total exports of crude, Japan 27 percent, France 22 percent, and Italy 9 percent. In 1946, however, 86 percent of the crude exports went to Canada, 5 percent to France, 3 percent to the United Kingdom, and 3 percent to Cuba.

Exports and Territorial shipments of refined oils were 26 percent less in 1946 than in 1945. The greatest decrease, both quantitatively and proportionally, was in outward shipments of motor fuel, which declined 48 percent from 1945 to 1946, largely as a result of the termination of Lend-Lease shipments. The most marked decline was in exports of motor fuel to Europe, especially to the United Kingdom and the U. S. S. R. Exports and Territorial shipments of distillate fuel oil were 12 percent lower in 1946 than in 1945, chiefly as a result of decreased exports to the United Kingdom; and of residual fuel oil were 19 percent less in 1946 than in 1945, likewise due to reduced shipments to the United Kingdom. On the other hand, the

Crude petroleum exported from the United States, 1939–46, by countries [1]

outside world took 38 percent more kerosine from the United States in 1946 than in 1945 and 68 percent more lubricating oils. Exports and Territorial shipments of paraffin wax increased 27 percent from 1945 to 1946, partly at least because of the virtual elimination of Burma and Indonesia from the export market.

Of the total exports and Territorial shipments of major refined oils and paraffin wax to foreign countries, 77 percent in 1945 and 59 percent in 1946 went to Europe. The United Kingdom received 69 percent of the total in 1945 but only 31 percent in 1946, and the U. S. S. R. 4 percent in 1945 and 2 percent in 1946. To other European countries that had been largely deprived of mineral oils during the war period, 4 percent went in 1945 but 26 percent in 1946.

North American countries received 6 percent of the total exports and Territorial shipments in 1945 but 15 percent in 1946. Canada's share of the whole increased from 3 percent in 1945 to 9 percent in 1946. South America took 1 percent of the total in 1945 and 2 percent in 1946.

Exports and Territorial shipments of major refined oils and wax from the United States to Oceania amounted to 2 percent of the total foreign sales in 1945 and 4 percent in 1946. Australia received 1½ percent of the whole in 1945 and 2 percent in 1946.

Africa accounted for 2 percent of the total exports and Territorial shipments of refined oils and wax in 1945 and for 4 percent in 1946.

Mineral oils, crude and refined, shipped from continental United States, including shipments to noncontiguous Territories, 1945–46, by classes and months [1]

WORLD PRODUCTION [4]

The world production of crude petroleum continued its upward trend, increasing 6 percent in 1946 over 1945 and attaining a new high. The United States production increased only 1 percent from 1945 to 1946, but other countries enlarged their output 16 percent.

The Western Hemisphere contributed 82 percent of the total world petroleum production in 1946. The United States alone supplied 63 percent of the world output and Venezuela 14 percent. In the Eastern Hemisphere, the U. S. S. R. furnished 6 percent of the world total, so far as unsatisfactory statistics would indicate, and Iran 5 percent.

Crude petroleum produced in principal countries of the world, 1941–46, in thousands of barrels

[6] Exclusive of U. S. S. R. fields in Asia (other than Sakhalin), which are included with U. S. S. R. in Europe.

In the Western Hemisphere, Venezuela had the largest increase in petroleum production—20 percent from 1945 to 1946. Other South American countries showed slight decreases, owing largely to difficulties in obtaining pipe and drilling equipment. Mexico definitely increased its petroleum production in 1946 over 1945. Trinidad produced a little less in 1946 than in 1945; and Canadian production in 1946 was lower than in any year since 1939.

Petroleum production in Europe showed a combination of recovery from war damages and of decline in the output of old and partly exhausted fields. Rumania, the largest European producer outside the U. S. S. R., produced 10 percent less oil in 1946 than in 1945. However, increased petroleum production in Germany, Hungary, Austria, and other countries offset the decline in Rumania.

The Middle East showed the largest proportional increase in petroleum production, enlarging its collective output 32 percent from 1945 to 1946. Its share of the world total increased from 7 percent in 1945 to 9 percent in 1946. Production in Iraq, limited by the fixed capacity of the pipe line from Kirkuk to the Mediterranean, was less than 2 percent larger in 1946 than in 1945. On the other hand, Iran increased its output 12 percent in 1946 over 1945, and Saudi Arabia in 1946 nearly trebled its 1945 production. Bahrein Island showed a 10-percent increase. Kuwait began commercial production in 1946.

In Far Eastern Asia, the Netherlands East Indies, troubled by domestic strife and political uncertainty, produced in 1946 only a small fraction of its prewar output. Repair of war damage retarded oil production in Burma. Japanese output was lower in 1946 than in 1945. India likewise produced less petroleum in 1946 than in 1945.

Statistically speaking, the U. S. S. R. remained a great enigma. Only a few brief statements in the Soviet press gave any indication of petroleum developments in this vast country during 1945 and 1946.

Phosphate Rock

By BERTRAND L. JOHNSON AND E. M. TUCKER

GENERAL SUMMARY

DEMAND for phosphate rock in recent years has been abnormally high (see fig. 1), and the upward trend continues. New records were made in the domestic phosphate-rock industry in 1946, according to reports submitted by operators to the Bureau of Mines. Total mine production reached a new high at 7,168,839 long tons. Phosphate rock sold or used by producers in 1946 also attained a new peak of 6,860,713 long tons containing 2,216,978 long tons of P_2O_5, valued at $31,043,821, which is over $7,000,000 more than the 1945 total. The marketed production from Florida and the Western States in 1946 was greater than ever before, and the quantity of Tennessee phosphate rock sold or used (although not a record) was greater than in 1945. Imports declined; exports increased 29 percent. Apparent domestic consumption in 1946 rose to 6,287,112 long tons (see footnote to apparent consumption table).

PRODUCTION

Again a new record has been made in the quantity of phosphate rock mined in the United States. In 1946, 7,168,839 long tons came from domestic mines, nearly 2,000,000 tons more than in 1945. Increases were recorded in Florida, Tennessee, and the Western States, new highs being reached in Florida and the Western States. Tennessee showed an increase in 1946 over 1945, but the production was below that of some previous years. Phosphate rock was mined in 1946 in Florida, Tennessee, Idaho, Montana, and Utah, and apatite in Virginia.

Phosphate rock mined in the United States, 1937–46, by States, in long tons

[1] Includes small quantity of apatite from Virginia and in 1938 small quantity of phosphate rock from South Carolina. Includes in 1938–43 some matrix of washer grade.

SALES

In 1946, another record was also made in the quantity of phosphate rock sold or used by producers—6,860,713 long tons—which exceeded the previous record, made in 1945, by over a million tons. The total value of $31,043,821 was more than $7,000,000 greater than in 1945, owing partly to the larger sales and partly to the higher average value per ton, which increased from $4.12 in 1945 to $4.52 in 1946.

Phosphate rock sold or used by producers in the United States, 1942–46

Year	Long tons	Value at mines		Year	Long tons	Value at mines	
		Total	Average			Total	Average
1942	4,644,240	$16,597,492	$3.57	1945	5,806,723	$23,951,077	$4.12
1943	5,126,232	18,962,021	3.70	1946	6,860,713	31,043,821	4.52
1944	5,376,643	20,856,429	3.88				

The following table shows sales of phosphate rock, by grades, for 1945 and 1946. For the first time these data are shown separately for Florida, Tennessee, and the Western States, as well as for the United States as a whole.

Phosphate rock sold or used by producers in the United States, 1945–46, by grades and States

[2] Includes a small quantity from Virginia.
[3] Less than 0.5 percent.

CONSUMPTION AND USES

Apparent consumption of phosphate rock in the United States in 1946 increased to 6,287,112 tons, continuing the wartime expansion of domestic demand for this material.

Apparent consumption[1] of phosphate rock in the United States, 1942–46, in long tons

PRICES

During most of 1946 the maximum prices of Florida land-pebble phosphate rock, Florida hard-rock phosphate, and Tennessee brown-rock phosphate for sales by miners were covered by Revised Maximum Price Regulation 240 and amendments. Prices through the early

part of the year were the same as those at the end of 1945. Effective June 19, 1946, however, new ceiling prices were placed on Florida land-pebble phosphate rock and on Tennessee brown- rock phosphate. On land pebble the price was advanced 40 cents per ton to cover an approved average wage increase of 20 cents an hour. On the Tennessee brown-rock phosphate the ceiling was raised 20 cents per ton to cover an approved wage increase of 10 cents an hour (Amendment 6 to Revised Maximum Price Regulation 240). Effective October 12, 1946, an advance of 70 cents per ton in maximum prices was granted to Florida hard-rock miners to compensate substantially for the increase in the cost of production (Amendment 7 to Revised Maximum Price Regulation 240). Ceiling prices on both Florida and Tennessee phosphate rock are shown in the accompanying table. All price controls on phosphate rock were ended November 10, 1946, by Office of Price Administration Supplementary Order 193.

Ceiling prices per long ton of Florida and Tennessee unground phosphate rock, f. o. b. cars at mines, by grades, in 1946 [1]

REVIEW BY STATES

Florida.—A new record was set in 1946 in the total quantity of Florida phosphate rock sold or used—5,005,511 long tons—over three-quarters of a million tons greater than the previous record high of 1945. The total value of this rock—$21,017,174—was $1,500,000 greater than the previous record of $19,464,362, made in 1920. Increases in the quantities and values of all types of Florida rock sold or used—land-pebble, hard rock, and soft rock—were made in 1946. The total average value per ton and the average values for hard rock and land-pebble were higher in 1946 than in 1945; but the average value per ton of soft rock, as reported by the producers, was less in 1946 than in the previous year.

The land-pebble phosphate-rock mining companies in operation in 1946 were the American Agricultural Chemical Co. (Pierce); American Cyanamid Co. (Brewster); Coronet Phosphate Co. (Plant City); Davison Chemical Corp., operating the property of the former Southern Phosphate Co. during the later part of the year; International Minerals & Chemical Corp. (Mulberry); Pembroke Chemical Corp. (Pembroke); Southern Phosphate Co. (Ridgewood), during the first

part of the year; Swift & Co. Fertilizer Works (Agricola); and the Virginia-Carolina Chemical Corp. (Nichols).

[1] Includes material from waste-pond operations.

The International Minerals & Chemical Corp. continued the operation of its Peace Valley mine and during the year installed at this mine the largest dragline excavator yet built, said to be the largest piece of moving machinery ever set up on land in the State of Florida. This was a huge Bucyrus-Erie walking dragline weighing 2,571,000 pounds, with a 215-foot boom and a 21.4-cubic-yard bucket. The machine is supported on a circular base 51 feet in diameter, with two walking shoes 9 feet wide and 54 feet long. The 215-foot boom is said to be 35 feet longer than any ever built before. It has a reach of 218 feet, a digging depth of 130 feet and can dump its load at a height of 80 feet. Each bucketload weighs 32 tons, and the dragline can handle 60 to 75 bucketfuls, or some 4,000,000 pounds an hour. The machine is electrically driven, with electronic controls. It contains 46 electric motors, the largest of 1,250 horsepower. A stress alarm system has been installed to warn the operator of any dangerous stress at possible points of overloading. The machine both strips the overburden and mines the phosphate-rock matrix, all operations being carried on from the surface level. A detailed description of the machine has been given by James A. Barr, Jr.[3]

At the Achan mine at Mulberry, International constructed a new plant, starting it in the spring and finishing it in August. The company will shortly open the Noralyn mine on a tract of about 1,800 acres of phosphate rock land near Bartow. This new 1,000,000-ton plant is scheduled to start operating in July 1947. Another dragline similar to the huge excavator at the Peace Valley mine has been

[3] Barr, James A., Jr., "Bigger Digger"—An Electronic Hercules: Rock Products, vol. 49, No. 11, November 1946, pp. 66–67, 69

ordered for this mine. Phosphate rock from the mine will be shipped to Mulberry, present center of the corporation's activities in Florida, where it will be graded, dried, stored, and distributed.

The Coronet Phosphate Co. in March 1946 began operation, at its Hopewell washing plant, of a 150-foot-diameter hydroseparator to secure a better separation of recoverable fine phosphate rock (14- to 150-mesh) from slime rejects in present washer debris. This machine was designed to handle 7,500 gallons per minute of washer debris, in addition to 5,000 gallons per minute of overflow from an existing 40-foot hydroseparator. This new hydroseparator does away with the use of the large settling basins formerly used at Hopewell. The operations of this company have been described in two recent articles.[4]

In August 1946 the Davison Chemical Corp., of Baltimore, Md., announced acquisition of the Florida phosphate-rock-mining properties of the Southern Phosphate Corp., these properties to be thereafter operated as the Phosphate Rock Division, Bartow, Fla., of the Davison Chemical Corp. The new division will furnish phosphate rock to the Davison plants.

In the hard-rock phosphate field, C. & J. Camp and J. Buttgenbach & Co. operated jointly, as in recent years, both mining and shipping phosphate rock. The Dunnellon Phosphate Mining Co. shipped to other mining companies some wet rock produced several years ago at its mine near Hernando. It also sold some dry rock from stock to other companies for export.

Several soft-phosphate companies recovered phosphate rock from waste ponds in the hard-rock phosphate field, and one company mined and shipped a phosphatic clay from Bartow.

Tennessee.—The tonnage of phosphate rock sold or used by Tennessee producers in 1946 (plus a small quantity of apatite from Virginia) was 1,362,600 long tons, an increase of about 5 percent over 1945, according to reports from the producing companies. Practically all of the production in 1946 was of the brown rock, although a few tons of blue rock were purchased and used by TVA. The total value of the Tennessee phosphate rock sold or used in 1946 was over $7,000,000, nearly a million dollars more than in 1945. This increase was due partly to the larger production and partly to the increase in average value per ton from $4.68 in 1945 to $5.15 in 1946.

Tennessee brown-rock phosphate was mined in 1946 by the Tennessee Valley Authority (Columbia, Tenn.) and by several private companies: Armour Fertilizer Works (Room 350, Hurt Building, Atlanta, Ga.); Federal Chemical Co. (634 Starks Building, Louisville, Ky.); Harsh Phosphate Co. (Route 1, Murfreesboro Road, Nashville, Tenn.); Hoover & Mason Phosphate Co. (8 South Michigan Avenue, Chicago, Ill.); International Minerals & Chemical Corp. (20 North Wacker Drive, Chicago, Ill.); Monsanto Chemical Co. (1700 South Second Street, St. Louis, Mo.); and Virginia Carolina Chemical Corp. (Richmond, Va.). Sales of blue rock are reported to have been made by George E. Sloan, Columbia, Tenn.

1944	1,324,849	5,975,337	4.51				

[1] Includes small quantity of blue rock and also apatite from Virginia.

According to the annual report of the TVA for the fiscal year ended June 30, 1946, operations at the chemical plant at Muscle Shoals were directed again to the production of new and improved plant nutrients. More than 19,500 tons of elemental phosphorus were produced during the fiscal year ended June 30, 1946; and all but about 2,300 tons, shipped to the Chemical Warfare Service early in the year, was used for phosphatic fertilizers and animal-feed supplement. With acid-making facilities limiting output, production of phosphorus was about 66 percent of the 1945 figure. About 68,000 tons of triple superphosphate were produced, equaling 1939 production but below that in 1940 and 1941. Difficulty in procuring proper charges for the furnaces hampered production of calcium metaphosphate, but more than 8,100 tons were produced. Production of dicalcium phosphate continued. Byproducts of the electric furnace phosphorus production included 1,900 tons of potash-phosphate ash and 6,300 tons of ferrophosphorus. A small experimental plant was operated to produce a quantity of diammonium phosphate fertilizer. Experiments continued on a process for the production of high-grade red phosphorus, and design for a new type of acid plant to produce a superphosphoric acid (85 percent P_2O_5) was started. A new process for the agglomeration of phosphate fines for electric furnace charges was also developed during the 1946 fiscal year.

The newly constructed TVA fused tricalcium phosphate plant at Columbia, Tenn., expected initially to produce about 36,000 tons annually, was placed in production early in the fiscal year and more than 15,800 tons were produced.

During World War II TVA supplied more than 60 percent of the 98,000 tons of elemental phosphorus provided the armed forces for use in incendiary bombs, tracer bullets, smoke screens, and other combat uses. Over and above military demands, TVA supplied more than 375,000 tons of phosphate and nitrate fertilizer materials to help increase wartime food production in the United States and furnished 114,000 tons of fertilizers for lend-lease and other export to our allies. TVA also produced 17,000 tons of dicalcium phosphate to help meet the critical shortage of mineral feed supplements for livestock.

Large-scale mining by TVA in Tennessee was suspended during most of the first 6 months of 1946 to permit consumption of inventories of washed sands at Columbia, Tenn., and Wilson Dam, Ala.

Virginia.—Production of apatite continued in 1946 at the Piney River nelsonite deposit by the Calco Chemical Division of the American Cyanamid Co. Shipments of apatite for the manufacture of

superphosphate were made during the first half of the year. There were no shipments after June 1946.

This depost was described late in 1946 by Davidson, Grout, and Schwartz.[5] Their conclusions differ markedly from those of Ross,[6] as they consider that this deposit is in large part an irregular apatite-ilmenite-bearing dike intruded into an earlier closely related anorthosite and later sheared and hydrothermally altered.

WESTERN STATES

New high records both for quantity and value of marketed production high-lighted the Western States phosphate-rock industry in 1946. Marketed production jumped from 274,198 long tons in 1945 to 492,602 tons in 1946, an increase of 80 percent. A large part of this increase resulted from War Department purchases of phosphate rock for overseas shipments to occupied countries. The value nearly doubled, rising from $1,589,915 in 1945 to $3,012,157 in 1946. The output in 1946 came from Idaho, Montana, and Utah; Wyoming phosphate mines were inactive.

The average value per ton of the Western States phosphate rock sold or used, as reported by producers to the Bureau of Mines, increased again in 1946, rising from $5.80 per ton in 1945 to $6.11 per ton in 1946. Increases were recorded in both Idaho and Montana, with a 64-cent rise in the latter State.

Western States phosphate rock sold or used by producers, 1942–46

[1] Includes Utah as follows: 1942, 1,184 long tons ($7,410); and 1943–45, none. In 1946 Bureau of Mines not at liberty to show Utah separately.

In March 1946 the Geological Survey issued a compilation map,[7] on a scale of approximately 16 miles to the inch, showing the location of the trace of the outcrop of the phosphate-rock-bearing Permian Phosphoria formation in Montana, Idaho, Wyoming, and Utah. The map includes a list of the source data and a table showing the general thickness and grade of the phosphate rock deposits in certain areas.

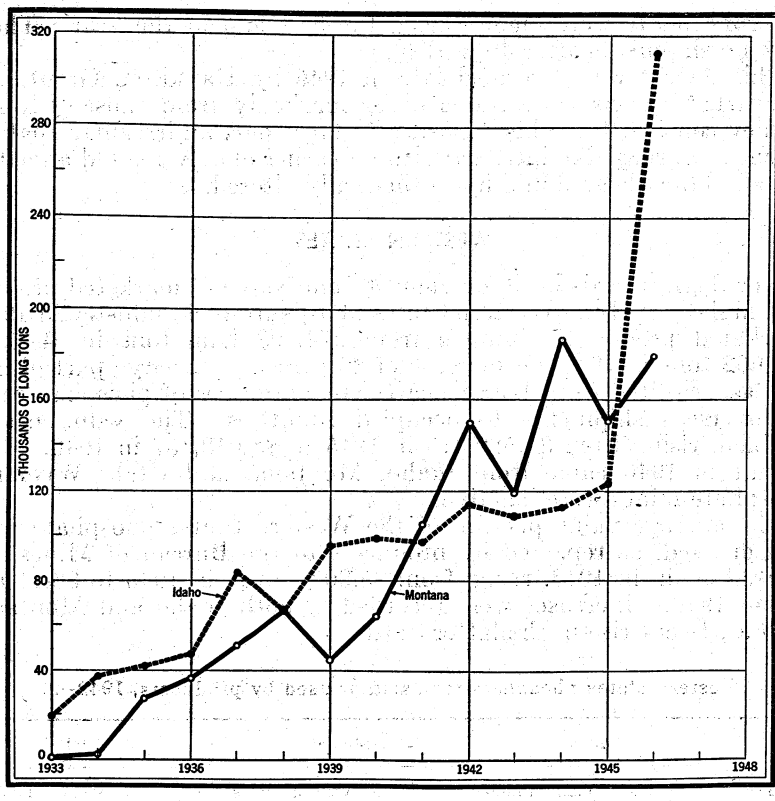

FIGURE 2.—Idaho and Montana phosphate rock sold or used by producers, 1933–46.

The production of fused phosphate rock-olivine and phosphate rock-serpentine fertilizers has begun on the west coast. The Permanente Metals Corp., Permanente, Calif., a Kaiser subsidiary, is said to have started commercial production late in 1946 at a rate of 150 tons a day of a phosphate fertilizer ("Thermo-Phos") by electric furnace fusion of serpentine, obtained locally, and Idaho phosphate rock. Two furnaces fomerly used to produce ferrosilicon were reconverted to manufacture the fertilizers. The product contains an appreciable amount of magnesium. Local demands are said to exceed Permanente's capacity. The fertilizer is reported suitable for direct application, but the major portion is used in mixed fertilizers. In Seattle, Manganese Products, Inc., is stated to have been ready, in the middle of 1946, to begin production of a fused fertilizer from phosphate rock and olivine (a magnesium-iron silicate) in an electric furnace. The phosphate rock is to come from the Philipsburg district, Montana, and the olivine from Cypress Island in the San Juan Archipelago in Puget Sound. The process has already been carried through the pilot-plant stage, according to reports, with a furnace of 4 tons daily capacity. The new commercial-scale plant is to have an output of 100 tons daily. The furnace is the direct-arc type, and is three-phase, three-electrode, nontilting, and topcharging.

The fertilizer contains over 20 percent available P_2O_5 (citric acid soluble) and 12 to 15 percent MgO. The finished product has an alkaline reaction.

Various chemical firms are reported to have recently investigated the economic possibilities of developing an elemental phosphorus industry in the intermountain area of the Western States, based on its immense phosphate-rock deposits and the availability of cheap power. The Bonneville Power Administration has released a preliminary appraisal of the markets, marketing area, possible production costs, and other factors affecting the soundness of an expanded production of phosphate fertilizer in the West.[8]

Idaho.—The output of phosphate rock in Idaho more than doubled the record tonnage produced in 1945, making that State the leading producer in the western region.

Only two companies in Idaho reported sales of phosphate rock in 1946. The larger producer, the San Francisco Chemical Co., 216 Pine Street, San Francisco 4, Calif., operated its Waterloo mine, near Montpelier, Bear Lake County, Idaho, selling the rock produced in both export and domestic markets but not consuming any of its production in its own California plant. The other company—the Anaconda Copper Mining Co.—operated its mine at Conda, Caribou County, Idaho. The shipments went, as in prior years, largely to the company plant at Anaconda, Mont., for conversion to superphosphate and phosphate chemicals. A considerable quantity was sold to other domestic consumers; none was exported. A new mine was opened by the J. R. Simplot Fertilizer Co. This company, which had operated the Government-financed fertilizer plant in Pocatello, Idaho, since its erection in 1944, announced its purchase in May 1946. This plant had been obtaining its phosphate rock from Caribou County, Idaho, and from near Montpelier, Bear Lake County, Idaho, and its sulfuric acid normally from Garfield, Utah. In June 1946, the J. R. Simplot Co. began phosphate-rock mining in Bingham County, Idaho, about 20 miles northeast of Pocatello on the Fort Hall Indian Reservation in T. 4 S., R. 37 E., Boise meridian. This mine is expected to develop into a source of 72-percent tricalcium phosphate rock much closer to the plant than the Montpelier and Conda mines. Diamond drilling is reported as being conducted by the company in other areas in the vicinity. The company in 1946 produced a large quantity of phosphate rock, which was hauled to the plant at Pocatello, where it was retained in stock, purchased material being used for its superphosphate operations. The superphosphate plant was being expanded in 1946, but its output is said to have been limited by strikes, particularly that at the Garfield sulfuric acid plant. The Teton Phosphate Co., Montpelier, Idaho, made no shipments in 1946 and did only development work at its mine near Montpelier during the year.

Montana.—Montana, the leading phosphate rock producer of the Western States for several years, dropped to second place in 1946; however, its marketed production—179,944 long tons—exceeded that

[8] Bonneville Power Administration, U. S. Department of the Interior, Preliminary Analysis of a Western Phosphate Fertilizer Industry: Paper presented by Roscoe E. Bell to the Fertilizer Committee of the National Grange, November 1946, and to the cooperative services conference of the American Farm Bureau Federation, December 1946.

of 1945—150,858 tons. Shipments were made by three companies. The Montana Phosphate Products Co., of Trail, British Columbia, the largest producer in Montana, operated its Anderson, Anaconda, and Gravely mines as well as several Government leases in the Garrison district. Most of the mined product was exported to the plant of the parent company, the Consolidated Mining & Smelting Co. of Canada, Ltd., at Trail, British Columbia. Only a small quantity was sold in the United States. Manganese Products, Inc., 4260 West Marginal Way, Seattle 6, Wash., shipped a small quantity of phosphate rock from a mine in the Philipsburg district, Montana. Lee H. Skeels, trustee and lessee of the Soluble Phosphates, Ltd., Maxville, Granite County, mined a small tonnage at a mine near Maxville and shipped the product for direct application to the soil. The Moonlight Mining Co., Maxville, operating a property near Princeton, is reported to have made a small shipment of phosphate rock in 1946. The International Minerals & Chemical Corp., confined its operations to mine and process development; it mined its property in the Douglas Creek area, Granite County, for about 2 months in 1946 but did not make any shipments during the year.

In November 1946 the Department of the Interior asked for bids for the development under lease of the phosphate-rock deposits in 200 acres in Silver Bow County. These deposits are in the Melrose phosphate-rock district in T. 2 S., R. 9 W., Montana principal meridian. The bids were opened on November 27, 1946, and the lease awarded to William Anderson, of Garrison, Mont. The lease—Great Falls 086,708 was issued January 10, 1947.

Utah.—Phosphate-rock operations in Utah in 1946 were confined to those of the Garfield Chemical & Manufacturing Corp., Salt Lake City, Utah, which mined and shipped phosphate rock from a Federal lease near Springville, Utah County, for use in iron-blast furnaces.

Wyoming.—No phosphate rock was produced in Wyoming in 1946. Although no mining operations were in progress on the John M. Thomas and the Walker-Doerr Phosphate Co. leases in the Sublette Ridge phosphate-rock field, southwestern Wyoming, development work was reported in the first half of the year.

FOREIGN TRADE[9]

Data on imports and exports of phosphate rock and other phosphatic materials are shown in the following tables.

[9] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce. Export figures exclude Army shipments to occupied territories.

Phosphate rock and phosphatic fertilizers imported for consumption in the United States, 1942–46

Fertilizer	1942		1943		1944		1945		1946	
	Long tons	Value	Long tons	Value	Long tons	Value	Long tons	Value	Long tons	Value

BASIC SLAG

Phosphatic slags obtained as byproducts of the smelting of high-phosphorus iron ores were very important sources of agricultural phosphates in Europe before the recent war, and some 5,200,000 tons of basic slag were produced there each year. The principal producers were Germany, France, Belgium, Luxembourg, United Kingdom, and Czechoslovakia. Germany alone produced about 2,500,000 tons a year and France 1,000,000 tons. Germany was the leading consumer—over 2½ million tons annually. Other important consumers were France, Netherlands, United Kingdom, Belgium, and Czechoslovakia. The European production of basic slag has been reduced to very low levels. In all western European countries, except the United Kingdom, its production has been greatly curtailed. Production figures for recent years are not available. Germany now is producing very little slag, and France during the year 1946–47 is expected to produce only 300,000 to 400,000 tons. In the United States the production of basic slag is very limited because of the low-phosphorus content of the iron ore currently used in this country, but no production figures for recent years are available. None has been imported into the United States since 1943.

Platinum and Allied Metals

By HUBERT W. DAVIS AND GERTRUDE N. GREENSPOON

GENERAL SUMMARY

SUSPENSION of ceiling prices on the six platinum-group metals by the Office of Price Administration on April 29, 1946, followed by greatly advanced quotations for platinum, ruthenium, and osmium, were features of the platinum industry in 1946. By mid-September the retail price of platinum and ruthenium had been raised $58 an ounce each, and osmium had been upped $50. Insufficient supplies, active demand, and speculation were largely responsible for the higher prices. Coincident with subsequent improvements in the supply and demand position, several price reductions were made on platinum and ruthenium, and by the year-end quotations on these metals had dropped to $56 an ounce.

Salient statistics of platinum and allied metals in the United States, 1945–46, in troy ounces

	1945	1946		1945	1946
Production:			Stocks in hands of refiners, importers, and dealers, Dec. 31:		
Crude platinum from placers	26,551	22,949	Platinum	138,839	187,624
New metals:			Palladium	119,757	132,523
Platinum	162,032	92,947	Other	43,376	41,876
Palladium	28,649	3,858		301,972	362,023
Other	13,825	4,973			
	204,506	101,778	Imports for consumption:		
Secondary metals:			Unrefined materials	172,029	76,012
Platinum	58,942	40,385	Refined metals	211,269	331,198
Palladium	32,968	27,856		383,298	407,210
Other	4,212	4,396	Exports:		
	96,122	72,637	Ore and concentrates		134
			Refined metals and alloys, including scrap	18,732	19,762
			Manufactures (except jewelry)	5,906	6,669

Platinum was refined in the United States in 1946 at a rate 40 percent lower than in 1945 and far below the domestic demand, which, however, was 30 percent smaller than in 1945. The refined-metal deficiency was met by imports of 119,853 ounces and by the release of 16,358 ounces by the Office of Metals Reserve. Much lessened demand and more abundant supplies of platinum in the fourth quarter of 1946 were reflected in a substantial increase in inventories of refiners and dealers. The jewelry trade was by far the largest outlet for platinum in 1946, taking 61 percent of the total sold. More platinum was sold to the jewelry trade in 1946 than in any previous year. The

record sales to the jewelry trade, however, were more than offset by drastic declines in demand by the chemical and electrical industries.

About half as much palladium was refined in the United States in 1946 as in 1945, comprising only one-seventh of sales, which established a new record. Quantity of palladium sold in 1946 was only 7 percent less than that of platinum. The deficit in palladium was met by importing 187,555 ounces of refined metal in 1946. The electrical industry again was the largest buyer of palladium and was responsible for most of the gain in total sales. However, demand by the jewelry trade, the second largest outlet, was slightly stronger than in 1945.

Much less of the other platinum metals—iridium, osmium, rhodium, and ruthenium—was refined than in 1945; this output was also substantially smaller than sales, which were greater for each metal except rhodium. The smaller recoveries by domestic refiners were supplemented by imports. Iridium and ruthenium were in much demand by the jewelry trade in 1946. Sales of rhodium were 26 percent less than in 1945.

Imports of platinum metals into the United States established a new high in 1946; they were 6 percent more than in 1945, the previous record year.

Figure 1 shows graphically the trend in world production of platinum metals from 1914 to 1946.

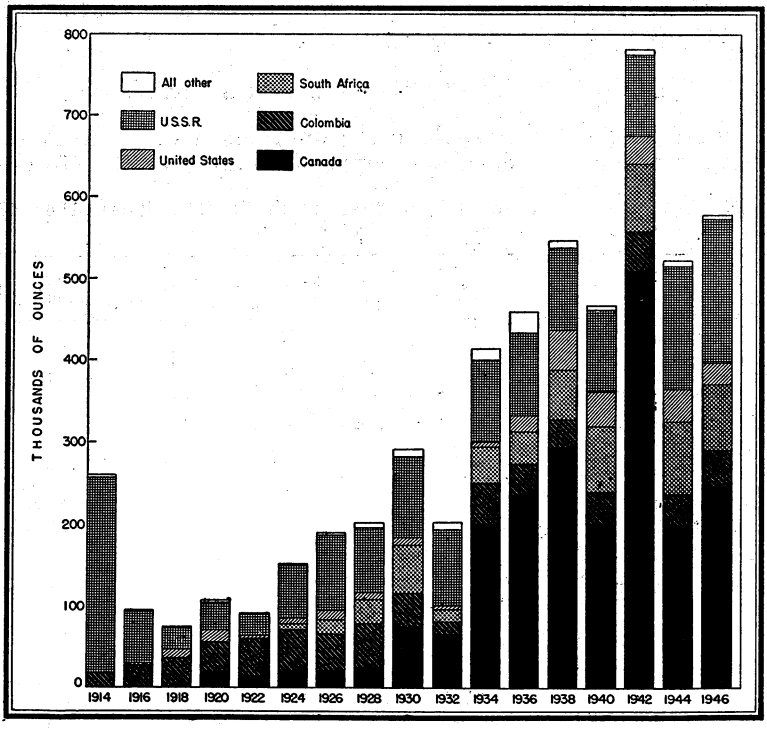

FIGURE 1.—Trend in world production of platinum metals, 1914–46.

CRUDE PLATINUM PRODUCTION

Mine returns for 1946 show a production of 22,882 ounces of crude platinum metals in Alaska and 67 ounces in California—a total of 22,949 ounces; comparable figures for 1945 are 26,505 ounces of crude platinum metals in Alaska, 43 ounces in California, and 3 ounces in Oregon—a total of 26,551 ounces. The Alaskan production, which contains about 90 percent platinum metals and a little gold, came from placer deposits in the Goodnews Bay district of southwestern Alaska. The operation of the Goodnews Bay Mining Co. in Alaska was described in the Mining World.[1] The output in California was a byproduct of gold placers in Butte, Sacramento, Shasta, Siskiyou, and Yuba Counties.

Many gold and copper ores in the United States contain small quantities of platinum metals. In 1946, 3,363 ounces of platinum metals were recovered as byproducts of refining gold and copper ores compared with 4,495 ounces in 1945.

Source of Purchases.—Purchases of domestic crude platinum metals by buyers in the United States were reported from the following sources in 1946: Alaska, 22,882 ounces, California, 215 ounces, and Oregon, 6 ounces—a total of 23,103 ounces (27,070 ounces in 1945). Domestic buyers also reported purchases of 42,813 ounces of foreign crude platinum metals from Colombia, 2 ounces from Canada, and 569 ounces of osmiridium from the Union of South Africa in 1946—a total of 43,384 ounces (29,571 ounces in 1945).

RECOVERY OF REFINED PLATINUM METALS

New Metals Recovered.—Reports from refiners of crude platinum metals, gold bullion, nickel, and copper indicate that 101,778 ounces

New platinum metals recovered by refiners in the United States, 1945–46, by sources, in troy ounces

[1] Mining World, Platinum Dredging: Vol. 8, No. 7, June 1946, pp. 26–29.

New platinum metals recovered by refiners in the United States, 1942–46, in troy ounces

Year	Platinum	Palladium	Iridium	Others	Total
1942	244,226	140,262	5,102	10,737	400,327
1943	234,320	82,441	5,286	13,209	335,256
1944	132,452	10,966	4,406	5,221	153,045
1945	162,032	28,649	5,783	8,042	204,506
1946	92,947	3,858	2,995	1,978	101,778

of platinum metals were recovered in the United States from such sources in 1946—a decrease of 50 percent from 1945. Of the new metals recovered in 1946, 70 percent was chiefly from concentrates from Canada and crude from Colombia, 27 percent from domestic crude (chiefly from Alaska) and 3 percent a byproduct of gold and copper ores.

Secondary Metals Recovered.—In 1946, 72,637 ounces of secondary platinum metals were recovered from the refining of scrap metal, sweeps, and other waste products of manufacture that contain platinum metals—a 24-percent decrease from 1945.

Substantial quantities of worn-out catalysts, spinnerets, laboratory ware, and other products are returned by consumers to refiners for refining. The refined platinum metals recovered from these products (or their equivalent in refined metals) are returned to the consumers. The platinum metals so recovered are not included in the statistics of secondary metals.

Secondary platinum metals recovered in the United States, 1942–46, in troy ounces

Year	Platinum	Palladium	Iridium	Others	Total
1942	56,150	16,416	1,552	2,493	76,611
1943	68,613	23,616	2,771	6,581	101,581

1945	58,942	32,968	812	3,400	96,122
1946	40,385	27,856	2,002	2,394	72,637

PRICES

Buyers reported purchases at $35 to $78.85 an ounce for domestic and foreign crude platinum metals and osmiridium in 1946. This price range results chiefly from variations in iridium content of crudes and from market fluctuations for refined platinum metals in 1946.

Maximum prices for the six platinum metals, fixed by the OPA on February 1, 1943, remained in effect until April 29, 1946, when they were suspended. The maximum prices per troy ounce for refined metals of a commercial purity of at least 99.5 percent were as follows: Platinum, $35; palladium, $24; iridium, $165; osmium, $50; rhodium, $125; and ruthenium, $35.

Suspension of the ceiling prices on the platinum-group metals was followed by greatly advanced quotations for platinum, ruthenium, and osmium. By September 16 the retail price of platinum and ruthenium had risen to a peak of $93 an ounce, and osmium had been raised to $100. Iridium, usually more sensitive to supply and demand rumors and to speculation than any of the other platinum metals, was advanced on June 27 from $95–$100 an ounce to $125, which however, was $40 less than the OPA fixed price. Insufficient supplies,

active demand, and speculation were largely responsible for the higher prices. Coincident with improvements in the supply and demand position, several price reductions were made on platinum and ruthenium, and by the year end they had been lowered to $56 an ounce. Iridium remained at $125 an ounce until October 24; thereafter it fluctuated between $130 and $110. Quotations on palladium and rhodium remained stable at $24 and $125 an ounce, respectively, throughout 1946.

CONSUMPTION

As pure metals, combined, clad, or alloyed with other metals, the platinum metals are employed in the electrical and chemical industries, in dentistry and jewelry, and for numerous miscellaneous purposes. Uses of the platinum metals are tabulated on page 801 of the Platinum and Allied Metals chapter in Minerals Yearbook, 1943. Sales of platinum metals to consumers in the United States were 484,575 ounces in 1946 compared with 550,045 ounces in 1945, an all-time high. In 1946, for the first time, sales of palladium, which established a new record, almost equaled those of platinum.

Platinum continued to be the most widely used metal of the group, but in 1946 sales were only 8 percent greater than those of palladium. Sales of platinum constituted 234,479 ounces (48 percent) of the total platinum metals sold to domestic consumers in 1946. By taking 61 percent of the total platinum sold in 1946, the jewelry industry was the chief buyer, displacing the chemical industry, which ranked first in 1945 but dropped to third place in 1946. Sales of platinum (144,015 ounces) to the jewelry trade were 77 percent greater than in 1945 and were larger than in any previous year. The record sales of platinum to the jewelry trade, however, were more than offset by drastic declines in demand by the chemical and electrical industries. Sales of platinum to these industries were only 31,107 and 35,007 ounces, respectively, or declines of 73 and 67 percent from 1945. Sales of platinum for dental and medical uses also dropped substantially (29 percent) from 1945 and comprised only 21,859 ounces (9 percent) of the total sold.

Sales of palladium established a new high in 1946 and for the first time almost equaled those of platinum. Palladium constituted 217,181 ounces (45 percent) of the total platinum metals sold to consumers in the United States in 1946. The electrical industry retained first place as a buyer of palladium in 1946 by taking 91,243 ounces (42 percent) of the total palladium sold. Sales of palladium to the electrical industry established a new record in 1946 and were 32 percent greater than in 1945. Despite the swing from palladium to platinum for fine jewelry upon removal of the restriction on the use of platinum, sales of palladium have continued at a high level and established a new peak in 1946. Sales of palladium to the jewelry trade were 60,294 ounces in 1946, an increase of 7 percent over 1945. The dental and medical trades continued to be the third largest outlet for palladium, but sales were 2 percent less in 1946 than in 1945. The dental and medical trades took 41,407 ounces (19 percent) of the total palladium sold in 1946. Sales of palladium to the chemical industry, which also reached a new peak, were 68 percent more than in 1945; however, they were only 15,092 ounces (7 percent) of the total sold in 1946. Appreciable quantities of palladium were sold to the pen and pencil trade for nibs and other parts in 1946.

Sales of the other platinum metals—iridium, osmium, rhodium, and ruthenium—were comparatively small; they made up 7 percent (32,915 ounces) of the total for the group in 1946. Iridium and ruthenium, hardening additions for platinum and palladium, were in much demand by the jewelry trade and, consequently, were the metals of this group most extensively sold, followed in order by rhodium and osmium. Sales of iridium, ruthenium, and osmium were 41, 10, and 69 percent, respectively, larger than in 1945, but sales of rhodium were 26 percent smaller.

The accompanying table shows reported sales of platinum metals to consuming industries in the United States for 1927–46. The figures for 1939 and earlier years do not include the sales of some

Platinum metals sold to consuming industries in the United States, 1927–46, in troy ounces

imported metals and are not, therefore, exactly comparable with those for later years, which comprise sales by refiners, importers, dealers, and Office of Metals Reserve.

STOCKS

Stocks of platinum metals in all forms in the hands of refiners, importers, and dealers totaled 362,023 ounces on December 31, 1946, compared with 301,972 ounces at the close of 1945. In addition, the Office of Metals Reserve held 78,137 ounces of refined platinum on December 31, 1946.

Stocks of platinum metals held by refiners, importers, and dealers in the United States, Dec. 31, 1942–46, in troy ounces

Year	Platinum	Palladium	Iridium, osmium, rhodium, and ruthenium	Total

Grand total	383,298	11,649,933	407,210	14,696,320

[1] The concentrates and crude imported from Canada contain platinum, palladium, iridium, rhodium, and ruthenium, and the crude sponge imported from Canada contains platinum and palladium. Although the U. S. Department of Commerce records "platinum content" for these entries, the Bureau of Mines has determined from the importers of these materials that most of the entries reflect the platinum metals content. The Bureau of Mines has also determined from the largest importer of crude platinum from Colombia that the entries for his material, recorded as "platinum content" by the U. S. Department of Commerce, represent the gross weight of the material.

[2] Bureau of Mines has determined that 7,000 ounces (valued at $490,000) classified as "grains and nuggets" by the U. S. Department of Commerce was crude sponge and is, therefore, included with "sponge and scrap" in this table.

[3] Commercially pure platinum sponge is classified by the Bureau of Mines as refined metal and, is therefore, included with refined platinum in this table.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Imports.—Imports of platinum metals into the United States established a new high in 1946; they were 6 percent more than in 1945, the previous record year. The principal sources of imported platinum metals in 1946 were Canada (216,762 ounces), U. S. S. R. (106,851 ounces), United Kingdom (40,199 ounces), and Colombia (38,658 ounces). Imports of refined metals (331,198 ounces) were 57 percent more than in 1945, but imports of unrefined material (76,012 ounces) were 56 percent less. Imports of refined platinum, palladium, iridium, and osmium were 65, 59, 100, and 113 percent, respectively, greater than in 1945, but imports of rhodium and ruthenium were 87 and 2 percent, respectively, less.

Platinum metals (unmanufactured) imported for consumption in the United States, 1945–46, by countries, in troy ounces

Country	Unrefined materials [1]				Refined metals					
	Ores and concentrates of platinum metals	Grains and nuggets (including crude, dust, and residues)	Sponge [2] and scrap	Osmiridium	Platinum [2]	Palladium	Iridium	Osmium	Rhodium and ruthenium	Total

1944	356,212	10,675,303			

[1] See footnote 1 of preceding table.

Exports.—Exports of refined platinum (including scrap) increased to 15,468 ounces in 1946 (7,781 ounces in 1945), but those of the other platinum-group metals (including scrap) decreased to 4,294

ounces (10,951 ounces in 1945). The chief foreign markets for platinum were Brazil (6,512 ounces), Mexico (1,849 ounces), United Kingdom (1,846 ounces), France (1,519 ounces), and Argentina (1,108 ounces) and for the other platinum-group metals Canada (1,341 ounces), Brazil (724 ounces) and Switzerland (585 ounces).

[1] Data not available.
[2] Recovered from nickel-copper mattes. The figures for 1945–46 represent the platinum metals contained in the concentrates actually recovered, whereas those for 1939–44 represent the metals refined from Canadian concentrates at Acton, England, plus the platinum metals content of concentrates sold.
[3] Includes certain adjustments to account for metals produced in Canada in 1938–44 but not previously accounted for in the statistics.
[4] Year ended June 30 of year stated.
[5] Produced from platinum ores.
[6] Produced from treatment of gold ores on the Witwatersrand and Extensions.
[7] New platinum metals recovered in gold and copper refining of domestic materials.

Canada.—According to the Dominion Bureau of Statistics, production of platinum metals from the nickel-copper ores of the Sudbury district, plus a very small quantity from placers in British Columbia, was 130,400 ounces of platinum and 114,200 ounces of other platinum-group metals in 1946, compared with 208,234 ounces of platinum and 458,674 ounces of other platinum-group metals in 1945. The figures on production for 1945 and 1946 represent the platinum metals contained in the concentrates actually recovered, whereas those for many previous years represent the metals refined from Canadian concentrates at Acton, England, plus the platinum-metals content of concentrates sold. Moreover, the figures for 1945 include certain adjustments to account for metals produced in 1938–44 but not previously included in the statistics.

Sales of platinum metals by the International Nickel Co. of Canada, Ltd., were 320,794 ounces in 1946 compared with 381,741 ounces in 1945.

Colombia.—The South American Gold & Platinum Co. produced 30,797 ounces of crude platinum metals in 1946 (20,346 in 1945). The crude material contains about 85 percent platinum metals. The production of crude platinum metals by other operators was about 13,742 ounces in 1946 (14,411 in 1945).

Union of South Africa.—According to the Department of Mines, 73,495 ounces of crude platinum containing 22,509 ounces of platinum metals and 1,326 short tons of concentrates containing 58,070 ounces of platinum metals were produced in South Africa in 1944, the latest year for which detailed information is available. Thus, total output of platinum metals was 80,579 ounces in 1944; sales were 71,465 ounces. The average composition of the product sold in 1944 was: Platinum, 63.58 percent; palladium, 27.01 percent; iridium, 0.38 percent; osmium and osmiridium, 0.03 percent; rhodium, 1.12 percent; ruthenium, 4.39 percent; and gold, 3.49 percent.

Outputs of crude platinum and concentrates were 75,906 ounces and 1,183 short tons, respectively, in 1946 compared with 73,166 ounces and 1,122 tons, respectively, in 1945. No assay data are available for 1945 and 1946; in 1944 the crude platinum averaged 30.63 percent platinum metals, and the concentrates contained 43.79 ounces of platinum metals per ton. The crude platinum and concentrates are produced in the Rustenburg district.

Output of osmiridium, which is recovered in the treatment of gold ores on the Witwatersrand and Extensions, was 6,142 ounces in 1944, and sales were 6,896 ounces. The average composition of the product sold in 1944 was: Osmium, 29.18 percent; iridium, 26.34 percent; ruthenium, 12.88 percent; platinum, 11.52 percent; rhodium, 0.68 percent; gold, 2.39 percent; and undetermined, 17.01 percent.

Potash

By BERTRAND L. JOHNSON AND DOROTHY I. MARSH

GENERAL SUMMARY

MORE new records were made in 1946 in the potash industry of the United States, both production of marketable potassium salts and sales reaching new highs. Production in 1946 was 1,687,735 short tons of potassium salts containing 931,812 tons of equivalent potash (K_2O), an increase over 1945 of 99,430 tons of potassium salts and 57,569 tons of K_2O. The production of marketable potassium salts in the United States has increased each year since 1934. (See fig. 1.) Sales (1,673,249 tons) were 76,089 tons greater in 1946 than in 1945 and contained 928,374 tons of K_2O. Stocks of potassium salts in producers' hands at the end of 1946 were larger than in 1945, as was also the K_2O content. Exports of fertilizer potash materials continued to decline, whereas those for chemical uses were considerably larger. Imports of potash materials for fertilizer purposes increased in 1946, but those of chemical materials decreased. Domestic consumption of potash again made a new high record—actual sales for consumption reaching 862,532 tons, according to the American Potash Institute.

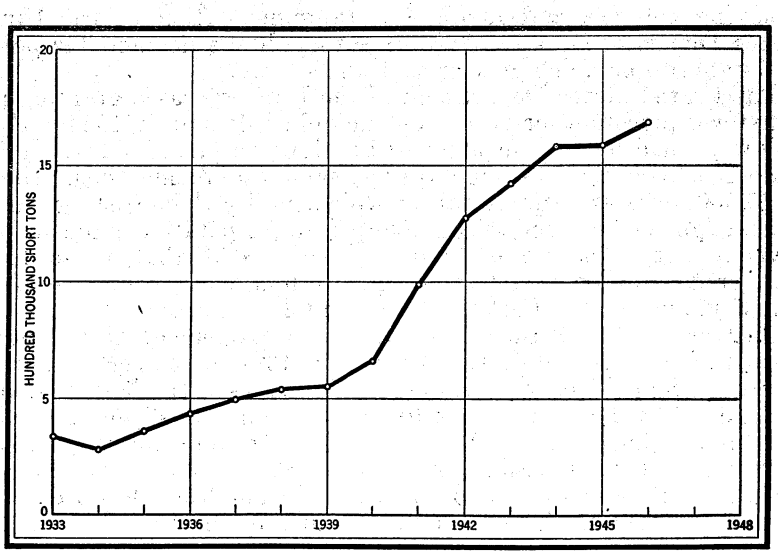

FIGURE 1.—Production of marketable potash salts in the United States, 1933-46.

Salient statistics of the potash industry in the United States, 1944–46

	1944	1945	1946
Production:			
Potassium salts (marketable)—short tons	1,578,498	1,588,305	1,687,735

Value	$3,142,096	$3,648,795	$5,055,441
Consumption:			
Apparent consumption:[2]			
Potassium salts—short tons	1,437,060	1,490,719	1,569,225
Approximate equivalent, K_2O—do	753,880	808,809	867,197

[1] Estimate by Bureau of Mines.
[2] Quantity sold by producers, plus imports, minus exports.

Government allocation of potash, under Schedule 98 of General Chemicals Order M–300, was suspended September 30, 1945. It was resumed, however, under Schedule 120 of General Chemicals Order M–300, on June 1, 1946. This latter schedule, in turn, was revoked by the Civilian Production Administration on February 17, 1947.[1] This step, according to CPA, complied with the general policy of removing controls and followed a recommendation of the United States Department of Agriculture, although the demand for potash was stated to be much greater than the supply.

The United States Department of the Interior ceased granting permits for exploration for potash on the public domain in 1934. Hearings were held by the Department at Albuquerque, N. Mex., in September 1946 on the question of the advisability of raising the maximum of 15,360 acres (24 square miles) which, under then-existing regulations, might be held under lease and permit for potash exploration and development. The potash industry contended that those limits hampered exploratory activities, might threaten continuance of the industry, and might affect the future supply of potash.

On March 24, 1947, the Bureau of Land Management, United States Department of the Interior, in Circular 1643, released certain amendments to the existing regulations which increased the land that may be held under Federal permit to prospect for potash on the public domain to 25,600 acres (40 square miles); at the same time, 15,360 acres may be held under lease, making a total of 40,960 acres. Heretofore the total permissible area under permits and leases has been limited to 15,360 acres. The Government, in these new regulations, lim-

[1] Federal Register ,February 18, 1947 ,p. 1106.

ited its right to purchase potash produced under the lease to one-tenth of the production, instead of the one-fourth previously stipulated.[2]

An important discovery of thick beds of potash overlying salt beds in the Unity oilfield, about 100 miles northwest of Saskatoon, in the southern part of the Province of Saskatchewan, Canada, was reported to have been made in June 1946 at a depth of 3,466 feet in a deep-test drilling for oil and gas. The deposits are said to extend southeastward about 350 miles, from the Unity field to Radville, Saskatchewan, thence into North Dakota, and possibly farther southward. The beds of potash salts encountered range from 9 to 28 feet in thickness. They are said to contain as high as 65.6 percent potassium chloride and the K_2O content to average 21.5 percent. Additional drilling to determine the extent of the deposit is reported in progress in the Verbata area, Saskatchewan.

Turrentine,[3] Albright,[4] and Kinnard[5] have discussed general features of the potash industry in 1946.

PRODUCTION AND SALES

Both production and sales of domestic marketable potassium salts were considerably larger in 1946 than in 1945, continuing the upward trend in evidence since 1934. The increases in 1946 over 1945 were larger than those shown in the latter year over 1944, both in marketed production and sales. Production of potassium salts in 1946 totaled 1,687,735 short tons, with an equivalent K_2O content of 931,812 tons. Sales were 1,673,249 tons, with an equivalent K_2O content of 928,374 tons. Production of potassium salts exceeded sales, and stocks in producers' hands at the end of the year showed an increase over those on December 31, 1945. The value of the sales in 1946 exceeded 32 million dollars. The average value per ton of the potassium salts sold in 1946 was $19.23, slightly higher than that of 1945.

Production of both grades of muriate of potash and of sulfate of potash and sulfate of potash-magnesia were larger in 1946 than in 1945. Production of manure salts (98,333 tons), however, even with the inclusion of spillage of higher-grade salts, continued in 1946 the decline that began in 1944 and now is much less than half of the 1943 production of 242,189 short tons. (See fig. 2.)

The Western States production remains the dominant factor in the domestic potash industry. California, New Mexico, and Utah furnished virtually all of the 1946 output, the larger part coming from the deeply buried Permian saline sedimentary deposits of sylvite and langbeinite of the Carlsbad region, southeastern New Mexico. The Eastern States supplied only a small quantity—from well brines in Michigan and as a byproduct of cement operations in Maryland.

Stocks in producers' hands at the end of the year have been rising steadily since 1942, reaching 37,999 short tons K_2O in 1946. (See fig. 3.)

Potassium salts produced in the United States, 1944–46, by grades, in short tons

Grade	1944	1945	1946
Muriate of potash:			
60–62 percent K_2O minimum [1]	1,082,132	1,258,332	[2] 1,346,699
48–50 percent K_2O minimum	114,550	117,677	122,257
Manure salts	217,560	115,798	[3] 98,333
Sulfate of potash and sulfate of potash-magnesia	164,256	96,498	120,446
	1,578,498	1,588,305	1,687,735

[1] Includes refined potash.
[2] Includes some 93–96 percent KCl.
[3] Includes spillage of some higher-grade salts.

The potash-producing companies in the United States in 1946, by States, were as follows:

California:

American Potash & Chemical Corp., 122 East Forty-second Street, New York, N. Y. (plant at Trona, on Searles Lake, Calif.).

Maryland:

North American Cement Corp., 41 East Forty-second Street, New York, N. Y. (plant at Security, Md.).

Michigan:

Dow Chemical Co., Midland, Mich. (brine wells and plant near Midland, Mich.).

New Mexico:

International Minerals & Chemical Corp., 20 North Wacker Drive, Chicago, Ill. (mine and plant near Carlsbad, N. Mex.).

Potash Co. of America, Carlsbad, N. Mex. (mine and plant near Carlsbad, N. Mex.).

United States Potash Co., Inc., 30 Rockfeller Plaza, New York, N. Y. (mine and plant near Carlsbad, N. Mex.).

Utah:

Bonneville, Ltd., 540 West Seventh South, Salt Lake City, Utah (plant near Wendover, Utah).

Max Krotki, Marysvale, Utah (alunite open-cut operations at Marysvale, Utah).

Production and sales of marketable potassium salts and stocks in the hands of producers for the last 5 years are summarized in the accompanying table.

Potassium salts produced, sold, and in producers' stocks in the United States, 1942–46

Year	Production			Sales				Producers' stocks, Dec. 31		
	Operators	Potassium salts (short tons)	Equivalent as potash (K_2O) (short tons)	Operators	Potassium salts (short tons)	Equivalent as potash (K_2O) (short tons)	Value f. o. b. plant	Operators	Potassium salts (short tons)	Equivalent as potash (K_2O) (short tons)
1942	7	1,267,455	679,206	7	1,277,317	680,831	$22,962,518	7	14,158	6,041
1943	7	1,428,840	739,141	7	1,401,271	732,151	26,183,073	7	43,591	13,984

CONSUMPTION

Apparent consumption of potash salts in the United States and its possessions increased from 808,809 short tons of potash (K_2O) in 1945 to 867,197 tons in 1946, as determined by subtracting exports from the sum of the imports and producers' sales.

Sales of potash in the United States for consumption and export, 1944–46, in short tons of K_2O

	1944	1945	1946
Deliveries of primary potash of domestic origin by major companies, as from reports of American Potash Institute—			
In United States and possessions:			
Agricultural	675,787	724,900	790,928
Chemical	82,198	85,169	75,797
For export	57,850	58,117	56,402
	815,835	868,186	923,127
Imports for consumption plus sales of minor domestic producers	5,364	6,435	5,048
	821,199	874,621	928,175
Total exports (estimate by Bureau of Mines)	68,880	67,583	65,643
Actual sales for consumption in the United States	752,319	807,038	862,532

The accompanying table, based largely upon deliveries of potash of domestic origin as reported by the American Potash Institute, indicates actual sales of 862,532 tons for domestic consumption in the

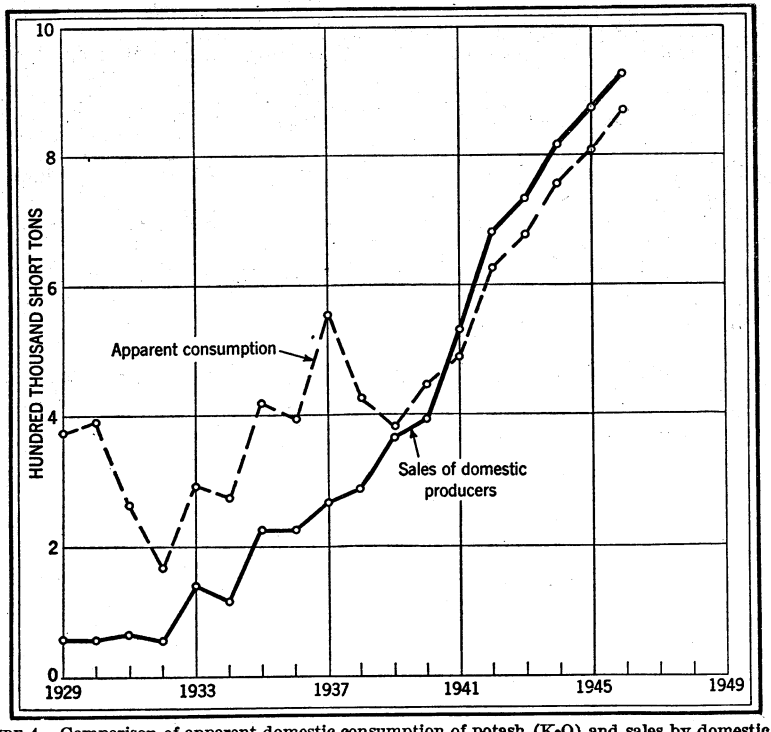

FIGURE 4.—Comparison of apparent domestic consumption of potash (K_2O) and sales by domestic producers of potash in the United States, 1929–46.

United States in 1946, an increase of 55,494 tons over the consumption in 1945.

Apparent domestic consumption of potash salts, in terms of equivalent potash (K_2O), and its relationships to sales of domestic producers, as reported to the Bureau of Mines for a period of years, are shown in figure 4.

According to the American Potash Institute, 763,590 short tons of agricultural potash (K_2O) of American origin and 75,797 tons of chemical potash (K_2O) were delivered in the United States in 1946, a total of 839,387 short tons.

Deliveries of agricultural potash and chemical potash in the calendar year 1946 are shown by States of destination in the accompanying tables. Georgia retained its leading position for deliveries of agricultural potash, and Illinois moved into second from fifth place. New York remains by far the leading recipient of chemical potash.

Deliveries of agricultural potash salts of American origin, by States of destination, in 1946, in short tons of K_2O

PRICES

Prices of potash—muriate of potash, manure salts, sulfate of potash, and sulfate of potash-magnesia—were covered during most of 1946 by Revised Maximum Price Regulation 205 (Fertilizer Raw Materials) of June 30, 1944. Amendment 10 to RMPR 205, issued May 27, 1946, and effective June 1, 1946,[6] increased the maximum price that could be charged for domestic sulfate of potash (basis 90 percent K_2SO_4) in bulk, for spot sales at west coast potash ports, to $39.25 per ton.

These price controls on potash were abolished on November 10, 1946, when all commodities except sugar and rice were exempted from price control by Office of Price Administration Supplementary Order 193, dated November 12, 1946.[7]

The regular price schedules for the 1946–47 season were announced in June and July 1946 by the major producers, on the same basis as the previous year. These prices, as reported by various companies on a basis bulk ex-vessel port, except for manure salts (the basis for which is f. o. b. seller's plant, Carlsbad, N. Mex.), were as follows:

Muriate of potash (62 to 63 percent K_2O; 62 percent minimum) Muriate of potash (60 percent K_2O minimum) Muriate of potash, granular (48 percent K_2O minimum)	53½ cents per unit K_2O.
Manure salts (22 percent K_2O minimum)	20 cents per unit K_2O.
Sulfate of potash (90 to 95 percent K_2SO_4, basis 90 percent K_2SO_4)	$36.25 per short ton.
Sulfate of potash-magnesia (basis 40 percent K_2SO_4, 18.50 percent MgO)	$26.00 per short ton.

REVIEW BY STATES

Five States—California, Maryland, Michigan, New Mexico, and Utah—produced merchantable potash salts in 1946. The output of the individual States cannot be given (except for New Mexico, where three companies were operating) without disclosing individual company returns. New Mexico was by far the largest domestic producer, contributing 84 percent of the total. California, a much smaller producer than New Mexico, furnished much more than the combined output of the other three States. Michigan is a new producer.

California.—The American Potash & Chemical Corp., New York, N. Y., remains the only potash-producing company on the Pacific coast. Potash is recovered from brines saturating the crystalline salt mass of Searles Lake in southeastern California, and potassium chloride and potassium sulfate are produced and marketed. A description of the deposit has recently been published.[8]

On March 27, 1946, 478,194 shares of the American Potash & Chemical Corp., which had been seized by the Alien Property Custodian as enemy property, were sold to a group of investment bankers—Kuhn, Loeb, & Co., Glore, Forgan & Co., and Lehman Bros.[9] These shares were offered for sale by the bankers on March 29, 1946,[10] and

[10] Standard Corporation Records, Corporation News Edition, June 1946: Vol. 24, No. 110, sec. 4, June 10, 1946, p. 4711.

100,000 of the shares were purchased by the Heyden Chemical Corp.,[11] making it the principal stockholder.[12] The remainder of the shares are said to have been widely distributed through sale to the public.[13]

Maryland.—The North American Cement Corp., New York City, was the only company in Maryland producing potash in 1946. This company recovered byproduct potash from cement-kiln flue dust at its plant at Security, Washington County, near Hagerstown. The product, an impure sulfate of potash of low potash content, was sold for agricultural use. This was the only operation of its kind reported in the United States in 1946.

Michigan.—Potassium chloride was produced in 1946 from natural brine from wells at Midland, Mich., by the Dow Chemical Co.

New Mexico.—Mine production of potash salts in the Carlsbad region of New Mexico continued to increase, and again a new record was made. The three companies operating in this area mined 4,309,649 short tons of sylvinite and crude langbeinite combined in 1946—an increase of 359,666 tons over 1945. The K_2O content of the mine production in 1946 was 893,126 short tons. The average equivalent K_2O content of the mined salts decreased slightly—from 21.34 percent in 1945 to 20.72 percent in 1946.

All three companies mined sylvite (potassium chloride) and one—International Minerals & Chemical Corp.—also mined langbeinite (potassium-magnesium sulfate). The greater part of the mine production of the region was sylvite, most of which was processed to yield 60 percent or higher-grade muriate. The production of merchantable potash salts in New Mexico in 1946 was 1,428,860 short tons, with an equivalent K_2O content of 782,166 tons. Sales were 789,473 tons, valued at $27,187,228. Muriate of potash was produced by all three companies. Potassium sulfate and potassium-magnesium sulfate (sulfate of potash-magnesia) were produced by the International Minerals & Chemical Corp. from langbeinite in the refinery at its mine near Carlsbad. Potassium sulfate was also produced by the Potash Co. of America.

Several articles and a large illustrated booklet have been published recently describing the potash operations of the Carlsbad region.[14]

Utah.—Commercial production of potash in Utah in 1946 was restricted to the potassium-bearing brines of Salduro Marsh and to the alunite deposits of the Marysvale district.

Bonneville, Ltd., continued to produce potassium chloride from the Salduro Marsh brines at its plant near Wendover, Tooele County, northwestern Utah, its output in 1946 being much larger than in 1945.

Ware, Louis, Magnesium from Potash Ores: Trans. Am. Inst. Min. and Met. Eng., vol. 159, 1944, pp. 280-284.

A description of the deposit and the method of mining and treatment of the potash brines was published in 1946.[15]

The only alunite production reported in the Marysvale district in 1946 came from the White Hills claim of Max Krotki, where a small quantity of crude alunite was obtained in open-cut operations, and shipped.

Operations by Kalunite, Inc., at the White Horse mine have been permanently discontinued and the mine lease canceled. The Government-financed experimental plant operated by this company in Salt Lake City, Utah, was idle in 1946. During the early part of the year it was held in stand-by status and was not on the market for sale or lease. On July 10, 1946, it was declared surplus. It was advertised for sale by the War Assets Administration on January 2, 1947, with a cut-off date early in February, which was later extended to March 20, 1947. Bids have since been received for the plant and in April 1947 were up before the Board of Review for consideration. This plant, the property of the Defense Plant Corporation, is reported to have cost $4,905,000. It was still in the preliminary stages of operation when it was closed down. The designed annual capacity is said to have been 72,000,000 pounds of alumina, with potassium salts to be recovered as coproducts. It is situated on a site of 79 acres on a Denver & Rio Grande Western Railroad siding from the Roper, Utah, yards. A description of the plant is contained in a brochure of the Defense Plant Corporation.

Several articles have been published recently relative to the occurrence of alunite in the Marysvale district.[16]

No development work is known to have been done in 1946 in the Grand County potash field in eastern Utah.

FOREIGN TRADE[17]

Imports.—Imports of potash salts continued at low levels in 1946, the total of 16,199 tons (4,365 tons K_2O) being below that of 1945. The total value of the imports likewise decreased, from $3,310,475 in 1945 to $2,350,734 in 1946, this decline being due largely to decreased importations of argols. France, Chile, and the U. S. S. R. were the principal sources of imports in the order given.

Potash (K_2O) for fertilizer use constituted only 59 percent of the imports for 1946, whereas in 1945 fertilizers had formed 64 percent of the total. Imports for chemical use in 1946 rose to 41 percent of the total compared with 36 percent in 1945.

[17] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The principal potash salt imported for fertilizer use was crude potassium-sodium nitrate from Chile. A slightly smaller quantity of potassium chloride came from the U. S. S. R. Imports of potassium-bearing materials for consumption in the chemical industries consisted largely of argols from numerous countries, but principally from France, Italy, and Portugal. Several hundred tons of chlorate and perchlorate of potash also came in, largely from France.

[2] Less than 1 ton.

Exports.—The total value of the export trade in potash materials increased in 1946 to $8,039,192 from $6,635,785 in 1945, a slight decline being shown in the value of the fertilizer potash materials exported and a marked increase registered in the value of chemical potash. The total quantity of fertilizer potash materials in 1946—96,822 short tons—was considerably less than in 1945, and the value remained slightly below $3,000,000. The fertilizer exports went largely to Canada, with much smaller quantities to several other countries, mostly in the Western Hemisphere. Exports of chemical potash materials increased from 18,966 tons in 1945 to 23,905 short tons in 1946, valued at $5,055,441. Canada, China, and Mexico, in the order named, were the leading recipients.

Potash materials exported from the United States, 1942–46

Year	Fertilizer		Chemical		Year	Fertilizer		Chemical	
	Short tons	Value	Short tons	Value		Short tons	Value	Short tons	Value
1942	84,402	$2,184,044	13,307	$3,611,656	1945	104,687	$2,986,990	18,966	$3,648,795

[1] In addition to countries listed China, Eritrea, Iran, Italy, Poland, and U. S. S. R. are reported to produce potash salts, but statistics of production are not available..
[2] Data not available.
[3] Equivalent K_2O content estimated at approximately 17 percent.
[4] Includes some natural kieserite.
[5] Salable.
[6] Extracted from waters of Dead Sea.
[7] Unofficial estimate.
[8] January to September, inclusive.

Salt

By FLORENCE E. HARRIS AND E. M. TUCKER

GENERAL SUMMARY

THE United States produced 15,132,145 short tons of salt valued at $44,912,586 in 1946 compared with 15,394,141 tons valued at $43,914,406 in 1945, a 2-percent decrease in quantity. Compared by types with the output in 1945, evaporated salt increased 2 percent, and brine and rock salt each decreased 3 percent.

Owing to higher costs of containers, other supplies, and labor, the average value per ton increased from $2.85 in 1945 to $2.97 per ton in 1946, and therefore prices were forced higher in certain localities. At some of the salt mines strikes delayed production 1½ months. Other operations were affected by strikes in other industries.

Increased interest has been manifested in exporting domestic salt. Exports of salt were the highest in 1946 that they have ever been.

During the war years domestic salt replaced salt formerly imported for curing fish. In 1946, however, fish salt was again imported, and the quantity of domestic salt sold for the purpose decreased, the reduction being in rock salt.

Salient statistics of the salt industry in the United States, 1935–39 (average) and 1942–46

	1935–39 (average)	1942	1943	1944	1945	1946
Sold or used by producers:

Apparent consumption [4] short tons	8,616,767	13,582,614	15,069,607	15,524,357	15,208,170	14,912,972

[1] Revised.
[2] Values are f. o. b. mine or refinery and do not include cost of cooperage or containers.
[3] Includes salt in bags, sacks, barrels, or other packages—1938: 93 tons, $673; 1942: 122 tons, $1,200.
[4] Quantity sold or used by producers plus imports minus exports.

As shown in figure 1, salt in brine, which has been leveling off in the past few years, dropped only 6 points—to just above the 200 mark—whereas the index of industrial production dipped 33 points. The index for evaporated and rock salt declined only 1 point.

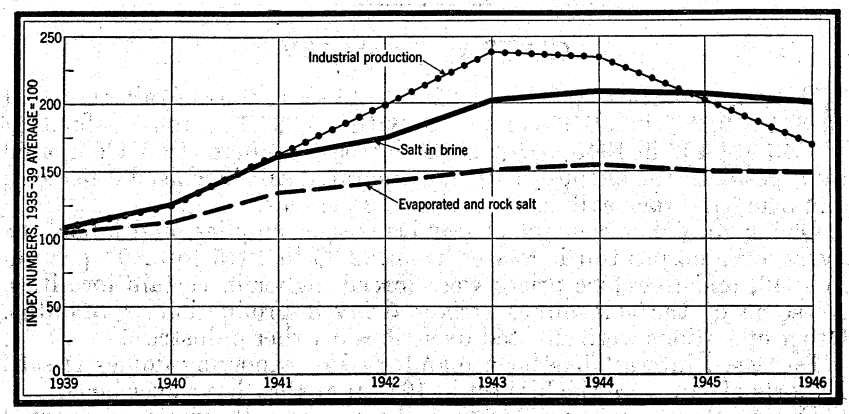

FIGURE 1.—Index of salt in brine and of evaporated and rock salt sold or used compared with industrial production, 1939–46. Index of industrial production from Federal Reserve Board.

Proportions of the three types of salt production are shown in figure 2, for 1939, the last normal prewar year, through 1946.

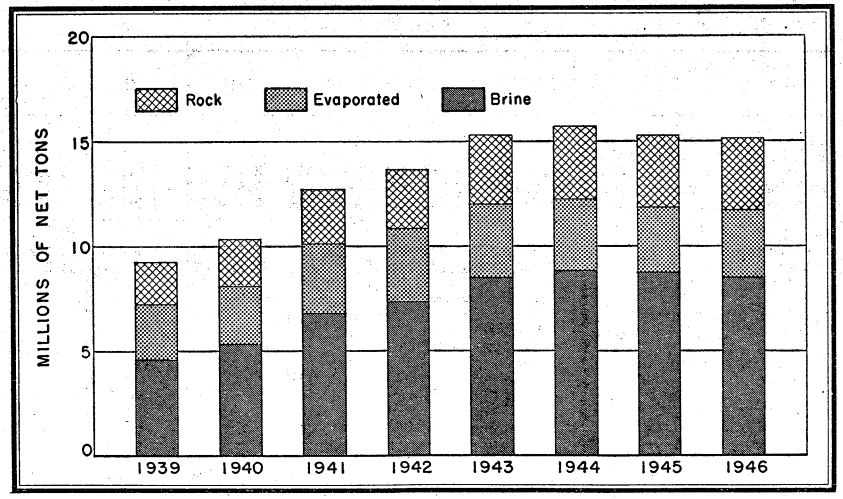

FIGURE 2.—Trends in the quantity of rock salt, evaporated salt, and brine (in terms of salt content) sold or used by producers in the United States, 1939–46.

PRODUCTION

PRODUCTION BY STATES

Salt was produced in the United States from underground mines, dry lakes, sea water, lake brine, springs, and wells, by 73 plants operated by 50 companies in 13 States and Puerto Rico in 1946 compared with 74 plants of 49 companies in 1945. Reports on salt in Ohio and Kansas were issued by the respective States.[1]

Salt sold or used by producers in the United States, 1944–46, by States

[1] Less than 0.5 percent.
[2] Revised.
[3] Includes Nevada, Oklahoma, and Virginia.

California.—The new salt ponds of the Leslie Salt Co., which have been under construction for the past several years, are nearing completion. This extension, covering nearly 4,000 acres in the San Francisco Bay area, will supply the Redwood City plant with crude salt. It is expected that by 1950 the output from these new ponds will be about 150,000 short tons, most of which will be exported. No salt was produced at the Long Beach Salt Co, plant at Los Angeles. The lease was canceled and the plant closed July 1, 1946. The plant of the Monterey Bay Salt Works was destroyed by fire in November 1946. C. C. Miller has begun a salt works in marsh water in Mono County, near Bishop. No shipments of salt were made in 1946, as operations were on an experimental basis.

Kansas.—At the American Salt Corp., Lyons, rebuilding of the evaporating, refining, and packaging plant, which was destroyed by fire in June 1945, was not completed in 1946. Rock salt, however, was produced.

Louisiana.—The Gordy Salt Co. began operating a brine well at Breaux Bridge in 1943. (This fact was inadvertently omitted from a previous chapter.)

[1] Gambs, Gerard C., and White, George W., Ohio's Mineral Resources—III. Salt Reserves: Ohio State University Studies Eng. Ser., Eng. Exper. Sta. Circ. 49, vol. 15, No. 3, September 1946, 24 pp.
Taft, Robert, Kansas and the Nation's Salt: Trans. Kansas Acad. Science, vol. 49, No. 3, December 1946, pp. 223–272.

Nevada.—The Leslie Salt Co. plant on the dry lake at Fallon has been closed since hostilities terminated; however, the company reports a few sales for the convenience of neighbors.

Ohio.—The Pomeroy Salt Co. has been shut down temporarily.

West Virginia.—On April 1, 1946, the Pittsburgh Plate Glass Co. took over the Natrium plant at New Martinsville, formerly owned and operated by the Defense Plant Corporation.

PRODUCTION BY METHODS OF RECOVERY

The accompanying table shows the output of salt obtained by the various processes used in 1946.

Salt sold or used by producers in the United States, 1945–46, by method of recovery

Method of recovery	1945 [1]		1946	
	Short tons	Value	Short tons	Value
Evaporated:				
Bulk:				
Open pans or grainers	637,529	$5,961,143	558,026	$5,905,704
Vacuum pans	1,846,011	14,144,622	1,840,061	14,165,778
Solar	446,112	1,712,171	553,056	1,971,947
Pressed blocks	252,918	2,553,161	298,314	2,942,966
Rock:				
Bulk	3,410,929	12,115,237	3,314,948	12,479,589
Pressed blocks	94,811	849,154	97,060	828,412
Salt in brine (sold or used as such)	8,705,831	6,578,918	8,470,680	6,618,190
Total	15,394,141	43,914,406	15,132,145	44,912,586

[1] All data revised except quantity and value of rock salt and total quantity (but not value) sold or used.

Rock Salt.—The production of rock salt from 19 plants in 8 States totaled 3,412,008 short tons in 1946.

Rock salt sold by producers in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	2,802,287	$9,623,461	1945	3,505,740	$12,964,391
1943	3,259,138	11,180,884	1946	3,412,008	13,308,801
1944	3,448,238	12,225,057			

Evaporated Salt.—In 1946, 49 plants in 12 States and Puerto Rico produced evaporated salt.

Evaporated salt sold or used by producers in the United States, 1945–46, by States

State	1945		1946	
	Short tons	Value	Short tons	Value
California	581,730	$3,114,191	595,747	$2,988,775
Kansas	337,697	2,676,919	338,532	2,829,111
Louisiana	65,264	548,922	87,834	584,815
Michigan	879,007	7,379,970	953,183	8,162,183

	[2] 3,182,570	[2] 24,371,097	3,249,457	24,986,395

[1] Includes Nevada, New Mexico, Oklahoma, and Texas.
[2] Revised.

Pressed Blocks.—The all-time high total of 395,374 short tons of pressed blocks was manufactured by 21 evaporated-salt plants and 8 rock-salt plants in 1946.

Pressed-salt blocks sold by original producers of the salt in the United States, 1942–46

Year	From evaporated salt		From rock salt		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1942	240,354	$2,228,062	67,490	$569,014	307,844	$2,797,076
1943	269,064	2,598,873	77,912	668,027	346,976	3,266,900
1944	274,216	2,797,015	79,063	724,456	353,279	3,521,471
1945	242,632	2,479,109	94,811	849,154	337,443	3,328,263
1946	298,314	2,942,966	97,060	828,412	395,374	3,771,378

Salt Content of Brine.—Fifteen plants in 7 States produced brine salt in 1946. Although brine salt was down 3 percent from 1945, it contributed 56 percent of the total salt produced in 1946—the same percentage as in 1945. Demand for chlorine and soda ash continued strong during 1946. A backlog of orders piled up that could not be satisfied because of shortage of containers, transportation, and fuel. The bituminous-coal strike affected soda ash manufacture especially, inasmuch as it takes nearly a ton of coal to produce a ton of soda ash.[2]

DISTRIBUTION AND MARKETING

The accompanying table shows salt shipped to destinations within the State in which it is produced totaled with that shipped into the State from other sources. As reshipments are disregarded, the statistics represent only original shipments into States by producers.

Packages.—On September 1, 1946, the National Bureau of Standards issued Simplified Practice Recommendation R70–46 on "Salt Packages," which supersedes R70–42. (See Salt chapters of Minerals Yearbooks 1940 and 1941.) As the salt producers have found that the simple wartime standards resulted in substantial economies and in general benefits, it was decided to retain them.

Grades.—Although there is some call for standardization of sizes and grades, the descriptions given by distributors appear to answer the needs fairly well. Occasionally consumers require unusually strict specifications, and in such instances special precautions must be taken by the producer.

[2] Shipping weight; not strictly comparable to earlier years.

USES

In 1946, the first full year of peace after World War II, the most notable changes in the consumption of salt were decreases in brine used for soda ash and chlorine and in dry salt used for meat packing and fish curing. There were increases in the quantity used for livestock, textile processing, water treatment, table and household purposes, "other food processing," and hides and leather.

"Other uses" in the accompanying table includes synthetic rubber manufacture, the output of which declined in 1946. Exclusive of the salt used for chlorine for rubber manufacture, about 100,000 short tons of rock and evaporated salt were used for making synthetic rubber and rubber products. This is about half the quantity so used in 1945.

The use of salt for meat packing declined during the meat crisis of 1945–46, when there was a shortage of meat to be dressed. On the other hand, the quantity of salt used for livestock increased.

Salt sold or used by producers in the United States, 1945–46, by classes and uses, in short tons

Use	1945				1946			
	Evaporated	Rock	Brine	Total	Evaporated	Rock	Brine	Total

[1] Revised figure.
[2] Data for evaporated salt included with "Undistributed."
[3] Data for salt in brine included with "Undistributed."
[4] Comprises miscellaneous uses and data not presentable by classes (footnotes 2 and 3), including most exports.

More dry salt was used for livestock than for any other purpose. The figures include not only the total pressed blocks but also an almost identical quantity in lumps and salt mixed in feed. Most of the cattle blocks are used in the Northeastern and Middle Western States, whereas much of the lump salt for livestock is consumed in parts of Texas and other southern areas. More than half of the livestock salt was supplied by Kansas, Texas, and Ohio, followed by New York,

Michigan, Louisiana, California, New Mexico, West Virginia, and Utah. The areas of maximum consumption naturally were the great cattle-raising sections.

Table salt is supplied chiefly by Michigan, New York, and Louisiana, and much smaller quantities by Ohio, California, Kansas, and West Virginia. Used everywhere in the United States, the greatest quantities are consumed in the largest centers of population.

Meat packing constitutes the third largest use of dry salt. A little over half was evaporated salt and the remainder rock salt. Kansas, New York, and Michigan supply most of the salt for this purpose, and Texas, Ohio, Louisiana, California, and West Virginia smaller quantities. Most of it is used in the great meat-packing centers in the Middle West and Northeast, and the remainder is scattered throughout the country.

Most salt-producing States supply salt for water treatment, but California greatly exceeds any other State. Substantial quantities are produced for this purpose in Ohio, New York, Louisiana, Michigan, Kansas, and Texas, with small amounts from West Virginia and New Mexico. It is consumed in every State, the quantity depending on the size of the industries and population.

Highways claim the next largest tonnage of dry salt. New York is the principal supplier of this material, with smaller amounts from Michigan, Kansas, Louisiana, Ohio, California, West Virginia, Utah, and Texas. Several magazine articles[3] have described methods of applying salt to city streets and roads.

Salt for curing hides and leathers is produced in New York (far in the lead), Kansas, California, Texas, Louisiana, Ohio, Michigan, and West Virginia.

Refrigeration consumes the next largest quantity of salt, most of which is produced in New York, California, Louisiana, and Texas, with less by Kansas, Michigan, Utah, Ohio, and West Virginia.

Salt for canning, dairy products, and other food processing is produced chiefly in Michigan, New York, and Ohio, and smaller quantities in Kansas, Louisiana, California, and West Virginia.

The source of supply of salt for canning and preserving was principally New York, Ohio, Michigan, California, Louisiana, Kansas, and some from West Virginia. This followed the pattern of the canning localities. Canneries abound in the Mid-Atlantic and Northeastern States. Many are found in the Middle Western States and along the Pacific coast. They are also scattered throughout the South but do not do the volume of business comparable to other sections as far as salt consumption goes. (Florida and Texas have large canning industries for citrus fruit juices but this requires less salt than meat and vegetable canning.)

Textile processing is carried on mainly in the New England and Southern States, although California does a certain amount. The salt for this processing is produced largely in New York and Louisiana and

Public Works, Use of Rock Salt for Removing Ice and Snow From Streets: Vol. 77, No. 1, January 1946, pp. 19–20.

smaller quantities in Ohio, Michigan, California, and West Virginia.

The salt for butter and cheese is supplied principally by Michigan, New York, and Ohio, and smaller quantities by Kansas, California, Louisiana, and West Virginia.

The sources of salt used for fish curing have changed in the last decade because so much of it was imported formerly. During the last decade more domestic salt was used in curing fish in the United States, and less was imported. The domestic salt so used in 1946 was provided by New York, Ohio, California, Louisiana, and Michigan, and smaller quantities by Kansas, West Virginia, and Texas.

During 1942–46, as shown in the accompanying compilation, domestic salt used for fish curing increased materially, the peak year (1945) being 107,694 short tons. Although the total for 1946 was considerably less than in 1945, it surpassed every year before 1943.

Domestic salt sold or used by producers for fish curing, 1940–46, in short tons

Year	Evaporated	Rock	Total	Year	Evaporated	Rock	Total
1940	34,207	2,260	36,467	1944	35,998	67,844	103,842
1941	34,939	3,363	38,302	1945	36,123	71,571	107,694
1942	28,908	32,007	60,915	1946	37,826	35,307	73,133
1943	32,724	53,463	86,187				

Information on imports of this type of salt is presented in the foreign trade section of this report. How much of this market for domestic salt will remain permanently is uncertain. Fishermen in the Northeast customarily have used solar salt from the West Indies, but during World War II found themselves cut off from that source and turned to domestic supplies.

The foregoing review relates only to continental United States. Much of the salt produced in Puerto Rico is used for table-salt purposes, and some is used for curing hides, fish curing, soap manufacturing, refrigeration, and water treatment.

PRICES

Salt prices customarily are quoted f. o. b. point of delivery, hence, there is no uniform price list applicable to the entire country. The accompanying New York quotations from Oil, Paint and Drug Reporter indicate the price trend in recent years.

Average prices per short ton of salt (bagged) delivered New York City, 1939–46

	1939	1940	1941	1942	1943	1944	1945	1946
Rock salt:								
In carlots	$13.50	$13.45	$13.95	$14.20	$14.20	$14.20	$14.20	$14.20
Less than carlots	15.30	15.50	16.50	17.50	17.50	17.60	17.60	17.60
Vacuum common fine:								
In carlots	15.30	15.50	15.70	15.70	15.70	15.70	15.70	15.70
Less than carlots	18.65	18.15	19.70	21.30	21.30	21.40	21.40	21.40

FOREIGN TRADE [4]

Imports of salt declined, but exports increased in 1946 compared with 1945. Imports have declined steadily since 1939, until in 1946 they were less than 10 percent of the average for 1935–39. Exports, however, were 250 percent greater than the average for 1935–39. Nevertheless both are negligible compared with domestic production. Imports were only a small part of 1 percent and exports somewhat more than 1 percent.

Salt imported for consumption in the United States, 1942–46, by classes

Year	In bags, sacks, barrels, or other packages (dutiable)[1]		Bulk			
			Dutiable		Free (used in curing fish)	
	Short tons	Value	Short tons	Value	Short tons	Value
1942	367	$4,138	953	$7,496	[2] 6,434	[2] $17,667

Europe:				
Switzerland			[1]	10
United Kingdom			1	20
	4,553	73,390	4,253	29,628

[1] Less than 1 ton.

Imports.—More than half of the salt imported in 1946 in bags, sacks, barrels, and other packages came from Canada. It entered through the Buffalo customs district and the Maine and New Hamp-

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

shire district; only about one-half ton each came through the Vermont and Dakota districts. Puerto Rico received 110 tons from Curaçao (N. W. I.); San Francisco 1 ton from United Kingdom; and New York less than 1 ton from Switzerland.

In the bulk class (dutiable) Canada supplied 1,903 tons, of which 969 tons entered through Michigan customs and 934 tons through Buffalo customs. Jamaica supplied 668 tons through the Michigan customs.

In the bulk salt (duty-free) class for curing fish, Jamaica supplied the entire 1,407 tons through the Virginia customs.

Buying habits necessarily shifted during the war. This was especially noticeable in regard to imports of salt for curing fish. Before World War II, the largest part of the salt imported was used in fish curing. From 1938 to 1942, imports of this type of salt in bulk were as follows:

Year	Short tons	Value	Including salt in bags, sacks, barrels, and other packages
1938	21,010	$47,800	93 tons valued at $673.
1939	15,461	27,700	None.
1940	12,965	25,174	6 tons valued at $12.
1941	7,426	30,058	None.
1942	6,434	17,667	122 tons valued at $1,200.

In 1943, 1944, and 1945 no imports of fish salt were recorded, but in 1946 bulk salt for curing fish again appeared in the customs records. During 1943–45, as seen by the figures given in the Uses section of this chapter, the use of domestic salt for curing fish increased materially; 107,694 tons were consumed for this purpose in the peak year 1945.

Exports.—In the past year interest in salt exports has quickened. This applies not only to crude and refined table salt but also to pressed blocks for consumption by livestock. In 1946 exports of salt were the highest they have ever been.

The customs districts, from which the salt exports shown in the accompanying table were made, are indicative of the area in which the salt originated. A review of shipments, by customs districts, shows that about 73 percent was shipped through Great Lakes and St. Lawrence ports; 8 percent through Pacific districts; 5 percent through North Atlantic States; 5 percent through Gulf ports, including Florida; 4 percent through the southern border States Arizona and Texas; 3 percent through the Middle and South Atlantic States; and 1.5 percent through northwestern border States—Dakota, and Montana and Idaho.

[1] Less than 1 ton.

WORLD REVIEW

A great many countries contribute to total world production of salt, but the output of the United States far exceeds all. Other countries high on the list are Germany, United Kingdom, China, Italy, France, and India.

World production of salt, 1939–46, by countries, in metric tons [1]

[Compiled by P. Roberts]

Country [1]	1939	1940	1941	1942	1943	1944	1945	1946
North America:								
Canada	385,550	420,974	510,930	591,343	619,528	632,841	610,601	481,032

[1] In addition to the countries listed salt is produced in Albania, Bolivia, Cyprus, Formosa (Taiwan), Gold Coast, Leeward Islands, Madagascar, Southern Rhodesia, U. S. S. R., and other Australian States (Victoria and Western Australia), but figures of production are not available. Russian production, however, is known to exceed 4½ million metric tons annually.

[2] Data not available. [3] Estimate. [4] Exports.

[5] Estimated. Excludes Sub-Carpathia, ceded to Hungary and U. S. S. R.

[6] Includes Northern Territories and Sub-Carpathia; in addition, beginning in 1941 includes Eastern Hungary and Transylvania, and beginning in 1942 includes Southern Territories.

[7] Excluding rock salt. [8] January to June, inclusive; Croatia only.

[9] Fiscal year ended March 31 of year stated.

[10] Data represents areas designated as Free China during the period of Japanese occupation.

[11] Fiscal year ended March 31 of year following that stated. [12] Incomplete data.

[13] Estimated by author of chapter; excludes estimates for countries listed in footnote 1.

The accompanying world production table contains foreign salt statistics that have been lacking for several years. Notable among these are figures for France (1939–46); Greece (1940–46); India (final 1944, and 1945); Japan (1939–45); Rumania (1944–45); and United Kingdom (1939–45). The output for Japan in 1938, not shown in this or previous tables, was 483,601 metric tons for its fiscal year, ended March 31, 1938.

Detailed information on the salt industries in foreign countries was published in Mineral Trade Notes as follows: Argentina,[5] Australia,[6] Austria,[7 8] Belgium,[9] Brazil,[5 9] Canada,[6 10 11 12] Ceylon,[9 12] China,[11 12] Colombia,[7] Czechoslovakia,[13] Denmark,[8 13] Dominican Republic,[10 14] Ecuador,[14] Egypt,[15] France,[13] Hungary,[13] Italy,[14] Kenya,[6 14] Japan,[8 16] Korea,[5] Mexico,[6 14 16 17] Newfoundland,[7] Panama,[14] Portugal,[7] Peru,[11] Rumania,[13] South-West Africa,[6] Spain,[7] Syria,[9 14] Turkey,[7 10] Turks and Caicos Islands,[7] and United Kingdom.[13]

A report [18] translated from the China Newsweek describes the salt wells of Szechwan, China.

Denmark.—Discovery of the first known occurrence of rock salt in Denmark was made on June 3, 1946, about 5 miles north of Holstebro in northwestern Jutland. This is very important to Denmark, inasmuch as in the past all salt requirements have been imported.

Japan.—Japan needed salt so desperately, particularly for salting fish, that early in 1946, several ferro-alloy plants were converted to making salt for domestic consumption and fish salting.[19] This was done by evaporating sea water in wooden tanks placed in open furnaces, filling them with sea water, then lowering electrodes into the tanks. It was acknowledged that the method was crude and wasted power, but was the best possible in the situation. Estimates indicate that about 20 percent of all salt recovered in the country by evaporating sea water is in the Heroult-type electric furnace.

Mexico.—The Lake Texcoco solar salt development, Mexico City Mexico,[20] is now evaporating 40,000 cubic feet of water per day and 10 tons a day of the concentrated solution is being pumped from the center of the caracol (snail, from its shape).

Sand and Gravel

By G. RICHARDS GWINN AND G. E. TUCKER

GENERAL SUMMARY

THE SAND and gravel and iron blast-furnace slag industries in 1946 had a prosperous year due primarily to the expanding construction program. As shown in figure 1, output of sand and gravel exceeded the production of any other peacetime year, being topped only by 1941 and 1942 in quantity and 1942 in value.

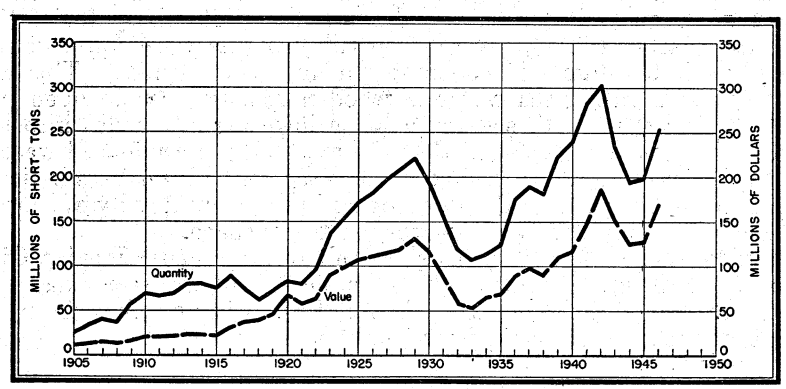

FIGURE 1.—Production of sand and gravel in the United States, 1905–46.

As stocks of sand and gravel are relatively small and constant from year to year, production virtually equals sales. Thus these terms are used interchangeably in this report.

As shown in the accompanying salient-statistics table, sales in 1946 of all kinds of sands by commercial operators, with the exception of molding, fire or furnace, and railroad-ballast, increased over those reported in 1945; sales of gravel by this class of operators, with the exception of railroad ballast, also increased. The combined total of sand and gravel used on Government-and-contractor operations also shows an increase in 1946. The upward trend, however, was accounted for entirely by gravel operations, as the quantity of sand utilized was 15 percent below that reported in 1945.

Sand and gravel sold or used by producers in the United States, 1945–46, by commercial and Government-and-contractor operations and by uses

[1] Includes blast sand as follows—1945: 318,390 tons valued at $766,013; 1946; 292,899 tons, $736,819.
[2] Includes ballast sand produced by railroads for their own use as follows—1945: 17,792 tons valued at $2,429; 1946: 83,422 tons, $10,562.
[3] Includes some sand used by railroads for fills and similar purposes as follows—1945: 220,244 tons valued at $44,356; 1946: 164,061 tons, $30,658.
[4] Includes ballast gravel produced by railroads for their own use as follows—1945: 8,587,465 tons valued at $2,987,940; 1946: 4,077,115 tons, $1,640,726.
[5] Includes some gravel used by railroads for fills and similar purposes as follows—1945: 843,969 tons valued at $133,494; 1946: 637,462 tons, $107,938.
[6] Approximate figures for States, counties, municipalities, and other Government agencies directly or under lease.

PRODUCTION

The production of sand and gravel in 1946 reached 254,131,000 short tons valued at $171,386,000, an increase of 30 percent in quantity and 33 percent in value over the 195,524,000 tons valued at $128,837,000 reported in 1945. The largest increases were reported for sand and gravel utilized in building, which reflect the great expansion of the construction industry.

California in 1946, as in 1945, was the largest producer, and Illinois, Michigan, Wisconsin, Ohio, New York, Texas, Minnesota, and Pennsylvania follow in that order. These 9 States, each with an output of more than 10,000,000 tons, accounted for 52 percent of the total production. The following tables show details of production, by States and uses, in 1946.

Sand and gravel sold or used by commercial and Government-and-contractor producers in the United States, 1942–46

Year	Sand		Gravel (including railroad ballast)		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1942	107,371,000	$74,443,000	196,975,000	$114,057,000	304,346,000	$188,500,000
1943	82,053,000	62,263,000	152,011,000	90,530,000	234,064,000	152,793,000
1944	68,978,000	54,054,000	125,805,000	71,110,000	194,783,000	125,164,000
1945	71,726,000	54,856,000	123,798,000	73,981,000	195,524,000	128,837,000
1946	96,440,000	74,975,000	157,691,000	96,411,000	254,131,000	171,386,000

[1] Figures that may not be shown separately are combined as "Undistributed."
[5] Includes 4,077,115 tons of ballast gravel valued at $1,640,726, produced by railroads for their own use.
[6] Includes 637,462 tons of gravel valued at $107,938, used by railroads for fills and similar purposes.

Government-and-Contractor Production.—As shown in the accompanying chart and tables, the output of sand and gravel from noncommercial or Government-and-contractor operations in 1946 accounted for 24 percent of the total tonnage, compared with 22 percent

in 1945. The value of this tonnage in 1946, as in 1945, represented 14 percent of the total for the industry. The increase in quantity is accounted for entirely by gravel and is attributed largely to the expansion of the Government program to improve existing roads and build new highways.

States reported 50 percent of the total in 1946, counties 42, municipalities 2, and other agencies 6.

In 1946 contractors furnished 39 percent of the Government-and-contractor tonnage, compared with 32 percent in 1945. The average value decreased 4 cents per ton in 1946.

DEGREE OF PREPARATION

The bulk of the sand and gravel shipped by commercial plants is prepared material, whereas most of the output of Government-and-contractor operations is unprepared material. The accompanying table shows this relationship in the past 2 years. Prepared sand and gravel accounted for 73 percent of the total production in 1946, compared to 71 percent in 1945. The increase is attributed to commercial plants, which reported 91 percent of their production prepared, an increase of 6 percent over that reported in 1945, whereas the proportion of prepared material produced by Government-and-contractors remained the same as in the previous year.

Sand and gravel (prepared or unprepared) sold or used by producers in the United States, 1945–46, by commercial and Government-and-contractor operations

	1945			1946		
	Quantity		Average value per ton	Quantity		Average value per ton
	Short tons	Percent		Short tons	Percent	
Commercial operations:						
Prepared	129,731,535	85	$0.77	174,195,542	91	$0.80
Unprepared	22,406,763	15	.46	17,897,024	9	.50
	152,138,298	100	.73	192,092,566	100	.77
Government-and-contractor operations:						
Prepared	8,434,000	19	.85	11,483,000	19	.70
Unprepared	34,952,000	81	.32	50,556,000	81	.30
	43,386,000	100	.42	62,039,000	100	.38
Grand total	195,524,000		.66	254,131,000		.67

SIZE OF PLANTS

The average plant output of commercial operators, excepting railroad plants, reached 88,000 short tons in 1946, an increase of 29 percent over the 68,000 reported for 1945. Plants producing between 100,000 and 200,000 tons in 1946 accounted for 21 percent of the total output, which represents the largest quantity produced by one group.

Plants producing over 500,000 tons increased from 28 to 48 and supplied 22 percent of the total tonnage. The 50,000- to 100,000-ton group showed the greatest expansion in numbers—from 328 to 398. Details of output, by size groups, are shown in the accompanying table.

Comparison of number and production of commercial sand and gravel plants in the United States, 1945–46, by size groups[1]

Size group, in short tons	1945				1946			
	Plants[2]		Production		Plants[2]		Production	
	Number	Percent of total	Short tons	Percent of total	Number	Percent of total	Short tons	Percent of total
Less than 25,000	1,001	47.6	9,345,000	6.6	838	39.5	7,601,000	4.0

500,000 to less than 600,000	9	.5	4,731,000	3.3	16	.8	8,620,000	4.6
600,000 to less than 700,000	6	.3	3,909,000	2.7	9	.4	5,927,000	3.2
700,000 to less than 800,000	3	.1	2,206,000	1.5	2	.1	1,468,000	.8
800,000 to less than 900,000	3	.1	2,520,000	1.8	7	.3	6,119,000	3.3
900,000 to less than 1,000,000	3	.1	2,800,000	2.0	2	.1	1,907,000	1.0
1,000,000 and over	4	.2	5,604,000	3.9	12	.6	16,469,000	8.8
	2,103	100.0	142,469,000	100.0	2,121	100.0	187,130,000	100.0

[1] Plants operated by or for States, counties, municipalities and other Government agencies are not included; also not included are approximately 165 railroad plants with an output of 9,669,000 tons of sand and gravel in 1945 and 133 plants with an output of 4,962,000 tons in 1946.

[2] Includes a few companies operating more than 1 plant but not submitting separate returns for individual plants.

METHOD OF TRANSPORTATION

Truck transportation in 1946, as in the previous year, dominated the industry, accounting for 51 percent of shipments from commercial plants. Railroads carried most of the shipments handled by other methods. Although the quantity shipped by water is small, this method is dominant in some areas. As shown in the accompanying table, the percentage moved by truck becomes even greater when Government-and-contractor output is added. A part of the increase in truck transportation in 1946 was attributed to the shortage of freight cars.

Sand and gravel sold or used by commercial producers in the United States, 1945–46, by methods of transportation [1]

Method of transportation	1945		1946	
	Short tons	Percent of total reported	Short tons	Percent of total reported
Truck	61,439,488	43.5	91,741,944	51.1
Rail	69,456,386	49.2	71,615,794	39.9
Waterway	10,389,771	7.3	16,231,812	9.0
Total reported	141,285,645	100.0	179,589,550	100.0
Percent of total commercial production covered		92.9		93.5

[1] For practical purposes, the entire output of Government-and-contractor operations commonly is moved by truck. Including Government-and-contractor production, sand and gravel moved approximately as follows—1945: Truck 57 percent, rail 37 percent, and waterway 6 percent; 1946: truck 64 percent, rail 29 percent, and waterway 7 percent.

CONSUMPTION TRENDS

Sand and Gravel for Construction.—The demand for sand and gravel by the construction industry in 1946, as measured by shipments from commercial plants, showed a sharp upturn. Building sand reached a peak of 48,237,949 tons, a figure 2,202,248 tons above the previous record year of 1942, and the combined quantity of building and paving sand consumed in 1946 was only 9 percent below that reported in 1942. Although a large number of construction contracts in 1946 were not completed and thus are carry-overs into 1947, many of them proceeded through the foundation stage, where the largest quantities of sand and gravel are consumed. Highway and building construction are expected to keep the demand for sand and gravel at a high level for a number of years.

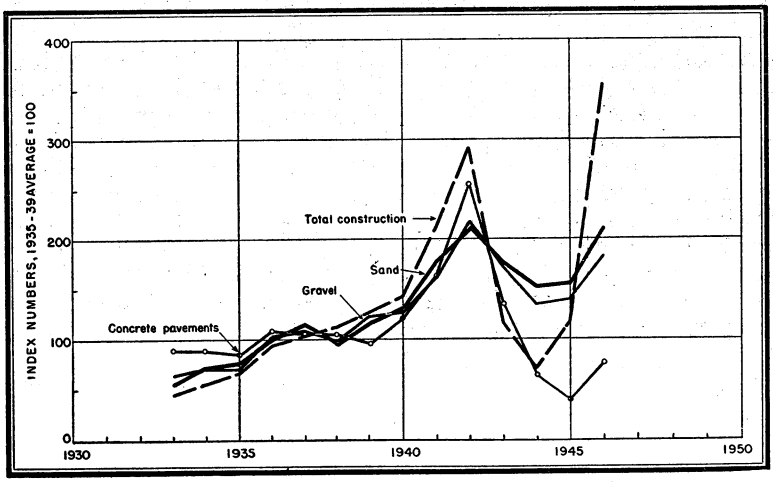

FIGURE 3.—Value of sand and gravel production, compared with total construction (contract awards, value) and concrete pavements (contract awards, thousands of square yards), in the United States, 1933–46. Data on construction and concrete pavements are from the Bureau of Foreign and Domestic Commerce.

Industrial Sands.—Although the output of the industrial sands in 1946 varied little from the previous years' totals, a slight increase is discernible. Industrial production is expected to continue at a high level for a number of years, and it is believed that the trend in the consumption of these sands will continue upward.

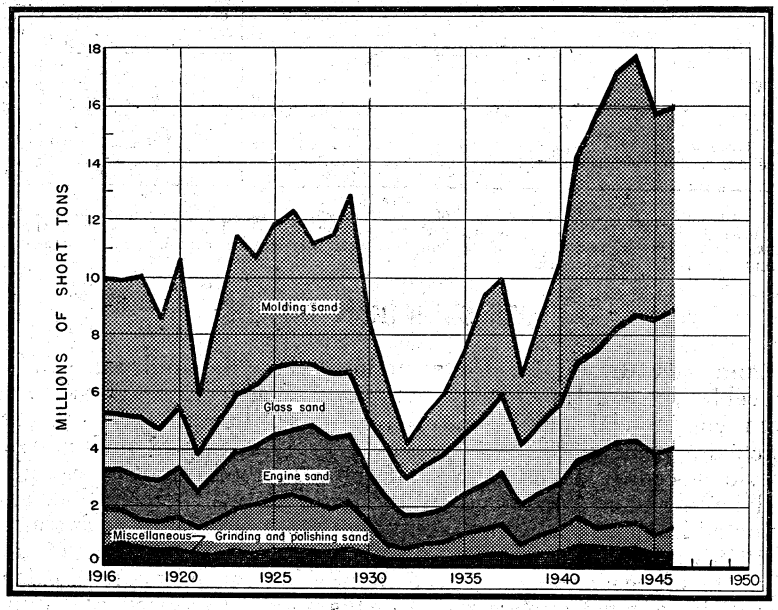

FIGURE 4.—Production of industrial sands in the United States, 1916–46.

EMPLOYMENT AND PRODUCTIVITY

The shortage of manpower available to the sand and gravel industry in 1945 eased somewhat during 1946, as total employment in the industry is believed to have averaged somewhat over 22,000 men. As shown in the following table, the number of days worked and the average production per man per shift was higher in 1946 than in any other year of the 1940–46 period. The accompanying table showing a detailed breakdown of employment and production, by regions, of all commercial plants (except those operated by railroads) indicate that the Pennsylvania-New Jersey-Delaware region employed the largest number of men, but the highest production per man per hour and shift was reported from the Nebraska-Iowa region.

Employment in the commercial sand and gravel industry and average output per man in the United States, 1940–46 [1]

Year	Employment					Production (short tons)			Percent of commercial industry represented
	Average number of men	Time employed				Commercial sand and gravel	Average per man		
		Average number of days	Total man-shifts	Man-hours			Per shift	Per hour	
				Average per man per day	Total

[1] Excludes plants operated by or directly for States, counties, municipalities, and other Government agencies.

PRICES

The average value for all shipments of sand and gravel in 1946 increased only 1.5 percent over the previous years' total. For commercial plants, however, the increase was 5.5 percent, which reflects the continued rise in labor and other production costs. Under Office of Price Administration Order No. 23 of May 3, 1946, maximum prices per cubic yard for sand and gravel in the Utica-Rochester area and the Northville area in Michigan were set at $1.10 to $1.20 for gravel 60/40 at the pit and $2.05 to $2.15 delivered; sand, $0.90 to $1 at the pit and $1.85 to $1.95 delivered; clear pebble, $1.55 to $1.70

at the pit and $2.50 to $2.65 delivered. On June 19, 1946, under Amendment 29 to Office of Price Administration Supplementary Order 129, sand and gravel classified as railroad ballast was released from price control. On November 10, 1946, controls on all classes of sand and gravel were abolished by the Office of Price Administration.

FOREIGN TRADE

Imports of sand and gravel in 1946 were 26 percent greater than in 1945 but represented only 0.14 percent of domestic production. Belgium and Luxembourg furnished virtually all of the glass sand received, and Canada supplied 260,203 tons of the "Other sand." The total gravel imported came from Canada. Exports of sand and gravel are not now classified separately by the United States Department of Commerce, but before 1939, when classified, they ranged from 25,000 to 100,000 tons a year. The accompanying table shows imports for the 1937–46 period.

Sand and gravel imported for consumption in the United States, 1937–46, by classes

Year	Sand				Gravel		Total	
	Glass sand [1]		Other sand [2]

[1] Classification reads "Sand containing 95 percent or more silica and not more than 0.6 percent oxide of iron and suitable for manufacture of glass."
[2] Classification reads "Sand, n. s. p. f."
[3] Less than 1 ton.

TECHNOLOGIC DEVELOPMENTS

The sand and gravel industry kept pace with modern machine methods in 1946. Water-jet systems were installed on dredges at several Louisiana plants to increase capacity and to provide steady flow and a greater percentage of solids through the dredge pumps.[1] Two Arizona plants featured pushbutton control of much of the equipment, reducing the manpower required to operate the plant.[2] A new plant in California provides ample headroom under all equipment and structures and paving of the entire plant area, including bin, floors, and driveways.[3] The B. F. Goodrich Rubber Co. announced

the discovery of a silica product that gives rubber compounds the same qualities achieved through the use of carbon black. The new material, called "fumed silica," produced by burning ethyl silicate, gives rubber compounds additional tear and abrasion resistance and tensile strength without affecting the rubber's color or translucency, as does carbon black. Commercial utilization of the new compound is still sometime away because of its present high cost.[4]

IRON BLAST-FURNACE SLAG

The production of iron blast-furnace slag in 1946 reached a new high of 16,706,792 short tons valued at $14,869,839, a figure 32 percent above the 12,635,868 tons valued at $10,450,852 in 1945. The 1946 output, as reported by the National Slag Association, came from 36 companies operating some 50 plants. Details of the tonnage and value of slag consumed in the various uses are shown in an accompanying table. Screened air-cooled slag, the major product, increased 25 percent over the 1945 figure. The largest increases percentagewise, however, occurred in sales of slag utilized for lightweight aggregate, which reached 773,150 tons, an increase of 230 percent; concrete block, 373,257 tons, 182 percent above the 1945 figure; and mineral wool, 629,782 tons, an increase of 57 percent. These commodities are used in the construction industry and present further evidence of the expansion of the highway and housing programs. Although screened, air-cooled, iron blast-furnace slag is produced in 12 States, most of the production comes from the steel centers in Ohio, Alabama, Pennsylvania, and Illinois. Ohio, as in the previous year, was the largest single producer.

Railroads transport the bulk of the tonnage, trucks account for a substantial quantity, and waterways carry only minor amounts. It is believed that the decrease of 6 percent in the quantity moved by railroads in 1946 was due largely to freight-car shortages.

Slag processors in 1946 reported the recovery of 180,432 short tons of iron from slag, an increase of 14 percent over the 158,186 tons recovered in 1945. In view of the critical shortage of pig iron in 1946 this recovery was welcomed by the iron and steel industry.

A total of 4,571,175 man-hours were expended by 2,023 plant and yard employees of the industry in the production of commercial slag in 1946. This excludes those assigned to administrative and sales activities.

Secondary copper and brass	1074	Secondary zinc	1089

GENERAL SUMMARY

FIGURES on the recovery of nonferrous secondary metals from purchased scrap in 1946 disclose a slight decline in the rate of production of material from secondary sources, as the various industries endeavored to overcome obstacles in the path of normal operation. Regulation of prices of most of the metals surveyed was ended late in the year; but this factor, together with labor difficulties, contributed to the decline in recovery of secondary metals. There were declines in the tonnage reclaimed for five of the metals surveyed, but recovery of lead, antimony, and nickel increased. In general, the trend indicated in the preceding 2 years, from a preponderance of new scrap consumed to one of old scrap, was continued. This trend was aided

[1] Corrected figure.

by such items as greatly increased recovery from old aircraft scrap but was more naturally the result of a return of industry to normal operating practice; during wartime new scrap is generated in higher proportions than in peacetime, and its consequent use is greater.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The value of metals recovered in 1946 from both new and old scrap was $474,292,793 compared with $481,582,318 in 1945. This decline was due entirely to the drop in total value of metals recovered from new scrap—from $269,499,103 (corrected figure) in 1945 to $232,896,138 in 1946. The value of metals reclaimed from old scrap registered a gain for the fourth successive year, increasing from $212,083,215 (corrected figure) in 1945 to $241,396,655 in 1946.

Secondary metals recovered as unalloyed metal, in alloys, and in chemical compounds in the United States, 1942–46, in short tons

Metal	1942	1943	1944	1945	1946
Aluminum	196,464	313,961	325,645	298,387	278,073
Antimony	18,200	15,483	15,886	17,148	19,115
Copper	927,755	1,086,047	950,942	1,006,516	803,546
Lead	323,001	342,094	331,416	363,039	392,787
Magnesium	6,238	11,404	14,185	9,247	5,117
Nickel	4,142	6,917	4,321	6,483	8,248
Tin	37,918	37,820	32,589	35,133	27,671
Zinc	330,526	368,488	345,469	360,444	300,682

These figures for the value of secondary metals recovered are calculated on the basis of the replacement of primary metals by secondary; that is, if the plants involved had not been able to use scrap in their operations, they would have had to use primary metals amounting in value to the figures quoted above. However, figures representing the current market value do not present the true worth of scrap-metal recovery to the country. A more far-reaching evaluation is afforded by taking into account the conservation of natural resources accomplished by the reclamation of metal from scrap and waste materials. A number of economic papers have appeared in magazines of the mining and metallurgical trades during the past 2 years concerning the economic mineral position of the United States—are we a "have" or a "have not" nation? Regardless of the resolution of this controversy, the fact remains that the secondary metal industry—represented by scrap-metal dealers, remelters, smelters, refiners, brass mills, foundries, chemical plants, and other manufacturers—is the most powerful force working toward the conservation of our natural resources.

It is regrettable that in ordinary times the utilization of secondary metals is of greater concern from an economic standpoint than from a metallurgical one and that, for this reason, the subject has been given inadequate consideration by technical bodies generally. Only under the stress of war calling for the utilization of all materials to the best advantage is any considerable amount of research done toward solving the problems of producing high-grade alloys and other materials from scrap. However, reasonable progress is made year after year in the improvement, metallurgically, of secondary metals. Much of this progress is accomplished because cost is of prime importance to the secondary smelter. Although quality of product is a necessity in such a highly competitive industry, the secondary smelters' objective is to avoid the comparatively costly procedure of "sweetening" melts with refined metal and alloying ingredients

and to concentrate on producing remelt alloys with compositions as near to those of the scrap materials treated as possible. Being bound by these economic limitations, the production records established by the industry in the past few years are remarkable.

SCOPE OF REPORT

Statistics for 1946 regarding scrap and secondary metals were derived from surveys covering all known consumers of purchased nonferrous scrap metals and a representative group of dealers. Reports on consumption of copper-base scrap, copper-alloy ingot, and refined copper were received from 122 plants classed as remelters, smelters, or refiners and from 2,483 plants classed as brass mills, foundries, wire mills, chemical works, and miscellaneous manufacturers. The large consumers of scrap in the secondary copper, lead, zinc, and aluminum industries were canvassed on a monthly basis by the Bureau of Mines, and additional information was received on annual reports from 1,103 foundries and other manufacturers concerning all types of nonferrous scrap except copper-base scrap. A total of 391 plants was represented in the group classed as remelters, smelters, or refiners. Approximately 1,300 of the 4,200 nonferrous scrap dealers in the United States were canvassed in the monthly dealer survey, and the reported figures were expanded to represent 100-percent coverage. Since this survey was discontinued in March 1947, 1946 was the last full year for dealer statistics.

Definitions of the terms used in this chapter are as follows:

"Secondary metals" are metals or alloys recovered from scrap and residues. The term "secondary" applies only to the source of metal and has no relation to the type of product recovered, either as to degree of purity or impurity or to physical characteristics.

"Purchased scrap" means all scrap that entered any plant in scrap form and includes scrap treated for customers upon a toll basis or conversion agreement and interplant transfers of scrap. Scrap salvaged by railroads from line operations and remelted in their own foundries and that melted by Navy Yard foundries which originated in salvage operations are included in this category, as a definite recovery of secondary metal results from the melting of such scrap.

"Interplant transfers" are those made between separate plants owned or operated by the same parent company but not located on the same ground. A transfer of scrap from a machine shop to a foundry at the same plant location is not an interplant transfer, and such "home scrap" is not included in this report. In some isolated instances where a foundry and a brass mill, or a brass mill and a wire mill, were operated at the same general location, it has been necessary to record scrap transferred from one operation to the other and include its consumption in these surveys.

"New scrap" is defined as the refuse produced during the manufacture of articles for ultimate consumption, including all defective finished or semifinished articles that must be reworked. Typical examples of new scrap are defective castings, clippings, punchings, turnings, borings, skimmings, drosses, and slag.

"Old scrap" is defined as scrap consisting of metal articles that have

been discarded after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, fired cartridge cases, automobile crankcases, used pipe, and lithographers' plates.

In addition to these definitions, some explanation needs to be given of the method of compiling in this chapter the tables concerning secondary metal recovered. For example, in the first table of the section on Secondary Aluminum, the amount given as secondary aluminum recovered is the same as that for the recoverable aluminum-alloy content. The latter figure is computed by multiplying the weights of all the different types of scrap used by established average percentages for recovery and composition, whereas the data for secondary aluminum recovered are obtained from the production sections of individual reports. It is obvious that the totals arrived at by these two methods could not be exactly the same without adjustment. In the table for aluminum recovery, the figure for "aluminum recovered in aluminum alloys" is adjusted to make the total the same on both sides of the table. Figures for corresponding tables for the other secondary metals are obtained in similar fashion. The term "aluminum" in the tables covers aluminum alloys, including all constituents recovered from aluminum-base scrap, such as copper, magnesium, zinc, silicon, etc. The copper, zinc, and magnesium recovered from aluminum-base scrap appear again in the tables devoted to those metals, so there is duplication of recovery to this extent.

SECONDARY ALUMINUM

The recovery of secondary aluminum declined for the second year in succession, totaling 278,073 short tons in 1946, valued at $78,639,044. The record year was 1944, when 325,645 tons were recovered. In 1945, recovery was 298,387 tons valued at $85,279,005. Values were calculated on the basis of the average market price of all grades of primary ingot and pig, which was 14.29 cents a pound in 1945 and 14.14 cents in 1946.

Secondary aluminum [1] recovered in the United States, 1945–46, in short tons

Secondary aluminum recovered			Recoverable aluminum-alloy content of scrap		
Form of recovery	1945	1946	Kind of scrap processed	1945	1946
As metal	2,145	2,075	New scrap:		
Aluminum alloys	293,967	274,068	Aluminum-base [2]	270,810	187,172
In brass and bronze	1,162	597	Copper-base	107	115
In zinc-base alloys	267	504	Zinc-base	159	52
In magnesium alloys		266	Magnesium-base		199
In chemical compounds	846	563		271,076	187,538
	298,387	278,073	Old scrap:		
			Aluminum-base [3]	26,712	90,005
			Copper-base	491	169
			Zinc-base	108	336
			Magnesium-base		25
				27,311	90,535
				298,387	278,073

[1] In accordance with common usage, the term "aluminum" covers aluminum alloys, and the figures include all constituents of the alloys recovered from aluminum-base scrap.
[2] Recoverable aluminum content of new aluminum-base scrap was 252,098 tons in 1945 and 174,737 tons in 1946.
[3] Recoverable aluminum content of old aluminum-base scrap was 24,527 tons in 1945 and 82,941 tons in 1946

Although the total recoverable aluminum-alloy content of all scrap treated declined, the recovery from old scrap increased, principally because of greatly increased recovery from aircraft scrap. This boosted the recovery of aluminum from old aluminum-base scrap from 26,712 tons in 1945 to 90,005 tons in 1946. Recovery of aluminum from zinc-base scrap increased threefold on account of increased use of zinc die-cast and die scrap, which contains about 4 percent aluminum.

The over-all decrease in recovery of aluminum from scrap was caused by a falling off in recovery from aluminum-base scrap in wrought products and castings at plants operated by primary producers. Production of secondary aluminum at primary plants declined from 108,705 tons in 1945 to 73,388 tons in 1946, a decrease of more than 32 percent. The figures for the production of secondary aluminum at primary plants represent the secondary metal content of the total production and do not refer to a separate secondary product. Scrap is melted at primary plants with virgin metal and constitutes only a small percentage of the total raw material used. At these plants, which are operated in connection with aluminum rolling mills, home scrap and purchased scrap are used with primary aluminum and added alloying ingredients, such as copper, manganese, and zinc, to make alloys suitable for wrought products or castings. The procedure is such that no method has yet been found for determining the proportions of the secondary recovery to be assigned to castings and to wrought products.

Production of secondary aluminum and aluminum-alloy products in the United States, 1944–46, gross weight, in short tons

	1944	1945	1946
Secondary aluminum ingot: [1]			
Pure aluminum (98.5 percent)	1,151	2,066	2,075
Silicon (max. Cu, 1 percent)	2,885	10,618	15.700
Silicon (Cu, 1 to 2.5 percent)	14,600	14,635	7,268

Aluminum-alloy castings (except by primary producers)	1,134	2,555	4,444
Aluminum in chemicals	1,616	846	559

[1] Gross weight of alloys, including copper, silicon, and other added elements; total secondary ingot contained 8,792 tons of primary aluminum in 1944, 6,816 tons in 1945, and 1,025 tons in 1946.
[2] Production for 1945 and 1946 included under other classifications.
[3] Includes 9,089 tons produced on toll.
[4] Combined with primary aluminum for the production of wrought products and castings.
[5] Does not include production measured as ingot for graining, powder, atomizing, or chemical purposes.

Output of remelt aluminum ingot increased from 198,426 tons in 1945 to 207,574 tons in 1946, a gain of approximately 5 percent. Monthly production exhibited a rising trend in the latter half of the

year, reaching a peak of 21,265 tons in October. Production of aluminum-silicon (maximum copper, 1 percent) alloys, No. 12, and aluminum-copper-silicon (each over 2.5 percent) alloys increased appreciably in 1946, but output of deoxidizing ingot declined from 44,175 tons in 1945 to 31,011 in 1946.

Consumption of aluminum-base scrap totaled 344,472 tons in 1946 or 20,796 tons more than in 1945, but the recovery of metal from this kind of scrap was 20,345 tons less. The explanation of this apparent anomaly lies in the fact that a much larger proportion of the scrap consumed in 1946 was aircraft scrap, from which the recovery is comparatively low. The 1946 consumption of the two items most used in 1945—alloy sheet and borings and turnings—was 88,054 and 34,763 tons, respectively, compared with 133,920 and 104,118 tons in 1945. Total consumption of plant scrap, which includes the higher-priced types, was almost a third more in 1945 than in 1946. New scrap consumption would have been greater in 1946 if more had been available from foundries and fabricators—the generators of such scrap. Activities at these plants were hindered during much of the year by strikes and reconversion problems. Plants reporting on the monthly aluminum scrap survey in 1946 comprised 68 aluminum-ingot makers, including 7 naval air stations.

Consumption of purchased aluminum scrap in the United States in 1946, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Aluminum-rolling mills		Foundries and other manufacturers		
	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
Pure clippings, wire, and foil	10,000	272	11,433	-------	776	12	22,493
Castings and forgings	31,320	21,038	3,964	-------	552	1,864	58,738
Alloy sheet	50,257	4,223	33,344	-------	158	72	88,054
Scrap sheet and sheet utensil	-------	3,188	-------	-------	67	256	3,511
Borings and turnings	33,323	-------	1,163	-------	277	-------	34,763
Die castings	-------	-------	-------	-------	765	8	773
Aircraft scrap	-------	55,284	-------	49,611	-------	50	104,945
Miscellaneous aluminum and dross	20,706	7,958	1,873	-------	658	-------	31,195
	145,606	91,963	51,777	49,611	3,253	2,262	344,472

Considerable progress was made during the year in developing improved methods of segregating aluminum scrap by alloy and in technique for treating scrap. Much was learned about the effect of furnace atmosphere on quality of metals; the elimination of oxide inclusions, absorbed gases, and undesirable elements; and the effect of minor elements on the properties of aluminum alloys. St. John [2] stated that many of the elements now severely limited by specifications can be present in reasonable amounts without in any way causing deterioration of the properties of the alloy. It was shown that zinc can be present in amounts far beyond the limitation in some of the specifications. It was also determined that, in some of

[2] St. John, A. E., The Smelting and Refining of Commercial Aluminum Ingot: Daily Metal Reporter, vol. 46, No. 86, May 4, 1946, part II, pp. 1, 13–18.

the alloys, iron and manganese are beneficial to mechanical properties. Birdsall [3] claims that, at Reynolds' Louisville Plant No. 5, the metal reclaimed from aircraft scrap was of such purity that no sweetening was required to make it suitable for use in wrought or cast products. Features of procedure at this plant were use of chlorine gas exclusively and continuously for fluxing, charging of aircraft scrap in large pieces without cutting or segregation, and recovery of over 95 percent of the aluminum content of the scrap.

Stocks of aluminum scrap in the hands of consumers at the end of 1946 totaled 52,386 tons, compared with 37,589 tons at the end of the preceding year. In addition, there were, on December 31, 1946, 3,113 tons of unprepared aircraft scrap at naval air stations and 6,610 tons of aluminum scrap, of which 4,200 tons were aircraft scrap, at the nine storage depots of the War Assets Administration. At five Army airfields there were also large stocks of aircraft scrap, which had been sold to private companies during the year. Some of these companies began dealer transactions which were reported on the dealer survey.

Consumers' stocks of purchased aluminum-base scrap in the United States at end of the year, 1945–46, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1945	Dec. 31, 1946
Castings and forgings	9,904	8,011
Sheet, turnings, clippings, etc.	15,006	25,145
Aircraft scrap	10,551	11,662
Miscellaneous aluminum and dross	2,128	7,568
	37,589	52,386

All of the aluminum-scrap figures derived from the dealer survey for 1946 are a little below those for 1945. Dealers' receipts, from generators and other sources, shipments to consumers, and stocks at the end of the year were 149,541, 151,874, and 53,252 tons, respectively. The corresponding figures for 1945 were 154,726, 155,043, and 55,495 tons.

Secondary aluminum ingot and scrap were not under price control during 1946, having been released from that limitation November 20, 1945. As a result of the strong demand in a free market, the dealers' buying price for cast-aluminum scrap in New York rose gradually from a monthly average of 3.75 cents in January to 7.75 cents in December, the average for the year being 5.24 cents. The average price of new aluminum clippings was 7.94 cents in 1946, an increase of 2.11 cents over the 1945 average of 5.83 cents. The prices for secondary ingot also increased, that for high-grade secondary ingot rising from 13.75 cents in January to 16.46 cents (higher than the quotation for primary aluminum) in December, the average for the year being 14.59 cents. The price for this grade of ingot during most of 1945 was 12.50 cents, the ceiling price.

The price limits set by Surplus Property Administration Regulation 12, below which aluminum scrap in contractor inventories could not

[3] Birdsall, G. W., Reclamation of Aircraft Aluminum: Metal Progress, vol. 50, No. 6, December 1946, pp. 1232-1238.

be sold but would be stored in Government depots, remained in effect with one change; the minimum price for class D scrap—solids mixed with foreign materials—was reduced from 4 cents to 2.5 cents a pound on March 28 by the War Assets Administration. On April 2 the WAA issued Revised Order 1 to SPA Regulation 12, which provided that all agencies file a report to the WAA on all sales of 250,000 pounds or more of aluminum in any form. A report also had to be made of any retention of such a quantity, or any sale of such quantity by a contractor out of contractor inventory.

SECONDARY MAGNESIUM

During 1946 only 5,117 short tons of secondary magnesium (including alloying ingredients) were recovered from scrap, representing a decline of 45 percent from the 9,247 tons reclaimed in 1945. The value of this secondary magnesium was $2,097,970 compared with $3,791,270 for that recovered in 1945, value being computed at 20.50 cents a pound in both years.

Recovery of magnesium from old scrap constituted 24 percent of the total, compared with only 9 percent in 1945. Although the tonnage reclaimed from old magnesium-base scrap was a little less than in the preceding year, recovery from old aluminum-base scrap increased considerably, and that from new magnesium-base scrap experienced a sharp decline. In this respect, consumption of magnesium scrap reached normal distribution during the year, as the quantity of turnings and borings used amounted to only 24 percent of the total compared with 65 percent in 1945 and 89 percent in 1944. These figures graphically illustrate the difference in the generation of scrap in wartime and peacetime production.

As the market for secondary magnesium ingot was practically nonexistent and the supply of scrap was small during the year, secondary smelters produced only 2,063 tons of secondary magnesium-alloy ingot, compared with 7,835 tons in 1945 and 14,419 tons in 1944. However, these smelters reported that production of the 2,063 tons of secondary ingot required blending only 3 tons of primary magnesium and 1 ton of alloying ingredients, in addition to the purchased scrap used, compared with 414 tons of primary magnesium and 168 tons of alloying ingredients used in 1945.

Secondary magnesium recovered in the United States, 1945–46, in short tons

Secondary magnesium recovered			Recoverable magnesium-alloy content of scrap		
Form of recovery	1945	1946	Kind of scrap processed	1945	1946
Magnesium-alloy ingot[1] (gross weight)	7,359	2,506	New scrap: Magnesium-base	8,422	3,907
Magnesium-alloy castings (gross weight)	496	1,145		8,422	3,907
Magnesium-alloy shapes	864	136	Old scrap:		
In aluminum alloys	274	1,218	Magnesium-base	697	632
In zinc alloys	3	4	Aluminum-base	128	578
In other alloys	10	2		825	1,210
Chemical and incendiary uses	241	106			
	9,247	5,117		9,247	5,117

[1] Figures include secondary magnesium incorporated in primary magnesium ingot.

Recovery of secondary magnesium in magnesium-alloy castings was greatly increased, totaling 1,145 short tons in 1946 compared with 496 tons in 1945. In view of the decline in secondary alloy ingot production, the increased consumption of purchased scrap in foundries is significant, as many magnesium foundries have reported in the past that they were unable to use their own home scrap, such as gates and risers, because of contamination of foundry sand by magnesium oxide and the resulting surface defects on castings.

In addition to the tonnage of magnesium recovered from the melting of aluminum-base scrap (principally wrecked aircraft), an increased quantity of magnesium was recovered in aluminum alloys because of the use of magnesium scrap directly for this purpose. A large part of this tonnage was reported by the primary aluminum producers, who find magnesium scrap a suitable means for introducing magnesium into aluminum alloys. Recovery of secondary magnesium in chemical and incendiary uses declined from 241 tons in 1945 to 106 in 1946. Chemical applications included use in fluxing compounds, in the Grignard reaction, and in the production of magnesium nitrate and chloride; and the incendiary uses, which accounted for large tonnages of borings during the war, were in flares and incendiary bombs. Owing to the decreased generation of magnesium turnings and borings, storage of this material did not present the same problem as in the past, when large quantities were disposed of by burning to avoid the fire hazard incident to storage.

Stocks and consumption of magnesium scrap in the United States in 1946, gross weight, in short tons

Scrap item	On hand—		Consumption during 1946
	Dec. 31, 1945	Dec. 31, 1946	
Cast scrap	1,424	3,350	2,601
Solid wrought scrap	625	1,598	1,261
Borings, grindings, drosses, etc.	227	292	1,233
	2,276	5,240	5,095

Dealer buying prices for magnesium scrap were not normally listed in the trade journals in 1946, probably because the greater part of the available tonnage was derived from contract terminations and Government sources. A reliable authority, however, quoted the average buying price at 7 cents a pound for segregated solid scrap and 4.50 to 5 cents a pound for unsegregated solids. The price of class A remelt magnesium ingot was quoted at 15.75 to 16.25 cents a pound (carload lots) until October 23, after which it rose slowly—the quotation being 18 to 18.50 cents at the end of the year.

The magnesium industry made considerable progress during the year in the application of this versatile light metal to production of consumer goods. The weight factor is an important consideration governing its future use in the transportation industry and in many uses where light weight saves labor and transportation costs, such as household appliances, office equipment, furniture, toys, farm equipment, etc. The aircraft industry will, of course, continue to be a

most important consumer. As the normal life of such goods is considerably longer than that of most articles made of magnesium in recent years, it seems certain that the quantity of magnesium scrap returning to smelters and foundries for reuse in the next few years will consist principally of production scrap, and some time will elapse before old magnesium scrap becomes an appreciable factor in nonferrous dealer transactions.

SECONDARY COPPER AND BRASS

The recovery of secondary copper from scrap totaled 803,546 short tons valued at $231,421,248 in 1946, a decline of 20 percent from the 1,006,516 tons valued at $237,537,776 recovered in 1945. Value was computed at 11.8 cents a pound in 1945 and 14.4 cents a pound in 1946, the average prices of deliveries of refined copper at New York in the 2 years, exclusive of bonus payments under the Premium Price Plan.

Recovery of copper from old scrap fell from 497,095 tons (corrected figure) in 1945 to 406,453 tons in 1946. However, recovery from old scrap amounted to approximately 51 percent of the total in 1946 compared with 49 percent in the preceding year. Recovery of copper from new scrap declined from 509,421 tons (corrected figure) in 1945 to 397,093 tons in 1946, as the source of this material was affected by such factors as labor trouble in the brass mills and loss of production caused by readjustment of industry to peacetime manufacturing procedures. Although recovery from new scrap represents, to a certain extent, the recycling of metal already consigned to the pool of metal in use, reclamation of metal from old scrap is regarded as a definite addition to the pool and may be combined with the data for net imports and domestic mine production in any given year to compute the total addition to the Nation's supply of that particular metal.

Secondary copper recovered in the United States, 1945-46, in short tons

Secondary copper recovered			Recoverable copper content of scrap		
Form of recovery	1945	1946	Kind of scrap processed	1945	1946
As unalloyed copper:			New scrap:		
At primary plants	96,662	105,572	Copper-base	[1] 495,407	388,291
At other plants	16,194	31,337	Aluminum-base	13,211	8,123
			Nickel-base	803	678
	112,856	136,909	Zinc-base	----------	1

				[1] 497,095	406,453
				1,006,516	803,546

[1] Corrected figure.

During 1946, 111,613 tons of refined copper (electrolytic grade) were produced from scrap, a gain of more than 13 percent over the 98,338 tons produced from this source in 1945. In view of the strong

demand for all types of copper and copper-base scrap during the year, this increase may be interpreted to mean that the lower-grade items of copper scrap, which are normally used by the refineries, were being marketed freely, whereas the more desirable grades, which are usually consumed by other industries, were being withheld from the market in anticipation of possible price increases. Total recovery of unalloyed copper from scrap increased 21 percent—from 112,856 tons in 1945 to 136,909 in 1946.

The commercial production of brass and bronze ingot declined for the second straight year, totaling 346,241 short tons (gross weight) in 1946 compared with 378,454 tons in 1945 and 518,261 in 1944. The 346,241 tons of ingot produced contained 282,981 tons of copper, of which 17,029 tons were refined copper and the rest was recovered directly from scrap. Shipments of ingot during the year totaled 353,457 tons, as inventories at producers' plants declined from 23,259 tons (revised figure) at the beginning of the year to 16,043 tons on December 31. Reports were tabulated covering 72 plants classified as brass and bronze-ingot producers in 1946. From their scrap melts 4 brass-ingot makers produced 4,241 tons of brass-mill billets and cakes, which were later rolled into finished products at brass mills.

Analysis and production of secondary copper and copper-alloy products in the United States, 1945–46

Item produced from scrap	Approximate analysis (percent)						Gross weight produced (short tons)	
	Cu	Sn	Pb	Zn	Ni	Al	1945	1946

Brass and bronze castings							[2] 142,532	[2] 129,102
Brass powder							659	803
Copper in chemical products (content)							18,666	19,192

[1] Gross weight of secondary brass and bronze in commercial shapes. Includes 398,822 tons of copper, 937 tons of nickel, 4,938 tons of lead, 837 tons of tin, 170,099 tons of zinc, and 482 tons of aluminum in 1945; and 266,859 tons of copper, 1,749 tons of nickel, 3,786 tons of lead, 381 tons of tin, 116,743 tons of zinc, and 69 tons of aluminum in 1946.

[2] Gross weight of secondary metal in brass and bronze castings. Includes 112,768 tons of copper, 158 tons of nickel, 12,917 tons of lead, 8,138 tons of tin, 8,517 tons of zinc, and 34 tons of aluminum in 1945; and 99,959 tons of copper, 112 tons of nickel, 15,415 tons of lead, 6,459 tons of tin, 7,022 tons of zinc, and 135 tons of aluminum in 1946.

An itemization of the tonnage of each type of billets made cannot be published, because individual company operations would be revealed.

Production by brass mills from copper and copper-base scrap declined 30 percent from the 1945 level. The tonnage recovered from scrap in brass and bronze sheet, rod, and tubing dropped from 576,115 tons in 1945 to 389,587 in 1946, although their recovery in the same products made of unalloyed copper increased from 8,037 tons in 1945 to 17,171 in the following year. Brass mills were not required to report their production to the Civilian Production Administration during the first 3 months of the year, when strikes in the copper refineries and brass mills were at a peak. Although exact analysis of the production statistics is difficult for that reason, it is evident that that portion of the total production represented by recovery of metal from scrap was slightly lower in 1946 than during the preceding year. However, reports filed with the Bureau of Mines indicated that, during that part of the first quarter when operations were possible, brass mills operated on a larger percentage of scrap than during the succeeding 9 months because of the shortage of refined copper. Toward the end of the year production by these mills was on a firm basis, that for October being the highest of any peacetime month in the history of the industry.

Recovery of secondary brass and bronze in castings by brass and bronze foundries declined more than 9 percent, from 142,532 tons in 1945 to 129,102 tons in 1946. As in the past, a considerable portion of this tonnage consisted of bronze railroad bearings remelted in railroad foundries and in plants of bearing companies on a toll basis.

Consumption of purchased copper scrap in the United States in 1946, gross weight, in short tons

	223,855	385,511	330,893	70,527	31,333	127,021	1,169,140

The total consumption of purchased copper and brass scrap in 1946 was 1,169,140 short tons, gross weight, a decline of approximately 21 percent from the 1,470,737 tons used in 1945. Brass-ingot makers and refiners decreased their consumption 15 percent to 609,366 tons,

and the use of scrap by brass mills declined 33 percent to 401,420 tons. Both decreases were due mainly to the extreme shortage of the more desirable grades of scrap. The quantity of cartridge cases reported consumed during the year was 63,941 tons. However, an additional tonnage of new deprimed cartridge cases amounting to about half this weight was absorbed by the industry during the year and was probably reported under other scrap classifications.

During all that portion of the year before November 10 the Office of Price Administration strove desperately to maintain ceiling prices unchanged on such items as primary copper, copper and copper-base scrap, brass- and wire-mill products, and brass ingot despite unremitting pressure from industry. Lack of sympathy with OPA policy on the part of industry fostered a shortage of available scrap, since dealers and other holders of the material were loath to sell with possible price increases in view. The artificial conditions created are evidenced by the fact that shipments of copper-base scrap to consumers by scrap-metal dealers rose rapidly after the removal of price controls and in January 1947 reached a record of 68,094 tons, about 35 percent higher than any monthly shipments reported in the previous 5-year period. During the summer of 1946, the shortage of copper was so acute that instances were reported wherein advantage was taken of loopholes in the price regulations to procure refined copper from scrap at whatever price was necessary.

A number of efforts were made by CPA and WAA to market Government-owned copper and brass scrap in such a way as to alleviate civilian shortages and still to fulfill the provisions of the stock-pile act. Order 3 to SPA Regulation 17, effective March 11, authorized sales of Army and Navy copper scrap direct to the trade instead of diverting the surplus to the strategic stock pile, but restricted inventories on all types of copper products to a 45-day supply. It later developed that the quantity of material available fell considerably short of expectations, and the demand for the material was greater than the supply. Consequently, on June 4, Order 3 was revoked upon request of CPA, and Direction 19 to Priorities Regulation 13 was issued by CPA to take its place. Direction 19 placed restrictions on sales of scrap and surplus brass- and wire-mill products, limiting sales of these materials by the WAA to persons who certified their needs to CPA. This automatically channeled copper and copper-base alloy scrap to smelters and reprocessors, except where persons buying for resale certified that they would promptly reoffer the material acquired. On September 24, the CPA issued Direction 22 to PR 13, which provided for the allocation of scrap from Army, Navy, and Maritime Commission sources by CPA, instead of having the material declared surplus to the WAA and distributed by that agency under CPA direction. This direction covered all lots of copper or copper-base alloy scrap that exceeded 10,000 pounds in weight. Direction 22 was amended on December 3 to cover only such items as cartridge-brass ingot and slab, fired-cartridge cases, and gilding-metal mill forms or remelt ingot. At the same time, CPA revoked Direction 19 to PR 13. An additional order was Direction 11 to PR 32, issued by CPA on October 29, which placed certain restrictions on receipts of copper and copper-base-alloy scrap by dealers and brokers.

Ceiling prices on brass and bronze ingot, which were controlled under Maximum Price Regulation 202, were advanced in amounts up to 2.50 cents a pound by Amendment 5 to that regulation on June 3 and an additional 0.25 cent a pound by Amendment 6 on August 27. After removal of price controls on November 10, the brass-ingot industry established prices on the principal grades of ingot, which held until the end of the year, as follows: 85–5–5–5, 20.50 cents a pound; 80–10–10, 23.50 cents; yellow brass, 16.25 cents; and 88–10–2, 24.75 cents. Maximum Price Regulation 20, which controlled the prices of all copper and copper-base scrap other than brass-mill scrap, was also amended on June 3, allowing increases up to 1.75 cents a pound. A further amendment on July 26 provided for variations in the copper content of soft red-brass borings. June 3 was likewise marked by the issuance of advanced prices on brass-mill scrap, by Amendment 10 to Revised Price Schedule 12. On September 20, the OPA announced that no increase in the ceiling prices of copper scrap, copper-base alloy scrap, or brass-mill scrap was planned in the foreseeable future, hoping to aid the flow of these materials toward consumers' plants. After November 10 prices jumped but were finally stabilized by the establishment of buying prices by ingot makers, brass mills, and refiners.

Consumers' stocks of purchased copper-base scrap in the United States at end of year, 1945–46, gross weight in short tons

Scrap item	On hand—	
	Dec. 31, 1945 [1]	Dec. 31, 1946
Unalloyed copper	16,145	23,034
Copper-base alloy	57,104	62,622
Low-grade scrap and residues	37,913	38,813
	111,162	124,469

[1] Revised figures.

Inventories of copper and brass scrap at consumers' plants increased 12 percent, from 111,162 short tons (revised figure) at the beginning of the year to 124,469 tons on December 31, 1946.

Shipments of copper and brass scrap by dealers to consumers during the year totaled 506,494 tons, an increase of 3 percent over the 490,789 tons shipped during the preceding year. There was a noticeable decline in shipments during May, when an early increase in price ceilings was expected, which materialized on June 3. After that date a flurry of sales during June caused shipments in that month to reach the year's highest point. Shipments were normal from July until December, when the removal of price controls caused dealers to begin reducing inventories again. Stocks held by dealers at the end of the year totaled 63,053 tons, compared with 70,604 tons on hand at the end of 1945 and 79,149 tons (the largest inventory on record) on May 31, 1946.

Dealers' buying prices for No. 1 copper scrap at New York averaged 10.69 cents a pound. The year opened with the price for this material at 9.12 cents, with slight advances in May, June, and July and in-

creases in November and December carrying the price to 15.75 cents at the end of the year. The average price for No. 1 composition scrap for 1946 was 10.11 cents a pound or 1.28 cents higher than the average for 1945.

Brass and copper scrap imported into and exported from the United States, 1945–46, in short tons

	1945	1946
Imports for consumption:		
Brass scrap	7,727	24,008
Scrap copper	1,348	1,030
Exports:		
Brass scrap	421	1,184
Scrap copper	133	909

SECONDARY NICKEL

The recovery of secondary nickel from nonferrous scrap in 1946 totaled 8,248 short tons, valued at $5,801,643, an increase of 27 percent over the 6,483 tons valued at $4,538,100 in 1945. The total value was calculated at 35.17 cents a pound in 1946 and 35.0 cents in 1945, the average spot-delivery price for electrolytic nickel in the 2 years. The increase in the recovery of secondary nickel was due to two factors—accelerated use of nickel-silver scrap (principally by brass mills) and a sharp increase in the quantity of metallic scrap and residues used in production of nickel chemicals.

Secondary nickel (nonferrous) recovered in the United States, 1945–46, in short tons

Secondary nickel recovered			Recoverable nickel content of scrap		
Form of recovery	1945	1946	Kind of scrap processed	1945	1946
As metal	31	299	New scrap:		
In nickel-base alloys	672	906	Nickel-base	2,203	3,190
In copper-base alloys	2,120	3,039	Copper-base	821	1,727
In aluminum-base alloys	1,364	916	Aluminum-base	1,227	666
In lead-base alloys		12			
In cast iron and steel [1]	1,702	1,225		4,251	5,583
In chemical compounds	594	1,851			
	6,483	8,248	Old scrap:		
			Nickel-base	1,449	1,911
			Copper-base	643	496
			Aluminum-base	136	250
			Lead-base	4	8
				2,232	2,665
				6,483	8,248

[1] Includes only nonferrous nickel scrap added to cast iron and steel.

Secondary nickel recovered as metal increased from 31 tons in 1945 to 299 tons in 1946, and the production of secondary monel-metal pig, shot, and castings also showed a substantial gain—from 450 tons in 1945 to 1,191 tons in 1946. Output of copper-nickel pig and shot declined from 670 tons averaging 51 percent nickel in 1945 to 350 tons, also averaging 51 percent nickel, in 1946. The year 1945 had marked

a definite change in the use of nickel-base scrap, in that a larger quantity of nickel in monel scrap than ever before was used by steel plants and foundries for alloying purposes in cast iron and steel products, and comparately insignificant tonnages of nickel-base scrap were consumed in the production of nickel as metal or in nickel-base alloys. This swing partly reversed itself in 1946, as use of nickel scrap in nickel ingot and nickel-base alloys swung back to the 1944 level; but recovery of nickel in cast iron and steel in 1946, 1,225 tons, was still considerably higher than the level of the years before 1945. Consymption of all types of nickel scrap gained over that in the previous year, the most important factors being the increased use of nickel-silver scrap in brass mills and of low-grade scrap residues by chemical plants. Stocks of nickel scrap in scrap-metal-dealers' yards declined from 2,114 tons on December 31, 1945, to 1,744 tons on December 31, 1946. However, inventories of nickel scrap at consumers' plants rose from 4,350 tons to 5,191 in the same period.

Consumption of purchased nickel scrap in the United States in 1946, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Pure nickel	177	43	1,209	190	1,619
Monel metal	312	2,009	1,616	290	4,227
Nickel silver	704	2,593	9,639	854	13,790
Miscellaneous nickel alloys	24	----	----	1	25
Nickel residues	997	----	1,543	991	3,531
	2,214	4,645	14,007	2,326	23,192

Although general regulation of nickel was in effect during the year under the provisions of General Preference Order M–21, which controlled the production of alloy steel and alloying materials used in steel production, this control was only nominal, and the metal was actually free of restrictions.

Dealers' buying prices for nickel scrap in New York, which were quoted at 18.50 cents a pound for nickel sheet and clips and 12.50 cents a pound for monel clips throughout 1945, remained at that level until the latter part of November 1946, when they were raised to 20.50 cents for nickel sheet and clips and 15 cents for monel clips. These increases in nickel-scrap prices followed the price increase of 3.50 cents a pound for electrolytic nickel that had been announced by the International Nickel Co. in mid-November.

No imports of nickel-bearing scrap were reported in 1945 or 1946, but exports in 1946 totaled 5,597 short tons, a substantial increase over the 2,287 short tons exported in 1945.

Consumers' stocks of purchased nonferrous nickel scrap [1] in the United States at end of year, 1945–46, gross weight in short tons

Scrap item	On hand—	
	Dec. 31, 1945	Dec. 31, 1946
Unalloyed nickel	937	225
Nonferrous nickel alloys	2,375	3,055
Nickel residues	1,038	1,911
	4,350	5,191

[1] Includes nickel-silver scrap.

SECONDARY LEAD

Operations in the secondary lead industry during 1946 reached a level second only to the record year 1941, 392,787 short tons of lead valued at $65,988,216 being recovered from scrap, compared with 363,039 tons valued at $46,468,992 recovered in 1945. Values were computed at 8.4 cents a pound in 1946 and 6.4 cents a pound in 1945, the average selling prices of all grades of primary lead exclusive of premium price payments in the 2 years. Secondary recovery thus exceeded the production of refined primary lead from domestic ores and base bullion for the second year in succession and the domestic mine production of lead for the first time, and did much to alleviate the shortage caused by low domestic production and imports of primary lead.

Secondary lead recovered in the United States, 1945–46, in short tons

Secondary lead recovered			Recoverable lead content of scrap		
Form of recovery	1945	1946	Kind of scrap processed	1945	1946
As metal:			New scrap:		
At primary plants	18,525	8,013	Lead-base	44,793	40,625
At other plants	42,598	65,691	Copper-base	[2] 8,397	7,619
	61,123	73,704		[2] 53,190	48,244
In antimonial lead [1]	194,079	193,684	Old scrap:		
In other lead alloys	77,051	94,653	Battery-lead plates	186,241	215,657
In copper-base alloys	30,346	30,101	All other lead-base	107,351	111,787
In tin-base alloys	440	645	Copper-base	[2] 16,218	17,074
			Tin-base	39	25
	301,916	319,083		[2] 309,849	344,543
	363,039	392,787		363,039	392,787

[1] Includes 42,366 tons of lead recovered in antimonial lead from secondary sources at primary plants in 1945 and 33,850 tons in 1946.
[2] Corrected figure.

Production of soft lead from scrap increased from 70,951 tons in 1945 to 76,150 tons in 1946, but the secondary lead content of antimonial lead produced showed a slight decline, from 194,079 tons in 1945 to 193,684 tons in the succeeding year. Secondary lead recovered in solder, which had declined to only 19,964 tons in 1945, increased 25 percent to 24,918 tons in 1946, whereas the secondary lead content of type metals produced showed a substantial increase for the second successive year—36,725 tons in 1946 compared with 28,525 tons in 1945 and 23,870 tons in 1944. Although total production of the secondary lead industry increased only slightly during the year, data furnished by responding companies revealed that the primary metal content of secondary lead products declined approximately 16 percent, so production from scrap increased substantially.

Shipments [1] of secondary lead, tin, and lead- and tin-alloy products in the United States in 1946, gross weight, in short tons

	Gross weight of product [2]	Secondary metal content			
		Lead	Tin	Antimony	Copper
Refined pig lead	65,932	65,932			
Remelt lead	9,470	7,458			
Lead foil	748	314			
	76,150	73,704			
Refined pig tin	2,803		2,803		
Remelt tin	241		135		
Tin foil					
	3,044		2,938		
Lead and tin alloys:

	389,343	288,330	10,020	19,099	133
Composition foil	986	652	82	16	
Tin content of chemical products	404		404		

[1] Most of the figures herein represent shipments rather than production of the items involved. However, it has been necessary to record actual production figures in some instances where the information is secured from reports on that basis.

[2] Difference between gross weight of product and secondary metal content represents added primary metals or impurity content.

Of the total secondary lead recovered, 368,094 short tons were reclaimed from lead- and tin-base scrap; the remaining 24,693 tons were contained in secondary brass and bronze and reclaimed by remelting copper-base scrap. A total of 5,408 tons of lead in lead-base scrap was added to brass and bronze to bring the total recovery of secondary lead in this type of product to 30,101 tons.

Consumption of purchased lead scrap in the United States in 1946, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Soft lead		43,132	68	817	44,017
Hard lead		19,855	64	1,220	21,139
Cable lead		13,995		27	14,022
Battery-lead plates		323,594		20	323,614
Mixed common babbitt		6,349	164	12,639	19,152
Solder and tinny lead		6,688	1,847	119	8,654
Type metals		18,962		142	19,104
Dross and residues	59,129		2		59,131
	59,129	432,575	2,145	14,984	508,833

The gross weight of lead-base scrap consumed during 1946 amounted to 508,833 short tons, the highest tonnage ever reported used and an increase of 8 percent over the 472,495 tons consumed in 1945. The use of battery-lead plates rose 44,143 tons, of cable-lead scrap 4,681 tons, of type-metal scrap 3,916 tons, and of mixed common-babbitt scrap 924 tons; however, consumption of drosses and residues declined 13,231 tons, of soft-lead scrap 2,541 tons, of solder and tinny-lead scrap 1,235 tons, and of hard-lead scrap 319 tons. Consumption of all lead-base scrap items showed a slow decline during the first half of the year under the influence of price restrictions in a rising market, increased substantially during July—the month in which there were no price controls because of lack of legislation—rose again slightly in October and then reached a peak for the year in December after price controls were removed.

Labor difficulties in the first 6 months of the year, both in this country and in Mexico, cut severely into the primary lead supply and threw more responsibility on secondary producers. It was apparent as early as the first quarter of 1946 that secondary smelters were meeting the emergency as best they could, for recovery from scrap in each quarter exceeded comparable figures for 1944 and 1945. However, there was a constant drain on stock piles of lead held by the Office of Metals Reserve, these inventories being reduced from about 68,000 tons on January 1 to 37,000 tons at the end of the year. A shortage of solder caused the War Assets Administration to issue instructions in September offering for sale immediately its entire stock of this alloy, to bolster the industrial supply.

Percentage metals circulated in pig form among remelters and smelters in 1946 totaled 59,541 short tons, consisting of 33,297 tons of antimonial lead, 10,563 tons of soft lead, 8,131 tons of lead babbitt, 3,672 tons of solder, 3,401 tons of type metal, 397 tons of tin babbitt, 72 tons of cable lead, 5 tons of remelt tin, and 3 tons of pewter.

Reflecting the removal of price controls late in the year, consumers' inventories of lead scrap rose from 79,974 tons on December 31, 1945, to 94,929 tons at the end of 1946. This increase was evident in all types of lead scrap—unalloyed lead scrap, lead-base alloy scrap, and drosses and residues. During the same period, stocks of secondary pig, bar, and ingot metals at these plants decreased from 28,982 short tons to 27,782 tons.

Consumers' stocks of purchased lead-base scrap in the United States at end of year, 1945–46, gross weight in short tons

Scrap item	On hand—	
	Dec. 31, 1945	Dec. 31, 1946
Unalloyed lead	3,624	4,043
Lead-base alloy	49,162	57,679
Drosses and residues	27,188	33,207
	79,974	94,929

There was considerable agitation early in the year for the OPA to readjust the price of lead above the 6.50-cent level of the war years, but it was not until June 3 that the primary lead price was raised to 8.25 cents and secondary and scrap lead adjusted accordingly. At the same time, battery-lead scrap prices were raised to reflect higher processing costs. When OPA controls were allowed to lapse on June 30, primary lead was promptly raised to 9.50 cents a pound by leading producers, causing a fluctuating market in lead scrap. When price controls were reestablished on July 26, some adjustment was expected by the industry for lead bought on the free market at a higher price, but late in August OPA made it clear that no increase in the ceiling price was contemplated and that any hoarding would call for compliance action. The lifting of price controls on November 10 brought an immediate price increase to 10.50 cents a pound, and before the end of the year lead was selling for 12.55 cents a pound, the highest price on record. With each price rise for primary metal, scrap and secondary lead were adjusted accordingly.

Dealers' buying prices for heavy-lead scrap opened the year at 5.37 cents a pound, which had been the monthly average quotation at New York since August 1942. Price changes for this type of scrap were frequent during the year, the average for December being 10.52 cents a pound and the yearly average 6.83 cents. Dealers' buying prices for battery-lead plates averaged 3.846 cents a pound for the year, being quoted at 3 cents until the first of June, 3.75 cents during June, 4.75 cents during most of July, and 4 cents from the end of July until November 12, rising to 6.25 cents at the end of the year.

General Preference Order M–38, which had controlled purchases and use of lead since 1942, was revoked December 27, 1946. However, inventories remained subject to control of the CPA under the provisions of Priority Regulation 32, consumers being allowed only a 30-day supply. Direction 5 to PR 32, which controlled dealer inventories of lead- and tin-base scrap, was continued throughout 1946. Lead was considered one of the metals in critical supply position during the year, but CPA allocated only the metal imported by the Office of Metals Reserve—the domestic market being held under surveillance, but operating without Government supervision.

Scrap-metal dealers' inventories of lead-base scrap, which were 36,734 tons on December 31, 1945, reached a peak of 41,691 tons on May 31, but declined from that point to a low mark of 29,871 tons on

December 31, 1946. Shipments of lead scrap from dealers to consumers totaled 333,190 tons during 1946, compared with 304,825 tons in the preceding year. By the end of 1946, selling of lead and tin scrap by dealers was at a peak, shipments during January 1947 reaching the highest point in the 5-year history of the dealer survey. Imports of lead scrap from other countries declined from 2,844 tons (lead content) in 1945 to 2,481 tons (lead content) in 1946.

SECONDARY TIN

Recovery of secondary tin from scrap totaled 27,671 short tons valued at $30,205,663 in 1946, a decline of 21 percent from the 35,133 tons valued at $36,538,320 in 1945. The value was computed at an average price of 54.58 cents a pound in 1946 and at 52 cents a pound in 1945.

Detinning plants produced 2,772 short tons of pig tin from old tin cans and new tin-plate clippings and 7 tons from tin-base scrap, whereas 159 tons as metal were recovered at plants of secondary smelters—recovery of unalloyed tin from scrap totaling 2,938 tons or 21 percent less than in 1945. Recovery of tin in lead-base alloys gained slightly over the 1945 figure, but recovery in solder, in tin babbitt, in chemical compounds, and in brass and bronze all declined. Shipments of secondary tin and lead-tin alloys are presented in a table in the Lead section of this chapter.

Secondary tin recovered in the United States, 1945–46, in short tons

Secondary tin recovered			Recoverable tin content of scrap		
Form of recovery	1945	1946	Kind of scrap processed	1945	1946
As metal:			New scrap:		
At detinning plants	3,527	2,779	Tin plate	2,911	2,884
At other plants	190	159	Tin-base	1,772	1,580
			Lead-base	1,360	2,280
	3,717	2,938	Copper-base	5,113	3,375
				11,156	10,119
In solder	7,740	4,975			
In tin babbitt	1,592	981			
In chemical compounds	465	404	Old scrap:		
In lead-base alloys	3,990	4,146	Tin cans	1,070	260
In brass and bronze	17,629	14,227	Tin-base	4,392	3,101
			Lead-base	5,156	4,239
	31,416	24,733	Copper-base	13,359	9,952
	35,133	27,671		23,977	17,552
				35,133	27,671

The effect of the growing scarcity of tin in the United States was reflected in the consumption of the various items of tin-base scrap. Although consumption of block-tin pipe and tin residues increased slightly, the use of tin dross, pewter scrap, and high-tin babbitt experienced substantial declines. The program of the National Lead Co. for recovering tin from excess type metal yielded 24 tons of tin in 1946 compared with 11 tons in 1945. This tin was recovered as a tin-bearing chemical residue and later reduced to pig tin at one of the detinning plants.

Consumption of purchased tin scrap in the United States in 1946, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Block-tin pipe, scrap, and foil		761	1	84	846
Tin scruff and dross	2,519				2,519
No. 1 pewter		64			64
High-tin babbitt		2,615		27	2,642
Residues	151				151
	2,670	3,440	1	111	6,222

Use and quota controls on tin, as administered under General Preference Order M–43, were continued throughout the year and into 1947. Import purchase of tin by the Government exclusively was also continued. As the decline in receipts of tin-base scrap at secondary smelters' plants revealed a progressive scarcity of this metal, Order M–43 was again amended on July 5, placing secondary tin under allocation for the first time—secondary tin being defined as any tin-bearing scrap or residue containing less than 95 but more than 1.50 percent of tin. On October 25, another amendment to Order M–43 permitted an increase in the quantity of tin used in the production of babbitt and bearings. This action was taken, not because of any increase in the supply of tin but because the bearing industry itself was threatened.

Consumers' stocks of purchased tin-base scrap in the United States at end of year, 1945–46, gross weight in short tons

Scrap item	On hand–	
	Dec. 31, 1945	Dec. 31, 1946
Unalloyed tin	69	86
Tin-base alloys	191	299
Drosses and residues	762	1,414
	1,022	1,799

Dealers' buying prices on block-tin-pipe scrap at New York remained at the 1945 level of 45.50 cents a pound until July 18, when the price increased to 48.50 cents and remained at that figure until price control was lifted on November 10, after which it advanced to 61 cents. Scrap-metal dealers reported shipments of tin babbitt and pewter totaling 791 tons to consumers during the year, and shipments of block-tin pipe amounted to 155 tons. These figures indicate that most shipments of tin scrap went directly to consumers from industrial sources instead of passing through dealer channels. No imports of tin dross were reported during 1946, and imports in 1945 totaled only 57 long tons. However, exports of tin scrap and waste totaled 6,684 long tons in 1946, compared with 3,453 tons in 1945.

Detinning Plants—Eight detinning plants reported operations in 1945: Johnston & Jennings Co., Metal & Thermit Corp. (three plants),

Standard Metal Refining Co., Vulcan Detinning Co. (two plants) and the Southern Detinning Co. The last-named plant, at Birmingham, Ala., was a Government-owned plant which closed May 10, 1946. There was an insufficient tonnage of tin-plate clippings and old cans during 1946 to keep these plants operating at capacity because of a precipitate decline in the quantity of old tin cans made available for treatment.

Secondary tin recovered at detinning plants in the United States, 1945–46

	1945	1946
Scrap treated:		
Clean tin plate, long tons	257,545	249,813
Old tin-coated containers, do	114,311	28,434
	371,856	278,247
Tin recovered from new tin-plate clippings, short tons	2,911	2,884
Tin recovered from old tin-coated containers, do	1,070	260
	3,981	3,144
Tin recovered as metal, short tons	[1] 3,527	[1] 2,772
Tin recovered in compounds, do	454	372
	[2] 3,981	[2] 3,144
Weight of tin compounds produced, short tons	933	757
Average quantity of tin recovered per long ton of clean tinplate scrap used, pounds	22.61	23.0
Average quantity of tin recovered per long ton of old tin-coated containers used, pounds	18.73	18.33
Average delivered cost of clean tin-plate scrap, per long ton	$14.18	$14.37
Average delivered cost of old tin-coated containers, do	$14.09	$13.98

[1] Includes a small tonnage of pig tin of less than standard purity and, consequently, subject to further refining or alloying.

[2] Recovery from tin-plate clippings and old containers only. In addition, detinners recovered 11 tons of tin as metal from tin-bearing chemical residues in 1945 and 30 tons of tin as metal and 8 tons of tin in compounds from tin-base scrap and residues in 1946.

After the end of the war, tin-can collection systems in the larger cities were discarded because the cans were no longer prepared for collection by housewives. Conservation Order M–325, which directed the delivery of tin-plate scrap and old tin cans to detinning plants, continued in effect until November 26, 1946. The CPA revoked the order on that date, explaining its action with the statement that the quantity of such scrap had been negligible during recent months. The plant at Birmingham, which was designed to treat unprepared tin cans and should have been assured of a raw material supply, was closed, not for this reason but because of high operating costs.

Almost all of the loss in tin recovered was from old cans, as that reclaimed from new tin-plate clippings declined only 1 percent—from 2,911 short tons in 1945 to 2,884 tons in 1946. Tin recovered from old tin-coated containers fell 76 percent—from 1,070 tons in 1945 to only 260 tons in 1946. A total of 249,813 long tons of clean tin-plate clippings was made available to detinners for treatment in 1946, compared to 257,545 tons in the preceding year, but the quantity of old tin cans treated was only 28,434 tons in 1946 compared with 114,311 tons in the preceding year.

The average quantity of tin recovered per long ton of clean tin-plate scrap used increased from 22.61 pounds in 1945 to 23.09 pounds in 1946, indicating a slightly heavier average coating of tin on new clippings during the year. However, the average quantity of tin recov-

ered per long ton of old tin-coated containers used continued a steady decline, dropping to 18.33 pounds in 1946 compared with 18.73 pounds in 1945. Of the 3,144 short tons of tin recovered, 2,772 tons were reclaimed as metal in the form of pigs and anodes and 372 tons in the form of tin compounds. These figures are comparable to the 1945 recovery of 3,527 tons as metal and 454 tons in compounds. In addition, detinners treated tin-bearing chemical residues and tin-base scrap to recover 30 tons of tin as metal and 8 tons of tin in compounds in 1946.

Imports of tin-plate scrap increased from 18,072 long tons in 1945 to 24,530 tons in 1946. Exports of tin-plate scrap, circles, waste-waste, and clippings declined from 14,710 long tons in 1945 to 11,451 tons in 1946.

SECONDARY ANTIMONY

Secondary antimony recovered from lead- and tin-base scrap totaled 19,115 short tons valued at $6,617,613 in 1946, a gain of more than 11 percent over the 17,148 tons valued at $5,432,487 recovered in 1945. The value was computed at 17.31 cents a pound in 1946 and 15.84 cents a pound in 1945—the average selling price for ordinary American-brand antimony in the 2 years at New York.

Secondary antimony recovered in the United States, 1945–46, in short tons

Secondary antimony recovered			Recoverable antimony content of scrap		
Form of recovery	1945	1946	Kind of scrap processed	1945	1946
In antimonial lead	11,223	12,054	New scrap:		
In other lead alloys	5,712	6,850	Lead-base	2,097	3,010
In tin-base alloys	213	211	Tin-base		
	17,148	19,115		2,097	3,010
			Old scrap:		
			Lead-base	14,766	15,925
			Tin-base	285	180
				15,051	16,105
				17,148	19,115

Old battery plates were the principal source of antimony recovered from scrap in 1946, as in the past. Even without the removal of price controls during the year, treatment of battery plates would have been more extensive than in 1945, but unloading of this scrap item by non-ferrous scrap dealers during the price "holiday" in July, and after the removal of price controls November 10, resulted in consumption of an unprecedented quantity by smelters and refiners. The tonnage of battery plates consumed increased from 279,471 tons in 1945 to 323,614 tons in 1946. This resulted in the recovery of 10,193 tons of antimony from this source during the year, an increase of 16 percent over the 8,804 tons reclaimed in 1945. Although the quantity of antimony recovered in antimonial lead and in other lead-base alloys was greater than in 1945, recovery of antimony in tin-base alloys declined. Remelters, smelters, and refiners recovered 94 percent of the antimony

reclaimed in 1946, the other 6 percent being recovered by bearing manufacturers and other foundries. Data on consumption of purchased scrap from which antimony was recovered may be found in the tables on the consumption of lead-base and tin-base scrap in the sections of this chapter devoted to those metals. Products in which antimony was recovered are included in the lead- and tin-products table.

During 1946 a larger quantity of antimonial-lead scrap than usual was "softened" to produce soft lead, and the resulting high-antimony drosses were consumed in other products. As a result of this operation, a study of reports made to the Bureau of Mines and to CPA was conducted to establish the fact that all antimony recovered from scrap remained in the alloyed state, none being regained as unalloyed metal or in chemical compounds. With the supply situation in primary antimony acute, the high-antimony lead drosses produced in the softening operations found a ready sale for their antimony content. Most of this work was carried out at secondary lead smelters, however, since the quantity of soft lead recovered at primary plants during the year was considerably below that in 1945.

Because of the continuing shortage of antimony, the CPA retained all restrictions on uses and inventories of the metal and continued allocating it under the provisions of General Preference Order M–112 throughout the year. Antimony ore and metal, which had been removed from import control in November 1944, were again placed under control in October 1946. The purpose of this action was to stop importation of ore concentrates for reexport of metal, a practice that would seriously interfere with the Government purchase program. However, on November 30 all restrictions on the importation of antimony were removed.

Antimony in all forms remained under price control until November 10, 1946—the effective date of OPA Supplementary Order 193 (announced November 12) which ended control of prices on all metals and minerals as well as hundreds of other items. On November 12, immediately after the order became effective, the wartime antimony price of 14.50 cents a pound at Laredo, Tex., was advanced to 23.50 cents and in December rose to 28.25 cents. The record high for antimony of 45 cents a pound occurred in 1916, when there were enormous demands for the metal for use in shrapnel, but the top price in peacetime had been 25 cents in 1926.[4]

SECONDARY ZINC

Secondary zinc recovered in 1946 from purchased scrap and residues totaled 300,682 short tons, with a value of $53,521,396, calculated at 8.9 cents a pound, the average selling price for the year of all grades of refined zinc, not including bonuses paid by the Office of Metals Reserve under the Premium Price Plan. This total was 17 percent lower than in 1945, when 360,444 tons, with a value of $61,996,368 at 8.6 cents a pound, were recovered.

[1] Zinc content.
[2] Revised figure.

This decrease in recovery of zinc from scrap can be ascribed to decreased activity of brass mills, brass foundries, and fabricators due to unsettled conditions—the aftermath of war. Secondary zinc recovered in brass and bronze was 28 percent less than in 1945, but the total zinc recovered from scrap in products other than brass and bronze was 137,308 tons in 1946 compared with 133,688 tons in 1945. In that year, 61 percent of all secondary zinc recovered came from brass and bronze scrap, but in 1946 the percentage fell to 52. The secondary zinc plants were less affected by the conversion period than were generators or consumers of copper-base scrap, and in the final quarter of 1946 a number of records for monthly output of secondary zinc products and consumption of zinc scrap were broken. The 1946 decrease in zinc recovered from copper-base scrap was due to unusual conditions; but if history repeats itself, the recovery of zinc from brass scrap in peacetime will be less than during the war years. In wartime, military demands cause the brass and bronze industries to be the largest consumers of zinc; but normally, galvanizing occupies first place. Increased galvanizing activity means increased generation of zinc residues, such as galvanizers' dross, skimmings, and sal skimmings; in general, increased generation of such plant scrap means increased consumption of scrap and increased secondary recovery of zinc as metal and in chemicals.

Total production of secondary zinc products increased from 133,853 tons in 1945 to 138,195 tons in 1946; and only two items, redistilled slab and rolled zinc, registered decreases. The output of lithopone and lead-free zinc oxide, although greater than in 1945, failed to meet the demand for their use in paints and pigments. The increase in zinc dust can be attributed to its increased use in the manufacture of sodium hydrosulfite, which is employed in making paper. Although zinc dust enters into the chemical processes incidental to the making of sodium hydrosulfite, zinc is not an element of the

product but can be recovered from the residues of the process as a byproduct, in the form of lead-free zinc oxide or carbonate.

Production of secondary zinc and zinc-alloy products in the United States, 1945–46, gross weight in short tons

Products	1945	1946
Redistilled slab zinc	49,242	44,516
Zinc dust	23,892	26,002
Remelt spelter [1]	8,090	8,212
Remelt die-cast slab	4,727	7,829
Zinc-die and die-casting alloys	2,281	3,002
Galvanizing stock	701	876
Rolled zinc	3,054	2,729
Secondary zinc in chemical products	41,866	45,029

[1] Contains small tonnages of zinc anodes.

Zinc scrap was used by 24 distillers in 1946. Of these, 13 made only redistilled slab, 6 made only dust, and the other 5 made both slab and dust. The 22 who distilled scrap in 1945 carried on the same kind of operations in 1946. One plant distilled zinc scrap for the first time in 1946, and 1 distiller who had not used scrap in 1945 did use it in 1946. Only 3 of these distillers could be described as primary plants using horizontal retorts only; 2 had equipment for both primary and secondary smelting, and the other 19 were secondary plants. All zinc dust is made in secondary plants using vertical retorts. The horizontal retorts used in primary plants are too small and too closely spaced to be conveniently used with the steel boxes employed for condensing zinc dust; but some primary plants distill solid scrap, or flue dust mixed with ore, in horizontal retorts to make slab zinc.

Production of heavy zinc chemicals was carried on in 39 plants. In addition to the distillers and chemical plants, 84 secondary smelters, die-casters, galvanizers, and miscellaneous remelters were covered by the monthly zinc-scrap survey, and these 147 plants accounted for 95 percent of the total recovery of secondary zinc from zinc-base scrap by all plants, including those reporting only on an annual basis.

Consumption of purchased zinc scrap in the United States in 1946, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Clippings	4,534		4,771		9,305
Sheet and strip		4,484		234	4,718
Engraver's plates		1,760		127	1,887
Skimmings and ashes	44,176		31,798		75,974
Dross	49,879		668		50,547
Die castings		19,024	217	185	19,426
Rod and die scrap		7,441			7,441
Flue dust and residues	14,338		23,240		37,578
	112,927	32,709	60,694	546	206,876

Zinc-base-scrap consumption totaled 206,876 tons in 1946, 2 percent more than in 1945. Monthly consumption was greatest in the latter

part of the year, exceeding 19,000 tons in each of the last 3 months. The most notable increase in consumption for the year was the 72 percent rise in the treatment of die-cast scrap, paralleling the increased manufacture and use of zinc die castings.

Consumers' stocks of purchased zinc-base scrap in the United States at end of year, 1945–46, gross weight in short tons

Scrap item	On hand—	
	Dec. 31, 1945	Dec. 31, 1946
Metallic zinc scrap	10,903	9,740
Dross	6,605	6,138
Skimmings and residues	21,670	18,723
	39,178	34,601

The supply of zinc scrap was plentiful in 1946 compared to that of most other metals. This is usually true because most of the zinc scrap treated consists of byproduct residues such as skimmings, dross, and flue dust. Some of these are low-grade and in slack times accumulate because they are unmarketable, but when scrap is scarce they are more easily disposed of and take the place, to some extent, of the higher-grade items.

Scrap-metal dealers shipped 66,814 tons of zinc scrap to consumers in 1946 compared with 56,491 tons in 1945 and 42,771 tons in 1944. Dealers' stocks of zinc scrap at the end of the year amounted to 13,547 tons, or 3,817 tons more than at the end of 1945, although total stocks of nonferrous scrap declined from 174,677 tons on December 31, 1945, to 161,467 tons on December 31, 1946.

Zinc was not under allocation in 1946, and there were no restrictions on the use of zinc or zinc scrap; but ceiling prices were in effect all year, except between June 30 and July 26, when Maximum Price Regulation 3 was not in effect, and after November 10, the date on which President Truman ended price control. On March 16, the OPA issued an amendment to MPR 3 establishing a maximum price of 9.25 cents per pound for high-grade secondary slab zinc. No ceiling price for that grade had been provided when ceilings were originally established, because at that time no high-grade secondary zinc was being produced. Ceiling prices for other grades of secondary slab zinc remained the same as in 1945 (except during July) until October 14, when OPA raised maximum prices of primary and secondary slab zinc 1 cent a pound. Prices of all grades of scrap zinc were raised three-quarters of a cent a pound, and prices of zinc chemicals were raised according to their zinc content. With removal of price controls on November 10, the price of Prime Western slab zinc at St. Louis rose quickly to 10.50 cents a pound and remained there for the rest of the year.

Dealers' buying prices for new zinc clippings averaged 6.03 cents a pound in 1946, compared with a monthly average of 5.83 cents in 1945 and 5.81 cents in 1944. The average monthly price for old zinc scrap was 4.70 cents a pound. For most of 1944 and all of 1945, it had remained at 4.37 cents. Higher prices during the parts of the

year when prices were not limited accounts for the increase in the 1946 average price for both types of scrap.

Imports of old zinc scrap into the United States totaled 1,286 tons in 1946 compared with 3,008 tons (revised figure) in 1945. Imported drosses and residues totaled 2,851 tons in 1946, a decrease of 1,472 tons from the 4,323 tons received from abroad in 1945. Large quantities of fume from a primary smelter in Canada were imported by one company for the manufacture of zinc sulfate and lithopone; the zinc reclaimed from this material was not counted as secondary metal but as recovered from material other than scrap.

Slate

By ROBERT W. METCALF AND M. G. DOWNEY

GENERAL SUMMARY

PARALLELING the high level of private residential construction and a record private nonresidential building program, sales of slate in 1946 totaled 759,770 short tons valued at $8,844,106, 4 percent higher (in quantity) than the former peak of 727,700 tons in 1924. Compared with 1945, total sales in 1946 increased 38 percent in quantity and 56 percent in value. Slate sold as dimension stone was 38 percent greater in quantity and 73 percent higher in value in 1946 than in 1945.

Sales of roofing slate, the highest since 1942, increased 45 percent in quantity and more than doubled in value compared with 1945,

Granules and flour		482,230	3,687,173		663,520	5,424,604	+38	+47
Grand total domestic production		551,890	5,658,913		759,770	8,844,106	+38	+56

[1] Square feet approximate. Number of pieces: 1945, 353,400; 1946, 535,950.
[2] Includes slate used for walkways, stepping stones, and miscellaneous uses.

achieving a rapid recovery from the low point of 1944. The average value per square in 1946 was $13.51, or 40 percent higher than that reported in 1945 ($9.64). In Pennsylvania, roofing-slate sales jumped 49 percent in quantity and 99 percent in value. Total sales in Vermont and Maine in 1946 were 25 percent higher in quantity and 104 percent higher in value than those reported for New York, Vermont, and Maine in 1945. Sales in the Buckingham district, Virginia, also registered a large increase in the number of squares sold and a much greater gain in value of sales.

The stepped-up construction activity, particularly in nonresidential building, was reflected directly in the enhanced demand for slate sold as mill stock. Total sales of the products included in this classification increased 13 percent in quantity and 39 percent in value. Blackboards, structural and sanitary slate, and billiard-table tops showed very large gains in 1946, particularly billiard-table tops. Sales of electrical slate were 7 percent higher than in 1945. On the other hand, sales of grave vaults and covers declined more than 50 percent, and school slates decreased slightly. Sales of flagstones, stepping stones, and similar products rose to a new high of 4,322,220 square feet valued at $403,990, surpassing 1941's previous record in quantity by 44 percent and 1945's former record value by 60 percent.

Slate granules are used in making roofing materials that compete in the roofing-slate market, but most of the slate employed in the manufacture of granules and flour is unsuited for other slate products. Sales of granules and flour in 1946 were the highest on record. Figures for sales of granules of all kinds, including slate, are given in the chapter on Stone in this volume.

The preceding table presents the principal statistical data for the slate industry in 1945 and 1946.

SALES

Dimension Slate.—The term "dimension slate" is applied to blocks or slabs of specified sizes and shapes. It includes all slate products except granules and flour. The following table indicates sales of dimension slate for the latest 5-year period.

As roofing slate is used chiefly in residential building, a comparison of roofing-slate sales with the number of new dwelling units serves to highlight a rather interesting trend. (See fig. 1.) From 1929 through 1938 slate sales compared favorably with the normally expected requirements of the small building programs in those years, but since 1938 they have fallen far below the normal demands of new dwelling units erected. This situation probably was due to the preponderance of low-priced and temporary housing, for which slate is not a suitable material.

Mill-stock slate is used most extensively in nonresidential building, and sales have followed rather closely the trend of new nonresidential construction since 1925. The relationships are shown in figure 1.

Figure 2 presents graphically a statistical history of slate over a 32-year period, by uses. The chart illustrates the decline of activity in the slate industry, brought about by both wars and depressions.

Figure 3 presents the history of slate production by uses on a quantity basis. Note that "granules and flour"—large-tonnage products

with relatively low unit value—assume greater prominence in this chart than in figure 2.

Dimension slate sold by producers in the United States, 1942–46

Year	Roofing			Mill stock		Other [1]		Total

[1] Includes flagstones, walkways, stepping stones, and miscellaneous slate.

Granules and Flour.—Sales of granules, which are used chiefly in surfacing prepared roofing, were 37 percent higher in quantity and 47 percent higher in value in 1946 than in 1945. Slate flour, largely a byproduct of granule manufacture, is used as a filler in road-asphalt surface mixtures, paints, roofing mastic, linoleum, and other products. Sales of this material increased slightly more than did those of granules. Stimulated by the increased tempo of building construction in 1946, sales of granules and flour combined established a new record. Granules were produced in Vermont, Pennsylvania, New York, Georgia, and Maryland, with smaller quantities from Virginia, Arkansas, and California. Sales of granules and flour for the latest 5-year period are indicated in an accompanying table.

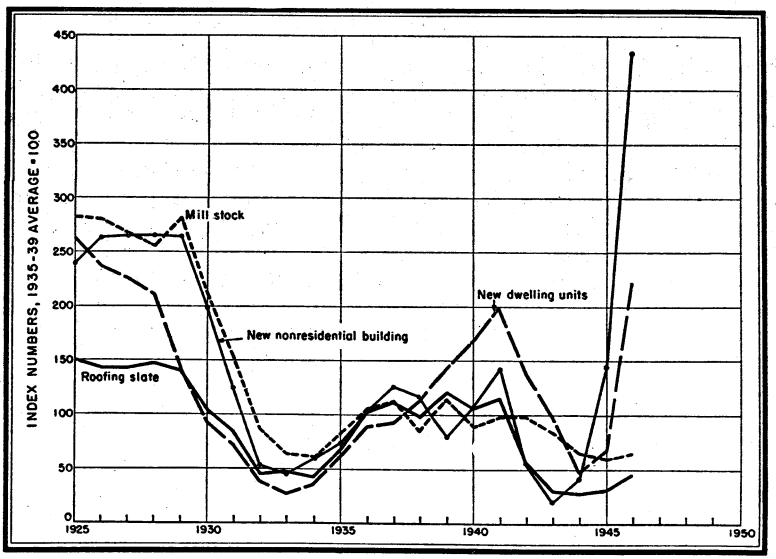

FIGURE 1.—Sales of roofing slate and mill stock compared with the number of new dwelling units and value of new nonresidential building, 1925–46. Data on new nonresidential building from U. S. Department of Commerce (joint estimates of U. S. Department of Commerce and U. S. Department of Labor, beginning 1944), and on new dwelling units from U. S. Department of Labor.

PRICES

The average value of roofing slate, f. o. b. quarry or mill, as reported to the Bureau of Mines, was 40 percent higher in 1946 than in 1945, rising to $13.51 a square compared with $9.64 in 1945. In Pennsylvania it increased 33 percent, in Virginia 61 percent, and in the New York-Vermont and Maine areas 63 percent.

After remaining at 35 cents a square foot for the 4 preceding years, the average value of mill stock in 1946 rose to 44 cents a square foot. The average value of electrical slate increased 16 cents, vaults and covers 12 cents, billiard-table tops 10 cents, structural and sanitary slate 7 cents, and blackboards and bulletin boards 4 cents a square foot compared with 1945. The average sales value of granules a short ton rose 64 cents and of slate flour 22 cents.

Price History.—Figure 4 shows the trend of annual average value of slate compared with wholesale prices of all building materials over a 32-year period. During recent years they have been in remarkably close accord.

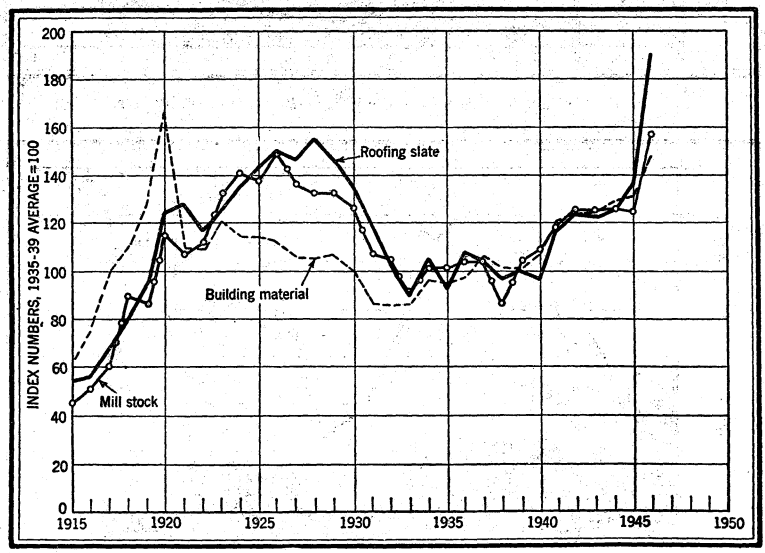

FIGURE 4.—Average value of slate compared with wholesale prices of building materials in general, 1915–46. Wholesale prices from U. S. Department of Labor.

REVIEW BY STATES AND DISTRICTS

The increased demand and market for slate has resulted in the reopening of a number of quarries closed during the war period as well as in new operations in several of the slate-producing districts. Three new producers of roofing and flagging were reported in Pennsylvania (the Lehigh area) and six new firms in New York, all of them producing flagging in Washington County. Another new firm reported output of roofing and flagging in Vermont. The accompanying table gives sales of slate in 1946, by States and uses.

Slate sold by producers in the United States in 1946, by States and uses

State	Operators	Roofing		Mill stock		Other uses (value) [1]	Total value
		Squares (100 square feet)	Value	Square feet	Value		
Arkansas	1					(2)	(2)
California	1					(2)	(2)
Georgia	1					(2)	(2)
Maryland	1					(2)	(2)
New York	13					$1,160,404	$1,160,404
Pennsylvania [3]	20	113,490	$1,401,427	2,010,650	$662,045	1,134,273	3,197,745
Vermont and Maine	19	20,010	348,161	361,170	370,539	2,171,093	2,889,793
Virginia	5	13,290	233,340			(2)	(2)
Undistributed						1,362,824	1,596,164
Total: 1946	61	146,790	1,982,928	2,371,820	1,032,584	5,828,594	8,844,106
1945	46	101,300	976,122	2,107,780	742,345	3,940,446	5,658,913

[1] Flagging and similar products, granules, and flour.
[2] Included under "Undistributed."
[3] For details of production in Pennsylvania, see following table.

Maine.—The principal product of the quarries near Monson is electrical slate. Minor quantities of roofing slate and vaults and covers were also produced in 1946. As in 1944 and 1945, only one company was active.

New York-Vermont.—In order that the output of an individual firm may not be revealed, Maine has been included with Vermont in the accompanying table. The total value of slate products sold in 1946 in Vermont and Maine was 51 percent greater than in 1945, although the figures are not quite comparable because roofing-slate production in New York is included with that of Vermont and Maine in 1945, and no output of this item from that State was reported in 1946. Roofing-slate production in Vermont showed large gains in 1946, and sales of the colored slates of this region may be expected to increase substantially when the proportion of moderate-to high-priced residential units rises. Production in New York, which consisted chiefly of granules and flour, was considerably higher in 1946 than in 1945.

An outstanding development in the New York-Vermont slate-producing area was the reported purchase by the Idea Development Corp., Buffalo, N. Y., of 18 quarries from the H. G. Williams Slate Co., in order to obtain material for the manufacture of slate brick and tile. The brick, which are to be used in building fronts, will be sawed from solid slate, and the tile will be manufactured from the varicolored quarry waste abundantly available in the district. Roofing and mill stock also will be produced. In addition to the New York and Vermont slate quarries acquired, the new owners also purchased two marble quarries and another slate quarry in Georgia, according to the trade press.[1]

Peach Bottom District.—In 1946 the slate quarries in the area near Cardiff, Md., and Delta, Pa., produced only granules, although high-quality roofing is a potential product.

Lehigh District.—The quarries of Lehigh and Northampton Counties, Pa., furnish all types of slate products and comprise the

[1] Pit and Quarry, vol. 39, No. 7, January 1947, p. 87.

most productive slate area in the United States. As separate figures may not be shown for York County, which includes part of the Peach Bottom district, it is included with Northampton County in the accompanying table giving detailed figures for Pennsylvania.

The total value of all slate products sold in the Lehigh district in 1946 increased 66 percent compared with 1945. Sales of roofing slate were 49 percent higher in quantity and nearly double in value. The total value of all mill products sold rose 43 percent compared with 1945. Sales of all products except vaults and covers and school slates showed very large increases. The percentage gains in 1946 over 1945 were as follows: Electrical slate, 32 percent in quantity and 31 percent in value; structural and sanitary, 39 percent in quantity and 56 percent in value; blackboards and bulletin boards, 25 percent in quantity and 41 percent in value; and billiard-table tops, 90 percent in quantity and 152 percent in value. Sales of school slates, however, declined 7 percent in quantity, although the sales realization increased 18 percent, and sales of grave vaults and covers dropped 54 percent in quantity and 33 percent in value. The value of miscellaneous products (granules and flour, flagstones, etc.) increased 49 percent. Most of the slate in this area is a blue-black "soft-vein," well adapted for structural products as well as for roofing. Detailed figures for production in Pennsylvania are given in the accompanying table.

Slate sold by producers in Pennsylvania in 1946, by counties and uses

County	Operators	Roofing slate		Mill stock					
				Electrical		Structural and sanitary		Vaults and covers	
		Squares (100 square feet)	Value	Square feet	Value	Square feet	Value	Square feet	Value

1945	649,470	170,359	151,360	51,859	307,570	8,033	763,248	1,929,741

[1] Small amount of slate for grave vaults and covers produced in Lehigh County included under Northampton and York Counties.
[2] York County produced granules and flour only.

Virginia.—The principal product of the Buckingham County quarries is roofing slate. The high quality of Virginia slate, which is dark gray or slightly greenish with a lustrous surface, has been main-

tained through many years of satisfactory service. The output in 1946 increased 43 percent in quantity and 130 percent in value compared with 1945. Substantial amounts of granules also are produced in Virginia; because of the small number of operators, however, sales may not be shown.

Other Districts.—Slate products, principally granules and flour, were produced in Montgomery County, Ark., near Glenwood; near Placerville, El Dorado County, Calif.; and in Bartow County, Ga., near Fair Mount.

FOREIGN TRADE [2]

Imports.—The value of slate imported for consumption has been very small during recent years, amounting to only $616 in 1946, nil in 1945 and 1943, $51 in 1944, $177 in 1942, and $1,648 in 1941.

Exports.—The following table gives the value of exports of slate products for the latest 5-year period as reported to the Bureau of Mines by shippers. In 1946 the total value of exports as shown rose 23 percent over 1945 to $508,462.

Slate exported from the United States, 1942–46, by uses [1]

[4] Includes slate for floors and walkways.

WORLD REVIEW

The American consulate general, Halifax, Nova Scotia, reports that the Acadia Slate Co., with an authorized capital of $300,000, has been organized to quarry a promising deposit near New Minas, Nova Scotia, and to manufacture slate shingles. The deposit is located near tidewater, and the operators expect to ship their products by water to Great Britain and New England points as well as to serve the eastern Canadian market.

The preparation and the desirable qualities of roofing slate in Great Britain were discussed by Robin.[3] Underground mining for slate in the Angers Basin, in eastern France, and manufacturing processes used in dressing and finishing slate in that country were described in detail.[4] The principal product is roofing slate, although a wide variety of other slate products is marketed, chiefly in France and England.

[2] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

GENERAL SUMMARY

OUTPUT of crushed and dimension stone combined (178,852,360 tons) was 17 percent greater in 1946 than in 1945 and 9 percent less than the record attained in 1942. The total value ($234,339,486) increased 31 percent. The tonnage of crushed and broken stone was 16 percent greater than in 1945, and the value 25 percent. Dimension stone increased 30 percent in quantity and 85 in value. In common with the general trend of prices, average unit values were higher for virtually all classes of stone products. However, it is worthy of note that prices of crushed stone have increased less than have those of many other construction materials.

The tables of this report give the quantities sold or used by producers and the values f. o. b. quarries and mills. Stone quarried and used by producers is considered as sold and is included in the statistics of sales. The data, however, do not include stone made into abrasives (such as grindstones) or that used in making lime and cement. These materials are reported in terms of finished products in the Abrasive Materials, Lime, and Cement chapters of this volume. The following tables show the total sales of stone by kinds, uses, and States.

Stone sold or used by producers in the United States, 1942–46, by kinds

[Quantities approximate]

Year	Granite		Basalt and related rocks (trap rock)		Marble		Limestone	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value

DIMENSION STONE

The term "dimension stone" is applied to blocks or slabs of natural stone, most of which are cut to definite shapes and sizes. These products are distinct from crushed and broken stone, which comprises irregular fragments or grains sized chiefly by mechanical screening or air separation. Crushed and broken stone is covered in a later section of this chapter.

Dimension-stone producers may be divided into three main groups upon the basis of plant operation. The first group includes operators who quarry stone and sell it as rough blocks or slabs; the second group quarries stone and also manufactures it into finished products; and the third buys sawed slabs or rough blocks of stone and manufactures them into finished products but does not operate quarries. The Bureau of Mines statistical canvass covers the first and second groups, but as the third group comprises manufacturers rather than quarrymen it is canvassed only by the Bureau of the Census. Bureau of Mines statistics are compiled from reports of quantities and values of original sales; hence they include some material sold as rough blocks and some sold as finished products.

Total sales of dimension stone in 1946 increased 30 percent in quantity and 84 percent in value compared with 1945. These over-all figures include slate, but detailed statistics of this branch of the industry are given in the separate chapter on Slate.

The accompanying table presents salient statistics for 1945 and 1946.

Dimension stone sold or used by producers in the United States, 1945–46, by kinds and uses

Kind and use	1945	1946	
		Total	Percent of change
Granite:			
Building stone:			
Rough construction—short tons	15,220	69,750	+358
Value	$56,314	$380,338	+575
Average per ton	$3.70	$5.45	+47
Cut stone, slabs, and mill blocks—cubic feet	151,250	538,810	+256
Value	$328,366	$2,127,124	+548
Average per cubic foot	$2.17	$3.95	+82
Rubble—short tons	108,880	130,820	+20
Value	$192,107	$263,054	+37
Monumental stone—cubic feet	2,600,760	3,194,740	+23
Value	$8,228,343	$13,433,094	+63
Average per cubic foot	$3.16	$4.20	+33
Paving blocks—number	212,570	578,750	+172
Value	$22,336	$50,346	+125
Curbing—cubic feet	119,270	314,540	+164
Value	$153,819	$458,312	+198
Total:			
Quantity—approximate short tons	361,650	535,230	+48
Value	$8,981,285	$16,712,268	+86
Basalt and related rocks (trap rock):			
Building stone:			
Rough construction—short tons	7,470	20,470	+174
Value	$19,702	$53,237	+170
Average per ton	$2.64	$2.60	−2
Rubble—short tons	196,050	29,460	−85
Value	$210,693	$17,232	−92
Total:			
Quantity—short tons	203,520	49,930	−75
Value	$230,395	$70,469	−69

Dimension stone sold or used by producers in the United States, 1945–46, by kinds and uses—Continued

Kind and use	1945	1946	
		Total	Percent of change

Value	$736,950	$2,327,078	+216
Miscellaneous stone: [1]			
Building stone—cubic feet	373,530	416,470	+11
Value	$676,285	$863,029	+28
Average per cubic foot	$1.81	$2.07	+14
Rubble—short tons	2,570	10,190	+296
Value	$7,381	$21,492	+191
Flagging—cubic feet	9,290	21,760	+134
Value	$5,899	$17,965	+205
Total:			
Quantity—approximate short tons	35,110	47,440	+35
Value	$689,565	$902,486	+31
Total dimension stone, excluding slate:			
Quantity—approximate short tons	1,058,690	1,374,580	+30
Value	$17,848,638	$32,972,220	+85
Slate as dimension stone [2]—approximate short tons	69,660	96,250	+38
Value	$1,971,740	$3,419,502	+73
Total dimension stone, including slate:			
Quantity—approximate short tons	1,128,350	1,470,830	+30
Value	$19,820,378	$36,391,722	+84

[1] Includes soapstone, mica schist, volcanic rocks, argillite, and other varieties that cannot be classified in the principal groups.

[2] Details of production, by uses, are given in the Slate chapter of this volume.

BUILDING STONE

The largest use of dimension stone is for building. During the war the output of dimension stone declined to a record low in 1944. However, demand improved in the following year, and in 1946 output increased 87 percent in quantity and 151 percent in value as compared with 1945. The following table gives the quantity and value of the major types of building stone used in 1946.

Building stone sold or used by producers in the United States in 1946, by kinds

Kind	Rough				Finished				Total	
	Construction		Architectural		Sawed		Cut			
	Cubic feet	Value	Cubic feet	Value	Cubic feet	Value	Cubic feet	Value	Cubic feet	Value
Granite	838,420	$380,338	143,840	$156,821	253,190	$654,453	141,780	$1,315,850	1,377,230	$2,507,462
Basalt	242,990	53,237							242,990	53,237
Marble			107,500	277,123	101,890	531,408	213,490	2,271,022	422,880	3,079,553
Limestone	700,640	147,420	2,596,340	1,843,624	1,487,950	1,607,584	593,760	2,065,215	5,378,690	5,663,843
Sandstone	313,530	134,644	102,910	66,864	855,600	1,217,677	56,090	181,564	1,328,130	1,600,749
Miscellaneous	416,470	863,029							416,470	863,029
	2,512,050	1,578,668	2,950,590	2,344,432	2,698,630	4,011,122	1,005,120	5,833,651	9,166,390	13,767,873

[1] Sawed stone corresponds to dressed stone for construction work (walls, foundations, bridges) and cut stone to architectural stone for high-class buildings.

GRANITE

Sales of granite in the form of blocks and slabs gained 48 percent in quantity and 86 percent in value in 1946 compared with 1945. The greatest gains were in the building-stone branch of the industry, rough construction stone sales gaining 358 percent and cut stone 256 percent in quantity compared with 1945. Monumental stone gained 23 percent in quantity and 63 percent in value. Paving block and curbing sales were more than two and one-half times as great as in 1945. Unit prices were higher in all but one of the important categories—that of rough architectural stone. The unit value of paving blocks—now a minor product of the industry— was also lower. Details by States are indicated in the following table.

Granite (dimension stone) sold or used by producers in the United States in 1946, by States and uses

State	Active plants	Building								Monumental				Paving blocks		Curbing		Total	
		Rough				Dressed		Rubble		Rough		Dressed							
		Construction		Architectural										Number	Value	Cubic feet	Value	Short tons (approximate)	Value
		Short tons	Value	Cubic feet	Value	Cubic feet	Value	Short tons	Value	Cubic feet	Value	Cubic feet	Value

[1] Included under "Undistributed."
[2] 838,420 cubic feet (approximate).

The following tables show sales of monumental granite in the Barre district, Vermont.

Monumental granite sold by quarrymen in the Barre district, Vermont, 1942–46 [1]

Year	Cubic feet	Value	Year	Cubic feet	Value
1942	612,220	$2,035,327	1945	713,050	$2,308,506
1943	635,350	2,267,777	1946	990,156	3,461,801
1944	733,500	2,553,681			

[1] Barre granite is sold also for construction and crushed stone.

Estimated output of monumental granite in the Barre district, Vermont, 1944–46 [1]

	1944	1945	1946
Total quarry output, rough stock—cubic feet	613,308	716,089	982,692
Shipped out of Barre district in rough—do	122,661	143,217	196,538
Manufactured in Barre district—do	490,647	572,872	786,154
Light stock consumed in district—do	383,319	477,393	524,103
Dark stock consumed in district—do	229,989	238,696	262,051
Number of cutters in district	1,200	1,318	1,500
Average daily wage	$10.00	$10.50	$11.00
Average number of days worked	244	250	250
Total pay roll for year	$2,928,000	$3,459,750	$4,125,000
Estimated overhead	1,464,000	1,729,875	2,062,500
Estimated value of light stock	1,494,934	1,862,833	2,718,781
Estimated value of dark stock	1,069,449	1,109,936	1,621,442
Estimated polishing cost	129,347	1,441,128	2,236,418
Estimated sawing cost	388,038	1,127,839	1,750,240
Total value of granite	7,473,768	10,731,361	14,514,381

[1] Through the kindness of the Granite Manufacturers' Association, Barre, figures covering the entire granite industry of the Barre district are given in this table to supplement figures of sales reported by quarrymen.

BASALT AND RELATED ROCKS (TRAP ROCK)

Owing to their dark color, basalt and related rocks are not used extensively as building stone. Sales in 1946 for rough construction were higher than in 1945, but sales of rubble—a crude form of building stone—declined greatly. Basalt and related rocks are used to some extent for memorials, but such stones are classed in trade as black granite and are therefore included with the figures for monumental granite.

Basalt and related rocks (trap rock) (dimension stone) sold or used by producers in the United States in 1946, by States and uses

[2] 242,990 cubic feet (approximate).

MARBLE

In 1946, sales of marble increased 29 percent in quantity and 50 percent in value compared with 1945. The marble industry is beginning to benefit from the rise in construction of large permanent public and private buildings. Although the emphasis of the building industry in 1946 was on residential construction, sales of building marble increased 59 percent in quantity and 96 percent in value. As a large potential demand for buildings that customarily are built partly of marble has accumulated during the past 15 years, further increases are expected.

Sales of monumental marble rose 10 percent in quantity and 28 percent in value in 1946.

LIMESTONE

Although equivalent to only about half the prewar tonnage and 27 percent of the 1929 value, the output of limestone, in the form of dimension stone, in 1946 was recovering steadily from the wartime lows. Less rough construction stone was reported than in 1945, but all other classes showed substantial gains in tonnage and value.

Production of cut stone was more than twice as great and the value per cubic foot was 19 percent higher than in 1945. Rubble gained 36 percent in tonnage. The total quantity of building limestone sold in 1946 was more than one and one-half times that of 1945, and the sales value was more than two and one-third times as great. See details in accompanying table.

The area in the United States most productive of dimension limestone is in the vicinity of Bedford and Bloomington, Ind. This area supplied 80 percent of the rough architectural and finished (sawed and cut) limestone sold in 1946.

The following tables show production in the Bedford-Bloomington, Ind., and Carthage, Mo., areas over a 5-year period.

Limestone sold by producers in the Indiana oolitic limestone district, 1942–46, by classes

SANDSTONE

The output of sandstone for use as dimension stone by the construction industry increased greatly in 1946. Sales of cut stone, slabs, and mill blocks gained 214 percent in quantity and 276 percent in value. Sandstone for rough construction, rubble, curbing, and flagging also gained in quantity and value. No production of paving stones was reported. The total quantity of sandstone sold in 1946 was two and one-half times that in 1945, and its value had more than tripled.

As in previous years, Ohio was the principal producer. Its quarries produced 61 percent of the total value of output in 1946. Other producing States, in order of sales value, were New York, Tennessee, Pennsylvania, and West Virginia.

[1] Included under "Undistributed."
[2] Includes 186,030 cubic feet of bluestone (approximately 15,720 tons) valued at $203,619 sold for construction, curbing, and flagging.
[3] Includes 87,690 cubic feet of bluestone (approximately 7,410 tons) valued at $70,898 sold for construction, curbing, and flagging.
[4] 313,530 cubic feet (approximate).

The accompanying table presents the sales of bluestone 1942–46. Bluestone is a type of sandstone that splits readily into thin, uniform sheets. It is particularly well adapted for flagging but is used also for building stone and curbing. During the past 20 years the industry has declined greatly because concrete has won much of its market. However in 1946 bluestone output had regained its prewar level.

Bluestone (dimension stone) sold or used in the United States, 1942–46 [1]

Year	Cubic feet	Value	Year	Cubic feet	Value
1942	183,470	$166,787	1945	109,330	$89,448
1943	99,840	92,059	1946	273,720	274,517
1944	156,160	108,732			

[1] New York and Pennsylvania are the only States that produce bluestone.

MISCELLANEOUS STONE

Types of stone other than those included in the major groups already discussed are covered in the following table. The principal varieties are mica schist, argillite, light-color volcanic rocks, soapstone, and greenstone. The quantity sold in 1946 increased 35 percent and the value 31 percent compared with 1945.

[2] Building stone (rough and dressed), approximately 416,470 cubic feet; flagging, approximately 21,760 cubic feet.

TRENDS IN USE OF DIMENSION STONE

A 31-year history of the output of dimension stone by kinds is shown in figure 1. Since the 1920's, depression, war, and competition of other construction materials have kept demand at low levels. The curve was rising in 1946 and prospects were brighter than they had been in many years.

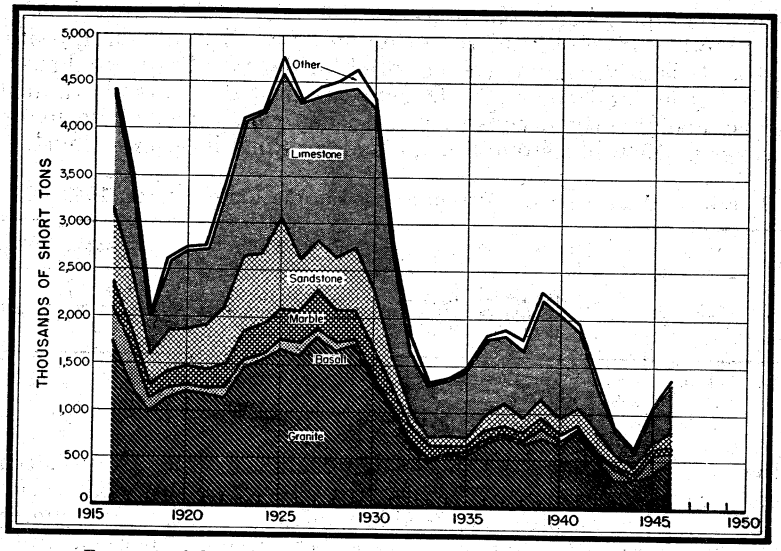

FIGURE 1.—Sales of dimension stone in the United States, by kinds, 1916–46.

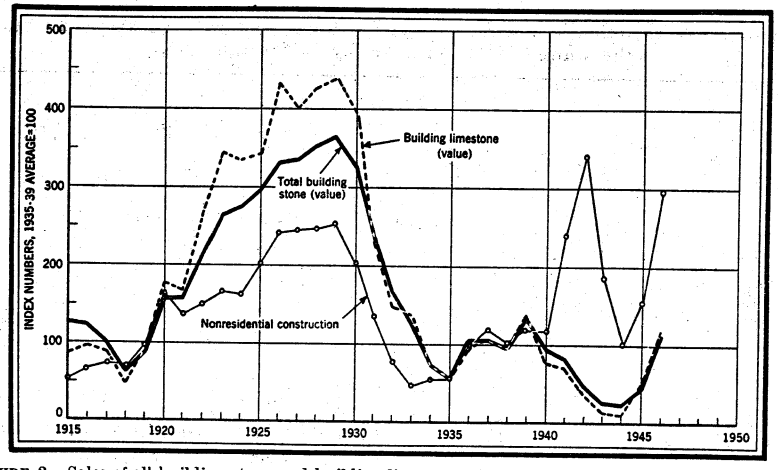

FIGURE 2.—Sales of all building stone and building limestone compared with nonresidential construction (public and private), 1915–46. Data on nonresidential building construction from Bureau of Foreign and Domestic Commerce.

Figure 2 traces for 32 years the history of production of all building stone and of the principal variety—limestone—in their relation to nonresidential building, the class of construction that normally uses stone most extensively. After a period of decline during the war years, when few buildings—either residential or nonresidential—of the substantial durable type that has dimension-stone components were built, the trend of demand is again up. There is a backlog of potential public and private nonresidential building construction that has been delayed owing to emphasis on the less expensive type of residential construction. The dimension-stone industry is expected to benefit from these building programs in the future.

TECHNOLOGIC DEVELOPMENTS

The wire saw has been used for many years for cutting the softer stones. It has been particularly successful in the slate industry, but it has not gained acceptance in granite quarrying. However, it is reported that in 1946 work was in progress on adaptation of the wire saw to cutting granite at Barre, Vermont, and the preliminary tests were encouraging.

For many years cast basalt has been produced on a small scale in Germany. The process and its commercial success has been described in a recent British pamphlet.[1] The basalt is melted at 1,200° to 1,500° C. over a 4- to 6-hour period, cast in cast-iron or sand molds, and annealed for about 60 hours at temperatures that start at 900° C. and decline to normal. The product is used as acid-resisting brick and pipe lining. The process is relatively expensive and has never attained great commercial success.

CRUSHED AND BROKEN STONE

Over 177 million short tons of crushed and broken stone were produced in 1946, exclusive of that used for making cement and lime. Output increased 16 percent in quantity and 25 percent in value. The principal gains were in the concrete and road metal and agricultural uses, whereas there were substantial declines in consumption of stone for ballast, metallurgy, riprap, and refractories. The average value at the quarry increased 7 cents a ton.

The accompanying table of salient statistics shows the quantity sold and the value of output during 1945 and 1946, by uses. Detailed data on asphaltic stone and slate granules and flour are given in the Asphalt and Slate chapters of this volume.

[1] Included under "Undistributed."
[2] To avoid disclosing confidential information, certain totals are somewhat incomplete, the figures not included being combined under "Undistributed."

COMMERCIAL AND NONCOMMERCIAL OPERATIONS

The accompanying table shows the production of crushed stone for concrete and road metal during recent years by Government agencies of various kinds, contrasted with that by commercial enterprises. For several years prior to 1940, Government-sponsored enterprises produced 29 to 46 percent of the total output. They consisted principally of make-work organizations designed to meet unemployment

and, to a lesser extent, of State, county, and city highway boards or commissions. War conditions changed this situation. Unemployment ceased to be a problem, highway construction (except for military roads) was virtually suspended, and even highway maintenance was widely neglected. Consequently the output of stone by noncommercial agencies had dropped to 7 percent of the total by 1945. Although the noncommercial tonnage increased substantially in 1946, the output of commercial firms increased proportionately and the percentage remained at 7.

Concrete and road metal sold or used by commercial and noncommercial operators in the United States, 1942–46

[Figures for "noncommercial operations" represent tonnages reported by States, counties, municipalities, and other Government agencies, produced either by themselves or by contractors expressly for their consumption, often with publicly owned equipment; they do not include purchases from commercial producers. Figures for "commercial operations" represent tonnages reported by all other producers]

Year	Commercial operations				Noncommercial operations				Total	
	Short tons	Average value per ton	Percent of change in quantity from preceding year	Percent of total quantity	Short tons	Average value per ton	Percent of change in quantity from preceding year	Percent of total quantity	Short tons	Percent of change in quantity from preceding year
1942	92,251,930	$0.97	+22	86	15,449,080	$1.05	−55	14	107,701,010	−2

GRANULES

Beginning with 1942, the coverage of granules for roofing purposes has been more complete than in former years. The following table shows total production for the past 5 years. Separate figures for slate granules are given in the chapter on Slate.

Roofing granules [1] sold or used in the United States, 1942–46, by kinds

Year	Natural		Artificially colored		Brick		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1942	352,320	$2,650,503	538,310	$7,594,174	43,230	$636,961	933,860	$10,881,638
1943	287,090	2,190,143	543,870	7,745,452	47,650	716,685	878,610	10,652,280

[1] Manufactured from stone, slate, slag, and brick.

SIZE OF PLANTS

In 1945 the average crushed-stone plant produced about 99,000 tons. Almost half (47 percent) of the plants reported less than 25,000 tons, but they contributed only 4 percent of the total output. On the other hand, the 19 plants that produced 900,000 tons or more contributed almost 25 percent of the total. The accompanying table shows additional details of the size pattern of the industry. Comparable statistics have been published in Minerals Yearbook for each year beginning with 1941.

Number and production of commercial crushed-stone [1] plants in 1945, by sizes of output

Range of output	Number of plants	Total production of plants (short tons)	Percent of total	Cumulative total (short tons)
Less than 1,000 tons	80	36,290	0.02	36,290
1,000 to 25,000	607	6,234,740	4.29	6,271,030
25,000 to 50,000	242	8,537,230	5.88	14,808,260
50,000 to 75,000	135	8,262,000	5.69	23,070,260
75,000 to 100,000	73	6,329,930	4.36	29,400,190
100,000 to 200,000	165	23,279,060	16.03	52,679,250
200,000 to 300,000	67	16,664,430	11.47	69,343,680
300,000 to 400,000	29	9,837,540	6.77	79,181,220
400,000 to 500,000	22	9,839,090	6.77	89,020,310
500,000 to 600,000	11	5,923,690	4.08	94,944,000
600,000 to 700,000	10	6,354,620	4.38	101,298,620
700,000 to 800,000	5	3,710,640	2.56	105,009,260
800,000 to 900,000	5	4,163,060	2.87	109,172,320
900,000 tons and over	19	36,062,720	24.83	145,235,040
Total	1,470	145,235,040	100.00	145,235,040

[1] Exclusive of marble, which is primarily a dimension-stone industry.

METHODS OF TRANSPORTATION

As shown in the accompanying table, truck transportation is the principal method used in the crushed-stone industry, and rail is a close second. Waterways provide minor but locally important facilities. In previous years the table has included only the transportation statistics of the commercial stone used for concrete and road metal. Beginning with 1946, the table will include all commercial crushed stone.

Crushed stone sold or used in the United States in 1946, by methods of transportation

Method of transportation	Commercial operations		Commercial and noncommercial [1] operations	
	Short tons	Percent of total	Short tons	Percent of total
Truck	73,076,890	43	80,918,070	46
Rail	55,627,720	33	55,627,720	31
Waterway	14,765,600	9	14,765,600	8
Unspecified	26,166,390	15	26,166,390	15
	169,636,600	100	177,477,780	100

[1] For practical purposes it is assumed that the entire output of noncommercial operations is moved by truck.

GRANITE

Sales of crushed and broken granite increased 43 percent in quantity and 58 percent in value in 1946. The average sales value per ton increased 12 cents. Sales of riprap declined in quantity but increased in value. Crushed granite for concrete and road metal gained 51 percent in quantity and 84 percent in total value, and the average value per ton was 22 cents higher than in 1945. Granite sold as railroad ballast advanced 13 percent in quantity and 24 percent in value. The average sales value of ballast increased 9 cents a ton. As shown in the accompanying table, granite is produced in a great many States, but the bulk of the output comes from the Southeastern States. North Carolina was the principal producer in 1946, followed by Georgia, South Carolina, California, and Virginia, in that order.

The number of individual operations supplying noncommercial crushed stone cannot be determined with any degree of accuracy from the reports submitted. Therefore, in the accompanying tables covering granite and most other kinds of crushed and broken stone, the number of active plants is not given. For many years before 1939, when noncommercial production was less important, such figures appeared in the tables.

BASALT AND RELATED ROCKS (TRAP ROCK)

Basalt, gabbro, diorite, and other dark igneous rocks that are known commercially as trap rock are widely used in the construction industry. In 1946 New Jersey was the leading State, but Washington produced nearly as much. They were followed by California, Massachusetts, Pennsylvania, Connecticut, and Oregon. Total sales of crushed and broken trap rock were 11 percent greater in quantity and 19 percent greater in value in 1946 than in 1945. The average value per ton increased from $1.18 to $1.26. See second table following.

Granite (crushed and broken stone) sold or used by producers in the United States in 1946, by States and uses

[1] Includes stone sold for rock-wool manufacture, roofing granules, waste, and unspecified uses.
[2] Included under "Undistributed."

MARBLE

Marble producers accumulate large quantities of waste material consisting either of defective blocks or cuttings and spalls from marble-dressing operations. This byproduct material is marketed for the variety of uses listed in the footnote of the accompanying table. The average value varies considerably from State to State because in some States a large portion is marketed for high-priced products, such as terrazzo or marble flour, whereas in others much must be sold for road stone, concrete aggregates, or other low-priced uses.

Marble (crushed and broken stone) sold by producers in the United States in 1946, by States [1]

[1] Includes stone used for agriculture, asphalt filler, cast stone, composition flooring, crushed stone, flux, mineral food, poultry grit, riprap, shingles, spalls, terrazzo, tile, whiting (excluding marble whiting made by companies that purchase their marble), and unspecified uses.
[2] Included under "Undistributed."

LIMESTONE

Because of its wide distribution, moderate production cost, and essentiality in the manufacturing as well as the construction industries, limestone is used more extensively than any other type of crushed and broken stone. In 1946, limestone (excluding that used for making cement and lime) constituted 76 percent of the total crushed and broken stone produced in the United States. Output was reported from 44 States and 3 Territories and was 20 percent greater than in 1945. Owing to the upward trend in construction, sales for use as concrete aggregates and road metal increased 47 percent. As farm income was exceptionally high, the tonnage of agricultural limestone rose 31 percent. On the other hand, output of fluxing stone and ballast declined. The tonnages consumed in "Miscellaneous Uses," which as a group gained 10 percent, are shown in an accompanying table.

Limestone (crushed and broken stone) sold or used by producers in the United States in 1946, by States and uses

[1] Revised figure.
[2] Includes stone for filler for calcimine, caulking compounds, explosives, foundry compounds, glue, insecticides, leather goods, linoleum, paint, paper, phonograph records, plastics, pottery, putty, roofing, rubber, tooth paste, wire coating, and unspecified uses.
[3] Includes stone for refractory magnesia.
[4] Includes stone for acid neutralization, athletic-field marking, carbon dioxide, chemicals (unspecified), concrete blocks and pipes, dyes, electric products, fill material, magnesium metal, motion-picture snow, oil-well drilling, rayon, spalls, waste rock, and water treatment.

Dolomite (calcium-magnesium carbonate) has a variety of uses, some of which are quite distinct from those of high-calcium limestone. Dead-burned dolomite is used as a refractory lining for metallurgical furnaces, and statistical data on this product (which is closely allied to lime) are given in the Lime chapter of this volume. Raw dolomite is also used as a refractory, particularly for patching furnace floors. Dolomite is also used as a source of magnesia (MgO), which may be applied to refractory use, employed for heat insulation, or used in various other ways. In 1943, for the first time, dolomite was used extensively as a source of magnesium metal. This use declined owing to the cut-back in the metal program, and none was reported for 1946.

Sales of dolomite and its primary product of calcination—dolomitic lime—for certain uses are covered in the accompanying table.

Dolomite and dolomitic lime sold or used by producers in the United States for specified purposes, 1945–46

	1945		1946

[1] Includes flux for copper, gold, lead, zinc, and unspecified smelters.
[2] Includes flux for foundries and for cupola and electric furnaces.

As the statistics of the lime and cement industries are presented in separate chapters of Minerals Yearbook, they are not covered in the Stone chapter. However, a commodity review of limestone would be incomplete without recognition of the large tonnage of limestone consumed by these industries. Consequently, the following table shows the total tonnage of limestone consumed for all purposes.

Limestone sold or used for all purposes in the United States, 1944–46, in short tons

Use	1944	1945	1946
Limestone (as given in this report) (approximate)	115,506,000	[1] 112,574,000	134,717,000
Portland and natural cement and cement rock [2]	24,148,000	27,332,000	43,877,000
Lime [3]	12,947,000	11,841,000	11,985,000
	152,601,000	[1] 151,747,000	190,579,000

[1] Revised figure.
[2] Reported in terms of cement in chapter on Cement.
[3] Reported in terms of lime in chapter on Lime.

SANDSTONE

The output of crushed sandstone in 1946 was 5 percent lower than in 1945, but its value was 14 percent greater. The principal decline was in the tonnage of refractory stone; smaller decreases were reported for ballast and concrete and road metal. The output for riprap and "other uses" increased. Average unit values for all uses increased. See details in accompanying table.

MISCELLANEOUS STONE

Crushed and broken stone, other than the five principal varieties already discussed, includes light-color volcanic rocks, schists, boulders from river beds, serpentine, and flint. The following table shows sales of stone of these types in 1946. Total sales decreased 11 percent in tonnage and 4 percent in value compared with 1945. See second table following.

793065—48——72

MARKETS

As has been shown in preceding sections of this chapter, the principal use of crushed stone is as concrete aggregates and road metal used in construction of buildings and highways. The tonnage of stone sold for such uses is compared, in figure 3, with the shipments of portland cement, the area of new concrete pavements, and the value of new construction. There is a definite correlation of trends, but stone output has shown somewhat less variation than the other statistical series. The trend in demand for crushed stone in construction was upward in 1946, and the prospect of further increase was good.

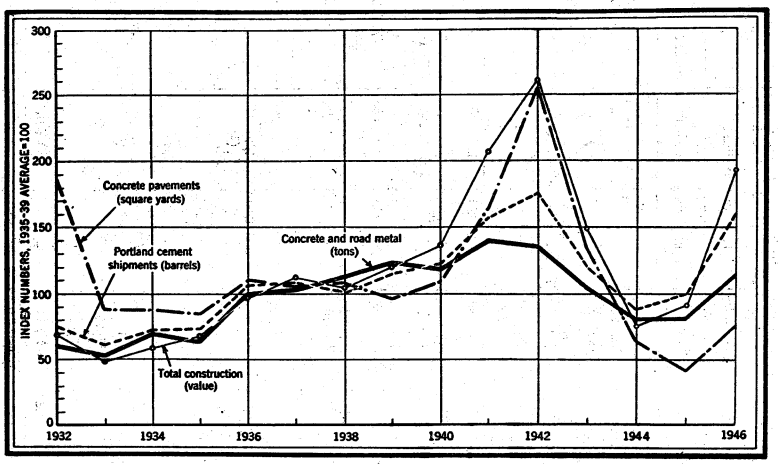

FIGURE 3.—Crushed-stone aggregates (concrete and road metal) sold or used in the United States compared with shipments of portland cement, total construction (value), and concrete pavements (contract awards, thousands of square yards), 1932–46. Data on construction and concrete pavements from Bureau of Foreign and Domestic Commerce.

The metallurgical industries operated at high rates during most of 1946. However, pig-iron production—nearly 45 million tons—was 16 percent lower than in 1945, and steel production, nearly 67 million tons, was 16 percent lower. Consequently, sales of fluxing stone declined 9 percent. Similarly, sales of refractories, such as dead-burned dolomite and ganister used in silica brick, declined. The correlations of fluxing-stone output with pig-iron production, and of refractory stone with steel-ingot production are shown in figure 4.

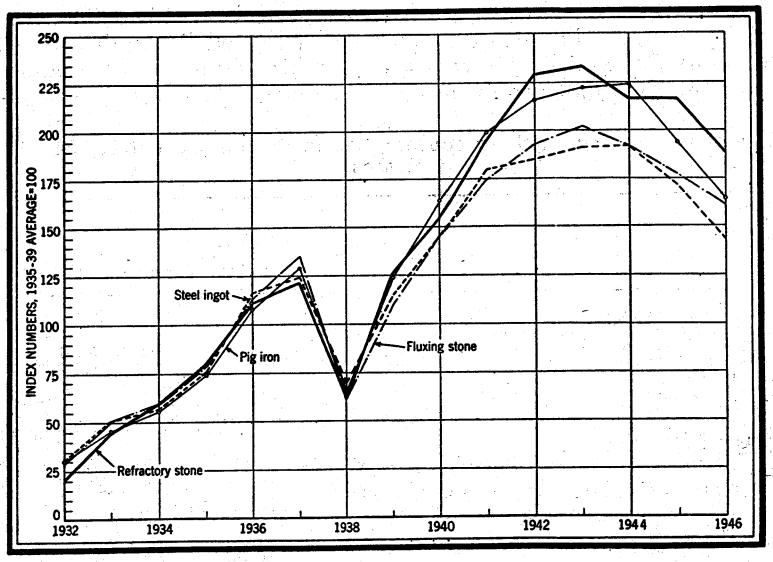

FIGURE 4.—Sales (tons) of fluxing stone and refractory stone, including that used in making lime, as recorded in the chaper on Lime, compared with production of steel ingot and pig iron, 1932–46. Statistics of steel-ingot production compiled by American Iron and Steel Institute.

TECHNOLOGIC DEVELOPMENTS

It was reported in 1946 that the use of "skull crackers" was increasing because of a shortage of drillers for secondary blasting. Many operators report that the drop ball can equal or exceed the efficiency and economy of secondary blasting, but some report relatively poor results. A variety of shapes of ball are used, and the drop may range from 6 to 50 feet. The ball usually weighs between 4,000 and 7,000 pounds.[2]

One of the problems encountered by the managements of crushed-stone plants is the damage sometimes done to neighboring buildings by quarry blasts. Consequently, considerable interest in delayed-action blasting has developed. In this method the blasts in successive holes are separated by small intervals of time, and it is said that the resultant shock wave will not damage property. The reduction in shock has been substantiated by seismic measurements. Another advantage claimed for the method is better breakage of the rock.[3]

FOREIGN TRADE[4]

Importation of stone into the United States increased greatly in 1946—total value was three times as great as in 1945. The greatest gain was made by marble (which comes principally from Italy). The value of marble imports was 11 times greater than in 1945. Granite imports were 7 times greater and other classes increased smaller amounts.

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The export trade in stone also increased in 1946, but was still relatively small. These products are distributed in small quantities throughout the world. However, the bulk is shipped to Canada and most of the remainder to other countries in the Western Hemisphere.

Stone and whiting imported for consumption in the United States, 1945–46, by classes

GENERAL SUMMARY

ALTHOUGH the world was going through a violent period of adjustment in 1946, most countries had one thing in common—they were trying to increase industrial production. Consequently, the demand for sulfur raw materials rose. To meet the high domestic requirements for native sulfur and a record export demand, production records were broken in the United States, and stocks were reduced. On the other hand, Italian native sulfur production was handicapped by high costs and foreign trade difficulties and therefore made only moderate progress toward the prewar level of output. Similarly, activity in the Japanese native sulfur industry was at a low level during its period of postwar adjustment. Although output was limited in many countries, the tonnage contributed by the United States was so large that world output of native sulfur attained a record in 1946. The rate of production of native sulfur has become so great that producers are accelerating their exploration programs to improve their reserve positions.

The production and international trade in pyrites began to swing slowly toward a more normal peacetime pattern in 1946. During the war shipping shortages and other difficulties greatly reduced the sales of some of the principal pyrite-exporting countries, such as Spain, Cyprus, and Portugal. Although such problems as monetary exchange, trade barriers, and stagnation of industry in some consuming areas were limiting factors, these countries have begun to recover their prewar markets. The pyrite output of countries such as Norway, France, Italy, and Germany that were under the control of the

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Axis during most of the war dropped to a low point in 1945, but in 1946 it had begun to increase with gradual revival of European industry. The same was true of Japan. In the United States the demand for sulfuric acid was so great that pyrites production reached record levels.

For many years the price of sulfur in the United States has been stable despite a substantial rise in wages and other costs. In 1946 the domestic price of crude sulfur was unchanged, but the export price was increased.

Salient statistics of the sulfur industry in the United States, 1935–39 (average) and 1943–46

	1935–39 (average)	1943	1944	1945	1946
Sulfur:					
Production of crude sulfur..long tons	2,175,057	2,538,786	3,218,158	3,753,188	3,859,642
Shipments of crude sulfur—					
For domestic consumption..do	1,420,236	2,296,452	2,865,397	2,914,603	2,939,140

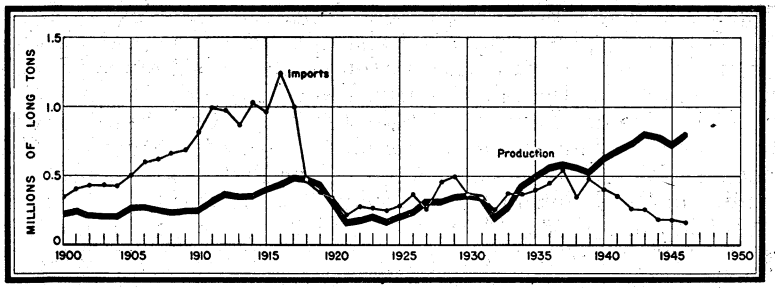

FIGURE 2.—Domestic production and imports of pyrites, 1900–46.

SULFUR

DOMESTIC PRODUCTION

Production of sulfur declined somewhat during the early months of 1946, but the trend was soon reversed. Thereafter, output increased rapidly and a new record of 3,859,642 long tons was attained—3 percent more than in 1945. Shipments from the mines, 8 percent greater than in 1945, also were the largest on record. In addition to the sulfur produced at Frasch-process mines, a modest tonnage of sulfur-bearing ore was mined in California, Colorado, Nevada, and Texas for agricultural purposes.

REVIEW BY STATES

Mines in Texas produced 77 percent and Louisiana nearly 23 percent of the native sulfur output of the United States in 1946.

Sulfur produced and shipped in the United States, 1942–46 [1]

Year	Produced (long tons)				Shipped	
	Texas	Louisiana	California and Utah	Total	Long tons	Approximate value
1942	2,885,621	570,345	4,720	3,460,686	3,128,559	$50,100,000
1943	1,908,581	630,205	----------	2,538,786	2,953,845	47,300,000
1944	2,582,238	635,920	----------	3,218,158	3,519,083	56,300,000
1945	2,969,778	783,410	----------	3,753,188	3,833,294	61,300,000
1946	2,975,472	884,170	----------	3,859,642	4,128,212	66,100,000

[1] In addition to the refined sulfur shown, native sulfur ore (10–70 percent S) for agriculture use was produced in Colorado and Texas in 1942–46 and in California and Nevada in 1946. Total shipments of this material were as follows, in long tons: 1942—1,590 ($16,000); 1943—2,572 ($26,215); 1944—1,639 ($8,950); 1945—1,426 ($12,170); 1946—6,344 ($95,531).

California.—Sulfur was produced at the Crater Claims and Fraction No. 1 mines in Inyo County by Roy Ketching and Bailey Miche, Big Pine, Calif.

Colorado.—General Agricultural Products Co. mined sulfur ore in Delta County.

Louisiana.—Output from the Grande Ecaille mine of the Freeport Sulphur Co. in Plaquemines Parish totaled 884,170 long tons in 1946, and production capacity was being expanded.

Nevada.—Production of sulfur in Humboldt County was reported by Oscar Streeter.

Texas.—The following companies operated in Texas in 1946: Duval Texas Sulphur Co., at Orchard Dome, Fort Bend County; Freeport Sulphur Co. at Hoskins Mound, Brazoria County; Jefferson Lake Sulphur Co., Inc., at Clemens Dome, Brazoria County, and at Long Point Dome, Fort Bend County; Texas Gulf Sulphur Co. at Boling Dome, Wharton County; and the Pecos Orla Sulphur Co. at Michigan Claims, Culberson County. The first production from the new mine of the Jefferson Lake Sulphur Co. at Long Point Dome was reported in June 1946. This property is operated under an unusual agreement whereby the producing company retains specified tonnages and delivers the remainder to the Texas Gulf Sulphur Co. Construction of a producing plant was initiated by the Texas Gulf Sulphur Co. at Moss Bluff Dome in Liberty County. The following table was compiled from information supplied by the Texas State Comptroller's Office.

Sulfur produced in Texas in 1946, by companies, in long tons

Company	First quarter	Second quarter	Third quarter	Fourth quarter	Total
Texas Gulf Sulphur Co	498,990	469,002	550,403	572,581	2,090,976
Freeport Sulphur Co	99,090	100,270	95,260	110,690	405,310
Jefferson Lake Sulphur Co., Inc	29,643	40,387	82,429	73,562	226,021
Duval Texas Sulphur Co	59,595	79,805	56,605	57,160	253,165
Total	687,318	689,464	784,697	813,993	2,975,472

RECOVERY AS BYPRODUCT

Sulfur occurs in many forms and, consequently, local conditions govern the choice of source. Some pyrites deposits are mined for their value as a source of sulfur. Elsewhere a large tonnage of pyrites is recovered as a byproduct flotation concentrate in the milling of copper and zinc ores. Similarly, "coal brasses" are obtained as a byproduct of coal washing. All these are included in the Pyrites section of this chapter.

The fumes evolved from copper and zinc smelters are at once a nuisance and a raw material. Where markets are available, large quantities of sulfuric acid are produced from them. The equivalent of 234,000 long tons of sulfur was recovered from this source in 1946. The following table shows the output of acid at smelters during the past 5 years.

Byproduct sulfuric acid (expressed as 60° B.) produced at copper, zinc, and lead plants in the United States, 1942–46, in short tons

	1942	1943	1944	1945	1946
Copper plants [1]	265,522	348,832	320,572	298,309	221,047
Zinc plants	695,242	879,266	839,451	786,582	701,080
	960,764	1,228,098	1,160,023	1,084,891	922,127

[1] Includes sulfuric acid produced as byproduct at a lead smelter.

Most of the elemental sulfur consumed in the United States is obtained as native sulfur, but some is also derived as a byproduct of industrial gases. Coke-oven, refinery, natural, and other industrial gases yield sulfur when treated by the Thylox, Ferrox, Nickel, or Sasco processes. United States Patent 2,403,451 was issued on the Sasco process in 1946. There were elemental sulfur-recovery plants in 10 States in 1946, and production totaled 34,990 long tons (calculated as 100 percent sulfur). Shipments totaled 37,499 long tons. Some of this material was marketed as paste containing 38 to 50 percent sulfur, but 91 percent was sold as brimstone.

Sulfur is also recovered from fuel gases in the form of hydrogen sulfide. The Phenolate, Phosphate, and Girbotol processes are used for this purpose, and the product is commonly converted to sulfuric acid or is burned as fuel. Hydrogen sulfide, recovered in three States in 1946, contained 18,366 long tons of sulfur.

STOCKS

During 1946 producers' stocks of sulfur declined 6 percent to 3,769,368 long tons, of which 3,191,039 tons were held at the mines.

PRICES

After a long period of stability sulfur prices began to increase in 1946. Trade journals continued to quote crude sulfur at $16 per long ton f. o. b. mines, but the export price at the port was, in some instances, increased per long ton from $17.50 to $20. Control of prices by the Office of Price Administration was terminated in November 1946.

CONSUMPTION AND USES

As shown in the accompanying tables, the consumption of native sulfur in the United States during the past 3 years has varied comparatively little. In 1946, however, total sales (including exports) apparently were about 6 percent greater than in 1945.

Apparent consumption of sulfur in the United States, 1942–46, in long tons

	1942	1943	1944	1945	1946
Shipments to consumers (apparent)	3,032,043	3,191,051	3,580,058	3,849,591	4,094,191
Imports	25,632	16,658	32	33	35
Total	3,057,675	3,207,709	3,580,090	3,849,624	4,094,226
Exports:					
Crude	568,249	657,393	653,686	918,691	1,189,072
Refined	17,030	25,079	21,546	23,971	56,748
Total	585,279	682,472	675,232	942,662	1,245,820
Apparent consumption	2,472,396	2,525,237	2,904,858	2,906,962	2,848,406

The pattern of sulfur consumption, by industries, has been estimated by Chemical Engineering as follows:

Sulfur consumed in the United States, 1942–46, by uses, in long tons

[Chemical Engineering]

Use	1942	1943	1944	1945	1946
Chemicals [1]	1,260,000	1,320,000	1,585,000	1,605,000	1,460,000
Fertilizer and insecticides	475,000	500,000	580,000	600,000	620,000
Pulp and paper	365,000	305,000	300,000	297,000	305,000
Explosives [1]	90,000	90,000	88,000	90,000	90,000
Dyes and coal-tar products	60,000	65,000	75,000	75,000	80,000
Rubber	35,000	45,000	55,000	58,000	65,000
Paint and varnish	70,000	80,000	90,000	94,000	105,000
Food products	6,000	7,000	7,000	7,000	7,000
Miscellaneous	110,000	120,000	140,000	135,000	215,000
Total	2,471,000	2,532,000	2,920,000	2,961,000	2,947,000

[1] To avoid disclosing estimated consumption of sulfur in direct war applications, such as military explosives, sulfur so used is included under "Chemicals."

Large tonnages of elemental sulfur are consumed in such uses as rubber compounding, insecticides, and paper, but about three-fourths is converted to sulfuric acid. Sulfuric acid has a multitude of uses and serves virtually every industry. Chemical Engineering has estimated consumption of sulfuric acid by the major consuming industries as follows:

Sulfuric acid (basis, 100 percent) consumed in the United States, 1944–46, by industries, in short tons

[Chemical Engineering

Industry	1944	1945	1946
Fertilizer	2,640,000	2,850,000	3,020,000
Petroleum refining	1,020,000	1,020,000	1,000,000
Chemicals and defense [1]	2,490,000	2,220,000	1,780,000
Coal products	625,000	600,000	510,000
Iron and steel	560,000	570,000	475,000
Other metallurgical	350,000	330,000	280,000
Paints and pigments	510,000	520,000	550,000
Industrial explosives	120,000	100,000	105,000
Rayon and cellulose film	450,000	495,000	556,000
Textiles	75,000	70,000	75,000
Miscellaneous	350,000	400,000	345,000
Total	9,190,000	9,175,000	8,696,000

[1] To avoid disclosing estimated consumption of acid in direct war applications, such as military explosives, acid so used is combined with "Chemicals."

In 1946 consumption of sulfuric acid is estimated to have been 5 percent lower than in 1945. However, the decline was principally in war uses, and there was a shortage of acid during the year in many areas. Some ordnance acid plants were sold to private companies. As shown in the accompanying table, the principal increase in consumption has been in fertilizer manufacturing. One difficulty that occasionally has limited movement of acid has been a shortage of tank cars. Sulfur, however, was provided in adequate quantities to supply all requirements.

An article outlining the present usage and value of application of sulfur as a fertilizer was published in 1946.[2]

As shown in the accompanying table of distribution of sulfuric acid production, the major sulfur markets are in the eastern and mid-western areas of the United States.

Distribution of sulfuric acid production in the United States, by market areas 1945–46

[Bureau of the Census]

Market area	1945		1946	
	Number of producing plants	New acid production (short tons)	Number of producing plants	New acid production (short tons)
New England	6	182,748	5	152,477
New York City	10	843,285	8	853,759

Total	192	8,687,070	171	8,649,163

FOREIGN TRADE

In 1946 the foreign demand for American sulfur was considerably greater than had been anticipated, and exports reached a record total of 1,245,820 tons. Some producers were unable to fill all orders, and foreign sales combined with domestic tonnage that moves in coastwise ships were so great that they taxed the available loading facilities. The world-wide distribution of these shipments is shown in the accompanying table. Imports now are small, consisting principally of occasional receipts of high-grade material from Canada and sulfur ore from Mexico.

Sulfur imported into and exported from the United States, 1942–46

Year	Imports				Exports			
	Ore		In any form, n. e. s.		Crude		Crushed, ground, refined, sublimed, and flowers of

WORLD PRODUCTION

Native sulfur is produced in many countries, but most of the output comes from comparatively few. In addition, a substantial tonnage of elemental sulfur is derived from pyrites and industrial gases. From the limited statistics available, it is estimated that world production of native and other elemental sulfur totaled about 4,400,000 long tons in 1946.

World production of native sulfur, 1939–46, by countries, in long tons [1]

[1] Native sulfur believed to be produced also in China, Cuba, Egypt, Formosa, India, Iran, and U. S. S. R., but complete data are not available; however, estimates by senior author of this chapter are included in total.
[2] Data not available; estimate by senior author of this chapter included in total.
[3] Incomplete data.
[4] Estimate.
[5] In addition, following quantities of sulfur rock reported—1939: 19,568 tons; 1940: 15,552 tons; 1941: 17,802 tons; 1942: 30,734 tons. Similar data not available for later years.
[6] Production of Sicily for fiscal year ended July 31 of year stated.
[7] Preliminary data.
[8] Fiscal year ended March 31 of year following that stated.
[9] Data cited appear to be concentrates of 65–70 percent sulfur content.
[10] Estimated by senior author of this chapter.

Argentina.—Argentina is attempting to become self-sufficient in sulfur and has made considerable progress in that direction. Domestic production of native sulfur is encouraged by the Government through financial assistance and import limitations. A new acid plant, using the flue gases of a zinc furnace, was expected to provide 6,600 tons of acid in 1946.[3]

Chile.—Over a period of years, Campania Azufrera Aucanquilcha has accumulated a stock pile of 200,000 tons of autoclave residues containing about 40 percent sulfur. The company is installing a flotation plant to treat them. Minero del Pacifico and Aucanquilcha are said to be the only two companies now operating.

Costa Rica.—On the slopes of Volcano Poas several deposits of sulfur are worked intermittently, but they have not attained commercial importance. Imports of sulfur have ranged from 11 to 62 metric tons in recent years.

France.—From deposits at Malvezy, near Narbonne, the Société Languedocienne de Recherches et d'Exploitations Minières plans to produce 35,000 metric tons of sulfur ore that will be beneficiated by flotation.

Guatemala.—There is said to be little immediate prospect of materially increasing Guatemalan production of native sulfur—ordinarily 10 to 15 tons a year. Deposits are scattered, refining would be expensive, and transportation is poor. The present small output of crude sulfur is consumed by the chemical company that mines it. From 100 to 200 metric tons of refined sulfur are imported annually. About 90 percent of the sulfur consumed in Guatemala is used in sugar refining, 8 percent in chemical production, and 2 percent in pharmaceuticals.

India.—A unique deposit of sulfur near Kona, Kistna District, Madras Presidency, was being investigated by the Geological Survey of India. The sulfur is found in clay and silt in an area along the coast that is flooded by seawater during the monsoon months. The sulfur is said to be derived from soluble sulfates in the seawater through the action of bacteria. Sulfur content of the material varies from traces up to 45 percent, averaging about 10 percent, and the beds are about 2 feet thick. During the war, India produced sulfur at the Koh-i-Sultan mines in Baluchistan, but a decision to discontinue this operation has been reported.[4]

Italy.—During 1946 production of sulfur in Italy was held at a low level by monetary exchange problems and other difficulties. The official price of 9,500 lire per ton f. o. b. Sicilian ports was too high to attract foreign buyers, as the exchange rate was 225 lire to 1 dollar. Consequently, stocks of 60,000 tons accumulated and some mines closed down. The Italian producers indicated that they need either the allocation of a trade area to them or some revision of the price structure to enable them to regain their export markets.

Japan.—A report issued by the Allied Military Government[5] contained the following summary:

Sulfur is one of the most abundant natural resources of Japan. It is used chiefly in rayon and paper pulp manufacture and in the chemi-

[3] Foreign Commerce Weekly, vol. 23, No. 10, June 8, 1946, p. 34.

[5] Natural Resources Section, General Headquarters, Supreme Commander for the Allied Powers, Sulfur Resources of Japan: Rep. 66, 1946, 29 pp.

cal industry. For many years it has been one of Japan's important export commodities. All of Japan's sulfur deposits are related to volcanic activity. Deposits occur throughout Japan, but the most important are in northern and central Honshu and in southwestern and northeastern Hokkaido. The most important sulfur-producing districts in Japan are (1) Matsuo, (2) Nagano Gumma, (3) Fukushima-Yamagata, (4) Kayabe-Kameda, (5) Horobetsu, and (6) Akan-ko-Musa-dake. Several other promising districts have not yet been developed. Sulfur deposits in Japan are divided into five types: (1) Sedimentary, (2) impregnation and replacement, (3) complex, (4) sublimation, and (5) sulfur flows. Complex deposits are the most important, followed by impregnation and replacement, and sedimentary deposits. Japan has adequate reserves to supply both domestic consumption and export needs for many years, and prospects for discovery of additional large reserves are excellent. Mining methods in the biggest sulfur mines in Japan compare favorably with those used in some of the mines of comparable size in the United States, although hand labor is used more widely in Japan. In the small mines, operations are primitive. Processing practices are simple, generally consisting only of crushing and sorting. In a few mines, flotation concentration is used before refining. Refining methods are crude, and recovery is fairly low.

Mexico.—The Mexican Gulf Sulphur Co. is said to have drilled four sulfur wells in the Province of Veracruz, and discovery of a major deposit of sulfur was reported.

U. S. S. R.—According to the Soviet press, a sulfur deposit, containing 2,000,000 tons, near Gaurdak in Turkmenia will be developed by the sulfur combine.

PYRITES

DOMESTIC PRODUCTION

After declining during the previous 2 years, production of pyrites in the United States in 1946 reached a new record, 1 percent above the high established in 1943.

Pyrites (ores and concentrates) produced in the United States, 1942–46

Year	Quantity		Value	Year	Quantity		Value
	Gross weight (long tons)	Sulfur content (percent)			Gross weight (long tons)	Sulfur content (percent)	
1942	720,363	42.6	$2,464,000	1945	722,596	41.0	$2,700,000
1943	802,384	42.0	2,844,000	1946	813,372	41.5	3,228,000
1944	788,530	42.2	2,598,000				

Owing to the competition of native sulfur, prices of pyrites are low, and in most areas in the United States production for sale on the open market is not attractive. Consequently, domestic production is largely by companies that can utilize the material locally without paying large transportation costs. In 1946, producing companies consumed 659,140 long tons, whereas they sold only 162,939 long tons.

793065—48——73

REVIEW BY STATES

California.—Output from the Hornet mine of the Mountain Copper Co., Shasta County, made California the third-largest pyrites-producing State in 1946.

Illinois.—At its Atkinson mine in Henry County, the Midland Electric Coal Corp. recovered 1,740 long tons of pyrites (coal brasses). As these occur in the coal as seams or lenses up to 4 inches in thickness, only moderate crushing is required to free them, allowing separation from washer waste, by jigs, of additional salable coal as well as byproduct lump pyrite.

Indiana.—Output of pyrite (coal brasses) by the Snow Hill Coal Corp. at the Talleydale mine, Vigo County, decreased in 1946.

Montana.—The Anaconda Copper Mining Co. recovered a substantial tonnage of pyrite in 1946 as a byproduct of its copper-plant operations at Anaconda, Deer Lodge County.

New York.—The St. Joseph Lead Co. shipped pyrites from the Balmat mine, St. Lawrence County, in 1946.

Pennsylvania.—The Bethlehem Steel Co. produced pyrites in Lebanon County.

Tennessee.—As in past years, Tennessee led all other States in the production of pyrites. Output came from mines operated by the Tennessee Copper Co. and was converted by that company to sulfuric acid and iron sinter.

Virginia.—Pyrites were produced by the General Chemical Co. at the Gossan mine to supply its sulfuric acid plant at Pulaski.

Wisconsin.—The Vinegar Hill Zinc Co. recovered pyrites in Grant County and converted them into acid.

PRICES

The price of Spanish pyrites, considering sulfur content only, is reported to have been approximately 14 cents per unit of sulfur, delivered to east coast ports. Price controls on pyrites were suspended by the Office of Price Administration on July 26, 1946.

FOREIGN TRADE

Imports of pyrites are much smaller than before the war, when they commonly ranged between 300,000 and 500,000 long tons. During the war receipts from Spain were small, being replaced by shipments from Canada and by substitution of native sulfur. Since 1942 imports from Canada have declined steadily, whereas those from Spain have slowly increased since 1944. However, Spain has been able to recover only a small portion of its American market. The accompanying table shows the statistics of pyrite imports during the past 5 years.

Pyrites, containing more than 25 percent sulfur, imported for consumption in the United States, 1942–46, by countries

Country	1942		1943		1944		1945		1946

WORLD PRODUCTION

Pyrites are produced in a great many countries and before the war supplied well over half the world's sulfur. However, in 1946 the industries of the main pyrites-consuming countries (European and Japan) had not yet fully recovered. Consequently, output was limited by lack of markets caused by a variety of problems ranging from currency exchange difficulties to virtual industrial paralysis in some areas. Complete statistics are not available, but it is estimated that world production of pyrites totaled about 7,000,000 metric tons in 1946.

World production of pyrites (including cupreous pyrites), 1938 and 1943–46, by countries, in metric tons [1]

[1] In addition to countries listed, Belgium, Brazil, China, Czechoslovakia, Egypt, Eire, Hungary, and Iran produce pyrites, but production data are not available; however, estimates by senior author of this chapter are included in total.

[2] Data not available; estimate by senior author of this chapter included in total.

[3] January to June, inclusive.

[4] Preliminary data for fiscal year ended Mar. 31 of year following that stated.

[5] Estimate.

[6] Estimated by senior author of this chapter.

Cyprus.—During most of the war pyrite mines on Cyprus were unable to operate. In 1945 Cyprus Mines Corp. shipped 81,878 long tons from stock, and in May 1946 mining operations were resumed. In 1946 production totaled 103,132 long tons and shipments 167,636. Stocks have been depleted, and production is being increased gradually as European demand develops and labor becomes available.

India.—The Mysore Geological Survey has reported discovery of deposits of massive pyrites containing 50 percent sulfur near Chitaldrug, about 150 miles from Bangalore.

Japan.—During the war output decreased steadily to a low in 1945. In 1946 the downtrend was reversed and production totaled about 475,000 metric tons. A report on the pyrite industry in Japan (covering history, production statistics, geology, mining methods, and descriptions of mines) has been published by the Allied military government.[6] The summary presented was as follows:

Since 1935 Japan has ranked second only to Spain in production of pyrite and has developed reserves sufficient for about 40 years. Pyrite occurs throughout the Home Islands, but the most important deposits are on Honshu and Shikoku. Although numerous mines produce pyrite, most of the output comes from less than 35 mines; 2 of these produce about half of the national total. Mines producing pyrite concentrates as a byproduct of metal mining far outnumber pyrite-sulfur mines, but the latter group produces about 60 percent of the national total. Although production is hampered by difficulties, an output of 2,000,000 metric tons is anticipated by 1948. This level can be maintained for many years. All pyrite in Japan is used in the manufacture of sulfuric acid, of which the fertilizer industry is the largest consumer. Exports, which were fairly large after 1935, were used almost entirely by Japanese-controlled sulfuric acid plants in Japanese-occupied territory. Imports, which were small and sporadic, were chiefly from Canada and Formosa. Mining methods vary widely in pyrite mines. The larger mines employ modern methods; the smaller ones are, in many instances, inefficiently operated. In both groups, hand labor is used far more extensively than in the United States. Milling methods are simple, consisting of crushing and sizing. In large metal mines, modern gravity and flotation plants separate pyrite and metal concentrates.

Norway.—As much of Norway's pyrite is exported, production dropped when the European industrial demand collapsed in 1945. In 1946 Norwegian pyrite output rose to about half the normal rate.

Portugal.—In 1946 production of pyrite in Portugal was recovering from the wartime slump but was still substantially below the prewar level.

Spain.—With recovery of European industrial activity, demand for Spanish pyrite is increasing; but many barriers remain to be overcome, and production is still far below the prewar rate.

Talc and Pyrophyllite [1]

By BERTRAND L. JOHNSON AND F. M. BARSIGIAN

GENERAL SUMMARY

MINE PRODUCTION of talc, pyrophyllite, and ground soapstone made a new high record in 1946, according to reports by producers. All-time records were also made in both total quantity and value of these commodities sold or used (see fig. 1.) Total imports were much larger in 1946 than in 1945, both in quantity and value, owing to the increased quantity of ground materials brought

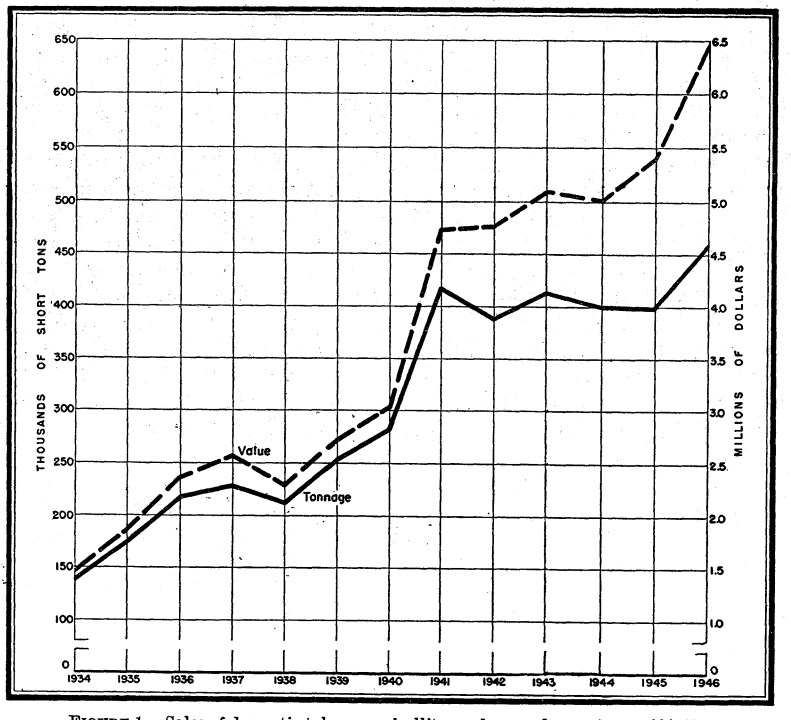

FIGURE 1.—Sales of domestic talc, pyrophyllite, and ground soapstone, 1934–46.

in. Exports of "talc, steatite, soapstone, and pyrophyllite, crude and ground" increased both in quantity and value in 1946, and exports of "powders—talcum (in packages), face, and compact" were over a million dollars greater in value in 1946 than they were in 1945.

[1] Including data for ground soapstone.

Pyrophyllite (a hydrous aluminum silicate) is included with talc (a hydrous magnesium silicate) in this chapter because of its resemblance to talc in certain physical properties and because it is interchangeable with talc in some uses, although certain specialized uses for pyrophyllite have been developed in recent years. Statistical details on the mining and sales of pyrophyllite are given in footnotes of the salient statistics and sales tables.

Salient statistics of the talc, pyrophyllite,[1] and ground-soapstone industries in the United States, 1945–46

	1945		1946	
	Short tons	Value	Short tons	Value
Mined:				
Sold crude	[2] 35,979	[2] $367,488	36,963	$348,484

		2,555,936		3,912,626

[1] In 1945: Mined, 77,716 short tons. Sold—crude, 6,215 tons, $38,166; ground, 71,379 tons, $613,034; total, 77,594 tons, $651,200. In 1946: Mined, 97,765 short tons. Sold—crude, 10,716 tons, $85,002; ground, 85,835 tons, $913,301; total, 96,551 tons, $998,303 (exclusive of pinite).
[2] Revised figure.
[3] Data not available.
[4] Exclusive of "Manufactures, n. s. p. f., except toilet preparations," as follows: 1945: $63; 1946: $15,687; quantities not available.
[5] Quantity not recorded.

Twelve States reported sales of talc, pyrophyllite, or ground soapstone in 1946, one less than in 1945, no talc being reported as sold from New Mexico. The greater part of the total sales in 1946 was made in the Eastern States.

Several publications dealing with talc or soapstone deposits have appeared recently. The Geological Survey issued in November 1945 a two-sheet uncolored outcrop map covering the Gouverneur talc district, St. Lawrence County, N. Y., on a scale of 400 feet to the inch, from Sylvia Lake near Balmat on the west to Edwards at the eastern end of the talc area. The New York talc deposits were discussed by Broughton [2] in a recent article. Teague [3] described the deposits, mining methods, and subsequent treatment of the mined talc in the four mines of the Chatsworth district in northern Georgia.

[2] Broughton, J. G., Geology of Ceramic Materials in New York State: New York Acad. Sci., vol. 7, 1945, pp. 107–108.
[3] Teague, K. F., Georgia Talc Industry Helped by Geologic Study: Eng. and Min. Jour., vol. 147, No. 11, November 1946, pp. 63–65.

He considers that the talc deposits occur as lenses in association with dolomitic and chloritic schists which have been intruded and included in a pre-Cambrian granite-gneiss, the talc appearing to have been formed by the alteration of impure dolomitic limestone of pre-Cambrian age. Barnes [4] described soapstone lenses, in the schists and gneisses of the central mineral region of Texas, consisting chiefly of talc and tremolite, with minor amounts of chlorite, magnetite, calcite, and serpentine. The soapstone is considered to be the product of the alteration of tremolite schist formed by the metamorphism of impure dolomites. The Reed talc mine, Esmeralda County, Nev., was mapped by the Geological Survey.

SALES

The quantity of domestic talc, pyrophyllite, and ground soapstone sold or used in 1946 was considerably greater than in 1945, according to reports of the producers to the Bureau of Mines. This output—457,066 short tons—was a new record, exceeding the former record set in 1941 by over 40,000 tons. The total value of $6,445,344 in 1946 was over a million dollars greater than in 1945 and was an all-time high. The average value per ton rose from $13.57 (revised) in 1945 to $14.10 in 1946.

Talc, pyrophyllite,[1] and ground soapstone sold by producers in the United States, 1942–46, by classes

Year	Crude			Sawed and manufactured

Sales by States.—New York in 1946 was still the leading producing State by a considerable margin, with North Carolina in second place. Increased sales were reported in many of the States in 1946. Sales of the leading States—California, Georgia, and North Carolina—reached new levels. Total sales of pyrophyllite, most of which comes from North Carolina, increased 24 percent in 1946 over 1945.

Talc, pyrophyllite, and ground soapstone, sold by producers in the United States, 1945–46, by States

State	1945 [1]		1946	
	Short tons	Value	Short tons	Value
California	67,321	$1,254,143	78,170	$1,434,978
Georgia	32,433	296,163	36,410	380,477
Maryland, Pennsylvania, and Virginia	34,084	329,631	42,505	424,334

CONSUMPTION AND USES

Five industries—paint, rubber, roofing, ceramics, and insecticides—consumed 77 percent of the sales of domestically produced talc, pyrophyllite, and ground soapstone in 1946, according to reports from the producers. Increases were reported in sales to the paint, rubber, roofing, ceramics, insecticides, and paper industries. Especially notable were the increases in the ceramic and insecticides industries. Consumption in paint was easily the leading use with 23 percent of the total. The rubber, ceramics, and insecticides industries were close competitors for second place, each taking about 14 percent of the total.

Estimated distribution of talc, pyrophyllite, and ground soapstone sold by producers in the United States, 1945–46, by uses

Use	1945 [1]		1946	
	Short tons	Percent of total	Short tons	Percent of total
Paint	103,583	26	103,828	23
Rubber	63,758	16	65,980	14
Roofing	46,783	12	54,581	12
Ceramics	37,889	10	62,389	14
Insecticides	37,012	9	64,954	14
Paper	28,138	7	32,300	7
Toilet preparations	21,543	5	17,111	4

Crayons	336	[3]	306	[3]
Other uses [4]	23,506	6	24,803	5
Unclassified	28,764	7	23,769	5
	398,384	100	457,066	100

[1] Revised figures. [3] Less than 0.5 percent.
[4] Asphalt filler, refractory, textile, plaster, plastics, agriculture, and miscellaneous uses.

Several articles on the use of talc in the ceramic industry appeared recently. A recent article [5] suggested the addition of talc to glass-pot

[5] Ceramic Industry, It Worked With Saggers—Why Not With Glass Pots?: Vol. 46, No. 3, March 1946, pp. 74–76.

batches and its use in saggers was stated to lower the expansion coefficient, tighten the body, and increase strength. Gingold [6] gave a short review of vitrified electrical insulating materials developed and used during recent years, and in a later article [7] discussed the decrease in modulus of rupture and compression strength of hollow cylinders with equal outside diameter as inside diameter is increased and explained this fact by the assumption that the natural fire coating acts as a glaze under tension. Gleason [8] presented a discussion of the use of steatite in electrical insulators for high-frequency purposes. He called attention to the fact that the excellent dielectric properties of steatite are due to the formation of clinoenstatite crystals in the heat treatment of the steatite talc, and that their interlocking structure imparts high mechanical strength.

PRICES

Prices of ground domestic talc per ton, carlots, bags, f. o. b. works, quoted by Oil, Paint and Drug Reporter in the early part of 1946 were the same as for several years. These prices were:

Talc, domestic, ordinary, ground	$14. 50–$24. 50
California	17. 50– 43. 00
New York, fibrous, ground, off color, coarse	13. 00
New York, fine, 325-mesh, 93–94 percent	13. 00– 18. 00
New York, fine, 325-mesh, 98–99.5 percent	15. 25– 19. 25
New York, fine, 325-mesh, 99.85–99.95 percent	17. 00– 21. 00
Pennsylvania	11. 00– 13. 50
Vermont	14. 00
Talc, imported, Canadian	24. 00– 30. 00

During the latter part of 1946, however, slight changes occurred in some of these prices, and on December 30, 1946, the range in prices of California talc had changed to $22 to $30; New York fibrous talc, ground, off color to $15.50; and Canadian talc to $35 to $44.50 per ton. The other quotations were unchanged.

Prices for pyrophyllite were the same in 1946 as in 1944 and 1945. According to Oil, Paint and Drug Reporter these were: Standard, 200-mesh, carlots, bulk, mines, per ton $10 to $11.50; 325-mesh, same basis, $13 to $13.90; No. 3, 200-mesh, carlots, bulk, mines, per ton $9.50; No. 3, 325-mesh, same basis, $11.50. Pyrophyllite in paper bags was $1.50 per ton extra.

The average values of all grades of talc, pyrophyllite, and ground soapstone in the past 5 years, as reported to the Bureau of Mines by producers, are given in the table under "Sales."

Price controls of talc, pyrophyllite, and ground soapstone by the Office of Price Administration in 1946 covered only the agricultural grades, which form but a very small percentage of the total consumption of these materials. Controls on industrial grades had been suspended by OPA October 16, 1945 (OPA Supplementary Order 129, amendment 2, sec. 10 (a): 10 F. R. 12768). The remaining controls (those on agricultural grades) were removed in May 1946.

FOREIGN TRADE [9]

Imports.—A marked increase in both the total quantity and value of "talc, steatite or soapstone, and French chalk" imported for consumption in the United States occurred in 1946, the quantity imported being nearly triple the 1945 figure and the value nearly four times that of the previous year. These increases were due to the much larger imports of ground talc, which more than counterbalanced decreased imports of crude and unground, and cut and sawed material. As usual, the ground material constituted the major part of the imports. The value of the imports of "Manufactures, n. s. p. f., except toilet preparations" was many times greater than in recent years due to large imports from China. Italy was the principal source of the ground imports, with Canada falling to second place (see fig. 2).

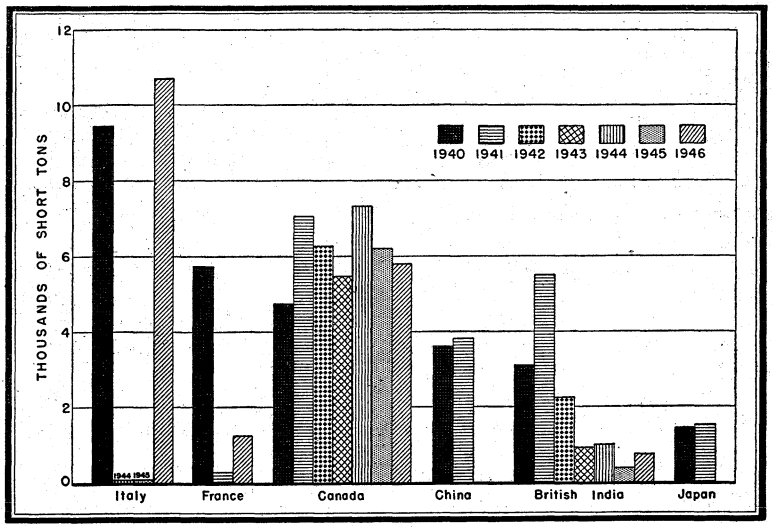

FIGURE 2.—Talc, steatite or soapstone, and French chalk imported for consumption in the United States, 1940–46, by leading countries.

Exports.—Another new record in the quantity of "Talc, steatite, soapstone, and pyrophyllite, crude and ground" exported from the United States was made in 1946, surpassing the previous record of 1945 by over 5,000 short tons. The value of these exports increased from $279,178 in 1945 to $394,799 in 1946, which was also a new record. The value of the exports of "Powders—talcum (in packages), face, and compact" increased nearly 1¼ million dollars over 1945.

Talcum and other powders exported from the United States, 1942–46

[1] In addition to countries listed, talc or pyrophyllite is reported produced in Brazil, Bulgaria, Greece, and U. S. S. R., but data on production are not available.
[2] Data not available.
[3] Less than 1 ton.
[4] Includes steatite, as follows—1940: 17,191; 1941: 18,948; 1942: 24,859; 1943: 9,741; 1944: 7,369; 1945: 15,577.
[5] Talc, pyrophyllite, and ground soapstone sold by producers; includes also pinite in 1940–42 and 1944.
[6] Exports.
[7] Excludes estimates for countries listed in footnote 1.

Canada.—The Canadian talc and soapstone industry in 1945 was described as follows:[10]

Producers' shipments of crude and milled talc and soapstone totaled 27,088 tons valued at $294,888 in 1945 compared with 32,597 tons at $357,249 in 1944. Operators in Quebec shipped 14,225 tons of talc and soapstone worth $153,694 and mines in Ontario sold 12,863 tons, mostly high-grade talc, valued at $141,194.

Imports of talc and soapstone in 1945 amounted to 6,389 tons at $131,863, and exports of talc totaled 7,363 tons valued at $100,114.

The 5 active firms in the industry in 1945 employed 103 workers to whom $134,782 were paid in salaries and wages. Fuel and electricity cost $27,978 and process supplies for the mines cost $49,266.

The Bureau of Mines, Ottawa, has given the following information with regard to the talc industry:

"Canada is self-sufficient in respect to most of the grades of ground talc needed for its industrial requirements, and there is considerable surplus for export. It also produces most of the sawn dimension soapstone and talc crayons used, but is dependent on imports, obtained mainly from the United States, for certain special qualities of ground talc demanded by the ceramic, paint, and cosmetic trades.

"Ground talc has a wide variety of uses, but much the greater part of the out-

[10] Deir, A. R., The Talc and Soapstone Industry in Canada, 1945: Canada Department of Trade and Commerce, Dominion Bureau of Statistics, Mining, Metallurgical, and Chemical Statistics, Ottawa, Canada, 1947, 5 pp.

put is employed in the paint, roofing, paper, rubber, and ceramic industries. It is used, also, in foundry facings, bleaching fillers for textiles, cosmetics and pharmaceuticals, soaps and cleansers, insecticides, polishes, plastics, and for rice polishing.

"Soapstone, a soft greenish rock containing a high percentage of talc, is used extensively in the form of sawn blocks and bricks for lining the alkali recovery * * * furnaces and kilns of Kraft pulp and paper mills. It is also used for brick and slab liners for fireboxes, stoves and ovens, and for switchboard panels, laboratory benches, etc. Considerable quantities of soapstone quarry and sawing waste are ground and marketed as low-grade talc to the rubber, roofing, foundry, and other trades."

Additional statistical details are contained in the report as well as the names and addresses of the five operating firms.

GENERAL SUMMARY

AN AFTERMATH of the Japanese conquest of Malaya and the Netherlands East Indies persisted through a fifth year, 1946, in the form of a world tin shortage. The disappointingly slow progress in rehabilitation of the Far Eastern tin areas, combined with tremendous demand, enforced a continuation of international control over the distribution of available supplies. World mine output rose about 3 percent over the long-time low of 1945 to 89,000 long tons, or roughly half the estimated needs. Drafts on stocks of the United Kingdom and the United States, plus a part of the tin recovered from Japanese operations—about 25,000 tons in all—helped ameliorate the stringency. Near the end of the year arrangements were made for the sale and distribution of about 15,000 tons (tin content) of materials left from Japanese operations in Siam. Production expansion is expected from all parts of the Far East in 1947, but late estimates indicate that the world total may not meet requirements until 1949.

Salient statistics for tin in the United States, 1925–29 (average) and 1942–46

[1] Including tin content of ores used direct to make alloys.
[2] Ceiling price, 52 cents.

For 5 years there has been no world market price for tin. In 1946 the general price situation became greatly confused owing to the spread between buying and selling levels, complicated by consummation of retroactive purchase agreements at higher figures, price differentials between internal and external markets, and black market prices for small quantities of uncontrolled metal. At the year end the price of tin was 30 to 40 percent above the 1941 level, but this represented an increase substantially less than for copper, lead, or zinc over the same period. In the United States the internal price for Grade A tin was retained at the former ceiling of 52 cents a pound until early November, when, following the revocation of price and wage controls, it advanced to 70 cents and so remained to the end of the year.

The International Tin Control scheme came to an end December 31, 1946. A step toward replacement was developed at a meeting of representatives of producing and consuming nations in London in October. The principal outcome was a recommendation to form a Tin Study Group to be allied with the International Trade Organization proposed by the United States in 1945. Invitations were sent to the several interested nations asking participation in such a group. Final acceptances were received early in 1947, and an organizational meeting was held in Brussels in April.

There was no recorded domestic production of ore or concentrates in 1946. The Longhorn smelter set a new high, with an output of 43,468 long tons of pig tin. In the highest month it was near an annual rate of 47,000 tons but declined to about a 38,000-ton level owing to the dearth and low grade of raw material. Consumption of primary tin, notwithstanding easing of various control measures, was at 54,627 long tons, 2 percent below that in 1945. In the United Kingdom, on the other hand, the use (25,600 tons) was 56 percent greater than in the preceding year. In the United States the use pattern more nearly approached that of the prewar period. Tin plate took 48 percent of the virgin metal; solder 25 percent—a very high ratio; brass and bronze 9 percent; and babbitt nearly 8 percent. Imports of metal were 83 percent more than in 1945 and included tin from Japanese sources sent to the United States for grading and analysis before being made available for distribution by the Combined Tin Committee. The tin content of concentrates received during 1946 increased 14 percent compared with 1945 and was, in the main, attributable to larger receipts from Bolivia (2,584 tons) and reappearance of Netherlands East Indies as a source (2,206 tons). Tin plate and terneplate, constituting the principal export, dropped over 24 percent from 1945. The decline in foreign shipments was to a large extent due to a shortage in black plate, in part to a result of work stoppages in the steel and coal industries, and in part to the heavy domestic demand for containers.

Total stocks, excluding the Japanese tin mentioned above, dropped 12 percent to 84,000 tons, divided as follows: Industry, 28,200; Government, including 12,140 tons in sterilized stocks, 31,100 tons in metal and 24,700 tons in concentrates. Consumers' pig-tin stocks covering about 3 months' needs would permit little or no reduction, and only about 17,000 tons of the Government-owned supplies were

left available for distribution at the year end. Inasmuch as the new supply outlook was unfavorable, it became evident that use controls would have to be continued for another year at least.

GOVERNMENT TIN OPERATIONS

Under terms of the Civilian Production Administration order governing imports of strategic materials (M–63), tin imports continued to be channeled through Government hands throughout 1946. In March 1946 the original authority to buy ores and concentrates for the Government-owned smelter was reaffirmed. The Reconstruction Finance Corporation was permitted to purchase such materials without time limit. The Corporation was also freed from the provisions of the Emergency Price Control Act of 1942 that forbade loss or subsidized sales. The power actually ceased with expiration of that legislation on June 30 but was revived July 25 with approval of an act restoring the Office of Price Administration. Therein it was provided that, to June 30, 1947, the Reconstruction Finance Corporation might take any losses accruing through sales at the ceiling prices of tin obtained from smelting of ores or concentrates. This was interpreted to cover also the difference between cost and sales price of purchased metal. Wage and price controls were lifted by Executive and OPA order effective November 10. Thereafter the selling price (see section on Prices) was set from month to month on the basis of trade journal quotations and presumably would approximate the cost. At least, the loss in the ceiling-price period, estimated to have been about $1,500,000 monthly, would be substantially reduced.

Several contracts for purchase of tin and concentrates were concluded during the year. These included acquisition of tin and concentrates from the Netherlands East Indies and tin from the United Kingdom and China. The principal arrangement was again made with Bolivia. The supplemental 1-year contract to the original 5-year agreement expired June 30, 1946. Thereunder the prices for the first and second quarters of 1946 were, respectively, 60.5 and 58.5 cents a pound payable tin content plus a 1.5-cent production bonus, f. o. b. Chilean or Peruvian ports. Negotiations for renewal were undertaken in the spring but unsuccessfully, largely because of a wide disparity between the offered and demanded price and the period to be covered. The new agreement was announced in mid-August but was not formally ratified by Bolivia until September 13. It was made retroactive to January 1 and to run to December 31,1946. For the first half year the base price was 62.5 cents a pound payable tin, f. o. b. Chilean or Peruvian ports, plus smelting and production bonuses of 1.5 and 1.0 cents, respectively. In the second half the tonnage bonus became 3 cents, other elements remaining the same. This bonus was payable on a graduated scale for excess over a 16,632 long-ton payable tin content of the year's shipments. Provision was made for shipments other than those of the Patino group to United Kingdom, to Chile, and for the use of the Oruro smelter.[1]

The agreement with Belgian Congo also expired on June 30. The

[1] The text of the agreement was published in American Metal Market, vol. 53, No. 180, Sept. 18, 1946, p.4.

producers had long been dissatisfied with their price, said to have been 55 cents, f. a. s. West African port, and were reportedly unwilling to make a new contract except at above 70 cents.

GOVERNMENT CONTROLS

Dwindling stocks and inadequate new supply necessitated retention of various controls over tin consumption in 1946. They were made effective principally through CPA Conservation Orders M–43, which limited distribution of tin, and M–81, containers. CPA Iron and Steel Production Order M–21 further provided means for directing the use of tin-mill products to certain purposes. Early in the year, during the steel mill work stoppages, Direction 9 under this order confined use of tin plate to specified uses, principally packing of seasonal and perishable foods. There were subsequent modifications and in December the restrictions were lifted. As a part of the overall plan to remove Federal controls over the flow of industrial raw materials, several amendments to M–43 and M–81 permitted wider use of tin. In general, they raised consumer quotas and permitted the use (or a greater percentage) of tin, in various products; regarding containers, they removed quota limitations and allowed the use of tin plate for a wide variety of food and nonfood packs heretofore prohibited. The tin weight for various packs, however, remained under control. At the year end the CPA, with general industry approval, reported that, in view of the continued scarcity, controls would be continued through March 31, 1947, when authority therefor under the second War Powers Act expired.

After 5 years of restrictions that held use of virgin tin in the neighborhood of 54,000 long tons despite the abnormal use in bronze and brass, it would appear that a much higher consumption need not arise when limitations no longer exist. Among the notable savings was that in solder. Automobile makers were large users; one large manufacturer estimated it to require 5 pounds of tin per car in 1940, with about 2 pounds in 1945, and there was a suggestion that return would not be made to earlier practice. The major saving was, however, in the development and use of electrolytic tin plate. This was reliably estimated to have exceeded 60,000 tons in the 5 years 1941–45. In 1946 the trend toward electrolytic plate was not accentuated. It comprised nearly one-third the total tin-plate production as in 1945. However, the output of electrolytic plate rose 3 percent, whereas that of hot-dipped was less than 1 percent higher than in 1945. In 1946 the average weight of tin per short ton of tin plate was 11.9 pounds for electrolytic, with 27.1 pounds for hot-dipped plate. Corresponding averages for 1945 were 11.9 and 27.2 pounds.

DOMESTIC TIN INVESTIGATIONS

Small-scale field investigations of tin occurrences were carried out in 1946. The Bureau of Mines continued exploration in the Cape York district, Alaska, and planned further work, in 1947. Several

publications [2] reviewing wartime strategic mineral surveys relating to tin have been issued. A general review [3] of Alaska's mineral potential by Bain gives a short summary of recent work.

DOMESTIC PRODUCTION

MINE OUTPUT

For the second successive year no production of domestic tin ore or concentrates was reported to the Bureau of Mines. Although investigations in known tin areas have revealed small deposits, none has shown evidence of being able to sustain a sizable commercial operation, even at a very high price for tin.

Mine production of tin (content) in the United States, 1942–46, by States, in long tons

Year	Alaska	South Dakota	Other States [1]	Total	
				Long tons	Value
1942	2.8	1.4	2.1	6.3	$7,300
1943	.1	.6	5.2	5.9	6,800
1944		[2]	[2]	5.4	6,200
1945					
1946

[2] Included in total.

SMELTER OUTPUT

In 1946 domestic tin smelters made a new high, with an output exceeding 43,500 long tons of metallic tin. This record was attributable to the 7 percent greater output of the Government-owned Longhorn smelter compared with that of the preceding year. Beginning in October 1945 with a record monthly outturn of 3,558 long tons, production increased each month through May 1946, when a new peak of 3,904 tons was established. Thereafter, largely, because of a dearth of concentrates, output fell and averaged 3,151 tons a month in the last quarter, and as the smelter's stocks were reduced to a working level production probably will not rise unless receipts increase.

The Longhorn smelter—which probably would rank as the world's largest if high-grade alluvial concentrates were procurable—nevertheless has produced more tin than any other since it began operation in April 1942. In nearly 5 years to the end of 1946, it had turned out 151,101 long tons of metal, with by far the greater part as Grade A. More than three-quarters of the ore supply was in the form of highly impure and low-grade Bolivian concentrates with a tin content range

[3] Bain, H. Foster, Alaska's Minerals as a Basis for Industry: Bureau of Mines Inf. Circ. 7379, 1946, 88 pp.

generally of 18 to 50 percent and a 1946 average in the neighborhood of 37 percent. Early in the year operating and miscellaneous costs were estimated to have been about 7.0 cents a pound of tin produced. Ore costs were about 65 cents, making a total of approximately 72 cents. With the selling price at 52 cents until November, sales were subsidized to the extent of 20 cents a pound or a total of about $17,000,000 for the year. During the year experiments on recovery of acid and metals from plant waste were carried out, and the construction of an ingot-casting machine was undertaken.

In addition to the Government smelter only the Vulcan Detinning Co. plant was active in 1946. This company has been experimenting with processes for the recovery of tin from complex low-grade ores.

SECONDARY TIN

Notwithstanding the strong demand and high prices that prevailed, the quantities of tin-bearing scrap—principally copper- and lead-base materials—treated in 1946 at secondary plants fell sharply and resulted in a drop of over 21 percent in total tin recovery compared with 1945. The decline in recovery at detinning plants was virtually of the same magnitude (21 percent) and was almost fully attributable to the 75-percent decrease in old cans treated, while the quantity of new clippings treated was off about 3 percent but only 1 percent in tin recovered. Although the CPA conservation order (M–325, effective June 16, 1943) that had directed tin-plate scrap and old cans to detinners was not revoked until November 26, 1946, the never effective salvage campaign deteriorated with great rapidity after mid-1945, and a year later the preparation of old cans by housewives had practically ceased.

Secondary tin recovered in the United States, 1925–29 (average) and 1942–46, in long tons

Year	Tin recovered at detinning plants			Tin recovered from all sources			
	As metal	In chemicals	Total	As metal	In alloys and chemicals	Total	
						Long tons	Value
1925–29 (average)	900	2,000	2,900	7,500	23,100	30,600	$38,034,120
1942	4,700	200	4,900	5,200	28,700	33,900	39,434,720
1943	3,900	200	4,100	4,700	29,100	33,800	39,332,800
1944	3,350	310	3,660	3,800	25,300	29,100	33,892,560
1945	3,150	400	3,550	3,300	28,100	31,400	36,538,320
1946	2,480	330	2,810	2,600	22,100	24,700	30,205,663

Nearly all the secondary tin was recovered at privately owned plants. The Government-owned plant at Birmingham, Ala., ceased operation in April 1946 and, offered for sale by the War Assets Administration in November, was sold for other than tin-recovery purposes. Its capacity was 20,000 tons of scrap annually. The Secondary Metals—Nonferrous chapter in this volume contains details on secondary tin recovery.

CONSUMPTION

APPARENT CONSUMPTION

Apparent consumption of tin in 1946 increased 21 percent over that in the preceding year. This figure is derived by adding net imports to domestic smelter production. Since changes in consumer, dealer, and Government stocks are not taken into account, the calculated figure may depart widely from the actual. When, as in the preceding 4 years, the deficit in supply is made up from accumulations, the apparent use understates the true value. The accompanying table gives the data for 1939–46. Comparable figures for 1910–38 were published in Minerals Yearbook, 1939, page 680.

Apparent consumption of tin, 1939–46, in long tons [1]

1939	67,997
1940	123,537
1941	141,618
1942	42,512
1943	[2] 31,638
1944	43,379
1945	[2] 48,086
1946	58,144

[1] Exports of domestic tin are not included in 1939–41. They are included in the figures for 1942–46 and are 244, 398, 405, 708, and 859, respectively.
[2] Revised figure.

CONSUMPTION BY USES

Despite some liberalization in permitted uses in 1946, the total consumption of tin was 3 percent below that of 1945 largely because of strikes in consuming or related industries. The consumption of primary metal did not reach the prewar (1935–39) average by about 8,000 long tons or 12 percent and was approximately 60 percent of the quantity estimated early in 1946 if there had been an unlimited availability. Such a consumption figure now appears unduly high. Tin savings based on the retention of some wartime economies render direct comparisons with prewar periods misleading. They are resorted to here solely for reference. The accompanying tables derived from reports made to the Bureau of Mines show actual consumption of primary and secondary tin, both where it entered process and left as finished products.

Tin plate (and terneplate) was the predominant user of primary tin, taking 48 percent of the new metal or about 6,000 tons (19 percent) less than in 1935–39, while, owing to the growing adoption of electrolytic plate, tin plate output was 22 percent higher. Solder, in second place, took 23 percent more than in 1945 and nearly 25 percent of the new tin used, owing to relaxation in tin limitations. Babbitt, which in the prewar period accounted for a little more than 6 percent of virgin tin consumption and held third place, remained in fourth position and took about 8 percent of the virgin tin. Third in rank was bronze (and brass), for which 34 percent less new tin was used in 1946 than in 1945.

In respect to total tin used, the four largest product groups accounted for more than 90 percent compared with 80 percent in 1935–39. Tin plate recovered first place, with 32 percent, followed by bronze and brass 28 percent, solder 21 percent, and babbitt 9 percent.

Consumption of primary and secondary tin in the United States, 1942–46, in long tons

	1942	1943	1944	1945	1946

STOCKS

The planned deterioration in the stock position in the United States, as in the world at large, was much in evidence in 1946. Actually the drop was a few thousand tons less than anticipated because of the steel and coal strikes. At the end of 1946, total stocks of tin and tin in ore were 71,734 long tons or 14 percent less than at the end of 1945. The total excludes 9,817 tons of Japanese tin sent to the United States by the Supreme Commander for the Allied Powers,

subject to international allocation by the Combined Tin Committee. The CTC, at its October 23, 1946, meeting, made 4,990 tons available. There being no other takers, it was acquired by the United States in February 1947. In addition, 12,204 tons were in process in scrap and as secondary tin. Aside from 12,140 tons of pig tin held by the Navy Department and the Bureau of Federal Supply (formerly the Procurement Division) of the Treasury Department, the Government held 18,932 tons of metal and 24,642 tons of tin in concentrates, down respectively 11 and 24 percent from 1945.

Usable Government stocks were something over 7 months' supply at the 1946 use rate; but much was locked up in in-process materials, and new supply available for distribution became essentially equivalent to receipts of foreign metal plus output of domestic smelters.

Stocks of virgin pig tin in the United States, Dec. 31, 1942–46, in long tons [1]

	1942	1943	1944	1945	1946
At consumers' plants	31,064	22,861	17,337	14,102	14,532
At other warehouses and in transit	78	316	1,941	1,600	1,000
Held by jobbers	84	50	47	69	124
Total consumers' stocks	31,226	23,227	19,325	15,771	15,656
Afloat to United States (estimated)	900	1,650	1,800		1,570
Total stocks [1]	32,126	24,877	21,125	15,771	17,226

[1] Excludes Government purchases delivered for stock piling or at Texas City smelter. Also excludes tin in process and secondary pig tin.

As customary for more than a decade, the Bureau of Mines canvassed tin users to determine consumption and stocks of tin. According to the replies, consumers had 14,532 tons of virgin tin at the year-end, of which 7,286 tons were held by tin-plate manufacturers; in addition, 439 tons of secondary pig tin were on hand. At the end of the year 1,000 tons of primary tin were in transit and in warehouses.

PRICES

In the United States in 1946 the price of tin until November 12 was held at the ceiling of 52 cents a pound (Grade A) established in 1942 by the Government. The President announced November 10 (Sunday) the lifting of most price controls. On November 12 the principal detinners named a price of 70 cents a pound for Grade A tin; and the following day the predominant supplier, the Office of Metals Reserve, directed the Tin Sales Corporation, its distributor, to price all uncompleted November and new November allocations at the same figure. At the end of the month the price for December deliveries was fixed at 70 cents for Grade A, with the usual differentials for other grades. The average for the year, according to the American Metal Market, was 54.58 cents. The November change brought domestic prices close to those established for the United Kingdom 1½ months earlier.

Prices, by grades and brands, beginning November 12 were as follows:

Grade A. 99.80% or higher, meeting specifications set forth in M. P. R. No. 17	70.00c
Following brands of pig tin will be considered as qualifying as Grade A: Longhorn 3-Star, Chempur, Pyrmont, Straits Trading, O. T. Lempriere & Co., E. S. Coy (Penang), Billiton, Mellanear (Guar. 99.9%), Hawthorne Refined, Banka, Union Min. du H. Katanga, M and T No. 1, M and T Electrolytic Refined, Vulcan American Refined, Vulcan Electrolytic , Pass No. 1.	
Grade B. 99.80% or higher, not meeting specifications for Grade A, providing arsenic content does not exceed 0.05%	69.87½c
Grade C. 99.65% to 99.79% and 99.80% or higher, not meeting specifications for Grade A or Grade B	69.62½c.
Grade D. 99.50% to 99.64% (includes Longhorn 2-Star)	69.50c.
Grade E. 99.00% to 99.49% (includes Longhorn 1-Star)	69.12½c
Grade F. Below 99% pure (for tin content) (includes Longhorn No-Star)	69.00c.

It long had been recognized that the domestic selling price was much below cost. The Office of Metals Reserve had been authorized at the end of 1945 to price tin for export without reference to price ceilings, but up to March 1 the export price was held at the internal level. It was then raised 6 cents to 58 cents, was advanced on June 1 to 61 cents, on September 21 to 64 cents, on November 1 to 69½ cents, and finally on November 13 to 70 cents—the new domestic price. Although tin exports have been inconsequential, the prices set seemingly reflected an attempted adjustment to foreign levels.

In the United Kingdom, the domestic price was held at £300 a long ton delivered buyers' works until September 26, when it was

raised to £380 10s. (99.0–99.75 percent grade) or 68⅜ cents. At the beginning of the year the export price was £375. On April 1 it was cut to £357 and then on September 26 was raised, delivered port, to the internal price. In Canada tin sold at 57¾ cents until after the dollar revaluation of July, when it became 63½ cents a pound.

At least since the closing of the London Metal Market in December 1941 there has been no generally accepted world price. British and American controlled sales prices since that time have run an approximately parallel course, but elsewhere there have been wide departures therefrom, as noted in earlier chapters of this series. The situation became even more complex when differential export prices were established. The gap between buying and selling prices became exaggerated as sellers refused to make new contracts at old prices. Not until autumn was there an approach to an approximate average and to one that reflected the greatly enhanced cost of production. For the last half year Nigerian producers received £357 10s. f. a. s. port; and Malayan, £370 at Penang-Singapore smelters with export sales at £372. The Bolivian price was raised to about £375 corresponding with the American agreement. At the end of the year the supported Australian price was £A383 or about 55¼ cents a pound. Small sales of "free" tin were said to have brought $1.00 a pound or more in South America, £680 in Hong Kong, and as much as £750 for Portuguese tin.

FOREIGN TRADE[4]

There has been no notable change in the foreign trade pattern since 1942, when imports of concentrates exceeded those of metal. Receipts of foreign tin in 1946 were 83 percent higher than in 1945 and the greatest in the past 4 years. The imports from Japan were a part of the tin stocks seized after the occupation and sent to the United States for grading and analysis. The first lots analyzed about 99.88 percent tin. Shipments from Malaya and Netherlands East Indies may have been in part tin found there after the Japanese evacuation. The tin content of concentrates imported was the highest recorded and was 14 percent more than in 1945. In terms of tin content, Bolivia with 28,520 tons (25,936 in 1945) furnished three-quarters of the material.

Foreign trade of the United States in tin and tin concentrates, 1942–46

Year	Imports				Exports

[1] Bars, blocks, pigs, grain, or granulated.
[2] Less than 1 ton.

The outward movement of tin plate, terneplate, and taggers tin dropped 24 percent from the 1945 level, in part owing to the strike-curtailed output in the United States and an increase of about 85,000 tons in British exports accompanied by a strong domestic demand for containers. In 1945 exports comprised about one-sixth of the tin-plate shipments, whereas they were about one-eighth in 1946. Latin America took, as in 1945, about 30 percent of the total and Canada about 16 percent. The greatest declines, amounting to about 70 percent of the total drop, were in shipments to countries in the British Commonwealth, notably to Australia and the Union of South Africa. A decline of about 32,000 tons in sales to Russia and 6,000 tons to France was not quite balanced by increased exports to other European countries.

WORLD REVIEW

INTERNATIONAL CONTROLS

The International Tin Control scheme remained formally in force to December 31, 1946, though practically it had not functioned after the British capitulation at Singapore in early 1942. A meeting of the International Tin Committee was held in London in March 1946 to discuss recommendations to be made to the participating Governments as to its future. The recommendations were not made public, but it was believed that continuation of the scheme was supported. At any rate, numerous influential producers strongly favored an extension to prevent the return of disordered industry conditions when an excess in supply should arise, which appeared probable by 1949 or (as later estimated) by 1950. Strong consumer opposition, principally on the part of the United States, brought about the support of the British Government to place the problem of tin production and distribution in the hands of a Study Group separate and distinct from the ITC, that later could be a unit of or related to the International Trade Organization proposed by the Department of State.

The first step toward that end was made by the United Kingdom Government after consultation with the Governments of the United States, Belgium, Bolivia, and the Netherlands in September 1946, when invitations were sent to the major producing and consuming countries—Belgium, Bolivia, China, France, Netherlands, Siam, United States, and the U. S. S. R.—which were asked to send delegates to an international conference to be held in London in October. The meeting was to consider the prospective tin position and whether any continuous intergovernmental study of that position is required. Delegates from all the invited countries except the U. S. S. R. attended the meeting. The conference agreed that world production in 1946 would be 94,400 tons, against consumption of 136,600 tons. In 1947 output was expected to reach 141,600 tons, with unrestricted use then reaching 190,000 tons and remaining through 1949 at that quantity, in which year production would have become 218,500 tons. The conference agreed that there was need for a continuing review of the world situation and consequently would recommend that an international tin study group be established as soon as possible. It was further agreed to recommend that the Combined Tin Committee continue to make allocations of available tin during the period of short supply and, moreover, that interested countries discuss means for continuation of the Tin Research Institute. The United Kingdom was to obtain, by January 1, 1947, from the governments invited to this conference, their decisions in respect to the establishment of the study group and to arrange for an early meeting. Early in 1947 acceptances were received and an organizational meeting was called for April 1947 at Brussels.

There was considerable dissatisfaction with the conference results. The final dissolution of the ITC was not touched upon, nor were matters of price, free markets, and the smelter situation discussed. The principal objection was that the study group would lack all authority, serving purely in an advisory capacity to the several interested governments.

WORLD MINE PRODUCTION

The receipt of official reports from many tin-producing countries has made possible further revisions in the accompanying table. Actual production figures for British Malaya during the Japanese occupation are not available, but the gross weights of production given by the Chief Inspector of Mines have been used as the basis for estimates.

Mine production in 1946 was approximately 3 percent greater than in 1945 and fell substantially below the expected figure, largely because of a decline in Bolivian exports and the slow recovery in southeast Asia, notably in Malaya. Supply exceeding normal demand is now not anticipated at earliest until 1949.

World mine production of tin (content of ore), 1925–29 (average) and 1939–46 by countries, in long tons

[Compiled by B. B. Mitchell]

Country	1925–29 (average)	1939	1940	1941	1942	1943	1944	1945	1946

WORLD SMELTER PRODUCTION

For the third year the United States was first in the smelting of tin ores, followed by the United Kingdom. Smelters in Malaya were in operation but were limited in output because of the shortage of ore supplies and to a minor degree lack of fuel. Native Siamese smelters were probably inactive, and in Japan one plant worked at part capacity for 3 months. On the Continent, Belgian and Dutch plants resumed on a small scale, whereas the principal British reduction works was reported to be near normal capacity. The accompanying table gives estimates of smelter output in 1939–46.

World smelter production of tin, 1925–29 (average) and 1939–46, by countries, in long tons

REVIEW BY COUNTRIES

Bolivia.—Exports of tin in concentrates and ore by Bolivia (37,717 tons) in 1946 declined 11 percent from 1945. The monthly rate of shipments improved during the latter half of 1946, consonant with the more favorable terms of a new retroactive tin ore-buying contract that was finally ratified on September 13, 1946. While terms were being negotiated, no material was tendered agents of the Reconstruction Finance Corporation. Ores continued to be shipped, however, to usual ports of destination. When the year closed, about 4,500 tons of tin in ore belonging to the United States were awaiting ship-

ment in South American ports. (Features of the contract are summarized in the section on Government Tin Operations.) Shortly before this contract expired on December 31, 1946, producers indicated they were going to ask for an increase in price to 76 cents for their product; and until a new contract was completed, producers decided to retain all production after January 1, 1947. There were reports during the latter part of October 1946 that Argentina was interested in acquiring Bolivian tin.

The United States was the destination of about 60 percent of 1946 shipments, and the remainder went to the United Kingdom. A considerable tonnage of low-grade material containing only about 8 percent tin from Compania Minera de Potosi was shipped to the Capper Pass smelter in England during the latter part of the year. The Hochschild group had been authorized to export 1,000 tons unsuited for treatment at the Texas City smelter. Consequently, shipments by the Medianos (independent intermediate-size operators)—13 percent of the total—increased 2 percent, whereas all other groups declined.

During 1946 exports of the Patino group amounting to 44 percent of the total declined 14 percent; those of the Hochschild group (27 percent) were 15 percent lower; those of Aramayo (7 percent) were 3 percent lower; and the small mines (9 percent) decreased 9 percent.

Political disturbances, labor difficulties, and increased operating costs adversely affected tin mining during 1946. Early in the year attempts were made to overthrow the Villarroel government. On July 18 an open revolt took place during which Villarroel and many other persons were killed. The provisional revolutionary government then set up was recognized by the United States on August 12. Cia. Minera Agricola Oploca de Bolivia (Patino group), which had been producing about 1,500 tons of fine tin annually, announced in November its intention to close down because of high costs. The San Jose mine of the Hochschild group was threatened with occupancy by the miners, but high costs presaged its probable early closing. Aramayo workers threatened to strike during February; and there were further disturbances during the latter part of December, when labor strikes occurred at this company's Telamayu and Animas mines. A strike of railroad employees tied up shipments of goods for about 9 days in June.

The Oruro tin smelter, after beginning production on a very small scale on ores above 55-percent grade in July, apparently has been unable to continue operations. A Villarroel decree ordering Patino and Aramayo to supply concentrates (50 tons tin content monthly) to the smelter has been considered null and void. The smelter's first test run resulted in the production of metallic tin of 98.75 percent (Grade F). Production costs were considerably more than had been expected.

British Malaya.—Revival of mining in Malaya was beset with manifold difficulties. There had been much damage to plant and equipment during the Japanese occupation, not only deliberately but by unskilled operation and faulty maintenance. The Japanese had surrendered in September 1945, but little other than surveys of prevailing conditions were carried out until the following spring. About one-third of the labor force had been dissipated, and there was serious

unrest among the remainder because of near-starvation conditions and lack of clothing and shelter—all aggravated by communist incitations. New equipment and replacements were slow to arrive and high in cost. Many Chinese, for example, did not reopen their properties because of the high cost of gravel pumps and because regulations covering rehabilitation loans were slow in the making. This same defect influenced many European operators, who lacked financial reserves to undertake substantial capital expenditures and were also uncertain as to adjustment for war losses and damages. Up to the end of 1946, however, rehabilitation loans of £2¼ to 2½ million had been approved and advances of about 70 percent made. Approved claims for war damage will apply against such loans. Aside from injury to plants was the matter of depletion of reserves. In September the Chief Inspector of Mines, Malaya, reported that the gross weight of Japanese production was 75,264 long tons in 1942–45, respectively, as follows—21,857, 36,161, 12,917, and 4,329 tons. Tin content was not given, but it has been estimated to have been 52,000 and 56,000 tons. Croston [5] estimated metal output to have been "78,797 metric tons of pig tin, mostly from Malayan operations." Imports into Japan from the Straits Settlements for 1942–45 were reported at 25,547 metric tons; and 4,500 long tons of tin and about 6,000 tons of concentrates were found after the British reoccupation.

A further deterrent to production was the matter of price. This had been set at £300 a ton (53⅞ cents a pound). Operators were reluctant to proceed, as their operating costs were much above the prewar level—variously estimated at 50 to 100 percent higher—and operating profits reduced about two-thirds. Further, both Britain and the United States were paying much more for poorer quality Bolivian concentrate. Finally, in September the price for the last half-year was fixed at £370 (66.4 cents a pound). The Tin Ore Buying Agency of the Ministry of Supply—the sole buyer of concentrates—and its Burmese counterpart ceased to fuction at the year end. Producers could then sell directly to any Malayan smelter, but the Ministry of Supply continues to purchase the entire metal output. Distribution is directed by the Combined Tin Committee. None was sent to the United States in 1946.

Coal, almost the entire source of energy, was provided from mines of the Malayan Collieries at Batu-Arang in Selangor. Production was 780,000 tons in 1940. When the British withdrew in 1941 the mine power plant was destroyed and the mines flooded. The Japanese attempted to revive production and mined about 250,000 tons in 1942. By the end of 1945 output had dropped to about 8,000 tons a month, with the mines in very bad condition and the native labor restive and unwilling to work. With the aid of military engineer detachments some repairs were made; and production reached about 25,000 tons in June 1946, then about sufficent to meet requirements. As the year advanced, production fell behind needs because of strikes, so that railroads and mines were rationed late in the year and some dredges shut down in December.

Another unsettling factor was the industrial nationalization pro-

[5] Croston, John J., Siam's Mining Industry Offers New Opportunities: Eng. and Min. Jour., vol. 147, No. 12, December 1946, pp. 60–64.

gram of the Home Government. While this had not been extended to the colonies—and all of Malaya is now essentially one—a White Paper had intimated that similar colonial action would at least be looked upon with favor. Inasmuch as the British coal mines were about to be taken over by the Government, there was some local apprehension that this program would be extended to Malayan coal mines.

Progress in the 1946 rehabilitaion program was disappointing. Reported output was only 786 tons (tin content) in the first quarter, virtually all from hand mining. Four dredges began operation in March; the number increased to 14 in September compared with the 41 expected according to the Inspection Committee report made public in the spring. In September, 24 additional dredges were under repair. At that time 181 mines were in operation (at the beginning of the year there were 45 small Chinese mines) and the month's output was 881 tons. The total for the three quarters was 5,424 tons, of which Chinese mines had furnished 36 percent, European-owned 34 percent, and others the remainder. Dredges that in the prewar period had provided half the tin accounted for only 23 percent of the output with 32 percent from gravel pumping—closely the prewar ratio. During the fourth quarter production increased to 3,008 tons, so that the total for 1946 was 8,432 tons (exports were 9,438 tons) compared with the Inspection Committee prediction of 12,300 tons.

The principal smelters at Penang and Singapore had suffered little damage, although the former had been used by the Japanese. The Penang plant resumed smelting on April 6, 1946, and the Pulau Brani works at Singapore on July 1. The Straits Trading Co., Ltd., plant at Butterworth was badly damaged by the Japanese. Refined-tin production was limited by ore shortage but should rise rapidly in 1947, not only because of increased Malayan mine output but from Burma ores and the British share of Siamese accumulations and new production.

Burma.—Mawchi Mines, Ltd., producer of tin and tungsten, had not completed assessment of damage to its plants and mines by the end of March 1946. During the year orders were placed for essential replacements and supplies. If no unforeseen delays should arise, it was expected that reconstruction would be so far advanced that operation would be resumed in the latter part of 1947. The Tavoy Tin Dredging Corp., Ltd., suffered considerable damage. Its office and records, as well as mine buildings and workshops at three operating sections, were destroyed, and supplies looted. Of six dredges, two were found to be beyond repair; the others were in fair to good order, and repairs to the three better ones were undertaken. The Japanese had worked all the dredges for a short time but had depleted reserves only slightly. All companies have or are submitting claims for compensation of war damage, but it was not expected that the Claims Commission in Burma would undertake their consideration until 1947, and the mining industry was low in the list of claimants. Strained internal political and economic conditions are likely to retard revival of mining.

Japan[6].—The discovery of tin (and tungsten) in 1908 in the ores

[6] Most of this section was abstracted from Tin Metallurgy in Japan, Report 82, Natural Resources Section, General Headquarters Supreme Commander for the Allied Powers, Tokyo, 1947, 34 pp.

of the Akenobe mine, Mitsubishi Mining Co., Ltd., south central Honshu, which had been worked for silver and copper for a millennium, led to the development of a tin mining and smelting industry. This mine has been the source of 60 to 70 percent of Japan's tin. Its peak output was 1,600 metric tons (tin content) in 1937. The ore contains about 0.7 percent tin, and concentrates ranged from about 40 to 55 percent. Most of the remainder of the native supply came from five mines in Kyushu. The Ikuno smelter, for which the Akenobe mine was the main source of ore, was built in 1913 with an annual capacity of about 120 tons; it was increased to about 1,650 tons in 1934 and to about 3,600 tons in the war period, when some high-grade foreign concentrates were used. The crude tin produced assayed about 91 to 97 percent. Depending on the grade and nature of the impurities, crude tin was fire-refined at the smelter or treated in the electrolytic refinery at Osaka constructed in 1920. The Toyo Mining Co., Ltd., reduction works at Oita, Kyushu, was the second largest tin producer. The first section, of about 1,080 metric tons annual capacity, came into operation in 1939. A second unit, of 480 tons annual capacity, began operation in 1941, and a third large one to handle concentrates from Siam and Indochina was constructed in 1941. The first two were supplied principally with tin and tin-lead concentrates from the Mitate mine, the second-largest ore producer in Japan. Until 1939 its ore was shipped to Singapore for treatment. The total output of refined tin in 1939–45 was given at 3,405 metric tons. The Mitsui Mining Co., Ltd., operated two smelters—the Totoro and the Miike plants, at Nobeoka and Omuta in Kyushu. The Totoro smelter was originally owned and built in 1934 by the Nakashima Mining Co., Ltd., and began production of crude tin in 1935. An electrolytic refinery was then added and began production in 1936. Output was very small until 1941, when concentrates from Indochina and Siam were made available. Imports were cut off by 1944 because of shipping losses, and operations ceased in April. The total output in 1938–44 was reported at 691 metric tons fine tin. The Miike plant was a small, temporary unit that operated only from 1942 to 1944 on Siamese and Indochinese concentrates. The total output for the period was only 239 tons.

None of the smelting plants received direct military damage; but some auxiliaries suffered from air raids, and equipment of the principal smelter was in bad condition through lack of care and maintenance. Only the Mitsubishi works was in operation in 1945 and apparently for only a short time. In October 1946 it temporarily resumed operation, using a remaining stock of imported concentrates. Output of refined tin in the last quarter of 1946 was about 70 metric tons. The future rate of operation was estimated at 20 to 40 tons, depending on the supply of coal and concentrates.

Annual consumption in Japan averaged 4,400 metric tons in 1927–31. The militaristic expansion that then set in raised the use to 6,472 tons in 1936. In 1941–45 apparent annual consumption was about 8,000 tons. Requirements for 1947 were estimated to be 3,200 tons. As domestic ores furnished more than 2,000 tons in only 4 years in the past 2 decades, requirements were met by metal imports, except during the war, when concentrates were received from southeast Asia. From 1925 through 1935 pig-tin receipts ranged from

2,970 to 4,252 tons and averaged about 3,750 tons. As preparations for war were made, they increased rapidly, reaching 10,868 tons in 1940. Imports of tin and concentrates from 1941 to 1945 are shown in the accompanying table. According to Croston,[7] the Japanese produced 78,797 metric tons in Malaya; but imports into Japan totaled 25,547 tons for 1942–45, and only about 4,500 long tons of tin had been reported found in Malaya up to the beginning of 1946, leaving about 49,000 metric tons to cover shipments to the other Axis nations, reputedly to Russia, and lost at sea. After the end of the war about 14,000 tons of tin were found in Japan. Nearly 10,000 tons were shipped to the United States for grading and distribution by the Combined Tin Committee, and 4,128 tons remained on hand in Japan as of January 1947.

Japanese imports of tin and tin concentrates, 1939–45, in metric tons

Netherlands Indies.—The Dutch returned to Billiton late in October 1945 and to Banka in February 1946. Japanese damage to dredges had not been severe; but much of the electric equipment had been removed, and power plants and transmission lines were wrecked. Revival of mining was slow at first, with only 5 tons output in January 1946. In November it had reached 1,278 tons, and the year's production was 6,535 tons or about 13 percent of the 1941 record but at a much better rate than in Malaya. About 8 dredges out of a prewar 14 were working on Billiton at the year end and 2 on Banka, plus several smaller ones, including suction dredges on overburden removal. Exports were 3,797 tons of pig tin and 4,950 tons in concentrates. The excess over production was derived from stocks, left by the Japanese, consisting of 3,818 tons of metal and 6,618 tons of concentrates (about 70 percent tin). Croston credited the Japanese with production of 31,354 metric tons of tin during the occupation period.

The first of two large dredges ordered in the United States in 1945 was launched October 26, 1946, and the second on January 4, 1947, both in Florida. They have 14-cubic-foot buckets and can dig 100 feet below water line. They are expected to recover, each, about 1,000 tons of tin annually. Orders for six dredges also had been placed in the Netherlands. The first was launched in September and the third in November. Outfitting was to have been completed in February 1947, at which time towing to the Indies would begin.

[7] Work cited in footnote 5 (p. 63).

Early in 1946 it was announced that half the Billiton output—Banka had little during the year—would be sent to the United States and the remainder to the Netherlands for reduction. There the Arnheim smelter had resumed operation and is believed to have produced about 800 tons of tin during the year.

Political conditions became increasingly serious and eventuated in the formation of an Indonesian Republic centered principally in Sumatra and Java, with the eastern islands—the tin group and the Riouws—remaining under Dutch control. Numerous disaffected areas persisted, leaving a final solution of the colonial problem much in doubt.

Nigeria.—Peak production of 12,835 tons in 1943 had declined to 11,224 in 1945 and 10,333 in 1946. Until the end of 1945, the Nigerian producers had contracted with the British Ministry of Supply for sale of concentrates on a prewar cost and profits base to which there had been growing objection. A renewal offer by the Ministry at £300 a ton for tin in concentrates, f. a. s. Nigerian port, was not acceptable to the Nigerian Chamber of Mines. During the war producers claimed that reserves had been notably depleted and plant and equipment had deteriorated through hard and more extended use with inadequate replacement. Now costs had risen, much deferred prospecting had to be undertaken, and the Ministry was paying others much more. Not until September 1946, coincidental with the establishment of new British and Malayan prices, were negotiations concluded. The rates announced were £340 a ton for tin in concentrates, f. a. s. Nigeria port of shipment, retroactive for the first half year and £357 10s. for the second half. Freight, insurance, and smelting charges as in the preceding contract were for the account of the purchaser. It was estimated that these expenses had risen to about £22½ to £25 a ton of tin.

Siam.—With an annual output of about 16,600 long tons in 1939–41, Siam provided 7.6 percent of the world's new supply of tin. Three-quarters of the production was in the hands of "European" operators—almost all British and Australian—with virtually all the remainder in Chinese and Siamese hands. The predominant group's output was mostly derived from dredging, with about 40 dredges in operation at the outbreak of the war. Immediately after the Pearl Harbor attack the Japanese-controlled Siamese Government formed the Thai Minerals & Rubber Co., Ltd., to take over foreign tin enterprises and retained about 90 percent of the capital stock. During the occupation production was 26,032 tons of concentrates containing 18,151 tons of tin. At the end of the war about 16,000 tons of concentrates and 4,000 tons of pig tin remained in Siam. Exports to Japan were 2,691 metric tons of tin in concentrates (metal was not shipped), but reported receipts (see section above on Japan) were about 10 percent less. Some tin was smuggled out of the country both during and after the war.

Formal peace agreements between Siam, Great Britain, and India were signed January 1, 1946, and with Australia on April 3, 1946. Siam expressed willingness to participate in any general international understandings regarding commodity agreements acceptable to the

United Nations. Further, exports of tin, except as recommended by the Combined Tin Committee, would be prohibited until September 1, 1947; and it also agreed to regulate the trade in tin and to stimulate production, while assuming responsibility for all British property rights and interests—including tin stocks—that were valid on December 7, 1941, and to compensate for losses and damage sustained during the war. Protracted discussions between the interested governments followed. They related importantly to procedures for disposal of accumulated tin stocks and of new production. The British program tied the disposal to reparations and would have tended to control the distribution of future output. The United States then entered the discussions and insisted that Siam's sovereignty be maintained and that the United States have free access to Siam's tin. In October the Siamese Government reported that it was prepared to return British and Australian mines to their owners, some of which at about that time were resuming production. On December 7, 1946, agreements were concluded between Siam and Great Britain and Australia. It was agreed that Siam compensate the owners for the operating profits on 15,993 tons of ore (70 percent tin), covering mine stocks as of December 8, 1941, and ore extracted up to the time of the peace treaties, at the price prevailing in 1941—that is, £264 12s. Mine owners further may claim damages for other losses they may have incurred during the war. Siam could then export tin, under supervision of a Tin Commission comprising a representative each from the United Kingdom, Australia, the United States, and Siam and in accordance with the allocations of the Combined Tin Committee. This group, which became the successor of the Combined Raw Materials Board on January 1, 1946, controls distribution of metal only. Siam was therefore free to distribute concentrates to its own advantage and agreed that they should be available equally to the United States and the United Kingdom at the ruling Malayan price, then £370 a ton for metal content. In 1946 the Combined Tin Committee allotted 2,000 tons of tin to the United States, but the first shipment—45 tons—was not received until May 1947 and the first lot of concentrates in June.

At the end of 1946 little was known of conditions at the various mines. Although no scorched-earth program was carried out, plant and equipment had deteriorated considerably. Available spare parts had been used while normal care and maintenance was not exercised, and some mining tracts were heavily depleted. The December agreements, however, contemplated quick compensation to property owners; and with the strong demand, current high prices, and apparent opportunity for new capital investment, it appeared that the Siamese tin industry would revive more rapidly than Malayan.

United Kingdom.—There was a strong upturn in the British tin trade in 1946. Imports of tin were 634 tons and 44,540 tons of concentrates, estimated to contain about 28,400 tons of tin. Exports of pig tin at 20,608 tons were about double those of 1945 and 20 percent above the prewar average. Consumption of primary tin (25,606 tons) was 56 percent higher than in 1945 and 12 percent more than in the 1935–39 period. The total tin used (33,244 tons) was about one-third greater than in the preceding year. The principal increased uses were for tin plate, up 57 percent at 7,331 tons; solder, 14 percent

to 6,646 tons; alloys, 16 percent to 14,055 tons; and collapsible tubes and foil, 342 percent to 2,126 tons. The several increases were at the expense of accumulated Government and consumer stocks that in tin content at the beginning of the year were closely 33,300 tons and at the end 20,400 tons.

Tin-plate ouput (including terneplate) rose sharply from 311,100 tons in 1945 to 439,000 in 1946 and exports (excluding terneplate of about 5,000 tons in each year) moved upward from 27,174 tons to 112,545. The controlled price of coke tin plate for home use was increased in August from 32s. 6d. to 34s. 3d. per base box, f. o. b. markers' works. The export prices were increased several times from 35s. at the beginning of the year to 47s. 6d. f. o. b. port in the last 3 months and averaged 41s. 9.45d. for the year. There was considerable range in the actual prices, which varied with country of destination.

A 5-year plan for the modernization of the British iron and steel industry, estimated to cost £200,000,000 had been approved by the Iron and Steel Federation but had not been agreed to by the Board of Trade up to February 1947. The plan envisaged the expenditure of about £50,000,000 in south Wales, where output is predominantly plate and sheet. A hot-strip and three cold-rolling mills and modern tin-plate mills are to be built. There appeared to be reluctance to provide electrolytic facilities beyond the plant now under construction at Ebbw Vale.

Mine production has declined uninterruptedly from 1,999 tons in 1938 to 793 in 1946. The East Pool and Agar mine that had been worked for more than a century closed in 1945 leaving only the South Crofty and Geevor mines in operation. In the year ended March 31, 1946, the latter crushed 44,943 tons and recovered 552.6 tons of concentrate or 27.54 pounds of black tin a ton. The Ministry of Supply purchased all Cornish tin on a cost-plus basis. An interrogation in the House of Commons brought out that the cost was about £456 (82 cents a pound) a ton in 1945.

Titanium

By HELENA M. MEYER AND R. LOUISE BRYSON

GENERAL SUMMARY

RECORD consumption of ilmenite by manufacturers of titanium pigments featured the titanium industry in 1946 as in 1945. Makers of titanium dioxide operated at a new high rate in 1946 but were unable to supply the unprecedented industrial requirements for their product. The rising use of titanium pigments in recent years has made increasing inroads into markets previously supplied by other white pigments. Titanium dioxide demand was accentuated in 1946, however, as in 1945, by the inability of makers of other white pigments to meet their market demand, chiefly because of crude material shortages. A lower rate of domestic production of ilmenite—8 percent less than in 1945—was due principally to a labor shortage and shorter work week at the world's largest titanium mine, Tahawas, N. Y.; but the gain of 15 percent in imports more than offset the domestic drop, and stocks were augmented by more than 100,000 tons during the year. Inventories of ilmenite on hand at the end of 1946 could fill consumption requirements at the peak rate in 1946 for almost a year.

Labor strikes at coal mines and steel plants impeded the delivery of structural materials, heavy machinery, and equipment for the plant expansion by three domestic titanium dioxide producers. Full effects of the expansion in progress early in 1947 will not be felt before 1948.

Rutile production was at a new record rate in 1946, or 4 percent over 1945. Because of this high rate and the 27-percent drop in consumption, domestic producers could supply domestic requirements for the first time since the mineral has become of industrial significance. Imports dropped 45 percent to the lowest level since 1940. Rutile inventories at the close of 1946 were sufficient for 2 years' consumption at the 1946 rate.

Increased possibilities for use of titanium metal in the light-metal construction field and for other engineering uses, as a result of a process developed by the Bureau of Mines for making cheaper metal, were pointed out in a recent report, discussed briefly under Technology.

The decision of the District Court of the United States for Southern New York that certain factors in the titanium pigments industry were guilty of monopolistic practices, mentioned in the report of this series for 1945, was appealed. The case was argued before the Supreme Court on February 3 and 4, 1947, but a decision had not been rendered at the time this report was written.

Ilmenite prices were reduced from $28–$30 a long ton, f. o. b. Atlantic seaboard, quoted nominally at that level since February 1941, to $19–$20 in December 1946, with the specified average grade

reduced from 60 percent to 57–60 percent. Prices for rutile have been unchanged at 8–10 cents a pound, 94 percent TiO_2, for several years.

DOMESTIC PRODUCTION

Ilmenite output fell 8 percent in 1946 but was second only to the production for 1945. On the other hand, rutile production rose 4 percent to a new high record in 1946. Shipments of ilmenite concentrates in 1946 ranged from 44 to 60 percent TiO_2 and shipments of rutile concentrates from 93 to 94 percent TiO_2.

Production and mine shipments of titanium concentrates from domestic ores in the United States, 1942–46

Year	Ilmenite				Rutile			
	Production (short tons)	Shipments			Production (short tons)	Shipments		
		Gross weight (short tons)	TiO_2 content (short tons)	Value		Gross weight (short tons)	TiO_2 content (short tons)	Value
1942	77,208	93,397	41,328	$1,805,823	2,648	2,649	2,466	$410,956
1943	203,551	211,715	94,283	3,738,970	3,987	3,941	3,639	610,879
1944	278,610	280,791	128,095	7,371,279	6,922	6,770	6,312	1,088,112
1945	308,516	308,518	141,852	7,359,170	7,179	6,837	6,414	869,920
1946	282,447	282,708	130,624	4,878,917	7,453	7,514	7,046	996,989

Florida.—Humphreys Gold Corp., operating under lease from Rutile Mining Co., and its parent company, the Titanium Alloy Manufacturing Co., near Jacksonville, has increased the capacity of its sand-washing plant (for recovery of rutile, ilmenite, and zircon) to 7,500 tons daily. There are 316 spirals in all at this plant.[1] Riz Mineral Co., producer of ilmenite, rutile, and zircon near Vero Beach, ceased operations the latter part of October 1946.

New York.—Production of ilmenite at Tahawus, Essex County, by the National Lead Co., dropped in 1946 compared with 1945 as a result of the labor shortage and reduced work week.

New Jersey.—The Calco Chemical Division, American Cyanamid Co., placed its revamped titanium-pigment facilities in operation at Gloucester City at the end of 1946. The plant was acquired from the Sherwin-Williams Co. in 1945.

North Carolina.—The Yadkin Valley Ilmenite Co., subsidiary of the Glidden Co., produced 17,102 short tons of ilmenite (averaging 52.4 percent TiO_2) at Finley, Caldwell County.

Virginia.—Rutile and ilmenite were produced near Roseland, Nelson County, by the American Rutile Corp., subsidiary of the Metal & Thermit Corp. The Calco Chemical Division of American Cyanamid Co. produced ilmenite at Piney River, Nelson County. A study of the ore body at Piney River indicates that most of the ilmenite is primary and occurs in an igneous dike formation suggesting greater continuity of the ore body.[2]

Wyoming.—The Iron Mountain deposits were examined[3] in 1943 by the Bureau of Mines and a diamond-drilling project was set

[1] Engineering and Mining Journal, vol. 147, No. 10, October 1946, p. 104.
[2] Davidson, D. M., Grout, F. F., and Swartz, G. M., Notes on the Ilmenite Deposit at Piney River, Va.: Econ. Geol., vol. 41, No. 7, November 1946, pp. 738–748.
[3] Frey, Eugene, Exploration of Iron Mountain Titaniferous Magnetite Deposits, Albany County, Wyo.: Bureau of Mines Rept. of Investigations 3968, 1946, 37 pp.

up under the strategic minerals program; drilling operations were completed November 1, 1944. Samples combining all outcrops of the deposit were submitted to Bureau of Mines metallurgical laboratories. The chemical composition of a typical specimen of titaniferous magnetite ore was: TiO_2, 10.5 percent; Fe, 36.05 percent; MgO, 13.4 percent; SiO_2, 16.6 percent.

CONSUMPTION AND USES

Consumption of ilmenite gained 6 percent in 1946, establishing a new high record; but titanium pigments, the chief product made, were in insufficient supply to meet demand, nonetheless. The manufacture of titanium dioxide took 99 percent of the total. All other uses took less ilmenite than in 1945. The use of rutile dropped 27 percent to the smallest total since 1941. Rutile is employed chiefly in welding-rod coatings, which took 84 percent, and alloys and carbide, which took 15 percent.

Consumption of ilmenite and rutile in the United States, 1945–46, by products, in short tons

Product	Ilmenite		Rutile	
	Gross weight	Estimated TiO_2 content	Gross weight	Estimated TiO_2 content
1945				
Pigments (manufactured titanium dioxide)[1]	371,691	183,195		
Welding-rod coatings [1]	115	62	7,813	7,344
Alloys and carbide	8,611	3,976	1,923	1,750
Ceramics			34	30
Miscellaneous [2]	761	347	21	20
Total consumption	381,178	187,580	9,791	9,144
1946				
Pigments (manufactured titanium dioxide)[1]	399,042	200,352		
Welding-rod coatings [1]	105	57	5,990	5,600
Alloys and carbide	4,685	2,025	1,035	966
Ceramics			75	72
Miscellaneous [2]	451	229	34	32
Total consumption	404,283	202,663	7,134	6,670

[1] "Pigments" include all manufactured titanium dioxide, consumption of which in welding-rod coatings was 2,258 tons in 1945 and 938 tons in 1946.
[2] Consists of ilmenite used as a steel flux and rutile used in lamp-electrode coatings and as a steel deoxidizer.

Titanium Pigments.—Production and sales of titanium pigments established new high records again in 1946, but the capacity production rate was inadequate by a substantial margin to fill the peak and still growing demand for the product. As pointed out in the opening statement of this report, the continuing pinch in supplies of raw materials for the manufacture of competitive white pigments (lead for white lead carbonate and white lead sulfate, and zinc for zinc oxide, lithopone, and zinc sulfide) accentuated the stringent supply situation in regard to titanium dioxide. Since 1939 titanium dioxide has been utilized in greater quantity than any other white pigment. The Bureau of Mines is not at liberty to publish figures on titanium pigments. According to information received from a leading manufac-

turer, the use pattern was unchanged in 1946 from 1945, when he estimated that 75 percent was used for paint, varnish, and lacquer, 10 percent for paper, 2 percent each for floor coverings and rubber, 1½ percent each for welding-rod coatings and textiles, and 8 percent for other uses.

Testimony in the United States Department of Justice antitrust suit against factors in the titanium-pigments industry brought out that production of titanium pigments in the United States had risen from 100 tons (TiO_2 content) in 1920 to about 128,000 tons in 1941 and was 110,000 tons in 1943. Estimated foreign production was about 1,000 tons in 1920 and 23,000 in 1938.

Welding-Rod Coatings.—Production of titanium-coated welding rods was 133,000 short tons in 1946, marking a continuation of the decline since 1943 and the smallest total since before 1941; 267,000 tons were produced in 1945, 382,000 in 1944 and 481,000 in 1943. Of these rods in 1946, 53 percent were coated with natural rutile, 33 percent with manufactured titanium dioxide (extracted from ilmenite), 8 percent with both varieties of dioxide, and 6 percent with ilmenite. The drop in welding-rod output was due to termination of war demand.

Titanium Alloys.—Titanium alloys are discussed in a report described under Technology.

Other Uses.—Titanium in the form of metal had been available in only very small quantities prior to recent experimental work by the Bureau of Mines (see section on Technology). The Bureau's report stated that the large-scale use of ductile metallic titanium would appear to depend only on its availability in suitable form and at a price no longer marking it a rare and precious metal.

STOCKS

Ilmenite and rutile stocks increased 40 and 46 percent, respectively, during 1946.

Stocks of titanium concentrates in the United States at end of year, 1945–46, in short tons

Stocks	1945				1946

[1] Includes ilmenite and rutile content of mixed zirconium-titanium concentrates.

PRICES

Ilmenite, 60 percent TiO_2, continued to be nominally quoted at $28–$30 a long ton, f. o. b. Atlantic seaboard, until June 1946, when 57–60 percent TiO_2 was quoted at $24–$26; in November it dropped

to $22–$24 and in December to $19–$20 a long ton. Rutile, 94 percent TiO_2, remained at 8–10 cents a pound. Steel quoted ferrotitanium, ton lots, at $1.23 per pound of contained Ti for 40- to 45-percent grade and $1.35 for 20- to 25-percent grade; and ferrocarbontitanium, 15–20 percent Ti at $142.50 a short ton for 6- to 8-percent carbon and $157.50 for 3- to 5-percent carbon. Titanium metal, 96–98 percent, was listed at $5–$5.50 a pound. The price of manufactured titanium dioxide remained at 14½–16½ cents a pound.

FOREIGN TRADE [4]

Imports.—Ilmenite imports in 1946 increased 15 percent compared with 1945. India furnished 90 percent of the entries in 1946; but, except for a small quantity in October, there were no receipts from that country in the last 7 months of the year. Entries from Norway increased during the year. Imports of rutile dropped 45 percent to the lowest level since 1940. Titanium is imported from Australia only in the form of mixed zircon-rutile-ilmenite concentrates, which are separated into their component minerals by the International Titanium Corp. (subsidiary of the American Rutile Corp. and Ventures, Ltd.), Carteret, N. J.; Orefraction, Inc., Pittsburgh, Pa.; and Titanium Alloy Manufacturing Co., Niagara Falls, N. Y. Four short tons of ferrotitanium and 12 tons of titanium potassium oxalate were imported in 1946.

Titanium concentrates [1] imported for consumption in the United States, 1942–46, by countries, in short tons

[1] Classified as "ore" by the U. S. Department of Commerce.
[2] All imports of titanium from Australia in 1942–46 were in mixed zircon-rutile-ilmenite concentrates. Totals of mixed concentrates are derived by addition of the U. S. Department of Commerce figures for imports of ilmenite, rutile, and "zirconium ore" from Australia. These totals are apportioned by the Bureau of Mines (on the basis of surveys of importers) into the three component minerals. The excess quantities of ilmenite and rutile over the quantities reported by the U. S. Department of Commerce in those specific categories are entered as "In 'zirconium ore.'"
[3] Includes 309 tons not recovered from mixed concentrates.
[4] Includes quantities reported by the U. S. Department of Commerce as originating in French Equatorial Africa, from which no rutile production has been recorded.

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Exports.—Of the concentrates exported in 1946, 32 percent went to Canada, 22 percent to Sweden, 22 percent to the United Kingdom, 7 percent to Netherlands, and 7 percent to Switzerland. Of the pigments, 74 percent went to Canada and 13 percent to Latin America (largely Brazil, Cuba, Mexico, and Argentina). Practically all of the ferro-alloys went to Canada. Total titanium products exported in 1946 were valued at $3,400,000.

TECHNOLOGY

Historical data on the technology of metallic titanium and its alloys and original research work of the Bureau of Mines in this connection were recently summarized by Dean and Silkes.[5] In a press notice announcing the report the Bureau said:

Still considered expensive to produce even under the improved method employed at the Bureau's Intermountain Experiment Station at Salt Lake City, Utah, pure titanium is a light corrosion-resistant metal that combines the properties of stainless steel with those of the strong aluminum alloys. * * *

Until about 1900, efforts to produce pure titanium were unsuccessful, but subsequently a number of methods were developed, one of which was modified by Bureau metallurgists and now attains a production of 100 pounds of metal a week at the Bureau's Boulder City, Nev., pilot plant. In the modified process, titanium is obtained by reducing titanium tetrachloride with pure molten magnesium in the presence of helium under slight pressure.

Ranking ninth in abundance among the elements, titanium places fourth among metallic elements suitable for engineering purposes, and is exceeded only by aluminum, iron, and magnesium. The metal is about twice as heavy as magnesium, which is slightly lighter than aluminum.

One of the outstanding properties which gives pure titanium an advantage over certain other metals is its relatively high proportional limit, a measure of the metal's elasticity. Bureau metallurgists have determined that the proportional limit of cold-worked titanium is as high as 75,000 pounds per square inch, compared with the unusually low proportional limit of stainless steel, which is reported to be not more than 25,000 pounds even when fully cold worked.

Because titanium thus offers a minimum weight where continued high stress is concerned, its use has been suggested in many parts of aircraft design and in a variety of diaphragms that are maintained under tension, particularly microphone diaphragms where weight is important. A considerable saving in power is predicted in the use of the light metal in textile machinery for high-speed spindles, spools, warp beams, and other working parts.

The fact that titanium can be surface hardened is important in the construction of parts subject to frictional wear and its lightness and strength, coupled with an expansion property a little less than that of cast iron, make titanium an ideal material for automotive pistons. Other metals, however, possess better

[5] Dean, R. S., and Silkes, B., Metallic Titanium and Its Alloys: Bureau of Mines Inf. Circ. 7381, 1946, 38 pp.

qualities for piston heads than titanium because of its less favorable heat conductivity.

Among other experimental uses for titanium, not fully tested because of the scarcity of the pure metal, are in sports goods such as tennis rackets and fishing rods; for spring balances and springs where a considerable extension in relatively low loads is desired; for marking glass; for tool mountings, and in the making of pen points and styluses.

WORLD REVIEW

Available data on world production of ilmenite and rutile in recent years are shown in the accompanying table. Brief notes on certain important producing and consuming countries follow.

World production of titanium concentrates (ilmenite and rutile), 1940–46, by countries, in metric tons

[Compiled by B. B. Mitchell]

[1] Data not available. Estimates for individual countries included in world totals shown.
[2] Includes 26 tons of garnet-ilmenite.
[3] Approximately 20 percent of ilmenite concentrates is zircon.
[4] Less than 1 ton.

Australia.—A recent report [6] indicated that the naturally concentrated sands containing rutile, zircon, and ilmenite, among other minerals, occur at intervals along 300 miles of the east coast between Coff's Harbour, New South Wales, and Tin Can Bay, Queensland. According to the report, the main output has come from deposits in the 50-mile stretch from Byron Bay, New South Wales, to Southport, Queensland. Preliminary investigations on a laboratory scale, with a view to improvement of plant practice, have recently been carried out at the metallurgical laboratory, University of Melbourne, by the Council for Scientific and Industrial Research.[7]

[7] Queensland Government Mining Journal, vol. 47, No. 541, November 1946, p. 325.

Egypt.—Egypt has deposits of hundreds of thousands of tons of ilmenite. Black sands at the mouth of the Nile contain monazite and zircon.[8]

Germany.—The titanium industry in Germany was summarized in a recent report.[9] The report is quoted in part as follows:

> The surprisingly extensive wartime research and patent applications of Titangesellschaft G. m. b. H., the only German manufacturers of titanium dioxide, represent thought-provoking viewpoints in this field. The comprehensive development of vitreous enamels based on titanium in place of boron is claimed not to provide merely a substitute for borax but, rather, products permitting better enamels and the use of fewer coats, with corresponding production economies. Titanium dielectrics and resistors as developed, or under investigation in Germany, seem to offer unusual possibilities in the fields of radio and electrical and electronic circuits and apparatus. Titanium carbide as a constituent of cemented carbide cutting tool tips seems to have made a place for itself beyond that of a mere substitute in high speed finishing cuts where minimum wear is important.

Titangesellschaft G. m. b. H. was the sole producer of titanium dioxide and titanium tetrachloride in Germany, and the output of titanium dioxide at the Leverkusen plant, near Cologne, for 1940–42, in metric tons, was as follows:

	Ore consumed (dry basis)	*Titanium dioxide produced (equivalent TiO_2)*
1940	30, 234	11, 730
1941	34, 927	13, 153
1942	39, 235	15, 323

A representative wartime distribution of an output of 1,200 tons a month of titanium dioxide was as follows:

	Metric tons
Paints and similar materials	300
Welding rods and metallurgy	300
Vitreous enameling, mainly flux	100
Paper manufacture	100
Silk delustering	100
Electrical ceramics	50
Titanium tetrachloride (manufactured)	50
Export to European countries	200
	1, 200

Except for a few experimental batches the pigment-grade TiO_2 was exclusively of the anatase crystal modification, whereas the rutile type was desired for welding-rod coatings and electrical ceramic purposes.

Titanium tetrachloride was produced in 1943–44 at a rate of 100 tons a month, presumably primarily for producing fogs for screening military movements.

Another report[10] stated that production ceased completely on October 26, 1944, owing to major damage sustained in a daylight bombing raid. Production was resumed on a limited scale in December 1945. The plant equipment did not sustain as much damage as the plant structure.

[10] British Intelligence Objectives Sub-Committee Final Report, Titanium Pigments, Titangesellschaft, Leverkusen: No. 451, p. 2.

India.—A pilot plant to produce titanium dioxide from bauxite sludge has been established in the laboratories of the Council of Scientific and Industrial Research, Delhi, India.[11] Arrangements for a pigment factory in Travancore, South India, have been completed. The government of Travancore will have sole ownership and control of mining, exporting, and processing of all mineral sands.[12]

Malaya.—There are about 300,000 tons of ilmenite collected in dumps in the tin fields of North Malaya from alluvial tin mining.[13]

Norway.—Deposits located south of Stavanger supplied virtually all of the ilmenite required for titanium products produced in Germany, according to a recent report.[14] The report said that ore reserves were said to exceed 30 million tons, with a titanium dioxide content of 25 to 40 percent. A representative analysis of the product exported to Germany was as follows following concentration: 44.40 percent TiO_2, 34.00 percent FeO, 12.44 percent Fe_2O_3, 0.63 percent FeS, 2.79 percent SiO_2, 3.55 percent MgO, 0.37 percent MnO, 0.175 percent V_2O_5, 0.085 percent NiO, 0.015 percent CuO, 0.015 percent P_2O_5, and less than 0.01 percent Cr_2O_3.

United Kingdom.—Paint shortage and increased demand necessitated a paint-distribution plan effective August 1, 1946. Several projects are afoot for new titanium pigment factories.[15] About 3,000 to 4,000 tons of rutile are consumed annually.[16]

Tungsten

By HUBERT W. DAVIS

GENERAL SUMMARY

PRODUCTION, shipments, and consumption of tungsten concentrates in the United States continued their downward trends in 1946, declining for the third consecutive year, but imports for consumption were greater than in 1945. Because of the lessened demand there was some weakening in price.

Output of tungsten concentrates in the first quarter of 1946 exceeded the quarterly average rate in 1945 and was also greater than the domestic consumption rate for the first quarter of 1946. To conform to the lessened demand, the operating rates at most of the larger mines and treatment plants were contracted, and production declined progressively through the last three quarters of 1946. Total production of tungsten concentrates dropped to 4,908 short tons (60 percent WO_3 basis) in 1946 compared with 5,662 tons (revised figure) in 1945. Domestic production was equivalent to 72 percent of United States consumption in 1946. A substantial part of the 1946 output was produced for the Government stock pile by the Government-owned Salt Lake City chemical plant, which discontinued operations in the third quarter.

Salient statistics of tungsten ores and concentrates in the United States, 1942–46, in pounds of tungsten

Year	Production	Shipments from mines	General imports (receipts)	Consumption	Industry stocks at end of year		
					Consumers and dealers	Producers	Total
1942	8,977,575	8,882,403	15,409,814	17,389,000	3,416,438	355,864	3,772,302
1943	11,472,985	11,368,295	18,678,426	19,313,000	2,459,246	458,586	2,917,832

1946	4,671,042	4,942,282	6,811,099	6,458,000	3,694,256	285,865	3,980,121

[1] Revised figure.

Receipts of imported tungsten ores and concentrates into the United States were 7,157 short tons (60 percent WO_3 basis) in 1946, a decline of 21 percent from 1945. Bolivia (37 percent) and Brazil (18 percent) were the chief sources of imports in 1946, but important quantities were also received from Southern Rhodesia and the United Kingdom. However, imports for consumption, which represent the concentrates entering into the domestic commerce of the United States,

were 7,218 tons (60 percent WO_3 basis), an increase of 44 percent over 1945.

Tungsten concentrates were consumed at an average rate of about 1,450 short tons (60 percent WO_3) during the first three quarters of 1946. In the fourth quarter, however, there was a sharp gain in usage, owing largely to a swing back to "18–4–1" type (18 percent tungsten, 4 percent chromium, and 1 percent vanadium) of high-speed steel for the tool requirements of some companies which had been using "6–6" (6 percent tungsten and 6 percent molybdenum) or molybdenum-type high-speed steel. Also contributing to the fourth-quarter gain was the inception of operation at the refinery at Henderson, Nev., where low-grade tungsten concentrates are processed chiefly to tungstic acid, ammonium paratungstate, and artificial scheelite. Notwithstanding the fourth-quarter rise, consumption of tungsten concentrates was only 6,800 short tons (60 percent WO_3) in 1946—a 54-percent drop from 1945.

Figure 1 shows trends in domestic shipments, imports, and prices of tungsten ores and concentrates since 1915.

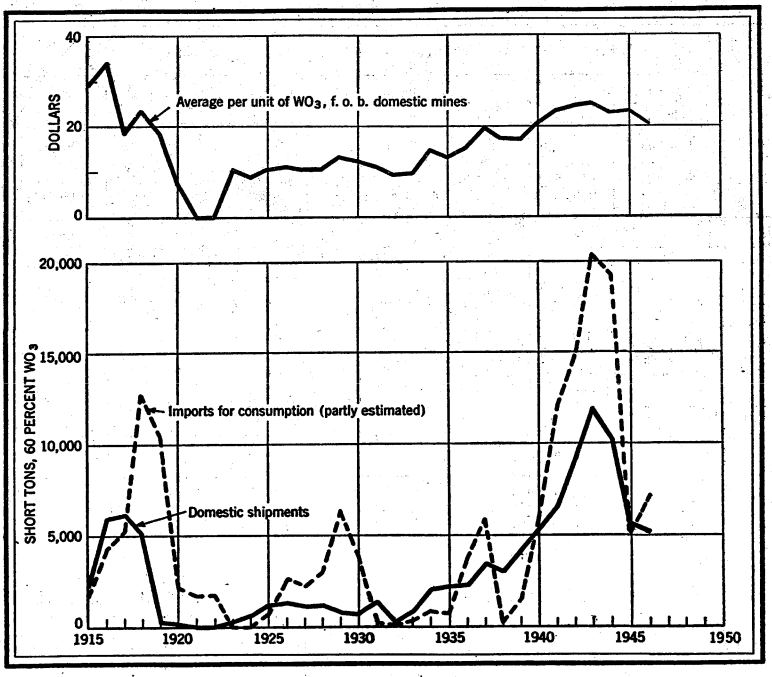

FIGURE 1.—Trends in domestic shipments, imports, and average price of tungsten ores and concentrates, 1915–46.

DOMESTIC PRODUCTION

The tungsten ore mined and milled in the United States, in general, contains 0.5 to 2.5 percent WO_3 and is beneficiated to a concentrate containing 60 percent or more WO_3. Scheelite (calcium tungstate) is the tungsten mineral in most domestic ore mined. The leading tung-

sten producers and many small operators depend on ore carrying tungsten only as scheelite. Ferberite (iron tungstate), hübnerite (manganese tungstate), and wolframite (iron-manganese tungstate), in the order listed, contribute a comparatively small part of the tungsten in domestic ore. Most of the concentrates are converted to ferrotungsten and tungsten metal. Some high-purity concentrates, however, are charged directly to the steel bath. Wolframite is preferred for the filaments in electric-light bulbs and radio tubes.

Smaller demand for tungsten in 1946 resulted in a decline in production of concentrates to 4,908 short tons (60 percent WO_3 basis), as compared with 5,662 tons (revised figure) in 1945. Output was obtained from many widely scattered operations in 11 States and Alaska, but 4 States—California, Idaho, Nevada, and North Carolina—supplied 93 percent of the total, and 5 operators (Bradley Mining Co., Nevada-Massachusetts Co., Office of Metals Reserve, Tungsten Mining Corp., and United States Vanadium Corp.) produced 85 percent of the United States total.

Tungsten concentrates produced and shipped in the United States, 1945–46, by States [1]

State	Produced				Shipped from mines

[1] Alaska, Connecticut, Missouri, New Mexico, Oregon, and Texas.
[2] Less than half ton.
[3] Revised figure.

In 1946, as in previous years, the secondary concentrates produced as feed for the chemical-treatment plants at Salt Lake City, Utah, and Bishop, Calif., have not been included in the statistics. Instead, the resulting primary concentrates recovered (as well as shipped) each year have been credited in the statistics to the State of origin. However, the low-grade concentrates produced and shipped to the refinery at Henderson, Nev., have been included in the figures for 1946.

Alaska.—Production of concentrates in Alaska was 28 short tons averaging 57 percent WO_3 in 1946; this output includes 15 tons of concentrate averaging 74.16 percent WO_3, recovered at the Salt Lake City, Utah, plant from treating secondary concentrates that were produced in 1944.

J. H. Scott Co., operating the Riverside mine near Hyder, produced (but did not ship) 13 short tons of concentrate averaging 31.9 percent WO_3 in 1946.

In the course of exploration work at the Big Chief mine near Fairbanks, the Yukon Corp. produced a few hundred pounds of concentrate averaging 63.4 percent WO_3 in 1946.

Arizona.—Production and shipments of tungsten concentrates in Arizona were 17 short tons averaging 71.24 percent WO_3 in 1946 compared with 140 tons averaging 41.77 percent WO_3 in 1945. The 1946 figures include 8 tons of concentrate averaging 74.16 percent WO_3, recovered at the Salt Lake City, Utah, plant from treating secondary concentrates produced previous to 1946. The remainder of the small output in 1946 came from several widely scattered operations.

California.—California ascended from third to second place as a tungsten-producing State in 1946. Output of concentrates was 5,607 short tons averaging 13.46 percent WO_3 in 1946 compared with 1,140 tons averaging 55 percent in 1945. Shipments of tungsten concentrates totaled 5,525 tons averaging 13.71 percent WO_3 in 1946 compared with 1,186 tons averaging 54.28 percent WO_3 in 1945. The lower WO_3 content of the concentrates produced and shipped in 1946 resulted from a change in the operating procedure at the Pine Creek mine in April. Although concentrates were produced at a number of widely scattered operations, 6 producers (Alpine Mining Co., Benware & Singley, Consolidated Tungsten, Hoefling Bros., Tulare County Tungsten Mines, and United States Vanadium Corp.) supplied 93 percent of the State total. The bulk of the remainder was contributed by Darwin Mines, El Diablo Mining Co., Embree & Eliason Mining Co., and Sheridan, Bennett & Kidder.

The Pine Creek mine of United States Vanadium Corp. near Bishop resumed production of ore in April; the ore is transported to the mine concentrator over a recently completed 2½-mile aerial tramway. The Pine Creek concentrator was operated at a greatly increased rate in 1946; as a consequence, production of concentrates about doubled that in 1945. The bulk of the output in 1946 was a low-grade flotation concentrate, which was shipped to the company refinery at Henderson, Nev., where it will be processed chiefly to tungstic acid, ammonium paratungstate, and artificial scheelite. The concentrator feed comprised ore from the Pine Creek mine and secondary concentrates, chiefly from the Yellow Pine mine in Idaho, the Mill City mill in Nevada, and the Riley mine in Nevada. The concentrates recovered from the treatment of secondary concentrates originating in Idaho and Nevada have been credited in the statistics to those States.

Hoefling Bros. continued to work the Spud Patch and other placers in San Bernardino County, but its output of concentrate in 1946 was 53 percent less than in 1945.

The Big Jim mine in Tulare County, operated by the Tulare County Tungsten Mines, was also worked at a reduced rate in 1946, but the Harrel Hill mine, also in Tulare County, operated by Consolidated Tungsten, produced at about the same rate as in 1945. In late 1946 Embree & Eliason Mining Co. completed a mill to serve its Sherman Peak mine in Tulare County, and a small quantity of concentrate was produeed and sold.

A mill to serve the Alpine mine in Alpine County was put into operation in May 1946 by the Alpine Mining Co., which produced (but did not market) 55 short tons of concentrate averaging about 60 percent WO_3.

The El Diablo Mining Co. resumed mining at the Brownstone mine in Inyo County in 1946.

Colorado.—Production and shipments of concentrates (60 percent WO_3 basis) in Colorado were 208 and 213 short tons, respectively, in 1946 compared with 252 and 234 tons, respectively, in 1945. The 1946 production and shipment figures include 116 tons of concentrate averaging 74.16 percent WO_3, recovered at the Salt Lake City, Utah, plant from the treatment of secondary concentrates originating in Colorado.

The Boulder Tungsten Mills, Inc., continued to treat ore purchased from the Office of Metals Reserve until February 1, 1946, when operations ceased; the mill was sold to Consolidated Caribou Silver Mines, Inc., and the remaining ore was disposed of to Geo. H. Teal & Associates.

The Conger mine was reopened by Tanner & Smith, who made a small output of concentrate in 1946.

The mill of Geo. H. Teal & Associates operated on purchased ore in 1946. The Red Signe mine was being opened.

The Firth-Sterling Steel Co. (Wolf Tongue Division) treated ore produced chiefly by lessors.

Idaho.—Production of concentrates in Idaho was 439 short tons averaging 74 percent WO_3 in 1946 compared with 1,727 tons averaging 70 percent WO_3 in 1945. Shipments also declined to 531 tons averaging 72 percent WO_3 in 1946 compared with 1,852 tons averaging 69 percent WO_3 in 1945. The figures include the concentrate recovered from treating Yellow Pine secondary concentrate at the plant of the United States Vanadium Corp. near Bishop, Calif.

Production of concentrate at the Ima mine in Lemhi County, operated by the Bradley Mining Co., was 17 percent less than in 1945. The purification plant of the Bradley Mining Co. at Boise was dismantled and sold in 1946.

Montana.—The H. & H. Mines continued to work the gravel containing scheelite and gold in lower Henderson Creek near Hall, Granite County, in 1946; production of concentrate was 45 short tons averaging 60 percent WO_3 and shipments were 76 tons averaging 61 percent WO_3.

The Jardine Mining Co. recovered 9 short tons of scheelite concentrate averaging 72 percent WO_3 in 1946.

Nevada.—Nevada again was the premier tungsten-producing State. Production of concentrates was 4,034 short tons averaging 37 percent WO_3 in 1946 compared with 1,740 tons (revised figure) averaging 71 percent in 1945. Shipments likewise declined and were 4,149 tons averaging 38 percent WO_3 in 1946 compared with 1,588 tons (revised figure) averaging 70 percent in 1945. The 1946 production and shipment figures include 737 and 752 tons, respectively, of concentrate averaging 74 percent WO_3, which were recovered at the Salt Lake City, Utah, plant from treating Nevada secondary concentrates. In addition, the concentrate recovered in California from treating Nevada secondary concentrates has been credited to Nevada in the statistics.

The Nevada-Massachusetts Co. and its affiliate, Rare Metals Corp., continued to be the chief producers in Nevada, but output was 22 percent less in 1946 than in 1945. In 1946 they operated the treatment plants at Mill City and Toulon; the latter plant suspended operations March 31. The feed for the Mill City plant was provided

by the Stank, Humboldt, and Sutton No. 2 mines and from treatment of old magnetic-reject dumps. In the Sutton No. 2 mine the shaft was sunk farther, and more mucking machines were added. Development by tunnels was under way in the new O'Byrne mine, near the Stank. In the mill a new bin and conveyor system was installed for the No. 2 ball mill, and a new 4-foot Symons crusher was being added to the crushing plant.

Smaller producers of concentrates in 1946 were the United States Vanadium Corp., operating the Riley mine in Humboldt County; Nevada Scheelite, Inc., operating a mine of the same name in Mineral County; and the Cherry Creek Tungsten Co., operating the Cherry Creek mine in White Pine County. The milling plant of Nevada Scheelite, Inc., was destroyed by fire June 10, 1946; it was being rebuilt. Production was discontinued at the Cherry Creek mine in June 1946, and output at the Riley mill was suspended temporarily in the latter part of the year.

The flotation plant of Getchell Mine, Inc., Red House, Nev., which since August 1945 had been treating, under toll agreement with the Office of Metals Reserve, the stock piles of tungsten ore in the vicinity of the mill, completed milling for that agency in April 1946. During January–April 1946, 35,057 tons of ore were milled, which yielded 1,643 tons of concentrate averaging 13.02 percent WO_3. The concentrate was shipped to the chemical plant at Salt Lake City for further treatment. Getchell Mine, Inc., also mined and treated 18,629 tons of ore which yielded 292 tons of concentrate averaging 13.92 percent WO_3; the concentrate was shipped to the refinery at Henderson.

At Henderson a refinery was completed and put into operation the latter part of 1946 by the United States Vanadium Corp. At this plant concentrates containing 8 to 50 percent WO_3 from the company Pine Creek and Riley mines, near Bishop, Calif., and Winnemucca, Nev., respectively, and custom concentrates from other properties, will be processed—chiefly to tungstic acid, ammonium paratungstate, and artificial scheelite—either by the acid treatment or pressure digestion treatment.

North Carolina.—The Tungsten Mining Corp., operating the Hamme mine in Vance County, produced 349 short tons of concentrate averaging 51.27 percent WO_3 in 1946 compared with 219 tons averaging 37.89 percent WO_3 in 1945.

The Seminole Rock & Sand Co., successor to the Southern Aggregates Corp., did no mining at its property, also in Vance County.

Utah.—The Government-owned chemical-treatment plant at Salt Lake City discontinued operations in the third quarter of 1946, when the operating agreement with United States Vanadium Corp. terminated. In 1946 it treated 5,805 tons of concentrates averaging 13.24 percent WO_3. The plant feed comprised secondary concentrates, chiefly from the mill of Getchell Mine, Inc. The resultant concentrates produced and shipped in 1946 have been credited in the statistics to Alaska, Arizona, Colorado, Nevada, South Dakota, Texas, Utah, and Washington. The Salt Lake City chemical-treatment plant began operating in April 1943; since then it has treated 34,703 tons of concentrates averaging 11.76 percent WO_3, which

yielded 5,448 tons of concentrates averaging 68 percent WO_3. The plant feed comprised chiefly secondary concentrates from the Yellow Pine mine in Idaho of Bradley Mining Co. and the mill in Nevada of Getchell Mine, Inc.; but concentrates from Alaska, Arizona, California, Colorado, Utah, and other mines in Nevada furnished a substantial part of the total.

CONSUMPTION

Consumption of tungsten concentrates in the United States was about 6,800 short tons (60 percent WO_3 basis) in 1946 compared with 14,900 tons in 1945. Of the total consumed in 1946, about 2,400 tons (35 percent of the total) were converted to ferrotungsten, the form in which most of the tungsten is introduced into steel. However, high-purity tungsten concentrates are charged directly to the steel bath; and 1,900 tons (28 percent) were so used in 1946. Tungsten-metal powder and other tungsten products, chiefly the former, employed about 2,500 tons or 37 percent of the total concentrates consumed in 1946. The accompanying table shows the production of tungsten products in the United States in 1945 and 1946.

Production of specified tungsten products in the United States, 1945–46, in pounds

Product	1945		1946	
	Gross weight	Tungsten content	Gross weight	Tungsten content
Ferrotungsten	8,214,504	6,545,277	2,699,926	2,089,608
Tungsten metal powder	4,909,061	4,900,177	1,368,195	1,364,264
Special tungsten alloys	409,040	253,200	434,619	179,030
Sodium tungstate [1]	421,704	236,085	791,255	440,841
Tungstic oxide [1]	599,828	474,092	273,470	216,037
Tungstic acid and ammonium paratungstate [1]	689,889	497,460	211,047	149,143

[1] Figures cover production for sale only and therefore exclude production as an intermediate product of producers. Probably the greater part of the production reported for tungstic acid, tungstic oxide, and ammonium paratungstate is used in making tungsten powder.

PRICES

Quotations on high-quality tungsten concentrates remained steady throughout 1946, but lower-quality concentrates fluctuated considerably. According to the Engineering and Mining Journal, Chinese ore was quoted at $24 a short-ton unit of WO_3, duty paid, and domestic scheelite of good known analysis, in carlots, delivered, at $24 to $24.50 a unit throughout 1946. However, prices on ores and concentrates from Bolivia, Brazil, and other countries were less steady and fluctuated between $24 and $21 a unit, duty paid. The increasing use of high-purity scheelite for direct smelting has placed a premium on this type of concentrate. The average price for domestic concentrates shipped to consumers in 1946, as reported to the Bureau of Mines, was $20.17 a short-ton unit.

FOREIGN TRADE [1]

Domestic production is inadequate for requirements, and the United States imports both tungsten concentrates and products, chiefly the former. General imports (receipts) of ores and concentrates into the United States totaled 6,811,099 pounds (tungsten content), equivalent to 7,157 short tons of 60 percent WO_3 in 1946, a 21-percent decrease from 1945. This quantity represents the ores and concentrates received into the United States, irrespective of final disposition.

Tungsten ores and concentrates imported into the United States, 1945–46, by countries

Country	General imports [1]		Imports for consumption [2]

[1] Bureau of Mines estimates that about 82 percent of the quantity credited to Peru in 1944 by the U. S. Department of Commerce originated in Bolivia.
[2] Less than half ton.
[3] Credited to "other British South Africa" by the U. S. Department of Commerce.

Although ores and concentrates were received from 20 foreign countries in 1946, 2—Bolivia (37 percent) and Brazil (18 percent)—supplied 55 percent of the total. However, important quantities were also received from Southern Rhodesia and the United Kingdom. Unsettled conditions in China prevented that country from regaining its important position in the world market.

Imports of ores and concentrates for consumption in the United States were 6,869,438 pounds (tungsten content), equivalent to 7,218 short tons of 60 percent WO_3 in 1946, an increase of 44 percent over

1945. Bolivia and Brazil supplied 37 and 26 percent, respectively, of the 1946 total. Imports for consumption represent ores and concentrates on which the duty has been paid and which have thereby entered into the domestic commerce of the United States.

In 1946, 1,724 tons (60 percent WO_3) of ores and concentrates were withdrawn from warehouses for smelting, refining, and export, and 1,517 tons (gross weight) were reexported. Ores and concentrates withdrawn for smelting, refining, and export and for reexport are free of duty.

The duty on tungsten ores and concentrates is 50 cents a pound on the metallic tungsten contained therein. This is equivalent to $7.93 a short-ton unit.[2]

Exports of domestic tungsten ores and concentrates from the United States are small; 78,473 pounds (gross weight) were exported in 1946 (4,240 pounds in 1945).

Imports of tungsten metal were 11,136 pounds in 1946 (4,396 pounds in 1945). Imports of combinations containing tungsten or tungsten carbide were 2 pounds in 1946 (none in 1945). There were no imports of tungstic acid in 1946 (2,295 pounds in 1945), and no tungsten carbide as such was imported in either year.

Export of tungsten metal, stellite, wire, shapes, and alloys other than ferrotungsten were 138,472 pounds in 1946 (260,435 pounds in 1945). Exports of ferrotungsten were 181,445 pounds in 1946 (861,461 pounds in 1945).

WORLD REVIEW

Argentina.—Argentina was the second-largest producer of tungsten in South America for many years previous to 1945, when it was displaced by Brazil. Production was 450 to 500 metric tons (66 percent WO_3) in 1945; data on output in 1946 are not available but from the meager information at hand it is apparent that production declined substantially.

Australia.—During the year ended October 31, 1946, the King Island Scheelite, N. L., milled 127,415 long tons of scheelite ore, which yielded 582 tons of concentrate averaging 67.5 percent WO_3.[3] In the corresponding year 1945 it milled 89,518 tons of ore which yielded 434 tons of concentrate. The mining and recovery of scheelite by the company has been described in the Chemical Engineering and Mining Review.[4]

Bolivia.—Greatly decreased demand and lower prices following the ending of hostilities resulted in an abrupt decline in production of tungsten in Bolivia; and, as happened after World War I, many mines closed or reduced operations. In an effort to keep mines open, the Bolivian Government waived the export tax on tungsten ore. Output (as indicated by exports) was only 2,120 metric tons (60 percent WO_3 basis) in 1946 compared with 3,851 tons in 1945. Despite the smaller production in 1946, Bolivia continued to be the largest tungsten producer in South America.

---

[2] A unit, as applied to tungsten ores, is 1 percent of a ton of contained tungsten trioxide (WO_3). Thus, a short-ton unit is 20 pounds of WO_3 or 15.86 pounds of tungsten (W).

[3] Mining Journal (London), vol. 228, No. 5831, May 24, 1947, p. 285.

[4] Chemical Engineering and Mining Review (Melbourne), Mining and Recovery of Scheelite at King Island: Vol. 38, No. 453, June 10, 1946, pp. 330-338.

Brazil.—Brazil continued to be the second-largest producer of tungsten in South America. Exports of tungsten concentrates were 1,476 metric tons (66 percent WO_3) in 1946, compared with 1,993 metric tons (66 percent WO_3) in 1945 and 1,989 tons (67 percent WO_3) in 1944.

French Morocco.[5]—The only known deposit of tungsten ore in French Morocco is the El Zguit, near Oulmes, east of Casablanca. The ore, which was not discovered until after World War II had begun, occurs as wolframite, ferberite, and scheelite along the margins of a few large quartz veins. The only production from the deposit has been accessory to exploratory trenching. Most of the work has been done on two veins, and mineralization has been found over a length of possibly 2 miles. The owner reports that crushing and washing yield a concentrate containing 65 percent WO_3.

Japan.[6]—The tungsten industry of Japan was negligible prior to 1934; Japanese industry demanded less than 100 metric tons of concentrates annually, a need supplied by a few mines in Japan and small imports from Korea. After 1934 the demand for tungsten concentrates increased, and exploration of domestic deposits was stimulated by high prices, Government subsidies, and priorities for labor and supplies. As a result, domestic production increased to a peak of 817 metric tons (60 percent WO_3 basis) in 1942 and totaled 4,478 tons from 1935 to 1945. This domestic output furnished about one-tenth of the concentrates consumed by the war-expanded industrial plants of Japan Proper. Almost three-fifths was supplied by imports from Korea, and about three-tenths from other countries. About 95 percent of all concentrates produced and imported by Japan was consumed in the production of ferrotungsten; the remainder was used in the manufacture of tungsten powder. Plants in Japan Proper produced 19,500 metric tons of ferrotungsten between 1934 and 1945. Estimated reserves of tungsten ore are small and of low grade. Future production of tungsten probably will be insufficient to meet requirements of industry.

The accompanying table shows world production of tungsten by countries from 1939 to 1946, insofar as statistics are available.

GENERAL SUMMARY

COGNIZANCE of the military and industrial power derivable from nuclear energy prompted an intensive global hunt in 1946 for uranium and thorium ores. Quantities found, mined, exported, or refined were kept secret by all nations for security reasons, and thus no measure of current or potential supply is obtainable. Before World War II the most productive uranium-radium mines were in Belgian Congo and Canada; there were other important mines in the United States, Czechoslovakia, Portugal, and possibly Russia. The principal thorium-cerium mines were in India and Brazil. The status of the United States as the only country with facilities for manufacturing atomic bombs probably was maintained in 1946, but chain-reacting piles for producing fissionable metals were under construction in the United Kingdom and Canada. Strict national controls on the production and transfer of uranium and thorium and on the dissemination of information on nucleonics were enacted by more than a dozen major countries in the closing months of 1945 and in 1946. International safeguards were discussed by the United Nations Atomic Energy Commission during the latter half of the year. Espionage activities were exemplified by Soviet efforts, described in a Canadian court report,[2] to procure secret American-British nucleonics data and samples of enriched uranium isotopes.

Nuclear work in the United States was administered from August 1942 (more comprehensively from the spring of 1943) to the end of

[1] In preceding issues of Minerals Yearbook uranium was discussed in the Radium and Uranium section of the Minor Metals chapter, and thorium was treated in the Monazite section of the Minor Nonmetals chapter.

This chapter in its entirety (except for data on consumption of uranium for nonenergy purposes) is a summary of information that has heretofore been published.

[2] Royal Commission To Investigate the Facts Relating To and the Circumstances Surrounding the Communication by Public Officials and Other Persons in Positions of Trust of Secret and Confidential Information to Agents of a Foreign Power, Report: Ottawa, 1946, 733 pp.

1946 by the Manhattan District, Corps of Engineers, Army Service Forces. A record of its activities was published in the Smyth report.[3] Numerous bills for the control of atomic energy were introduced in the Congress in September 1945 and subsequent months, but none became law for nearly a year. The delay "has meant, unfortunately," stated [4] Maj. Gen. Leslie R. Groves, officer in charge of the Manhattan District, "that we have had to make decisions that will commit that commission (which Congress will establish) for years to come. Some of them probably for as much as 5, 10 or 15 years." The Atomic Energy Act was approved August 1, 1946. It provided for establishment of a civilian Atomic Energy Commission that took over Manhattan District facilities, functions, and personnel December 31. At that time there were working on the project more than 5,000 direct employees—military and civilian—plus more than 50,000 employees of contractors operating Government installations.

Funds appropriated by Congress for the atomic bomb project totaled almost 2 billion dollars by the middle of 1945. In 1946 the War Department transferred to the Atomic Energy Commission $506,000,000, of which $263,991,000 was immediately allocated to cover contracts and other obligations and $5,000,000 was assigned to the Federal Bureau of Investigation. The President's budget for the fiscal year beginning July 1, 1947, included $250,000,000 for Commission expenditures and a like amount for Commission contract authorizations.

The U. S. Geological Survey continued in 1946 its services for the Atomic Energy Commission.

In the present state of world affairs, the most important use of uranium would seem to be in making atomic bombs. Two were detonated at Bikini, Marshall Islands, in July 1946 to assay their effect on naval ships. Research on the propulsion of ships and aircraft by nuclear energy was under way during the year. Development of atomic energy for industrial purposes began to receive greater emphasis, but the consensus was that actual commercial application, probably for generation of electricity, was at least 5 years distant. Even the industrial developments are significant from a security point of view, as stressed by Rear Adm. William S. Parsons, director of atomic defense for the United States Navy:

> That point is the strengthening of the Nation's over-all war potential through the development of all the peacetime constructive uses of atomic energy. For example—our automobile industry is a peacetime industry—and grew up in peacetime—but it was a most vital part of our total war potential. Atomic energy, through medical and other research advances, and through development of power, which is industrial energy, may be as important to war because of its peacetime applications as it appears to be because of its purely military applications.

Valuable byproducts of the production of fissionable metals are radioactive isotopes useful in radiation therapy (particularly radioiodine and radiophosphorus) and in tracing biological and industrial chemical reactions (particularly radiocarbon). The Manhattan District began deliveries of radioisotopes to private institutions in August 1946.

[4] Marder, Murrey, Rotarians Told Lack of Laws Forced Army to Act on Atoms: Washington Post, Apr. 30, 1946, p. 6.

Consumption of uranium for nonenergy purposes in the United States in 1946 was only 2 tons—about the same as in 1945. Chemical reagents and special glasses were the major uses. A small quantity of thorium went into gas mantles and refractories.

There were no standard prices on uranium in 1946, but one buyer of concentrates stated in May 1947 that it would pay for the vanadium content and 35 cents to $1.10 per pound for contained U_3O_8, depending on a concentration ranging upward from 0.2 percent. One group of scientists assumed in 1946 that refined uranium metal was worth about $10 a pound and plutonium metal $20 a gram.

DOMESTIC PRODUCTION

Uranium and thorium production may be considered at a number of stages such as ore, source metal, and fissionable metal.

MINE PRODUCTION

Carnotite Ore.—Deposits of carnotite, a radium-bearing potassium-uranium vanadate, are widely distributed in western Colorado and eastern Utah, and some occur in northern Arizona.[5] These ores were mined primarily for radium until 1922, when a lull was induced by competition from Congo radium. Production was stimulated in 1935–41, principally for vanadium. Carnotite-ore shipments up to the beginning of World War II totaled several hundred thousand tons, but the demand for uranium was so small that only about 13,000 tons were classed as uranium ore. Shipments of carnotite during the latest decade for which data are available, as compiled by the Bureau of Mines, are shown in the accompanying table. It will be noted that ore and concentrates shipped during that period contained 1 to 2 percent U. It is not known how much of this uranium was recovered or how much was discarded in dumps amenable to subsequent retreatment. It is public knowledge, however, that several plants were erected in the early 1940's to treat for uranium the tailings from past and current vanadium operations.

Carnotite ore and concentrates shipped from mines in the United States, 1932–41 [1]

Year	Short tons	Value	Content		
			Uranium (pounds)	Radium (milligrams)	Vanadium (pounds)
1932	61	$6,150	3,186	481	3,024
1933	52	3,099	1,694	256	2,240
1934	254	11,074	6,661	1,007	12,528
1935	1,145	56,223	22,009	3,329	50,776
1936	1,439	73,881	17,961	2,716	52,695
1937	1,708	65,294	20,764	3,141	73,788

Uraninite Ore.—Some 150 tons of ore containing uraninite (pitchblende), an oxide of uranium, have been produced in Colorado, principally in Gilpin County before 1900. Uraninite specimens have been obtained for mineral collections from pegmatite dikes in New Hampshire, Connecticut, North Carolina, South Dakota, and other States.

Thorium Ore.—Between 1887 and 1917 the United States produced 5,456 short tons of monazite concentrates from sands and gravels in North Carolina, South Carolina, Florida, and Idaho.[6] There was little or no domestic production between World Wars I and II. Monazite is a phosphate of rare-earth metals (cerium, lanthanum, praseodymium, etc.) and contains from less than 1 percent to 18 percent thorium. Commercial monazite concentrates generally contain 6 to 8 percent thorium dioxide.

PRODUCTION OF SOURCE METALS

Source metals are those metals from which fissionable metals are derived. An account abstracted largely from the Smyth report follows.

Uranium Metal.—At the end of 1941, when the Office of Scientific Research and Development was investigating raw-material procurement as a prelude to broadening research toward an atomic bomb, the only uranium metal in existence in the United States was a few grams of pure material made on an experimental basis by the Westinghouse Electric Corp., East Pittsburgh, Pa., and by others and a few pounds of impure pyrophoric powder made by Metal Hydrides, Inc., Beverly, Mass. Westinghouse received its first Government order for uranium metal—10 kilograms—in December 1941. The quantity was supplied, for the most part, in a wide variety of shapes and sizes for the use of physicists making measurements for the plutonium piles. Articles varied from spirals of square wire to cast spheres with pipes through the center.[7]

As a step toward increasing the supply of uranium, the OSRD in May 1942 completed arrangements with Mallinckrodt Chemical Works, St. Louis, Mo., to put an improved grade of Canadian oxide through an ether-extraction process to yield a purified brown uranium dioxide. Deliveries were begun in July 1942 at a rate of 30 tons a month. At about this time the problem of uranium procurement was assumed by the Manhattan District.

The small-scale production of uranium metal at the Westinghouse laboratory in early 1942 was by electrolysis of potassium-uranium pentafluoride. That salt was later replaced by uranium tetrafluoride, production of which was begun in August 1942 by Harshaw Chemical Co., Cleveland, Ohio, and by E. I. du Pont de Nemours & Co., Inc., Penns Grove, N. J. By October 1942 production of tetrafluoride was up to 700 pounds per day by the Harshaw firm and to 300 pounds per day by the Du Pont company. As a result of this supply of raw material and also of plant expansion, production of uranium metal by Westinghouse had totaled more than 6,000 pounds by November 1942 and reached a rate of 500 pounds per day by January 1943.

Production of metal of suitable purity by Metal Hydrides, delayed by various circumstances, was begun in November 1942 and was

[6] Houk, Lawrence, G., Monazite Sand: Bureau of Mines Inf. Circ. 7233, 1943 (revised 1946), 19 pp.
[7] Chemical and Engineering News, Lamp Filament to Atomic Pile: Vol. 25, No. 4, Jan. 27, 1947, p. 236.

expected to reach 1,000 pounds per week thereafter. To exploit a new process developed by Iowa State College and the National Bureau of Standards, production facilities were set up at Ames, Iowa, in the fall of 1942; more than 1 ton of metal had been produced by the end of November of that year.

Thus almost no uranium metal was available during most of 1942, a fact that seriously delayed the progress of atomic investigations. However, the production problems had been nearly solved by the end of 1942, and 12,400 pounds of metal—the total quantity obtainable—were incorporated in the first self-sustaining chain-reacting pile, built in November 1942 at the University of Chicago. By December arrangements had been made by the Manhattan District to increase metal production by making greater use of the facilities of Mallinckrodt Chemical Works, the Union Carbide & Carbon Corp., and the Du Pont company. Further research had indicated additional process changes that could be made to advantage, and by the middle of 1943 Iowa State College and other producers were using the final production method adopted. No further serious delays or difficulties occurred because of uranium metal shortages.

Thorium Metal.—Early in the atomic investigations it was decided that uranium rather than thorium would be the source metal from which physicists would attempt to derive usable quantities of fissionable metals. Thus it appears that there was established no program, similar to that of uranium, for raising the laboratory-scale production of thorium metal to a sizable industrial level.

PRODUCTION OF FISSIONABLE METALS

Substances that consist purely of atoms that can be split artificially to release atomic energy are defined as fissionable materials. Only those that undergo fission with slow neutrons, however, are at this time important as nuclear fuels—namely, uranium–235, plutonium–239, and uranium–233.

Uranium and plutonium differ from each other in physical and chemical properties for the same reason that any other two metals are dissimilar; that is, the atoms of which they are composed simply have unlike numbers of protons (plus-charged particles) and of electrons (minus-charged particles). Uranium atoms each have 92 protons and 92 electrons, and plutonium atoms each have 94 protons and 94 electrons. As might be supposed, any atom has the same number of protons as electrons.

ISOTOPES OF URANIUM

Natural uranium consists of 99.3 percent U–238, 0.7 percent U–235, and 0.006 percent U–234. Thorium can be converted to U–233. These varieties (isotopes) of uranium are identical in chemical properties but differ pronouncedly in fissionability and to some extent in unit weight. It is, in fact, the weight to which the numerical designation of each isotope refers. The electrons that swing in orbits around the nucleus of an atom have comparatively no weight, so the weight of an atom is expressed by the sum of the neutrons (uncharged particles) and protons in its nucleus. Thus U–238 has 92 protons and

793065—48——77

146 neutrons (totaling 238), and U–235 has 92 protons and 143 neutrons (totaling 235).

The production of pure U–235, one of the three nuclear fuels, involves the treatment of refined natural uranium metal to separate out the 1 part in 140 that is U–235. Separation has been achieved by four methods: (1) Gaseous diffusion, (2) electromagnetism, (3) thermal diffusion, and (4) centrifugation.

U–235 by Gaseous Diffusion.—It had been demonstrated before the end of 1941 that the isotopes of uranium could be separated by passing gaseous uranium hexafluoride through a series of porous barriers, such as acid-etched silver-zinc alloy. Plans for the first large-scale plant were begun by Kellex Corp., Jersey City, N. J., subsidiary of the M. W. Kellogg Co., early in 1942 with the objective of an enrichment 10 times greater than in natural uranium; several thousand process stages were to be required. Construction of various major units was commenced between June and September 1943 at the Clinton Engineer Works, Oak Ridge, Tenn., and the gaseous diffusion plant was in successful operation by the Carbide & Carbon Chemical Corp., subsidiary of Union Carbide & Carbon Corp., before the summer of 1945. The plant cost $545,000,000.

U–235 by Electromagnetic Separation.—Construction of the first large-scale plant for electromagnetic separation of uranium isotopes was begun at the Clinton Engineer Works, Oak Ridge, Tenn., in March 1943, and initial units were completed by the fall of the year. Total cost of construction was $350,000,000. The Tennessee Eastman Corp., subsidiary of Eastman Kodak Co., assumed responsibility of operation. In the winter of 1944–45 the electromagnetic plant achieved large-scale production of U–235 of sufficient purity for use in atomic bombs and was thus the earliest source of appreciable quantities of the prized uranium isotope.

U–235 by Thermal Diffusion.—A pilot plant for the separation of isotopes by thermal diffusion in a liquid compound of uranium had been built by the spring of 1943 at the Naval Research Laboratory, Washington, D. C., and another a little later at the Philadelphia Navy Yard, Philadelphia, Pa. The success of those units led in the late summer of 1944 to erection of a large-scale plant, costing $10,500,000, at Oak Ridge in order to provide enriched feed material for increasing considerably the production rate of the electromagnetic plant. That purpose was achieved; but a number of disappointments were encountered, and the future of the thermal-diffusion plant was stated officially in 1945 to be uncertain.

U–235 by Centrifugation.—Standard Oil Development Co., Bayway, N. J., successfully operated a pilot plant for centrifugal enrichment of uranium isotopes and obtained approximately the same degree of separation as predicted by theory. The pilot plant was later shut down, and no large-scale plant was authorized.

Uranium–233.—It is known that U–233, obtained by transmutation of thorium, undergoes fission with slow neutrons and is thus a potential nuclear fuel.

PLUTONIUM

Besides U–235, plutonium (Pu–239) also is fissionable and thus releases atomic energy. It too is derived from natural uranium

metal; but, unlike U–235, plutonium is a different element and can therefore be extracted by chemical means rather than by the laborious physical processes just outlined for separating the isotope. Only minute quantities of plutonium are contained in natural uranium, but pure uranium metal embedded in a large graphite pile can be transmuted into plutonium. In such a pile the neutrons spontaneously emitted by the 0.7 percent of U–235 present in the uranium metal are slowed down in speed by the graphite moderator to a specific velocity that permits them to penetrate the nuclei of uranium atoms with two beneficial results: (1) Those neutrons that penetrate atoms of U–235 cause fission with release of energy and with emanation of additional neutrons that keep the pile operating automatically through a chain reaction; (2) those neutrons that penetrate atoms of common U–238 convert the nonfissionable uranium to fissionable plutonium.

Plutonium was discovered toward the close of 1940 and by the end of 1942 something over 500 micrograms in the form of pure salts had been produced in cyclotrons at the University of California, Berkeley, Calif., and Washington University, St. Louis, Mo. The first self-sustaining chain-reacting pile began operation in the Metallurgical Laboratory, University of Chicago, Chicago, Ill., December 2, 1942, and reached a power level of 0.2 kilowatt December 12. The following month a decision was made to build a plutonium production plant of large capacity. It was clear that a rate of output somewhere between 1 kilogram (2.2 pounds) of plutonium a month and 1 kilogram a day would be required, and that the latter rate would necessitate a plant of 500,000 to 1,500,000 kilowatts. E. I. du Pont de Nemours & Co., Inc., designed and constructed at the Clinton Engineer Works, Oak Ridge, Tenn., a $12,000,000 semiworks operated by the University of Chicago Metallurgical Laboratory. The plant began operation November 4, 1943; by the end of January 1944 metal from the pile was going to the separation plant at the rate of one-third ton per day, and 190 milligrams of plutonium had been produced. The output of plutonium the following month was several grams. Although planned at 1,000 kilowatts, a power level of 1,800 kilowatts was attained in May 1944. The pile was air-cooled and thus differed from subsequent piles that were water-cooled, so only the chemical separation unit could be considered a pilot plant. Construction of the first large-scale plutonium-production plant was begun at the Hanford Engineer Works, Pasco, Wash., June 7, 1943. Of three Hanford piles, the first was put into operation September 26, 1944, and the second and third in the fall of 1944 and early months of 1945. The plant, costing $350,000,000, was designed by the Du Pont company and was operated by it until September 1, 1946, when the General Electric Co. assumed operation. An experimental pile was built at the Manhattan District $60,000,000 laboratory at Los Alamos, N. Mex., some time after the spring of 1943.

RESERVES

The Smyth report states: "Early rough estimates, which are probably optimistic, were that the nuclear energy available in known deposits of uranium was adequate to supply the total power needs of this country for 200 years (assuming utilization of U–238 as well as

U-235)." It pointed out later, however, with reference to uranium in unspecified form, that "the total available supply is seriously limited."

Igneous rocks average 0.008 percent uranium and 0.002 percent thorium, according to one study,[8] and the earth's crust averages 0.0004 percent uranium and 0.0011 percent thorium, according to another.[9] It would thus appear that uranium and thorium are more plentiful than gold, silver, bismuth, mercury, and boron and nearly as abundant as lead, zinc, and tin. Such comparisons, however, have little meaning from the point of view of availability. The more important consideration is what quantity of a given metal has been concentrated by geological processes into accessible bodies so as to form ore deposits. As regards uranium and thorium, the minimum concentration of any interest at present is 0.05 percent, judging from Atomic Energy Commission license regulations.

Plutonium (element 94, nuclear fuel derived by transmutation of uranium) occurs in pitchblende to the extent of only 1 part in 10^{14} and in carnotite at about the same concentration. Thus it is not likely that transuranium elements exist in practical quantities on the surface of the earth.[10]

GOVERNMENT REGULATIONS

As early as 1939 scientists began voluntarily to withhold from publication papers concerning nuclear fission. The policy was systemized in the spring of 1940 by the establishment in the National Research Council of a Reference Committee, to which the editors of scientific journals sent papers on the subject in cases where the advisability of publication was in doubt. All personnel of the Manhattan District were required to regard information about their work as secret, in accordance with provisions of the Wartime Espionage Act.

Government control of uranium was initiated through War Production Board Conservation Order M-285, effective January 26, 1943, which restricted the use of uranium in ceramics and photography. The order was amended March 1, 1945, to place uranium under allocation (beginning retroactively September 1, 1944) and to require reporting of stocks of uranium in any form, including ore and tailings. No corresponding order for thorium was promulgated during the war.

Subject to existing rights, all public lands of the United States containing deposits of radioactive minerals were withdrawn from disposal and reserved for the use of the United States, according to President Truman's Executive Order 9613 of September 13, 1945. That order was revoked March 4, 1946, and superseded by Executive Order 9701, which reserved fissionable materials (instead of radioactive minerals) to the Federal Government.

Although President Truman had recommended legislation on atomic energy August 6 and—in a more comprehensive message—October 3, 1945, it was not until August 1, 1946, that the first congressional act

[8] Clarke, Frank Wigglesworth, and Washington, Henry Stephens, The Composition of the Earth's Crust: Geol. Survey Prof. Paper 127, 1924, pp. 20-24.

[10] Chemical and Engineering News, Seaborg Discusses Transuranium Elements in Howe Lecture: Vol. 24, No. 23, Dec. 10, 1946, pp. 3160-3161.

on the subject—the Atomic Energy Act of 1946 (Public Law 585, 79th Congress)—was approved. The act provided for the establishment of an Atomic Energy Commission with very broad powers of control over both the military and industrial production and utilization of atomic energy. An abstract, largely paraphrased, of the act follows:

Section 1. Declaration of Policy.—It is hereby declared to be the policy of the people of the United States that, subject at all times to the paramount objective of assuring the common defense and security, the development and utilization of atomic energy shall, so far as practicable, be directed toward improving the public welfare, increasing the standard of living, strengthening free competition in private enterprise, and promoting world peace.

Section 2. Organization.—An Atomic Energy Commission of five members, including a Chairman, shall be appointed by the President with the consent of the Senate. The term of office shall be five years, except that the first term will expire August 1, 1948, and the second one will be from one to five years so as to stagger future appointments. There are established within the Commission a General Manager and separate Divisions of Research, Production, Engineering, and Military Application. The annual salary of the Chairman is to be $17,500, other members and the General Manager $15,000, and division Directors $14,000. The Commission shall be advised by a General Advisory Committee of nine members, appointed by the President, and by a Military Liaison Committee detailed by the Secretaries of War and Navy in such number as they may determine.

Section 3. Research.—The Commission is authorized to conduct research in its own facilities and to contract with public or private institutions or persons for research on the theoretical and practical aspects of nuclear processes, atomic energy, protection of health, and the utilization of fissionable and radioactive materials for medical, biological, health, military, and industrial purposes.

Section 4. Production of Fissionable Material.—The Commission shall be the exclusive owner of all facilities for the production of fissionable material other than research and development facilities whose potential production rate is insufficient to produce an atomic weapon. The Commission is authorized to produce fissionable materials in quantities determined by the President, and it may let contracts for operation of its facilities. No person may manufacture, transfer, or acquire facilities for the production of fissionable material except by license from the Commission.

Section 5 (a). Control of Fissionable Materials.—As used in this Act, the term "fissionable material" means plutonium, uranium enriched in the isotope 235, any other material which the Commission determines to be capable of releasing substantial quantities of energy through nuclear chain reaction of the material, or any material artificially enriched by any of the foregoing; but does not include source material. It shall be unlawful for any person after September 30, 1946, to possess or transfer any fissionable material, except as authorized by the Commission. The Commission shall be the exclusive owner of all fissionable material within the jurisdiction of the United States, but it is directed to distribute sufficient fissionable material owned by it to permit widespread independent research and development, to the maximum extent practicable. No applicant shall be distributed a quantity of fissionable material sufficient to construct a military weapon.

Section 5 (b) (1–5). Control of Source Materials.—As used in this Act, the term "source material" means uranium, thorium, or any other material which is determined by the Commission, with the approval of the President, to be peculiarly essential to the production of fissionable materials; but includes ores only if they contain one or more of the foregoing materials in such concentration as the Commission may by regulation determine from time to time. Unless authorized by a license issued by the Commission, no person may deliver or receive any source material after removal from its place of deposit in nature, except that licenses shall not be required for quantities of source materials which, in the opinion of the Commission, are unimportant. The Commission is directed to acquire supplies of source materials and interest in property containing deposits of source materials to the extent it deems necessary to effectuate the provisions of this Act.

Section 5 (b) (6). Exploration for Source Materials.—The Commission is authorized to conduct and enter into contracts for the conduct of exploratory operations, investigations, and inspections to determine the location, extent, mode of occurrence, use, or conditions of deposits or supplies of source materials, making

just compensation for any damage or injury occasioned thereby. Such exploratory operations may be conducted only with the consent of the owner, but such investigations and inspections may be conducted with or without such consent.

Section 5 (b) (7). Source Materials on Public Lands.—All uranium, thorium, and other materials peculiarly essential to the production of fissionable material, contained, in whatever concentration, in deposits in the public lands are hereby reserved for the use of the United States subject to valid claims existing on August 1, 1946. No individual who had any part in the development of the atomic bomb project may benefit by a location made upon the public domain after August 1, 1946, that was a result of acquisition of confidential official information regarding the existence of source materials in the lands upon which such location is made. Any patented lands on the public domain may be worked, but when such use results in the extraction of any source material in quantities which may not be transferred without a license, such material shall be the property of the Commission and the Commission may require delivery of such material to it by any possessor thereof after such material has been separated from the ores in which it was contained. If the Commission requires the delivery of such material to it, it shall pay to the person mining or extracting the same, or to such other person as the Commission determines to be entitled thereto, such sums, including profits, as the Commission deems fair and reasonable for the discovery, mining, development, production, extraction, and other services performed, but such payment shall not include any amount on account of the value of such material before removal from its place of deposit in nature.

Section 5 (c). Control of Byproduct Materials.—As used in this Act, the term "byproduct material" means any radioactive material (except fissionable material) yielded in or made radioactive by exposure to radiation incident to the processes of producing or utilizing fissionable material. The Commission is authorized to distribute byproduct materials and shall give preference to applicants proposing to use such materials in the conduct of research and development activity or medical therapy. The Commission shall recall any materials used in a manner other than as disclosed in the application therefor.

Section 5 (d). General Provisions for Control of Materials.—The Commission shall not distribute fissionable material to any foreign government or to any person for a use which is not within the jurisdiction of the United States.

Section 6. Military Applications.—The Commission is authorized to develop and produce atomic weapons but only to an extent directed by the President. The President from time to time may direct the Commission (1) to deliver fissionable materials or weapons to the armed forces and (2) to authorize the armed forces to manufacture equipment utilizing fissionable material as a weapon.

Section 7. Utilization of Atomic Energy.—It shall be unlawful, except as provided in sections 5 (a) and 6, for any person to manufacture, use, or export any equipment utilizing fissionable material or atomic energy except under a license from the Commission. Nothing in this section shall be deemed to require a license for the conduct of research or development activities relating to the manufacture of such equipment or the utilization of fissionable material or atomic energy, or for the manufacture or use of equipment for medical therapy.

Section 8. International Arrangements.—Any provision of this Act or any action of the Commission to the extent that it conflicts with the provisions of any international arrangement made after August 1, 1946, shall be deemed to be of no further force or effect.

Section 9. Property of the Commission.—The President shall direct the transfer to the Commission of all interests owned by the United States in fissionable material, atomic weapons, facilities and materials for producing and utilizing fissionable material and atomic energy, technical information, patents, inventions, and discoveries related thereto.

Section 10. Control of Information.—It shall be the policy of the Commission to control the dissemination of restricted data in such a manner as to assure the common defense and security. Until Congress declares that effective international safeguards against the use of atomic energy for destructive purposes have been established, there shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes. The dissemination of scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free interchange of ideas and criticisms which is essential to scientific progress. Whoever discloses, or attempts to acquire with intent of disclosure, any restricted data concerning the production or utilization of fissionable material, atomic weapons or atomic power, or whoever

conceals, alters, or destroys such restricted data, with intent to injure the United States or to secure an advantage to a foreign nation, upon conviction thereof, shall be punished by death or by imprisonment for life; or by a fine of not more than $20,000 or imprisonment for not more than twenty years, or both.

Section 11. Patents and Inventions.—Any person who makes an invention or discovery useful in producing or utilizing fissionable material or atomic weapons shall file with the Commission a complete description thereof. No patent shall be granted on the production of fissionable materials or atomic weapons. Patents may be granted on the utilization of atomic energy, but the Commission may requisition or condemn such patents, making just compensation therefor.

Sections 12–21.—The last ten sections are titled General Authority, Compensation for Property Acquired, Judicial Review and Administrative Procedure, Joint Committee on Atomic Energy, Enforcement, Reports, Definitions, Appropriations, Separability of Provisions, and Short Title. Section 17 on Reports directs the Commission to submit to Congress in January and July of each year a report concerning its activities.

After passage of the act, section 15 was implemented by organization of a Congressional Joint Committee on Atomic Energy, which elected Senator Brien McMahon chairman for the remainder of the Seventy-ninth Congress, second session.

Members of the Atomic Energy Commission were appointed by President Truman October 28, 1946, and held their first formal meeting November 13 at Oak Ridge, Tenn. Other presidential appointees were the General Advisory Committee, December 12, and the General Manager, December 30. The Military Liaison Committee was named by the Secretaries of War and Navy November 4. Properties, functions, and—in large part—personnel of the Manhattan District were transferred to the Atomic Energy Commission in accordance with Executive Order 9816, effective January 1, 1947. At that time the organization of the Commission was as follows:

Members:
- David E. Lilienthal, Chairman
- Robert F. Bacher
- Sumner T. Pike
- Lewis L. Strauss
- William W. Waymack

General Advisory Committee:
- J. Robert Oppenheimer, Chairman
- James B. Conant
- Lee A. DuBridge
- Enrico Fermi
- Isidor I. Rabi
- Hartley Rowe
- Glenn T. Seaborg
- Cyril S. Smith
- Hood Worthington

General Manager: Carroll L. Wilson
Director, Division of Research: James B. Fisk
Director, Division of Production: Walter J. Williams
Director of Organization and Personnel: G. Lyle Belsley
General Counsel: Herbert S. Marks
Military Liaison Committee:
- Lt. Gen. Lewis H. Brereton, Chairman
- Maj. Gen. Lunsford E. Oliver
- Col. John H. Hinds
- Rear Adm. Thorvald A. Solberg
- Rear Adm. Ralph A. Ofstie
- Rear Adm. William S. Parsons

The Senate Committee on Atomic Energy began hearings January 27, 1947, on the appointments of the members and General Manager

of the Commission. After considerable testimony, particularly with respect to the proposed chairman, the appointees were confirmed by the Senate April 9, 1947.

Conservation Order M–285, previously mentioned, was administered by the Civilian Production Administration during most of 1946 and by the Office of Temporary Controls, its successor, from December 12,1946, to March 31, 1947, when the order lapsed and was superseded by Atomic Energy Commission Control of Source Material Part 40 (Code of Federal Regulations Title 11).

The new regulation provided that on and after April 1, 1947, no person, unless licensed by the Atomic Energy Commission, may transfer, deliver, receive possession of or title to, or export any source material, after removal from its place of deposit in nature, containing as much as 0.05 percent uranium or thorium in any proportion. The restrictions were stated not to apply to transfers or deliveries in any one month of source material containing less than 10 pounds of uranium or thorium. Nor do they apply to incandescent mantles, ceramic products, refractories, glass products, and vacuum tubes; to photographic film, negatives, and prints; or to rare-earth metal, compounds, mixtures, and products containing not more than 0.25 percent Th or U. All stocks of raw source material that have been removed from their place of deposit in nature and contain 10 pounds or more U or Th and all stocks of refined source material that contain 1 pound or more U or Th must be reported to the United States Atomic Energy Commission, P. O. Box 42, Station F, New York 16, N. Y., where applications for licenses are handled.

International Control.—The United Nations organization came into official existence October 24, 1945. A proposal to set up within that organization a commission to prepare recommendations on atomic energy was made by President Truman, Prime Minister Attlee of the United Kingdom, and Prime Minister King of Canada in the Three-Nation Agreed Declaration signed in Washington November 15, 1945. A comprehensive inquiry into the nature and possibilities of effective safeguards was initiated by Secretary of State Byrnes, who in January 1946 appointed a committee consisting of Under Secretary of State Dean Acheson, chairman, John J. McCloy, Vannevar Bush, James B. Conant, and Maj. Gen. Leslie R. Groves. That committee January 23 appointed a Board of Consultants, who published March 28 the Acheson-Lilienthal report,[11] not as a statement of policy but as a basis for discussing effective safeguards.

The United Nations Atomic Energy Commission was established January 24, 1946. Bernard M. Baruch was appointed United States Representative on that Commission by President Truman March 18, with Senate approval April 5. Baruch selected as associates John M. Hancock, Ferdinand Eberstadt, Fred Searls, Jr., Herbert B. Swope, Richard C. Tolman, Thomas F. Farrell, and John Parks Davis. The first meeting of the international commission was in New York City June 14, 1946. Official declarations and proposals

[11] Lilienthal, David E. (Chairman), Barnard, Chester I., Oppenheimer, J. Robert, Thomas, Charles Allen, and Winne, Harry A., A Report on the International Control of Atomic Energy: U. S. Department of State Pub. 2498, 1946, 61 pp.

relating to the international control of atomic energy were published.[12] Baruch and his principal associates resigned January 7, 1947, because they considered that their phase in the work of guaranteeing the peaceful use of atomic energy had been completed. United States representation on the international commission was then added to the duties of Warren R. Austin, United States member of the United Nations Security Council.

CONSUMPTION AND USES

Most of the uranium produced currently in the world is apparently being used in the development and production of atomic weapons and, in lesser degree, of industrial power. Radioactive elements useful in medicine, science, and industry are byproducts. There are minor chemical and ceramic uses of uranium and thorium compounds.

WEAPONS

The first atomic bomb was detonated July 16, 1945, on the Alamogordo proving ground, Los Alamos, N. Mex. The second and third were exploded August 6 and 9 (August 5 and 8, United States time), 1945, over the Japanese cities of Hiroshima and Nagasaki, respectively.[13] The fourth and fifth atomic bombs were used July 1 and 25 (June 30 and July 24, United States time), 1946, to test their effect on naval ships and auxiliary vessels at Bikini atoll, Marshall Islands.[14] A British report has been quoted[15] as stating that the minimum quantity of plutonium to be explosive is 22 to 66 pounds (10 to 30 kilograms).

Production operations by the Manhattan District and research and development work on improved atomic weapons were continued during 1946, according to the Atomic Energy Commission first semiannual report. Research was begun on the development of atomic engines for large naval ships, and there was official speculation about atomic torpedoes. The NEPA (Nuclear Energy for Propulsion of Aircraft) project was begun in July 1946 to investigate the possibility of applying nucleonics to airplanes;[16] the work is a joint effort of the Army Air Forces, National Advisory Committee on Aeronautics, the Fairchild Engine & Airplane Corp. (prime contractor), and other private companies.

INDUSTRIAL POWER

Operation of a number of chain-reacting piles between 1942 and 1946 demonstrated that the energy of the atomic nucleus had been effectively harnessed. During 1946 it was generally believed that pilot plants would be producing commercially usable nuclear power within a few years and that such power would find economic industrial application—most probably for central-station generation of electricity—in less than 10 years. By the end of 1946 there were some predictions that commercial electric power from atomic prime movers was only about 5 years away.

Compton-Jeffries Statement.—Some of the factors involved in converting atomic energy to usable power were outlined by two scientists, formerly affiliated with the Manhattan District, in a statement [17] transmitted to the United Nations Atomic Energy Commission on July 10, 1946. It was pointed out that, while there may be other possibilities, the most obvious method of producing power from atomic fission is to heat a cooling agent in the chain-reacting pile and pass the heated coolant through a heat exchanger that makes steam for driving a turbine. By using uranium containing more than the usual fraction of U–235, chain-reacting units of smaller size may be built, but there is a lower limit to size and weight imposed by the massive shield necessary to prevent emanation of dangerous radiations. For ordinary uses the weight of this shield would need to be of the order of tons. The use of atomic energy for driving automobiles or aircraft of customary size is therefore not in sight, the two scientists believed. Prominent among the advantages of atomic power are the wide flexibility and easy control of the rate at which power is developed, the insignificant weights of uranium compared with conventional fuels for equal quantities of heat energy (particularly important in areas of high transportation costs), and the production of radioactive products of sufficient value to carry a fair share of the operating cost. Unfavorable factors include the necessity, at the present stage of technological development, of an involved and expensive chemical treatment to decontaminate periodically the uranium fuel and of the maintenance of special technical crews familiar with radiological hazards.

Monsanto Study.—Under the direction of Charles A. Thomas, a technical staff of Monsanto Chemical Co., operator of the Clinton Laboratories, Oak Ridge, Tenn., prepared for transmittal to the United Nations Atomic Energy Commission on September 5, 1946, a brief report [18] on the possible costs of nuclear power. Although no such plant had ever been built or even designed, it was felt probably that a stationary nuclear power plant of 75,000 kilowatts could be built in eastern United States for approximately $25,000,000 and would deliver power at about 8 mills per kilowatt-hour. Under similar conditions a coal-power plant would cost $10,000,000 to build and 6½ mills per kilowatt-hour to operate, provided its fuel was bituminous coal (13,500 B. t. u.) at $7 per ton delivered. Equality of operating

[17] Compton, Arthur H., and Jeffries, Zay, Future of Atomic Energy: The International Control of Atomic Energy—Scientific Information Transmitted to the United Nations Atomic Energy Commission June 14–Oct. 14, 1946: U. S. and United Nations Rept. 5, U. S. Department of State Pub. 2661, 1946, pp. 81–85.

[18] Tolman, Richard C., Nuclear Power. Work cited in footnote 17, pp. 125–127.

costs between nuclear and coal plants would be reached if the coal cost $10 per ton. In each instance, it was assumed that the plant would operate at 100 percent of capacity and that the interest charges on the investment would be 3 percent. The commercial pile considered would differ from the Hanford piles in that the operating temperature would be high enough to supply power and all plutonium formed would be recovered for later consumption in a pile. It seems reasonable to expect, the report pointed out, that development of nuclear power will result in standardization of design and material reduction in investment and operating costs. The placing of small nuclear power plants at strategic points on established utility-company systems would greatly reduce power-transmission costs, make feasible greater decentralization of industry, and insure partial operation of a system if its superpower stations were inoperative. The combination of a nuclear power plant with the modern gas turbine,[19] makes unnecessary a supply of water for steam or cooling.

California Scientists' Study.—The Carnegie Endowment Committee on Atomic Energy, in cooperation with J. B. Condliffe of the University of California and with other members of the Northern California Association of Scientists, called together a group to analyze such information regarding nuclear power potentialities as was then publicly available.[20] The group, without benefit of confidential information, estimated costs and income of nuclear power stations under specified conditions, as shown in the accompanying table. It was concluded that a large primary pile probably could sell plutonium at a price equivalent thermally to coal and still produce power at a cost of 3 to 4 mills per kilowatt-hour and that stations consuming plutonium priced at $20 per gram could generate power costing 5 to 15 percent less than that from competitive plants using coal at $6 per short ton. Primary pile units must be relatively large in order to be efficient, particularly in consideration of the facilities for chemical processing and disposal of wastes. In this study a yield of only 550 pounds of plutonium from an original 10,000 pounds of uranium was assumed. An approximately equal weight of fission products would be formed, so that the over-all efficiency of uranium transmutation assumed is only about 11 percent, the remaining 89 percent going out with the wastes. The process need not be so inefficient; but even if it were, only 100 tons of pure uranium per year would be required to supply the electric power that is now used in the United States.

Westinghouse Interim Study.—Two engineers of Westinghouse Electric Corp., East Pittsburgh, Pa., concluded in the fall of 1946 that nuclear energy is likely to become commercial, that the cost will not be excessive but neither is it likely to revolutionize power costs, and that numerous large technical difficulties must be resolved—probably by years of development—before a commercial nuclear energy plant can be established.[21] The engineers estimated that a 100,000-kilowatt nuclear power plant would cost $12,000,000 to $18,000,000 compared with a coal-fueled plant costing $9,000,000. Their calculations indicate that such a nuclear plant could generate power, assuming a load

Costs and income of nuclear power stations (estimated) compared with coal-fueled power stations, in thousands of dollars [1]

[Northern California Association of Scientists]

Item	500,000-kw. primary pile	100,000-kw. plant		20,000-kw. plant	
		Plutonium	Coal	Plutonium	Coal
CAPITAL COSTS					
Land and improvements	$2,000	$100	$600	$60	$60
Buildings (except piles)	8,500	2,000	3,000	700	1,000
Pile units and accessories	24,000	2,000		1,100	
Fuel handling and storage	200	100	2,000		
Boiler plant	7,500	1,000	1,500	600	1,000
Other equipment	26,500	5,900	6,100	1,220	1,220
Total capital costs	68,700	11,100	13,200	3,680	3,280
OPERATING COSTS (ANNUAL)					
Fuel	$100	$1,000	$1,000	$270	$360
Wages and salaries (at $4,000)	800	160	240	80	100
Maintenance and supplies	1,000	150	120	40	30
Fixed charges (15 percent)	10,300	1,660	1,980	570	490
Total operating costs	12,200	2,970	3,340	960	980
INCOME (ANNUAL)					
Sale of power [2]	$8,800	$3,290	$3,290	$965	$965
Sale of plutonium (250 kg.)	5,000				
Sale of tracers (at $500 per gm.)		250		50	
Total income	13,800	3,540	3,290	1,015	965
Income above costs (annual)	$1,600	$570	(3)	$55	(3)

[1] Assumptions: Plant factor of 50 (4,380 kw.-hr. per year per kilowatt installed capacity). Utilization factor of 90 (peak load is 90 percent of rated capacity). Costs for coal plants representative of plants in 1946 designed in the United States. Data for atomic pile units are preliminary estimates. Fuel prices based on coal at $6 per short ton, uranium at $10 per pound, and plutonium at $20 per gram.

[2] Power at 500,000-kw., 100,000-kw., and 20,000-kw. plants valued at 4, 7½, and 11 mills, respectively.

[3] Apparent deficit probably a result of using conservative figure for sale of power.

Competitive costs of plutonium and coal

[Northern California Association of Scientists]

Assumed cost of coal (per short ton) in stations of—		Permissible competitive [1] cost of plutonium (per gram)	Assumed cost of nuclear power station		Permissible competitive [2] cost of plutonium (per gram)
100,000 kw.	20,000 kw.		100,000 kw.	20,000 kw.	
--------	$3	$11	$9,000,000	$2,500,000	$8
--------	4	15	--------	2,000,000	14
--------	5	20	6,000,000	--------	19
$3	--------	21	--------	1,500,000	20
--------	6	24	--------	1,100,000	24
4	--------	25	4,000,000	--------	25
5	--------	28	--------	800,000	27
6	--------	31	2,000,000	--------	31
--------	10	42	1,000,000	--------	34
10	--------	44			
12	12	51			

[1] Assumption: Nuclear power stations of 100,000 kw. and 20,000 kw., costing $2,000,000 and $1,100,000 respectively.

[2] Assumption: Coal costing $5 per short ton.

factor of 50 percent, at 4.4 to 6.4 mills per kilowatt-hour if uranium metal cost $5 a pound (equivalent to coal at $2 to $6 per short ton), or at 5.1 to 7.1 mills if uranium cost $20 a pound (equivalent to coal at $4 to $7 a ton).

Manhattan District Release.—Prime contracts for the development of industrial atomic power have been awarded by the Manhattan District to Monsanto Chemical Co., St. Louis, Mo., and to General Electric Co., Schenectady, N. Y., according to a War Department release of November 22, 1946. The Monsanto firm was working on a power pile based on designs by Farrington Daniels, professor of chemistry at the University of Wisconsin and chairman of the board of trustees of the Argonne National Laboratory, Chicago. A pilot plant will be built at Oak Ridge, Tenn., but difficulties of procurement of equipment may delay completion until 1948.

RADIOISOTOPES

Isotopes, as previously pointed out, are varieties of the same element that differ slightly in weight but have identical chemical properties. Many are radioactive and are thus called radioisotopes. Certain of these offer promise in the treatment of cancer and other diseases and in the promotion of special chemical reactions. The greatest demand quantitatively for radioisotopes is as "tracers"; materials in the bodies of animals and plants or in industrial batches can be "tagged" with small quantities of an isotope, the radioactivity of which makes possible accurate measurement of circulation and of distribution of components in biological processes and chemical reactions. Radioisotopes may be derived (1) by irradiation of elements or compounds placed in a chain-reacting pile or in a cyclotron, (2) by fission of uranium-235 in a pile, and (3) by physical separation from the commoner substance in which they are dispersed.

The availability of radioisotopes in mid-1946 was described by the Manhattan District,[22] which stated that most of the radioisotopes in greatest demand must be produced by irradiation of materials foreign to the pile. Existing pile facilities do not permit production of a sufficient quantity and quality of many radioisotopes to meet anticipated national demands. To accomplish this, it would very likely be necessary to build piles especially designed for the purpose. The cyclotron yields a greater variety of isotopes than does a pile but is extremely limited as regards quantity of output.

Although large numbers of radioisotopes are formed in abundance by the fission of uranium in piles, their availability is restricted by difficulties encountered in isolating them. It has not yet been found possible to remove individual fission products from waste solutions of the plutonium extraction process. Most of the few fission products being made available are not salvaged byproducts of the plutonium process but are items requiring special production from unprocessed irradiated uranium.

[22] Manhattan Project Headquarters, Availability of Radioactive Isotopes: Science, vol. 103, No. 2685 June 14, 1946, pp. 697–705.

Radiocarbon.—Irradiation of calcium nitrate in a uranium pile produces by transmutation carbon–14, a radioisotope with a half-life[23] of about 5,100 years and priced by the Manhattan District at $367 a millicurie[24] in the latter part of 1946 and $50 a millicurie after February 1947. As carbon is the fundamental "building block" of living animal and plant matter and of industrial organic materials such as petroleum products, coal chemicals, and plastics, the importance of a radioactive carbon tracer is evident. The first radioactive material made available by the Manhattan District for civilian research was carbon–14. At a ceremony at Oak Ridge, Tenn., August 2, 1946, about 1 milligram of the precious isotope was delivered by E. P. Wigner, research director of the Clinton Laboratories, to E. V. Cowdry of Barnard Free Skin and Cancer Hospital, St. Louis, Mo. It was in the form of barium carbonate and was subsequently built into a cancer-producing agent (20–methylcholanthrene) by the Kettering Foundation for the Study of Chlorophyll and Photosynthesis, Antioch College, Yellow Springs, Ohio. There is a potential demand in the United States for several thousand grams of carbon–14 annually if the price is low, according to the Northern California scientists study,[25] which estimated that a 100,000-kilowatt nuclear power station could produce 100 to 1,000 grams of the isotope annually and sell it profitably at a price of 50 cents a milligram.

Radioiodine and Radiophosphorus.—Only two artificially radioactive elements—iodine and phosphorus—have proved conclusively to have therapeutic value.[26] Iodine–131, a fission product of uranium, is a cure of hyperthyroidism (overactivity of the thyroid gland). It has a half-life of 8 days and was priced at $1.69 a millicurie by the Manhattan District. Estimated annual requirements in the United States are 337 curies for hyperthyroidism and 40 curies for attempts at controlling thyroid cancer. Phosphorus–32, produced by pile irradiation of sulfur, is the best of known therapeutic agents for polycythemia (overactive formation of red blood corpuscles). It has a half-life of 14 days and was priced by the Manhattan District at $1.09 a millicurie in the form of pure dibasic sodium phosphate and 5 cents a millicurie unseparated from its sulfur carrier. Estimated annual requirements are 151 curies for polycythemia and 180 curies for attempts at remitting luekemia (malignant overactive formation of white blood corpuscles). An advantage of radiophosphorus over X-rays is freedom from radiation sickness.

Other Radioisotopes.—About 80 other radioisotopes were announced as available from the Manhattan District, Oak Ridge, Tenn.; they were priced in a list dated June 28, 1946.

NONENERGY USES

Uranium.—Consumption of uranium in nonenergy applications was further restricted and in 1946 totaled only 2 tons. The largest consumer in this class was the chemical industry, which utilizes uranium

[23] Time required to decay to one-half its former size and radioactive intensity. Decay proceeds at an inverse geometric rate; that is, at the end of the first decay period one-half of the original quantity remains, at the end of the second period one-fourth, at the end of the third period one-eighth, etc.

[24] A millicurie is the intensity of radioactivity equivalent to that possessed by 1 milligram of radium, that is, 3.7×10^7 disintegrations per second.

[25] Work cited in footnote 20, p. 131.

[26] Rhoads, C. P., and Solomon, A. K., Therapeutic Uses of Artificial Radioactivity. Work cited in footnote 17, pp. 53–61.

acetate and nitrate as analytical reagents in the determination of sodium and zinc. All the uranium allocated to the ceramic industry in 1946 went into glass of specific coefficients of expansion for glass-to-metal contacts in vacuum tubes and into amber-colored glass for signal lights and lenses. Small quantities of uranium were used to tone motion-picture film and to make negative-temperature-coefficient resistors, according to the Atomic Energy Commission.

Consumption of uranium compounds for nonenergy purposes in the United States, 1943–46, in pounds of contained U_3O_8

[Atomic Energy Commission]

Industry	1943	1944	1945	1946
Chemical	4,000	6,700	3,800	2,500
Photographic				360
Electrical	250	800	1,000	300
Ceramic (including glass)	7,500	100	150	1,000
Total	11,750	7,600	4,950	4,160

Thorium.—Gas mantles are treated with thorium nitrate, and some special refractory crucibles are made of thorium oxide. Certain optical glass batches have included thorium.

STOCKS

Industry stocks of monazite exceeded 4,000 short tons at the end of 1944 but were greatly reduced in 1945–46 as a result of meager imports. The Government completed a war-inspired stock pile of 3,262 short tons of monazite by May 1944. No data on stocks of uranium are available for publication.

PRICES

Uranium.—Carnotite ore and concentrates containing 1.06 percent U, 3.23 percent V, and 3.2 milligrams Ra per ton shipped from domestic mines in 1940 had an average value of $78 a short ton; corresponding data for recent years are not available. The first postwar prices on uranium in ore—quoted in May 1947 by the Vanadium Corp. of America—are shown in the accompanying table. The corporation stated at the time that ore containing over 6 percent $CaCO_3$ may be rejected. Pure uranium metal cost $22 a pound in 1942, according to the Smyth report. The Northern California scientists valued refined uranium at $10 a pound and plutonium at $20 a gram in their recent cost study.[27] Oil, Paint and Drug Reporter quoted black uranium oxide unchanged at $2.55 a pound and uranium yellow (sodium uranate) at $1.65 a pound throughout 1946. Canadian Chemistry and Process Industries during the same period listed black uranium oxide at $3.35 a pound, uranium nitrate at $2.85 a pound, and yellow or orange sodium uranate at $2.20 a pound.

[27] Work cited in footnote 20, p. 132.

Prices offered for uranium oxide contained in ores and concentrates, delivered to Naturita, Colo., May 1947

U_3O_8 contained (percent)	Value	U_3O_8 contained (percent)	Value
	Per pound		*Per pound*
0.20–0.30	$0.35	1.26–1.50	$0.80
0.31–0.40	.40	1.51–1.75	.90
0.41–0.50	.50	1.76–2.00	1.00
0.51–1.00	.60	2.01 and over	1.10
1.01–1.25	.70		

Thorium.—Monazite concentrates, minimum 8 percent ThO_2, were quoted nominally at $60 a short ton by E&MJ Metal and Mineral Markets during the first 5 months of 1946. The quotation, specifying 70 percent rare-earth oxides, f. o. b. Atlantic ports, was $70 a ton from June to November and lowered to $65 a ton in December 1946. Thorium metal, 98–99 percent, pound lots, was quoted at 3½ d. a gram by the Metal Bulletin (London) and thorium nitrate at $2 a pound by Oil, Paint and Drug Reporter during 1946.

FOREIGN TRADE [28]

Imports.—Belgian Congo and Canada have been the principal sources of imported uranium, and Brazil and India have supplied most of the imported thorium, according to such figures for recent years as are available and are published in the accompanying tables. The uranium compounds from Belgium are believed to have been manufactured entirely from Congo concentrates.

Uranium ore, concentrates, and compounds imported for consumption in the United States, 1937–46

Year	Uranium ore and concentrates				Uranium oxide and salts				
	Pounds from—			Value	Pounds from—				Value
	Belgian Congo	Canada	Total		Belgium	Canada	Other countries [1]	Total	
1937	(2)	(2)	(2)	(2)	160,072	37,846	5,555	203,473	$258,417
1938	(2)	(2)	(2)	(2)	287,752	88,954	2	376,708	520,540
1939		5	5	$10	1,333,053	106,271		1,439,324	1,197,786
1940	2,400,198		2,400,198	2,110,927	169,388	70,811		240,199	388,355
1941					[3] 53,090	334,415		387,505	501,370
1942	525,559	15,748	541,307	806,919		377,398		377,398	851,098

[1] Data for 1946 not available for publication.
[2] Includes following quantities originating in India but reported by U. S. Department of Commerce from United Kingdom: 1936, 29 tons; 1938, 7 tons; 1943, 36 tons.
[3] 1936: Ceylon; 1939: Netherlands East Indies.
[4] 1936: France (4,410) and Germany (1); 1945: Canada.

Exports.—Canada was the destination of the exported uranium and thorium ores and concentrates shown in the accompanying table. Of the uranium oxide and salts exported between mid-1941 and the end of 1945, 55 percent went to Latin America, 24 percent to Canada, 16 percent to Sweden, and 5 percent to other countries. Of the thorium compounds exported in the same period, 31 percent went to Canada, 28 percent to Russia, 21 percent to Egypt, 10 percent to India, 6 percent to China, almost 3 percent to France, 1 percent to Argentina, and much less than 1 percent to several other countries.

The Office of International Trade in September 1946 tightened export controls covering shipments moving under general in-transit licenses to prevent exportation of ores, concentrates, and compounds of uranium; metal, alloys, and compounds of thorium; metal and compounds of polonium; and compounds of actinium.

Uranium and thorium ores, concentrates, and compounds exported from the United States, 1941–45 [1]

Year	Uranium				Thorium			
	Ore and concentrates		Oxide and salts		Ore and concentrates		Compounds	
	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value
1941 [2]			604	$2,256			36,875	$50,700
1942	1	$1,076	426	1,827			30,872	51,056
1943			321	1,972			33,191	45,703
1944			221	1,064	5	$325	13,560	25,348
1945	(1)	(1)	150	993	(1)	(1)	10,790	41,122

[1] Data for 1945 (except compounds) and for 1946 not available for publication.
[2] July to December, inclusive; earlier data not separately recorded.

TECHNOLOGY

Methods of exploring for radioactive ores,[29] analyzing uranium materials,[30] and measuring radiation [31] were described in 1946. Some of the metallurgical problems involved in the production of fissionable metals were discussed.[32]

The hazard of a new, highly efficient process being discovered which would render obsolete all existing nuclear plants is a very real one as long as no general theory for the behavior of atomic nuclei exists; once the theory has been developed and worked for some years the chance of a complete revolution decreases substantially.[33] One example of the effect of technologic advancement was noted in December 1946, when the Atomic Energy Commission was informed that improvement in the isotope-separation processes at Oak Ridge would permit considerable savings in operating costs and substantial reduction in the number of employees required at one plant.

WORLD REVIEW

Uranium-radium ore production at the onset of World War II centered in the Belgian Congo and Canada, but there was some output also in the United States, Czechoslovakia, and Portugal.

World production of monazite in 1893–1938 totaled 107,347 metric tons—61 percent in Brazil, 32 percent in India, 5 percent in the United States, and 1 percent each in the Netherlands East Indies and Ceylon.[34]

AMERICA

Brazil.—Production of monazite in Brazil in 1895–1938 totaled 65,612 metric tons. The bulk of the output was from coastal sands in the States of Bahia and Espirito Santo. Uranium minerals such as samarskite, euxenite, and polycrasite occur in some of the beryl-tantalite pegmatites of Minas Gerais and Paraiba, and the Brazilian Academy of Sciences has urged the Brazilian Government to allocate funds for intensified research to determine in what quantities uranium is present.

Canada.—One of the world's principal uranium mines is at La Bine Point, on the east shore of Great Bear Lake, Northwest Territories. It is operated by Eldorado Mining & Refining Co., a Crown company that took over the property from Eldorado Gold Mining Co. January 28, 1944. Geology, development, and milling at the Eldorado mine were described.[35] Field parties, continuing work done in previous years, were active in the summer of 1946 exploring Northwest Terri-

tories for other uranium deposits. The International Uranium Mining Co., Ltd., continued development of its silver-uranium property (purchased in 1944 from Bear Exploration & Radium, Ltd.) at Contact Lake, southwest of the Eldorado mine; the power plant and some other buildings were damaged in a fire November 1946, but plans to reopen the property remained active.

Pitchblende concentrates from the Eldorado mine are shipped to the Government refinery at Port Hope, Ontario. During World War II the refinery was modernized from batch operation to continuous circuit. In recent years Canada exported a substantial supply of uranium to the United States under contract and a small quantity to the United Kingdom, it was officially stated by C. D. Howe, Minister of Reconstruction.[36]

The National Research Council is to operate a uranium-heavy-water chain-reacting pile and other equipment under construction during 1945 and 1946 at the National Institute for Nuclear Research, Chalk River, Ontario. The Institute—as well as the Eldorado mine, Port Hope refinery, and a plutonium-heavy-water unit in western Canada—will be operated in accordance with the policy of the Atomic Energy Control Board, established by the provisions of the Atomic Energy Control Act passed by the Dominion Parliament in June 1946. C. D. Howe, as chairman of the Committee of the Privy Council on Scientific and Industrial Research, was appointed director of the five-man control board. Canada's investment in atomic energy research and development reached $27,000,000 by early 1946.

Mexico.—All deposits of uranium, thorium, actinium, and other radioactive elements discovered in future in Mexico were withdrawn from private exploitation and placed in the National Mineral Reserve, according to a decree effective September 17, 1945, and amended October 17, 1946.

AFRICA

Belgian Congo.—The Chinkolobwe mine of the Union Minière du Haut Katanga exploits one of the largest known deposits of uranium in the world. Before World War II it shipped enough concentrates to Belgium to sustain an output of as much as 60 grams of radium annually. Shipments of 1,089 metric tons of uranium concentrates to the United States in 1940 and 238 tons in 1942 were recorded by the United States Department of Commerce before censorship was imposed.

Madagascar.—A few hundred tons of uranium concentrates have been produced in Madagascar and exported to France. Betafite was mined at Ambatofotsy and Amparitena, euxenite in the vicinity of Ankazove, and autunite in alluvium of the Fitamalama River, 16 miles south-southeast of Antsirabe. Exports of uranium minerals were 49 kilograms in the first quarter 1946 and none in the second and third quarters. The Paris decree of April 5 was promulgated in Madagascar by the Governor General's order of July 3, 1946, reserving to the State all new rights for research and exploitation of uranium, thorium, and beryllium ores.

[36] Northern Miner, Radioactive Ore Control Looms: Vol. 32, No. 11, June 6, 1946, p. 4.

EUROPE

Austria.—The principal refiner of uranium-radium ores in German-occupied Europe during World War II was Treibacher Chemische Werke, A. G., at Treibach, 18 miles north of Klagenfurt, Carinthia, south-central Austria. The plant, undamaged by hostilities, treated about two-thirds of the pitchblende mined in Czechoslovakia during the war; it produced uranium compounds in 1940–44 containing 28,964 kilograms of U_3O_8—all shipped to Germany. Stocks at Treibach in June 1945 included 4,500 kilograms of U_3O_8 in ammonium uranate and sodium uranate and 4,500 kilograms of pitchblende.[37]

Belgium.—The Société Générale Métallurgique de Hoboken, subsidiary of Union Minière du Haut Katanga, operates a refinery at Oolen, near Antwerp, for treating Congo ore. Exports of uranium oxide were officially reported at 150 metric tons in 1936, 82 in 1937, 130 in 1938, and 88 in 1939. However, the United States reported receipts from Belgium of 605 metric tons of oxide in 1939 and 77 tons in 1940.

Bulgaria.—A deposit at Goten, 13 miles northeast of Sofia, is said to contain 25,000 tons of ore averaging 2 percent U.[38]

Czechoslovakia.—Mines at Jachymov (Joachimsthal), Bohemia, were worked for silver in the 16th century, for uranium as a glass colorant since about 1830, and for radium since 1898, when the Curies discovered the then new element in the ore. Ore produced in the late 1920's and early 1930's yielded about 13 metric tons of uranium compounds and 2 or 3 grams of radium annually. Production at Jachymov (including some 10 percent at nearby Schmiedeberg) in 1939–44, during German occupation, totaled about 110 metric tons of pitchblende concentrates containing some 40 percent recoverable U_3O_8 and about 175 milligrams of recoverable Ra per ton, according to Singer.[39] Two-thirds of that output was refined at Treibach, Austria, and one-third in Brunswick, Germany. In 1946 the Czechoslovak Government announced [40] its establishment of full control over the Jachymov mine and resumed operations.

France.—Uranium minerals have been known for many years to occur near Autun, Saône-et-Loire; Beauregard, Nièvre; and elsewhere in France. Particular interest was aroused in 1946 in uranium deposits in the vicinity of Limoges, Haute-Vienne.[41] Control of atomic energy in France was implemented by the establishment of a Commissariat of Atomic Energy October 18, 1945, and the enactment of a decree April 5, 1946, reserving to the Government rights for research on and exploitation of uranium, thorium, and beryllium ores in all French colonies (except the Antilles and Réunion). Plans are being formulated [42] to construct a huge experimental laboratory for atomic energy on the Saclay Plateau, near Orsay, west of Paris.

[42] Joliot-Curie, Frederic, Atomic Power—The Perfect Slave: United Nations World, vol. 1, No. 2, March 1947, pp. 19–23, 78.

Germany.—In 1939–43 Germany produced from 49,017 metric tons of ore 1,699 tons of uranium-bismuth-cobalt-nickel concentrates containing 35 tons of U_3O_8;[43] the source, although not specified, was probably Schneeberg, Saxony. The ultimate progress of German research toward development of uranium bombs has not been publicly revealed, but the following comments [44] are suggestive:

> Allied investigators found in Germany nuclear research reports data on almost all of the basic concepts used by Allied atomic workers. The ideas in both cases were fundamentally similar or even identical, but the emphasis was different—enough different, as it turned out, to put the Nazis on the wrong track. The Germans, for example, never once came to understand how much of the job of making atomic bombs was purely an industrial and engineering undertaking * * * Nazi Germany's inefficient scientific mobilization had something to do with it.

Norway.—Government geologists mapped uranium deposits in 1946, and a small mine was opened.[45] All such deposits are subject to government control in accordance with a Royal Resolution of December 7, 1945. Norsk Hydro-Elektrisk Kvaelstofaktieselskab has a unit at Rjukan for producing heavy water, a moderator for atomic reactions; the plant was effectively damaged by a Norwegian-British land party during the German occupation, but production is said to have been resumed after the liberation.

Portugal.—Production was 330 metric tons of autunite ore (1–1.8 percent U_3O_8) in 1941, but data for 1942–45 are not available. In the first quarter of 1946 there was no output of uranium ore, according to a minerals attaché report from the American Embassy at Lisbon.

Spain.—There has been no reported production of uranium in Spain, but the Director General of Mines and Fuels published October 4, 1945, a provisional order reserving to the State uranium deposits in 14 Provinces. Some Spanish occurrences were described.[46]

Sweden.—The $25,000,000 shale-oil plant at Kvarntorp, Province of Narke, treats shale averaging about 0.02 percent U_3O_8. Sweden's shale-oil deposits contain 225,000 metric tons of uranium oxide, Gustav Egloff, director of research of Universal Oil Products Co., estimates.[47]

United Kingdom.—Pitchblende has been produced in Cornwall, notably some years ago at the South Terras mine, Grampound Road, and at the Trenwith mine, St. Ives. Geologists are reportedly making a new survey of the deposits.[48] A chemical defense plant at Salwick, near Preston, is to be converted to a uranium refinery, where pitchblende concentrates will be reduced to metal and the metal machined into uranium rods.[49] The Atomic Research Station, including two chain-reacting piles and a heavy-water-production unit, was under construction at Harwell, near Didcot, during 1946; the smaller pile, according to J. D. Cockcroft, director of atomic research, was expected to operate a few months after the end of the year.[50] The Government purchased the radiochemical business and plant at Amersham, Bucks,

of Thorium, Ltd., which as agent of the Ministry of Supply will operate a national center for processing and distributing thorium, radium, and artificial radioactive substances. The Atomic Energy bill passed by the House of Commons in October 1946 envisaged an expenditure of £30,000,000 on the project.[51] About £2,800,000 of this was spent in the fiscal year beginning April 1, 1946, according to press reports. Ores and concentrates of uranium and thorium were placed under export control after the middle of 1946.

ASIA

Ceylon.—Large deposits of monazite and meager occurrences of thorianite and zirkellite have been known in Ceylon for some years. Production of monazite was 773 metric tons in 1918–29 and none in 1930–38. During the first half of 1946 the Government Mineralogist's Department was conducting further investigations of the deposits, and legislation regulating production of radioactive minerals was being drafted.[52]

India.—An important source of monazite is the marine and fluvial beach sand of Travancore. Production of monazite totaled 34,593 metric tons in 1911–38.

Netherlands East Indies.—The Netherlands Indies produced 1,431 metric tons of monazite in 1936–38. The principal source was the tin-mining island of Billiton in the Java Sea.

U. S. S. R.—Stalactitic varieties of tuyamunite, volborthite and turanite have been mined intermittently at Tuya-Muyun (40°21′22″ N., 72°35′01″ E.), Ferghana, Turkestan. The crude ore averaged 1.1–1.4 percent U_3O_8 and also contained radium, vanadium, and copper.

AUSTRALIA AND NEW ZEALAND

Australia.—The autunite-torbernite deposits in the Mount Painter area, South Australia, some 400 miles north of Adelaide, have yielded to date about 138 metric tons of selected uranium-radium ore valued at £10,000, chiefly the value of the radium. Readily available reserves in the area are estimated at 500 tons of ore averaging 0.33 percent UO_3. Detailed exploration was conducted for the British Government at Mount Painter between June 1944 and February 1945, but the only output during the period was a small quantity of ore for ore-dressing studies. The Control of Materials Act of 1946 reserved all deposits of uranium and thorium ores to the Crown.[53] The South Australian budget for 1947 provides £10,000 (probably to be increased) for development of the Mount Painter deposits.[54]

New Zealand.—The Department of Scientific and Industrial Research is investigating the occurrence of radioactive minerals throughout the Dominion. No deposits believed to be of economic

importance at present have been found, but certain mineral by-products of gold dredging on the west coast of South Island may represent a potential source. For instance, 3 percent of the concentrate from one dredge was uranothorite with 12 percent UO_2 and nearly 70 percent ThO_2; 8 percent of the concentrate from another dredge was monazite containing 2 percent UO_2 and 4 percent ThO_2.[55] Research on methods of concentration has been initiated. In accordance with the New Zealand Atomic Energy Act, effective December 7, 1945, the Government controls the mining and processing of uranium and other source materials.

Vanadium

By EDWIN K. JENCKES

GENERAL SUMMARY

THE decrease in production and consumption of vanadium ores that occurred in 1945 continued in 1946, marking it as the third successive year of decline from the all-time high established in 1943. Production in 1946 was 1,272,148 pounds (of contained vanadium), a drop of 1,691,765 pounds from that in the previous year; and consumption of domestic ores was 1,495,839 pounds, a decrease of 2,325,580 pounds.

For the third successive year consumption of domestic ores exceeded production, with a corresponding decrease in inventories of mined-ore stocks. Visible stocks of vanadium oxide declined, while inventories of ferrovanadium increased moderately.

Imports and exports of vanadium ore and concentrates (791,057 pounds and 6,051 pounds, respectively) showed marked declines from those in 1945.

Salient statistics of the vanadium industry in the United States, 1942–46, in pounds of vanadium contained

	Pounds of vanadium contained				
	1942	1943	1944	1945	1946
Mine shipments of ores and concentrates [1]	4,439,130	5,586,492	3,527,054	2,963,913	1,272,148
Imports:					
Ore or concentrates	2,422,376	2,052,620	1,284,603	1,552,307	791,057
Vanadium-bearing flue dust	154,028	64,393	40,171	26,293	20,931
Exports of ore, concentrates, and vanadium oxide	22,140	38,180	6,254	113,927	6,051
Consumption (domestic ores only)	3,914,673	5,179,290	4,113,309	3,821,419	1,495,839

[1] Measured by receipts at mills and Government purchasing depots.

GOVERNMENT REGULATIONS

Department of Justice.—In October the defendants in the antitrust suit instituted by the Attorney General in 1945 filed a motion seeking dismissal of the suit and a bill of particulars.[1] The motion was argued and denied, and the case is now awaiting the setting of a trial date.

Atomic Energy Commission.—The actions taken by the Atomic Energy Commission and their implications with respect to the mining of carnotite ores are discussed in the section of this chapter on domestic production. Further details are contained in the Uranium and Thorium chapter of this volume.

[1] Mining Record, Vanadium Trust Asks Dismissal of Case in U. S. Court: Vol. 57, No. 49, Dec. 5, 1946, p. 3.

DOMESTIC PRODUCTION

The production of domestic vanadium ores in the past 10 years is given in the accompanying table.

Vanadium in ores and concentrates produced in the United States, 1937–46 [1]

Year	Pounds of vanadium	Year	Pounds of vanadium
1937	1,086,125	1942	4,439,130
1938	1,613,155	1943	5,586,492
1939	1,984,068	1944	3,527,054
1940	2,162,916	1945	2,963,913
1941	2,513,051	1946	1,272,148

[1] Data for 1940–46 are receipts at mills and Government purchasing depots.

United States production for the period 1910–46, inclusive, totaled 44,415,000 pounds of contained vanadium; 1910 records the first commercial production of vanadium ores in the United States.

The sandstones of Colorado, Utah, and Arizona furnished the largest source of domestic vanadium in 1946; New Mexico, an important producer during the war, had no output in 1946. The important minerals in the sandstone ores are carnotite and the group of minerals locally called roscoelites. The supply from these ores is augmented by byproduct recovery of vanadium from phosphate rock mined in Idaho. Potential sources not currently productive are the shales of the Phosphoria formation of Utah, Idaho, and Wyoming, and vanadium-bearing titaniferous magnetites, particularly those adjacent to Sanford Lake, N. Y. Lead vanadates have been mined in Nevada and Arizona, but no commercial recovery of vanadium from this source has been reported to the Bureau of Mines.

Prior to the development of atomic fission two factors operated to prevent utilization of carnotite ores as ordinarily found as sources of uranium compounds, namely the generally low content of U_3O_8 in the ore and the limited market for uranium. Before World War II the demand for uranium was so small that it could be supplied easily by the rarely found carnotites of high U_3O_8 content; and it is understood that, in the case of these ores, the U_3O_8 only was paid for. In the ordinary vanadium-refining process in use before the war (salt roast), the uranium remained in the sands from which the vanadium had been extracted and found its way to the tailings pile. Under these conditions the U_3O_8 content had no commercial value and was not paid for.

There has been a strong and growing demand from vanadium miners that the uranium in ores be paid for. The miners claim that the mining of carnotite has been restricted by several factors including: (1) The little-publicized provisions of War Production Board Order M–285; (2) the imperfectly understood provisions of the Atomic Energy Act, which were misinterpreted as restricting discussions of and transactions in uranium ore; and (3) the inability of the Atomic Energy Commission to function pending confirmation of its members by the Senate.

Following confirmation of the Commission's membership steps have been taken to receive and examine applications for licenses for the disposal of uranium-bearing ores and materials, and with this end in view a visit has been made to the carnotite-producing region by L. C. Burman, chief of the Licensing Branch of the Commission.[2]

The Vanadium Corporation of America has offered to purchase carnotite ores on the basis of the combined oxides of uranium and vanadium.[3]

The unprecedented increase in alloy-steel production during the war years required a corresponding increase in the output of vanadium and resulted in shortages in 1941–42. By the fall of 1943, however, the supply of vanadium had overtaken the demand; hence, allocation controls under WPB Order M–23 were terminated.

During the 7-year period 1940–46, 22½ million pounds (contained vanadium) were produced in the United States. This represents over half of the vanadium that has been mined domestically since production was first recorded in 1910. Wartime requirements and postwar needs sustained this enormously expanded output, and domestic resources proved responsive to the sudden demand. Inasmuch as large quantities of the sandstone ores have been mined in meeting the emergency, the desirability of developing other known but latent sources of vanadium can well be appreciated.

REVIEW BY STATES

The accompanying table shows production of vanadium ores by all producers, by States, measured in terms of receipts at mills.

Vanadium in ores and concentrates produced in the United States, 1942–46, by States, in pounds

State	Pounds of vanadium contained				
	1942	1943	1944	1945	1946
Colorado	3,071,330	4,159,830	3,058,727	2,701,103	1,036,050
Utah	1,075,596	833,680	287,045	97,572	63,188
Other [1]	292,204	592,982	181,282	165,238	172,910
	4,439,130	5,586,492	3,527,054	2,963,913	1,272,148

[1] Includes Arizona and Idaho, 1942–46; Nevada, 1942–43; and New Mexico, 1943–44.

Arizona.—Two producers made small deliveries of ore in 1946. Mammoth-St. Anthony Ltd. (Tiger, Ariz.), Arizona's oldest vanadium producer, did not recover any vanadium from its complex ores in 1945 or 1946.

Colorado.—Only one refining plant, that of the United States Vanadium Corp. at Rifle, was in operation in 1946. The Bureau has received reports of deliveries varying in quantity up to 20,000 pounds of contained V_2O_5 from 19 independent mine operators.

Idaho, Montana, and Wyoming.—The byproduct recovery of vanadium by the Anaconda Copper Mining Co. from phosphate rock

[2] Mining Record, Way Now Cleared for Operation of Uranium Mines of West: Vol. 58, No. 15, Apr. 17, 1947, p. 8.
[3] Mining Record, Vanadium Mill to Pay for Uranium: Vol. 58, No. 15, Apr. 17, 1947, p. 3.

mined at Conda, Idaho, and treated at Anaconda, Mont., has been consistent since 1941. The Phosphoria formation in Idaho and Wyoming contains extensive vanadium-bearing shales, but their treatment offers serious difficulties.

Utah.—The Monticello plant, operated under lease from the Defense Plant Corporation by the Vanadium Corp. of America, completed refining of the ores purchased by that company from the Office of Metals Reserve and also refined ores from other sources. The plant was shut down at the end of the year.

Reports were received by the Bureau from 14 independent mine operators who made deliveries in quantities varying up to 29,000 pounds of contained V_2O_5.

EXPLORATION AND DEVELOPMENT

The Bureau of Mines has published a report [4] describing vanadium exploration work carried out during 1943–44. The Geological Survey reported no field work and published no reports on vanadium in 1946.

CONSUMPTION AND USES

Consumption of domestic vanadium ores rose continuously from 1940 (the first year for which these data were collected) to the peak year 1943, when consumption was 2.4 times that in 1940. Since 1943 the consumption has fallen each year, and that for 1946 was 29 percent of the 1943 figure.

Vanadium is used in various forms, 90 percent as alloys (largely ferrovanadium) and 10 percent as chemical compounds (virtually entirely as fused or air-dried oxide.) By far the largest part of the vanadium consumed enters alloy steels, as is shown in the accompanying table, which presents the percentages of vanadium consumption by seven end uses.

Distribution of vanadium consumption by type of use in 1946, in percent

Use:	*Percent of total*
Steel:	
High-speed steel	52.4
Other tool steel	10.8
Other alloy steel	25.8
Deoxidation and degasification	1.5
Total steel	90.5
Nonsteel:	
Nonferrous alloys	4.8
Catalysts	3.1
Alloy cast iron	.1
Total nonsteel	8.0
Undistributed	1.5
Grand total	100.0

Vanadium stands in sharp contrast to molybdenum in that it finds slight applicability to either the stainless steels or the high temperature-high strength materials, in either this country or in England.

[4] Huleatt, W. P., Scott, W. H. Jr., and Traver, W. M. Jr., Exploration of Vanadium Region of Western Colorado and Eastern Utah; Bureau of Mines Rept. of Investigations 3930, 1946, 30 pp.

In Germany vanadium was used for these applications, apparently with considerable success. It seems probable that these German applications were dictated more by the scarcity of other alloying additives than by the superiority of vanadium.

Nonferrous alloys containing vanadium (the "Vicalloys" and "Hastelloy B" are typical) are useful for special and exacting services. Other nonsteel uses are indicated in the accompanying table.

The development of a market for vanadium chemicals is receiving attention from the Carbide and Carbon Chemicals Corp.[5]

PRICES

Vanadium ore has been quoted at 27½ cents a pound of V_2O_5 since 1935. This, however, is a quotation without regard to the grade of ore or the presence or absence of objectionable impurities—matters of importance to the refineries, inasmuch as they affect recovery vitally. The Office of Price Administration did not place vanadium ore under control at any time. Maximum prices for vanadium products established by MPR 489 are given in Minerals Yearbook, 1944 (p. 643) and remained unchanged until price control was suspended by Amendment 26 to Supplementary Order 129 on June 12, 1946.

E&MJ Metal and Mineral Markets quoted vanadium ore at 27½ cents a pound of V_2O_5 throughout 1946. Ferro-vanadium prices held at $2.75–$2.90 per pound of contained vanadium (depending upon the grade of the alloy) from January 1 until December 12, when the price changed to $2.70–$2.90, a level held throughout the remainder of the year.

FOREIGN TRADE[6]

Vanadium imports into the United States comprise ore, concentrates, dried precipitated vanadium pentoxide, and flue dust. In 1946 all ore, concentrates, and pentoxide were imported from Peru, and all the flue dust from Curaçao. The percentage of V_2O_5 in the imports from Peru was markedly higher than in 1945. The 1946 imports (measured in terms of vanadium contained) were 51 percent of those in 1945.

Vanadium ore or concentrates and vanadium-bearing flue dust imported for consumption in the United States, 1945–46, by countries

Class of material and country	1945			1946		
	Pounds		Value	Pounds		Value
	Gross weight	Vanadium content		Gross weight	Vanadium content	
Ore or concentrates: Peru	8,777,018	1,552,307	$725,666	2,784,349	791,057	$390,077
Vanadium-bearing flue dust: Curaçao (N. W. I.)	133,795	26,293	19,378	97,750	20,931	13,480

[6] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Vanadium ore or concentrates imported for consumption in the United States, 1937–46

Year	Pounds		Value	Year	Pounds		Value
	Gross weight	Vanadium content			Gross weight	Vanadium content	
1937	14,806,400	1,258,880	$638,799	1942	36,492,268	2,422,376	$1,274,483
1938	19,962,880	1,384,320	891,475	1943	22,117,131	2,052,620	1,080,150
1939	31,387,722	2,132,548	991,511	1944	4,247,490	1,284,603	633,719
1940	45,102,004	2,574,951	1,216,705	1945	8,777,018	1,552,307	725,666
1941	24,645,686	2,138,608	1,012,991	1946	2,784,349	791,057	390,077

Exports of vanadium ore and concentrates decreased from 113,927 pounds (contained vanadium) in 1945 to 6,051 pounds in 1946. Exports of ferrovanadium were 113,058 pounds (of ferro) valued at $161,289. The exports comprised 85,973 pounds to Canada, 24,240 pounds to China, 2,370 pounds to Brazil, 440 pounds to Argentina, and 35 pounds to Portugal.

Vanadium ore and concentrates [1] exported from the United States, 1944–46, by countries, in pounds

Country	1944		1945		1946 [2]
	Gross weight	Vanadium content	Gross weight	Vanadium content	Vanadium content
Canada	6,390	2,201	3,049	955	
Curaçao (N. W. I.)			13,268	3,715	
France			218,500	105,931	
India and Dependencies	9,878	4,053	8	2	
Italy					5,936
Switzerland					115
U. S. S. R.			6,767	3,324	
	16,268	6,254	241,592	113,927	6,051

[1] Classed as ore and concentrates but probably also includes fused vanadium oxide.
[2] Beginning January 1, 1946 gross weight not reported.

WORLD REVIEW

Complete data on world mine production of vanadium are lacking for 1946, but indications are that the United States has held its position as the world's largest producer. The world output in 1946 is estimated to have approximated 1,000 metric tons of contained vanadium. It must be noted, however, that the above estimate is made without considering any production in the U. S. S. R., Germany, French Morocco, and Spain, from which countries data are entirely lacking. Production in Germany for 1940–45 is unknown, but was unquestionably large, inasmuch as that country was able to substitute vanadium (recovered from the minette ores) for scarcer alloying additives.

World production of vanadium in ores and concentrates, 1938–46, in metric tons

[Compiled by B. B. Mitchell]

Country	1938	1939	1940	1941	1942	1943	1944	1945	1946
Argentina	------	15	1	6	------	------	(1)	(1)	(1)
Mexico	101	80	32	(2)	------	------	------	------	------
Northern Rhodesia	374	384	368	342	388	426	254	219	68
Peru	826	1,016	1,214	1,017	1,010	847	514	688	324
South-West Africa	557	514	428	269	453	577	385	128	100
United States (shipments)	732	900	981	1,140	2,014	2,534	1,600	1,344	577
Total [3]	2,590	2,909	3,024	2,774	3,865	4,384	2,753	2,379	1,069

[1] Data not available.
[2] Less than 1 ton.
[3] Total represents data only for countries shown in table and excludes vanadium produced in French Morocco, Spain, and U. S. S. R. and by Germany from the minette ores; accurate figures are not yet available.

Germany.—During most of World War II Germany had an internal source of vanadium, because of the special smelting methods applied to the minette ores of France, Belgium, and Luxembourg. A wartime regulation required that vanadium be recovered from known V-bearing iron ores, and an overall recovery of 50–60 percent has been reported.[7] German production of vanadium from this source is reported to have been approximately 3,000,000 pounds a year at the beginning of the war and to have increased to 6,500,000 pounds by the end.

Japan.—Japanese metallurgical practices for the production of ferroalloys have been described in detail.[8] The only vanadium-bearing materials known to exist in Japan are vanadium-bearing magnetite beach sands.

The native beach sands were processed by concentration and chemical treatment and the products reduced to ferrovanadium by the Thermit process. The ferrovanadium production of Japan is stated to have been:

Year:	*Metric tons of ferrovanadium*
1925–39	None
1940	708
1941	832
1942	533
1943	322
1944	224
1945	46
	2,665

Vanadium pentoxide was formerly imported from the United States, and ores or concentrates were brought in from Peru, Manchuria, and Mexico.

Northern Rhodesia.[9]—After a shut-down of 6 months the vanadium plant of the Broken Hill Development Co., Ltd., was reopened in March 1945. Production of fused oxide by the company has been: 1940—711 long tons; 1941—660 tons; 1942—743 tons; 1944—494 tons. Exports from Northern Rhodesia were 833 tons in 1943 and 260 tons in 1944.

[9] Bureau of Mines, Mineral Trade Notes: Vol. 22, No. 1, Jan. 20, 1946, p. 21.

South-West Africa.—The South-West Africa Co., Ltd., is the only producer of vanadium in South-West Africa. It operates the Adenab and Adenab West mines about 20 miles north of Grootfontein. The concentrates average substantially 20 percent V_2O_5. It has been announced [10] that the Otavi Mines & Railway Co., Ltd. (Otavi Minen und Eisenbahngesellschaft), has been purchased by the Tsumeb Corp. Ltd., from the Custodian of Enemy Property for £1,010,000. The O'Okiep Copper Co. and the Magma Copper Co., of America, are reported to be interested financially in the Tsumeb Corp.

Peru.—Hewett [11] has given a comprehensive account of the discovery of patronite at Mina Ragra in 1905 while he was in Peru examining the asphaltites as sources of vanadium.

GENERAL SUMMARY

WORK stoppages due to strikes, higher operating costs, and price uncertainty when Government subsidies lapsed temporarily at midyear were major obstacles that restricted domestic zinc output in 1946. However, despite a drop in production and imports, the over-all available supply of slab zinc was sufficient to meet requirements and permit expansion of consumers' stocks.

Domestic mine production was 6 percent less than in 1945, and the outputs of primary and redistilled secondary slab zinc were 5 and 10 percent lower, respectively. The drop in domestic smelter output was partly offset, however, by an 8-percent gain in slab zinc imports, the quantity of which was the greatest in the history of the zinc industry in 1946. Imports of zinc in ores and concentrates dropped 29 percent from 1945. Year-end inventories at domestic smelters were 31 percent less than at the beginning, whereas consumers' stocks gained 28 percent over the quantity on hand at the beginning of the year.

The St. Louis quotation for Prime Western zinc averaged 8.73 cents per pound in 1946 compared with 8.25 cents in 1945.

[1] This report deals primarily with the smelting branch of the industry. Full details of zinc mining are given in the various State reports of this volume. As some zinc ore is used directly in the manufacture of zinc pigments, see also the chapter on Lead and Zinc Pigments and Zinc Salts.

LABOR PROBLEMS

Most significant among the many labor problems confronting operators during 1946 were the widespread strikes at principal mines, mills, smelters, and refineries that paralyzed the industry during the first half of the year. Work stoppages in 1946 began in Utah on January 21, when approximately 1,300 workers at the American Smelting & Refining Co. Murray lead smelter and the United States Smelting, Refining & Mining Co. West Mountain (Bingham) district lead-zinc mine and Midvale concentrator struck when negotiations for increased wages collapsed. Workers at certain Colorado and Arizona lead-zinc mining and milling operations of the American Smelting & Refining Co. and the Phelps Dodge Corp. joined the strike on February 25 and March 20, respectively. Lead smelters operated by the American Smelting & Refining Co. in California, Colorado, Montana, Nebraska New Jersey, and Texas also became strike-bound on February 25, and although these closures did not restrict the output of mines producing zinc alone, many zinc-lead operations were forced to close owing to limited storage facilities for ore and concentrate and insufficient capital to cover operating expenses without prompt sale of products. These strikes continued to hamper zinc mining in the West until the end of June, when new labor contracts were signed. Zinc mine production in the Eastern States was impeded by labor strikes at mines of the American Zinc Co. of Tennessee in Knox and Jefferson Counties, Tenn., from February 2 through May 4 and at mines of the New Jersey Zinc Co. in New Jersey from mid-June to August 17.

Labor strikes at zinc smelters at East St. Louis and Monsanto, Ill., restricted production in January, and a complete shut-down of the smelter at Danville, Ill., in March stopped production for the remain-

der of the year. The Henryetta, Okla., smelter closed in early April owing to strike conditions and did not resume operations until the latter part of September. In Pennsylvania, a strike stopped production at the Langeloth smelter from June to October, and a shortage of electrical power due to a labor strike curtailed output at the Josephtown smelter in October.

The shortage of mine and mill labor continued to be a potent factor limiting domestic mine output during 1946. The predicted return to the mines of former employees who migrated to the cities for high-paying wartime jobs fell far short of expectations. Likewise, a large percentage of the labor supply that entered the armed services during the war did not return upon demobilization; however, most operators considered that the manpower supply problem had improved somewhat by the end of 1946.

GOVERNMENT REGULATIONS

Except for a few minor regulations, the zinc industry operated throughout 1946 free of Government controls. At the end of the year Priorities Regulation 32 limiting manufacturers' inventories of all grades of slab zinc and die-cast alloy to 30 days' requirements or a practicable working inventory, whichever is less, remained operative. Regulations requiring a license for exporting slab zinc and zinc semimanufactures to certain countries also remained operative during the year. Consumers requesting zinc supplies from the Reconstruction Finance Corporation reserve stocks were required to file proof of necessity.

Subsidy payments under the Premium Price Plan for over-quota production were continued through June but collapsed with expiration of Office of Price Administration and ceiling prices June 30. Upon reestablishment of the OPA, provisions were made for retroactive premium payments to cover the period when no plan was in effect.

The establishment of a Federal Government stock pile of strategic minerals and metals for national defense was authorized on July 23 when President Truman signed the Strategic and Critical Materials Stock-piling Act (Public Law 520, 79th Congress). The act authorizes and directs the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior, acting jointly through the agency of the Army and Navy Munitions Board, to determine from time to time what materials are strategic, and to establish quantities and dates for stock piling. The act further provides that purchases for stock piling shall be made from supplies in excess of current industrial demand and at a price not to exceed current open market price. Except to provide for the rotation of any stock-piled material where necessary to prevent deterioration, no disposition of stock-piled material shall be made without 6 months' public notice and congressional approval. The President, however, may order the release of stock-piled materials when required for purposes of the common defense or in time of war or national emergency.

Figure 1 shows trends in the domestic zinc industry in the United States since 1900.

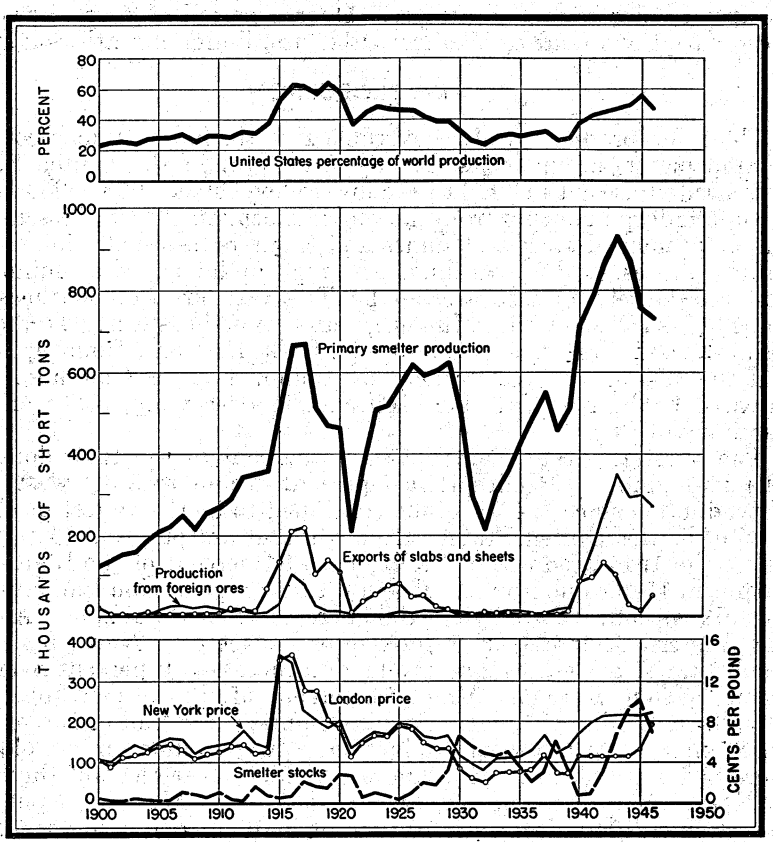

FIGURE 1.—Trends in the zinc industry in the United States 1900–46. Imports for consumption of slab and sheet zinc are not shown. Before 1936 they seldom exceeded 500 tons annually, but in recent years they have increased, amounting to 36,402 tons in 1942, 56,155 tons in 1943, 63,641 tons in 1944, 96,710 tons in 1945, and 104,015 tons in 1946.

TARIFF

The import tariff on zinc-bearing ores remained at ¾ cent per pound (zinc content) and on zinc in blocks, pigs or slabs, and dust at ⅞ cent per pound during 1946.

DOMESTIC PRODUCTION

Zinc-production statistics may be prepared on a mine or on a smelter basis. The mine-production data compiled on a basis of zinc content in ores and concentrates and adjusted to account for average losses in smelting are the most accurate measure of output from year to year. The slab-zinc production, as reported by smelters, presents a more precise figure of actual zinc recovery but generally differs from the mine figure owing to overlap or lag between mine shipments and smelter

receipts of ores and concentrates. Over a period of years, however, these variations tend to balance within the limits of statistical error.

MINE PRODUCTION

The mine production of recoverable zinc (including that recovered as zinc pigments and salts directly from ore) in the United States decreased 6 percent in 1946 to the lowest level since 1938. The uninterrupted drop in output from the wartime peak in 1942 was essentially due to prolonged strikes at mines and smelters, especially in western United States, and a continued shortage of labor. Zinc mining is centered largely in five areas—the Tri-State area of southeastern Kansas, southwestern Missouri, and northeastern Oklahoma; Tennessee-Virginia; Sussex County, N. J.; St. Lawrence County, N. Y.; and the Western States (principally Idaho, Arizona, Colorado, New Mexico, Utah, Nevada, and Montana, in descending order of productivity in 1946).

The Western States contributed 48 percent of the total domestic output of zinc in 1946 despite a 7-percent decline to the lowest level of production since 1940. Idaho continued to be the largest producer of zinc in the United States, although 1946 output was 14 percent below the 1945 production. More than 94 percent of the Idaho zinc output in 1946 came from the Coeur d'Alene region; zinc-lead ores and old tailings concentrated yielded 85 percent of the total zinc. Among the Western States, Arizona took second place over New Mexico by a substantial margin as zinc production increased 9 percent over the record output of 1945. About 51 percent of the Arizona total zinc came from a mine at Bisbee, Cochise County; zinc-lead ore accounted for 87 percent of the total production. Zinc production in Colorado increased 1 percent in 1946; zinc ore yielded 53 percent of the State total zinc and zinc-lead ore, 38 percent. New Mexico output, the lowest since 1940, decreased 10 percent in 1946 compared with 1945. Over 89 percent of the total output came from mines in the Central district, Grant County; zinc ore yielded 91 percent of the total zinc produced. Utah zinc output slumped 16 percent to the lowest level since 1934. Owing to a 5-month labor strike at the United States and Lark group, production of zinc in the West Mountain (Bingham) district—for years the leading source of zinc in Utah—declined to about half that in 1945, permitting the Park City region to advance to first place. Zinc-lead ore concentrated supplied 79 percent of the total zinc in 1946, and zinc slag fumed most of the remainder. Production of zinc in Nevada in 1946 was the greatest in the history of the State. About 70 percent of the total was mined in the Pioche district, Lincoln County; nearly 92 percent of the zinc recovered was from zinc-lead ore. The mine output of zinc in Montana declined 4 percent in 1946; zinc-lead ore accounted for 65 percent of Montana's zinc in 1946, and 34 percent was from zinc ore and old slag.

Zinc production in the Central States, smallest since 1933, decreased 1 percent from the 1945 output. The Tri-State (Joplin) region maintained its position as the principal zinc-producing district, with 24 percent (23 percent in 1945) of the total United States output.

Mine production of recoverable zinc in the United States, 1925–29 (average) and 1942–46, by States, in short tons

State	1925–29 (average)	1942	1943	1944	1945	1946
Western States:						
Arizona	2,628	18,522	19,677	29,077	40,226	43,665
California	3,999	613	1,856	8,455	9,923	6,877
Colorado	32,868	32,215	44,094	39,955	35,773	36,147
Idaho	29,128	87,256	86,707	91,372	83,463	71,507
Montana	72,519	54,715	37,606	36,127	17,403	16,770
Nevada	5,570	10,197	13,647	20,699	21,457	22,649

SMELTER PRODUCTION

During 1946, 21 primary zinc-reduction plants were in operation, of which 12 operated with horizontal retorts exclusively, 1 with both horizontal and vertical retorts, 3 with vertical retorts exclusively (one electrothermic), and 5 with electrolytic methods.

The St. Joseph Lead Co. continued experimental operation of its slag-fuming plant at Herculaneum, Mo., in 1946 for the recovery of

slab zinc as a direct product of the operation that treats lead blast-furnace slag containing 12 to 16 percent zinc.

Horizontal-Retort Plants.—The total number of retorts reported at active horizontal-retort primary plants in 1946 was 73,240, a 1-percent decrease from the 74,120 retorts on December 31, 1945, at plants which operated during that year. Of the total retorts reported, 54,272 (74 percent) were in use at the close of 1946, compared with 54,932 (74 percent) in operation at the end of 1945.

Vertical-Retort Plants.—Four vertical-retort continuous distilling plants operated during 1946. The St. Joseph Lead Co. operated its 9 electrothermic units at Josephtown, Pa., at about 90 percent capacity throughout the year. Of the 66 vertical retorts at the remaining 3 plants, 62 were in operation on December 31, 1946.

Electrolytic Plants.—Five electrolytic plants were in operation during 1946, as in 1945. There were 3,670 cells at the plants on December 31, 1946, of which 3,128 (85 percent) were in operation compared with 3,184 (99 percent) at the end of 1945. No new installations were reported under construction or planned.

Smelting Capacity.—Irrespective of additions or subtractions of smelter recovery units, statistics on domestic smelting capacity vary from year to year owing to changes in metallurgical practices among the various plants. According to reports to the Bureau of Mines, the zinc-reduction plants in the United States on December 31, 1946, had a stated annual capacity to produce 1,067,800 tons of slab zinc under normal operating conditions, allowing for necessary shut-downs for repairs. This figure, which compares with a 1,054,000-ton reported capacity at the end of 1945, indicates that the 1946 output was 72 percent of the capacity as compared with 77 percent in 1945. Horizontal- and vertical-retort plants operated at 73 percent of a stated 641,000-ton capacity (77 percent of a 672,000-ton capacity in 1945), electrolytic plants at 74 percent of a 382,400-ton capacity (80 percent in 1945), and secondary smelters at 59 percent of a 44,400-ton capacity (64 percent of a 44,000-ton capacity in 1945).

No additional smelting capacity was planned at the end of 1946, and only a small increase of four graphite retorts was under construction at one smelter.

Waelz Kilns.—Waelz plants have been installed in recent years at several midwestern and eastern smelters to facilitate recovery of additional metals from the ore and to reduce over-all smelting losses. The following companies operated Waelz kilns in 1946:

Arkansas:
- Fort Smith—The Residue Co.

Illinois:
- Fairmont City—American zinc Co. of Illinois.
- Danville—The Hegeler Zinc Co.
- La Salle—Matthiessen & Hegeler Zinc Co.

Kansas:
- Cherryvale—National Zinc Co., Inc.

Oklahoma:
- Henryetta—Eagle-Picher Mining & Smelting Co.

Pennsylvania:
- Donora—American Steel & Wire Co.
- Langeloth—American Zinc & Chemical Co.
- Palmerton—New Jersey Zinc Co.

Slag-Fuming Plants.—The recovery of zinc from lead smelting slags has become an increasingly important source of zinc in the United States in recent years. In the slag-fuming process zinc is recovered in the form of oxidized zinc fume from hot slags of lead blast furnaces and reclaimed dump slags from old lead smelter slag accumulations. The oxidized zinc fume is further treated at electrolytic and horizontal retort zinc smelters for recovery of metallic zinc. The following companies operated slag-fuming plants in 1946:

Idaho:
Bradley—Bunker Hill & Sullivan Mining & Concentrating Co.
Montana:
East Helena—Anaconda Copper Mining Co.
Utah:
Tooele—International Smelting & Refining Co.

In 1946, the three plants in the United States treated 486,428 tons of hot and cold slag, which yielded 75,385 tons of oxide fume containing 41,566 tons of recoverable zinc.

The American Smelting & Refining Co. completed plans in 1946 for the construction of a slag-fuming plant to recover zinc from slag at the company El Paso (Texas) smelter. Construction on the project was begun early in 1947.

Active Zinc-Reduction Plants.—A list of the zinc-reduction plants operating in the United States in 1946 follows:

Horizontal-retort plants

Arkansas:
Fort Smith—Athletic Mining & Smelting Co.
Van Buren—Arkansas Smelting Co.[2]
Illinois:
Fairmont City—American Zinc Co. of Illinois.
Danville—The Hegeler Zinc Co.
La Salle—Matthiessen & Hegeler Zinc Co.
Oklahoma:
Blackwell—Blackwell Zinc Co.
Henryetta—Eagle-Picher Mining & Smelting Co.
Bartlesville—National Zinc Co., Inc.
Pennsylvania:
Langeloth—American Zinc & Chemical Co.
Donora—American Steel & Wire Co.
Palmerton—The New Jersey Zinc Co. of Pennsylvania.
Texas:
Amarillo—American Smelting & Refining Co.
Dumas—American Zinc Co. of Illinois.

Vertical-retort plants

Illinois:
Dupue—The New Jersey Zinc Co.
Pennsylvania:
Palmerton—The New Jersey Zinc Co. of Pennsylvania.
Josephtown—St. Joseph Lead Co.
West Virginia:
Meadowbrook—E. I. du Pont de Nemours & Co.

Electrolytic plants

Idaho:
Kellogg—Sullivan Mining Co.
Illinois:
East St. Louis—American Zinc Co. of Illinois.
Montana:
Anaconda—Anaconda Copper Mining Co.
Great Falls—Anaconda Copper Mining Co.
Texas:
Corpus Christi—American Smelting & Refining Co.

[2] Operations suspended January 1946.

PRIMARY AND REDISTILLED SECONDARY SLAB ZINC

The output of primary slab zinc in 1946, the smallest since 1940, dropped 5 percent below the 1945 production. Although the use of foreign ore declined and the slab zinc produced from this source dropped 10 percent, the quantity of zinc recovered from foreign ore continued high in comparison with prewar years. Production from domestic ore, lowest since 1938, declined 2 percent to continue the downward trend in evidence since 1941.

Production of redistilled slab zinc from zinc scrap declined 10 percent in 1946. Of the 44,516 short tons of redistilled secondary slab zinc produced, 18,408 tons (41 percent) were derived from primary smelters, and 26,108 tons (59 percent) were produced at secondary plants. Data on the output of remelted secondary slab zinc are not included with those for redistilled metal. In 1946 the production of slab zinc recovered by remelting purchased scrap amounted to 8,212 tons (8,090 tons in 1945). Zinc rolling mills and other consumers of slab zinc recover large quantities of zinc from their own plant scrap; but such metal is not measured statistically, for it normally does not enter the market as scrap.

Primary and redistilled secondary slab zinc produced in the United States, 1942–46, in short tons

Year	Primary			Redistilled secondary	Total (excludes zinc recovered by remelting)
	Domestic	Foreign	Total		
1942	629,957	[1] 261,915	891,872	53,195	945,067
1943	594,250	[1] 348,059	942,309	48,215	990,524
1944	574,453	[1] 294,849	869,302	49,037	918,339
1945	467,084	[1] 297,477	764,561	49,242	813,803
1946	459,205	269,057	728,262	44,516	772,778

[1] Includes a small tonnage of foreign slab zinc further refined into high-grade metal in the United States.

DISTILLED AND ELECTROLYTIC ZINC

Of the 1946 output of primary zinc, 61 percent was distilled and 39 percent was produced electrolytically compared with 65 and 35 percent, respectively, in 1945.

An increased demand for zinc for alloy die-casting was largely the cause for the gain in output of Special High Grade zinc, the only grade of slab zinc in which production increased in 1946. In contrast to a 7-percent rise in output of Special High Grade, Regular (Ordinary) High Grade decreased 6 percent, Intermediate 34 percent, Selected 21 percent, and Prime Western 10 percent. Production of Brass Special remained virtually unchanged. The original first-stage smelter production of Prime Western zinc was somewhat higher than is indicated in the following table, but to avoid duplication the quantity consumed in redistilling was omitted because the resultant Special High Grade slab zinc thus produced is reported. Of the total 1946 production (comparable 1945 figures in parentheses), 30 percent (32 percent) was Prime Western, 31 percent (27 percent) Special High Grade, 23 percent (24 percent) Regular High Grade, 10 percent (9 percent) Brass Special, 4 percent (6 percent) Intermediate, and 2 percent (2 percent) Selected.

Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1942–46, in short tons

CLASSIFIED ACCORDING TO METHOD OF REDUCTION

Year	Electrolytic primary	Distilled	Redistilled secondary [1]		Total
			At primary smelters	At secondary smelters	
1942	252,987	638,885	20,978	32,217	945,067
1943	329,902	612,407	24,385	23,830	990,524
1944	317,388	551,914	24,673	24,364	918,339

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

PRIMARY SLAB ZINC, BY STATES

Montana was the leading producer of primary slab zinc in 1946. Pennsylvania, which displaced Montana for first place in 1945, ranked second in 1946 and was followed by Oklahoma. Of the States for which production figures may be released, Illinois, Idaho, and Arkansas occupied the next three positions, in order of decreasing importance. Montana and Idaho, as usual, produced electrolytic zinc only, Illinois and Texas made both electrolytic and distilled metal, and all other States confined their operations to distillation alone.

Some indication of the movement of foreign ores and concentrates within the United States is revealed when a break-down of the production of primary slab zinc from this source is considered. Of the 269,057 tons of primary slab zinc of foreign origin recovered in 1946, smelters in Montana accounted for 29 percent, Pennsylvania 21 percent, Oklahoma 17 percent, Illinois 13 percent, Texas 11 percent, West Virginia, Arkansas, and Idaho combined 9 percent. Of the total slab zinc produced from foreign ores and concentrates, 46 percent was recovered by electrolytic methods and 54 percent by distillation.

Primary slab zinc produced in the United States, by States where smelted, 1942–46, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Other States [1]	Total	
								Short tons	Value
1942	41,649	39,916	175,455	193,486	102,422	231,362	107,582	891,872	$155,186,000

[1] Texas and West Virginia; also Missouri in 1943 and 1944.

SECONDARY ZINC

In addition to the redistilled secondary slab zinc (unalloyed) already reported herein, some remelted slab zinc is produced, and a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in the Secondary Metals—Nonferrous chapter of this volume.

BYPRODUCT SULFURIC ACID

Sulfuric acid made from the sulfur dioxide gases produced in roasting zinc blende (sphalerite) is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consume large quantities of native sulfur. The production of sulfuric acid at zinc-blende roasting plants decreased 17 percent in 1946.

Sulfuric acid (60° B. basis) made at zinc-blende roasting plants in the United States, 1942–46

Year	Made from zinc blende [1]		Made from native sulfur		Total [1]		
	Short tons	Value [2]	Short tons	Value [2]	Short tons	Value [2]	
						Total	Average per ton
1942	695,242	$6,570,037	147,513	$1,393,998	842,755	$7,964,035	$9.45
1943	879,266	8,687,148	155,210	1,533,475	1,034,476	10,220,623	9.88

1946	701,080	6,842,541	207,141	2,021,696	908,221	8,864,237	9.76

[1] Includes acid from foreign blende.
[2] At average of sales of 60° acid.

ZINC DUST

All previous records for production of zinc dust were broken in 1946, the total output being 10 percent greater than in 1945 and 8 percent above the former high point reached in 1944. Zinc powder and blue powder are not included in the total produced; the zinc dust statistically reported is restricted to commercial grades that comply with severe specifications as to percentage of unoxidized metal, evenness of grading, and fineness of particles. The zinc content of the dust produced in 1946 ranged from 94.97 to 99.69 percent and averaged 97.91 percent. Shipments of zinc dust totaled 27,257 tons, of which 1 percent went to foreign countries. Shipments of zinc dust were slightly lower than production, and as the quantity consumed at manufacturers' plants was small (3 percent of output), producers' stocks increased from 1,622 tons (corrected figure) at the beginning to 2,148 tons at the close of the year.

The average price of zinc dust shipped to domestic consumers in 1946 was 10.6 cents a pound compared with 10.1 cents in 1945. The raw materials used to manufacture zinc dust are reviewed in the Secondary Metals—Nonferrous chapter of this volume. Most of the production is from zinc scrap (principally galvanizers' dross), but some is recovered from zinc ore, slab zinc, and as a byproduct of zinc refining.

Zinc dust [1] produced in the United States, 1942–46

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average per pound			Total	Average per pound
1942	22,805	$4,789,050	$0.105	1945	25,877	$5,227,154	$0.101
1943	25,990	5,249,980	.101	1946	28,574	6,057,688	.106
1944	26,511	5,408,244	.102				

[1] All produced by distillation.

ZINC PIGMENTS AND SALTS

The principal zinc pigments are zinc oxide and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinc-bearing materials, including ore, metal, scrap, and residues. Details of the production of zinc pigments and salts are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

DOMESTIC CONSUMPTION

NEW SUPPLY

The following table shows the 5-year record of primary slab zinc available for consumption in the United States. This calculated quantity, in effect, is equivalent to primary slab zinc apparently made available each year for shipment to domestic consumers during the year.

In addition to primary slab zinc, 45,213 tons of redistilled secondary slab zinc were made available to consumers in 1946, after allowance for a decrease in stocks at secondary smelters. Also 8,212 tons of remelt spelter were produced from purchased scrap.

Primary slab zinc available for consumption in the United States, 1942–46, in short tons

	1942	1943	1944	1945	1946
Supply:					
Stocks at smelters Jan. 1	24,212	82,498	168,777	233,044	254,765

Stocks at smelters Dec. 31	82,498	168,777	233,044	254,765	175,586
Total withdrawn	216,436	266,216	254,620	267,849	275,024
Available for consumption	730,938	806,265	845,008	826,627	812,746

[1] Adjusted to exclude imported slab zinc further refined into high-grade metal in the United States.

CONSUMPTION [3]

According to reports from plants representing an estimated 99 percent of the consuming industry in the United States (670 plants in 1946), 801,242 tons of slab zinc (including 3,912 tons of purchased remelt spelter) were put in process in 1946, a 6-percent decline from the 1945 total of 852,311 tons and 10 percent below the record level of 888,626 tons in 1944. Receipts at consumers' plants during 1946 were 821,930 tons. The apparent discrepancy between this figure and the calculated 866,171 tons of primary and secondary slab zinc and remelt spelter shipped to domestic consumers in 1946 can be attributed to incomplete coverage of the survey, variations in the quantity of metal in transit from producer to consumer at the beginning and the end of the year, and unaccounted-for slab zinc stored in bonded warehouses.

Galvanizing continued as the principal use of slab zinc, although the quantity consumed for this purpose in 1946 declined 5 percent. The use of slab zinc fell sharply, owing largely to labor strikes at the brass mills and the increasing use of brass scrap in lieu of virgin metal. The quantity of zinc used for zinc-base alloys reached an all-time high of 212,211 tons, a gain of 62 percent over 1945.

Consumption of slab zinc in the United States, 1942–46, by industries, in short tons [1]

Industry and product	1942	1943	1944	1945	1946

[1] Based of a canvass of 600 plants in 1942 and a somewhat larger coverage in 1943–46 mostly from small consumers.
[2] Includes zinc used in electrogalvanizing, but excludes sherardizing.
[3] Separate figures not available but included in "Other."
[4] Includes miscellaneous articles not given elsewhere.
[5] Included under "Other uses."
[6] Included under "Zinc-base alloy" in 1943–46.
[7] Includes zinc used in making zinc dust, bronze powder, alloys, chemicals, castings, and miscellaneous uses not elsewhere mentioned.
[8] Includes 6,982 tons of remelt zinc in 1944, 5,111 tons in 1945, and 3,912 tons in 1946.

[3] See also, Ransome, Alfred L., Consumption of Slab Zinc in the United States, 1900–45, by Industries, Grades and Geographic Divisions: Bureau of Mines Inf. Circ. 7450, February 1948, 31 pp.

The volume of slab zinc consumed for rolled products fell 5 percent short of equaling the 1945 figure. In addition to slab zinc, the rolling mills remelt and reroll the metallic scrap produced from their fabricating operations. The scrap so treated in 1946 amounted to 18,670 tons—a 42-percent decrease from the comparable total processed in 1945. Purchased zinc scrap in the form of zinc clippings, old zinc scrap, and engravers' plates totaling 3,313 tons were melted and rolled in 1946 (3,652 tons in 1945). Production of rolled zinc from slab zinc and purchased scrap was 92,648 tons, a decrease of 6 percent from the total for 1945. Inventories of rolled zinc were 2,556 tons on December 31, 1946, compared with 2,498 tons (revised figure) on the same date in 1945. In addition to the actual shipments of 61,128 tons of rolled zinc in 1946, the rolling mills processed 50,133 tons of rolled zinc (including that which was remelted and rerolled) in manufacturing 32,429 tons of semifabricated and finished products.

Rolled zinc produced and quantity available for consumption in the United States, 1945–46

	1945			1946		
	Short tons	Value		Short tons	Value

Value added by rolling			.040			.052

[1] Figures represent net production. In addition, 31,968 tons of strip and ribbon zinc in 1945 and 18,670 tons in 1946 were rerolled from scrap originating in fabricating plants in connection with zinc rolling mills.
[2] Less than 1 ton.
[3] Allowances made for change in producers' stocks of rolled zinc.
[4] Revised figure.

The following table shows the six commercial grades of refined slab zinc and purchased remelt spelter consumed by the various industries in 1946. Of the 801,242 tons of domestic and foreign zinc consumed, 37 percent was Prime Western, 32 percent Special High Grade, and 17 percent Regular High Grade, compared with 38, 25, and 22 percent, respectively, in 1945. All grades of zinc were used for galvanizing and in the manufacture of brass and rolled zinc products. Prime Western was the principal grade used in the hot-dip process of galvanizing, the higher grades being used chiefly for electrogalvanizing. Rigid specifications in brass manufacture necessitate the use of high-purity metal, 66 percent of the total used in this industry being of the two highest grades.

Consumption of slab zinc in the United States in 1946, by grades, according to industry, in short tons

	Special High Grade	Regular High Grade	Intermediate	Brass Special	Selected	Prime Western	Remelt	Total
Galvanizing	11,514	14,610	10,985	12,870	973	266,270	2,537	319,759
Brass products	33,975	64,239	11,193	14,046	261	24,613	775	149,102
Zinc-base alloy	207,063	3,905	688			229	326	212,211

Zinc oxide	1,870	17,300						19,170
Other uses	1,381	3,469	1,281	669		1,529	274	8,603
Total	259,657	139,301	35,692	64,083	2,394	296,203	3,912	801,242

STOCKS

Producers' Stocks.—Inventories of slab zinc at producers' plants dropped 31 percent in 1946 and were the lowest recorded since 1943. Of the 176,342 tons on hand at the end of the year, 123,231 tons were Special High Grade and Regular High Grade and the remainder (53,111 tons) of lower grades, compared with 169,679 tons and 86,537 tons, respectively, at the end of 1945. Nearly the entire decline can be accounted for by reduced inventories of Prime Western (75 percent) and Special High Grade and Regular High Grade (27 percent).

Stocks of zinc ore (60 percent concentrates) in the Tri-State district (as reported by the Tri-State Zinc and Lead Ore Producers' Association) were 3,677 tons, lowest for the year, at the beginning of 1946. Inventories increased to 6,930 tons on March 23 but declined thereafter to 3,988 tons on July 13. High point of the year was reached on November 2, with a total of 10,614 tons, followed by a general downward trend to 8,328 tons on December 28.

Stocks of zinc on hand at zinc-reduction plants in the United States at end of year, 1942–46, in short tons

	1942	1943	1944	1945	1946
At primary reduction plants	82,498	168,777	233,044	254,765	175,586
At secondary distilling plants	1,942	1,829	652	1,451	756
	84,440	170,606	233,696	256,216	176,342

Consumers' Stocks.—Stocks of slab zinc at consumers' plants increased markedly in 1946, the total on December 31 being 28 percent over the quantity on hand at the beginning of the year. Inventories increased abruptly at the first of the year to a high of about 116,300 tons on May 31, followed by a general downward trend during the remainder of the year. At the average monthly rate of consumption in 1946, consumers' stocks on hand at the end of 1946 were slightly more than 1 month's requirements.

Consumers' stocks of slab zinc at plants at the beginning and end of 1946, by industries, in short tons

	Galvanizers	Die casters [1]	Brass mills [2]	Zinc rolling mills	Oxide plants	Others	Total
Dec. 31, 1945	[3] 33,086	[3] 12,791	[3] 18,185	6,317	[3] 585	[3] 1,417	[3] [4] 72,381
Dec. 31, 1946	42,678	22,271	20,041	6,548	346	1,104	[4] 92,988

[1] Includes producers of zinc-base die castings, zinc-alloy dies, and zinc-alloy rods.
[2] Includes brass mills, brass ingot makers, and brass products.
[3] Revised figure.
[4] Stocks on December 31, 1945 and 1946, exclude 416 tons and 497 tons, respectively, of remelt spelter.

PRICES

The base ceiling price established by the Office of Price Administration of 8.25 cents a pound for Prime Western grade slab zinc at St. Louis remained unchanged through June 30. A bill to extend the OPA was vetoed by the President on June 29, and on July 3 the price of zinc advanced to 9.50 cents, St. Louis. With reestablishment of the OPA by legislative action on July 25, the former ceiling price of 8.25 cents became effective and prevailed until October 14, when the OPA announced an upward revision of 1 cent per pound in the ceiling price, establishing the market at 9.25 cents, St. Louis. The OPA order of November 12, retroactive to November 10, removed ceiling prices from all metals and opened the way for a further price advance on November 12 to 10.50 cents, St. Louis, the highest quotation on Prime Western zinc since March 1917. The weighted average price received by the producers for all grades of zinc sold in 1946 was 8.9 cents a pound, f. o. b. plants, compared with 8.6 cents in 1945. The 1946 price of 12.2 cents for zinc, which appears in the State chapters of this volume, represents the weighted average price received for all grades of slab zinc (8.9 cents) plus the increment—in terms of cents per pound based upon the total mine output of recoverable zinc—of $37,954,842 in subsidies for overquota production and special mine and smelter contracts paid by the Office of Metals Reserve.

The general policy of the Quota Committee pertaining to the Premium Price Plan for overquota mine production of domestic zinc (copper and lead were also included) prevailed through June but collapsed with expiration of the OPA and ceiling prices on June 30. Upon reestablishment of the OPA in late July provisions were made for retroactive premium payments to cover the period when no plan was in effect. The Premium Price Plan was extended until June 30, 1947, under the same terms as in the past, except that incorporated in the subsidy section of the bill extending the OPA was a provision that "adjustments shall be made to encourage exploration and development work and adequate allowances for depreciation and depletion." The bill further provided that all classes of premiums were noncancelable unless necessary to make individual adjustments of income to specific mines. With the abandonment of metal price ceilings on November 10, subsidies to mines financially aided by the Premium Price Plan were computed with average monthly market quotations as a base. A compilation of important data showing production of zinc under the Premium Price Plan, 1943–46, at the various quota levels and the payments made, is given in the following table.

793065—48——80

Salient statistics on zinc with regard to operation of Premium Price Plan, 1943–46 [1]

[1] From published and unpublished reports of the Office of Price Administration and the Office of Premium Price Plan for Copper, Lead, Zinc, and Manganese.

[2] Production of Tri-State zinc from Office of Metals Reserve agency, Joplin, Mo.; all other from Bureau of Mines monthly reports. These data are preliminary and do not exactly equal final annual totals for the United States except for 1945.

[3] January-October. "A", "B", and "C" quotas and premium payments for November and December are not separable and are shown with footnote 4.

[4] Total "A", "B", and "C" quotas and premium payments for November and December; separation by kinds not available.

[5] Data on premium payments, payments to smelters, and Metals Reserve mine-contract payments from Office of Metals Reserve. All payments shown are subject to correction due to additional payments as a result of retroactive quota adjustments, late reports by smelters and custom mills, etc.

[6] All average prices shown include OPA ceiling price.

The official London maximum price of £31 5s. per long ton, duty paid, for foreign zinc delivered to consumers, fixed by the British Ministry of Supply on June 11, 1945, was advanced to £39 5s. on April 8, 1946. Subsequent price advances during the year occurred on July 1 and November 13 when quotations rose to £50 and £55, respectively. The London price remained unchanged the balance of the year but was raised to £70 per long ton beginning January 1, 1947. Quotations of the London Metal Exchange, discontinued at the outbreak of the war in September 1939, were not resumed during 1946.

Selected	8.18	7.95	8.27	8.32	8.89
Grade E: Prime Western	8.23	8.31	8.24	8.24	8.60
All grades	8.7	8.6	8.6	8.6	8.88
Prime Western; spot quotation at St. Louis	8.25	8.25	8.25	8.25	8.73

[1] Does not include overquota premium payments made by Office of Metals Reserve.
[2] American Metal Market quotes average prices (delivered) of High Grade and Brass Special as follows: High Grade (f. o. b. New York)—1942–45, 9.25 cents; 1946, 9.73 cents. Brass Special (f. o. b. East St. Louis)—1942–45, 8.50 cents; 1946, 8.98 cents.

FOREIGN TRADE [4]

Imports.—Total imports of zinc in ores and concentrates in 1946 declined 29 percent from 1945. Of the 272,056 tons of zinc imported in ores and concentrates in 1946, approximately 47 percent came from Mexico, 21 percent from Canada, 18 percent from Peru, 10 percent from Bolivia, 3 percent from Argentina, and 1 percent from Australia. Slab zinc imports increased 8 percent over 1945 and were the greatest of any year in the history of the zinc industry. A 56-percent decrease in imports from Mexico were more than offset by an 83-percent gain in the quantity of slab zinc imported from Canada.

Zinc imported into the United States in ore, blocks, pigs, or slabs, 1944–46, by countries, in short tons [1]

Country	1944	1945	1946
Ore (zinc content):			
Argentina	22,253		8,295
Australia	42,216	15,377	3,780
Bolivia	5,305	5,771	26,207
Canada	112,297	90,200	57,298
Chile [2]	96	34,438	
Mexico	177,625	177,003	127,685
Newfoundland and Labrador	19,013	23,515	
Peru	43,889	35,415	48,791
Other countries			[3]
	422,694	381,719	272,056
Blocks, pigs, or slabs:			
Australia	4,480	14,417	3,221
Canada	18,099	46,594	85,194
Mexico	39,703	36,105	15,777
Other countries	1,344		551
	63,626	97,116	104,743

[1] Data include zinc imported for immediate consumption plus material entering country under bond.
[2] Substantially all zinc shown as received from Chile originated in Bolivia and was shipped from Chilean ports.
[3] Less than 1 ton.

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Zinc imported for consumption in the United States, 1942–46, by classes

Year	Ores (zinc content)		Blocks, pigs, slabs		Sheets		Old, dross and skimmings [1]		Zinc dust		Total value [2]
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	
1942	283,167	$10,723,983	36,352	$2,924,438	50	$10,086	3,357	$158,929	702	$43,464	$13,860,900
1943	516,646	20,475,688	56,155	5,825,874	(3)	56	5,146	226,754	106	17,585	26,545,957
1944	415,004	18,678,957	63,626	6,132,877	15	2,540	5,603	300,188	------	------	25,114,562
1945	330,397	14,962,057	96,710	12,165,873	(3)	2	7,331	477,893	362	39,789	27,645,614
1946	166,885	8,122,471	104,015	16,474,850	(3)	10	4,137	300,429	77	4,942	24,902,702

[1] Includes dross and skimmings as follows—1942: 3,214 tons, $150,913; 1943: 5,032 tons, $216,425; 1944: 4,694 tons, $224,995; 1945: 4,323 tons, $231,946; and 1946: 2,851 tons, $188,972.
[2] In addition, manufactures of zinc imported as follows—1942: $16; 1943: $35,355; 1944: $14,223; 1945: $8,077; and 1946: $1,929.
[3] Less than 1 ton.

Exports.—The value of export of zinc ores (and concentrates) and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) amounted to $11,199,007 in 1946, compared with $2,956,222 in 1945. In addition to the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. Export data on zinc pigments and chemicals are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume. Much of the zinc used in the manufacture of such products is of foreign origin, and when they are exported a draw-back of 99 percent of the import duty is refunded upon the basis of zinc contained in the finished product. Data covering draw-back in 1945 and 1946 are not yet available. Draw-back refunds were made on 7,274 tons in 1943 and on 29,738 tons in 1944.

Zinc ore and manufactures of zinc, exported from the United States, 1942–46

WORLD REVIEW

World production of zinc in recent years, insofar as data are available is shown in the accompanying table.

World smelter production of zinc, 1940–46, by countries where smelted, in metric tons

[Compiled by B. B. Mitchell]

Country	1940	1941	1942	1943	1944	1945	1946
Argentina			410	728	1,200	1,542	1,814

[1] Included with Germany.
[2] Data not available; estimate by senior author of chapter included in total.
[3] Includes Austria, Czechoslovakia, and Poland in 1940–44.
[4] Estimated.
[5] January to June, inclusive.
[6] Preliminary data for fiscal year ended March 31 of year following that stated.
[7] Some secondary metal included.

Argentina.—The Aguilar mine of the Compania Minera Aguilar, S. A., subsidiary of the St. Joseph Lead Co., continued to be the leading producer in 1946, although the property operated at about 60 percent capacity owing to shortage of mine timber, fuel oil, and inability of the railroad to provide enough cars for shipping concentrates from the mine. The zinc-concentrates production at the Aguilar mine in 1946 was 29,601 metric tons compared with 25,862 tons in 1945.

Australia.—Labor shortages and the difficulty in obtaining new mining machinery continued to restrict zinc production at Australian mines and smelters in 1946.

The production of crude ore at the Broken Hill South, Ltd., for the fiscal year ended June 30, 1946, was 293,130 long tons compared with 309,605 tons for the previous year.

The Lake George Mining Corp., Ltd., at Captain's Flat, New South Wales, produced 135,244 tons of ore for the fiscal year ended June 30, 1946, compared with 164,549 tons for the previous year. The total estimated ore reserves remaining at the property on June 30 were 1,382,753 tons assaying 1.1 dwt. gold and 1.4 ounces of silver per ton, and 7.2 percent lead, 12.4 percent zinc, and 0.7 percent copper.

The electrolytic plant of the Electrolytic Zinc Co. of Australasia, Ltd., at Risdon, Tasmania, which treats zinc concentrates from Broken Hill, New South Wales, as well as from the company-owned Tasmanian mines, produced 77,299 long tons of slab zinc during 1946.

Canada.—At Trail, British Columbia, the Consolidated Mining & Smelting Co. continued to be the principal source of Canadian zinc production. According to the company's annual report to stockholders, slab zinc produced at the electrolytic plant at Trail was 134,393 short tons compared with 134,873 tons in 1945. Ore reserves at the end of the year showed a net increase of about 3.3 million tons.

The Hudson Bay Mining & Smelting Co., Ltd., at Flin Flon, Manitoba, according to the company's annual report to stockholders, produced 1,837,472 short tons of ore in 1946. About 145,900 tons of zinc concentrates averaging 45.4 percent zinc were produced at the company flotation mill. Slab-zinc production at the company electrolytic plant was 51,328 tons compared with 47,468 tons in 1945. At Sherridon, Manitoba, the Sherritt Gordon Mines, Ltd., milled 558,836 tons of ore in 1946, from which 17,291 tons of zinc concentrates were recovered. Ore reserves in the West mine at the end of 1946 were 1,368,000 tons averaging 2.12 percent zinc and 2.60 percent copper; known ore at the East mine was completely mined out during the year.

The Normetal Mining Corp., Ltd., at Normetal, Quebec, during the year milled 186,634 tons of ore averaging 3.64 percent copper and 7.04 percent zinc, which yielded 20,508 short tons of zinc concentrate (52.88 percent zinc), in addition to copper concentrate. Ore reserves at year end were 1,716,000 tons averaging 7.28 percent zinc and 3.68 percent copper. Ore reserves at the Waite Amulet Mines, Ltd., were reduced from 2,517,538 tons in 1945 to 1,997,739 tons at the end of 1946.

Mexico.—Labor strikes, poor railroad facilities, and high taxes were the principal factors limiting Mexican zinc output in 1946. On December 31, 1945, a general strike of Mexican mine and smelter

labor, originally scheduled for December 17, shut off zinc output until the end of February 1946, when new wage scales were established and the workers returned to their jobs.

Newfoundland.—The mine production of zinc, in terms of zinc content of concentrates produced, totaled 87,673 short tons in 1946 compared with 49,350 tons in 1945.

United Kingdom.—Consumption of zinc in the United Kingdom totaled 289,364 long tons in 1946, of which 216,089 tons were primary zinc and 73,275 tons secondary (including remelted) zinc. Comparable figures for 1945 were 250,383 tons consumed, of which 173,323 tons were primary and 77,060 tons secondary. Of the total zinc consumed in 1946, 33 percent was used in brass products, 25 percent in galvanizing, 19 percent in zinc oxide, 9 percent in rolled zinc, 7 percent for die castings, and 7 percent for zinc dust and miscellaneous uses.

U. S. S. R.—Virtually no official production figures have been available on the Russian zinc industry during the last 7 years. Data, however, presented in the announcement March 1946 of the new Five Year Plan indicate that zinc output has been declining in recent years.

Minor Metals

By ALLAN F. MATTHEWS[1]

	PAGE		PAGE
Barium	1266	Germanium	1275

Gallium	1275	Thallium	1281
		Zirconium	1282

BARIUM

SEVERAL thousand pounds of barium metal are produced annually in the United States. The output in 1946 was only about half that in 1945, reflecting the decline in demand for military electronic equipment. The two domestic producers were Kemet Laboratories Co., Inc. (unit of Union Carbide & Carbon Corp.), Cleveland, Ohio, and King Laboratories, Inc., Syracuse, N. Y. Barium metal production is contemplated by Dominion Magnesium, Ltd., Haley's Station, near Ottawa, Ontario. The metal sold for a few dollars a pound during 1946.

The principal use of barium metal is as a getter—a material that is installed or vaporized inside an electronic tube to absorb residual gases and thus promote the vacuum on which the efficiency of the tube depends. In this application the barium was often alloyed with other alkaline-earth metals and with light metals, but the present tendency is away from magnesium toward compositions more nearly pure barium. Lead-base bearing alloys used in Germany during World War II were hardened by 0.4 percent Ba.

Barium ores and chemicals are discussed in the Barite chapter of this volume.

BERYLLIUM

Demand for beryllium subsided somewhat in 1946 compared with that during the war, but the problem of obtaining enough beryl from foreign or domestic sources to sustain the refining industry in the United States remained acute. Beryllium metal became subject to export control November 27, 1946.

Domestic Mine Production.—Beryl was shipped from mines in 1946 by the Whitehall Co., Inc., Grafton and Raymond, N. H., and by the following companies and individuals in South Dakota: Consoli-

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

dated Feldspar Corp. and John D. Fisher, both near Custer; and Vincent and J. B. Cordes, Keystone Feldspar & Chemical Co., Harry A. Linde, and Lor Mining Co.—all four near Keystone. Spectrographic Services & Supplies, Inc., Saratoga Springs, N. Y., assigned a geologist to explore further the helvite deposit at Iron Mountain, north of Winston, N. Mex.

Beryllium concentrates (beryl) shipped from mines in the United States, 1940–46, by States, in short tons

[Compiled by R. W. Metcalf]

State	1940	1941	1942	1943	1944	1945	1946
Colorado	(1)		3	68	35		
Maine	(1)	(1)	45	2	2

Value	$3,721	$7,300	$24,188	$44,407	$56,135	$6,133	$17,787
Average per ton	$30.75	$46.20	$89.92	$124.74	$144.68	$157.26	$177.87

[1] Included with "Other." Bureau of Mines not at liberty to show separately.
[2] Figures include—1940: Colorado, Maine; 1941: Maine, New Hampshire, Wyoming; 1943: Massachusetts, New Mexico, North Carolina, Virginia; 1944: Connecticut, New Hampshire, North Carolina, Virginia.

Domestic Refiners and Fabricators.—The three beryllium refineries in the United States in 1946 were operated by the Beryllium Corp., Temple, near Reading, Pa. (beryllium-copper and beryllium oxide); Brush Beryllium Co., Cleveland, Ohio (metal, alloys, and compounds); and Clifton Products, Inc., Painesville, Ohio (oxide). As a result of Government-financed expansion during the war, a part of each refinery was owned by the War Assets Administration; the Beryllium Corp. in 1946 purchased the Government's share at Temple for $788,210. Government facilities at Cleveland cost $922,460 to build, and those at Painesville cost $286,087. The principal companies that consumed beryllium-copper master alloy in making beryllium-copper sheet, wire, rod, and bar were the American Brass Co., Waterbury, Conn.; the Beryllium Corp.; Wilbur B. Driver Co., Newark, N. J.; and Riverside Metal Co., Riverside, N. J. The American Brass Co. discontinued its beryllium-copper business at about the end of 1946 because it considered such a specialty item out of place in a large mill. An agreement between the United Steelworkers of America (CIO) and the Beryllium Corp. in mid 1946 provided for guaranteed annual wages.

Consumption and Uses.—Consumption of beryl for production of beryllium metal, alloys, and compounds in the United States was 1,013 short tons in 1946 compared with 1,738 tons in 1945. Addition of 2 percent beryllium hardens and strengthens copper alloys. Beryllium oxide is used in fluorescent lamps as a phosphor (material capable of absorbing ultraviolet light and emitting it as visible light) and in special refractories.[2] The metal is fabricated into windows for X-ray tubes and used in atomic energy apparatus.

[2] Geller, R. F., Yavorsky, P. J., Steierman, B. L., and Creamer, A. S., Studies of Binary and Ternary Combinations of Magnesia, Calcia, Baria, Beryllia, Alumina, Thoria, and Zirconia in Relation to Their Use as Porcelains: Jour. Nat. Bureau of Standards, vol. 36, No. 3, March 1946, pp. 277–312.

Stocks.—The principal consumers of beryl increased their stocks from 90 short tons at the beginning of 1946 to 879 tons at the end of the year. As a result of shipments to industry during 1946, beryl stocks of the Office of Metals Reserve declined from 4,497 tons to 4,118 tons.

Prices.—Domestic beryl, 8 to 12 percent BeO, was nominally quoted at $8–$10 per short-ton unit of BeO, f. o. b. mines, during 1946, according to E&MJ Metal and Mineral Markets. A higher price would doubtless have been paid, particularly later in the year, for any sizable lot offered. Foreign beryl, delivered consumer's plant, was listed by the American Metal Market at $10–$11 per unit for 8–10 percent BeO early in 1946, $10.39–$12.39 for 10–12 percent BeO from mid March to mid November, $13.50–$15.50 in late November and early December, and $14–$16, f. o. b. Atlantic port, during the remainder of the month. The price of beryllium copper master alloy, 4 percent Be, was reduced in February 1946 from $15 to $14.75 per pound of contained beryllium. In that month the Office of Price Administration relinquished control of the price of beryllium.

Foreign Trade.—Imports of beryl in 1946 declined for the third successive year, although they were greater than in any year prior to 1941. Exports of beryllium ore in 1946 were 2,751 pounds valued at $2,894. Beryllium metal, alloys, and scrap exported during the year totaled 139,735 pounds valued at $130,291; of that quantity, 76,516 pounds went to the United Kingdom, 30,613 to Canada, 20,000 to Switzerland, and 12,606 to nine other countries.

Beryllium ore (beryl concentrates) imported for consumption in the United States, 1942–46, by countries, in short tons

Country	1942	1943	1944	1945	1946
Anglo-Egyptian Sudan			1		
Argentina	703	1,162	229		53
Australia		457	518	105	20
Brazil	912	2,551	1,453	572	906

[4] Tien, Jack M., Preparation of Beryllium Powder: Trans. Electrochem. Soc., vol. 89, 1946, pp. 237–245.

processes and uses for beryllium were published.[5] The Italian beryllium refinery has been converted to a cast-iron foundry. The only active beryllium refinery outside of the United States in 1946 was in France, which was receiving beryl from a 500-ton stock pile in Germany. The mother country also reserved for itself the output of Madagascar. Another country that discontinued beryl shipments to the United States was India, which placed an embargo on the mineral in June 1946. Korea produced 59.6 metric tons of beryl averaging 12 percent BeO in 1944; about two-thirds of the output was from southern Korea, chiefly from one mine.[6]

World production of beryllium concentrates (beryl), 1940–46, by countries, in metric tons [1]

[Compiled by B. B. Mitchell]

Country	1940	1941	1942	1943	1944	1945	1946
Argentina	520	2,186	925	881	342	[2] 40	[3]
Australia	2	3		534	417	47	19
Brazil (exports)	1,472	1,703	1,634	2,027	1,185	510	1,294
India	53	[4]	121	1,486	508	108	[5] 100
Madagascar	[3]	[3]	[3]	[5] 67	50	[5] 10	[3]

South-West Africa	[3]	20	39	36	1	5	
Uganda	[3]	[3]	[3]		18	4	[3]
United States (mine shipments)	110	143	244	323	352	35	91
World total (estimate)[6]	2,161	4,090	2,971	5,374	2,996	770	1,526

[1] In addition to countries listed, beryllium concentrates may also be produced in Finland, France, Kenya Korea, Norway, Rumania, and U. S. S. R. Canada has produced beryl but reported no sales.
[2] Estimate.
[3] Data not available.
[4] Less than 1 ton.
[5] Estimate based on United States imports.
[6] Estimate exclusive of U. S. S. R. Production in other countries for which data are not available is believed to be negligible, except that Korea produced 60 metric tons in 1944.

BORON

Production.—Shipments of boron ferro-alloys were 74 short tons containing 11 tons of boron in 1946 compared with 109 tons containing 16 tons in 1945. The producers were Electro Metallurgical Co., Niagara Falls, N. Y.; Molybdenum Corp. of America, Washington, Pa.; and Ohio Ferro-Alloys Corp., Philo, Ohio. In addition, complex addition alloys (0.2–2 percent B) such as Silvaz, Bortam, and Grainal are produced respectively by Electro Metallurgical Co.; Titanium Alloy Manufacturing Co., Niagara Falls, N. Y.; and Vanadium Corp. of America, Bridgeville, Pa.

Uses.—Additions of 0.001 to 0.003 percent of boron to steel increase hardenability (depth of hardness). The effects of such additions and the methods of introducing boron and of analyzing it were described in a Bureau of Mines report,[7] which includes a comprehensive bibliography. A report on boron in steel, prepared by the War Metallurgy Committee of the National Academy of Sciences [8] in late 1942, was published. From the standpoint of hardenability, boron was found to be able to replace at least half of the molybdenum in cast or wrought nickel-chromium-molybdenum or manganese-molybdenum steels originally containing 0.4 percent molybdenum.[9]

Prices.—Ferroboron, 17.5 percent B, was quoted throughout 1946 at $1.30 a pound for less-than-ton lots in the eastern area, according to Iron Age.

Ores.—Boron minerals are discussed in the Magnesium Compounds and Miscellaneous Salines chapter of this volume.

CALCIUM

Domestic Production.—Calcium metal was produced in the United States in 1946 only by the Electro Metallurgical Co., Sault Ste. Marie, Mich. There was no output during the year by the New England Lime Co., Canaan, Conn., which during World War II produced as much as 10,000 pounds of high-purity metal (98–99 percent Ca) a day and had a capacity of twice that rate. The process at the Canaan plant involved thermal reduction and high-vacuum distillation.[10] About 1,000,000 pounds of calcium hydride was manufactured from purchased metal during the war by Metal Hydrides, Inc., Beverly, Mass., a subsidiary of Ventures, Ltd.[11]

Uses.—Calcium metal is used in deoxidizing and scavenging steel melts and, to a much lesser extent, in reducing metals such as chromium, thorium, and zirconium. Calcium hydride is a conveniently portable source of hydrogen for inflating weather and signal balloons, and large quantities were utilized for that purpose by the United States Signal Corps and the Royal Air Force during World War II. Lead alloys containing 0.03 to 0.7 percent calcium are made into cable sheaths, storage-battery grids, and bearings.[12] "Lurgimetall" is a bearing alloy of lead and 2.8 percent barium, 0.4 percent calcium, and 0.3 percent sodium produced by Metallgesellschaft, A. G., Frankfurt, Germany.

Prices.—Calcium metal was quoted throughout 1946 at $1.85 a pound, in ton lots, cast in slabs and small pieces (apparently for 97–98 percent purity), according to E&MJ Metal and Mineral Markets. The metal was exempted from price control in August by Office of Price Administration Supplementary Order 129 as amended. The quotation for calcium-silicon (28–35 percent Ca, 60–65 percent Si, 6 percent max. Fe), lump, carlots, f. o. b. Welland, Ontario, decreased

from 15½ cents a pound at the beginning of 1946 to 14½ cents by the end of the year.

Foreign Trade.—Of the calcium-silicon imports of 661,200 pounds in 1946, 594,000 were from Canada and 67,200 from France. There were no entries of calcium metal during the year.

Calcium metal and calcium-silicon imported for consumption in the United States, 1942–46 [1]

Commodity	1942		1945		1946	
	Pounds	Value	Pounds	Value	Pounds	Value
Calcium metal			17,086	$15,845		
Calcium-silicon	60,300	$10,144	164	22	661,200	$87,647

[1] No transactions reported during 1943 and 1944.

Canada.—Dominion Magnesium, Ltd., Haley's Station, near Ottawa, Ontario, produced 53,548 pounds ($68,720) of calcium metal in 1946 compared with 29,543 pounds in 1945. Production was interrupted during plant alterations in the latter part of 1946 but was planned to be resumed early in 1947. Calcium-silicon and calcium-manganese-silicon are produced by St. Lawrence Alloys & Metals, Ltd., Beauharnois, Quebec.

CERIUM AND OTHER RARE-EARTH METALS

Cerium master alloy (misch metal) has been produced from imported concentrates in the United States in recent years by Cerium Metals Corp., Niagara Falls, N. Y.; Cooper Metallurgical Laboratory, Cleveland, Ohio; Kent Metal & Chemical Works, Edgewater, N. J.; and New Process Metals Corp., Newark, N. J. The composition of the alloy is about 40–52 percent cerium; 22–30 percent lanthanum; 15–17 percent neodymium; 8–10 percent praseodymium, yttrium, samarium, and other rare-earth metals; and 0–5 percent iron. The master alloy is diluted to 15–40 percent iron content, and treated with small quantities of certain metals to improve its characteristics, in making ferrocerium for sparking "flints" of cigarette lighters, miners' lamps, and acetylene welding torches. There is some refining [13] of misch metal to yield pure cerium metal for radio tubes and nonferrous alloys. Additions of 4 to 10 percent cerium improve the properties of cast or forged magnesium at elevated temperatures.[14]

Imports of cerium alloys for consumption in the United States totaled 15,660 pounds ($80,276) in 1946 compared with 33,080 pounds ($151,963) in 1945. All the entries were from Canada. Exports of cerium metal and alloys were 39,718 pounds ($167,641) in 1946 and 32,175 pounds ($100,958) in 1945.

Rote, F. B., Burgess, P. B., and Rustag, A. L., Production and Properties of Magnesium Press and Hammer Forgings: Office of Production Research and Development, War Production Board; section relating to cerium reprinted by Cerium Metals Corp., New York, 1946, 10 pp.

The Canadian producer of cerium alloys is Shawinigan Chemicals, Ltd., Shawinigan Falls, Quebec. In Korea, Nihon Magnesite KK, Joshin-Fu, Kankyo-hokudo, produced 50 metric tons of ferrocerium (averaging 70 percent Ce) in 1944 and 13 tons in the first 7 months of 1945.[15] The Treibacher Chemische Werke, A. G., Treibach, Austria, produced 222 metric tons of misch metal in 1940–44, and I. G. Farbenindustrie, Bitterfeld, Germany, had an output about 10 to 15 percent greater than that of the Treibach firm.[16] During 1946 the United Kingdom and Eire consumed 8,455 long tons of sulfuric acid (100 percent basis) in refining rare earths.[17] The Metal Bulletin (London) quoted cerium metal at £7¼ per pound, cerium alloy (52 percent) at 32 s. 6 d. per pound, and lanthanum metal (98–99 percent) at 15 s. per gram throughout 1946, except that the price of the alloy was increased to 36–38 s. during the final quarter.

Monazite—the principal source of cerium, other rare-earth metals, and thorium—and rare-earth compounds are discussed in the Minor Nonmetals and Uranium and Thorium chapters of this volume.

COLUMBIUM AND TANTALUM

Domestic Production.—No columbite was shipped from mines in the United States in 1946 and only 1,149 pounds in 1945. Shipments of tantalum concentrates were 3,475 pounds in 1946 compared with 5,500 pounds in 1945. Of the tantalum concentrated in 1946, microlite was produced by Arthur Montgomery, Harding mine, Dixon, Taos County, N. Mex., and tantalite by Mrs. George Hardesty, Hardesty Ranch mine, Pennington County, S. Dak., and Mineral Mills, Inc., Old Mike mine, Custer County, S. Dak. Development of microlite at the Harding mine[18] and at the Brown Derby group of claims, Gunnison County, Colo.,[19] was described. Ferrocolumbium is produced by the Electro Metallurgical Co., Niagara Falls, N. Y., and tantalum metal by the Fansteel Metallurgical Corp., North Chicago, Ill.

Columbium and tantalum concentrates shipped from mines in the United States, 1942–46

[Compiled by R. W. Metcalf]

Year	Columbium concentrates		Tantalum concentrates	
	Pounds	Value	Pounds	Value
1942			200	$175
1943	5,771	$1,465	9,411	27,621
1944	3,208	917	7,204	23,317
1945	1,149	287	5,500	13,366
1946			3,475	8,793

Uses.—Columbium is added in quantities of 0.5–0.8 percent to stainless steel to improve weldability, creep strength, and impact strength. These steels together with new complex nonferrous alloys, some of which contain as much as 4 percent Cb, are used in making rotor wheels and blades for jet-propelled airplanes and in fashioning exhaust systems for both jet and internal-combustion aircraft engines.[20] A columbium nitride surface comprises the receiver in the bolometer, a heat-detecting device so sensitive that it can be used to determine range and bearing of objects in military operations and in navigation. Tantalum is utilized primarily as a getter in radio and radar tubes, as a catalyst for the manufacture of synthetic rubber, and as a constituent of carbide cutting tools.[21] It is also used in making aerial camera lenses, corrosion-resistant chemical equipment,[22] and skull plates and surgical wire.

Government Stocks.—The Office of Metals Reserve had 33,991 pounds of columbite on hand at the beginning of 1946 and 2,179 pounds at the end of the year. Its stocks of tantalite (averaging 41.3 percent Ta_2O_5) increased from 1,095,862 pounds to 1,125,004 pounds during 1946, and those of tantalum-columbium slag (9.2 percent Ta_2O_5) were unchanged at 3,460 short tons.

Prices.—In 1946, the principal consumer was offering about 55 cents per pound of contained Cb_2O_5 for columbite with a Cb:Ta ratio of 10:1, 50 cents for 4:1, and 45 cents for 2:1, c. i. f. New York. No minimum content columbium or maximum content of titanium or tin entered into the specification, but the percentage of columbium had to exceed that of tantalum. The Metal Bulletin (London) quoted columbite at 60 s. per unit of combined Cb_2O_5 and Ta_2O_5, c. i. f., in the first half of 1946 and 50–55 s. in the latter half of the year. The same journal quoted tantalum ore at £3½–£3¾ per unit at the beginning of 1946, £10 from late March until the end of June, and £7 in the second half of the year. Domestic prices for metals and alloys, according to E&MJ Metal and Mineral Markets, remained unchanged throughout 1946 as follows: Columbium metal, $500–$560 a kilogram ($227–$254 a pound). Ferro-columbium, 50–55 percent Cb, f. o. b. producer's plant, $2.25–$2.30 per pound of contained columbium. Tantalum metal, $143–$160.60 a kilogram ($65–$73 a pound).

Foreign Trade.—Imports of columbite are principally from Nigeria, and those of tantalite chiefly from Belgian Congo and Brazil, as shown in the accompanying table. Exports in 1946 were as follows: Columbite, 7,924 pounds ($3,566); columbium metal and alloys, 4,076 pounds ($5,296); tantalum concentrates, 21 pounds ($319); and tantalum metal and alloys, 494 pounds ($26,801).

[2] Classified by U. S. Department of Commerce as British East Africa.

World Review.—About 99 percent of the world columbite output is a byproduct of alluvial tin operations in Nigeria, where production totaled 1,550 long tons in 1946 compared with 1,571 tons in 1945.[23] The concentrates averaged about 65 percent Cb_2O_5. Amalgamated Tin Mines of Nigeria, Ltd., produced 773 long tons in the fiscal year ended March 31, 1947, compared with 583 tons in the year ended March 31, 1946. Jantar Nigeria Co., Ltd., produced 315 tons in the year ended September 30, 1946, compared with 373 tons in the year ended September 30, 1945. Bisichi Tin Co. (Nigeria), Ltd., produced 59½ tons in the calendar year 1946 and 100 tons in 1945. Brazil exported 7 metric tons of columbite in 1946, and Uganda exported 8 tons in 1945. The Bolivian Development Corp. reopened in 1945 the La Verde mine, near Santa Cruz, Bolivia (formerly worked for mica), and produced 3,116 kilograms of columbite in 1946. Malaya produced 5 tons of columbite during the Japanese occupation.[24] It is planned to open a deposit of columbite near Mayoko, French Equatorial Africa.[25] A columbium mine in the Ural Mountains, U. S. S. R., is being worked, and a concentrating plant was said to be under construction.[26]

The largest tantalite producer in the world is the Geomines company in the Belgian Congo; its output was 122 metric tons in the fiscal year 1945–46 compared with 128 tons in 1944–45 and 226 tons in 1940–41.[27] Brazil [28] exported 44 metric tons of tantalite in 1946 compared with 30 tons in 1945 and 254 tons in 1944. The Mines Department of Nigeria began in 1944 to stimulate tantalite production,[29] and output of the mineral in 1946 was valued at £1,333. Tantalum Industries Holdings Pty., Ltd., intends to build a tantalum refinery at

Finsbury, near Adelaide, South Australia. The company holds mineral leases in the Northern Territories and has obtained an option over the assets and leases of Tantalite, Ltd., in the Pilbarra and Greenbushes districts of Western Australia.[30] Tantalite production in Southern Rhodesia in 1946 was valued at £6,880.[31] Uganda exported 7 long tons (£3,240) of tantalite and bismutotantalite in 1945, and the Union of South Africa exported 2,000 pounds (£683) of tantalite in 1946. A 100-ton concentrator was installed in 1946 by Peg Tantalum Mines, Ltd., at Ross Lake, 45 miles northeast of Yellowknife, Northwest Territories, Canada.[32] It is intended that the concentrates will be treated for recovery of tantalum and columbium at a plant planned to be built by an affiliate, Tantalum Mining & Refining Corp. of America, at Edmonton, Alberta. Two other companies reportedly working tantalum properties in the Northwest Territories are De Steffany Beryllium Tantalum Mines, Ltd., Hearne Channel section, Great Slave Lake, and Laurence Lee Gold Mines, Yellowknife area.

GALLIUM

The Eagle-Picher Lead Co., Joplin, Mo., was the only producer of gallium in the United States in 1946. The Anaconda Copper Mining Co., Great Falls, Mont., produced several thousand grams in 1943–45 but had no output in 1946. The Bureau of Mines plans to investigate extractive processes on very low-grade domestic gallium-bearing material.

Gallium is the only metal other than mercury that is liquid at low temperatures but differs from the latter in having a high boiling point. These properties are useful in certain military devices, which will be designed to require gallium if a sufficient supply can be assured. Gallium is the filling in a thermometer for use up to 1,000° C. (1,832° F.).[33] It was employed by the Manhattan Project as a volatile "carrier" to sweep out impurities during uranium analyses.[34] The price of gallium during World War II was about $3 a gram. The metal was added October 17, 1946, to the Positive List of Commodities requiring license for export.

Germanite containing gallium occurs in the Mansfeld copper mines, Germany, and in the Tsumeb (Otavi) copper-lead mine, South-West Africa. The latter property was purchased by Tsumeb Corp., Ltd., a new American-British firm, in January 1947.

GERMANIUM

Germanium production in the United States reached an annual level of several hundred pounds for the first time in 1946. The entire output was by the Eagle-Picher Lead Co., Joplin, Mo., from cadmium fume obtained as a byproduct of sintering zinc concentrates. Distillation of the fume with hydrochloric acid yields germanium chloride, which is hydrolyzed with ammonium hydroxide and dried to the

[34] Chemical and Engineering News, Carrier-Distillation Analysis of Uranium: Vol. 25, No. 11, Mar. 17, 1947, p. 777.

oxide; the oxide can be reduced to metal by sodium cyanide, carbon, or hydrogen.[35] The germanium content of ores can be analyzed by a spectrochemical method.[36] Shipments of germanium in 1946 were principally in the form of oxide but also as metal and chloride.

High electrical resistance, expansion on solidification, and anti-corrosive properties are characteristic of germanium. The principal application is in electronic devices. It is also used as a catalyst in the hydrogenation of coal and is being alloyed experimentally with aluminum, magnesium, gold,[37] and platinum. The price during 1946 was about $180 a pound for the metal and $50 a pound for oxide. The Metal Bulletin (London) quoted metal, 99.5 percent, at 19s. per gram throughout the year.

Copper-lead ore from the Tsumeb (Otavi) mine, South-West Africa, has yielded a residue containing 3.8 percent Ge. The mine was shut down soon after the outbreak of World War II; but rehabilitation was begun following its purchase in January 1947 by Tsumeb Corp., Ltd., a new organization owned principally by Newmont Mining Corp. and the American Metal Co., Ltd.

INDIUM

The indium content of metal and compounds shipped by domestic producers was 9,667 troy ounces in 1946 compared with 57,434 ounces in 1945. A byproduct of zinc and lead operations, the indium was shipped in 1946 by the American Smelting & Refining Co., Perth Amboy, N. J., and Denver, Colo.; Anaconda Copper Mining Co., Great Falls, Mont.; Eagle-Picher Lead Co., Joplin, Mo.; and National Zinc Co., Inc., Bartlesville, Okla. The Perth Amboy plant was the only one of the five that produced indium in 1946. The principal distributor is the Indium Corp. of America, subsidiary of Anaconda Copper Mining Co. and Oneida, Ltd.

Plating indium on the lead coating of steel bearings and subsequently diffusing the indium into the lead at 350° F. considerably decreases galling. The indium improves corrosion resistance, permits bearing surfaces to retain a more complete oil film, and increases the strength of the surface into which it is impregnated.[38] Indium is also used in plating special alloys[39] and in making low-melting alloys and indium-zinc coatings. Laboratory experiments utilizing radioactive indium as a tracer were described.[40]

The price of indium metal, 99.9 percent was $2.25 a troy ounce throughout 1946, according to E&MJ Metal and Mineral Markets.

From Peru, the Cerro de Pasco Copper Corp., Oroya, exported 155,692 grams of indium in 1946 and 41,457 grams in 1945. Société

Belgochimie is conducting research in Belgium to develop new applications for indium.[41]

LITHIUM

Lithium metal was produced in 1946 by Maywood Chemical Works, Maywood, N. J., and plans for output were made by Metalloy Corp., Minneapolis, Minn. Lithaloys Corp., New York, N. Y., filed a petition for reorganization June 3, 1946, and suspended operations. Nonelectrolytic methods of preparing metallic lithium were investigated by the National Research Corp., Boston, Mass.[42] The metal was under Government allocation from September 1, 1942, to October 1944 in accordance with War production Board Order M–191.

Lithium is added to copper-base alloy melts as a scavenger and is a minor constituent of certain nonferrous alloys. Lithium atmospheres in heat-treating furnaces prevent scaling (oxidation) and permit control of both carburizing and decarburizing.[43] Lithium peroxide and lithium borohydride can be used to generate oxygen and hydrogen, respectively. Lithium-aluminum hydride reduces organic compounds rapidly at room temperature in ether solutions, and its reactions are noteworthy for rapidity, cleanness, and increased yields compared with other reducing agents.[44] Lithium uses and methods of extraction in Germany were described.[45]

The price of lithium metal, 98–99 percent, 5-ton lots, was $12.50 a pound from January to mid November and $10 a pound during the remainder of the year, according to E&MJ Metal and Mineral Markets.

Ores and compounds of lithium are discussed in the Minor Nonmetals chapter of this volume.

RADIUM AND MESOTHORIUM[46]

Radium is produced as an accessory of uranium and vanadium from carnotite ores mined in Colorado and Utah,[47] but data on the quantities of ore produced and radium refined in recent years are not available for publication. Radium is used primarily in cancer treatment, dial painting, and radiographic inspection of heavy castings and welds. A new therapeutic use for radium is in the treatment of deafness, particularly of children and of war-injured airmen. Radium-alloy static eliminators are manufactured by the United States Radium Corp., New York, N. Y. Mesothorium—a radium isotope obtained from monazite residues—is used in radioactive dial paints also.

The number of radioactive specimens tested annually by the National Bureau of Standards gives some index as to demand. Such specimens contained 51.8 grams of radium and 0.3 gram of meso-

thorium in 1946 compared with 65.9 and zero grams, respectively, in 1945. Radium was quoted nominally at $25,000 to $30,000 a gram throughout 1946, according to Canadian Metals and Metallurgical Industries. Foreign trade in radium and mesothorium in recent years is shown in the accompanying table.

Radium salts and mesothorium salts imported for consumption and exported from the United States, 1942–46

Year	Imports				Exports				
	Radium salts			Radioactive substitutes [1] (value)	Radium salts			Mesothorium salts	
	Grams	Value			Grams	Value		Milligrams	Value

[1] Principally mesothorium.
[2] Not separately classified.

Geology, development, and milling at the uranium-radium mine at La Bine Point, east shore of Great Bear Lake, Northwest Territories, Canada—operated by Eldorado Mining & Refining Co., a crown company—were described.[48] Pitchblende concentrates from the Eldorado mine are shipped to the Government refinery at Port Hope, Ontario. During World War II the refinery was modernized from batch operation to continuous circuit. Union Minière du Haut Katanga exploits in the Belgian Congo one of the largest known uranium-radium deposits in the world. The company sold 80 to 150 grams of refined radium annually during the war.[49] Production at Jachymov (including some 10 percent at nearby Schmiedeberg), Czechoslovakia, in 1939–44 totaled about 110 metric tons of pitchblende concentrates containing approximately 175 milligrams of recoverable Ra per ton.[50] Two-thirds of that output was refined at Triebach, Austria, and one-third in Brunswick, Germany. The capacity of the Treibach plant is variously rated at 6–12 grams of radium annually, but output averaged only 3.5 grams yearly in 1936–44 owing to limited ore supplies. During that 9-year period the quantity of radium refined was 31.823 grams, of which 8.655 were from pitchblende, 7.413 from autunite, 0.250 from samarskite, 2.548 from "ore residues," 9.069 from "intermediate products," 2.579 from old carriers, and 1.309 from old neutron preparations. Mesothorium production at Treibach was 10.142 grams in 1936–44. The British Ministry of Supply plans to establish a national center for the processing and distribution of radium, radon (gaseous radioactive element 86, disintegration product

of radium), and artificial radioactive substances.[51] The Ministry will purchase the radio chemical plant and business of Thorium, Ltd., Amersham, Bucks, England (except the manufacture of luminous compounds and other secondary products), take over from the Medical Research Council the extraction of radon, and receive from Johnson Matthey & Co., Ltd., the business of filling radium containers.

RHENIUM

Rhenium is produced by the Department of Chemistry, University of Tennessee, Knoxville, under the supervision of Prof. A. D. Melaven, from molybdenite roaster flue dust (0.4 to 1.5 percent Re) supplied by the Miami Copper Co., Miami, Ariz. The process involves agitating the flue dust in water, filtering off molybdenum sulfide, and treating the filtrate with potassium chloride to precipitate potassium perrhenate ($KReO_4$), which is reduced by hydrogen to metal. Production of potassium perrhenate by the university was 2 pounds in 1942, 12 pounds in 1943, 23 pounds in 1944, and none in 1945 or 1946. Delivery of new processing equipment was expected to result in an output of 150 to 200 pounds in the 1947–48 school year. One pound of perrhenate yields approximately 0.6 pound of metal.

No commercial applications for rhenium have yet become established. However, patents have been issued covering the use of rhenium and its alloys of tungsten, molybdenum, chromium, tantalum, and platinum-group metals in lamp filaments, electric contact points, thermocouples, corrosion-resistant alloys, catalysts, and pen-point nibs. Rhenium is silver-white, has a specific gravity of 21, and melts at about 3,100° C. The University of Tennessee sold rhenium during 1946 at the following prices, per gram:

	Potassium perrhenate	*Rhenium metal*
First 10 grams at	$2.00	$3.25
Next 90 grams at	1.50	2.50
Each gram over 100 grams	1.00	1.75

The cost of perrhenate was $8 a gram in 1942 to July 1943, $6 from August 1943 to March 1944, and $4 from August 1944 to December 1945. The corresponding figures for rhenium metal were $14, $10, and $6.50, respectively.

Vereinigte Kaliwerke Salzdetfurth A. G., Werk Hattorf, Phillipsthal, Germany, formerly treated potash residues (now exhausted) to yield potassium perrhenate, from which Deutsche Gold und Silber Scheideanstalt, Frankfurt-on-Main, produced about 200 kilograms annually of rhenium-metal powder (99.5 percent) during the middle 1930's.[52] The smelting of copper at Kupferschieferbauernde Gesellschaft, Mansfeld, yields a rhenium-bearing residue from which Gebruder Borchers A. G., Oker, near Goslar, attempted to produce rhenium. The metal was used in Germany primarily as a substitute for osmium and iridium in platinum alloys for fountain-pen points.[53]

SELENIUM AND TELLURIUM

Domestic Production.—The 21-percent drop in production of refined copper, as a result of labor management difficulties, was reflected in a 36-percent decline in selenium output. Recovery of tellurium was virtually suspended as a result of weak demand and heavy stocks. Producers of refined selenium and tellurium are the American Smelting & Refining Co., Baltimore, Md.; International Smelting & Refining Co., Perth Amboy, N. J.; United States Metals Refining Co., Chrome, N. J.; and United States Smelting, Refining & Mining Co., East Chicago, Ind. Silver slimes containing selenium and tellurium are recovered by Phelps Dodge Refining Corp., Laurel Hill, Long Island, N. Y., and El Paso, Tex. All the selenium and most of the tellurium refined come from tank slimes of electrolytic-copper refineries; some tellurium is a byproduct of lead.

Salient statistics of elemental selenium and tellurium in the United States 1942–46, in pounds

Year	Selenium					Tellurium [1]		
	Production	Producers' shipments [2]	Producers' stocks at end of year	Imports [3]		Production	Producers' shipments [2]	Producers' stocks at end of year
				Pounds	Value			
1942	506,426	316,613	341,900	83,666	$127,004	224,132	98,798	145,700
1943	635,581	521,779	455,677	81,720	142,032	56,174	62,260	139,403

1946	291,103	405,226	257,135	475,081	806,205	3,765	38,523	148,769

[1] Includes tellurium content of small quantity of oxide.
[2] Bureau of Mines not at liberty to publish value.
[3] Includes selenium salts.
[4] Revised figure.

Uses.—Selenium is used in decolorizing clear glass, manufacturing rectifiers, making red cadmium sulfoselenide pigments, and improving the machinability of stainless steels and copper alloys. The use of selenium in German rectifiers was described.[54] Selenium and tellurium are added to rubber cable coverings to promote resistance to heat, oxidation, and abrasion and to increase resilience. Tellurium-lead work-hardens and is resistant to acids.[55] Tellurium-copper (0.5–1 percent Te) was used in the body of the magnetron—the British-invented device generating the very high frequencies essential to radar; the tellurium addition renders the metal free-machining, making possible "machine-made copper parts at high speed with increased accuracy and better finish, comparatively free from burrs, the thermal and

electrical properties being little affected." [56] The chill depth of cast iron is increased by tellurium.[57]

Prices.—Selenium (black, powdered, 99.5 percent) and tellurium were quoted at $1.75 a pound throughout 1946, according to E&MJ Metal and Mineral Markets. The Metal Bulletin reported the London price steady also at 8s. 6d. a pound for selenium and 7s. a pound for tellurium.

Foreign Trade.—Imports of selenium and selenium salts for consumption in 1946 totaled 475,081 pounds—473,819 from Canada, 711 from United Kingdom, and 551 from Belgium. Data on imports of tellurium and exports of selenium and tellurium in 1946 are not available.

Canada.—Production of selenium in Canada was 521,867 pounds ($949,798) in 1946 compared with 379,187 pounds ($728,039) in 1945. Exports of selenium were 723,490 pounds ($1,261,205) in 1946 and 350,744 pounds ($385,369) in 1945. The Dominion output of tellurium was 15,848 pounds ($24,405) in 1946 compared with final figures of 484 pounds ($929) in 1945. The principal producer was Canadian Copper Refiners, Ltd. (subsidiary of Noranda Mines, Ltd.), Montreal East, Quebec;[58] and the other was Ontario Refining Co. (subsidiary of International Nickel Co. of Canada, Ltd.), Copper Cliff, Ontario.

Germany.[59]—The principal German producer of selenium during World War II was Norddeutsche Affinerie, Hamburg, which had an output of 16.5 metric tons in 1939, 4.1 in 1940, 4.0 in 1941, 5.3 in 1942, 5.8 in 1943, and 5.0 in 1944—largely from the anode sludges of refining foreign copper ores. Additional selenium was imported from Sweden. There was some tellurium production during the period, but consumption probably did not exceed 1 ton a year.

THALLIUM

Thallium output in the United States was affected by strikes at nonferrous smelters in 1946 and was only a fifth of the several thousand pounds produced in 1945. All domestic production was recovered by the American Smelting & Refining Co. from cadmium-containing flue dusts treated at Denver, Colo. Thallium has been used, principally in the form of sulfate, as a rodenticide and insecticide; the organic preparations "Antu" and "1080" have recently appeared as competitive products. Thallium depresses the freezing point of mercury for low-temperature measurements and is also an activator for fluorescent materials. Thallium bromoiodide crystals transmit wavelengths in the far infrared region and are thus valuable in detection and signaling devices.

Price control of thallium metal was lifted in February 1946; but nominal quotations, according to E&MJ Metal and Mineral Markets, remained at the 1945 level of $12.50 a pound from January to mid August 1946 and were then listed at $17.50 for the remainder of the year. Imports of thallium sulfate reported by Oil, Paint and Drug

Reporter in May–December 1946 totaled 25 cases, at least partly (probably entirely) from Europe. Canada produced 128 pounds of thallium in 1944 but none in 1945–46.

ZIRCONIUM

Domestic Production.—Zircon production in the United States in 1946, all in Florida, surpassed—and by a wide margin—the former record of 3,646 short tons in 1927. The bulk of the output is recovered with ilmenite and rutile from dune sands near South Jacksonville; operations are by the Humphreys Gold Corp. for the Rutile Mining Co. of Florida, subsidiary of Titanium Alloy Manufacturing Co. The only other domestic producer was Riz Mineral Co., which mined black sands near Vero Beach, Indian River County, Fla., and recovered zircon, rutile, and ilmenite in its concentrator at Melbourne, Brevard County, Fla.

Milling and Refining.—Mixed zircon-rutile-ilmenite concentrates imported from Australia are separated into their component minerals by the International Titanium Corp. (subsidiary of the American Rutile Corp. and Ventures, Ltd.), Carteret, N. J.; Orefraction, Inc., Pittsburgh, Pa.; and Titanium Alloy Manufacturing Co., Niagara Falls, N. Y. Zirconium ferrosilicon is produced by Electro Metallurgical Co. at Sheffield, Ala.; Niagara Falls, N. Y.; and Alloy, W. Va. Zirconium-copper is produced by the Beryllium Corp., Reading, Pa., and Metal Hydrides, Inc., Beverly, Mass. Zirconium metal is prepared by Foote Mineral Co., Philadelphia, Pa.; Metal Hydrides, Inc.; and Titanium Alloy Manufacturing Co.

Consumption and Uses.—Shipments of foreign and domestic zircon to consumers in the United States reached an all-time high of 20,555 short tons in 1946 compared with 15,988 tons in 1945. Use distribution in 1946, according to estimates by principal shippers, was as follows, in percentages: Refractories, 28; vitreous enamels, 25; electrical and chemical porcelains, 19; metal and alloys, 16; pottery glazes, 10; and miscellaneous, 2. Zirconium refractories were described [60] and their utilization in gas turbines suggested.[61] The impact resistance of steel is substantially improved by small additions of zirconium.[62] The pure metal is used in vacuum tubes, [63] flash bulbs, and pyrotechnics. Addition of 0.5–1 percent Zr to magnesium-base alloys profoundly refines the grain, permitting high-speed rolling and extrusion.[64] A lamp whose pin-point zirconium-oxide cathode emits a brilliant white light has been developed.[65]

Stocks.—Producers' and distributors' inventories of zircon (including zircon content of zirconium-titanium concentrates) dropped from 6,316 short tons at the end of 1945 to 5,059 tons at the end of 1946.

[65] Iron Age, vol. 157, No. 17, Apr. 25, 1946. p. 54; vol. 158, No. 5, Aug. 1, 1946, p. 92.

Government stocks held by the Office of Metals Reserve declined during 1946 from 15,829 tons of baddeleyite and 2,581 tons of zircon on January 1 to 10,336 tons of baddeleyite and 2,251 tons of zircon on December 31.

Prices.—Zirconium ore, 55 percent ZrO_2, f. o. b. Atlantic seaboard, was quoted nominally at $60–$70 during the first 5 months of 1946, $45–$47 in June to October, and $42–$45 in the two last months of the year according to E&MJ Metal and Mineral Markets. Zirconium ferrosilicon was quoted throughout the year at $102.50–$107.50 a long ton for 12- to 15-percent Zr content and 14–16 cents a pound for 35–40 percent Zr. Powdered zirconium metal was listed at $7 a pound.

Foreign Trade.—Zircon imports are almost exclusively from Australia, and baddeleyite entries are entirely from Brazil. Exports comprised 259 short tons ($17,285) of zirconium concentrates and 2,377 pounds ($6,122) of metal and alloys in 1946 compared with 108 tons ($7,126) of concentrates and 30 tons ($15,383) of metal and alloys in 1946.

Zirconium concentrates imported for consumption in the United States, 1942–46, by countries, in short tons [1]

Year	Zircon				Baddeleyite from Brazil	Accessory titanium minerals [3]	Total zirconium concentrates [4]	
	From Australia	From Brazil	Other [2]	Total			Short tons	Value
1942	11,145	----	196	11,341	15,283	7,282	33,906	$816,364

[3] Rutile and ilmenite content of mixed zirconium-titanium concentrates imported from Australia.
[4] Classified as "ore" by U. S. Department of Commerce.
[5] Any zircon imports from Brazil, 1944–46, included with baddeleyite.

Technology.—Methods of preparing ductile zirconium by the Bureau of Mines [66] and of zirconium oxide and halides by Auergesellschaft Aktiengesellschaft, Berlin,[67] were described.

World Review.—World production of zirconium concentrates was estimated at 25,000 short tons in 1946. Australia produced 6,400 short tons (principally contained in zirconium-titanium concentrates) in 1945 compared with 15,680 tons in 1944. Output was from the 50-mile stretch of beach between Byron Bay, New South Wales, and Southport, Queensland.[68] Brazil exported 4,453 metric tons of baddeleyite (possibly including some zircon) in 1946 compared with 758 tons in 1945 and 2,152 tons in 1944. Enormous tonnages of ilmenite and smaller quantities of rutile, zircon, and monazite are recovered

rom beach sands along the Malabar Coast, Travancore, India.[69] The Travancore Government has assumed control of mining, processing, and exporting.[70] Imports of zirconium concentrates by the United Kingdom totaled 656 long tons in 1940–44.[71] Zircon is mined near Mariupol in the Ukraine, U. S. S. R.[72] The Soviet practice of oxygenizing blast furnaces has increased the demand for zircon refractories.[73] Malaya produced 741 long tons of zircon and 207 tons of mixed monazite-zircon concentrates during the Japanese occupation.[74] Small quantities of zircon are produced from time to time in Egypt, Italy, Korea, Madagascar, and Senegal. Deutsche Gold und Silber Scheideanstalt, Frankfurt-on-Main, Germany, produced 47,956 kilograms of zirconium metal during World War II,[75] and Tokushu Kinzoku KK, Sakai, Osaka, made about 6 tons of ferrozirconium (40 percent) in 1944–45 from Korean river sands.[76]

Monazite	1293	Wollastonite	1298

GRAPHITE

PRODUCTION of crystalline and amorphous graphite in 1946 was 14 percent greater than 1945, but sales were 9 percent below the 1945 total. There are too few domestic producers to show separate statistics on amorphous and on crystalline graphite. The accompanying table shows combined figures for the 1942–46 period. Producers' stocks totaled 949 short tons at the end of 1946. Manufactured graphite was produced by several companies during 1946, but production figures are not available for publication. The manufactured material competes with natural graphite in many uses. Among them are: Self-lubricating bearings, mold wash in steel mills, pencils, crayons, paint, polishes, and powder glazing.

Production and shipments of natural graphite in the United States, 1942–46

Year	Production (short tons)	Shipments		Year	Production (short tons)	Shipments	
		Short tons	Value			Short tons	Value
1942	7,120	7,253	$401,690	1945	4,888	5,334	$299,207
1943	9,939	9,597	903,102	1946	5,575	4,844	252,596
1944	5,408	5,768	349,663				

Total imports of graphite were less than in the previous year. No shipments of powdered or dust graphite were received, and imports of carbon lump from Ceylon were greatly reduced. Although the quantity of crystalline flake received from Madagascar was greater than in 1945, it fell far short of demands. Labor troubles, fluctuations in the Metropolitan and Malagasy (Madagascan) franc, and a serious

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

landslide at one of the large mines caused almost a complete cessation of activities in the Madagascar graphite mines during part of 1946. A new and higher scale of prices effective January 17, 1947, will, it is believed, effect a large increase in output from Madagascar mines in 1947. The decrease in Ceylon imports is attributed to smaller requirements. Imports for the 1942–46 period are summarized in the following table.

Graphite (natural and artificial) imported for consumption in the United States, 1942–46

Year	Crystalline				Amorphous				Total	
	Flake		Lump, chip, or dust		Natural		Artificial

Crucible-grade flake graphite and high-carbon flake and amorphous graphite are included in the list of strategic minerals that must be stock-piled for national defense.

Exports of natural graphite, 1942–46, were—1942: 4,095 short tons, valued at $413,281; 1943: 3,010 tons, $317,586; 1944: 2,230 tons, $248,257; 1945: 1,308 tons, $134,414; 1946: 2,313 tons, $267,137.

Trade-journal quotations of prices for graphite f. o. b. New York in 1946 were: Ceylon lump, 10–12 cents per pound; carbon lump, 9–10 cents; dust, 4–5 cents; Madagascar No. 1 flake, 9–16 cents; No. 2, 7 cents upward; fine ground, 55 to 70 percent carbon, 3 cents upward. Crude amorphous graphite was $14 to $30 per ton, according to grade. All prices nominal.

World production figures for graphite for the 1915–39 period were published in Minerals Yearbook, Review of 1940 (p. 1414). The accompanying table shows available statistics for 1938–46.

World production of natural graphite, 1938–46, by countries, in metric tons[1]

[Compiled by B. B. Mitchell]

GREENSAND

Production of greensand by three companies in New Jersey in 1946 reached 5,045 short tons; shipments totaled 5,140 tons valued at $424,900 compared to an output of 4,738 tons and shipments of 4,986 tons valued at $477,919 in 1945. All material shipped in 1946, as in the previous year, was utilized in the manufacture of water-softening compounds and water-purification agents. Greensand was released from price control on July 26, 1946, under amendment 36 of Office of Price Administration Supplementary Order 129.

Statistics for greensand sold or used are shown in the accompanying table.

Greensand marl sold or used by producers in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	10,110	$448,440	1945	4,986	$477,919
1943	10,056	522,124	1946	5,140	424,900
1944	4,908	505,651			

KYANITE, ANDALUSITE, DUMORTIERITE, AND SILLIMANITE

Domestic production of kyanite reached an all-time high in 1946. Imports of kyanite from India were less than in the previous year because of transportation problems in that country. Minor amounts also were received from British East Africa and the Union of South Africa. The receipt of 592 short tons of sillimanite valued at $13,856 from Australia was also reported. Available statistics for recent years are summarized in the following table.

Statistics on the domestic kyanite industry have not been released since 1943, because there have been too few producers to allow publication of the figures. Shipments of domestic kyanite for the 1940–43 period were published in Minerals Yearbook, 1943 (p. 1579).

Consumption and stocks of imported kyanite in the United States, 1942–46

	Imports		Consumption (short tons)	Stocks Dec. 31 (short tons)
	Short tons	Value		
1942: India	6,524	$93,743	[1] [2] 8,024	[1] 9,500
1943: India	9,972	105,042	[1] [2] 8,416	[1] 11,000
1944:				
British East Africa	55	591	[3]	[3]
India	5,680	66,850	[3]	[3]
	5,735	67,441	[1] 8,064	[1] 8,600
1945:				
British East Africa	560	7,000	[3]	[3]
India	13,994	160,997	[3]	[3]
	14,554	167,997	[4] 15,000	[4] 8,000
1946:				
British East Africa	395	3,308	[3]	[3]
India	10,110	109,990	[3]	[3]
Union of South Africa	277	3,187	[3]	[3]
	10,782	116,485	[4] 11,500	7,280

[1] Consumption and stocks as reported by WPB for 1942–44.
[2] Includes 154 tons in 1942 and 316 tons in 1943 reexported to Canada.
[3] Data not available.
[4] Partly estimated.

Production of kyanite in 1946 was reported by the Kyanite Mining Corp., near Farmville, Va.; the Vitrefrax Corp., near Ogilby, Calif; and the A. P. Green Firebrick Co., of Mexico, Mo., from a deposit near Clarksville, Ga. The Kyanite Mining Corp., by far the largest producer, is the only company selling on the open market.

Kyanite minerals were released from price control under Amendment 36 of Office of Price Administration Supplementary Order 129, on July 26, 1946. Prices of domestic kyanite in 1946 ranged from $19 per short ton for crude kyanite to $37.50 for calcined concentrate, 35-mesh, in carlots. The cost of Indian kyanite laid down at Atlantic seaports in 1946 was about $22 per short ton.

Because of relatively large stocks on hand and small requirements, Champion Sillimanite, Inc., the only domestic producer, did not operate its andalusite mine in Mono County, Calif., or its dumortierite mine in Pershing County, Nev.

Laboratory and pilot-plant work on the sillimanite schists in the

Southeastern States is still in progress. A review of the Bureau of Mines, work on these deposits has recently been released.[2]

Separate classification of exports of kyanite and associated minerals was started in 1945. Exports for that year totaled 307 short tons valued at $20,205. The markets were Canada, Mexico, Argentina, Brazil, and Nicaragua. Exports in 1946 reached 342 short tons valued at $17,881 and the Netherlands, China, and the United Kingdom were added to the export market. The bulk of the material exported in both years, however, was purchased by Canada.

LITHIUM MINERALS

Production of all kinds of lithium raw materials in 1946, with the exception of amblygonite, was greater than in 1945. The American Potash & Chemical Corp. at Searles Lake, Calif., was again by far the largest producer.

The Hayden Mining Co., of Colorado Springs, Colo., the only domestic producer of lepidolite, operated the Pidlite mines in San Miguel County and the Harding mine in Taos County, N. Mex., as well as the Brown Derby mine in Gunnison County, Colo.

The tonnage and value of lithium ores and compounds shipped in recent years and the approximate Li_2O content are shown in the accompanying table.

Although far below the volume of the recent wartime output, shipments in 1946 were 131 percent above the 1935–39 average, and the Li_2O content was 267 percent greater.

Shipments of lithium ores and compounds from mines in the United States, 1935–39 (average) and 1942–46

Year	Ore (short tons)	Value	Li_2O (short tons)	Year	Ore (short tons)	Value	Li_2O (short tons)
1935–39 (average)	1,327	$48,280	88	1944	13,319	$552,977	848
1942	5,405	243,516	299	1945	2,446	285,520	274
1943	8,155	314,660	463	1946	3,065	303,892	323

Several new uses for lithium compounds were reported in 1946. They were: Lithium peroxide, a solid of high stability containing about 35 percent of available oxygen by weight; lithium borohydride, a solid stable in dry air and capable of generating 66 cubic feet of hydrogen per pound on contact with water; and lithium diborane, a gas which at room temperature liberates 88 cubic feet of hydrogen per pound on contact with water. The Texas Co., 135 East 42d St., New York, announced a new synthetic low-temperature grease with a lithium base which is stable in temperatures from −100° to +300° C.

A new reducing agent, lithium aluminum hydride, has also recently been announced. This new material, first made in June 1945, bids fair to win an important place as a research and industrial tool in organic and inorganic chemistry. It will be of particular aid in the

[2] Hudson, W. C., Exploration of Georgia and South Carolina Sillimanite Deposits: Bureau of Mines Rept. of Investigations 3927, 1946, 44 pp.

reduction of unsaturated compounds, since it apparently does not attack the carbon-to-carbon double bond.[3]

The Bureau of Mines has recently issued a report on the lithium industry in Germany with particular reference to activity during the latter part of World War II.[4]

Trade-journal prices of lithium ores were as follows: Spodumene, $5 to $6 per 20 pounds of contained Li_2O on 6 percent grade, carlots; amblygonite, 8 to 9 percent Li_2O, $40 to $50, per short ton f. o. b. mine; and lepidolite, 3 percent Li_2O, $24 to $25 per short ton, f. o. b. mine. The price of dilithium sodium phosphate was reported at about $230 per ton.

MINERAL EARTH PIGMENTS

[By Charles L. Harness]

The construction boom in 1946 placed severe demands on paint materials of all kinds, and the earth pigments shared the rising market with lead, zinc, and titanium pigments. Total sales of mineral earth pigments were 14 percent greater than that reported in 1945.

Synthetic earth pigments accounted for 33 percent of the total tonnage and 54 percent of the total value. This is a substantial increase over the 3 percent of tonnage recorded by the Bureau of the Census in 1921 and the 11 percent noted by the same agency in 1927.

Among the German pigment developments described by a team of American technical experts was the manufacture of black and yellow iron oxide pigments as byproducts in the reduction of nitrobenzene to aniline. The report[5] also describes the production of red iron oxide pigments from iron carbonyl and a magnetic brown oxide, suitable for use in the plastic tape of magnetophone sound reproduction units.

Of particular interest to the American paint industry in 1946 was the trend of imports of foreign earth pigments. Italian siennas, Turkey umbers, French ochers, and Spanish red oxide were received in small but significant quantities, and the flow will probably be greater when more containers are available in the countries of origin. It seems likely that imports of Spanish red oxide and Turkey umber will regain a substantial portion of their prewar American markets. Siennas and ochers, on the other hand, may meet stronger competition from American synthetic pigments.

Production of Spanish red oxide was 4,242 metric tons in 1945 and 1,572 tons in 1946.[6] Half the output was shipped to the United States, and the remainder principally to Argentina, Spain, Portugal and Sweden.

Prices of finished earth pigments, which are quoted in cents per pound, barrels, works, were generally unchanged during 1946, according to the Oil, Paint and Drug Reporter. Precipitated magnetic blacks were quoted at 8½; metallic brown was 2½; synthetic (pure) browns, 12; burnt siennas, American type, 6½ to 8; Italian-type burnt siennas, 8¾ to 9¾; American-type raw siennas, 4 to 10; raw siennas, Italian type, 8 to 10; Turkey-type umbers, 4¾ to 5⅞, depending on point of purchase; Vandyke brown, regular, 9; sap brown (special Vandyke brown) 12; synthetic (pure) red iron oxides, 9 to 9¾; Venetian reds, 2.2 to 4, depending on iron oxide content; natural (metallic) red oxide, 2; natural yellow oxides, high iron, 4¼; synthetic (pure) iron oxide yellows, 6.85; and French-type ochers, 8.45.

Natural mineral pigments and manufactured iron oxide pigments sold by processors in the United States, 1945–46, by kinds

[1] Less than 1 ton.

MINERAL WOOL

The most recent mineral-wool production statistics available are those for 1944. Figures for the 1942–44 period were published in Minerals Yearbooks, 1943 and 1944, on pages 1583 and 1541, respectively. The mineral-wool canvass was transferred to the Bureau of the Census in 1945, but no statistics have been compiled. It is estimated, however, that the combined production of home and industrial insulation in 1945 was approximately 720,000 short tons valued at $70,000,000, and the 1946 total is believed to be 20 percent above the 1945 figure.

Insulation has become virtually an essential element of dwelling construction and not just a temporary measure for fuel conservation during times of war. A review of the advantages to the home owner of insulation with mineral products has recently been released by the Bureau of Mines.[7]

The mineral-wool industry expanded substantially in 1946. Several new plants began operations, many existing plants added equipment, and others were in the process of construction. Among the new plants are the Everock Products Co., at Tacoma, Wash., which features a modern induction-type electric furnace instead of the conventional water-jacketed cupola used in most plants; Independent Insulations, Inc., also at Tacoma, has a daily capacity of 40 tons, which it expects to increase to 200 tons. The Weathermaster Manufacturing Co., at Tonganoxie, Kans., and the Owens-Corning Fiberglas Co., at Kansas City, Kans., also began operation in 1946. Additional plants are either in the planning or construction stage in California, Ohio, Oklahoma, Texas, and Washington.

[7] Bowles, O., Home Insulation With Mineral Products—Conserves Fuel—Reduces Cost—Increases Comfort: Bureau of Mines Inf. Circ. 7388, 1946, 11 pp.

The commercial standard for Industrial Mineral Wool, All Types—Testing and Reporting, presented by the Industrial Mineral Wool Institute in 1945 and prepared by the National Bureau of Standards, was accepted by the trade and became effective on March 15, 1946, as Commercial Standard CS 131–46.[8]

MONAZITE

Monazite contains thorium—a source material for atomic energy—and thus very little material on the current uses and output can be published. The quantity and value of the monazite sand imported in 1946 therefore cannot be released. Import figures covering the 1936–45 period, as well as Government regulations pertaining to thorium, are contained in the Uranium and Thorium chapter of this volume.

Although there are large deposits of monazite in Brazil, the current producing and concentrating capacity is not adequate for our needs. A review of the monazite-sand industry in Travancore, India, including material on occurrence, mining, and preparation, has recently been released.[9]

Domestic industry is currently more interested in the rare earths contained in monazite than in the thorium content. Perhaps the largest use is for the rare-earth oxides and fluorides required in the cores of positive arc electrodes for moving-picture projectors and floodlights. Glass polishing with cerium oxide is also gaining in volume. The advantages claimed for this material are increased speed in the production of finished lenses, lack of stain on the hands and clothing—in contrast to rouge (ferric oxide), and a brighter polish on the finished product. Rare-earth chlorides are also utilized by the bleaching and dyeing industry.

In view of the difficulties in obtaining imported monazite, the consumers are making every effort to locate domestic deposits of commercial size. Market requirements are 8 percent thorium and 63 to 68 percent rare earth content. Current market prices for monazite containing 65 percent rare earths are $60 to $65 per short ton, f. o. b. Atlantic seaports.

OLIVINE

In 1946 shipments of olivine reached an all-time high of 7,649 short tons valued at $92,868. Most of the production was consumed in refractories, but one operator reported the use of his material as building stone, road ballast, and concrete sand.

Several other new uses for this mineral are in the laboratory and pilot-plant stage. Manganese Products, Inc., Seattle, Wash., has purchased a deposit of olivine on Cypress Island in the San Juan Archipelago for use in the production of fertilizer. The fusion of this mineral with phosphate rock produces a fertilizer containing about 20

[8] Copies may be purchased from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C., at 10 cents per copy.

Olivine sold or used by producers in the United States, 1942–46

Year	Short tons	Value	Year	Short tons	Value
1942	5,739	$45,201	1945	(1)	(1)
1943	5,415	48,633	1946	7,649	$92,868
1944	3,270	35,207			

[1] Data not available for publication.

percent available phosphate. Refractory blocks composed of olivine, magnesite, and sodium silicate as binder that stand up well at 1,500° C. have been prepared at the Bureau of Mines, Norris, Tenn., Station. A report which describes a method for the production of pure magnesium chloride from olivine has also recently been released by the Bureau of Mines.[10]

A rough estimate of the cost of the commercial production of MgO from this product was also included. The Minerals Research Laboratory, North Carolina State College, Asheville, N. C., is investigating the possibility of using olivine in the production of roofing granules.[11]

PERLITE

After several years of pilot-plant development, the perlite industry started commercial production in 1946, and the output reached 4,206 short tons. Five companies reported production: The Chem-Cote Perlite Corp., Superior, Ariz.; Superior Perlite Co., Superior, Ariz.; Rheem Research Products, Inc., 714 West Olympic Boulevard, Los Angeles, Calif., with operations also at Superior, Ariz.; Continental Basic Materials Corp., Chula Vista, Calif., with operation near Beatty, Nev.; and the Great Lakes Carbon Corp., 22 East 40th Street, New York, N. Y., with a quarry at Superior, Ariz., and processing plant at Torrance, Calif. Only three companies, however, made shipments, which totaled 3,022 tons. As one of these sold only processed material, value figures cannot be released. Dant & Russell, Inc., of Portland, Oreg., virtually completed pilot-plant work in 1946 on material from a perlite deposit in southern Wasco County, Oreg., and expect to get into commercial production in 1947.[12] Several other companies have completed pilot-plant tests and also expect to get into production in 1947.

All the material sold in 1946 was utilized by the construction industry as thermal insulation and lightweight aggregate.

A review of the available information on the physical properties, preparation, and uses of this material has recently been released by the Bureau of Mines.[13]

The average price of unprocessed perlite was $5.50 per short ton, f. o. b. mine; the processed material brought $35 to $37 per ton.

RADIO-GRADE QUARTZ

Imports of uncut quartz crystal reached 370,556 pounds valued at $2,376,598 in 1946, and 36 companies produced 1,744,100 finished piezoelectric devices.

Brazil remains virtually the sole supplier of radio-grade quartz, although small quantities were also received from Madagascar and Denmark. Previous shipments from Madagascar have been rejected because the material was poorly graded. The Quartz Society of Madagascar, however, has renewed its efforts to enter the market and has started a more rigid inspection of the material before shipping. It is believed that the 6,600 pounds of quartz valued at $78 received from Denmark is not of radio grade because the value reported is far below the price quoted for such material.

The accompanying table shows the quantity of quartz imported and the number of piezoelectric devices produced in recent years.

Imports of uncut quartz crystal, consumption of radio-grade quartz, and production of piezoelectric devices in the United States, 1942–46

Year	Imports of uncut quartz crystal [1]		Consumption of radio-grade quartz [2] (pounds)	Production of piezoelectric devices [2 3] (number)
	Pounds	Value		
1942	2,612,106	$8,987,108	682,000	6,888,000
1943	3,356,000	11,409,803	1,588,000	22,575,000
1944	2,300,506	11,178,643	1,858,000	29,939,000
1945	1,329,798	6,190,621	1,040,000	18,918,000
1946	370,556	2,376,598	172,400	1,744,100

[1] Includes optical-grade quartz used in production of optical instruments.
[2] 1942–44, War Production Board.
[3] Includes oscillators, resonators, and other piezoelectric devices.

The discovery of deposits of radio-grade quartz in Africa [14] and in the Karuli State of India [15] have recently been reported.

A survey of the efforts of the Germans to produce radio-grade quartz during World War II shows that their program yielded significant experimental results which show definite promise, but no crystals of commercial grade. They were not only hampered by a shortage of quartz, but also by lack of coordination and planning in the manufacture of piezoelectric devices. Trade secrets among individual companies were not shared, and fabrication techniques were neither modern nor efficient.

Rochelle salts, which have better piezoelectric qualities than quartz but are less stable, are being utilized in the United States as crystal filters and sonar projectors by the telephone, radio, and electronic industries. The Soviet press also reports the production of such crystals from sodium-potassium tartrate, a byproduct of the wine industry. These crystals, however, do not meet the specifications for radio-grade quartz and thus will not affect the stock-pile requirements of quartz crystals.

It is believed that the demand by industry and the armed forces for radio-grade quartz for the next few years will be largely for 100- to

[15] Dubiz, V. S., and others, A Deposit of Quartz Crystals near Saportra, Karuli State, India: Chem. Abs., vol. 40, No. 15, 1946, p. 4319.

500-gram material, the greatest demand being for plates of one-half square inch. Smaller quantities of material, weighing 1,000 grams and over, will also be required for uses of equal importance. The larger pieces will be utilized in the production of prisms for infrared work. Although annual requirements will not reach the wartime level, the many new military and commercial uses for piezoelectric devices will insure a steady demand for radio-grade quartz.

Buying prices for radio grade quartz in 1946 were essentially the same as in 1945, ranging from $1.50 per pound to $36.95 per pound according to quality. They were reported in detail in Minerals Yearbook, 1943, p. 1586.

STRONTIUM MINERALS

[By Charles L. Harness]

The year 1946 almost wrote "finis" to the domestic celestite industry. Founded in the late thirties as a substitute for barite in drilling oil wells, the industry received added impetus during the war years as a source of raw material for tracer bullets. These markets are gone. The patent on the use of barite in drilling wells expired in 1943, and with it the $17 per ton royalty which had permitted celestite to compete with barite. Purchases of domestic celestite for war needs virtually ceased in 1944. Only 243 tons of celestite valued at $3,726 were sold in 1946, by two firms in California, the Pan-Chemical Co., 205 First National Bank Building, Pomona—mine near Westmorland; and Rowe, Gabelic & Beuhler, 1555 Sunset Avenue, Pasadena 3—mine near Ludlow. These figures compare with 2,784 short tons valued at $27,840 in 1945, and 3,005 tons valued at $48,165 in 1944. Shipments in 1946 went mostly into strontium chemicals, with small quantities sold for oil-well drilling.

Peacetime uses of celestite are mainly red signal flares ("fusees") for railroads, trucks, aircraft, and ships. Minor uses are ceramic fluxes, medicinals, and lubricants. Strontium greases are said to be stable in the range of 300°–400° F., water- and hydrocarbon-resistant, and resistant to mechanical working.[16]

E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., and Foote Mineral Co., Philadelphia, Pa., are the two main buyers in the East. In the West Barium Products, Ltd., Modesto, Calif., is occasionally in the market.

In 1946 imported crude celestite was worth about $28 to $30 a short ton laid down at Philadelphia.

Celestite imported for consumption in the United States, 1944–46, by countries, in short tons

Country	1944		1945		1946	
	Short tons	Value	Short tons	Value	Short tons	Value
Mexico	3,170	$38,191	3,016	$38,365	1,977	$24,165
Spain	2,622	47,576	675	12,251		
United Kingdom	1	652			2,530	42,033
	5,793	86,419	3,691	50,616	4,507	66,198

[16] Worth, H. J., and McClennon, L. W., Strontium Greases: Oil and Gas Jour., vol. 45, No. 43, Mar. 1, 1947, pp. 74, 78.

Exports of strontium salts were not separately classified in 1946, and thus totals are not available. Exports for 1944 and 1945 are shown in the accompanying table, as they were incorrectly reported in the 1945 volume, the data for 1944 and 1945 being transposed.

Strontium chemicals exported from the United States, 1944–45 [1], in short tons

	1944		1945	
	Short tons	Value	Short tons	Value
Strontium nitrate	284	$52,129	223	$36,698
Strontium oxalate	19	15,058	2	1,198
Other	17	24,269	13	7,823
	320	91,456	238	45,719

[1] Not separately classified beginning January 1, 1946.

TOPAZ

Shipments of topaz in 1946 from the Brewer mine near Kershaw, S. C., were lower than in the previous year. The Carolina Mining & Exploration Corp., of Naples, N. C., was the only producer. Crude topaz crushed and screened or in lump form was used in the production of refractory cements and for thinning slag in open-hearth furnaces. At the Bureau of Mines Southern Experiment Station a very good refractory has been made from a mixture of topaz and domestic kyanite. Because of the fuming of the escaping fluoride, which requires great care in handling, refractory manufacturers are not using this material.

VERMICULITE

The upward trend in the production and sale of vermiculite which began in 1944 continued through 1946 and reached a new high of 86,390 short tons, 33 percent above the previous record set in 1945. Exfoliated vermiculite was used in 1946 principally in lightweight aggregate for concrete and in plaster.

Production in 1946 was reported from seven States: Colorado, Montana, Nevada, North Carolina, South Carolina, Texas, and Wyoming. As in previous years, the bulk of the output came from the Universal Zonolite Insulation Co. mine at Libby, Mont. This company also produced cleaned and screened vermiculite from a deposit near Traveller's Rest, S. C., in 1946. The property has been under lease for some time, but this represents the first commercial production by Universal Zonolite in the East.

The AleXite Engineering Co., of Colorado Springs, Colo., has opened a new deposit in the Encampment district of Wyoming, which is reported to be the second largest in the United States.

The Southwestern Graphite Co., at Burnet, Tex., is a new producer of vermiculite and first reported output in 1946. Barrimore & Sons, of Hollywood, Calif., has purchased a vermiculite deposit near Silver Peak, Nev., and expects to get into commercial production in 1947.

Vermiculite was released from price control on July 26, 1946, under Amendment 36, Office of Price Administration Supplementary Order 129. However, as this mineral was in good supply, prices were not

affected. Screened and cleaned vermiculite averages $8 to $12 per short ton. Recent information obtained from exfoliators places the loss of weight in exfoliating at about 5 percent. Assuming an average price of $75 per ton, the total value of exfoliated vermiculite sold in 1946 would be approximately $6,155,000.

Some relatively new uses for exfoliated vermiculite are in insulating refractory brick, lightweight and fireproof structural units, and non-load-bearing partition tile.[17] United States Patent 2,411,470 was granted to Thomas Patton Gladstone Shaw of Shawinigan Falls, Quebec, Canada, in November 1946. This patent covers invention of a product composed of vermiculite and a thermoplastic resin which may be used as floor covering, gasket, crown-cap seals, and insulation. Shaw has assigned the patent to Shawinigan Chemicals, Ltd., Montreal, Quebec. A review of the occurrence and utilization of the vermiculites has recently been released by the Colorado School of Mines, at Golden.[18] The tonnage and value of screened and cleaned vermiculite shipped in recent years are shown in the accompanying table.

Screened and cleaned vermiculite sold or used by producers in the United States, 1935–39 (average) and 1940–46

Year	Short tons	Value	Year	Short tons	Value
1935–39 (average)	18,486	$180,297	1943	46,645	$471,595
1940	22,299	137,698	1944	54,116	541,744
1941	23,438	125,444	1945	64,808	648,077
1942	57,848	319,931	1946	86,390	867,973

WOLLASTONITE

Production and sales of wollastonite from the Burnham property near Willsboro, N. Y., were lower in 1946 than as reported in 1945.

The Industrial Research Division of the United States Department of Commerce is sponsoring a research program to determine the value of this mineral in the manufacture of thermal insulation, in glaze for pottery, and as a filler in paint, rubber, and linoleum.

[17] Rea, F. R., Vermiculite Added to Fired Clay Products Offers New Uses: Brick and Clay Rec., vol. 108, 1946, No. 3, pp. 54 and 58, and No. 5, p. 68.

PART III. STATE REVIEWS

The Mineral Industry of Alaska

(MINE REPORT)

By ALFRED L. RANSOME [1]

GENERAL SUMMARY

PARTIAL restoration of gold mining, an all-time record in coal output, and a fairly steady yield of crude platinum were chiefly responsible for raising the value of mineral production in Alaska to $12,430,000 in 1946 from $10,174,000 in 1945. However, the value in 1946 was lower than in any of the 40 preceding years except 1931–32 and 1943–45 and was less than half of any year in the 1937–41 period. Gold regained in 1946 its leadership as the mineral produced in greatest value, followed by coal, platinum, sand and gravel, mercury, silver, tungsten, and lead. A general report on Alaska's mineral resources was published [2] by the Bureau of Mines.

Mineral production of Alaska, 1944–46

	1944		1945		1946	
	Quantity	Value	Quantity	Value	Quantity	Value
Antimony ore.....short tons	73	$6,465

Total		6,903,000		10,174,000		12,430,000

[1] Bureau of Mines not at liberty to publish separately; value included with "Miscellaneous."
[2] Shipments.
[3] Comprises value of stone and value of items indicated by "(1)".

Production of gold in Alaska in 1946 more than tripled the output in 1945, but the 226,781 fine ounces valued at $7,937,335 recovered from ores and gravels was still far short of output during the years immediately preceding the war. The value of the gold in 1946 was 99 percent of the total value of the gold, silver, copper, and lead

[1] Statements on minerals other than gold, silver, copper, lead, and zinc were prepared by other members of Bureau of Mines.
[2] Bain, H. Foster, Alaska's Minerals As a Basis for Industry: Bureau of Mines Inf. Cir. 7379, 1946, 88 pp.

produced. As the 1946 season was the first full one since War Production Board Limitation Order L-208 was rescinded July 1, 1945, gold production might have been expected to be much higher. The fact that it was not greater was due apparently to the continuing difficulty in obtaining and transporting mining equipment and supplies, to cost of such equipment and supplies, and to labor costs so high that there was but little incentive to work gold properties. The shipping strike on the Pacific coast late in 1946 had little effect on mining during the year but did result in delaying shipments of concentrates and bullion to smelters and refineries in the United States and of supplies to Alaska.

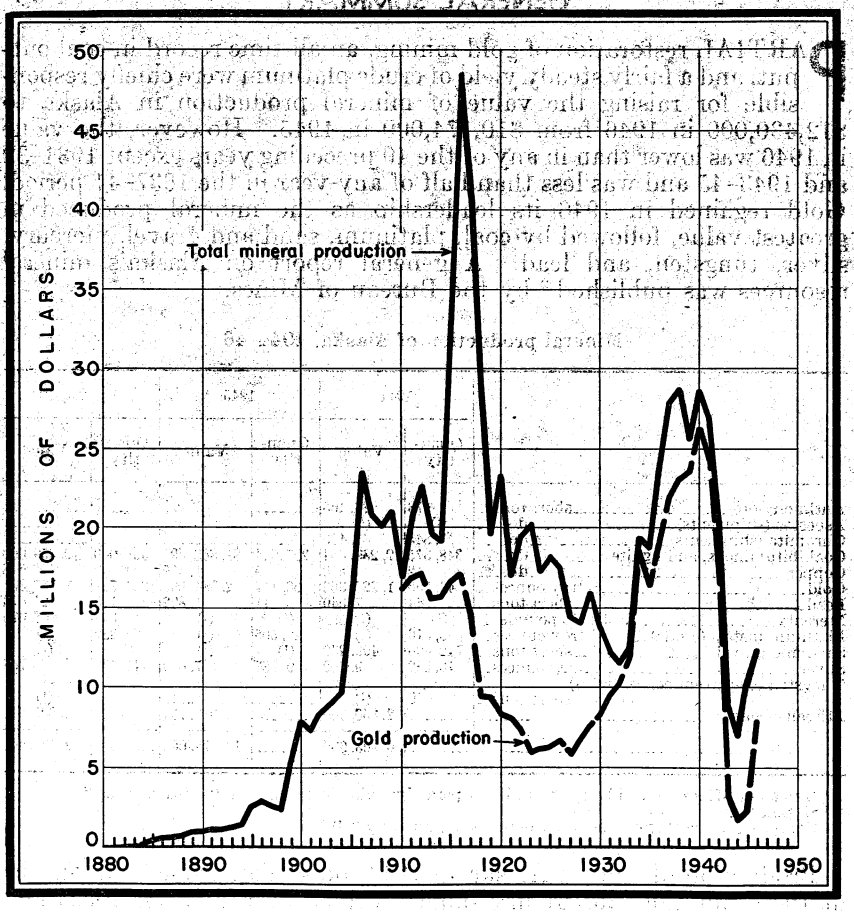

FIGURE 1.—Trends in value of total mineral production (1880–1946) and gold production (1910–46) in Alaska. From 1911 to 1931 copper production accounted for most of the value of minerals other than gold.

Production from placer operations provided much of the increased gold output, largely because the dredging companies were in a better position than the lode-mine operators to resume work. In all, 24 dredges and 38 draglines operated during the year, as compared with

14 (revised) and 16, respectively, in 1945. In addition, 244 other placer properties were active some portion of the year (172 in 1945). Of the lode mines, production was reported from 16 properties, 2 less than in 1945.

PRODUCTION OF GOLD, SILVER, COPPER, AND LEAD

The accompanying tables show the mine production of gold, silver, copper, and lead in Alaska, 1942–46, and 1880–1946, in terms of recovered metals; the output of gold and silver in 1946, by types of operation; and the output of gold, silver, copper, and lead, from amalgamation and cyanidation mills (with or without concentration equipment) in 1946, by regions.

A small proportion of the production shown in the tables following was mined in the years 1942–45 but apparently was not then shipped because of war or other conditions. Shipments of 41,211 ounces of gold and 6,339 ounces of silver received at the Seattle Assay Office in January and February 1947 are here credited as 1946 production. The greater part of these shipments no doubt would have been received at the Seattle Assay Office in 1946 had there been no shipping strike.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of gold, silver, copper, and lead production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, and lead, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067
1943	35.00	.711+	.130	.075
1944	35.00	.711+	.135	.080
1945	35.00	.711+	.135	.086
1946	35.00	.808	.162	.109

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1 to Dec. 31, 1946: $0.905.
[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Gold.—Floating connected-bucket dredges recovered 65 percent of the total Alaska output of gold in 1946 compared with 51 percent in 1945; 24 dredges operated during the year at 18 properties. Three mines operated two dredges each and one mine operated four dredges. In all, placer and lode mines in 1946 yielded (in terms of recoverable metal) 226,781 ounces of gold valued at $7,937,335 compared with 68,117 ounces valued at $2,384,095 in 1945, an increase of 233 percent. This apparently marked improvement is less impressive when 1946 output is compared with that in 1940 (755,970 ounces, valued at $26,458,950). The United States Smelting Refining & Mining Co.,

operating four connected-bucket dredges in the Fairbanks district, Yukon River Basin region, was the largest producer of gold in Alaska in 1946. The following nine companies (all operating placer mines) were important producers in the order listed: New York Alaska Gold Dredging Corp. (two connected-bucket dredges, Tuluksak River), Tuluksak-Aniak district, Kuskokwim region; Arctic Circle Exploration Co. (connected-bucket dredge and hydraulic giants, Candle Creek), Fairhaven district, Seward Peninsula region; Alluvial Golds, Inc. (connected-bucket dredge, Woodchopper Creek), Circle district, Yukon River Basin region; Cripple Creek Mining Co. (dragline operation, Cripple Creek), Innoko district, Yukon River Basin region; Brinker-Johnson Co. (connected-bucket dredge, Caribou Creek), Fairbanks district, Yukon River Basin region; Gold Placers, Inc. (connected-bucket dredge, Coal Creek), Circle district, Yukon River Basin region; Yukon Placer Mining Co. (Walker's Fork Creek), Fortymile district, Yukon River Basin region; Nome Creek Mining Co. (connected-bucket dredge, Nome Creek), Toloyana district, Yukon River Basin region; and Wade Creek Dredging Co. (Jack Wade Creek), Fortymile district, Yukon River Basin region. Of the lode mines active during 1946, the Cleary Hill Mines Co., Cleary Hill mine (Fairbanks district), and the Alaska Pacific Consolidated Mining Co., Independence mine (Willow Creek district, Cook Inlet-Susitna region), were the most important. A substantial quantity of gold came from clean-up operations at the Alaska-Juneau mill, but the mine did not operate during 1946. Only 3 percent of the total Alaska output of gold in 1946 came from lode mines.

Silver.—Of the silver produced in Alaska in 1946, 83 percent was a byproduct of gold mining, and 17 percent came from lead ore. The ratio of silver production to gold production in 1946 was 1 : 5.4, compared with 1 : 6.8 in 1945. The most important producer of silver in Alaska in 1946 was the United States Smelting Refining & Mining Co.; the silver was a byproduct of connected-bucket gold-dredging operations in the Fairbanks district.

Copper and lead.—The Southeastern Alaska region was the sole source of copper and lead production in 1946. Both metals were recovered from lead concentrate shipped to United States smelters outside the Territory for treatment.

Mine production of gold, silver, copper, and lead in Alaska, 1942–46, and total 1880–1946, in terms of recovered metals

Year	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total value
	Fine ounces	Value	Fine ounces	Value	Pounds	Value	Pounds	Value	
1942	487,621	$17,066,735	119,704	$85,123	44,000	$5,324	830,000	$55,610	$17,212,792
1943	99,583	3,485,405	42,788	30,427	54,000	7,020	400,000	30,000	3,552,852
1944	49,296	1,725,360	13,362	9,502	4,000	540	88,000	7,040	1,742,442
1945	68,117	2,384,095	9,983	7,099	10,000	1,350	22,000	1,892	2,394,436

[1] Short tons.

Mine production of gold and silver in Alaska in 1946, by types of operation in terms of recovered metals

Type of operation	Mines producing	Material treated	Gold			Silver			Total value
			Fine ounces	Percent of total		Fine ounces	Percent of total		
				1946	1945		1946	1945	
Lode mines	16	[1] 10,798	6,073	3	15	8,137	19	29	$219,130
Floating connected-bucket dredges	[2] 18	[3] 9,789,300	148,834	65	51	21,752	52	39	5,226,766
Other placers (dragline and dry-land dredges, hydraulic, drift mining, etc.)	[4] 282	([5])	71,874	32	34	11,904	29	32	2,525,208
Total: 1946	316		226,781	100		41,793	100		7,971,104
1945	218		68,117		100	9,983		100	2,391,194

[1] Short tons of ore.
[2] 24 dredges; 3 mines operated 2 dredges each, and 1 mine operated 4 dredges.
[3] Cubic yards of gravel.
[4] Includes all other types and sizes of placer operations.
[5] Figure not available.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Alaska in 1946, by regions, in terms of recovered metals

Region	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal			
		Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)	Lead (pounds)
Cook Inlet-Susitna	2,698	1,006	57	55	269	22	
Copper River	500	282	36				
Kenai Peninsula	399	175	48	3	16	8	
Kuskokwim	375	561	169				
Southeastern Alaska	3,172	1,819	295	3	27	51	
Yukon River Basin	1,295	1,676	351				
Total: 1946	8,439	5,519	956	61	312	81	
1945	6,506	9,214	1,660	104	1,192	1,199	22,000

Bullion of Alaska origin deposited at United States Assay Office, Seattle, Wash., during 1946, in fine ounces

Region	Gold	Silver	Region	Gold	Silver
Cook Inlet-Susitna	1,944	223	Seward Peninsula	22,720	2,827
Copper River	626	69	Southeastern Alaska	1,847	298
Kenai Peninsula	125	31	Yukon River Basin	143,037	22,855
Kodiak Island	7	1			
Kuskokwim	14,468	1,582		184,774	27,886

COOK INLET-SUSITNA REGION

Willow Creek District.—The Alaska-Pacific Consolidated Mining Co. operated its Independence mine on the west fork of Fishhook Creek north of Wasilla from May 10 to December 31, 1946. The 70-ton amalgamation-flotation-concentration mill operated only from November 5 to December 22, treating 2,138 tons of gold ore;

774 ounces of gold and 45 ounces of silver were recovered by amalgamation and 269 ounces of gold and a few ounces of silver from 55 tons of concentrates produced. The Gold Cord Mining Co. operated the Gold Cord mine on Fishhook Creek north of Wasilla during the latter half of 1946, treating gold ore by amalgamation. No placer mines reported production in the district in 1946.

Yentna-Cache Creek District.—Placer mines (24 mines), including several hydraulic operations, yielded considerable gold from stream and bench gravels. Among the larger producers were the Morgan & Kellogg Mining Co. and Collinsville Mines (dragline-dredge operation).

COPPER RIVER REGION

Chistochina District.—Of the four placer mines that operated during 1946, the Slate Creek Gold Placers property was the most important; 668 ounces of gold and 62 ounces of silver were recovered by hydraulicking 19,000 cubic yards of bench and creek-bed gravels.

Nizina District.—Only three placer mines were worked during 1946, the principal one being operated by the Chitutu Mines.

Prince William Sound District.—The Young-Garner Mining Co. operated the Granite lode gold mine 2 miles north of Hobo Bay from April 6 to September 7, 1946.

KENAI PENINSULA REGION

Moose Pass-Hope District.—The Chugach Mining Co. operated a placer mine on Resurrection Creek, but the greater production of gold from the district came from two lode mines—the Marigold operated by George Lindsey and the Skeen-Leckner (Falls Creek) mine by the Falls Creek Mining Co.

KUSKOKWIM REGION

Goodnews Bay District.—The largest producer of gold in the district was the Bristol Bay Mining Co. operating No. 2 claim above Wata-muse Creek; 2,713 ounces of gold and 657 ounces of silver were recovered from 65,212 cubic yards of stream gravel using a dragline excavator and floating washing plant. The Goodnews Bay Mining Co. operated a Diesel-electric connected-bucket dredge (equipped with 93 8-cubic-foot buckets) and two 1¼-cubic-yard Diesel-powered dragline excavators on its property on the Salmon River for the recovery of platinum during 1946; gold was recovered as a byproduct.

McGrath District.—Strandberg & Sons, using dragline equipment on Candle Creek, was the only placer-mine operator in the district. The only producing lode mine was the Nixon Fork owned by Mespelt & Co. and operated from August 8 to December 31 by the Nixon Fork Mining Co. under a purchase contract; 375 tons of gold ore were milled in a 50-ton stamp mill and 561 ounces of gold and 169 of silver recovered by amalgamation.

Tuluksak-Aniak District.—Two floating connected-bucket dredges were operated by the New York Alaska Gold Dredging Corp., the largest gold producer in the region and the second largest in the Territory in 1946. Other important producers using dragline equipment at placer properties were Peandori Placer Mining Co. (on Cripple

and Dome Creeks) and Marvel Creek Mining Co. (on Marvel Creek); the last-named company recovered 1,746 ounces of gold and 246 ounces of silver from 100,000 cubic yards of gravel washed.

NORTHWESTERN ALASKA REGION

Kiana District.—Mining in the Northwestern Alaska region—comprising the Kiana and Shungnak districts and covering the area of the Kobuk River Valley—was confined to four placer operations during 1946, two in each district. The Lammers Exploration Co. recovered a sizable quantity of gold from its operation of a floating Diesel-electric connected-bucket dredge (equipped with 57 3-cubic-foot buckets) on Klery Creek, Kiana district, from August 14 through October 1, 1946.

SEWARD PENINSULA REGION

The Seward Peninsula region had seven floating connected-bucket dredges in 1946; in addition, there were numerous bulldozer-hydraulicking, dragline, and ground-sluicing operations, but no producing lode mines.

Council-Bluff District.—The principal producers in the district were Swanberg & Sons on Niukluk River, Sourdough Dredging Co. on Ophir Creek, and L. E. Ost on Ophir and Crooked Creeks.

Fairhaven District.—The Arctic Circle Exploration Co., operating two dredges (each with 70 3½-cubic-yard buckets) on Candle Creek, ranked first in production of gold in the district and in the region and third in the Territory; a substantial quantity of gold was recovered, in addition, by hydraulic operations, also on Candle Creek. Other companies operating connected-bucket dredges in the district were Dry Creek Dredging Co. and the Forsgren Dredging Co., both operating on the Inmachuk River. Among other larger producers of gold from placers worked hydraulically and in combination with bulldozers, draglines, and pumping equipment were John B. Havenstrite and Northern States Mines Co.

Kougarok District.—Mining in the district was limited in 1946 to placer operations, principally by hydraulicking and ground sluicing methods; the larger operators were the Grant Mining Co. on Coffee Creek, Dahl Creek Mining Co. on Dahl Creek, Louis Nashenweng on Quartz Creek, Rainbow Mines, and the Trinity Mining Co. on the Kougarok River.

Koyuk District.—Of the five placer mines working during 1946, the Wallace Porter operation on Bear and Sweepstake Creeks was the largest.

Nome District.—The largest gold producer in the district was the Lee Bros. Dredging Co., operating two floating connected-bucket dredges on the Solomon River and Little Hurrah Creek. Casa de Paga Gold Co., operated a floating connected-bucket dredge (equipped with 66 2-cubic-foot buckets) near Nome; 1,628 ounces of gold and 203 of silver were recovered from 169,000 cubic yards of gravel handled during the 1946 season. Tolbert Scott operated a connected-bucket dredge on Iron Creek.

Among the larger producers of gold from placers worked by hydraulic giants with some combination of bulldozers, draglines, and pumping equipment were: Peter Curran on Big Hurrah Creek,

793065—48——83

Glacier Creek Mining Co. working the Rainbow claim on Glacier Creek, E. W. Quigley, and Herbert Engstrom on Clara and Basin Creeks. A number of small-scale hand operators recovered some gold from beach sands on Nome beach.

Port Clarence District.—Of the 10 placer mines worked in the district during the 1946 season, the largest operation was carried on by N. B. Tweet & Sons on Igloo Creek from June 15 to September 15; gold was recovered from stream gravel, using a bulldozer, hydraulic giant, and pumping plant.

Serpentine River District.—George Bodis operated a hydraulic mine on Dick Creek from June 20 to September 20.

SOUTHEASTERN ALASKA REGION

A third of the total Alaska lode gold output in 1946 came from five mines in the Hyder, Juneau, and Ketchikan districts, Southeastern Alaska; no placer operations were reported active. All of the copper and lead came from this region.

Hyder District.—The J. H. Scott Co. operated the Riverside Tungsten & Lead mine from April 25 to November 14, 1946, treating lead ore in its 50-ton combination flotation-gravity concentration mill.

Juneau District.—The Alaska Juneau mine did not operate during 1946, but the greater proportion of the gold from the district came from clean-up of the Alaska Juneau mill.

Ketchikan District.—The Hope Puyallup mine was operated from July 1 to August 20 by Adams and Brill; gold ore was treated by amalgamation. Wendell Dawson shipped gold concentrates to a smelter from the Dawson mine in 1946 and also recovered gold by amalgamation.

YUKON RIVER BASIN REGION

The Yukon River Basin region accounted for 79 percent of the total Alaska gold in 1946 from 156 placer and 5 lode mines in 16 districts, including the Bonnifield-Nenana, Chandalar, Chisana, Circle, Eagle, Fairbanks, Fortymile, Hot Springs, Iditarod, Innoko, Kantishna, Koyukuk, Marshall, Rampart, Ruby, and Tolovana. Of the 176,606 ounces of placer gold produced in the region, 71 percent was recovered by eight floating connected-bucket dredges. Nearly one-third of the total Alaska gold from lode mines came from the region. The Fairbanks district was the most important.

Chisana District.—After being idle for nearly 5 years during the war, work was resumed at the Golden Eagle property (Nabesna mine) of the Nabesna Mining Corp. on June 1, 1946. Actual operation was limited to September; the 100-ton concentration mill was operated 255 hours and treated 540 tons of gold ore by gravity method. The 9 tons of concentrate produced were shipped to a smelter; 172 ounces of gold and 104 ounces of silver were recovered.

Circle District.—In the Circle district three dredges were active in 1946. Alluvial Golds, Inc., operated its Diesel-powered connected-bucket dredge (equipped with 72 4-cubic-foot buckets) on Woodchopper Creek. On Coal Creek, Gold Placers, Inc., ran a dredge of similar type equipped with 60 4-cubic-foot buckets. The C. J. Berry Dredging Co. operated a dredge on Lower Mammoth Creek. The out-

put by these dredges accounted for 82 percent of the gold from the district and placed the district in second place in gold produced in the Yukon River Basin region. Among the larger producers in the district using hydraulic giants and bulldozers or draglines with screening and washing plants were: Half Dollar Mining Co., Deadwood Mining Co., Harrison Creek Mining Co., and Frasca & Gibson.

Fairbanks District.—The United States Smelting, Refining & Mining Co., operating four floating connected-bucket dredges in the Fairbanks district, was by far the largest producer of gold and silver, not only in the district but in the Territory. The company operated 2 6-cubic-foot Bethlehem dredges (with 68 and 78 buckets, respectively), 1 10-cubic-foot Bethlehem dredge (with 113 buckets), and 1 10-cubic-foot Yuba dredge (with 106 buckets); all the dredges are electrically operated. Other equipment used (chiefly for removing overburden) included 45 Joshua Hendy hydraulic giants. Of the dredges operated in 1946, one each was on Cleary, Cripple, Ester, and Goldstream Creeks. Stripping operations were carried on at the Sheep Creek property of the company, but no actual mining.

The Brinker-Johnson Co. operated its W. W. Johnson Co. Diesel-powered connected-bucket dredge (with 78 4½-cubic-foot buckets) on Caribou Creek, 60 miles east of Fairbanks, from June 9 to November 1, 1946. The company, second largest producer in the district (and the only other dredge operator), recovered 3,914 ounces of gold and 460 ounces of silver from 476,600 cubic yards of gravel handled.

The Alder Creek Mining Co., the third largest producer in the Fairbanks district, handled approximately 372,000 cubic yards of gravel and overburden with hydraulic giants, bulldozer, and a 1½-cubic-yard dragline on Fairbanks Creek, May through September 1946; the yield was 1,887 ounces of gold and 274 ounces of silver. Other sizable producers in the district using hydraulic giants, bulldozers, and dragline equipment in various combinations were the Wolf Creek Mining Co., Parker, Raymond & Hopkins on Fairbanks and Ester Creeks, the Deep Creek Mining Co., Fish Creek Mining Co., and the Strom Co. on Rose Creek.

The Cleary Hill Mines Co., operating the Cleary Hill mine and amalgamation-flotation mill 27 miles northeast of Fairbanks, was the leading producer of lode gold in the district, which produced a total of 1,676 ounces of lode gold and 351 ounces of silver. Other small lode-gold producers in the Fairbanks district in 1946 included O. M. Grant (Irishman No. 1 mine), D. E. Turnbarge (Emma Creek mine), and A. J. Stern (St. Paul mine).

Fortymile District.—Of the placer gold recovered at 19 mines in the district during 1946, 83 percent came from properties operated by the Yukon Placer Mining Co. on Walker's Fork Creek and by the Wade Creek Dredging Co. on Jack Wade Creek. The Yukon Placer Mining Co. washed 235,000 cubic yards of gravel to recover 3,156 ounces of gold and 474 ounces of silver, and the Wade Creek Dredging Co. recovered 2,901 ounces of gold and 469 ounces of silver from 120,000 cubic yards of gravel.

Hot Springs District.—Among the larger operators in the Hot Springs district in 1946 were the Cleary Hill Mines Co., operating a dragline, hydraulic giants, and bulldozers on Tofty Creek, and Johnson & Johnson Co., hydraulicking on Glenn Gulch and Eureka Creek.

Iditarod District.—The North American Dredging Co., operating a connected-bucket dredge (with 70 3½-cubic-foot buckets) on Flat and Otter Creeks from June 10 to September 5, was the largest gold producer in the Iditarod district in 1946. The Awe Mining Co., Hatton, Banquier & Turner, Patrick Savage, Peter Miscovitch, and the Moore Creek Mining Co. were the larger producers of gold, using hydraulic giants, bulldozers, and dragline equipment in various combinations.

Innoko District.—Isaacson & Peterson operated its connected-bucket dredge on Ganes Creek during 1946. The largest producer of gold in the district was the Cripple Creek Mining Co., operating a dragline and portable dry-land washing plant on Cripple Creek. Degnan & Rosander operated similar equipment on Little Creek. Hubbard & McFarland operated Nos. 1, 2, and 3 claims on Helena Gulch, leased from Robert Jaquemai; 1,119 ounces of gold and 201 ounces of silver were recovered from 60,000 cubic yards of gravel sluiced through bedrock boxes using a dragline and two bulldozers. Hard & Uotila ground-sluiced 24,000 cubic yards of gold-bearing stream and bench gravel on Beaver and Bear Creeks, using a dragline and two bulldozers in conjunction with hydraulic giants; 953 ounces of gold and 95 ounces of silver were recovered. On lower Ophir Creek Uotila & Hard, using similar equipment, recovered 939 ounces of gold and 90 ounces of silver. Also using similar equipment, Savage & Matheson washed 90,000 cubic yards of bench gravel on Spruce Creek, recovering 871 ounces of gold and 110 ounces of silver, and N. J. Vibe operated on Little Creek recovering 858 ounces of gold and 173 of silver.

Kantishna District.—On Caribou Creek, Caribou Mines handled 145,340 cubic yards of gravel from June 6 to September 23, using a 1¼-cubic-yard dragline, two bulldozers, and a dry-land washing plant; 2,327 ounces of gold and 1,103 of silver were recovered.

Koyukuk District.—The principal producer of gold in the Koyukuk district in 1946 was the South Fork Mining Co., operating a dragline-bulldozer combination.

Marshall District.—The Yukon Mining Co. mined from April 1 to November 1 on placer ground on Bobtail, Windy, and Buster Creeks; sluicing was done on bedrock, using dragline, bulldozer, and pump equipment.

Rampart District.—There was little activity in the Rampart district during the 1946 season. The Little Minook Mining Co. operated from May 1 to September 25 on Little Minook Creek 10 miles southeast of Rampart, recovering 575 ounces of gold and 73 of silver from 25,000 yards of gold-bearing gravel washed. Equipment used included a dragline, two bulldozers, and four hydraulic giants.

Ruby District.—The Greenstone Mining Co. washed 100,000 cubic yards of bench gravel on Greenstone Creek from June 10 to November 7, recovering 895 ounces of gold and 134 of silver; equipment included two bulldozers and a hydraulic giant. Other large producers in the district among this type of placer operation were the Iver Johnson & Co., Peter Miscovitch & Sons, and the Long Creek Mining Co.

Tolovana District.—The Nome Creek Mining Co., the largest producer in the Tolovana district, operated its connected-bucket dredge (with 4-cubic-foot buckets) on Nome Creek from May 16 to

October 28; 3,097 ounces of gold and 238 of silver were recovered from 467,000 cubic yards of gravel. Parker & Son conducted placer operations on Olive Creek, and the Amy Creek Mining Co. operated on Amy Creek, using dragline-bulldozer-hydraulic giant equipment.

PRODUCTION OF OTHER MINERALS

Coal.—Production of bituminous coal and lignite in Alaska reached a new high in 1946 of 368,000 short tons valued at $2,359,000, a quantity 24 percent greater than in 1945 and 6 percent more than in the previous record year 1944. Output came principally from the lower Matanuska Valley field, 45 miles northeast of Anchorage, and the Nenana field, approximately 75 miles southwest of Fairbanks. A report[3] describing the properties of Alaska coals, location of coal fields, reserves, production, and distribution was published.

Gem Stones.—Jade (nephrite) of various grades is mined in the Kobuk River region. The Arctic Circle Exploration Co., principal producer and fabricator, shipped 13¾ short tons in the summer of 1946. Some of the material in the rough (according to Sydney H. Ball in the Gem Stones chapter of this volume) is worth $5 a pound, and select material is said to have brought $55 a pound.

Mercury.—In 1946, 699 flasks (76 pounds each) of mercury valued at $68,670 were produced by the Red Devil (New Idria-Alaska) and Decoursey Mountain mines, the former in a Gould rotary furnace and the latter in retorts. Developed reserves at the Red Devil were virtually worked out at the end of 1946, and further operations at the mine were reported to depend on higher prices.

Platinum Metals.—Placer deposits in the Goodnews Bay district in Southwestern Alaska yielded 22,882 ounces of crude platinum metals in 1946 (26,505 ounces in 1945). The platinum operations of the Goodnews Bay Mining Co. were described.[4]

Sand and Gravel.—Production of sand and gravel was 712,496 short tons ($499,269) in 1944. The output was greater in 1945 and 1946, but data are not available for publication.

Tungsten.—Shipments of tungsten concentrates in Alaska were 19 short tons (60 percent WO_3 equivalent) in 1946 compared with none in 1945 and 19 tons in 1944. Production of concentrates was 28 tons averaging 57 percent WO_3 in 1946; this output includes 15 tons of concentrate averaging 74.16 percent WO_3 recovered at Salt Lake City, Utah, from treating secondary concentrates produced in 1944. J. H. Scott, operating the Riverside mine near Hyder, produced (but did not ship) 13 tons of concentrate averaging 31.9 percent WO_3 in 1946. In the course of exploration work at the Big Chief mine near Fairbanks, the Yukon Corp. produced a few hundred pounds of concentrate averaging 63.4 percent WO_3 in 1946.

Miscellaneous Minerals.—Data on production of stone are not available for publication. There was no recorded production of antimony, asbestos, chromite, gypsum, iron ore, petroleum, tin, or zinc in Alaska in 1946.

		Review by counties and districts	1321

GENERAL SUMMARY

DESPITE a serious labor strike at certain copper mines and smelters in Arizona from March 20 to June 30, the State copper production was approximately 1 percent greater in 1946 than in 1945. The upward trend in copper output to an average of 58,000,000 pounds a month during the last quarter of 1946 from an average of 48,000,000 pounds a month during the first quarter more than offset a pending decrease. The outputs of gold, lead, and zinc increased also, but that of silver declined; however, the value of the silver output was greater, owing to an increase in the average market price of the metal. Production in 1946 (in terms of recoverable metals) was 79,024 fine ounces of gold, 3,268,765 fine ounces of silver, 578,446,000 pounds of copper, 47,860,000 pounds of lead, and 87,330,000 pounds of zinc, indicating increases over 1945 of 2 percent in gold, nearly 1 percent in copper, 5 percent in lead, and 9 percent in zinc; the output of silver decreased 8 percent. The total value of the five metals was $114,986,254 in 1946, the greatest value since 1943 and a 20-percent gain over 1945. The total value of the gold was $2,765,840—2 percent of the State total value; silver, $2,641,162—2 percent; copper, $93,708,252—more than 81 percent; lead, $5,216,740—more than 4 percent; and zinc, $10,654,260—9 percent. The value of the metals recovered from copper ore was $96,309,170 in 1946 ($80,461,465 in 1945), or 84 percent of the State total. About 89 percent of the State gold production and 78 percent of the silver in 1946 came from seven districts—Ajo, Big Bug, Copper Mountain (Morenci), Globe-Miami, Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 98 percent of the copper came from eight districts—Ajo, Copper Mountain (Morenci), Eureka (Bagdad), Globe-Miami, Mineral Creek (Ray), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 84 percent of the lead came from four districts—Big Bug, Old Hat, Pima, and Warren (Bisbee); and 91 percent of the zinc came from six districts—Big Bug, Cochise (Dragoon), Harshaw. Old Hat, Pima, and Warren (Bisbee).

Of outstanding significance to the copper industry was the con-

tinued development of the San Manuel property in Pinal County, which has proved to date a total of 211,500,000 tons of copper ore. The ore body is one of the relatively small number of really large copper deposits discovered in the United States and the only one in many years.

The base price of copper, lead, and zinc rose in 1946, the first time since February 1942, when the Government inaugurated the Premium Price Plan. The average price of copper increased to $0.162 a pound in 1946; lead to $0.109 a pound; and zinc to $0.122 a pound. The price of gold remained at $35 per fine ounce, but the average price of silver rose to $0.808 per fine ounce. The basic Government policy of premium payments for overquota production of copper, lead, and zinc remained in force throughout 1946.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, 1946 to Dec. 31, 1946: $0.905.
[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Arizona, 1942–46, and total, 1860–1946, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1942	515	163	33,920,731	253,651	$8,877,785	7,064,467	$5,023,621

1946	88	2	9		116	14	185	46	398	62

[1] Includes placer sands treated by dry concentration plants.
[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

Gold.—Compared with other Western States, gold mines in Arizona have been slow to resume production after being idle during the war years. In 1946 Congress Metals, Inc., did considerable rehabilitation at its 300-ton cyanide mill on the old Congress property; the mill began treating waste-dump ore and old tailings August 1. In 1946 more than 77 percent of the State gold output was recovered from copper ore, 16 percent from zinc-lead ore, more than 4 percent from siliceous ores, and most of the remainder from lead ore and from placers. Gold from copper ore declined slightly, but that from siliceous ores increased 51 percent and from zinc-lead ore 19 percent. Gold from placers decreased from 540 ounces to 398 ounces. The New Cornelia mine of the Phelps Dodge Corp., in Pima County, was by far the leading gold producer in Arizona; it was followed by the Iron King and United Verde mines in Yavapai County, the Magma mine in Pinal County, the Copper Queen (Bisbee) branch of the Phelps Dodge Corp. in Cochise County, the Morenci branch of the Phelps Dodge Corp. in Greenlee County, and the Castle Dome mine in Gila County; these seven properties (all copper mines except the Iron King) produced 86 percent of the State total gold.

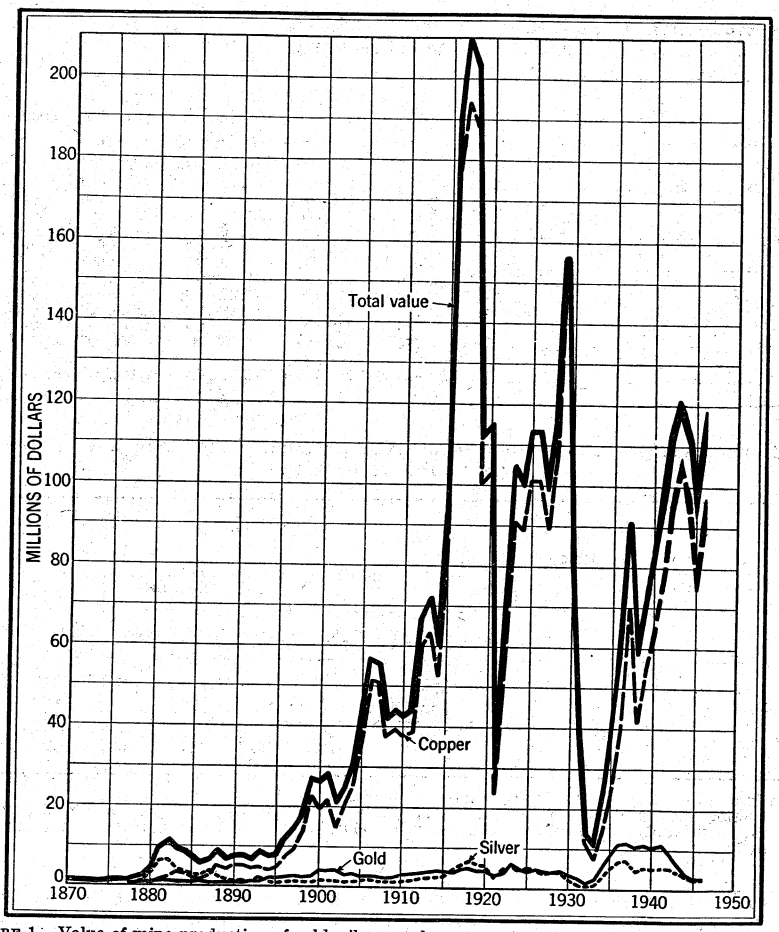

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1946. The value of lead and zinc has been less than $2,000,000 annually, except in a few years.

Silver.—The decrease of nearly 300,000 ounces in output of silver in Arizona in 1946 compared with 1945 resulted mainly from a marked decline in output of copper ore from the Copper Queen mine at Bisbee. Most of the silver produced in Arizona is a byproduct of copper ore and zinc-lead ore, and in 1946 these two classes of ore yielded 91 percent of the State total (copper ore yielded 54 percent and zinc-lead ore 37 percent); the remainder came principally from siliceous ores, lead ore, zinc-lead-copper ore, lead-copper ore, and zinc-copper ore. Silver from copper ore declined 348,979 ounces or 17 percent, and that from zinc-copper ore 58,071 ounces or 76 percent; however, the output of silver from zinc-lead ore increased 83,693 ounces or 7 percent, and that from siliceous ores 18,590 ounces or 13 percent. The Phelps Dodge Corp. continued to be the chief silver producer in Arizona, although its output was 11 percent less than in 1945; its four properties (Copper Queen, Morenci, New Cornelia, and United Verde) produced 63 percent of the State gold output, 54 percent of

the silver, and 55 percent of the copper. Other large silver producers in Arizona in 1946 were the Iron King, Magma, San Xavier (Eagle-Picher Mining & Smelting Co.), Trench-Flux, Castle Dome, and St. Anthony properties. Of the State total silver, 35 percent came from the Warren and Verde districts, but the output from these districts decreased 298,757 ounces from that in 1945.

Copper.—Although Arizona's output of copper was greater in 1946 than in 1945, the labor strike at some mines and smelters from March 20 to June 30, 1946, substantially affected the annual output. Production in 1946 was 578,446,000 pounds—an increase of 4,040,000 pounds or nearly 1 percent over 1945. The Copper Mountain (Morenci) district, with an output of 190,731,500 net pounds of copper, remained the leading copper-producing area in the State; it was followed by the Globe-Miami district with 177,111,500 pounds, Ajo with 90,465,000, Mineral Creek (Ray) with 32,709,000, Verde (Jerome) with 32,351,000, Pioneer (Superior) with 24,488,000, Eureka (Bagdad) with 11,864,500, and Warren (Bisbee) with 9,210,000. Marked increases in copper output from the Globe-Miami, Ajo, Pioneer (Superior), and Eureka (Bagdad) districts more than offset large decreases from the Warren (Bisbee), Copper Mountain (Morenci), Mineral Creek (Ray), and Verde (Jerome) districts. Copper ore and its products yielded 572,435,765 pounds of copper, as follows: 26,984,754 tons of copper ore treated by concentration yielded 81 percent; 432,354 tons of copper ore shipped crude to smelter, 6 percent; and 2,969,041 tons of copper ore leached and 10,851 tons of cement copper (from mine-water precipitates and underground leaching operations). 13 percent. The Morenci branch of the Phelps Dodge Corp. was again the largest copper producer in Arizona in 1946, although its output was less than in 1945 because of a labor strike; it was followed in order by the New Cornelia branch of the Phelps Dodge Corp., Inspiration, Castle Dome, Miami, Ray (Kennecott Copper Corp.), United Verde, Magma, Bagdad, and Copper Queen properties.

Lead and Zinc.—In spite of a labor strike at some zinc-lead mines in Arizona during the spring months of 1946, which resulted in a loss for the year of approximately 8,000,000 pounds of lead and 15,000,000 pounds of zinc, the State in 1946 exceeded its 1945 record output of both lead and zinc. Production of lead in 1946 (47,860,000 pounds) and zinc (87,330,000 pounds) was the largest in any year in the history of the State; the lead output exceeded the record output of 1945 by 2,126,000 pounds or 5 percent, and the zinc output by 6,878,000 pounds or 9 percent. These increases in both lead and zinc resulted principally from a greater output of zinc-lead ore from the Copper Queen mine of the Phelps Dodge Corp. at Bisbee. The property was by far the largest producer of lead and zinc in Arizona in 1946. Other large producers of lead, in order of output, were the St. Anthony property at Tiger, San Xavier mine near Sahuarita, Iron King mine at Humboldt, and Trench-Flux group near Patagonia. Other large producers of zinc, in order of output, were the Iron King, St. Anthony, San Xavier, Republic & Mammoth, Trench-Flux, Duquesne, and Abril properties. Of the State total, 45 percent of the lead and 51 percent of the zinc came from a mine at Bisbee in Cochise County, 20 percent of the lead and 10 percent of the zinc from a mine at Tiger in Pinal County, 9 percent of the lead and 12 percent of the zinc from a

mine at Humboldt in Yavapai County, and 10 percent of the lead and 8 percent of the zinc from a mine near Sahuarita in Pima County; most of the remaining lead and zinc output came from Santa Cruz, Mohave, Gila, and Graham Counties. About 90 percent of the total lead and 87 percent of the total zinc came from zinc-lead ore; 6 percent of the total lead came from lead ore and nearly all the rest of the lead from zinc-lead-copper ore, siliceous ores, lead-copper ore, zinc ore, and zinc-copper ore; and 8 percent of the total zinc came from zinc-copper ore, and nearly all the rest from zinc ore and zinc-lead-copper ore.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1946, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Cochise	16		6,698	$234,430	799,088	$645,663
Gila	21		3,834	134,190	192,167	155,271

MINING INDUSTRY

Although a serious labor strike during the spring months of 1946 held up mining of copper ore and zinc-lead ore in three of the principal copper and zinc-lead districts in Arizona, the effect on the annual output of these ores was not great. In fact, more zinc-lead ore was mined in 1946 than in any year in the history of the State; and the mining of copper ore, the most important part of the State mining industry, declined only 1 percent from that in 1945. The increase of approximately 35,000 tons in output of zinc-lead ore resulted principally from the mining of more zinc-lead ore from the Copper Queen

mine at Bisbee, San Xavier mine near Sahuarita, and St. Anthony property at Tiger. A shortage of labor still exists at most of the underground copper mines and at zinc-lead mines; however, some of the larger copper producers reported that the supply of labor was beginning to meet requirements at the close of the year. The total production of ore of all classes declined from 31,266,904 in 1945 to 31,058,179 in 1946. The output of copper ore was 30,386,149 tons—a 1-percent loss from 1945; zinc-lead ore, 515,047 tons—a 7-percent gain; zinc-copper ore, 63,854 tons—a 21-percent loss, lead ore, 13,441 tons—a 37-percent loss; zinc ore, 13,233 tons—a 48-percent gain; and zinc-lead-copper ore, 12,295 tons—a 7-percent gain. The output of siliceous ores was 53,094 tons compared with 19,506 tons in 1945—a 172-percent increase. Of the State total ore, 30,265,589 tons (97 percent) was copper ore mined in the Globe-Miami, Copper Mountain (Morenci), Ajo, Mineral Creek (Ray), Eureka (Bagdad), Verde (Jerome), Warren (Bisbee), and Pioneer (Superior) districts; 96 percent of the State total zinc-lead ore was mined in the Warren (Bisbee), Big Bug, Old Hat (Oracle), Harshaw, Pima, and Wallapai (Chloride) districts; all the zinc-lead-copper ore came from a mine in the Patagonia district; 84 percent of the zinc-copper ore came from a property in the Cochise (Dragoon) district; 54 percent of the zinc ore came from a mine in the Turquoise district; and 75 percent of the lead ore came from four properties in the Swisshelm, Aravaipa, and Castle Dome districts. More than 79 percent of the State total siliceous material was old tailings and waste-dump ore (gold) from the Martinez (Congress) district, old tailings (gold-silver) from the Tombstone district, and silver ore from the Ash Peak district. Mining operations at three open pits—Ajo, Miami (Castle Dome), and Morenci—produced 20,052,078 tons of copper ore in 1946 compared with 19,872,867 tons in 1945.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Arizona in 1946, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	48	25,613	2,305	7,413	7,486	73,556	----------
Dry and siliceous gold-silver ore	11	13,327	987	50,804	36,718	370,150	----------
Dry and siliceous silver ore	14	14,154	272	107,827	75,201	56,058	----------
	73	53,094	3,564	166,044	119,405	499,764	----------

[1] Includes 475 ounces recovered from underground mine-water precipitates.
[2] Includes 73,554,391 pounds recovered from ore leached and mine-water precipitates.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 322 ounces recovered from underground mine-water precipitates.
[5] Includes 56,344,468 pounds recovered from ore leached and mine-water precipitates.

METALLURGIC INDUSTRY

Of the 31,058,179 tons of ore produced in 1946 in Arizona, 27,593,067 tons (89 percent) were treated at 30 concentration plants, 2,969,041 tons (more than 9 percent) at 3 leaching plants, 23,505 tons at 3 cyanidation plants, and 83 tons at 3 amalgamation plants; 472,483 tons (more than 1 percent) were shipped crude to smelters.

Ore treated at concentration plants in 1946 comprised chiefly 26,984,754 tons of copper ore, 515,046 tons of zinc-lead ore, 63,854 tons of zinc-copper ore, 12,566 tons of zinc ore, and 12,295 tons of zinc-lead-copper ore. Copper ore from the Miami property was treated by a combination of leaching and concentration, copper ore from the Inspiration mine was treated by straight leaching and by leaching and concentration, and copper ore from the Emerald Isle and Troy mines was treated by straight leaching. The large copper-concentration plants at Ajo (25,000-ton-a-day), Clarkdale (2,100-ton), Hayden (10,000-ton), Miami (18,000-ton), Inspiration (18,000-ton), Castle Dome (10,000-ton), Bagdad (3,000-ton), and Superior (850-ton), and the copper-leaching plants at Inspiration (9,000-ton) and Miami (3,000-ton) were operated continuously in 1946, most of them at a higher rate than in 1945. The 45,000-ton copper concentrator and smelter at Morenci and the copper smelter at Douglas were idle from March 20 to June 30, owing to a labor strike; however, the copper smelters at Clarkdale, Hayden, and Miami operated continuously and the copper smelter at Superior intermittently. Most of the copper concentrates produced at mills in Arizona are treated at smelters in Arizona, but all the lead concentrates produced at mills in Arizona in 1946 were shipped to the smelter at El Paso, Tex., and all the zinc concentrates were shipped to smelters at Amarillo, Dumas, and Corpus Christi, Tex.; Bartlesville, Okla.; Great Falls and Anaconda, Mont.; East St. Louis, Ill.; and Fort Smith, Ark.

The following tables give details of the treatment of all ores produced in Arizona in 1946.

Mine production of metals in Arizona in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	83	194	33			
Ore and old tailings cyanided	23,505	889	6,823			
Concentrates smelted	1,008,835	62,422	2,493,508	471,549,204	44,434,907	87,070,205
Ore smelted	472,483	15,121	767,864	33,342,405	3,425,093	259,795
Copper precipitates smelted	10,851		475	[1] 16,492,429		
Copper ore leached	[2] 2,969,041			57,061,962		
Placer		398	62			
Total: 1946		79,024	3,268,765	578,446,000	47,860,000	87,330,000
1945		77,223	3,558,216	574,406,000	45,734,000	80,452,000

[1] Distributed as follows: Cochise County, 398,000 pounds; Gila County, 7,797,700 pounds; Greenlee County, 731,575 pounds; Mohave County, 215,500 pounds; Pinal County, 7,062,754 pounds; and Yavapai County, 286,900 pounds.

[2] Treated by straight leaching at 1 plant in Gila County, 1 plant in Mohav County, and 1 plant in Pinal County.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment in Arizona in 1946, by types of mills and by counties, in terms of recovered metals.

REVIEW BY COUNTIES AND DISTRICTS

COCHISE COUNTY

Cochise District.—Continuous operations at the Republic and Mammoth mines, by the Coronado Copper & Zinc Co., resulted in a substantial increase in production of silver, copper, and zinc in the Cochise district in 1946 over 1945. The company reported that 53,655 tons of zinc-copper ore were treated in its 150-ton flotation mill, which yielded 5,930 tons of zinc concentrate and 2,163 tons of copper concentrate. In addition, 4,454 tons of copper ore were shipped direct to a smelter. The rest of the district output was a small lot of lead ore produced from the Johnson claim.

Dos Cabezas and Tevis District.—A lessee continued to operate the Elma claim of the Tout group and shipped seven cars (330 tons) of highly siliceous copper ore to smelters in Arizona and Texas.

Hartford (Huachuca Mountains) District.—The output of the Hartford district in 1946 was all zinc-lead ore (387 tons) produced from the Cave Creek Canyon and State of Texas properties and treated in the Shattuck Denn custom mill at Bisbee.

Swisshelm District (Elfrida).—Lessees operated the Scribner and Chance properties throughout the year and shipped 4,189 tons of oxide silver-lead ore to the lead smelter at El Paso, Tex.; 3,039 tons came from the Scribner mine and 1,150 tons from the Chance property.

[1] Old Hat district lies in both Pima and Pinal Counties.

Tombstone District.—Most of the output in the Tombstone district in 1946 was old siliceous tailings (11,590 tons), containing 622 ounces of gold, 37,000 ounces of silver, 34,300 pounds of copper, and 400,000 pounds of lead, shipped to a smelter from the Grand Central dump near Fairbank. A lessee operated the Tombstone Extension mine a few months and shipped 163 tons of oxide silver-lead ore to the smelter at El Paso.

Turquoise District (Courtland, Pearce, Gleeson).—The principal operation in the Turquoise district in 1946 was the development of the Abril mine near Pearce by the Shattuck Denn Mining Corp. During the year the company hauled 7,123 tons of zinc ore from this mine to its custom flotation mill at Bisbee. According to the corporation annual report for 1946, exploration was carried on at the mine during most of the year and is continuing. Although the mine has not progressed very far beyond the status of a prospect, substantial quantities of ore have been proved and indicated; the metallic value so far has been almost entirely zinc. Nearly all the rest of the district output was crude copper ore shipped to a smelter; 377 tons came from the Tom Scott mine and 122 tons from the Shannon group.

Warren District (Bisbee, Warren).—The value of the metal output of the Warren district decreased from $10,407,940 in 1945 to $10,106,446 in 1946, owing to the marked decline in output of copper ore from the Copper Queen mine, which not only caused a large drop in production of copper but also in gold and silver. However, the district made a record output of lead and zinc, in consequence of a notable increase in the production of zinc-lead ore from the Copper Queen branch of the Phelps Dodge Corp. The corporation reported that 46,560 tons of copper ore were mined and smelted in 1946 compared with 185,394 tons in 1945 and that 211,956 tons of zinc-lead ore were treated in flotation mills in Arizona and New Mexico compared with 177,513 tons. In addition, 1,036 tons of lead-copper ore were shipped direct to the smelter at El Paso, and 444 tons of copper precipitates were produced by surface and underground precipitation plants and sent to the corporation smelter at Douglas. During the last quarter of the year, all zinc-lead ore produced by the corporation was treated in its own flotation mill, as plant capacity was increased from 450 tons to 900 tons a day.

According to the corporation annual report for 1946, production during the first 6 months of the year was drastically reduced, caused partly by a shortage of labor but principally by a labor strike from March 20 to June 30. During the year, only 46,560 tons of copper ore were mined. However, the output of zinc-lead ore increased 35,479 tons. The shortage of labor and the strike not only affected production adversely but also curtailed exploration. There was little change in the reserves of copper ore, but zinc-lead ore developments continued favorable. The improvement in the labor supply at the end of the year, if continued, will enable mining operations, including development, to be expanded in the copper areas, without interfering with the prevailing rate of zinc-lead production.

The Denn mine of the Shattuck Denn Mining Corp. was closed in March on account of a labor strike and remained closed throughout the remainder of the year. During the first quarter of the year the corporation shipped 21,700 tons of copper ore to the smelter at El

Paso and treated 99 tons of zinc-lead ore in its 150-ton flotation mill. The mill was utilized almost entirely for treating custom ores, and during the year it handled 30,532 tons of ore, which yielded 375 tons of copper concentrate, 2,728 tons of lead concentrate, and 6,364 tons of zinc concentrate. About 52 percent of the ore was zinc-lead ore from the Copper Queen mine at Bisbee and the remainder mainly zinc ore from the Abril mine near Pearce, zinc-lead ore from the "79" mine near Hayden, and zinc-copper ore from the Copper World mine near Yucca. According to the corporation annual report for 1946, the Denn mine was sold to the Phelps Dodge Corp. March 8, 1947.

The rest of the district output was 331 tons of copper ore and 279 tons of lead ore produced from the Shattuck mine by a lessee.

GILA COUNTY

Banner and Dripping Springs District.—The main output in the Banner and Dripping Springs district continued to be high-lime fluxing ore (19,921 tons in 1946), containing an average of 1.95 percent copper to the ton, mined from the Christmas mine by Sam Knight Mining Lease, Inc. The ore is shipped to the copper smelter at Hayden where it is needed for fluxing purposes. The remainder of the district output comprised 3,812 tons of zinc-lead ore and 615 tons of lead ore produced from the "79" mine by the 79 Lead-Copper Co., 170 tons of gold ore from the Round Top and Iron Butte properties, and 20 tons of copper ore from the Idaho claim.

Globe-Miami District.—The Globe-Miami district, with a production of 177,111,500 net pounds of copper in 1946 (157,291,400 net pounds in 1945) continued to rank second among the important copper-producing areas in Arizona; the Copper Mountain (Morenci) district in Greenlee County remained in first place. The Inspiration property, with a yield of 61,658,590 net pounds of copper (53,292,670 net pounds in 1945), was the chief copper producer in the district and ranked third in the State. The Inspiration Consolidated Copper Co. reported that 3,176,483 tons of copper ore were treated in 1946 compared with 3,852,543 tons of copper ore and tailings in 1945. Of the total ore, 2,948,981 tons, averaging 1.112 percent copper—0.565 percent copper as oxide and 0.547 percent as sulfide—from which the slimes had been removed, were treated in the main leaching plant; the ore was leached by acid ferric sulfate. Slimes (226,822 tons, averaging 1.254 percent copper) removed from ore at the main leaching plant were treated in the company flotation concentrator for extraction of the sulfide copper content, and the tailings from this operation were leached by sulfuric acid solution for extraction of oxide copper content. In addition, 680 tons of crude copper ore were sent direct to the smelter at Miami. The total copper production per ton of ore treated in 1946 was 19.625 pounds. The labor supply, especially in the mining division, gradually improved as the year progressed, with a consequent rise in production.

According to the annual report of the company for 1946, ore mined during the year totaled 3,182,809 dry tons, assaying 1.122 percent copper—0.587 percent as oxide and 0.535 percent as sulfide. Of the total ore mined, 110,384 tons were from development. Total underground development aggregated 38,019 feet of drifts and

raises and 3,448 cubic yards of miscellaneous development. During the last 4 months of the year, 1,633 feet of diamond drilling were done for development purposes. Studies during the year in connection with future mining plans in certain areas of the ore body showed that the application of open-pit mining in those areas would be economically preferable to mining by underground methods. A proposed plan for such open-pit mining has been approved, and preparatory work is in progress.

The Castle Dome Copper Co., Inc., a wholly owned subsidiary of the Miami Copper Co., and the Miami mine of the Miami Copper Co. ranked second and third, respectively, in copper production in the district. The Miami Copper Co. reported that 56,590,107 net pounds of copper (53,341,226 net pounds in 1945) were produced from the Castle Dome property in 1946 and 56,515,534 net pounds of copper (48,066,662 net pounds in 1945) from the Miami mine.

According to the annual report of the Miami Copper Co. for 1946, the Castle Dome open pit and 12,000-ton concentrator were operated at full capacity 3 shifts a day 7 days a week throughout the year, except for national holidays and minor shut-downs. The mill treated 4,102,566 tons of ore averaging 0.79 percent copper. In addition to copper, the concentrate contained 2,111 ounces of gold and 99,595 ounces of silver. Ore reserves as of January 1, 1947, are estimated to be 14,901,000 tons averaging 0.726 percent copper. Exploration of the area lying southwest of the Castle Dome ore body was completed during the year. From the information obtained by drilling of 43 churn-drill holes with an aggregate footage of 13,508 feet, it is estimated that 6,127,000 tons of ore averaging 0.704 percent copper have been developed in addition to the ore reserves mentioned above. To mine this ore body considerable expense for stripping and equipment would be required, and the cost of mining would be higher than that at the Castle Dome ore body.

Mining and milling at the Miami mine of the Miami Copper Co. were continuous throughout the year. The company's 18,000-ton concentrator and 3,000-ton leaching plant treated 4,222,698 tons of ore averaging 0.734 percent copper, and 2,688 tons of copper precipitates were produced from leaching of ore in place. In addition, 654 tons of molybdenum concentrate were recovered as a byproduct in treating copper ore. Sufficient labor was available throughout the year, and mine development and the undercutting of the ore body in preparation for mining progressed at a rate suitable for mining requirements. The pilot plant for manufacturing a solvent to be used in recovering the sulfide copper remaining in the mined-out areas was operated intermittently during the year. From the results obtained, it would appear that, after certain mechanical changes in its design, the process developed for the manufacture of such a solvent is practicable. Ore reserves, as of January 1, 1947, are estimated to be 36,794,000 tons averaging 0.865 percent copper.

The rest of the district output was principally 16,965 tons of copper ore shipped direct to smelters; 12,746 tons came from various claims and waste dumps of the Old Dominion property, 2,819 tons from the Carlota mine, and 1,400 tons from the Superior & Boston property. A total of 313 tons of lead ore was shipped from the Albert Lea and Defiance mines and 206 tons of silver ore from the Rescue mine.

Green Valley District.—Summit Copper Mines, Inc., continued working the Summit mine near Payson and shipped 82 tons of gold ore to smelters in Arizona. Leasing operations at the Cracker Jack mine produced 24 tons of copper ore.

Spring Creek (Young) District.—The Wild Bull mine near Young was operated a few months in 1946, and 57 tons of copper ore were shipped to smelters in Arizona.

GRAHAM COUNTY

Aravaipa District.—Mining and development of zinc-lead ore were carried on throughout the year at the Aravaipa group near Klondyke by the Athletic Mining Co. The company reported that 3,815 tons of zinc-lead ore were shipped to the lead smelter at El Paso, Tex.; and 3,592 tons of lower-grade zinc-lead ore were treated in the Eagle-Picher flotation mill near Sahuarita.

GREENLEE COUNTY

Ash Peak District.—The Ash Peak Lease continued operating the Ash Peak mine near Duncan and shipped 8,571 tons of fluxing ore to the International copper smelter at Miami. The ore averaged 0.026 ounce of gold and 5.75 ounces of silver to the ton and 81.20 percent silica.

Copper Mountain District (Morenci).—The Copper Mountain district, with a production of 190,731,500 net pounds of copper in 1946 (201,652,200 net pounds in 1945), remained the chief copper-producing area in Arizona. The Morenci mine of the Phelps Dodge Corp. continued to be the outstanding producer of copper in the State despite the decrease of more than 5 percent caused by a labor strike from March 20 to June 30. The corporation reported that 9,569,178 tons of copper ore were treated in the combined (Phelps Dodge and Reconstruction Finance Corporation) 45,000-ton concentrator and that 35,492 tons of crude copper ore and 690 tons of copper precipitates were shipped direct to the Morenci smelter. In addition to copper, the mine was an important producer of gold and silver.

According to the annual report of the Phelps Dodge Corp. for 1946, a marked improvement in labor supply, following resumption of work in July after the labor strike ended, made possible a progressive increase in the scale of operations at the Morenci branch; at the end of the year near-capacity operation was attained. These favorable conditions in the late months of the year permitted the productive potentialities of the open-pit mine and reduction works to be realized. Copper ore mined totaled 9,604,670 tons and waste and leach material stripped 11,836,545 tons; the ratio of waste to ore was 1.23. The grade and tonnage of ore mined, compared with estimates, continued favorable. Preparatory work for the opening of the 4,550 level was started. A program of metallurgical research is being carried on for further improvement in concentrating practices and metal recoveries.

The remainder of the district output was 43 tons of crude gold-silver ore shipped from the Climax Lode claim.

MARICOPA COUNTY

White Butte District.—A little development was done in 1946 at the Charlotte claim resulting in the shipments of small lots of gold ore.

Wickenburg District.—The only output in the Wickenburg district continued to be old tailings containing principally gold.

MOHAVE COUNTY

Cedar Valley District.—Copper ore and zinc-copper ore were mined throughout the year at the Copper World mine, 16 miles east of Yucca, by the Dye & Bathrick Mining Co. The company shipped 4,484 tons of zinc-copper ore to custom flotation mills in Arizona, Nevada, and Utah, where it was separated into copper concentrate and zinc concentrate, and 2,002 tons of copper ore to a smelter in Arizona. The total ore contained 28 ounces of gold, 4,471 ounces of silver, 448,919 pounds of copper, 35,500 pounds of lead, and 1,261,600 pounds of zinc. Zinc-copper ore was mined also from the Antler mine by the Arizona Antlers Mining Co.; 2,310 tons of ore were shipped to custom flotation mills in Arizona and Utah.

Indian Secret (White Hills) District.—The White Hills Leasing Co. operated the White Hills group north of Chloride a few months in 1946 and treated 1,400 tons of silver ore in a cyanide mill.

Music Mountain District.—Lessees worked the Music Mountain group near Hackberry a short time in 1946 and shipped 34 tons of gold ore to a smelter.

Owens (McCracken and Potts Mountain) District.—A lessee continued to operate the Stein mine and shipped 100 tons of copper ore to the smelter at Hayden, and a small lot of gold ore was produced from the Golden Midas claim.

Wallapai District (Cerbat, Chloride, Mineral Park, Stockton Hill).—The output of the Wallapai district in 1946 comprised 20,698 tons of copper ore, 11,588 tons of zinc-lead ore, 1,390 tons of zinc ore, 993 tons of gold-silver ore, 136 tons of gold ore, 49 tons of silver ore, and 45 tons of lead ore. All of the copper ore was produced from the Emerald Isle mine by the Emerald Isle Copper Co.; most of it was treated by sulfuric acid in the company 300-ton leaching plant. However, the mine was closed in June. Ralph R. Langley worked his Summit group throughout the year and hauled 4,563 tons of zinc-lead ore to the Mineral Park custom flotation mill near Chloride, where it was separated into lead concentrate and zinc concentrate. About 3,555 tons of ore, averaging 0.05 ounce of gold and 2.50 ounces of silver to the ton, 4.15 percent lead, and 7.03 percent zinc, were produced from the Tennessee mine by the Miners Co-operative Association and treated in the company 150-ton flotation mill. The mill yielded 223 tons of lead concentrate and 413 tons of zinc concentrate. Other producers of zinc-lead ore included the Lone Jack mine (1,740 tons), Silver Hill mine (1,246 tons), and El Oro mine (468 tons). The rest of the district output was mainly 1,314 tons of zinc ore produced from the Columbus mine and 866 tons of gold-silver ore from the White Eagle mine. The Mineral Park Milling Co. operated its 100-ton flotation mill near Chloride continuously on custom ores purchased from various operators in the district; the mill treated a total of 9,256 tons of ore.

Weaver District.—In 1946 about 100 tons of low-grade gold-silver ore from the Dixie Queen & Rock property were treated in a cyanide mill.

PIMA COUNTY

Ajo District.—All the output of the Ajo district was copper ore from the New Cornelia mine of the Phelps Dodge Corp. In 1946 the district ranked first in gold and third in copper and silver output in the State. According to the annual report of the Phelps Dodge Corp. for 1946, operations at the New Cornelia Branch were not affected by labor strikes but were continuous throughout the year. Copper-ore production and waste removal were curtailed in the early months by labor shortages but were increased during the latter half of the year by improved manpower supply; at the close of the year operations approached a normal rate. Production in 1946 was 6,339,294 tons of copper ore and 5,221,756 tons of waste, a total of 11,561,050 tons and an increase of 2,750,030 tons over the 1945 tonnage. The company 25,000-ton concentrator treated 6,344,842 tons of copper ore in 1946 compared with 5,256,445 tons in 1945.

Amole District.—The old Palo Verde mine, 11 miles west of Tucson, was operated during the first 4 months of the year, and 1,574 tons of zinc-lead ore were hauled to the Eagle-Picher mill near Sahuarita. Ore (1,640 tons) from the Old Yuma waste dump, containing chiefly gold and lead, was treated in a concentration mill near Tucson.

Arivaca District.—C. R. Leikem operated the Tiger mine a few months in 1946, shipped 178 tons of gold ore to smelters in Arizona, and sold 4 tons of high-grade lead ore to an ore buyer in Douglas. Gold ore (30 tons) was produced also from the Fortuna mine.

Cababi District.—Virtually all the output in the Cababi district in 1946 was 227 tons of gold-silver ore shipped from property near Sells by the Ninety-Nine Mining Co.

Cerro Colorado District.—Operations were carried on throughout the year at the Mary G. mine, and 42 tons of silver-lead ore were shipped to the smelter at El Paso.

Empire District.—A lessee worked the Empire (Hilton) mine in 1946 and shipped 306 tons of lead ore to El Paso. A small lot of copper ore was produced from the Esperanza claim.

Greaterville District.—The St. Louis Mines, Inc., operated the St. Louis mine in 1946 and hauled 110 tons of zinc-lead ore to the Eagle-Picher flotation mill near Sahuarita.

Helvetia (Rosemont) District.—Six mines in the Helvetia district produced a total of 44,577 tons of ore in 1946; all but 118 tons was copper ore. The Blankenship family operated the Helvetia group continuously, shipped 32,268 tons of copper ore to smelters in Arizona and Texas, and hauled 393 tons of similar ore to the Eagle-Picher mill. Other producers of copper ore included the Mohawk (8,308 tons), Newman (1,818 tons), Daylight (939 tons), and Rosemont (693 tons) properties. In addition to copper ore, the Daylight mine produced 118 tons of zinc-copper ore, which was treated in the Eagle-Picher mill.

Old Hat District (Oracle).—Control Mines Co. operated the Geeseman mine until May 1, 1946, when it was abandoned and allowed to fill with water. During the first 4 months of the year the company

treated 700 tons of copper ore in its 100-ton flotation mill and shipped 516 tons of similar ore to the copper smelter at Hayden; the mill was dismantled in June. Copper ore (106 tons) was produced also from a claim operated by Newton Wells.

Pima (Sierritas, Papago, Twin Buttes) District.—The most important operation of a zinc-lead mine in Pima County in 1946 was at the San Xavier property near Sahuarita by the Eagle-Picher Mining & Smelting Co. The company 400-ton flotation mill treated 69,007 tons of ore during the year. Of this total, 46,108 tons, averaging 3.22 ounces of silver to the ton, 0.76 percent copper, 6.035 percent lead, and 10.794 percent zinc came from the San Xavier group, and the remainder—22,899 tons—comprised various classes of ore received from custom shippers. The mill yielded 4,775 tons of lead concentrate, 10,855 tons of zinc concentrate, and 755 tons of lead-copper concentrate. The rest of the district output comprised 3,287 tons of zinc-copper ore produced from the Contention mine and treated in the Eagle-Picher mill, 204 tons of silver-lead ore from the Sunshine mine, and 200 tons of gold-silver ore from the Whitcomb property.

Roskruge and Waterman (Silver Hill) District.—Copper-silver ore was mined most of the year at the old Silver Hill mine by the Arizona Copper Bell Mining Co.; the company shipped 2,625 tons of crude ore to smelters in Arizona and Texas.

Silver Bell District.—The Indiana-Arizona Mining Co. operated under lease the Arizona-Indiana mine in 1946 and shipped 106 tons of silver-lead ore and 55 tons of copper ore to El Paso, Tex.

PINAL COUNTY

Martinez Canyon District.—Approximately 574 tons of lead ore were produced in 1946 from the Silver Bell-Martinez group by the California Steel Products Co.; 522 tons were treated in the company 50-ton gravity-concentration mill, and 52 tons were shipped direct to a smelter.

Mineral Creek District (Ray).—Mining of copper ore at the Ray property of the Kennecott Copper Corp. was continuous throughout the year but at a lower rate than in 1945; in 1946 the output was 1,300,758 tons compared with 1,366,473 tons in 1945. The crude ore, averaging 1.238 percent copper (1.277 percent in 1945), was hauled by rail 26 miles to the company 10,000-ton flotation mill at Hayden, where it was reduced to 49,268 tons of concentrate averaging 25.724 percent copper; the concentrate was smelted in the American Smelting & Refining Co. plant, also at Hayden. In addition, 4,241 tons of copper precipitates were shipped to the Kennecott Copper Corp. smelter at Hurley, N. Mex. Nearly all the rest of the district output was oxide copper ore (14,034 tons) produced from an open pit at the Copper Butte property and shipped to the smelter at Hayden.

Mineral Hill District.—Leasing operations at the Silver Pick mine produced 24 tons of silver ore in 1946.

Old Hat District (Oracle).—The name of the company operating the Mammoth-St. Anthony property at Tiger was changed in 1946 from Mammoth-St. Anthony, Ltd., to St. Anthony Mining & Development Co., Ltd. The property, one of the most important producers of zinc-lead ore in Arizona, was operated continuously in 1946; 86,049

tons of ore, averaging 0.007 ounce of gold and 1.14 ounces of silver to the ton, 0.45 percent copper, 6.10 percent lead, and 7.48 percent zinc, were treated in the company 350-ton concentration mill. The lead concentrate (7,211 tons) and the zinc concentrate (8,720 tons) were shipped to smelters in Texas. The property ranked second in production of lead in Arizona in 1946 and third in zinc. A small lot of high-grade lead ore was produced from a prospect south of Oracle. No ore was produced in 1946 from the San Manuel property, south of Tiger, owned by the Magma Copper Co.; but, according to the company annual report for 1946, active drilling continued throughout the year which greatly increased the proved tonnage of copper ore to a total of 211,500,000. It is believed that 127,500,000 tons of this total can be treated by ordinary sulfide flotation, but the balance of about 84,000,000 tons must be treated by some method suitable to oxidized material. The major drilling campaign is almost completed, and there is now sufficient tonnage of ore to support the large-scale production necessary for the successful operation of the property. Much capital and considerable time will be necessary to bring the property into production. Plans for financing the next step in the development of this project are now under consideration.

Pioneer District (Superior).—The Magma mine, one of the most important producers of gold, silver, and copper (no zinc produced in 1946) in Arizona, was operated continuously in 1946 and at a greater rate than in 1945. During the year 176,063 tons of copper ore were treated in the company 850-ton concentrator, and 24,753 tons of crude copper ore and 42,273 tons of copper concentrate were sent to the company 450-ton smelter at Superior; the concentrates averaged 0.144 ounce of gold and 4.464 ounces of silver to the ton and 25.764 percent copper. No zinc concentrate was produced in 1946.

According to the company annual report for 1946, the net metal produced from Magma ore and concentrates comprised 7,549 ounces, of gold, 241,951 ounces of silver, and 23,581,845 pounds of copper. The average net cost of producing copper after gold and silver values were deducted was 15.69 cents a pound in 1946 compared with 13.70 cents in 1945. The increased cost resulted largely from a much higher wage scale, which became effective late in 1945 and early in 1946. The labor supply has improved considerably compared with 1945, but 300 additional men are needed to fulfill present requirements for full production and development. Because of this shortage, production is currently approximately 60 percent of normal. Most of the ore mined in 1946 came from the 3,800, 4,000, and 4,200 levels in the west block. Stoping was resumed on the 3,200 level in the east block, and some ore was mined on the 4,400 level, where stopes in the west block were being reopened. Development during the year comprised 1,784 feet of raising, 1,507 feet of drifting, and 285 feet of crosscutting. The progress in constructing the new mill has been disappointingly slow. The crushing plant should be completed by June; and the mill should be completed by September 1947, contingent on delivery of equipment.

The remainder of the district output was principally 894 tons of siliceous silver ore produced from the Reymert and Picket Post properties and shipped to the Magma smelter.

Summit District.—Lessees operated the American mine a few months in 1946 and shipped 84 tons of copper ore to the Magma smelter.

SANTA CRUZ COUNTY

Harshaw District.—Output of ore in the Harshaw district in 1946 was much smaller than in 1945, owing to a marked decline in production of zinc-lead-silver ore caused by a labor strike from February 25 to June 20 at the Trench-Flux-January groups operated by the American Smelting & Refining Co. The company reported that 25,080 tons of zinc-lead-silver ore were produced in 1946 compared with 44,437 tons in 1945. This tonnage, along with 3,066 tons of zinc-lead-copper ore received from an operator in the Patagonia district was treated in the company 200-ton flotation mill. The rest of the district output was 147 tons of oxide lead ore shipped direct to a smelter from the Hardshell mine by the American Smelting & Refining Co.

Oro Blanco District (Ruby).—Hugo W. Miller worked the Montana mine continuously in 1946, hauled 410 tons of zinc-lead ore to the Eagle-Picher mill near Sahuarita, and shipped 156 tons of silver-lead ore to the smelter at El Paso. About 75 tons of gold ore from the Oro Blanco property were treated in an amalgamation mill.

Palmetto District.—Output of ore in the Palmetto district dropped from 5,251 tons in 1945 to 640 tons in 1946, as the Three "R" mine, the only producer in the district, was operated only 2 months in 1946; all the output was copper ore shipped to a smelter.

Patagonia (Duquesne) District.—A. R. Byrd, Jr., operated the Duquesne and Pride of the West properties continuously in 1946; hauled 12,295 tons of ore, containing an average of 3.71 ounces of silver to the ton and 1.91 percent copper, 4.11 percent lead, and 9.10 percent zinc, to the Eagle-Picher and Trench flotation mills; and shipped 367 tons of lead ore and copper ore to smelters at El Paso. The remainder of the district output was 631 tons of copper ore shipped to smelters from the Arizona, Buena Vista, and Roy mines.

Tyndall District.—Lessees continued to work the Jefferson mine, hauled 1,268 tons of zinc-lead ore to the Eagle-Picher mill, and shipped 44 tons of lead ore to a smelter. The rest of the district output was 320 tons of copper ore produced from the Royal Blue mine and 60 tons of zinc-lead ore and 39 tons of copper ore from the Bland claim.

YAVAPAI COUNTY

Agua Fria District.—All the output in the Agua Fria district continued to be high-silica copper ore shipped direct to smelters; 5,565 tons were produced in 1946 from the Stoddard mine, 3,724 tons from the Binghampton mine 6 miles east of Mayer, and 375 tons from the Yaller Kid claim.

Big Bug District.—In 1946 the Big Bug district ranked second in gold and zinc production in the State and fourth in silver and lead production. The Iron King mine of the Shattuck Denn Mining Corp. was the principal producer; it was operated continuously throughout the year, and 115,613 tons of ore averaging 0.113 ounce of gold and 4.04 ounces of silver to the ton and 0.213 percent copper, 2.49 percent lead, 7.30 percent zinc, and 22.00 percent iron were

treated in the company 375-ton flotation mill. The mill treated a total of 117,343 tons of ore (including 1,730 tons of custom ores) in 1946, which yielded 8,959 tons of lead concentrate, 12,547 tons of zinc concentrate, and 4,848 tons of iron concentrate. According to the annual report of the Shattuck Denn Mining Corp. for 1946, production of lead, zinc, and other metals from the Iron King mine was higher than in any preceding year. Additions and improvements are now being installed at the mill, which will increase its capacity by 30 percent. The rest of the district lode output was mainly 3,395 tons of copper ore shipped to a smelter from the Blue Bell mine. The placer output was 75 ounces of gold and 10 ounces of silver; most of it was recovered by a dragline dredge at the Nelson & Fitch property near Mayer.

Black Canyon District.—A total of 83 tons of ore was produced in 1946 from three mines in the Black Canyon district, and 2 ounces of placer gold were recovered from a claim near Cordes. Zinc ore (42 tons) was produced from the French Lilly mine, gold ore (34 tons) from the Golden Turkey mine, and high-grade silver ore (7 tons) from the Thunderbolt mine.

Blue Tank (Hassayampa River) District.—About 12 ounces of placer gold were recovered in 1946 by sluicing at claims along the Hassayampa River, 8 miles north of Wickenburg.

Castle Creek District.—Small lots of copper ore containing gold and silver were produced from two claims in the Castle Creek district in 1946, and 4 ounces of placer gold were recovered from the Buckhorn property.

Cherry Creek District.—The output of the Cherry Creek district in 1946 was all gold ore (17 tons) produced from the Gold Pick No. 1 claim.

Copper Basin District.—Fred D. Schemmer operated the Commercial mine continuously in 1946 and shipped 9,070 tons of high-silica copper ore to the smelter at Clarkdale. W. B. Tenney, lessee of the Boston-Arizona mine, hauled 1,411 tons of zinc ore to the Iron King flotation mill at Humboldt for treatment.

Eureka District (Bagdad).—Mining and milling copper ore from the Bagdad mine of the Bagdad Copper Corp. were continuous throughout the year and at a greater rate than in 1945. The company reported that 862,535 tons of ore, averaging 1.00 percent copper were treated in 1946 in its 3,000-ton flotation mill and that 17,095 tons of copper concentrate were shipped to the smelter at El Paso. During the year the company began constructing a leach-float plant, and a conveyor was being erected to haul ore from the pit to the mill. The remainder of the district lode output was principally 667 tons of zinc oxide ore and 372 tons of zinc-lead sulfide ore shipped to various reduction works in Arizona and Utah from the Copper King mine, 532 tons of zinc-lead ore produced from the Ethiopia mine, and 143 tons of gold-silver ore shipped to a smelter from the Hillside mine. Placer gold, amounting to 7 fine ounces, was recovered from Burro Creek and Santa Maria River.

Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) District.—More activity at both lode and placer properties in the Hassayampa district in 1946 resulted in a greater metal output than in 1945. The principal lode output was 324 tons of gold ore produced

from the Gold Charm mine and 244 tons of zinc-lead-gold ore from the Sun Dance mine. The placer output was 194 fine ounces of gold and 47 fine ounces of silver; nearly all of it was recovered by a dragline dredge at the Hobbs property on the Hassayampa River.

Lynx Creek District.—The output of the Lynx Creek district in 1946 was all placer gold and silver recovered by a special land washing plant at the Fitzmaurice property.

Martinez (Congress) District.—The 300-ton cyanide mill at the Congress property, idle since May 1, 1942, on account of the war, was operated continuously from August 1, 1946, to the end of the year by the Congress Metals, Inc. Approximately 22,000 tons of waste dump ore and old tailings were treated, which yielded 857 fine ounces of gold and 2,812 fine ounces of silver. The remainder of the district output was 2 tons of gold ore produced from the Gold Key claim.

Pine Grove District (Crown King).—The value of the metal output in the Pine Grove district was much greater in 1946 than in 1945, owing to an increase in output of zinc-lead-gold-silver ore from the Gladiator-War Eagle group and to new production of zinc ore and gold ore from the Crown King-Wildflower group. About 6,000 tons of ore from the Gladiator-War Eagle group were treated by flotation and gravity concentration, which yielded 296 tons of lead concentrate containing considerable gold and 272 tons of zinc concentrate. The Golden Crown Mining Co. operated the Crown King-Wildflower group all year; treated 2,600 tons of ore, averaging 0.03 ounce of gold and 2.62 ounces of silver to the ton and 0.65 percent copper and 5.34 percent zinc, in its 75-ton flotation mill; and shipped 70 tons of gold ore direct to a smelter. The rest of the district output was mainly 148 tons of copper ore produced from the Springfield mine and 49 tons of lead ore from the Del Pasco mine.

Silver Mountain District.—Some low-grade gold ore (34 tons) was shipped in 1946 from the Fenton No. 1 claim, and small lots of lead ore were produced from the Colossal property.

Squaw Peak District.—In 1946, as in 1945, all the output in the Squaw Peak district was copper-molybdenum ore produced from the Squaw Peak mine; 378 tons of ore were treated in a 25-ton flotation mill, which yielded 16 tons of copper concentrate and 2 tons of molybdenum concentrate.

Turkey Creek District.—Jack Shull operated the Old Soldier mine in 1946, and shipped 15 tons of gold-silver-copper ore to the smelter at Clarkdale.

Verde District (Jerome).—Contrary to some of the large copper producers in Arizona, operations at the United Verde mine in 1946, were not affected by a labor strike; however, the output of copper ore continued to decline from 377,217 tons in 1945 to 336,745 tons in 1946. Of the ore mined in 1946, from the property by the Phelps Dodge Corp., 161,166 tons were siliceous-copper ore shipped to the corporation smelter at Clarkdale, and 175,579 tons were similar ore treated in the corporation's 2,100-ton concentrator. In addition, 204 tons of copper precipitates were shipped to the smelter.

According to the annual report of the corporation for 1946, progressive depletion of the remaining copper ore reserves and accompanying restriction in stoping areas resulted in a further decline in the rate of

production. Present indications are that the copper-ore reserves will be exhausted within 2 or 3 years unless in the meantime additional ore should be discovered. Exploratory work by drifting and diamond drilling was continued on the lower levels contiguous to No. 8 shaft; however, no mineralized areas of importance were discovered. During the year a total of 18,323 feet of prospecting and development was completed, comprising 1,819 feet of drifting, 766 feet of raising, and 15,738 feet of diamond drilling.

The remainder of the district output was 13,720 tons of siliceous-copper ore shipped to the smelter at Clarkdale from the Dundee-Arizona, Florentia, and Verde properties.

Walker District.—Most of the output in the Walker district in 1946, was gold ore (110 tons) produced from the Champion, Gold Coin, Oro Plata, St. Elmo, and Sheldon properties, and zinc-lead ore (49 tons) from the Lost Wonder and New Strike mines.

Walnut Grove (Hassayampa River) District.—About 7 ounces of placer gold were recovered in 1946, by sluicing gravel along the Hassayampa River near Walnut Grove.

Weaver District (Octave).—The output of the Weaver district in 1946 was 448 tons of gold ore shipped to smelters from the Gold Bug, Lost Dutchman, Helen Morris, Octave, Rincon, and Surprise properties and 6 ounces of placer gold recovered from gravel at Rich Hill and from Antelope Creek. Nearly 79 percent of the gold ore was produced by lessees operating the Octave mine.

White Picacho District.—Gold ore (32 tons) was shipped in 1946 from the Bullfrog mine, and small lots of silver ore, silver-lead ore, and copper ore were produced from various claims and sold to the Wickenburg ore market.

YUMA COUNTY

Castle Dome District.—The Joplin Lead Co. took over the De Luce and Rialto groups in 1946, rehabilitated the 300-ton gravity concentration mill at McPhaul bridge on the Gila river, treated about 2,000 tons of oxide lead ore in the mill, and shipped 19 tons of crude lead ore to the smelter at El Paso. The lead concentrate (148 tons) contained 2,794 ounces of silver, 151,545 pounds of lead, and a little zinc.

Ellsworth (Harqua Hala) District.—The Yuma Copper mine near Vicksburg was operated a few months in 1946 by the Liberator Mines Co.; 1,131 tons of ore, containing 55 ounces of gold, 309 ounces of silver, and 62,338 pounds of copper, were shipped to the Magma smelter at Superior. The rest of the district output was nearly all gold-copper ore (190 tons) produced from the Quail Nest mine near Aguila.

Plomosa District—Both lode and placer properties were operated in 1946 in the Plomosa district. The lode output comprised 1,014 tons of silver ore shipped to a smelter by lessees working the R. & A. mine; 66 tons of gold ore shipped from the Little Butte mine; and 1 ton of ore amalgamated by the Mohave Mining Co., which yielded 173 fine ounces of gold and 23 fine ounces of silver. The placer output (17 fine ounces of gold) was recovered principally by drift mining at the Big Wash Basin and Mackey properties.

California

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By ALFRED L. RANSOME

Calculation of value of metal production	1337	Ore classification	1348
Mine production by counties	1345	Metallurgic industry	1352
		Review by counties and districts	

GENERAL SUMMARY

CALIFORNIA lead production in 1946 was one-third greater than in 1945—only 9 percent below the record output of 1917—and the value was the largest in the history of mining in the State. Gold production was nearly two and one-half times that for 1945, but far below the prewar level (1,408,793 fine ounces in 1941). Silver production was 36 percent higher than in 1945, making 1946 the third successive year of increase, whereas copper and zinc production dropped about one-third below the 1945 output. The total value of the five metals was $18,788,664, an increase of 68 percent above 1945. The upward trend in gold output was largely the result of increased placer-mining activity. The increased prices of silver, copper, lead and zinc might have been expected to result in a greater output of these metals. Although this was apparently true for silver and lead, the rise in production of silver and lead and the lower output of copper and zinc largely resulted from the activity of a few mines and did not reflect the general upswing in the industry evidenced by the increase in the number of mines in operation. In 1946, 150 lode mines and 172 placer mines were active compared with 87 and 99, respectively, in 1945.

Comparing 1946 with 1945, gold increased 141 percent in quantity and value; silver advanced 36 percent in quantity and 55 percent in value; copper decreased 34 percent in quantity and 21 percent in value; lead increased 37 percent in quantity and 74 percent in value; and zinc was 31 percent lower in quantity and 26 percent in value. Of the total value of the five metals in 1946, gold represented 66, lead 12, zinc 9, copper 7, and silver 6 percent.

As the result of large-scale gold dredging in 1946, Sacramento County was the largest contributor to metal-mining output in California, an advance from fourth place in 1945; it supplied 19 percent of the State total value of the five metals. Inyo County yielded the first place which it held in 1945 but ranked second by a close margin, owing to lead production, which represented nearly two-thirds of the total value of its metal output; the greater portion of

lead, as well as substantial quantities of silver, copper, and zinc, came from the Darwin group of mines, Coso district. Inyo County contributed 17 percent of the total value of the five metals. Yuba County (almost entirely from gold dredging) supplied 11 percent of the total value of the five metals; Nevada County (largely from gold ore), 10 percent; Shasta County (largely from zinc-copper ore), 9 percent; Calaveras County (from zinc and copper ores and old tailings, gold ore, and gravels), 8 percent; Stanislaus and Butte Counties (largely from gold dredging), 5 and 4 percent, respectively; and San Bernardino (from zinc, lead, and gold ores, and gravels) and Trinity (largely from placer gravels), 3 percent each. Of the 32 counties producing the 5 metals in California in 1946, the first 6 of the foregoing 10 counties each contributed over 1 million dollars worth; together the 10 counties supplied 88 percent of the total value of these metals.

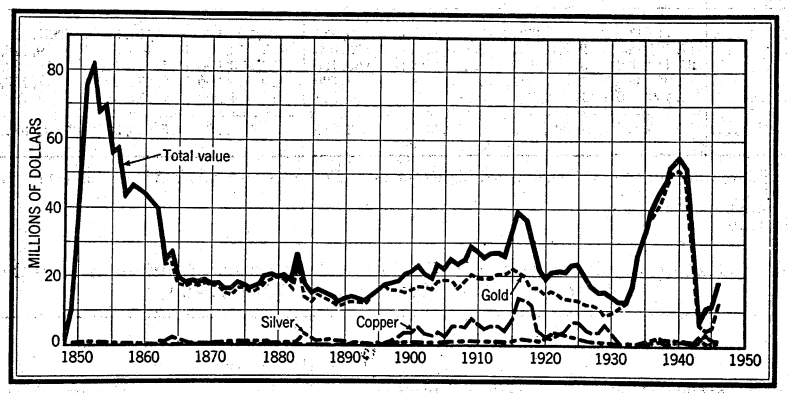

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in California, 1848–1946. The value of lead and zinc has exceeded $1,000,000 in only a few years.

All tonnage figures are short tons and "dry weight"; that is, they do not contain moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per ounce fine	*Per ounce fine*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in California, 1942–46, and total, 1848–1946, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1942	434	428	2,503,198	847,997	$29,679,895	1,450,440	$1,031,424
1943	139	82	739,956	148,328	5,191,480	609,075	433,120
1944	109	66	925,953	117,373	4,108,055	778,936	553,910

[1] For historic data by years see Minerals Yearbook, Review of 1940, p. 219.
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Includes all placer operations using suction pump for delivering gravel to floating washing plant except those producing less than 100 ounces of gold which are included under "Small-scale hand methods."
[4] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[5] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[6] From property not classed as a "mine."
[7] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.
[8] Complete data not available.

Gold.—Production of 356,824 ounces of gold in California in 1946 was nearly 2½ times the output in 1945. Although 1946 was the second year of increase from the low point of 117,373 ounces in 1944 under War Production Board Limitation Order L–208, the value of the output ($12,488,840) was only 25 percent of the $50,948,485 in gold produced in 1940, the largest value since 1856. The marked increase in the production of gold since the rescinding of Order L–208, effective July 1, 1945, was due largely to the rapid acceleration in placer mining, principally by connected-bucket dredging. The rate of increase in production would have been even greater had lode gold mining been reestablished with equal rapidity. With the exception of a few properties, many of the lode mines that were large producers before the war had not reopened, and one famous producer—the Empire Star Mines Co., Ltd., in the Grass Valley district, Nevada County—suspended operation of its Empire Star group of mines July 1, 1946. The principal reasons for this shut-down, as well as the failure of so many other properties to reopen at all, were the fixed price for gold and the over-all inflationary trend that affected costs of labor, supplies, and equipment.

Monthly production of gold in 1946 gained rapidly during the first 3 months to continue the upward swing that began in September 1945. From March through July the monthly output remained relatively unchanged at about 29,700 ounces. Following a rise to 34,340 ounces in August, the monthly rate of production again leveled for the balance of the year. The monthly average for the year was 29,735 ounces compared with 12,328 ounces for 1945 and 9,781 ounces for 1944. Monthly production figures since January 1937 through the war years have been discussed in detail in this chapter for 1944 and 1945.

The 25 leading gold-producing mines in California in 1946, listed in the accompanying table, yielded 88 percent of the total gold output of the State; the leading 5 mines produced 56 percent and the leading 10 mines, 70 percent.

Twenty-five leading gold-producing mines in California in 1946, in order of output

Rank	Mine	District	County	Rank in 1945	Operator	Source of gold
1	Natomas Co	Folsom	Sacramento	2	Natomas Co	Dredge.

1 Not operated in 1945.

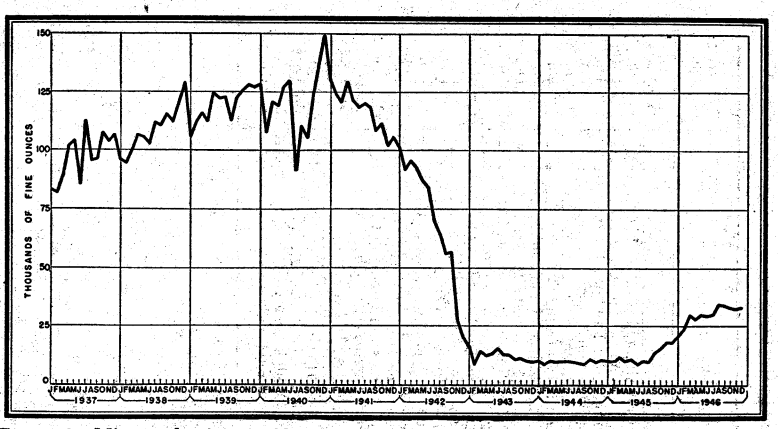

FIGURE 2.—Mine production of gold in California, 1937–46, by months, in terms of recovered gold.

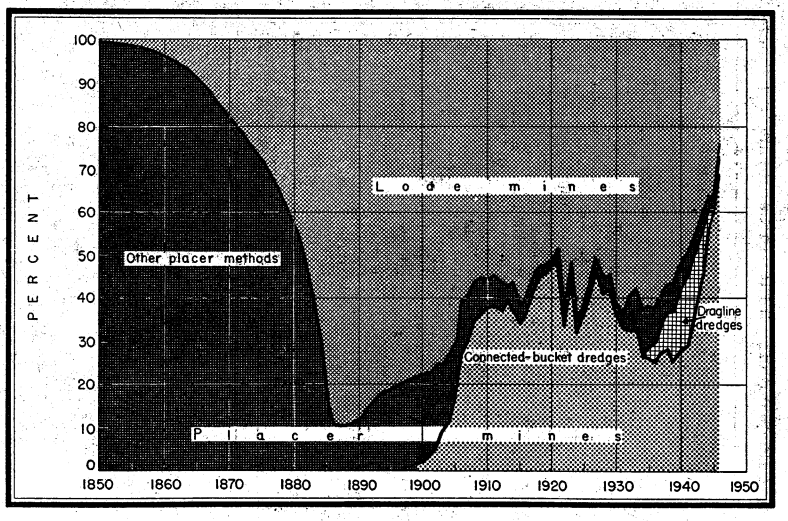

FIGURE 3.—Percentage of total California gold produced at lode and placer mines and by various methods of placer mining, 1850–1946.

Silver.—The 10 leading silver-producing mines listed in the accompanying table yielded 95 percent of the State total recoverable silver in 1946; the 3 leading mines yielded 80 percent. Of the 10 leading silver-producing mines, 8 derived their silver from argentiferous base-metal ores, 1 from gold-silver ore, and 1 from tungsten ore.

Silver production by months in 1946, as presented in the accompanying table, shows a sharp drop in February, followed by a period of moderate fluctuation through August at an average level of 83,300 ounces. Output in September increased markedly to 132,450 ounces, followed by a continuing advance during the last quarter that showed indications of leveling by the end of the year. The entire background for the trend in production is closely allied to the operation of the Darwin group of mines, Coso district, Inyo County, operated by the Anaconda Copper Mining Co.

Ten leading silver-producing mines in California in 1946, in order of output

Rank	Mine	District	County	Rank in 1945	Operator	Source of silver
1	Darwin group	Coso	Inyo	1	Anaconda Copper Mining Co	Lead ore.
2	Penn	Campo Seco	Calaveras	4	Shawmut Copper Mine Co	Zinc ore.
3	Hornet	Flat Creek	Shasta	3	The Mountain Copper Co., Ltd	Zinc-copper ore.
4	Columbia No. 2	Resting Springs	Inyo	5	Finley Co	Lead ore.
5	Kelly and Juanita	Randsburg	San Bernardino	(1)	F. W. Royer	Gold-silver ore.
6	Carbonate King	Clark Mountain	do	(1)	Crystal Cave Mining Co	Zinc ore.
7	Mohawk	do	do	7	Dunton-Ray & Greenwood	Lead and lead-zinc ore.
8	Modoc	Coso	Inyo	6	L. D. Foreman & Co	Lead ore.
9	Pine Creek	Bishop Creek	do	(1)	U. S. Vanadium Corp	Tungsten ore.
10	Newton	Ione	Amador	9	Pacific Mining Co	Copper ore.

[1] Not operated in 1945.

Mine production of gold, silver, copper, lead, and zinc by months in 1946, in terms of recovered metals

Month	Gold (Fine ounces)	Silver (Fine ounces)	Copper (Short tons)	Lead (Short tons)	Zinc (Short tons)
January	20,604	127,544	508	1,084	736
February	23,576	74,565	390	690	508
March	29,727	90,262	456	927	547
April	28,189	89,772	521	937	745
May	29,727	77,508	456	730	697
June	29,214	78,489	430	690	692
July	29,727	82,413	352	740	542
August	34,340	81,432	261	690	513

October	32,802	156,978	248	818	484
November	32,289	174,638	195	937	484
December	32,802	176,600	195	961	484
Total	356,824	1,342,651	4,240	9,923	6,877

Copper.—Copper production in California in 1946 dropped 34 percent below that for 1945, owing largely to the inactivity of two mines that had been large wartime producers and had produced during the first half of 1945 (Dakin or Gray Eagle mine, Klamath River district, Siskiyou County, and the Keystone mine, Copperopolis district, Calaveras County). The monthly copper-production figures given in the accompanying table show only the approximate trend in production during 1946. Because of the strike at copper smelters during the first half of 1946 much of the copper ore and copper concentrate was stock-piled at mines, and some properties were forced to curtail production or close. In general, production was erratic, but the over-all trend was downward throughout the year. The following six properties (operators in parentheses), listed in order of output and each producing over 100,000 pounds, supplied 98 percent of the State total, and the first three 91 percent: Hornet mine, Flat Creek district, Shasta County (The Mountain Copper Co., Ltd.); Newton mine, Ione district, Amador County (Pacific Mining Co.); Penn mine, Campo Seco district, Calaveras County (Shawmut Copper Mine Co.); Pine Creek Tungsten mine, Bishop Creek district, Inyo County (U. S. Vanadium Corp.); Union mine (old tailings), Copperopolis district, Calaveras County (Pacific Mining Co.); and the Darwin group, Coso district, Inyo County (Anaconda Copper Mining Co.).

Lead.—The expansion of lead production from 990,000 pounds in 1938 to 19,846,000 pounds in 1946 (within 9 percent of the all-time record of 21,868,628 pounds in 1917) resulted in lead displacing copper as the second most valuable of the five metals produced in the State (in 1942 lead displaced copper as the third most valuable metal); output of lead was 37 percent above 1945. The monthly lead-production figures given in the accompanying table follow a trend which closely parallels that for silver and is allied to operation of the Darwin group of mines, Coso district, Inyo County. The three leading producers of lead accounted for 93 percent of the State total in 1946. The following six properties (operators in parentheses), listed in order of lead output and each producing over 100,000 pounds, furnished 98 percent of the State total: The Darwin group, Coso district, Inyo County (Anaconda Copper Mining Co.); Columbia No. 2 mine, Resting Springs district, Inyo County (Finley Co.);

Mohawk mine, Clark Mountain district, San Bernardino County (Emerson A. Ray et al.); Modoc mine, Modoc district, Inyo County (L. D. Foreman & Co.); Penn mine, Campo Seco district, Calaveras County (Shawmut Copper Mine Co.); and Gold Bottom & Ophir mines, Slate Range district, Inyo County (Damon & Damon).

Zinc.—Zinc production in California in 1946 showed a marked drop of 31 percent from 1945, owing largely to the shut-down of the Blue Moon mine, Hunter Valley district, Mariposa County, November 15, 1945, and inactivity at the Big Bend mine, Yankee Hill district, Butte County, during 1946. The following five properties (operators in parentheses), listed in order of zinc output and each producing over 300,000 pounds in 1946, furnished 99 percent of the State total: Penn mine, Campo Seco district, Calaveras County (Shawmut Copper Mine Co.); Hornet mine, Flat Creek district, Shasta County (The Mountain Copper Co., Ltd.); Darwin group, Coso district, Inyo County (Anaconda Copper Mining Co.); and the Carbonate King mine (J. Q. Little under contract from Crystal Cave Mining Co.) and Mohawk mine (Emerson A. Ray et al.), both in the Clark Mountain district, San Bernardino County. Monthly production of zinc in 1946 was uneven, but a downward trend was evident during the latter half of the year.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in California in 1946, by counties, in terms of recovered metals

1945	12,946,000	1,747,710	14,448,000	1,242,528	19,846,000	2,282,290	11,152,081

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] Output from property not classed as a "mine."

MINING INDUSTRY

The tonnage of material from lode mines in California treated in 1946 decreased 13 percent compared with 1945, but the yardage at placer mines increased 163 percent. The output of lode gold increased 60 percent, but the gold from this source accounted for only 24 percent of the State total, whereas production from placer mines advanced 189 percent and accounted for 76 percent of the total. The decrease in base-metal ore production was less than the increase in gold-ore output. The average recoverable gold content of gravels increased 10 percent.

Dredges of the connected-bucket type washed 93 percent of the total gravel mined in the State in 1946 and recovered 91 percent of the total placer gold. Dragline dredging increased markedly; equipment of this type washed 5 percent of the total gravel mined and recovered 6 percent of the placer gold, the highest point reached by dragline dredging in yardage washed or gold recovered since 1942.

All other placer-mining methods showed increases in gravel washed and gold recovered except drift mining, which recovered less gold in 1946 from a larger quantity of material handled. No Becker-Hopkins dredges have been reported in production since 1942, but suction dredging made its appearance in 1946 for the first time since that year. The prospect of an increase in the suction-dredge type of operation seems favorable.

Although the number of hydraulic mines in operation in 1946 was the same as in 1945, the quantity of gold recovered and gravel handled increased 24 and 57 percent, respectively. The number of drift mines operating in 1946 was the same as in 1945, but the quantity of gold recovered was less from a greater yardage of gravel handled; once very productive in California, this type of mining has shown no signs of recovering from the war-time decline.

ORE CLASSIFICATION

Of the 627,767 tons of ore (including 73,203 tons of old tailings) sold or treated in 1946, 53 percent was gold ore, 16 percent zinc-copper, 14 percent copper, 9 percent lead, 7 percent zinc, and 1 percent zinc-lead and gold-silver. Silver ore sold or treated was negligible in quantity. Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in California in 1946, with content in terms of recovered metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry and siliceous gold ore	[1] 327,991	3,780	[2] 79,776	[2] 48,931	[2] 273,500	7,600

[1] Excludes tungsten ore.
[2] Includes metal recovered from tungsten ore.
[3] Includes metal recovered from pyritic ore (residue).
[4] Includes 61,100 pounds from precipitates.

METALLURGIC INDUSTRY

During 1946, 59 percent of the total ore and old tailings handled was treated at amalgamation and cyanidation mills, 30 percent was treated at concentrating mills, and 11 percent was shipped for direct smelting. Smelters also received 38,166 tons of flotation concentrates and 15 tons of gravity concentrates from California mine operators. Comparing 1946 with 1945, material treated at cyanidation mills was slightly lower, whereas the quantity of material amalgamated increased 120 percent. The tonnage of crude ore and old tailings smelted remained virtually unchanged, and the quantity of ore and old tailings concentrated decreased 61 percent.

Companies producing most of California's lode gold in 1946 owned and operated their own metallurgical plants. Included with the few mills that did receive custom gold ore were Burton Bros., Inc., Rosamond (treatment by cyanidation), and Butte Lode Mining Co., Randsburg (amalgamation), both in Kern County. The Empire Star Mines Co., Ltd., Grass Valley, Nevada County, cyanided some lots of concentrates. The Selby lead plant of the American Smelting & Refining Co. at Selby, Contra Costa County—the State's only smelter—was closed from February 25 to June 17 as a result of the widespread strike that similarly affected many of the smelters in the Western States.

Mine production of metals in California in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (Short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and old tailings amalgamated	365,190	45,838	8,355			
Ore, old tailings, and concentrates cyanided	24,939	27,372	16,407			
Concentrates smelted:

REVIEW BY COUNTIES AND DISTRICTS

AMADOR COUNTY

East Belt District.—The Belden Amador Mines, Inc., worked the Belden mine during the latter half of December 1946, and Russell A. Donnelly worked the Peterson mine during the year; gold ore from each property was treated by amalgamation. The Garibaldi property was operated by dry-land dredging, using a dragline excavator; 89 ounces of gold and 8 ounces of silver were recovered from 2,900 cubic yards of gravel. The Union Flat (Elephant) mine was hydraulicked from February 1 to May 31, and 38 ounces of gold and 2 ounces of silver were recovered from 4,200 cubic yards of gravel.

Ione District.—The Pacific Mining Co., operating under contract from the Winston Copper Co., worked the Newton mine throughout 1946 and shipped 18,474 tons of copper smelting ore containing 181 ounces of gold, 15,240 ounces of silver and 2,049,076 pounds of copper.

Mother Lode District.—The Nevada Wabash Mining Co. operated the Nevada Wabash mine from August 2 to September 5, 1946, and treated the ore by amalgamation. R. S. Wilson and F. W. Sprung shipped 70 tons of old tailings from the Original Amador mine to the Nevada Wabash mill for treatment; 8 ounces of gold and 4 ounces of silver were recovered. The Argonaut Mining Co., Ltd., recovered a small quantity of gold from a clean-up at the idle Argonaut mine. The Mountain Gold Dredging Co. operated a 2½-cubic-yard dragline excavator and floating washing plant on the Burke Ranch and Skagg Ranch for 6 months in 1946; 95,900 cubic yards of gravel yielded 690 ounces of gold and 70 ounces of silver. Other dragline dredge operations included E. L. Lilly on the Cosumnes River west of Plymouth from August 22 through December 31, and Rimmer Dredge on the Cuneo Ranch from July 1 to August 4, 1946.

BUTTE COUNTY

Butte Creek District.—The Wyoming mine was operated from January 1 to April 1 and again from August 1 to December 30, 1946; a small quantity of gold was recovered by amalgamation. The Lancha Plana Gold Dredging Co. operated its connected-bucket dredge No. 5 (with 65 4½-cubic-foot buckets; electrically powered) on Butte Creek throughout 1946.

Oroville District.—Hoosier Gulch Placers operated a dragline dredge (boat No. 1) from August 23 to December 15. W. R. Clark operated a dragline dredge on the South Fork, Feather River, for 60 days; 20,400 cubic yards of gravel yielded 134 ounces of gold and 8 ounces of silver. Experimental mining of Oroville tailings with a dragline dredge was carried on from August 23 to October 11 by the Goldfield Consolidated Mines Co. During the first part of 1946 the Sunmar Dredging Co. operated a dragline dredge in the Oroville district; later in the year the equipment was moved to Mono County. Yuba Consolidated Goldfields, Butte unit, operated two connected-bucket dredges on land adjoining the Feather River throughout the year; both dredges were of the Yuba type, electrically powered, one having 84 9-cubic-foot buckets and the other 87 9-cubic-foot buckets. The Kister dredge of the Gold Hill Dredging Co. operated on the east

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 11 and their output included under "Other districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Sources of total silver as follows: 1,322,830 ounces from lode mines and 19,821 ounces from placers.

[4] Camanche district lies in Amador and San Joaquin Counties.

[5] East Belt district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[6] Mother Lode district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[7] Output from property not classed as a "mine."

[8] Butcher Ranch district lies in Eldorado and Placer Counties.

[9] Included under "Other districts."

[10] Exclusive of lode output, which is included under "Other districts."

[11] Includes following: East Belt district [5] in Calaveras and Eldorado Counties; Bishop Creek and Resting Springs in Inyo County; Green Mountain and Sageland in Kern County; Homer in Mono County; North Bloomfield, Washington (lode), and Yuba River in Nevada County; Iowa Hill (lode) in Placer County; Cosumnes River and Ione in Sacramento County; Ivanpah in San Bernardino County; Flat Creek in Shasta County Scott Bar in Siskiyou County; La Grange in Stanislaus County; Helena (lode) and Trinity Center in Trinity County; and Yuba River in Yuba County.

[12] Excludes tungsten ore.

[13] Includes metal recovered from tungsten ore.

side of the Feather River about 7 miles south of Oroville throughout the year; the electrically powered connected-bucket dredge has 72 9-cubic foot buckets. The Morris Ravine Mining Co. produced 108 ounces of gold and 9 ounces of silver from 530 cubic yards of gravel at the Morris Ravine drift mine from January 1 to August 9, 1946.

CALAVERAS COUNTY

Campo Seco District.—The Penn mine was operated throughout 1946—for the first 6 months by the Eagle Shawmut Mine and subsequently by a newly formed corporation known as Shawmut Copper Mine Co., the principal officers being the same; 42,627 tons of zinc ore were trucked to the Eagle Shawmut mill for treatment by amalgamation and selective flotation. Copper concentrate (3,233 tons containing 2,679 ounces of gold, 80,971 ounces of silver, 1,453,472 pounds of copper, 413,649 pounds of lead, and 19,420 pounds of zinc) and zinc concentrate (6,588 tons containing 382 ounces of gold, 28,802 ounces of silver, 249,533 pounds of copper, 92,701 pounds of lead, and 6,735,986 pounds of zinc) were shipped to smelters. In addition, 194 ounces of gold and 51 ounces of silver were recovered by amalgamation.

Copperopolis District.—The Mountain King mine was operated by the open-cut method by the Mountain King Mill & Mine (a limited partnership) from March 4 to September 6, 1946; gold ore was treated in the company 700-ton amalgamation-flotation plant, concentrate being shipped to a smelter. The Pacific Mining Co. operated a flotation plant on old tailings at the Union mine during the first half of 1946; 64,558 tons of material were treated to produce 1,115 tons of copper concentrate containing 10 ounces of gold, 559 ounces of silver, and 182,407 pounds of copper.

Jenny Lind District.—Matchett & Ruddy operated a dragline dredge 6 miles east of Bellota during the first 3 and last 2 months of 1946; 8,500 cubic yards of gravel yielded 85 ounces of gold and 4 ounces of silver. The Pacific Bridge Co. operated the Royal mine until August 1946, under lease from Frank S. Tower. Gold ore was treated in a 30-stamp mill by amalgamation and flotation; the concentrate was shipped to a smelter.

Mother Lode District.—Several placer mines were operated by the dragline dredging method during 1946. The Angels Dredging Co. operated on Angels Creek from August 25 to September 5; Grant Mining Co. on Gomez, Roberts, Ponte, Cuneo, and Basco leases along San Antonio Creek from February 1 to December 31 (300,000 yards of gravel yielded 1,410 ounces of gold and 182 ounces of silver); Wolsco Dredging Co. on Oneta, Huberty, P. G. & E., Guttinger, Ferron, and Hogate properties from March 17 to July 25; and Gavrilko Bros. Gold Dredging Co. on Willow Creek from March 18 to May 11. The Mole Mining Co. operated a drift mine near Railroad Flat from January 15 to July 10.

EL DORADO COUNTY

Butcher Ranch District.—The French Corral Gold Dredging Co. (formerly Golden Feather Dredging Co.) operated an electric dragline excavator on the Middle Fork of the American River (about 8

miles northeast of Auburn) in El Dorado and Placer Counties; operations in El Dorado County lasted from March 6 to April 4.

East Belt District.—Cosumnes Mines, Inc., operated the Cosumnes mine at Grizzly Flat throughout 1946 treating gold ore in a 60-ton amalgamation-flotation plant; concentrate was shipped to a smelter.

Mother Lode District.—Operation of the Pioneer-Lilyama mine by Pioneer-Lilyama Mines (O. H. Griggs) throughout 1946 was limited to development work; 214 tons of copper concentrate (containing 107 ounces of gold, 873 ounces of silver, and 71,883 pounds of copper) from copper ore treated in the company 250-ton flotation mill were shipped to a smelter. Joseph L. Liddicoat operated the Grit mine during the last 4 months of 1946 and treated gold ore by amalgamation. Norden and Baskin test-treated 1,050 tons of old dump ore from the Davidson mine by amalgamation and flotation; concentrate produced was shipped to a smelter. Operations in the mine during 1946 were limited to rehabilitation and development. Several dragline dredges operated during 1946, including R. H. Nelson on the Boarman estate from January 3 to August 10, El Dorado Dredging Co. on the Galloway property for 2 weeks in December, Henness & Legare on the Ostenrider property throughout the year (66,000 cubic yards of gravel yielded 457 ounces of gold and 38 ounces of silver), and the River Pine Mining Co. on the North Fork of the Cosumnes River from August 5 to December 10 (90,000 cubic yards of gravel yielded 438 ounces of gold and 64 ounces of silver). The Allen Gold Dredge Co. operated a suction dredge on Bacchi Ranch from July 20 to December 3.

FRESNO COUNTY

Friant District.—Gold was recovered as a byproduct from commercial sand and gravel operations by the Grant Pacific Rock Co. and by Pacific Coast Aggregates, Inc. (formerly Grant Service Rock Co. Consolidated), from its Rockfield plant 2 miles south of Friant.

HUMBOLDT COUNTY

Orleans District.—The Pearch hydraulic mine operated during April and May 1946; 64 ounces of gold and 8 ounces of silver were recovered.

IMPERIAL COUNTY

Cargo Muchacho District.—The Homestake Mining Co. treated old tailings from the Tumco mine by cyanidation during 1946.

Mesquite Diggings District.—Van Derpoel & Murphy operated the Mary Lode mine from March 1 to May 1, 1946; gold ore was treated in the company 25-ton amalgamation-cyanidation mill.

INYO COUNTY

Bishop Creek District.—The United States Vanadium Corp. produced, by flotation, a copper concentrate containing a substantial quantity of silver as a byproduct of ore treated primarily for tungsten.

Cerro Gordo District.—L. D. Foreman & Co. shipped material to a smelter from the Cerro Gordo old slag dump.

Coso District.—The Darwin mine (the largest producer of silver and lead in the State) was operated by the Anaconda Copper Mining Co.

throughout 1946. A total of 18,135 tons of lead ore was treated in the company 150-ton bulk flotation plant on the property to produce 4,377 tons of lead concentrate (containing 71 ounces of gold, 103,030 ounces of silver, 3,205,216 pounds of lead, and 527,314 pounds of zinc), which was shipped to a smelter; no zinc concentrate was produced in 1946. In addition, 20,958 tons of lead ore containing 366 ounces of gold, 762,842 ounces of silver, 196,345 pounds of copper, 12,329,098 pounds of lead, and 1,806,209 pounds of zinc were shipped for direct smelting. L. D. Foreman & Co. shipped material to a smelter from the Eagle tailings dump and the Last Chance old-slag dump. Dopplemayer & Crandell worked the Empress mine beginning June 1, 1946, and shipped 79 tons of lead ore containing 1 ounce of gold, 530 ounces of silver, 2,033 pounds of copper, 34,891 pounds of lead, and 12,539 pounds of zinc to a smelter. Theodore Peterson shipped zinc-lead ore to a smelter from the Silver Spoon mine.

Modoc District.—L. D. Foreman & Co. shipped lead ore and old slag, containing a substantial quantity of silver, to a smelter from the Modoc property.

Resting Springs District.—The Finley Co. (Shoshone Division) operated the Columbia No. 2 mine from January 1 to 28 and from July 5 through the balance of 1946; lead ore containing a substantial quantity of silver was shipped to a smelter.

Slate Range District.—Damon & Damon worked the Gold Bottom and Ophir mines during 1946; zinc-lead ore and lead ore was shipped for direct smelting, and flotation lead concentrate was shipped to a smelter.

Ubehebe District.—George Lippincott worked the Lead King mine during March, April, and May 1946 and shipped 109 tons of lead ore (containing 1 ounce of gold, 118 ounces of silver, 17,519 pounds of lead, and 16,932 pounds of zinc) to a smelter.

Union District.—T. L. Bright shipped gold ore to a smelter from the Reward (Brown Monster) mine.

KERN COUNTY

Green Mountain District.—Mattie Moreland amalgamated ore from the Evening Star group during an operating period from April 15 to August 30, 1946.

Mojave District.—Burton Bros., Inc., cyanided 4,436 tons of gold ore from the Tropico mine (including a minor tonnage from the Yellow Dog and Standard Hill mines) during 1946 and recovered 2,075 ounces of gold and 8,446 ounces of silver.

Randsburg District.—A number of small mines in the district (including the Alphonso, American Gold Coin, Barnett, Big Dyke, Florence, King Soloman, Marie Rose, Minnesota, New Deal, and Wade) were worked at various times during 1946; gold ore from virtually all the mines was treated by amalgamation at the 30-ton custom stamp mill operated by the Butte Lode Mining Co. at Randsburg. The Butte Lode Mining Co., operating the Butte Lode mine (five claims) throughout the year, treated 1,127 tons of gold ore and 258 tons of old tailings by amalgamation in the company mill and recovered 186 ounces of gold and 56 ounces of silver. T. B. Peterson worked the Lucky Boy mine from July 9 to September 20 and again

from November 1 to December 23; 161 ounces of gold and 39 ounces of silver were recovered from 186 tons of gold ore treated by amalgamation in the Butte Lode Mining Co. mill. Gates, Atkinson & Cavalli also shipped ore to the Butte Lode Mining Co. mill from the Sunshine and Nine Spot claims during 1946; 101 tons of gold ore yielded 36 ounces of gold and 9 ounces of silver.

Sageland District.—Curtis & Prout operated the St. Johns group from January 1 to November 15, 1946; gold ore was treated in a 24-ton mill using a ball mill, jig, and amalgamation barrel.

LOS ANGELES COUNTY

San Gabriel District.—The Azusa Rock & Sand Co. recovered 36 ounces of gold and 5 ounces of silver as byproducts of its commercial sand and gravel plant operation on the San Gabriel River channel during 1946.

MARIPOSA COUNTY

East Belt District.—H. N. Hammond & Partners worked the Early mine during May, June,and July and again in September and October 1946; gold ore was treated by amalgamation, and a small quantity of concentrate was shipped to a smelter. The Schroeder group was operated by Schroeder & Moss during 1946; 30 tons of gold ore treated by amalgamation in a 20-ton Huntington mill yielded 107 ounces of gold and 14 ounces of silver. B. W. Spurgeon worked the Summit mine during an operating period April 1 to October 15 and treated free-milling gold ore by amalgamation.

Hunter Valley District.—The Mount Gaines Mining Co. operated the Mount Gaines mine throughout the year and amalgamated 4,160 tons of ore from which were recovered bullion (containing 2,115 ounces of gold and 653 ounces of silver) and 100 tons of flotation concentrate containing 1,070 ounces of gold, 377 ounces of silver, 486 pounds of copper, and 1,265 pounds of lead. The Trebor Corp. operated a 2-cubic-yard dragline excavator and floating washing plant on Burns Creek near Hornitos during a 2-month period in 1946; 15,000 cubic yards of gravel yielded 108 ounces of gold and 31 ounces of silver.

Mother Lode District.—The Our Chance, Specimen, Yucatan, and Manzanita mines were worked during relatively short periods in 1946, small quantities of gold being recovered by amalgamation at each property.

MERCED COUNTY

Snelling District.—The Merced Dredging Co. operated its dredge No. 1 (electrically powered and equipped with 60 9½-cubic-foot buckets) on the Merced River ¾ mile from Snelling from September 6 to December 31. Dredging was resumed in September following a favorable court ruling on an injunction asked by the company against a county resoiling ordnance, which had halted operations on September 13, 1945. The Snelling Gold Dredging Co. operated its Yuba-type electric connected-bucket dredge (with 66 7-cubic-foot buckets) on the Merced River near Snelling from September 8 to December 31; the dredge is 1 of 2 that suspended operations October 15, 1942, because of the War Production Board Limitation Order

L–208. A small quantity of gold was recovered as a byproduct of gravel-washing operations at the Merced Sand & Gravel Co. plant on the Merced River.

MONO COUNTY

Blind Springs District.—L. D. Foreman & Co. shipped Benton tailings containing silver and some copper and lead to a smelter.

Homer District.—The Sunmar Dredging Co. operated a dragline dredge at the Dogtown Placers from March 25 to July 23, 1946; the equipment was the same as that used in the Oroville district, Butte County, earlier in the year. Log Cabin Mines Co. operated the Log Cabin mine, 7 miles north from Leevining, throughout 1946; gold ore was treated in a 100-ton amalgamation mill.

Masonic District.—Ed Byers worked the Chipmunk mine during the latter half of 1946 and recovered gold by amalgamation.

NEVADA COUNTY

Grass Valley-Nevada City District.—The Empire Star Mines Co., Ltd., suspended operations at its Empire, North Star, and Pennsylvania mines at Grass Valley, Nevada County, on July 1, because mining was unprofitable under conditions of high operating costs and a fixed price for gold. Ore produced from the Empire Star group during the first 6 months of 1946 was treated by amalgamation and cyanidation at the company plant; ore from the company properties at Browns Valley in Yuba County, as well as concentrates from several neighboring mines, also was treated at the plant, which operated throughout the year. The Idaho-Maryland Mines Corp. operated the Idaho-Maryland and Brunswick mines throughout the year; 186,664 tons of ore were treated by amalgamation followed by cyanidation of concentrates yielding 40,691 ounces of gold and 8,808 ounces of silver.

North Bloomfield District.—Western Gold, Inc., hydraulicked the Relief Hill mine from February 21 to June 20, 1946.

Washington District.—The Ancho Erie Mining Co. operated the Ancho and Erie groups throughout 1946; 18,039 tons of gold ore were milled, from which 3,472 ounces of gold and 378 ounces of silver were recovered by amalgamation. In addition, 1,905 ounces of gold and 312 ounces of silver were recovered from 271 tons of flotation concentrate produced at the company 100-ton plant and shipped to the Empire Star plant at Grass Valley for treatment by cyanidation. A 6-ton cyanide plant was installed late in 1946 for the treatment of concentrate to avoid shipping.

ORANGE COUNTY

Santa Rosa District.—The Blue Light Silver Mines Co. operated the Silverado mine from January 1 through June 3, 1946, on a small scale; 152 tons of zinc-lead ore (containing 16 ounces of gold, 3,082 ounces of silver, 547 pounds of copper, 6,773 pounds of lead, and 39,102 pounds of zinc) were shipped to a concentrator-smelter.

PLACER COUNTY

Butcher Ranch District.—The French Corral Gold Dredging Co. (Golden Feather Dredging Co.) operated an electric dragline dredge on the Middle Fork of the American River (Browns, Mammoth, and Little Kennebec bars) in El Dorado and Placer Counties; operations in Placer County lasted from January 3 to March 5 and from October 7 to November 29.

Foresthill District.—Horseshoe Bar Mines operated a dragline excavator and floating washing plant on the Middle Fork of the American River from April to December 1946. Gavrilko Bros. Gold Dredging Co. operated for a short period in September and October on Georgetown Creek.

Iowa Hill District.—The Drummond Mining Co. operated the Drummond mine on a small scale from January 20 to December 1, 1946; gold was recovered by amalgamation. A. H. Howe worked the Golden Stream and Bonanza claims on a small scale during the first half of 1946; gold ore from pockets was ground by hand, the gold being recovered by panning and amalgamation.

Ophir District.—A small quantity of gold was recovered as a by-product from a commercial sand and gravel operation at the Culbertson Gravel Co. plant during 1946.

PLUMAS COUNTY

Greenville District.—Technical Porcelain & Chinaware Co. operated the Plumas Quartz mine near Crescent Mills from June 1 to November 30, 1946. Gold was recovered by amalgamation and from flotation concentrates shipped to a smelter.

SACRAMENTO COUNTY

Cosumnes River District.—Thurman & Wright operated an electric connected-bucket dredge (with 86 6-cubic-foot buckets) 3 miles southeast of Sloughouse during 1946; operation of the dredge was begun February 8.

Folsom District.—The Capital Dredging Co. operated an electric connected-bucket dredge on its property 5 miles south of Folsom throughout 1946; the dredge was equipped with 100 18-cubic-foot buckets. The General Dredging Co. operated its 3-cubic-yard dragline excavator and floating washing plant on Alder Creek, 1½ miles west of Natoma, from June 1 to December 29, 1946. Dredge No. 4 of the Lancha Plana Gold Dredging Co. operated for 345 days in 1946 on the American River 8 miles south of Folsom; the dredge had 84 6-cubic-foot buckets. The Natomas Co., the leading California gold producer in 1946, operated all of its fleet of electric connected-bucket dredges throughout 1946 except dredge No. 8, which did not begin work until August. The number and size of buckets per dredge were: No. 1, 62 15-cubic-foot; No. 4, 67 15-cubic-foot; No. 5, 105 11-cubic-foot; No. 6, 106 11-cubic-foot; No. 7, 98 9-cubic-foot; No. 8, 105 12-cubic-foot; and No. 10, 83 15-cubic-foot. Recovery of gold as a byproduct of gravel-washing operations was reported by C. M. Craig at the Brighton Sand & Gravel, Del Paso Rock Products, and Perkins Gravel plants and by the Fair Oaks Gravel Co. at its

plant on the American River. The Fair Oaks Gravel Co. recovered 311 ounces of gold and 24 ounces of silver from 76,683 cubic yards of material handled.

Ione District.—The Wallace Dredging Co. operated an electric connected-bucket dredge (with 71 3-cubic-foot buckets) 8 miles west of Ione from January 27 to November 23, 1946.

SAN BERNARDINO COUNTY

Buckeye District.—Donald F. Love, lessee, shipped a substantial quantity of gold ore containing some silver and copper to a smelter from the Bagdad-Chase (Pacific) mine.

Calico District.—Louis Warnken, Jr., shipped old tailings containing silver and lead to a smelter from the Calico mine.

Clark Mountain District.—The Carbonate King mine was operated throughout 1946 by J. Q. Little under contract from the Crystal Cave Mining Co; 2,416 tons of zinc ore containing 16 ounces of gold, 24,017 ounces of silver, 50 pounds of copper, 18,939 pounds of lead, and 1,588,638 pounds of zinc were shipped to a smelter. Emerson A. Ray & Associates and lessees operated the Mohawk mine and shipped lead ore and zinc-lead ore to smelters.

Ivanpah District.—Verdi Development Co. shipped a small quantity of silver ore from the Albermarle mine, and Arthur J. Ansite shipped gold ore from the Beverly Glenn mine to a smelter in 1946.

Randsburg District.—Frank W. Royer worked the Kelly and Juanita mines during 1946 and shipped gold-silver ore to smelters. Floyd Holstrom operated the Pioneer group (H. & H. Nos. 1–5) from January 1 to July 27, 1946; 14 ounces of gold and 4 ounces of silver were recovered from 130 tons of gold ore treated by amalgamation in the Butte Lode Mining Co. mill. Hoefling Bros. recovered 1,591 ounces of gold and 304 ounces of silver from 500,000 cubic-yards of gravel, handled chiefly for scheelite, at the Spud Patch mine by dry-land dredging throughout 1946; equipment used included two electric and one Diesel dragline excavators with 1½-cubic-yard buckets and 2 portable washing plants.

Solo District.—Jerry Korfist treated gold ore from the Oro Fino mine by amalgamation. John L. Alexander shipped gold ore from the Telegraph mine to a smelter.

SAN FRANCISCO COUNTY

San Francisco District.—Five separate operators using small-scale hand methods recovered 28 ounces of gold and 3 ounces of silver from beach sand during short periods of operation in 1946.

SAN JOAQUIN COUNTY

Camanche District.—The Gold Hill Dredging Co. operated its Upper Comanche connected-bucket dredge (with 64 7½-cubic-foot buckets) and Lower Comanche dredge (with 76 8½-cubic-foot buckets) along the Mokelumne River throughout 1946. The Mokelumne Sand & Gravel Co. recovered gold as a byproduct from its commercial gravel washing operations during 1946.

SHASTA COUNTY

Flat Creek District.—The Mountain Copper Co., Ltd., largest mineral producer in Shasta County, worked the Hornet mine throughout 1946. Zinc-copper ore from the Mattie ore body was treated in the company 400-ton selective flotation mill to produce copper and zinc concentrates, which were shipped to smelters. A small quantity of gold, silver, and copper was recovered from smelting cinder derived from burning pyrites in a sulfuric acid plant; the pyrites was produced at the Hornet mine.

French Gulch District.—The French Gulch Dredging Co. operated its connected-bucket electric-powered dredge (with 76 4½-cubic-foot buckets) on Clear Creek from January 1 to July 27, 1946; the dredge was then moved to a new location on Indian Creek—Deadwood district in Siskiyou County. Also on Clear Creek, a dragline dredge was operated by Enterprise Engineering Co. from March 11 to May 2. The G & H Mining Co. operated a ¾-cubic-yard dragline dredge on Cline Gulch from September 1 to October 22; 60,000 cubic yards of material yielded 107 ounces of gold and 13 ounces of silver. The St. Jude Mining Co. worked the St. Jude mine and treated gold ore by amalgamation and concentration; the concentrate was shipped to a smelter. J. H. Scott Co. operated the Washington mine throughout 1946 and treated 590 tons of gold ore by amalgamation (yielding 36 ounces of gold and 8 ounces of silver) followed by concentration; the flotation concentrate (18 tons containing 37 ounces of gold and 4 ounces of silver) was shipped to a smelter.

Redding District.—The Thurman Gold Dredging Co. operated its connected-bucket dredge (with 72 9-cubic-foot buckets) on Clear Creek about 4 miles south of Redding throughout 1946. Dragline dredges were operated in the Redding district during 1946 by the Sandra Gold Dredging Co. on Tadpole Creek and by Artie E. Griffith (Red Gulch No. 1). Chris Kutras conducted placer operations on the Kutras tract during the year.

Shasta District.—Tom Cook worked the Judy claim, and Austin H. Merrill operated the Yankee John mine during 1946; gold ore from both properties was treated by amalgamation.

SIERRA COUNTY

Alleghany District.—The American Hill (Pilgrim) mine was worked from October 15 to December 20, 1946, by American Hill Mines; 600 tons of gold ore was treated by amalgamation (yielding 145 ounces of gold and 22 ounces of silver) followed by concentration; 6 tons of gravity concentrate containing 4 ounces of gold and 1 ounce of silver were shipped to a smelter. Maurice Derrnau produced a small quantity of gold from the Eureka mine, and the Dickey Exploration Co. reopened the Oriental mine in April 1946. The Original Sixteen to One Mine, Inc., operated its Original Sixteen to One mine throughout 1946 and recovered a substantial quantity of gold and some silver by amalgamation.

Downieville District.—Alfred L. Merritt operated the Brush Creek mine, 1½ miles south of Goodyears bar, throughout 1946; 2,102 tons of ore treated by amalgamation yielded 2,583 ounces of gold and 510 ounces of silver.

Pike District.—Harvey L. Sorensen, lessee, recovered gold by amalgamation at the Alaska mine in 1946. The Bowman mine was operated by David H. Casey until July 1946; 1,364 tons of gold ore treated by amalgamation yielded 196 ounces of gold and 36 ounces of silver.

SISKIYOU COUNTY

Callahan District.—Yuba Consolidated Gold Fields (Siskiyou unit) operated its electric connected-bucket dredge (Yuba type with 72 9-cubic-foot buckets) on the Scott River from January 1 to April 15, 1946.

Cottonwood District.—A minor quantity of gold was recovered by amalgamating ore from the Golden Rule mine (operated by Robert Clay, Jr.) and the Nims mine (operated by the Marath Mining Corp.) during 1946.

Deadwood District.—The West Branch Dredging Co. operated a 1½-cubic-yard dragline excavator and floating washing plant on the Good-Luck, Kentuck, and O. K. claims on Indian Creek from March 1 to June 15, 1946; 30,000 cubic yards of gravel yielded 119 ounces of gold and 27 ounces of silver. The French Gulch Dredging Co. began operating its connected-bucket dredge on Indian Creek November 20, 1946; the equipment had been moved from the former site of company operations on Clear Creek, French Gulch district, Shasta County.

Klamath River District.—The Yreka Gold Dredging Co. operated its electric connected-bucket dredge (with 67 6-cubic-foot buckets) in Seiad Valley throughout 1946. Scandia Mines (Larsen & Harms) operated two dragline dredges (each dragline excavator was equipped with a 3-cubic-yard bucket) at Scandia Nos. 1, 2, and 3 mines at different periods throughout 1946; 679,500 cubic yards of gravel handled yielded 2,854 ounces of gold and 457 ounces of silver.

Liberty District.—Hydraulicking was carried on during 1946 at the Joubert mine by Alex Markon and at the Judge mine by Judge Hydraulic Mine. Norman Marvin worked the Hansen mine and Alex Markon the Anna Johnson mine during 1946; a small quantity of gold ore from each property was treated by amalgamation. Harry M. Thompson conducted sampling operations at the Quartz Hill mine during the latter part of 1946 to determine the possibility of milling; a few ounces of gold were recovered by amalgamating gold ore.

STANISLAUS COUNTY

La Grange District.—The La Grange Gold Dredging Co. operated its connected-bucket dredge No. 4 (with 62 10-cubic-foot buckets) on the Tuolumne River throughout 1946. The Tuolumne Gold Dredging Corp. operated its connected-bucket dredge throughout the year; the dredge is equipped with 100 12-cubic-foot buckets.

TRINITY COUNTY

Junction City District.—The Junction City Mining Co. operated its electric connected-bucket dredge (with 75 10-cubic-foot buckets) along Trinity River throughout 1946. The Chapman and Fisher mine was hydraulicked during the first half of 1946 by Chapman, Hill, McCartney & Loft; 12,000 cubic yards of gravel yielded 48 ounces of

gold and 4 ounces of silver. Gilzean Bros. and Hill, McCartney & Loft worked the Northern California Mines Co. property (Red Hill, Oak Hill, Montezuma, Evans & Bartlett, and Mammoth placers) under lease from the Goldfield Consolidated Mines Co. during the first half of 1946; gold was recovered principally by hydraulicking.

Trinity Center District.—The Carrville Gold Co. operated an electric connected-bucket dredge (with 77 12-cubic-foot buckets) on the Trinity River from March 20 to July 30 and again from December 9–31, 1946. The Thomson Divide Mining Co. operated its dragline excavator (with a 1½-cubic-yard bucket) and floating washing plant at the Squirrel Gulch mine throughout the year.

Weaverville District.—P. & W. Trinity Placers operated a dragline dredge at the P. & W. mine from August 1 to October 15, 1946. W. E. Woodberry conducted hydraulic operations at the Rex mine during a 3-month period in 1946; this was one of several placers worked in the district by this method during 1946.

TUOLUMNE COUNTY

East Belt District.—E. T. Harper worked the Grizzly and Eureka mines from March through December 1946; 55 ounces of gold and 12 ounces of silver were recovered by amalgamation from 1 ton of ore. Harry Gibson and H. C. Keenan worked the Hidden Treasure mine during 1946 and recovered 130 ounces of gold and 11 ounces of silver by amalgamation from 5 tons of ore. Several other lode mines were worked on a small scale during 1946 including the Lazar, Southern Cross, and Wind Wheel; a few ounces of gold from each property were recovered by amalgamation.

Mother Lode District.—Miller & Clemson (Eagle Shawmut Mine) operated the Eagle Shawmut mine from June 8, 1946, through the remainder of the year; 12,272 tons of gold ore treated in the company 500-ton flotation mill yielded bullion containing 56 ounces of gold and 16 ounces of silver and 479 tons of concentrate (containing 1,088 ounces of gold and 995 ounces of silver), which was shipped to a smelter. Tom Owen and George Marbut worked the Maryatt mine during 1946; gold was recovered by amalgamation and from concentrate shipped to a smelter.

YUBA COUNTY

Yuba River District.—Yuba Consolidated Gold Fields (Yuba unit) operated five connected-bucket dredges in the Yuba River Basin throughout 1946; the operation ranked second in production of gold in the State. The dredges are of the Yuba type, electrically operated, and had the following number and capacity of buckets: Two with 100 18-cubic-foot buckets; one with 126 18-cubic-foot buckets; one with 135 18-cubic-foot buckets; and one with 87 18-cubic-foot buckets.

Central States
Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

MOST of the copper, lead, and zinc mines in the Central States continued to operate under the Premium Price Plan throughout 1946. The removal of price ceilings from base metals, effective November 10, enabled some mines to put operations back on a competitive peacetime footing. The manpower shortage, an obstacle to economical operation, was ameliorated. The principal impediment to complete reconversion of the industry is the advanced stage of ore-reserve depletion in some areas. During the rearmament and early war period ore reserves were depleted at an abnormally high rate because of high production rates and neglect of development work. This condition led to utilization of much low-grade or "high-cost" ore, and mining and milling operations were sustained by premiums provided under the Premium Price Plan. The plan will expire June 30, 1947, unless the Congress extends it. In 1946 premiums represented 54 percent of the total price paid for Central States zinc concentrates, 25 percent for lead concentrates, and 32 percent for copper (mine output, excluding byproduct copper from lead smelters). Premium payments were generally higher in 1946 than in 1945 because of quota adjustments to compensate the decrease in the market price of zinc concentrates and increases in operating costs resulting from the general wage increase and the advance in prices of equipment and supplies. The market prices of concentrates and copper rose sharply after decontrol but were still less than the maximum prices provided under the Premium Price Plan as the year ended.

The output of recoverable zinc in 1946 decreased 1 percent from 1945, lead decreased 18 percent, and copper 30 percent. The copper tailing plants and all but one of the mines in Michigan were idle 5 weeks in May and June because of the coal shortage. In the Tri-State zinc-lead district (Kansas-Missouri-Oklahoma) nearly all operations were suspended about 3 weeks in July pending reinstatement of the Premium Price Plan, and a few mines were closed for other short periods by labor strikes. A strike closed five large lead mines in Southeastern Missouri from October 23 to 31.

The silver produced in the Central States is a minor byproduct derived from some of the base-metal ores. No production of gold has been reported from Central States mines since 1940.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, 1946 to Dec. 31, 1946: $0.905.
[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of silver, copper, lead, and zinc in the Central States, 1942–46, in terms of recovered metals

Year	Mines producing	Ore and old tailings (short tons)	Silver		Copper	
			Fine ounces	Value	Pounds	Value
1942	502	30,726,994	130,884	$93,073	93,958,000	$11,368,918
1943	407	32,653,764	161,917	115,141	96,208,000	12,507,040
1944	386	34,240,455	148,898	105,883	91,446,000	12,345,210
1945	334	31,873,116	118,883	84,539	67,600,000	9,126,000
1946	355	30,001,691	71,703	57,936	47,040,000	7,620,480

Year	Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	
1942	235,229	$31,520,686	258,181	$48,021,666	$91,004,343
1943	217,060	32,559,000	222,707	48,104,712	93,285,893
1944	201,577	32,252,320	214,949	49,008,372	93,711,785
1945	201,520	34,661,440	164,225	37,771,750	81,643,729
1946	164,804	35,927,272	162,962	39,762,728	83,368,416

Mine production of silver, copper, lead, and zinc in the Central States in 1946, by months, in terms of recovered metals

Month	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	7,228	2,013	16,528	14,737
February	6,544	1,897	15,075	13,796
March	6,886	2,264	15,933	14,702
April	6,393	2,336	15,260	14,761
May	5,318	1,239	13,584	14,634
June	5,114	1,310	11,985	13,646
July	5,288	1,969	11,388	5,757
August	6,539	2,129	13,631	14,094
September	5,305	2,156	13,330	14,105
October	5,753	2,033	11,378	14,699
November	5,066	2,139	13,390	13,884
December	6,269	2,035	13,322	14,147
Total 1946	71,703	23,520	164,804	162,962

Silver.—The mine output of silver in the Central States in 1946 comprised 67,734 ounces recovered from lead bullion and smelter residues derived from Southeastern Missouri lead concentrates, 1,667 ounces from Missouri lead-copper ore, and 2,302 ounces from Southern Illinois zinc-lead fluorspar and lead fluorspar ores. Ordinarily some silver is recovered from Michigan copper ore, but none was reported from this source in 1946.

Copper.—Michigan contributed 92 percent and Missouri 8 percent of the Central States total mine output of copper in 1946. The Michigan output decreased 29 percent from 1945. The Quincy and Copper Range mines, in operation until August 1945, were idle throughout 1946; the Quincy reclamation plant continued to operate. The Missouri output of copper decreased 45 percent; there were decreases both in the quantity of byproduct copper-lead matte shipped from smelters treating Southeastern Missouri lead concentrates and in the quantity of copper concentrates shipped from the Madison mill at Fredericktown, which treated lead-copper ore.

Lead.—Lead production by mines in the Central States amounted to 164,804 tons in 1946 compared with 201,520 tons in 1945. The highest recorded annual output was 317,375 tons in 1925. In 1946 the disseminated-lead district of Southeastern Missouri produced 82 percent and the Tri-State district (Kansas, Southwestern Missouri, Oklahoma) 14 percent of the Central States total lead output; the rest came from Wisconsin, Illinois, Kentucky, Central Missouri, and Arkansas.

Zinc.—The 1-percent decrease in zinc output in the Central States in 1946 resulted from the drop in the quantity recovered from old tailings; the quantity recovered from newly mined ore increased. Of the 162,962 tons of zinc produced in 1946, the Tri-State district contributed 139,038 tons or 85 percent. A general review of mining and milling in this district is given in this chapter under Southwestern Missouri. Output in the Wisconsin-Northern Illinois district was 18,344 tons, or 11 percent of the Central States total. Other producing districts were Kentucky-Southern Illinois, Southeastern and Central Missouri, and Northern Arkansas.

MINE PRODUCTION BY STATES AND REGIONS

Mine production of silver, copper, lead, and zinc in the Central States in 1946, by States, in terms of recovered metals

State	Mines producing	Material sold or treated		Silver	
		Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value
Arkansas	3	4,302			
Illinois	18	[1] 288,942	103,491	2,302	$1,860
Kansas	82	2,980,313	1,314,012		
Kentucky	6	12,270			
Michigan	9	1,611,579	3,108,415		
Missouri	70	7,147,213	354,717	69,401	56,076
Oklahoma	114	3,699,762	8,509,891		
Wisconsin	53	314,819	551,965		
Total: 1946	355	16,059,200	13,942,491	71,703	57,936
1945	334	16,780,823	15,092,293	118,883	84,539

[1] Excludes lead-bearing material mined with fluorspar and from which some lead was recovered as a byproduct of the mining and milling of the fluorspar.

Mine production of silver, copper, lead, and zinc in the Central States in 1946, by States, in terms of recovered metals—Continued

State	Copper		Lead		Zinc		Total value
	Pounds	Value	Short tons	Value	Short tons	Value	
Arkansas			2	$436	85	$20,740	$21,176
Illinois			3,865	842,570	8,798	2,146,712	2,991,142
Kansas			6,445	1,405,010	47,703	11,639,532	13,044,542
Kentucky			95	20,710	314	76,616	97,326
Michigan	43,326,000	$7,018,812					7,018,812

[1] Only small-scale intermittent mining done in Arkansas from 1918 to 1946; Kentucky and Illinois excluded because part of the metal output (lead and zinc) was a byproduct of fluorspar mining, and the quantity of metal-bearing material hoisted could not be determined.
[2] The percentages represent metal content of the ore insofar as it is recovered in the concentrates. In Michigan the metal so recovered is copper; in Missouri, copper, lead, and zinc; and in Kansas, Oklahoma, and Wisconsin, lead and zinc. The relative proportions of the metals are shown in the fourth table of this chapter and in tables of tenor of ore given in sections devoted to the respective States.

MINING AND METALLURGIC INDUSTRY

The tonnage of straight copper and lead ores mined in the Central States in 1946 decreased sharply from 1945, but that of zinc and zinc-lead ores increased. The available supply of labor was augmented gradually during the year and nearly balanced demand as the year ended. In some districts this favorable condition did not lead to expansion of actual mining operations. During the war, development was hampered by labor shortage, and the normal ratio of ore developed to that mined was not maintained. When the emergency passed, development work was intensified and the rate of ore extraction adjusted to the point required for economic operation. No important new sources of ore were reported found by exploratory drilling and geophysical investigations carried on outside proved mineralized areas in 1946. The Bureau of Mines and Geological Survey continued to investigate sources of strategic minerals. The work on copper, lead, and zinc included exploratory drilling, geophysical surveys, field examinations, and metallurgical tests.

Most of the mills in the Central States use gravity concentration and flotation. In 1946 flotation concentrates comprised 46 percent of the total copper concentrates (excluding copper-lead flotation concentrates from Missouri), 45 percent of the lead concentrates, and 57 percent of the zinc concentrates produced. Active smelters in the Central States in 1946 were the copper smelter at Hubbell, Mich.; lead smelters at Alton, Ill., Herculaneum, Mo., and Galena, Kans.; and zinc smelters at Bartlesville, Blackwell, and Henryetta, Okla.; Fort Smith, Ark.; and Danville, Depue, East St. Louis (electrolytic plant also), and LaSalle, Ill. One oxide plant at Coffeyville, Kans., two at Hillsboro, Ill., and one at Columbus, Ohio, used raw or roasted concentrates. Smelters at Donora and Josephtown, Pa., and Meadowbrook, W. Va., treated some of the concentrates from the Central States. Six waelz plants, operated in conjunction with zinc smelters in the Central States, treated a total of 172,650 tons of old residues, current residues, carbonate ore, and clean-up material yielding 31,485 tons of oxide averaging 65.38 percent zinc and about 3 percent lead. Most of the oxide was smelted along with concentrates to produce metal.

REVIEW BY STATES

ARKANSAS

Mines in Arkansas produced 246 tons of zinc carbonate concentrates in 1946 compared with 823 tons of carbonate and 29 tons of sulfide in 1945. The output of lead concentrates was 2 tons in 1946 and 1 ton in 1945. The producing zinc mines in 1946 were the Big Hurricane open-pit mine in Searcy County and Mine 16 in Marion County, both equipped with mills. The lead came from the Brewer mine in Newton County.

ILLINOIS

Northern Illinois (see section on Wisconsin for output data).—The Tri-State Zinc, Inc., continued to operate the Gray mine [1] and 600-ton flotation mill south of Galena and in June began operating also the newly developed Bautsch mine. The Gray is opened by two shafts 200 and 278 feet deep. The Bautsch shaft is 282 feet deep. Besides ore from the two mines, the mill treated old tailings from nearby properties. The Big Six (North Unity) and Bennett (South Unity) mines shipped ore to the Vinegar Hill custom flotation mill at Cuba City, Wis. The Ginte mine and jig mill were in production during January and February. The mill was used to re-treat tailings after the mine was closed. The Eagle-Picher Mining & Smelting Co. carried on exploratory drilling north of Galena. The Bureau of Mines continued small-scale exploratory drilling in the area.

Southern Illinois.—The Ozark-Mahoning Co. (formerly Mahoning Mining Co.) operated its fluorspar-zinc-lead mines near Cave in Rock and 320-ton flotation mill at Rosiclare. The producing shafts were the W. L. Davis-Deardorf, W. L. Davis No. 2, East Green, and West Green, which are 311, 146, 230, and 363 feet deep, respectively. The mill handled chiefly company ore but also treated ore, bulk concentrates, and middlings containing zinc, lead, and fluorspar from other mines and mills in Southern Illinois and Kentucky. The mill products were fluorspar concentrates (mostly acid grade), zinc concentrates averaging 62.88 percent zinc, and lead concentrates containing 71.39 percent lead. The Minerva Oil Co. fluorspar-zinc mine and 200-ton flotation mill north of Cave in Rock were operated steadily. The mine is opened by a 645-foot double-compartment shaft and drifts and raises from the 640-foot level. Most of the fluorspar concentrates shipped were of ceramic grade, and the zinc concentrates averaged 63.16 percent zinc. The Alco Lead Corp. operated its open-pit lead mine near Elizabethtown and the remodeled Benson mill. The concentrates comprised roughly two-thirds lead carbonate and one-third lead sulfide; part of them contained some zinc sulfide also. The total output of lead concentrates in Southern Illinois in 1946 was 5,546 tons averaging 66.08 percent lead and yielding 3,592 tons of recoverable lead, 29 tons of zinc, and 2,302 ounces of recoverable silver; zinc concentrates totaled 8,290 tons averaging 62.99 percent zinc and yielding 4,701 tons of recoverable zinc.

KANSAS

The Kansas zinc and lead mines are in the Tri-State (Joplin) mining region, embracing parts of Cherokee County, Kans., and Ottawa County, Okla., and about 12 counties in Southwestern Missouri. General details of the Tri-State mining industry are given in the following pages on Southwestern Missouri.

[1] Zinner, Paul, and Lincoln, Francis Church, Exploration of the Gray and Bautsch Lead and Zinc Deposits, Jo Daviess County, Ill.: Bureau of Mines Rept. of Investigations 3947, 1946, 28 pp.

Mine production of lead and zinc in Kansas, 1942–46

Year	Mines producing	Lead concentrates		Zinc concentrates		Metal content [1]			
						Lead		Zinc	
		Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1942	81	12,253	$1,167,302	103,247	$6,926,745	9,419	$1,262,146	55,874	$10,392,564
1943	82	12,243	1,473,891	105,656	10,792,583	9,213	1,381,950	56,944	12,299,904

1946	82	8,499	1,388,210	87,963	9,902,906	6,445	1,405,010	47,703	11,639,532

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the value of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

Tenor of lead and zinc ore and old tailings milled and concentrates produced in Kansas, 1945–46

	1945		1946	
	Crude ore	Old tailings	Crude ore	Old tailings
Total ore and old tailings milled ..... short tons	2,693,110	1,883,269	2,980,313	1,314,012
Total concentrates produced:				
Galena ..... do	9,967	----------	8,499	----------
Sphalerite ..... do	83,830	5,475	84,010	3,953
Ratio of concentrates to ore, etc.:				
Lead ..... percent	0.37	----------	0.29	----------
Zinc ..... do	3.11	0.29	2.82	0.30
Metal content of ore, etc.: [1]				
Lead ..... do	.28	----------	.22	----------
Zinc ..... do	1.88	.17	1.70	.18
Average lead content of galena concentrates ..... do	75.42	----------	77.31	----------
Average zinc content of sphalerite concentrates ..... do	60.32	58.54	60.29	59.55
Average value per ton:				
Galena concentrates	$124.04	----------	$163.34	----------
Sphalerite concentrates	107.83	$123.52	112.40	$116.36

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

The Baxter Springs-Blue Mound-Treece area contributed 84 percent of the total Kansas output of zinc concentrates and 95 percent of the lead concentrates in 1946. About 36 percent of the crude ore mined in the area was concentrated in the Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin, Okla. Most of the ore was transported to the mill over the Northeast Oklahoma Railroad, which has spur tracks to the principal ore-hoisting shafts. A large producer opened in 1946 was the Eagle-Picher Foley-Mullen mine at Blue Mound. The mine is worked through a new 455-foot shaft (the deepest shaft in the Tri-State district) on the north end of the Foley lease. Other producing Eagle-Picher mines in this area were the Big John, Leopard No. 2, Parmenter, Puterbaugh, Sim C. No. 1, Webber mines, Westside-Foley mines, Wilbur, and Leopard-Youse Slaughter. The company operated the Paxson, Stoskopf, and Swalley "D" mines and the Paxson mill as agent for the Office of Metals Reserve. Diesel truck haulage is being used advantageously in the Paxson mine.[2]

[2] Clarke, S. S., Diesel Truck Haulage at the Paxson Mine: Eng. and Min. Jour., vol. 148, No. 3, March 1947, pp. 54–56.

The St. Louis Smelting & Refining Co. mines near Baxter Springs were large producers; they comprised the Ballard, Clark, English "O", Keith (North 60), Moore, Shanks, Slaughter, and Walter H. The mines are served by the company No. 8 central mill, which also treated custom ore from the Keith (South 20) mine and the C. & M. lease (St. Louis No. 4) in Oklahoma. Other Kansas mines were served by the Beck No. 3, Dines, Youngman, and Wade mills or by mills in Oklahoma. Important producers included the MacArthur mine, Beck (Smith, Swalley), Lula Bell (Liza Jane), Dines (Hartley No. 1, Stoskopf, Tar Creek), C. K. & E. (Stebbins, Karcher), Robinson (Douthit, Jarrett), Harris (E–W. No. 24, Silver Fox), Bilharz (Muncie), Bilwil (Ebenstein), Little Ben (Bendelari), Mark Twain (Blue Mound), Mid-Continent (Wright), and Wade-Rea (Hunter, Hartley).

The Barr Cleanup mill continued active. The Captain mill and the Semple (Martin, in Oklahoma) treated old tailings from Kansas. Stripping operations by F. W. Evans Mines on the old caved Peru mine workings were suspended early in 1946. In November Fred Childress & Sons began sinking a 434-foot shaft on the Vanatta property near Melrose.

At Galena the principal producers were the Eagle-Picher Murphy and the Galena Mining Co. Southside mines, shipping to the Central mill; and the Bonanza, Mess Cave, and Murray-Davis, shipping to mills in Missouri. The Eagle-Picher lead smelter and lead and zinc pigment plant at Galena purchases most of the lead concentrates produced in the Tri-State district. At Peacock the Carson tailing mill operated until it burned March 7.

In the Waco district (Kansas part) the St. Louis Smelting & Refining Co. operated its No. 9 mill on company and custom ore. The Kansas shippers to the mill were the company Barnsdall and Grasselli mines and the Stotts City Mining Co. Oscar Bennett mine. The F. W. Evans Mines operated its mill and the St. Louis and O'Neill mines.

KENTUCKY

The Kentucky output of recoverable zinc in 1946 was 314 tons and lead 95 tons compared with 182 and 129 tons, respectively, in 1945. The K. T. Dome Mining Syndicate operated the Gratz zinc-lead mine and 50-ton mill at Gratz in Owen County. The United States Coal & Coke Co. produced byproduct zinc and lead concentrates in its fluorspar mill at Mexico, Crittenden County. Other fluorspar producers shipped material containing zinc, lead, and fluorspar to the Ozark-Mahoning mill at Rosiclare, Ill.; the principal shippers were the Ozark-Mahoning Mineral Ridge and Babb mines.

MICHIGAN

The mine output of copper in Michigan decreased 29 percent in 1946 from 1945. This drop, following the 28-percent decline in 1945, reduced production to the lowest level since 1879. The Quincy and Copper Range mines, operated until August 1945, were idle throughout 1946. The reclamation plants and all but one of the mines were inoperative from May 11 to June 16 because of the shortage of coal. The average price per pound of fine copper paid for the mine output was 20.48 cents (including Federal premiums) compared with 17.77

cents (including premiums and increment from special prices) in 1945. In 1946 mine mills treated 1,611,579 tons of rock yielding 31,018,000 pounds of fine copper, and reclamation plants handled 3,108,415 tons of old tailings yielding 12,308,000 pounds of copper.

The concentrate ("mineral") produced at mills in Michigan in 1946 was smelted in the Calumet & Hecla smelter at Hubbell; the Copper Range smelter was not run in 1946. None of the copper bullion produced during the year was shipped to electrolytic refineries for recovery of silver, and no silver was reported recovered from tables or jigs in the mills.

Mine production of silver and copper in Michigan, 1942–46 [1]

Year	Silver (fine ounces)	Copper			Concentrate ("mineral")		Crude ore and sands (short tons)
		Pounds	Yield		Pounds	Yield (percent copper)	
			Pounds per ton of crude ore and sands	Percent			
1942	61,674	91,358,000	20.9	1.05	141,372,582	64.6	4,362,640
1943	48,479	93,528,000	21.2	1.06	143,142,155	65.3	4,403,594
1944	54,218	84,842,000	15.7	.78	129,646,181	65.4	5,410,238
1945	21,863	60,802,000	11.7	.58	97,467,825	62.4	5,196,932
1946	----------	43,326,000	9.2	.46	72,179,300	60.0	4,719,994

[1] Figures based upon actual recovery of copper from "mineral" smelted and estimated recovery from "mineral" not smelted during year.

Value of silver and copper produced by Michigan mines, 1942–46

Year	Silver	Copper		Total	Year	Silver	Copper		Total
		Total	Per ton of crude ore and sands				Total	Per ton of crude ore and sands	
1942	$43,857	[1] $11,054,318	[1] $2.53	$11,098,175	1945	$15,547	[1] $8,208,270	[1] $1.58	$8,223,817
1943	34,474	[1] 12,158,640	[1] 2.76	12,193,114	1946	--------	[1] 7,018,812	[1] 1.49	7,018,812
1944	38,555	[1] 11,453,670	[1] 2.12	11,492,225					

[1] Value of copper calculated at average weighted price (including Government bonuses) for all domestic copper sold (see first table of this chapter, footnote 3). If calculated at actual prices paid to Michigan operators, the value of the copper was—1942: $11,722,792, or $2.69 to the ton of crude ore and sands; 1943: $15,139,831, or $3.44 to the ton; 1944: $14,033,131, or $2.59 to the ton; 1945: $10,801,506, or $2.08 to the ton; 1946: $8,871,332, or $1.88 to the ton.

The Calumet and Hecla Consolidated Copper Co. operated its Ahmeek stamp mill, the Lake Linden and Tamarack reclamation plants, and the Ahmeek, Allouez, Centennial, Douglass, Iroquois, North Kearsarge, and Peninsula mines. Ore was also produced in development at the Seneca No. 2 mine, last operated in 1930. The shaft and surface plants were being reconditioned to develop at depth ground overlying the Kearsarge lode adjacent to the Ahmeek mine. The following data are extracted from the annual company report to stockholders. Production the first half of 1946 was hampered by shortage of underground labor and the 36-day shut-down caused by the coal strike. Rock stamped totaled 1,264,836 tons yielding 24,515,-

647 pounds of copper. The output of primary copper from the two reclamation plants totaled 7,255,485 pounds. The Lake Linden plant treated low-grade amygdaloid tailings from the Osceola lode. Because of the gradually decreasing copper content, the current operating cost has risen to 22 cents, the maximum allowed under the Premium Price Plan. The Tamarack plant, operating on amygdaloid tailings from the Kearsarge lode, showed a small profit. The new secondary copper department reached a satisfactory production rate. At the smelter two furnaces were rebuilt. Increased smelting requirements will necessitate erection of another furnace. Exploration by diamond drilling continued throughout the year. The results in the Copper Harbor area were negative, and it was decided to transfer attention to company lands nearer the known ore bodies. The mineral rights were purchased on more than 2,000 acres of the Mayflower-Old Colony land. The exploratory program has added materially to the company's known ore reserves. If the present relationship between copper prices and labor and supply costs is maintained, the mines of the company are assured of many years of productive life.

The Isle Royale Copper Co. operated its mine continuously and produced 16 percent more copper than in 1945. According to the annual company report to stockholders, mining operations consisted entirely of stoping out ore reserves, as no development work was done in 1946. The mill stamped 346,743 tons of rock, with two heads operated most of the time on a 5-day-week basis. The yield of refined copper was 18.754 pounds per ton of rock stamped compared with 18.946 pounds in 1945. Production costs were 19.295 cents per pound of copper delivered. Depletion amounted to 1.3772 cents per pound, making an over-all cost of 20.6722 cents.

The Quincy Mining Co. reclamation plant treated 1,006,415 tons of sands yielding 5,052,515 pounds of fine copper. The Quincy mine, closed August 31, 1945, remained idle throughout 1946. The mine had been operating under a special-price Government contract for copper and was unable to continue operations at the price obtainable under the Premium Price Plan after the contract expired. The annual company report to stockholders for 1945 states that the mine had been in operation nearly 100 years. Copper produced totaled 848,083,134 pounds, and dividends paid amounted to $27,002,500. Mining in recent years was at depths ranging from 8,000 to 9,000 feet on the lode, or at vertical depths ranging from 5,000 to 6,000 feet. The copper contents of the lode continued good at these depths. In discontinuing operations the shaft pillars were not mined, so that it will be necessary only to unwater the mine to resume operations if future conditions make them profitable.

The Copper Range Co. mines, mill, tailing plant, and smelter in Houghton County remained idle throughout 1946. In Ontonagon County the company continued drilling on its White Pine property and sank a 30° inclined shaft. Ore was encountered at a depth of 900 feet, and the shaft was continued to 1,400 feet. A station was cut, and drifting on one level near the bottom of the shaft was progressing as the year ended.

MISSOURI

Missouri has been the chief lead-producing State for the past 39 years and until 1918 had ranked first in zinc production for many years. The principal lead mines are in the Southeastern Missouri region. Silver and copper are recovered as byproducts in smelting lead concentrates produced in this region, and copper and a little silver have been recovered in some years (including 1944–46) from lead-copper-cobalt-nickel-iron ore mined in Madison County. Silver recovered in 1946 totaled 69,401 ounces and copper 1,857 tons compared with 94,822 ounces and 3,399 tons, respectively, in 1945. In the sale of the lead concentrates, no value is attached to the silver and copper, as the quantity recovered per ton of concentrates is very small. The zinc output comes mostly from zinc-lead mines in Southwestern Missouri. The Central district of Missouri had a small output of lead in 1946 and of both zinc and lead in the years 1942–45; the figures are included with those of Southeastern Missouri in the table that follows.

Mine production of lead and zinc in Southeastern and Central Missouri, 1942–46

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite) [1]		Metal content [2]			
					Lead		Zinc	
	Short tons	Value [3]	Short tons	Value	Short tons	Value	Short tons	Value
1942	277,255	$19,426,540	1,739	$41,913	197,432	$26,455,888	[4] 842	$156,612
1943	257,305	18,490,413	2,284	99,710	179,134	26,870,100	[5] 923	199,368
1944	243,279	19,920,200	3,206	112,485	169,962	27,193,920	[6] 1,508	343,824
1945	245,805	21,870,243	1,335	45,706	173,053	29,765,116	[7] 595	136,850
1946	189,401	21,677,221	1,731	61,147	135,891	29,624,238	451	110,044

[1] Includes zinc-lead carbonate concentrates.
[2] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.
[3] Values given are to a certain extent arbitrary, as part of the lead concentrates are smelted by the producer.
[4] Includes 450 tons recovered from lead-smelter slags.
[5] Includes 360 tons recovered from lead-smelter slags.
[6] Includes 776 tons recovered from lead-smelter slags and byproduct matte from lead smelting.
[7] Includes 240 tons recovered from byproduct matte from lead smelting.

Mine production of lead and zinc in Southwestern Missouri, 1942–46

Year	Lead concentrates				Zinc concentrates				Metal content [1]			
	Galena		Carbonate		Sphalerite		Silicate		Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

Tenor of lead ore and concentrates in Southeastern Missouri disseminated-lead district, 1942–46

	1942	1943	1944	1945	1946
Total lead ore [1] short tons	7,107,191	6,831,377	6,535,874	6,675,767	5,491,239

Zinc silicates and carbonates	73.60	----------	60.97	----------

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

Southeastern and Central Missouri.—The Southeastern Missouri disseminated-lead district produced 135,796 tons of recoverable lead in 1946 compared with 173,005 tons in 1945. The output in 1945 represented 44 percent of the United States total mine production and that in 1946 about 40 percent.

The St. Joseph Lead Co. mines in St. Francois County were the principal producers. Four large groups were operated. The central ore-hoisting shafts and mills (one for each group) are at Bonne Terre, Desloge, Federal (Flat River), and Leadwood. Other shafts are used for men, supplies, and poor rock. The depth of the 15 shafts operated in 1946 ranged from 181 to 755 feet and averaged 430 feet. Development done on the four groups during the year totaled 64,814 feet of drifting, 2,489,903 feet of diamond drilling, and 6,471 feet of churn drilling. The four mills together have a daily capacity of 21,400 tons. Treatment is by table concentration followed by flotation. Operating time was reduced from 6 to 5 days a week April 28. A strike called by the local union October 23, which broke the no-strike 30-year record of the company, caused the loss of 7 working days. Other data extracted from the annual company report to stockholders follow. Wages were increased 18.5 cents an

hour on April 28 and were again increased (12 percent) on November 11, after free market conditions were established and lead prices advanced substantially. Salary adjustments were also made. Lead concentrates produced totaled 166,556 tons with a pig lead equivalent of 113,344 tons compared with 219,241 and 146,395 tons, respectively, in 1945. Reconstruction of the Herculaneum zinc furnace was completed by the year's end, but resumption of slag smelting was postponed until the latter part of March 1947, owing to shortage of power and natural gas during the winter months in the St. Louis area.

In Madison County the principal producer of lead was the Mine La Motte mine, owned by the Mine La Motte Corp. and operated by the St. Joseph Lead Co. The mill has a daily capacity of 1,500 tons. Two shafts 115 and 307 feet deep were operated. Development totaled 4,440 feet of drifts, 40,652 feet of diamond drilling, and 43,597 feet of churn drilling. The Park City Consolidated Mines Co. Ruth mine and 500-ton flotation mill were operated steadily. The mine shaft is 370 feet deep. The Fredericktown Lead Co. operated its 400-ton mill and the Catherine and Fleming mines. The Catherine had one active shaft 71 feet deep and the Fleming two shafts 195 and 112 feet deep. The St. Louis Smelting & Refining Co. produced chiefly lead and lead-copper ore from its Madison group in 1946. Operations on the ore bodies that yield considerable cobalt and nickel were curtailed. Three shafts on the property average about 425 feet in depth. The 600-ton flotation mill made both lead and copper concentrates. In Jefferson County the DeSoto Lead & Zinc Co. mill operated on zinc-lead carbonate ore from the Valle dumps. Companies that did deep exploratory drilling in Washington County announced no conclusive results during the year.

In Central Missouri the D. F. & H. Mining Co. operated the Glover open-pit lead mine and a small Joplin-type mill.

Southwestern Missouri.—The following table, the first four paragraphs, and the charts under this heading pertain to the Tri-State mining industry as a whole; the remaining text reviews mining and milling in Southwestern Missouri only.

The Tri-State district continued in 1946 to be much the largest zinc-producing district in the United States and again ranked third in lead production. A large part of the output came from mines that operated under maximum-price quotas of the Premium Price Plan. Some mines in this group have no developed ore reserves left but, with the aid of premiums, derive ore from undergrade rock removed in drifting out from edges of worked-out ore bodies on feeders (mineralized fractures), ordinarily an exploratory operation.

The weekly quoted price for 60-percent zinc concentrates at Joplin in 1946 was $50 a ton from January 5 to October 26 (except for the weeks ending July 13, 20, and 27, when there was no market), $54 from November 2 to 9, and $64 from November 16 through December 28. The quoted price of lead concentrates was $76.01 a ton from January 5 to June 1, $99.96 the rest of June, $117.96 from July 6 to 20 (no market July 27), $99.90 from August 3 to November 9, $132.30 on November 16, $151.02 from November 23 to December 14, and $160.50 on December 21 and 28 (the highest on record up to that time, but later advances brought the price to $195.65 on March 8, 1947).

Federal premium payments continued on essentially the same basis as in 1945, except that producers who began operating after October 27, 1943, became eligible for the same premiums as old producers. These premiums were: For 60-percent zinc concentrates, $29.70 a ton for assigned production under the A-level quota, $59.40 for B-level, and $89.10 for C-level; for 80-percent lead concentrates, $41.80 for A-level and $83.60 for B-level. In 1946 the maximum B lead premium was expanded an additional $41.80 a ton of concentrates, and an exploration premium of $10.80 a ton for zinc concentrates and $15.20 for lead concentrates was established. After ceiling prices were abolished November 9, premiums were computed on the basis of market prices and were assigned in terms of dollars per ton of concentrates instead of A, B, or C quotas.

Production of lead and zinc concentrates in the Tri-State district (Kansas, Oklahoma, and Southwestern Missouri), 1942–46

FROM CRUDE ORE

Year	Ore, etc., milled (short tons)	Concentrates produced (short tons)		Concentrate recovery (percent)		Average assay of concentrates (percent)		Average value per ton of concentrates	
		Lead	Zinc	Lead	Zinc	Lead	Zinc	Lead	Zinc
1942	8,587,337	44,397	378,751	0.52	4.41	78.35	59.86	$99.55	$68.00

1946	18,450,132	30,650	258,705	.17	1.40	77.23	59.71	164.37	116.27

About 43 mills were operating in the district in December 1946; 14 were tailing mills, compared with 50 in December 1945, including 16 tailing mills. The mine mills, including those treating custom ore, together served about 183 mines (active all or part of the year) operated by 87 companies and individuals. These mines do not include very small gouges, mill clean-ups, or clean-ups of boulder piles at old shafts; the total producing mines, gouges, and clean-ups was 248 compared with 226 in 1945. The depth of the operating shafts ranged from 45 to 450 feet. Most of the mines and mills were shut down about 3 weeks in July pending reinstatement of the Premium Price Plan, and a few were closed for other short periods by labor strikes. Prospect drilling lagged, but considerable drilling was done to develop extensions of ore bodies. The Bureau of Mines did churn

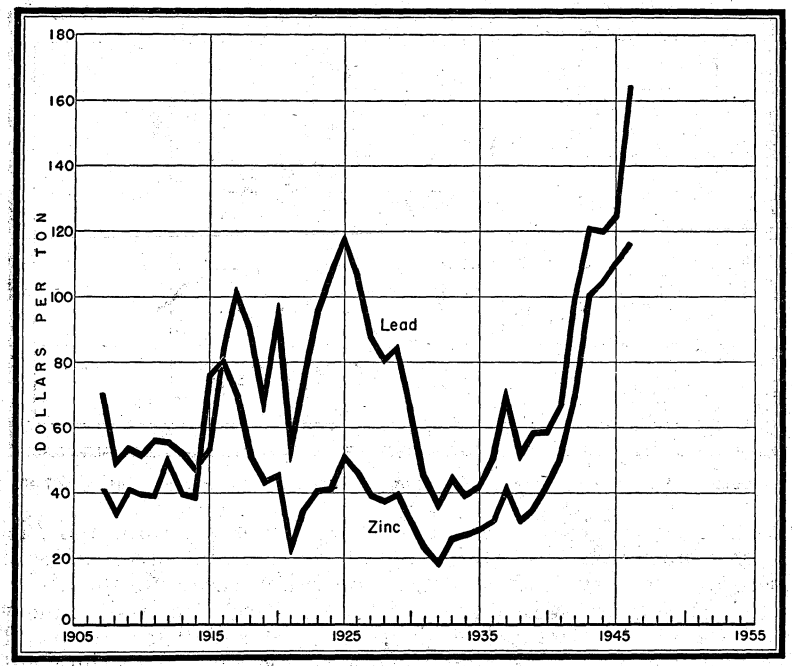

FIGURE 1.—Average prices received by sellers per ton of concentrates in the Tri-State district.

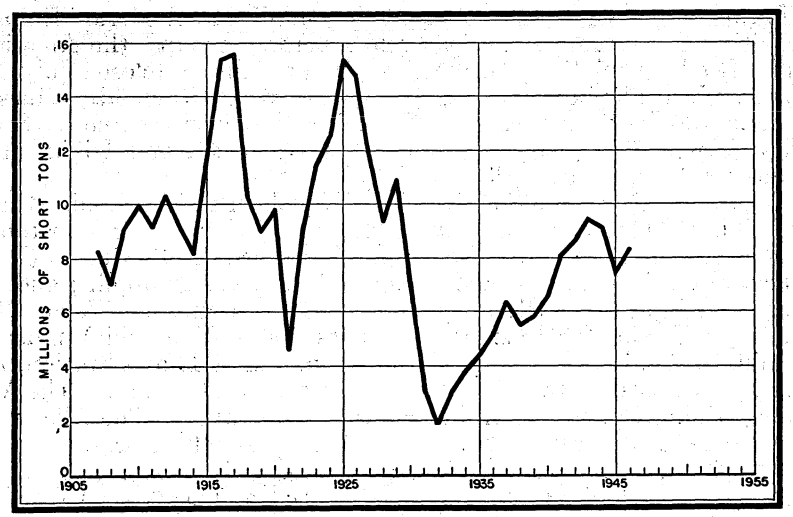

FIGURE 2.—Quantity of crude ore milled in the Tri-State district.

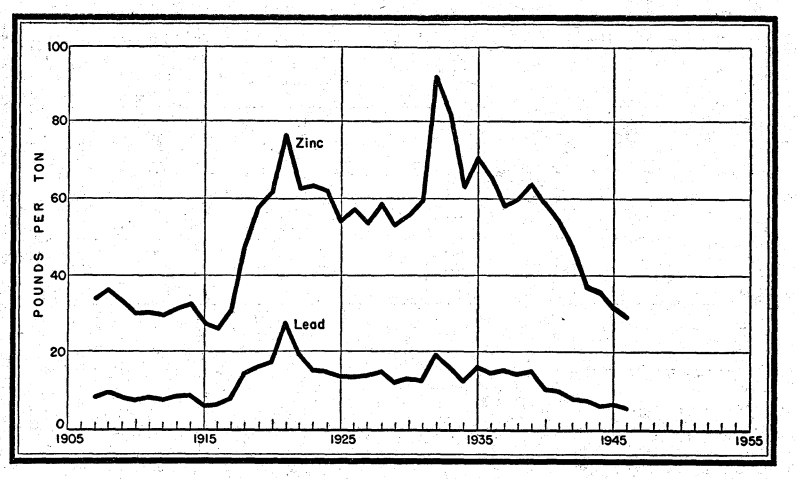

FIGURE 3.—Metal recovered per ton of crude ore (rock) milled in the Tri-State district, 1907-46.

drilling in the Melrose, Galena, Racine, Thoms Station, and Picher (Kansas part) areas. Certain data on drilling and ore reserves and a historic summary of the district production were published.[3]

In Southwestern Missouri the Oronogo Circle open-pit mine was again the largest producer of zinc. The pit is 230 feet deep. The ore is trucked out of the pit and shipped by railroad to the Central Mill. The Eagle-Picher Needmore and the Fenix & Sons Oronogo No. 5 shaft mines shipped ore to the Central Mill. Operating Southwestern Missouri mines equipped with mills included the Fenix & Martin La Tosca at Oronogo; the Kansas Explorations Buckingham-Gibson north of Oronogo and Jasper near Joplin; the Federal Mining & Smelting Co. Granby-American and Duenweg groups; the American Zinc, Lead & Smelting Co. Hunter group at Aurora (closed July 31); the F. W. Evans Sucker Flat; the C. C. Playter (Reynolds) mines at Waco; the Southwest (K. D. F.) silicate-carbonate mine at Stark City (closed April 16); the Kline at Wentworth; and Dividend at Spurgeon (closed in March).

Other producing mines included the Napoleon and St. Louis Mining & Milling Co. group at Thoms Station; the Manning & Winston at Duenweg; the Little Pat, Mattes (Zig Zag), Eureka Producers (Rex), Turkey Creek (Swartz), and Wildwood (Potter) at Joplin; and the Gascho, High Five, Olsen, O'Neill, and St. Louis at Waco. The C. G. & C. Co. (Northside) and Mess Cave (Southside) mills at Joplin, the St. Louis Mining & Milling Co. mill at Thoms Station, and the Magajupa (Sciota) at Webb City treated custom ore. The Missouri Mining Co. tailing mill at Chitwood operated. The Alice mine in Ozark County shipped sorted carbonate and sulfide ores.

Average value per ton:				
Galena concentrates	$122.60	$68.52	$163.40	$90.91
Zinc concentrates	110.54	103.39	116.75	118.78

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

The Eagle-Picher Mining & Smelting Co., largest producer of zinc and lead in the Tri-State district, operated its Central mill at Cardin at a higher rate than in 1945. The mill (capacity expanded to 15,000 tons daily) is equipped with differential-density (sink-and-float) preliminary-concentration units, which furnish an enriched product for treatment by jigging and flotation. Of the total ore treated in 1946 (3,496,105 tons), 59 percent came from Oklahoma. Eagle-Picher mines in Oklahoma shipping to the mill were the Blue Goose mines, Buffalo, Crawfish, Douthat, Goodeagle mines, Gordon No. 2, Grace Walker No. 2, Hum-bah-wat-tah mines, John Beaver, Little Greenback, Lotson mines, Netta, Piokee, See Sah No. 3, Slim Jim

(Bankard and Vantage), Southside, Swift, and White. The company also milled a large tonnage of low-grade boulders obtained from waste shaft dumps. Other large Oklahoma shippers to the mill included the Davis Big Chief (Skelton, Imbeau), Federal Mining & Smelting Co. (Lucky Syndicate-Howe, Gordon, Quapaw-Davenport), Mid-Continent (Acme, Wright), F. W. Evans (Shorthorn, Craig), W. M. & W. (Velie), Carpenter (New York-Grace Walker, Oko), C. G. & C. (Lucky Bill), Mahutska (Jeff City-Eudora), Tongaha, Hudson (Bingham), Blue Bird, and Bob White.

Other large producers equipped with mills were the American Zinc No. 7 mine, Cameron & Henderson (Admiralty mine), Marcia K (formerly Lawyers), Rialto, Scott, United Zinc Royal and Park Walton, and Weidman (Woodchuck and Townsite). The Mission mill treated custom ore. The Baird (Harris), C. & M. (St. Louis No. 4), Farmington, Pelican, Quebec-Gray, Toltec, and Waxahachie mines were operated. The Kansas Explorations Ritz mill ran until March, when the mill, shaft derrick, and hopper burned. The derrick and hopper were rebuilt during the year. The M. & W. Mining Co. Brewster-Huttig and Ninety-Six mines shipped ore to the company mill near Baxter Springs, Kans. The Four-Mile (T. R. Smith) mine made a small output.

Operating tailing mills in Oklahoma comprised the Atlas, Big Chief, Britt & Britt, C. G. & C., Cardin Nos. 2, 3, and Western, Evans-Wallower No. 4, Semple (Martin), and Tri-State Zinc Ottawa and Sooner.

WISCONSIN

The Wisconsin zinc- and lead-mining area is in the Upper Mississippi Valley region, which includes adjacent parts of Illinois and Iowa. The Iowa part has had no production since 1917. Since 1942 the Office of Metals Reserve has purchased and stock-piled locally some of the crude ore mined in the region. The metal output from the stock-piled ore is credited to the production of the year in which the ore is milled rather than to the year in which it is mined.

The total regional output of finished (60-percent) zinc concentrates was 32,930 tons and lead concentrates 2,557 tons in 1946, compared with 34,758 and 3,011 tons, respectively, in 1945. The Northern Illinois area produced 7,338 tons of finished zinc concentrates and 367 tons of lead concentrates in 1946 compared with 6,726 and 648 tons, respectively, in 1945; the yield of recoverable metals was 4,068 tons of zinc and 273 tons of lead in 1946, compared with 3,757 and 485 tons, respectively, in 1945. The Wisconsin output from 1942 to 1946 is shown in the following table.

The Vinegar Hill Zinc Co. custom-flotation mill at Cuba City affords a regional market for crude ore and rougher jig zinc-iron-lead sulfide concentrates. The mill produces finished zinc and lead concentrates and also iron concentrates utilized in the adjoining company sulfuric-acid plant. The principal Wisconsin shippers to the mill in 1946 were the Cuba Mining Co. (Andrews mine), Gill Bros. (James), Meloy & Baker (Hoskins, Martin); the C. F. & H. (Mulcahy), New

Lucky Hit (Coughlin, Wilkins), Kittoe, Hofer (Boyle), Thompson, Little Benny (Monroe), Fox (Cottingham), Little Grant, North Star, and Deuce (New Harty) mining companies; Harold Reinke Partnership (Federal), and Whitechurch & Farr (Little Mullen).

Other Wisconsin mills making finished (flotation) concentrates were the Dodgeville Mining Co. mill at Dodgeville (serving the Dodgeville No. 3 and Simpson mines); the W. E. Faithorn mill at New Diggings (Champion mine); the Northwest Zinc Co. tailing mill near Hazel Green; the Chestnut Hill Zinc Co. tailing mill near Shullsburg; and the Coker mill near Livingston. The Coker mill was operated by the United Milling & Mining Co. until August 25, when the company completed running its tailing reserve and ceased operations. The mill was then taken over by the Inland Lead & Zinc Co., which had been developing the Coker and Rundell mines. The new company built a crushing plant on the Rundell property and used it and the Coker flotation mill to treat ore from the two mines.

The Mining Division office of the Bureau of Mines at Platteville, closed early in 1946, was reopened in August, and field investigations were resumed. Drilling in the vicinity of Fairplay began November 19. Data on some of the drilling done in previous years were published.[4]

Mine production of lead and zinc in Wisconsin, 1942–46

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1942	1,092	[2] $104,896	17,449	[2] $1,028,828	775	$103,850	9,426	$1,753,236
1943	1,307	[2] 111,360	26,632	[2] 1,624,858	920	138,000	14,387	3,107,592
1944	1,954	[2] 166,853	28,696	[2] 1,892,313	1,415	226,400	15,549	3,545,172
1945	2,363	[2] 210,414	28,032	[2] 2,109,877	1,776	305,472	15,561	3,579,030
1946	2,190	[3] 323,550	25,592	[3] 2,730,408	1,588	346,184	14,276	3,483,344

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

[2] Most of the finished zinc concentrates and part of the lead concentrates produced in Wisconsin in 1942–45 came from a custom mill treating purchased crude ores and low-grade bulk concentrates on which premium payments had been made previously to mine operators; therefore the value of these concentrates is calculated at market prices. Premium payments not reflected in the value of the finished concentrates amounted to about $399,000 in 1942, $1,059,000 in 1943, $1,384,367 in 1944, and $1,087,243 in 1945 for zinc and $18,500, $40,600, $71,498, and $96,074 respectively, for lead; part of these payments, however, were for ore which was stock-piled.

[3] Includes calculated value of premium payments on ore milled at custom mill.

Tenor of lead and zinc ore and old tailings milled and concentrates produced in Wisconsin, 1945–46

	1945		1946	
	Crude ore	Old tailings	Crude ore	Old tailings
Total ore, etc., milled ..... short tons	338,033	619,644	314,819	551,965
Total concentrates produced:				
Lead ..... do	2,363	----------	2,182	8
Zinc ..... do	23,435	4,597	21,005	4,587
Ratio of concentrates to ore, etc.:[1]				
Lead ..... percent	0.70	----------	0.69	0.001
Zinc ..... do	6.93	0.74	6.67	.83
Metal content of ore, etc.:[2]				
Lead ..... do	.54	----------	.53	.001
Zinc ..... do	4.29	.45	4.15	.51
Average lead content of galena concentrates ..... do	76.77	----------	76.81	50.00
Average zinc content of sphalerite concentrates .. do	61.83	60.93	62.15	61.11
Average value per ton:[3]				
Galena concentrates	$89.05	----------	$147.83	$122.13
Sphalerite concentrates	64.19	$131.73	101.08	132.37

[1] Percentage represents finished flotation concentrates.
[2] Percentages represent metal content of the ore insofar as it is recovered in the concentrates.
[3] Most of the finished zinc concentrates and part of the lead concentrates produced in Wisconsin in 1945 came from a custom mill treating purchased crude ores and low grade bulk concentrates on which premium payments had been made previously to mine operators; therefore, the value of these concentrates is calculated at market prices. Value in 1946 includes premium payments on all ore milled.

Colorado

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

Mine production by counties	1390	Golden Cycle mill	1402
Mining industry	1391	Leadville district	1404
Ore classification	1392	Cripple Creek district	1410

GENERAL SUMMARY

PRODUCTION of recovered gold increased 41 percent in Colorado in 1946 compared with 1945 but, except for 1943, 1944, and 1945, was the lowest since 1876. The year 1946 marked the first full year of operation of lode and placer gold mines without the restrictions of War Production Board Order L–208 since 1942. There were no important increases in 1946 in the quantities of silver, copper, and zinc recovered from ores mined in Colorado; lead production was virtually the same as in 1945.

Colorado mines in 1946 yielded, in terms of recovered metals, 142,613 fine ounces of gold, 2,240,151 fine ounces of silver, 3,508,000 pounds of copper, 34,072,000 pounds of lead, and 72,294,000 pounds of zinc, the total valued at $19,903,509, a 19-percent increase over 1945. Comparing 1946 with 1945, gold increased 41 percent in quantity and value; silver increased less than 1 percent in quantity and 14 percent in value; copper increased 18 percent in quantity and 42 percent in value; lead production was virtually the same, but the value increased about 27 percent; and zinc increased 1 percent in quantity and 7 percent in value. Of the total value of these five metals, zinc represented 44 percent, gold 25 percent, lead 19 percent, silver 9 percent, and copper 3 percent.

Seven counties in Colorado produced over $1,000,000 in value of the five metals; in order of output, they were: Eagle, Lake, San Miguel, San Juan, Teller, Dolores, and Summit.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, 1946 to Dec. 31, 1946: $0.905.
[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for over-quota production.

Annual figures for the 5 years ended with 1946 and total production from 1858 are given in the table that follows. Colorado is second in the production of silver and gold, having yielded first place in the production of silver to Montana in 1942; California is the leading gold producer.

Mine production of gold, silver, copper, lead, and zinc in Colorado, 1942–46, and total, 1858–1946, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] Figure not available.
[2] Short tons.

Gold.—Colorado mines yielded 142,613 ounces of gold in 1946 compared with 100,935 ounces in 1945. The principal gold-producing districts were: Cripple Creek in Teller County, which produced 34 percent of the State total gold output; Upper San Miguel in San Miguel County, 17 percent; Fairplay and Tarryall districts in Park County, 13 percent; Animas in San Juan County, 11 percent; and California (Leadville) in Lake County, 8 percent. Dry and siliceous ores yielded 74 percent of the State total gold; placers, 14 percent; zinc-lead ore, 9 percent; and zinc, lead, copper, and lead-copper ores, 3 percent.

Gold and silver produced at placer mines in Colorado, 1942–46, in fine ounces, in terms of recovered metals [1]

Year	Small-scale hand methods [2]		Hydraulic		Gravel mechanically handled						Total	
					Nonfloating washing plants [3]		Dragline dredges		Connected-bucket dredges			
	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver
1942	317	70	63	15	1,541	259	6,173	945	14,523	2,913	22,617	4,202
1943	44	9	36	8	403	60	------	------	38	13	521	90
1944	66	8	28	8	249	74	------	------	------	------	343	90
1945	147	35	49	11	409	72	------	------	7,296	1,277	7,901	1,395
1946	89	15	------	------	1,047	169	(4)	(4)	[4] 19,036	[4] 3,514	20,172	3,698

[1] Nomenclature of methods revised to conform with tables of other State chapters.
[2] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[3] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[4] Production by dragline dredges included with that by connected-bucket dredge; Bureau of Mines not at liberty to publish separately.

Silver.—The output of silver increased from 2,226,780 ounces in 1945 to 2,240,151 ounces in 1946. The leading silver-producing districts were: Upper San Miguel in San Miguel County, which produced 16 percent of the State total silver; Creede in Mineral County, 16 percent; Animas in San Juan County, 15 percent; California (Leadville) in Lake County, 15 percent; and Pioneer in Dolores County, 8 percent. Dry and siliceous ores yielded 58 percent of the State total silver; zinc-lead ore, 33 percent; zinc ore, 5 percent; and lead, copper, and lead-copper ores and placers, 4 percent.

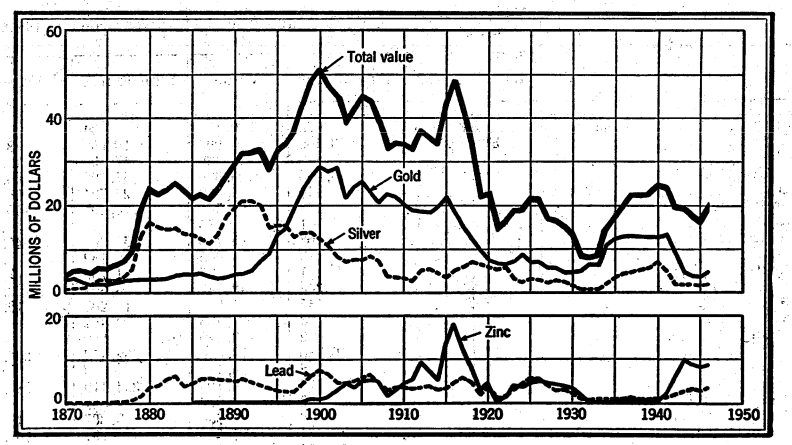

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1946. The value of copper has been less than $2,000,000 annually, except in a few years.

Copper.—The output of recovered copper from mines in Colorado in 1946 was 3,508,000 pounds compared with 2,970,000 pounds in 1945. Most of the copper produced in Colorado is recovered as a byproduct from ores mined for zinc, lead, or precious metal content; the exceptions are the ores from the Cashin mine in Montrose County,

the Malachite mine in Jefferson County, and the Idarado Mining Co. in San Miguel County—the latter makes a copper concentrate from its complex gold-silver-copper-lead-zinc ore. Dry and siliceous ores yielded 59 percent of the State total copper; zinc-lead ore, 24 percent; copper ore, 13 percent; and zinc, lead, and lead-copper ores, 4 percent.

Lead.—The mine production of recovered lead in Colorado was 34,072,000 pounds in 1946 compared with 34,088,000 pounds in 1945. The California (Leadville) district, Lake County, continued to be the largest producing area in the State and accounted for 26 percent of the State total lead. Other important producing districts included the Animas in San Juan County, 19 percent; Upper San Miguel in San Miguel County, 14 percent; and Pioneer in Dolores County, 13 percent. Zinc-lead ore yielded 54 percent of the State total lead; dry and siliceous ores, 37 percent; zinc ore, 6 percent; and lead, copper, and lead-copper ores, 3 percent.

Zinc.—The output of recovered zinc from mines in Colorado increased from 71,546,000 pounds in 1945 to 72,294,000 pounds in 1946. The principal zinc-producing districts in 1946, in order of output, were: Red Cliff, California (Leadville), Pioneer, Ten Mile, Upper San Miguel, Animas, and Breckenridge. These seven districts produced 91 percent of the State total output in 1946. Zinc ore yielded 53 percent of the State total zinc; zinc-lead ore, 38 percent; and dry and siliceous ores, 9 percent.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1946, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

MINING INDUSTRY

The nonferrous metal-mining industry in Colorado in 1946 continued to operate for most of the year at about the same rate as in the last part of 1945. Shipments of ores and concentrates from several properties commencing or resuming operations in 1946 were not begun until late in the year and accounted for much of the increased production for the State in November and December.

During 1946 skilled labor continued to be scarce, but common labor became comparatively plentiful. Materials and supplies were still difficult to obtain. Metal prices, except for gold, increased, as did costs of material and labor. The Premium Price Plan for copper, lead, and zinc ended June 30, along with price control. There was no price control from July 1 to July 25, when the President signed a new law effective July 26. Also on July 25 the President signed a new Premium Price Plan for copper, lead, and zinc (expiring June 30, 1947); this plan was retroactive to July 1, 1946.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Colorado in 1946, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	507,997	72,494	156,857	359,107	2,188,398	1,180,554
Dry and siliceous gold-silver ore	293,907	33,210	637,283	1,616,439	9,132,883	5,340,561
Dry and siliceous silver ore	39,829	303	496,583	91,336	1,139,018	318,315
	841,733	106,007	1,290,723	2,066,882	12,460,299	6,839,430
Copper ore	8,292	131	36,286	466,901	12,249	----------
Lead ore	19,307	1,880	39,911	26,980	1,089,123	----------
Lead-copper ore	5	3	77	346	879	----------

METALLURGIC INDUSTRY

Of the 1,463,496 tons of ore mined in 1946 in Colorado, 1,077,577 tons (73 percent) were treated at concentrating mills and 360,750 tons (25 percent) at amalgamation and cyanidation mills with concentrating equipment; 25,169 tons (2 percent) were shipped crude to smelters. Colorado has no zinc smelters, consequently all zinc concentrates produced were shipped out of the State; markets for these concentrates were had at Amarillo and Dumas, Tex., Depue, Ill., Palmerton, Pa., and Anaconda and Great Falls, Mont. The Arkansas Valley lead bullion-leady copper matte smelter at Leadville purchased most of the siliceous gold-silver and lead concentrates and silver, lead-copper, and lead ores shipped to smelters during the year; the Golden Cycle mill at Colorado Springs offered a market for nearly all the gold ores shipped for treatment. Smelters and custom mills in the Salt Lake Valley, Utah, continued to be important as a market for Colorado zinc-lead ores and concentrates.

The destination and treatment of concentrates and ores produced by operators in the State are discussed in the following review by counties and districts.

Mine production of metals in Colorado in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and concentrates amalgamated	342,976	21,519	4,769			
Sands and slimes cyanided	[1] 305,735	39,802	9,553			
Concentrates smelted	134,720	57,594	2,080,460	3,071,718	32,715,026	72,240,512
Ore smelted	25,169	3,526	141,671	436,282	1,356,974	53,488
Placer		20,172	3,698			
Total: 1946		142,613	2,240,151	3,508,000	34,072,000	72,294,000
1945		100,935	2,226,780	2,970,000	34,088,000	71,546,000

[1] Comprises 303,777 tons of sands and slimes from ore first roasted and amalgamated and 1,958 tons of selective-flotation tailings.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Colorado in 1946, in terms of recovered metals

REVIEW BY COUNTIES AND DISTRICTS

ADAMS COUNTY

Gold and silver were recovered in 1946 as byproducts from gravel washed for concrete aggregate by W. B. Kerkling from the Brannan Sand & Gravel Co. pit No. 10 near Lakewood, and by Kerkling & Slensker from the Superior Sand & Gravel Co. pit near Lakewood.

BOULDER COUNTY

Central (Jamestown) District.—All the recovered copper and lead, 81 percent of the silver, and much of the gold produced in the district in 1946 were recovered as byproducts in the beneficiation of fluorspar ore by the Ozark-Mahoning Co. (formerly Mahoning Mining Co.). The Smuggler mine of the Smuggler Mining & Milling Co. was operated throughout 1946 by the Smuggler Lease; 667 tons of ore containing 614 ounces of gold and 800 ounces of silver were produced. The John Jay mine was operated throughout 1946 by Ellen McNaughton & Earl Craig; 429 tons of ore containing 418 ounces of gold and 30 ounces of silver were produced. The Last Chance mine was operated by lessees from March 18 to December 31; 51 tons of gold ore were produced.

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1946, by counties and districts, in terms of recovered metals

[1] Less than ½ ton.

[2] Bureau of Mines not at liberty to publish district production figures separately.

Gold Hill District.—James Pastore operated dumps of the American and Interocean claims of the United Empire Gold Mines & United Mines Co. from April through October and shipped 699 tons of gold ore containing 122 ounces of gold. James Pastore and Karl Egle operated the Big Horn mine from July through December and shipped 430 tons of gold ore containing 199 ounces of gold. Harrison S. Cobb operated the Emancipation group from February 1 through December 31 and the Ingram group during January only. A total of 392 tons of gold ore containing 121 ounces of gold was produced from the Emancipation group, and 328 tons of ore containing 98 ounces of gold were produced from the Ingram group. Lessees operated the Black Cloud mine in 1946 and produced 350 tons of ore; 90 tons, containing 1,075 ounces of gold, 1,991 ounces of silver, 276 pounds of copper, and 12,919 pounds of lead, were shipped direct to the Leadville smelter, and 260 tons were milled at the Wallstreet mill (leased from A. B. More). From the ore milled, 52 tons of concentrates containing 120 ounces of gold, 1,174 ounces of silver, 105 pounds of copper, and 4,456 pounds of lead were recovered. Other mines in the district from which shipments of ore were made in 1946 included the Home Sweet Home, Melvina, Parker No. 1, and Great Britain.

Grand Island District.—Clara Rugg operated the Enterprise mine from June 15 to October 15 and shipped 93 tons of gold ore. Other mines from which small shipments of gold ore were made in 1946 included the Blue Bird group, Eureka, and Shirley group.

Magnolia District.—Early in 1946 Henna Mines, Inc., purchased the Cash group of mines and began unwatering and retimbering the mine in April; 50 tons of ore containing 15 ounces of gold and 110 ounces of silver were shipped in August. A small shipment of gold ore was made from the Hereafter mine.

Sugar Loaf District.—Lessees operated the Poorman-Relief mine from January through March 15 and from April through August 10. Production was 407 tons of ore containing 288 ounces of gold and about an equal quantity of silver. Lessees operated the Alpine Horn mine and produced 242 tons of gold ore. The Hard Rock Mining Co. operated the Nancy group throughout 1946 and produced 161 tons of gold ore. Maud A. Coughlin operated the Herold mine from January through September and shipped 140 tons of ore containing 97 ounces of gold. Other mines from which less than 50 tons of ore were produced in 1946 included the Smoky Hill, Livingston Dike group, Wood Mountain & Franklin group, and Tambourine mine.

Ward District.—Harrison S. Cobb operated the Columbia mine for 2 weeks in February and shipped 36 tons of gold ore. Charles W. Strong, Jr., operated the Boston Lode from January 1 to 20 and shipped 16 tons of ore containing 30 ounces of gold, 15 ounces of silver, and 831 pounds of copper.

CHAFFEE COUNTY

Chalk Creek (Romley, St. Elmo) District.—A test shipment of ore was made in 1946 from the Stonewall claim.

Granite District.—The Good Hope Mining Co., Ltd., operated the Gold Basin placer from July 16 to October 15. The company used a gasoline-driven power shovel and caterpillar bulldozer to move the

stream gravel to a sluice. A small lot of gold ore was produced by lessees operating the Monogram mine.

Monarch District.—The Alaska and Little Annie claims of the Garfield mine group were operated throughout 1946. A total of 3,355 tons of zinc ore and 430 tons of copper ore was produced. The zinc ore contained 80 ounces of gold, 15,254 ounces of silver, 43,995 pounds of copper, 49,426 pounds of lead, and 1,139,202 pounds of zinc. The copper ore contained 5 ounces of gold, 7,518 ounces of silver, 51,429 pounds of copper, and 5,226 pounds of lead. Development completed in 1946 included 444 feet of drifts, 48 feet of crosscuts, 150 feet of winzes, and 70 feet of raises. The Utze Lode Mining Co. made test shipments of lead ore from the Madonna mine.

CLEAR CREEK COUNTY

Alice District.—The Lombard Mining & Milling Co. produced 120 tons of gold ore from development; the company began construction early in 1946 of a 100-ton flotation mill.

Argentine District.—O. Barlow Willmarth shipped 6 tons of lead ore from the National mine in January. The Lupton Mining Co. operated the Grizzly Gulch mine and 50-ton selective-flotation mill (purchased February 1) for 11 months. A total of 3,791 tons of gold-silver-copper-lead-zinc ore was treated.

Empire District.—The P. M. Leasers operated the Gold Fissure group intermittently for 9 months during 1946. Henry C. Nelson operated the Crown Prince group from April through December, producing 202 tons of gold ore and 1 ton of lead ore.

Griffith District.—The Utze Lode Mining Co. was the largest producer of zinc in Clear Creek County in 1946. The company operated the Mendota mine and 100-ton selective-flotation mill. Approximately 4,900 tons of zinc-lead ore were produced and treated. The Elida Mining Co. operated the Smuggler group throughout 1946 and produced about 3,000 tons of silver ore, which were treated in the Silver Leaf mill. The lead concentrates produced (109 tons) contained 8 ounces of gold, 42,886 ounces of silver, 1,365 pounds of copper, and 114,194 pounds of lead; and the zinc concentrates (217 tons) contained 5 ounces of gold, 4,397 ounces of silver, 901 pounds of copper, 6,757 pounds of lead, and 194,337 pounds of zinc. The Lupton Mining Co. operated the New Boston mine (purchased in February 1946) from January 1 through August 31 and produced 1,894 tons of gold-silver ore.

Idaho Springs District.—The Williams Mining Co. operated the Nixon claim and produced 14,767 tons of gold ore, which were treated in the company Gilpin-Eureka mill. LeRoy Giles & Co. operated the Dixie mine throughout 1946 and produced 2,933 tons of gold ore, which were treated in the leased Silver Spruce mill. A total of 1,854 ounces of gold and 680 ounces of silver was recovered as bullion; 66 tons of concentrates were recovered, which contained 257 ounces of gold, 3,709 ounces of silver, 424 pounds of copper, and 4,581 pounds of lead. Arthur Portenier operated the Silver Age claim, producing about 1,045 tons of gold-silver ore, and the Franklin claim, producing 285 tons of gold-silver ore, for a short time during the early part of 1946. The ores from these claims were treated at both the Silver

Spruce and Hoosac mills. The Franklin Mining Co. operated the Franklin claim after the Arthur Portenier permit to mine was terminated. Among other producing mines in the district were the Widow Woman, Dexter group, Diamond Mountain, Old Settler, and Kitty Clyde.

Montana District.—The Jo Reynolds mine was operated by the Elida Mining Co. The silver ore produced (about 1,200 tons) was treated in the Silver Leaf mill.

Trail Creek District.—The Harrison-Croesus Mining Co. operated the Ben Harrison mine throughout 1946 and produced 614 tons of ore.

CUSTER COUNTY

Hardscrabble District.—The Lady Franklin mine near Westcliffe, the largest producer of zinc in Custer County in 1946, was operated throughout the year by George L. Beardsley. A total of 2,720 tons of zinc-lead ore was mined and sent to the Leadville milling unit of the American Smelting & Refining Co. for concentration. Colgate & Hoge operated the Keystone mine from January to July and from September to December 15. A total of 1,122 tons of zinc-lead ore was produced and shipped to the Leadville milling unit for concentration. Henning, Kettle & Walker operated the Defender mine throughout 1946 and produced 907 tons of lead ore containing 3 ounces of gold, 5,695 ounces of silver, 238 pounds of copper, and 185,328 pounds of lead. A shipment of 13 tons of lead ore was made from the Revelle mine. The King of the Carbonates mine produced 12 tons of silver ore.

DOLORES COUNTY

Pioneer (Rico) District.—The Rico Argentine Mining Co., one of the large producers of lead and zinc in Colorado, operated its property near Rico continuously in 1946 and shipped lead and zinc concentrates to the Leadville and the Amarillo, Tex., smelters. Ore milled in the company 135-ton selective-flotation plant totaled 35,604 tons and averaged about 13 percent zinc and about 7 percent lead. Development during 1946 comprised 6,600 feet of drifts, 3,229 feet of tunnel, and 3,642 feet of diamond drilling. Markey Bros. operated the Yellow Jacket group under lease from the Rico Argentine Mining Co. and shipped 177 tons of zinc-lead ore to the Midvale, Utah, concentrator. Stamphel & Barnes shipped 101 tons of zinc-lead ore from the Nora Lilly mine to the Midvale, Utah, concentrator.

EAGLE COUNTY

Holy Cross District.—The Glengary Mines made a test shipment of gold ore from the French American claim.

Red Cliff (Battle Mountain) District.—The Red Cliff district continued to rank first among the Colorado districts in the total value of its production of the five metals. In 1946 the district produced 45 percent of the total output of recovered zinc in the State. The New Jersey Zinc Co. Empire zinc division operated its Eagle mine and 600-ton underground selective-flotation mill continuously during 1946; production remained almost constant the first half of 1946, decreased during July, September, and October, and increased again in Novem-

ber and December. The ore mined and milled yielded chiefly zinc concentrates, which were shipped to the company smelters at Depue, Ill., and Palmerton, Pa. A. H. Stoner made a test shipment of 3 tons of gold ore from the Stoner mine.

EL PASO COUNTY

Golden Cycle Mill.—The Golden Cycle mill at Colorado Springs operated throughout 1946 on company and custom ores; 306,790 tons of ores of all classes were treated in 1946 compared with 227,063 tons in 1945. Of the total ores treated, 299,438 tons were company and custom gold-silver sulfotelluride ores from the Cripple Creek district (Teller County), 4,911 tons were gold ore from Boulder, Chaffee, Clear Creek, Gilpin, and La Plata Counties, and 2,441 tons were zinc-lead middlings from Lake County. About 70 percent of the ores treated from the Cripple Creek district came from the mining of dumps. The Golden Cycle Corp. ceased purchasing complex ores in December 1945; in 1946, except during February when zinc-lead middlings were accepted from the Ore & Chemical Co. because of terms of a previous contract, the company purchased only gold and gold-silver ores. (See Teller County section for other details.)

FREMONT COUNTY

Arkansas River District.—Mock & McKinney shipped 109 tons of slag from the Florence smelter site to the Leadville smelter.

Cotopaxi District.—The Monarch Galena Co. operated its Cotopaxi mine from January 1 to July 14 and produced 1,148 tons of zinc ore containing 17 ounces of gold, 1,811 ounces of silver, 27,345 pounds of copper, 25,294 pounds of lead, and 267,600 pounds of zinc; and 95 tons of copper ore containing 2 ounces of gold, 216 ounces of silver, and 10,142 pounds of copper. Fire destroyed the mine buildings on July 14. The lease on this property was taken over in October by Jean H. Eicheim.

Current Creek District.—The Warwick Mining Co. operated the Isabel mine from April to October. Production was 91 tons of zinc ore containing 2 ounces of gold, 168 ounces of silver, 866 pounds of copper, 1,723 pounds of lead, and 12,824 pounds of zinc.

Grape Creek District.—Eichheim & Hart shipped 609 tons of zinc ore from the Horseshoe mine to the Leadville milling unit of the American Smelting & Refining Co. during 1946.

GARFIELD COUNTY

Rifle Creek District.—Burney, Nall & Fischer operated the Grandview group from March through December and produced 707 tons of zinc-lead ore containing 2 ounces of gold, 1,944 ounces of silver, 75 pounds of copper, 39,300 pounds of lead, and 128,675 pounds of zinc. The ore was shipped to the Tooele, Utah, smelter.

GILPIN COUNTY

Southern (Blackhawk, Central City, Nevadaville, Russell Gulch) Districts. The Success Gold Mining & Milling Corp. operated the Pittsburg-Notaway group intermittently during 1946, shipped dump

ore from the Ivanhoe mine, and made test shipments from the Meeker-Success group. Ores from the Pittsburg-Notaway and Meeker-Success groups were treated at the Pittsburg 30-ton flotation mill; ore from the Ivanhoe dump was treated at the J. & R. 100-ton flotation mill. The Lu Ev Mining Co. operated the New Brunswick and Silver Dollar claims throughout 1946 and produced about 1,710 tons of gold ore, 10 tons of which were shipped direct to the Golden Cycle mill and about 1,700 tons treated in the company amalgamation-concentration mill. H. L. Griffith operated the Boodle mine. The ore produced was milled and made about 70 tons of zinc-lead concentrates, which were shipped to the Tooele, Utah, smelter. Among other mines active in the district in 1946 were the Saratoga, Gumtree, and Duchess. Several small-scale hand placer operations on the north fork of Clear Creek and in Gregory Gulch were active during 1946.

Northern District.—Small shipments of gold ore were made from the Evergreen mine and from cleanup at the Perigo mill.

GUNNISON COUNTY

Gold Brick District.—The Carter Mines, Inc., acquired the Carter mine in April 1946; remodeling of the mill and preparations for mining were begun on April 8. The first shipments of bullion were made in October; concentrates made in 1946 were not shipped until January 1947. The Murray Davis Lease operated the Gold Links mine.

Rock Creek District.—In July A. J. Betz shipped 44 tons of zinc-lead ore, mined in 1945, from the Catalpa mine to the Leadville milling unit of the American Smelting & Refining Co.

Taylor Park District.—John Lambertson operated the Star mine throughout 1946 and produced 101 tons of lead ore containing 1 ounce of gold, 1,578 ounces of silver, 203 pounds of copper, and 75,262 pounds of lead. J. A. McLain shipped 44 tons of lead ore from the Bull Domingo mine to the Leadville smelter in August.

Tomichi District.—The Callahan Zinc-Lead Co., Inc., continued to operate its Akron unit at White Pine during 1946. The unit comprises a large number of claims, of which only the Lost Contact, Erie, and Sunset lodes were productive during 1946. The ore mined was shipped to the Midvale, Utah, concentrator and the Leadville milling unit of the American Smelting & Refining Co. for treatment. A total of 4,220 tons of ore containing approximately 50 ounces of gold, 20,044 ounces of silver, 62,507 pounds of copper, 887,950 pounds of lead, and 1,389,551 pounds of zinc was treated. Development during 1946 included 19 feet of shaft, 500 feet of drifts, and 800 feet of diamond drilling.

HINSDALE COUNTY

Lake District.—James M. Wells operated the Gold Quartz mine from May 15 to December 5 and shipped 11 tons of ore containing 3 ounces of gold, 442 ounces of silver, and 4,192 pounds of copper.

JEFFERSON COUNTY

The Malachite mine, 3½ miles northwest of Morrison, was reopened by R. M. Moore in July. The mine has a complex copper-zinc ore which was first milled at the Silver Spruce mill near Idaho Springs

and later at the company mill at Dumont. About 3,100 tons of ore were treated, and 167 tons of copper concentrates were made, which contained 86 ounces of gold, 849 ounces of silver, and 85,030 pounds of copper; shipments of concentrates were begun in September. A small quantity of gold was recovered as a byproduct at the J. B. Bertrand concrete-aggregate gravel plant and from two small hand placer operations on Clear Creek near Golden.

LAKE COUNTY

California (Leadville) District.—The American Smelting & Refining Co. operated its Arkansas Valley lead bullion-leady copper matte smelter from January 1 to February 1, when the smelter was closed in order to build up a stock pile of ores (from February 25 through June 17 the workers were on strike and ore shipments, except those in transit, were refused), and from June 20 throughout the remainder of 1946. A total of 67,805 tons of material was received for treatment, of which 62,922 tons were considered of domestic origin and 4,883 tons of foreign origin. About 50,182 tons of ores, concentrates, and slag came from mines in almost every active district in Colorado; the remainder was largely residues from smelters or reduction plants in Illinois, New Jersey, Oklahoma, Pennsylvania, and Virginia. Foreign ores were chiefly from the New Calumet Mines, Ltd., Quebec, Canada, part of which was purchased through the Office of Metals Reserve and part direct. The American Smelting & Refining Co. operated its Leadville milling unit throughout 1946, and treated company ores from its Kokomo unit and custom ores from mines in Chaffee, Clear Creek, Custer, Fremont, Gunnison, Lake, Mineral, Ouray, Park, Pitkin, Saguache, San Juan, and Summit Counties.

The Resurrection Mining Co. operated its Resurrection mine throughout 1946, and was the largest producer of lead and zinc in the county. Production was chiefly from the Dolly B, Annie C, Lizzie C, Polaris No. 1, and Famous claims. The property is equipped with a 600-ton selective-flotation mill which has two 300-ton units. In addition to treating company zinc-lead ore, custom ores from mines in Clear Creek, Lake, Park, Saguache, and Summit Counties were handled.

The Ore & Chemical Co. operated its 1,000-ton heavy media separation plant from January to August and treated ores from the Small Hopes, Robert E. Emmett, Colorado No. 2, and Colonel Sellers dumps. The middling product made was shipped to the Leadville milling unit, Leadville smelter, Golden Cycle mill, and Combined Metals Reduction Co. plant at Bauer, Utah.

John Hamm Mining & Milling, Ltd., operated its 600-ton gravity-concentration mill the entire year on ores from the Wolftone, A. Y. & Minnie, and Mahala dumps. The middling product was shipped to the Leadville milling unit, Resurrection mill, and Combined Metals Reduction Co. plant at Bauer, Utah.

The American Smelting & Refining Co. shipped a considerable tonnage of slag from the American smelter dump to the Leadville smelter. Paul R. Clark operated the Fortune mine during the first quarter and produced 3,783 tons of zinc-lead ore. Robert L. Jones, operating the Sunday claim under lease from the Garibaldi Lease,

shipped 2,971 tons of zinc-lead ore beginning in March. The Ibex Mining Co. and W. E. Wilson & Co. operated the Ibex mine throughout 1946. The Reynolds-Young Lease operated the Little Jonny claim from January 1 to May 31 and produced 1,353 tons of zinc-lead ore. McCaughlan & Co. operated the Dolly B mine throughout 1946, and produced 1,307 tons of zinc-lead ore and 251 tons of lead smelting ore. John Bogunovich operated the Commerce mine from June through November and produced 976 tons of gold-silver ore. R. C. Nelson operated the New Monarch mine throughout 1946, and produced 998 tons of zinc ore and 358 tons of lead smelting ore. Harry Sundstrom & Co. operated the Valley Lease throughout 1946. Clyde F. Jones operated the Colorado No. 2 claim during August, September, and October and produced 448 tons of lead ore. Other producers operating in the district in 1946, were Bogunovich & Webster (Adelaide mine), Joseph Kerzon (St. Louis mine), Rock Hill Mines Co. (Rock and Dome mines), Eddie Patterson (New Monarch dump), Baillie-Turnipseed Lease (Hummer Lode), M. & K. Mining Co. (Yukon mine), and John Joyce (Breece mine). All of the above producers shipped to the Leadville smelter, Leadville milling unit, or Resurrection mill. A total of 20 ounces of gold and 3 ounces of silver was recovered by a small hand-placer operation on the Key placer.

St. Kevin District.—Markus Thuren operated the Lakewood mine during September and October; the gold-silver ore produced was sent to the Leadville smelter. A total of 11 tons of lead ore was shipped from the St. Kevin mine to the Leadville smelter in October.

LA PLATA COUNTY

California (or La Plata) (Hesperus, La Plata) District.—Producers operating in the district during 1946 and shipping high-grade gold ore or bullion included Bert Thompson, Glen W. & Dean Stewart, A. B. Crosby, and Frank C. Rand, Jr.

MINERAL COUNTY

Creede District.—The Emperius Mining Co. operated its 100-ton flotation mill throughout 1946, on ore from the Commodore, Amethyst, New York, and Del Monte-Aspen groups and Equinox mine. The mill was operated on a three-shift basis 7 days a week and treated 15,433 tons of silver ore, of which 15,153 tons were company ore, averaging 0.0092 ounce of gold and 25.69 ounces of silver per ton and 2.01 percent lead. The company also produced 311 tons of silver ore, containing 2 ounces of gold, 15,495 ounces of silver, and 24,359 pounds of lead, which were sent direct to the Leadville smelter. P. B. Davis shipped 280 tons of silver ore from the Equity dump to the Emperius mill. The New Ridge Mining Co. operated its property throughout 1946, and shipped lead and zinc-lead ores to the Leadville milling unit, Leadville smelter, and Midvale, Utah, concentrator.

MONTEZUMA COUNTY

The Ute Mining Co. operated the Red Arrow group and its 25-ton amalgamation-flotation mill 9 miles northeast of Mancos from May 1 to December 1. A total of 801 tons of gold ore was treated.

MONTROSE COUNTY

La Sal District.—The New Cashin Mines, Inc., operated the Cashin group of claims continuously throughout 1946 and shipped 4,414 tons of copper ore containing 16 ounces of gold, 23,307 ounces of silver, and 297,773 pounds of copper to the Garfield smelter.

OURAY COUNTY

Red Mountain District.—Four properties were productive in the district during 1946. They included, in order of output, the Beaver and Belfast claims, Lost Day mine, Dauntless group, and Red Mountain mine.

Sneffels District.—The largest producer in Ouray County in 1946 was the Camp Bird mine and its 100- to 125-ton amalgamation-flotation mill operated by King Lease, Inc. Development in 1946 included 760 feet of raises, 1,232 feet of drifts, and 1,864 feet of diamond drilling.

Uncompahgre District.—The General Ore Reduction Co. operated its 60-ton mill until July, when it was sold to the American Zinc Lead & Smelting Co. The American Zinc Lead & Smelting Co. immediately began remodeling and enlarging the mill (renamed American No. 1) to approximately 350-ton capacity by adding new equipment and transferring equipment from its Hunter mill in Aurora, Mo. During remodeling, the company continued to operate the original 60-ton unit on company and custom ores. During 1946 the American Zinc Lead & Smelting Co. also acquired the Sonza lease on the Bachelor mine and a lease on the Portland group (in the Uncompahgre district) and the San Antonio group (in the Red Mountain district—part of the San Antonio group lies in San Juan County). Operation of these properties was begun by the company late in 1946. The Bachelor mine was operated under the Sonza lease by J. R. Sonza until the American Zinc Lead & Smelting Co. took possession. The Southwest Metals Co. operated the Michael Breen and Monarch claims throughout 1946 and produced 2,885 tons of zinc-lead ore.

PARK COUNTY

Alma Placers District.—S. F. Bradford operated a nonfloating washing plant on the Alma placer in 1946.

Buckskin District.—The Buckskin Joe Mines, Ltd., operated its Phillips group of mines throughout 1946 and produced 4,011 tons of zinc ore and 41 tons of gold ore. The company mill burned December 12, 1945, and in 1946 the zinc ore was sent to the Resurrection mill at Leadville for beneficiation and gold ore direct to the Leadville smelter. The Niagara Mines, Ltd., operated the Sweet Home and Bluebird claims (part of the Sweet Home group) from February 11 through December 31. A small quantity of gold and silver was recovered from the Buckskin placer.

Consolidated Montgomery District.—John H. Snyder operated the Cresskill and Star claims on Mount Bross from July 1 through October 15; 173 tons of ore containing 39 ounces of gold and 3,079 ounces of silver were shipped to the Leadville smelter.

Fairplay District.—The South Platte Dredging Co. operated its electrically powered connected-bucket dredge (with 103 12-cubic foot buckets) on the Lee Andrews and Cincinnati placers throughout

1946; about 4,844,000 cubic yards of gravel were washed. The Timberline Dredging Co. resumed operation of its dragline dredging operation on the Snowstorm Placers May 17 and operated until November 4; the plant had been idle since 1942. About 440,000 cubic yards of gravel were washed in 1946. A few ounces of gold were recovered in the district by small-scale hand-placer operations.

Freshwater District.—Welsh Industries, Inc., made test shipments of ores from its properties. N. Gow recovered a small quantity of gold by a small-scale hand-placer operation.

Mosquito District.—M. J. Krokicki operated the Orphan Boy mine from June through December and produced 158 tons of zinc-lead ore. R. M. Taylor operated the Hock Hocking group and the Evening Star mine from June 1 to December 15, producing 129 tons of silver ore from the Hock Hocking group and 15 tons of silver ore from the Evening Star mine.

Tarryall District.—Cooley Bros. resumed dredging operations on Tarryall Creek May 19 and worked until December 3, using a Bodinson electric washing plant, 3½-cubic yard dragline, and two bulldozers.

PITKIN COUNTY

Roaring Fork (Aspen) District.—The Midnight Mining Co. operated its Midnight mine and 50-ton selective-flotation mill throughout 1946. A total of 4,990 tons of ore, containing 54,391 ounces of silver, 257,484 pounds of lead, and 214,570 pounds of zinc, was produced, from which 175 tons of lead concentrates containing 38,689 ounces of silver and 130,555 pounds of lead were recovered. Herron Bros. operated its 150-ton gravity-concentration mill on dump ores intermittently during 1946.

RIO GRANDE COUNTY

Summitville District.—The Gold Links Mine operated its mine and 65-ton amalgamation and flotation-concentration mill from January 1 to June 20, and the Summitville Mining Co. operated the property from June 21 throughout the remainder of 1946. A total of about 4,500 tons of ore averaging 0.509 ounce of gold and 0.73 ounce of silver per ton and 0.246 percent copper was treated. Development in 1946 included 100 feet of shaft and 100 feet of drifts.

ROUTT COUNTY

Milbank Franz worked the Greenville mine in the Hahns Peak area during 1946 and shipped 54 tons of zinc ore to the International Smelting & Refining Co.

SAGUACHE COUNTY

Kerber Creek (Bonanza) District.—The Superior Mines Division of the Conejos Corp. operated the Superior-Erie group of mines throughout 1946 and was the largest producer of the five metals in the county. The Pratt-Bonanza Mining & Milling Co. operated its St. Louis mine from January 1 to July 17 and produced 290 tons of ore. Wm. J. Costello operated the Rawley group throughout 1946 and produced 160 tons of lead ore and 221 tons of copper ore. Nicholas Keserich operated the Warwick group intermittently from January 1 to October 15. Other properties producing in the district during

1946 included the Vallejo mine operated by Tom Raymond & Sons, Shawmut mine operated by Geo. R. Smith, and the Cora group operated by Nevada Mines Co.

SAN JUAN COUNTY

Animas District.—The Shenandoah-Dives Mining Co. was the chief producer of metals in San Juan County in 1946. The company worked the Shenandoah-Dives consolidated group of claims on King Solomon Mountain and the Silver Lake group of properties, owned by the American Smelting & Refining Co. In 1946 a total of 175,121 tons of company ore and 3,844 tons of custom ore was milled in the 700-ton Shenandoah-Dives selective-flotation mill. A total of 5,171 tons of concentrates was made, including 2,904 tons of flotation mill concentrates, 1,466 tons of flotation zinc concentrates, and 801 tons of iron-gold-silver-lead table concentrates containing in aggregate 11,941 ounces of gold, 131,095 ounces of silver, 406,885 pounds of copper, 2,234,240 pounds of lead, and 1,666,754 pounds of zinc. Development completed during 1946 included 2,681 feet of drifts, 182 feet of crosscuts, 229 feet of raises, and 741 feet of diamond drilling.

The Denver Equipment Co., as agent, operated the Pride of the West group and Green Mountain mines and the Pride 100-ton selective-flotation mill at Howardsville during 1946 for the owners of the property—Pride of the West, Inc.; 30,972 tons of ore were treated. Development during 1946 included 104 feet of shaft, 910 feet of drifts, and 550 feet of diamond drilling.

Highland Mary Mines, Inc., operated its Highland Mary mine and 100-ton selective-flotation mill in Cunningham Gulch from April 16 to December 31. A total of 19,129 tons of ore, averaging 0.11 ounce of gold and 3.36 ounces of silver per ton and 0.11 percent copper, 2.34 percent lead, and 0.20 percent zinc, was treated. The U. S. Coal Corp. operated the Lark mine throughout 1946. The Osceola mine was operated on lease from March 1 to December 31; 1,008 tons of ore containing 19 ounces of gold, 1,590 ounces of silver, 12,384 pounds of copper, 84,539 pounds of lead, and 124,724 pounds of zinc were produced. Other producing mines in the district included the Coming Wonder and Belcher.

Eureka District.—The Lead Carbonate Mines operated the Lead Carbonate mine from July 1 to December 31. The Foursome Mining Co. operated the Columbus mine throughout 1946 and produced 2,541 tons of zinc-lead ore. A. R. Walker operated the Mountain Queen mine and produced 475 tons of ore containing 14 ounces of gold, 3,815 ounces of silver, 5,928 pounds of copper, 45,612 pounds of lead, and 50,739 pounds of zinc. Other mines in the district from which small quantities of ore were produced included the Toltec No. 3, Tom Moore, and Burrows.

Ice Lake Basin District.—The Bandora mine was operated by the Esmeralda Lease and produced 386 tons of ore containing 39 ounces of gold, 4,899 ounces of silver, 6,655 pounds of copper, 91,298 pounds of lead, and 54,326 pounds of zinc.

SAN MIGUEL COUNTY

Iron Springs District.—The Silver Bell Mines Co. reopened the Silver Bell group and began construction early in 1946 of a 100-ton

flotation-concentration mill at Ophir. The mill was not completed during 1946; however a considerable tonnage of ore from development was treated in test runs from September through December. A small quantity of bullion was shipped from the New Dominion mine to the Denver Mint.

Upper San Miguel (Telluride) District.—Telluride Mines, Inc., operated throughout 1946 on the Smuggler-Union and Montana groups. The ore produced was treated in the company 550-ton amalgamation and gravity- and flotation-concentration mill; no custom ore was treated. Development in the mine in 1946 included 354 feet of raises, 2,773 feet of drifts, and 995 feet of tunnel; the lower level adit, on which work was begun late in 1945, had been driven 1,000 feet by the end of 1946.

The production of the Idarado Mining Co. is credited to San Miguel County, although the property is developed and worked through the 12,000-foot Treasury tunnel, with its portal in Ouray County, because the ore comes from claims in San Miguel County. During 1946 the Idarado Mining Co. continued to develop its Black Bear property through the Treasury tunnel; ore produced was treated in its 300-ton selective-flotation mill. Development in 1946 included 2,351 feet of raises, 14,555 feet of drifts, and 2,399 feet of diamond drilling.

Alta Mines, Inc., operated the Alta-St. Louis mine and its 100-ton flotation mill throughout 1946. Other properties producing in the district included the Breckenridge mine, Juan millsite, Allegheny mine, and Telluride claim. Production from these mines was chiefly gold recovered by amalgamation of high-grade ore.

SUMMIT COUNTY

Breckenridge District.—The Garvie London Gold Mining Co. operated its Country Boy mine throughout 1946 and produced a considerable quantity of zinc ore, which was shipped chiefly to the Resurrection mill for concentration. Development completed during 1946 included 620 feet of drifts and 760 feet of raises. The Sally Barber mine was operated by F. P. Lilly and T. C. Moran under lease and produced about 3,143 tons of zinc ore, which were shipped to the Tooele, Utah, concentrator. Other mines which were operated in the district during 1946 included the Jumbo, Minnie B. Lode, Little Fool, Fredonia, and Virginia. A total of 102 ounces of gold and 22 ounces of silver was produced from placer operations on the Highbar placer and Williams placer.

Green Mountain District.—Walter McDaniel operated the Big Four mine intermittently during 1946 and produced about 169 tons of zinc ore and 54 tons of silver ore.

Montezuma District.—The Florado Mining Co. operated its Pinnacle mine and 100-ton flotation mill intermittently during 1946. The Summit Mining & Milling Co. operated the Silver King mine and its 60-ton flotation mill for a short time early in the spring of 1946. Max L. Bunker operated the Ida Belle group and produced 185 tons of zinc-lead ore, which were shipped to the Resurrection mill and the Leadville milling unit for concentration. Jeffrey & Ulibarri operated the Erickson mine from January 1 to September 10. Small quantities of ore were produced from the Morgan group operated by Rogers Mines,

Inc., and the Bullion group operated under lease by George W. Goodman.

Ten Mile (Kokomo, Robinson) District.—The American Smelting & Refining Co. operated its Kokomo unit (Lucky Strike group, Victory, and Wilson mines) throughout 1946. The greater part of the production was from the Victory mine; development at this property included 300 feet of shaft, 150 feet of drifts, and 10,565 feet of diamond drilling. All the ore produced during 1946, except minor tonnages of high-grade ore sent direct to the Leadville smelter, was sent to the company Leadville milling unit for concentration. The Wilfley Leasing Co. operated the Wilfley mine throughout 1946 and produced 5,795 tons of ore containing 422 ounces of gold, 25,262 ounces of silver, 213,409 pounds of lead, and 1,202,189 pounds of zinc, all of which was sent to the Resurrection mill for concentration. The Kokomo-Kimberly Mines, Inc., operated the Kimberly mine and produced about 2,650 tons of ore. The Snowbank mine was operated by the Clark McKey Development Co. and produced 1,381 tons of zinc-lead ore. Some silver ore was produced from the Queen of the West mine.

TELLER COUNTY

Cripple Creek District.—The Cripple Creek district yielded 33 percent of the total gold production of the State in 1946. From 1891, when gold was discovered in the area, through 1946 the district has yielded 18,572,899 fine ounces of gold valued at $403,625,947, or 48 percent of the State total output of gold from 1858 to 1946, inclusive. The total production of ore from Cripple Creek mines and dumps in 1946 was 298,876 tons—all treated in the Golden Cycle mill (see El Paso County).

Operations of the Golden Cycle Corp., which owns and operates the Golden Cycle mill at Colorado Springs and several mines in the Cripple Creek district, are described in the following extract from its annual report to stockholders for the year ended December 31, 1946 (dated April 14, 1947):

Golden Cycle Mill.—The total tonnage of ore handled at the Golden Cycle mill in West Colorado Springs, for 1946 was the largest since 1942. A total of 306,790 dry tons with a total gross value of $1,972,911 and an average per ton value of $6.43, were treated during the year. This compares with 1939 (our last normal year) when 545,323 tons with a total gross value of $5,592,772 and an average per ton value of $10.26, were treated. Of the total tonnage handled in 1946, 210,282 tons or 70 percent were low-grade dump ore and the balance of 30 percent was mine ore.

During the past year a considerable amount of rehabilitation of the equipment in various mill departments was done. It was necessary to do this since, due to the lack of labor, materials, etc., it had been impossible during the war years to do all of the essential maintenance work which was absolutely necessary.

Metal Mining Operations.—Total ore production of the Golden Cycle-Cripple Creek mining operations for 1946 was 108,805 tons with a total gross value of $682,617 and an average per ton value of $6.27. Of this tonnage, however, 84,555 tons with a total gross value of $215,342 and an average per ton value of $2.55 were shipped from the Granite and Dillon dump operations on the Ajax mine. In addition, operating as a lessee, the Golden Cycle Corp. shipped from the Theresa dump, owned by the United Gold Mines Co., 93,353 tons of ore with a total gross value of $297,153 and an average per ton value of $3.18.

Ajax Operation.—In 1946 company and lessee operations produced and shipped a total of 20,303 tons of ore with a total gross value of $432,297 and an average per ton value of $21.29.

Development work during the year amounted to a total of 3,413 feet of drifts, crosscuts, and raises.

Anchoria Leland.—During 1946 all work on this property was done by lessees with a total of 1,298 feet of drifts, crosscuts and raises driven. A total of 3,862 tons of ore with a total gross value of $34,541 and an average per ton value of $8.94, were produced and shipped during the year.

Cameron and Index.—During 1946 lessees shipped 3 cars of dump material from these two properties.

Carlton Drainage Tunnel.—During 1946 water continued to flow from the Carlton drainage tunnel at the rate of approximately 4,000 gallons per minute. No trouble of any kind was experienced with tunnel operations.

The annual report of the United Gold Mines Co., an operating and holding company for property scattered throughout the Cripple Creek district, for the year ended December 31, 1946 (dated February 1, 1947), gives the following details on operations at individual mines:

Net loss for 1946 was $62,007 vs. net loss in 1945 of $408, a loss increase of $61,599. Current assets at the close of 1946 were $100,235 vs. current assets of $169,349, in 1945 a decrease of $69,114. Taxes of all kinds paid in 1946 were $11,427, compared to $11,253 in 1945, an increase of $174.

During 1946 a total of 11,274 feet of work was done consisting of 2,560 feet of drifts and crosscuts on the Vindicator and Portland properties by the company, and 8,714 feet of development work by the lessees.

Total production during 1946 was 149,366 tons of ore with a gross value of $700,629, an average per ton value of $4.69.

Production of company ore by United Gold Mines Co. in 1946

Mine	Net tons	Gross value [1]	Company or cash receipts	Average gross value per ton [1]
Vindicator	3,055	$12,295	$3,033	$4.02
Portland	5,072	37,751	19,574	7.44
No. 2 plant	16,818	58,343	11,032	3.47
Cycle dump	93,353	297,153	23,561	3.18
Total	118,298	405,542	57,200	3.43

[1] Gross value calculated at settlement value.

Production of lessee ore of United Gold Mines Co. in 1946

Group	Net tons	Gross value [1]	Royalties received	Lessees' receipts	Average gross value per ton [1]
Vindicator	18,202	$131,515	$28,008	$37,891	$7.23
Rose Nichol	255	1,587	119	635	6.23
Portland	5,832	106,550	38,986	38,296	18.27
Bull Hill	6,780	55,435	4,618	24,768	8.17
Total	31,069	295,087	71,731	101,590	9.50

[1] Settlement value.

Production of properties of United Gold Mines Co. before and after organization of the company (May 15, 1902) to Dec. 31, 1946

	New tons	Gross value [1]
Ore mined before consolidation	26,310	$456,806
Production under operation of United Gold Mines Co	2,768,569	27,016,542
Total to Dec. 31, 1946	2,794,879	27,473,348

[1] Settlement value.

The annual report of the Cresson Consolidated Gold Mining & Milling Co. for the calendar year 1946 (dated February 1, 1947), says—

After the resumption of operations on April 1, 1946, some progress was made toward normal operations. However, on the afternoon of July 22, the Cresson mine suffered one of the worst catastrophes in its long history. The surface commenced caving not far from the Cresson shaft, and within a space of minutes the blacksmith shop, the trestle work, and some of the other mine buildings disappeared in the large surface hole created by the cave-in. Before caving had stopped the steel shop, the warehouse and upper end of the tramway were pulled into the cavity and from this wreckage only a small amount of equipment was saved.

Immediately after the cave-in work was started to fill in the tremendous cavity with dump and waste material. It was necessary to remove remaining buildings which were in jeopardy of being lost down the hole.

Our engineers estimate that at least 120,000 yards of waste were poured into the hole.

Operations were again resumed on the Cresson mine October 21, and are now continuing. During the year development consisted of 984 feet of drifts, crosscuts and raises.

Production of Cresson Consolidated Gold Mining & Milling Co., 1903 to Dec. 31, 1946

Period	Dry short tons	Gross value [1]	Freight and treatment	Net value
1903 to Dec. 31, 1945	3,218,358	$46,471,267	$15,352,230	$31,119,037
1946:				
Company ore	2,146	21,466	9,295	12,172
Lessee ore	14,828	178,324	66,029	112,295
1903 to Dec. 31, 1946	3,235,332	46,671,057	15,427,554	31,243,504

Period	Royalties received by company	Amount paid lessees	Average gross value per ton	Average net value per ton	Dividends
1903 to Dec. 31, 1945			$14.44	$9.67	$13,564,673
1946:					
Company ore			10.00	5.67	
Lessee ore	$59,295	$53,000	12.03	7.57	
1903 to Dec. 31, 1946			14.43	9.66	[2] 13,564,673

[1] Settlement value.
[2] Represents 29.06 percent of gross value and 43.42 percent of net value.

Shipments from the Stratton Estate properties in 1946 totaled 10,376 tons of ore containing 2,525 ounces of gold. Ore was produced by lessees operating on the Orpha May, Favorite, Geneva, Logan, and Proper claims. Mines, Inc., carried on an extensive sampling program of several properties of the Stratton Estate on Globe Hill; the samples were sent to the Golden Cycle mill for testing. Among other mines and dumps operating in the Cripple Creek district in 1946, in order of output, were the Acacia, Free Coinage, Le Clair, Strong, Joe Dandy, Empire Lee, Gold King, and Elkton.

Eastern States
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

ECONOMIC conditions in 1946 were generally favorable for copper, lead, and zinc mining but afforded no incentive for resumption of gold mining in the Eastern States. Since 1943 nearly all the output of gold and silver has been incidental to the production of other metals. The labor shortage was ameliorated gradually during 1946, and a number of the base metal mines stepped up production rates. The output of lead increased 8 percent and copper 3 percent over 1945. During several months of 1946 zinc production was unusually low, as labor strikes interrupted operations at certain mines. Because of the strikes and of the closing in January of a low-grade open-pit mine that had been an important producer since October 1943, the output of zinc again decreased 11 percent. The removal of price ceilings from base metals, effective November 11, 1946, was a propitious event for the copper-, lead-, and zinc-mining industry of the Eastern States. Some of the mines operated throughout the nearly 5 years during which the Premium Price Plan served as an adjunct to price control without receiving a premium on any part of their output. Premium and overceiling payments in 1946, calculated on the entire Eastern States output, averaged about 3 cents a pound of recoverable copper, 0.13 cent a pound of lead, and 0.38 cent a pound of zinc. As the last price ceilings were 14.375 cents for copper, 8.25 cents for lead, and 9.25 cents for zinc, the advance in the free-market price of copper to 19.5 cents, lead to 12.5 cents, and zinc to 10.5 cents from November 11 through December raised materially the average prices received by the mines.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported, except that of zinc in New Jersey, has been calculated at the prices in the following table. The value of the New Jersey output is the total value of the

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per ounce fine	*Per ounce fine*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver, 1942 to June 30, 1946: $0.71111111; July 1, 1946 to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

zinc recoverable as metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

Annual figures for the 5 years ended with 1946 are given in the table that follows. The figures for tonnage of ore sold or treated do not include magnetite ore containing pyrite and chalcopyrite, from which copper, gold, and silver were recovered as byproducts.

Mine production of gold, silver, copper, lead, and zinc in the Eastern States, 1942–46, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons) [1]	Gold (lode and placer) [2]		Silver (lode and placer) [3]	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1942	36	17	4,130,226	14,699	$514,465	105,307	$74,885
1943	29	3	4,211,961	2,878	100,730	128,129	91,114
1944	26	2	4,202,461	2,595	90,825	124,006	88,182

Total 1946	1,432	76,964	12,850	5,579	138,488

Gold.—There was little activity in gold mining in the Eastern States in 1946. Individuals recovered 22 fine ounces of gold from placer mines in Georgia and Alabama. Gold was recovered as a byproduct from magnetite-pyrite-chalcopyrite ore from the Cornwall mine, Lebanon County, Pa.; from copper ore from the Elizabeth mine, Orange County, Vt.; and from copper-iron-zinc ore from the Tennessee Copper Co. mines, Polk County, Tenn. Output of gold in the Southern Appalachian States from 1799 to 1946 is estimated as follows:

Mine production of gold in the Southern Appalachian States, 1799–1946

State	Period	Fine ounces	Value	State	Period	Fine ounces	Value
Alabama	1830–1946	49,495	$1,198,985	South Carolina	1829–1946	318,801	$7,562,125
Georgia	1830–1946	870,547	18,084,992	Tennessee	1831–1946	20,965	481,405
Maryland	(1) –1946	6,102	163,940	Virginia	1828–1946	167,558	3,577,509
North Carolina	1799–1946	1,164,588	24,327,843	Total	1799–1946	2,598,056	55,396,799

[1] Year of first production not recorded.

Silver.—The mine output of silver in the Eastern States in 1946 comprised 35,275 fine ounces recovered from copper ore from Vermont, 18,016 ounces from copper-iron-zinc ore from Tennessee, 15,786 ounces from zinc-lead ore from New York, and 7,887 ounces from magnetite-pyrite-chalcopyrite ore from Pennsylvania.

Copper.—Production of recoverable copper in the Eastern States in 1946 totaled 25,700,000 pounds, a 3-percent increase over 1945. The Tennessee Copper Co., operating copper-iron-zinc mines in the Ducktown district of Tennessee, continued to be the leading producer of copper; the output from these mines increased slightly over 1945. Output by the Elizabeth mine, Orange County, Vt., operated by the Vermont Copper Co., increased sharply. The Bethlehem Steel Co. continued to recover copper as a byproduct in treating magnetite ore containing pyrite and chalcopyrite from the Cornwall mine in Lebanon County, Pa.

Lead.—Zinc-lead and zinc-iron-lead sulfide ores from the Austinville mine in Virginia and the Balmat in New York yielded the bulk of the Eastern States lead output in 1946; the rest was recovered from lead carbonate ore shipped from the Embree mine in Tennessee. The

total output was 5,579 tons compared with 5,159 tons in 1945.

Zinc.—Decreasing 11 percent annually the past 3 years, the mine output of recoverable zinc in the Eastern States dropped to 138,488 tons in 1946 from 199,233 tons in 1943. The decrease in 1946 was due largely to labor strikes, which shut down two mines in New Jersey for 2 months and five mines in Tennessee for 3 months; another contributing factor was exhaustion in January of the Shallow Ore open-pit ore body at New Market, Tenn. The New Jersey output of zinc decreased 21 percent and the Tennessee output 27 percent from 1945. In New York and Virginia zinc production increased 30 percent and 5 percent, respectively, as operations were nearly continuous and more men became available for work in the mines. Several of the large mines still received no Government premium for any part of their output, and only 7 percent of the total "mine" value of the zinc concentrates (calculated for all concentrates upon the basis of the average grade and value reported for the New York, Tennessee, and Virginia concentrates) represented premium payments for overquota production.

In the 4-year period 1942–45 the domestic mine output of zinc totaled 2,845,221 tons, and overceiling payments on zinc recorded by the Office of Price Administration amounted to $121,209,474. In the same period mines in the Eastern States produced 731,638 tons of zinc—26 percent of the total production—and received $4,084,118 (figures compiled from reports of mine operators)—only 3.4 percent of the total premium payments. The calculated premium per pound of zinc averaged 0.28 cent on the Eastern States output compared with 2.77 cents on the rest of the domestic output. In 1946 there was a general increase in premium payments to compensate the general wage increase; the payments on the Eastern States output averaged 0.38 cent per pound of zinc. The rise in the ceiling price from 8.25 to 9.25 cents October 14 and the advance in the market price to 10.50 cents upon removal of the ceiling November 11 raised materially the average total price received by Eastern States mines and improved the outlook for increased production and greater activity in prospecting and development.

MINE PRODUCTION BY STATES

Mine production of gold, silver, copper, lead, and zinc in the Eastern States in 1946, by States, in terms of recovered metals

State	Mines producing		Ore (short tons)	Gold			Silver (all lode)	
				Fine ounces		Total value	Fine ounces	Total value
	Lode	Placer		Lode	Placer			
Alabama		1			1	$35		
Georgia		4			21	735		
New Jersey	2		413,755					
New York	3		392,266				15,786	$12,755

1945 [3]	24,910,000	3,362,850	5,159	887,348	156,269	31,520,742	35,894,234

[1] Ore is magnetite-pyrite-chalcopyrite, flotation copper concentrates from which yielded gold, silver, and copper; Bureau of Mines not at liberty to publish figures for ore.
[2] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.
[3] No production from Georgia in 1945.
[4] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[5] Data for copper in Pennsylvania and Vermont included with Tennessee; Bureau of Mines not at liberty to publish separate figures.

MINING INDUSTRY

With operations at some of the zinc mines interrupted by labor strikes, the quantity of zinc ore mined in the Eastern States decreased 31 percent in 1946 from 1945. The two mines producing zinc-lead ore operated steadily, and their combined output of ore increased 11 percent. The tonnage of straight lead ore mined was small. The output of copper ore increased 4 percent over 1945. The magnetite-pyrite-chalcopyrite ore mined in Pennsylvania, which yields copper, gold, and silver as byproducts, is classed as iron ore and is not included in the figures for crude ore given in the tables of this chapter. In the table on ore classification that follows, the copper recovered from the magnetite ore is included with that from copper ore, and the gold and silver are shown separately. No gold ore was reported mined in the Eastern States in 1946, but 22 ounces of gold were recovered from placer gravel. Most of the base-metal ores yield byproducts (besides gold and silver), the values of which are not shown in the tables of this chapter but would have to be considered to show the full value of the crude ore mined. The byproducts include pyrite concentrates (used in making sulfuric acid and iron sinter), sulfur dioxide gas (used in making sulfuric acid), produced in roasting sulfide concentrates, spiegeleisen, and mill tailings (used for agricultural lime, concrete, and other purposes). Mine development work and exploratory drilling reported by the companies decreased from 1945 in total footages for drifting and drilling and increased in the footage for shaft sinking. The Bureau of Mines continued to investigate sources of strategic minerals; the work done included diamond drilling (on copper deposits in Orange County, Vt.), field examinations, and tests of ore-treatment methods.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in the Eastern States in 1946, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (short tons)	Zinc (short tons)
Copper ore	1,139,692	260	53,291	[1] 25,700,000	----------	[2]
Magnetite-pyrite-chalcopyrite ore	[3]	1,150	7,887	[1]	----------	----------
Zinc ore	1,342,233	----------	----------	----------	----------	96,986
Zinc-lead ore	[4] 754,075	----------	15,786	----------	5,579	[2] 41,502
Total, all lode mines	[5] 3,236,000	1,410	76,964	25,700,000	5,579	138,488
Placer	----------	22	----------	----------	----------	----------
Total: 1946	[5] 3,236,000	1,432	76,964	25,700,000	5,579	138,488
1945	[5] 3,718,073	1,857	81,983	24,910,000	5,159	156,269

[1] Copper from magnetite-pyrite-chalcopyrite ore included with that from copper ore.
[2] Zinc from copper ore included with that from zinc-lead ore; Bureau of Mines not at liberty to publish separate figures.
[3] Bureau of Mines not at liberty to publish separate figures for ore.
[4] Includes small tonnage of lead ore.
[5] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

METALLURGIC INDUSTRY

The 4,000-ton Mascot mill in Knox County, Tenn.—equipped with a differential density (sink-and float) preliminary concentration unit, jigs, and flotation machines, and treating straight zinc ore—had the largest crude-ore capacity of any mill treating ores of copper, lead, or zinc in the Eastern States in 1946, although some of the mills treating higher-grade ore produced a larger tonnage of concentrates. The methods of treatment used in the mills and other operating details, including the tonnage and grade of the concentrates produced by some of the mills, are given in the Review by States that follows. Most of the concentrates were shipped to smelters operated by the companies that own the mines. No amalgamation or cyanidation mills were operated. Concentrates smelted (74,319 tons) yielded 1,410 ounces of gold and 76,964 ounces of silver; the tonnage of concentrates does not include material yielding no gold or silver. The total for concentrates (including low-grade concentrates shipped to oxide plants) was 534,003 tons. Direct-smelting ore (125,240 tons) treated was credited with no yield of gold or silver, as the quantity of these metals contained in the ore was very small and any recovery made would be accounted for in the gold and silver recovered from concentrates.

REVIEW BY STATES

ALABAMA

Gold dust containing about 1 ounce of fine gold was recovered by sluicing on the Hog Mountain mine property near Alexander City, Tallapoosa County.

GEORGIA

In 1946 individuals recovered a total of 21 fine ounces of gold from the Baggs Branch, Battle Branch, Consolidated, and Mill Creek

placers in Lumpkin County and the Kin Mori placer in Dawson County. The old Calhoun gold mine in Lumpkin County was under development by Calhoun Mines, Inc., which drove 530 feet of tunnel and 140 feet of drifts.

NEW JERSEY

Although the zinc mines in New Jersey were idle from June 17 to August 17 because of a labor strike, the State continued in 1946 to be the leading producer of zinc in the Eastern States and ranked third in the United States. The State output of recoverable zinc as metal or in oxide was 64,454 tons compared with 81,392 tons in 1945. Crude ore hoisted totaled 412,544 tons in 1946 compared with 516,225 tons in 1945. In addition to the crude ore milled, 1,211 tons of old tailings were remilled in 1946 and 5,952 tons in 1945. The operating mines in both years were the Mine Hill at Franklin and the Sterling Hill at Ogdensburg, Sussex County. The commercial ore minerals comprise chiefly franklinite (zinc-iron-manganese oxide) and willemite (zinc silicate) but also include zincite (red oxide of zinc). In reduction of the ore the franklinite is removed from the crushed ore by magnetic separators, and the willemite and zincite are concentrated on jigs and tables. The concentrates are shipped to smelting and manufacturing plants at Palmerton, Pa. The franklinite is used in the manufacture of zinc oxide and spiegeleisen, and the willemite-zincite concentrate is smelted to produce high-grade slab zinc.

The value of the New Jersey output of zinc given in the table of this chapter under the heading "Mine Production by States" is the combined value of the zinc recoverable in both metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

Copper deposits in New Jersey were worked or prospected intermittently from Colonial days up to about 1912, and a little silver was reported recovered from some of the copper ore. Copper and lead smelters and refineries at Carteret and Perth Amboy treat ores, scrap, byproducts, and bullion from various States and foreign countries.

NEW YORK

Largely as the result of improvement in labor supply, zinc production in New York rose 30 percent and lead 24 percent in 1946 over 1945. The figures for recoverable metals were 32,515 tons of zinc and 1,073 tons of lead in 1946 compared with 24,978 and 862 tons, respectively, in 1945. The silver production, which is incidental to that of zinc and lead, was 15,786 ounces in 1946 and 14,271 ounces in 1945. The mines are in St. Lawrence County east and southeast of Gouverneur. The principal producers were the Balmat at Sylvan Lake and the Edwards at the town of Edwards, both owned and operated by the St. Joseph Lead Co. The Balmat is opened by a 2,907-foot, 40° inclined shaft, 252 feet of which were sunk in 1946. The ore contains zinc, iron, and lead sulfides, with some silver associated with the lead; it is treated in the 1,200-ton selective flotation mill at the mine. The mill is described in a recent publication.[1] The mill feed in 1946 totaled 262,197 tons; it yielded 1,795 tons of lead concentrates containing 61.01 percent lead and 11.28 ounces of silver

[1] Casale, James, St. Joe's Balmat Mill—Problem in Four Dimensions: Eng. and Min. Jour., vol. 147, No. 11, November 1946, pp. 56–62.

to the ton, 43,405 tons of zinc concentrates containing 57.26 percent zinc, and 54,467 tons of pyrite concentrates containing 41.69 percent iron and about 49 percent sulfur. The Edwards mine, equipped with a 600-ton flotation mill, was operated through a vertical shaft 1,560 feet deep and an underground shaft (inclined 42° from horizontal) 1,226 feet to the mine workings. Ore treated totaled 106,080 tons yielding 15,634 tons of zinc concentrates containing 59.15 percent zinc. The zinc concentrates from both mills were shipped to the company smelter at Josephtown, Pa.; the lead concentrates from the Balmat mill were shipped to the company Herculaneum, Mo., smelter. The pyrite concentrates were sold to sulfuric acid plants. The Universal Exploration Co. Hyatt mine, equipped with a 200-ton flotation mill, increased output in 1946 and was a substantial producer of zinc. The mine shaft is 450 feet deep. Development work in 1946 totaled 264 feet of drifts and 281 feet of diamond drilling. The concentrates were shipped to the Donora, Pa., smelter.

No commercial mine output of gold or copper in New York has been reported during the period covered by the annual mine canvass, which was begun in 1907. The Phelps Dodge Refining Corp. has a custom copper smelter and an electrolytic refinery at Laurel Hill, which treat copper ore, matte, bullion, and copper-bearing scrap material.

NORTH CAROLINA

North Carolina ordinarily produces gold, silver, and copper but had no output in 1945 or 1946. The Condor (old Howie) mine near Waxhaw, Union County, equipped with a 125-ton cyanidation mill, was the leading producer of gold in the State when war restrictions on gold mining caused it to shut down in October 1942. Reopening has been held in abeyance since the restrictions were removed July 1, 1945 because of high wage levels and scarcity of labor. An account of exploratory drilling by the Bureau of Mines at the Cline mine, Cabarrus County, has been published.[2]

PENNSYLVANIA

The gold, silver, and copper produced in Pennsylvania are by-products recovered in treating magnetite-pyrite-chalcopyrite ore from the Cornwall mine of the Bethlehem Steel Co., in Lebanon County. The ore is mined from an open pit and two underground mines. It is crushed to about 1-inch size at the mines in Cornwall and shipped in 70-ton hopper-bottom railroad cars to the treatment plants at Lebanon, which comprise a combined magnetic concentration and flotation mill and a sintering plant. The magnetic concentration equipment has a daily capacity of 6,000 tons, the flotation equipment 2,200 tons, and the sintering plant 2,400 tons. Part of the magnetic product is shipped to another sintering plant at Bethlehem. The flotation equipment treats tailings from the magnetic separators for the recovery of copper concentrates, which contain most of the gold and silver, and pyrite concentrates, which contain cobalt. The copper concentrates are shipped to a custom smelter and the pyrite concentrates to plants equipped for recovery of sulfur

[2] Beck, William A., Exploration at the Cline mine, Cabarrus County, N. C., Bureau of Mines Rept. of Investigations 3873, 1946, 4 pp.

(as sulfuric acid) and cobalt; the final pyrite residue is sintered and shipped to an iron and steel plant.

The zinc mines in Pennsylvania have been idle for many years. Zinc smelters at Donora, Langeloth, Josephtown, and Palmerton treat most of the zinc concentrates produced in the Eastern States, as well as large tonnages from the Central States and foreign countries. There is a roasting plant for concentrates at New Castle and an electrogalvanizing plant for sheets at Johnstown uses roasted zinc concentrates.

SOUTH CAROLINA

The Haile mine, Lancaster County, leading producer of gold in South Carolina and the Eastern States from 1938 to 1942, was shut down in September 1942 because of the diminishing supply of labor and materials available for gold mining under war conditions. The mine, equipped with a 400-ton cyanide mill, is owned by the Haile Gold Mines, Inc. The company reported at the end of 1946 that the date of reopening depends entirely upon labor conditions.

TENNESSEE

Zinc production in Tennessee in 1946 (the lowest since 1936) totaled 24,614 tons, in terms of recoverable metal, compared with 33,824 tons in 1945. The decrease was caused by the labor strike lasting from February 2 to May 6 at the American Zinc Co. mines in Knox and Jefferson Counties and exhaustion in January of the company Shallow Ore open-pit ore body at New Market. The output of lead was 125 tons compared with 54 tons in 1945. Gold production decreased from 148 fine ounces in 1945 to 95 ounces in 1946 and silver from 35,391 to 18,016 ounces. Copper production increased slightly in 1946.

The gold, silver, and copper and considerable zinc came from the Tennessee Copper Co. Burra Burra, Boyd, Calloway, and Eureka mines at Ducktown, Polk County. The ore was mined at depths ranging from 750 to 2,400 feet and hoisted through vertical shafts. Development work done at the 4 mines in 1946 totaled 93 feet of shaft, 9,084 feet of drifts, and 6,927 feet of diamond drilling. The ore contains heavy sulfides of iron, copper, and zinc; most of that mined in 1946 was concentrated by selective flotation in the London and Isabella mills, which together had a combined daily capacity of 3,000 tons at the end of the year. Some of the ore was smelted direct in a blast furnace in the company smelter at Copperhill. The copper concentrates from the mills were smelted in a reverberatory furnace. The matte from the reverberatory and blast furnaces was treated in a converter. Part of the blister copper from the converter was cast into pigs and shipped to an electrolytic refinery on the Atlantic seaboard where some gold and silver were recovered. Production of shot copper (used in making copper sulfate in the plant adjoining the smelter) increased in 1946; as a result, more of the gold and silver accumulated in the shot copper residue, and less was available for sale than in 1945. The iron concentrates were used in making sulfuric acid in the company plants at Copperhill and Isabella; they also yielded iron sinter, which was sold to iron and steel plants. Sulfur dioxide gas from the blast furnace and copper converter was also used in making sulfuric acid.

The zinc concentrates were sold to custom smelters. Smelter slag was screened and sized for sale, mostly as railroad ballast, road material, concrete aggregate, and roofing granules.

Most of the State zinc output comes from the Mascot-New Market-Jefferson City or East Tennessee district in Knox and Jefferson Counties. The district production in 1946 was the lowest since 1935. The American Zinc Co. Mascot No. 2, Mascot Graves, Grasselli, Jarnagin, and Mossy Creek mines were shut down from February 2 to May 6 by a labor strike. The company Shallow Ore open-pit mine was closed in January owing to exhaustion of the ore body; its total output from the beginning of operations in October 1943 through January 1946 was 812,565 tons of crude ore yielding 26,413 tons of concentrates averaging 60.92 percent zinc. The Mascot mines are worked through a 520-foot vertical shaft and an inclined shaft from the 520-foot level to the maximum depth of 850 feet. The Grasselli ore-hoisting shaft is 350 feet deep, and the Jarnagin shaft is 280 feet deep. The Mossy Creek mine is opened by 249-foot incline shaft. The ore from all five mines was concentrated in the 4,000-ton mill at the Mascot No. 2 mine. The mill is equipped with a differential-density (sink-and-float) cone unit, jigs, and flotation machines. Ore treated in 1946 totaled 569,862 tons yielding 26,176 tons of 61.57-percent zinc concentrates compared with 1,119,569 tons in 1945 yielding 45,520 tons of 61-percent concentrates. The mill tailings, chiefly limestone, are sent to the byproduct plant to be prepared for sale as railroad ballast, commercial stone, sand, or a pulverized product. Data extracted from the annual company report to stockholders follow. Surface drilling done during the year totaled 49,794 feet, underground drilling 10,407 feet, and drifting, raising, and slabbing 5,043 feet. Surface drilling results were very satisfactory. Mineral rights were purchased on additional Jefferson County properties. Ore reserves on company-owned properties in Knox and Jefferson Counties were reduced by approximately 8,023 tons of concentrates. Ore reserves on the Grasselli property were increased 16,656 tons of concentrates, making a net gain in ore reserves of 8,633 tons of concentrates. The total reserves at the end of 1946 were the highest ever recorded.

The Universal Exploration Co. Davis-Bible group of mines and 800-ton flotation mill near Jefferson City operated continuously in 1946. The output of concentrates increased over 1945. The grade of the concentrates is exceptionally high; those shipped from 1930 through 1946 averaged 64.58 percent zinc. Two shafts 180 and 240 feet deep were operated. Development during the year totaled 1,048 feet of drifts, 1,430 feet of diamond drilling, and 9,377 feet of churn drilling. The mill is equipped with crushers, rod mills, and flotation machines. The mill tailings are sold, mostly for use as agricultural lime. The company shipped ore from the Straight Creek mine near New Tazewell, Claiborne County, in November and December but abandoned the property December 16. Data on some of the Bureau of Mines exploratory drilling in this county have been published.[3] The Tennessee Zinc Co. operated the Embreeville group in Washington and Unicoi Counties. The ore was concentrated by washing,

[3] Sayrs, Richard L., Exploration of Stiner and Bunch Hollow Zinc Properties, Powell River Area, Union and Claiborne Counties, Tenn.: Bureau of Mines Rept. of Investigations 3856, 1946, 4 pp.

jigging, tabling, and drying. Most of the concentrate output was zinc carbonate; the rest was lead carbonate. The company sank a 140-foot shaft and drove 500 feet of tunnel during the year. In Cannon County the Hoover (Gaither) mine east of Murfreesboro, equipped with a 25-ton mill, continued to produce about a car of zinc sulfide concentrates monthly.

VERMONT

The Vermont Copper Co. operated the Elizabeth mine and 500-ton flotation mill in Orange County throughout 1946. The output of copper increased sharply over 1945. Revised figures on mine-development footage show that the haulage adit is 1,300 feet long and that the underground 30° inclined shaft opening up working levels on the vein is 825 feet long. Sinking of another shaft 450 feet on a 60° incline was completed in 1946. Other development done during the year included 2,163 feet of drifts and crosscuts, 348 feet of raises, and 1,355 feet of diamond drilling. The ore minerals are chalcopyrite and pyrrhotite, carrying some silver and a little gold. The concentrates produced averaged 23.50 percent copper (wet assay) and 0.013 ounce of gold and 2.73 ounces of silver to the ton; they were shipped to the Phelps Dodge smelter at Laurel Hill, N. Y. The Bureau of Mines did diamond drilling at the Ely mine near South Strafford during September and October.

VIRGINIA

The output of recoverable zinc in Virginia was 16,905 tons and of lead 4,381 tons in 1946 compared with 16,075 and 4,243 tons, respectively, in 1945. The Austinville mine, Wythe County, which has been in continuous operation since 1924, operated at a slightly higher average monthly rate than in 1945; the ore is treated in a 2,000-ton flotation mill at the mine. No output of gold, silver, or copper was reported in the State in 1946. The Toncrae Mining Co. reported progress on constructing a plant to heap-roast and leach ore and precipitate copper at the Toncrae mine, Floyd County.

Idaho
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

GENERAL SUMMARY

UNLIKE other Western States, Idaho was not affected by a serious labor strike in 1946; but it was still plagued by a shortage of labor, which caused further declines in the output of silver, lead, zinc, and copper. However, the output of gold in Idaho increased greatly in 1946, owing principally to resumption of dredging at placer properties after being closed since October 8, 1942, when War Production Board Order L–208 suspended nearly all gold mining. In 1946 the State output of gold rose to 42,975 fine ounces from 17,780 fine ounces in 1945. The output of silver declined from 8,142,667 fine ounces to 6,491,104 (20 percent); copper, from 3,096,000 pounds to 2,076,000 (33 percent); lead, from 136,894,000 pounds to 119,974,000 (12 percent); and zinc, from 166,926,000 pounds to 143,014,000 (14 percent). The output of gold in 1946 was the largest for any year since 1942; silver, the smallest since 1922; copper, the smallest since 1934; lead, the smallest since 1899; and zinc, the smallest since 1940. However, the State remained the largest producer of silver and zinc in the United States and the second largest producer of lead (exceeded only by Missouri). The total value of the gold was $1,504,125—4 percent of the State total value; silver, $5,244,812—14 percent; copper, $336,312—1 percent; lead, $13,077,166—35 percent; and zinc, $17,447,708—46 percent. The total value of the five metals was $37,610,123 in 1946 compared with $37,799,975 in 1945. About 87 percent of the State silver production, 78 percent of the copper, 94 percent of the lead, and 94 percent of the zinc came from the Coeur d'Alene region of Shoshone County; the rest of the silver, copper, lead, and zinc came largely from the Warm Springs district in Blaine County.

Nearly 87 percent of the State gold production came from the Yellow Pine district in Valley County, Middle Boise (Atlanta) district in

Elmore County, Boise Basin district in Boise County, Yankee Fork district in Custer County, and Warm Springs district in Blaine County.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1 to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Idaho, 1942–46, and total, 1863–1946, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1942	203	236	2,900,704	95,020	$3,325,700	14,644,890	$10,414,144

Grand total placer:					
1942	238	9,098,217	44,580	1,560,300	.171
1943	30	29,750	255	8,925	.300
1944	20	15,867	136	4,760	.300
1945	27	270,533	1,769	61,915	.229
1946	71	4,178,023	20,123	704,305	.169

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

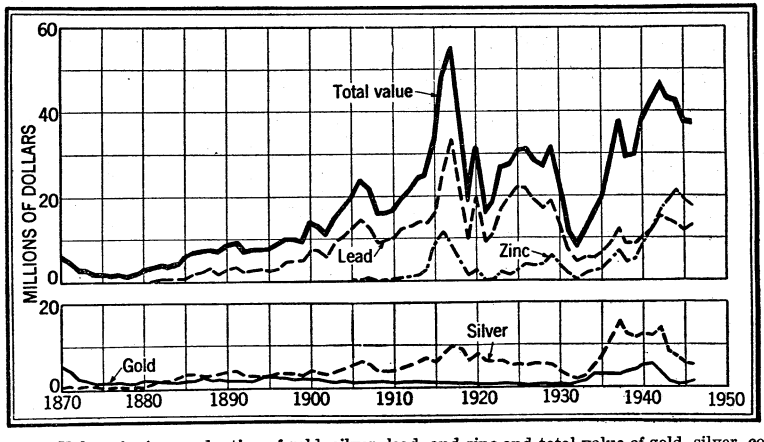

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1946. The value of copper has been less than $2,000,000 annually, except in a few years.

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1946, by months, in terms of recovered metals

	Gold (ounces)	Silver (ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
January	1,100	420,000	140,000	11,900,000	13,000,000
February	720	505,000	176,000	11,400,000	12,700,000
March	1,880	525,000	174,000	11,900,000	14,000,000
April	2,000	455,000	150,000	11,100,000	12,300,000
May	5,400	454,104	120,000	9,600,000	11,500,000
June	5,580	440,000	180,000	8,066,000	11,600,000
July	5,750	505,000	180,000	8,500,000	10,600,000
August	5,570	557,000	180,000	9,100,000	11,200,000
September	3,650	510,000	178,000	9,100,000	11,100,000
October	2,750	510,000	172,000	9,150,000	11,414,000
November	3,750	592,000	230,000	9,150,000	11,500,000
December	4,825	1,018,000	196,000	11,008,000	12,100,000
Total 1946	42,975	6,491,104	2,076,000	119,974,000	143,014,000

Gold.—Despite an increase of 142 percent in output of recoverable gold from mines in Idaho in 1946 compared with 1945, the output was far below that during the years before the war. The yield of gold from lode mines increased from 16,011 ounces in 1945 to 22,852 in 1946 and that from placer properties from 1,769 ounces to 20,123. This marked increase in output of gold from placer properties resulted principally from resumption, during the spring months of 1946, of dredging in the Boise Basin, Yankee Fork, Middle Boise, Elk City, Orogrande, and Gibbonsville districts. Seven bucket dredges and six dragline dredges treated about 4,131,000 cubic yards of gravel in 1946 and recovered 19,720 fine ounces of gold and 6,370 fine ounces of silver. The Bradley Mining Co., operating the Yellow Pine mine at Stibnite, treated more gold-silver-antimony ore in its flotation plant in 1946 than in 1945 and became the largest producer of gold in Idaho. The Talache Mines, Inc., operating a lode property at Atlanta, ranked second in gold output and was followed by the Snake River Mining Co. (bucket dredge) at Sunbeam, Baumhoff & Marshall (formerly Fisher-Baumhoff Co.) (two bucket dredges) near Centerville, Pyramid Mining Co. (bucket dredge) near Twin Springs, Triumph mine at Triumph, Idaho-Canadian Dredging Co. (bucket dredge) at Idaho City, and Smith Bros. & Courtis, Inc. (dragline dredge) near Gibbonsville. Of the total gold produced in Idaho in 1946, more than 40 percent came from bucket dredging, 39 percent from gold ore, 13 percent from zinc-lead ore, and most of the remainder from dragline dredging.

Silver.—Idaho's production of recoverable silver has dropped every year except 1940 since 1937; the largest production was in 1937, when 19,587,766 fine ounces were produced. In 1946 the output was 6,491,104 fine ounces compared with 8,142,667 fine ounces in 1945; nevertheless, the State remained the largest producer of silver in the United States—a place it has held since 1933. The loss in 1946 resulted mainly from a decline in output of zinc-lead-silver ore from mines in the Coeur d'Alene region and from the after effects of a fire in December 1945 in the Sunshine mine—also in the Coeur d'Alene region. Large decreases in silver output were reported by the Sun-

shine Mining Co., Bunker Hill & Sullivan Mining & Concentrating Co., Federal Mining & Smelting Co., (Morning mine), operators of the Osburn tailing plant, Sherman Lead Co., Monitor Mining Co., Triumph Mining Co., Clayton Silver Mines, Tamarack & Custer Consolidated Mining Co., and Sullivan Mining Co. (Star mine); however, a marked increase was made at the Page mine of the Federal Mining & Smelting Co. and at the Yellow Pine mine of the Bradley Mining Co. The Coeur d'Alene region produced 87 percent of the State total silver in 1946; the remainder came largely from the Warm Springs, Bayhorse, Deadwood Basin, Yellow Pine, and Blue Wing districts. Of the State total silver, zinc-lead ore and old tailings yielded 53 percent, silver ore 40 percent, lead ore 4 percent, and gold ore, zinc slag, and lead-copper ore nearly all the remainder. The recovery of silver from silver ore decreased 970,800 ounces, owing chiefly to the decline in output of ore from property operated by the Sunshine Mining Co.; and the recovery of silver from zinc-lead ore decreased 534,159 ounces owing to a decline in output of zinc-lead ore from most of the principal producers, but the recovery of silver from gold ore more than doubled that in 1945, as a result of more gold ore being mined at two properties in Elmore and Valley Counties.

Ten mines—the Sunshine, Polaris, Bunker Hill & Sullivan, Silver Dollar, Osburn tailing plant, Triumph, Page, Morning, Star, and Sweeny tailing dump—produced 75 percent of the silver output of the State in 1946. All but the Triumph are in the Coeur d'Alene region.

Copper.—The output of copper in Idaho continued to decline and dropped to 2,076,000 pounds in 1946. About 78 percent of the State copper output in 1946 was recovered as a byproduct in the treatment of zinc-lead ore, silver ore, silver-copper-antimony ore, and lead ore from mines in the Coeur d'Alene region; the remainder was recovered largely from zinc-lead ore produced in the Warm Springs district, silver-tungsten ore in the Blue Wing district, zinc-lead ore in the Deadwood Basin district, and copper ore in the Alder Creek district.

The Osburn tailing plant at Osburn in the Coeur d'Alene region was the largest producer of copper in Idaho in 1946. It was followed by the Sunshine, Triumph, and Polaris properties.

Lead.—The output of recoverable lead in Idaho has been dropping steadily since 1942, and the output in 1946 (119,974,000 pounds) was the smallest since 1899; however, the value of the output was $1,304,282 more than in 1945, owing to an increase in the average price of the metal. The loss in quantity resulted principally from a decline in output of zinc-lead-silver ore and silver-lead ore from mines in the Coeur d'Alene region, caused by a shortage of underground labor. Marked decreases in lead output in 1946 were reported by the operators of Osburn tailing plant, Federal Mining & Smelting Co. (Morning mine), Sherman Lead Co., Sunshine Mining Co., Bunker Hill & Sullivan Mining & Concentrating Co., Triumph Mining Co., Monitor Mining Co., and Clayton Silver Mines; however, substantial increases were made at the Page, Sidney, and Liberal King properties. About 94 percent of the State total lead came from the Coeur d'Alene region; most of the remainder was produced in the Warm Springs, Bayhorse,

Deadwood Basin, Dome, Texas, and Alder Creek districts. Zinc-lead ore and old tailings (2,296,768 tons) from the Coeur d'Alene region yielded 82 percent of the State total lead, and lead ore and silver ore, chiefly from the Coeur d'Alene region, yielded 10 percent; the remainder came largely from zinc-lead ore in the Warm Springs district and from old zinc slag in the Coeur d'Alene region. Lead recovered from zinc-lead ore and old tailings decreased 14,744,219 pounds and that from silver ore 2,347,181 pounds, but lead from zinc ore and old slag increased 151,623 pounds and that from lead ore 10,771 pounds.

In 1946 the combined lead output of the five largest producing mines—the Bunker Hill & Sullivan, Page, Star, Osburn tailing plant, and Morning—was 62,646,295 pounds, 52 percent of the State total. In 1945 the combined lead output of these properties was 70,131,690 pounds. Other important producers in 1946 were the Sweeny tailing dump, Tamarack, Bunker Hill slag dump, Triumph, Sherman, Frisco, Dayrock, and Sidney properties.

Zinc.—Although Idaho's output of recoverable zinc declined to 143,014,000 pounds in 1946, the State continued to be the largest producer of zinc in the United States, and the output in 1946 again exceeded the lead output. Idaho reached its peak production of zinc in 1944, when 182,744,000 pounds were produced. Marked decreases in output of zinc in 1946 at the Morning, Osburn tailing plant, Monitor, Tamarack, Bunker Hill & Sullivan, Frisco, Triumph, Little Pittsburg, and Star properties more than offset substantial increases at the Page, Spokane-Idaho, White Knob, Sidney, and Liberal King properties. More than 94 percent of the State total zinc in 1946 came from the Coeur d'Alene region and nearly all the remainder from the Warm Springs, Alder Creek, Deadwood Basin, Lava Creek, Bayhorse, and Mineral Hill & Camas districts. Zinc-lead ore and old tailings concentrated yielded 85 percent of the State total zinc; old zinc slag smelted and fumed, 12 percent; and zinc ore smelted, zinc ore concentrated, lead ore concentrated, silver ore concentrated, and zinc-lead ore smelted nearly all the remainder.

Eleven properties—the Star, Bunker Hill smelter slag dump, Osburn tailing plant, Page, Morning, Tamarack, Frisco, Bunker Hill & Sullivan mine, Monitor, Spokane-Idaho, and Triumph—produced 77 percent of the State total zinc in 1946.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1946, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

MINING INDUSTRY

In spite of higher prices for silver, copper, lead, and zinc in 1946, base-metal mining in Idaho continued to decline, not because of labor strikes, as in some Western States, but principally because of a shortage of underground labor. The large producers of zinc-lead-silver ore and silver-lead ore in the Coeur d'Alene region, Shoshone County—the chief source of silver, copper, lead, and zinc in Idaho—were required to curtail operations with such an inadequate supply of labor. However, gold mining in Idaho, especially bucket dredging and dragline dredging at placer properties, made a substantial recovery in 1946 after sharply curtailed activity since October 8, 1942, when War Production Board Order L–208 suspended nearly all gold mining. The number of bucket dredges increased from one in 1945 to seven in 1946 and the number of dragline dredges from none to six. The output of zinc-lead ore and old tailings (by far the chief ore output of the State) decreased from 2,687,912 tons to 2,407,404, siliceous silver ore from 122,094 tons to 92,209, and copper ore from 8,569 tons to 903; but siliceous gold ore increased from 113,030 tons to 163,666, lead ore from 107,511 tons to 113,175, and zinc ore and old slag from 100,039 tons to 104,585. Nearly all the gold ore mined in Idaho in 1946 came from two properties—one in the Middle Boise district, Elmore County, and the other in the Yellow Pine district, Valley County; 64 percent of the silver ore, 92 percent of the lead ore, 95 percent of the zinc ore and old slag, and 95 percent of the zinc-lead ore and old tailings came from various properties in the Coeur d'Alene region and nearly all of the copper ore from one mine in the Alder Creek (Mackay) district.

ORE CLASSIFICATION

Details on ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Idaho in 1946, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	28	163,666	16,847	105,383	361	288	----------
Dry and siliceous gold-silver ore	9	126	110	3,990	----------	400	----------
Dry and siliceous silver ore	12	92,209	70	2,610,389	720,040	4,003,300	237,587
	49	256,001	17,027	2,719,762	720,401	4,003,988	237,587
Copper ore	3	903	60	1,086	53,275	----------	----------
Lead ore	31	113,175	107	264,279	36,805	8,287,636	622,724
Lead-copper ore	1	119	1	18,154	9,345	36,850	----------
Zinc ore	6	[1] 104,585	40	39,614	17,080	3,454,623	20,117,230
Zinc-lead ore	58	2,407,404	5,617	3,441,787	1,239,094	104,190,903	122,036,459
Total lode mines	[2] 139	[1] 2,882,187	22,852	6,484,682	2,076,000	119,974,000	143,014,000
Placers	71	----------	20,123	6,422	----------	----------	----------
Total: 1946	210	[1] 2,882,187	42,975	6,491,104	2,076,000	119,974,000	143,014,000
1945	143	[3] 3,139,286	17,780	8,142,667	3,096,000	136,894,000	166,926,000

[1] Includes 92,072 tons of old lead-smelter slag.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[3] Includes 92,266 tons of old lead-smelter slag.

METALLURGIC INDUSTRY

Of the 2,882,187 tons of ore produced in 1946 in Idaho, 2,757,813 tons (95 percent) were treated at concentration plants, 108,667 tons (4 percent) were shipped crude to smelters, and 15,707 tons (nearly 1 percent) were treated at amalgamation mills.

Concentration plants in 1946 treated 147,505 tons of gold ore, 91,959 tons of silver ore, 105,682 tons of lead ore, 6,908 tons of zinc ore, and 2,405,759 tons of zinc-lead ore and old tailings. Current hot zinc slag totaling 140,044 tons was fumed, and 92,072 tons of old dump lead-smelter slag were delivered for smelting and fuming in 1946. Metals recovered from the old dump slag were credited to the Bunker Hill smelter dump, and metals recovered from the hot slag were credited to various producers of the ores and concentrates that contributed during the year to the slag-making material.

Ore treated at straight amalgamation mills in 1946 totaled 262 tons and that at combined amalgamation and concentration plants 15,445 tons; none was treated at cyanidation plants.

The Bunker Hill & Sullivan Mining & Concentrating Co. operated its Bradley lead smelter and refinery at a lower rate than in 1945 on ore and concentrates, chiefly from mines and mills in the Coeur d'Alene region. The company also operated its antimony and cadmium plants, 1,700-ton flotation mill (including a sink-and-float unit), 300-ton tailing-treatment plant for recovery of silver, iron, and lead from old jig tailings, and 450-ton zinc slag-fuming plant at Bradley. According to the company annual stockholders' report for 1946, the smelter produced 2,271 ounces of gold, 4,127,943 ounces of silver, 147,055 pounds of cadmium, 625 tons of copper, 463 tons of antimony, 15,013 tons of zinc, and 33,669 tons of lead. The slag-fuming plant yielded 22,579 dry tons of deleaded zinc fume and 3,936 dry tons of lead fume; the production of lead in 1946 was more than double that in 1945, but the production of zinc was nearly 2,000,000 pounds less. The Sullivan Mining Co. operated continuously its 100-ton electrolytic zinc plant near Bradley, but had to inactivate 150 of its 450 cells because of a labor shortage during a large part of the year; however, increased manpower during the last weeks of the year permitted full operations. The Bradley Mining Co. operated its flotation mill at Stibnite, Valley County, 8 months of the year principally on gold-silver-iron-antimony ore; in September and October the mill re-treated old stock-piled tungsten concentrate. By adding a rod mill in October the capacity of the mill was increased from 800 tons of ore a day to 1,800 tons a day. Tungsten concentrates and silver-copper-lead-iron concentrates were produced throughout the year in the Ima mill at Patterson, Lemhi County.

Mine production of metals in Idaho in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	15,707	2,919	1,766

[1] Includes 92,072 tons of old lead-smelter slag smelted and fumed.
[2] Includes 92,266 tons of old lead-smelter slag smelted and fumed.

REVIEW BY COUNTIES AND DISTRICTS

ADAMS COUNTY

In 1946 the output in Adams County was all carbonate copper ore (23 tons) produced from the Helena claim near Cuprum in the Seven Devils district.

BENEWAH COUNTY

John Bush operated his placer claim on the South Fork of Tyson Creek a short time in 1946 and recovered 14 fine ounces of gold from sluicing 250 cubic yards of gravel.

BLAINE COUNTY

Lava Creek District.—In April 1946 Smith Bros. began mining zinc-lead-iron ore from the Paymaster mine, 32 miles southwest of Arco, and during the year shipped 3,339 tons of ore to custom milling plants in Utah, where a lead concentrate, a zinc concentrate, and an iron concentrate were recovered.

Little Wood River (Muldoon) District.—Lessees worked the Jupiter-Garfield group in 1946 and shipped 207 tons of zinc-lead-iron ore to custom flotation mills in Utah.

Mineral Hill and Camas District.—A total of 3,261 tons of old tailings, containing 40 ounces of gold, 23,232 ounces of silver, 8,170 pounds of copper, 88,385 pounds of lead, 304,789 pounds of zinc, and some iron, was shipped from the Red Elephant dump near Hailey to the custom milling plant at Midvale, Utah, from June to September 1946.

Warm Springs District.—Despite an increase in the prices of silver, lead, and zinc in 1946, the output of zinc-lead-silver ore from the Triumph-North Star-Independence groups declined from 93,067 tons in 1945 to 69,836 tons in 1946. The Triumph Mining Co. operated the groups throughout 1946 and in its 300-ton gravity-flotation mill, treated 56,799 tons of ore, containing 5,696 ounces of gold, 449,798 ounces of silver, 227,196 pounds of copper, 3,067,813 pounds of lead, and 4,380,544 pounds of zinc, which yielded 15,036 tons of zinc-lead middlings and 2,474 tons of lead-silver concentrate. The middling and 13,037 tons of zinc-lead-silver ore were shipped to Bauer, Utah, for treatment, and the lead-silver concentrate was shipped direct to a lead smelter. The property remained the most important producer of gold, silver, lead, and zinc in southern Idaho.

BOISE COUNTY

Boise Basin District (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—The output of gold in the Boise Basin district, in 1946 was 7,758 ounces compared with 1,858 ounces in 1945. This marked increase resulted mainly from the operation of two bucket dredges—a 6-cubic foot and a 2-cubic foot—by Baumhoff & Marshall (formerly Fisher-Baumhoff Co.) that had been idle since October

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1946, by counties and districts, in terms of recovered metals

[1] Lava Creek district is in both Blaine and Butte Counties.

1942, when War Production Board Order L–208 closed all gold mines. The two dredges operated on Granite and Ophir Creeks near Centerville and treated a total of 1,155,000 cubic yards of gravel, which yielded 4,943 fine ounces of gold and 1,111 fine ounces of silver. The Idaho-Canadian Dredging Co. worked its 7½-cubic foot bucket dredge at property on Moores Creek near Idaho City from March 1 to October 9; 805,000 cubic yards of gravel were washed, which yielded 2,602 fine ounces of gold and 627 fine ounces of silver.

The lode output of the district was 152 ounces of gold, 1,708 ounces of silver, and 200 pounds of lead, recovered largely from ore produced from the Come-Back mine and from old tailings from the Boulder dump.

BONNER COUNTY

Clark Fork District.—The Whitedelf mine of the Whitedelf Mining & Development Co. was operated on a production basis only during the first quarter of the year; thereafter all work was confined to development. About 880 tons of silver-lead ore were treated in the company 50-ton flotation mill, which yielded 67 tons of high-grade silver-lead concentrate.

Lakeview District.—Operations at the Hewer (Idaho-Lakeview) mine were continuous throughout the year; and 2,000 tons of silver ore, containing a little copper, lead, and zinc, were treated by flotation.

Pend d'Oreille District.—Five tons of ore, containing 2,474 ounces of silver and 302 pounds of copper, were produced from the Brown Bear claim in 1946 and shipped direct to a lead smelter.

BONNEVILLE COUNTY

Oscar Lundin worked the Lottie placer near Gray in the Mount Pisgah district during the spring months of 1946 and recovered 47 fine ounces of gold from bench gravel by hydraulicking and sluicing.

BOUNDARY COUNTY

All the output in Boundary County in 1946 was old tailings (3,845 tons), containing 2 ounces of gold, 2,500 ounces of silver, 3,000 pounds of copper, 131,500 pounds of lead, and 16,000 pounds of zinc, from the Idaho-Continental dump in the Port Hill district.

BUTTE COUNTY

Dome District.—William H. Gibson worked the Wilbert mine continuously in 1946 and shipped 1,750 tons of zinc-lead ore to the custom flotation mill at Bauer, Utah. Old tailings (2,131 tons), containing chiefly silver and lead, from the Wilbert dump were treated in a 50-ton gravity concentrator on the property by M. C. Settles.

Lava Creek District.—The metal output of the Lava Creek district in Butte County in 1946 was much less than that in 1945, as the Era Mining & Development Co. ceased shipping zinc-lead-iron ore from the Horn Silver mine in March 1946. During the first quarter of the year the company shipped 770 tons of zinc-lead-iron ore to custom flotation mills in Utah and in August shipped 92 tons of silver ore direct to a smelter.

CLEARWATER COUNTY

Hellerud & Lewis leased the Crawford placer claims on Cow Creek in the Pierce district in 1946, and during the last 2 months of the year recovered 121 fine ounces of gold and 42 fine ounces of silver from washing 75,000 cubic yards of gravel in a dry-land plant.

CUSTER COUNTY

Alder Creek District.—The most important output in the Alder Creek district in 1946 was oxide zinc ore produced from the Homestake mine near Mackay by the White Knob Mining Co.; 5,605 tons of ore were shipped to a lead smelter where the gold, silver, and lead were recovered; the hot slag was fumed for recovery of zinc. In addition, 171 tons of silver-lead ore were shipped direct to a lead smelter. The rest of the district output was 877 tons of copper ore produced from the Empire mine and 244 tons of lead ore from the Horseshoe mine.

Bayhorse District.—Operations at the Clayton mine, the principal producer in the Bayhorse district, were interrupted from February 1 through June 1946 by labor strikes; however, mining of zinc-lead ore was not resumed until after August. During the year 10,764 tons of zinc-lead ore were produced from this mine and treated in the company 120-ton flotation mill compared with 29,127 tons in 1945. Swigert Mines operated the Pacific claim of the Salmon group nearly all year, treated 1,200 tons of zinc-lead ore by gravity concentration, and shipped 1,136 tons of similar ore to a lead smelter in Utah. The remainder of the district output comprised 132 tons of silver-lead ore from the South Butte mine, 119 tons of high-grade lead-copper-silver ore from the Ramshorn mine, 37 tons of lead ore from the Twin Apex and Turtle properties, and 12 tons of zinc-lead ore from the St. Joe claim.

Boulder District.—Owners of the Livingston mine shipped 500 tons of zinc-lead ore to custom flotation mills in Utah by May 10, 1946, when the mine was sold to C. A. Tout, of Victor, Mont.

Yankee Fork District.—The output of the Yankee Fork district in 1946 was 5,272 ounces of gold and 3,235 ounces of silver compared with 125 ounces of gold, 76 ounces of silver, and 200 pounds of copper in 1945. This notable gain in output of gold and silver resulted from resumption in April 1946 of bucket dredging at the Yankee Fork placer by the Snake River Mining Co. after being idle since October 1942. The 8-cubic-foot bucket dredge operated until December 20, 1946, and treated 1,098,853 cubic yards of gravel.

ELMORE COUNTY

Middle Boise (Atlanta) District.—Greater activity at both lode and placer properties in the Middle Boise district in 1946 resulted in an increase of $332,220 in the value of the metal output over 1945. The principal producers were the Boise-Rochester-Monarch lode property of Talache Mines, Inc., and the Boise King placer property of Pyramid Mining Co. (formerly Boise King Placers). Talache Mines, Inc., operated its mine and 400-ton amalgamation and concentration mill continuously; the mill treated 14,523 tons of gold ore, which yielded

5,071 fine ounces of gold and 24,068 fine ounces of silver. In addition, 68 tons of high-grade gold ore were shipped direct to a smelter. The Pyramid Mining Co. worked its 7½-cubic-foot bucket dredge from April 30 to September 30, and treated 557,394 cubic yards of gravel.

IDAHO COUNTY

Gold mining in Idaho County was greater in 1946 than in any year since the war but is still far below that during the years before the war. Two dredges that were large producers of gold in 1942 and had to close because of War Production Board Order L–208 began operating again in the spring of 1946. Bangasser & Smith, Inc. (formerly Mt. Vernon Co.), operated its 2-cubic-foot bucket dredge from March 1 to September 7 at the Crooked River property in the Orogrande district. This dredge treated 126,499 cubic yards of gravel and recovered 625 fine ounces of gold and 141 fine ounces of silver. The Tyee Mining Co. operated its dragline dredge with floating washing plant from June 25 to November 1 at property on American River in the Elk City district. The Secesh Dredging Co. (a new operator) placed a 2½-cubic foot bucket dredge at property on Secesh Meadows in the Burgdorf-Marshall Lake district, but it operated only 1 month.

LEMHI COUNTY

Blue Wing District.—Silver-tungsten ore from the Ima mine was mined and milled continuously by the Bradley Mining Co. throughout the year. The company reported that 30,605 tons of ore containing hübnerite, galena, tetrahedrite, and pyrite were treated in a 150-ton concentrator; 168 tons of tungsten concentrate were recovered by gravity and flotation concentration, followed by magnetic separation; and 923 tons of lead-copper-silver concentrate were recovered by bulk sulfide flotation.

Gibbonsville District.—The dragline dredge with a floating washing plant at the Hagel placer property—a large producer of gold in 1942 which had to close on account of War Production Board Order L–208—resumed operation in May 1946. Smith Bros. & Courtis, Inc., operated the dredge, which handled about 160,000 cubic yards of gravel during the last 8 months of the year.

Kirtley Creek District.—In September 1946 a dragline dredge and dry-land washing plant were placed on the Hagel Ranch ground on Kirtley Creek by the Washington Iron Works; the dredge operated from October 10 to November 10 and handled 22,000 cubic yards of gravel.

Texas District.—Milo Zook operated the Latest Out mine at Gilmore nearly all year and shipped 751 tons of oxide zinc-lead-silver ore to smelters in Utah. The rest of the district output was 226 tons of lead ore produced from the Alex Stevens mine.

OWYHEE COUNTY

The principal output in Owyhee County in 1946 was 872 tons of surface gold ore, treated by amalgamation and concentration, from the Lewis group in the Carson district, and placer gold recovered from gravel along the Snake River near Grandview.

SHOSHONE COUNTY—COEUR D'ALENE REGION

Despite higher prices for silver, copper, lead, and zinc in 1946, production of these metals in the Coeur d'Alene region, Shoshone County, was far below that in 1945; a shortage of labor was the principal factor that interfered with normal production. The output of silver declined more than 20 percent, copper 20 percent, lead 11 percent, and zinc more than 13 percent; production of gold declined only 7 percent. The value of the metal output of the region was $33,673,731 (more than 89 percent of the State value) compared with $34,258,050 in 1945. Although production of silver, lead, and zinc decreased substantially in 1946, the region remained the largest silver-producing area in the United States and ranked second in lead and zinc; it produced 87 percent of Idaho's silver, 78 percent of the copper and 94 percent each of the lead and zinc. The chief producers of zinc in the region in 1946, according to rank (each producing more than 6,000,000 pounds), were the Star, Bunker Hill smelter-slag dump, Osburn tailing plant, Page, Morning, and Tamarack properties. The chief producers of lead, according to rank (each producing more than 6,800,000 pounds), were the Bunker Hill & Sullivan, Page, Star, Osburn tailing plant, Morning, and Sweeny tailing properties. The chief producers of silver, according to rank (each producing more than 375,000 ounces), were the Sunshine, Polaris, Bunker Hill & Sullivan, Silver Dollar, Osburn tailing plant, and Page properties.

Of the total material (2,559,636 tons) produced in 1946 in the Coeur d'Alene region, 90 percent was zinc-lead ore and old tailings, 4 percent silver-lead ore, 3 percent zinc slag, and nearly all the remainder silver ore.

Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1945–46, and total 1884–1946, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (Lode and placer) (fine ounces)	Silver (Lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
	Lode	Placer							
1945	49	1	2,794,208	1,898	7,115,646	2,036,000	126,860,000	156,059,000	$34,258,050
1946	56	1	2,559,636	1,758	5,655,672	1,619,000	113,096,000	134,858,000	33,673,731
Total, 1884–1946	------	-------	[1]	393,066	432,287,424	[2] 65,364	[2] 5,532,067	[2] 1,196,866	1,122,925,382

[1] Figure not available.
[2] Short tons.

Beaver District.—The output of the Beaver district in 1946 was 80,123 tons of zinc-lead ore, a drop of 32,484 tons from that in 1945. This loss resulted largely from a decline in output of zinc-lead ore from the Amazon-Carlisle-Portland group (Monitor Mining Co.) caused by a shortage of underground miners. The company reported that 48,608 tons of ore, averaging 0.97 ounce of silver to the ton, 2.21 percent lead, and 6.16 percent zinc, were treated in the Hercules, Dayrock, and Carlisle flotation mills near Wallace. According to the printed annual report of the Monitor Mining Co. for 1946, development and exploration were greater than in 1945; but not as much new

ore was discovered as was extracted, owing to a large amount of work required to rehabilitate and connect the old Interstate mine with the Amazon and Carlisle workings. Underground labor turn-over during the past year was roughly 400 percent, and at the end of the year the company had 145 employees. Known ore reserves remain substantial, though relatively low in grade.

Sunset Lease worked the Sunset mine continuously and hauled 27,656 tons of ore, averaging 2.35 ounces of silver to the ton, 4.52 percent lead, and 7.14 percent zinc, to the Golconda custom flotation mill near Wallace. The rest of the district output was 3,859 tons of zinc-lead ore produced from the Nipsic claim of the Interstate-Callahan group by the Daylight Lease. This lease was abandoned in March, as all commercial ore was exhausted.

Evolution District.—The output of the Evolution district in 1946 comprised 869,954 tons of zinc-lead old tailings, 51,111 tons of silver-lead ore, 8,193 tons of silver-copper-antimony ore, 2,000 tons of zinc old tailings, 50 tons of silver ore, and 42 tons of old mill cleanings (lead-silver). Most of the old tailings came from the Osburn dump, all the silver-lead ore from the Chester vein and the Silver Syndicate fault zone, and all the silver-copper-antimony ore from the Mineral Point mine. The 2,500-ton sink-and-float plant and 500-ton flotation mill at the Osburn tailing dump were operated throughout the year by the Hecla Mining Co. The company reported that 845,468 tons of old tailings, containing an average of 1.19 ounces of silver to the ton, 1.33 percent lead, 1.43 percent zinc, and a little copper, were treated during the year in the sink-and-float plant; the resulting zinc-lead middling (530,579 tons) was treated in the Osburn, Polaris, and Hecla flotation mills, where it was separated into 7,220 tons of lead concentrate and 15,703 tons of zinc concentrate. The property ranked third in zinc production in Idaho in 1946, fourth in lead, and fifth in silver. Zanetti Bros. worked another part of the Osburn tailing dump during the last quarter of the year and hauled 15,986 tons of zinc-lead old tailings to the Polaris mill for treatment. The Sunshine Mining Co. operated the Chester vein and the Silver Syndicate fault zone continuously, and developed the Yankee Girl vein in Sunshine Consolidated ground during the year after a 3-year suspension. The Chester vein and Silver Syndicate fault zone (known as Rambo, Omega, and Rotbart areas) includes property owned by the Sunshine Mining Co., Polaris Mining Co., Silver Dollar Mining Co., and Silver Syndicate, Inc., but all exploration, development, mining, and milling of ore are done by the Sunshine Mining Co. The Sunshine Mining Co. reported that the total output of ore in 1946 was 51,044 tons (21,251 tons for Sunshine account and 29,793 tons for account of Polaris, Silver Dollar, and Silver Syndicate) compared with 75,179 tons in 1945; the ore averaged 49.13 ounces of silver to the ton, 0.61 percent copper, 4 percent lead, and a little zinc. The tailings averaged 0.86 ounce of silver to the ton and 0.13 percent lead; lead recovery was 97.2 percent and silver 98.5 percent. Lead-silver concentrates (6,760 tons) contained 2,469,252 ounces of silver, 607,240 pounds of copper, and 3,948,371 pounds of lead, of which the net for Sunshine account was 959,472 ounces of silver, 237,284 pounds of copper, and 1,551,304 pounds of lead. Production credited to the other companies (Polaris, Silver Dollar, and Silver Syndicate) was 1,509,780 ounces

of silver, 369,956 pounds of copper, and 2,397,067 pounds of lead. The average per-ton operating costs for the year were $10.62 for mining, $1.34 for ore treatment, $0.54 for depreciation, and $7.51 for general expense and overhead—a total of $20.01. According to the annual report of the Sunshine Mining Co., production was less in 1946 than in 1945 owing to the after effects of a mine fire in December 1945 and to a serious labor shortage during the summer months of 1946. Developments of especial interest during the year were extensions of drifts at the 3,700-foot level on the Silver Syndicate fault and at the 3,100-foot level (Sunshine Consolidated) on the Yankee Girl vein. The former drift was advanced about 100 feet beyond that reported in 1945, and of the 265 feet now exposed 210 feet show ore averaging 4.3 feet in width having an average assay of 46.0 ounces of silver per ton and 21.7 percent lead. The 3,100-foot level of the Sunshine Consolidated drift was advanced 226 feet west on a vein averaging 1.9 feet in width and 54.3 ounces of silver per ton. Total developed ore reserves increased over those of 1945 and were estimated at 1,230,000 tons.

The Coeur d'Alene Mines Corp. operated its Mineral Point mine throughout the year, but the company 600-ton flotation mill ran only intermittently. The mill treated 8,193 tons of silver-copper-antimony ore, which yielded 179 tons of concentrate containing 72,996 ounces of silver, 94,966 pounds of copper, and 54,855 pounds of antimony. According to the corporation annual report to stockholders, production during part of 1946 was almost completely discontinued, and operations were limited to development and maintenance. The grade of ore mined was too low for profitable operations, but it carried sufficient values to pay a portion of the maintenance and overhead expenses, in addition to the ore-breaking cost. Development during the year failed to disclose adequate quantities of commercial ore. Shaft sinking was begun in May, and in September the shaft was completed to a point 130 feet below the 2,800-foot level. The remainder of the district output was nearly all old tailings (10,500 tons), containing chiefly lead and zinc, from dumps near Osburn and treated in the Galena (Zanetti) custom mill.

Hunter District (Mullan).—The output of ore and old tailings in the Hunter district declined from 450,343 tons in 1945 to 342,633 tons in 1946, owing chiefly to an insufficient supply of underground labor. The principal output was 277,408 tons of zinc-lead ore from the Morning and Star mines, a drop of 118,430 tons from that in 1945. The Morning mine of the Federal Mining & Smelting Co. was operated continuously; 88,552 tons of waste-dump ore, containing an average of 1.1 ounces of silver to the ton, 1.7 percent lead, and 1.6 percent zinc, and 56,945 tons of mine ore, containing an average of 2 ounces of silver to the ton, 6.4 percent lead, and 6.7 percent zinc, were treated in the company 1,250-ton flotation mill at Mullan. The average mill recoveries in lead concentrate were silver 76 percent, lead 85 percent, and zinc 14.5 percent; in zinc concentrate, silver 13.6 percent, lead 4.3 percent, and zinc 76.2 percent. According to the annual stockholders' report of the company for 1946, production was less than that in 1945 because of a labor shortage, which continued throughout the year, but some improvement was noted during the last 3 months, and the year closed with a gain of 34 men; however,

on January 1, 1947, the crew was about 200 men below normal. No shaft sinking was done in 1946, and development was limited. Ore reserves at the end of the year, including developed and probable ore in both the Morning and You-Like portions of the mine, are estimated at 545,000 tons, a decrease of 37,500 tons from the estimated tonnage at the end of 1945.

The 1,000-ton flotation mill of the Sullivan Mining Co. at the Star mine operated continuously in 1946, but at a lower rate than in 1945. The mill treated 131,911 tons of zinc-lead ore (145,527 tons in 1945) from the Star mine, yielding 7,046 tons of lead concentrate and 23,743 tons of zinc concentrate, which contained 143 ounces of gold, 174,354 ounces of silver, 12,073,679 pounds of lead, and 25,476,553 pounds of zinc. The mine continued as the largest producer of zinc in Idaho and ranked third in lead. The Hunter Lease has operated the Gold Hunter mine at Mullan since July 3, 1933, and in 1946 the 500-ton flotation mill on the property treated 37,430 tons of mine ore and 9,750 tons of waste-dump ore, which contained 98,560 ounces of silver, 90,000 pounds of copper, 2,050,440 pounds of lead, and 353,000 pounds of zinc. The remainder of the district output comprised 14,670 tons of old zinc-lead tailings from the Granada and Mary D. properties and 3,375 tons of zinc-lead-silver ore from the Lucky Friday mine; all old tailings and ore were treated in the Golconda custom flotation mill near Wallace.

Lelande District (Burke, Mace, Firsco).—A total of 160,902 tons of ore and old tailings was treated from nine properties in the Lelande district in 1946 compared with 155,802 tons of ore and old tailings from nine properties in 1945. The output in 1946 was largely 80,000 tons of old zinc-lead tailings from the Canyon Creek and Elgin properties above Wallace and 65,862 tons of zinc-lead-silver ore from the Frisco and Sherman mines. Approximately 80,000 tons of old tailings, containing an average of 1 ounce of silver to the ton, 1.4 percent lead, and 2.1 percent zinc, from the Canyon Creek and Elgin properties, were treated in 1946 in the Formosa 140-ton flotation mill of the Small Leasing Co. and in the Golconda custom flotation mill. The Federal Mining & Smelting Co. worked the lower levels of the Frisco mine at Gem throughout the year and hauled 28,828 tons of ore (containing an average of 1.27 ounces of silver to the ton, 3.50 percent lead, and 5.97 percent zinc) to the Morning mill at Mullan; Hull Lease continued working the upper levels and, in its own 90-ton flotation mill at Gem, treated 18,159 tons of similar ore, which yielded 856 tons of lead concentrate and 1,896 tons of zinc concentrate. According to the annual stockholders' report of the Federal Mining & Smelting Co., operations at the Frisco mine were retarded in 1946 by a labor shortage. With more labor, production will gradually expand, and a further increase will result when a new hoist is put in operation about the middle of 1947. Ore reserves at the end of 1946 were estimated at 210,000 tons of developed and probable ore. From present indications, additional ores will be developed as the lower levels are made accessible.

The Sherman Lead Co. operated its mine and 300-ton flotation mill continuously in 1946, but at a lower rate than in 1945. In 1946 the mill treated 18,875 tons of ore, containing an average of 5.57 ounces of

silver to the ton, 9.51 percent lead, and 1.98 percent zinc, which yielded 3,022 tons of zinc-lead-silver concentrate. According to the company annual report to stockholders, very little development work was done at the Sherman mine in 1946, and output of ore was less than in 1945, due entirely to lack of underground labor. The average crew of men decreased from 60 to 53, leaving the company lacking more than 50 men required for capacity production. The rest of the district output comprised 8,022 tons of silver-lead ore produced from the Hercules mine, 2,157 tons of lead ore from the Black Bear mine, 884 tons of zinc-lead ore from the Mace property, 477 tons of silver-lead ore from the Hecla mine, and 3,500 tons of old zinc-lead tailings from the Woodland property.

Placer Center District.—The output of the Placer Center district in 1946 was 99,438 tons of zinc-lead-silver ore and old tailings, 27,873 tons of silver-lead ore, and 4,805 tons of zinc ore and old tailings. More than 77 percent of the zinc-lead-silver ore and old tailings came from the Tamarack mine, and all of the silver-lead ore came from the Dayrock property. The Tamarack & Custer Consolidated Mining Co. reported that 66,324 tons of ore (containing an average of 1.1 ounces of silver to the ton, 3.4 percent lead, and 5.2 percent zinc) were produced from the Tamarack mine in 1946 (66,082 tons in 1945) and treated in its 400-ton flotation mill. In addition, lessees hauled 1,976 tons of mine ore and 8,707 tons of waste-dump ore to custom flotation mills near Wallace. According to the company annual report to stockholders, the tons of ore milled in 1946 were about the same as that in 1945, but production of lead and zinc was less, owing to a lower metal content. Development was much more extensive than in 1945, especially on the 2,200- and 2,400-foot levels. The most important disclosure was on the 2,400-foot level—deepest in the mine—of a sill 600 feet long and containing good-grade ore. However, it appears that the future of the mine depends on deeper exploration, which will require larger hoisting facilities. Ore reserves were increased slightly during the year. The company is still short 200 men required for capacity production.

The 200-ton flotation mill of the Dayrock Mining Co. ran continuously in 1946; it treated 27,873 tons of ore (containing an average of 3.5 ounces of silver to the ton, 5.7 percent lead, and 0.9 percent zinc) from the Dayrock property and 6,259 tons of custom ores. According to the annual stockholders' report of the Dayrock Mining Co., work at the Dayrock mine in 1946 was carried on at all levels below the 100-foot level, resulting in a substantial increase in ore reserves; current known ore is greater in tonnage than in several past years.

The Callahan Consolidated Mines, Inc., operated its Rex group until June 30, 1946, when operations ceased. During the 6-month operation the company 100-ton flotation mill treated 15,768 tons of Rex ore containing 9,450 ounces of silver, 600,000 pounds of lead, and 1,200,000 pounds of zinc. The remainder of the district output was 6,663 tons of zinc-lead old tailings from the Rose and Zanetti properties, 3,500 tons of zinc old tailings from the Tomsche property, and 1,305 tons of zinc ore from the Success mine—all treated in custom flotation mills near Wallace.

Yreka District (Kellogg).—The value of the metal output of the Yreka district was $14,668,324 in 1946, an increase of $2,091,994 over 1945. The district remained the chief lead- and zinc-producing area in Idaho and ranked second in silver. In 1946 material treated in the district comprised 754,039 tons of zinc-lead-silver ore and old tailings, 92,072 tons of old zinc slag, 44,205 tons of old zinc-lead-iron-silver tailings, and 16,001 tons of silver-lead ore—a total of 906,317 tons compared with a total of 852,433 tons in 1945. Of the total ore, old tailings, and old slag, 275,435 tons were zinc-lead-silver ore from 10 mines in the Pine Creek area of the district; however, the Bunker Hill & Sullivan mine at Kellogg, with an output of 160,371 tons of zinc-lead-silver ore and 11,012 tons of silver-lead ore in 1946, continued to be the most important producer of ore in the district. The company main 1,700-ton flotation mill, equipped with a sink-and-float unit, operated throughout the year and treated 160,371 tons of zinc-lead-silver ore from the Bunker Hill & Sullivan mine and 317,733 tons of old zinc-lead tailings from the Sweeny dump. The ore contained an average of 4.53 ounces of silver to the ton, 6.37 percent lead, and 2.14 percent zinc and the old tailings 0.81 ounce of silver to the ton, 1.58 percent lead, and 0.74 percent zinc. In addition, 1,012 tons of silver-lead ore were produced from the Bunker Hill & Sullivan mine and shipped direct to a smelter. John George continued leasing operations in the upper levels of the Bunker Hill & Sullivan mine and treated about 10,000 tons of silver-lead ore in his mill. The Bunker Hill & Sullivan Mining & Concentrating Co. also operated its 300-ton gravity-flotation plant from April to the end of the year; treated 44,205 tons of old jig tailings containing an average of 1.35 ounces of silver to the ton, 2.48 percent lead, 1.07 percent zinc, and 16.32 percent iron; and shipped 92,072 tons of old Bunker Hill smelter slag (containing an average of 0.30 ounce of silver to the ton, 1.85 percent lead, and 12.08 percent zinc) to its lead smelter at Bradley. The resulting hot slag was sent to the slag-fuming plant, also at Bradley, to recover the zinc. According to the company annual report to stockholders, there were produced and recovered from Bunker Hill & Sullivan mine ore (including lessee ore) 673,330 ounces of silver, 19,678,000 pounds of lead, and 5,808,000 pounds of zinc. A decrease in metal output in 1946, as well as in 1945, resulted entirely from a shortage of labor; however, some improvement in the manpower shortage was noticeable during the last weeks of the year. Development in 1946, as in former years, was held to a minimum because of the shortage of underground labor and consisted largely of extending known ore bodies. This resulted in a slight decrease of ore reserves fully developed and ready for mining—ore reserves January 1, 1947, totaled 2,586,461 tons of zinc-lead-silver ore. Operations at the zinc slag-fuming plant of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley were continuous throughout the year. In 1946 the plant received 140,044 tons of current hot slag from the lead furnaces of the Bunker Hill smelter at Bradley; the resulting lead fume (3,936 tons) was sent to the Bunker Hill lead smelter, and the zinc fume (22,579 tons) was shipped to smelters in the East. All of the lead and zinc produced at the plant in 1946 was

credited to the mines and an old slag dump furnishing the slag-making material.

Output of zinc-lead-silver ore from the Page mine of the Federal Mining & Smelting Co. increased from 80,727 tons in 1945 to 102,875 tons in 1946. The ore, treated in the Page 500-ton flotation mill, contained an average of 3.97 ounces of silver to the ton, 7.01 percent lead, and 7.92 percent zinc. The mine ranked second in lead production in Idaho in 1946, fourth in zinc, and seventh in silver. According to the annual stockholders' report of the company, no shaft sinking or development was done in 1946 because of insufficient labor; however, the labor supply improved during the last 3 months of the year, and the crew gained 48 men for the year. On January 1, 1947, the crew was only 20 men below normal. Ore reserves at the end of the year were estimated at 618,000 tons of developed and probable ore—a decrease of 59,000 tons from the estimated tonnage at the end of 1945.

The Denver Development Co. continued to operate under lease the Little Pittsburg mine on Denver Creek; and during the year 39,844 tons of ore, containing an average of 1.01 ounces of silver to the ton, 2.47 percent lead, and 6.35 percent zinc, were treated in the company 150-ton flotation mill. The capacity of the mill at the Spokane-Idaho property on Pine Creek was increased to 175 tons of ore a day during 1946, and the company reported that 36,715 tons of ore containing 75,000 ounces of silver, 2,350,000 pounds of lead, and 6,000,000 pounds of zinc were treated by flotation. Operations at the Highland-Surprise mine on Stewart Creek by the Highland-Surprise Consolidated Mining Co. were continuous in 1946; the company 200-ton flotation mill treated 25,940 tons of ore containing 23,000 ounces of silver, 1,571,900 pounds of lead, and 3,055,000 pounds of zinc. Output of zinc-lead-silver ore from the Sidney mine of the Sidney Mining Co. on Denver Creek increased from 17,286 tons in 1945 to 24,562 tons in 1946. In June the company completed a new 250-ton flotation mill which replaced the old 50-ton plant. The Liberal King mine on Pine Creek was operated under lease throughout the year by Sunset Minerals, Inc.; 20,793 tons of zinc-lead ore were treated in the company 100-ton flotation mill. The Small Leasing Co. operated the Douglas mine, also on Pine Creek, continuously in 1946 and treated by flotation 15,112 tons of ore containing 27,000 ounces of silver, 825,000 pounds of lead, and 2,160,000 pounds of zinc. About 8,000 tons of zinc-lead ore were produced in 1946 from the Nabob mine by the Nabob Silver-Lead Co. and treated in the new 250-ton company flotation mill. The rest of the district output was principally 4,989 tons of silver-lead-iron fluxing ore shipped direct to a smelter from the Sierra-Nevada waste dump and 894 tons of zinc-lead ore produced from the Senator Stewart property.

VALLEY COUNTY

Deadwood Basin District.—Mining and milling of zinc-lead-silver ore at the Hall-Interstate property, the only lode producer in the Deadwood Basin district, were on a limited scale in 1946, owing to inadequate ore reserves and a shortage of labor; the output of ore

dropped from 24,377 tons in 1945 to 16,350 tons in 1946. During the first 6 months of the year the property was operated under lease by the Callahan Zinc-Lead Co., and during the last 6 months by a sublessee.

Yellow Pine District.—Milling of gold-silver-iron-antimony ore from the open pit at the Yellow Pine mine by the Bradley Mining Co. was intermittent in 1946; nevertheless, the mine was by far the largest producer of gold in Idaho. During the year the flotation mill treated 147,505 tons of ore (containing an average of 0.10 ounce of gold and 0.58 ounce of silver to the ton and 1.38 percent antimony) and 5,014 tons of old tungsten tailings, which yielded 1,353 tons of gold concentrate, 5,488 tons of gold-antimony concentrate, and 72 tons of tungsten concentrate. When the milling of ore began in May, a complete new flow sheet was introduced, and by adding a rod mill in October the capacity of the mill was increased from 800 to 1,800 tons of ore a day.

GENERAL SUMMARY

THE OVER-ALL 58-percent rise in gold production in Montana in 1946 was in sharp contrast to the declines made by the other four metals from 1945 output. Silver in 1946 dropped 45 percent below the yield in 1945; copper, 34; lead, 17; and zinc, 4. Increases in the average prices of all metals except gold had only a slight effect in resisting the 4-year downward trend in total value of the 5 metals, which declined 15 percent from $35,405,505 in 1945 to $29,957,206 in 1946. Of the total value in 1946, copper contributed 63 percent, zinc 14, silver 9, gold 8, and lead 6. Instrumental in maintaining zinc production near the 1945 level were the successful treatment of the Butte Hill waste dumps at Butte (beginning in November) and the treatment of a greater tonnage of old cold smelter slag at the East Helena slag-fuming plant during the labor strike at the East Helena lead smelter. In addition to strikes, labor shortages handicapped the mining industry seriously in 1946.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Montana in 1942–46 and total, 1862–1946, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1942	370	170	5,678,280	146,892	$5,141,220	11,188,118	$7,955,995
1943	227	45	5,873,016	59,586	2,085,510	8,450,370	6,009,152
1944	188	24	6,049,462	50,021	1,750,735	7,093,215	5,044,064
1945	160	26	4,919,562	44,597	1,560,895	5,942,070	4,225,472
1946	193	42	2,234,958	70,507	2,467,745	3,273,140	2,644,697

1945	44,597	5,942,070	177,012,000	19,998,000	34,806,000

Gold.—Output of gold in Montana in 1946 rose to the highest figure since 1942, for the gold-mining industry recovered a considerable part of its former importance and pushed base-metal mines to a less important position as a source of State gold. Of particular significance was the marked increase in production of placer gold through the resumption of a number of dredge operations, although output from lode-gold mines also gained. Placer mines washed 275 percent more gravel in 1946 than in 1945 and recovered 189 percent more gold; lode mines gained 22 percent in gold output.

Of Montana's total gold in 1946, 39 percent was derived from siliceous gold and silver ores (45 percent in 1945), 21 percent from base-metal ores (33 percent in 1945), and 40 percent from placers (22 percent in 1945). Ores concentrated yielded 20 percent of the State total gold; ores shipped to smelters nearly 17 percent; and ores treated at amalgamation and cyanidation mills (with or without concentrating equipment) 24 percent.

The leading gold producers in Montana in 1946 were the Jardine Mining Co. (gold ore), at Jardine; Winston Bros. (placer), in Jefferson County; Porter Bros. (placer), at Helena; McLaren Gold Mines Co. (copper ore), in Park County; Anaconda Copper Mining Co. (copper ore and waste materials), at Butte and Anaconda; the Golden Sunlight mine (gold ore), near Whitehall; the Drumlummon mine (gold ore), at Marysville; H. & H. Mines (placer) in Granite County; Emigrant Dredging Co. (placer), in Park County; and the U. S. Grant mine (gold-silver ore), near Virginia City. These 10 producers furnished nearly 75 percent of the State total gold.

Silver.—The slump of 2,668,930 ounces from the 1945 output of 5,942,070 ounces brought Montana's production of silver in 1946 to the lowest point since 1933. Most of the loss resulted from a 53-percent decrease in the yield of byproduct silver from the copper-producing operations of the Anaconda Copper Mining Co. at Butte and Anaconda. However, the company supplied 67 percent of the

State total compared with 77 percent in 1945 from its copper mines, mine dumps, tailing dumps, slime ponds, zinc mines, and the North Butte and Flathead mines. Other leading producers of silver in 1946 were the U. S. Grant mine, the Emma & Ophir mine at Butte, and the Mike Horse mine at Flesher.

Copper ore and tailings furnished 64 percent of the State total silver in 1946; zinc-lead ore, 21 percent; siliceous ore, 14 percent; and lead ore and zinc ore, 1 percent. Ore treated at concentrating mills yielded 84 percent of the total silver, and smelting ore, 15 percent; old slag fumed, ores amalgamated or cyanided, and placers were minor sources.

Copper.—For the fourth consecutive year Montana copper output declined in 1946 and was the smallest since 1934. The marked decrease was due largely to a 61-percent reduction in tonnage of crude copper ore and waste material from the properties of the Anaconda Copper Mining Co. at Butte and Anaconda. The company supplied 96 percent of the State total copper in 1946, and the North Butte mine at Butte furnished about half of the remainder. Smaller producers included the Estelle and New Year's Gift, Emma & Ophir, Mike Horse, Travona, and Drake mines.

Lead.—Owing to a reduction of 3,438,000 pounds from the 1945 output, Montana's production of lead in 1946 was the lowest since 1933. The decrease was rather uniformly distributed among all the larger lead producers, with the exception of the slag-fuming plant of the Anaconda Copper Mining Co. at East Helena, which made a gain. The Mike Horse mine near Flesher again was the leading State lead producer, followed in order by the Emma & Ophir mine at Butte, the Jack Waite mine in Sanders County, the slag-fuming plant at East Helena, the Toledo-Buckeye group near Sheridan, and the Poulin and Travona mines at Butte. These seven sources contributed 73 percent of the State total in 1946. Of the State lead output, 84 percent was recovered from zinc-lead ore, 7 percent from lead ore, 6 percent from zinc ore and slag, and 3 percent from siliceous ores.

Zinc.—Zinc in Montana in 1946 held steadier than any of the other five metals except gold, and output fell only 1,266,000 pounds below that in 1945. The slag-fuming plant of the Anaconda Copper Mining Co. at East Helena made an increase of recoverable zinc creditable to Montana, as did the Poulin mine and the Iron Mask mine near Townsend; the Butte Hill waste dumps of the Anaconda Copper Mining Co. at Butte became an important source of zinc in November. The slag-fuming plant was the leading source of the metal in 1946, followed in order by the Emma & Ophir (zinc-manganese ore), Mike Horse (zinc-lead ore), Poulin (zinc ore), Toledo-Buckeye (zinc-lead ore), Travona (zinc-lead ore), Iron Mask (zinc-lead ore), and Anaconda Copper Mining Co. (zinc ore and zinc-lead dump ore). These eight producers supplied 88 percent of the State total zinc. Of Montana's zinc in 1946, 65 percent was derived from zinc-lead ore, 34 percent from zinc ore and old slag, and nearly all the remainder from siliceous gold and silver ores.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Montana in 1946, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

MINING INDUSTRY

Persistent manpower shortages and labor difficulties were the chief factors in reducing Montana's total output of ore and old tailings treated in 1946 by 2,684,604 tons (55 percent) below that in 1945. Declines were especially heavy in the Summit Valley (Butte) district.

The labor shortage was particularly acute at Butte, where it was reported that 3,000 men were needed to reach normal capacity, although toward the end of the year labor over the State became more plentiful.

Labor strikes hampered production but were less serious than in some other Western States. In April a strike lasting 10 days was called at the operations of the Anaconda Copper Mining Co. at Butte. In February a strike became effective at 18 plants of the American Smelting & Refining Co. in 12 States. This strike affected operations for 5 months at the company lead smelter at East Helena, although most large producers were able to stock-pile their concentrates for future shipment and thus not close their mines.

About 80 percent of the total ore and tailings treated in 1946 was copper ore, 10 percent was zinc-lead ore, nearly 7 percent was siliceous gold and silver ores, and less than 4 percent was zinc ore and lead ore.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Montana in 1946, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	68	113,653	23,815	31,438	12,705	40,329	15,721
Dry and siliceous gold-silver ore	24	19,147	3,516	259,349	13,533	140,283	63,853
Dry and siliceous silver ore	28	16,811	471	162,143	119,351	293,259	245,555
	120	149,611	27,802	452,930	145,589	473,871	325,129
Copper ore	15	1,781,895	11,590	2,082,321	[1] 115,742,329		
Lead ore	32	5,857	634	35,259	18,037	1,086,932	136,953
Zinc ore	6	[2] 73,727	68	16,750	49,481	1,007,902	11,247,210
Zinc-lead ore	37	223,868	2,427	680,526	1,006,564	13,991,295	21,830,708
Total lode mines	[3] 193	2,234,958	42,521	3,267,786	[1] 116,962,000	16,560,000	33,540,000
Placers	42		27,986	5,354			
Total: 1946	235	2,234,958	70,507	3,273,140	[1] 116,962,000	16,560,000	33,540,000
1945	186	4,919,562	44,597	5,942,070	[4] 177,012,000	19,998,000	34,806,000

[1] Includes 6,376,070 pounds recovered from precipitates.
[2] Includes 55,458 tons of old lead smelter slag fumed and 232 tons of old lead smelter slag smelted.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 5,803,665 pounds recovered from precipitates.

METALLURGIC INDUSTRY

The 2,234,958 tons of ore produced from Montana lode mines in 1946 were treated as follows: 2,005,486 tons (90 percent) at concentrating mills (4,664,259 tons in 1945); 74,535 tons (3 percent) shipped to smelters (183,037 tons in 1945); 55,458 tons (2 percent) of old lead-smelter slag fumed (25,711 tons in 1945); 82,040 tons (4 percent) at cyanidation mills (45,217 tons in 1945); and 17,439 tons (nearly 1 percent) at amalgamation mills (1,338 tons in 1945). The ore that went to concentrating mills comprised 1,761,041 tons of copper ore, 222,054 tons of zinc-lead ore, 17,552 tons of zinc ore, 4,555 tons of siliceous ore, and 284 tons of lead ore.

The 12,320-ton copper concentrator, the 2,000-ton zinc concentrator, and the 2,000-ton slime-disintegrating plant of the Anaconda Copper Mining Co., all at Anaconda, were operated continuously in 1946, but at reduced rates. The company copper smelter (annual capacity, 1,300,000 tons of charge) and the two electrolytic zinc plants at Anaconda and Great Falls (combined capacity, 233,400 tons of slab zinc per year) also were operated throughout the year. The zinc plants treated 401,963 tons of zinc concentrates containing 431,938,462 pounds of zinc, compared with 394,110 tons containing 425,699,262 pounds of zinc in 1945. The concentrates were received from mills in Arizona, Idaho, California, Montana, Nevada, New Mexico, Utah, Colorado, Washington, and several foreign countries. The company zinc-fuming plant at East Helena was operated throughout the year, but at a lower rate than in 1945. The output of zinc-lead fume decreased from 32,233 tons in 1945 to 26,180 tons in 1946; nearly all was treated at the Great Falls zinc plant.

The lead smelter of the American Smelting & Refining Co. at East Helena was closed during the 5-month labor strike. During the period of its operation the plant treated chiefly lead-silver concentrates from the Coeur d'Alene region in Idaho and the Loomis-Oroville district in Washington, residues from the electrolytic-zinc plants at Anaconda and Great Falls, and crude ores, concentrates, and old tailings from various districts in Montana.

Mine production of metals in Montana in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	17,439	4,805	16,844	2,136	7,079	6,332
Ore cyanided	82,040	11,943	6,174			
Concentrates smelted [1]	2,005,486	14,013	2,744,481	108,817,326	13,734,643	22,728,350
Copper precipitates smelted	4,212			6,376,070		
Ore smelted	[2] 74,535	11,760	492,787	1,766,468	1,898,278	855,318
Old slag fumed	55,458		7,500		920,000	9,950,000
Placer		27,986	5,354			
Total: 1946		70,507	3,273,140	116,962,000	16,560,000	33,540,000
1945		44,597	5,942,070	177,012,000	19,998,000	34,806,000

[1] Includes zinc concentrates treated at electrolytic plants.
[2] Includes 232 tons of old zinc slag smelted.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Montana in 1946, by types of mills and by counties, in terms of recovered metals

AMALGAMATION MILLS

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal

REVIEW BY COUNTIES AND DISTRICTS

BEAVERHEAD COUNTY

Argenta District.—Ida B. Hand operated the Louis Phillip mine throughout the year and shipped to smelters 763 tons of lead ore containing 138 ounces of gold, 6,178 ounces of silver, 2,752 pounds of copper, 143,273 pounds of lead, and 8,331 pounds of zinc. From the Shafter group 766 tons of gold ore containing 515 ounces of gold and 909 ounces of silver were shipped to a smelter. Remaining district production was 84 tons of lead ore from the Tuscarora mine, 33 tons of zinc-lead ore from the Ferdinand group, and 18 tons of gold ore from the Pine Tree claim.

Bryant District.—Output from the Hecla mine and dumps comprised 390 tons of dump gold-silver ore, 1,267 tons of silver old tailings, 268 tons of old zinc-lead slag, 316 tons of dump lead ore, and 1,084 tons of old lead slag, all shipped to smelters in Utah.

Horse Prairie Creek District.—W. C. McLeod operated a dragline excavator and nonfloating washing plant on the Golden Leaf placer from June 1 to September 15 and recovered 188 ounces of gold and 26 ounces of silver from 70,000 cubic yards of gravel.

Vipond District.—Lessees operated the Quartz Hill Mines group and shipped 90 tons of silver ore to a smelter.

BROADWATER COUNTY

Backer District.—Small lots of high-grade gold ore treated by amalgamation were produced from the Superior group of claims and two small-scale placer operators recovered 7 ounces of gold.

Beaver District.—H. W. Carver, lessee, worked the East Pacific and No. 4 Tunnel claims throughout 1946, milled about 3,000 tons of old gold-silver-lead tailings that made lead concentrate, sent 835 tons of zinc-lead ore to a custom mill in Utah, and shipped 177 tons of zinc-lead ore to a smelter. Remaining production from the district, all shipped to smelters, comprised a total of 178 tons of gold ore from the Custer, Edna No. 2, Joe Dandy, Martha Washington, Vosburg, and Lame Deer properties.

Cedar Plains District.—R. S. Stewart worked the Ruby Silver mine in 1946 and shipped to a smelter 443 tons of ore containing 2 ounces of gold, 1,220 ounces of silver, 629 pounds of copper, 23,251 pounds of lead, and 149,734 pounds of zinc. Other district production was mainly 470 tons of gold ore concentrated from the Keating mine, 236 tons of crude lead ore from the Joe Dandy and Santa Anita properties, 75 tons of gold ore from the Buckhorn and Nada claims, and 17 tons of silver ore from the Spar claim.

Park or Indian Creek District.—The Broadwater Zinc & Lead Co. milled 4,825 tons of zinc-lead ore from its Iron Mask mine; the mill yielded 1,062 tons of zinc concentrate and 317 tons of lead concentrate. Other lode output from the district was largely 470 tons of gold ore amalgamated from the Diamond Hill mine and 54 tons of gold ore shipped direct to a smelter from the Marietta claim. Douglas Placers operated its dragline dredge on Indian Creek from February until Christmas and washed 300,000 cubic yards of gravel.

[1]Barker district lies in Cascade and Judith Basin Counties.

CASCADE COUNTY

Barker District.—Output in 1946 was 398 tons of zinc-lead ore shipped to custom mills in Utah from the Fairplay & Bon Ton mine. Gross metal content of the ore was 2 ounces of gold, 1,769 ounces of silver, 684 pounds of copper, 71,095 pounds of lead, and 209,275 pounds of zinc.

Montana District.—The Montana Leasing Co. operated the Benton group until December 1, after which the Lexington Silver & Lead Mines, Inc., took charge. The output—6,469 tons of zinc-lead-silver ore—was treated in the company 100-ton flotation mill and produced 519 tons of zinc-lead-silver concentrate. The Neihart Mine & Milling Co. worked the Broadwater group throughout 1946 and produced 10,248 tons of zinc-lead ore, which was treated in the company 80-ton flotation mill; the ore yielded 334 tons of zinc concentrate and 238 tons of zinc-lead concentrate. The Dacotah group was worked for 7 months by the Bennett Mining Co. and produced 1,900 tons of zinc-lead ore, which was treated in the company 75-ton flotation mill. The Star group was operated throughout the year; 3,200 tons of zinc-lead ore were treated in the 50-ton flotation mill on the property. Remaining district output was 5 tons of zinc-lead-silver ore produced from the Champion B claim.

FERGUS COUNTY

Total production from Fergus County in 1946 was a car of copper milling ore from the Blue Dick claim in the Warm Springs district.

FLATHEAD COUNTY

Hog Heaven District.—Output in 1946 was 2,020 tons of siliceous silver ore from the Flathead mine, operated by the Anaconda Copper Mining Co. The mine closed at midsummer.

GRANITE COUNTY

Alps District.—The Alps Mining & Milling Co. developed its Alps group throughout the year and shipped to a smelter 93 tons of gold ore containing 21 ounces of gold and 5 ounces of silver.

Boulder and South Boulder District.—The bulk of the output in 1946 was 203 tons of silver ore shipped to a smelter from the Brooklyn group and 40 tons of gold-silver ore from the Mediterranean claim, treated in a 50-ton flotation mill on the property.

Dunkleberg District.—The Forest Rose, Wasa, and Monarch claims of the Forest Rose Syndicate were operated only until June. The company 100-ton flotation mill treated 12,255 tons of zinc ore, which yielded 34 tons of lead concentrate and 732 tons of zinc concentrate.

First Chance District.—Lode production was principally 60 tons of gold smelting ore from the Fairview claim. Small-scale placering recovered 30 ounces of gold from the Lucky Jim, Overlook, and Lehson's No. C claims.

Flint Creek District.—From its Trout group the Trout Mining Division of American Machine & Metals, Inc., shipped to a smelter 103 tons of zinc-lead ore containing 2 ounces of gold, 3,354 ounces of

793065—48——93

silver, 250 pounds of copper, 11,872 pounds of lead, and 16,304 pounds of zinc. Remaining district production was mainly 104 tons of silver ore and 57 tons of zinc-lead ore from the Moorlight (True Fissure) group.

Henderson District.—The connected-bucket dredge of the H. & H. Mines on Henderson Creek was operated from March 13 to September 10; gold output was considerably less than in 1945. From the Combination group, Ben Walkup shipped to a smelter 4,600 tons of old silver tailings.

Red Lion District.—High-grade gold ore (37 tons) was shipped to a smelter from the Glittering Hill claim.

JEFFERSON COUNTY

Amazon District.—From the East Mint claim 75 tons of gold-silver ore were shipped to a smelter; metal content was 12 ounces of gold, 542 ounces of silver, 1,321 pounds of copper, 4,631 pounds of lead, and 3,750 pounds of zinc.

Cataract District.—J. K. Curtiss operated the Morning Glory mine throughout 1946 and shipped to a smelter 139 tons of ore containing 24 ounces of gold and 4,986 ounces of silver. Remaining district production was largely 49 tons of gold ore from the Boulder claim, 28 tons of gold-silver ore from the Comet dump, and 26 tons of lead ore from the Klondyke claim.

Clancey District.—Idle since October 15, 1942, Winston Bros. resumed operations May 12, 1946, with its connected-bucket dredge on Prickly Pear Creek and to the end of the year handled 1,413,761 cubic yards of gravel. The dredge is equipped with 86 6-cubic foot buckets. The N. Rogers Gold Mining Co. operated the Jefferson Placers from February 18 to the end of the year with a 1½-cubic yard dragline dredge, a ¾-cubic yard power shovel, and a nonfloating washing plant. Remaining output from the district was a small quantity of gold recovered by hand placering.

Colorado District.—The principal output in 1946 was 863 tons of ore (containing 76 ounces of gold, 3,540 ounces of silver, 1,487 pounds of copper, 22,449 pounds of lead, and 14,264 pounds of zinc) shipped to a smelter from the Blizzard waste dump. Other district production, all shipped to smelters, was mainly 136 tons of gold-silver ore from the Blue Bird group, 44 tons of copper ore from the Chalcopyrite mine, and 34 tons of gold-silver ore from the Mount Washington property.

Elkhorn District.—The bulk of the production in 1946 came from the Elkhorn property. The output (3,769 tons of old silver tailings and 287 tons of crude silver ore) was shipped to smelters. Remaining district production was 712 tons of lead-silver ore shipped to a smelter from the Elkhorn Queen mine.

Golconda District.—The Mines Development Co. operated the Gold Coin claim and shipped to a smelter 32 tons of ore containing 23 ounces of gold, 306 ounces of silver, 5,547 pounds of lead, and 1,856 pounds of zinc. Remaining district production was 13 tons of lead ore shipped to a smelter from the Big Chief claim.

Whitehall District.—The Golden Sunlight mine, operated by Marvin F. Riebhoff, was again the largest producer in the Whitehall district;

output was 9,838 tons of gold ore shipped to a smelter. George W. Wolfe operated the Lucky Hit mine throughout the year and shipped to smelters 332 tons of gold ore containing 218 ounces of gold, 523 ounces of silver, 2,281 pounds of copper, 20,498 pounds of lead, and 11,520 pounds of zinc. Remaining district output, all shipped to smelters, comprised 1,061 tons of lead ore from the Carbonate, Surprise, Iron Side, Minerva, and Perhaps properties; 36 tons of silver ore from the Florence Fraction claim; and 32 tons of gold ore from the Sunny Corner mine.

Wilson and Ticer Creeks District.—The Callahan Mining Syndicate worked the Deer Horn Nos. 1, 2, and 3 claims a short time in 1946 and milled 285 tons of gold ore by amalgamation and concentration.

JUDITH BASIN COUNTY

Barker District.—The Faith Mining Co. operated its group of claims and shipped 124 tons of zinc-lead-silver ore to a smelter.

Yogo District.—Walter C. Lehman worked the Gold Bug mine a few months in 1946 and shipped to a smelter 116 tons of ore containing 51 ounces of gold, 380 ounces of silver, and 538 pounds of copper.

LEWIS AND CLARK COUNTY

Blue Cloud District.—Output of the Blue Cloud district in 1946 was 31 tons of gold ore produced from the Pearl claim and 13 tons of silver-lead ore from the Lincoln mine.

Heddelston District.—The Mike Horse Mining & Milling Co., a subsidiary of the American Smelting & Refining Co., operated the Mike Horse mine throughout 1946 and treated 59,207 tons of zinc-lead ore in the company 250-ton flotation mill; the mill yielded 4,388 tons of lead concentrate and 2,544 tons of zinc concentrate containing 92 ounces of gold, 109,786 ounces of silver, 310,318 pounds of copper, 5,379,789 pounds of lead, and 3,198,283 pounds of zinc.

Helena District.—Porter Bros. Corp. operated its 6-cubic-foot Yuba dredge on Last Chance Gulch throughout the year and washed 1,903,323 cubic yards of gravel. Remaining lode and placer production from the district was very small.

Marysville District.—The Montana Rainbow Mining Co. operated the Drumlummon mine continuously in 1946 and milled 16,182 tons of gold ore in its 160-ton amalgamation and concentration plant. The rest of the district output was 432 tons of gold ore shipped to a smelter from the Belmont-Cruse group and 16 tons of lead ore produced from the Empire property.

Ophir Gulch District.—Total production was 21 tons of gold ore shipped to a smelter from the Victory claim.

Rimini District.—In 1946 about 3,000 tons of zinc-lead ore from the Valley Forge waste dump were treated in the flotation mill of the Rimini Milling Co., and 45 tons of gold-silver ore from the Lee Mountain waste dump were concentrated. Output of smelting ore was mainly 9 tons of gold-silver ore, 48 tons of lead ore, and 56 tons of zinc-lead ore from the Bunker Hill claim, 30 tons of gold ore from the Clementh claim, 21 tons of lead ore from the Copper Dyke mine, 33 tons of zinc-lead ore from the Lexington claim, 30 tons of gold-silver ore from the Eureka claim, and 58 tons of lead ore from the Anna May

& Broadway group. Hand placering on the Gould claim recovered 5 fine ounces of gold.

Smelter District.—As in previous years, the bulk of production in the Smelter district in 1946 came from operations of the Anaconda Copper Mining Co. slag-fuming plant at East Helena. Hot slag and cold slag treated at the plant totaled 161,306 tons in 1946, compared with 197,244 tons in 1945, but only the metals recovered from fuming 55,458 tons of old cold lead-smelter slag were credited to the plant as a producer in the Smelter district. The remaining metals, after elimination of material from foreign sources, were credited to the individual domestic mines producing the ores and concentrates that yielded the current hot slag treated in the slag-fuming plant. The American Smelting & Refining Co. resmelted 232 tons of old zinc slag during the year.

LINCOLN COUNTY

Cabinet (Fisher River) District.—The Silver Butte Zinc-Lead Mining Co. milled about 450 tons of zinc-lead ore from the Silver Butte claim in 1946; it yielded 20 tons of zinc concentrate and 10 tons of zinc-lead concentrate.

Libby District.—The Liberty and Comet placer claims produced 19 ounces of gold.

MADISON COUNTY

Cherry Creek District.—Output in 1946 was 17 tons of gold-silver smelting ore from the Gold Plate, Kennebeck, and Lucky Strike claims.

McCarthy Mountain District.—L. B. Lively worked the Polly Jane claim in 1946 and shipped 100 tons of lead ore to a smelter.

Norris and Norwegian District.—A. J. Theis operated the Boaz group throughout the year and shipped to smelters 102 tons of ore containing 377 ounces of gold, 231 ounces of silver, and 5,230 pounds pounds of lead. Remaining district output was mainly 400 tons of gold old tailings from the Revenue dump and 66 tons of gold ore from the Emperor mine.

Pony and South Boulder District.—Output was principally 33 tons of gold ore from the Little King group.

Renova District.—Total output in 1946 was 13 tons of gold ore from the Mary Ingaber claim.

Rochester District.—Lessees worked the Calvin group continuously in 1946 and shipped 795 tons of zinc-lead ore to a smelter in Utah. The rest of the district output was principally 155 tons of zinc-lead ore and 81 tons of gold-silver ore produced from the Emma group and 220 tons of lead ore from the Cooper property.

Sheridan District.—Victoria Mines, Inc., operated the Toledo-Buckeye group throughout 1946 and treated 42,064 tons of zinc-lead ore in the company 125-ton flotation mill which yielded 606 tons of lead concentrate and 1,550 tons of zinc concentrate. Wm. E. Horton worked the Silver Bullion group under lease all year and shipped to a smelter 188 tons of ore containing 3 ounces of gold and 3,928 ounces of silver; 72 tons of similar ore were produced by the Mitchell Mining Co. from the Goldsmith group. The remainder of the district output

was chiefly 36 fine ounces of gold and 5 fine ounces of silver recovered from 2 placer properties.

Silver Star District.—Output in 1946 was largely 105 tons of high-grade gold ore shipped to a smelter from the Stella mine and 20 tons of low-grade gold ore amalgamated from the Green Campbell waste dump.

Tidal Wave District.—Gold ore shipped to smelters was produced in 1946 from the Corncracker mine (104 tons); the Gold Crest mine (35 tons); the Granger group (47 tons); and the Smith & Thompson property (153 tons). Remaining district output was principally 79 tons of gold ore and 54 tons of lead ore from the High Ridge and High Ridge Fraction claims.

Virginia City District.—The U. S. Grant Mining Co. operated its U. S. Grant mine throughout the year and shipped to a smelter 12,919 tons of ore containing 2,702 ounces of gold and 234,612 ounces of silver. Gold-silver ore also was shipped from the Alameda & Wa Koosta property (227 tons), the Eureka claim (51 tons), and the Forkes claim (24 tons). From the Bamboo Chief mine 149 tons of gold ore were shipped to a smelter. Russell Unrue worked the Barton Gulch placer with a dragline dredge and washed 103,400 cubic yards of gravel from mid-May to late September.

MEAGHER COUNTY

The total output of Meagher County in 1946 was 48 tons of lead ore shipped to a smelter from the Yellowstone claim in the Castle Mountain district.

MINERAL COUNTY

Keystone District.—E. G. Smith worked the Nancy Lee group throughout 1946 and treated 11,763 tons of zinc-lead ore in the 100-ton flotation mill on the property.

MISSOULA COUNTY

Coloma District.—Output was 19 tons of gold ore shipped to a smelter from the Mammoth group.

Elk Creek District.—Lode production in 1946 was 13 tons of gold ore shipped to a smelter from the Cato claim. Linton & Austin worked the Elk Creek placer for a month with a 1½-cubic-yard dragline dredge and recovered 46 fine ounces of gold and 5 fine ounces of silver. Small-scale placering recovered an additional 4 ounces of gold from claims in the district.

Nine Mile District.—Canusco, Inc., successors to the Beaver Dredging Co., operated a 2½-cubic-yard dragline dredge on the Housum group of placer claims from April through December and recovered 2,276 fine ounces of gold and 42 fine ounces of silver. Hydraulicking and sluicing at the Crysalis placer recovered 3 fine ounces of gold.

PARK COUNTY

Emigrant Creek District.—After having been idle since October 15, 1942, the Emigrant Dredging Co. resumed operations April 22, 1946, with its connected-bucket dredge on the Hefferlin group of placer

claims in Emigrant Gulch and during the rest of the year handled 947,320 cubic yards of gravel. The dredge is equipped with 110 10-cubic-foot buckets.

New World District.—The McLaren Gold Mines Co. operated the Estelle mine continuously in 1946 and treated 30,735 tons of copper-gold ore in the company 200-ton flotation mill; it yielded 1,397 tons of copper concentrate containing 5,859 ounces of gold, 8,483 ounces of silver, and 371,059 pounds of copper. A total of 1,219 tons of zinc-lead ore was produced in 1946 from the Irma mine; 1,060 tons were treated by flotation and 159 tons of ore were shipped direct to a smelter.

Sheepeater District.—The Jardine Mining Co. operated its Jardine mine and 300-ton cyanide mill throughout the year; 52,040 tons of gold ore were treated by cyanidation and yielded 9,822 fine ounces of gold and 1,760 fine ounces of silver.

PHILLIPS COUNTY

Little Rockies District.—The Ruby Gulch Mining Co. resumed operations at the Ruby group July 1, 1946, after having been inactive since August 1942. In 1946 about 30,000 tons of gold ore were treated in the company 300-ton cyanidation mill; the yield was 2,121 ounces of gold and 4,414 ounces of silver. Remaining district production was 55 tons of gold smelting ore from the Little Ben mine.

POWELL COUNTY

Big Blackfoot District.—W. A. Noon developed the Marcum Hill claim in 1946 and shipped a car of lead ore to a smelter. John B. Hopkins worked the Hopkins drift mine from May through December and sluiced about 2,500 cubic yards of gravel. Remaining lode and placer output from the district was small.

Nigger Hill District.—Hopkins & Sons Mining Co., lessees, operated the Charter Oak mine throughout the year, shipped 473 tons of lead ore to a smelter, and treated 284 tons of zinc-lead ore in the 40-ton flotation mill on the property. From the Sunnyside & Sunset group 61 tons of zinc-lead ore were shipped to a custom mill in Utah for treatment. Remaining district output was 14 tons of lead ore produced from the Flora Best and Negros claims.

Zozell District.—The Bonanza Leasing Co. operated the Bonanza group from June through December and shipped to a smelter 440 tons of ore containing 339 ounces of gold and 183 ounces of silver. The Deer Lodge Mining Co. worked the Emery group and milled about 1,000 tons of gold-silver ore, which produced 163 tons of zinc-lead concentrate. Remaining district production was 70 tons of gold ore and 5 tons of lead ore produced from the Hidden Hand group.

RAVALLI COUNTY

Curlew District.—C. A. Tout operated the Curlew mine nearly all year and milled 4,480 tons of zinc ore by flotation which yielded 288 tons of zinc concentrate, 28 tons of zinc-lead concentrate, and 16 tons of lead concentrate.

SANDERS COUNTY

Camas Prairie District.—Laurence G. Howard operated the Glaucus & Cardiff mine all of 1946 and shipped to a smelter 430 tons of ore containing 8 ounces of gold, 578 ounces of silver, and 32,397 pounds of copper.

Eagle District.—The Jack Waite mine was worked the entire year by the American Smelting & Refining Co. Of the output (3,814 tons), 117 tons of lead ore were shipped to a smelter and 3,697 tons of zinc-lead ore were treated in the company 400-ton flotation mill at Duthie, Idaho; the yield was 523 tons of lead concentrate and 130 tons of zinc concentrate.

Revais Creek District.—Following a fire in 1945 that destroyed all the surface plant, the Green Mountain Mining Co. resumed operations at the Drake group June 1, 1946, and during the rest of the year shipped 421 tons of copper ore to a smelter and treated about 255 tons of similar ore in the rebuilt 50-ton flotation mill. Remaining district output was 47 tons of copper smelting ore from the Lucky Strike claim.

Vermillion District.—The Pringle Dredging & Mining Co. operated a Becker-Hopkins suction dredge on Trout Creek for a few weeks in 1946 and recovered 32 ounces of gold and 5 ounces of silver.

SILVER BOW COUNTY

Ore production in Silver Bow County declined 60 percent from that in 1945, resulting in decreases of 45 percent in gold output, 51 percent in silver, 34 percent in copper, 19 percent in lead, and 16 percent in zinc. The total value of the five metals produced in 1946 dropped 23 percent below that in 1945. The following table gives the output of mines in Silver Bow County, which includes the Summit Valley (Butte) district, in 1945 and 1946 and the total from 1882 to the end of 1946.

Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1945–46, and total, 1882–1946, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1945	24	4,528,282	12,484	4,976,910	175,899,200	5,851,500	16,986,400	$30,179,133
1946	27	1,827,606	6,962	2,417,969	115,809,000	4,713,000	14,216,500	23,205,317
1882–1946		[1]	2,026,233	545,784,979	[2] 6,543,819	[2] 234,862	[2] 1,570,769	2,599,412,012

[1] Figure not available.
[2] Short tons.

German Gulch District.—Hydraulicking and hand placering at the Beal Hill and Agnes placers recovered 42 ounces of gold and 5 ounces of silver.

Melrose (Camp Creek) District.—Output was 60 tons of silver ore from the Old Glory claim.

Summit Valley (Butte) District.—The copper concentrator of the Anaconda Copper Mining Co. at Anaconda treated 1,187,143 tons of copper ore from company-owned Butte mines in 1946, compared

with 1,747,946 tons in 1945, a decline of 32 percent; 4,203 tons of copper mine-water precipitates were produced, compared with 4,114 tons in 1945. Additional material treated in the concentrator was as follows (1945 figures in parentheses); New Works sand tailings, none (591,914 tons); mixed Butte slime and tailings, 171,646 tons (905,001 tons); mine dumps, none (424,684 tons); special waste 29,286 tons (64,375 tons); and East Project ore and Special Exploration project (Adams ore), 53,671 tons (none). Direct-smelting ore totaled 19,846 tons.

Total slimes treated at the slime-disintegrating plant in 1946 comprised 252,462 tons of New Works Valley Pond slimes, compared with 283,831 tons from the same source in 1945; the total from all sources in 1945 was 548,216 tons.

The contract between the Anaconda Copper Mining Co. and the North Butte Mining Co. for operation of the North Butte mine was terminated March 31, and in July the North Butte Mining Co. assumed control of the property. Output for the year was 35,793 tons of copper milling ore and 9 tons of copper mine-water precipitates.

Zinc ore mined from the zinc mines of the Anaconda Copper Mining Co. totaled 766 tons in 1946. In November the company began treating zinc-lead ore from the Butte Hill waste dumps at Butte and during the rest of the year treated 31,973 tons. The operation rapidly became a major source of Montana zinc and an important source of lead. The initial product is a bulk zinc-lead concentrate, which is further separated into zinc concentrate and lead concentrate. The company continued operating the Emma & Ophir mine under lease and produced 21,305 tons of zinc-lead middling from the treatment of manganese-zinc ore. In addition, 5,791 tons of zinc-lead middling were produced in milling manganese-zinc ore from the Travona mine; the middling was treated further at the Anaconda zinc concentrator.

Lessees of the Anaconda Copper Mining Co. operated a number of properties at Butte during the year and produced 17,403 tons of ore, of which 12,662 tons (zinc-lead ore) came from the Poulin mine. The remainder of the district output was mainly 211 tons of silver ore from the Bluebird and Mona claims and 142 tons of gold-silver ore from the Ruby mine.

Nevada
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By ALFRED L. RANSOME

	PAGE		PAGE
General summary	1473	Mining industry	1479
Calculation of value of metal production	1474	Ore classification	1479
Mine production by counties	1478	Metallurgic industry	1480
		Review by counties and districts	1484

GENERAL SUMMARY

THE QUANTITY and value of zinc produced in Nevada in 1946 attained the highest levels in the history of the State, surpassing the previous record of 1945 by 6 percent in quantity and 12 percent in value. In contrast, gold output was 2 percent below the total for 1945 and was the lowest in quantity since 1895. Copper production decreased 8 percent to the lowest point since 1938, but the output of silver and lead was up 20 and 14 percent, respectively, above the totals for 1945. The total value of gold, silver, copper, lead, and zinc recovered from ore, old tailings, and gravels in Nevada in 1946 was $27,026,416 compared with $24,186,294 in 1945—an increase of 12 percent—owing to a greater average price for all metals except gold. As a result of this price increase, the total value of copper produced in 1946 was 11 percent above the value of the greater output in 1945. Increased output was largely a matter of incentive resulting from higher prices and was accomplished in spite of continued rising costs of labor, supplies, and equipment. Also, for the first year since the war, labor was beginning to become more available.

Comparing 1946 with 1945, gold output decreased 2 percent in quantity and value, and copper decreased 8 percent in quantity but advanced 11 percent in value; silver increased 20 percent in quantity and 36 percent in value; lead increased 14 percent in quantity and 45 percent in value; and zinc advanced 6 percent in quantity and 12 percent in value. Of the total value of the five metals, copper comprised 58 percent; zinc, 20 percent; gold, 12 percent; lead, 6 percent; and silver, 4 percent.

White Pine County continued its lead over the other counties by producing 62 percent of the State total value of the five metals; it stood first in output of copper and gold, second in silver, third in zinc, and fifth in lead. Lincoln County ranked second to White Pine County, with 20 percent of the State total value; it led the State in production of silver, lead, and zinc.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per ounce fine	*Per ounce fine*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	711+	.130	.075	.108
1944	35.00	711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1 to Dec. 31, 1946: $0.905.
[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Nevada, 1942–46, and total, 1859–1946, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] From 1904 (when first satisfactory annual canvass of mine production was made) to 1946, inclusive, the output was as follows: Gold, 13,690,124.51 ounces valued at $327,173,478; silver, 301,190,863 ounces, $203,568,379; copper, 1,780,742 tons, $505,056,894; lead, 309,389 tons, $37,610,955; zinc, 347,488 tons, $55,488,516; total value, $1,128,898,222.
[3] Figure not available. [4] Short tons.

Gold.—Gold production in Nevada in 1946, decreasing 2 percent below the 1945 output, was the lowest in quantity since 1895 and in value since 1933. Continued rising costs of labor, supplies, and equipment left little room for incentive to mine gold at the established and unchanged price. Although output from a larger number of placer mines increased 55 percent above the total for 1945, gold from lode mines—which accounted for 84 percent of the State's total gold production—declined 8 percent. Monthly production of gold, as shown in the accompanying table, was erratic, with no definite trend indicated. Byproduct gold from base-metal ores comprised 52 percent of the output of gold, again exceeding the gold recovered from precious-metal ores, which was 32 percent of the total.

The 10 leading gold-producing mines in 1946 produced 88 percent of Nevada's output, the three leaders contributing 58 percent.

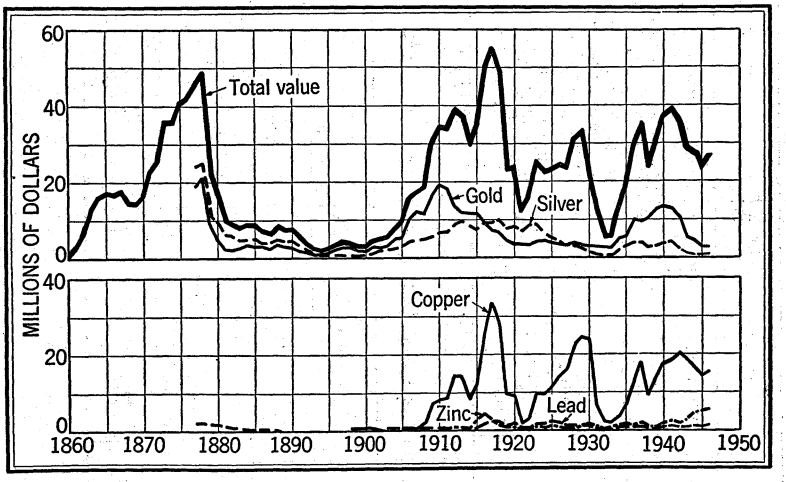

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Nevada 1860–1946.

Silver.—As in preceding years, most of the silver output of Nevada was a byproduct of ore mined chiefly for other metals. Base-metal ores were the source of 80 percent of the State's silver production in 1946; only 5 percent of the silver was derived from straight silver ore. The monthly production figures in the accompanying table show a higher level of output during the latter half of 1946, with no special trend indicated. The 10 leading silver-producing mines in Nevada in 1946 produced 65 percent of the State total recoverable silver, the first three yielding 34 percent of the total.

Ten leading gold-producing mines in Nevada in 1946, in order of output

Rank	Mine	District	County	Rank in 1945	Operator	Source of gold
1	Ruth and Copper Flat Pit	Robinson	White Pine	1	Kennecott Copper Corp. (Nevada Mines Division).	Copper ore.

[1] Did not produce in 1945.

Mine production of gold, silver, copper, lead, and zinc in Nevada in 1946, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Cepper (short tons)	Lead (short tons)	Zinc (short tons)
January	6,967	102,243	4,083	616	1,820
February	7,582	99,540	4,083	616	1,948
March	7,379	93,781	4,849	561	2,204
April	8,709	90,491	4,900	561	2,381
May	6,968	96,954	4,440	645	2,548
June	7,582	98,247	4,772	460	2,007
July	5,636	113,407	2,144	493	1,574
August	7,685	117,638	3,369	616	1,673
September	7,172	115,170	3,471	616	1,525
October	6,967	99,892	3,726	645	1,623
November	9,836	111,644	4,287	673	1,673
December	8,197	111,644	4,492	673	1,673
Total 1946	90,680	1,250,651	48,616	7,175	22,649

Copper.—The three leading copper producers in Nevada in 1946 accounted for 98 percent of the copper output; these were: The Kennecott Copper Corp. (Nevada Mines Division), working the Ruth and the Copper Flat open-pit mines, and the Consolidated Coppermines Corp., working the Coppermines group at Kimberly (all in the Robinson district, White Pine County); and the Mountain City Copper Co., working the Mountain City mine at Mountain City (in the Cope district, Elko County). The monthly production of copper fluctuated rather widely during the year, reaching a high point of 4,900 short tons in April; the low point of 2,144 tons in July was followed by a steady rise to 4,492 tons in December.

Lead.—Of the recoverable lead produced in Nevada in 1946, 49 percent was mined in the Pioche district, Lincoln County, where the leading properties were: The Combined Metals Reduction Co., working the Pioche No. 1 and 2 groups and also the Raymond Ely West property, Ely Valley mine, operated by Ely Valley Mine, the Prince mine, operated by the Prince Consolidated Mining Co., and the Financier mine, operated under lease from the Salt Lake Pioche Mining Co. Other important producers in the State were: The B. B. S. Mining Corp. and Wilson & Simpson, working the Simon Lead mine (Bell district, Mineral County); McFarland & Hullinger, Cleveland mine (Delano district, Elko County); Nevada Lead & Zinc Co., Nevada Lead mine (Spruce Mountain district, Elko County); the International Mining Corp. and Dan Sheahan, Groom mine (Groom district, Lincoln County); and the Bristol Silver Mines Co., Bristol Silver mine (Jack Rabbit district, Lincoln County). The monthly State total production of lead showed a decline during the first half of 1946 followed by an upward trend during the second half, the December total being 9 percent above that for January.

Zinc.—In 1946, as in recent years, zinc production in Nevada was centered in the Pioche district, Lincoln County, where 70 percent of the State total for the year was mined. The Combined Metals Reduction Co. (including the Raymond Ely West property) and Ely Valley Mine were the State's leading producers, in that order; both are in the Pioche district. Other important producers in the State were: Callahan Zinc-Lead Co., Mount Hope mine (Eureka district, Eureka County); Prince Consolidated Mining Co., Prince mine

(Pioche district, Lincoln County); Grand Deposit Mining Co., Grand Deposit mine (Aurum district, White Pine County); Sam Robinson, Columbia mine (Robinson district, White Pine County); and Nevada Lead & Zinc Co., Nevada Lead mine (Spruce Mountain district, Elko County). The monthly State total production figures in the accompanying table show a gradual increase during the first 5 months of 1946 to the high point of the year in May. Output during the latter half of the year showed some fluctuation, followed by a leveling during the fourth quarter at a point below the general level of the first 6 months.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Nevada in 1946, by counties, in terms of recovered metals

County	Mines producing [1]		Gold						Silver (lode and placer)

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

MINING INDUSTRY

The 7-percent increase in total tonnage of ores and old tailings sold or treated in Nevada in 1946 compared with 1945 reflects an increase in total dry and siliceous ores (to a large extent used as fluxing ore at base-metal smelters) and an increase in all the base-metal ores except zinc ore. The increased production resulted from higher prices for all metals except gold. It is notable that a greater tonnage of copper ore was treated in 1946 to produce a smaller quantity of copper compared with 1945, which denotes an over-all lower grade of such ore mined.

The connected-bucket dredge of the Manhattan Gold Dredging Co. in the Manhattan district, Nye County, was again the largest producer of placer gold and the third largest producer of gold in the State. Except for this operation and two dragline dredge operations (in Lyon and Lander Counties), Nevada placer mines were limited almost entirely to small-scale hand operations.

ORE CLASSIFICATION

The accompanying table classifying ores sold or treated in Nevada in 1946 shows that 89 percent of the tonnage (including old tailings) was copper ore, 5 percent gold ore and old tailings, 5 percent zinc-lead ore, and the remainder lead ore and old tailings, zinc ore, and silver and gold-silver ore and old tailings.

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in Nevada in 1946, with content in terms of recovered metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry and siliceous gold ore	312,179	165	27,614	85,979	2,700	8,000	----------
Dry and siliceous gold-silver ore	6,310	1,838	1,184	93,151	9,500	14,700	----------
Dry and siliceous silver ore	7,241	1,842	175	63,579	17,800	186,700	2,000
Total	325,730	3,845	28,973	242,709	30,000	209,400	2,000
Copper ore	5,102,212	--------	43,260	289,701	[1] 96,959,900	508.000	515,000
Lead ore	11,946	2,522	371	196,518	31,200	3,145,800	19,700
Zinc ore	11,306	--------	103	17,339	89,100	397,200	3,148,600
Zinc-lead ore	268,244	--------	3,187	498,402	121,800	10,089,600	41,612,700
Total lode mines	5,719,438	6,367	75,894	1,244,669	[1] 97,232,000	14,350,000	45,298,000
Placers	----------	--------	14,786	5,982	----------	----------	----------
Total: 1946	5,719,438	6,367	90,680	1,250,651	[1] 97,232,000	14,350,000	45,298,000
1945	5,360,513	14,160	92,265	1,043,380	[2] 105,190,000	12,550,000	42,914,000

[1] Includes 3,229,000 pounds of copper from precipitates.
[2] Includes 4,459,300 pounds of copper from precipitates.

METALLURGIC INDUSTRY

Of the 5,725,805 tons of lode material from Nevada mines sold or treated during 1946, 93 percent went to concentrating mills, 5 percent to amalgamation and cyanidation mills, and 2 percent to smelters; of the total, 6,367 tons (0.11 percent) was old tailings, all cyanided or smelted. Flotation was employed at concentration mills to the virtual exclusion of gravity concentration. Of the gold recovered as bullion, cyanidation supplied 91 percent and amalgamation 9 percent; of the silver recovered as bullion, 98 percent was derived by cyanidation and 2 percent by amalgamation. The tonnage of crude ore and old tailings shipped to smelters decreased 22 percent compared with 1945.

The 600-ton selective-flotation mill operated by the Combined Metals Reduction Co. at Pioche, Lincoln County, treated zinc-lead and zinc ores on a custom basis for several neighboring mines and also milled company zinc-lead ore. The Kennecott Copper Corp. treated all the copper ore produced by the Consolidated Coppermines Corp., on a contract basis, in addition to milling its own ore. The Kennecott Copper Corp. also operated the McGill copper smelter, Nevada's only smelter.

Mine production of metals in Nevada in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	3,502	1,915	1,397			
Ore and old tailings cyanided	303,293	20,298	71,882			
Concentrates smelted:

REVIEW BY COUNTIES AND DISTRICTS

CHURCHILL COUNTY

Eastgate District.—William H. Schweis shipped gold ore to a smelter from the Gold Ledge mine during 1946. Fred F. Erb worked the Gold Trail & Lucky group during the year and recovered gold by amalgamation. Ed Tavernia shipped 13 tons of gold-silver ore to a smelter from the North Star mine and recovered 2 ounces of gold and 318 ounces of silver.

Holy Cross District.—A small quantity of gold-silver ore from the Good Hope mine was shipped to a smelter by Louis DeVetsera, and J. J. Martin shipped 6 tons of silver ore to a smelter during 1946.

CLARK COUNTY

Eldorado Canyon District.—The Patimac Metals Co. operated the Eldorado, Rover, Crown, and Rambler groups of claims in 1946.

Searchlight District.—Lessees shipped gold ore to smelters from the Blossom mine during 1946. The M & M Mines, Inc., operated the Quartette mine during July and August 1946; gold-silver ore containing some copper and lead was shipped to a smelter.

Yellow Pine (Goodsprings) District.—The Argentena Consolidated Mining Co. worked the Argentena mine throughout 1946; 989 tons of zinc ore containing 10 ounces of gold, 3,663 ounces of silver, 1,702 pounds of copper, 53,110 pounds of lead, and 418,243 pounds of zinc were shipped to a smelter. R. F. Carlson operated the Clementina mine from April 1 through December 20, 1946, and shipped 22 tons of gold ore to a smelter. William T. Frazer worked the Hoosier mine during the first 6 months of 1946 and shipped zinc-lead ore to a smelter. The Diamond Gold Mining Co. operated the Mountain Top mine from February 15 to March 25, 1946, shipping 45 tons of zinc-lead ore containing 30 ounces of silver, 5,536 pounds of lead, and 15,006 pounds of zinc to a smelter. H. K. Thurber shipped 42 tons of copper ore to a smelter from the Ninety-Nine mine during the last 2 months of 1946; the ore contained 179 ounces of silver, 10,291 pounds of copper, and 209 pounds of lead. Hamilton and Jacobson operated the Pilgrim, Root Zinc, and Sultan mines during 1946. Zinc-lead ore from the Pilgrim mine (965 tons containing 9 ounces of gold, 2,934 ounces of silver, 19,029 pounds of copper, 115,571 pounds of lead, and 372,492 pounds of zinc) was shipped to a smelter. Zinc ore from the Root Zinc mine (773 tons containing 6 ounces of gold, 1,763 ounces of silver, 24,902 pounds of copper, 60,977 pounds of lead, and 292,107 pounds of zinc) was shipped also to a smelter. From the Sultan mine 3,685 tons of zinc-lead ore were milled in a 75-ton gravity concentration plant to produce 488 tons of zinc-lead concentrates containing 4 ounces of gold, 8,676 ounces of silver, 903 pounds of copper, 192,622 pounds of lead, and 156,404 pounds of zinc; in addition, 1,295 tons of zinc-lead ore containing 7 ounces of gold, 10,716 ounces of silver, 2,860 pounds of copper, 185,512 pounds of lead, and 570,505 pounds of zinc were shipped to a smelter. The Coronado Copper & Zinc Co. worked the Yellow Pine mine from January through August 1946 and shipped zinc ore to a smelter.

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures: other producing districts listed in footnote 7 and their output included under "Other districts."

[2] Excludes itinerant prospectors, snipers, high graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 1,244,669 ounces from lode mines and 5,982 from placers.

[4] Included under "Other districts."

[5] Exclusive of lode output, which is included in "Other districts."

[6] Output from property not classed as a mine.

[7] Includes following districts: Eastgate in Churchill County; Cope in Elko County; East Walker and Regents (lode) in Mineral County; and Osceola in White Pine County.

ELKO COUNTY

Contact (Salmon River) District.—The Marshall Mining Co. worked the Allen and Delano claims during 5 months in 1946 and shipped 975 tons of copper ore containing 10 ounces of gold, 943 ounces of silver, and 56,716 pounds of copper to a smelter. Lessees worked the Galena King mine during 1946, shipping lead ore to a smelter.

Cope (Mountain City) District.—The Mountain City Copper Co. (the third largest copper producer in Nevada) operated throughout 1946; most of the ore was treated in the company 400-ton flotation mill, but some high-grade copper ore was shipped for direct smelting.

Cortez District.—The McCarthy Mining Co. operated the Mill Canyon mine throughout 1946; 325 tons of zinc-lead ore were shipped to a concentrator-smelter.

Delano District.—McFarland & Hullinger worked the Cleveland mine during 1946, shipping lead ore to a smelter. Aaron Bracken shipped lead ore from the Gold Note mine to a smelter.

Loray District.—During 1946, L. D. Foreman and Charles E. Roberts shipped old tailings containing silver, lead, and a small quantity of copper to a smelter from the Maybelle mine.

Merrimac District.—The Rip Van Winkle Consolidated Mining Co. operated the Rip Van Winkle mine from May to December 1946, shipping 825 tons of zinc-lead ore containing 8 ounces of gold, 7,335 ounces of silver, 3,746 pounds of copper, 59,129 pounds of lead, and 93,936 pounds of zinc to a concentrator-smelter for treatment.

Railroad District.—Byrns Basin Mines, Inc., worked the Gray Eagle mine, shipping copper ore to a smelter and zinc-lead ore to a concentrator-smelter for treatment.

Ruby Valley District.—Lambert & Associates operated the Michigan group and shipped a small quantity of zinc-lead ore to a smelter.

Spruce Mountain District.—Eugene Parker shipped 28 tons of lead ore containing 209 ounces of silver, 205 pounds of copper, and 6,739 pounds of lead to a smelter from the Humbug mine in 1946. The Missouri Monarch Consolidated Mines Co. and R. J. Birch worked the Monarch mine during 1946, shipping silver ore and lead ore to a smelter. The Nevada Lead Zinc Co. operated the Nevada Lead mine during 1946, shipping zinc-lead ore to a smelter. Edgar O. Gibson shipped lead ore from the Spruce Standard mine during a short period of operation in the last quarter of 1946.

ESMERALDA COUNTY

Goldfield District.—The Combination Fraction Mining Co. worked the Combination Fraction mine throughout 1946; 51 tons of gold ore containing 103 ounces of gold and 14 ounces of silver were shipped to a smelter. Pius Kaelin worked the Possibility mine, shipping a small tonnage of lead ore to a smelter. Lessees operated the St. Ives, Florence, and Black Butte claims of the Goldfield Deep Mines Co. of Nevada intermittently during 1946; 107 tons of gold ore containing 216 ounces of gold and 78 ounces of silver were shipped to a smelter. The Goldfield Consolidated Mines Co. worked the mine of the same name during 1946 and shipped 51 tons of gold ore containing 63 ounces of gold and 30 ounces of silver to a smelter.

Gold Mountain (Divide) District.—Lessees working the Tonopah Divide mine shipped 1,383 tons of gold ore containing 1,123 ounces of gold and 5,046 ounces of silver to a smelter during 1946. N. L. Brown operated the Gila Monster mine for 6 months in 1946, shipping 8 tons of gold ore to a smelter.

Hornsilver District.—Earl B. Mack operated the Gold Crest (Ohio) mine and shipped gold ore to a smelter; in addition, a small quantity of gold and silver was recovered by amalgamation.

Silver Peak District.—Roy Cleary and Frank Scott recovered 48 ounces of gold and 31 ounces of silver from 26 tons of gold ore shipped to a smelter from the Coyote mine during the latter part of 1946.

EUREKA COUNTY

Eureka District.—The Callahan Zinc-Lead Co. worked the Mount Hope mine throughout 1946, treating 60,486 tons of zinc-lead ore in the company 250-ton flotation mill. Two hundred and five tons of lead concentrate (containing 10 ounces of gold, 25,845 ounces of silver, 2,224 pounds of copper, 246,762 pounds of lead, and 14,580 pounds of zinc) and 7,847 tons of zinc concentrate (containing 29 ounces of gold, 17,266 ounces of silver, 41,769 pounds of copper, 58,951 pounds of lead, and 7,549,469 pounds of zinc) were shipped to smelters. Santos Jayo and Wallace R. Jurey shipped 4 tons of silver ore containing 1 ounce of gold and 317 ounces of silver from the Gates Bertrand open-pit mine to a smelter.

HUMBOLDT COUNTY

Awakening District.—The Awakening Syndicate did some rehabilitation work at the Alabama mine in 1946 and shipped 37 tons of gold ore to a smelter. The Austin Bros. Gold Mining Co. treated gold ore from the Jumbo mine by amalgamation during 1946. Jay S. Jones worked the May Day mine intermittently during 1946 and treated gold ore by amalgamation.

Barrett Springs District.—Jeff Rice worked the King Gold No. 2 and Stormy Weather mines in 1946; gold ore from each mine was treated by amalgamation. M. J. Smith treated the Ten Mile tailings dump by cyanidation during irregular periods of operation in 1946.

Paradise Valley District.—Wesley Lane reopened the El Paso mine during the last quarter of 1946 after a long period of idleness; 75 tons of gold ore containing 13 ounces of gold and 3 ounces of silver were treated by amalgamation in a newly installed 25-ton mill. Arnold Scossa treated a few tons of gold ore by amalgamation at the Yellow Metal mine.

Potosi District.—Getchell Mines, Inc., made some test runs of ore from the Getchell mine and from less than a ton of material shipped to two smelters recovered 17 ounces of gold and 5 ounces of silver.

LANDER COUNTY

Battle Mountain District.—The Hi-Bar Co. conducted placer operations in Iron Canyon, and the Natomas Co. operated a dragline dredge at Greenan Placers in 1946. Lessees operated the Copper Canyon Mining Co. Copper Basin property during 1946; although most of

the copper ore was shipped to a smelter, some ore was treated by flotation in the Copper Canyon Mining Co. mill. The Copper Canyon mine and 350-ton flotation mill were operated by the Copper Canyon Mining Co. throughout 1946; copper concentrate was shipped to a smelter. Claude A. Post, lessee, worked the Gold Butte mine for 2 months in 1946 and shipped 52 tons of gold-silver ore (containing 7 ounces of gold, 540 ounces of silver, 236 pounds of copper, and 5,182 pounds of lead) to a smelter. Nelson & Riech, lessees, operated the Silver Chief group from March 1 to June 10, 1946, shipping 41 tons of gold-silver ore containing 5 ounces of gold, 184 ounces of silver, 259 pounds of copper, and 5,184 pounds of lead to a smelter. The same partnership worked the Nevada group from August 26 through the remainder of the year, shipping 189 tons of lead ore containing 16 ounces of gold, 1,536 ounces of silver, 282 pounds of copper, and 48,935 pounds of lead to a smelter.

Bullion District.—The Goldacres mine was operated throughout 1946, for the first 9 months by Willow Creek Mines, Inc., and the last 3 months by Consolidated Goldacres Co., owner of the property. Ore mined by open-pit method was treated by cyanidation. O'Leary & Kinsella shipped gold ore to a smelter from the Gold Quartz mine during the first part of 1946.

New Pass District.—The Thomas W. mine was operated almost continuously throughout 1946 by the Reorganized Silver King Divide Mining Co.; gold ore was treated by amalgamation, and in addition lead ore was shipped for direct smelting.

LINCOLN COUNTY

Chief (Caliente) District.—Lloyd Hoskins, lessee, shipped gold ore from the Caliente-Cobalt mine to a smelter.

Comet District.—Comet Mines, Inc., worked the Comet mine during 1946 and shipped zinc-lead ore to a custom flotation mill for treatment. Joan Valente shipped a small tonnage of lead ore from the Wood Butcher mine to a smelter.

Ferguson District.—During 1946 lessees shipped gold ore to a smelter from the Delamar mine.

Groom District.—The International Mining Corp. and Dan Sheahan worked the Groom mine during the first 6 months of 1946, and during the latter half of the year Dan Sheahan operated the property. Lead ore (3,012 tons containing 11 ounces of gold, 7,786 ounces of silver, 3,498 pounds of copper, 698,706 pounds of lead, and 40,402 pounds of zinc) was shipped to a smelter; in addition, 54 tons of lead ore containing 399 ounces of silver, 181 pounds of copper, 25,276 pounds of lead, and 24,934 pounds of zinc were shipped to a concentrator-smelter for treatment.

Jack Rabbit District.—The Bristol Silver Mines Co. operated the Bristol Silver mine throughout 1946; 6,263 tons of copper ore containing 37 ounces of gold, 78,760 ounces of silver, 443,763 pounds of copper, 479,159 pounds of lead, and 711,266 pounds of zinc were shipped to a smelter.

Pioche District.—The Combined Metals Reduction Co. operated its enlarged 600-ton flotation mill on company and custom ore throughout

1946. Company ore was derived from the Abe Lincoln, Pioche No. 2, and Amalgamated Pioche properties. This ore, with custom ore from the Raymond Ely West Mining Co. property, was hoisted through the Castleton shaft. Additional custom zinc-lead ore for the mill was derived from the Ely Valley and Prince mines. The mill products were lead concentrate and zinc concentrate, which were shipped to smelters. The Salt Lake-Pioche Mining Co. operated the Apex and Financier mines throughout 1946. Lead ore from the Apex mine (454 tons containing 36 ounces of gold, 11,764 ounces of silver, 268 pounds of copper, and 84,805 pounds of lead) was shipped to a smelter. Also shipped to a smelter, 1,579 tons of lead ore from the Financier mine (leased to O. G. Jarvis) contained 120 ounces of gold, 41,205 ounces of silver, 663 pounds of copper, and 317,886 pounds of lead. Free Bros. operated the Black Prince mine in 1946, shipping gold-silver ore to a smelter; it also shipped old tailings from the Dry Valley mine and recovered gold, silver, and some lead. Hall Bros., under a lease from Amalgamated Pioche Mines, shipped several carlots of gold-silver ore from the old Raymond Ely dump to a smelter.

LYON COUNTY

Silver City District.—The Grafe Dayton Dredging Co. operated a large dragline excavator and floating washing plant at the north edge of Dayton during the last quarter of 1946. W. M. Donovan operated his custom cyanide mill in Silver City during 1946 on ores from his own mines—the Silver Hill and the Hartford (Storey County). A number of small mines in the district were active during 1946; gold ore from the following properties was treated by amalgamation: Buckeye Extension (Leo K. Johnson), Dayton (Willis F. Wilson), Gamble and M. C. Nos. 1–2–3 (J. A. Cushman), Montezuma (Panos & McGuire), Haywood and Oest (Harry Bennett), Silver City (Nevada Mining Exchange, Inc.), Valentine (Serfeno Pedroli), and Wonder Extension (A. R. Dickson et al.).

Talapoosa District.—F. J. De Longchamps operated the Talapoosa mine from January through April 1946 and shipped gold ore to a smelter.

Yerington District.—Ed Parr shipped copper ore to a smelter from the Malachite mine during 1946 and also worked the Mason Valley mine, as did J. B. Bookman, Anton Lilja, and Al Matt; copper ore was shipped to a smelter. Anton Lilja worked the Northern Lights mine during the latter part of 1946, shipping copper ore to a smelter.

MINERAL COUNTY

Bell District.—The Simon Lead mine was worked extensively during 1946 by the B. B. S. Mining Corp. and Wilson & Simpson; zinc-lead ore was shipped to a concentrator-smelter for treatment, and a smaller tonnage of lead ore was shipped for direct smelting.

Columbus (Candelaria) District.—Charles R. Hammock shipped old tailings containing silver and lead from the Columbus mine to a smelter during 1946.

Santa Fe District.—Olsen, Cram & Taylor worked the Commodore mine during 1946, shipping silver ore to smelters. The Lime Point

mine was operated for a short period during the year by Charles R. Hammock; lead ore was shipped to a smelter.

Silver Star District.—Layton & Brasher, lessees, shipped 54 tons of gold ore containing 55 ounces of gold and 62 ounces of silver to a smelter from the Sunshine mine during 1946.

NYE COUNTY

Bellehelen District.—Western Gold Co. and Neighbors & Terrell shipped gold-silver ore from the dumps of the Clifford mine to a smelter during 1946.

Manhattan District.—The Manhattan Gold Dredging Co. (largest producer of placer gold in the State) operated throughout 1946 its electric connected-bucket dredge equipped with 108 9½-cubic-foot buckets. The Manhattan Gold Mines Co. operated the Manhattan mine during 1946; gold ore was treated by amalgamation.

Quartz Mountain District.—Obie LeFavor, lessee, worked the San Rafael mine throughout 1946; 517 tons of lead ore containing 13 ounces of gold, 5,573 ounces of silver, 4,947 pounds of copper, and 86,799 pounds of lead were shipped to a smelter.

Reveille District.—O. J. Belleville, lessee, worked the Reveille mine dumps intermittently during 1946; 71 tons of material shipped to a smelter contained 1 ounce of gold, 607 ounces of silver, 138 pounds of copper, and 31,794 pounds of lead.

San Antone District.—W. E. King and H. J. Kniefel worked the Burbank No. 1 mine during 1946, shipping 24 tons of silver ore containing 2 ounces of gold and 439 ounces of silver to a smelter.

Tonopah District.—Gold-silver ore mined by a lessee at the Jim Butler mine (220 tons containing 114 ounces of gold and 9,667 ounces of silver) was shipped to smelters. Several separate groups of lessees worked the property of the Tonopah Mining Co. of Nevada during 1946 and shipped 1,892 tons of gold-silver ore containing 763 ounces of gold and 63,703 ounces of silver to smelters.

Union District.—Alexander and Brooklyn Mines, Inc., operated the Alexander mine during 1946; lead ore was treated in the company 50-ton flotation mill, and the lead concentrate produced was shipped to a smelter.

PERSHING COUNTY

Echo (Rye Patch) District.—The Standard Cyaniding Co. operated the Standard mine, 18 miles south of Imlay, from September 16 to December 31, 1946; 52,021 tons of gold ore were cyanided to recover 1,886 ounces of gold and 3,804 ounces of silver.

Rochester District.—Silver ore was shipped to a smelter from the Bonanza King mine by V. D. Bradley and from the Olive mine by Fred Neff during 1946.

Seven Troughs District.—G. P. Williams worked the Portland mine during 1946; gold ore was treated in an amalgamation-concentration mill.

Sierra District.—Clarence Basso worked the Auburn mine from April 16 to November 6, 1946, and recovered 9 ounces of gold and 4 ounces of silver from 29 tons of ore treated by amalgamation.

STOREY COUNTY

Comstock District.—W. M. Donovan operated the Hartford mine during 1946 and treated the ore by cyanidation at his mill at Silver City. The South Comstock Gold Mines, Inc., operated the Brunswick mine for a short period in 1946; gold ore was treated in an amalgamation-concentration mill, the concentrates being shipped to a smelter. The Consolidated Virginia Mining Co. operated the Consolidated Virginia mine for 2 months in 1946; 5,000 tons of gold ore were treated in a 100-ton flotation mill to produce 75 tons of concentrate (containing 216 ounces of gold, 2,210 ounces of silver, and 175 pounds of copper), which was shipped to a smelter. The Dayton Consolidated Mines Co. operated the company custom cyanide mill at Silver City, Lyon County, during the first part of 1946 treating gold ore from the Keystone mine and various smaller shippers. The Overman open-pit mine was operated by the Consolidated Chollar Gould & Savage Mining Co. from April 10 through December 31, 1946; 111,078 tons of gold ore were treated in the company 500-ton cyanide plant to recover 4,558 ounces of gold and 43,688 ounces of silver.

WASHOE COUNTY

Galena District.—The Union Lead Mining & Smelting Co. shipped milling-grade zinc-lead ore to custom concentrators for selective flotation.

WHITE PINE COUNTY

Aurum (Silver Mountain) District.—The Grand Deposit Mining Co. operated the Grand Deposit and Kansas mines throughout 1946. From the Grand Deposit mine 5,493 tons of zinc ore (containing 25 ounces of gold, 5,084 ounces of silver, 62,811 pounds of copper, 104,903 pounds of lead, and 2,140,819 pounds of zinc) and 44 tons of silver ore (containing 1 ounce of gold, 288 ounces of silver, 1,544 pounds of copper, and 4,059 pounds of lead) were shipped to smelters for treatment. From the Kansas mine 2,410 tons of copper ore containing 25 ounces of gold, 3,430 ounces of silver, and 205,118 pounds of copper were shipped for direct smelting.

Osceola District.—The Gilded Age Mining Co. operated the Gilded Age mine throughout 1946 and shipped gold ore to a smelter.

Robinson (Ely) District.—The Nevada Mines Division of the Kennecott Copper Corp. worked the Copper Flat pit and the Ruth mine throughout 1946. This corporation also operated the McGill flotation concentrator and the McGill copper smelter—both at McGill—where the product from its mines and that of the Consolidated Coppermines Corp. were treated. Kennecott, the largest privately financed industrial organization in Nevada, produced over half the total copper for the State and was the leading producer of gold in Nevada. The Consolidated Coppermines Corp., second largest copper and gold producer in the State in 1946, was active throughout the year. Korgan-Piscovich worked the Calumet group during 1946 and shipped 679 tons of zinc ore containing 3 ounces of gold, 473 ounces of silver, 2,925 pounds of copper, 5,612 pounds of lead, and

297,527 pounds of zinc to a smelter. Sam Robinson shipped zinc ore to a smelter from the Columbia mine. Drollinger & Steele worked the Golden Revenue mine intermittently in 1946 and shipped 441 tons of gold-silver ore containing 62 ounces of gold, and 1,508 ounces of silver to a smelter. Benson Bros. and Johnson & Mays shipped 42 tons of lead ore (containing 3 ounces of gold, 485 ounces of silver, 146 pounds of copper, and 31,840 pounds of lead) to a smelter from the Golden Rod mine. Lessees worked the Sunbeam claim of the Kennecott Copper Corp. during the latter half of 1946; 71 tons of gold-silver ore containing 26 ounces of gold and 2,501 ounces of silver were shipped. O. V. Siegle and Roy Linsea worked the Veteran mine during the last quarter of 1946 and shipped gold ore and copper ore to a smelter.

Taylor District.—Ramsey, Bower & Gubler worked the Capital Hills mine from April 1 to December 15, 1946, and shipped silver ore to a smelter. The Goodman mine was operated by the Nevada Sunshine Silver Mines and A. E. Potash, lessees, during 1946; a substantial tonnage of silver ore and lead ore was shipped to smelters.

White Pine District.—E. R. Woolley shipped lead ore to a smelter from the Dog Star mine and the Young Treasure dump during 1946. Hall Bros. shipped a substantial tonnage of silver ore to a smelter from the Treasure Hill mine during 1946.

New Mexico
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By S. A. GUSTAVSON

GENERAL SUMMARY

THE quantities of gold, silver, copper, lead, and zinc produced by New Mexico mines in 1946 compared with 1945 were less in each instance, but the total value of the five metals was slightly greater in 1946. Factors contributing to the decrease in production were shortage of skilled labor, uncertainty of the continuation of the Premium Price Plan, labor strikes or unrest at major producing mines and smelters, and, to some extent, a lower average grade of ore mined (considerable quantities of low-grade ore from development were treated). Also, difficulties in obtaining equipment and higher cost of both labor and equipment were deterrents to the reopening of mines, especially those most dependent upon gold as a source of revenue.

Production (in terms of recovered metals) in 1946 was 4,009 fine ounces of gold, 338,000 fine ounces of silver, 100,382,000 pounds of copper, 9,798,000 pounds of lead, and 72,206,000 pounds of zinc, compared with 5,604 ounces of gold, 465,127 ounces of silver, 113,142,000 pounds of copper, 15,324,000 pounds of lead, and 80,590,000 pounds of zinc in 1945.

The total gross value of gold, silver, copper, lead, and zinc produced in 1946, calculated at the average prices shown in the following table, was $26,552,417, compared with $26,386,781 in 1945, and included gold valued at $140,315, silver $273,104, copper $16,261,884, lead $1,067,-

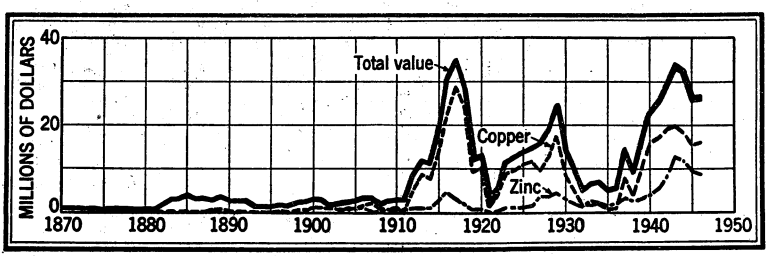

FIGURE 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1946. The value of gold, silver, and lead produced annually has been relatively small.

982, and zinc $8,809,132. Of the 1945 total, $196,140 was in gold, $330,757 in silver, $15,274,170 in copper, $1,317,864 in lead, and $9,267,850 in zinc. Thus the output of all five metals decreased in both quantity and value except copper, which, however, increased only in value.

A comparison of mine production in 1946 with 1945 and former years shows: Gold production decreased 28 percent from 1945 and was the lowest since 1876; silver decreased 27 percent and was the lowest since 1904; copper decreased 11 percent but was greater than any year prior to 1940 except 1917; lead decreased 36 percent but was greater than the war years 1941 and 1942; and zinc decreased 10 percent but was still the highest of any year prior to 1941—the peak of 119,048,000 pounds was reached in 1943.

Of the 11 counties producing in New Mexico in 1946 Grant County was by far the largest contributor to the metal output, accounting for 93 percent of the State total value and ranking first in output of each of the five metals. Socorro County produced these five metals valued at 5 percent and all other counties 2 percent of the State total.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver, 1942 to June 30, 1946: $0.71111111; July 1, 1946 to Dec. 31, 1946: $0.905.
[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1946, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds	Zinc (pounds)
January	370	26,500	9,068,000	1,100,000	5,526,000
February	370	28,400	8,144,000	1,030,000	5,858,000
March	273	22,600	8,734,000	748,000	5,266,000
April	413	24,850	8,634,000	756,000	4,940,000
May	487	21,200	7,872,000	668,000	5,308,000
June	290	26,690	8,046,000	760,000	5,068,000
July	220	28,680	8,892,000	892,000	6,404,000
August	343	24,750	8,276,000	712,000	7,006,000
September	352	29,730	8,170,000	672,000	6,260,000
October	300	37,100	8,390,000	880,000	6,760,000
November	300	34,000	8,000,000	800,000	6,950,000
December	291	33,500	8,156,000	780,000	6,860,000
Total: 1946	4,009	338,000	100,382,000	9,798,000	72,206,000
1945	5,604	465,127	113,142,000	15,324,000	80,590,000

The following table shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc and their annual output of ore and metals from 1942 to 1946, as well as the total production from 1848 to 1946. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent records, year by year, may be found in annual issues of Mineral Resources and Minerals Yearbook.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1942–46, and total, 1848–1946, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1942	78	48	8,221,512	11,961	$418,635	676,170	$480,832
1943	64	16	8,329,043	5,563	194,705	463,583	329,659
1944	55	3	7,943,846	6,918	242,130	535,275	380,640
1945	46	4	6,843,327	5,604	196,140	465,127	330,757
1946	50	4	6,594,890	4,009	140,315	338,000	273,104
1848–1946			(1)	2,182,835	49,733,418	67,754,731	52,945,198

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1942	160,200,000	$19,384,200	9,216,000	$617,472	92,922,000	$8,641,746	$29,542,885
1943	152,326,000	19,802,380	11,446,000	858,450	119,048,000	12,857,184	34,042,378

Gold and silver produced at placer mines in New Mexico, 1942–46, in terms of recovered metals

Year	Gold		Silver		Total value	Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value			Fine ounces	Value	Fine ounces	Value	
1942	1,247	$43,645	135	$96	$43,741	1945	15	$525	7	$5	$530
1943	92	3,220	25	18	3,238	1946	10	350	2	2	352
1944	8	280			280						

Gold.—During 1946, the first full year after revocation of War Production Board Limitation Order L–208 (effective July 1, 1945), production of gold from the State decreased 28 percent from 1945. This decrease in gold output can be attributed to the suspension of operations from June to November by the Exploration Syndicate, Inc., at the Carlisle group of mines and the loss of about 3 months' production because of a labor strike at the American Smelting & Refining Co. Hanover unit; moreover, high labor and material costs

hampered the reopening of gold mines. Mine production of recovered gold in New Mexico decreased from 5,604 fine ounces in 1945 to 4,009 ounces in 1946. The principal gold-producing districts in 1946 were: Lordsburg, Hidalgo County, which produced 39 percent of the State total; Central, Grant County, 30 percent; Steeple Rock, Grant County, 10 percent; Mogollon, Catron County, 8 percent, and Pinos Altos, Grant County, 7 percent. All others produced 6 percent. Copper ore yielded 39 percent of the State total gold, dry and siliceous ores 34 percent, zinc ore 19 percent, and lead and zinc-lead ores and placers 8 percent. The principal producing mines in 1946, in order of output, were: Atwood mine, Lordsburg district, Hidalgo County; Bayard mine, Central district, Grant County; Bonney and Miser's Chest group, Lordsburg district, Hidalgo County; Boston Bicket mine, Central district, Grant County; Carlisle mine, Steeple Rock district, Grant County; Bearup mine, Mogollon district, Catron County; and Houston-Thomas mine, Pinos Altos district, Grant County. These seven properties produced 90 percent of the State total.

Silver.—Mine production of recovered silver in New Mexico declined from 465,127 fine ounces in 1945 to 338,000 ounces in 1946—a 27-percent decrease; in value the decrease was 17 percent. It can be attributed to cessation in 1945 of operations of the Peerless mine, Grant County, and Tom mine group and Crosby mine, Hidalgo County; and to decreased production in 1946 from the Ground Hog Unit of the American Smelting & Refining Co., Hobo mine of the Black Hawk Consolidated Mines Co., Carlisle mine of the Explora tion Syndicate, Inc.—all in Grant County—and the Bearup mine of the Silver Creek Mining Co., Catron County. The principal silver-producing districts in 1946 were: Central, Grant County, which produced 39 percent of the State total; Lordsburg, Hidalgo County, 30 percent; Magdalena, Socorro County, 21 percent; Mogollon, Catron County, 5 percent; and all other districts, 5 percent. Of the total silver produced in the State during 1946, zinc ore yielded 41 percent, copper ore 30 percent, zinc-lead ore 19 percent, dry and siliceous ores 9 percent, and lead ore 1 percent. The following nine producers, in order of output, contributed 93 percent of the State total: United States Smelting, Refining & Mining Co. (Bayard mine) in Grant County, C. H. & S. A. McIntosh (Atwood mine) in Hidalgo County, American Smelting & Refining Co. (Magdalena unit) in Socorro County, Banner Mining Co. (Bonney and Miser's Chest group) in Hidalgo County, American Smelting & Refining Co. (Ground Hog Unit) in Grant County, J. E. Torres and C. S. Elayer (Kelly mine) in Socorro County, Peru Mining Co. and subsidiary (Pewabic, Kearny, and Copper Flat mines) in Grant County, Silver Creek Mining Co. (Bearup mine) in Catron County, and Exploration Syndicate, Inc. (Carlisle mine), in Grant County.

Copper.—Mine production of recovered copper in New Mexico in 1946 was 100,382,000 pounds—an 11-percent decrease from 1945; in value, however, there was a 6-percent increase. The Chino open-pit mine of the Kennecott Copper Corp. at Santa Rita, Grant County, was by far the largest copper producer in the State; the second largest was the Bonney and Miser's Chest group of the Banner Mining Co. south of Lordsburg, Hidalgo County. Other producing mines, in

order of output, were: The leaching operation at the Burro Mountain properties of the Phelps Dodge Corp. at Tyrone, Grant County; the Atwood mine south of Lordsburg, operated by C. H. & S. A. McIntosh, Hidalgo County; the Bayard mine, operated by the United States Smelting, Refining & Mining Co., Grant County; the Magdelena Unit, operated by American Smelting & Refining Co., Socorro County; and the Ground Hog Unit, operated by the American Smelting & Refining Co., Grant County. The above seven mines produced over 99 percent of the State total production of copper in 1946; of the total copper produced, copper ore, mine-water precipitates, and precipitates from leaching dump material accounted for 99 percent.

Lead.—Lead production in New Mexico in 1946 decreased 36 percent in quantity and 19 percent in value from 1945. This decrease can be attributed to cessation of operations in 1945 of the Peerless mine, Grant County, and Tom mine group and Crosby mine, Hidalgo County, and to decreased production in 1946 from the Ground Hog Unit of the American Smelting & Refining Co., the Hobo mine of the Black Hawk Consolidated Mines Co., and the Carlisle mine of the Exploration Syndicate, Inc., all in Grant County. Other producers maintained or reported a slight increase in production. Zinc ore yielded 67 percent of the total lead, zinc-lead ore 26 percent, dry and siliceous ores 4 percent, and copper and lead ores 3 percent. The principal lead-producing districts in 1946 were the Central, Grant County (65 percent); Magdalena, Socorro County (26 percent); Steeple Rock, Grant County (4 percent); Lordsburg, Hidalgo County (2 percent); and Cerrillos, Santa Fe County (1 percent). The nine largest producers of lead in New Mexico supplied 96 percent of the State total; in order of output they were: United States Smelting, Refining & Mining Co. (Bayard mine), Grant County; American Smelting & Refining Co. (Magdalena Unit), Socorro County; American Smelting & Refining Co. (Ground Hog Group), Grant County; J. E. Torres and C. S. Elayer (Kelly mine), Socorro County; Exploration Syndicate, Inc. (Carlisle mine), Grant County; Peru Mining Co. and subsidiary (Pewabic, Kearny, and Copper Flat mines), Grant County; C. H. & S. A. McIntosh (Atwood mine), Hidalgo County; Empire Zinc Co. (Hanover mine group), Grant County; and Moline Mining & Milling Co. (Franklin group), Santa Fe County.

Zinc.—Production of recovered zinc in New Mexico in 1946 decreased 10 percent in quantity and 5 percent in value from 1945. The eight leading producers of zinc in New Mexico in 1946 accounted for 98 percent of that metal and, in order of output, were: United States Smelting, Refining & Mining Co. operating the Bayard mine, Peru Mining Co. and subsidiary operating the Pewabic, Kearny, and Copper Flat mines, Empire Zinc Co. operating the Hanover mine unit, Kennecott Copper Corp. operating the Oswaldo mine, and American Smelting & Refining Co. operating the Ground Hog Unit, all in Grant County; and American Smelting & Refining Co. operating the Magdalena Unit, J. E. Torres and C. S. Elayer operating the Kelly mine, and McDonald & Dobson operating the Nitt mine, all in Socorro County. Zinc ore yielded 91 percent and zinc-lead ore 8 percent of the total zinc. Six mining districts produced all of the recovered zinc in the State. They were the Central, Grant County

(89 percent); Magdalena, Socorro County (10 percent); and Steeple Rock, Pinos Altos, and Swartz, Grant County, together with Cerrillos, Santa Fe County (1 percent). Of the above eight leading zinc producers in New Mexico, the American Smelting & Refining Co. (Magdalena Unit) and J. E. Torres and C. S. Elayer (Kelly mine), in Socorro County, and Kennecott Copper Corp. (Oswaldo mine), in Grant County, mined greater tonnages of ores and had a greater zinc production in 1946 than in 1945. The United States Smelting, Refining & Mining Co. (Bayard mine) and Peru Mining Co. and subsidiary (Pewabic, Kearny, and Copper Flat mines) mined greater tonnages but had a slightly smaller zinc production partly because of the lower grade of large quantities of ores from development work done in 1946. The Empire Zinc Co. (Hanover mine unit) in Grant County and McDonald & Dobson (Nitt mine) in Socorro County treated slightly less ore and produced less zinc. The American Smelting & Refining Co. Hanover Unit, Grant County, was idle from February 24 to June 20 because of a strike of its employees (beginning February 25 and ending June 17) which resulted in a considerable decrease in tonnage of ore mined and zinc produced during 1946.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1946, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

MINING INDUSTRY

During 1946 skilled labor continued to be scarce, but common labor became comparatively plentiful. Materials and supplies were still difficult to obtain. Metal prices, except for gold, increased, as did costs of material and labor.

The Premium Price Plan for copper, lead, and zinc expired June 30. Price control ended on the same date, when legislation for the extension of the Office of Price Administration was vetoed. There was no price control from July 1 to July 25, when a new law was signed by the President, effective July 26. The Premium Price Plan for copper, lead, and zinc was reestablished with some new provisions. This plan, effective until June 30, 1947, was retroactive to July 1; it included allowance of adjustment in premiums, gave allowances for depreciation, and made all classes of premiums noncancellable unless necessary in order to make individual adjustments to specific mines.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in New Mexico in 1946, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	512	697	924	5,888	5,436	
Dry and siliceous gold-silver ore	10,557	687	27,368	88,365	407,240	328,800
Dry and siliceous silver ore	159		1,532	600	9,000	
	11,228	1,384	29,824	94,853	421,676	328,800
Copper ore	6,044,004	1,566	[1] 100,318	[1] 99,275,228	180,087	
Lead ore	737	179	3,537	2,937	122,344	
Zinc ore	487,063	743	140,674	754,786	6,515,316	65,888,449
Zinc-lead ore	51,858	127	63,645	254,196	2,558,577	5,988,751
	6,583,662	2,615	[1] 308,174	[1] 100,287,147	9,376,324	71,877,200
Total lode mines	6,594,890	3,999	[1] 337,998	[1] 100,382,000	9,798,000	72,206,000
Placers		10	2			
Total: 1946	6,594,890	4,009	[1] 338,000	[1] 100,382,000	9,798,000	72,206,000
1945	6,843,327	5,604	[1] 465,127	[1] 113,142,000	15,324,000	80,590,000

[1] Silver and copper contained in precipitates recovered from mine water and leached dumps are included with that in copper ore as follows: 1946, 73 ounces of silver and 20,203,536 pounds of copper; 1945, 381 ounces of silver and 23,855,551 pounds of copper.

METALLURGIC INDUSTRY

Of the 6,594,890 tons of ores from New Mexico mines in 1946, 6,522,646 tons (99 percent) were treated at nine concentrating plants, 135 tons were treated first by amalgamation and then concentration at two small mills, and 72,109 tons were shipped crude to smelters. Of the 6,522,646 tons of ores sent to concentrating plants, 5,974,442 tons were copper ore, 486,862 tons zinc ore, 51,858 tons zinc-lead ore, and 9,484 tons dry and siliceous ores. Of the 72,109 tons of ores sent crude to smelters, 69,562 tons were copper ore, 1,157 tons dry and siliceous gold-silver ore, 737 tons lead ore, 377 tons dry and siliceous gold ore, 201 tons zinc ore, and 75 tons dry and siliceous silver ore.

The nine concentrating plants operating in New Mexico in 1946 were: Hanover Unit of the American Smelting & Refining Co. (company and custom zinc and zinc-lead ores); Magdalena Unit of the American Smelting & Refining Co. (company zinc-lead ore); Banner mill of the Banner Mining Co. (company copper ore); East Camp mill of the Exploration Syndicate, Inc. (company gold-silver ore); Hanover milling unit of the Empire Zinc Co. (company and custom zinc and zinc-lead ores); Hurley concentrating unit of the Kennecott Copper Corp. (company copper ore); Moline mill of the Moline Mining & Milling Co. (company zinc-lead ore); Peru mill of the Peru Mining Co. (company zinc and custom zinc and zinc-lead ores); and Bayard mill (formerly called Bullfrog mill) of the United States Smelting, Refining & Mining Co. (company zinc ore).

The Chino reverberatory copper smelter of the Kennecott Copper Corp. was operated throughout 1946 and treated company copper concentrates, siliceous copper ore, and copper precipitates; the precipitates were derived from the company operation at Chino and company operation at Ray, Ariz. All of the copper produced during the year was marketed as fire-refined copper bars.

Mine production of metals in New Mexico in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	135	27	61	4,200		
Concentrates smelted	250,081	1,800	[1] 244,481	[1] 99,196,563	9,481,330	72,051,707
Ore smelted	72,109	2,172	93,456	1,181,237	316,670	154,293
Placer		10	2			
Total: 1946		4,009	[1] 338,000	[1] 100,382,000	9,798,000	72,206,000
1945		5,604	[1] 465,127	[1] 113,142,000	15,324,000	80,590,000

[1] Silver and copper contained in precipitates recovered from mine water and leached dumps are included with that in copper concentrates as follows: 1946, 73 ounces of silver and 20,203,536 pounds of copper; 1945 381 ounces of silver and 23,855,551 pounds of copper.

Mine production of metals from amalgamation mills (with or without concentration equipment) in New Mexico in 1946, by counties, in terms of recovered metals

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal			
		Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)
Santa Fe	100	6	1	11	10	55	4,200
Socorro	35	11	5				
Total 1946 [1]	135	17	6	11	10	55	4,200

[1] No ore treated in amalgamation mills in 1945.

Gross metal content of concentrates (all produced at concentrating mills) from ores mined in New Mexico in 1946, by classes of concentrates smelted

Class of concentrates	Concentrates produced (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (wet assay) (pounds)	Lead (wet assay) (pounds)	Zinc (pounds)
Copper	169,645	5,336	[1] 98,144	[1] 100,700,083	1,042	862
Lead	6,792	754	130,897	520,203	8,180,168	1,076,685
Zinc	73,644	508	95,417	830,538	1,959,714	79,405,403
Total: 1946	250,081	6,598	[1] 324,458	[1] 102,050,824	10,140,924	80,482,950
1945	266,259	6,978	[1] 372,553	[1] 113,328,738	14,475,798	90,469,815

[1] Silver and copper contained in precipitates recovered from mine water and leached dumps are included with that in copper concentrates as follows: 1946, 89 ounces of silver and 20,630,891 pounds of copper; 1945, 405 ounces of silver and 24,348,144 pounds of copper.

Mine production of metals from concentrating mills in New Mexico in 1946, in terms of recovered metals

REVIEW BY COUNTIES AND DISTRICTS

CATRON COUNTY

Mogollon District.—The Silver Creek Mining Co. operated the Bearup group on Silver Creek about 8 miles north of Glenwood throughout 1946 and shipped 1,090 tons of dry gold-silver ore containing 318 ounces of gold, 18,173 ounces of silver, and 467 pounds of copper. Development included 50 feet of shaft and 150 feet of drifts. The Bradley Mining Co. continued extension and repair (begun in 1945) of the Oaks tunnel, but produced no ore.

DONA ANA COUNTY

Organ District.—J. H. Brown treated about 84 tons of ore, chiefly from dumps of the Torpedo group, in a small gravity-concentration plant and shipped 14 tons of lead concentrates containing 110 ounces of silver and 4,929 pounds of lead. Geophysical and magnetometer work was done in the district by the Empire Zinc Co. in 1946 preparatory to a diamond-drilling program to begin in 1947.

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1946, by counties and districts, in terms of recovered metals

[1] Includes Burro Mountain district, silver and copper, figures for which Bureau of Mines is not at liberty to publish separately.
[2] Includes silver recovered from precipitates.
[3] Includes copper recovered from precipitates.

GRANT COUNTY

Black Hawk District.—Saunders & Billingsley shipped 67 tons of gold-silver ore from the Astrologer and Rover claims in July. The properties are about 2 miles south of Tyrone.

Burro Mountain (Tyrone) District.—Leaching operations at the Burro Mountain mine of the Phelps Dodge Corp. were continued throughout 1946, except for the period March 4 to July 1, when workers were on strike. Water is percolated through subsided areas of the former mine workings, and copper is precipitated from the return solutions in wooden precipitating tanks that can handle about 600 gallons per minute. Robert P. Thompson precipitated copper from copper-carrying waters originating in the Liberty Bell mine.

Central (Bayard, Fierro, Georgetown, Hanover, Santa Rita) District.—The Chino Mines Division of the Kennecott Copper Corp., the largest copper producer in New Mexico, operated its open-pit mine at Santa Rita and its flotation mill and reverberatory copper smelter at Hurley at near capacity during 1946. The mill was operated on a 6-day week for 8 months and a 5-day week for 4 months. Production was not as great as for 1940 to 1945, inclusive, when the plant was operated at and above rated capacity. Copper produced in 1946 was marketed in the form of fire-refined copper bars; as a result, molybdenite was the only byproduct made from ore containing gold, silver, copper, and molybdenum. Copper was recovered also by leaching accumulated dump material from the pit and from siliceous copper ore used in the converter as flux. The company began construction of two large thickeners to reclaim more water from the mill tailings; it is estimated that 500 gallons per minute of "new" water will be available as a result of this work. The company continued development of its Oswaldo zinc property and shipped increasing quantities of zinc ore to the Empire Zinc Co. mill at Hanover. Development at the Oswaldo mine in 1946 included 2,063 feet of drifts, 162 feet of raises, and 15,544 feet of diamond drilling.

The United States Smelting, Refining & Mining Co. operated several properties in the Central district under the single name "Bayard mine" and was the largest producer of zinc and lead in New Mexico in 1946. The ore was treated at the company 450-ton selective-flotation mill. Lead concentrates were made and shipped to the El Paso, Tex., smelter and zinc concentrates to the Anaconda and Great Falls, Mont., electrolytic plants. The company purchased the Combination, Hobo, and Hobo No. 2 mines on lease and option from the Black Hawk Consolidated Mines Co.; possession was taken July 1, 1946.

The Empire Zinc Co. operated its Hanover mine group and selective-flotation mill throughout 1946. In addition to ore from the company properties in the Central district, the mill treated ore from the Kelly mine group at Kelly, Socorro County; Oswaldo mine of the Kennecott Copper Corp. in the Central district, Grant County; and Cleveland mine in the Pinos Altos district, Grant County. Zinc concentrates were shipped to Palmerton, Pa., and Depue, Ill., smelters; lead concentrates were shipped to the American Smelting & Refining Co. El Paso, Tex., smelter.

The Peru Mining Co. operated the Pewabic mine throughout 1946. The New Mexico Consolidated Mining Co., a subsidiary of the Peru

Mining Co., operated the Kearny mine throughout the year and the Copper Flat mine for 9 months. Development in 1946 included 910 feet of drifts and 2,933 feet of diamond drilling in the Pewabic mine and 1,480 feet of drifts and 2,959 feet of diamond drilling in the Kearny mine. Ore from the mines was treated at the Peru 1,000-ton selective-flotation mill at Wemple, 5 miles north of Deming, Luna County. In addition to company ores, the mill treated custom ores from the Phelps Dodge Corp. Campbell Junction mine at Bisbee, Ariz., and the Nitt mine, Magdalena district, Socorro County. Zinc concentrates were shipped to the Dumas, Tex., smelter and lead concentrates to the El Paso, Tex., smelter.

The American Smelting & Refining Co. operated its Ground Hog group in the Central district and the leased 400-ton Hanover milling unit (formerly Combination-Black Hawk mill) continuously throughout 1946, except for the period of a labor strike, February 25 to June 17 (actual operation was resumed June 20). Custom ores were treated in the Hanover milling unit from the Hobo mine in the Central district, Houston-Thomas mine in the Pinos Altos district, and Royal John mine in the Swartz district, all in Grant County; the Nitt mine in the Magdalena district, Socorro County; and Pennsylvania mine in the Cerrillos district, Santa Fe County. Stock-piled ore (from the Hobo mine) of the Office of the Metals Reserve was also milled in the Hanover unit. Development at the Ground Hog group included 4,813 feet of crosscuts and raises and 20,013 feet of diamond drilling. Further improvements in mine ventilation were made during the year.

The Black Hawk Consolidated Mines Co. operated its Hobo mine from January 1 to May 1 and produced 3,539 tons of zinc ore, which were shipped to the Hanover milling unit of the American Smelting & Refining Co. Possession of the mine (purchased on lease and option) was taken by the United States Smelting, Refining & Mining Co. on July 1, 1946.

A. Vigil & Sons shipped 81 tons of gold ore from the Little Goat mine to the El Paso smelter, and Cesario Holguin shipped 62 tons of high-grade gold ore from the Boston Bicket mine to the El Paso smelter.

Steeple Rock District.—The Exploration Syndicate, Inc., operated its 125-ton selective-flotation mill and leased Carlisle group of mines from January 1 to July 1, when the mine was closed. Shipments of concentrates were resumed again in November. Elayer & Richmond operated the Center and Pennsylvania mines from January 1 through April 10, 1946, and produced 120 tons of gold ore containing 32 ounces of gold, 96 ounces of silver, 552 pounds of copper, 2,640 pounds of lead, and 2,400 pounds of zinc. Development included 100 feet of drifts and 200 feet of diamond drilling. J. A. Nard shipped 15 tons of gold ore from the Rival mine to Hawley & Hawley, bullion buyers at Douglas, Ariz. The ore contained 17 ounces of gold and 62 ounces of silver.

Swartz (Carpenter, Camp Monarch) District.—A. L. Owen operated the Royal John mine and shipped 877 tons of ore from July through October to the American Smelting & Refining Co. Hanover milling unit. The ore contained 2 ounces of gold, 842 ounces of silver, 2,631 pounds of copper, 68,278 pounds of lead, and 170,208 pounds of zinc.

HIDALGO COUNTY

Lordsburg District.—The Banner Mining Co., the largest producer in Hidalgo County in 1946, operated its Bonney and Miser's Chest group of copper mines and 500-ton flotation mill throughout the year. The mill operated 6 days a week and handled an average of 110 tons of ore a day; copper concentrates were made and shipped to the El Paso, Tex., smelter. Development included 102 feet of shaft, 2,061 feet of drifts, and 568 feet of diamond drilling. Improvements at the mine included construction of a change house at the Miser's Chest mine.

The Atwood group of claims on Atwood Hill near Valedon 4 miles south of Lordsburg was operated throughout the year by C. H. & S. A. McIntosh. The mine was worked through a three-compartment vertical shaft 800 feet deep with crosscuts to the vein at three levels—the 210-foot, 350-foot, and 500-foot. The shrinkage-stope method of mining is used. Most of the mining and development during 1946 was carried on at the 500-foot level. Development included 800 feet of drifts, 200 feet of crosscuts, and 700 feet of diamond drilling. A new air compressor and additional water pumps were installed during the year. By the end of the year production had been increased to about 100 tons of ore a day. The ore was shipped crude to the El Paso, Tex., smelter.

SANTA FE COUNTY

Cerrillos District.—The Moline Mining & Milling Co. operated its 35-ton selective-flotation mill intermittently from January 1 through August 3 on zinc-lead ore, chiefly from the Franklin claim. Approximately 2,000 tons of zinc-lead ore were produced, which yielded 93 tons of lead concentrates, containing 16 ounces of gold, 1,313 ounces of silver, 1,195 pounds of copper, and 103,780 pounds of lead, and 44 tons of zinc concentrates, containing 1 ounce of gold, 163 ounces of silver, 295 pounds of copper, 9,477 pounds of lead, and 39,512 pounds of zinc. The Cerrillos Lead & Zinc Co. operated the Pennsylvania group of mines from January 1 to August 15 and produced 166 tons of zinc-lead ore containing 3 ounces of gold, 680 ounces of silver, 1,111 pounds of copper, 43,866 pounds of lead, and 57,491 pounds of zinc. The ore was shipped to the American Smelting & Refining Co. Hanover milling unit for treatment.

San Pedro (New Placers) District.—The Shamrock Gold Mining Co. operated the Padilla mine and 25-ton amalgamation-concentration mill (built in 1946) 2 weeks in November and treated 100 tons of gold-silver-copper ore. Six ounces of gold and 1 ounce of silver were recovered as bullion; and 11 tons of copper concentrates were made, which contained 10 ounces of gold, 55 ounces of silver, and 4,618 pounds of copper.

SOCORRO COUNTY

Magdalena District.—The American Smelting & Refining Co. operated its Magdalena unit (Waldo mine) and 200-ton selective-flotation mill throughout 1946. The mill was operated three shifts, 4 days a week; lead concentrates and zinc concentrates were sent to Texas smelters. The crude ore is crushed at the mine plant and delivered to the mill over a 1-mile aerial tram; secondary crushing is done at the mill. Development included 2,171 feet of drifts and 13,601 feet of diamond drilling.

Oregon

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By ALFRED L. RANSOME

GENERAL SUMMARY

PRODUCTION of gold in Oregon in 1946 was four times the 1945 output, owing largely to dredging operations, but the total recovered was only 16 percent of the all-time record set in 1940. Silver production was down to 66 percent of the 1945 output, and copper and lead production remained extremely low. No zinc production was reported.

The total value of the gold, silver, copper, and lead (in terms of recovered metals) produced in Oregon was $624,231 in 1946 compared with $164,456 in 1945 and $4,148,271 in the peak year 1940. It was divided among the metals as follows: Gold, 98.7 percent; silver, 0.9 percent; copper and lead combined, 0.4 percent. Baker County continued to be the leading metal producer and contributed 55 percent of the State total value; Grant County yielded 34 percent, Jackson, Josephine, and Lane Counties each 3 percent, and the other seven producing counties 2 percent.

The major portion of the increased value of production came from placer gold operations, largely worked by connected-bucket dredges. There was an increasing number of dragline dredges in operation in 1946—the first year that any have been in operation since 1942, when gold mines were closed as the result of War Production Board Limitation Order L–208. Both placer and lode mines continued to face increasing costs and the problem of obtaining labor and supplies. Because of these factors and because of the smelter strike during the first half of 1946, the relatively minor contribution to output made by lode mines did not appear until late in the year.

Placer mines contributed 94 percent and lode mines 6 percent of the gold produced in Oregon in 1946. In 1945 the ratio was placer mines 89 percent and lode mines 11 percent.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1 to Dec. 31, 1946: $0.905.
[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Oregon, 1942–46, and total, 1852–1946, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.
[3] Gold from terminal clean-up; property and equipment not counted as producing.
[4] Includes all placer operations using suction pump for delivering gravel to floating washing plant, except those producing less than 100 ounces of gold, which are included under "Small-scale hand methods."
[5] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge".
[6] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc.

Gold.—Production of gold in Oregon in 1946 increased 294 percent compared with 1945, 94 percent coming from placer mines. Of the total placer gold, connected-bucket dredges recovered 84 percent, dragline dredges 12 precent, hydraulicking 2 percent, and combined small-scale hand methods, drift mines, suction dredging, and non-floating washing plants (with mechanical excavators) 2 percent. All the lode gold was derived from dry and siliceous ores. Although 60 properties produced in 1946 (19 in 1945), the greatest proportion of the gold came from relatively few mines; the following 5 properties, listed in order of output, supplied 83 percent of the State total: Sumpter Valley Dredging Co., Western Gold Dredging Co., Porter & Co., and Sunshine Mining Co. (Burnt River Division)—all connected-bucket dredges—and Associated Dredging Co. (dragline dredge).

Mine production of gold and silver in Oregon in 1946, by months, in fine ounces, in terms of recovered metal

Month	Gold	Silver	Month	Gold	Silver
January	646	159	August	1,994	647
February	483	100	September	1,615	1,764
March	1,634	341	October	1,425	412
April	1,064	176	November	1,520	382
May	1,899	1,623	December	1,235	265
June	2,374	588			
July	1,709	470	Total	17,598	6,927

The monthly production figures given in the accompanying table show a marked increase in gold output in March following the usual seasonal slump due to winter conditions, with the high point of the year reached in June. Production during the latter half of 1946 was somewhat erratic, but the general pattern was one of a decline. Of four connected-bucket dredge operations in Oregon, only two were in operation December 31, the remainder having shut down September 1 and October 15, respectively. None of the dragline dredges was in operation in December.

Silver.—Silver production in Oregon in 1946 decreased 34 percent compared with 1945. Of the State total, Baker County yielded nearly one-half, and most of the remainder came from Grant, Jefferson, and Lane Counties; 53 percent came from lode mines, principally from dry gold ore, and direct smelting was the principal method of recovery. The accompanying table gives the monthly production during 1946. Output was erratic and for the most part tended to follow the trend of gold. The marked increases in May and September reflect periods of substantial production from lode mines.

Copper, Lead, and Zinc.—Most of the copper output of Oregon was from copper ore mined at one property, the balance being a byproduct of ores worked primarily for their gold content. Lead output was entirely a byproduct from gold ores. No zinc was reported recovered.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Oregon in 1946, by counties, in terms of recovered metals

County	Mines producing [1]		Gold					
			Lode		Placer		Total	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value	Fine ounces	Value
Baker	5	6	176	$6,160	9,540	$333,900	9,716	$340,060
Curry	1		18	630			18	630

Wheeler	14	11							2,706
Total: 1946	6,927	5,597	14,000	2,268	4,000	436			624,231
1945	10,461	7,439	2,000	270	2,000	172	2,000	$230	164,456

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual outputs.
[3] Sources of total silver as follows—1946: 3,698 ounces from lode mines and 3,229 ounces from placers; 1945: 9,672 ounces from lode mines and 789 ounces from placers.

MINING INDUSTRY

Of the 3,246 tons of ore (including 2,630 tons of old tailings) sold or treated in Oregon in 1946, Baker County produced 2,579 tons (including 2,500 tons of old tailings) or 79 percent, Lane County 238 tons or 7 percent, Josephine County 133 tons (including 130 tons of old tailings) or 4 percent, and Harney County 5 percent. Almost 95 percent of the total (including all the old tailings) was dry gold ore, and almost all the remainder was copper ore.

The four properties worked by connected-bucket dredges had one dredge each; at the end of the year only two of the dredges were in operation. Eight dragline dredges washed gravel at nine Oregon

793065—48——96

properties, and one suction-type dredge operated in two locations; none of these types of dredges was in operation at the close of the year.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in Oregon in 1946, with content in terms of recovered metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry and siliceous gold ore	439	2,630	1,083	2,310	4,000	4,000	
Dry and siliceous gold-silver ore	1		7	377			
Dry and siliceous silver ore	24		6	954			
	464	2,630	1,096	3,641	4,000	4,000	
Copper ore	152			57	10,000		
Total lode mines	616	2,630	1,096	3,698	14,000	4,000	
Placers			16,502	3,229			
Total: 1946	616	2,630	17,598	6,927	14,000	4,000	
1945	1,378		4,467	10,461	2,000	2,000	2,000

METALLURGIC INDUSTRY

Of the State total ore and old tailings (3,246 tons), 81 percent (including all the old tailings) was cyanided, 14 percent was shipped crude to smelters, and 5 percent was amalgamated. Ultimate recovery of 67 percent of the total lode gold was from the smelting of ore, 19 percent was as bullion from the amalgamation of ore, and 14 percent was as bullion from the cyanidation of ore. Of the lode silver recovered, 83 percent was from the direct smelting of ore, 16 percent from ore cyanided, and 1 percent from ore amalgamated. All material requiring smelting was shipped out of the State, as Oregon has no smelters. No data covering quicksilver or cyanide consumption at Oregon mills were obtained in 1946.

Mine production of metals in Oregon in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	167	207	37			
Ore cyanided	2,632	156	607			
Ore smelted	447	733	3,054	14,000	4,000	
Total lode mines		1,096	3,698	14,000	4,000	
Placers		16,502	3,229			
Total: 1946		17,598	6,927	14,000	4,000	
1945		4,467	10,461	2,000	2,000	2,000

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Oregon in 1946, by types of mills and by counties, in terms of recovered metals

AMALGAMATION MILLS

County	Material treated		Recovered in bullion		Concentrates smelted and metal recovered		
	Ore (short tons)	Old tailings (short tons)	Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)
Baker	77		43	6			
Curry	21		18	5			
Jackson	61		76	15			
Josephine	1		4				
Lane	3		1				
Wheeler	4		65	11

REVIEW BY COUNTIES AND DISTRICTS

BAKER COUNTY

Cornucopia District.—Pine Creek Placer Co. operated the High-Bar mine, 10 miles northeast of Hereford, from June 10 to July 15. Bench gravel was worked by power shovel and treated in a portable washing plant; 45 ounces of gold and 6 ounces of silver were recovered. The Golden Dredging Co. operated a 1½-cubic yard dragline dredge on Pine Creek near Burnt River from March 17 to May 30 and recovered a substantial quantity of gold and some silver. The equipment was subsequently moved to the Middle Fork, John Day River, near Caribou Creek in Grant County.

Cracker Creek District.—D. N. McTavish, under lease from the Bald Mountain Mine, treated 2,500 tons of old tailings from the Bald Mountain mine during 1946 from which 122 ounces of gold and 597 ounces of silver were recovered by cyanidation. A small quantity of material shipped to a smelter yielded 7 ounces of gold and 377 ounces of silver.

Greenhorn District.—The Sunshine Mining Co. (Burnt River Division) operated a Yuba electric connected-bucket dredge with 3½-cubic foot buckets from March 1 to October 15, 1946; gravel treated during this period yielded 1,098 ounces of gold and 238 ounces of silver.

Sumpter District.—The Sumpter Valley Dredging Co., the largest producer of gold in Oregon in 1946, operated its Yuba electric connected-bucket dredge with 72 9-cubic foot buckets throughout the year. Treatment of 3,085,000 cubic yards of gravel yielded 8,055 ounces of gold and 1,816 ounces of silver.

Upper Burnt River District.—Pat Vinson operated the Dawn O'Day mine from July 15 to August 18, 1946. A small test shipment of gold ore was made to a smelter, and 4 ounces of gold and 1 ounce of silver were recovered.

Virtue District.—Joe J. Davis worked the Virtue mine under lease from March 1 to December 15. A small quantity of gold and some silver were recovered by amalgamation.

Weatherby District.—A few ounces of gold and silver were reported recovered by amalgamation of gold ore from the Lovejoy mine by A. V. Lovejoy during intermittent operation early in 1946.

Mine production of gold, silver, copper, and lead, in Oregon in 1946, by counties and districts, in terms of recovered metals

[1] Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 10 and their output included under "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of silver: 3,698 ounces from lode mines, 3,229 ounces from placers.
[4] Output from property not classed as a "mine."
[5] Greenhorn district is in Baker and Grant Counties.
[6] Mormon Basin district is in Baker and Malheur Counties.
[7] Included under "Other districts."
[8] Exclusive of placer output which is included under "Other districts."
[9] Includes value of 4,000 pounds of lead from Bohemia district, Lane County.
[10] Includes Granite district (placer), Grant County; Mormon Basin, Malheur County; Camp Carson, Union County.

CURRY COUNTY

Chetco District.—W. D. Bowser operated the Robert E. mine from January 1 to August 1, 1946; 21 tons of ore amalgamated and cyanided yielded 18 ounces of gold and 5 ounces of silver.

GRANT COUNTY

Canyon District.—The Golden Dredging Co., following movement of its 1½-cubic yard dragline equipment from Pine Creek in Baker County, operated on the Middle Fork of the John Day River from July 1 to August 8, 1946. From November 18 to 25 the property was again in operation, but the operator's name had been changed to the Dixie

Dredging Co. A moderate quantity of gold and some silver were recovered. The Western Gold Dredging Co. operated its connected-bucket dredge with 72 6-cubic foot buckets on the John Day River from January 1 to September 1, 1946.

Granite District.—The Buffalo mine was operated intermittently during 1946 by Bruce Dennis. During the latter part of the year the property was acquired from Dennis under lease and bond by a partnership represented by Alan Kissock. Gold ore was shipped to a smelter. Porter & Co. resumed operation of its connected-bucket dredge with 62 4½-cubic foot buckets on April 5 following a period of idleness since October 16, 1942, occasioned by War Production Board Limitation Order L–208. The dredge continued to operate on the property on Clear Creek throughout the remainder of the year. The Associated Dredging Co. operated a ¾-cubic yard Lima dragline excavator and Bodison floating washing plant on Vincent Creek near Bates from June 1 to November 6, 1946; 79,000 cubic yards of gravel yielded 729 ounces of gold and 127 ounces of silver.

HARNEY COUNTY

Pueblo Mountain District.—Harrison Grove shipped copper ore to a smelter from the Northern Light mine.

JACKSON COUNTY

Gold Hill District.—Mardon Bros. amalgamated 20 tons of ore from the Sunrise mine in 1946; 60 ounces of gold and 10 ounces of silver were recovered. The mine was operated from January 15 to April 20. The Crescent Pacific Mining Co. operated a 1¾-cubic yard dragline dredge on Kane's Creek from February 16 to April 10, 1946; treatment of 39,000 cubic yards of gravel yielded 114 ounces of gold and 17 ounces of silver. R. E. Cook hydraulicked 600 cubic yards of gravel from the Lance mine on Foots Creek during a 10-day period in February and recovered 8 ounces of gold. F. G. Lyons and Ellis B. Matherly operated a suction-type dredge on the Rogue River from January 1 to August 19; the operation was carried on in Jackson County from May 11 following a period of operation in Josephine County.

Jacksonville District.—The C. & D. Mining Co. operated a dragline dredge, having a 1¼-cubic yard bucket, from January 1 to May 15. Luyben & Goodwin operated a ¾-cubic yard dragline dredge four blocks north of the Jacksonville Post Office from March 1 to July 1; 2,000 cubic yards of gravel yielded 12 ounces of gold and 2 ounces of silver. Paul Pearce hydraulicked 11,200 cubic yards of old tailings from the Sterling mine from January 1 to May 15 and recovered 82 ounces of gold and 13 ounces of silver. Bert Pankey operated the Red Dog mine from January 15 to March 17; a small tonnage of gold ore was treated by amalgamation.

Upper Applegate District.—George Slade operated the Rock Gulch mine and D. A. Wright the Steamboat mine during the first half of 1946. The small quantity of gold ore produced from each property was treated by amalgamation.

JEFFERSON COUNTY

Ashwood District.—Henry Anderegg operated the Oregon King mine under lease from Oregon King Mines, and in May made one shipment of silver ore for direct smelting.

JOSEPHINE COUNTY

Grants Pass District.—F. G. Lyons and Ellis B. Matherly operated a suction-type dredge on the Rogue River from January 1 to August 19; the operation was carried on in Josephine County until May 10 and subsequently in Jackson County. Hydraulicking was carried on by T. L. Schrader at the Sexton mine from January 1 to April 15.

Greenback District.—M. H. Davis carried on a hydraulicking operation at the Blue Channel mine on Coyote Creek from January 1 to May 1. Vernon L. Story recovered a moderate quantity of gold and a few ounces of silver by hydraulicking at the Buckhorn mine. Charles Lull cyanided a small quantity of gold ore produced from the Copper King mine during October 1946.

Illinois River District.—B. H. Oregon, Ltd., operated a dragline dredge on Sucker Creek from October 10 to November 13. Harry H. McGrath hydraulicked at the Frances mine on Josephine Creek during the early months in 1946. Earl Young cyanided 130 tons of old tailings at the Eureka mine during 1946 and recovered 32 ounces of gold and 8 ounces of silver.

LANE COUNTY

Bohemia District.—Fred J. Bartels operated the Champion mine during 1946 and shipped gold ore for direct smelting. Kenneth O. Watkins operated the Helena mine during the latter part of the year and shipped gold ore to a smelter. A small quantity of copper and lead was recovered from the ore from both properties.

MALHEUR COUNTY

Morman Basin District.—The Placeritas Mining Co. operated a dragline dredge in Morman Basin for a short period in October and November; the dragline excavator was equipped with a 1½-cubic yard bucket.

UNION COUNTY

Camp Carson District.—The Progress Mining Co. operated a dragline dredge on East Fork Creek, tributary of the Grande Ronde River, from May 4 to July 17.

WHEELER COUNTY

Antone District.—A. C., R. T., and Isaac New worked the Oregon Gold mine and Rosa D. claim during 1946; the small quantity of gold ore produced from each property was treated by amalgamation.

SOUTH DAKOTA

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By S. A. GUSTAVSON

GENERAL SUMMARY

PRODUCTION of gold and silver from lode-gold mining, the principal source of mineral revenue in South Dakota, was valued in 1946 at nearly $11,000,000. This was about 52 percent of the value of the production in 1941, the last prewar year. During 1946, 5 lode-gold mines were operated, 2 continuously and 3 intermittently, as compared with 3 lode mines in 1945, and 10 lode and 41 small placer mines in 1941. In South Dakota 312,247 fine ounces of gold, valued at $10,928,645, were recovered in 1946, compared with 55,948 fine ounces valued at $1,958,180 in 1945. The output of silver, all a byproduct of gold mining, was 86,901 fine ounces valued at $70,216, compared with 26,564 fine ounces valued at $18,890 in 1945.

The Homestake mine supplied 95 percent of the total value of metals produced in 1946 and the Bald Mountain mine most of the remainder. Chiefly due to a shortage of skilled underground workers, both the above companies were operated at only slightly more than half capacity.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in South Dakota, 1942–46, and total, 1876–1946, in terms of recovered metals [1]

MINE PRODUCTION BY COUNTIES

Mine production of gold and silver in South Dakota in 1946 by counties, in terms of recovered metals

County	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode placer)		Total value
	Lode	Placer		Fine ounces	Value	Fine ounces	Value	
Lawrence	4	------	872,202	312,246	$10,928,610	86,901	$70,216	$10,998,826
Pennington	1	------	40	1	35	------	------	35
Total: 1946	5	------	872,242	312,247	10,928,645	86,901	70,216	10,998,861
1945	3	------	312,612	55,948	1,958,180	26,564	18,890	1,977,070

MINING AND METALLURGIC INDUSTRY

The total ore mined and treated by producers of lode gold and silver in South Dakota in 1946 was 872,242 tons, yielding, in recovered metals, 312,247 fine ounces of gold and 86,901 fine ounces of silver. No copper, lead, or zinc was produced; all ore mined was dry and siliceous gold ore containing no economically recoverable base metal. A break-down by methods of treatment shows that 792,994 tons of ore, yielding 298,470 ounces of gold and 53,668 ounces of silver, were treated by amalgamation followed by cyanidation of sands and slimes; 79,208 tons, yielding 13,776 ounces of gold and 33,233 ounces of silver, were treated by flotation followed by cyanidation, or cyanidation only; and 40 tons, yielding 1 ounce of gold, were treated by amalgamation only.

No recovery of metals has been reported from placer operations since 1942.

Gold and silver bullion produced at mills in South Dakota by amalgamation, 1942–46

REVIEW BY COUNTIES

LAWRENCE COUNTY

Homestake Mine.—The Homestake Mining Co. operated its Homestake mine throughout the year, the first full year of work, except for maintenance, since closing June 8, 1943, because of War Production Board Limitation Order L–208.

Surface plants treated an average of 2,173 tons of ore per day, operating three shifts, 7 days a week. The milling unit consists of

primary crushing plants at the hoists, the South mill, which includes the main secondary crushing (including 180 stamps), grinding, and amalgamating plant, with a capacity of 3,900 tons per 24 hours, cyanide sand plant No. 1, cyanide sand plant No. 3, and the refinery—all at Lead; and the slime plant at Deadwood. At the refinery silver is parted from the gold and virtually pure metals are shipped to the Denver Mint. Development in the mine during the year included 11,924 feet of drifts, 8,014 feet of raises, and 15,304 feet of diamond drilling; no shaft sinking was performed. The annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1946, says—

Ore mined in 1946 amounted to 792,994 tons which compares with approximately 1,400,000 tons annually before suspension of operations in 1942. Bullion with value of $10,458,896.22 was produced. Average realization was $13.19 per ton and metallurgical recovery was 95.60 percent.

The mine and plant are in excellent condition and functioned without interruption throughout the year. In December, production of ore had reached 70,430 tons and was entirely from shrinkage and timber stopes. Mining of low-grade ore by caving operations on the upper levels, from which a substantial part of the tonnage had to be obtained when operations were resumed after the shut-down, was discontinued in May, which resulted in some temporary decrease in tonnage though it caused little change in output of bullion.

Operating expenses per ton, exclusive of taxes, were higher than in pre-war years because of increases in wages and in cost of supplies and also on account of production being substantially less than capacity.

There are 330,000 tons of broken ore in shrinkage stopes as compared to 167,000 tons at the end of 1945.

The reserve of developed ore including broken ore in shrinkage stopes is 19,845,000 tons, an increase of 866,000 tons over the reserve at the end of 1945.

In 1947 it is expected that progress toward full-scale operations will continue though it will depend upon the rate at which new men can be obtained and trained for mine work. A sufficient number of men are available for all surface work.

Precipitation during 1946 was 40.09 inches as compared to a maximum of 40.75 inches during the forty-two years in which records have been kept. The very heavy rainfall in May caused floods which in places washed out roads and bridges, filled intake dams for the hydro-electric plants and washed out one section of pipeline which resulted in shut-down of Hydro-electric Plant No. 2 for thirty-three days. In general, however, results were beneficial in that hydro-electric power was 20 percent greater than in 1945 and 93 percent above the output in 1940 at the end of a period of dry years.

The operation and output of our sawmill in Spearfish were normal. As our requirements for mine timber are still relatively low, some surplus was available for local needs.

Production of coal from the Wyodak mine was 174,337 tons as compared to a previous record of 122,426 tons. Increasing demand for electric power made additional generating capacity necessary and installation is now in progress.

Ore milled, receipts, and dividends, Homestake mine, 1942–46 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1942	1,275,138	$17,068,437.84	$13.3856	$7,534,800
1943	183,246	3,629,507.33	19.8067	----------
1944	(2)	402,591.29	(2)	----------
1945	298,828	1,873,872.64	6.2707	----------
1946	792,994	10,458,896.22	13.1891	2,812,992

[1] From 1876 to 1946, inclusive, this mine yielded bullion and concentrates that brought a net return of $451,975,133 and paid $152,618,794 in dividends.

[2] No ore milled; bullion product recovered in clean-up of launders, pipe lines, mill liners, and other machinery during course of mill maintenance.

Other Mines.—The Bald Mountain Mining Co. operated its property at Trojan throughout the year, mining chiefly the Portland, Dakota, and Clinton claims. Its 370-ton all-sliming countercurrent-cyanidation plant, also at Trojan, operated 7 days per week on a three-shift basis and treated an average of 214 tons of ore per day. Development by the company included 450 feet of drifts, 843 feet of crosscuts, and 1,744 feet of diamond drilling. The Belle Eldridge Gold Mines, Inc., operated its Belle Eldridge mine and 150-ton flotation and cyanidation mill at Deadwood and made its only shipment of bullion to the Denver Mint in December. Additions to the mill, including a cyanidation section begun in 1945, had been completed early in 1946. Mine development included 1,000 feet of drifting. There were 26 ounces of gold and 65 ounces of silver recovered from ore treated at the Frerichs Mining Co. cyanidation mill during the year.

PENNINGTON COUNTY

R. E. Nelson and James A. Murphy operated the Western Bell lode near Hill City 90 days and treated about 40 tons of ore in their amalgamation plant, recovering about 1 ounce of gold.

TEXAS

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By S. A. GUSTAVSON

GENERAL SUMMARY

SMALL shipments of zinc concentrates during 1946 from the Bonanza mine, Hudspeth County, marked the first recovery of zinc from Texas ores since 1917. Moreover, plans for a slag-fuming plant at El Paso, construction of which was begun early in 1947, promised to raise Texas to the ranks of substantial zinc producers. The fuming plant would have a large accumulation of zinc-bearing slag to treat as well as hot slag from a lead smelter.

Texas production of gold, silver, copper, lead, and zinc had a total value of $56,950 in 1946. This production was from five mines—three in Hudspeth County and two in Presidio County. In terms of recoverable metals, Texas mines produced 9 fine ounces of gold 42,922 fine ounces of silver, 6,000 pounds of copper, 94,000 pounds of lead, and 88,000 pounds of zinc in 1946, compared with 23,265 fine ounces of silver, 110,000 pounds of copper, and no gold, lead, or zinc in 1945.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, 1946 to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by the Office of Metals Reserve for overquota production.

MINE PRODUCTION

The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1942 to 1946, as well as the total metal production from 1885 to 1946.

Mine production of gold, silver, copper, lead, and zinc in Texas, 1942–46, and total, 1885–1946, in terms of recovered metals

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1942	100,698	236	$8,260	672,781	$478,422
1943	4,134	4	140	10,284	7,313
1944	4,160			5,355	3,808
1945	2,693			23,265	16,544
1946	6,705	9	315	42,922	34,681
1885–1946	[1]	8,290	224,095	33,268,363	23,415,061

Year	Copper		Lead		Zinc		Total value

1945	4	2,693		23,265	110,000		

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Texas in 1946, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous silver ore	1	2,054	1	41,300	765	28,193	----
Copper ore	1	80	----	18	5,000	----	----
Lead ore	2	221	7	813	235	43,697	----
Total to copper and lead plants	4	2,355	8	42,131	6,000	71,890	----
Zinc ore to zinc plants	1	4,350	1	791	----	22,110	88,000
Total: 1946	5	6,705	9	42,922	6,000	94,000	88,000
1945	4	2,693	----	23,265	110,000	----	----

SMELTING AND REFINING PLANTS IN TEXAS

Texas has in its smelting industry a capacity for the reduction of ores and concentrates containing gold, silver, copper, lead, and zinc far beyond the capacity of its mines and mills to produce them. The industry shows a diversity of smelter products that is equaled only by Montana among the Western States. Texas smelters provide a market for ores and concentrates from mines chiefly in the nearby Western States of New Mexico, Arizona, and Colorado and from mines in foreign countries of the Western Hemisphere; a substantial quantity of smelter residue is treated from other sections of the United States. The industry has abundant supplies of natural gas available as fuel.

In 1946 two horizontal-retort zinc smelters and one electrolytic zinc smelter, one copper smelter, one lead smelter, and one copper refinery were in operation in Texas. The zinc smelters had capacity for producing 134,500 tons of slab zinc at the end of 1946, and the lead and copper smelters had capacity to treat 250,000 tons and 600,000 tons, respectively, of ores and concentrates. Gold and silver ores were absorbed at both lead and copper smelters as flux. The copper refinery had a capacity of 240,000 tons of refined copper.

The American Smelting & Refining Co. operated its lead and copper smelters at El Paso throughout 1946, except from February 5 to June 17, when the workers were on strike. The lead plant consists of two blast furnaces. Ores and concentrates were supplied domestically by operators in Arizona, New Mexico, and Texas, and material was received also from foreign operators in Mexico, Newfoundland, South-West Africa, and Argentina. The copper plant consists of two reverberatory furnaces and three converters. Ores and concentrates were supplied domestically by operators in Arizona, Colo-

rado, New Mexico, and Texas, and foreign material was received from Mexico and Newfoundland. The lead and copper plants also treated residues from other smelting plants. Plans were made and design work was done in 1946 for a slag-fuming plant to treat old slag of the company El Paso smelters for the recovery of zinc; construction was begun early in 1947.

At Amarillo the American Smelting & Refining Co. operated its horizontal-retort zinc smelter throughout the year. The plant is equipped with 8 furnaces having a total of 6,400 horizontal retorts and has an annual rated capacity of 56,500 tons of metal. The plant also makes a highly refined zinc product by further distillation, recovering cadmium oxide as a byproduct from this process. The plant was operated on a 48-hour cycle during 1946. The Office of Metals Reserve maintains a stock pile of concentrates at the plant. Concentrates were received from domestic mines in Arizona, Colorado, New Mexico and Utah and foreign ores from Mexico.

The American Zinc Co. of Illinois operated its Machovec gas-fired horizontal-retort zinc smelter near Dumas throughout 1946. The plant is equipped with 8 furnaces having a total of 6,656 retorts and can produce 48,000 tons of zinc metal annually. A stock pile of zinc concentrates is maintained at the plant by the Office of Metals Reserve. In 1946 concentrates were purchased from operators in Arizona, Colorado, New Mexico, Utah, Mexico and Peru.

Electrolytic zinc was produced throughout 1946 by the American Smelting & Refining Co. at its Corpus Christi plant, which has an annual capacity of 30,000 tons of cathode zinc. The plant treated both foreign and domestic concentrates; it received and stock-piled zinc concentrates for the account of the Office of Metals Reserve.

The Phelps Dodge Corp. Nichols electrolytic copper refinery at El Paso continued to treat blister-copper anodes cast at corporation smelters in Arizona throughout 1946, except for the period March 4 to July 1, when the plant was closed because of a labor strike. Early in the year the plant operated at less than capacity; however, after resuming work July 1, output was increased steadily until capacity production was reached about August 15. This production rate was maintained for the rest of the year. The corporation also has a copper sulfate (blue vitriol) section and a slime plant (for recovery of rare metals and gold, silver, and lead) in connection with the electrolytic plant. The blue vitriol plant has a capacity of 1,000 tons per month. Improvement and remodeling of the slime residue plant was begun during 1946.

REVIEW BY COUNTIES

Hudspeth County.—The Clark Mining Co. operated the Bonanza mine and its 300-ton gravity-concentration mill intermittently throughout 1946. Both the mine and mill are in the Quitman Mountains southwest of Sierra Blanca. The mill treated about 4,350 tons of ore during 78 days of operation; 15 tons of lead concentrates, containing 1 ounce of gold, 791 ounces of silver, and 19,283 pounds of lead, and 112 tons of zinc concentrates, containing 4,524 pounds of lead and 100,156 pounds of zinc, were recovered. The mill consists of a crushing plant having a jaw crusher, two trommels, and two sets of rolls and a concentrating plant consisting of eight Clark-type jigs (three 42 by 42 inches and five 24 by 24 inches). Power for both mill and mine is supplied by gasoline engines.

In January A. T. Barrett shipped 80 tons of ore mined in 1945 from the Black Shaft mine in the Carrizo Mountains, 9 miles north of Allamoore; the ore contained 18 ounces of silver and 5,644 pounds of copper. J. J. Trepanier shipped 11 tons of lead ore from the Big Four mine, Sierra Blanca district, in December.

Presidio County.—M. F. Drunzer, a lessee, operated a part of the Presidio mine and shipped 2,054 tons of silver ore from July through December; the ore contained 1 ounce of gold, 41,300 ounces of silver, 1,056 pounds of copper, and 29,368 pounds of lead. R. I. Carr operated the Carr mine near Presidio from August through December and shipped 210 tons of lead ore containing 7 ounces of gold, 627 ounces of silver, 294 pounds of copper, and 43,704 pounds of lead.

Utah
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. NEEDHAM AND PAUL LUFF

GENERAL SUMMARY

PROLONGED labor strikes and continued shortages of labor drove 1946 production of gold, silver, copper, lead, and zinc in Utah down to the lowest levels in recent years. Copper bore the brunt of the precipitous decline, but the output of each of the other four metals also slumped markedly. Despite appreciable increases in average prices of all metals except gold, the value of the five metals in Utah decreased 33 percent from $90,018,641 in 1945 to $60,202,627 in 1946. Of the State total value in 1946, copper contributed 62, zinc 11, lead 11, gold 10, and silver 6 percent. Compared with 1945, the value of the five metals produced in the West Mountain (Bingham) district in 1946 declined 40 percent; the Park City region and the Tintic district showed an opposite trend and gained 22 and 3 percent, respectively.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Utah, 1942–46, and total, 1864–1946, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

November	23,915	500,375	33,918,000	7,396,000	6,348,000
December	38,910	615,320	46,538,000	8,602,000	7,446,000
Total: 1946	178,533	4,118,453	228,568,000	61,422,000	56,584,000
1945	279,979	6,106,545	452,752,000	81,634,000	67,260,000

Gold.—The yield of gold in Utah in 1946 experienced a sharp decline of 101,446 ounces (36 percent) from the 1945 output because of labor strikes that seriously affected operations at the principal copper and zinc-lead mines. Copper ore continued to be the chief source of gold, supplying 75 percent of the State output; zinc-lead ore followed with 13 percent; and siliceous ore furnished most of the remainder. One placer was active in 1946.

The West Mountain (Bingham) district remained the leading Utah gold district in 1946, producing 79 percent of the State output. However, production was only 57 percent of that in 1945, mainly because of severe decreases at the Utah Copper mine and the United States & Lark group. The Tintic district, second in position, gained 22 percent in gold output, mainly as a result of a marked increase in production

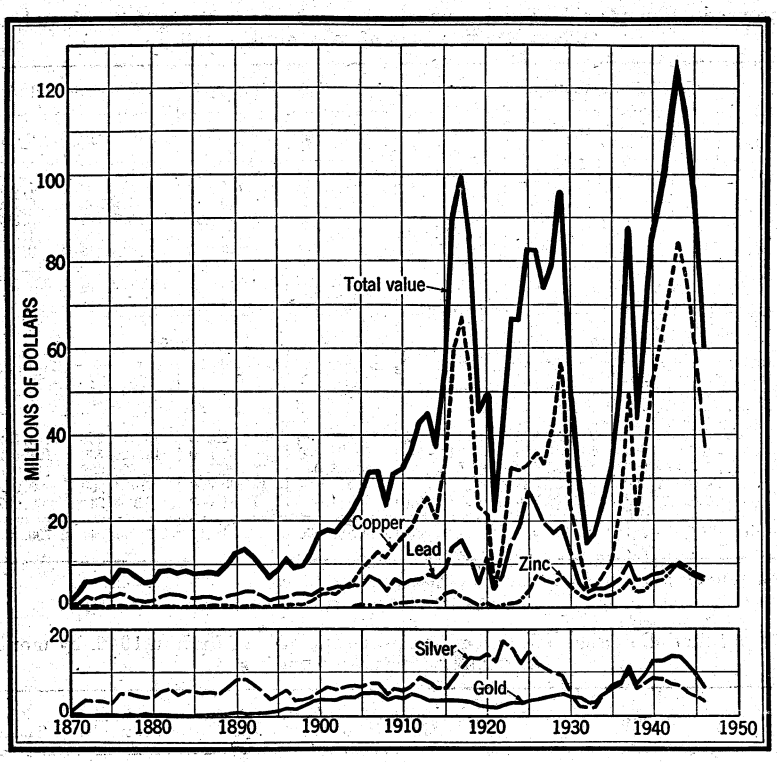

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc, and total value in Utah, 1870–1946

from the Tintic Bullion mine. The Park City region again was in third place and recorded an increase of 23 percent over 1945 output.

Following the Utah Copper mine in State gold output, in the order named, were the New Park Mining Co. property (zinc-lead ore) in the Park City region, the Tintic Bullion mine (gold ore) in the Tintic district, the United States & Lark group (principally zinc-lead ore) and the National Tunnel & Mines Co. property (copper ore and zinc-lead ore) in the West Mountain (Bingham) district, the Calumet mine (zinc-lead ore) in the Rush Valley district, the Butterfield property (zinc-lead ore) in the West Mountain (Bingham) district, and the Tintic Standard mine (lead ore and siliceous ore) in the Tintic district. These eight properties produced 96 percent of the State gold in 1946.

Silver.—The slump of 1,988,092 ounces (nearly 33 percent) from the 1945 output of 6,106,545 ounces dropped Utah production of silver in 1946 to the lowest figure since 1880. Losses were particularly pronounced in the West Mountain (Bingham) district, as silver output for the year at the Utah Copper mine and the United States & Lark group dropped almost 50 percent below that in 1945. Silver production in the Tintic district decreased 43 percent, but only 2 percent in the Park City region, where a substantial gain by the New Park Mining Co. partly counterbalanced declines at other properties in the district.

The Utah Copper mine remained well in the lead among State silver producers in 1946, followed in the order named by the United States & Lark group, the New Park Mining Co. property, Chief Consolidated Mining Co. properties in the Tintic district, Park Utah Consolidated properties and the Silver King Coalition mine in the Park City region, and the Calumet mine. From these seven properties came 82 percent of the State silver in 1946.

Zinc-lead ore, zinc ore, lead ore, and lead-copper ore together supplied over 59 percent of the total silver in Utah in 1946, copper ore 30 percent, and siliceous ores 9 percent; the remainder came from zinc slag fumed.

Copper.—The output of recoverable copper in Utah in 1946 decreased nearly 50 percent from that in 1945 and was the lowest since 1938. All the principal copper-producing operations reported a decline in 1946, the greatest being at the Utah Copper mine of the Kennecott Copper Corp. at Bingham, which was closed by a labor strike from January 21 to June 26. In spite of this, the property remained the leading copper mine in the United States.

Utah mines that yielded over a million pounds of recoverable copper each in 1946 included the Utah Copper mine, the National Tunnel & Mines Co. property, the Columbia group of the Ohio Copper Co.—all in the West Mountain (Bingham) district—and the Big Indian property of the Ohio Copper Co. in the La Sal district, San Juan County. These four properties supplied 98 percent of the State copper in 1946.

Lead.—The lead industry in Utah in 1946 was less affected by labor strikes than the copper industry, yet output of recoverable lead dropped 25 percent below that in 1945 and was the lowest since 1899. Outstanding in the slump were the United States & Lark group and the Tintic Standard properties, which together fell nearly 22,000,000 pounds of lead below the 1945 output; substantial decreases also were noted at a number of other important producers. Reversing the general trend, outstanding gains in yield of recoverable lead were made at the Horn Silver mine in the San Francisco district, the New Park Mining Co. property, the Chief Consolidated Mining Co. properties, and the Tooele slag-fuming plant.

Utah operations that yielded over a million pounds of recoverable lead each in 1946 included, in the order named, the United States & Lark group, the New Park Mining Co. property, the Chief Consolidated Mining Co. properties, the Calumet mine, the Park Utah Consolidated Mining Co. property, the Silver King Coalition mine, the Tooele slag-fuming plant, the Tintic Standard mine, the Butterfield group, and the Horn Silver mine. These 10 properties supplied 89 percent of the State lead in 1946.

About 83 percent of the total lead output was recovered from zinc-lead ores concentrated, and most of the remainder from lead, siliceous, and zinc-lead ores smelted and zinc slag fumed.

Zinc.—Zinc made the best showing among the five metals in Utah in 1946, as the output of recoverable metal declined less than 16 percent from that in 1945; nevertheless, the yield was the lowest since 1934. Mainly because of a 5-month labor strike at the United States & Lark group, output of zinc in the West Mountain (Bingham) district, for years the leading source of zinc in Utah, was reduced to

about half of the 1945 level, permitting the Park City region to advance to first place. Smaller declines were registered at the operations of the Park Utah Consolidated Mines Co., the Tooele slag-fuming plant, the Silver King Coalition Mines Co., and the Calumet mine. Important increases were made by the New Park Mining Co. and the Chief Consolidated Mining Co. The Pacific Bridge Co. began operating an old tailing dump near Park City in August and soon became a major producer of zinc.

The leading producers of zinc in Utah in 1946 were the United States & Lark group, the Tooele slag-fuming plant, and the New Park, Chief Consolidated, Park Utah Consolidated, Calumet, Silver King Coalition, and Pacific Bridge properties. These eight properties furnished 91 percent of the State zinc in 1946.

Zinc-lead ore concentrated supplied 79 percent of the total zinc in 1946, and zinc slag fumed most of the remainder.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Utah in 1946, by counties, in terms of recovered metals

County	Mines producing		Ore (short tons)	Gold		Silver

MINING INDUSTRY

Ore production in Utah in 1946 was 46 percent less than in 1945, and most of the decline was in copper ore and zinc-lead ore from the West Mountain (Bingham) district. Chief among the causes for this poor showing was the labor strike called January 21, which lasted until June 26 and involved about 5,000 mine, mill, and smelter workers employed by the Kennecott Copper Corp., the United States Smelting, Refining & Mining Co., and the American Smelting & Refining Co. In addition to stopping all work at the properties of the above companies, production was retarded or halted at many other mines using the milling or smelting facilities of the companies concerned. A smaller strike, involving 80 men, affected operations of the Park Utah Consolidated Mines Co. from March 2 to 5.

Following the resumption of major operations in July, production mounted rapidly but was prevented from wiping out the strike-incurred losses largely because of a labor shortage of long standing, and only near the end of the year was the situation eased.

The only new operation of large size in the State in 1946 was that of the Pacific Bridge Co. at Park City—a 1,500-ton plant completed in August for treating old zinc-lead oxide and sulfide tailings. The 4,600-foot transportation tunnel to the floor of the Utah Copper pit to provide an outlet for sublevel copper ore was put into operation in August, and an electric ore-haulage line from the mine to the mills was partly completed.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Utah in 1946, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	11	3,990	15,227	17,160	73,308	66,279	
Dry and siliceous gold-silver ore	14	41,269	3,072	182,855	377,598	1,459,631	19,486
Dry and siliceous silver ore	18	34,616	776	185,732	159,031	1,514,956	
	43	79,875	19,075	385,747	609,937	3,040,866	19,486
Copper	13	12,471,208	133,454	1,237,060	[1] 224,796,576	13,585	
Lead	33	11,700	1,300	76,870	42,252	3,536,492	274,719
Lead-copper	4	1,236	312	49,620	921,348	537,120	
Zinc	6	[2] 105,222	357	54,056	526,968	2,239,141	10,381,636
Zinc-lead	30	576,450	24,028	2,315,100	1,670,919	52,054,796	45,908,159
Total lode mines	[3] 88	13,245,691	178,526	4,118,453	[1] 228,568,000	61,422,000	56,584,000
Placers	1		7				
Total: 1946	89	13,245,691	178,533	4,118,453	[1] 228,568,000	61,422,000	56,584,000
1945	[4] 89	24,723,184	279,979	6,106,545	[5] 452,752,000	81,634,000	67,260,000

[1] Includes 10,142,892 pounds recovered from mine-water precipitates.
[2] Includes 83,117 tons of zinc slag.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] All lode mines; no placers operated in 1945.
[5] Includes 22,787,627 pounds recovered from mine-water precipitates.

METALLURGIC INDUSTRY

The 13,245,691 tons of ore produced in Utah in 1946 were treated as follows: 13,055,452 tons (nearly 99 percent) at concentrating mills, compared with 24,456,945 tons in 1945; 107,122 tons (nearly 1 percent) shipped crude to smelters, compared with 186,826 tons in 1945; and 83,117 tons (0.6 percent) of old slag fumed, compared with 79,413 tons in 1945.

The 10 concentrating mills active in Utah in 1946 treated ore and old tailings as follows: 5 plants (Arthur, Magna, Ohio Copper, Tooele, and Big Indian), 12,466,732 tons of copper ore and old tailings; 5 mills (Bauer, Midvale, Pacific Bridge, Silver King, and Tooele), 570,720 tons of zinc-lead ore and old tailings and zinc ore; and 1 flotation mill in Summit County, 18,000 tons of current zinc tailings. The custom milling capacity of the concentration mills in the Salt Lake Valley area remained at about 3,900 tons of ore per day, but less than half of this total was used in 1946. The largest custom mill in the area, the Midvale 1,700-ton concentrator of the United States Smelting, Refining & Mining Co., treated largely zinc-lead ore, which came mainly from company-owned properties in the West Mountain (Bingham) district. The plant was closed during the labor strike from late January to the end of June. The copper unit of the International Smelting & Refining Co. concentrator at Tooele operated continuously, but the zinc-lead unit operated at such times during the year as milling ore was available; the bulk of the ore continued to come from custom sources. The 700-ton concentrator of the Combined Metals Reduction Co. at Bauer operated continuously, principally on zinc-lead ore from company-owned or -operated mines in Utah and Idaho. The Silver King Coalition Mines Co. 800-ton concentrator at Park City was active throughout the year and treated only zinc-lead-silver ore from the company mine. The 1,500-ton tailing plant of the Pacific Bridge Co. at Park City operated from August to the end of the year.

The Garfield copper smelter and the Murray lead smelter operated by the American Smelting & Refining Co. and the Midvale lead smelter of the United States Smelting, Refining & Mining Co. all were closed during the 5-month labor strike, and the Tooele copper smelter of the International Smelting & Refining Co. remained idle throughout the year. The Garfield plant continued to operate largely on copper concentrates produced from the Utah Copper mills at Arthur and Magna; the Tooele lead plant of the International Smelting & Refining Co. operated in conjunction with the company slag-fuming plant and treated zinc-lead ores and old slag, zinc-copper ores, lead concentrates, and zinc ores from company-owned operations as well as from custom sources; the Murray plant treated lead concentrates, lead ore, and siliceous ore chiefly from mines in Utah and Idaho; and the Midvale plant treated lead concentrates, lead ore, and siliceous ores principally from company-owned properties in Utah.

Mine production of metals in Utah in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Concentrates smelted	453,026	156,610	3,473,187	215,849,601	50,764,353	45,036,802
Ore smelted [1]	190,239	21,916	645,266	2,575,507	10,657,647	11,547,198
Mine-water precipitates smelted [2]	6,356			10,142,892		
Total lode		178,526	4,118,453	228,568,000	61,422,000	56,584,000
Placer		7				
Total: 1946		178,533	4,118,453	228,568,000	61,422,000	56,584,000
1945		279,979	6,106,545	452,752,000	81,634,000	67,260,000

[1] Includes 83,117 tons of old slag. [2] All from Salt Lake County.

Gross metal content of concentrates produced from ores mined in Utah in 1946, by classes of concentrates smelted

Class of concentrates	Concentrates (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Copper	334,757	132,647	1,197,164	218,606,031

[1] Tintic district lies in both Juab and Utah Counties.
[2] Properties not counted as mines; material credited to district came from slag dump, clean-ups, and railroad yards.
[3] Includes production from Smelter district; Bureau of Mines not at liberty to publish separate figures.

BEAVER COUNTY

Granite District.—From the Beaver View group, R. A. Glenny, lessee, produced 73 tons of zinc-lead ore and 11 tons of lead ore. Metal content of the zinc-lead ore was 16 ounces of gold, 100 ounces of silver, 9,051 pounds of lead, and 16,784 pounds of zinc; that of the lead ore, 4 ounces of gold, 17 ounces of silver, and 1,337 pounds of lead.

Rocky District.—F. S. Leany, lessee, worked the Old Hickory group until July 1 and thereafter shipped ore from stock piles. Shipments totaled 3,956 tons of gold-silver ore containing 61 ounces of gold, 6,078 ounces of silver, and 173,371 pounds of copper.

San Francisco District.—The Horn Silver mine was operated under lease throughout the year by Metal Producers, Inc. Ore output (16,870 tons) comprised 8,329 tons of silver smelting ore containing 187 ounces of gold, 31,081 ounces of silver, 47,415 pounds of copper, and 593,466 pounds of lead and 8,541 tons of zinc-lead milling ore containing 187 ounces of gold, 38,444 ounces of silver, 19,146 pounds of copper, 804,796 pounds of lead, and 863,189 pounds of zinc. Remaining district output was principally 306 tons of gold ore shipped to a smelter from the Golden Reef group.

Star and North Star District.—James D. Williams, lessee, again worked the Harrington-Hickory group throughout 1946 and produced 3,220 tons of zinc-lead ore containing 28 ounces of gold, 25,537 ounces of silver, 24,908 pounds of copper, 820,463 pounds of lead, and 750,400 pounds of zinc; 499 tons of lead ore containing 5 ounces of gold, 3,490 ounces of silver, 4,038 pounds of copper, and 133,928 pounds of lead; and 127 tons of silver ore containing 1 ounce of gold, 555 ounces of silver, 876 pounds of copper, and 13,062 pounds of lead. Moscow Mines, Inc., operated the Burning Moscow group of claims in 1946 and shipped 570 tons of silver ore, 638 tons of zinc ore, and 836 tons of zinc-lead ore. The remainder of the district output was largely 244 tons of silver-lead ore produced from the Wild Bill and Rebel mines.

BOX ELDER COUNTY

Crater Island District.—About two cars of gold-copper ore from the Copper Blossom mine were shipped to a smelter in 1946.

Lucin District.—Lessees worked the Copper Mountain mine in 1946 and shipped two cars of copper ore to a smelter.

Promontory District.—From the Lake View Carbonate mine the Lakeview Mining Co. shipped 368 tons of zinc-lead ore to a smelter.

IRON COUNTY

Indian Peak District.—The New Arrowhead Mining Co. operated the Arrowhead mine in 1946 and produced 259 tons of zinc-lead smelting ore and 29 tons of zinc-lead milling ore.

Stateline District.—H. J. Holt operated the Etna Gold mine in 1946 and shipped 60 tons of gold ore to a smelter.

JUAB COUNTY

Mount Nebo District.—Lucius Rowe shipped 2 tons of high-grade lead-gold ore to a smelter from the Central Sultana claim, and 2 tons of similar ore were produced from the Mona claim.

Tintic District.—The Tintic district, which lies in both Juab and Utah Counties, is reviewed here. The table that follows gives the metal production in each section of the district in 1946, a comparison with the total in 1945, and the grand total from 1869 to 1946.

Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1945–46, and total, 1869–1946, in terms of recovered metals

	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1946								
Juab County	10	108,918	1,798	453,641	173,500	6,484,000	7,367,500	$2,063,170
Utah County	9	23,408	16,001	166,083	277,000	1,993,000	51,500	962,624
Total: 1946	19	132,326	17,799	619,724	450,500	8,477,000	7,419,000	3,025,794
1945	18	160,816	14,536	1,086,435	918,000	9,859,000	5,855,400	2,926,511
Total: 1869–1946		(1)	2,588,373	259,815,729	242,745,564	1,863,860,079	68,994,538	393,526,912

[1] Figure not available.

The Chief Consolidated Mining Co. operated its Chief No. 1, Gemini, and Eureka Hill mines throughout 1946. Output from the three mines comprised 77,978 tons of zinc-lead milling ore containing 1,391 ounces of gold, 339,240 ounces of silver, 44,134 pounds of copper, 5,911,248 pounds of lead, and 9,379,179 pounds of zinc; 5,424 tons of silver smelting ore containing 110 ounces of gold, 25,835 ounces of silver, 20,043 pounds of copper, and 368,162 pounds of lead; and 1,726 tons of lead smelting ore containing 22 ounces of gold, 14,970 ounces of silver, 2,089 pounds of copper, 514,311 pounds of lead, and 194,237 pounds of zinc. In 1946 the properties ranked third among State lead producers and fourth in silver and zinc.

Lessees operated the Centennial-Beck-Victoria mine throughout the year and shipped about 200 cars of silver ore to a smelter. Philip P. Clark, lessee, again worked the Godiva mine throughout the year and shipped 1,821 tons of silver ore and lead ore to smelters. The Mammoth Mining Co. increased its output of ore over 1,100 tons, compared with that in 1945; total production of 7,181 tons of smelting ore contained 401 ounces of gold, 20,459 ounces of silver, 66,961 pounds of copper, and 112,003 pounds of lead. Other production from the district was as follows: Dragon and Martha Washington properties, 371 tons of silver ore; Eagle and Blue Bell mine, 801 tons of gold-silver ore; Windridge mine, 293 tons of silver ore; Alaska mine, 94 tons of zinc-lead ore; Showers group, 142 tons of zinc-lead ore and 83 tons of silver-lead ore.

The Tintic Standard Mining Co. operated its Tintic Standard mine the entire year and shipped all production to smelters. Output comprised 8,166 tons of gold-silver ore, which contained 661 ounces of gold, 71,728 ounces of silver, 34,039 pounds of copper, and 650,486 pounds of lead; and 2,781 tons of lead ore, which contained 134 ounces of gold, 19,103 ounces of silver, 6,723 pounds of copper, 1,365,683 pounds of lead, and 57,389 pounds of zinc. The company worked the

Iron Blossom mine from July through December and shipped 1,132 tons of silver ore to a smelter.

The Tintic Bullion mine was operated in 1946 by the North Lily Mining Co. and the International Smelting & Refining Co. Output was high-grade gold ore shipped to a smelter. The mine ranked third among State gold producers in 1946. The Colorado Consolidated Mines Co. operated its Colorado property from July through December and produced 1,935 tons of gold-silver ore which was shipped to a smelter. Owing to smelter strikes, the Yankee mine of the Yankee Consolidated Mining Co. was worked about 7 months; output was 877 tons of gold-silver ore shipped to a smelter. The Eureka Lilly Consolidated Mining Co. operated its Eureka Lilly group about 7 months in 1946 and shipped 3,231 tons of copper-gold-silver ore to a smelter; metal content was 785 ounces of gold, 33,100 ounces of silver, and 164,867 pounds of copper. Other production from this part of the district, all shipped to smelters, included 375 tons of silver ore from the Eureka Bullion mine; 1,611 tons of gold-silver ore from the Mountain View group; and a few cars of silver ore from the Twentieth Century lease.

West Tintic District.—S. L. Jerman, lessee, operated the Scotia group from July to December and shipped to smelters 117 tons of gold-silver ore containing 17 ounces of gold, 606 ounces of silver, 823 pounds of copper, and 14,963 pounds of lead and 186 tons of lead ore containing 30 ounces of gold, 967 ounces of silver, 2,289 pounds of copper, and 36,575 pounds of lead.

PIUTE COUNTY

Gold Mountain District.—From the Annie Laurie claim 40 tons of gold ore were shipped to a smelter.

Ohio District.—Tushar Mines, Inc., operated its Tushar group from July to November and shipped 32 tons of silver ore to a smelter. About 1 ton of lead ore shipped to a smelter from the Cascade claim contained 28 ounces of gold, 32 ounces of silver, and 256 pounds of lead.

SALT LAKE COUNTY

Big Cottonwood District.—Mountain Mines Co. worked the Lake Blanche and other claims from May to December and shipped to a smelter 65 tons of gold-silver ore containing 10 ounces of gold, 401 ounces of silver, and 1,561 pounds of lead.

Little Cottonwood District.—Production from the Little Cottonwood district in 1946 was shipped to smelters and included several cars of lead-copper ore and copper ore from the Wasatch Mines; 207 tons of silver ore from the Michigan-Utah mine dump; 1 ton of high-grade gold ore from the Clementine mine; and a test shipment of lead-copper ore from the Emma & South Hecla mine. In addition, R. G. Shaw worked the Peruvian Consolidated mine from June to October and shipped 106 tons of lead ore and 7 tons of zinc-lead ore to smelters.

Smelter District.—Output credited to the Smelter district in 1946 was lead plant dump slag and clean-ups shipped to a smelter.

West Mountain (Bingham) District.—In 1946 the West Mountain (Bingham) district contributed 79 percent of the State gold output, 49 percent of the silver, 98 percent of the copper, 40 percent of the

lead, and 27 percent of the zinc; the total value of the metal output declined 40 percent from that in 1945. The following table shows production in the district in 1945 and 1946 and the total from 1865 to 1946.

Mine production of gold, silver, copper, lead, and zinc in West Mountain (Bingham) district, Salt Lake County, Utah, 1945–46, and total, 1865–1946, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1945	8	24,209,565	248,923	3,628,229	448,568,800	45,446,000	29,340,800	$79,131,715
1946	6	12,572,289	140,877	2,030,182	224,166,500	24,685,500	15,186,500	47,429,473
Total: 1865–1946		(1)	5,844,029	143,124,523	[2] 4,670,321	[2] 1,562,029	[2] 479,697	1,802,426,865

[1] Figure not available.
[2] Short tons.

Operations at the Utah Copper mine of the Kennecott Copper Corp. in Bingham were seriously hampered by labor strikes, which closed the mine and mills from January 21 to June 26. As a result, the output of copper ore declined over 50 percent from that in 1935; nevertheless, the mine remained the Nation's leading copper mine and Utah's leading gold and silver producer, as well as an important producer of molybdenum. Copper ore was milled at the Arthur and Magna plants at an average daily rate of 67,566 tons, compared with 67,517 tons in 1945. Important quantities of copper continued to be leached from waste dumps and precipitated at the company plant at Lead Mine in the mouth of Bingham Canyon.

The United States & Lark property, operated by the United States Smelting, Refining & Mining Co., continued to be the largest producer of lead and zinc in the State and ranked second in silver and fourth in gold. Labor strikes closed the mine from January 21 to June 26; consequently, output of ore declined greatly and for 1946 fell 43 percent below that in 1945. The great bulk of the output was zinc-lead ore treated at the company Midvale concentrator, but in addition some gold-silver ore and lead ore were shipped to smelters and a few cars of zinc-lead ore to the Tooele slag-fuming plant.

The National Tunnel & Mines Co. operated the Apex-Delaware group throughout the year; ore production was 25 percent less than in 1945. The output was mainly copper ore treated at the Tooele concentrator, but considerable zinc-lead ore also went to the Tooele concentrator and some to a lead smelter. In 1946 the property ranked second among State copper producers and fifth in gold.

The Columbia group of the Ohio Copper Co. was worked continuously in 1946, and 515,732 tons of old tailings were treated in the company leaching-flotation plant. The yield was 5,277 tons of copper concentrate containing 351 ounces of gold, 3,883 ounces of silver, and 2,177,942 pounds of copper. In addition, 51 tons of precipitated copper were produced.

Combined Metals Reduction Co. and lessees operated the Butterfield group in 1946 and produced 737 tons of gold-silver ore, which

was shipped to a smelter, and 12,252 tons of zinc-lead ore, which was treated at the Bauer mill. Gross metal content of the total ore was 1,422 ounces of gold, 61,012 ounces of silver, 1,669,464 pounds of lead, and 776,832 pounds of zinc.

Montana-Bingham Consolidated Mining Co. operated its property for about 7 months in 1946 and shipped several cars of zinc-lead ore to the Midvale concentrator.

SAN JUAN COUNTY

La Sal District.—The Big Indian open-pit mine of the Ohio Copper Co. was operated throughout 1946. Carbonate copper ore treated in the company 250-ton flotation mill totaled 46,333 tons in 1946, which yielded 1,830 tons of copper concentrate containing 521 ounces of silver and 1,025,433 pounds of copper.

White Canyon District.—Bronson & Cooper worked the Happy Jack claim from September 15 to October 30 and shipped 49 tons of copper ore to a smelter.

SUMMIT AND WASATCH COUNTIES

PARK CITY REGION

The Park City region includes the Uintah district in Summit County and the Blue Ledge and Snake Creek districts in Wasatch County. The following table shows the production and total value of the five metals in 1946 compared with 1945 and the total from 1870 to 1946.

Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1945–46, and total, 1870–1946, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1945	12	154,609	13,822	1,033,830	740,800	17,831,500	14,870,000	$4,562,505
1946	9	336,474	16,956	1,009,422	892,500	16,745,000	17,752,500	5,544,668
Total: 1870–1946	-------	(1)	561,806	234,774,700	68,637,413	2,408,443,934	685,811,111	367,184,321

[1] Figure not available.

The Silver King Coalition Mines Co. operated its mine without interruption during 1946 and produced 28,665 tons of ore compared with 31,117 tons in 1945. Of the 28,665 tons, 28,367 tons of zinc-lead ore were treated in the company 800-ton flotation mill, which yielded 3,003 tons of lead concentrate containing 231 ounces of gold, 208,509 ounces of silver, 114,055 pounds of copper, 4,044,497 pounds of lead, and 434,086 pounds of zinc; and 1,979 tons of zinc concentrate containing 20 ounces of gold, 8,025 ounces of silver, 10,511 pounds of copper, 67,630 pounds of lead, and 2,421,363 pounds of zinc. In addition, direct shipments to smelters comprised 224 tons of silver ore, containing 6 ounces of gold, 2,326 ounces of silver, 721 pounds of copper, and 18,561 pounds of lead and 74 tons of lead ore containing 2 ounces of gold, 1,827 ounces of silver, 639 pounds of copper, and

19,054 pounds of lead. In 1946 the property ranked sixth in State output of silver and lead and seventh in zinc.

In 1946 the Park Utah Consolidated Mines Co. produced 28,401 tons of zinc-lead ore from its Park Utah Consolidated group in Summit and Wasatch Counties, compared with 27,893 tons in 1945. Of the total, 27,834 tons were treated at the Tooele concentrator; gross metal content was 645 ounces of gold, 300,974 ounces of silver, 178,347 pounds of copper, 4,802,538 pounds of lead, and 4,385,938 pounds of zinc. The remaining 567 tons were shipped to a lead smelter; metal content was 13 ounces of gold, 8,301 ounces of silver, 9,109 pounds of copper, 200,344 pounds of lead, and 155,720 pounds of zinc.

In August the Pacific Bridge Co. began production from the Grasselli tailings dump along Silver Creek, and the operation advanced rapidly to a major position in State output of zinc. During the remainder of the year, the company treated 196,793 tons of zinc-lead old tailings in the company 1,500-ton mill by screening, jigging, and spiral concentration, after which the gravity concentrate was treated by selective flotation to produce lead concentrate and zinc concentrate. Concentrates comprised 1,168 tons of lead concentrate—which contained 59 ounces of gold, 35,636 ounces of silver, 24,294 pounds of copper, 485,164 pounds of lead, and 180,830 pounds of zinc—and 1,978 tons of zinc concentrate, which contained 20 ounces of gold, 15,583 ounces of silver, 9,811 pounds of copper, 78,447 pounds of lead, and 2,238,621 pounds of zinc. In 1946 the operation ranked eighth in State zinc output.

The New Park Mining Co. operated its Park Galena and Mayflower properties throughout 1946 and produced 61,802 tons of ore, compared with 50,043 tons in 1945. Of the total, 61,521 tons of zinc-lead ore were treated in custom mills; gross metal content was 17,812 ounces of gold, 447,641 ounces of silver, 795,623 pounds of copper, 8,210,944 pounds of lead, and 11,050,067 pounds of zinc. The remaining 281 tons was gold ore shipped to a smelter; it contained 884 ounces of gold, 6,500 ounces of silver, 8,590 pounds of copper, and 24,402 pounds of lead. In 1946 the property ranked second in State lead and gold production and third in silver and zinc.

The West Park Mining Co. operated its West Park mine from May to November and shipped 197 tons of copper ore to a smelter. Reuben Garbett re-treated about 18,000 tons of current tailings from the Silver King Coalition mill in a small flotation mill and produced 374 tons of zinc middling, which was treated further at the Midvale concentrator. Remaining production from the region was 2,616 tons of old tailings, principally siliceous, shipped to smelters.

TOOELE COUNTY

Clifton District.—Fred Cook shipped 14 tons of lead ore to a smelter from the Herot claim. The Silver King claim produced 14 tons of copper smelting ore.

Columbia District.—Joseph Marshall shipped about 2 cars of zinc ore from the Sultana claim to the Bauer mill for treatment.

Dugway District.—Amos Epperson shipped 483 tons of zinc ore from the Smelter Canyon & Four Metals group to a smelter; and 8 tons of copper ore were produced from the Cannon claim.

Erickson District.—Treloar & Huber produced 37 tons of lead smelting ore from the Esther group.

Free Coinage District.—Eaton Leasers shipped 9 tons of lead ore from the White Quail claim to a smelter.

North Tintic District.—H. A. Bellows worked the waste dump at the Scranton property intermittently during the year and shipped 2,900 tons of zinc ore to a smelter.

Ophir District.—The Ophir Development Co. operated its Ophir Hill mine from February to the end of the year and produced 444 tons of lead smelting ore and 399 tons of zinc-lead milling ore. Gross metal content of lead ore was 4 ounces of gold, 2,868 ounces of silver, 5,492 pounds of copper, 99,445 pounds of lead, and 56,407 pounds of zinc; that of the zinc-lead ore, 3 ounces of gold, 2,467 ounces of silver, 7,418 pounds of copper, 54,979 pounds of lead, and 43,125 pounds of zinc. The Hidden Treasure Mine—the largest producer in the Ophir district in 1946—was worked under lease from September through December; output was 2,034 tons of zinc-lead ore. The Ophir unit of the United States Smelting, Refining & Mining Co. was operated under lease throughout the year and produced 857 tons of zinc-lead ore, nearly all of which was treated at the Midvale concentrator.

Rush Valley District.—The West Calumet (Calumet) mine operated by the Combined Metals Reduction Co. was the largest producer in the Rush Valley district in 1946, ranking fourth in State lead output and sixth in zinc. Output comprised 30,713 tons of zinc-lead ore treated in the Bauer mill and 789 tons of lead ore shipped to a smelter. Metal content of the total ore was 1,723 ounces of gold, 220,918 ounces of silver, 5,889,092 pounds of lead, and 3,983,479 pounds of zinc. The company also operated the Honerine-Galena King and Bluestone groups in 1946. The former group produced 220 tons of lead smelting ore and 252 tons of zinc-lead milling ore; the latter produced 118 tons of lead ore shipped to a smelter. From the Silver Eagle group the Hampton Mining Co. shipped 2 cars of gold-silver ore to a smelter and several cars of zinc-lead ore to custom mills. From the Emilie claim 6 tons of lead ore were shipped to a smelter.

Smelter District.—The slag-fuming plant of the International Smelting & Refining Co. at Tooele ranked second in State production of zinc and seventh in lead in 1946. The plant operated 359 days during the year and treated 179,715 tons of hot current slag, old cold slag, and crude ore. However, only the metals recovered from fuming 83,117 tons of old slag are credited to the plant as a producer in the Smelter district. The remaining metals are credited to the individual mines producing the ore and concentrates that yielded the current hot slag for treatment in the fuming plant.

Willow Springs District.—Lessees operated the Oro Del Rey group from January 15 to November 15 and shipped 363 tons of gold-lead ore to smelters; 9 tons of gold ore were produced from the Depression mine.

UTAH COUNTY

American Fork District.—The Dutchman group was worked under lease the entire year, and 1,945 tons of zinc-lead ore were shipped to custom flotation mills; gross metal content of the ore was 56 ounces of gold, 7,798 ounces of silver, 6,938 pounds of copper, 370,798 pounds

of lead, and 775,619 pounds of zinc. From the Globe mine the Howell Mining Co. shipped to a custom mill 777 tons of zinc-lead ore containing 11 ounces of gold, 7,230 ounces of silver, 3,350 pounds of copper, 77,986 pounds of lead, and 133,223 pounds of zinc. From the Blue Rock claim 51 tons of lead ore were shipped to a smelter.

Tintic District.—Mines in the Tintic district, including those of the Utah County section, are reviewed under Juab County.

WASHINGTON COUNTY

Tutsagubet District.—E. L. Cox worked the Dixie mine from January to October and shipped 530 tons of copper ore and 308 tons of lead ore to smelters. The total ore contained 2,693 ounces of silver 181,093 pounds of copper, and 70,757 pounds of lead.

WASHINGTON
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. NEEDHAM AND PAUL LUFF

GENERAL SUMMARY

IN the production of gold, silver, copper, lead, and zinc in Washington in 1946, the output of each metal declined from that in 1945. Copper made the poorest showing and slumped 22 percent in quantity, followed closely by lead, with 21 percent; gold decreased 12, silver 6, and zinc 3 percent. In spite of higher average prices for all metals except gold, the total value of the five metals declined 4 percent—from $7,140,242 in 1945 to $6,886,748 in 1946; only zinc and silver increased in value over 1945. Of the total value, zinc contributed over 40 percent, gold 26, copper 21, lead over 9, and silver 3 percent.

Chelan County remained in first place in total value of the five metals produced in 1946, and Pend Oreille County was the only other county in the State having a metal output over $1,000,000. Together the two counties produced 79 percent of the State total value in 1946, compared with 84 percent in 1945.

Labor strikes, manpower shortages, and lack of ore development were largely responsible for the downward trend in ore production. However, a few companies pushed their tonnages above the 1945 levels, among them the Pend Oreille Mines & Metals Co., the Knob Hill Mines, Inc., the Kaaba-Texas Mining Co., the Jamison-Higginbotham Mining Co., and Bonanza Mines.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67 + ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver 1942 to June 30, 1946: $0.71111111; July 1, 1946 to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by the Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Washington, 1942–46, and total, 1860–1946, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1942	37	18	1,222,937	75,396	$2,638,860	369,038	$262,427
1943	24	2	1,131,281	65,244	2,283,540	370,440	263,424
1944	25	3	1,180,662	47,277	1,654,695	321,608	228,699
1945	21	3	968,246	57,860	2,025,100	281,444	200,138
1946	16	5	858,023	51,168	1,790,880	264,453	213,678
1860–1946			(1)	2,178,670	55,008,773	12,829,873	9,109,513

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1942	16,060,000	$1,943,260	9,702,000	$650,034	28,796,000	$2,678,028	$8,172,609
1943	14,630,000	1,901,900	10,044,000	753,300	24,406,000	2,635,848	7,838,012
1944	12,338,000	1,665,630	11,650,000	932,000	23,808,000	2,714,112	7,195,136

[1] 1860–1903: Figures not available; 1904–46, 12,525,422 tons produced.
[2] Short tons.

Mine production of gold, silver, copper, lead, and zinc in Washington in 1946, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
January	5,254	21,135	1,010,000	538,000	1,748,000
February	5,436	17,045	808,000	524,000	1,962,000
March	5,425	25,746	958,000	610,000	2,162,000
April	5,052	25,323	1,030,000	588,000	1,996,000
May	4,346	21,620	898,000	566,000	2,304,000
June	4,682	23,812	908,000	404,000	2,096,000
July	4,323	25,363	822,000	242,000	1,154,000
August	3,045	22,167	888,000	232,000	1,340,000
September	4,073	24,267	796,000	546,000	2,248,000
October	4,460	24,402	714,000	610,000	2,270,000
November	2,864	17,612	214,000	608,000	1,638,000
December	2,208	15,961	8,000	506,000	1,740,000
Total: 1946	51,168	264,453	9,054,000	5,974,000	22,658,000
1945	57,860	281,444	11,642,000	7,604,000	23,386,000

Gold.—The decrease of about 6,700 ounces in the State output of recoverable gold in 1946, compared with 1945, resulted in large part from a reduced output of gold from the Holden property of the Howe Sound Co. in Chelan County; the mine, however, remained the State's leading gold producer by a wide margin. The Knob Hill mine in Ferry County was the only other important gold producer in 1946; output from this property was 7 percent greater than in 1945. These two properties supplied over 96 percent of the State total gold in 1946. Placer mining was more active in 1946 than in 1945; the quantity of gravel washed was 90 times greater than in 1945, but the quantity

of gold recovered increased only a little more than seven times. Fifty-eight percent of the State gold output in 1946 was recovered from ore treated in concentration mills and most of the remainder from current slimes cyanided.

Silver.—Silver production in Washington in 1946 remained entirely a byproduct of gold and base-metal ores. Again, the two leading silver producers were the Holden and Knob Hill mines, but in 1946 their position were reversed, Knob Hill leading by a small margin. Neither company in 1946 maintained its 1945 level of silver output. The Kaaba mine in Okanogan County ranked third and increased its silver output over 50 percent compared with 1945 output. These three properties supplied 86 percent of the State total silver in 1946.

Gold ore moved to first place as a source of silver in Washington in 1946, contributing 40 percent, and zinc-copper ore dropped to 35 percent; zinc-lead ore produced 20 percent, lead ore 5 percent, and zinc ore, copper ore, and placers together less than 0.5 percent. Of the State silver output in 1946, 57 percent was recovered from ore treated in concentration mills; 37 percent from ore, concentrates, and current slimes cyanided; and nearly all the remainder from crude ore smelted.

Copper.—Copper output in Washington in 1946 declined for the sixth consecutive year. The Holden mine in Chelan County, producing from zinc-copper ore treated by flotation, remained the only significant copper producer. In November the Holden mill closed, and all work was directed toward mine development.

Lead.—The marked decline in lead production in Washington in 1946 resulted mainly from labor strikes in the Metaline district, Pend Oreille County. The Grandview mine of the American Zinc, Lead & Smelting Co. was the leading producer, followed by the property of the Pend Oreille Mines & Metals Co., both in Pend Oreille County. The Bonanza mine in Stevens County ranked third, and the Metaline Mining & Leasing Co. was fourth. These four properties produced 88 percent of the State total lead. About 80 percent of the total lead output was derived from zinc-lead ore concentrated, and nearly all the remainder from lead ore concentrated.

Zinc.—Among the five metals in Washington in 1946, zinc made the best showing. The slight decline was due mainly to reduced production at the Holden mine and to work stoppages for 2 months caused by a labor strike at the properties of the American Zinc, Lead & Smelting Co. and the Metaline Mining & Leasing Co. Nearly 99 percent of the State zinc came from the five following properties, ranking in the order named: The Grandview mine; the property operated by the Pend Oreille Mines & Metals Co.; the Deep Creek mine of the Jamison-Higgenbotham Mining Co. in Stevens County; the Holden mine; and the property of the Metaline Mining & Leasing Co. Sixty-nine percent of the total zinc was recovered from zinc-lead ore concentrated, 16 percent from zinc ore concentrated, and 15 percent from zinc-copper ore concentrated.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Washington in 1946, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Asotin		1	85	$2,975	16	$13
Benton		1	1	35

Small-scale hand methods:					
1942	11	700	24	840	1.200
1943	1	40	2	70	1.750
1944	2	75	4	140	1.867
1945	3	275	14	490	1.782
1946	3	115	5	175	1.522
Grand total, placer:					
1942	18	44,191	356	12,460	.282
1943	2	4,870	116	4,060	.834
1944	3	5,575	59	2,065	.370
1945	3	275	14	490	1.782
1946	5	25,115	101	3,535	.141

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

MINING INDUSTRY

Increased average prices for all metals except gold failed to halt the downward trend in ore output in Washington in 1946, and the quantity of ore produced declined 11 percent from that in 1945. Chief among the causes for the decrease were the 2-month strike, called late in June, at operations of the American Zinc, Lead & Smelting Co. and the Metaline Mining & Leasing Co.; continued labor shortages at many mines; and the closing of the Holden mill in November in preparation for a 6-month development program at the mine. During the year, the seven leading properties produced 842,186 tons of ore—98 percent of the State total—compared with 947,167 tons in 1945.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Washington in 1946, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	6	51,622	18,686	103,369			
Copper ore	1	43	3	349	16,000		
Lead ore	2	6,920	12	14,433	2,150	1,066,800	51,000
Zinc ore	1	39,634	6	708	4,000	78,000	3,580,000
Zinc-copper ore	1	491,402	32,353	93,859	8,987,000		3,460,000
Zinc-lead ore	5	268,402	7	51,714	44,850	4,829,200	15,567,000
Total, lode mines	16	858,023	51,067	264,432	9,054,000	5,974,000	22,658,000
Total, placers	5		101	21			
Total: 1946	21	858,023	51,168	264,453	9,054,000	5,974,000	22,658,000
1945	24	968,246	57,860	281,444	11,642,000	7,604,000	23,386,000

METALLURGIC INDUSTRY

Of the 858,023 tons of lode material from Washington mines sold or treated in 1946, 806,147 tons (94 percent) went to concentrating mills, 43,107 tons (5 percent) to a cyanidation-concentration mill, and 8,769 tons (1 percent) to smelters, compared with 94, 4, and 2 percent, respectively, in 1945.

The cyanide plant at the Holden mill at Holden operated throughout the year until November 9, except for May; 416,721 tons of current flotation tailings from zinc-copper ore were cyanided. The 400-ton cyanidation-concentration mill of Knob Hill Mines, Inc., at Republic was active throughout the year and cyanided 12,543 tons of crude ore, 28,433 tons of current flotation tailings, and 1,110 tons of flotation concentrate.

The 806,147 tons of ore treated by concentration in 1946 were distributed among eight mills as follows: One plant, 491,402 tons of zinc-copper ore; four plants, 268,043 tons of zinc-lead ore; two plants, 6,920 tons of lead ore; and one plant, 39,634 tons of zinc ore. In addition, 148 tons of zinc-lead ore were shipped to Bauer, Utah, for treatment.

Mine production of metals in Washington in 1946, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore, concentrates, and current slimes cyanided	458,807	19,365	99,101			
Concentrates smelted	806,147	29,881	151,984	9,037,468	5,931,400	22,621,350
Ore smelted	8,769	1,821	13,347	16,532	42,600	36,650
Placer		101	21			
Total: 1946		51,168	264,453	9,054,000	5,974,000	22,658,000
1945		57,860	281,444	11,642,000	7,604,000	23,386,000

Mine production of metals from cyanidation mills [1] (with or without concentration equipment) in Washington in 1946, by counties, in terms of recovered metals

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal		
		Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)
Chelan	(2)	[2] 2,493	[2] 3,873			
Ferry	[3] 44,217	11,265	57,204	1,021	5,607	38,024
Total: 1946	[3] 44,217	13,758	61,077	1,021	5,607	38,024
1945	[4] 33,227	5,060	27,907	2,170	10,932	81,685

[1] No amalgamation in 1945 or 1946.
[2] Material cyanided was 416,721 tons of current tailings from zinc-copper ore.
[3] Includes 1,110 tons of flotation concentrates cyanided.
[4] Includes 774 tons of flotation concentrates cyanided.

Mine production of metals from concentrating mills in Washington in 1946, by counties, in terms of recovered metals

ASOTIN COUNTY

Snake River District.—Clyne J. Johnson operated a dragline dredge on the Ausman claim intermittently for nine months during 1946 and washed about 10,000 cubic yards of gravel, which yielded 85 ounces of gold and 16 ounces of silver.

CHELAN COUNTY

Chelan Lake District.—The Holden mine of the Howe Sound Co. remained the leading producer of gold and copper in Washington in 1946 but dropped to second place in silver and from third to fourth place in zinc output. The mine was operated throughout the year, but the company 2,000-ton flotation mill was closed November 9. Zinc-copper ore treated declined from 617,120 tons in 1945 to 491,402 tons in 1946; gross metal content of the ore treated in 1946 was 37,700 ounces of gold, 136,700 ounces of silver, 9,750,000 pounds of copper, and 5,875,000 pounds of zinc. The mill yielded 20,027 tons of copper concentrate and 3,841 tons of zinc concentrate. In addition, 416,721 tons of current tailings were treated by cyanidation to produce gold and silver bullion. In November an extensive development program was launched at the mine to last about 6 months, during which time the mill will remain idle.

Peshastin Creek (Blewett) District.—Karl W. Fackler operated the Polepick mine in 1946 and shipped two cars of high-grade gold ore to a smelter.

Wenatchee River District.—A few cars of highly siliceous low-grade gold ore from the Gold King and MacBeth claims were shipped to a smelter early in the year, after which option on the property was surrendered by the Knob Hill Mines, Inc.

FERRY COUNTY

Republic District.—Knob Hill Mines, Inc., operated its mine throughout 1946 and produced 84 percent of the ore mined in the district; the output of ore was substantially higher than in 1945. The mine was the State's leading silver producer in 1946 and ranked second in gold. The company 400-ton flotation-cyanidation mill was operated continuously throughout the year; during the first quarter, the flotation concentrate was given special cyanidation treatment and discarded; during the second quarter, the ore was cyanided directly without flotation treatment; beginning July 1 flotation was resumed, and until November 1 the concentrate was subjected to cyanidation before shipment to a smelter; and after November 1 the concentrate without cyanidation went to a smelter. Lessees worked several claims of the Aurum group and shipped 4,541 tons of gold ore to a smelter. A car of similar ore was shipped also from the Republic group. C. M. Trevitt shipped 3,635 tons of gold ore from the South Penn mine to a smelter; the metal content was 480 ounces of gold and 2,344 ounces of silver.

KITTITAS COUNTY

Swauk Disrict.—The Mohawk Mining Co. operated a dry-land dredge on Swauk Creek during the 1946 season. The washing of about 15,000 cubic yards of gravel yielded 11 ounces of gold and 5 ounces of silver.

OKANOGAN COUNTY

Loomis-Oroville District.—The Kaaba mine of the Kaaba-Texas Mining Co. ranked third in silver output and fifth in lead among Washington producers in 1946. The company 150-ton flotation mill operated at a daily average of 98 tons during the year and treated 20,395 tons of zinc-lead ore which contained 2 ounces of gold, 40,750

ounces of silver, 80,000 pounds of copper, 530,000 pounds of lead, and 300,000 pounds of zinc.

PEND OREILLE COUNTY

Metaline District.—Output of zinc-lead ore from the Metaline district held steady in 1946 in spite of some labor difficulties, and production declined little more than 2 percent from that in 1945; despite higher prices for silver, copper, lead, and zinc, the value of metal output in 1946 decreased 1 percent from that in 1945.

In 1946 the Grandview mine of the American Zinc, Lead & Smelting Co. ranked first in output of lead and zinc among State producers, but production of ore dropped nearly 6 percent from that in 1945, largely because of a labor strike at the property from June 25 to August 26.

The Pend Oreille Mines & Metals Co. operated its Josephine, Hortense, Sullivan, and Yellowhead groups throughout the year and treated 122,106 tons of zinc-lead ore in the company 750-ton flotation mill, compared with 116,696 tons in 1945. Gross metal content of the ore was 5,000 ounces of silver, 20,000 pounds of copper, 1,680,000 pounds of lead, and 7,400,000 pounds of zinc.

Operations of the Metaline Mining & Leasing Co. were hampered during the year by a labor strike, which closed the company mine from June 25 to August 26, and ore production declined over 8 percent from 1945. Among State producers in 1946, the property ranked fourth in lead production and fifth in zinc.

SNOHOMISH COUNTY

Index District.—The Index Mining Co. conducted exploration on the Sunset claim during the year and shipped a car of copper ore to a smelter.

STEVENS COUNTY

Bossburg District.—Bonanza Lead operated its Bonanza mine and 100-ton flotation mill throughout the year. The property ranked third among State lead producers. Morris & Leighton, lessees, operated the Young America mine about 150 days in 1946 and produced a total of 359 tons of zinc-lead ore. Of this quantity 211 tons, containing 4 ounces of gold, 4,857 ounces of silver, 650 pounds of copper, 43,424 pounds of lead, and 45,865 pounds of zinc, were shipped to a smelter; the remaining 148 tons treated at Bauer, Utah, contained 5 ounces of gold, 1,793 ounces of silver, 481 pounds of copper, 16,431 pounds of lead, and 58,232 pounds of zinc.

Deer Trail District.—Zenith Mines, Inc., lessee, mined a substantial quantity of lead ore from the Cleveland mine, which yielded several cars of lead concentrate and a car of zinc concentrate. The property ranked sixth among State lead producers in 1946.

Northport District.—The Jamison-Higginbotham Mining Co., worked its Deep Creek mine and produced 39,634 tons of zinc ore in 1946, an increase of more than 10,000 tons over its 1945 output. The ore was treated in the Sierra Zinc Co. Blue Ridge flotation mill on Deep Creek. The zinc concentrate produced (3,295 tons) contained 6 ounces of gold, 708 ounces of silver, 4,111 pounds of copper, 81,242 pounds of lead, and 4,000,000 pounds of zinc. The property ranked third among State zinc producers in 1946.

Wyoming
Gold, Silver, Copper, and Lead

(MINE REPORT)

By S. A. GUSTAVSON

GENERAL SUMMARY

IN Wyoming, intermittent operation of three lode and two placer mines accounted for all the 1946 production of gold, silver, and copper; the total value was $4,020. No recoverable lead or zinc was mined. The total production in 1945 of gold, silver, and lead was valued at $608. In 1946, 105 ounces of gold, 26 ounces of silver, and 2,000 pounds of copper were recovered from mining operations, compared with 2 ounces of gold, 31 ounces of silver, and 6,000 pounds of lead in 1945.

A summary of the past production of Wyoming shows that the State has produced gold, silver, copper, and lead having a total value of $7,577,418 during the period 1867 to 1946, inclusive. Gold and silver have been produced from many localities throughout the State, whereas the output of copper (most of which was mined prior to 1924 and which represents over three-fourths of the total recorded value of the four metals) has come from the Encampment district, in Carbon County; the Hartville district, originally in Laramie County, now in Platte County; and the Laramie district, in Albany County. All the lead produced in the State came from the Spring Creek district, in Carbon County; the Hurricane district, in Crook County; and the Douglas Creek district, in Albany County; it was mined during 1932, 1934, 1935, 1942, and 1945.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1942–46

Year	Gold[1]	Silver[2]	Copper[3]	Lead[3]	Zinc[3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1942	$35.00	$0.711+	$0.121	$0.067	$0.093
1943	35.00	.711+	.130	.075	.108
1944	35.00	.711+	.135	.080	.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1942 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1946: $0.905.

[3] Yearly average weighted price of all grades of primary metal sold by producers; price includes bonus payments by Office of Metals Reserve for overquota production.

MINE PRODUCTION

The following table shows the annual output of ore from lode mines producing gold, silver, copper, and lead and the quantity and value of the metals recovered from both lode and placer mines in Wyoming from 1942 to 1946; it also gives the total production of metals from 1867 to 1946.

Mine production of gold, silver, copper, and lead in Wyoming, 1942–46, and total, 1867–1946, in terms of recovered metals

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total value
		Fine ounces	Value	Fine ounces	Value	Pounds	Value	Pounds	Value	
1942	84	23	$805	52	$37			6,000	$402	$1,244
1943										
1944	6	20	700	3	2					702
1945	52	2	70	31	22			6,000	516	608
1946	61	105	3,675	26	21	[1] 2,000	$324			4,020
1867–1946	(2)	78,041	1,839,763	74,692	51,797	[3] 16,326	5,684,372	[3] 14	1,486	7,577,418

[1] Includes less than ½ ton of recoverable copper produced in 1945 from the Bartlett (Copper King) mine in Laramie County.

[3] Short tons.

REVIEW BY COUNTIES

ALBANY COUNTY

One lode and two placer mines operated in Albany County in 1946. The Silver King Mining Co. made a test shipment of 19 tons of copper ore from the Silver King mine in sec. 20, T. 16 N., R. 72 W. (a few miles east of Laramie). The ore contained 0.4 ounce of gold, 10 ounces of silver, and 1,027 pounds of copper. The Medicine Bow Mining Co. operated a dragline excavator and dry-land washing plant on the McClellan and F & M claims on Douglas, Muddy, Lake, Jim, and Willow Creeks, all situated in the Douglas Creek district. The plant was operated from June to October and washed about 8,000 cubic yards of gravel, which yielded 14 ounces of gold and 3 ounces of silver. About 3 ounces of gold were recovered from small hand operations at the Triangle placer on Beaver Creek.

FREMONT COUNTY

Two lode mines, both in the Atlantic City and South Pass district, were operated in Fremont County in 1946. J. E. Vanderwalker & Co. operated the Duncan mine during September and produced 17 tons of ore containing 83 ounces of gold and 12 ounces of silver. J. Don Birch and Rex Birch treated by amalgamation 25 tons of ore from the Mary B mine in the Lemlie mill, recovering about 5 ounces of gold and 1 ounce of silver. The Mica Mountain Mines, Inc., made preparations at the Carissa mine and mill to begin mining operations in 1947.

GENERAL SUMMARY[2]

MINING in the Western Hemisphere south of the United States, as in the rest of the world, encountered many retarding obstacles in 1946 in adjusting to postwar conditions. Production of about one-third of the principal metals in 1946 increased, but only two of the large-tonnage ores—bauxite and iron ore—were included in this group. The scarcity and increased cost of labor, strikes and other manifestations of social unrest, high rates of taxation, burdensome legislation, and continued scarcity of machinery and supplies combined to nullify, in most mining operations, the incentive offered by favorable demand and prices.

Production of nonmetallic minerals responded better in general to increased demand where such demand was predominantly local rather than international, and in particular to the favorable world market for diamonds and Chilean nitrates.

[1] Reviews of the mineral industries in Canada, Newfoundland, and the Eastern Hemisphere cannot be presented in Minerals Yearbook, 1946 (except in part in various commodity chapters), as a result of reduction in staff.

[2] The tonnage unit used in this chapter is the metric ton.

A few discrepancies exist between the foreign statistics in some of the commodity chapters and the statistics presented in this chapter inasmuch as the latter are based on new and revised information received from abroad, subsequent to the preparation of the commodity chapters.

Outstanding success was attained in improving the output of hydrocarbons. Increased coal production by Mexico, Peru, and possibly Colombia more than offset decreases in Brazil and Chile. A slight recession in the crude petroleum yields of Argentina, Colombia, Peru, Ecuador, Brazil, and Trinidad was overshadowed by the enormous increase in Venezuela and the lesser but substantial gain in Mexico. Increased output of refinery products was recorded from 8 of the 10 countries that have refining facilities.

MIDDLE AMERICA

BRITISH WEST INDIES

Mineral production in the British West Indies is confined to asphalt and petroleum, limestone and lime, construction stone (including sand and gravel), and salt.

Bahamas.—Extraction of salt from sea water by West India Chemicals, Ltd., which amounted to 60,960 tons in 1944 and 38,825 tons in 1945, and the production of limestone have not been reported for 1946.

Petroleum exploration was active throughout 1946, but production has not yet been attained. Concessions totaling 47,399 square miles of land and off-shore waters have been granted to seven companies and extensive exploration is under way by use of gravity, seismic, and magnetic survey methods. The first test well, started on April 24, 1946, on Andros Island reached a depth of 12,440 feet by the end of the year.

Barbados.—Quantities of limestone, sandstone, sand, and earth produced locally for domestic consumption have not been reported for 1946. Production of the variety of natural asphalt known as manjak has been dwindling for several years and was insignificant in 1946. The British Union Oil Co. bails small quantities of crude petroleum from shallow wells for local refining and use. Production amounted to 1,738 barrels in 1945 and 1,278 barrels in 1946. About 7 million cubic feet of natural gas a year come from the same field.

Bermuda.—Bermuda is reported to quarry about 75,000 tons of limestone a year, of which roughly 22,000 tons is burned to yield some 12,500 tons of lime, and the remainder is used in construction and road building.

Jamaica.—Limestone and lime are produced in Jamaica in unreported amounts.

The potential success of bauxite mining offers one of the few prospects for the island's economic rehabilitation. Sample shipments were made in 1946, and both the Reynolds Metals Co. and Jamaica Bauxites, Ltd. (Aluminum Co. of Canada) continued postponement of commercial development of their concessions pending long-delayed adoption of a mining code for Jamaica.[3] Intensive prospecting of the dauxite deposits was begun in 1942 and discontinued in 1946.

Turks and Caicos Islands (Jamaica Dependencies).—Increase in production of salt from 21,229 tons in 1945 to 31,571 in 1946 represented recovery from most of the destruction of salinas and Govern-

[3] Appropriate mining legislation was drafted in the Colonial Office and passed by the Legislature on August 22, 1947.

ment-owned stocks by the hurricane of September 1945. Production and export of salt is the only important industry of the island group.

Trinidad.—Limestone production rose 8 percent from 617,350 tons in 1945 to 667,000 tons in 1946. Asphalt production (Trinidad Lake) more than tripled from 29,462 tons in 1945 to 92,160 tons in 1946, exceeding the output of 81,753 tons in 1941. Production of crude petroleum [4] dropped 4 percent from 21,092,603 barrels in 1945 to 20,232,941 barrels in 1946, the output of 1820 wells in 14 fields. The decrease, accompanied by an increase in total footage drilled and in average number of producing wells, marks a general weakening in the productivity of the known fields of the island, and has stimulated interest in the discovery of new reserves. Particular attention has been directed to the extension of the producing area westward into the Gulf of Paria, where three seismographic crews were engaged in geophysical surveying by early 1947.

Of Trinidad's seven refineries, the five smallest are shut down. The two remaining large plants of Trinidad Leaseholds, Ltd., at Pointe à Pierre and United British Oilfields at Point Fortin exported 20,651,037 barrels of refinery products in 1945 and 20,431,747 barrels in 1946.

CUBA

Outstanding events in the Cuban minerals industries in 1946 were the closing of the Cuban Mining Co. manganese nodulizing plant at the end of the year, the initiation of chemical-grade manganese ore production on a commercial scale, the intention of the Nicaro Nickel Co. to cease operating its nickel oxide plant early in 1947, and the renewal of gold mining on the Isle of Pines. Output in 1945–46 is presented in the accompanying table.

METALLIC ORES AND CONCENTRATES

Chromite.—Although the production of refractory-grade chromite declined during the latter half of the year, total output compared favorably with that of 1945 and may be expected to be sustained at about the same level in 1947. Principal producers were Cía. Minera Moa, S. A., Cía. Cubana de Minas y Minerales, S. A., and the Juragua Iron Co. The Narciso and Cromita mines of Primativo del Portal produced in the first three quarters of the year only.

Miranda-Gasset and Landa y Asencio were closed down throughout 1946, leaving the Mayari Mining Co., S. A., the sole producer of metallurgical-grade chromite; output was from its Caledonia mine, Province of Oriente. Three-fourths of the ore was mined in the latter half of the year, following conclusion of satisfactory price agreements.

Copper.—As anticipated last year, the development of newly found reserves at Minas de Matahambre, S. A., boosted 1946 production to the position of the best copper year since 1938, and further improvement is expected in 1947. The Matahambre mine is the only copper property operating in the Republic; and considerations of reopening the old Candida, Dora, and Francisco mines—also in the Province of Pinar del Rio—were abandoned early in 1946 following geological investigations that yielded discouraging results. Arozena y Suarez

[4] For a more detailed review, see The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 213, 215.

Mineral production of Cuba, 1945–46, in metric tons (unless otherwise indicated)

Mineral	1945	1946	Change, percent
METALLIC ORES AND CONCENTRATES			
Chromite:			
Refractory grade [1]	161,612	169,763	+5

[5] Figure not available.
[6] Estimated.

Somoano, S. L., plans to reopen the Mercedes mine near Guane, Pinar del Rio Province, and construction of a new copper concentrating mill is reported to be nearing completion.

Iron.—Exports of 103,854 metric tons of iron ore from Cuba in 1946 were entirely from accumulated stocks of the Juragua Iron Co., which has mined no iron ore since 1944.

Manganese.—The Charco Redondo mine of Marsden Leeder was the sole producer of direct-shipping metallurgical-grade manganese ore in 1946, the high cost of operation and transportation having eliminated the small producers that were active during World War II. Output of Charco Redondo was interrupted by flooding from November 1 to December 12; but pumps have now been installed which, reportedly, will prevent any further shut-down from this cause.

With a 32-percent drop from 1945, the year 1946 apparently marks the end of Cuban production of manganese nodules. The sintering plant of the Cuban Mining Co. at Cristo, Oriente Province, was shut down permanently on December 31 because of exhaustion of suitable

ore from the company Quinto and Ponupo mines. The sugar industry is expected to absorb most of the 426 workmen.

Following a trial shipment of 254 metric tons of chemical-grade manganese ore in 1945, production on a commercial scale was initiated in the second quarter of 1946 and was proceeding at the rate of about 750 tons a month by the end of the year. The tonnage was supplied by 18 mines. Continued demand for this grade of ore throughout 1947 is hoped for but not assured.

The future output of manganese ore by Cuba will be greatly reduced by exhaustion of ores suitable for sintering, and less than 50,000 tons a year may well come to be regarded as normal.

Nickel.—Although the United States Government-sponsored plant of the Nicaro Nickel Co. at Nicaro, on the peninsula of Lengua de Pajaro, Oriente Province, produced more nickel oxide in 1946 than at any time since operation was begun in 1943, it encountered several mechanical and technical difficulties and fell considerably short of attaining its rated annual capacity of 14,515 metric tons (16,000 short tons) of contained nickel. The Nicaro contract with the Reconstruction Finance Corporation expired December 31, 1946, but was extended to March 31, 1947, when the plant was closed and offered for sale. Performance of the plant failed to demonstrate ability to operate at a profit on a competitive basis.

Precious Metals and Byproducts.—Since 1941, when the Delita mine on the Isle of Pines and the Nueva Potosí mine in the Province of Oriente closed down, gold and silver production has been confined chiefly to the amounts contained in copper concentrates from the Matahambre mine. Early in 1946 the Delita mine, about 8 miles southwest of Santa Barbara, was reopened by the Cia. Minera de Isla de Pinos, and in the second quarter the mill produced its first concentrates from complex sulfide ore. By the end of the year 2,812 tons of ore had yielded 133 tons of concentrates containing 1,105 ounces of gold, 4,745 ounces of silver, 5.4 tons of lead, some zinc, and minor quantities of arsenic, antimony, and copper. The 34,696 tons of copper concentrates milled at Matahambre contained an additional 122,477 ounces of silver, with no gold reported.

Tungsten.—The tungsten-concentrating plant of the Corporación Pan America de Tungsteno, S. A., 30 miles southwest of Nueva Gerono on the Isle of Pines, remained shut down throughout 1946 and was offered for sale. There is little likelihood that it will be operated in 1947.

NONMETALLIC MINERALS

Barite.—Since completion of a contract with the United States Commercial Company in 1945, production of barite by Mineral Products Corp. from its quarry at Amelia has been suspended.

Diamonds.—Cuba, which produces no diamonds, in 1946 experienced a sharp set-back in its war-born diamond-cutting industry. Started in 1942, the industry reached optimum development in 1945, with 52 factories employing 3,500 workers and producing a weekly average of 1,800 carats of cut and polished diamonds. By the end of 1946 the number of operating factories had been reduced to 13, employing approximately 600 workers who cut and polished a weekly average of 500 carats of diamonds. This decline was caused by re-

current wage conflicts and the abrupt drop in prices and demand in the New York luxury market during the second half of the year. Continued recession of the industry is expected in 1947.

Salt.—Salt production by the evaporation of sea water at Sagua la Grande, Las Villas, and Caimanera, Oriente, amounted to more than 100,000 tons annually in the prewar years but declined during the war to a low of 15,422 tons in 1944 because of distribution difficulties brought about by the scarcity and rationing of fuel and gas oil. Output in 1945 and 1946 progressed along the road to industrial recovery.

Other Nonmetallic Minerals.—Estimated production of cut marble rose from 1,000 cubic feet in 1945 to 6,350 cubic feet in 1946, while crushed rock for road building and construction increased in the same period from roughly 1,590,000 to 2,385,000 metric tons. The quantitative production of lime, sand, gravel, clay, and pigment earths is not reported, although the industries are active. Magnesite production has been dormant since 1944 and is not likely to revive in the near future.

HYDROCARBONS

Asphalt.—Reports of asphalt production in Cuba in past years have been difficult to interpret because of their failure to differentiate between types. Gilsonite [5] is chiefly exported, and two other less intensely metamorphosed types of asphalt were widely used as substitute fuel while war conditions imposed restrictions on fuel imports. The clarified statistics for 1946 indicate that the domestic use of asphalt for fuel has subsided greatly from the war years, and that gilsonite production was far below normal. Cía. Exploradora de Asfalto, S. A., engaged in a drilling program to determine total asphalt deposits in Mariel, Province of Pinar del Rio, but before the end of the year abandoned plans to manufacture asphalt products.

Petroleum.—Elimination of naphtha-distribution controls at the beginning of 1946, while strict rationing of gasoline sales was maintained until July 1, stimulated activity in the Motembo field in the first half of the year and resulted in a marked increase in the year's total production over that of 1945; but the output trend was abruptly downward during the last 6 months, and the field is believed to be approaching exhaustion.

The production trend of natural-gas oil from the Jarahueca field has been sharply upward since the field was opened October 16, 1943, with 3,825 barrels in 1943, 14,831 barrels in 1944, 87,600 barrels in 1945, and 200,200 barrels in 1946. Additional refining facilities are contemplated to meet an expected further increase in production in 1947.

Several large foreign oil companies have made and are making important geological and geophysical studies elsewhere in Cuba, and three of them have engaged in test drilling. Results have been encouraging, but not yet productive.

[5] The word "gilsonite" is here applied as a term accepted commercially to describe material that technically has been classified as grahamite.

DOMINICAN REPUBLIC

Gold.—Gold continued to be washed by hand methods in the Province of Seybo and elsewhere, without any big strikes having been reported. Nominal production amounted to only 646 ounces in 1946 (486 ounces in 1945) but will doubtless continue so long as the native people engaged in this type of mining can make a daily wage of 60 to 80 cents.

Bauxite.—About midyear the Alcoa Exploration Co. completed testing the Barahona bauxite concession obtained from the Government on April 2, 1945, and withdrew from the area. The company had until May 1947 to specify whether it desired to retain contractual rights, the exercise of which would involve construction of at least 15 miles of transportation facilities to the nearest coastal outlet. The Reynolds Metals Co. withdrew from similar exploration in 1944.

Gypsum.—The gypsum mines 25 miles north of Barahona, to which port they are connected by narrow-gage railway, were taken over on January 12 from the now-defunct Cía. Salinera Dominicana, C. por A., by the Banco Agrícola e Hipotecario, which will operate them under exclusive arrangements with the Government. Output of the mines rose from 3,258 metric tons in 1945 to a record 10,974 tons in 1946; the entire tonnage was exported.

Salt.—On January 12, 1946, the salt concession of Cía. Salinera Dominicana, C. por A., was taken over by the Banco Agrícola e Hipotecario. Production during the year was an estimated 2,590 tons from the Barahona mines and 13,160 tons from the evaporation of sea water—a total of approximately 15,750 tons compared with 15,100 tons in 1945.

Petroleum.—Cía. Seaboard de Petroleo, C. por A. (Standard Oil Co. of New Jersey), test-drilled in the Provinces of Barahona and Azua. The exploration program, started in June 1939, has yet to prove the presence of petroleum in commercial quantity.

HAITI

Gold.—Small-scale gold production continued to diminish from 432 troy ounces in 1942 to 73 ounces (United States imports from Haiti) in 1945 and only 41 ounces in 1946.

Bauxite.—The Reynolds Mining Co. failed to engage in active commercial exploitation of its bauxite deposits in the Ste. Croix area after August 4, as called for in its contract with the Haitian Government, but continued construction of an access road from its concession to the coast and conducted surveys for an aerial tramway and harbor facilities in the vicinity of Miragoane. During the year several hundred additional tons of bauxite were shipped to the United States for experimental work, but the inauguration of commercial exploitation has been postponed subject to whatever terms of extension time may be granted by the Haitian Government.

Building Material.—Quantitative production of the small local limestone and lime, construction-stone, and brick industries is not regularly reported.

Salt.—The amount of crude salt recovered from sea water was not reported for 1946 but is presumed to have been adequate to meet the usual local demand for about 8,000 metric tons annually.

Petroleum.—The Cul-de-Sac test well of the Atlantic Refining Co. reached a depth of approximately 6,500 feet by the end of the year without positive results.

NETHERLANDS WEST INDIES

Gold.—Gold was produced on a small scale on the island of Aruba from 1824 until the late 1920's, when the oil-refining industry absorbed all the cheap labor. Mining interest revived in 1945 when a Canadian group obtained concessions on favorable terms and formed Aruba Combined Goldfield, Ltd., capitalized at $5,000,000. The company started exploratory test drilling on September 15, 1946.

Phosphate.—Phosphate mining at Newport, Curaçao, which was suspended during the last half of 1945, apparently was revived vigorously in 1946, as exports of 73,594 tons were recorded compared with only 8,770 tons in 1945 and 7,813 tons in 1944.

Salt.—Shipments of marine salt from salinas on the islands of Bonaire, St. Martin, and St. Eustace, totaled 3,109 tons in 1945. Production of 2,017 tons in 1946 was from Bonaire only.

Petroleum.—Crude petroleum imported for treatment in the great refineries of Aruba and Curaçao amounted to a combined total of 206,505 thousand barrels in 1945 and 231,485 thousand barrels in 1946. Of the 1945 total 1,472 thousand barrels came from Colombia; the remainder in 1945 and all of the crude treated in 1946 was of Venezuelan origin. Refinery products derived from these crudes were exported in quantities amounting to 205,731 thousand barrels in 1945 and 225,324 thousand barrels in 1946. Aruba shipped 126,038 thousand barrels of the 1946 total and Curaçao 99,286 thousand barrels. Compared with 1945, imports of crude petroleum rose 12 percent in 1946 and exports of refinery products increased 10 percent.

MEXICO

Virtually all mines except copper were on strike during most of the first quarter of 1946, accounting for the substantial reduction in output of minerals other than fuels for the year, and comparison of the latter half of 1945 with the equivalent period in 1946 shows that the general trend of mining is definitely downward. Policies of taxation, labor, and social legislation are intimately interwoven with this trend. Some hope for improvement may be seen in the fact that during the year Mexican authorities rebated the export tax to one large mining company conditional upon the company using an equivalent sum for exploration, and the result was discovery of new ore bodies; it is too early, however, to interpret this incident as marking the beginning of a new policy.

Comparison of mineral production and exports in 1945 and 1946 is presented in the accompanying table.

Mineral production and exports of Mexico, 1945–46, in metric tons (unless otherwise indicated) [1]

Mineral	Production			Exports		
	1945	1946	Change, percent	1945	1946	Change, percent

[9] Crude, 15–20 percent sulfur.

METALS

Antimony.—While production of antimony in Mexico declined 25 percent in 1946 compared with the preceding year, that of Bolivia increased 26 percent, and Mexico relinquished again to Bolivia the position of world's largest producer, which it had held throughout 1944 and 1945. San Luis Potosí, Oaxaca, Querétaro, and Sonora were probably the largest producers in 1946, with Chicahuaxtla,

Oaxaca, the most important single district. Production in 1946 included 693 tons of refined and impure bars and an additional 5,879 tons of antimony in ores and concentrates.

Arsenic.—Production of white arsenic in 1946 followed the downward trend in lead-zinc ores, of which it is principally a byproduct. White arsenic is recovered by direct smelting at the San Luis Potosí plant of Cía. Minera Asarco, S. A. (American Smelting & Refining Co.), and also from its own flue dust. Arsenic is also recovered from flue dust at the Torreon, Coahuila, plant of Cía. Minera de Peñoles, S. A. (American Metal Co.). The largest producers of arsenical ores are the lead-zinc-silver mines of Santa María de la Paz y Anexas, S. A., at San Luis Potosí, and the lead-silver-gold mines shipping to Peñoles from Velardeña, Durango.

Bismuth.—The recovery of bismuth in impure bars at the Monterrey plant of American Smelting & Refining Co. is essential to the purification of lead, though hardly a profitable operation. Production in 1946, as measured by exports, followed the downward trend of refined lead; exports were to the United States.

Cadmium.—Mexico is second only to the United States in world production of cadmium. Official statistics show only that portion recovered in flue dust, while much of the metal refined in the United States is taken from Mexican zinc concentrates averaging close to 0.3 percent cadmium. The 38-percent decrease in calculated cadmium exports followed closely the 36-percent decrease in zinc exports from 1945 to 1946, but the 32-percent decrease in cadmium flue dust does not appear compatible with the decrease of only 14 percent in slab zinc production. The American Smelting & Refining Co. is the only producer of cadmium flue dust, which is shipped to its plant in Denver, Colo., for reduction to metal.

Copper.—Copper production was slightly less than in 1945, but was well upheld relative to most other metals because the strike that affected most mines during the first quarter was not applied against the Cananea Consolidated Copper Co., which operated Mexico's largest copper project at Cananea, Sonora, throughout the year. Of the total production, 52,371 tons were in refined and semi-refined forms. Heavy consumption and demand, accompanied by advancing prices in the latter half of the year and complete removal of price control on November 10, stimulated a sharp upward trend in production in the United States but failed to produce a similar reaction in Mexico, indicating something of the strength of economic factors other than demand and price as applied to Mexican mining. Some response to advanced prices, however, should be evidenced in 1947, particularly among such marginal enterprises as the Boleo mine at Santa Rosalia, Baja California.

A small electrolytic copper refinery in Mexico, D. F., built in 1946 by Cobre de Mexico, S. A., encountered certain technical and other difficulties and has not yet started production.

Gold and Silver.—Precious metal production, which has declined steadily since 1942, dropped proportionate to the 1946 drop in precious-metal ores and that part of base-metal ores which carried precious-metal values.

Mexico is second only to Colombia among Latin American gold producers. The Real del Monte silver-gold mine of Cía. de Real del

Monte y Pachuca, in Hidalgo, was the leading producer, as it has been for many years. The Government extended financial aid to the cooperative working the Dos Estrellas, La Esperanza, and El Oro gold mines at El Oro, Michoacán, and turned its problems over to the Comisión de Fomento Minero for possible solution; difficulties in this area may have an adverse effect on total production in 1947. The Moctezuma mine, Moctezuma, Sonora, was leased to Cía. Minerales de Nacozari, a new company which intends to install machinery to handle low-grade ore.

Despite the drop in silver output, Mexico's position as the world's largest producer was not threatened in 1946. The Real del Monte mine at Pachuca was still the country's largest single producer, but the greater part of total output came from base-metal ores. Several factors contribute to the notable observation that price fluctuations have had little or no effect on silver production: (1) Straight silver and gold-silver producers are working at plant capacities which cannot be expanded, regardless of price, without heavy expenditures that are not warranted under present economic conditions; (2) byproduct output of silver is influenced more by base-metal prices than by silver prices; (3) little or none of the benefits of increased silver prices accrue to the mine operators—they are absorbed by taxes and by advanced wages which fail, however, to follow price recessions. The straight-precious-metal producers are facing a serious labor problem, and many of them will be unable to continue operations if costs are further increased. The Dos Carlos cooperative silver-gold mine at Pachuca was saved, at least temporarily, only by financial aid from the Government; and the historic Guanajuato district is approaching abandonment, with large tonnages of low-grade ore, workable under more favorable conditions, remaining in the ground.

The Santo Domingo copper-silver-gold-lead mine at Pilares de Nacozari, Sonora, was leased to Haile Mines, Inc., of New York. Operations are expected to start in 1947.

Iron and Steel.—Iron-ore production, which has decreased somewhat since 1944, was chiefly limited in 1946 by the availability of metallurgical coke. Ample reserves of high-grade ore exist at Cerro de Mercado near Durango in eastern Chihuahua and elsewhere; preliminary investigations of Las Truchas deposits in Michoacán by Bethlehem Steel Co. were abandoned early in the year, and plans of others for opening La Perla and La Negra iron deposits in eastern Chihuahua are, for the time being, in abeyance.

An apparent discrepancy is presented in official figures which indicate a 1944–45 drop of 6 percent and a 1945–46 drop of 3 percent in iron-ore production compared with a 62-percent and a 29-percent rise in pig-iron production during the same periods. Output is from two blast furnaces of Cía. Fundidora de Fierro y Acero de Monterrey, S. A., at Monterrey and one of Altos Hornos de Mexico at Monclova, Coahuila.

Steel-making capacity falls far short of meeting the requirements of the country. Steel is produced by Cía. Fundidora and Altos Hornos, principally from pig smelted in their own furnaces, and by La Consolidada, S. A., from domestic and imported scrap with some additions of local pig iron. If a plan for increasing coal production in the Sabinas area materializes, it should relieve the extreme shortage

of coke and proportionately relieve the limitation on pig-iron and steel putput. The coke-making capacity of existing beehive ovens is ample to feed present smelting capacities. Steel remelt and processing capacity is expanding moderately: La Consolidada added a new furnace to its plant at Mexico City; Acero Nacionales, S. A., a new company, started construction of a new plant that will include rolling mills and two or more electric furnaces at Tlalnepantla, 10 miles northwest of Mexico City; and another new company, Fierro Comercial, S. A., has started construction of a small plant at Ciudad Juárez to make steel bars, angles, structural beams, and similar products.

Lead and Zinc.—Production of lead and zinc in Mexico failed to respond to the upward climb of prices throughout the second half of the year and the final removal of price controls in the United States on November 10. Delayed response is expected in 1947 when, barring shut-downs by labor disputes, the mines, mills, and smelters should be operating at full capacity. Of the 140,143 tons of lead produced in 1946, 137,742 tons represented refined and semirefined forms and 2,401 tons metal contained in ores and concentrates; of the 139,535 tons of zinc, 41,982 tons were refined slabs and 97,553 tons contained in ores and concentrates. Exports of lead to countries other than the United States increased during the year, with substantial quantities going to various European countries and limited quantities to Argentina, Brazil, and Uruguay.

An outstanding event of the year was the discovery of important lead-zinc-silver ore bodies in the adjacent Concha and San Antonio mines in the Taxco district, Guerrero, at a time when the Minas de Guerrero mine in the same district was approaching exhaustion. The American Smelting & Refining Co., owner of the San Antonio mine, later (1947) arranged with the owners of the Concha to operate the two properties as a unit and expects to erect a mill. This will considerably extend the life of the district. Cía. Minera de Guerrero, S. A. (Eagle-Picher Co.), expects to terminate operation of its Taxco mine in 1947 and transfer its flotation mill to the newly reopened Esmeralda silver-lead-zinc mine of Eagle-Picher de Mexico, S. A., in the Parral district of Chihuahua. Eagle-Picher de Mexico also plans to reopen the Corralitos lead-gold mine in Chihuahua, about 100 miles southwest of El Paso, Tex. The Fresnillo Co. optioned the Santa Marta mine in western Chihuahua and El Gashi mine, Sonora, and has started exploration work.

Manganese.—Of the scores of manganese deposits worked during the war, only those of the Lucifer and Gavilán mines in Baja California, the Talamantes district in Chihuahua, La Abundancia mines in Zacatecas, and Montaña de Manganeso mine in San Luis Potosí were operated in 1946. Demand for the metal has been reduced, and the decline in production has been drastic. The Lucifer mine of Metales Mexico continued to be the most important single producer. Its sintering plant was closed in 1946, and the company now sends unsintered ores to the United States. An airplane landing strip was built to serve the Gavilán mine of Cía. Mexicana de Manganeso (Homestake Mining Co.), but the company suffered a set-back in September when its mill and various buildings in the mine area were destroyed by a cyclone.

Mercury.—From the war peak of 32,443 flasks in 1942, mercury production in Mexico declined moderately for 2 years and quite abruptly in 1945–46. Output in 1946 represented only 36 percent of that in 1942. Sources have not been reported in 1946, but it is believed that the Huahuaxtla district of Guerrero was the principal supplier, with remaining production divided among the Sain Alto district in Zacatecas and scattered areas in Durango, San Luis Potosí, Guanajuato, and Jalisco. The general drop in demand and consequently in price and the reentry of Italy into the world market contributed largely to the production slump.

Molybdenum.—The 75-percent increase in the 1946 production of molybdenum concentrates reflects what was probably a comparable increase in Cananea Consolidated Copper Co.'s output of copper concentrates, of which molybdenite is a byproduct. For many years the copper ores of Cananea, Sonora, have yielded virtually all of the molybdenite produced in Mexico.

Tin.—Illegal local sales of tin have long been common practice in Mexico, and it has been variously estimated that officially reported production represents somewhere between 30 and 85 percent of actual production, probably toward the higher percentages. It is evident that a few more of the small producers in five States (Durango, Guanajuato, Jalisco, San Luis Potosí, and Zacatecas) turned out more metal in 1946 than in 1945, but production remains relatively unimportant.

Tungsten.—The tungsten mines were reported closed for the first 8 months of 1946, but operations started in October so actively that production for the latter half was up 190 percent over that of the latter half of 1945, although totals for the 2 complete years showed a 26-percent decrease. The areas that registered this activity have not been identified. Most of the ore was scheelite.

Vanadium.—No vanadium ores have been mined or processed in Mexico since 1941. Inadvertent production includes the small quantities contained in Mexican crude petroleum, an unknown portion of which is recovered in the United States from soot collected from the boilers and stacks of ships that burn Mexican fuel oil.

NONMETALLIC MINERALS

Fluorspar.—It has been learned that annual production of fluorspar (not officially reported) customarily exceeds exports by about 2,150 metric tons, with the following break-down of consumption:

	Metric tons
Cía. Fundidora de Fierro y Acero de Monterrey	1,000
La Consolidada	600
Altos Hornos de Mexico	500
Total for steel making	2,100
Industrial de San Bartolo, S. A. de C. V., for hydrofluoric acid	50
Total known use	2,150

Fluorspar deposits have been reported in 13 States, but the most important exploitation developments have been made in the northern district, comprising adjacent sections of Chihuahua and Durango, and the southern district, in the States of Mexico and Guerrero.

The abrupt drop in output in 1946 showed the effect of the shut-down of the Azul mine near Taxco, Guerrero, which during the war supplied about half of Mexico's total production.

Graphite.—Exports of amorphous graphite are believed to represent total Mexican production, which is limited to that of two companies, Sonora Graphite Co., S. A., and Cía. Minera de San José, S. A., operating in the Guaymas district, Sonora. Production was well-maintained in 1946 and doubtless would have equaled or exceeded that of 1945 but for the coal and steel strikes in the United States during the first quarter. A large volume of orders at improved prices was received by both companies during the last quarter, but the year closed with a temporary shortage of railway cars and an accumulation of stocks at the mines. Prospects for 1947 are very good.

Mica.—Large scale mica mining in Oaxaca—the only Mexican State that has produced—ceased in June 1945, but scattered areas continued a small and unrecorded production of larger sheets used principally in the local manufacture of electrical appliances, such as flatirons. Exports in 1946 represented mica believed to have been imported in bond from Canada and the United States for splitting and trimming in the shops of Leo Framery in Querétaro. The Cía. Mercantil de Oaxaca shop, which formerly did this kind of work, has been closed down.

Salt.—Although salt production unfortunately is not entered in officially published statistics, the industry is large and has recently been well-described in a published report [6] with an accompanying map showing 52 active salinas in 15 states.

Strontium.—The normal relaxation of demand for strontium following the close of the war depressed the 1946 output of celestite by Mexico's principal producer, the Providencia mine at Villa de La Paz, San Luis Potosí, though not yet to the extent that had been anticipated. There is no known use of the mineral within the Republic, and all exports were to the United States.

Sulfur.—Sulfur production figures, which have never been complete, were not reported for 1946. The most important producing center is the area of Cerritos, San Luis Potosí; the melted and semirefined product is now being delivered in carlots to the new sulfuric acid plant of Cía. Minera Asarco, S. A., at San Luis Potosí, the ultimate purpose of which is to utilize sulfur now wasted in the smelting of sulfide ores.

In the course of drilling for oil, sulfur deposits said to be similar to those in the great producing centers of Texas and Louisiana have been discovered in five principal salt domes lying within a 20-mile-radius of Jaltipan, Veracruz, on the Isthmus of Tehuantepec. Explorations continued throughout 1946, with plans for extensive development by the Frasch process still under consideration.

HYDROCARBONS

Coal.—The upward trend in coal production that started in 1945 gained some slight momentum in 1946 which, if uninterrupted, should bring 1947 output to or beyond the 1943 level of 1,025,326 metric

[6] Lozano Garciá, Raul, Estudio Tecnologico de la Industria de la Sal en Mexico: Universidad Nacional Autonoma de Mexico, Instituto de Geologia, Mexico D. F., 1946, 70 pp.

tons, but the shortage of supply is still extreme. The Sabinas field in Coahuila is the principal producer, and nearly 60 percent of the total output goes to the inadequate production of coke. A plan to open a large new mine in the Sabinas area is being considered.

Petroleum.[7]—Production of crude petroleum, which has been accelerating in an upward climb that started in 1943, reached its highest level since 1928 in 1946. This apparent reflection of a healthy condition of the industry, however, may be misleading, as production in the near future probably will be downward if new fields are not discovered. Petróleos Mexicanos, the Government oil monopoly, was afflicted by disorganization and repeated strikes and shut-downs during most of 1946, but the outlook has greatly improved with the drastic reorganization that immediately followed inauguration of the new national administration on December 1.[8] Under a new director, Pemex is undertaking an extensive program of exploration and plans to sink a large number of wildcat and development wells in 1947, partly by contract with experienced American drillers.

BRITISH HONDURAS

Production of limestone from Government-owned quarries—the only known mineral industry in British Honduras—has been estimated at 31,000 metric tons in 1946 (25,400 cubic yards, valued at $38,100), compared with 29,000 tons in 1945 and 43,800 tons in 1944.

COSTA RICA

Gold and Silver.—As measured by United States imports from Costa Rica, production of precious metal concentrates and bullion dropped 59 percent in gold content—from 3,054 troy ounces in 1945 to 1,251 ounces in 1946—and 56 percent in silver content—from 1,380 ounces in 1945 to 604 ounces in 1946. The decline has been continuous in gold since 1941, in silver since 1944. A small part of the production originated in the placer operations of the Osa Peninsula, opposite Golfito, where plans of one group to start dredging have not yet materialized.

Panaminas, Inc., found no economically exploitable ore in its examination of the Albangares mining properties, and it abandoned exploration in February 1946.

The New York & Honduras Rosario Mining Co. continued development of the Union de Aguacate mine and operation of a small cyanide plant throughout 1946. Most of the year's total production is believed to have originated from this source. Two of the company's options expire in early 1947 and one in November; renewal will depend on results of development and legal negotiations.

Nonmetallic Minerals.—Pacific coastal salinas in the Provinces of Puntarenas and Guanacaste yielded 8,000 metric tons of salt in 1946, compared to 6,033 tons in 1945. Substantial but unknown quantities of limestone were quarried for use in building and calcined for use as whitewash, mortar, and fertilizer. A discussion of building-stone potentialities was published during the year.[9] Kieselguhr

[7] For further details see The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 85–97.
[8] World Petroleum, Mexican Oil Situation Helped by Settlement of Labor Issue: Vol. 18, No. 8, August 1947, pp. 58–60.
[9] Bureau of Mines, Mineral Trade Notes: Vol. 23, No. 4, October 1946, pp. 18–19.

(diatomite) is found in a number of rich deposits and is extracted in small quantities by various operators for sale to sugar refineries and to manufacturers of electrical equipment. Production has been estimated at 50 tons in 1945, 5 tons in 1946. Sulfur deposits on the slopes of the Poas volcano are worked sporadically by rudimentary methods, but production is not on a commercial scale.

Petroleum.—No active petroleum exploration or exploitation was undertaken in Costa Rica in 1946, but several international firms approached the Government in regard to concessions. The interest shown has resulted in Congressional consideration of a basic petroleum law, the text of which was prepared by a commission of three engineers and presented to the Congress by the Ministerio de Fomento on September 1. Conclusive action by the Congress had not been taken by the close of the year.

EL SALVADOR

Gold and Silver.—Gold production as measured by exports, which decreased rapidly from 50,425 ounces in 1940 to only 16,526 ounces in 1945, reversed the trend and recovered to 21,798 ounces in 1946. Output of silver, also as measured by exports, rose from 223,705 ounces in 1945 to 313,180 ounces in 1946. The ratio of gold to silver has been erratic over the years, however, and the fluctuations in metal output do not necessarily reflect comparable variations in tonnages of ore mined.

All the gold and silver shipped in 1946 was the product of four operating mines: El Hormiguero mine of Comacaran Gold Mining Co.; Montecristo mine of Minas Montecristo, S. A.; Potosi mine of Cía. Minera de Oriente, S. A.; and San Sebastian mine of Butters Salvador Mines, Ltd. Ores of the Butters Salvador company contain small but unreported quantities of copper. This company is said to be in liquidation but has announced plans for extensive exploration work in 1947. Mineral Los Encuentros closed its properties sometime since 1944.

The New York and El Salvador Mining Co., Inc., a new subsidiary of the New York & Honduras Rosario Mining Co., engaged in favorable development of El Dorado mine near San Isidro. Construction of a mill with a capacity for 150 tons of gold-silver ore daily was started; and production is anticipated by the end of 1947, contingent upon delivery of equipment that has been ordered.

Lead and Zinc.—René Keilhauer, a French citizen, engaged in exploration and development of lead-zinc ores at the San Juan mine near the town of Metapan.

Other Minerals.—A number of small potteries, using native clays, produced an estimated 150 tons of clay products in 1946. No information has been received relative to other industrial mineral or mining activities during the year. Lime was being produced at the rate of 4,875 tons in 1944. Quarrying of ornamental stone has not been reported since 1941, nor have figures on salt production been received since 1944, when 1,894 tons were recovered from sea water.

GUATEMALA

METALS

Chromite.—Mine production of chromite in the Department of Jalapa is believed to have been approximately 600 tons of ore containing 300 tons of chrome oxide in 1946, compared to 442 tons of ore containing 211 tons of chrome oxide in 1945. All of the ore was stocked, and exports amounted to little or nothing during the year.

Gold.—Activity of individuals in panning alluvial gold dwindled toward the vanishing point during the past 5 years. The United States imported only 66 ounces of gold from Guatemala in 1945 and 36 ounces in 1946. During the last 3 years of dredging operations, gold production declined from 5,058 ounces in 1939 to 2,560 ounces in 1941.

Iron.—Iron ore for use in the Guatemala City cement plant is mined from a deposit near Zacapa at a rate of approximately 150 tons a month.

Lead and Zinc.—Lead smelting in small local furnaces from ore extracted in the vicinity of Huehuetenango usually yields 100 to 150 tons of lead metal a year, for domestic use only. Output was reported to be 115 tons in 1945 and 131 tons in 1946. Some interest was shown in lead and zinc mining in 1946; one well-known American firm established a local office, carried out prospecting operations, and requested development concessions, although actual production was not initiated.

NONMETALLIC MINERALS

Mica.—Mica mining in the Departments of Quiché and Baja Verapaz, while too small to be significant, appears to have overcome its 1944 slump of 468 kilograms and to be heading in the direction of its 1943 war peak of 5,356 kilograms. As measured by United States imports from Guatemala, production amounted to 1,156 kilograms (2,549 pounds) in 1945 and 3,689 kilograms (8,133 pounds) in 1946.

Salt.—The two methods of producing salt in Guatemala are solar evaporation of sea water and the boiling of coastal marine earths. Quantitative output has not been reported since 1944, when about 12,600 tons of salt annually was meeting the total needs of the country. The industry is regulated by an Inspector General of Salt Mines, under the Department of Agriculture.

Other Nonmetallic Minerals.—About 10 tons of crude sulfur are produced annually from numerous volcanic craters, and a small mineral pigments mill operating near San Juan Sacatépequez grinds unreported quantities of ocher, gray and blue-green earth, and "lignite powder"—probably a black oxide of iron.

HYDROCARBONS

Petroleum.—The draft of a new petroleum law, to replace the inadequate Ley de Hidrocarburos of 1933, was presented to the Congress in December 1946. Until this or a similar law is adopted, no action

is expected on several applications for concessions that were filed during the year, including one by a major United States oil company. Guatemalan areas showing favorable indications of potential petroleum production are in the Departments of Izabel, Alta Verapaz, and the Petán.

HONDURAS

Gold and Silver.—Of the 12,833 ounces of gold produced in Honduras in 1946, 12,095 ounces in doré bullion was derived from 202,225 tons of ore taken from the San Juancito mine by the New York & Honduras Rosario Mining Co., and 739 ounces in gold bullion was the product of individually mined placers. The total was 25 percent less than the 17,078 ounces recovered in 1945.

The same mine of the Rosario company dropped 11 percent in its output of silver in doré bullion. The 2,682,910 ounces in 1946 and 3,003,495 ounces in 1945 represented the total production of Honduras.

Exports in 1946 included a sample shipment of gold concentrates from the Agua Fria Mining Co., which started development operations after 3 years of inactivity and expects to resume production in 1947.

The Rosario company actively developed its newly acquired gold-silver mines at Yuscaran, Department of El Paraiso, and expects to be so engaged throughout 1947. Similar activity at its El Mochito silver-lead property, Department of Santa Barbara, was retarded by the lack of essential electrical and other supplies, which will not be obtainable before October 1947. Lack of equipment has also impeded systematic exploration of El Transito gold property near the Bay of Fonseca, Department of El Valle, which the company holds jointly with the American Smelting & Refining Co. Panaminas, Inc. (a subsidiary of Ventures, Ltd.), engaged in development work on a gold deposit in the Department of Comayagua.

The Pan American Mining & Development Co., after considerable work, abandoned its placer mining at El Viajao, Department of Olancho, and at least one other new company's explorations proved unsuccessful.

Antimony.—Commercial production of antimony was suspended in Honduras in 1945 with the closing of El Quetzal mine, Department of Copan. The reported production of 10 metric tons of antimony in 1946 represents metal contained in a sample shipment of 15 tons of ore assayed at 64.95 percent antimony from a claim near La Union, Department of Olancho, which, because of isolated location and lack of capital, probably will not be developed, at least for some time.

Iron.—The American steel company interested in iron ore deposits in the Departments of Yoro, Atlántida, and Comayagua—and particularly those at Agalteca, Department of Francisco Morazan—continued exploration throughout 1946 but found that transportation costs within Honduras did not favor further development.

Salt.—Recovery of salt by the evaporation of sea water, for domestic use only, amounted to 3,400 tons in 1942, 2,500 tons in 1943, and 2,700 tons in 1944. No explanation has been offered for the appreciable drop to 900 tons in 1945 and 850 tons in 1946.

Petroleum.—Several new contracts for petroleum exploration—all in eastern Honduras—were granted during the year.

NICARAGUA

Gold and Silver.—Exports of precious metals to the United States amounted to 206,389 ounces of gold and 223,308 ounces of silver in 1946, compared with 207,427 ounces of gold and 234,379 ounces of silver in 1945, showing declines of 0.5 and 4.7 percent, respectively.

Output by mines in 1946, in troy ounces, was as follows:

Company	Mine	Location	Gold	Silver
La Luz Mines, Ltd	La Luz	Siuna, Zelaya	60,351	39,464
Neptune Gold Mining Co	Neptune	Bonanza, Zelaya	55,918	85,908
Empressa Minera de Nicaragua	El Limon	Larreynaga, Leon	28,839	2,957
Cía. Minera de La India	La India	Santa Rosita, Leon	31,818	44,662

Salt.—Salinas on the west coast have been recovering about 6,000 tons of salt annually from sea water for several years, but exact figures are not available. The supply is not equal to domestic demand and is supplemented by imports.

Petroleum.—The American International Petroleum & Refining Co. continued seismographic exploration initiated in 1945. Results have not been announced.

Other Minerals.—Production reported only as insignificant includes copper, lead, and zinc in gold-silver concentrates, gypsum, lime, and sulfur.

PANAMA

Manganese.—Interest in possible renewal of manganese production has been noted in the grant of a concession in the hills near Nombre de Diós on the Atlantic coast, Province of Colón, exploration of which may be undertaken in 1947. The total production of manganese by Panama to date is 21,651 metric tons mined during the last 3 years of World War I (1916–18).

Salt.—Salt has been the only mineral produced in Panama since 1943. The Banco Agro-Pecuario e Industrial controls the industry and establishes annual quotas, under which system output of various salinas amounted to approximately 10,000 metric tons in 1944, 2,437 tons in 1945, and 7,958 tons in 1946. Recovery from sea water is expected to be limited in 1947 to about half that of 1946, or 4,000 tons.

Hydrocarbons.—A contract was signed in September 1946 between the Panamanian Government and American oil interests for the exploration of potential petroleum deposits within the Republic.

SOUTH AMERICA

ARGENTINA

The new regime of President Juan D. Perón, although not inaugurated until June 1946, exercised a powerful influence on the affairs of the country throughout the year. A multiplicity of Government measures in 1946 shaped a new economic policy for Argentina leading toward the adoption of a Five-Year Plan (1947–51) involving substantial increase in Government control over the domestic economy. The plan embodies 27 bills gaged to vast economic and social development and setting goals for 1951 that include a 43-percent increase over 1943 in the value of goods processed, a 52-percent increase in wages, a 34-percent increase in employment, a 50-percent increase in motive power installed, improvement and expansion of railway facilities to connect major and projected industrial, mineral, and agricultural areas and new centers of population, and the improvement of river transportation and port facilities. The policy of the Government is to own and operate all essential public services that are national in their scope; ownership of the railroads and most of the gas services and internal telecommunication systems has already been obtained.

Government reorganization included the centralization of all statistical services under the newly created National Administration of Census, Research, and Statistics, which suspended the issuance of basic statistics relating to trade and industrial development, with the exception of the petroleum industry. Information covering operation of the minerals industries since 1942 is spotty and incomplete, and a comprehensive review of 1946 cannot be presented. Nothing is known of developments in arsenic, antimony, bismuth, chromite, columbite-tantalite, copper, gold and silver, vanadium, zinc, or any of the nonmetallic minerals. The June 1946 issue of Industria Minería (Argentine Chamber of Minerals) made the following observations on tungsten, mica, beryl, and lead:

> Export minerals, especially wolfram, mica and beryl are still governed by a series of factors which are not dependent upon demand, since requests for export permits for beryl and wolfram run into a number of difficulties in the offices dealing with those minerals, which paralyze all export possibilities. The latest requests presented for the export of wolfram have not been granted the benefits of preferential exchange, while beryl has no official privileges which permit its export, all of which obviously causes unrest and uncertainty in market operations.
>
> In reality there is interest as regards the export of wolfram and beryl and although the former has undergone a long period of quiet due possibly to the large reserves in the possession of purchaser countries, we hope that a new demand for this mineral will be forthcoming as these supplies are slowly used up. Beryl, on the other hand, can be placed at once but it is not possible to obtain official export facilities in spite of the continued efforts made by the Chamber to this end.
>
> According to the latest information, the time is not far distant when there will be official measures to bolster lead prices. This will increase the present market value of lead and thus, at prices which take into consideration mining costs, transport, etc., the exploitation of this mineral could be more rational and more intense.
>
> The government has recently made purchase agreements for lead with Peru and overtures are being made to do the same with Bolivia in spite of the fact that it is well known that there are large quantities in this country.

The most significant event in the metallurgical industry was approval of the Argentine Steel-Making Plan providing for expansion of present iron- and steel-making facilities (which produced about

120,000 metric tons in 1946) to an annual capacity of 315,000 tons, utilizing iron ore from Cerro de Zapla and Puesto Niejo in the Province of Jujuy. (Maximum iron-ore production last reported was 3,750 tons in 1941.) Initial capitalization of the new Argentine Mixed Steel Corp. is to be 90 percent by the Government and 10 percent by private shareholders, with private shareholders privileged to acquire up to 40 percent after the first year of operation.

Refined-lead production dropped 24 percent from 21,159 tons in 1945 to 16,190 tons in 1946—the lowest since 1940—of which 15,225 tons was derived from domestic and 965 tons from Bolivian concentrates. Other metallurgical operations resulted in the estimated 1946 production of 850 tons of tin and 1,814 tons of electrolytic zinc, both representing substantial increases over 1945 and the war years.

Production of solid mineral fuel, comprising approximately 98,600 tons of asphaltite and 9,000 tons of lignite in 1944, has not been reported since. The solid-fuel situation for Argentina was greatly improved in 1946, however, when 1,146,415 tons of coal and coke were made available through imports, compared with 798,875 tons in 1945.

Crude-petroleum production in 1946 was 20,603,729 barrels,[10] the lowest since 1939; a shortage of drilling and pumping equipment probably will not permit reversal of the downward trend before 1948. Since the end of the war, consumption—and consequently imports—have increased. The petroleum section of the Five-Year Plan proposes to produce enough petroleum in Argentina to provide for the needs of the country, as well as to maintain adequate reserves both above and below ground.[11] Provision is made for an extensive program of increasing refinery capacity and for the renewal of extracting equipment for the existing fields. It may be expected, however, that Argentina will have to depend rather heavily on imports for some years to come.

BOLIVIA

General.—The total value of reported mineral exports from Bolivia, exclusive of petroleum and petroleum products, declined 11 percent in 1946 to US$65,460,138, compared with US$73,861,581 in 1945. Production of mercury, asbestos, and fluorspar ceased before the beginning of 1946, and both value and quantity decreased during the year of all products except antimony, columbite, copper, cement, and petroleum refinery products. Columbite was produced for the first time in Bolivia in 1945.

The general decrease in production reflects the many labor difficulties that faced the mining industry in 1946; a series of serious strikes with many threats of violence not only hampered operations but caused many foreign technical personnel to leave the country. The revolution of July 21 and the days of mourning for ex-President Villarroel also contributed to production losses, while increased labor costs and the steadily declining metallic content of most ores forced complete closure or drastic curtailment of operations of many of the smaller and some of the larger mines. The 30- to 50-percent increases

[10] For additional details of production see The Oil Weekly, 1947 World Atlas, June 30, 1947, pp. 137–147.

[1] Exclusive of bismuth and gold, for which export figures are not believed to be indicative of production; and of clay, lime, salt, and stone, which are produced for domestic use in quantities not reported.
[2] United States imports from Bolivia.
[3] Over 500 percent.

in wages won by labor were partly offset by the increase in cost of living as measured by the official index, and continued labor troubles are anticipated throughout 1947.

METALS

Antimony.—A guaranteed price offered by Banco Minero throughout 1946 supported antimony mining, which was accelerated during the last quarter enough to push the total year's output ahead of the 1945 figure but short of the 7,448 tons exported in 1944.

Bismuth.—As pointed out in this chapter last year, exports of bismuth in concentrates ordinarily reflect production but are not believed to have done so since 1943, when the purchase agreement with the United States Commercial Company was terminated. Exports of bismuth in concentrates, amounting to 12,419 kilograms in 1943, virtually ceased for a time while concentrates separated as a byproduct of tin mining accumulated in the country. Exports, in kilograms of contained bismuth, actually amounted to 605 in 1944, 15,337 in 1945, and 27,867 in 1946. If this represents a cumulative production approximating 43,809 kilograms over the 3-year period, it seems reasonable to suppose that the distribution of production, paralleling that of tin, may have been somewhat of the order of 14,300 kilograms in 1944, 15,600 in 1945, and 13,900 in 1946.

Columbite.—It has now been learned that the Bolivian Development Corp. in 1945 actually did reopen the La Verde mine, near Santa Cruz—formerly worked for mica— and produced columbite amounting to 469 kilograms, as measured by United States general imports. With the initial work completed, output jumped to some importance in 1946, with 3,116 kilograms reported officially, and the outlook for the next few years appears favorable.

Copper.—The Corocoro mine of the American Smelting & Refining Co., the Pulacayo mine of Cía. Minera Huanchaca de Bolivia, the Animas mine of Cía. Aramayo de Minas en Bolivia, and various small properties combined to maintain copper production at the virtually constant level of the previous 6 years. The Corocoro mine contributed by far the largest portion of the total.

Lead and Zinc.—The anticipated continuation of the 1945 upward trend in lead and zinc was deflected downward in 1946 by labor troubles. Cía. Huanchaca de Bolivia contributed the major part of the production of both metals. Nothing more has been heard of plans, discussed in 1945, for construction of a lead smelter in southern Bolivia. Most of the lead concentrates, as in the past, were shipped to Argentina for smelting.

Precious Metals.—Gold exports in 1946 amounted to 2,853 ounces, compared with a figure for 1945 reported last year as 28,901 ounces, but since changed without explanation to 3,180 ounces. With unknown quantities retained within and possibly smuggled out of Bolivia, production cannot be estimated. Early in the year, in a new attempt to increase the purchase of gold by Banco Central and Banco Minero and to stop contraband sales to neighboring countries, the Government published a decree prohibiting the sale and transfer of gold between private persons and entities and imposing heavy penalties for violators. Efforts of two companies to gain new contracts for the exploitation of gold in the Tipuasi-Rio Kaka region, to replace contracts abrogated in 1944, were unsuccessful, but will probably be renewed in 1947.

Silver production followed the downward trend of the base-metal concentrates from which it is derived as a byproduct.

Tin.—Patiño's new sink-and-float plant for the Llallagua mine at Catavi attained successful operation, but Cía. Minera Unificada del Cerro de Potosi (Hochschild) announced its intention to abandon its Tainton-process plant as a failure.

Experimental runs were started in midyear at a new tin smelter owned by Mariano Peró, near Oruro. Eventual planned output is 200 tons of 98-percent tin per month, but the lack of coal is regarded as one serious obstacle to realization.

The contract signed with Bolivian independent producers in September 1945 established a price of \$0.60½ per pound of tin delivered in the first quarter of 1946 and \$0.58½ per pound in the second quarter, at the end of which the contract expired. A new contract covering the latter half of the year was signed August 14, 1946, setting a base price of \$0.62½ per pound and making that price effective retroactively to January 1, 1946. During the last quarter, conversations started between representatives of the Bolivian and Argentine Governments that later (1947) led to a contract for delivery of 8,000 tons of tin to Argentina in 1947 and established a 1947 price of \$0.76 per pound.

The outstanding operational development in Bolivian tin mining during 1946 was the spread of resistance of operators to high costs and what they consider unreasonable labor and social laws by closing down, discharging the workers, and then rehiring them on a purely contractual basis. Strong opposition to this system, which relieves

the companies of compliance with many social laws relating to hours, wages, housing, and medical attention, is expected from the Federation of Mine Workers in 1947, when an effort to outlaw the practice is anticipated. Included among the mines that have followed or initiated this procedure are the Huanuni mine of the Bolivian Tin & Tungsten Corp. and the Oploca mine of Cía. Minera y Agricola Oploca de Bolivia (Patiño group), and the San José mine of Cía. Minera de Oruro (Hochschild group), all large producers. The interruption of operation of these mines, of Patiño's Catavia mine, and of the Santa Fé mine contributed to the over-all decline in 1946 tin production. Several other mines that threatened to close were kept open by Government grants of compromise concessions relating to specified tax exemptions and special foreign exchange privileges.

Tungsten.—The downward trend in tungsten-ore production that started in July 1944 continued through 1946 with total exports lower than in any year since 1937. The Caracoles-Tazna mine of Cía. Aramayo de Minas en Bolivia was the most important source of ore. The Banco Minero attempted to stimulate production by purchasing all wolframite offered to it and waiving export taxes.

NONMETALLIC MINERALS

Production of fluorspar was initiated and suspended between the beginning and close of 1945. Asbestos exports, never important in Bolivia, ceased during 1946 but may be expected to be resumed in 1947 to fill commitments to Argentina, provided the Argentine-Bolivian agreement on economic, financial, and cultural cooperation, signed March 26, 1947, is ratified. Ratification of this agreement should also reverse the 3-year downward trend in the production of sulfur, which in 1946 reached its lowest point in at least 14 years.

HYDROCARBONS

Petroleum.—Although Yaciementos Petrólifera Fiscales Bolivina, the State petroleum monopoly, made very slight progress in the development of the Camiri and Sanandita oil fields in 1946, it was more than offset by the reduced output of the Bermejo field.

All of the crude produced at Bermejo and a large part of the fuel oil from the Sanandita refinery were sold to Argentina. Most of the remaining refinery products were sold locally, while the needs of the larger consuming centers of the Andean highlands, such as La Paz, Cochabamba, and Oruro, were largely supplied by imports from Peru.[12]

BRAZIL

Reports of 1946 mineral production in Brazil are spotty. As in past years, production is accepted as being fairly well indicated by exports of those items for which there is relatively little or no market within the country. Statistics for 1945 having been unavailable at the time of last year's review, the accompanying table presents a comparison of 1944 and 1945, with such preliminary 1946 figures as have been reported.

[12] See The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 151–153.

The year 1946 was one of transition in the sense that the mining industry as a whole returned largely to established commercial trade channels in replacement of the government purchasing programs of the war period, and European markets again became a trade factor.

Brazilian producers, however, were still handicapped by Government control of export prices and permits, which complicated and retarded trade.

Outstanding development of 1946 was the promulgation of the new Brazilian Constitution [13] and the provision which permits the entry of foreign capital into the country, as a Brazilian corporation, to participate in all types of mining activities. This liberalization is a reversal of the nationalistic 1937 constitution, which denied such rights to anyone other than native-born Brazilians. Exercise of like privileges to foreign capital in exploration for petroleum must await adoption of a new petroleum law, the drafting of which was unfinished by mid-1947.

METALS

Aluminum.—The Ouro Preto plant of Eletro-Quimica Brazileira closed down without remotely approaching its announced anticipated capacity of 2,500 tons of aluminum ingots a year. The company is said to have been unable to reduce its costs to a level at which it could compete with imported metal.

Beryl, Tantalite, and Columbite.—Mining of these three minerals, which generally occur together, was resumed in 1946 following more than a year's shut-down that had resulted from Government regulation of exports. Shipments of beryl were good but not up to the earlier war years. Tantalite shipments were up relative to 1945, but not proportionately to those of beryl. Prices were not conducive to larger sales. Columbite was exported for the first time since 1942.

Chromite.—At midyear Chromita do Brazil S. A. was producing about 300 tons of chromite ore a month from its mine in Bahia. This rate was more than twice that of 1945.

Chromium Mineração, S. A., discontinued shipment of ore from its Piuhy (Minas Gerais) property. Freight rates, plus the difficulty and expense of raising its substantial reserve of 35-percent ore to 45-percent Cr grade by sorting, has made continued operation unprofitable. Ore samples have been sent to the United States for experimentation on a suitable process for concentration.

Gold, Silver, and Arsenic.—The St. John del Rey Mining Co. is still the leading gold-mining company in Brazil, but since enactment of the law of June 19, 1945, revoking the obligation to sell all gold to the Banco do Brazil, total Brazilian production is difficult to obtain. Break-down of 1945 output shows 147,270 ounces from St. John del Rey, 12,386 ounces from Cia. Minas de Passagem, 2,139 ounces from Cia. Brazileira de Mineração, S. A., 1,311 ounces from Minas Leão Jr., Limitada, and an estimated 49,094 ounces (23 percent of the total) from some 50,000 individuals engaged in placer panning. In 1946, still unreported quantitatively, the industry suffered somewhat from increased costs against controlled sales value. Placer production represented an estimated 20 percent of the total. It seems reasonable to expect that production at about the 1946 rate will continue for some years to come.

[13] An English translation of the old Brazilian Mining Code of 1940 and Amendments is available free on request to the Bureau of Mines, Foreign Minerals Branch, Washington 25, D. C. At the close of 1946 a new code was being drafted to conform with the new constitution.

As byproducts of gold-arsenopyrite ores in Minas Gerais, silver and arsenic are presumed to have been produced in slightly less quantities than in 1945.

Iron and Steel.—Iron-ore production has been estimated for the year 1946 at 1,000,000 tons, indicating a substantial increase over the estimated 716,000 tons mined in 1945 and suggesting an abundance of stocks accumulated at the new Volta Redunda plant of Cia. Siderúrgica National (National Steel) and at charcoal furnaces. The signing of an agreement on April 26, 1946, between the Hanna Exploration Co. and the government of the Territory of Amapá marked the first attempt of a foreign company to undertake mining in Brazil under the terms of the new constitution of the Dutra government. Preliminary drilling indicated that the hematite ore bodies may not be as extensive as originally hoped.

A new 50-ton-per-day charcoal-iron blast furnace near Corumba, Mato Grosso, was added to the 25 previously in operation, to supply the São Paulo market. Belgo-Mineira Co. continued in heavy activity, and Cia. Ferro Aço of Victoria started expansion of its facilities; the total output of pig iron rose 40 percent.

Construction of the Volta Redonda iron and steel plant of Cía. Siderúrgica Nacional is nearly complete. On February 20 the coke ovens were lighted; on June 9 the first blast furnace was blown in, pouring pig iron 2 days later; on June 25 the first steel was produced; and on October 12 the plant opened its rail-rolling and shapes unit and began operating at a rate of approximately 500 tons a day, or about half of the designed capacity. The most serious operational problem is the procurement of coal in quantities and quality adequate for the new plant, as coal production in southern Brazil has not reached expectations. Volta Redonda has depended almost entirely on coal imports from the United States and probably will continue to do so for some time.

Considerable progress was reported toward completion of a specialized steel plant of Cía. de Aços Especiais Itabira near Coronel Fabriciana, Minas Gerais, which is expected to supplement the production of Volta Redonda by specializing in the output of complex alloy steels.

Lead.—New equipment was installed late in 1946 at the Ribeira plant of Cía. Plumbum, S. A., the only producer of refined lead during the year, in the hope of increasing output by a large margin. Production amounting to only 25 tons in 1945 may have reached 1,500 tons during 1946.

Manganese.—Manganese production in 1946 has not been reported quantitatively but is said to have declined in respect to 1945 principally because of increased freight rates and poor transportation facilities. New management acquired control of the Minas da Bahia and announced that it was equipping the mine for immediate production. The Hanna Exploration Co. started examination of a new and important discovery of several million tons of manganese ore, reportedly of shipping grade, on the Amaperi River, Territory of Amapá.

Tin.—Minas de Estanho de São João d'El-Rei has proposed construction of a gravity-concentration plant with a capacity of 100–125 tons a day of ore containing cassiterite. This represents the first

known attempt to mine lode tin ore in Minas Gerais, although alluvial deposits have yielded cassiterite from which more than 300 metric tons of metallic tin a year have been refined.

Titanium.—No reports have been received on the production of titanium ore in 1946. No ilmenite was exported, but some was doubtless separated from beach sands and stocked for future sale. Representatives of several American organizations made a survey during 1946 of beach sands of Esperito Santo, with a view toward development of an improved process for the recovery of ilmenite with monazite and zircon as byproducts.

The 28 tons of rutile shipped may have been from stocks mined in 1945, and probably were washed from alluvial deposits of central Goiaz.

Tungsten.—Diminished 1946 production of tungsten ore, as measured by exports, reflects the postwar reduction in price. Output of scheelite from northeastern Brazil and wolframite from the Irhandjara mine in São Paulo is expected to continue at about the 1946 level of roughly 1,600 tons of 60-percent WO_3 (equivalent) concentrate, unless altered by a price change or stimulated by foreign aid in mining and milling.

Zirconium.—A single large shipment to Norway boosted 1946 exports of zirconium concentrates to the highest tonnage since 1943. Production is from São Paulo, Minas Gerais, and is a byproduct from the monazite-ilmenite beach sands of Espirito Santo.

NONMETALLIC MINERALS

Barite.—Cía. Pigmentos Minerais Industrial e Comercial, S. A., completed installation of mining, milling, and dock facilities on Camamú Island, Bahia, and initiated operation of its barite grinding and bagging mill on January 22, 1946. First shipment was made in April, and sales to the Caribbean oil fields' market were well-sustained throughout the remainder of the year. Total output reached probably 20,000 tons.

Diamonds.—Diamond production has been estimated at 325,000 carats in 1946 and 275,000 carats in 1945. Exports in 1946, compared parenthetically with 1945, amounted to 113,815 (39,355) carats of rough gem stones, 12,645 (49,010) carats of cut gems, and 9,070 (3,960) carats of carbonados, giving totals of 135,530 (92,325) carats of diamonds. Exports bear no constant relation to production. The estimated 1946 production increase is in part based on discovery in the State of Piauhy, in April, of new alluvial deposits, which were worked intensively for several months but largely abandoned before the end of the year.

The number of people employed by diamond cutters in Brazil declined from a peak of about 3,000 to only 1,500 in 1946, reportedly because of the shortage of rough stones for cutting, and some of the cutters returned to Europe.

Graphite.—Graphite is mined by Cía. National de Grafite, Ltda., near Itapecerica, Minas Gerais. The indicated production in 1944 was about 800 tons of concentrates. Graphite exports—not indicative of production—amounted to 199 tons in 1944, 131 tons in 1945, and 92 tons in 1946.

Marble.—About 17,000 tons of marble are produced annually from

8 States, principally Minas Gerais, Rio de Janeiro, Santa Catarina, and São Paulo.

Mica.—The total 1946 increase in mica exports was not in line with the downward trend toward the end of the year. Production in 1947 may be expected to find a level lower than 1946 but possibly somewhat higher than that of prewar years. No new prospecting or development was done; and, in general, mica mining has reverted to its traditional unorganized methods.

Monazite.—Monazite was favored by good demand in 1946, and exports of sand from the beaches of Espirito Santo were up 21 percent in respect to 1945.

Phosphate.—Although present production of phosphate is not known, output from the Ipanema and Jacupirana (São Paulo) apatite deposits by Serrana S. A. de Mineração was reported to be increasing slightly from the 5,216-ton level of 1944. Production is far below fertilizer requirements but can hardly be improved substantially without the introduction of more efficient and larger-scale methods of ore treatment.

Quartz Crystal.—The continued postwar slump in demand for quartz crystal resulted in 1946 exports amounting to less than a fourth of 1945 shipments. Export volume in 1947 is not expected to exceed 10 or 12 tons a month.

Semiprecious Stones.—Compared with 1945, exports of semiprecious stones were up in quantity but down in value. While the European market again became a trade factor, purchase interest in the United States became dull, except for rare stones of good quality, and Brazilian production exceeded demand.

HYDROCARBONS

Coal.—Production of cleaned coal available for market in 1946 has been estimated at 676,000 tons from Rio Grande do Sul, 474,248 tons from Santa Catarina, 70,000 tons from Parana, and 5,000 tons from São Paulo. The 1,225,248-ton total was 18 percent less than that for 1945; an appreciable increase from Santa Catarina was more than offset by the decrease from Rio Grande do Sul resulting from operational difficulties and protracted labor disputes. In an attempt to improve production generally, the Government by decree placed distribution of all Brazilian coal in the hands of the Ministry of Transport and Public Works and fixed values for the different types of coal mined. United States control authorities sharply curtailed the export of deep-mine coal in the late part of 1946, and Brazilian importers registered complaints over the decrease in quality of coal received.

Petroleum.[14]—Brazil's decrease in crude-oil production from 79,265 barrels in 1945 to 66,697 barrels in 1946 was the result of deliberate limitation forced by an inadequacy of refining facilities and pipe-line outlets. The accompanying table summarizes the Brazilian petroleum situation for the past 2 years.

These figures clearly demonstrate how far short Brazil is of meeting current domestic requirements with domestic resources and facilities. Refinery production is from five small plants. Plans are under way by Conselho Nacional de Petroleo for immediate construction of a

[14] For a more detailed review see The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 155–57.

Salient statistics of petroleum industry in Brazil, 1945–46, in barrels of 42 gallons

	1945	1946
Production, crude:

refinery of 2,500-barrel daily capacity in the vicinity of the oil fields in Bahia, and consideration is being given to the proposed construction of four larger plants in São Paulo and Rio de Janeiro to add a combined daily capacity of 32,000 barrels.

BRITISH GUIANA

Bauxite.—Exports of bauxite recovered from a 2-year slump and reached 1,137,991 metric tons in 1946 compared with 750,398 tons in 1945—an increase of 52 percent. (Production was 678,482 tons in 1945; production in 1946 was virtually the same as exports.) Most of the shipments were destined for Canada, but the United States took some 70,000 tons, and smaller consignments (less than 10,000 tons each) went to the United Kingdom, Sweden, and Argentina. The upward break in output came during the second quarter of the year, when additional Canadian ships became available for service on the Canada-British Guiana route. Demerara Bauxite Co., Ltd. (Aluminum Co. of Canada), and Berbice Co., Ltd. (American Cyanamid & Chemical Corp.), were the only active producers in the colony. Undeveloped deposits of bauxite were examined during the year by engineers representing the Reynolds Metals Co. and the Kaiser interests.

Gold.—The upward trend in crude gold production that started with 22,533 troy ounces in 1945 (18,986 ounces in 1944) continued to 24,741 ounces in 1946. (Fineness was reported for the first time in 1946 at 0.800, indicating a fine-gold production of 19,793 ounces. Whether the same degree of fineness is applicable to preceding years has not been established.) The increase was less than anticipated in view of new discoveries by the two established companies—Cuyuni Goldfields, Ltd., and British Guiana Consolidated Goldfields, Ltd.—and the advent of at least two new companies, Rupununi Gold Mining Co. and Wairiri Gold Mines, to the fields, and more substantial advances are expected in 1947. Concessions are said to have been granted recently to American and Swedish interests, and greater exploitation of lode deposits has already started.

Diamonds.—Diamond production jumped to 30,958 carats, of which 28,745 carats were exported in 1946, doubling the recovery of 15,442 carats in 1945, when 17,251 carats were exported. The

excellent world market for diamonds stimulated activity in general, and the Consolidated African Selection Trust, Ltd. (a West African concern controlled by De Beers), negotiated for permission to operate on a large scale within an area of 4,260 square miles in portions of the drainage basins of the Ireng, Burro Burro, and Siparuni Rivers. If the plans of this company are successfully completed they may be expected to contribute effectively to the badly needed organization of the industry.

Granite.—Production of quarried stone, chiefly granite, rose 74 percent from 25,688 tons in 1945 to 44,805 tons in 1946. Total output was for construction use within the colony.

CHILE

Production in 1945, not available in last year's review, is presented in comparison with 1944 in the accompanying table, together with such preliminary 1946 production figures as have been reported.

Mineral production in Chile, 1944–46, in metric tons (unless otherwise indicated)

Mineral	1944	1945		1946	
		Quantity	Change, percent	Quantity	Change, percent
METALLIC ORES AND METALS					
Cobalt, in ore	5	1	−80		−100

[1] More than 500 percent. [2] Not reported. [3] Figure not available.

METALS

Copper.—The sharp 1946 decrease in copper production can be attributed to three causes. Strikes closed El Teniente plant of the Braden Copper Co. during October and November and the Chuquicamata plant of the Chile Exploration Co. during June; a serious water shortage further reduced output at El Teniente throughout December; and the customs smelters at Chagres and Naltagua were closed during the entire year coincident with virtual elimination of small mine production following cancellation of the U. S. Commercial Company contract in the latter part of 1945. A number of small mine operators announced their intention to reopen to take advantage of the increased price of copper, and it is rumored that the Chagres smelter may also reopen.

Gold.—Of the 1946 gold production, 32,514 ounces were in precious metal ores and concentrates, 6,600 ounces in base metal ores and concentrates, 21,922 ounces in copper bars, 120,031 ounces in gold bars from lode mines, and 4,836 ounces in gold bars from placers.

Iron and Steel.—The substantial increase in 1946 iron-ore production reflected a comparable increase in availability of ships for ore exporting, which still regulates production. Cía. de Acero del Pacifico has acquired property on San Vincente Bay near Concepción, and construction of a 180,000-ton steel plant, started in 1946, is expected to be completed in 1949. The plant will be under American management and its planned capacity is adequate to provide Chile with its basic iron and steel requirements.

Manganese.—Increased production of manganese ore over that of 1945 still fell far short of previous years. The Coquimbana mine of Manganeso de Atacama, S. A., was the only one in operation during 1946. The Government decreed that all sales and deliveries of metallurgical-grade manganese ore shall be controlled by Government regulation. The decree does not apply to manganese dioxide, production of which amounted to 4,880 tons in 1946.

Mercury.—The Punitaqui mine, Province of Coquimbo, continued throughout 1946 as Chile's only producer of mercury. Output receded to 827 flasks, the lowest since 1940.

Molybdenum.—Separation of molybdenum concentrates from El Teniente copper ores of the Braden Copper Co. was well below the 1945 output, because of forced curtailment of operations during the last quarter of the year.

Silver.—Silver production as reported for 1946 was the smallest since 1933. Of the total, 491,971 ounces, or 60 percent, was in copper bars; 128,313 ounces in ores, concentrates, and precipitates; and 202,936 ounces in refined bars.

NONMETALLIC MINERALS

Nitrates.—Chile's postwar recovery of nitrate production continued following a temporary set-back resulting from a prolonged strike by the Tocopilla dock workers. Only 12 oficinas were in operation at

the end of 1946, compared with 19 on June 30 and 22 on January 1, but the major oficinas entered 1947 working at full capacity.

Production in 1946 of such minerals associated with nitrate as sodium and calcium sulfates, potassium chloride, and sodium carbonate has not been reported. Output of iodine and sodium sulfate dropped slightly, while that of borates increased.

HYDROCARBONS

Coal.—Decreased coal production in 1946 was a result of the closing of 7 of the 30 operating mines in Chile and of serious labor conflicts experienced by the 2 large producers in the Concepción area. The output trend was up during the last quarter, however, and throughout the year the balance between production and consumption remained about equal.

Petroleum.[15]—Progress of the Corporacion de Fomento de la Produccion in its effort to expand the Springhill field was slight; 4 holes were completed in 1946, of which 2 showed some promise. Springhill Nos. 1 and 3 are shut in pending construction of handling facilities; a dock and storage tanks are now being erected at Bahia Gente Grande that are to be linked with Springhill by a pipe line. The Fomento Corporation has announced plans to construct a 10,000-barrel refinery near Viña del Mar to process both imported and national crude.

COLOMBIA

Mineral production of Colombia, 1945–46, in metric tons (unless otherwise indicated)

[1] Not reported.
[2] Figure not available.
[3] Estimate based on actual production of 300,720 tons during the first 11 months.
[4] Approximate.

[15] See The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 157–159.

METALS

Precious Metals.—The decline in gold and silver production has been gradual but continuous since 1941, reflecting the effect of wartime difficulties in obtaining new machinery and equipment, and of continuously rising costs against static gold prices and relatively ineffectual changes in the price of silver. The two metals occur together and are mined from lodes and placers. A detailed review of the industry was made available.[16]

Platinum production from streams on the Pacific slope showed marked improvement, and was the highest since 1941. The largest production is from dredges of the South American Gold & Platinum Co. along the San Juan River.

Iron and Steel.—The proposed Paz del Rio iron and steel project sponsored by the Instituto de Fomento Industrial is still in the planning stage, and no date has been announced for the start of plant construction. At present one small furnace at Pacho is making about 5 tons of pig iron per day.

Lead.—The small pilot plant at Mochancata appears to have been inactive in 1946, as no lead production was reported.

NONMETALLIC MINERALS

Barite.—Barite production, unreported quantitatively, is estimated to have continued at approximately the 2,600-ton annual rate of the past 2 years. Quarries in the Departments of Santander and Tolima sell chiefly to oil companies for use in drilling, and in minor quantities to local manufacturers of paint and other commodities.

Salt.—The salt industry showed healthy activity in 1946, particularly in the recovery of salt from sea water. Since 1943, terrestrial figures have not shown the breakdown between rock salt and salt contained in brines, which up to that time had been produced in a ratio of roughly 1:15.

HYDROCARBONS

Coal.—Coal-production figures have not been made available for the past 2 years. The upward trend, starting with 403,345 tons in 1941 and reaching 499,169 tons in 1944, suggests a figure somewhere close to 550,000 tons for 1946. Colombian coal is of excellent grade; it is largely consumed within the Republic.

Petroleum.[17]—Although both petroleum production and the productive potential increased steadily from 1942 (following a sharp recession) through 1945, output in 1946 was forced into a reduction by labor difficulties late in the year. Drilling activity, however, was greater than in any year since 1939.

METALS

Gold and Silver.—Except for minor placer operations, the mining of gold, silver, copper, and lead in Ecuador has been confined to two American companies with interlocking directorates. The Cotopaxi Exploration Co., following failure to find a new ore body, ceased operating its silver-gold-copper-lead mine at Macuchi in July 1946. The South American Development Co. recovered from the low year that followed the break-down of one of two hydroelectric plants and the flooding of its gold-silver-lead mine at Portovelo, in El Oro Province, near the close of 1944. However, the company continued to operate under difficulties and has sought tax relief from the Government to forestall the possible necessity of closing down. The Government was studying these proposals when 1946 ended.

The increases in the production of gold and lead obviously are not significant, and the only bright spot in the future outlook for gold lies in possible large-scale development in the region of the Toachi River in Cotopaxi Province, just south of the Quito-Esmeraldas highway. Intensive explorations in this region, begun in March 1946, are said to have resulted in showings of considerable promise.

Copper and Lead.—Recovery of copper in the form of blister bars at the Macuchi smelter ceased following closing of the mine, ending what has been virtually the total output of the country. Closing of the Macuchi mine also means that the 1947 and subsequent produc-

tion of lead will be confined to the lead content of gold-silver concentrates issuing from Portovelo, until new lead-bearing deposits may be discovered and developed.

NONMETALLIC MINERALS

Salt.—Most of the 1946 salt production came from the privately owned salinas of Santa Elena, the small remainder from the Government-owned salinas of Punta Arenas. Total output showed a substantial increase over that of 1945, to about the level of 1944.

Minor Industrial Minerals.—Activity of the Government-owned sulfur mine at Tixan, Province of Chimborazo, was almost dormant in 1946. As usual, minor production was maintained in china clay, geyserite, and iron oxide. No information has been received on the output of ocher, gypsum, and stone.

HYDROCARBONS

Petroleum.[18]—Commercial production of crude petroleum continued to be confined to the peninsula of Santa Elena in 1946. The International Ecuadorian Petroleum Co. abandoned its efforts to find oil elsewhere and withdrew from the country in the early part of 1947, while the Shell Co. of Ecuador, Ltd., continued its exploration of the Oriente region. Nearly half of the crude petroleum produced in Ecuador is refined for use within the country.

FRENCH GUIANA

The time may be ripe for some interest to be shown in expanding gold production and examining some of the bauxite, and possibly iron, deposits known to exist within the colony.

Gold.—Placer gold production, which declined from 37,606 ounces in 1939 to 20,609 ounces in 1943, appears to have become fairly well stabilized slightly below the low figure. Official figures show 18,583 ounces in 1944, 20,631 ounces in 1945, and 19,749 ounces in 1946. Most of the production comes from the Territory of Inini, which supplied 18,701 ounces of the total in 1945 and 17,774 in 1946.

PARAGUAY

Paraguay has no established mining or mineral industry of commercial interest, although there is a small production of limestone and lime, building stone, and salt.

Petroleum.—The Union Oil Co., which since January 1945 has had two seismographic crews exploring in the Gran Chaco, started drilling its first test well on July 16, 1946. Exploration probably will continue for several years.

PERU

The production trend in 1946 for Peruvian mineral products generally was downward, with the exception of bismuth, coal, and a few minor items. The decline in production, and consequently in

[18] See The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 177–181.

exports, has been attributed principally to labor shortages at the mines and a normal decline in the productivity of existing oil fields. Comparison of production and exports during the past 2 years is presented in the accompanying table. It will be noted that 1945

production figures are official data replacing the preliminary estimates presented in last year's review; the new data reveal that actually the 1944–45 production trend was upward instead of downward (as first reported) for antimony, cadmium, lead, zinc, magnesium sulfate, mica, and mineral water, and downward instead of upward for gold and silver.

METALS

Antimony.—Production in 1946 was only slightly more than half that of 1945 but exceeded 1944 by about 20 percent. Of the 1946 total, 808 tons was in various ores and concentrates and the remainder in products of the Cerro de Pasco Copper Corp. smelter at Oroya: 227 tons in crude antimony bars, 1 ton in refined bars, 168 tons in antimonial lead bars, and 1 ton in lead-tin-antimony bars.

Byproduct Metals.—White arsenic, bismuth, cadmium, indium, tellurium, tin, and sulfuric acid are all byproducts of smelting operations of the Cerro de Pasco plant at Oroya. The 1946 output of crude white arsenic and refined cadmium followed the decrease in the treatment of copper, lead, and zinc ores. Bismuth production was upheld by a well-maintained rate of ore output at the principal bismuth-producing mine, San Gregorio, belonging to the Fernandini interests. The relatively great increase in refining of indium resulted from expanded operation of the recovery plant rather than an increased supply of metal in ore. Tellurium recovery, initiated with 140 kilograms in 1943, has not been reported quantitatively since that year. Recovery of tin in the process of lead smelting is maintained at an annual level well below 100 tons.

Copper.—Continued decrease in copper production in 1946 was due to a shortage of mine labor and to continued decrease in the grade of ore from the principal copper districts, which have been marked by a declining output trend since 1929. Of the 24,700 metric tons mined in 1946, 19,400 tons were extracted at the Oroya plant of Cerro de Pasco Copper Corp. in the form of blister bars, 206 tons in matte, and 303 tons in electrolytic bars. The copper refinery under construction at Oroya probably will not be completed before 1948 or early 1949.

Gold.—Compared with 1945, the 1946 production of gold was down in total in all categories except content of gold-silver bars, which amounted to 79,040 ounces in 1945 and 91,150 ounces in 1946. Production associated with complex ores, compared paranthetically with 1945, amounted to 12,316 (16,438) ounces contained in ores, concentrates, precipitates, etc., and 42,811 (54,157) ounces contained in copper bars. Placer production dropped from 23,026 ounces in 1945 to only 12,101 ounces in 1946. The Peruvian Government has been studying ways whereby capital may be attracted to gold mining on a larger scale. Particular attention is being given to the possibilities of establishing dredging operations, and some competent organization might find the present time favorable for negotiating with the Government for exploration rights with a view to obtaining operational concessions.

Iron and Steel.—During 1946 the Peruvian Government agency "Corporación Peruana del Santa" continued to investigate and plan for establishing a steel industry at Chimbote. The plan includes

electric furnaces to utilize power from the hydroelectric plant now under construction at Cañon del Pato for the smelting of iron ore from the Marcona deposits about 200 miles south of Lima, where transportation facilities are being constructed.

Lead.—Lead production dropped to approximately the level of 1942, due partly to a cave-in that temporarily disrupted operations at the important mine of Cía. des Minas de Huaron and partly to the lessened output at some of the smaller mines resulting from decline in the grade of ore mined. Of the total 44,518 metric tons of lead in ore mined in 1946, 38,058 tons were recovered at the Oroya plant of the Cerro de Pasco Copper Corp. in refined lead bars and impure bars.

Mercury.—Suspension of operation of practically all of the few small mercury mines of the country reduced production and exports of mercury to almost nothing in 1946. The low price of mercury brought about this situation and was also responsible for stoppage of construction of the hydroelectric plant that was to have supplied power for the new concentrating plant at Huancavelica, erected in 1945 to treat cinnabar ore from the Santa Barbara mine.

Molybdenum.—With liquidation in 1945 of Peru Molibdeno, S. A., production in 1946 was confined to the negligible output of the Salazar mine.

Silver.—Distribution of 1946 production of silver, compared parenthetically with 1945, shows 3,850,598 (3,350,847) ounces in untreated base-metal ores and concentrates, 27,232 (27,360) ounces in gold-silver bars from the gold lode mines, and—from the Oroya plant of the Cerro de Pasco Copper Corp.—687,318 (1,231,406) ounces in 0.999 fine refined bars, 1,850,211 (1,928,530) ounces in 0.925 fine sterling bars, 5,918,791 (6,459,598) ounces in copper bars, and 611 (none) ounces in lead-tin-antimony bullion. The decrease followed the decline in base-metal production, of which virtually all of the silver is a by-product. Exports of silver art objects suggest that the activity of Peruvian silversmiths may have subsided somewhat since 1945.

Tungsten.—Rising prices upheld production of tungsten concentrates during most of the year, particularly from the principal mines of Malaga Santolalla i Hijos in north-central Peru, where mining was unfortunately interrupted in November by a severe earthquake that badly damaged surface installations. Production was expected to be back to normal by May 1947, and construction started on a new concentrating mill of 150-ton-per-day capacity by August.

Vanadium.—The new $4,000,000 plant at Junasha—completed in 1945 with Defense Plant Corporation funds and designed to treat low-grade ores from the Minaragra mine—was purchased by the Vanadium Corp. of America in 1946. The abrupt decrease in 1946 production was due to exhaustion of the known higher-grade portions of the ore body, which necessitated the shut-down of the old mill, and difficulties encountered in attaining satisfactory extraction of vanadium from the lower-grade "Broza" ore by lixiviation in the new plant, which is now reported to be working more efficiently.

Zinc.—Increased zinc output of the large Volcan mine in 1946 was insufficient to offset larger decreases from the Huaron, Cercapuquio, and San Antonio Esquilache mines. All zinc concentrates are exported, except for enough to feed Cerro de Pasco Copper Corps'. pilot plant at Oroya, which produced for export 1,583 metric tons of

refined electrolytic bars in 1945 and 1,331 tons in 1946, plus 105 tons in 1945 and 142 tons in 1946, for sale to domestic users. The company plans to erect an electrolytic refinery and is stock-piling zinc concentrates at Cerro de Pasco for such future treatment.

NONMETALLIC MINERALS

Marble.—Exports of Peruvian marble have increased in the past 2 years to meet an apparently growing market in eastern United States.

Mica.—Production of mica was completely shut down about the end of 1945 when a satisfactory postwar market could not be found. Statistics for 1946 appear to indicate the resumption of operations, although reported production and exports may represent shipments from previously accumulated stocks.

Other Nonmetallic Minerals.—Peru continues to export small quantities of aluminum, magnesium, and manganese sulfates, graphite, onyx, and sulfur, having little importance individually but notable value in the aggregate.

HYDROCARBONS

Coal.—Continued expansion in development of the anthracite field at Ancos far outweighed the 10-percent drop in bituminous-coal output, netting a 14-percent gain in total coal production and supplying all of the coal sold in export. Anthracite represented only 3 percent of total coal production in 1942, 36 percent in 1946. Continued growth will follow realization of the industrial development of the Chimbote area.

Petroleum.[19]—Crude petroleum production in 1946 dropped 9 percent from that of the preceding year, continuing the decline that began in 1944. An effort to open new areas of crude production was seen in preparations for wildcat drilling on the Ucayali River, Cantamana region, about 125 miles north of Aqua Caliente, by Establicimientos Petroliferos Fiscales (Peruvian Government) and Cía. Petrolera de Oriente, a private Peruvian company. The former agency is also attempting, by wildcatting, to reopen the Pirin area, northwest of Lake Titicaca, Puno Province, which has been unproductive since 1940. Independent experts, who have projected the natural decline of production from present fields and the growing domestic consumption of petroleum products, predict that unless new oil fields are discovered and developed Peru will cease to be a petroleum-exporting country by the end of 1953.

SURINAM

Bauxite.—Shipments of bauxite have been increasing steadily since 1944 and in 1946 surpassed those of the best prewar years, with 827,843 tons, compared with 683,961 tons in 1945. The Paranam and Moengo mines of the Surinam Bauxite Co. supplied 94 percent (775,386 tons) of the total. The Billiton Co. (N. V. Billiton Maatschappij), on a contract of about 100,000 tons, shipped 52,457 tons from its stock pile to American interests, delivered to Baton Rouge, La.

New calcining equipment installed at the Paranam plant of the Surinam Bauxite Co. early in 1947 and the acquisition of new ships by Alcoa are expected to speed the output of bauxite in 1947.

[19] See The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 185–191.

During the year both the Permanente Metals Corp. (a subsidiary of the Kaiser Corp., Oakland, Calif.) and the Reynolds Metal Co. sent engineers to Surinam to prospect for bauxite. Permanente obtained an option on a large area not far from the town of Albina on the Marowijn River and is engaged in detailed examination. The Reynolds Co. applied to the Government for a concession covering another discovery, but no action had been taken by the close of the year.

Gold.—Production of gold dropped 21 percent from 5,895 ounces in 1945 to 4,648 ounces in 1946. Of the 1946 output, 2,314 ounces came from Sara Creek Gold Fields, 885 ounces from Whitewater Mines, Ltd., and 1,449 ounces from individual placer mines. Production is handicapped by difficult problems of transportation, high cost of food and supplies, and the low price, equivalent to $30.05 an ounce, paid by the Surinam Bank, where by law all gold must be sold. Nevertheless, interest seems to be growing in the development of new placers on the Lawa River and of lode-mining possibilities elsewhere. Several groups, including foreign companies, have sent engineers to examine a mining district near the Government railroad south of Paramaribo, and construction of a small mill has been started at the old Savannah mine with the intention of working a deposit of gold-bearing quartz. Some results of these activities should become apparent in 1947.

URUGUAY

There has been no ore production in Uruguay since 1941, when gold was last produced on a commercial scale. Nonmetallic minerals, chiefly for use in construction, find a ready market domestically and

Mineral production of Uruguay, 1945–46, in metric tons (unless otherwise indicated)

to a considerable extent in foreign trade, particularly with Argentina, Paraguay, and Brazil. The accompanying table summarizes a preliminary comparison of production in the past 2 years.

The general upward production trend in most mineral items reflected the continuance of a construction boom and was accompanied by a predominantly downward trend in exports. In general, the prices of construction materials showed exorbitant increases, in many instances doubling those of 1940. Relief from the paralysis of imports of gypsum from Argentina came in the third quarter with the arrival of 2,520 metric tons from France.

VENEZUELA

Mineral production of Venezuela, 1945–46, in metric tons (unless otherwise indicated)

METALS

Gold.—Venezuela's steady decline in gold production since the peak year 1940 has been due largely to the wartime difficulties encountered by mining companies in obtaining essential transportation and replacement equipment, complicated by continued unrest among the miners. During 1946 the weakened financial position of New Goldfields of Venezuela, Ltd., the largest producer, was bolstered by a loan from the Venezuelan Government. This new capital, however, proved inadequate for continued operations, and on November 15 the properties were turned over for development work to Guayana Mines, Ltd., a company newly organized by Ventures, Ltd., of Toronto, Canada, and its subsidiary, Panaminas, to exercise an option granted the previous month. This interruption of production will undoubtedly result in a further decline in 1947, as the properties of New Goldfields normally supply about 78 percent of the country's total output of gold. Most of the remaining portion comes from Vuela Caras mine, also in the State of Bolivar, while placer deposits in the Caroni region continue to yield minor values.

Iron.—Additional progress was made by the Iron Mines Co. of Venezuela (Bethlehem Steel Co.) in its program for the development of ore deposits at El Pao, but considerable work must yet be completed before actual production can be started. A deep-water loading station, originally planned for a small island off the coast of Trinidad,

has been relocated to the southern coast of the Paria Peninsula, near the municipality of Cristóbal Colón. The second of a fleet of four ore ships was launched in March 1947.

The Oliver Mining Co. (United States Steel Corp.) explored concessions obtained from the Government late in 1945, and discovered iron deposits reported to be of commercial size and grade in the vicinity of Tucupita, in the Orinoco delta. Development on a commercial scale may be undertaken.

Nickel.—Sampling of the garnierite deposit at Lorno de Hierro near San Pedras, State of Aragua, was completed by the International Nickel Co. Development of the property will probably depend on current metallurgical research.

Vanadium.—During 1946 the United States imported 44 metric tons of flue dust containing 17 tons of V_2O_5, or 9 tons of vanadium, from Curaçao, compared with 61 tons of flue dust containing 21 tons of V_2O_5, or 12 tons of vanadium, in 1945. This represents material derived from crude petroleum of Venezuelan origin, though only a portion of the total potentially available from that source.

NONMETALLIC MINERALS

Asbestos.—Cía. Anónima Minas de Amiante de Tinaquillo, which started operation of its asbestos mill west of Tinaquillo, State of Cojedes, late in 1945, continued at a restricted operating rate throughout 1946. Preliminary figures suggest that either the grade of ore, which yielded 64,997 kilograms of fiber, or the efficiency of recovery was disappointingly low and that the extraction of asbestos in Venezuela must still be regarded as experimental.

Diamonds.—Venezuela responded to a record world diamond market with a 64-percent increase in production over 1945 but failed to equal that of any of the years 1941–44. Production by districts (all in the State of Bolivar) was as follows, in carats:

Producing district	*1945*	*1946*
Lower Caroni-Paragua Basin	2, 414. 28	5, 114. 36
Upper Caroni Basin (Gran Sabana)	10, 228. 00	15, 577. 64
Cuyuni and Mazaruni (Kamarán) Basins	126. 60	219. 63
Total Venezuela	12, 768. 88	20, 911. 63

Of possible significance was the first authoritative identification, in 1946, of carbonado from Venezuela. This form of diamond has never been produced on an important scale outside of Brazil.

Magnesite.—The future of Venezuela's magnesite industry depends on the growth of domestic demand for calcined products. After 23 years of inactivity, production was resumed on Margarita Island in 1943 by La Industria Nueva Esparta, C. A. Deposits range in grade from 20 to 92 percent magnesite; only the high-grade is being worked. The company ships crude to its plant at Palomar for calcining, and thence to its factory at Caracas.

Salt.—Recovery of salt from sea water, principally on the Araya Peninsula, State of Sucre, in 1946 was the highest on record.

Other Nonmetallic Minerals.—Quantitative production of limestone, lime, gypsum, clay, sand, and gravel has not been reported.

HYDROCARBONS

Coal.—Privately owned mines in the Coro district, State of Falcon, supplied 2,690 of the 3,621 tons of coal mined in 1946. The remaining 931 tons came from the Government-owned Naricual mine in the State of Anzoátegui.

Petroleum.[20]—In 1946 Venezuela further strengthened its position as the world's second largest petroleum producer by establishing a new all-time record output for the third successive year. The Western district, including the great Lake Maracaibo Basin, produced 266,765,995 barrels of crude; the Eastern district, including the States of Monagas and Anzoátegui and the Territory of Delta Amacuro (and 91,692 barrels from the new Central district in the State of Guarico), 121,720,229 barrels. The Creole Petroleum Corp. (Standard Oil Co. of New Jersey), the Shell Oil Co., and the Mene Grande Oil Co. (Gulf Oil Corp.) produced 95 percent of the total; the remaining 5 percent was the product of nine companies. Of 627 holes drilled during the year, 574 resulted in new producing wells.

Eight refineries treated 32,645,515 and 35,160,905 barrels of crude oil in 1945 and 1946, yielding 32,549,423 and 34,998,158 barrels of refinery products, respectively. At the end of the year, three complete refineries were still in the planning stage, one was under construction by Shell, and two small skimming plants, also by Shell, were nearing completion.

[20] See The Oil Weekly, 1947 World Oil Atlas, June 30, 1947, pp. 195-209.
