WISCONSIN D. H. I. A. YEARBOOK

VOL. II

PROGENY TESTED SIRES AND DAMS

1935

Dedicated to the dairyman who is trying to build a more efficient and profitable dairy herd through a continuous testing program.

Compiled from records made in Wisconsin Dairy Herd Improvement Associations reported by cow testers to the Farm and Dairy Records Office up to April 1, 1935

by

Farm and Dairy Records Office
College of Agriculture, Madison.

DAIRY CATTLE BREEDING PROGRAM

Wisconsin Dairy Records Office
College of Agricultural Sciences

INTRODUCTION

THE WISCONSIN D. H. I. A. Year Book, Volume No. 2, listing progeny tested sires and dams is a continuation of the Wisconsin Bull Book published last year in cooperation with the Wisconsin Dairymen's Association. The name has been changed due to the fact that information on the transmitting of cows as well as bulls is included.

The Year Book is published as an aid to those dairymen who are interested in increasing their net farm income by building a better herd. By a better herd is meant one that is capable of producing more butterfat on the same amount of feed. The producing ability of cows must be known to improve the present herd. The transmitting ability of sires and dams must be known to improve the herd of the future.

Dairy animals and dairy herds carrying superior inheritance for milk and fat production can be most effectively located by having a statewide plan for recording and filing the valuable information that piles up every year through cow testing operations. The Farm and Dairy Records Office, College of Agriculture, in addition to offering a farm management program to the cow testing member has established a regular system of recording, filing and using all individual cow records in co-operation with the Wisconsin Dairymen's Association. This Dairy cattle breeding program includes:

1. Standardizing all production records to 2 milkings per day, to a 305 day milking period, and to a mature basis.
2. Identification of unregistered animals through eartagging. Calves to be raised are given an Official Wisconsin eartag (same as used by State and Federal Veterinarians) and the sire, dam and date of birth recorded in the owner's permanent herdbook and at the central office. This enables any D. H. I. A. herdowner to prove the sire he is using and select breeding stock from his best cows.
3. A Permanent Herdbook (looseleaf) for the herd owner in which the lifetime breeding, health and production records and pedigree of each cow in the herd is summarized on a single sheet.
4. A Barn Breeding Sheet which makes it easy to record events at the barn as they occur from day to day. Testers transfer this information to the owners Permanent herdbook each month.
5. Pedigrees containing all record information and free from "filler" prepared for all sires in use by association members.
6. A Bull List containing living proved sires and sires for sale or exchange by association members. This list goes to all County Agents, Cow Testers and Vocational Agriculture teachers, for the use of dairymen in locating herd sires, and is kept up to date by a monthly supplement.
7. Furnishing plans for construction of bull exercise paddocks, and encouraging the formation of cooperative "bull circles".
8. Permanent filing of all individual cow records in a central office where information on the transmitting ability of sires and dams is compiled.
9. Annual publication of the accumulated record information on the breeding worth of sires and dams available to the dairymen of the state.

Use of Record Information

A proved sire is one having at least five unselected daughter-dam comparisons made from comparable records on daughters and their dams. This information may prove a bull good, bad or indifferent in transmitting ability. A sire proved good is one whose daughters are uniformly better in production and test than their dams. If the dams are very high producers, a sire is proved good if his daughters come up to the same high level of production.

The Sire Index is an estimate of what level of inheritance for test and total production a bull is capable of transmitting to his offspring. The more records we have on each daughter and dam, the more dependable the sire's Index will be. The Index is obtained by adding the difference between the average for the daughters and the average for their dams, to the daughters' average, if the daughters average is higher than their dams. If the daughters average is lower than their dams this difference is subtracted from the daughters' average to obtain the sires Index. For example:

If the daughters are higher:				Corrected
	lbs. milk	% fat	lbs. fat	Fat
15 daughters average	10,000	4.00	400	500
15 dams average	10,000	3.50	350	400
Sires Index		4.50		600
If the daughters are lower:				
15 daughters average	10,000	3.50	350	400
15 dams average	10,000	4.00	400	500
Sires Index		3.00		300

A good brood cow is one with three or more tested daughters all averaging 400 lbs. of butterfat or over, under practical dairy herd conditions, in addition to a high average lifetime production of her own.

The D. H. I. A. Year Book enables dairymen to look up the transmitting ability of the sire and dam of the bull he is thinking of buying, if enough records are available on them. If both the sire and dam are known to transmit high production and test, from their daughters records, the chances of picking a poor herd sire are reduced to a minimum.

All animals are listed alphabetically by name within each breed. Refer to the Index on the inside of cover for arrangement of information.

I. D. H. I. A. Yearly Records

The information in this section is based on D. H. I. A. yearly records, which start with the association testing year and end 365 days later, regardless of the calving date of the individual cow. Records were discarded when the cow milked less than 240 days during the testing year.

Individual records may range anywhere from 240 to 365 days in length, and may be composed of any part of a lactation or combination of parts of two lactations. Because of the fact that these records may start at any stage of lactation, no correction was made for the number of days milked. The average of all normal records for each cow was used as a measure of her producing ability. Averaging together several years records eliminates much of the error due to variation in length of record and feed supply from one year to another.

Almost all records were made under twice a day milking. Records known to have been made under 3 or 4 milkings per day were reduced to a 2 milking per day basis by multiplying the actual butterfat yield by .80 and .66 respectively.

In order to compare dams and daughters having records made at different ages, the expected yield as a mature cow was calculated for all records using the following factors—

1.3 for 2 yr. old records	1.05 for 5 yr. old records
1.2 for 3 yr. old records	1.02 for 11 yr. old records
1.1 for 4 yr. old records	1.05 for 12 yr. old records
6 to 10 yr. old records were considered mature.	

A 300 lb. fat 2 year old record is calculated thus: 300 times 1.3 equals 390 lbs. fat. Two year old records include all records started before 3 years of age, three year old records include all started between 3 and 4 years of age, etc.

Sires With Five or More Tested Daughters

In addition to the date of birth, sire, dam and average production of all the tested daughters of the sire, the average production of the daughters whose dams have records is given with the average production of their dams. From these "pairs" of comparisons the sires Index for butterfat test and mature butterfat production is calculated. The total number of records is given in the first column of figures.

The two figures in parenthesis indicate the number of daughters which actually were better than their dams in butterfat test and mature butterfat production respectively.

Unregistered sires identified by eartag number are listed at the end of each breed.

Ayrshire Sires

Dams With Three or More Tested Daughters

The sire, dam and date of birth is given for each dam. If the dam has been tested the number of records with the average production for all records is given directly opposite her name. Each individual daughter's average production is found in a parenthesis. The first figure is the number of records averaged for that daughter; the second figure is her average butterfat test; the third figure is her average mature equivalent butterfat production; i.e. (2R-3.64%-325 F) means the daughter has 2 records averaging 3.64% butterfat and 325 lbs. butterfat.

Unregistered dams identified by eartag number are listed at the end of each breed.

Ayrshire Dams

	No. of Records Averaged	Actual Milk Lbs.	Test %	Actual Fat Lbs.	Mature Fat Equivalent Lbs.

II. Standardized Milking Period Records

The information in this section is based on complete lactation records which start with the third day after calving and end when the cow is dry. The number of milkings per day, the length of lactation and the age at calving to the nearest month are reported for each record.

All milking period records are calculated to maturity, to twice a day milking and to a 305 day milking period. This makes the conditions of management under which dams and daughters are compared as nearly the same as it is possible at the present time. The factors for converting actual records to the standard basis are as follows—

1. Milkings per day.

Multiply records made under 3 milkings per day by .80.

Multiply records made under 4 milkings per day by .66.

2. Factors for converting to a standard milking period length of 305 days.

Based on study of 600 milking period records obtained from daily milk weights, made by G. E. Dickerson, Dept. of Genetics and Dairy Records.

Lactation Length Days	Conversion Factor	Lactation Length Days	Conversion Factor
230-239	1.231	390-399	.805
240-249	1.192	400-409	.788
250-259	1.155	410-419	.772
260-269	1.120	420-429	.756
270-279	1.088	430-439	.741
280-289	1.057	440-449	.727
290-299	1.028	450-459	.713
300-309	1.000	460-469	.700
310-319	.974	470-479	.687
320-329	.949	480-489	.674
330-339	.925	490-499	.662
340-349	.903	500-509	.651
350-359	.882	510-519	.640
360-369	.861	520-529	.629
370-379	.842	530-539	.618
380-389	.823	540-549	.608

3. Factors for converting to a Mature Basis.

Holsteins. Factors based on study of 10,000 Holstein H. I. R. records by H. W. Norton Jr., Supt. of A. R., Holstein Friesian Association of America.

Age	Factor	Age	Factor
2 yr.	1.25	4½ yr.	1.05
2½ yr.	1.20	5 yr.	1.02
3 yr.	1.15	6 to 9 inc.	1.00
3½ yr.	1.10	10 yr.	1.03
4 yr.	1.07	11 & over	1.05

All other breeds. Factors based on study of 4058 D. H. I. A. records by J. F. Kendrick, Bureau of Dairy Industry, U. S. D. A.

Age Yr. Mo.	Factor	Age Yr. Mo.	Factor
2-0	1.294	4-1	1.059
2-1	1.279	4-2	1.054
2-2	1.264	4-3	1.049
2-3	1.250	4-4	1.045
2-4	1.236	4-5	1.041
2-5	1.222	4-6	1.036
2-6	1.211	4-7	1.033
2-7	1.199	4-8	1.031
2-8	1.188	4-9	1.028
2-9	1.176	4-10	1.025
2-10	1.167	4-11	1.024
2-11	1.159	5-0	1.020
3-0	1.149	5-1	1.018
3-1	1.142	5-2	1.016
3-2	1.135	5-3	1.013
3-3	1.127	5-4	1.011
3-4	1.119	5-5	1.009
3-5	1.111	5-6	1.007
3-6	1.103	5-7	1.006
3-7	1.095	5-8	1.005
3-8	1.089	5-9	1.004
3-9	1.082	5-10	1.003
3-10	1.076	5-11	1.002
3-11	1.071	6-10	1.000
4-0	1.064	11	1.020
		12-or over	1.050

Example. The record of a Guernsey cow freshening at 2 years, 5 months of age and milked twice daily for 340 days to produce 350 lbs. butter fat would be corrected as follows—No correction for number of milkings per day. To correct to a mature basis the factor is 1.222; 350×1.222 equals 428 lbs. mature fat equivalent. To correct to a 305 day milking period the factor is .903; $428 \times .903$ equals 386 lbs. mature 305 day equivalent. The milk is corrected in the same manner.

If a cow has more than one normal record, the average of all records is used as her production.

Sires with Five or More Tested Daughters

In addition to the date of birth, sire, dam and average production of all tested daughters of the sire, the average production of the daughters whose dams have records is given with the average production of their dams. From these "Pairs" of comparisons with "Sire's Index" for milk and butterfat test is calculated.

The total number of records on the sire's daughters and their dams is shown in the first column of figures. The two figures in parenthesis indicate the number of daughters which actually were better than their dams in butterfat test and total butterfat production. Unregistered sires identified by eartag number are listed at the end of each breed.

Dams With Three or More Tested Daughters

The sire, dam and date of birth is given for each dam. If the dam has been tested, the number of records and the average production for all records is given directly opposite her name.

Each individual daughter's average production is found in a parenthesis. The first figure is the number of records averaged for that daughter; the second figure is her average butterfat test; and the third figure is her average lbs. butterfat production. i.e. (2R-3.64%-376F) means that daughter has two records averaging 3.64% butterfat and 376 lbs. butterfat. Unregistered dams identified by eartag are listed at the end of each breed.

III—Guernsey Sires with Ten or More A.R. Daughter-Dam Comparisons

Sires listed in this section are those having ten or more daughters tested in Guernsey A.R. whose dams also have A.R. records. The average of all records for each daughter and dam are used. Record information on which these daughter-dam comparisons are based was furnished through the courtesy of the A.R. office of the American Guernsey Cattle Club.

In order to make these records comparable to records made in D.H.I.A. Associations and therefore of greater value to Wisconsin dairymen, all records were calculated to a standard two milkings a day, 305 day, mature basis. The corrections for the number of milkings per day, length of record, and age at calving were combined to make a single set of factors.

BASIS OF CORRECTION

Milkings per day.

To correct 3x milking to 2x milking the factor .80 was used.

To correct 4x to 2x milking the factor .66 was used.

Days in lactation.

To reduce 365 day single and double letter records to 305 day equivalent the factor .86 was used.

Age.

Calculated from 32131 single letter, 6591 double letter and 3464 triple letter records given in the October 1, 1934 Guernsey Breeder's Journal

COMBINED FACTORS

Class	Single Letter			Double Letter			Triple Letter
	2x	3x	4x	2x	3x	4x	2x
A	.861	.689	.572	.861	.689	.572	1.000
B	.885	.708	.588	.869	.695	.577	1.011
C	.917	.734	.609	.904	.723	.600	1.048
D	.943	.754	.626	.931	.745	.618	1.106
E	.994	.795	.660	.973	.778	.646	1.144
F	1.022	.818	.679	1.000	.800	.664	1.209
G	1.066	.853	.708	1.051	.841	.698	1.276

Records in which cows milked 3 times daily for over 3 months were considered as 3 milkings per day records. Records in which cows milked 4 times a day for over 3 months were considered 4 milkings per day records. e.g. A class G single letter, 3 milkings per day record would be multiplied by .853 to obtain the 2x milking, 305 day mature equivalent.

In addition to the date of birth, sire, dam and the average production for the daughters and their dams, the total number of records on both daughters and dams is given. The figures in parenthesis opposite the bull's name represent:

1. Total number of registered daughters.
 2. Total number of tested daughters.
 3. Number of daughter—dam comparisons.
 4. Number of daughters better than their dams in butterfat test.
 5. Number of daughters better than their dams in butterfat production.
- e.g. (19-14-12-6-9) indicates 19 registered daughters, 14 tested daughters, 12 daughter—dam comparisons, 6 daughters better than their dams in butterfat test, and 9 daughters better than their own dams in total butterfat production.
