CARTOSE

—Uniformity

This milk modifier is prescribed in infant feeding by a rapidly increasing number of physicians, because of its uniformity.

Cartose is the dextrin-maltose-dextrose-sucrose carbohydrate with the uniform bacterial purity of new high standards.

Exacting selection of raw materials, careful processing technique, and new scientific methods of enclosing the product have developed uniformity—as in a carefully prepared pharmaceutical prescription.

No chance of upsets when a different package is obtained. Shelf life does not influence Cartose sealed in glass with vacuum.

Cartose has been prepared exclusively for the physician and the weight gains, normal stools, and general results prove the value of this uniform carbohydrate.

*An excellent inexpensive addition
to the infant feeding formula*
