A

SUPPLEMENT

TO

Ephraim

Mr. CHAMBERS's Cyclopædia:

OR,

UNIVERSAL DICTIONARY

OF

ARTS AND SCIENCES.

IN TWO VOLUMES.

VOL. I.

LONDON:

Printed for W. INNYS and J. RICHARDSON, R. WARE, J. and P. KNAPTON, T. OSBORNE, S. BIRT, T. and T. LONGMAN, D. BROWNE, C. HITCH and L. HAWES, J. HODGES, J. SHUCKBURGH, A. MILLAR, J. and J. RIVINGTON, J. WARD, M. SENEX, and the Executors of J. DARBY.

M. DCC. LIII.

READER,

TO THE

TO THE

READER.

THE late ingenious Mr. CHAMBERS, in the Preface to his celebrated *Univerſal Dictionary of Arts and Sciences*, juſtly obſerved, that "ſuch a work, well executed, "would anſwer all the good purpoſes of a library, and contribute more to the propa-"gating of uſeful knowledge, than half the books extant;" and he had the pleaſure of ſeeing his judgment confirmed, and his labours approved, by the avidity with which that performance was bought up by all ranks of people, both at home and abroad.

THAT the CYCLOPÆDIA was every where ſo kindly received, is not indeed ſurprizing; for what other book could pretend to be ſo extenſively uſeful and agreeable as that in which the man of learning, of ſcience, of curioſity, of buſineſs, of pleaſure, of art, down to the loweſt mechanic, might expect to find each his particular account? There the ſcholar hath a ready repertory, and he whom circumſtance or inclination will not permit to read many books, may there find abſtracts of the beſt, ſuited to his occaſions.

SOME few however condemn the uſe of all ſuch dictionaries, on the ſlight pretence, that, by leſſening the difficulties of attaining knowledge, they abate our diligence in the purſuit of it; and by dazzling our eyes with ſuperficial ſhew, ſeduce us from digging ſolid riches in the mine itſelf. To ſuch we need only anſwer, that they have not ſufficiently conſidered the diſtinction between hiſtorical and ſcientifical knowlege. Tho' the latter, as Mr. Chambers has obſerved, cannot be delivered, and ſo ought not to be expected, in the order of a Dictionary, yet the former may. And it ſeems obvious, that an hiſtorical knowlege of the Arts and Sciences may be of great uſe; not only to thoſe who have no leiſure for deeper reſearches, but to thoſe alſo, who intending a farther progreſs, conſider hiſtorical as the beſt preparation for ſcientifical knowlege. Not to mention the vaſt uſe of refreſhing the memory occaſionally, and thereby preſerving ideas and notions already gain'd.

OTHERS again alledge againſt the utility of all works of this kind, that they are every one imperfect; none of them being free from numerous defects and errors, beſides other faults, by means of which he that truſts to them for information, is in danger of being either diſappointed or miſled. But whatever truth there may be in this objection, there is as little reaſon in it as in the former; ſince every human performance is equally liable to it. Perfection is not attainable by man: his beſt work therefore is that which has the feweſt faults. So far in general muſt be allowed.

WITH reſpect to the CYCLOPÆDIA in particular, whatever faults of any kind it may be juſtly charged with, yet every man of candour, who will allow himſelf to reflect a moment on the extenſive, various, complicated nature of the work, will rather wonder that the author committed no more, than cenſure him for thoſe that eſcaped him.

NO body, however, can be more ſenſible of thoſe faults than he himſelf was, as ſufficiently appears in his Preface; nor more earneſtly deſirous of reforming them, than he ſhewed himſelf to be by labouring with indefatigable, inceſſant pains, to the very laſt, in collecting and diſpoſing proper materials for that purpoſe: So that, if he had lived to complete his deſign, he would undoubtedly have produced the moſt ſatisfactory proofs both of his zeal and his capacity to ſerve mankind in the important and difficult province which he had undertaken.

BUT his death having put an end to this ſcheme, the benefit of his labours would have been entirely loſt, had not GEORGE LEWIS SCOTT, Eſq; F. R. S. a Gentleman of acknowledged learning, and of abilities every way equal to ſuch an undertaking, (ſince appointed Sub-Preceptor to Their Royal Highneſſes the Prince of WALES, and Prince EDWARD) been prevailed upon to peruſe the papers left by Mr. CHAMBERS, in order to ſelect ſuch articles as were fit for the preſs, and to ſupply ſuch others, as ſeemed to be moſt wanting.

TO the execution of this latter part of the deſign, ſeveral late excellent authors, whom Mr. CHAMBERS could not have the opportunity of conſulting, have contributed largely. By their help conſiderable additions have been made to the work, particularly with regard to natural hiſtory. However, that this uſeful branch of learning might be treated in the moſt accurate manner, as indeed it deſerves, a Gentleman who has diſtinguiſhed himſelf advantageouſly therein, was engaged to compoſe the articles relating to it. The ſame hand alſo drew many articles in anatomy, ſurgery, chemiſtry, mineralogy, agriculture, medicine, and other analogous ſubjects.

THAT

To the READER.

THAT the reader may form ſome idea of what has been done for his ſervice, and of the manner in which this performance hath been conducted, he will be pleaſed to obſerve;

1. THAT the plan of the CYCLOPÆDIA has been, in general, adhered to, with this improvement upon it; that proper authorities are almoſt every where quoted, in the double view of producing vouchers for what is advanced, and of directing ſuch as want further information where to find it.

2. That care has been taken to connect the SUPPLEMENT with the CYCLOPÆDIA, ſo as to make the whole in a manner but one work; it being always referred to for thoſe articles which, having been treated of there, are here re-conſidered, and enlarged, or corrected; every ſuch article having the ſyllable *Cycl.* annexed to it, as a direction to conſult the CYCLOPÆDIA firſt on that head.

3. THAT the main end of the work being kept always in view, ſome branches of learning have been treated much more at length than others, with a due preference to the moſt intereſting: Nor is it to be feared that the reader will condemn a diſtinction ſo much to his own advantage.

ON this principle it was judged improper to ſwell the book with details of the ſubtilties of ſchoolmen, and the frivolous and vague queſtions debated among them. Nor did the niceties of philology and literature ſeem to deſerve much more notice than has already been taken of them in the CYCLOPÆDIA. In general, the additions on all theſe heads conſiſt chiefly of the explanation of ſome terms omitted in that work. However, many ſubjects of this kind are more fully treated here, with additional illuſtrations of thoſe of a like nature found in the CYCLOPÆDIA.

ON the other hand, natural hiſtory, and the other branches of real knowlege, have been chiefly attended to; moſt of the various articles relating to theſe ſubjects, which are to be found in the CYCLOPÆDIA, being here very conſiderably enlarged, and a multitude of new ones ſuperadded.

THO' great regard ought to be paid to the mathematical and phyſico-mathematical ſciences, on account of their ſtrict connection with the knowledge of nature, yet as it was not proper, nor indeed practicable in a work of this kind, to give more than general and hiſtorical views of them, and as the CYCLOPÆDIA already contains extracts from the beſt elementary writers on thoſe ſubjects, large additions were judged unneceſſary. However, ſeveral new articles, both curious and uſeful, will be found in this SUPPLEMENT, and in the APPENDIX. In particular, ſuch care hath been taken to explain the principles of the modern geometry, and the methods of computation uſed in it, as to enable a reader, without any great ſkill in mathematics, to ſatisfy his mind that thoſe things are not involved in unexplicable myſtery, as the late ingenious author of the Analyſt pretends; miſtaking the great inventor's conciſeneſs for obſcurity, and the inadequate and confuſed notions of ſome of his followers, for the accurate doctrines of their maſter.

WITH regard to manual arts and manufactures, whether depending on chemiſtry or mechanics, ſo eminently and extenſively beneficial to mankind, it were to be wiſhed, that more complete information, than is to be found here, or in any books extant, could be given the reader. It is indeed to be lamented that there are ſo very few good writers on thoſe important ſubjects; but it is no wonder that thoſe who underſtand and practiſe them beſt, ſhould have the leaſt leiſure or inclination to communicate them to others. Above half a century paſt, an illuſtrious foreign academy formed the noble deſign of compoſing a Hiſtory of Arts; but little or nothing has as yet appeared in conſequence thereof, and their ingenious ſecretary juſtly repreſents the difficulty of the undertaking in ſo ſtrong a light, that what he has ſaid may well ſerve as an apology for the CYCLOPÆDIA, and SUPPLEMENT, if they ſhould be cenſured as defective on this head. However, the reader will find ſeveral curious particulars relating to the arts depending on chemiſtry.

IN general it is hoped that, as the bulk of the book ſhews the additions and emendations to be very conſiderable in quantity, the reader will find them no leſs ſo in point of pleaſure and utility; and that the purchaſers of the CYCLOPÆDIA will be ſatisfied with the juſtice which the proprietors have done them by printing the SUPPLEMENT ſeparately, in the two volumes now offered to the public.

DIRECTIONS to the BINDER.

Place all the CUTS in the Order they are number'd at the End of the Second Volume.

SUPPLEMENT

TO THE

CYCLOPÆDIA,

OR,

UNIVERSAL DICTIONARY

OF

ARTS AND SCIENCES.

A.

AB, in the Hebrew chronology, the eleventh month of the civil year, and the fifth of the eccleſiaſtical year, which begins with *Niſan*. The month *Ab* anſwers to the moon of July. This month had thirty days. *Calmet.*

ABACATUAIA, in zoology, the name of an American fiſh, of the ſhape of the European doree or faber. It is much of the ſhape, ſize, and figure of the common plaiſe. Its mouth is ſmall and toothleſs, and its eyes have a black pupil, and a ſilvery iris. It has five fins, one on the back, and another on the belly; each running to the tail; and two at the gills. The tail makes the fifth, and is conſiderably forked. It has, beſide theſe, two long filaments on the belly, and one ſuch on the back, near the origin of the back-fin. It has no ſcales, but is covered with a very ſmooth and ſoft ſkin. It is all over of a fine ſhining ſilvery white, except theſe filaments, which are perfectly black. It is caught about the ſhores of the Braſils, and is commonly eaten there. See Tab. of Fiſhes, N°. 51. *Margrave*'s Hiſt. Braſ.

ABACAY, in natural hiſtory, a name given by the people of the Philippine iſlands to a ſpecies of parrot, called alſo calangay. See CALANGAY.

ABACINARE, or ABBACINARE, in writers of the middle age, a ſpecies of puniſhment, conſiſting in the blinding of the criminal, by holding a red-hot baſon, or bowl before his eyes [a].

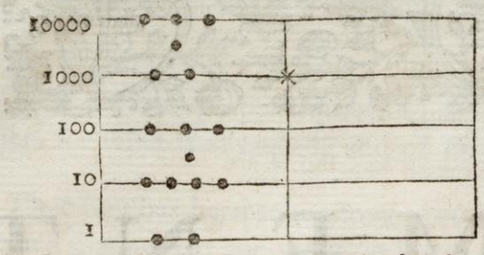
The word is formed of the Italian *bacino*, a baſon; though Menage chooſes to derive it from the Italian *bacio*, a dark or cloſe place; the puniſhment frequently going no farther, than to the diminiſhing the ſight [b].—[[a] *Du Cang.* Gloſſ. Med. Lat. T. 1. p. 2. *Schoettg.* Lex. Ant. p. 148. [b] V. *Aquin.* Lex. Mil. T. 1. p. 4. Cruſc. T. 1. p. 3. Voc. *Abbacinare.*]

ABACISCUS. See ABACUS.

ABACIST, ABACISTA, in writers of the middle and barbarous ages, denotes an arithmetician, or accomptant [a].—[[a] *Du Cang.* Gloſſ. Med. Lat. T. 1. p. 4. in Voc. *Abacus.* Cruſc. T. 1. p. 3. Voc. *Abbachiſta.*]

ABACOT, in our old writers, the antient coronet or cap of ſtate worn by our Engliſh kings, made up in form of two crowns. *Spelm.* Gloſſ. Arch. p. 1.

ABACUS, (*Cycl.*) — or ABACISCUS, in the antient architecture, is uſed to denote certain compartiments in the incruſtation or lining of the walls of ſtate-rooms, Moſaic pavements, and the like.



There were *Abaci* of marble, porphyry, jaſper, alabaſter, or [a] even glaſs; ſhaped variouſly, ſquare, triangular, and the like. —[[a] Vid. *Plin.* l. 35. c. 1. *Harduin.* Not. ad Loc. *Vitruv.* l. 7. c. 3. p. 133. *Baxt.* Gloſſ. Rom. p. 2. ſeq.]

The *Abacus* for facilitating the operations of arithmetic, is an inſtrument almoſt as antient, and as extenſive, as the art of arithmetic itſelf: if it be later than the methods of computing by the fingers, and by lapilli, or ſtones, (which obtained among the [b] Egyptians) 'tis at leaſt much prior to the uſe of numeral letters, or figures, wrought with the pen.—[[b] *Herodot.* l. 1. Hiſt. Acad. R. Inſcr. T. 3. p. 389.]

We find it in uſe, under ſome variations, among the Greeks, Romans, Chineſe, Germans, French, &c. It excells in point of facility, and cleanlineſs of operation, as working without any ſtrokes, or blots of the pen, or waſte of paper; ſome alſo give it the preference in point of expedition: at leaſt it appears better adapted to the apprehenſion of children, and beginners in accounts, who might commodiouſly enough be firſt initiated this way. Adam Rieſe, who has written largely on the uſe of the *Abacus*, aſſures us he has found, in the teaching of youth, that thoſe who begin with computing on the *Abacus*, become afterwards more dexterous and expert at accounts, than thoſe who begin with figures. *Wolf.* Lex. Math. p. 171. Voc. *Arithmetica.*

The art of computing by the *Abacus* makes a peculiar ſpecies of arithmetic, called *calculatoria*, or *logiſtica per calculos*; by the French, *la logiſtique par jettons* [c].—[[c] It is treated of by *Herigon*, in Curſ. Mathem. P. 3. p. 125. & *Dechales*, in Mund. Mathem. T. 1. p. 412. ſeq. V. *Wolf.* lib. cit. p. 170.]

The *Abacus* is variouſly contrived; that chiefly uſed in European countries is made by drawing any number of parallel lines, at pleaſure, at a diſtance from each other, equal to twice the diameter of a *calculus*, or counter. Here a counter placed on the firſt or lowermoſt line ſignifies 1; on the ſecond, 10; on the third, 100; on the fourth, 1000; on the fifth, 10000; and ſo on. In the ſpaces between the lines, the ſame counters ſignify half of what they ſignify on the next ſuperior line; *viz.* in the ſpace between the firſt and the ſecond lines, 5; between the ſecond and third, 50; between the third and fourth, 500; and ſo on. Thus the counters on the *Abacus*, in the figure here ſubjoined, make the ſum of 37392.—The *Abacus* is alſo divided croſs-wiſe into *Areolæ*, by means whereof ſubtractions are made. *Wolf.* Lex. Math. p. 171. ſeq.

The Grecian *Abacus*, αβαξ, or counting-board, was an oblong frame, divided by ſeveral braſs wires ſtretched parallel to one another, and mounted with an equal number of little ivory balls, like the beads of a necklace. By the arrangement of theſe balls, diſtinguiſhing the numbers into different claſſes, and obſerving the relations of the lower to the upper, all kinds of computations were eaſily performed. *Mahudel*, in Hiſt. Acad. R. Inſcr. T. 3. p. 390.

The Roman *Abacus* was much the ſame with the Grecian, except that inſtead of ſtrings, or wires, and beads in the Roman, we find pins and grooves for them to ſlide in. It is deſcribed by ſeveral authors; but notwithſtanding all theſe deſcriptions, we ſhould have had a very obſcure idea of the ancient manner of reckoning, had there not been a figure of it found among the ancient marbles. It is given by Schottus [d], Gruter [e], Velſerus [f], and Pignorius [g].—[[d] Nodor. Ciceron. l. 1. c. 6. [e] Inſcript. vet. p. 224. [f] *Opp.* p. 422, 819, & 842. [g] De Servis, p. 340. *Fabric.* Bibl. Antiq. c. 16. §. 15. See the figure in Phil. Tranſ. N°. 180.]

The Chineſe *Abacus* conſiſts, like the Grecian, of ſeveral ſeries's of beads ſtrung on braſs wires, extended from the top to the bottom of the Inſtrument, and divided in the middle by a croſs piece from ſide to ſide; ſo as in the upper row each ſtring has two beads, which are each reckoned for five; and in the lower row, each ſtring has five beads of different values; the firſt being reckoned as 1; the ſecond, as 10; the third, as 100, &c. as among us [h]. Add, that inſtead of four pins for digits, or units in the Roman *Abacus*, the Chineſe has five beads; which ſeems to argue, that this latter was intended for a duodecimal progreſſion, as the Roman was for a decimal [i]. We have two different figures, and deſcriptions of the Chineſe *Abacus*, one given by F. Martinius, who had lived many years in China; the other by Dr. Hook, who copied it from a Chineſe dictionary of the court-language.—[[h] V. *Martin.* Sinic. Hiſt. Dec. 1. l. 1. p. 27. [i] *Hook*, in Philoſ. Tranſact. N°. 180. p. 166.]

ABACUS is alſo uſed by modern writers for a table of numbers ready caſt up, to expedite the operations of arithmetic. V. *Alſt.* Comp. Lex. Phil. p. 3252.

In this ſenſe we have *Abaci* of addition, of multiplication, of diviſion; an *Abacus logiſticus*; *Abacus* of ſquares, of cubes, &c.

ABACUS *logiſticus* is a rectangled triangle, whoſe ſides, forming the right angle, contain the numbers from 1 to 60; and its area, the factums of each two of the numbers perpendicularly oppoſite. This is alſo called a *canon of ſexageſimals*. *Alſt.* Comp. Lex. Phil. p. 3264.

ABACUS *& palmulæ*, in the ancient muſic, denote the machinery, whereby the ſtrings of polyplectra, or inſtruments of many ſtrings, were ſtruck, with a plectrum, made of quills. *Malc.* Treat. of muſick, c. 14. §. 5. p. 558.

ABACUS *harmonicus*, is uſed by Kircher for the ſtructure and diſpoſition of the keys of a muſical inſtrument, whether to be touched with the hands, or the feet. *Walth.* Lex. Muſ. p. 1.

ABADIR, in the Roman theology, the ſtone which Saturn ſwallowed, believing it his new-born ſon Jupiter, and which at length became deified, and the object of religious worſhip. *Priſcian.* Inſt. Grammat. l. 5. p. 125.

The word is alſo written *Abaddir*, *Abdir*, *Abbadier*, *Abdira*, and even *Agadir*.

The origin of the word has greatly puzzled etymologiſts. The curious may conſult *Bochart* Chanaan, l. 2. c. 2. p. 786. *Baxter*, Gloſſ. Antiq. Rom. p. 3. Mem. de l'Acad. des Inſcript. T. 9. p. 194. *Clerici*, Not. ad Heſiod. Theogon. v. 485. Bibl. Univ. T. 21. p. 111.

ABAISSE', in Heraldry. See ABASED, *Cycl.*

ABARCA, an antient kind of ſhoe, uſed by the country people in Spain to paſs mountainous and rocky places; being made of raw bullocks or goats hides, and bound about the feet with cords, which ſecured them againſt the ſnow [a].—[[a] *Du Cang.* Gloſſ. Lat. T. 1. p. 6. *Aquin.* T. 1. p. 3. *Steph.* Span. Dict. in voc.]

Stephens mentions another ſort of *Abarca*, made of wood, like the French *Sabots*; called *Abarca's*, becauſe ſhaped like a boat, *barca*.

ABAS, a Perſian weight, uſed in weighing pearls; one eighth leſs than the European caract. *Savar.* Dict. Comm. T. 1. p. 1.

ABASSI, or ABASSIS, a ſilver coin, current in Perſia, equivalent to twenty French ſols, ſomewhat leſs than an Engliſh ſhilling. Nouv. Mem. des Miſſ. T. 3. p. 396.

The *Abaſſi* took its denomination from Schah Abas II. king of Perſia, under whom it was ſtruck. On one ſide, it bears the Mahometan profeſſion of faith; on the other, the name ABAS, and that of the city where it was coined. *Savar.* Dict. Comm. T. 1. p. 1. ſeq.

There are alſo pieces of five *Abaſſis*, and others of two, tho' little uſed. Fifty *Abaſſis* make the toman.

ABATIS, or ABBATIS, in writers of the barbarous age, denotes an officer in the ſtables, who had the care, and diſtribution of the provender.

Spelman [a] explains *Abatis* by hoſtler; and agreeably hereto, derives the word from the Greek αβατος, ſtupid; a character which he ſuppoſes to belong to that ſervile people. But the *Abatis*, at leaſt in the houſholds of princes, was an officer of better figure: his function ſeems to have amounted to the ſame with that of marſhal, others ſay of ſeneſchal, or avenor. Hence Du Cange, with more probability, derives the word from *batum*, an antient meaſure wherein the oats were dealt out: he was doubtleſs firſt called *à batis*; as others, *à ſcriniis*, *à ſecretis* [b], &c.—[[a] *Spelm.* Gloſſ. p. 4. Voc. *Abbatis.* [b] V. *Du Cang.* Gloſſ. Lat. T. 1. p. 7. ſeq.]

ABATOR, in law, is uſed for one that enters into a houſe or land, void by the death of the laſt poſſeſſor; before the heir takes poſſeſſion, and thereby keeps him out. Old Nat. Br. 115. *Cowel.*

ABBA, in the Syriac, and Chaldee languages, literally ſignifies a *father*; and figuratively, a ſuperior, reputed as a father in reſpect of age, dignity, or affection.

The word has been adopted by divers other languages, beſides the Syriac, and Chaldee, as the Ruſſian, Ethiopic, &c. Whence ſome authors have dreamt of a natural ſignificancy in it. V. Miſ. Lipſ. T. 7. p. 41.

ABBA, ABA, or ANBA, is more particularly uſed in the Syriac, Coptic, and Ethiopic churches, as a title which the people give their biſhops. *D'Herbelot*, Bibl. Orient. Voc. *Aba.*

The biſhops themſelves beſtow the title *Abba*, more eminently on the patriarch of Alexandria; which occaſion'd the people to give him that of *baba*, or *papa*, that is grandfather: a title which he bore before the biſhop of Rome.

ABBA is alſo a Jewiſh title of honour, given to certain of that claſs of rabbins, called Tanaites. V. *Wolf.* Bibl. Heb. T. 2. p. 866.

We have no diſtinct account of this dignity, which however appears to be very antient; as being given to the moſt antient of the Gemaric doctors, and even the Seburæans.

ABBA, is alſo particularly uſed by ſome writers of the middle age, for the ſuperior of a monaſtery, uſually called *Abbot*. *Du Cange*, Gloſſ. Lat. See ABBOT *Cycl.*

ABBAISSEUR, in anatomy, a name given by Winſlow and other French writers, to one of the muſcles of the eye, called by others the *deprimens* and *humilis*, and by Fabricius, the *rectus inferior*: Cowper, and Albinus, call it the *depreſſor oculi*, and it is one of the *quatuor recti oculi* of the laſt author.

ABBAT, ABBAS. See ABBOT, *Cycl.*

ABBATIS. See ABATIS.

ABBAYANCE, in law books. See ABEYANCE, *Cycl.*

ABBREVIATOR, is ſometimes uſed for a perſon who contracts, or reduces a long writing, or other matter into a ſhorter compaſs.

ABBREVIATOR, is more particularly uſed for an officer in the court of Rome, appointed as aſſiſtant to the vice-chancellor, for drawing up the pope's briefs, and reducing petitions, when granted by the pontiff, into proper form, for being converted into bulls.

The *Abbreviators* are ſuppoſed by Ciampini, to be the ſucceſſors either of the *cancellarii* in the imperial houſhold, or of the ſeven *notarii*, ſaid to have been plac'd by pope Clement I. in the ſeven quarters of Rome, to write down the acts of the martyrs within their ſeveral diſtricts [a].

They are ſaid to have taken the name, either from their writing the *brevia*, briefs, or ſhorter epiſtles of the popes [b]; or from their making uſe of *notæ*, or abbreviations in writing. The latter opinion may ſeem the more probable, in that the name is ſometimes uſed by writers of the ſixth age, as ſynonymous with *notarii* or *breviatores* [c].—[[a] V. *Ciampin.* de Abbreviator. c. 1. ſeq. [b] *Calv.* Lex. Jur. p. 127. Voc. *Breviator.* [c] *Walch.* ap Miſc. Lipſ. T. 1. p. 147.]

The earlieſt mention made of *Abbreviators* in the papal court, is in one of the *extravagantes* of pope John XXII. in 1317. Pius II. firſt erected them into a college or order, in 1463, and confer'd on them ample privileges. They were ſuppreſs'd by his ſucceſſor Paul II. in 1474, as uſeleſs and ignorant [d]: and reſtor'd and confirm'd anew by Sixtus IV. in 1478 [e].—[[d] *Platin.* de Vit. Paul. p. 331. [e] *Ciampini* de Abbreviator. c. 4. ſeq.]

The *Abbreviators* at preſent make a college of ſeventy-two perſons, divided into two parks or ranks; one call'd *Abbreviatores de parco majore*, who are twelve in number, all prelates; the other, *Abbreviatores de parco minore*, call'd alſo *examinatores*, who may be laymen [h].—See farther in Ciampini, who has two volumes expreſs, on the inſtitution, office, privileges, ceremonies, &c. of the *Abbreviators* [i].—[[h] Jour. des Scav. T. 37. p. 348. [i] De Abbreviatorum de parco majori, &c. *Joannis Ciampini Romani*, fol. Rom. 1691. Extracts whereof are given in the Act. Erud. Ann. 1691. p. 306. and Journ. des Scav. T. 21. p. 120. Abbreviatoris de curia compendiaria notitia. Rom. 1696. An Extract hereof is given in Act. Erud. Lipſ. 1998. p. 67. ſeq.]

ABBRE-

ABBREVIATORS is also a name given by some authors to an antient litteral academy, suppos'd to have been at Rome, in the fifteenth century, and compos'd of the chief men of letters of the age; as, Pomp. Lætus, Platina, Pontanus, Sannazarius, Sabellicus, &c. who, by the rules of the society, chang'd their names at their admission, for those of some antient Greek or Roman.

They are supposed to have been thus called, either in honour of Platina, one of the papal *Abbreviators*, who was the director of this academy; or because they undertook to *abbreviate* and reduce into a narrow compass, what had been written diffusively on various subjects. *Walch.* in Misc. Lips. Vol. 1. p. 150.

The existence of such an academy has been much controverted: Stempelius first broach'd the notion, which has been since defended by Walchius, and countenanc'd by Struvius, and some other learned men; but exploded by Heumannus, as a fiction, grounded only on mistakes [a].—[a Vid. *Struv.* Introd. ad Not. rei. liter. C. 10. §. 5. *Walch.* in Misc. Lips. T. 1. p. 144. And *Heuman.* de fabula Societ. Abbreviat. Romanæ. Misc. Lips. T. 3. p. 2.]

ABDALS, in the Eastern countries, a kind of saints supposed to be inspir'd to a degree of madness. The word, comes, perhaps, from the Arabic, *Abdallah*, the servant of God.—The Persians call them *devaneh khoda*, agreeable to the Latins way of speaking of their prophets, and sibils, *q. d. furentes deo*, raging with the god.

The *Abdals* are often carry'd by excess of zeal, especially in the Indies, to run about the streets, and kill all they meet of a different religion; of which travellers furnish many instances. The English call this, *running a muk*, from the name of the instrument, a sort of poignard, which they employ on those desperate occasions. If they are kill'd, as it commonly happens, before they have done much mischief, they reckon it highly meritorious, and are esteem'd, by the vulgar, martyrs for their faith. V. *D'Herbel.* Bibl. Orient. p. 5.

ABDEST, among the Mahometans, a peculiar manner of washing, before prayer, entering the mosque, or reading the alcoran; practis'd with some difference both by Turks and Persians. The word is compounded of the Persian *ab*, water, and *dest*, hand.

The Persian *Abdest*, or lotion, is perform'd by passing the hands with water over the head, from the neck to the forehead, twice; and afterwards over the feet to the ankles.—The Turks, on the contrary, pour water on their heads, and wash their feet thrice; but if they have wash'd the feet in the morning, before dressing, they content themselves to wet their heads, and stroke it over their stockings, from the toe to the ankle [a]. Rycaut [b] and Pitts [c] describe the ceremony somewhat differently.—[a *D'Herbel.* Bibl. Orient. p. 10. b *Rycaut*, Pres. Stat. Ottom. Emp. l. 2. c. 23. p. 158. c *Pitts*, Account of Mohamm. c. 6. p. 36. seq.]

ABDICARIA *propositio*, in logic, is used for a negative proposition.

ABDOMEN, *(Cycl.)* — Authors are not agreed, whether the hind part be properly included in the *Abdomen*, which some restrain to the anterior, or fore part only [a]. Keill varies between the two, excluding in one place the back part, yet in another, making it part of the *Abdomen* [b]. Dictionary-writers are still more faulty; some of them make the *Abdomen* only part of the lower venter [c]; others more expressly call it the external part [d]; by which we suppose they mean the integuments of the *Abdomen*.—[a *Cast.* Lex. Med. p. 2. b *Keil*, Comp. Anat. p. 7, 8. c *Danet.* Dict. Lat. p. 7. *Richelet*, T. 1. p. 5. Col. 1. d *Trev.* Dict. Univ. T. 1. p. 24.]

Diseases of the ABDOMEN are inflammations, abscesses, schirrus's, indurations, inflations, spasms, &c. Hence the *Abdomen* becomes the seat of divers operations; as perforations, sutures, sections, &c.

Wounds of the ABDOMEN, either only affect the common integuments and muscles, or else they penetrate into the cavity of the *Abdomen*.

Wounds are examined as to this particular, either by the eye, the passing the probe, or the injecting of warm water; if the water meets no obstruction, you are sure the wound penetrates; if it returns back upon you, and the probe does not pass in, but meets with obstruction, the *Abdomen* is not entirely opened.

Those wounds that do not penetrate into the cavity of the *Abdomen*, are either only in the common integuments, or the muscles of the *Abdomen* are divided as far as the peritoneum. The first of these cases requires little care, being only a common slight wound, but the last is very dangerous, for the intestines very often fall thro' the wound. If the wound is large, great skill is required in the surgeon, especially, if it is made in a transverse, or oblique direction, for in this case the suture is necessary, to keep the gaping lips of the wound together. Having taken these precautions, to preserve the intestines and peritoneum in their natural situation, the wound is to be dressed with vulnerary balsams, and an adhesive plaister; the patient must also be enjoined abstinence, must have rest, and his bowels must be kept open.

In wounds of the *Abdomen*, that penetrate into its cavity, the surgeon is first to examine very carefully, whether any of its contents partake of the injury. It will be found that this is not the case, if there is no great degree of weakness, hæmorrhage, pain, fever, &c. if on laying the patient upon the wounded side, there is no discharge of chyle, gall, excrement, or urine; if milk being injected warm, returns without any alteration in its colour; if the inflicting instrument has not been very sharp; and lastly, if there is no vomiting or discharge of blood by the mouth, stool, or urine, nor swelling or hardness of the belly. *Heister*'s Surg. p. 55.

In the philosophical Transactions, we have an account of a very extraordinary size of the *Abdomen* of a young woman, who was in a dropsy from the want of a kidney. The circumference of the *Abdomen* was six feet four inches, and from the xyphoid cartilage to the os pubis, above four feet. Phil. Trans. N° 482. Sect. 2.

We have some remarks on the hydropical tumors of the *Abdomen*, in the medical essays of Edinburgh. Vol. 5. art. 59.

ABDUCENS *labiorum*, in anatomy, a name given by Spigelius to a muscle, which he also calls the *secundus ad latera trahens*. This is the *levator anguli oris* of Albinus, and the *caninus* or *elevator labiorum communis* of others.

ABDUCENT, in anatomy. See ABDUCTOR, *Cycl.*

ABDUCTION, *(Cycl.)* in surgery, denotes a species of fracture, wherein the bone being broken near a joint, along its whole thickness, the two stumps start to a good distance from each other. See FRACTURE.

This *Abduction* is the same with what Greek writers call απαγμα, or αποκλασμα; sometimes καυληδον, *q. d. Caulatim facta fractura*; some Latin writers call it *Abruptio. Castellus.*

ABDUCTOR, *(Cycl.)* — *Abductor longus pollicis*, in anatomy, a name given by Albinus to a muscle of the hand, called by Winslow, Cowper, and others, *extensor primus pollicis*.

ABDUCTOR *Ossis metacarpi digiti minimi*, in anatomy, a name given by Albinus to a muscle of the hand called by Winslow, and some others, the *metacarpialis*, and by the generality of writers by names but badly expressing its nature or uses. Riolanus calls it *pars hypothenaris parvi digiti*; and Spigelius, *interosseus ultimo ossi metacarpii, parte manus externa, adherens*. Cowper calls it the *abductor minimi digiti*; and Douglas's the *flexor primi internodii minimi digiti*.

ABELMOSCH, or ABELMUSK, the *musk-seed*; a small odoriferous seed brought from Egypt; chiefly used in perfumes. See MUSK-SEED.

The word is Arabic; compounded of *Ab*, *el*, and *mosch*; as being the musk of the Arabs. *Blanc.* Lex. Med. p. 1. seq.

ABELOITES. } See ABELIANS, *Cycl.*
ABELONIANS. }

ABEREMURDER, ABEREMURDRUM, in antient law books, denotes murder that has been proved, or made appear by judiciary process. *Wilk.* Gloss. in voc. *Abarnare*.

The word is Anglo-Saxon; compound of Ebene, bare or clear; and Mopð, killing, homicide. *Spelm.* Gloss. p. 4.

In this sense *Aberemurder*, called also *Eberemurder*, amounts to the same with *probatum murdrum*, or murder which needed proof; and stands opposed to open murder, which was murder sufficiently known by the notoriety of the fact.

Lambard explains *Aberemurder* by *manifestum murdrum*; and Spelman, and after him Du Cange, by *apertum murdrum* [a]; which seems to be a mistake, unless we are to suppose *apertum* and *manifestum* are here to be taken in that loose signification in which Spelman elsewhere uses the latter, when he interprets it, *non quod in aperto fit, sed quod aperto constat de perpetrato scelere*; that is, has been fully proved [b].—[a *Spelm.* loc. cit. *Du Cang.* Gloss. Lat. T. 2. p. 111. Voc. *Eberemurdrum.* b *Spelm.* Gloss. p. 193. Voc. *Eberemurder.*]

Aberemurdrum was one of those crimes, which could not be atoned for with money; as most others might.

ABERRATION, in optics, is used to denote that error or deviation of the rays of light, when inflected by a lens or speculum, whereby they are hindred from meeting or uniting in the same point.

There are two species of the aberrations of rays, distinguished by their different causes, one arising from the figure of the glass or speculum; the other from the unequal refrangibility of the rays of light. See LENS and SPECULUM.

The second species of aberration is sometimes called the Newtonian, from the name of its inventor.

ABESTA, the name of one of the sacred books of the Persian Magi; which they attribute to their great founder Zoroaster, or Zerdusht.

The *Abesta* is a commentary or exposition of two other of their religious books, called *zend* and *pazend* [a]; the three together include the whole system of the *ignicolæ*, or worshippers of fire.—[a *D'Herbel.* Bibl. Orient. p. 11. See also *Hyde*, de Relig. Vet. Pers. c. 2. *Fabrici* Cod. Pseudepig. Vet. Test. T. 1. §. 108. p. 350.]

ABESTON, a word us'd by some of the writers of the middle ages as the name of a stone, to which they attribute great virtues;

virtues; it seems no other than a careless mistake in writing the word Asbestus.

ABEVACUATION, in medicine, denotes a partial evacuation. See EVACUATION, *Cycl.*

Abevacuation is synonymous with the Greek αποκενωσις; which stands in the same relation to κενωσις, or an universal evacuation. V. *Cast.* Lex. Med. in Voc. *Cenosis.*

ABHEL, in botany, a name given by some to savin, an evergreen garden-shrub, well known in physic in many intentions. *Ger.* Emac. Ind. 2.

ABIB, in the Hebrew chronology, the name of the first month of their ecclesiastical year. This month was afterwards called *Nisan*, and answers to our March. *Calmet.*

ABIES. See FIR-TREE.

ABIGEATUS, ABIGEAT, in the civil law, the crime of stealing cattle, or driving them off, especially in droves, or numbers [a].—[a V. *Briss.* de Verb. Signif. p. 3. Voc. *Abigei. Calv.* Lex. Jur. p. 7. *Voss.* Etym. p. 15. Voc. *Ago. Spieg.* ap. Calv. loc. cit.]

The Roman lawyers generally call this crime *Abigeatus*; the orators and poets *Abactus*.—The criminal who commits it is denominated *Abigeus* or *Abigevus*; sometimes *Abactor*, *Abigator*, and even *Abigeator*, by the Greeks αβιγεω, απελατης, and βοηλατης.

Abigeat was a peculiar species of theft, and had its appropriate process: authors vary as to the essence of it, and its distinction from *furtum*. Some fix its characteristic in the quality of the thing stolen, which is to be cattle: others extend it so as to include other kinds of animals, as fowls, and even servants. Others distinguish it by the quantity of the thing stolen; according to which, he who takes a single sheep, or hog, is only *fur*; he that takes a whole herd *Abigeus*. Others make it essential to *Abigeat*, that it be done clandestinely, as in the night, or by enticement, (*e. gr.* throwing corn to pidgeons) not by open force; and that the thing be afterwards concealed. Some again make the place the essential part, as that the thing be taken out of the fold, house, or pasture; not out of the stables, nor straying in the woods, or highways. Others place it in the habit; as if *furtum* were the first, or an occasional offence, *Abigeat* the practice, or making a trade of it. Lastly, others seem to make the frighting of cattle away, a species of *Abigeat.*

The punishment of *Abigeat* was more severe than that of *furtum*; viz. condemnation to the mines, banishment, or even death itself, according to the quality of the offender. But sometimes in Spain the punishment was more severe than elsewhere, in regard the people of that country were more than ordinarly addicted to it [b].—[b *Briss.* & *Calv.* loc. cit. *Aubert.* in Voc. *Pitisc.* Lex. Ant. T. 1. p. 7. seq.]

ABIGEATUS, among physicians, the procuring an abortion by art or medicine [a]; called also *Abactus*, and *Abigere partum.* See ABORTION.

Hence the name *Abiga*, sometimes given to the herb *chamæpitys*, from its use in that action [b]; and sometimes also to the third membrane of the secundines, on account of its supposed office, *abigere lotium*, to keep off the fœtus's urine from annoying it [c]. See SECUNDINE, URACHUS, &c.—[a *Briss.* de Verb. Signif. p. 3. *Calv.* Lex. Jur. p. 7. b *Plin.* Hist. Nat. l. 24. c. 6. *Gorr.* Med. Defin. p. 504. Voc. χαμαιπιτυς. c *Mart.* Lex. Phil. T. 1. p. 2.]

ABILITY, is used in law, for a capacity of doing certain things, relating either to the acquisition of property, or the transferring of it.

Ability in this sense coincides with *capacity*, and stands opposed to *disability*, or *non-ability.*

Every person is supposed to be *able*, i. e. to have the power of taking and disposing of effects, whom the law does not disable. *Hale* Anal. of Law, § 1. p. 3.

ABLAQUEATION, (*Cycl.*) is synonimous with *baring* of trees in some English writers. It stands contradistinguished from *fossio*; and perhaps from *rastri* and *subaratio*, which were more superficial diggings, and did not reach to the roots. *Salmas.* Exercit. ad Solin. T. 1. p. 516.

This great critic censures Solinus for confounding *rastri* with *Ablaqueation*, and seems to make them opposites: *aliud rastrorum opus in agro & vinea, aliud ablaqueatio:—Fossio igitur & rastri non proprie ad radices pertinent vitium, sed ablaqueatio.* Yet, elsewhere, he himself makes them synonymous, and blames the same Solinus for distinguishing them.—*Sic etiam erraverit Solinus, qui rastros & ablaqueationem discernit.* Id. ubi supra, p. 512.

Ablaqueation was practised by the antients on all trees [a]; particularly the vine, and myrrh-tree [b]. The instrument by which it was done, seems to Salmasius, to have been the rastri [c]: its design, and use was, in general, to promote the fertility of fruit-trees, by exposing their roots to the sun and air, for fresh influence; and thus both increase their bearing, and accelerate the ripening of their fruit [d]. But in the myrrh-tree, *Ablaqueation* is said to have had farther views, viz. to cool its root, and hereby promote the bleeding of its gum [e]. Modern husbandmen also find it of use for curing the moss [f], and phyllomania [g]; and for abating the exuberance of trees [h]. The larger roots alone, not the lesser fibres, according to Bradley, are to be laid bare.——Dr. Tong takes *Ablaqueation* to have much the same tendency and use with cross-hacking; and thinks it chiefly contributes to fertility, by hindering the nourishment of the outer coats, and circles of the roots, as well as of suckers and leaves; and thus supplying a greater stock of nutriment to the inner coats, which alone reaches to the outermost sprigs of the last years, on which the fruit are chiefly to be expected [i].—[a *Plin.* Hist. Nat. l. 17. c. 39. b Id. l. 12. c. 33. c Lib. cit. p. 516. d *Pitisc.* Lex. Ant. T. 1. p. 8. e *Diodor.* Bibl. l. 5. p. 317. f *Evel.* Terra, p. 309. g Id. ibid. p. 327. h Phil. Trans. N°. 46. p. 916. i In Phil. Trans. loc. cit.]

The season for *Ablaqueation* is in autumn: an old writer fixes it before the middle of October [k], for the benefit of the winter-rain, and snow-water: a late botanic professor places it in January [l].—[k *Curt.* de Cult. Hort. ap. Pitisc. ubi supra. l *Bradl.* Dict. Bot. in voc. Dict. Rust. Voc. *Baring.*]

ABLATIVE, (*Cycl.*) the question concerning the Greek *Ablative* has been the subject of a famous literary war, between two great grammarians, Frischlin [a] and Crusius [b]; the former of whom stood for, and the latter against the reality of it.

The dispute is scarce decided to this day. Sanctius [c], and the Port-royalists [d] still maintain the affirmative; Perizonius [e] the negative. The chief reason alledg'd by Sanctius is, that the Roman writers often joined Greek words with the Latin prepositions, which govern *Ablative* cases, as well as with nouns of the same case. To which Perizonius answers, that the Latins antiently had no *Ablative* themselves; but instead thereof, made use, like the Greeks, of the dative case; till at length they formed an *Ablative*, governed by prepositions, which were not put before the dative: that, at first, the two cases had always the same termination, as they still have in many instances: but that this was afterwards chang'd in certain words. 'Tis no wonder then, that the Latins sometimes join prepositions which govern an *Ablative* case, or nouns in the *Ablative* case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin *Ablative* [f].—[a Demonstratio Græcos non carere Ablativo. Argent. 1586. 4to. b Antistrigilis cum refutatione demonstrat. Ablativi Græcorum. Argent. 1586. 8vo. c In Minerva, Ed. Perizon. p. 26. d Abreg. de la Nouv. Meth. Grecq. c. 2. e Not. ad Sanct. loc. cit. f *Le Clerc*, Bibl. Univ. T. 5. p. 303. seq.]

ABLATIVE *absolute*, in grammar. See ABSOLUTE, *Cycl.*

ABLECTI, in antiquity, a choice or select part of the soldiery in the Roman armies, picked out of those called *extraordinarii.*

The word is Latin, formed of *ablegendo*, *quasi ex plurimis lecti*, of the Greek απολεγειν [a].——Pitiscus [b] takes the word *Ablecti* for a corruption, and to have arisen from a wrong translation of απολεκτος; which, according to him, ought rather to have been rendered *selecti*: which is confirmed by Turnebus, who alters *Ablectæ ædes* in Plautus, for *abjectæ*: but Aquinas defends the authenticity of *Ablecti*; and urges, after Scaliger, *ablegmina*, on his side, as a word of the same origin [c].—[a *Aquin.* Lex. Mil. T. 1. p. 3. *Kenn.* Rom. Ant. Not. l. 4. c. 6. p. 192. b *Scal.* in Fest. Voc. *Albegmina.* c *Pitisc.* Lex. Antiq. Rom. T. 2. p. 721. Voc. *Selecti. Aquin.* loc. cit.]

ABLEGMINA, in antiquity, those choice parts of the entrails of victims, which were offered in sacrifice to the gods.

In Festus we find the word *Albegmina* [a], which Scaliger [b], and others after him [c], take for a corruption of the text; the word being apparently derived from *ablegere*, to cull or separate; formed in imitation of the Greek απολεγειν, which signifies the same. In which sense *Ablegmina* coincides with απολεγμοι; unless, as others suggest, the word be of Latin origin, and derived from *albeo*, whence *Albegmina*, on account of the whiteness of these parts. —[a *Fest.* in *Albegmina.* b Not. in Fest. c *Voss.* Etym. p. 2.]

The *Ablegmina* were otherwise called *prosiciæ*, *porriciæ*, *prosecta*, and *prosegmina* [d]: they seem to have differed from *strebula*, which were the like morsels of the fleshy parts [e]; and from *augmentum*, which particularly denoted a part of the liver [f].—[d *Baxt.* & *Dan.* in Voc. e *Paul. Diacon.* in Fest. Voc. *Strebula.* f *Varro*, de Ling. Lat. l. 4. *Briss.* de Formul. l. 1. p. 24. *Lomeier*, de Lustrat. c. 23. p. 225.]

Some authors make *Ablegmina* to denote all those parts of the victims which were offered to the deities; contrary to the authority of Festus, who restrains *Ablegmina* to the *exta*, or entrails only.

The *exta* being found good, were to be prosected or parted; *i. e.* the extremes or prominent parts cut off, as *Ablegmina*, to be sprinkled with flour, and burnt by the priests on the altar, pouring wine on them [g].——Tertullian rallies the heathens for thus serving their gods with scraps and offals [h].—[g *Pitisc.* Lex. Ant. T. 1. p. 8. h *Tertull.* Apolog. c. 13. *Non dico quales sitis in sacrificando, cum enecta & tabidosa quæque mactatis: cum de optimis & integris supervacua quæque truncatis, capitula & ungulas; quæ domi pueris vel canibus quoque destinas-setis.*]

ABLET, or ABLEN, in zoology, a name given by some to the common bleak, a small fresh-water fish, called in Latin *Alburnus.* See ALBURNUS. *Willoughby*, Hist. Pisc. p. 263.

The *Ablet* is truly and properly a ſpecies of cyprinus, and is diſtinguiſhed by Artedi by the name of the five-inch cyprinus, with twenty rays in the *prima ani*. See the articles ALBURNUS and CYPRINUS.

ABLUTION, (*Cycl.*)—Ablutions appear to be as old as any ceremonies, and external worſhip itſelf. Moſes enjoined them; the heathens adopted them [a], and Mahomet and his followers have continued them: thus they have got footing among moſt nations, and make a conſiderable part of moſt eſtabliſhed religions.—The Egyptian prieſts had their diurnal and nocturnal *Ablutions* [b]: the Grecians their ſprinklings [c]: the Romans their luſtrations and lavations [d]: the Jews their waſhings of hands and feet [e], beſide their baptiſms [f]: the antient Chriſtians had their *Ablutions* before communion [g], which the Romiſh church ſtill retain before their maſs, ſometimes after [h]: the Syrians, Cophts, &c. have their ſolemn waſhings on Good-Friday [i]: the Turks [k] their greater and leſſer *Ablutions*; their Gaſt and Wodou, their Aman, Taharat, Guſul, and Abdeſt, &c.—[a V. *Thomaſ.* Meth. Etud. Poet. P. 3. l. 1. c. 16. p. 240. b *Herod.* l. 2. c. 37. c *Pott.* Archæol. l. 2. c. 4. d *Briſſon.* de Formul. l. 1. p. 4. ſeq. *Struv.* Antiq. Rom. c. 2. p. 192. *Pitiſc.* Lex. Ant. Mohamm. l. 1. c. 8. *Le Brun*, Voy. de Levant. ap. Jour. des Scav. T. 58. p. 438.]

ABOLITION, (*Cycl.*) is particularly uſed among civilians, for remitting the puniſhment of a crime.

In this ſenſe *Abolition* is a lower ſpecies of amneſty, which takes off the puniſhment, but not the infamy: *Liberat, ſed notat.*

Aloyſius Catalanus has a treatiſe expreſs on amneſty, and *Abolition*. Tract. Criminalis Amneſtiæ, præſertim *Abolitionis* & Indultus. Ven. 1605. & 1644. fol.

ABOLITION is alſo particularly uſed, among Roman lawyers, for the annulling a proſecution, or legal accuſation.

Abolition in this ſenſe differs from amneſty, and oblivion; in that in the former, the accuſation might be renewed, even by the ſame proſecutor, which in the latter was extinguiſhed for ever.

Within thirty day after a public *Abolition*, the ſame accuſer, by the prince's licence, was allowed to renew the charge; after a private *Abolition*, another accuſer might renew it, but the ſame could not.

This kind of *Abolition* is either granted in favour of the accuſed, or of the accuſer; and is either public, granted by the prince or ſenate, on occaſions of publick rejoicing, victory, and congratulation; or private, ſued for to the preſident or judge, by one of the parties; frequently by the accuſer himſelf, who after having imbarked in the proſecution, by ſubſcribing his name to the charge, could not by the Turpilian ſenatus-conſult otherwiſe deſiſt, without incurring infamy. On ſuch occaſions therefore the accuſer would *petere Abolitionem*; that is, move for an *Abolition:* which was only granted, on his ſhewing fair and honeſt motives for withdrawing the charge; viz. inadvertency, youth, warmth, or the like: nor was it granted without the conſent of the accuſed; or if the accuſation appeared to have been utterly falſe, or malicious, &c.

For the accuſed, the charge againſt him was alſo *aboliſhed* by the death of the accuſer, or his being incapacitated from proſecuting by reaſon of ſickneſs, or the like.———An action of injury was *aboliſhed* by diſſimulation: a ſentence of condemnation by indulgence. V. *Briſſ.* de Verb. Signif. p. 4. *Calv.* Lex. Jur. p. 8. ſeq.

ABOLITION was alſo uſed for expunging a perſon's name out of the public liſt of the accuſed, hung up in the treaſury.

This was called *abolere nomen*; and, like the former, was either public, as that under Auguſtus, when all the names, which had long hung up, were expunged at once [a]; or private, done at the motion of one of the parties [b].—[a *Suet.* in Auguſt. c. 32. n. 5. *Diuturnorum reorum, & ex quorum ſordibus nihil aliud quam voluptas inimicis quæreretur, nomina abolevit: conditione præpoſitâ, ut ſi quem quis repetere vellet, par periculum pœnæ ſubiret.* b *Pitiſc.* Lex. Ant. T. 1. p. 9.]

By ſeveral laws in the Theodoſian code it appears, that an *Abolition* of debts was ſometimes granted the debtors to the fiſcus. We have a medal of the emperor Adrian, wherein that prince is repreſented ſtanding with a ſcepter in his left hand, and a lighted torch in his right; with which he ſets fire to ſeveral papers in preſence of the people, who teſtify their joy and gratitude by lifting up their hands towards heaven. The legend is, *Reliqua vetera* H. S. *nummis abolita. Aubert.* ap. Richel. in Voc.

ABOLLA, in antiquity, a warm kind of garment, lined or doubled, uſed by the Greeks and Romans; chiefly out of the city, in following the camp [a].

The word is Latin, formed, as ſome imagine, from *bulla*, on a ſuppoſition that this veſtment was garniſhed with thoſe ornaments called *bullæ* [b]. Others, denying this circumſtance, derive it from the Greek αμβολη, of αναβολη, *amictus*, cloathing [c].—[a *Aquin.* Lex. Mil. T. 1. p. 4. *Pitiſc.* Lex. Ant. T. 1. p. 9. b *Bayf.* de Re Veſtiar. c. 15. c *Voſſ.* Etym. p. 2. *Scal.* in Feſt. Voc. *Bulla. Baxt.* Gloſſ. p. 7.]

Critics and antiquaries are greatly divided as to the form, uſe, kinds, &c. of this garment. Papias makes it a ſpecies of the *toga*, or gown; but Nonius, and the generality, a ſpecies of the *pallium*, or cloak.

The *Abolla* ſeems rather to have ſtood oppoſed to *toga*, which was a garment of peace, as the *Abolla* was of war; at leaſt Varro and Martial [d] place them in this oppoſite light.

Some, after Nonius, hold it to have been a military garb alone; others, after Papias, a ſenatorial; and Salmaſius [e] particularly, to have been worn by the preſidents in the provinces, and even by the præfecti of the city, when they adminiſtered juſtice; which Pitiſcus endeavours to refute. Others will alſo have the *Abolla* to have been uſed by the philoſophers [f], particularly the Stoics, Cynics, &c. Laſtly, others reconcile all theſe variances, by making divers kinds of *Abolla's*, accommodated to different occaſions and profeſſions. Even kings appear to have uſed the *Abolla:* Caligula was affronted at king Ptolemy for appearing at the ſhews in a *purple Abolla*, and by the eclat thereof turning the eyes of the ſpectators from the emperor upon himſelf.—[d *Mart.* Epigr. 48. l. 8. v. 1. e De Uſur. c. 3. *Pitiſc.* T. 1. p. 9. f *Ferrar.* Elect. II. 9. *Fabric.* Bibl. Antiq. c. 17. p. 558. *Donat.* Elucid. in Suet. Calig. c. 35.]

ABORTION, (*Cycl.*)—The antient Greek legiſlators, Solon and Lycurgus, prohibited this practice of creating *Abortion*. Whether or no it was permitted among the Romans, has been much diſputed, between two learned modern Civilians. 'Tis certain the practice, which was by them called *viſceribus vim inferre*, was frequent enough [a]: but whether there was any penalty on it, before the emperors Severus and Antonine, is the queſtion? Noodt maintains the negative; and further, that thoſe princes only made it criminal in one particular caſe: viz. of a married woman's practiſing it out of reſentment againſt her huſband, in order to defraud him of the comfort of children; this was ordered to be puniſhed by a temporary exile: *ſiqua prægnans vim viſceribus ſuis intulerit ne inimico marito filium procrearet, temporali exilio coerceatur* [b]. He adds, that there was no general prohibition of the practice before Gratian and Valens. 'Tis true we find in Cicero an earlier inſtance, of a woman puniſhed for this fact [c]; but it was in Mileſia, a country not ſubject to the Roman laws [d]. Bynkerſhoeck however denies that a woman was allowed to drink the *poculum Abortionis, impunè*; and the reaſon he gives, is, that the womb was the huſband's property, who was declared, by the laws, the ſole *cuſtos* of it; to prevent his being impoſed on in the children he was to bring up. But then this does not affect women, who had been impregnated by others than their huſbands.

The foundation on which the practice is ſaid to have been allowed, was, that the fœtus, while *in utero*, was reputed as a part of the mother, ranked as one of her own viſcera, over which ſhe had the ſame power as over the reſt: beſides, that it was not reputed as a man, *homo*; nor to be alive, otherwiſe than as a vegetable: conſequently, the crime amounted to little more than that of plucking unripe fruit from the tree. V. *Juven.* Sat. 6. v. 500. *Senec.* Conſolat. ad Helviam Matrem, c. 16.

This laſt cited author repreſents it as a peculiar glory of Helvia, that ſhe had never, like other women, whoſe chief ſtudy is their beauty and ſhape, deſtroyed the fœtus in her womb. *Nunquam te fœcunditatis tuæ quaſi exprobraret ætatem, puduit: nunquam more alienarum quibus omnis commendatio ex forma petitur, tumeſcentem uterum abſcondiſti quaſi indecens onus, nec inter viſcera tua conceptas ſpes liberorum eliſiſti.*—[a *Tryphonin.* l. 39. D. de Pœnis. b *Cic.* Orat. pro Cluent. c *Noodt*, Julius Paulus ſive de partus Expoſit. & Nece. c. 11. p. 75. ſeq. d Lib. cit. p. 77. ejuſd. *Noodt*, Reſp. ad Bynkerſh. in Bibl. Anc. Mod. T. 18. p. 373.]

The primitive fathers, Athenagoras [e], Tertullian, Minutius Felix [f], Auguſtin [g], &c. declaimed loudly againſt the practice, as virtual murder; *Homicidii feſtinatio eſt, prohibere naſci; nec refert, natam quis eripiat animam, an naſcentem diſturbet* [h]. Several councils have declared againſt it [i]. Yet we are told that the modern Romiſh eccleſiaſtical laws allow of diſpenſations for it. Egane [k] mentions the rates at which a diſpenſation for it may be had.—[e Legat pro Chriſt. p. 398. f Octav. p. 91. g Serm. 3. de Temp. ap. Barthol. de Puerper. p. 79. h *Tertull.* Apolog. ap. Noodt Jul. Paul. p. 79. i *Bingh.* Orig. Eccleſ. l. 16. c. 10. §. 4. k Book of Rates, Rome. p. 11.]

In ſome countries, the procuring of *Abortion* is ſtill ſaid not only to be allowed, but even enjoined by law; as among the Formoſans, if we may believe Mr. Pſalmanazar, who relates, that the women here, though married, are not allowed to breed before thirty-five years of age. When with child before that time, they are obliged to make themſelves *abortive* by force: to this end the prieſteſs (for in that country it ſeems the prieſtly

office belongs to women) tramples on the patient's belly, till ſhe bring forth. The author laſt cited, who pretends to have lived long in that country, affirms he has known women loſe their births in this manner fifteen of ſixteen times. *Sit penes ipſum fides.*

The practice of artificial *Abortion* is chiefly in the hands of women and nurſes, rarely in that of phyſicians; who, in ſome countries, are not admitted to the profeſſion without abjuring it. Hippocrates, in the oath he would have enjoined on all phyſicians, includes their not giving the *peſſus Abortivus*. Tho' elſewhere he gives the formal proceſs, whereby he himſelf procured a maid to miſcarry. The time for it is preſently after impregnation: at leaſt within the third or fourth month of geſtation [m]. The manner of effecting it is chiefly by medicines of the purgative, and deobſtruent kind: Roman authors ſpeak of the *poculum Abortionis*, or *abortive* draught, frequent among them. External violences are alſo ſometimes had recourſe to; as leaping from a ſtool, preſcribed by Hippocrates: obſtinate faſtings, and vehement evacuations, have been frequently practiſed for the ſame end.—Yet all the powers of medicine often fail to procure *Abortion*; by reaſon of the naturally cloſe contraction of the orifice of the uterus [n]; which has been known to hold out againſt the moſt malignant fevers, dyſenteries, ſalivations [o], and the like; againſt the ſtrongeſt aperients and evacuants [p]; againſt diſtilled oils of juniper, ſavin, ſuccinum; againſt large quantities of crocus metallorum, artemiſia, myrrh, mercury, the farina of muſcus terreſtris, &c.—[m *Erndl.* de Itin. Angl. p. 84. n *Albrecht.* Obſ. 165. in Ephem. Acad. N. C. dec. 2. an. 8. p. 384. o *Barthol.* Obſ. 52. in Ephem. Acad. N. C. dec. 1. an 1. *Albr.* loc. cit. *Zacut. Luſit.* Prax. Admir. Obſ. 43. ſeq. p *Zacut.* Prax. Admir. Obſ. 144.]

The moſt fatal method is by punctures of the uterus, with a pointed inſtrument for the purpoſe; too often uſed among us, and not unknown to the ancients.—Patin mentions a midwife hang'd at Paris, for killing a fœtus in the womb, by running a ſtilletto, or kind of bodkin, up the vagina, thro' the orifice of the uterus; by which a miſcarriage was procur'd, but with ſuch ill ſucceſs, that the mother was ſeized with convulſions, and died miſerably [q]. The criminal confeſs'd ſhe had treated many before in the ſame manner, with good effect. Our own age and country afford a parallel inſtance, a woman having been a few years ago executed among us for the like fact. Tertullian has a paſſage which ſhews the ſame was practiſed in thoſe days; *eſt etiam æneum ſpiculum, quo jugulatio ipſa dirigitur cæco latrocinio ἐμβρυοϑάκτην appellant, utique viventis infantis peremptorium* [r]. The operation, conſidering the tenderneſs of the part, muſt be of the utmoſt danger [s]: Brendelius gives an account of what he obſerv'd in diſſecting a girl at Norimberg, in 1714, who died of the operation, which ſhe had perform'd on herſelf; the neck of the uterus appear'd exceedingly diſtended, the veſſels lacerated and mortified, the uterus itſelf inflam'd and putrefy'd [t], &c.—[q *Patin.* T. 1. Lett. 191. An. 1660. r *Tertull.* de Anim. c. 35. Ed. *Rigalt.* p. 328. *Erndl.* lib. cit. p. 85. s V. *Erndl.* ubi ſupra, p. 87. t Ephem. Acad. N. C. Obſ. 167. p. 377.]

To prevent ABORTION. See MISCARRIAGE.

We meet with many anomalous caſes of *Abortions*, not yet taken into the ſyſtem of phyſic; as, of *Abortions* happening at new, and full moon; *Abortions* by the way of the navel, or anus; *Abortions* caus'd by poiſon, manna [u], bathing [x], a box on the the ear, worms, ſtone, juniper, fumes of ale, coſtiveneſs, and the like; *Abortions* cauſed by epilepſies, prevented by iſſues, prognoſticated by lice, &c. [y]. *Abortions* without lochia [z], attended by moles [a], with a retention of the ſecundines [b], ſwelling of the body, diabetes, and the like.—[u Ephem. Acad. N. C. dec. 1. an. 6. p. 355. x Id. dec. 2. an. 1. p. 305. y Id. dec. 2. an. 9. p. 151. z Id. dec. 2. an. 4. p. 334. a *Gullman.* Obſ. 92. Ephem. Acad. N. C. Cent. 7. p. 217. b Id. dec. 2. an. 1. p. 230. & 292.]

But what ſhall we ſay to *Abortions* by the mouth? Grave authors give inſtances of them; as Salmuth [c], Bartholin [d], Maroldus [e], Sachs [f], &c. yet their reality may well be called in queſtion. That famous one of the ſhoemaker's wife, related by Salmuth, has been vigorouſly attacked by Lud. Kepplerus, and defended by Bartholin: ſome account for it, by ſuppoſing the fœtus conceived in the ſtomach, the huſband, it ſeems, being ſuſpected of ſome abominable way of converſing with his wife [g]. Maroldus gives a different rationale; he ſuppoſes the conception to have been *in utero*; but how it came thence to the ſtomach is a myſtery; ſince naturally there is no canal or communication between the two, whatever ſome authors imagine to the contrary; who pretend it might have aſcended by the veins of the uterus to the vena cava, and thence have fallen into the ſtomach [h]. This ſyſtem Maroldus refutes, as alſo another of Bartholin, who apprehended that the ſtomach and uterus might have been ulcerated, and that the two viſcera being contiguous in pregnant women, the fœtus had been ſhifted out of one into the other. Maroldus reſolves the whole into the vitious conformation of the uterus, which he ſuppoſes had an orifice extraordinary, with a canal paſſing from the fund and opening into the ſtomach; ſomething of which ſtructure has been obſerved in frogs [i].—[c *Salmuth.* Cent. 3. Obſ. 94. d *Barthol.* de Inſolit. Partus Viis. c. 9. e Ephem. Acad. N. C. dec. 1. An. 1. Obſ. 108. p. 215. ſeq. f Ephem. Acad. N. C. dec. 1. an. 1. Obſ. 109. Schol. p. 221. ſeq. g *Barthol.* Anat. Reform. p. 168. h *Fondech.* in Lum. 2. p. 244. i *Marold.* Diſſ. de Abortu per Vomitum rejecto, Ephem. Acad. N. C. ubi ſupra. p. 209. ſeq.]

ABORTIVE *Flux*, *fluxus Abortivus*, is ſometimes uſed, among the antients, as ſynonymous with abortion or effluxion; viz. where the embryo loſes its hold, and ſlips away [a]. In this ſenſe, the eagle-ſtone is celebrated for ſtopping *Abortive* fluxes; for which end it was to be hung to the arm, *ſubnexus ſpem uteri defendit a fluxibus Abortivis* [b]. See ÆTITES.—[a *Salm.* Exerc. Plin. p. 715. 1. D. b *Solin.* Polyhiſt. p. 67. B.]

Among modern phyſicians, *Abortive* fluxes are chiefly underſtood of a kind of hæmorrhages, which ſometimes precede, and bring on abortion; at other times burſt forth in the act of excluſion. *Junck.* Conſp. Med. tab. 11. p. 60.

In this ſenſe, a late author defines them a ſpecies of uterine hæmorrahges, happening to married women; when after a ſtoppage of the menſes, for three or four months ſucceſſively, with a gradual ſwelling of the abdomen, and other ſigns of pregnancy, the blood begins to iſſue from the womb, at firſt ſparingly, like the regular menſes, but afterwards, burſts out with great force, attended with anxieties, fainting fits, and ſometimes with miſcarriage. *Blaz.* Spec. Pathol. tab. 23. p. 125.

The cauſe is a violent ſeparation of the ſecundines from the uterus [c]; which may ariſe from a vehement fit of paſſion, or motion of the body, a fall, fright, or the like. Thunder, lightning, hot liquor, too liberal uſe of deobſtruents, or the navel-ſtring being too ſhort, ſometimes occaſion an *Abortive* hæmorrhage [d].—[c *Davent.* Art Midwif. c. 33. p. 160. d *Bohn.* Diſſ. de Abort. Salub. app. Nov. Lit. Germ. 1708. p. 104.]

ABRAHAMIANS, or ABRAHAMITES, a ſect of heretics, who renewed the error of the Paulicians.

They took their name from that of their leader Abraham, a native of Antioch, by the Arabs called Ibrahim; whence alſo the name *Ibrahimiah*, given by them to this ſect. The *Abrahamians* aroſe about the cloſe of the eighth century, and were ſuppreſſed by the vigilance of Cyriacus, patriarch of Antioch. *Elmacin.* Hiſt. Sacr. p. 123. *D'Herbel.* Bibl. Orient. p. 283. Voc. *Ibrahimiah.* Trev. Dict. Univ. T. 1. p. 39.

ABRAHAMITES is alſo uſed, in church-hiſtory, for a party of monks, who ſuffered death for the worſhip of images under Theophilus. *Conſt. Porphyrog.* l. 3. c. 11. Trev. Dict. Univ. T. 1. p. 40.

ABRAMIS, in ichthyology, a name given by Bellonius and others, to the *Cyprinus latus* or Bream. See the article CYPRINUS, and BRAMA.

ABRAUM, in natural hiſtory, a name given by ſome writers, to a ſpecies of red clay, uſed in *England* by the cabinet-makers, *&c.* to give a red colour to new mohogany-wood; we have it from the iſle of Wight, but it is alſo found in Germany and Italy. The German writers call it *Tam Erde*, and the writers of ſome other nations *Terra Adamica*, from an opinion, that it was out of this very kind of earth that *Adam* was made.

ABRAXAS, *(Cycl.)* a barbarous word, denoting a power which preſides over three hundred ſixty five others, the number of days in the year. *Du Cang.* Gloſſ. Græc. Add. p. 5. Mem. de Trev. Nov. 1703. p. 220. *Caſt.* Lex. Med. p. 3.

Abraxas is a word of obſcure origin, framed by antient heretics as ſhould ſeem for quaintneſs ſake [b]: it is ſuppoſed to be technically compounded of the Greek letters, conſidered as numeral characters; according to the cuſtom of the Grecians, who expreſſed their numbers by letters of the alphabet; the values of which in the preſent word ſtand thus: A 1, B 2, P 100, A 1, Ξ 60, ΑΣ 200; which added together make the number 365.

The word is uſually written, among modern authors, *Abraxas*, tho', as ſome hold, by a corrupt tranſpoſition of the letters Σ and Ξ, for *abraſax*, as it is found in all the Greek fathers [c], as well as on antient ſtones. Irenæus indeed has *Abraxas*, but the reaſon may be, that the chapter in which the word occurs is only extant in Latin; ſo that tho' it be in Greek characters, the orthography is of Latin copiſts or tranſlators. — In ſtrictneſs, the word ought to be written in Greek characters, ΑΒΡΑCΑΞ; ſince beſides that the inventors of it ſpoke that language, the word does not contain the number 365, when written in the Latin character. Hence a further error in moſt books, wherein the word occurs in the ſmaller or running character, on account of the Greek ſigma; which having in antient inſcriptions the ſame figure with the Latin C, is often rendered by a Roman C inſtead of S; whence *Abracax* for *Abraſax* [d].—[b *Du Cang.* Gloſſ. Lat. Præf. p. 21. *Reiman.* Hiſt. Voc. Lat. p. 67. c *Baron.* Ann. 120. N°. 10. T. 2. App. d *Trev.* Dict. Univ. T. 1. p. 38.]

ABRAXAS is more particularly uſed, in the Baſilidian theology, for the ſupreme God, as ſuppoſed to contain the values or powers of 365 dependent deities. Vid. *Iren.* adv. Hæreſ. l. 1. c. 23. *Tertull.* de Præſcr. c. 46. *Epiphan.* Hæreſ. 24. n. 7. 8. p. 56. *Auguſt.* de Hæreſ. c. 4. *Danæus* ad eund. p. 11. *Euſeb.* Hiſt. Eccleſ. l. 4. c. 7. *Hieron.* ad Amos, c. 3. *Theodoret.* Hær. Fab. l. 1. c. 4. *Gaſſend.* Vit. Pireſc. p. 38.

Abraxas was properly the principle of the Gnoſtic hierarchy; the ſpring from whence their plurality of Æons aroſe [a]. From *Abraxas* proceeded the primigenial mind; from the primigenial mind the logos, or word; from the word, phroneſis or prudence; from prudence, ſophia and dynamis, or wiſdom and ſtrength; and from theſe two proceeded principalities, and powers, and angels; and from theſe, other angels, to the number of 365, the regents or intelligences of ſo many celeſtial orbs [b].—[[a] *Montf.* Palæog. Gr. l. 2. c. 8. p. 177. [b] *Sagitt.* Intr. Hiſt. Eccl. T. 1. p. 883. *Micræl.* Hiſt. Eccl. l. 2. Sec. 1. p. 291.]

The Baſilidians, who paſs for the authors of the *diſciplina arcani*, and the Platonic trinity, are ſuſpected among Chriſtians of ſome meaning ſtill deeper, and more myſterious, in their *Abraxas*. Several have even ſmelled ſomething of the goſpel trinity concealed in this word; which they explain, by ſuppoſing it compounded of the initial letters of the Hebrew words *Ab ben rouah*, *q. d.* father, ſon, and ſpirit [c]. Wendelin, canon of Tournay, and father Hardouin, have given more preciſe explications of the word, according to this ſyſtem. The former makes it ſtand for *pater*, *filius*, *ſpiritus ſanctus*, *ſalus a ligno* [d]: the latter, improving ſomewhat on the explication, makes it repreſent as hereunder [e].

A	Ab	Pater	A	1
B	Ben	Filius	B	2
P	Rouah-hakadoſh	Spir. Sanctus	P	100
A	ανθρώπους	homines	A	1
C	σωζων	ſalvans	C	200
A	αγιω	per ſacrum	A	1
ΞΞ	ξυλω	lignum	ΞΞ	60
				365

[[c] *Platon.* unveil. P. 1. c. 8. p. 25. [d] *Honor.* Reflex. Regl. Crit. l. 4. Diſſ. 8. p. 597. [e] Mem. de Trev. Sept. 1701. p. 235. ſeq.]

ABRAXAS is alſo uſed, among antiquaries, for a ſpecies of graven gem, on which the word *Abraxas* is uſually inſcribed; ſuppoſed to have been worn by the antient Gnoſtics, Baſilidians, and Carpocratians, as an amulet or taliſman againſt diſeaſes. *Baudel.* Util. des Voy. p. 340. ſeq. Nouv. Rep. Lett. T. 6. p. 424. Bibl. Univ. T. 4. p. 260.

Abraxas, in this ſenſe, is ſynonymous with Baſilidian ſtone [a], a name by which ſome authors call theſe antiques; or *Abraxean ſtone* [b], as they are denominated by others.—[[a] *Macar.* de Gemm. Baſilid. *Honor.* Reſl. Reg. Crit. l. 4. Diſſ. 8. p. 598. *Chiffl.* ad Macar. Capell. Prodr. Icon. Mem. de Trev. Nov. 1703. p. 2018. [b] *Montf.* Palæog. Gr. l. 2. c. 8. p. 177. ſeq.]

Abraxas's are of divers figures and ſizes; ſometimes in that of rings to be worn on the finger; in which form they were ſuppoſed of great efficacy for driving away flies. *Caſt.* Lex. Med. p. 3.

Abraxas's are frequent in the cabinets of the curious: a collection of them, as compleat as poſſible, has been much deſired by ſeveral [c]. There is a fine one in the abby of S. Genevieve, which has occaſioned much inquiry. They are chiefly of the third century; moſt of them ſeem to have come from Egypt [d]; whence they become of conſiderable uſe for explaining the antiquities of that country.

Macarius, Chifflet, and Capello have works expreſs on *Abraxas's*: the two former have given explications of a great number of theſe ſtones; the laſt, figures only, without explications. The former are reproached with exceſs of conjectures and erudition [e]; the latter, with puzzling the reader with mere riddles [f]: there is ſtill room for ſomething better on the ſubject [g].—[[c] V. Bibl. Ital. T. 4. p. 148. [d] *Baudel.* ubi ſupra. Bibl. Ital. T. 4. p. 148. [e] *Sagittar.* ubi ſupra. [f] Mem. de Trev. loc. cit. [g] Bibl. Ital. ubi ſupra.]

Abraxas's have ſometimes no other inſcription beſide the word; but more uſually ſome ſymbol of the Baſilidian god [h]. Beſides which, we ſometimes find other marks and words adjoined; as, the names of ſaints, angels, Baſilidian virtues, apoſtles, and the ineffable name Jehovah itſelf, either at length, or in the abbreviature IAΩ; ſometimes the words σαβαωθ Αδωναι, or the names of other gods; as Mithras, or Mithraξ; שמש, Semes, Sol; Ανουβις; εις Ζευς Σεραπις; and the like [i]. Sometimes Iſis ſitting on a lotus [k], or Apis ſurrounded with ſtars; ſometimes monſtrous compoſitions of animals, obſcene images, Phalli, and Ithyphalli [l]. The graving of *Abraxas's* is not uniform, rarely good [m]; the reverſe, on which is the word, is ſaid to be ſometimes of a lower and a more modern taſte than the face [n]. The characters are uſually Greek, ſometimes Hebrew, Coptic, or Hetrurian; and ſometimes of a mongrel kind, forged as ſhould ſeem on purpoſe to make their import impenetrable [o]. 'Tis diſputed, whether or no the Veronica of Montreuil [p], or the Granite obeliſk, mentioned by Gori [q], be *Abraxas's*.—[[h] *Baudel.* ubi ſupra. [i] *Capell.* Prodr. Icon. N°. 124. *Montf.* ubi ſupra. Journ. Scav. T. 33. p. 93. Mem. de Trev. ubi ſupra, p. 2020. ſeq. *Hardouin.* in Mem. Trev. Sept. 1701. p. 239. *Spond.* Ann. Bar. An. 120. [k] *Capell.* ubi ſupra. Mem. Trev. loc. cit. [l] *Montf.* ubi ſupra, p. 178. ſeq. [m] *Baudel.* ubi ſupra, p. 340. [n] *Hardouin.* ubi ſupra, p. 239. [o] *Montf.* p. 180. [p] *Mabill.* Muſ. Ital. T. 1. p. 89. *Honor.* Reſl. Reg. Crit. l. 4. Diſſ. 8. p. 597. [q] *Salvin.* Inſcr. Ant. P. 1. Bibl. Ital. T. 4. 147.]

ABRIDGMENT, (*Cycl.*)—*Abridgments of the common law*, are a kind of digeſts of the numerous caſes, arguments, readings, pleadings, &c. diſperſed in the year-books, and other reports, and books of law; reduced under proper heads or common places [a]. The firſt was that of Statham, which comes as low as Henry VI. That of Fitzherbert was publiſhed in 1516 [b]. Brook's in 1573 [c]; of which Hughes's, publiſhed in 1663, is a ſequel [d]. Roll, Danvers, and Nelſon have alſo publiſhed *Abridgments*, including the caſes of later days. To which may be added the new *Abridgment*, and Vyner's *Abridgment*.—[[a] *Nichols*, Engl. Hiſt. Libr. par. 3. p. 233. [b] *Wood*, Athen. Oxon. T. 1. p. 50. [c] *Wood*, loc. cit. p. 110. [d] *Baſſ.* Cat. Law-Books, p. 3.]

Abridgments of the ſtatutes have been made by ſeveral, from Magna Charta to the times of the reſpective abridgers. The firſt by Raſtal, publiſhed in 1559 [e]: the ſecond by Pulton, in 1606 [f]: the third by Wingate, in 1641 [g]: and others ſince by Hughes, Manby, Waſhington, Boult, Nelſon, and the moſt compleat of any by Mr. Cay, in two volumes fol. publiſhed 1739.—[[e] *Wood*, lib. cit. p. 148. [f] Id. ibid. p. 427. [g] Id. T. 2. p. 208.]

Abridgments of books are numerous; 'tis the occupation of one ſet of literati, to make ſhort *Abridgments* from huge volumes; of another ſet, to make huge volumes from ſmall *Abridgments* [h].—We have *Abridgments* of the bible, of the talmud, of the alcoran, and the like. Some in the way of analyſis, others of notitia, others of hiſtory, others of tables, and others of queſtion and anſwer.—We have even *Abridgments* of *Abridgments*; ſuch is the *Abridgment* of Feſtus by Paulus Diaconus, the former of which is itſelf an *Abridgment* of Verrius Flaccus. Many of the voyages in Harris's collection are *Abridgments* of thoſe in Purchas, which themſelves are only *Abridgments*. M. de Renneville, being aſſured that the late king George, to whom he dedicated his hiſtory of the Baſtille, would not be at the pains to read it, gave him an *Abridgment* of it in his preface; but fearing even this would prove too long, he made an *Abridgment* of this *Abridgment* for the Prince of Wales [i]. Modern authors have even found the way to make an *Abridgment* of one book from another: an *Abridgment* of the bible was lately publiſhed by a French monk, *tiré de differens auteurs*, taken from divers authors [k].—The Polyhiſtor of Solinus may ſerve as an inſtance of a bad *Abridgment* [l]; wherein the original, which is Pliny's natural hiſtory, is mutilated, and miſtaken in a thouſand places. On the contrary, Mezeray's *Abregé de l'hiſtoire de France*, is an inſtance of an *Abridgment* preferable to the original itſelf; as being more correct, by ten years labour, and beſides improved with the memoirs of the eccleſiaſtical hiſtory of France, furniſhed him by Meſſ. Launois and Dirois; which, in the opinion of the connoiſſeurs, make the beſt part of the work [m].——[[h] *Gladov.* Præf. Apol. ad Naud. Bibl. Polit. p. 3. [i] Jour. Liter. 1715. p. 207. [k] Abregé de la Sainte Bible, tiré des differens Autheurs, par Dom. R. G. &c. Rou. 1707. V. Jour. des Scav. T. 38. p. 232. [l] *Le Clerc*, Bibl. Univ. T. 19. p. 445. [m] *Le Long.* Bibl. Hiſt. Franc. l. 3. p. 446. Jour. des Scav. Oct. 1719. p. 369. Id. Jan. 1727. p. 36.]

Montaigne lays it down as a maxim, that every *Abridgment* of a good book, is an ill *Abridgment* [n]. In effect, 'tis chiefly the conſideration of ſuperfluities in the original, that warrants an *Abridgment*. Writers, whoſe ſtyle is tedious or diffuſe, or order interrupted with digreſſions and epiſodes, require *Abridgment*: ſuch are Mr. Boyle and Dr. Cudworth; and ſuch are moſt authors repreſented to be by their reſpective abridgers.—[[n] *Montaign.* Eſſ. l. 3. c. 8. p. 950. *Tout Abbregé ſur un bon livre, eſt un ſot Abbregé.*]

Abridgments are uſually ſaid to have had their riſe in the times of ignorance; to have been one of the firſt fruits of that barbariſm which enſued on the decline of the Roman Empire; and to have been unknown in thoſe happy days, when letters flouriſhed among the Greeks and Romans [o]: yet we have ſome traces of them in thoſe times [p].—[[o] V. *Salmaſ.* Præf. ad Ampel. *Baill.* Jugem. des Scav. T. 1. p. 2. c. 11. p. 455. ſeq. [p] Mem. de Trev. An. 1708. p. 1668.]

Many books, which ordinarily paſs for originals, are ſuſpected by learned men to be only *Abridgments*; ſuch are thoſe of Syneſius [q], Apollodorus, Valerius Maximus [r], Stephanus Byzantinus [s], Florus, Athenæus [t], and others. F. Simon has even the temerity to aſſert the ſame of the books of the bible [u].—[[q] Jour des Scav. Sept. 1710. p. 269. [r] *Voſſ.* de Hiſtor. Lat. l. 1. c. 24. p. 123. ſeq. [s] *Ryck.* Præf. in Not. Holſten. ad Stephan. *Baill.* lib. cit. p. 466. ſeq. [t] V. *Caſaub.* Præf. ad Athen. [u] Act. Erud. Lipſ. 1682. p. 97.]

In ſome books it is hard to diſcover which is the *Abridgment*, which the original. Thus it is diſputed between Dr. Grabe and Mr. Whiſton, whether the apoſtolical conſtitutions be an *Abridgment* of ſome antienter conſtitutions, of which there are ſome fragments ſtill extant in the MSS. as the former holds: or theſe fragments an *Abridgment* of the apoſtolical conſtitutions, as is maintained with great zeal by the latter [x].—The common opinion among learned men is, that the ſhorter

epiſtles

epiſtles of Ignatius are the genuine work of that martyr, and the longer a paraphraſe on them, made by a later hand, who has intermixed his own tenets [y]: Mr. Whiſton maintains the contrary, that the longer are the original, and the ſhorter an *Abridgment* of them [z].—[[x] *Whiſt.* St. Clement. &c. Vindic. of Apoſt. Conſt. p. 5. [y] Diſſ. de Epiſt. Ignat. in Cleric. Patr. Apoſt. P. 2. 6. [z] *Le Clerc*, Bibl. Anc. Mod. T. 22. p. 312.]

The uſe of *Abridgments* is either for relieving the memory, or ſaving time, and ſhortning the courſe of ſtudy: ſomething alſo is gained in the price and handineſs of ſmall books, compared with bulky volumes. It has been alledged, that *Abridgments* are chiefly of uſe to the makers; at leaſt to thoſe who have read the originals. A late author adds, that they are chiefly prejudicial to thoſe for whom they are intended, viz. young ſtudents; properly ſpeaking, ſays he, they are only of uſe to thoſe who have no occaſion for them, *i. e.* to proficients. *Baill.* Jug. des Scav. T. 1. P. 2. c. 11. p. 470.

But there are alſo inconveniences attending *Abridgments*; as, their tendency to diminiſh application and ſtudy, by facilitating the acquiſition of knowledge; their conveying only ſuperficial notions, and thus making ſmatterers in ſcience; their maiming good authors, by ſuppreſſing material circumſtances, and thus making them obſcure; and frequently miſrepreſenting them, and thus propagating errors: laſtly, their occaſioning the originals to be overlooked, and in conſequence thereof at length loſt. Thus the loſs of 2000 Roman lawyers is attributed to the digeſt: the loſs of many Greek fathers to the catenæ: that of a number of antient writers on huſbandry, farrying, hiſtory, &c. to the *Abridgments* of Conſtant. Porphyrogenitus; the loſs of Trogus Pompeius to Juſtin; of Dion to Xiphilin; of much of Livy to Florus; of Caſſiodorus to Jornandes, &c.—On theſe grounds, *Abridgments* are but of ill repute in the republic of letters; and are abſolutely condemned by many of the ſeverer critics, though defended by others. Salmaſius, Huet, and Lamy, are of the number of opponents: the ſame Salmaſius, and Le Clerc, with the whole body of journaliſts, bibliothecarians, and epitomiſts, are ſtrenuous advocates of *Abridgments*: 'tis urged in their favour, that they excite and raiſe an appetite for the originals, rather than divert us from them; that many antient books are loſt that were never *abridged*; that many others are ſtill extant of which we have *Abridgments*; that of ſome, the *Abridgments* have been loſt, while the originals are ſtill ſafe; that in the caſe of Dion, part of him was *abridged* by Xiphilin, and part of him is loſt, but the parts are not the ſame: ſo that if the loſs of the twenty laſt books be attributed to that abbreviator, to whom ſhall we aſcribe the loſs of the other thirty-five books, which Xiphilin did not touch? and what reaſon can be alledged, why the twenty-five books ſtill remaining of this hiſtorian did not periſh with the reſt, ſince Xiphilin *abridged* theſe as well as the others? There appears then no great connection between the *abridging* and the loſing of a book; on the contrary, it ſeems owing to *Abridgments*, that many excellent authors are not wholly loſt; that ſome planks at leaſt have eſcaped the general wreck.

ABRIDGING, in algebra, is the reducing a compound problem, or equation to its more ſimple expreſſion. See PROBLEM, EQUATION, and EXPRESSION.

To prevent the mind's being diſtracted with attending to known quantities, concerning which nothing further is required; and to keep the attention entire for the reſt; mathematicians uſe to *abridge* their equations, by expreſſing all the known quantities of the ſame term, by a ſingle letter.—For an inſtance: to *abridge* the equation

$$\begin{array}{l} x^3 - axx + abx - abc = 0 \\ \quad -b \quad +ac \\ \quad -c \quad +bc \end{array}$$

All the known quantities $-a-b-c$ of the ſecond term are ſuppoſed equal to one ſingle letter $-n$: all the known quantities $+ab+ac+bc$ of the third term, equal to another letter $+p$: and all the known quantities $-abc$ of the fourth term to a ſingle letter $-q$. By which means we have $x^3 - nxx + px - q = 0$, inſtead of the equation propoſed. *Reyn.* Anal. Demonſt. l. 2. ſec. 2. §. 17. p. 36.

An equation thus *abridged*, is called a formula. See FORMULA.

ABROCAMENTUM, in antient law writers. See ABROCHMENT, *Cycl.*

ABROKUS, in botany, a name uſed by ſome of the Latin writers, for the *bromus*, or *avena ſterilis*, the wild oat; and by others, for the *orobus*, or bitter vetch. The Greeks originally uſed the word, and that not only for theſe two vegetables, but, in a much larger ſenſe, underſtanding by it any herb reſembling the plants cultivated for the uſe of the table, but not eſculent. The Greeks and Romans had a way of expreſſing the boiling of pulſe, or herbs, by words ſignifying the wetting them: thus the Greeks expreſſed boiled things by *brocha*, βεγχα, and the Romans by *madida* [a]. Virgil uſes this word for the peaſe, and Plautus for all eſculent things that were boiled: hence theſe baſtard peaſe and oats were called *abrocha*, *non madida*, not fit for boiling or eating.—[[a] *Ainſworth's* Dict. in Voc. *Madidus.*]

ABRONO, in botany, a name given by Serapion, and others, to the heart-peas; called alſo *Abrugi*. *Ger.* Emac. Ind. 2.

ABROTANUM, ABROTONUM. See SOUTHERNWOOD.

ABRUGI, in botany, a name given by ſome to the heart-peas. *Ger.* Emac. Ind. 2.

ABRUS, in the materia medica, the name of a ſeed produced by one of the phaſeole, or kidney-beans, and commonly called Angola ſeeds. *Dale's* Pharm. p. 217.

ABSCESS, (*Cycl.*)—See IMPOSTHUMATION.

ABSCESS *in the liver*. See LIVER.

ABSCISSION, *Abſciſſio*, the act of cutting off a thing.

ABSCISSION, in rhetoric, is a figure of ſpeech, when beginning to ſay a thing, we break off ſhort, as ſuppoſing the matter ſufficiently ſignified, by what has been already ſaid. *Cic.* ad Herenn. l. 4. c. 77.

For an inſtance: One of her ſex, age, and beauty, to be ſeen alone, at ſuch an hour, with a man of his character.—I need ſay no more.

Abſciſſion is a ſpecies of ellipſis, or ſuppreſſion.—Scaliger diſtinguiſhes it from præciſion, and ſuſpenſion. *Scal.* Poet. l. 3. c. 76.

Aſtrologers alſo ſpeak of an *Abſciſſion of the Light* of a planet, by another planet's outſtripping it, and joining a third before it. *Abſciſſion* is held a deterioration. *Vital.* Lex. Math. p. 4.

ABSCISSION, in ſurgery, denotes the act of taking away ſome morbid or ſuperfluous part by an edged inſtrument [a].

In this ſenſe, *Abſciſſion* amounts to the ſame with the Greek αποκοπη. Cowper ſpeaks of the *Abſciſſion* of a leg; which is more properly called amputation [b]. The *Abſciſſion* of the præpuce makes what we call circumciſion. *Abſciſſion* of the ears is a kind of legal puniſhment, inflicted on perjury. In ſome countries they alſo practiſe *Abſciſſion* of the noſe on traitors in an army, as a puniſhment reputed worſe than death [c].—[[a] *Caſt.* Lex. Med. p. 4. [b] Phil. Tranſ. N°. 280. p. 1195. [c] *Beier.* Jur. Milit. §. 1285.]

ABSCISSION is more properly uſed for the operation of cutting away ſome ſoft part of the body, when depraved, or grown hurtful. *Blanc.* Lex. Med. p. 3.

In which ſenſe, *Abſciſſion* differs from amputation, in that the latter is of a ſolid or bony part, the former of a fleſhy or membranous one; yet they are ſometimes confounded. *Caſt.* Lex. Med. p. 4.

We ſay, the *Abſciſſion* of a nerve, lip, cheek, or the like: Mr. Shipton gives an inſtance of the *Abſciſſion* of a portion of the inteſtines not mortal. Phil. Tranſ. N°. 283.

ABSINTHITES, ABSINTHIAC, or ABSINTHIATED, ſomething tinged or impregnated with the virtues of abſinthium, or wormwood. *Colum.* l. 12. c. 35. *Martin.* Lex. Phil. T. 1. p. 4. *Voſſ.* Etym. p. 2.

Bartholin mentions a woman whoſe milk was become *Abſinthiated*, and rendered bitter as gall, by the too liberal uſe of wormwood [a].

Vinum Abſinthites, or *poculum Abſinthiatum*, wormwood wine, is much ſpoke of among the antients, as a wholeſome agreeable drink, and even an antidote againſt drunkenneſs; though ſome have charged it with being offenſive to the head [b], and liable to cauſe fevers, cephalalgias, vomitings, uterine fluxes [c], &c. Ray alſo makes it a hinderer of venery [d]. The preparation is given by many [e]. According to the common account, it is made by infuſing the leaves of the plant in a quantity of wine. But Fehr ſhews that it ſhould rather be prepared by fermentation, in order to correct the crudities of the plant, and call forth its volatile ſalt. Paulli prepares it even without abſinthium. Dr. Bowle prefers the *aqua Abſinthites*, or wormwood water, taken in a ſmall quantity after meals, to the wine; as being leſs liable to affect the head, and fill it with vapours [f]. — [[a] *Barthol.* Act. Med. T. 2. obſ. 62. [b] *Lang.* Ed. Medic. 38. l. 2. [c] *Nebel.* Diſp. 2. in Nov. Lit. Mar. Balt. Jul. 1707. p. 241. [d] *Ray*, Synopſ. Stirp. Brit. Gen. 7. p. 94. *Sinibald.* Geneanthr. l. 31. Tr. 3. c. 22. p. 371. [e] *Dioſcor.* l. 5. c. 49. *Plin.* Hiſt. Nat. l. 14. c. 19. *Fehr.* Hier. Picr. in Ephem. Acad. N. C. dec. 2. an. 5. app. p. 170. [f] *Ray*, loc. cit.]

ABSOLUTISM, the dogm of God's acting abſolutely in the affair of ſalvation, and not being guided in his willing, or nilling, by any reaſon. *Loeſch.* Parox. Abſol. Decr. Nov. Lit. Germ. 1708. p. 183.

Abſolutiſm is one of thoſe doctrines charged on the Calviniſts, for which the Lutherans refuſe all union with them. See CALVINIST and CALVINISM.

ABSORBENTS, (*Cycl.*) in a general ſenſe, is uſed for ſuch things as have the faculty of *abſorbing*, or ſwallowing up others.

Aſhes are an *Abſorbent* in reſpect of water, though not in the degree ſuppoſed by Ariſtotle, from whom we derive a vulgar error, That a pot full of aſhes will ſtill *abſorb* as much water as if empty [a]. Cloves are ſo violent an *Abſorbent* of moiſture, that we are told, if care be not taken in the importing, to keep all water, wine and the like at a good diſtance from them, a certain quantity of cloves will, in two days time, drain a whole hogſhead of wine [b]. M. Homberg has a diſcourſe on the quantity of acids *abſorbed* by terreſtrial alcalis; wherein he ſhews, how much acid any known alcali will retain [c]. M. de la Hire gives an experiment for aſcertaining the quantity of water *abſorbed* by plants.—[[a] *Brown*, Vulg. Err. l. 2. c. 5. p. 68. [b] *Ovingt.* Voy. to Surrat. Jour. des Scav. T. 78. p. 63. [c] Mem Acad. R. Scienc. an. 1700. p. 81.]

Abſorbents are of divers kinds; ſimple, compound, ſaline, cinnabarine, marine, fixed, earthy, acid, alcaline, &c. In the Pharmacopœias, we meet with ſeveral forms of *Abſorbents*; *Abſorbent* powders, electuaries, draughts, &c. *Harris*, de Morb. Infant. ap. Jour. des Scav. T. 38. p. 276. ſeq. Mem. de Trev. 1713. p. 1248.

Abſorbents conſume the humours without fuſing them, and have ſometimes the effect of ſtrengtheners, ſometimes of purgatives [d], oftner of calmers, to allay fermentations [e]. They are of uſe for tempering acrimonies [f], and after emollients and attenuants, for healing tumours; ſome hold them neceſſary for preventing the ill effects of bitters; they are good in cardialgias or heats of the ſtomach [g], and hiccups [h]; are alſo given in hectics [i], and other chronical caſes, as coughs [k], though with great caution and reſerve [l]. *Abſorbents* have alſo their ill effects; eſpecially if too laviſhly given, being liable to make congeſtions in the viſcera [m]: they are hurtful in the itch [n], bilious fevers [o], dyſenteries [p], hypochondrial and hyſteric caſes [q], quartans [r], &c. according to ſome.—[[d] Ephem. Acad. Nat. Cur. Dec. 2. an. 7. p. 242. [e] *Junck.* Conſp. Med. tab. 14. p. 82. [f] Remarq. ſur l'abus des Purgatifs 1. Jour. Scav. T. 87. p. 662. ſeq. [g] *Dol.* Encyc. Med. l. 3. p. 287. a. [h] Id. ib. p. 294. a. [i] *Junck.* Conſp. tab. 58. p. 389. [k] *Nent.* Fundam. Med tab. 64. p. 44. [l] *Junck.* ubi ſupra, p. 391. [m] *Albert.* in Act. Acad. N. C. T. 2. p. 316. [n] *Junck.* lib. cit. tab. 68. p. 458. [o] Id. ib. tab. 42. p. 282. [p] Id. ib. tab. 52. p. 350. [q] Id. ib. tab. 29. p. 192. [r] *Junck.* tab. 56. p. 378. &. tab. 61. p. 402.]

Abſorbents are generally preſcribed as the only remedy for the acute diſeaſes of infants, tho' held by others rather hurtful to children, by loading their tender viſcera, and creating obſtructions in the capillaries. *Kozamer*, Inform. de Infant. Valetud. tuend. Jour. des Scav. T. 63. p. 699. ſeq.

Particular kinds of *Abſorbents* have their particular effects; old oiſter-ſhells are preferred for children; magiſteries and precipitates are leaſt ſuitable, as being already ſurcharged with acids. *Abſorbents* ſaturated with acid juices, as of citrons, are good in coughs, and catarrhs; thoſe prepared with cinnabar, in iſchurias; with aſtringents, in the diabetes; ſaline, in the itch; marine, in chronical diſeaſes of the breaſt: in which laſt caſe, the earthy are hurtful. *Quinc.* diſpenſ. Par. 2. Sec. 2. p. 87.

Abſorbents, are ſometimes applied to ulcers; but it is to be obſerved, that the inſipid terreſtreous *Abſorbents*, ſuch as coral, &c. put into an ulcer, where a bone is carious, can have little other effect than to imbibe the matter of the ulcer; if they fall into any cavernulæ of the corrupted bone, they may remain ſo long there, that the matter they imbibe may become acrid. Lint is an *Abſorbent*, which has not this diſadvantage. *Monro*, in Med. Eſſ. *Edinb.* Vol. 5. Art. 24.

The taking an immoderate quantity of crabs eyes, and other *Abſorbents* for the heart-burn, has ſometimes been attended with fatal conſequences. See Phil. Tranſ. N° 459. Sect. 2.

Van Swieten in his comment on Boerhaave's aphoriſm obſerves, that theſe *Abſorbent* powders ought not to be ground too fine, but rather left ſomewhat coarſe, as they will be leſs apt to concrete and prove dangerous.

ABSORBENT *Veſſels*, a minute kind of veſſels, found in animal bodies, which attract, and imbibe the nutritious, and other matters brought near their mouths.

Theſe are ſometimes alſo called *reſorbent veſſels*, and ſometimes *Abſorbent pores*.

Abſorbent Veſſels are found in all parts of the body, eſpecially where the membranes lie open to cavities, as in the mouth, œſophagus, ſtomach, inteſtines, &c. A late author computes no leſs than 7,000,000,000 in one ſquare foot of the ſurface of the ſtomach [a]: by theſe, mercury, plaſters, and the like medicines externally applied, enter the habit of the body: to theſe are alſo owing the inſtantaneous effects of ſpirits, drams, water, &c. upon the body. The like veſſels are alſo numerous in the ſkin; where they are ſuppoſed to imbibe the fluid matters floating in the ambient air, and convey them into the body [b]. —[[a] *Mortimer*, Exerc. Inaug. de Ingreſſ. Humor. in Corp. Jour. des Scav. T. 77. p. 31. [b] Id. ibid.]

ABSORBENT *Veſſels*, are more particularly uſed for thoſe lacteals which open into the ſides of the inteſtinal tube, to imbibe the chyle in its deſcent from the ſtomach, and convey it into the meſenteric veins.

Naturaliſts ſpeak of the like *Abſorbents* in plants; the fibrous or hairy roots of which are conſidered as a kind of *vaſa Abſorbentia*, which attract and imbibe the nutritious juices from the earth. Vid. *Malpigh.* Anat. Plant. par. 2. Bibl. Univ. T. 4. p. 244. *Leewenhoeck.* Let. 2. Bibl. Univ. T. 1. p. 474. ſeq. *Fontenel.* Hiſt. Acad. R. Scien. 1708. p. 81. *De la Hire*, Explic. Phyſ. de la Direct. Vert. des Tiges, ap. Mem. Acad. R. Scien. 1708. p. 297.

ABSORBING, the act of ſucking up, or imbibing another body.

Sir I. Newton ſhews that black bodies *abſorb* all the rays they receive, and that thoſe rays of light which impinge againſt the ſolid particles of bodies are *abſorbed* and loſt. Some naturaliſts are of opinion, that the whole antediluvian earth has been *abſorbed* and covered by the ſea [a]. Rudbeck ſpeaks on the authority of an antient poet, of a large iſland near Britain, *abſorbed* by the ocean: the ſame fate is Plato's Atlantis ſuppoſed to have undergone. Gardeners obſerve, that luxuriant wood-branches *abſorb* and waſte the nutritious juices, which ſhould feed the fruit of the trees. The Copts and Ethiopians hold that the human nature of Chriſt is *abſorbed*, and loſt in the divine nature, as a drop of wine is loſt and *abſorbed* in the ſea [b]—[[a] *De la Pryme*, in Phil. Tranſ. N°. 266. p. 683. ſeq. *Wallis* Ep. ad Leibn. Phil. Tranſ. N°. 255. p. 283. [b] *Poncet.* Voi. d'Ethiop. p. 106. Lett. Edif. & Cur. T. 4.

ABSORPTION. in the animal œconomy, is uſed for that power whereby the ſmall open orifices of veſſels, imbibe liquors lodged in the cavities of the animal bodies. This according to Mr. Monro is obſerved to increaſe or diminiſh proportionally to the ſtrength or weakneſs of the creature. See Medic. Eſſ. *Edinb.* Vol. 2. p. 132.

ABSORPTIONS *of the Earth*, a term uſed by Kircher and others, for the ſinking in of large tracts of land, by means of ſubterranean commotions. See SINKING.

ABSTENTUS, among civilians, is underſtood of an heir withheld by his tutor from taking on him an inheritance. *Calv.* Lex. Jur. p. 11.

Among eccleſiaſtical writers, the word is alſo uſed for a perſon excommunicated. *Spelm.* Gloſſ. p. 6. *Schmid.* Lex. Eccleſ. p. 11.

ABSTERGENTS, (*Cycl.*) — Theſe are given in conſumptions in many caſes, and the moſt proper on this occaſion, are the ſaline ones, with the common abſorbents, ſaturated with acids. Stahl greatly recommends a mixture of tartarum vitriolatum and crabs eyes, ſaturated with lemon juice, each half an ounce, mixt with the diſtilled waters of ſcordium, ſcabious and chervill, each three ounces. Of this the patient ſhould take a ſpoonful, two or three times a day, with ſmall doſes of nitre at the intermediate hours, to take off the febrile heat; and as the patient in theſe caſes is uſually tired out with the long continuance in a courſe with any medicines, this may after a time be changed for a decoction of the roots of arum and pimpernell, half an ounce of each, with ſpeedwell, colts-foot, chervill, daiſy leaves, of each a handful, and maidenhair, and ſanicle, of each half a handful: theſe are to be boiled in two quarts of water, till a pint is conſumed, and then the clear liquor ſweetened with honey. *Juncker*'s, Conſp. Med.

The pectoral *Abſtergents*, are alſo the beſt of all medicines in the decline of an hæmorrhage by the mouth, in which blood has been voided clear from the lungs: in this caſe they never fail to reſolve any grumes that may remain in the part; and at the ſame time, wonderfully reſtore the due tone of the viſcera. The moſt proper on this occaſion are decoctions of daiſy leaves, ground-ivy, ſpeedwell, and the ſmall nettle, with powders of nitre, and dried goat's blood, and a mixture of an ounce of crabs eyes in a pint of white wine.

ABSTINENCE, (*Cycl.*) — We have an account of extraordinary *Abſtinence* in a young woman, cauſed by a difficulty of ſwallowing, ſo great, that on every attempt towards it, ſhe fell into fits. This laſted for thirty four days, about a month afterwards, the difficulty returned, and ſhe remained without meat or drink for fifty four days, without any ſenſe of hunger or thirſt. See. Medic. Eſſ. *Edinb.* Vol. 5. Art. 43. See alſo the article FASTING.

ABSTINENTES, in eccleſiaſtical hiſtory, a ſort of people in the antient church, who carried the buſineſs of *Abſtinence* and mortification ſo far, that they have been put in the catalogue of heretics; tho' wherein their error conſiſted, is little agreed on.

Some repreſent the *Abſtinentes* as the ſame with thoſe otherwiſe called *continentes*, and that they particularly enjoined *Abſtinence* from the uſe of marriage; others ſay, from fleſh; and others, from wine [a]. Others will have them a branch of the Gnoſtics, and that their hereſy conſiſted in holding fleſh evil in itſelf, and created by the devil. Some make them the ſame with the Hieracites; others with the Encratites [b]. They are ſaid to have ariſen in Spain and the Gauls in the third century.—[[a] *Du Cang.* Gloſſ. Lat. T. 1. p. 29. [b] *Trev.* Dict. Univ. T. 1. p. 50.

ABSTRACTI, ABSTRACTED, is a name given to a ſect, or party, in the Lutheran church, charged with heterodoxy in the uſe of the word *Abſtract*, as applied to Chriſt.

Their leader was Heſhuſius a Pruſſian biſhop, or ſuperintendant, who aſſerted againſt Beza, "That Chriſt was not only to be adored, in the concrete, as ſon of God; but that his very fleſh in the *Abſtract* was an object of adoration, or that the right of being adored was communicated to his fleſh." This being underſtood as importing, that the fleſh of Chriſt in its *Abſtract*, or eſſence, excluſive of its union with the divine nature, was an object of adoration; great conteſts aroſe; and tho' Heſhuſius explained his meaning orthodoxly, it would not be taken. Wigandus another biſhop of the ſame church, tho' he allow'd they were agreed about the thing; yet apprehended ſo much danger from the phraſe, That the humanity of Chriſt is to be adored in the *Abſtract*, as omnipotence, &c. that he ceaſed not till Heſhuſius was depoſed: but times turned; the *Abſtracti* gained the aſcendant, and Wigandus himſelf was ſilenced. *Micræl.* Hiſt. Eccl. l. 3. Sect. 2. §. 72. p. 890. *Budd.* Iſag. Hiſt. Theol. l. 2. c. 7. p. 1211.

ABSTRACTION, (*Cycl.*)—*Abſtraction*, in chemiſtry, denotes the drawing off, or exhaling away, a menſtruum from the ſubject it had been put to diſſolve.

Some alſo uſe the word as ſynonymous with diſtillation, or even cohobation. *Teichmey*, Inſtit. Chem. P. 1. c. 4. p. 23.

ABSTRACTITIOUS, or ABSTRACTIVE, is applied by ſome modern chemiſts, to a ſpirit drawn from vegetables without fermentation.

In which ſenſe *Abſtractitious* ſpirits are ſynonymous with natural ſpirits, and ſtand oppoſed to fermentative or artificial ones. *Quinc.* Lex. Med. p. 4.

Such ſpirits are chiefly procured from plants which abound in volatile ſalt. The *Abſtractitious* ſpirit of ſcurvy-graſs is preferred to that procured by fermentation. *Vid. Ludovic.* Pharmac. diſſ. 1. p. 457. *Caſtel.* Lex. Med. p. 4. *Quinc.* Lex. Med. p. 4.

ABSURDITY, (*Cycl.*)—The great cauſe of *Abſurdity*, is in ſpeech. As reaſon conſiſts in the due uſe of names and words, *Abſurdity* conſiſts in the abuſe of them. The higheſt of all our faculties, and our failings, take their riſe from the ſame thing, language; and are as it were coupled together, to temper each other, and reduce human nature to a kind of mediocrity.

Hobbes aſſigns *Abſurdity* as a privilege peculiar to man, and which no other creature is capable of: he adds, that of all men, thoſe called philoſophers, are moſt expoſed to it. Whence the ſaying of Cicero: there is nothing ſo *abſurd* but has been ſaid by a philoſopher, *nihil tam abſurde dici poteſt, quod non dicatur a philoſopho.* The reaſon ſeems to be, that of all men they reaſon, and diſcourſe moſt. Yet a nearer and more appoſite cauſe may be aſſigned; viz. their neglect at ſetting out, to define the terms they make uſe of, *i. e.* to aſſign the preciſe idea each is made to repreſent: which is much like a man's undertaking to number, without knowing the value of the numeral figures; reaſoning, according to the author firſt cited, being no other than computing. Divers *Abſurdities* alſo ariſe from the wrong connecting names into propoſitions; as firſt, when the names of bodies are applied to accidents; or the names of accidents to bodies: as in that propoſition, faith is infuſed, or inſpired; ſince nothing is either fuſible, or inſpirable, but body: and the ſame *Abſurdity* the Carteſians fall into, when they make extenſion to conſtitute body, &c. Secondly, when the names of accidents inherent in external bodies are attributed to accidents of our own bodies; as when it is ſaid that colour is in the object, ſound in the air, &c. Thirdly, when the names of bodies are attributed to words, or conceptions; as is done by thoſe who aſſert that there are univerſal things, that animal is a genus, &c. Fourthly, when the names of accidents are given to words, and propoſitions; as when it is ſaid that the definition is the nature of the thing, or a perſon's command, is his will. Fifthly, when in lieu of proper words, metaphors and tropes are made uſe of; as, the way leads to ſuch a place, the proverb ſays this or that: which though allowable on ordinary occaſions, yet is of miſchievous conſequence in reaſoning and ſearching after truth. Laſtly, when names are taken at random, and uſed without meaning, as tranſubſtantiation, conſubſtantiation, entelechia, &c.

He that can avoid theſe rocks will not eaſily fall into an *Abſurdity*, except in a very long chain of reaſoning, when he may be apt to forget ſome propoſition before laid down. *Hobb.* Leviath. P. 1. c. 5. p. 22. ſeq.

ABSYNTHIUM, in botany. See WORMWOOD.

ABSYNTHUS, in natural hiſtory, the name of a ſtone, deſcribed by ſome old authors as being of a black colour, variegated with ſpots and veins of red. They ſay that when once heated it retains the warmth for ſeven days. The account ſeems ſuperſtitious and imaginary, and the deſcriptions they give ſo ſhort, that it is not eaſy to gueſs what ſtone, if any in nature, was meant to be pointed out by them. Probably the word is only a corruption of the aſiictos, or aſyctos, of Pliny. See ASIICTOS.

ABUNA, among the Chriſtian Arabs, is the title or appellation of a religious.

The word, which is Arabic, is ſometimes alſo written *Abouna*, ſometimes *Abana* [a], and by ſome *Abbuna* [b], or *Abunna* [c]; and literally denotes father.—[[a] *Trev.* Dict. Univ. T. 1. p. 52. [b] *Fabric.* Lux Evang. c. 45. p. 710. [c] *Pagit.* Chriſtianogr. p. 40.]

ABUNA is more particularly uſed for the archbiſhop, or metropolitan of the Abyſſinian church.

Some ſay he is alſo called maco, or macus [a]; others, catholicus: ſome repreſent him as patriarch, but improperly, his office being rather that of biſhop. The *Abuna* is nominated, and conſecrated by the Coptic patriarch of Alexandria, reſiding at Cairo [b]. The Abyſſinians ſome years ago attempted to ſhake off the primacy of the Copts, and refuſed to receive any more of their metropolitans or *Abunas*; inſtead of whom they took patriarchs from the Portugueſe, and were reconciled to the pope: but this laſted not long. The *Abunas* trace their ſucceſſion from St. Frumentius, the firſt *Abuna* or Abyſſinian biſhop [c].—[[a] *Micræl.* Hiſt. Eccl. l. 3. S. 2. §. 7. p. 641. [b] *Fabric.* Lux Evang. c. 45. p. 710. [c] *Ludolph.* Hiſt. Æthiop. l. 3. c. 7. Mem. for Ingen. N°. 5. p. 38.]

ABUTILON, in botany, the name of a genus of plants, allied to the mallow kind. The characters are theſe. The flower wholly reſembles that of the mallow; but the fruit reſembles a ſort of head compoſed of ſeveral capſules, ſo diſpoſed round an axis that every ſtria of that receives one of theſe. Theſe capſules are bivalve, and uſually contain kidney-ſhaped ſeeds.

The ſpecies of *Abutilon*, enumerated by Tournefort, are theſe. 1. The common kind. 2. The Indian *Abutilon* of Authors. 3. The vine-leaved Indian *Abutilon*, with a quinque-capſular fruit. 4. The rough hairy ſtalked *Abutilon*, with pointed leaves and ſmall ſtellated fruit. 5. The African *Abutilon*, with rugged leaves and downy ſeed-veſſels. 6. The great American *Abutilon*, with purple ſtalks and purple ribs in the leaves. 7. The great leaved American *Abutilon*, with hairy ſtalks. 8. The ſhrubby American *Abutilon*, with long leaves, yellow flowers, and a ſmall prickly fruit. 9. The ſhrubby American *Abutilon*, with rounder leaves, yellow flowers, and a larger prickly fruit. And, 10. The marſh American *Abutilon*, with ſmall whitiſh flowers collected into a long pyramidal ſpike. *Tourn.* Inſt. p. 99.

ABUNDANT, (*Cycl.*)—*Abundant* notion, in logic, is that which includes more marks and characteriſtics than are neceſſary to diſtinguiſh it from others.

Thus, we may be ſaid to give an *Abundant* notion of a rectilinear triangle, when we deſcribe it as a ſpace terminated by three right lines, and containing three angles. Inaſmuch as the number of its angles is determined by that of its ſides; ſo that the bare mention of its three ſides, was ſufficient to have defined it. *Wolf.* Phil. Ration. §. 93, p. 161.

ABYSS, (*Cycl.*)—The exiſtence of an *Abyſs*, or receptacle of ſubterraneous waters, is controverted by Camerarius [a], and defended by Dr. Woodward, chiefly by two arguments; the firſt drawn from the vaſt quantity of water, which covered the earth in the time of the deluge; the ſecond, from the conſideration of earthquakes, which he endeavours to ſhew are occaſioned by the violence of the waters in this *Abyſs* [b]. A great part of the terreſtrial globe has been frequently ſhaken at the ſame moment; which argues, that the waters, which were the occaſion hereof, were co-extended with that part of the globe. There are even inſtances of univerſal earthquakes; which ſhew that the whole *Abyſs* muſt have been agitated: for ſo general an effect muſt have been produced by as general a cauſe; and that cauſe can be nothing but the ſubterraneous *Abyſs* [c].—[[a] *Camerar.* Differt. Taurin Act. Erud. Supp. T. 6. p. 24. [b] V. *Woodward*, Natur. Hiſt. Tellur. Illuſtr. Jour. des Scav. T. 58. p. 393. Mem. of Liter. T. 8. p. 101. ſeq. [c] Mem. of Liter. T. 8. p. 104.]

This *Abyſs* is no uſeleſs thing; when once eſtabliſhed, it ſerves to ſolve ſeveral difficult phænomina; as the origin of ſprings and rivers; the level maintained in the ſurface of different ſeas, and their not overflowing their banks. To the effluvia emitted from this *Abyſs* ſome even attribute all the diverſities of weather, and changes in our atmoſphere; and what is more, the origin of every thing in the earth, or on its ſurface. Dr. Woodward has an epiſtle expreſs on the œconomy of the great *Abyſs* hid in the bowels of the earth, and the perpetual communication between it and the atmoſphere [d].

Ray and other authors, antient as well as modern, ſuppoſe a communication between the Caſpian ſea and the ocean, by means of a ſubterranean *Abyſs*: and to this they attribute it, that the Caſpian does not overflow, notwithſtanding the great number of large rivers it receives [e]; of which Kempfer reckons above fifty, in the compaſs of ſixty miles [f]. But may not the daily evaporation ſuffice to keep a level here?—[[d] *Holloway*, Int. to Woodward's Natur. Hiſt. of Earth. Act. Erud. 1727. p. 313. [e] *Ray*, Phyſ. Theol. Diſc. 2. c. 2. p. 76. [f] *Kempf.* Amœn. Exot. F. 2. R. 1. §. 1. p. 256.]

ABYSS is alſo uſed to to denote the cavernous belly of a hollow mountain.

In which ſenſe M. Tournefort deſcribes the *Abyſs* of mount Ararat, a horrible ſpectacle. *Tournef.* Voy. Levant. let. 19. T. 2. p. 150.

ABYSS is alſo uſed to denote hell [a].

In which ſenſe the word is ſynonymous with what is otherwiſe called Barathrum, Erebus [b], and Tartarus; in the Engliſh bible, the *bottomleſs pit*. The unclean ſpirits expelled by Chriſt, begged, *ne imperaret, ut in Abyſſum irent*, according to the vulgate; εις αβυσσον, according to the Greek [c].—[[a] *Suic.* Theſ. T. 1. p. 12. *Calm.* Dict. Bibl. T. 1. p. 29. *Magr.* Notiz. de Vocab. Eccleſ. p. 2. [b] *Saur.* Diſſ. O. Teſt. T. 1. p. 58. [c] Luke, *c.* viii. *v.* 31. Revel. *c.* ix. *v.* 1.]

ABYSS is more particularly uſed, in antiquity, to denote the temple of Proſerpine.

It was thus called on account of the immenſe fund of gold and riches depoſited there; ſome ſay hid under ground. *Suid.* Lex. T. 1. p. 16.

ABYSS is alſo uſed, in heraldry, to denote the centre of an eſcutcheon.

In which ſenſe, a thing is ſaid to be bore in *Abyſs*, *en Abyſme*, when placed in the middle of the ſhield, clear from any other bearing: he bears azure, a flower de lys, in *Abyſs*. *Colombiere*, Scienc. Heroique. Trev. Dict. Univ. T. 1. p. 56.

ABYSS is alſo uſed, by ſome alchymiſts, for the immediate receptacle of ſeminal matter [a]; by others for the firſt matter itſelf [b].—[[a] *Libav.* in Exam. Philoſoph. Vivent. T. 4. p. 139.

Caſt.

Caſt. Lex. Med. p. 4.. [b] *Menenſ.* Tractat. Aurei Veller. l. 1. c. 7. in Theatr. Chym. T. 5. p. 274. *Caſt.* loc. cit.

ABYSS is alſo uſed metaphorically for a thing not to be known or comprehended, on account of its immenſe extent, or profundity. *Magri.* Notiz. Vocab. Eccleſ. p. 2. *Trev.* Dict. Univ. T. 1. p. 56.

In which ſenſe it coincides with ſecret, inſcrutable, incomprehenſible, &c.—The judgments of God are called a great *Abyſs* [a]. The ſcripture is repreſented by an antient father as an *Abyſs* of queſtions, αβυσσος ζητηματων [b].—[a Pſalm xxxv. or xxxvi. *v.* 7. b *Chryſoſt.* Homil. in Act. T. 4. p. 747.]

ABYSS, in hydrography, is ſynonymous with gulph. *Ozan.* Dict. Math. p. 358.

ABYSSINIAN is uſed as the name of a ſect, or hereſy, in the Chriſtian church; eſtabliſhed in the empire of *Abyſſinia.*

The *Abyſſinians* are a branch of the Copts, or Jacobites; with whom they agree in admitting only one nature in Jeſus Chriſt, and rejecting the council of Chalcedon: whence they are alſo called Monophyſites, and Eutychians.

The *Abyſſinians* ſtand oppoſed to the *Melchites*; and are only diſtinguiſhed from the Copts, and other ſects of Jacobites by ſome peculiar national uſages [a]: they are charged indeed with hereſy, but it is a hereſy of a ſubtle kind, hard to define; ſome take it for a mere name, and hold them to be orthodox in reality. In effect, they themſelves deny their being Eutychians, and even anathematize Appollinarius [b], which with ſome zealots is not enough [c]. Ludolph juſtifies them of Eutychianiſm, proving that they allow Jeſus Chriſt to be true God and true man, without mixture and confuſion; and that if they only allow one nature in him, it is becauſe they have no clear idea of the ſignification of that word [d]. Their hereſy, like ſome others, reſolves itſelf into logomachia's, and miſunderſtandings about the terms, nature, perſon [e], &c.—[a *Boſii* Diſc. de Stat. Europ. §. 29. b *Le Grand.* Diſſ. ſur Lobo Voy. d'Abyſſ. p. 2031. c *Renaudot.* Defenſ. Hiſt. Patriarch. ap. Mem. de Trev. an. 1718. p. 661. ſeq. d *Ludolf.* Com. Hiſt. Ethiop. ap. Bibl. Univ. T. 21. p. 19. Oeuv. des Scav. an. 1691. p. 73. e *Le Grand.* Diſſ. ſur Lobo, p. 2032.]

The *Abyſſinian* ſect or church is governed by a biſhop, or metropolitan, ſtiled Abuna, (ſee ABUNA,) ſent them by the Coptic patriarch of Alexandria reſiding at Cairo, who is the only perſon that ordains prieſts. The next dignity is that of Komos, or Hegumenus, who is a kind of arch-preſbyter. They have canons alſo, and monks; the former of whom marry, the latter at their admiſſion vow celibacy, but with a reſervation. Le Grand ſays, they make a promiſe aloud, before their ſuperior, to keep chaſtity, but add in a low voice, *as you keep it* [f]. The emperor has a kind of ſupremacy in eccleſiaſtical matters [g]. He alone takes cognizance of all eccleſiaſtic cauſes, except ſome ſmaller ones reſerved to the judges, and confers all benefices, except that of Abuna [h]. Ludolfus [i], makes their hierarchy reſemble that of the Engliſh church, where the ſupremacy in ſpirituals is lodged in the ſovereign. Mr. Le Grand maintains the contrary, that the Abuna depends only on the patriarch of Alexandria [k].—[f *Le Grand* ubi ſupra, p. 2042. g *Pagit.* Chriſtianogr. P. 1. c. 4. p. 89. *Fabric.* Lux Evang. c. 45. p. 710. h *Pagit.* ubi ſupr. i *Ludolf.* Hiſt. loc. cit. Week. Mem. Ingen. N°. 5. p. 38. k *Le Grand* ubi ſupr. p. 2041.]

The *Abyſſinians* have divers times expreſſed an inclination to be reconciled to the ſee of Rome; but rather out of intereſt of ſtate than any other motive. The emperor David, or the queen regent on his behalf, wrote a letter on this head to pope Clement VII. full of ſubmiſſion, and demanding a patriarch from Rome to be inſtructed by. Which being complied with, he publickly abjured the doctrine of Eutychius and Dioſcorus in 1626, and allowed the ſupremacy of the pope [l]. Under the emperor Seltan Seghed all was undone again; the Romiſh miſſionaries ſettled there, had their churches taken from them, and their new converts baniſhed, or put to death. The congregration *de propaganda* have made ſeveral attempts to revive the miſſion, but to little purpoſe.

It is pretended that the *Abyſſinians* ſent embaſſadors, as early as 1177, to pope Alexander III. and others ſince, in 1459, to the council of Florence; but this conſiſts ill with what others relate, that before the late miſſions of the Jeſuits, the *Abyſſinians* do not appear to have ſo much as known the pope. Some even imagine, that the embaſſadors, who appeared at the council of Florence, were only impoſtors, dreſſed up by pope Eugenius IV. to make the Greeks believe that his authority was allowed as far as Æthiopia [m].—[l *Ludolf.* Comment. ubi ſupra, p. 77. m V. *La Croix* Relat. Univ. de l'Afriq. Oeuv. des Scav. an. 1689. p. 412.]

Meneſis, and other miſſionaries accuſe the *Abyſſinians* of Judaiſm, in regard of the many Jewiſh obſervances ſtill in uſe among them: ſome have even doubted, whether they are more Chriſtians, or Jews [n]? Lobo [o] ſays expreſsly they are only Chriſtians in name: they practiſe circumciſion on females, as well as males. They eat no meats prohibited by the law of Moſes.—Women are obliged to the legal purifications.—Brothers marry their brother's wives [p], &c. They abſtain from hog's fleſh, blood, meats ſtrangled [q], &c. and obſerve both Saturday and Sunday ſabbath, according to the cuſtom of the primitive church [r]: all of them marks of Judaiſm; tho' by ſome reſolved into mere human inſtitution, and uſage [s]. They celebrate the Epiphany with peculiar feſtivity, in memory of Chriſt's baptiſm; when they plunge and ſport in ponds and rivers, which has occaſioned ſome to affirm that they were baptized a-new every year. Among the ſaints-days is one conſecrated to Pilate and his wife; by reaſon Pilate waſhed his hands before he pronounced ſentence on Chriſt; and his wife deſired him to have nothing to do with the blood of that juſt perſon [t]. They have four lents [u]: the great one commences ten days earlier than ours, and is obſerved with much ſeverity, many abſtaining therein even from fiſh, by reaſon St. Paul [x] ſays there is one kind of fleſh of men, and another of fiſhes. They allow of divorce, which is eaſily granted among them, and by the civil judge [y]: nor do their civil laws prohibit polygamy itſelf [z]. They have at leaſt as many miracles, and legends of ſaints as the Romiſh church [a]; which proved no ſmall embaraſſment to the Jeſuit miſſionaries, to whom they produced ſo many miracles, wrought by their ſaints, in proof of their religion, and thoſe ſo well circumſtantiated and atteſted, that the Jeſuits were obliged to deny miracles to be any proof of a true religion; and in proof hereof to alledge the ſame arguments againſt the *Abyſſinians*, which Proteſtants in Europe alledge againſt the Papiſts [b]. Ludolf [c] allows that they believe the real preſence after the Lutheran manner, but denies that they hold tranſubſtantiation: tho' Renaudot aſſerts, that they maintain this latter. They pray for the dead, and invoke ſaints and angels [d]; have ſo great a veneration for the virgin, that they charged the Jeſuits with not rendering her honour enough [e]. Images in painting they venerate, but abhor all thoſe in relievo, except the croſs [f]. They hold that the ſoul of man is not created, becauſe, ſay they, God finiſhed all his work on the ſixth day [g]. They admit the apocryphal books, and the canons of the apoſtles, as well as the apoſtolical conſtitutions, for genuine [h]. Their liturgy is given by Alvarez, and in Engliſh by Pagit [i]; their calendar by Ludolf: the anſwers of abba Gregory to certain queſtions, propoſed by the author laſt cited, are publiſhed by Fabricius, under the title of *Theologia Æthiopica* [k].—[n *Le Grand*, ubi ſupra, p. 2024. o *Lobo*, Voyag. ACACALIS, in the materia medica, the name given by ſome authors, to the ſiliqua ſylveſtris or wild Carob. *Dale* Pharm. p. 340.

ACACALOTL, in zoology, the name of an American bird, called by ſome *corvus aquaticus*, or the water raven. The male is four ſpans long from his beak to the end of his tail, and is moderately fleſhy, his legs are a ſpan and a half long. Its beak is two hands breadth long, is bent like a bow, and of a blue colour; its head is ſmall; it is of a mixt brown and red colour on the breaſt and belly, and of a finely variegated hue on the back, made up of a ſhining purple, black, and green; its wings are of a lovely green, which looks very bright and gloſſy in the ſun. It is a native of Mexico, and is common about lakes and rivers, feeding on fiſh; it is eaten, but is coarſe, and of a rank fiſhy taſte. *Margrave*'s Hiſt. Braſil.

ACACIA, (*Cycl.*)—in botany, the name of a genus of trees, the characters of which are theſe: The flower conſiſts only of one leaf, and is of the funnel-faſhioned kind, and uſually contains a great number of ſtamina, and the flowers are commonly collected in cluſters, or little heads; the piſtil ariſes from the bottom of the flower, and finally becomes a ſiliquous fruit divided into ſeveral hollows, and containing a number of roundiſh ſeeds. *Tourn.* Inſt. p. 605.

The ſpecies of *Acacia* enumerated by Mr. Tournefort are theſe: 1. The true *Acacia.* 2. The white flowered Ægyptian *Acacia.* 3. The Indian Farneſe *Acacia.* 4. The large leaved American *Acacia*, with rounded pods. 5. The broad leaved, white flowered, alopecuroide American *Acacia.* 6. The ſmooth, white flowered American *Acacia*, with broad flatted pods. 7. The tamarind-leaved, white flowered, prickly American *Acacia.* 8. The ſiliqua-leaved, prickly, creeping, American *Acacia*, with white flowers. 9. The purple flowered, wallnut-leaved, ſmooth American *Acacia.* 10. The creeping, prickly American *Acacia*, with white flowers and extreamly ſmall leaves. 11. The purple flowered, ſmooth ſhrub American *Acacia.* 12. The yellow flowered *Acacia*, with very long and thick white prickles.

The Æthiopian pepper of Mathiolus ſeems to belong to this genus of plants.

The manner of propagating theſe trees, is, to ſow their ſeeds on a hot-bed in ſpring; they will ſoon appear above the ground, and are then to be tranſplanted. For this purpoſe, another hot-

bed muſt be prepared, into which muſt be plunged as many ſmall pots as there is occaſion for. Theſe muſt be firſt filled with earth; and when they have ſtood twenty-four hours, this earth will be of a proper warmth. Then the plants are to be raiſed gently out of the firſt hot-bed, and planted one in the middle of each pot, and watered gently to ſettle the earth to their roots. The bed is then to be ſhaded with mats, till they have taken root; and after this, air muſt be given them, as they are able to bear it, by raiſing the glaſſes which cover the beds.

The two kinds called the locuſt-tree and the water *Acacia* of Carolina, and the other hardier kinds, may be wholly uncovered in the hot-bed by midſummer. The firſt and ſecond winter, theſe ſhould be ſheltered in a common hot-bed frame, till they are grown woody; and after this, they may be taken out of the pots in the ſpring of the year, and planted in the open ground, where they are intended to ſtand; which ſhould always be in a wilderneſs or clump of trees, where they may be ſheltered from the wind, the violence of which is otherwiſe apt to ſplit them. When they are eight or ten feet high, they will make very vigorous ſhoots, which ſhould be annually ſhortened, that the heads of the trees ſhould not become open and naked. They love a looſe and ſomewhat moiſt ſoil.

The other tenderer kinds of *Acacia* ſhould be kept in the hot-beds till July, and after this be expoſed to the air by degrees, though the glaſſes ſhould not be removed from them wholly for the firſt year. Theſe muſt be ſet in a ſtove the firſt and ſecond winters; but when they are grown woody, they will live in a good green-houſe, and may be expoſed in ſummer, as myrtles, orange-trees, and the like. They muſt be very little watered in winter; eſpecially thoſe which ſhed their leaves.

The tendereſt kinds of all, which are the true Egyptian *Acacia*, the branched leaved *Acacia* with twiſted pods, and the large four-leaved *Acacia* with twiſted pods, muſt have a hot-bed of tanners bark, and muſt be ſhifted into larger pots, as they increaſe in bulk. The earth for theſe muſt be ſomewhat ſandy; and great care muſt be taken not to give them too large pots. The firſt of theſe three may, when grown woody, be ſet in a common ſtove among viburnums, and the like; but the other two muſt have a bark ſtove in winter: nor ſhould they be expoſed to the open air in ſummer, at leaſt till they are four or five years old. In winter, theſe are to have very little water; but in ſummer, they require frequent refreſhings. *Miller*'s Gardn. Dict.

The Chineſe cultivate theſe trees for the ſake of their flowers, which they uſe in dying. They gather the ſeeds when perfectly ripe, and dry them in the ſun, and lay them up all winter. A little before the ſummer ſolſtice, they throw them into water, and there leave them till they begin to ſhoot; they then take them out and ſow them in a good fat ſoil, with hempſeed mixed among them. Both ſeeds will grow up together; and they gather the hemp at its proper time, and tye up the young *Acacias* to poles, to keep them upright. The ſecond and third year, they, in the ſame manner, ſow hemp among them. The uſe of this is principally to defend them, while young, from the inclemencies of the weather; but after the third year they generally are ſtrong enough to bear it, and are then to be tranſplanted out into proper places, where they will grow to handſome trees. Obſerv. ſur les Coutumes de l'Aſie, p. 256.

The flowers of the *Acacia* are uſed by the Chineſe in making that yellow, which, we ſee, bears waſhing in their ſilks and ſtuffs; and appears with ſo much elegance in their painting on paper. The method is this:

They gather the flowers before they are fully open; theſe they put into a clean earthen veſſel over a gentle heat, and ſtir them continually about, as they do the tea leaves, till they become dryiſh and of a yellow colour; then to half a pound of the flowers they add three ſpoonfuls of fair water, and after that a little more, till there is juſt enough to hold the flowers incorporated together: they boil this for ſome time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and ſtrain it through a piece of coarſe ſilk. To the liquor they add half an ounce of common allum, and an ounce of calcined oyſter-ſhells reduced to a fine powder. All is then well mixed together; and this is the fine laſting yellow they have ſo long uſed. Obſerv. ſur les Coutumes de l'Aſie, p. 242.

The dyers of large pieces uſe the flowers and ſeeds of the *Acacia* for dying three different ſorts of yellow. They roaſt the flowers, as before obſerved; and then mixing the ſeeds with them, which muſt be gathered for this purpoſe when full ripe, by different admixtures of theſe, they give the different ſhades of colour, only for the deepeſt of all, they give a ſmall mixture of Braſil wood. See DYES, YELLOW.

Mr. Geoffroy, with great probability, attributes the origin of bezoar to the ſeeds of this plant; which being broufed by certain animals, and vellicating the ſtomach by their great ſourneſs, and aſtringency, cauſe a condenſation of the juices, till at length they become coated over with a ſtony matter, which we call bezoard [a].

Some will alſo have the *Acacia* to be the tree which yields the gum arabic, or ſenegal [b]. The juice we are aſſured by others makes the baſe of the true Catechu, or Japan earth [c].

'Tis diſputed whether our *Acacia* be the ſame with that ſpoke of by Dioſcorides [d], Pliny [e], and other antients. F. Hardouin [f], Saracenus [g], and others aſſert the affirmative; Salmaſius, Menage [h], &c. the negative; maintaining that the antient *Acacia*, or *ſpina Ægyptia*, from whence their medicinal juice was prepared, was the ſame with our *caſſia fiſtula*. The antients diſtinguiſhed two kinds of *Acacia*; the white, and the black: Salmaſius takes the latter to have been our *caſſia fiſtula*, whoſe uſe was then unknown. The uſe of the former, or white kind, he ſuppoſes loſt to us. So that their *Acacia* is unknown to us, as ours to them. But this is refining to a great pitch. 'Tis certain Pliny's deſcription, in the main, anſwers to the modern *Acacia*, as exactly, perhaps, as Salmaſius himſelf could at this day have deſcribed it [i].

—[a Mem. de l'Acad. loc. cit. b Mem. des Miſſ. T. 2. p. 187. c *Cleyer.* in Ephem. German. dec. 2. an. 4. obſ. 3. p. 6. d *Dioſcor.* l. 1. c. 133. e *Plin.* Hiſt. Nat. l. 24. c. 12. f Not. ad Plin. ACACIA, in antiquity, according to Du Cange, the ακακια, properly ſo called, was a purple bag, filled with earth, or ſand, and bore by the prince in his left hand, to remind him of his frailty and mortallty; to prevent his being too much elated with his ſtation [a]. 'Tis queſtioned, however, whether this *Acacia*, in the hands of the Greek emperors, be the ſame with that repreſented in the ſtatues of the earlier Roman magiſtrates, as conſuls, queſtors, and the like. The latter rather appears to have been a roll, or volume [b].—[a *Codin.* de Offic. Aul. Conſtant. c. 6. §. 27. *Du Cang.* Diſſ. de Infer. Æv. Numiſm. §. 13. p. 11. Ejuſd. Gloſſ. Græc. T. 1. p. 38. b *Du Cang.* Diſſ. loc. cit.]

ACACIANS, ACACIANI, in church-hiſtory, a ſect, or hereſy, who denied the ſon to be conſubſtantial, or of the ſame ſubſtance with the father, but aſſerted him to be of a like, or ſimilar ſubſtance.

They took the denomination from Acacius, biſhop of Cæſarea, who flouriſhed about the middle of the fourth century, whoſe followers they were.

The *Acacians* are otherwiſe called Semi-Arians; though in ſtrictneſs, they are rather a particular ſect or branch of the Semi-Arians. *Micræl.* Hiſt. Eccleſ. l. 2. ſec. 2. p. 434.

ACACIANS alſo denote a ſect of heretics, who held the ſon to be of a different, or diſſimilar ſubſtance from the father.

Theſe are more frequently called Aetians, and Anomæans; by ſome, the later or poſterior *Acacians*, in reſpect of the former, who are hence alſo denominated the prior or former *Acacians*.

They derive their name from the ſame Acacius, who, out of oppoſition to St. Cyril, as ſome alledge, quitted the party of the Semi-Arians, and eſpouſed that of the Anomæans. Vid. *Du Pin*, Bibl. Eccleſ. T. 2. p. 122. *Micræl.* Hiſt Eccleſ. l. 2. ſect. 2. p. 434.

ACACIANS is alſo the denomination of a third ſect, the followers of Acacius, patriarch of Conſtantinople, towards the cloſe of the fifth century, who favoured the errors of Eutychius. Vid. *Petav.* Rationar. Temp. P. 1. l. 6. p. 359.

ACADEMY, (*Cycl.*)—*Medical Academies*, as, that of the Naturæ Curioſi in Germany [a]; that founded at Palermo, in 1645; another at Venice, in 1701, which meets weekly in a hall near the grand hoſpital; another at Geneva, in 1715, in the houſe of M. le Clerc. The college of phyſicians at London is alſo by ſome ranked in the number of *Accademies* [b].

The *Academy* of *Naturæ Curioſi*, called alſo the Leopoldine *Academy*, had its origin in 1652 [c], when Jo. Laur. Bauſchius, induced by the example of the Engliſh, publiſhed an invitation to all phyſicians to communicate their obſervations of extraordinary caſes; which meeting with ſucceſs, he was elected preſident: though the ſociety was not fully eſtabliſhed, till the preſidentſhip of Jo. Mich. Fehr. Their works were at firſt publiſhed ſeparately. In the year 1670, a new ſcheme was laid for publiſhing periodically, a volume of obſervations every year; the firſt of which appeared in 1684, under the title of Ephemerides, and has been continued under ſome interruptions and variations of title, &c [d]. In 1687, the Emperor Leopold took the ſociety under his protection, granting them ſeveral privileges, particularly, that their preſidents ſhould be Counts Palatine of the holy Roman empire [e]. This *Academy* differs from all others, in that it has no fixed reſidence, or regular aſſemblies [f]; inſtead whereof is a kind of bureau, or office, firſt eſtabliſhed at Breſlaw, afterwards removed to Nuremberg, where letters, obſervations, &c. from members and correſpondents are taken in [g]. The *Academy* conſiſts of a preſident, two adjuncts or ſecretaries, and collegues or members. The collegues, at their admiſſion, oblige themſelves to two things; firſt, to chooſe ſome ſubject out of the animal, vegetable, or mineral kingdom to handle, provided it had not been treated of by any collegue before; the ſecond, to apply themſelves to furniſh materials for the annual Ephemerides. Each member to bear a ſymbol of the

Academy, viz. a gold ring, whereon, inſtead of a ſtone, is a book open, and on the face thereof an eye; on the other ſide, the motto of the Academy, *nunquam otioſus* [b].—[a *Gimma*, ap. Bibl. Ital. Tom. 2. [b] V. Mem. de Trev. 1715. p. 2232. [c] *Vockerodt*. Introd. ad Notit. Societat. Literar. c. 2. §. 3. [d] See Mem. de Trev. an. 1707. p. 1858. &. an. 1714. p. 1112. [e] See *Struv*. loc. cit. §. 25. p. 882. [f] *Riedlin*. Iter. Medic. p. 28. [g] V. Mem. de Trev. an. 1716. p. 1914. [h] See the hiſtory, laws, &c. of this *Academy*, with the names of its members, and the titles of its pieces, in Ephem. Germ. dec. 1. an. 1. & 2. Pref. and the continuation of the ſame in the prefaces and appendixes to the enſuing volumes. See alſo *Wedelii* Salve Academicum, vel Judicia & Elogia ſuper recens adornata Academia, Nat. Curioſ. 1662. 4to. & Ejuſd. Progreſſus Acad. N. C. Catal. Patron. & Colleg. Jen. 1680. 4to. For the literary hiſtory of the *Academy*, or a notitia of the ſeveral pieces produced by the members of it, ſee *Valentini* Hiſt. Literar. Acad. Naturæ Curioſorum. in Ephem. Germ. dec. 3. an. 1. App. p. 147. & ſeq. Jour. de Scav. 1710. p. 396. See alſo *Reimman*. Introd. ad Hiſt. Liter. German. T. 5. p. 809. *Vockerodt*. lib. cit. ſec. 2. c. 1. §. 23.

Chirurgical ACADEMIES, as that lately inſtituted by public authority at Paris; the members of which are not only to publiſh their own and correſpondents obſervations and improvements, but to give an account of all that is publiſhed in ſurgery, and to compoſe a compleat hiſtory of this art, by their extracts from all the authors, antient and modern, who have wrote on it. A queſtion in ſurgery is to be propoſed by the *Academy* yearly; and a prize of a gold medal of two hundred livres value to be given him, who furniſhes the moſt ſatisfactory anſwer. Medic. Eſſ. Edinb. T. 1. p. 361.

Eccleſiaſtical ACADEMIES, as that at Bologna, employed in the examination of the doctrine, diſcipline, and hiſtory of each age of the church. Giorn. de Letter. de Parm. an. 1687. p. 144.

Coſmographical, as that of the Argonauts at Venice, inſtituted at the ſollicitation of F. Coronelli, for the improvement of geography. The deſign of the *Accademia Coſmografica* is to procure exact maps, both geographical, topographical, hydrographical, and ichnographical, of the cæleſtial as well as terreſtrial globe, and the ſeveral regions and parts thereof, together with geographical, hiſtorical, and aſtromomical deſcriptions accommodated thereto, to be made and publiſhed: in order to which, the ſeveral members oblige themſelves, by their ſubſcription, to take one or more copies of each piece, publiſhed under the direction of the *Academy*; and to advance the money, or part of it, in order to defray the charge of publication. To this end, there are three ſocieties ſettled, at Venice, Paris, and Rome; the firſt under F. Moro, provincial of the Minorites of Hungary: the ſecond, under the abbot Laurence au Rue Payenne au Marais; the third, under F. Ant. Baldigiani, jeſuit, profeſſor of mathematics in the Roman college; to whom thoſe addreſs themſelves, who are willing to engage in this deſign. The Argonauts number 196 members in the ſeveral countries of Europe: their device is the terraqueous globe, with the motto, *plus ultra*. At the expence of this *Academy*, all the globes, maps, and geographical writings of F. Coronelli have been publiſh'd [b].—[a V. *Krauſ*. Nouv. Liter. an. 1719. p. 18. [b] Act. Erud. Lipſ. an. 1688. p. 524.]

Naval ACADEMIES, as that at Peterſburgh; and another erected among us at Portſmouth, for the breeding up youth for the ſea-ſervice. V. Nouv. Mem. ſur. l'Etat de la grande Ruſſie. Mem de Trev. an. 1725. p. 1507.

ACADEMIES *of Sciences* chiefly denote thoſe erected for improving natural and mathematical knowledge, otherwiſe called philoſophical and phyſical *Academies*: ſuch as the *Academy Secretorum Naturæ*, formed at Naples in the houſe of Baptiſta Porta, about the year 1560, was the firſt *Academy* of the philoſophical kind. It was ſucceeded by

The *Academy of Lyncei*, founded at Rome by Prince Frederic Ceſi, towards the cloſe of the ſame century; ſeveral of whoſe members rendered it famous by their diſcoveries: the celebrated Galileo Galilei was of the number.

Divers other *Academies* contributed alſo to the advancement of theſe ſciences; but it was by ſpeculations, rather than by repeated experiments on the phænomena of nature: ſuch were the *Academy of Beſſarian* at Rome, and that of Laurence de Medicis at Florence, in the fifteenth century; in the ſixteenth that of Infiammati at Padua, of Vegna Juoli at Rome, of Ortolani at Placentia, and of Umidi at Florence. The firſt of theſe ſtudied fire and pyrotechnia, the ſecond wine and vineyards, the third gardens and pot-herbs, the fourth water and hydraulics. Add to theſe, that of Venice, called La Veneta, founded by Frederic Badoara, a noble Venetian; another in the ſame city, whereof Campegio, biſhop of Feltro, appears to have been the chief; and that of *Coſenza*, or *la Conſentina*, whereof Bernadin Teleſio, Sertorio Quatromanni, Paulus Aquinas, Julio Cavalcanti, and Fabio Cicali, celebrated philoſophers, were the chief members.

The compoſitions of all theſe *Academies* of the ſixteenth century were good in their kind, but none of them comparable to thoſe of the Lyncei.

The *Academy Del Cimento* made its appearance at Florence, ſome years after the death of Torricelli, under the protection of Prince Leopold, afterwards Cardinal de Medicis. Redi was one of its chief members. Count Laurence Magalotti, ſecretary of this *Academy*, publiſhed a volume of curious experiments in 1667, under the title of *Saggi di Naturali Eſperienze*; a copy of which being preſented to the Royal Society, was tranſlated into Engliſh by Mr. Waller, and publiſhed at London, in 4to.

The *Academy Degl' Inquieti* at Bologna, incorporated afterwards into that *Della Traccia* in the ſame city, followed the example of that *Del Cimento*: their meetings were at the houſe of the abbot Antonio Sampieri. Here Geminiano Montanari, one of the chief members, made excellent diſcourſes on phyſical and mathematical ſubjects, part whereof was publiſhed in 1667, under the title of *Penſieri Fiſico Matematici*. This *Academy* afterwards met in an apartment of Euſtachio Manfredi; and afterwards in that of Jacob Sandri, but arrived at a higher luſtre, when its aſſemblies were held in the palace Marſilli.

The *Academy of Roſſano*, in the kingdom of Naples, called *La Societa Scientifica Roſſaneſe degl' Incurioſi*, was founded about the year 1540, under the name of *Naviganti*, and renewed under that of *Spenſierati* by Camillo Toſcano, about the year 1600. It was transformed from an *Academy* of Belles Lettres into an *Academy* of Sciences, at the ſollicitation of the learned abbot Don Giacinto Gimma; who being made preſident, under the title of promoter-general thereof, in 1695, gave a new ſet of regulations. He divided the *academiſts* into ſeveral claſſes, viz. grammarians, rhetoricians, poets, hiſtorians, philoſophers, phyſicians, mathematicians, lawyers, and divines, with a claſs apart for cardinals and perſons of quality. To be admitted a member, a man muſt have degrees in ſome faculty. The members are not allowed to take the title of *academiſt*, in the beginning of their books, without a written permiſſion from the preſident, which is not granted till the work has been examined by the cenſors of the *Academy*. This permiſſion is the greateſt honour the *Academy* can confer; ſince hereby they, as it were, adopt the work; and are anſwerable for it againſt all critiques which may be made of it. The preſident or promoter himſelf is ſubject to this law. Add, that no *Academiſt* is allowed to publiſh any thing againſt the writings of another, without leave from the ſociety [a].

There have been ſeveral other *Academies* of ſciences in Italy, which have not ſubſiſted long, for want of being ſupported by the princes. Such were at Naples that of the *Inveſtiganti*, founded about the year 1679, by the Marquis d'Arena, Don Andrea Concubletto: and that which met in 1698, in the palace of the Duke de Medina, Don Lewis della Cerda, viceroy of Naples. At Rome, that of *Fiſico Matematici*, which met in 1686, in the houſe of Sig. Ciampini: at Verona, that of *Aletofili*, founded the ſame year by Sig. Joſeph Gazola, which met in the houſe of the Count Serenghi della Cucca: at Breſs, that of *Fileſotici*, founded the ſame year for the cultivation of phyſics and mathematics, and ended the year following: that of F. Franciſco Lana, a Jeſuit of great ſkill in thoſe ſciences: laſtly, that of *Fiſico Critici* at Sienna, founded in 1691, by Sig. Peter Maria Gabrielli.

Some other *Academies* ſtill ſubſiſting in Italy, repair with advantage the loſs of the former. One of the principal is the *Academy* of *Filarmonici* at Verona, ſupported by the Marquis Scipio Maffei, one of the moſt learned men in Italy. Tho' the members of this body apply themſelves to the Belles Lettres, they do not neglect the ſciences. The *Academy* of *Ricovrati* at Padua ſtill ſubſiſts with reputation; in it learned diſcourſes are held from time to time on phyſical ſubjects; ſuch for inſtance is that, which the celebrated Sig. Antonio Valliſnieri, firſt profeſſor of phyſic in the univerſity of that city, delivered here on the origin of ſprings; ſince printed. The like may be ſaid of the *Academy* of the *Muti di Reggio*, at Modena; to which the ſame Sig. Valliſnieri, a native of that city, preſented an excellent diſcourſe on the ſcale of created beings, ſince inſerted in his hiſtory of the generation of man and animals; printed at Venice in 1721. In the number of theſe *Academies* may alſo be ranked the aſſembly of learned men, which of late years have met at Venice in the houſe of Sig. Criſtino Martinelli, a noble Venetian, and great patron of learning.

Among the new *Academies*, the firſt place, after the inſtitute of Bologna, is given to that of the counteſs Donna Clelia Grillo Borromeo, one of the moſt learned ladies of the age, to whom Sig. Gimma dedicates his literary hiſtory of Italy. She had lately eſtabliſhed an *Academy* of experimental philoſophy in her palace at Milan; of which Sig. Valliſnieri was nominated preſident, and had already drawn up the regulations of it, tho' we do not find it has yet taken place [b].

F. Merſenne is ſaid to have given the firſt idea of a philoſophical *Academy* in France, towards the beginning of the ſeventeenth century, by the conferences of naturaliſts and mathematicians, occaſionally held at his lodgings; at which Gaſſendi, Des Cartes, Hobbs, Roberval, Paſcal, Blondel, and others aſſiſted. F. Merſenne propoſed to each, certain problems to examine, or certain experiments to be made. Theſe private aſſemblies were ſucceeded by more public ones, formed by Mr. Montmort and Mr. Thevenot, the celebrated traveller. The French example animated ſeveral Engliſhmen of

distinction and learning to erect a kind of philosophical *Academy* at Oxford, towards the close of Cromwell's administration; which, after the restoration, was erected by authority into a Royal Society. The English example in its turn animated the French. Lewis XIV. in 1666, assisted by the counsels of Mr. Colbert, founded an *Academy* of sciences at Paris, with a sufficient revenue to defray the charge of experiments, and salaries to the members.

The *Royal Academy of Sciences* at Paris. See the *Cyclopædia*, and Mr. Fontenelle [c], the Republic of Letters [d], as also *Fontenay* [e].

This *Academy* has done great things, for the service of learning; by the continuation of the meridian, by the sending persons to different parts of the world for making observations; but especially by the excellent writings they have published, either in a separate [f], or a joint capacity; particularly their memoirs. Indeed they have an advantage over most *Academies* [g], in being defrayed their expences, and even paid for time and attendance. Nevertheless they have undergone some imputations; particularly that of plagiary, in borrowing their neighbours inventions [h]: with what justice, we do not say. They have the distribution of annual prizes. Their history to the year 1697 was written by Mr. Du Hamel [i]; and since that time continued from year to year by Mr. Fontenelle, their secretary, and his successors; being chiefly a notitia, or view of the several pieces delivered to the *Academy*: especially such as are capable of being made clearer, or contain hints and inlets to new systems [k].

A new history, from the institution of the *Academy* to the period from whence Mr. de Fontenelle commences, has been formed; with a series of the works published under the name of that *Academy*, during that first interval [l].

The *Royal Society at Berlin*, was founded by the late King Frederic of Prussia in 1700, on the model of that of England, excepting that besides natural knowledge it likewise comprehends the *Belles Lettres* [m]. A new form, and a new set of statutes were given it in 1710; by which it is ordained, that the president shall be one of the counsellors of state, and nominated by the king. The members to be divided into four classes; the first, for prosecuting physics, medicine, and chemistry; the second, for mathematics, astronomy, and mechanics; the third, for the German language, and the history of the country; the fourth, for oriental learning, particularly as it may concern the propagation of the gospel among infidels. Each class to elect a director for themselves, who shall hold his post for life. Their meeting to be in the castle called New Marshal; one class to meet every week in their turns. The members of any of the classes to have free admission into the assemblies of any of the rest [n]. The great promoter of this institution was the celebrated M. Leibnitz, who accordingly was made the first director [o]. The *Academy* has published several volumes of its lucubrations in Latin, under the title of *Miscellanea Berlinensia* [p]. This *Academy* has since been renewed; and two volumes of its transactions published in French, for the years 1745, 1746.

The *Academy of Petersburg* was founded, or rather projected by the late Czar, Peter the Great, and happily executed by the magnificence of the Czarina, Catherine, his wife, and successor, on the the model nearly of the *Academy* of Paris [q], whereof the Czar was a member [r]. Hither that prince invited learned men, from all parts of Europe.

The *Academy* held its first public meeting in Dec. 1725, in the presence of the duke of Holstein, and a large appearance of persons of distinction [s]. The ordinary assemblies are held twice a week, and public or solemn ones thrice in the year; wherein an account is given of what has been done in the private ones. The building, apparatus, &c. of this *Academy* are extraordinary. They have a fine library [t], an observatory, &c. In effect, it partakes much of what we call an university; having regular professors in the several faculties, who read lectures as in our schools [u]. One of their occupations, is to be the composing a Russian dictionary, including all the dialects of that language; also a Russian grammar, &c. At the first public assembly, a discourse was read by M. Bulffinger, professor in experimental philosophy, containing a short history of the progress of learning in Europe, from its beginning to the establishment of *Academies*, with an idea of the nature, use, &c. of *Academies* of sciences; and an inquiry whether the magnetic science has been carried so far as to enable us to discover the longitude by it: another by M. Herman, professor of mathematics [x]. Several volumes of the works of this *Academy*, under the title of *Commentarii*, have been published; beside several mathematical pieces, composed by particular members of it [y].

The *Academy of Sciences*, called *The Institute of Bologna*, was founded by Count Marsigli, in 1712; for the cultivating of physics, mathetatics, medicine, chemistry, and natural history. Its history is written by M. de Limiers, from memoirs furnished by the founder himself [z].—[[a] Gimma Elog. Academ. Dell. Societ. degli Spensierati. Jour. des Scav. T. 32. p. 1049. [b] Gimm. ACADEMIES *of Law*, as that famous one at Beryta [a], and that of the *Sitientes* at Bologna [b].—[[a] V. *Masson*, Hist. Crit. Rep. Lett. T. 13. p. 368. [b] V. *Vockerodt.* loc. cit. c. 2. §. 3.]

ACADEMIES *of History*, as

The *Royal Academy of Portuguese History* at Lisbon, was instituted by the present King John V. in 1720; as appears by a medal struck by the *Academy*, on the front whereof is that prince's effigy, with the inscription *Johannes V. Lusitanorum Rex*; and on the reverse, the same prince standing is represented supporting and raising history, almost prostrate before him, with the legend *Historia Resurges*: underneath are the following words in abbreviature, REGia ACADemia HISToriæ LUSITanæ INSTITuta VI. Idus Decembris MDCCXX. This *Academy* consists of a director, four censors, a secretary, and fifty members; to each of whom is assigned some part, either of the ecclesiastical, or civil history of the nation; which he is to treat either in Latin, or Portuguese: the method to be observed in compiling such history, amounts to this; that in the church-history of each diocese, the prelates, synods, councils, churches, monasteries, *Academies*, persons illustrious for sanctity, or learning, places famous for miracles, or relicks, be distinctly related in twelve chapters: the civil history to comprize the transactions in this country during the government of the Romans, Goths, and Moors; the genealogies of the kings; their wars, acquisitions in Asia, Africa, and America, with the several treaties, and other matters relating to the political and military state of the kingdom. The members who reside in the country, are obliged to make collections and extracts out of all the registers, &c. of the province where they live. Their meetings to be once in fifteen days [a]. The laws they have prescribed themselves, with regard to the credit to be paid, or refused to the testimony of authors, are very just [b]. Their secretary, the count de Villarmajor, called elsewhere Emanuel Tellez de Sylva, Marquis d'Alegrete, has already published five volumes of their works, under the title of documents [c]: the same author has also given the history of the *Academy* in the Portuguese tongue [d].

The *Academy of Suabian History* at Tubingen, was lately established by some learned men, for publishing the best historical writings, the lives of the chief historians, and compiling new memoirs, on the several Points and periods thereof [e].—

Where the office, œconomy, ſtatutes, members, &c. of this *Academy* are related at large.]

ACADEMIES *of Antiquities*, as

The *Academy* at Cortona, lately eſtabliſhed for the ſtudy of the Hetrurian antiquities, and conſequently, by right of conqueſt, the antiquities of the whole world. Their head is called Lucumon, a name taken from the antient governors of Hetruria. One of their laws is, to give audience to poets only one day in the year: another is, to fix their ſeſſions and impoſe a tax of a diſſertation on each member in his turn [a].

The *Academy of Antiquities* at Upſal, owes its riſe to Queen Chriſtina, but its eſtabliſhment chiefly to Charles Guſtavus her ſucceſſor. Its deſign is for illuſtrating the northern languages, and the antiquities of the country, as ſtones, coins, and the like monuments; in which notable diſcoveries have been made by it. The more eminent of its members have been Verelius, Loccenius, Scheffer, Rudbecks, Keder, Peringſkiold, Salin [b], &c.

The *Academy of Medals and Inſcriptions* at Paris, was ſet on foot by M. Colbert in 1663, for the ſtudy and explanation of antient monuments, and perpetuating of great and memorable events, eſpecially thoſe of the French monarchy, by coins, relievo's, inſcriptions, &c. The number of members at firſt was confined to four or five, but in 1701 was increaſed to forty; whereof ten to be honoraries, ten penſionaries, ten aſſociates, and the ſame number of novices or eleves. The king nominates their preſident and vice-preſident yearly; but their ſecretary and treaſurer are perpetual. The reſt are choſen by the members themſelves, agreeably to the conſtitutions on that behalf given them [c]. Their chief work is a kind of metallic hiſtory of the reign of Louis XIV [d]. Beſides which we have ſeveral volumes of their eſſays, under the title of memoirs; and their hiſtory, written and continued by their ſecretaries [e].—[[a] Bibl. Ital. T. 4. p. 130. ACADEMIES *of Belles Lettres*, thoſe wherein eloquence, and poetry are chiefly cultivated. Italy is full of theſe; and France has its ſhare; ſuch are

The *Academy of Umidi* at Florence, called afterwards La Fiorentina, in honour of the grand duke Coſmo I. who declared himſelf its protector in 1549, is illuſtrious both for the works it has produced, and its members; which for theſe two laſt ages have included moſt of the eminent men, not only in Tuſcany, but in all Italy. Their chief attention is to the Italian poetry: and as the famous Dante and Petrarch were the great improvers of the ſame, the *Academy* looks on thoſe two as its fathers, or maſters; ſo that the imployment of a great part of their aſſemblies, is in illuſtrating and commenting on thoſe two writers. This *Academy* has contributed greatly to the progreſs of the ſciences, by the noble emulation of its members, in giving excellent Italian tranſlations of the antient Greek and Latin hiſtorians; at the ſame time they applied themſelves to the poliſhing their language, which gave occaſion to the riſe of the *Academy* La Cruſca.

The *Academy of Humoriſts*, *Umoriſti*, had its origin at Rome, from the marriage of Lorenzo Mancini, a Roman gentleman; at which ſeveral perſons of condition were gueſts; and it being carnival-time, to give the ladies ſome diverſion, they took themſelves to the reciting of verſes, ſonnets, ſpeeches, and comedies, firſt *ex tempore*, and afterwards premeditatedly; which gave them the denomination of *Belli humori*. After ſome experience, coming more and more into the taſte of theſe exerciſes, they reſolved to form an *Academy* of *Belles Lettres*; and changed the title *Belli Humori* for that of *Humoriſti*; chuſing for their device a cloud, which after being formed of the ſaline exhalations of the ſea, returns in a gentle ſweet ſhower, with the motto from Lucretius, *redit agmine dulci* [a].

The *Academy of Arcadi*, was eſtabliſhed at Rome in 1690, for reviving the ſtudy of poetry, and the *Belles Lettres*; and comprehends moſt of the politer wits in Italy, of both ſexes; many princes, cardinals, and other eccleſiaſtics: to avoid all diſputes among whom, about preheminence, 'tis wiſely provided, that all appear maſked, after the manner of ſhepherds of Arcadia. Within ten years from its firſt eſtabliſhment, the number of *academiſts* amounted to ſix hundred. They hold aſſemblies ſeven times a year in a mead, or grove; of late in the gardens of the duke of Salviati. Six of theſe meetings are employed in the recitation of poems, and verſes of the Arcadi reſiding at Rome; who read their own compoſitions; except ladies, and cardinals, who are allowed to make uſe of other ſhepherds for this office. The ſeventh meeting is ſet apart for the compoſitions of foreign, or abſent members; in which there is more entertainment than in all the reſt; by reaſon of the pieces produced here, written in all the different ſtyles, and dialects of Italy. The government of this *Academy* is wholly Democratical, allowing of no prince, or protector whatever, but only a cuſtos, who repreſents the whole ſociety, choſen each olympiad, that is, every four years; with a power of electing twelve others yearly, to aſſiſt him in the adminiſtration. Under theſe are two ſubcuſtodes, one vicar or procuſtos, and four deputies, or ſuperintendants annually choſen. There are five manners of electing members; the firſt called *Acclamation*, uſed when ſovereign princes, cardinals, and embaſſadors of kings deſire to be admitted; in which caſe the votes are given *viva voce*: the ſecond *Annumeration*, introduced in favour of ladies, and *academical* colonies; where the votes are taken privately: the third *Repreſentation*, eſtabliſhed in favour of colleges and univerſities, where the young gentry are bred; who have each a privilege of recommending one, or two members privately to be balloted for: the fourth *Surrogation*, whereby new ſhepherds are ſubſtituted in the room of thoſe dead, or expelled: the laſt *Deſtination*, whereby, when there is no vacancy of members, perſons of poetical merit have the title Arcadi conferred on them, till ſuch time as a vacancy ſhall happen. All the members of this body, at their admiſſion, aſſume new paſtoral names, in imitation of thoſe of antient Arcadians. The *Academy* has divers colonies of Arcadi eſtabliſhed in other cities in Italy, all regulated after the ſame manner. They have vice-cuſtodes for their directors, and take different denominations either from the city where they are eſtabliſhed, or from ſome other *Academy* flouriſhing in the ſame place; ſuch are the *Forzata* at Arezzo, *Animoſa* at Venice, *Ferrarian* at Ferrara, *Fiſico Critica* at Sienna, &c. The laws of the Arcadi are immutable, and bear a near reſemblance to the antient model: Alpheſibœus Carius being cuſtos at the time of enacting them, addreſſed the aſſembly in this formula; *Velitis, jubeatis Arcades, ut quæ in his legibus ad noſtri communis regimen comprehenſa, perſcriptaque ſunt, authoritate juſſuque communi juſta, rata, firma perpetuo ſient, iiſdemque paſtores poſthac omnes perpetuo teneantur, ut quicumque Arcadicum deinceps nomen adſumſerit obſtrictus H. L. veluti ſacramento ſiet:* the anſwer is, *Cœtus univerſus ſcivit. Olympiad.* DCXVIII. *an.* 3. *ab Arcadia inſtaurata. Olympiad.* II. *an.* 2 [b].

The *Royal Academy* at Caen, was eſtabliſhed by letters-patent in 1705: it had its riſe fifty years earlier in private conferences, held firſt in the houſe of M. de Brieux. M. de Segrais retiring to this city to ſpend the reſt of his days, reſtored and gave new luſtre to their meetings. In 1707, M. Foucault, intendant of the generality of Caen, procured the king's letters-patent for erecting them into a perpetual *Academy*, of which M. Foucault to be protector for the time, and the choice afterwards left to the members, the number of whom was fixed to thirty, and the choice of them, for this time, left to M. Foucault. Beſides the thirty, leave is given to add ſome ſupernumerary members, not exceeding ſix, from the eccleſiaſtical communities in that city [c].

An aſſembly of men of letters at Lyons, are ſaid only to want letters-patent to form a royal *Academy*, inferior to few in France. It conſiſts of twenty *academiſts*, with a director at their head, and a ſecretary who is perpetual. F. Lombard, a jeſuit, one of the members, here read a learned diſſertation on infinity [d].—[[a] V. *Peliſſ.* Hiſt. Acad. Franc. p. 4. ſeq. [b] V. *Creſcemben.* la Bellezza della Volgar Poeſia, &c. Act. Erud. Lipſ. Supp. T. 3. p. 460. ſeq. [c] V. Lettres Patentes avec les Statuts pour l'Academie des Belles Lettres etablie en la Ville de Caen: an Extract hereof is given in Journ. des Scav. T. 33. p. 610. [d] See Nouv. Liter. T. 2. p. 82.]

ACADEMIES *of Languages*, are called by ſome, *Grammatical Academies*; as

The *Academy della Cruſca* at Florence, famous for its vocabulary [a] of the Italian tongue, was formed in 1582, but ſcarce heard of before the year 1584, when it became noted for a diſpute between Taſſo and ſeveral of its members. Many authors of note confound this with the Florentine *Academy* [b]. The diſcourſes which Torricelli, the celebrated diſciple of Galileo, delivered in the aſſemblies concerning levity, the wind, the power of percuſſion, mathematics, and military architecture, are a proof that theſe *academiſts* applied themſelves to things, as well as words.

The *Academy of Fructiferi*, had its riſe in 1617, at an aſſembly of ſeveral princes and nobility of the country, who met with a deſign to refine and perfect the German tongue. It flouriſhed long under the direction of princes of the empire, who were always choſen preſidents. In 1668, the number of members aroſe to upwards of nine hundred. It was prior in time to the French *Academy*, which only appeared in 1629, and was not eſtabliſhed into an *Academy* before the year 1635 [c]. Its hiſtory is written in the German tongue, by George Neumarck.

The *French Academy* had its riſe in a private meeting of men of letters, in the houſe of Mr. Conrart [d], in the year 1628: Cardinal Richlieu, in 1635, at the inſtance of Mr. Chapelain, erected it into an *Academy* for refining, and aſcertaining the French language and ſtyle. The number of the members was limited

limited to forty, out of whom, a director, a chancellor, and secretary are to be chosen; the two former hold their post for two months, the secretary is perpetual. Several privileges and immunities were conferred on the new *Academy*, particularly the *Droit de Committimus*, or a privilege of not appearing to answer before any court, but that of the king's household. Their first assemblies were held in the cardinal's apartment, after his death in that of the Chancellor Seguier. At last an apartment was given them in the Louvre [e], now called *l'Academie Francoise*. They meet three times a week in the Louvre; at breaking up, forty silver medals are distributed among them, having on one side, the king of France's head, and on the reverse, *Protecteur de l'Academie*, with a laurel and this motto, *a l'Immortalité*. By this distribution, the attendance of the *academists* is secured: those who are present receiving the surplus, otherwise intended for the absent. To elect or expel a member, twenty persons, at least eighteen [f], are ordinarily required; nor can any be chosen unless he petition for it [g]: an expedient to prevent the affront of refusals from persons elected. Religious are not admitted [h]. None to be expelled, except for base and dishoneſt practices. There are but two instances of such expulsions, the first of M. Granier, for refusing to return a deposit; the other of the Abbe Furetiere, for the crime of plagiarism. After the death of Cardinal Richlieu, first protector of the *Academy*, the king took the office on himself [i]. The society met with great opposition to its establishment, on the part of the parliament of Paris; being delayed two years before the patents granted by the king would be register'd. Several satyrists appeared against them, as the Abbe Morgues; *la Comedie de l'Academie*, by M. St. Evremond [k]; *Rolle des presentations faites aux grands jours de l'Eloquence Françoise*, by the author of *Francion*; and the *Requête des Dictionaires*, by M. Menage. As to the employment of the *Academy*; its design being not only to give rules, but examples of good writing: they began with making speeches on subjects taken at pleasure, each member in his turn: twenty of these have been printed. Their next work was a critique of the Cid of M. Corneille, a task enjoined them by the cardinal [l]. They set next about a dictionary of the French tongue, which, after, about fifty years spent in it, in order to settle the words and phrases to be used in writing, &c. was published in 1694 [m]; having in the mean while given occasion to some smart disputes with M. L'Abbe Furetiere, one of their own members [n]. See the article DICTIONARY. Other works destined for them are a perfect French grammar and rhetoric; and an art of poetry; but it should seem these are laid aside. One of their own members in some reflections, with regard to their future employments, shews the unsuitableness of those works, and marks out another employment, viz. making critical observations on the sentiments of authors [o]. Some speak with great panegyric of the success of the *Academy*, and its merits towards the French language [p]; part of which seems to be true. Others object to them, that by refining they have enervated the language [q]. In effect we have seen the *academic* style severely ridiculed [r], What is worse, they are charged with having surfeited the world with flattery [s]; and having exhausted all the topics of panegyric in behalf of their founder [t]: it being a branch of duty incumbent on every member at his admission to make a speech in praise of the king, the cardinal, the chancellor Seguier, and the person in whose place he is elected [u]. Their history is written with great elegancy to the year 1652, by M. Pelisson [x]: improved and continued to the year 1700, by M. l'Abbe d'Olivet [y]; the fame is given rhetorically, by F. le Camus [z].

The *Royal Spanish Academy* at Madrid, held its first meeting in July, 1713, in the palace of its founder Don John Emanuel Fernadeus Pacheco, Duke d'Escalona; it consisted at first of eight *academists*, including the duke; to which number were afterwards added fourteen others, the founder being chosen president or director, and Don Vincent Squarcafigo secretary. Their first act was a petition for the king's confirmation and protection, which was granted in 1714. Their device is a crucible in the middle of the fire, with this motto, *Limpia, Fya, y da Esplendor*, it purifies, fixes, and gives brightness; which some have criticized [a]. Their object, as marked out by the royal declaration, is to cultivate and improve the national language: in order to which, they are to begin with choosing carefully such words and phrases, as have been used by the best Spanish writers; noting the low, barbarous, or obsolete ones, and composing a dictionary, wherein these may be distinguished from the former, &c. by which means, adds that prince, it will clearly appear, that the Castilian tongue is inferior to none of those most esteemed in the world; and may be employed with advantage either in teaching the arts and sciences, or in expressing the most perfect Latin or Greek originals in exact translations. The number of members is limited to twenty four; the Duke d'Escalona to be director for life; but his successors chosen yearly. The secretary to be perpetual. The *Academy* to have its own printer; yet not to put any thing to the press without permission of the council. For further encouragement, all privileges and immunities enjoyed by the domestic officers, actually in the king's service and the royal palace, are granted the *academists*. Their assemblies are all to open with the anthem, *Veni sancte spiritus*, and the prayer *Actiones nostras*; and terminate with the prayer, *Agimus tibi gratias*. When the dictionary is finished, they are to compose a grammar, poetry, and a history of the Spanish tongue [b].—[[a] Vocabolario de gli Accademici della Crusca. 1691. Firenz. 4 vol. fol. ACADEMIES *of Dancing*, as that erected by the late king of France, with privileges beyond all the rest.

ACADEMIES *of Painting*, as those celebrated ones antiently at Florence and Milan, called also *Schools*; and that other at Bologna, lately incorporated into the new institute [a]; to which may be added the *Academy* of painting and sculpture at Paris and Vienna [b]; and another of designing at Rome [c].

The *Academy of Painting and Sculpture* at Paris was established fifty years ago, under the cardinal Mazarine, first protector thereof; and the chancellor Seguier, vice-protector.

It consists of a director, a chancellor, four rectors, a treasurer, twelve professors; adjuncts to the rectors and professors; counsellors; a secretary; a professor for anatomy, and another for geometry, and perspective.

Persons are here admitted either in quality of painters or sculptors.—The painters are admitted according to their respective talents; there being a distinction made between those who work in history, and those who only point portraits, or landskips, or beasts, or fruits, or flowers, or paint in mignature; or only design; or engrave; or carve, &c. An account of it has been pubished by Guerin [d].—[[a] V. *Jark.* c. 2. §. 21. seq. *Vockerodt*, c. 2. §. 3. [b] V. Bibl. Germ. T. 12. p. 217. [c] Giorn. de Letter. d'Ital. T. 4. p. 257. [d] V. *Guerin.* Descript. de l'Acad. Roy. de Peintur. & Sculpt. Act. Erud. 1717. p. 188.]

The Romans had a kind of military *Academies*, established in all the cities of Italy, under the name of Campi Martis. Here the youth fit for war were admitted indifferently, to be trained to arms, at the public expence. They learned to fence, ride, shoot with bows, swim, run, leap, and vault, with all the evolutions of horse and foot.—The Greeks, beside *Academies* of this kind, had military professors called Tractici, who taught all the higher offices of war, as what related to the general, &c. *Folard.* sur Polyb. T. 2. p. 19.

We have now a royal *Academy* at Woolwich, where youth are taught fortification, gunnery, and such branches of the

mathematical ſciences, as are neceſſary to qualify them for Engineers.

ACADEMY is alſo uſed among us for a kind of collegiate ſchool, or ſeminary; where youth are inſtructed in the liberal arts and ſciences in a private way.

Milton gives a project of an *Academy* of this kind, formed in imitation of the antient gymnaſiums of the Greeks and Romans; by way of oppoſition to the modern ſchools and univerſities. *Milton.* Tract. of Educat. Bibl. Angl. T. 4. p. 639.

The non-conformiſt miniſters in England are many of them bred up in private *Academies*; where they are taught *academical* learning without going to any univerſity. The advocates for the hierarchy, and the univerſities, are frequently complaining againſt the *Academies* of diſſenters; we have even books expreſs againſt them. V. New Aſſociation. P. 2. p. 14.

ACÆNA, Ακαινα, in antiquity, a Grecian decemped, or ten-foot rod, uſed in meaſuring of their lands [a].

Some late Greek authors write the word ακενα, and ſome Latin ones *aſcena*. It is compounded, as ſome ſuggeſt, from the privative α, and καινω, *occido*, I kill; as ſerving to prevent quarrels and bloodſhed. But Salmaſius [b] gives a more probable origin: the *Acæna* according to him was originally a long rod with an iron goad at the end, wherewith the oxen were pricked forward at plow; and hence the name was given to the meaſuring rod.—[a *Beverin.* Syntagm. de Ponderib. & Menſur. p. 177. *Hoſt.* de Veter. Menſur. &c. l. 3. c. 7. §. 2. *Opp.* T. 2. p. 248. b V. *Salmaſ.* Exerc. in Solin. p. 684. *Voſſius* Etym. p. 6. in voc. *Acnua.*

Acæna is the ſame with what Plato and others call δικαπυς: its invention is attributed to the Theſſalians. Its length was equal to 10 Grecian feet, or 40 palms, 160 digits, 6 ⅔ cubits, 1 ⅔ orgyia, or to twelve antient Roman feet. Some make it the 60th part of a ſtadium. V. *Ricciol.* Geograph. l. 2. c 4. *Beverin.* ubi ſupra. See alſo *Bernard.* de Menſur. & Ponder. l. 3. §. 20. p. 224. & *Salmaſ.* lib. cit. p. 683. ſeq.

ACAIAIBA, in botany, a name by which ſome authors have called the tree, which produces the caſhew nuts: the Acajou of other writers. *Piſo.*

ACAJOU, in botany, the name of a genus of plants, the characters of which are theſe. The flower conſiſts of one leaf, and is of the funnel faſhioned kind, and divided into many ſegments at the edges. From the cup of this there ariſes a piſtil, which is ſurrounded with a multitude of ſtamina, and is fixed in the manner of a nail, to the hinder part of the flower; this finally becomes a ſoft turbinated fruit, to which there is affixed a capſule of the ſhape of a kidney containing a ſeed, or kernel of the ſame figure. *Tourn.* Inſt. p. 658.

There is only one known ſpecies of this genus, which is the tree which produces the caſhew nut, or Weſt-Indian anacardium.

ACALYPHA, in botany, the name of a genus of plants, called by Boerhaave, and others, Ricinocarpos. The characters are theſe, the male and female flowers are diſtinct, but they are produced on the ſame plants, the male ones uſually ſtanding immediately over the female ones. *Linnæi*, Gen. Plant. 456.

In the males, the perianthium conſiſts of four roundiſh concave leaves, equal one to another in ſize; there are no petals; the ſtamina are a number of ſhort filaments from eight to ſixteen, which ſtand very thick together, and are terminated by roundiſh antheræ. The female flowers are fewer in number. They are placed in one large divided involucrum; each of them has a three leaved perianthium; the leaves being ſmall, oval and concave, and meeting almoſt together. There are no petals; the germen of the the piſtil is roundiſh, and there are three long ſtyles which are often branched, and are crowned with ſimple ſtigmata. The fruit is a roundiſh capſule, with three furrows on its outſide, and containing three cells, the valves opening in two parts. The ſeeds are ſingle, roundiſh and very large. *Boerhaave* Ind. Plant. p. 92.

ACANACEOUS, in botany, a word applied to ſuch plants as are prickly, and bear their flowers and ſeeds in a ſort of heads, as thiſtles and the like.

ACANOPHORA, in botany, a name given by ſome, to the common knapweed, or jacca, a common wild plant. *Ger.* Emac. Ind. 2.

ACANTHA, in a general ſenſe, a ſpine or prickle, chiefly of plants of the thorny kind.

The word is Greek, ακανθα, formed from ακη, *mucro*, point, and ανθος, flower.

ACANTHA, in a more particular ſenſe, denotes a ſpine, or quill of certain fiſhes, as the echinus marinus, or ſea hedge-hog. Hence the thorn-back, a ſpecies of the galeus, is peculiarly called *Acanthias*, from the two prickles on its back. *Rondelet* de Piſcib. l. 13. c. 2. *Caſt.* Lex. Med. p. 5.

ACANTHABOLUS, Ακανθαβολος, a ſurgeon's inſtrument, wherewith to extract foreign bodies, which by the ſharpneſs of their points have penetrated and entered the parts of the body. The word is ſometimes alſo written, corruptly, *Acantabolus*. It is compounded of the Greek ακανθα, *ſpina*, and βαλλω, *jacio*, I caſt away. *Æginet.* l. 6. c. 32. ap. *Caſt.* Lex. Med. p. 5.

The *Acanthabolus* is the ſame with what is otherwiſe called *volſella* [a].—Its uſe is for extracting darts, fiſh-bones, or the like, ſticking in the œſophagus; alſo the fragments of bones, hair, &c. remaining in wounds.—Its figure reſembles that of a pair of pincers: ſometimes it is alſo made crooked, for more commodious application to the fauces [b].—[a *Celſ.* l. 7. c. 30. b V. *Scultet.* Armam. Chirurg. tab. 2. fig. 1. Item, tab. 10. fig. 1. *Caſt.* loc. cit.]

ACANTHABOLUS is alſo ſometimes uſed for an inſtrument, wherewith people pull out the hairs from their eye-brows, &c. *Blanc.* Lex. Med. p. 5.

ACANTHE, in the materia medica of the antients, a name given to the plant we now call the artichoak. The name of this comes ſo near that of the bears-breech, or *Acanthus*, that the commentators on the antients have generally confounded them, and not obſerved that they meant two very diſtinct plants. The editions of Dioſcorides in general alſo confound the very text, by printing *Acanthe* for *Acanthus*; and thus they give the flexile branches of the bears-breech to the rigid artichoak, and the round and eſculent head of the artichoak, to the bears-breech.

ACANTHE *Arabica*, in botany, a name given by ſome of the Greek writers to a plant called alſo *Leucacanthe*, and by the Arabian phyſicians *Bunkon*. It was a prickly plant, whoſe roots were ſomewhat like thoſe of the Cyperus, and compoſed of ſeveral knobs or joints, and of a bitter taſte. It was brought for medicinal uſe from the Eaſt Indies and ſome parts of Arabia, and was the root of the *amgaila* of Aviſenna and others. It was not uſed till it had lain ſo long, as to be in ſome degree corrupted, and to fall ſpontaneouſly aſunder. They recommended ſuch as the beſt, which was yellow, light, and of a ſtrong ſmell; and condemned that which was white and heavy, as not fit for uſe. The Arabians alſo uſed the word bunkon, or bunk-myrrh, for the myrtidanum of Theophraſtus and Dioſcorides; but this was not the common ſenſe of the word. The root bunk, or *amgaila*, was uſed in all the warm carminative compoſitions of the antients, and in their ſcents. We are not at this time well informed what it is; but it is to be obſerved, that as it ſignifies the ſame with the *Acanthe Arabica*, in many parts of the works of Dioſcorides, &c. it is a plant, not a ſhrub; and therefore, this term, tho' ſometimes uſed to expreſs the *Acacia* tree, yet was alſo uſed to expreſs a prickly plant or thiſtle, with odoriferous roots.

ACANTHIAS, in zoology, a name given by ſome authors to the fiſh, the ſkin of which is uſed by our artificers in poliſhing, and called by them ſimply fiſh-ſkin. See the article GALEUS.

ACANTHICE, *Maſtich*, in antient naturaliſts, a kind of gum, yielded by the herb helxine [a]. Gaza explains it by *Spinalis Maſticha* [b].—[a *Plin.* Hiſt. Nat. l. 21. c. 16. b *Hard.* Not. ad loc.]

ACANTHINE, *Acanthinus*, denotes a thing relating to, or reſembling the herb *acanthus*. *Martin.* Lex. Philol. T. 1. p. 5. See the article ACANTHUS.

In this ſenſe, we read of *Acanthina veſtimenta*, Acanthine garments, of which we have two different explications. Some underſtand by it a kind of embroidery, wrought in imitation of the Egyptian *acanthus* or thorn, whoſe ſmall ſprigs are much interlaced [a]. Others will have it a peculiar kind of ſilken ſtuff, made of the lanugo or down of a plant of the thiſtle kind, growing in Sicily and the Eaſt [b].—[a V. *Iſid.* Orig. l. 17. c. 9. b *Plin.* Nat. Hiſt. l. 24. c. 12. *Hardouin.* ad loc. *Dioſc.* l. 3. c. 18. *Salmaſ.* Exerc. in Solin. p. 299. ſeq. *Voſſ.* Etym. Lat. p. 3.]

ACANTHINUM *Lignum*, is uſed by ſome writers for braſil. Thus we read of a tincture of *lignum Acanthinum*. V. *Morley*, Collect. Chym. Leyd. c. 5. p. 3.

ACANTHION, among naturaliſts, a plant of the thorn, or rather of the thiſtle kind; whoſe down being cleanſed from the prickles, was manufactured into a kind of ſtuff, not unlike ſilk. V. *Plin.* Hiſt. Nat. l. 24. c. 12. & *Hardou.* Not. ad loc. *Dioſcor.* l. 3. c. 18.

ACANTHOPTERYGII, Ακανθοπτερυγιοι, in natural hiſtory, a term uſed to expreſs one of the general claſſes or families of fiſhes; the character of which is, that the rays of the fins are bony, and ſome of them prickly at the extremities. *Artedi*, Gen. Piſc.

The word is derived from the Greek ακανθα, a thorn or prickle, and πτερυγιον a fin. The fiſhes of this order have bony fins, with ſome of their rays pointed or ſharp. *Lennæi* Syſtema naturæ, p. 53.

ACANTHUS, in botany, the name of a genus of plants, the characters of which are theſe. The flower conſiſts of one leaf, and is divided in its anterior part into three ſegments its hinder part terminating in a ſort of ring; and a great number of ſtamina ſupplying the place of the upper lip, and carrying a tuft of apices like brooms. The piſtil ariſes from the cup, and is fixed in the manner of a nail into the hinder part of the flower; this finally becomes a fruit reſembling an acorn in ſhape, and is encloſed by the cup, and divided by an intermediate membrane into two cells, which uſually contain a number of gibboſe ſeeds. See Tab. 1. of Botany, Claſs 3.

The ſpecies of *Acanthus*, enumerated by Mr. *Tournefort*, are theſe. 1. The ſmooth *Acanthus*, or *Acanthus* of Virgil. 2. The prickly *Acanthus*. 3. The *Acanthus*, which has only a few ſhort prickles. *Tourne.* Inſt. p. 176.

The ſeveral ſpecies of *Acanthus*, may be known, when not in flower, by the beautiful ſhape of their leaves, which are

ſo elegant as to be imitated in the carvings of the antients and moderns.

The antients have not only called the herb bears-breech by this name, but alſo a thorny tree growing in Egypt. Theophraſtus mentions the Egyptian *Acanthus* as a robuſt ſhrub; and Iſidore, ſpeaking of the tree which produces myrrh, ſays, in the words of a very antient author, that it is a robuſt ſhrub, growing to five cubits or more in height, and ſomewhat reſembling the Egyptian *Acanthus*. Diodorus Siculus, and Dioſcorides alſo, compare the myrrh-tree to the *Acanthus*. It is very evident this could not be meant of the herb *Acanthus*, though the ſame name is made to expreſs it. The ſame Iſidore, however, afterwards confounds this ſhrub with the plant of the ſame name, ſaying, that the *Acanthus* of Egypt was a tender plant, always green, full of prickles, and having large leaves, and bending or flexile ſtalks. Servius alſo runs into the ſame error, and ſuppoſes the Egyptian and common *Acanthus* to be the ſame plant.

An accurate examination of the antient writers will, however, ſhew very plainly, that they meant two very different vegetables under this name; the *Acanthus* of Virgil, and the Egyptian *Acanthus* of Theophraſtus [a], being two wholly different plants. Virgil mentions the *Acanthus* as being an evergreen plant, and producing berries, or a ſmall round fruit, *Baccas ſemper frondentis Acanthi*, are his words: and Theophraſtus tells us, that his Egyptian *Acanthus* is a prickly tree, and bears pods like thoſe of beans. It is plain, that the *Acanthus* of Theophraſtus, is the acacia, a tree, from ſome ſpecies of which, we have the gum Arabic now in uſe; and the *Acanthus* of Virgil, mentioned in this place, ſeems to be the Cyrenian lotus, which Herodotus ſays is like the Egyptian *Acanthus*. Thus we find a third plant brought into the world, under the ſame name: and this lotus, called by ſome *Acanthus*, was found in Egypt, as well as in Cyrene, and had the term *Acanthus* at firſt annexed to its name, by way of a diſtinctive epithet, though it became afterwards uſed ſingly for it, the original name lotus being forgot. The epithet *Acanthus* was uſed to this lotus, becauſe it was prickly. Demetrius, in Athenæus [b], when he deſcribes the Egyptian *Acanthus*, is to be underſtood alſo to mean this plant, he allowing that a round fruit, which Virgil calls a berry, not the pod, as Theophraſtus's *Acanthus* muſt have had. Servius rightly underſtands the account the antients give of the Cyrenian lotus, or *Acanthus*, which he allows to have been a true lotus, and only called *Acanthus*, becauſe prickly. The Latins, as well as the Greeks, having uſed both the ſubſtantive *Acanthus*, and the derivative adjective *Acanthinus*, to expreſs any thing prickly, or beſet with thorns. *Acanthium gummi* was an old name for gum Arabic; becauſe produced by a thorny tree: and Pliny calls the leaves of the euphorbium plant *Acanthina*; not becauſe they were like thoſe of the *Acanthus*, but becauſe they were prickly.—[a *Theophraſt.* de Arboribus. b *Athenæus*, l. 5.]

ACAPATLI, in botany, a name uſed by ſome authors for the plant which produces the long pepper uſed in medicine. *De Laet*, Ind. Occid. p. 231.

ACARA, in zoology, the name of a fiſh caught in the freſh waters of the Braſils, and eſteemed a very delicate and well-taſted one. It ſeldom exceeds three or four inches in length, and has a high back like the pearch. Its mouth is ſmall, and its jaws rough like a file. It has one long back fin, which is ſupported by a great number of rigid and prickly rays, and reaches to the tail. Its ſcales are large; its back is of a gloſſy brown; its ſides and belly white; its tail is not forked. It has a large black ſpot on the middle of each ſide, and another near the tail. Its fins are all brown. *Margrave*'s Hiſt. Braſil.

ACARAAYA, in zoology, the name of a fiſh caught on the Braſilian ſhores, and by ſome called alſo *Garanha*. It grows to three feet in length, and is of the ſhape of our carp. Its lower jaw is furniſhed with an even range of ſharp teeth, like little needles. Its upper jaw has two very long ones, and beſides theſe, a multitude of other very ſhort ones. Its eyes are large, and their iris red. Its tail is broad, and a little forked. Its ſcales are of a moderate ſize, and of a ſilver hue, with an admixture of purple. Its belly, and the under part of its head, are wholly white; and its fins all of a fine pale red, except thoſe under the belly, which are white, with a ſlight edge of red. It is eaten in Braſil, both freſh and ſalted. *Margrave*'s Hiſt. Braſil.

ACARAMUCU, in zoology, the name of a fiſh found in the weſtern ocean, and in ſome other parts of the world. It is a very ſingular and remarkable animal. It is of a flatted, but long body, and not thick. It is uſually of about eight or ten fingers breadth long, and about four broad. Its mouth is round, but very ſmall, ſcarce admitting the end of one's little-finger. In the fore-part of the mouth, both above and below, there are triangular and ſharp teeth. One each ſide, juſt below the eyes, there are two ſquariſh fiſſures, which ſerve in the place of gills; and on the ridge of the back, directly behind the eyes, there is placed a fine ſlender pointed horn, which ſtands nearly erect, but bending a little backward; this is of a cylindrical ſhape, and four fingers breadth long. It has no ſcales, but a ſmooth ſkin, and is of a mixed greyiſh and browniſh colour. It feeds on ſea weeds; and its fleſh is not eatable. *Margrave*'s Hiſt. Braſil, p. 114.

ACARAPEBA, in zoology, the name of an American fiſh, called alſo by ſome *Broſeme*. It has a ſomewhat broad and flat body, covered with large ſcales of a fine ſilver whiteneſs. It grows to a foot in length, and to four or five fingers in breadth. It has a large mouth, but without teeth; and its tail is forked. It has one long back fin, the anterior rays, or naves of which are rigid and prickly, the hind naves ſoft and flexile. The fins are all like the reſt of the body, of a pure white. The fiſh ſeems a kind of *Smaris*. *Margrave*'s Hiſt. Braſil.

ACARAPINIMA, in zoology, the name of a Braſilian fiſh, of the cantharus kind, and ſeeming of the ſame ſpecies with the cantharus of the Mediterranean. *Ray*'s Ichthyogr. p. 310.

ACARAPITAMBA, in zoology, the name of a fiſh caught in the Braſilian ſeas, of an oblong figure, reſembling the mullet, and growing to two feet or more in length. Its mouth and teeth are very ſmall. It has one long fin on the back, running very nearly to the tail, which is ſupported by rigid and prickly rays. Its tail terminates in two oblique horns. Its ſcales are large, and of a purpliſh colour, with a fine admixture of blue; and along the middle of each ſide there runs, from the gills to the tail, a very broad and beautiful gold coloured line. Its back, down to this line, is variegated alſo with ſmall gold coloured ſpots; and the ſides under the line are very beautifully variegated with ſmall and fine longitudinal, but ſhort gold coloured lines, of a ſomewhat paler colour than the broad one. Its belly is white, and its fins yellow. *Margrave*'s Hiſt. Braſil. *Willoughby*, Hiſt. Piſc. p. 337.

ACARAPUCU, in zoology, the name of a Braſilian fiſh, caught in the freſh waters, and growing to eighteen inches in length. It is of a rounded body; and its mouth is ſmall and not prominent. It has lips, which it can hide, or ſuffer to appear at pleaſure, and has no teeth. Its tail is long and forked; its ſcales are all of a ſilvery hue. On the back it has a fine golden gloſs, ſhining among the whiteneſs; and on the ſides five or ſix large blue ſpots. Its back and ſide fins are of a pale blue, as is alſo the tail: the belly fins are yellowiſh. It is a well-taſted fiſh. *Margrave*'s Hiſt. Braſil.

ACARAUNA, in zoology, an American fiſh, of which there are two ſpecies; the one called *Acarauna*, without any addition; and the other the *Acarauna quadrata*, or ſquare *Acarauna*; and by our ſailors, the *Old wife*.

The *Acarauna*, ſimply ſo called, grows to about four or five inches long, and is conſiderably broad and flat. It is covered with ſmall blackiſh ſcales; its tail is large and forked. It has two fins under the gills, two more under the belly, and a long one running all along the back, and another anſwering it from the anus to the tail. Its mouth is ſmall and narrow, and its teeth very ſmall. Its eyes are but ſmall; and on each ſide, near the tail, it has an extremely ſharp thorn, or prickle: theſe it can draw in at pleaſure into its ſides, and occaſionally throw them out, to annoy other fiſhes. *Willoughby*, Hiſt. Piſc. p. 217.

The *Acarauna quadrata*, or ſquare *Acarauna*, or old wife, is much of the ſame ſize with the former ſpecies. It is frequently preſerved in the cabinets of the curious, and is found there, of a pale brown, with its tail and the fore-part of the body of a pale yellow, or ſtraw colour. It is covered with ſcales, furrowed with ſlight parallel lines, except that the anterior part of its head is covered with a naked, but rough ſkin. The top of the head riſes into an acute angle; the forehead is flat; and the eyes round and large, and placed high. Its mouth is very ſmall; and its teeth are very ſlender, and ſtand cloſe together. The upper jaw has on each ſide four ſharp thorns growing from it, and the lower two very large and ſharp ones, bending downward, and in ſhape and ſtructure reſembling a cock's ſpur; and from theſe, there runs up a row of ſmall thorns to the eye. *Willoughby*, Hiſt. Piſc. p. 218.

ACARI, or ACARIS, in natural hiſtory, an animalcule bred in wax; ſaid by Ariſtotle to be the leaſt object of human ſight. *Caſt.* Lex. Med. p. 5. *Card.* de Subtil. l. 9. p. 369. *Scalig.* ad Cardan. Exerc. 194. §. 7. p. 600. *Morhof.* Polyhiſt. Philoſ. l. 2. P. 2. c. 14. n. 3.

ACARI, or ACARUS, is alſo uſed for a kind of vermin lodged under the cutis, where preying on the parts, it excites an itching, and raiſes pimples.

The *Acari*, according to ſome, are the ſame with what we otherwiſe call *cirrhones*, *cyrones*, or *ſirones*; others will have them the ſame with the *teredo*; others diſtinguiſh them from all three. *Jun.* Nomencl. p. 76. V. *Aldrovand.* de Inſect. l. 5. c. 4. *Piſo*, de Morb. Cogn. & Cur. l. 1. c. 4. *Caſt.* Lex. Med. p. 5.

A German phyſician has traced their origin; he finds the *Acari* ariſe from milk-meats turning ſtale and ſour. Their ſeat is chiefly in the hands or feet, rarely in the arms or legs. *Ludovic.* in Ephem. Germ. dec. 19. obſ. 39. p. 109. *Camerar.* Mirab. Cent. 9. P. 83. & *Hildan.* c. 1. obſ. 96.

ACARNA, in botany, a name by which Theophraſtus, and ſome other writers, expreſs the common artichoak. *Ger.* Emac. Ind. 2.

Monſ. Vaillant gives the name *Acarna* to one of the genera of the *Cynarocephalus*, or artichoak-headed claſs of plants. See Mem. Acad. Scienc. an. 1718. p. 207. Edit. Holland.

ACARNAN, in zoology, the name of a ſmall ſea fiſh, very common in the Mediterranean, and brought to market among the *Rubellios*, or *Erythryni*, and called by the fiſhermen by the name, *Fravolino*, or *Phragolino*. It very much reſembles the erythrinus in ſhape; but as that is of a fine red, this, on the contrary, is of a ſilvery white. Its mouth is moderately large; its teeth ſlender and pointed; and its eyes large, and having fine yellow iris's. Its fins are white, but have each a black ſpot at their origin. It ſeems doubtful whether this be really any way different from the erythrynus, except in colour, which alone is not diſtinction ſufficient to make a ſpecies. *Rondelet.* de Piſc. *Gemar.* de Piſc. p. 1. See ERYTHRINUS.

ACATHISTUS, Ακαθιστος, in an eccleſiaſtical ſenſe, a ſolemn hymn, or vigil, antiently ſung in the Greek church, on the Saturday of the fifth week of Lent, in honour of the Virgin, for having thrice delivered Conſtantinople from the invaſions of barbarous nations.

It was called ακαθιστος, *i. e.* without ſitting, in regard it was celebrated ſtanding: the people ſtood all night, ſinging the praiſes of their deliverers.

The ſame name is alſo given to the day whereon it was performed, which is called the feaſt τυ ακαθιστυ. V. *Codin.* de Offic. Aulæ C. P. c. 12. n. 10. *Gretſer.* ad eund. l. 3. c. 7. p. 238. ſeq. *Magri*, Notit. Vocab. Eccl. p. 2. ſeq. *Suic.* Theſ. Eccleſ. T. 1. p. 145. *Schmidt*, Lex. Eccleſ. p. 12.

ACAULIS, in botany, a term applied to certain plants, the flowers of which have no ſtalk or pedicle to ſupport them, but reſt immediately on the ground: of this kind are the carline thiſtle, and ſome others.

ACAULOSE, or ACAULOUS, is applied, by botaniſts, to thoſe plants which have no proper ſtem, or caulis. *Ray*, Hiſt. Plant. T. 1. l. 3. Phil. Tranſ. N°. 186. p. 284.

ACBAB, in natural hiſtory, a name given by the people of the Philippine iſlands, to a bird, very like our common hen, which is very frequently wild among them. It lives on rice and other vegetables, and does a great deal of miſchief; but it is ſhort winged, and does not fly well, ſo that they find it eaſy to kill it.

ACCALIA, in antiquity, ſolemn feaſts, held in honour of Acca Larentia, nurſe, or foſter-mother of Romulus.

Theſe were otherwiſe called *Larentalia*.—To the ſame Acca is alſo attributed the inſtitution of the *fratres arvales*. Vid. *Varro*, de Ling. Lat. l. 5. §. 3. *Scalig.* Conject. in Varr. p. 78.

ACCENDENTES, or ACCENSORES, in eccleſiaſtical writers, a lower order of miniſters in the church of Rome, whoſe office is to light, ſnuff, and trim the candles or tapers. *Spelm.* Gloſſ. p. 6.

The *Accendentes* are much the ſame with thoſe otherwiſe called *Acolythi* and *Ceroferarii*.

ACCENDONES, or ACCEDONES, in Roman antiquity, a kind of gladiators, whoſe office was to excite and animate the combatants, during the engagement [a]. See the article GLADIATOR, *Cycl.*

The orthography of the word is conteſted: the firſt edition of Tertullian, by Rhenanus, has it *Accedones*, an antient manuſcript *Accendones*; Aquinas adheres to the former [b], Pitiſcus to the latter [c]. The origin of the word, ſuppoſing it *Accendones*, is from *accendo*, I kindle; ſuppoſing it *Accedones*, from *accedo*, I accede, am added to. The former places their diſtinguiſhing character in enlivening the combat by their exhortations and ſuggeſtions; the latter ſuppoſes them to be much the ſame with what among us are called *ſeconds*, among the Italians *patroni*: excepting that theſe latter only ſtand by to ſee the laws of the ſword duly obſerved, without intermeddling to give advice or inſtructions.—[a *Tertull.* de Pall. c. 6. b *Aquin.* Lex. Milit. T. 1. p. 4. c *Pitiſc.* Lex. Antiq. Rom. T. 1. p. 10.]

ACCENSI, (*Cycl.*)—The *Accenſi* were thus denominated, *quia accenſebantur*, or *ad cenſum adjiciebantur*: Vegetius calls them *ſupernumerarii legionum*: Cato calls them *ferentarii*, in regard they furniſhed thoſe engaged in battle with weapons, drink, &c [a]. Though Nonius ſuggeſts another reaſon of that appellation, viz. becauſe they fought with ſtones, ſlings, and weapons, *quæ ferrentur*, ſuch as are thrown, not carried in the hand [b]. They were ſometimes alſo called *velites*, and *velati*, becauſe they fought clothed, but not in armour; ſometimes *adſcripticii*, and *adſcriptivi*; ſometimes *rorarii* [c]. The *Accenſi*, Livy obſerves, were placed at the rear of the army, becauſe no great matter was expected from them [d]: they were taken out of the fifth claſs of citizens [e].—[a Vid. *Feſt.* in Voc. *Ferentarii*. b *Non. Marcell.* de Propriet. Serm. c. 12. §. 8. c *Pitiſc.* Lex. Ant. T. 2. p. 10. item in Voc. *Rorarii*. *Baxt.* Gloſſ. Antiq. Rom. p. 11. d *Dan.* Dict. Antiq. Rom. in Voc. e *Salmaſ.* de Re Milit. Rom. c. 15.]

ACCENSI was alſo an appellation given to a kind of adjutants, appointed by the tribune to aſſiſt each centurion and decurion.

In which ſenſe *Accenſus* is ſynonymous with *optio* [a].—In an antient inſcription, given by à Torre, we meet with ACCENSUS EQUITUM ROMANORUM; an office no where elſe heard of; that author ſuſpects it for a corruption, and inſtead thereof reads A CENSIBUS [b].—[a *Feſt.* in Voc. *Optio*, & *Paul.* ad eund. b Monum. Veter. Antii. c. 3. Act. Erud. Lipſ. 1701. p. 259.]

ACCENT is diſtinguiſhed from emphaſis, as the former regards the tune of the voice, the latter the ſtrength of it. The *Accent* raiſes the voice in certain ſyllables, to a higher, *i. e.* more acute pitch or tone, and in others depreſſes it lower, but both admit of ſome emphaſis, *i. e.* of more or leſs vigorous pronounciation. The circumflex *Accent* keeps the voice in a middle tune, and therefore in the Latin is compounded of both the other, but withal adds an emphaſis, and longer ſtay upon that ſyllable. *Hold.* Elem. Speech, p. 99.

Von der Hardt has given a diſcouſe on the nature and uſe of *Accents* [a], wherein he aſſerts, that there are but theſe three *Accents* in nature: viz. the *acute*, *grave*, and *circumflex*. But if it be true, that the whole ſyſtem of pronounciation turns on three *Accents*, 'tis no leſs true, that each of theſe three admits of ſeveral degrees. The acute *Accent*, for inſtance, may be either higher, or lower; may be ſimply acute, or very acute; and the like holds of the grave and circumflex. So that each of the three common *Accents* is, as it were, a genus, including divers particular ſpecies; though the antient Grammarians have not thought fit to give particular names, and figures to all theſe differences [b].—[a *Vonder Hardt*, Arcanum Accentuum Græcorum, Helmſt. 1715. 12mo. b Mem. de Trev. an. 1715. p. 1614. ſeq.]

The uſe of *Accents*, to prevent ambiguities, is moſt remarkably perceived in ſome eaſtern languages, particularly the Siameſe, and Chineſe. Among the people of China, every word, or which is the ſame thing, ſyllable, admits of five *Accents*, as ſpoken more acutely or remiſsly; and thus ſtands for many different things. The ſame ſound *ya*, according to the *Accent* affixed to it, ſignifies *God*, a *Wall*, *Excellent*, *Stupidity*, and a *Gooſe* [c].—The Chineſe have but 330 ſpoken words in their language; but theſe being multiplied by the different *Accents* or tones, which affect the vowels, furniſh a language tolerably copious [d]. By means hereof, their 330 ſimple ſounds come to denote 1650 things; but this being hardly ſufficient, they are increaſed further by aſpirates added to each word, to double the number [e].—[c *Spizel.* de Re Liter. Sinenſ. p. 106. *Bulffing.* Diſſ. de Liter. Sinenſ. p. 308. d Hiſt. de l'Acad. Roy. des Inſcript. T. 3. p. 460. e *Bulfing.* lib. cit. §. 7. p. 296. ſeq.]

The Chineſe only reckon four *Accents*; for which the miſſionaries uſe the following marks, *aá*, *â*, *à*, *ā*; to which they have added a fifth, thus *ă*. They make a kind of modulation, wherein, prolonging the duration of the ſound of the vowel, they vary the tone; raiſing and falling it by a certain pitch of voice: ſo that their talking is a ſort of muſic or ſinging. Attempts have been made to determine the quantity of the riſe or fall in each *Accent* by means of muſical notes. But this is hard to effect, as being different in different perſons.

Hence the great difficulty of the language to foreigners; they are forced to ſing moſt ſcrupulouſly: if they deviate ever ſo little from the *Accent*, they ſay quite a contrary thing than what was intended. Thus, meaning to compliment the perſon you are talking to with the title Sir, you call him a beaſt, with the ſame word, only a little varied in the tone [f].—Magalhon makes the language the eaſier to learn on this account [g].—[f *Le Comte*, Nouv. Mem. ſur la Chine, T. 1. p. 270. *Spizel.* lib. cit. p. 104. *Bulffing.* ubi ſupra, p. 308. ſeq. g *Bulffing.* loc. cit. p. 309.]

The Siameſe are alſo obſerved to ſing rather than talk. Their alphabet begins with ſix characters, all only equivalent to a K, but differently *accented*. For though in the pronounciation the *Accents* are naturally on the vowels, yet they have ſome to diverſify ſuch of their conſonants as are in other reſpects the ſame. *De la Loubere* du Royaume de Siam. T. 2. §. 8. Bibl. Univ. T. 21. p. 113.

As minutely as the *Accents* of words have been ſtudied, the *Accents* of ſentences ſeem to have been utterly overlooked: yet it may be obſerved, that all mankind lower the voice at the end of a period, elevate it in interrogations, and the like. See *Bacon*, de Augment. Scient. l. 6. c. 1.

ACCESSARY. See ACCESSORY, *Cycl.* The word is generally ſpelt *acceſſary* in our ſtatutes and law books.

ACCESSION, (*Cycl.*) in the language of the conclave, is a method of electing a pope, by procuring ſome candidate two thirds of the voices, upon which the reſt are inrolled by way of *Acceſſion*. *Richel.* Bibl. Franc. T. 6. p. 17.

ACCESSION, in the civil law, denotes a method of acquiring property in certain things, by virtue of their connection with other things, which already belong to us.

Acceſſion is effected divers ways, from whence ariſe ſeveral ſpecies of it: ſimple and mixt *Acceſſion*; natural and artificial; diſcrete and concrete *Acceſſion*. Vid. *Briſſ.* de Verb. Signif. p. 6. *Calv.* Lex. Jur. p. 14.

ACCESSORIUS *Williſii*, in anatomy. See ACCESSORY, *Cycl.*

ACCIPENSER, in the Linnæan ſyſtem of zoology, the name of a genus of fiſhes, of the order of the chondropterygii. This genus comprehends the ſturgeon, &c. Its diſtinguiſhing characters are, that the mouth is tubulated, and without teeth;

teeth; and the gills have only one hole or aperture on each ſide. *Linnæi* Syſtem. Natur. p. 52.

In the Artedian ſyſtem of ichthyology, the characters of this genus are,—there is only one foramen or aperture of the bronchia on each ſide, the mouth is placed in the under part of the head, and is like a tube, and has no teeth. The body is oblong, and has uſually ſeven fins; and the fiſh is of the chondropterygious kind.

The ſpecies of this genus are two, the ſturgeon, and the huſo, or iſinglaſs fiſh. The firſt of theſe Artedi diſtinguiſhes by the name *Accipenſer corpore tuberculis ſpinoſis aſpero*. And the other by that of *Accipenſer tuberculis carens*. This laſt ſeems to be the *Mario* of Pliny. *Artedi*, Gen. Piſc. p. 43.

The antients, and ſome of the later authors, give the name *Accipenſer* to the ſturgeon.

There have been many diſputes, whether the ſturio or ſturgeon be the ſame fiſh with the *Accipenſer* or not, and what was the difference between the *Accipenſer* and *Silurus* of the antients; but the whole ſeems to have been this, that the Romans called the ſturgeon *Accipenſer*, when they had it freſh, and caught in their own neighbourhood, but *Silurus* when it was brought to them in pickle from the Grecian ports. *Ray*'s Ichthyography, p. 240.

The word *Accipenſer* is Latin, and is uſed by Plautus, Cicero, and many other of the antient Roman authors in the ſame ſenſe, in which we now uſe it. Its derivation is uncertain, but its ſenſe always the ſame.

ACCIPESIUS, in ichthyology a name given by Athenæus and other of the Greek writers, to the ſturgeon, called by others Oniſcos. See ACCIPENSER.

ACCIPITER, in ichthyology, a name given by Gillius, and ſome others to the fiſh called by others, the *Milvus* and *Lucerna*. It is a ſpecies of the *Trigla* and is diſtinguiſhed by Artedi, by the name of the *Trigla*, with the head a little aculeated, and with a ſingular fin, placed near the pectoral fins.

ACCIPITER, the hawk, in the Linnæan ſyſtem of zoology, the name of one whole order of birds: The diſtinguiſhing character of which, is their having a hooked or crooked beak. Of this order there are three genera, the parrot, the owl, and the falcon, diſtinguiſhed by their ſeveral marks. *Linnæus*, Syſtem. Natur. p. 44. See PARROT, *&c.*

ACCIPITRINA, in botany, a name by which ſome authors have expreſſed the hawk-weed, and others the flix-weed, or *Sophia Chirurgorum*. *Ger.* Emac. Ind. 2.

ACCISMUS, denotes a feigned refuſal of ſomething which a perſon earneſtly deſires. The word is Latin, or rather Greek Ακκισμος; ſuppoſed to be formed from *Acco*, the name of a fooliſh old woman, famous in antiquity, for an affectation of this kind. V. *Bayl.* Dict. Crit. T. 1. in Voc. *Acco*.

Acciſmus is ſometimes conſidered as a virtue, ſometimes as a vice, which Auguſtus and Tiberius, practiſed with great ſucceſs. V. *Clapmar.* de Arcan. Imper. c. 16. p. 66.

Cromwell's refuſal of the crown of England, may be brought as an inſtance of an *Acciſmus*.

ACCISMUS, is more particularly uſed in rhetoric, as a ſpecies of irony. *Alſt.* Encycl. T. 1. p. 378.

ACCLAMATION, (*Cycl.*)—*Acclamation*, in a more proper ſenſe, denotes a certain *formula* of words, uttered with extraordinary vehemence, and in a peculiar tone, ſomewhat reſembling a ſong frequent in the antient aſſemblies. V. *Schlemm.* de Acclamationibus Veterum. Gen. 4°. 1665. *Pitiſc.* Lex. Antiq. T. 1. p. 12. *Aquin.* Lex. Milit. T. 1. p. 6.

Acclamations were uſually accompanied with applauſes, with which they are ſometimes confounded though they ought to be diſtinguiſhed; as

Acclamation was given by the voice, applauſe by the hands; add, that *Acclamation* was alſo beſtowed on perſons abſent, applauſe only on thoſe preſent. *Acclamation* was alſo given by women, whereas applauſe ſeems to have been confined to men. *Ferrar.* de Acclam. & Plauſ. l. 1. c. 8. *Pitiſc.* loc. cit.

Acclamations are of divers kinds; eccleſiaſtical, military, nuptial, ſenatorial, ſynodical, ſcholaſtic, theatrical, *&c.* We meet with loud *Acclamations*, muſical and rhythmical *Acclamations*, *Acclamations* of joy and reſpect, and even of reproach and contumely. The former, wherein words of happy omen were uſed, were alſo called *laudationes & bona vota*, or good wiſhes: the latter *execrationes & convicia*. Suetonius furniſhes an inſtance of this laſt kind in the Roman Senate, on occaſion of the decree for demoliſhng the ſtatues of Domitian, when the fathers, as the hiſtorian repreſents it, could not refrain from contumelious *Acclamations* of the deceaſed. *Suet.* in Domit. c. 23. §. 2.

The like were ſhewn after the death of Commodus, where the *Acclamations* run in the following ſtrain, *hoſti patriæ honores detrahantur, parricidæ honores detrahantur; hoſtis ſtatuas undique, parricidæ ſtatuas undique, gladiatoris ſtatuas undique*, &c. *Ferrar.* l. 4. c. 5. *Pitiſc.* loc. cit.

The formula, in *Acclamations*, was repeated ſometimes a greater, ſometimes a leſſer number of times. Hence we find in Roman writers, *Acclamatum eſt quinquies, & vicies*, five and twenty times; ſometimes alſo *ſexagies* and even *octuagies*, ſixty and eighty times. *Aquin.* Lex. Milit. T. 1. p. 6.

Acclamations were not unknown on the theatres in the earlieſt ages of the Roman commonwealth; but they were artleſs then, and little other than confuſed ſhouts. Afterwards they became a ſort of regular concerts. That mentioned by Phædrus *lætare incolumis Roma ſalvo principe*, which was made for Auguſtus, and proved the occaſion of a pleaſant miſtake of a flute player called *princeps*, ſhews that muſical *Acclamations* were of uſe in that emperor's reign. *Revertentem ex Provincia modulatis carminibus proſequebantur*, ſays Suetonius, who gives another inſtance in the time of Tiberius: a falſe report of Germanicus's recovery being ſpread through Rome, the people ran in crouds to the capitol with torches and victims ſinging, *Salva Roma, Salva Patria, Salvus eſt Germanicus*.

Nero, paſſionately fond of Muſic, took eſpecial care to improve and perfect the muſic of *Acclamations*. Charmed with the harmony wherewith the Alexandrians who came to the games celebrated at Naples, had ſung his praiſes, he brought ſeveral over to inſtruct a number of youth, choſen from among the knights and people, in the different kinds of *Acclamations* practiſed at Alexandria. Theſe continued in uſe as low as the reign of Theodoric; but the people did not always make a ſingle chorus, ſometimes there were two, who anſwered each other alternately: thus when Nero played on the theatre, Burrhus and Seneca, who were on either hand, giving the ſignal by clapping, 5000 ſoldiers called Auguſtals, began to chant his praiſe, which the ſpectators were obliged to repeat. The whole was conducted by a muſic-maſter called *Meſochorus* or *Pauſarius*.

The honour of *Acclamations*, was chiefly rendered to emperors, their children, and favourites; and to the magiſtrates who preſided at the games. Perſons of diſtinguiſhed merit alſo ſometimes received them, of which Quintilian gives us inſtances in Cato and Virgil. The moſt uſual forms were *Feliciter, longiorem vitam, annos felices*. The actors themſelves, and they who gained the prizes in the games of the circus were not excluded the honour of *Acclamations*. V. *Laurent.* Polymath. l. 2. c. 12. *Chokier* Fax. Hiſtor. l. 2. c. 11. *Lipſ.* Elect. l. 2. c. 10. *Ferrar.* l. 2. c. 20.

To theatrical *Acclamations* may be added thoſe of the ſoldiery, and the people in time of triumph. The victorious army accompanied their general to the capitol, and among the verſes they ſung in his praiſes frequently repeated Io TRIUMPHE, which the people anſwered in the ſame ſtrain. It was alſo in the way of *Acclamation*, that the ſoldiers gave their general the title of IMPERATOR, after ſome notable victory: a title which he only kept till the time of his triumph. See the article IMPERATOR.

The *Acclamations* of the ſenate are ſomewhat more ſerious than the popular ones, but aroſe from the ſame principle, *viz.* a deſire of pleaſing the prince or his favourites; and aimed likewiſe at the ſame end, either to expreſs the general approbation and zeal of the company, or to congratulate him on his victories, or to make him new proteſtations of fidelity. Theſe *Acclamations* were uſually given after a report made by ſome ſenator, to which the reſt all expreſſed their conſent by crying OMNES, OMNES; or elſe, ÆQUUM EST, JUSTUM EST: ſometimes they began with *Acclamations* and ſometimes ended with them without other debates. It was after this manner that all the elections and proclamations of emperors, made by the ſenate, were conducted; ſomething of which practice is ſtill retained at modern elections of kings and emperors, where *vivat rex, vive le roy*, and long live the king, are cuſtomary forms. V. *Ferrar.* l. 6. c. 3.—11. *Briſſon.* de Formul. l. 4. p. 349. *Ferrar.* l. 7. c. 4, 5, and 6. ſeq. *Briſſ.* de Formul. l. 2. See ELECTION.

The Greeks borrowed the cuſtom of receiving their emperors in the publick places from the Romans. Luitprand relates, that at a proceſſion where he was preſent, they ſung to the emperor Nicephorus πολλα ετη, that is, many years; which Codin expreſſes by το ψαλλειν το πολυχρονιον, or by το πολυχρονιζειν, and the wiſh or ſalute by πολυχρονισμα. And at dinner, the Greeks then preſent wiſhed with a loud voice to the emperor and Bardas, *ut Deus annos multiplicet*, as he tranſlates the Greek. Plutarch mentions an *Acclamation* ſo loud, upon occaſion of Flaminius's reſtoring liberty to Greece, that the very birds fell from heaven with the ſhout. The Turks practiſe ſomething like this on the ſight of their emperors, and grand viziers, to this day. *Baxt.* Gloſſ. Antiq. Rom. *Smith*, Obſ. on Conſtantin. Phil. Tranſ. N°. 155. p. 442.

For the *Acclamations*, wherewith authors, poets, &c. were received, who recited their works in publick; it is to be obſerved the aſſemblies for this purpoſe, were held with great parade in the moſt ſolemn places, as the capitol, temples, the Athæneum, and the houſes of great men. Invitations were ſent every where in order to get the greater appearance. The chief care was that the *Acclamations* might be given with all the order and pomp poſſible. Men of fortune who pretended to wit, kept able applauders in their ſervice, and lent them to their friends. Others endeavoured to gain them by preſents and treats. Philoſtratus mentions a young man named Vavus, who lent money to the men of letters, and forgave the intereſt to ſuch as applauded his exerciſes. Theſe *Acclamations* were conducted much after the ſame manner as thoſe on the theatre, both as to the muſic and the accompanyments: they were to be ſuited both to the ſubject and

the perſon. There were particular ones for the philoſophers, for orators, for hiſtorians, and for poets. It would be difficult to rehearſe all the forms of them; one of the moſt uſual was *Sophos*, which was to be repeated three times. Martial comprehends ſeveral other uſual forms in this verſe.

Graviter, Cito, Nequiter, Euge, Beate.

Neither the Greeks nor Romans were barren, on this head. The names of gods and heroes were given thoſe whom they would applaud; it was not enough to do it after each head of diſcourſe, chiefly after the exordium, but the *Acclamations* were renewed at every fine paſſage, frequently at every period, with which the authors were ſometimes ſo fatigued, that they were obliged to beg quarter of the audience. On the other hand it was death to them, if the audience were not loud enough in their praiſe. Paulus Samoſatenus in his pulpit would even break out into reproaches againſt his hearers, if they did not ſhake their handkerchiefs with ſufficient zeal, which was one method of applauding. Such *Acclamations* were not only honourable, but uſeful to thoſe who ſpoke in public, when their memory failed, for on ſuch occaſions the people redoubled their *Acclamations*, to give them time to recover themſelves.

The *Acclamations* wherewith the ſpectators honoured the victories of the Athletæ, were a natural conſequence of the impetuous motions which attended the Gymnaſtic games. The cries and *Acclamations* of the people, ſometimes expreſſing their compaſſion and joy, ſometimes their horror and diſguſt, are ſtrongly painted by divers poets and orators. See *Burette*, Mem. 3. ſur les Athletes in Mem. de Liter. de l'Acad. Roy. des Inſcript. T. 1. p. 330. ſeq.

Acclamations made alſo a part of the ceremony of marriage. They were uſed for the omens ſake; being the *Læta omina*, ſometimes ſpoken of before marriage, in Roman writers.

Acclamation, at firſt practiſed in the theatre, and paſſing thence to the ſenate, &c. was in proceſs of time, received into the acts of councils, and the ordinary aſſemblies of the church. The people expreſſed their approbation of the preacher variouſly; the more uſual forms were *Orthodox! third Apoſtle*, &c. V. *Arnd.* Lex. Ant. Eccl. p. 272. *Bing.* Orig. Eccleſ. l. 14. c. 4. *Ferrar.* de Rit. Sacrar. Concion. l. 2. c. 23. Id. de Acclamat. l. 5. c. 1. ſeq.

Theſe *Acclamations* being ſometimes carried to exceſs, and often miſplaced, were frequently prohibited by the antient doctors, and at length abrogated; tho' they appear to have been in ſome uſe as low as the time of St. Bernard.

ACCLAMATION is alſo applied among antiquaries to certain medals; whereon, the people are repreſented expreſſing their joy for ſome conſiderable favour.

In this ſenſe, *Acclamation* is alſo uſed to denote the vows repreſented on medals, for the proſperity of the emperor and commonwealth.

ACCLAMATION alſo denotes a method of election, practiſed in the academy of *Arcadi*. See ACADEMY.

Acclamation, in this ſenſe, is when the votes are not given in ſecret, as is practiſed on other occaſions, but *viva voce*. Cardinals, princes, vice-roys, and embaſſadors are elected by *Acclamation*.

The members thus choſen, aſſume the title *Arcade acclamato*, a dignity ſomewhat ſuperior to the reſt. *Giorn.* de Letter. d'Ital. T. 14. p. 137. ſeq.

ACCLAMATION, in rhetoric, is a figure of ſpeech, thus called by the Latins, by the Greeks *Epiphonema*. *Thomas*, Erot. Rhet. c. 25. p. 55. *Voſſ.* Elem. Rhetor. c. 20. p. 39. See EPIPHONEMA *Cycl.*

ACCOLADE, (*Cycl.*)—Antiquaries are not agreed, wherein the *Accolade* properly conſiſted.—The generality ſuppoſe it to be, the embrace, or kiſs, which princes antiently gave the new knight, as a token of their affection.—Whence the word *Accolade*, q. d. a claſping, or taking round the neck [a]. A very ingenious author [b] will rather have it to be a blow on the chine of the neck, given on the ſame occaſion. Fauchet, ſeems to reconcile the two opinions: he ſuppoſes it to be the kiſs; but withal, imagines the kiſs to be intended as a ſtroak on the cheek, *En leur baillant ſur la joue.*—The ceremony being only an imitation of that practiſed among the Romans, in the manumiſſion of their ſlaves, where it is known a blow was given [c].—[[a] *Skinner*, Etymol. Voc. Antiq. in Voc. [b] *Caſeneuv.* Orig. Franc. [c] *Colomb.* Theat. d'Honneur. *Aubert.* ap. Richel. in Voc.] See the article MANUMISSION, *Cycl.*

The *Accolade* is of ſome antiquity, in which ſoever of the two ſenſes it be taken.—Greg. de Tours writes, that the kings of France, even of the firſt race, in conferring the gilt ſhoulder belt, kiſſed the knights on the left cheek.

For the *Accoleé*, or blow, John of Saliſbury, aſſures us, it was in uſe among the antient Normans: by this it was that William the conqueror conferred the honour of knighthood on his ſon Henry.

At firſt, it was given with the naked fiſt; thus Lambertus Ardenſis, deſcribing the manner in which Baldric, count de Guines, was created knight by Thomas a Becket, ſays, *eidem comiti in ſignum militiæ gladium lateri et calario ſui militis pedibus aptavit, & alapam collo ejus inflixit.* But this was afterwards changed into a blow with the flat of a ſword, on the ſhoulder of the knight.

Salmonet, and after him the continuators of Morery, mention an order in England, called knights of the *Accolade*; ſo called from the manner of their creation. The order here meant is that of knights batchelors, or *equites aurati*. But the name, if ever, is now no longer known among us.

ACCOLEE' is ſometimes uſed as ſynonimous with *Accolade*. See the article ACCOLADE.

Accoleé is alſo uſed in heraldry in divers ſenſes, when two things are joined together, as two ſhields divided at the flanks, they are ſaid to be *Accoleé*. *Niſbet*, Eſſay on Armories, c. 5. p. 62.

Accoleé is alſo uſed in ſpeaking of lions, dogs, and other animals, which have collars, or crowns about their necks; as the lion in the arms of the name of Ogilvy.

Engliſh heralds ordinarily ſay, *collared*, or *gorged* with an open crown, inſtead of *Accoleé*.

Others uſe the term *Accoleé*, when two kews, battons, maces, ſwords, &c. are ſaltier wiſe, behind the ſhield. *Niſbet*, Eſſay on Armor. in Ind.

ACCOMMODATION, (*Cycl.*)—The primitive church accommodated multitudes of Jewiſh, and even heathen ceremonies and practices to chriſtian purpoſes; but the Jews had before done the ſame by the Gentiles: ſome will even have circumciſion, the tabernacle, brazen ſerpent, &c. to have been originally of Egyptian uſe, and only accommodated by Moſes to the purpoſes of Judaiſm. *Saurin.* Diſſert. O. Teſt. T. 1. p. 506.

Spencer maintains, that moſt of the rites of the old law, were an imitation of thoſe of the gentiles, and particularly of the Egyptians; that God, in order to divert the children of Iſrael from the worſhip they payed to the falſe deities, conſecrated the greateſt part of the ceremonies performed by thoſe idolaters, and had formed out of them a body of the ceremonial law; that he had indeed made ſome alterations therein, as barriers againſt idolatry; and that he thus accommodated his worſhip to the genius and occaſions of his antient people. To this condeſcenſion of God, according to Spencer, is owing the origin of the tabernacle in general, and particularly that of the ark. *Saurin.* l. c. *Spencer* de Legib. Hebræor. Diſſ. 1. l. 3. p. 32.

ACCOMPANYMENT, (*Cycl.*) in muſic, denotes the inſtruments which accompany a voice, to ſuſtain it, as well as to make the muſic more full.

The *Accompanyment* is uſed in recitative, as well as in ſong; on the ſtage, as well as in the choir, &c. The antients had likewiſe their *Accompanyments* on the theatre; they had even different kinds of inſtruments to *accompany* the chorus, from thoſe which accompanied the actors in the recitation. *Boſ.* Reflex. Crit. ſur la Poeſ. &c. §. 42. p. 442. Ex *Diomed.* de Art. Gram. l. 3.

The *Accompanyment*, among the moderns, is frequently a different part or melody, from the ſong it accompanies. It is diſputed whether it was ſo among the antients [a]. It is generally alledged, that their *Accompanyments* went no farther than the playing in octave, or in antiphony to the voice: the Abbe Fraguier, from a paſſage in Plato [b], pretends to prove, that they had actual ſymphony, or muſic in parts. But the learned Abbe's arguments are far from being concluſive, as is ſhewn by the jeſuit de Cerceau [c], and by Monſieur Burette [d]. —[[a] *Malc.* Treat. of Muſ. c. 14. Sect. 6. p. 588. ſeq. [b] De Legib. l. 7. [d] *Cerceau*, Diſſert. ſur la Muſique des Græcs. Mem. de Trev. 1725. p. 1780. ſeq. or Bibl. Franc. T. 7. p. 115. ſeq. [c] In Hiſt. Acad. R. Inſcr. T. 2. p. 190. ſeq.

ACCOMPLICE (*Cycl.*)—By the law of Scotland, the *Accomplice* can only be proſecuted after the conviction of the principal offender: Unleſs the acceſſion of the *Accomplice* is immediate, in *ipſo actu*, ſo as in effect to render them co-principal. *Mackenz.* and *Bayne.*

By the general rule, the *Accomplice* ſuffers the ſame puniſhment with the principal offender. Yet if he be remarkably leſs guilty, juſtice will not permit equal puniſhment.

In the law of England, the word acceſſary is uſed for *Accomplices* in crimes.

It is diſputed among the Roman canoniſts, in what caſes it is allowed a confeſſor to diſcover the *Accomplices* revealed to him.

The council of Sens, and ſeveral other ſynodical ſtatutes, expreſsly prohibit the revealing of *Accomplices*. Yet ſome writers contend for a contrary practice. Vid. Act. Erud. Lipſ. 1710. p. 439. *Freſn.* Trait. du Secret. de Confeſſ. c. 12. Mem. de Trev. 1711. p. 2092. Theor. & Pract. des Sacrem. T. 2. c. 5. Mem. de Trev. 1714. p. 1435.

ACCOMPLISHMENT, (*Cycl.*)—is principally uſed in ſpeak- of events foretold by the Jewiſh prophets, in the old teſtament, and fulfilled under the new.

We ſay a literal *Accompliſhment*, a myſtical or ſpiritual *Accompliſhment*, a ſingle *Accompliſhment*, a double *Accompliſhment*, a Jewiſh *Accompliſhment*, a chriſtian, a heathen *Accompliſhment*.

The ſame prophecy is ſometimes accompliſhed in all, or ſeveral of thoſe different ways; thus of ſome of the prophecies of the old teſtament, the Jews find a literal *Accompliſhment* in their own

own hiſtory, about the time when the prophecy was given: the Chriſtians find another in Chriſt, or the earlieſt days of the church: the heathens another in ſome of their emperors: the Mahometans another in their legiſlator.

Friſchmuth gives an account of divers prophecies of the Old Teſtament, which the muſſulmen hold received their *Accompliſhment* in Mahomet. *Friſch.* Diſſ. in Theſaur. Theol. Philol. Works of the Learned, T. 4. p. 29.

There are two principal ways of *accompliſhing* a prophecy; *directly*, and by *accommodation*. See ACCOMMODATION, and PROPHECY, *Cycl.* and *Suppl.*

Some authors ſpeak of *Accompliſhments* before the prophecy, and of others cotemporary with it, as well as after it. Thus that paſſage of Moſes, "In the beginning God created the "heavens and the earth," is by them conſidered as a prophecy, which was *accompliſhed* at the creation. *Eder.* Oecon. Bibl. l. 2. p. 208.

'Tis difficult to judge of the miſſion of a prophet, from the *Accompliſhment*, or Non-*Accompliſhment*, of his predictions; ſince, beſides that the prophet is uſually dead before the *Accompliſhment* come in courſe, we find that God is often diverted from fulfilling his prophecies, by the repentance or obduracy of the perſons, in whom they were to be *accompliſhed*; as in the caſe of the judgment of Nineveh. *Stilingfl.* Orig. Sacr. Ouv. des Scav. Mars, 1690. p. 306.

ACCOUNT, or ACCOMPT, (*Cycl.*).—There are divers kinds of *Accounts* among merchants, as perſonal, real, imaginary, general, particular *Accounts*, &c.

Perſonal ACCOUNTS, are thoſe which diſcover what each perſon, or ſubject, with whom a man has dealings on credit, owes to, or has owing to him.

Real ACCOUNTS, are thoſe whereby a dealer diſcovers what effects are on hand at any time, and what is gained or loſt on each.

Every Account is diſtinguiſhed into two parts, for which two oppoſite pages are aſſigned of one folio or opening; the name of the perſon with whom a man has *Account* being written on the top of each, with the word debtor on the left-ſide, and creditor on the right.

A *perſonal Account* is to contain on the debtor ſide what the perſon owes me, and the payments I make to him; and on the creditor ſide, all that I owe to him, and the payments he makes of his debts to me.

A *real Account* muſt contain on the debtor ſide the quantity and value of what was upon hand at the beginning of the *Account*, and all afterwards received, with the coſts and charges thereof; and on the creditor ſide, the quantity and value of what is diſpoſed of, or any way taken out of it, with the returns it has made us.

Imaginary ACCOUNTS, are then brought in to make a balance between credit and debt, and in caſes where the real and perſonal *Accounts* will not in the articles belonging to them make, as they uſually do, ſuch balance.

The chief of theſe is the *Account* of *profit* and *loſs*; on the debtor ſide of which are entered all loſſes, and on the creditor ſide all gains. Such alſo is the *ſtock Account*, &c.

Sundry ACCOUNTS, when one *Account* is balanced by ſundry; *i. e.* when one debtor or creditor for a ſum, and *ſundry Accounts* creditors or debtors for the parts of the ſum; it is entered under the head of to, or by, *ſundry Accounts*.

General ACCOUNTS, are thoſe where all the goods of the ſame name are put into one *Account*. Vid. *Malc.* Treat. of Book-keeping.

Particular ACCOUNTS, are thoſe where each ſpecies, or ſubdiviſion of things under the ſame name, have their ſeparate *Account*.

Open ACCOUNT, is uſed for an *Account* not liquidated or ſettled.

ACCOUNT *in bank*, is a fund of money, which merchants, or others, place in the common caſh of a bank, to be in readineſs for the payment of bills of exchange, promiſſory notes, purchaſes, and other debts contracted in the courſe of buſineſs. Such payments are made by transferring part, or the whole of the ſum lodged in the bank to to the creditor; who hereby is entered creditor of the bank in his place. *Savar.* Dict. Com. T. 1. p. 1440. voc. *Compte*.

ACCOUNT *current*, amounts to the ſame with an open *Account*.

Opening an ACCOUNT with any one, ſignifies the placing him, for the firſt time, in the great book. This is done by writing his name, ſurname, and place of reſidence, in large characters, and afterwards charging him with articles, either of debtor or creditor, as affairs turn up.

When an *Account* is opened with any perſon in the great book, his name is to be entered at the ſame time in the index, or alphabet book, with the page wherein his *Account* is to be found. *Savar.* Dict. Com. T. 2. p. 1439.

Placing a ſum to an ACCOUNT, is to enter down in the great book the ſeveral particulars for which a perſon becomes either debtor or creditor.

Examining an ACCOUNT, is the reading it exactly over, pointing the ſeveral articles, and verifying the computation, in order to find whether there be any error, and whether the ſum total, or the balance, be juſt.

Caſting up, or cloſing an ACCOUNT, is the ſtating and ſettling of it, to find the balance: this is called alſo *balancing or ſettling an Account*.

Accounts are *cloſed* in the great book on two occaſions: the firſt, when it is required to terminate an affair entirely, either with debtors or creditors, in order to learn what is due. The ſecond, when it is neceſſary to carry on the *Account* to another page of the ſame book, or to a new book, for want of room.

Balance of an ACCOUNT, is the ſum by which the debt exceeds the credit, or *vice verſa*, upon ſtating or ſettling of it. *Savar.* lib. cit.

ACCOUNT is more particularly uſed for the method of computing time: in which ſenſe, the word is ſynonymous with ſtyle.

We ſay the Engliſh, the foreign *Account*, the Julian, the Gregorian, the new and the old *Account*. Biſhop Beveridge gives us the different *Accounts* of Time. *Beveridg.* Inſt. Chron. l. 2. Phil. Tranſ. N°. 47. p. 958.

ACCOUNTS are kept in different kinds of denominations in different countries: as in pounds ſterling in England; in livres and ſols in France; in roupees in India; in milrees in Portugal; in Barbadoes, till of late, their *Accounts* were kept in pounds of ſugar, and the laws of the colony allowed all debts to be paid in that ſpecie. Anſw. to Groans of Plantat. p. 3.

Books of ACCOUNTS, of merchants and tradeſmen, are conſidered as a ſort of private inſtruments, and in the civil law, and law of merchants, are allowed to make a half proof. The Reaſon is, that merchants are often under a neceſſity of dealing on truſt, without note or writing. Hence the ſuppletory oath of the merchant, with his book of *Accounts*, is admitted abroad as a full proof againſt his chapman. But in England this is under ſome limitation. *Gail.* l. 2. obſerv. 20. and 23. See alſo Stat. 7. *Jac.* I. c. 12.

Auditing an ACCOUNT, is the examining and paſſing an *Account* by an officer appointed for the purpoſe. See AUDITOR, *Cycl.*

Round ACCOUNT, is that which conſiſts chiefly of round ſums, or numbers; as tens, dozens, ſcores, hundreds, &c.

Broken ACCOUNT, is that which conſiſts chiefly of fractions.

ACCOUNT, in common law, denotes a writ or action which lies againſt a perſon, who by his office ought to give an *Account*, but refuſes.

A writ or action of *Account* properly lies only againſt bailiffs, receivers, and guardians in ſocage; though others are alſo brought in as a ſecondary intendment. Terms de Ley, fol. 8.

ACCROCHE', in heraldry, denotes a thing's being hooked into another. *Coats*'s Herald. p. 6.

ACCROCHING, in old law books, the act of incroaching or uſurping on another's right. 25. *Ed.* III. Stat. 3. c. 8. *Skin.* Etym. Forinſ. in voc.

The word is originally French, *Accrocher*, which ſignifies to faſten a thing by a hook.

ACCUBATION, a poſture of the body, between ſitting and lying. *Briſſ.* de Verb. Signif. p. 9. *Chauv.* Lex. Philoſ. p. 11.

The word comes from the Latin, *Accubare*, compounded of *ad*, to, and *cubo*, I lie down.

Accubation, or *Accubitus*, was the table poſture of the Greeks and Romans; whence we find the words particularly uſed for the lying, or rather as we call it, ſitting down to meat.

The Greeks introduced this poſture. The Romans, during the frugal ages of the republic, were ſtrangers to it. But as luxury got footing, this poſture became adopted, at leaſt by the men; for as to women, it was reputed an indecency in them to lye down among the men: though afterwards this too was got over. But children did not lye down, nor ſervants, nor ſoldiers, nor perſons of meaner condition; but took their meals ſitting, as a poſture leſs indulgent. V. *Auct.* cit. apud Fabric. Bibl. Antiq. c. 19. §. 2. p. 565.

The Roman manner of diſpoſing themſelves at table was this: a low round table was placed in the cænaculum, or dining-room, and about this uſually three, ſometimes only two beds, or couches; according to the number of which, it was called *biclinium*, or *triclinium*. Theſe were covered with a ſort of bed-cloaths, richer or plainer, according to the quality of the perſon, and furniſhed with quilts and pillows, that the gueſts might lye the more commodiouſly. There were ordinarily three perſons on each bed; to crowd more was eſteemed ſordid. In eating they lay down on their left ſides, with their heads reſting on the pillows, or rather on their elbows. The firſt lay at the head of the bed, with his feet extended behind the back of the ſecond; the ſecond lay with the back of his head towards the navel of the firſt, only ſeparated by a pillow, his feet behind the back of the third; and ſo of the third, or fourth. The middle place was eſteemed the moſt honourable. Before they came to table, they changed their cloaths, putting on what they called *cænatoria veſtis*, the dining garment, and pulled off their ſhoes, to prevent fouling the bed. V. *Pitiſc.* Lex. Antiq.

ACCUBITOR, (*Cycl.*)—The *Accubitor* was the head of the youths of the bed-chamber, and had the cubicularius and procubitor under him. *Pitiſc.* Lex. Antiq.

ACCUMULATION, (*Cycl.*)—In the antient agriculture, *Accumulation* denotes the operation of covering up the roots of trees, by throwing on them the earth that had been before dug from them. *Salmaſ.* Exerc. ad Solin. p. 519.

In which ſenſe, *Accumulation* ſtands oppoſed to *Ablaqueation*. See ABLAQUEATION.

ACCUMULATION *of arms*, *cumulatio armorum*, is uſed by antient heralds, for what the moderns call *quartering* of arms. *Niſbet.* Herald. c. 7. p. 87. See the article QUARTERING, *Cycl.*

ACCUMULATION *of degrees*, in an univerſity, is uſed for the taking of ſeveral degrees together, and with fewer exerciſes, or nearer to each other, than the ordinary rules allow of. See DEGREE, *Cycl.*

Wood gives numerous inſtances of *Accumulators*, *i. e.* perſons who *accumulated*, or took degrees by *Accumulation*, at Oxford. *Wood*, Athen. Oxon. T. 2. p. 974. *Faſt.* T. 1. p. 179, 190, 255. T. 2. p. 95, 103, 106.

ACCUSATION, (*Cycl.*)—Writers on politics treat of the benefit and the inconveniencies of public *Accuſations*. Various arguments are alledged, both for the encouragement and the diſcouragement of *Accuſations* againſt great men. Nothing, according to Machiavel, tends more to the preſervation of a ſtate, than frequent *Accuſations* of perſons truſted with the adminiſtration of public affairs. This, accordingly, was ſtrictly obſerved by the Romans, in the inſtances of Camillus, accuſed of corruption by Manlius Capitolinus, &c. *Accuſations*, however, in the judgment of the ſame author, are not more beneficial than calumnies are pernicious; which is alſo confirmed by the practice of the Romans. Manlius not being able to make good his charge againſt Camillus, was caſt into priſon. *Machiav.* de Repub. l. 1. c. 7. p. 35.

The antient Roman lawyers diſtinguiſhed between *poſtulatio*, *delatio*, and *Accuſatio*: for firſt, leave was deſired to bring a charge againſt one, which was called *poſtulare*; then he againſt whom the charge was laid, was brought before the judge, which was called *deferre*, or *nominis delatio*: laſtly, the charge was drawn up, and preſented, which was properly the *Accuſatio*. *Voſſ.* Etym. Lat. *Danet.* Dict. Antiq. in voc. *Accuſare*.

The *Accuſation* properly commenced, according to Pædianus, when the *reus*, or party charged, being interrogated, denied he was guilty of the crime, and ſubſcribed his name to the *delatio* made by his opponent. *Calv.* Lex. Jur. p. 17.

In the French law, none but the *Procureur general*, or his deputies, can form an *Accuſation*, except for high treaſon, and coining, where *Accuſation* is open to every body. In other crimes, private perſons can only act the part of denouncers, and demand reparation for the offence, with damages. *Trev.* Dict. Univ. T. 1. p. 92.

There are three ways of entering an information in the tribunal of the inquiſition. The firſt, by way of inquiſition, when a private perſon, applying to the inquiſitor, declares he will neither be denunciator, nor *Accuſer*, but that common fame gives out, that ſuch and ſuch a perſon is an heretic: the ſecond, by way of *Accuſation*, when the informer takes on him the office of *Accuſer*, which rarely happens; becauſe, in this caſe, the *Accuſer* is obliged to prove, and expoſes himſelf to the *lex Talionis*, in caſe his information prove falſe. The laſt, and moſt uſual way, is, by *Denunciation*, that is, by naming thoſe who know the fact. Holy Inquiſit. c. 8. ſect. 1 and 2. p. 104. ſeq.

A Chineſe, of the province of Nanquin, having loſt his only daughter, notwithſtanding the prayers and offerings he had made at the ſhrine of an idol, whoſe power had been magnified to him by the Bonzes, brought an *Accuſation* in form againſt the idol; which, by a decree of the ſovereign council of Pekin, was condemned accordingly to perpetual exile, its temple razed, and the Bonze ſeverely puniſhed. *Bayl.* Contin. des Penſées ſur la Comet. Jour. des Scav. T. 35. p. 205.

ACE, in gaming, a card, or the ſide of a die, marked with a ſingle point.

The word comes from the French *As*, which ſignifies the ſame. Hence the term, *ames Ace*, when two dice are both thrown *Aces*.

ACENTETUM, or ACENTETA, in natural hiſtory, a name given by the antients to the pureſt and fineſt kind of rock cryſtal. They uſed the cryſtal in many ways, ſometimes engraving on it, and ſometimes forming it into vaſes and cups, which were held next in value to the *murrhina vaſa* of thoſe times. The cryſtal they obtained from the mines of Cyprus was much eſteemed, but often faulty in particular parts, having hairs, cracks, and foulneſſes, which they called ſalts, in the midſt of the large pieces. Pliny tells us, that when it was uſed for engraving on, the artiſt could conceal all theſe blemiſhes among the ſtrokes of his work; but when it was to be formed into cups and pretious vaſes, they always choſe the *Acentatum*, that is, the pure cryſtal, which had no flaws or blemiſhes.

ACEPHALUS, or ACEPHALOUS, (*Cycl.*)—The *lumbricus latus*, or joint worm, was long taken to be *acephalous*: the who firſt gave it a head was Tulpius, and after him Fehr; the former even makes it *biceps*, or two-headed. *Tulp.* Obſerv. Ed. 1651. *Fehr*, de Hiera Picra, p. 125. *Tyſon.* Lumbricus Latus, in Phil. Tranſ. N°. 146. p. 125.

ACEPHALUS is more particularly uſed in ſpeaking of certain nations, or people, repreſented by antient naturaliſts and coſmographers, as well as by ſome modern travellers, as formed without heads; their eyes, mouths, &c. being lodged in other parts.

Such are the Blemmyes, a nation of Africa, near the head of the Niger, repreſented to be by Pliny [a] and Solinus [b]; *Blemmyis traduntur capita abeſſe, ore & oculis pectore affixis.* Cteſias and Solinus mention others in India, near the Ganges, *ſine cervice, oculos in humeris habentes.* Mela [c] alſo ſpeaks of people, *quibus capita & vultus in pectore ſunt.* And Suidas, Stephanus Byzantinus, Vopiſcus, and others after them, relate the like. Some modern travellers ſtill pretend to find *Acephalous* people in America.

Marcus Mappus [d], a phyſician of Straſburg, has written the medical hiſtory of *Acephali*, on occaſion of the diſpute, whether the fœtus in utero derives its nouriſhment by the mouth, or the navel. The ſtory of entire nations of *Acephali* being alledged as an argument againſt the former opinion, this author undertook to refute it; and ſhews that the whole is a fable, invented by travellers, and propagated by geographers.

Several opinions have been framed as to the origin of the fable of the *Acephali*. The firſt is that of Thomas Bartholin, who turns the whole into a metaphor; being convinced, that the name *Acephali* was antiently given to ſuch as had leſs brain, or conducted themſelves leſs by the rules of prudence, than others. Olearius [e] rather apprehends, that the antient voyagers viewing certain barbarous people from the coaſts, had been impoſed on by their uncouth dreſs; for that the Samogitians, being ſhort of ſtature, and going, in the ſeveverity of winter, with their heads covered in hoods, ſeem at a diſtance as if they were headleſs. F. Lafitau [f] ſays, that by *Acephali* are only meant people whoſe heads are ſunk below their ſhoulders; ſuch as the natives of the Caribbees are found to be. In effect, Hulſius [g], in his epitome of Sir Walter Raleigh's voyage to Guaiana, alſo ſpeaks of a people which that traveller found in the province of Irvipanama, between the lakes of Panama and Caſſipa, who had no head or neck: and Hondius, in his map, marks the place with the figures of theſe monſters. Yet De Laet [h] rejects the ſtory; being informed by other hands, that the inhabitants of the banks of the Caora, a river that flows out of the lake of Caſſipa, have their head ſo far ſunk between their ſhoulders, that many believed they had their eyes in their ſhoulders, and their mouths in their breaſts.

But though the exiſtence of a nation of *Acephali* be ill warranted, naturaliſts furniſh ſeveral inſtances of individuals born without heads, by ſome luſus or aberration of nature. Wepfer [i] gives a catalogue of ſuch *acephalous* births from Schenckius, Licetus, Paræus, Wolfius, Mauriceau, &c.

Mappus [k] reduces them to two kinds; the firſt, properly called *Acephali*, being thoſe born without a head, or any thing in lieu thereof; the ſecond, leſs properly ſo called, having a ſort of heads, but thoſe imperfect, or half-formed; *e. gr.* ſome whoſe heads do not appear when they lye on their backs.—[a Hiſt. Nat. l. 5. c. 8. Id. ibid. l. 7. c. 2. b *Solin.* Polyhiſt. c. 45. & 65. c *Mela*, de Situ Orbis, l. 1. c. 4. Vid. *Wepfer.* in Ephem. German. dec. 1. an. 3. obſ. 129. p. 181. ſeq. d *Mapp.* Hiſt. Medic. de Acephalis, Argent. 1687. 4to. Jour. des Scav. T. 15. p. 538. e *Olear.* Itin. Moſcov. & Perſic. l. 3. c. 3. f *Lafitau*, Paral. des Mœurs des Sauv. Mem. de Trev. 1725. p. 237. g *Hulſ.* Epit. Itin. Raleigh, an. 1594. h *De Laet*, Deſcript. Americ. l. 17. c. 22. i In Ephem. Germ. l. c. p. 184. Ibid. Dec. 2. an. 9. obſ. 148. p. 258. k Jour. des Scav. T. 82. p. 276. See alſo *Borell.* cent. 4. obſ. 78.]

ACEPHALUS is alſo uſed, in poetry, for a verſe which is lame or defective, by wanting a beginning. *Martin.* Lex. Philol. T. 1. p. 8.

Some alſo give the name Ακεφαλος to all verſes which begin with a ſhort, inſtead of a long ſyllable. Bibl. Anc. Mod. T. 25. p. 385. ſeq.

ACER, in botany. See the article MAPLE.

ACERINA, in ichthyology, a name given by Pliny, and other of the old naturaliſts, to the fiſh we at this time call the *cornua*, and *aurata fluviatilis*, and in England the *Ruffe*. It is a genuine ſpecies of pearch, and is diſtinguiſhed by Artedi from all the other fiſhes of that genus, by having the back fin ſingle, and the head cavernous. See the articles CORNUA, AURATA, and PERCA.

ACERRA, (*Cycl.*)—By the laws of the twelve tables, the erecting of *acerræ* was prohibited. *Salmuth.* ad Pancirol. P. 1. Tit. 62. p. 343. *Feſt.* in Voc. *Pitiſc.* Lex. Ant.

The *Acerra* alſo ſignified a little pot, wherein the incenſe and perfumes were put, to be burnt on the altars of the gods, and before the dead. *Pitiſc.* Lex. Antiq.

The *Acerra* appears to have been the ſame with what was otherwiſe called *thuribulum*, and *pyxis*; ſome have alſo confounded it with the *pateræ*, in which libations were offered. *Cornut.* ad Perſ. Sat. 2. Vet. Schol. ad *Horat.* l. 3. Od. 8. *Voſſ.* Etym. p. 4.

We find mention of *Acerræ* in the antient church. The Jews had alſo their *Acerræ*, in our verſion rendered *cenſers*; and the romaniſts ſtill reſtrain them under the name of *incenſe pots*. *Tertull.* adv. Gent. c. 9. magr. notiz. Vocab. Eccleſ. p. 3.

In Roman writers, we frequently meet with *plena Acerra*, a full *Acerra*; to underſtand which it is to be obſerved, that people were obliged to offer incenſe in proportion to their eſtate and condition; the rich in larger quantities, the poor only a few grains: the former poured out *Acerras* full on the altar; the latter took out two or three bits with their fingers. V. *Briſſon.* de formul. l. 1. p. m. 25. *Marcill.* ad Perſ. Sat. 2. v. 5.

ACETABULUM, (*Cycl.*)—in botany, the name of a genus of ſea-plants, compoſed of leaves formed in the ſhape of a baſon, and making a ſort of inverted cone.

The ſpecies of *Acetabulum*, mentioned by Mr. Tournefort, are two. 1. The taller ſea *Acetabulum*, called *Androſace*, and 2. The ſmaller ſea *Acetabulum*, called the ſmaller *Androſace*. *Tourn.* Inſt. p. 569. See Tab. 1. of botany, Claſs 17.

ACETARY is uſed for an inner part in the ſtructure of certain fruits; thus called from the ſourneſs of its taſte. *Grew.* Anat. Veget. l. 1. c. 6. §. 3. p. 41.

The *Acetary* of a pear is a globular part, lying within the calculary, or choak, and ſurrounding the coar. It is of the ſame ſubſtance with the parenchyma or pulp, only that the bladders of which it conſiſts are ſmaller, and rounder than thoſe of the parenchyma: from whence however it ſeems to be derived. Whence it is ſometimes, alſo called, the *Inner Parenchyma*.

The quince alſo has an *Acetary*, reſembling, tho' leſs than, that of a pear.

ACETIFICATION is uſed by ſome chymiſts to denote the action or operation whereby vinegar is made. *Becher.* Phyſ. Subterr. l. 1. Sec. 5. c. 2. n. 124. p. 362. ſeq.

Acetification is a branch or ſpecies of fermentation, ariſing by expoſing vinous liquors in open veſſels, and a warm place, which turns them acid. Vid. Act. Lipſ. an. 1701. and an. 1703.

Acetification chiefly differs from the fermentation, whereby wine is made, in this, that the latter is effected by a gentler heat, ſufficient only to raiſe, and rarify the ſulphureous parts; whereas, in *Acetification*, there is what is ſufficient to raiſe and rarify the ſaline parts; which is the preciſe point, wherein *Acetification* conſiſts. *Becher.* Phyſ. Subterr. l. 1. Sect. 5. c. 2. n. 124. p. 362. ſeq.

ACETOSA, in botany. See the article SORREL.

ACETOSE. See ACETOUS, *Cycl.*

ACETUM (*Cycl.*)—*Acetum eſuriens*, in chemiſtry, a diſtilled vinegar, rectified with the help of verdigreaſe. It is made by diſſolving the common verdigreaſe in fine diſtilled vinegar, then evaporating the ſolution, and procuring the verdigreaſe again in form of cryſtals; and from this, by a proper degree of fire, diſtilling with a retort an acid ſpirit, which is the richeſt acid that can by any art be prepared from vinegar. Zwelfer, to whom this acid owes its name, affirms, that it maintains its acid qualities, after having diſſolved pearls or other of the alcaline abſorbents; but in this he is not to be credited. *Boerhaave*'s Chem. p. 138.

ACETUM *Portabile*. See the article VINEGAR.

ACHAC, in natural hiſtory, the name given by the people of the Philippine Iſlands, to a bird common there. It is of the ſize of a common hen; its belly, breaſt, and neck are of a pale brown, and its back of a duſky reddiſh colour; its wings are extreamly beautiful, being principally of a greeniſh blue colour; the tail is white, ſhort and continually in motion; the eyes are black, and the beak is thick and ſtrong, and is of a black colour, and obtuſe figure; the legs are reddiſh, and the claws black: when it makes any noiſe, it ſeems to utter the word phi, phi, very often repeated. It lives principally about the cultivated parts of the iſlands, and feeds on rice, and other vegetables, being properly of the partridge kind.

ACHALALACTLI, in zoology, the name of an American bird, deſcribed by Nieremberg, and remarkable for a chain or ring of ſilvery whiteneſs round its neck. It is of the ſize of a pigeon, its beak is ſharp and three fingers breadth long, and its head is ornamented with a very long creſt of a bluiſh black colour. The belly and under ſide of the wings are white, and the back and outſide of the wings are of the colour of the creſt, of a bluiſh black, and variegated with white ſpots; the tail is partly black, and partly blue. It is common about the lakes and rivers of Mexico, and feeds on ſmall fiſh. *Ray*'s Ornithol. p. 301.

ACHANDES, in ichthyology, a name given by ſome to the *Remora*. See REMORA.

ACHAOVA, in the materia medica of the antients, the name of an herb much celebrated in many diſtempers; but we are not aſſured at preſent, what is the plant that it truly belongs to. Some have eſteemed it, what is called in Egypt Uchove, an herb nearly reſembling chamomile, but lower, and with broader leaves, approaching to thoſe of feverfew, and of a faint, but not diſagreeable ſmell.

Aviſenna ſeems however to have meant a different plant, by this name, and probably the herb we call *Marum*; for he deſcribes it as being of a very acrid taſte and ſtrong ſmell, in ſome reſpects reſembling our origanum or wild majorum, but of a whiter colour. *Proſper.* Alpin. de Plant. Egypt.

ACHATES, in natural hiſtory, the ſtone popularly called *Agat*. See AGAT, *Cycl.*

Dr. Plot makes uſe of the word *Achat* in this ſenſe; on what authority we know not. V. Nat. Hiſt. *Stafford.* c. 4. §. 47. p. 175.

ACHATOR, in our old ſtatutes, is uſed for Pourveyor. See ACHAT and POURVEYOR, *Cycl.*

ACHE, in ſome old authors, a name given to the plant called *Apium paluſtre*, or *paludapium*, in Engliſh, *ſmallage*. *Ger.* Emac. Ind. 4.

ACHERNER, (*Cycl.*)—This word is alſo written *Acarnar*, and *Achernar*, ſometimes *Acharnahar*, and *Acharnaharim*. *Vital.* Lex. Mathem. Voc. *Acarnar*.

Acherner is the ſame with what is otherwiſe denominated *Phæton*, and by the Perſians, *Aulax*, that is ſafe. *Wolf.* Lex. Math. p. 1054. Voc. *Phæton*.

ACHETA, in natural hiſtory, a name by which the antients called the large ſpecies of *Cicada*, the nymphs of which they uſed to eat, and eſteemed an excellent food: the ſmaller kind, which ſeems to have been our middling ſort (for we have three kinds) they called *Tettigonia*. See CICADA.

ACHIÆNUS, or ACHÆINUS, in natural hiſtory, a word uſed by the antients to expreſs a ſtag or deer in the ſecond year's age. In the firſt, it was called *Nebrus*, in the third *Dicrotus*, and always after that *Ceraſtes*. *Pliny.*

ACHILLEA, in the materia medica of the antients, a name given to the gum, which we at this time know by that of *ſanguis draconis*, or dragons-blood.

The antient Greeks called this *Cinnabari*; and the uſe of that word for the mineral which we now call cinnabar, was only becauſe of its being of the ſame fine red colour with this gum. Aviſenna treating of the *Achillea*, ſays it is otherwiſe called ſanguis-draconis, and deſcribes it as a red gum, univerſally known in his time. Many have been of opinion, that the *Achillea* was an inſpiſſated juice of the plant of that name; but this paſſage of Aviſenna, added to there being no gum of the *Achillea* mentioned by any of the antients, ſufficiently explodes this opinion. The more probable account of the name is, that this very plant was called ſanguis draconis, becauſe of its leaves being uſually as red as blood; which peculiarity is mentioned in its deſcription by Dioſcorides, and all the antient writers. Now this plant being for this reaſon called ſanguis draconis, that name, and *Achillea*, became ſynonymous terms; and thence the name *Achillea*, as a ſynonymous one for ſanguis draconis, became given to the gum ſo called. *Aviſenna*, L. 4. c. 99.

ACHIOTL, in botany, a name given by ſome authors to the *Uraca*, or *Arnetto*, called *Orleana*, and *Orellana*, by other writers. See the following article.

ACHIOTTE, a red drug from America, uſed in dying, and in the preparation of chocolate.

The word is Braſilian, where it properly ſignifies the tree from whence this matter is procured [a]. *Ray* writes it *Acchiote* [b]. —[a *Trev.* Dict. Univ. T. 1. p. 101. [b *Ray*, Trav. p. 485.]

Achiotte is the ſame with what the French frequently call *Rocou*, and the Dutch *Orleane*. It has been commonly eſteemed a kind of argilla, or earth; but later obſervers find it a flower, or ſeed of a tree, which grows chiefly in very hot countries, as Yucutan, or Campeche, and Guatimala. It is about the ſize of a plumb-tree, only more tufted; its branches, being longer than the trunk. The fruit is encloſed in a rind like a cheſnut, except that it is of an oval figure. It begins to open croſs-ways from the middle to the top; and ſubdivides into four parts; having in the middle a beautiful carnation coloured flower. The tree has no leaves; but inſtead thereof ſhoots out filaments like thoſe of ſaffron, only bigger and longer. Between theſe grow little ſoft vermillion coloured grains, about the ſize of pepper-corns; which the indians, ſeperating from the filaments, bake in cakes of about half a pound each; in which form the drug is brought into Europe. *Savar.* Dict. Comm. T. 1. p. 13.

The poor people uſe *Achiotte* inſtead of ſaffron, others mixt it as an ingredient in chocolate, during the grinding of the cacoa, the quantity of two drams to a pound, to give it a reddiſh colour, &c. tho' this practice was formerly more frequent than at preſent; the opinion of its being an earth, which even Mr. Ray fell into, having diſcredited its uſe. Some alſo uſe it to dye wax of a vermillion colour. Phyſicians hold it a good cordial, and preſervative againſt retention of urine. V. Mem. de Trev. An. 1704. p. 1974.

F. Labat deſcribes the *Achiotte* ſomewhat differently; eſpecially, the preparation of it for dying. The tree according to him, produces yearly its crops of flowers, of a carnation colour; not unlike wild roſes. Theſe are ſucceeded by a kind of rough pods, or fruit reſembling cheſnuts, full of ſmall grains; which being fermented in water, and this water afterwards paſſed thro' a carribbe ſieve, it contracts a red colour. It is then boiled, ſcummed, ſet on the fire again and ſtirred; till at length it thickens, and will fall looſe from the ſpatula: which is the *Achiotte*, or *Rocou* in perfection: tho' to make it more beautiful, they have two

further proceſſes, which are deſcribed by F. Labat. V. *Labat*, Nouv. Relat. du Voy. des Iſl. Antill. Mem. de Trev. 1722. p. 637.

According to *Savary*, to procure the *Achiotte*, they ſhake out the grains in an earthen veſſel, ſoak and then waſh them in ſeveral repeated warm waters, till they have diſcharged all their vermillion colour; after which letting the water ſtand to ſettle, the fecula at the bottom is taken and formed into little cakes, and balls; which when pure, and not adulterated either with red earth, or fine brick-duſt, are highly valued. Some alſo uſe fire to boil the *Achiotte*, and give it a farther conſiſtence. V. *Savar.* Dict. Comm. T. 2. p. 1407. ſeq. Voc. *Rocou.*

ACHIROPŒTOS, a name given by antient writers to certain miraculous pictures of Chriſt and the virgin, ſuppoſed to have been made without hands. *Salmaſ.* Exerc. ad Solin. p. 816. *Du Cang.* Gloſs. Græc. T. 1. p. 161.

The word is Greek, Αχειροποιητος, q. d. *non manu factus*; Latin authors frequently write it *Acheropeta* [a], ſome *Acheropœta*, others *Acheiropſita*, and even *Antheropſita* [b].—[a *Magri.* Notiz. Vocab. Eccleſ. p. 3. *Schmid.* Lex. Eccleſ. p. 13. [b] Bibl. Germ. T. 20. p. 40.]

The moſt celebrated of theſe is the picture of Chriſt, preſerved in the church of Saint John Lateran at Rome; ſaid to have been begun by Saint Luke, but finiſhed by the miniſtry of angels. Anaſtaſius the librarian, Onuphrius Panvinius, and others, ſpeak of the great honours paid to the *Acheiropœtos* [a]. Rome being threatned by Aſtulphus, king of the Lombards, under Pope Stephen III. the pope had recourſe to prayers and proceſſions, in which the *Acheiropœtos* was carried devoutly, on his own ſhoulders, to the church of the virgin called *Præſepe* [b].—[a V. *Anaſtaſ.* in Vit. *Steph.* III. aliis II. ap. T. 3. Scriptor. Rer. Ital. p. 166. Bibl. *Germ.* T. 20. p. 40. ſeq. [b] Id. ib.]

ACHLIS. See MACHLIS.

ACHLYS, in medicine, a darkneſs, or dimneſs of ſight, ariſing from a ſmall *cicatricula* on the pupil, occaſioned by a ſuperficial ulcer on the *cornea*. *Blanc.* Lex. Med. p. 8. *Gorr.* Defin. Med.

The word is Greek, αχλυς, which literally ſignifies a kind of cloud, or thickneſs of air. *Caſtel.* Lex.

Achlys, is the ſame with what Latin writers call *Caligo*.

Some conſider the *Achlys*, as a ſpecies of amblyopia.

Others make the *Achlys* to be the ulcer itſelf, and define it a ſlight ſuperficial ulcer, appearing on the black of the eye of a bluiſh colour, not unlike a cloudy air. *Zuing.* Inſt. Medic. p. 2. §. 230. p. 189.

In a metaphorical ſenſe, *Achlys* alſo denotes a diſorder of the womb; anſwering to what Latin writers call *ſuffuſio uteri*. *Hippoc.* l. 2. de Morb. Mulier.

ACHOR, (*Cycl.*)—writers of medical obſervations afford divers anomalous inſtances of *Achores*, viz. Some are found even in aged people, others on the feet; others reſembling the venereal diſeaſe; others which diſappeared upon cutting the hair, and returned on its growing anew; others followed by a thickneſs of hearing; others by pannics; and others by a *gutta ſerena*. Their drying up has ſometimes been followed by a fever, their repulſion inwards by an epilepſy. V. *Albert.* Lex. Real. Obſerv. T. 1. p. 6. T. 2. p. 10.

ACHRAS, in botany, the name of a genus of plants, the characters of which are theſe. The cup is a perianthium compoſed of five erect leaves of an oval ſhape, but pointed at the ends, and remaining after the flower is fallen. The flower conſiſts of five petals, which are oblong, cordated and placed erect; the germen of the piſtillum is oval, and the fruit is an oval berry divided into five cells; the ſeeds are ſingle, very elegant, of an oval compreſſed figure, and with a point ſtanding out in one part. *Linnæi*, Gen. Plant. p. 519.

ACHYRONIA, in botany, the name given by Van Royen, and continued by Linnæus, to a genus of plants of the papilionaceous kind; the characters of which are theſe. The flower has a perianthium, divided into five ſegments at the edge, the upper one being longer than the reſt; the vexillum of the flower is compreſſed, hairy or rough on the outſide, and obtuſe; the alæ are lunated, obtuſe, and open, and are ſhorter than the vexillum; the carina is bifid, and its length the ſame as that of the alæ; the ſtamina are nine or ten filaments growing into a ſort of vagina; the antheræ are roundiſh, but ſomewhat oblong; the germen of the piſtil is oval; the ſtyle is ſimple, and aſcendent; the ſtigma is acute; the fruit is an oval oblong pod, containing a few kidney-ſhaped ſeeds. *Linnæi.* Gen. Plant. p. 346. *Royen.*

ACHYROPHORUS, in botany, the name of a genus of plants of the ſame characters with the hypochæris. See HYPOCHÆRIS.

ACIA, a term in the Roman ſurgery, about the meaning whereof, phyſicians and commentators are much divided.

Celſus ſpeaking of the healing of wounds, either by ſuture, or the fibula, ſays, each is beſt effected by means of a ſoft *Acia*, not too much twiſted, that it may ſit the eaſier on the body. *Ex Acia molli, non nimis torta, quo mitius corpori inſideat. Celſ.* de Medic. l. 5. c. 26. V. *Turneb.* Adverſ. 17, 21.

Some will have *Acia*, here, to be a corruption of *Acus*, and only to denote a needle [a]. But in what ſenſe can a needle be called *ſoft?* Others underſtand by *Acia*, the thread in the needle whereby the lips of the wound were to be ſowed [b]. But how is this applicable to the fibula? —[a *Pantin.* In. Not. ad loc. *Celſ.* p. 435. [b] *Caſt.* Lex. Med. p. 8.]

Again, ſuppoſing the *Acia* to do the office of thread, the matter of that thread is diſputed; ſome will have it a linnen, others a ſilken, and others a metalline one. V. *Gaſſend.* de de Vita Peireſk. l. 5. p. 437.

Boxhornius ſets all theſe opinions aſide, and will have the *Acia* to be the *Acus* of the fibula, or that part which pinched—In which view *Acia mollis* only imported, that it was not ſet ſo as to pinch too much. *Boxhorn.* ad *Plutarch.* quæſt. Rom. *Pitiſc.* Lex. Antiq. p. 16.

Chiflet, de Figuero, and Rhodius, have written treatiſes expreſsly on the *Acia* of Celſus; in the laſt of whom, we find collected every thing relating to the ſubject. Diſſ. de *Acia* ad Corn. Celſ. mentem Petav. 4to. 1639, republiſhed with additions by Tho. Bartholin. Haffn. 1672. V. Act. Medic. P. 2. p. 294.

ACICULÆ, in natural hiſtory, ſmall ſpikes, or prickles in form of needles, with which nature has armed ſeveral creatures. See Tab. of fiſhes, N°. 20. and Tab. of teſtacious and cruſtaceous animals, N°. 13. See alſo Tab. of Quadrupeds, N°. 15, 25, and 26.

ACID, (*Cycl.*)—*Acid* and alcali have been conſidered by ſome chemiſts, as the two athletæ of nature, the great inſtruments whereby all things were effected; and the cauſe not only of natural, but præternatural things, as diſeaſes and cures.

This hypotheſis, we chiefly owe to Tachenius, a German apothecary and chemiſt, and a follower of Helmont's ſyſtem; who publiſhed two books, to ſhew that all natural things are compoſed of alkali and *Acid*. The *Acid*, which he held was generated in the air, from the ſun, and contained in it the hidden ſeeds, or ſouls of all things, aſſociated the alkali to itſelf; and from hence, as a paſſive ſubject, aroſe the eſſe or forms of things. All this he pretended to prove by the authority of Hippocrates. He was followed by Swalve, and his doctrine has been ſince defended by others; but combated and refuted by Bohnius, Boyle, Bertrand, Pitcairn, Hoffman, *&c.*

Some have pretended to mend the hypotheſis of *Acid* and alkali, by altering it into *Acid* and *Viſcid*; which they will have to be the cauſes of all diſeaſes, and fluid alkali the inſtrument of all cures. This doctrine is aſſerted by Bontekoe and Blanchard, but refuted by Hoffman. V. Act. Erud. Lipſ. An. 1689.

In reality, tho' the terms *Acid* and alkali be new, the notions, at leaſt ſomething very like them, are met with in antient writers, who frequently aſcribe the origin of many diſeaſes to unnatural, ſour, and corroſive juices in the body. Hippocrates ſays further, that man and other animals conſiſt of two contrary principles, which yet concur in the effect, *viz.* fire and water; and that theſe in conjunction are ſufficient to give being to all things. Which words Tachenius interprets of his *Acid* and alkali, which he apprehends ſufficient to account for the production of all bodies, and all the appearances thereof. Plato is alſo brought to give ſome countenance to the opinion; he deſcribes the particles of fire as pyramidal, and proceeding hence to reaſon on its effects, ſays, that by the ſharpneſs of their angles, the ſubtilty of their ſides, the minuteneſs of their parts, and the rapidity of their motion, they penetrate and break the contexture of all bodies; all which coincides with the modern theory of *Acids*: add, that as water according to Hippocrates is a paſſive principle, which ſerves to take off the edge of fire, and make a temperate body in conjunction with it; ſo alkali is repreſented as a porous matter, fit to receive and ſheathe the ſharp points of an *Acid*. *Sanguinet.* Diſſ. ap. Phil. Tranſ. N°. 273.

Helmont aſſerts, that no *Acid* can be lodged naturally in any part of the human body, except the ſtomach; that if it extend further, it becomes unnatural, infects the ſweet and balſamic juices, and proves the cauſe of moſt diſeaſes.

In effect, the opinion of *Acidity* has ſo far prevailed, that all diſeaſes, acute as well as chronical, fevers, cachexies, dropſies, ſuppreſſion of the menſes, the venereal diſeaſe, rheumatiſms, cholics, pleuriſies, apoplexies, epilepſies, and what not, are derived from this univerſal ſource. Harris attributes the diſeaſes of infants, Aignan the gout, Ferrari melancholy, *&c.* to an *acid* cauſe. *Sanguinet.* Lib. cit. *Harris*, de Morb. Infant. Mem. de Trev. 1713. p. 1245. *Aignan.* Tr. de la Goute in Jour. des Scav. T. 39. p. 425. *Ferrari*, Reſp. ad Queſit. del Maraffa. p. 329. Giorn. de Letter. d'Ital. T. 14. p. 225, 232.

Pitcairn has a diſſertaion on the hypotheſis of *Acid* and alcali, wherein he maintains, that neither *Acids* nor alcali either cauſe or cure any diſorder, at leaſt beyond the *primæ viæ*. *Pitcairn*, Diſſert. Medic. 8vo. Jour. des Scav. T. 30. p. 331.

To correct the redundancy of *Acids* in the ſtomach, all alcalious, or urinary ſalts, both fixed, as of wormwood, centaury, carduus; and volatile, as ſpirit of ſal armoniac, ſpirit and ſalt of hartſhorn, ſcurvy-graſs, &c. are commended. Under correctives alſo come all fixed earthy or metalline concretes, which abſorb the *Acid*, as iron, ſaccharum ſaturni, antimony, and all oils and fat things, which obtund and inviſcate the parts of *Acids*, as ſpirit of wine, oil of cloves, &c.

Acids are commonly ranked in the number of reſolving medicines; but they have not this effect *per ſe*, in as much as they rather aſtringe and incraſſate: what they contribute towards reſolving, is either by repreſſing, as when by their gentle aſtriction they repel ſtagnant humours, or when joined with other medicines which facilitate a reſolution. *Junker*, Conſp. Therap. tab. 14. §. 8. p. 390.

Acids have been found uſeful in acute, inflamatory, putrid, and petechial fevers; alſo in the rheumatiſm, phthiſis, diabetes, and even, as ſome ſay, tertians: though others attribute the cauſe of all agues to them: they are particularly ſuppoſed to be endowed with an anti-aſthmatic virtue. *Albert.* Lex. Real. Obſerv. T. 2.

The Engliſh phyſicians are divided on the propriety of adminiſtring *Acids* in the ſmall-pox. *Woodward*, State of Phyſ.

Acids are alledged to be hurtful in coughs, and moſt of them, except the juice of lemons, in diſeaſes of the breaſt.

Sig. Poli, an Italian chemiſt, member of the academy of ſciences at Paris, publiſhed a treatiſe, entitled, *Il Triomfo de gli Acidi*, the triumph of *Acids*, wherein he undertakes to prove, that 'tis unjuſtly *Acids* are charged with being the cauſe of an infinity of diſeaſes; and that, on the contrary, they are the ſovereign remedy thereof. According to this author, *Acids* are abſolutely neceſſary to all the fermentations or digeſtions performed in the ſtomach, whether of aliments or medicines: and thoſe *Acids* which are noxious, only become ſuch, as being made from ſubſtances which abound too much in alcali's: yet the *Acids* never enter the blood, but are precipitated in the inteſtines, and go out with the excrements; all that paſſes the lacteals being only a fine ſpirituous vapour, raiſed by the natural heat, and formed of a ſmooth oil and volatile alcali. *Fontenel.* Elog. de Poli. See alſo Jour. des Scav. T. 38. p. 328. ſeq.

Several authors have pretended to determine the figure of *Acids*. The generality ſuppoſe them to be aſſemblages of ſpiculæ, or ſolid, oblong particles, ſharp pointed at both ends: their ſolidity is inferred from their diſſolving the hardeſt bodies; their ſharpneſs from their pungency on the tongue; and their being pointed at both ends ſpindle faſhion, from their penetrating bodies with eaſe, and retaining their fluidity in the coldeſt ſeaſons. *Senac.* Nouv. Cours de Chym. T. 1. Mem. de Trev. 1724. p. 210.

A late mechanical author is more preciſe in ſettling the figure and dimenſions of *Acid* particles, which he will have to be triangular, but hollowed, according to the dimenſions of the particles of water, within the interſtices whereof he ſuppoſes them formed. The arch of an *Acid*, according to him, is 60 degrees, but the ſhorteſt way only 45; its ſemidiameter is to the ſemidiameter of a particle of water, as 4 to 7; its altitude, to the ſemidiameter of the ſame watery particle, as 31 to 49; and its weight, as 5 to 18. *Sweedenborg.* Prodrom. Principior. Rer. Natur. in Act. Erud. Lipſ. 1722. p. 85. See Tab. of Microſcopical Objects, Claſs 3.

Acids, eſpecially foſſil, are reckoned correctors of opium, when it affects the head or lungs. See OPIUM.

The only animal *Acid* yielded from the freſh animal by diſtillation, ſo far as yet known, is the *Acid* ſpirit of piſmires; all other fleſh, fiſh, and inſects, which have been tried, yielding an urinous one. Diſtillation is not neceſſary for the obtaining the *Acid* juice from this animal, though it is the moſt convenient way of obtaining it in quantities. If a ſtick be thruſt into an ant-hill, the creatures will drop their *Acid* liquor, in large drops, upon it, and this, when ſmelt to, twinges the noſe like new diſtilled ſpirit of vitriol. It will make the blue flowers of ſuccory, borrage, &c. red. And this *Acid* obtained, either by diſtillation, or by throwing the living animals into water till it be ſufficiently impregnated with it, will, with lead, make a peculiar ſort of ſaccharum ſaturni, which on diſtillation will give back the *Acid* in its own form again. Phil. Tranſ. N°. 68.

Some are of opinion, that all mineral *Acids* differ only according to their degree of ſtrength; but this opinion is liable to difficulties.

In Borelli, de Mot. Animal. l. 2. prop. 224. we have ſeveral experiments on dogs, with the *Acid* of ſulphur, nitre, &c.

ACID *juice of tar*, that procured from tar by diſtillation. See TAR-WATER.

ACINARIA, in botany, a name given by ſome to the marſh whortle-berries, or *vaccinia paluſtria*. *Ger.* Emac. Ind. 2.

ACINODENDRON, in botany, the name given by Burman, in his Theſaurus, to a genus of plants, afterwards called *melaſtoma*. *Burman*, Theſaur. Zeyl. p. 363. See MELASTOMA.

ACINOS. See OCYMUM.

ACITLI, in zoology, the common Mexican name for the great creſted diver, common to Europe and America, and more uſually called by authors, the *lepus aqueus*, or water-hare. *Ray*'s Ornithol. p. 257. See LEPUS *Aqueus*.

ACKNOWLEDGMENT-*money*, a ſum paid, in ſome parts of England, by tenants, on the death of their landlords, as an *Acknowledgment* of their new lords. *Blount.*

ACLIDES, in the Roman military art, a kind of miſſive weapon, having a thong fixed to it, by which, after caſting it out of the hand, it might be drawn back again.

Servius deſcribes the *Aclides* as full of ſpiculæ, or eminences; whence the word may ſeem from ακιδες, of ακις, point. Others ſuppoſe it formed from αγκυλιδες, of αγκυλη, which alſo ſignified a dart.

The *Aclides* is generally deſcribed as a kind of dart or javelin. Scaliger makes it round, or globular, having a ſlender wooden ſtem whereby to poiſe it. It was full of ſpikes, and ſo would do miſchief both where it ſtruck, and in the withdrawing. Each warriour ſeems to have been furniſhed with two. Vid. *Serv.* ad Æn. l. 7. v. 730. *Voſſ.* Etym. p. 5. ſeq. *Aquin.* Lex. Mil. T. 1. p. 14. ſeq. *Pitiſc.* Lex. Ant. T. 1. p. 17.

ACLOWA, in botany, the name of a plant common in Guinea, and uſed by the natives to cure the itch. They rub it on the body, as we do our ungents. Petiver accounts it a kind of colutea, and has named it the Guinea *ſcorpioide colutea*, with leaves like the gum tragacanth ſhrub. Its leaves are very like thoſe of that plant, and ſtand in pairs on the ribs, to the number of twelve, ſixteen, or twenty on a rib. They ſtand at ſuch ſmall diſtances, that the whole compound leaf is but ſhort. Each of theſe ſingle leaves is oblong; the pods are long, ſmooth and ſtraight, and they terminate in a point; they are about four inches long, and of the thickneſs of a crow's quill. The ſeeds are brown and ſmall, but of a thick and turgid ſhape, and each is ſeparated from the reſt by a thin ſeptum, or tranſparent membrane. Philoſ. Tranſ. N°. 232.

ACMELLA. See AHMELLA.

ACOLCHICHI, in zoology, the Mexican name for a bird, deſcribed by Nieremberg under the name of the *pterophœnico Indiarum*. See PTEROPHOENICO.

ACOLIN, in zoology, the name of a bird, of the partridge kind, common in the Spaniſh Weſt-Indies. It is no larger than a ſtarling; its legs and feet are of a pale greeniſh colour, and its toes very long; its beak is yellow, and ſomewhat long; its head ſmall; its breaſt and belly are white; its ſides are ſpotted with brown, and its back and tail of a duſky yellowiſh brown; its tail is very ſhort, and both that and the back have ſome black ſpots, and ſome narrow ſtreaks of white. It frequents the ſides of lakes; and is ſuppoſed to feed on flies, worms, and other inſects, which are found about watery places. It is a tolerably well taſted bird. *Ray*'s Ornithol. p. 304.

ACOLUTHI, or ACOLYTHI, (*Cycl.*)—*Acolythus* was a title in the Grecian empire, given to the captain or commander of the *Varangi*, a body of guards appointed for the ſecurity of the emperor's palace. *Codin.* de Offic. Aul. Conſtant. c. 1. n. 51. & c. 5. n. 71. *Meurſ.* Gloſſ. Gr. Barb. p. 18. *Du Cang.* Gloſſ. Gr. T. 1. p. 41.

ACOLYTHIA, in the Greek church, denotes the office, or order of divine ſervice. *Du Cang.* Gloſſ. Græc. T. 1. p. 41. Voc. Ακολυθια.

The ſame name is alſo given to the prayers, ceremonies, hymns, and the like, whereof the Greek ſervice is compoſed. *Suic.* Theſ. Græc. T. 1. p. 163.

They are ſuppoſed to be ſo called Απο τυ Ακολυθειν, *a ſequendo*, from their ſequence or following each other; or becauſe of their cohering and agreeing well together.

ACONE, in the natural hiſtory of the antients, the name of a ſtone uſed as a whetſtone, and for ſeveral other purpoſes; but more uſually known among the Romans by the name *coticula*. See COTICULA.

ACONCROBA, in botany, a name given by the natives of Guinea to a plant, growing wild with them, and in great eſteem for its virtues in the ſmall-pox. They give an infuſion of it in wine. The leaves of this plant are opake, and as ſtiff as thoſe of the phillerey; they grow in pairs, and ſtand on ſhort foot-ſtalks; they are ſmall at each end, and broad in the middle; and the largeſt of them are about three inches in length, and an inch and quarter in breadth in the middle. They ſomewhat reſemble thoſe of our bay. They are of a duſky colour on the upper ſide, and of a pale green underneath.

ACONITE, (*Cycl.*)—ACONITUM, *Wolfsbane*, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the polypetalous anomalous kind, conſiſting of five irregular leaves, and ſomewhat reſembling a man's head, with a hood or helmet on it. The upper petal ſeems to perform the office of a hood or helmet; the two lower leaves repreſent that part of the helmet which receives the lower jaw, and the two wings ſeem adapted to the upper part of the face, or the temples. From the center of the flower there ariſe two piſtils, ſhaped like feet, and received into the hollow of the upper petal or hood, as is alſo the piſtil, which finally becomes a fruit, compoſed of ſeveral membranaceous vaginæ collected into a head, and uſually containing angular and wrinkled ſeeds. See Tab. 1. of Botany, Claſs 11.

The ſpecies of *Aconite*, enumerated by Mr. Tournefort, are theſe. 1. The common yellow *Aconite*. 2. The great yellow *Aconite*, with thicker ſtalks and broader leaves. 3. The yellow *Aconite*, with lower ſtalks and ſmaller leaves. 4. The Pyrenæan *Aconite*, with large and deeply divided leaves. 5. The blue flowered *Aconite*. 6. The narrow leaved *Aconite*, with bending ſpikes. 7. The *Aconite* with bending ſpikes, with fewer flowers and deeply divided leaves. 8. The

Aconite with broader leaves and bending ſpikes. 9. The greateſt *Aconite* with bending ſpikes. 10. The common blue *Aconite*, commonly called blue monk's-hood. 11. The pale red flowered monk's-hood. 12. The white flowered monk's-hood. 13. The monk's-hood with blue and white variegated flowers. 14. The monk's-hood with purple and white variegated flowers. 15. The violet flowered monk's-hood. 16. The purple flowered monk's-hood. 17. The monk's-hood with very large purpliſh blue flowers. 18. The leſſer blue flowered monk's-hood. 19. The pyramidal many flowered monk's-hood. 20. The healing monk's-hood, called *anthora*. 21. The large Pyrenæan anthora, with dark green leaves and very large flowers. *Tournef.* Inſt. p. 424.

'Tis not agreed what the antient *Aconite* was, the antient botaniſts uſing the name with ſome diverſity; ſometimes even in a general ſenſe, to denote any poiſon; whence alſo *Aconitarius*, became ſynonymous with φαρμακοποωλης, a poiſoner. *Calv.* Lex. Jur. p. 18. *Du Cang.* Gloſſ. Lat. T. 1. p. 45. Dioſcorides only makes two kinds of *Aconite*; the firſt the ſame with the *thelyphonium*, the ſecond the proper *Aconite*. In ſtrictneſs there appears to have been but one ſpecies of *Aconite*, which reſembled the thelyphonium in its virtue and effects, but differed from it in leaf, colour, ſoil, root, &c. Vid. *Salmaſ.* Exerc. ad Solin. T. 2. p. 881. ſeq. *Gorr.* Med. Defin. p. 16. ſeq. voc Ακονιτον.

Some compare the poiſon of the *Aconite* to that of the napellus [a]. Others ſeem to make it of the ſame kind with that of the ſalamander [b]. Dr. Mead will have it to agree with the cicuta [c]. 'Tis the root alone that is hurtful [d]; for its leaves and fruit are ſaid to be innocent [e].—[[a] Ephem. Germ. Dec. 1. an. 2. p. 82. [b] *Plin.* Hiſt. Nat. T. 2. l. 29. c. 4. p. 505. [c] *Mead*, of Poiſons. Jour. des Scav. T. 47. p. 64. [d] *Salmaſ.* lib. cit. p. 882. [e] *Vater.* Phyſ. Exper. in app. c. 3. §. 2. p. 870.]

ACONITI, Ακονιτι, is an appellation given to ſome of the antient *athletæ*, but differently interpreted. Mercurialis underſtands it of thoſe who only anointed their bodies with oil, but did not ſmear themſelves over with duſt, as was the uſual practice. M. Burette will have it to ſignify thoſe who conquered eaſily without duſt, *q. d.* απονιτι, αμαχει, with little ado. Vid. *Burette.* in Mem. de l'Acad. des Inſcript. T. 1. p. 294. ſeq.

ACONTIAS, (*Cycl.*)—in zoology, the name of a ſpecies of ſerpent, called alſo *jaculum*, or the dart ſnake, from its manner of vibrating its body in the manner of a dart. Bellonius found one of theſe in the iſland of Rhodes, which he deſcribes in this manner. It is about three hands-breadth long, and of the thickneſs of one's little-finger. Its colour is a milky grey on the back, variegated with ſmall black ſpots, like ſo many eyes; and on the belly it is perfectly white. The neck is wholly black, and from that two milk white ſtreaks run all the way along the back to the tail; the black ſpots alſo are each ſurrounded with a ſmall circle of white. It is found in Egypt alſo, and Lybia, and in the iſlands of the Mediterranean. *Ray*'s Synopſ. Anim. p. 290.

ACONTIUM, in antient writers, a kind of Grecian dart, or javelin, ſomewhat reſembling the Roman *pilum*. *Aquin.* Lex. Milit. *Salmaſ.* Exerc. ad Solin. T. 2. p. 1017.

ACOPA, in botany, a name given by Dioſcorides, and ſome other authors, to the *trifolium paludoſum*, or buck-bean.

Acopa is alſo uſed to denote medicines againſt laſſitude. *Acopum*, Ακοπον, from α privative, and κοπος, wearineſs.

ACOPIS, the name of a ſort of foſſil ſalt, deſcribed by Pliny, and ſaid to have been uſed by the antients, mixed with oil and heated, to rub over the limbs to cure wearineſs. The deſcription Pliny gives of it is a very odd one. He ſays, it was of a light, porous and ſpungy texture, reſembling the pumice, and that it was variegated with gold coloured ſpots. All that is poſſible to collect from this, is, that it might be an impure ſort of the *natrum*, or nitre of the antients, ſuch as is now found about Smyrna, and uſed inſtead of ſoap; this is of a lax ſpungy texture, and naturally of a greyiſh white, but it is ſubject to be tinged by accidents; and poſſibly what Pliny calls *Acopis*, might be only ſuch of it as was accidentally ſpotted with an admixture of a yellow ochreous earth.

ACORN, in natural hiſtory and agriculture, denotes the fruit of trees of the oak kind.

The *Acorn*, according to Dr. Grew, is the nut of an oak, with this only difference, that beſides the cup it ſtands in, it has only a leathern or parchment cover, inſtead of a ſhell. And hence it is, that whereas the kernel of a nut is ſweet, that of an *Acorn* is of a very rough taſte; the auſtere parts of the ſap, which in a nut are drained off into the ſhell, being here imbibed by the kernel itſelf. *Grew*, Anat. of Plants, l. 4. c. 4. §. 8.

Writers on huſbandry give rules concerning ſeminaries or nurſeries of *Acorns*, the propagating, ſowing, or planting of *Acorns*. Vid. *Evel.* Sylv. c. 2. *Hought.* Collect. N°. 466. T. 3. p. 139.

For timber, thoſe *Acorns* are to be choſen as ſeed which are moſt ſolid and heavy, not thoſe which are biggeſt.

Acorns were the food of the firſt ages; but when corn was found out, *Acorns* were neglected. They are of little uſe in our days, but to fatten hogs, and other cattle, and poultry. Yet among the Spaniards the *Acorns*, *glans Iberica*, is ſaid to have long remained a delicacy, and been ſerved up in the nature of a deſert. *Hought.* N°. 480. p. 168. *Plin.* Hiſt. Nat. l. 16.

In dearths, *Acorns* have been ſometimes dried, ground into meal, and baked into bread.

The inhabitants of Chio held out a long ſiege, without other food. But they are ſaid to breed headachs and ventoſities, and to be hard of digeſtion [a]. A decoction of *Acorns* is reputed good againſt dyſenteries and cholics. A peſſary of them is ſaid to be good in immoderate fluxes of the menſes [b].—[[a] *Barthol.* Act. Med. T. 2. obſ. 57. [b] *Gorr.* Med. Defin. voc. Βαλανος.]

ACORUS, (*Cycl.*)—in the materia medica, a name by which ſome authors have called the great galangal. *Dale*, Pharm. p. 252.

Acorus *adulterinus*, in the materia medica, the name of the root of the *iris lutea paluſtris*, or common yellow water-flag flower. *C. Bauhin.* Pin. p. 34.

ACOUSMATICI, an appellation given to ſuch among the diſciples of Pythagoras, as were ſtill under the five years probation. V. *Gentzken.* Hiſt. Philoſ. p. 47.

The *Acouſmatici*, ακουσματικοι, are ſometimes alſo called *Acouſtici*, ακουστικοι; by Latin writers, *Acuſtici*. The *Acouſmatici* ſtood oppoſed to the *mathematici*, who were thoſe initiated into the ſecrets of ſcience; and the *Acouſmatic* philoſophy, to the mathematic. *Voſſ.* de Sect. Philoſ. c. 6. §. 18. p. 35.

The *Acouſmatici* were inſtructed by bare poſitive precepts and rules, without reaſons or demonſtrations; theſe precepts they called *Acouſmata*, which were divided into three kinds. The firſt, Such as aſſerted what ſome thing is; *e. gr.* what is the ſun, the moon, the tetractys, or the like. The ſecond, Such as told what is moſt ſuch a thing; *e. gr.* what is moſt juſt? to ſacrifice: what is the moſt powerful? reaſon: what is the trueſt? that men are wicked. The third preſcribed what is to be done, and what not; *e. gr.* that we ought to beget children; that we are to put off the right ſhoe firſt: that we ought not to go in the common road, &c. Such were the Pythagorean *Acouſmata*; and thoſe among his diſciples who retained the greateſt fund of theſe, were eſteemed the wiſeſt men. *Stanley*, Hiſt. Philoſ. P. 9. p. 519.

Some have denied the appellation of Pythagoreans to be due to the *Acouſmatici*, in regard many of theſe had their learning not immediately from Pythagoras, but from Hippaſus, who, according to ſome, was of Crotona, but according to others, of Metapontium. *Jamblich.* de Vit. Pythag. c. 18. p. 54. *Stanl.* loc. cit.

ACOUSTIC *veſſels*. In the antient theatres there were a kind of *Acouſtic* veſſels, made of braſs, ſhaped in the bell faſhion, which being of all tones within the pitch of the voice, or even of inſtruments, rendered the ſounds more audible, ſo that the actors could be heard through all parts of theatres, which were even 400 feet in diameter. *Vitruv.* de Archit. l. 5. c. 5. *Boindin.* in Mem. de Trev. 1709. p. 30.

Acoustic *duct*, *ductus acouſticus*, is applied to the external paſſage of the ear; called alſo *meatus auditorius*.

Acoustic *nerve*, *nervus acouſticus*, is the ſame which we otherwiſe call the *auditory* nerve.

Acoustic *diſciples*, among the antient Pythagoreans, thoſe more frequently called *Acouſmatici*. *Voſſ.* de Sect. Philoſ. c. 6. §. 18. p. 35. See the article Acousmatici.

ACRE, (*Cycl.*)—An *Acre* is 10 ſquare chains, of 22 yards each, that is, 4840 ſquare yards. And a mile being 1760 yards ſquare, a mile ſquare will be found to contain 640 *Acres*.

Houghton gives a table of the number of *Acres* to a houſe in each county of South-Britain, which is found to vary in the Engliſh counties, from $3\frac{1}{2}$ *Acre*, the proportion in Middleſex, and $17\frac{1}{2}$ in Surry, to 49 *Acres* in Southampton. In the Welſh counties, from 51 *Acres*, as it is found in Flintſhire, to 193, as in Merionethſhire. *Houghton*, Collect. N°. 28. T. 1. p. 80. ſeq.

Dr. Grew attempts to aſcertain the number of *Acres* in England, which, according to him, amounts to 46 millions and 80000. Phil. Tranſ. N°. 330. p. 266. ſeq.

Sir William Petty reckons but 28 millions; others 29 millions.

And by an account of the number of *Acres* in each county, ſuppoſed to be taken from ſome old regiſter, the number of *Acres* in England amounted only to $39\frac{1}{4}$ millions. But Dr. Grew ſhews, that this is too little.

The province of Holland is ſaid to contain but one million of *Acres*; and was thought formerly to contain 2 millions 400,000 ſouls. But by the more acurate computations of Mr. Kerſſeboom, that province does not contain one million of ſouls. If England were as well peopled in proportion, it would contain 46 millions of inhabitants; that is, perhaps, above five times as many as it now contains.

The Scotch *Acre* contains four Scotch roods, and bears proportion to that of the Engliſh by ſtatute, as 100,000 to 78,694, regard being had to the difference betwixt the Scotch and Engliſh foot. Treat. Pract. Geom. p. 86. See Foot.

ACRID, in natural hiſtory, denotes any thing ſharp or pungent to the taſte.

Antient naturaliſts diſtinguiſh two kinds of *Acrid* taſtes; the firſt proceeding from hot and dry, as that of pepper; the ſecond from hot and moiſt, as that of garlic.

Acrid,

Acrid, according to Grew, properly belongs to the claſs of compound taſtes. It is not ſimply ſour or pungent; there being bodies not *Acrid*, which yet are pungent, *e. gr. arum*: nor is it ſimply hot; for there are many hot bodies which are not *Acrid*, as the roots of zedoary, yarrow, and contrayerva.—The characteriſtic therefore of *Acritude* conſiſts in pungency joined with heat. *Grew*, Diſc. of Taſtes, c. 1. §. 21. p. 281.

Acrid bodies, by the pungency and tenuity of their parts, incide, digeſt, heat, open, irritate, purge, cauſe appetite, &c.

The eating of *Acrid* foods with thoſe intentions, is particularly called by the Greeks drimyphagia. *Gorr.* Def. Med. p. 116. in Voc. Δριμυφαγια.

Acrid things are hurtful to the head and eyes, and contrary to bilious temperaments; but advantageous to pituitous ones. *Abercromb.* de Dignoſcend. Medic. Plant. Virib. ap. Giorn. de Letter. de Parm. 1688. p. 185.

ACROAMATIC, in the Ariſtotelian hiſtory, imports the ſame with *Acroatic*. *Voſſ.* de Sect. Philoſ. c. 17. §. 9. See the article ACROATIC.

ACROAMATIC, in a more general ſenſe, denotes a thing ſublime, profound, or abſtruſe. In which ſenſe, it ſtands oppoſed to exoteric.

We ſay *acroamatic* philoſophy, *acroamatic* theology, an *acroamatic* method, *acroamatic* interpretation, &c.

Few ſects, or profeſſions, but have had two ways of teaching, if not two ſorts of doctrine, an *acroamatic* for adepts and proficients; and an exoteric for novices [a]. We find traces of this among the heathen as well as chriſtian divines, philoſophers, and chemiſts. Hence the ceremonies of initiations, and ablutions, the diſcipline of ſecrecy; and hence alſo the origin of fables, ænigma's, parables, ſymbols, &c [b]. —[a Vid. *Zeidler*, *de gemino docendi more*, *exoterico & acroamatico paſſim*. An analyſis of which is given in Reimman, Syſt. Antiq. Literar. P. 3. Sec. 2. p. 134. b *Bac.* de Augment. Scient. l. 6. c. 2. opp. T. 1. p. 166.]

ACROAMATIC, is ſometimes alſo uſed in a more general ſenſe for any thing kept ſecret, or remote from popular uſe.

In which ſenſe Reimman gives the title *Bibliotheca Acroamatica*, to a deſcription of the MSS. of the library of Vienna, abridged from the vaſt commentaries of Lambecius and Neſſelius. *Reimman*, Bibl. Acroam. Hannov. 1712. 12°.

ACROAMATICI, a denomination given the diſciples, or followers of Ariſtotle, &c. who were admitted into the ſecrets of the inner or *acroamatic* philoſophy. *Scheffer.* de Philoſ. Ital. c. 10. Bibl. Choiſ. T. 10. p. 174.

ACROATIC, Ariſtotle's lectures to his diſciples were of two kinds, *exoteric*, and *acroatic*, Ακροατικα. The *acroatic* were thoſe, to which only his own diſciples and intimate friends were admitted; whereas the exoteric were publick or open to all; but there are other differences. The *acroatic* were ſet apart for the higher and more abſtruſe ſubjects; the exoteric were employed in rhetorical and civil ſpeculations. Vid. *Salmaſ.* ad Epict. p. 228. ſeq.

Again, the *Acroatics* were more ſubtile and exact, evidence and demonſtration being here aimed at; the exoterics chiefly aimed at the probable and plauſible. The former were the ſubject of the mornings exerciſes in the Lyceum, the latter of the evenings: add that the exoterics were publiſhed, whereas the *Acroatics* were kept ſecret, being either entirely concealed, or if they were publiſhed, it was in ſuch obſcure terms, that few but his own diſciples would be the wiſer for them. Hence when Alexander complained of his præceptor for publiſhing his *Acroatics*, and thus revealing what ſhould have been reſerved to his diſciple; Ariſtotle anſwered, that they were made publick and not publick, for that none who had not heard them explained by the author, *viva voce*, would underſtand them. Vid. *Gell.* l. 2. c. 5. *Plut.* in Alex. *Stanley*, Hiſt. Philoſ. P. 6. c. 8.

ACROBATICA, or ACROBATICUM, an antient engine, whereby people were raiſed aloft, that they might ſee more conveniently about them. *Pitiſc.* Lex. Antiq. Rom. T. 1. p. 18.

The *Acrobatica* among the Greeks, amounted to the ſame with what was called ſcanſorium among the Latins. *Vitruv.* Archit. 10. c. 1. p. 204.

Authors are divided as to the office of this engine. Turnebus and Barbarus [a], take it to have been of the military kind, raiſed by beſiegers, high enough to over look the walls, and diſcover the ſtate of things on the other ſide. Baldus rather ſuppoſes it a kind of moveable ſcaffold, or cradle contrived for raiſing painters, plaiſterers, and other workmen, to the tops of houſes, trees, &c. Some ſuſpect that it might have been uſed for both purpoſes [b].—[a Ad Loc. Vitruv. b *Bald.* Lex. Vitruv. p. 5. *Aquin.* Lex. Milit. T. 1. p. 15. *Buleng.* de Theat. l. 1. c. 22.

ACROCHIRISMUS, Ακροχειρισμος, among the antients, a kind of gymnaſtic exerciſe, wherein the two parties contended only with their hands and fingers, without cloſing, or engaging the other parts of the body. V. *Lang.* Epiſt. Medic. l. 1. Ep. 52. p. 240. *Scal.* Poet. l. 1. c. 22. *Caſtel.* Lex. Med. in Voc.

The word is alſo written *Acrochireſis*, and *Acrochiria*, it is originally Greek, formed from Ακροχειρ, the part employed in this combat, which ſome would needleſsly reſtrain to the tips of the fingers; tho' the etymon does not make this neceſſary.

Some make this a diſtinct exerciſe from wreſtling [a], and ſuppoſe it to have given the denomination *Acrochiriſtæ*, to a peculiar ſet of athletæ who profeſſed it [b]. Others with more probability conſider it as only a ſpecies, or branch of wreſtling; ſome will have it to have been properly only a prelude to a wreſtling bout, wherewith the athletæ began to try each others ſtrength, and bring their arms into play [c].—[a V. *Mercurial.* de Art Gymnaſt. l. 3. c. 5. b *Bud.* in Pandec. p. 96. *Lang.* l. c. c *Burette*, in Mem. Acad. Inſcrip. T. 4. p. 337.]

This exerciſe made part of the pancratium. Pauſanius ſpeaks of a famous pancratiaſt, named Soſtrates, who got the ſirname *Acrocherſites*, or *Acrocheiriſtes*, from his having overcome all his antagoniſts at the *Acrochiriſm.*—It appears to have been in uſe in the age of Hippocrates, who aſcribes to it a virtue of extenuating the reſt of the body, and making the arms fleſhy. *Caſtell.* Renov. p. 12.

ACROCHORDON, a painful ſpecies of wart, very prominent and pendulous, having a large head with a ſmall pedicle, or baſe. *Zuing.* Inſtit. Pathol. §. 349. p. 210. *Caſt.* Lex. Med. p. 12. See WART, *Cycl.*

Theſe are alſo called *Penſiles Verrucæ*, or hanging warts, and ſtand diſtinguiſhed from *Seſſiles Verrucæ*, or *Myrmecia*.

Others deſcribe the *Acrochordon*, as a harder, rougher ſort of wart, growing under the cutis, very callous, and uſually of the ſame colour with the ſkin; ſmall at bottom and bigger upwards, but rarely exceeding the ſize of a bean. *Gorr.* Def. Med. p. 18. *Celſ.* de Medic. l. 5. c. 28. *Caſt.* Lex. Med.

ACROCORION, in botany, a name uſed by ſome authors for the ſeveral ſpecies of the ſpring crocuſes. *Ger.* Emac. Ind. 2.

ACROE, in botany, the name given by the natives of Guinea, to a kind of ſhrub, which they uſe in wine, as a reſtorative and analeptick. It is of the trifoliate kind, and has ſomewhat of the appearance of the corallodendrous, but it is not prickly; the middle or end leaf ſtands on a pedicle of an inch long, the other two leaves have no pedicles at all. Phil. Tranſ. N°. 232.

ACROMONOGRAMMATICUM, among poets, denotes a kind of poem, or compoſition, wherein each ſubſequent verſe commences with the ſame letter, with which the verſe preceding terminates.

ACRONYCHAL, (*Cycl.*)—Among antient writers, a ſtar was properly ſaid to be *acronychal*, or to riſe *acronychally*, which roſe in the evening, when the ſun was ſet. Greek writers, it is true, uſe the term Ακρονυχιος indifferently, in ſpeaking either of evening or morning, by reaſon both are conſidered as Ακρα της νυκτος, the extremities of the night. And hence, among them we find *acronychal* applied to the riſing and ſetting of the ſtars, either in the morning or evening. But the antients were more diſtinct, and by the Ακρονυκτιος rather meant the firſt beginning or approach of night, than the end or period of it; and accordingly among them, the ſtars which roſe in the evening, not thoſe in the morning, were ſaid to riſe *acronychally*. V. *Salmaſ.* Exercit. ad Solin. p. 720.

ACRONYCHAL is ſometimes alſo applied improperly, to any riſing or ſetting of a ſtar, during the night, or while the ſun is below the horizon. *Wolf.* Lex. Math. Voc. *Ortus*.

ACRONYCHAL is likewiſe an appellation more peculiarly given to the ſuperior planets, Saturn, Jupiter, and Mars, when they were come to the meridian of midnight.

ACROSTIC, (*Cycl.*)—Among eccleſiaſtical writers, *Acroſtics* denote the ends of verſes of pſalms, which the people ſang by way of chorus, or reſponſe to the præcentor or leader of the pſalm. This was called ſinging *Acroſtics*, *Acroſtichia*, which is a ſpecies of pſalmody, uſual in the antient church. V. *Bingh.* Orig. Eccleſ. T. 1. l. 14. c. 1. §. 12. p. 666.

Acroſtic in this ſenſe amounts to the ſame with *Hypopſalma*, *Diapſalma*, *Acroteleution*, and *Ephymnion*, which are all terms of the ſame ſignification.

Tho' an *Acroſtic* properly ſignifies the beginning of a verſe, yet it is ſometimes alſo uſed for the end or cloſe of it; as by the author of the conſtitutions, when he orders one to ſing the hymns of David, and the people to ſing after him the *Acroſtics* or ends of the verſes.

It does not however denote preciſely the end of the verſe, but ſomething added at the end of a pſalm, or ſomething frequently repeated in the courſe of a pſalm, anſwering to our *Gloria Patri*.

Some pretend to find *Acroſtics* in the pſalms, particularly in thoſe called Abcdarian pſalms. V. le Clerc. in Bibl. Choiſ. T. 9. p. 242. *Du Hamel.* ad Pſalm. 25. Nouv. Rep. Lett. T. 29. p. 511.

ACROSTICUM, in the Linnæan ſyſtem of botany, the name of a genus of capillary plants, the character of which is, that the fructifications are not diſpoſed in any regular manner on the leaves, as in moſt of the other capillary plants; but they are ſo placed as to form a heap, covering the whole underſide of the leaf: the *ruta muraria* is of this kind.

ACROSTOLIUM, in antiquity, an ornament of the prow, or forecaſtle of a ſhip, chiefly of war; ſometimes ſhaped like a buckler, a helmet, or an animal, but more frequently turned circular or ſpiral [a]. The antients had divers decorations or additional parts to their ſhips, called by a general name Κοσμηματα, thoſe on the prow were more particularly called στολος, of which the extreme part alone was denominated *Acroſtolium* [b].—[a *Pitiſc.* Lex. Antiq. Rom. T. 1. p. 18. b V. *Hoffm.* Lex. Univ. T. 1. p. 47. *Salmaſ.* Exerc. ad Solin. p. 572. ſeq.]

The *Acroſtolium*, Ακροστολιον, in the prow correſponded to the *Apluſtre*, in the poop of the ſhip. See APLUSTRE.

Some authors apply the word *Acroſtolium*, indifferently to the decorations of the prow, and of the poop; others extend the *Acroſtolia* to all the decorations of the poop [c]; and even Feſtus and others, confound the *Acroſtolia* with the *Roſtra*. But the more exact diſtinguiſh in all thoſe caſes [d].—[c *Aquin.* Lex. Milit. T. 1. p. 15. d V. *Scheff.* de Milit. Naval. l. 2. c. 6.]

To the *Acroſtolia* may be referred the *Anſerculus*, mentioned by Bayfius; and alſo thoſe poliſhed ſteel pieces reſembling a duck's neck, uſed by the Venetians at the heads of their Gondolas.

The *Acroſtolia* were torn from vanquiſhed ſhips, and faſtened to the conqueror's, as a ſignal of victory [e]. We frequently find them repreſented on the reverſes of antient medals. An *Acroſtolium* is alſo ſeen in the famous ſculpture of the apotheoſis of Homer [f].—[e *Diod. Sicul.* l. 20. c. 53. *Scheff.* de Milit. Nav. l. 2. c. 6. f V. *Moreau de Mautour.* ap. Mem. de Litterat. de Saleng. Contin. T. 7. p. 443. ſeq.]

ACROTELEUTIC, among eccleſiaſtical writers, denotes the end of a verſe or pſalm; or ſomething added thereto to be ſung by the people. *Bingh.* Orig. Eccleſ. T. 1. l. 14. c. 1. §. 12. p. 666. ſeq.

In which ſenſe *Acroteleutic* amounts to the ſame with Acroſtic, Hypopſalma, Diapſalma, Epode, &c.

The *gloria patri* is by ſome writers called the *Acroteleutic* to the pſalms; becauſe always uſed to be repeated by the people at the end of each.

Hence the word *Acroteleutic*, is ſometimes alſo uſed as ſynonymous with doxology. *Sozom.* Hiſt. Eccleſ. l. 8. c. 8. and l. 5. c. 19. *Du Cang.* Gloſſ. Græc. T. 1. p. 45.

ACROTERIA, (*Cycl*).—*Acroteria*, among antient phyſicians, was uſed to denote the greater extremities of the body, as the head, hands, and feet.

The *Acroteria* growing cold in acute diſtempers, is held a prognoſtic of death; as indicating a decay of the vital flame, either by reaſon of a coagulation of the blood, or too great a conſumption of it before.

Ariſtotle alſo uſes *Acroteria*, for the tips or extreme parts of the fingers, covered by the nails; ſometimes alſo for the eminences of the bones. *Gorr.* Def. Med. p. 18. *Caſt.* Lex. Med. p. 13.

ACROTERIASM, Ακρωτηριασμος, among antient phyſicians, the act of cutting off the extreme parts of the body, when putrified, by a ſaw.

Several writers deſcribe the operation of *Acroteriaſm*. V. *Gorr.* Def. Med. p. 18. *Caſt.* Lex. Med p. 13. *Aquapend.* in Op. Chirurg. *Hildan.* Tr. de Gangren.

ACROTHYMIA, in ſurgery, the name of a large tumor in the fleſh, riſing in the ſhape of a wart, tho' ſometimes depreſſed and flat. *Heiſter*'s Surgery, p. 323.

ACT *of Faith*, (*Cycl.*) — The *Auto de Fe*, may be called the laſt act of the inquiſitorial tragedy; it is a kind of gaol-delivery, appointed as oft as a competent number of priſoners in the inquiſition are convicted of hereſy, either by their own voluntary, or extorted confeſſion; or on the evidence of certain witneſſes. The proceſs is thus: in the morning, they are brought into a great hall, where they have certain habits put on, which they are to wear in the proceſſion. The proceſſion is led up by dominican friars, after which come the penitents, ſome with ſan benitoes, and ſome without, according to the nature of their crimes; being all in black coats without ſleeves, and bare-footed with a wax candle in their hands. Theſe are followed by the penitents who have narrowly eſcaped being burnt, who over their black coats have flames painted with their points turned downwards, *Feugo revolto*. Next come the negative, and relapſed, who are to be burnt, having flames on their habit pointing upwards; after theſe come ſuch as profeſs doctrines contrary to the faith of Rome, who, beſides flames pointing upwards, have their picture painted on their breaſts, with dogs, ſerpents, and devils, all open mouthed, about it. Each priſoner is attended with a familiar of the inquiſition, and thoſe to be burnt have alſo a jeſuit on each hand, who are continually preaching to them to abjure. After the priſoners, comes a troop of familiars on horſe-back, and after them the inquiſitors, and other officers of the court, on mules; laſt of all, the inquiſitor general on a white horſe, led by two men with black hats and green hat-bands.

A ſcaffold is erected in the *Terreiro de Paio*, big enough for two or three thouſand people; at one end of which are the priſoners, at the other, the inquiſitors. After a ſermon made up of encomiums of the inquiſition, and invectives againſt hereticks, a prieſt aſcends a deſk near the middle of the ſcaffold, and having taken the abjuration of the penitents, recites the final ſentence of thoſe who are to be put to death; and delivers them to the ſecular arm, earneſtly beſeeching at the ſame time the ſecular power, not to touch their blood, or put their lives in danger.

The priſoners being thus in the hands of the civil magiſtrate, are preſently loaded with chains, and carried firſt to the ſecular goal, and from thence in an hour or two brought before the civil judge, who, after aſking in what religion they intend to die, pronounces ſentence, on ſuch as declare they die in the communion of the church of Rome, that they ſhall be firſt ſtrangled, and then burnt to aſhes; on ſuch as die in any other faith, that they be burnt alive.

Both are immediately carried to the *Ribera*, the place of execution, where there are as many ſtakes ſet up, as there are priſoners to be burnt, with a quantity of dry furz about them. The ſtakes of the profeſſed, that is, ſuch as perſiſt in their hereſy, are about four yards high, having a ſmall board towards the top for the priſoner to be ſeated on. The negative, and relapſed being firſt ſtrangled and burnt, the profeſſed mount their ſtakes by a ladder; and the jeſuits after ſeveral repeated exhortations, to be reconciled to the church, part with them, telling them they leave them to the devil, who is ſtanding at their elbow to receive their ſouls, and carry them with him into the flames of hell. On this a great ſhout is raiſed, and the cry is, let the dogs *beards be made*, which is done by thruſting flaming furzes faſtened to long poles againſt their faces, till their faces are burnt to a coal, which is accompanied with the loudeſt acclamations of joy. At laſt, fire is ſet to the furz at the bottom of the ſtake, over which the profeſt are chained ſo high, that the top of the flame ſeldom reaches higher than the ſeat they ſit on, ſo that they rather ſeem roaſted than burnt. There cannot be a more lamentable ſpectacle; the ſufferers continually crying out, while they are able, *miſericordia per amor de Dios*: yet it is beheld by all ſexes, and ages, with tranſports of joy and ſatisfaction. See *Gedd.* View of Inquiſ. ap. Miſcel. Tract. T. 1. p. 442. ſeq. *Limborch.* Hiſt. Inquiſ. l. 4. *Le Clerc.* Bibl. Univ. T. 23. p. 463. ſeq. Relat. de l'Inquiſ. de Goa. c. 20. ſeq. Ouv. des Scav. Oct. 1687. ſeq. Act. Erud. Lipſ. Sup. T. 1. p. 70. Mem de Trev. Sept. 1701. p. 64. ſeq.

ACTS *of the ſenate*, *Acta Senatus*, among the Romans, were minutes of what paſſed and was debated in the ſenate houſe.

Theſe were alſo called *Commentarii*, and by a Greek name ὑπομνηματα. They had their origin in the conſulſhip of Julius Cæſar, who ordered them both to be kept, and publiſhed. The keeping them was continued under Auguſtus, but the publication was abrogated. Afterwards all writings, relating to the decrees or ſentences of the judges, or what paſſed and was done before them, or by their authority, in any cauſe, were alſo called by the name *Acta*. In which ſenſe we read of civil *Acts*, criminal *Acts*, intervenient *Acts*, *Acta civilia*, *criminalia*, *intervenientia*, &c. V. *Suet.* in Auguſt. c. 36. *Pitiſc.* Lex. Antiq. Voc. *Acta*.

ACTS *of the People*, *Acta populi*, among the Romans, were journals or regiſters of the daily occurrences, as aſſemblies, trials, executions, buildings, births, marriages, deaths, &c. of illuſtrious perſons, and the like.

Theſe were otherwiſe called *Acta publica*, and *Acta diurna*, or ſimply *Acta*.

The *Acta* only differed from annals in that only the greater and more important matters were in the latter, and thoſe of leſs note in the former. V. *Tacit.* Annal. xiii. 31. *Pitiſc.* Lex. Ant. Voc. *Acta*.

Their origin is attributed to Julius Cæſar, who firſt ordered the keeping and making publick the acts of the people; ſome trace them higher, to Servius Tullius, who to diſcover the number of perſons, born, dead, and alive, ordered that the next of kin, upon a birth, ſhould put a certain piece of money into the treaſury of *Juno Lucina*; upon a death, into that of *Venus Libitina*: the like was alſo to be done upon aſſuming the *Toga Virilis*, &c. Under Marcus Antoninus, this was carried further; perſons were obliged to notify the births of their children, with their names, and ſurnames, the day, conſul, and whether legitimate or ſpurious, to the præfects of the *Ærarium Saturni*; to be entered in the public *Acts*. Tho' before this time the births of perſons of quality appear to have thus been regiſtred. V. *Suet.* in Jul. c. 20. n. 1. *Capitol.* in Marc. c. 9. *Suet.* in Tib. c. 5. Calig. c. 8. *Pitiſc.* loc. cit.

Publick ACTS. The knowledge of publick *Acts* has been erected into a peculiar ſcience, called the *diplomatic*, of great importance to an hiſtorian, ſtateſman, chronologer [a], and even critic [b]. The preſervation of them was the firſt occaſion of erecting libraries [c].—[a *Leibnitz.* ap. Journ. des Scav. T. 23. p. 18. It. T. 46. p. 182. b Act. Erud. Lipſ. an. 1727. p. 530. *Morhoff.* Polyhiſt. Liter. l. 1. c. 3. xii. p. 23. c Bibl. Anc. Mod. T. 26. p. 31. *Reimman.* Introd. Hiſt. Liter. T. 2. p. 146.]

The ſtyle of *Acts* is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineneſs, and even whether there be any certain rules at all? F. Germon

will have the greater part of the *Acts* of former ages to be ſpurious. Fontanini [d] aſſerts, that the number of forged *Acts* now extant is very ſmall. 'Tis certain there were ſevere puniſhments inflicted on the forgers and falſifiers of *Acts*.—[[d] Vind. Ant. Diplom. c. 5. Jour. des Scav. T. 34. p. 1018.]

The chief of the Engliſh *Acts*, or public records, are publiſhed by Rymer, under the title of *Fœdera*, and continued by Saunderſon: an extract whereof has been given in French by Rapin, and tranſlated into Engliſh, under the title of *Acta Regia* [e]. Great commendations have been given this work [f], and ſome exceptions made to it: as that there are many ſpurious *Acts* [g], as well as errors in it; ſome have even charged it with falſifications [h].—[[e] New Mem. of Liter. T. 2. p. 233. [f] Bibl. Choiſ. T. 16. p. 1. Journ. des Scav. T. 46. p. 182. [g] Journ. des Scav. T. 75. p. 537. [h] *Fennel.* in Journ. des Scav. T. 81. See alſo Act. Erud. Lipſ. an. 1728.]

The public *Acts* of France fell into the hands of the Engliſh after the battle of Poitiers, and are commonly ſaid to have been carried by them out of the country. But the tradition is not ſupported by any ſufficient teſtimony, and has even been ſhewn by M. Bruſſel to be falſe. V. Journ. des Scav. T. 84. p. 245. ſeq.

ACTS *of councils*. Theſe differed from canons, in that the latter contained only the reſults, or the laws and regulations agreed on, and drawn up in form; whereas the *Acts* included the preceding debates, motions, &c.

In the firſt collections of councils, only the bare canons were delivered. Afterwards they began to give the *Acts* as well as the canons.

Hence we have two kinds of ſynodical collections: one containing all the *Acts*, or tranſactions relating to matters of faith and doctrine; the other containing only the canons relating to diſcipline, properly called the book of canons. *Hoffman.* Lex. Univ. T. 1. p. 47.

ACTION, (*Cycl.*)—*Phyſical* ACTION, or the ACTION *of bodies* on each other, is a preſſure.

If a body be urged by equal and contrary *Actions* or preſſures, it will remain at reſt. But if one of theſe preſſures be greater than its oppoſite, motion will enſue towards the parts leaſt preſſed.

It is to be obſerved, that the *Actions* of bodies on each other, in a ſpace that is carried uniformly forward, are the ſame as if the ſpace were at reſt; and any powers or motions that act upon all bodies, ſo as to produce equal velocities in them in the ſame, or in parallel right lines, have no effect on their mutual *Actions*, or relative motions. Thus the motion of bodies aboard a ſhip, that is carried ſteadily and uniformly forward, are performed in the ſame manner as if the ſhip was at reſt. The motion of the earth round its axis has no effect on the *Actions* of bodies and agents at its ſurface, but ſo far as it is not uniform and rectilineal. In general, the *Actions* of bodies upon each other depend not on their *abſolute*, but *relative* motion.

Quantity of ACTION, in mechanics, is uſed for the product of the maſs of a body, by its velocity, and by the ſpace it runs through.

When a body is tranſported from one place to another, the *Action* is the greater, in proportion to the maſs, to the velocity, or rapidity of the motion, and to the ſpace through which the body is carried.

Monſ. de Maupertuis [a] lays it down as a general principle, that "whenever any change happens in nature, the quantity of *Action* neceſſary to produce this change is always the leaſt poſſible." And this, he ſays, is a law indicating the higheſt wiſdom.

From this general principle, and the common rule for finding a minimum by fluxions, he deduces the known laws of percuſſion, for hard and elaſtic bodies, and even the laws of reſt, as he calls them; that is, of the equilibrium, or equipollency of preſſures.

This ingenious author ſeems to think, that the laws of motion, thus deduced, afford a ſtronger proof for the exiſtence of God, or of a firſt intelligent cauſe, than the other arguments commonly alledged, and deduced from the order of nature. But we apprehend, that few metaphyſicians will be of his opinion. The proof of a God from the order of nature ſeems to depend on two principles. 1. That there is an order in nature. 2. That this order is contingent. For if this order was not contingent, but abſolutely neceſſary, as Spinoſa, and other atheiſts pretend, it ſeems that no ſufficient reaſon, from the order of nature, could be aſſigned for the exiſtence of a firſt intelligent cauſe. Now, Monſ. de Maupertuis not having eſtabliſhed the contingency of his principle of the minimum of *Action*, his argument ſeems defective in this reſpect; not to mention others.

Mr. Euler [b] has demonſtrated, that in the trajectories deſcribed by bodies urged by central forces, the velocity, multiplied by the element of the curve, is always a minimum. Monſ. Maupertuis [c] looks on this as an application of his principle, to the motion of the planets.—[[a] Mem. de l'Acad. de Berlin, 1746. T. 2. p. 290. [b] Method. Inven. Lin. Curv. Maxim. Minim. Proprietate gaudentes, in Supplem. [c] Lib. cit. p. 267.]

ACTRESS, ACTRIX, a female who *acts*, or does the office of an *Actor*. See ACTOR, *Cycl.*

Actreſſes, or women actors, were unknown to the antients, among whom men always performed the part of women: and hence one reaſon for the uſe of maſks among them. *Boindin.* in Mem. Acad. Inſcript. T. 7. p. 188. ſeq.

Actreſſes are even ſaid not to have been introduced on the Engliſh ſtage, till after the reſtoration of king Charles II. who has been charged with contributing to the corruption of our manners, by importing this uſage from abroad [a]. But this can be but partly true: the queen of James I. acted a part in a paſtoral; and Pryn, in his Hiſtriomaſtix, ſpeaks of women actors in his time as whores; which was one occaſion of the ſevere proſecution brought againſt him for that book [b].—[[a] Apol. du Charact. des Angl. ap. Bibl. Franc. T. 8. p. 27. [b] *Whitlock*, Memor. An. 1632. *Wood*, Athen. Oxon. T. 2. p. 434.]

ACTUARIUS, or ACTARIUS, primarily denotes a notary, or officer appointed to write down the acts or proceedings of a court, aſſembly, or the like. V. *Calv.* Lex. Jur. p. 34. *Aquin.* Lex. Mil. T. 1. p. 15. voc. *Actarii*. *Pitiſc.* Lex. Ant. T. 1. p. 23.

In the eaſtern empire, the *Actuarii* were properly officers who kept the military accounts, received the corn from the *ſuſceptores*, or ſtorekeepers, and diſtributed it to the ſoldiers. Theſe acted as a kind of brokers with the ſoldiers; made bargains with them for receiving their pay before it became due; for which there were fixed rates. *Aquin.* Lex. Mil. T. 1. p. 15. *Pitiſc.* Lex. Ant. T. 1. p. 23. *Du Cang.* Gloſſ. Lat. T. 1. p. 49.

ACTUARIUS was alſo a title of dignity, in the court of Conſtantinople, peculiar to phyſicians. *Du Cang.* Gloſſ. Gr. p. 46. voc. Ακτουαριος.

From an appellative, the word has become a proper name of a celebrated Greek phyſician, author of a treatiſe, ſtill extant, on urines. *Fabric.* Bibl. Græc. l. 6. c. 7. §. 7. T. 12. p. 635. ſeq.

ACUANITES, ACUANITÆ, antient heretics, called more frequently *Manichees*. See MANICHEE, *Cycl.*

They took the name from Acua, a diſciple of Thomas, one of the twelve apoſtles. V. Bibl. Univ. T. 24. p. 330.

ACUBENE, in aſtronomy, a name given by ſome to a ſtar on the ſouthern claw of Cancer. See CANCER, *Cycl.*

ACUHYATLI, in zoology, the name of a very large ſerpent, of a poiſonous quality, in America, more uſually known by its name of *cucuruca*, or *curucuca*. See CUCURUCA.

ACUITION, in grammar and proſody. See the article ACUTITION.

ACULEATE, ACULEATED, ſomething that has *Aculei*, or prickles. See ACULEI.

Naturaliſts divide fiſhes into thoſe with *aculeated* and non-*aculeated* fins. Phil. Tranſ. N°. 204.

ACULEATUS *longus*, in zoology, a name given by ſome to the *pugnitius marinus longus*, a ſmall prickly Weſt-India fiſh. See the article PUGNITIUS. *Willughby*, Hiſt. Piſc. p. 340.

ACULEI, among botaniſts, &c. denotes the prickles or ſpines of plants of the thorny kind.

The word is Latin, formed from *acus*, a needle.

Among zoologiſts, *Aculeus* is alſo uſed for the ſting of a bee, ſcorpion, or the like.

The word *Aculeus* is alſo uſed for certain parts of the *Echini marini*. See Tab. of Foſſils, Claſs 10.

ACULEI *pinnarum*. See the article PINNÆ.

ACULER, in the manege, is uſed for the motion of a horſe, when in working upon volts he does not go far enough forward, at every time or motion, ſo that his ſhoulders embrace or take in too little ground, and his croupe comes too near the center of the volt. Horſes are naturally inclined to this fault, in making demi-volts. *Guillet.*

ACUMEN, ὀξύτης, in the antient muſic, was uſed to ſignify a a ſound produced by the *Intention*, or raiſing of the voice.

Acumen differs from *Intention*, as the effect from the cauſe. Vid. *Ariſtoxen.* p. 10—13. Ed. Meibom.

ACUMINA, among the antients, denoted a kind of military omen, or auſpice, ſuppoſed to have been taken from the points or edges of darts, javelins, ſwords, or other weapons; viz. by examining whether they were bright or ſolid, ſharp or blunted. *Hoffman.* Lex. Univ. T. 1. p. 50. *Aquin.* Lex. Milit. T. 1. p. 16.

Of this opinion are Turnebus [a] and Valtrinus [b]. Cœlius Calcagninus [c] ſuggeſts another hypotheſis, viz. That *Acumina* ſignified ſtars, or flames, mentioned by Seneca, as ſometimes appearing over ſpears and other weapons. Others, with Leſcalopier, ſuppoſe this omen to have been taken from the *Acumina montium*, or tops of mountains; La Cerda, from the *roſtra*, or beaks of ſhips; Gevartius, from military enſigns ſtuck in the ground, according to the degree of eaſe or readineſs wherewith they were pulled out again. A German writer [d] has a diſcourſe expreſs on auſpices, wherein he adopts and defends this laſt opinion.—[[a] *Turneb.* Adverſ. l. 3. c. 12. [b] *I. Valtr.* de Re Milit. l. 1. c. 6. [c] *Calcagn.* Epiſt. [d] *Matth.* Diſp. de Auſp. Vet. Rom. ex Acuminib. ap. Nov. Liter. Lubec. an. 1705. p. 54.]

ACUPUNCTURE, or ACUPUNCTURATION, a method of curing many diſeaſes, by pricking ſeveral parts of the body with a needle, or inſtrument of that form.

This is practiſed every day by the Chineſe and Japaneſe, and other nations in that part of the world. They perform the operation with a large gold, or ſilver needle, which they ſtrike into the ſeveral parts of the body, either with their hand, or with a hammer made on purpoſe. It is extremely ſurprizing that ſo ſevere and deſperate an operation ſhould be practiſed ſo much by a people otherwiſe judicious, and that too in the head and breaſt, as well as in the abdomen, arms, legs, thighs, and many other parts of the body, nay even in the abdomen of women with child, when the fœtus is reſtleſs. *Heiſter*'s Surgery, p. 313.

The operators in the *Acupuncture* are called by a peculiar name, among the Chineſe, *Xinxieu*; among the Japaneſe, *Farriatte*.—In Kempfer, the former name is written *Jenſuſi*, the latter *Faritatte*. Act. Erud. Lipſ. an. 1684. p. 341. *Kempfer*, Amæn. Exot. Faſc. 3. obſ. 2. p. 585.

We ſometimes alſo find mention of an *Acupuncture* practiſed in Europe; but this amounts to no more than the perforating or opening a part, *e. gr.* the cornea, with the point of a needle; which has been done with good ſucceſs, for the cure of an *hydrophthalmia* and *hypopyon*. *Valentin.* in Ephem. Germ. dec. 2. A. 6. p. 159. ſeq.

For the Chineſe operation of *Acupuncture*, the needle is made long, ſharp, ſlender, of gold, or at leaſt ſilver, with a wreathed handle: it is to be conveyed either by the hand, or a little mallet, into the part, gently, a finger's breadth, or more, as the caſe requires, and to be held there the ſpace of thirty breathings, (if the patient can bear it) otherwiſe repeated punctures are rather uſed.

It is chiefly uſed in diſeaſes of the head and lower belly: it is applied to the head, in head-aches, lethargies, convulſions, epilepſies, diſeaſes of the eyes, &c. To the abdomen, in cholics, dyſenteries, want of appetite, hyſterical diſorders, ſurfeits, pains of the belly and joints, obſtructions of the liver and ſpleen, &c.

The ſurgeons keep images, wherein all the places in the body proper for the needle are deſigned by marks. M. Ten Ryne was an eye-witneſs of the uſe of this puncture on a ſoldier, who being afflicted with violent diſorders of the ſtomach, and frequent vomitings at ſea, ſuddenly relieved himſelf, by pricking a thumb's breadth deep into four different places about the region of his pylorus. *Ten Ryn.* Diſſ. de Acupunct. ap. Phil. Tranſ. N°. 148. p. 231. ſeq. *Kempf.* loc. cit.

ACUS, in ichthyography, the name of a long and ſlender ſea fiſh, of which there are two ſpecies, a larger and a ſmaller.

The larger is often a cubit long, and not thicker than a finger. Its ſnout is long, tubular, and not ſlit all the way up, but only open at the end; its eyes are prominent. From the head to the anus it is of an hexagonal figure, and from the anus to the tail it is ſquare. The anus is nearly in the middle of the body, and near it is a long longitudinal fiſſure for the eggs of the female. In all theſe reſpects it very much reſembles the hippocampus. It has two fins at the gills, and another on the back; theſe are all very ſmall, and the laſt, in particular, ſcarce diſcernible, unleſs when the fiſh is alive and in motion. Its tail is a ſmall ſingle fin. It has a hard variegated ſkin, and has ſo little fleſh about it, that it is not regarded as eatable. It is common in the Mediterranean, and is called by the Venetian fiſhermen *Biſcia*, that is, the viper fiſh. Its mouth is of a ſtrange figure, opening upward at the end of the ſnout. See Tab. of Fiſhes, N°. 25. *Rondelet*, de Piſc.

ACUS ſignifies alſo, with other authors, the *Belone* or *Paphix*, called in Engliſh the gar-fiſh, and by ſome the horn-fiſh. The two diſtinct kinds underſtood by this too general term, are diſtinguiſhed by the names of the authors who firſt named them; the tobacco-pipe fiſh, or that with the tubular noſe, being called the *Acus* of Ariſtotle; and the gar-fiſh, or that with the horizontal open mouth, the *Acus* of Oppian.

This laſt is in ſhape ſomewhat like the former, being very long and ſlender, with a round back, and a flat belly. Its noſe or ſnout is very long, pointed and ſharp, and its head flat. The back is of a greeniſh colour, and the ſides and belly of a ſilvery white. The head is of a bluiſh green, and there is an obſcurely purple dotted line, which runs all along the back. The under jaw is longer than the upper, and both are thick ſet with ſharp teeth. It has only one back fin, and its tail is forked. *Willughby*, Hiſt. Piſc. p. 231.

Bellonius has deſcribed another ſpecies of this fiſh, which is ſcaly, and has broader teeth, and is conſiderably larger than the common one, which either has no ſcales, or extremely minute ones. Its dotted line on the back is ſaid by ſome to be a ſingle row of ſcales; and theſe authors affirm, that the fiſh has no other. *Rondelet*, de Piſc. p. 26. See the article LACERTUS.

ACUS is alſo uſed by ſome authors for the *ammodytes*, or ſand-eel; a ſmall eel caught in the ſands. *Willughby*, Hiſt. Piſc. p. 113. See AMMODYTES.

ACUTE, (*Cycl.*)—*Acute-angled cone*, in geometry, is a right cone, the ſection of which, through its axis, is an *acute*-angled triangle.

ACUTELLA, in botany, a name uſed by ſome to expreſs the common *anonis*, or reſt-harrow, a ſmall prickly plant, with red or white flowers, and famous for its ſpreading and tough roots. *Ger.* Emac. Ind. 2.

ACUTITION, or ACUITION, in a general ſenſe, the ſame with acuating or ſharpening.

ACUTITION, in grammar, denotes the pronouncing, or marking a ſyllable with an acute accent. See ACUTE and ACCENT, *Cycl.*

The *Acuition*, ſays Gaza, is where the ſound is higheſt in the pronunciation of a word. — Short ſyllables are oftener acuted than long ones. V. *Gaz.* Gram. Inſtit. p. 64.

Manwaring cries out againſt the error of the moderns, in pronouncing acuted ſyllables in the Greek as long, when they are naturally ſhort. *Manwar.* Stichol. c. 14. p. 55.

ACUTITION, or *Acuition*, in medicine and chemiſtry, is uſed for ſharpening, or increaſing the force of any medicine. *Caſtel.* Lex. voc. *Acuitio.*

ACUTENESS, (*Cycl.*)—The cauſe or principle of the *Acuteneſs* of ſounds, is reſolved into the greater degree of tenſion of the ſonorous body; by virtue of which, its parts vibrate more ſwiftly, or make a greater number of returns in the ſame time. But this is not the only principle, ſounds being alſo more or leſs *acute*, according to the ſpecies of matter, and the leſs or greater quantity of it. Thus a ſilver body yields a more *acute* ſound than a gold one: one ſolid foot, than two; a ſhorter ſtring gives a more *acute* ſound than one that is longer, of the ſame matter, diameter, and tenſion. V. *Holder*, on Harmon. c. 2. p. 6. and c. 4. p. 56. ſeq. Jour. des Scav. T. 35. p. 549. *Hobb.* Elem. de Corp. c. 29. p. 279. ſeq. *Malcolm.* Muſic. c. 1. ſec. 1. §. 3. p. 16. ſeq. Ib. c. 14. ſec. 4. §. 1. p. 500. Id. c. 2. §. 1. p. 34. and c. 2. p. 44. See CHORD.

ACUTIATOR, in writers of the barbarous age, denotes a perſon that whets, or grinds cutting inſtruments; called alſo in antient gloſſaries, *Acutor*, Ακονιτης; *Samiarius*, *Coharius*, &c. *Du Cang.* Gloſſ. Lat. T. 1. p. 51.

In the antient armies there were *Acutiatores*, a kind of ſmiths retained for wetting or keeping the arms ſharp. *Aquin.* Lex. Mil. T. 1. p. 16.

ACYROLOGIA, denotes an improper acceptation, or expreſſion, wherein a word or phraſe is uſed in ſome unuſual or oblique ſenſe, hardly reducible to the rules of language.

The word is Greek, ακυρολογια, compounded of ακυρος, improper, and λογος, *ſermo*.

Such *e. gr.* is the word *ſpero* ſometimes uſed in Roman writers for *timeo*.

The *Acyrologia* bears a near affinity to the *Catachreſis*, inſomuch that divers terms and expreſſions, alledged as inſtances of the latter, are by others brought as examples of the former.

AD *beſtias*, in antiquity, is underſtood of a kind of puniſhment of criminals, condemned to be thrown to wild beaſts. Vid. *Kenn.* Rom. Ant. P. 2. c. 3. l. 20. p. 147. *Calv.* Lex. Jur. p. 36.

The term was alſo applied to a ſort of gladiators hired to fight with wild beaſts.

Theſe were otherwiſe called *beſtiarii*. *Calv.* loc. cit.

AD *extra*, a term uſed among ſchool divines, in ſpeaking of the eternal operations of the Godhead.

Acts or operations *ad extra*, are properly thoſe whoſe term or effect is not within the divine eſſence; by which they ſtand oppoſed to operations *ad intra*. Creation, preſervation, regeneration, converſion, renovation, &c. are actions of God *ad extra*. *Hebenſtr.* Metaph. P. 3. ſec. 2. c. 4 p. 703.

AD *intra*, among ſchool divines, is underſtood of thoſe acts of the divine being, whoſe term and effect is within his own eſſence.

In which ſenſe, acts or operations *ad intra*, ſtand oppoſed to thoſe *ad extra*.

AD *hominem*, among logicians, is underſtood of a kind of argument drawn from the belief or principles of thoſe we argue with, and which of conſequence muſt be concluſive to them, though otherwiſe diſbelieved by us; or, it is where a diſputant quits his own language and ſyſtem, and borrows that of his opponent, to convince him by turning his own prejudices or errors againſt himſelf. See ARGUMENT.

This the ſchoolmen call *argumentum ad hominem*, or Καθ' ανθρωπον. Bayle [a] made great uſe of the *argument ad hominem*. Sextus Empiricus argues *ad hominem*, from the popular opinions, to overthrow the popular ſyſtem [b].

The apoſtles themſelves appear to have argued *ad hominem* againſt the Jews, from methods of interpretation practiſed by them, and texts which they underſtood as ſpoken of the Meſſia, though in reality they were ſpoken of others [c]. This is what divines call the method or ſyſtem of accommodation. —[a Vid. Bibl. Choiſ. T. 12. p. 255. b Bibl. Anc. Mod. T. 14. p. 32. & 92. c Bibl. Choiſ. T. 27. p. 410. It. T. 23. p. 433. Nouv. Rep. Lett. T. 18. p. 524.] See ACCOMMODATION and ACCOMPLISHMENT.

AD *libitum*, is ſometimes uſed in muſic, for, *ſe piace*, at diſcretion. *Broſſ.* Dict. Muſ. p. 8.

AD *ludos*, in antiquity, a Roman ſentence, whereby criminals were condemned to entertain the people, either by fighting with beaſts, or with each other, and thus executing juſtice on themſelves. *Ken.* Rom. Ant. P. 2. l. 3. c. 10. p. 147. See GLADIATOR, *Cycl.*

AD *metalla*, in antiquity, the puniſhment of being doomed to work in the mines. *Ken.* Rom. Ant. P. 2. l. 3. c. 20. p. 147.

Criminals

Criminals condemned to this, were called *Metallici*. Leg. 10. Dig. de Pœnis.

AD *quiddities*, among ſchoolmen, include the relations, analogies, agreements, diſagreements, ſimilitudes, diſſimilitudes of things. See QUIDDITY, *Cycl.*

Ad quiddities are properly thoſe attributes of things, which anſwer to the queſtion, *ad quid?* to what? By which they differ from mere *Quiddities*, which anſwer to the queſtion, *quid ſit?* What is it? The latter inquire what things are in themſelves; the former what they are, *ad alia*. V. *Herb.* de Verit. p. 233.

AD *valorem*, is uſed in ſpeaking of the duties, or cuſtoms, paid by certain commodities; ſome things are rated by the weight, meaſure, tale, or the like; others pay *ad valorem*, according to their value, or worth ſworn to by the owner.

The duties *ad valorem*, formerly payable on books imported, ceaſed in 1723. Inſtead of which a duty of fourteen ſhillings *per* hundred weight on bound, and ſeven ſhillings on unbound books was impoſed. Stat. 9. *Georg.* 1. c. 19.

ADAGIO, (*Cycl.*)—Sometimes this word is repeated, as *Adagio, Adagio*, to denote a ſtill greater retardation in the time of the muſic. *Broſſ.* Dict. Muſ. p. 8.

The word literally imports ſoftly, leiſurely. Vocab. de la Cruſc. T. 2. p. 28.

ADAMANT, ADAMAS, (*Cycl.*)—*Adamas* is uſed in ſome antient naturaliſts, for the ſpume or ſcoria of gold; which is caſt away, as not being malleable. *Salmaſ.* Not. ad Solin.

This is particularly called, χρυσου αδαμας, and is miſtaken by Pliny, for the gemm of that name. Id. ibid. p. 1084.

ADAMANT is alſo uſed for a ſpecies of iron, denoting the hardeſt, or higheſt tempered part thereof. *Salmaſ.* Exerc. ad Solin. p. 1081. ſeq. 1084. and 1089.

This is ſometimes called the *adamantine* part of iron. *Salmaſ.* ibid.

Mr. Boyle more particularly gives the denomination, *Adamas lucidus*, to a diamond in his poſſeſſion, which had the faculty of ſhining in the dark; a property ſince diſcovered in many others, at leaſt when excited by friction. V. *Boyl.* Phil. Work. Abr. T. 1. p. 494. It. T. 3. p. 155.

ADAMANT is ſometimes alſo uſed for the magnet, or loadſtone. See MAGNET, *Cycl.* and *Suppl.*

In which ſenſe Skinner thinks it may be beſt derived from the French *Aimant*, which ſignifies the ſame. *Skinn.* Etym. in Voc.

ADAMANTII, in church hiſtory, a name given by ſome chriſtian hiſtorians to the followers of Origin [a], ſurnamed *Adamantius*, according to ſome; or rather, as Heuman ſays [b], whoſe name was *Adamantius*. In effect, we find ſeveral other *Adamantii*; a ſophiſt *Adamantius* [c], a martyr *Adamantius* [d], &c. —[a *Sagittar.* Introd. ad Hiſt. Eccleſ. T. 1. c. 31. Sec. 58. p. 1113. [b] *Heuman.* Via ad Hiſt. Liter. c. 4. §. 17. Not. p. 77. [c] *Fabric.* Bibl. Græc. T. 2. l. 3. c. 6. p. 171. [d] *Lipſ.* Var. Lect. c. 28. p. 884.]

ADAMI *Pomum*, (*Cycl*) The name Adam's apple, is given to a kind of fruit frequent in Italy, reſembling a lemon, ſaid to be a good remedy againſt the itch. Dict. Ruſt. T. 1. in Voc.

ADAMIC *earth*, *Terra Adamica*, is a name ſome have given to common clay; called alſo *terra Zoica*, *rubella* and *lutum. Woodw.* Meth. Foſſ. p. 4.

The occaſion of the name we ſuppoſe to be, that this is taken for the *Adamah*, or ruddy earth, of which the firſt man was formed. V. Act. Erud. Lipſ. an. 1703. p. 39.

Kunkel gives the name, *terra adamica*, to the earth, or mud, which ſettles to the bottom of water putrified on the land, and which it is ſaid, is capable of growing to ſuch a degree of hardneſs and ſolidity, as to equal the weight of ſome metals, and conſtitute ſtone, &c. This he ſuppoſes to be the univerſal principle of which all things were made. V. Mem. de Trev. an. 1724. p. 205. ſeq.

ADAMITES, (*Cycl.*) in church hiſtory, a name given by ſome writers to the firſt patriarchs, the ſons or deſcendants of Adam by Seth. In which ſenſe *Adamites* amount to the ſame with *Sethites*, and ſtand diſtinguiſhed from *Cainites*. There are divers traditions concerning the quarrels, wars, &c. between the *Adamites* and the *Cainites*. V. Obſerv. Halens. T. 10. Obſerv. 11. §. 26. p. 301. ſeq.

Some perſons, from a paſſage in St. Paul, have ſtarted an opinion concerning men before Adam, under the denomination of Preadamites. *Rom.* c. 5. v. 13. ſeq. See PREADAMITE, *Cycl.*

As to the ſect of the *Adamites*, mentioned in the Cyclopœdia, it is to be obſerved, that the Romaniſts and reformed have branded each other with having *Adamites* among them. Moreri affirms that there are *Adamites* in England, where they hold meetings in the night, and that their great principle is *jura, perjura, ſecretum prodere noli*, for which he has been cenſured by ſome of his own country-men. *Sorbier.* p. 17. V. *Micrel.* Hiſt. Eccleſ. l. 3. ſec. 1. §. 6. p. 883.

Furetiere ſpeaks of *Adamites* in Germany, for which he is cenſured by Le Clerc. *Bibl.* Choiſ. T. 16. p. 124. ſeq.

On the other hand, Danæus [a] affirms, that there are *Adamites* ſtill exiſting in Italy, who go naked by vow, in conſequence of the rules of their order; for which he is cenſured by Bayle [b]. —[a In *Auguſt.* de Heræſ. c. 31. [b] *Bayl.* Dict. Crit. T. 1. in Voc.]

The Lumbard *Adamites* appeared in the XII[th] century, headed by Tandemius of Antwerp; but they do not appear to deſerve the name of a religious ſect, for that they are ſaid to have been a troop of military men, who raviſhed all the women they met with. They were otherwiſe called Langobardi. *Baron.* ad Ann. 1126. p. 12. *Pfaff.* Inſt. Hiſt. Eccleſ. Sæc. XII. c. 3. §. 1. p. 565.

The *Adamites* of Bohemia, commonly ſaid to have ariſen in the XV[th] century, are the ſame ſort which is otherwiſe called the *Fratres Bohemi*, and at other times, *Picards*, and *Waldenſes*.

A late ingenious writer, has ſhewn that the *Adamitiſm*, i. e. the nakedneſs of theſe people is a mere calumny, forged by their adverſaries, the Calixtines and papiſts, at the time when the Vaudois firſt ſhewed themſelves in that country [b]. —[a *Beauſobre*, Diſſ. ſur les Adamites de Boheme, ap. Bibl. Germ. T. 4. p. 118. It. T. 19. p. 73. [b] For further particulars concerning this ſect, See *Pfaff.* Hiſt. Eccleſ. Sæc. XV. c. 3. §. 2. p. 732. Ouvres des Sav. Aout, 1689. p. 511. Jour. des Scav. T. 35. p. 573. *Bayl.* Dict. Crit. Voc. *Picard* in Not. (*B*). *Arnd.* Lex. Eccleſ. p. 495. *Budd.* Iſag. ad Theolog. l. 2. c. 7. p. 1173.

ADAR, in the Hebrew chronology, the twelfth month of their eccleſiaſtical year, and the ſixth of their civil year. It contains only nine and twenty days, and anſwers to our *February*, and ſometimes enters into the month of *March*, according to the courſe of the moon. *Calmet* Dict. in Voc.

ADARCE, in the materia medica of the antients, a ſaltiſh humor concreting about the ſtalks of reeds, and other vegetable matter, in form of incruſtations. V. *Gorr.* Def. Med. p. 5. *Hardouin.* Not. ad *Plin.* l. 32. c. 9. *Caſtell.* Lex. Med. in Voc.

The word is alſo written, *Adarca*, *Adarcion*, *Adarcus*, Αδαρκη, Αδαρκιον, Αδαρκις. *Adarce* is ſometimes alſo called *Pericalamitum* and *Calamochium* [a], ſometimes λιμνησις, or λιμνιλις, or λιμνητρον, from the lakes and marſhes, where it is found; Hippocrates ſeems to call it οχομενιον, on account of the plenty in which it grew in the lake of that name [b]. In latter times, it is ſuppoſed to be known by the name *Balla marinum* [c].—[a *Caſtel.* Lex. Med. in Voc. *Adarce.* [b] *Salmaſ.* Exerc. ad Solin. p. 1301. *Martin.* Lex. Philoſ. T. 1. p. 12. [c] *Caſtel.* l. c.]

The antients ſpeak of *Adarce*, as chiefly produced in Cappadocia and Galatia, tho' we alſo read of it in Italy; and of a native kind produced in Indian reeds, much as ſugar in the cane.

The antients tempered the *Adarce* with other matters, and thus applied it externally, as a detergent and reſolver, againſt divers cutaneous foulneſſes, alſo for the teeth [d].

We alſo read of *Adarce*, growing out of the ſpume of freſh water [e].

Dr. Plot obſerved the freſh water *Adarce*, both in Oxfordſhire and Staffordſhire. [f].—[d V. *Dioſcor.* l. 5. c. 137. *Caſt.* Lex. Med. p. 15. [e] *Rulland.* Lex. Alchem. p. 6. [f] *Plot*, Nat. Hiſt. Oxfordſhire, c. 5. §. 141. Id. Staffordſhire, c. 5. §. 28.]

Tho' ſome have ſuppoſed the incruſtations, often ſeen about our ſprings, to be the ſame with the *Adarce* of the Greek phyſicians; this ſeems a miſtake, as theſe incruſtations poſſeſs none of the virtues, or properties of that ſubſtance; it being principally compoſed of ſea-ſalt, of which thoſe contain no particle, being merely a mixture of earth and ſpar. See SPAR.

ADARCON, *Adarconim*, an antient coin, mentioned in ſcripture, uſually of gold.

Adarcon, is the ſame with what is otherwiſe called *Darchmon*, both words being derived, as ſome think, from thoſe gold pieces coined by Darius, called Δαρεικοι; others ſuppoſe the word a corruption of the Greek δραχμη: the Septuagint renders it by δραχμη, the Latin tranſlation by ten thouſand, and the Engliſh, by drachm. 1 Chron. c. xxix. v. 7. Ezra c. iii. v. 27. Nehem. c. vii. v. 69, 70.

Hoſtus makes the *Adarcon* only equal to the Attic drachma; but biſhop Cumberland, after the ſcholiaſts of Ariſtophanes and Harpocration, twice as much. V. *Hoſt.* Hiſt. Rei. Numar. c. 4. p. 305. Eſſ. on Jew. Meaſ. &c. c. 4. p. 112. ſeq. See alſo *Calmet.* Dict. T. 1. p. 44. ſeq.

ADARME, in commerce, a ſmall Spaniſh weight uſed through their American provinces, equal to the ſixteenth part of an ounce. *Savar.* Dict. Com. T. 1. p. 22.

Stephens renders it in Engliſh by a dram. *Steph.* Span. Dict. in voc.

ADARTICULATION, in ſome phyſicians, is uſed for αρθρωδια; in others, for διαρθρωσις. *Caſt.* Lex. Med. p. 15. See ARTHRODIA, and DIARTHROSIS, *Cycl.*

ADCHER, in the materia medica, a name given by Avicenna and Serapion, to the Scænanthe, or camel's hay. This ſeems to have been at that time, the common Arabian name of this drug; but Garcias tells us, that in his time the Arabs called it *Adher*. The Greeks, who have borrowed the Arabick names for medicines, confirm the original word, being as we have it in Aviſenna, they all writing it *Adcher*, or *Edcher*. The Lexicon Saracenicum, has the word *Eletcher*, for the name of Scænanth: this, and the word *Aladcher*, and the word *Azcher*, being all uſed at times, as names of the

the ſame plant ſcænanth. It is to be obſerved, however, that the Arabians have not confined this word to the ſcænanth alone, but expreſs by it all the kinds of ruſhes. Thus,

Aviſenna tells us, that the *Adcher* is of two kinds, the one bearing no fruit, the other bearing a hard black fruit; this plainly belongs not to the ſcænanth, but the common ruſh, of which Dioſcorides has, in the ſame manner, deſcribed two kinds, thus differing from one another. What he adds afterwards, of chuſing by the ſmell and colour, is to be underſtood of the Arabian ruſh, or ſcænanth; and thus are Aviſenna and the reſt to be explained; the words ſchænos and *Adcher* ſignifying both the ſame thing, that is ruſh in general; and the epithet of ſweet-ſcentedneſs, and virtues as an aromatick, alone diſtinguiſhing that ruſh called ſcænanth, from the other common ruſhes. *Aviſenna.*

ADCORDABILES *denarii*, in antient law books, denote money paid by the vaſſal to his Lord, in the nature of a fine, upon the ſelling or exchanging of a feud. *Du Cang.* Gloſſ. Lat. T. 1. p. 54.

The word is formed from the French *accorder*, to agree.

ADCRESCENTES, in the Roman empire, denoted a kind of junior ſoldiery, or candidates of arms, entered in the army, but not yet put on duty; being to ſerve as a reſerve, to ſupply the places of ſuch as ſhould be loſt.

They were thus called from the verb *adcreſcere*, by reaſon of their growing up gradually to the legitimate rank; or becauſe the military bodies were increaſed, and recruited by the acceſſion of theſe. Cod. *Theod.* de Re Milit. Leg. 11. &, *de Tyron.* Leg. 6. ſeq. *Du Cang.* Gloſſ. Lat. T. 1. p. 54.

The *Adcreſcentes* are alſo called by Byzantine writers, *ſcholares*; by the purer Roman writers, *accenſi*, and *ſupplementa militum*; by Greek writers, σχολαζωλες. *Aquin.* Lex. Mil. T. 1. p. 17. See ACCENSI.

ADDACE, in natural hiſtory, the name by which the Africans call the common Antelope. *Ray*, Syn. Quad. p. 79. See the article GAZELLA.

ADDEPHAGIA, in medicine, a term uſed by ſome phyſicians, to denote a greedineſs in children, whereby they cram down new food, ere the old is digeſted. This is ſometimes alſo written corruptly, *Adephagia*. *Suid.* Lex. T. 1. p. 51. *Blanc.* Lex. Med. p. 12.

The word is compounded of the Greek, αδδη, *largiter*, much, and φαγω, *comedo*, I eat.

The Sicilians deified gluttony, worſhiping it as a goddeſs under the name *Addephagia*. *Ælian.* Var. Hiſt. l. 1. c. 27. *Rhodig.* l. 7. c. 11.

Some uſe *Addephagia* in a more extenſive ſenſe, for voraciouſneſs in the general, ſo as to comprehend the *bulimia*, *pica*, and *malacia*. V. *Junck.* Conſpect. Medic. Tab. 92. p. 603. Id. Tab. 93. p. 603.

Others ſeem to limit it to childrens immoderate eating of bread; the chief cauſe, as ſome alledge, of the worms. *Caſtell.* Lex. in Voc.

ADDER, in natural hiſtory, a venemous reptile of the ſerpent kind, more uſually called a *Viper*. See VIPER, *Cycl.*

ADDER is alſo ſometimes confounded with *Aſp*, Ασπις; thus the deaf *Adder*, ſpoken of in the Engliſh bible, is not properly the *Adder*, but the *Aſp*. V. *Calmet*, Dict. T. 1. voc. *Aſp.*

The *Adder* differs from the ſnake, in that the former is much ſhorter for its bigneſs, eſpecially his tail below the vent; that it is marked on the back, with black lines or ſpots, which the ſnake wants; that its belly is blackiſh, and of one colour, whereas the ſnake's is particoloured, of a pale yellow and blue; that it never grows to the bigneſs which ſome ſnakes attain to; and laſtly, that it is viviparous, whereas the ſnake is oviparous.

ADDER'S-TONGUE, in botany, a medicinal plant, ſo called, either from its reſembling or its curing the bite of a viper. *Cole*'s Acct. of Simpl. c. 27. p. 88.

Phyſicians more uſually call it *Ophioglosſum*, and reckon it a vulnerary, both internally and externally uſed. *Quinc.* Diſp. 12th. Edit. p. 117. See OPHIOGLOSSUM.

Farriers, &c. prepare an ointment of this herb, called *Adder's-tongue ointment*, uſed as a remedy againſt the bites of venomous beaſts. V. Dict. Ruſtic. T. 1. in voc.

Adder's-tongue, is applied by country people to cattle, when ſtung or bitten with any kind of venomous reptiles; as adders, ſcorpions, or by an hedge-hog, ſhrove or ſhrew, or the like. Dict. Ruſtic. in voc.

ADDEXTRATORES, or ADDEXTRARII, in the court of Rome, denote the popes mitre-bearers. *Schmid.* Lex. Eccleſ. p. 16. See MITRE, *Cycl.*

Some ſuppoſe them thus called, from *ad*, to, and *dextra*, right-hand, on account of their walking at the pope's right-hand, when he rides to viſit the churches. V. *Du Cange*, Gloſſ. Lat. T. 1. p. 55.

ADDICTI, in antiquity, inſolvent perſons, or thoſe who being ſentenced to pay a debt, but unable to do it, were adjudged to a kind of temporary ſervitude to the creditor.

In this ſenſe *Addicti* were a ſpecies of ſlaves, or *ſervi*; from whom, however, they differed in this, that a ſlave when diſcharged, became a *libertus*; whereas, an *Addictus* became *ingenuus*. Again, a ſlave could not be diſcharged without conſent of his maſter; whereas the *Addictus* was diſcharged of courſe, when his debt was ſatisfied. V. *Briſſ.* de Verbor. Signif. p. 11. *Pitiſc.* Lex. Antiq. T. 1. p. 15. *Calv.* Lex. Jur. p. 36.

ADDITION, (*Cycl.*)—ADDITION *of Ratios*, is uſed by ſome authors in the ſame ſenſe, as compoſition of ratios. See COMPOSITION and RATIO.

ADDITION, in muſic.—The note or mark of *Addition*, is a dot placed on the right ſide of a note, to ſignify, that the time of the ſound of ſuch note, is to be lengthened half as much more, as it would otherwiſe be.

A note of *Addition*, amounts to the ſame, with what is by ſome old Engliſh authors, called *prick of perfection*. *Playf.* Introd. Muſ. c. 2.

Thus a ſemibreve, when marked with a dot, is to be as long as three minims; the minim with a like dot, to be as long as three crotchets; the crotchet, as three quavers, &c. See CHARACTER, *Cycl.*

ADDITIONS, in heraldry, denote a kind of bearings, in coats of arms, wherein are placed rewards, or additional marks of honour.

In which ſenſe, *Additions* ſtand oppoſed to *abatements*, or *diminutions*. See ABATEMENT, DIMINUTION, and DIFFERENCE, *Cycl.*

Additions reſemble, but differ from, ordinaries. To the claſs of *Additions* belong a bordure, quarter, canton, gyron, pile, flaſques, hanches, voiders, ermine, and an eſcutcheon, gules, called alſo an *eſcutcheon of pretence*. On any of theſe may an *Addition* of honour be placed according to the pleaſure of the prince, or the fancy of the herald, which reward deſcends to none of the family, except the perſon's own direct line. In this manner, the arms of a kingdom have been ſometimes given, by way of *Addition*, to a private ſubject. *Carter.* Anal. of Hon. p. 107.

ADDITIONS, in diſtilling, a name given to ſuch things as are added to the waſh, or liquor, while in a ſtate of fermentation, in order to improve the vinoſity of the ſpirit, procure a larger quantity of it, or give it a particular flavour.

All things of whatever kind, thus added in the time of fermentation, are called by thoſe of the buſineſs, who ſpeak moſt intelligently, *Additions*; but many confound them with things of a very different nature, under the name of ferments. See FERMENT.

The *Additions* uſed in the diſtillery, may be reduced to four general heads. 1. Salts, 2. Acids, 3. Aromaticks, and 4. Oils. A little tartar, nitre, or common ſalt finely powdered, may be added to the liquor while fermenting, eſpecially in the beginning of the operation; or in their ſtead, a little of the vegetable, or finer mineral acids, may be dropped in at different times when found neceſſary. Theſe are of great uſe, eſpecially, in the fermenting ſolutions of treacle, honey, and the like ſweet and rich vegetable juices, which either wholly want an acid in themſelves, or have it in too ſmall a proportion, or have been robbed or diveſted of it. The proper acids for this purpoſe are, the juice of Seville oranges, or lemons, or the ſpirit of ſulphur, or Glauber's ſpirit of ſalt, or, what is greatly preferable to all theſe, a particular aqueous ſolution of tartar, a ſuccedaneum for which may be tamarinds, or the robs of ſome very acid fruits, or the *media ſubſtantia vini*. On this foundation ſtands that ingenious practice of uſing a ſuitable proportion of the ſtill bottoms, or the remaining waſh, in the ſubſequent brewing.

Theſe *Additions* are manifeſtly deſigned to give a vinous acidity, or to improve that naturally afforded by the ſubject, without any expectation of conſiderably encreaſing the quantity of the ſpirit. This laſt is the more immediate intent in the mixtures of aromaticks and oils, at the ſame time that they give, alter, and improve the flavour. *Shaw*'s Eſſay on Diſtillery.

All the pungent aromaticks have a ſurpriſing property of encreaſing the quantity of ſpirit; but their uſe requires a cloſe or compreſſed fermentation, and if the quantity intended be large, that the *Addition* be not made all at once, leſt the oilineſs of the ingredients ſhould hinder the operation. If the flavour be the only thing required from them, then they ſhould not be put in, till toward the end of the fermentation.

After the ſame manner, a very conſiderable quantity of any eſſential vegetable oil, may by proper management be converted into a ſurpriſingly large quantity of inflammable ſpirit; but great care in this caſe muſt be had not to drop it in too faſt, nor too much at a time; this might damp the fermentation: and indeed, the adding a large quantity of oil at once, is the common way of ſtopping the fermentation at any point required.

The beſt method of all others, of introducing the oil, ſo as to avoid all inconvenience, is to reduce it firſt to an eloeoſaccharum, by grinding it in a mortar, with a due quantity of fine ſugar in powder. The oil thus added with its particles diſunited, and in form of powder, will readily mix with the liquor, and immediately ferment with it.

A large proportion of rectified ſpirit, or of any other ſpirit, may, by prudent management, be alſo introduced into the fermenting liquor; and this will always come back with a large *Addition* to the quantity of ſpirit, that would otherwiſe have ariſen from the diſtillation. *Shaw*'s Eſſay on Diſtillery.

ADDITIVE, denotes ſomething to be added to another.

Geometricians ſpeak of *additive ratio's*; aſtronomers of *additive equations*, &c.

ADDITIVE *ratio* is uſed by ſome writers, for that whoſe terms are diſpoſed to addition, that is, to compoſition, in oppoſition to *ſubſtractive ratio*, whoſe terms are diſpoſed to ſubſtraction, *i. e.* to diviſion. Vid. *Hug. de Omeriq.* Anal. Geomet. P. 1. diſ. 1. in Philoſ. Tranſ. N°. 257. p. 352.

Suppoſe the line *a c* divided in the points *b* and *x*,

a *b* *x* *c*

the ratio between *a b* and *b x* is *additive*; becauſe the terms *a b* and *b x* compoſe the whole *a x*. But the ratio between *a x* and *b x* is ſubſtractive, becauſe *a x* and *b x* differ by the line *a b*.

ADDITIVE *equations*, in aſtronomy, thoſe which are to be added to the ſun's mean anomaly, in order to find the true one. V. Hiſt. Acad. Roy. des Scienc. 1720. p. 118. See EQUATION, ANOMALY, &c. *Cycl.*

ADDUCTOR, (*Cycl.*)—ADDUCTORS, in anatomy, thoſe otherwiſe called *adducent* muſcles. See ADDUCENT, *Cycl.*

The *Adductor* muſcle of the arm ſerves to approach it towards the trunk of the body; though Winſlow finds its office more complicated, and that it acts in concurrence with the flexors and extenſors, in the bending and extending the arm.

ADDUCTOR *pollicis*, in anatomy, a name given by Cowper, and ſome others, to a muſcle, called more properly by Albinus, and the generality of writers, the *Abductor indicis*; and by Winſlow, the *ſemi-interoſſeus indicis*.

ADDUCTOR *proſtatæ*, a name given by Santorini to a muſcle, which he alſo calls *levator proſtatæ*; and which Winſlow calls *proſtaticus ſuperior*. Albinus, from its office, has very properly called it *compreſſor proſtatæ*.

ADEB, in commerce, the name of a large Egyptian weight, uſed principally for rice, and conſiſting of two hundred and ten okes, each of three rotolos, a weight of about two drams leſs than the Engliſh pound. But this is no certain weight; for at Roſetto the *Adeb* is only one hundred and fifty okes. *Pocock*'s Egypt. p. 175.

ADEL *fiſh*, a name given by ſome nations to the *lavaretus*, or *albula nobilis*.

Theſe are generally treated of by authors as two different kinds of fiſh. But Artedi contends, that they are the ſame ſpecies, and diſtinguiſhes them by the name of the *coregonus*, with the upper jaw flat, and longer than the under; and with fourteen rays in the back fin.

ADELPHIANI, in church-hiſtory, a ſect of antient heretics, ſo called from their leader *Adelphius*.

They were ſingular in this, that they kept the ſabbath as a faſt. V. *Bingh.* Orig. Eccleſ. l. 20. c. 3. §. 5. *Opp.* T. 2. p. 300.

Many idle and extravagant opinions are attributed to them, with what juſtice may be hard to ſay. V. *Arnd.* Lex. Ant. Eccleſ. p. 475. *Budd.* Iſag. Theol. l. 2. c. 7. p. 1058. *Prateol.* Elench. Heret. p. 7.

ADELSCALC, in antient cuſtoms, denotes a ſervant of the king. *Du Cang.* Gloſſ. Lat. T. 1. p. 55.

The word is alſo written *Adelſcalche*, and *Adelſcalcus*. It is compounded of the German *Adel*, or *Edel*, noble, and *Scalc*, ſervant.

Among the Bavarians, *Adelſcalcs* appear to have been the ſame with royal *thanes* among the Saxons, and thoſe called *miniſtri regis* in antient charters. V. *Spelm.* Gloſſ. p. 10.

ADENANTHERA, in botany, the name of a genus of plants, the characters of which are theſe. The perianthium is very ſmall, and is compoſed only of one leaf divided into five ſegments at the edge. The flower conſiſts of five leaves, and is of a campanulated form. The petals are pointed and ſeſſile, and they turn inwards, and are hollowed underneath. The ſtamina are ten erect tubulated filaments, a little ſhorter than the flower; and the anthoræ are roundiſh and incumbent, and bear on their exterior apex a globoſe glandule. The germen of the piſtil is oblong and gibbous on the back in the lower part. The ſtyle is tubulated, and of the length of the ſtamina, and the ſtigma is ſimple. The fruit is a long compreſſed pod, in which are ſeveral round ſeeds. *Linnæi*, Gen. Plant. p. 183. Hort. Malab. Vol. 6. 14. *Royen.* Hort. Lugd. Bat. p. 462.

ADENOGRAPHY, that branch of anatomy which deſcribes the glands, and glandular parts of the body.

The word is compounded of the Greek, αδην, gland, and γραφω, *ſcribo*, I deſcribe.

Adenography is the ſame with what ſome others call *Adenology*, or the adenological part of anatomy. V. *Douglas*, Myogr. Comp. p. 212.

Nuck [a] and Wharton [b] have written expreſly on the *Adenographia*.—[[a] Adenographia Curioſa, & Uteri Feminei Anatome nova, Lugd. Bat. 1692. 8vo. an extract of which is given in Act. Erud. Lipſ. 1692. p. 97. [b] Adenographia, ſeu Deſcriptio Glandularum totius Corporis, Lond. 1656. 8vo. Amſt. 1659. See its character and eulogy in Wood, Athen. Oxon. T. 2. p. 522.]

ADENOSUS *abſceſſus*, in medicine, a crude hard tubercle, difficult of diſcuſſion, and reſembling the appearance of a gland. *Caſt.* Lex. Med.

ADERAIMIN. See ALDERAIMIN.

ADFILIATION, ADFILIATIO, is uſed to ſignify a Gothic cuſtom; where a perſon remarrying, who has children by a former bed, renders them capable of inheriting equally with the common children of both the parties.

This is done by agreement, and is otherwiſe called, by ſome, *adoptio per matrimonium*. *Kulpis.* ap. Journ. des Scav. T. 34. p. 325.

This cuſtom is ſtill retained in Germany, under the name *Einkindſchafft*, and *unio prolium*.

But the learned Heineccius obſerves, that the *unio prolium* is not an adoption. V. *Heinec.* Elem. Juris Germ. T. 1. §. 161.

ADHATODA, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the perſonated kind, conſiſting of one leaf, and is divided into two lips, the upper of which is crooked, or bent upwards and backwards, the lower is divided into three parts. The piſtil riſes from the cup of the flower, and is fixed into the lower part of the flower, in the manner of a nail; this afterwards becomes a club-faſhioned fruit, or capſule of a flatted form, divided into two cells, and containing a number of ſmall compreſſed and heart-faſhioned ſeeds. See Tab. 1. of Botany, Claſs 3.

The ſpecies of *Adhatoda*, enumerated by Mr. Tournefort, are theſe. 1. The Ceyloneſe *Adhatoda*. 2. The ſmaller flowered *Adhatoda*, called by the people of Malabar, *Bem-curini*. 3. The *Adhatoda* with the upper lip of the flower extremely narrow, and bent upwards and backwards: this is called, by the people of Malabar, *Carim-curini*. 4. The herbaceous *Adhatoda*, with leaves like thoſe of enchanters nightſhade, and a very ſmall fruit. *Tournef.* Inſt. p. 175.

ADHESION, (*Cycl.*)—Dr. Deſaguliers has given experiments of the *Adheſion* of leaden bullets to each other: the cauſe of which is reſolved into the principle of attraction [a]. See ATTRACTION, *Cycl.*

The argument drawn from the *Adheſion* of two poliſhed planes, urged in behalf of the weight and preſſure of the atmoſphere [b], might be objected to, as this preſſure is not ſufficient to produce the effect, and that poliſhed bodies will adhere very ſtrongly, even in an exhauſted receiver [c]. However, it is certain, that the air contributes in part to this *Adheſion*.

Anatomiſts ſometimes obſerve *Adheſions* of the lungs to the ſides of the thorax, the pleura, and the diaphragm, which give occaſion to various diſorders.

We alſo read of *Adheſions* of the dura mater to the cranium [d]; of the ſtone to the bladder: though ſome combat this laſt as a chimera [e]; at leaſt the inſtances of it appear to be rare [f], in compariſon of the noiſe that has been made about it.—[[a] Phil. Tranſ. N°. 389. p. 345. [b] V. *Hawkſb.* Exper. p. 88. [c] V. *Hugen.* Oper. Vol. 1. p. 775. [d] Giorn. de Letter. d'Ital. T. 20. p. 374. [e] *Douglas*, Lithot. c. 2. Mem. Liter. de Gr. Brit. T. 13. p. 200. [f] Jour. des Scav. T. 43. p. 416.]

We have alſo ſeveral caſes of *Adheſions* of the inteſtines, mentioned in the Philoſophical Tranſactions, N°. 481. p. 288.

ADHIL, in aſtronomy, a ſtar, of the ſixth magnitude, upon the garment of Andromeda, under the laſt ſtar in her foot.

ADHOA, in antient cuſtoms, denotes what we otherwiſe call *relief*. See RELIEF, *Cycl.*

In which ſenſe, we ſometimes alſo find the word written *Adoha*, *Adhoamentum*, and *Adhogamentum*. *Du Cang.* Gloſſ. Lat. T. 1. p. 57.

ADJACENT, (*Cycl.*)—ADJACENT *angles*, in geometry, are thoſe ariſing from the continuation of one of the ſides of an angle. See ANGLE, *Cycl.*

ADIANTUM, *Maidenhair*, in botany, the name of a genus of plants, the characters of which are theſe. The flowers are not diſcovered. The ſeeds are contained in ſpherical capſules, placed in the ſinuſes and complications of the leaves, and ſurrounded each with an elaſtic ring, which contracting, burſts the capſule, and ſcatters abroad the minute ſeeds. To this it is to be added, that the leaves of the maidenhairs have all one general appearance, by which they are eaſily diſtinguiſhed at ſight, from the other plants of the fern kind. See Tab. 1. of Botany, Claſs 16.

The ſpecies of *Adiantum*, enumerated by Mr. Tournefort, are theſe. 1. The coriander-leaved *Adiantum*, called the true *Adiantum*, or maidenhair, and the Montpelier capillaire. 2. The great Scotch coriander-leaved *Adiantum*. 3. The leſſer Scotch *Adiantum*, with obtuſe and deeply cut leaves. 4. The American *Adiantum*, called the Canada capillaire. 5. The many rooted procumbent *Adiantum*, with pellucid leaves, and ſeeds in ſmall globules, called the little rock maidenhair, with bifid and trifid leaves. 6. The *Adiantum* with hexagonal leaves. 7. The three leaved blunt *Adiantum*. 8. The Italian *Adiantum*, with multifid leaves. 9. The ſmalleſt *Adiantum*, with various leaves. 10. The elegant branched Chineſe *Adiantum*, with fan-like leaves of a reddiſh colour. 11. The moſſy *Adiantum*, with the appearance of ſtone liverwort. 12. The branched *Adiantum*, with ſquare ſhaped dentated leaves. 13. The creeping prickly ſhrub *Adiantum*. 14. The much branched *Adiantum*, with

leaves like the common kind. 15. The *Adiantum* with white lunated marks. 16. The finely divided *Adiantum*. 17. The low trifoliate creeping *Adiantum*. 18. The *Adiantum* with leaves divided into very deep ſegments. 19. The *Adiantum* with capillaceous leaves. And, 20. The climbing *Adiantum*, with finely divided and retuſe leaves. *Tournef.* Inſt. p. 543.

In the Linnæan ſyſtem of botany, the general character of the *Adianta* is, their having the fructifications in form of oval ſpots, diſpoſed in cluſters under the reflected tops of the leaves.

The Engliſh uſually write *Adianthum*, apparently from a miſtaken etymology, as if derived from ἀνθος, flower. The true orthography is *Adiantum*, in Greek ἀδιαντον; formed from the privative α and διαινω, *humecto*; in regard, as ſome ſuggeſt, its leaves do not grow wet with the rain, but ſtill appear dry; or, as others think, from its growing to the inner walls, and margins of wells. V. *Voſſ.* Etym. p. 8. *Martin.* Lex. Philol. T. 1. p. 12. *Blanc.* Lex. Med. p. 13. *Lemery*, Dict. des Drogues, p. 14.

Adiantum is alſo called καλλιτριχον, *callitrichum*, and πολυτριχον, *polytrichum*, from its effect in tinging the hair, and making it grow thick.

Adiantum is the ſame with what we popularly call maiden-hair, and the *capillus veneris* of the ſhops; though ſome pretend to diſtinguiſh between the two.

Others give it the name *terræ capillus*; and others, that of *ſupercilium terræ*. *Gorr.* Def. Med. p. 5, 6.

The *Adiantum* is eſteemed a great pectoral, and gives name to a ſyrup, much in uſe for that intention [a]. It is alſo ſaid to be a remover of obſtructions, both of the kidneys and the menſes, though little uſed in thoſe intentions. Its eſſence is by ſome commended in hypochondriac and hyſteric complaints [b].—[a *Quinc.* Diſpenſ. P. 2. ſec. 4. b *Junck.* Conſp. Med. tab. 29. p. 189.]

ADIANTUM *aureum*, called alſo *Muſcus capillaris*, *Polytrichum aureum medium*, C. B. *Polytrichum nobile*, *vel primum*, *Polytrichum Apulei aureum*, &c. in Engliſh, *Golden maiden-hair*, is of the moſs kind. It grows in heathy and boggy ground. It is a good ſudorific, and its infuſion drank hot is recommended againſt pleuriſies [c]. Camerarius gives a relation of this plant riſing ſpontaneouſly out of the ruins of a town burnt down in Germany; as the *Eriſymum vulgare* did from the ruins of London [d].—[c *Lemery*, Dict. des Drog. p. 14, 15. d Ephem. Germ. dec. 3. an. 5. obſ. 17. p. 47.]

ADIT, (*Cycl.*) in a general ſenſe, denotes the approach to, or entrance of any thing.

The word is originally Latin, *aditus*, formed from *adire*, to go to.

In which ſenſe, we meet with *Adit* of a houſe, *Adit* of a theatre, of the circus, &c. *Salmaſ.* Exerc. ad Solin. p. 916.

ADITS *of a theatre*, *Aditus theatri*, in antiquity, were doors on the ſtairs, whereby perſons entered from the outer portico's, and deſcended into the ſeats. *Vitruv.* l. 5. c. 3. *Pitiſc.* Lex. Ant. T. 1. p. 26. *Baxt.* Gloſſ. p. 35.

ADIT, *in ſhips*, in antiquity, was a ſpace in the upper part, where the ſhip was wideſt, at which people entered, antiently called *Agea*. *Pitiſc.* loc. cit. & p. 55. in voc. *Agea*.

ADIT *of a mine* amounts to the ſame with *Cuniculus*, or *Drift*, and is diſtinguiſhed from *Airſhaft*. Phil. Tranſ. N°. 69. p. 2104. See AIR-SHAFT.

The *Adit* is uſually made on the ſide of a hill, towards the bottom thereof, about 4, 5 or 6 feet high, and 8 wide, in form of an arch; ſometimes cut in the rock, and ſometimes ſupported with timber, ſo conducted, as that the ſole or bottom of the *Adit* may anſwer to the bottom of the ſhaft, only ſomewhat lower, that the water may have a ſufficient current to paſs away, without the uſe of the pump. *Pett.* Hiſt. of Mines, c. 2. p. 2.

Damps and the impurity of the air are the great impediments againſt driving *Adits* above 20 or 30 fathoms, by reaſon of the neceſſity, in this caſe, of letting down air-ſhafts from the day to meet the *Adit*, which are often very expenſive, both on account of the great depth of mines, and the hardneſs of the mineral ſtrata to be cut through. The beſt remedy againſt this, is that practiſed in the coal-mines near Liege, where they work their *Adits* without air-ſhafts: the manner of which is deſcribed by Sir Robert Moray. Vid. Phil. Tranſ. N°. 5. p. 79. See AIR-SHAFT.

ADIT *of a mine* is ſometimes uſed for the air-ſhaft itſelf, being a hole driven perpendicularly from the ſurface of the earth into ſome part of a mine, to give entrance to the air.

In this ſenſe, we ſometimes find it improperly written *Addit*. Phil. Tranſ. N°. 200. p. 738.

To draw off the ſtanding water in winter, in deep mines, they drive up an *Adit*, or air-ſhaft, upon which the air diſengages itſelf from the water, when it begins to run, with ſuch violence, as produces a noiſe equal to the burſting of a canon, daſhes every thing in the way againſt the ſides of the mine, and looſens the very rocks at a diſtance. Phil. Tranſ. N°. 26. p. 481.

ADJUNCT, (*Cycl.*)—ADJUNCT *gods*, or ADJUNCTS *of the gods*, among the Romans, were a kind of inferior deities, added as aſſiſtants to the principal ones, to eaſe them in their functions. Thus, to Mars was adjoined Bellona and Nemeſis; to Neptune, Salacia; to Vulcan, the Cabiri; to the good Genius, the Lares; to the Evil, the Lemures, &c. V. *Struv.* Synt. Ant. Rom. c. 1. p. 170. ſeq. Jour. des Scav. T. 39. p. 542.

ADJUNCTS, or ADJOINTS, in the royal academy of ſciences at Paris, denote a claſs of members, attached to the purſuit of particular ſciences.

The claſs of *Adjuncts* was created in 1716, in lieu of the *Eleves*: they are twelve in number; two for geometry, two for mechanics, two for aſtronomy, two for anatomy, two for chemiſtry, and two for botany.—The *Eleves* not taken into this eſtabliſhment were admitted on the foot of ſupernumerary *Adjuncts*. V. *Fontenel.* Hiſt. Acad Scienc. 1716. p. 3. ſeq. See ACADEMY, *Cycl.* and *Suppl*

ADJUTANT, (*Cycl.*)—The general of the Jeſuits has a ſelect number of fathers of that order reſiding with him, under the denomination of *Adjutants-general*; who have each their ſeveral province, or country, under their care, as France, England, &c. Their buſineſs is to inform the father-general of the occurrences of ſtate in ſuch countries; to which end, each of them have their correſpondents delegated, emiſſaries, viſitors, regents, provincials, &c. Pyrotech. Loyol. c. 2. p. 17. ſeq.

In the cavalry, each regiment has an *Adjutant*, and in the infantry, each battalion.

The *Adjutant* receives the orders every night from the brigade-major, which, after he has carried to the colonel, he delivers out to the ſerjeants. Where detachments are to be made, he gives the number each company muſt furniſh, and aſſigns the hour and place of rendezvous. He alſo places the guards, receives and diſtributes ammunition to the companies, and, by the major's order, regulates the price of bread, beer, &c. *Guillet*, P. 2. in voc.

ADJUTORIUM, (*Cycl.*)—Some authors uſe this word for a medicine intended only as auxiliary, or ſubſervient to another of more efficacy: in particular, after a due uſe of internals, for an external remedy, applied to a part affected, to aſſiſt in and compleat the cure. *Caſt.* Lex. Med. p. 17. *Blanc.* Lex. Med. p. 13.

ADLE *egg*, that which is not fecundified by the cock's tread. See EGG.

Minſhew derives the word from *idle*; ſuppoſing *adle egg* to have been originally written, *idle egg*, *q. d.* vain, empty, inſignificant. Skinner chuſes to deduce it from the Anglo-Saxon *Adel*, ſickneſs, *q. d.* a ſick or morbid egg. *Skin.* Etym. Angl. in voc.

Adle egg is the ſame with what is otherwiſe called a *ſubventaneous* one.

Adle eggs, after incubation, are found to contain a ſhapeleſs, globoſe, aſh-coloured body, not unlike a *mola*. Phil. Tranſ. N°. 87. p. 5080.

ADLEGATION, in the public law of the German empire, a right claimed by the ſtates of the empire, of adjoining plenipotentiaries, in public treaties and negotiations, to thoſe of the emperor, for the tranſacting of matters which relate to the empire in general. V. Mem. de Trev. 1706. p. 1928.

In which ſenſe, *Adlegation* differs from *Legation*, which is the right of ſending ambaſſadors on a perſon's own account.

Several princes and ſtates of the empire enjoy the right of *legation*, who have not that of *Adlegation*, and *vice verſa*. The biſhops, for inſtance, have the right of *Adlegation* in treaties which concern the common intereſt, but no right of *legation* for their own private affairs. The like had the duke of Mantua.

The emperor allows the princes of Germany the privilege of *legation*, but diſputes that of *Adlegation*. They challenge it as belonging to them *jure regni*, which they enjoy in common with the emperor himſelf. Ludwig has a diſcourſe expreſs on the ſubject, wherein the controverſy is treated at large. De Jure Adleg. Ordinum, S. R. I. Ital. 1704. 4to. An extract of it is given in Mem. de Trev. loc. cit.

ADLOCUTION, ADLOCUTIO, in antiquity, is chiefly underſtood of ſpeeches made by Roman generals to their armies, to encourage them before a battle. We frequently find theſe *Adlocutions* expreſſed on medals, by the abbreviature ADLOCUT. COH. V. *Pitiſc.* Lex. Antiq. T. 1. p. 27. *Urſat.* de Not. Rom. p. 4.

The general is ſometimes repreſented as placed on a tribunal; often on a bank or mount of turf, with the cohorts ranged orderly round him, in *manipuli* and *turmæ*. The uſual formula in *Adlocutions* was, *fortis eſſet ac fidus*. V. *Lindenbrog.* ad Marculf. l. 15. *Walk.* on Coin, P. 1. c. 10. p. 157. *Lipſ.* de Mil. Rom. l. 4. dial. 9. *Pitiſc.* loc. cit.

ADMANUENSES, in antient law books, denote perſons who ſwore by laying their hands on the book. *Du Cang.* Gloſſ. Lat. T. 1. p. 61. *Hoffm.* Lex. Univ. T. 1. p. 60.

The word is compounded of the Latin, *ad*, to, and *manus*, hand.

In which ſenſe, *Admanuenſes* amount to the ſame with laymen, and ſtand oppoſed to clerks, who were forbid to ſwear on the book, their word being to be reputed as their oath; whence they were alſo denominated *fide digni*.

ADMINICULATOR, in eccleſiaſtical writers, denotes an antient officer of the church, whoſe buſineſs was to defend the cauſe of widows, orphans, and others deſtitute of help.

help [a]. The *Adminiculator* is the ſame with what is otherwiſe called *Advocate* of the poor [b].—[a *Magri* Vocab. Eccleſ. p. 5. *Spelm.* Gloſſ. p. 11. *Du Cange*, Gloſſ. Lat. T. 1. p. 62. *Hoffm.* Lex. Univ. T. 1. p. 60. [b] *Micræl.* Hiſt. Eccleſ. l. 2. ſect. 2. p. 454.] See ADVOCATE.

ADMINISTRATION, (*Cycl.*)—The *Adminiſtration* of government denotes, or ought to denote, the attendance of the truſtees of the people on the intereſt and affairs of the people [a]. Syneſius [b], the emperor Conſt. Porphyrogenitus [c], and others, have written on the *Adminiſtration* of government.—[a Cato's Letters, T. 1. p. 98. It. T. 2. p. 3, 64. [b] *Syneſ.* de Regno bene Gerendo; a notitia of which is given in *Fabric.* Bibl. Græc. T. 8. l. 5. c. 22. p. 222. [c] *Conſt. Porphyr.* de Adminiſtrando Imperio; a notitia of it is given in *Fabric.* loc. cit. T. 6. l. 5. §. 17. p. 486. and in Hiſt. Crit. Rep. Lett. T. 7. p. 226.]

The two criterions of a good *Adminiſtration* in England, according to Trenchard, are, the keeping the nation out of foreign broils, and paying off the public debts; the latter of which depends on the former. Cato's Lett. T. 1. Pref. p. 27.

ADMINISTRATION is alſo uſed by anatomiſts, for the manner of diſſecting the parts of the body, particularly the muſcles. V. *Goclic.* Hiſt. Anat. §. 4. p. 4 & 38.

In which ſenſe, *Adminiſtration* is ſynonymous with *Encheireſis*, *Exerciſe*, &c.

Anatomical *Adminiſtrations* are not to be learned by oral precepts [a], but require ocular inſpection.—Galen [b], Harvey, and others [c], have diſcourſes expreſs under the title of anatomical *Adminiſtrations*.—[a *Dougl.* Myogr. in Pref. p. 10. [b] *Fabric.* Bibl. Græc. T. 3. p. 529. [c] *Wood*, Faſt. Oxon. T. 2. p. 56.]

ADMINISTRATION is alſo uſed for a Spaniſh ſtaple at Calao in Peru, a city on the coaſts of the ſouth-ſea, where all ſhips, allowed to trade on the coaſt, are obliged to unload their European goods, and pay certain duties. *Savar.* Dict. Comm. T. 1. p. 24.

ADMINISTRATOR, (*Cycl.*) is ſometimes uſed for the preſident of a province. *Hoffm.* Lex. Univ. T. 1. p. 60.

In a like ſenſe, we alſo find the word *adminiſtrans* uſed for the *rector provinciæ* [a].—Sometimes alſo the word *adminiſtratio* is uſed by a figure in the ſame ſenſe; much as *regnum* is uſed for *rex*, &c [b].—[a *Briſſ.* de Verb. Signif. p. 17. [b] *Spartian.* in Peſcen. Nig. c. 7. *Lamprid.* in Alex. c. 30. *Salmaſ.* Not. ad loc. and *Hoffm.* loc. cit.]

ADMINISTRATOR is alſo uſed for the advocate of a church.

ADMINISTRATOR is alſo uſed for a perſon appointed to receive, manage, and diſtribute the revenues of a hoſpital, or religious houſe.

In which ſenſe, we read of the *Adminiſtrators* of the *Hotel-Dieu*; *Adminiſtrators* of the hoſpital of St. John, in the order of Malta, &c. Jour. des Scav. T. 83. p. 12.

ADMINISTRATOR is alſo uſed for a prince who enjoys the revenues of a ſecularized biſhopric.

Yet this title does not hold univerſally: the king of England, as elector of Brunſwic-Lunenburg, for inſtance, is not called *Adminiſtrator*, but duke of Bremen and Verden; and the king of Pruſſia is not *Adminiſtrator*, but duke of Magdeburg, and prince of Halberſtadt. *De la Croix*, Geogr. Univerſ. P. 1. p. 141. Act. Erud. Lipſ. 1693. p. 116.

ADMINISTRATOR is alſo uſed for the regent or protector of a kingdom, during the minority of its proper prince, or even a vacancy of the throne.

In which ſenſe, we ſay the *Adminiſtrator* of Wirtemberg, of Sweden, &c [a]. Ferdinand king of Arragon was made *Adminiſtrator* of the kingdom of Caſtile, during the minority of Charles V. by the intereſt of cardinal Ximenes [b].—[a *Richel.* Dict. T. 1. p. 32. [b] Mem. de Trev. an. 1704. p. 679.]

'Tis diſputed, whether *Adminiſtrators* may be properly ſaid to be ſovereigns [a], and whether women be capable of the office in France, without infraction of the Salic law [b]?—[a *Vitriar.* Inſt. Jur. Publ. l. 1. c. 3. qu. 38. [b] *Hotom.* Franc. Gall. c. 20. p. 128.]

The pope pretends to the *Adminiſtration* of the empire, during a vacancy, by cenſure, or ſuſpenſion. We find an antient papal bull dated thus:—*Domino noſtro Papæ Alexandro Romanum Imperium tenente, & Hederico III. regnante* [a]. Some will allow the emperor himſelf for no more than *Adminiſtrator* of the empire, or director of the diets thereof [b].—[a Bibl. Anc. Mod. T. 26. p. 22. [b] *Boecl.* Notit. Imper. l. 22. c. 3. p. 383.]

ADMINISTRATOR, in the Engliſh law. See the *Cyclopædia*; and *Raſt.* Term. de Ley, p. 11. ſeq. and *Cowel*'s Interpr. in voc.

The origin of *Adminiſtrators* is derived from the civil law. Their eſtabliſhment in England is owing to a ſtatute made in the thirty-firſt year of Edward III. Till then, no office of this kind was known, beſide that of executor: in caſe of a want of which, the ordinary had the diſpoſal of goods of perſons inteſtate, &c.

We find many things in law books concerning the office, powers, privileges, &c. of *Adminiſtrators*; the diſtribution they are to make of the effects of the defunct among the relations; the property they have in the goods; how far they are accountable; in caſe of miſmanagement, how they are to make ſatisfaction *de bonis propriis*: how to plead, ſue, and be ſued; for the detail of which, we muſt refer to the Abridgments of the law.

ADMINISTRATIVE *power*, is uſed by ſome in contradiſtinction to dominion, or power in propriety.

'Tis contraverted whether the power given to Auguſtus were only *adminiſtrative*, or proper and immediate. The affirmative is aſſerted by Cocceius, who inſiſts, that the people never diveſted themſelves of the ſovereign power, to confer it on that emperor. Bibl. Germ. T. 19. p. 163.

ADMINISTRATRIX, ſhe that hath goods and chattels of an inteſtate committed to her charge, as an *Adminiſtrator*. See ADMINISTRATOR, *Cycl.* and *Suppl.*

ADMIRAL, (*Cycl.*)—ADMIRAL, in conchyliology, the name given by authors to a very beautiful, and very precious ſhell, of the voluta kind. See Tab. of Shells, N°. 10.

Of theſe the curious reckon four ſpecies. 1. The grand *Admiral*. 2. The vice *Admiral*. 3. The orange *Admiral*. And, 4. The extra *Admiral*.

The firſt of theſe is the moſt eſteemed, and has been ſold, in Holland, for five hundred florins the ſingle ſhell. It is of a very elegant and bright white enamel, and is variegated with bands of yellow, repreſenting, in ſome degree, the colours of the flags of a man of war at ſea; hence it obtained its name. It is of a very curious ſhape, and particularly elegantly formed about the head; the clavicle being exerted. There runs along the center of the large yellow band in this ſhell, a fine denticulated line, which is its diſtinguiſhing character.

The vice *Admiral* is an elegant ſhell, but its head is leſs beautifully wrought than in the *Admiral*, and its broad band wants the dentated line, ſo remarkable in that.

The orange *Admiral* has more yellow than either of the others.

The extra *Admiral* has the ſame bands with theſe, but they run one into another, and form a more mixed clouding.

ADMONITION, in eccleſiaſtical affairs, a part of diſcipline much uſed in the antient church [a]. It was the firſt act, or ſtep, towards the puniſhment, or expulſion of delinquents. In caſe of private offences, it was performed according to the evangelical rule [b], privately: in caſe of public offence, openly, before the church. If either of thoſe took place, for the recovery of the fallen perſon, all further proceedings, in the way of cenſure, ceaſed: if they did not, recourſe was had to excommunication.—[a Vid. *Bingh.* Orig. Eccleſ. T. 2. l 16. c. 2. §. 6. p. 31. *Calv.* Inſt. l. 4. c. 12. §. 2. [b] Matth. *c.* xviii. *v.* 15. ſeq.]

By the antient canons, nine monitories, or *Admonitions*, at due diſtance, are required before excommunication. In ſome caſes, the interval might be abridged, and only a ſingle one given. There is a kind of tacit *Admonition* ſuppoſed, even before excommunications *ipſo facto*. Jour. des Scav. T. 58. p. 258.

In the reformed churches, *Admonition* is chiefly to be adminiſtred in and by the *conſiſtory*. Act. of Synod. Charent. c. 5. p. 42.

The Romans had a military puniſhment, called *Admonitio fuſtium*, reſembling, in ſome reſpects, our whipping, or laſhing, being performed with a vine-branch. V. *Sichterman.* Diſſ. de Pœn. Milit. Rom. c. 12. Jour. des Scav. T. 41. p. 480. *Briſſon.* de Verb. Sign. and *Calv.* Lex. Jur.

ADMONITION is alſo uſed, in writers of the barbarous age, for the citation, or ſummoning a perſon to appear in a court of juſtice. *Du Cang.* Gloſſ. Lat. T. 1. p. 63. See CITATION, SUMMONS, *&c.*

ADMORTIZATION, among feudal writers, the act of reducing lands to mortmain. See MORTMAIN.

Admortization denotes the acquiſition of lands, by a monaſtery, college, church, chapel, or even lay corporation; by which ſuch lands ceaſe to be ſubject to certain dues and incumbrances, to which other feuds are liable, as relief, ward, marriage, and the like. V. *Du Cang.* Gloſſ. Lat. T. 1.

Admortization cannot take place without the conſent of the prince, or lord of the feud; to whom ſatisfaction ordinarily is made for the loſs he ſuſtains, by a payment of a third part of the whole price.

ADNATA, (*Cycl.*)—The *Adnata* ſprings from the pericranium, and grows to the exterior part of the tunica cornea, ſerving to connect the whole eye both to the palpebræ, and and the adjacent bones, and thus keep it faſt in the ſocket: whence it is alſo called *conjunctiva*.

To leave room for the viſible ſpecies to paſs thro' it, a little round aperture is left in the fore part, called the ſight, thro' which the iris, and pupilla appear. *Drake* Anthropol. l. 3. c. 11. p. 324.

The *Adnata* abounds with veins and arteries, which, though ordinarily not viſible, are conſpicuous in ophthalmies, which are properly inflammations of this part. The academiſts *naturæ curioſi* give the hiſtory of a dropſy of the *Adnata*, and its cure. Ephem. Germ. Dec. 3. an. 3. Obſ. 3. p. 4.

ADNATA, or ADNASCENTIA, among gardeners, denote thoſe off-ſets, which by a new germination under the earth, pro-

ceed from the lilly, narciſſus, hyacinth, and other flowers; and afterwards grow to true roots. The French call them *Cayeux*, Stalks. *Mill.* Gard. Dict. in Voc.

ADNOUN, ADNOMEN, or ADNAME, is uſed by ſome grammarians to expreſs what we more uſually call an Adjective. *Low.* Gram. Lat. p. 3, and 8.

The word is formed by way of analogy, to Adverb, in regard Adjectives have much the ſame office and relation to nouns, that Adverbs have to Verbs.

Biſhop *Wilkins* uſes the word *Adname* in another ſenſe, *viz.* for what we otherwiſe call a Præpoſition. *Real.* Charact. P. 3. c. 3. §. 1. p. 309.

ADONAI, one of the names of God in ſcripture: this word ſignifies properly *my Lords*, in the plural number, as *Adoni*, ſignifies *my Lord*, in the ſingular number. The Jews, who either out of reſpect, or ſuperſtition, do not pronounce the name of *Jehovah*, read *Adonai* in the room of it, as often as they meet with *Jehovah* in the Hebrew text. But the antient Jews were not ſo nice; there is no law which forbids them to pronounce the name of God. *Calmet.* Dict. in voc. *Hoffm.* Lex. Univ. T. 1. p. 62.

Adonai, is originally Hebrew, but adopted into the Engliſh and other modern tongues.

The word literally ſignifies Lord, and accordingly is rendered in the Septuagint by Κυριος, and in the vulgate by *Dominus*. *Herbert.* Relig. Gent. c. 3. p. 28. Trev. Dict. Univ. T. 1. p. 137. ſeq.

Adonai amounts to the ſame with *Jehova* or *Elohim*.

We find great diſputes in authors, concerning the uſe and acceptation of the word *Adonai*; particularly, whether it is always read for the word *Jehovah*.

This has given riſe to two oppoſite ſects among *Hebraiſts*, called *Adoniſts* and *Jehoviſts*. V. Mem. de Trev. an. 1709. p. 1120.

The *Baſilidians* ſeem to have made a *magic* uſe of the word *Adonai*, which is frequently found inſcribed on their gems, or *Abraxas*. V. *Montfauc.* Palæogr. Græc. l. 2. c. 8. p. 179. See ABRAXAS.

Adonai is a name ſometimes alſo applied to creatures, viz. angels and men. In which ſenſe, it frequently occurs in the *Hebrew* bible.

Ordinarily where it ſtands for men, it is put in the ſingular number, *Adoni*; or if in the plural, it is diſtinguiſhed by a ſhort *a*; whereas, when ſpoken of God, it is always written *Adonai*, with a Kametz, or long *A*. V. Jour. des Scav. T. 44. p. 549. See alſo Nouv. Rep. Lett. T. 53. p. 600. and Act. Erud. Lipſ. ann. 1685. p. 202. Mem. de Trev. ann. 1711. p. 2072. *Du Pin*, Bibl. Proteſt. T. 2. p. 270, 329.

ADONIA, (*Cycl.*) in antiquity, ſolemn feaſts in honour of *Venus*, and in memory of her beloved *Adonis* [a].

The *Adonia* were otherwiſe called *Salambo* [b]. The abbé Banier has a memoir expreſs on the hiſtory of the *Adonia* [c].

The *Adonia* were obſerved with great ſolemnity by moſt nations [d], Greeks, Phœnicians, Lycians [e], Syrians, Egyptians, &c.

From Syria, they are ſuppoſed to have paſſed into India [f]: The prophet Ezekiel is underſtood to ſpeak of them [g]. They were ſtill obſerved at Alexandria, in the time of St. Cyril [h]; and at Antioch in that of Julian the apoſtate, who happened to enter that city during the ſolemnity, which was taken for an ill omen [i]. Some pretend to diſcover certain traces of them in the Perſian feaſt Noroux [k].—[[a] V. *Meurſ.* Græc. Ferial. Pott. Archæol. Att. l. 2. c. 20. *Le Clerc* Bibl. Univ. T. 3. p. 13. See alſo *Suid.* Lex. T. 1. p. 55. in Αδωνια and Αδωνις, *Kuſt.* Not. ad eund. *Morer.* Dict. T. 1. p. 40. ſeq. *Hoffm.* Lex. Univ. T. 1. p. 62. *Calm.* Dict. T. 1. p. 48. ſeq. *Bayle*, Dict. T. 1. p. 81. ſeq. [b] *Lamprid.* in Vita Heliog. c. 7. [c] Mem. Acad. Inſcript. T. 4. p. 138. ſeq. [d] *Bayle*, loc. cit. [e] Nouv. Rep. Lett. T. 9. p. 323. [f] Id. T. 8. p. 991. [g] Ezek. c. viii. v. 14. [h] *Cyr.* in Eſai. l. 2. [i] *Am. Marcell.* l. 22. c. 9. [k] Nouv. Rep. Lett. T. 18. p. 544.]

The *Adonia* laſted two days; on the firſt of which certain images of *Venus* and *Adonis* were carried, with all the pomp and ceremonies practiſed at funerals; the women wept, tore their hair, beat their breaſts, &c. imitating the cries and lamentations of Venus, for the death of her paramour. This lamentation they called Αδωνια or Αδωνιασμος. Lucian, ſays the river Byblos bore a part in the ceremony, turning red at that time out of grief. *Lucian* de Dea Syria. Nouv. Rep. Lett. T. 37. p. 327.

The Syrians were not contented with weeping, but gave themſelves diſcipline, ſhaved their heads, &c. Among the Egyptians, the queen herſelf uſed to carry the image of *Adonis* in proceſſion.

St. Cyril, mentions an extraordinary ceremony practiſed by the Alexandrians: a letter was written to the women of Byblos, to inform them that *Adonis* was found again, this letter was thrown into the ſea, which did not fail punctually to convey it to Byblos in ſeven days; upon the receipt of which the Byblian women ceaſed their mourning. *Cyr.* ubi Supr. the like is related by *Procop.* Gaz. in comm. in Eſai. c. 18. *Bayle*, loc. cit.

The Egyptian *Adonia* are ſaid to have been held in memory of the death of Oſiris; by others, in that of his ſickneſs and recovery [l]. Biſhop Patrick dates their origin from the ſlaughter of the firſt born under Moſes [m].—[[l] Bibl. Univ. T. 3. p. 13. [m] Exod. c. xii. v. 30. V. *Patric.* ad loc. Nouv. Rep. Lett. T. 39. p. 577.]

ADONIAS, in botany, a name given by the antient Greek writers to the Anemone, from the tradition of its having been produced out of the earth by the tears of Venus, when lamenting the death of *Adonis*.

The antients had a vaſt variety of this flower, and were very fond of it in their garlands; Pliny tells us, of a bulbous rooted Anemone; but that being mentioned by no other author, and being contrary to the ordinary courſe of nature, in the ſtructure of plants, it is probable that there never was any ſuch plant; but that it is either an error of Pliny in ſome of his tranſlations from the Greek writers, or elſe a mere child of his own imagination. Theophraſtus, ſpeaking of the flowers uſed in garlands, mentions the wild or mountain anemone, and the woolly bulbocodium. Pliny ſeems to have had this paſſage in his eye, in one part of his account of the anemone, and probably has careleſsly joined together the anemone and the bulbocodium, and made one imaginary plant from them both.

ADONIC, (*Cycl.*)—We meet with *Adonics* by themſelves without ſapphics, as alſo ſapphics without *Adonics*.—The ſcheme of the *Adonic* verſe is thus,

$$- \smile\smile \;\Big|\; \begin{matrix} - \smile \\ \text{or} \\ - - \end{matrix}$$

For an inſtance of *Adonic* verſes, take the following from Bœthius, de Conſol. Philoſ. l. 1. p. 67.

Gaudia pelle,
Pelle timorem,
Spemque fugato,
Nec dolor adſit:
Nubila mens eſt,
Vinctaque frænis,
Hæc ubi regnant.

ADONIDES, in botany, are thoſe writers, who have given hiſtories, or catalogues of the plants cultivated in ſome particular place. *Linnæus*, Fund. Bot. p. 1.

ADONION, αδωνιον, among the antient botaniſts, a ſpecies of ſouthernwood according to Gorræus, which uſed to be ſet in pots, and ſerved as an ornament for gardens. *Gorr.* Def. Medic.

ADONIS, in zoology, the name of a ſmall fiſh, of the anguilliform kind, of a cylindric ſhape, and about ſix inches long; it is of a gold colour, mixt with a greeniſh hue in ſome parts, and in others with a reddiſh. It has on each ſide, a white ſtrait line running from the gills to the tail. Its gills are very remarkably ſmall, and many have ſuppoſed thence that it had none. It is remarkable for ſleeping on the ſurface of the water, and near the ſhores; and Rondeletius affirms, that he has ſeen of them ſleeping upon the dry rocks. *Geſner* de Piſc. p. 15.

Mr. Ray ſuſpects this fiſh, which is alſo called *exocætus*, to be the ſame with the exocætus of Bellonius, or the gottorugine. See GOTTORUGINE.

ADONIS *Flos*, pheaſant's eye, or red maithers, in botany. The characters of this plant are, the leaves are like fennel, or chamomile; the flowers conſiſt of many leaves, which are expanded in form of a roſe; and the ſeeds are collected into oblong heads.

There are three varieties of this plant, commonly called, 1. The common red bird's eye, or roſe a ruby. 2. The long leaved yellow bird's eye. 3. The hellebore rooted pheaſant's eye; or, the fennel leaved black hellebore.

ADONIS *Potio*, an antient beverage or drink made of wine, mixed with flower of roaſted ador; the ſame with what was otherwiſe called cyceon. *Salmaſ.* Exerc. ad Solin. p. 328. *Cagnat.* Var. Obſerv. c. 23. p. 198. *Hoffm.* Lex. Univ. T. 1. p. 64.

ADONISTS, a ſect, or party among divines, and critics, who maintain, that the Hebrew points ordinarily annexed to the conſonants of the word Jehovah, are not the natural points belonging to that word, nor expreſs the true pronunciation of it, but are the vowel points, belonging to the words *Adonai* or *Elohim*, applied to the conſonants of the ineffable name Jehovah; to warn the readers, that inſtead of the word Jehovah, which the Jews were forbid to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read *Adonai*.

In this ſenſe *Adoniſts* ſtands oppoſed to Jehoviſts.

Druſius, Amama, Capellus, Buxtorf, Alting and Reland, are the principal among the *Adoniſts*; a collection of whoſe writings on the ſubject, together with thoſe of their oppoſers, has been lately publiſhed by the author laſt mentioned. Decaſſ. Exercit. Philol. de vera Pronunc. Nom. Jehovah, Traj. ad Rhen. an. 1707. 8vo. Extracts of it are given in Jour. des Scav. T. 44. p. 537. ſeq. Mem. de Trev. an. 1714. p. 694.

ADOPTIANI, (*Cycl.*)—The *Adoptiani*, are ſometimes called *Adoptionarii*; ſometimes Feliciani, Elipandiani, and Urgelatani;

gelatani. Their doctrine is also called the *Spaniſh hereſy*, from the names, country, &c. of the founders, and chief advocates of it.

The *Adoptiani* differ from the *Bonoſiani* chiefly in point of time, theſe latter having maintained much the ſame doctrine of the ſonſhip of Chriſt.—Whether the *Adoptiani* are Neſtorians, is a queſtion ſtrongly controverted among eccleſiaſtical writers. V. *Vogt*. Bibl. Hiſt. Hæret.

ADOPTION, (*Cycl.*) — *Adoption* was allowed among the Greeks to ſuch as had no iſſue of their own; excepting thoſe who were not Κυριοι ἑαυτων, *their own maſters*, *e. gr.* ſlaves, women, madmen, infants, or perſons under twenty years of age; who being incapable of making wills, or managing their own eſtates, were not allowed to *adopt* heirs to them. Foreigners being incapable of inheriting at Athens, if any ſuch were *adopted*, it was neceſſary firſt to make them free of the city. The ceremony of *Adoption* being over, the *adopted* had his name inrolled in the tribe and ward of his new father; for which entry a peculiar time was allotted, viz. the feſtival Θαργηλια.

To prevent raſh and inconſiderate *Adoptions*, the Lacedemonians had a law, that *Adoptions* ſhould be tranſacted, or at leaſt confirmed, in the preſence of their kings. The children *adopted* were inveſted with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceaſed to have any claim of inheritance, or kindred, in the family which they had left, unleſs they firſt renounced their *Adoption*; which, by the laws of Solon, they were not allowed to do, unleſs they had firſt begotten children, to bear the name of the perſon who had *adopted* them: thus providing againſt the ruin of families, which would otherwiſe have been extinguiſhed by the deſertion of thoſe who had been *adopted* to preſerve them. If the children *adopted* happened to die without children, the inheritance could not be alienated from the family into which they had been *adopted*, but returned to the relations of the *Adopter*.

It ſhould ſeem, that by the Athenian law, a perſon, after having *adopted* another, was not allowed to marry, without permiſſion from the magiſtrate: in effect, there are inſtances of perſons, who being ill uſed by their *adoptive* children, petitioned for ſuch leave. However this be, 'tis certain ſome men married after they had *adopted* ſons: in which caſe, if they begat legitimate children, their eſtates were equally ſhared between the begotten and *adopted*. *Pott*. Archæol. Græc. l. 4. c. 15. p 342. ſeq.

Beſides the formalities preſcribed by the Roman law, divers other methods have taken place; which have given denominations to divers ſpecies of *Adoptions*, among the Gothic nations, in different ages. As,

ADOPTION *by teſtament*, that performed by appointing a perſon heir by will, on condition of his aſſuming the name, arms, &c. of the *Adopter*.

Of which kind, we meet with divers inſtances in the Roman hiſtory. Vid. *Cycl*.

Some reſemblance of it we alſo find in the hiſtory of our own nation and age.

ADOPTION *by baptiſm* is that ſpiritual affinity which is contracted by godfathers and godchildren in the ceremony of baptiſm.

This kind of *Adoption* was introduced into the Greek church, and came afterwards in uſe among the antient Franks, as appears by the capitulars of Charlemaign.

The preſents which the godfathers made in this ſolemnity, called *filiolatus*, *filiolatium*, and *filiolagium*, are proofs of this practice. In reality, the godfather was ſo far conſidered as *adoptive* father, that his godchildren were ſuppoſed to be entitled to a ſhare in the inheritance of his eſtate. *Du Cang*. Gloſſ. Lat. T. 2. p. 438. in voc. *Filiolus*.

ADOPTION *by arms* was when a prince made a preſent of arms to a perſon, in conſideration of his merit and valour [a].—Thus it was that the king of the Heruli was *adopted* by Theodoric; Athalaric by the emperor Juſtinian; and Coſroes, nephew of the king of Perſia, by the emperor Juſtin.

This method of *Adoption*, practiſed in Germany, was called *barbarous*, by way of oppoſition to the Roman cuſtom.

The obligation here laid on the *adoptive* ſon was, to protect and defend the father from injuries, affronts, &c [b].—And hence the ceremony of dubbing knights took its origin, as well as name [c].—[a Vid. *Ol. Magn*. Epit. l. 8. c. 2 and 3. p. 264. ſeq. *Jornand*. de Reb. Getic. p. 140. *Caſſiod*. Ep. 2. l. 4. b V. Obſerv. Halenſ. T. 2. obſ. 3. §. 2. p. 43. c V. *Seld*. Titl. Hon. p. 865.]

The barbarous *Adoption* differed from the Roman, in that the latter was performed by writing, the former by the delivery of military weapons. It may be added, that the barbarous kind ordinarily gave no right of inheritance; though among the Franks, thoſe adopted *per haſtam* did inherit. Obſerv. Hal. loc. cit.

ADOPTION *by hair*, *Adoptio per capillum*, or *crinem*, was performed by cutting off the hair of a perſon, and giving it to the *adoptive* father. Vid. *Cycl*.

ADOPTION *by matrimony* is the taking the children of a wife or huſband, by a former marriage, into the condition of proper or natural children [a]; and admitting them to inherit on the ſame footing with thoſe of the preſent marriage. This is a practice peculiar to the Germans; among whom, it is more particularly known by the name of *Einkindſchaft* [b], among their writers in Latin, by that of *unio prolium*, or union of iſſues. But the more accurate writers obſerve, that this is no *Adoption* [c].—[a *Hartung*. ubi ſupra, p. 18. Nov. Liter. Germ. an. 1709. p. 457. *Gail*. l. 2. obſerv. 125. *Wood*, Inſt. Imper. Law, l. 1. c. 2. p. 125. b Bibl. Jur. Imper. c. 4. poſ. 1. §. 14. p. 309. c See ADFILIATION.]

Among the Turks, by the law of Mahomet, *Adoption* is no impediment of marriage [c]. The ceremony of *Adoption* is performed by obliging the perſon *adopted* to paſs through the ſhirt of the *Adopter*. Hence, among that people, to *adopt* is expreſſed by the phraſe, *to draw another through my ſhirt* [d].—[c Koran. c. 33. See alſo *Sale*, Not. ad loc. d *D'Herb*. Bibl. Orient. p. 47. in voc. *Ahrat*.]

It is ſaid that ſomething like this has alſo been obſerved among the Hebrews; where the prophet Elijah *adopted* Eliſha for his ſon and ſucceſſor, and communicated to him the gift of prophecy, by letting fall his cloak, or mantle on him.

But *Adoption*, properly ſo called, does not appear to have been practiſed among the antient Jews: Moſes ſays nothing of it in his laws; and Jacob's *Adoption* of his two grandſons, Ephraim and Manaſſeh, is not ſo properly an *Adoption*, as a kind of ſubſtitution, whereby thoſe two ſons of Joſeph were allotted an equal portion in Iſrael with his own ſons.

Some have conſidered the law among the Iſraelites, by which one brother was under an obligation to marry the widow of another, who died without children, as a kind of *Adoption*; the children born of the ſecond marriage being looked upon as belonging to the deceaſed brother, and going by his name. V. *Calmet*'s Dict. in voc. *Adoption*.

'Tis the uſual opinion, that *Adoption* and emancipation are aboliſhed in all countries governed by cuſtomary laws; particularly in Germany. M. de Kulpis [e] has ſhewn the contrary; and as the *Adoption* of princes ſhould ſeem moſt liable to ſuch an abolition, in regard *Adoptions* are only fictions of the civil law, which ſeems hereby to infringe on the natural law, to which alone princes are ſubject, that author gives a curious detail of inſtances of ſuch *Adoptions* of princes, both in antient and modern hiſtory, among the Jews, Romans, Goths, Franks, Germans, Spaniards, Italians, &c. In effect, the ſeveral pretenſions of the French, Spaniards, and houſe of Auſtria, to the kingdom of Naples, are founded on no other than the ſucceſſive *Adoptions*, which their laſt queen Joan made of princes of the houſe of Anjou and Arragon, for her heirs and ſucceſſors [f].—[e Vid. *Kulp*. Diſſ. Acad. 4. de Adoptione & Emancipatione Principum. Jour. des Scav. T. 34. p. 323. ſeq. f Mem. de Trev. an. 1721. p. 1438. ſeq.]

Adoption is ſtill ſaid to ſubſiſt, in ſome meaſure, even among private perſons in Xaintogne, and ſome provinces of France. *Trev*. Dict. Univ.

In our own hiſtory, king Stephen, to put an end to the diſputes about the ſucceſſion, *adopted* Henry II. as his ſon and ſucceſſor, in excluſion of his own ſon William, who was induced by oath to acknowledge the new right of ſucceſſion [g]; the charter of which *Adoption* is ſtill extant in Brompton. Queen Elizabeth alſo promiſed to *adopt* Mary queen of Scots, and procure her to be declared heir aparent to the Engliſh throne by act of parliament, on condition of her marrying the earl of Leiceſter [h].—[g *Bromp*. Coll. 1037. Bibl. Anc. Mod. T. 21. p. 149. h *Mackenz*. Scot. Writ. T. 3. p. 149.]

ADOPTION is alſo uſed, in theology, for a federal act of God's free grace; whereby thoſe that are regenerate by faith, are admitted into his houſhold, and entitled to a ſhare in the inheritance of the kingdom of heaven. V. *Pfaff*. Inſt. Theol. P. 2. c. 8. §. 4. p. 477.

ADOPTION is ſometimes alſo uſed, in ſpeaking of the antient clergy, who had a cuſtom of taking a maid or widow into their houſes, under the denomination of an *adoptive* or ſpiritual ſiſter, or niece. *Du Cang*. Gloſſ. Lat. T. 1. p. 66. See ADOPTIVE.

ADOPTION is alſo uſed in ſpeaking of the admiſſion of perſons into certain hoſpitals, particularly that of Lyons; the adminiſtrators whereof have all the power and rights of parents over the children admitted. Mem. de Trev. 1713.

ADOPTION is alſo uſed for the reception of a new academy into the body of an old one.

In which ſenſe, *Adoption* amounts to much the ſame with *Incorporation*.

The French academy of Marſeilles was adopted by that of Paris; on which account, we find a volume of ſpeeches extant, made by ſeveral members of the academy of Marſeilles, deputed to return thanks to that of Paris, for the honour. V. Bibl. Franc. Sept. 1726. p. 203. ſeq.

In a ſenſe, not unlike this, *Adoption* is alſo applied by the Greeks, to the admitting a monk, or brother, into a monaſtic community; ſometimes called ſpiritual *Adoption*. V. *Du Cang*. Gloſſ. Græc. in voc. Αδελφοποια, Αδελφοποιησις, Αδελφοποιτια, Αδελφοῖης πνευματικη.

ADOPTIVE, (*Cycl.*)—In eccleſiaſtical writers we find *adoptive* women, or ſiſters, *adoptivæ fœminæ*, or *ſorores*, uſed for thoſe

handmaids of the antient clergy, otherwiſe called *ſubintroductæ*, and Συνεισακται. The third canon of the council of Nice is entitled *de ſubintroductis*, i. e. *adoptivis ſororibus*. Obſerv. Halenſ. T. 6. p. 244. *Du Cange*, Gloſſ. Lat. T. 1. p. 66.

ADOPTIVE *arms*, are thoſe which a perſon enjoys, by the gift or conceſſion of another, and to which he was not otherwiſe entitled.

Theſe are otherwiſe called *arms of adoption*; and by this ſtand contradiſtinguiſhed from *arms of alliance*, which the bearers, as general heirs, may carry, or not carry, at pleaſure: whereas *arms of adoption* are indiſpenſably required by the adopter to be marſhalled with the perſon's own, as a condition of ſome honour, or eſtate left him. *Niſbet* on Herald. c. 8. p. 112.

ADOPTIVE is alſo uſed to expreſs a thing borrowed or taken from another. In which ſenſe, we ſometimes meet with *adoptive hair*, by way of oppoſition to natural hair; and *adoptive gods*, by way of contradiſtinction to domeſtic ones.

Clemens Alexandrinus makes uſe of an odd argument againſt the lawfulneſs of *adoptive* hair, viz. that it prevents the prieſt's benediction, by laying his hands on the head, from taking effect on the proper ſubject, the bleſſing, in this caſe, being tranſmitted to him to whom the hair naturally belonged. Jour. des Scav. T. 60. p. 523.

The Romans, notwithſtanding the number of their domeſtic, had their *adoptive* gods, taken chiefly from the Egyptians: ſuch were Iſis, Oſiris, Anubis, Apis, Harpocrates, and Canopus. Many private perſons, on their own authority, erected temples to theſe, which were afterwards demoliſhed by order of the ſenate; and being reſtored at the ſolicitation of the augurs, were again demoliſhed, and again reſtored by Auguſtus. Mem. de Trev. 1706. p. 1747.

ADORATION, (*Cycl.*)—The Romans practiſed *Adoration* at ſacrifices, and other ſolemnities; in paſſing by temples, altars, groves, &c. at the ſight of ſtatues, images, or the like, whether of ſtone or wood, wherein any thing of divinity was ſuppoſed to reſide. Uſually there were images of the gods placed at the gates of cities, for thoſe who went in, or out, to pay their reſpects to. *Pitiſc.* Lex. Ant. T. 1. p. 29. ſeq. *Turneb.* Adverſ. l. 18. c. 6. *Muret.* Var. Lect. l. 10. c. 1. *Kipping.* Antiq. Rom. l. 1. c. 9. §. 5. *Salmuth.* ad Pancirol. p. 433.

In the ſymbols of Pythagoras, *Adoration* is enjoined to be performed in a ſitting poſture, genuflexion being then unknown. Nouv. Rep. Lett. T. 39. p. 294.

The ceremony of *Adoration* among the antient Romans was thus: the devotee having his head covered, applied his right hand to his lips, the fore-finger reſting on the thumb, which was erect, and thus bowing his head, turned himſelf round from left to right [a]. The kiſs thus given was called *oſculum labratum*: for ordinarily they were afraid to touch the images of their gods themſelves with their profane lips. Sometimes, however, they would kiſs their feet, or even knees, it being held an incivility to touch their mouths: ſo that the affair paſſed at ſome diſtance. Others pretend, that they firſt ſtretched out the hand, and afterwards drew it back to their lips; but it rather appears, that the contrary order was obſerved [b]. Saturn, however, and Hercules, were *adored* with the head bare; whence the worſhip of the laſt was called *inſtitutum peregrinum*, and *ritus Græcanicus*, as departing from the cuſtomary Roman method, which was to ſacrifice and *adore*, with the face veiled, and the cloths drawn up to the ears, to prevent any interruption in the ceremony, by the ſight of unlucky objects [c].—[[a] *Salmaſ.* Exerc. ad Solin. p. 936. [b] *Pitiſc.* loc. cit. *Plin.* Hiſt. Nat. l. 28. c. 2. *Apul.* Apol. p. 496. *Lipſ.* Elect. n. 6. [c] *Hoffm.* Lex. Univ. T. 1. p. 63. *Danet.* Lex. Ant. in voc. *Plut.* Queſt. Rom. 11. & 13. *Serv.* ad 3 Æneid. v. 407.]

Sometimes alſo proſtration, or falling on the face, and ſometimes kneeling, were practiſed; ſometimes they turned towards the ſun, and ſometimes to the eaſt. V. Act. Erud. Lipſ. ann. 1694. p. 331.

Other circumſtances of *Adoration* were the putting crowns, garlands, and the like, on the ſtatues or images *adored*; ſitting down by them, praying them, in ſoft trembling murmurs, to be favourable, *faveas mihi*.

The Gauls, inſtead of turning about to the right hand, after the Roman manner, thought it more religious to turn to the left. *Plin.* Hiſt. Nat. T. 2. l. 28. c. 2. p. 444. *Salmaſ.* Exerc. ad Solin. p. 236.

The Jewiſh manner of *Adoration* was by proſtration, bowing, and kneeling [d]. Pinchon has a diſcourſe expreſs on the form of the Jewiſh *Adoration* [e]. The Chriſtians adopted the Grecian rather than the Roman method, and *adored* always uncovered. The ordinary poſture of the antient Chriſtians was kneeling [f], but on Sundays, ſtanding. In this they conformed to the heathens, that a peculiar regard was had to the Eaſt, to which point they ordinarily directed their prayers; which occaſioned a belief among the heathens, as if they *adored* the ſun. Something of this uſage is ſtill retained, as appears by the poſition of our churches. A late author has diſcovered an error of the builders in this reſpect; many of our antient churches being found to vary ſeveral degrees from the true eaſt and Weſt [g].—[[d] Mem. de Trev. an. 1705. p. 530. [e] *Pinchon* de Form. Adorat. Ind. [f] Bibl. Anc. Mod. T. 4. p. 23. [g] *Plot*, Nat. Hiſt. of Stafford. c. 9. §. 55. p. 362. ſeq.]

ADORATION is more particularly uſed for the act of praying, or preferring our requeſts, or thankſgivings to God.

Brouër a Nyedek has a diſſertation expreſs on antient and modern *Adorations*. De Populorum Veter. ac Recent. Adorationib. Amſt. 1713. 8vo. Extracts of it are given in Journ. des Scav. T. 54. p. 425. ſeq. & Act. Erud. Lipſ. ſup. 6. p. 80. ſeq. Mem. de Trev. 1715. p. 207.

ADORATION is alſo uſed for certain extraordinary civil honours, or reſpects, which reſemble thoſe paid to the deity, yet are given to men. *Calm.* Dict. T. 1. p. 51. Trev. Dict. Univ. Mem. de Trev. an. 1706. p. 1030.

We read of *Adorations* paid to kings, princes, emperors, popes, biſhops, abbots, &c. *Adorations* paid to the purple, to the perſon. *Adoration* by kneeling, by falling proſtrate, kiſſing feet, hand, garment, &c.

The Perſian manner of *Adoration*, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, ſtriking the earth with the forehead, and kiſſing the ground. This ceremony, which the Greeks called προσκυνειν, Conon refuſed to perform to Artaxerxes, and Caliſthenes to Alexander the great, as reputing it impious and unlawful.

The *Adoration* performed to the Roman and Grecian emperors, conſiſted in bowing, or kneeling at the prince's feet, laying hold of his purple robe, and preſently withdrawing the hand, and clapping it to the lips. Some attribute the origin of this practice to Conſtantius. It was only perſons of ſome rank or dignity that were entitled to the honour. Bare kneeling before the emperor to deliver a petition, was alſo called *Adoration*. V. *Hoffm.* Lex. Univ. T. 1. p. 63. *Pitiſc.* Lex. Antiq. T. 1. p. 29. ſeq. *Calv.* Lex. Jur. p. 43. *Briſſ.* de Verb. Signif. p. 21. ſeq. and the authorities there cited.

The practice of *Adoration* may be ſaid to be ſtill ſubſiſting in England, in the ceremony of kiſſing the king's, or queen's hand, and in ſerving them at table, both being performed kneeling.

ADORATION is more particularly uſed for kiſſing one's hand in preſence of another, as a token of reverence. Hiſt. Acad. Inſcr. T. 2. p. 104.

The Jews *adored* by kiſſing their hands, and bowing down their heads; whence in their language *kiſſing* is properly uſed for *Adoration*. *Calm.* Dict. Bibl.

ADORATION is alſo uſed among Roman writers, for a high ſpecies of applauſe given to perſons, who had ſpoken or performed well in public. See ACCLAMATION.

We meet with *Adoration* paid to orators, actors, muſicians, &c. The method of expreſſing it was, by riſing, putting both hands to their mouth, and then returning them towards the perſon intended to be honoured. Hiſt. Acad. des Inſcr. T. 1. p. 142.

ADORATION is alſo uſed in the court of Rome, for the ceremony of kiſſing the pope's feet. Jour. des Scav. T. 73. p. 370.

The introduction of *Adoration* among the Romans is aſcribed to the low flattery of Vitellius, who upon the return of C. Cæſar from Syria, would not approach him otherwiſe than with his head covered, turning himſelf round, and then falling on his face. Heliogabalus reſtored the practice, and Alexander Severus again prohibited it. Diocletian redemanded it, and it was, in ſome meaſure, continued under the ſucceeding princes, even after the eſtabliſhment of Chriſtianity, as Conſtantine, Conſtantius, &c. It is particularly ſaid of Diocletian, that he had gems faſtened to his ſhoes, that divine honours might be more willingly paid him, by kiſſing his feet. The like uſage was afterwards adopted by the popes, and is obſerved to this day. Theſe prelates finding a vehement diſpoſition in the people to fall down before them, and kiſs their feet, procured crucifixes to be faſtened on their ſlippers; by which ſtratagem, the *Adoration* intended for the pope's perſon, is ſuppoſed to be transferred to Chriſt. Divers acts of this *Adoration* we find offered even by princes to the pope. V. *Baldwin.* de Calceo, c. 27. Oeuvr. des Scav. Oct. 1700. p. 471.

Proteſtant authors have not failed to take occaſion, from this ceremony, of charging the popes with exceſſive pride, and even impiety, as if they laid claim to divine honours. Yet we are told, that in the antient church the ſame ceremony was practiſed to all biſhops; people kiſſed their feet, and ſaluted them with the phraſe προσκυω σε, *I adore thee* [b]. Roman catholics, in their turn, have brought the like imputation on ſome of their oppoſers. One of the articles againſt Varennes, that ſcourge of the tyranny, and concubinage of the clergy, was, that he made himſelf be *adored* as a god [c]. —[[a] *Heideg.* in Apoc. Proph. de Babyl. diſſ. 10. p. 442. ſeq. Nouv. Rep. Lett. T. 10. p. 636. [b] *Fileſan.* ap. Du Pin, Bibl. Eccleſ. T. 17. p. 117. [c] Bibl. Germ. T. 4. p. 156.]

ADORATION is alſo particularly uſed for the ceremony of owning, or paying homage to a new elected pope.

Adoration properly is payed only to the pope when placed on the altar, in which poſture the cardinals, conclaviſts, alone, are admitted to kiſs his feet. The people are afterwards admitted to do the like at St. Peter's church: the ceremony is deſcribed at large by Guicciardin. Nouv. Rep. Lett. T. 48. p. 424. Hiſt. Ital. l. 1.

In a like ſenſe, the ceremony of ſaluting the new abbot elect of St. Genevieve, is alſo called *Adoration*. V. Act. Erud. Lipſ. 1724.

ADORATION is alſo uſed for a method of electing a pope without ſcrutiny, or voting. See the *Cyclopædia*.

ADORATION is of divers kinds, and qualities; ſupreme and ſubordinate, mediate and immediate, abſolute and relalative, internal and external, ſecret and open.

External ADORATION is that performed and ſignified by ſome outward ceremonies. This coincides with what is otherwiſe called ritual *Adoration*.

Internal ADORATION, that conſiſting in the ſincere diſpoſition of mind to honour and obey God. This coincides with ſpiritual *Adoration*, called alſo *Adoration* in ſpirit and in truth.

Solemn ADORATION, that performed in public, with ſtated ceremonies preſcribed by authority. In oppoſition to private, or tacit, or implicit *Adoration*.

The ſolemn *Adoration* of the hoſt, by elevation and other ceremonies now in uſe, is allowed to be a modern thing, unknown before the 13th century, even by the biſhop of Meaux; tho' he aſſerts the internal, or eſſential part to have obtained in all ages; and to be implied in theſe expreſſions of the fathers, that the euchariſt is a terrible and adorable myſtery. V. Ouvr. des Scav. Oct. 1690. p. 73.

Supreme ADORATION, the higheſt degree of religious honour or worſhip rendered to a being, as ſuppoſing him the ſupreme God; in oppoſition to ſubordinate worſhip given to inferior beings [a]. The former amounts to the ſame with what ſome call *latria*, and ſtands oppoſed to *dulia* and *hyperdulia*. Arians and Socinians maintain, that *Adoration* abſolutely ſupreme, is due to none but God the Father. [b] Proteſtants charge Catholics with rendering ſupreme *Adoration* to images, &c. [c]—[a *Wendel.* Theol. Chriſt. l. 2. c. 4. p. 823. [b] Bibl. Choiſ. T. 25. p. 187. Ibid. T. 26. p. 430. ſeq. [c] Jour des Scav. T. 33. p. 961.]

Abſolute ADORATION, that rendered immediately to a being in conſideration of his own eſſential perfections, and terminating in himſelf. This coincides with immediate *Adoration*, and ſtands oppoſed to relative or mediate *Adoration*. The *Adoration* of God the Father is by ſome held alone abſolute, that of the ſon and holy ghoſt, ſay they, ought only to be relative to the Father, and centre or terminate in him [b]. We are to adore the Father, in the Son, by the Holy Ghoſt. Olearius has a diſſertation expreſs on the *Adoration* of the Father, by the Son [c].—[a Nouv. Rep. Lett. T. 40. p. 134. ſeq. [b] Journ. Liter. T. 1. p. 282. Mem. de Trev. An. 1713. p. 1295. [c] See an extract of it in Nouv. Liter. Germ. An. 1709. p. 72.]

Relative ADORATION is that worſhip paid to an object, as belonging to, or repreſentative of another.

In which ſenſe the Romaniſts profeſs to adore the croſs, not ſimply or immediately, which they allow would be idolatry, but in reſpect of Jeſus Chriſt, whom they ſuppoſe to be on it. The Jeſuits in China carry an image of Chriſt under their cloaths, and to this refer mentally the public *Adorations* they offer to Chacinchoan. V. *Paſcal.* Lettr. Provinc. 5.

Proteſtants generally hold the *Adoration* of the hoſt to be idolatrous. Indeed, if it be founded on a tranſubſtantiation of the ſpecies, as ſeveral of the Romiſh communion have allowed, the adorers can have but little ſecurity of its not being idolatry; ſince the miſſal mentions ſome 20 caſes, wherein it may be doubted, whether the converſion be really effected on account of defects in the matter, form, intention, or ordination of the miniſter. This charge others would evade, by founding the *Adoration*, not in the ſuppoſition of a tranſubſtantiation, but of a real preſence. It is ſufficient ſay they, there be any preſence of Chriſt to render the adoration legitimate. V. Work. of Learn. Vol. 2. p. 719.

Perpetual ADORATION is a kind of ſociety or aſſociation of devout perſons eſtabliſhed in Romiſh countries, who take their turns to pray before the euchariſt, regularly relieving each other, ſo that the ſervice never ceaſes day nor night.

The members of the perpetual *Adoration* anſwer to the Acœmeti in the eaſtern church. See ACOEMETI.

We find ſocieties under this denomination in France, Germany, Italy, &c. Thoſe in France are a ſort of parochial congregations. Each perſon is to pray an hour with a taper before him [a]. F. Bern. Cavalieri, preacher to the emperor, introduced the like uſage at Vienna, Milan, and ſeveral other cities, which ſpread ſo much, that in a few years, there were no leſs than 40000 members [b]. —[a V. *Aubert*, ap. *Richelet*. Dict. T. 1. p. 34. [b] Giorn. de Letter. d'Ital. T. 29. p. 377.]

Barbarous ADORATION is a term uſed in the laws of king Canute, for that performed after the heathen manner, who adored idols. *Du Cange*, Gloſſ. Lat. T. 1. p. 66.

The Romiſh church is charged with the adoration of ſaints, martyrs, images, crucifixes, relicks, the virgin and the hoſt; all which by proteſtants are generally aggravated into idolatry [a], on a ſuppoſition, that the honour thus paid to them is abſolute and ſupreme, called by way of diſtinction *Latria*, which is due only to God. Roman catholics on the contrary, explain them, as only a relative or ſubordinate worſhip called *Dulia* and *Hyperdulia*, which terminates ultimately in God alone [b].—[a V Fabric. Bibl. Ant. c. 3. §. 28. p. 281. Act. Erudit. Lipſ. An. 1688. p. 573. [b] V. Jour. des Scav. T. 33. p. 961. Id. T. 16. p. 576. *Du Pin.* Bibl. Eccleſ. T. 18. p. 162.]

May not the ſame be ſaid of the idol worſhip of the antient Heathens?

The Phænicians adored the winds, on account of the terrible effects produced by them; the ſame was adopted by moſt of the other nations, Perſians, Greeks, Romans, &c. Mem. de Liter. de Saleng. Contin. T. 1. P. 1. p. 51. ſeq.

The Troglodytes adored tortoiſes, as ſomething peculiarly ſacred [a]; ſeveral people adored weapons, and inſtruments of war. The Scythians, &c. adored ſwords, the Romans axes, the Arabs ſtones [b], the Indians adored vipers [c], the Bengaleſe [d] and Canadeſe the ſun, the latter of which nations is alſo ſaid to adore the croſs [e]. The Manta, a Peruvian people in the iſland of Puna, antiently adored a huge emerald, of the bigneſs of an oſtrich's egg, by offering to it other emeralds of a leſſer ſize. All which the prieſts kept for their own uſe; the doctrine, as Garcilaſſo obſerves, being founded on their avarice [f].—[a *Plin.* Hiſt. Nat. T. 1. l. 9. c. 10. p. 504. [b] Mem. de Trev. An. 1703. p. 2035. [c] Journ. des Scav. T. 45. p. 538. [d] Id. Tom. 39. p. 526. [e] Bibl. Univ. T. 23. p. 87, 92. *Le Clerc*, Relat. de la Gaſp. ap. Nouv. Rep. Lett. T. 23. p. 92. [f] *Garcil. de la Vega.* Hiſt. des Yncas, ap. Jour. des Scav. Juin. 1707. p. 457, 458.]

Several antient fathers, particularly Juſtin, Origin, and Clemens Alexandrinus aſſert, that God not only permitted the heathens to adore the ſun and ſtars, but that theſe luminaries were even given them for that purpoſe, to be the object of religious worſhip, prevent their falling into atheiſm, and ſerve as means to raiſe them to the true God [g]. This doctrine is founded on a paſſage in Moſes [h], where the Jews are forbid ſuch *Adoration*, as if the prohibition had been given to the Jews only, excluſive of the Gentiles.—[g *Whitby* Diſſ. de S. Script. Interpr. Sec. 5. p. 35. Jour. Liter. T. 6. p. 96. ſeq. Mem. de Trev. An. 1719. p. 82. [h] Deut. c. iv. v. 9.]

The Perſians chiefly paid their *Adorations* to the ſun and fire, ſome ſay alſo to rivers, the wind, &c. The motive of adoring the ſun was the benefits they received from that glorious luminary [i], which of all creatures has doubtleſs the beſt pretenſions to ſuch homage; the inſtitution of the fire-worſhip is uſually referred to Zoroaſter. The retainers to it are called Ignicolæ; by the Perſians, Ghebr, Ateſch, Pereſh [k].—[i *Le Vayer*, Dial. Scept. p. 290. [k] *De Herbel*, Bibl. Orient. p. 144. 726. in Voc. *Ateſch*, *Pereſh*.]

Dr. Hyde reduces the Perſian fire-worſhip to a ſubordinate kind of honour, or ſervice, which he calls pyrodulia, defending that people from any charge of pyrolatria, or idolatry of fire [l]. A late traveller into theſe parts does the ſame [m]. —[l *Hyde*, de Relig. Vet. Perſ. ap. Nouv. Rep. Lett. T. 22. p. 159. [m] *Gemelli Careri*, Voyage, ap. Jour. des Scav. T. 67. p. 473.]

The Greeks and Romans alſo adored fire under the name of Veſta. Pliny mentions the method of adoring lightening, which was by poppiſms, or gentle clappings of the hands. *Plin.* Hiſt. Nat. T. 2. l. 28. c. 2. alſo *Hardouin.* Not. ad loc.

The Jews have been charged by Heathens with adoring the vine [n], an aſſes head, &c. By Chriſtians, with adoring the book of the law; a charge which one of their rabbies has been at the pains to defend them from [o]. The *Adoration* of the golden calf, into which they fell in the wilderneſs, ſeems to have been borrowed, like many other of their ceremonies from the Egyptians [p].—[n *Gaffar.* Curioſ. Inv. in Pref. [o] *Manaſſ. ben Iſrael.* Vindic. Jud. [p] Bibl. Choiſ. T. 3. p. 160.]

The Egyptians are ſaid to have paid *Adoration* to divers animals, plants, fiſhes, &c. the crocodile, the ibis, onions, and I know not what. But thoſe were only ſymbolical, or relative acts of homage; they adored the ſun in a more peculiar manner, under the name of Oſiris. V. Ouvr. des Scav. Oct. 1699. p. 468.

It is diſputed, whether the Chineſe pay divine, or only civil honours to the ſtatues of Confucius, and their anceſtors. That people however, appear to adore heaven; whence the inſcription in all their temples, and which even the Chriſtians are ſaid to have retained in their churches, *King Tien i. e.* adore heaven. V. Nouv. Rep. Lett. T. 18. p. 665.

The Indians are ſaid to adore the devil. Some charge the ſame on the Bramins. V. Bibl. Univ. T. 6. p. 269. Hiſt. des Bramins, P. 2. c. 16. Bibl. Choiſ. T. 13. p. 202.

ADOSCULATION is uſed, by ſome naturaliſts, for a ſpecies of copulation, or impregnation, by mere external contact between the genital parts of the two ſexes, without intromiſſion. *Grew*, Anat. of Plants, c. 5. §. 9.

Such is that of plants, by the falling of the *farina fœcundans* on the piſtil, or uterus.

Divers kinds of birds and fiſhes are alſo impregnated by *Adoſculation*. V. *Grew*, loc. cit.

ADOSSEE is uſed, in heraldry, to denote two figures or bearings, placed back to back. Trev. Dict. T. 1. p. 143.

The arms of the duchy of Bar are two bars *adoſſee*. Dict. de l'Acad. Franc. T. 1. p. 25.

ADOXA, in botany, a name given by Linnæus to the genus of plants, called by other writers *Moſchatellina*. *Linnæi*, Gen. Plant. p. 172. See MOSCHATELLINA.

ADPERCEPTION, in the Leibnitzian ſtyle, denotes the act whereby the mind becomes conſcious to its ſelf of a perception. *Thummig*. Inſt. Pſych. §. 16.

ADQUISITUS, in ſome antient Latin writers of muſic, is uſed for the note, or chord, which the Greeks called προσλαμβανομενος. See DIAGRAM.

ADRASTIA, or ADRASTEA, in antiquity, an epithet given to the goddeſs Nemeſis, or Revenge. Vid. *Strab*. Geogr. l. 13. *Suid*. T. 1. p. 56. in voc. Αδραστια. *Kuſt*. Not. ad eund. *Hoffm*. Lex. Univ. T. 1. p. 64.

It was taken from king Adraſtus, who firſt erected a temple to that deity.

Authors make frequent appeals to the law of Nemeſis Adraſtia, which none may eſcape [a]; by which law, is meant no other than the irreſiſtible force of the cauſe of truth, and a right of vindicating the luſtre of it from all its adverſaries; eſpecially in aſcertaining the cauſes of things; ſo as at length to extort a confeſſion from the adverſaries themſelves [b].—[[a] V. *Gal*. de Uſu Partium, l. 6. c. 12. *Hoffm*. ad Gal. n. 374. [b] *Eraſ*. Adag. Chil. 11. cent. 6. ad 38. *Hoffm*. Lex. Univ. T. 1. p. 64.]

ADRASTIA *certamina*, in antiquity, a kind of Pithian games, inſtituted by Adraſtus king of Argos, in the year of the world 2700, in honour of Apollo, at Sicyon. *Heder*. Schul. Lex. p. 64.

Theſe are to be diſtinguiſhed from the Pithian games celebrated at Delphi.

ADRIANISTS, a branch of Anabaptiſts, the diſciples of Adrian Hamſtedius, in the ſixteenth century, who taught firſt in Zealand, and afterwards in England. Trev. Dict. Univ. T. 1. p. 146. ſeq. *Hoffm*. Lex. Univ. T. 1. p. 65. See ANABAPTIST, *Cycl*.

The *Adrianiſts*, beſides the common dogma of Anabaptiſm, are ſaid to have had ſome peculiar notions relating to the perſon of Chriſt.

Theodoret alſo mentions another elder ſect of *Adrianiſts*, a branch of the Simonians, or followers of Simon Magus, not ſpoken of by any other antient author. 'Tis probable they took their name from that of ſome diſciple of Simon. Dict. Trev. loc. cit.

ADRIUNE, in botany, a name given by the Arabian writers to the plant known at this time by the name of *Cyclamen*, or ſowbread. It has been ſuppoſed by many, that they uſed the word *artanita*, as we do, for a name of this plant; but though the word *arthanita*, or *harthanithe*, is frequent in their works, it appears, on enquiry, that it was the name of a very different plant; a kind of thiſtle, uſed in the cleaning of wooll, and called by the Greeks *ſtruthium*, and by the Romans *lanaria herba*. There is indeed a chapter of Aviſenna, in which the virtues of the *cyclamen*, and the deſcription of the *leontopetalon* of Dioſcorides, are adapted to the *arthanita*; but that author himſelf ſees the error of this, and lays the fault upon the tranſlator of Dioſcorides into Arabic, whoſe verſion both he and Serapion uſed inſtead of the original, and confeſſes that *arthanita* was at that time the name of the *Struthium*, and *Adriune* the name of the *Cyclamen*. *Aviſenna*, l. 2. c. 62.

ADROP, among alchemiſts, denotes either that preciſe matter, as lead, out of which the mercury is to be extracted for the philoſophers ſtone; or it denotes the philoſophers ſtone itſelf, inaſmuch as this is alſo called *Saturn* and *plumbum*, or lead. *Caſtellus*, in voc.

ADSCRIPTS is uſed, by ſome mathematicians, for the natural tangents, called alſo, by Vieta, *Proſines*. *Mackenzie*'s Scot. Writ. Vol. 3. p. 520.

ADSIDELA, in antiquity, a table at which the flamens ſat, when they offered ſacrifice. See FLAMEN, SACRIFICE.

ADSIGNIFICATION, among ſchoolmen, the act of noting, or ſignifying a thing, with the addition of the time when it happened. *Chauv*. Lex. Phil. p. 16. in voc. *Adſignificare*.

ADUAR, a kind of ambulatory village, wherein Arab families inhabit, in a ſort of tents, moveable on occaſion, as forage and proviſions ſuit. Some alſo write the word *Adouar*, and *Adouard*. There are reckoned thirty thouſand *Aduars* in the kingdom of Algiers. V. Jour. des Scav. T. 22. p. 638. *Steph*. Span. Dict. in voc.

ADVENTITIA *cœna*, in antiquity, an entertainment made by the friends of a perſon who had been travelling, by way of welcome at his return. This was otherwiſe called *cœna adventoria*. V. *Pitiſc*. Lex. Ant. voc. *Cœna*.

ADVENTITIOUS, (*Cycl*.)—*Adventitious foſſils*, are foreign or extraneous ones, found incorporated with others, to which they do not properly belong. Such are ſea-ſhells, &c. *Woodw*. Hiſt. Foſſ. T. 1. Pref. p. 16.

ADVENTURE, (*Cycl*.)—A Bill of *Adventure* is a writing ſigned by a merchant, atteſting that the property of goods ſhipped, or ſent away in his name, belongs to another, the *Adventure* or chance whereof the ſaid perſon is to ſtand, with a covenant to account to him for the produce of it. V. Lex. Mercat. p. 42. Treat. of Dom. of Sea, p. 585.

ADVENTURERS is particularly uſed for an antient company of merchants and traders, erected for the diſcovery of lands, territories, trades, &c. unknown.

The ſociety of *Adventurers* had its riſe in Burgundy, and its firſt eſtabliſhment from John duke of Brabant, in 1248; being known by the name of *the Brotherhood of St. Thomas à Becket*. It was afterwards tranſlated into England, and ſucceſſively confirmed by Edward III. and IV. Richard III. Henry IV, V, VI. and VII. who gave it the appellation of *Merchant Adventurers*. *Molloy*. de Jur. Marit. l. 3. c. 7. §. 3. p. 413.

We have ſeveral pieces extant concerning this company; of which Kennet gives an ample catalogue [a]. Such are, the act of parliament for erecting them into a corporation [b]; Letters patents of queen Elizabeth, for granting them divers privileges for fourteen years, for diſcovery of the trade to the Eaſt-Indies [c]; The emperor Rodolph's mandate, baniſhing and proſcribing all Engliſh merchant *Adventurers*, with their hurtful dealings, traffics, and contractings, dated at Prague, Aug. 1. 1597 [d]; Queen Elizabeth's letter to the mayor and ſheriff of London, aſſuring him that ſhe had demanded the emperor Rodolph's mandate to be revoked, or ſuſpended, and, in the mean time, commanded all the emperor's ſubjects to forbear traffic in England, and depart the realm [e]; Atteſtation of the town of Midleburgh, in behalf of the Engliſh company of merchants *Adventurers* there reſiding, dated 7th July, 1600 [f]. Wheeler has publiſhed a treatiſe of commerce, ſhewing the advantages ariſing by a well ordered trade, ſuch as that of the ſociety of merchants *Adventurers* [g].—[[a] Americ. Libr. p. 18, 230. ſeq. [b] Extat ap. Hakluit's Voy. p. 394. [c] Extat ap. Purchas's Pilgrim. T. 1. l. 3. p. 144. [d] Ap. Wheeler, Treat. of Comm. p. 80. [e] Ib. p. 130. [f] Ib. p. 176. [g] Lond. 1601. 4to.]

By our ſtatutes, *Adventurers* making ſettlements in any part of America belonging to the enemy, may obtain a charter from the king. Stat. 13. *Geo*. II. c. 4. ſect. 13.

ADVERBIAL, ſomething relating to *Adverbs*. We ſay an *adverbial* phraſe, *adverbial* expreſſion, &c.

ADVERBIAL *numbers* are ſometimes uſed, to denote once, twice, thrice, &c. *Alſted*. Lex. Philoſ. p. 3252.

ADVERSARIA, (*Cycl*.)—*Adverſaria* amounts to the ſame with *Opiſthographia*, ὑπομνημαλα, or *Memoriale*; and ſtands oppoſed to *Codex*; the former being for occaſional matters which were taken down haſtily, from which they were afterwards tranſcribed into the latter, in a fair, regular manner, for ſtanding uſe.

Morhof ſpeaks much of the uſe and advantages of ſuch *Adverſaria* to men of letters, wherein they may enter down whatever occurs to them worthy of notice, in their reading and converſation, in an eaſy manner, and in the order in which it occurs. This method of making collections, he ſhews, has great advantages over that of digeſting things under certain heads, or common places; although he adviſes, in imitation of merchants, to uſe both methods, viz. a day-book, or journal and leger. *Morhof*. Polyhiſt. l. 3. c. 1. p. 561. ſeq.

ADVERSARIA is alſo a title given to divers books, containing collections of miſcellaneous obſervations, remarks, &c. Bibl. Anc. Mod. T. 28. p. 233.

In which ſenſe, *Adverſaria* amounts to much the ſame with *variæ lectiones*, *variæ obſervationes*, *commentarii*, *lectiones antiquæ*, *loci communes*, *geniales dies*, *veſperæ*, *electa*, *miſcellanea*, &c. *Struv*. Bibl. Ant. §. 7. p. 13.

The works under this denomination are often confuſed, incorrect, full of repetitions, contradictions, &c. V. *Richer*. Obſtet. Anim. p. 171.

ADVERSARIA is alſo uſed for a commentary on ſome text, or writing.

This was ſo called, becauſe the notes were written on the *adverſe* or oppoſite page. *Hoffm*. Lex. Univ. T. 1. p. 67.

ADVERSATOR, in antiquity, a ſervant ſent to wait his maſter's returning from ſupper, and attending him home.

The rich had ſervants in this quality, to give them notice of ſtones, or dangerous places, at which they might be apt to ſtumble. *Pitiſc*. in voc. *Hoffm*. in voc. *Foris*.

ADULT, (*Cycl*.) in a general ſenſe, denotes a thing arrived at fullneſs, or maturity.

We find many things in authors concerning the diſeaſes, the regimen, the diet, &c. of *Adults* [a].—The Chineſe have a peculiar ſchool of *Adults* [b].—[[a] *Welſt*. de Ætate Adult. Paſſim. Act. Erud. Lipſ. 1725. p. 446. [b] V. Act. Erud. Lipſ. 1726. p. 236.]

In the practice of the primitive church, few were admitted to baptiſm till they were of years of diſcretion: St. Chryſoſtom, and St. Gregory Nazianzen, were not baptized before this

age. V. Bibl. Univ. T. 4. p. 118. *Du Pin*, Bibl. Eccleſ. T. 17. p. 95. Nouv. Rep. Lett. T. 45. p. 564.

Several conditions and preparations were required at the baptiſm of *Adults*, or catechumens, beyond what were uſed in that of infants. V. *Durand.* de Ritib. l. 1. c. 19. p. 154. *Bingh.* Orig. Eccleſ. l. 11. c. 5. §. 1. Works of the Learn. T. 3. p. 60. Bibl. Univ. T. 3. p. 507.

ADULT is alſo uſed, in civil law writers, for a youth between fourteen and twenty-five years of age. *Briſſ.* de Verb. Signif. in voc. *Adoleſcentes.*

In which ſenſe, *adultus* is ſynonymous with *juvenis*, *adoleſcens*, or *aduleſcens.*

ADULT *Plants*, a late author obſerves, differ from immature ones, in that they contain more oil, and leſs ſalt; and the ſame he judges will hold of men: but this requires farther examination. Vid. *Terenzoni* ap. Giorn. de Letter. d'Ital. T. 29. p. 317, 318.

ADULTERATION, (*Cycl.*) in matters of pharmacy, denotes a fraudulent corruption of drugs, or medicines, by ſubſtituting ingredients of leſs value, for the ſake of greater gain.

This practice the dealers in all the parts of medicine are but too well acquainted with. Pharmaceutical authors give numerous inſtances of *Adulterations*, both in ſimple and compound medicines. *Horſt.* Diſpenſ. Pharm. Univ. P. 1. l. 4. c. 17. *Goriſ.* Chymia ab inutili verborum pondere liberata. Jour. des Scav. T. 31. p. 1093.

French brandies are ordinarily *adulterated* in England, by the admixture of coarſer ſpirits of our own manufacture, as cyder, malt, melaſſes, and ſugar ſpirits. To detect the cheat, is the buſineſs of what they call *eſſay liquors*, &c. See PROOF, ESSAY, &c.

This *Adulteration* is little practiſed either in France or Holland, for want of cheaper ſpirits to *adulterate* withal, thoſe of melaſſes, or treacle, being prohibited in both countries: in the latter, they chiefly *adulterate* with ſpirits drawn from wine lees. *Shaw*, Eſſay on Diſtillat. §. 5. p. 134.

The *crimen Adulteratorum vinorum* is an offence, whereby wicked perſons, whether vintners, innkeepers, or even carriers, mariners, apothecaries, or others, impregnate their wines with noxious, or prohibited drugs, and hereby bring the healths and lives of men in danger, caſt a damp on the commerce of the place, defraud both buyers and ſellers, and occaſion various grievances to the community; and this for their own private gain. M. Weber, a German profeſſor, has a diſcourſe expreſs on this crime, occaſioned by the execution of a vintner at Stutgard, for ſelling ſour unripe wines, *adulterated* with noxious drugs, eſpecially litharge, contrary to a ſtrict prohibition of the duke of Wirtemberg. He enumerates the ſeveral laws and proviſions made againſt this crime, among the Romans, the Greeks, Germans, French, &c. particularly by the emperors Frederic III. Maximilian I. Rudolph II. &c. in the diets of Worms, Augſbourgh, &c. with the ſeveral penalties decreed by them, viz. pecuniary fines, forfeitures, whipping, *amende honorable*, and in ſome caſes death: alſo the divers manners of *adulterating*, as with water, milk, ſulphur, and, which is worſt of all, litharge. *Weber*, Diſp. Jurid. Crimen. Adulterator. Vinor. 4to. an. 1708. an extract of which is given in Nov. Liter. Germ. an. 1708. p. 433. ſeq.

By the Engliſh laws, the ſeller of *adulterated* wines forfeits 300 pounds. Stat. 1. *W.* & *M.* c. 34.

The emperor Frederic was very ſevere on the *adulterators* of wine with water; who, for the firſt offence, were mulcted a pound of gold; for the ſecond, loſt their right hand; and for the third, were hanged. Cantharus, the famous vintner of Athens, who gave occaſion to the proverb, *Cantharo aſtutior*, was put to death for no other crime. Conſtit. Sicul. l. 3. tit. 36.

The practice of *adulterating* wine with litharge ſpread much about the year 1696, in the duchy of Wirtemberg; and gave occaſion to great complaints and diſputes, an epidemical colic, which then raged, being attributed to it. V. *Camerar.* Diſp. de Colic. Tubing. 1698.

ADULTERATION *of coin* properly imports the making, or caſting, of a wrong metal, or with too baſe or too much alloy.

In which ſenſe, *adulterating* is ſomewhat leſs extenſive than *debaſing*, which includes diminiſhing, clipping, &c.

Evelyn gives rules and methods, both of *adulterating* and detecting *adulterated* medals, &c. *Evel.* Diſſ. on Medals, c. 6. p. 209. ſeq.

Adulterations of coins are effected divers ways, as, by forging another ſtamp, or inſcription; by mixing impurer metals with the gold, or ſilver: moſt properly, by making uſe of a wrong metal, or an undue alloy, or too great an admixture of the baſer metals with gold, or ſilver. Counterfeiting the ſtamp, or clipping and leſſening the weight, do not ſo properly come under the denomination of adulterating. *Hoffm.* Lex. Univ. T. 1. p. 68. in voc. *Adulterare.* Act. Erud. Lipſ. an. 1696. p. 87.

The *adulterating* of gems is a curious art, and the methods of detecting it no leſs uſeful. Vid. *Nichols*, Lapid. p. 18. ſeq.

ADULTERESS, a woman who commits *adultery.*

Adultereſſes are ſuch either by the canon, or civil law.

According to the former, a woman is an *Adultereſs* who either being herſelf married converſes carnally with another man; or being ſingle herſelf, converſes with a man that is married.

According to the latter, ſhe is not an *Adultereſs*, if ſhe be not herſelf in the married ſtate, though ſhe converſes with a man that is. The crime in this caſe was more properly called *ſtuprum* than *adulterium:*

Hence, among the Romans, the word *Adultera*, Adultereſs, differed from *pellex*, which denoted a ſingle woman, who cohabited with a married man: and *pellex* differed from *concubina*, which ſignified her who had only to do with an unmarried man. The former was reputed infamous, and the latter innocent. V. *Heinec.* Com. ad Leg. Jul. ap. Jour. des Scav. T. 82. p. 123. *Cujac.* Obſerv. 20.

The Jews had a particular method of trying, or rather purging an *Adultereſs*, or woman ſuſpected of the crime, by making her drink the bitter waters of jealouſy; which, if ſhe were guilty, made her ſwell.

The hiſtory of the *Adultereſs* acquitted by Chriſt, as related in St. John, has occaſioned great diſputes among critics and commentators. V. *Calm.* Dict. Bibl. T. 1. p. 54.

Many have doubted of its authenticity; ſuſpecting it for an interpolation of the text made by Papias, either from the Goſpel of the Nazarenes, in which alone it was found in the time of Euſebius, or at moſt, from apoſtolical tradition. The reaſons of the ſurmiſe are, that it was not in the text in the time of Euſebius; that it is ſtill wanting in moſt of the antient Greek MSS. particularly in the Alexandrian, and in the Syriac and Coptic verſions, though found in the Latin and Arabic copies; that it was unknown in the antient Greek church, though owned by the Latins, and even found in St. Irenæus; that it is omitted by the Greek fathers, in their commentaries on this book, as St. Chryſoſtom, Cyril, &c. though the Latin fathers, as Jerom, Auguſtine, &c. ſpeak of it as authentic; that Euthymius is the only Greek who mentions it, and he does it with this addition, that it is not found in the beſt copies. Beza ſeems to reject it, Calvin adopts it; F. Simon doubts of it, Grotius explodes it; F. St. Honore, and others, defend it. M. Le Clerc ſuggeſts, as if it had been borrowed from an obſcene adventure of Menedemus in Diogenes Laertius; for which he has undergone ſome ſevere reflections. Origen is ſaid to have expunged it out of many copies. Scherzer has a treatiſe expreſs on the woman that was an *Adultereſs.* For the particulars, ſee *Scherz.* Hiſt. Adulteræ, ex Joan. *c.* viii. Lipſ. 4to. 1671. Ouvr. des Scav. Sept. an. 1706. p. 404. ſeq. Nouv. Rep. Lett. T. 15. p. 245. It. T. 23. p. 176. It. T. 44. p. 56. Bibl. Anc. Mod. T. 7. p. 202. Jour des Scav. T. 22. p. 580. Bibl. Choiſ. T. 16. p. 294. *Honor. de St. Marie*, Reflex. ſur Regl. de Crit. diſſ. 2. p. 119. *Mackenz.* Scot. Writ. T. 2. p. 313. Mem. de Trev. an. 1710. p. 802. Bibl. Univ. T. 12. p. 436. *Du Pin*, Bibl. Eccleſ. T. 29. p. 318. It. in Diſſ. Prelim. l. 2. c. 2. §. 6. *Simon*, Not. ſur le Nouv. Teſt. T. 2. p. 54. Act. Erud. Lipſ. an. 1704. p. 82. It. an. 1708. p. 5. Vid. *Le Clerc*, Not. ad Hammond, in loc. *La Croze*, Diſſ. Hiſtor. p. 56. Hiſt. Crit. Rep. Lett. T. 9. p. 342. Jour. Liter. T. 12. p. 136.

ADULTERINE, (*Cycl.*)—ADULTERINE *marriages*, in St. Auſtin's ſenſe, denote ſecond marriages, contracted after a divorce.—That father has a celebrated treatiſe on *adulterine marriages*, wherein he undertakes to ſhew the unlawfulneſs of them. His arguments have been examined and refuted by Schilter. De Adulterinis Conjugiis, &c. cum Notis Schilteri. Extracts of it are given in Act. Erud. Lipſ. 1698. p. 339. ſeq. and in *Du Pin*, Bibl. Eccleſ. T. 3. p. 226.

ADULTERINE *writings* denote ſpurious, or ſuppoſititious ones. —Thus we read of *adulterine* dialogues of Plato. Eſſ. de Liter. T. 2. p. 46.

ADULTERINE *coins* are thoſe which are either debaſed as to quantity, or counterfeit as to quality. See ADULTERATION.

Divers rules are given for diſtinguiſhing *adulterine* coins from genuine ones. V. Act. Erud. Lipſ. 1694. p. 229.

ADULTERINE *balance*, *adulterina ſtatera*, among civilians, denotes an unequal or fraudulent one.

ADULTERINE *key*, *adulterina clavis*, is a falſe or counterfeit one.—*Adulterinum ſignum* is that made with another ſeal, &c. *Briſſ.* de Verb. Signif. *Calv.* Lex. Jur.

ADULTERINE *children* are not eaſily diſpenſed with for admiſſion to orders. Thoſe are not deemed *adulterine*, who are begotten of a woman openly married, through ignorance of a former wife being alive. *Du Cange*, Gloſſ. Lat.

By a decree of the parliament of Paris, *adulterine children* are declared not legitimated by the ſubſequent marriage of the parties, even though a papal diſpenſation be had for ſuch marriage, wherein is a clauſe of legitimation. Act. Erud. Lipſ. an. 1685. p. 156.

ADULTERY, (*Cycl.*)—Moraliſts, and canoniſts, and divines, have diſtinguiſhed ſeveral ſpecies of *Adultery*, as,

Manifeſt ADULTERY, that wherein the parties are caught ἐν ἔργῳ, in the fact, or as ſome expreſs it, *Res in Re.*

On

On such occasions, strangers or people not interested in the family, have been allowed to accuse, and prosecute women for *Adultery*, either if committed during a husband's long absence, or thro' his connivance.

Occult or *secret* ADULTERY, that kept concealed from the knowledge of the world, and only divulged to a confessor or the like.—In the canon law this is most favourably dealt with; persons were admitted to penance for this, and absolved, who were refused it for the open kind. *Du Cange*, Gloss. Lat. T. 1. p. 75. seq.

Presumptive ADULTERY, that which is only discovered or inferred from certain signs, or indications. Such are the parties being found in bed together, *Nudus cum Nuda*.

Interpretative, or *reputed* ADULTERY, denotes an act which tho' properly not included under the denomination, yet is reputed as equivalent thereto, and accordingly punished as such.

Thus mixed marriages between Christians and Jews, *e. g.* between a christian man, and a jewish woman, are put by the laws of Arcadius, and Honorius, on the footing of *Adultery*. *Fabric.* Lux Verit. c. 13. p. 281. Observ. Halens. T. 10. Obs. 10. §. 26. p. 372.

So also second marriages are called by some fathers, as Athenagoras, and St. Ambrose, an honourable or better sort of *Adulteries*. *Budd.* Isag. Theol. l. 2. c. 4. p. 621. Bibl. Rais. T. 1. p. 300. seq. & 323.

Improper ADULTERY includes other extraordinary cases and species; such are the commerce with a woman only espoused, not actually married; with a married woman who lives as a common whore; with a married woman taking her for single; with a putative wife, or concubine, taking her for a real wife; and with a nun, who by her vows is doomed espoused.

Figurative ADULTERY, that intended only to represent, or prefigure another fact, or convey some other instruction. This coincides with typical, or allegorical *Adultery*, and stands opposed to actual. Thus David's *Adultery* is said by St. Ambrose to be a type of Christ, who notwithstanding his former wife the jewish church, married the Gentiles [a]. So also the *Adultery* of Mars and Venus, is turned into an allegory by naturalists, moralists, alchemists [b], &c.—[[a] Nouv. Rep. Lett. T. 54. p. 233. [b] *Bossu.* du Poem. Epiq. l. 5. c. 2. p. 413.]

Single ADULTERY is that where only one of the parties is married, in contradistinction from double *Adultery*, which is, where both parties are married. *Calv.* Lex. Jurid. 117. c. 8.

Incestuous ADULTERY, that wherein the parties are related within the third degree of consanguinity.

Licit ADULTERY, that not prohibited by any express or known Law.

It has been disputed whether *Adultery* be *malum in se*, or only *malum prohibitum*, i. e. evil in itself, or only rendered evil, by virtue of positive laws, and prohibitions [c]. St. Ambrose and some others have maintained, that *Adultery* was not criminal before the mosaic law [d].—[[c] *Hobb.* de civ. c. 6. §. 16. p. 110. [d] V. *Budd.* Isag. l. 2. c. 4. p. 634. Id in Hist. Eccles. Par. 1. Sec. 1. T. 2. p. 106.]

It has been controverted, whether *Adultery* may be lawfully committed in war, with the enemies wives [e]? The answer is in the negative, and the authorised practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit *Adultery* with the consent of her husband, and for the procuring some great good to him? St. Austin apparently allows of it, at least, does not condemn it. His reasons are, that as married people have a right to the use of each others bodies, they may transfer that right to whom they please; a doctrine which he allows indeed, will not generally hold under the gospel, but concludes, there may be particular cases, wherein it may lawfully take place, as to save the life of a husband, or wife [f]; as in the celebrated case of Acindymus governor of Antioch [g]. This father places the essence of *Adultery*, in the desire of carnal pleasure, a principle which will involve equally the greater part of people lawfully married, under the crime of *Adultery* [h].—[[e] *Vitriar.* Inst. Jur. Nat. Lib. 3. c. 4. Quest. 13. [f] *August.* de Serm. Dom. in Mont. l. 1. c. 16. §. 49. ejusd. de Civ. Dei. l. 16. c. 25. [g] *Bayle*, Dict. Crit. T. 1. p. 64. seq. in Voc. *Acindymus*. [h] V. *Barbeyrac* Traité de la morale des Peres. c. 16. Pref. Stat. Rep. Lett. T. 2. p. 23. seq. Bibl. Raison. T. 3. p. 70.]

On the like footing stands that other dispute, whether it be lawful for one of the parties married to commit *Adultery*, with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who on this account conversed with Hagar; and of Cato, who for the same reason lent his wife Marcia to his friend Hortensius. The like was allowed among the Greeks: thus by the laws of Athens, an heiress was permitted, in case she found her husband defective, to make use of his nearest relation [i]. Lycurgus introduced the like practice among the Spartans, as the best expedient to prevent jealousy; laughing at those who thought the violation of their bed such an insupportable affront, as to revenge it with cruel murthers and wars. He even encouraged people who had handsome wives, and were in no great likelihood of having a breed themselves, to admit healthy, able bodied men to converse with them; the issue of such conversations was esteemed and loved by them as if they were their own [k]. Only kings were exempt from this law, to preserve the royal blood unmixt.—[[i] *Potter*. Archæol. l. 4. c. 12. T. 2. p. 298. [k] *Strab.* Geogr. l. 7.]

Pollman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use. V. Nouv. Liter. Germ. An. 1707. p. 316.

Illicit ADULTERY, that which is expressly contrary to some obligatory law: such, according to the generality of casuists, is all *Adultery*, proper, improper, single, double, open, and occult; by reason of a natural baseness or turpitude in the thing, as well as its being a violation of conjugal faith, and injury to our neighbour.

In effect, punishments have been annexed to *Adultery* in most ages and nations, tho' of different degrees of severity. In many it has been capital, in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are serious, and even cruel, others of a jocose and humorous kind. Even contrary things have been enacted as punishments for *Adultery*. By some laws, the crimimals are forbid marrying together, in case they become single; by others, they are forbid to marry any besides each other; by some, they are incapacitated from ever committing the like crime again; by others, they are glutted with it till it becomes downright nauseous. See the *Cyclopædia*, and Act. Erud. Lipsi. An. 1690. p. 325. Id. 1687. p. 6. Bibl. Univ. T. 11. p 179.

Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father in such cases, returned the dower he had received from her husband, which some think, was refunded by the adulterer. Another punishment among those people was, putting out the eyes of adulterers. *Potter*, ubi supr. p. 301. seq.

The Athenians had an extraordinary way of punishing adulterers, called παραλιλμῶ· αραφανοιδωσις, practised at least on the poorer sort, who were not able to pay the fines. This was an awkward sort of empalement, performed by thrusting one of the largest raddishes up the *anus* of the adulterer, or in defect thereof, a fish with a large head called *Mugil*, Mullet. Alcæus is said to have died this way, tho' it is doubted whether the punishment was reputed mortal. Juvenal and Catullus speak of this custom, as received also among the Romans, tho' not authorized by an express law, as it was among the Greeks. V. *Salmuth.* ad Pancirol. P. 2. Tit. 2. p. 87. *Pott.* lib. cit. p. 304. *Bayle* Dict. Crit. T. 1. p. 135. in Voc. *Alcee*. *Hoffm.* Lex. Univ. *Suid.* Lex. T. 3. p. 40. and 252. in Vocib. παραλιλλείαια, ραφανις. *Juv.* Sat. 10. v. 317. *Catull.* Epig. 15.

Among the Mingrelians, adultery is punished with the forfeiture of a hog, which is usually eaten in good friendship between the gallant, the adulteress, and the cuckold. *Chardin*, Voy. T. 1. p. 47. Bibl. Chois. T. 23. p. 359. Nouv. Rep. Lett. T. 8. p. 1068.

In some parts of the Indies, it is said any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her, to have been rated so high. *Montaigne*, Ess. l. 3. c. 5. p. 878.

Adultery is said to be so frequent at Ceylon, that not a woman but practises it, notwithstanding its being punishable with death. Bibl. Univ. T. 23. p. 237.

Nor does it seem to have been less familiar among the antient Egyptians, inasmuch as when their blind king Pheron was told by an oracle, that he could only recover his sight by washing his eyes in the water of a woman, who had never known man, beside her own husband; it was a long time e'er all Egypt could afford him a drop for the purpose. V. *Herodot.* ap. Hist. Acad. Inscript. T. 1. p. 241. Nouv. Rep. Lett. T. 52. p. 29.

Among the Japonese, and divers other nations, *Adultery* is only penal in the woman [a]. Among the Abyssinians, the crime of the husband is said to be only punished on the innocent wife [b]. In the Marian islands on the contrary, the woman is not punishable for *Adultery*; but if the man go astray, he pays severely: the wife and her relations waste his lands, turn him out of his house, &c. [c]—[[a] *Turner*. Hist. Relig. p. 484. [b] *Lobo*, Voyage d'Abyss. ap. Bibl. Rais. T. 1. p. 59. [c] Nouv. Rep. Lett. T. 25. p. 321.]

It is controverted whether, among the Romans, *Adultery* was allowed to be compounded? Noodt shews that it might, after the crime was rendered capital, not before; which seems directly to thwart the constitution of the emperors Diocletian and Maximian, where *Adultery* is declared the only capital crime excepted from composition. M. Noodt takes the words *excepto adulterio*, for an interpolation. De Transact. & Pact. Crim. ap. Jour des Scav. T. 33. p. 1139. Ouv. des Scav. Oct. 1704. p. 469. Bibl. Chois. T. 4. p. 306. seq.

By an edict of the emperor Antoninus, the husband was not allowed to bring an action of *Adultery* against his wife, unless he himself were innocent; the reason given for it is very natural, *periniquum enim videtur esse ut pudicitiam vir ob uxore exigat, quam ipse non exhibeat*. V. Mem. de Trev. 1723. p. 1179. Bibl. Univ. T. 25. p. 95.

There are various conjectures concerning the antient punishment of *Adultery* among the Romans. Some will have it to have been made capital, by a law of Romulus, and again by the twelve tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in the early days was very various, much being left to the discretion of the husband and parents of the *adulterous* wife, who exercised it differently, rather with the silence and countenance of the magistrate, than any formal authority from him. Thus we are told the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and, as it were, with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean, or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer [d]. On many occasions, however, revenge was not carried so far, but mutilating, castrating [e], cutting off the ears, noses, &c. served the turn. The punishment allotted by the *lex Julia*, was not, as many have imagined, death; but rather banishment, or deportation, being interdicted fire and water: though Octavius appears, in several instances, to have gone beyond his own law, and to have put *Adulterers* to death. Under Macrinus, many were burnt at a stake [f]. Constantine first by law made the crime capital [g]. Under Constantius and Constans, *Adulterers* were burnt, or sewed in sacks and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose. Under Justinian, a further mitigation was granted, at least in favour of the wife, who was only to be scourged, lose her dower, and be shut up in a monastery: after two years, the husband was at liberty to take her back again; if he refused, she was shaven, and made a nun for life: but it still remained death in the husband [h]. The reason alledged for this differencce is, that the woman is the weaker vessel. Matthæus declaims against the empress Theodora, who is supposed to have been the cause of this law, as well as of others procured in favour of the sex from that emperor [i].—[d *Gell.* Noct. Att. l. 10. c. 23. *Ridley*, View of Civ. Law, p. 130. e *Simon*, Impot. Conjug. c. 9. th. 2. p. 16. seq. f *Capitol.* in Vit. Macrin. c. 12. Bibl. Univ. T. 25. p. 232. l. 30. c. de *Adulter.* g *Noodt*, ubi supra. *Brisson.* ad Leg. Jul. de Adulter. p. 150. *Bayle*, Dict. in voc. *Sengebers*, n. B. h Nov. 117. c. 8. Nov. 134. c. 10. Observ. Halens. T. 12. p. 218. i *Matth.* de Crimin. p. 377.]

Under Theodosius, women convicted of this crime were punished after a very singular manner, viz. by a public constupration; being locked up in a narrow cell, and forced to admit all the men to their embraces that would offer themselves. To this end, the gallants were to dress themselves on purpose, having several little bells fastened to their cloaths, the tinkling of which gave notice to those without of every motion. This custom was again abolished by the same prince. *Socrat.* Hist. Eccles. l. 5. c. 18. *Brantome*, Mem. T. 3. p. 282. seq. *Bayle*, Dict. Crit. T. 1. p. 411. in voc. *Babelot*, Not. (C.)

In England, *Adultery* is reckoned a spiritual offence, that is, cognizable by the spiritual courts. The common law takes no farther notice of it, than to allow the party grieved an action of damages. This practice is often censured by foreigners, as making too light of a crime, the bad consequences of which, public as well as private, are so great. But, perhaps this penalty, by civil action, is more wisely calculated to prevent the frequency of the offence, which ought to be the end of all laws, than a severer punishment. He that by a judgment of law is, according to circumstances, stripped of great part of his fortune, thrown into prison till he can pay it, or forced to fly his country, will, no doubt, in most cases, own, that he pays dearly for his amusement.

It is much disputed, whether *Adultery* dissolves the bond of matrimony, and be a sufficient cause of divorce, so that the parties may marry again. k This was allowed in the antient church, l and is still continued in the Greek, m as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent n even anathematized those who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Cephalonia, &c. the contrary usage obtains. The difference arises, in a great measure, from this; that in St. Matthew's gospel, Christ is represented as disallowing divorce in any case, except that of fornication, (by which is to be understood *Adultery*) whereas the other evangelists, in reciting the same transaction, omit the exception. The question then is, *utri credetis?* which will you believe? Protestants prefer Matthew, Papists Mark, &c. The ecclesiastical courts in England so far agree with the Papists, that they only grant a divorce *a mensa & thoro*, in case of *Adultery*; so that a compleat divorce, to enable the parties to marry again, cannot be had without an act of parliament. —[k *Du Pin*, Bibl. Eccles. T. 8. p. 16, 115, 127. seq. Act. Erud. Lipf. an. 1698. p. 340. l Nouv. Rep. Lett. T. 1. p. 511. Act. Erud. Lipf. an. 1687. p. 377. m Jour. des Scav. T. 72. p. 614. n Nouv. Rep. Lett. T. 12. p. 93.]

By a council of Nantes, marriage was declared dissolved by *Adultery*, but the innocent party was not allowed second marriage [o]. In after times, leave was given the innocent party alone; and afterwards the same was also allowed the criminal party [p].—[o Act. Erud. Lipf. 1687. p. 377. p *Brouer.* de Jur. Connub. ap. Jour. des Scav. T. 58. p. 20.]

ADULTERY is also used in antient customs, for the punishment, or fine imposed for that offence, or the privilege of prosecuting for it. *Spelm.* Gloss. p. 19.

In which sense, *Adulterium* amounts to the same with what the Saxons called *Legerwita.*

ADULTERY is sometimes used, in a more extensive sense, for any species of impurity, or crime, against the virtue of chastity: and in this sense divines understand the seventh commandment.

ADULTERY is also used, especially in Scripture, for idolatry, or departing from the true God, to the worship of a false one.

ADULTERY is also used, in ecclesiastical writers, for a person's invading, or intruding into a bishopric, during the former bishop's life. The reason of the appellation is, that a bishop is supposed to contract a kind of spiritual marriage with his church. *Du Cange*, Gloss. Lat.

The translation of a bishop from one see to another was also reputed a species of *Adultery*; on the supposition of its being a kind of second marriage, which, in those days, was esteemed a degree of *Adultery*. This conclusion was founded on that text of St. Paul, *Let a bishop be the husband of one wife*, by a forced construction of church for wife, and of bishop for husband. *Du Cange*, loc. cit.

ADULTERY is also used, in antient naturalists, for the act of engrafting one plant upon another.

In which sense, Pliny speaks of the *Adulteries* of trees, *arborum adulteria*, which he represents as contrary to nature, and a piece of luxury, or needless refinement. Ouvr. des Scav. Juin. 1695. p. 458. Mem. de Trev. 1724. p. 2257.

ADVOCARIA, in middle age writers, a tax paid the lord, for his protection; sometimes also called *Salvamentum.* *Du Cange*, Gloss. Lat. T. 1. p. 88.

ADVOCATE, ADVOCATUS, (*Cycl.*)—Among the Romans, when a trial came on, the parties usually invited all their friends, of any interest or authority, to assist them with their countenance and protection, in order to render the judges, &c. favourable: these were the original *Advocati.* V. *Ascon.* in Cicer. Verin. *Calv.* Lex. Jur.

Advocates took their first origin from the *jus patronatus.* The patricians performed the office for their clients among the plebeians [a]. Upon entering an action, the parties frequently petitioned the prætor to grant them *Advocati*, which was done accordingly [b]. On this occasion, Cicero [c] relates a pleasant answer of a Sicilian, who having a very rich, but silly and ignorant person assigned him for a patron, addressed the prætor thus: *Quæso, prætor, adversario meo da istum patronum: deinde mihi neminem dederis.*—[a V. Bibl. Franc. T. 4. p. 133. b *Pitisc.* Lex. Ant. *Briss.* de Verb. Signif. voc. *Advocationes.* c De Orat. l. 2. *Briss.* de Form. l. 5. p. 358.]

The *Advocates* were seated in rows, on equal benches; and when it came to any one's turn to speak, he stood up; though some of the more distinguished, we are told, had the privilege of speaking seated. Their ordinary habit was the *toga*; whence we find them frequently distinguished by the name *Togati:* though, on some occasions, they pleaded in the *penula.* *Baxt.* Gloss. Ant. Rom. *Pitis.* loc. cit.

We find great complaints of the ignorance of *Advocates* under Valens and Valentinian; and of their tyranny and frauds under most of the emperors: no names have been thought bad enough for them; public robbers, hawks, hungry dogs, vultures in gowns, &c. V. *Ammian. Marcellin.* l. 30. c. 4. *Groning.* Diss. de Næv. Corp. Jur. §. 9. *Meibom.* Præf. ad Vogler. Introd. p. 125. Misc. Lipf. T. 4. p. 209. Jour. des Scav. T. 38. p. 165.

'Tis controverted, whether an *Advocate* may lawfully meddle with the procuration, or soliciting of causes. M. le Sure has a discourse expres to shew he may, nay, and in some cases ought, without either depreciating the dignity of his office, or incroaching on that of the proctors, &c. *e. gr.* in behalf of his friends, relations; but then he is to do it *gratis.* Vid. Jour. des Scav. T. 86. p. 55. seq.

'Tis disputed, whether an *Advocate* is obliged to defend all causes committed to him [d]; and whether, notwithstanding the oath he has taken, he may, in good conscience, undertake the defence of a cause, which he knows to be bad [e]. Cicero maintains the affirmative, agreeably to the principles of the academics [f]. The like has also been solemnly decided by the states of Friezeland, with this restriction, that the *Advocate* say or do nothing, but at the expres requirement of the parties. But Papinian chose rather to have his head cut off, than undertake the defence of Caracalla's murder of his brother Geta. Schertzer has a dissertation expres on the point, wherein he maintains the negative against Cicero [g].—[d *Albert.* Jurispr. Med. P. 1. p. 392. §. 2. e Act. Erud. Lipf. 1689. p. 304. f Vid. Nouv. Rep. Lett. T. 52. p. 311. g De Patrono malæ Causæ. V. Nouv. Liter. Germ. an. 1706. p. 278.]

Advocates are usually supposed to have a privilege of lying [h]: yet it is disputed, whether they are allowed to make use of false colours, tricks, stratagems, &c. even in behalf of a cause which they are convinced is good [i]. Casuists generally deny it.—[h *Puffendorff*, Jus. Nat. & Gent. p. 264. i *Bronchorst.* de Reg. Jur. p. 218, 220. Act. Erud. Lipsi. an. 1693. p. 338.]

Advocates say, that their fees are *honorarium*, *non mercenarium*; and accordingly, the *Advocates* of the chief courts of Paris have waved the right of bringing actions for their fees, piquing themselves on taking nothing but what is voluntary [a]. The German lawyers are less delicate; they pretend not only to a right of action, but to the preference to all other creditors in the same cause, and to a right of retaining their clients writings till the fees are paid [b].—[a Ouvr. des Scav. Mai 1706. p. 194. Jour. des Scav. T. 49. p. 294. b Act. Erud. Lipsi. an. 1696 p. 65.]

Juridical ADVOCATES, in the middle age, were those who from attending causes, in the court of the Comes, or count of the province, became judges themselves, and held courts of their vassals thrice a year, under the name of the *tria placita generalia*.

In consideration of this further service, they had a particular allowance of one third part of all fines, or mulcts imposed on defaulters, &c. which was called *tertia bannorum pars*, *tertius denarius*, *tertia pars compositionum*, *tertia pars legum*, or *emendarum*, &c. Besides a proportion of diet for themselves and servants.

Elective ADVOCATES, those chosen by the abbot, bishop, or chapter, a particular licence being had from the king, or prince for that purpose. The elections were originally made in the presence of the count of the province.

Nominative ADVOCATES, those appointed by a king, or pope. Sometimes the churches petitioned kings, &c. to appoint them an *Advocate*; at other times, this was done of their own accord. By some regulations, no person was capable of being elected *Advocate*, unless he had an estate in land in the same county.

Military ADVOCATES, those appointed for the defence of the church, rather by arms and authority, than by pleading and eloquence.

These were introduced in the times of confusion, when every person was obliged to maintain their own by force; bishops and abbots not being permitted to bear arms, and the scholastic or gowned *Advocates*, being equally unacquainted with them, recourse was had to knights, noblemen, soldiers, or even to princes.

But the office became greatly abused, insomuch that from being *Advocates*, they proved the tyrants and oppressors of their churches. History is full of complaints against them, and of royal regulations, and papal laws for restraining, and keeping them within bounds. They had their settled stipends, and allowances, of provision, perquisites, &c. which not contented with, they invaded the church lands themselves, appropriated many of them to their own uses, and made them hereditary in their families. V. *Matth.* de Nobil. l. 2. c. 28. Bibl. Univ. T. 1. p. 97. *Du Pin.* Bibl. Eccles. T. 17. p. 242. It. T. 10. p. 136. Jour. des Scav. T. 86. p. 56. Act. Erud. Lipsi. 1683. p. 58. Bibl. Germ. T. 6. p. 163.

Feudal ADVOCATES. These were of the military kind, who, to tie them the firmer to the interest of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the bishop or abbot. These were to lead the vassals of the church to war, not only in private quarrels of the church itself; but in military expeditions for the kings service, in which they were the standard-bearers of their churches. *Aquin.* Lex. Milit. Mem. de Trev. 1712. p. 1338.

Supreme or *Sovereign* ADVOCATES were those, who had the authority in chief, but acted by deputies, or subordinate *Advocates*. These were also called principal, greater, and sometimes general *Advocates*.—Such in many cases were kings, &c. when either they had been chosen *Advocates*, or became such by being founders, or endowers of churches.—Thus Charlemaign had the title of *Advouee*, or *Advocate* of St. Peter's. And Bolandus mentions some letters of pope Nicholas, by which he constituted king Edward the confessor, and his successors, *Advocates* of the monastery at Westminster, and of all the churches in England.

Princes had also another title to *Advocate*-ship, some of them pretending to be *Advocati nati*, of the churches within their dominions. The German emperors claimed great authority in the electing of a pope, on account of their quality of *Advocate* of the universal church; a quality which has been much contested them. V. Nouv. Rep. Lett. T. 13. p. 742. Bibl. Anc. Mod. T. 20. p. 215. Act. Erud. Lipsi. 1688. p. 148.

Subordinate ADVOCATES, those appointed by other superior ones, acting under them, and accountable to them.

These were called by various other names, as *Sub-advocates*, *Pro-advocates*, *Post-advocates*, *Vice-advocates*, *Second Advocates*, *Sub-defensores*, *Sub-advocatores*, *Advocati infeudati*, *Advocati feudales*, and *minor Advocates*.

There were divers reasons for the creation of these subordinate *Advocates*; as, the superior quality of the principal *Advocate*, his being detained in war, or being involved in other affairs; but chiefly the too great distance of some of the church lands, and their lying in the dominions of foreign princes. On these and the like considerations, they became multiplied to such a degree, as grew exceedingly burthensome to the churches; there being a several *Advocate* for almost every estate, or farm; instead of defenders, they proved the severest oppressors. This put the bishops, &c. upon an expedient, which was, by imposing a condition at the time of electing an *Advocate*; that he should not have the power to appoint a *Sub-advocate*, without the consent of the church. In the council of Rheims held in 1148, the power of *Sub-advocates* was totally abrogated.

Matricular ADVOCATES were the *Advocates* of the mother, or cathedral, churches. V. *Du Cange*, Gloss. Lat. in Voc. *Advocati*. T. 1. p. 78. seq.

Regular ADVOCATES, those duely formed and qualified for their profession, by a proper course of study, the requisite oath, subscription, licence, &c.

ADVOCATIA, in the feudal law, the procuration of some public business, committed by a superior to his substitute. *Hotoman.* de Verb. *Feud. Calv.* Lex. Jur.

ADVOCATIA is also used for the patronage and protection of a church, college, monastery, and the like.

In which sense it amounts to the same with *Advowson*. See ADVOWSON, *Cycl.*

ADVOCATIA is also used for the protection or defence of lay persons, estates, &c. *Du Cange*, Gloss. Lat. T. 1. p. 88. Trev. Dict Univ. T. 1. p. 163. in Voc. *Avouerie*.

ADVOCATION, *Advocatio*, in the civil law, the act of calling another to our aid, relief, or defence. *Pitisc.* Lex. Ant. T. 1. p. 33. *Calv.* Lex. Jurid. p. 47. See ADVOCATE, *Cycl.* and *Suppl.*

Letters of ADVOCATION, in the law of Scotland, those granted by the Lords of session, upon complaint of a person sued before an incompetent judge. By these letters, the lords of session advocate, that is, call that cause from the incompetent judge to themselves.

If after letters of *Advocation* are intimated to that judge, he yet proceeds, his decree will be null, as given *spreto mandato*. *Mackenzie*, Instit. B. 1. Tit. 2.

ADVOCATURA, in writers of the middle and barbarous age, denotes an inferior kind of jurisdiction, exercised by advocates within the districts of their respective churches, &c. The word is sometimes used as synonymous with *Advocatia*. *Du Cange*, Gloss. Lat. T. 1. p. 90.

ADVOWSONS, (*Cycl.*)—Colleges holding more *Advowsons* in number, than a moiety of the fellows, are not capable of purchasing more [a]. Grants of *Advowsons* by papists are void [b]. —[a See Stat. 9. Geor. 2. c. 36. Sect. 5. b See Stat. 11. Geor. 2. c. 17. Sect. 5.]

ADY, in natural history, a name given to the palm-tree of the island of St. Thomas. It is a tall tree, with a thick, bare, upright stem, growing single on its root, of a thin light timber, and full of juice. The head of this tree shoots into a vast number of branches, which being cut off, or an incision being made therein, afford a great quantity of sweet juice, which fermenting, supplies the place of wine, among the Indians.

The fruit of this tree is called by the Portuguese *Caryoces* and *Carioſſe*; and by the black natives, *Abanga*. This fruit is of the size and shape of a lemon, and contains a kernel, which is good to eat. The fruit itself is eat roasted, and the raw kernels are often mixed with mandioc meal. These kernels are supposed very cordial. An oil is also prepared from this fruit, which answers the purpose of oil, or butter, in Europe.

This oil is also used for anointing stiff, and contracted parts of the body. V. *Ray*, Hist. Plant.

ADYNAMON, among antient physicians, a kind of weak factitious wine, prepared with must boiled down with water; to be given patients, to whom genuine wine might be hurtful.

The word is originally Greek, ἀδυναμον, q. d. *invalidum*, from its want of strength. *Gorr.* Defin. Med. in Voc.

ÆCHMALOTARCHA, (*Cycl.*)—The eastern Jews had their princes of the captivity, as the western Jews their patriarchs. By the eastern Jews are meant those who are settled at Babylon, in Chaldæa, Assyria, Persia; and they who dwell in Judæa, Italy, Egypt, and other parts of the Roman empire were called western Jews. There was no prince of the captivity before the end of the second century. Huna was the first invested with this character, about the time abovementioned: the office continued till the eleventh century. The princes of the captivity had their residence at Babylon; there they were installed with ceremony, held courts of justice, &c. See more of them in *Basnage*, Histoire des Juifs, l. 1. c. 4. *Calmet*, Dict.

The Jews are still said to have an *Æchmalotarcha* at Babylon, but without the authority of the antient ones; if such an officer be now in being, Prideaux says, he is no more than their *Alatarcha* at Alexandria, their *Ethnarch* at Antioch, or their *Episcopus Judæorum* in England; that is, the head of their sect in that place, without sword or sceptre, or any

power of coercion, ſave what the Jews voluntarily allow him. *Prideaux*, Connect. P. 2. l. 9. p. 934.

ÆDILATE, ÆDILATUS, in antiquity, the dignity or magiſtracy of Roman *Ædiles*. See ÆDILE, *Cycl.*

This is otherwiſe called *Ædilitas*, Ædility. In inſcriptions we find it repreſented by the abreviature AED. *Urſat.* de Not. Rom. p. 4.

ÆDILITIUM *Edictum*, among the Romans, was that whereby a remedy was given a buyer, in caſe a vitious, or unſound beaſt, or ſlave were ſold him. It was called *Ædilitium*, becauſe the preventing of frauds in ſales and contract, belonged eſpecially to the Curule *Ædiles*. *Calv.* Lex. Jur.

ÆDITUUS, in antiquity, the keeper of a ſacred manſion, who had the care of the offerings and ornaments of the deity venerated therein.

The word is compounded of *ædes* and *tueor*, I defend; q. d. *a tuendis Ædibus*: originally it was written, *Æditimus*. *Gell.* Not. Att. l. 12. c. 10.

The *Ædituus* is the ſame with what Scævola calls *Hierophylax*, the Latins ſometimes *Ædilis*, and the Greeks Νεωκορος; anſwering to the ſexton among us.

The *Æditui*, among the Romans, were officers of diſtinction, being the depoſitaries not only of the treaſure, but of the public acts, or records.—The *Æditui* had their ſeveral cells, near the temples, the cuſtody of which was committed to them. *Struv.* Ant. Rom. c. 11. p. 518. & c. 12. p. 638.

The female deities had a woman officer of the ſame kind, under the denomination *Æditua*. *Danet.* Dict. Ant. in voc.

ÆGAGROPILA, or ÆGAGROPILUS, in natural hiſtory, a ball generated in the ſtomach of the *Rupicapra*, or *Chamois goat*, hard on the outſide, and conſiſting of a ſubſtance like hair. *Caſt.* Lex. Med. p. 18. See *Hair* BALL.

The word is Greek, Αιγαγροπιλος, from αιγαγρος, the rupicapra, or rock goat, and πιλος, a ball.

The *Ægagropilus* is ſometimes called *Bezoar Germanicum*, or the German bezoard. It is a ball found in the ſtomach of does and goats in Germany, which ſome have pretended to be formed of the *doronicum*, or leopards-bane, on which theſe animals feed; but it is now certain, that this ball conſiſts only of hairs which they ſwallow. The like are found in the ſtomach of cows, hogs, &c. and are of no medicinal value; though, from the falſe opinion concerning their original, ſome have celebrated them in looſeneſſes, hæmorrhages, &c. becauſe of the plants whence they conceived them to be formed.

Some have been whimſical enough to recommend theſe *Ægagropili* in vertigo's, becauſe the goats which produce them climb very ſteep rocks, without being giddy. Vid. *Geoffroy*, Mat. Med.

ÆGELETHRON, in botany, is a name uſed by ſome authors for the common *mercurialis*, or Engliſh mercury, an eatable wild herb. *Ger.* Emac. Ind. 2.

ÆGIAS, Αιγιας, in antient Greek phyſicians, denotes a white ſpeck on the pupil of the eye, occaſioning a dimneſs of ſight; either ariſing from an excrementitious humour, or from the relicts of the cicatricula of an ulcer on the part. *Caſtel.* Lex. Med.

This is the ſame with what others write *Aigis*, and ſome *Aiglia*. *Gorr.* Def. Med. p. 9. in voc. Αιγλιη.

ÆGILOPS, (*Cycl.*)—The *Ægilops* is difficult of cure: before it has reached the lachrymal paſſages, it is managed like other ulcers. Galen orders it to be treated with actual cauteries, introduced through a cannula [a]: which method is ſtill uſed, where the bone is foul; where it is not, collyriums and aſtringents may ſuffice [b]. The ſame author notes, that others chuſe rather to bore a hole through the bone, and diſcharge the matter thus. Albinus has a diſſertation expreſs on the *Ægilops* [c].—[a V. *Goelic.* Hiſt. Chir. Vet. §. 66. p. 51. b *Horn.* Microtec. p. 80. See alſo Ephem. Germ. cent. 5. app. p. 138. *Zuinger.* Pædoiatr. Obſ. 29. p. 155. ſeq. *Shaw*, Pract. Phyſ. p. 45. *Allen*, Synopſ. Medic. c. 10. §. 47. p. 265. c A notitia of it is given in *Goelic.* Hiſt. Chir. Recent. §. 534. p. 343.]

The name *Ægilops* is alſo given to a kind of oat, called alſo *cerris*, and by the Latins *feſtuca*, the flour of which mixed with honey, has been reputed a remedy for this diſeaſe. *Gorr.* Def. Med. p. 9. *Blanc.* Lex. Med. p. 14. ſeq.

The *Ægilops* is the *avena ſylveſtris*, the wild oat, common among corn. *Dale*, Pharm. &c. p. 263. See BROMUS.

ÆGILOPS is alſo uſed for the *Holme oak, with great acorns*; the *Cerrus mas majore glande* [a], *Quercus calyce echinato, glande majore*, αιγιλωψ *Idæorum*, *Aſpris Maurorum*, *Cerrus Latinorum* [b].—[a Vid. *Parkinſ.* Theatr. p. 1387. b *Caſp. Bauhin.*]

At Venice, they make cups of the acorns of this tree; which is alſo uſed, as we do oak-bark, to dreſs leather. *Ray*, Hiſt. Plant.

The cup of this acorn is an inch and an half in diameter, and ſomewhat leſs in depth. Theſe cups are alſo uſed, inſtead of galls, to die woollen cloth black. Id. ibid.

ÆGINETA, in botany, the name given by Linnæus [a] to a genus of plants; the characters of which are theſe. The cup is an oval inflated, and coloured ſpathle; it is univalve, and opens longitudinally near the top. The flower conſiſts of one petal. Its baſe is large, round, and inflated. The tube is ſhort, cylindric, and open; and the mouth is ſmall, but expanded, and turns back at the edge. The ſtamina are four crooked filaments; two of them are of the length of the flower, and the other two a little ſhorter. The antheræ are oblong, and ſtand cloſe to one another at their tops. The germen of the piſtil is oval; the ſtyle is ſubulated, and of the length of the ſtamina; and the ſtigma is large, round, and bending. The Hortus Malabaricus [b] is the only work in which we have a deſcription of this plant; and there the fruit and ſeed are not mentioned. Without theſe, however, the flower gives a very evident proof of its being a genus wholly diſtinct from all others.—[a *Linn.* Gen. Plant. p. 304. b Hort. Malab. Vol. 11. p. 47.]

ÆGLEFINUS, in zoology, the name given, by the generality of authors, to the *haddock*, called by others the *onos*, or *aſinus antiquorum*. It is a well known fiſh, and ſeems of a middle nature between the cod and the whiting. It is black on the back, and covered with ſmall ſcales, and has a black line running along each ſide from the gills to the tail. Under this line, in the middle of the ſides, and a little below the gills, it has on each ſide a black ſpot, pretended to have been made by the finger and thumb of St. Peter, in one of theſe fiſh, and to have been from thence propagated through the whole ſpecies. A like idle tale there alſo is, of the faber, or John Dory. The eyes are large, and there is a ſhort beard under the chin. The jaws are both furniſhed with teeth, as is alſo a part of the roof of the mouth, as in the common cod-fiſh. Its fins are of the ſame number and ſituation with thoſe of the cod; but its tail is forked. *Geſner*, de Piſc. p. 100.

ÆGLEUS, in botany, a term of diſtinction for the white chamæleon thiſtle. It is derived from the Greek αιγληεις of Galen; by which word he diſtinguiſhes the white chamæleon, which was an eſculent and medicinal plant, from the *erebennus*, or ἐρεβεννος, which was what we call the black chamæleon thiſtle, and was eſteemed poiſonous.

ÆGOBOLIUM, in antiquity, the ſacrifice of a goat offered to Cybele. V. Act Erud. Lipſ. an. 1703. p. 83. Mem. de Trev. 1703. p. 1331. It. 1705. p. 1001. *Struv.* Syntagm. Antiq. Rom. c. 10. p. 485.

The *Ægobolium* was an expiatory ſacrifice, which bore a near reſemblance to the *taurobolium* and *criobolium*, and ſeems to have been ſometimes joined with them.

The notion of an *Ægobolium* ſeems to have been firſt ſtarted by Reineſius, from the copy of an antient inſcription, wherein were the following words [a]; CRIOBOLIUM & AEMOBOLIUM MOVIT; where he takes *Æmobolium* for a corruption of *Ægobolium*. Van Dale, and ſome others, allow the correction; but M. de Boze explodes both it and the *Ægobolium*, aſſerting *Æmobolium*, for a mere effuſion of blood, to be the genuine reading [b].—[a Inſcript. p. 212. b Mem. Acad. Inſcript. T. 4. p. 117.]

ÆGOCEPHALUS, in zoology, the name by which the generality of authors call the bird, known in England by the name of the *godwit*, or in ſome places the *ſtone plover*, the *yarwherp*, or *yarwhip*. It is ſomewhat larger than the woodcock. Its head is covered with feathers black in the middle, and of a greyiſh brown, with ſome rediſhneſs at the edges; its neck and throat are of a rediſh brown; its breaſt is of a duſky whitiſh, and its back variegated with black, white, and yellowiſh red, the middle of all the feathers being black. The male has black tranſverſe ſtreaks on its breaſt and throat, which the female wants, and are of a plain greyiſh colour; and the rump is either white with black ſpots, or has a large triangular white ſpot on it, pointing upwards. The beak is ſomewhat longer than the ſnipe's; but the legs are ſhort. It is frequent on the ſandy ſhores of the ſea, where it walks very erect and boldly. *Ray*'s Ornithol. p. 214, 218.

ÆGOMANTIA, in antiquity, a ſpecies of divination performed by means of a goat. V. *Buleng.* l. 3. de Divinat. c. 22. p. 215.

ÆGONYCHUS, in natural hiſtory, a name mentioned by Pliny, as ſynonym of the *lithoſpermum*, or gromwell.

It had this name given it, by the Greek writers, from the words αιγος ὀνυξ, the claw or hoof of a goat.

The antients had another name for this plant, of the ſame ſort or origin, which was *Exonychon*: by this they expreſſed its being like the exterior part of the human nails on the fingers. The hardneſs and ſcaly nature of the ſeeds, gave the idea of the reſemblance of a nail, or hoof. *Pliny*, l. 26. c. 11.

ÆGOPHTHALMUS, the *goat's eye-ſtone*, a name given, by ſome authors, to thoſe pieces of agat, or other ſemipellucid gems, as have circular ſpots in them reſembling the eyes of that animal, in colour, and in their round figure.

ÆGOPOGON, in botany, a name uſed by Tragus, and ſome others, to expreſs the *common meadowſweet*, or *ulmaria*. *Ger.* Emac. Ind. 2.

ÆGREFINUS, in zoology, a word more uſually ſpelt *Æglefinus*, and uſed as a name for the common haddoc. *Bellonius*, de Piſc. p. 104. See the article ÆGLEFINUS.

ÆGYPTIACUM, (*Cycl.*)—The German diſpenſaries have another compoſition called *Ægyptiacum Compoſitum Magiſtrale*,

giſtrale, or *Hildani*, wherein treacle, mithridate, camphor, &c. are ingredients. *Junck.* Lex. Chym. Pharm. P. 2. p. 414.

White *Ægyptiacum* is a compoſition of lilly roots mixed up with aromatics: it is mentioned by Hippocrates, and is the ſame with what other antients call *Cicinum*. It was uſed by the ladies of thoſe days to ſmear over their faces, to preſerve their complexions. *Gorr.* Def. Med.

Hippocrates alſo ſpeaks of another unguent under the ſame name, compoſed of the flowers of the Egyptian thorn.

Farriers make a red, as well as black kind, of much the ſame ingredients, only with ſome difference in the proportions; uſed eſpecially to ſoften the hoofs of a horſe, when too hard. V. Dict. Ruſt.

ÆGYPTILLA, in natural hiſtory, the name of a ſtone deſcribed by the antients, and ſaid, by ſome authors, to have the remarkable quality of giving water the colour and taſte of wine. This ſeems a very imaginary virtue, as are indeed too many of thoſe in former ages attributed to ſtones.

The deſcriptions left us of this remarkable foſſil tell us, that it was variegated with, or compoſed of, veins of black and white or black and blueiſh, with ſometimes a plate or vein of whitiſh red. The authors of theſe accounts ſeem to have underſtood by this name the ſeveral ſtones of the onyx, ſardonyx, and camæa kind, all which we have at preſent common among us, but none of which poſſeſs any ſuch ſtrange properties.

ÆHOITULLA, in zoology, the name of an Eaſt-Indian ſpecies of ſerpent, found frequently in the iſland of Ceylon; it is a very long and ſlender ſnake ſometimes wholly of a fine green, ſometimes green and white, and lives principally on trees and among buſhes. *Ray*'s Synopſ. Anim. p. 332.

ÆINAUTÆ, in antiquity, ſenators of Miletus, who held their deliberations on board a ſhip, far from ſhore, and till matters were reſolved upon, never returned to land. *Plut.* in Queſt. Rom. *Calv.* Lex. Jur.

The word is Greek, Αἰναυται; q. d. *ſemper nautæ*, always mariners.

AELQUAPPE, in zoology, the common name, among the German nations, of a fiſh of the muſtela kind, the viviparous eelpout, called by Schonefeldt *Muſtela vivipara*, and in ſome places, aelpute, aelmoder, and aelmutter. It is uſually of a foot long or more. Its ſkin is perfectly ſmooth, and the colour of its back and head a browniſh yellow, marked with blotches of black; the colour of the back grows paler on the ſides, and on the belly is whitiſh. It has four gills on a ſide, and the head is ſhaped like that of the eel; the back fin reaches the whole length of the body, terminating near the tail. The belly fin begins at the anus, and reaches to the extremity of the fiſh, ending in a fine ſlender and ſomewhat reddiſh tail. Beſides theſe, it has two pair of fins, one at the bottom of the gills, which are ſomewhat broad, and the other very fine and ſlender under the throat. The young are often found alive in this ſpecies, to the number of three hundred in one individual; they are found of two fingers breadth long, and live ſome time after taken out. *Schonefeldt*, Ichthiogr.

AEM, or AM, a liquid meaſure uſed at Amſterdam, and thoughout Germany.—The *Aem* of Amſterdam is equal to four ankers or $\frac{1}{6}$ of a ton; amounting to about 250 or 260 Paris pints. The German *Aem* is different in different towns; the common one is equal to 20 vertels, that of Heidelberg to 12. *Savar.* Dict. Comm. T. 1. p. 26. ſeq.

ÆMOBOLIUM, in antiquity, the blood of a bull, or ram offered in the ſacrifices, called *Taurobolia* and *Criobolia*.

In which ſenſe the word occurs in antient inſcriptions, Reineſius and Vandale take it for a corruption, and alter it to *Ægobolium*. M. de Boze defends the *Æmobolium*. V. Mem. Acad. Inſcrip. T. 3. p. 117. Mem. de Trev. 1705. p. 2087. See ÆGOBOLIUM.

ÆNEATORES, in antiquity, the muſicians in an army; including thoſe who played trumpets, horns, *Litui*, *Buccinæ*, &c. *Kenn.* Ant. Rom. P. 2. l. 4. c. 11. p. 208. *Pitiſc.* Lex. Ant. T. 1. p. 42.

The word is formed from *æneus*, on account of the brazen inſtruments uſed by them.

ÆNIGMA, (*Cycl.*)—Some repreſent the *Ænigma* as the ſame with *gryphus*, but the more exact writers make a diſtinction; tho' wherein the difference lies is not agreed on. Some make it conſiſt in this, that the *Ænigma* properly imports ſomething merry, or jocoſe, and *gryphus* a ſubject more grave and profound [a]. Others reduce the difference to this, that in the *gryphus* there is ſomething captious, and capable of leading into a ſnare, which is not found in the *Ænigma* [b].—[[a] *Pollux*, ap. Scal. Poet. l. 3. c. 83. p. 319. [b] Mem. de Trev. Sept. 1701. p. 173.]

The *rebus* is alſo ranked by ſome in the number of *Ænigma's*.

In a general ſenſe, every dark ſaying, every difficult queſtion, every parable, may paſs for an *Ænigma*. Hence obſcure laws, are called *Ænigmata Juris*.

The alchemiſts are great dealers in the ænigmatic language, their proceſſes for the philoſophers ſtone, being generally wrapped up in riddles. e. gr. *Fac ex mare et fœmina circulum, inde quadrangulum, hinc triangulum, fac circulum et habebis lapidem philoſophorum.* Barchuſen, has publiſhed an explication of the riddles of chemiſts, alchemiſts, phyſicians, &c. Acroamata, Traj. Bat. 1703. 8°. an extract of it is given in Act. Erud. Lipſ. 1704. p. 348. ſeq.

Among the *Ænigma's* of chemiſts, that called the ſybelline *Ænigma* is famous, of which we find a copy in a MS. of Stephanus Alexandrinus. V. Miſcel. Berol. T. 1. Art. 2. p. 19. ſeq. *Fabric.* Bibl. Græc.

Ενιέα γεαμμαῖ' ἔχω, τέτρασύλλαϐός ειμι, νόειμε.
Αι τρεῖς αι πρῶται δυό γεάμμαῖ' ἔχυσιν ἑκάςη,
Ἡ λοιπὴ δὲ τα λοιπα, καὶ εἰσὶν ἄφωνα τα πέντε.
Τῶ παντὸς δ' αριθμῶ ἑκατονταάδες εἰσὶ δὶς ἑπτά,
Καὶ τρεῖς τρὶς δεκάδες καὶ δὶς τρία. Γνῶς δὲ τίς ειμι;
Ὄυκ ἀμύντος ἔση τῆς παᾳ ἐμῶ σοφίης.

Thus tranſlated by M. Leibnitz,

Literulis noſcor quadriſyllabus ipſe novenis:
Syllaba habet binas, niſi quod tenet ultima ternas.
Vocales quatuor, quinis non propria vox eſt.
Bis ſeptem vicibus numerum centuria totum
Ingreditur, decadeſque novem, tum bis tria. Si me
Noveris, hinc aditus ad ſacra noſtra patent.

Stephanus gives a myſtical ſolution of this *Ænigma*. Moret will have it ſignify the name Jehovah, which according to him comprehends the number 1696 abating one, the number contained in the *Ænigma*. Brentius maintains that the whole ſum amounts to 1711, and that it repreſents the word φοσφορος. The generality underſtand it of the word arſenic, or ΑΡΣΕΝΙΚΟΝ. M. Leibnitz gives a very artful ſolution of it in this ſenſe, by only ſuppoſing the A to ſtand for a thouſand, and 1 for unity, as we ſometimes find them uſed by grammarians.

Another *Ænigma* of the ſame character is that of Baſil Valentine, in high Dutch, thus tranſlated alſo by Mr. Leibnitz.

Quinque libros fecit divino numine Moſes,
Quos numerus Joſuæ ſuſcipit inde minor.
Tres muta populis patriarchæ voce loquuntur,
Unicus hos teſtis vera dediſſe probat;
Nil agit, hæc qui non attenta mente revolvit
Nec quinquaquinta quinque ſubeſſe videt.
Sunt tamen illa duo, queis ſi millena ſubirent,
Divitias ſapiens ſine parare poteſt.
Naſcenti quinos comites aſſiſtere cernes,
Quinque etiam comites mox morientis erunt.
Sunt quatuor, quorum nutu ſententia fertur:
Judicio prodit res tamen una ſuo.

By which is to be underſtood vitriol, or *VICTRIOLUM*; in which manner vitriol is often written by the Germans, from a corrupt etymology, as ſuppoſing it derived from *victoria*. V. Miſcel. Berol. T. 1. Art. 2. p. 19. ſeq. *Fabric.* Bibl. Græc. l. 6. c. 7. p. 696.

Among the divers ſpecies of revelation, enumerated by divines, there is one called the *ænigmatical*. Vander Hard maintains at large, that the whole book of Jonah is *ænigmatical*, particularly, that by the prophet himſelf, is to be underſtood the Jewiſh nation; by his being caſt into the ſea in a ſtorm, and ſwallowed by a whale, the Jews being carried into captivity; by his prayer in the fiſhes belly, the Jewiſh exiles ſupplications in their captivity; by the fiſhes vomiting him up, their return into their own country, &c. V. *Ænigmata ſacra*, Francof. 1624. 12°. *Ænigmata Priſci Orbis*, Helmſt. 1723. Fol. p. 294. ſeq. *A Seelen*, Medit. exegit. P. 2. p. 33. ſeq.

F. Meneſtrier has attempted to reduce the compoſition and reſolution of *Ænigma's* to a kind of art, with fixed rules, and principles, which he calls the philoſophy of *ænigmatic* images.

The ſubject of an ÆNIGMA, or the thing to be concealed, and made a myſtery of, he juſtly obſerves, ought not to be ſuch in itſelf; but on the contrary, common, obvious and eaſy to be conceived. It is to be taken, either from nature, as the heavens, or ſtars; or from art, as painting, the compaſs, a mirror, or the like.

The form of ÆNIGMA's conſiſts in the words, which, whether they be in proſe or verſe, contain either ſome deſcription, a queſtion, or a proſopopœia. The laſt kind are the moſt pleaſing, inaſmuch as they give life and action to things, which otherwiſe have them not. To make an *Ænigma* therefore, two things are to be pitched on, which bear ſome reſemblance to each other; as the ſun, and a monarch; or a ſhip, and a houſe; and on this reſemblance is to be raiſed a ſuperſtructure of contrarieties to amuſe and perplex. It is eaſier to find great ſubjects for *Ænigmas* in figures than in words, inaſmuch as painting attracts the eyes, and excites the attention to diſcover the ſenſe. The ſubjects of *Ænigma's* in painting, are to be taken either from hiſtory or fable; the compoſition here is a kind of metamorphoſis, wherein, *e. gr.* human figures are changed into trees, and rivers into metals. This converſion however, does not depend merely on caprice, there muſt be ſomething of ſuitableneſs, and even erudition to authorize it. Thus the battle of Conſtantine,

tine, againſt Maxentius may be taken for the ſubject of an *Ænigma*, to repreſent the game of cheſs: the ſign which appeared in the heavens with the words, *in hoc ſigno vinces*, may properly enough repreſent the ſecret of this game, which conſiſts in ſaving the king; it is much eaſier to turn mythology into *Ænigma's*, than hiſtory. Accordingly ſeveral have imagined, that the conqueſt of the golden fleece, was no other than the tranſmutation of metals; and that the fable of Circe, was the art of chemiſtry in *Ænigma*.

ÆNIGMA's of pure invention are a kind of poetry, and more ſubtle than thoſe drawn from mythology; ſince here the matter itſelf is to be created; inſtead of adopting ſome hiſtory or received fable, ſomething probable is feigned, the chief action whereof is known, *e. gr.* a ſhipwreck, a conflagration, an amphitheatre, or the like.

It is eſſential to *Ænigma's*, that the hiſtory or fable, under which they are preſented, be known to every body; otherwiſe it will be two *Ænigma's* inſtead of one; the firſt of the hiſtory or fable, the ſecond of the ſenſe it is to be taken in. There are few ſubjects more proper for *Ænigma's*, than the hiſtories of the old teſtament, *e. gr.* the creation of the world, the formation of Eve, the ſacrifices of Abel or Abraham, the deſtruction of Sodom, and the like. Prints of the metamorphoſes, and other fables, may alſo furniſh *Ænigma's*.

Another eſſential rule of the *Ænigma* is, that it only admit of one ſenſe. Every *Ænigma* which is ſuſceptive of different interpretations, all equally natural, is ſo far imperfect. What gives a kind of erudition to an *Ænigma*, is the invention of figures, in ſituations, geſtures, colours, &c. authorized by paſſages of the poets, the cuſtom of artiſts in ſtatues, baſſo relievo's, inſcriptions, and medals.

In foreign colleges, eſpecially thoſe of the Jeſuits, the explication of *Ænigma's* makes a conſiderable exerciſe, and that one of the moſt difficult and amuſing, where wit and penetration have the largeſt field. By explaining an *Ænigma*, is meant the finding a motto correſponding to the action and perſons repreſented in a picture, taken either from hiſtory or mythology. The great art of this exerciſe conſiſts in the choice of a motto, which either by itſelf, or the circumſtances of time, place, perſon who ſpeaks, or thoſe before whom he is ſpeaking, may divert the ſpectators, and furniſh occcaſion for ſtrokes of wit; alſo in ſhewing to advantage, the conformities between the figure and thing figured, giving ingenious turns to the reaſons employed to ſupport what is advanced, and in artfully introducing pieces of poetry to illuſtrate the ſubject, and awake the attention of the audience. F. le Jay has given a diſſertation expreſs on the rules and method of explaining *Ænigma's* in painting, in Bibl. Rhetor. See Mem. de Trev. 1716. p. 1212.

For the ſolution of *Ænigma's*, it may be obſerved, that thoſe are eaſieſt gueſſed, which conſiſt only of ſome letter of the alphabet, diſpoſed in ſeveral words; ſince, if they be of any length, by examining the oppoſite terms, we readily find out the letter intended. But 'tis otherwiſe with *Ænigma's* founded on the properties, motions, and qualities of a ſubject, which muſt be well known to ſolve them.

Ænigma's expreſſed by figures are more difficult to explain than thoſe conſiſting of words, by reaſon images may ſignify more things than words can; ſo that to fix them to a particular ſenſe, we muſt apply every ſituation, ſymbol, &c. and without omitting a circumſtance.

As there are few perſons in hiſtory, or mythology, but have ſome particular character of vice or virtue, we are, before all things, to attend to this character, in order to divine what the figure of a perſon repreſented in a painting ſignifies, and to find what agreement this may have with the ſubject whereof we would explain it. Thus, if Proteus be repreſented in a picture, it may be taken to denote inconſtancy, and applied either to a phyſical or moral ſubject, whoſe character is to be changeable, *e. gr.* an almanac, which expreſſes the weather, the ſeaſons, heat, cold, ſtorms, and the like.

The colours of figures may alſo help to unriddle what they mean: white, for inſtance, is a mark of innocence, red of modeſty, green of hope, black of ſorrow, &c.

The number may alſo contribute to aſcertain the meaning of an *Ænigma*; ſince there are ſome things which are ſingle in their kind, as the phœnix, ſun, world; which therefore become proper to ſignify monarchy. There are other things which are of ſome determinate number, *e. gr.* the four elements, five ſenſes, ſeven planets, nine muſes, twelve apoſtles, &c. When the ſame numbers are found in the natural, or artificial things, to which the figures of an *Ænigma* are applied, 'tis a ſtrong indication of the juſtneſs of the ſolution.

When figures are accompanied with ſymbols, they are leſs precarious; theſe being, as it were, the ſoul of *Ænigma's*, and the key that opens the myſtery of them. Of all the kinds of ſymbols which may be met with in thoſe who have treated profeſſedly on the ſubject, the only truly *ænigmatical* are thoſe of Pythagoras, which, under dark proverbs, hold forth leſſons of morality; as when he ſays, *ſtateram ne tranſilias*, to ſignify, do no injuſtice. Vid. *Meneſtr.* Philoſ. des Imag. Enigmat. 12mo. Paris 1694.

But it muſt be added, we meet with ſome *Ænigma's* in hiſtory, complicated to a degree which much tranſcends all theſe rules, and has given great perplexity to the interpreters of them. Such is that celebrated antient one, *Ælia, Lælia Criſpis*, about which many learned have puzzled their heads. There are two examplars of it; one found 120 years ago, on a marble near Bologna; the other in an antient MS. written in Gothic letters, at Milan. 'Tis controverted between the two cities, which is to be reputed the more authentic.

The Bononian *Ænigma*.

D. M.
Ælia Lælia Criſpis,
Nec vir, nec mulier,
Nec androgyna,
Nec puella, nec juvenis,
Nec anus,
Nec caſta, nec meretrix,
Nec pudica,
Sed omnia:
Sublata
Neque fame, neque ferro,
Neque veneno,
Sed omnibus:
Nec cœlo, nec terris,
Nec aquis,
Sed ubique jacet.
Lucius Agatho Priſcius,
Nec maritus, nec amator,
Nec neceſſarius;
Neque mœrens, neque gaudens,
Neque fiens,
Hanc,
Nec molem, nec pyramidem,
Nec ſepulchrum,
Sed omnia
Scit & neſcit, cui poſuerit.

That is to ſay, *To the gods manes, Ælia Lælia Criſpis, neither man nor woman, nor hermaphrodite, neither girl, nor young woman, nor old, neither chaſte, nor a whore, but all theſe: killed neither by hunger, nor ſteel, nor poiſon, but by all theſe: neither reſts in heaven, nor on earth, nor in the waters, but every where. Lucius Agatho Priſcius, neither her huſband, nor lover, nor friend; neither ſorrowful, nor joyful, nor weeping, certain, or uncertain, to whom he rears this monument, neither erects her a temple, nor a pyramid, nor a tomb, but all theſe.* In the MSS. at Milan, inſtead of *D. M.* we find *A. M. P. P. D.* and at the end, the following addition.

Hoc eſt ſepulchrum intus cadaver non habens,
Hoc eſt cadaver ſepulchrum extra non habens,
Sed cadaver idem eſt & ſepulchrum.

We find near fifty ſeveral ſolutions of this *Ænigma* advanced by learned men. Marius Michael Angelus maintains, *Ælia Lælia Criſpis* to ſignify rain-water falling into the ſea. Ri. Vitus firſt explained it of Niobe turned to a ſtone, afterwards of the rational ſoul, and afterwards of the Platonic idea; Jo. Turrius, of the *materia prima*; Fr. Schottus, of an eunuch; Nic. Bernandus, of the philoſophers ſtone, in which he is followed by Borrichius; Zach. Pontinus, of three human bodies in the ſame ſituation, and buried by three different men at the ſame time; and Neſmondius, of a law-ſuit; Jo. Gaſ. Gerartius, of Love; Zu. Boxhornius, of a ſhadow [a]; P. Terronus, of muſic; Fort. Licetus, of generation, friendſhip, and privation; M. Ov. Montalbanus, of hemp; Car. Cæſ. Malvaſia [b], of an abortive girl promiſed in marriage; Fr. Maſtrius, of an hermaphrodite; Pet. Mengulus, of the rule of chaſtity, preſcribed by the founder of the military religion of St. Mary; M. de Ciconia, of pope Joan; Heumannus, of Lot's wife [d]; and laſtly, J. C. S. an anonymous writer in the Lipſic Acts, of the Chriſtian church [e].—[a] Allegoria Peripatetica de Generatione Amicitia & Privatione in Ariſtotel. Ælia Lælia Criſpis, Patav. 1630. 4to. [b] Ælia Lælia Criſpis non Nata reſurgens, Bonon. 1683. 4to. Extracts of it may be ſeen in Act. Erud. Lipſ. 1684. p. 263. ſeq. Giorn. de Lettr. de Parm. T. 1. p. 68. Jour. des Scav. T. 13. p. 192. [c] Monum. Ælia Lælia Criſpis, ſive Celeber. Ænigmatis Bononienſis Hiſtoria Explicat. Bonon. 1706 & 1717. 4to. Extracts of which are given in Act. Erud. Lipſ. 1706. p. 88. ſeq. Nov. Liter. T. 2. p. 225. [d] Diſſ. de Fato Uxor. Loti. V. Act. Erud. Lipſ. 1720. p. 7. ſeq. [e] Act. Erud. Lipſ. an. 1727. p. 332. See alſo *Miſſon*, Nouv. Voy. d'Ital. T. 3. p. 270. *Kuſt.* Bibl. Nov. Libror. 1698. p. 636. ſeq.]

In imitation of this, we find another *Ænigma* propoſed in the Journal of Parma, which has exerciſed ſeveral of the wits of Italy, and given occaſion to many philoſophical and philological ſpeculations. Giorn. de Letter. de Parm. an. 1690. p. 193. ſeq.

Hic
Terra jacet & cœlo manet
Vir non vir
Qui
Mare horrens & mari hærens

Nomen
Et amiſit & non amiſit
Alienum ſumeret, proprium dimiſit
Homo & mulier
Neque dico
Mas & fœmina
Nec hermaphroditus
Qui
Virgo non caruit prole
Qui
Non pater non mater
Filium habuit
Quandoque vero pater
Nunquam vere mater
Quod eſſe non potuit bis eſſe voluit
Quia
Quod bis eſſe potuit eſſe noluit.

ÆNIGMATICAL, ſomething that relates to, or partakes of, the nature of *Ænigma's*. See ÆNIGMA.

The philoſophy of the Druids was altogether *ænigmatical*. V. *Rowl.* Mon. Antiq. p. 61. See DRUIDS, *Cycl.*

The antient ſages in general affected an *ænigmatical* way of writing [a], to conceal their doctrines from the populace. The Romans in Nero's time were obliged to have recourſe to the like method, though for different reaſons [b]. The *ænigmatical* characters of the Egyptians were a ſpecies of hieroglyphics, conſiſting of ſuch as bore no natural reſemblance to the things they repreſented. Such was the beetle, uſed to expreſs the ſun; the ſerpent, to repreſent the ſtars [c].—[a Mem. de Trev. an. 1718. p. 763. b Ibid. an. 1719. p. 559. c Id. an. 1704. p. 988.] See HIEROGLYPHIC, *Cycl.*

We read of an *ænigmatical* medal preſented by the Huguenots to Henry III. [d] Schott has publiſhed an explication of an *ænigmatical* coin of the emperor Auguſtus, concerning which, antiquaries have been long divided [e].—[d Mem. de Trev. 1704. p. 2127. e Explic. d'une Medaille Enigmatique d'Auguſt. Berl. 1711. 4to. *Le Clerc*, Bibl. Anc. Mod. T. 3. p. 212. Jour. des Scav. T. 51. p. 535.]

ÆNIGMATOGRAPHER, or ÆNIGMATIST, a maker or explainer of *Ænigma's*. See ÆNIGMA.

Hardouin, Vander Hardt, &c. are great *Ænigmatiſts*. Heumannus ſeems to have proved, that the famous *Ænigmatographer* Sympoſius, or Sympoſitus, as the name is ſometimes written, is no other than the eloquent father Lactantius; and Sympoſius only a corruption of the *Sympoſium*, or banquet mentioned by St. Jerom [b], to have been written by that author. In reality, it appears, by the preface to the *Ænigma's*, that they were propoſed at a banquet; beſides, St. Jerom informs us, that Lactantius's book was written in hexameter verſes; ſo is the book of *Ænigma's*. Laſtly, Cœlius Firmianus, which is the ſirname of Lactantius, is alſo that of the imaginary Sympoſius. 'Tis more than probable, therefore, this laſt came no otherwiſe to be a poet, than Articulus Smalcaldienſis, and Alcoranus, to be heretics [c].—[a *Fabric.* Bibl. Lat. l. 4. c. 1. p. 208. b Catal. Script. Eccleſ. c. 80. c Bibl. Germ. T. 2. art. 7. p. 152. ſeq.]

ÆNIGMATOGRAPHY, ÆNIGMATOGRAPHIA, the art of making and reſolving, or of collecting *Ænigma's*. See ÆNIGMA.

The word is compounded of Αινιγμα and γραφειν, to deſcribe.

ÆNIGMATOGRAPHY, otherwiſe called *Ænigmatology*, may be divided into general and particular. The firſt gives rules concerning the nature, kinds, compoſition, and uſe of *Ænigma's*: the ſecond conſiders the *Ænigma's* in particular ſciences, or languages, Greek, Latin, Hebrew, philological, philoſophical, theological, &c.

Nic. Reuſner has a treatiſe, under the title of *Ænigmatographia* [a], containing the *Ænigma's* of Sympoſius, Lorichius, Hadormarius, &c [b].—[a Francf. 1602. 12mo. b *Fabric.* Bibl. Lat. l. 4. c. 1. p. 208. *Heum.* Præf. ad Sympoſ. Lactant. Amæn. Litt. T. 1. p. 477. ſeq.]

ÆNITTOLOGIUS, in poetry, a kind of verſe, conſiſting of two *dactyls*, and three *trocheus's* Such is, *Scal.* Poet. P. 2. c. 24.

Prælia dira placent truci juventæ.

ÆOLIC, (*Cycl.*)—The ÆOLIC *digamma* is a name given to the letter F, which the *Æolians* uſed to prefix to words beginning with vowels, as Foινος, for οινος; alſo to inſert between vowels, as οFις, for οις. *Verwey.* Nov. Via Docend. Græc. l. 8. c. 4. §. 4.

ÆOLIC *verſe*, *carmen Æolicum*, a kind of meaſure, conſiſting firſt of an *iambic*, or *ſpondee*, then of two *anapeſts*, divided by a ſyllable, and laſtly, a ſyllable common.

This is otherwiſe called *Eulogic*, and, from the chief poets who uſed it, *Archilochian* and *Pindaric*. V. *Scal.* Poet. l. 2. c. 16. p. 142.

Its type is $\frac{\text{— } \upsilon}{\text{— —}} \mid \upsilon\,\upsilon\,\text{—} \mid \text{—} \mid \upsilon\,\upsilon\,\text{—} \mid \frac{\text{—}}{\upsilon} \mid$

E. gr. *O ſtelliferi conditor orbis.*

ÆOLIPILE, (*Cycl.*)—Dr. Plot gives an inſtance where the *Æolipile* is actually uſed to blow the fire: the lord of the manor of Eſſington, is bound by his tenure to drive a gooſe every New-year's-day three times round the hall of the lord of Hilton, while Jack of Hilton (a brazen figure having the ſtructure of an *Æolipile*) blows the fire. *Plott*, Nat. Hiſt. Stafford. c. 6. §. 65. p. 433.

In Italy it is ſaid, that the *Æolipile* is commonly made uſe of to cure ſmoaky chimneys: for being hung over the fire, the blaſt ariſing from it carries up the loitering ſmoak along with it.

F. Merſennus, and ſome others, have made uſe of this machine, to meaſure the gravity and degree of rarefaction of the air. But this method is liable to conſiderable objections. Vid. *Merſen.* Phænom. Pneum. prop. 29. *Boyle*, Phyſ. Mech. exper. 36. *Heinric.* Epiſt. ad Boyl. in fin. *Paulin.* Obſerv. p. 127. ſeq.

Some late authors have diſcovered a ſtill more extraordinary uſe, to which the frauds of the heathen prieſthood applied the *Æolipile*, viz. the working of ſham miracles. Beſides Jack of Hilton, which had been an antient Saxon image, or idol, M. Weber ſhews, that *Pluſter*, a celebrated German idol, is alſo of the *Æolipile* kind; and in virtue thereof, could do notable feats; being filled with a fluid, and thus ſet on the fire, it would be covered with ſweat; and as the heat increaſed, would at length burſt out into flames. Vid. *Staube*, Pluſterus Vet. Germ. Idol. Jour. des Scav. T. 61. p. 593.

ÆORA, in the medical writings of the antients, is uſed for geſtation; which ſort of exerciſe was often preſcribed by the phyſicians of thoſe days. Other exerciſes conſiſted principally in the motion of the body, but in the *Æora* the limbs were at reſt, while the body was carried about and moved from place to place, in ſuch a manner as the phyſician preſcribed. It had therefore the advantages of exerciſe, without the fatigue of it. *Aetius*, Tetrab. Serm. 1. c. 6.

This exerciſe was promoted ſeveral ways: ſometimes the patient was laid in a ſort of hammoc, ſupported by ropes, and moved backward and forward; ſometimes his bed run nimbly on its feet. And beſide theſe, the ſeveral ways of travelling were accounted ſpecies of the *Æora*, whether in the litter, in a boat or ſhip, or on even ground in a chariot.

ÆQUABILE *diatonum*, in muſic. See GENUS.

ÆQUILIBRATOR *regis*, in ſome writers of the middle age, denotes the king's preceptor, or governor; ſo called, becauſe he balanced, or kept his pupil ſteady. *Du Cange*, Gloſſ. Lat. T. 1. p. 92.

ÆRA (*Cycl.*) amounts to the ſame with *epocha*; though ſome authors make a difference between them: but wherein it conſiſts, they do not agree. A late critic aſſigns this difference, that in ſtrictneſs of ſpeech, *epocha* is that fixed point where an *Æra* made uſe of commences. Thus the 26th February, 747 (abating fifty-ſeven days) before the Chriſtian *Æra*, may be ſaid to be the *epocha* of the *Æra* of Nabonaſſar. Within this *Æra* other epocha's may be noted; as that of the death of Auguſtus, that of the death of Alexander, &c. But theſe cannot properly be called *epocha's* of the *Æra* of Nabonaſſar. V. Bibl. Germ. T. 5. p. 172.

Vallemont makes another difference, viz. that an epocha is a point fixed by chronologers, and an *Æra* a like point, only fixed by the popular uſage of a country, or nation. Perhaps it might not be amiſs, if chronologers would keep to this difference; but 'tis, certain the current of them hitherto uſe the two words promiſcuouſly. V. *Vallem.* Elem. de l'Hiſt. l. 1. p. 6. See EPOCHA, *Cycl.*

The Spaniſh *Æra* was introduced after the ſecond diviſion of the Roman provinces, between Auguſtus, Anthony, and Lepidus, in the year of Rome 714, the 4676th year of the Julian period, and the 38th year before Chriſt. In the 447th year of this *Æra*, the Alani, the Vandals, Suevi, &c. entered Spain. We find frequent mention of it in the Spaniſh affairs; their councils, and other public acts, being all dated according to it. Some ſay it was aboliſhed under Peter the IVth. king of Arragon, in the year of Chriſt 1358, and the Chriſtian *Æra* ſubſtituted in its place. Mariana obſerves, that it ceaſed in the year of Chriſt 1383, under John I. king of Caſtile. The like was afterwards done in Portugal.

If to any year of the Spaniſh *Æra* we add the number 4675, the ſum is the Julian year; or if from the ſame year we ſubtract 38, the remainder is the year of the Chriſtian *Æra*. V. *Strauch.* Brev. Chron. B. iv. c. 37.

ÆRA is alſo uſed, in ſome writers of the barbarous age, for any year.

In which ſenſe, we meet with *entering down the Æra*, the eleven hundred and eighth *Æra*, &c. *Du Cange*, Gloſſ. Lat. T. 1. p. 92.

Chriſtian ÆRA. It is generally allowed by chronologers, that the computation of time from the birth of Chriſt, was not introduced till the ſixth century, in the reign of Juſtinian, and is commonly aſcribed to Dionyſius Exiguus. See *Petav.* Doctrin. Temp. l. 12. c. 2, 3. *Bever.* Inſt. Chron. l. 2. c. 10. *Strauch.* Breviar. Chron. l. 4. c. 40. quæſt. 4.

ÆRARIUM (*Cycl.*) differs from *fiſcus*, as the firſt contained the public money, the ſecond that of the prince. Yet the two are ſometimes uſed promiſcuouſly for each other. *Calv.* Lex. Jur. p. 50. Jour. des Scav. T. 34. p. 67.

ÆRARIUM *ſanctius* was an appendage to the former, added on occaſion of the growth of the Roman ſtate, when there was not room enough for lodging all the public monies, and the public acts, which were depoſited with it. *Calv.* loc. cit. *Pitiſc.* Lex. Ant. T. 1. p. 45.

It was called *ſanctius*, becauſe placed in an inner and ſafer part of the temple; or becauſe in it was lodged the *aurum viceſimarium*, or twentieth, which was kept as a fund, or reſerve, for extreme neceſſity of the ſtate. On which account it was alſo called *ærarium viceſimarium*.

ÆRARIUM *Ilithiæ*, or of *Juno Lucina*, was erected by Servius Tullius, ſixth king of the Romans, and compoſed of money paid in by parents, for the birth of each child. *Dion. Halicarn.* l. 4. *Pitiſc.* Lex. Ant. T. 1. p. 45.

ÆRARIUM *privatum*, or the privy-purſe, contained the money and effects which the prince was maſter of before his acceſſion to the empire [a]. This was under the care of the *comes rerum privatarum* [b].—We meet alſo with *Ærarium juventutis*, *veneris*, *libitinæ*, and other leſſer treaſuries, *Æraria minora*, in the provinces. [[a] *Guther.* de Offic. Dom. Aug. l 3. c. 18. *Pitiſc.* Lex. Ant. T. 1. p. 45. [b] *Calv.* Lex. Jur. p. 50.]

ÆRARIUS, in antiquity, an officer inſtituted by Alexander Severus, for the diſtribution of the money given in largeſſes to the ſoldiery, or people. *Pitiſc.* Lex. Ant. T. 1. p. 45.

ÆRARIUS was alſo uſed for a perſon whoſe name was ſtruck out by the cenſors from the *album*, or liſt of his century, and was only conſidered as a citizen ſo far as to make him ſubject to pay taxes, *æra*, without being entitled to any privileges, or advantages from the common-wealth. Liv. dec. 3. l. 9.

Hence the phraſes, *ærarium facere*, *inter ærarios referre*, *ærariis eximere*, &c.—Not only Plebeians, to whom ſome have reſtrained it, but alſo knights and ſenators were ſubject to this kind of degradation. V. *Kenn.* Rom. Ant. P. 2. l. 3. c. 7. p. 113.

The *Ærarii* were incapable of making a will, of inheriting, of voting in aſſemblies, of enjoying any poſt of honour or profit, in effect were only ſubject to the burdens, without the benefits of ſociety; yet they retained their freedom, and were not reduced to the condition of ſlaves. To be made an *Ærarius* was a puniſhment inflicted for ſome offence, and reputed one degree more ſevere than to be expelled a tribe, *tribu moveri*.

ÆRARIUS is alſo uſed for a perſon employed in coining [a], or otherwiſe working braſs [b].—[[a] *Hoſt.* Hiſt. Rei Nummar. T. 1. l. 1. p. 15. [b] *Pitiſc.* Lex. Ant. T. 1. p. 46. *Calv.* Lex. Jur. p. 50.]

Theſe are ſometimes called *Ærarii fuſores*: at other times *Ærarius* is diſtinguiſhed from *fuſor*; the former anſwering to what we now call copper-ſmiths, the latter to founders.

ÆRARIUS is alſo applied to a ſoldier who receives pay. *Hoſt.* Hiſt. Rei Nummar. T. 1. l. 1. p. 15. *Calv.* Lex. Jur. p. 50. See SOLDIER, *Cycl.*

ÆRATA AQUA. See the article ZIMENT-WATER.

ÆRICA, or *Erica*, in natural hiſtory, a name given by Gaza and others to the common herring.

AEROGRAPHY, a deſcription of the air, or atmoſphere, its limits, dimenſions, properties, &c. V. Mem. de Trev. 1725. p. 1993. *Caſtel.* Mathem. Univ. p. 185.

This amounts to much the ſame with aerology, unleſs we ſuppoſe the latter to enter into the rational, and the former to confine itſelf to a deſcription of the more obvious affections thereof.

AEROLOGY, the doctrine or ſcience of the air, and its phænomena. V. Jour. des Scav. T. 24. p. 97.

AEROLOGY, called alſo the *Aerologica*, makes a part of the regimen of health, or the branch of medicine called by ſome *diaſoſtica*, or the non naturals. *Linden.* Manuduct. ad Medicin. p. 91. ſeq.

AEROMANCY (*Cycl.*) included the buſineſs of augury, and *auſpicia*; the rules of prediction from uncommon winds, ſtorms, ſhowers, and other prodigies. V. *Pott.* Antiq. Græc. l. 2. c. 18. p. 351.

Modern authors ſpeak of a more rational *Aeromancy*, meaning by it, the art of foretelling the changes and variations in the air, and weather, winds, ſtorms, and the like.

Morhof advances conſiderations for reducing *Aeromancy* to a certainty, by means of a regular ſeries of meteorological obſervations. But tho' many ſuch have been inſtituted with great care in many parts, this art has hitherto made a very ſmall progreſs.

Barometers, thermometers, hygrometers, and anemometers, are of conſiderable uſe in this kind of *Aeromancy*. *Morhorf.* Polyhiſt. Philoſ. l. 2. P. 2. c. 18. * 7. ſeq.

Mizoldus has publiſhed a body of rules for foretelling ſtorms, &c. drawn partly from vulgar obſervation, and the experience of mariners, partly from aſtrological conſiderations; under the title of *Aeromantia*. Francof. 1613. 12°. *Morhof.* ubi ſupra.

AERONAUTICA, the pretended art of ſailing in a veſſel thro' the air, or atmoſphere, ſuſtained as a ſhip in the ſea.

AEROPHYLACEA, in natural hiſtory, denotes ſubterraneous receptacles of air or wind. The word is of Greek origin, compounded of Αηρ, air, and φυλαχη *cuſtodia*, keeping.—In which ſenſe *Aerophylacea* ſtand contradiſtinguiſhed from *Hydrophylacea*, *Pyrophilacea*, &c.

Kircher ſpeaks much of *Aerophylacea*, or huge caverns replete with air, diſpoſed under ground, from whence thro' numerous occult paſſages, that element is conveyed, either to ſubterraneous receptacles of water, which are hereby raiſed into ſprings and rivers, or into the funds of ſubterraneous fire, which are hereby fed and kept alive for the reparation of metals, minerals, and the like. *Kirch.* Mund. Subterran. l. 2. c. 19. §. 1. and 4. p. 111. and 114. ſeq.

AEROSIS, Αερωσις, among the antient phyſicians, denotes the act whereby the blood is attenuated and converted into an *aura*, for the ſupport of the vital ſpirits, and the maintenance of the flame of life. *Caſtel.* Lex. Med. p. 21.

AEROSTATICA, is uſed by ſome authors for the ſcience called by others aërometry. See AEROMETRY, *Cycl.*

AEROSTATICA is properly the doctrine of the weight, preſſure, and ballance of the air and atmoſphere. *Leupold.* Theat. Static. P. 3. Act. Erud. Lipſ. 1726. p. 383.

ÆRUGO, (*Cycl.*)— The *Ærugo* of copper is the ſame with what is otherwiſe called *viride æris*.

Grew will have the turcois ſtone to be only a kind of petrified *Ærugo*. V. Act. Erud. Lipſ. 1682. p. 33.

Naturaliſts ſpeak of two kinds of *Ærugo*, one native, and the other factitious.

Native ÆRUGO is only the ſuperficial particles of the metal diſſolved, and intimately mixed with acid ſalts; in which form it is ordinarily found in copper mines, and other moiſt places. V. *Mercat.* Metalloth. arm. 4. c. 10. p. 72. *Lanciſ.* Not. ad loc.

The *Ærugo* of antient medals adds greatly to their value. It is ſometimes found of a blue, ſometimes of a crimſon, and ſometimes of a violet colour. It is ſaid to be inimitable by art; for as to that produced by ſal ammoniac and vinegar, it comes far behind it in beauty. The genuine kind inſinuates itſelf into the fineſt ſtrokes of the letters, &c. without effacing them, better than any enamel; it is only obſerved on braſs coins; for as to thoſe of ſilver, the *Ærugo* deſtroys them, and therefore is to be carefully ſcoured off with vinegar, or lemon juice. *Joubert.* Scienc. des Medail. Sec. 8. Act. Erud. Lipſ. 1694. p. 226.

Artificial *Ærugo* is what we more frequently call verdigreaſe. Ephem. Germ. dec. 3. an. 7. app. p. 164. *Caſtel.* Lex. Med. p. 21. See VERDIGREASE, *Cycl.*

ÆRUGO *Salis*, in natural hiſtory, a name given by *Pliny*, and ſeveral other antient authors, to a rediſh ſlimy matter, ſeparated from the Egyptian ſalt, called natrum, in the purifying it. We find this matter remain in the filter, on diſſolving and filtring the Egyptian nitre, at this time; it ſeems to be a mixture of a bituminus matter and a red earth, which had mixed themſelves among the cakes of the ſalt, during the time of their concreting from the water.

ÆRUSCATORES, in antiquity, a kind of ſharping ſtrollers, who got their living by tricks, telling fortunes and the like, much like modern gypſies. *A. Gell.* l. 14. c. 1. *Pitiſc.* Lex. Ant. T. 1. p. 46. ſeq.

The word is formed from *æruſcari* to beg, mump, &c.

The *Galli*, or prieſts of Cybele were called *æruſcatores magnæ matris*, and μητραγυρται, on account of their begging, or collecting alms in the ſtreets. To which end they had little bells whereby to draw peoples attention to them, much like ſome orders of mendicants abroad. *Hofm.* Lex. Univ. T. 1. p. 93. *Voſſ.* de Idol. l. 2. c. 55, and 56. *Mag.* de Tintinab. c. 7.

ÆRUSCATORES is alſo uſed for griping exactors or collectors of the revenue, who abuſe their office to the oppreſſion of the people. *Salmuth.* ad Pancirol. P. 1. Tit. 50. p. 237.

ÆS (*Cycl.*)—Æs *grave*, has been variouſly defined by critics, but is yet unaſcertained. Buddeus and Scaliger, followed by the generality, explain the term by copper in the maſs or lump, that is, uncoined; and taken in payments by the weight only. In which ſenſe, it amounts to the ſame with *Æs rude*, and ſtands oppoſed to *Æs ſignatum*. In this form it was that all ſpecies were paid in the early days of Rome. Vid. *Budd.* de Aſſe, l. 1. p. 178. and l. 2. p. 622. *Hoſt.* Hiſt. Rei Nummar. l. 2. p. 73. *Walker* on Coins, P. 1. c. 1. p. 3.

Others by *Æs grave* underſtand large pieces of copper coined, containing for inſtance, an *As*, or pound of that metal; ſuch as we find current in Sweden [a]. Theſe they aſſert bore the

title *Æs grave*, till ſuch time as they were reduced to a ſmaller ſtandard [b].—Gronovius, on the contrary, maintains, that the *As*, or pound weight did not acquire the appellation, *Æs grave*, till after their reduction. For what neceſſity could there be for calling theſe pieces *Æs grave*, heavy money, at a time when no ſmaller was known.—[[a] Philoſ. Tranſ. N°. 197. p. 1901. [b] *Salmaſ.* de Mod. Uſur. c. 6. and c. 16. *Voſſ.* Etym. in voc. *As.*]

After the reduction, authors, who had occaſion to ſpeak of the antient money, now out of uſe, could not better characterize, and diſtinguiſh it from the new ſort, which was lighter, than by calling it, *Æs grave*, heavy money. *Gronov.* de Pecun. Vet. l. 3. c. 15.

Kuſter rejects all theſe opinions, as errors which authors have fallen into, by confining themſelves to the compariſon of a heavier metal with a lighter one. The antients, he aſſerts, never meant, by *Æs grave*, any particular kind of copper money, differing in weight, or form, from other ſpecies of the ſame metal. The expreſſion is uſed by them, to denote any kind of copper money, compared with gold or ſilver; which, with regard to the bulk and ſize of the pieces, was much lighter, though of greater value. The term *Æs grave*, therefore, according to this author, was only introduced, after they had begun to coin gold and ſilver; for that the word *Æs*, being then common to all kinds of money, they could not make a particular application of it to copper money, without joining it to the adjective *grave*, heavy, which limited its ſignification, and removed the equivoque. We are not, therefore, to imagine, that when authors ſpeak of a kind of money, which they call *Æs grave*, in the earlieſt days of Rome, that there was any money which bore this denomination at that time; but that thoſe authors accommodating themſelves to the cuſtom of the age wherein they lived, when the name *Æs* was applied indifferently to any kind of money, found it neceſſary in ſpeaking of the antient money, which was only copper, and of conſiderable weight, to diſtinguiſh it from the new by the qualification of *grave*, heavy, joined with the general word *Æs*. *Kuſt.* Diſq. quid fuerit *Æs grave?* printed in his Diatribe Anti-Gronoviana, Amſt. 1712. 8vo. And in *Le Clerc*, Bibl. Choiſ. T. 24. p. 111. ſeq. Extracts and notitias of which are given in Jour. des Scav. T. 53. p. 254. Mem. de Trev. 1713. p. 924. It. 1714. p. 517. Hiſt. Acad. Inſcript. T. 2. p. 546.

But this ſyſtem, however plauſible, is rejected by ſeveral learned men, particularly Perizonius, and Mr. Ward [c]. The former has a diſſertation expreſs on the ſubject, wherein the opinion of Gronovius is further examined and defended [d].—[[c] Diſſ. de Aſſe, p. 18. ſeq. [d] Diſſ. de Ære gravi. Leyd. 1713. 12mo. An extract of which is given in Jour. des Scav. T. 55. p. 202. ſeq. See alſo *Pitiſc.* Lex. Ant. in voc. & Mem. de Trev. 1729. p. 1253.]

Æs *rude*, that unſhaped, or not faſhioned for any particular purpoſe.—Some will have this to be the ſame with *Æs grave*. —The money during the firſt ages of Rome was all of this kind. *Pitiſc.* Lex. Antiq. T. 1. p. 49. See Æs *grave*.

Others, by *Æs rude*, underſtand metal unſtamped; in oppoſition to *Æs ſignatum*, that ſtamped, or coined. *Hoſt.* ubi ſupra.

Æs *uſtum*, among chemiſts, is the ſame with what ſome call *Æs veneris*, or ſaffron of Venus; others, *Æs crematum*. *Caſtel.* Lex. Med.

There are various ways of preparing *Æs uſtum*: the moſt frequent is, by expoſing the plates to a reverberatory, or a potter's furnace, ſo long, till they will crumble into a powder [a]. Another is, by heating a long ſlip of copper in a vehement fire, till it ſparkles, then pulling it ſuddenly out, and applying a piece of ſulphur on it; this immediately liquifies the copper, which drops down in a veſſel of cold water, placed to receive it [b]. A third is mentioned in the *Cyclopædia*. See alſo *Lemeri*, Treat. des Drog. p. 15. A fourth is, by ſteeping the metal in a ſolution of ſalt, or ſtrong vinegar; then ſtratifying it with ſulphur, as above. After this, it is put in vinegar impregnated with ſal ammoniac. The like is repeated till the plates are conſumed. The vinegar being diſtilled from it, what remains is *Æs uſtum* [c].—[[a] Vid. *Junck.* Conſp. Chem. tab. 35. p. 907, 911. [b] *Junken*, Lex. Chem. Pharm. p. 10. ſeq. [c] Trev. Dict. Univ. T. 1. p. 167.]

Æs uſtum is very drying and deterſive, and, on that account, mixed with plaſters and ungents, for drying up fiſtulous ulcers, and the imbibing acrimonious humours, or ſanies. It alſo ſerves to eat off dead fleſh; to which end, it is ſaid they heat it red hot in the furnace nine times, and quench it as often in linſeed oil. But it is apt to render the bones carious. Vid. *Junck.* Conſp. Chirurg. p. 252, 257, 271.

Flos Æris, called by the Greeks, χαλκυ ανθος, (ſometimes confounded by moderns with *chalcanthum*) is prepared of copper melted, and removed into other furnaces, wherein being expoſed to a further and greater heat, and vehemently agitated by bellows, it depoſites an infinite number of ſmall ſcales, like millet grains, which being ſeparated by lotion, make the *flos Æris*. *Rul.* Lex. Alchem. p. 2. *Caſt.* loc. cit. *Gorr.* Def. Med. p. 502. ſeq. in voc. χαλκυ ανθος.

Among the moderns, *flos Æris* is ſometimes uſed for *ærugo*, or verdigreaſe. See Verdigrease, *Cycl.*

Squamma Æris properly denotes flakes of that metal ſtruck off by the hammer, in the operations of the forge, &c. Vid. *Plin.* Hiſt. Nat. T. 2. l. 34. c. 11. p. 661. *Hardouin.* Not. ad loc. *Rul.* loc. cit. *Gorr.* loc. cit. p. 502. in voc. χαλκυ λεπις.

Per Æs *& libram* was a formula in the Roman law, whereby purchaſes and ſales were ratified. *Pitiſc.* Lex. Ant. T. 1. p. 49. ſeq. *Briſſ.* de Verb. Signif. p. 30. *Danet.* Lex. Ant. in voc.

Originally the phraſe ſeems to have been only uſed in ſpeaking of things ſold by weight, or by the ſcales; but it afterwards had place on other occaſions. Hence even in adoptions, as there was a kind of imaginary purchaſe, the formula thereof expreſſed, that the perſon adopted was bought *per æs & libram*. See Adoption.

Æs *caldarium*, a term uſed by the German mineraliſts, for a ſubſtance which ſometimes occurs to thoſe who work upon cobalt, and is uſed for the making the fine blue colour, called ſmalt.

Biſmuth ore is ſometimes ſo intimately mixed with cobalt, that they cannot be ſeparated from one another. In this caſe, when they have been roaſted together, and when the arſenic is ſeparated in flours, there remains, inſtead of the fixed earth of cobalt, a coarſe regulus of biſmuth, of a reddiſh colour; to ſeparate which from the earth, they muſt have recourſe to a ſecond operation. This mixed matter they ſometimes call, in general, *ſpeiſſe*; but more uſually they divide it into two parts, and call the under part *glockenſpeiſſe*, and the upper part *Æs caldarium*.

Æs *flavum*, *yellow copper*. The Roman authors have all mentioned the way of making braſs with calamine and copper: but their fineſt kind, which they called *orichalcum*, or *aurichalcum*, they diſtinguiſhed from the inferior ſorts, which had only the name of *Æs flavum*. Pliny tells us, that the Marian yellow braſs took up a very large quantity of the calamine in the preparation, and approached to the nature of the orichalcum. This ſeems plainly to ſpeak, the orichalcum to be a different metal; but this, perhaps, may be owing to an error of Pliny, who ſuppoſes, that there was once a native metal of this colour. This he calls orichalcum, in compariſon of which, he ſays, all the artificial ones are poor. But this is not ſupported by experience, or any other teſtimony. Pliny tells us, that the Roman ſeſterces were made of yellow copper, or *Æs flavum*; and the Aſſes, of the Cyprian *Æs*, that is, of the copper in its natural colour. Our medaliſts preſerve ſeveral of the ſeſterces of this *Æs flavum*, which Pliny ſays approached nearly to the orichalcum; and it is evident, that this very metal is called orichalcum by many authors of authority and credit. The Roman authors all mention the throwing *cadmia*, or calamine, into melting copper, to make it yellow; and the chemical writers among the Greeks all mention the ſame proceſs, as a thing well known. It is therefore not to be doubted, but that the *Æs flavum* and *orichalcum* were the ſame thing, only perhaps in different degrees of perfection, as made of different proportions of the two ingredients. See Brass.

ÆSALON, in zoology, the name of a ſpecies of hawk of the long-winged kind, called in Engliſh the *merlin*. It is the ſmalleſt of all the kawk kind, uſed in the diverſion of hawking. It is of about the ſize of the blackbird. Its beak is blue, and its eyes hazel; it has a wreath of whitiſh yellow feathers behind its head; its chin is white, and its back and wings of a duſky blackiſh brown. Its larger wing feathers are black, with brown ſpots; and its tail long, and variegated with tranſverſe ſtreaks of black and whitiſh brown. Its breaſt and belly are of a whitiſh brown, variegated with blackiſh brown ſpots. Its legs are long and yellow. It feeds on partridges and other birds. *Ray*'s Ornithology, p. 51.

ÆSCH, in zoology, a name by which ſome have called the grayling, or tumbler, a fiſh of the truttaceous kind, called in Latin *thymallus*. *Willughby*, Hiſt. Piſc. p. 187.

ÆSCHNA, in natural hiſtory, the name of a ſpecies of water fly, of an aſh colour, with four wings, and a long body, hairy near the tail.

ÆSCULAPII *anguis*, in zoology, the name of a harmleſs ſpecies of ſerpent, common in Spain and Italy, called alſo *paræa*. See Paræa.

ÆSTIVAL, (*Cycl.*)—Æstival *point* is that whereby the ſun's aſcent above the equator is determined. *Wolf.* Elem. Aſtron. §. 150.

Æstival *ſigns* are thoſe extended from the ſummer ſolſtitial point, *i. e.* the ſun's greateſt declination northward, to the interſection of the zodiac and equinoctial ſouthward, including Cancer, Leo, Virgo. *Wolf.* Elem. Aſtron. §. 152.

ÆSTIVAL *ſolſtice*, the time when the ſun enters the *æſtival* point. See Solstice, *Cycl.*

ÆSTUARY, (*Cycl.*)—Æstuary, in the antient baths, was applied to the occult paſſages, or openings from the *hypocauſtum*, or ſtove, penetrating into the chambers. *Pitiſc.* Lex. Ant. T. 1. p. 51.

ÆSYM-

ÆSYMNETIC *monarchy*, among antient writers on government, denotes a limited elective monarchy. *Ariſt.* Polit. c. 10. *Thomaſ.* Philoſ. Pract. tab. 44. & in Annot.

The word is originally Greek, formed from αισυμναω, *regno*, I govern.—An *æſymnetic* ſtate ſtands oppoſed to a barbaric, or hereditary one.

ÆTATE *probanda*, in law, a writ that lay to enquire whether the king's tenant, holding in chief by chivalry, were of full age to receive his lands into his own hands. It was directed to the eſcheator of the county; but is now diſuſed, ſince wards and liveries are taken away by the ſtatute *Car.* II. Reg. Orig. 294. *Blount*, *Cowel.*

ÆTHALE, αιθαλη, αιθαλος, in natural hiſtory, a name given by ſome writers to the *cadmia fornacum*, or tutty.

It had this name from its being the concreted ſoot, or vapour of the *lapis calaminaris* and copper, melted together, in the making of braſs.

They who tranſlate this word, by the Engliſh ſoot, miſtake its true meaning; for the Greeks have carefully diſtinguiſhed between this and ſoot, which they called, ασθολη, *aſbole*. What they expreſs by *Æthale*, is that fine and thin vapour of a bluiſh colour, which riſes in form of a flame, from the ſurface of the melted metal; and this concreting againſt the top and ſides of the furnace, either in botryoid cluſters, or in thin flakes, formed what they generally called *cadmia*, but ſometimes *Æthale*, the name of the vapour that formed it.

ÆTHER, (*Cycl.*)—Some of the antients, particularly Anaxagoras, ſuppoſed the *Æther* to be of the nature of fire. An opinion like which, divers moderns have entertained, who conceive *Æther* as no other than the matter of the ſun, or ſolar particles put in a violent rotatory motion, by the ſtrokes of the body of the ſun, from which they are emitted. V. *Verdries*, Phyſ. Proleg. §. 2. p. 6. It. P. 1. c. 4. §. 5. p. 108. Mem. de Trev. 1703. p. 172. Act. Erud. Lipſ. 1707. p. 361. Works of Learn. T. 7. p. 484.

Some repreſent the *Æther* as 7200 times more rare than air [a]. Others make it more denſe than gold itſelf: for the *Æther* is all *Æther*, whereas in gold there are numerous pores filled with other matter [b]. Some pretend that there are ſeveral ſpecies of *Æther*, of different degrees of ſubtilty [c]. Others reject them all, judging the rays of light ſufficient to anſwer all the purpoſes of an *ætherial* matter [d].—[[a] *Perrault*, Ouv. Div. de Phyſ. T. 1. Bibl. Choiſ. T. 1. p. 250. [b] *Hook*, Poſthum. Works, p. 172. [c] *Perrault* & *Hook*, ubi ſupra. [d] Act. Erud. Lipſ. 1701. p. 391.]

A late philoſopher eſtabliſhes two general principles of all bodies; the firſt, *Æther*, or radiating particles, whoſe motion is from the center towards the circumference: theſe he ſuppoſes continually ſupplied from the ſun and fixed ſtars. The ſecond, Air, compoſed of globular particles, the motion of which is from the circumference towards the center. Hence a ready ſolution of expanſive and contractile forces. *Rudiger*, Phyſ. Divin. & in Philoſ. Synth. p. 91. ſeq. Nouv. Rep. Lett. T. 54. p. 150. Mem. de Trev. 1718. p. 1082. Act. Erud. Lipſ. 1716. p. 345.

Des Cartes and Huygens account for gravitation, or the centripetal tendency of bodies, from the centrifugal power, and circular motion of the *Æther* [e]. The abbé de Catelan has a diſcourſe expreſs to overturn this ſolution [f]. Herman goes farther, and ſhews, that the centrifugal power of the *Æther* ſhould rather repel bodies from the earth, than impel them towards it [g]. James Bernouilli [h], in a treatiſe on the gravity of the *Æther*, takes a middle courſe, maintaining, that the ſubtile *ætherial* matter, diffuſed through the ſpaces above the atmoſphere, has its gravity, as well as the air itſelf; and that the two co-operating together, produce thoſe effects commonly attributed to the preſſure of the atmoſphere alone.—[[e] Mem. de Trev. an. 1721. p. 2087. It. an. 1722. p. 111. Id. an. 1723. p. 198. *Verdries*, loc. cit. c. 6. §. 11. p. 166. *Stair*, Phyſiol. Nov. Exper. 5. Act. Erud. Lipſ. an. 1686. p. 405. *Hook*, Poſthum. Works, p. 167. [f] V. Act. Erud. Lipſ. an. 1712. p. 357. ſeq. [g] Exerc. Francof. T. 1. Ex. 4. p. 79. Act. Erud. Lipſ. an. 1712. p. 45. [h] Cogit. de Gravitate Ætheris, Amſt. 8vo. an. 1683. Extracts of it may be ſeen in Journ. des Scav. T. 13. p. 87. ſeq. & Act. Erud. Lipſ. an. 1683. p. 106. ſeq.]

Dr. Hook, long ago, had ſome ſuſpicion, that the *Æther* permeated all bodies, was the medium of light, the fluid body in which the air is but as a tincture, that it cauſed gravity in the earth, or other cœleſtial bodies, aſſiſted in the action of fire and burning, and in the diſſolution of other bodies by menſtruums, in fermentation, and the like. *Hook*, Poſthum. Works, p. 29. See farther concerning the exiſtence of *Æther*, *Boyl.* Philoſ. Works abr. T. 2. p. 504. *Vater*, Phyſ. Exper. c. 2. p. 72. ſeq. Its fluidity, circulation, elaſticity, &c. *Vater*, ib. p. 75. ſeq. *Verdries*, P. 2. c. 3. §. 1. p. 293. *Hook*, loc. cit. p. 171. Its being the primum mobile, or ſource of all motion, *Verdries*, p. 6, 63, & 107. Its influence on the air, *Hook*, ib. p. 380. Impediment to the moon's motion, Id. ib. p. 191. Its being the cauſe of the planetary motions, Giorn. de Letter. d'Ital. T. 10. p. 6. ſeq. Of colours and refrangibility, &c. Ib. T. 23. p. 132. Of ſound, Ib. T. 9. p. 315. and Mem. Acad. Scienc. an. 1720, p. 50. Philoſ. Tranſ. N°. 100. p. 15.

The misfortune is, that theſe learned authors only aſſert, but do not demonſtrate.

ÆTHER, in chemiſtry. See the article SPIRITUS *ætherеus Frobenii*.

ÆTHERIAL, (*Cycl.*)—The antient Platoniſts and Pythagoreans ſuppoſe different bodies united within the human ſoul; viz. the groſs, or material one; a finer aerial one; and, 3dly, the fineſt of all which they call *ætherial*, cœleſtial, &c. σωμα αερανιον, Αιθεριον, αυγοειδες. *Cudworth*, Intell. Syſt. c. 4. Bibl. Choiſ. T. 8. p. 52.

Several authors conſider the ſoul as an *ætherial* ſubſtance [a]. Hippocrates himſelf ſeems of this opinion [b]. And hence modern phyſicians aſcribe many phænomena in the animal oeconomy, to the action of an *ætherial* ſubſtance [c]. Divers alſo conceive the animal ſpirits as of an *ætherial* nature [d].—[[a] Bibl. Choiſ. T. 6. p. 244. *Garman.* de Mirac. Mort. l. 2. tit. 10. §. 76. [b] Jour. des Scav. T. 85. p. 80. [c] Obſerv. Halenſ. T. 11. p. 28. Jour. des Scav. T. 85. p. 51. [d] Mem. de Trev. an. 1715. p. 1362.]

The Chaldees placed an *ætherial* world between the empyreum and the region of the fixed ſtars. Beſide which, they ſometimes alſo ſpeak of a ſecond *ætherial* world, meaning by it the ſtarry orb; and a third *ætherial* world, by which is meant the planetary region. *Stanl.* Hiſt. Philoſ. P. 15. p. 1040. ſeq.

ÆTHERIAL *phoſphorus* is a name generally given, by Bernouilli, to that called mercurial, or barometrical phoſphorus. V. Bibl. Anc. Mod. T. 8. p. 227. See PHOSPHORUS, *Cycl.*

ÆTHIOPIAN *crown*, in natural hiſtory, the name of a ſhell-fiſh, of the genus of the *dolium*, or *concha globoſa*. It is of a brown colour, but differs from the common ſhell of this genus, in having the top, or head, dentated, ſo as to repreſent a crown. See DOLIUM.

ÆTHIOPS, (*Cycl.*)—A new preparation of *Æthiops* is given by Cruger, a German phyſician, which is white and fair; and, on that account, called *Æthiops minerale ſanguine regis ablutum:* in oppoſition to which, he calls the dark, or vulgar kind, *Æthiops cum ſtercore ſuo*. Ephem. Germ. dec. 3. an. 7. obſ. 105. p. 173.

Authors are not agreed as to the merits of *Æthiops* mineral. Cheyne, and many more, commend it highly. Boerhaave, on the contrary, and ſome other authors, reject it as uſeleſs. V. *Gorris*, Mercur. Triumph. Act. Erud. Lipſ. an. 1717. p. 158. and *Boerhaave*'s Chem. Part 3.

ÆTHIOPS *albus*, in pharmacy, quickſilver rubbed with a double quantity of crabs-eyes, or of ſugar-candy, till it is extinguiſhed. This has been taken by ſome, without any ſenſible effect; yet a very ſmall quantity of it has raiſed a high ſalivation in others. Quickſilver extinguiſhed in prunels, has operated much the ſame way.

ÆTHIOPS *of Dr. Plummer*. See PLUMMER's *Æthiops*.

ÆTHYIA, in zoology, a name by which the old authors have called one of the web-footed fowl, ſeeming to be the *utamania* of Crete, or the common auk, or razor-bill. See the articles ALKA and UTAMANIA.

ÆTIOLOGICAL, ſomething that aſſigns the cauſe of an effect, or appearance. The *ætiological* part of phyſic, is otherwiſe called *Ætiology*.

ÆTIOLOGY (*Cycl.*) is uſed for a figure in rhetoric, whereby in relating an event, we aſſign alſo the cauſe of it. *Voſſ.* Elem. Rhetor. c. 16. p. 35. *Thomaſ.* Erot. Rhet. c. 25. p. 52.

In which ſenſe, *Ætiology* differs from *color*, as the former aſſigns the true cauſe, the latter only a feigned or ſpecious one.

The ſceptics were profeſſed opponents of all *Ætiology*, or argumentation from cauſes. *Sext. Emper.* Pyrrh. Hypotyp. l. 1. c. 25. *Stanl.* Hiſt. Philoſ. p. 787.

ÆTITES, (*Cycl.*) the *eagle-ſtone*. This foſſil ſubſtance has been much renowned for its imaginary virtues. There are two or three diſtinct genera of bodies, ſeveral of the ſpecies of which, at times, form the body called by this name. The *geodes*, when their earthy matter is pretty firmly united within them, and will rattle on ſhaking them, are not uncommonly called by this name; and much more frequently than theſe, the *heteropyræ*, a genus of the cruſtated ferrugineous bodies with hard and ſolid ſubſtances, ſerving for their nuclei, and ſometimes looſe in them. Theſe laſt are what are ſold in the German ſhops, under the name of *ætitæ*, and are there uſed ſometimes internally in medicine. See GEODES and HETEROPYRA.

But the fineſt and moſt valued of all the eagle-ſtones, are accidental ſtates of one or other of our common pebbles. Theſe are ſo far from being a peculiar ſpecies of foſſil, though uſually accounted ſuch, that they are not determinately of any one ſpecies of pebble. That, however, which moſt uſually furniſhes them, is the brown centered pebble, with whitiſh, bluiſh, and brown cruſts. See CALCULI.

The plain hiſtory of this remarkable foſſil is this. The central nucleus of many ſpecies of pebbles, peculiarly of this, is coarſer than the reſt of the ſtone, that is, it is made up of more

more earth and leſs cryſtal; the natural conſequence of which muſt be, that being of a more looſe and rare texture, it is in drying more apt to ſhrink than ſuch maſſes, as are compoſed of a harder and purer matter. The central nucleus in this ſpecies is alſo ſurrounded with a whitiſh cruſt, of a more looſe texture, and more ſubject to ſhrink in drying than even the nucleus itſelf; and being compoſed of more earth and leſs cryſtal, is alſo more friable and ſoft. The outer circles of this ſtone, are of a greatly harder ſubſtance. Whenever the earthy matter in the nucleus, and firſt cruſt of this pebble, a little exceeds its juſt proportion, the conſequence will be, that the ſtone will become an ætites. For the nucleus ſhrinking and contracting itſelf to a ſmall ſize on the evaporation of its fluid matter, muſt ſeparate itſelf from its firſt cruſt, and that alſo ſhrinking, muſt be drawn backward toward the other cruſts; whence the cavity will become larger between that and the nucleus, and conſequently, the nucleus will rattle in it when the ſtone is ſhaken. The pebble in this ſtate having been afterwards rolled about by waters, the nucleus has by rolling, broken to pieces all the inner cruſt, and is uſually found in the hollow of the ſtone, buried in a large quantity of a whitiſh powder.

Theſe eagle ſtones are not uncommon in our gravel-pits, but being, by their hollowneſs rendered leſs ſtrong than the ſolid pebbles we frequently find them broken; but on trying ſeveral of the whole pebbles of the ſame outer appearance, it is not uncommon to meet with a whole one. V. *Hill*'s Hiſt. of Foſſ. p. 517.

In the ſandy plain of Bhar bela ma, in Egypt, the *Ætites* is found two or three inches below the ſurface of the ground, and in mines or quarries, about half a mile diſtant from each other. F. Sicard relates the manner wherein the ſand is here metamorphoſed into ſtones. It is probable the earth emits a metalic, or petrifying fume, which ferments with the ſand it meets with, and in this fermentation forms it into roundiſh maſſes, ſtill gathering more and more ſand, till by degrees it hardens, and turns black by the heat of the ſun. Nouv. Mem. des Miſſ. T. 2. p. 75. Jour. des Scav. T. 62. p. 679. ſeq.

Langius explains the proceſs ſomewhat more minutely. The whole matter, he obſerves, does not become ſtony at once, but that next the ſurface firſt; either becauſe the ſtony juice does not reach to the center, or is not ſtrong enough to petrify the whole. While the internal parts are hardening, they ſhrink, and by this means occaſion a cavity, and thus ariſes the geodes. If the petrifying juice, after having hardened the ſuperficial parts, inſinuate to the centre, there is formed a nucleus, which ſhrinking likewiſe in the petrifaction, leaves a cavity, or vacancy between the two, and this is the *Ætites*. *Lang.* Hiſt. Lapid. Figurat. Helvet. p. 117. ſeq. Act. Erud. Lipſ. an. 1709. p. 21. ſeq.

The *Ætites* according to Sicard, while in its mine under ground, has three qualities. 1. It is ſoft and brittle as an egg. 2. It yields no ſound. 3. It is of a light violet, yellow, or aſh-colour. After continuing a while in the open air, it turns hard as coral, the internal matter dries and ſhrinks into leſs compaſs, ſo that when ſhaken it rattles; and its light colour turns to a deep brown, or dark.

See further concerning the hiſtory of the *Ætites* in Mercat. Metalloth. arm. 9. c. 22. *Nicholſ.* Lapid. P. 3. c. 54. p. 184. ſeq. *Plin.* Hiſt. Nat. T. 2. l. 36. c. 21. *Hardouin.* Not. ad loc.

Other particulars concerning the *Ætites* are alſo found in Bibl. Germ. T. 5. p. 113. Jour des Scav. T. 31. p. 385. Concerning its formation, in *Plott.* Nat. Hiſt. Stafford. c. 4. §. 11. The noiſe it yields, in *Mercat.* ubi ſupra, & *Lancis.* not. ad loc. Extraordinary kinds and figures of it, male, female, florid, angular, ridged, orbicular, amygdalate, oval, chalcedonian, flinty, *&c.* in *Grew*, Muſ. Reg. Societ. P. 3. Sec. 1. c. 5. p. 297. ſeq. *Woodw.* Hiſt. Engl. Foſſ. T. 2. p. 69. & 102.

The *Ætites* is alſo known by the names *Eutocium*, *Echites*, *Erodialis*, *Aquileius*, *& Lapis prægnans*; ſome rank it under the claſs of precious ſtones, to which it has no title. Some think it may come properly enough under that of figured ſtones. V. *Fabric.* Bibl. Græc. T. 4. l. 4. c. 29. p. 327.

The *Ætites* kind differs from the bezoar mineral, in that the coats or cruſts of the latter are cloſe and without any cavity within them; whereas thoſe of the former are looſe, and hollow within. See BEZOAR.

Pliny and others make the geodes a ſpecies of it, but the more exact diſtinguiſh between the two; limiting the *Ætites* to that which has another within it, and the geodes, to that which in lieu of a ſtone, has a ſoft matter within it. See GEODES.

Dr. Woodward places the diſtinguiſhing characteriſtic of the *Ætites*, in that it conſiſts of ſeveral cruſts, which have in them a cavity with matter in it, looſe and moveable; either firſt ſolid and ſtony called a *callimus*, which makes the *Ætites* properly ſo called; or ſecondly looſe, as ſand, ockre, chalk, or earth, which makes the *geodes*; or thirdly, liquid, which makes the *enhydros*. V. *Woodw.* Nat. Hiſt. Engl. Foſſ. T. 1. p. 238.

It is uſual enough, ſays a modern virtuoſo, for ſtones, eſpecially thoſe of a globular or oval form, to have coat upon coat; and thoſe coats ſometimes very different from one another, ſome of them ſoft, ſome hard; nay ſometimes, after a long ſpace of time, one of theſe coats will ſhrink from another, after the manner of a kernel, when the ſhell grows dry; and then if the encloſed ſubſtance continue ſoft, and marly, the ſtone is called a geodes, if ſtony, it makes on of thoſe rattling ſtones called *Ætites*. *Thoreſby*, ap. Phil. Tranſ. N° 277. p. 1071.

ÆTNA-*Salt*, *Sal Ætnæ*, a name given by ſome authors to the ſal armoniac, which is found on the ſurface and ſides of the openings of *Ætna*, and other burning mountains after their eruptions; and ſometimes, on the ſurface of the ferrugineous matter which they throw out. This ſalt makes a very various appearance in many caſes; it is ſometimes found in large and thick cakes, ſometimes only in form of a thin powder, ſcattered over the ſurface of the earth and ſtones. Some of this ſalt is yellow, ſome white, and ſome greeniſh.

This ſalt is a concrete of nitre, ſulphur, and vitriol, burnt and ſublimed together; Borelli found once, a vaſt quantity of this ſalt on mount *Ætna*, and tried many experiments on it, particularly, as to its exploſive effects.

It is a generally received opinion, that ſal armoniac properly added to gun-powder, will greatly aſſiſt its exploſion; from this common opinion that author conceived, the *Sal Ætnæ* might have greatly aſſiſted in the exploſions and conflagrations of that mountain, and in the fluxing or melting the fabulous and other vitrifiable matter into the ſlags, which we find, on the eruptions, thrown out in great abundance.

For a trial of the effects of this ſalt, he added ſome of it to pulveriſed ſulphur and nitre, but he found to his amazement, that it was ſo far from being kindled by the fire; that it manifeſtly prevented the accenſion of the brimſtone, and ſalt petre, which were even extinguiſhed by it, as if water had been thrown upon them. The ſame was the effect where powdered charcoal was added, and hence he concludes, that this ſalt is ſo far from occaſioning the exploſions of that mountain, that it does not exiſt in it, but is formed during the burning. Phil. Tranſ. N°. 100.

ÆTOLARCHA, in antiquity, the prince or chief of the nation of the Ætolians. V. Miſc. Lipſ. T. 5. p. 184. Liv. 34, 23.

AFDELLES, in ichthyology, a name given by the Cretans to the fiſh called at Rome, *donzellina* and *zigurella*. It is the *Julis* of authors, and, according to the artedian ſyſtem, is a ſpecies of the *Labrus*. Artedi diſtinguiſhes it from the others, by the name of the *Palmar Labrus*, with variegated ſides, and two large teeth in the upper jaw.

AFFATOMIA, in antient laws, a kind of donation made by thruſting a wand into the perſon's boſom, to whom it was made. V. *Du Cange*, Gloſſ. Lat. T. 1. p. 98.

The word is alſo written *Adfatomia*, *Adfatimus*, *Affatimia*, &c.

AFFECTIO *Bovina* is a diſeaſe incident to cattle, occaſioned by a little worm, bred between the fleſh and the ſkin; which works its way over all parts of the body. *Le Clerc.* Hiſt. de la Medic. p. 777. Jour. des Scav. T. 75. p. 647. See WORM.

Dr. Friend charges M. Le Clerc with confounding the *Affectio Bovina* with the *Vena Medinenſis*, which Ætius, and Albucaſis expreſsly diſtinguiſh [a]. But the charge does not ſeem well grounded [b].—[[a] *Friend*, Hiſt. Phyſ. P. 1. p. 51. [b] V. Bibl. Anc. Mod. T. 27. p. 405.]

AFFETTUOSO, or *Con* AFFETTO, in the Italian muſic, is uſed to denote that kind of muſic, which muſt be performed in a very tender, moving, and affecting manner; and for that reaſon rather ſlow than faſt. *Broſſ.* Dict. Muſ. in voc.

AFFINITY, *Affinitas*,—(*Cycl.*) among civilians, ſtands diſtinguiſhed from kinſhip, *Cognatio*, or Conſanguinity, *Conſanguinitas*, as theſe ariſe from blood; from *Neceſſitudo*, which ariſes from offices, from *Gentilitas*, which ariſes from being of the ſame family, and ſurname. *Calv.* Lex. Jur. p. 52.

Affinity does not found any real kinſhip, it is no more than a kind of fiction, introduced on account of the cloſe relation between huſband, and wife [a]. It is even ſaid to ceaſe, when the cauſe of it ceaſes; hence a woman who is not capable of being a witneſs for her huſband's brother, during his life time, is allowed for a witneſs, when a widow, by reaſon the *Affinity* is diſſolved. Yet with regard to the contracting marriage, *Affinity* is not diſſolved by death, tho' it be in every thing elſe [b].—[[a] *Berger.* Diſq. de Matrim. Comprivign. [b] *Calv.* Lex. Jur p. 53.]

There is no proper *Affinity* between the kindred of the two married perſons, nor between the kindred of thoſe, who are in the ſecond or third degree of *Affinity*, nor even between the huſband and the wife. *Hartung.* exercit. p. 53. & *Calv.* Lex. Jur. p. 52.

There are no peculiar lines or degrees of *Affinity*, but it is reckoned after the ſame manner as conſanguinity; conſequently, differently in the civil, from what it is in the canon law. Whatever line or degree of conſanguinity, the kindred of one of the parties married are in, they are in the ſame line and degree of *Affinity* to the other. And again, in whatever line or degree of *Affinity* perſons are, in the firſt kind; they are in the ſame in the ſecond and third kinds of *Affinity*. Hence ariſe what we may call a direct and a collateral, an aſcending and a deſcending line of *Affinity*.

The degrees and terms of *Affinity* are chiefly, father in law, *i. e.* husband's or wife's father, in Latin *Socer*; ſtep father, *i. e.* mother's huſband, *Vitricus*; mother in law, *i. e.* huſband's or wife's mother; ſtep-mother, *i. e.* father's wife, *Noverca*; ſon-in-law, *Gener*; daughter-in-law, *Nurus*; ſtep-daughter, *i. e.* huſband's or wife's daughter by another marriage, *Privigna*; ſtep-ſon, *i. e.* huſband's or wife's ſon by a former marriage, *Privignus*; which two laſt conſidered in relation to each other are called *Comprivigini*; ſon-in-law, *i. e.* daughter's huſband; brother-in-law, *i. e.* huſband's brother, or ſiſter's huſband, *Levir*; wife's brother; brother's wife; ſiſter-in-law, *i. e.* huſband's or wife's ſiſter, *Gloſſ.* V. *Calv.* loc. cit.

As to the doctrine of the canoniſts concerning impediments to marriage ariſing from *Affinity*, See. *Lang.* Tract. de Nupt. & Divort. p. 21. Act. Erud. Lipſ. an. 1716. p. 78. *Henning.* de Grad. Matrim. Jour. des Scav. T. 49. p. 17. Act. Erud. Lipſ. 1705. p. 44.

In the Lutheran church, marriage within the ſecond degree of *Affinity*, either in the direct or collateral line is prohibited; ſo that a man is not here allowed even to marry the widow of his wife's brother, without a particular diſpenſation. *Lang.* loc. cit. Jour. des Scav. T. 62. p. 166.

It is diſputed, whether *Affinity* in the firſt degree be an impediment by the divine, or only by the poſitive laws? The negative is generally allowed; which is the foundation of the diſpenſations granted for marriages within it, by the pope, in the Romiſh countries, and by the ſovereign, in proteſtant ones. V. Jour. des Scav. T. 83. p. 180. It. T. 1. p. 180. Nouv. Rep. Lett. T. 2. p. 688. ſeq.

The Lutheran doctors have had a long diſpute concerning the marriage of *Comprivigni: i. e.* ſuppoſing a man who had children by a former wife, marries a woman who has children by a former huſband, whether this ſecond marriage becomes an impediment to that of the children by the firſt? The civil and canon laws, 'tis certain, know no ſuch impediment. Among the divines of the Lutheran perſuaſion, there are four different opinions concerning the point.—Some declare abſolutely, and without exception, againſt all marriages between *Comprivigni*; of which number is Cramer, who holds ſuch marriages prohibited by the divine law. Others aſſert, that they are all, without exception, lawful. Others take a middle courſe; maintaining, that ſuch perſons may lawfully marry when there are no children by the ſecond marriage; but that the birth, or even conception of a child by this marriage, is an impediment to the children of the former. Laſtly, others maintain that even in this caſe, marriage is not expreſsly forbid by the divine law, but that it is nevertheleſs better to abſtain from it, by reaſon of the general prohibition, *ad proximam ſanguinis tui non accedes.*

M. Berger has a diſſertation expreſsly on the ſubject, wherein, after ſtating the ſeveral opinions on the point, he declares for the laſt. Diſq. de Matrim. Comprivign. Lipſ. 1706. 4°. extracts of it are given in Jour. des Scav. T. 44. p. 330.—333. and in Mem. de Trev. an. 1710. p. 247.—252.

The foundation of this third opinion is a motive of decency, which it is apprehended does not allow, that a child born of the ſecond marriage, ſhould bear the title of brother or ſiſter, with regard to two others who are married together. The difficulty ariſes from the text in Leviticus; the nakedneſs of thy father's wife's daughter begotten of thy father, (ſhe is thy ſiſter) thou ſhalt not uncover; which as commonly underſtood, only forbids marriage between brothers and ſiſters of the ſame fathers. Bohlius alledges that the text in Leviticus is to be underſtood thus, thou ſhalt not marry the daughter of a woman, who has had children by thy father; grounding his opinion on this, that the Hebrew word *Moledech* (uſed by Moſes in the phraſe, thou ſhalt not marry her who is *Moledech Abicha*) is to be tranſlated by the participle active, in Latin, *parientis patri tuo*, bringing forth children to thy father; in as much as it may be taken for the participle of the active conjugation *Hiphil.* Levit. *c.* xviii. *v.* 11. Fabricius, Vanerius, Strychius and Thomaſius have eſpouſed this opinion, which yet the journaliſts De Trevoux pretend, deſtroys itſelf. Calavius, Carpzovius, Lud. De Dieu, and Cothman, profeſſor at Roſtoch, are the principal who have oppoſed it. V. Mem. de Trev. 1710. p. 249. ſeq.

AFFINITY, in the civil law, is divided into civil, that between free perſons, and ſervile, that between ſlaves.

Legitimate AFFINITY is that contracted by a proper and legal matrimony; or between ſlaves by *Contubernium.*

Illegitimate AFFINITY, that contracted out of legal marriage. *Affinity* may be contracted by an unlawful commerce; thus a perſon who has impregnated two ſiſters, is prohibited marrying either of them; thus an *Affinity* may commence between huſband and wife, by his lying with her ſiſter [a]. The duke of Wirtemberg-Montbeliard having had children by one ſiſter as a miſtreſs, and afterwards taking the other ſiſter for wife, the *Affinity* contracted by means of the former was made an objection to the validity of the marriage of the latter, and the legitimacy of her children, and conſequently their right of inheriting. But it was replied, that the laws of *Affinity* are not binding on ſovereign princes of the proteſtant profeſſion, but may be diſpenſed withal by them; and that the duke had given himſelf a diſpenſation [b].—[a *Henning.* de Grad. Matrim. c. 3. Act. Erud. Lipſ. 1719. p. 117. *Pitiſc.* Lex. Ant. T. 1. p. 54. [b] V. Jour. des Scav. T. 83. p. 179.]

True AFFINITY is that ſubſiſting, while the marriage between the two parties ſubſiſts.

Quaſi AFFINITY, that ſubſiſting either after the diſſolution of the marriage, as between a huſband, and his wife's daughter begot by another after her being divorced from him; or before the marriage is ſolemnized, as that between a father and a daughter, only eſpouſed, or betrothed to his ſon. V. Jour. des Scav. T. 58. p. 19.

AFFINITY *of the firſt kind*, that between the huſband, and his wife's kindred by blood; or between the wife, and her huſband's kindred by blood.

AFFINITY *of the ſecond kind*, that between the huſband, and his wife's relations by marriage; or between the wife, and her huſband's relations by marriage.

AFFINITY *of the third kind*, that between the huſband, and the relations of his wife's relations by marriage; or between the wife, and the relations of her huſband's relations by marriage.

Contius, Hotoman, and many others, have written expreſsly on the ſubject of *Affinity*. V. Bibl. Thuan. T. 1. 225. *Lipen.* Bibl. Jur. p. 11.

Affinity is ſometimes alſo uſed abuſively, for the relation between the huſband and wife. *Calv.* Lex. Jur. p. 52.

This is more properly called union, communion, propinquity, *&c.*

AFFINITY is alſo uſed figuratively, for a conformity, or agreement between one thing and another.

In which ſenſe the word ſtands oppoſed to diverſity, variety, oppoſition, *&c.*

Biſhop Wilkins gives tables, wherein things are claſſed according to their *Affinities*. V. *Real.* Charact. P. 2. p. 22.

Henckelius has a treatiſe expreſs, on the *Affinity* between vegetables and minerals. Lipſ. 1722. 8°. V. Act. Erud. Lipſ. an. 1723. p. 409. ſeq.

AFFINITY is more particularly uſed, in ſpeaking of the relation or ſimilitude beetween languages, occaſioned by their being derived from the ſame ſource.

There is an *Affinity* between dialects of the ſame mother-tongue, but none between mother-tongues themſelves, as being ſuppoſed of entirely different origins. *Wallis*, ap. *Greenw.* Engl. Gram. pref. p. 20.

Grammarians and etymologiſts find many *Affinities* between languages, and imagine many more; Hebrew being the reputed ſource of all others, there are few languages, but what have been obſerved to bear a near *Affinity* to it, not only the Greek, the Latin, the Runic, Saxon, Swediſh, German, and Welch; but even the Chineſe and the Laponic. V. *Thomaſſ.* Meth. Etud. Gram. l. 1. c. 7. Pref. p. 107. It. l. 3. c. 9. ſeq. *Rowl.* Mon. Antiq. p. 275.

Beſides the conformity between words of different languages, Grammarians conſider the *Affinity* between words of the ſame language formed from each other, *e. gr.* adjectives from ſubſtantives, participles from verbs, *&c.* Hence the claſs of paronyma, or conjugates. V. *Wallis*, Gram. Angl. c. 14. p. 102. ſeq.

Paſſerat has a celebrated work on the *Affinity* between letters [a], on which he put ſo great value, that he wiſhed no other piece of his had ever ſeen the light [b].—[a *De Literarum inter ſe cognatione & permutatione*, 1606. 8°. See an account of it. in Bibl. Anc. Mod. T. 7. p. 346. & *Colom.* Bibl. Choiſ. p. 44. [b] *Gillot.* Lett. 52. l. 1. a M. De la Scala. V. *Scalig.* Epiſt. 355. l. 4. ad Labb.]

AFFINITY is ſometimes uſed in chemiſtry, and other parts of natural knowledge, for the ſimilitudes, or like properties and powers of bodies.

M. Geoffroy has given a table of the different degrees of *Affinity* between moſt of the bodies employed in chemiſtry, combined various ways; whereby we may foretel the reſult of any mixture, what will be the iſſue of the combat, which will ſurmount, and which give way to the other. V. Mem. Acad. Scienc. An. 1718. p. 256, 269. Some objections to this table, with an illuſtration of it, are given in the memoirs for the year 1720. p. 24. and the Hiſt. p. 42. See RELATION.

AFFIRMATION (*Cycl.*)—The ſign of *Affirmation*, in logic, is the copula *is*, which denotes the connection between the two notions.—This copula is either expreſſed, or implied; in Latin, it is often implied, as in *Sol lucet*, q. d. *Sol eſt lucens.* V. *Wolf.* Logic. §. 206.

Some mechanical philoſophers pretend to reduce the judgment of the mind in *affirming*, to a diſpoſition, or modification of the brain, ariſing from the ſynchroniſm of the two vibrations of the fibres thereof, one of which repreſents the ſubject, the other the attribute of the *Affirmation*, or negation; or, in other words, from the ſynchroniſm, or equality of the vibrations excited in the fibres of the brain, whereby the idea of the ſubject is produced, with the vibration in the fibres of the brain whereby the idea of the attribute is excited. V. *Aſtruc.* Quæſt. Med. de Natur. & Præternat. Judic. p. 14. ſeq. Jour. des Scav. T. 68. p. 168.

But we apprehend, that it would be extremely difficult, if not impoſſible, to ſhew how a child learns to know, that two and two is four, by mechanical vibrations.

AFFIRMATION is of divers kinds, tacit, by words, by a nod, or geſture, &c.

In a civil law ſenſe, *Affirmation* may be divided into *ſimple*, which is that from which no obligation ariſes; and *qualified*, which infers an obligation.

The requiſites of this latter are, that it be, 1*mo.* deliberate and free; 2*do.* ſincere; 3*tio.* certain and ſpecific; 4*to.* clear and perſpicuous. V. *Pagenſtecher*, Diſſ. de Obligat. Affirm. Nov. Liter. Germ. 1705. p. 22. ſeq.

AFFIX, in grammar, a particle added at the beginning of a word, either to diverſify its form, or alter its ſignification.

The word is Latin, *affixus*, compounded of *ad* and *figo*, I fix.

In which ſenſe, *affix* amounts to much the ſame with *prefix*, and ſtands oppoſed to *ſuffix*.

We meet with *affixes* in the Saxon, the German, and other northern languages; but more eſpecially in the Hebrew, and other oriental tongues.

Wachter gives a liſt of ſeventy-five *affixes* in the German language, of various lengths, from a ſingle letter to two ſyllables, in Gloſſ. Germ. ap. Jour. des Scav. T. 86. p. 273.

The oriental languages are much the ſame as to the radicals; and differ chiefly from each other as to *affixes* and *ſuffixes*. Mem. Acad. Inſcrip. T. 9. p. 334.

The Hebrew *Affixes* are ſingle ſyllables, frequently ſingle letters, *prefixed* to nouns and verbs, inſtead of pronouns poſſeſſive; and contribute not a little to the brevity of that language. Mem. de Trev. 1705. p. 1842.

AFFLATUS literally denotes a blaſt of wind, breath, or vapour, ſtriking with force againſt another body.

The word is Latin, formed from *ad* and *flare*, to blow.

Naturaliſts ſometimes ſpeaks of the *Afflatus* of ſerpents.

Tully uſes the word figuratively, for a divine inſpiration. In which ſenſe, he aſcribes all great and eminent accompliſhments to a divine *Afflatus*.

The Pythian prieſteſs being placed on a *tripod*, or perforated ſtool, over a hollow cave, received the divine *Afflatus*, as a late author expreſſes it, in her belly; and being thus inſpired, fell into agitations, like a phrenetic; during which, ſhe pronounced, in hollow groans, and broken ſentences, the will of the deity. *Mackenz.* Scott. Writ. T. 2. p. 480.

This *Afflatus* is ſuppoſed, by ſome, to have been a ſubterraneous fume, or exhalation, wherewith the prieſteſs was literally inſpired. Accordingly, it had the effects of a real phyſical diſeaſe; the paroxyſm of which was ſo vehement, that Plutarch obſerves it ſometimes proved mortal.

Van Dale thinks this indecent attitude of the Pythia to be a fable, invented by Origen, and others of the firſt Chriſtians. Van Dale himſelf ſuppoſes the pretended enthuſiaſm of the Pythia to have ariſen from the fumes of aromatics. V. Mem. Acad. Inſcr. T. 4. p. 212. ſeq. where M. Hardion oppoſes Van Dale.

AFFORCEMENT, AFFORCIAMENTUM, in ſome antient charters, denotes a fortreſs, or work of fortification and Defence. *Du Cange*, Gloſſ. Lat. T. 1. p. 102. *Prin.* Animad. on Cok. p. 184. *Blount*, Law Dict. See FORTRESS, DEFENCE, &c. *Cycl.*

The word is derived from the barbarous Latin, *afforciare*, to ſtrengthen, confirm. V. *Brad.* l. 4. Tr. 1. c. 19. *Du Cange*, loc. cit.

Whence alſo *afforciatus*, is uſed for thickened, made cloſer and firmer, in ſpeaking of cloth. *Du Cange*, loc. cit.

In an antient chartulary, we find *Afforciamentum curiæ* uſed for the calling or ſummoning of a court, on ſome ſolemn or extraordinary occaſion. *Blount*, lib. cit.

AFFUIAGE, AFFUIAGIUM, in antient cuſtoms, a right of cutting fewel-wood in a foreſt, or the like, for maintaining family fire. *Du Cange*, Gloſſ. Lat. T. 1. p. 101. in voc. *Affuare*.

The word is derived from *affoer*, *q. d. affocare*, to make a fire, of *ad* and *focus*.

AFFUSION, the act of pouring ſome fluid ſubſtance on another body.

Dr. Grew gives ſeveral experiments of the luctation ariſing from the *Affuſion* of divers menſtruums on all ſorts of bodies. V. *Grew*, Diſc. of Mixt. Lect. 2. p. 238.

Divines and church hiſtorians ſpeak of baptiſm by *affuſion*; which amounts to much the ſame with what we now call ſprinkling. See BAPTISM.

AFOBA, in botany, a name given, by the natives of Guinea, to a kind of plant, of the genus of the *phaſeolus*, or kidney-bean. They uſe it pounded and mixed with oil, to cure the itch, and other cutaneous foulneſſes. It is more hairy than the common kinds, and its leaves are very ſmall. Philoſ. Tranſ. N°. 232.

AFRA *avis*, in natural hiſtory. See PINTADO.

AFRICANISM, the ſtyle, or manner, of writing peculiar to *African* writers.

We ſay the *Africaniſm* of Tertullian, of St. Auguſtin, &c. The characters of *Africaniſm* are heat, tumidity, exaggeration, violent figures, declamatory airs, &c. Some take Tertullian's repreſentation of the multitudes, ſtrength, and importance of the Chriſtians in his time, which he makes to be equal or ſuperior to that of the heathens [a], for an *Africaniſm* [b]. —[a *Tertull.* Apolog. c. 37. b V. *Moyle*, Lett. on Thund. Legion. Bibl. Angl. T. 14. p. 536.]

AFTER-*birth*, (*Cycl.*)—Authors ſpeak of a ſtrange kind of *After-birth*, of the mole kind, frequent among Dutch women, where it is called *ſuyger*, *q. d.* leech, by naturaliſts *mola volatilis*. The ſkeleton of one of theſe is repreſented by Thomas Bartholine. V. Ephem. Germ. dec. 1. an. 2. obſ. 160. p. 255. ſeq.

The *After-birth* of ripe children are brought away more eaſily than thoſe of abortions. See ſome reaſons for this in Medic. Eſſ. Edinb. Vol. 2. p. 239.

AFTER-*noon*, the latter half of the artificial day, or that ſpace between noon and night.

The antient Romans dedicated their *Afternoons* to diverſion, as their *forenoons* to buſineſs. The former were reſerved for pleaſure, and the enjoyment of life. But though it was the rule not to take any part of the *Afternoon* for buſineſs, nor any of the *forenoon* for pleaſure, yet ſome few of the more laborious magiſtrates made it a cuſtom to continue their occupation to the tenth hour, anſwering to our four o'clock, as is related of Aſinius Polio; but after that time, he would not ſo much as open a letter, from whatever quarter it came. This we have from Cicero. Cato, for all his ſeverity and application, would not break in upon his *Afternoon's* eaſe, even in his prætorſhip. Plutarch refutes it, as a reproach which ſome had faſtened on his memory, that he had kept on the bench in the *Afternoon*.

The uſual diverſions in which the Romans ſpent their *Afternoons*, were at the game called *pila*, and other exerciſes of the body, eſpecially walking, or riding. Theſe laſted till the eighth or ninth hour, anſwering to our three o'clock; which was the time for the baths. After bathing, they anointed and perfumed themſelves; and, about the tenth hour, went to *cœna*, ſupper, about three hours before ſun-ſet: which done, the day was ended at the public ſpectacles, theatrical, or amphitheatrical ſports; with muſic, ſinging, and the like. Vid. *Couture*, de la Vie Priv. des Rom. Mem. Acad. Inſcrip. T. 2. p. 405. Mem. de Trev. 1709. p. 1418.

AFTER-*ſwarms*, in ſpeaking of bees, are ſecondary or poſterior ſwarms, frequently found to quit the hives within a fortnight after the firſt.

Butler tells us, that the *After-ſwarms* differ from the prime, in that the latter are directed by the vulgar, or crowd of bees, whoſe only rule is the fulneſs of the hive; whereas the former are appointed by the ruling bees, and indicated by a noiſe, or call, which theſe make for the ſpace of two or three days, as it were to give warning to the common herd to prepare for a march. Within eight or ten days after the prime-ſwarm is gone, if the princeſs next in order find a competent number fledged and ready, ſhe begins to tune her treble voice, in a mournful and begging note, as if ſhe prayed the queen-mother to let them go; to which voice, if ſhe vouchſafe a reply, by tuning her baſe to the others treble, it marks her conſent: in conſequence of which, within a day or two after, if the weather allow, the new ſwarm appears. If the prime ſwarm be broken, the *after* will both call and ſwarm the ſooner, perhaps the next day; in which a third, ſometimes a fourth, ſucceeds in the ſame ſeaſon; but all uſually within a fortnight after the prime ſwarm. V. *Butler*, Hiſt. Bees, c. 5. n. 26. p. 75. ſeq.

AFTO, in botany, a name given, by the natives of Guinea, to a plant of the *eryſimum* kind, which they grind to powder, and take as ſnuff, to cure the head-ach. Petiver has called this plant the woody and woolly *eryſimum*, or hedge-muſtard of the coaſts of Guinea. Phil. Tranſ. N°. 232.

AGA, (*Cycl.*)—The *Aga* of the janizaries is an officer of great importance. He is the only perſon who is allowed to appear before the grand ſignor without his arms acroſs his breaſt in the poſture of a ſlave.

Eunuchs at Conſtantinople are in poſſeſſion of moſt of the principal poſts of the ſeraglio. The title *Aga* is given to them all, whether in employment, or out. *Herbel.* Bibl. Orient. p. 67. See alſo *Aquin.* Lex. Milit. T. 1. p. 27. Trev. Dict. Univ. T. 1. p. 190. *Moreri*, Dict. Hiſt. T. 1. p. 50.

We find alſo *Aga's* in other countries. The chief officers under the Khan of Tartary are called by this name. And among the Algerines we read of *Aga's* choſen from among the *boluk baſhi's*, (the firſt rank of military officers) and ſent to govern in chief the towns and garriſons of that ſtate. Mem. de Miſſ. T. 1. p. 118.

The *Aga* of Algiers is the preſident of the divan, or ſenate. For ſome years the *Aga* was the ſupreme officer, and governed the ſtate in the place of baſhaw, whoſe power dwindled to a ſhadow. But the ſoldiery riſing againſt the *boluk bachi's*, or *Aga's*, maſſacred moſt of them, and transferred the ſovereign power to the calif, with the title of *Dey*, or king. Mem. de Trev. Sept. an. 1703. p. 1597. ſeq.

AGALLOCHUM, a medicinal wood imported from the Eaſt-Indies, uſually in ſmall bits, of a very fragrant ſcent.

The word is Greek, αγαλλοχον, from the verb αγαλλομαι, I exult, or boaſt; in alluſion to the excellency of its odour.

AGAL-

AGALLOCHUM is otherwiſe called *Lignum aloes* and *Xyloaloe*, q. d. aloe-wood, not that it is produced from the common aloe plant, which yields the inſpiſſated juice of that name. It is the produce of a tree of a very different kind, growing in the Eaſt-Indies, particularly Sumatra and Cochinchina. Some call it likewiſe *Lignum Paradiſi*.

The *Agallochum* ſpoke of by the antients, is thought not to be the ſame as ours: theirs reſembled the aloes-wood, but was different.

The *Agallochum* is of a bluiſh purple colour, marked with veins and ſpots, very heavy and bitter; when burnt it yields drops of an aſtringent liquor, and a ſweet aromatic fume. It is hot and drying, and eſteemed a great ſtrengthener of the nerves in general, but particularly of the head and ſtomach. V. *Quinc.* Diſpenſ. P. 2. Sect. 1. p. 77. *Gorr.* Def. Med. p. 1. *Caſt.* Lex. Med. p. 24. *Blanc.* Lex. Med. p. 17. *Savar.* Dict. Com. T. 1. p. 34. ſeq.

AGALMATA, in antiquity originally denoted the ornaments of temples, and ſtatutes; but came afterwards to be popularly uſed for the ſtatues and temples themſelves. V. *Salmaſ.* Exerc. ad Solin. p. 192. *Pitiſc.* Lex. Ant. T. 1. p. 55.

AGAPIS *Lapis*, in natural hiſtory, a name given by antient writers, to a ſtone of a duſky yellow, or the colour of a lion's ſkin; it was held in great eſteem in many nations, on account of its ſuppoſed virtues, as an anodyne and vulnerary. It was ſaid to take off the pain of wounds, on being moiſtened with water and applied to them; and was one of the many ſtones in thoſe dark times, ſuppoſed to have a power of curing the bites of ſerpents and other venomous creatures.

AGARENI, or AGARENIANS, a name given by ſome to the followers of the religion of Mahomet.

The word is derived from Agar, or Hagar, handmaid of Abraham, and mother of Iſhmael.

Prateolus [a], and after him divers modern writers [b], conſider *Agareni* as the name of a religious ſect, anſwering to what we otherwiſe call Mahometans, tho' improperly; it ought rather to be eſteemed the name of a people, *viz.* the Arabs, called alſo Iſhmaelites, and by later writers Sarazens.—[a *Elench.* Hæret. l. 1. n. 17. p. 12. ſeq. b *Hoffm.* Lex. Univ. T. 1. p. 104. Trev. Dict. Univ. T. 1. p. 192.]

AGARIC, (*Cycl.*)—in botany, the name of a genus of plants, the characters of which are theſe. The whole ſtructure and ſubſtance reſembles the common muſhroom, and it grows uſually out of the trunks of trees.

The Latin name of *Agaric* is *Agaricum*, αγαρικον, not *Agaricus*, as ſome write it. V. *Burgrav.* Lex. Med. in voc.

The ſpecies of *Agaric* enumerated by Mr. Tournefort, are theſe.

1. The common *Agaric*. 2. The horſeſhoe *Agaric*. 3. The ear ſhaped *Agaric*, commonly called *Jews ears*. 4. The ſquammoſe various coloured *Agaric*. 5. The lichen like variegated *Agaric*. 6. The hard black orbiculated *Agaric* of the aſh. 7. The endive like *Agaric*. 8. The great eſculent *Agaric*. 9. The *Agaric* reſembling the Fallopian tube. 10. The foliated buck's horn *Agaric*. 11. The early, creſted, blueiſh white *Agaric*. 12. The great creſted wood *Agaric*. 13. The great branched wood *Agaric*. 14. The hairy jagged *Agaric*. 15. The blueiſh green excavated oak *Agaric*, or Dædalian *Agaric*. 16. The black digitated ſmall *Agaric*. 17. The ſmall black digitated *Agaric* with white tops. 18. The ſmall autumnal black bifid *Agaric*. *Tournef.* Inſt. p. 562.

Iſidore plainly declares the *Agaric* of the antients, to have been wholly different from the *Agaric* of theſe times; he ſuppoſes it to be the root of the *vitis alba*, or white vine, a name by which he underſtands white bryony root. Heſychius deſcribes it as a root, and Galen plainly ſpeaks of it as a root. See GARICON.

Agaric was a purge in much eſteem among the antients, but it has very diſervedly fallen into diſrepute of later years; for it is very ſlow and tedious in its operation, and in its long ſtay in the ſtomach, frequently occaſions vomitings and unſupportable nauſeas, which are often ſucceeded by ſweats and faintings which laſt a long time; and after all this, it leaves upon the ſtomach a laſting diſreliſh for food. The antients, not having ſo many purging medicines to chooſe out of as we have, were not very nice in their potions of this kind.

Mr. Boulduc, who was very curious in his experiments on all the purgative medicines, did not omit this in his diſquiſitions; he tried upon it the two great diſſolvents, the aqueous and the ſulphureous, he drew a tincture from it with ſpirit of wine; this was of an inſupportable taſte and ſmell, and a ſingle drop of it, received upon the tongue, would ſet a perſon a vomiting, and give a diſtate to every thing for the whole day. Farther experiments proved, that the bark of the *Agaric* was the only part that contained the purgative virtue, the farinaceous internal ſubſtance being uſeleſs. So that whenever *Agaric* is to be uſed, it would be beſt to take only the bark; but this is ſo nauſeous, that it ought never to be given alone, but mixed with other purgatives. Water alone extracts nothing from *Agaric*; but with the addition of ſalt of tartar, its makes a ſort of mucilaginous liquor with the *Agaric*, which, after ſome time ſtanding, becomes clear at top, and depoſits fæculæ of a ſolid conſiſtence at the bottom. From the clear liquor ſwimming at top, there may be ſeparated by evaporation, a reſinous extract of a good conſiſtence: this purges much more gently than the tincture with ſpirit of wine, and without giving thoſe intolerable nauſeas. The matter which ſettled to the bottom, appeared on tryal to be only the earthy part of the *Agaric*, and not at all purgative. Diſtilled vinegar, uſed inſtead of ſalt of tartar and water, gives an extract of the ſame kind, and poſſeſſed of the ſame virtues, but in ſmaller quantity.

Agaric affords on diſtillation a large quantity of volatile ſalt, with a very ſmall quantity of eſſential ſalt; and the *caput mortuum* contains very little fixt or lixivial ſalt.

In the writings of the moſt antient phyſicians, we find the name *Agaric*, and we often wonder at its being made an ingredient in compoſitions, which ſeem of a contrary intention to thoſe that might be expected to be anſwered by this drug, which we generally look on as a nauſeous bitter and purgative. But it is an error to ſuppoſe, the *Agaric* of the antients the ſame as ours; and a ſtrict enquiry into the works of Dioſcorides, Theophraſtus, and the other old authors will prove it to be ſo.

We very well know that the ſubſtance, which we call *Agaric*, is a ſort of fungus, or muſhroom, growing on the trunk and branches of the Larix or Larch tree, and on ſome other trees. But Dioſcorides plainly tells us, that *Agaric* is a root, or at leaſt, that this drug was uſually ſuppoſed to be ſo; it is not to be imagined that any body could miſtake ſuch a light porous ſubſtance, as what we call *agaric*, for a root, or indeed take it for any thing elſe than what it really is, a fungus. But this is not all that makes againſt it in this author; he adds, that it was like the root of ſilphium; we are therefore to have recourſe to the deſcription of the ſilphium, in order to know what was the ſhape and figure of the *Agaric* of thoſe times. Theophraſtus ſays, that the root of the ſilphium was a cubit long, and had a protuberance or head at the top, which ſtood prominent out of the ground; it is plain that our *Agaric* is of no ſuch ſhape as this, and therefore, not the ſame with the *Agaric* of Dioſcorides, and of the antients in general. Another reaſon is, the ſcarcity of it in Greece: our *Agaric* is common on the larch and other trees in Greece, Italy, and other parts of Europe; and therefore the Greeks needed not to have ſent from far for it, as it is evident they did: the name is ſufficient to prove this. Dioſcorides tells us, that this drug had its name from the place where it grew, which was in Sarmatia; he has indeed left us a falſe ſpelling of the word, and as the text ſtands, it is ſaid to come from Agria in Sarmatia: but were this the caſe, the name would have been Agricon or Agriacon, not Agaricon. The interpreters have miſtaken ſo far as not to ſuppoſe Agria the name of any peculiar place, but have explained the paſſage, by ſaying, that it grew in the wild and uncultivated places of Sarmatia. Stephens indeed ſays, Agroi ſignifies a people, living between the mountains of Hæmus and Rhodope; and Strabo makes them a people of the Mæotis. Ptolemy leads us to the truth, by telling us, that there is a river and promontory called Agarus, in the European Sarmatia; and that thence the Agarican ſheep ſo famous for their taſte, were brought into Greece. This agrees with the account Dioſcorides gives of the place, whence the *Agaric* was brought, which tho' he miſpels it, yet he ſays truly that it was in Sarmatia. It appears from the whole, that the antient Greeks ſent a great way for their *Agaric*, and their not knowing whether it was a root, or ſome other vegetable production, is a ſufficient proof of its not being our *Agaric*, which both then and now grows commonly in their country.

Tho' the *Agaric* of Dioſcorides, therefore, is not the ſame with the *Agaric* of theſe times, yet many have been of opinion, that the *Agaric* of Pliny, and of the authors ſince his time, is the ſame with ours. His words ſeem to expreſs this too clearly to leave any doubt; but as they accuſe him of an error, they are not ſuch expreſs teſtimonies, as they ſeem at firſt ſight. He ſays, that the glandiferous trees, as the oak, and others of that kind, are the principal ones which produce *Agaric*, and that this *Agaric* is a white ſweet-ſcented fungus, or muſhroom, good in antidotes. He adds, that it grows principally on the upper branches of trees; and that it ſhines in the dark, and is gathered by people employed for that purpoſe in the night time, diſcovering itſelf by the light it caſts forth at this time, and not being ſo eaſily found in the day. Dioſcorides ſays not a word about this ſort of *Agaric*, nor makes any mention of a fungus as being really that drug; yet in the account he gives of the male and female *Agaric*, and the opinions he cites of others, as to its origin, he has ſome things that may have given riſe to theſe words of Pliny. Dioſcorides ſays, ſome were of opinion, that *Agaric* was not a root, but that it was produced on ſome parts of trees, by putrefaction, in the ſame manner that fungus's were produced. Such was the opinion of his times, about the origin of fungus's; and it is plain that he diſtinguiſhes *Agaric* from a fungus, by comparing it to one.

This account of Dioſcorides ſeems to have given riſe to Pliny's hiſtory of the *Agaric*; and the *Agaric* of that author, tho' a fungous ſubſtance, ſeems not to have been truly a fungus

of itſelf, but that ſort of rotten wood, which we call touch-wood, and which often ſhines like fire in the night; a property that no fungus has. This ſhining rotten wood is common in many places; and as it is not to be diſtinguiſhed from other rotten wood by day-light, thoſe who were of opinion that it contained any peculiar medicinal virtues, were in the right to have it collected in the night. The female *Agaric* of Dioſcorides ſeems to have been this ſubſtance; for he deſcribes it as being of a ſpungy texture, and having ſtrait fibres, which this rotten wood always has. The oak, and other glandiferous trees, are alſo moſt remarkable for producing this touchwood; though the larix is the tree which produces the *Agaric*. The ſhining of this wood, when in its rotten ſtate, is accidental, not being always found in it.

Mineral AGARIC, *Agaricus mineralis*, in natural hiſtory, the name of a light, ſpungy, marley earth, called by others *marga Feroenſis*, and *lac lunæ*, and by the antients *terra*, or *creta Seleneuſiaca*. It had its antient name from the city Selinus in Sicily, near which it uſed to be found in great abundance; and its more modern one from its reſemblance to the vegetable *Agaric*, in its lightneſs, colour, and fungoſe texture.

It is an earth ſubject in itſelf to various admixtures, and mixing itſelf with various other bodies: it is, however, generally found pure, and is then abſolutely the ſame in all parts of the world.

It never conſtitutes of itſelf a ſtratum in the earth, but is found in the perpendicular fiſſures of the ſtrata of ſtones, and in a thouſand imperceptible cracks in them; at which the maſſes naturally break, and diſcharge this matter from them, in form of a white powder. It alſo ſometimes lines the roofs of caverns, and ſometimes lies, like the *terra Samia*, in large quantities, in the horizontal vacuities of theſe ſtrata. In theſe ſeveral places it is found, either in irregular maſſes, of a fine and pure white colour, porous, friable, and ſtaining the fingers, and adhering firmly to the tongue; or elſe in ſmaller, and ſomewhat firmer maſſes; or, laſtly, in a diſcontinuous ſtate, or in form of an impalpable powder, of a pure ſnow white.

Mineral Agaric ferments violently with acid menſtrua, and diffuſes immediately in water. It is often found ſtained with adventitious particles of other earths, &c. and is then altered in colour, and found browniſh, yellowiſh, or reddiſh; and is frequently received into the bodies of other foſſils, being very probably the moſt frequent debaſing earth of cryſtal. V. *Hill*'s Hiſtory of Foſſils, p. 40.

Some ſuppoſe *mineral Agaric* to have been known to the antients; and that it is the ſame with what they call *morocthus*, and *galactites*.

Formerly Switzerland was the only country known to produce this mineral; but, of late, it has been diſcovered in the territory of Nuremberg. Something very much like it has been obſerved among the ſtones near Rouen in France. V. Ephem. Germ. cent. 1. obſ. 2. p. 5. Jour. des Scav. T. 43. p. 381. ſeq.

It is uſed internally againſt hæmorrhages, the ſtrangury, gravel, and eſpecially dyſenteries; externally, to dry and heal old ulcers, ſtop defluxions of the eyes, &c. *Lang.* Idea Hiſt. Natur. Lapid. Figur. Helvet. c. 3. in Ephem. Germ. dec. 3. an. 9. app. p. 211. ſeq.

AGARICUS, in the Linnæan ſyſtem of botany, the term uſed to expreſs that genus of fungus's, which have no pedicle, but grow to trees, &c. by one ſide, and are therefore called horizontal fungus's, and are lamellated underneath: by this laſt character they are diſtinguiſhed from the *Boleti* of Linnæus which are thoſe horizontal fungus's which are porous underneath.

AGASYLLIS, in the materia medica, a name given by ſome of the antient Greek writers, to gum ammoniac; and by others, to the tree which produced that gum. By their deſcriptions of this medicine, it appears not to have been the ſame which we now know by this name.

AGAT (*Cycl.*)—The *Agat* is a peculiar and very extenſive genus of the ſemi-pellucid gems. The characters of which are, that they are variegated with veins and clouds, but have no zones, like thoſe of the onyx. They are compoſed of cryſtal, debaſed by a large quantity of earth, and not formed, either by repeated incruſtations round a central nucleus, or made up of plates laid evenly on one another, but are merely the effect of one ſimple concretion, and variegated only by the diſpoſition the fluid they were formed in gave to their differently coloured veins, or matters.

Theſe are a very numerous genus of foſſils, and ſubject to great variegations in their colours. They are, however, arranged into ſome order, according to the different colours of their ground.

Of thoſe of a *white ground*, there are three ſpecies. 1. The *dendrachates*, or *Mocoa-ſtone*. See DENDRACHATES. 2. The dull milky-looking *Agat*. This, though greatly inferior to the former in beauty, is yet a very beautiful ſtone. This is common on the ſhores of rivers in the Eaſt-Indies, and alſo in Germany, and ſome other parts of Europe. Our lapidaries cut it into counters for card-playing, and other toys of ſmall value. 3. The lead-coloured *Agat*, called the *phaſſachates*, by the antients. See the article PHASSACHATES.

Of the *Agats* with a *reddiſh ground*, there are four ſpecies. 1. An impure one of a fleſh coloured white. This is of but little beauty, in compariſon with many other *Agats*. The admixture of fleſh colour is but very ſlight, and it is often found without any clouds, veins, or other variegations; but ſometimes it is prettily veined, or variegated with ſpots of irregular figures, with fimbriated edges. It is found in Germany, Italy, and ſome other parts of Europe, and is wrought into toys of ſmall value, and often into the German gun-flints. It has been found, ſometimes, with evident large ſpecimens of the perfect moſſes bedded deep in it. 2. The ſecond of the red grounded *Agats*, is that ſpecies of a pure blood-colour, called *hæmachates*, or the *bloody Agat*, by the antients. See HÆMACHATES. 3. The third is the clouded and ſpotted *Agat*, of a pale fleſh colour, called the *carnelian Agat*, or *ſardachates*, by the antients. See SARDACHATES. 4. And the fourth, the red-lead coloured one, variegated with yellow, called the *coral Agat*, or *corallo-achates*, by the antients. See CORALLO-ACHATES.

Of the *Agats* with a *yellowiſh ground*. There are only two known ſpecies. 1. The one of the colour of yellow wax, called *cerachates* by the antients. 2. The other a very elegant ſtone, of a yellow ground, variegated with white, black, and green, called the *leonina*, and *leonteſeres*, by the antients. See LEONTESERES.

Laſtly, of the *Agats* with a *greeniſh ground*. There is only one known ſpecies, which was the *jaſpachates* of the antients. See JASPACHATES. *Hill*'s Hiſtory of Foſſils.

Some have attributed great medicinal virtues to the *Agat*; as, to reſiſt poiſon, eſpecially thoſe of the viper, the ſcorpion, and ſpider; to appeaſe thirſt, ſtrengthen the ſight, and I know not what. *Plin. Caſtel.* Lex. p. 8. *Ruland.* Lex. Alchem. p. 2.

Oriental *Agats* are ſaid to be all brought from the river Gambay. *Hamilton*, Account of Eaſt-India, c. 13. Preſ. State Rep. Lett. T. 2. p. 171.

A mine of *Agats* was lately diſcovered in Tranſilvania, of divers colours, ſome of a large ſize, weighing ſeveral pounds. Ephem. Germ. cent. 9. p. 427.

Agats have been diſtinguiſhed by other names, than thoſe before mentioned. Thus we find

Vermilion AGAT, that of a deep vermilion colour. This, in the text of Pliny, is called *Achates unius coloris*, which ſome correct by *minii coloris*. Hardouin prefers the antient reading. V. *Hardouin*, Not. ad Plin. l. 37. c. 10.

White ringed AGAT, *Achates perileucos*, diſtinguiſhed by black and white circles [a]. Plott mentions this under the denomination of *crow-ſtone* [b].—[a *Salmaſ.* ad Solin. Polyh. p. 94. b *Plott*, Nat. Hiſt. Staffordſh. c. 4. §. 47. p. 175.]

White AGAT, *leucachates*, that altogether white, or at leaſt diverſified with white ſtrokes, being frequently ſemi-tranſparent, and bearing a reſemblance to the white of an egg.

Vitreous, or *tranſparent* AGAT, of a thin ſtone-blue colour.

Leopardine AGAT, *Achates pardalios*, ſpotted like the ſkin of a leopard. This is otherwiſe called *pandalion*, *pantachates*.

Sapphirine AGAT, that of a ſky-blue colour, tranſparent; ſometimes found with *lapis lazuli*, and called alſo *ſapphiro-achates*.

Luminated AGAT, diſtinguiſhed by divers colours, as white, black, yellow, brown, placed over each other, at equal diſtances.

AGATS are alſo divided, with regard to the objects repreſented on them, into

Arboreſcent AGAT, *dendrachates*. See DENDRACHATES and DENDRITES.

This ſeems to be the ſame with what ſome authors call the *Achates*, with roſemary in the middle, and others, *Achates*, with little branches of black leaves. *Borrich.* Act. Haf. 1677. p. 206.

Horned AGAT, *cerachates*, is ſaid by ſome to be that which, by lines and ſpots, repreſents the figure of a horn [a]. Others explain the *cerachates* to be that ſpecies which has a waxy ſurface [b]. The difference ariſes from the etymon of the word. The former ſuppoſes it formed from the Greek, κερας, *cornu*, horn; the latter from the Latin, *cera*, wax.—[a *Worm.* Muſ. p. 90. b *Salmaſ.* loc. cit. p. 94. ſeq.]

Aphrodiſian AGAT, *Achates aphrodiſius*, is a term given by Velſchius to an *Agat* in his cuſtody, of a fleſh colour, on one ſide of which appears a half-moon, in great perfection, repreſented by a milky ſemicircle; on the other ſide, the phaſes of Veſper, or the evening ſtar; whence the denomination *aphrodiſius*. Ephem. Germ. Dec. 1. an. 1. obſ. 156. p. 296.

Corſoid AGAT, repreſenting human hair. *Salmaſ.* Exerc. in Solin. p. 539.

Arithmetical AGAT, repreſenting the numbers 4191, 191. V. *Settala*, Muſ. 81.

Aſtronomical AGAT, repreſenting the hemiſphere, with its ſeveral orbs, and the earth in the middle. To which head may be alſo referred an *Agat* mentioned by Borrichius, repreſenting the five orbs in great perfection. Act. Hafn. 1677. p. 208.

Elementary AGAT, conſiſting of four colours; blue, ſuppoſed to expreſs water; white, the air; red, the fire; and brown, the earth. *Velſch.* Hecat. 1. obſ. 42.

Anthropomorphous AGATS, thoſe wherein the figures of men or women are expreſſed. Such is that mentioned by Kircher, repreſenting a heroine armed [a]. That in the church of St. Mark at Venice, repreſenting a king's head adorned with a diadem. That other in the muſæum of the prince of Gonzaga, wherein the body of a man is ſeen, his head, neck, arms and legs, with all the cloaths, in a running poſture [b]. That mentioned by De Boot [c], wherein a circle appears ſtruck in brown, as juſtly as if done with a pair of compaſſes, and in the middle of the circle, the exact figure of a biſhop with a mitre on; but inverting the ſtone a little, another figure appears; and if turned yet further, two other figures appear, one of a man, the other of a woman. That mentioned by Rumphius, on the plane whereof is diſtinctly ſeen the figure of a pope at prayer, found in the ruins of an antient heathen temple near Rome [d]. But the moſt celebrated *Agat* of this kind is that of Pyrrhus, wherein were repreſented the nine muſes, each with their proper attributes, and Apollo in the middle playing on the harp: *Achates in qua IX muſæ & Apollo citharum tenens, non arte, ſed natura ſponte, ita diſcurrentibus maculis, ut muſis quoque ſingulis ſua redderentur inſignia* [e].—[a *Kirch.* Mund. Subter. l. 8. p. 30. b *Calceol.* Muſ. p. 21. c De Gem. l. 2. c. 95. d Theſ. Tab. E. Jour. des Scav. T. 50. p. 630. e *Plin.* l. 37. c. 3. See alſo *Hardouin*, Not. ad loc.]

In the emperor's cabinet is an oriental *Agat* of ſurprizing bulk, being faſhioned into a cup, whoſe diameter is a Vienna ell, abating two inches. In the cavity, is found delineated, in black ſpecks, B. XRISTOR. S. XXX.

Some account for the phænomenon from natural cauſes, after Kircher's manner, who had ſeen a like ſtone, in which were depicted the four letters uſually inſcribed on crucifixes, I. N. R. I. Some real crucifix he apprehends had been buried under ground, among ſtones and other rubbiſh, where the inſcription happening to be parted from the croſs, and to be received among a ſoft mould, or clay, ſuſceptible of the impreſſion of the letters, this came afterwards, by means of ſome lapidific juice, or fume, to be petrified [f]. In the ſame manner, that author ſuppoſes the *Agat* of Pyrrhus to have been formed. Others reſolve much of the wonder into fancy, and ſuppoſe thoſe ſtones formed in no other manner than the camieux, or Florentine ſtones [g].—[f *Kirch.* Mund. Subter. T. 2. l. 8. ſect. 1. p. 41. g *Velſch.* in Ephem. Germ. ubi ſupra, p. 296.] See CAMAIEU, *Cycl.*

To the claſs of anthropomorphous *Agats*, may alſo be referred an *Agat* in the library of Francfort, repreſenting the heart, lungs, and part of the veins of a man. *Koning.* Regn. Miner. p. 106.

Leucophthalmous AGATS, thoſe repreſenting the figures of eyes. Such is that mentioned by Velſchius [a], which he calls *ommatia*, or *omphophthalmus*: or thoſe by Cardan [b], and others, repreſenting the eyes of birds, fiſhes, wolves, called *lycophthalmi*; of goats, *ægophthalmi*; of oxen, *boophthalmi*.—[a Hecatoſt. 1. obſ. 22. b De Subtil. p. 290.]

AGATS are alſo divided with regard to the affinities they bear to other ſtones: hence the *jaſpachates*, *ſardachates*, &c.

We find alſo *onychates*, between an *onyx* and an *Agat*, compoſed not of zones, or balls, but of plates perſpicuous and aſh coloured. *Grew*, Muſ. Reg. Soc. P. 3. p. 289.

Oriental ſardonyx AGAT, of an oval figure, and a white colour, in the middle of which appears a body of water, which, upon ſhaking, is perceived to move [a]. This ſpecies is otherwiſe called *coccus*, *ovum ſolis*, *coccus paraquanorum*, *venter cryſtallinus*, *ætites gemmata* [b], &c. and may be referred to the *ætites* kind [c].—[a *Settala*, Muſ. p. 80. b *Johnſton*, Notit. Regn. Miner. tit. 2. c. 4. art. 2. p. 44. ſeq. c *Bauſch.* de Ætit. p. 23.]

To this kind may alſo be referred the *Agat* of Chili, which has cryſtals ſeen in it; and another called *berylloachates*, containing pieces of beryls.

ANTACHATES, that which in burning yields a ſmell of myrrh. This, though mentioned by Pliny among *Agats*, ſeems rather to belong to the head of ambers, or bitumens. Others write it *anchachates*; others, *ſtactachates*. *Salmaſ.* Exerc. ad Solin. p. 133.

See farther concerning the hiſtory of *Agats*, *Nicolſ.* Lapid. c. 26. p. 133. *Grew*, Muſ. p. 287. The figures of *Agats*, *Mercat.* Melloth, p. 375. ſeq. Their ſtructure, *Woodward*, Nat. Hiſt. Engl. Foſſ. T. 2. p. 16. Experiments on them in the burning-glaſs, Giorn. de Letter. d'Ital. T. 8. p. 282. The commerce and manufacture of *Agats*, *Hought.* Coll. T. 2. p. 41. The counterfeiting of *Agats* in glaſs, *Neri*, Art of Glaſs, l. 2. c. 37. p. 59.

Agats may be ſtained artificially, by a ſolution of ſilver in ſpirit of nitre, and afterwards expoſing the ſtone, for ſome hours, to the ſun. This operation ſucceeds beſt in whitiſh *Agats*.

But it is to be obſerved, that no art has hitherto been able to imitate the fineneſs and beauty of the vegetable repreſentations, formed by nature, in ſome *Agats*; ſuch as are commonly called *dendrites*. And though art ſhould attain to ſuch a perfect imitation of nature in this caſe, as to deceive the eye, yet might the difference be otherwiſe diſcovered.

For if an *Agat* be coloured by art, it will loſe a great part of its colour, by heating it; and this colour may again be reſtored, by adding the ſolution of ſilver in ſpirit of nitre.

Again, by putting a little aqua-fortis, or ſpirit of nitre, on the ſuſpected *Agat*, without expoſing it to the ſun, the artificial colours will diſappear in a night's time; and this colour may again be reſtored, by expoſing the ſtone to the ſun for ſome days. V. *Du Fay*, in Mem. Acad. Scienc. 1728.

But Monſ. de la Condamine has ſince obſerved, that even natural *Agats*, which, by the fineneſs of the lines repreſented upon them, were beyond all ſuſpicion of art, yet ſuffered a great change in their colours, by the application of aqua-fortis. It is true, the change did not happen ſoon, as in *Agats* ſtained by art, in which ten or twelve hours have been found ſufficient to diſcharge the colour. In natural *Agats* no change was obſerved for three or four days; but a *dendrites* put into aqua-fortis, having been forgot in a window, and expoſed to moiſt and rainy weather, was found very much changed, and the fainter parts of the vegetations were entirely effaced. V. Hiſt. Acad. Scienc. 1733. p. 35, 36. Edit. Amſt.

So that the trial of *Agats*, by aqua-fortis, ſeems precarious. However, ſo far remains true, that the artificial colours ſoon diſappear in ſuch a trial; whereas it requires ſome days to diſcharge the natural colours.

AGAT, among antiquaries, denotes a ſtone of this kind, engraven by art.

In which ſenſe, *Agats* make a ſpecies of antique gems; in the workmanſhip whereof, we find eminent proofs of the great ſkill and dexterity of the antient ſculptors. Several *Agats* of exquiſite beauty are preſerved in the cabinets of the curious. The facts, or hiſtories, repreſented in antique *Agats*, with how much addreſs ſoever conducted, are become, at this diſtance of time, many of them obſcure and dubious, and their explication difficult enough; whence divers miſtakes have been committed, and numerous conjectures and diſputes raiſed.

The great *Agat* of the apotheoſis of Auguſtus, in the treaſury of the holy chapel, antiently paſſed for a triumph of Joſeph, when firſt ſent from Conſtantinople to St. Lewis; and 'tis probable, there are ſtill in many churches, even among theſe held and worſhipped for relicts, many of the remains of paganiſm, which the ſimplicity of our anceſtors has, as it were, conſecrated [a]. An *Agat*, now in the French king's cabinet, had been kept ſeven hundred years, with great devotion, in the Benedictin abby of St. Evre at Toul, where it paſſed for a St. John the evangeliſt, carried away by an eagle, and crowned by an angel. Of late years, the heatheniſm of it having been detected, the religious would no longer give it place among their relicts, but preſented it, in 1684, to the king: the antiquaries of the academy find it the apotheoſis of Germanicus. Another *Agat*, in the ſame cabinet, which had formerly paſſed for a triumph of Joſeph in Egypt, has been lately found to repreſent Germanicus and Agrippina, under the figures of Ceres and Triptolemus [b]. A curious *Agat*, in the cabinet of the French king, has been the ſubject of the inquiries of the academy of inſcriptions [c]: it had been preſerved, for time immemorial, in one of the moſt antient churches of France, where it had paſſed for a repreſentation of paradiſe, and the fall of man; there being ſeen on it two figures reſembling Adam and Eve, with a tree, a ſerpent, and a Hebrew inſcription around it, taken from the third chapter of Geneſis, "The woman ſaw that the fruit was good, &c." The French academiſts, inſtead of our firſt parents, find Jupiter and Minerva repreſented by the figures; and as to the inſcription, find it of modern date, being written in a Rabbinical character, very incorrect, and poorly engraven. But after this diſcovery of the type, there ſtill remained great difficulty in the explication of it. Some underſtood it of the birth of Minerva, ſpringing compleatly armed out of Jupiter's head; others of the diſpute of that goddeſs with Neptune; others, in fine, of the birth of Erichthonus, and the fabulous traditions of the monſter half man half ſerpent, begot by Vulcan and the Earth. But the prevailing opinion was, that the *Agat* repreſented ſimply the worſhip of Jupiter and Minerva at Athens.—[a Vid. Hiſt. Acad. R. Inſcrip. T. 1. p. 338. b Id. ibid. p. 340—344. c V. Hiſt. Acad. Inſcrip. T. 1. p. 337—339.]

AGATS are ſometimes denominated from the ſubject repreſented on them.

Among the more curious, we meet with Tiberian *Agat*, *Achates Tiberianus*, a name given, by ſome, to the famous *Agat* in the treaſury of the French king's chapel, repreſenting the apotheoſis of Auguſtus, and the ſeries and portraits of the family of Tiberius and Julia, with divers foreign nations ſubdued in war; concerning which, many different explications and conjectures have been advanced by the learned. V. Act. Erud. Lipſ. 1684. p. 255—259.

Iſiac AGAT, *Achates Iſiacus annularis*, is a curious antique *Agat* at Rome, ſo called, as repreſenting the head of Iſis, and being ſet in a ring. Sig. Fontanini has given an explication of this *Agat*,

AGATHODÆMON, a beneficent genius, or dæmon. See DÆMON and GENIUS, *Cycl.*

The word is Greek, compounded of αγαθος, good, and δαιμων, dæmon.

Among antient writers, *Agathodæmon* is a denomination given to a kind of ſerpents, bred up and revered by the Egyptians, from an opinion of ſome ſanctity reſiding in them.

They are alſo called dragons, *dracones*, or *dracunculi*, and fabulouſly deſcribed as having wings.—They appear to be the ſame with thoſe otherwiſe called *ſirenes*. Vid. *Lamprid.* in Heliogab. c. 28. *Caſaub.* Not. ad Sueton. Ed. 2. *Bochart*, Hieroſ. P. 2. l. 3. c. 14 *Hoffm.* Lex. Univ. T. 1. p. 106.

AGE (*Cycl.*)—Dr. Woodward holds, that the ages to which men arrive, are proportional to the number of their lacteals. Mem. de Trev. 1725. p. 983.

AGE is alſo uſed for the duration of vegetable matters. In which ſenſe, we ſay the *Age* of roots, of leaves, of corn, of wine, &c. V. *Grew*, Anat. Plant. l. 2. p. 91. Id. ibid. l. 4. c. 5. p. 56. Mem. Acad. Scienc. 1708. p. 95. Hiſt. Crit. Rep. Lett. T. 1. p. 236.

Trees after a certain *Age* waſte. An oak at a hundred years old ceaſes to grow. The uſual rule for judging of the *Age* of wood, is by the number of circles which appear in the ſubſtance of a trunk, or ſtock, cut perpendicularly, each circle being ſuppoſed the growth of a year [a]; though ſome reject this method as precarious, alledging, that a ſimple circle is ſometimes the produce of ſeveral years; beſides that, after a certain *Age*, no new circles are formed [b].—[[a] Philoſ. Tranſ. N°. 43. p. 857. Bibl. Univ. T. 13. p. 197. & T. 1. p. 474. Mem. de Trev. 1711. p. 700. [b] Act. Erud. Lipſ. 1713. p. 146.]

AGE is alſo uſed for the duration of things inanimate, and even factitious.

In which ſenſe we ſay, the *Age* of a houſe, of a country [a], a ſtate, [b] a commonwealth, or the like. A late author propoſes a method of diſcovering the *Age* of the ſea, by the number of layers of incruſtated ſediment wherewith its bottom is lined [c].—[[a] *Rudbeck*, Atlant. ap. Nouv. Rep. Lett. T. 3. p. 66. [b] *Bodin*, de Repub. l. 4. c. 1. [c] Mem. Acad. Scien. 1710 p. 32.]

Some have laid it down as a rule with regard to the *Age* of ſtates, that none ſurvive thirteen hundred years [d]. Civilians eſtimate the *Age* of houſes, by the materials of which they are formed. Thus a ſtone houſe was reckoned the day it was built, as if it were to ſtand eighty years; ſo that, if it had coſt, *e. gr.* an hundred crowns, and were burnt down after ſtanding forty years, the value of it was diminiſhed one half [e]. A houſe built of burnt bricks was reputed immortal; whence Pliny calls the walls made of this ſtuff *parietes æternos* [f].—[[d] Nouv. Rep. Lett. T. 12. p. 196. [e] *Bodin*, ubi ſupra, l. 4. c. 2. p. 633. [f] *Plin.* Hiſt. Nat. l. 35. c. 14.]

AGE *of the world* denotes the time elapſed ſince the creation.

There are infinite diſputes among chronologers concerning the *Age* of the world, which ſome extend, others contract, beyond the ordinary term [a]. The followers of Herodotus, and the Hebrew, make it much leſs than thoſe who adhere to Cteſias and the Septuagint [b]. Sir Iſaac Newton has taken upwards of three hundred years from the world's *Age* [c]; for which, however, he has made a retribution elſewhere. F. Pezron has added above two thouſand years to it [d].—[[a] Vid. *Voſſ.* Caſtig. ad Script. Horn. de Ætate Mundi, Hag. 4to. 1659. Mem. de Trev. 1729. p. 1567. *Strauch.* Brev. Chron. l. 4. c. 1. p. 150. *Bodin*, de la Repub. l. 4. c. 2. p. 654. *Brown*, Vulg. Err. l. 6. c. 1. p. 233. Act. Erud. Lipſ. ſup. T. 7. p. 416. It. an. 1704. p. 141. Giorn. de Letter. d'Ital. T. 31. p. 52. [b] *Kuſter*, Bibl. Nov. Liter. 1699. p. 466. [c] V. Chronol. p. 204. Bibl. Franc. T. 14. p. 56. [d] L'Antiq. des Tems Retablie. It. Defenſe de l'Antiq. des Tems. Jour. des Scav. T. 15. p. 109. Nouv. Rep. Lett. T. 10. p. 648. *Du Pin*, Bibl. Eccleſ. T. 19. p. 156. ſeq. *Le Clerc*, Bibl. Univ. T. 24. p. 105.]

Divers methods have been uſed for computing the world's *Age*; as by the invention of letters [e], the origin and progreſs of ſciences [f], and the like. Some late writers have propoſed other methods; as by the growth of the ſoil of a country [g]; the increaſe of ſaltneſs of the ſea [h]; the ſlow motion of the ſun's apogee [i].—[[e] Hiſt. Crit. Repub. Lett. T. 9. p. 1. [f] Nouv. Repub. Lett. T. 40. p. 292. [g] *Rudbeck*, Atlant. Ap. *Hook*, Phil. Collect. N°. 4. p. 119. [h] *Halley*, in Phil. Tranſ. N°. 344. p. 296. [i] *Power*, Exp. Phil. p. 188.]

Golden AGE, the firſt ſtate of the world, according to the antient poets; ſuppoſed to be the time when Saturn reigned, and during which the ground produced plenty of every thing, without labour or tillage. Aſtræa, *i. e.* juſtice, then reſided on earth; men held all things in common, and lived in perfect friendſhip. This period is ſuppoſed to have laſted till Saturn was expelled from his kingdom. V. *Ovid*, Metamor. l. 1. v. 88. ſeq. *Heſiod*, Opp. & Dies, v. 108. ſeq. *Thomaſſin*, Meth. Etud. Poet. P. 1. l. 2. c. 16. p. 517. ſeq. Nouv. Rep. Lett. T. 4. p. 749.

This, and the three remaining poetic *Ages*, the *Silver*, the *Brazen*, and the *Iron Ages*, are too well known to need any deſcription. Dr. Hook has given us a phyſical explication of the four *Ages*. Vid. Poſth. Works, p. 379. ſeq. See alſo *Burnet*, Archæol. c. 5. p. 88. Mem. de Trev. 1724.

A late author, reflecting on the barbariſm of the firſt *Ages*, will have the order which the poets aſſign to the four *Ages* inverted; the firſt being a time of rudeneſs and ignorance, more properly denominated an *Iron*, than a *Golden Age*. When cities and ſtates were founded, the *Silver Age* commenced; and ſince arts and ſciences, navigation, commerce, &c. have been cultivated, the *Golden Age* has taken place.

Rocky or ſtony AGE, in ſome antient northern monuments, correſponds to the *Brazen Age* of Heſiod, and the Greeks; being called *Rocky*, on account of Noah's Ark, which reſted on mount Ararat. Whence men were ſaid to be deſcended, or ſprung, from mountains, or from Deucalion and Pyrrha, reſtoring the race of mankind, by throwing ſtones over their heads.

Aſhen AGE, the fourth *Age* of the northern poets; ſo called from a Gothic king, Madenis, or Mannus, who, on account of his great ſtrength, was ſaid to be made of aſh; or, becauſe in his time people began to make uſe of weapons made of that wood. Vid. *Rudbeck*, Atlant. P. 3. c. 4—9. Philoſ. Tranſ. N°. 301. p. 207.

Hiſtorical AGE, that which commenced from the firſt Olympiad, in the year of the world 3228, and ſtill continues.

This diviſion, it is to be obſerved, only holds good with regard to the Greeks and Romans, who had no hiſtories earlier than the firſt Olympiad. The Jews, Egyptians, Phœnicians, Chaldees, not to ſay the Indians and Chineſe, who pretend to much earlier monuments, will not be concluded by it. Bibl. Univ. T. 1. p. 246.

AGE *before the law*, among the Jews, called alſo the *Void Age*, *Sæculum inane*, was the ſpace of time from the creation to Moſes. The length of this is differently computed, according to the tradition attributed to Elias; this, as well as the two following ones, conſiſt each of two thouſand years. The uſual Jewiſh computation, as alſo thoſe of Scaliger and Uſher, are mentioned in the *Cyclopædia*; as are alſo ſome opinions about the duration of the *Age* of the law, and of the *Age* of grace. V. *Strauch.* Brev. Chron. §. 13. p. 5.

The Sibylline oracles, which, according to ſome, were alſo written by Jews, acquainted with the prophecies of the Old Teſtament, divide the duration of the world into ten *Ages*; and, according to Joſephus, each *Age* comprehended ſix hundred years. It appears, by Virgil's fourth eclogue, and other teſtimonies, that the *Age* of Auguſtus was reputed the end of theſe ten *Ages*, conſequently as the period of the world's duration. *Pezron*, Defenſe de l'Antiq. des Tems, p. 505. ſeq. Bibl. Univ. T. 24. p. 145. ſeq.

Preſent AGE, among Jewiſh writers, frequently denotes all the ſpace of time before the Meſſiah, in contradiſtinction from *future Age*, or *Agetocome*, the time after the coming of the Meſſiah.

Middle AGE denotes the ſpace of time commencing from Conſtantine, and ending at the taking of Conſtantinople by the Turks, in the fifteenth century. *Martin.* Dial. Geogr. in Pref. Mem. de Trev. an. 1729. p. 1359. See alſo Bibl. Univ. T. 12. p. 393. ſeq.

A late author chuſes rather to date the middle *Age* from the diviſion of the empire made by Theodoſius, at the cloſe of the fourth century, and extend it to the time of the emperor Maximilian I. at the beginning of the 16th century, when the empire was firſt divided into circles. But this ſeems more accommodated to the ſtate of Germany in particular, than of Europe in general.

We ſay, a medal of the middle *Age* [a]; the philoſophy of the middle *Age* [b]. Junker has publiſhed a geography of the middle *Age*, in High-Dutch [c], which 'tis a pity were not to be had in ſome more popular language. Cellarius [d] has given a hiſtory of the middle *Age*; Eccard [e] a body of the hiſtorians of the middle *Age*; *Du Cange* a gloſſary of the Latin of the middle *Age*, and another of the Greek.—[[a] Bibl. Univ. T. 24. p. 405. [b] *Reinhard.* Hiſt. Philoſ. p. 125. ſeq. [c] See extracts of it in Act. Erud. Lipſ. 1712. p. 371. ſeq. & Mem. of Liter. T. 6. p. 296. [d] Hiſt. Medii Ævi. See an extract of it in Act. Erud. Lipſ. 1688. p. 272. ſeq. & Giorn. de Letter. de Parm. an. 1688. p. 176. [e] Corp. Hiſt. Medii Ævi, T. 2. fol. See Jour. des Scav. T. 75. p. 86. & Act. Erud. Lipſ. an. 1723. p. 377. & 438.]

The middle is by ſome denominated the barbarous *Age*, and the latter part of it, the loweſt *Age*. Some divide it into

Non Academical AGE, the ſpace of time from the VIth to the IXth centuries, during which ſchools or academies were loſt in Europe.

Academical AGE, from the IXth century, when ſchools were reſtored and univerſities eſtabliſhed, chiefly by the care of Charlemaign. Obſerv. *Halens.* T. 6. Obſ. 18. §. 4. p. 144.

Milliary or *Millenary* AGE, *ſæculum milliarium*, or *millenarium*, on medals denotes the laſt year of a Millennium or thouſand year.

Several medals of the emperors Philip, ſtruck in the thouſandth year from the building of Rome, have this legend.

AGE is alſo uſed among antient poets for the ſpace of thirty years. *Averan.* Diſſ. in Anthol. Ep. 2. Giorn. de Letter. d'Ital. T. 24. p. 423.

In which ſenſe, *Age* amounts to much the ſame with generation.

Neſtor is ſaid to have lived three *Ages*, at the time when he was ninety.

New AGE, on antient medals, denotes the beginning, or firſt year of a new *ſæculum*, or century of years. V. Mem. de Trev. Jan. 1701. p. 133. ſeq.

AGE is alſo underſtood of the ſeveral degrees or periods of of human life.

Age is ranked among the *res naturales*, and as ſuch contributes to health or diſeaſe.

It is ſaid to be found by experience, that there are more perſons living between ſixteen and twenty-ſix years, than of any other age, or Decad in the life of man. On this principle Sir William Petty eſtabliſhes a rule, that the roots of every number of mens *Ages* under ſixteen, whoſe root is four, compared with this number four, ſhews the proportion of the probabilities of each man's arriving at ſeventy years of age. Thus it is four times more likely that one of ſixteen years ſhould live to ſeventy, than that a new born babe ſhould; and twice as likely that one of ſixteen ſhould reach that *Age*, as that one of four years ſhould do it, *&c.* *Petty*, Diſc. of Dupl. Propor. p. 82. ſeq. See Phil. Tranſ. N°. 196. p. 598. Jour. des Scav. T. 1. p. 613. Miſc. Lipſ. T. 11. Obſ. 221. p. 12. ſeq.

But it is to be obſerved, that the rules laid down by this gentleman, are often the reſult of haſty and incomplete inductions; and in this particular caſe, of two lives of ſixteen and four years of *Age*, the chance of the former's arriving to the *Age* of ſeventy, is ſo far from being double of the chance of the latter, that the proportion of the chances is but as 760 to 622. See *Halley*'s table of lives in *De Moivre*, Doctr. of Chanc. 2d. Ed. p. 253.

Age is more particularly underſtood of a certain ſtate, or portion of the ordinary life of man, uſually diſtinguiſhed by ſome conſiderable change in the temperament, or conſtitution. *Caſt.* Renov. p. 22. Voc. *Ætas*.

AGE is differently conſidered by naturaliſts from what it is by lawyers; and even in each of thoſe profeſſions we find various ſyſtems and diviſions of *Age*. Upon which the curious may conſult *Briſſon.* de Verb. Signif. *Calvin.* Lex. Jur. voc. *Ætas*. *Farnel.* Univ. Medic. l. 3. c. 10. *Chauvin.* Lex. Phil. voc. *Ætas*.

By the Roman law we find divers *Ages* aſcertained, *viz.*

Conſular AGE, or that wherein a perſon might regularly hold the conſulſhip, was the forty-third year, ſo that he might ſue for it in the forty-ſecond. Where it is to be obſerved, that it was not neceſſary either of thoſe years ſhould be expired, but only begun; beſides, that men of extraordinary merits towards the republic, were in this matter exempt from the ordinary laws. Hence Corvinus was conſul at twenty-three years, Scipio Æmilianus at thirty-ſix, and Pompey the great at thirty-five; others broke thro' the laws by violence, as C. Marius the younger, and Octavius Cæſar, who procured themſelves to be made conſuls, before twenty years of *Age*. *Macchiav.* Diſc. in Liv. l. 1. c. 60. p. 210. *Pitiſc.* Lex. Ant. T. 1. p. 52.

Judiciary AGE, or that wherein a perſon was capable of ſitting as judge, was not always the ſame; for by the *lex Servilia Glauciæ*, none was allowed to be choſen under thirty years of *Age*, or above ſixty. By ſome other laws the *Age* ſeems to have been limited to thirty-five, but reduced afterwards by Auguſtus to 30; tho' Pitiſcus ſuppoſes a miſtake here in the text, and that inſtead of thirty-five and thirty, it ought to be read twenty-five and twenty. *Pitiſc.* Lex. Ant. T. 1. p. 52.

Military AGE, or that wherein the Romans were obliged to enter themſelves in the army, was at ſeventeen years; at forty-five, they might demand their diſmiſſion. *Aquin.* Lex. Milit. T. 1. p. 26. ſeq. *Pitiſc.* loc. cit. *Bodin.* de Republ. l. 5. c. 5. p. 869.

Among the Lombards, the *Age* of entry was between eighteen and nineteen; among the Saxons, at thirteen. Bibl. Univ. T. 6. p. 336. ſeq.

AGE *for holding offices in the city*, as quæſtor, ædile, tribune of the people, *&c.* is not determined by the annal-laws of Villius, but appears to have been the twenty-ſeventh year.

For it was neceſſary that the perſon who claimed any urban employment, had firſt ſerved ten years without interruption in the army, commencing from the ſeventeenth year. Tho' ſome think the quæſtorſhip might have been held at twenty-five years. *Polyb.* l. 6. c. 17. *Pitiſc.* loc. cit.

Prætorian AGE, or that wherein a perſon might ſollicit for the prætorſhip, was at forty; two years earlier, than the *Age* required for conſul.

Legitimate AGE, denotes the *Age* of twenty-five, ſo called as ſome imagine, becauſe, youth were then by law allowed, to take the direction of their affairs into their own hands. *Briſſ.* Select. Antiq. ex Jur. civ. l. 3. c. 2.

Diſpenſation of AGE, *ætatis venia*, is a right which a perſon obtained from the prince, or ſovereign of ſetting aſide a tutor or curator, and taking the adminiſtration of his affairs into his own hands, before the legitimate *Age*. *Briſſ.* de Verb. Signif. p. 31. *Calv.* Lex. Jur. p. 52. in voc. *Ætatis Venia*.

Adoptive AGE, called alſo *plena pubertas*, requires the adopter to be eighteen years older than the perſon adopted, that there may appear a probability of his being a natural child. *Manut.* de Legib. c. 14. *Pitiſc.* Lex. Ant. T. 1. p. 51. in voc. *Ætas*. See ADOPTION, *Cycl.* and *Suppl.*

Matrimonial AGE, is defined by the time, wherein a perſon is deemed capable of natural procreation, which again is defined by the beginning of puberty.

Various methods have been in uſe for determining this *Age*. One ſect of antient Roman lawyers called Caſſiani, fixed it by the ſtate of the body, which Juſtinian and others after him, ſuppoſe to have been done by ſearch, or inſpection of the genital parts, at leaſt in the male ſex; for as to the female, it is pretended the twelfth year was the only guide, tho' others alledge that the eruption of the menſes ſerved inſtead hereof. The Proculiani, on the contrary, determined the puberty of males, by the expiration of the fourteenth year. Javolenus took a middle courſe, and made uſe of both methods. V. *Hartung.* Exerc. de Stat. Matrim. c. 2. p. 12. Nouv. Rep. Lett. T. 7. p. 784. It. T. 49. p. 230. Jour. des Scav. T. 66. p. 497. *Pitiſc.* loc. cit.

The *Age* of marriage has undergone divers modifications: in princes it is allowed earlier than in private perſons [a]; in ſome countries than in others [b]. In Perſia girls are married at nine, boys only at thirteen [c], in Holland, males are not allowed to marry without conſent of parents or curators, before twenty-five, girls not before twenty [d]; the Romans choſe to marry their wives young, for the advantage of having them innocent and tractable [e]. Others declaim againſt præmature marriages. Some have pretended to limit the other extreme of marriageable age to forty-five, but this too will be variable in different conſtitutions. We meet with inſtances of generation from ſixty to one hundred and four, or even one hundred and twenty-one years of *Age* [f]. In *Formoſa*, if we may truſt Pſalmanazar, women are not allowed to bear children before thirty-five or thirty-ſeven, and if any prove with child before that *Age*, the law orders an abortion to be procured in a very extraordinary manner [g].—[[a] Jour. des Scav. T. 51. p. 484. [b] Nouv. Rep. Lett. T. 44. p. 527. [c] Mem. of Liter. T. 3. p. 155. [d] Jour. des Scav. T. 30. p. 954. [e] Giorn. de Letter. d'Ital. T. 6. p. 99. [f] *Plott.* Nat. Hiſt. Stafford. c. 8. §. 3. p. 269. *Schenck.* Obſerv. Medic. T. 2. p. 89. [g] Nouv. Rep. Lett. T. 38. p. 57. Work of Learn. T. 8. p. 516.] See ABORTION.

The canon or eccleſiaſtical law alſo notes divers *Ages*, viz. of baptiſm, of ordination to prieſthood, which is not to be before twenty-four; nor to epiſcopacy before thirty-three. V. *Arnd.* Lex. Eccleſ. p. 214. *Du Pin.* Bibl. Eccleſ. T. 18. p. 10.

It is diſputed whether confirmation may be before ſeven years of *Age*. Jour. des Scav. T. 82. p. 116.

By an edict of the late king of France, the children of the reformed, were enabled to chooſe their religion at ſeven years of *Age* [h]. By the antient canons, the clergy were not allowed to have maid-ſervants in their houſes, till paſt the *Age* of child-bearing [i].—[[h] Ouvr. des Scav. Mar. 1695. p. 307. [i] *Sacy*, Not. ſur 1. Tim. c. 5. Jour. des Scav. T. 43. p. 375.]

AGED *of the mountain* is a title or denomination given to the chief or prince of the people called Aſſaſſins. Jour. des Scav. T. 83. p. 20. See ASSASSIN, *Cycl.*

AGEMA, in the antient military art, a kind of ſoldiery, chiefly in the Macedonian armies.

The word is Greek and literally denotes vehemence; to expreſs the ſtrength and eagerneſs of this corps. *Suid.* Lex. T. 1. p. 27. *Aquin.* Lex. Milit. T. 1. p. 28. *Pitiſc.* Lex. Ant. T. 1. p. 55.

Some will rather have *Agema* to have denoted a certain number of picked men, anſwering to a legion among the Romans, which is authoriſed by a paſſage in Livy; Arrian on the contrary, ſpeaks of the *Agema*, as a wing of horſe; not but the term is alſo applied to foot. *Liv.* Decad. 5. l. 2.

AGEMOGLANS (*Cycl.*)—The *Agemoglans* only differ from the Ichoglans, as the former are bred up for the lower, and the latter reſerved for the higher offices of the empire. *Tourneſ.* Voy. du Levant. T. 2. Lett. 13. p. 24. *D' Herbel.* Bibl. Orient. p. 69. Trev. Dict. Univ. T. 1. p. 197.

AGENDA, in a general ſenſe, denotes things to be done or performed, in conſequence of a man's duty.

The word is Latin, formed from *agere*, to do, and divines ſpeak of the *Agenda* of a chriſtian, meaning the things to be practiſed by way of contradiſtinction from *credenda*, or the things to be believed; the former imports the articles of obedience, the latter of faith.

AGENDA is alſo uſed for a book containing notes, or memorandums of things neceſſary to be done.

In which ſenſe, *Agenda* amounts to much the ſame with table-book, *&c.* An anonymous French author, has publiſhed the *Agenda* of a man of the world, containing maxims or rules, proper for the conduct of life. Tablettes. de l' Homme de Coſmop. 1715. an extract of which is given in Jour. Liter. T. 6. p. 174,—184.

AGENDA is more particularly uſed among eccleſiaſtical writers for the ſervice, or office of the church. We meet with *Agenda matutina & veſpertina*, morning and evening prayers; *Agenda diei*, the office of the day, whether feaſt or faſt day;

Agenda mortuorum, called alſo ſimply *Agenda*, the ſervice for the dead. V. *Du Cange*, Gloſſ. Lat. T. 1. p. 106.

AGENDA is alſo applied to certain church books, compiled by public authority, preſcribing the order and manner to be obſerved by the miniſters, and people, in the principal ceremonies, and devotions of the church, that all things may be done decently, and in order. V. Miſc. Lipſ. T. 8. Obſ. 165. p. 35. Mem. de Trev. Juin. 1702. p. 82. Nouv. Rep. Lett. T. 46. p. 418.

In which ſenſe, *Agenda* amounts to the ſame with what is otherwiſe called, ritual, liturgy, acalouthia, miſſal, formulary, directory, &c.

AGENFRIDA, in antient cuſtoms, denotes own lord, or he who has the abſolute property, and dominion of a thing.

The word is alſo written *Agenfriga*, and *agenfrie*. It is derived from the Saxon, *Agen*, own, and *Frea*, lord, maſter. V. *Spelm.* Gloſſ. p. 22. *Somn.* and *Skinn.* Etym. in voc. *Wilk.* Gloſſ. ad Legg. Angl. Sax. p. 389.

AGENHINE, in our old writers, ſignifies a gueſt that has lodged at an inn for three nights, after which time he is accounted one of the family. *Blount*, *Cowel.* See HOGHENHINE, *Cycl.*

AGENT (*Cycl.*)—It is a celebrated queſtion among philoſophers, and divines, whether man be a free, or a neceſſary *Agent?* It may be thus ſtated; man is a neceſſary *Agent* if all his actions are ſo determined by the cauſe preceding each action, that not one paſt action could poſſibly not have come to paſs, or have been otherwiſe than it was; nor one future action can poſſibly not come to paſs, or be otherwiſe than it ſhall be. On the contrary, man is a free *Agent*, if he be able at any time, under the circumſtances and cauſes he then is, to do different things; or in other words, if he is not ever unavoidably determined in every point of time, by the circumſtances he is in, to do that one thing he does, and not poſſibly to do any other.

Which of theſe two definitions agrees to man, is a queſtion of fact to be determined by what we experience in ourſelves, with regard to the operations of our own minds [a]. A late author pretends to reduce the latter definition to an abſurdity [b].—[[a] *Coll.* Philoſ. Enquir. Concern. Libert. p. 11. Jour. Liter. T. 10. p. 88. [b] *Cato*'s Lett. T. 4. p. 190. ſeq.] See LIBERTY, NECESSITY, WILL, *Cycl.*

AGENT is more particularly uſed in medicine, for a being which has motion within itſelf. *Caſt.* Lex. Med. p. 24.

In which ſenſe it ſtands oppoſed to patient, which receives motion from another; thus medicines are conſidered as *Agents*, or as acting on the body; by way of contradiſtinction from aliments, which are ſuppoſed rather to be acted on, than to act.

AGENT is ſometimes attributed to menſtruums, or ſuch bodies as in mixture have the greateſt ſhare of activity and motion. *Quincy*, Lex, Phyſ. Med. p. 12.

That internal *Agent* in man, whereby all the vital motions neceſſary to the preſervation and reſtoration of the body are managed, is by ſome called nature; by others *archæus*, *callidum innatum*, animal ſoul, vital ſpirit, or principle, &c. *Spreng.* Nat. Morb. Medic. in *Purm.* Chir. Cur. l. 3. c. 16.

AGENT is ſometimes alſo uſed in chemiſtry for what we more uſually call inſtrument. Jour. des Scav. T. 69. p. 350.

In which ſenſe, fire, water, air, earth, and menſtruums, are chemical *Agents*.

AGENTS *of the victualing-office* are officers under the commiſſioners, appointed to buy, and contract for proviſions, &c. Some of theſe are ſettled in the ports, where they have much the ſame office and authority, as the commiſſioners themſelves at London. V. *Maydm.* Nav. Specul. 4. p. 123.

AGENT *victualler* is uſed in the ſame ſenſe.

AGENT is more particularly uſed for the miniſter of a prince, or ſtate at another court.

In which ſenſe, *Agents* are commonly reputed a ſpecies of public miniſters, or embaſſadors; but they differ eſſentially, in that *Agents* are not inveſted with any repreſentative character, altho' intruſted with the affairs, and intereſts of their princes. See EMBASSADOR, ENVOY, *Cycl.*

AGENT is ſometimes uſed in writers of the middle age, for the king's miniſter or officer.

In which ſenſe, the king is ſaid to have ſent to his dukes, counts, and the reſt of his *Agents*. *Du Cange*, Gloſſ. Lat. T. 1. p. 107.

AGENTES *ad reſponſum*, among the Romans. See MAGISTER *Scrinii diſpoſitionum.*

AGENTES *in Rebus*, one of the ſchools, or ranks of officers in the court of the Conſtantinopolitan emperors, whoſe buſineſs was, to collect and convey the corn both for the army, and houſhold; carry letters, and meſſuages from court to all parts of the empire; regulate couriers, and their vehicles; to make frequent journeys, and expeditions thro' the provinces, have an eye to any motions, diſturbances, machinations tending that way, and give early notice thereof to the emperor. V. *Aquin.* Lex. Milit. T. 1. p. 28. *Pitiſc.* Lex. Ant. T. 1. p. 56. *Calv.* Lex. Jur. p. 53. *Hartung.* Exerc. 3. c. 14. §. 15.

The *Agentes in Rebus*, are by ſome made ſynonymous with our poſt-maſters, but their function was of greater extent. They correſpond to what the Greeks call Πυξοφοροι, and the Latins *Veredarii*. They differ from the *Frumentarii*, in little more than the name, being erected upon the ſuppreſſion of the *Frumentarii*, to ſupply their place, not long before the age of Conſtantine. V. *Aurel. Vict.* de Cæſar. c. 39. n. 44. *Pitiſc.* Lex. Antiq.

The *Agentes in Rebus* were of the number of the palatine officers, and as ſuch under the management of the *Magiſter officiorum*; tho' their employment was not confined to the court, for which reaſon they are ſometimes ſpoken of as different from the palatine officers.

There were divers orders or degrees of *Agentes in Rebus*, as *Tribuni*, *Primicerii*, *Senatores*, *Ducenarii*, *Biarchi*, *Circitores*, *Equites*, *Tyrones*, &c. thro' all which they roſe *gradatim*. Their chief was denominated *princeps*, which was a poſt of great dignity, being reckoned on a level with that of proconſul.

The *Princeps Agentium in Rebus*, reſided at Conſtantinople, others of them were diſpoſed in every part of the empire. They are alſo ſaid to have ſerved as interpreters. V. *Hartung.* loc. cit. c. 11. §. 14.

AGER, (*Cycl.*)—AGER *Vectigalis privatus*, in Roman antiquity, that whoſe property was granted to private perſons on the reſerve of a certain rent, or tribute.

AGER *Vectigalis publicus*, that whoſe property was reſerved to the public, and being let out to farm, the rents or profits accrued to the public treaſury.

AGER is alſo uſed for a certain portion or meaſure of land, antiently allowed in the diviſion of grounds to each citizen.

In the early days of the Roman ſtate, the *Ager* was only two *Jugera*, amounting to 1¼ Engliſh acre.—After the expulſion of the kings, ſeven *Jugera* were allowed a Plebeian. Under the conſulate of C. Licinius Stolo, in the year of Rome 376, a law was made to limit eſtates to 500 *Jugera*, or 330 Engliſh acres. Under Julius Cæſar another agrarian law was publiſhed, by which thoſe who enlarged their pittance of land, were to pay 50 *Aurei* to the public. V. *Arbuthn.* Diſſ. of Rom. Money, c. 1. *Baxt.* Gloſſ. p. 66. ſeq. *Hoffm.* Lex. Univ. T. 1. p. 108. Jour. des Scav. T. 21. p. 159. See AGRARIAN.

AGER is alſo uſed in middle age writers, for what we now call an acre. *Spelm.* Gloſſ. p. 22. *Du Cange*, Gloſſ. Lat. T. 1. p. 107. See ACRE.

AGER *Mineralium*, among chemiſts, denotes the element of water; conſidered as the field, or ſoil, wherein mineral bodies have their firſt root, and from whence they ſhoot their branches upon the earth. *Dorn.* Geneal. Mineral. c. 3. in Theat. Chem. T. 1. p. 571. *Caſt.* ap. Lex. Med. p. 24. See WATER, and MINERAL, *Cycl.*

Some conſider the *Uterus* as a kind of *Ager naturæ*, bearing a near reſemblance in point of office, to the earth itſelf, in receiving and foſtering the ſemen, &c. V. *Burggrav.* Med. p. 345. See UTERUS, *Cycl.*

AGERATUM, in botany, the name of a genus of plants, the characters of which are theſe; the flower is monopetalous, of the perſonated kind, and tubular in its lower part, and in the upper divided into two lips, the upper of which is bifid, and the lower divided into three ſegments. The piſtil ariſes from the cup, and finally becomes an oblong membranaceous fruit, divided into two cells, which contain a number of very fine ſeeds affixed to a placenta.

The ſpecies of *Ageratum* enumerated by Mr. Tournefort are theſe.

1. The ſmooth leaved ſerrated alpine *Ageratum*, with purple flowers. 2. The ſmooth leaved ſerrated alpine *Ageratum*, with white flowers. 3. The hairy ſerrated alpine *Ageratum*, with purple flowers. 4. The hairy alpine ſerrated *Ageratum*, with white flowers. 5. The American *Ageratum*, with the leaves and whole appearance of the rapunculus. *Tournef.* Inſt. p. 651. ſeq.

AGERATUM is an officinal plant, popularly called *maudlin.*

The word is originally Greek αγηραλον, compounded of the privative α and γηρας old age, on account of its flowers, which do not eaſily wither or grow old [a].

Ageratum bears a near reſemblance to the Coſtmary, from which it only differs, in that its flowers are formed into looſe umbels; there are divers ſpecies of it. The officinal is called *Ageratum foliis ſerratis*, C. B. or *Ageratum Luteum*, and is the ſame with the *Eupatorium Meſues*, ſo called on account of its virtue in diſeaſes and obſtructions of the liver [b].

Ageratum is of an aſtringent quality, and as ſuch recommended by Riverius, and others, againſt incontinence of urine; Geſner has alſo diſcovered a briſk purgative power in its [c] roots. But it is rarely preſcribed in the preſent practice.—[[a] *Lemery*, Dict. des Drog. p. 18. [b] *Quinc.* Diſpenſ. P. 1. Sec. 4. n. 257. *Mill.* Gard. Dict. in voc. [c] *Quinc.* ib. See alſo *Burggrav.* Lex. Med. T. 1. p. 346. ſeq. & *Junck.* Conſp. Therap. Tab. 20. p. 516.]

AGERATUS *Lapis*, in the materia medica of the antients, the name of a ſtone mentioned by Galen and other writers; and ſaid to be of the nature of the Phrygian ſtone, but more aſtringent; and as that was uſed in dying, this was in dreſſing of leather: we have no account of its external appearance, but probably it contained vitriol, and perhaps alum.

The great uſe of vitriol or copperas in the management of leather, is well known; and the ſtones which contain it, or Pyritæ, are every where common. The method uſed alſo in the

preparation of the *Phrygius lapis*, which was the wetting and ſlightly calcining it, muſt be very proper to make the vitriol contained in this appear and exert itſelf in the working with it. *Galen*, de Med. Simpl. L. 9. See alſo *Mercat.* Metaloth. Am. 9. c. 15. p. 240.

AGGADA, in Jewiſh antiquity, an ingenious tale, or ſtory; of which kind there are many in the Talmudt.

There are ſeveral books extant among the Jews under this title [a]. R. San-Iſrael Ben Juda has publiſhed *Novellas Aggadarum*, or new explanations of the ſtories and relations in the Talmud, diſcovering the hidden meanings thereof [b]. —[a Vid. *Wolf.* Bibl. Hebr. b Act. Erud. Lipſ. 1685. p. 1. ſeq.]

AGGER, in antient Latin writers, denotes the middle part of a military road, raiſed into a ridge, with a gentle ſlope on either ſide, to make a drain for the water, and keep the way dry.

AGGER is alſo uſed for the whole road, or military way. *Du Cange*, Gloſſ. Lat. T. 1. p. 107. ſeq.

Where high-ways were to be made in low grounds, as between two hills, the Romans uſed to raiſe them above the adjacent land, ſo as to make them of a level with the hills. Theſe banks they called *Aggeres*. Bergier mentions ſeveral in the *Gallia Belgica*, which were thus raiſed, ten, fifteen, or twenty feet above ground, and five or ſix leagues long. V. *Bergier*, Hiſt. des Chemins, l. 2. Mem. of Liter. T. 7. p. 35.

They are ſometimes alſo called *Aggeres calceati*, and now generally known by the name chauſſees, or cauſeways.

AGGER alſo denotes a work of fortification, uſed both for the defence and the attack of towns, camps, &c.

In which ſenſe, *Agger* is the ſame with what was otherwiſe called *vallum* [a], and in latter times *aggeſtum* [b], and among the moderns *lines*; ſometimes *cavaliers*, *teraſſes*, &c. —[a V. *Horſley*, Britan. Rom. l. 1. c. 8. p. 107. b *Pitiſc.* Lex. Antiq.]

The *Agger* was uſually a bank, or elevation of earth, or other matter, bound and ſupported with timber; having ſometimes turrets on the top, wherein the workmen, engineers, and ſoldiery were placed. It was alſo accompanied with a ditch, which ſerved as its chief defence.

The uſual materials, of which it was made, were earth, boughs, faſcines, ſtakes, and even trunks of trees, ropes, &c. variouſly croſſed, and interwoven ſomewhat in the figure of ſtars; whence they were called *ſtellati axes*. Where theſe were wanting, ſtones, bricks, tyles, ſupplied the office: on ſome occaſions, arms, utenſils, pack-ſaddles, were thrown in to fill up. What is more, we read of *Aggers* formed of the carcaſſes of the ſlain [c]; ſometimes of dead bones mixed with lime [d]; and even with the heads of ſlaughtered citizens [e]. For want of due binding, or ſolid materials, *Aggers* have ſometimes tumbled down, with infinite miſchief to the men. —[c *Valer. Max.* l. 7. c. 6. *Appian.* de Bell. Civ. l. 2. *Hirt.* de Bell. Hiſpan. *Joſeph.* de Bell. Judaic. l. 4. d *Spon.* Voy. P. 1. e *Ducaſ.* Hiſt. Byzant. c. 17.]

The beſiegers uſed to carry on a work of this kind nearer and nearer towards the place, till, at length, they even reached the wall. The methods taken, on the other ſide, to defeat them, were by fire, eſpecially if the *Agger* were of wood; by ſapping and undermining, if of earth; and, in ſome caſes, by erecting a counter *Agger*.

The height of the *Agger* was frequently equal to that of the wall of the place. Cæſar tells us of one he made, which was thirty feet high, and three hundred and thirty feet broad. Beſides the uſe of *Aggers* before towns, the generals uſed to fortify their camps with the ſame; for want of which precaution, divers armies have been ſurprized and ruined.

There were vaſt *Aggers* made in towns, and places on the ſea-ſide, fortified with towers, caſtles, &c. Thoſe made by Cæſar and Pompey at Brunduſium, are famous [f]. Sometimes *Aggers* were even built acroſs arms of the ſea, lakes, and moraſſes; as was done by Alexander before Tyre [g], and by M. Antony and Caſſius [h].—[f V. *Cæſar.* de Bell. Civ. l. 1. g *Q. Curt.* l. 4. h *Appian.* loc. cit.]

The wall of Severus, in the north of England, may be conſidered as a grand *Agger*, to which belong ſeveral leſſer ones. Beſides the principal *Agger*, or *vallum*, on the brink of the ditch, M. Horſley deſcribes another *Agger* on the ſouth ſide of the former, about five paces diſtant from it, which he calls the ſouth *Agger*; and another larger *Agger* on the north ſide of the ditch, called the north *Agger*. This latter he conjectures to have ſerved as a military way; the former, probably, was made for an inner defence, in caſe the enemy ſhould beat them from any part of the principal *vallum*, or to protect the ſoldiers againſt any ſudden attack from the provincial Britains. *Horſl.* Brit. Rom. l. 1. c. 8. p. 117.

AGGER *Tarquinii*, *Tarquin's Agger*, was a famous fence built by Tarquinius Superbus, on the eaſt ſide of Rome, to ſtop the incurſions of the Latins, and other enemies, whereby the city might be infeſted. V. *Pitiſc.* Lex. Ant. in voc.

AGGER is alſo uſed for the earth dug out of a trench and thrown up on the brink of it.

In which ſenſe, the chevalier Folard thinks the word to be underſtood, when uſed in the plural number, ſince we can hardly ſuppoſe they would raiſe a number of cavaliers, or terraſſes. V. Bibl. Raiſ. T. 5. p. 112.

AGGER is alſo uſed for a bank, or wall, erected againſt the ſea, or ſome great river, to confine or keep it within bounds.

In which ſenſe, *Agger* amounts to the ſame with what the antients called *tumulus* and *moles*; the Dutch, *dyke*; we, *dam*, *ſea-wall*.

The firſt hint of this kind of *Aggers* is ſaid to have been taken from ſwallows, which ſo ſtopped up one of the mouths of the Nile, with a vaſt continued cluſter of neſts, as to withſtand all the weight and force of that river. We find a title in the code *de Aggeribus Nili non rumpendis*. *Plin.* Hiſt. Nat. T. 1. l. 10. c. 33. p. 562. ſeq. *Hoffm.* Lex. Univ. T. 1. p. 109.

AGGER alſo denotes a heap of earth, raiſed over the graves of the antients. *Baxt.* Gloſſ. p. 67. ſeq. *Danet.* Lex. Ant. in voc.

In which ſenſe, it amounts to the ſame with *tumulus*; and is ſometimes alſo called *aggeſtum*. V. *Hoffm.* Lex. Univ. T. 1. p. 109. in voc. *Aggeſtum*.

AGGLUTINATION (*Cycl.*)—Some aſſign a difference between *Agglutination* and aſſimilation: in that ſpecies of leoproſy, called λευκη, there is an adheſion, or *Agglutination* of the nutriment, but no aſſimilation. In the anaſarcous dropſy, on the contrary, there is an adjunction, without any *Agglutination*; *i. e.* there is an afflux of new matter, or nouriſhment, but this ſo thin and watery, that it wants the due ſtiffneſs and tenacity to make it bind. *Gorr.* Def. Med. p. 390. in voc. προσφυσις. *Quinc.* Lex. Med. p. 12.

Some will have *Agglutination* to be effected by a ferment; others aſſert, that by reaſon of the glutinous quality of the chyle, a mere contact ſuffices to make it adhere to the parts. Nouv. Rep. Lett. T. 14. p. 1296.

AGGLUTINATION is uſed by ſome aſtronomers to denote the meeting of two or more ſtars in the ſame part of the zodiac. *Vital.* Lex. Math. p. 15.

AGGLUTINATION is more peculiarly underſtood of the ſeeming coalition of ſeveral ſtars, ſo as to form a nebulous ſtar. See NEBULOUS, *Cycl.*

AGGREGATE (*Cycl.*) is particularly uſed by ſome modern chemiſts, and naturaliſts, for a numerous collection of atoms, or minuteſt corpuſcles, whether homogeneous or heterogeneous, joined together by contiguity, without regard to the quality of ſuch atoms.

In which ſenſe, *Aggregate* differs from *text*, as the former ſuppoſes no particular ſituation, or poſition, of the corpuſcles, other than what ariſes from their proportion, and the relation they bear to the ambient bodies, among whom the coalition is formed. See TEXT.

Aggregate alſo differs from *mixt*, as the latter is formed immediately out of the principles of matter, ſo firmly united, as that it is very difficult, if not impoſſible, to ſeparate them.

Aggregate again differs from *compound*, as the latter is formed out of *mixts*, and is eaſily diſſolvable.

Aggregates then are the ultimate compounds, or the laſt effects of compoſition; they reſolve into compounds as their next ingredients, theſe into mixts, and mixts into ſimples, or principles; though, in ſtrictneſs, *Aggregates* may reſolve alſo into mixts, and mixts into ſimples, inaſmuch as they conſiſt of heterogeneous parts.

This doctrine and diſtinction of *Aggregates*, *mixts*, and *compounds*, is the foundation of the chemical theory of Beccher and Stahl; which laſt has traced it with great exactneſs. Hence has ariſen a new doctrine of earths, metals, &c. Vid. *Stahl*, Diſſ. de Temperam, c. 1. Eund. de Differ. *Mixti*, *Texti*, *Aggregati*, *Individui*, in Obſerv. Halenſ. T. 4. obſ. 14. §. 21. p. 314. ſeq. It. Philoſ. Princip. Chemiſt. P. 1. §. 1. *Shaw*, Not. ad Eund. p. 8 & 10. *Caſt.* Lex. Med. p. 24. *Burggrav.* Lex. Med. T. 1. p. 348.

AGIADES, a kind of Turkiſh ſoldiery, employed in fortifying of camps, ſmoothing of roads, and the like offices. *Meurſ.* Gloſſ. p. 7. *Du Cange*, Gloſſ. Gr. T. 1. p. 10. *Aquin.* Lex. Milit. T. 1. p. 31.

AGIASMA, among antient writers, is ſometimes uſed for the whole church, ſometimes for the more ſacred part, or *Bema*, wherein maſs was ſaid. *Du Cange*, Gloſſ. Græc. T. 1. p. 10. ſeq.

AGILENSZ, in botany, a name uſed, by ſome, for the common hazel. *Ger.* Emac. Ind. 2.

AGILITY (*Cycl.*)—Some define *Agility*, the art or habit of directing our ſtrength, *i. e.* of intending, or remitting it to advantage. *Placc.* Acceſſ. Ethic. c. 3. §. 24. ſeq. Miſc. Lipſ. T. 1. p. 277.

The improving of *Agility* was one of the chief objects of the inſtitution of games and exerciſes. The Athletæ made particular profeſſion of the ſcience of cultivating and improving *Agility*. V. Mem. Acad. Inſcript. T. 4. p. 441.

Agility of body is often ſuppoſed peculiar to ſome people; yet it ſeems not owing to any thing in their frame and ſtructure different from others, but entirely to practice. Our travellers are uſually ſurprized at the great *Agility* of the natives of Malabar; but Baldæus takes off the wonder, by telling us, that all the gentry, and all the military people there, are bred in a manner to render this eaſy to them; and, from the age

of seven, are used to have their sinews stretched, and to be anointed with ungents, to make them supple. The consequence of this, and of their practising from this early time all sorts of motion is, that they are able to turn and wind their body about every way. *Baldæus*, de Ind. Orient.

AGILLARIUS (*Cycl.*)—The *Agillarius*, or *heyward of a town*, or *village*, was to supervise the greater cattle, or common herd of beasts, and keep them within their due bounds; and was otherwise called *bubulcus*, *q. d.* cow-ward, (whence the reproachful term *coward.*)—If he were a cottager, or other servile tenant, he was exempted from the customary services, as being presumed to be always attending on his herd, as a shepherd on his flock, who had therefore the like privilege.

The *Agillarius of the lord of a manor*, or a *religious house*, was an officer appointed to take care of the tillage and harvest work, to pay the labourers, and see there were no incroachments made, or trespasses committed: the same in effect with what has been otherwise called *fieldsman*, and *tithingman*; and among us *bailiff*. *Kenn.* Gloss. ad Paroch. Ant. in voc. See BAILIFF, &c.

AGIO (*Cycl.*)—It is to be observed, that in cities where there are banks, money in bank is usually worth more than current cash, or money in specie.

This difference is various, at different times and places: at Amsterdam it was formerly 6 per cent [a]. Of late days it has been 3 or 4 per cent. so that, *e. gr.* 103 or 104 florins, are to be given current money, to have 100 florins in bank. At Venice the *Agio* is fixed at 20 per cent [b].—[a] Le Negoc. d'Amsterd. c. 1. p. 2. seq. [b] *Savar.* Dict. Comm. T. 1. p. 47. seq.

AGIO is also used for the profit arising from discounting a note, bill, or the like.

AGIO is also used, though with some impropriety, for the rate of exchange of a sum negotiated, whether to profit or loss.

AGIO *of assurance* is used, by some, for what we more usually call *policy of assurance*. *Savar.* Dict. Com. T. 1. p. 1, 48.

AGIOSYMANDRUM, a wooden instrument used by the Greek and other churches, under the dominion of the Turks, to call together assemblies of the people.

The word is compounded of αγιος, holy, and σημαγω, *significo*, I signify, denote.

The *Agiosymandrum* was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to sedition. Vid. *Hoffm.* Lex. Univ. T. 1. p. 109.

AGIST. To *agist the forest*, *agistare forestam*, is to take in cattle to pasture within the bounds of the forest, for one month, viz. fifteen days before Michaelmas, and as many after; when the running of cattle can be no prejudice to the game. See AGISTMENT.

In a like sense, they also say, *agistare boscum*, *silvam*, *campum*, *agistare animalia*, &c.

Our graziers still call the cattle, which they take in to keep by the week, *Gisements*, or *Juicements*.—To *gise*, or *juice* ground, is when the lord, or owner, feeds it not with his own stock, but takes in other cattle to *agist*, or feed on it. *Spelm.* Gloss. p. 22. *Du Cange*, Gloss. Lat. T. 1. p. 109. *Rast.* Terms de Ley, fol. 14. voc. *Agist.* *Cowel*, Interpr. in voc. *Kenn.* Gloss. ad Paroch. Ant. in voc.

AGISTMENT (*Cycl.*)—The duty and levy for repairing the banks and walls in Romney-marsh was particularly called *Agistamentum*; and the act of laying such a proportion of this duty on the several estates was called *Agistatio*. *Spelm.* Gloss. p. 22. *Du Cange*, Gloss. Lat. T. 1. p. 109.

AGITATION, (*Cycl.*) in physics, is often used for an intestine commotion of the parts of a natural body.

Fermentation and effervescence are attended with a brisk *Agitation* of the particles: heat is supposed, by some, to consist in the *Agitation* of the parts of the hot body: and hence some attempt to demonstrate the quantity of heat in bodies of the like texture, to be in a ratio compounded of the density of the bodies, and the duplicate ratio of the *Agitation* of their particles.—Hence also a method is deduced, of measuring the degree of *Agitation* of the particles of the air [a].—Mercury, by a brisk *Agitation* in vacuo, produces light; and hence that new species of phosphorus, called mercurial [b].—[a] Vid. *Herman.* Phoron. l. 2. c. 24. p. 366. seq. [b] V. *Hawksb.* Phys. Mechan. Exper. sec. 1. n. 4. p. 15. Jour. des Scav. T. 61. p. 513. It. T. 66. p. 104.

Sound is produced by a tremulous *Agitation*, excited first in the sonorous body, and communicated thence to the ambient air. V. *Herman.* ubi supra, l. 2. c. 23. p. 377.

AGITATION is one of the chief causes or instruments of mixtion: by the *Agitation* of the parts of the blood and chyle, in their continual circulation, sanguification is, in good measure, effected. Butter is made out of milk by the same means: in which operation, a separation is made of the oleous parts from the serous, and a conjunction of the oleous together. Digestion itself is only supposed to be an insensible kind of *Agitation*. The readiest way to dissolve sugar in wine, or other liquor, is to give the vessel a hasty turn, together with a smart knock against any hard and steady body, whereby all the parts of the sugar and liquor are put into a vehement *Agitation*. V. *Grew*, Disc. of Mixt. lect. 1. c. 4. p. 230.

AGITATION is reputed one of the symptoms of inspiration [a]. Petit informs us, that, in the last century, there arose in a church in Italy, for the space of a year, a vapour of an extraordinary kind, which put all the people into trembling and *Agitations*, and, unless they got away betimes, set them a dancing, with strange contortions and gesticulations. This seems to verify what has been related of the temple of Delphi [b].—[a] V. Act. Erud. Lipsi. an. 1692. p. 230. Nouv. Rep. Lett. T. 42. p. 332. Lett. Edif. T. 9. p. 66. [b] *Petit.* de Sybilla, l. 1. Nouv. Rep. Lett. T. 8. p. 1113.]

AGITATION is also used in medicine, for a species of exercise, popularly called *swinging*.

The antients held *Agitation* of the body necessary: in cases where the patient could not be moved from one place to another, they suspended him in his bed, and swang him backwards and forwards. *Cels.* de Medic. l. 2. Jour. des Scav. T. 57. p. 25.

Maurice prince of Orange found this method a relief against the severe pains of the gout and stone. Act. Erud. Lipsi. an. 1705. p. 42.

Bartholine mentions fits of the tooth-ach, deafness, &c. removed by vehement *Agitations* of the body. *Barth.* Act. Med. T. 5. obs. 126. p. 321.

AGITATIONS of the arms, and other parts, are found of especial use for dissolving concretions in the body. *Cast.* Lex. Med.

Among the Jews, there was one kind of sacrifice offered by *Agitation*, *i. e.* by waving towards the east, west, north, and south, to denote that God was to be served in every part of the earth.—This, in our version, is rendered a *wave-offering*. Vid. Exod. *c.* xxix. *v.* 24. It. *c.* xxxv. *v.* 22. Levit. *c.* ix. *v.* 21. *Hoffm.* Lex. Univ. T. 1. p. 110.

AGITATIVE, something that agitates or shakes another. See AGITATION.

AGITATIVE *force* of a pendulum, is that which produces motion in it.

The *agitative force* of the pendulum arises from three things. 1*mo*. The power of gravity. 2*do*. The weight fastened at the end of the rod. 3*tio*. The distance of that weight from the point of suspension; or, which amounts to the same thing, the length of the rod, or pendulum. V. Hist. Acad. Scienc. an. 1714. p. 127.

AGITATOR, in antiquity, a charioteer; or he who drove or directed a chariot, or horses in a race. *Pitisc.* Lex. Ant. T. 1. p. 60. See CHARIOTEER.

In which sense, *Agitator* amounts to the same with what the Romans called *auriga*, and we a coachman, driver, &c.

AGITATOR was more particularly used for him who drove in the public *Curule* games in the *circus*. *Pitisc.* Lex. Ant. T. 1. p. 60. *Schoetg.* Lex. Ant. p. 157. seq. in voc. *Aurigæ*.

The *Agitators* were distinguished, by their habits, into *Russati*, *Albati*, *Prasini*, and *Veneti*, which gave the rise and denomination to so many factions. Besides which, they had other marks, or ensigns of their family, corresponding to what we call arms.

The conquerors, besides the ordinary rewards, *braviæ*, as crowns, &c. had statues erected to them in the circus; on the bases whereof, their titles, atchievements, &c. were inscribed; several of which are still found among antient inscriptions, drawn in the following formulæ: *Vicit Sejuge*, *Septejuge*, *Bigas*, *Trigas*, *uno anno*, *alieno Principio*, *duobus introjugis*, &c.

It has been disputed, whether the *Agitators* were on the footing of mimes and pantomimes, and by law held infamous? Brissonius shews the negative; they did not become so till after the introduction of Christianity [a]. By a canon of the antient church, they were excluded from the communion, while they followed the profession [b]. Some alledge, for a reason of the exclusion, that they used to practise magic and enchantments, to retard and hinder their adversaries. Add, that the circus, wherein they performed, was adorned with the statues of false gods, and the whole tenor of the shews had a face of idolatry.—[a] *Brisson.* Select. ex. Jur. Civ. Ant. l. 1. c. 10. [b] V. Jour. des Scav. T. 34. p. 638. & *Hoffm.* Lex. Univ. T. 1. p. 110.]

Miliarian AGITATORS, *Agitatores miliarii*, were those who drove in the forum at Constantinople, a place adorned with statues, &c. after the manner of the circus at Rome, having a *milium*, or *miliarium*, in the middle. *Buleng.* de Circ. c. 52. *Pitisc.* Lex. Ant. T. 1. p. 60.

AGLAOPHOTIS, in botany, a name used, by some, for piony. *Ger.* Emac. Ind. 2.

AGLIA, αγλια, among antient physicians, a whitish cicatrix, or spot in the eye, formed by a congestion of humours. *Cast.* Lex. Med. p. 24.

AGMEN, in antiquity, properly denotes a Roman army in march. *Pitisc.* Lex. Ant. T. 1. p. 60. seq. *Aquin.* Lex. Milit. T. 1. p. 32. seq.

In which sense, it stands contradistinguished from *acies*, which denoted the army in battle array; though, on some occasions, we find the two words used indifferently for each other.

The

The Roman armies, in their marches, were divided into *primum Agmen*, anſwering to our vanguard; *medium Agmen*, our main-battle; and *poſtremum Agmen*, the rear-guard.

The order of their march was thus: after the firſt ſignal with the trumpets, &c. the tents were taken down, and the bagagge packed up; at the ſecond ſignal, the baggage was to be loaden on the horſes and carriages; and at the third ſignal, they were to begin their march. Firſt came the *extraordinarii*; then the auxiliaries of the firſt wing, with their baggage; theſe were followed by the legions. The cacavalry marched either on each ſide, or behind.

AGMEN *pilatum*, that diſpoſed in a narrow oblong form, or column; being withal cloſe and compact; thus called, as reſembling the figure of a *pila*, or peer. Vegetius compares it to that of a broach, or ſpit. This form was chiefly uſed in marching without their baggage, through bad ways, and cloſe countries. V. *Pitiſc.* Lex. Ant. T. 1. p. 61. *Voſſ.* Etym.

AGMEN *quadratum*, that ranged ſomewhat in a ſquare form; being the method ordinarily obſerved in the Roman armies. This was alſo called *Agmen grave*, by the Greeks Τελεσγωνος Ταξις [a]. The three lines, or columns, in which the army uſually marched, were conſiderably more in length, or breadth, than in depth: but as the baggage marched, ſomewhat in the ſame order, the whole approached to the figure of a ſquare [b]. —[a V. *Baxt.* Gloſſ. p. 69. b *Pitiſc.* loc. cit.]

AGMEN is alſo uſed for any number of perſons, or even animals, moving or advancing in ſome regular order. V. *Salmaſ.* de Re Milit. c. 17.

AGNANTHUS, in botany, the name given by Vaillant to a genus of plants, called afterwards *cornutia*, by Plumier and Linnæus. See CORNUTIA.

AGNEL, an antient French gold coin, firſt ſtruck under the reign of St. Louis, worth about twelve ſols, ſix deniers. V. *Le Blanc.* Hiſt. Monn. de France, ap. Act. Erud. Lipſ. Supp. T. 3. p. 184. Trev. Dict. Univ. T. 1. p. 204.

The *Agnel* is alſo called ſometimes *Mouton d'or*, and *Agnel d'or*.

The denomination is ſuppoſed to have ariſen from the figure of a lamb, or ſheep, ſtruck on one ſide.

AGNELET, an antient French ſilver coin, firſt ſtruck under Philip le Bel, worth about twenty ſols. Trev. Dict. Univ. T. 1. p. 205.

AGNOETISM, the diſtinguiſhing doctrine, or ſyſtem, of the *Agnoetæ*. See AGNOETÆ, *Cycl.*

There ſeems to have been two kinds of *Agnoetiſm*, and *Agnoetæ*, though uſually confounded. The firſt founded by Theophronius, an Eunomian, under the empire of Valens, who quitted his party, taught ſome erroneous tenets concerning God's preſcience, and its difference from knowledge: the latter, founded by Themiſtius the deacon of Alexandria. As to all which, the curious may conſult Obſerv. Halenſ. T. 1. obſ. 15. *Fabric.* Bibl. Græc. T. 8. l. 5. c. 18. *Niceph. Calliſt.* Hiſt. Eccleſ. l. 18. c. 11, 18, 45, 49, 50. *Pratæol.* Elench. Hæreſ. l. 1. p. 19.

AGNOMEN, (*Cycl.*)—There have been great diſputes among antiquaries, concerning the *Agnomina* of the Romans. Beſides the notion delivered in the *Cyclopædia*, divers others have been ſtarted. The generality of grammarians ſpeak of the *Agnomen* as a fourth name ſuperadded to the *cognomen*, or third name, on account of ſome extraordinary action, virtue, or the like: as *Africanus*, in Publius Cornelius Scipio Africanus; *Creticus*, in Quintus Cæcilius Metellus Creticus; *Fœlix*, in Lucius Cornelius Sylla Fœlix, &c. *Cantel.* Diſſ. 1. ad Valer. Max. Jour. des Scav. T. 8. p. 19. Nouv. Meth. Lat. p. 597.

But what refutes this notion, is, that theſe, and other names after the *cognomen*, or family name, are frequently called, by antient writers, *cognomina*, and not *Agnomina*. This led Sigonius to conclude the *Agnomen* and *cognomen* to be the ſame thing; notwithſtanding that Cicero expreſly diſtinguiſhes them. Others following Robortellus, take the *Agnomen* to be the ſame with the *nomen gentile*, or that belonging to the *Agnati*; which appears ſtill farther from the truth. A late author decides the difficulty, by making the *Agnomen* to be generally the ſame with the *cognomen*, though not always, but only in caſes of adoption.

According to this ſyſtem, *Agnomen* is the name which a perſon adopted retains after his adoption. It was a cuſtom among the Romans, for a perſon, when adopted into another family, to lay aſide all his other names, and only retain his family name, to which he added the *prænomen*, *nomen*, and *cognomen* of the adopter. Thus P. Cornelius Scipio, being adopted by Q. Cæcilius Metellus, laid aſide his *prænomen* Publius, and *nomen* Cornelius, and was called Q. Cæcilius Metellus Scipio. So alſo L. Calpurnius Piſo, being adopted by M. Pupius, was called M. Pupius Piſo. And M. Junius Brutus, being adopted by Q. Servilius Cæpio, was called Q. Servilius Cæpio Brutus. It follows, that Piſo and Brutus are here real *Agnomina*, as being *Agnata*, or belonging to the proper family of the perſon; whereas the other three are foreign, or ſuperadded on account of adoption. V. *P. Serv.* Miſcell. c. 8. *Pitiſc.* Lex. Ant. T. 1. p. 62. ſeq. See ADOPTION and ADOPTIVE, *Cycl.* and *Suppl.*

AGNOS, in ichthyology, a name given by Athenæus, and many other of the Greek writers, to that fiſh called *callyonymus*, or *uranoſcopus*. It is a ſpecies of the *trachinus*, and is diſtinguiſhed, by Artedi, from the reſt of that genus, by the name of the *trachinus* with a great number of beards growing from the lower jaws.

AGNUS *caſtus*, (*Cycl.*) is alſo called *agnon*, *vitex*, ſometimes *elæagnon*, *ſalix amerina*, *lygon*, *lygus*.

There are divers ſpecies of it. Pliny mentions two, the *greater*, called alſo the *white* kind, and the *leſſer*, or *black*. Miller ſpeaks of four; only one of which, called by botaniſts, *vitex foliis anguſtioribus*, *canabis modo diſpoſitis*, is pretty common in Engliſh gardens; the reſt are rare.

The *Agnus caſtus* is a ſmall ſhrub, which ſhoots ſeveral long, ſlender, flexible branches, covered with an aſh coloured rind; its leaves are long, narrow, pointed, and lanuginous, diſpoſed like thoſe of hemp; its ſeed round, about the bigneſs of pepper, and having a pungent aromatic taſte. Whence the French ſometimes call it *wild pepper*. It grows in waſte grounds, about the banks of rivers, and contains a great deal of ſalt and oil, but little phlegm.

AGNUS *caſtus* was eſteemed ſacred to Ceres, and is ſometimes repreſented on medals, in her hand.

To obviate looſe deſires, ſome of the Italian religious, to this day, not only fill the pillows they lye on with the leaves, bloſſoms, and ſeed of the ſame, but alſo tye ſome of its branches about their middle. Some of the nunneries in France are alſo ſaid to rear this plant in their gardens, for the ſame purpoſe. M. de la Barmondiere, curate of the ſeminary of St. Sulpice at Paris, uſed to have conſerves and electuaries made of the *Agnus caſtus*, which he diſtributed among his diſciples, as he found occaſion. Yet by its ſmell and taſte, as well as its operation as a diuretic and emmenagogue, one would rather ſuſpect that it ſhould have a contrary effect. Vid. *Plin.* Hiſt. Nat. l. 24. c. 9. *Hardouin.* Not. ad loc. *Lemeri*, Tr. des Drog. p. 18. *Chomel.* Dict. Œcon. T. 1. p. 39. *Mill.* Gard. Dict. in voc. *Burggr.* Lex. Med. T. 1. p. 350. ſeq. Mem. Acad. Inſcrip. T. 5. p. 53. Mem. de Trev. an. 1703. p. 258. Jour. des Scav. T. 45. p. 413. It. T. 47. p. 438. Phil. Tranſ. N°. 111. p. 249. *Evel.* Sylv. c. 20. §. 28.

AGNUS *Dei* (*Cycl.*)—The manufacture, or preparation of *Agnus Dei's* is carried on in the Vatican; and the Bernardins are the operators. A late traveller found a number of them hard at work in one apartment; ſome kneading the paſte, others rolling it, others ſtamping it, &c. In the next rooms were long tables full of *Agnus Dei's*, of all ſizes, in prodigious number, ready for the papal benediction. Vid. Mem. of Liter. T. 5. p. 272.

The origin of *Agnus Dei's* is uſually referred to the time of Conſtantin, or that of St. Chryſoſtom, or of pope Zoſimus, *i. e.* to the fourth or fifth century. Though P. de Vitry will have it much older; and pretends, that it came from apoſtolical tradition.

It ſeems antiently to have been a cuſtom for Chriſtians, to have theſe waxen images put in their coffins with them: accordingly the tomb of the empreſs, wife of Honorius, who died in the middle of the fifth century, being diſcovered in 1544, there is ſaid to have been found in it an *Agnus Dei*. V. Mem. de Trev. an. 1728. p. 1538.

The ceremony of conſecrating the *Agnus Dei's* bears ſome affinity to that of baptiſm, and is accordingly called by that name [a]. Onuphrius Panvinius deduces its origin from that ſacrament [b].—[a Jour. des Scav. T. 37. p. 371. b *Du Pin*, Bibl. Eccleſ. T. 16. p. 99.] See BAPTISM.

In the *Ordo Romanus* it is ſaid, that on Eaſter Saturday, the archdeacon of Rome pours melted wax into a veſſel, mixes a little oil with it, and after bleſſing it, pours it into moulds graven with the image of a lamb, to be kept till the Sunday in Albis, and then diſtributed by him to the people, to be burnt in their houſes as a preſervative from ill accidents. But of late days, this office is performed by the pope himſelf, and that not every year, as of old; but the firſt year of his pontificate, and every ſeventh year afterwards [a]. The *Agnus Dei*'s are received from the pontiff by the cardinals in their caps, and by the other prelates in their mitres, &c. with the utmoſt veneration; it being held a profanation to touch them with hands. At the ſame time parcels of them are ſent as a preſent to all the princes of the Romiſh communion. A brief, or order of pope Sixtus Vth. ſent with a box of *Agnus Dei*'s to the Doge of Venice, has been publiſhed by the journaliſts of that city: wherein we have an authentic account of the deſign, Uſe, &c. of *Agnus Dei*'s.—They are made of pure white virgin wax, ſays the brief, to denote the humanity of Chriſt, born of an immaculate virgin; the figure of the lamb impreſſed on them, repreſents that unſpotted lamb, who ſuffered for us upon the croſs. They are baptized or dipped by the pope in holy water, wherein balſam had been firſt put, to repreſent the report of a good name, which a chriſtian is to purchaſe by the innocence of his converſation, as alſo chriſm, by which charity the greateſt of all virtues is figured. The immerſion is accompanied with prayers, whereby the pontiff beſeeches God to ſanctify theſe images, and infuſe his hea-

venly

venly virtue into them, that they who keep and carry them worthily, and with faith, may have their ſins waſhed away, and moreover, that ſtorms, hail, whirlwinds, thunder, &c. may be prevented from injuring them, that evil ſpirits may be expelled, that no miſchief may befall them, no corruption of the air, no falling ſickneſs, no fire may moleſt them; that women with child may be preſerved with their young: in fine, that all may be ſecured from innundations of water, ſudden death, and all calamities. It is wiſely added, that tho' we are not to doubt, but in conſequence of theſe prayers, thoſe powers are actually communicated to them; yet thro' the want of faith in the poſſeſſors, they have not always the full effect [b].—[[a] *Du Pin.* Bibl. Eccleſ. T. 18. p. 69. [b] V. Giorn. de Letter. d' Ital. T. 17. p. 435. ſeq. See alſo further concerning the origin of *Agnus Dei*'s, Jour des Scav. T. 31. p. 252. Mem. de Trev. an. 1722. p. 2010. Their virtues, Act. Erud. Lipſ. Supp. T. 4. p. 224. Their myſtic meanings, *Du Pin*, Bibl. Eccleſ. T. 18. p. 68. The order of conſecrating them, *Magri*, Notiz. de Vocab. Eccleſ. in voc.]

Some authors alſo ſpeak of a kind of metalline *Agnus Dei*'s, hung to chapelets, or pater-noſters. *Schmid.* Lex. Eccleſ.

The *Agnus Dei* is ſaid to have been firſt brought into the miſſal, by pope Sergius I. Jour. des Scav. T. 31. p. 1101.

AGNUS *Scythicus*, in natural hiſtory, a kind of Zoophyte, or plant animal, ſaid to grow in Tartary, reſembling the figure and ſtructure of a lamb. See ZOOPHYTON, *Cycl.*

The *Agnus Scythicus*, or Scythian lamb, is alſo called *Agnus Vegetabilis*, the vegetable lamb; *Agnus Tartaricus*, the Tartarian lamb; and by the people of the country, *Borometz*, *Borametz*, or *Boranetz*.

The uſual account given of this extraordinary production is, that the Tartars ſow in their ground a ſeed reſembling that of melon, but leſs oblong; from whence ariſes a plant called by them Borometz, *i. e.* lamb, growing almoſt to the height of three feet, and having feet, hoofs, ears, and the whole head, excepting horns reſembling that animal. In lieu of horns it has a peculiar ſort of hair, not unlike horns; it is covered with a fine thin ſkin, which being pulled off, is worn by the natives as a cover for the head. The pulp within reſembles that of the Gammarus; and when wounded, a liquor ouzes out like blood. It lives as long as there is graſs and herbage around it; but when theſe are conſumed, it waſtes and dies. Add, that wolves are fond of it, while no other beaſts will feed on it. V. *Card.* de Subtil. Exerc. 181. Sec. 29. ſeq.

Deuſingius [a] ſeems to have been the firſt, who enquiring more narrowly into this vegetable monſter, ſuſpected the whole for a fable. His reaſons are, 1. that no credible author atteſts the having ever ſeen it, for as to what Wormius [b] relates from the travels of Eovald de Kleiſs, the elector of Brandenburgh's ambaſſador, who had a dried plant ſhewn him by a Tartar, to which grew a fruit, like the above deſcribed, covered with a curly fleece, it is no hard matter to conceive, how that miniſter might have been impoſed on; and as for the ſkins ſtill in ſeveral muſæums of Virtuoſi, they may be accounted for otherwiſe. 2. That Kempfer, when in the country, making diligent enquiry concerning the place where the Borometz grew, could hear of nothing like it.—[[a] *Deuſing. de Agno Vegetabili.* Ext. in Faſcic. Diſſ. Select. p. 598. ſeq. [b] *Worm.* Muſ. p. 190.]

Kempfer gives a probable account of the origin of this fable of the Scythian lamb: there is a peculiar kind of ſheep bred in the provinces near the Caſpian, remarkable for the fineneſs, ſoftneſs, and beauty of their ſkins; which on that account are much coveted for ornaments in apparel. The rich to diſtinguiſh themſelves, procure the ſkins of the youngeſt lambs, which are much ſuperior to thoſe of the grown ſheep; and their luxury in this reſpect is carried ſo far, that the dams are often killed while with young, for the ſake of abortive ſkins; the hair of which the ſkinners of that country have a way of forming into a fine cloſe down. By this means, after cutting off the extremities, the ſkin has ſcarce any appearance of leather, but reſembles rather a kind of vellum covered with a lanugo, which might well enough paſs among the ignorant for that of a melon. This is uſed for the lining of mitres, and ſometimes of gowns, robes, and the like. What confirms this account is, that the name Borometz appears to be a corruption of the Muſcovite Boranetz, called by the Poles Baranek, whoſe root in the Sclavonic, is Baran, which ſignifies a ſheep, or ram. *Kempf.* Obſerv. *de Agno Scythico, ſeu fructu Borometz.* Ext. in Diſſ. Inaug. & in Amæn. Exotic. Faſc. 3. Obſ. 1.

As to the plants ſhewn under this denomination, in ſome repoſitories of rarities, they appear to be originally the roots, or ſtalks of certain vegetables, probably of the capillary kind, covered with a woolly moſs, which naturally bearing reſemblance to the figure of a lamb, have been helped out and brought near to it by art and the addition of new parts. Much as thoſe *Homunculi*, or figures of men, of which Charletans make parade, are made out of the roots of Mandragoras, and Bryony; Sir Hans Sloane [a], and Breynius [b], give us the figures, and deſcriptions of ſuch Borometz's in their collections. It is from theſe plants that the Indian moſs is gathered, famous for its uſe in ſtaunching blood. Deuſingius, Kempfer, Breynius, and Libavius have written expreſsly on the *Agnus Scythicus* [c].—[[a] V. Phil. Tranſ. N°. 287. p. 861. [b] Diſſ. *de Agno Vegetabili Scythico*, in Phil. Tranſ. N°. 390. p. 353. ſeq. [c] Hiſt. *Agni Scythici.* For further particulars ſee *Kirch.* de Art. Magnet. p. 504. ſeq. *Bacon.* Hiſt. Natur. Cent. 7. n. 609. *Licet.* de Spontan. Vivent. Ortu. c. 45.]

AGOGA, in natural hiſtory, a ditch or drain for carrying off the water from a mine. *Plin.* Hiſt. Nat. l. 33 c. 4.

The word ſeems of Greek origin, derived from αγωγη, *ductus*, of αγω, *duco*, I draw. Tho' Hardouin [a], rather than not oppoſe Salmaſius [b], will have it derived from the antient Spaniſh; alledging that in ſome MSS. it is written *Agangas*. M. Durand [c], adopts this conjecture.—[[a] *Hardouin.* Not. ad *Plin.* loc. cit. [b] *Salmaſ.* Exerc. *Plin.* p. 1076. [c] *Durand.* Hiſt. Nat. d'or &c. ap. Bibl. Raiſ. T. 3. p. 32.]

AGOGE, Αγωγη, in the antient muſic, a ſpecies of modulation, wherein the ſounds or notes proceed by continuous degrees of the ſcale, both riſing and falling. As when we ſing, re, mi, fa, ſol, la; la, ſol, fa, mi, re.

Agoge anſwers to what the Latins call *Ductus*, and the Itali- *Conducimento*, and *di grado*: it ſtands contradiſtinguiſhed from *Ploce*, *Petteia*, &c.

Agoge makes the firſt part of the *Melopœia*, or art of modulating.

There are three ſpecies or caſes of this modulation; firſt when the ſounds follow each other from grave to acute, *i. e.* riſing as in ſinging, B C D E. This the Latins call *ductus rectus*, and the Italians *Conducimento retto.*

The ſecond, when they go from acute to grave, *i. e.* falling, as in the notes E D C B, called by the antients *ductus revertens*, and by the mordern Italians *Conducimento ritornante.*

The third when they riſe by flats and fall by ſharps, as in D, E, F *ſharp*, G, or, *vice verſa*, as in G, F *natural*, E *flat*, D. This the antients call *ductus circumcurrens*, and the Italians *conducimento circoncorrente. Euclid.* Introd. Harmon. p. 22. *Ariſtid. Quintil.* de Melop. l. 1. p. 28. Mem. Acad. Inſcrip. T. 7. p. 275. 277, and *Malc.* on Muſ. c. 14. §. 4. p. 542. *Broſſ.* Dict. Muſ. in voc.

AGON (*Cycl.*) — AGON *Adrianalis*, was that inſtituted at Athens, by the emperor Adrian; called alſo Παναθηναια, Παν-ελληνια, and Ολυμπια Αδριανια.

AGON *Iſelaſticus*, inſtituted at Puzzuoli by the emperor Antoninus Pius, and held every fifth year. It was a ſacred combat, and the victors at it were called *Hieronicæ*: they were to be received into the city, thro' a breach in the wall, made on purpoſe.

AGON *Muſicus*, that wherein either poets, or muſicians diſputed for the prize; ſuch was that dedicated by Ptolemy to Apollo and the muſes, with rewards aſſigned to the writers who gained the victory. Of this kind were alſo found in the Pythian, Nemæan and Iſthmian games; alſo in the Olympic games, after Nero's time, who firſt introduced a muſical *Agon* here; others were founded by the emperor Domitian, and others at Rome, Naples, Alba, &c.

We have an antient Greek writer extant, under the title of αγων Ομηρου και Ησιοδου, the *Agon* of Homer and Heſiod, ſuppoſed to be a narrative of the diſpute of theſe two poets, at the funeral of Amphidamas in Chalcis, before king Panidis brother of the deceaſed, who gave the prize, a tripod, to Heſiod.—Many antient authors make mention of this combat, ſome moderns have ſuſpected the whole for a fiction.

The learned Fabricius, tho' he ſuppoſes the book above-mentioned, to have been framed by ſome admirer of Heſiod; yet allows the reality of ſome ſuch diſpute, and thinks it might have happened when Homer was very old, and Heſiod young. But this opinion is liable to chronological difficulties. V. *Fabric.* Bibl. Græc. T. 1. l. 2. c. 8. §. 2. p. 370, 371.

AGON *Neronianus*, a quinquennial combat, called alſo *Neronian*, from the name of its inſtitutor, who here bore away the prize for playing on the harp, *Cithara. Pitiſc.* Lex. Ant. T. 1. p. 63.

AGON is alſo uſed for a place near the Tyber, otherwiſe called *circus flamineus*, wherein Curule games and combats were celebrated. *Aquin.* Lex. Milit. T. 1. p. 34. *Pitiſc.* Lex. Ant. T. 1. p. 63.

AGON is alſo uſed, by phyſicians, for the ſtruggle of death. V. *Caſt.* Lex. Med. *Burggrav.* Lex. Med. T. 1. See AGONY, *Cycl.* and *Suppl.*

AGONALIA (*Cycl.*)—The *Agonalia* appear to have been held thrice in the year, viz. on the 5th of the ides of January, on the 12th of the calends of June, and the 3d of the ides of December. V. *Struv.* Antiq. Rom. c. 8. p. 352. ſeq. *Urſat.* de Not. Roman. ap. Theſ. Ant. Grev. T. 11. p. 541.

AGONISMA, in antiquity, the palm or prize given the victor in a game or combat. *Aquin.* Lex. Milit. T. 1. p. 34.

AGONISTARCHA, in antiquity, ſeems to have been much the ſame with *Agonotheta* [a]; though ſome ſuggeſt a difference, making it the office of the former to preſide at, and direct the private exerciſes of the *Athletæ*, which they went thro' by way of practice, before they made their appearance on the public theatres or amphitheatres [b].—[[a] *Aquin.* loc. cit. in voc. *Agonotheta.* [b] *Pitiſc.* Lex. Ant. T. 1. p. 64.] See AGONOTHETA, *Cycl.* and *Suppl.*

AGONISTIC, *Agoniſtica*, the ſcience of what relates to the combats, or *Agones* of the antients.

In which ſenſe, *Agoniſtic* amounts to much the ſame with *Athletic*, and makes a branch of *Gymnaſtics*.

The preſident du Faur, or Faber, has publiſhed a learned work on the ſubject of *Agoniſtics* [a], much applauded by ſeveral critics [b]. Lydius has alſo a work entitled the *Agoniſtica ſacra*, being an explication of ſuch paſſages of ſcripture, and eſpecially in St. Paul's epiſtles, as relate or allude to the antient manner of combating.—A late author paſſes a ſevere cenſure on it, as wholly ſtollen from du Faur [c]. Yet it has been republiſhed with additions by Lomier [d].—[a Agoniſticon, ſeu de Re Athletica Ludiſque veterum, Lugd. 1595. fol. b *Baillet*, Jugem. des Scav. T. 2. P. 2. p. 131. ſeq. c V. *Reimman.* Catal. Bibl. Theol. p. 361. d An extract of the additions is given in Act. Erud. Lipſ. an. 1700. p. 536. ſeq.]

AGONISTIC, Αγωνιστικον, is alſo uſed among antient phyſicians for cold ſpring water.

The reaſon of the denomination is taken from the plentiful uſe of that element in the ſtate of an acute eryſipelaceous fever, wherein water was ſuppoſed to combat and ſtruggle with the febrile heat. *Gorr.* Def. Med. p. 4. *Caſt.* Lex. Med. p. 25.

AGONISTICI (*Cycl.*)—St. Auguſtin ſometimes calls this ſect by the name *Agoniſtrii*.

The *Agoniſtici* are alſo the ſame with thoſe otherwiſe called *Circuitores*, *Cercelliones*, *Catropitæ*, *Coropitæ*, and at Rome *Montenſes*.

AGONIUM, in Roman antiquity, was uſed for the day whereon the *Rex ſacrorum* ſacrificed a victim. The ſame name was alſo given to the place wherein the games were antiently celebrated. *Pitiſc.* Lex. Ant. T. 1. p. 64.

AGONOTHETA (*Cycl.*) amounts to the ſame with what was otherwiſe called Ἑλλανοδικος, *Hellanodicus*; ſometimes alſo *Æſymneta*, *Brabeuta*, *Agonarcha*, *Agonodica*, and *Athlotheta*.

Some make a difference between the *Athlotheta*, and *Agonotheta*; urging that the latter preſided only at the ſcenic games, and the former at the gymnic, but the diſtinction ſeems without foundation. V. *Fabri* Agoniſt. l. 1. c. 18. *Pitiſc.* Lex. Ant. T. 1. p. 64.

Middle age writers uſually confound *Agoniſtæ*, the combatants at the games, with the *Agonothetæ*, or preſidents of them. *Aquin.* Lex. Milit. T. 1. p. 34.

The *Agonothetæ* had the immediate charge of the manner of life, diſcipline, and morals of the *Athletæ*. It was they who examined, and admitted, or expelled them the ſociety, or order [a]. During the combats, the *Agonothetæ* were clothed in purple, and rode in a triumphal manner thro' the circus, holding in their hands an ivory ſceptre, with an eagle on it.—At firſt there was only one *Agonotheta*; in the fifth olympiad, a ſecond was added, and in the twenty-fifth olympiad, ſeven more.—Of theſe, three had the direction of the horſe-races; as many of the Pentathlos; and the reſt of the other exerciſes [b].—Van Dale has a diſſertation expreſs on the *Agonothetæ* [c].—[a V. Mem. Acad. Inſcrip. T. 2. p. 310. b Vid. *Scalig.* Poet. l. 1. c. 24. *Potter.* Archæol. l. 2. c. 21. T. 1. p. 441. c Diſſert. 7. de Agonothet. Hellanod. &c. V. Act. Erud. Lipſ. 1703. p. 90. ſeq.]

The name *Agonotheta* is ſtill retained in ſchools, and academies for him who defrays the charge of the prizes diſtributed. The founders of prizes are perpetual *Agonothetæ*. Trev. Dict. Univ. T. 1. p. 207. ſeq.

AGONUS, in zoology, a name uſed by the generality of authors, for the fiſh called by ſome *Sarachus*, by others *Chalcis*, and by others *Sardella*.

It is in many particulars very like the *Alauſa* or ſhad, called the mother of herrings, but ſmaller, never arriving at more than a foot in length; and is always lean and lank in ſpring, and fat in autumn. But the diſtinctions between it and the *Alauſa*, if real, are ſo very ſmall, that Mr. Ray, and many of the moſt accurate naturaliſts, have ſuſpected it the ſame fiſh, only in a different ſtate. *Ray*'s Ichthyograph. p. 226.

AGONY (*Cycl.*)—Much of the terror of death conſiſts in the pangs and convulſions wherewith the *Agony* ſeems attended; tho' we have reaſon to believe, that the pain in ſuch caſes is ordinarily not extremly acute; a courſe of pain and ſickneſs having uſually ſtupified, and indiſpoſed the nerves for any quick ſenſations. However various means have been thought of for mitigating the *Agony* of death. Lord Bacon conſiders this as part of the province of a phyſician, and that not only, when ſuch a mitigation may tend to a recovery, but alſo when there being no further hopes of a recovery, it can only tend to make the paſſage out of life more calm, and eaſy. Since complacency in death, which Auguſtus ſo much deſired, is no ſmall part of happineſs; our phyſicians, when a patient is deſperate, make it a point of conſcience to give him over, when they ought rather to be endeavouring to make him depart with more eaſe and tranquility. Accordingly the author laſt cited ranks *Euthanaſia*, or the art of dying eaſily among the *deſiderata* of ſcience; and does not even ſeem to diſapprove of the courſe Epicurus took for that end. *Bacon*, de Augm. Scient. l. 4. c. 2.

———*Hinc Stygias ebrius hauſit aquas.*

Opium has been applied for this purpoſe, with the applauſe of ſome, but the condemnation of more. V. Ephem. Germ. Dec. 2. An. 1. p. 41.

Baglivi promiſed a treatiſe expreſs, *de Medicina Agonizantium*, or the method of treating thoſe in the agonies of death [a]. Some think a medicine might be found out, which would alleviate the pains of death, without accelerating it, or which might even tend at the ſame time to retard it [b]. But perhaps one of the beſt recipe's for this end, is that of M. Patin, *viz.* abſtinence from all medicines.—[a V. *Bagliv.* de Medic. Solid. Can. 45. Act. Erud. Lipſ. 1707. p. 341. b *Shaw*, Treat. of Incur. Diſeaſ. p. 17.]

The method uſed by the Perſians is certainly very innocent, if it be not effectual: they make a practice of redeeming captive birds, and reſtoring them to liberty, as a ſure means of rendering their own migration into another ſtate eaſy. *Olear.* Itin. Perſ. l. 5. c. 22.

Among the Armenians, when a perſon is in the *Agony* of death, ſo that there is no hopes left, they think it an office of humanity to put him out of his pain, by laying him in a certain ſituation, to haſten his paſſage; and by cloſing his eyes and mouth, to prevent his breathing. V. Bibl. Univ. T. 1. p. 290.

AGORÆUS, in antiquity, an appellation given to thoſe deities, who had ſtatues in the public markets or *Fora*. The word is Greek, formed of αγορα, market, in which ſenſe, we meet with *Mercury Agoræus*, at Athens, Sicyon, Thebes, and Sparta, &c. *Minerva Agoræa*, αγοραια, was in extraordinary veneration among the Lacedemonians. V. *Hederic.* Lex. Mythol. *Suicer.* Theſ. T. 1. p. 65. ſeq.

AGORANOMUS (*Cycl.*)—The *Agoranomi*, at Athens, were ten in number, five belonging to the city, and as many to the Piræus; tho' others make them fifteen in all, of which they aſſign ten to the city. To theſe a certain toll or tribute was paid, by all who brought any thing to ſell in the market. They had the care of the vendibles, except corn, and were eſpecially concerned to ſee that no man wronged, or any way over-reached, another in buying or ſelling. *Potter.* Archæol. Attic. T. 1. l. 1. c. 15. p. 83.

AGRARIÆ *Stationes*, in the antient military art, corps of guards poſted in the fields, and in the open air. V. *Aquin.* Lex. Milit. T. 1. p. 35.

Theſe are alſo called ſimply *Agrariæ*, which in the text of Vegetius is corruptly written *Angariæ*. *Turneb.* Adverſ. l. 4. c. 7.

AGRARIÆ *Naves* was uſed for veſſels placed to keep watch, or guard. V. *Aquin.* lib. cit. p. 34.

AGRARIAN, (*Cycl.*) in a general ſenſe, ſomething relating to fields or lands. *Calv.* Lex. Jur. p. 56.

The word is originally Latin, *Agrarius*, formed of *Ager*, a field.

There are ſeveral antient writers extant, on *Agrarian* affairs, which have been collected together, and divers times publiſhed under the title of *Auctores legeſque rei Agrariæ, ſive finium regundorum.* The principal are Siculus Flaccus, Sex. Julius Frontinus, Agenus Urbicus, Hyginus, Varro, &c. An account of the editions, with the titles, &c. of each is given by Fabricius. V. *Fabric.* Bibl. Lat. T. 2. l. 4. c. 11. p. 573.

The Roman lands were of divers kinds, ſome conquered from the enemies, and not yet brought to the public account; others brought indeed to the public, but clandeſtinely uſurped by private great men: laſtly, others purchaſed with the public money in order to be divided. *Agrarian* laws, either for dividing lands taken from the enemy, or the public lands, or thoſe purchaſed with the public money, were eaſily paſſed without diſturbance; but thoſe whereby private rich men, were to be outed of their lands, and the common people put in poſſeſſion of what had been held by the nobility, were never attempted without great diſturbances. *Pitiſc.* Lex. Ant. T. 1. p. 56. ſeq. *Machiav.* Diſc. in Liv. l. 1. c. 37. *Hoffm.* Lex. Univ. T. 1. p. 114. Mem. de Trev. 1719. p. 764.

We have two orations of Cicero ſtill extant, *de Lege Agraria*, againſt a law of this kind propoſed by P. Servilius Rullus, in in the year of Rome 691. V. *Fabric.* Bibl. Lat. T. 1. l. 1. c. 8. §. 17.

Several have pleaded for the neceſſity of *Agrarian* laws, among us. William Sprigge [a], or as ſome ſay, Fr. Oſborne, has written expreſsly on the ſubject [b].—[a V. *Cat.* Lett. T. 1. p. 283. ſeq. b Mod. Plea. for Commonw. &c. the expediency of an *Agrarian* law. Lond. 1659. 4°. V. *Wood*, Ath. Oxon. T. 2. p. 997.]

But the author who ſeems to have entered deepeſt into the nature and uſe of *Agrarian* laws, is Harrington; he ſhews that the ballance of property in a ſtate cannot be fixed but by laws, and the laws whereby ſuch a proviſion is made are *Agrarian* laws. Now theſe are neceſſary to the ſtability of government, becauſe governments will, according to the diverſe ballance of property, be of diverſe or contrary natures, that is monarchical, or popular. Thus monarchy requires of the ſtandard of property, that it be vaſt or great; and of *Agrarian* laws, that they hinder receſs or diminution, at leaſt in ſo much as is thereby intailed upon honour. But popular government requires,

that the ſtandard be moderate, and that its *Agrarian* laws prevent accumulation.

This author thinks, that in a territory not exceeding England in revenue, if the ballance be in more hands than three hundred, it is declining from monarchy; and if it be in fewer than five thouſand hands, it is ſwerving from a commonwealth. V. *Harringt.* Works. p. 392.

The ſame writer defines an equal *Agrarian*, a perpetual law eſtabliſhing and preſerving the ballance of dominion by ſuch a diſtribution, that no one man, or number of men, within the compaſs of the few or ariſtocracy, can come to overpower the whole people, by their poſſeſſions in lands. Ibid. p. 54.

He alſo obſerves, that the people of Rome by ſtriving for an *Agrarian*, ſtrove to ſave their liberty; and that commonwealth, thro' want of ſuch a law, or the non-obſervance of it, came to ruin.

In the Grecian cities, the defect of an *Agrarian* was ſupplied by oſtraciſm.

In Venice, the council of ten, and the officers of pomp, reſtrain thoſe who might be too powerful; and theſe two orders in a commonwealth, where the gentry have but ſmall eſtates in land, are as much as needs be in lieu of an *Agrarian*.

Some German republics have no more to ſupply the place of this law, than that eſtates deſcending are divided among the children.—And the ſame law would eſtabliſh an *Agrarian* in England. Ib. p. 292, 293.

Agrarian laws may be framed different ways, as by intailing the lands upon certain families, without power of alienation in any caſe, as in Iſrael and Lacedemon: or, except with leave of the magiſtrate, as in Spain. But this by making ſome families too ſecure, as thoſe in poſſeſſion, and others too deſpairing, as thoſe not in poſſeſſion, may make the whole people leſs induſtrious.

Therefore Harrington prefers a law regulating eſtates, ſo that no man ſhall have above two thouſand pounds a year in land; and that the eſtates of thoſe who exceed this proportion, ſhall be divided in deſcending to their children, till the greater ſhare do not exceed 2000 *l. per annum.* This is the rule he lays down for his commonwealth of Oceana, by which he means his ſcheme for the government of England.

By this law Harrington intended that the property of land in England, ſhould never fall into fewer hands than 5000; as he computes the rents of this country to be ten millions. But if theſe rents, as is probable, amount now to twenty millions, it would follow that, by our author's rule, the land could never be in leſs than 10000 hands, which, according to his ſyſtem, muſt effectually ſecure the liberties of the people.

It would exceed the limits of our deſign, to enter into the full detail of all the reaſonings of this ingenious author, on the ſubject of *Agrarian* laws; we therefore refer to his works. See alſo the articles GOVERNMENT, PROPERTY, &c.

AGRESTA, in medicine, an unripe grape; otherwiſe called, *Omphax* and *Uva acerba*, by the French *Verjus*.

Agreſtæ are held cooling, deterſive, and aſtringent; they temper the acrimony of the bile, and chear the heart [a]. Eaten plentifully, they have been found to deſtroy worms [b].—[a *Lemery*, des Drog. p. 19. [b] *Vallisnieri*, Prim. Raccolt. d'oſſeroaz. p. 89. Giorn. de Letter. d'Ital. T. 5. p. 182.]

AGRESTA is ſometimes alſo applied to the juice of this fruit, more properly called *Omphacium*. *Caſt.* Lex. Med. p. 25. *Quinc.* Lex. Med. p. 12. *Burggr.* Lex. Med. p. 357. ſeq.

AGRICULTURE (*Cycl.*) is particularly uſed to denote the art of managing and improving fields, arable, paſture, and meadow.

In which ſenſe it ſtands contradiſtinguiſhed from gardening, the culture of the vineyard, of timber, woods, &c.

AGRICULTURE is alſo uſed in a more extenſive ſenſe, for the whole art of huſbandry. Phil. Tranſ. N°. 114. p. 320.

Agriculture, in this ſenſe, beſides tillage, comprehends feeding and the management of cattle, and the rural ſports, hunting, fiſhing, &c. Some even include under it the buſineſs of mines, coal-pits, and other ſubterraneous matter. *Walch.* Introd. Philoſ. l. 2. c. 7. §. 30. p. 611. ſeq.

Agriculture is ſaid to have been firſt invented, at leaſt perfected in Europe, by Ceres, queen of Sicily, in memory whereof, ſhe was placed among the principal divinities: ſhe taught the inhabitants of that iſland how to ſow all kinds of grain, particularly wheat, as well as the manner of reaping, grinding, and making bread. Till that time corn had only been conſidered like other herbs, and ſuffered to grow wild among the reſt, without any care taken to ſeperate, cultivate, or apply it to the nouriſhment of man. Sicily, where the ſoil is ſo fertile in corns, was the place where its uſe was firſt diſcovered; and from hence the knowledge of it was propagated into Italy, Greece, and the more northern parts of Europe. In conſequence of the new invention, Ceres firſt made a law, for diſtinguiſhing lands and poſſeſſions, which till then lay open and in common, that each perſon might reap the corn, he had been at the pains of ſowing. Vid. *Le Clerc.* Bibl. Hiſtor. T. 6. p. 62. ſeq.

The primitive *Agriculture* is ſtill ſaid to be ſubſiſting among the ſavages of America, who ſow, reap, and prepare the corn much as was done ſome thouſand years ago, e'er mills were invented. *Laſitau*, Paral. des Mœurs des Sauvag. ap. Mem. de Trev. 1725. p. 200.

During the firſt 500 years of Rome, the people employed all their intervals of peace in *Agriculture*; the difference of condition was not then at all perceived in the difference of occupation. The great were not leſs laborious than the poor, and thoſe two ranks ſo different from each other in the city, under the titles of Patricians and Plebeians, were united in the country under the common name of huſbandmen. Hiſtory is full of ſuch inſtances, not only in the firſt ages of the commonwealth, when it was uſual to take dictators, and conſuls from their farms; and from the low office of driving cattle, remove them to the command of legions; but alſo in thoſe flouriſhing days, when Rome had already ſubdued Italy, and began to be reſpected on the other ſide the ſea. It is trite that Q. Cincinatus was found plowing his ground, when news was brought of his being named dictator. But what is not ſo well known, Curius Dentatus, Fabricius, Attilius, Licinius Stolo, Cato the cenſor, and many others appear to have taken their ſurnames from that part of the country life, to which they had chiefly applied themſelves. For it is hence, according to Varro, Pliny, and Plutarch, that the families Aſinia, Vitellia, Suillia, Porcia, and Ovinia were ſo called; by reaſon of their authors or founders, who had diſtinguiſhed themſelves, by the breeding of ſuch animals. And thus others rendered themſelves famous by the culture of certain herbs, or pulſe; whence the denominations Fabius, Piſo, Cicero, &c. Vid. L'Abbe *de Couture*, in Mem. Acad. Inſcrip, T. 2. p. 388. Mem. de Trev. 1708. p. 1159.

It was reputed a kind of infamy to neglect or deſpiſe the culture of their grounds, and it was to praiſe a man, in Cato's judgment, to ſay he was much addicted to tillage. The inhabitants of the country were held in more eſteem than thoſe of cities; and accordingly the ruſtic tribes were allowed the preheminence, and it is ſaid to have been chiefly theſe that produced the braveſt ſoldiers. *Olivet*, ap. Jour. des Scav. T. 67. p. 653.

Agriculture firſt fell to decay in Italy towards the cloſe of the eighth century, on occaſion of the irruptions of the Lombards, under king Aſtolphus, and afterwards of the Hungari and the Sarazens, who ſpread terror and deſolation over the whole country. The Popes being forced to Avignon, could bring no remedy to the diſeaſe; and it is only within theſe two laſt centuries, that any meaſures have been taken in earneſt for cultivating the country about Rome. S. Nuzzi a learned Roman prelate, has a treatiſe on the ſubject, wherein he propoſes divers means for that end.

The firſt, to grant privileges to huſbandmen, after the example of Theodoſius, Arcadius, Honorius, and divers popes, as Clement VII, Sixtus IV, Julius II, Clement VIII, Paul V.

The ſecond by ſettling a vent for corn into other countries.

The third by introducing the culture of other plants beſides corn, as hemp, olives, millet, vines, mulberry-trees, &c. V. Mem. de Trev. 1703. p. 468,—472.

Agriculture has met with different fates in different nations; of all people the Jews ſeem to have been moſt entirely attached to it [a]. It was long neglected among the northern nations, as the Goths [b], Germans, Britons [c], &c; who choſe rather to ſubſiſt themſelves by the chace, the uſe of milk, fiſh, fowl, &c. The like ſtill obtains among the ſavages of Louiſiana, where the tillage of the ground is left to the women [d], the men being employed in hunting, &c. Among the Japaneſe, *Agriculture* retains its antient honour, and among the Chineſe is diſtinguiſhed and encouraged by the court beyond all other ſciences.—[a *Gundling*. Hiſt. Philoſ. Moral. c. 7. §. 3. p. 82. [b] *Rudbeck.* Atlant. ap. Phil. Tranſ. N°. 300. p. 2032. [c] *Conring.* de Habit. Corp. Germ. p. 53. ſeq. [d] Jour. des Scav. T. 67. p. 621.]

To encourage the people to *Agriculture*, the emperor of China yearly, at the beginning of ſpring, goes to plough in perſon, aſſiſted by all the princes and grandees of the empire. The ceremony is performed with great ſolemnity; and is accompanied with a ſacrifice, which the emperor, as high-prieſt, offers to Chang Ti, to produce a plentiful crop in favour of his people. To prepare himſelf for this ſacrifice, the emperor is to faſt, and abſtain from venery, the three days preceding; and the like preparation is to be made by thoſe who attend him. On the day of the ceremony, the emperor deputes ſome of his chief courtiers to the hall of his anceſtors, where, falling proſtrate, they give them notice, as if they were ſtill alive, that on the morrow he will offer the great ſacrifice. Divers tribunals have alſo a ſhare in the preparations: one is to provide the things to be offered; another compoſes the words, which the emperor is to rehearſe; a third is to aſſemble forty or fifty venerable aged huſbandmen, to be preſent when the emperor ploughs; as many young perſons, of the ſame profeſſion, are alſo brought, to put the plough-gear in order, harneſs the oxen, and prepare the ſeed corn. The emperor ſows five kinds of grain, which are thoſe moſt neceſſary in China, and under which all the reſt are included, viz. wheat, rice, beans, and two ſpecies of millet.

millet. Several great lords carry the ſeed to be ſowed, in rich boxes; and the whole court aſſiſts in ſilence. The emperor takes the plough in hand, and, after ſeveral goings and returns, gives it to a prince of the blood, he, in his turn, to another, till the field is ploughed. When all is over, the governor of Pekin makes frequent viſits to this field, inſpects the furrows, and ſeeks for ears extraordinary, and of good omen, of which he gives notice at court. The ſame officer is truſted with reaping this field; the corn of which being put in yellow bags, which is the imperial colour, is reſerved for the moſt ſolemn ceremonies, and ſacrifices, of the enſuing year, which the emperor offers to Tien, Chang-ti, and his anceſtors. V. Letter. Edif. T. 19. p. 386—392. Mem. de Trev. 1730. p. 232. ſeq.

Among the Spaniards, *Agriculture* is much neglected. Theſe people truſt wholly for their country operations to foreigners; crowds of whom come uſually from the neighbouring provinces of France, &c. to till their ground. What is more, the inhabitants of the two Caſtiles, we are told, depend on the poor peaſants of the mountains of Gallicia, for the reaping their corn; which latter, when their own crop of rye proves tolerable, never trouble themſelves about the Caſtilians, who, in this caſe, muſt want bread; which they chuſe rather to do, than gather their crop themſelves. *Vayrac*, Etat. Preſ. de l'Eſpagne, T. 1. Jour. des Scav. T. 64. p. 393. ſeq.

The Egyptians confide ſo much in the goodneſs of their ſoil, that they are ſcarce at any pains to till it. As ſoon as the water of the Nile is returned into its bed, the peaſants ſow their ground. All they have more to do, is only to mix ſand with the mud which the Nile has left, in caſe this has fattened the ſoil too much; and they fail not of a plentiful crop. Mem. de Miſſ. T. 2. p. 13.

In England, *Agriculture*, though much improved in ſome parts, may, in general, be ſaid to be far from perfection. Whatever huſbandmen are apt to conceive of their abilities, moſt of them believing they have brought it to the higheſt pitch in their reſpective countries, and howſoever froward in entertaining any thing new, yet 'tis certain, were they really ſo knowing as they pretend, or would admit of ſuch notices as might be communicated to them, we ſhould have no ſuch complaints of uncertain crops, ſmuts, mildews, and the like. But ſo unſkilful is the huſbandman, ſo ignorant in appropriating the grain to the ſoil, that he knows not ſo much as the grains for thoſe purpoſes, though near neighbours to him; much leſs are the grains of one country known to another.—Of which divers inſtances might be given in wheat, barley, &c. Vid. *Plot.* in *Hought.* Collect. T. 4. N°. 3. p. 33. ſeq.

It is to be wondered at, that *Agriculture* has never been a regular ſtudy, like other arts and ſciences, but left wholly for improvement to empirical practice. Several complaints of this kind have been made by antient as well as modern writers; and, as a remedy, the inſtitution of ſchools, colleges, &c. of *Agriculture*, has been propoſed, but hitherto without much effect: though ſome attempts of this kind have been made at London, Rome, Cambridge, Edinburgh, &c. Columella, and after him Mr. Cowley, lament, that while all arts and ſciences have their public ſchools and maſters, we ſhould never ſee or hear of any man who took upon him to profeſs teaching this ſo pleaſant, ſo virtuous, ſo honourable, ſo neceſſary art. Mr. Cowley wiſhed, that one college in each univerſity were erected, and appropriated to this ſtudy, as there are to phyſic and civil law. There would be no need of making a body of ſcholars and fellows, with certain endowments, as in other colleges; it would ſuffice, if, after the manner of halls in Oxford, there were only four profeſſors conſtituted, to teach the four parts. 1. Aration, and all things relating thereto. 2. Paſturage. 3. Gardens, orchards, vineyards, woods. 4. All parts of rural oeconomy; including the government of bees, ſwine, poultry, decoys, ponds; together with the ſports of the field, and the domeſtic conſervation and uſes of all that is brought in by induſtry from abroad. The buſineſs of theſe profeſſors ſhould not be, as is commonly practiſed in other arts, only to read pompous and ſuperficial lectures on Virgil's Georgic's, Pliny, Varro, or Columella, but to inſtruct their pupils in the whole method and courſe of this ſtudy; which might, perhaps, be gone through, with diligence, in a year or two.

Agriculture, 'tis certain, might be brought to much greater perfection in England, if farmers had opportunities and judgment to make experiments, or had ſome fixed place, where they might ſee examples of all kinds of huſbandry, as a ſchool, for their information.

The Royal Society, ſoon after its inſtitution, appointed a committee for *Agriculture*, to conſider of the hiſtory and improvement thereof; who began their work with drawing up certain heads of enquiry, to be diſtributed among perſons experienced in huſbandry, over the three kingdoms, in order to procure a faithful and authentic information of the knowledge and practice already obtained therein, with regard to ſoils, grain, ſeed, wheat, graſs, and the diſeaſes and annoyances thereof. V. Phil. Tranſ. N°. 5. p. 91, 94.

A ſociety has alſo been eſtabliſhed at Edinburgh, for the improvement of *Agriculture*, who have publiſhed a treatiſe on the ſubject, with great applauſe. Vid. Treatiſe concerning the beſt Manner of fallowing Ground, raiſing Graſs Seed, and training of Lint and Hemp, for the Uſe, &c. of the Linnen Manufacture, Edinb. 1720, 8vo. V. Preſ. Stat. Rep. Lett. T. 2. p. 317.

The authors on *Agriculture* are numerous. Beſides thoſe already cited, we find among the Greeks, Heſiod [e], Philo Judæus [f], Themiſtius [g], and others, publiſhed under the titles of Geoponics, Georgics, &c. See GEOPONICS, &c. Among the Latins, Celſus [h], Hyginus [i], Cato, Columella, and others, publiſhed under the title of *De Re Ruſtica*.—

[e V. Εργα και ἡμεραι, Opera & Dies. *Fabric.* loc. cit. l. 2. c. 8. §. 5. *Baill.* Jugem. des Scav. T. 3. P. 1. p. 285.

[i *Fabric.* Bibl. Lat. T. 1. l. 2. c. 1. p. 360.]

The antient Roman writers contain many things not hitherto common among us, and many others that have never been tried in our fields and gardens. Thus grafting in the root, which is found the readieſt way of propagating any plant; and the moſt certain ſpecies of that operation was but lately introduced by Dr. Agricola, from thoſe authors: and it is to be preſumed, many other things mentioned by them, if put in practice, would be found of no leſs uſe. Their farms are excellently deſigned, and there are beauties in their gardens, which we have not among us. Bradley has given us the ſubſtance of the antient Roman writers on *Agriculture*; and, to accommodate them to our own times and country, has reduced their calendar to ours, and ſhewn the difference between the ſeaſons of Italy and England: ſo that it will not be difficult to put their precepts in practice.

Among the Engliſh, beſides thoſe mentioned in the *Cyclopædia*, we have alſo the writings of Mr. Tull, and of Mr. Ellis, a practical farmer. Many particulars alſo relating to this art, are occaſionally delivered by the writers on natural hiſtory, oeconomy, trade, &c. See *Plot*, *Houghton*, the Philoſophical Tranſactions, &c.

AGRIFOLIUM, in botany, the holly-tree. See AQUIFOLIUM.

AGRIGINTINE *ſalt*, in natural hiſtory, a kind of eatable ſalt, famous among the antients for its not cracking in the fire, as common ſalt does. It might probably owe this quality to the fineneſs of the powder, in form of which it was generally uſed. But Pliny has added greatly to the miracle, by telling us, that though it did not crackle and leap in the fire, it did when thrown into water. Solinus has added even to this, by telling us, that it would readily melt in the fire. This cannot be a property of common ſalt, and therefore the author muſt have miſtaken the account of Pliny, or of ſome other writer, from whom he collected what he has ſaid about it.

AGRIMONOIDES, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the roſaceous kind, conſiſting of ſeveral petals, arranged in a circular form, and growing out of the diviſions of the cup. This flower and its cup are alſo received into another cup, of a funnel-like ſhape, and fimbriated at the edges. The proper cup of the flower finally becomes a fruit of an oval form, pointed and enveloped by the outer cup, and uſually containing only one ſeed.

There is but one known ſpecies of this plant, which is the *Agrimonoides*, or *Agrimonia ſimilis*, the baſtard agrimony of authors. *Tourn.* Inſt. p. 301.

This plant is called by ſome *pimpinella folio Agrimoniæ*.

AGRIMONY, AGRIMONIA, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the roſaceous kind, conſiſting of ſeveral petals, which are arranged in a circular form, and ſtand upon a cup, which finally becomes an oblong echinated fruit, containing one or two oblong ſeeds.

The ſpecies of *Agrimony*, enumerated by Mr. Tournefort, are theſe. 1. The common wild *Agrimony*. 2. The ſweet ſcented *Agrimony*. 3. Sweet ſcented French *Agrimony*. *Tourn.* Inſt. p. 301.

The firſt ſpecies of this genus is frequent in dry paſtures, and flowers in June. The dried leaves make a very pleaſant infuſion, in the manner of tea; and are eſteemed a very great medicine in obſtructions of the liver and ſpleen. It is celebrated in the jaundice, and in cachectic caſes; and is given in coughs and catarrhs, and in ſuppreſſions alſo of the menſes.

It uſed to be a very common ingredient in the baths of the antients, prepared with the decoctions of detergent and emollient herbs.

Agrimony is otherwiſe called *Eupatorium veterum*, or *Græcorum*, or I. B.

From Mr. Geoffrey's analyſis of *Agrimony*, it appears that this plant contains very little ſalt of the ammoniacal kind,

ſince

ſince no concrete urinous ſalt is got from it, but the acid ſalt, wherewith it abounds, joined with earth, forms a concrete reſembling tartar, or ſalt of coral combined with a large proportion of ſulphur.

Agrimony has a ſaline taſte, ſubaſtringent and acid; its juice turns the tincture of Heliotropium to a faint red, ſo that its aſtringent and aperitive virtues ſeem both owing to the ſame auſtere ſalt. For tho' theſe effects ſeem contrary to one another, yet they often flow from one and the ſame principle, the ſtrengthening of the weak and lax fibres of the ſolid parts. Experience ſhews, ſays Geoffroy, that *Agrimony* has the virtues ſuppoſed to ariſe from its compoſition; for it is aſtringent, detergent, reſolvent, vulnerary, and aperient.

The country people uſe the common or officinal *Agrimony* bruiſed, or its juice, in contuſions, and freſh wounds. Etmuller ſays, it removes ſwellings and inflammations of the ſcrotum. Yet it is rarely found in ſhop compoſitions, though frequently preſcribed by the ſurgeons, in diſcutient and vulnerary fomentations.

The *ſweet ſmelling* AGRIMONY, *Agrimonia odorata*, is by ſome preferred, for medicinal purpoſes, to the former, as being more grateful to infuſe for pectoral decoctions. Vid. *Lemer.* Tr. des Drog. p. 19. *Quinc.* Diſpenſ. P. 2. ſec. 4. p. 113. *Ray*, Synopſ. Stirp. Britan. p. 99. *Junck.* Conſpec. Therap. p. 333. *Burggr.* Lex. Med. T. 1. p. 360. ſeq.

AGRIOCINARA, in botany, a name uſed by ſome authors for the coudy artichoak, the root of which is uſed inſtead of the *coſtos nigra*. *Dale*, Pharm. p. 104.

AGRIOMELENZANION, in the botanical writings of the antients, a word that has perplexed many of the later writers. Fuchſius frankly confeſſes, that he does not know what to make of it; and others, though not ſo honeſt, are found, on examination, full as ignorant. The Arabian writers Aviſenna and Serapion uſed the word *bedengian* for the fruit of the *pomum amoris*, a kind of eſculent nightſhade, or *ſolanum*, called by the old Greek writers, as Theophraſtus, &c. *ſtrychnos*, and only diſtinguiſhed from the other *ſtrychni*, or nightſhades, by its being deſcribed as wholeſome, not poiſonous. From this Arabic word *bedengian*, the Italians formed their word *melanzana*, and the late Greek writers their *melenzanion*, which they uſed as the name of the ſame fruit. This, when the plant was cultivated in gardens, was probably larger and fairer, than when it grew wild; but, in this latter ſtate, was not leſs uſed, but was diſtinguiſhed by the term *Agriomelanzanion*. If the Greeks, who uſe this word, or the *melanzanion*, would have appropriated them to the *pomum amoris*, and diſtinguiſhed theſe from the other nightſhades, they would have done a ſervice to the world.

AGRIOPHAGI, in antiquity, a name given to thoſe who fed on wild beaſts.

The word is Greek, compounded of αγριος, wild, ſavage, and φαγω, I eat.

The name is given, by antient writers, to certain people, real or fabulous, ſaid to have fed altogether on lions and panthers. Pliny [a] and Solinus [b] ſpeak of *Agriophagi* in Ethiopia, and Ptolemy [c] of others in India, on this ſide the Ganges.—[[a] *Plin.* Hiſt. Nat. T. 1. l. 6. c. 30. p. 347. [b] *Solin.* Polyhiſt. c. 33. See alſo *Salmaſ.* Exerc. ad Eund. p. 303, 385. [c] *Ptolem.* ap. Trev. Dict. Univ. T. 1. p. 211.]

AGRIPPA (*Cycl.*)—The etymon of this word, viz. *quaſi ægre parti*, given by Pliny [a], and generally followed by other authors, is diſputed by Salmaſius [b], who gives a very different origin; whence ariſes a different ſignification. He derives it from the Greek αγρευω, *venari*, and ιππος, *equus*, *q. d.* a hunter of horſes; which etymon, in effect, ſeems the beſt ſupported, inaſmuch as the word is ranged, by the grammarian Soſipater, among Greek words, and found accordingly in ſome antient Greek poets and ſcholiaſts.—[[a] *Plin.* Hiſt. Nat. T. 1. l. 7. c. 8. p. 377. ſeq. *Hardouin*, in Not. ad loc. Gell. l. 16. c. 16. [b] *Salmaſ.* Exerc. ad Solin. p. 23. Bibl. Univ. T. 5. p. 14. *Voſſ.* Etym. p. 15.]

Agrippa, notwithſtanding, is eſtabliſhed in the antient ſenſe, and retained by modern authors and midwives. Pliny ſuperſtitiouſly ſpeaks of this kind of birth, as reputed an omen of unhappineſs, which ſcarce ever failed of being accompliſhed, except in the inſtance of M. Agrippa, in whoſe life, however, he finds calamities enough to verify, rather than falſify the omen.

Daventer has a chapter expreſs of *Agrippa's*, or infants coming with their feet foremoſt, which, according to him, is one of the moſt convenient and ſafe ways for a mature birth. *Davent.* Midwif. improv. c. 45. p. 227. ſeq. See alſo *Burggrav.* Lex. Med. T. 1. p. 364. *Dionis*, *La Motte*, &c.

Agrippa gives the denomination to an ungent, deſcribed in the *Antidotarium Nicolai*, and in ſeveral other diſpenſatories, ſuppoſed, by ſome, to have been invented by Agrippa king of Judæa, but as others ſuſpect, by Julius Agrippa, a Roman phyſician. *Fabric.* Bibl. Græc. T. 13. p. 43.

AGRIPPINIANS, in church-hiſtory, the followers of *Agrippinus* biſhop of Carthage, in the third century, who firſt introduced and defended the practice of rebaptization. *Arnd.* Lex. Ant. Eccleſ. p. 465.

AGRIUM, in the materia medica of the antients, a name given to an impurer ſort of *natrum*. The purer ſort of this ſalt they called *halmyrhaga*, and the coarſer and dirtier *Agrium*. The former of theſe they had from Media, the latter from Thrace. *Hill's* Hiſt. of Foſſ. p. 390.

AGROM, a diſeaſe frequent in Bengal, and other parts of the Indies, wherein the tongue chaps and cleaves in ſeveral places, being extremely rough withal, and ſometimes covered with white ſpots. The Indians are very fearful of this diſeaſe, which they attribute to extreme heat of the ſtomach.

Their remedy is, to chew the black ſeeded baſilica, drink ſome chalybeated liquor, or the juice of large mint. Lett. Edif. T. 15. p. 416.

AGROSTEMA, in botany, the name given by Linnæus to a genus of plants, uſually confounded by other authors among the ſpecies of *lychnis*. See LYCHNIS.

The characters of the genus are theſe. The perianthium conſiſts of one leaf, which forms an oblong tube, of a coriaceous texture, and ribbed with ten ſtriæ. The limb of this, which is of the ſame length with the flower, is divided into five ſegments, which are ſlender and permanent. The flower conſiſts of five petals, the ungues of which are as long as the tube of the cup; the limb is obtuſe and expanded. The ſtamina are ten ſubulated filaments affixed to the ungues of the flower. The antheræ are ſimple. The germen of the piſtil is oval. The ſtyles are capillary, and are five in number: they are erect, and of the length of the ſtamina. The ſtigmata are ſimple. The fruit is an oblong capſule covered by the cup, and contains only one cell, in which are a number of ſpotted kidney-ſhaped ſeeds, in a looſe and free receptacle. *Linnæi*, Gen. Plant. p. 200. *Tournef.* Inſt. p. 175.

AGROSTIS, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants, of the graſs kind; the diſtinguiſhing characteriſtics of which are theſe. The calyx is a pointed bivalve glume, containing only one flower. The flower is made of two pointed valves, ſhorter than the calyx, and has one of the valves larger than the other, and terminated by a beard, or awn. The ſtamina are three capillary filaments longer than the flower; the antheræ are ſplit at their ends. The germen of the piſtillum is roundiſh; the ſtyles are two, reflex and hairy; and the ſtigmata are of a like ſtructure. The flower cloſely ſhuts in the ſeed, and does not open to let it fall out. The ſeed is ſingle, roundiſh, and pointed at each end. *Linnæi*, Gen. Plant. p. 19.

Agroſtis is commonly uſed for the ſpecies of graſs called *quick-graſs*, or *couch-graſs*. It is a tall graſs, ſometimes above three cubits high; the leaves, which are for the moſt part rough, proceed from a long ſheath, four or five on a ſtalk, that is, one from each joint. The ſtalk bears an ear on its top, in the ſame ſituation as that of wheat, but thinner, and more inconſiderable, on all accounts, reddiſh, with a very ſhort beard. The ſeed is of an oblong figure, and of a dark colour. The roots, with reſpect to graſs, are ſomewhat big, creep far and wide, are hard, ſharp, and pungent at their extremities, and of a ſweet taſte. *Ray*, Synopſ.

This plant is ſaid to diſſolve ſtones, eſpecially bilious ones, and hence to cure oxen and ſheep that feed upon it.

AGROSTOGRAPHIA, in phyſiology, the hiſtory, or deſcription of gramens, or plants of the graſſy kind.

The word is compounded of the Greek, αγρωσις, *gramen*, graſs, and γραφη, deſcription.

AGROSTOGRAPHIA is alſo the title of a learned and laborious work of John Scheuchzer [a], containing an exact deſcription of about four hundred ſpecies of graſs; particularly dogs-tooth, cyperus, cyperoides, ruſhes, &c. all diſpoſed in a new method; yet the hiſtory is far from being compleat. As numerous as are the ſpecies of this one genus here rehearſed, there are great numbers wanting of thoſe indicated by Bauhin, Ray, Barrelier, Plukenet, &c. not to mention others in both the Indies. In effect, this is rather the *Agroſtographia* of Switzerland, as the author elſewhere calls it, than of the world. The publication of it was preceded by a *prodromus* [b], and an idea of an *Agroſtographia* [c].—[[a] V. Jour. des Scav. T. 70. p. 416—420. [b] V. An extract of it in Jour. des Scav. T. 43. p. 393. [c] V. An account of it in Jour. des Scav. T. 70. p. 176. ſeq. See alſo Nouv. Rep. Lett. T. 47. p. 113.]

AGRYPNIA, (*Cycl.*) in the Greek church, is uſed for the vigil of any of the greater feaſt days, obſerved by the monks and clergy. *Du Cange*, Gloſſ. Græc. T. 1. p. 20. ſeq.

AGUAGUIN, in botany, the name of a ſhrub among the Africans, who eſteem it greatly as a balſamic, and vulnerary. The leaves of this ſhrub reſemble thoſe of our common lilac; they grow alternately, and ſtand upon foot ſtalks of half an inch long; and when held up to the light, they ſhew a very fine texture of the ſmaller veins. Philoſ. Tranſact. N°. 232.

AGUAPECACA, in zoology, the name of a Braſilian bird, of the moor-hen kind. It is of the ſize of a pigeon, very long legged, and has a beak like that of the gallinaceous kind. Its back, and the upper part of its wings, are brown, and in each wing they have a ſharp horn, or prickle, ſerving for their defence. *Margrave*, Hiſt. Braſil.

AGUARA QUIYA, in botany, a Braſil plant, thought to be the *Solanum vulgare*, or common nightſhade, by Ray.

AGUARA PONDA, in botany, a plant otherwiſe called, *Viola ſpicata Braſiliana*. It grows to the height of a foot and an half, or more, with a ſmooth round green and jointed ſtalk. At each joint, come forth four, five, or more, narrow, ſerrated, pointed, green, and unequal leaves. The top of the ſtalk bears an ear a foot long, ſmooth, and covered with flowers of a fine violet azure; or the colour of our *viola martia*, conſiſting of five roundiſh leaves. The whole flower is not unlike the *viola martia*, and has ſomewhat of its ſmell. The root is ſtrait, of a moderate thickneſs, and ſhoots out into abundance of leſſer ones, and theſe again into filaments.

There is another kind, diſtinguiſhed by the wideneſs of its ear of flowers, which repreſents a helmet of a green colour. It is marked with cubic pits, from whence proceed azure flowers. *Ray*, Synopſ.

AGUE (*Cycl.*)—The quotidian *Ague* has its acceſſion καθ' ἡμέραν, or every day; the tertian παρὰ μίαν, every other day; the quartan διὰ δυο ἡμερῶν μεσων, every third day. Alexander Aphrodiſius alſo mentions the πεμπαῖον, or quintan, the ἑβδομαῖον, or ſeptenary; and the ἐναλαῖον, or novenary *Agues*. In all which it is obſervable, that the days of intermiſſion are fewer by two than the number, in the name of the *Ague*. Thus if the *Ague* be τριταῖος, the day of intermiſſion is but one; if τεταρταῖος, two, if πεμπαῖος, three, if ἑβδομαῖος, five, if ἐναλαῖος, ſeven, &c.

The cauſe and ſeat of *Agues* is variouſly aſſigned. Some with Sanctorius [a], ſuppoſe it ſeated in the capillary veſſels of the ſkin, which being ſtopped, a putrid lympha accumulated produces the ſymptoms. Others with Sylvius de la Boe [b], place it in an obſtruction of the pancreas, occaſioned by an accumulation of lympha in that part, which prevents the due diſcharge of the pancreatic juice into the duodenum, till that juice by its detention growing at length acrid, forces its way thro' the obſtructing lymph, and enters the duodenum, where mixing with the bile, and thus paſſing into the blood, it cauſes a feveriſh effervescence. Others aſcribe it to a defect in digeſtion, which furniſhing a crude ſour aliment, this as it enters the blood raiſes a fermentation, and according to the ſtock or quantity of it, occaſions the returns of the diſeaſe to be more or leſs frequent [c]. Others make the ſpleen the principal ſeat of *Agues*, which being deficient, the blood wants its due ferment, and thus becomes obſtructed in its circulation; whence the phænomena of the diſeaſe [d].—[[a] Static. Aphor. 95. Sec. 1. Jour. des Scav. T. 79. p. 365. It. T. 78. p. 421. [b] Jour. des Scav. T. 47. p. 285. See alſo T. 40. p. 439. [c] *Gaſtaldi*, in Jour. des Scav. T. 63. p. 236. See alſo T. 9. p. 36. [d] *Talb.* of the cauſe, &c. of *Agues*, c. 2. p. 20.]

Others, as Slare [e] &c. account for it from the mixture of a foreign acid with the volatile ſalt of the blood, which cauſes a congelation or coldneſs, on the going off of which a feveriſh heat enſues. Others as Wedelius [f], attribute *Agues* to a ſharp, ſour, bilious ferment in the *primæ viæ*, and inteſtinal glands, which paſſing thence, and fixing in the ſubcutaneous pores, diſcharges itſelf periodically into the blood.—[[e] Phil. Tranſ. N°. 150. p. 297. *Lemery*, ap. Jour. des Scav. T. 7. p. 206. [f] Jour. des Scav. T. 42. p. 268.]

We meet with divers other methods of curing *Agues*, beſides that by the cortex; as by means of tea, which taken an hour before the acceſs, is ſaid to remove the obſtruction, and correct the acidity [g]; by ſal volatile, which acts by attenuating the blood [h]: in the iſland of Tino, by an infuſion of flowers of little centaury [i]; not to mention arcanums and ſpecifics for this diſeaſe adminiſtred by royal authority [k]; or cures by ſtroaking [l], by charms [m], eſpecially by virtue of the word Abracadabra [n].—[[g] Jour. des Scav. T. 40. p. 434. [h] Phil. Tranſ. N° 145. p. 80. [i] Jour. des Scav. T. 8. p. 208. [k] Mem. de Trev. An. 1713. p. 1851. [l] *Wood*, Ath. Oxon. T. 2. p. 566. [m] *Friend*. Hiſt. Phyſ. T. 1. p. 85. Phil. Tranſ. N°. 178. p. 1289. [n] Mem. de Trev. Sept. 1701. p. 237.]

Etmuller gives divers inſtances of *Agues* cured by putting the patient in a fit of paſſion [o]. Others have been effected by a fright, a fit of drunkenneſs, &c. "Do we not often ſee "*Agues* cured by amulets and pericarpia? I myſelf, ſays Mr. "Boyle [p], was cured of a violent quotidian by applying to my "wriſts a paſte made of bay ſalt, new hops and blue currants, "which has alſo relieved many others both of quotidians and "tertians."—[[o] *Etmull.* Diſſ. de Ira. ap. Mem. de Trev. 1707. p. 922. [p] *Boyle*, Phil. Work Abr. T. 1. p. 80.]

As to the cauſe of the periods and returns of *Agues*, if it be granted that there is ſome morbific matter of a viſcous, or not eaſily diſſipable texture harboured in ſome part of the body, which requires a determinate time to be made fluid, and reſolvable, the cold fits of *Agues* need not appear ſurprizing, ſince tho' juſt before the fit, the ſame parcel of matter which is to produce it, was actually in the body; yet it was not by reaſon of its clammineſs actually reſolved into ſuch parts, and mixed with thoſe of the blood, and conſequently could not make ſuch a change in the motion of the fluid, as is felt in the cold fit of an *Ague*. So, in ſome other caſes, a ſmall quantity of matter being reſolved into minute parts, may produce a great ſenſe of coldneſs in a particular part of the body, which by reaſon of its ſtructure, may be particularly diſpoſed to be affected thereby, as hyſterical women complain of great coldneſs ſuddenly invading the head or back. And that if a cold vapour or matter be exceeding ſubtile, an inconſiderable quantity of it being diſperſed through the blood, may produce a great degree of coldneſs, appears from the effects of ſome poiſons, particularly the ſting of a ſcorpion, which frequently diffuſes an univerſal coldneſs. *Boyle*, Phil. Work Abr. T. 1. p. 555. ſeq.

Agues ſeem to be much altered from what they were among the antients, both as to their type, or form, and the method of cure; Phlebotomy which made the chief part of the cure among them, is now found rather prejudicial [a]. The old Engliſh proverb, an *Ague* in the Spring is phyſic for a king, Mr. Ray [b] ſhews is reducible to juſt phyſical principles. The The Italians have another proverb no leſs grounded on obſervation, *Febre quartana ammaza i Vecchii & i Giovani riſana*, A quartan *Ague* kills old men and cures young [c].—[[a] *Needh.* Medel. Med. c. 2. p. 19. ſeq. [b] *Ray*, Coll. Engl. Proverb. p. 32. [c] *Boyle*, loc. cit. p. 41.]

Streater [d], Talbor [e], Gaſtaldi [f], have pieces expreſsly on *Agues*: other particulars on the ſubject may be found in the writers on pathology, and the praxis medica [g].—[[d] Of an *Ague* and the curing thereof, Lond. 1641. *Wood*, Ath. Oxon. T. 2. p. 29. [e] Πυρετολογια, a rational account of the cauſe and cure of *Agues*, Lond. 1672. 12°. [f] Quæſt. Med. An Febrib. Intermit. Quinquina, &c. Par. 1717. 12°. Tho' the bark be the moſt effectual remedy in this diſtemper, yet it has been known to cauſe worſe diſorders. See PERUVIAN.

AGUE *free* is a name given by ſome to ſaſſafras, on account of its febrifuge vertue. *Skin.* Etym. Bot. in voc. See SASSAFRAS.

AGUGLIA, (*Cycl.*) is ſometimes uſed by travellers for the obeliſks in Egypt, Conſtantinople, &c.

The word is Italian, and literally ſignifies needle. Some writers of the latter ages uſe *Aguglia* in the ſame ſenſe. *Du Cange*, Gloſſ. Lat. T. 1. p. 114.

AGUGLIA is alſo the name given by the Italian fiſhermen to the acus of Oppian, called in Engliſh the garfiſh. *Willughby*, Hiſt. Piſc. p. 232. See ACUS and LACERTUS.

AGUILLANEUF, or AUGUILLANEUF, a form of rejoicing, uſed among the antient Franks on the firſt day of the year.

The word is compounded of the French, *A*, to, *gui*, miſsleto, and *l'an neuf*, i. e. the new year.

Its origin is traced from a druid-ceremony: the prieſts uſed to go yearly in December, which with them was reputed a ſacred month, to gather miſsleto of the oak in great ſolemnity. The prophets marched in the front, ſinging hymns in honour of their deities; after theſe came a herald with a caduceus in his hand; theſe were followed by three druids a-breaſt, bearing the things neceſſary for ſacrifice. Laſt of all came the chief, or arch-druid, accompanied with the train of people.

The chief druid climbing the oak, cut off the miſsleto with a golden ſickle, and the other druids received it in a white cloth; on the firſt day of the year, it was diſtributed among the people, after having bleſſed and conſecrated it by crying *Au Gui l'an neuf*, to proclaim the new year.

This cry is ſtill continued in Picardy, with the addition of *Plantez*, *Plantez*, to wiſh a plentiful year. In Burgundy and ſome other parts, the children uſe the ſame word to beg a new-year's gift.

Of later times the name *Auguillaneuf* was alſo given to a ſort of begging, practiſed in ſome dioceſes, for church tapers, on new-year's day, by a troop of young people of both ſexes, having a chief &c. It was attended with divers ridiculous ceremonies, as dancing in the church, &c. which occaſioned the ſynods to ſuppreſs it. V. *Merul.* Coſmog. P. 2. l. 3. c. 11. *Thierſ.* Tr. des Jeux. *Menage*, Etym. p. 12. *Aubert*, ap. *Richel.* Dict. T. 1. p. 52. *Moreri*, Dict. Hiſt. T. 1. p. 65.

AGUL, in botany, a ſmall ſhrub very prickly. Its leaves are longiſh, and reſemble thoſe of the knot graſs. It abounds with flowers of a reddiſh colour. Theſe are ſucceeded by red huſks. Its root is long, and of a purple colour.

This plant is otherwiſe called *Alhagi maurorum*, by Rauwolf: it grows in Arabia, Perſia, and Meſopotamia.

Manna is found on it leaves, as large as the grains of coriander, of the ſame taſte and ſmell as ours, but it melts if the ſun ſhines upon it. The leaves of this plant are purgative. *Lemery*, Dict. des Drog.

AGURAH, in Jewiſh antiquity, the twentieth part of an antient ſilver ſhekel. *Cumberl.* Eſſ. Jew. Meaſ. c. 4. p. 138. Bibl. Univ. T. 5. p. 182. ſeq. See SHEKEL, *Cycl.*

The *Agurah* is the ſame with what is otherwiſe called *Gerah* and *Keſhitah*. The Septuagint tranſlation renders it ὀβολος.

AGUSADURA, in antient cuſtoms, a fee due from vaſſals to their lord for the ſharpening their plowing tackle.

Antiently the tenants in ſome manors were not allowed to have their rural implements ſharpened by any but whom the lord appointed; for which an acknowledgement was to be paid, called *Aguſadura*, in ſome places *Aguſage*: which ſome take to be the ſame with what was otherwiſe called *Reillage*, from the antient French *Reille*, a plow-ſhare. *Du Cange*, Gloſſ. Lat. T. 1. p. 114.

AGUTI, in zoology, the name of an American animal, much reſembling the Guinea pig, as we call it, having the characters of the rat kind, with the voice and hair of the hog.

The hairs are very hard, thick and gloſſy, and are of a mixt colour, of a reddiſh and brown with more or leſs black; thoſe on the belly however are yellowiſh; its head and whiſkers are like thoſe of the rabbit kind, but that the noſe is ſharper, and the upper chop longer than the under one, as in the hog kind; the upper lip is ſplit as in the hare, and the legs are naked, or have at the utmoſt only a few ſcattering hairs on them; the fore feet have four toes, and the hinder ones ſix, and theſe are much longer than the fore legs; its tail is very ſhort, and its eyes prominent; its voice altogether reſembles the grunting of a hog. It is a very voracious animal, devouring its food with extream eagerneſs, and uſing its fore feet for hands in the manner of the ſquirrel. It runs very ſwiftly, and is very expert at digging, ſo that it ſoon buries itſelf in the earth. When provoked, it raiſes all the hair of its back upright, and ſtrikes the earth with its hinder feet. *Ray*, Syn. Quad. p. 226.

AGUTI TREVA *inſulæ Marignanæ*, in botany, a plant mentioned by De Laet. It has the leaves of the orange tree, only thinner, a dewy flower, a large fruit, with a greeniſh rind, which contains kernels like thoſe of the pomegranate, thin, ſweet, and not ill taſted. *Ray*, Hiſt. Plant.

AGUTIGUEPA *Obi Braſilienſibus*, in medicine, the name given by many authors to the arrow root, or *Sagittaria alexipharmaca* of the Weſt Indies. *Margrave*, p. 23. *Piſo*. p. 224.

AGYEI, in antiquity, a kind of obeliſk conſecrated to Apollo, and placed in the veſtibles of houſes, for the ſecurity thereof.

The *Agyei* were no other than huge ſtones, or perhaps ſometimes timber, having either a circular or ſquare baſis, and terminating in a point at the top, ſacred to Apollo, or as ſome ſay, to Bacchus, as protector of the high ways. Others will have them to have been erected to both thoſe deities. V. *Suid.* Lex. T. 1. p. 41. *Pitiſc.* Lex. Ant. T. 1. p. 65. *Baxt.* Gloſſ. p. 72.

AGYNIANI, in church hiſtory, a ſect who condemned all uſe of fleſh, and marriage, as not inſtituted by God, but introduced at the inſtigation of the devil.

The word is compounded of the privative α, and γυνη, woman. They are ſometimes alſo called *Agynnenſes*, and *Agynii*; and are ſaid to have appeared about the year 694. It is no wonder they were of no long continuance. Their tenets coincide in great meaſure with thoſe of the *Abelians*, *Gnoſtics*, *Cerdonians*, and other preachers of chaſtity and abſtinence. *Prateol.* Elench. Hæreſ. l. 1. n. 18. p. 13. *Arnd.* Lex. Eccleſ. p. 491.

AGYRTÆ, in antiquity, a kind of ſtrolling impoſtors running about the country, to pick up money by telling fortunes at rich mens doors, pretending to cure diſeaſes, by charms, ſacrifices, and other religious myſteries; alſo to expiate the crimes of their deceaſed anceſtors, by virtue of certain odours and fumigations; to torment their enemies, by the uſe of magical verſes and the like.

The word is Greek Αγυρται, formed of the verb αγυρω, I congregate; alluding to the practice of Charletans, who gather a crowd about them. *Magri*, Vocab. Eccleſ. p. 8.

AGYRTÆ, among the Greeks, amount to the ſame with *Æruſcatores*, among the Latins, and differ not much from gypſies among us. *Lang.* Epiſt. Medic. 33. l. 1. p. 141. *Voſſ.* Etym. p. 15. Ejuſd. Inſtit. Orat. l. 4. c. 6. *Pitiſc.* Lex. Ant. T. 1. p. 65. *Hoffm.* Lex. Univ. T. 1. p. 117. *Burg.* Lex. Med. T. 1. p. 366. ſeq.

AHALOTH, in the materia medica, a name uſed by ſome writers for the *lignum aloes*, or aloes wood. It is the Hebrew name.

AHANIGER, in ichthyology, a name given by Albertus, and and others, to the fiſh called by authors *Acus vulgaris*, and by us the garfiſh. The ſhape of this fiſh, which is very long and ſlender, has cauſed it to be confounded with the *Syngnathus*, or tobacco-pipe fiſh, called alſo *acus*; but they differ extreamly when examined; that being a true ſpecies of the *Syngnathus*, and this of the *Eſox* or pike. See ESOX.

AHOUAI, in botany, the name of a genus of plants, the characters of which are theſe.

The flower conſiſts of one leaf, and is of the funnel faſhioned kind, and divided into ſeveral ſegments at the edge; from the cup there ariſes a piſtil, which is fixed in the manner of a nail to the lower part of the flower, and finally becomes a fleſhy and pear faſhioned fruit, containing a trigonal ſtone with its kernel.

The ſpecies of *Ahouai* mentioned by Mr. Tournefort are theſe. 1. The *Ahouai* of Thevet, or the apple-leaved poiſonous *Ahouai*. And 2. The Nerium-leaved *Ahouai*. *Tournef.* Inſt. p. 658. See alſo *Miller*, Gardn. Dict. Vol. 2. in voc.

AHMELLA, in botany, the name given by the Ceyloneſe to a plant famous for its virtues, as a lithontriptic, and diuretic; it is a ſpecies of bidens, or water hemp agrimony. Its flowers are large, and reſemble thoſe of the marygold; they grow in large numbers on the tops of the ſtalk, and of the large branches, and are ſucceeded by oblong ſeeds, which have the ſame ſort of points at one end with thoſe of our common bidens, and all the other plants of that genus. The ſtalks are ſquare, and the leaves ſtand in pairs, and are in ſhape like thoſe of the common nettle.

It firſt got into uſe in the iſland of Ceylon, and other parts of the Eaſt-Indies as a diuretic; and thence obtained among the Europeans, under the great character of a certain cure for the ſtone. The ſeeds contain the principal virtues.

It is very probable that tho' this plant may not come up to the character which was at firſt given of it, yet both it and all the other plants of the ſame genus, may have very conſiderable virtues in working by urine. We have one ſpecies of it very common in all parts of England, about watry places; and eaſily known by its ſeeds, in Autumn, ſticking to the cloths and ſtockings of people who go near the plant; by means of the three points at the end, which are ſharp and bearded. It would be worth while to try whether theſe ſeeds poſſeſs virtues worthy notice in phyſic, for at preſent they are neglected.

This plant and the others of the ſame genus are called by the name *bidens*, from the teeth or prickles at the ends of the ſeeds, but the word ſhould be *tridens*, for there are three of them. V. Phil. Tranſ. N°. 257. p. 365.

AHICCYATLI, in zoology, the name of an American ſerpent, approaching to the nature of the Hæmorrhous and rattleſnake, but larger than the former, and wanting the rattle of the latter; it is as fatal in the effect of its poiſon, as any known ſpecies of ſerpent. *Ray*, Syn. Anim. p. 287.

AIAIA, in zoology the name of a Braſilian bird, of the *Platea*, or ſpoonbill kind, called by the Portugueſe *Colhorado*. It is exactly of the ſame ſhape, and much of the ſame ſize with the European ſpoonbill, and its beak is in the very ſame manner broad at the end. It is of a pale but very bright and ſhining fleſh colour, on the back and wings; the other parts of its body are perfectly white; it is common about the ſhores of rivers, and its fleſh is very well taſted. *Margrave*, Hiſt. Braſil.

AJAX, in antiquity, a furious kind of dance, in uſe among the Grecians; intended to repreſent the madneſs of that hero, after his defeat by Ulyſſes, to whom the Greeks had given the preference in his conteſt for Achilles's arms.

Lucian, in his treatiſe of dancing, ſpeaks of dancing the Ajax. There was alſo an annual feaſt called *Ajantia*, Αιαντεια, conſecrated to that prince, and obſerved with great ſolemnity in the iſland of Salamis, as well as in Attica; where, in memory of the valour of Ajax, a bier was expoſed, ſet out with a compleat ſet of armour. *Potter*, Archæol. Attic. l. 2. c. 20.

AICHMALOTARCHA. See ÆCHMALOTARCHA, *Cycl.* and *Suppl.*

AID (*Cycl.*)—The *Aids*, or aſſiſtances of divine grace which are offered to man, have been the ſubject of much diſpute betwixt Janſeniſts and Jeſuits; for the compoſing whereof, a celebrated congregation was erected at Rome under the title of congregation of *Aids*, *Congregatio de Auxiliis*.

Some divines after St. Auguſtine, diſtinguiſh two kinds of *Aids*, viz. *ſine quo*, and *quo*.

Auxilium ſine quo, that which the mind is at liberty either to uſe or refuſe; ſuch is ſuppoſed to have been the *Aid* miniſtred to man in the ſtate of innocency, while his mind and will were ſound and upright.

Auxilium quo amounts to what is otherwiſe called efficacious grace, which ſurmounts and ſubdues the will; ſuch, according to the Calviniſts and Janſeniſts, is ſuppoſed to be the *Aid* miniſtred by grace, in the preſent fallen ſtate of human nature. Jour. des Scav. T. 33. p. 1047.

AIDS, in antient cuſtoms, are divided into legitimate and free.

Legitimate AIDS are thoſe impoſed by authority of law, or antient cuſtom; theſe are ſometimes alſo denominated *Legitimæ Talliæ*, *Leaux Aydes*, *Aydes Couſtumieres*, and *Auxilia Communia*. Of which kind are the capital *Aids*, *Aids de Relief*, *de Marriage*, &c.

AID *de Relief*, *Auxilium pro Relevio ſeu Racheto*, is that due from the tenants in fee, upon the death of the Lord Meſn, to his heir, towards the charge of a relief of the fee, of the ſuperior Lord.

Capital AID, *Ayde Chevel*, or *Auxilium Capitale*, mentioned in the Cyclopædia, was alſo called *Taille Seigneurale*, and *Aid* of Chivalry. We alſo meet with *Auxilium pro Militia Domini*, *Aid* for the lords being knighted; and *Auxilium pro Militia Fratris*, for his brothers being dubbed.

Authors have been under ſome miſtake on this head; the generality ſuppoſe, that the chivalry or knighthood here ſpoken of, was ſome particular order conferred by the king. Berand, and Baſnage ſuppoſe it, in Normandy, to have been the order of the Holy Ghoſt; their ſyſtem is, that the oldeſt ſons of

the Norman Lords were antiently created knights, with certain ceremonies, which depended on the king. Having obſerved that Francis I, Henry II, and Henry III. levied this *Aid* in favour of their eldeſt ſons; and that in the age of the two former of thoſe princes, the order of St. Michael, and in the age of the laſt, the order of the Holy Ghoſt, were the king's orders, they concluded that the form of creation of knights, which gave a title to this *Aid*, was variable; that the form of the two orders juſt mentioned had been ſubſtituted to the more antient one; and conſequently, that the *Aid* of chivalry was only now due, where the lord was made a knight of the king's order.

A later writer has overturned this origin, and ſhewn, that the orders of knighthood now in vogue bear no relation to the *Aid* of chivalry, mentioned in this cuſtom. This *Aid* is, in reality, a feudal right, and derives its origin from the primitive law of feuds, which is much prior to any order of knighthood. Chivalry, according to this author, amounts to little other than what we commonly call military ſervice, or the profeſſion of arms. To make a ſon a knight, was only to fit him out with the arms and acouterments proper for a *miles*, or horſeman; to put him into the military rank, and make him, like other knights of fees, fit for ſerving in war. The occaſion of this *Aid* then was, to defray the expence of the new equipage. What confirms this account is, that it is plain, from antient cuſtom, that the making a ſon a knight depended altogether on the father, not on the king, as the dubbing, or creating of knights of orders eſſentially does. De Jort has a diſſertation expreſs on the capital *Aid* of Normandy. This *Aid* is well known in the Engliſh law books, under the name of *Aid pur faire fitz chevaler*; by which, as De Jort rightly ſays, no particular order was meant. V. Diſſ. ſur les Aides Chevels de Normandie, appellez Aides Coutumieres, Rouen 1706. 12mo. An extract of it is given in Jour. des Scav. T. 36. p. 71. ſeq.

There were alſo *Aids* for the king's, or lords going the firſt time to the war, *Auxilia pro militia domini*, or *pro militia*. *Aids* for maintaining the lords war, *Auxilium ad guerram domini manutenendam*: ſometimes alſo called, *pro expeditione*, paid on the king's undertaking an expedition abroad, and ſometimes denominated *Ayde de l'oſt*.

Aid for attending the emperor, *Auxilium pro eundo ad imperatorem*, was paid in ſome provinces of France and Germany.

The biſhops alſo received *Aids*, *Auxilia epiſcopi*, ſometimes alſo called *conſuetudines epiſcopales*, *denarii paſchales*, *ſynodales*, & *pentecoſtales*. Some were to be paid at the time of their conſecration, called *Auxilia pro conſecratione*; others, when they had a king to entertain, *Auxilium pro corredo ſuo*; others, when they were called by the pope to his court, or to a council, or by the king to his army; others, when they went to receive the *pallium* called *Auxilium pallii*.

A kind of feudal *Aids* are ſtill levied in Germany, &c. under the title of *collectæ*. V. Jour. des Scav. T. 65. p. 450.

In Congo, an *Aid* is levied for the queen, the firſt night of her marriage; the ſubjects are all rated by their beds, with one meaſured in ſpans for the purpoſe. V. Bibl. Univ. T. 2. p. 374.

AIDS, in French laws, denote a duty paid on all goods ſold and tranſported either out of, or into the kingdom.

In this ſenſe, *Aids* anſwer to what the Latins call *vectigalia*, a *vehendis mercibus*, and are paid by all kinds of perſons, privileged, or non-privileged; by which they differ from *tailles*, taxes, which are only paid by the peaſants, being a ſort of capitation, anſwering to what the Latins call *tributum*. The farm of the *Aids* was formerly diſtinct from, but now united to, that of the *gabelles*, and other impoſts. Trev. Dict. Univ. T. 1. p. 216. ſeq.

Court of AIDS, a ſovereign court eſtabliſhed in ſeveral cities of France, for the management and direction of the taxes, gabelles, and *Aids*, impoſed on ſeveral ſorts of commodities, eſpecially wine; and to which belongs the cognizance and juriſdiction of all cauſes relating thereto.

There are thirteen courts of *Aids* ſeated at Paris, Rouen, Bourdeaux, Aix, Montpellier, &c [a]. The principal is that at Paris. It was firſt erected by king John I. in 1355, when it only conſiſted of one chamber. Henry II. in 1551, added a ſecond chamber; and Lewis XIII. in 1635, a third. This court is compoſed of preſidents, counſellors, advocates, and procureurs-general [b]. Jacquin has a treatiſe on the court of *Aids* of Paris [c]. Chevillard [d] has alſo publiſhed a draught of the court of *Aids*. Corbin and Philippi give edicts and regulations relating to the court of *Aids*.—[[a] V. *Vallem.* Elem. de l'Hiſt. T. 1. p. 226. [b] Mem. de Trev. 1707. p. 1228. Works of Learn. T. 4. p. 376. [c] Mem. de Trev. 1707. p. 1226. ſeq. [d] *Le Long*, Bibl. Hiſt. p. 733.]

AIDS, in the manege, are otherwiſe called, by ſome writers, *cheriſhings*.

AIEREBA, in zoology, the name of a fiſh of the *paſtinacha marina* kind, but differing from all the others, in that the form of its body is regularly round, or oval, and its head placed far within the verge of its thin part. It is common in the weſtern ocean; but is not much eſteemed for the table, being more looſe and flabby in its fleſh than the other kinds. *Margr.* Hiſt. Braſ. p. 123.

AIGHENDALE, a liquid meaſure in Lancaſhire, containing ſeven quarts. *Hought.* Collect. T. 1. p. 132.

AIGITHALUS, Αἰγίθαλος, in zoology, a name by which ſome of the old authors called the *parus*, or titmouſe. See PARUS.

AIGRETTA, in zoology, a name uſed by ſome authors, as the name of a diſtinct ſpecies of heron, but ſeeming to be no other than a ſynonym of the *gaza giovane*, or *ardea alba minor*, the ſmall white heron. *Bellonius*, de Avibus. See GAZA *giovane*.

AILERONS, in natural hiſtory, petty-wings, a French term, expreſſing two ſmall ſhelly ſubſtances, reſembling parts of wings, or young and juſt growing wings, and found in the two-winged flies, ſituated at the root of the larger wings. *Reaumur*, Hiſt. Inſect. T. 4. p. 218.

The word is a diminutive of the French, *Aile*, wing.

AILES *vitrees*, in natural hiſtory, a French term, uſed to expreſs the wings of a ſeries of inſects, which ſeem of a middle nature, between the fly and the butterfly kind, and are therefore called *papilion mouches* by theſe writers. The wings of theſe inſects are in part covered with duſt, or ſcales, and in part free from it, and tranſparent. In theſe free parts they look glaſſy; whence their name, ſignifying *glaſſy wings*.

AIPIMIXIRA, in zoology, the name of an American fiſh, more uſually known by the name of *pudiano*. It is a ſmall fiſh, of the ſhape of a pearch, with a purple back, and yellow ſides and belly. *Margrave*, Hiſt. Braſil. See PUDIANO.

AIR (*Cycl.*)—By the ingenious experiments of the reverend Mr. Hales, it appears, that *Air* is inſpired by vegetables, not only at their roots, but alſo through ſeveral parts of their trunk and branches; and this *Air* may be ſeen aſcending, in great plenty, through the ſap of the vine, in tubes affixed to them at the bleeding ſeaſon.

Mr. Boyle made many experiments on the *Air*, and found, that a quantity of this fluid was producible, from ſeveral ſorts of vegetables, by putting them into exhauſted and unexhauſted receivers, where they continued, for ſeveral days, emitting great quantities of *Air*. Some account of this is given in the Cyclopædia.

Mr. Hales ſince attempted to find more exactly the quantity of *Air* that might be obtained from different ſubſtances. And this he affected, by making hydroſtatical gauges of retorts and boltheads, in the manner deſcribed in his excellent Vegetable Statics, chap. 6.

From theſe experiments it appears, that a very conſiderable quantity of permanent *Air* was produced by diſtillation from animal ſubſtances; not only from the blood and fat, but alſo from the horns, and other ſolid parts of animals. In particular, it was found, that half a cubic inch of fallow deer's horn, weighing 241 grains, contained 33 grains of factitious *Air*; which is near one ſeventh part of the whole horn.

In theſe experiments it was obſervable, that the particles of new *Air* were detached from the blood and horns, at the ſame time with the white fumes, which conſtitute the volatil ſalt; and that this volatil ſalt, which mounts with great activity in the *Air*, is ſo far from generating true elaſtic *Air*, that, on the contrary, it abſorbs it. It appears, in particular, that a dram of volatil ſalt of ſal armoniac abſorbed two cubic inches and an half of *Air*. Phoſphorus alſo was found to abſorb *Air*.

Vegetable ſubſtances produce *Air* in great plenty. Indian wheat, for inſtance, produced one fourth of its weight of *Air*. Peaſe produced ſomething more than one third of their weight. But camphor neither generated nor abſorbed *Air*; agreeable to what Mr. Boyle found, when he burnt it in vacuo.

Brandy gives very little *Air*; but well water gives about a fiftieth part; and Pyrmont water double that proportion.

The quantity of *Air* in nitre is about one eighth part. From Rheniſh tartar there aroſe about one third of the whole in *Air*; and ſalt of tartar gave nearly one ninth of its weight.

A good part of the *Air* thus raiſed from ſeveral bodies, by the force of Fire, is apt gradually to loſe its elaſticity, by ſtanding ſeveral days. The reaſon of which is, that the acid ſulphureous fumes raiſed with that *Air*, reſorb and fix the elaſtic particles. But Mr. Hales obviated this inconvenience, by making the *Air* raiſed in diſtillation paſs through water to the top of the receiver, in the manner deſcribed chap. 6. exper. 77. of his Vegetable Statics. By this means, the acid ſpirit, and ſulphureous fumes, were intercepted, and retained in the water; in conſequence of which, the new generated *Air* continued in a more permanently elaſtic ſtate, ſo as not to loſe above one fifteenth, or one eighteenth of its elaſticity, and that chiefly the firſt twenty-four hours. After this, the remainder continued in a conſtantly elaſtic ſtate; excepting the *Air* of tartar, which, in ſix or eight days, loſt conſtantly above one third of its elaſticity, after which, the remainder was permanently elaſtic.

That the great quantities of this fluid, thus obtained, are true *Air*, and not a mere flatulent vapour, Mr. Hales aſſured himſelf by ſeveral experiments; by which it appeared, that there

there was no difference of ſpecific gravity diſcernable between the true and factitious *Air*, neither was there any difference found between their elaſticities.

The *Air* was thus produced by means of fire; but the production, fixation, and abſorption of *Air*, may alſo ariſe from efferveſcence and fermentation, by the mixture of variety of ſolids and fluids. And this method of producing, of abſorbing, and of fixing the elaſtic particles of *Air*, by efferveſcence and fermentation, ſeems to be more according to nature's uſual way of proceeding, than the other by fire. Thus half a cubic inch of oyſter-ſhell, and a cubic inch of oil of vitriol, generated thirty-two cubic inches of *Air*. But a cubic inch of lemon juice, and near an equal quantity of ſpirit of hartſhorn, *per ſe*, that is, not made with lime, did, in four hours, abſorb three or four cubic inches of *Air*; and the following day, it remitted or generated two cubic inches of *Air*; the third day, turning from very warm to cold, it again abſorbed that *Air*, and continued in an abſorbing ſtate for a day or two.

It alſo appears, from the ſame ingenious author's experiments, that there is great plenty of *Air* incorporated into the ſubſtance of vegetables, which, by the action of fermentation, is rouſed into an elaſtic ſtate. Thus forty-two cubic inches of ale from the tun, which had been ſet to ferment thirty-four hours before, generated, from the 2d of March to the 9th of June, 639 cubic inches of *Air*, with a very unequal progreſſion, more or leſs, as the weather was warm, cool, or cold, and ſometimes upon a change from warm to cool, it reſorbed *Air*, in all, thirty-two cubic inches. Peaſe, wheat, and barley, do alſo, in fermentation, generate great quantities of *Air*.

That this *Air* ariſing in ſuch great quantities, from fermenting and diſſolving vegetables, is true permanent *Air*, is certain, by its continuing in the ſame expanded elaſtic ſtate for many weeks and months; which expanding watery vapours will not do, but ſoon condenſe when cold. And that this new generated *Air* is elaſtical, appears not only from its dilating and contracting with heat and cold, as common *Air* does, but alſo by its being compreſſible, in proportion to the incumbent weight, as Mr. Hales found, by two ingenious experiments. See Veget. Stat. chap. 6. exper. 88, 89.

If to the *Air* generated from a veſſel of any vegetable liquor, by fermentation, we add the *Air* that might afterwards be obtained from it, by heat, or diſtillation; and to that alſo the vaſt quantity of *Air*, which is found to be contained in the tartar which adheres to the ſides of the veſſel; it will follow, that *Air* makes a very conſiderable part of the ſubſtance of vegetables, as well as of animals.

But it is reaſonable to think, that moſt of theſe active particles of the new generated *Air* were in a fixed ſtate in the vegetable ſubſtance, before they were rouſed and put into an active repelling ſtate, by fermentation and fire. For if they were in an elaſtic ſtate, in an apple, for inſtance, of ſixteen ſquare inches ſurface, this fruit generating forty-eight times its bulk of *Air*, this *Air*, when compreſſed in the apple, muſt conſequently be forty-eight times, at leaſt, more denſe than common *Air*, and therefore cannot be retained by a force leſs than forty-eight times the weight of our atmoſphere; which, upon a ſurface of ſixteen ſquare inches, would amount to 11776 pounds. Now, the expanſive force of the compreſſed *Air* muſt alſo be equal to this, action and reaction being equal. But ſo great a force muſt tear the apple to pieces. It ſeems therefore, that moſt of theſe particles of *Air* were in a fixed ſtate, ſtrongly adhering to, and wrought into the ſubſtance of the apple; although, on the other hand, it be evident, from ſome of Mr. Hales's experiments, that innumerable bubbles of *Air* inceſſantly riſe through the ſap of vines, and that we may therefore preſume, there is a conſiderable quantity of *Air* in vegetables, upon the wing, and in a very active ſtate, eſpecially in warm weather, which increaſes their activity. V. Veget. Stat. exper. 34, 38.

Air may alſo be produced from mineral ſubſtances, by the action of fire in diſtillation; and the ingenious author ſo often quoted ſhews us alſo, by many experiments, that great plenty of *Air* is generated by ſome fermenting mineral mixtures, abſorbed by others, and by others alternately generated and abſorbed; and it was remarkable, that the ſame mixtures changed from generating to abſorbing, and, *vice verſa*, ſometimes with, and ſometimes without any ſenſible alteration of the temperature of the *Air*. *Hales*, Veget. Stat. exper. 90, 91, &c.

Some mixtures have a very ſtrong abſorbing effect. Thus two cubic inches of lime, and an equal quantity of ſal armoniac, abſorbed 115 cubic inches of *Air*. *Hales*, ib. exper. 100. Filings of iron alſo, with ſpirit of nitre, either with an equal quantity of water, or without water, abſorbed *Air*, but moſt without water; whereas one fourth of a cubic inch of filings of iron, and a cubic inch of oil of vitriol, with three times its quantity of water, generated 108 cubic inches of *Air*. Id. exper. 94.

Burning and flaming bodies, as alſo the reſpiration of animals, deſtroy the elaſticity of the *Air* in part [a]. Thus burning of nitre, although it produce a large quantity of new *Air*, yet the elaſticity of this *Air* daily decreaſes, in the ſame manner as Mr. Hauksbee [b] obſerved the *Air* of fired gun-powder to do.—[a *Hales*, Exper. 102. b Phyſico-Mechan. Exper. p. 83.]

By the burning of rags dipped in melted brimſtone, in a cloſe veſſel, one tenth of the whole *Air* of the veſſel was abſorbed. And it was obſervable, that more *Air* in proportion was abſorbed in ſmall veſſels than in large ones. The like happens by the burning of a candle. And the *Air* abſorbed by burning brimſtone, or the flame of a candle, does not recover its elaſticity again. *Hales*, ib. exp. 104.

A groſs *Air* loaded with vapours, is more apt, in equal times, to loſe its elaſticity in greater quantities, than a clear *Air*. Mr. Hales obſerved, as to the burning of candles in cloſe veſſels, that where the veſſels are equal, and the ſize of the candles unequal, the elaſticity of more *Air* will be deſtroyed by the large, than by the ſmall candle. And where candles are equal, there moſt *Air*, in proportion to the bulk of the veſſel, will be abſorbed in the ſmalleſt veſſel; though, with equal candles, there is always moſt elaſtic *Air* deſtroyed in the largeſt veſſel, where the candle burns longeſt.

The ſame author tells us, he was never able to deſtroy the whole elaſticity of any included bulk of *Air*, whether common or factitious. The reaſon of which he takes to be, that when any quantity of *Air* is ſaturated with abſorbing vapours to a certain degree, no more elaſtic *Air* is abſorbed, notwithſtanding that the ſame quantity of abſorbing ſubſtances would, in a larger quantity of *Air*, have abſorbed much more. Ib. exper. 106. in fin.

Dr. Mayow found, that a mouſe abſorbed one fourteenth of the whole *Air* in a glaſs veſſel. Mr. Hales tried the experiment with a full grown rat. The creature lived about fourteen hours, in which time, the quantity of elaſtic *Air* abſorbed was above one twenty-ſeventh of the whole, and nearly the ſame with what was abſorbed by a candle. And in theſe experiments with animals, as alſo in the caſe of burning brimſtone and candles, more *Air* was found to be abſorbed in large veſſels, than in ſmall ones; and *vice verſa*, more *Air*, in proportion to the capacity of the veſſel, was abſorbed in ſmall than in large veſſels. Ib. exper. 107.

The elaſticity of the *Air* is alſo greatly deſtroyed by the reſpiration of human lungs. See RESPIRATION and LUNGS.

The ſudden and fatal effect of noxious vapours has generally been ſuppoſed to be wholly owing to the loſs and waſte of the *vivifying ſpirit of Air*. But this effect may not unreaſonably be alſo attributed to the loſs of a conſiderable part of the *Air*'s elaſticity, and the groſſneſs and denſity of the vapours, with which the *Air* is charged; for mutually attracting particles, when floating in ſo thin a medium as *Air*, will readily coaleſce into groſſer combinations. And this effect of vapours having not been duly obſerved before, it was concluded that they did not affect the *Air*'s elaſticity; and that, conſequently, the lungs muſt needs be as much dilated in inſpiration by this, as by a clear *Air*. But Mr. Hales found, by an experiment made on himſelf, that the lungs will not riſe, and dilate as uſual, when they draw in ſuch noxious *Air*, which decreaſes faſt in its elaſticity. For having made a bladder very ſupple by wetting of it, and then cut off ſo much of the neck, as would make a hole wide enough for the biggeſt end of a large foſſet to enter, to which the bladder was bound faſt; and having blown up the bladder, he put the ſmall end of the foſſet into his mouth, and, at the ſame time, pinched his noſtrils cloſe, that no *Air* might paſs that way, ſo that he could only breathe to and fro the *Air* contained in the bladder, which, with the foſſet, contained ſeventy-four cubic inches. In leſs than half a minute, he found a conſiderable difficulty in breathing, and was forced to fetch his breath very faſt; and, at the end of the minute, the ſuffocating uneaſineſs was ſo great, that he was forced to take away the bladder from his mouth. Towards the end of the minute, the bladder was become ſo flaccid, that he could not blow it above half full, with the greateſt expiration he could make; and, at the ſame time, he could plainly perceive that his lungs were much fallen, in the ſame manner as when we breathe out of them all the *Air* we can at once. Hence it appeared, that a conſiderable quantity of the elaſticity of the *Air* in the bladder and his lungs was deſtroyed; and that when the ſuffocating quality of the *Air* of the bladder was greateſt, it was with much difficulty that he could dilate his lungs a very little.

The ingenious author thinks, from this, and ſeveral other experiments, that the life of animals is preſerved rather by the elaſtic force of the *Air* acting on their lungs, than by its vivifying ſpirit; and that candles and matches ceaſing to burn, ſoon after they are confined in a ſmall quantity of *Air*, ſeems not to be owing to their having rendered that *Air* effete, by having conſumed its vivifying ſpirit; but ſhould rather be owing to the great quantity of acid fuliginous vapours, with which that *Air* is charged, which deſtroy a good deal of its elaſticity, and very much clog and retard the elaſtic motion of the remainder. See *Animal* LIFE and FIRE.

It ſeems evident alſo, from Mr. Hales's experiments, that the matter often loſt in the chemical analyſes of bodies is elaſtic *Air*, a very active principle in fire, but not elemental fire, as Lemery, and other chemiſts, ſuppoſe. See FIRE.

The elaſticity of the *Air* is greatly deſtroyed by ſulphureous bodies; and great plenty of *Air* is united with ſulphur in the oil of vegetables. But ſulphur in a quieſcent fixed ſtate in a large body, as a roll of brimſtone, does not abſorb the elaſtic *Air*. And it is to be obſerved, that as ſulphur thus attracts *Air*, this fluid will alſo attract ſulphur. See SULPHUR.

Air is found in much greater proportion in the ſolid parts of vegetables, than in their fluid parts. See VEGETABLE.

Since we find ſuch great quantities of elaſtic *Air*, generated in the ſolution of animal and vegetable ſubſtances, a good deal muſt conſtantly ariſe from the diſſolving of theſe elements in the ſtomach and bowels, which diſſolution it greatly promotes. See DIGESTION.

The *Air* is very inſtrumental in the production and growth of animals and vegetables, both by invigorating their ſeveral juices, while in an elaſtic active ſtate; and alſo by greatly contributing in a fixed ſtate, to the union and firm connection of the ſeveral conſtituent parts of thoſe bodies, *viz.* their water, ſalt, ſulphur, and earth. This band of union, in conjunction with the external *Air*, is alſo a very powerful agent in the diſſolution and corruption of the ſame bodies; for it makes one in every fermenting mixture: now the action and reaction of the aëreal and ſulphureous particles, is in many fermenting mixtures ſo great as to excite a burning heat, and in others a ſudden flame. And it is by the like action and reaction of the ſame principles, in fuel and the ambient *Air*, that common culinary fires are produced and maintained.

Since then *Air* is found ſo manifeſtly to abound in almoſt all natural bodies; ſince we find it ſo operative and active a principle in every chemical operation; ſince its conſtituent parts are of ſo durable a nature, that the moſt violent action of the fire, or fermentation, cannot induce ſuch an alteration of its texture, as thereby to diſqualify it from reſuming, either by the means of fire, or fermentation, its former elaſtic ſtate, unleſs in the caſe of vitrification, when with the vegetable ſalt and nitre, in which it is incorporated, ſome of it with other chemical principles may, perhaps, be immutably fixt: ſince this is the caſe, may we not with good reaſon adopt this now fixt, now volatile proteus, among the chemical principles, and that a very active one, as well as acid ſulphur; notwithſtanding it has been hitherto over-looked, and rejected by chemiſts, as no way entitled to that denomination? *Hales*, Veget. Stat. Chap. 6. in fin. See farther of the properties of *Air*, in the articles VAPOUR, FERMENTATION, VEGETATION, ATMOSPHERE, LUNGS, RESPIRATION, WATER, ICE, SULPHUR, FIRE, *&c.*

The ingenious author ſo often cited has given the general name of *Air* to the fluid ariſing from animal, vegetable, and mineral ſubſtances, by diſtillation, fermentation, exploſion, as in gun-powder, *&c.* And tho' his experiments prove this factititious *Air* to be a permanent elaſtic fluid, and to be of the ſame weight, and elaſticity as the *Air* we breathe; yet ſome doubt might remain, as to this factitious or artificial *Air* being entirely the ſame with natural *Air*, and of its being able to ſerve the ſame purpoſes of life in animals. On the contrary, from ſome experiments made by Mr. Cotes, and others, it ſeems that the effects of artificial *Air* are different from the effects of common *Air*. Thus in particular, it appeared that artificial *Air* did not reſtore the power of motion to a bee, which had been put into an exhauſted receiver; yet when ſhe was expoſed to the open *Air*, in a little time ſhe began to move herſelf: and hence Mr. Cotes ſuſpects that artificial *Air* is unfit for the life of animals. This was farther confirmed by an experiment made on two flies included in a receiver, out of which the common *Air* being exhauſted, ſome gooſberry *Air* was made to ſupply its place. Afterwards two other flies were included in *vacuo*, but with this difference, that common *Air* was reſtored to them. The event was, that the latter flies thereby recovered their power of motion, which they had loſt in *vacuo*; but the former, in the factitious *Air*, remained irrecoverably dead. It appeared likewiſe by Mr. Cotes's experiments, that artificial *Air* is not only prejudicial to the life of animals, but to flame alſo. See *Cotes*, Hydroſt. and Pneumat. Lect. 16. Art. 5.

Nay, by ſome experiments it appears, that factitious *Air* is a greater enemy to animals, than a *vacuum* itſelf; and thence the laſt quoted excellent author ſeems to collect, that it kills by ſome venomous quality, and not only by the defect of common *Air*.

But it muſt be admitted, with Mr. Hales, that the noxious qualities of factitious *Air*, whether made by fermentation, effervеſcence, or diſtillation, is not a ſufficient reaſon againſt its being true *Air*; becauſe it is well known, that common *Air* is frequently alſo impregnated with moſt noxious and deadly vapours. Thus the fumes which aſcend in the *Air* from fermenting wines, are very pernicious; thoſe alſo from burning brimſtone are moſt deadly; and ſuch alſo Mr. Haukſbee found *Air* to be, which had paſſed thro' heated iron and braſs tubes. But the *Air* which paſſed thro' a heated glaſs tube was not noxious; an argument that the vapours which aroſe from the iron and braſs were noxious, and not the hot *Air*. And it ſeems probable that the noxiouſneſs of new generated *Air*, either by fermentation, effervеſcence, or fire, as alſo common *Air* impregnated with the like fumes, is principally owing to thoſe fumes or vapours, and not to a diminution of the degrees of its elaſtiticy; which is the ſame in common and in factitious *Air*. V. Stat. Eſſ. Vol. 2. p. 317, 318.

We have already mentioned that *Air*, by being breathed becomes unfit for reſpiration; and this was proved from ſeveral experiments, made by the reſpiration of *Air* included in bladders. But leſt any inconvenience might ariſe from the rancid vapour of bladders, Mr. Hales, contrived to breathe the *Air* of an *Air*-pump receiver, by cementing a wooden foſſet to it. The reſult of the experiment was, that near two gallons of *Air*, which received no noxious fumes from the receiver; yet being breathed to and fro for two minutes and an half, became thereby unfit for reſpiration. Stat. Eſſ. Vol. 2. p. 319, 320. See alſo Phil. Tranſ. N°. 463.

Hence it is no wonder that the *Air* ſhould be infected, and apt to breed diſtempers in cloſe priſons; where not only the breath, but alſo the plentiful perſpiration of many confined together, ſtench the *Air*, and make it apt to breed what are called goal-diſtempers. This inconvenience might in a good meaſure be prevented, if goals were ſo contrived as to have a free paſſage for the wind to blow thro' them, and thereby communicate freſh *Air*; for want of which many unhappy perſons are deprived of life.

It has been found that *Air* which paſſed thro' cloths dipped in vinegar, could be breathed to and fro as long again, as the like quantity of *Air*, which was not thus purified; ſo that the ſprinkling the decks of ſhips with vinegar may refreſh the *Air*: and this is confirmed by experience. See *Hales*, Stat. Eſſ. Vol. 2. p. 321.

But where the ſtench and corruption of the *Air* is great, vinegar can be but of little benefit, and that only for a ſhort time; and nothing but a thorough ventilating the *Air*, can be an effectual cure. See VENTILATOR.

Air which has been breathed becomes moiſt, as is commonly known; and according to Mr. Hales's computation, the additional moiſture, to about two gallons of dry *Air*, by breathing it to and fro for two minutes and an half, is not one tenth of its weight. Now this additional moiſture in the *Air*, does not ſeem alone ſufficient to diſqualify it for reſpiration; for common *Air* has frequently one third, and ſometimes one half of its weight, of moiſture in it. And therefore, *Air* that has been breathed, is not diſqualified merely by additional moiſture; but by ſome bad quality in that moiſture. Mr. Hales ſuſpects among others, the groſſneſs of the exhalations from the lungs, which may hinder their free entrance into the minute veſicles. V. Stat. Eſſ. Vol. 2. p. 323, 324.

The effect of the *Air* in chemical ſolutions, is very different in different inſtances; if copper filings be put into a ſmall quantity of ſal armoniac, and two veſſels thus prepared, be one of them ſet in the exhauſted receiver of an *Air*-pump, and the other in the free *Air*; that in *vacuo* will be found not to be at all altered, in the ſame time in which that in the open *Air* is become of a fine blue. Hence the free acceſs of external *Air* certainly promotes ſolution in ſome caſes, where it ſeems to act by encreaſing the action of the menſtruum. But if another experiment be made, by pouring two ounces of diſtilled vinegar upon two drams of whole crabs eyes in the exhauſted receiver, and at the ſame time in another veſſel in the open *Air*; the ebullition is more violent in *vacuo* than in the open *Air*, and the gage of the *Air*-pump ſinks, and ſhews that *Air* has been generated in the conflict, as before-mentioned. And ſome of theſe mixtures produce *Air* in ſuch quantities and with ſuch violence, as to throw off the receiver of the *Air*-pump. V. *Shaw*, Chem. Lectures, p. 50.

Some philoſophers have ſuſpected that the *Air* may become impregnated with lapideſcent ſalts. Vid. Phil. Tranſ. N°. 481. p. 326.

We read of a man dead in appearance, but recovered by diſtending his lungs with *Air*; this was done by blowing into his mouth, and ſtopping his noſtrils. See the caſe in Medic. Eſſ. Edinb. Vol. 5. Art. 55. or the abridgm. Vol. 2. p. 399, and alſo p. 240. of Vol. 1.

Air refracts the rays of light, like other fluids, and tranſparent bodies; and according to Mr. Haukſbee's experiments and computations, the line of incidence in *vacuo*, is to the line of refraction into common *Air*, as 1000000 to 999736. *Hauksb.* Phyſ. Mech. Exp. p. 225. *Smith*'s Optics in the Rem. Art. 410. See REFRACTION.

This refractive power of the *Air*, its trembling motion, and that of the interſperſed vapours, are the cauſe of the twinkling of ſtars. See STAR.

AIR *inflammable.* See the article DAMPS.

AIR-BLADDER, a kind of veſicula found in the bodies of fiſhes, by means whereof they are enabled to ſubſtain themſelves in any depth of water, and either to riſe or ſink therein at pleaſure.

The *Air-bladder* is the ſame with what is otherwiſe called the *ſwim* or *ſwimming-bladder.*

The diſcovery of the uſe of the *Air-bladder* took its riſe from reflecting, that a bubble of air in riſing from the bottom of a fluid continually dilates till it reaches the top, by reaſon of the continual diminution of the weight, or preſſure of the incumbent water. For the air in the bladder, is like the bubble,

bubble, more or leſs compreſſed according to the depth the fiſh ſwims at, and takes up more or leſs ſpace; and conſequently the body of the fiſh, part of whoſe bulk this bladder is, is greater or leſs according to the ſeveral depths, tho' it retains the ſame weight. The rule of hydroſtatics is, that a body heavier than ſo much water, as is equal in quantity to the bulk of it, will ſink; a body lighter, will ſwim: a body of equal weight will reſt in any part of the water. By which rule if the fiſh in the middle region of the water, be of equal weight with an equal bulk of the water, the fiſh will reſt there, without any tendency either upwards or downwards; and if the fiſh be deeper in the water, its bulk becoming leſs by the compreſſion of the bladder, and yet retaining the ſame weight, it will ſink and reſt at the bottom: on the other ſide, if the fiſh be higher than the middle region, the air dilating itſelf, and the bulk of the fiſh conſequently increaſing, without any increaſe of the weight, the fiſh will riſe and reſt at the top of the water.

Perhaps the fiſh by ſome action can emit air out of the bladder, and afterwards out of its body; and alſo when there is not enough, take in more air, and convey it to this bladder; in which caſe it will be no wonder, that there ſhould be always a fit proportion of air in the bodies of all fiſhes, to ſerve their uſe according to the depth of water they live in: perhaps alſo by ſome muſcle, the fiſh can contract this bladder beyond the preſſure of the weight of water; and perhaps it can by its ſides, or ſome other defence, keep off the preſſure of the water, and give the air leave to dilate itſelf. In theſe caſes, the fiſh will be helped in all intermediate diſtances, and may riſe or ſink from any region without moving a fin. Phil. Tranſ. N°. 114. p. 310.

If the *Air-bladder* of a fiſh be pricked or broken, the fiſh preſently ſinks to the bottom, unable either to ſupport or raiſe itſelf up again. Flat fiſhes, as ſoles, plaiſe, *&c.* which always lie groveling at the bottom, having no *Air-bladder*.

In moſt fiſhes there is a manifeſt channel, leading from the gullet, or upper orifice of the ſtomach to the *Air-bladder*, which doubtleſs ſerves for conveying air into it. In a ſturgeon Mr. Willughby obſerved, that upon preſſing the bladder, the ſtomach preſently ſwelled; ſo in that fiſh it ſeems the air paſſes freely both ways. Poſſibly the fiſh while alive may have a power to raiſe up this valve, and let out air on occaſion.

All the cartilaginous kind want *Air-bladders:* by what means it is they aſcend and deſcend in water, is yet unknown. The cetaceous kind, or ſea beaſts, are alſo without the *Air-bladder:* indeed, as theſe differ in little from quadrupeds, but the want of feet; the air which they receive into their lungs in inſpiration, may ſerve to render their bodies equiponderant to water; and the conſtriction or dilatation of it, by the help of the diaphragm, and muſcles of reſpiration, may poſſibly aſſiſt them to aſcend, or deſcend in the water, by a light impulſe thereof with their fins[a]. Moſt of the eel kind have bladders, yet they can hardly raiſe themſelves in the water, by reaſon of the length and weight of their tails: the *Air-bladder* being near their heads, may help them to lift up their heads and fore part[b].—[[a] *Ray*, Wiſd. of God in Creat. P. 1. p. 26. [b] Phil. Tranſ. N°. 115. p. 349. ſeq.]

There is great diverſity in *Air-bladders*, in reſpect of figure, ſubſtance, ſituation, and connexion, in different fiſhes.

In ſome, the *Air-bladder* is divided into two, *e. gr.* in carps; and in others, into three. Needham maintains, that all fiſhes which have teeth in their jaws, have only a ſingle *Air-bladder*; whereas thoſe without teeth have a double one, or which amounts to the ſame, the *Air-bladder* of theſe laſt is divided into two cells. Sig. Redi refutes this diſtinction; giving inſtances of fiſhes with teeth, whoſe *Air-bladder* is double; and of others without teeth, who have only a ſingle *Air-bladder*. V. Nouv. Rep. Lett. T. 43. p. 282. ſeq.

The water ſnake in lieu of a bladder, has a large membranous air-bag on its back, which it empties and fills with air at pleaſure, by an apperture, which it can ſhut very cloſe, from without inwards, by means of a ſort of valve, ſo that the leaſt globule of water cannot enter without its conſent. By this artifice it can enlarge or leſſen the bulk of its body, and inhabit all depths of the water[c]. Tho' a conjecture has been advanced by Mr. Ray, that it is by the help of water which they take in, and let out, by two holes in the lower part of their abdomen, near to the ventricle. They ſink in the water, by letting in ſome of it, at theſe holes; the orifices whereof are opened and ſhut at pleaſure, by means of proper muſcles. The water being thus received into the cavity of their abdomen, by which they preponderate the water, and deſcend. When they would aſcend again, a compreſſion is made by the muſcles of their abdomen, and the water forced out again, at leaſt ſo much as ſuffices to give the degree of levity wanted[d].—[[c] V. Jour. des Scav. T. 22. p. 264. [d] *Ray*, Wiſd. of God. P. 2. p. 346.]

AIR-GUN. See WIND-GUN.

AIR-SHAFTS, among miners, denote holes or ſhafts let down from the day to meet the adits, and furniſh freſh air.

The damps, want and impurity of air, which occur when adits are wrought 30 or 40 fathom long, make it neceſſary to let down *Air-Shafts*, in order to give the air liberty to play thro' the whole work, and thus diſcharge bad vapours, and furniſh good air for reſpiration: the expence of which ſhafts in regard of their vaſt depths, hardneſs of the rock, drawing of water, *&c.* ſometimes equals, nay exceeds the ordinary charge of the whole adit.

Sir Robert Murray deſcribes a method, uſed in the coal mines at Liege, of working mines, without *Air-ſhafts*. Phil. Tranſ. N°. 5.

When the miners at Mendip have ſunk a groove, they will not be at the charge of an *Air-ſhaft*, till they come at ore; and for the ſupply of air have boxes of elm exactly cloſed, of about ſix inches in the clear, by which they carry it down above twenty fathom. They cut a trench at a little diſtance from the top of the groove, covering it with turf and rods diſpoſed to receive the pipe, which they contrive to come in ſide-ways to their groove, four feet from the top; which carries down the air to a great depth. When they come at ore, and need an *Air-ſhaft*, they ſink it four or five fathom diſtant, according to the convenience of the breadth, and of the ſame faſhion with the groove, to draw as well ore as air. Phil. Tranſ. N°. 39. p. 769.

AIR-THREADS *of ſpiders*. See AIR-THREADS.

AIR-VESSELS in plants, are certain canals, or ducts, whereby a kind of reſpiration is effected in vegetable bodies. See PLANT, RESPIRATION, *&c.*

Air-Veſſels ſtand diſtinguiſhed from ſap-veſſels; the former anſwering to the trachea, and lungs of animals, the latter to their lacteals, and blood-veſſels.

Dr. Grew has an inquiry into the motion and cauſe of the air in vegetables; wherein he ſhews that it enters them various ways, not only by the trunk, leaves, and other parts above ground, but at the root. For the reception, as well as expulſion of air, the pores are ſo very large in the trunks of ſome plants, as in the better ſort of thick walking canes, that they are viſible to a good eye without a glaſs; but with a glaſs, the cane ſeems as if it were ſtuck full of large pinholes; reſembling the pores of the ſkin in the ends of the fingers, and ball of the hand. In the leaves of the pine, thro' a glaſs they make an elegant ſhow; ſtanding almoſt exactly in rank and file, throughout the length of the leaves.

But tho' the air enters in part at the trunk and other parts, eſpecially in ſome plants; yet its chief admiſſion is at the root: much as in animals, ſome parts of the air may continually paſs into the body and blood by the pores of the ſkin; but the chief draught is at the mouth. If the chief entrance of the air were at the trunk; before it could be mixed with the ſap in the root, it muſt deſcend; and ſo move not only contrary to its own nature, but in a contrary courſe to the ſap: whereas by its reception at the root, and its tranſition from thence, it has a more natural and eaſy motion of aſcent.

The ſame is farther argued, from the fineneſs and ſmallneſs of the diametral apertures in the trunk, in compariſon of thoſe in the root; which nature has plainly deſigned for the ſeparation of the air from the ſap, after they are both together received thereinto. *Grew*, Anat. of Root. c. 3. p. 127.

Air-Veſſels are found in the leaves of all plants, and are even diſcoverable in many without the help of glaſſes: for upon breaking the ſtalk, or chief fibres of a leaf; the likeneſs of a fine woolly ſubſtance, or rather of curious ſmall cob-webs, may be ſeen to hang at both the broken ends. This is taken notice of only in ſome few plants, as in ſcabious, where it is more viſible: but may alſo be ſeen more or leſs in moſt others, if the leaves be very tenderly broken. This wool is really a ſkein of *Air-veſſels*, or rather of the fibres of the *Air-veſſels*, looſed from their ſpiral poſition, and ſo drawn drawn out in length. Id. ibid. c. 4. p. 155.

That air is inſpired by vegetables, has been fully proved by Mr. Hales, in his ſtatical eſſays; and he has in many inſtances ſhewn, that air freely enters the veſſels of trees, and that it is in great abundance wrought into their ſubſtance. But as to particular *Air-veſſels* in plants, he ſeems to ſpeak doubtfully; he ſays by way of queſtion, may not the uſe of thoſe ſpiral wreaths, that are coiled round the inſides of thoſe veſſels, which are ſuppoſed to be *Air-veſſels*, and which are manifeſtly to be ſeen in ſeveral trees; as alſo in the leaves of the vine and ſcabious, may not theſe be deſigned by nature to promote the quicker aſcent of *Air*, by being in ſome meaſure conformed to its elaſtic contortions? For ſuch ſpiral wreaths ſeem to be altogether uſeleſs, for promoting the aſcent of any liquor, as the ſap, which aſcends moſt freely thro' innumerable other capillary veſſels, having no ſuch ſpiral coils in them. Not that we are to ſuppoſe the air in its elaſtic ſtate actually to touch, and thereby to be determined in the courſe of theſe ſpirals, as any liquor would be. But as the rays of light, when they are reflected from a ſolid body, are found to be reflected, without actually touching the reflecting body in the point of reflection; ſo it is not unreaſonable to ſuppoſe, that elaſtic air may, like light, be diverted from one courſe, and ſo be determined to another, by the ſolid bodies it approaches without touching them, but rebounding like light from thoſe ſolid bodies near the point of contact.

Mr. Hales has obſerved, that theſe ſpirals are coiled in a courſe oppoſite to the courſe of the ſun, that is, from Weſt to Eaſt. V. Static. Eſſ. Vol. 2. p. 265, 266.

AIRANI, in church-hiſtory, an obſcure ſect of Arians, in the fourth century, who denied the conſubſtantiality of the Holy Ghoſt with the Father and the Son.

They are otherwiſe called *Airaniſtæ*, and are ſaid to have taken their name from one *Airas*, who diſtinguiſhed himſelf at the head of this party, in the reigns of Valentinian and Gratian. V. *Prateol.* Elench. Hæreſ. l. 1. n. 21.

AIRING, in the general ſenſe of taking, or going into the freſh air, is too well known to need any explanation.

The word is particularly uſed for exerciſing horſes in the open air; which is of the greateſt advantage to theſe animals. It purifies the blood, purges the body from groſs humours, and enures the creature to fatigue, ſo as not to be hurt by it, when much greater than on theſe occaſions; and it teaches him, as the jockies expreſs it, how to make his wind rake equally, and keep time with the other motions of his body. It alſo ſharpens the ſtomach, and keeps the creature hungry; which is a thing of great conſequence, as hunters and racers are very apt to have their ſtomach fall off, either from want of exerciſe, or from the too violent exerciſe which they are often expoſed to.

If the horſe be over fat, it is beſt to air him before ſun-riſe, and after ſun-ſetting; and, in general, it is allowed by all, that nothing is more beneficial to theſe creatures, than early and late *Airings*.

Some of our modern managers, however, diſpute this; they ſay, that the cold of theſe times is too great for the creature, and that if, in particular, he is ſubject to catarrhs, rheums, or the like complaints, the dews and cold fogs, in theſe early and late *Airings*, will be apt to increaſe all thoſe diſorders. Nature, we ſee, alſo points out the ſun beams as of great uſe to theſe animals; thoſe which are kept hardy, and lie out all night, always running to thoſe places where the ſunſhine comes, as ſoon as it appears in a morning.

This ſhould ſeem to recommend thoſe *Airings* that are to be made before ſun-ſet, and a little time after ſun-riſe; and as to the caution, ſo earneſtly inculcated by Markham, of uſing theſe early and late *Airings* for fat horſes, it is found unneceſſary by many; for they ſay, that the ſame effect may be produced by *Airings* at warmer times, provided only that they are made longer; and that, in general, it is from long *Airings* that we are to expect to bring a horſe to a perfect wind, and ſound courage. *Markham*'s Compl. Farrier. *Solleyſel*, Horſeman.

AJUGA, in botany, the name of a genus of plants, according to Linnæus, which are called by Tournefort, and other authors, *bugala*. *Linnæi*, Gen. Plant. p. 263. See BUGALA.

AJURU-CATINGA, in zoology, the name of a Braſilian parrot. It is of the ſize of a pullet, and is all over of a very fine bright green; its eyes are red, and the ſkinny circle about them is white; its beak and legs are alſo white. *Margrave*, Hiſt. Braſil.

AJURU-CURAU, in zoology, the name of a Braſilian ſpecies of parrot, of the ſize and ſhape of the common green parrot, of which there are two kinds. The firſt an extremely beautiful one, with a blue crown; the throat and ſides of the head are of a fine yellow, and all the reſt of the body of a chearful green; the long wing-feathers are half black, and half of a fine ſtrong yellow, and at their ends variegated with blue and green; and the tail edged with red, black, and blue.

The other kind has the ſame colours differently diſpoſed; its head is yellow, with a whitiſh caſt; the throat and ſides of the head about the eyes are of a clearer yellow; and there is a ſea-green ſpot near the head.

Beſide theſe, there is alſo yet another variety, the ſpecies of which have all the colours of the firſt kind, but have an admixture of black about the head, a yellow ſpot on the crown, another of the ſame colour below the eyes, and a blue one under the throat. *Ray*, Ornithol. p. 76.

AJURU-PARA, in zoology, the name of a Braſilian ſpecies of parrot, of a ſmall ſize, all over of a beautiful green, and with white legs, a white beak, and white ſkinny circles round its eyes. *Margrave*, Hiſt. Braſil.

AIZOON, in botany, a name given by ſome authors to houſeleek. *Chabræus*, p. 538.

ALA, (*Cycl.*) in botany, a name given, by the Latin writers of medicine, in the later ages, to the *helenium*, or elecampane. Iſidore, ſpeaking of the aromatic herbs in common uſe in his time, mentions *helenium*, or elecampane, which, he ſays, was vulgarly called *Ala*. The modern Spaniards and Portugueſe call it *Alla*. And Macer gives *Inula* as the true name of the elecampane plant; but ſays, that the common people of his time called it *Ala*, and the phyſicians *helenium*. Pliny mentions a plant called *Alum*; but this was of a very different genus, being, according to his own account, a ſpecies of wild garlic, growing in the fields and under hedges. In another place he gives *Alum*, or *Alus*, as a name uſed by the Romans for the plant called by the Greeks *ſymphytum petræum*, or rock comfrey. It is probable that the two former of theſe plants obtained the names *Ala* and *Alum*, *ab halando*, from ſmelling very ſtrong; the one being uſed for its ſweet ſmell, and the other known by its ſtrong odour. *Pliny*, l. 26.

ALA has ſeveral other different ſignifications. It moſt frequently is uſed to expreſs the hollow of the ſtalk of a plant, which either the leaf, or the pedicle of the leaf, make with it; or it is that hollow turning, or ſinus, placed between the ſtalk, or branch of a plant, and its leaf, from whence a new offſpring is wont to put forth. Sometimes it is taken alſo for a little branch, as when we ſay, a ſtock, or ſtem of a plant is armed with many *Alæ*; becauſe theſe ſmall branches ſtand out from it, in form of ſo many wings.

ALÆ is alſo uſed to ſignify thoſe petals, or leaves of the papilionaceous flowers, placed between thoſe others which are called the *vexillum* and the *carina*, which make the top and bottom of the flower. Inſtances of flowers of this ſtructure are ſeen in the flowers of peas and beans, in which the top leaf, or petal, is the *vexillum*, the bottom the *carina*, and the ſide ones the *Alæ*.

ALÆ is alſo uſed for thoſe extremely ſlender and membranaceous parts of ſome ſeeds, which appear as wings placed on them, as in the *plumeria*, the fruit of the trumpet flower, the fruit of the maple, and the like, which are called by botaniſts *alated* ſeeds.

ALÆ is, finally, uſed alſo for thoſe membranaceous expanſions, which run all the way along the ſtems of ſome plants, which are therefore called *alated* ſtalks. *Miller*'s Gard. Dict.

ALÆ, in anatomy, is ſometimes applied to the armpits, otherwiſe called *axillæ*. Theſe parts abound with glands, and are great receptacles of humours; whence a rank ſmell ſometimes exhales, called *fœtor alarum*. *Caſtel.* Lex. Med.

ALA is alſo applied to the proceſs of the *os ſphenoides*. See SPHENOIDES, *Cycl.*

ALABARCHA, in antiquity, a kind of magiſtrate among the Jews of Alexandria, whom the emperors allowed them to elect, to have the ſuperintendency of their policy, and decide differences and diſputes which aroſe among them.

The origin is much conteſted; ſome derive it from the Hebrew *Hereb*, a mixture, or mob of people, and ſuppoſe it to have been given by the gentiles of Alexandria, in the way of deriſion [a]. Others derive it from *Alaba*, ink; on which footing, *Alabarcha* is ſuppoſed to import a ſecretary, or collector of duties on cattle carried out of the country: or, as others think, an officer like our *agiſtor*, who had the care of the cattle taken to graze in the king's foreſt, and collected the money due for the ſame [b]. Fuller deduces it from the Hebrew or Syriac *Halaph* and *Arcin*, *q. d.* intendant, or delegate of the ſovereign. Rhenferd rather chuſes to fetch it from *Harab*, a rabbin, or doctor of the law, and the Greek, Αρχης, chief. Le Clerc thinks it may come from Αραβος, noiſe, or tumult, as denoting the chief of a noiſy, or tumultuous people, ſuch as the Jews were repreſented to be.—[a Bibl. Anc. Mod. T. 17. p. 112. b *Calv.* Lex. Jur. p. 57. *Pitiſc.* Lex. Ant. T. 1. p. 67.]

Some are not ſatisfied with any of theſe origins: it is certain the dignity of *Alabarch* was pretty common in Egypt, being mentioned by Juvenal [c]; and that the emperors Valens, Gratian, and Theodoſius, ſpeak of certain cuſtoms, or impoſts on ſalt, in Egypt, called *Alabarchia* [d]. It is not improbable therefore, that the word originally ſignified an Egyptian officer, who had the inſpection of the duty on ſalt; and that it was afterwards given, by way of contempt, to the chief, or governor of the Alexandrian Jews [e].—In this view, *Alabarcha* will derive its origin from the Greek, αλς, ſalt, and αρχης, chief.—[c *Juv.* Sat. 1. v. 129. d V. *Pitiſc.* Lex. Ant. T. 1. p. 67. *Calv.* Lex. Jur. p. 57. e *Calmet.* Dict. Bibl. T. 1. p. 84.]

In this ſenſe *Alabarcha* amounts to the ſame with what is otherwiſe called *Arabarcha*, ſometimes *Genarcha*, and ſometimes alſo *Ethnarcha*; though Bacchius thinks, that the *Ethnarch* and *Alabarch* were originally different officers. Giorn. de Letter d'Ital. T. 22. p. 69. See ETHNARCHA, *Cycl.*

Rhenferd has a diſſertation expreſs on the Jewiſh *Alabarcha*, in Op. Philol. diſſ. 14. An extract of it is given in Bibl. Anc. Mod. T. 17. p. 111.

ALABASTER (*Cycl.*)—It is diſputed to what claſs of ſtones *Alabaſter* is to be referred. Agricola ranks it among marbles [a]; to which Hoffman objects [b], on account of the ſoftneſs of *Alabaſter*, which rather ſeems to claim a place for it among earths. Yet Schroeder [c], and ſome others, conſider it as a crude, or imperfect kind of marble.—[a De Nat. Foſſ. l. 7. b Paralip. Offic. c. 72. c Pharmac. l. 3. c. 8.] See ALABASTRITÆ.

The fineneſs and clearneſs of this ſtone, renders it, in ſome meaſure, tranſparent; whence it has been ſometimes alſo employed for windows. There is a church at Florence ſtill illuminated by *Alabaſter* windows; inſtead of panes of glaſs, there are ſlabs of *Alabaſter* near fifteen feet high, each of which forms a ſingle window, through which the light is conveyed. *Monfauc.* Dial. Ital. ap. Nouv. Rep. Lett. T. 28. p. 137.

Naturaliſts alſo mention divers extraordinary kinds of *Alabaſter*, *ſoft*, *yellow*, *variegated*, *Indian*, *Caramanian*, *German* [d], &c. Grew [e] ſpeaks of a *baſtard Alabaſter*, ſpotted, which he calls *Gypſum variegatum*, whereof there are divers ſorts and colours in the repoſitory of the Royal Society. Theſe all make a ſtrong efferveſcence with ſpirit of nitre.

They are found in Burgundy, Miſnia, &c. Of theſe lightly burnt, is made that which is popularly called plaiſter of Paris. —[d *Grew*, Muſ. P. 3. ſec. 1. c. 6. p. 319. *Woodw.* Nat. Hiſt. Engl. Foſſ. T. 1. It. T. 2. p. 6. *Ruland.* Lex. *Ferrant. Imperat.* Hiſt. Nat. l. 24. c. 13. ſeq. e Muſ. Reg. Soc.]

Antient authors ſpeak much of the medicinal virtues of *Alabaſter*, as a diſcutient f. Some recommend it as a ſpecific in a dyſentery g. But modern phyſicians ſcarce allow it in either of thoſe characters. Yet ſome diſpenſatories ſtill retain a preparation of it, under the title of *Unguentum Alabaſtrinum*, preſcribed for the head-ach h.—[f *Nicol.* Lapid. P. 3. c. 66. p. 217. g *Boot.* de Gem. l. 2. c. 270. h *Burgr.* Lex. Med. p. 374. ſeq. *Zuing.* Comp. Medic. p. 553.]

ALABASTER is alſo uſed for a vaſe, wherein odoriferous liquors were antiently put. *Gorr.* Def. Med. p. 19. *Pitiſc.* Lex. Ant. T. 1. p. 67. *Calm.* Dict. Bibl. p. 174. ſeq.

The reaſon of the denomination is, that veſſels for this purpoſe were frequently made of the *Alabaſter* ſtone, which Pliny, and other antients, repreſent as peculiarly proper for this purpoſe.

Several critics will have the box mentioned in the goſpels as made of *Alabaſter*, to have been of glaſs a. And though the texts ſay, that the woman broke it, yet the pieces ſeem miraculouſly to have been united, ſince we are told, the entire box was purchaſed by the emperor Conſtantine, and preſerved as a relick of great price b.—[a *Caſaub.* Exerc. 14. §. 13. p. 244. Jour. des Scav. T. 3. p. 77. It. T. 25. p. 604. Miſc. Lipſ. T. 11. obſ. 228. p. 177. ſeq. *Calm.* Dict. Bibl. p. 174. b *Baron.* An. c. 32. *Suid.* Lex. Miſ. Lipſ. loc. cit.]

Others will have it, that the name *Alabaſter* denotes the form, rather than the matter of this box. In this view they define *Alabaſter*, by a box without a handle, deriving the word from the privative α and λαβη, *anſa*, handle.

ALABASTER is alſo ſaid to have been uſed for an antient liquid meaſure, containing ten ounces of wine, or nine of oil. *Epiphan.* ap. Beverin. de Ponder. & Menſur. p. 115.

In this ſenſe, the *Alabaſter* was equal to half the ſextary.

ALABASTRA, (*Cycl.*) in botany, amount to the ſame with calyx, or flower cup, before it be expanded. What Pliny calls *Alabaſtra*, an antient poet calls *pyramides*. The denominations are taken from the form of the antient ungent veſſels, which the young flower in this ſtate reſembled. *Hardouin.* in Not. ad Plin. loc. cit.

Some, with Jungius, explain *Alabaſtra*, by the globe, or roundiſh bud of the roſe juſt peeping out. *Mill.* Gard. Dict. in voc.

ALABASTRITÆ, *Alabaſters*, in natural hiſtory, the name of a genus of foſſils allied to the marbles, and defined to be ſtones compoſed of large ſeparate concretions, of great brightneſs, and an elegant, but ſhattery ſtructure, not very hard, not giving fire with ſteel, fermenting with and ſoluble in acids, and calcining in a ſlight fire.

Of this genus we have only three known ſpecies.

1. A white, ſhattery, lucid kind, called *Lygdine* marble by the antients. See LYGDINUM *marmor*.

2. A bright, ſhattery, yellowiſh white one, called *Phengites* by the antients. See PHENGITES.

3. A yellow and reddiſh variegated ſhattery kind, which was what they called ſimply *Alabaſter*. See ALABASTER, *Cycl.* and *Suppl.*

The *Alabaſter* of the antients was therefore a very different ſubſtance from what our workmen commonly call by that name, which is any ſpecies of white marble; though ſome of them have alſo called this the oriental alabaſter.

It is a very remarkably bright glittering and pellucid ſtone, of an extremely elegant, but very ſhattery texture, but of a moſt extremely agreeable variety and diſpoſition of colours. Its ground is a fine clear pale yellow, between that of honey and amber, pellucid and bright as the phengites, and of the ſame ſhattery ſtructure. It is beautifully variegated with arched and undulated veins, ſome broader and others narrower, and ſome of a pale reddiſh hue, others whitiſh, and others of a very agreeable pale brown. The whole makes a very elegant ſtone, and though but ſoft and friable, yet is capable of a very fine poliſh. It is found in Egypt at this time, as it was alſo in the times of the antients; but we have alſo great abundance of it in Cornwal, and ſome other parts of England.

The antients called this ſtone alſo *onyx*, and *marmor onychites*, partly from its having its variegations diſpoſed in a ſort of onyx order, and partly from its being uſed like the gem of that name, for making boxes for perfumes, &c. V. *Hill*'s Hiſt. of Foſſ. p. 492.

ALABASTRITES is often uſed as ſynonymous with *Alabaſter*. But Anſalmus Boetius diſtinguiſhes between *Alabaſter* and *Alabaſtrites*, in making the criterion of the former to be ſo ſoft, that it may be cut with a knife; and of the latter, that it is ſo hard that it cannot be ſo cut. *Nicol.* Lapid. P. 3. c. 69. p. 215.

Grew ſpeaks of a ſort of *Alabaſtrites*, repreſenting the tranſverſe ſection of the trunk of a tree. *Grew*, Muſ. Reg. Societ. P. 3. ſec. 1. p. 268.

ALABASTRUM *dendroide*, in natural hiſtory, a name given by authors to a ſpecies of alabaſter, found in great abundance in the province of Hohenſtein, and famous for the elegant delineations of trees, and other figures deſcribed in it. It is a foſſil ſtone, and often is compoſed of laminæ, ſo thin as ſcarce to equal thick paper; theſe eaſily part horizontally from one another, and may be ſeparated in divers thickneſſes. Theſe all ſhew, on both ſides, beautiful landſcapes. The delineations of trees, ſhrubs, and herbs, are all in black. Theſe are moſt elegantly regular, and are ſeen growing on the banks of rivers, on rugged mountains, or from the ruins of old buildings; all which are figured with great elegance. Over theſe there is a repreſentation of clouds, of various forms and figures, and of all the natural colours, black, white, blueiſh, and tinged in ſeveral parts with ſtreaks of fire colour. The colours in theſe very often repreſent all the beauties of the clouds painted by a ſetting ſun. Other pieces frequently repreſent vaſt caverns in the earth, natural caſcades of rivers, and almoſt infinite variety of other natural proſpects, with the ſame regularity and beauty. The colours are principally grey, black, reddiſh, and white. *Ritter.* de Alabaſt.

ALACUOTH, among Arabian phyſicians, an infirmity of the nerves, whereby a perſon in the act of venery, lets go at the ſame time his *fæces*. *Aviſen.* ap. Caſtel. Lex. Med. p. 27.

ALADINISTS, a ſect among the Arabs, anſwering to free-thinkers among us.

The *Aladiniſts* multiplied greatly under the two learned kings Almanſor and Miramolinus. *Naud.* Arcan. Stat. c. 4. p. 372.

ALALCOMENIUS, in antient chronology, the Bæotian name for the Athenian month *Mæmacterion*, which was the fourth of their year, and anſwered to the latter part of our September and beginning of October. See the articles MÆMACTERION and MONTH.

ALAMANNICUM, in antiquity, a tribute impoſed on the people by the emperor Alexias Angelus, for raiſing the ſum of ſixteen talents of gold, to be paid the *Alamanni*, as the conditions of a peace ſtipulated with them. *Du Cange*, Gloſſ. Græc. T. 1. p. 48.

The eccleſiaſtics themſelves were not exempted from this tax. *Nicet.* in Alex. l. 1. n. 8.

ALAMODALITY, *Alamodalitas*, is defined, by a late writer, a ſtudy, or endeavour to accommodate a man's ſelf in point of behaviour, dreſs, converſation, and other actions of life, to the reigning taſte of cuſtom, from a motive of complaiſance, and to avoid the imputation of ill-breeding.

ALAMODALITY *of writing*, *Alamodalitas ſcribendi*, is defined, by the ſame perſon, a particular ſtudy, or endeavour of learned men to adapt the productions of their minds, both as to the choice of ſubject, and the manner of treating it, to the genius or taſte of the times, in order to render them more acceptable to the readers.

A German writer, under the name of Geamoenus a, has a diſſertation expreſs on *Alamodality* in writing, which he even maintains to be, in ſome meaſure, *jure divino*, from a precept of St. Paul b, which, according to ſome good MSS. and learned commentators, is to be read, *ſerving the time*, Τω καιρω δουλευοντες; though the Engliſh tranſlators follow another reading, and for καιρω, ſubſtitute Κυριω, *the Lord*. This writer enlarges on the neceſſity of conforming to the taſte of the time, and traces the different taſtes and faſhions of writing, which have had their turn in Germany, from Luther to the preſent time, viz. the Polemic, the Aſcetic, the Satyric, the Romantic, the Moral, the Hiſtorical, and the Philological, which have each had their age, or period.—The ſame diverſity he obſerves to have prevailed in the manner of writing, preaching, &c. Luther's time he calls the Heroic age, which was ſucceeded by the Synthetic, or Schematic, and that by the Laconic, or Sententious, which he calls the Engliſh method. The laſt was the age of Journals, or periodical pieces, the preſent may be called the Dictionary age.—[a *Geamoeni*, de Alamodalitate Scribendi, ap. Miſc. Lipſ. T. 5. obſ. 99. An extract of it is given in Jour. des Scav. T. 65. p. 6. ſeq. b Rom. *c.* 12. *v.* 11.]

A LA MODE, (*Cycl.*) a phraſe originally French, importing a thing to be in the faſhion, or mode.

The phraſe has been adopted not only into ſeveral of the living languages, as the Engliſh and High-Dutch, but ſome have even taken it into the Latin. Hence we meet with *Alamodicus* and *Alamodalitas*. A learned German a has a ſerious enquiry whether it be lawful to dance *Alamodicé*, by which he means French dancing. Zach. Grapius has a diſſertation expreſs on *Alamodic*, or artificial ſermons b.—[a Nov. Liter. Lubec. 1705. p. 3. b Roſtoc. 1704. An extract is given in Nov. Liter. Lub. 1704. p. 261. ſeq.]

Writers on cookery give the preparation of *Alamode*, or larded beef. *Collins*, Salt and Fiſh. p. 132.

ALANFUTA, in the Arabian phyſic, the name given to a vein between the chin and under lip, antiently uſed to be opened

againſt a ſtinking breath. *Avicen.* ap. Caſt. Lex. Med. p. 27.

ALAPOULI, in natural hiſtory, the name of an Eaſt-Indian tree, a ſpecies of the bilimbi, which is uſed in medicine as a purge and vomit, mixt with the ſeeds of muſtard. *Bout.* Med. Ind.

ALAQUECA, a medicinal ſtone brought from the Indies, in ſmall gloſſy fragments; much praiſed by ſome for its efficacy in ſtopping hæmorrhages, when applied externally. *Lemer.* Dict. des Drog. in voc. and *Boyle's* Works Abr. Vol. 1. p. 79.

ALARAF, in the Mahometan theology, the partition wall that ſeparates heaven from hell.

The word is plural, and properly written *Al Araf*; in the ſingular it is written *Al Arf*. It is derived from the Arabic verb *Arafa*, to diſtinguiſh. *Sale*, Prelim. Diſc. to Koran. Sect. 4. p. 94.

Al Araf gives the denomination to the ſeventh chapter of the alcoran, wherein mention is made of this wall; Mahomet ſeems to have copied his *Al Araf*, either from the great gulf of ſeparation mentioned in the new teſtament, or from the Jewiſh writers, who alſo ſpeak of a thin wall dividing heaven from hell.

Mahometan writers differ extreamly, as to the perſons who are to be found on *Al Araf*. Some take it for a ſort of Limbus for the patriarchs, prophets, *&c.* others place here ſuch whoſe good and evil works ſo exactly balance each other, that they neither deſerve reward nor puniſhment. Others imagine this intermediate ſpace poſſeſſed by thoſe, who going to war without their parents leave, and ſuffering martyrdom there, are excluded paradiſe for their diſobedience, yet eſcape hell becauſe they are martyrs. Id. ibid. p. 95.

ALARM (*Cycl.*)—*Alarms* are either true, that is, founded on juſt notice, or falſe.

Falſe ALARMS are frequently given by an enemy, either to fatigue the other's army, or by way of diverſion; to keep themſelves ſafe and quiet from attacks. To remedy the inconveniences of formal *Alarms*, and prevent the horror, and confuſion of trumpets, and noiſe of warlike cries, the captains uſually give the *Alarm*, by ſilent advice, without noiſe. *Cruſ.* Milit. Inſtruc. for Cavalr. P. 3. c. 8.

Falſe Alarms are ſometimes occaſioned by fearful or negligent centinels; and ſometimes deſignedly by diligent officers, to try the diſpoſition and readineſs of the guards. In war the piquet guard has been often called out haſtily, by way of trial, what might be expected from them, in caſe of real danger. *Guill.* Gent. Dict.

Falſe Alarms have been ſometimes, for reaſons of ſtate, propagated deſignedly through a whole nation; ſuch was the *Alarm* of the Iriſh invaſion in 1688, which in one night ſpread thro' the whole iſland: ſuch alſo was that of the Moreſcoes in Spain, which in one day run thro' that vaſt kingdom, tho' founded on nothing: one city or town gave the *Alarm* to another, all were deceived and deceivers in their turn. *Gedd.* Miſcell. Tract. T. 1. p. 155.

The *Alarm*-place, in a camp, garriſon, or the like, is alſo called the *Rendezvous*. V. *Cruſ.* Milit. Inſtruct. Caval. P. 3. c. 5. p. 32. See RENDEZVOUS, *Cycl.*

ALARM, in fencing, denotes a ſtep, or ſtamp made on the ground with the advancing foot.

This coincides with what is otherwiſe called an appel, or challenge.

In practice, the *Alarm* is frequently diſadvantageous, as it retards the motion of the feint, and gives the adverſary a better opportunity to parry it. When only a ſlow feint is intended to ſift, and try the adverſary how it will take with him, the motion of the ſword hand, may in this caſe, be attended with the appel, or *Alarm* of the advanced foot; but for a feint, where execution is really intended to follow, the *Alarm* is beſt let alone. *Hope*, New Meth. of Fenc. c. 4. p. 102.

ALARM is alſo uſed for an inſtrument to awaken perſons at a certain hour: one very ſimple contrivance of this kind, is that uſed by weavers. See WEAVER'S *Alarm*.

ALARM-*Bell*, that which is rung to call the people together on ſome ſuch occaſion as a fire, mutiny, or the appearance of an enemy. This is what the French call *Toeſin*.

ALASCANI, in church hiſtory, a ſect of Antilutherans, whoſe diſtinguiſhing tenet, beſides their denying baptiſm, is ſaid to have been this, that the words, *This is my body*, in the inſtitution of the euchariſt, are not to be underſtood of the bread, but of the whole action, or celebration of the ſupper.

They are ſaid to have taken the name from one Joannes a Laſco, a Poliſh baron, ſuperintendent of the church of that country, in in England. *Prateol.* Elench. Hæret. l. 1. p. 28.

ALASTROB, among alchemiſts, denotes lead [a]; tho' ſome will have it to ſignify calx [b].—[[a] *Rul.* Lex. Alch. p. 25. [b] *Johnſ.* Lex. Chem. p. 12.]

ALATED quadrupeds. See the article QUADRUPED.

ALATERNUS, in botany, the name of a genus of trees, the characters of which are theſe. The flower conſiſts only of one leaf, and is of a funnel like ſhape, divided into four ſegments, and of a ſort of ſtellar form; from the bottom of this flower there ariſes a piſtil, which finally becomes a fruit or berry, uſually containing three ſeeds, which are gibboſe on one ſide, and angular on the other.

The ſpecies of *Alaternus* enumerated by Mr. Tournefort are theſe. 1. The common tall *Alaternus*. 2. The *Alaternus* with ſmaller leaves. 3. The golden *Alaternus*, or *Alaternus* with leaves variegated with a bright yellow. 4. The ſilvery *Alaternus*, or *Alaternus* with leaves variegated with white. 5. The Montpelier *Alaternus*, with deeply divided leaves. 6. The ſmall box-leaved *Alaternus*. 7. The broad leaved Spaniſh *Alaternus*. 8. The thorny box-leaved American *Alaternus*. *Tournef.* Inſt. p. 595.

ALAUDA, in zoology, the name of a genus of birds, called in Engliſh larks, and diſtinguiſhed from others of the ſlender beaked ſmall birds, by having the claw of their hinder toe of a very remarkable length, and by ſinging very ſweetly as they fly to vaſt heights in the air. We have in England, four ſpecies of this bird.

1. The common *Lark*. 2. The wood *Lark*. 3. The tit-*Lark*. And 4. The ſmall creſted *Lark*. And beſide theſe there are ſeveral exotic ſpecies of birds, properly reducible to this genus as the *Locuſtella*, *Calandra*, *Spipola*, *Spipoletta*. See LOCUSTELLA, *&c.*

The common lark is well known, and not leſs eſteemed for its delicacy at table, than for its ſinging. It is very fat in winter, and taken in prodigious numbers; it builds on the ground, and lays four or five eggs.

The wood lark is ſmaller than the common lark, and is ſhorter bodied; it generally flies in large flocks, and as it is in the air ſings with a voice more like that of the blackbird, than of the common lark. It has a circle of white feathers like a crown, reaching from one eye to the other acroſs the head; the tip of its tail is white; and it ſits on trees. Theſe are its diſtinctions from the common lark.

The tit-lark is called by authors the *Alauda pratorum:* this ſits upon trees like the wood lark, is ſmaller than the common lark, and has more of a duſky greeniſh hue, and is leſs beautiful in its colour than the common lark. It is thought that we have in England, beſide the common ſpecies of tit-lark, another kind, which differs from the common kind, in that it is larger, has leſs greenneſs in its colouring, has paler coloured feet and ſhorter heels.

The laſt or creſted lark, is the *Alauda criſtata minor* of authors: this is like the large foreign creſted larks, but is much ſmaller; its creſt is very long in proportion to its ſize, and its feet are red. It is all over of a pale brown colour, and is ſeen in flocks in the northern parts of England. *Ray*, Ornithol. p. 149—152. See LARK.

In the Linnæan ſyſtem of zoology, the *Alauda*, or lark, makes a diſtinct genus of birds, of the order of the *Paſſeres*: the characters of which are, that the tongue has a rim or margin round it, and is membranaceous and pointed; the beak is ſtrait and pointed; the maxillæ equal in ſize; and the claw of the hinder toe is longer than any of the other toes. *Linnæus*, Syſtem. Nat. p. 49.

ALAUDA *non criſtata*, a name by which ſome of the authors in ichthyography have called the *Galletto*, commonly called in Engliſh the bullard. *Rondelet*, De Piſc.

ALAUDA *marina*, the ſea lark, in zoology, a name by which French authors uſually call the bird, known in Engliſh by the name of the ſtint. See STINT.

ALB (*Cycl.*)—*Albs* were not only worn by prieſts, but even by laymen living in monaſteries. *Du Cange*, Gloſſ. Lat. in voc. *Alba*.

The *Alb* is otherwiſe called *Camiſia Poderis Talaris*, and *Subucula*.—In the Roman order it is denominated *Linea dalmatica*.

The ſacerdotal *Albs* were ſometimes variouſly enriched with embroidery, *&c.*

Paſchal ALB, *Alba Paſchalis*, that wherein the biſhop antiently appeared during the ſolemnities of Eaſter, and even of other holy days. Id. Ibid.

ALB is alſo uſed for the white garment, worn in the antient church by thoſe newly baptized, as a mark of the innocence and purity which they profeſſed. *Du Cange*, in voc.

The wearing a garment of this colour was to denote their having paſſed out of darkneſs into light; the catechumens were plunged naked into the font, and at their emerging were habited in *Albs* at the expence of the church. Theſe they wore for eight days, during which time they were called *Albati*, and *in Albis poſiti*.—The laying down the *Alb* on the eighth day, was performed with ſome ceremony. *Clem. Alexand.* Pædag. l. 1. c. 6.

ALBS, *Albæ*, is ſometimes uſed in eccleſiaſtical writers for what we call Eaſter-week.

It takes the name hence, that the antient Neophytes, baptized on Eaſter-day, wore *Albs* this week; the Sunday enſuing is ſtill called in divers liturgies, *Dominica in Albis*.

The diſtribution of *Agnus Dei*'s is performed with great ceremony on the Sunday in *Albis*. *Du Pin*, Bibl. Eccleſ. T. 18. p. 68. ſeq. See AGNUS *Dei*.

ALB is alſo uſed to denote a Turkiſh coin, otherwiſe called *Aſper*. *Bobov.* on Turk. Liturg. Sect. 3. p. 123. *Hyde*, Not. ad Eund. See ASPER, *Cycl.*

ALBA *Terra*, among alchemiſts, denotes the philoſopher's ſtone, compounded of mercury and ſulphur. Theat. Chem. T. 4. p. 721, 727. ſeq. ap. *Caſt.* Lex. Med. p. 28.

ALBAHURIM, in the Arabian aſtrology, a figure of ſixteen ſides, anſwering to the moons courſe, from the beginning of a diſeaſe to its end. *Vital.* Lex. Math. p. 16. ſeq.

This is otherwiſe called by Latin writers, *Figura ſexdecim Laterum*.

The *Albahurim* is a matter of capital conſideration among the aſtrological phyſicians, who, on this, ground their critical

tical days; particular attention it ſeems is to be had to the ſtate of the patient on thoſe days, when the moon is in the angles of the *Albahurim*: from theſe chiefly are their prognoſticks taken. *Vital.* Lex. p. 16. and p. 188.

ALBANENSES. (See ALBIGENSES, *Cycl.*)—Some will have theſe to have been the ſame ſect, others different; but they who are for the diverſity attribute the ſame opinions to both: only making the *Albanenſes* to have been prior in reſpect of time, as having been found towards the cloſe of the VIIIth century, whereas the *Albigenſes* appeared not till the XIIth century. *Prateol.* Elench. l. 1. Tit. 22. p. 17. ſeq. *Du Cange*, Gloſſ. Lat. T. 1. p. 122. ſeq.

ALBANI, in middle aged writers, denotes ſtrangers or foreigners; anſwering to what we call aliens. *Du Cange*, Gloſſ. Lat. T. 1. p. 123. ſeq.

The origin of the word is deduced by Walafrid Strabo [a], from the Scotiſh nation, which was antiently called by the name *Albani*; and being ſuch determined ramblers into other countries, the word became an appellative: ſo that an Alban and a foreigner became ſynonymous terms. And hence alſo ſome, not improbably, derive the French *Aubain* [b].—[a In Vit. S. Gal. l. 2. c. 47. b *Trev.* Dict. Univ. T. 1. p. 256.]

ALBANI, in antiquity, a college of *Salii* or prieſts of Mars, inſtituted by Tarquin, and denominated from mount *Albanus*, the place of their reſidence. V. Ouvr. des Scav. Jan. 1709. p. 27.

ALBANUM, among chemiſts, denotes ſalt of urine. *Rul.* Lex. Alch. p. 25.

ALBARA or ALBORA, among phyſicians, a mixt ſpecies of malignant itch, compounded of the morphew, ſerpigo, and lepra. *Paracelſ.* de Ulcer. c. 42. ap. *Caſt.* Lex. Med. p. 28.

The *Albora* partakes moſt of the nature of the leproſy; ſome make it the ſame with the leuce, vitiligo, or morphew. *Walth.* Sylv. Med. p. 1059.

ALBARDEOLA, in zoology, a name given by many authors to the platea, or ſpoon-bill; a bird approaching to the nature of the heron. See PLATEA.

ALBARII, in antiquity, properly denoted thoſe who gave the whitening to earthen veſſels, *&c.* In which ſenſe they ſtood contradiſtinguiſhed from *dealbatores*, who whitened walls. *Baxt.* Gloſſ. p. 76.

ALBARIUM *Opus*, in the antient building, the incruſtation or covering of the roofs of houſes with white plaiſter, made of mere lime.

This is otherwiſe called *opus album.* It differs from *tectorium*, which is a common name given to all roofing or ceiling, including even that formed of lime and ſand, or even lime and marble; whereas *Albarium* was reſtrained to that made of lime alone. *Pitiſc.* and *Du Cange*, in voc.

ALBATI *Equi*, in antiquity, was a denomination given to thoſe horſes in the games of the *Circus*, which were diſtinguiſhed by white cloths or furniture. *Aquin.* Lex. Milit. T. 1. p. 37.

In which ſenſe, *Albati* ſtands contradiſtinguiſhed from *Ruſſati*, *Praſini*, and *Veneti*.

Several authors have miſtakenly ſuppoſed that *Albati* referred to the colour of the horſes; whereas in reality *Equi Albati*, might be of black, brown, or other colour.

ALBELEN, in zoology, the name of a fiſh of the truttaceous kind called alſo *Albula*, and much reſembling the *Ferra*. It is caught in the German and other lakes, and is found from five or ſix to twelve pound weight, but that more rarely. Its colour is a fine ſilvery white, whence it has its name, but it is a little way on the back browniſh and duſky. The head is ſmall; the mouth of a moderate ſize, and without teeth; the eyes are moderately large, and ſilver coloured; the belly, from the firſt to the ſecond pair of fins, is flatted a little, not running to an edge; the ſides are divided by a dotted line running from the head to the tail, and nearer the back than the belly. It is a fine firm and well taſted fiſh. *Willughby*'s Hiſt. Piſc. p. 184.

ALBELLUS. See the article MERGUS.

ALBERTISTS, a ſect of ſcholaſtics denominated from their leader *Albertus Magnus*. *Thomas* Introd. Phil. Aul. c. 1. §. 64. *Reinhard.* Hiſt. Philoſ. p. 132.

ALBESIA, a kind of ſhield uſed by the antient *Albenſes*, a nation of the Marſi. *Feſt.* in voc.

Theſe were otherwiſe called *Decumana*, as being very large; reſembling the *fluctus Decumani*.

ALBICILLA, in natural hiſtory, a name given by ſome authors to that ſpecies of eagle commonly called *Pyrargus*, from the whiteneſs of part of its tail. *Willughby*'s, Ornithol. p. 31.

ALBIGENSES (*Cycl.*)—This ſect had their name, it is ſuppoſed, either by reaſon there were great numbers of them in the dioceſe of Albi, or becauſe they were condemned by a council held in that city. In effect it does not appear that they were known by this name, before the holding of that council. *Limborch*, Hiſt. Inquiſ. l. 1. c. 8. Bibl. Univ. T. 23. p. 372. It. T. 20. p. 202.

The *Albigenſes* were alſo called *Albiani*, *Albigeſei*, *Albii*, and *Albanenſes*, tho' ſome diſtinguiſh theſe laſt from them. *Thomaſ.* Hiſt. Sapient. & Stult. p. 46. See ALBANENSES.

Other names given to them are, Henricians, Abelardiſts, Bulgarians, *&c.* ſome on account of the qualities they aſſumed; others on that of the country, from whence it is pretended they were derived; and others on account of perſons of note, who adopted their cauſe, as Peter de Brius, Arnold de Breſſe, Abelard, Henry, *&c.* Berengarius, if not Wickliff himſelf, is by ſome ranked in the number. Jour. des Scav. T. 3. p. 330. ſeq. Bibl. Univ. T. 3. p. 33.

The *Albigenſes* are frequently confounded with the *Waldenſes*, from whom however they differ in many reſpects, both as being prior to them in point of time, as having their origin in a different country, and as being charged with divers hereſies, particularly Manicheiſm, from which the *Waldenſes* are exempt. *Limborch*, loc. cit. Ouvr. des Scav. Mai. 1693. p. 508. Mem. de Trev. 1713. p. 703. Act. Erud. Lipſ. 1693. p. 324. See VAUDOIS, *Cycl.*

Several proteſtant writers have vindicated them from that imputation. And ſome, inſtead of heretics, find not only forerunners of the reformation in them, but ſaints and martyrs. Certain authors even aſſert to find them prefigured, among the heavenly hoſt, in the apocalypſe. Yet Limboreh finds himſelf obliged, from certain acts of the inquiſition of Thouloufe, paſſed between the years 1307 and 1323, publiſhed in 1692, to allow in part the Manicheiſm of the *Albigenſes*.

In order to this, he diſtinguiſhed two kinds of *Albigenſes*; one tainted with that hereſy, the other orthodox. Some however except againſt any concluſion drawn from the faith of theſe acts, in as much as they were made by their profeſſed enemies, perſons who were under a neceſſity to repreſent them as highly criminal; in as much as they were reſolved to put them to death. The truth rather ſeems on Dr. Allix's ſide, who ſhews, that a great number of Manichees, did ſpread over the weſtern countries from Bulgaria, and ſettled in Italy, Languedoc, and other places, where there were alſo *Albigenſes*; by which means being both under the imputation of hereſy, they came, either by ignorance or malice, to be confounded, and called by the ſame common name, tho' in reality entirely different. *Allix*, Rem. Hiſt. Piedm. c. 15. Act. Erudit. Lipſ. 1691. p. 261.

At the beginning of the XIIIth century, they had intereſt enough to engage the kings of England and of Arragon, to defend them againſt the Croiſes. Peter king of Arragon was killed in a battle which he fought on their behalf; at the head of an army of an hundred thouſand men. The viſcount De Beziers, and the count De Thouloufe, rather choſe to loſe their dominions than abandon the *Albigenſes*. Philip Auguſtus king of France ſtill ſupported the croiſade; Louis VIII. marched in perſon againſt the *Albigenſes*, and St. Louis finiſhed their entire deſtruction, which was one of his chief titles to ſanctity. But the perſon who diſtinguiſhed himſelf moſt by his zeal and exploits againſt the *Albigenſes*, was Simon count De Montfort. The chief miſſionaries whoſe preachings ſupplied the army with Croiſes, were Arnaud arch-biſhop of Narbone, Guy biſhop of Carcaſſon, James De Vitri doctor of Paris, and St. Dominic, founder of the order of friars Predicants, and of the inquiſition. Mem. de Trev. 1704. p. 97. ſeq.

Other errors imputed to the *Albigenſes* by their opponents, the monks of thoſe days, were, that they admitted two Chriſts, one evil, who appeared on earth; the other good, who has not yet appeared. That they denied the reſurrection of the body, and maintained human ſouls to be dæmons impriſoned in our bodies, by way of puniſhment for their ſins; that they condemned all the ſacraments of the church, rejected baptiſm as uſeleſs, held the euchariſt in abhorrence; excluded the uſe of confeſſions and penance, maintained marriage unlawful, laughed at purgatory, prayers for the dead, images, crucifixes, *&c.* *Du Pin*, Bibl. Eccleſ. T. 11. p. 169.

With regard to their manner of living, we may conſider the *Albigenſes* as of two kinds, the perfect, and the believers. The former profeſſed to live in continence, abſtained from fleſh, eggs, cheeſe, abhorred lying, and never ſwore. The latter lived like other men, but were nevertheleſs perſuaded they ſhould be ſaved by the faith of the perfect, and that none of them who received impoſition of hands from theſe ſhould be damned. *Du Pin*, loc. cit.

See further concerning the hiſtory of the *Albigenſes*, *Prateol.* Elench. Hær. The perſecutions, wars, and croiſades raiſed againſt them, *Limborch*, Hiſt. Inquiſit. l. 1. c. 8. ſeq. Act. Erud. Lipſ. 1693. p. 324. ſeq. *Kuſter*, Bibl. Nov. Libr. T. 3. p. 33. *Du Pin*, Bibl. Eccleſ. T. 10. p. 166. Jour. des Scav. T. 26. p. 109. It. T. 28. p. 481. Bibl. Choiſ. T. 27. p. 42. Holy Inquiſ. c. 3. Sapient. & Stult. c. 4. p. 44. Their merits as reformers, Act. Erud. Lipſ. 1693. p. 173. seq. Mem. de Trev. 1717. p. 1375. Bibl. Univ. T. 9. p. 33. As ſaints and martyrs, Hiſt. Crit. Rep. Lett. T. 4. p. 19. Jour. des Scav. T. 35. p. 385.

ALBIGENSES is alſo a name ſometimes given to the followers of Peter Vaud, or Waldo.

In this ſenſe, *Albigenſes* is ſynonymous with what we more properly call *Waldenſes*, or poor men of Lions. See WALDENSES, *Cycl.*

In this ſenſe is the word applied by Camerarius, Thuanus, and divers other writers. The reaſon ſeems to be, that the two parties agreed in their oppoſition to the papal innovations and incroachments, though in divers other reſpects ſaid to be different enough [a]. The biſhop of Meaux [b] labours hard to ſupport a diſtinction between the two ſects, alledging that the *Albigenſes* were heretics and Manichees, whereas the Waldenſes were only ſchiſmatics, not heretics; being ſound as to articles of faith, and only ſeparating from the church of Rome on account of ceremonies and diſcipline. Dr. Allix [c] endeavours to ſet aſide the diſtinction, and ſhews, that both of them held the ſame opinions, and were equally condemned and held for heretics; and this not for points of faith, but for declaiming againſt the papal tyranny and idolatry, and holding the pope to be the Antichriſt. Which laſt, according to M. de Meaux, conſtitutes nothing leſs than Manicheiſm. —[a *Thomaſ.* Hiſt. Sapient. & Stult. c. 4. p. 48. seq. b Ubi ſupra. c Rem. Hiſt. Piedm. c. 20. Act. Erud. Lipſ. 1691. p. 262. seq.]

In this ſenſe the Lollards and Wickliffites in England were not only Albigenſes, but Manichees. *Allex*, ubi ſupra, p. 201. seq. Act. Erud. Lipſ. 1693. p. 175.

ALBINI, in antiquity, the workmen employed in what was called *Opus Albarium*. See the article ALBARIUM *Opus*.

Theſe are otherwiſe denominated *Albarii*. They make a different profeſſion from the *Dealbatores*, or whiteners. *Pitiſc.* in voc. See ALBARII.

ALBITROSSE, the name of a large ſea bird, common about Jamaica, and in many other places. This is a thieviſh creature, and principally feeds on the prey which another ſea bird, called the *booby*, provides for itſelf.

It is ſaid that the head of the *Albitroſſe* changes from brown to a fine ſcarlet, while it ſits on its eggs, and afterwards becomes brown again.

ALBOGALERUS, in Roman antiquity, a ſacerdotal cap, or ornament, worn by the *flamen dialis*.

This is otherwiſe called *galerus*.

The *Albogalerus* was made of the ſkin of ſome white victim ſacrificed to Jupiter; on the top of which was a decoration of olive branches. *Feſt.* in voc.

ALBORAK, in the Mahometan theology, the beaſt on which the prophet rode, in his extraordinary aerial journies.

The word is Arabic, *Al-borak*, which literally denotes ſplendour; alluding to the extraordinary brightneſs of this beaſt [a]; or, as others ſay, to its great quickneſs, which was equal to that of lightning itſelf [b].—[a *D'Herbel.* Bibl. Orient. p. 578. b Life of Mahom. p. 47. seq.]

The Arab commentators give many fables concerning this extraordinary vehicle. It is repreſented as of an intermediate ſhape and ſize, between an aſs and a mule. A place, it ſeems, was ſecured for it in paradiſe, at the interceſſion of Mahomet; which, however, was, in ſome meaſure, extorted from the prophet, by *Alborak*'s refuſing to let him mount him, when the angel Gabriel was come to conduct him to heaven.

ALBORO, in zoology, a name by which the *erythrinus*, a ſmall red fiſh, caught in the Mediterranean, is commonly known, in the markets of Rome and Venice. *Willughby*, Hiſt. Piſc. p. 311. See the article ERYTHRINUS.

ALBUCUS, in botany, a name uſed by ſome for the white aſphodel. *Ger.* Emac. Ind. 2.

ALBUGINEA *tunica*, (*Cycl.*) in anatomy, is the third coat of the teſticles; ſo called from its colour, which is white.

It is a ſtrong thick membrane, very ſmooth on the outer ſurface; the inner, which adheres to the ſubſtance of the teſticle, being rough and uneaven. Into its upper part are inſerted blood veſſels, nerves, and lymphatics, which from thence ſend divers branches into the ſubſtance of the teſticles. V. *Keil.* Anat. c. 2. ſec. 15. p. 93. *Drake*, Anthropol. l. 1. c. 19. p. 119. See TUNICA.

ALBUGINEUS is applied, by ſome, for the aqueous humour of the eye. *Caſt.* Lex. Med. p. 28.

ALBUGO (*Cycl.*)—This diſeaſe of the eye is otherwiſe called λευκωμα, ὑπηλον, ἕλκος, παραλαμψις, *leucoma*, *hypoulon*, *helcos*, and *paralampſis*; by Celſus, *ulcus ſupercreſcens*; by others, *ulcus ſubnaſcens*; by others, *cicatrix ſupereminens*.—It differs from ἕλκη, or cicatrix, in that the latter infects only the black of the eye, or the pupil. It differs from the αἰγις, αἰγιας, or αἰχλιη, of Hippocrates, in that theſe denote only a whitiſh concretion of viſcid matter, growing on the outer ſurface of the cornea, and eaſily curable. It differs alſo from the *ungula*, *pterygium*, *pterygotomum*, *tela*, pin, and web, in that theſe are only external, ſlight, or ſuperficial ſpecks, whereas the *Albugo* is thicker and harder, and penetrates into the ſubſtance of the part. It differs from *unguis* and *onyx*, ονυξ, in that theſe import an abſceſs, or ſuppuration of the cornea [a].—Laſtly, it differs from the *coiloma*, in that this latter is ſeated in the *tunica albuginea*, not in the *cornea*; though ſome affect to make theſe two the ſame, in order to diſtinguiſh the *Albugo* from the *pterygium*, the latter of which they ſuppoſe ſeated in the *cornea*, as the former in the *albuginea* [b].—[a *Woolhouſ.* Quadrag. Operat. Chirurg. c. 1. Ephem. Germ. cent. 5. app. p. 131. seq. b *Kenned.* Ophthalm. c. 13. Jour. des Scav. T. 56. p. 260.]

The *Albugo* then, is a whitiſh, denſe, opake ſpot, or film, growing on the *tunica cornea*, and obſtructing the ſight.

It oftenest ariſes as a ſcar after an inflammation, or ulcer of that part, particularly in the ſmall-pox; ſometimes from a congeſtion of tough, impacted humours. The *unguis* alſo, if neglected, or wrong treated, ſometimes degenerates into an *Albugo*.

The *Albugo* is by moſt looked upon as incurable; though ſome pretend to effect its cure by a ſort of myſterious ſtone, called *lapis divinus* [c]. Coward mentions the juice of granates and juſquiamnus, as of good ſervice for reducing the *Albugo* from its white colour to a brown one, more approaching the natural colour of the eye [d]. — [c Mem. de Trev. 1707. p. 731. d *Cow.* Ophthalm. in Jour. des Scav. T. 39. p. 130.]

Heiſter obſerves, that as in ſeveral other claſſes of diſorders belonging to the eyes, ſo in this we meet with a great deal of confuſion, by a miſapplication and reduplication of ſeveral names, which are often uſed to import the ſame diſeaſe; whence ariſe difficulties and miſtakes, and errors in the method of cure.

The moſt eminent ſurgeons and phyſicians mean by *Albugo*, *leucoma*, *nebula*, *nubecula*, a ſort of whitiſh ſpots in the cornea, though they appear not always alike, and of the ſame kind, being ſometimes larger or ſmaller, thicker or thinner, more or leſs pellucid and protuberant.

The cauſes of theſe are various. They may ariſe, 1. From an obſtruction of the pellucid veſſels of the cornea, and inſpiſſation of their juices, proceeding from a violent inflammation of the eye. 2. From a ſuppuration, and then an induration of theſe juices in the cornea, after an inflammation; ſo that, by degrees, it becomes more opake, as it hardens, putting on a whitiſh hue; and hence has been ſometimes miſtaken for an *unguis*. 3. Theſe ſpots may ariſe from an eroſion, or ulcer. 4. From puſtules in inflammatory diſorders. 5. From the ſmall-pox. 6. From ſcars left after punctures in the cornea, by ſwords, knives, glaſs, &c. 7. From burns. 8. From cauſtic ſubſtances falling into the eye. 9. Theſe ſpots may alſo be formed by a peculiar tunic growing to the eye itſelf.

The cure is various, according to circumſtances. If the diſorder ariſes from inſpiſſated humours, an attenuating diet and medicines, eſpecially ſudorific decoctions and infuſions; together with phlebotomy, ſcarifications, bliſters, and pediluvia, are uſeful. Cold and aſtringent collyria, eſpecially thoſe of white vitriol, are here pernicious; whereas warm applications are of the greateſt ſervice. But if theſe diſorders be of long ſtanding, there is little or no hope of a cure.

If the diſorder proceeds from abſceſſes, or a ſuppuration of matter, after an inflammation, betwixt the laminæ of the cornea, which they elevate like a pea, or pearl, whence they are ſometimes called *pearls*, an inciſion ought to be made into the cornea, to diſcharge the included matter. But neither this nor any other method will ſucceed ſo as to preſerve the eye-ſight clear, if the matter be lodged deep.

If the puſtules take their riſe from burns, or the ſmall-pox, the contained matter muſt be diſcharged, and the pellicle muſt be removed with *alum. uſt. cum ſacchar. cand. & ovor. teſt. pp.* applied every day to the cornea.

Spots in the cornea ariſing from wounds, ſcars, or the abuſe of vitriolic *collyria* are ſeldom curable. See *Heiſter*'s Surgery, P. 2. ch. 58.

ALBULA, in ichthyology, a genus of fiſhes of the truttaceous kind, having no teeth.

There are ſeveral ſpecies of this, the *Albula parva*, called *Albete*; the *Albula nobilis* of Schonefeldt; the *Albula cærulea*, called *Bozola*; and the *Albula minima*, diſtinguiſhed from the reſt by its ſmallneſs, and the pale colour of its head.

Writers on theſe ſubjects ſeem, however, to have conſtituted more ſpecies than are of nature's making, in this genus. Several of their diſtinctions being only of the ſame fiſh, in its different ſtages of growth; the *ferra* and *lavaretus* are alſo plainly of the *Albula* kind; and it is not certain whether the differences of place, age, and ſeaſon, are not the origin of the diſtinctions even between theſe.

The only fundamental diſtinction nature ſeems to have placed between them is, that ſome are of the herring ſhape, as the *lavaretus*, and ſome of the ſalmon ſhape, as the *ferra*. But it requires an accurate and repeated examination of the ſeveral fiſh of theſe kinds, from different places, to ſay determinately what number of ſpecies there are of each. *Willughby*, Hiſt. Piſc. p. 186.

ALBULA *Indica*, the name of a ſmall fiſh, reſembling a herring, caught about the ſhores of the Eaſt-Indies, and called

by the Dutch there, the *wit-fiſh*. It is a ſcaly fiſh, much of the ſhape of a ſmall herring, with a large and thick head. Its back is brown, and its ſides and belly of a blueiſh yellow. It is caught, in great abundance, with nets, and is a very well taſted fiſh. *Ray*, Ichthyogr. Append. p. 3.

ALBULA *nobilis*, the name of one of the truttaceous fiſhes, caught in great plenty in the lakes of Germany, and other places. It is uſually caught of about two feet long, and is in ſhape very like the common ſalmon. Its back and ſides are of a duſky browniſh green colour, and its belly white. The mouth is large, but has no teeth; and the upper jaw is ſo much larger than the under, that its ſides fall over it when the mouth is ſhut. Its head is of a pale and faint blueiſh colour, and is ſpotted with a ſomewhat deeper blue. It has two fins on the back; one near the middle, the other but a finger's breadth from the tail. The tail is membranaceous, as in the reſt of the fiſh of this kind, and is a little forked. It has alſo two pair of fins on the under part; one near the gills, the other under the belly, and another behind the anus. The fleſh is firm, and well flavoured. *Schonefeldt*, de Piſc.

ALBULA is alſo a name given, by ſome naturaliſts, to mineral waters of the aluminous kind; hence endued with an aſtringent quality, and of uſe in wounds. *Gal.* Mat. Med. l. 8. c. 2. ap. *Caſt.* Lex Med.

The word is Greek, Αλβυλα, where it ſignifies the ſame.

ALBUM, in literary hiſtory, is uſed to denote a kind of table, or pocket-book, wherein the men of letters with whom a perſon has converſed, inſcribe their names, with ſome ſentence, or motto.

This is called by divers names and titles, as *Album amicorum*, *repoſitorium amicorum*, &c. *Schott.* ad Proverb. Vatican. App. 1. 80.

ALBUM, in antiquity, denotes a white table, or the like, whereon names, or other matters, were to be inſcribed, or entered.

In which ſenſe, the word is ſynonymous with the Greek, λευκωμα. Hence we meet with *Album prætoris*, *Album decurionum*, *Album judicum*, &c.

Album decurionum was the regiſter wherein the names of the *decuriones* were entered. This is otherwiſe called *matriculatio decurionum.*

Album prætoris, that wherein the *formulæ* of all actions, and the names of ſuch judges as the prætor had choſen to decide cauſes, were written.

Album judicum, that wherein the names of the perſons of thoſe *decuriæ*, who judged at certain times, were entered.

Album ſenatorum, the liſt of ſenators names, which was firſt introduced by Auguſtus, and renewed yearly. Vid. *Pitiſc.* Lex. Antiq. T. 1. p. 69.

The high-prieſt entered the chief tranſactions of each year into an *Album*, or table, which was hung up in his houſe for the public uſe.

ALBUM, in natural hiſtory, is uſed for the white of an egg; more properly called *Albumen*. *Caſt.* Lex. Med. p. 28.

ALBUM, among chemiſts, is uſed for white lead, properly called *ceruſs*. *Caſt.* Lex. in voc.

ALBUM is alſo uſed, among alchemiſts, for a tincture pretended to tranſmute metals. *Caſt.* Lex.

ALBUM is alſo applied, in pharmacy, as a title, or epithet of divers compound medicines. Thus we meet with *unguentum album cum camphora*, &c. V. Pharmacop. Londin.

ALBUM *græcum*, (*Cycl.*) is otherwiſe called *Album canis*, and *ſtercus canis officinale.*

Some ſpeak of its uſe internally, in the angina, and other inflammations; as alſo in the dyſentery, cholic, &c.—Divers preparations of it are given by pharmaceutical writers. Vid. *Junck.* Conſpec. Therap. tab. 20. p. 518.

ALBUM *nigrum* is uſed, among medical writers, for mice dung, by ſome alſo called *muſcerda*. *Etmull.* Colleg. ad Schrod. in App. T. 1. p. 795. *Caſt.* Lex. Med. p. 28. *Blanc.* Lex. Med. p. 23.

ALBUM *oculi*, among anatomiſts, denotes the *tunica adnata*; ſometimes alſo called *Albugo*; popularly the white of the eye. *Caſtel.* Lex. Med. p. 28.

ALBUMEN, (*Cycl.*) in natural hiſtory and medicine, a white, clear, viſcid liquor, in an egg, which every where encompaſſes the *vitellus*, or yolk.

Albumen amounts to the ſame with what the Greeks call λευκωμα, and λευκον; the Latins, *album ovi*, *albor*, ſometimes *ovi candidum*, *albugo*, and *albumentum*; the French, *glaire*; the Engliſh, popularly, *white of an egg*. Anaxagoras calls it ορνιθος γαλα, that is, bird's milk. Vid. *Scribon.* p. 24, 26. *Rhod.* Lex. Scriben. *Caſt.* Lex. Med. p. 29.

There are properly two *Albumens* obſervable in an egg, each incloſed in its ſeparate membrane; the one *external*, next the ſhell, which being of a thin conſiſtence, upon breaking the the cortex, runs out; the other *internal*, immediately ſurrounding the yolk, which being of a denſer ſubſtance, retains its place and figure, after the effuſion of the former: to this end, it is guarded by a fine thin membrane, too ſubtle to be perceived by the eye; which being broken, this too falls out. The two ends of the egg are chiefly poſſeſſed by the internal *Albumen*. In general it is obſerved, that there is moſt *Albumen* in the obtuſe end of an egg, leſs in the acute end, and leaſt in the reſt. V. *Harv.* de Gener. c. 11. p. 41.

The *Albumen* is a thickiſh, viſcous humour, miſcible with water, inſipid and inodorous, affording no indications, either of an alcaline, or an acid nature; ſo that though applied to the moſt ſenſible part, as the eye, it excites not the leaſt pain. When expoſed to a gentle heat, as that of a healthy man's body, it grows continually more and more liquid, till at length loſing all its conſiſtence, it diſſolves into a liquor reſembling urine; at the ſame time, it waſtes ſenſibly; and, at laſt, leaves nothing but a thin pellicle, reſembling paper. *Boerhaave*, New Meth. Chem. P. 3. proc. 96. p. 206.

The *Albumen*, if applied to a degree of heat ſomething greater, inſpiſſates and hardens into a whitiſh, concrete, flaky ſubſtance, with the loſs of ſome of its finer fluid part, which eſcapes in form of a fume.

In effect, if an egg be laid on coals not the moſt intenſely hot, the ſame finer fluid will be found ſenſibly to tranſude the pores of the ſhell. Add, that if ſpirit of wine be poured on the freſh *Albumen* of a new laid egg, a coagulation is immediately produced, as if by fire; and this the more perfectly, as the ſpirit and the *Albumen* are more intimately mixed. By this means, the white of an egg is defended from all putrefaction. *Boervaave*, loc. cit. proc. 98. p. 207.

Diſtilling the *Albumen* by a retort in a ſand heat, till it be brought to a dryneſs, it yields an incredible quantity of water, which has moſt of the properties of the whole maſs. Id. ibid. proc. 99. p. 208.

The white of an egg makes an extraordinary menſtruum. Being boiled hard in the ſhell, and afterwards ſuſpended in the air by a thread, it reſolves and drops down into an inſipid ſcentleſs liquor, which appears to be that anomalous unaccountable menſtruum, ſo much uſed by Paracelſus; and will, though it contain nothing ſharp, oleaginous, or ſaponaceous, make a thorough ſolution of myrrh; which is more than either water, oil, ſpirits, or even fire itſelf, can effect. *Boerhaave*, loc. cit. P. 2. p. 358. ſeq. But ſee the article MYRRH.

The origination of the *Albumen* is ſomewhat obſcure.—'Tis matter of common obſervation, that eggs, while in the ovaries of their birds, *e. gr.* of hens, conſiſt only of a yolk, without any *Albumen*; and in eggs, when boiled, 'tis apparent there is only a contiguity, no connection between the two parts, ſince they are eaſily ſeparated, without a rupture of any thing, except in the places where the chalazæ are found. The reſult of the lateſt obſervations on this ſubject is, that the vitellus being deſcended into the ovary, the cavity of the ovary diſtils the matter of the *Albumen*, and glues, or annexes it to the ſurface of the yolk. V. *Harv.* de Generat. Anim. exerc. 14. p. 57. *Bellin.* de Mot. Cord. p. 40; *Burggr.* Lex. Med. in voc.

The office and uſe of the *Albumen* has occaſioned much controverſy. The generality ſuppoſe it to ſerve as nutriment to the chick, while *in ovo* [a]; though others attribute this office to the yolk [b]. The truth ſeems chiefly to lye on the ſide of the former: the *Albumen* is the matter whereof the chick is formed, and ſuſtained till within a few days before hatching; at which time it begins to feed on the yolk [c].—[[a] V. *Harv.* ubi ſupra. [b] *Belling.* Tract. de Fœt. c. 8. Bibl. Angl. T. 2. p. 70. [c] V. Ephem. Germ. Dec. 2. an. 10. obſ. 4. p. 13.]

A late author pretends to reduce the office of the *Albumen*, to the ſerving as a defence to the fœtus againſt accidents, and affording room for its members to ſtretch and grow in. *Belling.* ubi ſupra. c. 10. Bibl. Angl. T. 2. p. 73.

Several have held the *Albumen* a mere inorganical maſs. Malpighi [d], and others [e], ſhew a regular texture in it: at firſt it conſiſts of a congeries of minute veſſels, perfectly like thoſe whereof the vitreous humour of the eye is compoſed. This diſpoſition is changed by incubation: the brooding heat of the hen diſſolves and liquifies the *Albumen*, and fits it to become a nutriment to the embryo.—[[d] De Format. Pull. It. de Ovo incub. *Burggr.* loc. cit. [e] *Maitre Jan*, Obſerv. ſur le Format. du Poulet. Jour. des Scav. T. 74. p. 556, 560. ſeq.]

'Tis diſputed, whether the whites of eggs be a wholſome food? The generality of phyſicians reject them, as indigeſtible. Others reſtrain their prohibition to thoſe which are much hardened by the fire, while in a ſofter ſtate they cannot but be at leaſt innocent; if they be the ſuſtenance of the tender embryo's, the chickens. Ephem. Germ. ubi ſupra.

ALBUMINA, or whites of eggs, are of ſome uſe in medicine, tho' rather externally, in the preparation of collyriums for the eyes, and *anacollemata*, on account of their cooling, agglutinating, and aſtringent quality, than internally; yet Hippocrates preſcribed them in feveriſh caſes, by way of a refrigerative. In ſuch caſes, they ſhould ſeem to be peculiarly prohibited: it being a known experiment, that an egg will boil, (if we may ſo call it) at leaſt turn hard, by only being held in the hands of a perſon in a fever; and the effects of ſuch induration, it naturally enough follows, from what has been aboveſaid, can by no means be ſerviceable to ſick perſons. *Hipp.* l. 3. de Morb. c. 30. p. 12.

Albumina are uſed for burns [a], and in ſome mixtures with bole armeniac, &c. for conſolidating freſh wounds, and under bandages, and compreſſes to prevent the luxation of bones after reduction [b]. A late writer recommends them as a ſecret in the jaundice [c].—[a *Junck.* Conſp. Therap. Tab. 13. p. 379. b *Zwinc.* Diſpenſ. P. 2. Sec. 12. p. 204. c Ephem. Germ. dec. 3. An. 2. Obſ. 35. p. 43.]

Beſides medical, the whites of eggs have alſo their chemical uſes, *e. gr.* for the clarifying of liquors; to which purpoſe, being mixed, and incorporated with the liquors to be clarified, and the whole afterwards boiled, the whites of eggs are by this means brought together, and hardened, and thus carry off the groſs parts of the liquor along with them.

ALBURN, (*Cycl.*) the Engliſh name of a colour partaking of red and white.

Skinner derives the word in this ſenſe, from the Latin *Albus*, and the Italian *Burno*, from *Bruno*, brown. *Skin.* Etym. Angl. in voc.

ALBURNUM, in phytology, the exterior part of the wood of a tree, next the bark. *Plin.* Hiſt. Nat. l. 16. c. 38. *Docton.* Hiſt. Stirp. Pempt. 1. l. 1. c. 1. *Caſt.* Lex. Med. p. 29. See the article BARK.

The word is formed from *Albus*, white, on account of its colour.

The *Alburnum* is the ſofteſt, freſheſt part of the wood, anſwering to what ſome call *Blea*. Pliny compares it to the fat in men.

ALBURNUS, in zoology, the name of a freſh water fiſh, commonly known in Engliſh by the name of the bleak.

It is a ſmall fiſh, commonly of the length of ones finger, and never exceeding five or ſix inches. Its body is ſomewhat compreſſed and broad, and its head very ſmall. It is covered with very ſmall ſcales of a fine ſilvery white, which readily fall off; its back however is a little greeniſh. It is common in our rivers, and in thoſe of Germany and elſewhere, and is eſteemed a well taſted fiſh. It is moſt in ſeaſon in September. *Geſner*, de Aquat. p. 93.

ALBURNUS *Lacuſtris*, in ichthyology, a name given by the writers who have copied Geſner's errors, to the *Ballerus* of the antients, or the *Pallerus*, or *Pleyſta* of the moderns. It is a ſpecies of the ſame genus with the *Alburnus*, but has no right to be named from it, being of a very different figure, more reſembling the bream than the *Alburnus*, tho' neither very greatly. It is called by Artedi the *Cyprinus* of a very broad and thin ſhape, with forty rays in the *Pinna Ani*.

Mr. Ray thinks the *Alburnus Lacuſtris*, to be the ſame with the common *Caraſſius*. V. *Ray*'s Ichth. p. 249.

ALBUS *Piſcis*, the white fiſh, in ichthyology, a name by which Salvian has called the fiſh more uſually called the *Capito Lacuſtris*; and ſeeming the ſame with the blue chub, or as it is more frequently called, the jentling. *Willughby*, Hiſt. Piſc. p. 257. See JENTLING.

This fiſh is a ſpecies of the cyprinus, called by the Italians *Albo*. See CYPRINUS.

ALCAID, (*Cycl.*) in matters of policy, an officer of juſtice among the Moors, Spaniards and Portugueſe.

The word is alſo written *Alcade*, *Alcalde* and *Alcayd*. Sometimes alſo *Alvacide*.

It is originally Arabic, compounded of the particle *Al*, and the verb *Kad*, or *Akad*, to rule, govern, adminiſter.

The emperor of Morocco's court conſiſts chiefly of ſeven or eight *Alcaids*, his devoted ſlaves.

In ſome places the *Alcaids* are little elſe than the emperor's tax-gatherers. Jour. des Scav. T. 22. p. 641, and 645. Bibl. Angl. T. 13. p. 145.

Alcaid, among the Spaniards, *&c.* is a kind of inferior judge, or miniſter of juſtice, who takes cognizance of cauſes in the firſt inſtance.

The Spaniſh *Alcaid* anſwers in good meaſure to the French prevoſt, and the Engliſh juſtice of peace. V. *Chevign.* Scienc. de Perſ. de Cour. T. 3. p. 180.

They had alſo their *Alcaid* of the whores, who took cognizance of caſes of whoredom, and adultery. This officer was otherwiſe called *Alcaid* of honour. *Du Cange*, Gloſſ. Lat. in voc.

ALCANNA, or ALCANA, (*Cycl.*) a dying drug, brought from Egypt and the Levant, being the leaves of a plant, called by botaniſts *Liguſtrum Ægyptiacum*, or the Egyptian privet.—The Egyptians call it *Elle hanne*.

The colour drawn from theſe leaves is either red or yellow, according to the manner of the preparation; yellow when ſteeped in common water, and red when infuſed in vinegar, or allum-water.

The people of Cairo, make a conſiderable traffic of theſe leaves; which they reduce to a powder called *Archenda*, much uſed by the women to dye their nailes, and hair of a golden yellow hue [a].—From the berries of *Alcanna* an oil is extracted, of a very agreeable ſmell, and ſome uſe in phyſic, as a calmer, called oil of *Cyprus*, a name which is ſometimes alſo given to the plant [b].—[a Trev. Dict. Univ. T. 1. p. 262. b *Savar.* Dict.Comm. T. 1. p. 65.]

ALCANNA is alſo a denomination given by ſome to iſinglaſs, or Icthyocolla. *Savar.* Dict. Comm. T. 1. p. 65. See ICTHYOCOLLA.

ALCANTARA (*Cycl.*)—The Spaniſh antiquaries vary much in their accounts of this order. The Jeſuit Mendo fixes its origin in 1156, Barboſa in 1176. The chronicles of the order relate, that Ferdinand king of Leon took it under his protection in 1176; that pope Alexander III. confirmed it the year following; that Lucius III, in 1184, gave it the order of St. Benedict; and that Nugnez Ferdinand, in 1218, gave it the city *Alcantara*, from whence it took the name.

Carro de Forres, and Franc. de Bades affirm, that it was at firſt called the order of St. Julian del Pereyro, from the name of the city where it was founded; but that the preciſe year of its inſtitution is not known. Trev. Dict. T. 1. p. 262.

The knights of *Alcantara* make the ſame vows as thoſe of Calatrava, and are only diſtinguiſhed from them by this, that the croſs fleurdeliſce which they bear over a large white cloak, is of a green colour: they poſſeſs thirty ſeven commendaries.

By the terms of the ſurrender of *Alcantara* to this order, it was ſtipulated, that there ſhould be a confraternity between the two orders, with the ſame practices and obſervances in both; and that the order of *Alcantara*, ſhould be ſubject to be viſited by the grand maſter of Calatrava. But the former ſoon got free from this engagement, on pretence that their grand maſter had not been called to the election of that of Calatrava, as had been likewiſe ſtipulated in the articles.

The hiſtory of this order is chiefly taken up in expeditions againſt the Moors, and broils with their neighbours. V. *Helyot.* Hiſt. des Ord. Monaſt. T. 6. Mem. de Trev. an. 1720. p. 150. ſeq. See CALATRAVA, *Cycl.*

ALCE, the elk, in zoology. See ELK.

ALCEA, in botany, the name of a genus of plants, the characters of which are the ſame with thoſe of the mallow, but that this has always deeply divided leaves. See MALVA.

The ſpecies of *Alcea*, enumerated by Tournefort, are theſe. 1. The common larger vervain mallow with red flowers. 2. The common larger *Alcea* with whitiſh flowers. 3. The common *Alcea* with hairy coverings to the ſeeds. 4. The rounder leaved jagged *Alcea*. 5. The cinquefoil, or hemp-leaved *Alcea*. 6. The larger tall *Alcea*. 7. The hairy *Alcea*. 8. The white flowered hairy *Alcea*. 9. The little Sicilian *Alcea* with ſmall flowers. 10. The ſlender curled leaved *Alcea*. 11. The ſmall procumbent ſea *Alcea*, with leaves like the geranium. 12. The great fig-leaved garden roſe *Alcea*. 13. The white flowered great fig-leaved garden roſe *Alcea*. 14. The yellow flowered great fig-leaved garden roſe *Alcea*. 15. The violet flowered great fig-leaved garden roſe *Alcea*. 16. The purple flowered great fig-leaved garden roſe *Alcea*. 17. The pale red flowered great fig-leaved garden roſe *Alcea*. 18. The black flowered great fig-leaved garden roſe *Alcea*. 19. The great fig-leaved garden roſe *Alcea*, with black rough flowers. The eight laſt are uſually ranked among the holly-oaks, or roſe-mallows. 20. The very hairy American *Alcea*. *Tournef.* Inſt. p. 98.

The word *Alcea*, αλκεα, is Greek, formed of αλκη, *auxilium*, help.

The *Alcea* is a medicinal herb: the officinal kind of it is called *Alcea vulgaris major*; by ſome, *herba Simeonis*, *canabis ſylveſtris*, *herba hungarica*, and *malva verbena*, in Engliſh, vervain mallow. Its virtues are much the ſame with thoſe of the mallow, only a degree weaker than either of them. It is uſed as an emollient. Dioſcorides mentions the root drank with wine, or water, as a remedy againſt dyſenteries and ruptures. *Lemery*, Trait. des Drog. p. 22. *Burggr.* Lex. Med. T. 1. p. 400. ſeq. See MALVA.

ALCEA *Veſicaria*, the *Bladder-Alcea*, in botany, the name of a ſpecies of *Ketmia*. See the article KETMIA.

ALCEDO *Vocalis*, in zoology, a name by which Bellonius, Aldrovandus, and ſome others, have called the reed ſparrow. *Aldrovand.* l. 20. c. 62. See the article JUNCO.

ALCHEMIST, a perſon who practiſes or profeſſes *Alchemy*.

The word is alſo written *Alchymiſt* ſometimes *Alchimiſt*, or even *Archimiſt*.

Alchemiſts are otherwiſe called ποιηται, *Poetæ*, q. d. Makers, and χρυσοποιηται, goldmakers; ſometimes *Ariſtæ*, popularly ſoufleurs, or blowers, adepts, goldmakers, goldfinders. Nouv. Rep. Lett. T. 35. p. 554.

The office of *Alchemiſts*, as aſſigned by ſome authors, is of great extent: to them it belongs to explain the principles, the properties, and qualities of all metals, and the ſeveral alterations theſe are capable of; to teach the manner of converting impure and groſs metals into gold and ſilver; to give even to precious ſtones the degree of perfection they want; to preſerve the human body in perfect vigour, and cure the moſt dangerous and deſperate deſeaſes incident thereto. Nouv. Rep. Lett. T. 11. p. 1178.

Adam, Enoch, Noah, Cham, Moſes, John the Evangeliſt, and other Patriarchs, and Apoſtles, are ranked in the number of *Alchemiſts*.

There is an apocryphal book ſtill extant aſcribed to Miriam, ſiſter of Moſes, on the practice of the philoſopher's ſtone. The ſages make that propheteſs a moſt expeditious operatrix; it is ſaid ſhe could finiſh the whole affair in three days, nay, in three hours, according to the verſe, *Maria lux roris ligam ligat tribus horis*. *Schmid.* Pſudo Vetus Teſtam. ap. Nov. Liter. Germ. 1708. p. 362. ſeq.

Democritus the Abderite, Ariſtotle, Hermes, &c. are alſo reputed to have been *Alchemiſts*. *Fabric.* Bibl. Græc. l. 6. c. 7. ſect. 17. It. l. 1. c. 10. T. 1. p. 66. ſeq.

We have had ſevere laws againſt the practice of *Alchemy*, and the multiplying of metals, as much as againſt coining. Rymer furniſhes us a licence for practiſing *Alchemy*, granted by Edward the fourth, in 1476. V. *Rym.* Fæder. T. 12. Bibl. Anc. Mod. T. 9. p. 67.

Great complaints are made concerning the obſcurity and myſteriouſneſs, the frauds and impoſtures, the folly, vanity, miſery, &c. of *Alchemiſts*. The Italians have a proverb, *Non ti fidiare all Alchemiſta povero, o medico amalato*; never truſt thyſelf to a poor *Alchemiſt*, or an unhealthy phyſician. *Agripp.* de Vanit. Art. c. 90. *Eraſm.* Colloq. p. 269. *Caſſaub.* in Credul. p. 15. Mem. de Trev. 1726. p. 594. Jour. des Scav. T. 73. p. 326.

The writer of Mr. Leibnitz's elogy ſpeaks of a ſociety of *Alchemiſts* at Nuremberg; who lived in great ſecrecy, and wrought on the philoſopher's ſtone. Mr. Leibnitz had a ſtrong deſire to be of the body, but the difficulty was to have a competent acquaintance with the myſteries of the ſcience, to procure him admiſſion. For want of this, he had recourſe to ſome books of *Alchemy*, out of which he picked all the moſt quaint, obſcure expreſſions, and thence compoſed an epiſtle unintelligible to himſelf, which he addreſſed to the preſident of the ſociety, demanding to be admitted, on this proof of his ſkill and proficiency. The author of the letter, it was preſently granted, muſt be an adept; accordingly, he was received with honour into the laboratory, and the poſt of ſecretary committed to him. *Fontenell.* Elog. de Leibnitz.

Kircher, fully inſtructed in all the ſecrets of chemiſtry, has diſplayed at large the ſeveral artifices and impoſtures of *Alchemiſts*; yet how many have been duped by them, ſince that time? M. Geoffroy has lately publiſhed a new detection; which will be at leaſt of this uſe, to ſhew that treachery and avarice, as induſtrious and inventive as they are, have diſcovered no new device theſe hundred years; but that inadvertency and forgetfulneſs on the part of mankind, ſupply the want of new artifices on the part of impoſtors. It may even be doubted, whether by publiſhing theſe myſteries of iniquity, authors do more good, or harm. It is well known moſt of the modern *Alchemiſts* and Charletans learnt their tricks in Kircher. Men ſeem naturally more inclined to be deceived than to be undeceived. An author who inſtructs men in what is evil, with a deſign to give them an averſion for it, is always ſure to teach the evil, but is not always ſure to give the averſion.

An *Alchemiſt* puts into a crucible, the matter which is to be converted into gold; this he ſets on the fire, blows it, ſtirs it it with rods; and, after divers operations, gold is found at the bottom of the crucible, inſtead of the matter firſt put in: this there are a thouſand ways of effecting without any tranſmutation. Sometimes it is done by dextrouſly dropping in a piece of gold concealed between the fingers, ſometimes by caſting in a little of the duſt of gold, or ſilver, diſguiſed under the appearance of ſome elixir, or other indifferent matter: ſometimes a crucible is uſed which has a double bottom, and gold put between the two; ſometimes the rod uſed to ſtir the matter is hollow, and filled with the duſt of the metal deſired; at other times there is metal mixed with the charcoal, the aſhes of the furnace, or the like. *Kirch.* Mund. Subterran. l. 11. and 12. *Geoff.* in Mem. Acad. Scienc. 1722. p. 81. *Fontenel.* Hiſt. 16. p. 52. Mem. de Trev. 1722. p. 1627. ſeq.

ALCHIMILLA, *Ladies-Mantle*, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the apetalous kind, being compoſed of a number of ſtamina, ariſing out of a funnel ſhaped cup, which is divided into ſeveral ſegments at the edge. The piſtil which ſtands in the center of theſe, finally becomes one or more ſeeds, contained in a capſule, which was originally the cup of the flower.

The ſpecies of *Ladies-Mantle*, enumerated by Mr. Tournefort, are theſe.

1. The common ladies-mantle. 2. The ladies-mantle with white flower cups. 3. The leſſer alpine ladies-mantle. 4. The common little ladies-mantle. 5. The little hoary alpine ladies-mantle. 6. The little cinquefoil alpine ladies-mantle, with fimbriated leaves. 7. The leaſt mountain ladies-mantle, called by the French *errepercepi*, or parſly piert. 8. The cinquefoil ladies-mantle, with leaves ſilvery underneath. 9. The procumbent *Alchimilla*, with graſſy leaves and ſmall flowers, called by ſome the narrow-leaved knot graſs. 10. The erect graſſy-leaved ladies-mantle, with ſmall flowers. 11. The graſſy-leaved *Alchimilla*, with larger flowers. 12. The toad-flax-leaved *Alchimilla*, with white cups: and 13. The toad-flax-leaved *Alchimilla*, with yellow cups. *Tournef.* Inſt. p. 405.

The ſpecies of this plant are all recommended as vulneraries, and incraſſants; and authors in general aſcribe to the common kind very conſiderable efficacy, in ſtopping the floodings of the menſes, and the *fluor albus*.

The name *Alchimilla* is ſaid to have been given this plant by alchemiſts, among whom it has been much tortured, from an expectation of finding ſomething extraordinary in it.

The officinal kind is called *Alchimilla vulgaris*; ſometimes *Pes, Patta*, or *Leonis, Planta, Pſiadium, Stella herba, Stellaria, Leontopodium, Droſera* and *Droſtum*; in Engliſh, ladies-mantle.

A diſtilled water and a conſerve, have formerly been procured from its flowers; but they are now out of uſe. Some apply it externally in the *vomica pulmonum*. *Lemery*, Tr. des Drog. p. 24. *Burggr.* Lex. Med. T. 1. p. 401. ſeq. *Junck.* Conſp. Med. p. 178.

ALCHIMILLA, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe. The cup is a tubular perianthium, remaining till the ſeed ripens; it is compoſed of one leaf, divided at the extremity into eight ſegments alternately larger and ſmaller. It has no petals; the ſtamina are four very ſmall erect, pointed filaments, inſerted in the rim of the cup; the antheræ are roundiſh; the germen of the piſtillum is of an oval figure; the ſtyle is ſlender, of the length of the ſtamina, and inſerted on the baſis of the germen; the ſtigma is of a globoſe figure. The neck of the cup ſhutting together, makes it ſerve in the place of a fruit, containing a ſingle compreſſed ſeed of an elliptic figure. *Linnæus*, Gen. Plantar. p. 52.

ALCHITRAM, among the alchemiſts, denotes ſometimes the oil of juniper, ſometimes liquid pitch, and ſometimes arſenic prepared by ablution. *Rul.* Lex. Alch. p. 26. *Caſt.* Lex. Med. p. 29.

This is otherwiſe written *Alchieram* and *Alchitran*; ſometimes *Alchytran* and *Alkytran*.

ALCHYMY (*Cycl.*)—The word is alſo written *Alchimy*; and by the modern Greeks, *Archemia*. Some will have its genuine orthography to be *Halchymia*.

The curious may conſult the following authors concerning the origin, progreſs, and pretenſions of *Alchymy*.

Miner. p. 103.

We have numerous writings on *Alchemy*, in Greek, Latin, Engliſh, High-Dutch, &c. under the titles of introductions, elements, practices, proceſſes, myſteries, examinations, vindications, revelations, &c. Among the Greeks, the chief are Heliodorus, Syneſius, Zozimus, Pappus, Theophraſtus, Oſtanus, Archelaus, Olympiodorus, Stephanus, Democritus, Pelagius, Eugenius, Johannes Archiereus, Iſis, Agathodæmon, Jamblichus, Comarius, Dioſcurus, Cleopatra, Michael Pſellus, and divers anonymous authors under the appellations of Chriſtianus, Hierotheus, &c. all preſerved in MS. in ſeveral libraries, particularly the French king's library at Paris, the imperial library at Vienna, the Vatican at Rome, the Eſcurial at Madrid, and others at Venice, Milan, Gotha, &c.

Theſe authors appear to have been partly heathens, and Jews, but the greater part Chriſtians, and chiefly monks, living at Alexandria, and Conſtantinople, from the fifth century downwards. The collection appears to have been firſt brought into Italy in the fifteenth century, by the Greek refugees, who came for ſhelter there, upon the taking of Conſtantinople by the Turks. The genuineneſs of many of them is much diſputed by Reineſius, and others; tho' defended by Morhof. Leo Allatius had a deſign to have publiſhed them: his failure herein has been much lamented by ſeveral; two of them, *viz.* Heliodorus and Syneſius, have actually ſeen the light by the care of Fabricius.

Id. ibid. T. 8. p. 232.]

The Engliſh alchemiſts, who have written on the ſcience in their own language, are Norton, Ripley, Pearce the black monk, Carpenter, Andrews, Charnock, Blomefield, Kelly, and Robinſon. Others, as Dr. Dee, &c. have written in Latin, who have been all publiſhed together with notes, &c. by Elias Aſhmole; which editor has alſo publiſhed a piece of his own on the ſubject, and tranſlated another of Dr. Dee's. See *Wood*, Athen. Oxon. and the Theatr. Chym. Britan.

The beſt writers in *Alchemy*, according to the judgment of Boerhaave, are Geber, Morienus, Roger Bacon, Ripley, Raim. Lully, Bern. count Treviſanus, John and Iſaac Holandus, Sendivogius, Baſil Valentine, Artephius, Paracelſus, Irenæus Philalethes, and Van Helmont. See *Boerhaave*'s Chemiſtry.

Albinus, Manget, and others, have publiſhed collections of writers in *Alchemy*, under the titles of Bibliothecas [a], Theatres [b], and Turbas [c], of chemiſts. Garlandia and Rulandus have given dictionaries of *Alchemy* [d]. Borellus, Borrichius, &c. catalogues of writers in *Alchemy* [e]. —[[a] *Nath. Albin.* Bibliotheca Chemica, Genev. 1653. & 1673. *Jo. ALCHEMY is alſo uſed, in a leſs proper ſenſe, for the art of common chemiſtry. See CHEMISTRY.

In which ſenſe, Libavius has publiſhed *a Practice of Alchemy*, deſcribing the preparations of the chief chemical medicines. *And. Libavii*, Praxis Alchemiæ, h. e. de artificioſa Præparatione Præcipuorum Medicamentorum, Francof. 1604. 8vo.

ALCIBIADIUM. See ALCIBIUM.

ALCIBIUM, in botany, a word uſed ſometimes by the antients, as an epithet, for a kind of *echium*, or viper's bugloſs, and ſometimes as the name of a peculiar plant. The firſt of theſe is no other than the common echium, which is called by ſome *echium Alcibium*, and by others *echium Alcibiadium*. But Nicander expreſly diſtinguiſhes the other from this, and ſays, that it was a different plant, and was ſimply called *Alcibium*, without the word *echium*. He ſays, that this had its name from a perſon ſo called, who being aſleep in the threſhing floor in ſummer, was bitten by a viper in the groin, and cured himſelf by this herb. We have no account of this plant, by which it is poſſible to gueſs what kind it was of; and Pliny confeſſes himſelf not to know it, or be able to find any account of it in the writers of the times before him; ſo that if Nicander is right in diſtinguiſhing it from the *echium*, ſo called, we have wholly loſt the knowledge of the plant. *Nicander*, de Theriaca.

ALCMANIAN (*Cycl.*)—Some authors aſſign other *Alcmanian* verſes, compoſed of three *dactyls*, and a long ſyllable [a].

E. gr. *Munera lætitiamque Dei.*

Others give an *Alcmanian*, compoſed of a *dactyl*, *ſpondee*, and another *dactyl*, and a long ſyllable [b].

E. gr. *Ne dubita nam vera fides.*

—[[a] Trev. Dict. Univ. T. 1. p. 264. [b] *Alſted.* Encycl. T. 1. p. 520. See alſo *Martin*, Lex. Philol. T. 1. p. 23. voc. *Alcman.*]

ALCOA *arbor*, in botany, a name uſed, by ſome authors, for the tree brought from St. Helena, the wood of which emulates the colour and texture of ebony. *Ray*'s Hiſt. Vol. 3. p. 520.

ALCOHOL (*Cycl.*) is otherwiſe written *Alchool*, *Alcool*, *Alkol*, and *Alcol*.

Rolfink [a] and Wedelius [b] diſpute much on the etymon of this word.—[[a] *Rolf.* Chym. l. 4. ſec. 8. [b] *Wedel.* Pharm. Acroam. l. 1. ſec. 1. c. 3. p. 16. ſeq.]

Jungken deſcribes various methods of preparing *Alcohol* of wine, from Helmont, Boyle, Glauber, Le Mort, &c. *Jungk.* Lex. Chym. Pharm. P. 1. p. 13. ſeq.

ALCOHOL is alſo uſed, by modern chemiſts, for any fine highly rectified ſpirit. *Caſtel.* Lex. Med. p. 29. See SPIRIT *rectified.*

ALCOHOL, in the Arabian aſtrology, is when a heavy ſlow-paced planet receives another lighter one within its orb, ſo as to come in junction therewith. *Vital.* Lex. Math. p. 18.

ALCOHOLIZATION, in chemiſtry, the rectification of a vinous ſpirit. *Teichm.* Elem. Chem. P. 1. c. 4. p. 2.

This is otherwiſe called *Alcooliſation.*

Alcoholization, according to Starkey, denotes the circulation of a volatile ſpirit on a fixed alkali, till ſuch time as out of the two ariſes one only neutral body, different from both the former. *Alcoholization* is one way of volatilizing alkali's. *Starkey*, p. 128. Mem. de Trev. an. 1706. p. 246.

ALCOHOLIZATION is alſo uſed for pulverization. *Juncker*, Conſp. Chem. tab. 12. p. 313. See PULVERIZATION, *Cycl.*

ALCOHOLISED is underſtood of things which are reduced to an *Alcohol.*

In this ſenſe, we meet with *alcoliſed* ſpirits, *alcoliſed* powders, &c.

This is otherwiſe written, *alcoolized*, and amounts to much the ſame as ſubtilized, rectified, &c.

According to Starkey's doctrine, as there are three kinds of ſpirits, acid, urinous, and vinous, we may alſo make three kinds of *alcoholized* alkali's, which are diſtinguiſhed by the names of *arcanum ponticitatis*, *arcanum microcoſmi*, and *arcanum famech.* *Starkey*, p. 128. Mem. de Trev. loc. cit.

ALCOLA is uſed, by alchemiſts, for the tartar of urine. *Caſt.* Lex. Med. p. 30.

Alcola is found in three different forms; viz. 1. Reſolved, or reduced into an impalpable ſubſtance. 2. Sandy, or voided under the appearance of ſmall grains of whitiſh or reddiſh ſand. 3. Mucilaginous, or viſcous. *Paracelſ.* de Urin. Indic. l. 1. tr. 2. c. 1. ſeq. ap. Caſt. Lex.

ALCOR, in aſtronomy, a ſmall ſtar adjoining to the large bright one in the middle of the tail of the Great Bear. Phil. Tranſact. N°. 283. p. 848. *Wolf.* Elem. Aſtron. §. 236. Edit. 1. See URSA *major*, *Cycl.*

The word is Arabic.—It is a proverb among the Arabians, applied to one who pretends to ſee ſmall things, but overlooks much greater, *Thou canſt ſee* Alcor, *and yet not ſee the full moon.* *Vital.* Lex. Math. p. 19. *Wolf.* Lex. Math. p. 34.

ALCORAN (*Cycl.*)—Some take this word to denote a collection, and ſuppoſe the name was given to this book, as being a collection of the looſe chapters, or ſheets, out of which it was firſt formed.

This opinion, to which Salmaſius adheres [a], is refuted by Mr. Sale [b] from this conſideration, that the name *Koran* is not only given to the whole compoſition, but to any part, or portion of it, conſequently cannot properly import a collection. M. Ancillon ſuggeſts, that the word is not a noun, but a verb, ſignifying *confeſſus eſt*, or *correxit*, and importing either a confeſſion of faith, or a correction of the Old and New Teſtament [c]; but this will hardly be adopted by any.—[[a] Exerc. ad Solin. in Proleg. [b] Prelim. Diſc. to Koran, §. 3. p. 56. ſeq. [c] *Ancill.* Melang. P. 1. p. 78. Act. Erud. Lipſ. 1698. p. 288.]

The *Alcoran* is known by divers other names, ſome of which are mentioned in the Cyclopædia. It is ſometimes alſo called *al Moſhaf*, *q. d.* the volume; *al Kitab*, the book; *Tanzil*, a thing deſcended from above; *Kelam Scheref*, the noble word; *Ketaz aziz*, the precious book. *Sale*, lib. cit. p. 57. Trev. Dict. Univ. T. 1. p. 264.

The form in which any paſſage of it is quoted by any of the Mahometan writers, in their works, is by writing in a large character, or in red letter, the two words *Coulho taala*, God ſays, without marking either chapter or verſe.

The work is divided into an hundred and fourteen *ſuras*, or chapters, and the ſuras ſubdivided into little verſes, or ſigns, called *ayat*; which are all compoſed in a broken interrupted ſtyle, reſembling proſe rather than verſe, though generally reckoned, by learned men, in the latter claſs.

Mr. Sale aſſures, that it is written in proſe, but that the ſentences generally conclude in a long continued rhime, for the ſake of which, the ſenſe is often interrupted, and unneceſſary repetitions made. The Arabs are ſo delighted with this jingling, that they employ it in their moſt elaborate compoſitions, which they embelliſh with frequent paſſages of, and alluſions to, the *Alcoran*; ſo that it is next to impoſſible to underſtand them, without being well verſed in this book.

The diviſion into ſura's is but of a late ſtanding. Neither the ſura's, nor the verſes, are actually marked in any of their copies, though, in ſome MSS. the number of verſes in each chapter is ſpecified after the title.

Beſide the diviſions of chapter and verſe, which are unequal, the Mahometans have divided the *Alcoran* into ſixty equal portions, called *hizb*, or *ahzab*, each of which is ſubdivided into four equal parts. This ſeems to be an imitation of the Jews, who have a like diviſion of their *Miſchna*, into ſixty portions, or *maſſiototh*. But the more uſual diviſion of the *Koran*, is into thirty ſections only, called *ajza*, each of twice the length of the former, and ſubdivided, like them, into four parts. Theſe diviſions are for the uſe of the public readers of the *Alcoran*, in the royal temples, and chapels adjoining to them, wherein are the tombs of their great men. Of the thirty readers belonging to every chapel, each reads his ſection every day; ſo that the whole *Alcoran* is read over once a day. *Sale*, lib. cit. p. 59.

After the title at the head of each chapter, excepting the ninth, is prefixed the formula, "In the name of the moſt "merciful God," called by the Mahometans *Biſmallah*, wherewith they conſtantly begin all their books and writings, as the diſtinguiſhing mark of their religion.

Twenty-nine of the chapters of the *Alcoran* have this further peculiarity, that there are certain letters of the alphabet prefixed to them. In ſome a ſingle letter; in others, two or more. Theſe letters are ſuppoſed, by the true believers, to conceal divers profound myſteries, the underſtanding whereof has been communicated to no man, their prophet excepted. Yet ſome have pretended to find their meaning, by ſuppoſing the letters to ſtand for ſo many words, expreſſing the names, attributes, and works of God. Others explain theſe letters from the organ made uſe of in their pronunciation; others from their value in numbers. Thus there are five chapters, whereof one is the ſecond, which begins with theſe letters, *A*, *L*, *M*. which ſome imagine to ſtand for *Allah*, *Latif*, *Magid*; God is gracious, and to be glorified. Others for *Ana*, *Li*, *Minni*; To me, and from me, viz. belongs all perfection, and proceeds all. Others for *Ana*, *Allah*, *Alam*; I am the moſt wiſe God. Taking the firſt letter to denote the beginning of the firſt word, the ſecond the middle of the ſecond, and the third the laſt of the third word. Others for *Allah*, *Gabriel*, *Mahomet*: the firſt, the author; the ſecond, the revealer; the third, the preacher of the *Alcoran*. Others pretend, that as the letter *A* belongs to the lower part of the throat, the firſt of the organs of ſpeech; *L* to the palate, the middle organ, and *M* to the lips, the laſt organ; ſo theſe letters denote, that God is the beginning, middle, and end. Others, that as the numerical value of theſe three letters is ſeventy-one, they denote, that in the ſpace of ſo many years, the religion preached in the *Koran* ſhall be fully eſtabliſhed. Golius conjectures, that theſe letters were put there by the copieſt, for *Amar li Mahomede*, *i. e.* at the command of Mahomet. *Gol.* Append. ad Gram. Erpen. p. 182. *Sale*, Prelim. Diſc. to Koran, ſect. 3. p. 60.

The *Alcoran* is allowed to be written with the utmoſt elegance and purity of language, in the dialect of the Koreiſhites, the moſt noble and polite of all the Arabians, but with ſome mixture of other dialects. It is the ſtandard of the Arabic tongue, and, as the orthodox believe, and are taught by the book itſelf, inimitable by any human pen; and therefore inſiſted on as a permanent miracle, greater than that of raiſing the dead, and alone ſufficient to convince the world of its divine original; and to this miracle did Mahomet himſelf chiefly appeal, for the confirmation of his miſſion, publicly challenging the moſt eloquent ſchoolmen in Arabia, to produce a ſingle chapter comparable to it. A late ingenious and candid writer, who is a very good judge, allows the ſtyle of the *Alcoran* to be generally beautiful and fluent, eſpecially where it imitates the prophetic manner, and ſcripture phraſe; conciſe, and often obſcure; adorned with bold figures, after the eaſtern taſte; enlivened with florid and ſententious expreſſions; and, in many places, eſpecially where the majeſty and attributes of God are deſcribed, ſublime and magnificent. *Sale*, lib. cit. p. 61.

To the pomp and harmony of expreſſion ſome aſcribe all the force and effect of the *Alcoran*; which they conſider as a ſort of muſic, equally fitted to raviſh and amaze, with other ſpecies of that art [d]. In this Mahomet ſucceeded ſo well, and ſo ſtrangely captivated the minds of his audience, that ſeveral of his opponents thought it the effect of witchcraft and enchantment, as he himſelf complains [e].—[d *Caſaub.* of Enthuſ. c. 4.

[e] Alcor. c. 15, 21, &c.

Others have attributed the effect of the *Alcoran* to the frequent mention of rewards and puniſhments; heaven and hell occur almoſt in every page [f]. Some ſuppoſe, that the ſenſual pleaſures of paradiſe, ſo frequently ſet before the imaginations of the readers of the *Alcoran*, was what chiefly bewitched them [g]. Though, with regard to theſe, there is great diſpute whether they are to be underſtood litterally, or ſpiritually [h]. Several have even allegorized the whole book. The ſame has happened among Jews and Chriſtians. In every ſect there are, from time to time, perſons of an imagination too fine, to be contented with the common ſyſtem, which is only accommodated to the multitude. Hence the tribe of allegoriſts, myſtics, cabaliſts, &c.—[f Mem. de Trev. 1725. p. 648. Bibl. Franc. T. 9. p. 198. [g] New Mem. of Liter. T. 5. p. 11. [h] Bibl. Univ. T. 10. p. 94. ſeq.]

The moſt elegant paſſage in the whole *Alcoran*, in the judgment of all the commentators, is that in the chapter of *Hud*, wherein God, to put a ſtop to the deluge, ſays; "O "earth, ſwallow up theſe waters! and thou, O heaven, "withdraw thy rain! And immediately the water abated; "the decree was fulfilled; the ark reſted on the mountain, "and a voice was heard, Woe to the ungodly." Al Kor. c. 11. p. 180. *Herbel.* Bibl. Orient. p. 87. ſeq.

The *Alcoran*, beſides the inconveniencies to which all books of revelation are ſubject, viz. to be differently underſtood and interpreted, has ſome peculiar ones. Mahomet placed the ſtreſs and merit of his *Alcoran* on the excellency of the ſtyle. This is ſubject to inconveniencies: the compoſition and arrangement of words admits of infinite varieties, and it can never be abſolutely ſaid, that any one is the beſt poſſible. Accordingly Hamzah Benahmed wrote a book againſt the *Alcoran*, with at leaſt equal elegancy [i], and Moſelema another, which even ſurpaſſed it [k], and occaſioned a defection of a great part of the muſſelmen.—[i V. Jour. des Scav. T. 13. p. 280. [k] Ouvr. des Scav. Nov. 1708. p. 494.]

The *Alcoran* is held not only of divine original, but eternal and uncreated, remaining, as ſome expreſs it, in the very eſſence of God. The firſt tranſcript has been from everlaſting by God's throne, written on a table of vaſt bigneſs, in which are alſo recorded the divine decrees, paſt and future. A copy from this table, in one volume, on paper, was ſent down to the loweſt heaven, in the month of Ramadan, on the night of power. From whence it was delivered out to Mahomet by parcels, ſome at Mecca, and ſome at Medina. Though he had the conſolation of ſeeing the whole once a year, and in the laſt part of his life twice. Ten new chapters were delivered entire, the greater part only in ſeparate periods, which were written down from time to time by the prophet's amanuenſis, in this or that part, of this or the other chapter, as he directed. The firſt parcel that was revealed, was the five firſt verſes of the ninety-ſixth chapter, which the prophet received in a cave of Mount Harah, near Mecca. *D'Herbel.* lib. cit. p. 85.

This method was formed on that of the Jews, who hold that the law was alſo given to Moſes by parcels. *Milt.* de Mahom. Antimahom. p. 365. *Sale*, lib. cit. p. 65.

There are great diſputes as to the time and manner of the deſcent of the *Alcoran*. Some will have it to have only begun to deſcend on the night above-mentioned. Others aſſert, that it arrived that night at the end of its journey: while other maintain, that it was only taken down that night from the table of the divine decree, which the muſſelmen call *Louh-al Mahfoudh*, or the *well kept table*, *i. e.* the ſecret book, or regiſter. This night, according to the Mahometans, returns yearly; but they are not agreed as to the preciſe time of its return. Some place it in one month, ſome in another; the generality in the month Ramadan. This opinion, however probable, not being certain, they obſerve nine ſeveral nights, for greater ſecurity, in memory of it.

This eternity and increation of the *Alcoran*, has occaſioned vehement diſputes, having been oppoſed by many, particularly by the ſect of the Motazalites, and the followers of Almozdar, who ſtuck not to accuſe thoſe who held the *Alcoran* to be increated, as infidels, and aſſerters of two eternal beings. The diſpute occaſioned great calamities. Some of the kaliphs of the family of Abas, publiſhed an edict, declaring the *Alcoran* to be created; and ſeveral were whipt, impriſoned, and put to death, for holding the contrary. But the edict was afterwards revoked, and men left at liberty to think on the point as they pleaſed. *D'Herbelot*, lib. cit. p. 85. ſeq.

The *Alcoran* has not wanted for cenſors and detractors, even among the Arabs, ſome of whom have denied any thing miraculous in the book, except the prophecies; adding, that as to the point of eloquence, the Arabians were able, without inſpiration, to have done ſomething equal, or even ſuperior to it. This was the opinion of the Motazalites, and particularly of Almozdar and Alnodham. *Sale*, lib. cit. p. 67. ſeq.

The general aim of the *Alcoran* was, to unite the profeſſors of the three different religions, then followed in Arabia, idolaters, Jews, and Chriſtians, in the knowledge and worſhip of one God, under the ſanction of certain laws, and the outward ſigns of ceremonies, partly of antient, and partly of novel inſtitution, enforced by the conſideration of rewards and puniſhments, both temporal and eternal, and to bring all to the obedience of Mahomet, as the prophet and embaſſador of God, who was to eſtabliſh the true religion on earth, and be acknowledged chief pontiff in ſpiritual matters. The chief point therefore inculcated in the *Alcoran*, is the unity of God, to reſtore which, the prophet confeſſed was the chief end of his miſſion. The reſt is taken up in preſcribing neceſſary laws and directions, frequent admonitions to moral and divine virtues, the worſhip and reverence of the ſupreme being, and reſignation to his will. One of their moſt learned commentators diſtinguiſhes the contents of the *Alcoran* into allegorical and literal; under the former are comprehended all the obſcure, parabolical, and ænigmatical paſſages, with ſuch as are repealed, or abrogated; the latter, ſuch as are clear, and in full force. Vid. *Golii*, Append. ad Gram. Erpen. p. 176. *Sale*, lib. cit. p. 62. ſeq.

The moſt excellent moral in the whole *Alcoran* is alſo allowed, by interpreters, to be that in the chapter *Al Araf* [l], *i. e.* ſhew mercy, do good to all, and diſpute not with the ignorant; or, as Mr. Sale renders it, Uſe indulgence, command that which is juſt, and withdraw far from the ignorant [m]. Mahomet, according to the authors of the *Keſchaf*, having begged of the angel Gabriel a more ample explication of this paſſage, he received it in the following terms: "Seek him who turns thee out, give to him who takes from "thee, pardon him who injures thee; for God will have "you plant in your ſouls the roots of his chief perfections." —[l *D'Herbel.* p. 88. [m] Al Koran, c. 7. p. 138.]

'Tis eaſy to ſee, that this commentary is copied from the Goſpel.—In reality, the neceſſity of forgiving enemies, though frequently inculcated in the *Alcoran*, is of a later date among the Mahometans, than among the Chriſtians; and among thoſe latter,

than among the heathens. But it matters not ſo much who had it firſt, as who obſerves it beſt. The caliph Haſſan, ſon of Hali, being at table, a ſlave unfortunately let fall a diſh of meat reeking hot, which ſcalded him ſeverely; the ſlave preſently fell on his knees, rehearſing theſe words of the *Alcoran*, "Paradiſe is for thoſe who reſtrain their anger." I am not angry with thee, anſwered the caliph. "And for thoſe who "forgive offences againſt them," continues the ſlave. I forgive thee thine, replies the caliph. "But above all, for "thoſe who return good for evil," adds the ſlave. I ſet thee at liberty, rejoin'd the caliph, and I give thee ten dinars. *Saadi*, ap. Mem. de Trev. 1705. p. 1137.

There are alſo a great number of occaſional paſſages in the *Alcoran*, relating only to particular emergencies. For this advantage Mahomet had in the piece-meal method of receiving his revelation, that whenever he happened to be perplexed and gravelled with any thing, he had a certain reſource in ſome new morſel of revelation. It was an admirable contrivance of his, to bring down the whole *Alcoran* at once, only to the loweſt heaven, not to earth; ſince, had the whole been publiſhed at once, innumerable objections would have been made, which it would have been impoſſible for him to ſolve; but as he received it by parcels, as God ſaw fit they ſhould be publiſhed for the converſion and inſtruction of the people, he had wherewithal in petto, to anſwer all emergencies, and extricate himſelf from all difficulties. *Sale*, lib. cit. p. 63. ſeq.

To give an inſtance, Naſſer Ben Hareth pretended to queſtion the authority of the *Alcoran*; Mahomet declined to enter into a diſpute on the head, but appealed to God for the truth of his doctrine; the former joined with him in this appeal, pronouncing the following words. "Lord, if what "Mahomet ſays come from thee, rain ſhowers of ſtones "upon us, and over-whelm us, as thou formerly didſt to "Abraham the Abyſſinian; and puniſh us ſeverely in the "next world." This was a fair trial of the *Alcoran*; and there ſeemed ſome neceſſity for a miracle to maintain its divinity. But an eaſier expedient ſerved: the angel Gabriel came down in the nick of time, and brought a new verſe to the following effect. "God does not care, O Mahomet, to "puniſh them, while thou art among them." On which paſſage the commentators take notice, that it has not been uſual for God to puniſh a people by extermination, while one of his prophets, or envoys was among them. This Naſſer, who puſhed Mahomet ſo vigorouſly, is never mentioned by Muſſulmen without execrations. *D' Herbel.* p. 86.

The Muſſulmen dare not ſo much as touch the *Alcoran*, without being firſt waſhed, or legally purified; to prevent which, an inſcription is put on the cover or label; *Let none touch but they who are clean.* It is read with great care and reſpect; being never held below the girdle. They ſwear by it, take omens from it on all weighty occaſions; carry it with them to war, write ſentences of it in their banners, adorn it with gold and precious ſtones, and knowingly ſuffer it not to be in the poſſeſſion of any of a different religion. Some ſay that it is puniſhable even with death, in a Chriſtian to touch it; others that the veneration of the Muſſulmen, leads them to condemn the tranſlating it into any other language as a prophanation; but theſe ſeem to be aggravations. The Mahometans have taken care to have their ſcripture tranſlated into the Perſian, the Javan, the Malayan, and other languages, tho' out of reſpect to the original, theſe verſions are generally if not always interlineated. *Reland*, de Relig. Mahom. p. 265. *Sale*, lib. cit. p. 69.

It is not enough with the Muſſulmen, that the *Alcoran* be the object of the ſtudy of men, but it muſt be that of their favourite brutes, as cats, horſes, and camels [n]. Its reception has been very different in different countries. In Turky it makes their eccleſiaſtical law, in Perſia their civil law [o], in Spain it has been burnt [p], in Italy prohibited [q], in Tartary thrown to horſes [r].—[[n] Jour. des Scav. T. 62. p. 272. [o] Act. Erud. Lipſ. 1695. p. 278. [p] *Gomez.* Vit. Ximen. Amæn. Liter. T. 1. p. 357. *Gedd.* Miſc. Tract. T. 1. p. 11. Jour. des Scav. T. 21. p. 424. [q] Act. Erud. Lipſ. 1699. p. 249. [r] *Gen.* Hiſt. Tart. T. 1. p. 110.]

The paſſages in the *Alcoran*, which are contradictory to each other, are ſolved by the Mahometan doctors from the doctrine of abrogation. They pretend that God commanded many things in the *Alcoran*, which for good reaſons he afterwards revoked.

In one ſenſe the *Alcoran* cannot be ſaid to be a bad book, ſince it is founded on the bible. A learned Jeſuit finds it ſo far from being hurtful to chriſtianity, that he has even liſted it into the chriſtian cauſe, and drawn proofs from it for the truths of the goſpel. P. de Colonia in Mem. de Trev. 1719. p. 613. See further concerning the Hiſtory of the *Alcoran*, *Boulainviliers*, Vie de Mahom. p. 258. Act. Erudit. Lipſ. 1694. p. 382. It. 1692. p. 331. ſeq. Its excellency and uſe, *Boulainvil.* lib. cit. p. 348. *Reland*, Relig. Mahom. in Pref. Jour. Liter. T. 10. p. 29. Its Characters and Confuſion, Ouvr. des Scav. Sept. 1704. p. 419. Jour. des Scav. T. 37. p. 39. It. T. 48. p. 87. ſeq. Its Obſcurity and Difficulties, Mem. de Trev. 1714. p. 1147. Its Doctrine of Chriſt, Phil. Tranſ. N°. 154. p. 433. See alſo *Poſtellus* on its conformity with the Goſpel. Contradictions in it, how ſolved. *D' Herbel.* p. 87.

ALCORAN is alſo figuratively applied to certain other books full of impieties and impoſtures.

In this ſenſe we meet with the *Alcoran* of the Cordeliers, which has made a great noiſe. Wherein St. Francis is extravagantly magnified, and put on a level with Jeſus Chriſt.

The *Alcoran* of the Cordeliers, is properly an extract of a very ſcarce book, entitled the conformity of the life of the ſeraphic father St. Francis, with the life of Chriſt, publiſhed in 1510. 4°. Since at Bologna in folio [s]. Eraſmus Albertus, being by the elector of Brandenburg appointed to viſit a monaſtery of Franciſcans, found this book; and being ſtruck with the extreme folly and abſurdity of it, collected a number of curioſities out of it, and publiſhed them under the title of the *Alcoran* of the Franciſcans, with a preface by Martin Luther [t]. This was afterwards tranſlated into French [u], and Latin [x], and publiſhed with additional extracts.—[[s] *Liber Aureus Inſcriptus Liber Conformitatum Vitæ beati ac ſeraphici P. Franciſci ad Vitam Jeſu Chriſti Domini noſtri, denuo editus correctus & illuſtratus a J. Jer. Bacchio Utinenſi, Sodali Franciſcano Doctore Theol. Bonon.* 1590. fol. [t] Altenb. 1542. 4°. [u] L' Alcoran des Cordelieres Extrait. mot a mot de ce malheureux Livre des Conformitez de St. Francis, &c. Gen. 1560. 2 Vol. 8°. [x] *Alcoranus Franciſcanorum*, Gen. 1578. 8°. Amæn. Liter. T. 3. p. 161. ſeq. *Lomier*, de Biblioth. p. 140. Mem. of Liter. T. 3. p. 33. Not.]

ALCORAN is alſo uſed in a more limited ſenſe, for a portion or chapter of the Koran. *Sale*, ubi ſupra. p. 56.

In which ſenſe, the word is ſynonymous with *Sura*.

ALCORANISTS, among Mahometans, thoſe who adhere ſtrictly to the letter or text of the *Alcoran*, from an opinion of its ultimate ſufficiency and perfection [a]. The Perſians are generally *Alcoraniſts*, as admitting the alcoran alone for their rule of faith. The Turks, Tartars, Arabs, &c. beſides the alcoran, admit a multitude of traditions [b].—[[a] *D' Herbel.* Bibl. Orient. p. 87. [b] *Pfaff.* Theol. Jud. & Moham. p. 397. Bibl. Univ. T. 7, p. 242.]

The *Alcoraniſts*, among Mahometans, amount to much the ſame with the Textuaries among the Jews. The *Alcoraniſts* can find nothing excellent out of the alcoran; are enemies of philoſophers, metaphyſicians, and ſcholaſtic writers. With them the alcoran is every thing.

ALCYON, (*Cycl.*) a name given by the antients to the Iſpida, or king-fiſher. See ISPIDA.

ALCYONIUM, in botany, the name of a genus of plants the characters of which are theſe. They are of a very irregular ſtructure, often very hard, and ſometimes ſoft; uſually of a cruſtaceous or vermiculated appearance, and affording no viſible ſeeds or flowers.

The ſpecies of *Alcyonium*, enumerated by Mr. Tournefort are theſe:

1. The hard *Alcyonium*, or firſt *Alcyonium* of Dioſcorides. 2. The ſoft *Alcyonium*, or fourth *Alcyonium* of Dioſcorides. 3. The ſtuppoſe *Alcyonium*. 4. The tuberous *Alcyonium*. 5. The hard, hat-faſhioned *Alcyonium*. 6. The great hard arboreſcent *Alcyonium*. 7. The perforated, red ſtuppoſe *Alcyonium*. 8. The purple vermiculated *Alcyonium*. 9. The white vermiculated *Alcyonium*. 10. The yellow vermiculated *Alcyonium*. 11. The capillaceous, curled and vermiculated *Alcyonium*. 12. The Engliſh vermiculated *Alcyoninm*, called by Mr. Ray, the long cylindric cord-like Fucus. *Tournef.* Inſt. p. 577.

ALCYONIUM is alſo a name given by Loyd, to a peculiar kind of foſſil coral, of the Aſtroites kind, found in Wales. It is very plentiful in that country, and puts on the appearance of a ſort of marble, being bedded in a marbly matter for its matrix. It is never found lodged in the ſtrata, but always in looſe nodules of ſix, nine, or twelve inches in diameter, and when poliſhed makes a very beautiful appearance. When cut horizontally, and when perpendicularly, it puts on two very different appearances. It is the ſame ſtone that De Boot has deſcribed, under the name of the firſt aſtroites. In its recent ſtate, it is a ſort of white coral, growing plentifully in the ſeas about Jamaica; and it is as frequently found foſſil in England, and is often buried in maſſes of a ſort of flint, ſo hard and beautiful, that it will take a poliſh like an agate. There are beſides this, many other things which are plentiful in their recent ſtate, in the ſeas about Jamaica; and are as common foſſils with us in England, in the inland countries, and in places near no ſeas, nor any other place, where they could have grown in their recent ſtate, even if they had been in that ſtate the produce of this iſland. The univerſal deluge alone can account for theſe changes. Philoſ. Tranſ. N°. 252. p. 188.

ALDABARAM, in oſteology, a name given by ſome to the ſeſamoide bones in the great toe. See SESAMOIDEA, *Cycl.*

ALDARU, in botany, a name given by Aviſenna, Serapion, and other writers of the Arabian nation, to the lentiſk tree. Aviſenna ſays, that *Aldaru* is the name of that kind of the turpentine tree, which produces the largeſt fruit. But Serapion, on the other hand, tells us that the turpentine tree is of two kinds, the one cultivated, and the other wild; and that the wild kind is called lentiſk, and has leaves and fruit

fruit like the common turpentine tree, only ſmaller. Abuanifa ſays, that in ſome places the turpentine tree grows wild on the mountains, and grows to as large a ſize as an oak, bearing proportionably large fruit; and Theophraſtus tells us, that in Syria, the turpentine grows to a large and lofty tree, tho' in other countries it be but a low ſhrub. The whole difference therefore between theſe authors may be, that the wild turpentine tree, and not the lentiſk, produces thoſe large fruit, which Aviſenna ſpeaks of; and indeed on comparing the whole chapter of Aviſenna, with the Greek of Dioſcorides, from which it is taken, it will be found ſo full of errors, that it will not appear wonderful he ſhould have ſaid wrong in this article.

ALDEBAC, in the materia medica of the antient Arabian phyſicians, the name by which they have called bird-lime. They place this among the vegetable poiſons, and always tranſlate the ἡ ἰξίας of Dioſcorides by this word, or by the word *debac*, without the particle *Al*. In this, they are much to be preferred to Pliny, who always tranſlates ἰξίας, *Viſcum*; whereas they only tranſlate it ſo, where the Greeks meant it ſo, that is, where they uſed it as a ſubſtantive feminine; but where they uſed it as a maſculine adjective, they have properly diſtinguiſhed it, and tranſlated it by the chamæleon thiſtle. This was evidently the ſenſe of the Greek writers, who in this ſenſe mention it as a ſafe remedy, and who called the white chamæleon thiſtle by this name, not from its poſſeſſing the qualities of bird-lime, but from its yielding a viſcous juice, which in time hardened into a ſubſtance like maſtick, and was uſed to hold in the mouth, to ſweeten the breath.

ALDEBARAN (*Cycl.*) is otherwiſe called *Lampas*, *Oculus Tauri*, in Engliſh the bull's eye. The Romans gave it the name *Palilitium*, from its riſing at the time when their feaſt called *Palilia* was celebrated. *Plin.* Hiſt. Nat. l. 18. c. 26.

ALDERAIMIN, in aſtronomy, a ſtar of the third magnitude on the right ſhoulder of Cepheus. See CEPHEUS, *Cycl.*

ALDHAFERA, in the Arabian aſtronomy, denotes a fixed ſtar of the third magnitude, in the lion's mane. *Vital.* Lex. Math. p. 19. ſeq.

ALDII, in antiquity, ſervants who attended their maſters in expeditions to the wars. *Aquin.* Lex. Milit. T. 1. p. 38.

Theſe were otherwiſe called *Aldiones*, *Aldionii*, and *Aldionarii*.

ALE (*Cycl.*)—The word *Ale* is originally Daniſh, *Ael*, by which name the liquor is ſtill called in that language. *Verſteg.* Antiquit. c. 3. p. 49.

We have different accounts of the origin of *Ale*. Some after Pliny derive it from the Egyptians, who it is even ſaid aſcribed the invention to one of their gods, *viz.* Dionyſius the ſon of Ammon, that is to Bacchus himſelf, who firſt diſcovered the method of making a potable liquor, by fermenting the water of the Nile with ſome of the grains of that country. Others, after Tacitus, maintain it to have been of German origin, tho' uſed alſo among the antient Gauls, and other more northern nations. Jour. des Scav. T. 67. p. 273. *Plin.* Hiſt. Nat. l. 22. c. 25. *Hardouin*, Not. ad Eund.

Ale is ſuppoſed to be much the ſame with what was known among the antients, by the names of *Zythum* and *Curmi*.

Pale ALE, that prepared of malt ſlightly dried.

Brown ALE, that made from malt higher dried, or roaſted.

The latter is found purer, thinner, and more fluid, the former ſtronger of the malt, and more viſcid. *Quinc.* Diſpenſ. P. 2. Sect. 13. p. 216.

Ale is generally held more diuretic than beer, in regard *Ale* is ſmoother, more ſoftening and relaxing, ſo that where urine is to be promoted by facilitating the paſſage, *Ale* is moſt likely to effect it. *Quinc.* Diſpenſ. P. 2. Sect. 13. p. 215.

Ale, it is ſaid, fouls the glands, ſtuffs the veſſels with ſlime and viſcidity, makes the body unweildy and corpulent, and paves the way for cachexies, jaundice, aſthmas, and incurable dropſies; fills the urinary paſſages with ſlough and matter of as ill conſequence as gravel itſelf. But may it not be aſked what proof there is of this? And whether all the diſeaſes aſcribed to *Ale*, be more than what may ariſe from a diet too plentiful in proportion to the exerciſe of a perſon?

Pale ALE brewed with hard waters, as thoſe of ſprings and wells, is judged the moſt wholeſome in regard the mineral particles, tend to prevent the coheſions of thoſe drawn from the grain, and enable them to paſs the proper ſecretions the better; ſofter waters, as thoſe of rivers, and rain, ſeem better ſuited to draw out the ſubſtance of high dried malts, which retain many igneous particles, beſt abſorbed in a ſmooth vehicle. *Quinc.* loc. cit.

In Staffordſhire, they have a ſecret of fining *Ale*, in a very ſhort time. Plot conjectures it to be done by adding alum, or vinegar in the working. *Plot*, Nat. Hiſt. Stafford. c. 9. §. 72.

Ale is prepared various ways, and of various ingredients, as of wheat, rye, millet, oats, barley, the berries of the quick bean, &c. *Bruckman*, ap. Act. Erud. Lipſ. 1722. p. 545. ſeq. *Evelyn*, Sylv. c. 15. §. 2.

Some have found that the juice which bleeds from the birch or ſycomore, is of great uſe on this occaſion, applied inſtead of water. It makes one buſhel of malt go as far as four in the common way. *Evelyn*, c. 16. §. 4.

Some have a method of preparing *Ale*, ſo that it will keep carried to the Eaſt or Weſt-Indies. The ſecret is by maſhing twice with freſh malt, boiling twice; and after ſhipping it, putting to every five gallons two new laid eggs whole, to remain therein. It is ſaid, that in a fortnight's time, the ſhells will be diſſolved; and the eggs become like wind eggs: and that afterwards the white would diſappear, and the yolk remain untouched. Phil. Tranſ. N°. 27. p. 495.

Ale brewed of white malt abounds in a ſalt and crude tartar, and on this account is found to heat too much, and, as ſome ſay, fatten, render the blood viſcid, and load the reſpiration, create obſtructions in the viſcera, diſpoſe to the ſtone, &c.

Yet the *Ale* of Koerenigs Lutter in Brunſwick is famous, and tho' made of white malt, is, by its panegyriſts, pretended to have the contrary of all theſe effects. *Bruckman*, loc. cit.

The conſumption of *Ale* in England is incredible. A late author makes it amount to the value of four millions yearly; including Great Britain, and Ireland. Plan of Engl. Comm. p. 202. ſeq.

ALEA, in Roman antiquity, ſignifies in general games of chance. V. *Pitiſc.* Lex. Ant in voc.

ALEA, in a more limited ſenſe, is applied by Roman writers to a particular game played with dice, in a pair of tables, ſomewhat after the manner of our back gammon, or tric trac. Inſtead of our men, they played with white and black ſtones, which were moved this way or that, as the dice directed.

Alea in this ſenſe appears to have been the ſame game with what the Greeks called *Pettia* and *Chivia*; the Romans ſometimes *Tabula*, *Teſſara*, and XII. *Scripta*. Giorn. de Letter. de Parm. 1690. p. 230. ſeq.

This game of *Alea* is very imperfectly delivered by antient writers. Agathias Scholaſticus [a] deſcribes it the fulleſt, but ſo obſcurely, that ſeveral of his commentators frankly own they underſtand nothing of the matter. Salmaſius undertook to explain this matter, but did not ſucceed. Corn. de Paw, has publiſhed a work expreſs on the ſubject, by which a better idea may be formed of the manner of playing at this game [b].

—[a Epigram. in Anthol. Græc. l. 1. c. 61. b Diatribe de *Alea* Veter. ad Epigr. Agath. Scholaſt. Utr. 1726. 12°. An Extract of it is given in Bibl. Anc. Mod. T. 24. p. 222.]

ALEATORIUM, in Roman antiquity, was the place where they played at alea.

The *Aleatorium* was near the *Sphæriſterium*; that the ſportſmen when tired with the pila, or more robuſt exerciſes, might refreſh themſelves in the *Aleatorium*. *Pitiſc.* Lex. Ant. in voc.

ALEC, in ichthyology, a name given by Gaza, in his commentaries on Ariſtotle, to the fiſh called by that author mainis, and by Ovid *Menerela*. This is the *Mæna* of the Latin ichthyologiſts, and is called by the Venetians *Menelo*, and *Menela*. The fiſh is properly of the ſparus kind, according to the Artedian ſyſtem, and is diſtinguiſhed from the other ſpecies of that genus, by having four large teeth, its ſides variegated, and a large black ſpot on each. See SPARUS.

ALECTORIA (*Cycl.*)—This is otherwiſe called *Alectorius Lapis*, ſometimes *Alectorolithos*, in Engliſh the cock-ſtone.

The more modern naturaliſts hold the *Alectorius Lapis* to be originally ſwallowed down, not generated in the ſtomach or gizzard of cocks and capons. It is known that many of the fowl kind make a practice of ſwallowing pebbles, as it is ſuppoſed to be of ſervice in the buſineſs of trituration and digeſtion. In two oſtriches diſſected ſome time ago, there were found above a hundred in each ſtomach [a]. It is in vain therefore that ſome have laboured to account for the origination of this ſtone in the ſtomach from the hypotheſis of alkali, and acid [b].—[a *Worm.* Muſ. *Lancis* Not. ad Mercat. Metalloth. Arm. 8. c. 6. p. 182. ſeq. Giorn. de Letter. d' Ital. T. 32. p. 150. Bibl. Ital. T. 1. p. 140. b *Plin.* Hiſt. Nat. l. 37. c. 10. p. 787. *Iſid.* Orig. l. 16. c. 13. *Mercat.* Metalloth. loc. cit. *Gorræi*, Deff. Med. p. 19. *Caſtel.* Lex. Med. p. 30. *Nichols*, Lapid. p. 173. See PALUMBELLARUM *Lapis*.

ALECTORICARDITES, in natural hiſtory, a name given by Plot, to a figured ſtone reſembling a pullet's heart, with the fat near the baſis of it, and the coronary veſſels deſcending from it. *Plot*, Nat. Hiſt. Stafford. c. 5. §. 7. p. 180.

The word is compounded of the Greek Αλεκτωρ, cock, and καρδια, heart.

ALECTORIUS *Lapis*, in natural hiſtory. See ALECTORIA.

ALECTORIUS *Lapis*, is alſo uſed for a ſmall ſpecies of Bufonites, or disjunct ſegment of a palate of a fiſh approaching to the nature of the *Chelidonius Lapis*.

ALECTOROMANTIA, (*Cycl.*) an antient kind of divination, formed by means of a cock.

This is otherwiſe called *Alectryomantia*, *Alectryomancy*. The word comes from the Greek Αλεκτωρ, a cock, and μαντεια, divination.

There appear to have been divers ſpecies of *Alectryomancy*. In ſome the augury was taken from the crowing of cocks; wherein regard was had to the time of the day, as whether before before noon or after, to which ſome added the conſide-

ration

ration of the ſign the ſun was in, and the motion of the moon [a]. Others ſpeak of a kind of *Alectryomancy*, performed with the help of a ring [b]. But the ſpecies moſt ſpoken of by authors was performed as follows. A circle was made on the ground, and divided into twenty-four equal parts, in each of which was written one of the letters of the alphabet, and upon each of theſe letters was laid a grain of wheat: this done, a cock was turned looſe into the circle, and careful obſervation made of the grains he picked.—The letters correſponding to theſe grains were afterwards formed into a word, which word was to be the anſwer deſired.—[[a] V. Philoſ. Tranſ. N°. 162. p. 707. [b] *Ammian. Marcellin.* l. 29. c. 1. Jour. des Scav. T. 51. p. 593.]

It was thus, according to Zonaras, that Libanius, and Jamblicus ſought who ſhould ſucceed the emperor Valens; and the cock eating the grains anſwering to the ſpaces ΘΕΟΔ. Several whoſe names began with thoſe letters, as Theodotus, Theodiſtes, Theodulus, *&c.* were put to death; which did not hinder, but promote Theodoſius to the ſucceſſion [c]. But the Story however current, is but ill ſupported: It has been called in queſtion by ſome, and refuted by others from the ſilence of Marcellinus, Socrates, and other hiſtorians of that time [d].—[[c] V. *Zonar.* Annal. p. 744. *Cedren.* p. 257. *Kircher*, Œdip. Ægyp. P. 2. p. 472. ſeq. *Voſſ.* de Philoſ. p. 167. *Bulling.* de Divin. l. 3. c. 40. *Potter*, Archæol. Attic. l. 2. c. 18. p. 352. Jour. des Scav. T. 18. p. 337. [d] V. *Marcellin.* l. 29. c 1. *Socrat.* l. 4. c. 19. *Sozom.* l. 6. c. 31. *Niceph.* Hiſt. Eccleſ. l. 11. c. 45. *Fabric.* Bibl. Græc. l. 4. c. 28. §. 2. Id. ibid. l. 5. c. 10. §. 1.]

Prætorius has a diſcourſe expreſs on *Alectryomancy*. *Francof.* 1681. 4°. *Fabric.* Bibl. Antiq. c. 12. p. 410.

ALEGER, a name given to an inferior ſort of vinegar, made of ale, or malt liquor, inſtead of wine. Power has given a deſcription of the eels in *Aleger*. V. *Power*, Exper. Philoſ. Obſ. 3. p. 32.

ALEIPHA, in the materia medica of the antients, a word uſed for all fatty bodies whatever. The oils of vegetables, and fat of animals were all called by this general name. But theſe ſimple ſubſtances were not the only ones called by it, for it is very frequently uſed to expreſs any ſort of medicated oil impregnated with aromatick vegetables; but its general acceptation in this ſenſe, was for ſuch compoſitions as were intended to anoint the body; and therefore, they were properly only vegetable or animal fats, impregnated with the lighter parts of plants, and not clogged with an addition of powders, nor with wax or any thing of that kind, which might have given them the conſiſtence of ointments. The antient phyſicians were very fond of theſe compoſitions, which they uſed either to ſome diſeaſed part only, or to the whole body, and after they had made the patient uſe the warm bath to relax and open the pores. *Hippocrates.*

ALEMBIC (*Cycl.*) is the ſame with what is otherwiſe called *Lembic*, *Helm*, *Galea*, *Pileus*, *Capitellum*, and *Ambix*. This laſt name ſeems to have been the moſt antient; Dioſcorides [a] ſpeaks of it, and aſſures us, they had a method in thoſe days of extracting the mercury from cinnabar, by ſublimating it in an ambix [b].—[[a] *Dioſcor.* l. 5. c. 110. [b] *Le Clerc.* Hiſt. de Medic. P. 3. l. 1. Nouv. Rep. Lett. T. 24. p. 407. Jour. des Scav. T. 75. p. 643.]

The open *Alembic* is called alſo Roſtratus, that is beaked. This diſcharges its vapour thro' a beak or noſe, into a recipient. The blind *Alembic* is uſed in ſublimation, being ſometimes alſo perforated at top to let the vapour aſcend.

German chemiſts deſcribe methods of colouring liquors in their paſſage thro' the *Alembic*. Ephem. Acad. N. C. dec. 2. An. 3. Obſ. 28. p. 83. ſeq.

Some naturaliſts ſuppoſe rocks and mountains to do the office of *Alembics*, with regard to the waters of the ſea, which they thus raiſe to the ſurface of the earth; and hence the the origin of ſprings and rivers [c]. Others reject this hypotheſis of natural *Alembics*, and ſuppoſe ſprings to be formed from vapour [d]. Dr. Halley adopts this laſt opinion, yet retains the *Alembics*, only inverting their uſe. He ſuppoſes the tops or external parts of hills, to collect the vapour wherewith the atmoſphere is loaded and ſerve as it were for *Alembics* to diſtil freſh water for the uſe of man and beaſt [e].—[[c] *Scheuch.* Hiſt. Alp. 2. p. 45. ſeq. Phil. Tranſ. N°. 316. p. 146. *De la Hire* in Hiſt. Acad. Scienc. An. 1703. p. 5. [d] Giorn. des Letter. d'Ital. T. 25. p. 349. [e] Phil. Tranſ. N°. 192. p. 473.]

See SPRING, VAPOUR, RIVER, &c. *Cycl.*

ALEMBROTH, in the writings of the alchemiſts, a word uſed for a ſort of fixed alkaline ſalt, which had the power of the famous alcaheſt, in diſſolving bodies, opening the pores of moſt or all known ſubſtances, and thence, as well as by deſtroying ſulphurs, promoting the ſeparation of metals from their ores.

The word is ſaid to be of Chaldee origin, and its natural meaning to be *clavis artis*, the key of art.

The word is alſo written *Alembrot*, ſometimes *Elebrot*. It is otherwiſe called *ſal fuſionis*, and *ſal fixionis*.

Alembroth is repreſented as partaking of the nature of halonitrum, and alum: it is ſaid to be extracted from a peculiar ſort of earth reſembling coagulated blood, found on the mountain Olympus in Cyprus. Libavius gives divers methods of preparing it, *Ruland.* Lex. Alch. p. 29. ap. *Caſtel.* Lex. Med. p. 30. *Libav.* Synt. Arcan. Chem. l. 8. c. 28.

Some alſo call ſalt of tartar *Alembroth deſiccatum.*

ALENON, a word uſed by ſome of the old medical writers, as a name for the oil of ſweet almonds.

ALEORE, Αλεωρη, a word uſed by the old medical writers, for an intermiſſion of eaſe, from the raging pains of any violent acute diſtemper. *Hippocrates.*

ALEUROMANCY, *Aleuromantia*, is the ſame with what was otherwiſe called *Alphitomantia*, and *Crithomantia*. *Ælian.* de Animal. l. 8. c. 5. *Fabric.* Bibl. Antiq. c. 12. p. 410.

Aleuromancy was an antient kind of divination performed by means of meal or flower.

ALEXANDERS, in botany, a genus of umbelliferous plants. See SMYRNIUM.

ALEXANDRIAN, in a particular ſenſe, is applied to all thoſe who profeſſed or taught the ſciences in the ſchool of Alexandria.

In this ſenſe, Clemens is denominated Alexandrinus, tho' born at Athens. The ſame may be ſaid of Apion, who was born at Oaſis; and Ariſtarchus by birth a Samothratian. *Johnſ.* de Script. Hiſt. Philoſ. l. 1. c. 2. §. 6.

The chief *Alexandrian* philoſophers, were Ammonius, Plotinus, Origen, Porphyry, Jamblicus, Sopater, Maximus, and Dexippus. Id. ib. l. 3. c. 16. §. 2.

ALEXANDRIAN is more particularly underſtood, of a college of prieſts, conſecrated to the ſervice of Alexander Severus, after his deification. Lampridius relates, that notwithſtanding Severus was killed by Maximin, the ſenate proſecuted his apotheoſis; and, for regularity of worſhip, founded an order of prieſts or *ſodales*, under the denomination of *Alexandrini*. V. Act. Erud. Lipſ. 1684. p. 41.

ALEXANDRIN (*Cycl.*)—*Alexandrins* are otherwiſe called dodecaſyllables; and are peculiar to the modern poetry. We find them in the Engliſh, French, Italian, and German poets; but moſt in the French, who generally compoſe their tragedies and Epic poems in this verſe. The Italians appear to have been the firſt who uſed it. Maffei mentions a MS poem, in the library of Verona, written about the year 1200, compoſed of *Alexandrins*. But they have been long diſuſed by the writers of that country. The like may be ſaid of the Engliſh.

The advantages of the *Alexandrin* verſe, are its keeping the rhimes from coming ſo near, and conſequently hindering them from being ſo much perceived. To this may be added, that coming nearer to the nature of proſe, it is fitter for theatrical dialogue, and ſupplies the office of the antient iambics, better than any other verſe in rhime. V. Contin. des Mem. de Saleng. T. 2. P. 1. p. 438. Jour. des Scav. T. 82. p. 381. It. T. 75. p. 222. Bibl. Ital. T. 2. p. 299. Mem. de Trev. 1730. p. 755. Nouv. Liter. T. 5. p. 3.

Alexandrins fell into diſuſe among the antient French poets, from which Ronſard firſt retrieved them, and brought them into vogue. That author ſpeaks much in their praiſe, as the only verſe fit for great ſubjects, as anſwering to the antient heroic, or hexameter verſe. If he did not compoſe his Franciad in them, he aſſures us it was not the effect of his own choice, but the commands he had received from Charles IX. who was fond of the common verſe. Ronſard even promiſed after that prince's death, to make his Franciad walk on Alexandrian feet, that is, to tranſlate it into this meaſure. But the ſame poet, in his latter days, recanted all this, confeſſing that he had been deceived in ſuppoſing the Alexandrian verſes to have correſponded to the antient heroics, which the common verſes rather do; that the *Alexandrins* rather anſwer to the Senarii of the antient Tragic poets; that they are too low and proſaic for great ſubjects, too rambling and diffuſive, and by the eaſineſs of their compoſition give too much ſcope to tattle; on the whole, that they are only fit for tranſlation, where they afford great advantages for expreſſing the ſenſe of the original. Notwithſtanding this we find moſt of the French epic, dramatic, as well as elegiac and paſtoral pieces, compoſed in this verſe. V. *Menag.* Orig. Franc. in voc.

ALEXANDRINUM, in the antient phyſick, is uſed for a kind of green ſalve, or drawing plaiſter, a deſcription of which is given by Celſus. V. *Celſ.* de Art. Med. l. 5. c. 19. *Gorr.* Med. Defin. p. 19. *Caſt.* Lex. Med. p. 31.

ALEXICACUS, ſomething that preſerves the body from harm or miſchief. The word is Greek, αλεξικακος, compounded of αλεξω, I drive away, and κακον, *malum*, evil.

Alexicacus amounts to much the ſame with alexiterial. Conſt. Rhodocanaces gives the name more peculiarly to the ſpirit of ſea-ſalt, and has publiſhed a work under that title. *Alexicacus*, ſpirit of ſalt or of the world, which vulgarly prepared is called the ſpirit of ſalt. Lond. 1664. 4°.

ALEXICACUS, in antiquity, was an attribute of Neptune, whom the tunny-fiſhers uſed to invoke under this appellation, that their nets might be preſerved from the ξιφιας, or ſword-fiſh, which uſed to tear them, and prevent the aſſiſtance, which it was pretended the dolphins uſed to give the tunnies on this occaſion. Hiſt. Acad. Inſcript. T. 2. p. 21.

ALEXIPHARMIC (*Cycl.*)—Phyſical authors afford many particulars relating to the *Alexipharmic* quality of myrrh [a], the

Alexipharmic ſcorzonera [b], the origin of the *Alexipharmic* virtue of bezoar [c], which ſome aſcribe to the animals feeding on contrayerva, and other plants of the ſame tendency. The reaſon why *Alexipharmics* deſtroy worms [d], &c.—Perlinus [e], and others, have treatiſes expreſs on *Alexipharmics*. Nicander [f], an antient Greek poet, has a work ſtill extant on the ſame ſubject, written in verſe; tho' Plutarch [g] diſputes it the title of a poem, as being a plain narrative without fiction.—[[a] *Poliſ.* Myrrhol. Sect. 1. c. 7. p. 21. [b] Ephem. Acad. N. C. Dec. 2. an. 1. obſ. 181. [c] Phil. Tranſ. N°. 305. p. 2202. [d] *Konig.* in Ephem. Acad. N. C. dec. 2. an. 5. obſ. 99. [e] *Lipen.* Bibl. Med. p. 11. [f] V. *Fabric.* Bibl. Græc. l. 3. c. 26. §. 3. [g] *Plut.* de Audiend. Poet. p. 16.] See MYRRH, SCORZONERA, BEZOARD, &c.

Alexipharmics are deemed proper correctors of opium, when it produces ſickneſs, naúſeas, &c. See OPIUM.

ALEXITERIAL, (*Cycl.*) in medicine, ſomething that has the nature, or does the office of an amulet. *Wolf.* Scrutin. Amulet. c. 1. Giorn. de Letter d'Ital. 1690. p. 164. See AMULET, *Cycl.* and *Suppl.*

Alexiterial is more particularly uſed for a remedy againſt poiſons. *Gorr.* Def. Med. p. 20. *Caſt.* Lex. Med. p. 31. *Blanc.* Lex. Med. p. 26. *Burggr.* Lex. Med. T. 1. p. 407. voc. *Alexipharmaca.*

Quincy [a] ſays, the name is ordinarily applied to medicines given in fevers; which is confounding *Alexiterics* with *Alexipyretics* [b].—[[a] Lex. Med. p. 16. [b] *Burggr.* Lex. Med. T. 1. p. 410.]

ALFAQUES, among the Spaniſh Moriſcoes, were the clergy, or thoſe who inſtructed them in the Mahometan faith. *Gedd.* Miſc. Tracts, T. 1. p. 111.

The *Alfaques* differed from the Morabites, who anſwered to monks, or religious, among Chriſtians. Mem. de Trev. 1704. p. 523.

ALFDOUCH, a name given by the Moors to a ſort of vermichelli, which they make of flour and water, and are very fond of in their entertainments.

ALFECCA, in aſtronomy, a name given to the ſtar commonly called *Lucida coronæ.*

ALGA, in botany, the name of a genus of plants growing under water, and of the ſame kind with the ſea fucus's, but that they are compoſed of very long and narrow graſſy leaves, or of long capillaceous filaments.

The ſpecies of *Alga*, enumerated by Tournefort, are theſe. 1. The common narrow leaved *Alga*. 2. The ſmall graſſy leaved *Alga*. 3. The very narrow leaved, naked *Alga*. 4. The branched, ſeeding, narrow leaved, graſſy *Alga*. 5. The ſea *Alga*, with extremely narrow leaves. 6. The graſſy river *Alga*, with extremely long leaves. 7. The green capillaceous leaved *Alga*. 8. The black capillaceous leaved *Alga*. And, 9. the yellowiſh capillaceous leaved *Alga*. *Tourn.* Inſt. p. 569.

The *Alga's* are ſome marine, or growing in the ſea; others fluviatile, or produced in rivers; others fontal, growing in ſprings; and ſome again grow on ſtones at the bottom of the water; others on ſhells by the ſhore; others even float on the ſurface of the water.

One of the moſt conſiderable of the tribe of *Alga's*, is the common, called *Alga marina*; ſometimes alſo *Alga anguſtifolia vitriariorum*, as being uſed in the glaſs-works like kali.

Its aſhes afford great plenty of fixed ſalt.

Some ſpeak of its medicinal properties as aperient, vulnerary, and deſiccative. *Lemery*, Tr. des Drog. p. 25.

Alga is popularly known in Engliſh by the name of *wreck*, as being generally conceived rather as excreſcences, than as regular plants.

ALGA *graminea*, in botany, the name of a genus of plants, which grow in the ſea, and are of an herbaceous, not ſtony texture, have long and narrow graſſy leaves, and produce their ſeeds in the joinings of their ſeveral leaves. It is commonly called in Engliſh *graſs-wreck*, and is common on all our ſhores. *Ray*, Meth. Acuta, p. 4.

Dioſcorides recommends it in the gout and inflammations.

ALGALI, a name given, by ſome of the old chemical writers, to nitre.

ALGAROT (*Cycl.*)—The word is otherwiſe written, *Algaroth*, *Algeroth*, *Algarel*, and *Algerel*. Some will have it not of Arabic, but Italian origin, deriving it from a phyſician of Verona, named *Algaroth*, who firſt invented the preparation.

There are divers ways of preparing *Algarot*, as by precipitating the butter, or by diſtilling antimony, together with the ſweet ſublimate, or white precipitate of mercury. *Lemery*, Treat. de l'Antimoine, P. 3. p. 172. ſeq. Mem. de Trev. 1707. p. 1161. ſeq. It. p. 2092. ſeq. *Le Mort.* Coll. Chym. Leid. c. 57. proc. 3. & 4. *Caſtel.* Lex. Med. p. 31.

ALGAVAREIA, the language antiently ſpoken by the Moriſcoes in Spain. *Gedd.* Miſc. Tract. T. 1. p. 23.

The *Algavareia* was a ſort of Arabic, and ſtood contradiſtinguiſhed from the *Aljameia*. See ALJAMEIA.

ALGEBRA (*Cycl.*) has often been accuſed of obſcurity; and the geometrical methods of the antients have by many, eſpecially in England, been preferred to the modern uſe of *Algebra* in geometry. But, on this occaſion, a great maſter of both methods has very juſtly obſerved, that the modern improvements made either in geometry, or in philoſophy, are, in a great meaſure, owing to the facility, conciſeneſs, and great extent of the methods of computation, or *algebraic* part. It is for the ſake of theſe advantages, that ſo many ſymbols are employed in *Algebra*, the number and complication of which (together with the greater care there has been taken in treating of geometry, after the excellent models left us by the antients) have contributed more to occaſion the preference that is often aſcribed to geometry, in reſpect to perſpicuity and evidence, than any eſſential difference that can be ſuppoſed to be between them. *Algebra* is a general kind of arithmetic, which is the very thing that renders its uſefulneſs ſo univerſal; nor can this be ſuppoſed to derogate from its evidence, for we have no ideas more clear or diſtinct, than thoſe of numbers; and hence often acquire more ſatisfactory and certain knowledge from computations, than from conſtructions. It may have been employed to cover, under a complication of ſymbols, abſtruſe doctrines, that could not bear the light ſo well in a plain geometrical form; but, without doubt, obſcurity may be avoided in this art, as well as in geometry, by defining clearly the import and uſe of the ſymbols, and proceeding with care afterwards. Vid. *Mac Laurin's* Flux. B. 2. See NEGATIVE-*ſign.*

ALGEBRAISM, or ALGEBRISM, is affectedly uſed, in ſome writers, for algebra itſelf. In which ſenſe, we read of the application of *Algebraiſm.* Mem. de Trev. 1722. p. 1193.

ALGIABARII, a Mahometan ſect of predeſtinarians, who attribute all the actions of men, good or evil, to the agency or influence of God.

The *Algiabarii* ſtand oppoſed to the *Alkadarii*. See ALKADARII.

They hold abſolute decrees, and phyſical premotion. For the juſtice of God in puniſhing the evil he has cauſed, they reſolve it wholly into his abſolute dominion over the creatures. *Abulpharag.* Hiſt. Dynaſt. ap. Lehman. Obſerv. Budd. Inſt. p. 195.

ALGOIDES, in botany, a name given, by Vaillant, to a genus of plants, called by Micheli and Linnæus, *zannichellia. Vaill.* a. J. 1719. T. 1. F. 1. See ZANNICHELLIA.

ALGONQUIN, one of the chief American languages, ſpoken eſpecially in Canada, or New France. The *Algonquin* is one of the two principal languages ſpoken in the Northern America, the other is the *Huron.*

It takes its name from an antient people of the ſame denomination, now almoſt extinct, the Troquois being the only remains.

The *Algonquin* tongue is ſpoken, with ſome diverſity of dialects, by moſt of the natives from the river St. Laurence to that of Miſſiſſippi. *Lafiteau*, Parall. des Moeurſ. ap. Nouv. Mem. de Litter. T. 1. p. 254.

The baron la Hontan [a] has given a little dictionary of the *Algonquin* language. Reland [b] has alſo given a gloſs on ſeveral words of the ſame.—[[a] Mem. de l'Amer. Septent. Hag. 1703. [b] Diſſ. Miſc. P. 3. diſſ. 2. Act. Erud. Lipſ. 1708. p. 439.]

ALGOR is uſed, by ſome medicinal writers, to denote a preternatural coldneſs or chilneſs in a part. Muys ſpeaks, in this ſenſe, of an *Algor* of the arm, attended with an *atrophy.*

ALGORAB, a fixed ſtar, of the third magnitude, in the right wing of the conſtellation *Corvus.* *Vital.* Lex. Math. p. 21.

ALGOSAREL, in botany, a name uſed by Avicenna, and ſome other authors, for the common wild carrot, or *Daucus Sylveſtris.* *Ger.* Emac. Ind. 2.

ALHABOR, among the Arabian aſtronomers, is that ſtar commonly called *Sirius.* *Vital.* Lex. Math. p. 22. ſeq.

ALHEN, in natural hiſtory, a name by which Dr. Shaw, and others, have called a genus of plants, ſince named by Linnæus *Lawſonia.* See LAWSONIA.

ALHIRTO, in aſtronomy, a fixed ſtar, of the third magnitude, in the conſtellation Capricorn. This is otherwiſe called *Roſtrum Gallinæ.* Near this ſtar, in the year 1600, appeared a new ſtar, which laſted twenty-one years, and then diſappeared again. *Vital.* Lex. Math. p. 22.

ALI gives the denomination to a ſect, or diviſion, among the Mahometans, who adhere to the right of ſucceſſion of *Ali*, the fourth caliph, or ſucceſſor of Mahomet, and the reform of muſſelmaniſm introduced by him. Vid. Mem. de Trev. 1720. p. 1618. ſeq. *Sale*, Prelim. Diſc. to Koran. ſec. 8. p. 178. *D'Herbel.* Bibl. Orient. in voc.

The ſectaries of *Ali* are more particularly called *Schiites*, and ſtand oppoſed to the *Sunnites*, or ſect of *Omar*, who adhere to the law, as left by Mahomet, Abubeker, and Omar.

Ali was couſin of Mahomet, and ſon-in-law of that prophet, having married his daughter Fatimah. After Mahomet's death, great diſputes aroſe about the ſucceſſion; many ſtood for Ali, but Abubeker was preferred, and elected the firſt kaliph. Ali took his turn, after the death of Othman.

The Perſians are the chief adherents to the ſect of Ali, whom they hold to have been the legitimate ſucceſſor of Mahomet, and Abubeker an uſurper. On the contrary, the Turks are of the ſect of Omar, and hold Ali in execration, having raiſed a furious civil war among the muſſulmen.

Mem. de Trev. 1715. p. 397. Bibl. Angl. T. 3. p. 155. & 356.

The Perſian emperors of the family of Sophi, pretend to be the direct deſcendants from Ali; but the deſcent is very darkly made out. Bibl. Raiſ. T. 2. p. 397.

The diſtinguiſhing badge of the followers of Ali, is a red turban, which is worn by the Perſians, who are hence called in deriſion, by the Turks, *Kiſilbachi*, *q. d.* red heads. Mem. de Trev. 1715. p. 386.

Ali is reputed the author of divers works, particularly a Centiloquium, in great repute among the Arabs and Perſians; part of which has been publiſhed in Engliſh by Mr. Ockley. V. Bibl. Angl. T. 1. p. 349. ſeq.

ALJAMEIA, is a name which the Moriſcoes in Spain give to the language of the Spaniards.

Among other articles agreed on by the junto, which was appointed by the emperor Charles V. in 1526, in favour of the Moriſcoes, this was one, That the Moriſcoes ſhould no longer ſpeak Algavareia, *i. e.* Mooriſh, or Arabic, but ſhould all ſpeak *Aljameia*, *i. e.* Spaniſh, as it was called by the Moors, and all their writings and contracts ſhould be in that language. *Geddes*, Miſc. Tract. T. 1. p. 23.

ALIARBUCHA, in natural hiſtory, the Arabian name for a large kind of rat, common in that country, and good to eat, according to Bochart, who thinks it the ſame as the *Schaphan*, mentioned in Leviticus, and there declared unclean. Levit. xi. 5. See CHOEROGRYLLUS.

ALICA, in the antient phyſic and diet, a kind of food, but the various accounts given of it by authors, make it uncertain what it was; ſome repreſenting it as a ſort of grain, and others as an aliment made of grain.

The Greek word for *Alica* was χονδρος, which term, and πτισσανη, ſeem to have been general names for all ſpelt or hulled grain, beaten or ground into a pulp. The author of the Geoponics, dedicated to Conſtantine, gives another method of preparing the *Alica*, viz. by ſteeping barley in hot water, then preſſing it, mixing it with gypſe and a white ſand, and laſtly ſifting it. The ſalubrity of which preparation will bear ſome doubt, on account of the noxious quality of the gypſe. Such is the *Alica* repreſented to be by Foeſius. It was uſed as a food in ſeveral diſeaſes, not unlike our water-gruel. *Plin.* Hiſt. Nat. T. 2. l. 18. c. 11. & 17. It. T. 2. l. 22. c. 25. p. 286. *Caſtel.* Lex. Med. p. 31. ſeq. *Voſſ.* Etym. p. 28. *Gorr.* Def. Med. p. 511. ſeq. in voc. χονδρος.

Galen and Oribaſius make the *Alica* a kind of wheat. Pliny is not conſiſtent with himſelf, making it in one place a natural ſeed, as lentils, &c. and in another ſomething factitious.

Ray, in his hiſtory, ſays the *Alica* differs from the χονδρος, as the genus from the ſpecies.

ALICES, in medicine, ſpots preceding the ſmall-pox. *Caſtel.* Lex. Med. p. 32.

ALICULA, in antiquity, a kind of puerile habit worn by the Roman children. V. *Pitiſc.* in voc. *Voſſ.* Etymol.

The *Alicula* was a ſort of *chlamys*: ſome explained it by *tunica manicata*.

ALIDES, in the Mahometan hiſtory, the deſcendants of *Ali*, otherwiſe called *Fatimites*.

The *Alides* had a long ſtruggle with the Ommiades, for the kaliphate, or ſucceſſion of Mahomet; which is the Mahometan papacy. See ALI.

ALJEMBUT, or, as ſome write it, *Gembut*, a name given by the Arabians, Aviſenna, and others, to a ſpecies of acacia, which they alſo called the Nabathæan pod, and ceration, or ſiliqua, and which ſome have ſuppoſed to be the ſame with the common carob; but they expreſly diſtinguiſh it, by ſaying, that it is an aſtringent; whereas the other is gently purgative, and that the fruit of it was given in hæmorrhages. Nay, Iſidore goes ſo far as to ſay, that the acacia juice of the ſhops was made of its fruit, while unripe. *Aviſenna*.

ALIEN (*Cycl.*)—A great queſtion aroſe in king James the firſt's time, Whether the *poſt nati*, *i. e.* thoſe born in the liegance of Scotland, after the acceſſion of that prince to the Engliſh throne, were *Aliens*, or denizens? The king, by proclamation, pronounced them all, *ipſo facto*, naturalized by his acceſſion. *Elleſmere*, Caſe of Poſt Nati, p. 5. ſeq. Vid. King *James*'s Speech to Parliament, March 1607. See alſo *Coke*'s Reports, Calvin's Caſe.

It has been much controverted, whether the law which excludes foreigners from inheriting, extends to the right of ſucceſſion to the crown? This was one of the difficulties ſtarted againſt the right of Mary queen of Scots to the Engliſh ſucceſſion. The advocates for that princeſs inſiſt, that the inheritance of the crown is excepted from the general law. In effect, the *infantes du roy* have a particular exception in their favour, in the very time of the ſtatute, *de natis ultra mare*. *Leiceſt.* Commonw. p. 127. ſeq.

Aliens are uſually divided by our lawyers into friends and enemies; to which ſome add a third kind, viz. *Alien* infidels.

ALIEN is ſometimes uſed, in middle age writers, for exempt. *Du Cange*, Gloſſ. Lat. T. 1. p. 134.

ALIEN-*amy* denotes a foreigner the ſubject of ſome prince in friendſhip with us.

ALIENS *duty*, an impoſt laid on all goods imported into England by *Aliens*, or denizens, and even on certain goods imported by natural ſubjects, if they be brought on foreign bottoms, over and above what is paid for the ſame goods imported by Britiſh, and in Britiſh ſhipping. 12 Stat. *Car.* II. *Crouch*, View of Cuſt. p. 6.

Aliens duty is otherwiſe called *petty cuſtoms*, and *navigation duty*.

Fiſh dried, or ſalted, and codfiſh, or herring not caught in Britiſh veſſels, and cured by Britiſh, pay a double *Aliens duty*. *Crouch*, lib. cit. p. 7.

ALIEN *priories* were a kind of cells to great abbies abroad, chiefly in Normandy, &c. endowed by Engliſhmen, who being ſmitten with devotion for ſome outlandiſh ſaint, or ſhrine, made donations to them of lands, tithes, churches, &c. upon which monaſteries were erected, and peopled chiefly by colonies of foreign monks from the mother abby, governed by the abbot thereof; ſo that neither a prior, nor a monk, could be made without his conſent. Upon breaking out of wars, the king uſually ſeized on the *Alien priories*, took their lands into his own hands, and frequently let them out to farm to the religious, for a certain rent.

The number of *Alien priories* in England was very great. Moſt of the Cluniac monaſteries belonged to this claſs.—They were ſometimes naturalized, and cut off from their foreign dependance, by the king's patents. A large number of them were ſuppreſſed, in 1414, by the parliament at Leiceſter, under Henry V. what remained fell with the firſt at the general diſſolution. Vid. *Dugd.* Monaſt. Abr. p. 44. It. p. 69. It. p. 119. *Steph.* Supp. to Dugd. T. 2. p. 12. ſeq. It. p. 231. Bibl. Anc. Mod. T. 1. p. 303.

ALIENATION (*Cycl.*)—By the laws of the antient Jews, lands could only be *alienated* for the ſpace of fifty years. At each return of the jubilee, all returned again to the primitive owners, or their deſcendants, to whom the lands were originally allotted, at the firſt diſtribution of Canaan. *Cuneuſ.* de Republ. Jud. ap. Mem. de Trev. 1717. p. 212.

By the ſtatute of Edward I. a bar was put to *Alienations*, by what we call *entails*, which is an expedient for procuring *perpetuities* in families; but a counter expedient was deviſed, by the judges, to defeat the intent of it, called a *recovery*, whereby the entails are cut off. See PERPETUITY, ENTAIL, RECOVERY, &c. *Cycl.*

The kingdom of England was, by king John, alienated and conveyed to the pope; but the *Alienation* was afterwards declared null by parliament, becauſe done without parliamentary conſent [a].—The crown of Scotland was alienated by king Baliol to Edward the firſt, for a ſum of money; but the Scots reclaimed againſt the ſame, partly as tranſacted without their privity, but more as denying that prince's title [b].—[[a] Vid. Mem. Liter. de la Gr. Bret. T. 7. p. 125. [b] V. Bibl. Choiſ. T. 23. p. 307.]

The *Alienation* of things ſacred to profane uſes, is, in ſome caſes, lawful; *e. gr.* where it is done by authority of the ſovereign, and for ſome good purpoſe of the ſtate; and where it conduces to the putting a period to a war, or the like.

Juſtinian allows of ſelling or pledging the ſacred veſſels for the redemption of captives; and even, in caſe of a ſuperfluity of ſuch utenſils, permits the ſelling them to pay the debts of the church. The heathens did not diſpute the ſovereign's right to diſpoſe of conſecrated things. There is nothing, ſays Plutarch, more ſacred than offerings dedicated to the gods, and yet no body ever ſaid but that the people might make uſe of them, and remove them from one place to another, as often as they thought convenient. To the like purpoſe, Seneca obſerves, that temples themſelves are ſometimes ſtripped for the benefit of the ſtate, *pro republica plerumque templa nudantur*. Divers other teſtimonies, of the ſame kind, are produced by Grotius [c]. What has been ſaid concerning the profaning of ſacred things, will hold ſtill more ſtrongly concerning the ſecularizing of eccleſiaſtical things; ſince theſe latter are not properly conſecrated, and conſequently are not *jure divino*. Church goods are only ſeparated from the ordinary commerce of the world, in quality of public goods, and as belonging to the church, which makes part of the ſtate: much after the ſame manner, as ſecular goods belonging to the public, may not be alienated and employed for private uſes [d].—[[c] *Grotius*, de Jur. Bell. l. 3. c. 5. §. 1. n. 3. [d] *Coccei*, de Evocat. Sacror. p. 43. ſeq. Bibl. Germ. T. 1. p. 75. ſeq.]

This point was largely diſcuſſed in the debates about the peace of Oſnaburgh; where the court of Rome moved heaven and earth to prevent the *Alienation* of the revenues of divers biſhoprics, abbies, &c. from the church, but in vain.

The *Alienations* of church lands at the reformation, was of vaſt benefit to this nation. Upon the acceſſion of queen Mary, the prieſts flattered themſelves with the hopes of a reſtitution of thoſe lands; eſpecially when cardinal Pool was ſent legat, to negotiate the reſtoration of papal power. The parliament, indeed, paſſed a bill in favour of that power, but inſerted a clauſe in it, that the *Alienations* of church goods ſhould be all ratified, and that the poſſeſſors ſhould not

not be liable to any cenſure, or proſecution, on account of them.

No artifice was left untried by Julius III. to elude this clauſe: it was offered, that the poſſeſſors of ſuch lands ſhould be acquitted for all that was paſt, and even for all the moveables which had come into their hands; but a reſtitution in form was demanded of all the immoveables. The reconciliation being like to ſplit on this rock, the legat was at length impowered to ratify the article as it ſtood in the bill; but, at the ſame time, denounced the divine judgments on the poſſeſſors of ſuch lands. Pope Julius dying before the affair was ended, his ſucceſſor, Paul IV. abſolutely refuſed to confirm what the legat had agreed on, and proteſted, that it was not in the power of the pope to permit ſuch a thing. *Rapin*, Extr. de Rymer, T. 15. Bibl. Anc. Mod. T. 17. p. 257. *Burnet*, Suppl. Hiſt. Reform. l. 5. Jour. Liter. T. 7. p. 248.

ALII *multi*, or ALII *de regno*, are phraſes which often occur in our antient records and hiſtorians. Their meaning has occaſioned much diſpute. Dr. Brady will have them ſignify only tenants *in capite*; which Mr. Tyrrhel endeavours to refute, and ſhew that they denote the whole commons of the kingdom. *Tyrrh.* Hiſt. Engl. T. 4. App. p. 14. ſeq. and p. 37. ſeq.

ALIMA, among mineraliſts, a kind of ſand found in gold mines, out of which lead is extracted. *Rul.* Lex. Alch. p. 29. *Caſt.* Lex. Med. p. 32.

ALIMENTARY (*Cycl.*)—ALIMENTARY *duct*, *Ductus Alimentalis*, amounts to the ſame with what Bartholine, and ſome others, rather chuſe to call *via*, or *canalis alimentorum*, the channel of aliments. Philoſ. Tranſ. N°. 130. p. 771. *Barth.* Act. Med. T. 5. p. 103.

The whole length from the throat to the anus is but one continued duct, though often variouſly diſtinguiſhed, according to nature's different intention, in the ſeveral ſpecies of animals. It is moſt plain and ſimple in the acus marinus, where you have neither oeſophagus, nor ſtomach, but only a ſtrait paſſage, and that too without any valves, only growing a little more taper towards the anus. In divers fiſh there is no oeſophagus, in ſome but a very ſhort one. In other animals it is not only long, but, by its ſwellings in ſome places, acquires different names; as the ingluvies, or crop in birds, the paunch, or μεγαλη κοιλια, in quadrupeds: and of the ſame kind ſeem to be theſe ſwellings in the gullet of the rattle-ſnake, which do the office of receptacles, for retaining what food the ſtomach cannot yet well receive; which ſeems the more requiſite, ſince they feed but at one time of the year.

The whole *ductus alimentalis*, from its uſes, may be ordinarily divided into four parts. 1. That which conveys the food, called the oeſophagus. 2. That which digeſts, or corrodes it, called the ſtomach. 3. That which diſtributes the chyle, called the inteſtines. 4. That which empties the fæces, called the rectum. Phil. Tranſ. N°. 144. p. 32. and 33.

This duct is ſaid to be the true characteriſtic of an animal, or *proprium quarto modo*; there being no animal but has it, and whatever has it, being properly enough ranged under the claſs of animals. Plants receive their nouriſhment by the numerous fibres of their roots, but have no common receptacle for digeſting the food received, or for carrying off the recrements. But in all, even the loweſt degree of animal life, we may obſerve a ſtomach, and inteſtines, even where we cannot perceive the leaſt formation of any organ of the ſenſes, unleſs that common one of feeling, as in oyſters. Phil. Tranſ. N°. 269. p. 776. ſeq.

Dr. Wallis brings an argument from the ſtructure of the *alimentary* tube in man, to prove that he is not naturally carnivorous. To the cogency of which, Dr. Tyſon makes ſome objections. V. Philoſ. Tranſ. N°. 269. p. 777. ſeq.

ALIMENTATION is uſed, by ſome naturaliſts, for what we more ordinarily call *nutrition*. V. *Bacon*, Nat. Hiſt. cent. 7. §. 602. *Opp.* T. 3. p. 120.

ALIMOS, in botany, a name given, by ſome of the Greek writers, to the common liquorice. It has been thus called, from its quality of palling the appetite, and making it inſenſible either of hunger or thirſt. There has been ſome confuſion among the later authors, owing to the confounding this *Alimos* with the *Halimos*, which is the ſea-purſlain, ſo called from its growing in ſalt places. The property of the *Alimos* in preventing thirſt, muſt, however, always be ſufficient to diſtinguiſh it from this plant. The tranſlators of the Greek phyſicians, not knowing that liquorice was the thing called by them *Alimos*, took it to be ſome new plant, and have rendered it, by the word *aurio*, which therefore ſtands with them as the name of a plant unknown to us, though it means only liquorice. *Dioſcorides.*

ALINDESIS, in the antient gymnaſtic medicine, a kind of exerciſe, wherein perſons being beſmeared with oil, rolled themſelves naked in the duſt. *Lang.* Epiſt. Medic. l. 1. ep. 15. p. 236. *Caſtel.* Lex. Med. p. 32.

The word is Greek, Αλινδησις, ſometimes alſo written Αλινδος.

ALIOS *baton*, in ichthyology, a name given, by Ariſtotle, to the ſtrange fiſh called, by Artedi, *Lophius*, and by others *rana piſcatrix*. See LOPHIUS.

ALIPÆNOS, in the antient phyſic, an appellation given to dry, topical medicines, or ſuch as have no fat mixed with them.

The word is ſometimes alſo written *Alipantos*. It is purely Greek, αλιπαινος, compounded of the privative α, and λιπαινειν, *pingueſcere*, to fatten. In which ſenſe, *Alipæna* ſtands oppoſed to *lipara*, or plaiſters, which have fat in their compoſition; called alſo, by Celſus, *lenia*.

Galen gives the name αλιπη, to the remedies applied to freſh wounds, to check the inflammation, and haſten their healing. *Gal.* de Comp. Medic. per Grad. l. 1. c. 15. *Celſ.* de Art. Med. l. 5. c. 19. *Caſt.* Lex. Med. p. 32. *Lang.* Epiſt. Med. l. 1. epiſt. 77. p. 421.

ALIPILARIUS, or ALIPILUS, in antiquity, an officer belonging to the baths, who, by means of wax, and waxen plaiſters, took off the hairs from the *alæ*, or armpits.

The *Alipilus* anſwered to what the Greeks called ἀξωπαχιστης.

The antient Romans made it a point of cleanlineſs to keep the armpits clear and ſmooth. In after times, they went further, and took off the hair from their arms, legs, and other parts, with pitch and roſin, and by the *volſella*, an inſtrument for that purpoſe. *Petit.* ad Leg. Attic. p. 301. *Fabric.* Bibl. Græc. l. 5. c. 26. *Caſt.* in voc. *Alipili*. *Voſſ.* Etym. p. 18. in voc. *Alipilus*.

ALIPTA, in the antient gymnaſtics, an officer appointed to anoint the *Athletæ*.

In which ſenſe, the *Aliptæ* amount to the ſame with what are otherwiſe called *Unctores*, and *Jatraliptæ*. Vid. *Buret.* Hiſt. Ath. l. 1. Mem. Acad. Inſcr. T. 2. p. 292. See JATRALIPTES.

ALIPTA is ſometimes alſo uſed, in a leſs proper ſenſe, for the director, or ſuperintendant of the exerciſes of the *Athletæ*.

In which ſenſe, *Alipta* is ſynonymous with *gymnaſtes*, and *pædotriba*. *Buret.* Hiſt. Athlet. l. 1. Mem. Acad. Inſcr. T. 2. p. 302.

ALIPTERIUM, αλειπτηριον, in antiquity, a place in the antient *paleſtræ*, where the *athletæ* were anointed before their exerciſes.

The *Alipterium*, or *Alipterion*, was otherwiſe called *elæotheſion*, and *unctuarium*; ſometimes alſo *ceroma*. *Lang.* Epiſt. Med. l. 1. ep. 51. p. 234. *Buret.* Mem. Acad. Inſcr. T. 2. p. 292. See ELÆOTHESIUM.

ALIQUOT *part* (*Cycl.*)—Hobbs ſeems to confound the notion of an *aliquot* part with that of a commenſurable.—For that every *aliquot* part is commenſurable with its whole. Dr. Wallis corrects him for it, and ſhews the difference. In effect, every *aliquot* part is a commenſurable, but not *vice verſa*. Thus four is commenſurable with ſix, but is not an *aliquot* part of it. Phil. Tranſ. N°. 41. p. 827. See COMMENSURABLE, *Cycl.*

ALISMA, in botany, a name given by ſome to the *plantago aquatica*, or water plantain. *Dill.* Cat. Giſſ. p. 227.

ALITES, in antiquity, a name given to thoſe birds which afforded auguries by their wings and flight. *Feſt.* de Verb. Signif. p. 10.

In this ſenſe, *Alites* ſtand oppoſed to *oſcines*, or birds which gave auguries by their mouths, by ſinging, or croaking, &c.

To the claſs of *Alites*, belong the buzzard, oſprey, &c. To that of *oſcines*, the crane, raven, owl, &c. *Voſſ.* Etym. p. 18. in voc. *Ales*. *Pitiſc.* Lex. Ant. T. 1. p. 72.

The word is Latin, formed from *ala*, a wing.

ALKA, in zoology, the name of a water bird, of the diver kind, called, in different parts of England, the *auk*, the *razor-bill*, and the *murre*. It approaches to the ſize of the common duck; and its head, neck, back, and tail, are all black; its belly and breaſt, and up half-way of the throat, is white; but the upper part of the throat is of a duſky browniſh, or blackiſh purple; the wings are variegated with black and white. Its bill is two fingers breadth long, and is flatted ſideways and narrow, and has a deep furrow on its upper part; the upper chap alſo is hooked and hollow, and receives the under one into it, as into a ſort of ſinus; they are both of the ſame length, and are both marked with two tranſverſe furrows. It has, from the form of its beak, got the name of the *razor-bill*. Its legs are black, its feet webbed, and it has no hinder toe.

It builds in the rocks on the ſea-coaſts, and makes no neſt, laying its eggs in ſome hollow of the naked rock. The eggs are very large, and are white, with black ſpots. *Ray*'s Ornithol. p. 243.

ALKADARII, a ſect among the Mahometans, who deny any eternal, fixed, divine decrees.

The word is formed from the Arabic, *Alkadar*, which ſignifies decree.

The *Alkadarii* are a branch of *Moatazalites*.—They ſtand oppoſed to the *Algiabarii*. See ALGIABARII.

The *Alkadarii* are aſſertors of free-will; hold that man is veſted with a ſufficient power to do good or ill; is capable of meriting and demeriting, and ſhall be rewarded or puniſhed accordingly. *Abulpharag.* Hiſt. Dynaſt. 9. ap. Lehman. obſ. in Budd. Inſt. Philoſ. c. 4. p. 195.

ALKAHEST (*Cycl.*)—The *Alkaheſt* is variouſly defined by chemical authors: by ſome as an univerſal diſſolvent, or *ſolvens benedictum*, which radically diſſolves gold, ſilver, &c. and fermenting together with them, produces an univerſal medicine;

cine [a]. By others as a mercurial liquor, which by a ſimilitude of parts, penetrates the texture of mixed bodies, deſtroys their coheſion, and without undergoing any re-action, or loſing any part of its ſtrength, divides them into ſeveral ſubſtances [b]. By others as a ſaline, inodorous, homogeneous fluid, indifferently diſpoſed with regard to all mixts, which it penetrates like a wedge, and reduces them into their true elements, without communicating any thing to, or receiving from, the the bodies ſo diſſolved. By Helmont, as the principal and moſt ſucceſsful among ſalts, which having obtained the higheſt degree of ſimplicity, purity, and ſubtility, alone enjoys the faculty of remaining unchanged and unimpaired, by the ſubjects it works on, and of diſſolving the moſt ſtubborn, and untractable bodies, as ſtones, gems, glaſs, earth, ſulphur, metals, &c. into real ſalt, equal in weight to the matter diſſolved; and this with as much eaſe, as hot water melts down ſnow.—[[a] Ephem. Acad. N. C. Dec. 3. An. 3. app. p. 103. [b] *Wedekind.* Diſp. de *Alkaheſt.* Erf. 1685. c. 2. §. 4.]

The *Alkaheſt* differs from *aqua regia* and other menſtruums, as theſe latter operate by corroſion; the former by a kind of ſympathy, or conſent of parts, whereby it eaſily inſinuates itſelf among the ſulphureous parts of bodies. Mem de Trev. 1708. p. 331. See DISSOLUTION, *Cycl.* and MENSTRUUM, AQUA-REGIA, &c. *Cycl.* and *Suppl.*

It differs from fixed alkalies volatilized, in that the former is ſuppoſed to volatilize the bodies it diſſolves, whereas the latter coagulates them [c].—It differs from the mercury of the philoſophers, in that the former is a ſalt, the latter real mercury: add that the philoſophical mercury is a metal which only acts on metals; whereas the *Alkaheſt* diſſolves all bodies, but without uniting radically with any of them; and ſo as ſtill to remain ſeparable from them [d].—It alſo differs from the mercury of the philoſophers, as the former, according to Becher, conſiſts of mercurial earth intimately mixed with water; whereas the latter conſiſts of a mercurial and ſulphurous earth, as its principles [e]. Faber [f], indeed, and ſome others, make the *Alkaheſt* and philoſophical mercury to be the ſame. —[[c] Mem. de Trev. p. 328. [d] Mem. de Trev. 1704. p. 1865. [e] *Bech.* Phyſ. Subter. Sect. 6. c. 8. p. 540. *Stahl.* Philoſ. Princip. Chem. Supp. §. 1. p. 38. *Junck.* Conſpec. Chem. Tab. 28. p. 634. [f] Manuſc. Chem. c. 30. Ephem. Acad. N. C. Dec. 2. An. 8. app. p. 112.] See MERCURY.

Some diſtinguiſh two kinds of *Alkaheſts*, ſimple and compound. —Simple is that compounded of the acids of metals, pure and rendered volatile with the ſpirit thereof.—Compound, that made of the acid of minerals, and the pure and ſaline parts of animals, and vegetables. *Faber.* lib. cit. p. 113.

The *Alkaheſt* is ſaid to be heavy, as being ſalt without any phlegm; volatile as being pure ſpirit without any mixture; its ſmell is weak, as not being compounded of heterogeneous parts; it is alſo ſaid to be immortal, as not being alterable by its action. *Pelletier*, in Mem. de Trev. 1704. p. 1867.

The *Alkaheſt* is repreſented as an inſtrument of uſe for preparing divers remedies. All the medicinal virtues found in animals, vegetables, metals, minerals, pearls, ſtones, are by this menſtruum extracted from the other matters. By this a ſpecific againſt the gout may be drawn from hellebore, a febrifuge from colocynthis; and other ſovereign remedies, from myrrh, aloes, ſaffron, &c. all which are indeed procurable on eaſier terms, without the *Alkaheſt*, but much inferior in virture. Gold which ſtands all the trials of the fire, being digeſted in the *Alkaheſt*, and the menſtruum drawn off, remains at the bottom of the veſſel, in form of a fuſible ſalt. The ſame liquor being cohobated ſeveral times on the ſalt; this latter becomes volatile, and being raiſed by diſtillation, forms two kinds of *Aurum potabile*; of two different colours, the one red, which is the *Tinctura hæmatina*, the higheſt preparation of gold, by ſome repreſented as an univerſal medicine. By the *Alkaheſt* are alſo prepared *Argentum potabile*, and the wonderful oil of Venus and mercury, whereof chemiſts relate ſuch wonders. *Pellet.* in Mem. de Trev. 1704. p. 1867.

The different conjectures of chemiſts, with relation to the matter of the *Alkaheſt*, are innumerable. Boerhaave ſeems to expect it from the ſea-ſalt, and mercury together.—Few bodies but ſome alchemiſts or other has fixed on, as the object of his reſeaches after the *Alkaheſt*. Some have wrought on equinoctial dew; others on rain-water, others on talc, others on zink, others on antimony itſelf.—Poterius and Glauber confined themſelves to nitre; Beguinus did the ſame, only concealing it under the name of hermaphrodite ſalt. Angel. Sala, Sir Kenelm Digby, and ſeveral others held for vitriol. The diſciples of Paracelſus, commonly chooſe ſea-ſalt; Sandivorgius, Tachenius, Beverovicius, Boyle, and ſome others, water. Pollemannus, Mullerus, &c. built all their hopes on black lead; others preferred flint; ſome Potters varniſh [g]. Helmont pretends, that the *Alkaheſt* is prepared from common ſalt and raddiſh juice, unleſs his words are to be taken figuratively. Becher will have it made of a moſt penetrating mercurial earth; others of a foliated earth of tartar, and an urinous ſalt, combined, digeſted, and circulated together; others of ſpirit of wine, and ſalt of urine, coupled in due form; others of ſublimate mercury, and vitriol; others of the ſame mercury, and highly rectified ſpirit of wine, frequently cohobated; others of the ſapa of urine, expoſed to the magnetiſm of the air, &c [h].—[[g] *Martini*, in Mem. de Trev. 1707. p. 1452. [h] *Junck.* Conſpect. Chem. Tab. 7. p. 202.]

The generality of chemiſts take the *Alkaheſts* of Paracelſus and Van Helmont, for the ſame; ſome others conclude them to be entirely different things. It is certain theſe two authors ſpeak of their reſpective *Alkaheſts*, in terms very different. Paracelſus only ſpeaks of his as a medicine for the liver, which would prevent diſorders of that viſcus, or even ſupply, and reſtore it if entirely gone.—Van Helmont chiefly ſpeaks of his, as a menſtruum which would diſſolve all bodies.—Cnoeffelius, after an exact compariſon of the ſeveral paſſages of Van Helmont, wherein the *Alkaheſt* is mentioned, concludes, that what he elſewhere calls *Ignis gehennæ*, is not the ſame liquor with that which Paracelſus calls by the name of *Alkaheſt*; but with that which Paracelſus calls his corroſive ſpecific, which appears to be a different thing from his *Alkaheſt*: ſince Paracelſus never uſed his ſpecific internally, nor does Helmont, in all his writings, mention one word concerning the internal uſe of his *Alkaheſt*; tho' he commends it externally for the leproſy. And it appears from Paracelſus himſelf, that it was only on account of its external application, that he ranked it among medicines. *Paracelſ.* p. 817.

On the whole, it appears, that a diſtinction is by all means to be made between the *Alkaheſt* of Raym. Lully, mentioned by Helmont, the medicinal *Alkaheſt* of Paracelſus, the corroſive ſpecific of that author, and the diſſolving *Alkaheſt* of Helmont, however authors have generally confounded them; and by this means involved a thing, already myſterious enough in itſelf, in a darkneſs more than cimmerian [i]. It rather appears that Paracelſus, by his *Alkaheſt*, meant a ſpecific purgative, prepared of tartar and vitriol, for expelling peccant matter of all kinds lodged in any part of the body [k].—[[i] *Cnoeffel.* in Ephem. Germ. Dec. 1. An. 4. Obſ. 108. p. 104.—106. [k] Id. ibid. p. 108.]

The moſt celebrated forms and preparations for Helmont's *Alkaheſt* are thoſe given by Starkey, Zwelfer, Cnoeffelius, Glauber, and Pelletier; to which may be added, that of a late anonymous French chemiſt.

Starkey will have the *Alkaheſt* of Van Helmont to be made of urine; in which opinion he is ſupported by Philalethes, and ſeconded by a late ingenious author, M. le Pelletier of Rouen, who ſhews the conformity of this ſyſtem with Helmont's mind. Diſeaſes, according to that chemiſt, ariſing from a diſturbance of the archæus, are only to be cured by compoſing the ſame; and the body of the archæus, *i. e.* the vital ſpirit, being ſaline, it follows, that the remedies made uſe of to appeaſe it muſt be of the ſame nature. But urine is known to be a ſaline agent: add, that life, according to the ſame ſyſtem, being only fire, or light; and ſickneſs only a decay or impairing of that light; where ſhall we find a matter more fit for this purpoſe, to rekindle this fire, or light; ſince urine itſelf is in great meaſure fire, as appears from its volatile ſalt burning quite away, and the phoſphorus which is prepared from it.—The the only difference between Starkey and Philalethes is, that the former prepares his *Alkaheſt* from urine alone; and the latter, from the ſalt of urine, with the admixture of a little human blood. *Pellet.* lib. cit. Jour. des Scav. T. 34. p. 837.

Starkey was lead to the diſcovery of his *Alkaheſt* by meditating on theſe words of Van Helmont: "the matter of this "diſſolvent, is both baſe, and precious. It coſts nothing. "All men have it in their power. Adam carried it with "him, when he went out of Paradiſe. It is concealed in "in the microcoſm, and very powerful in the macrocoſm.—In "fine it is human urine." V. Mem. de Trev. An. 1704. p. 1867.

But it ſeems incredible, that all the *Alkaheſts* above recited ſhould agree to urine, in what manner ſoever prepared. It ſhould ſeem, that all that can be had from urine, can only ſerve to extract the ſulphurs of bodies, to be afterwards volatilized, and is doubtleſs what Paracelſus means by his *Arcanum Microcoſmi*. To arrive at the true *Alkaheſt* of Paracelſus, and Helmont; it muſt firſt be known how to procure their *ſal enixum*; to reduce it into a ſweet alkali; then into a ſublimate; and laſtly, into the precious mercurial liquor, which has been the object of the inquiry of ſo many chemiſts. *De la Caze*, Lett. in Mem de Trev. 1707. p. 1463. ſeq.

Tho' the matter of *Alkaheſt* be explained by Starkey, the manner of preparing it, he owns, is ſtill difficult: in effect, he deſcribes it in terms only one degree leſs ænigmatic, than Van Helmont himſelf. All he has left us, as to the method of compoſing the *Alkaheſt*, is what follows.

This ſharp, ſubtile, penetrating ſpirit of human urine, by means of another intermediate ſpirit, not of a different ferment from its own, but centrally the ſame with it, muſt be united with an acid that is not corroſive, but perfectly agreeable to it. This acid muſt alſo be as volatile as the ſalt of urine, before it can unite intimately with it. The mixture, by repeated circulations, arrives at a due degree of purity, which entitles it to the denominations of the *Ens Primum* of ſalts, the moſt uſeful and glorious of all ſalts. M. Pelletier gives an explanation of all the ambiguous terms in this paſſage,

and deduces from it the whole myſtery of the *Alkaheſt*: it was not much more eaſy for him to divine the preparation from Starkey's words, than it was for Starkey to diſcover it from Van Helmont's. According to this author, urine is the remote matter of the *Alkaheſt*. The next matter of it is, three different ſpirits procurable from urine. The 1ſt. a vinous and inflammable ſpirit. The 2d. an urinous, or burning ſpirit. The 3d. a fermented ſpirit, which, according to Helmont, diſſolves without corroſion the duelec, or ſtone formed in the human body. The three ſpirits being indicated in the ænigmatic paſſage, cited from Starkey, it is inferred they are the next matter, whereof the *Alkaheſt* is compoſed. It may be added, that thoſe three ſpirits never appear but in form of two, the one ſimple, the other double, for that the volatile and vinous are never the one without the other in fermented urine.

Pelletier deſcribes at large the proceſs, whereby the *Alkaheſt* is to be procured on his principles, *viz.* by ſetting a quantity of urine of young healthy people, who drink only wine, to ferment thirty or forty days; then diſtilling it by a ſand heat, till one third part of it is raiſed; ſetting the fæces, which remain, to ferment thirty or forty days more; rectifying ſeveral times the ſpirit procured by the former operation, and only ſaving what riſes firſt: to which is to be put, an equal quantity of highly rectified ſpirit of wine; the whole to be ſhaken together in the veſſel, till a white coagulum is formed; then an equal quantity of ſpirit of nitre, to be added to the mixture, by which the whole will fix into a kind of ſal armoniac. The fæces of the firſt diſtillation, which had been ſet to ferment *de novo*, are next diſtilled a ſecond time; and only a fourth part ſaved: this to be continued, till the reſidue is found of the conſiſtence of honey; and the phlegm being thrown away, a cohobation is next to be made of this reſidue, with the fourth part of the ſpirit laſt extracted; and this cohobation to be continued, till the whole become of an uniform conſiſtence. The ſpirit thus procured is next to be rectified, and poured on ſal armoniac; and the whole ſet to digeſt in dung, for eight days. By which the ſalt will be reduced into a liquor. This being diſtilled in *Balneo mariæ*, to get out the phlegm, and what is left at the bottom being re-diſtilled to a dryneſs; if nothing remain after this diſtillation, you have the *Alkaheſt* in perfection: if any thing does remain, it muſt be diſtilled and cohobated, till ſuch time as the whole riſe in one homogeneous uniform liquor.

The chief objections to it are, that the ſpirit of wine in this caſe will not make a coagulum with the rectified ſpirit of urine, at leaſt, unleſs it have been firſt fermented with the urine, and ſeparated again, by diſtilling the urinous ſpirit: And that it may be doubted, whether ſpirit of nitre, poured on ſuch a coagulum, will fix it into a ſal armoniac. It does not appear, whether M. Pelletier has made the experiment; at leaſt, he ſeems to decline the reputation of it, as frankly foregoing his pretenſions to be an adept [l]. Some are not inclinable to take him at his word; while others [m] note certain defects in his proceſs, which intimate that it was not altogether out of modeſty, that he declined the title.—Others [n] are ſaid to have tried it without effect. But it is further objected to the whole proceſs, that it does not anſwer Van Helmont's deſcription; for that a mixture of three bodies of different kingdoms, can never produce a liquor perfectly homogeneous.—[[l] Mem. de Trev. ubi ſupra, p. 1876. [m] *Martini*, in Mem. de Trev. 1707. p. 1454. ſeq. [n] *De la Gaze*, Lett. in Mem. de Trev. 1707. p. 1465.]

A later chemiſt adopts likewiſe Starkey's hypotheſis of urine, but gives an explanation, and a proceſs ſomewhat different from thoſe of Pelletier. The material principles, of which the *Alkaheſt* is immediately to be compoſed, he ſuppoſes to be three; a volatile urinous ſpirit; an intermediate ſpirit, which is the eſſential oil of urine; and an acid not corroſive, which is the vinous ſpirit of urine itſelf. The oily ſpirit is to coagulate the ſalt, and the vinous ſpirit to diſſolve both, but to be united with them by fermentation. This operation is to be repeated, till the whole is reduced to an eſſence, entirely ſpirituous and firy; in a word, to a ſalt without phlegm.

In this ſyſtem, the preparation of the *Alkaheſt* is reduced to the ſame operations as the volatilization of fixed alkalies. In effect, that fixed alkalies volatilized, which are the uſual ſubſtitutes of the *Alkaheſt*, have a great diſſolving power, appears owing to the mixture of eſſential oils, ſpirit of wine, and ſal alkali. From whence it is inferred, that the *Alkaheſt* alſo derives its quality and power from the mixture of the eſſential oil, and vinous ſpirit of urine, united with the volatile ſalt of it. Mem. de Trev. 1708. p. 327. ſeq.

Hence it is, that the *Alkaheſt* volatilizes the bodies diſſolved by it, by reaſon the urinous ſalt ſtill retains its volatility; whereas fixed alkalies volatilized coagulate the bodies they diſſolve, by reaſon they ſtill retain ſomething of the fixity of the ſalt they were made from. Van Helmont gives an intimation of this ſyſtem, when he ſays, if you cannot attain the ſecret of our fire, *i. e.* the *Alkaheſt*, at leaſt, learn a thing which comes next it in excellence, *viz.* to render alkalies volatile, that by means of the ſpirits of theſe, you may be able to make your diſſolutions. Starkey, in ſpite of all his myſtery, has left ſome things that confirm the doctrine: immediately after explaining the method of volatilizing fixed ſalts, he ſubjoins, "that the ſame operation is to be performed for procuring the *Alkaheſt*:" he adds, "underſtand but this well, "and the ſecret of the *Alkaheſt* will not be unknown to you." Now it is certain the way of volatilizing fixed ſalt, is by means of eſſential oils, and vinous ſpirits, conſequently, *&c.*

The preparation of Helmont's *Alkaheſt*, or *Ignis gehennæ*, according to Cnoeffelius's ſyſtem, which ſuppoſes it the ſame with Paracelſus's *Specificum corroſivum*, is as follows.—"Take "*Aqua fortis*, rectified from its *caput mortuum*, one pound; "ſublimate mercury, and ſal armoniac, each two ounces; "mix them, that they may conſume each other; then take "*aqua mercurialis*, *ad pondus omnium*, and reſerve the liquor "for uſe; this corroſive is irreſiſtable by the diamond itſelf." —Thus far is from Paracelſus himſelf. But what this *aqua mercurialis* is, might create much doubt; to remove which we have the following proceſs given by Paracelſus, in the appendix to his greater ſurgery, under the title of, *aqua mercurii maximum arcanum*. "Take mercury ſublimated from "ſalt of tartar ſo often, till it riſes, which will be the ſeventh "time; alſo arſenic ſublimated, and ſal ammoniac, each one "pound; let them be drenched ſeveral times with oil of ſalt of "tartar: after which diſſolve them on a marble into water." This is *aqua mercurialis*. Vid. *Paracelſ.* Chirurg. Magn. App. 1685. Fol. p. 15.

Whether this celebrated *Alkaheſt* will perform all the wonders which Helmont has related of it, we will not ſay: but it is certainly no ways probable, that with ſuch a fiery preparation, Paracelſus could pretend to cure, or reſtore the liver!

Glauber's *Alkaheſt*, known in the ſhops by the title, *Alkaheſtum Glauberi*, is a preparation of fixed or alkalized nitre, the proceſs of which follows.—Melt a quantity of nitre in a crucible, by a vehement fire, and add from time to time a quantity of powdered charcoal; by this means the ſulphureous acid of the nitre being kindled by the ſulphur of the charcoal, a conflict and deflagration enſues. When it will no longer deflagrate, it is found a fixed alkaline ſalt of nitre; which expoſed to the open air, in a low, calm, cool place, will preſently begin to melt. As it runs, pour it off into a glaſs veſſel, and expoſe the reſidue a ſecond time to the air. Repeat this till the whole ſalt is liquified. The liquor thus procured being ſtrained, is found limpid, alkaline and thickiſh, reſembling oil of tartar *per deliquium* [o].—This liquor Glauber impoſed on the world, for an univerſal diſſolvent; as being found effectual for diſſolving bodies of all the three kingdoms. But ſince the ſecret of its preparation has been diſcovered, its value is much abated. Boerhaave aſſures us, that in all the experiments he has made with it, he has found nothing in it, but what is equally found in oil of tartar *per deliquium*.—Only that the former is more difficult of preparation, and coſts more. Its principal uſe is for diſſolving reſins and gums, which it opens in ſuch a manner, that with the further help of ſpirit of wine, a genuine tincture may be procured from them. —The method of applying it is, by ſetting the reſin to digeſt with the *Alkaheſt*, in an open glaſs, for the ſpace of twenty four hours, or to a dryneſs; then pouring on the ſpirit of wine, ſome inches deep above the reſin [p].—[[o] *Teichmey*, Inſtit. Chem. c. 13. p. 177. *Beerh.* Elem. Chem. P. 3. T. 2. Proc. 131. & 138. [p] *Junck.* Lex. Chym. Pharm. P. 1. p. 13.]

Zwelfer's *Alkaheſt*, *Alkaheſtum Zwelferi*, is a preparation of verdigreaſe, made by diſſolving it in ſix times the quantity of diſtilled vinegar; then filtrating, and ſetting it to cryſtalize. Theſe cryſtals being diſſolved in ſpirit of wine, ſtrained thro' paper, and ſet on fire, the fine particles of the copper are exhaled; or if the cryſtals be diſtilled, they yield a very concentrated vinegar, part of which burns like ſpirit of wine, the other part being acid, yet in ſome meaſure volatile: So that almoſt the whole of it may be again ſeparated.—This vinegar is a very powerful diſſolvent, in ſo much that it paſſed on Zwelfer for the *Alkaheſt* of Helmont. *Junck.* Conſpect. Chem. Tab. 35. p. 309. *Boerhaav.* New Meth. Chem. P. 2. p. 355.

But it ſhould ſeem natural, before men put themſelves into the ſearch of the *Alkaheſt*, that they enquire into the poſſibility of it?

Tho' we have the expreſs teſtimonies of Paracelſus, Helmont, Philalethes, Starkey, Faber, and others, that they were actually poſſeſſed of the ſecret, yet many among the later writers, as Boyle [q], Wedelius [r], Major, Martini [s], and others, perſiſt in holding it impoſſible, and even to involve contradictions.—[[q] Uſefulneſs of experim. Philoſ. P. 2. Sect. 1. [r] Pharmac. in Art. Form. Redact. l. 2. Sect. 6. c. 19. [s] Gen. Errant. c. 19.]

In effect, we find qualities directly contrary aſcribed to the *Alkaheſt*: ſome will have it very ſubtile, others extremely ponderous, ſo that it will not riſe in diſtillation. If it diſſolve all bodies, what can contain it, or hinder it from diſſolving its own veſſel? How can it be immortal, and unchangeable, while it contains ſalts, the points of which muſt wear away by continual friction againſt the bodies to be diſſolved? If it be volatile, it muſt evaporate when employed! If fatty, or viſcous, it muſt adhere to the bodies diſſolved by it, and thus loſe many of its parts! *Martini*, ubi ſupra, p. 1452.

The moſt frequent objection to its exiſtence is, in what kind of veſſel it is to be contained? If it be anſwered in a glaſs veſſel, there is at once a negation of its univerſality; ſince glaſs, except of a particular compact kind, cannot ſuſtain the diſſolving power of divers acid ſpirits, but, in a few hours, turns to a kind of magiſtery. Glauber [t] indeed enjoins, that a freſh thick glaſs be applied every ſix hours, to prevent the *Alkaheſt* from being ſpilt by diſſolving the glaſs; but, on this ſuppoſition, it cannot poſſibly ever be a pure liquor, but muſt be impregnated with the atoms, or corroded particles of the glaſs, and conſequently be a ſort of *vitrum potabile*. How abſurd, then, muſt that pretenſion of Glauber be, where he affirms, that the *Alkaheſt* was the fire of the Maccabees hid under the altar [u], and diſcovered many years after in a pit, in form of a thick oil?—If this were the *Alkaheſt*, how, or in what, had it been preſerved ſo long? and what hindered it from reſolving the pit into its firſt matter, and by eating itſelf a paſſage under ground, undermining the whole country? Wedekind would ſolve the inconſiſtency, by alledging, that divers things are requiſite to the operation of the *Alkaheſt*; that bodies, before applied to it for ſolution, are to undergo a preparation; if vegetables, by cutting, contuſing, raſping, &c. if ſtones, or the like, by trituration, alcoholization, &c. if metals, by lamination, calcination, &c. Beſides that in the operation, there is to be digeſtion, repeated cohobations, and even fire applied for a certain time. But this will not ſuffice; ſince it is agreed, that the preparations above-mentioned are only uſed for the eaſier and quicker ſolution; not that they are eſſentially neceſſary. If there be an *Alkaheſt*, it cannot fail, in proceſs of time, to reduce the glaſs into its firſt principles, without any previous preparation; though, with the help of an alcoholization, it might have effected it in leſs time. Nor can a long time be neceſſary for ſuch end, ſince there are other corroſive liquors, which will diſſolve glaſs in a ſhort time; which, in that caſe, muſt have much the preference to the *Alkaheſt*. Add, that if the *Alkaheſt*, according to the definition ſometimes given of it, only diſſolve the coheſion of mixts, it will follow, that the greater number of heterogeneous particles a mixt conſiſts of, the more fæces will be left at bottom; whereas it ought to have reſolved theſe fæces themſelves, nay all the matter of the three kingdoms, into their primitive matter, viz. water, &c. To reduce a mixed into ſeveral ſubſtances, is not ſo properly to diſſolve as to corrode it; the latter, *aqua regia* does to gold; the former is required from the *Alkaheſt*; which is not to reduce bodies into divers matters, but into their firſt, or elementary matter, which therefore is but one. And if this ſolvent require fire, digeſtion, cohobation, &c. to make it act, how ſhall we conceive it to operate without reaction, paſſion, &c. and, on ſuch ſuppoſition, what uſe would digeſtion be of [w]? —[[t] *Opp.* Miner. P. 10. p. 315. ſeq. [u] 2 Maccab. *c.* i. *v.* 19. [w] Ephem. Acad. N. C. dec. 3. an. 3. App. p. 101, 104.]

After all, who can doubt of the poſſibility of the *Alkaheſt*? All the objections ariſe only from the obſcurities of the proceſs, which has rendered ſucceſsleſs the attempts of moſt of thoſe who have undertaken to prepare it: our reader, therefore, 'tis to be hoped, will thank us for a new proceſs for making this wonderful liquor, in terms not eaſy to be miſtaken, by any of the genuine ſons of Hermes. If he read it with a mind duly prepared, and purged from thoſe heterogenities wherewith ſenſe ſometimes over-clouds the intellect. It is faithfully tranſcribed from an Egyptian marble, hewn by the author of the tomb of Semiramis, from the great pyramid.—Take then ſome ſubterraneous Adam, which is a metal not a metal, a marcaſite not a marcaſite, a mineral not a mineral, nothing and all things: take this Adam; and as the firſt Adam was commanded in the ſweat of his brow to eat his bread; do you proceed in the contrary method; ſee that your Adam be firſt well fed, and filled; that he eat to ſweat, and not ſweat to eat. When thoroughly ſated, cut off his limbs; thruſt him into a ſtove; and gradually raiſing the fire, ſweat him till he melt down to the very bones. This ſweat, when duely cleanſed, will be of a whitiſh-black colour, and taſte ſtrongly of a ſower ſweet. Infuſe the limbs in this ſweat; a fine golden, permanent tincture will be hereby had; into which a handful of mineral blood being caſt, well ſaturated with vegetable blood; a glittering ruddy colour will ariſe, far tranſcending that of a carbuncle. The mineral is then to be ſeparated from the vegetable blood, and ſet to bathe, till it has got wings, by means whereof it will flutter about perpetually. Having thus acquired an aerial nature, a lotion in *aqua cœleſtis*, condenſes it again into a heavy ſubſtance, more ponderous than gold, yet lighter than a feather; harder and more compact than a diamond, yet rarer, and more pervious than æther itſelf: which is the true *Alkaheſt*; wherewith, if you underſtand this proceſs, you may reſtore your Adam to life again.

Philaletha [x], Starkey, Pelletier [y], Martini [z], De la Caze [a], and others, have diſcourſes, dialogues, epiſtles, &c. on the ſubject of the *Alkaheſt*.—Divers particulars alſo relating to the ſame are occaſionally delivered by the writers on chemiſtry, the philoſophers ſtone, &c [b].

[x] L'Alkaheſt, ou le Diſſolvant Univerſel de Van Helmont, revelé dans pluſieurs Traitez, qui en decouvrent le Secret, Rou. 1706. 12mo. It is properly a collection of the beſt pieces on the *Alkaheſt*; comprehending ſome fragments extracted from Philaletha, wherein he deſcribes, after an ingenious manner, the ſecret of that diſſolvent: alſo five chapters of Starkey's Pyrothechnia; a dialogue on the *Alkaheſt*; and a poſthumous piece, wherein he ſhews how he diſcovered this liquor, and the manner of preparing it. Extracts of the work are given in Jour. des Scav. T. 34. p. 831. It. p. 1042. Mem. de Trev. 1704. p. 1861. Works of Learn. T. 8. p. 643. Ephem. Acad. N. C. dec. 1. an. 4. App. p. 75.]

The word *Alkaheſt* ſeems to have been coined by Paracelſus, no writer of any kind having ever mentioned it before him. He ſays, it is a remedy of great effect upon the liver, reſtoring and fortifying it, and preventing dropſies, and other diſeaſes. He tells us, its proceſs is to reſolve it after it is coagulated, and then coagulate it again into a tranſmuted form. He adds, that though the liquor were to be given in caſes where the liver were all diſſolved, it would be able to ſupply the place of the liver in the human body; and therefore, that it is neceſſary for every phyſician to know this medicine, that he may be able to cure numerous diſeaſes of the liver, not curable by any other means.

This is the account of the *Alkaheſt* given by its author, who never ſeems to have hinted at any ſuch property in it, as its being an univerſal diſſolvent. But his ſucceſſor, Van Helmont, who always found hidden meanings in his works, diſcovered the ſecret, as he pretends, of this, and diſcovered theſe its amazing qualities.

All chemical ſolutions, as Boerhaave very juſtly obſerves, ſeem the effect of a latent attraction and repulſion betwixt the parts of the ſolvent and ſolvend, and conſequently the whole action depends upon a mutual relation and affinity between theſe two: and if this be the caſe, there can be no body, either natural or artificial, which can have a power of diſſolving all the reſt. *Boerhaave*'s Chem. p. 569.

Helmont, however, poſitively affirms the fact, and Mr. Boyle and many other great men, though they pretended not to believe the poſſibility of it, yet, by their numerous, though vain attempts, to diſcover it, ſeem to have, in ſecret, thought it might be.

It was the cuſtom of Paracelſus to tranſpoſe the letters in words, which he uſed as the names of his medicines, and ſometimes to join parts of different words into one; as in his names *ſutratar*, for tartar, given as a medicine to open obſtructions of the ſpleen, and *aroph*, for *aroma philoſophorum*, an affected name given, by ſome, to tartar. Hence ſome have imagined, that by this word *Alkaheſt*, he only meant *alkali eſt*, it is an alkali; intimating, that the baſis of the medicine was an alkali, though ſated with a proper acid in the preparation. Others have imagined, it was called *Alkaheſt*, from *ſaltz-geiſt*, ſpirit of ſalt, ſuppoſing the *Alkaheſt* the ſame with the *ſal circulatum* prepared from ſea ſalt, coagulated, reſolved, and again coagulated into a tranſmutated form: and others ſuppoſe it had its origin from *algeiſt*, that is, a perfect ſpirit made by coagulation, reſolution, and a ſecond coagulation. This agrees with the opinion of Faber, who takes it to be a pure mercurial, or metallic ſpirit, ſo united to its proper body, as thence to become one inſeparable and indeſtructible ſubſtance. All this, however, is but bare conjecture, and that upon no very ſolid grounds.

Paracelſus gives no ſynonyma for the *Alkaheſt*; but Helmont calls it ſometimes a thin and clear water; ſometimes a thick water; in which ſenſe, he ſuppoſes it like the thick water mentioned in the Maccabees, which was perpetual fire; and in other places he calls it an immutable diſſolving water. He

calls

calls it alſo *ignis aqua*, fire water, and *latex*, or clear water, reduced to the minuteſt atoms poſſible; and affirms, that all ſubſtances may be readily converted by it into a thin water: and, in other places, he calls it the infernal fire, or *ignis gehennæ*; he ſays, that native ſand reſiſts both art and nature for ſolution, and is never to be diſſolved in any other manner, than by the *ignis gehennæ*, or *Alkaheſt*; but this artificial watery fire, he ſays, converts ſand into ſalt. If Helmont follows Paracelſus cloſely, in applying this term *ignis gehennæ* as a ſynonymon of the *Alkaheſt*, we may thence arrive at ſome knowledge of what the *Alkaheſt* is, ſince this *ignis gehennæ* Paracelſus has explained himſelf pretty largely upon.

Helmont, in other places, ſays, that the *Alkaheſt* is the higheſt exalted, and moſt ſucceſsful of all ſalts, having obtained the utmoſt degree of purity and ſubtilty poſſible in nature; and hence he calls it the *ens primum* of ſalts, and the *ſal circulatum* of Paracelſus. Could Helmont's ſincerity be depended upon, we might from this alſo, compared with the works of Paracelſus, attempt to diſcover this wonderful menſtruum. The origin of the *Alkaheſt*, we are told by Helmont, is from art; he expreſly ſays, that nature has it not; he ſays, that a part of earth may, by art, be reduced to water, but that nature has no agent of power to do this; but the *Alkaheſt* alone can effect it.

Some have pretended themſelves poſſeſſed of this great menſtruum, and declared, that it was prepared by a very ſimple and eaſy proceſs; but this is a very different account from that of their maſter Helmont, who poſitively declares it the moſt tedious and difficult of all the chemical proceſſes; nor are they to pretend there are two or more different kinds of *Alkaheſts*, for Helmont poſitively affirms that there is but one.

The effects of this wonderful menſtruum are, that all ſenſible bodies are diſſolved by it, not excepting even gold and mercury, upon which no other ſubſtance can intimately act; ſtones, flint, ſand, gems, marcaſites, clay, earth, brick, glaſs, lime, ſulphur, &c. may all, according to Helmont, be tranſmuted by it into an actual ſalt, equal in quantity to their whole bulk; and plants, fleſh, fiſh, bone, and all other animal ſubſtances, are by it reſolved into their pure principles; but metals, on account of the equal commixture of their ſeminal matter, are very difficultly reduced to ſalt, and that no other menſtruum but the *Alkaheſt* can perform this. Charcoal is diſſolved by it into a clear water, which riſes all in diſtillation, leaving no fæces. The power of this menſtruum, as of all others, is greatly increaſed by fire, though only a very ſmall degree of it is neceſſary; for, according to the author, a charcoal made of oak being put into a glaſs, with an equal weight of the *Alkaheſt*, and hermetically ſealed, the whole was reduced to a clear and pellucid liquor, without fæces, by a three days digeſtion in *balneo mariæ*; and an equal quantity of cedar wood in chips, and of the *Alkaheſt*, being treated in the ſame manner, a week's digeſtion converted the whole into one homogene milky liquor, without any ſediment; and the *Alkaheſt* only poured upon mercury, and once diſtilled from it, leaves it behind in form of a ſolid maſs, eaſily reducible to a fixed powder, without either increaſing or diminiſhing its weight. It diſſolves the *ludus helmontii*, or *ſeptaria*, in a few hours, into a ſalt of equal weight with itſelf, and never requires any great degree of fire for any ſolution, itſelf riſing in diſtillation with the ſecond degree of heat of a ſand furnace, but not riſing in a *balneum mariæ*. *Boerhaave*'s Chem. p. 573.

Boerhaave obſerves, that there has never been any thing in all nature obſerved, or related, more ſurprizing than the phyſical change which theſe authors attribute to the action of this menſtruum; as it at once changes the whole ſubſtance of the ſubject into a different matter, without the leaſt alteration of weight in the operation. The maſs, after this operation, ſeems always to appear either in a fluid, or in a ſaline form, though with ſome difference; for we find, that quickſilver is only reduced by it into a ſolid pulveriſable maſs, which, on account of its great purity and ſimplicity, cannot be converted into ſalt; whence it radically reſiſts all the poſſible ſeparations of art, or nature, and therefore is perfectly indiſtructible. Theſe other bodies, therefore, when turned into an equal quantity of ſalt by the *Alkaheſt*, ſtill retain their peculiar qualities and virtues, depending on their ſeveral powers lodged in their ſeminal principles.

By this means, therefore, all theſe bodies turn to a ſaline volatile ſubſtance, which contains all their virtues, and is capable of commixion with all the animal fluids; and in this ſtate they are potable, in the true ſenſe of the word; for what the chemiſts mean by potable gold, is gold thus reduced to a ſaline and ſoluble ſubſtance, equal to itſelf in quantity, and capable of circulation through all the veſſels of the body. All the ſolutions of gold are only mixtures of gold in acids, its particles remaining unaltered, though ſuſpended in the liquor; but the true *aurum potabile* of the chemiſts is gold reduced to a liquor equal to itſelf in weight, and properly the *ens primum* of gold. *Boerhaave*'s Chem. p. 575.

The moſt remarkable, however, of all the properties of the *Alkaheſt*, is that of its being able to diſſolve all theſe bodies, without ever mixing itſelf among them, but remaining itſelf perfectly ſeparate from all their particles, and ſo neither increaſing nor diminiſhing their weight. This appears, by the example given by Helmont of the ſolution of the oak coal, which, when perfected, conſiſted of two different liquors; the liquor of the diſſolved coal riſing alone in diſtillation firſt, and leaving the ſolvent all behind, unaltered, either in quantity, or in any of its qualities. He expreſly affirms, that he never found any body to which the *Alkaheſt* would unite, being itſelf a pure ſubtile ſubſtance, reduced to its ſmalleſt poſſible particles, and therefore uncapable of all fermentation, or admixture; ſo that it produces its effects by a bare external action upon the ſubject, not by any admixture with it, and acts as the pureſt fire upon bodies, or as hot water in diſſolving ice.

Hence the *Alkaheſt* appears to have two very extraordinary properties, with reſpect to all other menſtruums. 1. That it does not act by attraction, or repulſion, but by a certain mechanical motion, contrary to that of all other menſtruums, unleſs, perhaps, we are to except fire. And, 2. That it conſtantly preſerves all the native properties of the bodies it diſſolves: yet Helmont ſays, that in diſſolving poiſons, it reduces them to wholeſome medicines, by bringing them into their firſt matter; but this is very difficult to underſtand.

When the *Alkaheſt* has thus reſolved all bodies into their volatile *ens primum*, ſo as to let them retain their ſeveral virtues, we are told, that if they are farther puſhed by this menſtruum, they loſe their ſeveral qualities, and become mere indolent and inſipid water; ſo that by applying the ſolvent too long, the former excellent productions are all deſtroyed: and hence it follows, that water is the ultimate principle of all tangible bodies, the *Alkaheſt* being unable to act any farther upon this water. This, however, is ready to receive the ſeminal matter of any other body, and thence to paſs itſelf into a new ſubſtance.

It ſeems extremely ſtrange, that this menſtruum, while it thus acts upon all bodies, itſelf ſhould remain unaltered by all. In this reſpect, it truly reſembles fire, which is the only known agent to which it can be compared.

It renders all bodies more volatile than itſelf, inſomuch, that whatever is diſſolved in it, is to be drawn over in diſtillation, in a bath heat, whereas itſelf is not to be raiſed, but in a certain ſtronger degree in ſand.

With all theſe properties, however, the *Alkaheſt*, as may be learnt from ſome paſſages of Helmont, has its equal. He ſays, in his enigmatical language, that one and the ſame liquor, *Alkaheſt*, ſubdues all the tangible bodies of the univerſe into their firſt life, without ſuffering any change in itſelf or any loſs of its virtue, being only ſubdued and changed by its equal. And, in another place, he adds, that mercury, freed from its original ſulphur, cleaving to its moſt internal part, is immutable in the fire, and immediately conſumes the ſeminal powers of all other bodies, except its equal.

This is the account Helmont has given, in different parts of his works, of his *Alkaheſt*, collected together. No antient philoſopher, chemiſt, or phyſician, has ſaid a word of any ſuch ſubſtance, nor any of the moderns ſeen the effects of it; yet the thing is, in itſelf, ſo deſirable, that all the late chemiſts have attempted the diſcovering it; and Boerhaave himſelf acknowledges, that he tried an incredible variety of experiments to this purpoſe.

Paracelſus had a liquor procured, by a tedious proceſs of circulation from ſea ſalt, wherein nature has placed the utmoſt perfection. This ſalt he, by incredible induſtry, reduced to an oil, which always kept fluid and unchanged; this oil he called the *ens primum* of ſalts, and the *ſal circulatum minus*, or leſſer circulated ſalt. The preparation is troubleſome, but pretty clearly deſcribed, and this preparation perfectly correſponds with what Helmont ſays, that the ſalts of bodies ſeveral times cohobated with the *ſal circulatum* of Paracelſus, turn to water; and hence he aſcribes the virtues of the *Alkaheſt* to the *ens primum* of ſalts. He alſo mentions the property of changing poiſons into medicines, and that of preparing the *ludus* with this ſalt.

But Paracelſus had another menſtruum, much more powerful, and much more difficult to be obtained, than the *circulatum minus*; this he calls the *circulatum majus*; he calls this the matter of mercurial ſalt, and the living fire. He acknowledges, that the higheſt fire, and celeſtial life, lie hid in common mercury; and ſays, the quinteſſence of mercury is celeſtial fire, if diſſolved with its parent, or the ſecret ſalt: when, therefore, theſe two are intimately combined by a ſtrong union, and brought to a high degree of purity, ſubtility, and volatility, they ſeem to make that wonderful mercurial water, which he deſcribes in his chapter of the ſpecific ſolvent, where he ſays, that gold dies therein, ſo as no longer to remain gold, whereas, in all other ſolutions, it is only intimately divided, but yet remains true gold in ſmall particles, being eaſily recoverable in its priſtine form, upon reduction. By this means, therefore, there is a perfect union made of water with water; for here are two kinds of water employed, the common water contained in the ſalt, and the metallic water contained in the mercury, though they are both ſuppoſed to have the ſame origin. All this ſeems to have been under-

underſtood in this very ſenſe by Van Helmont; and this the general account he and Paracelſus give of it.

Hence it is eaſy to ſee, that the *Alkaheſt* is not to be ſought for in human urine, nor in any production thereof; nor in tartar or any of its preparations, tho' it is ſaid that a ſubſtitute may hence be had for the principal; nor can the phoſphorus be ever ſuppoſed juſtly to be the *Alkaheſt*, becauſe it is repugnant to ſeveral of the properties and qualities, above laid down, from theſe authors. Glauber alſo in vain ſought the *Alkaheſt* in the fixed alkali of nitre; and Zwelfer in diſtilled vinegar ſeparated from the cryſtals of verdigreaſe; Rolfink had no juſt idea of it, when he ſuppoſed it to conſiſt of the fixed alkali of tartar for its baſis, mixed with ſome acid of the mineral vegetable or animal tribe; for ſalt of tartar with the vinegar of antimony, makes only a *tartarum tartariſatum*, and with acid whey only a better ſort of the ſame; nor does the addition of ſal armoniac much alter the matter. But no one ſeems better to have underſtood the mind of Paracelſus and Helmont in deſcribing the *Alkaheſt*, than Petrus Johannes Faber; in a paper of his publiſhed in the German ephimerides, he obſerves, that the liquor *Alkaheſt* is a pure mercurial metallick ſpirit, ſo cloſely connected to its own natural body, that theſe two become one inſeparable indeſtructible ſubſtance, deſtroying all things and turning them into their firſt matter. It is a true philoſophical mercury choſen from the mineral kingdom, and joined with its own pure body, whereby it becomes an inſeparable milky and butiraceous liquor, which penetrates and diſſolves all things.

Becher is alſo of the ſame opinion: he expreſly ſays, that he diſcovered in ſea-ſalt, a certain arſenical and mercurifying power, which, when ſeparated pure, would be the *Alkaheſt*, tho' a very different thing from the philoſophic mercury: and hence he takes mercury for a ſulphureous metallic ſubſtance, which of itſelf would be ſolid; but that it receives all its fluidity from the arſenical ſulphur of common ſalt. The pureſt quickſilver, he obſerves, being diſſolved in ſpirit of nitre and precipitated with ſpirit of ſea-ſalt becomes volatile, and diſpoſed to part with its mercury eaſily; conſequently ſea-ſalt, may convert the pureſt metals from their own fixed nature into true mercury. This is a ſubtile inſinuation, which Boerhaave wiſhes the author had given more fully.

Upon the whole, it does not appear plainly, that the *Alkaheſt* was ever put to all the teſts mentioned, or that all the great things recorded of its power were really experimented. The chemiſts are very apt to reaſon from analogy, and from one operation of a body to deduce more. Helmont complains that the vial of it once given him was taken away again; whence probably he did not make any great number of experiments with it; and Paracelſus is no where very particular in his accounts of his own ſolvents: however it is the advice of Boerhaave, to all who have leiſure, and love chemiſtry, to treat ſea-ſalt and mercury in every chemical way, in order to diſcover it; in which, tho' they ſhould not ſucceed, yet the knowledge obtained from the experiments, made with that intent, will well repay the trouble of them. *Boerh.* Chem. p. 580.

ALKAHEST is alſo uſed in a more extenſive ſenſe, ſo as to comprehend all fixed ſalts volatilized, and reduced into a quinteſſence.—Some judge it to be in this ſenſe, that the word is uſed by Paracelſus in the paſſages above cited.

In this view there are numerous *Alkaheſts*, all different from the univerſal one.

The former are ſo many particular menſtruums, each ſtronger or weaker than other; and which, at leaſt ſome of them, loſe part of their virtue, at each operation. Whereas the latter is ſuppoſed immutable, and to have as much force after a thouſand diſſolutions as at firſt. Hence it is that theſe writers ſpeak of three kinds of *Alkaheſts*, or diſſolvents, called, *Arcanum Microcoſmi*, *Arcanum ſamech*, *Arcanum Ponticitatis*. The firſt is certainly prepared from urine, which Philaletha, and after him others, have miſtakenly ſuppoſed to be the matter of the third. The ſecond is made from ſpirit of wine. For the third kind, *viz.* the *Arcanum Ponticitatis*, which is the moſt ſublime, and myſterious, an idea of it may be thus conceived. All mineral and metalline ſalts contain an acid, which by alcoholiſation with their fixed ſalt may be reduced to a quinteſſence, which makes the *Alkaheſt* now ſpoken of; otherwiſe called the catholic *Alkaheſt*, of which we have treated above.

The preparation of this is much the ſame with that of the leſſer *ſal circulatum*, only that there is ſome further ſecret in it known to few. With this, neutral ſalts are prepared, alkalized, ſublimated, and at laſt reduced into a mercurial eſſence, which conſtitutes as many *Alkaheſts* or diſſolvents, as there are ſalts on the earth. *De la Caze*, Lett. in Mem. de Trev. 1707. p. 1462. ſeq.

Lully's *Alkaheſt* ſeems to have been of a kind different from all the reſt: it is repreſented as a kind of mercurial gold, whereby he not only fixed mercury, but tranſmuted it into gold.—Of which Helmont makes frequent mention. Tract. Natur. Contr. Neſcia. §. 40. p. 108. It. in Demonſt. Theſ. §. 58. p. 409. It. Vita æterna. p. 452. It. in Art. Vit. p. 483. *Cnoeffel.* in Ephem. Acad. N. C. Dec. 1. An. 4. Obſ. 108. p. 108.

ALKAHESTIC is uſed by ſome to denote the quality of bodies which are powerfully ſolvent.

In which ſenſe, *Alkaheſtic* amounts to much the ſame with menſtruous; except that the former imports a greater degree of the ſolutive power, than the latter. See MENSTRUUM.

De Bernitz has given divers forms and proceſſes of *Alkaheſtic* liquors, after Helmont, Cnoeffelius, &c. One, for the reſolution of minerals; another for that of vegetables; and a third, for that of animal matters. Faſcic. Alter. Medicam. Singul. Tit. 27. Ephem. Acad. N. C. Dec. 1. An. 6. app. p. 139. ſeq. See SOLVENTS and SOLUTION.

ALKALI. See the article ALKALY.

ALKALINE, (*Cycl.*) in a general ſenſe, ſomething that has the properties of an alkali.

In this ſenſe we ſay, *Alkaline* ſalts, *Alkaline* ſpirits, *Alkaline* ſubſtances, &c.

The word is otherwiſe written, *Alcaline*, *Alkaleous*, *Alcalious*, *Alkalizate*, and *Alcalizate*, which all amount to the ſame thing.

Beſides *Alkaline* ſalts, there are many other bodies, which produce nearly the ſame effects, with acids; being diſſolved by them with ebullition and efferveſcence, and like fixed and volatile *Alkaline* ſalts, forming ſaline ſubſtances of different figures in their cryſtalizations.

Theſe *Alkaline* ſubſtances are of different natures. Some are merely earthy, as quicklime, marble, ſealed earths, &c. Others are metalline; among which ſome have their peculiar and appropriate acids to act on them, as gold, tin, and antimony, which diſſolve with *aqua regia*; ſilver, lead, and and mercury, with *aqua fortis*; others diſſolve with all ſorts of acids, as iron, copper, zink, biſmuth, &c. There are others of the animal claſs, conſiſting 1. Of ſtony matters found in the viſcera of certain ſpecies, as the *calculus humanus*, bezoard, crabs-eyes, &c. 2. Teſtaceous matters and ſhells, as pearls, oyſter-ſhells, cuttle-fiſh bones, the ſhells or coats of lobſters, crabs, &c. 3. The parts of animals which, by length of time or ſome other cauſe, are become ſtony, or even earthy, as the foſſil unicorns horn, &c. 4. Laſtly, almoſt all ſtony marine plants, as coral. *Homberg*, in Mem. Acad. Scienc. An. 1708. p. 411.

For the proportion of the diſſolving power in the *aqua regia*, and *aqua fortis*, claſſes of acids, ſee the article ALKALY.

The chemiſts have divers *Alkaline* concretes of great uſe, as cauſtics, ſolvents, &c. ſuch is that made of equal parts of nitre and martial regulus of antimony, ignited together in a crucible: another of the martial regulus of tartar; another of nitre calcined with quick lime. *Stahl.* Philoſ. Princ. Chem. P. 2. Sect. 1. p. 146—149.

ALKALINE is more peculiarly applied to ſalts which will perſiſt in, and bear a ſtrong fire, without flying away and vaniſhing in the air. In which ſenſe theſe *Alkaline* ſalts are ſaid to be fixed. *Meret*, Obſerv. on Neri. c. 6. p. 263. *Stahl.* Philoſ. Princ. Chem. P. 2. Sec. 1. p. 137. ſeq. *Techmey.* Inſtit. Chem. c. 13. p. 170. ſeq.

ALKALY, or ALKALI (*Cycl.*) The opinion that *Alkali's* ferment only with acids, ſeems too haſtily taken up; for the different *Alkali's* will ferment with one another: ſpirit of hartſhorn, ſpirit of urine, ſpirit of ſal armoniac, and other volatile ſpirits of the *alkaline* kind, when in the dry form of ſalts, all ferment with ſalt of tartar, or other fixed *Alkali's* of the lixivial kind. Nor are the acids wanting in properties of the ſame kind. Spirit of ſalt is an *Alkali*, in regard to ſpirit of nitre, and ferments with it; and many of the acids ferment with ſulphur. A ſpirit of ſulphur, may be prepared ſo concentrated, that it will ferment violently with water, which will become hot, and as it were boiling, on the mixing it with it; yet water is certainly neither an acid nor an *Alkali*. This concentrated ſpirit of ſulphur is made by rectifying by diſtillation, in a retort, the oil of ſulphur made by the bell: this being placed in a retort, in a ſand heat, there riſes firſt an inſipid water, and after that an extremely acid liquor; every drop of which as it falls into the water, has the ſame effect, as a piece of red hot iron would have. When the veſſels are cold, the liquor remaining in the retort will be found clear as cryſtal, and almoſt as heavy as quickſilver: this is the concentrated oil of ſulphur. Mem. Acad. Par. 1714.

Terreſtrial ALKALI is a term uſed to diſtinguiſh the common alkaline ſubſtances, ſuch as chalk, coral, and the like, from the fixt lixivial ſalts of plants, and other *Alkali's* which are ſaline, and diſtinguiſhed from theſe by that appellation. Mr. Homberg obſerving that the *Alkali's* of this kind were much preſcribed, and greatly depended upon in medicine, entered on ſome experiments in regard to them, to prove in what degree each of them poſſeſſed that quality, that the phyſician might know how far to depend on each in his preſcriptions. This he attempted to aſcertain by diſſolving them in ſeveral acids; whence it appeared plainly that all the acid ſpirits produced by chemiſtry, were far from being of the ſame nature, ſome of them diſſolving certain bodies, which, the others would not touch; and others diſſolving more or leſs of the ſame body.

The acid liquors, however, he obſerves, may be divided into two claſſes, the one containing all thoſe of the nature of *aqua fortis*, and the other all thoſe of the nature of *aqua regia*. It ſhould ſeem alſo, that the ſeveral acid humours which oc-

caſion diſorders in the human body, might be arranged under the ſame two claſſes, it appearing certainly that ſome certain *Alkali's* have the power of curing ſome of theſe diſorders, and other certain ones of others; neither of which will have the ſame effect on the other diſtemper. Thus the pox is cured by mercury, and the poiſon of the bite of the viper, by the volatile urinous *Alkali's*, neither of which could be expected to have ſuch a ſalutary effect in the other caſe. Mem. Acad. Par. 1700.

As the acids in the human body are therefore of theſe two different kinds, it did not appear ſufficient to this curious experimenter to determine the ſtrength of every terreſtrial *Alkali* in deſtroying an acid, but he determined to try which would deſtroy moſt of each of two acids, which might anſwer to each of the two before eſtabliſhed claſſes; which was eaſy to be known, by ſeeing how much of each *Alkali*, each acid would diſſolve, in a given quantity. The acids he choſe, as the ſpecimens of the two claſſes, were the ſpirit of nitre, for thoſe of the *aqua fortis* claſs, and the ſpirit of ſalt, for thoſe of the nature of the *aqua regia*. The ſpirits he uſed on this occaſion, he took care firſt to deflegmate ſo well, that the *aqua regia* would perfectly diſſolve pure gold, and the ſpirit of nitre pure ſilver. The *Alkali's* diſſolved in theſe were the following, and their proportions in ſolution as expreſſed below.

An ounce of this ſpirit of nitre diſſolved	An ounce of this ſpirit of ſalt diſſolved
4 drams 9 grains of crabs-eyes, readily.	3 drams of crabs eyes, readily.
3 drams 7 grains of coral, readily.	2 drams 20 grains of coral, readily.
2 drams 58 grains of mother of pearl, readily.	1 dram and 56 grains of pearls, readily.
1 dram 36 grains of oriental bezoar, ſlowly.	1 dram 60 grains of mother of pearl, readily.
1 dram 60 grains of occidental bezoar, leſs ſlowly.	46 grains of oriental bezoar, ſlowly.
2 drams 28 grains of human calculus, ſlowly.	51 grains of occidental bezoar, ſlowly.
3 drams 20 grains of oyſter-ſhells, quickly.	1 dram 24 grains of *calculus humanus*, ſlowly.
3 drams 28 grains of burnt hartſhorn, without any ſenſible ebullition.	2 drams 12 grains of oyſter-ſhells, readily.
2 drams 36 grains of quick-lime, readily.	2 drams 21 grains of burnt harts-horn, without ebullition.
3 drams of ſlack'd lime, as readily.	2 drams 55 grains of quick lime, readily.
	2 drams 49 grains of ſlack'd lime, readily.

There appears by this table, to be a very great difference between the acid ſolvents of the *aqua fortis*, and thoſe of the *aqua regia* kind. The ſpirit of nitre, in ſome of theſe inſtances diſſolving more than double the quantity of the ſpirit of ſalt; and in almoſt all the inſtances proving a greatly more powerful diſſolvent. This difference in the power of the acid, as a ſolvent is to be attributed partly to the number and partly to the figure of the points of theſe acid ſpirits, which are the means of their acting as ſolvents on theſe alkaline ſubſtances; that it is not to any one of theſe alone that this difference is wholly owing, appears from this, that there are as above, many ſubſtances of which ſpirit of nitre diſſolves double the quantity that ſpirit of ſalt does; but it is alſo plain that this is not the caſe in ſome others, which ſpirit of nitre will diſſolve, and ſpirit of ſalt will not touch: in the firſt caſe the different number of the diſſolvent points, in the two acids, might be very rationally ſuppoſed the occaſion of the difference; but in the other, it muſt be owing to a different configuration of thoſe points. Mem. Acad. Par. 1700.

It might be ſuppoſed, that the configuration of the points of acid liquors might be known, by the figure of the ſalts from which they are drawn by diſtillation; but this cannot be, ſince we well know theſe ſalts are formed of combinations of acids and *Alkali's*; and we very well know, that the ſame acid ſpirit forms differently figured cryſtals, when it has diſſolved different *Alkali's*: for example, ſpirit of nitre, when it has diſſolved ſilver, ſhoots into cryſtals of a broad flat and triangular figure; and, after diſſolving copper, the ſame ſalt ſhoots into long thick hexagonal cryſtals; and from ſalt of tartar, the ſame ſalt forms true cryſtals, of the ſhape of thoſe of pure nitre. We are therefore only to judge of the figures of theſe points, from the effects we ſee them produce, not from the ſhape of the ſalts they are made from, which may eaſily be ſuppoſed to be wholly altered by the fire.

In the diſſolutions of theſe ſeveral *Alkali's*, it is obſervable, that each of the acids diſſolved the bezoars and human calculi, ſlowly, and with trouble; yet we know by chemical analyſes, that the greateſt part of both theſe ſubſtances is a volatile alkaline ſalt, which is a ſubſtance that naturally produces a much greater ebullition with acids, than chalk, or crabs-eyes, or any other ſubſtance of this kind. The ſlowneſs of this ſolution is probably owing to the large quantity of a coarſe thick oil, contained in thoſe ſubſtances, which, enveloping the alkaline particles, defends them greatly from the violence of the acid diſſolvent.

ALKEKENGI, (*Cycl.*) in botany, the name of a genus of plants, the characters of which are theſe. The flower conſiſts of one leaf, and is of a rotated form, and divided into ſeveral ſegments. The cup is ſhaped like a bell, and from it there ariſes a piſtil, which is fixed in the manner of a nail to the middle of the flower, and finally becomes a ſoft fruit of the ſhape of a cherry, but containing a number of flat ſeeds, and ſurrounded with a looſe foliaceous huſk, which is indeed no other than the cup greatly enlarged.

The ſpecies of *Alkekengi*, enumerated by Mr. Tournefort are theſe.

1. The common *Alkekengi*, or winter cherry of the ſhops, called by many authors, *ſolanum veſicarium*, the bladder night-ſhade. 2. The common *Alkekengi*, with variegated leaves. 3. The leſſer fruited whorled *Alkekengi*, called by Dodonæus and many others the ſleepy night-ſhade. 4. The Virginian *Alkekengi*, with yellow fruit. 5. The greater Indian *Alkekengi*. 6. The leſſer Indian *Alkekengi*, with greeniſh fruit. 7. The Indian *Alkekengi*, with yellow fruit. 8. The white flowered American *Alkekengi*, with greeniſh red huſks, and yellow fruit. *Tournef.* Inſt. p. 151.

Divers medicines are prepared from the *Alkekengi*, chiefly troches, wine, ſyrup, diſtilled water, both ſimple and compound, rol or pulp, ſpirit and eſſence; but they are all much out of modern uſe. The moſt celebrated are the *trochiſchi Alkekengi*, called alſo *trochiſci de halicacabo*, *de Veſicaria*, and *diaphyſſalidon*; which, beſide the common virtues of the berry, are ſuppoſed to have ſome peculiar ones derived from the other ingredients joined with them; and to be anodyne, cooling, aperient, *&c.* The like holds, *cæteris paribus*, of the reſt.

For the preparation and uſes of the troches, wine, water, *&c.* of *Alkekengi*, ſee *Burggr.* Lex. Med. T. 1. p. 433. ſeq. For the ſyrup of *Alkekengi*, *Lang.* Epiſt. Medic. l. 3. c. 3. p. 809. See alſo *Quinc.* Diſpenſ. P. 2. Sec. 5. n. 338. p. 148. and *Junck.* Conſp. Therap. tab. 5. n. 62. p. 180.

ALKERMES (*Cycl.*)—Divers forms of the *confectio Alkermes* are found in the different diſpenſaries. Junken[a] gives the Auguſtan, Noremberg, Brandenburg, Amſterdam, and Utrecht forms. —Bartholine, the Daniſh[b].—[[a] *Jungk.* Lex. Chem. Pharm. P. 2. p. 128. ſeq. [b] Act. Med. T. 1. Obſ. 43. p. 80. ſee alſo *Pemberton*, Tranſlat. of Coll. Diſpenſ. p. 303.]

The confection *Alkermes* has undergone divers changes and cenſures: its inventor, Meſue, firſt threw out the ſilk, originally uſed in it, and in lieu thereof, ſubſtituted the kermes: others have thrown out the *lapis lazuli*, which others retain, notwithſtanding its purgative virtue. Several have objected to the mixture of gold in it: ſome have complained, that while the kermes is found in other countries, yet this confection is only had from France. Some inſtead of kermes have propoſed the berries of the *Solanum Racemoſum tinctorii Americani*, to be uſed in this medicine, on account of the near affinity between the two kinds of berries. Camerarius has a piece expreſs on that ſubject. Ephem Acad. N. C. Dec. 2. An. 6. Obſ. 98.

Count Marſigli has an enquiry into the compoſition of this medicine, wherein he ſhews, that many of the ingredients, wherewith the antients ſo plenteouſly loaded it, and which are ſtill retained in it by the moderns, are not only uſeleſs, but hurtful; more particularly the *Lapis lazuli*, by many miſtakenly held cordial, by reaſon of the appearance of veins of gold in it: whereas, in reality it is only a marcaſite of ſulphur and vitriol, and contains a great quantity of acid, directly repugnant to the alkaline nature of the kermes, and highly prejudicial in diſeaſes, where the blood tends to coagulation. *Marſigli*, Annotaz. Intorn. Alla *Grana* della kermes. p. 68. ſeq. Giorn. de Letter. d'Ital. T. 9. p. 31. See KERMES, *Cycl.* and *Suppl.*

ALKUSSA, in ichthyology, a name given by the Swedes to a fiſh, which they alſo call *lake*. It is a ſpecies of the ſilurus, and is diſtinguiſhed by Artedi by the name of the ſilurus with only one cirrus, or beard, under the chin. The common ſilurus, which is the glanus of the antients, has four cirri. See SILURUS.

ALKY *of Lead*, among alchemiſts, denotes a ſweet ſubſtance procured from lead. *Ruland*, Lex. Alch. p. 31. *Caſt.* Lex. Med. in voc.

ALL *Saints*, in the kalender, denotes a feſtival celebrated on the firſt of November, in commemoration of all the ſaints in general; which is otherwiſe called *All-hallows*.

The number of ſaints being ſo exceſſively multiplied, it was found too burdenſome, to dedicate a feaſt day to each. In reality there were not days enough, ſcarce hours enough, in the year for this purpoſe. Hence an expedient was had recourſe to by commemorating ſuch in the lump, as had not their own days. Boniface IV. in the ninth century, introduced the feaſt of *All Saints* in Italy, which was ſoon after adopted into the other churches. V. *Baron.* ad Martyrol. 1. Novemb. Liturg. Calend. Sect. 16. p. 96. Works of Learn. T. 2. p. 534.

ALL *Souls*, in the kalender, denotes a feaſt day, held on the ſecond of November, in commemoration of all the faithful deceaſed.

The feaſt of *All-ſouls* was firſt introduced in the eleventh century, by Odilon abbot of Cluny, who enjoined it on his own order; but it was not long before it became adopted by the neighbouring churches. Vid. *Baron.* ad Martyrol. Nov. 2. Act. Sanctor. 1. Jan. in Vit. Odil. *Zimmerman*, Florileg. Phil. Hiſt. p. 93. ſeq. *Dupin*, Bibl. Eccleſ. ſect. 11. p. 130.

ALLAH, or ALLA, the name which all who profeſs Mahometaniſm give to God. Vid. *D'Herbelot*, Bibl. Orient. p. 99.

The word is Arabic, but is uſed alſo in the Turkiſh.

Allah is the ſame in Arabic with *Eloah* in the Hebrew, which is the ſingular of *Elohim*.

It alſo anſwers to the Hebrew *Adonai*; and even to that called *Tetragrammaton*, which more immediately expreſſes the Divine Eſſence.

The Mahometans make frequent repetitions of the word *Allah*, *Allah*, in their prayers.

ALLANTOIS (*Cycl.*)—This membrane is otherwiſe called *farciminalis*.

The human *Allantois* is a third coat or membrane of a fœtus, inveſting part thereof, in manner of a ſcarf, or collar, extending from the *cartilago xiphoides* to the bottom of the hips. See FOETUS.

Several anatomiſts, who diſpute the exiſtence of the human *Allantois*, allow of an intermediate membrane in the human ſpecies, between the chorion and amnios, but deny it the appellation of an *Allantois*, as holding it to differ from the *Allantoides* of brutes, in ſtructure, as well as office.

Hobokenus, and others, chuſe rather to denominate it *membrana intermedia*; Needham, *pſeudo-allantoides*. Some of theſe authors deny an urinary membrane to a human fœtus, as ſuppoſing the urachus here to be impervious, conſequently no paſſage of urine from it, and therefore no need of an *Allantois*. Others, who allow of a pervious urachus, deny the exiſtence of an *Allantois*, ſuppoſing that the urine is conveyed by the former, to between the amnios and chorion. V. *Rouhault.* in Mem. Acad. Scien. 1715. p. 135.

Harvey will not allow an *Allantois* even in brutes, but fancies the *Allantois* and the chorion to be the ſame membrane, only with two names; the firſt derived from its ſhape, the ſecond from its office. According to his opinion, the fœtus does not void any urine, but the whole is contained in the bladder, till the time of birth. Hale reſolves all theſe difficulties. Heiſter [a] lay under the ſame incredulity with Harvey; but has lately publiſhed his recantation in form [b]. Galen, and moſt of the antients, 'tis certain, not only hold the *Allantois* and chorion for diſtinct membranes, but allow an *Allantois* to the human fœtus; though this, it is to be obſerved, they did not ſo much from their experience of it, as from a ſuppoſed conformity between the viſcera, &c. of men, and of brutes. Hence the accounts they have left as to the figure, ſituation, &c. of the *Allantois*, agree only to their appearance in brutes. Galen deſcribes the *Allantois* as part of the navel-ſtring, reſembling a pudding, and reaching from one corner of the uterus to the other.—[a Ephem. Acad. N. C. cent. 1. p. 433. b Ibid. cent. 5. p. 231.]

In the greater number of animals that have hitherto been carefully examined, the *allantoid* membrane, with its contained urine, has been found.

The *Allantois* of ſome animals, as mares, bitches, and cats, ſurrounds the amnios, being every where interpoſed between it and the chorion. In others, as cows, ſheep, and goats, the *Allantois* incloſes a conſiderable ſhare of the amnios; and in others, as ſwine and rabbits, it is confined to a ſmall ſpace. *Monro*, in Medic. Eſſ. Edinb. Vol. 2. p. 147.

The *Allantois* appears differently in different animals. Fabricius ab Aquapendente will have dogs, cats, and the like animals, which have teeth both in the upper and nether jaw, to be without it. It is moſt conſpicuous in the cow and ſheep kind. Its length in the former extends to about twelve feet. It is very dilatable, and may be blown up to above a foot diameter [c]. The inhabitants of Iceland make uſe of it, inſtead of glaſs, for windows [d].—[c *Heiſt.* Compend Anat. p. 87. *Burggr.* Lex. Med. T. 1. p. 437. ſeq. d *Borrich.* in Barthol. Act. Med. T. 5. obſ. 45. p. 132.]

Dr. Grew ſuppoſes, with ſome of the beſt anatomiſts, that the human fœtus has no *Allantois*. Phil. Tranſ. N°. 457. Concerning the *Allantois* of a ſow, ſee farther in Phil. Tranſ. N°. 202. p. 851. Of a lamb, Ephem. N. C. dec. 2. an. 1. p. 376. Of a cow, Id. cent. 5. obſ. 24. p. 231. Of a human fœtus, Hiſt. Acad. Scienc. 1701. p. 28. It. 1702. p. 38. *Fanton.* Anat. P. 1. p. 234. Giorn. de Letter. d'Ital. T. 10. p. 325. Method of finding it, *Hale*, ap. Phil. Tranſ. N°. 202. p. 836. ſeq. Difficulty of its diſcovery, and miſtaken deſcriptions of it, Id. ibid.

ALLAZÆZIS, in the language of the chemiſts, denotes a philoſophical braſs, or copper, called alſo *æs album*, *aqua mercurii*, and divers other names. *Caſt.* Lex. Med. p. 34.

ALLEGATA, a word antiently ſubſcribed at the bottom of reſcripts and conſtitutions of the emperors, as *ſignata*, or *teſtata*, was under other inſtruments.

In this ſenſe, *Allegata* imports as much as verified, *verificata*. *Baxt.* Gloſſ. p. 81.

Allegata was a kind of ſubſcription, ſomewhat leſs uſual than *data*, *propoſitum*, *accepta*, *ſubdita*, *ſuppoſita*, or *ſubſcripta*. V. *Pitiſc.* Lex. Ant. T. 1. p. 72.

ALLEGIANCE (*Cycl.*)—The oath of *Allegiance*, taken by the people to the king, is only the counter-part to the coronation oath, taken by the king to the people, and as ſuch, partakes of the nature of a covenant; that is, is conditional, and ceaſes on a violation of the contract by the prince; at leaſt this is the doctrine of ſome of the chief advocates for the revolution [a]. The anti-revolutioners, on the contrary, hold the oath of *Allegiance* to be abſolute and unconditional [b].—[a *Johnſ.* Rem. on Sherl. p. 11. b Obſ. on Johnſ. Rem. on Sherl. p. 7. ſeq.]

An oath of *Allegiance* was impoſed on the people under queen Elizabeth; the popiſh prieſts took it, but evaded it, by reſtraining its obligation to the permiſſive form of the pope's toleration. The tenor of their ſwearing was, that they would obey ſo long as the pope gave them leave. In reality, they did not wait long for an abſolution from this oath. The pope, it is known, pronounced a ſolemn anathema againſt all who ſhould afterwards pay obedience to the queen. Some Engliſh Jeſuits at Rome propoſed a new oath of abjuration of the oath of *Allegiance*, to be impoſed on all who had taken that oath; at leaſt, all who were to be admitted into the Jeſuits houſe were to take an oath never to take it. V. Declarat. of Favour. Deal. of her Majeſt. Commiſſ. 1583. 4to. p. 4.

The gun-powder plot gave occaſion to the impoſing a new oath of *Allegiance* in 1606, which ſhould oblige the papiſts to be true to their prince, without breaking in upon the tenets of their religion. Some ambiguous terms in this oath ſet all the papiſts at variance; ſome were for taking it, others againſt it; ſome maintained, that it was only a bare proteſtation of civil obedience, while others oppoſed it, as eſſentially contrary to the principles of their religion. Blackwell, the arch-prieſt, then the head of the Romiſh clergy in England, not only took it, but wrote a defence of it. Bellarmine thought proper to chaſtiſe him for it, in a letter printed on the occaſion. King James I. wrote an anſwer to Bellarmine; to which the cardinal made a reply, under the name of his chaplain Math. Tortus. Biſhop Andrews undertook a refutation of this laſt piece, under the title of *Tortura Torti*. Several other papiſts appeared in behalf of the oath: Widdrington, a Benedictin monk, wrote a maſter-piece in defence of it; and the fathers Caron and Walſh outdid every body in their zeal and writings for it [c]. In effect, the generality of the clergy were for it, yet the Jeſuits to a man refuſed it; and the Spaniſh and Flemiſh clergy branded it as downright perfidy [d]. The pope was adviſed with; he put forth a bull againſt it, declaring the oath inconſiſtent with ſalvation; and after this a ſecond. But neither of them were regarded, even by the papiſts themſelves; no more than thoſe had been which had abſolved the Engliſh people from their *Allegiance* to queen Elizabeth [e].—[c Nouv. Rep. Lett. T. 1. p. 329. d Act. Erud. Lipſ. 1685. p. 276. e Hiſt. Engl. Coll. at Doway, p. 25.]

The reformed of the French church were not idle ſpectators of the diſpute, particularly Meſſ. du Pleſſis, Mornay, and du Moulin. The firſt publiſhed a work, intitled, The Myſtery of Iniquity [f]; ſhewing by what ſteps the popes had raiſed themſelves to their preſent grandeur. The Latin edition of this piece was addreſſed to king James, with an epiſtle, exhorting that prince, *de quitter doreſenavant la plume, pour aller l'eſpée a la main deſnicher l'Antichriſt hors de ſa forteresſe*, to give over engaging in a war with the pen, to go directly, ſword in hand, to drive Antichriſt out of his ſtrong hold [g].—[f Saumur. 1611. fol. g *Bac.* Lett. 35. Not. ap. Work. T. 4. p. 574.]

The convention of eſtates having offered the crown to the prince and princeſs of Orange, who accepted of it, the old oaths of *Allegiance* impoſed by the Stat. 1. Q. Eliz. and 3d James I. were abrogated; and a new oath was drawn up, to be taken by all the ſubjects of England, on penalty of being deprived of all employments, both civil, military, and eccleſiaſtical. Seſſ. 1. c. 8. Stat. abridg. T. 3. p. 8. ſeq. 8vo. The form of which was:

"I *A. B.* do ſincerely promiſe and ſwear, that I will be "faithful, and bear true *Allegiance* to their majeſties king "William and queen Mary. So help me God."

A conſiderable term, however, was allowed for every perſon, to have time to conſider of it. During this interval, an infinite number of pieces ws publiſhed for and againſt the power of kings and people. The reſult was, that the people, chiefly the clergy, divided into different parties and ſentiments. Some were of opinion, that the oath might be taken with a ſafe conſcience, but that it had been better not to have impoſed it. Others were perſuaded, that the juſtice of this ſubmiſſion was but probable, not certain, and therefore durſt not condemn thoſe who ſcrupled to take it. To others it ſeemed, that the oath might be taken in divers ſenſes; and it became either good or evil, according to the view wherein it was taken. Accordingly, theſe took it with mental reſervation, that hereby they engaged themſelves no further, than conſcience, and the fundamental laws of the nation allowed them

them to do it. Others grounded the king's right to their *Allegiance*, on the title of conqueſt. Others, as Dr. Sherlock, on his being in poſſeſſion, and having the power to keep it. Laſtly, others rejected all temperaments and mitigations, and condemned the oath as utterly unlawful. Some of the ring-leaders of theſe were Dr. Hicks and Mr. Kettlewell; and ſince, the ſect of what we call *non-jurors*. Vid. K. Will. and Q. Mary Conquerors, Lond. 1693. 4to. and Bibl. Angl. T. 7. p. 105. ſeq.

ALLEGORY (*Cycl.*) — The word *Allegory*, Αλληγορια, is Greek, for which the Latins have no proper name. Hence Scaliger gives it that of *prætextus*, as expreſſing the general deſign and uſe of it. V. *Scalig.* Poet. l. 3. c. 53.

Allegory includes parable, apologue, μυθος, or fable, and *paræmia*, or proverbs; at leaſt, under *Allegories* are comprehended ſuch proverbs as are applicable to ſubjects of different kinds. V. *Scalig.* Poet. l. 1. c. 57. & l. 3. c. 83. & c. 52, 53.

Scaliger [a] conſiders *Allegory* as one part, or ſide of a compariſon. It differs from irony, in that *Allegory* imports a ſimilitude between the thing ſpoken and intended; irony a contrariety between them [b].—[a *Scalig.* lib. cit. c. 52. b *Scalig.* lib. cit. c. 84.]

Some have allegorized, or reduced to *Allegory*, whole ſciences, as heathen theology, mythology, antient hiſtory, poetry, coſmogony, theogony, and moſt of the wiſdom of the antients, as well as of the moderns. By the help of *Allegory*, we find natural philoſophy in Moſes, chemiſtry in the antient poets, ſublime and ſpiritual things in low, vulgar, or groſs ones, wonderful diſcoveries in Rabbinical fables, admirable ſenſe and harmony, inſtead of contradiction, blunder, and folly.

Allegories have been in uſe in all ages and countries; we find them particularly among the orientals, and the Egyptians, who are ſuppoſed to have been the fathers of them. They were adopted by the antient Jews, but more by the Rabbins, and cabbaliſts of latter days. The Chriſtians borrowed the uſage very early; the primitive fathers abound with them. The Mahometans alſo give into *Allegory*, where the literal ſenſe of the Alcoran is liable to objections, particularly in the carnal account of paradiſe.

The Gnoſtics, Valentinians, and Baſilidians, appear to have been great dealers in *Allegory*; at leaſt if the conjectures of moderns be not herein miſtaken, who reſolve the doctrine of the Æons, of Abraxa's, &c. into the allegorical ſyſtem.

The great ſource of *Allegory*, or allegorical interpretations, is ſome difficulty, or abſurdity, in the literal and obvious ſenſe.—For a refuge, either to ſave the reputation of the writer, or conceal the ignorance of the commentator, recourſe is had to the expedient of *Allegory*. The miſchief is, as there are no certain laws, or rules, whereby to conduct, moderate, and reſtrain the ſpirit of allegorizing, we find ſtrange confuſion, and endleſs diſcord the fruit of it.

Allegories are diſtinguiſhed into divers kinds: as, verbal, real, ſimple, alluſive, phyſical, moral, political, theological, &c.

Simple ALLEGORY, according to ſome writers, is that which is taken from any kind of natural things.

Alluſive ALLEGORY is that which relates to other words, or things. *Gale*, Philoſ. Gener. l. 1. c. 2. ſec. 6. §. 6.

Verbal ALLEGORY is a thread, or ſeries of metaphors; or a continuation of the ſame trope, chiefly metaphor, through many words.—Such is that in Virgil:

Claudite jam rivos pueri, ſat prata biberunt.

Where the metaphor of watering the ground is carried on to the ſhutting of the ſluices, &c [a]. Or, that in Horace:

Parturiunt montes, naſcetur ridiculus mus.

Where the metaphor of the mountains (uſed for great undertakings) is purſued to their being in labour, and bringing forth nothing [b].—[a *Thomaſ.* Erot. Rhet. c. 22. p. 44. b *Voſſ.* Elem. Rhet. c. 9. §. 4.]

Perpetual, or *continued* ALLEGORY, is that where the allegorical thread is purſued through all the parts of a conſiderable diſcourſe.—Such are the books of Jonah [a], of Canticles [b], not to ſay the whole Old Teſtament, as it is by many held to be.—[a Bibl. Germ. T. 1. p. 258. It. T. 5. p. 134. b V. Bibl. Angl. T. 11. p. 471. Mem. de Trev. 1719. p. 601.]

Phyſical ALLEGORIES, thoſe wherein ſome point of natural philoſophy is repreſented: ſuch in Homer, are Juno, who repreſents the air; Jupiter, the æther, &c. ſuppoſed by many to be. Alſted [a] pretended to find the principles of all arts and ſciences in the Bible alone. Dr. Dickinſon has a treatiſe to prove, that the books of Moſes, allegorically taken, exhibit a perfect ſyſtem of phyſics; from which it was, that Thales, Anaxagoras, Empedocles, Leucippus, &c. borrowed the principles of the corpuſcular philoſophy [b].—[a Vid. *Alſt.* Triumph. Bibliæ. b Phyſ. Vet. & Nov. Lond. 1702. *Gundling*. Hiſt. Philoſ. Mor. c. 7.]

Medical ALLEGORIES, thoſe wherein ſome ſecret of phyſic is revealed: ſuch is Solomon's deſcription of old age [a]; wherein, according to certain authors, the circulation of the blood is indicated [b]: ſuch alſo, according to a modern writer, is the ſtory of the labours of Hercules.—[a Eccleſ. *c.* xii. *v.* 1. ſeq. b *Warlitz*, Valetud. Senum Salom. ap. Jour. des Scav. T. 43. p. 232.]

Chemical ALLEGORIES, thoſe relating to chemiſtry: ſuch, according to Suidas [a], and many moderns, is the ſtory of the Argonautic expedition ſuppoſed to be; wherein the proceſs of making gold is exactly deſcribed: ſuch alſo, according to Tollius [b], is the name and title of Baſil, Valentine, Benedictine, Monk; under which are concealed the ſecret of the philoſophical mercury.—[a *Suid.* in voc. Δεξας. b V. Bibl. Univ. T. 13. p. 206.]

Moral ALLEGORIES, thoſe whereby ſome uſeful moral inſtruction is held forth: ſuch, in Homer, is the victory of Diomede over Venus, or fleſhy luſt: ſuch alſo are the Pythagorean Metempſychoſis [a], and the ſtory of the judgment of Hercules, given by Prodicus [b], ſuppoſed to have been. To which may be added, the fables of avarice and luxury [c]; of the grotto of grief, and others in the Spectators [d].—[a Bibl. Choiſ. T. 10. p. 186. b Tatl. N°. 97. T. 2. p. 282. c Spectat. N°. 55. T. 1. p. 215. d Jour. Liter. T. 7. p. 298—305.]

A grammarian of the laſt century maintained, that the name of mice and frogs in Homer's *Batrachomyomachia*, were allegorical, and might be underſtood of the vitious manners of mankind [e]. Some think Homer intended to expoſe the vanity of man, by the noble and elevated ſentiments which he puts in the mouths of thoſe miſerable animals, and by the terrible diſorders which the death of a pitiful mouſe produced. Spencer's general plan is the repreſentation of ſix virtues, holineſs, temperance, chaſtity, friendſhip, juſtice, and courteſy, in ſix legends, by ſix perſons. The ſix perſonages are ſuppoſed under proper *Allegories* ſuitable to their reſpective characters, to do all that is neceſſary for the full manifeſtation of the reſpective virtues, which they are to exert. The red croſs knight runs through the whole ſteps of the Chriſtian life; Guyon does all that temperance can poſſibly require; Britomartis (a woman) obſerves the true rules of unaffected chaſtity; Arthegal is, in every reſpect of life, ſtrictly and wiſely juſt; Calidore is rightly courteous [f].—[e V. Mem. de Trev. 1718. p. 162. f Spect. N°. 540. Vol. 7. p. 256.]

Political ALLEGORIES, thoſe wherein ſome maxim of good government is artfully wrapped up: ſuch is that celebrated one of Menenius Agrippa, whereby he prevailed on the Roman people, who had withdrawn in diſcontent at the magiſtrates, to return into the city; to which purpoſe, he related to them the parable of a war raiſed by the ſeveral parts of the human body againſt the ſtomach. Vid. *Lamy*, Art de Parler, c. 12. Mem. de Trev. Jan. 1702. p. 46.

As to the ode of Horace, lib. 1. od. 14. mentioned in the Cyclopædia, it is diſputed whether the republic be therein ſignified, or only the ſhip which brought the poet back to Italy, after the battle of Philippi. V. Jour. des Scav. T. 4. p. 315. ſeq. & T. 86. p. 171.

Theological ALLEGORIES, thoſe wherein ſome truth relating to the nature or attributes of God is couched.

The method of defending Homer's gods, by having recourſe to *Allegory*, has been zealouſly ſupported of late by madame Dacier, and others, but in vain. The advocates for that poet are by no means agreed on the allegorical meanings they aſcribe to him; and whatever *Allegory* they chuſe, whether it be theological, moral, or phyſical, the difficulty is ſo great to make it quadrate to the whole of what the poet ſays of each god, that 'tis plain the *Allegories* only come in *ex poſt facto*, and are foreign to the author's intention. It is almoſt certain, Homer never thought of any ſuch thing; and that Metrodorus of Lampſacus, and Anaxagoras are the firſt who thought of this expedient, to pacify thoſe, who were offended at the poet. But ſuppoſing Homer to have been as errant an allegoriſt, as ſome would have him; he will not yet eſcape cenſure, for having choſen his figures, and compoſed his fictions ſo ill, that at firſt ſight ſeveral of them exhibit moſt pernicious ideas: as the invention of *Allegories*, was in his own power, ought he not better to have obſerved decorums [a]. For an inſtance, the defenders of this ſcheme aſſert, that by Minerva, Homer means the divine wiſdom, or underſtanding. Notwithſtanding which, it has been obſerved, that Minerva makes one of the moſt ſenſeleſs perſons in the whole iliad. Being enraged at Jupiter, ſhe repents her having complied with his requeſt, in aſſiſting Hercules to eſcape from hell. This, according to madame Dacier, only ſhews how much power paſſion has over wiſdom itſelf. But may it not be anſwered, what power can paſſion have over the divine wiſdom?—[a Mem. de Trev. 1716. p. 771. b Jour. Liter. T. 7. p. 298.]

There is nothing but may be defended, by the uſe of *Allegory*. The impieties of Homer's gods are by that means turned into the contrary virtues. By the like means, a man who would be at the trouble, might find excellent moral ſenſes in the moſt obſcene poems of Martial, or Ovid. Have we not heard of a learned writer, who, by help of *Allegory*, pretended to find the hiſtory of the Jews in Homer's Odyſſee? Nouv. Rep. Lett. T. 52. p. 383.

Lud. Vives actually turned the eclogues of Virgil into *Allegories*; and Turnebus and Politian, found great myſteries in Catullus's Sparrow [c]. The monk Jacobus Hugo, has with great ſagacity, found the whole Roman hiſtory to be only the hiſtory of the goſpel under other names. The pious Æneas flying from Troy, and carrying his gods with him into Italy, is no other than St. Peter, quitting the ſee of Antioch, and going to fix at Rome [d].—[c Act. Erud. Lipſ. 1695. p. 23. d Ouvr. des Scav. 1694. p. 161.]

Surenhuſius ſhews how the Gemaric doctors, and *allegorical* interpreters of the old teſtament, have diſcovered the myſtic ſenſes, under the letter which conceals them. This letter they call the body, and the *Allegory* the ſoul. The literal ſenſe with them is vile, and the *allegorical* precious. Maimonides has treated of the ſeveral methods whereby they ſupport their *Allegories*, which may be reduced to the following ones. 1. By not reading the words according to the points under them, but according to other points, which might be put under them, even, tho' the former ſhould make no ill ſenſe. 2. By changing ſome letters for others, either of the ſame organ, (as they call it,) or a different one. 3. By both changing letters and points. 4. By adding and ſubſtracting certain letters. 5. By tranſpoſing letters and words, to make a new ſenſe out of them. 6. By ſeparating one word into two. 7. By ſubſtituting other words, inſtead of thoſe that are written, to render the ſenſe clearer, and accommodate it to the ſubject. 8. By inverting the order of the words, to give them another ſenſe. 9. By both inverting the order, and adding of new words. 10. By both adding, inverting, and ſubſtracting words. V. *Surenhuſ.* de Veter. Theolog. Hebr. Formul. *&c.* ap. Bibl. Choiſ. T. 25. p. 411. ſeq.

Athenagoras, Theophilus of Antioch, with many others of venerable rank, and antiquity, conſidered the chriſtian religion only as a new ſect of philoſophy, which under low and popular ſimilitudes, contained the moſt hidden ſenſe, and profoundeſt myſteries of all ſorts of natural and divine ſciences. Platoniſm unveiled, P. 1. c. 8. p. 27.

The Æons of the Valentinians, the Abraxa's of the Braſilidians, are generally held to have only been *Allegories*. Such alſo is the platonic *logos* ſuppoſed to have been. Hermannus Deuſingius has even had the temerity to turn the doctrine of the trinity into a mere *Allegory*: according to him, the three perſons are only three faculties in God; like the underſtanding, the judgment, and the will in man. Theſe three faculties, he ſuppoſes to have manifeſted themſelves at different times. The underſtanding revealed itſelf to the Jews, under the name of father, whereof judgment, which is the ſon, was in ſome meaſure the complement or perfection; the Holy Ghoſt, which is the will and the love of God, only manifeſted itſelf in the new teſtament: and thus by a kind of progreſſion, or degrees, each age of the chriſtian church receiving more and more of it than the preceding ones. Nouv. Rep. Lett. T. 30. p. 270. ſeq.

The antient Jews, as the Therapeutæ, the author of the book of wiſdom, Joſephus, and Philo, and, in imitation of them, the generality of the fathers, turned even the hiſtorical paſſages of the ſcripture into *Allegories*, without excepting thoſe places, where the literal ſenſe is moſt clear and unexceptionable. *Calm.* Dict. Bibl. T. 1. p. 105.

ALLEGORY is alſo uſed for the drawing ſome words, plainly and literally intended at firſt, from their natural and proper meaning, to a foreign ſenſe; for the better inſtructing of our minds in ſome point of faith, or manners. This coincides with what is otherwiſe called accommodation. See ACCOMMODATION, *Cycl.* and *Suppl.*

ALLEGRO (*Cycl.*)—*Piu* ALLEGRO, in the Italian muſic, intimates to play, or ſing, a little quicker.

Poco piu ALLEGRO, ſignifies, that the part it is joined to muſt be played, or ſung, a little more briſk, and lively, than *Allegro* alone requires.

ALLELENGYON, in antiquity, a kind of tax, or tribute, which the rich paid for the poor, when abſent in the armies. *Pitiſc.* Lex. Antiq. in voc.

ALLELOPHAGI, in natural hiſtory, a term uſed by Mouffet, and other writers on inſects, to expreſs a peculiar genus of flies, which feed on one another. They are thus called in diſtinction from another claſs, called the *heterophagi*, from their feeding on different ſubſtances, not on one another.

ALLELUJA, (*Cycl.*) in botany, a name uſed by many for the common wood ſorrel. *Ger.* Emac. Ind. 2.

ALLEMANNIC, in a general ſenſe, ſomething relating to the antient Germans. The word is alſo written *Alamannic*, *Alemannic*, and *Alemanic*. It is formed from *Alemanni*, *Allemanni*, or *Alamanni*; the name whereby the German nation was antiently known.

In this ſenſe we meet with *Allemannic* hiſtory, *Allemannic* language, *Allemannic* laws, *&c.* Goldaſtus, and others, have publiſhed collections of writers on *Allemannic* affairs: *Allemannicarum rerum ſcriptores.*

Allemannic language was ſpoken throughout the ſouthern parts of Germany. It is divided into ſeveral dialects; the principal of which are the Suevic, and Helvetic. Act. Erud. Lipſ. 1728. p. 11.

The *Alemannic* differed from the Francic, which was the language in uſe through the northern parts of Germany: the chief dialects of this, are the Palatine, Franconian, and Saxon.

ALEMANNIC *Law*, *Jus Allemannicum*, is the ſame with what is otherwiſe called the Suevic law, being that which obtained in the more ſouthern parts of the country, as the Saxon law did throughout the northern. *Hartung.* Exerc. Jur. Civ. 1. c. 7. p. 986.

Schilter has publiſhed the provincial *Alemannic* law [a], and alſo the code of the feudal *Alemannic* law [b].—[a V. Act. Erud. Lipſ. 1728. p. 338. b V. Journ. des Scav. T. 84. p. 177. ſeq.]

ALLIANCE (*Cycl.*)—*Arms of* ALLIANCE, in heraldry, are thoſe born by the iſſue of families, whoſe heireſſes have married with other families, to ſhew their deſcent paternal as well as maternal from both families. *Niſbet*, Eſſ. on Armoury, c. 7. Hence in great meaſure the uſe and office of what they call marſhaling, and quartering.

ALLIANCE is alſo extended to leagues or treaties, concluded between ſovereign princes, and ſtates, for their mutual ſafety and defence.

In this ſenſe, *Alliance* amounts to the ſame with what we otherwiſe call confederacy, league, *&c.*

Alliances make a ſpecies of treaties; which are uſually divided into treaties of peace, of commerce, and of *Alliance*, properly ſo called. Theſe are ſometimes particularly denominated foreign *Alliances.*

Alliances are variouſly diſtinguiſhed, according to their object, the parties in them, *&c.* Hence we read of equal, unequal, triple, quadruple, grand, offenſive, defenſive, *&c. Alliances.*

Unequal ALLIANCES, *Fœdera inequalia*, are thoſe wherein one of the contracting powers promiſes patronage, or protection, and the other fidelity, and obſervance; by which they ſtand contradiſtinguiſhed from equal *Alliances*, wherein the ſeveral powers treat on a par. *Grot.* de Jur. Bell. l. 1. c. 3.

Offenſive ALLIANCE, that whereby the parties oblige themſelves jointly to attack ſome other power. This ſtands contradiſtinguiſhed from defenſive *Alliances*, where the parties only oblige themſelves mutually to defend each other.

The forms or ceremonies of *Alliances* have been various in different ages and countries. Among, us ſigning and ſwearing, ſometimes at the altar, are the chief; antiently eating and drinking together [a], chiefly offering ſacrifices together, were the cuſtomary rite of ratifying an *Alliance*. Among the Jews and Chaldeans, heifers or calves; among the Greeks, bulls or goats; and among the Romans, hogs, were ſacrificed on this occaſion [b]. Among the antient Arabs, *Alliances* were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a ſharp ſtone, dipping herein a piece of their garments, and therewith ſmearing ſeven ſtones, at the ſame time invoking the gods Vrotalt, and Alilat, *i. e.* according to Herodotus, Bacchus, and Urania [c]. Among the people of Cholchis, the confirmation of *Alliances* is effected by one of the princes offering his wife's breaſts to the other to ſuck, which he is obliged to do till there comes out blood [d].—[a Hiſt. Crit. Rep. Lett. T. 2. p. 250. b Jour. des Scav. T. 46. p. 114. c *Herodot.* l. 3. Nouv. Rep. Lett. T. 52. p. 31. d *Galen.* Hiſt. Armen. Ap. Bibl. Univ. T. 1. p. 293.]

It has been diſputed, whether the ſtates of the empire have a right of making *Alliances*, without the emperor's participation. And whether the king of England be veſted with abſolute power of making *Alliances* at diſcretion, without conſent of parliament. Dr. Davenant aſſerts the negative. According to him, the contrary opinion owes its riſe to the meer flattery of modern courtiers, having no foundation in the antient laws and conſtitution of the kingdom. King John and Richard II. were, according to this author, the firſt that attempted any thing like it. It is certain, there occur numerous inſtances in hiſtory, where the king has aſked, or the parliament have offered, their advice, concerning *Alliances* to be made; but there are many others, at leaſt of later times, wherein no footſteps of any ſuch conſultation appear. Vid. Obſerv. *Halenſ.* T. 6. Obſ. 31. §. 15. ſeq. *Boecl.* Notit. Imper. Germ. l. 16. c. 2.

Alliances are become much more frequent of late than in antient times, which has not a little diminiſhed the ſanction of them. Grown familiar, they are overlooked and thrown aſide at pleaſure. It may be aſked what end do *Alliances* anſwer? Can a prince or ſtate even reſt ſecure under the fence of *Alliances?* It is certain no [e]. The avowed principle of ſtateſmen and politicians is, that *Alliances* oblige princes no longer than they are for the intereſt of their reſpective people [f]. As the intereſts of nations are perpetually varying, the moſt ſolemn *Alliances* will be every day annulling themſelves, even without any perfidy, or breach of faith, on the part of the ſovereigns, or their miniſters. In this light did De Wit, or rather La Cour, conſider foreign *Alliances*, when he diſſuaded his countrymen from making any, even tho' attacked by a ſuperior power [g]. If you *ally* with a weaker prince, the burden muſt lie chiefly on you; if with a ſuperior, you become dependent on him, and will be treated at diſcretion. An *Alliance* may involve you in a war, but will ſcarce ever ſave you from it. If you run riſks, confiding in the faith of your allies, it is odds you are ſacrificed. The moment an *Al-*

liance is concluded, you ceaſe to be at liberty, to take the meaſures which you find moſt advantageous, except ſo far as the other powers *allied* will pleaſe to permit.—[[c] Jour. Liter. T. 4. p. 34. [f] *Chevign.* Scienc. des Perſon. de la Cour. T. 3. p. 291. [g] *De Witt*, Mem. P. 2. Mem. de Trev. An. 1710. p. 219. ſeq.]

According to the modern politics, to render an *Alliance* valid, it is neceſſary, that it not only be juſt in its principles, but beneficial in its effects. A prince can oblige himſelf no further than thoſe two go: he cannot lay himſelf under a neceſſity to ſuccour an ally, beyond what may be for his people's benefit. He may even make peace without the conſent of his ally, tho' the contrary has been expreſsly ſtipulated between them; provided ſuch peace be for the intereſt of his ſtate. This is ſufficiently warranted by the practice of princes. Henry the great of France, at the treaty of Vervins, concluded a ſeparate peace with Spain, tho' there was a poſitive article in the treaty of *Alliance* between him, queen Elizabeth, and the ſtates general, that none of them ſhould make peace without the conſent of the reſt. The like was done by Chriſtian IV. king of Denmark, who treated with the emperor, contrary to his engagement with the duke of Saxony, and his other allies. Queen Chriſtina of Sweden, did the like at the treaty of Munſter, in 1648, which was concluded without the conſent of the allies, the Dutch and French; the former of whom afterwards, made a ſeparate peace with the other branch of that houſe, without conſent of the French. *Brown*, Miſcel. Aulic. p. 172. ſeq. Mem. de Trev. Sept. 1702. p. 143.

ALLIGATI, in antiquity, the baſeſt and worſt kind of ſlaves, whom they kept locked up, or with fetters on.

The Romans had three degrees, or orders of ſlaves, or ſervants, the firſt employed in the management of their eſtates, the ſecond in menial or lower functions of the family, the third called *Alligati* above-mentioned. *Pitiſc.* Lex. Ant. T. 1. p. 72.

ALLIOTH (*Cycl.*) is alſo written *Alliot*, and *Aliot*, and literally denotes a horſe. The Arabs give this name to each of the three ſtars, in the tail of the great bear, on account of their appearing like three horſes, ranged for the drawing a waggon. *Vital.* Lex. Math. p. 23.

ALLIUM, in botany. See GARLICK.

ALLODIARIUS, the owner or proprietor of an *Allodium*, or *allodial* lands.

This is otherwiſe written *Alodiarius*, *Alodarius*, *Aloarius*, *Aloer*, *Aloerius*, and *Aleutier*. *Du Cange*, Gloſſ. Lat. T. 1. p. 147. in voc. *Alodiarius*.

ALLODIUM, (*Cycl.*) land held of a man's own right.

This word is alſo written *Alodium*, *Alods*, *Alodis*, *Alaudium*, and *Alaudum*; by French writers *Alleu*, *Aleu*, *Aleuf*, or *Aleud*. We ſometimes alſo find it more particularly expreſſed by the names *Franc Aleu*, *Franc Aleud*, *Franc Aloy*, *Franc Aleuf*, *Liberum Allodium*, and *Regale Allodium*. *Calv.* Lex. Jur. p. 61. *Du Cange*, Gloſſ. Lat. T. 1. p. 143.

Some define it to be land, not only free from all ſervice whether real or perſonal, tho' the owner of it might ſometimes acknowledge ſome ſuperior lord, from whom he firſt received it in quality of an honorary fee. We ſay ſometimes, for *Allodia* were often without owning any ſuperior lord. *Du Cange*, loc. cit.

Allodium and *Patrimonium*, are frequently uſed indiſcriminately.

The maxim which obtains in many places, *nulla Terra ſine Domino*, ſets aſide all *Allodia*, except where there are direct proofs of the contrary. *Vertot*, Diſſ. ſur les Loix Saliques, ap. Mem. Acad. Inſcr. T. 4. p. 338. ſeq.

Leibnitz [a] derives the word *Allod*, from the Teutonic, *Ahn Leod*, q. d. not *Leodium*, or not liable, of the Saxon *Leodes*, liable. Skinner [b] from the Teutonic, *All loſz*, q. d. *Allfree*. Spelman [c] from the Anglo-Saxon, *Leod*, people, q. d. popular eſtate; or from *a* and *Leod*, vaſſal, q. d. without vaſſalage; or from *a* and *Lad*, burden, q. d. not incumbent. Hicks from the Theotiſcal and Gothic *Lood*, q. d. whole produce of land. According to this author, a free farm, where the owner, beſides the poſſeſſion, enjoyed the property of the land, without ſervice, was called among the Goths *Allalod*, where he had only half the profit, or was ſubject to any payment or ſervices to a ſuperior lord, it was called half *Allalod*.—[[a] Act. Erud. Lipſ. Supp. T. 4. p. 238. [b] *Skinn.* Etym. in voc. [c] *Spelm.* Gloſſ. p. 27.]

Allodium, or *Allode*, is derived by ſome others, from the German words *All*, *omne*, and *ode*, *patrimonium*, *ſeu poſſeſſio*. V. *Strykii*, Exam. Jur. Feud. Cap. 2. Qu. 5, and 6.

Schilter derives it from *ahl*, or *alt*, *vetus*, and *ode*, *quaſi vetus vel paternum bonum*.

Altho' inſtances of *Allodial* donations occur in the Engliſh hiſtory, yet as Sir Edward Coke obſerves, there is now no *Allodium* in England. V. 1. Inſt. 1. b.

In domeſday, tenants in fee ſimple are called *Alodarii*, or *Aloarii*. *Coke*, loc. cit.

The antient Germans had what they called *Sonnen Lehn*, or *Feudum ſolare*, which they held of none but the ſun, their god of old. This ſeems analogous to *Allodium*. V. *Stryk.* Ex. Jur. Feud. Cap. 2. Qu. 5.

In the cuſtomary laws of France, we find mention made of two kinds of *Allodiums*, viz.

ALLODIUM *Nobile*, *Aleu Noble*, that to which *Juſtitia* or juriſdiction was annexed; and which was alſo free from all homage, or ſervice.

ALLODIUM *Villanum*, *Aleu Raturier*, that to which no juriſdiction was annexed. Trev. Dict. Univ. in voc. *Alleu*.

ALLOGIA, in antiquity, denote winter quarters appointed for the ſoldiery. *Aquin.* Lex. Milit. T. 1. p. 38. ſeq.

Some will have the word of French origin from *Logement*; others with more probability from the Italian *Alloggio*, formed of the Latin *Locus*, place.

ALLOM. See the article ALUM.

ALLOY (*Cycl.*)—The *Alloy* of gold is eſtimated by carats, that of ſilver by penny-weights.

Gold without any *Alloy* is ſaid to be twenty-four carats fine. According to the proportion of pure gold, to that of the *Alloy* in an ounce; the mixture is ſaid to be ſo many carats fine. If there be two carats of *Alloy*, to twenty-two of pure gold, it is ſaid to be twenty-two carats fine. If four of *Alloy*, to twenty of gold, twenty carats fine, *&c.*

In different nations, different proportions of *Alloy*, are uſed; whence their monies are ſaid to be of different degrees of fineneſs, or baſeneſs; and are valued accordingly, in foreign exchanges.—The ſilver coin, among the Romans, was long kept to a great degree of purity; which was firſt broke in upon by the tribune Livius Druſus; who mixed with them, an eighth part of copper. But the acts of his tribunate were afterwards annulled, and the money reſtored to its antient fineneſs. Thus things remained till the time of the emperor Severus, who encreaſed the *Alloy* ſtill more; yet on his medals, he took the title of *Reſtitutor Monetæ*. Jour. des Scav. T. 29. p. 765.

The *Alloy* of ſilver with copper, may be examined by the coppel in the following manner. Firſt have ready a touch-ſtone, and a ſet of touch needles; wipe carefully both the touchſtone, and the metal to be examined, and rub the metal on the ſtone; compare its mark with the needles, and by that means making a gueſs at the quantity of copper contained, and of courſe know how much lead will be neceſſary for conſuming that quantity. But as the lead neceſſary for conſuming the copper is not in a quantity proportionable to that of the copper, when this is mixed with ſilver, we ſhall here give, from Lazarus Erker, the quantity to be added in every caſe. We ſhall take for our examples, a ſeries of touch needles, made according to the mark, divided into half ounces and grains. See the article TOUCH-NEEDLES.

½ ounce ſilver,	½ ounce copper,	marks of lead to be added,
15 ½ —	½ —	4.
15 —	1 —	6.
14 —	2 —	8.
12 and 13.	4 and 3	10.
9 — 12	7 — 4	14.
4 — 8	12 — 8	15.
1 — 4	15 — 12	16.

Every body may reduce this table to the needles, made according to the mark of the avoirdupoiſe, or that of carats: nor is it neceſſary to proportion the quantities of lead to be added, ſo far as one half centner. *Cramers*, Art of aſſaying p. 226.

In the mean time, let the metal to be tried with the needles undergo the operation of copelling together with the quantity of lead indicated by the touching; and the fire muſt be made the gentler, as the ſilver is allayed with a greater quantity of copper, and on the contrary, the ſmaller the quantity of the *Alloy* of copper is, the ſtronger muſt be the fire to be uſed in the operation. When the lead, which muſt be firſt put into the coppel, begins to ſmoke and boil, then the metal to be examined is to be added, and the fire continued till the copper is all conſumed and reduced to yellow ſcoriæ, and the bead of ſilver left in the center of the copel muſt be weighed, which, ſubſtracting the known quantity of ſilver in the lead uſed in the operation, will ſhew the quantity of ſilver and conſequently that of the copper in the *Alloy*.

ALLUM, (*Cycl.*) in natural hiſtory. See ALUM.

ALLUSION (*Cycl.*)—*Alluſions* to paſſages in books or authors, make what ſome call indirect quotations. Hiſt. Acad. Inſcrip. T. 3. p. 108.

We find frequent *Alluſions* in the new teſtament, to paſſages in the old. The writings of the rabbins, the Arabs, the Perſians, Chineſe, Literati, *&c.* are full of *Alluſions* to the law, the Alcoran, and the works of Confucius. Many of the accompliſhments of prophecies in the old teſtament mentioned in the new, are generally allowed by critics to be only *Alluſions*, or accommodations of ſuch prophecies to other events, which originally they had no reſpect to.—This makes what ſome call the ſyſtem of accommodation. Jour. des Scav. T. 74. p. 320. *Sykes*, Eſſ. on the truth of chriſtian. c. 15. Bibl. Angl. T. 12. p. 470. Bibl. Anc. Mod. T. 11. p. 102. It. T. 17. p. 46. Bibl. Choiſ. T. 25. p. 426. Act. Erud. Lipſ. 1689. p. 167. Nouv. Rep. Lett. T. 18. p. 526. Platon. unveiled, c. 17. See ACCOMMODATION, *Cycl.* and *Suppl.*

A multitude of texts of ſcripture are only to be explained by pointing out the *Alluſion* they bear to heathen, or Jewiſh rites, uſages, *&c.*

This part of Hermeneutics, has been cultivated in the two laſt ages above all others. And hence it is that the ſcripture is ſo much better known among modern divines, than among the fathers themſelves. Not but that the itch of finding *Alluſions* has been too much indulged; inſomuch that many things have by this means been attributed to the inſpired writers, which it is certain they never meant. Dr. Hammond finds the gnoſtics intimated throughout all the epiſtles of the apoſtles: and Kircher who had dealt much in the Ægyptian language, and antiquities, finds Ægyptianiſm in every thing. For an inſtance to what degree intepreters have multiplied *Alluſions*, we will mention thoſe ſtarted from that ſaying of St. Paul [a], *put on the Lord Jeſus*. Many find this paſſage an *Alluſion* to heathen antiquity; but diſagree as to the particular thing alluded to. Some, *e. gr.* will have it to be the feaſts of the Palii, when they dreſſed themſelves in armour, and run about the ſtreets; others, the Roman Lupercalia, or Saturnalia, when ſervants dreſſed in the habits of their maſters; others, a religious cuſtom, wherein profane perſons wore the habit of their gods; others, a method of conferring the ſupreme degree among the Sophiſts, by dreſſing the candidate in a ſort of conſecrated garments; others again will have it allude to a Jewiſh ceremony, *viz.* the method of inaugurating the high prieſt by putting on him the pontifical robes: Others, will have it to be a point of Chriſtian antiquity, that is here alluded to, *viz.* the antient ceremony of baptiſm, wherein, after the catechumens aroſe out of the water, they were habited in new white garments [b].—[[a] Rom. c. xiii. v. 14. *Rambach.* Inſtit. Hermen. Sacr. l. 3. c. 7. §. 8. p. 591. ſeq.]

ALLUVION (*Cycl.*)—Great alterations are made in the face and limits of countries, by *Alluvions* of the ſea, rivers, *&c.* [c] Whole plains are ſometimes formed by *Alluvions* [d]. It is controverted whether *Alluvions* be to be conſidered as fruits, and as ſuch accruing to *Uſu-fructuaries* [e].—[[c] Giorn. de Letter. d' Ital. T. 21. p. 295. Jour. des Scav. T. 39. p. 561. [d] Mem. Acad. Scienc. 1710. p. 210. [e] Jour. des Scav. T. 38. p. 284.]

ALMADIE, in ſhip building, a ſmall veſſel uſed by the negroes of Africa, about four fathom long; and made uſually of the bark of a tree.

The ſame name is alſo given to the veſſels of Calicut in India, which are eighty foot long, and ſix or ſeven broad, and ſquare ſterned. Dict. de Marin. in voc.

Theſe are otherwiſe denominated *Cathuri*. They go with great ſwiftneſs. Witſen ſays, they are twelve or thirteen paces long, ſharp at head and ſtern, and that they are wrought both by ſails and oars. In time of war the king of Calicut fits out two or three hundred of theſe veſſels. *Witſen.* Ap. Dict. de Marine, in voc.

ALMAGEST (*Cycl.*)—This work was publiſhed at Baſil in 1538. *Claud. Ptolemæi Conſtructio magna S. Almageſtum, græcè, cum Comm. Theonis Alexandrini.*

The *Almageſt* was tranſlated from Greek into Latin in 1558, by G. Trapezuntius [a], but great complaints have been made of the errors and inaccuracies of this verſion [b]. Purbachius began to reduce the *Almageſt* into a more commodious form, and leſs compaſs, for the uſe of learners; but dying before he had half finiſhed, the work was left to be compleated by Regiomontanus, who publiſhed it in 1550 [c]. There is alſo a verſion and epitome of Ptolemy's *Almageſt* in Hebrew, made from the Arabic, by R. Jac. ben Abraham ben Samſon, Andoli, *&c.* [d] tho' yet only extant in MS.—[[a] Venet. 4°. 1515. 1525. *Lipen.* Bibl. Phil. T. 1. p. 31. [b] Miſc. Lipſ. T. 2. p. 596. *Fabric.* Bibl. Græc. l. 4. c. 14. *Naud.* Arcan. Stat. p. 367. [c] *Wolf.* Com. de Script. Mathem. in fin. Elem. Mathef. T. 2. p. 1051. Ed. 1. [d] V. *Wolf.* Bibl. Hebr. T. 3. p. 920. It. T. 1. p. 20.]

Riccioli [e] has alſo publiſhed a body of aſtronomy, which he entitles after Ptolemy, the new *Almageſt*; being a collection of the principal antient, as well as modern obſervations and diſcoveries in that ſcience. Riccioli's *Almageſt* contains a great variety of different ſyſtems, opinions, *&c.* likely enough to confound thoſe who are not deep enough in the ſcience, to be able to make a choice and judgment among them. He was therefore afterwards at the pains to examine and compare the divers obſervations, *&c*, together, and from the whole to draw out a more uniform and conſiſtent body, ſince publiſhed under the title of *Aſtronomia reformata* [f]. Some authors ſpeak of another *Almageſt* in Hebrew, by Avu Abad Baal [g]; but we do not find that it has been yet publiſhed.—[[e] *Jo. Bapt. Riccioli, Almageſtum novum ſive Aſtronomia Antiquo-nova. Bonon.* 1651. Fol. *Lipen.* Bibl. Phil. T. 1. p. 31. [f] Jour. des Scav. T. 2. p. 19. [g] *Wolf.* Bibl. Hebr. T. 3. p. 3.]

We have alſo botanical *Almageſts*, compoſed by Plukenet [h], being a kind of pinax, or general index of plants, containing the proper, and deſcriptive names of upwards of ſix thouſand. To which in a ſupplement, ſince publiſhed by the ſame author, have been added above one thouſand others [i].—[[h] *Almageſtum botanicum, ſive Phytographiæ Plucnetianæ Onomaſticon*, &c. Lond. 1696. Fol. an extract of it is given in Phil. Tranſ. N°. 225. p. 434. [i] *Almageſti Botanici Mantiſſa, plantarum noviſſime detectarum, ultra Millenarium Numerum complectens.* Lond. 1700. Fol. An extract of it may be ſeen in work of Learn. T. 2. p. 225.]

ALMAGRA, in natural hiſtory, a name given in later ages to an earth of the ochre kind, called *Sil atticum* by the antients. It is an ochre of a fine and deep red, with ſome admixture of purple, very heavy, and of a denſe yet friable ſtructure, and rough duſty ſurface. It adheres very firmly to the tongue, and melts freely and eaſily in the mouth, and is of an auſtere and ſtrongly aſtringent taſte, it ſtains the ſkin in touching it, and ferments very violently with acid menſtruums; by which ſingle quality, it is ſufficiently diſtinguiſhed from the *Sil Syricum*, to which it has in many reſpects a great affinity.

It is found in immenſe quantities, in many parts of Spain; and in Andaluſia there are in a manner whole mountains of it. It is uſed in painting, and in medicine, being a very valuable aſtringent.

The generality of authors, have been guilty of a very great error, in confounding the *Sil atticum* and *Ochra attica* of the antients with one another, and imagining them the ſame ſubſtance; but a careful examination of what is left us, in regard to theſe ſubſtances, very evidently ſhews, that the one was red, and the other yellow, and that we have them both yet in great plenty in different parts of the world. *Hill*'s Hiſt. of Foſſils, p. 57.

ALMAGRA, in the cant of chemiſts, denotes red bole, or ruddle, ſometimes a lotion, or waſh.

ALMALECI, in medical hiſtory, a celebrated work, containing a ſyſtem of the antient Arabian phyſic.

The word imports as much as the royal work.

The author of it was Haly Abbas, a perſon of great repute for learning, in his age; on which account he had the title of Magus.

It was compoſed about the year 980, and dedicated in very hyperbolical language to the Caliph Ada d'Odaula. It was tranſlated into Latin by Stephen of Antioch, in 1127. In which dreſs it is ſtill extant.

Others give this work the title of *Pantechni*, or *Complementum Medicinæ*, and aſcribe it to Iſaac Iſraelita. In reality there are many paſſages in the work exactly the ſame with what are quoted by Rhazes under the name of Iſaac. And no doubt, Haly might borrow from Iſaac, as well as he did from Rhazes. Concerning the hiſtory, contents, *&c.* of the *Almaleci*, ſee *Friend*'s Hiſt. of Phyſ. P. 2. p. 36. ſeq.

ALMANAC (*Cycl.*) is uſed, among antiquaries, for a kind of inſtrument, uſually of wood, inſcribed with various figures, and Runic characters, and repreſenting the order of the feaſts, dominical letters, days of the week, and golden number, with other matters neceſſary to be known throughout the year; uſed by the antient northern nations, in their computations of time, both civil and eccleſiaſtical.

Almanacs of this kind are known by various names, among the different nations wherein they have been uſed, as rimſtocks, primſtaries, runſtocks, runſtaffs, *Scipiones Runici*, *Baculi Annales*, clogs, *&c.*

They appear to have been uſed only by the Swedes, Danes, and Norwegians. From the ſecond of theſe people, their uſe was introduced into England, whence divers remains of them in our counties. Dr. Plot [a] has given the deſcription and figure of one of theſe clogs, found in Staffordſhire, under the title of the perpetual Staffordſhire *Almanac*. Wormius dates their origin, from the time of Julius Cæſar, which Rudbeck [b] is not contented with, but aſſerts them to be upwards of three thouſand years old, and even to have been invented by Atlas, the great founder of aſtronomy, from whom they are ſometimes alſo denominated Atlas's calendars. According to this author, they were firſt made in the country of the Cimmerians, ſituate on the fartheſt extremity of the Bothnic gulph, where the ſun in the middle of winter is hid from the inhabitants forty days together.—[[a] *Plot*, Nat. Hiſt. Stafford. c. 10. p. 420. ſeq. [b] *Atlant.* P. 3. c. 1. Phil. Tranſ. N°. 301. p. 2005.]

The external figure and matter of theſe calendars appear to have been various. Sometimes they were cut on one or more wooden leaves, bound together after the manner of books; ſometimes on the ſcabbards of ſwords, or even on daggers; ſometimes on tools and implements, as portable ſtillyards, hammers, the helves of hatches, flails, *&c.* Sometimes they were made of braſs or horn; ſometimes of the ſkins of eels, which being drawn over a ſtick properly inſcribed, retained the impreſſions of it. But the moſt uſual form was that of walking ſtaves, or ſticks, which they carried about with them to church, market, *&c.*

Some divide theſe *Almanacs* into public and private, perfect and imperfect; others into heathen and chriſtian.

Public *Almanacs* are thoſe of a larger ſize, uſually hung up at one end of the mantle-trees of chimnies, for common or family uſe [c]; private are thoſe of a ſmaller kind, to be carried about either in the hand, after the manner of a ſtaff, or in the pocket; perfect, thoſe which have the dominical letters as well as primes, and feaſts inſcribed to them; imperfect, thoſe which have only the primes and immoveable feaſts. Till about the the fourth century, they all carry the marks of heatheniſm; from that age to the ſeventh, they are generally divided between heatheniſm and chriſtianity [d].—[[c] *Plot*, lib. cit. c. 10. §. 45. [d] Nouv. Liter. Germ. 1709. p. 296.]

Each of these staves is divided into three regions, whereof the first indicates the signs, the second the days of the week and year, and the third the golden number.

The characters engraven on them are, in some, the antient Runic, in others, the later Gothic character of Ulfilus. The saints days are expressed in hieroglyphics, significative either of some endowment of the saint, the manner of his martyrdom, or the like. Thus, against the notch for the first of March, or St. David's day, is represented a harp; against the 25th of October, or Crispin's day, a pair of shoes; against the 10th of August, or St. Lawrence's day, a gridiron; and, lastly, against New-year's-day, a horn, the mark of good drinking, which our ancestors gave a loose to at that season [e]. Elvius has given a dissertation express on the Runic staff [f].—[[e] *Plot*, Nat. Hist. Stafford. c. 10. §. 59. [f] Idea Scipionis Runici, 4to. 1709. Upsal. An extract of it is given in Nov. Liter. Germ. 1709. p. 296. seq.]

Some think this word *Almanac* has been borrowed from the Egyptian astrologers, long before the Arabs; it appearing, from Porphyry, that *Almenach* and *Almenachica descriptio*, (Αλμεναχικα) were in use among that people in his age, for monthly predictions. V. *Euseb.* de Prep. Evang. l. 3. c. 4. See also *Worm.* in Fast. Danic. l. 1. c. 2. Vid. *Du Cange*, Gloss. Lat. in voc. *Almanach.*

Almanacs are of somewhat different composition, some containing more points, others fewer. The essential part is the kalendar of months and days, with the risings and settings of the sun, age of the moon, &c. To these are added various parerga, astronomical, astrological, meteorological, chronological, and even political, rural, medical, &c. as calculations and accounts of eclipses, solar ingresses, aspects and configurations of the heavenly bodies, lunations, heliocentrical and geocentrical motions of the planets, prognostics of the weather, and predictions of other events, tables of the planetary motions, the tides, terms, interest, twilight, equation, kings, &c.

We have a great variety of *Almanacs* annually published, some in books, others in loose papers, called *Sheet-Almanacs*: such are the Oxford *Almanac*, the London *Almanac*, &c. Others bound, which may be denominated *Book-Almanacs.*

The first author or inventor of *Almanacs* is contested; some will have it to have been Johannes Regiomontanus; of which opinion is P. Ramus. Cardan shews this to be a mistake, since he had seen an *Almanac* for the year 1414; whereas that of Regiomontanus only appeared in 1474. Volaterranus [g] ascribes the first *Almanac* to Laur. Miniatensis, who lived at Rome.—Be this as it will, Regiomontanus appears to have been the first who reduced *Almanacs* to their present form and method; gave the characters of each year and month; foretold the eclipses, and other phases, calculated the motions of the planets, &c [h].—[[g] Anthropol. l. 21. c. ult. Nouv. Rep. Lett. T. 32. p. 219. [h] V. *Gassend.* Vit. Regiomont. p. 361.]

The company of stationers have an exclusive privilege for publishing of *Almanacs.*—In 1673, an Oxford *Almanac* was printed in octavo, with so much success, that an edition of 30,000 was sold. This alarming the stationers of London, they purchased its suppression for the future with a considerable sum of money. After this, the Oxonians were contented only to publish a sheet *Almanac*, which is continued to this day.

The protestant states of Germany came to a resolution, in 1699, to reform the *Almanac*, by suppressing eleven days, and proceeding for the future in a method of computation different both from the Julian and Gregorian calendar. Vid. Phil. Transf. N°. 260. p. 459. See CALENDAR, JULIAN, GREGORIAN, &c. *Cycl.*

Evans [i], Lilly, Wharton [k], Gellibrand [l], Booker, Gadbury, Partridge, Parker, &c. are the principal among the English *Almanac* makers.—[[i] V. *Wood*, Ath. Oxon. T. 1. p. 579. [k] Hemeroscopiums, or Almanacs, from 1640 to 1666. *Wood*, ubi supra, T. 2. p. 684. [l] *Wood*, lib. cit. T. 1. p. 613.]

Sir Samuel Moreland [m], Jo. Newton [n], and Ro. Wood [o], have published universal *Almanacs*; Blount, a catholic *Almanac* [p]; Le Fevre, an *Almanac* for 150 years [q]. The royal academy of sciences at Paris [r], publish annual tables, from whence *Almanacs* are easily made.—We also meet with historical *Almanacs* [s], bibliographical *Almanacs* [t], alphabets of Parnassus, &c.—[[m] Descript. of two Arithmet. Instrum. Lond. 1673, 12mo. V. Phil. Transf. N°. 94. p. 6048. [n] *Wood*, Ath. Oxon. T. 2. p. 632. [o] A Specimen of a new Almanac for ever, or a rectified Account of Time by a Luni-solar Year described in the Garter. *Hook*, Phil. Collect. N°. 2. p. 26. [p] V. *Wood*, Ath. Oxon. T. 2. p. 73. [q] Almanac de Cabinet, pour toutes les Annees depuis 1600 jusqu'à 1750, Par. 1714. V. Jour des Scav. T. 56. p. 327. [r] La Connoisance des Temps, Par. 12mo. continued yearly. V. Jour. des Scav. 1707. p. 442. seq. [s] V. Mem. de Trev. 1715. p. 456. [t] Almanac Bibliographique pour l'Anne 1709. Par. 1709. 12mo. Vid. Nouv. Rep. Lett. T. 46. p. 101. seq.]

ALMANAR, in the Arabian astrology, denotes the pre-eminence, or prevalency of one planet over another. *Vital.* Lex. Math. p. 23.

ALMEHRAB, among Mahometans, denotes a niche in their mosques, which directs to the Keblah, that is, to the temple of Mecca, to which they are obliged to bow their faces in praying. Vid. *Sale*, Prelim. Disc. to Koran, sec. 4. p. 108.

The word is Arabic, where it is properly written *Al Mehrab.*

ALMEISAR, a celebrated game among the antient Arabs, performed by a kind of casting of lots, with arrows, strictly forbid by the law of Mahomet, on account of the frequent quarrels occasioned by it.

The manner of the game was thus: a young camel being brought and killed, was divided into a number of parts. The adventurers, to the number of seven, being met, eleven arrows were provided without heads or feathers; seven of which were marked, the first with one notch, the second with two, the third with three, &c. the other four had no marks. These arrows were put promiscuously into a bag, and thus drawn by an indifferent person. Those to whom the marked arrows fell, won shares in proportion to their lot; the rest to whom the blanks fell, were intitled to no part of the camel, but obliged to pay the whole price of it.

Even the winners tasted not of the flesh themselves, more than the losers, but the whole was distributed to the poor. V. *Sale*, Prelim. Disc. to Koran, sec. 5. p. 124. seq.

ALMELILETU is used, by Avisenna, for a preternatural kind of heat, a degree more remiss than that of a fever, and which sometimes remains after a fever is gone. Vid. *Castel.* Lex. Med. p. 34.

ALMENE, a name given, by some of the Arabian writers, to the prickly *lotus* of Africa, called by some of the antients *lotus acanthos*, and by Virgil *acanthus*, only. In speaking of this acanthus, he mentions its berries; and his commentator, Dr. Martyn, supposes, that by acanthus he means the Egyptian acacia, and that he calls the globular flowers of that tree *baccas*, berries. But Virgil seems justifiable in calling the lotus here described acanthus, from some of the other antients; and this lotus does truly bear berries.

ALMIGGIM *wood*, a word used in the scriptures, to signify a beautiful and light sort of wood. It has been conjectured to be several different sorts of woods now in use; others think it has been lost long since. But Meibom proves, from the accounts of Josephus, that it was the wood of the Indian pine, or fir-tree. This was excellent for its whiteness, and for a shining levity, and therefore was used in musical instruments.

ALMIZADIR, among alchemists, is sometimes used for verdegrease; sometimes for the process of the philosophers stone; and sometimes for the *aqua mercurialis*, or *aqua philosophorum. Ruland*, Lex. Alchem. p. 31. *Castel.* Lex. Med. p. 34. See ALCAHEST.

ALMOGIZA, among Arabian writers, denotes the limb, or circumference of the astrolabe. *Vital.* Lex. Math. p. 24.

ALMOHARRAM, one of the sacred months of the antient Arabs.

The word is Arabic, *Al Moharram.* It was the first month of the Arab year.—On some occasions they put off the observance of this month, to the following month Safar. Vid. *Sale*, Prelim. Disc. to Koran, sec. 7. p. 149.

ALMOND *tree*, *Amygdalus*, (*Cycl.*) in botany, the name of a genus of trees; the characters of which are these. The flower is of the rosaceous kind, being composed of several petals arranged in a circular form. The pistil arises from the cup, and finally becomes an oblong stony fruit, covered with a callous coat, and containing an oblong kernel.

The species of *Almond*, enumerated by Mr. Tournefort, are these. 1. The cultivated *Almond*, with large fruit. 2. The cultivated *Almond*, with small fruit. 3. The sweet *Almond*, with a soft coat. 4. The bitter *Almond.* And, 5. The Indian dwarf *Almond. Tournef.* Inst. p. 626.

The *Almond* tree is propagated by inoculating a bud of any of the species into the stock of a plumb, peach, or *Almond* of another species, in the month of July. See the article INOCULATION.

The second year after their budding, they are to be removed to the places where they are to remain.

The best season for transplanting them, if for dry ground, is in October; but for a wet soil, February is always found the propereſt season. *Miller*'s Gardner's Dict.

The *Almond* was antiently called *nux Græca*, because first brought into Italy from Greece. *Macrob.* Saturn. l. 2. c. 4. *Burggr.* Lex. Med. T. 1. p. 618. seq. in voc.

The tree is a very early blossomer. Aaron's rod, by whose budding the priesthood was preserved to him [a], was of this tree [b].—[[a] Num. *c.* xvii. *v.* 8. [b] *Lamy.* Introd. Script. l. 3. c. 3. p. 420. seq.]

There are two kinds of sweet *Almonds.* 1. Jordan, which are the larger, longer, and dearer kind, chiefly sold to be eat with raisins. 2. Valentian and Barbary *Almonds*, which are those from whence the oil is procured. *Hought.* Collect. N°. 434. T. 2. p. 76.

Dioscorides [c] relates, that bitter *Almonds* kill foxes, which, it is said, has been since abundantly verified by experiment.—The like is observed with regard to cats, cocks, hens, &c.

It may be obſerved, that ſome ſuſpect whether this be the true reading; ſince, in an antient MS. Hoffman found *lumbricis*, inſtead of *vulpibus*, which transfers the mortality from foxes to worms.—Some imagine the poiſonous virtue here to reſide chiefly in the rind; for when this is peeled off, they do not prove ſo mortal [d].—[c *Dioſcor.* l. 1. c. 176. d *Wepf.* de Cicut. Aquat. p. 248. De Medic. Offic. l. 2. c. 162. §. 42.] See LAURO-CERASUS.

Almond bloſſoms are often brought to market inſtead of thoſe of peaches.—The kernels of bitter *Almonds* give much the ſame reliſh in diſtillation, as the kernel of the cherry: on which account, ſome practiſe the making a counterfeit cherry brandy with them. They are alſo frequently uſed inſtead of apricoc kernels, in ratafia. *Quinc.* Diſpenſ. P. 2. ſec. 4. §. 19. p. 106.

Blanched ALMONDS are thoſe which, having been put a while in warm water, have ſlipped out of their ſhells.—Theſe are uſed with the cold ſeeds in emulſions, ptiſans, &c. *Hought.* loc. cit.

ALMOND *milk* is a preparation made of ſweet blanched *Almonds* and water, of ſome uſe in medicine, as an emollient, cooler, &c. *Hought.* ubi ſupra.

ALMOND *butter* is a preparation made of cream and whites of eggs boiled; to which is afterwards added, blanched *Almonds*; the whole ſet over a ſlow fire, till it become thick. *Hought.* T. 1. N°. 168. p. 438.

Several have publiſhed pieces and obſervations expreſly on *Almonds*: Schelhammer [e], on the germination of *Almonds*; Breynius, on the *Almonds* of the Cape of Good Hope [f].—[e *Gunth. Chriſt. Schelhammer*, Amygdalarum Germinatio in Ephem. Acad. N. C. dec. 2. an. 8. obſ. 32. f *Jac. Breynii*, Obſerv. de Amygdalo Holoſerico Capitis Bonæ Spei. Ephem. Acad. N. C. dec. 1. an 3. obſ. 292.]

Durrius [g], and the academiſts Naturæ Curioſi [h], have written on the poiſonous effects of *Almonds* on brutes.—Many particulars relating to *Almonds* are alſo occaſionally given by the botaniſts, phyſicians, &c [i].—[g *Durrii*, Obſerv. de Morte Subitanea in Volucribus Canarienſibus ex eſu Amygdalarum Amararum, in Ephem. Acad. N. C. dec. 3. an. 1. obſ. 156. h Obſerv. de Amygdala Amara quibuſdam Animalibus Nociva ac Lethali. in Ephem. dec. 1. an. 8. obſ. 99. i See particulars concerning the *Almond* tree, *Tournef.* Inſt. cl. 21. ſec. 7. gen. 5. p. 627. *Burggr.* Lex. Med. T. 1. p. 618. ſeq. in voc. *Amygdalæ*. *Zwing.* diſſ. 4. de Amygdal. p. 112. *Ruel.* de Nat. Stirp. l. 1. c. 51. *Ray*, Hiſt. Plant. l. 2. c. 7. Anatomy of the *Almond* fruit, *Malpig.* Anat. Plant. de Ulteror. Augment. p. 69. *Burggr.* loc. cit. Its importation into England, *Hought.* lib. cit. p. 75. Sweet *Almonds*, their qualities and uſe againſt coſtiveneſs, aſthma, ſtone, &c. *Burggr.* ubi ſupra. Their oil, if hurtful or beneficial in fevers, Giorn. de Letter. d'Ital. T. 14. p. 213, 217, 229. ſeq. It. T. 15. p. 410. Good againſt worms, Act. Erud. Lipſ. 1720. p. 409. Againſt colic, Act. Erud. Lipſ. Supp. T. 2. p. 14. Bitter *Almonds*, whether endowed with an opening or aſtringent quality, Ephem. Acad. N. C. dec. 1. an. 8. p. 185. ſeq. Whether they be a preſervative from drunkenneſs, *Brown*, Vul. Err. l. 2. c. 6. p. 80. *Camerar.* Memor. Cent. 3. P. 1. p. 88. Whence their power againſt intoxication, Ephem. Acad. loc. cit. Whence their mortality to hens, &c. Ephem. Acad. N. C. dec. 1. an. 8. p. 184. ſeq. Their diuretic and vermifuge quality, Ephem. Acad. N. C. dec. 2. an. 1. p. 184. ſeq. Coſmetic uſe, *Hought.* Collect. T. 3. N°. 434. p. 75.]

ALMOND *furnace*, in metallurgy, the furnace in which the refiners of ſilver out of lead melt the ſlags of the litharge left in this operation, and reduce them into lead again, with the help of charcoal. *Ray*'s Engl. Words, p. 116.

ALMONER, (*Cycl.*) in its primitive ſenſe, denotes an officer in religious houſes, to whom belonged the management and diſtribution of the alms of the houſe.

We find many things in writers on the monaſtic ſtate, concerning the qualities, conduct, &c. of the *Almoner*. Vid. *Lanfranc.* in Decret. pro Ord. S. Benedict. c. 8. ſec. 3. *Udalric.* Conſuetud. Cluniac. l. 3. c. 24.

By the antient canons, all monaſteries were to ſpend at leaſt a tenth part of their income in alms to the poor.

The *Almoner* of St. Paul's is to diſpoſe of the monies left for charity, according to the appointment of the donors, to bury the poor who die in the neighbourhood, and to breed up eight boys to ſinging, for the uſe of the choir. *Dugd.* Monaſt. abridged, p. 325.

By an antient canon, all biſhops are required to keep *Almoners*. *Johnſ.* Eccleſ. Law. 1222. §. 2.

The French kings have their great *Almoners*, firſt *Almoners*, ordinary or quarterly *Almoners*, &c.

Great *Almoner*, *grand Aumonier*, is the higheſt eccleſiaſtical dignity in that kingdom. To him belongs the ſuperintendency of all hoſpitals, and houſes of lepers. The king receives the ſacrament from his hand. He ſays maſs before the king, in all grand ceremonies and ſolemnities.

This office was firſt erected, under this denomination, by Charles VIII. before whoſe time, he had only the title of king's *Almoner*. Du Cange contends for a difference between king's *Almoner* and chaplain. Roulliard aſſerts them to have been the ſame. According to this writer, the office of great *Almoner* had ſubſiſted, though under ſome diverſity of names, in all ages of the monarchy.

Under the firſt race, he was called *Apocriſiarius*; under the ſecond, *Archicapellanus*; and under the third, *grand Almoner*. Under the firſt race, the office was ſerved by biſhops, who came to court for it by turns; under the ſecond, by prieſts, that the biſhops might not be obliged to non-reſidence; under the third, it has been uſually ſupplied by archbiſhops, or even cardinals. On this footing, *grand Almoner* is the ſame with what, in ſome antient writers, we find called *cuſtos ſacri palatii*, *antiſtes ſacri palatii*, or biſhop of the court; ſometimes *preſbyter de palatio*, or prieſt of the court.

His office anſwered to that of *proto papas*, in the court of the Greek emperors.

Frizon, Chevillard, and St. Marthe [a], have publiſhed liſts and genealogies of the great *Almoners*. Seb. Roulliard, a treatiſe of the antiquity of the office of great *Almoner* [b].—[a *Le Long*, Bibl. Hiſt. de la Franc. p. 705. b *Seb. Roulliard*, le Grand Aumonier, Par. 1607. 8vo. An extract of it is given in Trev. Dict. Univ. T. 1. p. 734.]

Firſt *Almoner*, *premier Aumonier*, ſupplies all offices which the great *Almoner* cannot attend, either by reaſon of his abſence, or multiplicity of buſineſs. *Raf.* Etat de la Franc. l. 1. c. 1. Mem. de Trev. 1723. p. 1019.

The *Almoners* in ordinary take their turn in waiting, to aſſiſt the king in his prayers, ſay grace, &c.

ALMONER is alſo applied, in eccleſiaſtical writers, to the deacons of churches. *Suic.* Theſ. T. 1. p. 870. See DEACON, *Cycl.*

ALMONER is alſo uſed, in hiſtorians of the middle age, for him appointed by a perſon to diſtribute his alms to the poor. In this ſenſe, *Almoner* amounts to much the ſame with what has been ſince denominated executor.

ALMONER is alſo ſometimes uſed for a perſon who left alms to the poor, by his laſt will.

ALMONER is ſometimes alſo uſed for a legatee.

In this ſenſe, it is the rule that the ſame perſon could not both be *Almoner* and heir. Trev. Dict. Univ. in voc. *Aumonier*.

ALMONER is alſo a more faſhionable title given, by ſome writers, to chaplains.

In this ſenſe, we meet with *Almoner* of a ſhip, *Almoner* of a regiment. Jour. des Scav. T. 36. p. 480.

ALMONRY (*Cycl.*)—The word is otherwiſe written *Almnery*, *Aulmry*, *Aumry*, *Almry*, and even *Ambry*.—By Latin writers *Almonaria*, *Almoneria*, *Almonerium*, *Eleemoſynaria*, *Eleemoſyna*, or *Hoſpitale pauperum*; ſometimes *Eleemoſyna pauperum*, or *Domus Eleemoſynaria*.

The *Almonry* is one of the clauſtral offices belonging to a religious houſe. It is found in the moſt antient abbys and conventual priories, and is reputed among the number of benefices. To this office were particular revenues given by benefactors, or aſſigned by the houſe, out of the common ſtock, to ſupply the charge of alms. In the reformed congregations, the *Almonry* is ſuppreſſed, and its revenues united to the conventual manſe. Trev. Dict. Univ. T. 1. p. 733.

ALMONRY is alſo uſed, in antient writers, for a purſe, out of which the alms uſed to be taken. *Du Cange*, Gloſſ. Lat. in voc. *Eleemoſynaria*.

In this ſenſe, we read of ſilk *Almonries*, embroidered *Almonries*, &c.

ALMS (*Cycl.*)—Paſchal *Alms*, *Eleemoſynæ Paſchales*, were thoſe diſtributed at the ſolemnity of Eaſter, attended, in ſome places, with other acts of humility, as waſhing of feet, &c. *Du Cange*, Gloſſ. Lat. in voc. *Eleemoſyna*.

Alms are divided by Mahometans, into *voluntary* and *legal*.

Voluntary ALMS are thoſe left to every man's diſcretion, to give more or leſs, as he ſees fit.

The *voluntary Alms* are properly denominated, by the Arabs, *Serdeckad*.

No religious ſyſtem is more frequent or warm in its exhortations to *Alms*-giving, than the Mahometan. The Alcoran repreſents *Alms* as a neceſſary means to make prayer be heard. Hence that ſaying of one of their caliſs, "Prayer carries us "half-way to God, faſting brings us to the door of his pa- "lace, and *Alms* introduces us into the preſence-chamber." Hence many illuſtrious examples of this virtue among the Mahometans. Haſan, the ſon of Ali, and grandſon of Mohammed, in particular, is related to have thrice in his life divided his ſubſtance equally between himſelf and the poor, and twice to have given away all he had. And the generality are ſo addicted to the doing of good, that they extend their charity even to brutes.

Legal ALMS, thoſe of indiſpenſible obligation, as being commanded by the law, which directs and determines both the portion to be given, and the kind of things it is to be given of.

The *legal Alms* are properly called, by the Mahometans, *Zacat*, either on account of their increaſing a man's ſtore, or of their purifying the remaining part of his ſubſtance.

Some writers have given these the denomination of tithes, but improperly; since, in some cases, they fall short, and in others, excceed the proportion of a tenth.

Alms, according to the prescriptions of the Mahommedan laws, are to be given of five things; that is to say, 1. Of camels, kine, and sheep. 2. Of money. 3. Of corn. 4. Of fruits, viz. dates and raisins. And, 5. Of wares sold. Of each of these, a certain portion is to be given in *Alms*, being usually one part in forty, or two and a half *per cent.* of the value. But no *Alms* are due for them, unless they amount to a certain quantity or number, nor until a man has been in possession of them eleven months, he not being obliged to give *Alms* thereon before the twelfth month is begun; nor are any *Alms* due for cattle employed in tilling the ground, or in carrying burdens. In some cases, a much larger proportion than the before-mentioned is reckoned due for *Alms:* thus, for what is got out of mines, or the sea, or by any art or profession, over and above what is sufficient for the reasonable support of a man's family, and especially where there is a mixture, or suspicion of unjust gain, a fifth part ought to be given in *Alms*. Moreover, at the end of the feast of Ramadan, every moslem is obliged to give, in *Alms* for himself, and for every one of his family, if he has any, a measure of wheat, barley, dates, raisins, rice, or other provisions commonly eaten.

Mahomet himself first took upon him to be collector of the *legal Alms*, as well as distributor of them; and his successors continued to do the same, till other taxes being introduced for the support of the government, to which these *Alms* were originally appropriated, the caliphs became weary of acting as almoners to their subjects, and left the payment of them to their consciences.

Alms, called by the Jews *Sedaka*, that is, justice, or righteousness, are preferred, by their rabbins, to sacrifices themselves. Besides the corners of the field, and the gleanings of their harvest, or vineyard, commanded to be left for the poor and the stranger, by the law of Moses, a certain portion of their corn and fruits is directed to be set apart for their relief, which portion is called the tithes of the poor. The Jews likewise were very conspicuous for their charity. We are told that some gave their whole substance, so that their doctors at length decreed, that no man should give above a fifth part of his goods in *Alms*. Vid. *Sale*, Prelim. Disc. to Koran. sect. 4. p. 109. seq.

ALMS is also used for lands given to churches, or religious houses, on condition of praying for the soul of the donor, both living and dead. This is otherwise called *free Alms*, sometimes *ecclesiastical Alms*, *Eleemosyna ecclesiastica*.

Free ALMS, *libera Eleemosyna*, or *pure Alms*, *Eleemosyna pura*, is more particularly used for that which is not subject to any rent, service, or the like [a]; or that which is given to the church, without any other reserve besides that of temporal jurisdiction, or the right of patronage [b].—[a *Du Cange*, Gloss. Lat. T. 2. p. 224. seq. in voc. *Eleemosyna*. b *Aubert*, ap. Richel. Dict. T. 1. p. 155. in voc. *Aumône*.

Charter of ALMS, *charta Eleemosynaria*, that whereby a thing is given to the church.

ALMS, *Aumône*, among the French, is also used for a compulsory payment, imposed by way of punishment, to be converted to pious or charitable uses.

In all adjudications to the king's right, there is an *Alms* reserved. This amounts to what among us is usually called *forfeiture to the poor*. Trev. Dict. Univ. in voc. *Aumône*.

ALMS *of plough-lands*, *Eleemosyna carucarum*, or *Eleemosyna pro aratris*, was a tax antiently paid to the benefit of the poor, at the rate of a penny for each plough-land.

ALMS *of the king*, *Eleemosyna regis*, denotes what was otherwise called *Peter-pence*.

This was sometimes also called *Alms* of St. Peter, *Eleemosyna S. Petri*.

Reasonable ALMS, *Eleemosyna rationalis*, a certain portion of the effects of persons dying intestate, set apart for the use of the church and the poor.

Several authors have written treatises expres on the subject of *Alms*, in Latin, English, French, Spanish, &c. Camerarius, de Lugo, Drexelius, Granada, Hyperius, Mertola, de Morques, Novar. Truxillo, de Valdes, Vasquez, and Villanova, Thiers and Cajetan, have treated on the duty of *Alms*; de Marini and Wheatley, on the usefulness of *Alms*; Downham and Quarre, on the necessity of *Alms*; Morques and Pancorvo, on the excellency of *Alms*; Watson, on the controversies on *Alms*. Vid. *Lipen.* Bibl. Theol. p. 589. seq. and Bibl. Jur. p. 167.

ALMS-*box*, or *chest*, a small chest, or coffer, called by the Greeks Κιβωτιον, wherein antiently the *Alms* were collected, both at church and at private houses. This is also in common use in several places. Vid. *Suicer*. Thes. T. 2. p. 100.

The *Alms-chest*, in churches, is a strong box, with a hole in the upper part, having three keys, one to be kept by the parson, or curate, the other two by the church-wardens.

The erecting of such *Alms-chest* in every church, is enjoined by the book of canons, as also the manner of distributing what is thus collected among the poor of the parish. Constit. & Can. Eccles. 84.

ALMUCIUM, in middle aged writers, denotes a kind of cover of the head, part of it pendant over the neck and shoulders, worn chiefly by the antient canons and monks. *Du Cange*, Gloss. Lat. in voc.

The word is also written, *Almucia*, *Aumucia*, *Almucella*, *Armutia*, and *Amicia*.

The *Almucium* appears to have been much the same with what is otherwise denominated *caputium*.

The *Almucium*, though proper only to religious, was sometimes also assumed by laymen, princes, and even women of quality.

The part which covered the head was of a square form, making, as it were, four horns, as may be seen from the antient pictures of canons. Hence appears the origin of the square caps, bonnets, &c. still retained in cathedrals and universities, which are no other than the upper part of the *Almucium*, without the lower.

ALMUCIA is also used, in some antient writers, for the furs, or skins worn by the canons, on their left arms, in the nature of muffs. *Pitisc.* Lex. Ant. T. 1. p. 73.

ALMUDHEBIS, in the Arabian astrology, a kind of Dignity, or preheminence accruing to a planet in some place, either from its disposition, or benign aspect. *Vital.* Lex. Math. p. 24.

ALMUG-*tree*, a kind of wood mentioned in scripture, imported by Solomon from Ophir, and used in the making of rails, or pillars of the temple. 1 Kings, *c.* x. *v.* 11, 12. 2 Chron. *c.* ii. *v.* 8.

The word is also written *Algum*-tree, in the Hebrew *Almugim*, *Algummim*, *Algumim*, or simply *Gummim*. The septuagint expresses it by *wrought wood*.

Critics have long disputed about the nature and kind of the *Almug*-tree. The Rabbins generally take it for coral; others for ebony; others for Brazil-wood; others for the pine [a]; others for the cedar [b]; others for the citron tree, a particular species of cedar [c]; while others hold it a general denomination for any kind of gummous, or resin-bearing tree [d]; deriving the name from *Agal* and *gummim*; *q. d.* drops of gum; several take it to be the same with the Shittim-wood.—[a *Calm.* Dict. Bibl. in voc. b *Evel.* ap. Hought. Collect. 3. p. 208. c *Huet.* ap. Kust. Bibl. Nov. Lit. T. 2. p. 190. d *Hiller.* Hierophyl. l. 1. c. 13. Bibl. Anc. Mod. T. 25. p. 71.]

ALMUGEA, in astrology, denotes a certain configuration of the five planets, in respect of the sun and moon, correspondent to that which is between the hours of those planets, and the sun's and moon's hours. *Vital.* Lex. Math. p. 25.

Thus Saturn will be in the *Almugea* of the sun, when distant from him the space of five signs in succession; or in the *Almugea* of the moon, when he is at the same distance, only contrary to the succession of the sign.

ALMUTAZAPHUS, a magistrate of Arragon, whose office is to search houses for stolen goods, weigh the bread, measure the wine, &c. *Du Cange*, Gloss. Lat. in voc.

ALMUTHEN, in the Arabian astrology, the planet which has the disposal of a place, that is, surpasses the rest in the number and efficacy of dignities, regard being had to the five essential points, viz. exaltation, terms, trigon, and phases. This is otherwise called *Almusteuli*. Vid. *Vital.* Lex. Math. p. 25.

ALNABATI, in the materia medica, a name given, by Avisenna and Serapion, to the *siliqua dulcis*, or carob-tree. They called both this and the acacia by the common name *charnub*, or *charub*; but they sufficiently distinguish this, not only by this appellation, but by telling us it was a gentle purge, whereas the other was astringent.

ALNAM, in botany, a name used, by some, for pennyroyal. *Ger.* Emac. Ind. 2.

ALNASI, in the Mahometan law, the transferring the observation of a sacred month to a profane month. V. *Sale*, Prelim. Disc. to Koran, sec. 7. p. 149.

The antient pagan Arabs, tired with observing two or three sacred months together, and eager to be making their customary expeditions for plunder, used, by way of expedient, to postpone the observance of *Al Moharram*, or the sacred month, to the succeeding one; so far thinking it lawful to profane the former, provided they hallowed the latter in its place, and gave notice of it at the preceding pilgrimage. Mahomet absolutely condemned this practice as an impious innovation.

ALNUS, the *Alder*, in botany, the name of a genus of trees, the characters of which are these. The flower is of the amentaceous kind, being composed of several apices, arising from four-leaved cups; these are affixed in a clustering manner to an axis, but these are barren. The young fruit appears in a different part of the tree, and is of a squammose structure, and loaded with embryo seeds; this finally increases in size, and becomes a regular fruit, containing a number of compressed seeds.

The species of *Alder*, enumerated by Mr. Tournefort, are these.

1. The common green glutinous-leaved *Alder*. 2. The *Alder* with smooth, longish, green leaves. 3. The hoary-leaved *Alder*. 4. The small alpine *Alder*. 5. The *Alder* with elegantly divided leaves. 6. The mountain *Alder*, with pale, smooth, sinuated leaves, resembling those of the elm.

7. The mountain *Alder*, with curled, ſerrated, and glutinous leaves. 8. The mountain *Alder*, with broad curled, glutinous, and not ſerrated leaves. *Tournef.* Inſt. p. 587.

ALNUS *baccifera*, the berry-bearing *Alder*, in botany, a name given, by ſome writers, to the *frangula*. See the article FRANGULA.

ALNUS alſo denotes a part in the antient theatres at the greateſt diſtance from the ſtage. *Pitiſc.* Lex. Ant. T. 1. p. 74.

ALOA, in antiquity, a Grecian feaſt, celebrated by the Athenian huſbandmen, in honour of Ceres, as inventreſs and protectreſs of corn and tillage.

The word is Greek, ἀλωα, ſometimes alſo written ἀλωα. It is formed of ἀλως, grange, or barn; it being in theſe places that much of the ſolemnity paſſed.

Authors are not agreed as to the time, or occaſion of the celebration of the *Aloa*. Some ſuppoſe it to have been before the beginning of harveſt; others will have it to have been a rejoicing after harveſt, not unlike our *harveſt-home*. The moſt probable opinion is that which fixes it to the month of Poſſidion, anſwering to our December, and to have taken its denomination from its being in the threſhing time, when the huſbandmen lived much in their barns. See further concerning the *Aloa* in *Suid.* Lex. in voc. *Euſtath.* ad Il. 1. *Hoffm.* Lex. Univ. T. 1. p. 155. Bibl. Univ. T. 6. p. 78.

ALOE, in botany, the name of a genus of plants, the characters of which are theſe. The flower is liliaceous, and conſiſts of one petal, which is of a tubular form, and is divided into ſix ſegments at the edge. In ſome ſpecies of this genus, the cup, and in others the piſtil, finally becomes a fruit, or ſeed-veſſel, of an oblong cylindric form, divided into three cells, and containing flat and ſemicircular ſeeds.

The ſpecies of *Aloe*, enumerated by Mr. Tournefort, are theſe.

1. The common *Aloe*. 2. The true *Aloe*, with a thorny rib. 3. The narrow leaved, purple flowered, prickly, ſuccotrine *Aloe*. 4. The *Aloe* with leaves terminating in very long prickles. 5. The leſſer *Aloe*, with the leaves terminating in very ſharp prickles. 6. The American *Aloe*, with broad blueiſh green leaves. 7. The ſoboliferous American *Aloe*. 8. The ſoboliferous American *Aloe*, with fewer prickles. 9. The ſoboliferous American *Aloe*, with beautifully variegated leaves. 10. The erect *Aloe*, with extremely ſharp thorns. 11. The ſmooth American *Aloe*, with very broad ſhining leaves. 12. The *Aloe* of Surinam, with broad, ſhining, and ſerrated leaves. 13. The leſſer American *Aloe*, with leaves armed at their edges with very numerous, but ſoft prickles. 14. The Braſilian *Aloe*, called by Margrave, *Caraguata*. *Tournef.* Inſt. p. 366.

The proper earth for planting theſe vegetables in, is, one half freſh light earth from a common, and the reſt an equal mixture of white ſea-ſand and ſifted lime rubbiſh; and this mixture ſhould be always made ſix or eight months, before the plants are to be ſet in it. The common great American *Aloe* is very hardy, with reſpect to cold, and being planted in a very dry ſoil, and under a ſouth wall, has endured abroad in mild winters, and is always very well kept in pots, or tubs, in a common green-houſe, with oranges and myrtles, but muſt have very little water in winter. Moſt of the other *Aloes* are beſt preſerved in an airy glaſs-caſe, in which there is a ſtove, to make a little fire in very bad weather. The tendereſt kinds, ſuch as the broad, green-leaved, curaſſo kind, with black ſpines; that kind, called in the Weſt-Indies, the ſilk-graſs; the ſoboliferous American kind; and ſome others, require a greater ſhare of heat to preſerve them in winter, and ſhould be kept in a good ſtove, in a degree of heat, according to Fowler's Thermometer, ten degrees above temperate. Many other kinds may alſo be kept in this heat; but the greater the heat, the more water they always require.

About the beginning of June, it is uſual in England to ſet the pots of *Aloes* out of the houſe; but they ſhould be ſet under the ſhelter of hedges, or trees, to keep them from the violence of the ſun. The rains alſo which uſually fall in this and the following month, are very apt to rot them. It is therefore beſt to keep them under cover the greateſt part of the year.

The beſt time to ſhift theſe plants is the middle of July. They are, on this occaſion, to be taken out of the pots, the looſe earth to be picked from about their roots, and the decayed or mouldy parts of them cut off; then a few ſtones are to be put at the bottom of the pot, and it is to be filled with the compoſition before deſcribed, and the plants carefully put in, the roots being ſo diſpoſed, as not to interfere with one another. They are to be carefully watered after this, at times, for three weeks, and ſet in a ſhady place.

The common kind will bear the open air from May to October, and ſhould be ſhifted every year. All the *Aloes* are propagated by off-ſets, which ſhould be taken from the mother plant, at the time when it is ſhifted; they are to be planted in very ſmall pots of the proper mixed earth; and if that part of them which joined to the mother plant, be obſerved to be moiſt when taken off, it ſhould lye on the ground in a ſhady place, two or three days before it is planted, otherwiſe it will rot. After planting theſe, they ſhould remain in a ſhady place a fortnight, and then be removed to a very moderate hot-bed, plunging the pots therein; which will help their ſtriking new roots. Toward the end of Auguſt, they muſt be, by degrees, hardened to the open air, by taking off the glaſſes of the hot-bed, and in September they may be removed into the green-houſe.

Moſt of the African *Aloes* flower with us annually, after they are three or four years old; but the American *Aloes* flowers only once, the root decaying when it has flowered. It always, at this time, however, produces very numerous off-ſets; ſo that the old one is replaced by a great number of young ones. It has been ſuppoſed, that this ſpecies flowers only in an hundred years; but that has been abundantly proved a miſtake; but the flowering with us, being ſomething rare, is uſually much talked of. The expreſſion of ſome body who has firſt ſaid this, has been ſo far miſunderſtood by thoſe who repeated it, that it was long ſuppoſed that the flowers, when they ſhoot out, give a crack like a gun.

Moſt of the African *Aloes* afford plenty of off-ſets; but thoſe which do not, may be propagated, by cutting off one of the under leaves of a flouriſhing plant, and, after laying it two or three days in the ſhade, planting it in a ſmall pot of earth, ſlightly watering it, and planting the pot in a moderate hot-bed, ſkreening it from too much ſun, and watering it gently at times, till it has taken root. The beſt ſeaſon for this is in the month of June; and thoſe ſet at this time, puſh out heads before winter. *Miller*'s Gardn. Dict.

The *Aloe* is a plant cultivated with great curioſity in our gardens, and reputed one of the chief ornaments thereof.—In reality, there is ſcarce any tribe of plants which affords a more pleaſing variety than theſe, from the odd ſhape of their leaves, the various manner of their ſpotting, and being ſome of them covered, as it were, with pearls.

Dioſcorides, Pliny, and the antient naturaliſts, ſeem only to have been acquainted with one ſpecies of *Aloes*; which is the *Aloe vulgaris Aſiatica*, from whence the drug of that name is procured.

But the late travels into Aſia, Africa, and America, have occaſioned the diſcovery of numerous other ſorts unknown to antiquity.

The ſlowneſs of the *Aloes* arriving at maturity, ſeems owing to the viſcidity and lentor of its juice, which requires a number of years before it be ſufficiently elaborated and ſubtilized, to cauſe an expanſion; but this is afterwards compenſated by the bulk to which it arrives, the height of its ſtyle, the velocity with which it ſhoots, and the prodigious number of flowers it produces, which ordinarily amounts to ſeveral thouſands. Another tradition is, that when the *Aloe* begins to ſhoot, it finiſhes its whole growth in thirty-ſix or forty-eight hours [a]: whereas it has ſince appeared, that the plant ordinarily takes up three months, viz. from May to July, from the firſt budding of the ſtem, to the finiſhing of the flowers. There are, however, exceptions from this rule. Munting relates, that an *Aloe* in the garden of cardinal Farneſe, at Rome, ſhot up in one month to the height of twenty-three feet; and another at Madrid, in one night, ten feet high, and in eight days thereafter, twenty-five feet more. The people imagined this ſo ſacred a buſineſs, that they built a chapel upon the place [b].—[[a] *Borell.* Obſerv. 1. c. 2. [b] Phil. Tranſ. N°. 111. p. 50. See alſo *Scarell.* ap. Giorn. de Letter. d'Ital. T. 4. p. 97.]

The progreſs of the bloſſoming of the Venetian *Aloes*, in the garden of Sig. Papafava, was obſerved as follows. The plant began to ſhoot its ſtem on the 20th of May, which by the 19th of June was riſen the height of four Paduan feet and one inch; on the 24th of the ſame month, it had gained ten inches more; on the 29th eight more, on which day it began to emit branches; on the 6th of July, it had gained a foot one inch; on the 17th, one foot eight inches more; on the 7th of Auguſt, one foot and an half. Laſtly, from that day to the 30th, it grew but ſlowly; but continued emitting branches and flowers. The trunk at the bottom meaſured a foot thick; the branches were twenty-three in number, on the top of each was a knot, or collection of flowers; on the firſt branches were an hundred and twelve, on others an hundred and ten, and on others an hundred flowers each. They yielded little ſmell, but what was of it was agreeable.

It is related of the *Aloe*, that it burſts out with a vehement noiſe and cracking, like the exploſion of a gun, ſo as even to make the earth quake [c]. Something like this has been related, by good authors, concerning the *arbor crepitans* in India, whoſe fruit, when ripe, is ſaid to burſt with a noiſe equal to that of a great gun [d]; but as to any noiſe at the eruption of the ſtem of the *Aloe*, later writers are entirely ſilent. Some, who have liſtened with great curioſity on the occaſion, have perceived none; yet a late French writer, M. Garidel, defends the report of its noiſe, againſt M. Ray, whom he taxes with incredulity for diſbelieving it [e].—[[c] *Borell.* loc. cit. [d] *Nicren. Berg.* Hiſt. Nat. l. 15. c. 10. [e] Nouv. Rep. Lett. T. 56. p. 389.]

When the tree has once flowered, it quickly dies; being quite exhauſted by ſo copious a birth. They ſeldom flower till of a conſiderable age, and this but once, during the life of the

plant for when the flower ſtem begins to ſhoot; from the middle of the plant, (which for the moſt part is of a large ſize, and grows to a great height,) it draws all the moiſture and nouriſhment from the leaves, ſo that as that advances the leaves decay, and when the flowers are fully blown, ſcarce any of the leaves remain alive; but whenever this happens, the old root ſends forth a numerous quantity of off-ſets for increaſe. Vid. ſupra, *Mill.* Gard. Dict. in voc.

Ray tells us, from Francis Hernandez, that the *Aloe* is uſeful to all purpoſes of human life; for the wood of it ſerves well for the uſe of the carpenter, and for fences; the ſtalks for timber; the leaves for covering of houſes; the nerves and fibres ſerve in room of hemp, flax and cotton, and will make ſhoes and veſtments; of the prickles are made nails and awls, alſo pins, needles, pikes, and ſuch like. From hence alſo (if rightly tapped) may be drawn, fifty pitchers full, of nine gallons each, of which, juice, by diſtillation, will become ſweeter and thicker, till it becomes ſugar.

The firſt *Aloe* in Italy, was in the garden of Jac. Ant. Cortuſio of Padua, where it was ſeen by Camerarius in 1551 [f]. The firſt that flowered was at Florence, in 1586, in the great duke's garden [g]. About the year 1590, there was another at Piſa; another flowered at Verona, in 1663, in the garden of the Conte Giuſti; another at Rome, in 1591; and a ſecond in the Farneſe garden, in 1625; beſides others ſince. In France the firſt *Aloe* that flowered was at Avignon, in 1599, in the garden of M. Doins; another was ſeen at Montpelier, in 1646; another flowered at Bezenes in Languedoc, in the preſence of Lewis XIII. and cardinal Richlieu, about the year 1641. —[f Narat. in Hort. Medic. p. 11. g Id. p. 10. 15. 86.]

In Germany, the firſt *Aloe* that flowered is ſaid to have been at Augſburg, in the garden of a private botaniſt, in the year 1633 [h]: Tho' ſome authors ſpeak of one earlier, *viz.* in 1627, in the *Hortus Onoldinus* [i]. The ſecond was in the ducal garden, at Stutgard, in 1658; it roſe twenty-three feet high, produced forty branches, on each whereof were two, three, or four hundred flowers, in all twelve thouſand [k]. Another at Chora, in Miſnia, in the garden of count Leeſer in Sahlitz, called by the German writers, the *Aloe Chora Salitiana*, in 1663: another at Sonderſhuys, in Thuringia, in the gardens of the count of Schwartzburg, in 1664; another at Gottorp, in Holſtein, in the duke's Garden, in 1668: another at Slevens, in Thuringia, in 1669: another in Sileſia, in the gardens of the count d'Opperſdorf, in 1662 [l]: another in 1687, in the gardens of duke Maurice of Saxony [m], remarkable for this, that inſtead of a ſingle ſtem, it divided into three, all ſhot about the ſame time, the talleſt thirteen feet, and the ſhorteſt eleven feet high; together they bore 3921 flowers. From the flowers dropped a water, like that which Sig. Scarella, above thirty years after, pretended had never been obſerved by any before him, in the Venetian *Aloe*. To theſe may be added, another *Aloe*, which flowered at Gottorp, in 1705; another at Leipſic, in 1700, another at Brunſwic, in 1701; another at Gotha, in 1710; another in Brandenburg, in 1712, not far from Berlin; another in the gardens of the duke of Wolfenbuttle, in 1701, in memory of which a medal was ſtruck [n]. Others have been obſerved at Vienna, in 1723; and at Copenhagen, in 1724 [o]. Even Sweden is not without inſtances of the ſame; an *Aloe* having been found to bloſſom in 1708, in the garden of the ſenator Gyllenſtolpe, at Nora in Upland, five miles from Stockholm; and what is remarkable, notwithſtanding the coldneſs of the climate, it began to bloſſom at the cloſe of October, and held in flower all the winter, tho' reckoned a very ſevere one for that place [p]: the thing was celebrated by the wits of Sweden: a collection of poems on the occaſion has been publiſhed [q], in which the famous northern poeteſs, Sophia Elizabeth Brenneria, makes a diſtinguiſhed figure.—[h Ephm. Acad. N. C. Dec. 1. An. 6. p. 339. i Act. Phyſ. Med. T. 2. p. 409. k *Elſholtz.* Flora. Marchic. p. 16. l *Sachs*, ap. Ephem. Acad. N. C. dec. 1. an. 1. Obſ. 90. m *Zapf.* Act. Erud. Lipſ. An. 1688. n V. Ephem. Acad. N. C. Cent. 7. App. p. 89. ſeq. o *Albert.* Lex. Real. T. 2. p. 34. p Nouv. Liter. Germ. 1709. p. 295. q *Holm.* 1709. Fol. See Nouv. Liter. loc. cit.]

For *Aloes* flowering in England, a late learned writer [r] informs, that none had been known before the year 1729, when that of a gentleman at Hoxton appeared. But this muſt be a miſtake: Miller ſpeaks of *Aloes* in our country which flowered long ago; tho' he does not mention when or where. At leaſt if our gardeners came not ſo early into the culture of the plant, as the Germans or Italians, they have made amends for it; there being no country in Europe, where the flower of *Aloes* is leſs unuſual than among us of late. In the year 1731, if we do not miſremember, there were two *Aloes* in bloſſom at the ſame time, within two miles of each other, one at Peckham, in Surry, in the lord Trevor's garden, the other at Greenwich [s].—[r Act. Phyſ. Med. Acad. N. C. T. 2. p. 409. s V. Month. Magaz. T. 1. p. 401.]

Some *Aloes* are arboreſcent, inclining to make large trees, breaking forth into branches; others are ſo ſmall, that a whole plant does not exceed the bigneſs of a crown piece. Some grow cloſe to the ground, others are more aſpiring, and have their crown of leaves raiſed upon a ſtem, ſomewhat above the earth. The kind moſt common in our gardens, with ſome few other ſorts, are brought from America; but the greateſt varieties, and as ſome think, the beſt kinds, come from Africa, chiefly from the Cape of Good Hope. Bradley aſſures us, he has ſeen above ſixty different kinds of *Aloes* in the phyſic-garden of Amſterdam, chiefly the product of the Cape; ſome of them have been raiſed from ſeed from that place, and others from young plants riſing from the roots, or putting forth from the ſtems. They are uſed with great tenderneſs; tho' the author laſt mentioned ſays, he has found them a hardy plant, and that of forty ſorts which he has cultivated in England, he has not loſt one by cold. *Bradley*, Improv. Gard. P. 3. c. 5. p. 267. ſeq.

The two kinds moſt conſiderable, the one for its curioſity, the other for its uſe, are the *Aloe Americana*, or flowering *Aloe*, and the *Aloe Aſiatica*, or drug *Aloe*.

Concerning the hiſtory of the *Aloe*, ſee *Munt.* Aloedar. paſſim. *Ray*, Hiſt. Plant. p. 1195—1200. The divers ſpecies of it, *Miller*, Gard. Dict. in voc. Jour. des Scav. T. 36. p. 46. Its culture, *Bradley*, New Improv. Gard. P. 3. p. 269. *Miller*, loc. cit. Spaniſh *Aloe*, *Sachs*, de *Aloe*. See Ephem. Acad. N. C. Dec. 1. An. 1. p. 182. ALOE, is alſo applied by ſome writers, to a kind of mineral juice produced in Judea. *Dioſcor.* in Pref. ad l. 1.

This is called foſſil, mineral, or metalline *Aloe*.—Some diſpute the exiſtence of any ſuch *Aloe* [a]. Others ſuppoſe it to be no other than the *Aſphaltus* [b].—[a *Plin.* Hiſt. Not. T. 2. l. 27. c. 4. p. 421. V. *Garc. ab Hort.* Hiſt. Arom. l. 1. 2. *Burggr.* Lex. Med. T. 1. p. 457. b *Bejer.* loc. cit.] See ASPHALTA.

ALOES, (*Cycl.*) in pharmacy.—A late writer deſcribes the preparation of *Aloes* thus: The leaves being pulled from the roots of the tree with the hand, or an inſtrument, and preſſed, diſtil a juice, of which juice, the thick parts will ſubſide, and the thinner are poured off, and put in the ſun till it dries and hardens, in which time it gains a yellow colour. This is called *Aloe Succotrina*. The thicker part remaining is put into another veſſel, and by being inſpiſſated in the ſun, gains a liver colour, and is called *Aloe Hepatica*. The thickeſt part is called *Caballina*, or horſe *Aloes*. Edreſſi, an Arabian writer, gives the proceſs ſomewhat differently. The people of Succotra, he obſerves, gather the leaves of this plant in the month of July, and boil them in great caldrons, to extract the juice out of them, which they put into bottles, and expoſe them to the ſun during the dog-days. *D' Herbel.* Bibl. Orient. p. 727. in voc. *Sabr.*

Mr. Boulduc, on his analyſis of *Aloes*, found that the difference between the ſeveral kinds was greater than could have been imagined; that the Succotrine *Aloes*, contained not more

than

than half the proportion of the reſin, or ſulphureous part, that the hepatic did; and about on third more of the ſaline. The Caballine, he obſerved, was uſually ſo very foul, and contained ſo ſmall a proportion, either of reſin or ſalt, to its earthy or uſeleſs matter, that it was not worth employing on any occaſion. But the different proportion of the principles in the two other kinds, he very well obſerves, may naturally lead us to underſtand the difference of their effects. As the reſinous part of *Aloes*, contrary to that of all other purgative medicines, is ſcarce at all purgative, there is plain reaſon why the Succotrine, which has leaſt of it, ſhould be employed for all internal purpoſes; it being much better qualified to act by its other parts as a purge, by being freed from an over quantity of this, which is but an incumbrance upon it; but on the other hand, there is as great reaſon to preſer the hepatic, which abounds in reſin, for all external uſes, where it is to act as a balſam in the healing of wounds, and the like; and Mr. Boulduc ſets it in theſe intentions upon a footing with the beſt of the natural balſams.

The ſalts of *Aloes* are very violent and active; they frequently corrode the extremities of the blood-veſſels, which lie in their way, and hence the hemorrhages which attend the uſe of this medicine. The reſinous part of this medicine is in all caſes a great guard againſt the ſaline, and a check upon the violence of its operations; theſe ſhould therefore never be ſeparated from one another; yet this is too often done by the unſkillful, whence ariſe great miſchiefs, which Mr. Boulduc affirms, he has himſelf been a witneſs of, from the giving the ſalt of *Aloes*, without that balſamic reſin, which nature has prudently ſet as a guard over it. This ingenious experimenter would have us, inſtead of dividing theſe principles, join them more intimately together; this he obſerves may be done by means of ſalt of tartar; and by this means *Aloes*, will be made in all internal caſes, an infinitely more ſafe remedy. Mem. Acad. Par. 1708.

The *Aloes*, as imported, is uſually too foul for medicinal purpoſes; as having a mixture of ſtraws, ſticks, or gritty matter. To purify it, they gently diſſolve it in water, enough to paſs it conveniently through a flannel cloth when warm, and afterwards evaporate it to a conſiſtence. Some for this purpoſe uſe ſpirit of wine, and others ſpirit of tartar, under the notion of better correcting the *Aloes*; but that diſſolvent ſeems moſt ſuitable, which leaves the drug its native qualities, after refinement, leaving it to the phyſician afterwards to correct it in preſcription as he pleaſes. *Quinc.* Diſpenſ. P. 2. p. 293. ſeq.

This drug applied to ſores will cauſe a purging. Thus we find in the medical eſſays, that a paſtil made of myrrh, *Aloes*, and honey, having been put every day into a cavity formed by an ulcer in the bone, the patient had a conſtant purging, which ceaſed the day after the *Aloes* was omitted. Med. Eſſ. Edinb. Vol. 5. Art. 24.

Where it is alſo obſerved, that the tincture of *Aloes*, applied to ulcers and carious bones, frequently brings on a purging.

Aloes is a prime ingredient in *Elixir proprietatis*, and *Species Hieræ Picræ*, with which the *Tinctura Sacra*, is made.

Aloes was uſed among the antients, in embalming, to preſerve bodies from putrefaction. Of this *Aloes*, interpreters underſtand that to have been which Nicodemus in the goſpel brought to embalm the body of Chriſt. *John*, c. xix. v. 39.

Several authors have treated expreſly on *Aloes*; as Bejer and Major; Duroſtantis on its ſubſtance, Marquis on its virtue, Martinez on its choices, Fuchſius and Puteanus on its opening the veins.—Many particulars alſo relating to *Aloes* are given occaſionally by botanic and pharmaceutical writers. V. *Lipen.* Bibl. Med. p. 12.

More particularly concerning the principles and analyſis of *Aloes*, ſee Hiſt. Acad. Science. 1708. p. 66. Act Erud. Lipſ. 1710. p. 294. Its efficacy and uſefulneſs, *Zacut. Luſit.* Med. Princ. Hiſt. l. 1. Hiſt. 21. p. 36. ſeq. Whether its virtue reſide in its gummy, or reſinous part, *Junck.* Conſp. Therap. Tab. 3. p. 61. Manner of its operation, *Quinc.* Pharm. Lect. 4. p. 47. Uſe in flatulencies, *Junck.* Conſp. Medic. p. 599. In facilitating delivery, Ephem. Acad. N. C. Dec. 2. An. 4. Obſ. 117. Uſed to exceſs, Ephem. Acad. N. C. Dec. 2. An. 5. p. 444. Occaſions Hæmorrhages, *Junck.* Therap. ubi ſupra, bloody urine, Barth. Act. Med. T. 2. p. 166. Extraordinary Preparation of it, Mem. de Trev. 1729. p. 19.

Lignum ALOES (*Cycl.*) —This wood, by the Indians and Portugueſe, is called *Calamba*, or *Calambac*, being the ſame with what is otherwiſe called by medical writers *Xyloaloes*, and *Agallochum*. V. Act. Erud. Liſp. An. 1695. p. 501. Nouv. Rep. Lett. T. 15. p. 202. See AGALLOCHUM, and CALAMBA.

Linſchoten [a], and after him Dr. Grew [b], and others, miſtakenly make the three ſpecies of woods, mentioned in the Cyclopædia, the produce of ſo many different trees growing in different places.—[[a] *Linſch.* l. 1. c. 76. [b] *Grew*, Muſ. Reg. Societ. P. 2. p. 180. See alſo *Bont.* Not. in Garc. ab Hort.]

Sir Philip Vernatti, formerly reſident in Java major, deſcribes the *Aloes*, as the wood of a living tree, tho' rarely gathered till it be dead, and withered. The outermoſt coat of wood is white, ſoft, and yields a milky juice extremely poiſonous. The *Lignum Aloes*, or calambac is found within the white wood, but not every where. When the tree decays, the white wood ſoon withers, and grows worm-eaten, and the milk ſo dries up, that you may eaſily rub it aſunder with your hand. The beſt is found in the midſt of the tree, nouriſhed by the heart root, which goes ſtreight down into the ground. Phil. Tranſ. N°. 43. p. 863.

Grew deſcribes a piece of *Lignum Aloes*, with its own gum growing on it, in the repoſitory of the royal ſociety. The taſte of the gum is perfectly like that of the wood; the colour like that of the pureſt and moſt lucid Succotrine *Aloes*; for with the light reflected, it looks almoſt like pitch; with the light tranſmitted, it gliſters like a carbuncle; powdered it is of a reddiſh yellow [c]. This or ſome other like aromatic gum was the *Aloes* of the Hebrews, divers times mentioned in the old teſtament, among perfumes: myrrh and *Aloes* [d], garments ſmelling of *Aloes* [e] and Caſſia. The harlot in Solomon had perfumed her bed with *Aloes* [f]. The Hebrew text, in theſe paſſages, has *Ahalim*; which word alſo occurs in the book of Numbers [g], where its meaning has occaſioned ſome diſpute; the vulgate renders it by *Tabernacula*, tents; St. Jerom by *Stacte*; others by *Santalum*, or ſanders; others by ſaffron [h]; the Engliſh verſion, with great propriety, by *Lignum Aloes*.—[[c] *Grew*, Muſ. Reg. Societ. P. 2. c. 1. p. 179. [d] Cant. c. iv. v. 14. [e] Pſal. xlv. v. 8. [f] Prov. c. vii. v. 17. [g] Numb. c. xxiv. v. 6. [h] *Caſtel.* Orat. de Botan. Sacr. p. 29. ſeq.]

Bejer has a diſcourſe expreſs on the *Ahalim*; wherein he ſhews it to be the ſame with the *Agallochum*. Printed in *Wedel.* Exerc. Medic. Philol. Dec. Oct. p. 1—10. See alſo *Sachs* de *Aloe* Siles. in Ephem. Acad. N. C. Dec. 1. An. 1. p. 182. Concerning the virtues and uſes of the *Aloes*. V. *Bejer.* loc. cit. p. 6. ſeq. An odoriferous water now extracted from it, Act. Erud. Lipſ. 1698. p. 390.

ALOEDARY, *Aloedarium*, Αλοηδαριον, denotes a purging medicine, wherein aloes is an ingredient. *Gorr.* Def. Med. p. 23. *Caſt.* Lex. Med. p. 34.

This amounts to the ſame with what we otherwiſe call an *Aloetic*. See ALOETIC, ALOE, *&c.*

ALOEDARY is alſo uſed for a hiſtory of the claſs of plants, under the denomination of aloes.

Munting has publiſhed an *Aloedary*, at the end of his hiſtory of the *Herba Britannica*; in which is contained a botanic and medical hiſtory of the *Aloe Mucronato folio Americanæ majoris*, and of divers other ſpecies, particularly the Aſiatic aloes, from whence the juice, or drug-aloes is procured. *Amſt.* 4°. 1681. A Notitia of it is given in Act. Erud. Lipſ. 1682. p. 17. and in Weekl. Mem. Ingen. N. 110. p. 265.

ALOETIC (*Cycl.*)—*Aloetics* open the orifices of the veſſels [a], and are on this account found hurtful in caſes of hæmorrhages [b], particularly at the noſe [c]; alſo in the Teneſmus [d], hemicranium [e], *&c.* The immoderate uſe of *Aloetics* tends to produce hæmorrhoids [f], hypochondriac pains, and inflations [g].—[[a] *Rolfinc.* Med. Conſult. l. 3. Conſ. 2. p. 339. [b] *Nent.* Fund. Med. Tab. 9. p. 11. & p. 35. [c] Id. ibid. Tab. 9. p. 19. [d] *Junck.* Conſp. Med. Tab. 88. p. 586. [e] Id. ibid. Tab. 20. p. 120. [f] *Nent.* loc. cit. p. 156. [g] *Wepf.* Obſerv. p. 603.]

Joannius has a treatiſe expreſs on *Aloetic* pills. *Jo. Joann. de Utilitate Pilularum Aloeticar. Hier. ab Aquapendente. Patav.* 1630. 8°. *Lipen.* Bibl. Med. p. 12.

ALOGIANS (*Cycl.*)—The *Alogians* made their appearance towards the cloſe of the ſecond century.—They aſſerted that John's goſpel, which the orthodox alledge was written in oppoſition to Cerinthus, was the compoſition of that very heretic; nor was the apocalypſe in any better eſteem with them.

St. Epiphanius [a] among the antients, and M. le Clerc, among the moderns, have written largely againſt this opinion of the *Alogians*. The arguments of the former have been ſhewn to be inconcluſive by F. Simon [b] and others; neither has the latter received thanks for his defence, having been charged by ſeveral with favouring underhand the *Alogian* ſyſtem [c].—[[a] *Hæreſ.* 51. p. 184. [b] Hiſt. Crit. de Nouv. Teſt. Ap. Bibl. Univ. T. 12. p. 134. [c] V. Act. Erud. Lipſ. 1697. p. 499. It. 1698. p. 456. *Kuſt.* Bibl. Nov. Liter. 1698. p. 683. Work of Learn. T. 1. p. 74.]

F. Maſſuet [d] pretends, from a paſſage in Iræneus, that the *Alogians* did not reject the whole goſpel of St. John, but only that part of it which ſpeaks of the Holy Ghoſt, or Paraclet; an opinion which has been ſufficiently refuted [e].—[[d] Not. ad Iren. l. 3. c. 11. §. 9. [e] Init. Evang. S. Joan. Reſtit. c. 24. p. 419. ſeq.]

ALOGOTROPHIA, in medicine, an irregular nutrition of ſome part, attended with a vicious figure or conformation thereof, as in the rickets. *Caſt.* Lex. Med. p. 34.

If the bones of the vertebræ of the back receive too much nutriment, on one ſide, as ſometimes happens in children, an incurvation neceſſarily enſues, which, as Charleton expreſſes it, is produced by an *Alogotrophia*. Exerc. 10. Pathol. §. 42. p. 200.

ALOIDES, in botany, a name uſed by ſome for the *Aloe paluſtris*, or freſh water aloes, called in ſome parts of England *water-ſolduc.* *Dale*, Pham. p. 198.

ALOPECIA (*Cycl.*) properly differs from *defluvium capillorum*, as in the former, certain parts or patches were left intirely bald, whereas in the latter, the hair only grows immoderately thin [a]. It alſo differs from the *Ophiaſis*, as this latter creeps

in ſpires about the head, like the windings of a ſerpent, whereas the former is not confined to any figure [b].—[a] *Poliſ.* Myrrhol. c. 15. Art. 2. p. 326. [b] *Burggr.* Lex. Med. T. 1. p. 467. ſeq.]

The *Alopecia* in effect ſeems only to differ from the ophiaſis, as it is a degree leſs malignant.

The *Alopecia* is called by Celſus *Area*, on account of its appearing in naked ſpots or patches. *Celſ.* de Medic. l. 6. c. 4.

The cauſe as well as cure of the *Alopecia* is the ſame as that of the ophiaſis; tho' ſome would make a difference: urging that the primary intention in the former, is to correct or carry off the vitious humour; in the latter, to ſupply the want of nutriment to the cutaneous parts. *Poliſ.* ubi ſupra. *Caſt.* Lex. Med. p. 34. ſeq. *Burggr.* loc. cit. See alſo Bibl. Anat. T. 2. p. 679.

ALOPECIA is alſo uſed, by Galen, for a change of the hair to another colour. De Rem. Fac. Par. c. 6. *Caſt.* Lex. Med. p. 34. ſeq.

ALOPECIAS, in zoology, a name of the *Vulpes marina*. See VULPES *Marina*.

ALOPECOPITHECOS, in natural hiſtory, a name derived from the Greek, and given by Aldrovand and others to that ſtrange creature, the opoſſum; an American animal, which has a pouch under its belly, into which it receives its young in time of danger. It is ſuppoſed, according to this name, to partake of the nature of the fox and the ape; but it in reality is wholly different from both, and merits a general name of its own. Tyſon has given it that of Marſupiale, which as it is founded on the pouch, which is its diſtinction from all other animals, ſeems a very good one, but authors do not ſeem to come into the uſing it. Philoſ. Tranſ. N°. 239. p. 110. See OPOSSUM.

ALOPECUROS, *fox-tail graſs*, in the Linnæan ſyſtem of botany, makes a diſtinct genus of plants, the diſtinguiſhing characters of which are, that the calyx is a glume compoſed of two valves, and encloſing a ſingle flower; theſe valves are oval, pointed and hollow: the flower is compoſed of only one valve, which is hollow and of the ſame length with the calyx, and has a long awn or beard inſerted on its back-part near its baſis; the ſtamina are three capillary filaments; the antheræ are oblong; the germen of the piſtil is roundiſh; the ſtyles are two in number, hairy, reflex, and exceed the length of the cup; the ſtigmata are ſimple; the flower encloſes the ſeed, which is ſingle, and roundiſh. *Linnæus*, *Genera Plantarum*, p. 18.

ALP, in zoology, an Engliſh name uſed by ſome for the bullfinch. *Ray*, Ornitholog.

ALPAGE, *Alpagium*, in antient writers, denotes the privilege of feeding cattle on the Alps, or high mountains, or a ſum paid for the purchaſe of ſuch a right.

This is otherwiſe called *Alpaticum*. *Du Cange*, Gloſſ. Lat. in voc. See ALPS.

ALPHA (*Cycl.*) is particularly uſed among antient writers, to denote the chief or firſt man of his claſs or rank.

In this ſenſe the word ſtands contradiſtinguiſhed from *Beta*, which denotes the ſecond perſon.

Plato was called the *Alpha* of the wits: Eratoſthenes, keeper of the Alexandrian library, whom ſome called a ſecond Plato, is frequently named *Beta*.

ALPHA is alſo uſed to denote the beginning of any thing.

In which ſenſe it ſtands oppoſed to *Omega*, which denotes the end. And theſe two letters were made the ſymbol of chriſtianity; and accordingly engraven on the tombs of the antient chriſtians, to diſtinguiſh them from thoſe of idolaters. Moralez, a Spaniſh writer, imagined that this cuſtom only commenced from the riſe of Arianiſm, and that it was peculiar to the orthodox, who hereby made confeſſion of the eternity of Chriſt: but there are tombs prior to the age of Conſtantine whereon the two letters were found, beſides that the emperor juſt mentioned, bore them on his labarum before Arius appeared. See LABARUM, *Cycl.*

ALPHA is alſo a title given by ſome antient writers to the Jewiſh legiſlator Moſes. The reaſon of the apellation is much controverted. Helladius, in his Chreſtomathia, and Ptolemy ſon of Hepheſtion, pretend that Moſes was infected with the leproſy, which the Greeks call ΑΛΦΟΣ, and that hence aroſe the denomination ΑΛΦΑ. This opinion ſeems to have owed its riſe to a tradition among the heathens, that the Jews were expelled Egypt, becauſe they were over-run with this diſeaſe. A tradition ſupported by Diodorus Siculus, Tacitus, Juſtin, Apion, and others; but refuted by Joſephus.—A late writer apprehends, that the notion of Moſes's leproſy took its riſe from that text in the old teſtament, wherein the prophet, having put his hand into his boſom, drew it out again white as a leper, which the Septuagint render ΑΛΦΟΣ.

Others have invented other reaſons of the appellation, which do more honour to Moſes. Nicolai conjectures that he might have been denominated *Alpha*, on account of the fairneſs and brightneſs of his complexion, when he came from the mount; or from his being the chief, or leader of the Jewiſh people; or even from his being well learned, in regard the Hebrew word *Aleph*, from whence the Greek *Alpha* was formed, ſignified as much. If none of theſe will ſerve, the ſame author, from the conſideration of the radical letters of the word *Alpha*, deduces divers other myſtical ſignifications: Moſes might have been ſo called, becauſe he was the moſt meek of men; or in regard he mediated between God and the Jews; or becauſe he was ſlow of ſpeech; or becauſe he converſed familiarly with God; or in fine, becauſe he wrote a hiſtory of the times before him. *Nicolai*, Diſquiſit. de Moſe *Alpha* dicto. Lugd. Bat. 1703. 12°. Extracts of which are given in Ouvr. des Scav. Janv. 1703. p. 18. Mem. de Trev. 1708. p. 1154. Jour. des Scav. T. 34. p. 71.

ALPHERATZ, in aſtronomy, a fixed ſtar of the third magnitude in Aquarius. See AQUARIUS, *Cycl.*

This is otherwiſe called *Alpharatz*. Some alſo give the denomination *Enif Alpharatz* and *Marchab Alpharatz*, to two other ſtars in the right ſhoulder of Pegaſus. *Vital.* Lex. Math. p. 26. See PEGASUS, *Cycl.*

ALPHESERA, in botany, a name by which the Arabian, and ſome other, authors expreſs the white bryony. *Ger.* Emac. Ind. 2.

ALPHESTES, in zoology, the name of a fiſh, called by others *Cinedus*, ſeeming to approach very much to the Turdus, or Wraſſe kind, but having the rays or nerves of its back-fin prickly all the way to the tail; whereas the Turdi have only the anterior rays of that fin prickly, the reſt ſmooth. It is a ſmall fiſh, and is always caught about the ſhores, and among rocks: its back is purple, and its ſides and belly yellowiſh. Its mouth is ſmall, and has thick and fleſhy lips. *Geſner*, de Piſc. p. 40.

ALPHITIDON, in ſurgery, a ſpecies of fracture, wherein the bone is broken into a great number of ſmall parts, or particles. *Caſtel.* Lex. Med. in voc.

The word is Greek, ΑΛΦΙΤΙΔΟΝ, formed of ΑΛΦΙΤΟΝ, *farina*, flower, q. d. a bone ground to flower or powder.

ALPHITOMANTIA, in antiquity. See the article ALEUROMANCY.

ALPHOS (*Cycl.*)—The *Alphos*, or *Alphus* is of two kinds.

1. *Alba*, where the ſkin is ſprinkled with rough whitiſh ſpots. This is the *Alphus* more properly ſo called, being otherwiſe denominated *Leuce*.

2. *Nigra*, where the ſpots are black. This is alſo called *Melane*. V. *Celſ.* l. 5. c. 28. *Caſtel.* Lex. Med. p. 35. *Zuing.* Epiſt. Juſt. Pathol. n. 328.

ALPIEU, in the game of baſſet, is when a couch or firſt ſtake is won by turning up or crooking the corner of the winning card. Comp. Gameſt. p. 33.

In this ſenſe, *Alpieu* amounts to much the ſame with *Paroli*. See BASSET.

ALPS, beſides its proper ſignification, by which it denotes a certain chain of mountains, which ſeparate France from Italy, is ſometimes uſed as an appellative to denote any mountains of extraordinary height. Phil. Argyr. in Virg. Geor. l. 3. v. 474. *Iſid.* Orig. l. 4. c. 8. *Serv.* ad Virg. loc. cit.

In this ſenſe Auſonius, and others call the Pyrenean mountains, *Alps*, and Gellius, the Spaniſh *Alps*, *Alpini Hiſpani*. *Auſon.* Epiſt. 24. *Fortunat.* l. 6. Poem. 2. It. l. 10. Poem. 25. Sidonius gives the ſame appellation of *Alps*, to mount Athos. Other authors ſpeak of Norman *Alps*, *Alpes Arvennæ*, *Alpes Aſtoricenſes*, *Alpes Dofrinæ*, *Alpes Romaniæ*, *Alpes Baſtarnicæ*.—The Apennins are alſo called by *Johannes Villaneuf*, *Alpi D'Apennini*. L. 1. c. 33. *Du Cange*, Gloſſ. Lat. in voc.

ALPS is alſo uſed to denote paſtures on the mountains, wherein cattle are fed in the ſummer time; or rather in the vallies, and ſpaces between the mountain tops. Some will have this to be the primary ſignification of the word *Alpes*, which is ſuppoſed by theſe authors literally to denote the ſtreights or appertures between hills.

ALRATICA, among the Arabian phyſicians, is where the vulva of a woman is imperforate, or at leaſt the foramen ſmaller than ordinary, whether naturally, or by accident. *Albucas*, Meth. Med. l. 2. c. 72. p. 119. *Caſt.* Lex. Med. p. 35. See the article ATRETI.

ALRAUPE, in ichthyology, a name given by the Germans, to the *Muſtela Fluviatilis*, or eelpout, a ſpecies of the *Gadus*. See the article GADUS, and MUSTELA.

ALRUKAK, in the materia medica, a word uſed by Aviſenna, and others of that nation, for what was called by the Greeks *Leptos Libanotis*, and *Manna Thuris*; this was the fragments of frankincenſe, which were broken off from the larger pieces in the collecting or packing up, and were moſt eſteemed in medicine, as being the drieſt and pureſt kind.

ALRUM, in the botanical writings of the antients, a name given to the tree which produces the Bdellium. This gum was originally known to be the exſudation of a tree growing in Arabia and the Eaſt-Indies, and well known to Aviſenna and others, and by all of them called by that name. There is however, a great deal of error and confuſion, about one of the ſynonymous names of the gum of this tree; this name is *Mokel* or *Molechil*; and the ſame name being alſo given to a fruit of the palm kind, produced by a tree according to all accounts as different from the Bdellium as one tree can be from another; this fruit has been ſuppoſed, to be produced on the ſame tree, and the interpreters of Aviſenna, obſerving that this author had every where diſtinguiſhed the fruit *Mokel*, and the gum *Mokel*, by calling the one *Mokel*

Meccenſe, and the other *Mokel Judaicum*, have indeed not made them the ſame thing; but they have told us, that the fruit *Mokel* is the nut of that tree, whoſe exſudation is the gum *Mokel*, or *Bdellium*.

The words of Aviſenna, which they have wreſted into this falſity, are, however, guiltleſs of it; what he ſays, when truly tranſlated, runs thus: the *Bdellium Judaicum* is of two kinds, the Selabic and the Arabian. Theſe are both called *Mokel*, and are both uſed in medicine; but the fruit *Mokel* is a very different thing, produced by a different tree, and called *Mokel Meccenſe*.

Serapio ſpeaks to the ſame purpoſe, and tells us, that though the tree which produced the *Mokel Judaicum* grew only in Arabia and the eaſt, the tree which produced the *Mokel Meccenſe* was common in Spain, and many other parts of Europe; that it was of the palm kind, and ſomewhat more tender than the other ſpecies, which are the natural produce of Europe, and never ripened its fruit in Spain, though about Mecca it produced them in great plenty.

The tranſlators of this author into Latin have rendered the word *Alrum*, by *arbor junci*, the ruſh tree: it does not appear what could have influenced them to do this, unleſs the miſtaking the word for *Aldis*, which, in that language, is ſometimes uſed to ſignify a ruſh; but Alpagus explains it better, and proves it, by many paſſages from the other Arabians, to be truly a palm tree.

ALSADAF, in the materia medica, a name given, by Aviſenna and Serapio, to the *unguis odoratus*, and alſo to the *murex*, or purple fiſh, of the ſhell of which it was ſuppoſed to be a part.

The word *Alſadaf* ſignifies properly, in Arabic, a ſhell in general; but it is applied peculiarly to the *purpura*, as the words *cochlea* and *conchylium* were among the Latins and Greeks, which properly ſignify all ſorts of ſhells, but are uſed for this particular kind by many authors.

ALSAHARATCIA, a name uſed in botany, by ſome, to ſignify the *parthenium*, or feverfew. *Ger.* Emac. Ind. 2.

ALSCNEFU, in botany, a name uſed, by ſome authors, for wormwood. *Ger.* Emac. Ind. 2.

ALSCHARCUR, in the materia medica, a name given, by Rhaſes and ſome other of the old writers, to the *ſkink*, a ſmall animal of the lizard kind, uſed in medicine as a cordial and provocative.

ALSEBON, a name given, by ſome of the chemical writers, to ſea ſalt.

ALSIMBEL, in the materia medica, a name given, by Aviſenna and others, to the ſpikenard of India. It is thus called from its having the appearance of a ſpike, or ear, and alſo *ſimbalath*, a word which ſignifies its being a congeries of many ſpikes, or ears, and ſuch is much of the *nardus indica*, or Indian ſpikenard, that we receive at this day; not that theſe ſpikes are at all of the nature of the ſpikes of corn, or any other flowers, or fruits of plants, but only the firſt ſhoots from the root of the plant, which are the moſt ſcented and fulleſt of virtue, and are of the ſhape of the ſpikes of other plants.

ALSINASTRUM, in botany, the name of a genus of plants, ſo called from their general reſemblance to the *alſines*, or chickweeds. The characters of the *Alſinaſtra* are theſe. The flower and fruit are the ſame with thoſe of the alſine; but the flower-cup in theſe is compoſed only of one leaf, whereas in thoſe it is made up of ſeveral.

The ſpecies of *Alſinaſtrum*, enumerated by Mr. Tournefort, are only two.

1. The *Alſinaſtrum* with leaves like the gratiola, or hedge-hyſſop. And, 2. The *Alſinaſtrum* with leaves like thoſe of ladies-bedſtraw. *Tourn.* Inſt. p. 244.

ALSINASTRUM, in botany, is alſo a name given, by Vaillant, genus of plants, compriſed, by Linnæus, in that of the *elatine*. *Vaillant*, Bot. Par. 1. fol. See ELATINE.

ALSINE, *chickweed*, in botany, the name of a very large genus of plants, the characters of which are theſe. The flower is of the roſaceous kind, and conſiſts of ſeveral petals, ſometimes whole, ſometimes bifid at the ends, diſpoſed in a circular form. The piſtil ariſes from the cup of the flower, and finally becomes an unicapſular membranaceous fruit, of a roundiſh, or conic figure, and containing many ſeeds affixed to a placenta.

The ſpecies of *Alſine*, or *chickweed*, enumerated by Mr. Tournefort, are theſe.

1. The tall *chickweed* of the woods, or large perennial *chickweed*. 2. The great nightſhade leaved *chickweed*. 3. The broad leaved mountain *chickweed*, with laciniated flowers. 4. The common *chickweed*. 5. The plantain leaved *chickweed*. 6. The St. John's-wort leaved *chickweed*. 7. The American *chickweed*, with leaves like thoſe of money-wort. 8. The perennial ſea *chickweed*, with money-wort leaves. 9. The Sicilian *chickweed*, with a ſpheroidal leaf. 10. The auricula leaved American *chickweed*. 11. The purſelain leaved ſea-ſhore *chickweed*. 12. The ſmooth ſpring *chickweed*, with white umbellated flowers. 13. The ſpring ſmooth, ſmaller *chickweed*. 14. The meadow *chickweed*, with graſſy leaves, and large flowers. 15. The meadow *chickweed*, with graſſy leaves, and ſmaller flowers. The four laſt are called *holoſtea*, and *ſtichworts*, by authors. 16. The long leaved marſh, or water *chickweed*. 17. The ſerpyllum leaved marſh *chickweed*. 18. The many ſtalked, and many flowered, ſerpyllum leaved alpine *chickweed*. 19. The common ſmall, many ſtalked *chickweed*. 20. The ſmooth Bononian *chickweed*. 21. The fine leaved *chickweed*. 22. The ruſhy leaved alpine *chickweed*. 23. The fine leaved moſſy *chickweed*. 24. The greater larch leaved ſtone *chickweed*, with larger flowers. 25. The ſmaller larch leaved ſtone *chickweed*, with ſmaller flowers. 26. The hair leaved, many flowered ſtone *chickweed*. 27. The leaſt hair leaved marſh *chickweed*. 28. The hairy alpine *chickweed*, with toad-flax leaves. 29. The hairy ſtalked alpine *chickweed*, with ſmooth toad-flax leaves. 30. The long rooted ſea *chickweed*, with rupture-wort leaves. 31. The graſſy leaved ſea *chickweed*. 32. The little graſſy *chickweed*, with four leaved flowers, called by authors graſſy ſaxifrage, and the moſſy mountain pink. 33. The ſmall annual graſſy *chickweed*, with four leaved flowers. 34. The fine leaved marſh *chickweed*, called by ſome marſh ſaxifrage. 35. The hairy fine leaved *chickweed*, with beautiful white flowers. 36. The fineſt leaved, beautiful flowered *chickweed*, or caryphylloide ſaxifrage, as ſome have called it. 37. The ſmall Portugal ſpring *chickweed*, with echinated heads. 38. The ſmalleſt *chickweed*, with quick fading flowers. 39. The hair leaved mountain *chickweed*. 40. The *chickweed* called the greater ſpurry. 41. The *chickweed* called the middle ſized ſpurry. 42. The *chickweed* called the leſſer ſpurry, with blueiſh flowers. 43. The *chickweed* called the ſmalleſt ſpurry, with marginated ſeeds. And, 44. The *chickweed*, called the ſmalleſt ſpurry, with naked ſeeds. *Tourn.* Inſt. p. 243.

There have been numerous other plants confounded by ſome writers, under the name *Alſine*; which ſee under the heads CUCUBALUS, VERONICA, ANDROSACE.

The *Alſine* is a medicinal plant, called alſo *morſus gallinæ*, popularly *chickweed*, on account of its being much coveted by poultry.

The word is Greek, αλσινη, formed of αλσος, a wood, or grove, on account of this plant's delighting chiefly to grow in ſhady places. *Dioſcor.* l. 4. c. 87.

There are divers plants under the denomination of *Alſine medica C. B.*

It is held a cooler, calmer, thickner, &c. in moſt reſpects reſembling pellitory of the wall; though now little uſed in medicine. New Diſpenſ. p. 48.

Some commend its diſtilled water againſt fervours of the blood, and conſumptions of the body, ariſing from hectics, &c [a]. The herb fried in linſeed oil, and externally applied to the belly, is ſaid to relieve the iliac pain [b].—[[a] *Zorn.* Botanolog. p. 51. [b] *Burggr.* Lex. Med. T. 1. p. 473. ſeq.]

Alſine is alſo called *myoſoton*, *q. d.* mouſe-ear, on account of the reſemblance its leaves bear to the ears of that animal. Vid. *Plin.* Nat. Hiſt. T. 2. l. 27. c. 4. p. 422.

ALSIRAT, in the Mahometan theology, a bridge laid over the middle of hell, finer than a hair, and ſharper than the edge of a ſword, over which people are to paſs, after their trial, on the day of judgment.

To add to the difficulty of the paſſage, Mahomet aſſures, that the *Alſirat*, narrow as it is, is beſet with briars and thorns; none of which, however, will be any impediment to the good, who ſhall fly over it like the wind; Mahomet and his muſſelmen lead the way; whereas the wicked, what with the narrowneſs of the path, the entangling of the thorns, and extinction of the light, which directed the former to paradiſe, will ſoon miſs their footing, and tumble headlong into hell, which is gaping beneath to receive them. Vid. *Sale*, Prelim. Diſc. to Koran, ſec. 4. p. 90.

ALTAR, (*Cycl.*) in antiquity, made the principal part of a temple [a]. Whence the antient magians [b], as well as the primitive Chriſtians, having no temples, are repreſented as without *Altars* [c].—[[a] Mem. de Trev. an. 1717. p. 1281. [b] V. Jour. des Scav. T. 78. p. 112. [c] *Minut. Felix*, p. 91. Mem. de Trev. 1718. p. 145. Jour. des Scav. T. 20. p. 56.] See TEMPLE, *Cycl.*

Altars were of divers kinds, with regard to their qualities, uſe, matter, form, accidents, and the like, and were ſacred to gods, heroes, virtues, vices, diſeaſes, &c. Thus we read of *inner Altar*, or that built under the roof or cover of ſome temple, or other building; *outer Altar*, that *ſub dio*, or under the open air; *golden Altar*, that which is covered or adorned with plates, &c. of gold; *brazen Altar*, one decorated, or plated over with braſs; *fixed*, or *ſtationary Altars*, thoſe built to remain conſtantly in the ſame place; *portable Altars*, thoſe contrived to be moved, or carried from place to place; *ſimple Altars*, thoſe without ornament or decoration; *magnificent Altars*, thoſe variouſly inriched with metals, precious ſtones, painting, ſculpture, &c. *ſtony Altars*, are thoſe made either of ſimple ſtones, or heaps of ſtones, or of maſſives bound by maſonry; *earthy*, or *turfy Altars*, thoſe thrown up only of earth, or turf accumulated; *extemporaneous Altars*, thoſe made in haſte, on ſome emergent occaſion; *ſacrificing Altars*, thoſe ſerving to hold victims, and offerings preſented to ſome deity; *memorial Altars*, thoſe erected

erected to perpetuate the memory of ſome bleſſing, or other extraordinary event which happened in the place; *anointed*, or *conſecrated Altars*, thoſe ſet apart or devoted to the Deity, by a regular form or ceremony, whereof unction made the chief part; *votive Altars*, thoſe vowed to ſome deity, in conſideration of ſome benefit received; *private*, or *domeſtic Altars*, thoſe erected by private perſons, in or about their own houſes, for family purpoſes; *public Altars*, thoſe conſecrated for the public uſe, in a ſolemn manner; *funeral Altars*, thoſe erected at the tombs of perſons defunct, inſcribed to their manes; *euchariſtic Altars*, thoſe whereon the communion, or Chriſtian ſacrifice is offered; *low Altars*, thoſe flat on the ground, or at moſt raiſed but little above the ſurface of it; *high Altars*, thoſe elevated a conſiderable height above the ground; *ſubterraneous Altars*, thoſe let down ſome depth under ground; *proper Altars*, whoſe which anſwer the characters and uſe ſpecified in the definition; *improper*, or *figurative Altars*, thoſe which only bear the denomination, by way of reſemblance or analogy, *e. gr.* the aſtronomical and poetical *Altars*; *idolatrous Altars*, thoſe erected to ſome idol, or falſe god; *principal Altar*, the chief *Altar* of a place where there are ſeveral; *horny Altars*, thoſe formed only of horns; *aſhen*, or *cineritious*, thoſe of aſhes; *wooden*, thoſe of timber; *bloody*, thoſe whereon animals are offered; *unbloody*, thoſe whereon plants, fruits, ſpices, or the like, are offered.

Altars are doubtleſs as antient as ſacrifices themſelves; conſequently their origin is not much later than that of the world. Gen. *c.* iv.

Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood [d]. Some carry them as far back as Adam, whoſe *Altar* is much ſpoken of by Jewiſh, and even Chriſtian writers [e].—Others are contented to make the patriarch Enoch the firſt who conſecrated a public *Altar* [f]. Be this as it will, the earlieſt *Altars* we find any expreſs teſtimony of, are thoſe erected by Abraham [g].—[[d] *Rhodig.* Lect. Ant. l. 18. c. 37. [e] *Fabric.* Cod. Pſeudepig. Vet. Teſt. T. 1. p. 89. [f] Gen. *c.* iv. *v.* 26. [g] Hiſt. Acad. Inſcrip. T. 3. p. 20.]

ALTAR *of Adam*, in antiquity, is pretended, by ſome Rabbins, and others, to have been erected by the firſt man, ſoon after the fall; when being overwhelmed with ſorrow, a promiſe was made him, by the miniſtry of the angel Haziel, that a redeemer ſhould be ſent. In gratitude for this news, and for a perpetual remembrance thereof, Adam is ſaid to have built an *Altar*, and ſacrificed on it a heifer.

The reliques of this *Altar* have been mentioned by ſeveral writers of late ages. It is pretended, that the *Altar* whereon Abraham ſacrificed on mount Moriah, was only a reparation of the *Altar* of Adam. It is added, that Cain and Abel offered ſacrifice on the ſame; that Noah, after the flood, repaired it, &c. Vid. *Hilſcher.* de Adam Relig. ap. *Fabric.* Cod. Pſeudepig. Vet. Teſt. T. 1. p. 89.

ALTAR-*thane*, in our antient law books, denotes a prieſt, or parſon of a pariſh. *Johnſ.* Eccleſ. Law, T. 1.

In this ſenſe, the word is ſynonymous with *church-thane*.

ALTARIST, *Altariſta*, properly denotes the vicar of a church, who ſerves the altar, and to whom the altarage, or produce of the altar, is aſſigned for his maintenance. *Du Cange*, Gloſſ. Lat. T. 1. p. 154.

The *Altariſt* is ſometimes alſo called *Altararius*, ſometimes *altar-prieſt*.

ALTARIST is alſo uſed for chaplain. *Du Cange*, loc. cit.

ALTASRIF, in literary hiſtory, the title of a medicinal book, written in Arabic, deſcribing the method of practice in uſe among the Arabs.

It was written by Alſaharavius, an author in the fifteenth century, and tranſlated into Latin by P. Ricius, in 1519. It conſiſts of thirty-two treatiſes. Its chief excellency is ſuppoſed to lye in the diagnoſtic part, and the deſcriptions of the ſymptoms of the diſeaſes. The book is indeed methodical, and doubtleſs deſerves a good character; but the greateſt part of it ſeems to be tranſcribed from Rhazes. Concerning the hiſtory and contents of the *Al-Taſrif*, ſee *Friend*, Hiſt. Phyſ. P. 2. p. 124. ſeq.

ALTAVELA, in zoology, the name of a flat cartilagineous fiſh, of the *aquila marina* kind; but with its wings, as they are called, that is, its thin and flat ſides, broad and obtuſe toward their lower part. The fiſhermen, from the reſemblance theſe flat ſides have to wings, have an opinion that this fiſh can fly. The tail is very ſhort, ſcarce being of half the length of the body. Its fleſh is ſolid, and well taſted, and it always ſells well in the markets. It is caught in the Mediterranean, and is frequently brought to market at Rome. *Fab. Columna*, p. 43.

ALTE *& baſsè*, in middle age writers, denotes ſovereignty, or a thing done with the ſupreme power. *Du Cange*, in voc.

ALTERANT (*Cycl.*)—The term *Alterant* is uſed for ſuch remedies as correct the morbid or diſorderly qualities of the animal fluids, without any particular, ſenſible evacuation.

Theſe are otherwiſe called *Alteratives*.

Alterants, in this ſenſe, make one of the capital ſpecies, or diviſions of medicines. They ſtand oppoſed to evacuants; and are alſo contradiſtinguiſhed from ſtrengtheners, &c.

Alterants are ſuppoſed to exert their power chiefly on the humours of the body; ſweetening the ſour, ſoftening the acid, abating their heat, or tempering their too great coldneſs, and the like. *Zwing.* Specim. Med. c. 1. §. 18.

Some define *Alterants* to be remedies which correct the pravity of the juices, whether acid or bilious, reſtoring to their natural ſtate the bitter, ſaline, ſweet, and acid, which Hippocrates, and other phyſicians, diſcover in the human body. Medic. Euporiſt. c. 4. Jour. des Scav. T. 5. p. 47.

When the blood is in its due temperature, it is ſaid to be of a ſweet taſte; if the bile prevail a little too much in it, it becomes ſaline; if this bile be increaſed, it turns acrid, &c.

Some object to the jeſuits-bark, that it only acts as an *Alterant*, without producing any ſenſible evacuation, and that of conſequence it leaves the cauſe of the diſtemper ſtill in the body, by which means many of thoſe, who have been cured by it, afterwards relapſe. Jour. des Scav. T. 54. p. 178.

We meet with medicines of the purgative kind, repreſented by practical writers as *Alterants*; the colocynth particularly by Helmont: for all medicines which operate in the fartheſt paſſages, they frequently include under that appellation. Phil. Tranſ. N°. 365. p. 75.

Accordingly, 'tis found of ſervice to give ſuch medicines as are properly cathartic, by way of *Alteratives*, in ſtubborn, chronical caſes; thus, *tinctura ſacra*, for inſtance, given in the quantity of half a ſpoonful for a doſe, has no immediate effect upon the inteſtines, ſo as to diſcharge their contents, but paſſes into the further ſtages of circulation. *Quinc.* Lex. Med. p. 17.

Dr. Woodward enquires into the efficacy of ſeveral of the moſt celebrated *Alterants*, and endeavours to ſhew on what little foundation their great uſe is eſtabliſhed. Of this number, according to him, are the abſorbents, cortex peruvianus, bitters, ſalts, ſteel and its preparations, mineral waters, &c. *Woodw.* State of Phyſ. Jour. des Scav. T. 70. p. 64.

The more efficacious and uſeful *Alterants*, according to the ſame writer, are cordials, ſtomachics, attenuants, mercurius dulcis, vegetable oils, mucilages, certain abſorbents, and ſome preparations of opium.

According to this learned phyſician, all that is commonly alledged concerning the change of the principles, or ferments of diſeaſes, by *alterant* remedies, is merely chimerical and imaginary, that there is no change made to the advantage of the human body, without a ſucceſſive renovation, and diſcharge of what is hurtful, and a ſupply of its place by ſomething innocent. *Woodw.* State of Phyſ. P. 1. Mem. de Trev. 1723. p. 796. Jour. des Scav. T. 69. p. 596.

The primitive or conſtituent elements of bodies never change their figure, magnitude, ſolidity, or gravity, but remain ſtill the ſame as at the creation. Hence ſome infer, 1. The vanity of all pretences to the tranſmutation of metals. And, 2. The folly of pretending to change the maſs of blood, by thoſe remedies called *Alterants*. *Woodw.* Idea of Natur. of Man, p. 8. Mem. de Trev. 1725. p. 986.

The mixtures and combinations of the primitive elements are almoſt infinite, and their alterations as to ſenſe and external appearance is ſo too. It may be added, that among *alterant* medicines, there are ſeveral which change the ſcene of the ſymptoms; others ſuſpend the action of the morbific matter for a time; and others diminiſh the ſenſibility of the organs. But theſe remedies, which hold the morbific principles captive for a time, are only palliatives, and even, on ſome accounts, dangerous, ſince they may as well captivate other principles neceſſary to life. Woodward gives the preference to evacuants, as being the only medicines capable of freeing the machine from what incommodes it. *Woodw.* loc. cit.

Some take a contrary courſe, and aſcribe even the ſalutary effects of evacuants to their alterative nature. This has been alledged of mercury in the venereal diſeaſe; the like is urged concerning minoratives, which ſome maintain do not work a cure by evacuation, ſo much as by alteration. The like is alledged of ipecacuanha in the cure of the dyſenteries, and in divers other emetics, in caſes of apoplexies. In effect, evacuating medicines, as they do not ſeparate the good from the bad, ſeem indifferently diſpoſed, either to do harm or good. *Stahl*, Negot. Otioſ. pr. 3. Jour. des Scav. T. 69. p. 90. ſeq.

Alterants are divided, by ſome, into abſorbents, calmers, incidents or attenuants, emollients, and demulcents [a]. Others divide them into *odorata*, or things which yield a quick ſcent, and *inodorata*, things which have little or no ſcent. The firſt of theſe likewiſe may be further divided into *dulcia*, *acriora*, and *fœtida*, and the latter into *emollientia*, *agglutinantia*, *aſtringentia*, and *abſorbentia* [b]. —[[a] *Hoffm.* Med. Ration. T. 3. ſec. 2. c. 4. Act. Erud. Lipſ. 1728. p. 374. [b] *Quinc.* Prælect. Pharm. 1. p. 2.]

A ſafe and powerful *Alterant* is readily and eaſily prepared in the following manner. Take an ounce of purified nitre, and two ſcruples of cochineal, in fine powder; boil theſe in five or ſix ounces of water; filter the liquor, and afterwards evaporate it to a dryneſs, keeping it continually ſtiring as it thickens, and a fine purple powder will be thus produced, very fit to be given in the form of bolus, pills, powder, &c. *Shaw*'s Lectures, p. 229.

Dr. Shaw on this occaſion obſerves, that if the medicinal virtues of nitre, were to be enumerated, as they ſtand confirmed by ſufficient experience, perhaps they would prove more numerous than thoſe of any one known medicine beſides. It is ſerviceable in the ſtone and ſtoppages of urine, in deliriums, malignant fevers, diarrhæas, the ſmall pox of the confluent kind, &c. ſo as to prove almoſt a general remedy. And all theſe excellent qualities are in this ſalt, joined to that deſirable property of being innocent, or ſcarce any way prejudicial to the body.

Plummer's æthiops is another powerful *Alterant*. See PLUMMER's *Æthiops*.

ALTERATION (*Cycl.*) is uſed in medicine to denote a change in the ſtate and qualities of an animal body, in reſpect of temperature or conſtitution, health or ſickneſs.

In this ſenſe, *Alteration* includes both evacuation and accretion. *Linden*, Sol. Med. Ex. 13. §. 335. ſeq.

ALTERATION is more ſtrictly taken for a change in the quality of the body, contradiſtinguiſhed from evacuation and appoſition.

In which ſenſe, *Alteration* is the effect of medicines called *Alterants*. See the article ALTERANT.

Alteration is one of the two great branches, or operations of phyſic, whereby chiefly the humours, when in a ſtate of diſorder, and threatening danger to the body, are prepared, changed or corrected in various manners, to the end that they may be more commodiouſly and ſafely evacuated afterwards. *Junck*. Conſp. Therap. Tab. 12. p. 348.

Alteration is chiefly applied in reſpect of the fluids, or humours of the body. When applied to the ſolids, it is chiefly in reſpect of the humours, or the motions thereof.

Alteration is ſometimes alſo applied in reſpect of the vital motions of the body.

Thus ſpecifics are applied to alter and rectify convulſive and other diſorderly motions. The *Alteration* of the humours is either extrinſic, or intrinſic.

Extrinſic ALTERATION is a change produced in the ſenſible appearances, as colour, thickneſs, and the like.

Intrinſic ALTERATION is a change in the primitive craſis, or conſtitution of a fluid. *Junck*. loc. cit.

ALTERATION, in a ſenſe ſtill more ſtrict, denotes that converſion which the food undergoes, to render it nouriſhment.

In this ſenſe *Alteration* both includes the digeſtion [a] performed in the ſtomach, and the aſſimilation in the habit of the body [b]. —[a *Gal.* de Sympt. Cauſ. l. 3. c. 2. b Id. de Compoſ. Med. l. 8. c. 6.]

It is diſputed among phyſicians what the *Alteration* is, which the food undergoes.—Some reduce it to a mere comminution or trituration.—Others aſſert a total tranſubſtantiation. Mem. de Trev. 1714. p. 2007. See DIGESTION, *Cycl.* and *Suppl.*

ALTERATION, in alchemy, denotes the converſion of one body into another by ſimilitude. V. *Caſt*. Lex. Med. in voc. *Alteratio*.

Coſmographers ſpeak of *Alterations* on the face of the earth [c], *Alterations* in reſpect of land and water [d], *Alterations* on the face of countries [e]. Aſtronomers [f] mention *Alterations* in the heavens, the ſtars, &c. [g]. Naturaliſts tell us of *Alterations* in the viſcera of the earth. Some have ſuggeſted *Alterations* of the meridian, of the earth's center [h] of gravity, the place of the poles in the heavens, the axis of rotation [i].—[c *Woodw.* Nat. Hiſt. Earth. p. 36, and 248. d *Rowl.* Mon. Ant. p. 5. 8, &c. *Hook*, Poſth. Works, p. 312. e Jour. des Scav. T. 68. p. 488. f *Niewent.* Relig. Philoſ. p. 435. *Keckerm.* Syſt. Mathem. p. 201. g *Kirch.* Mund. Subterr. l. 8. Sec. 1. c. 5. p. 9. *Hook*, loc. cit. p. 346. h *Hook*, loc. cit. p. 345, 540. i Id. ibid. p. 322, 345, 349, 353, 357, 359, 551.]

Concerning the *Alterations* of bodies by chemical Analys. See Mem. Acad. Scienc. An. 1718. p. 262. Hiſt. Ejuſd. An. 1721. p. 428. by mixture, Mem. Ejuſd. An. 1718. p. 262. Of colours of hair, feathers, &c. *Bac.* Nat. Hiſt. Cent. 1. n. 93. Opp. T. 3. p. 24. ſeq. Of the colours of Fluids, Eſſ. Acad. Ciment. p. 138. Obſerv. Halenſ. T. 11. p. 29. Jour. des Scav. T. 76. p. 6. Of Diſeaſes, Medul. Medic. p. 29. 56. ſeq.

ALTERATION *of Quantities*, among algebraiſts, denote what we otherwiſe call variations, or permutations. *Jones*, Synopſ. p. 216.

ALTERATIVE, in medicine, the ſame with *Alterant*. See ALTERANT, *Cycl.* and *Suppl.*

ALTERCUM, in botany, a name by which ſome of the old authors expreſs the *Hyoſcyamus*, or henbane. See HYOSCYAMUS. *Ger.* Emac. Ind. 2.

ALTERITY is uſed by ſome philoſophers for diverſity. *Stanl.* Hiſt. Philoſ. p. 828. See DIVERSITY, *Cycl.*

The word is formed of the Latin *Alter*, another.

Alterity amounts to the ſame with what others call *Aliety*, *Alietas*. *Scherz.* Man. p. 14.

ALTERNATE, or ALTERNATIVE (*Cycl.*)—ALTERNATIVE *Promiſe*, is where two or more are engaged to do a thing under a diſjunction, ſo that both are under obligation, though if either of them diſcharge it, both are acquitted. *Calv.* Lex. Jur. p. 62.

This is otherwiſe called a diſjunctive promiſe.

An *Alternative*, or diſjunctive propoſition is true, if one ſide or part of it be true.

ALTERNATION, (*Cycl.*) in its primary ſenſe, denotes a ſucceſſion by turns. *Feſt.* de Verb. Signif. p. 10.

ALTERNATION is more particularly uſed among civilians for diſjunction, as in ſaying this or that. *Briſſ.* de Verb. Signif. p. 41. *Calv.* lib. cit. p. 62.

ALTERNATIVE. See ALTERNATE.

ALTHÆA, *Marſh-mallow*, in botany. See MARSH-MALLOW.

ALTINCAR, among mineraliſts, a ſpecies of factitious ſalt uſed in the fuſion and purification of metals. *Caſt.* in voc.

The *Altincar* is a ſort of flux powder. Divers ways of preparing it are given by Libavius. *Synt.* Arcan. Chym. l. 8. c. 38.

ALTITH, in botany, a name given by ſome authors to the plant of which the *Aſſafætida* of the ſhops is the gum. *Bont.* p. 41.

ALTITUDE (*Cycl.*)—*Determinative* ALTITUDE, *Altitudo Determinatrix*, is uſed by ſome writers for the height from whence a falling body by its natural acceleration acquired a certain velocity. *Herman*, Phoron. l. 1. p. 92.

Circles of ALTITUDE are uſually known by the name of *Almucantars*. See ALMUCANTAR, *Cycl.*

Some have ſuſpected a variation in the apparent ſolſtitial *Altitudes* of the ſun. Something of this kind was perceived by M. Caſſini in 1655. by means of the great gnomon in the church of St. Petronius at Bologna; which was further confirmed by other obſervations at the royal obſervatory at Paris. The variation obſerved by M. Caſſini during the courſe of twenty two years, only amounted to a few ſeconds. And by comparing the obſervation made by Phytheas at Marſeilles three hundred years before Chriſt, with another made by Caſſini in 1672 at the ſame place, it appears that in two thouſand years time, this difference of *Altitude* has only amounted to a few minutes. V. Mem. Acad. Scienc. 1693. p. 180. ſeq. See ECLIPTIC.

The *Altitude* of the ſun, it is ſaid, may be found to a few ſeconds, with an inſtrument of three foot radius. But this is rarely found in fact [a]. A French engineer, M. Hautefeuille has propoſed a new inſtrument, whereby he pretends to take *Altitudes* even to thirds [b].—[a Jour. des Scav. T. 32. p. 33. ſeq. b Mem de Trev. 1704. p. 440.]

To find the ſun's *Altitude* by the globe. See GLOBE, *Cycl.*

ALTITUDE *of a Star*, or other point, is properly an arch of a vertical circle, intercepted between the aſſigned point and the horizon [a]. Or it is the arch of a circle, perpendicular to the horizon, in whoſe center the ſpectator is, terminated by the horizon and the ſtar [b].—[a *Wolf.* Elem. Aſtron. §. 86. b *Graveſende*, Mathem. Elem. T. 2. n. 1105.] See VERTICAL, *Cycl.*

An irregularity has been obſerved in the apparent *Altitudes* of the ſtars near the Meridian. On ſome occaſions, when they are mounting towards the meridian, they appear to fall, and after paſſing the meridian, to riſe. Hiſt. Acad. Scienc. 1719. p. 75. ſeq. See MERIDIAN, *Cycl.*

Mariners can rarely take *Altitudes* of the ſtars to leſs than five, ſix, or ſeven minutes. And as there is no fixed meridian aboard of a ſhip, as at land, the continual motion of the veſſel, will be perpetually changing the ſtars *Altitude*; beſides, that their inſtruments are commonly coarſely made; an error of ſix minutes, will make an error of a tenth part of a degree, *viz.* two leagues or upwards, in taking a latitude. Hiſt. Acad. Scienc. 1722. p. 145. See LATITUDE, *Cycl.*

The difference of *Altitude* of a ſtar, according as the obſerver is ſuppoſed in the center, or on the ſurface of the earth, makes what we call the parallax of the ſtars. *Graveſend.* lib. cit. n. 1106. See PARALLAX, *Cycl.*

M. Parent has given a new method of taking *Altitudes* at ſea, with a common watch. As the celeſtial tables give us the right aſcenſions, and declinations of all the fixed ſtars, we have only to obſerve the difference of time between the riſing of two ſtars, and in this difference ſeparating that which ariſes from their different poſition from that which ariſes from the obliquity of the ſphere, which laſt will be the *Altitude* of the pole of the place of obſervation.

As we cannot have too many ways of finding the poles *Altitude* at ſea, this method may be ſure, ſince here no other obſervation is required, but that of the riſings of two ſtars, the difference of time between theſe is ſufficiently given by a watch, without being any of the beſt, ſince it can hardly err much in the three or four hours between the riſings of the two ſtars. One difficulty ſeems to occur, viz. that the ſhip is not fixed, but will have changed its place between the two obſervations. To which it is anſwered, that the little way a ſhip has made, either in longitude or latitude, between two obſervations, which will uſually be at no great diſtance from each other, may be ſafely neglected. At the worſt, if the ſhip has made any conſiderable way, it need only be eſtimated in the uſual manner of reckoning. Vid. Hiſt. Acad. Scienc. an. 1703. p. 107. ſeq.

The *Altitude* of the equator above the horizon is ſometimes alſo called its *elevation*. Mem. Acad. Scienc. 1714. p. 87. *Wolf.* Elem. Aſtron. p. 397. ſeq. See ELEVATION, *Cycl.*

ALTITUDE *of the tropics* amounts to the ſame with what is otherwiſe called the *ſolſtitial Altitude* of the ſun. Mem. Acad. Scienc. 1714. p. 89.

ALTITUDE *of the horizon*, or of ſtars ſeen therein, is variable by the refraction, according to the quantity of which the horizon is either elevated or depreſſed more or leſs. Hiſt. Acad. Scienc. 1700. p. 128. It. 1707. p. 111.

ALTITUDE *of the moon's atmoſphere* is thought, by ſome, to be much greater than that of the earth; the former being not leſs than ſixty-four French leagues. But the exiſtence of this atmoſphere is ſtill in diſpute. Hiſt. Acad. Scienc. 1715. p. 68.

M. de la Hire propoſed a method of diſcovering the *Altitude* of the atmoſphere, the hint of which was firſt given by Kepler, viz. by the magnitude of the arch whereby the ſun is ſunk below the horizon, when the crepuſculum begins or ends. V. Hiſt. Acad. Scienc. 1713. p. 8. ſeq.

ALTITUDE *of the Aurora Borealis* in 1719, has been much conteſted, viz. whether it were above the atmoſphere, or within the limits of it: the former opinion being defended by Dr. Halley, the latter by Mr. Whiſton. The name meteor, which is given it, ſeems to favour the latter.—Beſides, it appears not by any obſervation to have been above thirty-eight miles high. V. Phil. Tranſ. N°. 360. Bibl. Angl. T. 6. p. 443. ſeq.

ALTITUDE, in ſpeaking of fluids, is more frequently expreſſed by the term depth.

ALTITUDE *of the ſea's ſurface* is not every where the ſame, as appears from the drift or currents ſetting ſtrong out of one ſea into another. Works of Learn. T. 4. p. 333. See CURRENT, SEA, &c. *Cycl.* and *Suppl.*

ALTITUDE *of the mercury*, in the barometer, is marked by degrees placed on the face of that Inſtrument, the variations of which are the chief object of barometrical obſervations. See BAROMETER, *Cycl.*

The mean *Altitude* of the mercury at London is about 29 inches.—The extreme *Altitudes* are 27 ½ inches and 31 ½ inches. Some ſuggeſtions have been made, as if the *Altitude* of the mercury were regularly greater in the morning than in the evening; at leaſt ſomething of this kind was obſerved to hold for a conſiderable time at Berlin. Hiſt. Crit. Rep. Let. T. 14. p. 239.

ALTITUDE *of the pyramids in Egypt* was meaſured ſo long ago as Thales, by means of their ſhadow, which makes one of the firſt geometrical obſervations we have any exact account of. Plutarch has given an account of the manner of this operation, which, according to this author, was done by erecting a ſtaff perpendicular upon the end of the ſhadow of the pyramid, and by two triangles made by the beams of the ſun, he demonſtrated, that what proportion there was between the ſhadows, the ſame was betwixt the pyramid and the ſtaff. *Stanl.* Hiſt. Philoſ. P. 1. p. 9.

ALTITUDE *of mountains* may be found divers ways, beſide thoſe already mentioned in the *Cyclopædia*, for acceſſible and inacceſſible heights; viz. by the plain table, theodolite, ſemicircle, barometer, &c. Mathematicians have even found out ways for meaſuring the mountains of the moon, as well as thoſe of the earth [a]. Various obſervations have been made of the height of the French and Swiſs mountains above the level of the ſea [b]. The *Altitude* of the higheſt mountain in France riſes only to 1660 toiſes. Mount Olympus, as meaſured by the antients, was found ten ſtadia, or furlongs [c]. But theſe are ſmall *Altitudes*, in compariſon of that of the Cordelleras in Peru.—[[a] Jour. des Scav. T. 70. p. 352. [b] Miſc. Lipſ. T. 8. p. 141. Mem. de Trev. 1713. p. 1258. & 1468. It. 1715. p. 1345. It. 1712. p. 875. Hiſt. Acad. Scienc. 1708. p. 32. It. 1712. p. 67. [c] Works of Learn. T. 7. p. 663.] See MOUNTAIN.

The barometrical method of meaſuring the *Altitude* of mountains is but of late invention. It is found very commodious in practice, being done with a ſmall apparatus, but is liable to great errors and irregularities, for which, however, certain corrections have been contrived. To conceive the principles of this method, it is to be obſerved, that the ordinary or mean *Altitude* of the barometer by the ſea-ſide is ſuppoſed to be 28 Paris inches, which are here equivalent to the weight of the whole incumbent atmoſphere. If the barometer be carried up higher, the mercury falls, as having a leſs depth of air to ſuſtain it. The proportion of this fall is commonly ſuppoſed a line for every 60 feet of air above the level of the ſea. As the barometer varies according to the divers alterations of the air, eſpecially as the weather is found fair, rainy, windy, or calm, it is evident the obſervations which are to determine the quantity, which the mercury falls for a given *Altitude* of place, ought to be made in the ſame weather, that the alterations thereof may have no ſhare in the event of the experiment.

If the *Altitude* of 60 feet always anſwered to a line of mercury, it would be eaſy to meaſure the height of a mountain above the level of the ſea. All here neceſſary would be, to find at what height the mercury ſtands near the ſea-ſide, and how much it falls at the ſame time, or under the ſame diſpoſition of the air, when carried to the top of a mountain.

But as the air is always more rare in proportion as it is further from the ſurface of the earth, that column of air, which, taken from the level of the ſea, will ſuſtain a line of mercury, is denſer, and conſequently ſhorter than a higher column which will ſuſtain another line; and ſo on, according to a certain progreſſion not hitherto well aſcertained.

Meſſieurs Caſſini and Maraldi, in continuing the meridian, made ſeveral experiments and obſervations of the barometer, at different *Altitudes*, which being compared with the geometrical meaſures of the ſame, and with the barometrical obſervations made at the obſervatory at Paris, which is known to be 46 fathom above the ſurface of the ocean, they have hence ventured to fix the progreſſion wherein the ſeveral columns of air anſwering to a line of mercury, grew higher and higher, to be ſuch as that, ſuppoſing the firſt column to be 61 feet high, the ſecond will be 62 feet, the third 63 feet, and ſo on, at leaſt for the height of half a league; for their obſervations had not been made on any mountains at a greater height than this. By ſuppoſing this progreſſion, they always found, by the fall of the mercury on a mountain, the mountain's height to be the ſame as they had found by geometrical menſuration, at leaſt within the difference of a few fathoms.

By ſuppoſing this progreſſion, therefore, it will be eaſy, by carrying a barometer to the top of a mountain, to find how much that mountain is above the ſurface of the ſea, provided it may be known at what height the mercury ſtood at the ſame time near the edge of the ſea, or in a place whoſe height above the ſea is known.

This method will even ſucceed ordinarily, though the mountain be at a very great diſtance from the ſea, unleſs it be apprehended, that at two places very remote the different *Altitudes* of the mercury may ariſe, in ſome meaſure, from the different ſtates of the air, as well as from its different *Altitudes*. Hiſt. Acad. Scienc. 1703. p. 13. ſeq. Mem. ejuſd. p. 274.

Suppoſing the progreſſion above-mentioned to obtain throughout the whole atmoſphere, it would be eaſy to find the *Altitude* of it, ſince the 28 inches of mercury, which are equivalent to the weight of the whole atmoſphere, producing 336 lines, we have hereby an arithmetical progreſſion, conſiſting of 336 terms, the difference whereof is one, and the firſt term 61, which will eaſily give us the ſum of the whole, viz. 6½ leagues for the *Altitude* of the whole atmoſphere. *Fonten.* Hiſt. Acad. Scienc. 1703. p. 16.

The defects of this method are, that we are obliged to ſuppoſe the barometer to vary at the ſame time, and in the ſame manner, in places at a conſiderable diſtance, which will not always hold true, beſides the uncertainty of the ratio of the dilatation of the air at different *Altitudes* of the atmoſphere. Id. ib. 1708.

The firſt experiment of this kind was made in France in 1648, by M. Perier, on the high mountain Puy de Dome in Auvergne. Others were afterwards made in 1666, by Sinclair, in Scotland; others by the undertakers of the great meridian line drawn through France. M. Mariotte, from theſe obſervations, drew rules for the conſtruction of tables, to ſhew the different *Altitudes* of places from the different *Altitudes* of the mercury, and the *Altitude* of air anſwering to each line of mercury in the barometer, from 28 inches, at which the mercury was ſuppoſed, at a medium, to ſtand near the ſea-ſide. Dr. Halley, in 1686, made another calculation, partly from the ſame principles with thoſe of Mariotte, and partly from the proportion of the ſpecific gravities of mercury to air, which he found to be 10800 to one. On which footing, a cylinder of air of 10800 inches will be equal to one inch of mercury. Agreeable to this, the ſame author calculated two tables, one to ſhew the *Altitudes* of air correſponding to the obſerved *Altitudes* of mercury, the other the *Altitudes* of mercury, correſponding to given *Altitudes* of the air. In 1703, M. Caſſini, the younger, comparing ſeveral obſervations which had been made in the ſouthern parts of France, in the proſecution of the new meridian, with Mariotte's rules, found a diſagreement between them; the *Altitudes* of the mountains meaſured generally ſurpaſſing thoſe which were given by the rules. On this he calculated new tables, wherein the reſults were conſiderably greater than according to the rules of Mariotte. In 1709, Dr. Scheuchzer made new experiments on the mountains of the Alps, by which he found 71, or, in other caſes, 69 Paris feet of air equal to one line of mercury. On the whole, according to this author, the tables made by the rules of Mariotte were found preferable, as coming much nearer to the truth than thoſe of Caſſini. Yet father Lavat, by other obſervations made on the mountains of St. Baume in 1708, found Caſſini's tables to hold with great exactneſs, beyond what could have been had from the rules of Mariotte. The brother of Dr. Scheuchzer, however, thought it neceſſary to calculate a new table, from the experiment at Pfeffers, which was made under ſuch circumſtances as ſeemed to render it, in ſome meaſure, a deciſive one. V. Phil. Tranſ. N°. 405. p. 542. ſeq. Mem. Acad. Scienc. 1705. p. 61. Ejuſd. Hiſt. 1708. p. 33. ſeq. See alſo Act. Phyſ. Med. Acad. N. C. T. 2. App. p. 52.

Several authors have written expreſs on the ſubject of *Altitudes*; Bouger [d], on the taking *Altitudes* at ſea; de Louville [e], on the ſolſtitial *Altitude* of the ſun; de la Hire [f], on the *Altitude* of the atmoſphere; Halley [g], Scheuchzer [h], de Lavat [i], and the academiſts of Paris [k], on the method of finding *Altitudes*

tudes by the barometer.—[[d] De la Meth. d'obſerver exactement ſur Mer la Hauteur des Aſtres, Paris 1729. 4to. Jour. des Scav. T. 90. p. 287. [k] Obſerv. de la Hauteur de diverſes Montagnes d'Auvergne, &c. in Suite des Mem. de l'Acad. de Scienc. 1718. P. 1. c. 10. p. 135.] See MOUNTAIN and ATMOSPHERE.

ALTITUDE, in aſtrology, denotes the ſecond of the five eſſential dignities, which the planets acquire in virtue of the ſigns they are found in. *Vital.* Lex. Math. p. 29.

In this ſenſe, *Altitude* is otherwiſe called *Exaltation.*

ALTOLIZOIM, among ſome chemiſts, denotes the *lutum Paracelſi*, well beaten, calcined, and boiled to the form of an oil, called alſo *fel terræ*; becauſe it is a bitter ſalt. *Helm.* de Lithias. c. 7. p. 22. *Caſt.* Lex. Med. in voc.

ALTUMAL, a term uſed to denote the mercantile ſtyle, or dialect.

In this ſenſe, we meet with *Altumal cant*, to denote the language of petty traders and tars. Medl. n. 18. p. 186.

ALVAH, the wood wherewith Moſes ſweetened the waters of Marah. Exod. *c.* xv. *v.* 25.

The name of this wood is not found in ſcripture, but the Mahometans give it that of *Alvah*, and pretend to trace its hiſtory from the patriarchs before the flood [a]. Joſephus, on the contrary, ſays, that Moſes uſed the wood, which he found next lying before him [b].—[[a] *Du Herbel.* Bibl. Orient. p. 105. & 1022. [b] *Calm.* Dict. Bibl. in voc.]

ALVARID, among the Spaniſh Moors, denoted a judge. *Du Cange*, Gloſſ. Lat. in voc.

The word is alſo written *Alvarilus*.—In this ſenſe, *Alvaridus* amounts to much the ſame with what is otherwiſe called *Alcaid.* See ALCAID.

ALVARISTS, in church hiſtory, a ſect or branch of modern Thomiſts, denominated from Alvares, whoſe method and principles they follow.

The *Alvariſts* differ from the antient Thomiſts, in that the former are aſſertors of ſufficient grace, the latter of efficacious grace. The former come near to the Jeſuits, the latter to the Janſeniſts. V. Mem. de Trev. 1725. p. 1251.

ALUCO, in zoology, the name by which authors have called the common white owl, or, as we commonly call it, the barn owl, or church owl. *Ray's* Ornithol. p. 67. See OWL.

ALUDEL, in chemiſtry, a name given to a particular kind of furnace, with two, or even four, copels of glaſs, or earthen ware. *Caſtel.* Lex. Med. in voc. See the table of chemical veſſels, &c. N°. 20.

ALVEARIUM (*Cycl.*) properly ſignifies a bee-hive.

The word is Latin, formed of *Alveus*, a channel, or cavity; in alluſion to the *alveoli*, or cells, in bee-hives.

Some of the antients alſo uſe the word *Alvearium* for a bee-houſe, more uſually called among us, *apiary.*

ALVEARIUM is ſometimes alſo uſed figuratively, to denote a collection.

In which ſenſe, *Alvearium* amounts to much the ſame with what we otherwiſe call *theſaurus*, *cornucopia*, or the like.

Vinc. Boreus has publiſhed an *Alvearium* of law. Alvearium Juris Mellifluum, Lugd. 4to. 1650. *Lipen.* Bibl. Jur. p. 16.

ALVEHEZIT, among Arabian writers, denotes what we ornarily call *falling-ſtars*, or *ſtar-ſhot*. *Vital.* Lex. Math. p. 29. See STAR-SHOT.

ALVEOLI, in anatomy, the ſockets wherein the teeth are fixed.

In ſome perſons the teeth are ſo faſt inſerted into the *Alveoli*, by ſeveral roots, that in drawing them, the latter break and are torn away with them. Journ. des Scav. T. 87. p. 378.

Some writers ſpeak of teeth growing without *Alveoli*. Pliny [a] mentions a perſon who had a tooth in his palate. Euſtachius [b] relates, that he ſaw a man who at ſixty had a tooth growing out of the middle of his fauces. Holler gives an inſtance of a perſon, whoſe teeth were of a piece with his jaws, without any inſertion into *Alveoli* [c].—[[a] Hiſt. Nat. l. 2. c. 27. [b] De Dentib. c. 29. [c] *Blaſ.* Comm. ad Veſling, c. 13. p. 203. *Caſt.* Lex. Medic.]

ALVEOLI is more eſpecially uſed, among naturaliſts, for thoſe waxen cells in the combs of bees, wherein their honey is depoſited. See HIVE, HONEY, &c.

The *Alveoli* are all of a hexagonal figure, compoſed of three rhombus's, flanked with ſix ſides. The advantages of which conſtruction are very great. See the article BEE.

Naturaliſts obſerve ſeveral things wonderful in the method of building, or forming the *Alveoli*, which is done with great aſſiduity and artifice, and in the connecting them together into proper ranges, with ſpaces between, to afford paſſage for the bees. What is remarkable is, that in each comb there are three orders of rhombus's, in three different planes, yet ſo uniformly conducted, that many thouſands of rhombus's belonging to the ſame range fall all exactly in the ſame plane. The wonder is, that ſo many thouſand inſects ſhould be employed at the ſame time, in the ſeveral parts of this work, yet all co-operate, by mere natural inſtinct, to finiſh a thing ſo difficult in itſelf, with ſo much nicety and exactneſs. A comb, ſix inches wide and a foot long, contains about four thouſand *Alveoli*, which they will compleat in a day, if things prove favourable. Each baſe conſiſts of three rhombus's, and on each ſide of theſe three, is a plane, which ſerves as a ſide to the oppoſite *Alveolus*, and, at the ſame time, makes a ſupport for the baſe of the oppoſite one. V. Mem. Acad. Scienc. 1712. p. 402—407.

The *Alveoli* ſerve for divers uſes; firſt, as ſtore-houſes, wherein to depoſite the honey for their winter ſupport; ſecondly, as nidus's, or lodges, wherein their little ones are hatched.—It may be added, that the wax prepared for future uſes, is alſo preſerved in the *Alveoli*. V. Hiſt. Acad. Scienc. an. 1712. p. 10.

There are a kind of *Alveoli* perceivable in the gum lacca, which diſcovers it not to be a gum, but a kind of comb, belonging to ſome inſect. The figure and ſtructure of theſe, is deſcribed by M. Geoffroy: they have not near the conveniencies of thoſe of bees. Mem. Acad. Scienc. an. 1714. p. 158. See LACCA.

ALVEOLUS, in natural hiſtory, the name of a marine body, found frequently foſſile, ſometimes lodged in the cavity, at the end of the belemnitæ, and ſometimes looſe; and in this laſt caſe, often ſo large, that we cannot ſuppoſe any belemnita ever to have exiſted ſo large as to have been able to contain it. We do not meet with theſe at this day in their recent ſtate, but what we find of them foſſile, are ever larger at one end, and tapering to a point at the other, and are compoſed of ſeveral hemiſpheric cells, like ſo many bee-hives jointed into one another, and having a ſiphunculus, or pipe of communication, like that in the thick nautilus. Theſe are ſometimes found perfect and whole, but much more frequently truncated, or wanting a part of their ſmaller end. *Klein.* de Tubul. Marin.

ALUESEN, in botany, a name uſed, by ſome, for the *peucedanum*, or hogs-fennel. *Ger.* Emac. Ind. 2.

ALVEUS properly denotes a channel.

Alveus is applied, by ſome anatomiſts, to the tumid lacteal branches ariſing from the *receptaculum chyli* under the diaphragm. *Barthol.* Anat. Libel. 1. c. 3. App. 2. p. 615. *Caſt.* Lex. Med. in voc.

ALVEUS is alſo uſed, in antiquity, to denote a ſmall veſſel, or boat, made out of the trunk of a ſingle tree, by boring or cutting it hollow. *Pitiſc.* Lex. Ant. T. 1. p. 77.

Such was that wherein Romulus and Remus are ſaid to have been expoſed. *Ovid.* Faſt. xi. 407.

ALUM, (*Cycl.*) *Alumen*, in natural hiſtory, is defined to be a ſalt found moſt frequently lodged in extremely ſmall and diſſeminated particles in ſtones and earths, as metals in their ores, but ſometimes alſo pure and unmixed, either in form of an efflorescence, or of a ſhapeleſs ſalt waſhed out of its ore by water, and afterwards deſerted by it.

Alum bears a near affinity to vitriol, in reſpect of the ſaline principle, *i. e.* the acid ſpirit, which is the ſame in both [a]. It differs from vitriol, as this latter is found to have a metalline baſis, *e. gr.* iron or copper, whereas the baſis or matter of *Alum*, wherewith the ſaline part is united, is an alcalious or chalky earth, or ſtone, reſembling lime-ſtone, as appears from the origin and preparation of *Alum*, and from the ſtony ſediment it depoſits by ſolution [b].—[[a] *Hoffm.* Obſerv. Phyſ. Chym. l. 3. Obſ. 8. p. 299. [b] *Burggr.* Lex. Med. T. 1. p. 482.] See VITRIOL.

Alum alſo bears a near conformity with ſulphur, as both are formed from the ſame ſaline ſpirit; which, if it meet with a ſtony ſubſtance, forms *Alum*, with a bituminous one, ſulphur. *Tournef.* Voy. au Levant. Let. 4. p. 60. See SULPHUR.

Alum then is formed of the univerſal acid, or fluid ſalt combining with a chalky earth.—The ſame acid with a mercurial earth forms common ſea ſalt, and with a moiſt rocky, or clay earth, *Sal Gemmæ*. *Stahl*, Phil. Princ. Chem. P. 1. Sec. 1. p. 17. ſeq.

This ſyſtem is confirmed, by what naturaliſts have obſerved concerning the origin of the native *Alum* in the iſle of Chio. That iſland is a hollow ſpungy rock, penetrated on all parts by the ſea-water. M. Tournefort conſiders the whole as a natural laboratory, wherein the ſea-water undergoes much the ſame action in it as in our retorts. By this means, an acid ſpirit is ſeparated from it, which, penetrating the ſubſtance of the rocks, diſſolves and incorporates with them, and forms mines of *Alum*. This ſeems hardly to be doubted, inaſmuch as by pouring ſpirit of ſalt on common ſtones, or chalk, aluminous concretions are readily formed. The ſame ſpirit mixing with a bitumen under-ground, forms ſulphur. V. *Tournef.* Voy. Lett. 4. p. 60. See SULPHUR.

Some attribute the origin of *Alum* chiefly to a ſulphureous principle acting on, corroding of, and coagulating with a mineral ſubſtance, uſually of a terrene and ſtony, rather than

metallic nature, tho' that metal be often contained in the *Alum* ſtone. That the ſulphur is the chief efficient and material cauſe of this production, ſeems to appear hence, that many *Alum* ſtones diſtilled *per deſcenſum*, yield good brimſtone, and all *Alum* ſtones during calcination, emit a ſulphureous ſteam. An inquiſitive naturaliſt gathered from the very ſame rock, and that within a few inches of each other, both vitriol, *Alum*, and ſulphur, all of them excellent in their kind. Indeed thoſe three minerals are ſo nearly allied, that an ingenious chemiſt aſſures us, he can by ſome artifices convert *Alum* into vitriol, or vitriol into *Alum*, the ſame to all intents and purpoſes, with the natural. Phil. Tranſ. N°. 104. p. 71. ſeq.

Alum is ranked by Homberg, and others, as an urinous neutral ſalt, on account of the urinous ſmell it exhales by burning, and its uſe in the volatilization of fixed ſalts. Yet ſome deny *Alum* to belong to the claſs of ſalts, and rank it rather among ſtony ſubſtances; by reaſon that after diſſolving *Alum*, and precipitating the ſolution with oil of tartar *per deliquium*, the coagulation at the bottom, reſembles a ſtony calx, and being expoſed to the fire will neither melt nor ſublime. *Junck.* Chym. Exper. Tit. *Alum.* Week. Mem. Ingen. N°. 15. p. 90.

The ore of *Alum*, if mature, yields its ſalt immediately, and without trouble; but if leſs mature, it requires a previous calcination, as is the caſe in many of our Engliſh *Alum* ſtones; and if very crude or immature, it muſt not only be burnt, but a long time expoſed to the air before it will yield its ſalt. From this it appears, that the *Alum* is not a genuine and native ſalt, but is compoſed by the acid of ſulphur, corroding ſome peculiar earth or ſtone, as vitriol is by its corroding ſome metal; and that, in both theſe operations, this corroding acid can ſometimes perform its buſineſs, while it lies in the bowels of the earth; and ſometimes while it lies in the open air, tho' it failed of it while buried. Philoſ. Tranſ. N°. 104.

Alum diſtilled into an acid ſpirit, with copper, or iron, becomes good vitriol; and vitriol freed from its metallick parts becomes aluminous; and, being diſtilled, yields a ſpirit not to be diſtinguiſhed by the taſte from that of *Alum*, and even ſcarce by the moſt accurate ſcrutiny. Rectified oil of vitriol, or ſpirit of ſulphur, of the ſame degree of ſtrength, will ſometimes concrete into a ſolid and tranſparent ſubſtance, reſembling cryſtallized *Alum*; and this ſubſtance is no way different whether prepared by one or the other of theſe ways, and in both reſembles the pureſt *Alum*, ſo as not to be diſtinguiſhable from it unleſs by taſting it.

Alum Ores generally contain vitriol as well as *Alum*, and are capable of great fermentation, when expoſed to the air, tho' they would never have been ſubject to it while buried in the earth. They will become ſo hot in the heap, that it is ſcarce poſſible to endure the hand upon them; and ſometimes will break out into abſolute flame. The acid and the ſulphur they contain are the occaſion of this; as, according to Sympſon and ſome others, they are of all ſubterranean fermentations and heats; and the whole is not badly explained, by the familiar inſtance of adding water to rectified oil of vitriol. The acid and the ſulphur of that fluid are, as in theſe ores, ſo combined as not to exert their forces naturally againſt one another; but all is quiet as in theſe ſtones while underground, but the water does to the one, what the air does to the other; ſends in a third, which not agreeing with either of the other, diſturbs and ſets their particles in motion, and the veſſel containing the liquid becomes as hot to the touch in the one caſe, as the ſolids themſelves are in the other. *Sympſon*, Zymolog. Chym.

The *Alum* found in ſome parts of the world pure and free from all admixture, might be eaſily miſtaken for a native ſalt; but this has only been waſhed out by water from its ore, and afterwards left, on the evaporation of that water, in a dry form. This, tho' unknown among us, is a very common appearance of this ſalt in many parts of the world.

All the *Alum* we uſe is ſeparated by art from various ſubſtances: in Italy from a ſoft reddiſh ſtone; and about Puteoli, from various earths. In the iſlands of the Archipelago, white earths and ſtones abound with it; and in England, we have it in a bluiſh, or whitiſh ſtone; and in great plenty in the ſubſtance called Iriſh ſlate. *Hill*'s Hiſt. of Foſ. p. 389, to 393.

The ſeveral ores of *Alum* are, all ſubject, at times, to be covered with an efflorescence of the ſalt, in a ſhapeleſs form. But the iſlands of the Archipelago are the places where *Alum* is found in the greateſt purity, and greateſt variety of forms; and are the places whence the antients had, and where we are therefore to expect to find, the ſorts they uſed, and have given us accounts of.

In the iſland of Melo, and ſome other places, there is found a vaſt quantity of that kind they called *Alumen plumoſum*, or feathered *Alum*. This is a finely ſtriated ſalt, and is an efflorescence from the *Alum* rocks in thoſe places. Liquid *Alum* is alſo found in great plenty in the many caverns in thoſe iſlands, and is no other than a ſolution of the *Alumen plumoſum* and other efflorescences of *Alum*, which cruſt over the ſides of thoſe ſubterranean caves, made in the water, with which their roofs and ſides are continually dropping. And theſe waters, collected in the ſmall cavities in the floors of the ſame grottoes, and about their entrances, when evaporated, leave behind the *Alum* which had been diſſolved in them, which is then found in ſmall lumps in theſe little holes, and is what the antients called round *Alum*, and what might eaſily be miſtaken for a native ſalt. The liquid, plumoſe, and round *Alum*, mentioned by the antients, might therefore be had at this time, if we deſired it: but they are not known among us, only that we ſometimes hear of the name of *Alumen plumoſum*. In the German ſhops, in the place of this, however, they keep a ſort of amianthus, which has no one character or property of *Alum*; and it is very happy for the world, that no phyſician there ever thought of preſcribing it, as it might be of very dangerous conſequence, to take that amianthus inwardly.

To diſcover *Alum* among vitriol, or vitriol among *Alum*, Mr. Lemery uſed to mix them with oil of tartar *per deliquium*: this deſtroying the power of the acid, breaks the combination of parts which formed the concrete, and immediately precipitates that ſubſtance, which by mixing with the acid conſtituted that particular body: this in *Alum* is a white earth, and in vitriol is that metal which the vitriol happened to partake of, be that iron, copper, or whatever.

There is indeed a much more expeditious and ready method than this, which is to throw a piece of the matter to be tried upon a burning charcoal, and after the ſwelling and evaporation occaſioned by the heat, there will remain a white ſpot on the coal, which is the white earth of the ſalt, if there were any *Alum* there, and if there were not, this would not happen. Some curious perſons have doubted, whether the white ſalts extracted from vitriol by Mr. Lemery, and by him ſaid to be *Alum*, were really *Alum* or not, ſince they did not give this character on the trial.

Mr. Lemery had four of theſe ſalts, or *Alums*, the one obtained from the *caput mortuum* of ſix pounds of *Alum*, which had been diſtilled; the other three he had prepared from the *Caput mortuum* of Engliſh, of German, and of the native white vitriol. The two firſt of theſe ſhewed no action at all upon the charcoal, but remained wholly unmoved there; the other two ſwelled, and had all the changes that were to be expected. It is plain, from theſe experiments that this teſt by the charcoal is a very uncertain one, ſince it ſometimes fails; and in this particular inſtance it failed, in regard to that ſalt which was inconteſtably *Alum*, while it ſucceeded with other ſalts which did not appear to be ſo evidently ſuch; and the oil of tartar, which acted evidently on all, is therefore to be greatly preferred as a teſt. It is eaſy to conceive, that the ſwelling and bliſtering up of *Alum*, when laid upon a burning charcoal, is owing to a viſcous aqueous humidity in it, and perhaps a ſulphureous one alſo, which when heated and rarified makes theſe efforts to diſengage itſelf from the mineral ſubſtance which it was before united with; and by means of theſe, the acid is by degrees freed from the earthy matter, and evaporates, leaving that only behind, which being a white calcarious earth, makes the white ſpot upon the coal, which is the criterion of this trial. But it is to be obſerved, that this humidity, which cauſes the ſwelling and bubbling of the matter, is not eſſential to *Alum*; it is only its acid and white earth which are ſo; and it is equally certain from experiment, that the degree of the combinations of theſe ſubſtances is by no means fixed, but the proportion of the one to the other is much greater in ſome *Alums* than in others; and ſeveral ſubſtances may be all equally *Alum*, and yet may all contain this foreign matter in different proportions; whether that be owing naturally to their combinations in the bowels of the earth, or be brought on by the different degrees of calcination; nay, the ſame calcination made with the ſame fire, and in the ſame furnace, may according to different accidents, have very different effects on ſeveral parcels of *Alum*. Therefore the trial by charcoal, which does not act upon any of the eſſential parts of *Alum*, muſt be a trial of a very inferior kind to that by oil of tartar, which acts immediately on that which conſtitutes the very eſſence of this ſalt.

The decompoſition of *Alum*, which is made on the charcoal is however very perfect, in compariſon of that made by the ordinary way of cloſe diſtillation in the retort, as well as more eaſy and expeditious: the firſt is the work of a few minutes, whereas in the other, after the phlegm has been driven off by a ſand heat, it requires to be kept in a violent wood fire ſeventy two hours, in order to have it only two thirds decompoſed. The account Mr. Lemery gives of this, is, that the operations differ greatly, in that the firſt is performed in the open air, the latter in cloſe veſſels. When the fire acts upon any body, ſo as to diſlodge from it thoſe particles which are ready for ſeparation, it is neceſſary for the completion of this, that they have ſome whither to go, and a place to receive them, where ſomething elſe will give way to them. In cloſe veſſels, the little air that they contain is by no means diſpoſed to give place to the evaporations of a heated body; and the greateſt effect that can be expected here muſt be either from the veſſels not being firmly enough luted, or from the evaporation of ſome particles, much finer and more ſubtile than the air itſelf, thro' the pores of the glaſs, (if air itſelf can be rendered by heat capable of ſuch a minute diviſion of its particles, and

to eſcape the evaporation from the heated body) which will fill the ſpace left by ſuch particles; and thus the body will by ſlow degrees be in part at leaſt decompoſed, being continually diveſted of ſome of its principles, driven from it by fire. Vid. Mem. Acad. Scienc. Par. 1736.

This ſeems all that can be done in the diſtillation by the retort; and it is eaſy to ſee how ſlow and imperfect this muſt needs be, compared with an evaporation in the open air, where there is ſpace eaſily given to every particle, as it ariſes or iſſues from the *Alum* laid on the coal, and influenced by its heat. This however is not all; for the immediate contact of the coal may eaſily be conceived to be of great ſervice in the proceſs, ſince the coal continually furniſhes a ſupply of ſulphureous or oily matter, which, Mr. Lemery has proved, is ever of great ſervice in the diſengaging and volatilizing of acids.

An accident which was diſcovered ſome time afterwards, in regard to the four *Alums* tried on the burning coal, the two with, and two without effect, which ſerved greatly to confirm this reaſoning in regard to the different effects of fire in the open air, and in cloſe veſſels. It was diſcovered, that the veſſels employed in the diſtillations from thoſe *Alums* had ſucceeded differently in the fire, two of them having remained perfectly whole, and the other two having cracked in ſeveral places. On enquiring to which of theſe the ſeveral *Alums*, which had been the ſubject of the ſucceeding obſervations had belonged, it was found, that the two which anſwered to the experiment had been the reſidue of the diſtillation in the veſſels which remained whole, while the *Alums* taken out of the two cracked retorts, had no change made in them, on the charcoal, but remained wholly unmoved and unaltered on it; theſe having ſuffered their ultimate decompoſure, in regard to theſe proceſſes, before, by means of their having had a communication with the open air, by theſe cracks; while the other *Alums*, which had been urged in whole veſſels, were yet ſubject to all the natural changes from heat and an open air.

Mr. Lemery has proved, that the common natural white vitriol is a mixt body, compounded of green vitriol and *Alum*. It is very certain that we are not able, by any known proceſs, to make white vitriol from theſe ingredients; but it is alſo certain, that tho' theſe two ſalts, being diſſolved in the ſame water, and afterwards cryſtallized in the common method, form their cryſtals quite ſeparate; yet nature does many things, which art in vain attempts to imitate, and may eaſily have effected this mixture in the bowels of the earth, which we in vain attempt by chymical veſſels and by furnaces; ſince all trials prove the certainty of Mr. Lemery's aſſertion, in regard to this body.

The ſeparation of the cryſtals of vitriol and *Alum*, when we make the ſolution of both together, is eaſily accountable for, on this principle, that they do not begin to form themſelves in the fluid at the ſame time; *Alum* being more difficultly ſoluble in water than vitriol, muſt be alſo more ready to form itſelf again into cryſtals, and ſhooting before the vitriol finds occaſion to ſhoot, it cannot but be ſeparated from it, and ſhoot alone. But we find that nature has found a nicer combination of theſe two ſalts than we know how to make; for tho' it is eaſily proved to demonſtration, that white vitriol, as we ſee it, does contain both vitriol and *Alum*; yet they are ſo cloſely combined, that, when the whole is diſſolved, they cryſtallize together, and continue mixed. Mem. Acad. Scienc. Par. 1736.

Mr. Geoffroy has entered more nicely into the origin of this ſalt, than any other author. We know, that beſide the ores which contain together vitriol, ſulphur, and *Alum*, there are ſome peculiar to *Alum* alone; and moſt writers on theſe ſubjects have agreed that the baſis of *Alum* is white unvitrifiable earth, of the nature of chalk, which fixes the common vitriolick acid into the form of this ſalt; and Mr. Geoffroy has proved from experiment, that this earth, which is the baſis of this ſalt, is contained in no ſmall quantities in ſeveral of the common foſſil ſubſtances, as the boles, clays, and the like; and many of theſe, even after burning, have furniſhed this curious enquirer with *Alum*, on the mixing them with oil of vitriol, or of ſulphur. When this is known, it will appear leſs ſtrange, that glaſs ſhould ſometimes afford *Alum*; ſince it may naturally be ſuppoſed often to contain the ſubſtance of this earth, to which there needs only the joining this common acid, to produce the ſalt; and to this was owing the remarkable quality of a certain coarſe glaſs, made ſome years ago in France, the bottles made of which, ſpoiled all the wine that was put into them, and that often in a very little time, by impregnating it with real *Alum*. Mem. Acad. Par. 1728.

The method by which Mr. Geoffroy ſucceeded beſt in making his artificial *Alum*, was this. He took pieces of common earthen veſſels, of the coarſer and more porous kind, and cauſed them to imbibe a large quantity of oil of vitriol, of which they would receive a larger quantity than the ſame earths would when unburned, as their pores were now more open: the acid cauſed ſome efferveſcence with them, and in fine became mucilaginous; and this mucilage, expoſed to the air, afforded cryſtals of pure *Alum*, of a regular figure, and of all the properties of that ſalt. Broken tobacco-pipes, wetted with ſpirit of ſulphur, in the ſame manner afforded cryſtals of *Alum*; and when the pipes had remained dry a conſiderable time, there ſhot out from them a beautiful and regular *Alumen plumoſum*; the ſmall remainder of the acid having had time to work in the pores of the ſubſtance, ſo as to afford this efflorescence.

The *Lapis Calaminaris*, of ſome kinds, alſo contains this white earth, which is the baſis of *Alum*; and the ſame Mr. Geoffroy diſcovered this by accident, when having made a mixture of this ſtone with the vitriolick acid, in hopes of obtaining from it an artificial white vitriol, he procured inſtead of what he hoped for, two different ſalts, a green vitriol, and a pure and perfect *Alum*.

The proceſs of making *Alum* at Whitby in Yorkſhire is thus deſcribed by Mr. Ray, at the end of his collection of Engliſh words not generally uſed, p. 139. They take the mine or ore picked from the deſſe or rock, and laying it in great heaps, burn it with whins or wood, till it be white. When it is ſufficiently burnt, they barrow it into a pit, ten foot long, ſix broad, and ſeven fourths of a yard deep, where it is ſteeped in water the ſpace of eight or ten hours; then they draw out the liquor, which is only a lixivium impregnated with the *Alum* mine, into troughs, by which it is conveyed to the *Alum* houſe, into a deep ciſtern, about twenty yards in circumference, and three yards and an half deep. After this firſt water is drawn off the mine in the pits, they do not preſently caſt away the mine, but pour freſh water on it a ſecond time; and after the ſecond water is drawn off, which is much weaker than the firſt, they caſt out the mine, and put in new, and pour on freſh water as before. Out of the ciſtern they convey the lixivium by troughs into the pans, where it is boiled the ſpace of twenty-four hours ordinarily. Then they take, the liquor out of the pans, and examine it by weight, to know how much lee made of kelp, it will require, which for the moſt part is ſix inches of the pan's depth. This being put in, as ſoon as the liquor boils or flows up, by the putting in of an iron coal-rake, or other iron inſtrument, they draw it off into a ſettler, and let it ſtand about an hour, that the ſulphur and other dregs may ſettle to the bottom; which being done, it is drawn off into coolers, where it continues about four days and nights. The cooler being drawn about half full, they pour into it a quantity of urine, *viz.* about eight gallons into a cooler that contains about two half tuns. Having thus ſtood about four days and nights, it is quite cool, and the *Alum* cryſtalized to the ſides of the cooler. Then they ſcoope out the liquor, which they call the mother, into a ciſtern, and put it into the pans again with new lixivium, to be evaporated by boiling, *&c.* The *Alum* that is ſhotten and cryſtalized on the ſides of the cooler they ſcrape off, and waſh with fair ſpring water, then throw it into a bing, where the water drains from it. Thence it is caſt into a pan, called the roching pan, and there melted; after which it is ſcooped out, and conveyed by troughs into tuns, in which it ſtands about ten days, till it be perfectly cool and condenſed. Then they unhoop and ſtave the tuns, and taking out the *Alum*, chip it and carry it into the ſtore-houſe. The exact proportion of kelp does not appear in this proceſs; for tho' the workmen told Mr. Ray, that the lee was ſix inches of the pans depth, yet they did not tell him how deep the pans were. Phil. Tranſ. N°. 142. p. 1054.

When a work is firſt begun, they take *Alum* of the liquor only that comes from the pits of the mine, without any other ingredients; and ſo might continue, but that it would ſpend ſo much liquor as not to quit coſt.

As to the proceſs of making *Alum* at Civita Vecchia, See Hiſt. Acad. Scienc. 1702. p. 26. See alſo Phil. Tranſ. N°. 265. about the *Alum* at Solfatura.

Alum is alſo prepared about Leipſic from a foſſil earth, impregnated with *aluminous* principles.

This ſome call common *Alum*, *Alumen vulgare*, by way of diſtinction from the Roche *Alum*.

The manner of preparing it is deſcribed at large by Hoffman, Obſerv. Phyſ. Chym. l. 3. Obſ. 8. p. 302. See *Burggr.* Lex. Med. in voc.

Naturaliſts ſpeak of divers kinds of *Alum*, which may be reduced to two, native and artificial.

Native ALUMS are thoſe prepared and perfected under ground, by the ſpontaneous operations of nature, mixing the proper ingredients, water, earth, and ſalt, or ſulphur.

Theſe are either liquid, or ſolid, and concrete.

Liquid ALUM appears to be the primitive kind, as being that out of which the reſt are formed.

Liquid Alum is deſcribed by Pliny, as formed of water exuding out of the earth in winter, and maturated by the ſun's heat in ſummer. *Plin.* Hiſt. Nat. T. 2. l. 35. c. 15. p. 716. See LIQUID *Alum*.

Solid, or *concrete* ALUM is divided into ſciſſile *Alum*, called by the Greeks σχιστὴ, as being ſoft and eaſily ſeparable. This is ſaid to bear a near reſemblance to our plumoſe *Alum*, only differing in this, that the former inſtead of whitiſh, is of a greeniſh hue. Some pretend to have done wonders with it againſt hæmorrhages, looſneſs of the teeth, the itch, pterygium, pernios, *&c.* In ſome of which its aluminous or aſtringent quality ſhould do more harm than good. *Junck.* Conſp. Therap. Tab. 16. p. 453. ſeq.

Round ALUM, *Alumen rotundum*, called alſo στρογγυλη, as being found ordinarily in roundiſh maſſes, though ſometimes angular.

Some diſtinguiſh the *Alumen rotundum* into divers kinds, viz. *Bulloſum*, of a whitiſh colour, without ſand, and very friable; *Pumicoſum*, porous, or full of holes like a ſponge; Αστραγαλωδης, or *talare*, in form of a dye; Πλινθιδης, or *latercularium*, flat, reſembling a trencher; Πλακωδης, or *cruſtarium*, formed of divers cruſts or coats. Vid. *Plin.* Hiſt. Nat. T. 2. l. 35. p. 716. *Gal.* de Comp. Med. ſecund. loc. l. 6. *Dioſcor.* l. 5. c. 82. *Mercat.* Metalloth. Arm. 3. c. 1. p. 53. *Kirch.* Mund. Subterr. l. 6. ſec. 3. c. 1. p. 312.

Sciſſile, or *foſſile* ALUM, is either compoſed of thin flakes, very friable to the fingers, or of ſtriæ, or whitiſh hairs, hence called στυπτηρια, or capillary *Alum*, uſually *plume Alum*.

But it may be obſerved, few, if any, of the antient native *Alums*, are known among the moderns; though ſpecimens of this or that kind are ſhewn in the collections of the curious. *Pomet*, Hiſt. des Drogues, P. 3. l. 2. p. 80.

The modern *Alums* are chiefly artificial, and may be reduced to two kinds; *rock*, or roche, and *common Alum*. The countries wherein they are chiefly produced are England, Italy, ſome parts of Germany, and Flanders.

Roche, or *rock* ALUM, is a whitiſh tranſparent ſalt, of an auſtere aſtringent taſte, rarely found in veins *per ſe*, but extracted by burning and lotion from aluminous ſtones, or by boiling from mineral waters, exhibiting cryſtals, uſually of the figure of octohedrons, or double pyramids, with ſquare baſes, joined together at their baſes. *Verdr.* Phyſ. P. Spec. c. 6. p. 464. *Liſt.* de Therm. *Gulielm.* de Salib. ap. Aſſalt. Not. ad Mercat. lib. cit. c. 2. p. 56.

Rock Alum is ſo called, becauſe prepared of the fragments of certain rocks, or ſtones calcined. *Scalig.* Exerc. ad Card. 104. §. 6.

This is otherwiſe called *Alumen rupeum*, and *Alumen rochæ*, *Alume di rocca*, among us frequently *common Alum*, as being that chiefly now in uſe.

Rock Alum is, by ſome, pretended to be the ſame with the *liquid Alum* of the antients. In proof hereof, Braſavolus alledges, that the *rock Alum* procured in the pope's territories, is originally liquid. But later and better enquirers ſhew this to be wholly a miſtake. *Mercat.* ubi ſupra, c. 2. p. 54. *Kirch.* loc. cit.

Dale, and ſome others, will have *rock Alum*, properly ſo called, confined to the *red Alum*, prepared from a reddiſh ſtone, uſually called *Roman Alum*. But, in the popular uſe, *rock Alum* is extended to all the *Alums* made from ſtones, by way of contradiſtinction from *common Alums*, which are prepared from earths.

Sacharine ALUM. See ALLUM, *Cycl.*

This is alſo called *Alumen Zuccarium*. *Kirch.* Mund. Subter. loc. cit. *Vater*. Phyſ. Exper. ſec. 5. c. 4. p. 417.

Burnt ALUM, *Alumen uſtum*, is prepared by melting the ſalt in a fire-ſhovel, or crucible, and letting it bubble till it comes to a white hard ſubſtance. This is uſed as an eſcharotic; it gently eats proud fleſh, but leaves ſuch a hardneſs on the part, as makes it little eſteemed in that intention.

Many mix a little of it with the ſugar they dulcify their cordial waters with; which fines them down, and throws the milkineſs to the bottom, from which they may be poured by inclination, or rack'd off with a crane. *Quinc.* Diſpenſ. p. 274.

Dioſcorides enumerates abundance of virtues and uſes of the *Alumen uſtum* [a]. Of this is prepared Tenzelius's *aquæ arcanæ contra iſchiam & contra ariduram* [b].—[a *Dioſcor.* l. 5. c. 123. b *Burggr.* Lex. Med. T. 1. p. 490. ſeq. See further concerning the uſe of *burnt Alum*, as a ſeptic, &c. in *Junck.* Conſp. Chirurg. p. 333. Ejuſd. Conſp. Medic. p. 470.]

Plume ALUM, *Alumen plumoſum*, is found chiefly in the iſland of Rhodes and Crete, where there are whole mountains of it.

The *plume Alum* is ſcarce known in theſe countries; what we have under the name in England, &c. being only a coarſe ſort of *amianthus*, from which the true *plume Alum* differs in many reſpects. The latter has a real ſaline aluminous taſte, and, like other ſorts of *Alum*, a ſtrong aſtringent quality; whereas the former does not belong to the claſs of ſalts, but of ſtones, and is neither aſtringent nor ſapid, except that it is a little pungent to the taſte; nor does it diſſolve in water, as the *plume Alum* ought to do: add, that it bears the fire, growing red hot in it, without ſuffering damage, which the *Alum* will not. *Junck.* Conſp. Terap. tab. 16. p. 453. Id. Conſp. Chem. p. 269. ſeq. Hiſt. Acad. Scienc. an. 1706. p. 412. See ASBESTOS.

ALUMEN *plumoſum* is alſo a name given, by ſome chemiſts, to a peculiar kind of ſublimate of mercury, invented by Baſil Valentine, whoſe name it alſo bears.

The preparation of the *Alumen plumoſum Baſilii Valentini* is thus: take of mercury one part, diſſolve it in ſix times the quantity of aqua-fortis, or aqua-regia; concentrate the ſolution, in a retort, to a dryneſs, and while hot, add to it one half, or one part, of rectified oil of vitriol; drive it a new over a gentle fire, till it riſe flaky, and fill the neck of the retort.

This is the *plume Alum*, which may be eaſily converted into *aqua mercurialis*. Vid. *Teichmey.* Inſt. Chem. P. 2. c. 10. p. 147.

ALUMEN *ſcagliolæ*, or *ſcalolæ*, a ſquamoſe or flaky ſtone, the ſame with what is otherwiſe called *lapis ſpecularis*. *Mercat.* ubi ſupra, c. 2. p. 56. See SPECULARIS.

Some take this for the ſame with what the antients called *ſchiſton*. *Kirch.* loc. cit.

ALUMEN *catini*, is a name which ſome have given to the aſhes, or rather ſalt of the herb kali, uſed chiefly in the making of glaſs. *Mercat.* & *Kirch.* ubi ſupra. See KALI.

In this ſenſe, *Alumen catini* amounts to the ſame with what is more frequently called *alkali*. See ALKALI.

ALUMEN *fæcis* is made of the lees of wine, formed into round maſſes, dried by the ſun, and then burnt or torrified ſo long by the fire, as to turn white. Its chief uſe is among the women, to dye their hair of a yellow colour, much affected in Italy. *Mercat.* loc. cit.

Purified ALUM is that prepared by diſſolving it in hot rain water, and evaporating it again, till it ſhoot into cryſtals.

By repeating this operation diverſe times, the fourneſs of the *Alum* is much abated.

Crude ALUM is the ſalt, ſuch as produced at the *Alum*-works, without further preparation. This ſtands contradiſtinguiſhed from prepared *Alum*.

It is, by ſome, uſed as a noſtrum againſt the itch and ſwellings of the feet; but rather palliates than works a thorough cure. *Junck.* Conſp. Therap. tab. 16. p. 453.

Prepared ALUM is of divers kinds.—Under this claſs come purified *Alum*, ſacharine *Alum*, burnt *Alum*, *Alum* magiſteries [a], tinctures of *Alum* [b], water, ſpirit, dulcedo of *Alum* [c].—[a V. *Tenzel.* Exeq. Chem. ap. A. Salam, Opp. p. 665. b *Burggr.* Lex. Med. T. 1. p. 486. ſeq. c *Poter*, Pharmac. l. 2. c. 9.]

Roman ALUM properly denotes a rock *Alum*, of a red colour, prepared in the country near Rome.

In the genuine Roman *Alum*, the red colour is not ſuperficial, but diffuſed through the whole ſubſtance of it; by which it may be diſtinguiſhed from the ſpurious, or counterfeit kind, which is only the common Engliſh *Alum* dyed red. *Pomet*, Hiſt. des Drog. P. 3. l. 2. c. 46. p. 87.

Alum is of uſe in medicine.—Many have been cured of agues with a nutmeg and its weight of *Alum*, powdered, and divided into three doſes, every morning faſting. Quincy has found its chief ſucceſs this way, to have been in ſtrong tough conſtitutions. The rationale of this coincides, in ſome meaſure, with that of the operation of the bark. *Quinc.* Diſp. P. 2. §. 151. p. 98.

And *Alum* poſſet is received into the London Diſpenſatory. The baſis of Helvetius's ſtyptic powder is *Alum*; the propriety of adding the dragon's blood is queſtioned in the narative prefixed to the laſt edition of that Pharmacopœa.

The *Alum* brought from the iſland of Melos was antiently uſed by the women, to prevent conception: to this purpoſe, before copulation, they applied it on the os vulvæ, that by its aſtringent virtue, the mouth of the uterus might be cloſed, ſo as to hinder the ingreſs of the ſemen [a]. *Alum* is alſo ſaid to be a capital ingredient in all thoſe medicaments uſed by women of later times, to conſtringe the pudendum, and make the loſs of virginity leſs perceivable [b]. A late writer pretends, that the German matrons, of beſt character, practice the ſame after child-bearing, to render themſelves more agreeable to their huſbands [c].—[a *Dioſcor.* l. 5. c. 123. b V. *Barthol.* Act. Med. T. 4. obſ. 41. p. 133. c *Burggr.* Lex. Med. T. 1. p. 488.]

Some antients ſpeak of another uſe made of *Alum*, viz. to render wood incombuſtible, by ſmearing it with a ſolution of this ſalt. Archelaus king of Cappadocia is ſaid to have made uſe of this expedient, to render his wooden tower, which defended the Piræus ſecure from fire. What the *Alum* muſt have been, that was endued with ſuch virtue, it is hard to ſay; for 'tis certain ours is not. See *A. Gell.* l. 15. c. 1. *Bayle*, Dict. Crit. T. 1. p. 295. ſeq. in voc. *Archelaus*, Not. (P.) Bibl. Raiſ. T. 5. p. 131. *Evel.* Sylv. c. 31. §. 7. p. 199.

Alum is uſually ſaid to contain but very little or no ſpirit; a pound of it ſcarce affords a few drops [d]. The reaſon is, *Alum* is of a very fixed nature, becauſe its calcarious earth is intimately united with the acid ſalt; and cloggs it in ſo great quantity, that they are hardly ſeparable by the impulſive motion of the fire. A vehement heat, inſtead of making a ſeparation, deſtroys the ſaline part, by evaporating its water; and thus the fine proper earthy part comes to be detained in the groſſer and leſs proper. Hence 'tis in vain to expect a ſpirit from common *Alum*, *i. e.* a ſeparation of its ſaline part, without the aſſiſtance of cryſtallization, by means of the finer waters, or elſe the interpoſition of ſome groſſer terreſtrial body, capable of dividing and diſcontinuing the concrete powerfully [e].—[d *Junck.* ubi ſupra, p. 90. e *Stahl*, lib. cit. p. 87.]

The phlegm of *Alum* remaining after diſtillation is held a good aſtringent, on which account, ſome ſurgeons dip all their dreſſings and bandages in it, or in *Alum*-water, and, after drying, apply them to the parts for ſtopping the hæmorrhages of wounds. *Burggr.* Lex. Med. T. 1. p. 490.

To make *Alum*-water; take *Alum* eight ounces, fair water one quart; boil them till the *Alum* is diſſolved. Or thus; take ſpring or well-water one gallon, roche *Alum* one pound; beat it to powder, and diſſolve it in the water by boiling; filter it through a brown paper, and keep it for uſe. With this water, if you wet your paper before you lay on your colours, it will keep them from ſinking in, and, withal, adds a luſtre and beauty to the colours laid on. But this you muſt note, that if your paper is not good, you muſt work it over four or five times, which may be done with a large pencil bruſh. Moreover, *Alum* generally raiſes ſtaining colours, and preſerves them from fading. *Salmon*, Polygraph. l. 3. c. 19. p. 202.

Heſſius, and an anonymous writer, have publiſhed pieces expreſs on *Alum* [f]. Many particulars relating thereto are alſo given by the writers on minerals, ſalts, &c [g].—[f *Lipen.* Bibl. Med. p. 13. g See particularly concerning the origin and compoſition of *Alum*, Philoſ. Tranſ. N°. 125. p. 615. Mem. Acad. Scienc. 1724. p. 558. Mem. de Trev. 1705. p. 1431. ALUM-*works*, places where this ſalt is prepared, and manufactured in quantities for ſale.

M. Colwal [a] has publiſhed an account of the *Alum*-works in in the north of England; M. Ray [b], of thoſe at Whitby; M. Geoffroy [c] and M. Silveſter [d], of thoſe at Solfatara and Civita Vecchia; Mercatus [e] and Kircher [f], may alſo be conſulted; Matthiolus, of thoſe in Germany [g]; Dr. Hoffman [h], of thoſe near Leipſic; Leopold [i], of thoſe in Sweden.—[a Philoſ. Tranſ. N°. 142. p. 1052—1056. b Coll. of Words, p. 139—141. c Hiſt. Acad. Scienc. an. 1702. p. 26. ſeq. d Phil. Tranſ. N°. 265. p. 633. e Metalloth. Arm. 3. c. 2. p. 54. ſeq. f Mund. Subterr. l. 6. ſec. 3. c. 2. p. 313. ſeq. Act. Erudit. Lipſ. 1721. p. 252. g *Matthiol.* Com. in Dioſcor. T. 2. p. 697. h Obſerv. Phyſ. Chym. l. 3. obſ. 8. p. 302. ſeq. *Burggr.* Lex. Med. T. 1. p. 481. ſeq. i *Leopold.* Relat. Hiſt. Suec. p. 12. Act. Erud. Lipſ. 1721. p. 252. Bibl. Angl. T. 7. p. 423. Concerning the redintegration of *Alum*-works, ſee Phil. Tranſ. N°. 219. p. 182.]

Alum-works are different from *Alum*-mines, as in the former an artificial *Alum*, in the latter a native one is produced.

There are ſtill mines of natural *Alum* in the iſland of Chio, though they are ſhut up, and no longer worked as formerly. The poor inhabitants voluntarily relinquiſh the benefit of them, which they cannot have, without paying to their Turkiſh maſters more than it is worth. M. Tournefort made them a viſit. They conſiſt chiefly of vaults and apartments incruſtated almoſt univerſally with *Alum*, which grows over them in flat pieces, or flakes, near an inch thick. As faſt as theſe are torn away, new ones grow in their place. They may be looked upon as exfoliations of the rock, occaſioned by the ſpirit of ſalt penetrating and diſſolving the ſame. *Tournef.* Voyag. du Levant, Let. 4. p. 63. Concerning mines of *Alum* in Egypt, ſee Mem. de Miſſ. T. 2. p. 186.

ALUMINOUS, ſomething partaking of the nature and qualities of *Alum*. See ALUM.

Grew deſcribes ſome extraordinary kinds of *aluminous* earths in the repoſitory of the royal ſociety. *Grew*, Muſ. Reg. Societ. P. 3. c. 1. p. 342.

ALUMINOUS *waters* are thoſe impregnated with the particles of that ſalt.

Aluminous waters make a ſpecies of thoſe called mineral or medicinal waters.

Such is the Spaw at Scarborough obſerved to be by Witty, Simpſon, &c. V. *Witty*, Scarb. Spaw, p. 187. ſeq.

According to the laſt author, that which gives the eſſence to this water is an acid *aluminous* mineral ſalt, preying on, and diſſolving a ſlight mixture of iron [a]. Dr Highmore objects, that ſuppoſing *Alum* the principal ingredient in theſe waters, the properties of *Alum* being to dry, to aſtringe, and to incraſſate, how comes it to paſs that they are pretended to be ſo highly deoppilative, and ſo beneficial to hypochondriac and cachectical perſons, where their aſtringency ſhould rather be noxious [b]? Dr. Witty anſwers, that they do not derive theſe virtues from the alum, but from the other ingredients in them [c].—It is diſputed whether or no the bath at Lucca be *aluminous* [d].—[a Vid. Phil. Tranſ. N°. 42. p. 851. b Phil. Tranſ. N°. 56. p. 1128. c It. N°. 160. p. 154. d Giorn. de Leter. d'Ital. T. 11. p. 186.]

We have alſo factitious waters, under the denomination of *aluminous*; ſuch is that called in the ſhops *aqua aluminoſa magiſterialis*.

Its preparation is thus; take of rock alum, and white ſublimate, ana ʒ ii, boil them in roſe and plantain water, ana ℔ i, till half is conſumed; filter the remainder, and keep it for uſe.

This is preſcribed againſt deformities of the ſkin, and often for the itch; but it is an uncertain remedy, and not to be uſed without caution. *Quinc.* Diſpenſ. P. 2. §. 456. p. 274.

ALUMTA, in botany, a name given, by ſome of the old Latin writers to the plant otherwiſe called *lutum* and *corniola*, and by the Greeks *cymene*. It was the ſame with our *geniſtella tinctoria*, or dyers-weed, and was uſed by the dyers, and by the ladies to tinge their hair yellow, the colour that was eſteemed moſt beautiful in thoſe times.

ALUS, in the materia medica of the antients, a name given to two different plants. Some of the later Roman authors uſe it only as the name of the *ſymphytum petræum*, or rock comfry; but the earlier authors ſometimes make it the name of this plant, and ſometimes of a very different one, a ſpecies of *allium*, or garlic, which grew wild in the fields and hedges. Pliny expreſly mentions both theſe kinds of *Alum*, or *Alus*. Beſide theſe, there is another plant, whoſe name comes very near theſe, that is, the *ala* of the old writers. This is the *helenium* of the antient Greeks, a plant of the verticillate kind, and of an aromatic ſmell, wholly different from the *helenium* of the preſent times, or elecampane. All theſe plants ſeem to have been called *Alum*, and *Ala*, *ab halando*, from their yielding a ſtrong ſmell. *Pliny*, l. 27. c. 7.

ALUSMA *Caramanica*, in botany, a term uſed ſometimes to expreſs a plant growing in Caramania, and ſometimes a preparation of that plant, or pigment made from it. The word frequently occurs in the writings of Aviſenna and Serapion, and is uſually underſtood to mean a particular ſort of indigo; but we have no account of the indigo plant growing in that part of the world, and this author always calls that plant *nil*, not *uſma*. He mentions the leaves of the *glaſtum*, or woad, frequently under the name of *uſma*; and the pigment prepared from them may therefore be very well expreſſed by the name *Aluſma*. The name *Caramanica* expreſſes alſo a country where we are informed, by other authors, that the *glaſtum*, or woad, grows; and there is no doubt, but that the general interpretation of the author is wrong, and that it is a kind of woad, not of indigo, that he means by this name.

ALWAIDII, a ſect of Mahometans, who hold that all great crimes are unpardonable, and the criminals reprobated to eternity.

The *Alwaidii* ſtand in oppoſition to the *Morgii*.—They attribute leſs efficacy to the true belief in the ſalvation of men, than the reſt of the muſſelmen. *Abulpharag*, Hiſt. Dyn. 9. ap. *Leehman.* Obſerv. Budd. Inſt. p. 196.

ALYPIAS, in the materia medica, a ſpecies of turbith, preſcribed, by ſome phyſicians, for the purging of bile. *Fallop.* de Purg. Simpl. c. 25. *Caſt.* Lex, Med. p. 37.

Some write the word *alypon*, and define it by white turbith [a]. Galen uſed *alypum*, ἄλυπον, for a minorative, or medicine that gently purges [b].—[a *Blancard*, Lex. Med. p. 32. b *Fallop.* ubi ſupra, c. 16.]

ALYPUM, in botany, a name given, by ſome authors, to a ſpecies of ſpurge, the *tithymalus amygdaloides anguſtifolius*, or narrow-leaved almond ſpurge of Tournefort. See TITHYMALUS.

ALYPUM is likewiſe a name given, by ſome authors, to a ſpecies of dogs-bane, diſtinguiſhed, by Mr. Tournefort, by the name of *apocynum maritimum venetum, ſalicis folio, flore purpureo*, the purple flowered ſea *apocynum* of Venice, with willow-like leaves. See the article APOCYNUM.

ALYSSOIDES, in botany, the name of a genus of plants, the characters of which are theſe. The flower conſiſts of four leaves, and is of the cruciform kind. The piſtil ariſes from the cup, and afterwards becomes a fruit, or ſeed-veſſel, of an elliptic figure, very thick and turgid, and divided by an intermediate membrane, into two cells, which contain an orbicular, flat, and marginated ſeed, in conſiderable quantity. See Tab. 1. of Botany, Claſs 5.

The ſpecies of *Alyſſoides*, enumerated by Mr. Tournefort, are theſe.

1. The ſhrubby *Alyſſoides*, with green leucoium leaves.
2. The hoary *Alyſſoides*, with ſinuated leaves. Theſe plants have been, by many, eſteemed of the leucoium kind, and called by that name. *Tourn.* Inſt. p. 217. See LEUCOIUM.

ALYSSON, *madwort*, in botany, the name of a genus of plants, the characters of which are theſe. The flower conſiſts of four leaves, and is of the cruciform kind. The piſtil ariſes from the cup, and becomes at length a ſmall fruit, or ſeed-veſſel,

of a humped or protuberant ſhape, divided into two cells by an intermediate membrane, and filled with ſmall ſeeds, of a roundiſh figure.

The ſpecies of *Alyſſon*, enumerated by Mr. Tournefort, are theſe.

1. The hoary, perennial, mountain *Alyſſon*. 2. The larger, yellow flowered, hoary *Alyſſon*, with ſerpyllum leaves. 3. The ſmaller hoary *Alyſſon*, with ſerpyllum leaves. 4. The naked-fruited ſerpyllum-leaved, hoary *Alyſſon*. 5. The ſea *Alyſſon*, commonly called the ſea *thlaſpi*. 6. The ever-green *Alyſſon*, with ſea purſelain leaves. 7. The leſſer *Alyſſon*, with a narrow ſilvery leaf. 8. The leaſt *Alyſſon*. 9. The ſhrubby, prickly *Alyſſon*. 10. The hoary ſhrub *Alyſſon*. 11. The yellow flowered, hairy, alpine *Alyſſon*. 12. The hoary, knot-graſs leaved, alpine *Alyſſon*. 13. The common knot-graſs leaved *Alyſſon*, with naked ſtalks. 14. The ſpeed-well leaved *Alyſſon*. 15. The corn *Alyſſon*, with ſharp pointed and auriculated leaves. 16. The larger fruited, corn *Alyſſon*, with ſharp pointed auriculated leaves. 17. The ſmall perennial Pyrenean *Alyſſon*, with trifid leaves. *Tourn.* Inſt. p. 216.

The *Alyſſon* is a medicinal plant, celebrated among the antients as a preventive of the hydrophobia.

The word is alſo written *Alyſon*.—It is formed of the privative α, and λυσσα, *rabies*, madneſs.

The antient naturaliſts relate of this herb, that being beaten to a pulp, and given among food to dogs, it cures madneſs; and if hung up in a houſe, prevents the effect of all charms, faſcinations, &c [a]. It is added, that being tied to the neck, it preſerves cattle from all diſeaſes, &c. Plutarch [b] repreſents it as a ſpecific againſt the hiccup, which, it is pretended, it cures by the mere touch, or even ſight of it.—[[a] *Dioſcor.* l. 3. c. 97. [b] Sympoſ. 3.]

The *Alyſſon* is uſually ſaid to be one of thoſe plants loſt or unknown to the moderns; yet Langius has diſcovered it in what we call *verbena*, or vervain, ſometimes *periſterion*; and, on account of its uſe in the hardening of iron, *ſideritis*. *Lang.* Epiſt. Med. 2. app. 37. p. 663. ſeq. Id. ib. l. 1. app. 73. p. 403. See alſo *Lemer.* de Drog. p. 32. ſeq.

ALYSSON, in botany, a name given alſo, by ſome authors, to the *myagrum*, or gold of pleaſure. *Tourn.* Inſt. p. 217. See MYAGRUM.

ALYTARCHA, in antiquity, a prieſt of Antioch in Syria, whoſe office was to lead up the *maſtigophori*, or *flagelliphori*, in honour of the gods.

In this ſenſe, the word is alſo written *Alytarcheus*.—The office, or prieſthood itſelf, was alſo hence denominated *Alytarchia*.

The officer who preſided at the Olympic games was alſo ſometimes denominated *Alytarcha*. *Briſſ. Calv.* & *Pitiſc.* in voc.

Some will have the *Alytarcha* to be the ſame with the *hellenodicus*, of which opinion are Faber and Prideaux.

Van Dale ſhews them to be different offices; not but that the *Alytarchi* might ſometimes be ſubſtituted by the hellenodici, to perform ſome parts of their function.

The *Alytarchi* were the directors, or *prefecti* of the *maſtigophori*, or *maſtigonomi*, officers with whips in their hands, who attended at the games or combats of the athletæ, encouraged them to behave ſtoutly, and, on occaſion, ſerved to preſerve good order, and keep off the crowd. *Van Dale*, Diſſert. 7. Act. Erud. Lipſ. 1703. p. 90. ſeq. See alſo *Norris*, Ann. Epoch. Syro. Maced. p. 220.

The *Alytarchi* were the ſame with what were called, in ſome other places, *Alytæ*.

A late writer aſcribes I know not what extraordinary dignity and honours to the *Alytarchi*, whom he repreſents as the chief of all the officers that preſided at games, that they were honoured as Jupiter himſelf, wore crowns ſet with jewels, and ivory ſcepters, and ſandals, &c. *Walk.* of Coins, P. 1. c. 6. p. 91.

ALZACHI, in the materia medica, the name given, by the Arabian phyſicians, to that kind of gourd called in the ſhops the *citrull*, and by the people of ſome parts of Italy, the *anguria*. It is an oblong, and uſually crooked gourd, and contains in its cavity a conſiderable quantity of water, which is drank by people of the places where the plant is common, to quench thirſt. It contains ſeeds of an oblong figure, flatted, and covered with a hard ſkin.

ALZAGIAT, in the materia medica, a name given, by the Arabian writers, to all the vitriolic minerals. It is alſo written *Zogi*, or *Zegi*. See ZEGI.

ALZARAC, in the materia medica of the Arabians, a name given to a kind of camphor, which was coarſe, and of a brown colour. It ſeems to have been the ſame with our rough camphor, as imported from the Indies, before being purified.

ALZIZ, in the materia medica, a name given, by Serapio and Aviſenna, to the roots of the *traſi*. The word *Ziz* is the name of a river in Africa, according to Leo; and the roots probably had this name from their being found in great plenty on the banks of that river, the *traſi* always growing in wet places.

ALZUM, in botany, a name given, by the antients, to the tree which produces the gum *bdellium*. It is alſo written *Alrum* and *Aldum*, which laſt ſeems the proper way. The gum of this tree was called, by the Arabians, *mokel*, and the ſame word *mokel* is uſed as the name of a fruit of a palm-tree. Hence it has been ſuppoſed, by ſome, that the bdellium was the gum of a kind of palm. But this is not at all countenanced by the old writers, who all make the gum *mokel*, and the fruit *mokel*, to be the produce of two abſolutely different trees.

AMA, in eccleſiaſtical writers, denotes a veſſel wherein wine, water, or the like, were held, for the ſervice of the Euchariſt.

In this ſenſe, the word is alſo written *Amula*; ſometimes alſo *Hama*, and *Hamula*. *Margr.* Vocab. Eccleſ. p. 13. *Du Cange*, Gloſſ. Lat. T. 1. p. 158.

AMA is ſometimes alſo uſed for a wine meaſure, as a caſk, pipe, or the like. *Du Cange*, loc. cit.

AMAIN (*Cycl.*)—The word is alſo written *Amayne*.—Waving *Amain*, is to make a ſign to another veſſel, by waving a bright ſword, or other thing, as a demand that they ſtrike their top-ſails.—This they commonly do either in the fore-top, or on the poop. *Manwayr.* Seam. Direct. p. 2.

AMAIN is alſo a term uſed in letting down a thing, by a tackle, into the hold, or elſe where, in the lowering a yard, or the like, to denote, that they are to let go that part of the rope which they held before, and let down the thing eaſily, and by degrees.

AMALGAMATION (*Cycl.*) is defined, by alchemiſts, the calcining of metals by mercury; for though the proceſs be ſomewhat different, and not purſued to the obtaining a direct calx, it being ſufficient for the purpoſe that a ſolution be made, and the metal converted into an amalgama, or paſte, yet is it, in the mean while, reduced into a fine powder, which alchemiſts call *calx*; in which form it is found, upon evaporating the mercury by a gentle fire. *Ruland*, Lex. Alchem. p. 36.

The inventor of this ingenious operation is not known; but it appears to be of great antiquity. Pliny [a] and Vitruvius [b] ſpeak of it, though not under this name. Wedelius [c] even endeavours to prove it to have been known to Hippocrates, by an argument, which, if it be not ſolid, is at leaſt pretty. "Thoſe who work in gold, Hippocrates [d] obſerves, diſſolve "it by a gentle fire, for that a ſtrong one does not fuſe it." What ſhould this gentle fire be, which diſſolves gold ſooner than a ſtrong one? It muſt be mercury, anſwers Wedelius [e]. [[a] *Plin.* Hiſt. Nat. T. 2. l. 33. c. 6. p. 621. ſeq. [b] *Vitruv.* de Archit. l. 7. c. 8. p. 140. ſeq. [c] *Wedel.* Pharm. Acroam. l. 1. ſec. 4. c. 5. [d] *Hippoc.* de Diæt. l. 1. c. 15. [e] *Burggr.* Lex. Med. T. 1. p. 514.]

Some authors divide *Amalgamation* into vulgar and philoſophical.

Vulgar AMALGAMATION is that made with vulgar mercury, or running quickſilver, above explained.

Philoſophical AMALGAMATION is that performed with the mercury of the philoſophers. *Caſt.* Lex. Med. p. 37.

Amalgamation is either done in the dry or humid way.

AMALGAMATION *in the dry way*, *viâ ſiccâ*, is performed in a mortar for the purpoſe, deſcribed by Beecher and others.

AMALGAMATION *in the humid way*, *viâ humidâ*, is when part of the metal is firſt diſſolved in its proper menſtruum, and afterwards precipitated into an amalgama, by the addition of mercury. *Teichmey.* Inſtit. Chem. P. 1. c. 4. §. 33.

The amalgams of gold, ſilver, tin, lead, zink, biſmuth, and copper, with quickſilver, are all white; and when the quantity of metal is large in proportion to that of the mercury, they thicken into a kind of paſte.

The following circumſtances muſt be obſerved for the quick making and good ſucceſs of theſe mixtures.

1. The metal muſt be comminuted; this may be done any way, provided there is no alkali uſed; becauſe this either retards, or totally hinders the operation of the mercury. 2. A mechanical mixture muſt be uſed between the two bodies, by grinding them together in a mortar. 3. As much heat is to be uſed as the mercury will bear, without being diſſipated. 4. The ſurface of the metal muſt be perfectly clean, and, above all things, muſt be free from any ſort of greaſyneſs. According to theſe rules, there will always be an *Amalgamation* made, and a greater or leſſer quantity of the metal will be taken up, according to the ſtrict regard to theſe cautions, and the purity of the mercury.

A part of the diſſolved metal muſt be, however, ſo perfectly attenuated by the mercury, that it may inſinuate through the pores of a filtre, as ſalts diſſolved in water; but it is only a ſmall quantity that can be thus perfectly diſſolved and attenuated; the reſt runs freely, indeed, with the mercury, but if ſtrained through a fine leather, will be left behind, with a portion of the mercury remaining embodied in it. Iron and the regulus of antimony reſiſt *Amalgamation* with mercury, by all the known ways.

AMALGAMATION *of lead* is thus performed. Melt a proper quantity of pure lead in an iron crucible, remove the veſſel from the fire, and when the metal is a little cooled, pour to it an equal weight of clean mercury, which will immediately enter the lead with a hiſſing noiſe. Stir the mixture well together with an iron rod, and when cold, it will appear in

the form of a ſoftiſh brittle maſs, called the *Amalgam* of mercury with lead. *Boerh.* New Meth. Chem. P. 3. p. 296.

This ſhews the general method of *Amalgamizations*.—After the ſame manner the amalgama of tin is made.

AMALGAMATION *of copper*.—The amalgamating mercury with copper is a very difficult proceſs, mercury not mixing well with that metal unleſs when in fuſion, and the heat ſufficient to keep it in that ſtate being great enough to evaporate the mercury. Trituration, however, may be made to ſupply the place of heat, firſt reducing the copper to an exceeding fine powder. This *Amalgama* boiled in river water, and then diſtilled in a retort, and cohobated twice, leaves the copper, in form of a new metal, of the colour of gold, and more ductile than before. *Shaw*'s Lectures, p. 433.

Amalgamations of copper may likewiſe be performed by diſſolving the metal in *Aqua fortis*, diluting the ſolution with twelve times the quantity of pure water, then heating it and putting into it poliſhed plates of iron; by this means the copper will be precipitated to the bottom, and the iron diſſolved. Pour off the liquor and waſh the precipitated powder with hot water, till it become inſipid. The powder being well dried and put in a glaſs mortar, with an equal quantity of hot mercury, an *Amalgama* will be made.

AMALGAMATION *of ſilver* may be effected after the ſame manner, by diſſolving it in *Aqua fortis*, and then precipitating it. V. *Burggr.* Lex. Med. T. 1. p. 516.

The method of extracting ſilver by *Amalgamation* is this: waſh the ores, earths, ſtones, ſands, *&c.* in which ſilver lies hidden in its metalick form, and when well waſhed infuſe them in very ſour vinegar, in a clean wooden, or glaſs veſſel; about one tenth part of alum, muſt alſo be firſt boiled, and diſſolved in this vinegar, let the vinegar entirely cover the ore, and leave it thus for one or two days. Decant off the vinegar, and waſh the macerated powder in pure warm water, till the water becomes quite inſipid, when juſt poured upon it; dry the powder, and put it into an iron mortar, then add mercury four times the quantity of the dried powder, and with a wooden peſtle fitted to the ſize of the mortar with a large round head, beat the whole till every part of the powder is rendered of a blackiſh colour, by the minute globules of mercury mixt with it; at this time pour water on the whole, and continue rubbing it with the peſtle for ſome time; pour out the turbid water, and add freſh till all the looſe powder is waſhed off; then dry the *Amalgama* with a ſponge. *Cramer*'s Art of Aſſaying, p. 232.

To ſeparate the ſilver from this *Amalgama*, ſpread a thin leather over a wide earthen or glaſs veſſel, fold it up in the form of bag, and put the *Amalgama* into it, tie the bag very firmly at the top, and ſqueeze it very hard, and the greateſt part of the mercury will be forced thro' into the veſſel placed underneath; untie the bag, and all the ſilver and gold, if there be any there, will be found remaining in it, with about an equal quantity of the mercury mixed with it. Put this paſte into a glaſs retort, ſet it in a ſand heat, adapt on a receiver with a quantity of water in it, let the noſe of the retort be immerſed in the water, make a fire conſiderably ſtrong, and the mercury will all be driven into the receiver, falling into the water with a hiſſing noiſe. If you hear a crackling in the retort, diminiſh the fire a little; when no more quickſilver can be driven over by a great fire, let the retort grow cool, then take it away and ſplit it by means of a thread dipped in brimſtone tied round the belly of the retort, and then ſet on fire, take out the maſs, and in an open fire run it with the help of borax into a maſs. *Cramer*'s Art of Aſſaying, p. 254.

AMALGAMATION is alſo applied, in a leſs proper ſenſe, to a ſolution of ſulphur with mercury. *Schrod.* l. 1. c. 3.

In this ſenſe *Amalgamation* amounts to the ſame with mollification or ſoftening; in which ſenſe, the word is uſed by ſome antient chemiſts. *Caſt.* Lex. Med. p. 37.

AMALOZQUE, in zoology, a name under which Nieremberg deſcribes a Mexican bird. The neck of this is red, it is of the ſize of the turtle, and lives about the lakes and rivers, but has not webbed feet; the breaſt, belly, and under part of the wings are white; the tail is variegated with black and yellow, and it has two black circles, a finger's ſpace aſunder, round the neck and breaſt. It has a very long and ſlender beak, and feeds on the inſects common in watery places. *Ray*, Ornithol. p. 301.

AMARACUS, among antient naturaliſts.—There has been much confuſion among the antients, about the two words *Amaracus* and *Sampſuchus*, which ſome will have to be the names of the ſame plant, and others of two different ones. The antients have indeed ſaid, that ſome people called the *Amaracus*, *Sampſuchus*. Diocles in Athenæus, and Dioſcorides, both affirm this; but the latter author ſays alſo, that the *Oleum ſampſuchinum*, and *Oleum amaracinum* were two different oils. It follows very certainly from this, that the two plants were different; and tho' ſome people might have called the *Amaracus* by the name *Sampſuchus*, it does not follow, that this word *Sampſuchus*, was not alſo the name of a peculiar plant. People who have been too earneſt in attempting to prove, that they were different plants, have brought in Theophraſtus, as ſaying it; but Theophraſtus no where ſo much as mentions the word *Sampſuchus*. See SAMPSUCHUS.

AMARANTE, an order of knighthood, inſtituted in Sweden by queen Chriſtina, in 1653, at the cloſe of an annual feaſt, celebrated in that country called *Wirtſchaft*.

This feaſt was ſolemnized with entertainments, balls, maſquerades, and the like diverſions, and held from evening till the next morning.—That princeſs, thinking the name too vulgar, changed it into that of the *feaſt of the gods*, in regard each perſon here repreſented ſome deity, according as it fell to his lot. The queen aſſumed the name of *Amarante*, that is, unfaiding, or immortal. The young nobility, dreſſed in the habit of nymphs and ſhepherds, ſerved the gods at the table.—At the end of the feaſt, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the maſques; and, in memory of ſo gallant a feaſt, founded a military order, called, in Swediſh, *Geſcilſchafft*, into which all that had been preſent at the feaſt were admitted, including ſixteen lords, and as many ladies, beſides the queen. Their device was the cypher of *Amarante*, compoſed of two A's, the one erect, the other inverted, and interwoven together; the whole incloſed by a lawrel crown, with this motto, *Dolce nella memoria*. V. *Juſtinian.* Hiſt. Ord. Milit. c. 85. Trev. Dict. Univ. in voc. *Amarante*.

Bulſtrode Whitlock, the Engliſh embaſſador from Cromwell to the court of Sweden, was made a knight of the order of *Amarante*.—On which account it ſeems to be, that we ſometimes find him ſtiled Sir Bulſtrode Whitlock. *Aſhmole*, Inſtit. Ord. Gart. c. 3. p. 123. ſeq. *Wood*, Ath. Oxon. T. 2. p. 546.

AMARANTH, or PRINCE'S-FEATHER, in botany, the name of a genus of plants; the characters of which are theſe. The flower conſiſts of ſeveral petals, diſpoſed in form of a roſe. The piſtil ariſes from the center of the flower, and finally becomes an oval or roundiſh fruit, containing roundiſh ſeeds.

The ſpecies of *Amaranth* enumerated by Mr. Tournefort are theſe.

1. The largeſt *Amaranth*, with duſky coloured flowers and white ſeeds. 2. The narrower leaved lower *Amaranth*, with a paler panicle. 3. The largeſt *Amaranth*, with a long ſparſed panicle. 4. The great *Amaranth*, with red ſeeds. 5. The great early flowering *Amaranth*, with pale ſeeds. 6. The great wild *Amaranth* of New England, which is all over green. 7. The great wild *Amaranth* of New England, with purple ſpikes. 8. The great wild *Amaranth* of New England, with fleſh coloured ſpikes. 9. The great beautiful ſcarlet *Amaranth*. 10. The crooked ſpiked *Amaranth*. 11. The creſted *Amaranth*, with bright red flowers. 12. The ſmall late flowering reticular, horned *Amaranth*. 13. The crimſon *Amaranth*. 14. The *Amaranth*, with yellow crooked panicles. 15. The *Amaranth*, with ſcarlet panicles. 16. The *Amaranth*, with browniſh red panicles. 17. The *Amaranth*, with duſky violet coloured panicles. 18. The ſimple panicled *Amaranth*, and purple flowers. 19. The great *Amaranth*, with upright purple panicles. 20. The great *Amaranth*, with upright green panicles. 21. The great *Amaranth*, with yellow panicles. 22. The ſilky ſpiked *Amaranth*, with yelloviſh green flowers. 23. The *Amaranth*, with ſcarlet ſpikes, variegated with a caſt of yellow. 24. The *Amaranth*, with ſpikes of yellow and fleſh-colour. 25. The *Amaranth*, with ſingle panicles of a ſhining flame-colour. 26. The *Amaranth*, with a gold yellow ſpike, variegated with red. 27. The perennial ſpiked Sicilian *Amaranth*. 28. The talleſt, long-leaved American *Amaranth*, with whitiſh green ſpikes. 29. The *Amaranth*, with conglomerated panicles. 30. The *Amaranth*, with large conglomerated panicles, and deep purple flowers. 31. The female, or bright coloured variegated leaved *Amaranth*. 32. The male variegated leaved *Amaranth*, with duſkier coloured leaves. 33. The prickly *Amaranth*, with ſlender panicles. 34. The Indian thorny *Amaranth*, with green ſpikes. 35. The Indian ſpiked, prickly *Amaranth*, with purple flowers. 36. The ſmall procumbent, purſelained-leaved Eaſt-Indian *Amaranth*, with headed flowers. *Tournef.* Inſt. p. 234, 235.

The culture and propagation of this beautful plant is this. It is to be ſowed on a good hot-bed in February, or in the beginning of March, and in about a fortnight's time the plants will riſe. Another hot-bed muſt then be prepared, covered with fine mould to about four inches deep, and the young plants muſt be carefully raiſed, and removed from the other, and planted at about four inches diſtance every way, and gently watered to ſettle the earth to their roots. In the heat of the day they muſt be ſcreened with mats from the heat of the ſun, and they muſt have air given them, by raiſing the glaſs that covers the bed; and the glaſſes muſt be either turned, or wiped from their moiſture, as often as they appear wet. In about three weeks or a month's time, theſe plants will have grown ſo large as to require another hot-bed; this muſt be of a moderate temper, and covered ſix inches deep with fine earth, then take them carefully up, and preſerve as much of the earth about their roots as may be, and plant them in this bed at eight inches diſtance, then let them be watered frequently a little at a time, and ſhaded with mats in the heat of the day. In the begining of May another hot-bed muſt prepared, with a deep frame, that the plants have room to grow;

grow; in this ſet as many pots as it will conveniently hold, let theſe be filled with freſh earth, and the intermediate ſpaces every way be filled alſo with earth. The plants are now to be raiſed with as much earth about their roots as may be, and planted in theſe pots. In about three weeks more, theſe plants will be grown to a large ſize, and muſt have air given them more and more every day in good weather. And in July they are to be ſet out in their places, often watering them. *Miller*'s Gardners Dict.

All the ſpecies of this plant are drying and aſtringent, but heat not in a violent degree. Schroder recommends the flowers of the common large garden kind dried and powdered, as good in diarrhæas, dyſenteries, hæmorrhages of all kinds, and incontinency of urine; but they are very little uſed in the preſent practice.

AMARANTHOIDES, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the floſculous kind, and collected into a ſquammoſe head; two imbricated little leaves grow together to the axis, and reſemble, in ſome degree, the claws of a crab; theſe embrace and incloſe a floſcule, which is jagged at the edge, and incloſed in its peculiar cup. From this cup ariſes the piſtil, which is fixed in the manner of a nail to the hinder part of the flower, and covered with a calyptra; this finally becomes a roundiſh and ſomewhat crooked ſeed.

The ſpecies of *Amaranthoides*, enumerated by Mr. Tournefort, are theſe.

1. The lychnis leaved *Amaranthoides*, with large ſilvery heads. 2. The lychnis leaved *Amaranthoides*, with ſmaller ſilvery heads. 3. The creeping ſea *Amaranthoides*, with knot-graſs leaves and ſilvery heads. And, 4. The purple headed, lychnis leaved *Amaranthoides*. *Tourn.* Inſt. p. 654.

The culture and propagation of theſe plants is, in all reſpects, the ſame with that of the amaranth; only that they muſt have a greater ſhare of heat, and muſt be forwarded more in the ſpring. See AMARANTH.

The flowers of this plant are commonly known by the name of *everlaſting flowers*, and, if kept in a dry place, after having been gathered in their full perfection, and before they begin to decay on the plant, they will retain their full beauty many years. *Miller*'s Gardn. Dict.

AMATIDES, in natural hiſtory, a name given, by Bartholomæus Anglus, and other writers of his time, to a ſtone, of which they recorded a wonderful virtue in reſiſting the fire; they ſaid, if a cloath was only rubbed over with it, it would not take fire, but on being thrown among burning coals, would only become the brighter and more beautiful. The whole ſeems a very groſs error, the word being probably no other than a corruption of *Amianthus*, and the properties of that ſtone, which are, that if it be divided into threads, and theſe woven into cloth, that cloth will bear burning in the fire, and may be cleaned by that means, inſtead of waſhing. The careleſs writers of thoſe times ſeem only to have miſtaken this account, and miſrepreſented it, in this ſtrange manner, in their works; and the more ſo, as the ſtone is ſaid by them to repreſent plumoſe alum, which is the character of the amianthus.

AMAUROSIS (*Cycl.*)—This diſtemper is ſometimes denonominated *ſuffuſio nigri*, the black cataract.

The *Amauroſis* differs from the *amblyopia*, this being in an inferior degree. *Gorr.* Med. Defin. in voc. See AMBLYOPY, *Cycl.*

The *Amauroſis* is either tranſient or permanent.

Tranſient AMAUROSIS is that found in apoplexies and lipothymias, from immoderate bleeding, and the like, which vaniſhes as the fit or paroxyſm goes off.—To this kind alſo belong thoſe ſometimes produced by the ſuppreſſion of the hæmorrhoids, menſes, or other habitual evacuations, the healing up of iſſues, or the like.

Permanent AMAUROSIS, that whoſe cauſe is fixed in the retina, or in the optic nerves; chiefly in the want of the clear intercourſe and influx between the brain and thoſe parts.—To this kind alſo belong thoſe occaſioned by hydrocephali, by ſtones found near the root of the optic nerves, or by ſteatoma's compreſſing thoſe nerves, or by debilities and extenuations, by contortions, or compreſſions of the ſame, at their iſſue out of the cranium. *Burggrave*, Lex. Med. in voc.

AMAUSA, a name by which the chemiſts have called the paſtes made of lead and cryſtal with various admixtures, for imitating gems.. *Merret*'s Notes on Neri, p. 322. See the article PASTE.

AMAZON (*Cycl.*)—We read of Scythian *Amazons* in Herodotus; of Lybian *Amazons* in Diodorus Siculus; and of German *Amazons* in Lucius Florus. Later geographers and travellers alſo ſpeak of Mingrelian and Georgian *Amazons*; *Amazons* in America, in Monomotopa, in the Philippine iſlands, in Denmark, &c.

The *Amazons* of South-America, living on the banks of the great river which bears their name, make the greateſt figure in modern ſtory. They are repreſented as governed and led to war only by their queen. No men are ſuffered to live among them; though thoſe of ſome neighbouring nations are ſuffered to viſit them, at a certain ſeaſon, for the ſake of procreation. The females iſſuing from this commerce are bred up with care, and inſtructed in what relates to war and government; for the males, they are ſent away into the country of their fathers. V. *Rogers*, Voyag. T. 1. p. 100. *Martin*, Dict. Geogr. T. 1. p. 300.

The Jeſuit miſſionaries ſpeak of a like republic of *Amazons*, in one of the new Philippine iſlands. They have their huſbands, who viſit them at a certain ſeaſon of the year, and after a few days commerce together, retire into their own iſland, carrying with them the male infants produced by the former interview, and leaving the females to the mothers care. Lett. Edif. T. 6. in Pref. Mem. de Trev. 1706. p. 462. ſeq.

The beſt troops in the emperor of Monomotopas armies are ſaid to be women, who inhabit in the neighbourhood of the Nile; they converſe at certain periods with men, and diſpoſe of their children after the ſame manner as the reſt. Recueil de Voyag. de la Compag. des Ind. Orient. T. 3.

Thevenot and others relate, that in Mingrelia there is a people inhabiting mount Caucaſus abounding in martial women, who make frequent incurſions into Muſcovy, and oft engage with the Calmuc Tartars. Vid. *Chardin*, Voyages, T. 2. p. 124. Nouv. Rep. Lett. T. 4. p. 835.

Adam Bremenſis, an eccleſiaſtic about the year 1070, ſpeaks of an *Amazon* nation on the Baltic coaſt, of which he relates much the ſame that has been ſaid concerning other *Amazons*, only with the addition of new wonders; for he ſays, that, according to ſome, they become with child by ſwallowing a few drops of a certain water; according to others, that they had converſation with merchants, who traded thither, or with the priſoners they made in war, or with monſters, which were frequent among them; which laſt opinion ſeems to Adam the moſt probable. De Situ Daniæ, c. 28. *Martin.* Dict. Geogr. T. 1. p. 305.

The *Amazons* are alſo called, by Plato, *Sauromatides*. Herodotus mentions, that, in the Scythian language, their denomination was *Aeorpata*, *q. d. viricida*, man-killer; formed apparently from the Celtic, *aeor*, man, and *pata*, to kill. V. Miſc. Berol. T. 1. p. 5.

The chief grounds on which the exiſtence of the *Amazons* was called in queſtion by Strabo, is the difficulty of conceiving a community of women without men to ſubſiſt any long time, make war with ſucceſs on the neighbouring nations, and even undertake long military expeditions. Palephatus's diſbelief of the *Amazons* is founded on a conſideration of leſs weight. His argument is, that no ſuch republic ever exiſted, becauſe there was nothing like it found in his time; it being a principle with him, that whatever had been in former times, was ſtill, and would be for the future. The ſame author ſtarts another objection, not much more cogent, viz. that the *Amazons* were only men dreſſed in women's cloaths. Nouv. Rep. Lett. T. 4. p. 833.

In defence of the ſtory of the *Amazons*, Petit argues, that the diverſity of climates produces a great diverſity of humours and inclinations, and that the country of the *Amazons* had its particular diſpoſitions, which gave even its female natives a robuſt temperament and ferocity. To this may be added, the force of education.

In reality, the manner of breeding up women among us ſeems to be the chief obſtacle to their becoming *Amazons*: were they inured, from their infancy, to laborious exerciſes, to handle the ſword and piſtol, and fight like men, no doubt they would make gallant ſoldiers.

In effect, Plato enjoins the youth of both ſexes, in his commonwealth, to be trained up to the ſame exerciſes. Nouv. Rep. Lett. T. 4. p. 836. ſeq.

Some endeavour to reconcile the two opinions, by holding a republic of mere *Amazons* a chimera, and aſſerting, that the republic we are ſpeaking of was compoſed, like all others, both of men and women; only that the females had the upper hand, and made the chief figure in war. This ſeems warranted by Pliny and Pomponius Mela, who make mention of a Scythian people, wherein the women had the ſupreme command, and call this the kingdom of the *Amazons*. Bibl. Univ. T. 4. p. 833.

Some think this too much, and ſuppoſe, that the whole might have been founded in an antient practice in divers nations, of wives going to war with their huſbands. The caſe of the antient Cimbri was no leſs remarkable. Vid. *Tacit.* de Morib. Germ. c. 8. *Dithm.* Comm. ad Lov. Bibl. Germ. T. 15. p. 120. *Pompon. Mela*, l. 3. c. 4. Bibl. Univ. T. 1. p. 273. *Steph. Cleric.* Diſſ. Philoſ. 2. Bibl. Univ. T. 4. p. 437. Mem. Acad. Inſcript. T. 8. p. 149.

The *Amazons* of Lybia were a commonwealth of women inhabiting the banks of the Lacus Tritonides, famous for their ſtruggles and competition with the Gorgons, and other nations of the ſame ſex. See GORGONS.

In this ſenſe, the Gorgons are contradiſtinguiſhed from the *Amazons*, and the great rivals of them, they being properly two different nations of female warriours in Lybia, both inhabiting near the Lacus Tritonides, and famous for their diſputes and wars together [a]. Diodorus Siculus ſpeaks of the tombs of the *Amazons*, ſome ruins whereof were ſtill in being in his time. Theſe tombs were three monuments erected by

an antient queen of the country, wherein were buried a great number of their martial women, who had been killed by the Gorgons [b].—[a] *Maſſieu*, Diſſ. ſur les Gorgon. in Mem. Acad. Inſcript. T. 4. p. 72. [b] *Maſſieu*, loc. cit.]

Beſides M. Petit's works on the *Amazons* [c], M. Moreau de Mautour has publiſhed a plan of a new hiſtory of the *Amazons* [d]; but we do not find that the promiſed hiſtory itſelf has appeared.—[c *Pet. Petiti* de Amazonibus Diſſertatio: qua an vere extiterent necne variis ultrocitroque Conjecturis & Argumentis diſputatur; multa etiam ad eam Gentem pertinentia ex Antiquis Monumentis eruuntur, atque illuſtrantur, Pariſ. 1685. 12mo. Act. Erud. Lipſ. 1685. p. 390. Nouv. Rep. Let. T. 4. p. 831. Jour. Liter. T. 10. p. 105. Trait. Hiſtor. ſur les Amazones, ou l'on trouve tout ce que les Auteurs tant Anciens que Moderns ont eſcrit pour ou contre ces Heroines, &c. Leid. 1718. 2 Tom. 8vo. [d] Diſc. Prelim. ſur la Diſſert. Hiſtor. des Amazones. Ap. Mem. de Trev. 1703. p. 157.]

AMAZON is alſo applied, in a figurative ſenſe, to bees, by reaſon among theſe inſects the females alone bear ſway. Vid. *Butler*, Hiſt. of Bees, in Pref.

Mr. Warder has publiſhed a work under the title of the true *Amazons*, or, the Commonwealth of Bees. See BEE.

AMAZONIAN, ſomething relating to, or reſembling Amazons. See AMAZON.

AMAZONIAN *kingdom* is particularly uſed for a feminine one, or that wherein the females alone bear ſway.

Ariſtotle, treating of the breeding of bees, profeſſes himſelf ignorant of their ſex, and therefore, willing to keep up the prerogative of the males, calls their governor Βασιλευς, *Rex*, in which he has been followed by the generality of others. An ingenious writer, of our own country, takes the liberty to ſtrain the ordinary ſignification of the word *rex*, and in ſuch places tranſlates it queen, this being an *Amazonian*, or female kingdom. Vid. *Butler* on bees, c. 4.

AMAZONIAN *habit*, in antiquity, denotes a dreſs formed in imitation of the Amazons.

Martia, the famous concubine of the emperor Commodus, had the appellation *Amazonian*, by reaſon it was in a habit of this kind that ſhe chiefly charmed him.—Hence alſo that prince himſelf engaged in combat, in the amphitheatre, in an *Amazonian* habit; and of all titles, the *Amazonius* was one of thoſe he moſt delighted in.—In honour either of the gallant, or his miſtreſs, the month December was alſo denominated *Amazonius*.

Some alſo apply *Amazonian* habit to the hunting dreſs worn by many ladies among us.

AMAZONIUS is an appellation given to a kind of paſtil, or troche, antiently uſed againſt riſings of the ſtomach, and vomitings.—The ingredients of which it is compoſed, are ſmallage, aniſeſeed, wormwood, myrrh, pepper, caſtoreum, opium, and cinnamon. *Gal.* de Compoſ. Medic. l. 8. c. 3. *Gorr.* Med. Def. p. 26.

AMBA, in botany, a name by which ſome authors have called the *manga Indica*, or mango tree. *J. Bauhin*, Vol. 1. p. 173.

AMBACHT, in topography, denotes a kind of juriſdiction, or territory, the poſſeſſor whereof has the adminiſtration of juſtice, both in *alto* and *baſſo*. *Aubert*, ap. Richel. Dict. T. 1 p. 74.

In this ſenſe, the term is uſed in ſome parts of Germany and Flanders, where cities and corporations, who elect chiefs, or ſuperiors, to whom they pay obedience, are called *Ambachten*, and thoſe ſuperiors *Ambachten Herren*, or *Heeren*. Countries were alſo divided into *Ambachties*. Hence, inſtead of the country of Engelbert, we meet, in antient charters, with the *Engelbrechtes*, and *Ambachte*, or *Ambechte*. *Du Cange*, Gloſſ. Lat. T. 1. p. 160.

Hence alſo we meet with *officina*, or *officium Ambachti*, or *Ambaht*.

In ſome antient writers *Ambacht* is particularly uſed for the juriſdiction, government, or chief magiſtracy of a city.

The word is very antient, though uſed originally in a ſenſe ſomewhat differet. Ennius calls a mercenary, or ſlave hired for money, *Ambactus*; and Cæſar gives the ſame appellation to a kind of dependents among the Gauls, who, without being ſlaves, were attached to the ſervice of great lords.

AMBAR-*ſeed*, in the materia medica, a name by which ſome have called muſk-ſeed. See the article MUSK-*ſeed*.

AMBARVALIA (*Cycl.*)—This feaſt was alſo called *Luſtratio Agrorum*.

Roſinus ranks it among the number of thoſe which were not fixed to any certain day; but were, nevertheleſs, to be conſtantly performed every year. The title of a chapter in Cato, on the contrary, ſeems to import, as if people were at their choice as to the ſolemnizing of this ceremony. *Cato*, de Re Ruſt. c. 141.

Some will have the *Ambarvalia* to have been held twice a year; the firſt time towards the end of January, or, as others think, in April; and the ſecond time in July, or, as Roſinus imagines, in Auguſt, at the time when the harveſt was ripe, *maturis frugibus*. Which opinion is the more probable, in that Ovid, who, in his *Faſti*, deſcribes the feaſts in the firſt ſix months of the year, from January to June incluſive, ſays nothing of the *Ambarvalia*.

The ſacrifice offered on this occaſion was hence called *Ambarvale ſacrum*, and *hoſtia Ambarvalis*.

The *Ambarvalia* were of two kinds, public and private.

The private were thoſe ſolemnized by the maſters of families, accompanied with their children and ſervants, in the villages and farms out of Rome.—They walked three times round the grounds, every one being crowned with leaves of oak, and ſinging hymns in honour of Ceres. After the proceſſion, they went to ſacrifice.

There were certain formulæ of words preſcribed on this occaſion. Vid. *Cato*, de Re Ruſt. ap. *Danet*, Dict. Ant. in voc.

The public *Ambarvalia* were thoſe celebrated in the boundaries of the city, and in which the twelve *fratres arvales* officiated pontifically, walking at the head of a proceſſion of the citizens, who had lands and vineyards in Rome.

The prayer, or formula here uſed, was *Avertas morbum, mortem, tabem, nebulam, impetiginem, peſeſtatem. Feſt.* de Verb. ſignif. in voc. *Peſeſtas*.

Some make a quinquennial as well as an annual *Ambarvalia*, the one performed once every *luſtrum*, the other once a year.

The former one was alſo called the greater *Ambarvalia*, as being performed according to a ſettled rite.—It is to theſe the denomination *Suovetaurilia*, ſeems alone to belong. *Baxt.* Gloſſ. See SUOVETAURILIA, *Cycl.*

AMBARVALIS *flos*, in botany, a name given, by ſome authors, to the *polygala*, or milkwort. *Ger.* Emac. Ind. 2.

AMBE (*Cycl.*)—The reduction of luxations of the arm with the ſhoulder is one of thoſe chirurgical operations which has many times puzzled the moſt ſkilful ſurgeons. Among the machines invented for this purpoſe, the *Ambe* of Hippocrates is one of the moſt antient, and moſt famous.

It conſiſts of an horizontal leaver, and a fixed point made of a piece of wood ſtanding vertically, to the extremity of which the leaver is joined by a hinge. The patient ſitting, and his arm that is hurt being raiſed, the machine is puſhed forward under the arm-pit, as far as can be, *curandum*, ſays Hippocrates, *ut quam penitiſſimè alam ſubeat*. The arm is tied to this horizontal piece, and then an aſſiſtant bears upon the ſcapula and the clavicula, whilſt another preſſes down the leaver, and thus makes the bone come into its place again.

The capital defect of the *Ambe* is, that it puſhes the head of the bone into its cavity, before the extenſion and counter-extenſion are made; the dangerous conſequences of which are, firſt, That the reduction is very difficult, becauſe the bone is not conducted by the ſame way it took in luxating itſelf, and that one meets with obſtacles from the parts that ſurround it, even the ſcapula itſelf, on which it articulates. Secondly, In making efforts for ſurmounting thoſe obſtacles, one runs the riſque of turning inwards the cartilaginous edge of the cavity of the ſcapula, or the *capſula ligamentoſa*. The third defect of the *Ambe* of Hippocrates is, that it cannot move the luxated bone, but from below upwards; conſequently, the machine is only proper in luxations directly downwards; and yet it is certain, that the arm luxates itſelf both outwards and inwards, and luxations forward are very frequent. In thoſe caſes, the *Ambe* is uſeleſs, and being dangerous in luxations downwards, it follows, that this machine labours under very great defects.

Mr. le Cat, in the Phil. Tranſ. N°. 469, has endeavoured to remedy theſe defects, by giving the deſcription and uſe of a new *Ambe*, not ſubject to the inconveniencies of the old one. But as the detail of this machine would exceed the bounds of our deſign, we muſt refer the curious to the tranſaction itſelf. See LUXATION, *Cycl.*

AMBER, (*Cycl.*) in natural hiſtory. See SUCCINUM.

AMBER *with inſects in it*. See INSECTS.

AMBERGREASE, *Ambra*, (*Cycl.*) in natural hiſtory, the name of a ſolid, dry, opake, inflamable foſſil, very light, of an agreeable ſmell, and melting into a fluid maſs in a very gentle fire.

The word is alſo written *Ambergreſs*, *Ambergreece*, and *Ambergris*. It is compounded of the barbarous Latin, *Amber*, and *gris*, grey.

Ambergreaſe is alſo known by the names *Ambarum*, *Ambra*, *Ambra griſea*, &c.

The author of a letter to Mr. Plukenet falſly affirms, that *Ambergreaſe* is an animal ſubſtance, produced from a ſort of inſect, as honey or ſilk are; and that in many parts of a large piece of *Ambergreaſe* found on the Jamaica coaſt, the beaks, wings, and part of the bodies of birds, were viſible. He adds, that he believes they ſwarm as bees on the ſea-ſhore, or even in the ſea. Phil. Tranſ. N°. 232. p. 712.

It is the opinion of ſome, that *Ambergreaſe* is really bred in the body of the *ſperma-ceti* whale, much after the ſame manner as muſk, civit, and ſome other ſubſtances, in their reſpective animals.—The diſcovery was firſt publiſhed by the honourable Paul Dudley, Eſq; as he received it from Mr. Atkins, a perſon of underſtanding and veracity, at Boſton, who had uſed the whale-fiſhery ten or twelve years; being one of the firſt of thoſe who undertook to fiſh

for the *Sperma-ceti* whale in 1720. His account is as follows.

Ambergreaſe is found only in the *Sperma-ceti* whales, and conſiſts of balls or globular bodies of various ſizes, from about three to twelve inches diameter, and weighing from a pound and a half to twenty two pounds, lying looſe in a large oval bag or bladder, three or four foot long, and two or three foot deep and wide, almoſt in the form of an ox's bladder, only the ends are drawn more acute, reſembling a black-ſmith's long bellows, with a ſpout running tapering into, and through the length of the *Penis*, and a duct or canal opening into the other end of the bag, and coming toward the kidneys. This bag lies juſt over the teſticles, which are above a foot long, and is placed length wiſe at the root of the *Penis*, about four or five foot below the navel, and three or four above the anus. This bag or bladder is almoſt full of a deep orange coloured liquor not quite ſo thick as oil, and ſmelling as ſtrong, or rather ſtronger of the ſame ſcent with the balls of *Ambergreaſe*, which float and ſwim looſe in it. The inſide of the bag is very deeply tinged with the ſame colour as the liquor, which alſo may be found in the canal of the *Penis*. The balls ſeem to be pretty hard, while the whale is alive, in as much, as there are many times found upon opening of the bag, large concave ſhelves of the ſame ſubſtance and conſiſtence, that have ſcaled off from them, and the balls themſelves ſeem to be compoſed of ſeveral diſtinct coats, incloſing one another, ſomething like the coats of an onion. As to the number of balls, Mr. Atkins never above four in a bag; where he once found one that weighed twenty-one pounds, which was the largeſt he ever ſaw, but there was only that one in the bag.

To one *Sperma-ceti* whale that has any of theſe balls, there are two that have nothing, but a deep orange coloured liquor in their bags; which confirms what another whale-man aſſured, that the *Ambergreaſe* was found only in ſuch *Sperma-ceti* whales, as are old and well grown. It is the general opinion of the whale-men, that the *Ambergreaſe* is produced only by the male, or the bull *Sperma-ceti* whale. The reaſon may be, that the cows are hardly ever taken, as being much more timorous than the males, and almoſt impoſſible to be come at, unleſs when found aſleep on the water, or detained by their calves, Mr. Atkins's method of getting the *Ambergreaſe* out of the whale was thus; after the fiſh is killed, he turns the belly upwards, fixes a tackle to the *penis*, cuts through the rim of the belly till he comes at the entrails, and then ſearching for the duct, or canal at the further end of the bag, he ties it pretty near to the bag, and cuts the duct off beyond it, upon which he draws forth the *Penis* by the tail, and the *Ambergreaſe* bag entirely follows it, and comes clean and whole out of the belly. The bag, an ingenious perſon conjectures to be the urinary bladder, and the *Ambegreaſe* ball to be a kind of concretion, formed out of the greaſy odoriferous ſubſtance of the liquor aforeſaid contained within it. Phil. Tranſ. N°. 387. p. 266. ſeq.

To this account it is objected, that the *Sperma-ceti* whales are found in the northern ſea, where no *Ambergreaſe* is to be met with.—Another objection is, that thoſe huge pieces of *Ambergreaſe*, mentioned by Garcias ab Horto, and other writers, are hardly reconcileable to this ſyſtem. *Garc. ab Hort.* Hiſt. Arom. l. 1. c. 1. *Verdr.* Phyſ. p. 2. c. 6. §. 6. *Ambergreaſe* plainly appears to be no animal ſubſtance, from the chemical principles obtained from it; for it affords no urinous volatile ſpirit, or ſalt; but, on the contrary, a ſmall quantity of an acid ſalt, exactly like that of amber.

In ſhort, the various erroneous conjectures, about the nature and origin of this ſubſtance, have been almoſt innumerable; but it is aſſuredly of mineral origin, and is no other than a light and frothy bitumen, exſudating out of the earth in a fluid form, and afterwards hardening into the conſiſtence in which we ſee it. Its having been once fluid is evinced by the ſame proof with that of amber, which is, that it frequently contains extraneous ſubſtances immerſed into its moſt ſolid maſſes, which could never have been admitted there, but when it was in a ſoft and fluid ſtate. Small ſhells, little pebbles, and grains of ſand, are not unfrequently found in it; and ſometimes the heads, and beak mouths of the calamary, and other fiſh of that kind: theſe have been miſtaken from their figure, for the beaks of parroquets and other birds, by thoſe who were ignorant of the nature of the fiſh they belonged to: and hence many extravagant conjectures have ariſen as to the origin of the body itſelf. *Hill*'s Hiſt. of Foſ. p. 112.

Authors have talked of two kinds of *Ambergreaſe*, a black and a grey, of which they acknowledged the grey the better; but the truth is, that theſe are only two appearances of the ſame ſubſtance. All *Ambergreaſe* is naturally compoſed of whitiſh and blackiſh particles, the whitiſh ones are the fineſt perfume, and when they are in greateſt abundance, the whole is the ſweeteſt and moſt valuable; but theſe whitiſh particles being crumbly and eaſily deſtroyed, are ſometimes in a great meaſure waſhed off, and the others left almoſt alone; the maſſes in this ſtate muſt be greatly inferior to the others in ſmell, and in value, and of a dark colour, and theſe are what are called black *Ambergreaſe*. *Hill*'s Hiſt. of Foſ. p. 412.

Ambergreaſe is found in more or leſs abundance, in moſt parts of the Eaſt-Indies. Japan furniſhes a large quantity; and the eaſtern parts of Java, and the Maldive iſlands have enriched many who knew how to ſearch after this commodity. It is in theſe places generally found faſtened to the roots of trees, that grow on the ſhore ſtooping into the ſea: while it is under water it is ſoft and pliable like wax, and ſometimes little harder than a jelly; but as ſoon as taken up, it begins to grow rigid, and ſoon becomes abſolutely ſo.

We are told of much larger pieces of *Ambergreaſe*, than that mentioned in the Cyclopædia, of two foot diameter. One was taken up near the Cape of good Hope, which weighed three hundred pound; and another, if we may credit the relation, fifteen thouſand pound. Phil. Tranſ. N°. 263. p. 573. See alſo N°. 232. p. 712.

In Jamaica, there is not unfrequently found a large quantity of this valuable commodity. We have, in the philoſophical tranſactions, an account of a perſon, who, in two voyages, picked up a hundred and fifty pounds weight of it: it is principally thrown on ſhore, on a part of the iſland, called from thence *Ambergreaſe* Point. There is an opinion there, of its being produced by a bird, they ſometimes finding the beak, feathers, *&c.* in it; and the rude voyager, who collected it, affirming, that he had ſeen the birds, and that they ſwarm like bees, and live about the rocks; but all this is erroneous. The beaks which are found in *Ambergreaſe* are not the beaks of birds, tho' very like them, but are the mouths of the calamary, a ſea-fiſh, which are often found picked up by it; and whatever other matters are at times found lodged among it, are in the ſame manner taken up by it, while yet moiſt and ſoft, and toſſed about by the waves.

The Weſtern coaſt of Ireland is often found to yield very large pieces of this precious drug. The coaſts of the counties of Sligo, Mayo, Kerry, and the iſles of Arran, are the principal places where it has been found; and we have, in the philoſophical tranſactions, an account of a lump found on the coaſt of the firſt mentioned county, in the year 1691, which weighed fifty two ounces, and was bought upon the ſpot for twenty pound, and ſold in London for more than a hundred pound. This was blackiſh and gloſſy like pitch on the outſide, but when cut it was of a yellowiſh colour and more ſpungy, ſpeckled with whitiſh grains, and of a very fine ſmell but not ſo compact nor of ſo grey a colour as the common kind; other pieces have been found on the ſame coaſts as black as pitch throughout, and ſome almoſt entirely white, reſembling what Wormius calls in his Muſæum unripe or imperfect *Ambergreaſe*: yet all theſe have a fine ſmell, though the black has the leaſt of it. Philoſ. Tranſ. N°. 227. p. 509.

Ambergreaſe may be known to be genuine by its fragrant ſcent, when a hot needle or pin is thruſt into it, and its melting like fat, of an uniform conſiſtence. Whereas the counterfeit will not yield ſuch a ſmell, nor prove of ſuch a fat texture. *Alleyn*, New Diſpenſ. p. 145.

One thing however is very remarkable, that this drug, which is the moſt ſweet of all the perfumes, ſhould be capable of being reſembled in ſmell, by a preparation of one of the moſt odious of all ſtinks. Mr. Homberg found, that a veſſel in which he had made a long digeſtion of the human fæces, acquired a very ſtrong and perfect ſmell of *Ambergreaſe*, inſomuch that any one would have thought a great quantity of eſſence of *Ambergreaſe* had been made in it. The perfume was ſo ſtrong and offenſive, that the veſſel was forced to be removed out of the elaboratory. Mem. Acad. Par. 1711.

Ambergreaſe is of much the ſame medicinal virtues with muſk; it is to be uſed for the ſame intentions, and generally to enter into the ſame compoſitions, only it is of ſomewhat a weaker ſcent. *Quinc.* Diſpenſ. P. 2. p. 86. See MUSK.

Hoffman ſays, that this drug is the beſt of antepileptics. Oper. Tom. 3. Sect. 1. c. 1. §. 4.

Eſſence or tincture of *Ambergreaſe*, is a cordial perfume prepared of *Ambergreaſe*, muſk, civet, and ſugar-candy, by digeſting them with tartarized ſpirit of wine.

Quincy affirms this to be the beſt of all medical perfumes, and fitteſt for perſpiration. *Quinc.* lib. cit. p. 294.

Dr. Newman of Berlin has given us a diſſertation on *Ambergreaſe*, in the Phil. Tranſ. N°. 435. Where alſo he mentions a very ſimple proceſs for making the ſolution of *Ambergreaſe* in ſpirit of wine; it is only to put a twelfth part of *Ambergreaſe* broke into ſmall pieces, into highly rectified tartarized ſpirit of wine, or even ſimple rectified ſpirit, without tartar, in a glaſs; and then to expoſe them to ſuch a heat, as will make the ſpirit begin to boil.

Several authors have treated expreſsly on the ſubject of *Ambergreaſe*, as Klobius[a], Clodius a Puteo[b], Camelli[c], and ſome anonymous writers[d]. Chevalier has publiſhed a deſcription of the large piece of *Ambergreaſe* at Amſterdam[e]. —

que la Chambre d'Amſterdam à receu des Indes Orientales peſant 182 Livres; avec un petit Traité de ſon Origine & de ſa Vertu, Amſter. 1700. 4to. Philoſ. Tranſ. N°. 263. p. 573.]

AMBERING is uſed, by ſome writers, to denote the giving a ſcent or perfume of *amber* to any thing.

This is otherwiſe called *enambering*. V. *Hook*, Phil. Collect. N°. 4. p. 105.

Dr. Hook mentions an extraordinary method of *ambering in infinitum*, *i. e.* with a ſmall quantity of *amber*, and other requiſites, *enambering* an hundred, or a thouſand pounds of ſugar, or the like, ſo as the firſt matter ſtill remains undecayed, to be uſed again. *Hook*, loc. cit.

AMBETTUWAY, in botany, a name given, by the natives of Guinea, to a kind of tree, whoſe leaves they uſe in medicine, giving them boiled in wine, to create an appetite. The leaves are rough, and reſemble, both in ſhape and ſize, thoſe of our common elm. Phil. Tranſ. N°. 232.

AMBIDEXTER (*Cycl.*)—For the natural cauſe of this faculty, ſome, as Hœfer [a], attribute it to an extraordinary ſupply of blood and ſpirits from the heart and brain, which furniſh both hands with the neceſſary ſtrength and agility: others, as Nic. Maſſa, to the erect ſituation of the heart, which inclines neither to the right-hand nor left; and others [b] to the right and left ſubclavian arteries being of the ſame height, and the ſame diſtance from the heart, by which the blood is propelled with equal force to both hands.—But theſe are only conjectures, or rather chimera's. The true cauſe being doubtleſs to be referred to education and habit, or rather to nature itſelf, which, if let alone, men as well as brutes would more than probably be all *Ambidexters*, there being no difference of right and left in the nature of things. The nurſes and good women are even forced to be at ſome pains to enure the infants under their care to forgo the uſe of their left-hand [c]. How far it may be our advantage to be deprived of half our natural dexterity, may be doubted. 'Tis certain, there are infinite occaſions in life, when it would be better to have the equal uſe of both hands. Surgeons and oculiſts are of neceſſity obliged to be *Ambidexters*; bleeding, &c. in the left-arm, or left-ankle [d], and operations on the left-eyes [e], cannot be well performed but with the left-hand. Divers inſtances occur in hiſtory, where the left-hand has been cultivated preferably to the right. But by the laws of the antient Scythians, people were enjoined to exerciſe both hands alike, without partiality either for the right or left; and Plato [f] enjoins *Ambidexterity* to be obſerved and encouraged in his republic.—[a Hercul. Med. l. 7. c. 6. b *Burggr.* Lex. Med. T. 1. in voc. c V. *Ferrar.* de Infant. Cura, P. 1. Aph. 45. d *Horn.* Microtec. ſec. 2. p. 151. e Mem. de Trev. an. 1706. p. 326. f De Legib. l. 3.]

In the Grecian armies, their more diſtinguiſhed ſoldiers, their pikemen and halbardeers, as thoſe who formed the firſt line of their battalions, were to be able to fight indifferently with left-hand or right. We find it mentioned in ſcripture [g], that, on an extraordinary occaſion, the ſingle tribe of Gad produced 700 brave men, who fought with the left-hand as well as the right. And the Roman hiſtorians aſſure us, that they had gladiators who were trained up to the ſame exerciſe. An ingenious French writer [h] is ſurprized, that among all the modern refinements in the art of war, none have thought of reſtoring the antient practice of forming *Ambidexters*, which it is certain might be of conſiderable ſervice in the way of ſtratagem.—[g Judg. *c.* xx. *v.* 16. h *Morin*, ap Hiſt. Acad. Inſcr. T. 2. p. 98.

AMBIEGNA, in antiquity, an appellation given to a victim, which was ſurrounded, or attended at the time of offering it, with other leſſer ones.

In this ſenſe, the word is alſo written *Ambegui*. We read of *Ambiegnæ oves* uſed in ſacrificing to Juno, which were ſheep, having brought forth twins, and offered up with their two lambs faſtened on either ſide. *Varro*, de Ling. Lat. l. 6. c. 3. *Pitiſc.* Lex. Ant. T. 1. p. 79. See alſo *Struv.* Antiq. Rom. c. 10.

AMBIGU denotes a kind of mixed entertainment, wherein both fleſh and fruit are ſerved together; ſo that it ſeems doubtful whether to denominate it a mere collation, or a meal. Trev. Dict. Univ. T. 1. p. 323.

AMBIGUOUS (*Cycl.*)—An anonymous writer has publiſhed a dictionary of *ambiguous* words. *Lexicon Philoſophicum de Ambiguitate Vocabulorum*, Francof. 1597. 4to.

AMBIT (*Cycl.*)—Iſaac Voſſius has a particular inquiry concerning the *Ambit*, or circumference of antient Rome. That of the city he makes to be 60¾ miles, or *mille paſſus*, and that of the city and ſuburbs together 72 miles; exceeding antient Babylon, whoſe *Ambit* was only 60 miles. *Voſſ.* de Antiq. Urbis Romæ Magnit. c. 5. ap. Var. Obſerv. p. 22.

AMBIT, *Ambitus*, was particularly uſed, in antiquity, to denote a ſpace of ground to be left vacant betwixt one building and another. By the laws of the twelve tables, houſes were not to be built contiguous, but an *Ambit*, or ſpace of 2½ feet, was to be left about each, for fear of fire. V. *Feſt.* de Verb. Signif. p. 11. *Danet.* Dict. Ant. in voc.

The *Ambitus* of a tomb or monument, denoted a certain number of feet, in length and breadth, around the ſame, within which the ſanctity aſſigned to it was limited. The whole ground wherein a tomb was erected, was not to be ſecreted from the common uſes; for this reaſon, it was frequent to inſcribe the *Ambit* on it, that it might be known how far its ſanctity extended: thus, *in fronte pedes tot*, *in agrum pedes tot*. *Kirch.* Man. de Funer. l. 3. c. 20.

AMBITUS, (*Cycl.*) among the Romans, differed from *Ambition*, as the former lies in the act, the latter in the mind.

Ambitus was of two kinds, one lawful, and even laudable, the other infamous.

The firſt, called alſo *Ambitus popularis*, was when a perſon offered his ſervice to the republic frankly, leaving it to every body to judge of his pretenſions as they found reaſonable.

This kind was not prohibited by any law, but always approved and practiſed by the beſt and greateſt men.

The means and inſtruments here made uſe of were various, 1. *Amici*, or friends, under divers relations, including *cognati*, *affines*, *neceſſarii*, *familiares*, *vicini*, *tribules*, *clientes*, *municipes*, *ſodales*, *collegæ*. 2. *Nomenclatura*, or the calling and ſaluting every perſon by his name; to which purpoſe, the candidates were attended with an officer, under the denomination of *interpres*, or *nomenclator*. 3. *Blanditia*, or obliging perſons by ſerving them, or their friends, patrons, or the like, with their vote and intereſt on other occaſions. 4. *Prenſatio*, the ſhaking every perſon by the hand, offering him his ſervice, friendſhip, &c. 5. *Aſſiduitas*. 6. The *toga candida*, worn looſe. 7. *Benignitas*, the diſtributing largeſſes, *congiaria*, &c.

The ſecond kind was that wherein force, cajoling, money, or other extraordinary influence, was made uſe of.—This was held infamous, and ſeverely puniſhed, as a ſource of corruption, and other miſchiefs.

Several laws were made againſt it, as the *Lex Acilia*, *Calpurnia*, *Aufidia*, *Bœbia*, *Æmilia*, *Cornelia*, *Fulvia*, *Fabia*, *Julia Auguſti*, *Julia Cæſaris*, *Licinia*, *Maria*, *Pœtelia*, *Pompeia*, *Tullia Vetus*. *Pitiſc.* Lex. Ant. T. 1. p. 80.

In the year of Rome 321, the uſe of the *toga candida* was prohibited. In the year 398, the candidates were forbid to go to the markets and meetings in the neighbouring towns. In 571, ſevere penalties were laid on the givers of largeſſes. In 594, this was made puniſhable by baniſhment. In 697, heavy fines were impoſed. *Baxt.* Gloſſ. p. 89. ſeq.

By the *Lex Tullia*, made in the conſulſhip of Cicero, the candidates were forbidden to beſtow any combats of gladiators on the people, to make any public feaſts, or to cauſe themſelves to be followed by a crowd of clients, for two years before they put in for any place.

A ſenator, who was guilty of a breach of this law, was puniſhed with ten years baniſhment; others were fined and rendered incapable of any dignity for ever. *Danet*, Dict. Ant. in voc.

Ambitus was not only practiſed at Rome and in the forum, but in the meetings and aſſemblies of other towns in Italy, where numbers of citizens were uſually found, on account of trade and buſineſs.

The practice ceaſed in the city from the time of the emperors, by reaſon poſts were not then to be had by courting the people, but by favour from the prince.

Perſons who had cauſes depending practiſed the ſame, going about among the judges to implore their favour and mercy. *Voſſ.* Etym. p. 22.

They who practiſed this were called *Ambitioſi*. Hence we alſo meet with *Ambitioſa decreta*, and *Ambitioſa juſſa*, uſed for ſuch ſentences and decrees as were thus procured from the judges, contrary to reaſon and equity, either gratuitouſly, or for money. Vid. *Pitiſc.* Lex. Ant. T. 1. p. 79. in voc. *Ambire*.

AMBIX, in antient writers, denotes a veſſel of glaſs, or ſhell. *Du Cange*, Gloſſ. Lat. in voc.

Hence the origin of the word *alembic*, which we ſometimes alſo find denoted by the word *Ambix*.

AMBLE (*Cycl.*)—This word is formed of *ambulare*, uſed in writers of the middle age, in the ſame ſenſe.

Ambling is alſo called, in thoſe writers, *ambulatura*, and *ambula*; by the Italians *ambiadura*. Vid. *Aquin.* Lex. Milit. in voc. *Ambulare*.

AMBO (*Cycl.*)—The *Ambo* is alſo called, by Sozomen, Βημα γνωστων, the readers *bema*, or deſk; by Cyprian, *pulpitum*, and *tribunal eccleſiæ*; by St. Auguſtin, *exedra*, and *apſis*. Card. Bona will alſo have the *Ambo* to have been called *ara*, altar; but Bingham overthrows this notion. V. *Bing.* Orig. Eccleſ. T. 1. l. 8. c. 5. §. 4. p. 294.

The modern reading deſks and pulpits have been generally ſubſtituted to the antient *Ambos*, though, in ſome churches, remains of the *Ambos* are ſtill ſeen. In that of St. John de Lateran at Rome, there are two moveable *Ambos*. M. Thiers inveighs againſt the diſuſe of the antient *Ambo*.—Thoſe by whom this innovation has been effected, he calls, by a new word, *Ambonoclaſtes*. *Richel.* Dict. T. 1. p. 75.

It was in the *Ambo* that publication was made of feaſts, faſts, proceſſions, &c. Here were read the acts of the martyrs, the the *ſancta ſanctis*, the diptychs, or commemoration of the dead; the letters of peace and communion, which one church ſent to another. Here new converts made their public profeſſion

feſſion of faith, and biſhops their defence againſt accuſations brought againſt them. Here treaties of peace were ſometimes alſo concluded, and coronations of kings and emperors performed, &c.

Divers antiquaries hold, that the *Ambo* was antiently the place from whence the biſhops and preſbyters made their ſermons; pulpits for that purpoſe having only been introduced by the mendicants, at the beginning of the thirteenth century. Jour. des Scav. T. 16. p. 126. *Bona*, Rer. Liturg. l. 2. c. 6. n. 3.

A late writer combats this opinion, and ſhews, that the uſual place from whence the antients preached was the ſteps of the altar; not but St. Chryſoſtom and St. Auguſtin both appear to have preached from the *Ambo*; but this was looked on as a thing ſomewhat extraordinary. *Bingh.* ubi ſupra. See alſo *Suic.* Theſ. Eccleſ. T. 1. p. 217. ſeq.

There is ſome diſpute concerning the part of the church, which is ſaid to be behind the *Ambo*, ὄπισθαμβωνος.—Properly ſpeaking, the *Ambo* was immediately behind the ſolea, or door of the bema. Hence that part next behind the *Ambo*, was, in reſpect of the *bema*, called ὄπισθαμβωνον, which was that wherein the catechumens and penitents were placed before the *miſſa catechumenorum*, after which they left it, and repaired into the *narthex*, or πρόναον. *Du Cange*, Gloſſ. Græc. T. 1. p. 58. ſeq.

M. de Thiers has a learned diſſertation on the uſe of *Ambos*; Sur les Jubez des Egliſes, ext. ap. ejuſd. Diſſert. Eccleſiaſt. 1688. Par. 12mo. V. Jour. des Scav. T. 16. p. 125. ſeq.

AMBONOCLASTES, a name given, by a late writer, to the demoliſhers of the *ambos* uſed in the primitive church. See AMBO.

The word is formed in imitation of *Iconoclaſtes*. See ICONOCLASTES, *Cycl.*

M. Thiers declaims ſeverely againſt the *Ambonoclaſtes*, as overturners of an inſtitution which was the fruit of the piety of the pureſt ages; as having maimed and disfigured churches, aboliſhed ſeveral ceremonies antiently performed there, and annihilated the myſteries which the *Ambos* exhibited. Diſſ. ſur les Jubez. Jour. des Scav. T. 16. p. 128.

AMBONUM, in natural hiſtory, a term uſed, by ſome of the old writers, to expreſs the prominent tubercles on certain ſtones. We ſee ſuch, in irregular figures, very common on our flints; and the *oculus beli* among the gems ſhews an inſtance of them, its pupil being ſometimes prominent. It ſeems only a corruption of the word *umbo*.

AMBRA, in natural hiſtory, ambergreaſe. See AMBERGREASE.

AMBROSE.—*St.* AMBROSE *in the wood*, by the Italians called, *al nemo*, is an order of religious, confirmed in 1431, under the rule of St. Auguſtine.

The monks of *St. Ambroſe al nemo* wear the image of the ſaint engraven on a little plate, and make uſe of the Ambroſian office.

In the province of Berry in France, the title *fathers of St. Ambroſe* is alſo given to the canons regular of St. Auguſtine, by reaſon their abbey at Bourges is dedicated to St. Ambroſe de Cahors. Trev. Dict. Univ. T. 1. p. 331.

AMBROSIA (*Cycl.*)—The *Ambroſia* is commonly repreſented as the ſolid food of the gods, by way of contradiſtinction from the fluid, which was called *nectar*: but the appellations are ſometimes inverted, and the name *Ambroſia* given to the drink of the dieties, as that of nectar to the meat. *Rhodig.* Antiq. Lect. l. 7. c. 13.

Wedelius has a diſſertation on *Ambroſia* and nectar, wherein he ſhews, that the term is ſometimes uſed to denote honey, ſometimes wine, ſometimes perfumes, and particularly ambergreaſe; ſometimes the method or ingredients for embalming or preſerving dead bodies from putrefaction, and ſometimes alſo for a ſtate of unchangeableneſs, or immortality. *Wedel.* Exerc. Phil. Med. Dec. 5. Ex. 5. de Nect. & Ambroſia.

AMBROSIA is alſo a ſplendid kind of title given, by ſome phyſicians, to certain alexipharmic compoſitions, of extraordinary virtue. *Galen*, de Loc. Affect. l. 4. c. 8. *Caſt.* Lex. Med. p. 38.

In this ſenſe, *Ambroſia*, Αμβροσια, amounts to much the ſame with Αθανασια, *Athanaſia*, as being ſuppoſed to conduce to immortality.

This name was particularly given to a famous antidote of Philip of Macedon againſt all poiſons, bites and ſtings of venomous creatures, as well as many internal diſeaſes. *Galen*, de Antidot. l. 2. c. 8.

AMBROSIA is alſo uſed for a pure ſpirituous kind of medicine, artfully extracted from the groſs elementary parts of a body, and which being adminiſtred in the ſmalleſt doſe is of conſiderable virtue, and may be taken without diſguſt, or inconvenience. *Caſt.* Lex. Med. p. 38.

In this ſenſe, *Ambroſia* amounts to much the ſame with what we otherwiſe call quinteſſence. See QUINTESSENCE, *Cycl.*

Nic. Abr. Frambeſa has a treatiſe expreſs on the preparation of theſe *Ambroſiæ*. Ambroſiopœa, Lugd. Bat. 1628. 12mo. Francof. 1629. 4to.

Some alſo uſe *Ambroſia* for a medicine agreeable to take, and which does not ruffle or diſturb the patient in the operation. Such are thoſe made up for delicate perſons and tender conſtitutions, to purge them, according to Hippocrates's rule, *cito*, *tuto*, and *jucunde*. Trev. Dict. Univ. T. 1. p. 331.

AMBROSIA, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the floſculous kind, being compoſed of ſeveral ſmall floſcules, which are barren, and are contained in great numbers in the ſame common cup. The embryo's grow in other parts of the ſame plant, and finally become fruits, of the ſhape of a club, containing oblong ſeeds.

The ſpecies of *Ambroſia*, enumerated by Mr. Tournefort, are theſe.

1. The ſea *Ambroſia*. 2. The tall ſea *Ambroſia*, with leaves like mugwort, and without ſcent. 3. The tall hairy *Ambroſia* of America, with leaves like the platanus. *Tournef.* Inſt. p. 439.

However determinate we may be in theſe ages in the names of plants, we are not to expect the ſame preciſion in the antients; they frequently applied the ſame name to ſeveral very different plants; and it is neceſſary to be informed of this, and to know the nature and characters of the plants thus included in the ſame name, before we can profit by the accounts they have left us of the virtues or uſes of them.

The *Ambroſia* of the moderns is not at all like the plant ſo called by the generality of the antients. Strabo tells us, that in his time the plant cultivated in gardens, under the name of *Ambroſia*, did not appear to be the ſame with the *Ambroſia* of antient writers.

It is plain from Pliny, that even in his time the word *Ambroſia* was a name given by authors to many different plants. It is not eaſy to ſay what two plants are more unlike than the lilly and the houſeleek, yet both theſe are called *Ambroſia*, by authors of thoſe times.

Dioſcorides tells us, that the *Ambroſia* of his time was an elegant and beautiful plant, and was uſed by the Cappadocians in their garlands, and other ornaments made of flowers. Our *Ambroſia* has no title to a place among theſe, nor any recommendation as an ornamental plant. Nicander tells us, that the *Ambroſia* uſed in theſe garlands was the lilly; and Athenæus ventures to tranſlate the *Ambroſia*, lilly, on this occaſion; but it does not appear evident that the lilly is the *Ambroſia* here meant by Dioſcorides, it is much more likely to have been ſome ſmaller garden flower.

Dioſcorides, among the ſynonyma of the *ſedum*, or great houſeleek, tells us, that ſome called it *buphthalmus*, others *zoophthalmus*, two names taken from the reſemblance of its round cluſters to the eyes of large animals; and that others called it *Ambroſia*.

AMBROSIA is alſo uſed, by ſome of the antient writers, to expreſs what they judged to be the food of the bees, and what probably is ſo, though that has not been the opinion of the generality of late writers. They called by this name the lumps of yellow matter found on the third joint of the hinder legs of bees, when returning to their hive; this is called by the French *cire brute*, or rough wax, and has been commonly ſuppoſed to be really wax; but, on examination, it appears to be a very different ſubſtance. It has not the properties of wax, and is indeed no other than a congeries of the farina of flowers, which ſtill retains the globular or oval figure of the granules of that farina, though collected into maſſes. It is neither fuſible nor ductile, as common wax is, but is brittle, and burns to a coal over the fire. It is very probable, that the bees actually feed upon this ſubſtance, according to the old opinion, and that, after having ſerved as nouriſhment to their little bodies, it becomes altered in their bowels into what we call wax; no experiment of any kind having been able to produce true wax from it. *Reaumur*, Hiſt. Inſect. Vol. 10. p. 50. See the article BEE.

This ſubſtance is, by ſome, taken to be a groſs or ſolid honey; and is contradiſtinguiſhed from the liquid or purer ſort, which is denominated *nectar*.

The *Ambroſia* will not keep, and, if not ſpeedily ſpent, corrupts and turns ſowr, making what is ſometime called *coom*, or *ſtopping*, or, after the Greeks, *ſandarak*, highly offenſive and pernicious to the hive. *Butler*, Hiſt. of Bees, c. 6.

AMBROSIA, in antiquity, denotes a feaſt celebrated by the Aconians, in honour of Bacchus.

The *Ambroſia* were alſo denominated *Choa* and *Lenæa*. They were held in the month called Lenæon. Vid. *Roſin.* Antiq. Rom. l. 4. c. 15. *Rhodig.* Antiq. Lect. l. 27. c. 24. It. l. 28. c. 25.

AMBROSIN, in middle aged writers, denotes a coin ſtruck by the lords or dukes of Milan, whereon was repreſented St. Ambroſe on horſeback, with a whip in his right-hand. The occaſion of this coinage is ſaid to have been a viſion of that ſaint, who appeared to the Milaneſe general, in 1339, during the time of a battle. *Du Cange*, Gloſſ. Lat. T. 1. p. 165.

AMBUBAJÆ, in antiquity, a kind of wanton minſtrels about Rome, who lived by playing and dancing in places of reſort, and proſtituting their bodies for hire.

Authors ſpeak as if there had been a regular college, or community of *Ambubajæ*, and that theſe were the ſame with what were otherwiſe called *tibicinæ*. *Horat.* l. 1. Sat. 2. v. 1.

Some ſuggeſt that the *Ambubajæ* were of the male kind, only dreſſed in the habit of women. Vid. *Struv.* Synt. Antiq. Rom. c. 12. p. 639.

Antiquaries have been greatly divided about the *Ambubajæ*; ſome will have them to have come to Rome out of Syria; others ſuppoſe them to have been Roman women, though called by a name of Syriac origin.

Torrentius, Turnebus, and Pulmannus, derive the name from *ambu*, or *am*, an old Latin prepoſition, denoting *circum*, about, and *Bajæ*, a delicious place near Naples; and maintain, that the *Ambubajæ* were a kind of curtezans, who frequented the baths of that city. Cruquius is of a different opinion, taking the word *Ambubajæ* to have been uſed for *Ambubeja*, and primarily to denote a ſeller of *Ambubeja*, an herb mentioned by antient naturaliſts. Theſe ſellers of *Ambubeja* being a kind of empirics, their name became afterwards applied to all charletans. Trev. Dict. Univ. T. 1. p. 332.

Hoffman has a diſcourſe expreſs on the *Ambubajæ*.

AMBUBEIA, in botany, a name given, by ſome authors, to wild ſuccory. *Ger.* Emac. Ind. 2.

AMBURBIUM (*Cycl.*)—This is otherwiſe called *Amburbia*, and *luſtratio Amburbialis*.—Apuleius calls it *luſtrale piamentum*; others, *ſacrificium luſtrale*, by way of expiation, as a preſervative from unhappy omens and dangers impending.

Servius expreſly diſtinguiſhes between the *Amburbia* and *Ambarvalia*.—*Dicitur hoc ſacrificium Ambarvale quod arva ambiat victima, ſicut Amburbale, vel Amburbium, quod urbem circuit & ambit victima.* The one was performed in the city, the other in the country. *Serv.* ad Virg. Ecl. 3. v. 77. *Scalig.* Not. in Feſt. p. 17. in voc. *Amtermini*. *Struv.* Synt. Antiq. Rom. c. 9.

AMBURY, or ANBURY, a name given, by our farriers, to a kind of ſoft and ſpungy ſwelling growing on the bodies of horſes, ſomewhat ſore to the touch, and full of blood. The method of curing it is, to tye a horſe-hair very hard round it, at the root; in about a week after this, it will fall off, and the part is then to have ſome powder of verdigreaſe ſtrewed upon it, to prevent the return of the complaint, and finally to be healed up with the common green ointment.

This is the common method, when the *Ambury* is high and prominent; but ſometimes it is flat and low, with a broad baſe: in this caſe, it is impoſſible to take it off by ligature, and there is a neceſſity of having recourſe to a ſeverer operation. It muſt, in this circumſtance, be taken away either by the knife or fire: if the former way be agreed on, the method is this; the ſkin is to be drawn back tight, and then the whole ſwelling cut off cloſe to the common level of the reſt of the fleſh: if in the other way, an iron is to be heated red hot and applied to it, continuing it on till the whole is burnt down to the even fleſh. In both caſes, care muſt be taken not to ſpare in the cutting or burning, ſo as to leave any root behind, for then the complaint will be renewed. When it is taken off, the common ointment of hogs-lard and turpentine will compleat a cure. There are ſome circumſtances, however, in which the knife and cautery may be both improper, as, if it grows in a ſinewy part, or the like; in this caſe, the proper method is, to eat out the core with oil of vitriol, or white ſublimate, and then ſtop the hole with flax dipped in honey and lime unſlaked. Some, for the firſt day or two, dip it only in the white of an egg, and after that, in the mixture of quick lime and honey; and this ſeems the better way. Vid. *Markham*'s Farrier.

Many of our farriers boaſt of a ſecret, which infallibly cures all kinds of protuberances of this kind, the preparation of which is this. Take three ounces of green vitriol, and one ounce of white arſenic, beat them to a coarſe powder, and put them into a crucible; place the crucible in the midſt of a charcoal fire, ſtirring the ſubſtance, but carefully avoiding the poiſonous ſteams; when the whole grows reddiſh, take the crucible out of the fire, and when cool, break it and take out the matter at the bottom; beat this to powder in a mortar, and add to four ounces of this powder five ounces of *album rhoſis*; make the whole into an ointment, and let it be applied cold to warts, rubbing them with it every day: they will, by this means, fall off gently and eaſily, without leaving any ſwellings. It is beſt to keep the horſe quiet, and without working, during the cure. What ſores remain on the parts where the ſwellings fall off from, may be cured with the common application, called the counteſs's ointment. *Sollyſel*'s Compleat Horſeman.

AMEA, in botany, a name given, by the natives of Guinea, to a plant, which they uſe in bleedings at the noſe, drying and powdering the leaves, and ſnuffing up the powder. It ſeems to be of the family of the plant called *pajamirioba*, by Sir Hans Sloane, in his Jamaica Catalogue. Its leaves are large and alated, and of a beautiful green, even when dried. Vid. Phil. Tranſ. N°. 232.

AMEDEI, *Amedians*, a congregation of religious in Italy, inſtituted in 1400.

Their name is formed of the Latin, *amans Deum*, *q. d.* lover of God, or rather of *amatus Deo*, beloved of God.

The *Amedei* wore a grey habit, and wooden ſhoes, had no breeches, and girt themſelves with a cord. They had twenty-eight convents; and were united by pope Pius V. partly with the Ciſtercian order, and partly with that of the Soccolanti, or wooden-ſhoe-wearers. *D'Emilian*, Hiſt. of Monaſt. Ord. p. 217. ſeq.

AMEIVA, in zoology, the name of a Braſilian ſpecies of lizard, reſembling the taraguira in figure, but having a bifid tail. This is Margrave's account of it; but Mr. Ray very judiciouſly queſtions the fact, not believing that there is in nature any ſuch ſpecies. Probably indeed it is only an accidental variety of the taraguira, or ſome other common lizard, perhaps from a wound, or other accident; perhaps from the egg, as we have lately ſeen from Barbadoes, a ſnake with two heads, taken out of an egg of ſome common kind; for aſſuredly there never was any ſuch ſpecies as a two headed ſerpent. *Ray*, Syn. Quad. p. 266.

AMEL (*Cycl.*) is ſometimes uſed for enamel: we frequently meet with it uſed in this ſenſe by Mr. Boyle. See his Works abridg. Vol. 1. p. 130. and in other places.

AMELLUS, in botany, a name uſed, by ſome authors, to expreſs the *caltha paluſtris*, or marſh marygold; and by Virgil, for the *aſter atticus*. *Ger.* Emac. Ind. 2.

Many of the critics on Virgil have ſuppoſed, that the poet meant no other than the common herb baum by this name. He ſays, the flowers are gold colour, and the leaves purple. This they explain, by obſerving, that the ſtamina, or threads of the flower, are yellow, and the flower-cup purple; and that he meant this, and not the leaves of the plant, in his deſcription. There is indeed this to countenance the opinion, that the Latin authors have often called the ſtamina of a plant the flower, and not the petals. This Vopiſcus, in Aurelian, carries ſo far as to the roſe, calling it a yellow flower in a purple caſe. It is evident from this, that the Greeks, as well as Romans, underſtood the yellow threads, which are very numerous, in the center of the roſe, to be the flower, and the purple petals, which we call the flower, they called the huſk.

Others are of opinion, and that with more ſhew of reaſon, that the *Amellus* of Virgil is the plant we call *aſter atticus*. The author deſcribes it as growing in meadows, which is the place of growth of that plant, though not of the baum; and as to the deſcription, if the ſtamina, or threads, are called by this author, as by others of the antients, the flower, theſe are more numerous and more yellow in this plant, than in the baum, and the leaves of the flower in this are of a beautiful blueiſh purple, and do not drive us to the cup, as in the making the baum to be the *Amellus*.

AMENDMENT, (*Cycl.*) in a general ſenſe, a change made in a thing for the better.

Amendment amounts to much the ſame with melioration, reformation, correction, &c.

AMENDMENT is more particularly uſed for a manure laid on the ground, to fatten or enrich it. See MANURING, *Cycl.* and *Suppl.*

AMENDMENT, in a literary ſenſe, is uſed to denote the corrections and other alterations made in the poſterior editions of books.

In this ſenſe, *Amendments* are alſo denominated emendations.

Many authors ſeem to conſider *Amendments* as the ſame thing with additions, but they are very different. We often meet with large additions, without any *Amendments*. *Amendments* properly reſpect the juſtneſs and exactneſs of a book, additions its extent and compaſs. We hear of *Amendments* of bills in parliament [a], even *Amendments* of *Amendments* [b], *Amendments* of returns of repreſentatives, &c.—[a Vid. *Hakew.* Mann. Paſſing Bills, ſec. 5. b Id. ib. ſec. 6.]

In caſes of wrong returns, ſo reported by the committee of privileges and elections, and voted by the houſe of commons, it is uſually ordered, that the returns be *amended* by the returning officer, according to the directions of the houſe, without iſſuing a new writ. Mem. of Proceed. in Parliam. c. 16.

Amendments ought always to be in that houſe from whence the thing to be *amended* originally proceeded, though the directions for the *Amendments* came from the other houſe. *Hakew.* Mann. of Paſſ. Bills, p. 167.

AMENTACEOUS, in botany, a term applied to the flowers of certain trees and plants, which are compoſed of a vaſt number of apices, or antheræ, hanging down in form of a rope; ſuch as the hazel, and the like.

AMENTUM, among alchemiſts, denotes *alumen ſciſſum*. See the article ALUM.

AMENTUM, in antiquity, a leathern thong faſtened about the middle of a dart, or javelin, whereby, after caſting it at the enemy, it might be drawn back again to the owner.

The *Amentum* ſerved alſo to increaſe the force of the ſtroke; for which reaſon, ſome of their great men refuſed to uſe it, as confiding wholly in the natural ſtrength of their own arms. *Pitiſc.* Lex. Antiq. in voc.

AMERADE, a kind of officers among the Saracens, anſwering to the governors of provinces among the Europeans. Trev. Dict. Univ. in voc.

The name is originally the ſame with that of *emir*.

AMERICIMA, in zoology, the name of a Braſilian ſpecies of lizard, very ſmall, being not above three fingers breadth long, and of the thickneſs of a ſwan's quill. Its body appears ſquare; its whole back is covered with deep grey ſcales, and its head, legs and ſides, with brown ones, and its tail with

with blue. All of them are very gloſſy, and extremely ſmooth to the touch. Its feet are ſcarce thicker than hogs briſtles. It is generally eſteemed a poiſonous animal. *Ray*, Syn. Quad. p. 267. See Tab. of Quadrupeds and Serpents. N°. 35.

AMETHYST, (*Cycl.*) the name of a very well known and very beautiful gem. The ſtone called *Amethyſt* by the antients, was evidently the ſame with that now generally known by this name, which is far from being the caſe in regard to ſome of the other gems. And the gem they called the *hyacinth* was alſo no other than a variety of this ſtone, reſembling the flower of that name. See HYACINTH.

They accounted, beſide that alſo, five other ſpecies of the *Amethyſt*, all which were truly no more than varieties of this ſtone in the degree of colour, and all which we alſo have at preſent, though not known among our jewellers under any particular names. Indeed there might be numberleſs names and numberleſs ſpecies accounted of this gem, if they were to be given according to its different degrees of colour, it having ſometimes a bluer, ſometimes a redder purple, and varying in degree through all the changes between the colour of the ripe purple grape, and the colourleſs hue of the pureſt cryſtals.

It is inferior to ſcarce any of the gems in beauty, and in the fineſt ſpecimens is of the ſame hardneſs and of equal value with the ruby. It is found of various ſizes, from the bigneſs of a ſmall vetch to an inch and half in diameter, and often to much more than that in length. It is as various in ſhape as the diamond, and ſome other of the gems; it is not unfrequently found in a roundiſh or pebble-like form, ſometimes a little longiſh, and often thicker at one end than the other, and reſembling in ſome ſort a pear. It is in theſe ſhapes ſometimes equally rounded every way, but more frequently it is flatted on one ſide, and often has very ſmall and very bright faces on ſeveral parts. Tho' this is no unuſual form to meet it in, its more common appearance however is a cryſtalliform figure, being found adhering by its baſe to ſtony matter, and either cruſting over the cracks and fiſſures in the ſtrata of ferrugineous ſtones, or coating the inſides of large and hollow ferrugineous nodules, reſembling thoſe hollow flints which we every day ſee in England, coated within with common ſmall pellucid cryſtals. In theſe nodules the *Amethyſt* always aſſumes the form either of a ſhort and thick column of four planes, terminated by a flat and ſhort pyramid of the ſame number of ſides, or elſe the very figure of our common hexangular cryſtal, and ſometimes that of a long pyramid without any column adhering to the matter of the nodule by its baſe; in the columnar ſhape it makes the gayeſt figure, but in the pebble-like maſſes it is always the hardeſt and moſt valuable. *Hill*'s Hiſt. of Foſ. p. 593.

The colour of the *Amethyſt* is ever purple tho' various in degree, ſometimes approaching to the violet colour, and ſometimes fading almoſt into a roſe colour. It is ſometimes alſo found naturally colourleſs, and may, at any time, be made ſo, by putting it into the fire; and whether it has been naturally, or thus artificially produced, it, in this ſtate, ſo nicely imitates the diamond, that its want of hardneſs ſeems the only way of diſtinguiſhing it.

The tips or points of the angular *Amethyſts* are often the only coloured part, the reſt of the column remaining white.

The *Amethyſt* is found in the Eaſt and Weſt-Indies, and alſo in Europe. Some of the oriental ones, eſpecially of the pebble kind, are very hard, and of a very great ſplendour and value; but theſe are rare, moſt even of the oriental ones being very little harder than common cryſtal; and all the European ones are of this ſoft kind: whence the *Amethyſt*, in general, is of much leſs value than moſt of the other gems, though a few ſpecimens of it are very valuable. The oriental *Amethyſts* are found in Calecut and Biſnagar. The European ones are common to many places; Germany, Sileſia, and Bohemia abound with them; and they are not uncommon in Spain and Italy; the Pyrenæans, and the mountains of Auvergne afford very fine ones, and the mountain St. Sigimont in Catalonia is dug in many places for them. They there find the fineſt lodged in the perpendicular fiſſures of the rock, among a looſe reddiſh ferrugineous earth.

M. Morin ſhewed Dr. Liſter a huge block of French *Amethyſt*, 2 or 300 pound weight [a]. Ray ſpeaks of a mountain of *Amethyſts* [b].—[a] Vid. *Liſt.* Journ. Pariſ. [b] *Ray*, Trav. p. 469.

Amethyſts may be counterfeited with glaſs, to which the proper colour or ſtain is given. There were fine ones made in France, about the year 1690, which may even impoſe on connoiſeurs, unleſs the ſtone be taken out of the collet.

The method of giving this colour to glaſs is as follows. Take cryſtal-frit, made with the moſt perfect and fine tarſo; then prepare a mixture of manganeſe in powder, one pound; zaffer prepared, one ounce and half; mix theſe powders well together, and add to every pound of the frit, an ounce of this powder. Let it be put into the pots with the frit, not into the already made metal. When the whole has ſtood long enough in fuſion to be perfectly pure, work it into veſſels, and they will reſemble the colour of the *Amethyſt*. *Neri*'s Art of Glaſs, p. 92.

Some phyſicians make a particular claſs of medicines, under the denomination of *Amethyſta*, Αμεθυστα; under which they comprehend all preſervatives from drunkenneſs. Vid. *Gal.* de Compoſ. Medic. ſec. loc. c. 2. *Gorr.* Def. Med. p. 28.

AMETHYSTINE is applied, in antiquity, to a kind of purple garment dyed of the hue of *Amethyſt*. *Plin.* Hiſt. Nat. T. 1. l. 9. c. 38. p. 526. ſeq.

In this ſenſe, *Amethyſtine* differed from *Tyrian*, as well as from *Hyacinthine* purple, being a kind of medium between both.

AMGAILA, or AMGAILAM, in the materia medica of the antients, a name given, by Aviſenna and others, to a plant ſometimes called *acantha Arabica*, and *leucacantha* by the Greeks; the roots of which were called *bunkon*, and much uſed in medicine by the Arabian phyſicians. The names of this plant were almoſt all common to it, and to the tree which produces the gum Arabic; and hence ariſes a great confuſion in reading the works of thoſe who name it. But it is very certain, that they are two extremely different vegetables, the one being a tree, and the other a plant, whoſe roots were uſed in medicine.

The *Amgaila*, called alſo *ſucaha*, or *zucahai*, is deſcribed as a prickly herb, having roots like thoſe of the cyprus, formed of ſeveral joints, or knots; and that theſe, when they had been ſo long expoſed to the air as to be, in ſome ſort, rotten, and to fall ſpontaneouſly from one another, were afterwards dried, and became very light, of a yellow colour, and agreeably aromatic ſmell, and bitter taſte. They were uſed in ſtomachic and cardiac compoſitions, and were choſen by their lightneſs and good ſmell.

AMIA, in zoology, the name of a very large ſea fiſh, called by ſome alſo *glaucus*, and by others *leccia*. It grows to a vaſt ſize, and in figure reſembles the ſalmon. Its body is long and thick, and becomes ſquare towards the tail. Its back is of a duſky blue, with a light tinge of purple. Its ſides are of a more purple hue. It is covered with conſiderably large ſcales, though they ſeem ſmall, when we compare them with the ſize of the fiſh. Its mouth is not large; its jaws are furniſhed with ſharp teeth. Its gill fins are very ſmall for its ſize; its belly fins are placed near theſe. It has alſo two on the back; the anterior has ſeveral very ſharp prickles; the poſterior is long, and reaches almoſt to the tail: this and the belly fin oppoſite to it, are undulated at their edges. The tail is very forked. It is very common in the Mediterranean, and grows to four or five feet long. *Salvian.* de Aquat. *Aldrovand.* de Piſc. p. 302.

AMIA is alſo the name of a fiſh called, by ſome authors, *pelamys*, but different both from the *pelamys ſarda*, more uſually called ſimply *pelamys*, and from the *pelamys* of the antients, which was no other than the *thynnus*, or tunny-fiſh, at a certain time of its growth.

This is, in ſhape and figure, very like the mackrel, long, round bodied, and ſlender near the tail; the back is of a duſky blue, the belly of a fine ſilvery white, and its ſides are variegated with eight or nine oblique black lines. Its jaws have only one row of teeth in each. Its eyes are ſmall. It is common in the Mediterranean, and is brought to the markets of Italy, &c. *Ray*'s Ichthyograph. p. 180.

AMIANTHUS, in natural hiſtory, the name of a genus of foſſils, of the claſs of the *fibrariæ*; the characters of which are, that the bodies of it are flexile and elaſtic, and compoſed of ſhort and abrupt filaments. See Tab. of Foſſils, Claſs 1.

It has been a common error to confound the ſpecies of this genus one with another, and all with the ſeveral ſpecies of the aſbeſtus, the conſequence of which has been the loſs of the art of ſpinning and working the aſbeſtus into incombuſtible cloth. See the article ASBESTUS.

The ſpecies of this genus, at preſent known in the world, are four, two of which are compoſed of larger, and two of finer or ſmaller filaments.

The firſt is a reddiſh black kind, with very ſhort threads. This is very common in the iron mines of Germany. 2. A ſoft, ſilky, white kind, with ſhort and crooked filaments. This is found in many parts of France and Germany.

The ſecond kinds are, 1. A greyiſh green, rigid one, called erroneouſly *alumen plumoſum* in the ſhops. This is found in Egypt, Africa, and Germany. And, 2. A greeniſh brown one, found in maſſes of ſtone in Yorkſhire, and in Wales, and ſometimes in the ſame green marble at Angleſea, in which one of the aſbeſti is often found. *Hill*'s Hiſt. of Foſſ. p. 108, 109, 110.

AMICABLE *benches*, *ſcamna amicabilia*, in antiquity, are generally ſuppoſed to denote the ſeats in the Roman courts, whereon the advocates were placed.—Some think, that theſe had but little title to the denomination of *amicable*, and therefore will have the word to be here uſed for the benches whereon the *aſſeſſors*, or thoſe called *judices pedanei*, were placed. *Pitiſc.* Lex. Antiq. in voc.

AMICABLE *compounder*, *amicabilis compoſitor*, is uſed, in ſome antient law writers, for an *arbitrator*. *Du Cange*, Gloſſ. Lat. in voc. See ARBITRATOR, *Cycl.*

AMICITIA.—*Tenure in* AMICITIA, *tenere in Amicitiam*, is applied, in antient writers, to lands granted freely, and of mere good-will, to be enjoyed at the diſcretion of the donor. *Du Cange*, Gloſſ. Lat. T. 1. p. 168.

AMICTUS (*Cycl.*)—This garment is otherwiſe called *anabolagium*; ſometimes *ambolagium*, *anagolagium*, and *humerale*. In antient Engliſh writers it is called *Amitte*.

The *Amict* is properly a linen garment, of a ſquare figure, worn on the head, when the *alb* is uſed. The *Amict* is the firſt of the ſix garments which are common to biſhops and prieſts. The others are, *alba*, *cingulum*, *ſtola*, *manipulus*, and *planeta*.

The *Amict* is alſo worn by deacons, ſub-deacons, and acoluthi, when they officiate at the altar. Trev. Dict. Univ. T. 1. p. 347. ſeq.

Antiently all eccleſiaſtics wore the *Amictus* over the head, as is ſtill done by religious; afterward it was worn over the *planeta*. *Magri*, Vocab. Eccleſ. p. 14.

The *Amictus* went over the ſhoulders, and was buckled, or claſped before the breaſt.—Divers myſtical applications are formed of this habit in eccleſiaſtical writers. Vid. *Du Gange*, Gloſſ. Lat. T. 1. p. 168. ſeq.

The prieſts and deacons, in ſome dioceſes, wear *Amicts* on their heads, from All-ſaints to Eaſter; though, by the canons, they be expreſly forbid to wear the *Amict*, without ſome conſiderable occaſion.

M. Thiers aſſerts, that the uſe of *Amicts* was not introduced into the Latin church before the twelfth century [a]. Dom. de Vert [b] maintains the contrary, chiefly from a figure of St. Firmin, firſt biſhop of Amiens, ſuppoſed to have ſuffered martyrdom towards the beginning of the ſeventh century, whereon he is repreſented in his pontifical habit, with the *Amict* on his head [c].—[[a] V. *Thiers*, Hiſt. des Perruq. c. 8. [b] Explic. des Cerem. de la Meſſa, T. 2. p. 242. [c] *Aubert*, ap. Richel. Dict. T. 1. p. 79.]

AMICTUS, in Roman antiquity, denotes any upper garment worn over the tunica. *Ferrar.* de Re Veſt.

AMICULUM, in antiquity, denoted an upper garment worn by the women.—The *Amiculum* is ſaid to have differed from the *palla*; but wherein the preciſe difference lay does not appear. An *Amiculum* was alſo in uſe among the men. This ſeems to have been the ſame with the *chlamys*, or *paludamentum*. *Pitiſc.* Lex. Ant. in voc.

AMILICTI, in the Chaldaic theology, denote a kind of intellectual powers, or perſons in the divine hierarchy. Vid. *Stanl.* Hiſt. Philoſ. c. 6.

The *Amiliſti* are repreſented as three in number, and conſtitute one of the *triads*, in the third order of the hierarchy.

AMINEUM *acetum*, a name by which ſome of the medical writers have called white-wine vinegar, to diſtinguiſh it from other kinds.

AMIRANTE, a great officer in Spain, anſwering to the lord high admiral in England.

AMMA, (*Cycl.*) in middle age writers, denotes a ſpiritual mother.

In this ſenſe, the word was chiefly underſtood of an abbeſs, or ſuperior of a nunnery. *Magri*, Vocab. Eccleſ. p. 14. See ABBESS, *Cycl.*

AMMAN, in the German and Belgic policy, denotes a judge who has the cognizance of civil cauſes.

The word is alſo written *Amant*. Thus it occurs in writers on the French officers, where it ſtands for a notary, or parochial officer, who draws acts or inſtruments. *Du Cange*, Gloſſ. Lat. T. 1. p. 171.

AMMANIA, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe. The calyx is an oblong, erect, quadrangular perianthium, with eight lines and folds on it, and divided into ſegments at the end, and remaining when the flower is fallen. The flower is compoſed of four petals growing within the cup, and of an oval figure. The ſtamina are four ſlender filaments of the length of the cup. The antheræ are double; the germen of the piſtillum is large and oval; the ſtyle is ſimple, and very ſhort; and the ſtigma has a rim, or ridge round it. The fruit is a roundiſh capſule, conſiſting of four cells covered with the calyx. The ſeeds are numerous and ſmall. Vid. *Linnæus*'s Gener. Plant. p. 51.

AMMI, (*Cycl.*) *biſhops-weed*, in botany, the name of a genus of umbelliferous plants, the characters of which are theſe. The flower is of the roſaceous kind, being compoſed of ſeveral leaves arranged in a circular form; theſe are all of a heart-like ſhape, and irregular in ſize. Theſe leaves ſtand upon the cup, which afterwards becomes a fruit, compoſed of two ſmall ſeeds, which are gibboſe and ſtriated on one ſide, and flat and ſmooth on the other. To this it may be added, that the leaves are long and narrow, ſtanding over-againſt one another on the middle rib, which is terminated by a ſingle leaf.

The ſpecies of *Ammi*, enumerated by Mr. Tournefort, are theſe.

1. The great, broader leaved *Ammi*. 2. The great *Ammi*, with leaves cut in at the edges, and a little curled. And, 3. The Perennial *Ammi*, called by ſome authors *eryngium*, and by others *crithmum*. *Tournef.* Inſt. p. 304.

AMMINEA *uva*, in botany, a name given, by the old writers, to the grapes of a wild vine, common in the hedges of Italy, and ſome other places. They uſed to make wine of theſe grapes, which they mixed with other richer wines, and had in common uſe.

Some write the word *taminea*, inſtead of *aminea*; and it has been ſuppoſed, from this, that the berries of the *tamnus*, or black bryony, were thus called. But theſe could never be fit to make any ſort of wine of, and therefore the conjecture appears to be erroneous.

AMMITES, in mineralogy, a kind of figured ſtone, of a looſe open contexture, formed of a number of ſmall globular ſtones. *Mercat.* Metalloth. Arm. 9. c. 58. Ib. Arm. 10. p. 378.

Ammites is the ſame with what is otherwiſe called *Ammonites*.

The word is derived from the Greek, αμμος, ſand; in regard the *Ammites* appears to the eye as a compoſition of large ſand.

The *Ammites* is found in divers countries of Germany, &c. of different colours, as well as different degrees of hardneſs. It bears a near reſemblance to the *coccodes*.

AMMOCÆTUS, in ichthyology, a name given, by Geſner and ſome others, to the *ammodytes*, or ſand-eel; called alſo *tobianus*, by Schoneveldt and others. See AMMODYTES.

AMMOCHOSIA, Αμμοχωσια, in the antient phyſic, a kind of remedy, or operation for drying the body, by lying along on warm ſand, and having the body covered with the ſame. Some prefer ſalt for this purpoſe to ſand. Vid. *Gorr.* Def. Med. p. 29.

AMMOCHRYSOS, a name given by authors, to a ſtone very common in Germany, and ſeeming to be compoſed of a golden ſand. It is of a yellow gold-like colour, and its particles are all very gloſſy, being all fragments of a coloured talc. It is uſually ſo ſoft, as to be eaſily rubbed to a powder in the hand; ſometimes it requires grinding to powder in a mortar, or otherwiſe. It is uſed only as ſand to ſtrew over writing. *Boet. de Boot*, de Gemmis, p. 462.

The Germans call it *katzengold*; and there is another kind of it leſs common, but much more beautiful, conſiſting of the ſame ſort of gloſſy ſpangles, but thoſe not of a gold colour, but of a bright red, like vermillion.

AMMOCHYSUS, in natural hiſtory, a kind of gem, ſuppoſed to be the ſame with the *venturine*. *Kirch.* Mund. Subterr. l. 8. ſec. 1. c. 8.

AMMODYTES, in zoology, the name of a ſpecies of ſerpent, called alſo *ſerpens cornutus* by ſome, from certain protuberances on the head. It is about the ſize of the viper, and is of a yellowiſh or ſand colour. Its head is ſhaped like that of the viper, but its jaws are wider; and, in the upper part of its head, it has a ſort of wart-like excreſcence, which is ſuppoſed to reſemble a horn; and thence its name of *ſerpens cornutus*, as it has its other of *Ammodytes*, or ſand-ſnake, from its ſand-like colour, or from its quality of ſometimes running under the ſands. It is found in Lybia, and in ſome parts of Italy. *Ray*'s Synopſ. Anim. p. 287.

AMMODYTES, in ichthyology, the name of a genus of fiſhes, the characters of which, according to Artedi, are theſe. The branchioſtege membrane contains on each ſide ſeven bones, but theſe are, in great part, hid by the laminæ of the branchia. The head is compreſſed, the body oblong and ſlender, nearly cylindrical, but a little compreſſed, and it has no belly fins. The fiſh is of the malacopterygious, or ſoft-finned kind; and the characters of the ſpecies, enumerated by Artedi, are theſe. The lower jaw is the longeſt; the lateral lines are double, or two on each ſide. The pectoral fins have each twelve rays; the the back fin has fifty-four; that of the anus twenty-eight. The tail is bifid, and has fifteen long rays; the mouth is toothleſs; the anus is nearer to the tail than the head. We call the fiſh, the *ſand-eel*; Schonfield, the *tobianus*. *Artedi*, Gen. Piſc. p. 17.

According to Ray, it is ſeldom of more than a foot long, and blueiſh on the back, and white on the ſides and belly. It has a ſtrait line drawn along the middle of each ſide, and three foſſulæ, or lines, along the middle of the belly. It has no ſcales, but the ſides are marked with a number of oblique lines. Its noſe is ſharp, and the lower jaw falls out beyond the upper; the opening of the mouth is extremely large, but it has no teeth. Its fleſh is well taſted, and is much ſought after by the other fiſh of prey. The males of this ſpecies are ſhorter and thicker than the females. The fiſh is commonly found at about half a foot deep under the ſand, when the tide has run out, and are caught there with iron hooks, with which the fiſhermen pull them out. *Ray*'s Ichthyograph. p. 113.

The name is formed of the Greek, αμμος, ſand, and δυνω, a diver, expreſſing the quality of this creature, to dive into, or bury itſelf under the ſand.

AMMONIACUM *gummi*.—It is much to be queſtioned, whether we have, at preſent, the gum *Ammoniacum* deſcribed by the antients; and indeed their deſcriptions of that drug ſeem to evince, that we have not. See AMMONIAC, *Cycl.*

Our *Ammoniacum* has not the characters which they attribute to theirs. Dioſcorides tells us, that one ſort of the gum *Ammoniacum* of his time was called *thrauſma*, and *thrauſton*, becauſe of its being ſo brittle, that it crumbled to pieces between the fingers. This is a character expreſſive enough of ſome of the dry reſins; but could never be properly given to a gum which is one of the moſt tenacious that we have. The ſame author tells us, that it was like the lumps of the

thus, or frankincenſe. Serapio ſuppoſes, that he meant this likeneſs of the ſmell; but it rather appears, that he meant it only of the colour: he ſays it was of a duſky colour without, and of a reddiſh brown within; and ſuch they deſcribe ſome of their frankincenſe of that time to have been. Dioſcorides diſtinguiſhes this by the name of *euchrous*, well coloured.

They had, beſide this, another ſort, which they called *Ammoniacum phyraton*. This was ſoft as wax, and might be moulded between the fingers; but this was uſually foul'd with dirt, ſtones, and other kinds of filth. This was the only kind in uſe in the ſhops, in the time of the later Greeks. But neither this nor the other ſeem perfectly to agree with our gum *Ammoniacum*, though this laſt comes neareſt it. Another unanſwerable objection to this being the ſame with ours, is, that the Arabian writers, who copy their accounts from the Greeks, and therefore certainly mean the ſame gum, by the ſame name, call this alſo *lezoc aldeheb*, that is, *chryſocolla*, or golden glue.

Aviſenna tells us, that they gave it this name, becauſe books and papers were coloured with it, and that the colour it yielded was a fine yellow, like that of gold, and ſtuck ſo firmly to the paper, that it never came off again: thus golden glue became a good name for it; but this is ſo far from being applicable to our *Ammoniacum*, that ſome have ſuppoſed it was meant of the *gamboge*; but the virtues attributed to both contradict this.

Neophytus has endeavoured to reconcile the accounts given by Dioſcorides, of the two ſorts of *Ammoniacum* uſed in thoſe times, to the one ſort uſed in his; but he has forced the ſenſe of the words, and his interpretation of Dioſcorides's meaning will by no means bear. Pliny gives us the ſame account that Dioſcorides does of the two kinds; and it is very natural to agree with them, that the hard kind muſt be purer than the ſoft, which would naturally take up every thing that came in the way of it, and ſo be fouled with earth, ſtones, &c.

AMMONIACUM *regeneratum*, in chemiſtry, the name given to a ſort of *ſal armoniac*, procured by chemiſtry from its principles. See ARMONIAC, *Cycl.*

The method of preparing it is this: take four ounces of alkaline ſpirit of *ſal armoniac*, dilute it with three times its weight of water, in a tall glaſs, and drop in ſpirit of ſea-ſalt, till the alkali is ſaturated, and no more effervescence happens. The ſaturation being nicely hit, the liquor will be ſcentleſs, and of the taſte of *ſal armoniac*, let it be filtrated and evaporated, and it will ſhoot out a fine woolly ſalt; or if it be evaporated to a dryneſs, a white ſalt will remain, and either one or the other of theſe will be found to be true genuine *ſal armoniac*, capable of riſing in flowers, and ſtanding all the teſts of the common *ſal armoniac*.

The volatile alkali of animal and vegetable ſubſtances, which of itſelf indifferently receives all acids, is here determined, by the acid of ſea-ſalt, into a ſemi-volatile ſea-ſalt; hence the chemical rule, that acids are capable of determining alcali's into their own nature, ſeems to receive confirmation, while the alkali either gives fixedneſs, or volatility, as itſelf is fixed, or volatile; and therefore, as a large quantity of volatile alkali is continually generated from putrified animals and vegetables, if there was in nature a ſpirit of ſea-ſalt floating about in ſeveral places, *ſal ammoniac* would, in theſe places, be continually produced; and the ſame ſpirit meeting with a fixed alkali, produced from the aſhes of vegetables, would immediately produce a true fixed ſea-ſalt, as appears by the proceſs of the regenerated ſea-ſalt.

But though it is eaſy to manifeſt theſe fixed alkali's by experiments, yet it is very difficult to ſhew the exiſtence of ſuch acids in nature, unleſs we had the ſecret of Mr. Boyle, who, in his treatiſe of mechanical experiments, declares, that, by a ſecret and long continued digeſtion, ſea-ſalt may be ſo diſpoſed as to part with its acid, by a gentle heat, and that before its water, and without any addition of any other ſubſtance. *Boerh.* Chem. P. 2. p. 261.

AMMONITÆ, in natural hiſtory. See SNAKE-*ſtone*.

AMNA, in phyſical writers, denotes the water found in limy ſoils, and which conſequently is tinged with a whitiſh colour, as in many places of England. *Caſt.* Lex. Med. p. 40.

In this ſenſe, Paracelſus ſpeaks of the medical virtues and uſes of *Amna*. *Paracelſ.* de Tartar. l. 1. trac. 5. c. 2. in Schol.

AMNIMODAR, in aſtrology, the planet that rectifies a geniture, or rather a method of rectifying a nativity, and finding the preciſe degree in the horoſcope at the time of an infant's birth, from the condition of the planet, which had the rule in the laſt preceding conjunction, or oppoſition of the luminaries. *Vital.* Lex. Math. p. 30.

AMNIOS (*Cycl.*)—Authors differ widely as to the quantity and quality of the liquor of the *Amnios*. Vid. Medic. Eſſ. Edinb. Vol. 2. art. 9.

The liquor of the *Amnios*, according to Mr. Monro, ſerves to keep the fœtus and its membranes ſoft and extenſible, hinders them from cohering, and defends the fœtus from preſſure, or other violence, which it needs moſt to be protected from, while its parts are very tender. V. Medic. Eſſ. Edinb. Vol. 2. art. 9.

It is a queſtion whether the liquor of the *Amnios* be a proper food for the fœtus. Vid. Medic. Eſſ. Edinb. abridg. Vol. 1. p. 310. Where Mr. Monro is of opinion, that whether the liquor of the *Amnios* be in a ſound or in a morbid ſtate, it appears to be very ill calculated for ſerving as food to be taken into the ſtomach of a fœtus.

It is alſo controverted, whether the liquor of the *Amnios* paſſes into the ſtomach of the fœtus. Mr. Monro aſſerts, that the liquor of the *Amnios* does not paſs into the ſtomach of the fœtus; and anſwers the arguments brought by ſeveral learned men for the contrary opinion. V. Medic. Eſſ. Edinb. abrid. ib. p. 314. ſeq. See NUTRITION and FOETUS.

AMNIS *alcaliſatus*, among chemiſts, denotes water impregnated with an alcalious quality, by paſſing through a limy or other alcaline ſubſtance under-ground. *Ruland.* Lex. Alchem. p. 40.

This amounts to much the ſame with what Paracelſus calls *amna*. See AMNA.

AMNITES, in natural hiſtory, a name uſed by ſome for the *hammites*, or ſpawn-ſtone, a ſtone ſuppoſed to be compoſed of the petrified ſpawn of fiſhes. Raczynſki, in his hiſtory of Poland, tells us of theſe ſtones found, in great abundance, in ſome of the ſubterranean caverns, and other places in that kingdom. He very accurately deſcribes them, and is much nearer the truth in his judgment of their nature and origin, than thoſe who ſuppoſe them the ſpawn of fiſhes: he ſuppoſes them to be formed of grains of ſand, naturally combined together in that form; but they are, in reality, a congeries of ſmall *ſtalagmitæ*, or drop-ſtones. See STALAGMITÆ.

AMOEBÆUM, in the antient poetry, denotes a kind of poem, or compoſition, wherein two parties ſpeak alternately in the ſame number of verſes, but ſo, as that he who anſwers either goes beyond, or contradicts the other. *Feſt.* de Verb. ſignif. *Baxt.* Gloſſ. in voc.

The word is originally Greek, Αμοιβαιος, ſignifying mutual, or alternate. Hence alſo we meet with *epiſtolæ amœbææ*. Such, *e. gr.* are thoſe of Pliny and Trajan.

AMOGABARI, a kind of antient Spaniſh ſoldiery, in great repute for their bravery.—Theſe are otherwiſe denominated, in ſome writers, *Almugaveiri*. *Du Cange*, Trev. Dict.

AMOGLOSSUS, in zoology, a name of a peculiar kind of flat fiſh, ſomewhat reſembling the ſoal, and called in ſome parts of England, the *lantern*. It is of a very ſlender, pellucid and white body, and never exceeds three inches in length, and is exceeding ſmooth to the touch, being covered only with a number of very thin ſcales, which fall off on touching it. Its fleſh is very finely taſted, and requires very little dreſſing, being enough almoſt as ſoon as put on the fire. *Willughby*, Hiſt. Piſc. p. 102.

AMOMI is uſed, by the Dutch traders, for what we otherwiſe call *Jamaica pepper*. *Savar.* Dict. Comm. T. 1. p. 94.

AMOMUM (*Cycl.*)—The ſeed of that kind of *ſium*, which is called by many by this name, is a powerful diuretic, and is good in all nephritic caſes. It is alſo commended as an aperient in general, and preſcribed in obſtructions of the liver and ſpleen, and in ſuppreſſions of the menſes. The people in ſome parts of England bruiſe the ſeeds, and give them in warm ale, in cholics; but thoſe of caraway, or aniſe, are better.

The antient *Amomum* was of divers kinds; but the Armenian moſt eſteemed. It was a heater, dryer, and aſtringent; uſed as a narcotic, to appeaſe pain, cure poiſonous bites, inflammations of the eyes, &c.

It was ſometimes adulterated with another plant not unlike it, called *amomis*. Pliny [a] and Dioſcorides [b] are the authors who ſpeak fulleſt of the *Amomum*; but their deſcriptions are ſo imperfect, as to leave room for twenty different modern plants to be taken for the *Amomum* [c].—[[a] *Plin.* Hiſt. Nat. T. 1. l. 12. c. 13. p. 662. ſeq. [b] *Dioſcor.* l. 1. c. 14. [c] *Burgrav.* Lex. Med. T. 1. p. 599.]

A late gloſſariſt is ſatisfied the *Amomum* was no other than the cinnamomum, both being deſcribed, in antient poets, as of great uſe in embalming. *Baxt.* Gloſſ. p. 100. ſeq. See the article CINNAMON.

Hence alſo all medicines and unguents uſed in the embalming and preſerving of dead bodies, were called *Amomia*. *Hoffm.* Lex. Univ. T. 1. p. 183.

AMORÆANS, a ſect or order of gemaric doctors, or commentators on the Jeruſalem Talmud.

The word is otherwiſe written *Amorœi*, and *Amoraitæ*, *Amoraim*.—The *Amorœans* are alſo called, by Scaliger [a], *ſophiſtæ*; by Alting, γνωμολογοι, or ſpeakers of ſentences; by Bartaloccius, *dicentes*, or *diſceptantes*, by reaſon they conferred and diſputed together in a ſcholaſtic manner [b].—[[a] *Scal.* de Emendat. Temp. p. 614, [b] Bibl. Rabbin. T. 3. p. 663.]

The *Amorœans* ſucceeded the Miſchnic doctors. They ſubſiſted 250 years; and were ſucceeded by the *Seburœans*. Vid. *Wolf.* Bibl. Hebr. T. 2. l. 4. c. 4. §. 1. p. 914.

AMORE, in zoology, the name of a genus of fiſhes, of which there are three ſpecies. 1. The *Amore piuxma*. 2. The *Amore guacu*. And, 3. The *Amore tinga*.

The *Amore piuxma* has a very broad head, and a very large mouth, but has no teeth. Its body is oblong, and its back

and ſides are of a duſky iron colour. Its belly, which is protuberant, is white. Its ſkin is ſoft; and it has ſeven fins, beſide the tail, which is rounded at the end. Its fleſh is firm, and well-taſted.

The *Amore guacu* is like the former, of an oblong figure; but it grows to ſix inches in length. Its head is thick, its gills large, and its mouth is furniſhed with ſmall teeth. Its eyes are ſmall, their pupil black, and the iris yellow. It has ſeven fins, beſide the tail, which is long, and rounded at the end. This ſpecies is covered with ſomewhat large ſcales, and is of a ruſty iron colour, but ſomewhat paler on the belly than in any other parts.

The *Amore tinga* is of the ſame ſhape with the former, but is much ſmaller, and is covered with whitiſh ſcales all over, but ſpotted with brown ſpots. Its tail is brown, and waved with different degrees of that colour. All the three ſpecies are eaten, but the firſt is eſteemed the beſt. They are caught about the American ſhores. *Margrave*'s Hiſt. of Braſil.

AMORPHA, in botany, the name of a genus of plants of the papilionaceous kind, the characters of which are theſe. The perianthium is one leaved, tubulated, and cylindric; its mouth is ſtrait, and is divided into five ſegments, the two upper ones being longer than the reſt. The flower conſiſts of one petal, vertically ovated, hollow, erect, and a little larger than the cup; this is inſerted into the cup, between the two larger upper ſegments. The ſtamina are ten filaments, ſlightly cohering at the baſe; they are of an irregular length, but are longer than the flower. The antheræ are ſimple; the germen of the piſtil is roundiſh; the ſtyle is of the ſame length with the ſtamina; and the ſtigma is ſimple. The fruit is a lunated pod, of a compreſſed form, larger than the cup, and covered with tubercles. The ſeeds are of an oblong kidney-like ſhape, and two of them are contained in each fruit. This plant differs from all others in the ſtructure of the flower, its ſingle petal being a true vexillum, and the alæ and carina being wholly wanting; which is a very great ſingularity in ſuch a flower. Vid. *Linnæi*, Gen. Plant. p. 342. Hort. Cliffort. p. 86.

AMPANA, in botany, a name given, in the Hortus Malabaricus, to a genus of plants, ſince deſcribed by Linnæus, under the name of *boraſſus*. Hort. Malab. l. 10. See the article BORASSUS.

AMPELIS, the *vine*, in botany. See the articles VINE and VITIS.

AMPELIS, in the Linnæan ſyſtem of zoology, the name of a genus of birds, of the order of the *paſſeres*; the diſtinguiſhing characters of which are, that the tongue is furniſhed with a rim, or margin all round; the beak is of a conic form, and ſtrait. *Linnæus*'s Syſtema Naturæ, p. 48.

AMPELIS is alſo the name of a bird, of the magpye kind, called by ſome *Garrulus Bohemicus*.

It is of the ſize of the black-bird. Its head is creſted with a little plume of feathers, and is of a fine gloſſy brown; its neck is very ſhort, and variegated with black, brown, and white; its breaſt is of a reddiſh brown, and its belly grey; its back is of a cheſnut brown, and its wing feathers variegated with black and grey. It is thought to be peculiar to Bohemia, not having been found in any other country. It feeds on fruits, particularly grapes, whence its name; and is very voracious, and generally flies in large flocks together. *Ray*'s Ornithol. p. 91. *Aldrovand.* de Avib. l. 12. c. 17.

AMPELITIS, (*Cycl.*) a bituminous earth, nearly reſembling pit-coal, inſomuch, that the difference between them is ſcarce ſenſible. Accordingly, Theophraſtus gives its deſcription under the the claſs of theſe coals; and Dr. Woodward ſeems of the ſame opinion. The *Ampelites* of the ſhops, according to him, is the ſame with our canal-coal found in Lancaſhire. *Woodw.* Nat. Hiſt. Engl. Foſſ. p. 165.

It differs from the common pit-coal, in that it is more friable and fat, and withal leſs compact and ſolid; which, it muſt be owned, does not agree with Woodward's deſcription of canal-coal, which he repreſents as very fine and hard, ſo as to take a pretty good poliſh.

The beſt, according to Dioſcorides, is that of a black colour, reſembling ſmall pieces of the *lapis piceus*, or pit-coal, equally gloſſy on all ſides, though, when kneaded up with a little oil, it readily melts.

It is found in the ſame places with pit-coal, is uſed by huſbandmen, &c. to ſmear their vines with, againſt vermin, and is endued with a drying diſcuſſive power; on which account, it is alſo uſed for the dying of hair. *Mercat.* Metalloth. Arm. 5. c. 8.

Libavius has treated at large of the *Terra Ampelitis*.

AMPELOGRAPHIA, the natural hiſtory or deſcription of the vine. See VINE and VITIS.

The word is originally Greek, compounded of αμπελις, a vine, and γραφη, deſcription.

Phil. James Sachs has publiſhed an *Ampelographia*, ſeu vitis viniferæ ejuſque partium conſideratio phyſica, &c. Uratiſlav. 1661. 8vo.

AMPER, a local term uſed in Eſſex for a *tumor*, or *phlegmon*.

In this ſenſe, the word is alſo written *Ampor*. Vid. *Skin.* Etym. in voc.

AMPHERES, in antiquity, a kind of veſſels wherein each mariner wrought two oars at the ſame time, one with his right-hand, and the other with his left. This is alſo called *Amphericum*. *Scheff.* de Milit. Nav. l. 2. c. 2.

AMPHIBALUM, among middle age writers. See AMPHIMALLUM.

AMPHIBIA, in natural hiſtory, a claſs of animals, whoſe eſſential characters are, that they have either a naked, or elſe a ſcaly body, with no grinders, or *dentes molares*, their teeth all ſharp and pointed, and without radiated fins. Vid. *Linnæus*'s Syſtema Naturæ, p. 33. See the article AMPHIBIOUS, *Cycl.* and *Suppl.*

AMPHIBIOUS (*Cycl.*)—In ſome *amphibious* animals, as the frog, tortoiſe, &c. the heart has but one cavity, with an artery to receive the blood coming out of it, and a vein to convey it thither. *Bagliv.* Prax. Med.

In others, the *foramen ovale* appears to be ſtill open for the paſſage of the blood from the vena cava to the arteria venoſa, without the help of breathing.

In the caſtor diſſected by the academiſts of Paris, though the *foramen* was not found actually open, yet the *veſtigia*, or marks of it appeared; and the cauſe of its cloſure might well enough be accounted for, from the animal's having been detained a good while from the water, by which the part having been in diſuſe, it cloſed up. In the otter the caſe is different; there is no appearance of any thing like a *foramen*, and hence the neceſſity the creature is under of riſing, from time to time, above water, to take in air. Nat. Hiſt. Anim. p. 90. ſeq. Phil. Tranſ. N°. 124. p. 595.

The ſtructure of the feet of the caſtor pronounces it *amphibious* at firſt ſight, the fore-feet being formed like thoſe of terreſtrial animals, who hold their food in their feet, *e. gr.* ſquirrels, while the hind-feet are faſhioned after the manner of river-fowl, with webs or membranes between the toes, as the gooſe, duck, &c. Hiſt. Acad. Scienc. 1704. p. 81.

A great part of the fly kind may be ſaid, in one ſenſe, to be *amphibious*. Gnats drop their eggs in water, where hatching, the young live and breathe after the manner of fiſhes, till at length undergoing a metamorphoſis, they take wing, quit their native element, and become inhabitants of the air [a]. May not ſwallows alſo be ranged under this claſs, which have been ſometimes found to paſs their winter aſleep under water, from which the warmth of the ſpring awakes, and calls them forth [b].—[[a] *Hook*, Microg. obſ. 43. p. 196. [b] Mem. de Trev. 1718. p. 94.]

A late philoſopher has advanced a paradox, that man may, by art, be rendered *amphibious*, and able to live under water as well as frogs. His principle is, that as the fœtus lives *in utero* without air, and the circulation is there continued, by means of the *foramen ovale*, by preſerving the paſſage open, and the other parts in *ſtatu quo*, after the birth the ſame faculty would ſtill continue. Now, the *foramen*, according to him, whould be preſerved in its open ſtate, were people accuſtomed, from their infancy, to hold their breath a conſiderable time once a day, that the blood might be forced to reſume its antient paſſage, and prevent its drying up, as it uſually does. This conjecture ſeems, in ſome meaſure, ſupported by the practice of divers [c], who are taught from their childhood to hold their breath, and keep long under water, by which means the antient channel is kept open. A Calabrian monk at Madrid laid claim to this *amphibious* quality, making an offer to the king of Spain, to continue twice twenty-four hours under water, without ever coming up to take breath [d].—[[c] *Cornelii*, Progymnaſm. Phyſ. ex. 7. Philoſ. Tranſ. N°. 30. p. 579. [d] Mem. de Trev. 1703. p. 1286.]

It has been warmly controverted in France, whether the fleſh of *amphibious* animals were to be ranked in the claſs of fleſh, which is prohibited in Lent, or under that of fiſh. M. Hecquet inveighs ſeverely againſt the practice of eating *amphibious* animals, as tortoiſes, frogs, ſolan geeſe, under the notion of their belonging to the fiſhy tribe; whereas, according to him, they ought rather to be referred to the claſs of birds and quadrupeds. Vid. Traité des Diſpenſ. de Careme, l. 1. c. 24. Jour. des Scav. T. 43. p. 430. ſeq. It. T. 47. p. 531. Mem. de Trev. 1710. p. 2073. See alſo *Andr.* Regim. de la Careme. Jour. des Scav. T. 47. p. 440.

Elias Geiſsler [e] has written expreſly concerning *amphibious* animals. M. Ottwald of Dantzic has left behind him anatomical obſervations on *amphibious* animals; but they yet wait for an editor [f].—[[e] De Amphibiis, Lipſ. 1676. 4to. [f] Nouv. Liter. T. 9. p. 113.]

AMPHIBIOUS is ſometimes alſo applied to plants which draw their nutriment both from the earth and water. Dict. Ruſt. in voc.

In which ſenſe, willows, and the like, are *amphibious* plants. *Amphibious*, in this ſenſe, amounts to the ſame with what we more commonly call aquatic. See AQUATIC, *Cycl.*

AMPHICOME, in natural hiſtory, a kind of figured ſtone, of a round ſhape, but rugged, and beſet with eminences, celebrated on account of its uſe in divination. *Mercat.* Metalloth. Arm. 9. c. 55.

The word is originally Greek, αμφικομη, *q. d. utrinque comata*, or hairy on all ſides.

The

This ſtone is alſo called *Erotylos*, Ερωτυλος, *Amatoria*, probably on account of its ſuppoſed power of creating love.

The *Amphicome* is mentioned by Democritus and Pliny, though little known among the moderns. Mercatus takes it for the ſame with the *lapis lumbricatus*, of which he gives a figure. *Aſſalt.* Not. ad Mercat. loc. cit.

AMPHICTYONS (*Cycl.*)—Some ſuppoſe the word Αμφικτιονες to be formed of αμφι, about, and κτιειν, or κτιζειν, in regard the inhabitants of the country round about met here in council. Others, with more probability, from *Amphictyon*, ſon of Deucalion, whom they ſuppoſe to have been the founder of this aſſembly; though others will have Acriſius, king of the Argives, to have been the firſt who gave a form and laws to this body.

Their aſſembly was called το κοινον των Ελληνων συνεδριον, or *commune Græciæ concilium*; ſometimes alſo Εκκλησια Αμφικτυονων, *Eccleſia Amphictyonum*.

Authors give different accounts of the number of the *Amphictyons*, as well as of the ſtates who were entitled to have their repreſentatives in this council; according to Strabo, Harpocration, and Suidas, they were twelve from their firſt inſtitution ſent by the following cities, and ſtates; the Ionians, Dorians, Perrhæbians, Bœotians, Magneſians, Achæans, Phthians, Melians, Dolopians, Ænianians, Delphians, and Phocæans. Æſchines only reckons eleven, inſtead of the Achæans, Ænianians, Delphians, and Dolopians, he only gives theſe three, the Theſſalians, Œtæans, and Locrians. Laſtly, Pauſanias's liſt only contains ten *Amphictyons*, which are mentioned in the *Cyclopædia*.

In the time of Philip of Macedon, the Phocæans were excluded the alliance, for having plundered the Delphian temple, and the Lacedæmonians were admitted in their place; but the Phocæans ſixty years after, having behaved gallantly againſt Brennus and his Gauls, were reſtored to their ſeat in the *Amphictyonic* council. Under Auguſtus, the city Nicopolis was admitted into the body; and to make room for it, the Magneſians, Melians, Phthians, and Ænianians, who till then had diſtinct voices, were ordered to be numbered with the Theſſalians, and to have only one common repreſentative. Strabo ſpeaks as if this council were extinct in the times of Auguſtus and Tiberius: but Pauſanias who lived many years after, under Antoninus Pius, aſſures us it remained intire in his time, and that the number of *Amphictyons* was then thirty.

The members were of two kinds; each city ſending two deputies, under different denominations, one called Ιερομνημων, whoſe buſineſs ſeems to have been more immediately to inſpect what related to ſacrifices and ceremonies of religion; the other Πυλαγορας, charged with hearing and deciding of cauſes and differences between private perſons.—Both had an equal right to deliberate and vote, in all that related to the common intereſts of Greece. The Hieromnemon was elected by lot; the Pylagoras, by plurality of voices.

Though the *Amphictyons* were firſt inſtituted at Thermopylæ, M. de Valois maintains that their firſt place of reſidence was at Delphi, where, for ſome ages, the tranquillity of the times found them no other employment than that of being, if we may ſo call it, church-wardens of the temple of Apollo. In after times the approach of armies frequently drove them to Thermopylæ, where they took their ſtation, to be nearer at hand to oppoſe the enemies progreſs, and order timely ſuccour to the cities in danger. Their ordinary reſidence, however, was at Delphi.

Here they decided all public differences and diſputes between any of the cities of Greece; but before they entered on buſineſs, they jointly ſacrificed an ox cut into ſmall pieces, as a ſymbol of their union. Their determinations were received with the greateſt veneration, and even held ſacred and inviolable.

The *Amphictyons*, at their admiſſion, took a ſolemn oath never to diveſt any city of their right of deputation, never to avert its running waters, and if any attempt of this kind were made by others, to make mortal war againſt him: more particularly, in caſe of any attempt to rob the temple of any of its ornaments, that they would employ hands, feet, tongue, their whole power, to revenge it.—This oath was backed with terrible imprecations againſt ſuch as ſhould violate it; *e. gr.* May they meet all the vengeance of Apollo, Diana, Minerva, &c. their ſoil produce no fruit, their wives bring forth nothing but monſters, &c.

The ſtated terms of their meeting was in ſpring and autumn; the ſpring meeting was called Εαρινη Πυλαια, that in autumn Μετοπωρινη. On extraordinary occaſions, however, they met at any time of the year, or even continued ſitting all the year round.

Philip of Macedon uſurped the right of preſiding in the aſſembly of the *Amphictyons*, and of firſt conſulting the oracle, which was called Προμαντεια. Vid. *Potter*, Archæol. Græc. l. 1. c. 16. p. 89. ſeq. *Valois*, ap. Mem. Acad. Inſcrip. T. 4. p. 265. ſeq. It. T. 7. p. 641. Trev. Dict. Univ. in voc. *Richel.* Dict. in voc. *Æſchin.* Orat. περι παραπρεσβειας.

AMPHIDROMIA (*Cycl.*) See LUSTRICUS *dies*.

AMPHIDRYON, in eccleſiaſtical writers, a veil or curtain uſually drawn before the door of the *bema* in antient churches. Vid. *Du Cange*, Gloſſ. Græc. in voc. See the article BEMA.

AMPHIMALLUM, in eccleſiaſtical writers, is otherwiſe called *Amphibalum*, and *Amphibolum*.

Magri ſuggeſts the *Amphimallum*, ſpoken of by eccleſiaſtical writers, to have been a garment peculiar to biſhops. *Magri*, Vocab. Eccleſ. p. 15.

AMPHIPNEUMA, among antient phyſicians, a great degree or ſpecies of difficult reſpiration. *Hippoc.* Epid. l. 4. c. 24. n. 17. *Foſſ.* ad Eund. p. 43. *Caſt.* Lex. Med. p. 41.

AMPHIPPII, in antiquity, thoſe who practiſed riding on two horſes, by jumping from one to the other. *Pitiſc.* Lex. Ant. T. 1. p. 84.

The word is Greek, Αμφιπποι; they are ſometimes alſo called Ιππαγωγοι, and ſometimes by corruption, Ανιπποι. The appellation was given to a ſort of cavalry in the Grecian armies, who, for their conveniency, had two horſes a-piece, on which they rode by turns, leading the other. Vid. *Pollux*, Onomaſt. *Aquin.* Lex. Milit. T. 1. p. 49. *Tiraquel.* ad Alex. ab Alex. c. 22. *Potter*, Archæol. Græc. T. 2. l. 3. c. 3. p. 18.

AMPHIPRORÆ, in antiquity, were ſhips which had prows at both ends, that no time might be loſt in turning them, and alſo on account of the rapidity of ſtreams, and narrowneſs of channels. *Caliagr.* de Re Naut. c. 12. *Pitiſc.* Lex. Ant. T. 1. p. 89.

AMPHISBÆNA, in zoology, the name of a ſpecies of ſnake, which goes with equal eaſe either forward or backward. This is all its name imports, though there has been generally underſtood by it a ſerpent, with a head at each end, a monſter not to be expected in the works of nature.

It is a ſmall ſpecies of ſnake, of a pale brown colour, equally thick at the head and tail, and moving, like many inſects, either backward or forward. It is found in Lybia, and in the iſland of Lemnos. *Ray*'s Syn. Anim. p. 288.

Pliny, Galen, Ælian, Solinus, and other antient naturaliſts, ſpeak much of a ſerpent found in Lybia, under this denomination, which, according to them, could bite either at head or tail, *tanquam parum eſſet uno ore effundi venenum* [a], as if one mouth were not enough to convey its poiſon by.—The moderns generally deny the exiſtence of ſuch an animal, at leaſt of any ſuch ſpecies: inſtances of this kind may be found, but then they are irregular and monſtrous [b]. What ſeems to have given riſe to the opinion is, that there are ſome kinds of worms equally big at both ends; ſo that 'tis difficult to diſtinguiſh the head from the tail. It may be added, that there are ſome which move both ways; and theſe are the *Amphiſbænæ*, according to the etymon.—Such is the *cæcilia*, or ſlow-worm, or blind-worm, and ſome ſorts of *ſcolopendræ*.—[a *Plin.* l. 8. c. 23. b *Brown*, Vulg. Err. l. 3. c. 15.]

Sir Phil. *Vernatti* even affirms the exiſtence of a ſpecies of ſerpents in Java Major, with a head at each end, called *capra capella*, held ſacred by the people. We ſuppoſe he means the *cobra de cabelos*, which 'tis certain, from other accounts, has not this property. Vid. Phil. Tranſ. N°. 43. p. 863.

Some naturaliſts apply the term *Amphiſbæna* to inſects which have no heads.—In this ſenſe, Aldrovand gives the name *Amphiſbæna aquatica* to that ſpecies of inſects which he otherwiſe calls animated horſe-hairs; from an opinion, that they have no heads, but ſwim both ways.

AMPHISBÆNA *aquatica*, a name given, by Bertrutius, Albertus, and ſeveral other authors, to that long and ſlender inſect, called by others the *ſeta aquatica*, and *vermis ſetarius*. It has the name *Amphiſbæna*, from its going backwards or forwards with equal eaſe and celerity. This creature is, by the vulgar, ſuppoſed to be an animated horſe-hair; and Albertus and other the like authors, have taught many to believe, that a horſe-hair thrown any where into a ſtanding water, will become ſuch an animal. The uſual ſize is four or five inches long, and the thickneſs of a large hair. They are deſcribed by ſome as growing to a cubit long, and by others as growing even to two cubits. Theſe authors alſo affirm, that they are poiſonous to ſwallow, but of no hurt to the touch, and that they move like ſerpents.

Dr. Liſter accidentally found out the origin of this worm, in his reſearches into the hiſtory of a very different ſort of inſect. Diſſecting one of the common black beetles dug up in a garden, he found in its belly two of theſe hair-worms, or *Amphiſbænæ*; and renewing the experiment on other beetles of the ſame ſpecies, he found that they uſually contained one, two, or three of theſe worms. As ſoon as the body of the beetle is opened, they always crawl out. When put into water, they will live a conſiderable time, and ſwim nimbly about; but often put up their heads above water, as if endeavouring to make their eſcape, and ſometimes faſtening themſelves by the mouth to the ſides of the veſſel, and drawing their whole bodies after them.

This author obſerves alſo, that they cannot be fairly ſaid to be *Amphiſbænæ*, but move always with the head forwards; and that the head is diſtinguiſhed from the reſt of the body, by being conſiderably blacker than any other part, and is eaſily diſtinguiſhed from the tail end, which is white. When there are two or three of theſe found in the body of one beetle, they are uſually ſmall; but when the worm is ſingle,

it is much larger, and of a paler colour. Theſe creatures are not only found in the waters, but buried in earth, and ſometimes on the leaves of trees, in our gardens and hedges. Phil. Tranſ. N°. 83.

AMPHITANE, in natural hiſtory, a name of a ſtone deſcribed by the antients, and ſaid to have the power of the magnet, or loadſtone; but with this remarkable difference, that as that ſtone attracts only iron, ſo this exerts its influence only on gold. Pliny ſays it was found in that part of the Indies, where the native gold lay ſo near the ſurface of the earth as to be turned up in ſmall maſſes, among the earth of ant-hills, and deſcribes it to have been of a ſquare figure, and of the colour and brightneſs of gold. The deſcription plainly points out a well known foſſil, called, by Mr. Hill, *pyricubium*: this is common in the mines of moſt parts of the world; but neither this nor any other ſtone was ever ſuppoſed, in our times, to have the power of attracting gold. Probably the whole account aroſe from this, that in the gold mines worked in thoſe days, this foſſil might be frequent; and as it uſually lies near metals, and its brightneſs and regular figure might naturally make it be taken notice of by the miners, they might make it a rule, that when they found it, gold was near; and this report, a little miſrepreſented, might eaſily, among a people fond of reporting marvelous things, be ſwelled into a ſtory of its attracting the gold. See PYRICUBIUM.

AMPHITAPA, in antiquity, a kind of carpets, or cloathing, having a ſoft warm nap on each ſide. *Briſſon*, de Verb. ſignif. *Pitiſc.* Lex. Ant. in voc.

AMPHITHEATRE, (*Cycl.*) in gardening, certain diſpoſitions of trees and ſhrubs on the ſides of hilly places, which, if the hill or riſing be naturally of a circular figure, always have the beſt effect. They are to be formed of evergreens, ſuch as hollies, phillereys, lauruſtines, bays, and the like, obſerving to plant the ſhorteſt growing trees in the front, and thoſe which will be the talleſt behind, ſuch as pines, firs, cedars of Lebanon, and the like. *Amphitheatres* are alſo ſometimes formed of ſlopes on the ſides of hills, covered only with turf, and, when well kept, they are a great ornament to large gardens. *Miller*'s Gard. Dict. in voc.

AMPHITHURA, in eccleſiaſtical antiquity, a name given to the veil, or curtain, which divided the chancel from the reſt of the church. *Bingh.* Orig. Eccleſ. l. 8. c. 6. §. 8.

The word is Greek, Αμφίθυρα, thus called on account of its opening in the middle, after the manner of folding-doors.

AMPHODONTA, in zoology, a deſignation given to animals which have teeth in both jaws, the upper as well as under. *Caſt.* Lex. Med. p. 41.

The word is Greek, Αμφοδοντα, compounded of αμφι, and οδος, tooth.

AMPHORA (*Cycl.*)—We meet with two kinds of *Amphoræ* in antient writers, the Italic and Attic.

Italic AMPHORA was that uſed by the Romans, and which is therefore ſometimes called the Roman *Amphora*.

The Italian *Amphora* was alſo called *quadrantale*, and ſometimes *cadus*. It contained 72 pounds of wine, or water, 80 of oil, and 180 of honey. *Rhod.* de Pond. & Menſ. p. 40. *Voluſ. Mæcian.* de Ponder. ap. Pitiſc. Lex. Ant. T. 1. p. 88.

The *Amphora* was equal to 2 urnæ, or 3 modii, 6 ſemodii, 8 congii, 48 ſextaries, 96 heminæ, 192 quartarii, and 570 cyathi, amounting to about 7 gallons one pint, Engliſh wine meaſure. *Arbuth.* Tab. 12.

The antient *Amphoræ* were either *feſſile*, *i. e.* ſuch as would ſtand, or *non feſſile*, terminating in a ſtarp bottom. Of both which kinds, we meet with figures in antient medals. *Reland.* de Num. Veter. Hebr. diſſ. 2. p. 10. ſeq.

The *Amphora capitolina* was the ſtandard of this meaſure, which was kept in the capitol to adjuſt others by. *Pitiſc.* Lex. Ant. T. 1. p. 88.

Suppoſing the *Amphora* to have been a cube of 4 feet each ſide, as Politian aſſerts it to have been, we may venture to ſay, that ten of the greateſt drinkers on earth could not have emptied it. Buddeus's computation is much more reaſonable, he makes the *Amphora* of wine amount to about $4\frac{1}{4}$ gallons Paris meaſure. Vid. *Budd.* de Aſſe, l. 5. p. 492. ſeq. and 519. ſeq.

Attic AMPHORA was that uſed by the Greeks, and therefore ſometimes alſo called the Grecian *Amphora*.

The Attic *Amphora* was one third part bigger than the Italic; ſo that as the latter contained 2 urnæ, or 48 ſextaries, the former contained 3 urnæ, or 72 ſextaries, amounting to about 10 gallons 2 pints, Engliſh wine meaſure [b]. This was called, by the Greek writers, Αμφορευς, ſometimes alſo Κεραμιον, and, by way of diſtinction from the Roman kind, μελιχρης [c].—[[a] *Beverin.* de Ponerib. P. 2. p. 121. [b] *Arbuth.* Tab. 10. [c] *Gorr.* Med. Def. p. 32. in voc. Αμφορευς.]

AMPHORA, in aſtronomy, a name given to the ſign more uſually called *Aquarius*. See AQUARIUS, *Cycl.*

AMPHORARIUM *vinum*, in antiquity, denotes that which is drawn or poured into *amphoræ*, or pitchers, by way of diſtinction from *vinum doliare*, or caſk wine. *Briſſ.* de Verb. ſignif. p. 43. ſeq.

The Romans had a method of keeping wine in *Amphoræ* for many years to ripen, by faſtening the lids tight down with pitch or gypſum, and placing them either in a place where the ſmoak came, or under-ground. *Columell.* Re. Ruſt. l. 1. c. 6. *Plin.* Hiſt. Nat. T. 2. l. 23. c. 1. Ephem. Acad. N. C. l. cent. 5. obſ. 39.

AMPHOTEROPLON, among civilians, denotes a kind of naval uſury, or inſurance, where the inſurers run the riſque both of the going out and return of a veſſel. *Budd.* de Aſſe, l. 1. p. 185.

In this ſenſe, the word ſtands oppoſed to *heteroplon*, where only the voyage outwards is inſured.

AMPHOTIDES, in antiquity, a kind of defence, or armour for the ears worn by the antient Pugiles, to prevent giving their adverſaries a handle by that part. *Aquin.* Lex. Milit. in voc.

Authors have been in the dark as to the nature and office of the *Amphotides*. Some explain them as a ſort of helmet for covering the noſe and ears. *Argol.* in Not. ad Panvin.

Fabretti firſt aſcertained their real uſe, from the figure of a Pugil, which had *Amphotides* over its ears, joined by a piece coming over the forehead, and tied with ſtrings under the chin. Column. Traj. c. 8.

AMPLIATION is uſed, in ſome writers, for the act of enlarging the compaſs or extent of a thing.

On a medal of the emperor Antoninus Pius, we find the title *Ampliator civium* given him, on account of his having extended the *jus civitatis*, or right of citizenſhip, to many ſtates and people before excluded from that privilege. In effect, it is generally ſuppoſed to have been this prince that made the famous conſtitution, whereby all the ſubjects of the empire were made citizens of Rome. M. Spanheim refutes this notion, and makes the emperor Caracalla to have been the author of that conſtitution. *Spanh.* Orbis Romanus, Exerc. 2. Ouvr. des Scav. Nov. 1702. p. 489.

AMPLIATION, in the Roman law, denotes the act of deferring a judicial ſentence, either by reaſon the cauſe is not clear, or in favour of him againſt whom it is to paſs.

Ampliation differed from *comperendination*, in that the former was granted on the mere motion or pleaſure of the judge, the latter at the petition of one or both the parties. Add, that the former was not limited to any certain time, whereas the latter could not be extended beyond the third day.—Beſides, *Ampliation* might be repealed, which *comperendination* might not.

The firſt introduction of *Ampliation* was in favour of the *rei*, or perſons accuſed. But it was afterwards uſed on other occaſions; *e. gr.* when certain witneſſes were wanting, or the crime or the fact had not been ſufficiently proved to found a final deciſion on, or that the kind or meaſure of puniſhment was not agreed on, &c.

In theſe caſes, the prætor ſignified his intention, by pronouncing the word *Amplius*, or the letters *N. L.* for *non liquet*, by which he denoted that the cauſe was not clear, but that a ſecond action muſt be brought.

The perſon whoſe ſentence, whether of condemnation or abſolution, was thus deferred, was ſaid to be *ampliatus*.

Hence the phraſes, *bis ampliatus*, *tertio abſolutus eſt reus*.

AMPLIATION is alſo uſed, among ſchoolmen, to denote the acceptation of a term for a different time from that ſignified by the verb in the propoſition, *e. gr. juſtus peccavit*, *i. e.* before he ſinned he was juſt. *Scherz.* Man. Philoſ. P. 1. p. 18.

AMPTRUARE, in antiquity, denoted a kind of dancing performed by the chief of the Salii, and anſwered with a correſpondent motion by others in the chorus.

This is ſometimes alſo called *amburvare*; the anſwer of the chorus was particularly called *redamtruare*.

AMPULLA, in antiquity, an oil-viol with a large belly, uſed for unctions at the baths. *Pitiſc.* Lex. Ant. in voc.

The word *Ampulla* was alſo uſed for a drinking veſſel uſed at table.

AMPULLA, among eccleſiaſtical writers, denotes one of the ſacred veſſels uſed at the altars. *Du Cange*, Gloſſ. Lat. T. 1. in voc.

The word is ſometimes alſo written in Engliſh *Ampul*.

Ampullæ were alſo uſed for holding the oil uſed in chriſmation, conſecration, coronation, &c.

Among the ornaments of churches, we find frequent mention made of *Ampuls*, or vials. In the inventory of the cathedral of Lincoln, we meet with *Ampuls* of cryſtal, variouſly enriched with ſilver feet and covers; one containing a tooth of St. Chriſtopher, another a tooth of St. Cecily, another a bone of the head of St. John Baptiſt. *Dugd.* Monaſt. T. 3. p. 272. Abridg. p. 304.

AMPULLACEÆ *conchæ*, in natural hiſtory, a name by which ſome authors have called a genus of ſhells, named by others *conchæ globoſæ*, and *dolia*, and by the French naturaliſts *tonnes*. See the article DOLIUM.

AMPUTATION (*Cycl.*)—We have ſeveral remarks on the *Amputations* of the larger extremities, by Mr. Monro, in the Medic. Eſſ. Edinb. Vol. 4. art. 22. to which we muſt refer the curious.

AMSEGETES, in antiquity, thoſe whoſe grounds abutted on the highway. Vid. *Feſt.* de Verb. ſignif. in voc.

The laws of the twelve tables decree, *Amſegetes viam muniunto*. *Baxt.* Gloſſ. in voc.

AMTRUSTIO, in antient charters, denotes a ſworn or liege tenant, or vaſſal, of the antient French or German kings. The word is alſo written *Antruſtio*. Spelman derives it from the German *Ampt*, office, buſineſs, and the Engliſh *Truſtee*. *Spelm.* Gloſſ. p. 29. ſeq.

AMULET (*Cycl.*)—Some think this word derived from *Amula*, a ſmall veſſel with luſtral water in it, antiently carried in the pocket by the Romans, for the ſake of purification and expiation. This laſt opinion appears the more probable, in that ſome *Amulets* were made in the ſhape of little veſſels, as appears from the teſtimony of Pliny, who obſerves, that pieces of amber, cut in form of little veſſels, were hung about childrens necks for *Amulets*. *Infantibus alligatur ſuccinum Amuleti ratione formam vaſculi habens*. Vid. Jour des Scav. T. 45. p. 382.

Amulets are by ſome conſidered as a natural ſpecies of Taliſmans.[a] Others rather make Taliſmans a ſpecies of *Amulets*[b].—[a Mem. de Trev. b 1707. p. 1250. b Jour. de Scav. T. 20. p. 416.]

The Sambucus is ſaid by Hartman to be an *Amulet* againſt the Epilepſy: Dipſaci, according to Dioſcorides and Scaliger, are *Amulets* againſt the Quartan: Toad Flax, *Linaria*, is by others reputed an *Amulet* againſt the hæmorrhoids: Orpin, *Telaphium*, by Wedelius, [c] againſt the blind piles, and condylomata: a ſpider incloſed in a ſmall nut, by others, againſt the phthiſis: Jet, againſt the gravel: a dead man's tooth, againſt the tooth-ach.[d]—[c Ephem. Acad. N. C. dec. 1. an. 2. Obſ. 195. d Jour. des Scav. T. 7. p. 38.]

The Bulla, worn by the antients; the Abraxas of the Braſilidians, &c. were alſo *Amulets*.

The antients made great uſe of gems for *Amulets*: The whole Eaſt, according to Chiflet, wore a kind of jaſpar for this purpoſe.—*Pitiſc.* Lex. Ant. T. 1. p. 90.

Some will have the Teraphim of Laban, [e] which were carried away by Rachel, and the ear-rings which Jacob hid under an oak, to have been *Amulets*. [f]—[eGen. *c.* xxxi. *v.* 19. f Gen. *c.* xxxv. *v.* 4. *Calm.* Dict. Bibl. T. 1. p. 122.

That ſpecies of *Amulets* compounded of poiſons, uſed as preſervatives from the plague, are more particularly denominated Zenechta. Vid. Giorn. de Letter. de Parm. 1690. p. 164.]

Under *Amulets*, ſome alſo include medicinal or other ſubſtances fixed to brutes, or even plants, to preſerve them from certain diſeaſes and dangers.

Charms, words, ſcrolls, magic figures and numbers make a large claſs of *Amulets*, to which the Turks are ſtill greatly devoted. Their *Amulets*, called *Chaimaili*, are little bits of paper of two or three fingers breadth, rolled up in pieces of ſilk, containing ſhort prayers or ſentences out of the Alcoran, with circles and other figures, in which they inſcribe the name of Jeſus, the figure of the croſs, the firſt words of St. John's goſpel, and the like. They hang them about their necks, or place them under their arm-pits, or in their boſom near their hearts, and eſpecially when they go to war, as a preſervative againſt the dangers of it. Phil. Tranſ. N° 155. p. 445.

The pope is ſuppoſed to have the virtue of making *Amulets*, which he exerciſes in the conſecrating of *Agnus Dei's*, &c. See the article AGNUS *Dei*.

The ſpunge which has wiped his table, was formerly in great veneration on this account, as a preſervative from wounds, and death it ſelf: On this account it was ſent with great ſolemnity by Gregory II. to the duke of Aquitain. Vid. Act. Erud. Lipſ. 1718. p. 210.

AMULET, in a more particular ſenſe, is reſtrained to ſuch medicines, as do not operate by any phyſical virtue, or thoſe wherein there is no proportion between the cauſe and effect. *Burggr.* Lex Med. in voc.

In this ſenſe medicines which operate by effluvia, odors, and the like, do not belong to the claſs of *Amulets*.

In this ſenſe alſo thoſe eſſence veſſels worn by hyſterical women on their breaſt, called by Greek authors καρδιοφυλακια, and by the Latin ones *domus pectoris*, were not properly *Amulets*.

AMULET is ſometimes alſo applied, in a more extenſive ſenſe, to all medicines, whether internal or external, whoſe virtue or manner of operation is occult.—Vid. Giorn. de Letter de Parm. 1690. p. 164.

We find Mr. Boyle giving credit to *Amulets*, not as magic charms, but as having ſome ſecret phyſical influence. He tells us, that he himſelf, being troubled with a bleeding at the noſe one ſummer, what he found the moſt effectual remedy was, the moſs of a dead man's ſkull, tho' it did but barely touch his ſkin. Vid. Boyle Phil. Works abr. vol. 1. p. 445.

Several authors have written expreſsly on *Amulets*, as Jul. Reichett, Dav. Rein, Caſp. Bartholin, Th. Eraſtus, Ant. Tollini, [g] and Jac. Wolfius, [h] which laſt has almoſt exhauſted the ſubject of *Amulets*.—[g V. *Lipen.* Bibl. Med. p. 15. Ejuſd. Bibl Phil. p. 42. h *Wolf.* Scrutinium Amuletorum Medicum, in quo de natura & attributibus illorum, uti & plurimis illis quæ paſſim in uſum tam in theoria quam praxi vocari ſueverunt, ac in ſpecie de Zenechtis, vel quæ peſti opponuntur, agitur, &c. Lipſ. 1690, 4°. An extract of it is given in Giorn. de Letter de Parma, 1690. p. 163, ſeq.

AMULETICS, in medicine, is uſed by ſome writers for what is more frequently called an *Amulet*.

Amuletics amount to the ſame with what are otherwiſe called *Sympathetics*. See AMULET, and SYMPATHY.

Amuletics are chiefly uſed of late times to ſtop bleeding; ſuch are the *perſicaria*, *lapis hæmatites*, dried toads, &c. alſo againſt warts, ſarcomas, &c. V. *Junck.* Conſp. Chirurg. tab. 59.

Digby's ſympathetic powder is one of the principal *Amuletics* in caſes of hæmorrhages; and with many the *ancora ſacra*. *Junck.* Conſp. Medic. tab. 3. n. 6.

AMUND, in antient writers, denotes a perſon free or diſcharged from tuition or wardſhip. *Du Cange*, Gloſſ. Lat. T. 1. p. 176.

The word is alſo written *Aamund*, *Amond*, and *Amont*; and is compounded of the privative *a*, and the Saxon *Munde*, defence, tuition.

AMURACORY, in ſome writers of the middle age, denote a kind of *Turkiſh* ſoldiery belonging to the corps or order of *Janizaries*.

They ſeem to be the ſame with thoſe otherwiſe called *Saraptarii* and *Pocillatores*. *Aquin.* Lex. Milit. in voc.

AMURCA (*Cycl.*) is properly an aqueous duſky coloured juice, which is expreſſed together with the oil out of olives; but which, upon ſtanding, ſeparates, and ſettles to the bottom.

Some define *Amurca* by the fæces or dregs of olives, an expreſſion not altogether proper; in regard what ſettles from the oil, after it is put in the caſk, is properly denominated its fæces.

The olive is ſaid to conſiſt of five ſubſtances, *oſs*, *nucleus*, *ſanſa*, *oleum* and *Amurca*. Calv. Lex. Jur. p. 66.

Amurca being boiled in a copper veſſel to the conſiſtence of honey, becomes a drug of ſome uſe in medicine, being reputed an aſtringent and drier [a]; and as ſuch ſometimes preſcribed in ulcers, as well as againſt diſeaſes of the teeth, eyes. &c [b].—[a *Savar.* Dict. Comm. T. 1. p. 96. b V. *Burggr.* Lex. Med. T. 1. p. 617.

Hippocrates applies the term *Amurca* to a crude, immature putrid ſtate of the liver. *Hippocr.* Aph. 45.

Some authors have alſo given the Name *Amurca* to the juice or fluid found in the *renes ſuccenturiati*. Caſtel. Lex. Med. in voc. *Amurca*. See SUCCENTURIATI.

AMYGDALA, in natural hiſtory, the name of a ſpecies of *echinus marinus*, of the genus of the Briſſoides. *Klein.* Echin. p. 16. See the article BRISSOIDES.

AMYGDALÆ, in ſurgery, denotes ſuperfluous fleſh growing at the root of the tongue. *Ruland.* Lex. Alchem. p. 41.

AMYGDALOIDES *lapis*, in natural hiſtory, the name given by authors to a ſtone which reſembles the kernel of an almond in figure. It is no natural foſſile, but the petrify'd ſpine of an *echinus marinus*, or ſea-urchin, of the nature of the *lapis Judaicus*, but wanting the pedicle or ſtalk of that ſpine.

AMYGDALUS, the almond-tree, in botany. See the article ALMOND-*Tree*.

AMYLON, in antient writers, a kind of pulment anſwering, as ſome apprehend, to our furmity. *Baxt.* Gloſſ. in voc.

The word is Greek, Αμυλον, thus called, becauſe made *ſine mola*.

AMYNTA, in literary hiſtory, a beautiful paſtoral comedy, compoſed by Taſſo; the model of all dramatic pieces wherein ſhepherds are actors.

Taſſo's *Amynta* is allowed by the critics to be a maſter-piece in its kind, as containing all the beauties and delicacies poſſible. The author even preferred it to his *Jeruſalem*: It has been tranſlated into French, Spaniſh, Engliſh, Flemiſh and High-Dutch; and been imitated by moſt of the Italian poets ſince, eſpecially by Guarini and Bonarelli: The *Paſtor Fido*, and *Filli di Sciro*, are only copies of this excellent piece. *Baill.* Jugm. des Scav. T. 4. P. 1 p. 393. ſeq. *Menag.* Diſcorſ. ſopr. Amynt. in pref. Anti-Baill. T. 1. n. 55.

AMYNTOR properly denotes a perſon who defends or vindicates a cauſe. The word is pure Greek, Αμυντωρ, formed of the verb αμυνω, I defend or avenge.

In this ſenſe Mr. Toland entitles his defence of Milton's life, *Amyntor*, as being a vindication of that work againſt Mr. Blackall, and others, who had charged him with queſtioning the authority of ſome of the books of the new Teſtament, and declaring his doubt that ſeveral pieces under the name of Chriſt and his apoſtles, received now by the whole Chriſtian church, were ſuppoſititious.

The foundation of *Amyntor* is, that what had been ſaid in the life of Milton concerning the ſpuriouſneſs of ſeveral pieces under the name of Chriſt and his apoſtles, was not meant of thoſe writings which are now received by the whole Chriſtian church, but of thoſe apocryphal pieces, which were in many places received and approved of by the Fathers, and the firſt ages; ſuch as the epiſtles of Barnabas, of Clement, and of Ignatius; and many others, under the titles of goſpels, acts, liturgies; ſome revelations, and the paſtor Hermas; all which he holds to be mere forgeries, ſome of pious biggots, and others of Heathens; but at the ſame time he ſuggeſts many things which tend to diminiſh the authority of the canon of the new Teſtament itſelf.

Mr. Richards [a], Mr. Nys [b], Dr. Clark [c], and others, have wrote expreſsly againſt *Amyntor*.—[a] Canon of the N. Teſt. vindicated in anſwer to the Objec. of J. T. in his *Amyntor*, Lond. 1701. 8°. [b] Hiſtor. Acct. and defence of the Canon of N. T. in Anſ. to *Amyntor*, Lond. 1700. 8°. [c] Some reflections on that part of *Amyntor*, which relates to the writings of the primitive fathers, &c. Lond. 1699. 8°.

AMYRALDISM, a name given by ſome writers to the doctrine of univerſal grace, as explained and aſſerted by Amyraldus, and others his followers among the reformed in France. *Jæger*. Hiſt. Eccleſ. T. 1. Nouv. Rep. lett. T. 48. p. 544. and 549. *Pfaff*. Primit. Tubing. P. 1. p. 116. Ejuſd. Diſcurſ. de Formal. Conſenſ. Helvet. Ejuſd. Introd. Hiſt. Theol. Liter. l 3. ſec. 8. p. 254.

Amyraldiſm is ſaid to have been a ſyſtem worked up, to bring on a reconciliation with the Lutherans. At bottom it hardly differs from the genuine ſentiments of Calvin. *Jæger*. loc. cit. p. 563.

Moſes Amyraldus, in French *Amyraut*, was a celebrated profeſſor of theology at Saumur, towards the middle of the ſeventeenth century. He chiefly followed Cameron's ſyſtem, in explaining the myſteries of grace and redemption. His antagoniſts, of whom Du Moulin was one of the chief, charged him with running counter to the ſynod of Dort, and favouring Arminianiſm.

Among the eſpouſers of *Amyraldiſm*, one of the chief was M. Daillé. A formal accuſation was brought againſt Amyraut in the national ſynod of Alençon; but after hearing him, he was acquitted with honour; and ſilence impoſed upon both parties, which however was but ill obſerved by either. Suppl. *Morer*. Dict. Hiſt. T. 1. p. 127. ſeq.

AMYRBERIS, in botany, a name uſed by ſome authors to expreſs the barberry tree. *Ger*. Emac. Ind. 2. See the article BARBERRY.

AMZELL, in zoology, the name of a bird of the *Merula*, or black-bird kind, of which there are two ſpecies. The ring *Amzell*, or *Merula torquata*, and the *Merula montana*, called ſimply the *Amzell*.

The ring *Amzell* is a little larger than the common black-bird. Its back is of a duſky blackiſh brown, and its throat and breaſt are beautifully variegated with ſpots and ſtreaks of white, and the lower part of the throat is adorned with a fine broad white ring, whence the bird has its name.: this ring is of a lunated ſhape, the points ending at the ſides of the neck. The wings and tail are blackiſh, but are ſomewhat variegated with white in the female; the white looks greyiſh. The female is ſaid alſo by ſome not to have the ring round its neck, and has by that means been miſtaken for the *Merula montana*, or common *Amzell*. This feeds on inſects and on berries. It is common about the Peak in Derbyſhire, and is there called the rock *Owzell*. *Ray*, Ornitholog. p. 143.

The common *Amzell*, or *Merula montana*, differs from this, in that it has no ring round the throat, which is variegated with a browniſh red and with ſpots of black, and the belly with grey and black ſpots. It ſeems however not determined certainly, whether this is any other than the female of the ring *Amzell*. Id. ibid. p. 144.

ANA (*Cycl.*) is uſed among ſome occult philoſophers to denote the human mind. Hence, according to ſome, is derived the word *Anaſapta*, a Dæmon invoked to the aſſiſtance of a ſick perſon. *Caſt*. Lex. Med. p. 42.

ANABAPTISTS (*Cycl.*)—It is ſaid *Anabaptiſts* hold it unlawful to bear arms, and decline all offices in government. They conſtantly make uſe of dipping. Some ſcruple the lawfulneſs of paying tythes, and ſome obſerve the Jewiſh ſabbath. But theſe do not ſo properly come under the denomination of *Anabaptiſts* as of Sabbatarians, Quakers, Muggletonians, &c. Chamberl. Pref. Stat. P. 1. l. 3. p. 163.

Notwithſtanding the ſeverity of their morals, which is remarkably great [a], ſome zealous catholics, as Prateolus, Morery, and others, have not ſcrupled to charge the *Anabaptiſts* with the moſt abominable impurity, with renewing the practice of the Adamites, and enjoining their women to proſtitute themſelves to every man who demanded it [b]. When aſked what would become of ſociety, if every body refuſed to be concerned in the adminiſtration of government, their anſwer is: "No fear, while there are men to be ſubjects, they will never want lords and maſters to reign over them [c]." [a] *Bayl*. Dict. T. 3. p. 300. [b] Id. T. 1. p. 204. n. (M.) [c] Id. T. 2. p. 555.

The *Anabaptiſts* abound moſt in Holland, where they are known by the name of *Mennonites*. They are divided into two principal ſects or families, viz. the *Apoſtolici* and *Galenici*. *Carpzov*. Introd. Libr. Bibl. T. 5. P. 1. c. 18. p. 326. Ottius, Spanheim, Schyn, Catrou, and others, have given the hiſtory of the *Anabaptiſts*; Vandale, Gale, and others, defences of them; Luther, Wigandus, Schelguigius, Oſiander, Cloppenburg Harder, d'Aſſigny, &c. refutations of them. V. *Budd*. Iſag. ad Theol. l. 2. c. 7. p. 1362. ſeq. Ouvr. des Scav. Sept. 1699. p. 378. Mem. de Trev. 1702. Octob. p. 214. Jour. des Scav. T. 35. p. 565. It. T. 41, p. 466. ſeq. Act. Erud. Lipſ. 1704. p. 329. It. Supp. p. 85. *Vandale*, Hiſt. Baptiſm. ap. Bibl. Choiſ. T. 9. p. 230, 232.

Walafrid Strabo, who lived in the ninth century, and Ludovicus Vives, Salmaſius, and other learned men of later times, though not ranked among the *Anabaptiſts*, yet have owned, that infants were not baptized in the primitive church. Nevertheleſs pædobaptiſm appears to have been in uſe in St. Cyprian's time, who lived in the third century. Vandale maintains, that it had its firſt origin in that age; that it was entirely unknown in the two firſt centuries, and that the occaſion of its introduction was an opinion, which then got footing, of the neceſſity of baptiſm to ſalvation.—See what has been alledged on the other hand by Dr. Wall; as well as the reply thereto by Dr. Gale. *Walaf. Strab*. de Reb. Eccleſ. c. 26. *Vives* Not. ad Auguſt. de Civit. Dei, c. 27. Bibl. Choiſ. T. 9. p. 230. ſeq. Nouv. Rep. Lett. T. 20. p. 610. See BAPTISM, *Cycl.* and *Suppl.*

ANABAPTISM, among antient divines, denotes the repetition of baptiſm, practiſed on thoſe who had been baptized by heretics. Vid. *Suic*. Theſ. Eccleſ. T. 1. p. 238. ſeq. in voc. Αναβαπτιζω, and Αναβαπτισις. *Du Cange*, Gloſſ. Græc. T. 1. p. 65. in voc. Αναβαπτιζειν.

The antient *Anabaptiſm*, aſſerted by the Donatiſts, the Montaniſts, &c. took its riſe from the notion of the neceſſity of baptiſm to ſalvation. It began in the age of Tertullian, and laſted, at leaſt in Africa, till the time of St. Cyprian. See DONATIST, MONTANIST, &c. *Cycl.*

ANABAPTISM is alſo applied, among modern writers, to the principles and practice of thoſe called *Anabaptiſts*. See ANABAPTISTS, *Cycl.* and *Suppl.*

ANABASIUS, a name given by Pliny to a plant, which he calls alſo *Ephedra*, and deſcribes as hanging down from the branches of large trees, in form of tufts of hair. It is very evident that he has formed the name *Ephedra* by corruption of the *Ephydra* of the Greeks, which is the name given by Dioſcorides and others to the horſetail, from its growing in wet places. And here the word ſeems applied to a different plant, only for its reſembling the naked thready branches of the horſetail. The plant deſcribed by Pliny and others of the antients under this name, is the *Uſnea*, or long hairy tree-moſs. See the article USNEA.

ANABATA, in antient cuſtoms, a cope, or ſacerdotal veſt, to cover the back and ſhoulders of the prieſt. *Kenn*. Gloſſ. ad Paroch. antiq.

It is otherwiſe called *Anaboladium*, formed of the Greek Αναβαλλεσθαι, to caſt over or cover. Id. ibid.

The word *Anabala* ſeems to be uſed in the ſame ſenſe. V. *Du Cange*, Gloſſ. Lat. in voc.

ANABATHRA, in ancient writers, denote a kind of ſteps or ladder, whereby to aſcend to ſome eminence. In this ſenſe we read of the *Anabathra* of theatres, pulpits. &c. *Pitiſc*. L. Ant. p. 90. *Du Cange*, Gloſſ. Græc. T. 1. p. 65.

Anabathra appears to have been ſometimes alſo applied to ranges of ſeats riſing gradually over each other. Id. ibid.

ANABATHRA is more particularly applied to a kind of ſtone-blocks raiſed by the highway ſides, to aſſiſt travellers in mounting or alighting, before the uſe of ſtirrups was invented. *Pitiſc*. Lex. Ant. T. 1. p. 90.

The firſt author of this contrivance, among the Romans, was C. Gracchus, brother of Tiberius. *Bergier*, de Viis Milit. ſec. 39. § 31.

ANABLATUM, in botany, a name uſed by ſome authors for the *Squammaria*, or toothwort, called *Dentaria* by others. *J. Bauhin*, Vol. 2. p. 783.

ANABLEPS, in the Artedian ſyſtem of ichthyology, the name of a new genus of fiſh, of the Malacopterygious kind, the characters, of which are theſe: The branchioſtege membrane contains ſix bones, and there is only one ſmall fin at the extremity of the back. There is a ſpecimen of this fiſh in the great collection of Albertus Seba in Holland.

ANABOLÆUM, in antiquity, denotes any kind of upper garment worn over the coat or tunic. *Pitiſc*. Lex. Ant. T. 1. p. 90. *Du Cange*, Gloſſ. Græc. T. 1. p. 65.

This is otherwiſe called *Anabole*.

ANABOLEUS, Αναβολευς, among the antients, a ſervant whoſe office was to aſſiſt in mounting on horſeback.—Theſe were in uſe before the invention of ſtirrups, or of thoſe ſtones called *Anabathra*. *Suid*. Lex. T. 1. p. 158. *Du Cange*, Gloſſ. Gr. T. 1. p. 65. *Pitiſc*. Lex. Ant. T. 1. p. 90.

ANABOLEUS is alſo uſed by Euſtathius, to denote a ſmall piece of iron, whereon the foot was ſet, in order to mount; from which Buddæus infers, that the antients had ſtirrups or foot-boards; to which Lipſius objects, that it does not appear this *Anaboleus* was any pendent part fixed to the ſaddle, after the manner of our ſtirrups, but rather a portable engine brought by a ſervant, and placed by the horſe's ſide. *Aquin*. Lex. Milit. T. 1. p. 50.

ANABROCHISMUS, Αναβροχισμος, in the antient phyſic, the operation of taking away offenſive hairs in the eye-lids.

The manner of performing the *Anabrochiſmus* is deſcribed by Gorræus. Vid. *Gorr*. Def. Med. in voc. Αναβροχισμος.

ANACA, in zoology, the name of a Braſilian ſpecies of paroquette. It is of the ſize of a lark; its beak is brown and crooked; the crown of its head is covered with feathers of a liver colour, and there are circles of brown ones near its eyes. Its throat is grey; the upper part of its neck and its ſides are green; its belly is of a reddiſh brown; its back green, with a pale brown ſpot; and its tail a pale brown. There is a deep blood red mark at the top of each wing, the reſt

of

of the wings is green, but that their extremities are bluciſh. Its thighs are covered with green feathers, and its legs and feet are grey. *Margrave*, Hiſt. Braſil.

ANACALYPTERIA, (*Cycl.*) according to Suidas, were preſents made to the bride by her huſband's relations, and friends when ſhe firſt uncovered her face and ſhewed herſelf to men. *Suid.* Lex T. 1. p. 165. See alſo *Spanheim ad* Callim. p. 180.

Theſe preſents were alſo called επαυλαια; for among the Greeks, virgins before marriage were under ſtrict confinement, being rarely permitted to appear in public, or converſe with the other ſex; and when allowed that liberty, wore a veil over their faces, termed Καλυπτρον, or Καλυπτρα, which was not left off in the preſence of men till the third day after marriage, whence, according to Heſychius this day was alſo called *Anacalypterion*. *Pott.* Archæol. l. 4. c. 11. p. 294. ſeq.

ANACAMPSEROS, *Orpin*, in botany, the name of a genus of plants, the flowers and ſeeds of which are wholly the ſame with thoſe of ſedum; but, the plants of this genus from their firſt ſhooting from ſeed immediately run up into ſtalks, whereas the others form firſt globular tufts of leaves, from which the ſtalks are afterwards propagated.

The ſpecies of *Orpin* enumerated by Mr. Tournefort are theſe.

1. The common *Orpin*. 2. The purple flowered *Orpin*. 3. The ſmaller purple flowered *Orpin*. 4. The largeſt broad leaved *Orpin*. 5. The ſmall round leaved ever-green *Orpin*. 6. The ſmall long leaved ever-green *Orpin*. 7. The ſweet rooted *Orpin*, called *Rhodia radix*, and roſewort. 8. The ſmaller ſweet rooted *Orpin*, or roſe-root. 9. The largeſt bloody Portugal *Orpin*. 10. The largeſt Portugal *Orpin*, with white flowers. 11. The purſelain leaved *Orpin*. 12. The purple flowered *Orpin*, with few leaves on the ſtalks, and 13. The ſmall procumbent white flowered *Orpin*. *Tourn.* Inſt. p. 264. See ORPIN.

ANACAMPTERIA, Αναχαμπτηρια, in eccleſiaſtic antiquity, denote little hoſpitals, or inns for the entertainment of the poor and ſtrangers, built adjoining to the antient churches.

The *Anacampteria* are mentioned in the Theodoſian code. Muſculus renders the word by *Deambulatorii receſſus*, taking them we preſume for walks about the church. But Valeſius more properly tranſlates it by *Diverſoria*. Bingham, takes them for the *Cellulæ*, or little cells or lodgings, ſpoken of in the foreſaid law of the Theodoſian code. Perhaps they might alſo ſerve as lodgings for ſuch as fled to take ſanctuary in the church. For theſe might neither eat nor drink within the church, but only in ſome of theſe outward buildings, which upon that account were made as ſafe a retreat as the very altar itſelf. *Bingh.* Orig. Eccleſ. l. 8. c. 7. §. 13.

ANACANDAIA, in zoology, the name of a ſpecies of ſerpent found in the iſland of Ceylon, and very miſchievous among the cattle, whence it is called *Bubalinus*. *Ray*, Syn. An. p. 332. See BUBALINUS.

ANACARDIUM, in botany, a medicinal fruit brought from the Eaſt Indies, antiently in great eſteem as a cephalic.

The word is formed of the Greek ανα and καρδια, heart, on account of the figure of this fruit, which bears ſome reſemblance to a heart.

The *Anacardium* is alſo known among the Arabs by the appellation *Balador*, among the Indians by that of *Bybo*. The Portugueſe denominate it *Fava de Malaqua*, the Molucca bean, by which title it is alſo known in England as bearing ſome reſemblance in figure to our bean, though as to magnitude bigger. Some call it the *Elephant's louſe*; in the ſhops, it is particularly diſtinguiſhed by the name *Anacardium orientale*, by way of contradiſtinction from another fruit called *occidentale*. *Garc. ab Hort.* Hiſt. Arom. c. 30. *Matthiol.* in Dioſcor. c. 141. *Burggr.* Lex. Med. in voc. See MOLUCCA.

As to the ſpecies of the tree, and the country where it is produced, botaniſts give very uncertain, and contradictory accounts. Some will have it the growth of Bantam, others of Malabar.

The *Anacardium* is a flattiſh ſeed uſually compared to the heart of a litte bird, blackiſh and ſhining, which under a double rind encloſes a white ſweetiſh kernel.

The pith or medullary part of the *Anacardium* is extremely pungent, and acrimonious; whence the antients made great uſe of it in cold diſeaſes of the head, particularly to ſtrengthen the memory; but the abuſe of it ſometimes turning them ſtupid, delirious, or even mad, the moderns rarely venture on the uſe of it, at leaſt not without great correctives. *Vater.* Phyſ. Exper. app. c. 3. It. 4.

The preparations made from *Anacardium* are, an electuary or confection, and a honey.

The method of preparing *Anacardium* is by ſteeping them in vinegar, and then ſlowly drying them again by evaporation, or even making an extract of them with the vinegar in them. *Zwelf.* Pharmac. Auguſt. Claſſ. 20. p. 407.

The confection of *Anacardiums*, *confectio Anacardina*, is prepared two different ways, agreebly to the different preſcripions of Meſue and Zwelfer.

The ingredients, according to the former, beſides prepared *Anacardiums*, are mirobalans, pepper, caſtorium, refined ſugar, laurel-berries, cyperus, coſtus, and rocket.

It is ſuppoſed to be of great virtue againſt all cold diſorders of the abdomen, the brain, &c. to purify the blood and ſpirits, aſſiſt the ſenſes, ſtrengthen the memory and underſtanding; whence it is called by Meſue *Confectio Sapientum*.

Zwelfer ſubſtitutes another method of preparation, as both leſs diſagreeable and more efficacious. The ingredients are *aqua majorana*, orange flowers and peel, prepared *Anacardiums*, ſugar, ambergreaſe, citron ſeeds, ſtyrax, laudanum, beſides divers of the aromatic tribe. *Zwelf.* Pharmac. Reg. Claſſ. 14. p. 654.

Honey of *Anacardiums*, *Mel Anacardinum*, is made by grinding and boiling the fruit in water, till it yield a kind of melleous ſubſtance of a dark ruddy colour, which ſwimming on the water is to be ſkimmed off for uſe. *Zwelf.* Pharm. Aug. Claſs. 1. p. 49.

Fuchſius gives a ſomewhat different preparation; according to him, the *Anacardiums*, after grinding are to be ſoaked ſeven days in water, and on the eighth boiled down to half the quantity, ſtrained through a linen cloth, the fæces dried, and when dry, boiled up with a due proportion of honey.

The like virtues are aſcribed to this as to the confection. But neither are to be uſed without ſome precaution. A proper occaſion of employing them is in palſies of the tongue. V. *Sennert.* Prax. Med. l. 1. P. 2. c. 5. *Hoffm.* de Medicam. Offic. l. 2. c. 162. ſec. 50. *Burgg.* Lex. Med. in voc.

ANACARDIUM *antarticum* is uſed by ſome for the Cajou-fruit. This is alſo called by others *Anacardium occidentale*, and is ordinarily uſed for the true, or eaſtern kind. *Savar.* Dict. Comm. New Engl. Diſpenſ. p. 117. See CAJOU.

ANACATHARSIS, in medicine, properly denotes a purgation by ſpitting. *Caſtel*, Lex. Med. in voc.

In this ſenſe is the word uſed by Hyppocrates and Galen; agreeably alſo to this Blaſius reſtrains *Anacatharſis* to expectoration. Only Blancard, on what authority does not appear, extends *anacathartic* medicines to all thoſe which work upwards, by the glands of the head, whether vomitories, ſternutatories, or maſticatories. *Blanc.* Lex. Med. in voc.

ANACATHARSIS is alſo a name given by civil lawyers to the *Baſilicon repetitæ prælectionis* made by order of the emperor Conſtantine Porphyrogenetus. *Calv.* Lex. Jur. p. 66. *Fabric.* Bibl. Græc. l. 6. c. 6. n. 12.

It was thus called as being a review or correction of the Baſilicon.

ANACATHARSIS, among divines, denotes the clearing up ſome obſcure paſſage, by a ſpiritual, or anagogical interpretation. *Suicer*, Theſ. T. 1. p. 274. ſeq.

ANACEIA, Ανακεια, an Athenian feſtival in honour of the Dioſcuri.

It took its name from thoſe deities, who were alſo called Ανακες, and honoured with a temple called Ανακειον, *Anacæum*. The ſacrifices offered at that time were named Ξενισμοι, becauſe thoſe deities were ξενοι, or ſtrangers; and conſiſted of three offerings, which were called Τριτιαι. Athenæus mentions plays acted in honour of theſe deities. *Athen.* Deipnoſ. Lib. 2. *Potter*, Archæol. l. 2. c. 20. Vol. I. p. 366.

ANACHORESIS, Αναχωρησις, denotes a withdrawing from ſociety, or retiring into ſolitude. *Du Cange*, Gloſſ. Lat. T. 1. p. 178.

Anachoreſis is chiefly uſed in ſpeaking of the retreat of the antient monks and ſolitaries into ſome deſolate place, for the ſake of pennance, meditation and prayer. *Suic.* Theſ. Eccleſ. T. 1. p. 327. ſeq. *Magr.* Vocab. Eccleſ. p. 15.

The *Anachoreſis* was not allowed to perſons, before they had ſpent thirty years in the community. *Iſid.* de Eccleſ. Off. l. 2. c. 15.

ANACHORET (*Cycl.*)—When many of the habitations of *Anachorets* were placed together in the ſame wilderneſs, at ſome diſtance from one another, they were all called by one common name, *Laura*, which, as Evagrius informs us, differed from a *Cænobium*, or convent, in that a *Laura* was many cells divided from each other, where every monk provided for himſelf, but a *Cænobium* was but one habitation, where the monks lived in ſociety, and had all things in common.

Palladius and Cyril have written the lives of the antient *Anachorets*. V. *Fabric.* Bibl. Græc. l. 5. c. 32. and 41. *Bingh.* Orig. Eccleſ. l. 7. c. 2. §. 2.

The modern Greek *Anachorets* live three or four together, in a houſe dependent on the monaſtery, of which they hire it for life. They have their chapel, and after prayers apply themſelves to the culture of their vineyards, olives, fig-trees, and the like, which afford them proviſion for the year.

Theſe *Anachorets* only differ from the conventual monks, in that they have leſs intercourſe with the world, and live but in ſmall bodies.

In ſome parts of Greece, the monks or caloyers are divided into *Anachorets*, and aſcetics, or hermits. *Tournef.* Voy. du Levant. Lett. 3. p. 41.

ANACHORITA, in eccleſiaſtical writers, a name ſometimes given to the cells of recluſes. *Du Cange*, Gloſſ. Gr. T. 1. in voc.

By the antient canons, no *Anachorita* could be erected without conſent of the biſhop.

ANACLASTIC *Glaſſes*, *Vitra Anaclaſtica*, a kind of ſonorous phials, or glaſſes, chiefly made in Germany, which have the property of being flexible; and emitting a vehement noiſe by the human breath.—They are alſo called vexing glaſſes, by the Germans, *vexier glaſer*, on account of the fright and diſturbance they occaſion by their reſilition.

The *Anaclaſtic* glaſſes are a low kind of phials with flat bellies, reſembling inverted funnels, whoſe bottoms are very thin, ſcarce ſurpaſſing the thickneſs of an onion peel: this bottom is not quite flat, but a little convex. But upon applying the mouth to the orifice, and gently inſpiring, or as it were ſucking out the air, the bottom gives way with a horrible crack, and of convex, becomes concave. On the contrary, upon expiring or breathing gently into the orifice of the ſame glaſs, the bottom with no leſs noiſe bounds back to its former place, and becomes gibbous as before.

The *Anaclaſtic* glaſſes firſt taken notice of were in the caſtle of Goldbach; where one of the academiſts *Naturæ curioſorum*, having ſeen and made experiments on them, publiſhed a piece expreſs on their hiſtory and phænomena. *Roſini Lentilii Oribaſii* Sched. de Vitris Anaclaſticis. V. Ephem. Acad. N. C. Dec. 2. An. 3. p. 489. ſeq. their figure may be ſeen in the book above cited.

They are all made of a fine white glaſs. It is to be obſerved in theſe, 1. That if the bottom be concave at the time of inſpiration, it will burſt; and the like will happen if it be convex at the time of expiration. 2. A ſtrong breath will have the ſame effect even under the contrary circumſtances.

ANACLETICUM, Ανακλητικον, in the antient art of war, a particular blaſt of the trumpet, whereby the fearful, and flying ſoldiers were rallied, and recalled to the combat. *Suid.* Lex. T. 1. p. 166.

ANACLINOPALE, Ανακλινοπαλη, in antiquity, a kind of wreſtling, wherein the champions threw themſelves voluntarily on the ground, and continued the combat by pinching, biting, ſcratching, and other methods of offence. *Potter.* Archæol. l. 2. c. 21.

The *Anaclinopale*, ſtood contradiſtinguiſhed from the orthopale, wherein the champions were erect. In the *Anaclinopale*, the weaker combatant ſometimes gained the victory.

ANACLINTERIA, in antiquity, a kind of pillows on the dining bed, whereon the gueſts uſed to lean.

The antient tricliniary beds had four ενηλια, one at the head, another at the feet, a third at the back, and a fourth at the breaſt. That on which the head lay, was properly called by the Greeks, ανακλινητηριον, or ανακλινητρον; by the Romans *Fulcrum*, ſometimes *Pluteus*. *Caſaub.* Not. ad Spartian. in Ælio Vero. c. 5. *Salmaſ.* ad eund.

According to other writers, *Anaclinteria* is more properly underſtood of the backs of chairs whereon we lean. *Pitiſc.* Lex. Ant. T. 1. p. 90.

ANACOENOSIS, *Communicatio*, a figure in rhetoric, when we conſult the adverſary, or appeal to the judges what ought, or could have been done on ſuch an occaſion. *Voſſ.* Rhet. c. 14. §. 2.

Such is that of Cicero, *Quæro, ſi te hodie domum tuam redeuntem, coacti homines et armati, non modo limine tectoque ædium tuarum, ſed primo aditu veſtibuloque prohibuerint, quid acturus fis?* *Cicero* pro Cecin.

ANACOLLEMA, in phyſic, denotes a liniment or other medicine applied to the forehead, to ſtop or prevent defluxions of the eyes. *Gorr.* Def. Med. p. 33.

The word is Greek, formed of ανακολλαω, *conglutino*.

Anacollemata make a ſpecies of medicines called *frontalia*. The qualities required are, to be drying, cooling, thickening, aſtringent, conglutinant, &c.

To the claſs of *Anacollemata* belong bran, manna, myrrh, terra Samia, Acacia, &c.

Jungken deſcribes an *Anacollema frontale* for ſtopping hæmorrhages at the noſe. *Jungk.* Lex. Chym. Pharm. P. 2. p. 12.

ANACOLUTHON, Ανακολουθον, among antient grammarians, denotes an incoherence, or a conſtruction which does not hang together. This is uſually ſignified by the appellation of a figure, which ought rather to be denominated an inaccuracy. *Fab.* Theſ. p. 152. *Heder.* Schul. Lex. p. 227. ſeq.

ANACRISIS, among the antient Greeks, is uſed for a kind of trial, or examination, which the Archons, or chief magiſtrates of Athens, were to undergo, before their admiſſion into that office.

The *Anacriſis* ſtands diſtinguiſhed from the *Docimaſia*, which was a ſecond examination, in the forum.

The *Anacriſis* was performed in the ſenate houſe. The queſtions here propoſed to them were concerning their family, kindred, behaviour, eſtate, &c. *Potter.* Archæol. l. 1. c. 12. Some will have it that all magiſtrates underwent the *Anacriſis*.

ANACRISIS, in the civil law, denotes a ſearch or enquiry into the truth by examination of witneſſes, and other proper means, eſpecially torture. *Calv.* Lex. Jur. p. 66. *Briſſ.* de verb. Signif. p. 45. *Suid.* Lex. T. 1. p. 167.

ANACROSIS, Ανακρωσις, in antiquity, denotes a part of the Pythian ſong, wherein the combat of Apollo and Python are deſcribed. *Potter.* Archæol. l. 2. c. 23.

The *Anacroſis* was the firſt part, and contained the preparation to the fight.

ANACTON *Pædon*, Ανακτων Παιδων, in antiquity, a feſtival held at Amphyſſa, the capital of Locris, in honour either of the Dioſcuri, or of the Curetes, or Cabiri, about which authors are not agreed. *Potter.* Archæol. l. 2. p. 20.

ANADAVADÆA, in zoology, the name of a ſmall bird of the Eaſt Indies, which has the beak of the chaffinch, and the feet of the lark. It is a very ſmall bird, ſcarce exceeding the gold creſted wren in ſize. It is brown on the back, but very beautifully red at the rump; its tail and its long wing feathers are black; the wings are ſpotted with white, and the breaſt is black in ſome birds, and in others of a fine bright red. It is ſometimes brought over to England alive in cages, and will live here very comfortably. *Ray*'s Ornitholog. p. 194.

ANADEMA, among the antients, denotes an ornament of the head, wherewith victors at the ſacred games had their temples bound. *Fab.* Theſ. p. 153.

The word is formed of the Greek Αναδεομαι, to be bound round the temples, to be crowned. *Suic.* Theſ. T. 1. p. 256. in voc. Αναδεομαι.

Some confound the *Anadema* with the *Diadema*, worn by the antient Perſian kings. *Pitiſc.* Lex. Ant. T. 1. p. 661. in voc. *Diadema*.

Anademata are alſo mentioned by antient writers among the ornaments of the heads of women. *Calv.* Lex. Jur. p. 66.

According to ſome the Greek word αναδεμα anſwers to what the Latins call *Redimiculum*.

ANADOSIS, in the antient medicine, denotes the diſtribution of the aliment, by the veſſels of the body. *Gorr.* Def. Med. p. 33. *Caſt.* Lex. Med. p. 43.

In this ſenſe *Anadoſis* makes a part of nutrition or digeſtion. Some uſe *Anadoſis* as ſynonymous with *Diadoſis*. Others diſtinguiſh between them, reſtraining *Anadoſis* to the act of conveying the chyle from the ſtomach into the greater veins, and *Diadoſis* to that of forwarding it from the greater into the ſmaller, and capillary veſſels. See DIGESTION.

ANADROMOUS, in ichthyography, a term of diſtinction among fiſhes, denoting ſuch as have their times of going from the freſh water to the ſalt, and afterwards returning back to the freſh water again.

The word is derived from the Greek, ανα, back again, and δρομος, a courſe, or paſſage. The truttaceous fiſhes are many of them of this kind, and the method nature has appointed of their courſe of changes ſeems to be this; they are firſt produced from the ſpawn in freſh water rivers, they live there till of ſome ſtrength and ſize, and then ſeek the ſalt water to feed more at large in, and grow to their full extent: at which period they return into the freſhes again to lay their ſpawn, that their young brood may have the ſame advantages themſelves before had of being firſt placed in freſh water. Some uſe the word *Catanadromi* in the ſame ſenſe. Vid. *Willughby*'s Hiſt. Piſc. p. 182. *Caſt.* Lex. Med. p. 48. *Du Cange*, Gloſſ. Græc. T. 1. p. 67.

ANADYSIS, among antient divines, denotes the ceremony of the emerſion in baptiſm. *Suic.* Theſ. Eccleſ. T. 1. p. 259. in voc. Αναδυω. See BAPTISM.

In which ſenſe, Αναδυσις ſtands contradiſtinguiſhed from καταδυσις, or immerſion. See IMMERSION, *Cycl.*

ANÆDEIA, in antiquity, a denomination given to a ſilver ſtool placed in the Areopagus, on which the defendant, or perſon accuſed was ſeated for examination. *Potter*, Archæol. l. 1. c. 19.

The word is Greek Αναιδεια, which imports impudence; but according to Junius's correction it ſhould rather be Αναιδια, q. d. innocence.

The plaintif, or accuſer was placed on an oppoſite ſtool called *Hybris*, or injury; here he propoſed three queſtions to the party accuſed; to which poſitive anſwers were to be given. The firſt, are you guilty of this fact? The ſecond, how did you commit the fact? The third, who were your accomplices? See ACCUSATION, *Cycl.* and *Suppl.*

ANÆRETA, in aſtrology, a place in the heavens, at which the *Apheta* arriving, an infant born at that time, is in danger of death. *Vital.* Lex. Math. p. 38.

The word is Greek, and literally imports, a cutter off, *Abſciſſor*.

In this ſenſe *Anæreta* ſtands oppoſed to *Apheta*.

Anæreta, among the Greek aſtrologers, amounts to the ſame, with what the Arabs call *Ahazin*.

ANÆSTHESIA, Αναισθησια, in medicine, a privation of ſenſe, or abolition of the faculty of perceiving external objects. *Zuinger.* Compend. Inſtit. Med. Pathol. n. 158.

The ſpecies or degrees of this are *ſtupor*, *hebetudo*, *depravatio*, &c.

ANAGALLIS, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe. The calyx is a perianthium divided into five hollowed ſegments, and remaining after the flower is fallen. The flower conſiſts of a ſingle petal, which forms no tube, but is divided into five roundiſh but ſomewhat oval ſegments, which join together at their bottoms. The ſtamina are five erect filaments ſhorter than

than the flower, and hairy in their lower part. The antheræ are ſimple; the germen of the piſtillum is globoſe; the ſtyle is ſlender, and ſlightly bent; and the ſtigma is headed. The fruit is a globoſe capſule, containing only one cell, and divided horizontally into two hemiſpheric portions. The ſeeds are numerous, and of an angular figure, and their receptacle globoſe, and very large. *Linnæi*, Gener. Plant. p. 65.

Anagallis is a medicinal plant, of which there are two kinds in uſe in the ſhops, viz.

ANAGALLIS *aquatica*, called alſo by botaniſts, *Veronica aquatica*, or *becca-bunga*, in Engliſh, *brook-lime*. It bears a reſemblance in its flowers to the Paul's-betony, though its leaves are larger, and the ridges entire. See the article VERONICA.

Its chief uſe is to abrade and clear away thoſe little viſcoſities which obſtruct the capillaries, and occaſion ſcabs and blotches, though it has alſo a diuretic virtue, and ſerves as a cleanſer of all the viſcera; whence it is frequently an ingredient in antiſcorbutic and deobſtruent compoſitions. *Quinc.* Diſpenſ. P. 2. ſec. 4. n. 291.

ANAGALLIS *terreſtris*, called, in Engliſh, *pimpernel*, is of two kinds, diſtinguiſhed by the colour of the flowers. 1. Male, *Anagallis terreſtris mas*, by ſome alſo called *Anagallis Phœnicio flore*. 2. Female, *Anagallis terreſtris fœminea*, or *Anagallis cæruleo flore*. *Alleyn*, Diſpenſ. p. 48.

The officinal preparations from the terreſtrial *Anagallis* are, a water, conſerve, ſyrup, and eſſence, all reputed of uſe in maniac caſes. Eſſence of *Anagallis* is made of the extract diſſolved in the eſſence of *hypericum*. *Burggr.* Lex. Med. in voc. See PIMPERNEL.

ANAGLYPHA, Αναγλυφα, in antient writers, denote veſſels, or other things, adorned with ſculpture in *baſſo relievo*. Vid. *Fabri*, Theſ. p. 153. *Du Cange*, Gloſſ. Lat. T. 1. p. 178. *Magr.* Vocab. Eccleſ. p. 15.

In this ſenſe, the term is ſometimes alſo written *Anaglyptus*, *Anaglyphicus*, or *Anaglyphatus*.

The artificers in this kind are denominated *Anaglyptes*, *Anaglypharii*, &c. Vid. *Meurſ.* Gloſſ. p. 32. ſeq. *Du Cange*, Gloſſ. Græc. T. 1. p. 66.

ANAGLYPHICE (*Cycl.*) includes what we call emboſſing, &c. and ſtands contradiſtinguiſhed from *diaglyphice*, or engraving in creux, where the ſtrokes are indented.

ANAGNOSES, or ANAGNOSMATA, in the Greek church, denotes an eccleſiaſtical book, containing the leſſons read at divine ſervice, in the ſeveral feaſts, &c. of the year. *Allat.* de Libr. Eccleſ. diſſ. 1.

The Greek Αναγνωσεις, or Αναγνωσμαλα, anſwers to what the Latin church calls *lectio*. Vid. *Du Cange*, Gloſſ. Græc. T. 1. p. 66. *Meurſ.* Gloſſ. p. 33. in voc. Αναγνωσαι. *Suic.* Theſ. Eccleſ. T. 1. p. 247. ſeq. & p. 250. ſeq. in voc. Αναγνωσαι.

St. Jerom is commonly ſaid to have been the firſt compiler of the Αναγνωσεις.

ANAGNOSTA, or ANAGNOSTES, among the antients, denotes a kind of ſervant retained in the families of perſons of rank, to read to them at meals. Vid. *Walch.* Parerg. Acad. p. 77.

Theſe were called by the Greeks Αναγνωσαι, and by the Romans *lectores*; ſometimes alſo *a ſtudiis*.

Even private families, who lived any thing politely, were not without this kind of literary ſervants. Servius [a] makes mention of a female *Anagnoſta*, under the denomination of *lectrix*. Sometimes the maſter himſelf performed the office of reader. The emperor Severus read himſelf at table. Martial mentions one Ligurinus, who read his own poems at dinner, to the great diſguſt of the gueſts [b].—[a Ad Virgil. l. 12 .v. 159. b *Mart.* Epig. 5. l. 3.

Among the Greeks there were alſo *Anagnoſtæ* in their theatres for public reading of the poets. *Gell.* l. 18. c. 5. *Fabr.* Theſ. p. 153. ſeq.

Bilbergius [a], and Th. Raynaud [b], have diſſertations expreſs on *Anagnoſtæ*.—[a Diſſ. Acad. de Anagnoſtis, Upſ. 1689. 8vo. An analyſis of it is given in Reimman. Idea Antiq. Liter. p. 46. ſeq. b De Anagnoſt. ad Menſem religioſam, ext. ap. Opp. ejuſd. Lugd. 1665.]

The *Anagnoſtæ* were inſtructed to read with clearneſs, expedition, propriety, and good accent, in order to which, they had maſters appointed them, called *prælectores*.

The time of reading was chiefly at ſupper; ſometimes alſo in other vacant hours, or even after waking in the night. The books chiefly read were hiſtorians and orators. *Alexand. ab Alexand.* Genial. Dict. l. 2. c. 30. *Schot.* Obſerv. 5. 29. p. 241. *Putean.* de Stil. c. 7. *Scheff.* Relig. conviv. priſc. T. 12. p. 258. Theſ. Ant. Rom. *Græv.* Pignor. de Serv. p. 109. *Meurſ.* Gloſſ. p. 251. *Hoffman.* Lex. in voc. *Pitiſc.* Lex. in voc. It. in voc. *Lectores*. *Fabric.* Bibl. Antiq. c. 19. §. 6. *Fabr.* Theſ. in voc. *Anagnoſtes*.

Some ſpeak of the *Anagnoſtæ*, as a ſpecies of *acroamata*, from which, however, in propriety they differed.

Cornelius Nepos relates of Atticus, that no *acroama* was ever heard at his meals, but an *Anagnoſtes*. He never ſupped without reading, ſo that the minds of his gueſts were no leſs agreeably entertained than their appetites. The ſame cuſtom Eginhard obſerves was kept up by Charlemain, who at table had the hiſtories and acts of antient kings read to him. This cuſtom ſeems to have been a relick of that of the antient Greeks, who had the praiſes of great men and hero's ſung to them, while at table. *C. Nepos*, Vit. Att. c. 14. n. 1.

The antient monks and clergy kept up the like uſage, as we are informed by St. Auguſtin. Sidonius praiſes a man of quality in his time, who, in this reſpect, lived a clerical life, though he was no prieſt.

ANAGNOSTIC, in middle aged writers, is ſometimes uſed for an epiſtle, or other writing. *Du Cange*, Gloſſ. Lat. T. 1. p. 178. ſeq.

ANAGOGIA, in antiquity, ſolemn ſacrifices to Venus at Eryx, in Sicily, where ſhe was honoured with a magnificent temple.

The name of this ſolemnity was derived, απο τυ αναγισθαι, *i. e.* from returning; becauſe the goddeſs was ſaid to leave Sicily, and return to Afric, at that time. *Potter*, Archeol. Græc. l. 2. c. 20.

ANAGOGICAL (*Cycl.*)—*Anagogical* expoſition is, when the ſacred text is explained with a regard to the end which Chriſtians ſhould have in view, and this is eternal life. For example, the reſt of the Sabbath, in the *anagogical* ſenſe, ſignifies the repoſe of everlaſting bleſſedneſs. *Calm.* Bibl. Dict. in voc. See ANAGOGY.

ANAGOGY (*Cycl.*) is particularly uſed, where words, in their natural or primary meaning, denote ſomething ſenſible, but have a further view to ſomething ſpiritual or inviſible. Vid. *Magr.* Vocab. Eccleſ. p. 16.

Anagogy, in a more particular ſenſe, denotes the application of the types and allegories of the Old Teſtament to ſubjects of the New; thus called, becauſe the veil being here drawn, what before was hidden is expoſed to open ſight. *Suic.* Theſ. Eccleſ. T. 1. p. 253. ſeq.

Some of the fathers place Αναγωγη, in oppoſition to ιστορια, hiſtory.

ANAGOGY, in medicine, denotes the return of humours, or the rejection of a matter upwards, or by the mouth. Vid. *Caſt.* Lex. Med. in voc.

Anagogy amounts to the ſame with what is otherwiſe called *anabole*. *Caſt.* lib. cit. in voc. *Anabole*.

ANAGOGY, Αναγωγια, in antient hiſtory, denotes a looſe education or diſcipline. *Suid.* in voc. & in voc. Αναγωγος.

ANAGRAMMATIST, a maker or compoſer of anagrams.

Thomas Billon, a provincial, was a celebrated *Anagrammatiſt*, and retained by Lewis XIII. with a penſion of 1200 livres, in quality of *Anagrammatiſt* to the king.

Lipenius gives a long liſt of *Anagrammatiſts*. Vid. *Lipen.* Bibl. Phil. p. 43. ſeq.

Th. Billon has given a ſet of prophecies in anagrams; Gul. Blancus, the art of compoſing anagrams. *Morhof.* Polyhiſt.

ANAGROS, a meaſure for corn, uſed in ſome cities in Spain, containing ſomewhat more than the Paris *mine*. *Savar.* Dict. Com. T. 1. p. 97.

This is otherwiſe called *Anegros*.

Four *Anagros* make a *cahi*, four *cahi's* a *tanega*. Id. Suppl. p. 25. in voc. *Anegros*.

ANAGYRIS, *bean-trefoil*, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the papilionaceous kind, but its vexillum is much ſhorter than any of the other petals. The piſtil ariſes from the cup, and finally becomes a pod, reſembling that of the kidney-bean, and containing uſually kidney-ſhaped ſeeds. To this it is to be added, that the leaves ſtand three on every pedicle.

The ſpecies of *Anagyris*, enumerated by Mr. Tournefort, are theſe.

1. The true ſtinking *Anagyris*. And, 2. The long leaved, ſtinking, cretic *Anagyris*, with yellow flowers. *Tournef.* Inſt. p. 647.

The leaves of *Anagyris* are reſolutive, and its ſeed emetic. *Lemery*, des Drogues.

ANALECTA, the fragments, or off-falls of meat, which dropped from the table on the ground.

Analecta was alſo uſed for a ſervant appointed to gather up the off-falls of the tables. *Pitiſc.* Lex. Ant. T. 1. p. 91.

In this ſenſe, the word is ſometimes alſo written *Analectes*.

Satellius Quadratus, in the way of deriſion, adviſed Calviſius Sabinus, a man of great wealth, and much affectation of learning, but with little memory, and leſs genius, to keep *Analectæ*, *ut grammaticos haberet Analectas*; a phraſe which has occaſioned much diſpute among critics and antiquaries. Vid. *Senec.* Epiſt. 27. *Fabr.* Theſ. p. 154. ſeq. *Pitiſc.* Lex. Ant. T. 1. p. 91. *Rhodig.* Ant. Lect. 13. p. 31. *Lipſ.* in Senec. loc. cit. *Turneb.* Adverſ. 24, 33.

ANALECTA, *Analects*, in literary hiſtory, a title given by ſeveral writers to collections of remarks, animadverſions, or even of diſtinct pieces and eſſays.

Pontanus and Swartius have publiſhed works, under the title of *Analecta*; Mabillon and Matthæus have given antient *Analecta*; Goclenius, *Analecta* of the Latin tongue; Monfaucon, Greek *Analecta*; Reland, Rabbinical *Analecta*; Hottinger and Nereus, hiſtorical *Analecta*; Urſinus, Baumannus, Doughtey, Friſchius, Montagu, &c. ſacred *Analecta*; Gonzalez, *Analecta* of Law; an anonymous author, *Analects* of Iriſh affairs, a work written with great diſingenuity and ſpleen againſt the Engliſh intereſt. *Fabric.* Bibl.

Græc. l. 6. c. 10. n. 12. Act. Erud. Lipſ. 1724. p. 81. Jour. des Scav. T. 75. p. 277. Ouvr. des Scav. Oct. 1697. p. 53. *Kuſt.* Bibl. Nov. Libr. an. 1698. p. 75. *Nichols.* Iriſh Hiſt. Libr. c. 1. p. 9. *Lipen.* Bibl. Phil. p. 44. Ejuſd. Bibl. Jur. p. 17. Ejuſd. Bibl. Theol. p. 37.

ANALEMMA (*Cycl.*)—This word is uſed by Ptolemy, who has given a treatiſe expreſs on the ſubject, περὶ ἀναλήμματος; but the Greek copy is loſt, and only the Latin tranſlation left, which is very faulty. It was publiſhed, with a commentary, by Frid. Commandinus, Rom. 1562. 4to. Vid. *Fabric.* Bibl. Græc. l. 4. c. 12. n. 9. Giorn. de Letter. d'Ital. T. 19. p. 153. ſeq.

The *Analemma* was invented by John de Royas, a Spaniard. The advantages of this above the aſtrolabes of Ptolemy and Gemma Friſius, are, that all the lines proceeding from the eye are parallel to each other, and perpendicular to the plane of projection, conſequently not only the equator is a right line, as in the aſtrolabe of Gemma Friſius, but all the parallels to the equator are ſo too; ſince, in virtue of the infinite diſtance of the eye, they are all in the ſame caſe, as if their plane paſſed through the eye. For the like reaſon, the horizon, and its parallels, are alſo right lines. On the other hand, whereas in the two former aſtrolabes the degrees of circles converted into right lines become very ſmall towards the center, and large towards the circumference, they become here ſmall towards the circumference, and large towards the center: ſo that their figures will be no leſs altered in this than in the others. Add, that moſt of the circles here degenerate into ellipſes, which are often difficult to deſcribe. Vid. Hiſt. Acad. Scienc. an. 1701. p. 125. ſeq.

ANALEMMA, in antient writers, denotes thoſe ſort of ſun-dials which ſhew only the height of the ſun at noon, every day, by the largeneſs of the ſhadow of the gnomon.

The antient *Analemma*, ſpoken of by Vitruvius and others, was not properly a dial; becauſe it did not ſhew the hours, but the ſigns and months only. Vid. *Pitiſc.* Lex. Ant. T. 1. p. 91. *Danet*, Dict. Antiq. in voc.

Jo. Twiſden has a treatiſe expreſs on the *Analemma*. Vid. Uſe of the great Planiſphere, called the *Analemma*, in the Reſolution of ſome uſeful Problems of Aſtronomy, Lond. 1685, 4to. *Wood*, Faſt. Oxon. T. 2. p. 97.

ANALEPSIS, the reſtauration of a body waſted by diſeaſe, by the uſe of a nutritious diet.

ANALEPSIS is alſo uſed for the method of hanging a broken or diſlocated member, eſpecially the hand, in a ſling. *Caſt.* Lex. Med. p. 44.

This operation to the arm is called *Analepſis*, to the foot *theſis*. *Gorr.* Def. Med. p. 33.

ANALOGISM, in medicine, denotes the judging of diſeaſes, and their remedies, by ſimilar appearances; or the diſcovery of cauſes and cures unknown, by ſome ſimilitude with others already known. Vid. *Caſt.* Lex. Med. in voc. *Quinc.* Lex. Phyſ. p. 19. ſeq.

Analogiſm is defined, by Gorræus, a method of reaſoning peculiar to dogmatic phyſicians, whereby, in obſcure and occult caſes, indications are taken from ſimilar diſeaſes. This method of deduction was called, by the antients, *medicina rationalis*, or *dogmatica*, in oppoſition to the *empirica*, called alſo *epilogiſm*, which was conducted by appearances only, without theory.

The rational or dogmatic method was called Ἀναλογικὴ, and the phyſicians who practiſed it, Ἀναλογιστικοὶ.

A late anonymous writer has given a diſcourſe on the *Analogiſm* of fevers. Vid. Exerc. Francof. T. 4. Ex. 2. See the article FEVER.

ANALOGISTA, among civil law writers, a tutor who is not obliged to give an account of his conduct. *Calv.* Lex. Jurid. p. 67.

In this ſenſe, *Analogiſta*, Ἀναλογιστὰ, amounts to the ſame with what is otherwiſe called *Aneclogiſtus*, Ἀνεκλογιστος, *Anexetaſtos*, Ἀνεξέλαστος.

Perſons dying ſometimes appointed friends to be tutors to their children, with this clauſe, that they ſhould be *Analogiſtæ*.

Some lawyers hold, that this did not exempt a tutor guilty of glaring miſmanagement, from being called to account, and puniſhed accordingly. Id. in voc. *Aneclogiſtus*.

ANALOGIUM, in eccleſiaſtical writers, denotes an *ambo*, or reading-deſk. Vid. *Meurſ.* Gloſſ. p. 35. *Du Cange*, Gloſſ. Græc. T. 1. p. 69. *Suic.* Theſ. Eccl. T. 1. p. 284. *Suid.* Lex. p. 169.

ANALOGIUM is ſometimes alſo uſed for a martyrology, or obituary of a monaſtery. Vid. *Du Cange*, Gloſſ. Lat. T. 1. p. 179.

ANALOGY (*Cycl.*) is one of the great ſources of knowledge. A great part of philoſophy and of theology itſelf ſtands on no other baſis. From a few data, a few points known and allowed, we reaſon by *Analogy*, and deduce a number of others. 'Tis thus that moſt branches of knowledge are extended to their preſent dimenſions. There are but few things actually obſerved, few experiments made; and all the obſervations and experiments we have are only ſingular. Such an effect was found from ſuch an individual body, under ſuch and ſuch circumſtances. Muſt we reſt here, and content ourſelves with having diſcovered a ſingle phænomenon; or muſt we proceed to make the like obſervations and experiments of all the other bodies of the ſame claſs, under the like circumſtances, before we can conclude any thing concerning them? The human mind is too impatient; knowledge, at this rate, would go on but ſlowly, or rather would not go on at all. We therefore take a ſhorter and more compendious, though a ſomewhat precarious courſe. We infer, that what has been obſerved of one body under ſuch circumſtances, will, from the *Analogy* and uniformity in the works of the creator, equally hold in all other bodies of the ſame ſpecies under the like circumſtances. This has many times drawn us into great errors; it continues every day to lead us into new ones, and may be ſaid to be the ſource of moſt of the miſtakes committed in purſuit of ſcience. But what remedy? how is it to be avoided? Mankind muſt be reaſoning and prying into things, where, let their patience and application be ever ſo great, they can never come at any actual knowledge by obſervation and experiment. They will enquire what paſſes, for inſtance, in the heavens, in the regions of the fixed ſtars and planets, in the neighbourhood of the ſun, on the ſurface of the moon, in the center of the earth, at the bottom of the ſea, in the bodies of animals, vegetables, and minerals. What have they but the *Analogy* of things, the ſuppoſed correſpondence between theſe unknown, inacceſſible objects, and other objects they are acquainted with, to be their guide.

The *Analogy*, *e. gr.* between the three kingdoms of plants, animals and minerals, has been the ſource of a multitude of diſcoveries, either real or imaginary: hence it is we have learnt, that ſtones vegetate; that plants breathe; that the ſap circulates in them; that generation is performed by eggs in the human kind; that the moon and planets have their atmoſpheres, their inhabitants, their trees, their ſeas, and what not. In effect, if we will follow whither *Analogy*, real or imaginary, will lead us, there is no end of ſcience. What magnificent things are we told of the *Analogy* between the microcoſm and the macrocoſm, the great and little world? how many large volumes on it have been written?

The world, according to Kircher, and others, is only a great animal, of which the ſun is the heart, the firmament the brain, Saturn the ſpleen, Mars the liver, Mercury the lungs, Jupiter the blood and ſpirits. There are bones and cartilages, veins, arteries, nerves, blood, &c. in the earth; or, if you had rather, there are ſtones, metals, minerals, rivers, lakes, caverns, in the human body. Vid. *Kirch.* Mund. Subter. l. 12. ſec. 1. c. 5.

The chemiſts have not been leſs happy in tracing the *Analogy* between the human body and a chemiſt's alembic. The heart is the focus, or fire-place, the ſkull the capital, the noſe the beak, &c. While mechanical phyſicians find nothing in the human body, but levers, pullies, ſcrews, preſſes, &c.

'Tis the ſame principle of *Analogy* that has filled the heavens with Cartes's vortices, and the human body with parts, which belong only to brutes. Anatomiſts in all ages, for want of opportunities of enquiring into man, have taken many of their deſcriptions from brutes, as ſuppoſing an *Analogy*.

The former, from the effects of mineral ſubſtances in their furnaces, infer, that they have the like in our bodies. And hence, for inſtance, it was, that Van Helmont decried bleeding in fevers. As, ſays he, we don't cool the liquor boiling in a kettle, by drawing off part of it, ſo, &c.—The heat, in the former caſe, is only to be abated by leſſening the fire; conſequently, in the latter caſe, the way to allay the fervor is by diſcharging ſome of the fuel, the febrile matter, by ſweat, or other evacuations.

As to divine and ſupernatural matters, 'tis aſſerted we know nothing of them, but by *Analogy*; that is, by the mediation and ſubſtitution of thoſe ideas we have of ourſelves and other natural beings [a]. Our ideas of God himſelf ariſe from this ſpring; we have no direct and immediate perception of him. The knowledge we have of the ſupreme being, is only an obſervation of his works, and a reflection of the mind, which ſhews what power, wiſdom, &c. appear neceſſary to enable him to produce them [b]. Having no proper ideas of his perfections, we give them the names of thoſe faculties in men, which we judge neceſſary.—[[a] Proced. Extent, &c. of Underſt. l. 1. c. 1. Preſ. State Rep. Lett. T. 2. p. 49. [b] *King*, Serm. on Divine Predeſt. Nouv. Rep. Lett. T. 49. p. 397. ſeq.]

But here, it is to be obſerved, a diſpute ariſes. The generality of divines make a diſtinction between the natural and moral attributes of God, maintaining the former to be only analogical, but the latter proper; *e. gr.* when the ſcriptures, ſay they, attribute hands, eyes, feet, and face to God, we are not to underſtand that God really has theſe parts, but only that he has a power to execute all thoſe actions, to the executing of which thoſe parts are neceſſary in us: and when the ſcripture attributes ſuch paſſions to God, as pleaſure, love, hatred, repentance, revenge, and the like, the meaning is, that he will as certainly puniſh the wicked, as if he was inflamed with the paſſion of anger; that he will as infallibly reward the good, as if he had a love for them, and that when men turn from their wickedneſs, he will ſuit diſpenſations to them,

them, as if he really repented or changed his mind. Theſe ſcripture attributes, anger, pleaſure, love, hatred, repentance, revenge, and the like, belong not to God, in a proper and juſt ſenſe, but only improperly or analogically. But when the ſame ſcripture attributes to God an underſtanding, wiſdom, will, goodneſs, holineſs, juſtice, and truth, theſe words are to be underſtood ſtrictly and properly, or in their common ſenſe. Archbiſhop Tillotſon, throughout his works, maintains this ſyſtem of the Deity. *Collins*, Diſc. of Free-th. ſec. 2. p. 50.

On the other ſide, archbiſhop King affirms, that wiſdom, underſtanding and mercy, foreknowledge, predeſtination and will, when aſcribed to God, are not to be taken properly. Again, that juſtice and virtue (and by conſequence the moral attributes of God) are not to be underſtood to ſignify the ſame thing, when applied to God and man, and that they are of ſo different a nature, and ſo ſuperior to all that we can conceive, that there is no more likeneſs between them, than between our hand and God's power. But all theſe attributes are to be underſtood in the ſame manner, as when men aſcribe hands, eyes and feet to God, or when men aſcribe anger, love, hatred, revenge, repentance, changing reſolutions, &c. and are to be taken in the ſame improper, analogical ſenſe.

On the whole, a late author draws this concluſion, that as archbiſhop Tillotſon would define God to be a being without parts and paſſions, holy, wiſe, juſt, true and good; biſhop King muſt, on the contrary, define God to be a being not only without parts and paſſions, but without underſtanding, will, mercy, holineſs, goodneſs, or truth. Diſc. of Free-think. ſec. 2. p. 51. ſeq.

But this ſneer of the author of the diſcourſe on free-thinking is equally invidious and unjuſt. The two archbiſhops might, upon farther explanation, have been found to differ more in words than in thought. As to the queſtion itſelf, it is plain, on the one hand, that we muſt derive our notions of the divine attributes from thoſe of the human mind, excluding limitations and imperfections; hence we may ſay, that we conceive the divine attributes by *Analogy*. But, on the other hand, it ſeems no leſs certain, that the divine underſtanding muſt be infinitely different from the human, whether we conſider its object, or manner of knowing. The human underſtanding does not extend to every thing poſſible, nor is it perfectly diſtinct, nor ſimultaneous. We cannot conceive any limitation or imperfection whatever in God. In him the diſtinction between inferior and ſuperior faculties cannot take place; and the degree and manner of his knowledge muſt be incomprehenſible to any limited intelligence. His underſtanding may be ſaid therefore, with the ſchoolmen, to differ *toto genere* from the human underſtanding; but will it therefore be juſt to charge Dr. King with ſaying, that God is a being that has no underſtanding?

ANALOGY *of faith*, among divines, denotes that relation which the ſeveral articles of faith bear to each other.

Analogy of faith is uſed, by the fathers, for a ſyſtem of the chief points and articles of ſcripture, containing the principal dogmata neceſſary to ſalvation. Vid. Act. Erud. Lipſ. 1686. p. 105.

Analogy of faith is the foundation, or general principle, whereby all expoſitions of ſcripture are to be tried, as by a touchſtone. *Rambach.* Inſtit. Hermen. l. 2. c. 1. §. 4.

Analogy of faith ſtands oppoſed, on one hand, to reaſon, which the Socinians obtrude as the chief rule of interpretation, and, on the other hand, to tradition and authority, which is the great rule of interpretation among catholics. *Budd.* Iſag. ad Theol. l. 2. c. 8. p. 1758.

By this it is required, that whether we interpret ſcripture, or explain the doctrines of Chriſtianity, all our poſitions and explications be conſiſtent with the *Analogy* of our faith, and thoſe evident propoſitions deduced from ſcripture.

Tortſchius, Antonius, Franckius, &c. have written expreſly on the *Analogy* of faith.

ANALOGY *of diſeaſes*, in medicine, is a certain relation or reſemblance between them, in virtue whereof, we may reaſon and conclude from one to another, and treat them all much in the ſame manner; *e. gr.* a pleuriſy, being a ſpecies of inflammation, produced like inflammations of other parts, is to be treated like them, relaxing the ſolids, which are too much ſtretched, and giving free paſſage for the humours. *Bagliv.* Diſſ. 5. ap. Opp. in 4to. Nouv. Rep. Lett. T. 33. p. 577. Jour. des Scav. T. 33. p. 220.

ANALOGY, in grammar, denotes the ſuitableneſs, or agreeableneſs of a word or phraſe to the common rules, or forms of language.

In this ſenſe, *Analogy* ſtands oppoſed to *Anomaly*. See the article ANOMALY, *Cycl.*

ANALOGY, in reſpect to language, denotes a conformity with other points already eſtabliſhed, ſerving as a rule, or model, for the making of new words and phraſes ſimilar to thoſe already in uſe.

Or, *Analogy* may be conſidered as a general or eſtabliſhed uſage, applied in ſimilar caſes, to certain words, phraſes, or conſtructions, not yet eſtabliſhed. Or, *Analogy* is only a particular uſage which, in certain caſes, is inferred from a general uſage already eſtabliſhed. *Quint.* l. 1. c. 6. *Vaugel.* Rem. in Præf. in voc.

Grammarians are divided into two parties. Some, with Sanctius, contend, that the *Analogy*, or reaſon, reigns through all the parts, all the phraſes and dictions of the Latin tongue. On the contrary, others, with Perizonius, aſſert, that there are many phraſes, contrary to *Analogy* and reaſon, derived all originally from the populace. Such, *e. gr.* are, *Nemo homo*, *deorſum verſum*, &c. Bibl. Univ. T. 5. p. 302.

Varro [a] and Cæſar [b] wrote expreſs on the *Analogy* of Latin words, now all loſt. Jac. Operarius has endeavoured to ſupply that loſs, by tracing the *Analogy* of 20000 Latin words. —[a *Fabric.* Bibl. Lat. *Baill.* Jugem. des Scav. T. 2. P. 3. p. 25. b *Fabric.* ubi ſupra, l. 1. c. 10.]

ANALOGY *of conjugation*, *Analogia conjugationis*, is not only when a verb is conjugated like another, but agrees with it in the quantities of the ſyllables. *Heder. Schul.* Lex. p. 230.

Thus *clamo* is conjugated like *amo*, and *clamabam* pronounced like *amabam*.

ANALOGY *of declenſion*, *Analogia declinationis*, is not only when a noun, pronoun, or participle is declined like another, but agrees with it in reſpect of the quantities of the ſyllables. *Heder. Schul.* loc. cit.

Thus, *e. gr. mater* is declined like *pater*, *ſaltans* as *amans*, *ſuus* as *tuus*. So *pennarum* is pronounced as *menſarum*, and *funeris* as *muneris*.

ANALOGY *of doctrine*, among critics, is one of the great rules to which regard is to be had in the interpretation of authors.

We are firſt to learn from the author himſelf, the general ſyſtem which he follows; and as no body is to be eaſily ſuppoſed to contradict himſelf, our interpretation is to be ſo conducted, as that nothing be admitted which is contrary to, or tends to overthrow this ſyſtem.

Thus, in interpreting an author who follows the Platonic ſcheme, we are to prefer a ſenſe which is conſiſtent with the Platonic doctrine, to another which is contrary thereto, unleſs there be ſome glaring proof, that the author here contradicts himſelf, or aſſerts things which are inconſiſtent. *Budd.* Elem. Phil. Inſtrum. P. 2. c. 4. §. 15.

ANALOGY, in rhetoric. See COMPARISON, *Cycl.*

ANALYSIS, in logic, is particularly uſed for the reduction of an imperfect ſyllogiſm to a perfect one. This is otherwiſe called *reduction*. See REDUCTION and SYLLOGISM, *Cycl.*

ANALYSIS *of ideas*, that whereby an idea is reſolved into the ideas of its ingredients, and the ideas of theſe again into ſimpler ones, till at length we arrive at the moſt ſimple. *Wolf.* Pſychol. §. 339.

Grammatical ANALYSIS is that employed about words, their etymons, homonyma's, or various acceptations, ſynonyma's, conſtructions, uſes, and the like.

Paſor has given a grammatical *Analyſis* of the difficult words in Heſiod, &c [a]. Sturmius has publiſhed a method of making the *Analyſis* of Latin words [b].—[a *Baill.* Jugem. des Scav. T. 2. P. 2. p. 301. b Jour. des Scav. T. 35. p. 51.]

Rhetorical ANALYSIS is that which examines the connexions, tropes, figures and the like, enquiring into the propoſition, diviſion, paſſions, arguments, and other apparatus of rhetoric.

Several authors, as Freigius and others, have given *Analyſes* of Cicero's orations, wherein they reduce them to their grammatical and logical principles; ſtrip them of all the ornaments and additions of rhetoric, which otherwiſe diſguiſe their true form, and hide the connection between one part and another. The deſign of theſe authors is to have thoſe admired harangues, juſt ſuch as the judgment diſpoſed them, without the help of imagination; ſo that here we may coolly view the force of each proof; and admire the uſe Cicero made of rhetorical figures, to conceal the foible of a cauſe. Mem. de Trev. 1704. p. 1084.

The *Analyſes* given by Freigius are the ſhorteſt, in three ſmall volumes; thoſe of F. Merouille, added to the dauphine's edition of Cicero's orations, are eſteemed; the like may be ſaid of thoſe of Maſene, and of F. Mart. Du Cygne, ſeveral times printed. The abbé Olivet, in his edition of Tully's works, has alſo given us the *Analyſis* of his orations.

A collection has been made of the *Analyſes* made by the moſt celebrated authors of the ſixteenth century, in three volumes folio. V. *Gibert.* Judg. des Sav. P. 2. p. 221, and 225. Mem. de Trev. loc. cit.

ANALYSIS is alſo uſed for a preciſe methodical ſcheme, or delineation of any art or ſcience deduced from its principles.

In this ſenſe Juncker has given *Analyſes* of phyſic, ſurgery, chemiſtry, &c. Carter has publiſhed an *Analyſis* of honour, &c.

ANALYSIS, in a more general ſenſe, may be defined, the method of diſcovering the poſſibility or impoſſibility, the truth or falſhood of a propoſition.

The Scholiaſt on Euclid defines *Analyſis*, the ſumption of a thing ſought by the conſequent, as if it were already known, in order to find out the truth. Examples of which we find in the five firſt propoſitions of the thirteenth book of Euclid, beſides

beſides ſeveral others that occur in Apollonius Pergæus, and Pappus Alexandrinus. *Stanl.* Hiſt. Philoſ. P. 5. p. 263.

The order of the *Syntheſis* is contrary to that of the *Analyſis*, one beginning where the other ends. The two methods cannot always be uſed indifferently; the *Analyſis* is moſt proper for the diſcovery of truth, and ſyntheſis for teaching and explaining it in a ſyſtematical way. Hence ſome call *Analyſis* the method of invention.

ANALYSIS may be divided into antient and modern, or new and old.

The modern *Analyſis* is what is often called *Algebra*; but they ought to be diſtinguiſhed, Algebra being only a part of the *analytic* art.

The moderns are at ſome loſs concerning the antient *Analyſis*, i. e. concerning the art or method whereby the antients reſolved problems and invented theorems. Some traces of their method are extant in Pappus [a], Apollonius [b], and Euclid [c]; and Dr. Hook ſuſpects, that their *Analyſis* went backwards thro' almoſt all the ſame ſteps, by which their demoſtrations went forwards [d].—[a Præf. ad L. 7. Vid. *Fabric.*. Bibl. Græc. l. 5. c. 22. b De Sectione Rationis. V. Mem. de Trev. an. 1706. p. 702. c Elem. l. 13. Vid. *Stanl.* Hiſt. Philoſ. P. 5. p. 263. d Poſthum. Work. p. 68.]

That this might often be the caſe, ſeems evident to any one who has ſtudied Euclid with care. They have indeed left us no precepts of their art. This, like almoſt all others, muſt be acquired by imitation of the excellent examples left us by the Greeks. But may we not ſay alſo, that the moderns have given us no precepts of their art, and that it cannot be acquired otherwiſe than by imitation? The precepts of invention we meet with in algebraical writers are very general and vague; and the principal point, the invention of the diagram, by which a problem is to be ſolved, or a propoſition demonſtrated, is commonly left untouched; ſo that, altho' we have very good obſervations in Newton's algebra and in ſome others, yet all theſe go but a little way towards the art of invention, which is a habit to be acquired in modern analytics, as well as in antient, by imitation and uſe, and not by precept. Men of genius among the moderns, who have ſtudied the works of the antient geometers, have been thereby enabled to imitate them, and penetrate into their methods: the works of Huggens and Newton, and of late, the treatiſe of conic ſections by Mr. Simſon, profeſſor of mathematics in the univerſity of Glaſgow; as alſo ſeveral parts of Mr. MacLaurin's treatiſe of fluxions, are evident proofs of this.

We have an attempt to reduce the geometrical *Analyſis* to an art, by Hugo de Omerique, a Spaniard. This work has been applauded by good judges; tho' ſome modern analyſts pretend, that he has done nothing but what may be performed much more eaſily by algebra.

Weigelius has endeavoured to retrieve the antient *Analyſis* of Ariſtotle, from Euclid, and other antient geometricians. Vid. *Weigel.* Analyſis Ariſtotelica ex Euclide reſtituta.

ANALYSIS is divided by ſome authors into ſimple and compound.

Simple ANALYSIS it that employed in ſolving problems reducible to ſimple equations. *Reynau*, Anal. Demonſtr. Præf. p. 4.

Compound, or *Complex* ANALYSIS, that which gives the expreſſions or ſolutions of problems in compounded equations.

ANALYSIS *of Powers* denotes the reſolving them into their roots. V. *Jones* Synopſ. Palmar. Matheſ. p. 51.

In this ſenſe *Analyſis* amounts to the ſame with what we otherwiſe call evolution. See EVOLUTION, *Cycl.*

We find divers other kinds of *Analyſis* treated of by mathematical writers, as the *Analyſis* of indiviſibles, &c [e]. M. Leibnitz ſpoke of an *Analyſis ſitus*, different from the *Analyſis* of magnitudes [f].—[e Act. Erud. Lipſ. an. 1686. p. 292. f V. Wolf. Elem. Anal. in Præf.

The *Analyſis* of geometrical curves ſhews their properties and internal conſtitution, their curvature, points of inflexion, ſtation, retrogradation, variation, &c.—In this *Analyſis*, curves are uſually conſidered as polygons compoſed of an infinite number of infinitely little ſides; but this ſuppoſition is neither accurate nor neceſſary, tho' it ſometimes affords convenient hints for invention. V. *MacLaurin*'s Fluxions paſſim.

F. Reynau of the oratory has given a large ſyſtem of algebra under the title of *Analyſis* [g]. F. Caſtel cenſures it as not ſufficiently methodical or ſyſtematical [h]. The great diviſions and members are drowned in the multitude of particular rules and methods.—[g Analyſe Demontrée. P. 1708. 4°. 2 Vol. V. Mem. de Trev. 1708. p. 1493. ſeqq. h *Caſtel* Mathem. Univ. p. 666.]

ANALYSIS, in chemiſtry.—The *Analyſis* of metals and metallic minerals conſiſts in what they call the mercurification of them: The *Analyſis* of other bodies is performed by diſtillation, lixiviation, &c. V. Mem. Acad. Scienc. an. 1702. p. 46.

The order of matters which ariſe in analyſing vegetable and animal bodies is different, according as thoſe bodies have been fermented or not; if they have, the ſpirits and volatile ſalts ariſe firſt, then aqueous liquors, then fœtid oil, after which a caput mortuum, which by calcination and lixiviation, is reduced to a fixed ſalt and inſipid earth. in bodies unfermented, the aqueous parts riſe firſt, afterwards the reſt ſucceed in the ſame order as above.

The zeal for analizing plants and other matters belonging to the *materia medica*, in order to a more preciſe diſcovery of their internal qualities, is much abated of late years, as having been proved in great meaſure uſeleſs. The *Analyſis* gives the chief principles ſeparately; from the qualities of which no concluſion can be drawn concerning the plant itſelf, wherein theſe principles are united. Beſides that, the fire alters the ſtructure of much the greater part of plants [i]. Fourteen hundred plants underwent this examination in the royal academy of ſciences at Paris; from all of which, however different in virtues, the ſame matters were procured. The decompoſition ſeems to reduce all to the ſame ſtuff. Plants in this ſtate may be conſidered like houſes in ruins; whatever different forms or diſpoſitions they had before, the rubbiſh is much the ſame in all. M. Lemery ſuggeſts a new ſort of *Analyſis*. According to this author, to learn the nature of a mixt, we are not to analyſe it exactly, but only bring it down one pitch lower, reſolve it not into its principles, but into other mixts a degree ſimpler than the former; the chief of which are ſaline and ſulphureous or fatty parts [k].—[i Jour. des Scav. T. 68. p. 16. k V. Hiſt. Acad. Scienc. an 1719. p. 63. Mem. ibid. p. 227.

Mr. Hales has given an attempt towards analyſing the air by chymico-ſtatical experiments, which ſhew in how great proportion air is wrought into the compoſition of animal, vegetable, and mineral bodies. *Hales*, Veget. Stat. in fine.

But it may be obſerved, the ingenious author here uſes the word in a ſenſe ſomewhat different from what a reader at firſt ſight would imagine. The tendency of this author's experiments is not to make what we call an *Analyſis* of the air, to ſhew its ingredients and principles, but to ſeparate or diſingage it from the bodies it happens to be mixed with, or incloſed in.—So that analyſing in his ſenſe amounts to the ſame with what we ordinarily call *extricating*. See AIR.

ANALYST, a perſon who analyzes a thing, or makes uſe of the analytical method. See ANALYSIS, and ANALYTIC. *Cycl.* and *Suppl.*

Some reſtrain the word more peculiarly to denote a mathematician, who makes great uſe of the algebraic method or calculus in geometry, in excluſion of the ſynthetic or ſtrict geometrical method.

In which ſenſe *Analyſt* amounts to much the ſame with *Computiſt* or *Calculator*.

In a ſenſe not unlike this, a late ingenious writer gives the title *Analyſt* to a book againſt the modern geometry, or doctrine of fluxions. See FLUXION, *Cycl.* and *Suppl.*

ANALYTIC *Chemiſtry*, the art of analyſing vegetable, animal, and mineral ſubſtances, and reſolving them into their different parts or principles. The whole of chemiſtry may be comprehended under the art of reſolving bodies into their principles, and of compoſing new compounds from theſe principles, this laſt part of it is called *ſynthetic Chemiſtry*. *Shaw*'s Lectures, p. 145.

ANALYTICS, (*Cycl.*) in literaryhiſtory, is particularly uſed to denote certain writings of Ariſtotle under this title.

Ariſtotle's *Analytics* conſiſt of four books, two under the denomination of *former*, Αναλυτικων πρωτερων, and as many under that of *latter*, υστερων.—They belong to the claſs of his acroamatic works. Galen ſuggeſts, that the antient and genuine title of the two former books, was περι συλλογισμων, concerning ſyllogiſm, which is confirmed by Boëthius: The title of the two latter, according to the ſame Galen, was περι αποδειξεως, on demonſtration. Petit maintains, that the *Analytics*, mentioned by Ariſtotle to Nicomachus, were different from thoſe now extant. In effect, Laertius ſpeaks of eight, or according to other copies, of nine or ten books of the former *Analytics*, beſides two of the latter. Add, that Ammonius aſſures us, that in the time of Ptolemy Philadelphus, there were no leſs than forty books of Ariſtotle's *Analytics* in the Alexandrian library.

Proclus cenſures Ariſtotle's *Analytics*, for being too plain and intelligible to every body: Ramus, perhaps with more juſtice, frequently complains of their being obſcure and incomprehenſible.

However it muſt be owned, that Ariſtotle in this work has ſhewn, that he thoroughly underſtood reaſoning and demonſtration; a compliment which cannot with juſtice be paid to many modern writers on the human uuderſtanding and logic. We have various commentators on Ariſtotle's *Analytics*; for which we refer to *Fabric.* Bibl. Græc. l. 3. c. 6. n. 3.

ANAMNESEIS, Αναμνησεις, in antient writers, denote enconiums of perſons who had behaved well in war or elſewhere, rehearſed before the emperors of Conſtantinople, to put them in mind of beſtowing ſuitable rewards. *Meurs.* Gloſs. Græc. Barbar. in voc.

ANAMNESES, in medicine, are uſed by ſome writers to denote thoſe ſigns which help to diſcover the paſt ſtate of a patient's body.

Theſe are otherwiſe called *Rememoratives*. *Caſt.* Lex. in voc.

ANAMNESTIC is alſo applied by Blancard to remedies proper for reſtoring or ſtrengthening the memory.

Such according to this author are all ſpirituous things. Vid. *Blancard*, Lex. in. voc.

ANANAS,

ANANAS, in botany, the name of a genus of plants, of which father Plumier gives the following characters. The flower is compoſed of one leaf and is of the funnel faſhioned kind, divided into three ſegments at the edge, and having the tubercles of the embryo fruit for its baſe; this embryo finally becomes a fleſhy fruit, very juicy and of a turbinated form, in which are lodged many ſmall ſeeds of a kidney-like ſhape, covered with their calyptræ. See PINE-APPLE.

The ſpecies of *Ananas* enumerated by Mr. Tournefort are theſe.

1. The prickly *Ananas*, with an oval fruit with white pulp. 2. The prickly *Ananas*, with a pyramidal fruit and yellow pulp. And, 3. The ſmooth or not prickly *Ananas*, called *pitta*. *Tournef.* Inſt. p. 659.

The method of preparing the *Ananas*, as practiſed by the Americans, is to pare it, ſlice it, put it in a veſſel well cloſed, and ſuſpend it in a kettle of water over the fire, by which means the juice iſſues ſpontaneouſly, and in the boiling loſes all its crudities. *Worm.* Muſ. p. 185. *Pomet*, Hiſt. des Drog. l. 7. c. 49. *Burggr.* Lex. Med. T. 1. p. 647.

Tiemeroth [a] and Lochner [b] have given diſſertations expreſs concerning the *Ananas*.—[[a] Diſſ. de Planta & Fructu *Ananas* Erf. 1723. [b] Comment de *Ananaſa*, ſive Nuce Indica Pinea, vulgo *Pinhas*, Norimb. 1716. 4°. An Extract of it is given in Jour des Scav. T. 62. p. 180. ſeq.]

ANANCITIS, in natural hiſtory, a kind of figured ſtone, or gem, famous among the antients for its magical uſe in raiſing the image of the gods. *Mercat.* Metalloth. Arm. 9. c. 57.

The word is alſo written *Ananchitis*, αναγχίτις, but more properly αναγκίτις.

It is formed from αναγκη, force, neceſſity, alluding to its conſtraining the gods to appear.

The *Anancitis* appears to be the ſame with the ſtone otherwiſe called *Synochitis*, celebrated for its virtue in raiſing the ſhadows of the infernal gods.

The *Anancitis* is of an elegant figure; it makes an hemiſphere finely furrowed all over. Its figure and deſcription may be ſeen in Mercatus.

ANANDRI, Ανανδροι, in antient writers, is applied to virgins, or thoſe who have not known man. *Caſt.* Lex. Med. p. 44.

In this ſenſe *Anandri* ſtands contradiſtinguiſhed from *Andrumæ*, Ανδρεμαι, thoſe who have had commerce with men.

ANANISABTA, or ANANISAPTA, a magical word frequently found inſcribed on coins and other amulets, ſuppoſed to have a virtue of preſerving the wearer from the plague. V. Miſc. Lipſ. T. 5. p. 284. Obſ. 115.

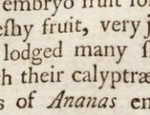
Serpilius thinks it has been formed from a miſunderſtanding of the word σαβαχθανι, uſed by our Saviour in his agony on the croſs. Hence alſo this inſcription is ſometimes found to accompany pretended pieces of the true croſs. In ſome inſtances the order of the letters is tranſpoſed, and in lieu of *Ananiſabta* written *Inana Sabta*.

M. Lyonet, phyſician of the king of France, ſtarts another explication of *Ananiſabta*. He ſuppoſes it a kind of abreviature, formed of the initial letters of the words, *Antidotus Nazareni Auferat Noxam Intoxicationis, Sanctificet Alimenta, Pocula Trinitas Alma*. But this is mere conjecture. A later writer has with equal probability, diſcovered after the ſame manner another meaning in the word, applicable to M. Lyonet himſelf; *Attulit Nequaquam Ananiſabtæ Noſtræ Innatam Significationem A Peſtis Tempore Alienam.*

ANAPÆSTIC, or ANAPÆST, is ſometimes uſed in a ſubſtantive ſenſe.

Such is the *Anapæſtus Ariſtophanæus*, in Cicero, which is a verſe conſiſting of eight feet, as

Axena Ponti per freta Colchos denique delatus adhæſi.

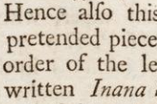


Vid. *Cic.* in Orat. c. 56. *Faber*, Theſ. in voc. *Anapæſtus*. This is otherwiſe called *Anapæſtus Octonarius*.

ANAPÆSTIC, in an adjective ſenſe, ſomething relating to, or compoſed of *Anapæſts*. See ANAPÆST, *Cycl.*

ANAPÆSTIC *kind*, *Genus Anapæſticum*, is a ſort of verſe compoſed of pure Ariſtophanic or Parthenaic *Anapæſts*.

Anapæſtic verſes are either Ariſtophanic or Pindaric. *Anapæſticus Ariſtophanius*, called alſo *Parthenaicus*, conſiſts of three *Anapæſts*, and one long ſyllable, but ſo as that inſtead of the firſt two *Anapæſts* as many ſpondees may be uſed. *Scalig.* Poet. l. 2. c. 36. *Groſſ.* Inſt. P. 5. Sec. 1. c. 2. §. 19.



Its type ſtands thus

Venient cito Sæcula quum jam
Socius calor oſſa reviſet
Animataque ſanguine vivo
Habitacula priſtina geſtet
Lacrymas ſuſpendite cuncti
Mors hæc reparatio vitæ eſt. Bona.

Pindaric Anapæſt admits, in the firſt region, either of an *Anapæſt* or a ſpondee; in the ſecond, only of an *Anapæſt*; in the third, of an *Anapæſt* or a ſpondee; in the fourth, either of a ſpondee or a trochee.

As in the following type:

In ſumma pericula venturi
Multos timor ipſe mali mittit.

ANAPHORA (*Cycl.*) is uſed, in the antient medicine, for the rejection of matter by the mouth. *Foes.* Œcon. Hippoc. p. 56. *Caſt.* Lex. Med. in voc.

Hence alſo we meet with the term *Anaphorici*, Αναφορικοι, uſed for thoſe labouring under an hæmoptye, who bring up blood from the lower part by the mouth. *Gorr.* Def. Med. in voc.

ANAPHORA among eccleſiaſtical writers, denotes the hoſt or ſpecies offered in the euchariſt. *Du Cange*, Gloſs. Græc. in voc. Αναφορα.

ANAPHORA is alſo uſed to denote the rehearſing a perſon's name from the diptychs in the liturgy. Id. ib. See DIPTYCH.

ANAPHORA is alſo a title given to thoſe little Syriac liturgies, wherein are contained the prayers after the *Oſculum Pacis*. Ignatius patriarch of the Marionites enumerates forty of theſe *Anaphoræ*. *Le Brun*, ap. Bibl. Franc. T. 9. p. 100.

ANAPHORA, in aſtrology, denotes the ſecond houſe, or that part of heaven which is thirty degrees diſtant from the horoſcope. *Bud.* de Aſſe, l. 1. p. 120.

The term *Anaphora* is alſo ſometimes promiſcuouſly applied to ſome of the ſucceeding houſes; as the ſecond, fifth, eighth, and eleventh. In this ſenſe *Anaphora* amounts to the ſame with *Epanaphora*, and ſtands oppoſed to *Cataphora*. See CATAPHORA.

ANAPHORA is alſo applied by ſome to the oblique aſcenſions of the ſtars. *Vital.* Lex. Math. in voc.

ANAPHRODISIA denotes impotency in reſpect of venery. Some alſo uſe it for a want of deſire or inclination to the ſex. *Bonet.* Medic.ſeptent. l. 3. Sec. 33. c. 7. *Caſt.* Lex. Med. p. 45.

In this ſenſe, the academiſt's *Naturæ Curioſi* give an extraordinary inſtance of this kind, in a perſon otherwiſe healthy and robuſt. Ephem. Acad. N. C. Dec. 1. an. 8. Obſ. 94.

ANAPHYSEMATA, in ſome antient writers, denotes winds iſſuing from under ground, at the clefts or appertures thereof. *Apul.* de Mund. ap. *Vital.* Lex. Math. p. 39.

Theſe are ſometimes called by later writers *Apogæi*.

ANAPLASIS, in medicine, the compleat reſtitution of a broken bone, ſo as the two ends meet and cloſe exactly together [a]. This is the ſame with what is otherwiſe called *Diaplaſis* [b].—[[a] *Caſt.* Lex. Med. p. 45. [b] V. *Foes.* Œcon. Hippoc. p. 51.]

ANAPLEROSIS, in the general ſenſe, denotes repletion.

Anapleroſis is more particularly uſed in medicine, to denote that part of ſurgery, whereby things wanting are ſupplied. *Caſt.* Lex. Med. p. 45.

In which ſenſe, *Anapleroſis* amounts to the ſame with what we otherwiſe call appoſition. *Barbet.* Chirurg. P. 1. c. 1

ANAPLEROSIS, in the civil law, is a name which ſome give to the four laſt books of Juſtinian's code. V. Jour. des Scav. T. 30. p. 768.

ANAPODOPHYLLON, *Duckfoot*, or *May-Apple*, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the roſaceous kind, conſiſting of ſeveral petals diſpoſed in a circular form; from the center of the flower ariſes a piſtil which is afterwards a fruit, or ſeed-veſſel of an oval form, unicapſular, and containing ſmall roundiſh ſeeds.

The ſpecies of *Anapodophyllon* enumerated by Mr. Tournefort are theſe.

1. The Canada *Anapodophyllon* of Morinus. And, 2. The Canada *Anapodophyllon*, with leaves like thoſe of the Ricinus. *Tournef.* Inſt. p. 239.

This plant is propagated by parting the roots in Auguſt, after the green leaves decay.

ANARGYRUS, Αναργυρος, in antient writers, denotes a perſon without money, tho' otherwiſe ſufficiently accommodated with land and other effects. *Suid.* in voc.

In a like ſenſe, we ſometimes alſo meet with the word *Anargyria*, uſed by lawyers for the condition of a perſon without ready money.

Mart. Phil. Fabricius has a diſſertation expreſs *de exceptione Anargyriæ*. *Argent.* 1666. 4°.

ANARGYRI, in eccleſiaſtical hiſtory, is an appellation given to certain ſaints in the Greek church, who having been phyſicians, gave not only their advice, but their remedies, gratis.—They are alſo called *Argentinopes*. *Meurs* & *Du Cange*, Gloſſ. Græc. & *Suic.* Theſ. in voc. Αναργυρ@.

ANARRAPHE, in ſurgery, denotes a kind of ſuture or retraction of the upper eye-lid, when relaxed and hanging over the eye. *Woolhouſe*, ap. Ephem. Acad. N. C. Cent. 5. app. p. 142. ſeq.

This is by ſome alſo called *Sutura blepharica*, by others *abbreviatio*, *contractio*, *collectio*, or *ſuſpenſio ſuperioris palpebræ*.—It is uſed in the *phalangoſis*, *ptoſis*, or *chalaſis*; where the ſight is obſtructed, by a *prolapſus* of the part, or the eye-lid itſelf is too thick beſet with briſtly hairs both within and without.

ANARCHI, Αναρχοι, in antiquity, a name given by the Athenians to four ſupernumerary days in their year, during which they had no magiſtrates.

The Attic year was divided into ten parts according to the number of tribes, to whom the precedency in the ſenate fell by turns.

Each diviſion conſiſted of thirty five days; what remained after the expiration of theſe, to make the lunar year compleat, which according to their computation conſiſted of three hundred fifty-four days, were employed in the creation of magiſtrates, and called αναρχοι ἡμεραι, and αρχαιρεσιοι. *Potter*, Archæol. l. 1. c. 18.

ANARCHY (*Cycl.*)—All kinds of ſtates are ſubject to *Anarchies*. We read of civil *Anarchies*, eccleſiaſtical or ſpiritual *Anarchies*, and even *Anarchies* in the republic of letters. It has been objected to a learned prelate, that his principles tended to reduce Chriſt's kingdom to an *Anarchy* [a]. Clem. Walker has given the hiſtory of independency, under the title of the Engliſh *Anarchy* [b].—[a Vid. Bibl. Angl. T. 3. p. 251. b Lond. 1649, 4to. *Wood*, Athen. Oxon. T. 2. p. 146.]

It has been ſometimes controverted which of the two is beſt, a ſtate of *Anarchy*, or of tyranny and arbitrary power. Vid. Nouv. Rep. Lett. T. 40. p. 262. *Cato*'s Letters, T. 2. p. 207, 213.

Anarchy is ſuppoſed to have reigned after the deluge, before the foundation of monarchies [a]. We ſtill find it obtain in divers parts, eſpecially of Africa and America; *e. gr.* among the Itinois, who are obſerved by travellers to live in a perfect independency of any ſuperior [b]; among the Canadeſe, who are ſaid to be without either judges or prieſts [c]; among the Californians, where every family makes its own laws, as well as religion [d]; in Chili, where every maſter of a family is a king [e]; in the Marian iſlands, where neither prince nor law is known, but every perſon governs himſelf according to his own fancy [f]; and to mention no more, among the Hotentots, where the only reſemblance of government that is found is that in each neighbourhood, the eldeſt is the firſt in honour, and his advice chiefly followed, not from any civil authority he is veſted with, but in regard of his ſuperior experience [g]. —[a Vid. *Thomaſſ.* Meth. Etud. Hiſt. l. 1. c. 13. p. 207. b Lett. Edif. T. 11. p. 305. c Works of Learn. T. 5. p. 79. d Mem. de Trev. 1705. p. 1750. e Nouv. Rep. Lett. T. 54. p. 110. f Ouvr. des Scav. Mars 1702. p. 114. g Phil. Tranſ. N°. 310. p. 2426.]

Some extend the idea of *Anarchy* further, ſo as to make it comprehend all the more popular governments.

In this ſenſe, *Anarchy* amounts to much the ſame with *Democracy*. See DEMOCRACY, *Cycl.*

Hobbs, in this ſenſe, calls the Roman commonwealth an *Anarchy*. *Chriſt. Machiav.* l. 3. c. 6. p. 105.

ANARCHY is alſo applied to certain troubleſome and diſorderly periods, even in governments otherwiſe regular.—In Germany the ſpace from the election of Richard duke of Cornwall to that of duke Rud. of Hapſburg, is commonly called the *Anarchy*, or interregnum. Vid. Bibl. Germ. T. 3. p. 242.

In England, the period between the death of Cromwell and king Charles's reſtoration, is commonly repreſented as an *Anarchy*. Every month produced a new ſcheme or form of government [a]. Enthuſiaſts talked of nothing but annulling all the laws, aboliſhing all writings, records, and regiſters, and bringing all men to the primitive level [b].—[a Ouvr. des Scav. Jan. 1699. p. 10. Works of Learn. T. 2. p. 103. b Bibl. Anc. Mod. T. 21. p. 94.]

No modern nation is more ſubject to *Anarchies* than Poland; where every interval between the death of one king and the election of another is a perfect picture of confuſion, inſomuch that it is a proverb among that people, Poland is governed by confuſion. Nouv. Rep. Lett. T. 12. p. 46.

The Jewiſh hiſtory preſents numerous inſtances of *Anarchies* in that ſtate, uſually denoted by this phraſe, that in thoſe days there was no king in Iſrael, but every man did that which was right in his own eyes [c]; which is a juſt picture of an *Anarchy*. The firſt *Anarchy* we read of in that commonwealth, is that which enſued on the death of Joſhuah, who leaving no ſucceſſor, the government devolved to the elders of the tribes, who ruled each according to his own mind. After the death of theſe elders, the *Anarchy* became compleat [d].—[c Vid. Judg. *c.* xvii. *v.* 6. Works of Learn. T. 2. p. 301. Nouv. Rep. Lett. T. 46. p. 448. d *Calm.* Dict. in voc.]

ANARRHICAS, in ichthyology, the name given, by Artedi, to the fiſh called by others the *lupus marinus*. He makes it a diſtinct genus of fiſhes, of the malacopterygious, or ſoft-finned kind, diſtinguiſhed by the following characters. The branchioſtege membrane on each ſide contains ſix or more bones. There are no belly fins, The back fin is ſingle, and very long, reaching even to the tail. The pinna ani is long; the tail is diſtinct and ſquare; the head is ſomewhat depreſſed; and the body ſomewhat compreſſed. The length of the fiſh is three or four feet. It is of a variegated colour, and ſlippery to the touch. The mouth opens extremely wide; the teeth are large, and ſtand in the jaws and palate, and fauces. The eyes are large, and placed upwards. The pectoral fins large and roundiſh. *Artedi*, Gen. Piſc. 18.

ANARRHINON, in botany, a name given by ſome of the antients to the plant called by others *lychnis agria*, and by others *antirrhinum*. Pliny tells us, that this plant reſembled flax; that it had ſcarce any root; that its flower was of the colour of the hyacinth, and its fruit reſembled the noſe of a calf. 'Tis from this reſemblance that we at this time call the plant *calve's ſnout*. Dioſcorides ſays, that it was like the anagallis.

ANAS, *duck*, in the Linnæan ſyſtem of zoology, the name of a large genus of birds, of the general order of anſeres. The diſtinguiſhing characters of this genus are, that the beak is convex, and ends in an obtuſe point. The birds of this genus are the ſwan, gooſe, widgeon, &c. *Linnæi*, Syſtem. Natur. p. 46. See DUCK.

ANAS *Compeſtris*, in zoology, the name of a bird common in France, and uſually called *tetrax*, and *canne petriere*. It is of the ſize of a pheaſant, and of the nature of the buſtard, having no hinder toe; it runs very ſwiftly, and ſits on the ground as the duck does in the water, whence it has its name. *Bellonius*, de Avibus. See TETRAX.

ANASARCA (*Cycl.*)—This diſtemper is ſometimes alſo called *Cataſarca*, ſometimes *Hypoſarcidium*, ſometimes *Epiſarcidium*, ſometimes *Aqua inter cutem* or *intercus*, in regard this pituitous humour ſpreads itſelf thro' the fleſh. Serenus Samonicus elegantly calls it *Lymphaticus error*; Albucaſis calls it a dropſy by infiltration. *Friend*, Hiſt. of Phyſ. P. 2. p. 168.

Anaſarca is a peculiar ſpecies of univerſal dropſy, differing both from the Aſcites and Tympanites. It differs from the Aſcites in that, tho' it uſually ariſes from the ſame cauſes, the waters in an Aſcites do not poſſeſs the upper parts of the body, at leaſt while the patient keeps in an erect poſture, which they do in the *Anaſarca*. *Juncк.* Conſp. Med. Tab. 65.

Some diſtinguiſh between the *Anaſarca* and the *leucophlegmatia*, in that the latter comes from the *Pituita*, the former from an ichorous ſeroſity diſcharged in the very habit of body; apparently thro' the fault of the lymphatic veſſels. Bibl. Anat. T. 2. p. 550.

The *Anaſarca* ſometimes ſtops at half its growth; in which caſe it is called by the antients *Phlegmatia*, where the blotting is conſpicuous, yet ſoft and looſe.

The uſual method of cure among us is much the ſame as that of the Aſcites. The antients had a peculiar method adapted to it.

Ætius relates, from Aſclepiades, the manner of curing an *Anaſarca* very exactly. This is by making inciſions on the inſide of the leg, about four fingers breadth above the ankle, as deep as generally thoſe in bleeding are made. At firſt a little blood iſſues out, afterwards there is a continual diſcharge of water, without any inflammation, ſo that the aperture cannot be cloſed, till the humour is ſpent, and the ſwelling gone down; and this drain cures the diſtemper, without any internal medicine. *Friend*, Hiſt. Phyſ. P. 1. p. 33. ſeq.

Leonides ſays further, that if the inciſions in the legs do not make a diſcharge quick enough, ſome ought to be made in other parts of the body; in the thighs, in the arms, or in the ſcrotum if ſwelled, by which means a great quantity of watry matter may be evacuated. *Friend*, Hiſt. Phyſ. P. 1. p. 34.

The operation itſelf is mentioned by Hippocrates, and had been practiſed from his time down to our own days, with ſucceſs; tho' ſometimes, mortifications have been known to enſue. Silvius de le Boe propoſes another way of acupuncture, and aſſumes the diſcovery of it to himſelf, though it is plain, it is all taken from the deſcription here given, and in ſo many words mentioned by Aviſenna. *Friend*, Hiſt. Phyſ. P. 1. p. 35.

In ſome caſes the *Anaſarca* appears to have been advantageous, inſomuch that a cure of it has killed the patient. V. Act. Phyſ. Med. Acad. N. C. T. 2. Obſ. 13.

Dr. Dovar's cure for an *Anaſarca* is an electuary compoſed of ſteel prepared with ſulphur and crude antimony, each an ounce, diagridium four ounces; make a fine powder of theſe; then add as much of any ſyrup as will make a ſoft electuary.

ANASSAS, in natural hiſtory, the name of a fruit very common in Guinea and in ſome other parts of Africa. It is very beautiful to the eye, and not leſs agreeable both to the taſte and ſmell, and is by ſome accounted the fineſt fruit in the world. The deſcriptions we meet with of it are very imperfect, but as there is nothing in them that contradicts its being the pine-apple, it may be that fruit, and if ſo it deſerves all the praiſe that is given it. See PINE-APPLE.

ANASTASIS, αναστασις, denotes a reſurrection.

Chiflet has given us a diſſertation on Childeric's tomb, under the title of *Anaſtaſis Childerici* [a]. Treuer has publiſhed the figure of a man and woman in the antient German habit, as found in an antient urn, under the title of *Anaſtaſis veteris Germani Germanæque fœminæ* [b]. —[a V. Jour. des Scav. T. 90. p. 216. b Bibl. Germ. T. 17. p. 216.]

ANASTATICA, in botany, the name of a genus of plants the characters of which are theſe. The perianthium conſiſts of four leaves and is coloured; the leaves are of an oval figure, hollowed, and erect. The flower conſiſts of four petals and is of the cruciform kind; the petals are roundiſh, flat, and expanded, and have ungues of the length of the cup, ſtanding alſo a great way aſunder. The ſtamina are ſix ſubulated fila-

filaments of the length of the cup; they ſtand erect and open, and two oppoſite ones are ſomewhat bent, and are ſhorter than the reſt. The antheræ are roundiſh. The germen of the piſtill is bifid and very ſmall; the ſtyle is ſubulated and of the length of the ſtamina; the ſtigma is headed. The fruit is an extreamly ſhort bilocular pod, the membrane which forms the diviſion between the two cells, terminating in an oblique inflated ſubulated ſtyle longer than the pod. The ſeeds are ſingle and roundiſh. *Linnæi*, Gen. Plant. p. 311.

ANASTOMOSIS (*Cycl.*)—It is a queſtion among *Anatomiſts*, whether the uterine arteries and veins *anaſtomoſe* with the veins and arteries of the ſecundines. Mr. Monro holds the negative, and he thinks that ſeveral inconveniences are avoided by the want of this *Anaſtomoſis*. V. Med. Eſſ. Edinb. Vol. 2. p. 133. ſeq. See FOETUS.

ANASTROUS *Signs*, in aſtronomy, an appellation given to the *Duodecatimoria*, or the twelve portions of the ecliptic, which the ſigns poſſeſſed antiently, but have deſerted by the præceſſion of the æquinox. *Keil*, Aſtron. Lect. 8. p. 81.

ANASTROPHE, Αναστροφη, in the antient military art, denotes the return of a battalion to its former ſtation, after a turn or evolution either to the right or left. *Potter*, Archæol. l. 3. c. 6. *Suid.* in voc.

The *Anaſtrophe* ſtands oppoſed to the epiſtrophe.

ANASTROPHE alſo denotes a grammatical figure, whereby a prepoſition, which regularly ought to precede, is placed after its caſe, e. g. *Saxa per et ſcopulos*. *Faber*. Theſ. p. 157.

ANASTROPHE, in rhetoric, denotes a quaint inverſion of the order of the words in a ſentence, e. gr. *ut ſcire poſſis ad quo te expediat loqui*, for *quoad expediat te loqui*. *Heder*. Schul. Lex. p. 233.

ANATHEMA, (*Cycl.*) in heathen antiquity, denotes a preſent offered to ſome god, and hung up in his temple.

In which ſenſe, the word is written in Greek, Αναθημα.

In reality moſt Greek writers, diſtinguiſh *Anathema* written with a long ē, Ἀναθημα, from *Anathema* with a ſhort ĕ, Ἀνάθεμα; tho' Beza and ſome others reject the difference.—Pollux in his lexicon obſerves, that the word properly ſignifies gifts dedicated to the gods. This interpretation is confirmed by Heſychius, who explains *Anathema* by ornaments. *Suic.* Theſ. Eccleſ. in voc. Ανάθεμα.

Making preſents to the gods was a cuſtom even from the earlieſt times, either to pacify them when angry, or to obtain ſome future benefit, or as a grateful acknowledgment of ſome paſt favour. They conſiſted of crowns and garlands, garments, cups of gold or other valuable metals, and any other thing which conduced to the ornament or the enriching of the temples.

Theſe were commonly termed ἀναθηματα, and ſometimes ἀναθεματα; from their being depoſited in the temple where they ſometimes were laid on the floor, ſometimes hung upon the walls, doors, pillars, or the roof, or any other conſpicuous place. Sometimes the occaſion of the dedication was inſcribed either upon the thing itſelf, or, when the matter of that could not bear an inſcription, upon a tablet hung up with it.

When any perſon left his employment, or way of life, it was cuſtomary to dedicate the inſtruments belonging to it, as a grateful commemoration of the divine favour and protection. Thus in an antient Greek epigram we find a fiſher makes a preſent of his nets to the nymphs of the ſea. Shepherds hung up their pipe to Pan, or ſome of the country deities, as we find done by one in Tibullus. So Lais decayed with age, dedicates her mirror to Venus [a]. Pauſanius has left us a particular deſcription of the *Anathemata* in the Delphian temple, which was the richeſt of any in Greece [b].—[[a] *Potter*, Archæol. l. 2. c. 4. [b] *Potter*, loc. cit.]

The term *Anathema* alſo occurs in a like ſenſe applied to chriſtian offerings.

The *Anathemata* or ornaments of the antient churches, are otherwiſe called in eccleſiaſtical writers *Donaria*.

Such in particular were thoſe called Εκτυπωματα, anſwering to the votive tablets of the heathens. Alſo pictures, moſaics, inſcriptions, and at length images, ſtatues, crucifixes, *&c. Bingh.* Orig. Eccleſ. l. 16. c. 8.

ANATHEMA is more particularly applied to men devoted to the *dii inferi*, or infernal gods. *Calv.* Lex. Jur. in voc.

In alluſion to the heathen offerings, Socrates thinks the term *Anathema* was introduced for excommunication, becauſe thereby a man's condemnation was publiſhed and proclaimed as if it were hung up upon a pillar. *Bingh.* loc. cit.

Some diſtinguiſh between *Anathema* and excommunication, ſuppoſing the former to be a greater degree of puniſhment, the latter a milder. The effect of the latter is only to cut men off from the commerce of the faithful, that of the former to exclude them from the joy of heaven. Mem. de Trev. 1715. p. 859.

The council of Gangra cloſes every one of its canons with the formula, Ανάθεμα ἐστω, let him be *Anathema* or accurſed; which ſome interpret, let him be excluded from the church; others, let him be tormented by Satan here; and others, let him be damned hereafter. *Bingh.* Orig. Eccleſ. l. 16. c. 2. Sect. 16.

This ſame is the ſtile of moſt other councils, grounded on that form of St. Paul, "if we or an angel from heaven preach any other goſpel unto you, than that which we have preached unto you, let him be *Anathema* or accurſed."

The antient *Anathema* in the judgment of ſeveral modern writers, amounted to no more than an excommunication, or expulſion from the church, and interdiction of all communion with her. Accordingly in the antient canons, it is diſtinguiſhed by the names of παυλειης αφορισμος, the total ſeparation, and *Anathema*, q. d. the curſe; as being the greateſt curſe that could be laid upon man. *Bingh.* Orig. Eccleſ. l. 16. c. 2. §. 8.

Delivering unto Satan, appears to have been but another expreſſion for this excommunication, and the ſpiritual effects conſequent to it, that is, the puniſhment of the ſoul and not of the body. Others are of opinion, that beſides this ſpiritual puniſhment naturally conſequent to excommunication, there was in the apoſtles days another conſequent to it, which was a corporal power and poſſeſſion, or the infliction of bodily vexations and torments by the miniſtry of Satan, on thoſe who were delivered unto him. Dr. Hammond, Grotius, and Lightfoot, are the great ſupporters of this opinion among the moderns, and they have almoſt the general concurrence of the antient interpreters on their ſide [a]. In effect it ſhould ſeem the general ſenſe of the antients, both Greek and Latin, that the power of *anathematizing* was an extraordinary apoſtolical power, diſtinct from the ordinary power of excommunication, ſince we do not find that they made uſe of this phraſe, *delivering unto Satan*, in any of the ordinary forms of excommunication, as being ſenſible, that the church after the power of miracles was ceaſed, had no pretence of inflicting bodily diſeaſes, as the apoſtles had [b].—[[a] *Bingh.* Orig. Eccleſ. Lex. 16. c. 2. §. 15. [b] *Bingh.* loc. cit.]

It is certain the church ſometimes pronounced a total, final, and irreverſible ſentence of excommunication againſt ſome more heinous criminals, keeping them under pennance all their lives, and denying them her external peace and communion at the hour of death, for example and terror [c]. But it is not ſo apparent that ſhe uſed to join execration to her cenſures, and devote men to temporal deſtruction, not only by refuſing to pray for them, but by praying againſt them, that God would take them out of the world, and deliver his church by that means, from their malicious power and machinations. Grotius thinks this was very rarely done; but yet there are ſome examples of it [d].—[[c] *Bingh.* Orig. Eccleſ. l. 16. c. 2. §. 16. [d] *Bingh.* Orig. Eccleſ. l. 16. c. 2. §. 17.]

Maranatha is an extraordinary formula, which occurs in antient cenſures. Authors are divided concerning its import and uſe. There is little ſaid of the word *maranatha* among the antients, and leſs of its uſe in any form of excommunication. St. Chryſoſtom ſays it is a Hebrew word, ſignifying *the Lord is come*; and he particularly applies it to the confuſion of thoſe who ſtill abuſe the privilege of the goſpel, notwithſtanding that the Lord was come among them.

St. Jerom ſays it was more a Syriac than an Hebrew word, tho' it had ſomething in it of both languages, ſignifying *our Lord is come*. But he applies it againſt the perverſeneſs of the Jews, and others who denied the coming of Chriſt, making this the ſenſe of the apoſtle; *if any man love not the Lord Jeſus Chriſt, let him be anathema*, the *Lord is come*.

According to this ſenſe, *maranatha* could not be any part of the form of excommunication, but only a reaſon for pronouncing the *anathema* againſt thoſe who expreſſed their hatred againſt Chriſt, by denying his coming, either in words, as the Jews did who blaſphemed him, and called Jeſus *anathema* or accurſed, or elſe by wicked works, as thoſe who lived profanely under the name of Chriſtian.

Others of the antients interpret the word of the future coming of Chriſt, particularly St. Auſtin, who ſays *maranatha* is a Syriac word ſignifying *the Lord will come*. And he particularly applies it againſt the Arians, who could not be ſaid to love the Lord, becauſe they denied his divine nature. Dr. Hammond and others will have *Anathema maranatha* to have anſwered to the third and higheſt degree of excommunication among the Jews, called *Shammatha*. *Bingh.* Orig. Eccleſ. l. 16. c. 2. §. 16.

The reformed church of France in their ſynod of Alez, at which Peter du Moulin aſſiſted as moderator in 1620, made an order, that in excommunication no one ſhould uſe the form of delivering to Satan, neither ſhould the cenſure of *Anathema maranatha* be pronounced againſt any, for that no man was entitled to uſe that form, but he that knows the ſecrets of reprobation. *Bingh.* Orig. Eccleſ. l. 16. c. 2. §. 15.

Balduinus, Deutrohmannus, Durrius, Stevartius, and others have written expreſsly concerning *Anathemas*. Hen. Labertus, a German writer, has given an *Anathematologia*, or doctrine of the church curſes, Vomkerchen, Bann. *Lipen.* Bibl. Theol. p. 38. ſeq.

ANATHEMATIZING, the act of pronouncing an *Anathema*. See ANATHEMA.

In which ſenſe *Anathematizing* amounts to the ſame with excommunicating. See EXCOMMUNICATION, *Cycl.*

The term is not only applied in ſpeaking of perſons, but of doctrines and opinions.—Thus the council of Trent *anathe-*

matize the opinion of those who hold, that free-will is not able to resist divine grace.

It has been much controverted, whether a person might be *anathematized* after his death; a controversy certainly of great moment, as turning on no less a question than this, whether a church can reverse the dispensations of heaven, and call persons perhaps out of paradise, and commit them to hell? *Pfaff.* Inst. Hist. Eccles. sec. 6. c. 5.

Church history abounds with instances of mutual anathemas, councils, fathers, heretics *anathematizing* each other. There are still extant the twelve anathemas of St. Cyril against Nestorius [c], and the counter-anathemas of Nestorius against St. Cyril [f].—[[c] *Fabric.* Bibl. Græc. l. 5. c. 27. n. 18. [f] Id. ibid. c. 34. p. 439.]

St. Athanasius is charged by Whiston with having interpolated the anathemas of the council of Nice. The critic pretends to convict the saint of having forged the clause, where the Arians are *anathematized*, for holding that Christ was created. It must not be omitted, that Mr. Thirlby has endeavoured to refute the charge. *Whist.* Argum. p. 38. seq.

ANATHEMATISM denotes the same with anathema or imprecation. See ANATHEMA.

The decrees of councils are commonly guarded by *Anathematisms*, to procure them respect, and secure the observance of them. See CANON, COUNCIL, &c. *Cycl.*

The *Anathematisms* of Greg. Thaumaturgus are extant in Canisius's collection; but have been shewn to be spurious, since mention is made in them of Arianism and Apollinaris. Vid. Bibl. Anc. Mod. T. 23. p. 272.

ANATHREPSIS, in medicine, amounts to much the same with *Analepsis*. *Cast.* Lex. Med. p. 47. See ANALEPSIS.

ANATICULA, in the old Roman authors, a term of fondness used by people in love. There is another of the same kind from a different bird *Palumbula*.

My little duck, and my little dove, were the most endearing terms the the lovers of those times could use; nor was this the custom of the Romans only, but the Greeks, as far off as Aristophanes, have it.

ANATIFERA *concha*, in natural history, the name of a genus of shells, the characters of which are these: It is a shell-fish of the multivalve kind, being of a triangular figure, flat, and composed of five shells fasten'd to a long pedicle, and furnished with fourteen hairs. Of this genus of shell-fish the cabinets of the curious afford us the following species. 1. The smooth-edg'd *Anatifera*, with a long pedicle. 2. The *glans marinus* of Rondeletius, with a long pedicle. 3. The almond-shaped *Anatifera*, with a short pedicle. 4. The arborescent or branched *Anatifera*, of a long acute form.

This genus of shells obtained this strange name from an erroneous opinion, that they produced ducks, or a species of wild fowl of that kind, the name signifying a shell producing ducks. The fable of this shell is told by many grave authors, and reported by persons who live in the places where that breed of wild fowl is found, as a known and inconteſtable fact, yet nothing can be more false or absurd. It is very well known to the more judicious part of the world, that these shells contain a fish of the nature of that in other kinds of shell-fish, and that this never has any analogy to, or connection with the fowl call'd the *Bernacle*, and supposed to be produced of it. The fowl has been of late years found to breed in many places in great abundance; and all that could have given rise to so idle an opinion as this of its being produced of this shell is, that the fish contained in it is of a plumose shape, or has certain parts somewhat resembling feathers, which it throws out of the shell upon occasion. The small resemblance of these to a bird, and the appearance of great numbers of these fowl at certain times of the year, without their being known to breed in the places where they were found, gave birth to a foolish opinion among the country people; which, it was very unlucky, that persons of more abilities ever gave any the least countenance to.

ANATOMICAL *Injections*. See INJECTIONS.

ANATOMY (*Cycl.*)—Aristotle, Galen, Vesalius, the royal academy of sciences at Paris, and others have treated on the *Anatomy* of brutes. Vid. *Conring.* Introd. in Medic. c. 3. § 9.

There is some dispute among physicians and naturalists concerning the usefulness of comparative *Anatomy*. On the one hand it is urged, that the parts less apparent in one animal, are found more distinct and conspicuous in another; so that the knowledge of the structure of the former, may be improved by analogy, from that of the latter. On the other hand it is objected, that the diversity is so great between one animal and another, according to the different manners of life they are intended for, that 'tis never safe concluding by mere analogy, from the structure of one to that of the other [a]. Malpighi [b] has been very large in the refutation of this objection.—[[a] Epist. & Recens. Medic. Phil. Transf. N° 228. p. 552. seq. [b] Opp. Posthum. ap. Phil. Transf. loc. cit. p. 554.]

Anatomy makes a great branch of that division of medicine called physiology. See PHYSIOLOGY, *Cycl.*

In another view it constitutes a branch of what we otherwise call anthropology. See ANTHROPOLOGY, *Cycl.*

Anatomy, with regard to its object, is divided into osteology and sarcology. See OSTEOLOGY, and SARCOLOGY.

The first treats of the bones and cartilages; the second is subdivded into splanchnology, which comprehends the history of the internal parts, and more particularly of the viscera; myology, or the doctrine of the muscles; and angeiology, which treats of the vessels, viz. the nerves, arteries, veins, and lymphatick vessels.

Others divide *Anatomy* with regard to its objects, into that of live bodies, and that of dead carcasses.

Herophilus and Erasistratus, we are told by Celsus, dissected live persons: Condemned criminals were sent to the former by princes, on purpose that he might have an opportunity of seeing the parts in their natural state, before any alterations induced in them by diseases or death.

The bodies of persons who have suffered a violent death, among which those that have been hanged, or lost their lives by strangulations with a cord, are the most proper, and to be preferred before the rest. 'Tis for that reason that Riolan rejects those dead carcasses which have been suffocated in the water, as improper for *Anatomy*; tho' Galen used most frequently to drown such of his living creatures, as he had chosen for his anatomical operations. Vid. Bibl. Anat. T. 2. p. 1. seq.

The inconveniencies that attend the dissecting of dead carcasses have occasioned the invention of another cleanlier and more durable kind of subjects. Reiselius contrived a human statue, wherein the circulation of the blood was represented to the sight, and something of the like kind was lately shewn among us by M. Chovet. .Vid. *Ephem.* Acad. N. C. dec. 1. an. 9. Obs. 1.

Who has not seen the wax-work *Anatomy*? The author of that ingenious invention seems to have been Gaetano Giulio Zumba, a Sicilian of Syracuse [b]. Yet M. des Noues, who learnt it of him, and probably made some improvements in it, bringing it to Paris, arrogated the chief honour of it to himself [c]. Some prefer before all the rest, for public lectures and courses, the use of real parts of dead bodies prepared by injection [d].—[[b] Bibl. Ital. T. 2. p. 16. [c] Jour. des Scav. T. 68. p. 335. seq. [d] Bibl. Ital. T. 3. p. 63. seq.]

Anatomy is by others divided into medicinal and physical.

Physical *Anatomy*, *Anatomia physica*, is that employed in enumerating and describing the several solid parts of the body, as bones, cartilages, membranes, muscles, tendons, nerves, ligaments, arteries, veins, lymphyducts, &c. describing their figure, situation, connection, &c.

Medicinal *Anatomy*, *Anatomia medica*, is that, which to the former enquiries adds that of the office and use of the several parts and their concern in health or diseases. *Goelic.* Hist. Anat. §. 8.

Some give a particular species of this under the denomination of chirurgical *Anatomy*. Jour. des Scav. T. 81. p. 10.

Instruments necessary to perform anatomical operations are of two kinds, viz. some for necessary use, others for shew only, or ornament's sake.

The necessary instruments are of twelve several sorts, viz. the needle, thread, dissecting knives, small hooks, a whet-stone, spunge, a pair of scissars, a style, a small hollow pipe, a pair of small bellows, a saw and an elevatory. Vid. Bibl. Anat. T. 2. p. 2.

Some considerable physicians have endeavoured to check a minute study of *Anatomy*, as of no use in physic. 'Tis in reality but a small part of the science, as it now stands, that comes in play in the medicinal practice. It seems enough for a physician to know the number, situation, communication, and use of the parts, without losing time in a minute investigation of their intimate structure, to the smallest fibers they are composed of. V. *Nenter.* Theor. Homin. Sani. Mem. de Trev. 1720. p. 77.

Anatomy is also of use in painting, designing, statuary, &c. Leonardo da Vinci, and all the great masters studied it with particular application. Titian took so much delight in it, that he designed the figures for Vesalius's *Anatomy*. M. de Piles, under the fictitious name of Tortebat [d], and de Rossi at Rome [e], have published books of *Anatomy* particularly accommodated to this use.—[[d] Nouv. Rep. Lett. T. 45. p. 553. [e] A translation of this has been given in England, under the title of "*Anatomy* improved and illustrated, with regard to the use "thereof in designing."]

Most of those who have attempted to give the history of *Anatomy*, have rather given that of the anatomists than of the art it self, that is, of the discoverers, than of the discoveries and improvements themselves, in the order wherein they were made. Solomon Albertus [f], in 1578 published an oration concerning the origin and growth of *Anatomy*; but it only contains the general points of the anatomical history. Many years after Goelick [g], professor of physic at Hall, published in 1713, a history of *Anatomy*, modern as well as antient, wherein he promised a view of most, if not all the writers on it from the origin of physic to his own time; but the work proved many ways defective, scarce a fourth part of the writers are mentioned in it, not to mention the superficial account here given of the progress of the knowledge of the structure of the human body, or the great number of errors committed in it. Dr. Douglass has succeeded much better in a specimen of an anatomical bibliotheca published

in 1715[h], containing an account of almoſt all the writers who have treated on *Anatomy*, either expreſsly or occaſionally, from Hippocrates to Harvey, wherein he gives neceſſary particulars relating to their lives, enumerates the ſeveral editions of their pieces, together with judgments or cenſures of many of them. It may be added, that Van Leempoel in 1725, gave a hiſtory of the origin and progreſs of *Anatomy*, and almoſt all the writers from Alcmeon to Veſalius inclusive[i]. He is fuller than Douglaſs, both in the number of authors, and in the lives and merits of anatomiſts, but more ſparing in noting the editions, of which he only indicates the firſt, referring the reader for the reſt toVander Linden[k]; but this work being only continued as low as Veſalius incluſive, excepting that he gives an account of the life and merits of Harvey, many other good authors, who have publiſhed books on *Anatomy* ſince Veſalius, are therein omitted. Of theſe an account has been given in a diſſertation expreſs by Frank[l]. The hiſtory uf the diſcoveries of the laſt age has alſo been given by Heiſter[m].—[[g] De Diſciplina Anatomica, quo ortu cœperit, & quomodo ſenſim aucta & ad poſteros tranſmiſſa ſit. Noremb. 1513. [h] Hiſt. Anatomiæ nova æquè ac antiqua. Halæ Madg. 1713. 8°. [i] Bibliogr. Anatom. Specim. ſive Catalog. Auctorum, &c. Lond. 1715. It. Lugd. Bat. 1734. 8°. [k] Anatomes Origo, Progreſſus. &c. Ludg. Bat. Deſcript. Med. [l] Bona nova Anatomica, hoc eſt noviter inventum per Anatomicorum accuratorum diligentiam. Heidelb. 1680. 4°. [m] Oratio de incrementis Anatomiæ in hoc ſæculo 18. cum annexo programmate de inventis Anatomicis hujus ſæculi. Wolffenbut. 1720. 8°.]

The oldeſt writings extant on *Anatomy* are thoſe of Hippocrates, who, tho' he only treats of the ſubject occaſionally and in part, has given ſuch a multitude of obſervations relating to the ſtructure of the body, that Riolanus has compiled out of his ſcattered pieces an intire ſyſtem of oſteology; and Burggravius a whole ſyſtem of all the branches of *Anatomy*. Vid. *Burggr.* Lex. in voc. *Anatome.* p. 672.

How well he was acquainted with the *Anatomy* of the bones, appears from thoſe excellent pieces on fractures and articulations, which could not have been compoſed without a perfect knowledge of oſteology. To leave an eternal monument of his labours in this kind, he conſecrated a brazen ſkeleton of admirable contrivance to Apollo of Delphi. Several paſſages occur in his writings, which ſeem to indicate as if he was not unacquainted with the circulation of the blood, and the ſecretion of the animal fluids. Dr. Douglaſs rehearſes the chief of them, as well as of thoſe relating to the other points of *Anatomy*.

Ariſtotle is cenſured by ſome, as having never diſſected himſelf, but related all things on the faith of other writers. Douglaſs ſhews that this cenſure is ill grounded, tho' he owns human diſſections were very rare at that time, and that Ariſtotle borrowed many of his anatomical matters from Hippocrates. Vid. *Dougl.* Bibl. Anat. p. 9. ſeq.

Galen, by general conſent of writers, is the prince of anatomiſts. By his early application, his unwearied aſſiduity, great ſagacity, and penetration of mind, as well as dexterity of hand, he not only carried the art infinitely beyond what had been done by thoſe before him, but even to that perfection wherein we find it at this day, abating only ſome few diſcoveries made by modern anatomiſts. In reality, many of the diſcoveries with which late writers plume themſelves, are due to him. Dr. Douglaſs enumerates ſeveral of the diſcoveries made by Galen in the ſtructure and uſe of the parts of the human body.

Some have objected to Galen, that he formed his deſcriptions not on the human body, but on the bodies of brutes, particularly monkies, and that he never diſſected a man; but this objection may be refuted from his own teſtimony. In many places he expreſsly compares and notes the difference between the ſtructure of men and brutes. His chief enemies among the moderns, are, Veſalius and Fallopius; his advocates Puteus and others. *Put.* Apologia in Anatome pro Galeno, contra And. Veſalium. Venet. 1562. 8°.

Anatomy ſuffered with the other ſciences by the invaſions of the Goths and Vandals, and at length ſunk into total barbariſm[n]; from which it was reſtored in the fourteenth century by Mundinus[o], a Milaneſe, who compoſed rudiments of that art in the year 1315, which, notwithſtanding the barbarous ſtyle wherein they are written, remain ſtill in eſteem, and are the only ſyſtem now taught in ſome of the principal ſchools in Italy. The ſtatutes of the univerſity of Padua expreſsly enjoin the profeſſors to follow the text of Mundinus in their lectures and expoſitions.—[[n] V. *Friend.* Hiſt. of Phyſ. P. 2. p. 397. [o] Anatome omnium humani corporis interiorum membrorum. Papiæ, 1478.]

Some with Fallopius rather aſcribe the honour of the reſtoration of *Anatomy* to Jac. Berengarius, called alſo Carpus or Carpenſis, who lived 200 years after Mundinus. He ſet out with commenting on that author, but afterwards wrote a much better book on the ſubject, of his own; in order to which he diſſected above one hundred bodies. Some have even charged him with the crime of Herophilus. 'Tis alledged that he bore an implacable hatred to the Spaniards; and that, having got ſome of them into his cuſtody, he intended to have proceeded to diſſection, but his deſign being diſcovered, he was baniſhed. Others deny the charge, and give other reaſons for his exile. Vid. *Dougl.* Bibliogr. Anat. p. 58.

The honour of reforming *Anatomy*, and bringing it to its preſent perfection, is commonly aſcribed to Veſalius, whoſe inclination to this ſcience was ſo great, that, when a boy, he could not forbear diſſecting moles, dormice, cats, and the like. As he grew up, his paſſion increaſed; when bodies were wanting for ſkeletons, he would ſteal them even off the gibbets; for which he was expelled Louvain, as he himſelf informs us. Bodies which he dug out of their graves, he would keep ſeveral weeks in his very bed-chamber. He publiſhed his famous work on the ſtructure of the human body at twenty-eight years of age. He was chief phyſician to the emperor Ch. V. and Philip. II. of Spain; but growing weary of a court-life, he undertook a pilgrimage to Jeruſalem, and died in his return. The motive of this expedition is attributed to his opening the body of a young Spaniard of quality, ſuppoſing him dead, whereas, when he came to the heart, he found it ſtill beating. Others give a different account of his misfortunes.

It is certain Veſalius explained, illuſtrated, and connected innumerable paſſages in the anatomical books of Galen, beſides many new things firſt diſcovered by himſelf; yet he has met with his cenſors. He has been charged with ſhining altogether with borrowed light: Cajus affirms, that he even corrupted Galen's text in an edition, the reviſal of which had been committed to him by Aldus, that he might have the greater field for correction in his own work. Others tax him with miſtaking, or at leaſt impoſing wrong and imaginary ſentiments and conſtructions on that author: Columbus with giving deſcriptions of brutes for men, particularly the larynx, tongue, and eye of an ox; and giving muſcles to the epiglottis, which belong only to brutes: Euſtathius with deſcribing the kidney of a dog for a human kidney: Arantius with giving the pudendum of a brute inſtead of that of a woman, for want of a ſubject of this laſt kind. Riolanus taxes his ſtyle with being too figurative, and thus darkening the deſcription of things in themſelves naturally obſcure enough. *Dougl.* Bibl. Anat. p. 80. ſeq.

The writers on *Anatomy* may be divided into ſuch as either treat on the ſubject profeſſedly or occaſionally.

Under the latter come phyſicians, natural hiſtorians, thoſe who treat of human nature and of brutes.

Among the profeſſed writers on *Anatomy*, ſome treat of the whole ſubject, others only of a part.

Under the latter come thoſe who have treated of the *Anatomy* of the bones, of which we have an excellent treatiſe by Mr. Monro; or of the muſcles, as Cowper; of the head, as Dryander; of the uſes of the parts, as Galen, Hoffman and Rudius; of the names of the parts, as Rufus Epheſius and Camerarius; of the art of diſſecting, as Galen, Cappivaccius, Hippolitus, Boſcus, and Lacuna; Horſtius on the art of preſerving carcaſſes.

Among thoſe who treat of the whole ſubject of *Anatomy*, Winſlow is moſt deſervedly eſteemed. This author has been tranſlated into Engliſh by Dr. George Douglaſs. We have alſo an excellent compendium of *Anatomy* by Heiſter. The merit of Albinus's tables and of his writings is well known; as is that of Mr. Cheſelden; ſo that, after reading Heiſter, Winſlow, Monro and Cheſelden, conſulting the tables of Veſalius and Albinus, a ſtudent may, we believe, conſider other books more as curious than neceſſary.

Manget and Le Clerc, two phyſicians of Geneva, have given us a bibliotheca anatomica, containing all the new diſcoveries that have been made in this art, but with many miſtakes, the detecting of which has been undertaken by Morgagni, who has publiſhed ſeveral volumes with that view, under the title of *Adverſaria Anatomica.*

ANATOMY is alſo uſed, in an improper ſenſe, for the analyſis of mixt bodies. See ANALYSIS.

In this ſenſe the chemiſts ſometimes call their art ſpagyrical *Anatomy*, *Anatomia ſpagyrica. Caſtel.* Lex. Med.

In which ſenſe we ſometimes ſay the *Anatomy* of vitriol, the *Anatomy* of ſulphur, the *Anatomy* of Rheniſh wine, &c.

ANATOMY is alſo uſed in a leſs proper ſenſe, to denote the art of reſolving compound bodies into ſimple ones.

In this ſenſe any kind of compound body may be conſidered as the object of *Anatomy*; that is, any body wherein there are divers parts joined together; even the taking aſunder an artificial, political, or moral being, may, in this ſenſe, come under *Anatomy*.

ANATOMY is alſo uſed figuratively, for an exact ſearch or examination of the parts of a diſcourſe, buſineſs, or the like.

In which ſenſe we ſay the *Anatomy* of a book, a doctrine, or the like. *Wood.* Ath. Oxon. T. 2. p. 101.

ANATOMY of plants may be conſidered as a branch of comparative *Anatomy*, otherwiſe called *Dendronatomy*.

The parts of plants which come under anatomical conſideration are, the root, wood, bark, pith, fruit, leaves, flowers, &c.

The *Anatomy* of vegetables is chiefly owing to the induſtry of Malpighi[p] and Dr. Grew[q], tho' conſiderably promoted

also by Ruysch[r], who by a peculiar method of injection has produced divers skeletons or systems of vessels of fruits, leaves, and the like. Something of the same kind has also been done by Thummigius[s].—[[p] Anatome Plantarum, Lond. 1675. Fol. An extract of it is given in Philos. Trans. N°. 118. p. 401. seq. Anatome Plantarum pars altera, Lond. 1679. See an account of it in Hook, Philos. Coll. N°. 1. p. 38. [q] The Anatomy of Plants, with an idea of a philosophical history of plants, &c. Lond. 1682. Fol. [r] Adversar. Anat. Dec. 3. c. 2. [s] Experim. Singul. de Arboribus ex folio educatis. *Halæ*, 1721.]

Some pretend to make F. Fabri the father of this science; and alledge that Malpighi took many of his discoveries from him[t]. Dr. Highmore in his book of generation, Dr. Sharrock on the propagation of plants, and Dr. Hook in his micrographia, have also given some observations tending this way, tho' only collaterally[u].—[[t] Jour. des Scav. T. 34. p. 885. [u] *Grew*, lib. cit. in Pref.]

ANATRIPSIS, in the antient medicine, denotes friction.

The word is sometimes also written simply *tripsis*. *Gorr.* Def. Med. p. 35.

ANATRON (*Cycl.*) is of a cineritious colour, and bitter taste, approaching to sal ammoniac.

It is the produce of a huge lake, on the surface of which it is gathered, in form of a scum. *Boerh.* New Meth. Chem. P. 2. p. 109.

The *Anatron* skimmed from glass fusion is the same with what others call *fel vitri*, or gall of glass. Vid. *Cast.* Lex. Med. *Savar.* Dict. Comm. *Teichmey.* Inst. Chem. c. 18. p. 235.

ANATRON is also used for the *terra saracenica*; of which there are several kinds, black, red, and blue. *Cast.* Lex. Med. in voc. *Anatron.*

ANAUDIA, among naturalists, denotes dumbness, or a want of the use of speech.

Anaudia is, by some, made to differ from *aphonia*, as the former is owing to a defect of the nerves of the tongue, the latter to that of the nerves of the *larynx*. Ephem. Acad. N. C. Dec. 2. an. 10. app. p. 99.

Infants and mutes are *Anaudi*, αναυδοι, not *aphoni*, αφωνοι.

ANAUMACHION, in antiquity, the crime of refusing to serve in the fleet.—The punishment assigned for this offence was infamy. *Potter*, Archæol. l. 1. p. 23.

ANAX, ανακ, in antient writers, denotes a hero, or a god.

The word seems formed of the Hebrew, *anacim*, or *enacim*, which signifies the same.

Some will have it originally to import gyants, called also γηγενεις, *earth-born*. Cicero assures us, that the three eldest sons of Jupiter, called Διοσκαροι, were also denominated *anaces*. *Thomas.* Meth. Etud. Poet. P. 1. l. 2. c. 15. n. 4.

ANAXAGORIA, Αναξαγορεια, in antiquity, a festival observed in honour of Anaxagoras.

The occasion of its being instituted was this, Anaxagoras dying at Lampsacus, the magistrates of that city asked him, whether he desired any thing to be done for him? He replied, that on the anniversary of his death the boys should have leave to play. This custom was observed in the time of Diogenes Laertius.

ANAXIMANDRIANS, a name given, by some writers, to the followers of Anaximander.

These are otherwise denominated *Hylopathii*, and stand opposed to the Atomists. *Cudworth*, Intellect. Syst. c. 5. Sect. 3. Bibl. Chois. T. 2. p. 54, 61. It. T. 8. p. 29. seq.

The *Anaximandrians* make the most antient sect of philosophical atheists: they allow of nothing in nature but bodies. These bodies they assert, admit of qualities, which produce and destroy one another in a circle without beginning or end.

ANBERTKEND, in the eastern learning, a celebrated book of the Brachmans, wherein the Indian philosophy and religion are contained. *D'Herbel.* Bibl. Orient. p. 114.

The word in its literal sense, denotes the cistern wherein is the water of life.

The *Anbertkend* is divided into fifty Beths, or discourses, each of which consists of ten chapters.

It has been translated from the original Indian into Arabic, under the title of *Morat al Maani*, q. d. the marrow of intelligence.

ANBURY, in farriery. See AMBURY.

ANCA, in middle age writers, denotes the thigh or hind leg.

In which sense the word is also written *Ancus*. *Kenn.* Gloss. ad Paroch. Antiq. in voc.

ANCESTORS (*Cycl.*)—Most nations have paid honours to their *Ancestors*.

It was properly the departed souls of their fore-fathers that the Romans worshiped under the denominations of *Lares*, *Lemures*, and household-gods. Mem. Acad. Inscript. T. 2. p. 41. and 479.

Hence the antient tombs were a kind of temples, or rather altars whereon oblations were made by the kindred of the deceased.

The Russians have still their anniversary feasts in memory of their *Ancestors*, which they call *Roditeli Sabot*, q. d. kinsfolk's sabbath, wherein they make formal visits to the dead in their graves, and carry them provisions, eatables, and presents of divers other kinds. They interrogate them with loud lamentable cries what they are doing? How they spend their time? What it is they want, and the like? New Mem. of Liter. T. 1. p. 372.

The Quojas, a people of Africa, offer sacrifices of rice and wine to their *Ancestors*, before ever they undertake any considerable action. The anniversaries of their deaths are always kept by their families with great solemnity. The king invokes the soul of his father and mother to make trade flourish, and the chase succeed.

The Chinese seem to have distinguished themselves above all other nations in the veneration they bear their *Ancestors*. By the laws of Confucius, part of the duty which children owe their parents, consists in worshipping them when dead. This service which makes a considerable part of the natural religion of the Chinese, is said to have been instituted by the emperor Kun, the fifth in order from the foundation of that antient empire. Bibl. Univ. T. 7. p. 395. and 401.

The Chinese have both a solemn and an ordinary worship which they pay their *Ancestors*. The former is held regularly twice a year, *viz.* spring and autumn, with much pomp. A person who was present at it gives the following account of the ceremonies on that occasion.

The sacrifices were made in a chapel well adorned, where there were six altars furnished with censers, tapers, and flowers. There were three ministers, and behind them two young Acolites; he that officiated was an aged man and a new christian. The three former went with a profound silence, and frequent genuflexions towards the five altars, pouring out wine: afterwards they drew near to the sixth, and when they came to the foot of the altar, half bowed down, they said their prayers with a low voice. That being finished, the three ministers went to the altar, the priest took up a vessel full of wine and drank, then he lifted up the head of a deer or goat: after which taking fire from the altar, they lighted a bit of paper, and the minister of the ceremonies turning towards the people, said with a high voice, that he gave them thanks in the name of their *Ancestors* for having so well honoured them, and in recompence he promised them, on their part, a plentiful harvest, a fruitful issue, good health and long life, and all those advantages that are most pleasing to men.

All the Chinese, pagans as well as christians, give their *Ancestors* another simpler and more private worship. To this end they have in their houses a niche or hollow place, where they put the names of their deceased fathers, and make prayers, and offerings of perfumes and spices to them at certain times, with bowing, &c. They do the like at their tombs. Works of Learn. T. 3. p. 221. Mem. de Trev. 1707. p. 1032.

It has been a question warmly agitated of late years, whether the worship which the Chinese pay their *Ancestors* be religious, or only of a civil nature. The Jesuits who not only allow their Neophytes or new converts to join in it, but even assist in it themselves, are necessitated to maintain the latter, to screen themselves from the charge of idolatry; the Dominicans and other missionaries maintain the former, and prohibit the service as absolutely unlawful.

The Jesuits argue, that with relation to the first institution, those honours might be given to our *Ancestors*, since at first they appear to have been only civil; even though they should since, thro' the superstitious disposition of the people, have degenerated into idolatry. But it is answered, that by this argument the most gross worship of idols might be authorized, because all idolatry appears at first only to have been civil worship, as is maintained in the book of wisdom. Chap. xiv. V. 15. Works of Learn. T. 3. p. 222.

The Jews settled in China are said to worship their *Ancestors* like the heathens, and with the same ceremonies, except that they offer not swines flesh. Near their synagogue they have a hall, or court of *Ancestors*, wherein are niches for Abraham, Isaac, &c. Lett. Edif. T. 7. p. 19. Mem. de Trev. 1707. p. 1032.

There is one peculiarity of another kind wherein the Chinese shew their regard for their *Ancestors*, in proportion as any of their descendants are preferred to a higher degree or dignity, their dead *Ancestors* are at the same time preferred and enobled with them. The kings *Ven*, *Van*, *Veu*, *Van*, and *Cheu*, *Cum*, who were descended from vassal kings, when they mounted the imperial throne, raised their *Ancestors* from the vassal or depending state wherein these had lived, to the dignity of emperors. So that the same honours were for the future rendered them, as if they had been emperors of China. The same example was followed by the subsequent kings, and now obtains among the grandees and literati; all now worship their *Ancestors*, according to the rank which they themselves hold in the world. If the son be a mandarin, and the father only a doctor, the latter is buried as a doctor, but sacrificed to as a mandarin. The like holds in degradations, where the condition of the fathers is that of their sons. Bibl. Univ. T. 7. p. 432.

ANCHILOPS (*Cycl.*)—Strictly speaking the *Anchilops* is only a tumor not yet exulcerated, nor is the tumor always within the *saccus lacrymalis*, but sometimes only near it. *Junck.* Consp. Chir. Tab. 45.

If the *Anchilops* be suffered to go too long, or be unskilfully managed, it degenerates, the stagnating humours corrupt, and an ulcer is produced.

It makes a ſpecies, or rather degree, of the *fiſtula lacrymalis*. When the tumor is broke, and the tears flow involuntarily, whilſt the *os lacrymale* is not carious, it is an ægylops; but when the ulcer is of a long ſtanding, deep, fetid, and the *os lacrymale* becomes carious, it is a fiſtula. *Shaw*, Pract. Phyſ. p. 45.

The *Anchilops* is ſometimes attended with an inflammation, and then reſembles a phlegmon; but when not inflamed it approaches nearer to thoſe tumors called *Atheromata*, *Steatomata* and *Melicerides*.

Its cure is by reſtriction and exciſion; tying it at the root on the *Glandula lacrymalis*; and when ready, cutting it off. *Purman.* Chirurg. Curioſ. l. 1. c. 26.

ANCHIROMACUS, in middle age writers, denotes a kind of veſſel, which on account of its nimble ſailing, was uſed for the conveyance of anchors, and other neceſſary utenſils of ſhips. *Iſid.* Orig. l. 19. c. 1.

In this ſenſe, the word is alſo written *Ancyromagus*, *Anchiromachus*, *Ancyromacus*, *Angromagus*, *Anquiromagus*, and *Anguiromagus*. *Du Cange*, Gloſſ. Lat. T. 1. p. 183.

ANCHOR (*Cycl.*)—Proof is made of *Anchors*, by raiſing them to a great height, and then letting them fall again on a kind of iron block placed acroſs for the purpoſe.—To try whether the flookes will turn to the bottom, and take hold of the ground, they place the *Anchor* on an even ſurface, with the end of one of the flookes, and one of the ends of the ſtock reſting on the ſurface; in caſe the *Anchor* turn, and the point of the flooke riſe upwards, the *Anchor* is good.

Baſkets full of ſtones are mentioned by Eunapius as uſed in lieu of *Anchors*; and inſtead of theſe they ſometimes made uſe of bags of ſand. But theſe chiefly obtained in rocky places, where other ſorts of *Anchors* would not take hold. V. *Suid.* Lex. in voc. ζευγμα.

The firſt *Anchors* of iron, had only a flooke on one ſide; this ſort the Greeks called πλεοσομος. The contrivance was compleated by Eupalamius, who made them flooked both ways; though ſome aſcribe the honour of this to *Anacharſis* the Scythian. V. *Plin.* l. 7. c. 56. *Strab.* l. 7. p. 209. *Scheffer*, de Milit. Nav. l. 11. c. 5. *Pitiſc.* Lex. Antiq. in voc.

All *Anchors* have now two arms; not but they might ſtill be uſed with only one arm, which ſtructure would have this advantage, that they would be lighter, and yet in fine weather would hold equally firm with the double kind. The reaſon of having two arms is, that the *Anchor* may always take, in order to which it is neceſſary that it be very heavy; beſides that *Anchors* with a ſingle arm would require more preparation for ſervice. *Aubin.* Dict. Mar. in voc.

For the proportions of *Anchors*, according to Manwayring, the ſhank is to be thrice the length of one of the flookes, and half the length of the beam; according to Aubin, the length of the *Anchor* is to be four tenths of the greateſt breadth of the ſhip: ſo that the ſhank, *e. gr.* of an *Anchor* in a veſſel thirty foot wide is to be twelve foot long. When the ſhank is for inſtance eight foot long, the two arms are to be ſeven foot long, meaſuring them according to their curvity. As to the degree of curvity given the arms, there is no rule for it; the workmen are here left to their own diſcretion.

Aubin gives a table from a Flemiſh writer wherein the lengths of the ſhanks of *Anchors*, for veſſels of all widths, is computed, as well as the weights of the *Anchors*, from a veſſel eight foot wide within, which requires an *Anchor* 3 $\frac{1}{5}$ foot long, weighing thirty three pound, to a veſſel forty-five foot wide, which demands an *Anchor* eighteen foot long and weighing 5832 pounds.

Veſſels that ſail on rivers have at leaſt one *Anchor*, thoſe which ſail in the canals of Zealand have two *Anchors*, but thoſe which go to ſea have always three, four, or more. *Aubin.* lib. cit. p. 27.

The diſtinctions of *Anchors* are taken from their uſe, and the proportion they bear in the ſhip, where they are employed; for that which in one ſhip would be called but a kedger, or kedge *Anchor*, in a leſſer would be a ſheet *Anchor*.

The kedge *Anchor* is the ſmalleſt, which by reaſon of its lightneſs, is firſt to ſtop the ſhip in kedging a river.

This is what the Dutch ſailors call *Werp Anchor*, the French *Ancre a touer*. It ought to weigh 450 pounds.

Stream ANCHOR is a ſmall *Anchor* faſtened to a ſtream cable, wherewith to ride in rivers, and gentle ſtreams, and to ſtop a tide withal in fair weather. *Botel.* Sea Dial. p. 238.

Sheet or *Sheat* ANCHOR is the biggeſt and ſtrongeſt, being that which the ſeamen call their laſt hope; never to be uſed but in great extremity.

This is what the Romans called *Anchora Sacra*; the Dutch *Plegt Anker*, and *Stop Anker*; the French *Maitreſſe Ancre*, or *Grande Ancre*.

The other *Anchors* are called by the name of the firſt, ſecond, and third *Anchor*; by any of which the ſhip may ride in any reaſonable weather, ſea-gate, or tide.—Theſe are ſomething bigger one than another, and uſually when they ſail in any ſtreights, or are near a port, they carry two of theſe at the bow; in which reſpect they are alſo called by the name of, firſt and ſecond bowers.

Second ANCHOR, called by the Dutch *Boeg-Anker*, or *Daagelyks-Anker*, is that ordinarily made uſe of.

Croſs ANCHOR, called by the Dutch *Tuy-Anker*, or *Vertuy-Anker*, and by the French *Ancre d'affourche*, is a middling *Anchor* thrown acroſs or oppoſite to another.—This ought to weigh 1500 pound, or near as much as the ſecond *Anchor*.

Riding at ANCHOR, in the ſea language, the ſtate of a veſſel moored and fixed by her *Anchors* at ſome proper ſtation. See MOORING, *Cycl.* and *Suppl.*

Where a great number of veſſels are moored in the ſame port, care is to be taken by the pilots, or thoſe who have the command, that each ſhip be at a due diſtance from the reſt to prevent their running foul of each other; alſo that they be neither too near, nor too far from land. The proper ſpace betwixt veſſels is from two to three cables length.

Dropping or letting fall the ANCHOR, otherwiſe called caſting *Anchor*, imports the letting it go down into the ſea.

In ſome caſes it is neceſſary to drop two *Anchors* oppoſite to each other, one of them to keep the ſhip firm againſt the tide, or flow, the other againſt the ebb.

Weighing ANCHOR imports the act of with-drawing or recovering the *Anchor* into the veſſel, in order for ſailing.

Dragging ANCHOR is when the *Anchor* gives way, or loſes its hold in the ground by the force of the wind, or ſea, and the veſſel drives from its place.

Clearing the ANCHOR ſignifies the getting the cable off the flooke.

Generally alſo when they let fall the *Anchor*, they uſe this term, to ſee that the buoy rope, nor any other ropes hang about it.

Fetching or bringing home the ANCHOR denotes the weighing it in the boat and bringing it aboard the ſhip.

The *Anchor* is ſaid to come home, when the ſhip drives away with the tide or ſea.—This may happen, either becauſe the *Anchor* is too ſmall for the burthen of the ſhip, or by reaſon the ground is ſoft, and oozie; in ſuch places ſhoeing is uſed.

Shoeing the ANCHOR denotes putting boards on the flookes, in the form of flookes themſelves, to make it broader than before, uſed when they are obliged to *Anchor* in bad ground to prevent the ſhip from driving.

This is what the French mariners call *breder l'Ancre*, and the Dutch, *t'Anker bekleeden*.

In ſome caſes they have been known to tallow the *Anchors*, where the ground being ſoft, the ordinary would not hinder them from coming home. Manwayring ſaw an inſtance of tallowing the *Anchor* in Porto Tareen by Tunis. The reaſon of the advantage is hard to aſſign; he ſuppoſes it to be, that the tallow ſinks deeper into the ooze, and finds ſome harder ground at the bottom, than the other.

Other terms and words of command relating to the *Anchors* are, *the Anchor is a peeke*, that is, when heaving up the *Anchor*, the cable is right perpendicular betwixt the hawes and the *Anchor*; *the Anchor is cock-ball*, when the *Anchor* hangs right down by the ſhip's ſide: this word is given by the maſters, when they are ready to bring the ſhip to an *Anchor*. *The Anchor is foul*, that is when the cable, by the turning of the ſhip, is hitched or got about the flooke; which will not only cut the cable aſunder, but hinder the *Anchor* from holding.

On this account when they come to an *Anchor* where there is a tide, they lay out two *Anchors*, by which means on the turning of the tide the ſhip winds up clear of either.

Juſtin [a] and Appian relate, that all the Seleucides were born marked with an *Anchor* on the thigh; on which account Antiochus Soter, Antiochus Θεος, and Demetrius, Nicator, Seleucus, and many of his ſucceſſors have *Anchors* engraven on their medals [b].—[[a] *Juſt.* Hiſt. l. 15. c. 4. [b] *Spanheim*, de Præſt. Nummiſm. p. 404. ſeq. Trev. Dict. Univ. in voc.]

ANCHOR, *Anchora*, in literary matters, the figure of an *Anchor*, repreſented in antient books; which is of two kinds, ſuperior and inferior. The ſuperior, &c. is where the crooked part is uppermoſt, uſed to denote a thing or paſſage ſtrongly expreſſed. *Du Cange*, Gloſſ. Lat. in voc.

The inferior is were the crooked part is at the bottom, to denote a thing poorly or meanly ſet forth. *Iſid.* Orig. l. 1. c. 20.

ANCHOR is alſo uſed in a leſs proper ſenſe, for any thing that holds another thing faſt, or prevents its driving.

In this ſenſe, ſea-muſcles are ſaid *to riſe at Anchor*, by a ſort of threads the thickneſs of a large hair, which they emit out of their body, to the number ſometimes of a hundred and fifty, which faſtening to the ſtones and other adjacent bodies, keep them firm in their place.—The ſame is done by the *Pinna Marina*. Vid. *Reaumur*, in Hiſt. Acad. Scienc. 1711. p. 10. ſeq.

ANCHORAGE, (*Cycl.*) in middle age writers, is called *Anchoragia* and *Ankeragia*. V. *Dugd.* Monaſt. T. 1. p. 718, 976.

In ſome towns of Italy and Sicily, there is a ſpecial officer appointed to collect this duty, under the denomination of *Anchoragius Portus*, *Ancoragio del Porto*. *Du Cange*, Gloſſ. Lat. in voc.

ANCUSA, *Alkanet*, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe. The cup is an oblong cylindric perianthium, divided into five ſegments at the edge, and remaining when the flower is fallen; the flower is compoſed of a ſingle petal, which is a cylindric tube

tube, of the length of the cup, ſlightly divided into five ſegments at the edge, ſomewhat erect, ſpread open, and obtuſe. The opening of it is covered with little ſcales which are convex, prominent, oblong, and converge toward one another: The ſtamina are five very ſhort filaments, plac'd in the mouth of the flowers. The antheræ are oblong, plac'd on the ſtamina, and cover'd. The piſtillum has four germina; the ſtyle is ſlender, and of the ſame length with the ſtamina; the ſtigma is obtuſe, and has a rim round its edge. The cup remains, to ſupply the place of a fruit, containing in its bottom four longiſh, obtuſe, and gibboſe ſeeds. *Linnæi*, Genera plantarum, p. 57.

The roots of the ſeveral kinds of *Alkanet* are by ſome ſuppoſed to be great vulneraries. There is a preſcription in many of the German authors, of a tincture drawn from the cortical part of them with petroleum, which has great praiſe as a remedy for punctures and all recent wounds.

ANCHYLOBLEPHARON, in phyſic, a diſtemperature of the eye-lids, wherein they ſometimes cohere to each other, and ſometimes to the globe of the eye itſelf. This is eaſily diſtinguiſhable from the ſlight glewing up of the eye-lids from the ſmall-pox, or other the like cauſes. This diſorder is ſometimes brought with an infant into the world, ſometimes it comes upon adults by a fleſhy excreſcence from the angles of the eyes, and ſometimes it happens from accidents, as blowing up of gun-powder, and the like. This is always dangerous, and difficult of cure, but moſt ſo when the eye-lids grow to the cornea. They are to be divided by a blunt pointed pair of ſciſſars, and when ſeparated from each other, it muſt be tryed whether they adhere to the eye; if they do, they muſt be ſeparated with great caution with a blunt pointed ſcalpel; but there is here great danger of injuring the ſight; when ſeparated, they muſt be kept from touching one another, to prevent their cohering again, by lint, or a plate of lead. *Heiſter*'s Surgery. p. 370.

ANCHYLOPS, in medicine. See ANCHILOPS.

ANCHYLOSIS, in phyſic, is, when a juncture or articulation becomes immoveable.

Anchyloſis bears an affinity to contractures, ſhrinkings, or witherings of the parts.

This ſymptom ſometimes happens in fractures near the joints, where the nutritious juice oozes into the cavities thereof.

This diſeaſe, when once formed, is incurable, but while yet freſh, is ſometimes removed by motion, friction, and the uſe of diſcutient medicines. *Junck.* Conſp. Chir. Tab. 62. p. 414.

ANTIENT *Muſic*, that in uſe among the antient Greeks and Romans. About the year 1024, Guido Aretine invented, or at leaſt revived muſic in parts, which may with propriety be called *antiquo-moderna*, modern with reſpect to the Greeks, and antient with regard to us. See MUSIC.

ANCLABRIS, in the religion of the antient Romans, denoted a table in temples, whereon the prieſts eat their portion of the ſacrifices and oblations. *Struv.* Antiq. Rom. c. 11. *Piſc.* Lex. Antiq. in voc.

ANCLE *luxated*, in ſurgery. — The *Ancle* is ſubject to be luxated, either in running, in jumping, or even in walking; and that in all four directions, either inward or outward, backward or forward. When the *Ancle* is luxated inward, the bottom of the foot is turned outward; and on the contrary, when it is luxated outward, the bottom of the foot is turned inward, which latter caſe is indeed much more frequent than the others. If it is diſlocated forward, the heel becomes ſhorter, and the foot longer than it ſhould be; and if backward, the contrary ſigns to theſe will appear. The *Ancle* however can ſcarce poſſibly be luxated outwards, unleſs the fibula be ſeparated from the tibia, or elſe quite broken, which may happen to the external *Ancle*; nor is it at all uncommon for a luxation of the *Ancle* to be attended with very grievous ſymptoms, eſpecially when occaſion'd by ſome great exernal violence; nor can it indeed well happen otherwiſe in this caſe, ſince the diſtortion of the foot muſt neceſſarily overſtrain the adjacent tendons, ligaments, and nerves, and thence excite very violent pains, and other bad ſymptoms; or the veins and arteries may alſo be very eaſily lacerated, which will occaſion a large extravaſation of blood about the whole foot, which too often gives riſe to a gangrene.

It is however neceſſary to obſerve, that the *Ancle* is not always luxated, after it has been violently ſtrained by leaping or turning the foot on one ſide; for it ſometimes happens, that the *Ancle* is not diſlocated on theſe occaſions, but only the parts are violently contuſed and ſtrained. The *Ancle*, when truly luxated, is more or leſs difficult to be reduced, according to the violence of the force by which the accident was occaſioned. The moſt ready way, however, of reducing a luxation of the *Ancle*, is, to place the patient upon a bed, ſeat, or table, leting the leg and foot be extended in oppoſite directions by two aſſiſtants, while the ſurgeon replaces the bones with his hands and fingers in their proper ſituation. When the foot is by this means reſtored to its proper poſition, it is to be well bathed with oxycrate and ſalt, and then carefully bound up with a proper bandage. The patient muſt be enjoined to keep his bed for a conſiderable time, till the bad ſymptoms are gone, and the *Ancle* has recovered its ſtrength ſo far, as to bear the weight of the body, without any uneaſineſs or danger. *Heiſter*. Surg. p. 173.

We have an account of the menſes regularly evacuated at an ulcer of the *Ancle*, in the Medic. Eſſ. Edinb. Vol 3. art. 29.

ANCON (*Cycl.*) is uſed in the antient architecture, to denote the two parts or branches of a ſquare, which meet in an angle reſembling the letter L. *Vitruv.* l. 3. c. ult.

ANCON is alſo uſed by Vitruvius, to denote a kind of *menſulæ*, or tables before doors, bent ſomewhat after the manner of volutes, ſo as to reſemble the letter S. Id. l. 4. c. 6.

In this ſenſe *Ancones* amount to the ſame with what the Greeks call προθυρίδες, *Prothyrides*. *Fabr.* Theſ. in voc. *Ancon.*

ANCON is particularly applied, in the antient architecture, to the brackets, or ſhouldering pieces, called *conſoles* by the moderns. *Neve*, Build. Dict. See CONSOLE, *Cycl.*

ANCON was alſo uſed by the Carthaginians, to denote a dark priſon or dungeon. Suidas mentions one of this kind, in which Gelimer uſed to put all who diſpleaſed him; from which Belliſarius delivered many merchants of the Eaſt, whom the tyrant intended to put to death. *Suid.* Lex. in voc. Αγκων.

ANCON is alſo applied to the angles or flexures of rivers; ſometimes alſo to the tops of mountains. Id. ibid.

ANCONÆUS *Externus*, (*Cycl.*) in anatomy, a long muſcle, lying on the outer part of the backſide of the os humeri, from its neck to the external condyle. It is fixed above in the neck of the os humeri, under the inferior ſurface of the great tuberoſity, and under the inſertion of the teres minor, but a little more backward. It runs down by the *Anconæus* major, adhering firmly to the bone, except at that oblique depreſſion, on account of which this bone appears contorted: it is likewiſe fixed by ſome oblique fibres in the external intermuſcular ligament. From all this ſpace the muſcular fibres contract in breadth, being joined more or leſs obliquely to the outer edge of the tendon of the *Anconæus* major, all the way to the olecranum. The termination of theſe two muſcles in the common tendon forms a very acute angle, and repreſents a ſort of penniform muſcle. *Winſlow*'s Anatomy. p. 188.

ANCONÆUS *internus*, a muſcle ſhorter, and more fleſhy than the *anconæus* externus, and lying towards the inner part of the lower half of the os humeri. It is fixed above, under the lower extremity of the teres major, but a little more backward, and to the intermuſcular ligament, which makes a kind of ſeptum between this and the brachiæus; from thence the fibres contracting in breadth, paſs towards the tendon of the *Anconæus* major, ſome of them running in between it and the bone, and are inſerted in the edge and inner ſide of that tendon. *Winſlow*. ibid.

ANCONÆUS *major*, a long fleſhy muſcle lying on the backſide of the os humeri. It is fixed above by a ſhort tendon to the inferior impreſſion in the neck of the ſcapula, and to a ſmall part of the inferior coſta of that bone; from thence it paſſes between the extremities of the ſubſcapularis and teres minor; and having reached the backſide of the lower extremity of the os humeri, it ends obliquely in a ſtrong broad tendon, which adhering cloſely to the ſcapular ligament, is afterwards fixed by a broad inſertion in the rough tuberoſity on the upper ſide of the olecranum. It lies between the two lateral *Anconæi*, and by its adheſion to them, a triceps muſcle is formed, of which this is the middle portion. Theſe three are all very properly called *Anconæi*, becauſe of their inſertion in the olecranum. *Winſlow*'s Anatomy, p. 187.

ANCONÆUS *minor*, a ſmall muſcle obliquely triangular, lying in the oblong foſſula on the outſide of the olecranum. It is fixed by a ſhort but pretty ſtrong tendon in the lower part of the external condyle of the os humeri; from thence the fleſhy fibres run down obliquely in a ſomewhat radiated form, and are inſerted in the bottom, and whole poſterior edge of the foſſula. It is cloſely united to, and in ſome ſubjects ſeems to communicate by ſeveral fibres with the ulnaris externus, and its tendon adheres very ſtrongly to that of the *Anconæus* externus. Some anatomiſts having confounded this muſcle with the ulnaris externus, and raiſing them together, have afterwards looked in vain for the *Anconæus minor*. It is however plainly diſtinguiſhed from the other, by a fatty or cellulous line. *Winſlow*'s Anatomy, p. 188.

ANCONY, (*Cycl.*) in the iron-works, a piece of half-wrought iron, of about three quarters of a hundred weight, and of the ſhape of a bar in the middle, but rude and unwrought at the ends.

The proceſs for bringing the iron to this ſtate is this: they firſt melt off a piece from a ſow of caſt iron, of the proper ſize; this they firſt hammer at the forge into a maſs of two feet long, and of a ſquare ſhape, which they call a *bloom*; when this is done, they ſend it to the finery, where, after two or three heats and workings, they bring it to this figure, and call it an *Ancony*. The middle part beat out at the finery is about three feet long, and of the ſhape and thickneſs the whole is to be; this is then ſent to the chafery, and there the ends are wrought to the ſhape of the middle, and the whole made into a bar. See BAR.

ANCTERES, in the antient medicine, ſeem to have been the ſame, at leaſt to have anſwered the ſame uſes, as our ſutures. See SUTURE, *Cycl.* and *Suppl.*

Some alſo ſpeak of a ſtrong kind of ſticking plaiſter under this denomination. *Lang.* Epiſt. Med. l. 1. Ep. 77. *Caſt.* Lex. Med. p. 48.

ANCTERIASMUS, in medicine, the operation of applying a fibula to cloſe the too patent lips of wounds. *Gorr.* Def. Med. p. 2. in voc. Αγκίηξες.

This is alſo called, by Latin writers, *infibulatio.*

ANCTERIASMUS is more particularly uſed to denote the paſſing a fibula through the prepuce of the antient ſtage-players and buffoons. *Rolfink*, de Partib. Genit. P. 1. c. 50.

ANCUBITUS, among antient phyſicians, denotes a diſeaſe of the eyes, wherein there is an appearance of ſand, or little ſtones ſprinkled on them. *Joh. Anglic.* Roſ. Ang. p. 867. *Caſt.* Lex. Med. in voc.

This is otherwiſe called *petrification.*

ANCYLOGLOSSUM, in medicine, is where the frænum extends to the tip of the tongue, and thus contracts, or bends it downwards.

The name is derived from αγκυλος, crooked, and γλωσσα, tongue.

The *Ancyloglossum* is, by ſome, alſo called *Ancylion*, Αγκυλιον; and thoſe afflicted with it *Ancyloglossi*, Αγκυλογλωσσοι, by ſome *mogilali*, μογιλαλοι. Vid. *Act.* l. 8. c. 36.

Ancyloglossum is either natural, *i. e.* born with the Infant, or accidental, occaſioned uſually by ſome ulcer under the tongue, which leaves behind it a hardneſs, or eſchar. It is the common opinion of midwives, that none are born without this Infirmity; and hence one of the firſt things after a birth is, to cut the ſtring of the infant's tongue. Vid. *Caſt.* Lex. Med. in voc. See alſo *Hildan.* obſerv. 28. cent. 3. *Barthol.* Anat. l. 3. c. 13. *Ægin* l. 6. c. 29.

The effect of the *Ancyloglossum* is not only to hinder the uſe of ſpeech, but in children it alſo diſables them from ſucking.

The cure is performed by a careful ſection of the frænum, ſo as not to hurt the nerves, or other veſſels.

This operation is never to be performed, where the infant is able to thruſt its tongue ſtraight out of the mouth.

Fabricius ab Aquapendente complains ſeverely on the officiouſneſs of midwives, who, without ever examining the condition of the frænum, practiſe the operation promiſcuouſly on all infants, from an opinion, that without it the child would never be able to ſpeak. But, according to this author, there is ſcarce one child in 100,000 in whom this ligament needs any cutting at all. Operat. Chirurg. P. 1. c. 36.

In ſome parts of Italy the midwives nouriſh a long nail on their right thumb, which is faſhioned after the manner of a knife's point, wherewith, as ſoon as the child is born, they cut the ligament. In other places, from a vain opinion that there is ſomething malignant in the nail, the operation is performed with the edge of a piece of money. Vid. *Hoffman*, in Galen de uſ. Part. l. 11. n. 805. *Columb.* l. 3. c. 3. It. l. 5. c. 13. *Jeſſen.* Inſtit. Chir. c. 2. *Sennert.* Prax. de Infant. Curat. P. 2. c. 15. See alſo *Franc.* Satyr. 20. de Inciſa Frænisublingua, §. 8.

The operation is painful to the infant, and is ſometimes followed by inflammations, and even death itſelf. *Burggr.* Lex. Med. in voc. See ANCYLOGLOSSUS, *Cycl.*

ANDABATÆ (*Cycl.*)—Some ſay the *Andabatæ* fought in the dark, or late at night, after the circenſia were over. There were two men in the chariot, viz. the driver, or auriga, and the παραβαλης, who was alſo called αναβαλης, *q. d.* adſcenſor, or mounter; whence, by corruption, the Latins formed their *Andabata.* *Turneb.* Adverſ. l. 19. c. 8.

It has been diſputed among critics, whether the *Andabatæ* were a people who actually fought blindfold, in their wars, or a ſet of combatants who only practiſed this method of fighting for exerciſe ſake. Vid. *Aquin.* & *Pitiſc.* in voc.

ANDELANGA, in middle age writers, occurs as part of the formula of divers donations.

In this ſenſe, we meet with *donare per Andelangam & feſtucam, vendere & tradere per Andelangam*, &c. Some will have the term properly to denote what we call an *andiron*; others a long ſtaff, or rod, which it is known was much uſed in the putting into poſſeſſion. *Spelm.* & *Du Cange*, in voc.

The word is ſometimes alſo written *Andelangus*, *Andelago*, *Andilago*, *Andalagus*, &c.

ANDENA, in antient writers, denotes a ſwath in mowing. The word is likewiſe uſed to ſignify as much ground as a man can ſtride over at once.

ANDERENÆ *fal*, in natural hiſtory, a name given, by many of the old writers, to the nitre of the antients, or natrum. Some have, ſince their time, applied it to our common nitre; and it has been wondered at, that the accounts do not agree with the ſubſtance. But it is to be obſerved, that the nitre, or natrum, of the antients is a fixed ſalt, approaching to the nature of potaſh, and not at all inflammable with ſulphur, as our nitre is. It is therefore no wonder if the things related of the one ſhould not be found to agree with the other.

ANDIRIAR, in botany, the name by which Rhaſes and ſome others expreſs the *fabago. Ger.* Emac. Ind. 2. See FABAGO.

ANDORINHA, in zoology, a name by which the Portugueſe in the Braſils call the Braſilian ſwallow, more uſually known by its Braſilian name *tapera.* See TAPERA.

ANDRACHNE, in botany, the name of a genus of plants, called by Tournefort, and ſome others, *telephioides.* The characters are theſe. It produces ſeparate, male and female flowers, on the ſame plant. The male flowers have an extremely large five-leaved cup, which withers very quickly. The corolla conſiſts of five ſlender and ſhort petals, which have each a thin rim or edge round them. The nectarium conſiſts of five greeniſh leaves, one affixed to each of the petals; theſe are ſmaller than the petals, and are lightly divided into two ſegments at the rim. The ſtamina are five ſmall filaments, inſerted into the baſe of a ſort of ſtyle. The antheræ are ſimple. In the female flowers, the cup is compoſed of five leaves, and is very large, and does not fall off. The corolla has no petals, but has a nectarium of the ſame ſhape with that of the male. The germen of the piſtil is globoſe. There are three capillary ſtyles, ſlightly divided into two at the ends, and terminated by globoſe ſtigmata. The fruit is a trilobate capſule, approaching to a globoſe figure. The cells are bivalve, and are of the ſize of the cup. The ſeeds are two in each cell; they are round on one ſide, and angular on the other, and approach ſomewhat to a trigonal form. Vid. *Linnæi*, Gener. Plant. p. 455. *Tourneſ.* Inſt. p. 365.

ANDRACHNE is alſo a name given, by the antients, ſometimes to a tree of the *arbutus*, or ſtrawberry-tree kind, and ſometimes to the herb purcelain. Pliny attempts to diſtinguiſh the two ſubjects, by changing the letter (*n*) into an (*l*) in one of them, writing the tree *Andrachne*, and the herb *Andrachle.* But this is not juſtifiable, for the Greeks wrote it indifferently either way, as they liked, the changing the letter (*n*) into (*l*) being very common: thus *nitrum* was ſometimes called *litrum*, λιτρον; and the not perceiving this has occaſioned the error in many authors, of calling the *aphronitron* and *aphrolitron* of Dioſcorides, and the antient Greeks, two different ſubſtances. See APHRONITRUM.

Some have doubted whether the word *Andrachne* was ever uſed by the Greeks, as the name of the herb purcelain; but there is no queſtion to be made of this, if the virtues and the deſcriptions they give of the figure of the plant are attended to. Macer gives us, in two lines, both theſe names; and the later Latin one of Chick-foot, *pulli pes*; whence the French name is borrowed, they calling this plant *pourpier quaſi poulpied.* The words of Macer are theſe:

Andrachne Græcis, quæ Portulaca Latinis
Dicitur, hæc vulgi Pes Pulli more vocatur.

Some of the later Latin writers have alſo called it *porcala*, and ſome of the later Greeks have called it *cairobotanon.* See PORTULACA.

ANDRAPODISMUS, Ανδραποδισμος, in antient writers, the ſelling of perſons for ſlaves. *Suid.* Lex. in voc. Ανδραποδιζω. Hence alſo *Andrapodiſtes*, Ανδραποδιστης, a dealer in ſlaves, more particularly a kidnapper, who ſteals men or children, to ſell them; a crime the Theſſalians were noted for.

ANDRAPODOCAPELI, Ανδραποδοκαπηλοι, in antiquity, a kind of dealers in ſlaves. The *Andropodocapeli* had a particular proceſs for taking off moles, and the like diſfigurements on the faces of the ſlaves they kept for ſale, by rubbing them with bran. *Suid.* Lex. in voc.

At Athens ſeveral places in the forum were appointed for the ſale of ſlaves. Upon the firſt day of every month, the merchants called Ανδραποδοκαπηλοι brought them into the market, and expoſed them to ſale, the crier ſtanding upon a ſtone erected for that purpoſe called the people together. *Potter*, Archæol. Græc. l. 1. c. 10.

ANDRIA, Ανδρεια, in antiquity, a name given by the Cretans to the public entertainments, at which whole cities, tribes, or other bodies of men were preſent.

What the Cretans called *Andria*, the Spartans termed φειδιτια, at leaſt of later ages; for originally they appear to have made uſe of the Cretan name. *Potter*, Archæol. Græc. l. 4. c. 17.

The hall, or place of eating, where theſe entertainments were held, was denominated *Andrion*, Ανδρειον, in the uppermoſt part of which was a conſtant table ſet apart for ſtrangers. Id. ib. c. 21.

ANDRIA is alſo uſed by ſome naturaliſts, to denote a ſpecies of hermaphrodite wherein the female ſex has the predominancy. *Vater.* Phyſ. Exper. Sect. 4. c. 5. q. 7. *Bonet.* Med. Septent. l. 3. Sec. 32. c. 4. *Caſt.* Lex. Med. in voc.

ANDRIA, in literary hiſtory, denotes a comedy of Terence, the firſt in order, in the uſual editions.

We have Engliſh tranſlations of the *Andria* by Webb, and Echard; French, by Des Periers and Dacier; and Italian, by Juſtiniani, *&c.* *Fabric.* Bibl. Lat. l. 1. c. 3. p. 32.

ANDROAS, in natural hiſtory, a name given by ſome of the antients to the foſſile more uſually called *Androdamas.* See ANDRODAMAS.

ANDRODAMAS, in natural hiſtory, the name of a ſtone, or foſſil body mentioned by the antients, as uſed by the magi on many occaſions. The deſcription Pliny gives of it is, that it

was very bright, and of the colour of ſilver, and was always of a regular ſquare or teſſelated figure.

This deſcription is enough to inform us, that it muſt have been one of that genus of pyritæ called, by Mr. Hill, *pyricubium*; but its virtues are too imaginary to deſerve a place here.

ANDRODAS, in antient writers, denotes the ſixty-third year of man's life. *Fabri*, Theſ. in voc.

This is otherwiſe called *Annus Ægyptius*, and *Climacter Magnus*.

Some think the word ought rather to be written *Androclas*, and derive it from the Greek, ανδρα, man, and κλαν, *frangere*. Hence Rigaltius renders it by *virifragum*.

ANDROGYNUM, Ανδρογυνον, in eccleſiaſtical writers, is uſed to denote matrimony; or even one of the parties married. *Du Cange*, Gloſſ. Græc. in voc.

Balneum ANDROGYNUM, Ανδρογυνον Βαλανειον, denotes a bath common to both ſexes. Id. ibid.

ANDROIDES (*Cycl.*) — Authors ſometimes ſpeak of brazen heads made under certain conſtellations, capable not only of ſpeaking, but of propheſying, and rendering oracles. Henry de Villeine, Virgil, pope Silveſter, Robert of Lincoln, and Roger Bacon, are ſaid to have had ſuch figures [a]. Albertus Magnus, it is pretended, went further. He made a compleat man, or *Androides*, after this manner; in a courſe of thirty years continual operation, by taking the benefit of an infinite number of different conſtellations, and aſpects, which preſented themſelves in that time: for inſtance, the eyes were made, when the ſun was in a ſign of the zodiac, which bore an analogy to that part; and the like of the reſt. It is generally ſaid to have been compoſed of a mixture of divers metals; though ſome will have it to have been made of fleſh and bones. It was burnt by Thomas Aquinas.—This *Androides*, it ſeems, ſolved all problems, and cleared up all difficulties for its author. We are even to ſuppoſe, that a great part of the twenty-nine volumes in folio, which this author produced, are compoſed of the dictates, or inſpired by the *Androides* [b].—[a Vid. *Naud.* Apol. des Gran. Hom. p. 528. ſeq. b *Bayle*, Dict. Crit. T. 1. p. 129. n. (F).]

ANDROMEDA, in aſtronomy, a conſtellation of the northern hemiſphere, repreſenting the figure of a woman chained.

It is ſuppoſed to have been formed in memory of *Andromeda*, daughter of Cepheus and Caſſiopeia, and wife of Perſeus, by whom ſhe had been delivered from a ſea-monſter, to which ſhe had been expoſed to be devoured for her mother's pride. Minerva tranſlated her into the heavens. Vid. *Fabri*, Theſ. p. 164.

Dr. Hook thinks he has diſcovered the hidden meaning of the ſtory of *Andromeda*. Vid. Poſthum. Works, p. 401.

The ſtars in the conſtellation *Andromeda* in Ptolomy's catalogue are twenty-three, in Tycho's twenty-two, in Bayer's twenty-ſeven, in Mr. Flamſted's no leſs than eighty-four.

ANDROMEDA, in the Linnæan ſyſtem of botany, the name of a genus of plants, including the *ledum* of Micheli, the *chamædaphne* of Buxbaum, the *poliifolia* of the ſame author, and the *ericæ ſpecies* and *chamærhododendros* of Tournefort. The characters are theſe: the perianthium is ſmall, coloured, and permanent, and is divided into five ſegments. The flower conſiſts of one petal, and is of an oval figure inflated, and divided into five reflex ſegments at the edge. The ſtamina are ten ſubulated filaments ſhorter than the flower, and ſcarce fixed to it. The antheræ are divided into two horns, and bend. The germen of the piſtil is roundiſh; the ſtyle is cylindric, and longer than the ſtamina, and is permanent. The ſtigma is obtuſe. The fruit is a roundiſh but pentangular capſule, having five cells, and being compoſed of as many valves; when ripe, it opens at their junctures. The ſeeds are numerous and roundiſh. The figure of the flower is ſomewhat various in this genus, but it differs evidently from the erica, or heath, in the number of its ſtamina. Vid. *Linnæi*, Gen. Plant. p. 188. *Micheli*, p. 106. *Tournef.* Inſt. p. 273. and 373.

ANDROMEDA, in middle age writers, denotes a kind of garment made of rams ſkins. *Du Cange*, Gloſſ. Lat. T. 1. p. 187. ſeq.

ANDROMEDA, in literary hiſtory, denotes a celebrated Greek tragedy of Euripides, admired by the antients above all the other compoſitions of that poet, but now loſt. Vid. *Fabric.* Bibl. Græc. l. 2. c. 18. p. 647.

It was the repreſentation of this play, in a hot ſummer day, that occaſioned that epidemic fever, or phrenzy, for which the Abderites are often mentioned, wherein they walked about the ſtreets, rehearſing verſes, and acting parts of this piece.—Some aſcribe this effect to the excellency of the poem; others to that of Archelaus the tragedian, who performed in it. Vid. *Baill.* Jugem. des Scav. T. 3. P. 1. p. 377. *Bayle*, Dict. Crit. in voc. *Abdera*.

ANDRON, or ANDRUM, in antiquity, an apartment in houſes aſſigned for the uſe of the men. This was otherwiſe denominated *Androna*, and *Andronites*. *Potter*, Archæol. Græc. l. 4. c. 13.

The *Andron* ſtood oppoſed to the *gynecæum*, or apartment of the women. See GYNÆCEUM, *Cycl.*

The Greeks alſo gave their dining-rooms the title *Andron*, becauſe the women had no admittance to feaſts with the men. Mem. de Trev. 1706. p. 483.

ANDRONA, in antient writers, denotes a ſtreet, or public place, where people met and converſed together. *Du Cange*, Gloſſ. Lat. T. 1. p. 188.

In ſome writers *Androna* is more expreſly uſed for the ſpace between two houſes. In which ſenſe, the Greeks alſo uſe the term Ανδρωνας, for the way or paſſage between two apartments. *Vitruv.* l. 6. c. 10.

The word is ſometimes alſo written *Andra*, *Andron*, and *Andronium*.

ANDRONA is alſo uſed, in eccleſiaſtical writers, for that part in churches deſtined for the men. Antiently it was the cuſtom for the men and women to have ſeparate apartments in places of worſhip, where they performed their devotions aſunder; which method is ſtill religiouſly obſerved in the Greek church.

The Ανδρων, or *Androna*, was in the ſouthern ſide of the church, and the women's apartment on the northern. *Magri*, Vocab. Eccleſ. p. 16.

ANDRONION, in phyſic, the name of a paſtil, invented by an antient phyſician named Andro, ſaid to have been of great efficacy againſt the carbuncle and herpes. Vid. *Ægin.* l. 4. c. 20. & 25. *Gorr.* & *Caſt.* in voc.

Its ingredients, according to Ægineta's preſcription, are the *ſquamæ* of copper, *æs uſtum*, *ſal ammoniac*, *alumen rotundum*, ſhavings of verdegreaſe, and frankincenſe, all wrought up with wine. Celſus gives another recipe, and Aetius a third.

ANDROPHAGI, among antient geographers, denotes man-eaters.

Theſe are more uſually called *Anthropophagi*.

Herodotus [a] and Pomp. Mela [b] ſpeak of a nation of *Androphagi* in Scythia.—[a *Herod.* Hiſt. l. 4. c. 106. b *Pomp. Mela*, de Sit. Orb. l. 3. c. 7.]

ANDROSACE, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe. The cup is a ſmall but general covering, containing many flowers, and compoſed of many leaves. The perianthium of each ſingle flower is of a ſomewhat pentagonal form, compoſed of one leaf, ſlightly divided into five ſegments, ſtanding erect, and remaining after the flower is fallen. The flower conſiſts of only one petal, in form of an oval tube, covered by the cup. The edge is divided into five oblong oval ſegments, with no indentings at their extremities. The ſtamina are five very ſhort filaments ſtanding in the tube of the flower; the antheræ are oblong and erect; the germen of the piſtillum is globoſe; the ſtyle is ſlender, and very ſhort; and the ſtigma globoſe. The fruit is a globoſe capſule, placed on a flat cup, containing only one cell, and ſpliting open in five places at its top. The ſeeds are very numerous, and ſomewhat roundiſh, but gibboſe on one ſide, and flat on the other. *Linnæi*, Gener. Plantarum, p. 62.

The characters of this genus, according to Mr. Tournefort, are theſe. The flower conſiſts of one leaf, and is of the ſaucer-ſhape, very wide at the mouth, and divided into ſeveral ſegments round the edge. The piſtil perforates the middle of the flower, and afterwards changes into a globoſe fruit, which is partly covered by the cup; this opens at the point, and is filled with ſmall ſeeds affixed to a placenta.

The ſpecies of *Androſace*, enumerated by Mr. Tournefort, are theſe.

1. The common, broad-leaved, annual *Androſace*. 2. The perennial, narrow-leaved, ſmooth, alpine *Androſace*. 3. The narrow-leaved, ſmooth, perennial *Androſace*, with a ſingle flower of a ſnow white. Vid. *Tournef.* Inſt. p. 123.

The *Androſaces* approach much to the nature of the auriculas, but differ in the ſtructure of the flower.

Androſace is ſo called, from its bringing relief to men, *q. d.* ανδρι ακος φερουσα. It is apperitive, and good for the dropſy, for retention of urine, and for the gout. Vid. *Lemery*, Dict. des Drogues.

ANDROSÆMUM, *tutſan*, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the roſaceous kind, conſiſting of ſeveral petals, diſpoſed in a circular form. The cup conſiſts alſo of many leaves, and from it there ariſes a piſtil, which finally becomes a moiſt oval fruit, unicapſular, and containing a number of ſmall ſeeds affixed to a threefold placenta.

There is only one known ſpecies of this genus, which is the *tutſan*, or park-leaves, called alſo *ſiciliana* by ſeveral authors. *Tournef.* Inſt. p. 251.

Androſæmum is ſo called, from the colour of its juice, which reſembles that of human blood. It is apperitive, vulnerary, reſolutive, good for the ſtone, to kill worms, to reſiſt malignity, and guard againſt madneſs; and is uſed either externally or internally. Vid. *Lemery*, Dict. des Drogues.

ANDRUM, in phyſiology, a local diſeaſe, epidemical among the people of Malabar, being a peculiar ſpecies of *hydrocele*, or watery tumor of the ſcrotum.

The *Andrum*, in the language of the country, is alſo called *perical*; ſometimes paraphraſtically, *Andu wajaku*, *q. d.* a popular water rupture.

Its origin is derived from the vicious quality of the country waters, impregnate with corrosive muriatic salts, the source of most other diseases that infect the Malabarians. Its signs, or symptoms, are an erysipelas of the scrotum, returning every new moon, by which the lymphatics being eroded, pour a serous saline humour into the cavity of the scrotum.

The *Andrum* is incureable; those once seized with it, have it for life; but it is not dangerous, nor very troublesome, to those used to it; though sometimes it degenerates into a hydrosarcocele.

The means of prevention is by a heap of sand fetched from a river of the province Mangatti, and strowed in the wells. This is practised by the rich. As to the cure, they have only a palliative one, which is by incision, or tapping and drawing off the water from the scrotum, once in a month or two. *Kempf.* Amæn. Exot. fasc. 3. obs. 7.

ANDRYGALA, in botany, the name of a genus of plants, the characters of which are these. The common cup is short, round, and hairy, and is divided into a great number of equal and subulated segments. The flower is of the compound kind, and is imbricated and uniform, being composed of a great number of equal small flowers, or corollulæ. Each of these consists of one petal, and is ligulated, narrow, truncated, and divided into five segments at the edge. The stamina are five very short and capillary filaments. The antheræ are of a cylindric figure, and tubular. The germen stands under the flower, and is small; the style is capillary, and of the length of the stamina; and the stigmata are two in number, and are reflex. The cup, when the flower is fallen, serves as a seed-vessel; it closes at the top, and becomes of a globular figure. The seeds are single; they are of an oval figure, and are crowned with a single down, of the length of the cup. The receptacle is hairy, and of a flat figure. *Linnæi*, Gen. Plant. p. 376.

ANECDOTES (*Cycl.*)—Procopius's *Anecdota* have been attacked expresly by Rivius, Bonifacius, and Eichelius; and their fidelity defended by Alcmannus [a]. Paschius ranks them in the number of satires, written with no other design, but by lies forged against the emperor, to render the court of that good prince odious to posterity [b].—[[a] *Budd.* Isag. ad Theol. l. 1. c. 4. p. 180. b. [b] Jour. des Scav. T. 42. p. 379.]

Some authors have doubted, whether the work were really Procopius's. Suidas, 'tis certain, ascribes it to him; but neither Agathias, Photius, nor any writer before Suidas, make any mention of it. What chiefly supports the doubt is, that the same Procopius, in his other history, extols Justinian to the skies; yet the critics generally allow the work to be genuine. The inference then is, either that Procopius must have been an arrant flatterer, or an abominable slanderer. What dependance then can be had on the faith of history, when historians are found to prevaricate so horribly [c]? Perhaps it may be of some service to Procopius, to take the book of *Anecdotes* in the light wherein Nicephorus put it [d], when he calls it, with propriety enough, a retractation of what he had said in praise of Justinian, and, as it were, a palinody of what he had spoken wrong.—[[c] Vid. *Fabric.* Bibl. Græc. T. 6. l. 5. c. 5. p. 255. seq. [d] *Niceph.* l. 8. c. 10.]

'Tis certain, however, Procopius was not the inventor of this kind of compositions. Cicero makes mention of his own *Anecdotes*, long before that historian's time; nor was Cicero the first; for he owns he only imitated Theopompus. Vid. *Fabric.* Bibl. Græc. T. 1. p. 146. See also *Cicero*, ad Attic. l. 2. Ep. 6. and ibid. l. 14. Ep. 17.

Among the moderns, besides Varillas [e], Alerac [f] has published *Anecdotes* of Poland; Valdory [g], *Anecdotes* of the ministry of the cardinals Richelieu and Mazarin; Mad. de Gomez, Persian *Anecdotes* [h].—[[e] *Anecdotes* de Florence, ou l'Histoire secrete de la Maison de Medicis, Hay. 1685. 12mo. Extracts of it are given in Jour. des Scav. T. 13. p. 329. Nouv. Rep. Lett. T. 4. p. 459. [f] Les *Anecdotes* de Pologne, &c. Par. 1699. 12mo. A critique is given of this work, in two letters printed in Nouv. Liter. T. 8. p. 257. & 293. [g] *Anecdotes* du Ministre du Cardinal Richelieu, & du Regne du Louis XIII. tires du Mercurio Siri, Par. 1717. 12mo. 2 vol. An extract of it is given in Nouv. Rep. Lett. T. 56. p. 96. [h] *Anecdotes* Persannes, Amst. 1729. 2 vol. 12mo. See an account of them in Jour. Liter. T. 14. p. 206.]

The title, in effect, has somewhat in it alluring. It promises to gratify our love of novelty, and of scandal into the bargain; which has induced authors to make use of it without much propriety. Thus it has been objected to the *Anecdotes* of Poland, that abating about a dozen circumstances, not mentioned by former writers, the work has little pretensions to the title of *Anecdotes*. Instead of this, some have charged it with being a plagiarism from the Memoirs of Chevalier Beaujeu. For the Persian *Anecdotes*, they are a romance, to all purposes. Those of Varillas, are but one degree removed from being the same. Nouv. Liter. T. 8. p. 258.

ANEE, in commerce, denotes a corn measure, used in some provinces of France.

It is otherwise called *Asnee*.

The *Anee* is not so properly a measure, as a denomination, or assemblage of a certain number of other measures.

The *Anee* at Lyons consists of six bichets, equal to one septier and three bushels, Paris measure. At Mâcon, the *Anee* is somewhat more. *Savar.* Dict. Comm. in voc.

ANEE is also used for a quantity of wine, supposed to be an ass's load; and is fixed to eighty pots.

ANEMOMACHIA, Ανεμομαχια, in some antient writers, denotes a whirlwind, or hurricane. *Du Cange*, Gloss. Græc. T. 1. p. 76.

In which sense, we sometimes also meet with *Anemozale*, Ανεμοζαλη; *Anemotaraxis*, Ανεμοταραξις, &c.

ANEMOMETER (*Cycl.*)—It is objected to the *Anemometer* mentioned in the Cyclopædia, from Wolfius, that it requires a considerable wind to make it work. Leutmannus has contrived another, wherein the sails are horizontal, and are more easily driven about, and will turn what way soever the wind blows. Vid. Act. Erud. Lipsi, 1726. p. 125. See WIND.

ANEMONE, *wind-flower*, in botany, the name of a genus of plants, the characters of which are these. The flower is of the rosaceous kind, being composed of several petals, arranged in a circular form. From the center of the flower there arises a pistil, which finally becomes an oblong fruit, to the axis of which there adhere a number of seeds, which are usually covered with a downy hood. To this it may be added, that the stalks of the *Anemone* are usually naked, except in one part, from whence there usually grow three leaves.

The species of *Anemone*, enumerated by Mr. Tournefort, are these.

1. The yellow, broad-leaved garden *Anemone*, with leaves like those of sow-bread, or of mallows. 2. The broader-leaved, yellow garden *Anemone*, with double flowers. 3. The broad-leaved *Anemone*, with flowers yellow within, and red or violet coloured on the outside. 4. The broad-leaved garden *Anemone*, with single perfectly white flowers. 5. The broad-leaved, white garden *Anemone*, with a double or triple series of petals. 6. The broad-leaved garden *Anemone*, with flowers white within, and purple or violet coloured on the outside. 7. The double broad-leaved garden *Anemone*, with flowers variegated with white and violet colour. 8. The broad-leaved peacock *Anemone*, with scarlet flowers. 9. The broad-leaved, proliferous, scarlet-flowered peacock *Anemone*. 10. The broad-leaved peacock *Anemone*, usually very luxuriant in leaves, and very rarely flowering. 11. The many-leaved peacock *Anemone*, with bright red flowers. 12. The double broad-leaved rose *Anemone*, with flowers of the colour of the peach blossoms. 13. The largest broad-leaved, changeable-coloured *Anemone*. 14. The great broad-leaved *Anemone*, with leaves variegated with purple and white. 15. The great *Anemone*, with green flowers variegated with purple and bright red. 16. The broad-leaved, double violet *Anemone*. 17. The broad-leaved *Anemone*, with velvety-brown leaves at the edges, green clusters of leaves within, and a blackish purple tuft in the center. 18. The broad-leaved, single, pale, saffron-coloured *Anemone*, with red streaks, called by many the lesser peacock *Anemone*. 19. The purple *Anemone*, with the roundish, cranes-bill leaf. 20. The roundish, cranes-bill-leaved *Anemone*, with very pale purple flowers. 21. The broad-leaved *Anemone*, with single flesh-coloured flowers. 22. The broad-leaved *Anemone*, with single deep purple flowers. 23. The broad-leaved *Anemone*, with violet purple flowers. 24. The double violet purple, broad-leaved *Anemone*. 25. The violet-coloured, broad-leaved *Anemone*. 26. The broad-leaved *Anemone*, with deeper violet-coloured flowers. 27. The broad-leaved *Anemone*, with streaky flowers. 28. The broad-leaved *Anemone*, with spotted flowers. 29. The broad-leaved *Anemone*, with flesh-coloured flowers. 30. The fanicle-leaved *Anemone*. 31. The broad-leaved *Anemone*, with orange-coloured flowers. 32. The broad-leaved *Anemone*, with scarlet flowers. 33. The broad-leaved *Anemone*, with very large scarlet flowers. 34. The broad-leaved *Anemone*, with purplish scarlet flowers. 35. The great white wood *Anemone*. 36. The smaller white wood *Anemone*. 37. The tall Virginian wood *Anemone*. 38. The blue-flowered, narrow-leaved garden *Anemone*. 39. The narrow-leaved garden *Anemone*, with double flesh-coloured flowers. 40. The dropwort-leaved garden *Anemone*, with a six-leaved violet-coloured flower. 41. The fine-leaved garden *Anemone*, with pale crimson flowers. 42. The fine-leaved garden *Anemone*, with a six-leaved scarlet flower. 43. The fine-leaved garden *Anemone*, with an eight-leaved crimson flower. 44. The fine-leaved garden *Anemone*, with a large six-leaved crimson flower. 45. The finely divided-leaved garden *Anemone*, with a blood-coloured flower. 46. The fine-leaved garden *Anemone*, with blood-coloured flowers, with white bottoms. 47. The fine-leaved garden *Anemone*, with a paler blood-coloured flower. 48. The fine-leaved garden *Anemone*, with a large six-leaved blood-coloured flower. 49. The fine-leaved garden *Anemone*, with large blackish-red flowers. 50. The fine-leaved garden *Anemone*, with deep red flowers. 51. The fine-leaved garden *Anemone*, with snow-white flowers. 52. The fine-leaved garden *Anemone*, with large white flowers. 53. The large white-flowered, cretic garden *Anemone*. 54. The common, single, white-flowered garden *Anemone*. 55. The fine-leaved garden *Anemone*, with large

greeniſh white flowers. 56. The fine-leaved garden *Anemone*, with ſmaller greeniſh white flowers. 57. The common fine-leaved garden *Anemone*, with browniſh white flowers. 58. The fine-leaved garden *Anemone*, with ſtriated fleſh-coloured flowers. 59. The garden fine-leaved *Anemone*, with large bright red flowers, with white bottoms. 60. The common fine-leaved, greyiſh white *Anemone*. 61. The fine-leaved *Anemone*, with ſingle ſcarlet flowers. 62. The fine-leaved garden *Anemone*, with ſingle bright red flowers. 63. The fine-leaved garden *Anemone*, with a crimſon flower. 64. The fine-leaved garden *Anemone*, with ſingle fire-coloured flowers. 65. The fine-leaved garden *Anemone*, with ſingle plain red flowers. 66. The fine-leaved garden *Anemone*, with blood-coloured flowers. 67. The fine-leaved *Anemone*, with bright ſhining red flowers. 68. The fine-leaved *Anemone*, with ſingle purple flowers. 69. The fine-leaved *Anemone*, with ſingle blackiſh purple flowers. 70. The fine-leaved *Anemone*, with ſingle blueiſh purple flowers. 71. The fine-leaved *Anemone*, with ſingle pale purple flowers. 72. The fine-leaved *Anemone*, with ſingle beautiful red flowers. 73. The fine-leaved *Anemone*, with ſingle violet-coloured flowers. 74. The fine-leaved *Anemone*, with ſingle pale violet-coloured flowers. 75. The fine-leaved *Anemone*, with ſingle purpliſh violet flowers. 76. The fine-leaved *Anemone*, with ſingle pale purpliſh violet flowers. 77. The fine-leaved *Anemone*, with ſingle greyiſh white flowers. 78. The fine-leaved *Anemone*, with ſingle ſilvery white flowers. 79. The fine-leaved *Anemone*, with ſingle water-coloured flowers. 80. The fine-leaved *Anemone*, with ſingle amethyſt-coloured flowers. 81. The fine-leaved *Anemone*, with ſingle deep blue flowers. 82. The fine-leaved *Anemone*, with ſingle pale blue flowers. 83. The fine-leaved *Anemone*, with white flowers, purpliſh about the ſtalk. 84. The fine-leaved *Anemone*, with ſingle pale red flowers, whitiſh toward the edges. 85. The fine-leaved *Anemone*, with bright flame coloured and white flowers. 86. The fine-leaved *Anemone*, with yellowiſh white flowers. 87. The fine-leaved purpliſh velvety *Anemone*. 88. The fine-leaved *Anemone*, with whitiſh and flame coloured flowers. 89. The amaranth *Anemone*, or fine-leaved *Anemone*, with the outer leaves of the flower of a duſky red, and the inner ones of a blackiſh purple. 90. The fine-leaved *Anemone*, with ſtreaked flowers and amaranthine ſtamina. 91. The fine-leaved *Anemone*, with double flowers variegated with crimſon and white. 92. The fine-leaved *Anemone*, with narrow petals and ſhining deep purple flowers. 93. The fine-leaved *Anemone*, with red and white variegated flowers. 94. The fine-leaved *Anemone*, with purple flowers with ſome bright white leaves. 95. The fine-leaved *Anemone*, with very bright red flowers, variegated with drops of white. 96. The largeſt early flowering pale violet-coloured *Anemone*. 97. The *Anemone* with purple flowers and a green umbo. 98. The fine-leaved *Anemone*, with deep violet-coloured flowers with broad ſtreaks of white. 99. The fine-leaved *Anemone*, with the largeſt white flowers. 100. The fine-leaved gelder roſe-flowered *Anemone*. 101. The larger flowered gelder roſe *Anemone*. 102. The largeſt fine-leaved *Anemone*, with white flowers purple at the edges. 103. The great procumbent *Anemone*, with faint purple flowers. 104. The fine-leaved *Anemone*, with large fleſh-coloured flowers ſtanding on very ſhort ſtalks. 105. The fine-leaved *Anemone*, with large red and white flowers, with yellow inner leaves. 106. The elegant red and white flowered ſmaller *Anemone*. 107. The giant *Anemone*, with pale flame-coloured flowers. 108. The vermillion *Anemone*, with white ſtreaks. 109. The fine-leaved *Anemone*, with a large blood-coloured flower. 110. The fine-leaved *Anemone*, with a very large blood-coloured flower. 111. The fine-leaved *Anemone*, with a very large bright red flower. 112. The fine-leaved *Anemone*, with a very large bright red flower, with leaves ſtreaked with white. 113. The deep red flowered *Anemone*, with white lines. 114. The largeſt fine-leaved *Anemone*, with purple flowers. 115. The fine-leaved *Anemone*, with a drooping flower variegated with copper colour and deep blue. 116. The fine-leaved *Anemone*, with pale blue flowers variegated with purple and green. 117. The blue flowered giant *Anemone*. 118. The procumbent *Anemone*, with a very large amethyſtine flower. 119. The fine-leaved *Anemone*, with blue flowers variegated with white. 120. The leafy *Anemone*, with a duſky red, or brick-coloured flower. 121. The fine-leaved *Anemone*, with flowers red at the baſe, and whitiſh at the top. 122. The leafy *Anemone*, with very wide white flowers, with red middles. 123. The milky and red *Anemone*, called the hermaphrodite *Anemone*. 124. The fine-leaved *Anemone*, with a ſingle very large white flower. 125. The fine-leaved *Anemone*, with a red lead-coloured flower, variegated with ſtreaks of white. 126. The double red fine-leaved *Anemone*. 127. The double purple fine-leaved *Anemone*. 128. The double blackiſh purple fine-leaved *Anemone*. 129. The double geranium-leaved *Anemone*. 130. The double white fine-leaved *Anemone*. 131. The fine-leaved double *Anemone*, with bluiſh white flowers. 132. The double white *Anemone*, with red edges. 133. The milky white double *Anemone*. 134. The double red fine-leaved *Anemone*. 135. The fine-leaved double, fire-coloured *Anemone*. 136. The double crimſon *Anemone*, with ſnow-white edges. 137. The double red and white fine-leaved *Anemone*. 138. The double fine ranunculus-leaved *Anemone*. 139. The double *Anemone*, with variegated flowers of white and a bright red lead colour. 140. The great fine-leaved double violet-coloured *Anemone*. 141. The leſſer fine-leaved double *Anemone*, with pale violet-coloured flowers. 142. The fine-leaved double *Anemone*, with peach bloſſom-coloured flowers. 143. The fine-leaved double *Anemone*, with variegated green and purple flowers. 144. The great fine-leaved *Anemone*, with double fleſh-coloured flowers, ſpotted with deep purple. 145. The taller erect fine-leaved double *Anemone*, with fleſh-coloured flowers ſpotted with red. 146. The chamæleon *Anemone*, or fine-leaved *Anemone*, which alters the flower every year. 147. The tall beautifully variegated fine-leaved *Anemone*. 148. The double fine-leaved *Anemone*, with crimſon petals with white edges. 149. The double browniſh red *Anemone*. 150. The double fine-leaved *Anemone*, with a bright red flower and violet-coloured ſtamina. 151. The double fine-leaved *Anemone*, with yellowiſh flowers. 152. The fine-leaved double *Anemone*, with crimſon petals and green ſtamina. 153. The beautiful double vermillion *Anemone*, with white bottoms to the petals. 154. The fire-coloured double *Anemone*, with white bottoms. 155. The fine-leaved double flowered red lead-coloured *Anemone*, with white ſpots. 156. The great fine-leaved double violet and purple *Anemone*. 157. The fine-leaved double *Anemone*, with violet and white flowers. 158. The fine-leaved double *Anemone*, with violet flowers, and white edges. 159. The great flowered more variegated blue and white double *Anemone*. 160. The fine-leaved *Anemone*, variegated with red, purple, and white, and with velvety ſtamina. 161. The ſomewhat broader-leaved double *Anemone*, with flame-coloured flowers. 162. The leafy *Anemone*, with double blood-coloured flowers. 163. The leafy *Anemone*, with double bright red flowers. 164. The white flowered leafy *Anemone*. 165. The greeniſh flowered leafy *Anemone*. 166. The leafy *Anemone*, with violet-coloured and white flowers. 167. The ſimply violet-coloured leafy *Anemone*. 168. The hyacinth-coloured leafy *Anemone*. Vid. *Tourn.* Inſt. p. 275. ſeq.

The *Anemonies* are good for pains of the head, and for inflammations; help diſeaſes of the uterus, and procure milk into the breaſts. Taken in ptiſan, or applied to the part in wool, they provoke the menſes. The root chewed in the mouth draws out phlegm, and makes the teeth ſound; and the decoction thereof cures inflammations in the eyes.

All the *Anemonies* are acrimonious and deterſive, drawers, and endued with the faculty of opening the mouths of the veins. Vid. *James*, Med. Dict. in voc.

ANEMOSCOPE (*Cycl.*)—The *Anemoſcope* of Væroe is famous. It is made of the bird *Lunde*, whoſe feathers are picked, the ſkin ſtripped off, viſcera taken out, and the ſkin in this ſtate drawn a new over the bones, this being hung up in the chimney, is ſaid always to direct its bill to the point from whence the wind is like to blow. Ephem. Acad. N. C. Dec. 3. An. 9. App. p. 245.

ANETHUM, *Dill*, in botany, the name of a genus of umbelliferous plants, the characters of which are theſe. The flower is of the roſaceous kind, being compoſed of ſeveral petals arranged in a circular form, and placed upon a cup which afterwards becomes a fruit compoſed of two ſeeds of an oval figure, flat, marginated, and ſtriated. To this it is to be added, that the leaves are like thoſe of fennel; there is only one known ſpecies of *Dill*, which is the common kind. *Tourn.* Inſt. p. 317.

Anethum is a medicinal plant, whoſe ſeed is of ſome uſe as a diſcuſſiant, carminative, and ſuppurative. V. *Quinc.* Diſpenſ. P. 2. Sect. 1. n. 47. *Lemer.* Tr. des Drog. p. 46. *Junck.* Conſp. Therap. Tab. 15. n. 16.

Some pretend that the ſeed of *Anethum* has alſo an antaphrodiſiac virtue. *Alleyn.* Diſp. p. 24.

The officinal preparations of *Anethum* are a water, oil, and aſhes.

Aſhes of ANETHUM, *Cinis Anethi*, are procured by mere conflagration. They are commended by Galen in humid ulcers, eſpecially about the pudenda.

Water of ANETHUM, *Aqua Anethi*, is procured from the leaves while in flower by diſtillation in *Balneo mariæ*. It is held ſtomachic, carminative and anodyne.

Oil of ANETHUM, is either procured by infuſion, or diſtillation. The former kind is deſcribed by Dioſcorides, as a proper emollient for diſorder of the privities; alſo a warm diſcutient, digeſtive, &c. The latter is held aromatic, ſtomachic, &c. *Dioſcor.* l. 1. c. 61.

ANEURISM (*Cycl.*) — Surgeons diſtinguiſh two kinds of *Aneuriſm*, which they call the true and the ſpurious. The true *Aneuriſm* is formed by a dilation only of the artery, either all round, or only on one ſide, much in the manner of the varices or tumors of the veins; this has always a pulſation. The ſpurious *Aneuriſm* is, when the artery having been opened by puncture or inciſion, or other accident, the blood is extravaſated between the muſcles and integuments, and the limb appears ſwelled and livid, and there is little or no pulſation. The moſt common ſeat of an *Aneuriſm* is in the brachial artery,

tery, and its moſt common occaſion a puncture of that artery in bleeding; but the ſame accident may happen to any artery, and from various cauſes, and is often the caſe in the internal arteries, from falls, blows and violent ſtrains; in the arm it often happens from the outer coat only of the artery having been cut in bleeding, and the inner one giving way by degrees, as not of ſtrength to bear the impulſe of the blood. Theſe are at firſt very ſmall and diſregarded by the patient, but they grow at length to the ſize of an egg, and ſometimes even to that of a man's head.

The *Aneuriſms* of the great internal arteries are moſt fatal of all others, thoſe of their external branches are often remedied, but thoſe in the arm frequently after the operation are attended with a waſting of the arm, and an amputation becomes neceſſary. The natural burſting of an *Aneuriſm* is very dangerous, as the patient may be loſt in a minute's time, if the artery be not compreſſed above; ſometimes ſurgeons have alſo opened the larger *Aneuriſms*, miſtaking them for abſceſſes. *Heiſter*'s Surgery, p. 290.

The method of curing a ſlight *Aneuriſm* in the arm or elſewhere, is either by deligation and compreſſion, or by inciſion; the firſt ought always to be firſt tried, and is done either by ſtrait bandages with compreſſes, or by an engine invented for that purpoſe. Small *Aneuriſms* are often thus cured; but when large and dangerous, the operation by the knife muſt be called in. In this the firſt care is to ſtop the courſe of the blood by the tournequet, the ſecond to denudate the artery, and free it from the adjacent integuments, and the laſt to contract or conſtringe it either by medicine or ligature.

The ſpurious *Aneuriſm* is often produced by the burſting of the true kind, under the integuments, and in this caſe is to be treated as the true, and cured by the operation with the knife, and by ligature or cauſticks; but in all theſe caſes the ligature ſeems the beſt method.

When any part of an artery has loſt its ſpring, it is leſs capable than before to reſiſt the impulſe of the blood. This part of a canal, which is continually puſhed by the blood, muſt therefore become gradually more and more dilated; and by degrees there becomes formed in the part that ſort of tumor which ſurgeons and anatomiſts call an *Aneuriſm* by dilatation, or the true *Aneuriſm*; and this dilated part of the veſſel is, properly ſpeaking, a kind of bag through which the blood that firſt formed it is continually paſſing.

When an artery has by any means been wounded, the blood which eſcapes thro'the orifice cauſes another ſort of tumor; and this is called an *Aneuriſm by wounding*, or a ſpurious *Aneuriſm*. Vid. ſupra.

Theſe two diſorders, tho' both called by the ſame name of *Aneuriſm*, it is eaſy to ſee are however very different in their nature and characters. They only agree in having the ſame veſſel for their origin, while in one the blood is contained within the artery, and in the other it is extravaſated. It is eaſy to conceive that in the firſt caſe, the blood which forms the tumor retains its fluidity, whereas in the *Aneuriſm* from a wound, the ſame blood which firſt forms the tumor remains there, and in time coagulates, and is no more received into the round of the circulation. The *Aneuriſm* by dilatation forms itſelf very ſlowly, for the veſſel having yet ſome ſpring or force in the part, gives way but by a very little at a time, and reſiſts in ſome meaſure the impulſe; but the *Aneuriſm* from a wound riſes to a large bulk in a very little time, and that the more quickly as the orifice and the veſſel wounded are larger. The *Aneuriſm* by dilatation is always ſoft, as the blood which forms the ſwelling ſtill retains its fluidity; that by a wound is harder; and the firſt diſappears when preſſed by the fingers, whereas the other is not to be preſſed away. In both caſes there is felt, on touching the tumor, a vibration correſpondent to that of the pulſe; but this is much more evident in the *Aneuriſm* by dilatation than in the other. On touching the *Aneuriſm* by dilatation there is always perceived a ſort of fluctuation, which is very little if at all to be found in the other kind; and if the ear be laid to the former kind, it in like manner perceives a noiſe like the rolling of waters, whereas this is not to be perceived, or at the utmoſt only very faintly, in the *Aneuriſm* from a wound. The *Aneuriſm* by dilatation always forms an equal and circumſcribed tumor, whereas the other kind forms one perfectly irregular, and often is variouſly blended among the membrana adipoſa; and finally the colour of the ſkin is not changed by an *Aneuriſm* by dilatation, whereas it is always bluiſh or black in the other.

It might ſeem needleſs to have given ſo many characters, for the diſtinction of theſe two kinds of *Aneuriſm*, ſince any one of them might appear ſufficient alone; but in truth all theſe are ſcarcely ſufficient, and the ſurgeons of the preſent age have often miſtaken one kind for the other, tho' they have examined the tumor carefully. It is certain that an *Aneuriſm* by a wound has often very much of the external appearance of one cauſed only by a dilatation of the veſſel; and on the other hand, an *Aneuriſm* by dilatation frequently at length becomes an *Aneuriſm* by wound, by the diſtended veſſels breaking in ſome weak part and extravaſating a large quantity of blood. This is a caſe that may eaſily perplex and puzzle the ableſt ſurgeon, who had not ſeen the malady in the beginning; ſince as the extravaſated blood forms a larger tumor, and by degrees coagulates, all the ſymptoms of the *Aneuriſm* by a wound come on by degrees, while the dilatation of the artery can no longer be perceived.

Aneuriſms by wound are more frequent than thoſe formed merely by dilatation; in order to judge properly of theſe, we are to conſider, that when an artery is but divided by a ſmall wound, if there be a proper degree of compreſſion given to the part, the blood will form a ſort of covering to the wound, and filling it up, will prevent the other blood from flowing out till the orifice is perfectly cicatrized; and ſometimes this cicatrix will remain firm and intire, ſometimes it is removed afterwards, and ſucceeding extravaſations happen. The moſt common *Aneuriſms* by wound happen from bleeding in the arm; in theſe, if the artery be but ſlightly wounded, and the bandage and compreſs properly applied, the cure is often performed, ſo that no farther miſchief enſues; but if the wound is larger, or the compreſſion leſs regular, bad ſymptoms come on ſooner or later, and there often is a neceſſity at laſt of ſubmitting to the operation of opening the ſkin, diſperſing the blood, and cloſing the veſſel. Mem. Acad. Scienc. Par. 1736.

Mr. du Vernoi deſcribes an *aneuriſmal* ſac, ſituate on the third to the ſixth vertebra of the thorax, which he ſays was the aorta dilated into a ſac ſix inches and an half wide, and as many inches long. Its coats had a great many bony laminæ in them, and were raiſed into unequal protuberances. The poſterior part of this ſac adhered ſo firmly to the carious bodies of the vertebræ, that it was impoſſible to ſeparate them, and theſe large depreſſions were made ſo deep into the vertebræ, as to be within a line or two of the cavity for the medulla ſpinalis. He ſeems to think the *Aneuriſm* was owing to the caries of the bones, by which the ſupport the arteries generally have on one ſide was taken away. The man who had this *Aneuriſm* was plump, well coloured, and in appearance healthy. Comment. Acad. Petrop. Tom. 6.

ANGARI, or ANGARII, in antiquity, denote public couriers, appointed for the carrying of meſſages.

The antient Perſians, Budæus obſerves, had their αγγαρειον δρομημα, which was a ſet of couriers on horſeback, poſted at certain ſtages or diſtances, always in readineſs to receive the diſpatches from one and forward them to another with wonderful celerity, anſwering to what the moderns call poſts, *q. d.* poſiti, as being poſted at certain places or ſtages. V. *Herodot.* l. 8. *Salmaſ.* ad Capitol. in Pio. c. 12. *Stewech.* ad Veget. l. 1. c. 3. *Fabri* Theſ. in voc.

The *Angari* were alſo called by the Perſians *Aſtandæ*; by the Greeks, ἡμεροδρομοι, on account of the long journies they made in one day, which according to Suidas amounted not to leſs than 1500 ſtadiums.

ANGARI is alſo applied figuratively to porters, and others employed in laborious offices, as bearing burdens. *Calv.* Lex. Jur. p. 67.

ANGARIA, (*Cycl.*) in the civil law, denotes a duty required of the ſubjects to furniſh out horſes and carriages for conveying of corn for the ſoldiers, and ſuch things as belonged to the fiſcus.

This duty goes by the name of *curſus publicus*, *angariæ*, *parangariæ*, *tranſlatio*, and *evectio*. The horſes uſed in this ſervice are particularly called *paraveredi*, and *equi curſuales*.

Angariæ are generally underſtood as excluſive of ſhips, though on ſome occaſions theſe were preſſed into the ſervice for tranſporting proviſions and the like. *Calv.* ibid.

Angariæ differ from *parangariæ*, in that the former are confined to public or main roads, the latter to oblique or croſs-roads. *Calv.* loc. cit.

In the book of feuds, the performance of *Angariæ* and *parangariæ* is ranked in the number of royal ſervices. L. 2. Tit. 56.

The clergy at firſt were exempt from this ſervice, by two laws of Conſtantius, made in the former part of his reign, which expreſsly excuſe both their perſons and their eſtates from the duty of the *parangariæ*. But by another law made in the laſt year of his reign, Anno 360. he revoked this privilege. This continued in force not only under Julian, but under Valentinian, till by a contrary law in 382, the clergy were reſtored to their antient privilege, which was farther confirmed to them by Honorius, in 412, whoſe law is ſtill extant in both the codes; yet Theodoſius junior, and Valentian the third, in 440, again took away their privilege, and by two laws made church lands liable to theſe burdens of the *Angariæ*, *parangariæ*, &c. whenever the emperor ſhould be upon any march or expedition, as well as others. *Bingh.* Orig. Eccleſ. l. 5. c. 3. §. 10.

Richter [a] and Stolberg [b] have diſcourſes expreſs on *Angariæ*. — [[a] *Lipen.* Bibl. Jur. p. 17. Ejuſd. Bibl. Theol. p. 39. [b] Diſſ. de *Angariis*. Veterum. Ext. Ap. Exerc. Græc. ling. Francof. 1688. 4°. V. Ouvr. des Scav. 1688. p. 490. ſeq.]

ANGARIA, in a ſtill more extenſive ſenſe, is uſed for any kind of vexation or oppreſſion, whether of body, mind, or eſtate. Hence alſo in ſome writers it is uſed for the act of compelling. V. *Calm.* Dict. Bibl. in voc. *Magri*, Vocab. Eccleſ. in voc. *Angariare*.

ANGARIA is alſo uſed in antient military writers, for a guard of ſoldiers poſted in any place for the ſecurity of it. *Veget.* l. 1. c. 3. It. l. 2. c. 19. It. l. 3. c. 8. *Aquin.* Lex. Milit.

Turnebus takes the word, in this ſenſe, to be a corruption of the text, introduced for *Agrarea*. *Turneb.* Adverſ. l. 4. c. 7.

ANGEIOTOMY, in ſurgery, is uſed by ſome to denote an artificial ſection of the veſſels, as in bleeding.

The word is formed of Αγγειον, veſſel, and τεμνω, *ſeco*, I cut. In this ſenſe *Angeiotomy* may be divided into *phlebotomy* and *arteriotomy*. See ARTERIOTOMY and PHLEBOTOMY.

ANGEL (*Cycl.*)—The whole *angelologia*, or doctrine of *Angels* is full of difficulties and diſputes. The intemperate curioſity of men has led them to enquire, not only concerning their nature, characters, offices, and operations; but concerning their hiſtory, their number, their names, and what not. What a ſource of vain conjectures? Mich. Pſellus gives this reaſon why *Angels* are leſs numerous than mankind, *viz.* that they are nearer to unity. *i. e.* God. *M. Pſell.* de Omnifar. Doctr. n. 19. *Fabric.* Bibl. Græc. T. 5. p. 128.

By the antient councils men are forbid to frame or give particular names to *Angels*; the only names owned by the church are Michael, Gabriel, and Raphael, to which is ſometimes added Uriel. *Du Cange*, Gloſſ. Lat. T. 1. Add. p. 1347.

Before the Babyloniſh captivity the Jews did not know the name of any *Angel*; at leaſt we find none mentioned in the books written before this event. The Talmudiſts ſay they brought theſe names from Babylon: it is true we find many of them called by their names in the book of Enoch; but this is known to be ſpurious, and to have been written after the captivity we are ſpeaking of. Tobit is the firſt who has called an *Angel* by his proper name: he mentions Raphael who conducted Tobias into Media. Tobit is thought to have lived at Nineveh ſome time before the captivity of Judah; Daniel, who lived at Babylon ſome time after Tobit, has taught us the names of Michael and Gabriel. The ſecond book of Eſdras ſpeaks of Uriel; but this book is modern in compariſon, the author of it having in all probability lived ſince the time of Jeſus Chriſt.

The Jewiſh cabaliſts make ſome particular *Angels*, whoſe names they give us, to have been preceptors to the patriarchs; for example, they ſay that Adam's preceptor was called Raziel, Shem's Jephiel, Abraham's Zedekiel, Iſaac's Raphael, Jacob's Seliel, Joſeph's Gabriel, Moſes's Metraton, or Metator, that is, he who ſhews the field; Elias's Maluſhiel, and David's Cerviel. *Calm.* Dict. Bibl. T. 1. in voc.

Julian denied the creation of *Angels*, by reaſon Moſes makes no mention of it in his hiſtory. Juſtinian condemns thoſe who follow this opinion. The antients give two reaſons for Moſes's ſilence concerning the creation of *Angels*; the firſt, that this prophet had only in view to deſcribe the creation of viſible things; the ſecond, that he was ſilent on this point to avoid giving the Jews any handle for idolatry.

Authors are divided as to the time of the creation of *Angels*; ſome will have it to have been before the creation of our world, or even before all ages, that is, from eternity; this was Origen's opinion, who according to Leontius held that all ſpirits, *Angels*, devils, and even human ſouls were from eternity.

Others hold *Angels* to have been created before the world, yet not from eternity, of which opinion are Nazianzen and others.

Others again maintain that they were created at the ſame time with our world, but on what day is diſputed. Theodoret and Epiphanius fix their date from the firſt day.

By *Angels of the Lord*, in ſcripture, are often meant men of God, prophets, *&c.* Then ſpake Hagai the *Angel of the Lord* from among the *Angels of the Lord*; Malachi the laſt of the twelve ſmall prophets, is by ſeveral of the fathers called the *Angel of God*; and this in reality is what his name ſignifies in Hebrew. Some believe Eſdras to be deſcribed by the name of Malachi, or *Angel of the Lord*.

The name of God is given in ſcripture to *Angels*, becauſe they acted in the name of God, were his ambaſſadors, were intruſted with his power, and the intepretation of his orders. They are not only called *Elohim*, and *Adonai*, names ſometimes attributed to judges and princes, but by that likewiſe of *Jehovah*, which belonged to God only, whoſe majeſty they repreſented.

In Deuteronomy it is ſaid, that when the Lord divided men, he divided them according to the name of the *Angels of God*. Deut. xxx. 8.

Deſtroying *Angel*, *Angel* of death, *Angel* of Satan, the *Angel* of the bottomleſs-pit, are terms uſed in ſcripture to ſignify the the Devil and his agents, the evil *Angels*. The *Angel* of Death is he to whom God has given a commiſſion to ſeparate the ſoul from the body. The Jews, Arabians, Turks, and Perſians own ſuch an one. The Perſians call him *Mordad* or *Aſuman*. The Rabbins and Arabians give him the name of *Azrael*; and the Chaldee paraphraſts that of *Malk-admonſa*. Others, as the book concerning the aſſumption, or the death of Moſes, call him the *Angel Samael*, prince of the devils.

Good *Angels* are called *Angels of light*, and thoſe on the contrary who are the devil's miniſters, *Angels of Darkneſs*. *Calm.* Dict. Bibl. in voc.

ANGEL *Fiſh*, in ichthyology, the Engliſh name of the fiſh called by the generality of authors the *ſquatina*, and by ſome the *ſquatus* and *Rhine*. It is alſo called the *monk-fiſh*, and is according to the Artedian ſyſtem a ſpecies of the *ſqualus*, diſtinguiſhed from the others of that genus by the name of the *ſqualus* with no *pinna ani*, and with the mouth placed in the top of the head. See the articles SQUATINA and SQUALUS.

ANGELIC (*Cycl.*)— ANGELIC *Powder*, an hyperbolical epithet given by ſome to the *mercurius vitæ*. *Schrod.* Pharm. l. 3. c. 15. See alſo *Libav.* Synt. Chem. Arc. l. 4. c. 17.

ANGELIC *Poem*, an appellation given by ſome to compoſitions in verſe, preſcribing rules for good morals. *Heder.* Schul. Lex. p. 245.

Such *e. gr.* are the golden verſes of Pythagoras; the *carmen*, ραβδιχον of Phocylides; the *Gnomæ* or ſentences of Theognis; not to mention the moral diſtichs of Cato.

ANGELICA, (*Cycl.*) in botany, the name of a genus of plants, the characters of which are theſe. They are of the rounded headed umbelliferous kind; the flower is roſaceous or compoſed of ſeveral leaves diſpoſed in a circular form and placed upon a cup, which afterwards becomes a fruit compoſed of two oblong thick ſeeds, larger than thoſe of parſly, and gibboſe and ſtriated on one ſide and plain on the other. To this it may be added, that the leaves are alated, and compoſed of large ſegments.

The ſpecies of *Angelica* enumerated by Mr. Tournefort are theſe.

1. The common ſmaller wild *Angelica*, called *gout-wort*. 2. The yellow flowered American *Angelica*. 3. The Alpine *Angelica*, with flowers at the joints of the ſtalks. 4. The ſmallage-leaved perennial mountain *Angelica*, called by ſome *liguſticum* or lovage. 5. The parſley-leaved marſh *Angelica*, called *ſeſeli* and *ſilaum*. 6. The narrower leaved marſh *Angelica*. 7. The columbine-leaved, perennial mountain *Angelica*, called by many *libanotis*. 8. The fine leaved American *Angelica*, with aſphodel-roots. 9. The Canada *Angelica*, with leaves as if eaten to pieces, and ending each in a very long narrow one. *Tourn.* Inſt. p. 313.

The roots of the garden *Angelica* are of conſiderable uſe in medicine; the leaves alſo are ſometimes uſed, and the ſeeds. It is a ſtomachic, a cordial, and ſudorific; it is good in flatulencies, and is by many ranked among the vulnerary herbs. It is preſcribed in malignant diſeaſes of all kinds, againſt the effects of poiſons, and in the plague.

It has been a cuſtom with ſome phyſicians, in the times of contagion of this kind, to make a paſte of the freſh roots beaten with vinegar, and to carry this in a box about them ready to be applied to the noſe occaſionally; others prefer the holding a piece of the dry root in the mouth, and others the drinking a glaſs of ſtrong vinegar, in which it has been infuſed, faſting.

It has alſo been a cuſtom to ſprinkle the powder of the root over the cloaths of perſons who go among the infected, through an opinion that it preſerves them from imbibing the effluvia, which otherwiſe they might carry elſewhere. *Geoffroy*, Mater. Med. Vol. 2. p. 8.

A dram of the powder of the root alone, or half that quantity with a dram of venice treacle, are recommended to be given as a remedy in the plague, to be repeated every ſix hours, and a gentle ſweat to be kept up all the time.

The root is uſed in many of our ſhop compoſitions, as in the plague-water, *&c.* and the dried leaves are a principal ingredient in the ladies red powder, famous in England for the cure of fevers.

The Laplanders are extremely fond of *Angelica*, and uſe it in great abundance both in meat and medicine. They uſe only the ſtalks, never medling with the roots or ſeed, in which we find the higheſt flavour and greateſt virtue. They gather the large ſtalks before the plant is run to ſeed, and roaſt them or bake them till they are thoroughly tender, and then eat them as a delicate diſh.

When they are ſick, they boil either theſe ſtalks or the roots of the moſs which they call *jerth* in water, and in worſe caſes in whey made of rain-deer milk, and give large draughts of this decoction to keep up a breathing ſweat; and it is wonderful to conceive how frequent the pleuriſy and ſmall pox are among them, and yet how few die of them, tho' this is their only medicine.

ANGELITÆ, *Angelites*, in eccleſiaſtical hiſtory, a kind of antient heretics, thus denominated from *Angelium*, the name of a place in Alexandria, where their firſt aſſemblies were held. *Niceph.* Hiſt. Eccleſ. l. 18. c. 49.

The *Angelites* appear to have been the ſame with what are otherwiſe called *Severites*, ſometimes *Theodoſiani* and *Damianiſti*, from the names of their leaders. Sometimes alſo *Tabellioniſtæ*.

They made their firſt appearance in the time of the emperor Anaſtaſius and pope Symmachus, about the year of Chriſt 494.

The diſtinguiſhing tenets of the *Angelitæ* were, that the ſeveral perſons of the trinity had no diſtinct eſſence, ſubſtance, or deity; but only a ſubſiſtance or deity in common, or indiviſible among them. *Prateol.* Heræſ. l. 1. n. 37.

ANGELOLATRIA, the ſuperſtitious worſhip, or adoration of angels. *Suic.* Theſ. T. 1. in voc. See ANGEL.

ANGELOLOGIA, the doctrine or ſcience of angels, their natures, office, *&c.*

Gerhard has publiſhed a ſacred *Angelologia*, Muſæus an apoſtolical *Angelologia*. *Lipen.* Bibl. Theol. T. 1. p. 40. ſeq.

Some

Some uſe the term *Angeloſophia* in a ſenſe much the ſame. A. Varenius has given an *Angeloſophia*. Id. ib. p. 41.

ANGELOGRAPHIA, a deſcription of angels, their orders, names, diſcipline, &c.

This amounts to much the ſame with what others call *Angelologia*.

Caſmannus and Manitius have publiſhed *Angelographies*, Schvarzenau a poſitive *Angelographia*. *Lipen.* Bibl. Theol. l. 1. p. 39. & 41. Ejuſd. Bibl. Phil. T. 1. p. 48. ſeq.

ANGELOT, an antient Engliſh gold coin, ſtruck at Paris, while under the Engliſh ſubjection. *Le Blanc.* Trait. des Monnoies, p. 297. *Menag.* Orig. Franc. p. 34.

It was thus called from the figure of an angel ſupporting the ſcutcheon of the arms of England and France.

There was another coin of the ſame denomination ſtruck under Philip de Valois. *Le Blanc.* loc. cit. p. 243. *Menag.* ubi. ſupr.

ANGELOT is alſo uſed in commerce to denote a ſmall, fat, rich ſort of cheeſe, brought from Normandy.

Skinner[a] ſuppoſes it to have been thus called from the name of the perſon who firſt made it up in that form, and perhaps ſtamped it with his own name. Menage[b] takes it to have been denominated from the reſemblance it bears to the Engliſh coin called *Angelot*.—[a *Skin.* Etym. in voc. b *Menag.* Orig. Franc. p. 35.]

It is made chiefly in the Pays de Bray, whence it is alſo denominated *Angelot de Bray*.

It is commonly made in vats, either ſquare or ſhaped like a heart. *Savar.* Dict. Comm. T. 1. p. 107.

ANGELUS, in the church hiſtory of France, denotes a prayer to the holy virgin, to be rehearſed three times a day, at the ſound of a bell rung for that purpoſe.

The *Angelus* is the ſame with what is otherwiſe called *Ave Maria*, or the angelic ſalutation. See AVE MARIA, *Cycl.*

ANGER.—A late moraliſt defines *Anger*, a propenſity to occaſion evil to another, ariſing upon apprehenſion of an injury done by him. *Hutcheſ.* Eſſ. on Paſſ. Sect. 3. p. 74. ſeq.

This violent propenſity is attended generally, when the injury is not very ſudden, with ſorrow for the injury ſuſtained, or threatned, and deſire of repelling it, and making the author of it repent of his attempt, or repair the damage.

But beſides theſe conditions, which are good, in ſome ſort intended by men when they are calm, as well as during the paſſion, there is in the angry perſon a propenſity to occaſion miſery to the offender, a determination to violence, even where there is no intention of any good to be obtained or evil avoided by this violence. And it is principally this propenſity which we denote by the name *Anger*, tho' other deſires often accompany it. *Hutcheſ.* Eſſ. on Paſſ. Sect. 3. p. 63.

Phyſicians and naturaliſts afford inſtances of very extraordinary effects of this paſſion. Borrichius cured a woman of an inveterate tertian ague, which had baffled the art of phyſic, by putting the patient in a furious fit of *Anger*. Valeriola made uſe of the ſame means with the like ſucceſs in a quartan ague. The ſame paſſion has been equally ſalutary to paralytic, gouty, and even dumb perſons; to which laſt it has ſometimes given the uſe of ſpeech. Ettmuller gives divers other inſtances of very ſingular cures wrought by *Anger*; among others he mentions a perſon laid up in the gout, who being provoked by his phyſician, flew upon him, and was cured. It is true the remedy is ſomewhat dangerous in the application, when a patient does not know how to uſe it with moderation. We meet with divers inſtances of princes to whom it has proved mortal. *e. gr.* Valentinian the firſt, Wenceſlas, Matthius Corvinus king of Hungary, and others. There are alſo inſtances wherein it has produced the epilepſy, jaundice, cholera-morbus, diarrhea, &c. Mem. de Trev. 1707. p. 923.

For the influence of this paſſion on the perſpiration and urine of human bodies, ſee PERSPIRATION.

ANGETENAR, in the Arabian aſtronomy, denotes a fixed ſtar of the fourth magnitude, in the body of cetus or the whale. *Vital.* Lex. Math. p. 41. See CETUS, *Cycl.*

ANGIGLOSSII denotes thoſe who ſpeak with difficulty, heſitation, or even ſtammering. *Blanc.* Lex. Med. p. 45.

ANGILDUM, in our old writers, denotes a ſimple gild, that is, the ſimple value of the man or other thing. *Spelm.* and *Du Cange*, in voc.

The word is compounded of the Saxon *An*, one, and *gild*, payment, price, or compenſation.

In this ſenſe, *Angildum* ſtands contradiſtinguiſhed from *Twigildum*, a double compenſation, *trigildum*, a triple compenſation.

ANGINA, in medicine. See QUINZY.

ANGINA *Lini*, in botany, a name uſed by ſome of the later Greek writers, to expreſs what the more antient writers of this nation called *linozoſtis*, and the Latins *epilinum*; this was the *coſcuta* or dodder growing on the flax, as that on the thyme was called *epithymum*. It was called *Angina Lini*, the quinzy of flax, from its choaking that plant.

ANGIOSPERMIA, in botany, a term uſed by Linnæus, to expreſs a certain ſeries of the didynamiæ or plants of the verticillate kind, which have their ſeeds not lodged naked within the cup. They are by this diſtinguiſhed from the *gymnoſpermia*, which have them ſo; whereas the *angioſpermia* have them encloſed in a capſule, and adhering to a placenta placed in the middle of that capſule. The claſs of didynamia contains the labiated and perſonated plants. The *Angioſpermia* are the perſonated, the others the labiated kinds.

ANGLE (*Cycl.*)—ANGLE *of a Semi-circle*, in geometry, the *Angle* which the diameter of a circle makes with the circumference. The chief property of this *Angle* is, that it is leſs than a right *Angle*, and greater than any acute right-lined *Angle*.

ANGLER, a fiſherman who profeſſes or practiſes *angling*.

An anonymous writer has publiſhed the rules neceſſary to form an *Angler*, under the title of the gentleman *Angler*. London, 1726. 8°. See ANGLING.

Anglers are to be diſtinguiſhed from poachers. Some make the ſame difference between them, that is between the fair trader and ſmuggler. Accordingly the legiſlature has made the latter penal, but laid no reſtraint on the former. *Angling* can do no prejudice to the fiſh of a river. Anglers fiſh for their recreation, not for lucre; whereas poachers make it their livelihood.

The tackle neceſſary for an *Angler* is various, according to the branch of the art he applies himſelf to. He muſt be equipt with variety of hooks, and a competent quantity of every ſort; he muſt not be without wax, ſilk, a pair of ſciſſars or pen-knife, a baſket, or bag, and landing-net, plummets, ſhot, and floats of every kind, needles and thread, lines, hair, Indian graſs, variety of feathers, more particularly thoſe taken from the neck of a mallard, the wing of a partridge, a capon's neck, the top of a plover, or the hackle of a red cock. He muſt likewiſe be furniſhed with twiſt, and bedding for dubbing his artificial flies; he muſt have a landing-hook, reels for his ſilk lines, a pouch or book for his hair lines, a convenient place wherein to repoſite his ſmall craft, viz. flies, hooks, wax, ſhot, ſilk, &c. a bag for his worms, a tin box for his gentles. Gentl. Angl. p. 2, 3. See ANGLING, *Cycl.* and *Suppl.*

When he takes his ſtand, he is to ſhelter himſelf under ſome buſh, or tree, or ſtand ſo far from the brink of the river that he can only diſcern his float; by reaſon fiſh are timorous, and eaſily frighted. The beſt way of *angling* with the fly is down the river, and not up; neither need the *Angler* ever make above half a dozen of trials in one place, either with fly or ground bait, when he angles for trout: by that time the fiſh will either offer to take, or refuſe the bait and not ſtir at all. Dict. Ruſt. in voc.

ANGLING (*Cycl.*)—The *angler*'s firſt buſineſs is to prepare for catching the fiſh by inviting them about him; the method of doing this in ſtanding waters, by throwing in grains, chopped worms and the like, is well known: but the chief difficulty is in running rivers and brooks. The method in this caſe, is to prepare a tin box capable of holding ſome hundreds of worms, bored on all ſides, and full of holes of ſuch a ſize as they may be juſt able to crawl out at; there muſt be a plummet faſtened to this box to ſink it, and a line to draw it back at pleaſure; in this caſe it is to be thrown into the water in a proper place, above which the angler may ſtand under cover. The worms will ſlowly and gradually crawl out of this box, and the fiſh will be gathered about to feed on them; the baited hook is to be thrown in higher up and carried down by the ſtream. If this method do not bring the fiſh about the place in a little time, there is reaſon to ſuſpect that ſome pike lies lurking thereabout, and deters them; in this caſe it is proper to throw out a baited hook and he will generally be taken, after this the attempt will ſucceed.

The *Angling* rod muſt be kept in a moderate ſtate neither too dry nor too moiſt, in the firſt caſe it will be brittle, in the other rotten. When paſtes are uſed, it is proper to mix a little tow with them, and rub them over with honey; finally a ſmall anointing them with butter is of great uſe to keep them from waſhing off the hook. The eyes of any fiſh that is taken are an excellent bait, for almoſt any other kind of fiſh.

In a pond, the beſt place for the *Angler* to take his ſtand is uſually that where the cattle go in to water; in rivers, if breams are fiſhed for, it ſhould be in the deepeſt and moſt quiet places; if eels, under the banks of rivers that hang over; perch are to be expected in clean places, where the ſtream is ſwift; and chub in deep ſhaded holes: roach are moſtly found where the perch are, and trout only in ſwift and clear ſtreams. Places where there are many weeds, or old ſtumps of trees, harbour fiſh in great numbers, and they uſually bite freely there, but there is danger of entangling the line, or faſtening the hook to the weeds.

In caſe of this accident, recourſe is to be had to a ring of lead, of about ſix inches round, faſtened to a ſmall pack-thread, this ring is to be truſt over the rod, and let to fall into the water. It will deſcend to the place where the hook is entangled, and then by pulling the pack-thread gently, the hook will be ſoon diſengaged, or at the worſt it can only be broke off near the end of the line; whereas when this is not employed, the rod itſelf is ſometimes broken, or the line nearer its upper end.

Deep waters are beſt for *Angling* in, for the fiſh do not love to be diſturbed by wind and weather.

The beſt ſeaſon is from April to October, for in very cold ſtormy weather the fiſh will not bite; the beſt times of the day are from three till nine in the morning, and from three in the afternoon till ſun-ſet.

In an eaſterly wind there is never much ſport for the *Angler*; the ſoutherly winds are the beſt for his purpoſe, and a warm but lowering day is moſt of all to be choſen; a gentle wind after a ſudden ſhower to diſturb the water makes a very good opportunity for the *Angler*; the cooler the weather in the hotteſt months, the better, but in winter on the contrary the warmer the day the better. A cloudy day after a bright moon-light night is always a good day for ſport, for the fiſh do not care for going after prey in the bright moon-ſhine, and are therefore hungry the next morning.

The openings of ſluices and mill-dams always bring fiſh up the current to ſeek for the food, which is brought with the ſtream, and angling in theſe places is uſually ſucceſsful.

Thoſe who are fond of *angling* might ſave themſelves ſome fruitleſs trouble, by obſerving when ſmall fiſh in a jar take or refuſe food. See the article FISH.

Angling differs from poaching, as the latter is performed chiefly by nets, and night-lines, the former by a rod, *&c.* Add that the latter is done in a clandeſtine manner, forbid by the laws, which does not hold of the former. By the poaching methods more fiſh are deſtroyed in one month, than all the *Anglers* in England can take in ſeven.

Ground-ANGLING. See the article GROUND.

Night-ANGLING. See the article NIGHT.

ANGLO-CALVINISTS, a name given by ſome eccleſiaſtical hiſtorians to the members of the church of England, conſidered as their church in matters of doctrine follow the ſyſtem of Calvin. V. *Natal. Alexand.* Select. Hiſt. Eccleſ. Sect. 15. P. 1. Act. Erud. Lipſ. 1687. p. 437.

The Anglo-Calviniſts make one of the four branches or diviſions of Calviniſm; and as ſuch ſtand diſtinguiſhed from the pure Calviniſts, the Piſcatorians, and the Arminians.

ANGLO-SAXON *Language*, that ſpoke by the antient Angli or Saxons who ſettled in England.

It was thus called from the people, who were partly Angli, partly Saxons.

It is otherwiſe denominated ſimply *Saxon*.

The *Anglo-Saxon*, or Engliſh Saxon, is properly the original Engliſh; being the language which our Saxon anceſtors firſt eſtabliſhed in this iſland.—It is now called *Anglo-Saxon* to diſtinguiſh it from the modern or preſent Engliſh. *Wallis*, Ap. Greenw. Engl. Gramm. Pref. p. 16.

ANGON, in the antient writers on mechanics, denotes a military engine of the bow-kind. *Hero*, de Machin. Bell. c. 17.

Authors are divided as to the form and ſtructure of the antient *Angon*. From the deſcription given of it by Hero, the *Angon* as well as the *monangon* appears to have been near a-kin to the Catapultæ and Balliſtæ, being ranked in the number of the Lithobolæ, or engines for throwing ſtones. *Aquin.* Lex. Milit. in voc.

Agathias ſpeaks of another kind of *Angones* of the javelin, or ſpear-kind, not unlike our halbards. Pachymeret ſays expreſsly theſe were the ſame with the antient Tragula. *Pachym.* in. Andron. l. 6. c. 30.

ANGONÆUS, in anatomy, a name given by Riolanus and others, to a muſcle called by the generality of other writers *anconæus*, and *cubitalis minor*. See ANCONÆUS.

ANGOR is uſed by ſome phyſicians to denote a ſhrinking inwards of the native heat of the body, or its retiring to the center; upon which enſues a pain, and palpitation of the heart, attended with ſadneſs and melancholy. *Caſt.* Lex. Med. p. 50.

In this ſenſe, *Angor* amounts to much the ſame with what the Greeks call *Agonia*.

The *Angor* is reputed a bad ſymptom, when it happens in the beginning of an acute fever. *Caſtel.* loc. cit. *Gall.* Com. 1. de Hum. & com. in Epid. l. 1. t. 75. It. de diff. pulſ. l. 4. c. 3.

ANGSANA or ANGSAVA, in botany, names by which ſome authors have deſcribed the *draco arbor*, or dragon tree; one of the trees ſaid to afford the *ſanguis draconis*, or dragon's blood of the ſhops. *Dale*, Pharm. p. 337.

ANGUELLA, in zoology, a name given by ſome authors to the fiſh more uſually called *hepſetos*, and *atherina*, a ſmall fiſh caught about the ſhores of the Mediterranean and ſome other places, and eſteemed a delicate taſted one. *Willughby*, Hiſt. Piſc. p. 210. See the article HEPSETUS.

ANGUILLA, in zoology. See EEL.

ANGUILLIFORM, *Anguilliformis*, in zoology, the term for a very large claſs of fiſhes, which are ſoft and lubricous like the eel, and have no ſcales.

The word is derived from the Latin *Anguilla*, an eel, and *Forma*, ſhape or appearance. Moſt of the fiſh compriſed in this claſs are long bodied alſo like the eel. Some of them have neither fins at their gills nor belly, as the murus and lampetra; others have fins at their gills, but none on their bellies, as the ſea-ſerpent, eel, conger, ophidion, and ammodytes. And others have both, as the tæniæ, muſtelæ, alaudæ, and the like. *Ray*, Ichthyograph. p. 103.

ANGUILLIFORM is ſometimes alſo applied to land animals which bear a reſemblance to eels, but do not properly belong to that claſs.

In this ſenſe, we read of *Anguilliform* worms. G. Elſerus maintains that eels are viviparous; having found in ſome of them certain membranes full of *Anguilliform* worms. Vid. Giorn. de Letter d'Ital. 75. p. 190.

ANGUINA, in botany, the name of a genus of plants deſcribed by Michel and mentioned by Plumier, and in the Malabar garden. It is the ſame genus with the *Trichoſanthes* of Linnæus deſcribed in his *genera plantarum*. p. 466. See TRICHOSANTHES.

ANGUINEI *Verſus*, in poetry, thoſe which may be read backwards. *Scal.* Poet. l. 2. c. 42.

Theſe are otherwiſe called recurrent verſes. Such *e. gr.* are

Optimum jus, lex amica, vox diſerta.
Diſerta vox, amica lex, jus optimum.

ANGUINUM *Ovum*, among antient writers, denotes an extraordinary ſort of egg, ſaid to be produced by the joint ſaliva of a cluſter of ſnakes; being toſſed up on high by the hiſs, and thus caught in the air by the druids. It was endued with many marvellous virtues. *Plin.* Hiſt. Nat. l. 9. c. 3. Bibl. Franc. T. 8. p. 227.

Mercatus and others by a miſtake give this name to a figured ſtone of the ſpecies of Echinites, more properly called *Scolopendrites*, by ſome *Bufonites*. *Mercat.* Metalloth. Arm. 9. c. 54. Giorn. de letter d'Ital. T. 32. p. 196.

ANGUIS, the *Snake*, in the Linnæan ſyſtem of zoology, makes a diſtinct and large genus of the order of the creeping, amphibious animals; the character of which is, their having no feet, and a ſcaly body of a cylindric figure. Of this genus are the viper, rattle-ſnake, blind-worm, aſp, cobra or hooded-ſerpent, *&c.* *Linnæi* Syſtema Naturæ, p. 50. See SNAKE.

ANGUIUM *Lapis*, a name given to a ſuppoſed ſtone in Germany, which is of a cylindric figure, and has a cavity capable of admitting a finger, and of a yellow colour with a great many variegations. The vulgar call it *duchaneck*, and have an idle opinion of its having its origin in ſome manner from a ſerpent ant. De Boot who had ſeen many of them declares them to be fictitious, and made of glaſs tinged with two or three colours.

ANGULARIS *Scapulæ*, in anatomy, a name given by Winſlow and ſome others to the muſcle of the ſhoulder generally called the *levator ſcapulæ*. See LEVATOR.

ANGURIA, in botany, the name of a genus of plants called by many authors *citruls*. They are very nearly allied to the melon and cucumber claſs, but differ from all in having their leaves deeply divided, and their fruit eatable.

The ſpecies of *citrul* enumerated by Mr. Tournefort are theſe. 1. The black ſeeded *citrul* or *Anguria*, with leaves cut like thoſe of colocynth. 2. The great Indian *Anguria*. 3. The trefoil American *Anguria* with ſmall fruit. And 4. The American *Anguria* with a rough eatable fruit. *Tourn.* Inſt. p. 106.

For the medical uſes of *citrul*. See CITRUL.

ANHALDIN, *Alhandinum*, an epithet given to various medicines, formerly kept as ſecrets in the family of Anhalt.

Three of the moſt celebrated medicines under this denomition are a corroſive, a water, and a ſpirit.

The corroſive as deſcribed by Burggrave is compounded of calcined antimony, ſublimate mercury, ſal ammoniac, and calcined tartar, diſtilled and rectified. *Hartman.* Opp. T. 1. p. 114.

The deſcription of the *Anhaltin* water is given in the common diſpenſatories, and that of the ſpirit may be found in De Spina. *Burggrave*, Lex. Pharm. p. 869.

ANHIMA, in zoology, the name of a Braſilian bird, ſomewhat reſembling the crane family, but not regularly of it. It is diſtinguiſhed in a very ſingular manner from all other birds, having a ſingle long horn on its head inſerted a little above the origin of the beak, and ſtanding forwards and a little bent downwards. This is of two or three fingers breadth long, and is ſlender and round as if nicely turned, and is of a boney ſubſtance and fine white colour; and on the front of each wing it has two other ſuch horns growing from the ſubſtance of the bone. It is found about waters, and is a very voracious bird, but feeds only on vegetables. It is longer than a ſwan; and is of a mixed colour of black grey and white, with a very little yellow in ſome places. It is always ſeen male and female together; and the male is twice as large as the female, which is here deſcribed, and is larger than our ſwan. It makes a very loud noiſe, often repeating the notes, *vyhu, vyhu*. *Marggrave*'s, Hiſt. Braſil.

ANHINGA, in zoology, the name of a very elegant Braſilian water fowl. It is about the ſize of our common duck; its beak is ſtrait, very ſharp, not thick, and about three fingers breath long, and has all along the middle, as well above as below, a long ſeries of hooked prickles all bending backwards. Its head is ſmall, and its neck ſlender and long, not leſs than a foot in length; its legs are ſhort, and its toes connected by a membrane, as in the cormorant and duck-kind. Its tail is ten fingers breadth long; its wings when folded reach not more than half the length of the tail; its head and neck are yellowiſh, and covered with extremely ſoft velvet-like feathers; its breaſt, belly, and thighs, are of a ſilvery white. The upper part of its back is brown ſpotted with yellow, and the reſt all black. It is common on the Braſilian ſhores, and feeds on fiſh. *Marggrave*'s, Hiſt. Braſil.

ANHUIBA, in botany, a name by which ſome authors call the ſaſſafras tree, the wood of which is ſo much uſed in medicine. *Piſo*, p. 145.

ANHYDROS, in botany, a name given by the antient Greeks and from them copied by the Romans in the time of Pliny, to expreſs one of thoſe kinds of the Strychna, or night-ſhades, which when taken internally cauſed madneſs. The more early writers confounded all the night-ſhades, ſo far as concerned names, under the general term Strychna; but that they diſtinguiſhed the Strychna into three different kinds from their effects, the firſt were the ſleepy, the ſecond the mad Solanum, and the third the eſculent ones, among which the principal were the Lycoperſicon or love-apple, and the Halicaccabum or winter cherry.

ANI, in zoology, the name of a Braſilian bird, ſomewhat allied to the paroquette kind. It is about the ſize of a thruſh, and is all over black, all its feathers, its beak, its eyes, and its feet being of that colour: its beak is large, very hooked and prominent, and running to a ſharp ridge at the top; and its legs and feet are very ſmall and ſlender. It is very common in the woods, but is not eaten. *Marggrave*, Hiſtor. Braſil.

ANIMA (*Cycl.*) is ſometimes uſed by phyſicians to denote the principle of life in the body.

In which ſenſe Willis calls the blood *Anima brutalis*. *Caſt.* Lex. Med. p. 51.

ANIMA is alſo figuratively uſed by chymiſts for the volatile principle in bodies whereby they are capable of being raiſed by the fire. *Dion. Zachar*, in Theat. Chym. T. 1. p. 714.

In which ſenſe, we meet with *Anima Jaſpidis*, the ſoul of jaſper, &c. Phil. Tranſ. N°. 74. p. 2233.

ANIMA is more peculiarly applied to ſimple medicines, artfully exalted by ſolution and extraction to a high degree of power.

In which ſenſe, we meet with *Anima Aloes*, *Anima Rhabarbari*, *Anima Veneris*, &c. *Caſt.* Lex. Med. p. 51.

Anima Rhabarbari is prepared of the powder of that root boiled with cichory water, till a purple tincture be procured. *Teichmey.* Inſt. Chem. p. 260.

ANIMA is alſo applied in ſpeaking of medicines, which are peculiarly friendly and ſalutary to certain parts of the body.

In which ſenſe, we meet with *Anima Pulmonum*, *Anima Hepatis*, *Anima Articulorum*, &c.

Some uſe the phraſe *Anima Catholica Mundi*, for the univerſal ſpirit joined with the humid ætherial ſubſtance of all bodies. Theat. Chym. T. 6. p. 147.

In the operation of the philoſopher's ſtone, *Anima* is uſed to denote the *Aqua Mercurialis Philoſophica*. Theat. Chym. T. 3. p. 26. It. T. 4. p. 75. and 721. ſeq.

The name *Anima* is alſo given to the philoſopher's ſtone itſelf. *Rul.* Lex. Alchem. p. 42.

ANIMA *Gemmarum*, a term uſed by Becher, and ſome others, to expreſs that principle, to which the gems and other beautiful ſtones owe their colours.

This *Anima lapidum* is no more than the metalline ſulphur to which theſe ſtones and gems, naturally colourleſs, owe their tinges; and, like other metalline ſulphurs, it may be raiſed and evaporated by fire. Becher is the author of an odd experiment, in which it is ſaid, melt a jaſper in a covered crucible, well luted, and the ſtone will become white, but its colour will be found on the cover and upper parts of the crucible. *Becher*, Phyſ. Subt.

ANIMA SATURNI, *the ſoul of lead*, a preparation of lead ſerving to many purpoſes in the enamel work. The method of making it is this:

Put litharge, powdered fine, into a glazed earthen veſſel, and pour diſtilled vinegar upon it to the height of four fingers; let it ſtand till the vinegar is of a white or milky hue: pour off this coloured vinegar, and put on freſh, and ſo do till the vinegar will no longer be coloured by the litharge; then ſet theſe liquors together in open glazed earthen veſſels, that the white powder may ſubſide, and the vinegar be poured off clear. This white ſubſtance is the *Anima Saturni*. Sometimes this white matter will not precipitate without the addition of water; and ſometimes it is neceſſary to evaporate the liquors; but by that means it is always prepared. *Nevis*'s art of glaſs, p. 184.

ANIMAL (*Cycl.*)—Some have objected to Ray's diviſion of *Animals*, mentioned in the Cyclopædia, that all *Animals* are ſanguineous, ſince all have a vital fluid circulating through veins and arteries, though it be not of a red colour in all, the eſſential character of the blood lying not in its crimſon colour, but in its office: in which view every fluid, by whoſe motion through veſſels the life of an *Animal* is ſuſtained, may be denominated *Blood*. See BLOOD.

But this is rather a diſpute about words than things.

ANIMAL is alſo ſometimes applied, in a figurative ſenſe, to artificial or moral things.

Hobbs conſiders government as a huge complex *Animal*, under the denomination of *Leviathan*.

The reaſon of the appellation is founded on the analogy between an *animal*, and a political body. The ſovereign or legiſlative power anſwers to the ſoul; the magiſtrates to the limbs or members; rewards and puniſhments are the nerves; riches, the ſtrength; counſellors, the faculty of memory; equity, reaſon; ſedition, ſickneſs; civil war, death. Vid. *Hobb.* Leviath. P. 1. p. 1.

ANIMAL *Gods*, *Dii Animales*, in the mythology of the antients, thoſe into which human ſouls were converted by means of certain religious ceremonies.

Labeo has written expreſsly on the *animal gods*. *Serv.* ad l. 3. Æneid. *Herald.* ad Arnob. p. 154. *Salmaſ.* Exerc. Plin. p. 64. *Kirchman.* de Funerib. l. 4. c. 13. *Voſſ.* Inſt. Orat. l. 1. c. 2. n. 5. *Gal.* ad Lactant. p. 79. ſeqq. *Fabri* Theſ. in voc.

ANIMAL *Syſtem* imports the whole claſs of beings endowed with *animal life*.

In which ſenſe *animal ſyſtem* amounts to the ſame with what chemiſts, and others, call the *animal kingdom*.

ANIMAL is alſo uſed for what we otherwiſe call *corporeal*.

In this ſenſe we ſay *animal* pleaſures, *animal* life, &c.

Wheel ANIMAL. See the article WHEEL *Animal*.

ANIMALS *ſimilar*. See SIMILAR *Animals*.

ANIMAL *liquors*.—The common opinion is, that all the *animal liquors*, excepting chyle and milk, are of an alcaleſcent nature; but Mr. Queſnay, in his book *ſur l'Oeconomie Animale*, affirms, that our gelatinous liquors contain a very aceſcent ſalt, capable of reſiſting a heat of two hundred degrees. The proof of which, ſays he, offers itſelf daily to every one. Who is it that has not remarked, that broth made with fleſh well freed from fat, when corrupted, becomes as ſour as verjuice? The foundation on which Mr. Queſnay builds his doctrine concerning *animal liquors*, is the ſeparation of milk into its oily, cheeſy, and watery ſubſtances. Medic. Eſſ. Edinb. T. 2. p. 448.

ANIMALCULE (*Cycl.*)—Naturaliſts have many ſpeculations concerning the origin, the multiplication, and propagation of *Animalcules*; whether, e. gr. it be by putrefaction, or by copulation, and the ordinary intercourſe of the two ſexes. Concerning the mechaniſm of *Animalcules*, the ſtructure of their eyes, their different orders and œconomy, their number, minuteneſs, food, office, uſe, &c.

Some will have *Animalcules* the cauſe of all diſeaſes, particularly the itch, the plague, &c. Others aſſign them a nobler uſe, and ſuppoſe them intended to animate and enliven all nature, to be the principle of life, motion, generation, and the firſt ſtamina or rudiments of man himſelf.

As to the origin and propagation of *Animalcules*, we find naturaliſts extremely at a loſs, and therefore advancing conjectures and hypotheſes, each more chimerical than the other. The ſyſtem of putrefaction ſolves the difficulty quickly: but the ſuppoſition is unphiloſophical, and contrary to obſervation and analogy. Yet how ſuch vaſt numbers of animals can be, as it were at pleaſure produced, without having recourſe to ſomething like equivocal generation, is very difficult to ſay! To produce a million of living creatures in a few hours, by only expoſing a little water in a window, or by adding to it a few grains of ſome ſeed, or leaves of a plant, ſeems difficult to believe. We therefore muſt ſuppoſe them to have been pre-exiſtent.

Huygens imagines, that the *Animalcules* in pepper or ginger water come thither out of the air, attracted by the ſpicy ſmell. But can we ſuppoſe that the effluvia of aromatic bodies, groſs enough to affect our olfactory organs, can produce the like ſenſations in creatures many millions of times leſs than us? Ought not the odorous particles which affect them, to be proportional to their own ſize? Each corpuſcle of the effluvia, e. gr. of pepper, may be many degrees bigger than the whole body of one of our *Animalcules*; and inſtead of entring its noſtrils, muſt knock it down, or even bury it under its load. Nouv. Rep. Lett. T. 32. p. 614. ſeq.

Harris is rather of opinion, that the eggs of ſome exceeding ſmall inſects, which are very numerous, may have been laid or lodg'd in the *plicæ* or *rugæ* of the coats of the grain, by ſome kinds that inhabit thoſe ſeeds, as their proper places. For that inſects of the larger kinds do frequently thus depoſite their eggs, on the flowers and leaves of plants, is often experimented; and it is probable that the ſmaller or microſcopical inſects do the ſame. Now theſe being waſhed out of the ſeeds by their immerſion in water, may riſe to the ſurface, and there be hatched into theſe animals which we ſee ſo plentifully to abound there. Or, the ſurface of the water may arreſt the ſtraggling eggs of ſome microſcopical inſects, which before floated in the air, and being prepared for this purpoſe by the infuſion of proper grain, or a due degree of heat, may compoſe ſo proper a nidus for them, that by the ſun's warmth they may eaſily be hatched into living creatures, which may afterwards turn into flies of the ſame ſpecies with the animal parent. Phil. Tranſ N° 220. p. 258. ſeq.

But this is not enough, M. Malezieu has diſcovered ſome *Animalcules* to be viviparous, and others oviparous. [a] And Lewenhoeck and others pretend to have ſeen them in the very act of copulation. [b] Others aſſure us they have ſeen eggs in the bodies of ſome *Animalcules* which are tranſparent, and that in others eggs have appeared placed on the outſide of the body; from which M. Malezieu and M. Tobelot have obſerved young ones to iſſue alive, of the ſame kind and form with their ſires and dames [c]. A ſingle *Animalcule*, diſcovered by Wolfius, in freſh rain water, was obſerved by

him to bring forth no leſs than 4000 eggs [d]. M. Huygens caught an *Animalcule* big with four young ones, and kept her ſome hours till ſhe was delivered [e]. Lewenhoeck gives the figure of an embryo *Animalcule* coming out of the body of an old one. At firſt he imagined the former had only been accidentally faſtened to the latter, but obſerving it more narrowly, found it to be a partus [f]. —[[a] Hiſt. Acad. Scienc. 1718. p. 11. [b] Bibl. Anc. Mod. T. 11. p. 454. [c] Hiſt. Acad. Scienc. 1718. p. 12. Mem. de Trev. 1719. p. 1406. [d] Act. Erud. Lipſ. 1723. p. 37. [e] Nouv. Rep. Lett. T. 32. p. 614. [f] Phil. Tranſ. N° 283. p. 1307.]

Indeed, conſidering the great variety of ſpecies of *Animalcules*, it is not probable they ſhould all propagate in the ſame manner. M. Harris obſerved a ſort of green belts on ſome that were found in the ſcum of puddle water; and on further obſervation found theſe belts compoſed of globules, ſo like the roes or ſpawn of fiſhes, that he could not but fancy they ſerved for the ſame uſe. After April he found many of them without any thing of the green belt; others with it very much, and that unequally, diminiſhed, and the water filled with a vaſt number of ſmall animals, which before he ſaw not there, and which he now looked on as the young animated fry, which the old ones had ſhed. Phil. Tranſ. N° 220. p. 256.

With regard to their ſtructure and œconomy, *Animalcules* are found of divers ſorts; ſome formed like fiſhes, others reptile, others hexapedal; ſome horned, *&c.* In ſeveral kinds, however ſmall, 'tis eaſy to diſcover the form of their mouths, their proboſcides, horns, *&c.* the motions of their hearts, lungs, and other parts. Mem. de Trev. 1719. p. 1406.

Every *Animalcule* being an organized body, how delicate and ſubtil muſt the parts be, that are neceſſary to conſtitute it, and to preſerve its vital actions! It is hard to conceive, how in ſo narrow a compaſs, there ſhould be contained a heart to be the fountain of life, muſcles neceſſary to its motions, glands for the ſecretion of its fluids, ſtomach and bowels to digeſt its food, and other innumerable members, without which an *Animalcule* cannot ſubſiſt. But ſince every one of theſe members is alſo an organical body, they muſt have likewiſe parts neceſſary to their actions. For they conſiſt of fibres, membranes, coats, veins, arteries, nerves, and an almoſt infinite number of fine tubes, like thoſe whoſe ſmallneſs ſeems to exceed all efforts of imagination. But there are ſome parts that ought to be almoſt infinitely leſs than theſe, as the fluids that flow along theſe fine tubes, the blood, lymph and animal ſpirits, whoſe ſubtilty, even in large animals, is incredible.

The multitude of *Animalcules* obſerved in the melt of a cod fiſh are not all alive at once, but only ſuch of them as are neareſt the paſſage, whereby they are to be diſcharged, and which have moſt moiſture about them: The reſt of them being more remote in the body, and incompaſſed with a thicker matter, are not yet animated. In reality, the cod fiſh is found a whole month in caſting its ſpawn, during all which time the ſeed is ſucceſſively ripening. The like holds of *Animalcules* in the ſpawn of frogs. Phil. Tranſ. N° 152. p. 347. ſeq.

Microſcopical ANIMALCULES, thoſe only diſcoverable by the help of a large magnifier. Theſe otherwiſe come under the denomination of *inviſible Animalcules*.

The exceſſive minuteneſs of theſe *Animalcules* conceals them from the human eye unarmed. One of the wonders of the modern philoſophy is, to have invented means for bringing creatures under our cognizance and inſpection, which God and nature ſeem to have intended to keep hid! An object a thouſand times too little to be able to affect our ſenſe, ſhould ſeem to have been very ſafe. Yet we have extended our views over animals, to whom theſe would be mountains. In reality, moſt of our microſcopical *Animalcules* are of ſo ſmall a magnitude, that through a lens, whoſe focal diſtance is the tenth part of an inch, they only appear as ſo many points; that is, their parts cannot be diſtinguiſhed, ſo that they appear from the vertex of that lens under an angle not exceeding a minute. If we inveſtigate the magnitude of ſuch an object, it will be found nearly equal to $\frac{1}{100^3000}$ of an inch long. Suppoſing therefore theſe *Animalcules* of a cubic figure, that is, of the ſame length, breadth and thickneſs, their magnitude would be expreſſed by the cube of the fraction $\frac{1}{100000}$, that is, by the number of $\frac{27}{1000,000,000,000,000}$, that is, ſo many parts of an inch is each *Animalcule* equal to. Hence what ſome philoſophers have dreamed concerning angels is ſtrictly true of theſe *Animalcules*, that many thouſands of them may dance on the point of a ſmall needle.

There are in ſome liquors *Animalcules* ſo ſmall, as upon calculation the whole magnitude of the earth is not found large enough to be a third proportional to theſe minute floating animals, and the whales in the ocean. *Keil*, Introd. Phil. l. 5. p. 56.

In ſome of the *Animalcules* obſerved by Lewenhoeck, he computed that three or four hundred of the ſmalleſt placed contiguous to each other in a line, would only equal the diameter of an ordinary grain of ſand. Now multiply 300 cubically, produces 27,000,000, *i. e.* twenty ſeven millions of animals equal one grain of ſand, ſo that a cubical inch would contain 13,824,000,000,000, or almoſt 14 millions of millions. Bibl. Angl. T. 14. p. 128.

This contemplation of *Animalcules* has made the ideas of infinitely ſmall bodies extremely familiar to us. A mite was antiently thought the limit of littleneſs; but we are not now ſurprized to be told of animals twenty-ſeven millions of times ſmaller than a mite. For ſuch is the enormouſly little ſize of a kind of microſcopical *Animalcule* obſerved by M. Malezieu, as he proves by a geometrical calculation of the augmentation which his glaſs makes [a]. Hartſoeker has carried the matter further. If the ſyſtem of generation be true, which ſuppoſes that all animals were formed from the beginning of the world, and incloſed one within another, and all of them in the firſt animals of each ſpecies, how minute muſt the *Animalcules* now produced have been at the beginning! It appears by calculation, that the ſpawn of the firſt fiſh muſt have been to that of the laſt, as unity followed by thirty or forty thouſand cyphers, is to unity [b].—[[a] Hiſt. Acad. Scienc. an. 1718. p. 11. [b] Bibl. Anc. Mod. T. 18. p. 198. ſeq.]

Viſible ANIMALCULES, thoſe which may be diſcerned by the naked eye.

Such, e. gr. are mites, divers ſpecies of inſects, reptiles, and other vermin.

As theſe in all probability are ſubſiſted on the ſmaller fry of microſcopical animals, they in their turn ſerve for food to quadrupeds, *&c.* Ray mentions two ſorts of tamunduus which live wholly on ants; whence they are called in Engliſh *ant bears*: The camelion lives on flies; the mole, on earth-worms; the badger, chiefly on beetles, worms, and other inſects.—By the way we may take notice, that becauſe ſo many creatures live on ants and their eggs, providence hath ſo ordered it that they ſhould be the moſt numerous of any tribe of inſects that we know. *Ray*, Wiſd. Creat. P. 2. p. 372. ſeq.

Minute animals are found proportionably much ſtronger, more active and vivacious than large ones. The ſpring of a flea in its leap, how vaſtly does it out-ſtrip any thing greater animals are capable of? A mite, how vaſtly faſter does it run than a race horſe? M. de l'Iſle has given the computation of the velocity of a little creature ſcarce viſible by its ſmallneſs, which he found to run three inches in half a ſecond; ſuppoſing now its feet to be the fifteenth part of a line, it muſt make 500 ſteps in the ſpace of three inches; that is, it muſt ſhift its legs 500 times in a ſecond, or in the ordinary pulſation of an artery. Hiſt. Acad. Scienc. 1711. p. 23.

Inviſible ANIMALCULES.—Naturaliſts ſuppoſe another ſpecies or order of inviſible *Animalcules*, *viz.* ſuch as eſcape the cognizance even of the beſt microſcopes, and give many probable conjectures in relation to them. Reaſon and analogy give ſome ſupport to the exiſtence of infinite imperceptible *Animalcules*.

The naked eye, ſay ſome, takes in from the elephant to the mite; but there commences a new order reſerved only for the microſcope, which comprehends all theſe from the mite, to thoſe twenty-ſeven millions of times ſmaller; and this order cannot be yet ſaid to be exhauſted, if the microſcope be not arrived at its laſt perfection: And when it is arrived there, ſhall we then have attained the whole ſyſtem of animals? 'Tis nowiſe probable that the limits of nature ſhould coincide exactly with the limits of our eye-ſight, when aſſiſted by the microſcope. [a] Who knows, ſays another, but the ſmalleſt and moſt imperceptible animals themſelves have others leſs bred and nouriſhed by them, and which bear the ſame proportion to them, that thoſe bear to the animals they are produced on [b].—[[a] Hiſt. Acad. Scienc. 1718. p. 11. ſeq. [b] Nouv. Rep. Let. T. 43. p. 364.]

Lewenhoeck, though he had often examined the ſemen of mice, yet by reaſon, as he judges, of its fluidity and clearneſs, he could never diſcover any *Animalcules* in it. But he makes no difficulty to conclude, that this too abounds with living creatures, ſince he has found them in animals of all bigneſſes and ſpecies, from a horſe, to a ſmall horſe-fly; for that nature obſerves the ſame method in the ſmalleſt as the greateſt bodies. *Hook*, Phil. Col. N° 3. p. 56.

ANIMALCULES, in medicine, *&c.*—We have large ſyſtems of phyſic, of pathology, of dæmonology, witchcraft, *&c.* founded on the *animalcular* principles. M. Lange will have *Animalcules* to be the immediate origins or inſtruments which the devil makes uſe of to effect temptations, ſeductions, illuſions, charms; in fine, to work on our imagination, and inſpire what thoughts and inclinations he pleaſes, and the like. The prince of the air, it ſeems, can act on the bodies of thoſe *Animalcules* at pleaſure, which being of aerial origin, belong to the number of his immediate ſubjects. He plays on their organs, they on ours, according to the part of the body in which they are lodged, as the brain, the heart, the genitals, *&c.*

Others attribute the itch, others the ſmall-pox and meaſles, others the epilepſy, *&c.* to *Animalcules*. Langius goes further, and pretends to reduce all diſeaſes in general to the ſame principle. A late writer at Paris, who aſſumed the title of an Engliſh phyſician, has done more. He not only

accounts

accounts for all diſeaſes, but for the operations of all medicines, from the hypotheſis of *Animalcules*. He has peculiar animals for every diſeaſe: ſcorbutic *Animalcules*, podagrical *Animalcules*, variolous *Animalcules*, &c. all at his ſervice.

To ſhew what lengths men are capable of purſuing chimeras, we will give a ſpecimen of his method of philoſophizing. The cauſe of an intermitting fever or an ague, of the tertian or quartan kind, is, that the patient has ſome way received into his body a number of feveriſh or aguiſh *Animalcules*, whoſe nature is to ſleep like the marmot, or dormouſe, or ſquirrel, ſome forty-eight hours, others twelve hours, and at waking cauſe the diſturbances which make the fit or acceſs of the diſeaſe. When a perſon in the rheumatiſm feels pains, ſometimes in the right arm, ſometimes in the left, ſometimes in one hip, ſometimes in the other; the reaſon is, that ſome rheumatic *Animalcule* has been admitted into his body, where having multiplied and bred a large number, theſe travel in herds, ſometimes to feed on one part of the body, ſometimes on another, as their fancy leads them to ſhift the ſcene, or as they grow tired of their former paſture. Such is his pathology. Jour. des Scav. T. 82. p. 535. ſeq.

For the curative part he obſerves, that meats, drinks, medicines, drugs, plants, minerals, are all full, both within and without of *Animalcules*, or their ova: each ſpecies of which is the bane or deſtruction of ſome other, as wolves are of ſheep, cats of mice, ſpurhawks of partridge, pikes of carps, and ſwallows of flies.

This author by forty years labour, and the uſe of a thouſand bottles of different infuſions of plants and minerals, made a nice diſcovery of above a thouſand ſpecies of *Animalcules*, their ſeveral changes and transformations, and different durations of their lives, manners of coupling, ſeaſons of hatching, ages of going to hunt others, their combats, *&c.* He tried different kinds on the blood and urine of his patients, till he had diſcovered which was the proper antagoniſt to thoſe of this or that diſeaſe. A. C. D. ſyſteme d'un medecin Anglois ſur la cauſe de toutes les eſpeces des maladies, avec les ſurprenantes configurations des differentes eſpeces des petits inſects, qu'on voit par le moyen d'un bon microſcope dans le ſang, & dans les urines des differens malades, & meme de tous ceux qui doivent le devenir, Paris 1726. 8°. Suite du ſyſtem d'un medecin Anglois, par lequel ſont indiquées les eſpeces des vegetaux, & des mineraux qui ſont des poiſons infallibles pour tuer les differentes eſpeces de petits animaux qui cauſent nos maladies, Paris 1727. 8°. Vid. Jour. des Scav. T. 84. p. 428.

Kircher, Fabri, Griffon, Bradley, and others, account for the plague, and all peſtilental diſeaſes from the ingreſs of a poiſonous ſpecies of *Animalcules* into our bodies, where after gnawing and conſuming the principles of fleſh, they lay their eggs in the emunctories of the body, from whence ariſe peſtelential buboes, in which ſwarms of little inſects have been obſerved. Jour. des Scav. T. 63. p. 348. It. T. 73. p. 473. ſeqq.

One would be almoſt tempted to doubt, whether the microſcope had done more good than harm. It has opened a large field for fiction and impoſture. Hartſoeker laughs at many of the pretended diſcoveries of Lewenhoeck. Many others have ſuſpected their reality. There was ſomething of myſtery at bottom. He is ſaid to have reſerved his fineſt glaſſes for his own uſe; none but his wife and daughters were ever ſuffered to ſee them. Vid. Bibl. Rais. T. 4. p. 186.

It may be added, that the Royal Society, to whom after his death he bequeathed his glaſſes, have not been able to find half his wonders in them. One man, 'tis alledged can ſee that by a microſcope which another cannot. The difference that is found between the ages of one man and another, as to the ſtrength and clearneſs of ſight, hold equally when they are armed with a microſcope, as when naked.

The *Animalcules*, which, according to M. Griffon, were the cauſe of the late plague of Marſeilles, were ſo very ſmall, that no body could ſee them, except a ſingle hermit of Thouloſe.—Without ſuppoſing any thing of miracle or impoſture in the caſe. Jour. des Scav. T. 73. p. 479.

A great part of the appearances of what they call *Animalcules* are tranſient, and many others obſcure and undeterminate. The imagination of the obſerver in many caſes is left to make what it can out of them. They are on much the ſame footing with the images we diſcern in the fire, or in the clouds, which either become animals, or any thing elſe, according to the ſtrength and pregnancy of the ſpectator's fancy. A mole or inanimate corpuſcle, with which all waters are replete, when magnified, may eaſily bear ſome affinity to one ſort of inſect or another. And the continual inteſtine motions and fluctuations in liquors, will drive their contents in all manner of directions, from whence it will not be hard to frame a notion of ſwimming, friſking about, *&c.*

ANIMALCULES *in the ſemen.* See SEMEN.

ANIMALCULES *in fluids.* See FLUIDS and PEPPER-*Water.*

ANIMATED (*Cycl.*)—Naturaliſts and philoſophers vary extremely in aſſigning the characters, ſubjects and ſpecies of *animate* bodies.—Some include ſtocks and ſtones in this rank; others exclude brutes themſelves. See ANIMATION.

Cardan will have all ſtones to be alive and *animated*: The Carteſians on the contrary deny a ſoul not only to plants, but to all animals, except man. Ephem. Acad. N. C. dec. 2. an. 7. App. p. 205.

Thales held the loadſtone and amber, others the cornu ammonis, ſponges, *&c.* to be *animated.* Vid. Jour. des Scav. T. 52. p. 679.

Some of the philoſophers have held that all nature is *animated*; that the ſun, the earth, the planets, rivers, trees, ſtones, *&c.* are ſo many animals; others, that the whole ſyſtem is only one huge animal, informed with an univerſal ſoul, or *anima mundi. Plato*, in Timæo. *Morheff.* Polyhiſt. Philoſ. l. 2. P. 1. c. 11. n. 7.

ANIMATED *horſe hairs.* See HORSE *hairs.*

ANIMATED is alſo uſed to denote a thing impregnated with vermin or animalcules. See ANIMALCULE.

In this ſenſe the whole earth may be ſaid to be *animated*; ſince in every part of it we meet with an infinite number of animals, either great or little, viſible or inviſible: they are found in air, water, earth, and even in the hardeſt ſtones: multitudes of them are found in all ſorts of plants; and there is perhaps no animal known, which does not breed numbers of others in the different parts of its body. Nouv. Rep. Lett. T. 43. p. 363. ſeq.

Kircher ſpeaks of an *animated putredo*, or morbid ſtate of fluid, and other bodies which generates ſwarms of inviſible animalcules or inſects, which, in the human body, occaſion various diſorders. See ANIMALCULE.

Langius has publiſhed a ſyſtem of *animated* pathology. *Pathologia animata, ſeu animadverſiones in pathologiam ſpagiricam Fabri: quibus morbos omnes ex genuinis ſuis cauſis, animatâ potiſſimum putredine, &c. explicat.* Francof. 1688. 8°. Bibl. Univ. T. 14. p. 92. ſeqq.

This book, according to Sig. Valliſnieri, does not anſwer the title; it being in reality but few diſeaſes that the author accounts for from this cauſe. Giorn. de Letter d'Ital. T. 19. p. 67. ſeq.

Needham gives into the ſame ſyſtem, of worms being concerned in all diſeaſes; and not only directs anthelmintics in fevers, but to be mixed in all the remedies given in all other caſes: one great part of the attention of a phyſician, according to him, is ſtill to aim at worms, which are more or leſs concerned in all diſeaſes. *Needham*, Medel. Medic. c. 5. p. 176. ſeq.

ANIMATION (*Cycl.*)—The hiſtory of the opinions concerning the *Animation* of the fœtus, or the origin of the human ſoul, is given at large by Jac. Thomaſius. Diſſ. de orig. animæ humanæ, Lipſ. 1669. An extract of which is given in *Burggr.* Lex. Med. in voc.

The different hypotheſes of phyſicians and philoſophers, concerning the time of *Animation*, have had their influence on the penal laws made againſt artificial abortions, it having been made capital to procure miſcarriage in the one ſtate, while in the other it was only deemed a venial crime. See the article ABORTION.

The emperor Charles V, by a conſtitution publiſhed in 1532, put the matter on another footing; inſtead of the diſtinction of an animated and unanimated fœtus, he introduced that of a vital and non-vital fœtus, as a thing of more obvious and eaſy deciſion, and not depending on any ſyſtem either of creation, traduction, or infuſion. *Burggrave*, Lex. Med. T. 1. p. 821.

Accordingly a fœtus is ſaid, in a legal ſenſe, to be animated, when it is perceived to ſtir in the womb; which uſually happens about the middle of the term of geſtation. *Teichmy.* Inſtit. Medic. legal. c. 8, 9, 21. See FOETUS.

T. Fienus, Gardinius, Verde, Fort. Liceetus, F. de Bonnonia, have written expreſsly on the *Animation* of the fœtus; Fr. Zanellis on the *Animation* of the ſeed. *Lipen*, Bibl. Med. pp. 180, 419.

ANIMATION is alſo uſed by ſome mechanical philoſophers, for the act of ſoliciting the deſcent of a body, ſo as to give it continually new degrees of acceleration. *Bernoul.* ap. Mem. Acad. Scienc. 1714. p. 271.

ANIMATION is alſo uſed by alchemiſts for the operation of fermenting a white foliated earth, with a kind of philoſophical or celeſtial water of ſulphur. *Libav.* Synt. Arc. Chym. l. 7. c. 8.

ANIMATION is alſo uſed in a moral or figurative ſenſe, for the act of giving life and force to a diſcourſe, or the like.

M. Barry has given rules to preachers, lawyers, *&c.* for animating or enlivening their ſpeeches. Methode pour bien prononcer un diſcours, & pour le bien *Animer.* Leid. 1708. 12mo. Vid. Nouv. Rep. Lett. T. 43. p. 223.

ANIMATION is alſo uſed by hermetic philoſophers, to denote a certain ſtate of perfection to which a body is brought by ſome appropriate proceſs, in virtue whereof it becomes capable of producing ſome extraordinary phænomena. *Quinc.* Lex. Phyſ. p. 27.

ANIME', (*Cycl.*) in heraldry, is where the eyes, *&c.* of a rapacious creature are borne of a different colour from the reſt of the creature. Dict. Herald.

The French ſay *animé*, the Engliſh *incenſed*, the Latins *inſenſus*, of ſuch or ſuch a colour.

ANIMETTA, in eccleſiaſtical writers, denotes the pall or cloth wherewith the cup is covered in the euchariſt. *Magri.* Vocab. Eccleſ. p. 17.

ANINGA, in commerce, a root growing in the Carribee iſlands, of uſe in the refinement of ſugar. *Savar.* Dict. Comm. T. 1. p. 107. ſeq.

The decoction of this root is found a more certain, as well as more innocent means of clarifying ſugar, than the ſublimate and arſenic uſed for this purpoſe, before the diſcovery of the *Aninga.*

ANISATUM, a name given to aniſe-ſeed water. *Trallian.* l. 8. c. 6. *Meurs*, Gloſſ. p. 38. See ANISE-SEED.

ANISCALPTOR, in anatomy, a name given by Laurentius and others to expreſs the muſcle now generally known by the name of latiſſimus dorſi. It is called alſo *aniterſor* by Riolanus. See LATISSIMUS.

ANISE-SEED — The plant which produces it is a ſpecies of apium or parſly, called by Tournefort *apium aniſum dictum ſemine ſuaviolenti majori*, parſly with large ſweet-ſcented ſeeds, commonly called aniſe [a]. The plant is of very difficult culture among us, and will hardly quit the coſt, as we can have the ſeed much better and cheaper from Italy, than they can be produced here [b].— [[a] Vid. *Junck.* Conſp. Therap. tab. 9. n. 41. *Lemery*, Tr. des Drog. p. 49. [b] *Mill.* Dict. Gard. in voc. *apium.*] See Tab. of microſcopical objects, claſs 2.

The compound powder of *Aniſe-ſeed* is called *dianiſum.* It is accounted a cordial, pectoral, and expeller of wind, and in thoſe intentions much uſed by farriers.

Starry ANISE-SEED, *Aniſum Stellatum*, is a ſeed brought chiefly from Tartary; thus called from the affinity it bears in ſmell to the common *Aniſe-ſeed*, and the ſtar-like figure of its capſula ſeminalis. *Junck.* Conſp. Therap. tab. 9. n. 41. *Lemery*, Tr. des Drog.

It was firſt brought into Europe from the Philippine iſlands by an Engliſh mariner, named Thomas Candy, in his return from a voyage round the world in the year 1601.—The natives call it *damor* and *zingi*; the Europeans ſometimes *fœniculum ſinenſe*, or *Chineſe fennel*; Botaniſts, *aniſum indicum*, *aniſum peregrinum*, *aniſum exoticum Philippinarum inſularum*, *cardamomum ſiberienſe*, *badianum*, &c. *Burggr.* Lex. Med. T. 1. p. 828.

Its virtues are of the ſame kind with thoſe of the common *Aniſe-ſeed*, only that it is ſweeter, more grateful, penetrating and aromatic. It is reputed a general cordial and ſtrengthner. The Chineſe uſe it in the preparation of their tea; and after their example the Dutch alſo uſe it in this liquor, pretending it makes it more pleaſant.

The wood is alſo imported into Europe, where it is employed in works of marquetry and moſaic.—It is alſo called *anil.* *Savar.* Dict. Com. T. 1. p. 107.

ANITERSOR, in anatomy, a name given by Riolanus and others to a muſcle, called by Laurentius *aniſcalptor*, and by others *latiſſimus dorſi.* See LATISSIMUS *dorſi.*

ANNA, among the Romans, a name given to the moon. *Hofm.* Lex. in voc. *Luna.*

ANNALS (*Cycl.*)—Cicero relates the origin of *Annals*, which were deſigned to preſerve the memory of tranſactions. The pontifex maximus, ſays he, wrote what paſſed each year, and expoſed it on tables, in his own houſe, where every one was at liberty to read them. *Cicero*, de Orat. l. 2. c. 12.

Theſe they called *Annales maximi*; and the cuſtom was kept up till the time of P. Mutius, in the year of Rome 620.

The denomination *maximi* was not given them on account of their bulk, but of their authors the pontifices maximi [a]. Livy alſo calls them *faſti* and *commentarii pontificum.* The author of the origin of the Roman nation calls them *Annales pontificales* [b].— [[a] *Feſt.* de Verb. ſignif. p. 97. [b] *Gell.* l. 4. c. 5. *Macrob.* l. 3. c. 2. *Cicero*, de Orat. c. 12.]

The *annales maximi* conſiſted of eighty books. They were moſt of them deſtroyed in the burning of the city by the Gauls. Vid. *Struv.* Synt. Antiq. Rom. c. 12.

The like *Annals* were kept from the earlieſt ages by the Egyptians, Babylonians, Perſians, Chaldeans, &c. *Strab.* l. 17. p. 543, 548. *Joſeph.* 1. contr. Apion. p. 1035. ſeq. *Fabric.* Bibl. Lat. p. 638.

We have alſo *Annals* of the benedictines by Mabillon; *Annals* of the Franciſcans by Wadding, &c. alſo an infinite number of provincial and local *Annals*; *Annals* of monaſteries, of churches, &c. civil *Annals*, political *Annals*, military *Annals*, &c. [a]; *Annals* of England, of Ireland, [b] &c.—[[a] Vid. *Lipen.* ubi ſupr. [b] Vid. *Nichols*, Iriſh Hiſt. Librar. c. 2. p. 30. It. in Append. N° 1. p. 179. It. N° 4. p. 243.]

ANNALE, in ſome middle-age writers, denotes a day held every year in commemoration of the dead.

In which ſenſe *Annale* amounts to the ſame with what is otherwiſe called *Anniverſarium.*

ANNALE is more particularly applied to the maſſes celebrated during the ſpace of a year for the dead. *Du Cange*, Gloſſ. Lat. T. 1. p. 196.

ANNALIS *actio*, in the civil law, denotes an action which may be put in practice any time within the year.

In the like ſenſe we meet with *Annale decretum* or *negatum*, *Annalis reſciſio*, &c. *Calv.* Lex. Jur. p. 69.

ANNALIS *clavus*, in Roman antiquity, the nail which the prætor, conſul, or dictator fixed every year in the wall of Jupiter's temple, on the ides of September, to ſhew the æra or number of years from the building of Rome. This cuſtom was afterwards changed, and the years were reckoned by the conſuls. *Danet*, Lex. in voc.

ANNALIS *exceptio*, a kind of privilege antiently granted the people of Italy, that whoever had made a contract, could not be compelled to the performance, or payment of what had been agreed on within the year. Some extended this privilege ſo as to render it ſtill more grievous, by computing the year excluſive of all holydays. *Calv.* Lex. Jur. p. 69.

ANNALES *libri*, in the civil law, denote books wherein the acts, and proceedings of a whole year were contained. *Calv.* Lex. Jur. in voc.

In which ſenſe *Annales* ſtand oppoſed to *ſemeſtres libri*, wherein the acts and conſtitutions of ſix months were contained.

ANNALES *baculi*, denote a kind of wooden almanacks uſed among our anceſtors, called alſo runſtocks or clogs. *Worm.* de faſt. Danic. l. 3. c. 2.

ANNALES, in middle-age writers, denotes yearlings, or young cattle of a year old, or under two. *Du Cange*, in voc.

ANNALES alſo denotes a kind of rent, or annual revenue. *Du Cange*, Gloſſ. Lat. in voc.

ANNATES (*Cycl.*)—The invention of *Annates* is aſcribed, by a late writer, to Anthonin biſhop of Epheſus, who exacted from all biſhops conſecrated by him, a ſum proportionate to the annual revenues of their ſees. The council of Epheſus held in 400, condemned this exaction, but not till Anthonin was dead. It was long after ere *Annates* got footing in the weſtern Church. The time when they were firſt introduced is very obſcure; ſome refer it to the pontificate of Alexander IVth; others to that of John XXIId, who the firſt year of his papacy got a year's revenue of all the cathedral benefices. In 1399, during the ſchiſm of the antipopes, Benedict IXth exacted a year's revenue of all the archbiſhoprics, biſhoprics, and abbies. But in the time of theſe popes, the *Annates* were not fixed; and the clergy often refuſed to pay them. There were even popes who condemned *Annates*; and the ſecular princes frequently ſtickled againſt the payment of them, forbidding any money to be carried out of their dominions on this account. The council of Baſil aboliſhed them. But by the concordat made between Leo Xth, and Francis Iſt, they were ſettled for perpetuity in France [a]. Notwithſtanding which, M. de Launoi continued all his life proteſting againſt them as a moſt deteſtable ſpecies of ſimony [b]. —[[a] *Aubert*, ap. Richel. Dict. in voc. [b] *B. Launoi* de Venerand. Eccleſ. Tradit. circa Simoniam, ap. *Budd.* Iſag. ad Theol. l. 2. c. 5. p. 820.]

Nic. de Clemangis, A. Maſſa, Galleſius, Campegius and Fernandus Cordubenſis have written expreſsly concerning *Annates.* Vid. *Lipen.* Bibl. Jur. p. 19.

ANNEALING, (*Cycl.*) or as it is popularly called *Nealing*, the art or act of burning or baking earthen or other ware in an oven.

The miners at Mendip, when they meet with a rock they cannot cut thro', *anneal* it by laying on wood and coal, and contriving the fire ſo that they quit the mine ere the operation begins; it being dangerous to enter it again before it be quite cleared of the ſmoak. Phil. Tranſ. N°. 39. p. 769.

ANNEALING *of tile*, is uſed in antient ſtatutes for the burning of tile. Stat. 17. Ed. 4. c. 4.

The word is formed of the Saxon *Onælan*, *accendere*, to light, burn. *Skin.* Etym. in voc.

ANNEALING *of Glaſs*, the baking of it in a kind of oven, over a melting furnace, called the tower, after it has been faſhioned into proper veſſels or utenſils. *Boerh.* Meth. Chem. P. 1. p. 140. Not. See GLASS.

ANNEALING is more particularly uſed for the act of burning, or fixing metalline colours on glaſs. See GLASS.

ANNEALING *of Iron.* See IRON.

ANNEALING *of Steel.* See STEEL.

ANNIHILATION (*Cycl.*)—Divines, philoſophers, Chriſtians, Heathens, Jews, Siameſe, Perſians, Papiſts, Socinians, &c. have their peculiar ſyſtems, ſentiments, conjectures, not to ſay dreams, concerning *Annihilation*; and we find great diſputes among them about the reality, the poſſibility, the means, meaſures, prevention, ends, &c. of *Annihilation.*

The firſt notions of the production of a thing from, or reduction of it to nothing, Dr. Burnet ſhews, aroſe from the Chriſtian theology; the words creation and *Annihilation* in the ſenſe now given to them, having been equally unknown to the Hebrews, the Greeks, and the Latins. Vid. Bibl. Univ. T. 24. p. 455.

The antient philoſophers in effect denied all *Annihilation* as well as creation, reſolving all the changes in the world into new modifications, without ſuppoſing the production of any thing new, or deſtruction of the old. Vid. Bibl. Choiſ. T. 1. p. 105. ſeq.

By daily experience they ſaw compounds diſſolved, and in their diſſolution nothing periſhed, but their union, or connection of parts: when in death the body and ſoul were ſeparated, the man they held was gone, but the ſpirit remained in its original the great ſoul of the world, and the body in its earth from whence it came; theſe were again wrought by nature

ture into new compoſitions; and entered new ſtates of being, which had no relation to the former. *Lucret.* l. 3.

If nature admitted any *Annihilation*, the world, ſays Ocellus Lucanus, had long ago periſhed. *Blount*, Anim. Mund. §. 5.

Hence they derived two other notions, *viz.* 1. That of the præ-exiſtence and immortality of ſouls, which being diſtinct things from the body, can neither be produced nor *annihilated*. 2. That the forms and qualities of bodies are nothing diſtinct from matter, ſince they are generated and *annihilated*; a doctrine held by all the antient atomiſts except Anaxagoras. Bibl. Choiſ. T. 1. p. 110.

The Perſian Bramins held, that after a certain period of time conſiſting of 71 Joogs, God not only *annihilates* the whole univerſe, but every thing elſe, angels, ſouls, ſpirits and all, by which he returns to the ſame ſtate he was in before the creation; but that having breathed a while, he goes to work again and a new creation ariſes, to ſubſiſt 71 joogs more, and then to be *annihilated* in its turn. Thus they hold there have been almoſt an infinite number of worlds; but how many joogs are elapſed ſince the laſt creation, they cannot certainly tell, only in an almanac written in the Sanſcript language in 1670, the world is ſaid to be then 3892771 years old from the laſt creation. Vid. Phil. Tranſ. N°. 268. p. 732, 733.

The Siameſe heaven is exactly the hell of ſome Socinians, and other Chriſtian writers, who, ſhocked with the horrible proſpect of eternal torments, have taken refuge in the ſyſtem of *Annihilation*. This ſyſtem ſeems countenanced by ſcripture; for that the words death, deſtruction, and periſhing, whereby the puniſhments of the wicked is moſt frequently expreſſed in ſcripture, do moſt properly import *Annihilation* and an utter end of being.—To this Tillotſon anſwers that theſe words as well as thoſe correſponding to them in other languages, are often both in ſcripture, and other writers uſed to ſignify a ſtate of great miſery and ſuffering, without the utter extinction of the miſerable. Thus God is often ſaid in ſcripture to bring deſtruction on a nation, when he ſends judgments upon them, but without exterminating or making an end of them; ſo in other languages it is frequent by periſhing to expreſs a perſons being made very miſerable, as in that known paſſage in Tiberius's letter to the Roman ſenate.—*Ita me dii, deæque omnes pejus perdant, quam hodie perire me ſentio.* As to the word death, a ſtate of miſery which is as bad or worſe than death may properly enough be called by that name. And thus the puniſhment of wicked men after the day of judgment is in the book of revelations frequently called the ſecond death. Vid. Bibl. Choiſ. T. 7. p. 314. ſeq. Supp. to Swind. p. 396. ſeq.

This ſuppoſition excludes all poſitive puniſhment and torment of ſinners; the fire of hell is quenched at once, and turned only into a frightful metaphor without further meaning. Add that, in this ſuppoſition, the puniſhment of all ſinners muſt of neceſſity be equal, ſince there are no degrees of *Annihilation*, or not being; which is directly contrary to the words of ſcripture.

The Socinians aſſert, that God will *annihilate* the ſouls of the damned, to put an end to their pains; this *Annihilation* makes what they call the ſecond death, or general death. Vid. Mem. de Trev. 1702. p. 6.

Some Chriſtian writers allow a long time of the moſt terrible torments of ſinners, and after that ſuppoſe, that there ſhall be an utter end of their being [a]; of which opinion Irenæus appears to have been, who, according to M. du Pin, taught that the ſouls, at leaſt of the wicked, would not ſubſiſt eternally; but that, after having undergone their torments for a certain period, they would at length ceaſe to be at all. But Tillemont, Petit, Didier, and others, endeavour to defend Irenæus from this imputation, as being too favourable to the wicked [b]. Athanaſius ſeems to ſpeak, as if man would have been *annihilated* after the fall, had it not been for his redemption [c]. Tho' ſome have doubted whether this be to be underſtood of an abſolute *Annihilation*.—[a Vid. Bibl. Choiſ. T. 7. p. 316. ſeq. Supp. to Swind. p. 400. ſeq. b Vid. Act. Erud. Lipſ. Supp. T. 3. p. 243. ſeq. Jour. des Scav. 1724. p. 195. ſeq. c Vid. Nouv. Rep. Lett. T. 16. p. 458.]

It has been much diſputed among divines, whether, at the conſummation of things, this earth is to be *annihilated*, or only purified, and fitted for the habitation of ſome new order of beings.

Gerard in his common places, and Hakewil in his apology, contend earneſtly for a total abolition or *Annihilation*. Ray [d], Calmet, and others, think the ſyſtem of renovation, or reſtitution more probable and more conſonant both to ſcripture, reaſon, and antiquity.—The fathers who have treated on the queſtion are divided, ſome holding that the univerſe ſhall not be *annihilated*, but only its external face changed; others aſſert that the ſubſtance of it ſhall be deſtroyed. But they all generally agree that there will be a renovation of the earth; ſo that they who hold for the *Annihilation* ſuppoſe there will be a new creation [e].—[d *Ray*, Phyſ. Theol. Diſc. 3. c. 11. e Jour. des Scav. Aout. 1715. p. 167. Jour. des Scav. 1723. Juin. p. 584.]

How widely have the ſentiments of mankind differed, as to the poſſibility and impoſſibility of *Annihilation?* According to ſome, nothing ſo difficult; it requires the infinite power of the Creator to effect it; ſome go further, and ſeem to put it out of the power of God himſelf. According to others, nothing ſo eaſy; exiſtence is a ſtate of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all. It will do itſelf, nay, what is more, it requires an infinite power to prevent it. I know not whether ſome do not deny it in the Creator's power to prevent it.

Many authors conſider preſervation as a continual reproduction of a thing, which ſubſiſting no longer of itſelf, would every moment return into nothing.—This ſome call the reproductive ſyſtem. Mem. de Trev. 1715. p. 224.

Gaſſendi on the contrary aſſerts, that the world may indeed be *annihilated* by the ſame power which firſt created it, but that to continue it there is no occaſion for any power of preſervation. Ibid. p. 225.

The Jews had a ſpecies of excommunication, called *cherem*, which implied a total extermination or cutting off, and which according to Maimonides extends to an *Annihilation* of the ſoul, and an excluſion from all future life.

Some divines, of which number the learned biſhop King ſeems to be, hold *Annihilation* for the greateſt of all evils, worſe even than the utmoſt torments of hell flames; while others with ſome of the eaſtern philoſophers acknowledge *Annihilation* for the ultimate pitch of happineſs human nature is capable of: that ſovereign good; that abſolute beatitude, ſo long vainly ſought for by the philoſophers is found here. No wonder it had been ſo long concealed; for who would have thought of looking for the *ſummum bonum*, where others have placed the ſum of miſery. Mem. de Trev. an. 1711. p. 2078.

Biſhop King propoſes it as a queſtion, whether ſuffering eternal torments be a greater evil than not exiſting? He thinks it highly probable that the damned will be ſuch fools, that feeling their own miſery in the moſt exquiſite degree, they will rather applaud their own conduct and chooſe to be, and to be what they are; rather than not to be at all; fond of their condition, however wretched, like people enraged, they will perſiſt in their former ſentiments without opening their eyes to their folly, and perceive by way of indignation and revenge.

M. Bayle refutes him on this head, but might, one would think, have ſaved himſelf the trouble. V. Nouv. Rep. Lett. T. 37. p. 73.

The Talapoins hold it the ſupreme degree of happineſs to have the ſoul totally *annihilated*, and freed from the burden and ſlavery of tranſmigrations.—They ſpeak of three Talapoins who after a great number of tranſmigrations became Gods, and when arrived at this ſtate, procured this further reward of their merit to be *annihilated*. The firſt of theſe, who is called Nacodon, or Sommonocodom, is ſuppoſed to have paſſed through five thouſand ſucceſſive bodies; ſince his *Annihilation* there has been no God left. *Chaumont*, Relat. de l'Ambaſſ. à Siam. Act. Erud. Lipſ. 2687. p. 110.

The ultimate reward of the higheſt perfection man can arrive at is Nieurepan, or *Annihilation*, which at length is granted to thoſe who are perfectly pure and good, after their ſouls have wandered many thouſand years through divers bodies. *De la Loubere*, Du Royaume de Siam. p. 487. Act. Erud. Lipſ. 1692. p. 487.

The Romiſh church holds a total *Annihilation* of the whole ſubſtance of the bread and wine in the euchariſt; but that the antient church were not of the ſame belief, appears clearly from that celebrated paſſage in St. Chryſoſtom's epiſtle to the monk Cæſarius, as well as from the firſt dialogue of Theodoret, and pope Gelaſius's book *de duabus naturis*. Vid. Nouv. Rep. Lett. T. 8. p. 1418. ſeq.

The quietiſts ſpeak much of a kind of myſtic *Annihilation*, whereby the human will is ſwallowed up, or extinguiſhed in the divine.

An uniformity between the divine and human wills, as to the ſame objects, is called union; which they hold may be ſo cloſe, that the ſoul ſhall loſe all endeavour or inclination of reſiſting. This ſtate they call the myſtical *Annihilation*, death, diviſion, or deſtruction of our own will, whereby man is brought to will or nill nothing but as God does. Vid. Act. Erud. Lipſ. 1713. p. 490.

This they pretend is founded on ſcripture. St Paul ſays, *I am nothing* [f]; and of Chriſt, that he *made himſelf nothing* [g], *ille ſe exaninivit*. Are not theſe plain marks of *Annihilation* [h]? Who can doubt it? It is a misfortune the Engliſh tranſlation ſhould have rendered the latter paſſage, ſo as to be of no ſervice to their cauſe.—[f 2 Cor. xii. 11. g Phil. ii. h Apol. Theol. Myſt. n. 15.]

M. De la Bruyere rallies the quietiſts on the total *Annihilation* which they require of their penitents; a man who is made for thinking muſt have very extraordinary aſſiſtances to enable him to think of nothing, that is not to think at all; and how will women ſupport ſo painful a ſuſpenſion of all their faculties? Nouv. Rep. Lett. 1699. T. 17. p. 34.

ANNIVERSARY-*Days*, (*Cycl.*) were antiently called *year-days*, or *mind-days*, i. e. memorial-days.

In ſome authors we alſo find it written *anniverſal.*

The Banians give an *Anniverſary* feaſt to all the flies in the country, to whom they ſerve up diſhes of honey and milk. Vid. Jour. des Scav. T. 78. p. 70.

The pope fulminates an *Anniverſary* excommunication againſt the people of England. The Armenians every year pronounce a ſolemn excommunication of the council of Calcedon and pope Leo. V. Work. Learn. T. 5. p. 662.

The Rabbins ſpeak of an *Anniverſary* judgment in this life, by which every man is tried in the firſt day of the year, and according as his righteouſneſs or iniquity is found to preponderate, he is ſealed for death or life. V. Bibl. Univ. T. 2. p. 253.

ANNIVERSARY *Winds* are thoſe which blow conſtantly at certain ſeaſons of the year.

Theſe are oth erwiſe called Eteſian winds: ſuch are the trade winds, and monſoons. See the article TRADE *Wind*, and MONSOON, *Cycl.*

ANNIVERSARY is more particularly uſed for the *annale*, or maſs rehearſed daily for the ſpace of a year after a perſon's death. *Linwood*, Provinc. p. 329, and 345. *Du Cange*, Gloſſ. Lat.

Il Perez de Lara has a treatiſe expreſs on *Anniverſaries* and chaplainſhips.

De Anniverſariis & capellaniis; in quibus etiam ſpecialiter diſputatur de annuo relicto pro virginibus maritandis, pro infantibus expoſitis nutriendis, captivis redimendis, &c. *Francof.* 1610. 4°.

ANNOMINATION, *Annominatio*, in rhetoric, the ſame with what is otherwiſe called *paronomaſia*. See the article PARONOMASIA, *Cycl.*

ANNONA, in antient writers, denotes victuals or proviſion of corn for a year. *Calv.* Lex. Jur. p. 69. *Pitiſc.* Lex. Ant. T. 1. p. 99.

ANNONA *Civilis*, the corn with which the granaries of cities were filled every year, for the ſubſiſtance of the citizens.

ANNONA *Militaris*, the corn and other proviſion laid up in the magazines, for the ſubſiſtance of an army during the campaign. *Danet*, Dict. Ant. in voc.

In antient writers we alſo meet with the phraſes *ſingulæ Annonæ*, *binæ Annonæ*, *ternæ Annonæ*; with regard to which Salmaſius lays down this rule, that when *Annona* occurs in the ſingular number, it includes not only corn, but fleſh, wine, oil, and other neceſſaries; whereas when it is uſed in the plural number, it imports bread alone. Aquinus is not contented with this rule, but inſtead thereof advances another, *viz.* that *Annona* in the ſingular number includes all kinds of proviſion; and, in the plural, imports ſo many rations or pittances of bread, fleſh, and the like, diſtributed to ſo many men.

In this ſenſe, ſoldiers are ſometimes ſaid to have riſen to the benefit of five or more *Annonæ*, that is, were entitled to ſo many rations. The emperors Arcadius and Honorius took great pains to reduce this profuſion. *Aquin.* Lex. Milit. T. 1. p. 53.

ANNONÆ *Præfectus*, or *curator*, was an officer extraordinary, intruſted with the direction of the corn, to ſee it ſold at a reaſonable price. *Briſſ.* de Verb. Signif. p. 46.

The *Annonæ Præfectus* amounted to much the ſame with what at other times was called *Ædilis Cerealis*.

ANNONÆ *Structor*, an officer who had the management of the military proviſions. *Aquin.* Lex. Milit. T. 1. p. 53.

The *Annonæ Structor* anſwered to what the Italians call *commiſſario di viveri*.

ANNONAGE *Annonagium*, a tax on corn. *Du Cange*, Gloſſ. Lat. T. 1. p. 197.

ANNONAGE is much the ſame with *frumentage*.

ANNONARIUS, in middle age writers, an officer appointed to diſtribute proviſion to the ſoldiery, *&c.* By the laws of the Viſigoths it appears, that they had *Annonarii* in each of their cities and caſtles, to take care their ſoldiers had their allowance fairly dealt them. *Du Cange*, loc. cit.

In the antient monaſteries we meet with an *Annonaria præpoſitura*, or office to which belonged either the buſineſs of purveyance, or of diſtributing the pittances to the monks. *Du Cange*, Gloſſ. Lat. T. 1. p. 197. ſeq.

ANNONARII is alſo uſed for a kind of monopoliſts, who bought up the whole of a commodity to ſell it again at a raiſed price. *Pitiſc.* Lex. Ant. T. 1. p. 99.

ANNOTATION, (*Cycl.*) in medicine, denotes the very beginning of a febrile paroxyſm, when the patient grows chill, ſhudders, yawns, is drowſy, and the like. This is called by the Greeks *epiſemaſia* [a]; ſometimes alſo, εισβολη παροξυσμου [b]. [a *Gal.* Aph. 2, 1. b *Caſt.* Lex. Med. p. 52.]

ANNOTATION is alſo uſed for a ſymptom peculiar to hectic fevers, when the patient, an hour or two after eating, finds himſelf hot, his pulſe quickened, *&c.* without any ſhuddering.—This is more peculiarly called *Annotatio incompreſſa*, επισημασια αθλιπλος. *Gal.* de Dif. Febr. c. 9.

ANNOTATION, in the civil law, denotes a kind of reſcript or grant of the emperor, ſigned with his own hand. But this *Annotation* differed from a mere reſcript, and a pragmatic ſanction. *Briſſ.* de Verb.Signif. in voc. V.Bibl. Ital. T. 2. p. 254.

It took its name from the note or ſubſcription at the bottom, which was in red letters.

ANNOTTO, in commerce, a kind of red dye, brought from the Weſt Indies. This is otherwiſe denominated *anate* and *attole*.

It is procured from a red flower, produced by a ſhrub, which grows ſeven or eight foot high. This flower being thrown into tubs or ciſterns, for the purpoſe, is treated much after the manner of indigo.

The *Annotto* is now only prepared by the Spaniards. The Engliſh had formerly a manufacture at St Angelo now ruined. The drug is preferred by the dyers to indigo, and ſold one fourth dearer. *Savar.* Dict. Comm. T. 1. p. 98. in voc. *Anate*.

ANNUA *Penſione*, an antient writ for providing the king's chaplain unpreferred with a penſion. It was brought where the king having due to him an annual penſion from an abbot or prior, for any of his chaplains whom he ſhould nominate (being unprovided of livings) to demand the ſame of ſuch abbot or prior. Reg. Orig. 165, 307. Terms of Law, *Blount*.

ANNUAL, *Annuale*, in church affairs, is uſed for the yearly produce of the prebend of a canon or clerk deceaſed. *Du Cange*, Gloſſ. Lat. T. 1. p. 198.

In which ſenſe *Annuale* amounts to the ſame with what we otherwiſe call *annat*. See ANNAT.

ANNUAL is alſo uſed, in eccleſiaſtical writers, to denote a yearly office, ſaid for the ſoul of a perſon deceaſed on the day of his obit, or anniverſary. *Du Cange*, Gloſſ. Lat. T. 1. p. 198. See ANNALE, ANNIVERSARY, &c.

ANNUAL, in the Scotiſh law, denotes any yearly revenue, or due paid at certain terms, either legal as Martimaſs and Whitſuntide, or conventional as the parties agree. *Skene*, de Verb. Signif. p. 7. ſeq.

In the acts of parliament, made by queen Mary, mention is made of ground *Annuel*, fue *Annuel*, and top *Annuel*; the meaning whereof is ſomewhat uncertain.

Ground ANNUEL, according to Skene, is when the property of any land, whether built or unbuilt, is let or ſold for a yearly, rent, to be paid either to the proprietor, or, to ſome chaplain, or prieſt.

Fue ANNUEL is either when the mail or due is diſpoſed of, as a yearly revenue; or when the lands or tenement is let in fee farm hereditary, for a certain yearly ſum to be paid under the denomination of *feuda firma*.

ANNUEL *of Norway*, of which mention is made in the acts of parliament of king James the third, was an *Annuel* payment of an hundred marks ſterling, which the kings of Scotland were obliged to pay to the kings of Norway, in ſatisfaction for ſome pretenſions which the latter had to the Scotiſh kingdom, by vertue of a conveyance made thereof by Malcom Kanmoir, who uſurped the crown after his brother's deceaſe.

This *Annuel* was firſt eſtabliſhed in 1266; in conſideration whereof the Norvegian renounced all title to the ſucceſſion of the iſles of Scotland. It was paid till the year 1468, when the *Annuel* with all its arrears was renounced in the contract of marriage between king James the third, and Margaret daughter of Chriſtian the firſt, king of Norway, Denmark, and Sweden. *Skene*, loc. cit. p. 8. ſeq.

Top ANNUEL is a due given or aſſigned out of houſes or buildings, where the property remains with the former owner, only with the condition of his paying the ſaid *Annuel*.

ANNUITY (*Cycl.*)—We have ſome obſervations of M. De Moivre, concerning the eaſieſt method for calculating the value of *Annuities* upon lives, from tables of obſervation. See Phil. Tranſ. N°. 473. Sect. 10.

Where he gives the ſolution and demonſtration of theſe two problems.

PROBLEM I.

To find the value of an Annuity, ſo circumſtantiated, that it ſhall be on a life of a given age; and that upon the failing of that life, ſuch a part of the rent ſhall be paid to the heirs of the late poſſeſſor of an Annuity, as may be exactly proportioned to the time intercepted between that of the laſt payment, and the very moment of the life's failing.

Let n repreſent the complement of life, that is the interval of time between the given age, and the extremity of old age ſuppoſed at 86. And let r be the amount of 1 $\mathcal{L}$. for one year; a, the hyperbolic logarithm of r; p, the preſent value of an *Annuity* of 1 $\mathcal{L}$. for the given time; $\mathcal{Q}$, the value of the life ſought.

$$\text{Then will } \mathcal{Q} = \frac{1}{r-1} - \frac{p}{an}$$

This is the rule given page 86. lin. 12. of the IId. Edit. of Mr. De Moiver's *Annuities* on lives, but without demonſtration.

As there are no printed tables of hyperbolic logarithms extant, it may be proper here to give ſuch as may be wanting for this calculation. Suppoſing,

$r = 1.04$ then will $a = 0.0392207 = \frac{2}{51}$
$r = 1.05$ —— $a = 0.0487901 = \frac{2}{41}$
$r = 1.06$ —— $a = 0.0582589 = \frac{6}{103}$
} nearly.

It is to be obſerved, that the rule here given makes the value of lives ſomewhat greater than what is found by Mr. De Moi-

Moivre's theorem in the firſt problem of his *Annuities* on lives; becauſe in the preſent caſe there is one payment more to be made than in the other, yet on the ſuppoſition of an equal decrement of life to the extremity of old age, the difference of the rules is but inconſiderable. But if ever we ſhould have tables of obſervation, concerning the mortality of mankind, intirely to be depended upon, then it would be convenient to divide the whole interval of life into ſuch ſmaller intervals, as, during which, the decrements of life have been obſerved to be uniform, notwithſtanding the decrements in ſome of thoſe intervals ſhould be quicker, or ſlower, than others; for then the theorem here given, would be preferable to the other.

PROBLEM II.

To find the value of an Annuity for a limited interval of life, during which the decrements of life may be conſidered as equal.

Let a and b repreſent the number of people living in the beginning and end of the given interval of years. Let s be that interval; P, the value of an *Annuity* certain for that interval; Q, the value of an *Annuity* for a life ſuppoſed to be neceſſarily extinct in the time s; or, which amounts to the ſame, the value of an *Annuity* for a life of which the complement is s.

Then $Q+\frac{b}{a}\times\overline{P-Q}$ will expreſs the value required. Example. Let it be required to find the value of an *Annuity* for an age of 54, to continue 16 years, and no longer.

Then by Dr. Halley's tables it appears that $a=302$, $b=172$. And $n=s=16$; and by the tables of the values of *Annuities* certain $P=10.8377$; alſo by probl. 1. $Q=\frac{1}{r-1}-\frac{p}{an}=6.1168$. Hence by the preſent problem, it follows, that $Q+\frac{b}{a}\times\overline{P-Q}=8.3365$; the years purchaſe required, ſuppoſing intereſt at 5 *per Cent. per Ann.*

In the ſame manner the value of an *Annuity* between the age of 42 and 49 is worth 5.3492 years purchaſe. And from the age of 49 to 54 is worth 4.0374 years purchaſe.

Now if it were required to determine the value of an *Annuity* or life to continue from 42 to 70, it might be determined from the foregoing partial computations; but deductions for the chance of the life's failing between 49 and 54, as alſo between 42 and 49, and the diſcount of money, during thoſe ſeveral intervals, muſt be allowed. Then the value of an *Annuity* to continue from 42 to 70 will be found to be 11.0571 years purchaſe. In the ſame manner of computation the laſt 16 years of life, reaching from 70 to 86, when properly diſcounted and alſo diminiſhed on account of the probability of living from 42 to 70, the value of thoſe 16 years will be reduced to 0.8; this being added to 11.0571 before found, the ſum 11.8571 will be the value of an *Annuity* to continue from 42 to 86; and this is the value of a life of 42. Now this value in Mr. De Moivre's tables is but 11.57, on the ſuppoſition of an uniform decrement of life, from an age given, to the extremity of old age. We ſee then how the more accurate obſervations concerning the mortality of mankind furniſh corrections to the tables of *Annuities* in uſe.

We muſt here obſerve, that Mr. De Moivre in this tranſaction has corrected the ſolutions he had formerly given of two problems, *viz.* the 23d, and 25th. in the II. edition of his *Annuities*.

ANNUITY *for Lives*. See LIFE.

ANNUNTIATOR, in the Greek church, an officer whoſe buſineſs is to give notice of the feaſts, and holy days to be obſerved. Trev. Dict. Univ. T. 1. p. 429.

ANOCHUS, an imaginary name of a medicine, concerning which many fruitleſs conjectures have been made. The word occurs only in Gaza's tranſlation of the account which Theophraſtus has left us of the euonymus of thoſe times. The author ſays, that the goats which eat the leaves and fruit of the euonymus were killed by it, and that they died of a ſtoppage of the bowels, which he has expreſſed by the word *anocho*, ανοχω, derived from the verb, ανεσχειν, which ſignifies a retention of the ſtools; and having added to this error a ſecond of reading the Greek word καθειρεισθαι into καθαιρεῖσαι, he explains it that they muſt be cured by *anochus*, which he miſtakes for the name of ſome medicine, not underſtanding it to be the name by which the author expreſſed the diſeaſe.

It is to be obſerved by the way, that the euonymus of the Greeks could not be the ſame plant known at this time by that name, ſince the cattle eat our euonymus or fuſanus whenever they can get it, and that without any danger; but the deſcriptions of theſe plants in the antient and modern authors ſhew alſo that they were very different. See FUSANUS

ANOCTORON, in eccleſiaſtical antiquity, a name uſed by ſome writers for a church. *Bingh.* Orig. Eccleſ. l. 8. c. 1. §. 5. *Anoctora* properly import Roman halls, divers of which were converted into churches.

In which ſenſe *Anoctora* amount to much the ſame with *baſilicæ*. See BASILICS.

ANOCYSTI, in natural hiſtory, the name of a claſs of the *echini marini*, which have an aperture for the anus at the top of the ſhell.

Some of theſe approach to a hemiſpheric or ſpheroidal figure, others flatter, and in ſhape ſomewhat reſembling a ſhield.

ANODUS is uſed by ſome chemical writers to denote a putritious matter ſeparated by the kidneys.

In this ſenſe *Anodus* ſtands contradiſtinguiſhed from the ſuperfluous part, that is the urine. *Paracelſ.* l. 1. de Tartar. Trac. 3. c. 2. Not.

ANODYNE (*Cycl.*)—A ready way of preparing a uſeful, ſafe, and efficacious *Anodyne* is as follows. Take half an ounce of opium, diſſolve it in a gentle heat in three ounces of water, ſtrain the ſolution and evaporate it to a dry ſubſtance. Grind this to powder in a glaſs mortar with twice the quantity of loaf-ſugar, and you have an excellent preparation of opium, to be given three or four grains for a doſe. *Shaw*'s Lectures p. 233.

By diſſolving the opium thus in water, we get rid not only of its groſs and foul parts, but alſo of it reſinous, which are found much more pernicious than the reſt; and by dividing its parts afterwards with ſugar the medicine is rendered more uniform, reſoluble, and miſcible with animal fluids.

But however opium is prepared, it ſtill muſt be acknowledged that it retains qualities that make it little leſs than a poiſon in an over doſe; whence it were much to be wiſhed ſomething could be found that would be more innocent, and yet ſupply it place. And this camphor and nitre will do on many, tho' not on all occaſions.

ANODYNUS *Mineralis Liquor*. See LIQUOR.

ANOINTERS, a religious ſect in ſome parts of England, ſo called from the ceremony they uſe of anointing all perſons before they admit them into their church. They found their opinion of anointing upon the fifth of St. James verſes 14 and 15. Is there any ſick among you (which they account all people to be but themſelves) let him call for the elders of the church, and let them pray over him, anointing him with oil in the name of the Lord; and the prayer of faith ſhall ſave the ſick, and the lord ſhall raiſe him up, and if he have committted ſins, they ſhall be forgiven him. The elders among theſe people are ſome of the mean tradeſmen of the place, and the oil they uſe is that commonly ſold in the ſhops, with which the proſelyte being ſmeared over, and fired with zeal, he preſently becomes a new light of this church. *Plot*'s Oxfordſhire, p. 208.

ANOLE, in zoology, the name of a ſpecies of lizard common in the Weſt-Indies, about houſes and plantations. It is of the ſize of the common lizard of Europe, but its head is longer, its ſkin of a yelloviſh colour, and its back variegated with green, blue, and grey lines running from the neck to the tail. They creep into holes for the night, and there make a continual and very diſagreeable noiſe; in the day time they are always in motion. *Rochefort*, Hiſt. Antill.

ANOLYMPIADES, in antiquity, a name given by the Eleans to thoſe Olympic games, which had been celebrated under the direction of the Piſæans and Arcadians. *Potter*, Archæol. Græc. l. 2. c. 22.

The Eleans claimed the ſole right of managing the Olympic games, in which they ſometimes met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Eleans were at that time reduced very low; this as well as thoſe managed by the inhabitants of Piſa, they called ανολυμπιαδας, that is, unlawful Olympiads, and left them out of their annals, wherein the names of the victors and other occurences were regiſtred.

ANOMŒANS, (*Cycl.*) in church hiſtory, were ſometimes called corruptly *Anomians*, *Anomii*, and *Anomiani*.

The *Anomœans* were a ſpecies of rigid Arians. They condemned the Semi-arians at the council of Ancyre for holding the το ομοιωσιον. *Budd.* Iſag. ad. Theol. l. 2. c. 2. p. 458.

Prateolus deſcribes the Antinomians, under the title of *Anomi* or *Anomœi*, *Anomœans*. *Elench.* Hæreſ. l. 1. n. 40. See alſo *Sozom.* l. 4. c. 13. and 28. It. l. 6. c. 26. *Socrat.* l. 2. c. 35. *Theodor.* l. 4. *Epiphan.* Hæreſ. 57, or 77. Trev. Dict. Univ. in voc.

The word *Anomœan* is compounded of α, and νομος, law and more properly belongs to the ſect whom we call *Antinomians*, than to the *Anomœans*. See ANTINOMIANS.

ANOMORHOMBOIDIA, in natural hiſtory, the name of a genus of ſpars; the word is derived from the Greek, ανωμαλὸς, irregular, and ῥόμβοειδὴς a rhomboidal figure.

The bodies of this genus are pellucid cryſtalline ſpars of no determinate or regular external form, but always breaking into regularly rhomboidal maſſes; eaſily fiſſil, and compoſed of plates running both horizontally and perpendicularly thro' the maſſes, but cleaving more readily and evenly in an horizontal than in a perpendicular direction. The plates being ever compoſed of irregular arrangements of rhomboidal concretions.

Of this genus there are five known ſpecies. 1. A white bright and ſhattery one; found in great quantities in the lead-mines of Derbyſhire, Yorkſhire, and Wales. 2. A milk-white opake and ſhattery one, found in ſome parts of France, and very plentifully in Germany, and ſometimes in Wales and Scotland, and in the hills of Yorkſhire. 3. A hard dull and

ſnow-white one, found in ſome of the mines in Derbyſhire, and in many of our northern countries. 4. A hard grey and pellucid one, found in the lead-mines of Yorkſhire, and very common in Germany. And, 5. a pellucid and colourleſs one; this is found in the lead-mines of Derbyſhire and Yorkſhire. All theſe in ſome degree have the double refraction of the iſland cryſtal. *Hill*'s Hiſt. of Foſ. p. 337.

ANONA, in botany, the name of a genus of plants, ſome ſpecies of which are deſcribed by Plumier, under the name *Guanabanus*. The characters are theſe. The perianthium is ſmall and conſiſts of three leaves, which are hollow, pointed, and ſhaped into a heart-like form at the end. The flower conſiſts of ſix heart-ſhaped petals, the inner three of which are ſmaller than the others; there are ſcarce any filaments to ſerve by way of ſtamina, but the antheræ are very numerous and ſeem to adhere to the ſides of the germen. The germen is roundiſh and ſtands upon the cup; there are no ſtyles, but ſeveral obtuſe ſtigmata. The fruit is an extreamly large berry of an oval and rounded figure, containing one cell, and covered with a ſcaly punctated bark; the ſeeds are numerous, hard, of an oblong oval figure and placed circularly. *Linnæi* Gen. Pl. p. 255. *Plumier*, 10.

ANONIS, in botany. See REST-HARROW.

ANONYMOUS, in anatomy, a name ſometimes given to parts newly diſcovered, or firſt taken notice of. *Quinc.* Lex. in voc.

ANONYMOUS is alſo an appellation antiently given to the ſecond cartilage of the throat, by later writers called *cricoides*, or *annuliformis*. *Theoph.* Protoſpath. de Hum. Corp. Fabr. l. 3. c. 15. *Caſt.* Lex. Med. in voc.

ANPITS, in ſome middle age writers, denotes a breaſt-work, anſwering to what is otherwiſe called *barbacan*. *Aquin.* Lex. Milit. T. 1. p. 53.

ANSARIUM, in the civil law, a duty impoſed on all proviſions carried in veſſels with *Anſæ*.

This was otherwiſe called *Anſurium*, and the collectors of it *Anſurii*. *Pitiſc.* Lex. Ant. T. 1. p. 113.

ANSATUM *Telum*, according to ſome, denotes a dart, or javelin with an *amentum* faſtened to it.

Others rather take the *anſæ* of a javelin to be thoſe two eminences about the middle of the *cuſpis*, or point, which hindered the weapon from piercing thro' the whole body. *Pitiſc.* Lex. Ant. T. 1. p. 113.

ANSER, *the Gooſe*, in ornithology. See GOOSE.

ANSER, in aſtronomy, a ſmall ſtar, of the fifth or ſixth magnitude, in the milky way, between the ſwan and eagle, firſt brought into order by Hevelius. Vid. *Hevel.* Prodrom. Aſtron. p. 117.

ANT, *Formica*, in the hiſtory of inſects. See FORMICA.

ANTS *Eggs* is a name popularly given to a kind of little white balls found in the banks or neſts of *Ants*, ordinarily ſuppoſed to be the ova of this inſect.

Late naturaliſts have obſerved, that theſe are not properly the *Ants-eggs*, but the young brood themſelves in their firſt ſtate; they are ſo many little vermiculi wrapped up in a film, or ſkin compoſed of a ſort of ſilk which they ſpin out of themſelves, as ſilk-worms and catterpillars do [a]. At firſt they are hardly obſerved to ſtir, but after a few days continuance, exhibit a feeble motion of flexion and extenſion; and begin to look yelloviſh and hairy, ſhaped like ſmall maggots, in which ſhape they grow up till they are almoſt as large as *Ants*. When they paſs their metamorphoſis, and appear in their proper ſhape [b], they have a ſmall black ſpeck on them cloſe to the anus of the included *Ant*, which M. Leewenhoeck probably enough imagines to be the *fæces* voided by it [c].—[a Bibl. Univ. T. 11. p. 156. b Phil. Tranſ. N°. 23. p. 426. c Bibl. Univ. T. 11. p. 156.]

Dr. Ed. King opened ſeveral of theſe vulgarly reputed eggs, in ſome of which he found only a maggot in the circumſtances as above deſcribed; while in another the maggot had begun to put on the ſhape of an *Ant* about the head, having two little yellow ſpecks, where the eyes were to be. And in others, a further progreſs was obſerved, the included maggot being furniſhed with every thing to compleat the ſhape of an *Ant*, but wholly tranſparent, the eyes only excepted, which were as black as bugles. Laſtly, in others, he took out every way perfect and compleat *Ants*, which immediately crept about among the reſt. Phil. Tranſ. loc. cit.

Theſe ſuppoſed *Ants-eggs* are brought up every morning in ſummer near the top of the bank, where they are lodged all the warm part of the day, within reach of the ſun's influence. At night, or if it be cool, or like to rain, they carry them down to a greater depth; ſo that you may dig a foot deep e'er you come at them. Id. ibid. p. 427. ſeq.

The true *Ants-eggs* are the white ſubſtance which upon opening their banks, appears to the eye like the ſcattterings of fine white ſugar, or ſalt, but very ſoft, and tender. Examined by a microſcope it is found to conſiſt of ſeveral, pure, white appearances in diſtinct membranes, all figured like the leſſer ſort of birds eggs, and as clear as a fiſhes bladder.

The ſame ſubſtance is found in the bodies of the *Ants* themſelves.—This ſpawn, when emitted, they lye in multitudes on, to brood; till in ſome time it is turned into little vermicles, as ſmall as mites, commonly called *Ants-eggs*. Phil. Tranſ. ibid. p. 426.

The progreſs of the generation and tranſormation of *Ants* is traced exactly by M. Leewenhoeck. V. Bibl. Univ. T. 11. p. 153.

ANT-*Hills* are little hillocks of earth, which the *Ants* throw up for their habitation and the breeding of their young. They are a very great miſchief to dry paſtures, not only by waſting ſo much land as they cover, but by hindering the ſcythe in mowing the graſs, and yielding a poor hungry food pernicious to cattle.

The manner of deſtroying them is to cut them into four parts from the top, and then dig into them ſo deep as to take out the core below, ſo deep that when the turf is laid down again it may lye ſomewhat lower than the level of the reſt of the land; by this means it will be wetter than the reſt of the land, and this will prevent the *Ants* from returning to the ſame place, which otherwiſe they would certainly do. The earth that is taken out muſt be ſcattered to as great a diſtance every way as may be, otherwiſe they will collect it together and make another hill juſt by. *Mortimer*'s Huſbandry, p. 329.

The proper time for doing this is winter, and if the places be left open, the froſt and rains of that time of the year will deſtroy the reſt; but in this caſe care muſt be taken, that they are covered up early enough in the ſpring, otherwiſe they will be leſs fertile in graſs than the other places.

In Hertfordſhire they uſe a particular kind of ſpade to this purpoſe. It is very ſharp and formed at the top into the ſhape of a creſcent, ſo that the whole edge makes up more than three fourths of a circle; this cuts in every part, and does the buſineſs very quickly and effectually; others uſe the ſame inſtruments that they do for mole-hills.

Human dung is a better remedy than all theſe, as is proved by experiment, for it will kill great numbers of them, and drive all the reſt away; if only a ſmall quantity of it be put into their hills.

Some put honey mixed with powder of ratſbane into little boxes pierced full of holes ſuch as will juſt admit this creature, and this never fails to deſtroy them in great numbers; care is to be taken however that theſe holes are not too large, for if they would admit a bee, thoſe creatures would as ſurely come in as the *Ants*, and would not only be deſtroyed themſelves but might chance to carry this poiſoned honey to the hive, and depoſit it in the combs among the reſt, before they died by it, which would render the whole ſtock of honey poiſonous.

A bottle filled half up with any ſweet liquor, and hung upon the trees will deſtroy great numbers by their getting in, and being drowned in it; but if they are troubleſome to the walks and allies in the pleaſure-garden, the watering theſe at times will ſend them away. *Mortimer*'s Huſbandry, p. 330.

ANTA (*Cycl.*)—There were alſo *Antæ* at doors and gates. Feſtus confines their uſe to this laſt place.

Vitruvius calls thoſe that have but two faces out of the wall angular *Antæ*, to diſtinguiſh them from others which have three faces diſengaged, and which are placed at the ends of the walls of porticos. *Perrault* of the five orders, P. 2. c. 6. p. 101. *Evelyn*, Archit. p. 25.

The *Antæ* were alſo called *Poſtes*; by the Greeks, παραστάδες. Some will have them to be the ſame with the *Antepagmenta*. *Vitruv.* 3. 1. *Voſſ.* Etym. p. 31. *Pitiſc.* Lex. Ant. T. 1. p. 114. *Wolf.* Elem. Archit. §. 75. See ANTEPAGMENTA.

ANTACÆUS, in ichthyology, a name firſt given by the Greek writers Ælian and Strabo to the ichthyocolla piſcis, the iſinglaſs fiſh, or huſo; and afterwards, by Jonſton and others, not only to this fiſh, but to the common ſturgeon.

ANTACHATES is uſed, by ſome naturaliſts, for a kind of bitumenous ſtone, of the nature of amber, though of a different colour, which in burning yields a ſmell like myrrh. *Gorr.* Def. Med. p. 39.

ANTACIDS, *Antacida*, is uſed by ſome writers to denote medicines proper to qualify and reſiſt acid humours. *Dol.* Encycl. Med. l. 1. c. 3. §. 19.

Antacids are chiefly of the alcalious kind.

Under the claſs of *Antacids* come, 1. Abſorbents, as chalk, coral, ſea-ſhells, hæmatites, and ſteel filings. 2. Obtundents, as oils, and fats. 3. Immutants, as lixivious ſalts and ſoaps. *Burggr.* Lex. Med. T. 1. p. 861.

ANTAGONIST *Muſcles*, in anatomy, are thoſe which have oppoſite functions. *Heiſt.* Comp. Anat. N°. 307. *Barthol.* Anat. l. 1. c. 5. p. 41. *Caſt.* Lex. Med. p. 54. See the article MUSCLE.

Thus *Flexors* and *Extenſors*, *Abductors* and *Adductors*, are *Antagoniſts* to each other. See FLEXOR, *&c.*

ANTALGIC, an epithet given by ſome writers to medicines proper to abate pain. *Caſt.* Lex. Med. p. 54.

In this ſenſe *Antalgics*, *Antalgica*, amount to the ſame with *Anodynes*. See ANODYNE, *Cycl.* and *Suppl.*

ANTALIUM, in natural hiſtory, a ſmall ſea ſhell of a tubular form, whence it is alſo denominated *Tubulus Marinus*.

The *Antalium*, otherwiſe written *Antale*, and *Antalus*, is about an inch and half long; the thickneſs of a large quill at one end, and of a ſmall one at the other; fluted from end to end, of a white or greeniſh-white colour, and is found on rocks,

and at the bottom of the ſea. V. *Du Cange*, Gloſſ. Gr. T. 1. p. 81. in voc. ανθαλι.

It is an *Alcali* and ſaid to be of ſome medicinal uſe as a reſolvent and dryer; at leaſt by the antients. V. *Myrepſ.* de Unguent. Sect. 3. c. 42.

The *Antalium* bears a near affinity both in origin, ſtructure, and uſe, with the *Dentalium*.

ANTAPHRODISIAC, an epithet given to medicines, which diminiſh the ſeed, and extinguiſh the ſtimuli or incitements to venery. *Wedel.* Amæn. Med. l. 2. Sect. 2. c. 18. *Caſt.* Lex. Med. p. 54.

ANTAPOCHA, in the civil law, denotes one's acknowledgement in writing of money paid, in the way of rent, penſion, intereſt, or the like incumbrance. Such inſtrument or *Antapocha* the debtor gives upon making payment to the creditor, to ſerve as a proof of the charge or incumbrance for futurity, and exclude any claim of preſcription againſt the payment of it. The *Antapocha* differs from the *Apocha*, in that this latter is given by the creditor to the debtor, the former *vice verſa*. *Calv.* Lex. Jur. p. 71.

ANTASTROPHE, in rhetoric, a ſpecies of antepoſition. See ANTEPOSITION.

ANTEAMBULONES, in antiquity, a kind of ſtate ſervants, who walked before their maſters to clear the way, and keep off the crowd. *Pitiſc.* Lex. Ant. T. 1. p. 114.

The formula uſed by theſe was *date locum domino meo.*

ANTECANIS is uſed, by ſome aſtronomers, to denote the ſtar or conſtellation otherwiſe called *canis minor*, or *Procyon*. It is thus denominated as preceding, or being the forerunner of the *canis major*, and riſing a little before it. *Vital.* Lex. Math. p. 47.

ANTECESSORS, in the antient art of war, is an appellation given to a party of horſe, diſpatched before the agmen or body of an army, partly by way of intelligence, and partly to chuſe out a proper place for encamping on, as well as the moſt convenient roads for the ſoldiery to travel in. *Aquin.* Lex. Milit. in voc.

Theſe are alſo denominated *Antecurſores*.

They amount to the ſame with what the Greeks call prodromi.

ANTECURSORES, in the antient military art, parties ſent before to mark out a camp, procure proviſion, or even reconnoitre the enemy. *Aquin.* Lex. Milit. T. 1. p. 55.

ANTEJUSTINIANEAN, an appellation ſometimes given to the antient Roman law, as it ſtood before the time of the emperor Juſtinian.

Tribonian has been often condemned for ſuppreſſing the writings of the *Antejuſtinianean* lawyers. Schulting, a celebrated profeſſor at Leyden, has a diſſertation expreſs on the equity of this cenſure [a]. Fabricius gives a catalogue of the antient *Antejuſtinianean* lawyers [b]. Schulting [c] has publiſhed a collection of the *Antejuſtinianean* writers.—[[a] Ext. in fine ejuſd. Juriſpr. Antejuſt. [b] Bibl. Græc. l. 6. c. 6. n. 5. [c] Juriſprudentia Vetus Antejuſtinianea. Lugd. Bat. 1717. 4to.]

ANTELIUS, or ANTHELIUS, in antient writers, denotes an idol placed over the doors of houſes, ſuppoſed to have the guardianſhip, or protection of them. *Magr.* Vocab. Eccleſ. p. 18.

The word is originally Greek, ανθηλιος, q. d. againſt the ſun, as being expoſed thereto.

ANTELOPE, in natural hiſtory, the name by which we commonly call the *Gazella*, a creature of the goat genus, of which there are three diſtinct kinds. See the article GAZELLA.

ANTELUCAN, in eccleſiaſtical writers, is applied to things done in the night or before day.

We find frequent mention of the *Antilucan* aſſemblies, *Cœtus Antelucani*, of the antient chriſtians in times of perſecution, for religious worſhip. *Bingh.* Orig. Eccleſ. l. 13. c. 10. §. 11.

ANTELUDIA, in antiquity, a day of ſhow or parade preceding the Circenſes, wherein the preparations made for thoſe ſolemnities were expoſed in great form and pomp. *Pitiſc.* Lex. Ant. T. 1. p. 115.

ANTEMURALE, in middle age writers, denotes a kind of outer wall environing the other walls and works of a place, and preventing the too near acceſs of the enemy to them. *Du Cange*, Gloſſ. Lat. in voc.

This is alſo called by Iſidore, *Promurale*, as being *pro munitione muri*, for the defence of the wall. *Iſid.* Orig. l. 15. c. 2.

In ſome writers we find it denominated *antepectoralis muris*, in others *anpits*. *Du Cange*, loc. cit.

ANTEMURALE is alſo uſed to denote any work without ſide the rampart or wall of the place. *Aquin.* Lex. Milit. in voc.

In this ſenſe, *Antemurale* amounts to the ſame with what we otherwiſe call *outwork*.

ANTEMURALE is alſo uſed in eccleſiaſtical writers for the veſtible or entrance of the preſbyterium, or bema.

ANTENATUS is uſed in ſome law writers for the firſt-born, or eldeſt ſon, anſwering to what we call *aiſnè*. *Du Cange*, Gloſſ. Lat. T. 1. p. 241.

ANTENATUS is alſo ſometimes uſed for a ſon, the iſſue of a former marriage.

In which ſenſe, *Antenatus* amounts to the ſame with *Privignus*.

ANTENATI, in the modern Engliſh hiſtory, is chiefly underſtood of the ſubjects of Scotland, born before king James the firſt's acceſſion to the Engliſh crown, and alive after it. V. *Rapin*, Extr. de Rym. Fæd. T. 16. Bibl. Anc. Mod. T. 18. p. 278.

In relation to theſe, thoſe who were born after the acceſſion were denominated *poſtnati*.

The *Antenati* were conſidered as aliens in England, whereas the *Poſtnati* claimed the privilege of natural ſubjects.

ANTENCLEMA, ανθεγκλημα, in oratory, is where the whole defence of the perſon accuſed turns on criminating the accuſer. *Quinct.* Inſt. l. 7. c. 3.

Such is the defence of Oreſtes, or the oration for Milo, *occiſus eſt ſed latro. Exſectus ſed raptor.* See the article RECRIMINATION, *Cycl.*

ANTENICENE, in eccleſiaſtical writers, denotes a thing or perſon prior to the firſt council of Nice.

We ſay the *Antenicene* faith, *Antenicene* creeds, *Antenicene* fathers [a]. There are great diſputes among divines and critics concerning the *Antenicene* ſyſtem of the trinity. Some will have it to have been Arianiſm, others Socinianiſm, others the ſame with what ſtill obtains [b]. Petavius with great learning endeavours to ſhew that the *Antenicene* fathers were all pure Arians; in which he has been ſeconded by M. le Clerc, under the borrowed name of Theophilus Alethinus; alſo by Baltus, Whiſton and others. [c] Biſhop Bull with no leſs learning defends the orthodoxy of the *Antenicene* fathers; and refutes the ſeveral objections produced by Petavius [d].—[[a] *Budd.* Iſag. ad Theol. l. 2. c. 2. p. 444. [b] *Budd.* loc. cit. c. 3. p. 581. Nouv. Rep. Lett. T. 4. p. 611. Mem. for Ingen. p. 52. [c] Journ. des Scav. T. 47. p. 223. Jour. Liter. T. 6. p. 85. ſeq. [d] Nouv. Rep. Lett. T. 31. p. 247.]

ANTENNÆ, in natural hiſtory. See FEELERS.

ANTENUPTIAL, ſomething that precedes marriage.

In this ſenſe, we ſay *Antenuptial* promiſes, *Antenuptial* preſents, *Antenuptial* covenants, *&c.*

Neoſtadius has a treatiſe expreſs *de pactis Antenuptialibus. Lipen.* Bibl. Jur. p. 370.

ANTEPILANI, among the antient Romans, denote the Haſtati or Principes of a legion.

They are ſuppoſed to have been thus called becauſe ranged before the Triarii, who were alſo called *Pilani*.

Some will have the word to be a corruption for *Anteſignani*. V. *Pitiſc.* Lex. Ant. in voc.

ANTEPILEPTIC, in medicine, denotes a quality in bodies, whereby they reſiſt or oppoſe the epilepſy and convulſive motions. V. *Caſt.* Lex. Med. in voc.

The chief *Antepileptics* from the vegetable kingdom are, the roots of pæony, valerian, the flowers of the lime tree, miſletoe of the oak, hazel and lime.

The animal kingdom affords a great number of *Antepileptics* either real or imaginary. Such are elks claws, caſtoreum, divers parts of the deer, ſwallows-hearts, the human cranium, blood, ſecundines, *&c.* the hippomanes, lizards, frogs and moles liver and ſpine, lions and peacocks dung, earth worms, *&c.*

The mineral kingdom affords hyacinths and ſmaragds prepared, alſo tincture of luna. *Junck.* Conſp. Therap. Gen. Tab. 90. p. 597. ſeq.

ANTEPOSITION, a grammatical figure, whereby a word which by the ordinary rules of ſyntax ought to follow another comes before it. As when in the Latin the adjective is put before the ſubſtantive, the verb before the nominative caſe, *&c.* *Thomas. Erot.* Rhet. p. 75.

Antepoſition ſtands oppoſed to *poſtpoſition*. One caſe or ſpecies of this figure is called by a particular name, *antaſtrophe*.

ANTERIDES, in the antient architecture, denotes buttreſſes erected to ſupport a wall.

Theſe are ſometimes alſo called *antes*, ſometimes *eriſmæ*, and by the Greeks ερεισμαλα.

Anterides anſwer to what the modern builders call *counterforts*, *arcbutants*; the Italians, *barbicane*, and *ſperoni*, or ſpurs. *Pitiſc.* Lex. Ant. T. 1. p. 115. *Aquin.* Lex. Milit. T. 1. p. 55. *Voſſ.* Etym. p. 32.

ANTEROTES, a name given by ſome of the antient writers on gems to a ſpecies of the amethyſt. Some have imagined they meant by it a ſort of opal, but Pliny expreſsly contradicts this, making the *Anterotes* the fifth kind of amethyſt in value.

ANTESIGNANI, in the Roman armies, a kind of ſoldiery poſted before the eagles, and other enſigns of the legions, whence their appellation.

The *Anteſignani* ſtand contradiſtinguiſhed from the *ſubſignani*, who were ranged in the ſame line with the enſign; and from the *poſtſignani*, who were placed behind them.

Critics are greatly divided concerning the *Anteſignani*. Lipſius maintains them to have been Haſtati, whoſe office was to defend the ſtandard; whence they were alſo denominated *propugnatores*, and *præpoſiti ſignorum*. On this ſuppoſition the Principes made the *ſubſignani*, and the Triarii the *poſtſignani* [a]. Others will have the Velites to have been the *Anteſignani*, at leaſt in Cæſar's time; agreeably to which Livy divides the whole army into *Anteſignani* and *poſtſignani*; the former of whom made the firſt line, compoſed of Velites, or

perſons lightly armed, and the *poſtſignani* the ſecond line, conſiſting of thoſe heavily armed [b]. Others aſſert the *Anteſignani* to have been the firſt body of ſoldiers in heavy armour, called by the Greeks προμαχοι.—[[a] *Aquin.* Lex. Milit. T. 1. p. 55. [b] *Salmaſ.* de Re Milit. Rom. c. 17.]

In effect, the Velites appear, on many accounts, to have been different from the *Anteſignani*, as the former only ſkirmiſhed in parties here and there without any regular enſigns, whereas the latter kept firm to their poſts. The Velites when preſſed were allowed eaſily to give way, whereas the *Anteſignani* were not to flinch except on very extraordinary occaſions. *Pitiſc.* Lex. Ant. T. 1. p. 115. ſeq.

ANTEVIRGILIAN *Huſbandry*. See HUSBANDRY.

ANTHALIUM, among the antients, a root growing in dry places, and about the bigneſs of the fruit of the medlar; it was dug up for food, and eſteemed very pleaſant and wholeſome. See MALINATHALLE.

ANTHESTERION, Ανθεστηριων, in antient chronology, the ſixth month of the Athenian year. It contained twenty-nine days, and anſwered to the latter part of our November and and beginning of December. The Macedonians called it *dæſion* or *deſion*.

It had its name from the feſtival *antheſteria* kept in it. See ANTHESTERIA, *Cycl.*

ANTHIA, in zoology, a name by which ſome improperly call the *falx venetorum*, or ſickle fiſh, a long anguilliform fiſh of the tænia kind. *Willughby*'s Hiſt. Piſc. p. 117.

ANTHIAS, in zoology, the name of a fiſh ſeeming to approach to the turdus or wraſſe kind, of which Rondeletius and ſome other authors have deſcribed four ſpecies. The ſecond of thoſe is however to be rejected from the number, being properly a ſpecies of whiting; all the others in moſt particulars ſo nearly reſemble the varieties of the common turdus, as by many to be ſuſpected to be only varieties of that fiſh.

The firſt ſpecies is of a red colour, and has a very ſtrong and ſharp prickle on the firſt ray of its back fin; its tail is forked, and that and all the fins are of a reddiſh hue; the head is roundiſh, not flatted, and the noſe not at all prominent.

The third ſpecies is by ſome authors called black, but it is truly all over of a deep and duſky purpliſh blue; its body is long and thick not flat, and its teeth very ſtrong and ſerrated. It has thick lips, and round and prominent eyes, the iriſes of which are of a purpliſh colour.

The fourth kind is diſtinguiſhed from all the others, by having two large and arched protuberances like eye-lids, one placed directly over each eye. *Geſner*, de Piſc. p. 62. ſeq.

ANTHINE, among antient naturaliſts, is an appellation given to certain ſpecies of wine and oil.

In this ſenſe the word is alſo written *Anthinos*.

Vinum Anthines, οινος Ανθινης, was that prepared with certain fragrant flowers to give it the more agreeable odour.

Oleum Anthinum is alſo denominated *liliaceum*, ſometimes *ſuſinum*. *Caſt.* Lex. Med. in voc.

Some alſo give the appellation *Anthine* to the compoſition otherwiſe called cyceon.

ANTHOCEROS, in botany, the name of a genus of moſſes. The name was given by Micheli, and the generical character eſtabliſhed in that it has a monopetalous flower, which is corniculated and divided into two carinated parts, the diviſion running to the center, where there ſtands a duſty ſtamen or filament; this he ſays is barren, and ariſes from the tubular cup of the flower; the fruit being ſometimes found on the ſame plants with theſe flowers, and ſometimes on others, and being of a radiated form, each of the ſeveral rays containing two, three, or four ſeeds.

Dillenius however obſerves, that what this author calls the monopetalous flower of the *Anthoceros* is properly the capſule containing a fine duſt, which is like that of the capſules of all the other moſſes, and is by him ſuppoſed to be the farina or male part of the fructification; the filament in the middle of this capſule is ſurrounded with a yellow duſt, and the whole capſule, viewed by the microſcope, appears of the nature of the common unicapſular and bivalve ſeed-veſſels of the larger plants, as the pods of muſtard and the like. And this author further obſerves, that he could not accurately perceive the ſeed-veſſels deſcribed by Micheli.

There are only five known ſpecies of this genus.

1. The common *Anthoceros*, with ſmaller and more divided leaves; this grows moſt frequently in damp ſhady places. 2. The *Anthoceros*, with larger and leſs divided leaves, the heads in this kind ſtanding on very ſhort pedicles; it is found in many parts of Germany. 3. The narrow leaved *Anthoceros* with a ſhort flower; this is found in Italy by way ſides. 4. The five cut leaved *Anthoceros*; the leaves of this are of a purple green; it grows on clayey ground. 5. The muſhroom headed moſs, or ſmall leafleſs moſs, with thick bivalve heads; this is frequent in Muſcovy. *Dillen.* Hiſt. Muſc. p. 476.

ANTHOLYZA, in the Linnæan ſyſtem of botany, the name of a plant which makes a diſtinct genus, the characters of which are theſe. In the place of a flower cup, there are a number of thin imbricated ſpathæ, interwoven with one another, and dividing the flowers; theſe remain after the flowers are fallen. The flower is compoſed of a ſingle petal, which from the form of a tube dilates by degrees into a flatted labiated form, the upper lip of which is placed erect and is very thin and long, and undulated, and near its baſis has two ſhort jaggs; the under lip is ſhort and trifid, and has the middle ſegment larger than the reſt and hanging down. The ſtamina are three long and ſlender filaments; two of theſe are placed under the upper lip, the other upon the lower; the antheræ are pointed. The germen of the piſtillum is beneath the receptacle; the ſtyle is thread-like, and is of the ſame length and placed in the ſame line with the two upper ſtamina; the ſtigma is capillary, bent downward, and divided into three ſegments. The fruit is a roundiſh capſule, but ſomething trigonal, containing three cells, with three valves; the ſeeds are very numerous and of a triangular form. *Linnæi* Genera Plantar. p. 10.

ANTHONY (*Cycl.*) — Juſtiniani [a], Caramuel [b], and others, ſpeak of an order of *St. Anthony* in Æthiopia, eſtabliſhed as early as the year 370. But beſides that Ludolphus makes no mention of them, an order of knights in the fourth century appears at firſt ſight a chimera.—[[a] Hiſtor. de l'Orig. de Cavallieri, c. 5. [b] Theolog. Regolar. P. 9.]

St. Anthony alſo gives the denomination to an order of religious founded in France about the year 1095, to take care of thoſe afflicted with *St. Anthony's fire*. *Emill.* Hiſt. Monaſt. Ord. c. 14. p. 127. ſeq.

The *Anthonins*, or monks of *St. Anthony*, are by ſome ſaid to be of the begging kind. Their founder was Gaſton Frank, who erected a monaſtry for them at la Motte, near Vienne, where the general ſtill lives; they follow the rule of St. Auguſtine. Others give a different account of their origin, and ſuppoſe them thus called, not on account of *St. Anthony's fire*, but becauſe inſtituted by a *St. Anthony*, prior of a monaſtery in that neighbourhood. It is added, that they are regular canons; but the former account ſeems the more probable, ſince it is plain they were originally hoſpitallers; that they had the care of the ſick and weak, and, as a mark of this, ſtill carried the T, the ſign of a crutch. *Aubert*, ap. Richel. Dict. T. 1. p. 95.

It is ſaid in ſome places, theſe monks aſſume to themſelves a power of giving, as well as removing the *ignis ſacer*, or eryſipelas, a power which ſtands them in great ſtead for keeping the poor people in ſubjection and extorting alms. To avoid the menaces of theſe monks, the country people preſent them every year with a fat hog a piece. Some prelates endeavoured to perſuade pope Paul III. to aboliſh the order *quæſtuarios iſtos ſancti Anthonii, qui decipiunt ruſticos & ſimplices, eoſque innumeris ſuperſtitionibus implicent de medio tollendos eſſe* [c]. But they ſubſiſt notwithſtanding to this day in ſeveral places [d].—[[c] *Sebaſt.* Frank. in Chron. p. 468. [d] *Emill.* Hiſt. Monaſt. Ord. c. 14. p. 128. ſeq.]

ST. ANTHONY's *Fire*, a name popularly given to the eryſipelas. See ERYSIPELAS, *Cycl.* and *Suppl.*

Apparently it took this denomination, as thoſe afflicted with it made their peculiar application to *St. Anthony* of Padua for cure. It is known, that antiently particular diſeaſes had their peculiar ſaints; thus in the ophthalmia perſons had recourſe to St. Lucia, in the tooth-ach to St. Apollonia, in the hydrophobia to St. Hubert, &c. *Skin.* Etym. in voc.

In effect, the Romaniſts in ſome parts are ſtill ſaid to repreſent *St. Anthony* with a fire kindled at his ſide, to ſignify that he delivers people from the *ſacer ignis* or eryſipelas. They alſo paint a hog near him, as a token that he cures beaſts of all diſeaſes. To do him the greater honour in ſeveral places, they keep at common charges a hog denominated *St. Anthony*'s hog, for which they have great veneration. Some will have *St. Anthony*'s picture on the walls of their houſes, hoping by that to be preſerved from the plague; and the Italians, who do not know the true ſignification of the fire painted at the ſide of their ſaint, concluding that he preſerves houſes from being burnt, invoke him on ſuch occaſions. *Emill.* Hiſt. Monaſt. Ord. c. 12.

ANTHOPHYLLI, a denomination given to the larger ſpecies of cloves. *Junck.* Conſp. Therap. Tab. 6. n. 44.

The word is otherwiſe written *antophali*, Ανθοφαλοι. *Du Cange*, Gloſſ. Græc. in voc.

ANTHORÆ *Radix*, the name of a root which holds a place in the catalogues of the materia medica, but is not kept at this time in the ſhops. It is the root of the *aconitum ſalutiferum*, or healing aconite of authors; it is kept with us in the gardens of the curious, and flowers in June. It is common wild on the Alps and Pyrenean mountains; the root is of a duſky brown without and whitiſh within, and of an acrid taſte and unpleaſant ſmell; it is accounted a cordial and a reſiſter of poiſon, and is an ingredient in the famous orvietan; and is by many thought to have the ſame virtues with contrayerva. *Pomet*'s Hiſt. of Drugs, p. 42. See the article ACONITE.

The root of *Anthora* became famous for its virtues in preventing the effect of the poiſonous aconite, and ſome other vegetables of the like miſchievous kind; hence it has been brought into uſe againſt poiſons of all kinds, and againſt the bites of venomous animals. Some of the German phyſicians give it alſo in malignant and petechial fevers, and even in

the

the plague; and in many places it is given in powder to children to deſtroy worms, and to relieve in pains of the bowels. It is true that Cluſius holds the root ſuſpected, and diſcourages the uſe of it in medicine; and John Bauhine tells us, it ought never to be given but with great caution, for that it purges violently. But Geſner, who ſpeaks from abſolute experience, tells us, that he had often taken it himſelf, and given it to others in caſes of malignant fevers, and even to children for worms, and that he never even found it to have the purgative quality which Bauhine aſcribes to it. It may be given in powder from a ſcruple to two ſcruples for a doſe, and is beſt given in form of a bolus, its taſte being very diſagreeable. *Cluſius*, *Johan. Bauhine*, *Geſner*, Epiſt.

ANTHORISMUS, Ανθορισμος, in rhetoric, denotes a counter definition or deſcription of a thing. *Heder.* Schul. Lex. p. 261.

Thus, if the plantiff urge, that to take any thing away from another, without his knowledge or conſent, is a theft; this is called ορος, or definition. If the defendant reply, that to take a thing away from another, without his knowledge or conſent, provided it be done with deſign to return it to him again, is not theft; this is an Ανθορισμος.

ANTHOS, in chemiſtry, is uſed to denote the quinteſſence or elixir of gold; and ſometimes for a medicine extracted from pearls. Vid. *Paracelſ.* de Vit. Long. l. 3. c. 1. *Rul.* Lex. Alch. in voc.

ANTHOS *Philoſophorum* is more particularly uſed to denote a method of tranſmuting metals by means of vitriol. *Libav.* Synt. Arc. Chem. l. 7. c. 7. *Caſt.* Lex. in voc.

ANTHOSMIAS, in ſome antient naturaliſts, denotes a rich odoriferous kind of wine. *Suid.* Lex. in Ανθοσμιας.

In this ſenſe *Anthoſmias* differs from *Anthinos*, as the latter imports a medicated wine ſcented with odoriferous herbs, whereas the former derived its fragrancy from the native grapes.

Some give a different explication of the antient *Anthoſmias*. Langius will have it to have been a wine mixt with a fiftieth part of ſea-water. *Lang.* Epiſt. Medic. l. 1. Ep. 27. p. 114. V. *Athen.* deipnos, l. 1. *Foes.* p. 61.

ANTHOXANTHUM, in the Linnæan ſyſtem of botany, the name of a ſort of graſs which makes a diſtinct genus of plants. The characters of this are, that the calix, or flower cup, is compoſed of two glumes, the exterior containing one flower compoſed of two valves of an oval figure, pointed, hollow, and the one larger than the other; the interior glume is compoſed of two valves of the ſame length with the exterior larger valve, and each ſending out a fine beard or acorn from its hinder part: this alſo contains one flower, which is compoſed of two unequal ſized valves, and is extremely thin in its whole ſtructure, and quickly falls off. The ſtamina are three capillary filaments; the antheræ are long, and ſplit at their ends; the germen of the piſtillum is oblong; the ſtyles are capillary, two in number and hoary; the ſtigmata are ſimple; the interior glume grows firmly to the ſeed, which is ſingle, oblong and pointed at each end. *Linnæi* Genera Plantarum, p. 18.

ANTHRACIS, in natural hiſtory, a word uſed by the antients in ſeveral different ſenſes. Pliny makes it ſynonymous with *Anthracias*, which was the name of a gem in uſe among them very remarkable for its luſtre, which as it was moved about reſembled the twinkling and glittering of the ſtars in a clear night; others have underſtood it to mean the aſteria of the antients, in which a light ſpeck reſembling a ſtar ſeemed to be included within the body of the ſtone, and to give light to the ſeveral parts of it as moved in different poſtures. Pliny evidently means this in one place, where he deſcribes this ſtone, for he ſays the ſtars ſeem to run about and change place in it, and that they are ſometimes black ſpecks not bright ones that thus change place in it. All this ſeems evidently to refer the ſtone to the cat's eye, or aſteria kind; but the word *anthracitis* being ſometimes uſed as the genitive caſe of this, there has been ſome confuſion brought into the ſubject by the ſameneſs of the ſound with that *anthracitis* which is the carbuncle. Many of the antients alſo have called the hæmatites or blood-ſtone by this name *anthracitis*, becauſe of its being of the colour of a burning coal.

The word therefore is never to be conſtrued haſtily, but the context examined before it can be aſcertained which of three ſo very different ſubſtances is meant by it.

ANTHRAX, in the natural hiſtory of the antients, was a word uſed by the moſt early writers for the ſubſtance we now call pit-coal and lithanthrax. Theophraſtus plainly tells us, that the ſubſtance ſtrictly and properly called *Anthrax* (for they alſo knew a gem by the ſame name uſed in a metaphorical ſenſe) was an earthy foſſil ſubſtance, which was broken in pieces to be uſed, and kindled well, and burnt almoſt like wood coals, and was uſed by the ſmiths.

This was a ſenſe however not univerſally received for the account of Theophraſtus till of late, and the underſtanding the paſſage in a wrong one, has been the occaſion of many erroneous gueſſes about what this *Anthrax* was, among thoſe who did not perceive that it meant the common coal.

Wormius expreſsly ſays, that Theophraſtus calls the ampelites or cannel coal, *Anthrax*, tho' there is no foundation for any ſuch aſſertion from his works; and others, willing to make ſome ſenſe of the paſſage, but ſeeing it could not bear this, have made even more unwarrantable conjectures. Vid. *Hill*'s Theophraſtus, p. 40.

ANTHRAX, in medicine—Some pretend to make a diſtinction between the *Anthrax* and carbuncle, limiting this latter to the glandular parts, and the former to all the others. But the diſtinction is ſcarce worth the making. *Le Clerc.* Comp. Surg. p. 112. See CARBUNCLE, *Cycl.*

Rivettus, Toſius, Gemma, and Meurerus, have diſcourſes expreſs on the *Anthrax*. *Lipen.* Bibl. Med. p. 32.

ANTHROMETRICA *Machina*, a name which Sanctorius gave to his weighing chair, contrived for meaſuring the quantity of inſenſible perſpiration. V. Act. Erud. Lipſ. 1726. p. 381.

ANTHROPODÆMON, Ανθρωποδαιμον, in antient writers, a dæmon concealed under the figure or appearance of a man. *Suid.* Lex. T. 1. p. 214.

ANTRHOPOGLOTTUS, Ανθρωπογλωττος, in natural hiſtory, ſomething that has a tongue, or ſpeech reſembling that of man.

The parrot-kind are denominated *Anthropoglotti*, on account of their broad thick and muſcular tongues, by which they are enabled to ſpeak, and to roll their meat from ſide to ſide under the edges of their bills. Vid. *Grew*, Muſ. Reg. Societ. P. 1. Sect. 4. c. 1. p. 57.

ANTHROPOGRAPHIA, a deſcription of man; more particularly, of the ſtructure of his body and the parts thereof.

ANTHROPOLATRÆ, a title given to the Neſtorians on account of their believing Chriſt to be a mere man, yet paying him the honour of a God. V. *Suic.* Theſ. & *Du Cange*, Gloſſ. Græc. in voc. Ανθρωπολαιλεαι.

ANTHROPOLATRIA, the paying divine worſhip or honours to a man. *Anthropolatria* is ſuppoſed by ſome to have been the moſt antient ſpecies of idolatry.

ANTHROPOMETRIA, a deſcription of the human body, with its ſeveral parts and members according to the three dimenſions, length, breadth, and thickneſs, both conſidered in themſelves, and comparatively to each other. *Caſtel.* Lex. in voc.

In this ſenſe, Etſholzius has given an *Anthropometria*, *de mutua membrorum corporis humani proportione*, &c. *Patav.* 1654. 4°. *Burggr.* Lex. Med. in voc.

The *Anthropometria*, it muſt be owned, is a term ſomewhat too narrow for this occaſion; ſince the author not only undertakes to deſcribe the dimenſions of man's body; but to ſhew the ſymmetry of it.

ANTHROPOMORPHA, in the Linnæan ſyſtem of nature, a claſs of animals in ſome degree reſembling the human form.

The word is derived from the Greek ανθρωπος, a man, and μορφη form.

The characters of the animals of this claſs are, that they have either four fore-teeth, or elſe they have none at all. Beſide the human ſpecies, which ſtands at the head of this claſs, the author makes it comprehend the monkey, the ignavus or ſloath, and the tomadua quacu, or ant-bear as it is uſually called. *Linnæi* Syſt. Nat. p. 34.

ANTHROPOMORPHISM, among divines, the error of thoſe who aſcribe a human figure to the deity.

Many of the antient ſaints and fathers as well as modern divines and philoſophers ſtand charged with *Anthropomorphiſm*. Johannes Hieroſolymitanus ſtrongly taxes St. Epiphanius with it[a]. The antient Ebionites were confeſſed *Anthropomorphites*, as appears from the author of the Clementines, who gives a proof of this opinion after his manner from ſcripture and reaſon[b].—[[a] V. *Budd.* Iſag. ad Theol. l. 2. c. 7. p. 1006. [b] Vid. Bibl. Choiſ. T. 2. p. 64.]

It is very difficult to trace the progreſs of *Anthropomorphiſm*, which has infected the whole Chriſtian world more or leſs; as well as a great part of the Jewiſh and heathen world. It ſeems indeed not very eaſy to ſay who is free from it; they whoſe ideas of the deity are pureſt, and moſt abſtract, do ſtill take in ſomething that is human, from which it ſeems almoſt impoſſible for us to get entirely looſe.

Rabbi Quarchi aſſures us, that God, when ſeated in heaven, had his feet in the temple of Jeruſalem, which was his foot-ſtool. Mem. de Trev. An. 1718. p. 957.

A late advocate[c] againſt Arianiſm ſeems to have carried *Anthropomorphiſm* further than had been known before. He aſſerts, that the three perſons of the trinity, the Father, the Son, and the Holy Ghoſt have each of them a figure reſembling that of a man; and that when the ſcripture attributes a face, eyes, hands, *&c.* to the divine being, it is to be taken literally. He adds that it was this reſemblance between man and the three divine perſons that occaſioned the fall of the angels; thoſe celeſtial ſpirits grew jealous of the honour that was conferred upon us, which prompted them to rebel[d]. —[[c] *Warren*, Antidot againſt Arianiſm. Jour. des Scav. T. 54. p. 236. [d] Mem de Trev. An. 1713. p. 1295.]

Indeed if we literally keep to ſcripture how ſhall we avoid *Anthropomorphiſm?* Dr. Coward aſſerts, that no unprejudiced perſon can read the Pentateuch, and be in any doubt, but that Moſes believed God to be corporeal. He adds, what can be more expreſs than that text in Exodus[e]? "God ſpoke to Moſes

face

face to face, as a man ſpeaks to his friend."—Again, the prophet deſiring to ſee the glory of God, was anſwered, that he ſhould ſtand on a rock, and that when God paſſed by he would cover him with his hand, ſo that Moſes ſhould ſee his back-parts, but that his face ſhould not be ſeen [f]. If, ſays Coward, we are to interpret theſe texts not according to the natural and literal import of them, but agreeably to a preconceived idea, the bible avails nothing; what is there but may be thus eluded? The ſcripture will be found to be juſt what every body is pleaſed to find it. Theſe reflections are refuted by M. Feſtas [g].—[e Exod. c. xxxiii. v. 11. f Ibid. v. 21. ſeq. g V. Ouvr. des Scav. Oct. 1708. p. 480. ſeq.]

Even philoſophers, for want of a better acquaintance with metaphyſics, ſeem to have fallen into *Anthropomorphiſm*, repreſenting God much after the manner of a human ſoul, without conſidering the difference between a finite and an infinite being, limited and abſolute perfections. *Wolfius* has laboured hard to avoid this rock, by having the difference ſtill preſent to his mind, and proceeding according to the antient rule, *quæ de Deo dicuntur* ανθρωποπαθως, *ea intellige* Θεοπρεπως. Vid. Act. Erud. Lipſ. An. 1724. p. 316.

The whole ſect of Stoics held God to be corporeal; and not to mention Tertullian and others among the fathers, Hobbs and his followers aſſert the ſame among ourſelves. Leibnitz charges Sir Iſaac Newton and his followers with repreſenting God under the conditions of a man [a]. But with what juſtice would be hard to ſay. [a Mem. de Trev. An. 1713. p. 266.]

ANTHROPOMORPHOUS, ſomething that bears the figure or reſemblance of a man. Naturaliſts give inſtances of *Anthropomorphous* plants, *Anthropomorphous* minerals, &c. Theſe generally come under the claſs of what they call *luſus naturæ*, or monſters.

Anthropomorphous ſtones make a ſpecies of thoſe called figured ſtones. Dr. Sachs has publiſhed an account of an *Anthropomorphous* rape, found in 1628, in a garden at Weiden near Juliers; repreſenting a naked woman ſitting with her arms, and legs folded. The hair, eyes, noſe, lips, trunk, thorax, &c. were very exactly expreſſed. De Rapa Monſtroſa Anthropomorpha. Ext. Ap. Ephem. Acad. N. C. Dec. 1. An. 1. Obſ. 48.

Among the divers extraordinary figures which the Orchis preſents, botaniſts ſpeak of an Orchis *anthropomorpha*, or as others call it *Anthropophora*, called in Engliſh man-Orchis, whoſe flower repreſents the figure of a man. Columella calls it *ſemi-homo* [a]. Seger has given the figure of an *Anthropomorphous* fungus [b].—[a *Brown*, vulg. Err. l. 2. c. 6. p. 75. *Ray*, Synopſ. p. 237. b V. Ephem. Acad. N. C. Dec. 1. An. 2. Obſ. 55.]

ANTHROPOMORPHOUS is an appellation more peculiarly given to *mandragora*, or mandrake. *Du Cange*, Gloſſ. Græc. T. 1. p. 78. See MANDRAGORA, *Cycl.* and *Suppl.*

ANTHROPOPHAGI (*Cycl.*)—Hiſtory gives us divers inſtances of perſons driven by exceſs of hunger to eat their own relations. Joſephus ſpeaks of a mother at the time of the ſiege of Jeruſalem, who killed her ſon, baked him, eat one part, and hid the reſt. Others commence *Anthropophagi* out of revenge and hatred; there are many inſtances of ſoldiers who in the heat of battle have been carried to ſuch exceſs of rage, as to tear their enemies with their teeth.

The violence of love has ſometime produced the ſame effect as the exceſs of hatred. The Tapuii eat the bodies of their friends and neareſt relations to preſerve them from worms and putrefaction, thinking they do not only hereby afford them an honourable grave, but even a new life, a kind of revivification in themſelves. Artemiſia did ſomething like this, when ſhe ſwallowed the aſhes of her dead huſband Mauſolus.

Among the Braſilians, the moſt honourable burial people can give their friends is to eat them, in order to which the corps is cut in pieces, and dealt out in greater or leſſer doles to their ſeveral relations as they are nearer or more remotely a-kin. They alſo eat their enemies, but with this difference, that theſe laſt are eaten raw, whereas the fleſh of their relations is dreſſed before they eat it. Mem. de Trev. An. 1702. p. 91.

Among the Eſſedonian Scythians, when a man's father died, his neighbours brought him ſeveral beaſts, which they killed, minced, and mixed up with the fleſh of the deceaſed, and made a feaſt. *Herodot.* Hiſt. l. 4. Vid. Nouv. Rep. Lett. T. 52. p. 34.

Among the Maſſageti, when any perſon grew old, they killed him and eat his fleſh; but if the party died of ſickneſs, they buried him, eſteeming him unhappy. *Herodot.* l. 1. Nouv. Rep. Lett. T. 52. p. 22.

Idolatry and ſuperſtition has occaſioned the eating more men, than both love and hatred put together. There are few nations but have offered human victims to their deities; and it was an eſtabliſhed cuſtom to eat part of the ſacrifices they offered.

The Jagos and the ſubjects of the great Macoco, are ſaid to be *Anthropophagi*. This prince is very powerful, having ten kings for his vaſſals; his court is ſo numerous, that there are 200 men butchered every day to ſupply the table, part of this number are criminals, the reſt ſlaves furniſhed in the nature of tribute. The fleſh of theſe unhappy people is dreſſed much as beef or mutton among us; and in Monſol, the capital of the country, there is an open ſhambles where man's fleſh is bought and ſold. This cannot be from neceſſity, for there is no want of cattle and other proviſions. *Dapper* Deſcript. de l'Afrique p. 359, 486. Bibl. Univ. T. 2. p. 384.

The ſeveral nations of the Moxas, in ſouth America, go out to hunt men, much as we do foxes or boars. Their chief view is to make a good number of captives, which they carry home, feed and fatten them with care as we do cattle, and then kill them one after another to ſupply their families. Mem. de Trev. 1717. p. 22.

Herodotus aſſures us, that ſeveral nations in the Indies killed all their old people, and their ſick, to feed on their fleſh; he adds, that perſons in health were ſometimes accuſed of being ſick for an occaſion of devouring them. *Herodot.* Hiſt. l. 3. Nouv. Rep. Lett. T. 52. p. 33.

Herrera ſpeaks of huge markets in China, furniſhed wholly with human fleſh for the better ſort of people. Marcus Paulus ſpeaks of the like in his time in the kingdom of Concha, towards Quinſay and the iſland Zapangit; others of the great Java; Barboſa of the kingdom of Siam, and iſland of Sumatra; others of the iſlands of the gulf of Bengal; others of the country of the Samogitians, &c.

Hiſtorians and travellers would furniſh us other inſtances of *Anthropophagi*; but is there no exaggeration in their accounts? Has not the terrible name *Anthropophagi* been made uſe of to raiſe our wonder, and ſometimes our averſion.

The Venitians, we are told, made uſe of this ſtratagem to alienate and keep their people from a liking to the Turks, by giving out that they were *Anthropophagi*. Jour. des Scav. T. 65. p. 138.

Father Lobo ſaw a camp of 2000 *Anthropophagi*, three leagues from Jubo in Ethiopia, who he ſays neither ſpared age nor ſex, nor gave quarter to any body: yet ſeveral of them made a viſit to the miſſionary with great frankneſs. They admired nothing but the extreme whiteneſs of his ſkin; we are to ſuppoſe they had dined before they came. Mem. de Trev. 1728. p. 2013. ſeq.

The reverend father John Joſeph de Santa Thereſa aſſures us, that the Dutch having conquered ſome part of Braſil from the Portugueſe, endeavoured to convert the Braſilians to Calviniſm, and to gain them the more eaſily, allowed them to eat as many Portugueſe as they pleaſed. Mem. de Trev. 1702. fev. p. 1705.

M. Petit has a learned diſſertation on the nature and manners of the *Anthropophagi*. De Natura et Moribus *Anthropophagorum*, Traject. ad Rhen. 1689. 4°. Extracts of it are given in Jour. des Scav. T. 17. p. 617. ſeq. Ouvr. des Scav. 1689. p. 195. ſeq. Act. Erud. Lipſ. 1689. p. 578. ſeq.

Among other things he diſputes whether or no the *Anthropophagi* act contrary to nature? The philoſophers, Diogenes, Chryſippus, and Zeno, followed by the whole body of ſtoics, held it a very reaſonable thing for men to eat each other, or even to eat themſelves if by any accident a part of the body ſhould come to be ſeparated from the reſt. According to Sextus Empiricus, the firſt laws were thoſe made to prevent men from eating each other, as had been done till that time. The Greek writers repreſent *Anthropophagy* as univerſal before Orpheus. To ſhew further, that *Anthropophagy* is not contrary to nature, a modern author urges, that cats, dogs, rabbits, and other animals, feed on each other. Pliny, after Ariſtotle, affirms, that ſwans eat each other; and the bees alſo eat their nymphæ, which are their young. The Dutch in Nova Zembla ſaw bears devour each other, and the like has been obſerved in the fiſh kind: the Tiburones, according to Ovid, are caught with a hook bated with their own fleſh. Leonardus Floroventius having fed a hog with hog's fleſh, and a dog with dog's fleſh, found a repugnancy in nature to ſuch food; the former loſt all its briſtles; the latter its hair; and the whole body broke out in blotches. It is known that the origin of the venereal diſeaſe is uſually attributed to the eating of human fleſh.

It may be aſked, whether the uſe which is made of certain parts of the human body in phyſic come under the denomination of *Anthropophagy?* How often have tombs been violated on this occaſion? To ſay nothing of mummies and the like. Pliny aſſures us, that in his time the phyſician ordered their epileptic patients to apply their lips to the wounds of gladiators, and ſwallow the blood as it ſtreamed from them. Jour. des Scav. T. 17. p. 621.

Some carry their reſpect for dead bodies a great length. M. Petit does not think it lawful for anatomiſts to diſſect human bodies, in order to learn their ſtructure, except thoſe of condemned criminals, and ſuch as are denied the rites of burial. The Arabs went farther; notwithſtanding all their curioſity and deſire to be acquainted with the human ſtructure, they could never be induced to make one diſſection; but were contented to borrow all their knowledge of this kind from the Greek phyſicians.

Some maintain it impoſſible, whatever precaution is uſed, to prevent the ingreſs of the parts of dead bodies with our food and drink. Add, that if we do not feed on our own ſpecies, we feed on plants and animals, which derive a great part of

their nutriment from us. Whence the impoſſibility of the reſurrection of the ſame body has been inferred. See RESURRECTION, *Cycl.*

ANTHROPOPHAGIA (*Cycl.*)—This is pretended by ſome to be the effect of a peculiar kind of diſeaſe which they call παμφαγια, and which leads people affected with it to eat every thing alike. Some chuſe only to conſider it as a ſpecies of pica.

The annals of Milan furniſh an extraordinary inſtance of *Anthropophagy*. A Milaneſe woman named Elizabeth, from a depraved appetite, like what women with child, and thoſe whoſe menſes are obſtructed frequently experience, had an invincible inclination to human fleſh, of which ſhe made proviſion by enticing children into her houſe, where ſhe killed and ſalted them; a diſcovery of which having been made, ſhe was broke on the wheel and burnt in 1519. Jour. des Scav. T. 44. p. 190. ſeq.

Authors have been divided as to the occaſion of the *Anthropophagia* charged on the primitive Chriſtians; the generality attribute its origin to what the Heathens had heard of the euchariſt and the communion, tho' M. Daillé and others after him are not ſatisfied with this conjecture. Wormius advances another reaſon; the Chriſtians it is known aſſembled in the catacombs, and about the tombs of the martyrs, where they made profeſſion of deſiring earneſtly the baptiſm of blood, an expreſſion by which they underſtood martyrdom; the Heathens miſtook the phraſe, and imagined that the Chriſtians being initiated by water baptiſm, had afterwards baptiſms of blood to confirm them in the faith. He adds, that the child covered with flower, *puer farre contectus*, who was ſtabbed by the perſon initiated, was no other than the euchariſt, or the body of Jeſus Chriſt, concealed under the ſubſtance of bread. Vid. Ouvr. des Scav. 1696. p. 376.

ANTHROPOSCOPIA, the art of judging or diſcovering a man's character, diſpoſition, paſſions, and inclinations, from the lineaments of his body.

In which ſenſe, *Anthropoſcopia* ſeems of ſomewhat greater extent than phyſiognomy, or metopoſcopy.

Otto has publiſhed an *Anthropoſcopia, ſive judicium hominis de homine ex lineamentis externis*. Regiom. 1647. 4°.

ANTHROPOSOPHIA, the ſcience of the nature of man, and his ſtructure and compoſition, both internal and external. *Charlt.* Œcon. Anim. Exerc. 3. §. 10.

In this ſenſe, *Anthropoſophia* amounts to much the ſame with the medical phyſiology or anatomy.

The word is uſed by Charleton, but with no great propriety; ſince Sophia or wiſdom imports the ſcience of uſing means to obtain an end, which is foreign to Charleton's intention. *Burggr.* Lex. Med. T. 1. p. 867.

ANTHROPOTHYSIA, Ανθρωποθυσια, in antient writers, denotes the offering of human victims. V. *Suic.* Theſ. Eccleſ. T. 1. p. 347. in voc. Ανθρωποθυτεω. *Fabric.* Bibl. Antiq. c. 11. n. 3.

The *Anthropothyſia*, whatever horror the idea of it may now excite, was a frequent practice among the antients. Some have imagined that the ſacrifice of Abraham was the firſt inſtance. Many reaſonings and diſquiſitions have been founded on this ſuppoſition; by which the ſeverity of Abraham's trial is thought by ſome to have been ſomewhat exaggerated. Human ſacrifices were in uſe among the Gentiles before that time; practiſed by kings as well as by private perſons; nay by entire nations, as the Egyptians, Phœnicians, Canaanites, &c. V. *Phil.* de Abraham. p. 375. *Marſh.* Can. Chron. Ægypt. Sect. 5. p. 77. *Budd.* Hiſt. Eccleſ. Vet. Teſt. Period. 1. Sect. 3. p. 280. ſeq.

ANTHUMON, in the materia medica of the antients, a name given to the epithymum, or dodder growing upon thyme. See the article EPITHYMUM.

ANTHUS, in zoology, a name by which Aldrovand and ſome other authors have called that ſpecies of the Œnanthe known in England by the name of the *Whin-chatt*. *Aldrovand.* de Avibus. See the article WHIN-CHATT.

ANTHYPOMOSIA, Ανθυπωμοσια, in antient writers, an oath taken by a proſecutor or accuſer, declaring that the abſence of the party accuſed is not for any juſt cauſe, and therefore demanding that judgment may no longer be delayed on that account. *Suid.* Lex. in voc.

ANTHYPOPHORA, Ανθυποφορα, in rhetoric, a figure whereby we covertly obviate a reaſon or objection. *Faber*, Theſ. p. 185. *Heder.* Schul. Lex. p. 262.

In this ſenſe *Anthypophora* ſtands oppoſed to ὑποφορα, *hypophora*, e. gr. If the *hypophora* be, grammar is very difficult to obtain; the *Anthypophora* may be, grammar is indeed a little difficult to attain, but then its uſe is infinite. See HYPOPHORA.

ANTIBARBAROUS, a title given to ſeveral works levelled againſt the uſe of barbarous terms and phraſes, chiefly in the Latin tongue.

Eraſmus, Nizolius, and Cellarius have publiſhed *Antibarbara*. Noltenius has given us a Lexicon *Anti-barbarum*, conſiſting of obſervations made by the grammarians of late ages in relation to the purity and corruption of Latin words. Sixt. Amama has given an *Antibarbarus biblicus*, wherein he pretends to have diſcovered ſeven ſources of the barbariſms which have got footing of late ages in the bible. *Helmſt.* 1730. 8°.

Peter du Moulin uſed the title *Antibarbarus* for a book againſt the uſe of an unknown tongue in divine ſervice.

ANTIBIBLOS Αντιβιβλος, in the civil law, an inſtrument or ſignature whereby the defendant owns he has received the libel or a copy of it, and notes the day whereon he received it. This is uſually done on the back of the libel. *Du Cange*, Gloſſ. Gr. T. 1. p. 83.

ANTICADMIA, denotes a ſpecies of mineral *Cadmia*, ſometimes alſo called *Pſeudo-Cadmia*. Vid. *Caſt.* Lex. Med. p. 56.

It takes the denomination *Anticadmia*, not as being oppoſite in quality to the *Cadmia*, but becauſe it is uſed as a ſubſtitute to it. Id. ibid.

ANTICATARRHAL, an epithet given to things which are levelled againſt catarrhs. *Caſt.* Lex. Med. in voc.

In this ſenſe, we meet with *Anticatarrhal* medicines, *Anticatarrhal* preſcriptions, &c. *Lentil.* Miſc. Medic. Pract. P. 2. p. 503.

ANTICATEGORIA, Αντικαλλιγορια, in oratory, denotes a recrimination or mutual accuſation [a]; where the two parties charge each other with the ſame crime [b].—[a *Quinct.* Inſt. l. 3. c. 8. [b] *Calv.* Lex. Jur. p. 73.]

Apollodorus conſiders the *Anticategoria* as two ſeveral cauſes or actions. *Quinct.* l. 7. c. 2.

ANTICAUSOTICS, among phyſicians, denote medicines againſt burning fevers.

In this ſenſe Juncken has given the deſcription of an *anticauſotic* ſyrup. *Junck.* Corp. Pharm. P. 2. p. 493.

ANTICNEMION, in anatomy, denotes the ſhin; or the fore prominent part of the *tibia*.

This is otherwiſe called by the Greeks Ακανθα, by the Latins *prima tibia*, or *anterior tibia*, and ſtands oppoſed to the *ſura* or calf of the leg, ſometimes called *ocrea*. *Gorr.* Def. Med. p. 39. *Caſt.* Lex. Med. p. 56.

ANTIDÆMONICI, in eccleſiaſtical hiſtory, a ſect who denied the exiſtence of devils, or evil ſpirits; alſo all ſpectres, incantations, witchcrafts, &c. *Prateol.* Elench. Hæret. l. 1. n. 46.

ANTICHRIST (*Cycl.*)—We have demonſtrations, diſputations, pro and con, and proofs in great order and number, both that the pope is, and that he is not *Antichriſt*.

F. Calmet is very large in deſcribing the father and mother of *Antichriſt*, his tribe and pedigree, his wars and conqueſts, his atchievements againſt Gog, Magog, &c.

Some place his capital at Conſtantinople, others at Jeruſalem, others at Moſcow, and ſome few at London, but the generality at Rome, though theſe laſt are divided. Grotius and ſome others ſuppoſe Rome Pagan to have been the ſeat of *Antichriſt*. Moſt of the Lutheran and reformed doctors contend earneſtly for Rome Chriſtian under the papal hierarchy.

M. Le Clerc holds that the rebel Jews and their leader Simon, whoſe hiſtory is given by Joſephus, are to be reputed as the true *Antichriſt*. Lightfoot and Vanderhart rather apply this character to the Jewiſh Sanhedrim. Hippolitus and others held that the devil himſelf was the true *Antichriſt*, that he was to be incarnate, and make his appearance in human ſhape before the conſummation of things. Others among the antients held that *Antichriſt* was to be born of a virgin, by ſome prolific power imparted to her by the devil. A modern writer of the female ſex, whom many hold for a ſaint, has improved on this ſentiment, maintaining that *Antichriſt* is to be begotten by the devil on the body of a witch by means of the ſemen of a man caught in the commiſſion of a certain crime, and conveyed, &c. *Bayle*, Dict. Crit. T. 1. p. 655. note (Q) voc. *Bourignon*.

But the majority of voices has fallen on Nero.

How endleſs are conjectures? Some of the Jews we are told actually took Cromwell for the Chriſt, while ſome others have laboured to prove him *Antichriſt* himſelf. Pfaffius aſſures us he ſaw a folio book in the Bodleian library, written on purpoſe to demonſtrate this latter poſition. *Pfaff.* Introd. in Hiſt. Theol. Liter. Lib. 1. p. 106.

Hunnius and ſome others to ſecure *Antichriſt* to the pope, notwithſtanding that this latter ſeemed excluded by not being of the tribe of Dan, have broke in upon the unity of *Antichriſt*, and aſſert that there is to be both an Eaſtern and a weſtern *Antichriſt*.

ANTICHRISTIANISM, a ſtate or quality in perſons or principles, which denominates them antichriſtian, or oppoſite to the kingdom of Chriſt.

M. Jurieu takes the idea of the unity of the church to have been the ſource of *Antichriſtianiſm*. Had not mankind been infatuated with this, they would never have ſtood in ſuch awe of the anathema's of Rome. It is on this the popes erected their monarchical power. Vid. Ouvr. des Scav. An. 1688. p. 493.

ANTICHRISTIANS properly denote the followers or worſhipers of *Antichriſt*. See ANTICHRIST.

ANTICHRISTIANS are more particularly underſtood of thoſe who ſet up or believe a falſe Chriſt, or Meſſiah. *Prateol.* Elench. Hæret. l. 1. n. 46.

In this ſenſe, many Jews and others may be denominated *Antichriſtians*. Bucer himſelf is by ſome ranked in the number, it being pretended that at his death he declared that Chriſt

was not the true Meſſiah promiſed to the Jews; but that another was ſtill to be expected. *Prateol.* loc. cit.

ANTICHTHON, Ἀντίχθων, in its primitive or aſtronomic ſenſe, denotes a kind of globe or earth reſembling ours, and like it moving round the ſun, but inviſible to us, becauſe on the oppoſite ſide of the ſun, that luminary being ſtill exactly interpoſed between this other earth and ours. *Thomaſius*, ubi infra. Nouv. Rep. Lett. T. 33. p. 422.

In this ſenſe it is, that Pythagoras and his diſciples aſſerted an *Antichthon*; of which we have the teſtimonies of Ariſtotle [a], Plutarch [b], &c.—[a De Cœlo. l. 2. c. 13. It. Metaph. l. 1. c. 5. b De Placit. Philoſ. l. 3. c. 11.]

There is a great variety of ſentiments concerning the Pythagorean *Antichthon*; ſome taking their account in a literal, others in a figurative ſenſe; ſome find a Heathen, others a Jewiſh, and others even a Chriſtian meaning in it.

By reaſon of the perfection of the number ten, they concluded there muſt be juſt ſo many ſpheres; and as our ſenſes only diſcover nine, *viz.* the ſeven planets, the ſphere of the fixed ſtars, and our earth, they imagined a tenth oppoſite to ours. V. *Thomaſ.* ubi infra. §. 16.

Others will not allow Pythagoras to have invented the *Antichthon*, but aſſert him to have borrowed the notion from the antient Jews, who inſtead of the preſent earth, ἀντὶ χθονος ταυτης, expected ἀντιχθονα. or another earth. V. Iſai. c. lxv. v. 17. Pet. c. iii. v. 10.

In reality it appears from a paſſage in Plato, that the Greeks conſidered their *Antichthon*, as ſeated in the heavens, and vaſtly more excellent than our earth. In Phæd. p. 398. V. Obſerv. Halens. T. 8. Obſ. 3. §. 11.

Some of the fathers who endeavoured to accommodate the doctrines of the Heathen philoſophers to thoſe of chriſtianity, aſſert that this Pythagorean earth is no other than the heavens of the righteous. V. *Clem. Alex.* Strom. l. 5. in fine.

Thomaſius has a diſſertation expreſs on the Pythagorean *Antichthon*. Ext. in Obſerv. Halens. T. 4. Obſ. 19.

ANTICIPATION, (*Cycl.*) in rhetoric, a figure otherwiſe called *Prolepſis*. See PROLEPSIS, *Cycl.*

ANTICIPATION is alſo uſed, in a logical ſenſe, for a preſumption, prejudice, or præconceived opinion. *Shafteſb.* Charact. T. 2. p. 120. 307. & 412.

This is alſo denominated præconception, præſenſation, or inſtinct.

ANTICIPATION, in the Epicurean philoſophy, denotes the firſt idea, or definition of a thing, without which we can neither name, think, doubt, or even enquire concerning it. *Gaſſend.* Synt. Philoſ. Epicur. P. 1. c. 2. p. 18.

This is otherwiſe denominated *prenotion*. See the article PRENOTION, *Cycl.*

Anticipation, in this ſenſe, makes the ſecond of Epicurus's criterions of truth.

ANTICIPATION is alſo uſed by lord Shafteſbury, in ſpeaking of painting, to denote the expreſſion of ſome future action, reſolution, or the like. *Shafteſb.* Charact. T. 3. p. 355. ſeq.

ANTICIPATION, in a medicinal ſenſe, is applied to diſeaſes, wherein part of the ſymptoms which regularly belong to ſome future period, appear in the beginning; or, the word may be underſtood of thoſe diſeaſes, which having their acceſſes and remiſſions at ſtated hours, gain in point of time, and finiſh their period ſooner than ordinary. V. *Gal.* de Criſ. l. 1. c. 3.

In this ſenſe, *Anticipation*, or *anticipated* diſeaſes, by the Greeks called προληπτικοι, ſtand oppoſed to hyſteretic, ὑστερητικοι, which come after the time. Vid. *Caſt.* Lex. Med. p. 56. in voc. *Anticipans.*

ANTICK, in ſculpture and painting, denotes a fantaſtical compoſure of figures of different natures, ſexes, &c. As men, beaſts, birds, flowers, fiſhes, and even things merely imaginary, or which have no exiſtence in the nature of things. Build. Dict. T. 1. in voc.

Antick amounts to much the ſame with what the Italians call *Groteſca*, and the French *Groteſque*.

ANTIDICOMARIANITES (*Cycl.*)—St. Epiphanius refutes the *Antidicomarianites* by this argument, *viz.* That the lioneſs never brings forth more than one; for that ſhe voids the uterus itſelf at her firſt birth, to make any future one impoſſible. Suppoſing the fact true, what has the lioneſs to do with Joſeph's wife? Chriſt was called the lion of the tribe of Judah; conſequently his mother was a lioneſs! The reaſoning is admirable! *Budd.* Iſag. ad Theol. l. 2. c. 3. p. 561.

Sutor has publiſhed an expreſs refutation of the *Antidicomarianites*. Apologet. in *Antidicomarianitas*. B. Virginis Laudibus detrahentes. Par. 1526. 4°.

ANTIDORON, in eccleſiaſtical writers, a name given by the Greeks to the conſecrated bread, out of which the middle part marked with the croſs, wherein the conſecration reſides, being taken away by the prieſt, the remainder is diſtributed, after maſs, to the poor. V. *Goar.* ad Euchol. Græc. p. 154. ſeq.

On the ſides of the *Antidoron* are impreſſed the words *Jeſus Chriſtus vicit*. *Schmid.* Lex. Eccleſ. p. 51.

The word is Greek, Ἀντιδωρον, formed from δωρον, *donum*, a gift, as being given away *loco muneris*, or in charity. *Magri.* Vocab. Eccleſ. p. 18.

The *Antidoron* is alſo called *panis præſanctificatus*. *Suic.* Theſ. T. 1. p. 373. in voc. Ἀντιδωρον.

Some ſuppoſe the *Antidoron* to be diſtributed in lieu of the ſacrament, to ſuch as were prevented from attending in perſon at the celebration; and thence derive the origin of the word, the euchariſt being denominated *doron* gift, by way of eminence. Trev. Dict. Univ. T. 1. p. 442. ſeq.

ANTIDOSIS, Ἀντιδωσις, in antiquity, denotes an exchange of eſtates, practiſed by the Greeks on certain occaſions with peculiar ceremonies, and firſt inſtituted by Solon.

When a perſon was nominated to an office, the expence of which he was not able to ſupport, he had recourſe to the *Antidoſis*; that is, he was to ſeek ſome other citizen of better ſubſtance than himſelf, who was free from this, and other offices; in which caſe the former was excuſed. In caſe the perſon thus ſubſtituted denied himſelf to be the richeſt, they were to exchange eſtates, after this manner, the doors of their houſes were cloſe ſhut up and ſealed, that nothing might be conveyed away, then both took an oath to make a faithful diſcovery of all their effects, except what lay in the ſilver mines; which by the laws was excuſed from all impoſts; accordingly, within three days, a full diſcovery and exchange of eſtates was made. *Potter*, Archæol. l. 1. c. 15.

ANTIDOTARY is uſed by ſome writers for what we more uſually call a diſpenſatory. *Caſt.* Lex. Med. in voc.

We have *Antidotaries* extant of ſeveral authors, as thoſe of Nicolaus, Meſue, Myrepſus, Rhaſis, &c.

ANTIDOTE (*Cycl.*)—The indian phyſic conſiſts much in the uſe of *Antidotes*, viz. the root mungo, and the viper-ſtone; both held ſovereign againſt the bite of the *Cobras de Cabelo*, and other venomous creatures. *Kempf.* Amæn. Exot. Faſc. 3. Obſ. 10.

ANTIDOTE is alſo uſed, in a more general ſenſe, for any compound medicine. *Friend*, Hiſt. of Phyſ. P. 2. p. 41.

In which ſenſe, Peter Damian ſpeaks of a perſon who in his whole life never took any *Antidote*. Epiſt. 30. l. 6. *Du Cange*, in voc.

ANTIDOTE is alſo uſed in a leſs proper ſenſe for any remedy againſt any diſeaſe, chiefly if it be inveterate, and ariſe from ſome ulcer or abſceſs. *Gal.* de Antidot. l. 2. c. 6.

ANTIDOTE is alſo uſed for a particular form of medicines, otherwiſe called *opiates*, or more properly *confections*. See CONFECTION, *Cycl.*

ANTIDOTE is alſo myſtically applied to the philoſopher's ſtone. *Caſtel.* Lex. Med. in voc.

ANTIGRAPHE, Ἀντιγραφη, in antiquity, denotes a law ſuit about kindred, whereby a perſon claimed relation to ſuch or ſuch a family. *Potter*, Archæol. l. 1. c. 24.

The *Antigraphe* appears to have been the ſame with the Παραγραφη. See PARACATABOLE.

ANTIGRAPHUS, Ἀντιγραφευς, in antiquity, an officer of Athens who kept a counterpart of the Apodecti, or chief treaſurers accounts to prevent miſtakes, and keep them from being falſified.

This magiſtrate was particularly denominated Ἀντιγραφευς της Διοικησεως, ſometimes alſo, Ἀντιγραφευς της βυλης. *Potter*, Archæol. l. 1. c. 14. *Suid.* Lex. p. 222.

ANTIGRAPHUS is alſo uſed, in middle age writers, for a ſecretary or chancellor. He is thus called, according to the old gloſſariſts, on account of his writing anſwers to the letters ſent to his maſter; *quod reſcribit literis miſſis ad dominum ſuum.* The *Antigraphus* is ſometimes alſo called *archigraphus*; and his dignity *Antigraphia*, or *archigraphia*. *Du Cange*, Gloſſ. Græc. T. 1. p. 83.

ANTIGRAPHUS is alſo uſed in Iſidorus for one of the notes of ſentences, which is placed with a dot to denote a diverſity of ſenſe in tranſlations. *Iſid.* Orig. l. 1. c. 20. Ephem. Diſſ. de Vet. Crit. σημειως. c. 2. §. 9.

ANTIGRAPHUS is alſo applied in eccleſiaſtical writers to an abbreviator of the papal letters. See ABBREVIATOR.

In which ſenſe the word is uſed by pope Gregory the great in his regiſter.

Of late days the office of *Antigraphus* conſiſts in making minutes of bulls from the petitions agreed to by his holineſs, and renewing the bulls after engroſſing. *Magri.* Vocab. Eccleſ. p. 18.

ANTIHECTICUM *Poterii* (*Cycl.*) is alſo called *antimonium diaphoreticum joviale*.

There are divers methods of preparing it, given by Wedelius, Etmuller, &c. V. *Juncken*, Lex. Pharm. in voc.

A learned author ſpeaks of it as a remedy fatal to conſumptive perſons. What ſhall we ſay? A medicine has been in common uſe upwards of an hundred years, yet phyſicians cannot agree whether it does good or harm. *Junck.* Conſp. Therap. Tab. 16. n. 57.

ANTILEXIS, in antiquity, denotes a new trial granted in the Athenian judicatories, where judgement had before paſſed againſt a party for non-appearance. *Potter*, Archæol. l. 1. c. 21.

ANTILUTHERANS, a ſect or party among the antient reformers, who maintained opinions, chiefly in relation to the euchariſt, different from thoſe of Luther. *Prateol.* Elench. Hæret. l. 1. n. 45.

Such were Caroloſtadius and his followers, called alſo *Sacramentarians*, and thoſe of Zuinglius denominated *Zuinglians*.

The ſect of *Antilutherans*, at firſt confined within narrow bounds, in a few years time ſubdivided into ſix or ſeven inferior ſects, and ere long into an infinite number more variouſly denominated. *V. Prateol.* loc. cit.

ANTILYSSUS *Pulvis*, in medicine, is compoſed of equal parts of the lichen cinereus terreſtris & piper niger. It is reckoned uſeful in preventing the rabies canina. Vid. Phil. Tranſ. N°. 448. Sect. 5.

ANTIMENSIUM, (*Cycl.*) in the Greek church, anſwers to the *altare portabile*, or portable altar in the Latin church. They are both only of late invention, tho' Habertus [a] would have them as old as St. Baſil, and to be indicated by the words, ἰδίαι τραπέζαι. But Durant and Bona do not pretend to find them in any author before the time of Bede and Charlemaign [b].—[[a] *Habert.* Archierat. p. 664. [b] *Bingh.* Orig. Eccleſ. l. 8. c. 6. §. 21.]

ANTIMENSIA is alſo applied to other tables, uſed in offices of religion, beſides thoſe whereon the euchariſt is adminiſtered: ſuch *e. gr.* are thoſe whereon the hoſt is expoſed, *&c.* *Du Cange*, Gloſſ. Gr. T. 1. p. 85. ſeq in voc. Ἀντιμινσια.

The origin of the *Antimenſia* is deſcribed by Meurſius, when the biſhop had conſecrated a church, the cloth which had been ſpread on the ground, and over the communion table, was torn in pieces and diſtributed among the prieſts, who carried each a fragment away, to ſerve to cover the tables in their churches and chapels. Not that it was neceſſary that ſuch cloths ſhould be laid on all tables; but only on thoſe which either were not conſecrated, or at leaſt whoſe conſecration was doubted of. *Suic.* Theſ. Eccleſ. T. 1. p. 377. in voc. Ἀντιμινσιος.

ANTIMENSIUS, an antient officer in the Greek church, whoſe buſineſs was to introduce and place the communicants at the euchariſt. *Suic.* Theſ. Eccleſ. T. 1. p. 377. in voc. Ἀντιμινσιος.

Some have imagined that he had the care of the *Antimenſia*. But this rather belonged to the office of great *Scevophylax*.

He is otherwiſe called Ἀρχων των Ἀντιμινσιων, chief of the *Antimenſii*. V. *Du Cange*, Gloſſ. Gr. T. 1. p. 85.

ANTIMERIA, in grammar, a figure whereby one part of ſpeech is uſed for another. e. gr. *velle ſuum cuique eſt*, for, *voluntas ſua cuique eſt*; alſo, *populus late rex*, for *populus late regnans*.

ANTIMERIA, in a more reſtrained ſenſe, is a figure whereby the noun is repeated inſtead of the pronoun. V. *Ludovic.* Hebraiſm, p. 68.

The *Antimeria* is frequent in the Hebrew, and is ſometimes retained in our verſion of the old teſtament accordingly.—e. gr. *Hear my voice, ye wives of Lamech*, for my wives. Gen. c. iv. v. 23.

ANTIMETABOLE, Ἀντιμεταβολὴ, in rhetoric, a figure which ſets two things in oppoſition to each other. See *Voſſ.* Rhet. lib. 5. p. 404.

The word is Greek, compounded of ἄντι, againſt, and μεταβολὴ from μεταβάλλω, I ſhift or transfer; *i. e.* a ſhifting, or ſetting two things over-againſt each other.

This figure is twice examplified in an apophthegm of Muſonius; which, on account of its excellence, is called *aureum monitum*, the golden maxim or precept.

Ἂν τὶ πρᾶξης καλὸν μετὰ πόνε, ὁ μὲν πόνος ὀιχεῖαι, τὸ δὲ καλὸν μένει. Ἂν τὶ ποιήσης αισχρὸν μετὰ ἡδονῆς, τὸ μὲν ἡδὺ ὀιχεῖαι, τὸ δὲ αἰσχρὸν μένει.

In Engliſh thus,

Allowing the performance of an honourable action to be attended with labour; the labour is ſoon over, but the honour immortal: whereas, ſhould even pleaſure wait on the commiſſion of what is diſhonourable; the pleaſure is ſoon gone, but the diſhonour eternal.

ANTIMISIUM, Ἀντιμισιον, in antiquity, a table placed before the Roman tribunal, or judgment ſeat. *Suid.* Lex. in voc.

What relation this has to the *Antimenſia* in the Greek church does not appear. Some writers confound them together as the ſame thing. V. *Suic.* in voc. Ἀντιμινσιον.

ANTIMONARCHIST, a perſon who maintains *antimonarchical* principles.

Antimonarchiſts are otherwiſe denominated *monarchomachi*, and ſtand oppoſed to *antimonarchomachi*. V. *Mackenz.* Scot. Writ. T. 3. p. 167. *Wood*, Faſt. Oxon. T. 1. p. 263, & 267. Obſerv. Halens. T. 1. Obſerv. 1. §. 7. Act. Erud. Lipſ. An. 1716. p. 439.

Buchanan, Milton, Hottoman, Languet, Ludlow, Sydney, and others, are celebrated *Antimonarchiſts*.

ANTIMONARCHOMACHI, *Antimonarchomachiſts*, is uſed by ſome political writers to denote maintainers of monarchical or abſolute power veſted by divine right in the perſons of princes.

In which ſenſe, *Antimonarchomachi* ſtand oppoſed to *monarchomachi*.

King James the firſt, Salmaſius, Peter du Moulin, biſhop Bramhall, Albericus Gentilis, Ziegler, William and George Barclays, Bochart, *&c.* have diſtinguiſhed themſelves in the claſs of *Antimonarchomachiſts* [a]. Acker has treated profeſſedly of the *monarchomachiſts* and *Antimonarchomachiſts* [b].—[[a] Act. Erud. Lipſ. 1716. p. 440. [b] Comm. de Monarch. & *Antimonarchomachis*, Rudolſt. 1716. 4°. An extract of which is given in Act. Erud. Lipſ. loc. cit.]

ANTIMONIALS (*Cycl.*)—Beſides thoſe numerous preparations which take their denominations from antimony, the chief of which are enumerated under that article in the Cyclopædia, there are ſeveral other *Antimonial* medicines: Such are the crocus metallorum, Poterius's cordial, the tinctura metallorum, mercurius vitæ, or powder of algarot, bezoardicum minerale, ſulphur metallorum, the Carthuſian powder, or kermes mineral, *&c.* See CROCUS, TINCTURE, ALGAROT, &c.

Lemery deſcribes ſeveral other preparations of this mineral. *Lem.* Traitè de l'Antimoine paſſim.

ANTIMONIATED, ſomething tinged with the qualities, or reſembling the appearances, of antimony.

Dr. Woodward ſpeaks of a kind of ſtriated, or *antimoniated*, lead ore. Nat. Hiſt. Engl. Foſſ. T. 1. p. 207.

ANTIMONY. See the article STIBIUM.

Glaſs of ANTIMONY. See GLASS.

Butter of ANTIMONY. See BUTTER *of Antimony*.

ANTINOEIA, in antiquity, annual ſacrifices, and quinquennial games in memory of Antinous the Bithynian.

They were inſtituted at the command of Adrian the Roman emperor, at Mantinea in Arcadia, where Antinous was honoured with a temple and divine worſhip. *Potter*, Archæol. l. 2. c. 20.

ANTINOMIANS, in church hiſtory, denote a religious ſect, who maintain the law of no uſe or obligation under the goſpel diſpenſation.

In this ſenſe, the *Antinomians* ſtand contradiſtinguiſhed from the *Neonomians*. *Budd.* Iſag. ad Theol. l. 2. c. 7. p. 1294.

The *Antinomians* took their origin from John Agricola about the year 1335, who taught that the law is no ways neceſſary under the goſpel; that good works do not promote our ſalvation, nor ill ones hinder it; that repentance is not to be preached from the decalogue, but only from the goſpel. *Budd.* Iſag. ad Theol. l. 2. c. 7. p. 1195.

Luther, Rutherford, Schluſſelburg, Sedgwick, Gataker, Witſius, Bull, *&c.* have written refutations [a]; Criſp, Richardſon, Saltmarſh, Williams, *&c.* defences of the *Antinomians* [b]. Wigandus a compariſon between antient and modern *Antinomians* [c].—[[a] *Pfaff.* Introd. Hiſt. Liter. Theol. l. 3. §. 8. [b] *Budd.* lib. cit. p. 1414. [c] *Pfaff.* loc. cit.]

ANTIOCHENUM, in botany, a name given by Lobel and ſome others to that ſpecies of bind-weed, whoſe root is the ſcammony uſed in medicine. See the article CONVOLVULUS.

ANTIOCHIAN *Sect*, or *academy*, a name given to the fifth academy, or branch of academics.

It took the denomination from its being founded by Antiochus, a philoſopher cotemporary with Cicero. V. *Voſſ.* de Sect. Philoſ. c. 15. §. 3.

The *Antiochian* academy ſucceeded the Philonian.—As to point of doctrine, the philoſophers of this ſect appear to have reſtored that of the antient academy, except that in the article of the criterion of truth, Antiochus was really a Stoic, and only nominally an academic. *Thomaſ.* Introd. Phil. Ant. c. 1. §. 29.

ANTIOCHIAN *Epocha*, a method of computing time from the proclamation of liberty granted the city of Antioch about the time of the battle of Pharſalia. *Strauch.* Brev. Chronol. l. 4. c. 34.

This is called particularly in antient writers, χρηματισμος της Ἀντιοχειας; for what reaſon does not appear.

It is diſputed among chronologers whether the *Antiochian* epocha commences in the ſpring or the autumn before the battle of Pharſalia. The chronicle of Alexandria fixes it to the former; Scaliger and Calviſius to the latter. In the firſt year of this epocha began the firſt indiction; ſo that the *Antiochian* years being divided by fifteen, the remainder ſhews the true character of the cycle of indiction.

ANTIPAPINIANUS, Ἀντιπαπινιανος, a title given by the Greek lawyers to the fourth part of the digeſt, including four books, beginning with the title de pignoribus. *Cujac.* Obſerv. l. 7. c. 32. *Du Cange*, Gloſſ. Gr. T. 1. p. 87.

This is otherwiſe called *Antipapianus*, Ἀντιπαπιανος.

The *Antipapinian* was thus denominated, not as being intended in oppoſition to Papinian, but becauſe it was to ſerve in the ſchools of the civil law in lieu of the books of that lawyer, purſuant to an edict of the emperor Juſtinian; ſo that the *Antipapinian* was ſo far from being a refutation of Papinian, that it was only a ſubſtitute for his writings, which were not ſo proper for the uſe of the younger ſort of ſtudents. *Baill.* Entret. 4. p. 39.

ANTIPARASTASIS, Ἀντιπαραστασις, in rhetoric, a reply made to an opponent, by allowing part of his argument, and denying the reſt, *e. gr.* you may paint whatever you pleaſe, provided the public ſuffer no prejudice from it; but you muſt not, if it does. Vid. *Voſſ.* Rhet. l. 1. p. 145. See alſo CONCESSION, *Cycl.*

ANTIPASCHA, in eccleſiaſtical writers, denotes the firſt ſunday after Eaſter. *Meurs.* Gloſſ. p. 43. *Du Cange*, Gloſſ. Græc. T. 1. p. 87. ſeq. *Suic.* Theſ. Eccleſ. T. 1. p. 380.

This is otherwiſe called *dominica in albis*.

ANTIPATHES, among the antient naturaliſts, was uſed to expreſs any ſtone or gem, which according to their ſuperſtitious ideas of the virtues of gems at that time was ſuppoſed to have a power of reſiſting the force of inchantments. Pliny mentions a very valuable gem, called by the antients *Antipathes* for this very reaſon; and the black coral had the ſame name, on the ſame occaſion. *Plin.* Hiſt. Nat. l. 37. c. 10.

ANTIPATHY (*Cycl.*)—A large part of the inſtances of *Antipathies* are perhaps no better than fables, and a ſevere examination would leave them on no other footing than vulgar errors[a]. Thus the *Antipathy* between the toad and the ſpider, and that they poiſonouſly deſtroy each other, is famous; and ſolemn ſtories have been written of their combats, wherein the victory commonly falls to the lot of the ſpider. But of what toads or ſpiders this holds good, may be hard to ſhew. The Phalangium and deadly ſpiders are different from thoſe we generally find in England: but for theſe laſt, Dr. Brown aſſures us, that having incloſed a toad with ſeveral ſpiders in a glaſs, the ſpiders were ſeen without any reſiſtance, ſitting on his head and paſſing over all parts of his body; till he could find an advantage, when he ſwallowed them down, and that to the number of ſeven in a few hours[b].—[a *Morhof.* Polyhiſt. T. 2. c. 8. n. 10. b *Brown*, Vulg. Errors, l. 3. c. 27. p. 147. ſeq.]

Whether a lion be alſo afraid of a cock, as is related by many and believed by moſt, may be pretty eaſily imagined from what Camerarius relates, *viz.* That in the court of Bavaria, one of the lions leaping down into a neighbour's yard, eat up the cocks and hens. *Brown*, Vul. Err. l. 3. c. 27. p. 148. See the article SYMPATHY.

ANTIPATHY is ſometimes alſo uſed in a moral ſenſe to denote a conteſt between the mind and the body, or between reaſon and inclination. *Chauv.* Lex. Phil. p. 47.

ANTIPATHY is uſed in painting, for an oppoſition between the qualities of colours. *Du Piles*, Converſat. ſur la Connoiſ. de la Paint. p. 295.

This *Antipathy* is chiefly obſerved between colours, which endeavour, as it were, to predominate over each other, and which by their mixture deſtroy each other. *e. gr.* ultramarine and vermillion. This does not obtain in the clair obſcure; for tho' there be nothing more oppoſite to each other than black and white, as the one repreſents light, and the other darkneſs; yet they each preſerve themſelves in the mixture, and form together a grey which partakes of both.

ANTIPELARGIA, Ἀντιπελαργια, among the antients, a law whereby children are obliged to furniſh neceſſaries to their aged parents. *Calv.* Lex. Jur. p. 74.

The Ciconia, or ſtork, is a bird famous for the care it takes of its parents when grown old. V. *Suic.* Theſ. T. 1. p. 380. ſeq. in voc. Ἀντιπελαργωσις.

Hence, in ſome Latin writers, this is rendered *lex Ciconiaria*, or the ſtorks law. Paſſavant has publiſhed a diſſertation expreſs *de Antipelargia.* Baſil. 1672. 4°.

ANTIPERISTALTIC (*Cycl.*)—Phyſicians antient as well as modern have uſually had recourſe to the notion of an *Antiperiſtaltic* motion to account for the action of vomiting and the phænomena of the *miſerere mei*, or iliac paſſion. In behalf of the former M. Littre alledges that as the œſophagus, the ſtomach and inteſtines are but one and the ſame continued canal, every where lined with the ſame fleſhy fibres, and as it is allowed, that the inteſtines beſides their natural or periſtaltic motion (whereby being ſucceſſively contracted from above downwards, they expel their contents in this direction;) have alſo an *Antiperiſtaltic* or præternatural motion, whereby they contract from below upwards and thus reject their contents; it is highly probable that the other members of the ſame canal, *viz.* the ſtomach, and œſophagus are alſo ſometimes ſubject to the like *Antiperiſtaltic* motion; and return their contents to the mouth. V. Hiſt. Acad. Scienc. An. 1700. p. 37.

The cauſe of the *Antiperiſtaltic* motion is uſually aſſigned to be a ſtoppage of ſome of the inteſtines, but chiefly of the ilium. The mechaniſm whereby it is effected differs in nothing from that which produces the periſtaltic motion, except in the determination of the motion, which in iliac caſes prevents the fæces from proceeding on to the anus; ſo that the motion is periſtaltic from the ſtomach to the place of obſtruction; but when the fecal matters are arrived there, they give riſe to an *Antiperiſtaltic* motion by occaſioning a great influx of ſpirits into the fleſhy fibres adjoining; theſe being contracted, of courſe will compreſs, and propel the contents and chylous matters towards that ſide where there is the leaſt reſiſtance, which will be upwards, ſince an inſurmountable obſtacle is ſuppoſed downwards: conſequently they muſt riſe to the fibres next above, which being contracted in their turn, will raiſe them a ſtep further, till by degrees they have reached the pylorus, whoſe valve being forced, admits them into the cavity of the ſtoma ch, from whence they continue their aſcent to the mouth.

Some late ingenious authors ſeem to have over-turned the whole *Antiperiſtaltic* ſyſtem, and ſhewn this motion imaginary as well as un neceſſary for accounting for theſe diſorders. Meſſ. Chirac and Du Verney have endeavoured to prove this in reſ pect of vomiting, and M. Haguenot[a], and after him M. St. Andre[b], in the iliac paſſion.—[a Mem. Acad. Scienc. 1713. p. 472. ſeq. b Phil. Tranſ. N°. 351. p. 581.]

ANTIPHERNA, among the antient Greeks, denoted a kind of ſettlement made on a wife in caſe of ſurviving her huſband, as an equivalent for her dowry. *Potter*, Archeol. l. 4. c. 11. *Pitiſc.* Lex. Ant. in voc.

The word is Greek, Ἀντιφερνη, and was otherwiſe called ὑποθολον, ſometimes Ἀποδιμημα.

ANTIPHONALLY, in reſpect of church muſic, imports as much as alternately, or anthem wiſe.

The Greeks have a method of ſinging *Antiphonally*, *antiphonatim*, called by them παραλληλακιον, wherein two perſons ſing together and then are ſilent, and ſucceeded by two others, who ſing a while and then are ſilent, and ſo on. *Goar.* ad Euchol. p. 123. *Du Cange*, Gloſſ. Gr. T. 1. p. 89. *Schmid.* Lex. p. 54.

ANTIPHONARY, *Antiphonarium*, a book containing the antiphonæ, or anthems of the whole year. *Spelm.* Gloſſ. p. 33. *Du Cange*, Gloſſ. Lat. T. 1. p. 244. See ANTIPHONY.

This is otherwiſe called *reſponſonarium*, from the reſponſes therein contained. *Durand*, Ration. l. 6. c. 1. n. 24.

The author of the Roman *Antiphonary* was pope Gregory the great.

We alſo find mention of nocturnal and diurnal *Antiphonaries*, for the uſe of the daily and nightly offices; ſummer and winter *Antiphonaries*, alſo *Antiphonaries* for country churches, &c. *Du Cange*, loc. cit. *Lipen.* Bibl. Theol. T. 1. p. 64.

ANTIPHONY, *Antiphona*, (*Cycl.*) ſometimes denotes a ſpecies of pſalmody, wherein the congregation being divided into two parts, repeat the pſalms, verſe for verſe, alternately. *Iſid.* Orig. l. 6. c. 19. *Spelm.* Gloſſ. p. 33. *Bingh.* Orig. Eccleſ. T. 1. l. 14. c. 1. §. 10.

In this ſenſe, *Antiphony* ſtands contradiſtinguiſhed from *ſymphony*, where the whole congregation ſings together. See SYMPHONY, *Cycl.*

Antiphony differs from *reſponſorium*, in that in this latter the verſe is only ſpoke by one perſon, whereas in the former, the verſes are ſung by the two choirs alternately. Socrates calls it Ἀντιφωνον ὑμνωδιαν, the antiphonal hymnody, St. Ambroſe *reſponſoria*, or ſinging by reſponſals. *Du Cange*, Gloſſ. Græc. T. 1. p. 89.

The original of antiphonal ſinging in the weſtern churches is referred to the time of St. Ambroſe. That father is ſaid to have firſt introduced it into the church of Milan, in imitation of the cuſtom of the eaſtern church, where it appears to be of greater antiquity, tho' as to the time of its inſtitution, authors are not agreed; ſome dating it only from the reign of Conſtantius, while others pretend to find it in the time of Ignatius. V. *Bingh.* and *Spelm.* loc. cit.

ANTIPHONY is alſo uſed to denote the words given out at the beginning of the pſalm, to which both the choirs are to accommodate their ſinging. *Magr.* Vocab. Eccleſ. p. 18. ſeq. *Du Cange*, Gloſſ. Gr. T. 1. p. 89. *Rechenb.* Hiero. Lex. T. 1. p. 96.

ANTIPHONY, in a more modern ſenſe, denotes a kind of compoſition made of ſeveral verſes extracted out of different pſalms, adopted to expreſs the myſtery ſolemnized on the occaſion. *Magr. Du Cange*, & *Rechenb.* loc. cit.

ANTIPHONA *ad Introitum*, that antiently ſung in the introit of the maſs. *Du Cange*, Gloſſ. Gr. T. 1. p. 89.

ANTIPHONA *Invitatoria*, that repeated at the pſalm *venite exultemus*. *Schmid.* Lex. Eccleſ. p. 55.

ANTIPHONÆ *Majores*, thoſe ſeven uſed to be ſung in the time of Advent, at the magnificat, and during the ſeven days before Chriſtmas. *Schmid.* loc. cit.

ANTIPHONÆ *proceſſionales*, thoſe ſung at proceſſions.

ANTIPHONÆ *Rogationales*, thoſe rehearſed at rogations.

ANTIPHONY, in the antient muſic, differed from ſymphony. See the article SYMPHONY.

ANTIPHYSON, an appellation given by ſome antient writers to the load-ſtone. *Marcell.* Empir. de Medicam. c. 1.

The name imports as much as, *reflans*, or blowing back, or againſt; being taken from the operation of the magnet, whereby it repels iron, which was formerly ſuppoſed to be done by virtue of a blaſt, or breath emitted from it. V. Mem. Acad. Inſcrip. T. 6. p. 386. ſeq.

ANTIPOPE, a falſe or pretended pope; or one that is irregularly elected in oppoſition to another.

Church hiſtory is full of the elections, the intrigues, and the ſchiſms of *Antipopes*; their depoſitions by councils; their promiſes and oaths to abdicate; and ſometimes, tho' very rarely, their performance of their oaths.

There have been *Antipopes* in all ages. Geddes gives the hiſtory of no leſs than twenty-four ſchiſms in the Romiſh church, cauſed by *Antipopes*; ſome took their riſe from a diverſity of doctrine and belief, which led different parties to elect each their ſeveral pope; but the greater part from dubious controverted rights of election, the fruits of chicane and ambition. V. *Gedd.* Hiſt. of Schiſm in Rom. Church. p. 2. ap. ejuſd. Miſ. Tract. T. 3. & *L'Enfant*, Hiſt. du Conc. de Piſ. l. 1. & 2. Jour. des Scav. T. 76. p. 11. ſeq.

ANTI-PORTICO is uſed by ſome for a veſtible, or porch, at the entrance of an edifice. V. Giorn. de Letter. d' Ital. T. 23. p. 332.

ANTIPRAXIA, in the antient phyſic, denotes a contrariety of functions, temperaments, &c. in different parts of the body; in-

invented to account for that contrariety of ſymptoms which frequently concur in hypochondriac caſes, when, *e. gr.* the liver is charged with being immoderately hot, and the ſtomach exceſſively cold. *Caſt.* Lex. Med. p. 58.

The moderns, particularly Etmuller, refute the notion of an *Antipraxia*, on this principle, that the blood circulating duly tho' the whole body warms all the parts as well the ſtomach as liver proportionably. To which ſome advocates for the antient ſyſtem object, that this is confounding the preternatural ſtate with the natural.

ANTIPROBABILISM, the doctrine or ſyſtem of thoſe who hold it unlawful to follow the leſs probable opinion, in oppoſition to the more probable one.

There have been vigorous advocates for *Antiprobabiliſm*; for even among its greateſt enemies, the Jeſuits, F. Giſbert has a treatiſe expreſs in favour of *Antiprobabiliſm*, viz. *Antiprobabiliſmus, ſeu tractatus theologicus fidelem totius probabiliſmi ſtateram continens*, &c. Par. 1703. 4°. Jour. des Scav. T. 31. p. 938. Act. Erud. Lipſ. 1706. p. 373.

ANTIPROBOLE, Ἀντιπροβολη, in rhetoric, a figure whereby the defendant adopts or admits the charge brought againſt him by the proſecutor. *Heder.* Schul. Lex. p. 285.

E. gr. Suppoſing the proſecutor's προβολη to be, Titus has killed Cajus; the defendant's *Antiprobole* may be, I have killed him, but undeſignedly.

ANTIPROPEMPTICON, Ἀντιπροπεμπτικον, in poetry, a poem wherein a perſon going a journey addreſſes himſelf to his friends. Such is that of Ovid, l. 1. Triſt.

Cum ſubit illius triſtiſſima noctis imago, &c.

It is oppoſed to *propempticon*. See PROPEMPTICON.

ANTIPROTASIS, Ἀντιπρόλασις, in rhetoric, a ſolution of the *protaſis*. See PROTASIS.

ANTIPSORA, in pharmacy, remedies proper againſt the itch. *Zwing.* Specim. Mat. Med. c. 44. n. 5.

ANTIPYRETON, among phyſicians, an appellation given to the medicines againſt fevers. *Caſt.* Lex. Med. p. 58.

ANTIQUARE, among Roman lawyers, properly denotes the rejecting of a new law, or refuſing to paſs it. *Briſſ.* de Verb. Signif. p. 49. *Calv.* Lex. Jur. p. 74.

In which ſenſe, *antiquating*, differs from *abrogating*; as the latter imports the annulling an old law, the former the rejecting a new one.

It was a cuſtom among the Romans, when they voted for caſting out a new law propoſed, to give their votes by a ballot, on which was inſcribed the letter A, to denote *Antiquo*.

ANTIQUARE is alſo uſed for a law's growing obſolete, or into diſuſe, either by age or non-obſervance. *Calv.* Lex. Jur. p. 74.

ANTIQUARIUM, among the antients, denoted a place or apartment, wherein their antique monuments were preſerved. *Pitiſc.* Lex. Antiq. in voc.

This is otherwiſe denominated Αρχειον.

ANTIQUARTIUM is uſed by ſome modern practitioners, for a ſpecific againſt the quartan ague. *Caſtel.* Lex. Med. in voc.

Hence ſome call the Jeſuits bark *Antiquartium Peruvianum*. Wedelius alſo ſpeaks of an *eſſentia antiquartia*.

The *antiquartan* of Riverius is a preparation of mercurius dulcis, aurum fulminans, ſulphur of antimony, and ſcammony. Vid. *Ettmul.* Colleg. Chem. c. 5. n. 3.

ANTIQUARY, *Antiquarius* (*Cycl.*)—There was an antient college of *Antiquaries* erected in Ireland by Ollamh Todhla, 700 years before Chriſt, for compoſing a hiſtory of the country. And to this, ſay the Iriſh hiſtorians, it is owing, that the hiſtory and antiquities of that kingdom may be traced back beyond thoſe of moſt other nations. *Kenned.* Chron. Diſſert. ap. Mem. de Trev. 1705. p. 1873. ſeq. *Nicholſ.* Iriſh Hiſt. Libr. App. N°. 1. p. 179. ſeq.

Foundations of this kind have often been wiſhed for, and ſometimes alſo attempted in England.

Sir. H. Spelman ſpeaks of a ſociety of *Antiquaries* in his time, to whom his treatiſe of the terms, written in the year 1614, was communicated, he himſelf being one of the number.

The ſociety was formed by Cambden, Sir Robert Cotton, Stow, and others; in 1589 R. Carew was admitted into it. Application was made to Queen Elizabeth for a charter and houſe wherein they might hold their meetings, erect a library, and the like. But by the death of that princeſs, their application proved abortive. And for her ſucceſſor king James the firſt, he was far from favouring their deſign. V. *Nicholſ.* Engl. Hiſt. Libr. P. 3. c. 3. p. 199. ſeq. *Smith*, Vit. Cotton. Mem. Liter. de la Gr. Bret. T. 13. p. 243. ſeqq.

In the year 1717, this ſociety was revived again, ſince which time no interruptions having happened, it is at preſent in a very flouriſhing condition; and, by a late conſtitution, which limits the number of its members, the ſociety conſiſts of one hundred learned and ingenious men, of the nobility, gentry, clergy, &c. whoſe buſineſs, as members, is to diſcover the antiquities of their own, as well as thoſe of other nations.

For further particulars, ſee Maitland's hiſtory of London, l. 6. c. 4. p. 647.

The preſent ſociety of *Antiquaries* have no charter.

ANTIQUARY, in middle age writers, is uſed for a copiſt, or perſon employed in tranſcribing antient books.

Antiquarius differs from *librarius*, in that the latter copied new as well as old books, whereas the former was wholly employed in antient ones. *Du Cange*, Gloſſ. Lat. in voc.

In ſome monaſteries there was a houſe or appartment on purpoſe for the *Antiquarii*, called *domus antiquariorum*, ſometimes alſo *ſcriptorum*. *Du Cange*, ibid.

ANTIQUARIES were alſo thoſe employed in repairing books injured with age.

ANTIQUARY, *Antiquarius*, is alſo uſed, by antient writers, for the keeper of the *Antiquarium*, or cabinet of antiquities.

This officer is otherwiſe called *archæota*, or *antiquary* of a king, a prince, a ſtate, or the like.

King Henry VIII gave John Leland the title of his *Antiquary*, a title which ſays the author of his life, no body ever enjoyed beſides himſelf. But the reſtriction, we ſuppoſe was only intended, to be underſtood in reſpect of the kings of England; M. Schott we find had the title of *Antiquary* to the king of Pruſſia, P. Pedruzzi, that of *Antiquary* of the duke of Parma [a], M. Galland reſided ſome time in Turky, under the title of *Antiquary* of the king of France [b].—[a Mem. de Trev. 1721. p. 43. b Hiſt. Acad. Inſcr. T. 2. p. 745.]

The Univerſity of Oxford have ſtill their *Antiquary*, under the denomination of *cuſtos archivorum*. *Wood*, Ath. Oxon. T. 2. p. 563.

The kings of Sweden have been at great expences in order to illuſtrate the *antiquity* of their country, having eſtabliſhed an academy of *Antiquaries* with this ſingle view. Mem. de Trev. 1709. p. 161. ſeq.

The office of the antient Iriſh *Antiquaries* was to preſerve the genealogies of the kings of Ireland, to correct the regal tables of ſucceſſion, and deliver down the pedigree of every collateral branch of the royal family. *Nicholſ.* Iriſh Hiſt. Libr. App. N°. 1. p. 180.

P. Labbe and Petavius have publiſhed pieces expreſs concerning the apparatus of *Antiquaries*. Vid. *Lipen.* Bibl. Phil. p. 76. ſeq.

ANTIQUE (*Cycl.*)—The ſcience of *Antiques* is alſo called by Spon *archæographia*. Præfat. Miſcel. Erud. Antiq. *Fabric.* Bibl. Antiq. c. 5. n. 2. See ARCHÆOGRAPHIA.

Under this is included the knowledge of antient coins, medals, inſcriptions, buildings, ſtatues, ſculptures, MSS, veſſels, weights, meaſures, &c.

ANTIQUING, in book-binding, a method of ornamenting the edges of books with divers foliages and ramifications, by means of hot iron tools cut for the purpoſe. *Savar.* Dict. Com.

This kind of decoration was formerly much in uſe, eſpecially in France; but of late has fallen into neglect.

ANTIQUITY (*Cycl.*)—There are great diſputes concerning the *antiquity*, or age of the world.

Ariſtotle carried it even to eternity; and Parmenides, Pythagoras, and the Chaldeans were of the ſame opinion; but the generality of philoſophers, as well as divines and hiſtorians, have always held an origin of it. V. *Thomaſ.* Meth. Etud. Hiſt. Prof. l. 1. c. 1. §. 1. ſeq.

Though where to fix that origin, is the difficulty. The different ſyſtems of chronology of the Greeks, the Egyptians, the Jews, the Hebrew text, and the ſeptuagint verſion, of Scaliger, of Pezron, of Sir Iſaac Newton, &c. to ſay nothing of the Chineſe annals, leave the point infinitely embarraſſed.

Dom. Pezron thinks he has merited well of the public by adding 2000 years to the age of the world, which had been taken from it by Scaliger and others; but this did not hinder F. Martianay from entering a proſecution againſt him in the archbiſhop's court of Paris, for hereſy.—His crime was following the Heathen, rather than the Hebrew chronology, in which however he was preceded by the generality of the fathers and primitive writers of the church; among whom it appears to have been a common practice, to make 5500 years between the creation, and the incarnation. In reality, the Jews are charged with having corrupted their chronology; by which the moderns have been miſled. Mem. de Trev. 1707. p. 1272. *Valem.* Elem. de l'Hiſt. T. 1. p. 16. ſeq.

Some have propoſed to make a trace of the *Antiquity* of the earth, by an obſervation of the ſaltneſs of the ſea; others by obſerving the elevation of the bottom of the ſea, or the growth of its ſtrata.—One mark or proof of *Antiquity* has been ſtarted by Rudbeck, which he pretends to have carried to a demonſtration; it is taken from the thickneſs of a certain black cruſt, called in the Swediſh tongue, *Mat-iorden*, and *Swart-myllan*, which covers the ſurface of the earth, being formed of a mixture of rotten graſs and other herbs, with duſt, and a kind of mud, which the melted ſnow leaves behind it. According to this antiquary, there are at leaſt 500 years requiſite to form an inch thick of this cruſt, which in many places of Sweden is found to be upwards of ſeven inches thick, where urns have been dug up full of bones and aſhes. From whence it follows, according to this author, that it is upwards of 3500 years ſince burning the dead was practiſed in Scandinavia. Jour. des Scav. T. 43. p. 86.

Pliny ſeems even to hold the uſe of letters to be eternal, *literas ſemper arbitror Aſſyriis fuere.* He goes on to obſerve, that the Babylonians had aſtronomical obſervations written on tables of brick, for the ſpace of 720 years, according to Epigenes, or at leaſt of 480 years, according to Beroſus [a]; and concludes, *ex quo apparet æternus literarum uſus* [b]. But it is known that the Chaldeans pretended to aſtronomical obſervations of 470,000 years according to Cicero, or of 473,000 years according to Diodorus; and it may be added that Beroſus, who is cited by Pliny, and who wrote ſoon after the death of Alexander, affirmed, in the firſt book of his hiſtory of Babylon, that there were books preſerved, which comprehended the hiſtory of above 150,000 years. Hence it has been inferred by Voſſius, Perizonius, and others, that Pliny's text ought to be amended, the 720 years of Epigenes, to be turned into 720,000, and the 480 of Beroſus into 480,000 [c]. —[a *Plin.* Hiſt. Nat. l. 7. c. 56. b ibid. c Hiſt. Crit. Rep. Lett. T. 1. p. 17. ſeq.]

The Abbot Sevin [d] has endeavoured to ſet aſide the correction of the paſſage of Pliny in a diſcourſe expreſs. Perizonius has altered the reading of Pliny, as to the numbers; in which he is followed by the generality of critics [e].—[d Hiſt. Acad. Inſcript. T. 2. p. 239. ſeq. e Vid. Mem. de Trev. 1721. p. 422.]

M. Maſſon has given a defence of it againſt M. Sevin. Vid. Hiſt. Crit. Rep. Lett. T. 9. P. 1.

The Jeſuits are charged with being enemies of *Antiquity.* The fathers Papebroch, and Germon are famous for the attack they have made on antient charters; and F. Hardouin has attacked the *Antiquity* of books and MSS.

F. Bougeant has lately revived the ſyſtem of this laſt. He is confident there are no MSS. to be found above ſix hundred years old. Bibl. Franc. T. 13. p. 228.

Jealouſy is by ſome ſuſpected to have had a large hand in this diſpute; it has been ſuggeſted, that the archives of the Jeſuits, being leſs ſtored with the venerable monuments of *Antiquity* than thoſe of the Benedictins, and ſome other religious, they had undertaken to attack not only the authenticity of charters and manuſcripts, but of every thing that bears the character of *Antiquity.* Jour. des Scav. T. 69. p. 261. ſeq.

The *Antiquity* of religion has been often urged as a proof of the truth of it.—Jews, Gentiles, Chriſtians, Proteſtants, Papiſts, have all in their turns made uſe of the argument from *Antiquity.* It is indeed of the inartificial kind; and comes rather under the denomination of a preſumption than a proof; on the whole it ſeems to ſerve the cauſe of error better than of truth; it is founded on this, that as we allow God to be a juſt and good being, it is hardly to be conceived that he ſhould have ſuffered a great part of the whole world for many ages to have continued in a religion which he did not approve of. But ſuppoſing this, had not the heathens reaſon to condemn chriſtianity at its firſt appearance; for how could it conſiſt with the goodneſs and juſtice of God to have permitted the whole world, excepting Judea, to have continued in heatheniſm during all former ages. V. Bibl. Anc. Mod. T. 24. p. 300.

There is ſcarce a nation under heaven, but lays claim to a greater degree of *Antiquity* than the reſt of its neighbours; the Scythians, the Phrygians, the Chaldeans, Egyptians, Greeks, Chineſe, *&c.* pretend each to the honour of being the firſt inhabitants of the earth; ſeveral of theſe nations, leſt they ſhould be outſtripped in their pretenſions by any of the reſt, have traced up their origin to ages long before the creation. Hence the appellation *aborigines*, *indigenæ*, *terrigenæ*, *antelunares*, &c. The Athenians were not aſhamed to pretend to be *Autochthones*; and what is moſt remarkable, Socrates himſelf gives them this ridiculous appellation, which, as ſome others of the philoſophers have wiſely obſerved, only put them on a level with ants, and graſhoppers. Mem. Acad. Inſcript. T. 7. p. 498.

The Chaldeans pretend to aſtronomical obſervations of 470,000 years; they mention the preciſe king who reigned over them at the time of the deluge, whoſe name was Xiſuthrus, and attribute to him ſeveral things which we aſcribe to Noah. Bibl. Univ. T. 3. p. 102.

St. Auguſtin laughs at the folly of the Egyptians, who pretend to obſervations of the ſtars above 100,000 years old; in effect no people appear to have been warmer in the conteſt for *Antiquity* than thoſe of Egypt. They pretend two periods of time; one ſhorter, during which the throne of Egypt had been filled by men, the other almoſt infinite, wherein gods, and demi-gods, had wore the crown. From Iſis and Oſiris to Alexander they reckoned a ſpace of 23000 years, the time before that, while the gods reigned, made 42984 years more; the whole duration from the beginning of their monarchy amounting to 65984. De Civit. Dei l. 18. c. 40.

The computation of their dynaſties as given by Manetho a writer of their own, (of whom we have extracts in Syncellus, taken from Julius Africanus and Euſebius) extends to 5550 years before Alexander's time, and the Egyptian chronicle, cited by the ſame Syncellus, goes further, reckoning 36525 years. Diogenes Laertius makes no leſs than 48863 years from the reign of Vulcan. Yet the Scythians, the Phrygians, the Ethiopians, and ſome others ſtill inſiſted on their priority to the Egyptians; and in the judgment of many ſeem to have carried their point. Juſtin after Trogus gives the precedency to the Scythians; and affirms that they were always allowed to have been before the Egyptians. *Juſt.* Hiſt. l. 2. c. 1.

Pſammetichus, to make proof whether the Egyptians or Phrygians were the oldeſt, ordered two infants to be bred up without a word of any language being ſpoken before them. At two years old the ſhepherd who had the care of them heard them both one day ſtretching out their hands towards him, and crying *beccos*, *beccos*, which in the Phrygian tongue denotes bread; from that time the honour of *Antiquity* is ſaid to have been generally allowed to the Phrygians. But the fact M. Rollin obſerves muſt be falſe, ſince if they had never heard a word, they would never have ſpoken one. Jour. Liter. T. 16. p. 192.

The Ethiopians, M. Fourmont thinks, have of all other nations the beſt title; among the antients there were none but the Egyptians could diſpute it with them. Diodorus Siculus gives the hiſtory of this famous conteſt between the two nations. The Ethiopians were not a bit embarraſſed with the long ſeries of years in the Egyptian account, they allowed them all the *Antiquity* they could deſire, owned their great knowledge in the arts and ſciences, their great diligence and exactneſs in recording the actions of their kings, and heroes; but deſired them, in virtue of this great knowledge and exactneſs, to tell them the preciſe epocha when the Ethiopian nation commenced, and how much exactly the Ethiopians were younger than themſelves? The impoſſibility the Egyptians were under to do this ſeems to have given a victory to their adverſaries. Mem. Acad. Inſcript. T. 7. p. 499. ſeq.

Some think that the Armenians have a better claim to priority than any other nation, it being allowed that the country which they inhabit was the firſt that men trod on after the deluge, when they came out of the ark. But it appears at the ſame time, that Noah and his family made no long ſettlement there. Mem. des Miſſ. T. 3. p. 14.

But the Chineſe is doubtleſs the moſt antient monarchy in the univerſe; having cultivated the ſciences from the earlieſt ages; and ſubſiſted at leaſt theſe 4000 years with the ſame laws, manners, and uſages. *Freret.* Ap. Mem. Acad. Inſcript. T. 9. p. 362.

Some indeed have called in queſtion the truth and authenticity of the Chineſe annals, yet we find them confirmed, at leaſt as high as 660 years before Chriſt, by the annals of Japan. At worſt the Chineſe *Antiquities* ſtand on as good a footing as thoſe either of Greece or Rome. Their annaliſts both for order and chronology are not inferior to any of thoſe antients ſo much admired among us; but far ſurpaſs them in point of *Antiquity*, and have a better title to be credited, as having written by public authority, which can be ſaid of few Greek or Roman pieces, except perhaps the capitoline marbles, which are not properly a hiſtory. *Vignol.* Ap. Bibl. Germ. T. 14. p. 143.

We have no inconſiderable confirmation of the truth of the Chineſe account, from an antient obſervation of a grand conjunction of the planets under Chuen-Hio emperor of China, related by Martinius. That prince lived 2513 years before Chriſt. M. Kirchius has defended the obſervation againſt Caſſini, and ſhewn a conjunction muſt really have happened at the time mentioned by the Chineſe annals. Miſc. Berol. T. 3. p. 165. ſeq.

But the authenticity of this obſervation, and the whole of the Chineſe chronology, has been lately attacked by an ingenious author, Mr. Coſtar. See Phil. Tranſ. N°. 483.

It muſt not be forgot that the Iriſh alſo pretend to be the antienteſt of all nations; they trace their origin without interruption to Japhet [f]. But the Scots ſtill diſpute the priority with them; holding themſelves an elder branch of the Scythians, the firſt of men [g]. The Iriſh however are not like to yield the victory; on the plauſible pretence of their being called the *antient Scots*, they reduce their neighbour Scots to a very late origin, pretending they were not ſettled in North-Britain before the eleventh century; whereas the Scotiſh hiſtorians trace them in the ſame country before the birth of Chriſt. The writers on both ſides generally allow them to have come thither from Ireland. But, in ſo much obſcurity is every thing belonging to *Antiquity* involved, ſome deny even this: Mackenzie maintains, that there are greater preſumptions for believing that the Scots in Ireland took their origin from thoſe in North-Britain, than *vice verſa.*—[f Act. Erud. Lipſ. 1696. p. 249. g *Mackenz.* Scot. Writ. T. 1. pref. p. 3.]

In the reign of king Laogair, which commenced Ann. Dom. 427, a committee of three kings and three biſhops, whereof St. Patrick was one, and three antiquaries, was appointed to examine the genealogies of the principal families and antient records of the kingdom, and having purged them of all ſpurious relations, to depoſite them in the archives of the iſland, as a venerable and authentic collection. This body of records was called the great *Antiquity*, and its veracity was never to be queſtioned by future generations; the book of Armach, the pſalter of Caſhel, *&c.* are tranſcripts of this. *Nicholſ.* Iriſh. Hiſt. Libr. App. n. 1. p. 181.

In effect, the *Antiquities* of the northern kingdoms are so confused, that it is almost impossible to distinguish truth from fable. The first historians of these as of other countries were poets, who embellished their writings with allegories and figures, which posterity has since taken for facts; hence the Danes treat those things as fabulous which the Swedes hold for incontestable truths; and the Norwegians, equally jealous of both nations, question the truth of what is advanced by both. Mem. de Trev. 1711. p. 1200. seq.

There are *e. gr.* three different systems of Danish *Antiquities*; the first supposes Danus the founder of the kingdom and nation; the second takes things up higher, and goes back to Noah's ark; supposing that Gomer, grandson of Japhet came by sea into Europe, and traversing Scythia settled in Denmark; the third keeps a medium between the other two. Mem. de Trev. 1719. p. 125.

The British *Antiquities* before Cæsar's invasion are utterly dubious, not to say fabulous. Old chronicles speak of Samothes, the son of Japhet, as the founder of the British monarchy; Albion a descendant of Cham invaded it three hundred years after; and about 600 years after this, Brute grandson of Æneas came and took possession of the island in the year of the world 2880, giving it the name which it still retained when Cæsar made his attempt [h]. This is Jeffrey of Monmouth's system of the *Antiquities* of the British nation, which the generality of our historians admit for want of a better. It has been defended by A. Thomson of Queen's college, in the preface to his English translation of that writer [i].—[h V. Ouvr. des Scav. Juin. 1706. p. 258. i Ox. 1718. 8°. V. Nouv. Liter. 1718. p. 167. seq.]

M. de Pouilly has shewn that the Roman *Antiquities* for the first 400 years of that state are at least extremely uncertain. Mem. Acad. Inscript. T. 8. p. 21.

Dionysius Halicarnasseus has traced the Roman *Antiquities*, Josephus the Jewish *Antiquities*, Berosus the Chaldaic *Antiquities*, Sanconiathon the Phœnician *Antiquities*, Manetho and Marsham the Egyptian *Antiquities*.

Dionysius gave his book the title of Roman *Antiquities*, on account of the curious enquiries he had made concerning the origin of the Romans, by tracing them back to the remotest ages. For fidelity as well as instruction he is generally preferred to Livy; his accounts are more ample, and his facts described with more particulars; he gives a full idea of the Roman ceremonies, the worship of their gods, sacrifices, manners, customs, discipline, policy, courts, laws, *&c.* V. Mem. de Trev. 1722. p. 555. seq. Jour. des Scav. T. 72. p. 118. seq. But the question is, upon what authority? See Mem. Acad. Inscr. loc. cit.

There are two French translations of the book; one by father Le Jay [k], a Jesuit, which is elegant indeed, but complained of as too free, and often departing from the precise sense of the author; the other more literal and exact by M. Bellengar [l] doctor of the Sorbonne.—[k Par. 1724. 4°. 2 Vol. V. Jour. des Scav. T. 74. p. 304. Mem. de Trev. 1723. Bibl. Franc. T. 1. p. 284. l Par. 1723. 4°. 2 Vol. Jour. des Scav. T. 74. p. 426.]

The Phœnician *Antiquities* of Sanconiathon are preserved in part by Eusebius. We have an English translation of Sanconiathon, with notes by bishop Cumberland, and a continuation from the canon of Eratosthenes. Lond. 1720. 8°. V. Mem. Liter. de la Gr. Bret. T. 8. p. 371. seq.

The Chaldaic *Antiquities* of Berosus are lost, except a few fragments which have been collected by Jos. Scaliger, and since more fully by Fabricius [m]. Annius of Viterbo, a Dominican Monk, towards the close of the 15th century, would not suffer us to want such a treasure, but officiously went to work, and forged a Berosus out of his own brain, which he published at Rome in 1498 [n]. The Monk went further; and from the same mint soon after produced Manetho's supplement to Berosus, from the time of Ægyptus king of Egypt to the origin of the Roman state. The mischief is Manetho lived before Berosus; this anachronism alone had sufficed to betray the cheat.—[m V. Bibl. Græc. l. 6. c. 12. n. 9. n Id. ibid. necnon. in Bibl. Lat. l. 4. c. 13. n. 5.]

To the same class of suppositious *Antiquities* belong the Hetrurian, *Antiquitates Hetruscæ*, pretended to have been found by Scornelli near Volaterra, and published in 1636 by Curtius Inghiramus, who is generally supposed to have been the forger of them. A great number of fictitious names of antient authors are cited in this book to give the better face to the cheat; but the stile betrayed it. Allatius and Ernstius early detected the imposture. *Fabric.* Bibl. Lat. l. 4. c. 13. n. 3.

ANTIQUITY is more peculiarly used to denote the ceremonies, customs, and usages which obtained in antient times, either with regard to persons, places, or things.

Antiquities, in this sense, are usually divided into sacred, political, military, literary, and domestic; sometimes only into civil and ecclesiastical.

Academical ANTIQUITIES, the origins, usages, *&c.* of the antient academies, schools, colleges, and other literary societies. These bear a near relation to scholastic *Antiquities*, and make a branch or division of literary *Antiquities*. Herm. Conringius has given a body of academical *Antiquities* [o], Ursinus a treatise of the scholastical *Antiquities* of the Hebrews [p].—[o De Antiquitatibus Academ. Dissertationes sex *Helmst.* 1651. 4°. Supplement. Earund. *Helmst.* 1674. 4°. V. *Thurman.* Bibl. Acad. p. 4. seq. p *G. Ursini*, Antiquitates Hebraicæ Scholastico-Academicæ, *Hafn.* 1697. 4°. V. Nouv. Liter. Lubec. 1698. p. 57.]

Apostolical ANTIQUITIES, the acts, monuments, *&c.* of the first planters of christianity. See APOSTLE, *Cycl.* and *Suppl.*

Dr. Cave has published a treatise of apostolical *Antiquities*, Antiquitates Apostolicæ, or the lives, acts, *&c.* of the apostles, evangelists, *&c.* Lond. 1674. Fol. 1684. and 1686. an extract of it may be seen in *Kust.* Bibl. Nouv. Libror. 1698. p. 191. seq.

Biblical ANTIQUITIES, the notices of antient laws, ceremonies, events, *&c.* occuring in the scriptures.

These make a branch of ecclesiastical *Antiquities*, and bear a near relation to the Jewish, *&c. Antiquities*.

Some pretend to deduce most of the heathen *Antiquities* from the bible; others as Spencer, *&c.* take the contrary course, and deduce the *Antiquities* of the bible from those of heathenism.

To interpret scripture it is absolutely necessary regard be had to the heathen *Antiquities* alluded to in them, and these not only such as are directly aimed at, or approved, but also such as are purposely opposed. Thus Maimonides conceives the rites of the Zabii very beneficial for giving light to many positive Levitical precepts, which now for want of them seem strange and impertinent; and it would doubtless have much contributed to the clear distinction of the moral and judicial laws, to have known all the ceremonies of the Chaldean and Phœnician idolatry. V. *Dodwel*, Lett. of Advice 2. p. 196. seq.

Philo Judæus among the antients, and Quensted, Moncæus, Calmet, *&c.* among the moderns, have published treatises expres's concerning the *Antiquities* of the bible.

Christian ANTIQUITIES, those which relate to the antient state of the Christian church.

These are the same with what we otherwise call ecclesiastical *Antiquities*.

The Magdeburg Centuries are looked upon by protestants as a library of Christian *Antiquites*.

Mr. Bingham has published a learned system of Christian *Antiquities*.

Civil ANTIQUITIES, all that belong not to the head of *ecclesiastical*.

Evangelical ANTIQUITIES amount to much the same with those otherwise called *apostolical*.

Literary ANTIQUITIES, those relating the matters of learning and study, *e. gr.* schools, academies, sciences, doctors, degrees, professors, disciples, recitations, studies, books, paper, writing, pen, ink, copist, bookseller, library, letter, hieroglyphic, note, abbreviature, printing, *&c.*

National ANTIQUITIES, those employed in tracing the origin, antient actions, usages, monuments, remains, *&c.* of some nation or people.

Parochial ANTIQUITIES, those confined to the limits of one or more parishes, and conversant chiefly in what relates to its tithes, revenues, *&c.* of the churches.

Dr. Kennet has published a learned and curious work under the title of *parochial Antiquities*, attempted in the history of Ambrosden and Burchester, and other adjacent parts in the counties of Oxford and Bucks. Oxf. 1695. 4°. V. Phil. Transf. N°. 220. p. 259.

Political ANTIQUITIES, those relating to the origins of states, governments, magistrates, and laws.

Under these come the consideration of the antient commonwealths, empires, monarchies, councils, senates, inaugurations, ensigns, crowns, scepters, nobility, plebeians, slaves, dignities, titles, rewards, punishments, revenues, tithes, weights, measures, fairs, markets, sales, usury, testaments, burials, coins, and the like.

Sacred ANTIQUITIES, those relating to the religious worship, discipline, and belief of antient times and people. *Fabric.* Bibl. Antiq. c. 8.

These may be subdivided, into Heathen, Christian, and Mahometan, *&c.*

Reland has a treatise expres's on the sacred *Antiquities* of the Jews; Struvius on those of the Romans; Lakemacher on those of the Greeks; and Stillingfleet on those of the British churches.

Fabricius has given two plans of a Thesaurus, or body of *Antiquities*; the one of Hebrew *Antiquities*, after the manner of Grævius and Gronovius; the other of ecclesiastical *Antiquities*, divided into twelve books. He gives the names and titles of 156 authors to be included in the first, and 101 authors for the second. Jour. des Scav. T. 42. p. 533.

Gronovius has given a collection of the chief writers on the Greek *Antiquities*, Rouse [a], Pfeiffer [b], Bos [c], and bishop Potter [d], have given shorter systems; the last is the best esteemed: tho' found too short by some in what relates to the religion, the gods, vows, and temples of Greece. To supply this deficiency, Lakemacher [e] Greek professor at Helmstadt, has given us a treatise of the sacred *Antiquities* of Greece, and seems further to promise the civil, military, domestic, and literary *Antiquities* of Greece, in the same manner; what he has already given is very exact.—[a Archæologia Attica 1637. and 1671. 4°. V. *Fabric.* Bibl. Antiq. c. 2. p. 35. *Wood*, Ath.

Ath. Oxon. T. 2. p. 47. [b] Antiquitates Græcæ Gentiles Regiom. 1688 and 1708, 4°. V. Lakemach. Antiq. Græc. Sacr. in Præf. [c] Deſcriptio Antiquitatum Græcarum, *Frank.* 1714. 12°. [d] Archæologia Græca, or the *Antiquities* of Greece, Lond. 1713. 2 Vol. 8°. tranſlated into Latin and inſerted in Gronovius's Theſaurus; but the tranſlation is faulty. [e] Antiquitates Græcorum ſacræ. *Helmſt.* 1734. 8°.]

The beſt ſyſtem of Roman *Antiquities* yet extant is that of Roſinus, with Dempſter's notes [f]; Struvius indeed had in view a more accurate and perfect work of this kind [g]. But he never publiſhed more than the firſt part, *viz.* what relates to the religion of Rome [h].—[[f] Antiquitates Romanæ cum Th. Dempſteri Paralipomenis, Lugd. Bat. 1663. 4°. It. Traj. ad Rhen. 1710. 4°. V. Morhof. Polyhiſt. T. 1. l. 5. c. 2. §. 4. [g] V. Obſerv. *Halenſ.* T. 3. Obſ. 1. §. 1. [h] Syntagma Antiquitatum Romanarum, Jen. 1701. 4°. V. *Morhof.* Polyhiſt. T. 1. l. 5. c. 2. Hiſt. Crit. Rep. Lett. T. 5. p. 370.]

We have compendiums and introductions to the Roman *Antiquities* by Hoepfner, Nieuport, Godwin, Cantelius, Baſil Kennet, *&c.*

Heineccius has given a collection of Roman *Antiquities*, for illuſtration of the civil law; and Briſſonius another, drawn from the books of the civil law. Gravina's origines juris civilis is excellent on this ſubject.

A body of the writers on the Roman *Antiquities* has been publiſhed by Grævius, and another of thoſe on the Greek *Antiquities* by Gronovius, both under the titles of Theſauri.

A ſupplement to the former has been publiſhed by Sallengre. Danet and Pitiſcus have alſo publiſhed lexicons of the Roman *Antiquities*. Varro's books of Roman *Antiquities* are entirely loſt, excepting ſome fragments, preſerved by St. Auguſtin. Rerum Humanarum Antiquitates libri 25 & Divinarum 16. V. *Auguſt.* de Civit. Dei. l. 6. c. 3. *Fabric.* Bibl. Lat. l. 1. c. 7.

Pezron has a treatiſe expreſs on the *Antiquity* of times. L'Antiquité des tems retablié & defendué contre les Juifs & les nouveaux Chronologiſtes, Par. 1687. 4°. V. Act. Erud. Lipſ. 1687. p. 465. Ejuſd. Defenſe de l'Antiquité des tems, ou l'on ſoutient la Tradition des Peres & des Egliſes contre celle du Talmud, Par. 1691. 4°. V. Bibl. Univ. T. 24. p. 103. ſeq.

ANTI-RATIONALISTS, a name ſometimes given to divines, who in matters of religion are for humbling reaſon, and making it bend to faith; aſſerting that the abſurdity of a thing is no reaſon for rejecting it. Mem. de Trev. An. 1707. p. 1745.

In this ſenſe, the rigid Calviniſts and adherers to the ſynod of Dort are denominated *Anti-rationaliſts*, on account of the doctrine of abſolute predeſtination, *&c.* The Roman Catholics are alſo entitled to the ſame appellation, on account of the doctrine of tranſubſtantiation.—M. Bayle took ſhelter in the ſyſtem of the *Anti-rationaliſts*, the better to combat the Chriſtian doctrines of the origin of evil, providence, *&c.*

ANTIRRHETICUM, Ἀντιῤῥητικον, in literary hiſtory, denotes a refutation of ſome book, author, or opinion.

In this ſenſe, we alſo meet with *Antirrheſis*, Ἀντιῤῥησις.

ANTIRRHINUM, in botany. See SNAP-DRAGON.

ANTI-SABBATARIANS, a modern religious ſect, who oppoſe the obſervance of the Chriſtian-Sabbath. V. *Pagit.* Hæreſiogr. p. 134.

The great principle of the *Anti-ſabbatarians* is, that the Jewiſh ſabbath was only of ceremonial not moral obligation; and conſequently is aboliſhed by the coming of Chriſt.

ANTISAGOGE, Ἀντεισαγωγή, in rhetoric, a figure differing little from that called *conceſſion*. The following paſſage from Cicero is an inſtance of it; *Difficilis ratio belli gerendi; at plena fidei, plena pietatis: et ſi dicas, magnus labor, multa pericula proponuntur; at gloria ex his immortalis eſt conſecutura.* *Voſſ.* Rhet. l. 4. p. 390. See CONCESSION, *Cycl.*

ANTI-SCEPTIC, ſomething oppoſed to the reaſonings and ſyſtem of Pyrrhoniſts, or Sceptics.

We have ſtill extant, under the name of Sextus, (commonly, tho' without reaſon, ſuppoſed to be Sextus Empiricus) certain *Anti-ſceptic* diſputations, wherein the difference between good and evil, truth and falſehood, *&c.* is defended. V. *Fabric.* Bibl. Græc. l. 6. c. 7. p. 617.

ANTI-STANCARIANS, a ſect of German proteſtants, who oppoſe the doctrine of Stancarius, who aſſerted that juſtification was the ſole effect of Chriſt's human nature, excluſive of his divinity.

The *Anti-ſtancarians* therefore maintained that our juſtification by Chriſt is the fruit of the divine as well as human nature of Chriſt, and that the divinity ſuffered with his humanity on the croſs. *Prateol.* Elench. Hæret. l. 1. n. 50.

ANTISTASIS, Ἀντιστασις, in oratory, a defence of an action from the conſideration that had it been omitted worſe would have enſued. *Quint.* l. 7. c. 4.

This is called by Latin writers *comparativum argumentum*, ſuch, *e. gr.* would be the general's defence, who had made an inglorious capitulation, that without it, the whole army muſt have periſhed.

ANTISTATIS, in antiquity, denotes the gibbous part of the liver in the Grecian victims. *Potter*, Archæol. l. 2. c. 14.

ANTISTES, in eccleſiaſtical writers, a title uſually given to biſhops, tho' ſometimes alſo to prieſts or preſbyters. V. *Bingh.* Orig. Eccleſ. l. 2. c. 19. §. 13.

Some will have the appellation to have been peculiar to biſhops, excluſive of preſbyters.

But Bingham produces inſtances of the contrary. Sidonius Apollinaris reconciles the matter, when he diſtinguiſhes between an *Antiſtes* of the firſt and the ſecond order. L. 4. Ep. 11.

Among the antient Romans, *Antiſtes* was an appellation given to the chief or firſt order of prieſts in the provinces. *Struv.* Antiq. Rom. c. 12.

In which ſenſe, *Antiſtes* ſtands diſtinguiſhed from *patres* and *magiſtri*.—In the more uſual ſenſe notwithſtanding, *Antiſtes* denotes the ſame with *ſacerdos*.

There were alſo females of this quality under the title of *Antiſtæ*. *Pitiſc.* Lex. Ant. T. 1. p. 117. ſeq.

ANTISTICHON. See ANTISTOECHON.

ANTISTŒCHON, Ἀντιστοιχον, a grammatical figure whereby one letter is uſed inſtead of another. *Fabri* Theſ. p. 191. *Heder.* Schul. Lex. p. 287.

This is otherwiſe called *Anthiſtichon*, by ſome writers.

ANTISTROPHE (*Cycl.*)—It was cuſtomary among the Greeks on ſome occaſions, to dance round the altars, whilſt they ſung the ſacred hymns, which conſiſted of three ſtanzas, or parts; the firſt of which, called *ſtrophe*, was ſung in turning from eaſt to weſt; the other, named *Antiſtrophe*, in returning from weſt to eaſt. Then they ſtood before the altar, and ſung the epode, which was the laſt part of the ſong. *Potter*, Archæol. l. 2. c. 4.

ANTISTROPHE, in rhetoric, the ſame with what is more commonly called *epiſtrophe*. See EPISTROPHE.

ANTISYLLOGISM, Ἀντισυλλογισμος, in logic, a ſyllogiſm, which infers a contrary concluſion to that of another ſyllogiſm. *Voſſ.* Rhet. l. 3. p. 380. See SYLLOGISM, *Cycl.*

ANTITHENAR, (*Cycl.*) in anatomy, a muſcle called alſo the *Semi-interoſſeus Pollicis*. It is ſmall, flat and fleſhy, and is ſituated obliquely between the firſt phalanx of the thumb, and firſt bone of the metacarpus; 'tis fixed by one end toward the baſis of the firſt metacarpal bone near the firſt bone of the ſecond row of the carpus, from thence it runs obliquely toward the head of the firſt phalanx of the thumb, and is inſerted in the lateral external part of that bone, or on that ſide which is turned to the firſt metacarpal bone. It croſſes over the ſemi-interoſſeus indicis; this muſcle lying toward the back of the hand, the *Antithenar* here deſcribed toward the palm.

ANTITHENAR *Pedis*, a ſmall compound muſcle lying obliquely under the metatarſal bones, fixed poſteriorly in the lower parts of the ſecond, third and fourth of thoſe bones near their baſes, in the ligaments of theſe bones and of thoſe of the tarſus, and in a lateral aponeuroſis of the hypothenar, all theſe portions contracting into a ſmall compaſs are inſerted in the outſide of the external ſeſamoide bone of the firſt phalanx of the great toe. *Winſlow's*, Anatomy, p. 222.

ANTITHESIS (*Cycl.*) is ſometimes uſed for controverſy.

In this ſenſe, we meet with *antithetic* method, *antithetic* diſcourſes, *&c.* Vid. *Lang.* Inſt. Stud. Theol. Sect. 1. c. 2. Memb. 3. §. 1.

Marcion compoſed a volume of *Antitheſes*, or contrarieties and oppoſitions between the law and the goſpel. *Fabric.* Bibl. Græc. l. 5. c. 1. p. 201.

ANTITHETON, Ἀντιθετον, in rhetoric, a figure wherein contraries are ſet in oppoſition to each other.

We have an example of it in Cicero's fourth oration againſt Verres, *conferte hanc pacem cum illo bello; hujus prætoris adventum cum illius imperatoris victoria; hujus cohortem impuram cum illius exercitu invicto; hujus libidines cum illius continentia, &c.* *Voſſ.* Rhet. l. 5. p. 402. ſeq.

Some diſtinguiſh between the *antitheſis* and *Antitheton*. Voſſius thinks that in the *Antitheton* nouns and verbs are oppoſed; but in the *antitheſis* their epithets only. Others comprehend the *antitheſis* under *Antitheton*. *Voſſ.* ibid.

ANTITRAGICUS, in anatomy, a name given by Albinus to one of the muſcles of the eye, called by Santorini and others *muſculus Antitragi*.

ANTITRAGUS (*Cycl.*) is the thicker part of the anthelix [a], or that ridge juſt above the tragus [b].—[[a] *Gorr.* Def. Med. p. 40. *Caſt.* Lex. Med. p. 59. [b] *Drake*, Anthropol. l. 3. c. 12.] See TRAGUS, *Cycl.*

A twig of the hard portion of the auditory nerve, running on the back of the *Antitragus*, is ſometimes ſucceſsfully cauterized in the tooth-ach. Phil. Tranſ. N°. 299. p. 1981.

ANTLIA, Ἀντλια, or Ἀντλεια, an antient machine, ſuppoſed to be the ſame with our pump. *Fabri* Theſ. p. 192.

Hence the phraſe, *in Antliam condemnari*, according to the critics, denotes a kind of puniſhment, whereby criminals were condemned to drain ponds, ditches, or the like. V. *Sueton.* in Tiber. c. 51. *Caſaub.* ad Eund. *Artemidor.* Oneirocrit. l. 1. c. 50. *Lipſ.* Elect. l. 2. c. 15.

ANTOMOSIA, Ἀντωμοσια, in antient writers, an oath taken by both the parties in a criminal accuſation; whereby the accuſer charges the other with the fact, and the accuſed in his turn denies the ſame. *Suid.* Lex. T. 1. p. 232.

In which ſenſe *Antomoſia* amounts to the ſame with *diomoſia*, tho' ſome diſtinguiſh between the two, reſtraining *Antomoſia* to the oath of the perſon accuſed, whereby he engages to make no other than a fair defence; and *diomoſia* to the pro-

profecutor's oath, whereby he fwears that his accufation is juftly founded.

Others will have *Antomofia* properly to denote a law-fuit about things to which there are no witneffes, and which can only be decided by the oaths of the parties.—Others again will have it to be, where the accufed party alledging ficknefs for his non-appearance, the profecutor takes an oath, that the ficknefs is only feigned, upon which the judges proceed to fentence.

ANTONIANA *Aqua*, in the materia medica, the name of a medicinal water of Germany, remarkably pleafant to the taſte and of ſervice in many caſes as a medicine.

This water if mixed with any acid liquor raiſes a conſiderable effervefcence, and when mixed with rheniſh wine and ſugar, which is a common way of drinking it, it makes a great hiſſing and bubbling, and becomes turbid and milky. If powder of galls be added to it, it ſuffers no change but remains limpid and colourleſs; whence it is plain that it contains no iron, nor vitriol. Syrup of vitriol mixed with it turns the whole green, whence it is plain that it contains an alkali; and if oil of tartar be added to it, it becomes turbid and milky, and precipitates a white ſediment, whence it appears that there is either common ſalt or a calcarious earth in it. If it be expoſed ſometime to the air in an open veſſel, it, like all the other mineral waters, loſes its pungent taſte and pellucidity, becoming turbid and vapid. A quart of it evaporated with a very gentle heat leaves two ſcruples of a dry ſediment, which being ſeparated by another ſolution is found to be one half an alkaline ſalt, and the other a calcarious earth. Oil of vitriol mixed with the ſalt produces a great effervefcence, and a penetrating ſcent ariſes like that produced by the mixing oil of vitriol and common ſalt. Hence it appears that theſe waters contain a ſmall portion of an alkaline ſalt, a larger portion of ſea ſalt, and a yet larger of a calcarious earth, and with theſe a very conſiderable quantity of a ſubtile and penetrating mineral ſpirit.

It is a very temperate water, not too ſtrongly operating either by ſtool or urine; and hence it is a very proper drink for perſons in chronic and in many acute caſes, either alone or mixed with wine to ſupply the place of malt liquor, which is proper but in very few illneſſes. A long uſe of it alone may alſo prove of conſiderable ſervice in hypochondriac caſes. *Hoffman*, Oper. T. 5. p. 145.

ANTONIANA *Margarita*, in literary hiſtory, the name of a celebrated book written by Gomez Pereira a Spaniſh phyſician of the ſixteenth century; and thus entitled, to do honour to his father and his mother, who bore thoſe names. V. *Baill.* Dict. Crit. T. 3. p. 650. in voc. *Pereira*, Not. (c).

The *Antoniana Margarita* is the ſource from which Des Cartes borrowed his ſyſtem of the ſouls of brutes being mere machines. The author ſpent thirty years in the compoſition of it. It is now in the number of thoſe rare books only to be met with in the libraries of the curious.

ANTOSIANDRIANS, a ſect of rigid Lutherans who oppoſe the doctrine of Oſiander relating to juſtification.

Theſe are otherwiſe denominated *Oſiandro Maſtiges*.

The *Antoſiandrians* deny that man is made juſt, with that juſtice wherewith God himſelf is juſt; that is, they aſſert that he is not made eſſentially but only imputatively juſt; or, that he is not really made juſt, but only pronounced ſo. *Prateol.* Elench. Hæret. l. 1. n. 53.

ANTRUM *Pylori* (*Cycl.*) was thus denominated by Willis, who aſſigned it the office of keeping the firſt digeſted chyle, till that which was later taken into the ſtomach be digeſted; tho' if what Dr. Wharton ſuggeſts, that there are lacteals at the bottom of the ſtomach, be true, ſuch a proviſion ſeems unneceſſary. *Drake*, Anthropol. l. 1. c. 10. p. 42. ſeq.

ANTRUM *Genæ*, a large cavity in the fourth bone of the upper jaw, communicating with the foramina narium.

It was thus called by Caſſerius, but by Dr. Highmore *Antrum maxillæ ſuperioris*.

The *Antrum Genæ* is near two inches long, and above an inch in depth, ſeated between the lower margin of the orbit of the eye, and the dentes molares of the ſame ſide. Backwards the thin bony parts of this cavity, with the os ſphenoides, make the foramen lacerum externum; its lower ſurface makes a thin covering to all the roots of the dentes molares, as well as dens caninus of the ſame ſide. It is very thin, and on drawing any teeth to which it ſticks, is frequently taken along with it whereby this cavity is opened into the Alveolus, and conſequently into the mouth, to the great terror and ſurprize of the patient. *Drake*, Anthropol. l. 3. c. 10. p. 311. See ALVEOLI.

The *Antrum Genæ* appears to be the chief ſeat of the Ozena. Dr. Drake mentions an operation which he put in practice for the cure of that diſeaſe; taking out the foremoſt dens molaris, and not finding any aperture from its alveolus, as is frequently obſerved, he bored a hole through the alveolus into the *Antrum genæ*, whereby the pus which before lay in the *Antrum* run out, and the medicines daily injected by this aperture paſſed into the noſtrils whereby the patient was cured.

ANTRUM *Buccinoſum* is uſed by ſome anatomiſts for the cochlea of the ear. *Barthol.* Anat. l. 4. c. 6. *Caſt.* Lex. Med. p. 59. See COCHLEA.

ANTYLION, in the antient pharmacy, a kind of aſtringent malagma, deſcribed by Ægineta. *Ægin.* l. 7. *Gorr.* Med. Def. in voc.

ANTYX, in antiquity, the outermoſt round, or circumference of a ſhield. *Potter*, Archæol. l. 3. c. 4.

ANVIL (*Cycl.*)—Forged *Anvils* are better than thoſe of caſt work. Locksmiths have alſo a ſmaller kind of *Anvil* called the *ſtake*, which is moveable and placed ordinarily on their work bench. Its uſe is for ſetting ſmall cold work ſtraight, or to cut or punch on with the cold chiſſel, or cold punch. *Moxon*, Mech. Exerc. p. 3.

ANUS (*Cycl.*) is otherwiſe called *Anutus*, and by the Greeks δακτυλιος. *Caſt.* Lex. Med.

The office of the *Anus* for extruding the fæces has been diſcharged by the penis in males, and the vulva in females [a]. Sometimes alſo its defect has been ſupplied by a little hole no broader than a pea, at which the thinner part of the excrements has oozed out [b]. In other caſes a wound in the abdomen has ſupplied this office of the *Anus* [c].—[[a] Ephem. Acad. N. C. Dec. 2. An. 4. Obſ. 112. and Dec. 3. An. 2. Obſ. 123. [b] Ephem. Acad. N. C. Dec. 3. An. 1. Obſ. 123. [c] Nouv. Rep. Lett. T. 46. p. 204.]

In ſome creatures the *Anus* is found to have other uſes, the pond muſcle not only breaths but feeds by the way of the *Anus*; i. e. in other words, the ſame aperture ſerves indifferently for mouth and *Anus*. In fowl the *Anus* has apparently ſome concern in the action of reſpiration; there are found many veſicles extended from the bronchiæ thro' the abdomen to the *Anus* of fowls; which may be the cauſe of of its conſtant motion, the air having both ingreſs and egreſs there. Whence it is that they are alſo found to have an attractive power, and as ſuch are uſed by ſome, to draw out the poiſon and malignity in certain diſeaſes. It may be added, that a kind of alternate ſyſtole and diaſtole is perceived, at leaſt on many occaſions, in the *Anus* of divers quadrupeds, as cows, mares, *&c.* But what concern this has with the action of reſpiration, remains to be diſcovered. Hiſt. Acad. Scienc. 1710. p. 39.

That the *Anus's* of fowls, applied in malignant diſtempers to draw the infection out of the body, act like cupping glaſſes; inſomuch that the fowl has often ſtuck by its *Anus* to the part till it died. Mr. Templer affirms he has ſeen ſeven chickens thus applied to the groin of one perſon ſeized with the plague, which all ſtuck till they died. The eighth went quickly off and lived. Phil. Tranſ. N°. 86. p. 5031. See alſo Ephem. Acad. N. C. Dec. 2. An. 9. Obſ. 138.

The *Anus* of birds and quadrupeds is generally conſtant and regular, as to the place it occupies in the body; in fiſh it conſiderably differs in the various kinds, and makes one of their marks of diſtinction. In the generality of fiſhes it is placed nearer the tail than the other end of the body; but in ſome as in the gadi, pleuronecti, conger, *&c.* it is placed nearer the head. In almoſt all fiſh it is ſingle and placed in the lower part of the belly, but in ſome of the pleuronecti, it is either double and placed one on each ſide of the body, or ſingle and then placed only on one ſide. The middle of the body therefore is the general place of the *Anus* in fiſhes as the extremity of the trunk is in moſt other animals. *Artedi*, Ichthyolog.

Some animals there are whoſe *Anus* is regularly placed in other parts; in the ſnail, Malpighi aſſures us, it is in the neck, and that the fæces are diſcharged that way; in the pond muſcle we have already obſerved it is in the mouth. Phil. Tranſ. N°. 64. p. 1535. See alſo Mem. Acad. Scienc. 1710. p. 412.

Some authors ſpeak of attempts made not without ſucceſs, for conveying nouriſhment to the human body by nutritive clyſters conveyed up the *Anus*, where the common canal by the gula has been rendered impracticable. Mem. Acad. Scien. 1716. p. 237.

It may be added, that we have inſtances of births or deliveries by the *Anus*; dead fœtus's long detained in utero, finding no other out-let have been frequently voided piece-meal at the *Anus* [d]. Dr. Wallis's and Halley's caſe is much more extraordinary, who ſpeak of a male greyhound delivered of an entire whelp the ſame way. For Calculi or Stones, inſtances of their being voided by the *Anus* are frequent [e].—[[d] V. *Becker.* Mantiſſ. ad Tract. de Submerſ. morte ſine potu aquæ. p. 93. Mem. Acad. Scienc. 1702. p. 313. Phil. Tranſ. N°. 385. p. 171. [e] Phil. Tranſ. N°. 380. p. 433. Act. Erud. Lipſ. 1688. p. 204. Ephem. Acad. N. C. Cent. 4. Obſ. 136.]

The account the royal ſociety had from Dr. Wallis, of a greyhound dog that voided an animal reſembling a whelp *per Anum*, as ſtrange and incredible as it may ſeem, yet was ſtedfaſtly believed at Cheſter; and the creature was kept for ſome time in ſpirit of wine, having lived for ſome ſhort time after it came into the world, and being ſeen by Mr. Roberts of the ſociety. This is certain that it coſt the dog his life, to gratify the curioſity of ſome gentlemen, who diſſected him, but were diſappointed of their expectations. For my own part, ſays Dr. Halley, as I am determined *nihil temere credere*, ſo I dare not pretend to limit the power of nature. V. Phil. Tranſ. N°. 222. p. 316.

Imperforate ANUS. —Children are ſometimes born without an *Anus*; and it is very difficult to hit on the right part for making a perforation into the rectum of children thus born: becauſe the extremity of the gut is generally formed into a knot. For performing ſuch a perforation Mr. Petit recommends a trocar, the canula and circular plate of which are ſo ſlit open, as to ſerve as a groove for a biſtoury to be run in, to enlarge the aperture after the trocar has been puſhed into the gut. See Mem. de L'Acad. de Chirurg. Tom. 1.

ANUS *of the Brain* is properly the poſterior orifice of the canal called *aquæductus ſylvii*. *Heiſt.* Comp. Anat. n. 270. See AQUÆDUCT.

The appellation *Anus* was probably occaſioned by this, that the prominent medullary parts between which this canal paſſes, are on account of their figure called *nates*, and *teſtes*; whence it was natural enough to give this aperture between them the title of *Anus*, as that of *vulva* was given to the oppoſite, or anterior orifice. *Burggr.* Lex. Med. in voc.

AORIST (*Cycl.*)—Critics are divided as to the proper and primary import of the Greek *Aoriſts*. Some take them for mere variations of the præterperfect tenſe, introduced only for *copia* ſake without any peculiar ſignification; but it is certain the antient grammarians of that nation allowed a difference between the *Aoriſts* and præter tenſes. According to them, the præterperfect tenſe expreſſes a thing juſt now or lately compleated; whereas the *Aoriſt* denotes it paſt, but indeterminately without regarding whether it were lately or long ago. This diſtinction however is rejected by Gretſer, who produces inſtances among the antients, where the two are uſed indifferently. Urſinus[a] alſo allows this promiſcuous uſe; but looks deeper into the origin and reaſon of the *Aoriſt*. According to this writer, an *Aoriſt* is then properly uſed αοριστως, as an *Aoriſt*, when it does not denote any certain or definite time, but in reality comprehends all times. That this is the primitive uſage of the *Aoriſt*, he ſhews by a great number of inſtances. This appears a peculiarity in the Greek tongue, unknown in any other language, to have a tenſe merely indefinite, yet comprehending all the other tenſes[b]—[a In Epiſt. ad Aveman. ap. Ejuſd. Onomaſt. German-Græc. in fine. b Act. Erud. Lipſ. 1690. p. 471.]

The Greeks uſually diſtinguiſh two *Aoriſts*. Some however will not allow of any ſecond *Aoriſt*, maintaining that what grammarians call the ſecond *Aoriſt* is the ſame tenſe with the firſt, only under a little difference of termination. Bibl. Anc. Mod. T. 5. p. 250.

AORISTIA, Αοριστια, in the ſceptic philoſophy, denotes that ſtate of the mind wherein we neither aſſert nor deny any thing poſitively, but only ſpeak of things as ſeeming or appearing to us in ſuch a manner. *Sext. Empir.* Pyrrhon. Hypot. l. 1. c. 26. *Stanl.* Hiſt. Philoſ. P. 12. c. 26. p. 788.

The *Aoriſtia* is one of the great points or terms of ſcepticiſm, to which the philoſophers of that denomination had continual recourſe by way of explication, or ſubterfuge. Their adverſaries the Dogmatiſts charged them with dogmatizing, and aſſerting the principles and poſitions of their ſect to be true and certain.

AORTA (*Cycl.*)—Anatomiſts treat of the ſtructure of the *Aorta*, compreſſion of the *Aorta*, valves, coats, ramifications, &c. of the *Aorta*. Vieuſſens[a] alſo ſpeaks of a kind of veſicular glands in the parietes of the *Aorta*. Dr. Keil[b] gives a computation of the velocity of the blood in the *Aorta*.—[a Act. Erud. Lipſ. 1705. p. 459. Nouv. Rep. Lett. T. 35. p. 214. b Eſſ. on Anim. Œcon. p. 138.]

The *Aorta* iſſuing from the heart by one only trunk, is furniſhed with three ſemi-lunar valves to prevent the blood's regurgitating: immediately above theſe it ſends out to the heart two arteries called *Coronariæ*; and afterwards bending down in form of a bow, divides itſelf into what they call its aſcending and deſcending parts. *Heiſt.* Comp. Anat. n. 293. *Keil*, Anat. c. 7. Sect. 5. *Drake*, in Anthrop. l. 3. c. 15. gives a fine figure of the *Aorta*. See alſo Phil. Tranſ. N°. 280. p. 1188.

Aſcending AORTA, or rather trunks of the *Aorta*, are thoſe which take their courſe towards the upper and lateral parts of the body. Such are the two carotids, the ſubclavian, cervical, ſcapular, upper intercoſtal, mediaſtinal, upper diaphragmatic, mammary, axillary, and brachial arteries.

Deſcending AORTA, or trunk of the *Aorta*, ſometimes alſo called ſimply *Aorta*, is that which takes its courſe downwards thro' the thorax and abdomen to the *os ſacrum*. From this ariſe Ruyſch's bronchial artery, the lower intercoſtals, æſophageous, lower diaphragmatic, cæliac, epiploic, emulgent, ſpermatic, meſenteric, and hypogaſtric arteries.

The diviſion of the *Aorta* into aſcending and deſcending trunks, tho' generally received by anatomiſts is excepted to by Heiſter as leſs natural; and ſuited rather to the ſtructure of quadrupeds, as dogs, calves, and the like, from which it ſeems to have been originally taken, than to that of the human body. In reality the aſcending *Aorta* is not one ſingle trunk as the name ſhould import, but conſiſts of three large branches or trunks: in ſome inſtances there have even been four obſerved, ſcarce ever only two, and never one; which however is uſually the caſe in quadrupeds.

The flexure of the *Aorta* after its quitting the heart, and before its diviſion into aſcending branches, is noted by Dr. Lower as an inſtance of the wiſdom of the creator; to effect a more equable and gentle diſtribution of the blood to the ſeveral parts of the body. For whereas the orifice of the heart opens right upwards, if the *Aorta*, which receives the firſt impulſe, were continued in a ſtraight line up to the region of the head, the blood would be poured too ſwiftly and plentifully on the brain, and the inferior parts be defrauded of their vital liquor. To obviate this the *Aorta* is ſo diſpoſed that the blood does not run directly into the aſcending branches, the axillaries and carotids, but fetches as it were a compaſs by means of the flexure, which ſuſtains the firſt effort of the ejected blood, and directs the greateſt torrent towards the deſcending trunk. *Ray*, Wiſd. of God in Creat. P. 2. 356.

The Diſpoſition of the *Aorta* is varied according to the kinds of animals, their different poſtures, and other occaſions: in man, by reaſon of his erect ſituation, the blood tends to flow faſter and more plentifully by the deſcending than by the aſcending trunks; in brutes, which bend downwards, the contrary; in both, proper proviſions are made for an equable diſtribution. In the male ſex of our ſpecies, Dr. Pitcairn aſſures us, the deſcending *Aorta* has fewer ramifications, and conſequently the blood will flow ſlower proportionably than in that of the female ſex, where there are more ramifications, and conſequently the blood finding leſs reſiſtance will flow more largely to the lower parts of women than men, from which cauſe ariſe the menſes. Jour. des Scav. T. 56. p. 530.

The deſcending *Aorta* is liable to compreſſions from the ſtomach and inteſtinal tube, and that either ordinarily or extraordinarily. The firſt happens whenever the ſtomach, &c. is full; the ſecond, when it is dilated beyond meaſure by the plethora and ebullition excited in fevers. The effect in either caſe will be an interruption or diminution of the flux of blood to the lower parts of the body; and an increaſe of that to the head, and higher parts. The ordinary, according to Dr. Woodward, is neceſſary to ſupply the buſineſs of cogitation, furniſh matter for animal ſpirits, &c[a]. The extraordinary ſerves M. Silva[b] to account for the violent headachs, deliriums, and other ſymptoms of fevers.—[a Jour. des Scav. T. 69. p. 592. b Id. T. 89. p. 457.]

The *Aorta* is found in divers ſtates, natural, morbid, oſſified, cartilaginous, aneuryſmatical, polypoſe, calculoſe, &c.

Some will have oſſifications of the *Aorta* one of the great cauſes of ſudden deaths. Hiſt. Acad. Scienc. 1701. p. 35. ſeq.

In an old man who died at the age of 130, Dr. Keil found the *Aorta* in the abdomen and iliacs to be for the greateſt part cartilaginous, which apparently was one cauſe of his death. Phil. Tranſ. N°. 306. p. 2248. ſeq.

The academiſts naturæ curioſi give an inſtance of ſix nail-like ſtones, or calculi, found in a prominence of the *Aorta*, under the kidneys of a perſon who had died of a moſt acute pain in the region of the loins. At each pulſation of the artery, theſe would be driven againſt the membranous fibrillæ of the coat of the veſſel, and hence thoſe ſhooting pains; the cauſe of concretion is attributed to the too frequent uſe of the viperine powder, taken for an ulcerated breaſt. V. Ephem. Acad. N. C. Cent. 9. App. Obſ. 1.

For the ſinus's of the *Aorta*, ſee SINUS.

APÆDEUSIA, Απαιδευσια, denotes ignorance or unſkilfulneſs in what relates to learning and the ſciences.

Hence alſo perſons uninſtructed and illiterate are called *Apædeutæ*.

The term *Apædeutæ* was particularly uſed among the French in the time of Huet; when the men of wit at Paris were divided into two factions, one called by way of reproach *Apædeutæ* and the others *Eruditi*.

The *Apædeutæ* are repreſented by Huet, as perſons who finding themſelves either incapable or unwilling to undergo a ſevere courſe of ſtudy, in order to become truly learned, conſpired to decry learning and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity. Vid. Mem. de Trev. An. 1722. p. 1310. ſeq.

The *Apædeutæ* in effect were the men of pleaſure. The *Eruditi* the men of ſtudy. The *Apædeutæ* in every thing preferred the modern writers to the antient, to ſuperſede the neceſſity of ſtudying the latter. The *Eruditi* decried the moderns, and valued themſelves wholly on their acquaintance with the antients.

APAGMA (*Cycl.*) is more properly uſed for a fracture of a bone, at or near the part whereby it is articulated with another. *Caſt.* Lex. Med. p. 59.

APAGOGE, Απαγωγη, (*Cycl.*) in the Athenian law, the carrying a criminal taken in the fact, to the magiſtrate. If the accuſer was not able to bring him to the magiſtrate, it was uſual to take the magiſtrate along with him to the houſe where the criminal lay concealed, or defended himſelf. Vid. *Pott.* Archæol. Græc. l. 1. c. 23.

APAGOGE, in mathematics, is ſometimes uſed to denote a progreſs or paſſage from one propoſition to another; when the firſt having been once demonſtrated, is afterwards employed in the proving of others. *Micræl.* Lex. Phil. p. 143.

APALACHINE, in botany, a name given by ſome authors to the ſhrub, called *Caſſine vera floridanorum* by other writers. Ind. Med. p. 11.

APAN-

APANTHROPY, in medicine, denotes a love of ſolitude, and averſion for the company of mankind. *Brun.* Lex. Med. in voc.

Apanthropy is by ſome reckoned among the ſymptoms, by others among the ſpecies or degrees, of melancholy; and alſo paſſes for an ill indication in leucophlegmatic caſes. V. *Wedel.* Pathol. Dogm. Sect. 3. c. 9.

APARACHITUM, among antient phyſicians, denotes a native or pure wine, not mixed with ſea water. *Caſt.* Lex. Med. p. 60.

In which ſenſe, *vinum aparachytum*, οινος απαραχυτος, amounts to the ſame with Αθαλασσος; and ſtands contradiſtinguiſhed from *vinum ſalſum*[a], οινος θαλαττιος or τεθαλασσωμενος. This mixture of wine with ſea-water was deemed a great invention among the antients[b].—[a V. *Celſ.* l. 1. c. 6. b V. *Dioſcor.* l. 5. c. 27. *Columel.* l. 12. c. 25. *Plut.* Quæſt. not.]

APARINE *Cleavers*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf and is bell-faſhioned, very wide, open at the mouth, and divided into ſeveral ſegments; the cup becomes a fruit, which is dry, covered with a very thin ſkin, and compoſed of two round bodies, which contain an umbilicated ſeed. The leaves of this plant are rough and hairy, and ſtand in rundles round the ſtalk.

The ſpecies of *Cleavers* enumerated by Mr. Tournefort are theſe:

1. The common *Cleavers*. 2. The ſmaller ſeeded *Cleavers*. 3. The rough ſeeded *Cleavers*. 4. The Portugal *Cleavers*, with echinated fruit. 5. The ſmooth ſeeded *Cleavers*. 6. The broad-leaved low mountain *Cleavers*. 7. The narrow-leaved low mountain *Cleavers*. 8. The blue flowered ſmall procumbent *Cleavers*, called by authors the little field madder. 9. The hoary ſeeded purple flowered *Cleavers*. 10. The little white flowered marſh *Cleavers*. 11. The ſmalleſt Spaniſh *Cleavers*. *Tournef.* Inſt. p. 114.

The *Cleavers* are known from the madders, by their having a dry fruit; and from creſſwort, by having five or more leaves at a joint; and finally from gallium, or ladies bedſtraw, by the leaves being rough or hairy.

APARINE, in the Linnæan ſyſtem of botany, makes a diſtinct genus of plants; the characters of which are theſe: the calyx is an extremely ſmall perianthium, placed on the germen, and divided by four notches at its end. The flower conſiſts of one ſingle petal which forms no tube, but is placed flat, and divided into four ſegments; the ſtamina are four pointed filaments ſhorter than the flower. The antheræ are ſimple; the germen of the piſtillum is double, and ſituated below the receptacle; the ſtyle is ſlender, ſomewhat bifid at the end, and of the ſame length with the ſtamina; the ſtigmata are headed. The fruit is compoſed of two roundiſh dry bodies, growing together, and armed with hooked hairs which make them rough and rigid and ſtick to things; the ſeeds are ſingle, roundiſh, umbilicated, and large. *Linnæi* Genera Plantarum, p. 24.

APARINE, in medicine.—The vulgar have an opinion of this plant as an antiſcorbutic, and eat it in ſpring with nettle-tops and the reſt of that tribe, to ſweeten their blood. It ſtands recommended by many authors as a remedy for the king's evil; and others have aſcribed a very powerful diuretic virtue to it; but theſe have in general ordered a very bad preparation of it for theſe purpoſes, the diſtilled ſimple water; doubtleſs a good decoction muſt be greatly preferable. We have the aſſurance of Dr. Palmer, from his own knowledge, that it is an excellent remedy in a gonorrhœa ſimplex.

APARITHMESIS, Απαριθμησις, in rhetoric, denotes the anſwer to the *protaſis* or propoſition itſelf. Thus if the *protaſis* be *appellandi tempus non erat*, the *Aparithmeſis* is *at tecum anno plus vixi*. Vid. *Heder.* Schul. Lex. in voc.

APARTISMENUS, Απαρτισμενος, in the antient poetry, an appellation given to a verſe, which comprehended an entire ſenſe or ſentence in itſelf. *Scalig.* Poet. l. 2. c. 29.

This is ſometimes alſo written, *Apartemenus*, i. e. ſuſpended, as not needing any following verſe.

APAULIA, Απαυλια, in antiquity, the third day of a marriage ſolemnity.

It was thus called, becauſe the bride, returning to her father's houſe, did απαυλιζεσθαι τω νυμφιω, lodge apart from the bridegroom. Some will have the *Apaulia* to have been the ſecond day of the marriage, *viz.* that whereon the chief ceremony was performed; thus called by way of contradiſtinction from the firſt day, which was called προαυλια. *Scalig.* Poet. l. 3. c. 100.

According to theſe authors, the third was properly called επαυλια. Others make απαυλια to be the ſame with επαυλια, whence a ſeeming difficulty ariſes, ſince thoſe two words import contraries, one ſeeming to denote the bride's lodging apart from the bridegroom, the other with him; but this may be eaſily ſolved by applying επαυλια to her lodging with her huſband, and απαυλια, to her departure from her father's houſe.

On the day called απαυλια, (whenever that was) the bride preſented her bridegroom with a garment called απαυλητηρια. *Potter*, Archæol. Græc. l. 4. c. 11. T. 2. p. 294.

APELLA, among phyſicians, a name given to thoſe, whoſe prepuce is either wanting, or ſhrunk, ſo that it can no longer cover the glans. *Brun.* Lex. Med. in voc.

Many authors have ſuppoſed this ſenſe of the word *Apella* warranted from the paſſage in Horace, *credat Judæus Apella, non ego. Hor.* Lib. 1. Sat. 5, v. 100.

But, according to Salmaſius and others, *Apella* is the proper name of a certain Jew, and not an adjective ſignifying circumciſed.

APENE, Απηνη, in antiquity, a kind of chariot wherein the images of the Gods were carried in proceſſion on certain days, attended with a ſolemn pomp, ſongs, hymns, dancings, &c. Vid. *Spanheim*, ad Callim. p. 565. *Pauſan.* Eliac. Prior. c. 19. p. 396. *Lakemach.* Antiq. Græc. Sacr. P. 1. c. 7. §. 16.

The *Apene*, or ſacred chariot of the Greeks, is called by Latin writers *Tenſa*.

It was very rich, made ſometimes of ivory, or of ſilver itſelf, and variouſly decorated. Vid. *Feſt.* de Verb. Signif. in voc. *Tenſa*

APENNIS, in antient laws, a deed or inſtrument made in favour of a perſon, who has loſt the title-deeds to his houſe or land by fire. *Du Cange*, Gloſſ. Lat. T. 1. p. 250. ſeq.

In ſuch caſe, an aſſembly of the people of the neighbourhood being called, and an exact enquiry made before the judge, another inſtrument was framed to confirm and ſecure the unhappy perſon's right. Id. Ibid.

APER, *Boar*, in zoology. See HOG and SUS.

APER is alſo uſed for the name of a ſea fiſh, called by ſome *Strivale* and *Riondo*. It approaches very much in ſhape to the faber or doree, but is much ſmaller. It is covered with fimbriated ſcales, and feels rough to the touch; its noſe is ſharp and turns a little upwards; its eyes are large; it has no teeth, and has two back-fins, the firſt ſhorter the laſt very long; the tail is not forked, and is tinged with red at the end; the gill fins are conſiderably long, and ſome of the nerves or rays of the long belly fin behind the anus, as well as ſome of thoſe of the anterior back fin, are prickly. It is very ſeldom found of more than three inches in length, and generally lives at the bottom of the ſea. It is caught in the Mediterranean after ſtorms, but either is not found about our coaſts, or its ſmallneſs makes it diſregarded. *Rondelet*, de Piſc. l. 5. c. 26. *Geſner*, de Aquat. p. 70. See Tab. of Fiſhes, N°. 19.

APER *moſchiferus*, a name by which many authors have called the *tajacu* of America. See TAJACU.

APER *Piſcis*, a name by which ſome authors have called the ſea-fiſh more uſually called the *Capriſcus*. *Willughby*, Hiſt. Piſc. p. 154. See the article CAPRISCUS.

APEREA, in zoology, the name of a ſmall American animal, of the rabbit kind, and ſeeming to be of a mixt nature between the rabbit and the mouſe, having exactly the ſhort roundiſh ears of the mouſe-kind, and all the other particulars of the rabbit. It grows, at its full ſize, to ten or twelve inches long, and its hair is juſt of the colour of our hares on the back and ſides, and whitiſh on the belly; its upper lip alſo is ſplit as in the hare, and its teeth, legs, &c. are wholly the ſame in ſtructure as in the hare, but its fore feet are divided into four toes, its hinder ones only into three; the claws are ſhort, and the middle toe of the hinder feet longer than the others. It has no tail, its head is a little longer than the hare's, and its fleſh in taſte wholly like the rabbit's; its manner of living and feeding is alſo wholly the ſame. *Ray*, Syn. Quad. p. 206.

APERIENS *Os*, in anatomy, a name given by ſome writers, to a muſcle of the mouth called by Albinus *biventer maxillæ inferioris*, and by others *digaſtricus*.

APERISTATON, in the antient phyſic, denotes an ulcer of a mild, or benign kind, and not attended with any ſevere ſymptom. *Gorr.* Def. Med. p. 42. *Caſt.* Lex. Med. p. 61. ſeq.

APERTOR *Oculi*, in anatomy, a name given by Spigelius and others to the muſcle called the *Aperiens palpebram*, and *levator palpebræ ſuperioris* by others.

APETALOUS, or APETALOSE *Plants*, (*Cycl.*) are ſuch as have an imperfect or ſtamineous flower. They are ſo called becauſe not compoſed of thoſe tender, fugacious, coloured leaves called *Petala*; but only of a calyx or cup, and of ſtamina or capillaments of ſtyles. Vid. *Ray*, Hiſt. Plant. l. 4. Phil. Tranſ. N°. 186. p. 284.

The *Apetalous* kind is ſubdivided by Ray, 1. Into ſuch whoſe fruits are not contiguous to their flowers, as in hops, hemp, nettles, ſpinach, mercury, palma chriſti, the American phyſic-nut, &c. 2. Such as have a triquetrous or triangular ſeed, as the docks, ſorrels, arſmarts, knot-graſs, ſnake-weeds, 3. Thoſe which have round compreſſed and otherwiſe figured ſeeds, as the pond-weeds, orraches, ſea-purſlane, the blites, the amaranthi, the beets, ſome kali's, &c. *Ray*, ibid. See Tab. 1. of Botany, Claſs 1.

APEUCTIC, Απευκτικον, in the antient poetry, denotes a kind of poem or prayer preferred to God for the averting ſome evil. *Scalig.* Poet. l. 3. c. 102.

In which ſenſe, *Apeucticum* ſtands contradiſtinguiſhed from *proſeucticum carmen*, which begs for ſome good, e. gr. *dii prohibete minas, dii talem avertite caſum, et placidi ſervate pios.*

APEX (*Cycl.*) is peculiarly uſed in antiquity for a kind of cap or covering of the head, wore by the Flamens, or prieſts of Jupiter.

Jupiter. V. *Salmuth.* ad Pancir. P. 1. Tit. 24. p. 176. *Struv.* Synt. Antiq. Rom. c. 12. p. 563. *Feſt.* de Verb. Signif. p. 15. *Pitiſc.* Lex. Ant. T. 1. p. 120. ſeq.

This was otherwiſe denominated *Pileus Epiroticus*, or *Albanus*; by the Greeks πιλημα πυργωλων, and Κυρβασιαν.

The *Apex* is deſcribed as a ſtitched cap in form of a helmet, with the addition of a little ſtick fixed on the top, and wound about with white wool. *Kenn.* Rom. Ant. Not. P. 2. l. 5. c. 8. p. 321. *Pitiſc.* loc. cit.

The other Flamens only wore the *Apex*, in the time of performing divine ſervice; the Flamen dialis always wore it out of doors; for within it was allowed him to be bareheaded. *Soler.* de Pil. Sect. 2. *Pitiſc.* loc. cit. See APICULUM.

APEX was alſo uſed among the Romans for the creſt of a helmet. V. *Salmaſ.* Exerc. ad Solin. p. 385.

APEX is alſo uſed by grammarians for a long accent or mark, to denote that a ſyllable is to be pronounced long. *Quinctil.* l. 1. c. 7.

Quinctilian condemns the practice of putting the *Apex* on all long ſyllables; yet in ſome caſes he allows the *Apex* neceſſary, *e. gr.* where the different lengths of a ſyllable diſtinguiſh the different ſenſes of a word, as in malus, which as long, or ſhort, denotes an ill man, or an apple-tree. See ACCENT, *Cycl.* and *Suppl.*

APHACHA, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the papilionaceous kind, and its piſtil, which ariſes from the cup, finally becomes a pod which contains roundiſh ſeeds. To this it is to be added, that there are only two leaves at every joint of the ſtalk, and that the tendrils grow from the alæ of theſe leaves.

There is only one known ſpecies of *Aphaca*, which is the yellow vetchling, called by ſome the bind-weed-leaved vetch. *Tournef.* Inſt. p. 399.

APHÆRESIS, Αφαιρεσις, (*Cycl.*) in medicine, denotes a neceſſary taking away or removal of ſomething that is noxious. In ſurgery, it ſignifies an operation whereby ſomething ſuperfluous is taken away. *Brun.* Lex. Med. in voc. *Nent.* Fund. Med. T. 2. Tab. 5. §. 4. *Van Horn.* Microtec. Sect. 1. §. 17.

APHANIS, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe: The cup is a tubular perianthium remaining till the ſeeds are ripe; it conſiſts of one leaf divided at the extremity into eight ſegments, which are extremely ſmall, and alternately different in ſize. There are no petals; the ſtamina are four erect, pointed, and very ſmall filaments, inſerted on the rim of the cup; the antheræ are roundiſh. The piſtillum has two germina of an oval figure, and two ſtyles of the ſame length with the ſtamina, inſerted on the baſis of theſe germina; the ſtigmata are headed. The cup ſupplies the place of a fruit, ſhutting together at its mouth, and containing two oval, pointed, compreſſed ſeeds, of the length of the ſtyles. *Linnæi* Genera Plantarum, p. 53.

APHASIA, Αφασια, in the ſceptic philoſophy, denotes a ſtate of doubt, wherein a Perſon not knowing what to determine on, it is beſt for him to be ſilent. *Sext. Empir.* Pyrrh. Hypotyp. l. 1. c. 26. Bibl. Anc. Mod. T. 14. p. 52. *Stanl.* Hiſt. of Philoſ. p. 788.

In this ſenſe, *Aphaſia* ſtands oppoſed to *phaſis*, under which are included both aſſertion and negation.

APHELIA, Αφελεια, in rhetoric, is uſed to denote ſimplicity of diction. See DICTION, *Cycl.*

APHESIS, Αφεσις, in the Athenian laws, was when a perſon deeply indebted deſired the people to remit part of the debt, by reaſon of his diſability to make payment. *Potter*, Archæol. l. 1. c. 24. *Budd.* Iſag. ad Theol. l. 2. c. 7. p. 1314.

Voetius has a diſſertation expreſs on the words *Apheſis* and *pareſis*, and their difference.

APHETERIA, in the antient military art, a kind of engines uſed in the beſieging of towns. *Suid.* Lex. T. 1. p. 394.

Suidas does not mention their particular form or ſtructure. Aquinus takes them to have been of the projective kind. Vid. *Aquin.* Lex. Milit. T. 1. p. 56.

APHILANTHROPY, among phyſicians, denotes the ſtate or diſorder, wherein a perſon has an unnatural diſreliſh for mirth and ſociety, and indulges ſolitude, and melancholy. Vid. *Wedel.* Pathol. Dogm. Sect. 3. c 9.

APHIOCEM, a compoſition made principally of the buds of hemp before they flower. It is much in uſe among the Arabs, and has the intoxicating quality of opium. *Pocock*'s Egypt, p. 181.

APHLASTUM, Αφλαστον, in the antient navigation, a wooden ornament, ſhaped like a plume of feathers, faſtened on the gooſe's or ſwan's neck uſed by the antient Greeks in the heads of their ſhips. *Aquin.* Lex. Milit. T. 1, p. 56.

The *Aphlaſtum* had much the ſame office and effect in a ſhip, that the creſt had on the helmet. It ſeems alſo to have had this further uſe, *viz.* by the waving of a party-coloured ribband faſtened to it, to indicate from what quarter the wind blew.

The *Aphlaſtum* was the proper ornament of the head, as the *Acroſtolium* was of the ſtern.

The Greek *Aphlaſtum*, anſwered to, and was probably the origin of the Latin *Apluſtre*.

APHORISM, Αφορισμος, (*Cycl.*) is uſed in eccleſiaſtical writers for the leſſer excommunication, by which the delinquent was cut off from the benefit of the ſacraments and the prayers of the faithful; but allowed to bear a part in the reſt of the ſervice. V. *Bingh.* Orig. Eccleſ. l. 16. c. 2. §. 7. ſeq.

APHORISM is alſo uſed for a kind of figure in rhetoric, whereby ſomething that has beed ſaid is limited or corrected. This is otherwiſe called *Diori ſmus*. *Micræl.* Lex. Phil. p. 145.

APHORISTIC, ſomething relating to or partaking of the nature of aphoriſms.

The *Aphoriſtic* method ſtands contradiſtinguiſhed to the *ſyſtematic*, or methodical, as alſo to the *diexodic*, or diſcurſive way.

The *Aphoriſtic* method has great advantages, as containing much matter in a ſmall compaſs; ſentiments are here almoſt as numerous as expreſſions; and doctrines may be counted by phraſes. Every thing is cloſe and pertinent, no room for uſeleſs diſcuſſions, or for languiſhing connections, and tranſitions; there is hardly a word to be loſt. V. *Bac.* de Augm. Scient. l. 6. c. 2. Jour. des Scav. T. 79. p. 362.

APHRACTI, Αφρακτοι, in the antient military art, denotes open veſſels, without decks or hatches, furniſhed only at head and ſtern with croſs planks, whereon the men ſtood to fight. *Kenn.* Rom. Ant. Not. P. 2. l. 4. c. 20. *Pitiſc.* Lex. Ant. T. 1. p. 121.

The *Aphracti*, or open veſſels, ſtood contradiſtinguiſhed from *cataphracti*, or covered ones.

APHRODISIA, Αφροδισια, in antiquity, feſtivals in honour of the goddeſs Αφροδιτη, or Venus.—There were ſeveral of theſe *Aphrodiſia* obſerved in divers parts of Græce; the moſt remarkable was that at Cyprus, firſt inſtituted by Cinyras, out of whoſe family certain prieſts of Venus were elected, and for that reaſon named Κινυραδαι. At this ſolemnity ſeveral myſterious rites were practiſed: all who were initiated to them offered a piece of money to Venus as an harlot, and received as a token of the goddeſs's favour a meaſure of ſalt, and a φαλλος; the former becauſe ſalt is a concretion of ſea-water, to which Venus was thought to owe her birth; the latter becauſe ſhe was the goddeſs of wantonneſs. *Pott.* Archæol. Græc. l. 2. c. 20. T. 1. p. 372. ſeq.

APHRODISIA, or APHRODISIASMUS, in medicine, denotes the uſe of venery, or the act of copulation between male and female. *Brun.* Lex. Med. in voc.

APHRODISIA is alſo uſed for the age of venery, more frequently denomineted *puberty*. *Rul.* Lex. Alch. in voc.

APHRODISIACS, in pharmacy, denote medicines proper to increaſe the ſeed, and promote luſt, or an inclination to venery.

In which ſenſe *Aphrodiſiacs* ſtand contradiſtinguiſhed from *Antaphrodiſiacs*.

It is diſputed whither the uſe of *Aphrodiſiacs* be lawful for a Chriſtian, the rigid caſuiſts abſolutely repeal them [a]. The more moderate allow of them, where uſed for an honeſt and laudable end, *viz.* the propagating the human ſpecies [b].—

[a] *Junck.* Conſpect. Therap. Tab. 18. p. 472. [b] *Vater.* Phyſ. Exper. App. c. 1. q. 4.]

Some authors give the appellation *Aphrodiſiaca*, to the epilepſy. See EPILEPSY, *Cycl.*

APRODISIACE, in the writing of the antients, a name given to a gem, ſuppoſed, according to the idle traditions of thoſe times, to have a power of procuring love to the perſon who wore it about him; all the deſcription we have of it is, that it was of a pale fleſh colour; but the ſtone as well as its virtues are wholly unknown to the world at preſent.

APHRODISIUS, in chronology, denotes the eleventh month in the Bythinian year, commencing on the 25th July in ours. *Wolf.* Elem. Chron. §. 120.

APHRODITARIUM, in the antient pharmacy, denotes a kind of dry medicine, compounded of frankincence, the ſcales of copper, ceruſs, ſtarch, and pomegranates, mixed in equal quantities. *Æginet.* l. 4. c. 40. *Gorr.* Def. Med. in voc.

The name is alſo given to a kind of collyrium, mentioned by Galen. De Compoſ. Medic. l. 4.

APHRODITES, in natural hiſtory, a name given by ſome authors to the fineſt ſpecies of amethyſt.

The antients had a way of diſtinguiſhing what they allowed to be gems, into ſeveral kinds, according to their degrees of colour: theſe they called ſo many ſpecies, and gave to each its peculiar name. This has been the occaſion of no little confuſion among the writers on theſe ſubjects, by ſeemingly enlarging the number of the gems. The pæderos and gemma veneris of the antients are the ſame ſtone with this, tho' many have applied theſe names to the opal.

APHROGALA, in the antient phyſic, denotes a kind of whipt cream, or milk agitated till it be converted wholly into froth. *Brun.* Lex. Med. p. 103.

The *Aphrogala* is directed by Galen, as proper againſt hot diſorders of the ſtomach. Method. Medend. l. 7. c. 4.

APHROLITRUM, in the antient phyſic, denotes the ſpume, or froth of *litrum*.

In which ſenſe, *Aphrolitrum* ſeems to amount to the ſame with *Aphronitrum*. Hoffman affirms that the *nitron* and *litron* only differ in dialect [a]. It appears, however, there was a great

great difference between the two medicines [b], *Aphrolitrum* reſembling meal, or farina, and being of a kind of intermediate virtue between *Aphronitrum* and ſalt [c].—[a Officin. Paralip. c. 53. b *Brun.* Lex. Med. in voc. c *Gorr.* Def. Med. p. 65.]

APHRONITRE, *Aphronitrum* (*Cycl.*)—Mercatus ſuppoſes *Aphronitrum*, *nitrum*, and *ſpuma nitri*, to have been much the ſame, and only to have differed in degree or point of excellence. *Mercat.* Metalloth. Vatic. Arm. 2. c. 9.

The *ſpuma nitri*, called by the Greeks αφρος του νίτρου, becauſe lighteſt, is ſaid by Pliny [a] to have been the beſt. Galen however and Serapion expreſsly diſtinguiſh between *nitrum* and *Aphronitrum*. [a] *Plin.* Hiſt. Nat. l. 31. c. 10.

Greek authors expreſſed two different ſubſtances by the word *Aphronitrum*, the one only a particular appearance of the *natrum*, or native nitre of thoſe ages; and the other a factitious ſubſtance, the froth or ſpume of the veſſels in which they boiled and purified their nitre. The earlieſt authors, however, diſtinguiſhed theſe two, calling the factitious ſubſtance *aphros nitrou* and the native *Aphronitron*; and Galen plainly tells us that theſe were two different ſubſtances. *Hill*'s Hiſt. of Foſſ. p. 390.

APHROSELENOS, Αφροσελήνος, among antient naturaliſts, a denomination given to the *Selenites*, or *lapis ſpecularis*. V. *Mercat.* Metalloth. Arm. 7. c. 11. p. 154. See SELENITES.

APHTHÆ (*Cycl.*) are ſometimes underſtood of ulcers in other parts of the body, beſides the mouth and palate.

Hippocrates applies the word to ulcers in the pudenda of women, alſo to thoſe in the aſpera arteria, and Galen ſpeaks of the teſticles as ſubject to the ſame diſeaſe. V. *Caſt.* Lex. Med. p. 63.

APHUA *Gobites*, in zoology, the name of a ſmall fiſh common in the Mediterranean and ſome other ſeas, and called by us the ſea-loach. It never exceeds three or four inches in length, its body is round, and flatted a little on the back, its colour is white variegated with black ſpots, its eyes are placed in the upper part of the head and are very prominent, its back fins are rigid and ſomewhat prickly, and its back and the upper part of its ſides are ſometimes variegated with brown ſpots. *Rondelet*, de Piſc.

APHYLLANTHES, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the liliaceous kind, and is compoſed of ſix petals which ariſe from the center of a ſquammoſe and in ſome degree tubular cup; the piſtil ariſes alſo from the cup and finally becomes a trigonal turbinated fruit, which when ripe burſts into three parts or cells, which contain roundiſh ſeeds. *Tournef.* Inſt. p. 657.

There is only one known ſpecies of this plant, which is the Montpelier *Aphyllanthes*, called by ſome the blue Montpelier *Pink*.

APIARIA, in natural hiſtory, the name given by authors to [a] fly found only in Autumn, and frequently met with on parſley; it is a two winged fly of a deep and ſhining black, and gathers wax on its legs in the manner of the bee.

APIASTELLUM, in botany, the name of two different ſpecies of plants with different authors; Dodonæus expreſſing by it the common balm, and Apuleius the black bryony. *Ger.* Emac. Ind. 2.

APIASTER, in zoology, a name given by ſome authors to the bee-eater, called by the generality of authors *Merops*. See the article MEROPS.

APIASTRUM, in botany, a name given by the antients to two different plants of ſuch contrary form and qualities, that it is unlucky they ſhould have given occaſion of confounding them together, as miſtakes about them might be of fatal conſequence. The one of theſe plants was the poiſonous water crowfoot; which they called *Apiaſtrum*, becauſe of its having leaves that ſomewhat reſembled ſmallage. The other *Apiaſtrum* is the common garden baum, ſo called by theſe writers, from their having obſerved that the bees were very fond of it; beſides this they have in ſome places called the ſelinum by this name, from its reſembling parſley, which they alſo called apium; and ſome of them have extended the name even to the animal world, and given it to a ſort of bird that feeds on bees. The difference between the two firſt *Apiaſtra* is ſo great, that it might be ſuppoſed no one could err about them, yet we find that Pliny has not eſcaped them, for he tells us, that baum is called by this name, becauſe bees eat it, and that it is condemned as a poiſon in Sardinia, as if the ſame thing was a ſalutiferous herb in Italy, and a poiſon in Sardinia.

APICULUM, in antiquity, a kind of thread or fillet which the Flamens wore, in the heat of ſummer, in lieu of the *Apex*. *Pitiſc.* Lex. Ant. T. 1. p. 121. See APEX.

Feſtus ſpeaks of the *Apiculum*, as a cover for the *Apex*; but the paſſage ſeems to be corrupt.

APIOS, in botany, a name given by many authors, to thoſe ſpecies of the tithymal, or ſpurge, which have tuberoſe or knobby roots. See the article TITHYMALUS.

APIOS is alſo the name given by Boerhaave to ſome of the leguminous plants, compriſed by Linnæus under the name *glycine*. *Boerh.* Ind. Alt. 146.

APIS, the bee, in zoology. See the article BEE.

APISTOS, a name given by ſome of the writers of the middle ages to the ſtone called aſyctos, or aſiictos, by Pliny. See the article ASIICTOS.

APIUM, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the umbelliferous kind, and is roſaceous, or compoſed of ſeveral regular leaves diſpoſed in a circular form. Theſe ſtand upon a cup, which finally becomes a fruit compoſed of two ſeeds, which are ſmall, gibboſe, and ſtriated on one ſide, and flat, and ſmooth on the other; to this it may be added, that the leaves are branched, or placed on ramoſe ribs.

The ſpecies of *Apium* enumerated by Mr. Tournefort are theſe.

1. The common cultivated *Apium*, called garden-parſley. 2. The curled-leaved garden *Parſley*. 3. The great broad-leaved garden *Parſley*, called in ſome places the Engliſh *Parſley*. 4. The Macedonian *Parſley*. 5. The roundiſh leaved Portugal *Apium*. 6. The Pyrenæan *Apium*, with the appearance of thapſia, called by ſome *Alpine ſeſeli*. 7. The *Apium* commonly called *Aniſe*, with large ſweet-ſcented ſeed. 8. The *Apium* called *Aniſe*, with ſmaller ſweet-ſcented ſeed. 9. The marſh *Apium*, called ſmallage. 10. The cultivated ſweet *Apium*, called by the gardeners *celeri*. 11. The ſmaller marſh *Apium*. *Tournef.* Inſt. p. 305.

The marſh *Apium* or ſmallage is the ſame with what botaniſts alſo call ελεοσελινον, *eleoſelinum*, ſometimes *paludapium*, and *Apium paluſtre*, and is of ſome uſe in medicine. V. *Gorr.* Def. Med. p. 132.

The root is chiefly uſed in medicine: it is about the thickneſs of a thumb, whitiſh, fibrous, of a warm taſte, and a fragrant ſmell; being one of the five greater openers of the ſhops. It is grateful and detergent, promotes urine, diſlodges gravel, and is alſo recommended in diſorders of the breaſt, and to promote expectoration. V. *Quinc.* Diſp. P. 2. n. 293. *Junck.* Conſp. Therap. Tab. 9. p. 266. It. Tab. 5. p. 153.

Its ſeed is alſo of the number of the leſſer hot ſeeds; and its leaves are given in decoction, or the expreſſed juice of them, in all nephritick complaints. The root is greatly recommended againſt ſuppreſſions of the menſes, and of the lochia, and is ſaid to be alone a remedy for the king's-evil, but this wants proof.

The antients had an opinion, that being eaten by a woman who gave ſuck, the infant would become epileptic. *Lang.* Epiſt. Med. l. 1. p. 333.

APIVORUS *Buteo*, in zoology, the name by which authors call the bird known in Engliſh by the name of the honey-buzzard. It is ſomewhat larger than the common buzzard; its beak is black, very much hooked, and protuberant in the middle, and covered to the noſtrils with a black wrinkled ſkin; its mouth opens very wide and is yellow within. Its head is grey and flatted, and the bottoms of the feathers on the hinder part of the head, and the back are white; its back is of a mouſe colour, but ſome of the wing feathers are white in part, and the wings and tail have a broad line of grey, and another of black acroſs them; the tail is very long and is mottled with black and white. Its throat and tail underneath are of a pure ſnow white, and its breaſt and belly mottled with white and black; its legs are ſhort ſtrong and yellow, and its claws very ſharp and black. It builds its neſt with ſticks covered with wool, and ſometimes uſes the deſerted neſt of a kite to lay and breed its young in, which it feeds principally with the nymphs, or maggot worms of bees and waſps; and it is common to find pieces of honey-combs in the neſts. It feeds on newts, frogs, and other ſmall animals, and is remarkable for running very ſwiftly on the ground: the female is larger than the male, as in moſt other birds of prey. *Ray*, Ornitholog. p. 39. See BUTEO.

APLUSTRE, or AMPLUSTRE, in the antient navigation, a carved tablet, ſomewhat after the manner of a ſhield, fixed by way of decoration to the extremity of a ſhip's head. V. *Scheff.* de Milit. Nav. l. 2. c. 6. *Salmaſ.* Exerc. ad Solin. p. 404. *Pitiſc.* Lex. Ant. T. 1. p. 122.

The word is apparently formed of the Greek αφλαστον, which imported much the ſame.

The *Apluſtre* is alſo called in antient writers, *tabulatum*, and Σανιδιον.

The roſtra or beaks of ſhips were ſometimes alſo called *Apluſtria*.

But ſome think that the *Apluſtre* anſwered to what we call the flag, or enſign. V. *Moreau* de *Mautour*. Ap. *Salengre*, Mem de Literat. Tom. 7. Part. 1. pag. 445.

APNOEA, in medicine, denotes a want of breath, or loſs of reſpiration.

In this ſenſe is the word uſed among the antients, not as importing a total privation of breath, which would only be another name for death; but to denote the reſpiration very ſmall, and ſlow, ſo as to ſeem quite gone, as is the caſe in ſuffocations of the uterus, apoplexies, ſyncopes, lethargies, &c. *Caſt.* Lex. Med. p. 63.

APOBAMINA is uſed by ſome phyſicians for a liquor wherein pieces of gold, or chains heated red hot, have been extinguiſhed, in order to fortify the ſpirits and principal members. Vid. *Cardan*, de Subtil. l. 5. Theatr. Chem. T. 1. p. 626. *Caſtel.* Lex. Med. in voc.

APOBATHRÆ, Αποβαθραι, in antiquity, a kind of little bridges, or ſtairs, joining the land to ſhips, or one ſhip to another. *Potter*, Archæol. l. 3. c. 16.

Theſe were alſo called Επιζωθραι, and κλιμακες.

APOBEE, in botany, a name given by the natives of Guinea to a ſpecies of corn-marygold, called by Petiver *chryſanthemum acaulon Guineenſe foliis longis anguſtis*, from its having long and narrow leaves, and no ſtalk to ſupport the flower. The people of the place uſe this in the ſmall-pox, and other eruptive fevers, boiled in water, and the liquor drank warm. Phil. Tranſ. N°. 232.

APOBOMIOI, Αποβωμιοι θυσιαι, in antiquity, ſacrifices offered on the bare earth, without altars. *Potter*, Archæol. l. 2. c. 2.

APOCARITES, or APOCARITÆ, in eccleſiaſtical hiſtory, antient heretics who aſſerted that the human ſoul is part of, or derived from, the ſubſtance of God. *Prateol.* Elench. Hæret. l. 1. n. 57.

The *Apocaritæ* are ranked as a branch of Manichees.

APOCARPASUM, in natural hiſtory, a name given by the antient Greeks, to a poiſonous drug, called alſo ſometimes ſimply *Carpaſum*; it was the exudation of a tree growing in the country of the Abyſſines, and was ſo like the fineſt myrrh, that it was often mixed among it, and many lives were loſt by adminiſtring it as myrrh. The wood of the tree which produced it was alſo poiſonous, tho' in a leſs degree, and was called by the ſame writers *Apocarpaſum*, as the wood of the balm of Gilead tree is *Apobalſamum*.

APOCATASTASIS, Αποκαταστασις, denotes the entire reſtitution, or redintegration of a thing.

In this ſenſe, we read of the *Apocataſtaſis* of the world, or of all things, Αποκαταστασις Παντων. V. *Pfaff.* Inſt. Hiſt. Eccleſ. Sect. 18. §. 3. Ejuſd. Inſt. Theol. P. 2. c. 12. p. 574.

APOCATASTASIS, among aſtronomers, denotes the period of a planet, or the time wherein it returns to the ſame point of the Zodiac from which it ſet out. *Micræl.* Lex. Phil. p. 148. *Sturm.* Math. Juven. T. 3. p. 162.

APOCATASTASIS is alſo uſed in medicine to denote the ſubſiding, or ſinking of a thing.

In this ſenſe, we read of the *Apocataſtaſis* of urine, the *Apocataſtaſis* of tumours; and other diſeaſes. V. *Brun.* Lex. Med. p. 105.

APOCATHARSIS, in a general ſenſe, denotes the ſame with *Catharſis*, or expurgation.

In this ſenſe, we read of *Apocatharſes* of bile, Αποκαθαρσεις χολης, a ſymptom mentioned by Thucydides in the plague of Athens [a]. Quincy [b] defines *Apocatharſis* a purging upwards and downwards, on what authority I know not. Hence alſo *Apocathartica*, a denomination ſometimes given to what we otherwiſe call ſimply *cathartics*.—[a V. *Brun.* Lex. Med. p. 105. b *Quinc.* Lex. Med. p. 30.]

APOCHA, Αποχη, in the civil law, denotes an acquittance, or receipt given by the creditor to his debtor for money paid. *Briſſ.* de Verb. Signif. p. 51. *Calv.* Lex. Jur. p. 76.

In which ſenſe the word ſtands contradiſtinguiſhed, from *antapocha*, which is given by the debtor to the creditor.—Reuſner and Zieglerus have diſſertations expreſs *de apochis*. *Lipen.* Bibl. Jur. p. 21.

APOCRISIARIUS (*Cycl.*)—The *Apocriſiarii*, or *reſponſales*, are uſed in eccleſiaſtical hiſtory for a ſort of reſidents in the imperial city, in the name of foreign churches and biſhops, whoſe office was to negotiate as proctors at the emperor's court in all eccleſiaſtical cauſes, wherein their principals were concerned.

The inſtitution of *Apocriſiarii* ſeems to have been in the time of Conſtantine, or not long after, when the emperors being become Chriſtians, foreign churches had more occaſion to promote their ſuits at court than formerly; at leaſt we find the office eſtabliſhed by law in the time of Juſtinian. In one of the novels it is ordered, that as no biſhop was to be long abſent from his church without ſpecial command from the emperor, if any one had occaſion to negotiate any eccleſiaſtical cauſe at court, he ſhould prefer his petition either by the *Apocriſiarius* of his church, appointed for ſuch purpoſe, or by the Œconomus, or ſome of his clergy ſent expreſs.

The *Apocriſiarii* ſeem to have been of the clergy; thus Anatolius a deacon of Alexandria was *Apocriſiarius*, or reſident, for Diocorus his biſhop at Conſtantinople, by which means he gained an opportunity of being choſen biſhop of Conſtantinople on the death of Flavian. And Evagrius obſerves the ſame of Eutychius, that from being *Apocriſiarius* to the biſhop of Amaſia, he was immediately advanced to be biſhop of the royal city after Mennas [a]. In imitation of the *Apocriſiarii* of churches, almoſt every monaſtery had their *Apocriſiarius* likewiſe, whoſe buſineſs was not to reſide in the royal city, as the former did, but to act as proctors for their monaſtery or any member of it, when they had occaſion to enter any appearance at law, before the biſhop under whoſe juriſdiction they were. This appears from another of Juſtinian's novels, which requires the Aſcetics in ſuch caſes to anſwer by their *Apocriſiarii*, or reſponſales; theſe were ſometimes alſo of the clergy, as appears from the acts of the 5th general council, where one Theonas ſtiles himſelf preſbyter and *Apocriſiarius* of the monaſtry of mount Sinai. The Latin tranſlator calls him *Ambaſiator*, which is not ſo proper, tho' it in ſome meaſure expreſſes the thing; ſince in after times the emperors alſo gave the name *Apocriſiarii* to their own ambaſſadors, and it became the common title of every legate whatſoever [b].—[a *Bingh.* Orig. Eccleſ. l. 3. c. 13. Sect. 6. b *Suic.* Theſ. Eccleſ. & *Du Cange*, Gloſſ. Gr. in voc. Αποκρισιαριος.

APOCRISIS, Αποκρισις, literally denotes an anſwer. Under the denomination αποκρισεις, or *Reſponſa*, were antiently included not only the reſcripts of the emperors to the petitions of parties, but all manner of decrees and mandates. *Du Cange*, Gloſſ. Lat. T. 1. p. 254. in voc. *Apocriſiarius*.

We have ſeveral books extant under the title of *Apocriſes*, and ſome in oppoſition to theſe, under the title of *Ant-Apocriſes*. *Baill.* Tr. des Anti. §. 173.

APOCRYPHAL (*Cycl.*) is often uſed to denote things falſe, or ſpurious.

We meet with numerous *Apocryphal*, or ſpppoſititious books, publiſhed under the names of patriarchs, prophets, evangeliſts, apoſtles, primitive fathers, ſaints, martyrs, &c. *Apocryphal* propheſies, *Apocryphal* goſpels, *Apocryphal* epiſtles, *Apocryphal* acts, *Apocryphal* apocalypſes, &c.

The writing of books under ſpurious names and obtruding them for the works of inſpired authors, tho' once reputed laudable, and conſecrated under the name of pious fraud, was condemned very early by an apoſtolical canon, in the inſtance of a prieſt, who was depoſed for forging the acts of Paul and Thecla. *Bingh.* Orig. Eccleſ. l. 17. c. 5. §. 18.

Fabricius has publiſhed the fragments and remains of the *Apocryphal* books both of the old and new teſtament, *i. e.* ſuch as bear the names of prophets, apoſtles, &c. who lived under the one teſtament or the other, with notes, &c. *Fabric.* Codex Pſeudepigraphus veteris Teſtamenti, Hamb. 1722 and 1723. 8°. 2 Vol. Codex Apocryphus novi Teſtamenti, 2 Vol. Hamb. 1719, &c. 8°.

APOCRYPHAL is alſo uſed to denote thoſe books which are not authorized or received as authentic by the catholic church.

In this ſenſe is the word uſed by the council of Rome, under pope Gelaſius. *Du Cange*, Gloſſ. Lat. T. 1. p. 256.

APOCRYPHAL is more peculiarly applied to denote certain books of the old teſtament extant only in Greek, admitted by the church of Rome as canonical, but rejected by the reformed churches as no part of holy writ; ſuch are the books of Judith, Wiſdom, Tobit, Baruch, Maccabees, the third and fourth books of Eſdras.

In this ſenſe *Apocryphal* ſtands diſtinguiſhed from canonical, tho' the Romiſh church diſowns the diſtinction. See the articles CANON and CANONICAL.

Authors are divided as to the origin of the appellation *Apocryphal*, and the reaſon why it was given to theſe books. See the *Cyclopædia* and *Carpzov.* Introd. ad Libr. Bibl. P. 1. c. 1. §. 2. It. c. 2. §. 1.

The *Apocryphal* books were not received into the canon, either of the Jews, or antient Chriſtians, but were firſt made canonical by a decree of the council of Trent.

The *Apocryphal* books are alſo called *Acanonical*, Ακανονιστοι; and by ſome writers, *eccleſiaſtical* books, becauſe, tho' not held of divine authority, they were allowed to be read in churches, as containing many things tending to edification, and godly inſtruction; on which account they continue ſtill in uſe in the church of England, though forbidden in the other reformed churches. Vid. *Suic.* Theſ. T. 1. p. 151. in voc. Ακανονιστος.

Wolfius gives the literary hiſtory of the *Apocryphal* books, their various editions, tranſlations, commentaries, &c. Bibl. Hebr. l. 2. Sect. 3. ſeq. T. 2. p. 192. ſeq.

APOCRYPHAL *Hereſy*, is the opinion of thoſe, who allowed only the *Apocryphal*, or ſuppoſititious writings of the prophets and apoſtles, rejecting the genuine books of ſcripture, as not canonical. *Prateol.* Elench. Hæret. l. 1. n. 56

Of this number, we are told, were the Manichees, Gnoſtics, Nicolaitans, Valentinians, and others.

APOCYMA, in the materia medica of the antients, a name given by the Greek authors to a ſort of cement, uſed to daub over the bottoms of their ſhips, to preſerve them from injuries by the water; they called this alſo by the name of *Zopiſſa*, and Aviſenna and Serapion call it *Ketran*, *Kitran*, or *Alkitran*. It was a mixture of bees-wax and pitch melted together, and after it had been ſoaked ſome time in the ſea-water it was ſuppoſed to have peculiar virtues, and was uſed in many compoſitions.

APOCYNUM, in botany. See DOGSBANE.

APODACRYTICA, Αποδακρυτικα, in pharmacy, medicines proper to excite tears. *Caſt.* Lex. Med. p. 64. b.

Some alſo uſe the term *Apodacrytica*, for remedies proper to ſuppreſs tears. *Blanch.* Lex. Med. p. 59.

APODECTÆ, Αποδεκται, in antiquity, a denomination given to ten general receivers, appointed by the Athenians, to receive the public revenues, taxes, debts, and the like. *Pott.* Archæol. l. 1. c. 14.

The *Apodectæ* had alſo a power to decide controverſies ariſing in relation to money and taxes, all but thoſe of the moſt difficult nature and higheſt concern, which were reſerved to the courts of judicature.

APODECTÆI, Αποδεκται, in the Athenian government, officers appointed to ſee that the meaſures of corn were juſt. *Pott.* Archæol. l. 1. c. 15.

The *Apodectæi* were nearly related to the *agaronomi*.

APODEMICA, Αποδημικη, the doctrine or ſcience of travelling, whether for knowledge or devotion's ſake. *Micræl.* Lex. Phil. p. 146.

Jo. Meraker has publiſhed an *Apodemica* [a]. Ranzovius a *methodus apodemica* [b].—[a Erff. 1634. 12°. b Lipſ. 1588. 12°. V. *Lipen.* Bibl. Med. p. 41.]

APODES, in a general ſenſe, denotes things without feet. Zoologiſts apply the name to a fabulous ſort of birds, ſaid to be found in ſome of the iſlands of the new world, which being entirely without feet, ſupport themſelves on the branches of trees by their crooked bills. What is related of their manner of reſting at night is ſtill more extraordinary, that they hang in cluſters in the open air only bound together by their bills, and ſupported by the denſity of the atmoſphere [a]. The Germans and Dutch have alſo their *Apodes*, a ſort of birds ſomewhat like ſwallows, whoſe legs and feet are ſo very ſmall that they ſeem rather formed for creeping than running [b].—[a V. *Lang.* Epiſt. Medic. 6. l. 3. p. 917. b *Brun.* Lex. Med. p. 109.]

APODICTICAL *Method* (*Cycl.*) is uſed by ſome writers to denote the ſyſtematical or ſcientifical method of teaching, or writing. *Paſch.* de Var. Mod. Moral. Trad. c. 6. §. 1. p. 469.

APODIOXIS, Αποδιοξις, in rhetoric, a figure whereby we either paſs over a thing ſlightly, or refer treating of it to ſome other time or place. *Fab.* Theſ. p. 201. *Heder.* Schul. Lex. p. 307.

This is alſo called by Latin writers, *rejectio*, e. gr. *Quid ego ſenatum defendam, judices? Equidem debeo*, &c. Again, *Quid ego ſenatum hoc loco defendam, judices? Fiat id rectius tum quum*, &c.

APODIOXIS, in logic, the rejection of ſuch things as do not neceſſarily belong to the queſtion to be conſidered. *Micræl.* Lex. Phil. p. 148.

APODIXIS, Αποδειξις, in rhetoric, denotes an evident proof, or demonſtration of a point. *Quint.* Inſt. Orat. l. 1. c. 10.

We have ſeveral books extant under the names of *Apodixes*, and ſome by way of anſwer to theſe, under that of *Antapodixes*. V. *Baill.* Tr. des Anti. §. 174.

APODIXIS, Αποδειξις, in middle age writers, denotes a receipt for money paid. *Du Cange*, Gloſſ. Lat. T. 1. p. 257. in voc.

In which ſenſe it amounts to the ſame with *Apocha*.

APODIXIS is alſo ſometimes uſed for a ſpecimen or proof of a thing.

APODOSIS, Αποδοσις, in rhetoric, makes the third part of a compleat exordium, being properly the application, or reſtriction, of the *protaſis*. *Heder.* Schul. Lex. p. 307.

The *Apodoſis* is the ſame with what is otherwiſe called *Axioſis*, αξιωσις; and ſtands oppoſed to *protaſis*. e. gr. *protaſis*, all branches of hiſtory are neceſſary for a ſtudent; *Cataſceue*, ſo that without theſe he can never make any conſiderable figure; *Apodoſis*, but literary hiſtory is of a more eſpecial uſe, which recommends it, &c.

APODOSIS is alſo uſed, in ſpeaking of ſimilies, for that part which makes the application of them. *Heder.* Schul. Lex. p. 308.

APODOSIS is alſo uſed in a rhetorical period, for the conſequent to a *protaſis*, or antecedent preceding. *Heder.* loc. cit.

APODOSIS is alſo uſed for a return to ſomething antecedent, or that went before.

This is otherwiſe called *antiſtophe*.

APODYTERIUM, Αποδυτηριον, in antiquity, a ſtripping room, or apartment at the entrance of baths, wherein perſons dreſſed and undreſſed. *Lang.* Epiſt. Med. 50. p. 225. *Pott.* Archæol. l. 1. c. 8. It. l. 4. c. 19.

This was otherwiſe denominated *coriceum*, *gymnaſterium*, and *ſpoliarium*.

Some will have the *Apodyterium* to have been the ſame with the *coniſterium*; but Voſſius ſhews they were two different places. De Quat. Art. Popul. c. 3. §. 13.

The word is formed of the Greek, αποδυειν, *exuere*, to put off, or undreſs.

APOGRAPHE, Απογραφη, in the antient law, was when a perſon being ſued for money ſuppoſed due to the public, pleaded that the charge was unjuſt, and withal produced all the money he was poſſeſſed of, and declared by what means it came to his hands.

Suidas adds, that απογραφη is ſometimes taken for an action againſt ſuch, as neither paid the fines laid upon them before the ninth prytanea following their ſentence, nor were able to give ſufficient ſecurity to the city. *Pott.* Archæol. Græc. l. 1. c 23.

APOGRAPHE, in the Roman law, denotes a catalogue, or inventory of goods. *Calv.* Lex. Jur. p. 76. b.

APOLEPSIS, Απολειψεως δικη, in the Athenian laws, an action of divorce; brought when a woman had fled from her huſband. *Pott.* Archæol. l. 1. c. 24.

APOLEPSIS, in the antient phyſic, denotes a retention of the urine, or any other matter which ought to be evacuated. *Brun.* Lex. Med. p. 107. a.

APOLEPSIS is alſo underſtood of an interception of the blood or ſpirits, or an extinction of the native heat of the veins.

APOLEPSIS is alſo a denomination of a ſpecies of apoplexy, wherein the ſpeech, ſenſe, motion, &c. ſuddenly fail. *Blanc.* Lex. Med. p. 59.

This ſeems to coincide with what is otherwiſe called a *catalepſis*. See CATALEPSIS, *Cycl.* and *Suppl.*

The word is ſometimes alſo written Απολημψις, *apolempſis*, and Απολημψια, *Apolepſia*.

APOLIDES, Απολιδες, in antiquity, thoſe condemned for life to the public works, or exiled into ſome iſland, and thus diveſted of the privileges of Roman citizens. *Pitiſc.* Lex. Ant. T. 1. p. 123.

APOLINOSIS, in the antient phyſic, a method of curing fiſtula's by means of raw flax. *Brun.* Lex. Med. in voc.

APOLLINARIAN *Games*, in Roman antiquity, were inſtituted in the year of Rome 542. The occaſion was a kind of oracle delivered by the phophet Marcus after the fatal battle at Cannæ, declaring, that to expel the enemy, and cure the people of an infectious diſeaſe, which then prevailed, ſacred games were to be annually performed in honour of Apollo. The prætor to have the direction of them; and the decemviri to offer ſacrifices after the Grecian rite. See *Livy*, l. 25. c. 12.

The ſenate ordered that this oracle ſhould be obſerved the rather, becauſe another of the ſame Marcus, wherein he had foretold the overthrow at Cannæ, had come true; for this reaſon they gave the prætor twelve thouſand aſſes out of the public caſh to defray the ſolemnity. There were ſacrificed an ox to Apollo, as alſo two white goats, and a cow to Latona: all with their horns gilt. Apollo had alſo a collection made for him, beſides what the people who were ſpectators gave voluntarily. The firſt prætor by whom they were held was P. Cornelius Sylla. For ſome time they were moveable or indictive, but at length were fixed, under P. Licinius Varus, to the fifth of July, and made perpetual.

The men, who were ſpectators at theſe games, wore garlands on their heads; the women performed their devotions in the temples at the ſame time, and at laſt they caroufed together in the veſtibles of their houſes, the doors ſtanding open.

The *Apollinarian* games were only ſcenical; and at firſt only obſerved with ſinging, piping, and other ſorts of muſic; but afterwards there were alſo introduced all manner of mountebank-tricks, dances, and the like, yet ſo as that they ſtill remained ſcenical, no chariot races, wreſtling, or the like laborious exerciſes of the body being ever practiſed at them. *Heder.* Schul. Lex. p. 30. ſeq. *Nicol.* Abram. in Not. ad Cicer. Philip. 2. c. 23. *Fabric.* Bibl. Ant. c. 22. §. 7. *Macrob.* Saturn. 1. 17. *Pitiſc.* Lex. Ant. T. 2. p. 114.

Danet, and others, confound the *ludi Apollinares* with the *actiaci*. *Danet*, Dict. Ant. in voc. *Aquin.* Lex. Milit. T. 1. p. 57. b.

APOLLINARES *Ludi* was alſo a general name given to all ſcenical games. V. *Scalig.* Poet. l. 1. c. 30.

Theſe were alſo called *Ludi liberales*, and *ſcenici*.

They differed from the *ludi theatrales*, in that the former were celebrated with all ſorts of plays, farces, poems, recitations, &c. the latter only by dancing, and muſic. *Scalig.* loc. cit.

This kind of *Apollinarians* had their ſhare in almoſt all the ſolemn games.

APOLLINARIS, in botany, a name given by ſome authors to henbane. *Ger.* Emac. Ind. 2.

APOLLONIA, Απολλωνια, in antiquity, feaſts ſacred to Apollo at *Egialea*.

The occaſion of their inſtitution is thus related. Apollo after his victory over Python, went to Egialea, accompanied with his ſiſter Diana; but being frighted thence, fled into Crete. After this the Egialians were infected with an epidemical diſtemper; and being adviſed by the prophets to appeaſe the two offended deities, ſent ſeven boys and as many virgins, to entreat them to return, Apollo and Diana accepted their piety, and came with them to the citadel of Egialea, in memory of which a temple was dedicated to Pitho the goddeſs of perſuaſion; and it became a cuſtom to appoint choſen boys and virgins, to make a ſolemn proceſſion, in ſhew, as if they deſigned to bring back Apollo and Diana; which ſolemnity was continued till Pauſanias's time. *Pott.* Arcæol. Græc. l. 2. c. 20. T. 1. p. 370.

APOLLOGUE (*Cycl.*)—We find many things in authors concerning the origin of *Apologues* [a], the diſtinguiſhing characters of *Apologues*, the uſe and advantages of the way of teaching by *Apologues* [b]. — [a V. *Bayle*, Dict. Crit. in voc. *Eſope*, Not. (A). b *Shafiſb.* Charact. T. 3. p. 206. ſeq. *Paſch.* de Var. Mod. Moral. Trad. c. 2. §. 12. ſeq. *Budd.* Iſag. ad Theol. l. 1. c. 4. p. 293.]

Apologue differs from fable, *fabula*, μυθος, as the former is uſed in ſpeeches, and harangues to perſuade; the latter in tragedies, comedies, and other pieces of poetry, to inſtruct and correct the manners. *Apologue* alſo differs from *ænus*, as the latter is only calculated for the uſe of men, and carries a graver and weightier admonition; whereas *Apologues* are propoſed to children. *Apologue* differs from parable, as the latter is a ſimilitude drawn from natural, moral, or any other branches of knowledge; the former only from moral topics. Others ſtate the difference thus; that parables are taken from the doings of men, *Apologues* from thoſe of brutes, or even of things inanimate; ſo that parables require probability in the narration, which *Apologues* do not. *Paſch.* de Var. Mod. Moral. Trad. c. 2. §. 20.

APOLYSIS, in a general ſenſe, the ſolution, or reſolution of any thing. Thus we read of the *Apolyſis* of a diſeaſe, the *Apolyſis* of a bandage, or the like. *Brun.* Lex. Med. p. 107. b.

APOLYSIS, in a more particular ſenſe, denotes the excluſion of any thing: Thus we read of the *Apolyſis* of the fœtus, the ſecundines, and the like.

APOMELI, in medicine, a kind of decoction prepared of honey, or an honey-comb mixed with vinegar, and boiled a ſhort time, till the qualities of both be united, and the acrimony of the vinegar allayed. *Caſt.* Lex. Med. p. 65.

This is ſometimes alſo called by the Greek writers οξυγλυκυ, *Oxyglycy*, or οξυγλυκες, *Oxyglyces*.

The *Apomeli* is repreſented as a kind of medium between mulſe and oxymel. It was antiently of great uſe among the Greeks, as a detergent, promoter of ſtool, urine, &c.

APOMYOS *Deus*, in the heathen mythology, a name under which Jupiter was worſhipped at Elis, and Hercules as well as Jupiter at the Olympic Games. Theſe Deities were ſupplicated under this name, to deſtroy or drive away the vaſt numbers of flies which always attended at the great ſacrifices: And in thoſe which accompanied the Olympic games, the firſt was always to the *Apomyos*, or Myiagrus Deus, that he might drive away the flies from the reſt. The uſual ſacrifice was a bull; and Pliny tells us, that on this the inſects would go off in whole myriads, in form of clouds, and not return to moleſt the prieſts in the reſt of their ſolemnities, during the whole time. This ſeems to ſtand upon the ſame rank with many other of Pliny's miracles.

APONEUROTICUS *muſculus*, in anatomy, a name given by Spigelius, and ſome others, to a muſcle of the thigh, called by Cowper and Winſlow the *Muſculus lati Tendinis*, and *Muſculus faſciæ latæ*. Winſlow has called it, with more propriety, the *Muſculus Vaginæ femoris*.

APONIA, among phyſicians, a ſtate of indolence, or the abſence of pain [a]. In which ſenſe, the word amounts to the ſame with *Anodynia*. Hence alſo *Apona*, Απονα, is uſed by ſome for medicines which do not excite pain [b].—[a *Gorr.* Def. Med. b *Brun.* Lex. Med. in voc.]

APONOGETON, in Botany, a name given by Pontedera to a genus of Plants, called by Micheli and Linnæus *Zannichellia*. See ZANNICHELLIA.

APOPEMPTIC, Αποπεμπτικος, in the antient poetry, a hymn addreſſed to a ſtranger on his departure from a place to his own country. *Scal.* Poet. l. 3. c. 113.

The antients had certain holy days, wherein they took leave of the gods with *apopemptic* ſongs, as ſuppoſing them returning each to his own country. The deities having the patronage of divers places, it was but juſt to divide their preſence, and allow ſome time to each. Hence it was, that among the Delians and Mileſians we find feaſts of Apollo, and among the Argians feaſts of Diana, called *Epidemiæ*, επιδημιαι, as ſuppoſing theſe deities then more peculiarly reſident among them. On the laſt day of the feaſt they diſmiſſed them, following them to the altars with *apopemptic* hymns.

APOPHASIS, Αποφασις, in the Athenian laws, was ſometimes uſed for the ſame with Απογραφη. *Suid.* Lex. T. 1. p. 300.

APOPHASIS was alſo uſed for the account given of eſtates, at the exchange of them for the avoiding public employments. When any man would excuſe himſelf from any troubleſome and chargeable truſt, by caſting it on another richer than himſelf, the perſon produced had power to challenge him to make an exchange of eſtates, and thereby compel him to undergo the office he had before refuſed. *Pott.* Archæol Græc. l. 1. c. 23.

APOPHASIS, Αποφασις, in the civil law, an anſwer or reſcript of the prince. *Calv.* Lex. Jur. p. 76.

Among logicians the word is alſo uſed for a negation or denial.

APOPHASIS, in rhetorick, a figure whereby we really ſay or adviſe a thing, under a feigned ſhew of paſſing over, or diſſuading it.

Quintilian makes the *Apophaſis* a ſpecies of irony [a]. Scaliger holds it the ſame with what is otherwiſe called *Occupatio* [b].—[a Inſt. l. 9. c. 2. b Poet. l. 3. c. 8.]

APOPHLEGMATISM, Αποφλεγματισμος, in medicine, the operation of purging phlegm or pituita from the head.

Apophlegmatiſm is of two kinds, the one a purgation of pituita by the noſtrils, *Apophlegmatiſmus per nares*; the other by the mouth, *Apophlegmatiſmus per os*.

APOPHLEGMATISM by the mouth is a kind of particular Salivation, differing from the general kind, in that, in the former not only ſaliva is brought from the ſalival glands, but other mucous and ſerous humours from the parts bordering upon the mouth. *Junck.* Conſp. Therap. tab. 7. p. 237.

This is more particularly by ſome authors denominated *Maſtication*. See MASTICATION, *Cycl.*

Some define it a ſhort ſpitting, *ſputatio brevis*, by way of contradiſtinction from a proper ſalivation, which is a long or continued ſpitting.

APOPHLEGMATISM *by the noſtrils* is a peculiar kind of evacuation, whereby the mucous humour lodged in the head, and liable to offend the ſame, is diſcharged either by the ſpontaneous action of the parts, or the uſe of proper medicines. *Junck.* l. c. tab. 6. p. 213. ſeq.

APOPHLEGMATIZANTS (*Cycl.*) are of two kinds, one adminiſtred by the way of the mouth, and intended to operate by ſpitting; the other given by the noſtrils, to operate by ſneezing, &c.

The former are more particularly denominated *Maſticatories*, or *Salivatories*. The latter *Errhines*, or *Sternutatories*.

Our dictionary-writers ſeem all to fail in this article; ſome reſtraining *Apophlegmatizants* to the noſe, as Blancard and Quincy; others to the mouth, as Caſtellus and Bruno.

The claſs of *Apophlegmatizants* adminiſtered by the mouth are by ſome ſubdivided into two ſorts: The firſt, properly denominated *Maſticatories*, conſiſt of thoſe which are merely inſipid, or without all acrimony; but which, by chewing in the mouth, draw ſaliva from the neighbouring glands. Such are paper, a leaden bullet, cryſtal, maſtic, and the like. See MASTICATORY, *Cycl.*

The ſecond, properly denominated *Apophlegmatizants*, are thoſe compoſed of acrimonious particles, which vellicating the membranous coats of the mouth, occaſion a more plentiful diſcharge of ſaliva, by which thoſe acrimonious particles are diluted and deterged.: Such are tobacco, ſage, and the like. *Nent.* Fundam. Med. T. 1. tab. 4. §. 9. p. 283.

Their chief uſe is in ſerous or watry diſorders of the head, apoplexies, hydrocephalus's; ſometimes alſo in diſorders of the eyes, the tooth-ach, and the like. V. *Boerh.* de Mat. Medic. p. 127. *Nent.* l. c. T. 2. tab. 24. p. 122.

The claſs of *Apophlegmatizants* adminiſtred by the noſe may be divided, 1°. into ſuch as operate without ſneezing, by reſolving the humours lodged in the glands of the noſtrils, and gently exciting the glands to an excretion. Theſe are more particularly denominated *Errhines*. Id. ibid. See the article ERRHINA, *Cycl.* and *Suppl*

2°. Such as operate by ſtrongly ſtimulating the membrane of the noſtrils, raiſing a ſneezing, and expelling the humours with violence. *Nent.* loc. cit. *Junck.* Conſp. Therap. tab. 6. p. 215.

Theſe are more properly denominated *Ptarmics* and *Sternutatories*. See PTARMICA and STERNUTATIVE, *Cycl.*

Such are tobacco, ſnuffs of divers ſorts, hellebore, &c.

APOPHORETA, in antiquity, preſents made to the gueſts at a feaſt, or other entertainment, which they carried away with them. *Lipſ.* Saturn. l. 1. c. 16. *Du Cange*, Gloſſ. Lat. T. 1. p. 258.

The word is formed of the Greek Αποφορεω, I carry away.

Veſpaſian gave *Apophoretæ* to the men in the Saturnalia, and to the women on the calends of March. *Suet.* in Veſp. c. 19.

Hence alſo Martial calls the fourteenth book of his Epigrams *Apophoreta*:—And in imitation of him, Grotius gives the ſame title to a book of his Poems. V. *Fabric.* Bibl. Lat. l. 2. c. 20.

The name *Apophoreta* was afterwards appropriated to the veſſel wherein the preſents were put. *Iſid.* orig. l. 20. c. 4.

It was ſometimes alſo applied to the caſe wherein relicts were kept.

APOPHRADES, Αποφραδες, in phyſic, denotes a ſort of unhappy days, wherein either no criſis, or an ill one, is to be expected. V. *Lang.* Epiſt. Medic. 36. l. 1. p. 161.

APOPHTHEGM, a ſhort, wiſe, and pithy ſaying. *Cic.* de offic. l. 1. c. 29.

Such is that of Cyrus: He is unworthy to be a magiſtrate, who is not better than his ſubjects. Or this; He that will not take care of his own buſineſs, will be forced to take care of that of others. Or that of Artaxerxes Mnemon, when reduced to hunger by the loſs of his baggage; How much pleaſure have I hitherto lived a ſtranger to? Or that of Cato; *Homines nihil agendo diſcunt male agere*. Or, finally, that of Auguſtus, σπευδε βραδεως, *feſtina lente*.

Plutarch, Eraſmus, and others, have publiſhed collections of *Apophthegms*. Harſdorffer has publiſhed the art of *Apophthegms*, *Ars Apophthegmatica*, in High Dutch, under the fictitious name of *Quirinus Pegeus*. Alph. Panormita has given four books of the *Apophthegms* of Alphonſus king of Arragon, which have been illuſtrated with commentaries by Æneas Silvius. *Paſch.* de Var. Mod. Mor. Trad. *Lipen.* Bibl. Phil. T. 1. p. 84.

The modern books under the titles of *Ana*, *Table-talk*, and the like, are full of the *Apophthegms*, or memorable ſayings, of learned men; as *Scaliger*, *Thuanus*, *Menage*, *Selden*, &c.

APOPHYGE, or APOPHYGIS, (*Cycl.*) in architecture, is properly a large concave or arched member, ſerving either to connect two flat members together, or to join a flat member to another not flat. *Wolf.* Elem. Archit. §. 109.

In this ſenſe we may diſtinguiſh two *Apophyges*, the upper and lower.

Upper APOPHYGIS is that part, or ſweep, whereby a large flat member of the upper part of an order is connected to the lower. Id. in Lex. Math. p. 127.

This is alſo called by the French *le Congé d' Enhaut*, and by the Italians *il Cavo di ſopra*.

Lower APOPHYGIS, *Apophygis inferior*, is a concave member which connects two flat parts in the lower part of an order. This the French call *le Congé d' Embas*, and the Italians *il Cavo di Baſſo*, ſometimes alſo *il Vivo di Baſſo*. Id. ibid.

APOPHYSIS (*Cycl.*) is the ſame with what we otherwiſe call proceſs, eminence, probole, projecture, protuberance, ecphyſis, head, and the like. *Van Horn.* Microcoſm. §. 11. p. 8.

Apophyſes differ from *Epiphyſes*, as theſe latter are only appendages adhering or contiguous to a bone; whereas the former are productions or continuations of the bone itſelf, ſhooting out from it like branches from the trunk of a tree. *Barthol.* Libel. 4. Anat. c. 1. See EPIPHYSIS, *Cycl.*

Apophyſes, with regard to figure, may be reduced to two kinds, round and long.

The former are called by the general name of *heads*. Theſe may be ſubdivided into two ſorts: If the head be large, oblong, and very prominent, it is called ſimply, Κεφαλη, *caput*, head; if flat and low, Κονδυλος, *condylus*.

The long kind are alſo ſubdivided into acute and obtuſe: The acute terminating in a point, is called Κορωνη, *corona*, from the reſemblance it bears to a quail's bill. There are divers ſpecies of this, diſtinguiſhed according to their figure, by different names; that reſembling a ſtyle or bodkin is called *ſtyloides*, στυλοειδης, or *graphioides*, γραφιοειδης; that reſembling a breaſt, *maſtoides* or *mammaria*, μαστοειδης; that reſembling an anchor, *anchoroides*, αγκοροειδης; that reſembling a crow's bill, *coracoides*, Κοραϰοειδης; that reſembling a tooth, οδοντοειδης, or *dentiformis*. Hence alſo the terms *glenoides*, *condyloides*, *pterygoides*, *corone*, *trochanter*, &c.

The obtuſe kind terminating in a head, is called *cervix*, *collum*, or neck. V. *Blaſ.* Comm. ad *Veſling.* c. 2. p. 16. *Heiſt.* Comp. Anat. §. 49. See CERVIX, &c.

The general uſe of *Apophyſes* is, 1°. For the greater conveniency of articulation, whether it be with or without motion. 2°. To afford a more commodious origination and inſertion to the muſcles; and 3°. To defend other parts. Their particular uſes will be indicated under the proper articles of each bone, *&c.* *Heiſt.* Compend. Anat. §. 50. p. 19.

APOPHYSIS is alſo applied by Hippocrates to certain fleſhy excreſcences, found in moles, and female fœtus's of ſeven months, as appearing rather proceſſes, and origins of members, than diſtinct members, ſuch as he ſays may be found in male fœtus's. V. *Caſt.* Lex. Med. p. 66. a.

APOPHYSIS *Raviana* denotes the larger proceſs of the malleus of the ear, into which the muſcles of the bone are inſerted. *Heiſt.* Comp. Anat. n. 68. p. 25. See MALLEUS.

APOPLANESIS, Αποπλανησις, in oratory, a kind of fallacious defence, and ſlurring over, darkening and concealing things, in order to blind the judges, or the audience. *Fab.* Theſ. in voc.

APOPLANESIS, in a more particular ſenſe, denotes a ſort of confutation, wherein the ſpeaker promiſes to anſwer what the adverſary objects in another place, but which being too difficult to anſwer, is afterwards forgot and left to paſs unanſwered. *Heder.* Schul. Lex. p. 315.

APOPLECTIC *Veins*, a name ſometimes given to the jugulars. Theſe are ſometimes alſo denominated among antient writers *ſoporales*.

Some writers reſtrain *apoplectic* to the internal jugular, aſcending by the ſide of the trachea. *Barthol.* Anat. Libel. 1. c. 6.

APOPLECTICA, *Apoplectical medicines*, a name uſed by ſome for what we more properly call *antapoplectics*. *Brun.* Lex. Med. in voc.

APOPLECTICAL *Balſams*, is a name given by ſome writers to a ſort of ſweet ſcented balms, prepared of diſtilled oils, and uſed by way of perfume. V. *Boerh.* New Meth. Chem. P. 3. p. 10. ſeq.

APOPLEXY (*Cycl.*)—This diſtemper is alſo denominated by Roman writers *Sideratio*. *Lang.* Epiſt. Med. p. 106.

The word Αφωνος, in Hippocrates, includes both *Apoplexies* and ſyncopies. *Friend*, Hiſt. of Phyſ. T. 1. p. 93.

Serous or lymphatic *Apoplexies* are thoſe chiefly incident to old men, in whom the vital heat is greatly abated. The young and corpulent are expoſed to the ſanguineous kind.

Some condemn the common method of letting blood from any vein in this diſtemper, giving emetics, or ſharp clyſters, and applying bliſters; but inſiſt much on the advantage of arteriotomy, and recommend cordials. *Calderwood*, new Meth. of cur. Apoplex. ap. Med. Eſſ. Edinb. Abrid. vol. 2. p. 460.

A late author thinks that the carus, cataphora, or ſubeta Avicennæ, lethargy, coma vigil, or typhomania Galeni, palſy, paraplegia, hemiplegia, *&c.* are nothing but different ſpecies of the *Apoplexy* in a leſſer degree. Medic. Eſſ. Edinb. Vol. 1. p. 266.

APOPLEXY is alſo reckoned among the diſeaſes of hawks, being a diſtemper which ſeizes their heads, occaſioned by too much greaſe and ſtore of blood, or their having ſtood too long expoſed to the heat of the ſun, or having been ſuffered too long flights in the heat of the day. Dict. Ruſt. T. 1. in voc.

Horſes are alſo ſaid to be ſubject to *Apoplexies*, occaſioned by want of exerciſe, or too plentiful feeding.

The diſtemper ſhews itſelf by a giddineſs, reeling, trembling, and ſometimes falling ſuddenly down, without ſenſe or motion. The cure is by taking a large quantity of blood from the neck, applying volatile ſpirits to the noſtrils. Farr. D. p. 28.

APOPLISTÆ, Αποπλισται, in antient laws, a ſort of officers in in the country, appointed to diſarm all private perſons, or thoſe not entitled to have arms; for the prevention of miſchief and violence. *Du Cange*, Gloſſ. Lat.

APOPOMPAE, Αποπομπαι, in antiquity, certain days in which ſacrifices were offered to the gods called *Pompæi*. Who theſe deities were is doubtful; certain it is, that Πομπαιος denotes any perſon that conducts another in his way; and therefore was applied to Mercury, who was believed to be Pluto's gentleman-uſher, and to conduct the ſouls of deceaſed perſons to the ſhades below. Potter however is rather inclined to think that theſe days belonged to the gods, called Αποπομπαῖοι, *i. e.* Αποτρόποι, (for αποπομπή is by Phavorinus expounded αποτροπή) otherwiſe named Λύσιοι, αλεξίκακοι, αποτρόπαῖοι, φύξιοι, and *Averrunci*, becauſe they were thought to avert evils; ſuch were Jupiter, Hercules, and others. *Pott.* Archæol. Græc. l. 2. c. 20. T. 1. p. 370.

APOPOMPÆUS, αποπομπαῖος. See AZAZEL.

APOPOMPES, Αποπομπης δικη, in Greek antiquity, an action of divorce, when the huſband had put away his wife. *Pott.* Archæol. Græc. l. 1. c. 24.

This ſtands contradiſtinguiſhed from *Apolepſis*. See the article APOLEPSIS.

APOPSYCHIA is ſometimes underſtood of effluvia, emitted from the ſun, moon, and other heavenly bodies; to which their influences on ſublunary things is aſcribed. *Voſſ.* de Scient. Mathem. c. 37. §. 2.

APORIA, in rhetoric, denotes a ſtate of doubt or wavering, wherein the orator appears undetermined whether to ſay a thing or not, *e. gr.* *Eloquar an ſileam?* Shall I ſpeak out, or hold my tongue? *Micræl.* Lex. Phil. p. 149.

This is otherwiſe called doubting, *dubitatio*, *addubitatio*.

APORON (*Cycl.*)—This word is ſometimes alſo uſed among law writers for an inexplicable ſpeech, or diſcourſe. *Calv.* Lex. Jur. p. 77. a.

APORRHOEA, (*Cycl.*) in phyſic, is ſometimes particularly uſed for morbid or contagious miaſmata, or effluvia from unwholeſome bodies. *Brun.* Lex. Med. p. 109.

APORRHOEA is alſo uſed to denote a ſhedding or falling off of the hair. See the articles ALOPECIA, BALDNESS, *&c.* *Cycl.* and *Suppl.*

APOSIOPESIS, Αποσιώπησις, in rhetoric, is commonly uſed to denote the ſame with *Ellipſis*. Jul. Scaliger diſtinguiſhes them. The latter, according to him, being only the ſuppreſſion of a word; as, *me, me: adſum qui feci*; the former, the omitting to relate ſome part of the action; as

Dixerat, atque illam media inter talia ferro
Collapſam adſpiciunt.——————

Where the poet does not mention how *Dido* killed herſelf. See ELLIPSIS. *Cycl.*

This figure is of uſe to keep up the grandeur and ſublimity of a diſcourſe. Vid. *Voſſ.* Rhet. l. 5. p. 345, 346, 352.

APOSITION, *Apoſitio*, in medicine, an averſion for food.

Apoſition amounts to much the ſame with *Anorexia*; though ſome make a difference; alledging that the latter imports no more than an inappetency, or want of deſire to eat; the former, an averſion or loathing of it. *Linden.* Select. Med. Ex. 13. §. 79.

APOSPASMA, in medicine, denotes a ſolution of continuity in ſome organical part, as a membrane, ligament, or the like. *Brun.* Lex. Med. in voc.

APOSPASMA is alſo applied to metalline recrements, as tutia, melanteria, miſy, ſory, or the like. *Ludov.* Diſſ. Pharmac. 1. p. 538.

APOSPHACELISIS, Αποσφακελισις, in the antient phyſic, denotes a Mortification of a fleſhy part, happening in caſes of wounds, and fractures, from too tight a ligature. *Caſtel.* in voc. and *Brun.* Lex. Med. p. 110.

APOSPHRAGISMA, Αποσφραγισμα, in antiquity, the figure or impreſſion of a ſeal. *Fab.* Theſ. p. 204.

It was forbid among the antients to have the figure or image of God on their rings or ſeals. To this purpoſe the precept of Pythagoras, Εν δακτυλιω εικονα Θεου μη περιφερειν! But in proceſs of time, this grew little regarded; it was uſual enough to have the figures of Egyptian and other deities, as well as of heroes, monſters, friends, anceſtors, and even brutes on their dactyli, or ring ſeals. Thus Cæſar had the image of Venus, Pollio of Alexander, Auguſtus of the ſphinx, Pompey of a frog, Lentulus of his grandfather, *&c.*

APOSPONGISMUS, among antient phyſicians, the application of a ſponge, whether dry or ſoaked with water, either to cleanſe the filth from a part, or to appeaſe pains, allay itching, or refreſh the ſpirits. *Caſtel.* lex. in voc. *Gorr.* Def. Med. p. 46.

APOSTAGMA, in natural hiſtory, the muſt or juice which runs from the grapes ere they be trodden or preſſed.

This is otherwiſe called *Apoſtalagma*; ſometimes, on account of its great ſweetneſs, γλυκυς; ſometimes *protropum*. *Linden.* Ex. 10. §. 206.

APOSTASIOU DICE, Αποστασιου δικη, in the Athenian laws, an action brought againſt foreigners ſojourning at Athens, who neglected to chuſe themſelves patrons. *Potter*, Archæol, l. 1. c. 24. p. 129.

APOSTASIOU DICE, Αποστασιου δικη, was alſo an action brought by a maſter or patron againſt his ſervants or clients, for refuſing to perform the ſervices they were bound to. *Pott.* Archæol. l. 1. c. 24.

APOSTASIS, Αποστασις, in phyſic, uſually ſignifies the ſame with abſceſs. See IMPOSTHUMATION.

In which ſenſe, the word is uſed by Hippocrates and others promiſcuouſly with Αποστημα, *Apoſtem.*

APOSTASIS, in a more particular ſenſe, denotes a departure or removal of the morbid matter, in the criſis or ſolution of a diſeaſe. *Junck.* Conſp. Chirurg. tab. 6. p. 66.

In which ſenſe, the word is alſo uſed by Hippocrates and the antients, as different from *Apoſtem.*

Apoſtaſis, in this ſenſe, is of two kinds; the firſt, Καθ' ἐκκρισιν; the ſecond, Καθ' ἀποθεσιν.

Ἀποστασις καθ' ἐκκρισιν denotes an excretion or efflux of the matter.

Under this are included immediate eruptions, and the like evacuations, whereby the containing cauſe of a diſeaſe, and the chief matter of it, are thrown off from the nobler and more intimate parts of the body, through the leſs noble and external parts.

Ἀποστασις καθ' Ἀποθεσιν denotes a tranſlation of the morbid matter from the principal to ſome other leſs noble parts, but without any total expulſion of it from the body.

Inſtances of this kind are chiefly in acute fevers, where their progreſs has been diſturbed, or a bad regimen been obſerved. *Junck.* lib. cit. p. 66.

Later writers have been led into great inaccuracies in relation to the preciſe differences and characters of Hippocrates's *Apoſtaſis* and *Apoſtema.* Dr. Stahl has given a diſſertation expreſs on the ſubject. *Goelic.* Hiſt. Chirurg. Recent. §. 563. p. 564.

APOSTASIS is alſo uſed by Hippocrates for a fracture of a bone, wherein ſome part is entirely ſeparated or broken off. *Hippocr.* de Fract. ap. *Brun.* Lex. Med. p. 111. a.

APOSTATE, in a general ſenſe, ſignifies a deſerter from the true religion. See APOSTACY, *Cycl.*

In which ſenſe, *Apoſtate* amounts to much the ſame with lapſed, perverted, &c.

Apoſtates to Mahometaniſm are commonly called *Renegado's.*

The *Greeks* frequently confound *Apoſtates* with Heretics. *Suic.* Theſ. Eccleſ. T. 1. p. 124. in voc. Αιρετικος.

The Emperors Adrian and Julian are on record in church hiſtory as *Apoſtates.* The former, according to Lampridius, having begun to erect temples to Chriſt, was prevailed on by the Præfectus Sacrorum to deſiſt, leſt all the world ſhould turn Chriſtians, and the other temples be deſerted.

The puniſhment of *Apoſtates* from Chriſtianity to Judaiſm was left by Conſtantine to the diſcretion of the Judges, who, when they thought fit, were at liberty to condemn them to death. The ſubſequent emperors, in lieu hereof, enacted confiſcations. The ſtate of theſe new Jews was much worſe than that of the native Jews. Theſe latter had many privileges; the former were not allowed to make wills, nor was their teſtimony admitted in the courts of juſtice. *Bing.* Orig. Eccleſ. l. 16. c. 6. §. 1.

APOSTATE is alſo uſed for a religious, who having taken the vows, quits the monaſtic profeſſion without leave. *Du Cange*, Gloſſ. Lat. T. 1. p. 259. ſeq. in voc. *Apoſtatare.*

APOSTATE is alſo applied to the prieſts who throw aſide the tonſure, and abandon the clerical life.

In a decree of pope Nicolas, publiſhed in 1059, theſe are called *Apoſtatæ Julianiſtæ*, or Julian *Apoſtates*, in alluſion, we ſuppoſe, to the tradition of the emperor Julian's having been in holy orders. Theſe, unleſs they returned to the clerical, were excluded all benefit of Chriſtian communion. Cod. tit. *de Apoſtatis*, l. 1. *du Cang.* Gloſſ. Lat. T. 1. p. 259.

APOSTATE, in eccleſiaſtical writers, a perſon who falls away voluntarily into heatheniſm, after having for ſome time made profeſſion of Chriſtianity.

Apoſtates differed from common lapſers into idolatry, in this, that the latter fell by Violence, and the terror of perſecution; but *Apoſtates* by principle and choice, out of a diſlike to chriſtianity, and a love of gentiliſm. As the lapſers generally returned as ſoon as they had opportunity, *Apoſtates* commonly continued ſuch all their days.

The ſtate of *Apoſtates* in the antient church was even worſe than that of heretics. The imperial laws, at leaſt from the time of Theodoſius, denied *Apoſtates* the common privileges of Roman ſubjects, depriving them of the power of diſpoſing of their eſtates by will, &c. [a] No man might make them his heirs, nor could they ſucceed to any inheritance. They were to have no commerce or ſociety with others; their teſtimony was not to be taken in law; in fine, they were to be infamous to all intents. They were not ſo much as allowed the right of ſanctuary. If they were not baniſhed, it was only for the greater puniſhment, to live among men, and not enjoy the common privileges of men; nor were they ever to regain their antient ſtate. Though they repented and returned it was to be no benefit to them: Their repentance could never obliterate their crime: Such was their condition in temporals. And, by ſome canons in the church, they were not leſs ſeverely treated in ſpirituals. The council of *Eliberis* forbad communion to the laſt to all *Apoſtates* [b].—[a *Bing.* Orig. Eccleſ. l. 16. c. 6. §. 4. b Id. Ibid. It. l. 8. c. 11. §. 6. *Suic.* Theſ. T. 1. p. 472.]

APOSTERIGMA, in the antient phyſic, denotes a reſt or ſupport for a diſeaſed part, without binding. *Brun.* Lex. Med. p. 111.

Such are pillows, cuſhions, and the like.

The word ſeems alſo to have been uſed by *Hippocrates* for a ſtoppage, or obſtruction of ſome vaſcular part.

APOSTHUME (*Cycl.*) is particularly uſed for a diſeaſe of hawks, which occaſions ſwellings in the head, ariſing from a redundancy of humours, and a preternatural heat of that part. *Ruſt.* Dict. T. 1. in voc.

The *Apoſthume* diſcovers itſelf by the ſwelling of the eyes, a moiſture iſſuing from the ears, and their wings extremely ſlothful.

APOSTIL, *Apoſtilla*, in matters of literature, a marginal addition, or note to a book, paſſage, or the like.

APOSTLE (*Cycl.*)—The *Apoſtles* are called by the Arabs *Havarioun*, *q. d.* whitſters or fullers, from their profeſſion, ſay ſome; but, according to others, becauſe repreſented by the antient Chriſtians, in their pictures, as clothed in white, and that their tradition informed them, that they appeared thus to the believers. The Arabs alſo give them the denomination *Aſhab Jeſa*, *q. d.* Companions, or diſciples of Chriſt; but never that of *Raſſoulon*, or *Morſeloun*, which properly ſignifies *Apoſtles*, or meſſengers. The former appellation they reſerve wholly for their own prophet Mahomet, and the latter for the patriarchs and prophets of the Old Teſtament. *d'Herbel.* Bibl. Orient. p. 439.

Jo. Simon has a diſcourſe expreſs, to ſhew that the *Apoſtles* were all Lutherans, none of them papiſts. Collegium Apoſtolico-Lutheranum contra Kellium, S. G. quod omnes Apoſtoli fuerint Lutherani, nulli Papiſtæ. Wittemb. 1676. 4°.

Fabricius gives a liſt of the chief writers, who have treated of the origin, office, &c. of the *Apoſtles.* *Fabric.* Bibl. Antiq. c. 13. §. 11.

APOSTLE is alſo a title or appellation given to Chriſt by the author of the epiſtle to the Hebrews, to John the Baptiſt by Tertullian, to the ſeventy diſciples, to the diſciples of the *Apoſtles*, and even to ſeveral who preached and propagated the goſpel long after the *Apoſtles* days. V. *Fabric.* Bibl. Antiq. c. 13. §. 11.

We even read in Dr. Grabe of a female *Apoſtle*, *Apoſtola*, or ἡ Αποστολος, *viz.* St. Thecla; and the ſame title appears to have been given to other godly women. *Grab.* Spicil. T. 1. p. 331. Grotius obſerves, that Conſtantine the Great was called *Apoſtle* among the princes, εν Βασιλευσι Αποστολος. *Grot.* de Jur. Summ. Poteſt. p. 21.

APOSTLE is alſo thought by many to have been the original name for biſhops, before the denomination *Biſhop* was appropriated to their order. At firſt the name biſhop and preſbyter are ſuppoſed to have been common to all miniſters of the firſt and ſecond order; during which time the appropriate name for biſhops, to diſtinguiſh them from meer preſbyters, was that of *Apoſtles.* Thus Theodoret ſays expreſly, the ſame perſons were antiently called promiſcuouſly both biſhops and preſbyters, whilſt thoſe who are now called biſhops, were called *Apoſtles.* Thus, he ſays, Epaphroditus was the *Apoſtle* of the Philippians, Titus the *Apoſtle* of the Cretians, and Timothy the *Apoſtle* of the Aſiatics. *Bing.* Orig. Eccleſ. l. 2. c. 2. ſec. 1.

APOSTLE, in middle age writers, is alſo uſed to denote the book of St. Paul's epiſtles, or the epiſtle which was taken out of them. *Du Cange*, Gloſſ. Lat. T. 1. p. 262.

In this ſenſe we meet with, reading the *Apoſtle*; then follows the *Apoſtle*, *deinde ſequitur Apoſtolus*, that is, a leſſon out of St. Paul's epiſtles.—Let him read the *Apoſtle* and the goſpel, &c. This is ſometimes alſo called *Apoſtolicum.* The ſub-deacon had the care of the *Apoſtolicum*, and the archdeacon of the *Evangelium*, or goſpel.

APOSTLE, *Apoſtolus*, is alſo uſed for a letter dimiſſory given by a biſhop, either to a clerk, or a layman, when going into another dioceſe; the layman for ordination there, and the clerk either to be admitted to adminiſter the ſacraments, or be entered in the catalogue of another church. *Du Cange*, Gloſſ. Lat. T. 1. p. 262. See DIMISSORY, *Cycl.*

Apoſtoli were alſo given by officials, and eccleſiaſtical judges, in caſe of perſons ſent to Rome on appeals to the pope.

All letters of appeal were ſometimes alſo denominated *Apoſtoli.* Matth. Paris writes the word, in this ſenſe, *Apoſtilli.* Hiſt. p. 458.

APOSTLES is alſo a denomination of a ſect of heretics, more frequently called *Apoſtolici.* *Du Cange*, Gloſſ. Lat. T. 1. p. 263. See APOSTOLICI, *Cycl.*

APOSTOLÆUM, or APOSTOLIUM, in eccleſiaſtical writers, denotes a church dedicated to, and called by, the name of an *Apoſtle.* *Bingh.* Orig. Eccleſ. l. 8. c. 1. §. 8. *Suic.* Theſ. T. 1. p. 473.

Sozomen ſpeaks of the *Apoſtolæum* of St. Peter at Rome, of the *Apoſtolæum* of St. Peter and St. Paul at Quercus near Chalcedon.

In this ſenſe *Apoſtolæum* ſtands diſtinguiſhed from *Prophetæum*, *Martyrium*, &c.

APOSTOLARE, APOSTOLICARE, *Apoſtolizing*, in ſome middle age writers, denotes the being preferred to the dignity of pope. *Du Cange*, Gloſſ. Lat. T. 1. p. 261.

APOSTOLATE, in a general ſenſe, is uſed for miſſion.

In this ſenſe Olearius has a diſcourſe expreſs concerning the *Apoſtolate* of Chriſt. Lipſ. 1681. 4°.

APOSTOLATE more properly denotes the dignity or office of an apoſtle of Chriſt. See APOSTLE, *Cycl.* and *Suppl.*

APOSTOLATE is alſo uſed, in antient writers, for the dignity or office of a biſhop.

In this ſenſe, we meet with ſeveral letters, petitions, requeſts, *&c.* directed to biſhops under the title of your *Apoſtolate*, *Apoſtulatus*, or *Apoſtolatus veſter*. *Du Cange*, Gloſſ. Lat. T. 1. p. 261.

But as the title *Apoſtolicus*, had been appropriated to the pope, ſo that of *Apoſtolate* became at length reſtrained to the ſole dignity of the popedom, under which title the biſhops of Rome were addreſſed even by kings and emperors; We beſeech your *Apoſtolate*; we intreat your *Apoſtolate*. The popes even made no ſcruple of uſing it in ſpeaking of themſelves; you have ſignified to our *Apoſtolate*; it ſeems good to our *Apoſtolate*, &c.

Every biſhop's ſee was antiently dignified with the title of *ſedes Apoſtolica*, an Apoſtolical ſee, which is now the peculiar denomination of the ſee of Rome. The catholic church, ſays Auſtin, is propagated, and diffuſed over all the world by the *Apoſtolical* ſees, and the ſucceſſion of biſhops in them. It is plain this is not ſpoken only of the biſhop of Rome, but of all other biſhops whatſoever. Sidonius Apollinaris uſes the ſame expreſſion, in ſpeaking of a private French biſhop, *viz.* that he ſat five and forty years, in his apoſtolical ſee. *Bingh.* Orig. Eccleſ. l. 2. c. 2. Sect. 3.

Pope Siricius himſelf gives all primates the appellation *Apoſtolici*, and it continued to be their title to the days of Alcuin, who ſpeaking of the election of biſhops, ſays, when the clergy and people have choſen one, they draw up an inſtrument, and go with their elect to the *Apoſtolicus*; by whom he means not the pope, but the primate or metropolitan of every province, who had the right and power of conſecration. *Bingh.* Orig. Eccleſ. l. 2. c. 16. Sect. 24.

APOSTOLICUM, Αποστολικον, is a peculiar name given to a kind of ſong or hymn, antiently uſed in churches.

The *Apoſtolicum* is mentioned by Greg. Thaumaturgus as uſed in his time. Voſſius underſtands it as ſpoken of the apoſtles creed; Suicer thinks this impoſſible, for that this creed was then unknown in the churches of the eaſt. *Suic.* Theſ. Eccleſ. T. 1. p. 473. ſeq.

APOSTROPHE, in medicine, denotes a loathing or averſion for food. *Æginet.* l. 3. c. 37. *Linden.* Exerc. 14. §. 63. *Caſtel.* Lex. Med. in voc.

In which ſenſe the word amounts to the ſame with *Apoſition*. See APOSITION.

APOSYRMA, Αποσυρμα, in medicine, denotes a deſquamation, or ſcaling of the ſkin.

In which ſenſe the word amounts to much the ſame with abraſion. Greek writers uſe the word *Apoſyrmata*, for what the Latins call *Abraſa*, viz. a ſuperficial kind of exulcerations, which raiſe the ſkin. *Brun.* Lex. Med. p. 111. b.

APOTAXOMENI, in eccleſiaſtical antiquity, a name antiently given to Monks on account of their renouncing the buſineſs and pleaſures of the world. *Bingh.* Orig. Eccleſ. l. 7. c. 2. §. 14.

APOTEICHISMUS, Αποτειχισμος, in the antient military art, a kind of line of circumvallation drawn round a place in order to beſiege it. *Potter*, Archæol. Att. l. 3. c. 10.

This was alſo called *Periteichiſmus*, περιτειχισμος.

The firſt thing the antients went about, when they deſigned to lay cloſe ſiege to a place, was the *Apoteichiſmus*; which ſometimes conſiſted of a double wall, or rampart, raiſed of earth; the innermoſt to prevent ſudden ſallies from the town; the outermoſt to keep off foreign enemies from coming to the relief of the beſieged. This anſwered to what is called lines of contravallation and circumvallation, among the moderns.

APOTELESMA, Αποτελεσμα, in a general ſenſe, denotes an effect of ſome cauſe. *Scheibl.* Topic. c. 6. n. 10.

APOTELESMA is alſo uſed for a prognoſtic, or natural prediction of an event.

In which ſenſe *Scaliger* ſpeaks of the *Apoteleſmata* of Hippocrates. The anſwers of aſtrologers deduced from the conſideration of the ſtars are particularly called *Apoteleſms*, or *Apoteleſmata*.

APOTELESMATA is more particularly uſed by aſtrologers for the effects of the ſtars and planets on ſublunary bodies. *Voſſ.* de Scient. Mathem. c. 37. §. 1.

In which ſenſe *Apoteleſmata* amount to the ſame with influences.

Some will alſo have *Apoteleſmata* to denote little figures and images of wax, made by magical art to receive the influence of the ſtars, and uſed as helps in divination. *Bingh.* Orig. Eccleſ. l. 16. c. 5. §. 1.

APOTELESMATICA, Αποτελεσματικη, the ſcience of apoteleſms, or the art of foretelling future events, from the aſpects and configurations of the heavenly bodies. *Voſſ.* de Scient. Mathem. c. 37. §. 1.

In this ſenſe, *Apoteleſmatica* amounts to the ſame with what we otherwiſe call *judicial aſtrology*.

Sozomen denominates this, *apoteleſmatical* aſtronomy. L. 3. c. 6.

Hence alſo aſtrologers are called *Apoteleſmatici*, as ſynonimous with mathematici, genethliaci, Chaldæi, *&c.* *Bingh.* Orig. Eccleſ. l. 16. c. 5. §. 1.

APOTHECARY (*Cycl.*)—In writers of the middle age, *Apothecaries* are called *confectioners*, *confectionarii*.

The perſon, attributes, and office of an *Apothecary*, are well deſcribed by Hofman, in his Clav. ad Schrod. p. 29.

The antient phyſicians were their own *Apothecaries*.

In Muſcovy, we are told, there are no *Apothecaries* at all; but then there are no phyſicians neither, except two or three retained by the court, and thoſe rather for ſtate than ſervice [a]. Travellers ſpeak of a famous *Apothecary*'s ſhop at Dreſden, furniſhed with four thouſand ſilver pots, all filled with the choiceſt drugs [b].—[a V. Nouv. Rep. Lett. T. 13. p. 506. b V. Jour. des Scav. An. 1676. p. 267.]

There are in London two kinds of *Apothecaries*, the wholeſale and the retail; it is the retail *Apothecary* that the phyſician is concerned with. The retail *Apothecary* generally acts by rule, follows his orders, and compounds with art and care; tho' he will ſometimes ſubſtitute a *quid pro quo*, and now and then venture to reverſe an order. According to the ſkill and care of this trader, he is more or leſs liable to be impoſed on by the druggiſt, and the trading chemiſt, all of them uſually ſelling what they buy; but if the *Apothecary* be here often deceived, how ſtands it with the phyſicians and the patient? *Shaw*'s Lectures, p. 194.

The retail *Apothecaries*, however, deal more in ſubſtitution, than in ſophiſtication; the prudent phyſician will therefore preſcribe what is uſually kept, and is proper to keep in the ſhops, or what otherwiſe is eaſily obtainable; and if there are other abuſes committed in this part of pharmacy, they may perhaps be chiefly attributed to want of ſkill or conduct in the phyſician. *Shaw*'s Lectures, p. 195.

At Paris the *Apothecaries* make a part of the company of *merchands epiciers*, that is grocers. *Savar.* Dict. Comm. in voc.

The company of *Apothecaries* were incorporated by a charter from king James I. procured at the ſolicitation of Dr. Mayerne and Dr. Atkins; till that time they only made a part of the grocers company; plumbs, ſugar, ſpice, Venice treacle, mithridate, *&c.* were ſold in the ſame ſhop and by the ſame perſon. The reaſon of ſeparating them was, that medicines might be better prepared, and in oppoſition to divers perſons who impoſed unwholeſome remedies on the people. Obſerv. on Caſe of Will. Roſe. §. 2.

Will. Roſe an *Apothecary* was proſecuted in 1704 by the college, for practiſing phyſic, or making up ſeveral bolus's, electuaries, and juleps, and ſelling and delivering them to one Sale a butcher without the advice of a phyſician, and not being licenſed by the college [c]. Thus is the caſe ſtated on the part of the defendants, *Apothecaries*, in their petition to parliament for a writ of error to reverſe a judgment obtained againſt them in the queenſbench: On the behalf of the phyſicians it is repreſented ſomewhat otherwiſe, from the teſtimony of Sale himſelf, *viz.* that Roſe kept his patient under hand for a year together, without giving him any relief, and brought in a bill of near fifty pounds; yet Sale being afterwards forced to apply to the diſpenſary, received his cure in ſix weeks, for leſs than forty ſhillings charge. See Obſerv. on his Caſe printed in 1704.

It was diſputed on this occaſion, what the buſineſs of an *Apothecary* is? Whether it be reſtrained to the making, compounding, and ſelling good and wholeſome medicines; or whether it alſo extend to the preſcribing and directing the uſe of them? Obſerv. §. 9.

The *Apothecaries* appealed to conſtant uſage, as the beſt expounder of their charter; and urged, that ſelling a few lozenges, or a ſmall electuary to any aſking for a remedy for a cold, or in other ordinary or common caſes, or when the medicine has known and certain effects, is not to be deemed unlawful, or practiſing as a phyſician, when no fee is taken or demanded for the ſame. Obſerv. §. 10. See alſo Neceſſ. and Uſefuln. of Diſpenſaries, and Anſwer to Tentam. Medicin. paſſim.

APOTHECARY, *Apothecarius*, in writers of the middle age, denotes a ſhop-keeper, or ware-houſe-keeper. *Du Cange*, Gloſſ. Lat. T. 1. p. 263. ſeq.

The word is formed af *Apotheca*, or rather of the barbarous word *Apothecar*, a ſhop.

APOTHECARIUS is alſo uſed to denote a ſtore-keeper, or officer appointed to have the direction of a magazine, granary, *&c.* See GRANARY, *Cycl.* and *Suppl.*

In which ſenſe *Apothecarii*, Αποθηκαριοι, is ſometimes rendered by *horrearii* and *rationarii*.

APOTHERAPIA, Αποθεραπεια, in phyſic, properly denotes a compleat or finiſhed cure. *Caſt.* Lex. Med. P. 68. a.

APOTHERAPIA is alſo uſed, in the gymnaſtic art, for the laſt part of all regular exerciſe, *viz.* friction or unction with oil, before as well as after bathing. V. *Lang.* Epiſt. Medic. 50. l. 1. p. 229.

The deſign of this was partly to cleanſe the ſkin from any filth or duſt, it might have contracted during the exerciſe, and partly to remove wearineſs.

Hence that part of phyſic which directed the due performance of this was denominated *Apotherapeutica*, Αποθεραπευτικη. *Caſt.* loc. cit.

Caſp. Bauhin has a treatiſe expreſs under the title of Αποθεραπευτικη Ιαλρικη. Baſ. 1581. 4°.

APOTHERMUM, Αποθερμον, in antient writers, a ſharp kind of ſauce, like that prepared of muſtard, oil, and vinegar, or of vinegar alone. *Caſt.* Lex. Med. p. 68.

APOTOME (*Cycl.*)—Euclid makes ſix ſorts of *Apotomes*.

APOTOME *Prima*, is when the greater number is a rational number, and the difference of the ſquares of both numbers is a ſquare number, *e. gr.* $3-\sqrt{5}$, where the difference of the ſquares 9 and 5 is the ſquare number 4. The ſame holds in $6-\sqrt{20}$, for that the difference of the ſquares 36 and 20, is the ſquare number 16.

APOTOME *Secunda*, is where the leſſer number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has a ratio expreſſible in numbers to the greater number, ſuch is $\sqrt{18}-4$, for that the difference of the ſquares 18 and 16 is 2, and $\sqrt{2}$ is to $\sqrt{18}$ as 1 to 3, becauſe $\sqrt{18}=3\sqrt{2}$. The ſame holds of $\sqrt{48}-6$, for that the difference of the ſquares 48 and 36 is 12; and $\sqrt{12}$ is to $\sqrt{48}$ as 1 to 2, for $\sqrt{12}=2\sqrt{3}$, and $\sqrt{48}=4\sqrt{3}$, or elſe $\sqrt{48}=2\sqrt{12}$.

APOTOME *Tertia*, is when both the numbers which are ſubſtracted from each other are irrational numbers, and the ſquare root of the difference of their ſquares has a ratio in numbers to the greater. This holds in $\sqrt{24}-\sqrt{18}$, for the difference of their ſquares 24 and 18 is 6, and the ſquare root thereof $\sqrt{6}$ is to $\sqrt{24}$ as 1 to 2, for $\sqrt{24}=2\sqrt{6}$.

APOTOME *Quarta*, is when the greater number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has no ratio to it in numbers. Such is $4-\sqrt{3}$, for that the difference of the ſquares, 16 and 3, is 13, but the ſquare root of 13, *viz.* $\sqrt{13}$ has no numerical ratio to 4.

APOTOME *Quinta*, is when the leſſer number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has no ratio in numbers to the greater number. Such is $\sqrt{6}-2$, for that the difference of the ſquares 6 and 4, is 2, and $\sqrt{2}$ has to $\sqrt{6}$ no ratio in numbers.

APOTOME *Sexta*, is where both numbers are irrational, and the ſquare root of the difference of their ſquares has no ratio in numbers to the greater. Such is the caſe in $\sqrt{6}-\sqrt{2}$, for the difference of the ſquares 6 and 2 is 4, and the root thereof 2 has to the $\sqrt{6}$ no ratio in numbers.

Peter Ramus cenſures Euclid's doctrine of *Apotomes*, and even all the reſt delivered in the tenth book concerning irrational lines in the following terms.

Materies decimo libro propoſita, eo modo eſt tradita, ut in humanis literis atque artibus ſimilem obſcuritatem nuſquam deprehenderim; obſcuritatem dico non ad intelligendum, quid præcipiat Euclides,—ſed ad perſpiciendum penitus et explorandum, quis finis et uſus ſit operi propoſitus, quæ genera, ſpecies, differentiæ ſunt rerum ſubjectarum; nihil enim unquam tam confuſum vel involutum legi vel audivi. Schol. Mathem. l. 21. p. 252.

He adds that the inventors of theſe matters made but an ill uſe of their time. Kepler anſwers Ramus, and ſhews, that on this doctrine is laid the foundation of the knowledge of the ſtructure of the world; he does not heſitate to ſay: *veſtrum eſto carpere quæ non intelligitis, mihi, qui rerum cauſas indago, præterquam in decimo Euclidis ſemitæ ad illas nullæ patuerunt.* The reaſon is that Euclid makes uſe of the knowledge of irrational lines to prove the properties of the five regular bodies, out of which Kepler, in his *myſterium coſmographicum*, deduces the number of the planets, and the magnitude of the world. Kepler alſo makes uſe of the ſame doctrine in his *Harmonice mundi*, where he ſhews the reaſons of the harmonical proportions. Harmon. Mund. l. 1. in Præf. p. 3.

Oughtred has publiſhed *Declarationem Elementi decimi Euclidis*, which has been reprinted with his Clavis at Oxford 1693; but he ſeems to have made the matter more obſcure, by an improper uſe of ſigns. Michael Slifelius has given a clear explanation of the whole tenth book of Euclid, and particularly of the doctrine of *Apotomes*, in his *Arithmetica integra*. Lib. 1. c. 23. p. 187 ſeq. *Wolf.* Lex. Math. p. 128. ſeq.

APOTOME, in muſic, is the difference of the tone major and Limma, expreſſed by $\frac{2187}{2048}$. There is a miſtake in the Cyclopædia, when it is ſaid, that the *Apotome* is the part remaining of an entire tone when the greater ſemi-tone has been taken from it. V. *Wallis* Append. ad Ptolem. Harm. p. 170. Oper. Tom. 3. See TONE and LIMMA.

The *Apotome* is by ſome authors, as Bœthius[a], called *hemitonium majus*; and the limma, *hemitonium minus*. He alſo calls the difference of theſe two *comma*[b].—[[a] Ap. *Wallis*, loc. cit. [b] *Wallis*, ibid.]

APOTRAGOPOGON, in the materia medica, a name given by ſome of the old authors to the *labdanum*. It is mentioned in a preſcription recorded in Galen from ſome of the empiricks of his time, it being the cuſtom of thoſe people who were fond of ſecrets, to diſguiſe the names of the things they uſed, that no body might find out what they meant. Many have ſuppoſed that this word ſtood for ſome ſort of the herb *tragopogon*, or goat's beard; but the whole meaning of its being made a name of *labdanum* was that this gum, which is produced from the ciſtus, is wiped off from the beards of the goats that feed on that ſhrub in the dewy mornings. See LABDANUM.

APOTROPÆA, Αποτροπαια, in the antient poetry, verſes, compoſed for averting the wrath of incenſed deities. *Scal.* Poet. l. 3. c. 102. Theſe amounted to much the ſame with *Apeuctic* verſes. See the article APEUCTIC.

APOZEM, (*Cycl.*) *Apozema*, is ſometimes alſo corruptly written *Apozim*. *Du Cange*, Gloſſ. Lat. T. 1. p. 264. in voc. *Apozimare*.

In writers of the barbarous age we meet with *Apozimare*, to infuſe, to make an *Apozem*. *Du Cange*, loc cit.

Apozem differs from infuſion on account of the greater degree of heat made uſe of in preparing the former, whereby the *Apozem* becomes more fitly impregnated with thoſe parts of the ſubject which are readily ſoluble in boiling water.

Apozems are medicines of the extemporaneous kind, and therefore the leſs uſed, by reaſon what is once made up will not keep. What is directed in this form, is generally ſent to the patient in the quantity of a quart at a time, to be drank off plentifully as common drink. *Quinc.* Pharm. Lect. 12. p. 132.

Apozems are frequently made of infuſions, that is, by firſt digeſting and drawing the infuſion of plants, then boiling the ſubject over again in the ſame liquor for an *Apozem*. Vid. *Boerh.* New Meth. of Chem. P. 3. Proc. 2. p. 20. ſeq.

APPANAGE (*Cycl.*)—Loiſel, cited by Menage, chuſes to deduce this word from the French *Appenner*, to feather, q. d. *donner des Pennes*, to give a young prince, turned out of his father's houſe feathers or means to fly and ſhift for himſelf. V. *Menag.* Orig. Franc.

St. Julien ſtarts another etymon, *viz.* from the old French word *Apaner*, which ſignifies to cut and deal every one his ſhare of bread.

The *Appanage* is unalienable; collateral branches do not inherit it. The eldeſt ſon alone is heir to the whole *Appanage*; but is to allow the younger an honourable maintenance. Vid. *Chopin.* Tract. du Domaine, l. 2. and 3.

In France *Appanages* are of two kinds, royal and cuſtomary; the firſt only granted to males the kings brothers, excluſive of the females. Theſe are not ſo properly alienations of the kings demeſnes as diſmembring of them. *Aubert*, Ap. Richel. Dict. T. 1. p. 96.

Cuſtomary *Appanages* are thoſe granted to women, the king's ſiſters.

Hoffmeiſter, Lyſerus, Schilter, Muller, Berger, &c. have diſcourſes expreſs concerning the laws and rights of *Appanage*. V. Bibl. Jur. Imper. c. 4. *Lipen.* Bibl. Jur. p. 21. Bibl. Germ. T. 9. p. 226.

Hertius, Thomaſius and Lombardus have treated expreſsly on the difference between *Appanage* and *Parage*.—The ſecond aſſerts the difference to be real, the firſt fictitious. Bibl. Jur. Imper. loc. cit.

Joach. Meierus has publiſhed a body of all the writers on *Appanage* and *Parage*, in one volume in folio. Corpus juris Appanagii, &c. continens ſcriptores quotquot inveniri potuerunt, qui de Appanagio et Paragio ex inſtituto egerunt—Lemgov. 1727. An account of which is given in Act. Erud. Lipſ. 1728. p. 49. ſeq.

APPARATOR *Comitatus* (*Cycl.*)—There was formerly an officer called by this name, for which the ſheriffs of Buckinghamſhire had a conſiderable yearly allowance; and in the reign of queen Elizabeth, there was an order of court for making that allowance. But the cuſtom and reaſon of it are now altered. *Hales*, Sher. Acco. 104.

APPARATUS *Chemical.* See VESSELS.

APPARENT (*Cycl.*)—APPARENT-*Diſtance*, in optics, that diſtance which we judge an object to be from us when ſeen afar off, being commonly very different from the true diſtance; becauſe we are apt to think that all very remote objects, whoſe parts cannot well be diſtinguiſhed, and which have no other object in view near them, to be at the ſame diſtance from us, though perhaps the one is thouſands of miles nearer than the other, as is the caſe with regard to the ſun and moon. *Stone*, Mathem. Dict. in voc. *Apparent.* See DISTANCE.

APPARENT *Figure*, in optics, that figure or ſhape, which an object appears under when viewed at a diſtance, being often very different from the true figure, for a ſtreight line viewed at a diſtance may appear but as a point; a ſurface, as a line; and a ſolid, as a ſurface; and each of theſe of different magnitudes, and the two laſt of different figures, according to their ſituation with regard to the eye. Thus an arch of a circle may appear a ſtreight line; a ſquare or oblong, a trapezium, or even a triangle; a circle, an ellipſis; angular magnitudes, round; a ſphere, a circle, &c.

Alſo any ſmall light, as a candle, ſeen at a diſtance in the dark, will appear magnified, and farther off than really it is. Add to this, that ſeveral objects ſeen at a diſtance, under angles that are ſo ſmall as to be inſenſible, as well as each of the angles ſubtended by any one of them and that next to it; then all theſe objects will appear not only to be contiguous, but to conſtitute, and ſeem but one continued magnitude. Id. Ibid.

APPARITION, (*Cycl.*) in a general ſenſe, the appearance or ſemblance of a thing.

APPARITION is alſo uſed to denote a ſpectre, or præternatural appearance of ſome ſpirit, or the like.

We read of *Apparitions* of angels, genii, dæmons, fairies, witches, departed ſouls, &c. *Apparitions* of God, of Chriſt, the Virgin, ſaints, prophets, and of the devil himſelf.

Several inſtances of *Apparitions* occur in the bible; that of Samuel, raiſed by the witch of Endor, has occaſioned great diſputes.

We find great controverſies among authors, in relation to the reality, the exiſtence or non-exiſtence, the poſſibility or impoſſibility of *Apparitions*. The Chaldeans, the Jews and other nations have been the ſteady aſſerters of the belief of *Apparitions*. The diſbelief of ſpirits and *Apparitions*, is by ſome made one of the marks of infidelity, if not of atheiſm.

Many of the *Apparitions*, we are told of in writers, are doubtleſs mere deluſions of the ſenſe; many others were ſeen but in dreams or deliquiums; many others are fictions contrived merely to amuſe, or anſwer ſome purpoſe. *Apparitions* it is certain are machines that on occaſion have been of good ſervice both to generals, to miniſters of ſtate, to prieſts and others. It has been controverted whether an *Apparition* be any proof of a future ſtate.

The abbé de St. Pierre has a diſcourſe expreſs on the phyſical method of ſolving or accounting for *Apparitions*; he makes them the effect of feveriſh dreams, diſturbed imaginations, *&c.* V. Mem. de Trev. An. 1726. p. 119. ſeq.

APPARITOR (*Cycl.*)—In middle age writers, *Apparitors* are alſo called *Barigildi*, *Paritaderii*, *Statores*, and *Taxeatæ*. V. *Du Cange*, Gloſſ. Lat. in voc. *Barigildi*, &c.

APPARITOR is alſo uſed in ſome antient Engliſh laws, for a judge or juſtice. *Wilk.* Gloſſ. ex LL. Hen. 1. c. 9. & 20.

APPEASING *Remedies*, in medicine, are thoſe which aſſuage the pain in a diſeaſe, and give the patient ſome reſt, or reſpite; and at the ſame time contribute to the cure.

Theſe amount to the ſame with what we otherwiſe call *paregorics*, *anodynes*, &c. *Brun.* Lex. Med. in voc. *Sedatio.* See PAREGORICS, &c. *Cycl.*

APPELLANT, a perſon who appeals, or brings an appeal. See APPEAL, *Cycl.*

APPELLANTS is particularly uſed in our time, for thoſe among the French clergy, who refuſe to ſubſcribe the conſtitution *unigenitus*, and appeal from it, either to the pope better informed, or a general council.

The French biſhops, prieſts, monks, and even nuns are divided into *Appellants*, and *non-Appellants*. The Janſeniſts and their followers are generally *Appellants*.

APPELLEE, in the common law, is a party appealed, or againſt whom an appeal is brought.

In the civil law *Appellee*, *Appellatus*, properly belongs only to the judge before whom an appeal is brought. *Calv.* Lex. Jur. p. 79. a

APPENDICULA denotes a little or diminutive *Appendix*. See APPENDIX, *Cycl.* and *Suppl.*

The word is ſcarce uſed, except by anatomiſts, in the phraſe, *Appendicula vermiformis*.

APPENDICULA *Vermiformis*, in anatomy, a name given by ſome to the inteſtine cæcum, which they conſider only as an appendage of the colon, and not as the true cæcum of the antients. V. *Van Horn.* Microcoſm §. 22. p. 26. *Drake*, Anthrop. l. 1. c. 11. p. 49. See CÆCUM, *Cycl.* and APPENDIX *Vermiformis*, *Suppl.*

APPENDICULÆ *Aſteriarum*, *Wires of Aſteriæ*, a name given by the writers on natural hiſtory, to certain ſmall branches which are placed in a circular order at different diſtances upon the columns of the aſteriæ. They are, however, very ſeldom found thus fixed, but are uſually met with looſe among the aſteriæ in the ſtrata of clay, or immerſed by themſelves in thoſe of ſtone; they are compoſed of a number of ſhort joints, the largeſt being always that which has been placed next the body of the aſteria, the reſt growing gradually ſmaller, and conſeqently the body taperer to the end. *Hill*'s Hiſt. of Foſſ. p. 654. See ASTERIA.

APPENDIX *Vermiformis* (*Cycl.*)—Mr. Monro aſſures us he never ſaw the *Appendix vermiformis* of any of the human fœtus's which he diſſected, diſtended with meconium, and therefore he cannot allow it as a reſervoir of the fæces during geſtation. From the numerous mucous lacunæ in the human *Appendix*, and the like ſtructure in the cæca of brutes, its uſe ſeems to be to furniſh mucus to lubricate the internal ſurface of the great ſac of the colon, and to moiſten the fæces in it, that they may be more eaſily puſhed forward out of this part of the gut, where there is the greateſt difficulty in their progreſs, and where by ſtagnating too long, they may bring on troubleſome ſymptoms. Witneſs the diſeaſe called *placenta inteſtinalis*. Med. Eſſ. Edinb. Vol. 4. Art. 12.

APPERCEPTION, or ADPERCEPTION, is uſed by Leibnitz and his followers, for an attribute of the mind conſidered as conſcious of or reflecting on its own perceptions. *Wolf.* Pſychol. Empir. §. 234.

In which ſenſe the word amounts to the ſame with what Des Cartes and others call *conſcience* or *conſciouſneſs*.

APPETITE (*Cycl.*) is divided by ſome authors into ſenſitive and rational.

Senſitive APPETITE is that which ariſes from a confuſed notion of goodneſs in the object, as apprehended chiefly by the ſenſes. Or it may be defined, an inclination of the ſoul towards an object on account of ſomething good confuſedly apprehended in it. *Wolf.* Pſychol. §. 580.

The ſchoolmen alſo call this *animal Appetite*, and *ſenſualitas*. Sometimes alſo they give the *ſenſitive Appetite* the denomination of *Appetite* in general; and divide it into iraſcible and concupiſcible, the firſt being no other than what we call averſion; the ſecond, the proper *ſenſitive Appetite*. The diviſion in effect is not taken from different powers, but from different acts of the ſame power.

The *Appetite* conſidered as inclining to good, is called *concupiſcible*, as flying from evil *iraſcible*.

In this view *ſenſitive Appetite* is that whereby we deſire a good, or avoid an evil confuſedly apprehended.

Some ſchoolmen, however, give a different account of the difference between concupiſcible *Appetite*, and the iraſcible. According to the Thomiſts, concupiſcible *Appetite* is that whereby we are led on towards good; and iraſcible *Appetite* that whereby we are led towards ſome difficult good, or hard to be arrived at. But the Scotiſts combat this diſtinction, aſſerting it to be the character of the concupiſcible *Appetite*, to incline towards every thing good, whether it be difficult or not.

Rational APPETITE is that which ariſes from a diſtinct repreſentation of good in the object. The ſchoolmen alſo call this *Intellectual Appetite*. This may be defined an inclination of the ſoul to an object, on account of the good we know, or think we diſtinctly perceive to be in it. *Wolf.* Pſychol. empir. §. 880.

In this ſenſe *Rational Appetite* is no other than what we call *Will*. See WILL, *Cycl.*

To render a thing an object of *Appetite*, it muſt be known, at leaſt imperfectly. Hence that Axiom of the antients, *Ignoti nulla cupido.*

The *Senſitive Appetite* admits of degrees, is ſtronger towards ſome objects, than towards others, and towards the ſame object at one time than at another; conſequently, it is ſuſceptible of menſuration, though the meaſure is not yet diſcovered. But the degree of *Appetite* changes, if the judgment we make of the good or evil of the object, be changed. Id. ibid. §. 599. ſeq.

Rules of APPETITE are thoſe which the ſoul obſerves in deſiring or willing things. Id. ibid. §. 902.

Such are theſe, that whenever we deſire a thing, we repreſent it to ourſelves as good; that whenever an evil thing appears good to us, we deſire it; and that we never deſire evil but under the notion of good, not even, when of two evils we chuſe the leaſt, *&c.* Id. ibid. §. 892. ſeq.

Law of APPETITE is the general principle, or ſource of the rules of *Appetite*. Id. ibid. §. 903.

The *Law of Appetite* is this propoſition, that whatever we repreſent to ourſelves as good, that we deſire. Id. ibid. §. 904.

The great power therefore, which man has over his moral conduct, conſiſts in the power he has of repreſenting objects to himſelf as good or evil. This is the ſource of the cultivation of all virtues.

In ſome caſes the *ſenſitive* and *rational Appetites* conſpire, or lead the ſame way, *e. gr.* When the ſame food that is found agreeable to the palate is alſo known to be wholeſome. In this caſe the object appears to us both confuſedly and diſtinctly good. *Wolf.* Pſychol. §. 908. ſeq.

This conformity is a point of great moment in moral matters, being the higheſt perfection man is capable of arriving at. The great problem of ethics is *to reduce the ſenſitive Appetite to a conformity with the rational* The general foundation of the ſolution has been above intimated; but the problem admits of as many particular caſes, as there are different virtues. Confucius is ſaid to have directed all his endeavours, from his youth upwards, to this end; which, by the time he arrived at his ſeventieth year, he had attained, inſomuch that the *ſenſitive Appetite* of its own accord ſubmitted to the *rational.* Id. ibid. §. 909.

In effect, the two *Appetites* are uſually intermixed: And hence it may happen that the *rational* may be ſtrengthened and heightened, as well as thwarted, by the *ſenſitive*, ſince this laſt admits of degrees; conſequently, when it conſpires with the former, or tends towards the ſame object, it cannot but fortify it. Id. ibid. §. 912.

The more uſual caſe is, when the two *Appetites* run counter to each other, and contend for the maſtery; ſuch, *e. gr.* is that in a ſick perſon, who being convinced that a certain medicine would do him good, has an utter averſion to its ſmell and taſte, ſo that he both deſires and abhors the ſame thing in a great degree. Id. ibid. §. 917.

The reaſon of this combat between our inclinations is, that we repreſent a thing to ourſelves, in the diſtinct way, good, which, in the confuſed way, appears evil; and *vice verſa*. Hence the ſource of that antient complaint, *Video meliora proboque*, *deteriora ſequor.*

APPETITE is reſtrained, by a late ingenious writer, to ſuch of our deſires as have a previous, painful and uneaſy ſenſation, antecedently to any opinion of good in the object; nay, ſo as that the object is often chiefly eſteemed good only for its allaying this pain or uneaſineſs, or if it give alſo poſitive pleaſure, yet the uneaſy ſenſation is previous to, and independent of this opinion of good in it. *Hutcheſ.* Eſſ. on Paſſ. §. 4. p. 89. ſeq.

Of this kind are hunger and thirſt, and the deſires between the ſexes; to which deſires there is an uneaſy ſenſation previous, even in thoſe who have little other notion of good in the objects, than allaying this pain or uneaſineſs. There is ſomething like to this in the deſire of ſociety, or the company of our fellow creatures.

Other deſires and averſions, neceſſarily preſuppoſe an opinion of good and evil in their objects; and the deſires or averſions, with their concomitant uneaſy ſenſations, are occaſioned by this opinion or apprehenſion.

Thus no man is diſtreſſed for want of fine ſmells, harmonious ſounds, beautiful objects, wealth, power, or grandeur, previouſly to ſome opinion formed of theſe things as good, or ſome prior ſenſation of their pleaſures. In like manner virtue and honour as neceſſarily give us pleaſure, when they occur to us, as vice and contempt give us pain; but, antecedently to ſome experience or opinion of this pleaſure, there is no previous uneaſy ſenſation in their abſence, as there is in the abſence of the objects of *Appetite*. Id. ibid. p. 91.

Exceſſive APPETITE, in medicine. See OREXIS.

Defective APPETITE—The defect of *Appetite* is of two kinds, and is uſually divided, by medical writers, under two names, the anorexia and nauſea. See ANOREXIA, *Cycl.*

The anorexia is a too great abſtinence from foods, which ſometimes has its origin from depravations of the ſtomach, ſometimes from other cauſes more remote.

The nauſea is defined to be a plenary abſtinence from foods, being a complaint of the ſame nature and origin with the anorexia, but differing in degree.

Theſe complaints are alſo divided by authors into two kinds, ſometimes be ingidiopathic, which is the caſe when the ſtomach itſelf is depraved, ſometimes ſymptomatic, which is the caſe when they appear for a time, but the *Appetite* returns again in the abſence of ſome other diſeaſe which occaſioned them. Theſe ſymptomatic nauſeas and anorexias are ſometimes of long continuance, as in caſes of dropſies, hectics, and other chronic diſorders; and ſometimes tranſitory, or of very ſhort duration, as in acute fevers. The nauſea of women with child is different from theſe.

The ſigns are very obvious, ſo far as a diſtaſte to food, which is common to both; but there is this difference, that in an anorexia the patients uſually eat ſomething, though without *Appetite*, and are troubled always with a pain and uneaſineſs in the ſtomach after it; but in the nauſea there is a greater diſreliſh of food of all kinds, and frequent ſtraining to vomit.

Men of idle lives, and ſuch as drink too freely of ſtrong liquors, are ſubject to idiopathic defects of *Appetite*, from actual injuries in the ſtomach; others labouring under the different diſeaſes before-mentioned, are as often ſubject to the ſymptomatic. *Junck.* Conſp. Med. p. 601.

The idiopathic anorexia and nauſea, have for their cauſes mucous, acid, and nidorous crudities in the ſtomach; they are ſometimes alſo occaſioned by a regurgitation of bile toward the orifice of the ſtomach, eſpecially when this is occaſioned by a violent fit of anger, and that juſt upon a meal. The ſymptomatic defects of *Appetite* are wholly owing to nature's being employed in ſome extraordinary labour in the expelling ſome other morbific matter, whence the ordinary office of concoction, and diſtribution of the chyle, is impeded for a time. Anorexias and nauſeas, when idiopathic, are eaſier to be cured than when ſymptomatic, becauſe the ſeat of the diſeaſes allows of medicines immediately to reach it; but when ſymptomatic, they can never be cured but by the cure of the diſeaſe, and that often proves of the obſtinate kinds.

As to the cure of idiopathic complaints of this kind, the mucous humours in the ſtomach muſt be firſt attenuated by the digeſtive ſalts, ſuch as vitriolated tartar, antimoniated nitre, and the like; after theſe, if there be no contraindication in the particular caſe, a vomit is to be given, eſpecially to perſons who are ſubject to reaching; and to this muſt be joined ſome purging medicine, that the matter may be at once voided both upwards and downwards; and in ſuch caſes where vomits are not proper, the buſineſs is to be effected by purges alone. After theſe things have been done, the proper medicines for reſtoring the tone of the parts are to be given, ſuch are the gentle bitters and ſtomachics, as gentian, zedoary, ſmall centaury, galangals, and the like, in tinctures or infuſions, and with theſe the gentle chalybeates.

In caſes where a bilious matter is the cauſe, nitrous and attemperating medicines are moſt proper, and, in the beginning, a gentle emetic. After the cure of the more common caſes, where a mucous matter is the cauſe, the eating a large quantiy of pepper, ginger, or the other hot things, is a good means of preventing a return.

In the ſymptomatic caſes, the *Appetite* uſually returns as ſoon as the diſeaſe that occaſioned the want of it is removed; but if this does not happen, there wants no further aſſiſtance than a ſmall doſe of ſome chalybeate before meals.

It is a very unhappy practice, but a too common one, to give the hot ſtomachic medicines, in caſes of ſymptomatic defects of *Appetite*, with an idle attempt to cure what is merely a ſymptom, while the primary diſeaſe remains: By this means the defects of *Appetite* can never be cured, and the original diſeaſe is often rendered worſe.

Small centaury is recommended beyond all other medicines in an idiopathic defect of *Appetite*, and its extract lightly acidulated with ſpirit of ſulphur, has often been known to perform very great things, by being regularly taken, in ſmall doſes, before dinner, for ſeveral weeks together: And Baglivi is particularly large in the praiſes of hiera picra in theſe caſes. Good wine ſometimes alone will do great ſervice, but when it is the menſtruum for infuſions of the bitters, it always adds very greatly to their virtue. People of a ſanguine habit, when afflicted with a loſs of *Appetite*, always find great relief in acids of the milder kind; and thoſe of a leucophlegmatic habit are often cured by taking ſmall doſes of elixir proprietatis every day before dinner. Some perſons are very fond of external applications to the ſtomach in theſe caſes, but theſe are rarely found to be of any great ſervice. The beſt of them is a plaiſter of tacamahaca, with oil of maſtic. *Junckers*, Conſp. Med. p. 602.

APPLAUSE, (*Cycl.*) in antiquity, differed from acclamation, as the latter was articulate and performed with the voice, the former with the hands. See the article ACCLAMATION, *Cycl.* and *Suppl.*

Among the Romans, *Applauſe* was an artificial muſical kind of noiſe, made by the audience or ſpectators to expreſs their ſatisfaction. It was performed by a motion of the hands; though we find ſome diſpute about the nature and manner of the motion. In ſome of the antients it is repreſented as done by a colliſion of the fingers, *extremis manibus excitatis*. Some will even have it to have been no other than what we call ſnapping the fingers, uſed among us to denote our contempt of a thing: While others, with more probability, reduce it to a colliſion of the palms of the two hands, not with both the hands flat; but the fingers of the right hand being a little contracted, it was ſtruck in due cadence on the palm of the left. V. *Ferrar.* de Acclam. & plauſ. l. 1. c. 1. ſeq. *Pitiſc.* Lex. Ant. T. 2. p. 443. in voc. *Plauſus.*

There were three ſpecies of *Applauſe*, denominated from the different noiſes made in them, *viz. Bombus*, *Imbrices*, and *Teſtæ*; the firſt a confuſed din, made either by the hands or the mouth; the ſecond and third by beating on a ſort of ſounding veſſels placed in the theatres for this purpoſe. *Pitiſc.* loc. cit. See BOMBUS, *&c.*

Perſons were inſtructed to give *Applauſe* with ſkill; and there were even maſters who profeſſed to teach the art. The proficients in this way let themſelves out for hire to the vainglorious among the poets, actors, *&c.* and were properly diſpoſed to ſupport a loud *Applauſe*. Theſe they called *Laudicoeni*, and Σοφοκλεις. *Pitiſc.* Lex. Ant. T. 2. p. 21. in voc. *Laudicoeni.*

At the end of the play, a loud peal of *Applauſe* was expected, and even aſked of the audience, either by the chorus, or the perſon who ſpoke laſt. The formula was, *Spectatores plaudite*, or *Valete & plaudite.*

The plauſores, or applauders, were divided into chori, and diſpoſed in theatres oppoſite to each other like the choriſters in cathedrals, ſo that there was a kind of concert of *Applauſes.*

APPLE (*Cycl.*) denotes a well known fruit, of a roundiſh figure, of conſiderable uſe both as a food, a remedy, and likewiſe as yielding cyder.

Apples are no natural fruit, but the mere creatures of art. The way of propagating them is by ſowing kernels in the ground, which only produce crabs or wildings, different in figure and taſte from the parent fruit. To turn theſe to *Apples* is the buſineſs of engrafting. A cyon of an *Apple*-tree inſerted into a crab-ſtock, occaſions the crab-tree from that time to produce *Apples* of the ſame quality with thoſe from whence the cyon was taken. Mr. Ray lays it down as a rule, that the fruit always follows the cyon. Philoſ. Lett. p. 348. See alſo *Boyle*, Phil. Work Abr. T. 1. p. 250.

Theſe are called *Orchard Apples*, *mala hortenſia*, by way of contradiſtinction from crabs or wildings, called *mala ſylveſtria. Quinc.* Diſp. p. 2. n. 451. p. 202. It. n. 452. p. 452.

The *Apple* is compoſed of four diſtinct parts, *viz.* the pill, the parenchyma, the branchery, and the coare.

The pill or ſkin is only a dilatation of the outermoſt ſkin or rind of the bark of the branch on which it grew.

The parenchyma or pulp, as tender and delicious as it is found, is only a dilatation, or as Dr. Grew [a] calls it, a ſwelth, or ſuperbience of the inner part of the bark of the branch. This appears not only from the viſible continuation of the bark from the one thro' the pedicle or ſtalk to the other; but alſo from the ſtructure common to both, as being both compoſed of bladders; with this only difference, that whereas in the bark, the veſiculæ are ſpherical, and very ſmall, ſcarce exceeding $\frac{1}{16}$ part of an inch in diameter; in the pulp they are oblong, and very large, generally meaſuring $\frac{1}{3}$ of an inch in length. But all uniformly ſtretched out by the arching of the veſſels from the coare towards the circumference of the *Apple* [b].—[a Anat. of Veget. l. 1. c. 6. p. 40. b *Grew*, Ibid. l. 4. c. 1. §. 3. p. 179. ſeq.]

The branchery, or veſſels are only ramifications of the woody part of the branch ſent throughout all the parts of the parenchyma the greater branches being made to communicate with each other by inoſculations of the leſs. The main branches are uſually twenty; ten of them diſtributed thro' the

the parenchyma, moſt of which enarch themſelves towards the cork or ſtool of the flower, the other ten running from the ſtalk in a directer line, at laſt meet the former at the cork, and are there inoſculated with them. To theſe branches the coats of the kernels are faſtened. Moſt of the branches were originally extended beyond the fruit, and inſerted into the flower for the due growth thereof; but when the fruit afterwards grew to a head, and thus intercepted the aliment before ſent to the flower, this latter being ſtarved and falling off, the ſervice of the ſaid branches becomes appropriated wholly to the fruit, fifteen to the pulp, and five to the ſeed.

The *Apple* coare is originally from the pith of the branch; the ſap of which finding room enough in the parenchyma, thro' which to diffuſe itſelf, quits the pith, which by this means hardens into coare. Id. Ibid. l. 1. c. 6. §. 2.

Mr. Boyle has given ſeveral experiments on *Apples* in the air-pump, and the production of air, *&c.* thereby. V. Phil. Work Abridg. T. 2. p. 567. ſeq. 609. 630. ſeq. 645. ſeq.

APPLE is alſo a name given to divers fruits, bearing ſome reſemblance in figure, rotundity, and the like to the orchard *Apple*.

The ananas is particularly denominated, *pine-Apple*. See ANANAS, and PINE-*Apple*.

Oak-APPLES are a kind of excreſcences or exudations of the nutritious juice of that tree, joined with ſome degree of putrefaction.

The like are ſometimes alſo found on willows.

It is a kind of prognoſtic among country people, that if the oak-*Apple*, when broken, be found full of worms, which it ſometimes is, it bodes, if not a plague, yet an unhealthy year. *Cole*'s Art. of ſimpl. c. 13. p. 4. ſeq.

Bitter APPLE, a name ſometimes given to the colocynthis. *Quinc.* Diſp. P. 2. n. 406. p. 178. See COLOCYNTHIS.

Prickle APPLE is remarkable for the ſeveral tuſſucks or bunches of thorns, with which it is armed all around; each bunch conſiſting of ſix or eight thorns, ſome erect, others couched a little, and crooked outwards, of ſeveral lengths from one inch to above two. V. *Ligen.* Hiſt. of Barbad. p. 70. *Grew*, Muſ. Reg. Societ. P. 2. c. 2. p. 186.

APPLE *Marchaſite*, ſo called by Dr. Grew, on account of its figure, as being round except on one ſide, where it falls in and has a ſtalk like a young *Apple*. *Grew*, Muſ. Reg. Societ. P. 3. Sect. 2. c. 3. p. 336.

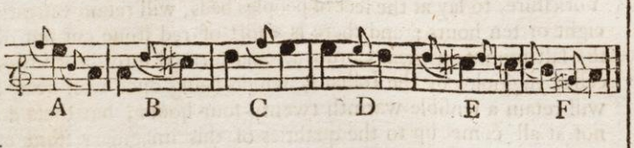
Among the antient ornaments of churches we read of *golden Apples*, *poma aurea* [a], by which it ſhould ſeem, we are to underſtand the globular parts of candleſticks [b].—[[a] *Du Cange*, Gloſſ. Lat. T. 3. p. 371. ſeq. in voc. *Malum*. Id. T. 4. p. 342. in voc. *pomum*. [b] Id. Ibid.]

Some antient cuſtomaries alſo ſpeak of *Apples* of wax, *poma de cera*.

APPLE *of the Eye*, a popular name for the pupil.

Burrhus, in a letter to Bartholin, relates divers caſes wherein he cut aſunder the *Apple of the eye* in ſeveral animals, and ſqueezed out the humours, even the chryſtalline itſelf; yet afterwards reſtored the animals to ſight. He adds, that the eyes of birds on which he had performed this operation looked better, and more vivid after it than before; and that he had even tried the experiment on many perſons with ſo much ſucceſs, that there remained not the leaſt appearance of a ſcar on their eyes. Phil. Tranſ. N°. 64. p. 1355.

Love APPLE. See LYCOPERSICON.



Mad APPLE. See MELONGENA.

APPLE, *Pomum*, is generally underſtood among botaniſts, of any fleſhy, veſicular fruit, containing more ſeeds than one. *Mart.* Lect. in Bot. p. 20. See POMA.

APPLE *Fly*, in natural hiſtory, the name given by authors to a ſmall green fly found ſometimes within an *Apple*, and hatched of a worm or maggot, very frequently found infeſting that fruit.

Gum of APPLES. See GUM.

APPOGGIATURA, in muſic, according to Graſſineau, is when in any part of a ſong, there are two notes at ſome diſtance from one another, as a third, or fifth; and in ſinging ſuch paſſage, the muſicians puts in ſmall intermediate notes aſcending, or deſcending: as in the example A. Muſic. Diction. in voc.

But the *Appoggiatura* is not always intermediate, unleſs it be in the order of time; (ſee the examples B and C) nor is it confined to diſtant notes. It may be uſed in paſſing from a note to the neareſt ſound either above or below it. See the examples D, E, and F.

The *Appoggiatura* is commonly marked by a ſmaller kind of note, as in the examples before given.

APPOINTE'E (*Cycl.*)—Theſe have been ſuppreſſed in France, except in the regiment of French guards, where forty *Appointees* are ſtill retained to each company of 150 men. *Guill.* Gent. Dict. P. 2. in voc.

Till the year 1670 they had alſo captains and lieutenants under the appellation of *Appointees*, who without reſiding in the regiment received their pay.

APPOINTE'E, in heraldry, is when two or more things are placed touching each other at the points or ends. *Corn.* Dict. des Arts. T. 1. p. 48. a

APPOSITORIUM, in chemiſtry, denotes a veſſel made of earthen ware or glaſs, of a conical figure, whoſe bigger end receives the neck of a retort, while the narrower is inſerted into the receiver. *Junck.* Conſp. Chem. Tab. 3. p. 60.

Its uſe is, where a ſtrong open fire is required to prevent the red hot retort by the immediate contact of its neck from burſting the receiver.

APPREHENSION (*Cycl.*) is generally uſed by Logicians for a ſimple attention to any object of ſenſe, or imagination, without paſſing a judgment, or making any inference.
