Broom-flowers make a principal ingredient in divers medicated ales. Their aſhes are extolled for purging off waters in dropſies; in which reſpect, however, Dr. Quincy aſſures us, they are no better than any other lixivious aſhes. See the article ASHES.

Some pickle the yellow buds with vinegar and ſalt, *&c.* after the manner of capers, from which they are then ſcarce to be diſtinguiſhed.

Among huſbandmen, *broom* is conſidered as a weed very pernicious to the culture of lands; and, on that account, to be grubbed up and deſtroyed. *Mortim.* Art of Huſband. T. 1. p. 309.

It roots deep, and, ſhedding no leaves, is continually ſucking the moiſture from the earth. The beſt method of deſtroying it, is the burning the land, then plowing it deep, and manuring it very well with dung and aſhes; the ſpreading on the land chalk or marle, or the manuring it with urine. If the ground be deſigned for paſture-land, it is beſt to cut it cloſe to the ground in May, when the ſap is ſtrong in it. By this artifice, the roots are deſtroyed; whereas, in the common way of pulling up the young plants, ſome ſtrings will be left, and the leaſt of theſe will grow. Foddering of cattle upon *broomy* land, is one very good way of deſtroying the *broom*, their urine killing the roots, and their treading the land making it leſs proper for the roots of this plant; for the *broom* is never obſerved to grow in trodden places. This troubleſome and pernicious plant is not, however, without its uſe to the farmer; for, when well laid, it will make an excellent and laſting kind of thatch for barns. Id ubi ſup.

BROOM, in botany. See the article GENISTA.

BROOM-*flower*, gives the denomination to an order of knights inſtituted by St. Lewis of France, on occaſion of his marriage. The motto was, *Exaltat humiles*, and the collar of the order made up of *broom-flowers* and husks, enamelled and intermixed with flower-de-luces of gold, ſet in open lozenges, enamelled white, chained together, and at it hung a *croſs florence* of gold. This anſwers to what the French call *Ordre de la Geneſte*, from the name of a ſpecies of *broom* ſo called; different from the common *broom*, as being lower, the ſtalk ſmaller, and leaf narrow; the flower is yellow, and bears a long huſk. *Giuſt.* Iſt. de gli Ord. Mil P. 2. p. 592. Trev. Dict. Univ. T. 3. p. 144. voc. *Geneſte*. *Cart.* Anal. of Hon. p. 194. *Coats*, Dict. Her. p. 59.

Some alſo ſpeak of another order of the *Geneſte*, or *broom*, eſtabliſhed by Charles Martel, or rather Charles VI. Trev. Dict. Univ. T. 3. p. 145. voc. *Geneſte*.

BROOM alſo denotes a well known houſhold beſom, or implement wherewith to ſweep away dirt, duſt, and the like.

We ſay, a birch-*broom*, a hair-*broom*, a ruſh-*broom*, a heath-*broom*. The primitive kind of *brooms*, from whence the denomination is given to all the reſt, was made of the *geniſta*, or wild *broom*, growing on commons.

BROOM-*gall*, in natural hiſtory, a name given by authors to a remarkable ſpecies of galls found on the *geniſta vulgaris*, or common broom. This is occaſioned, like all other galls, by the puncture and eating of an inſect, and, when opened, is found to contain a ſmall oblong worm, of a red colour, but whoſe ſize requires the uſe of a glaſs in order to ſee it diſtinctly. This gall is of a very ſingular kind; it is round and prickly: the ſtalk of the broom always grows directly through it, as if thruſt through its middle; and, when nicely examined, the whole gall appears to be formed of a congeries of leaves much larger than thoſe of the broom naturally are, and twiſted into a ſort of horns or cornets, ending in a point; theſe leaves are all hollowed in the middle, and are ſo thick-ſet and nicely fixed to one another, that they make up the ſubſtance of the gall, which is nevertheleſs a conſiderably hard one, and their points make the appearance of ſpines, or prickles, on the outſide. Sometimes there is a ſort of fleſhy or pulpy ſubſtance within it, which ſupports the leaves, and the worms are ſometimes found in this, ſometimes in the hollows of the leaves, and ſometimes between them: they are ſo numerous, that there are often ſome hundreds of them in one gall. The origin of this gall is not from the eggs of the parent animal lodged in the tree, but they are depoſited on the ſurface of the branches, and the young worms, while very ſmall, almoſt as ſoon as hatched from them, go in company to ſome bud on the ſide of the branch; they get into the folds of this bud, and wounding it in ſeveral parts, cauſe a wrong derivation of the juices into it, the conſequence of which is, that, inſtead of forming a branch ſhooting out from the other, it only yields a congeries of leaves, which every way ſurround it. Theſe galls are of various ſizes, the largeſt ſeldom exceeding that of a nut; and there are often three or four of them ſeen on one branch, placed at an inch or a little more diſtance from one another. *Reaumur*, Hiſt. Inſect. Vol. VI. p. 191, ſeq.

BROSSÆA, in botany, the name of a genus of plants, the characters of which are theſe: The cup is an one-leaved perianthium, divided into five ſegments, each of which terminates in a long point, of the ſame length with the petals; the flower is monopetalous, of the ſhape of a truncated cone, and undivided at the edge; the germen is divided into five parts; the ſtyle is pointed, not ſo long as the flower, and its ſtigma ſimple. The fruit is a roundiſh capſule, divided by fine deep furrows into five cells; it is covered with a large cup, which cloſes over its top; it is ſucculent and fleſhy; and, finally, opening at the ſides, it diſcharges a great number of minute ſeeds. *Linnæi* Gen. Plant. p. 520. *Plumier*, p. 17.

BROTHEL. See the article STEWS, *Cycl.*

BROTHER *Cycl.*—By the civil law, *brothers* and ſiſters ſtand in the ſecond degree of conſanguinity; by the canon law, they are in the firſt degree. *Calv.* Lex. Jur. p. 384 voc. *Frater*.

By the Moſaic law, the *brother* of a man who died without iſſue, was obliged to marry the widow of the de ceaſed. *Deuter.* xxv. 7. *Calm.* Dict. Bibl. T. 1. p. 329.] See LEVIRATE.

Foſter-BROTHERS, thoſe which ſucked the ſame nurſe. The French call them *freres du lait*, or *brothers by milk*; which is moſt properly uſed in reſpect of a perſon who ſucked a nurſe at the ſame time with the nurſe's own child. Trev. Dict. Com. T. 2. p. 2023. voc. *Frere*.

BROTHER was alſo uſed, in middle age writers, for a *comes*, or governor of a province. *Du Cange*, Gloſſ. Lat. T. 2. p. 526. *Pitiſc.* Lex. Ant. T. 1. p. 818.

BROTHER is applied in a leſs proper ſenſe, to denote a perſon of the ſame profeſſion. In which ſenſe, judges, biſhops, prieſts, *&c.* call each other *brothers*.

Conſcript BROTHERS, *Fratres conſcripti*, denote laymen and others entered in the catalogue of the *brothers* of a monaſtery, or rather poſſeſſed of the fraternity thereof. *Du Cange*, Gloſſ. Lat. T. 2. p. 527.

BROTHER *in Chriſt*, *Frater in Chriſto*, the ſame with ſpiritual *brother*, a perſon admitted into a monaſtic ſociety or fraternity. Id. ibid. p. 528.

Outer BROTHER, *Frater exterior*, ſometimes denotes a lay-*brother*. Id. ibid.

Strange BROTHER, *Frater adveniens*, a hoſt or gueſt belonging to another monaſtery. Id. ibid. p. 526.

Foreign BROTHER, *Frater externus*, either a monk, prieſt, or canon of ſome other monaſtery, to whom the prayers of the ſociety are granted. Id. ibid. p. 528.

Mature BROTHER, *Frater maturus*, one diſtinguiſhed by his age, gravity, or probity, above the reſt.

Spiritual BROTHERS, laymen admitted into a monaſtic fraternity. The name was alſo given to thoſe otherwiſe called *mature brothers*, and ſometimes alſo to a ſort of adopted *brothers*, or perſons who commenced a kind of *brotherhood*, with the ceremony of breaking bread together in the church before the prieſt. Id. ibid. p. 529.

Lay-BROTHER, *Frater laicus*, or *converſus*, is a religious appointed to ſerve or attend on the reſt, who, in reſpect hereof, are called *brothers of the choir*.

The order of *lay-brothers* was inſtituted for performance of the laborious and manual offices belonging to the convent. They are properly the ſervants of the houſe, and the uſual method is only to admit perſons of ſome trade, who have a deſign to retire from the world. In ſome orders they are only retained by a civil contract, which however binds them for life: in other orders they are to paſs through four years of probation, as among the Jacobins; or ſeven, as among the Feuillants. The Capuchins admit none before nineteen years of age. The Jeſuits call them *coadjutors*.

Given BROTHER, *Frater donatus*, among the Carthuſians, denotes a young perſon dreſſed in minim cloth, and wearing a hat, whoſe office is to ſerve in the houſe, anſwering to what in other orders is called an *offered brother*, *frater oblatus*. Trev. Dict. Univ. T. 2. p. 2024.

BROTHER is alſo an appellation more peculiarly given to certain orders of religious: thus, the

BROTHERS *of St. Alexis*, in the Low Countries, were an order of perſons who attended on thoſe who lay dying, and took care of the burial of the dead. Id. ibid.

BROTHERS *of Ave Maria*. See the article SERVITES, *Cycl.*

BROTHERS *of Charity*, a ſort of religious hoſpitallers, founded about the year 1297, ſince denominated *Billetins*. They took the third order of St. Francis, and the Scapulary, making three uſual vows, but without begging.

BROTHERS *of Charity* alſo denote an order of hoſpitallers ſtill ſubſiſting in Romiſh countries, whoſe buſineſs is to attend the ſick, poor, and miniſter to them both ſpiritual and temporal ſuccour.

They are all laymen, except a few prieſts for adminiſtring the ſacraments to the ſick in their hoſpitals; which prieſts, by the rules of the ſociety, are incapable of being elected to any dignity in the order, leſt the hoſpitality, which is the chief end of their inſtitution, ſhould ſuffer thereby. The *brothers of charity* uſually cultivate botany, pharmacy, ſurgery, and chemiſtry, which they practiſe with ſucceſs. In

In Italy, they are called *fate ben fratelli*, or, abbreviately, *ben-fratelli*, becauſe antiently, in begging alms, they uſed that formula; ſignifying as much as, Do well, or do good, my brethren. In Spain, they are called *brothers of hoſpitality*; in France, *freres de la charité*.

They were firſt founded at Granada by St. John de Dieu: a ſecond eſtabliſhment was made at Madrid, in the year 1553. The order was confirmed by pope Gregory XIII. in 1572, and ſeveral privileges given to it, which have been increaſed by ſucceeding popes. Gregory XIV. forbad them to take holy orders, or to make ſolemn profeſſion; ordering, that, for the future, they ſhould only make a vow of poverty and hoſpitality, and be governed by a major, and ſubject to the biſhop: but he afterwards reſtored them to the right of erecting a general. In 1609, leave was granted by pope Paul V. that a few of the *brothers* might be admitted into orders; and, in 1611, that they might make the ſolemn vows of monks, with the addition of a fourth, that they would wait on the ſick. In 1619, the ſame pope exempted them from the juriſdiction of the biſhop, which his ſucceſſor Urban VIII. reſtrained to thoſe hoſpitals wherein there were at leaſt twelve religious.

The *brothers of charity* in Spain have been ſince ſeparated from the reſt, and have their general apart; and thoſe of France, Germany, Poland, and Italy, have the like, who reſide at Rome.

The *brothers of charity* were firſt introduced into France in 1601, by Mary of Medicis, who gave them a houſe in the faux bourg St. Germain, where they have ſince built a fine hoſpital. Vid. *Helyot*. Hiſt. des Ord. Monaſt. T. 4. c. 18. Trev. Dict. Univ. T. 2. p. 2024, ſeq.

BROTHERS *of charity of St. Hippolytus*, a religious congregation firſt ſet on foot by Alvarez, a citizen of Mexico, in 1585, who aſſociated with him ſeveral other pious perſons, to attend on the ſick, and founded an hoſpital without the wall of that city; which being approved of by the pope, and the number of like hoſpitals increaſing, a congregation was formed under the title of *the charity of St. Hippolytus*, by reaſon the firſt hoſpital had been dedicated to that ſaint, on whoſe feaſt-day the city firſt fell into the hands of the Chriſtians. Clement VIII. in 1594, granted them all the privileges of the *brothers of the charity* of St. John de Dieu.

At firſt they only made two vows, one of charity, the other of poverty; quitting the congregation when they pleaſed. To tye them faſt, Clement VIII. ordered them to make vows of perpetual hoſpitality and obedience. In 1700, Innocent XII. admitted them to make the ſolemn vows of chaſtity, poverty, obedience, and hoſpitality, under the rule of St. Auguſtin, and erected their congregation into a religious order, under the protection of the holy ſee. Vid. *Bonan.* Catal. Ord. Relig. P. 1. *Helyot*. Hiſt. des Ord. Monaſt. T. 4. c. 19. Trev. loc. cit.

BROTHERS *of Death*, a denomination uſually given to the religious of the order of St. Paul, the firſt hermit. See the article HERMIT, *Cycl.*

They are called *brothers of death*, *fratres a morte*, on account of the figure of a death's head, which they were always to have with them, in order to keep perpetually before them the thoughts of death.

Their origin is not well known; by their conſtitutions, which were made in 1620, it ſhould ſeem they had not been eſtabliſhed long before pope Paul V. who approved of theſe conſtitutions; and Lewis XIII. by letters patent, in 1621, permitted them to ſettle in France. But it is probable, this order of *brothers of death* was ſuppreſſed by pope Urban VIII. *Helyot*. ubi ſupr. T. 3. c. 44. Trev. loc. cit.

BROTHERS *of penitence*, or of *the penitence of Jeſus Chriſt*, a name given at Thouloufe to the religious of the third order of St. Francis, called alſo *Beguini*; and to a fraternity of penitents held in the chapel of the church of the third order, under the direction of the Beguini. Trev. Dict. Univ. T. 2. p. 2025. See BEGUINS, *Cycl.*

Pyed BROTHERS, *Fratres pii*, a denomination given to all monks, whoſe habit was partly white, partly black; they were otherwiſe called *Agaches*. *Du Cange*, Gloſſ. Lat. T. 2. p. 529. Trev. Dict. ubi ſupr. p. 2026.

BROTHERS *of St. Gregory the Illuminator*, a religious order eſtabliſhed in Armenia, in the 14th century, which being much reduced and decayed by the conqueſts of the Turks and Perſians, was, in 1356, united to the order of St. Dominic. Trev. Dict. ibid.

Joyful BROTHERS, *Fratres gaudentes*, in Italy, denote the knights of the order of the Virgin Mary, firſt inſtituted at Bologna in 1261, for whom a rule was preſcribed by pope Urban IV. *Du Cange*, Gloſſ. Lat. T. 2. p. 528.

The ſame name was alſo given to divers of the Minorites, who lived in a looſer manner than the reſt; ſometimes alſo called *Beguini*. See the article BEGUINS, *Cycl.*

Poor BROTHERS, in the Charter-houſe, a denomination given to decayed gentlemen, to the number of 80, who are ſubſiſted with diet, cloathing and lodging, on the eſtabliſhment. See the article CHARTER-HOUSE, *Cycl.*

The *poor brothers* are to be gentlemen by deſcent, come to poverty, or decayed merchants, ſoldiers, or officers of the king's houſhold. The conditions of admiſſion are, that they have no eſtate for life worth 200 l. nor coming in, *viis & modis*, 24 l. *per annum*; and that they be fifty years old, unleſs they have been maimed in the public ſervice; in which caſe, the age of forty ſuffices. They wear a livery-gown within doors. New View of Lond. T. 2. ſect. 6. p. 772.

White BROTHERS, the name of a ſect which appeared in Ruſſia towards the beginning of the 14th century; ſo called from their white cloaks, on which was a St. Andrew's croſs, of a green colour. They pretended to immediate revelation, whereby God had enjoined them to recover the Holy land out of the hands of the infidels; but they were of no long duration.

BROTHERS *of Arms*, an appellation given thoſe who contract a kind of fraternity in war, obliging themſelves to the mutual ſervice and aſſiſtance of each other.

Lame or maimed BROTHERS, among alchemiſts, denote the imperfect metals which are to be cured of their lameneſs by the perfect elixir; *i. e.* are to be purified and ſeparated from their droſs, *&c.* by the philoſopher's ſtone. Trev. Dict. Univ. T. 2. p. 2026.

BROWS, or EYE-BROWS, *Supercilia*, are two hairy arches above the orbits of the eyes, bunching out by means of ſome fat under the ſkin in this place.

That end next the noſe is called the head, *caput*, the other the tail, *cauda*, of the *eye-brow*.

The uſe of the *eye-brows* is partly to break the rays of light deſcending from above, that they may not dart too ſtrongly into the eyes; and partly to be a ſkreen to the eyes from ſweat, duſt, or other matters deſcending from the forehead. *Heiſt.* Comp. Anat. §. 276. p. 213. *Keil*, Comp. Anat. c. 4. §. 4. p. 191.

BROW-*poſt*, in carpentry, a beam which goes acroſs or overthwart a building. *Neve*, Build. Dict. in voc

BROW-*antler*, the firſt branch of the horn of a hart or buck, ſhooting out from the beam or main horn next the head. *Cox*, Gent. Recr. P. 1. p. 12.

BROWALLIA, in botany, the name of a genus of plants, the characters of which are theſe: The perianthium is very ſhort; it conſiſts of one leaf of a tubular form, divided into five ſegments at the edge, and remains after the flower is fallen; its ſegments are ſomewhat unequal in ſize; the flower conſiſts of one petal, and is of a funnel-ſhape; the tube is cylindric, and of twice the length of the cup; the verge is even and divided into five roundiſh ſegments, the upper one being a little larger than the others; the ſtamina are four filaments, placed in the upper part of the tube of the flower, and hid by the umbilicus of the verge; they are all ſhort, but particularly two of them are much ſhorter than the others; the antheræ are ſimple, crooked, and conniving together; the germen of the piſtil is oval; the ſtyle is capillary, of the length of the tube of the flower; the ſtigma is thick, obtuſe and emarginated; the fruit is an obtuſe oval capſule, containing only one cell, and opening at the top into four parts, when ripe; the ſeeds are ſmall, and very numerous, and the receptacle large. *Linnæi* Gen. Plant. p. 301.

BROWN, a duſky kind of colour, inclining ſomewhat towards redneſs.

Dyers diſtinguiſh divers ſhades and gradations of *brown*, a *ſad brown*, *London brown*, *clove brown*, *purple brown*, *walnut-tree brown*, *&c.*

Spaniſh brown is a dull red colour, uſed by houſe-painters, chiefly for priming, as being cheap and eaſy to work. *Smith*, Art Paint. c. 2. p. 22. *Neve*, Build. Dict. in voc.

BROWN *bay*, in the manege, is underſtood of horſes of a very dark cheſnut colour. *Savar.* Dict. Comm. T. 1. p. 493. See the article BAY, *Cycl.* and *Suppl.*

BROWNISTS (*Cycl.*)—Lipſenius and Konig, by a groſs miſtake, make Sir Thomas Brown the founder of the ſect of *Browniſts* [a]. Biſhop Hall wrote againſt the *Browniſts*. Robinſon compoſed an apology for them [b].—[*Struv.* Introd. Hiſt. Liter. c. 1. §. 4. p. 12. [b] *Pfaff.* Introd. Hiſt. Theol. l. 3. ſect. 11. p. 384.]

Pagit aſſures, that the *Browniſts* were extinguiſhed early; Robert Brown himſelf renouncing his errors, died parſon of Aychurch in Northamptonſhire, and his followers were ſoon ſwept away; inſomuch that, according to the teſtimony of George Johnſon, not one of them, then alive, continued faithful [c]. But this muſt be taken *cum grano ſalis*. The defection of their founder, and the diviſions among themſelves, made them aſſume new names, and adopt peculiar tenets, from their reſpective chiefs; as the *Browniſts*, who held the church of England to be Sodom, Babylon, and Egypt; the Wilkinſonians, who affirmed themſelves apoſtles, as much as Peter or Paul; the Johnſonians, who pretended to be the true antient *Browniſts*; the Ainſworthians, who arrogated this honour to themſelves, treating the former as apoſtates; the Robinſonians, who accuſed both the former of being renegadoes and ſchiſmatics. Some even rank the Anabaptiſts in the number of *Browniſts* [d].—[[c] *Pagit*, Hæreſiogr. p. 55. [d] Id. ibid. p. 75, ſeq.] See the article ANABAPTIST, *Cycl.* and *Suppl.*

BROWSE, the tops of the branches of trees, whereon beaſts feed. This is ſometimes alſo called brouce, and bruttle; probably from the French *brout*, which ſignifies the ſame. Dict. Ruſt. T. 1. in voc.

BROWSE more properly denotes the food which deer find in young copſes, continually ſprouting anew.

Beasts of BROWSE, *or* BROWSING *beasts*, a denomination including all of the fallow kind, as the deer, roe-buck, rupicapra, *&c.*

BROWSE-*wood*, the same with spray or brushwood.

BROWTING, *Brouter*, among the French gardners, signifies breaking off the tips of the slender branches of trees, when too long in proportion to their strength. Trev. Dict. Univ. T. 1. p. 1261. voc. *Brouter*.

BRUISING, in pharmacy, signifies the operation of breaking or pounding a thing coarsely, or by halves; frequently practised on roots, woods, and other hard bodies, to make them yield their juice or virtue more freely than they would do whole.

BRUMALIA, (*Cycl.*) in antiquity, a religious feast celebrated on the day of the winter solstice; from which indications were taken of the felicity of the remaining part of the winter.

The word is also written *broumalia*, and *bromalia*; being formed from *bruma*, the shortest day [a]; or, as others pretend, from *Bromius*, a surname of Bacchus, in whose honour the generality of writers mistakenly suppose this feast to have been held [b]. [a Vid. *Voss.* Etym. p. 297. Trev. Dict. Univ. T. 1. p. 1256. voc. *Bromales*. b *Meurs.* Gloss. Græc. p. 123. *Du Cange*, Gloss. Græc. T. 1. p. 228, seq. voc. Βρωμαλια.]

The *brumalia* were also called *hiemalia*. *Pitisc.* Lex. Ant. T. 1. p. 297.

BRUNELLA. See the article PRUNELLA.

BRUSH, an assemblage of hairs or hogs bristles, fastened in the holes of a wooden handle or board, pierced for that purpose, serving to cleanse divers bodies by rubbing therewith. Trev. Dict. Univ. T. 1. p. 1258. voc. *Brosse*.

We say a round, a flat, or a square *brush*, clothes-*brush*, head-*brush*, horse-*brush*, beard-*brush*, comb-*brush*, weavers-*brush*, and the like. *Crouch*, View of Brit. Cust. p. 124.

Sheermens BRUSH, is made of wild boars bristles, and serves to lay the wool or nap of cloths, after sheering it for the last time. *Savar.* Dict. Comm. T. 1. p. 490.

The flesh-*brush* is of use in medicine, especially in case of rheumatisms, and certain cutaneous disorders. See the article FRICTION, *Cycl.*

The *brush* is also applied to the soles of the feet of new-born infants, when fainting, to find whether they be alive or dead. *Davent.* Midwif. c. 26. *Cast.* Lex. Med. p. 658. voc. *scopula*.

The manner of making *brushes* is by folding the hair or bristle in two, and bringing it by means of a pack-thread, which is engaged in the fold, through the holes wherewith the wood is pierced all over, being afterwards fastened thereon with glue. When the holes are thus all filled, they cut the ends of the hair, to make the surface even. *Savar.* Dict. Comm. T. 2. p. 1878. voc. *Vergette*.

BRUSH, among painters, a larger and coarser kind of pencil, made of hogs bristles, wherewith to lay the colours on their large pieces. See the article PENCIL, *Cycl.*

Brushes for painters are of divers shapes and sizes, some round, others flat; the latter chiefly used for drawing lines, and in imitating olive and walnut work. *Smith*, Art of Painting, c. 1. p. 5.

The Chinese painters *brush* consists of the stalk of a plant, whose fibres being fretted at both ends, and tied again, serve for a *brush*. Phil. Transact. N° 250. p. 72.

Plasterers have three kinds of implements wherewith they apply their plaster and white-wash on walls, *viz.* stock *brushes*, round *brushes*, and pencils. *Moxon*, Mechan. Exerc. p. 249. See the article PLASTERING.

Brushes are also used by glaziers, to clean their glass [a]; by gilders, to lay on their size [b], and by workers in stucco [c], *&c.* [a *Felib.* l. 1. c. 21. p. 192. b Idem ibid. c. 22. p. 208. c Id. ibid. l. 2. c. 6. p. 247.]

Wire-BRUSHES, are used by silver-smiths, and gilders, for scrubbing silver, copper, or brass pieces, in order to the gilding them. *Parkins.* Treat. of Japann. c. 22. p. 65.

There is a method of dying or colouring leather, performed by only rubbing the colour on the skin with a *brush*. This the French leather-gilders call *brouissure*; being the lowest of all the sorts of dye allowed by their statutes.

BRUSH *of a fox*, among sportsmen, signifies his drag or tail, the tip or end of which is called the chape. *Cox*, Gent. Recr. P. 1. p. 11.

BRUSH *iron-ore*, signifies a kind of ore full of striæ, resembling the hair of a brush. *Grew*, Mus. Reg. Societ. P. 3. sec. 2. c. 2. p. 330, seq. *Woodw.* Hist. Engl. Foss. T. 1. p. 226. See the articles ORE, and IRON.

BRUSH is also used in speaking of a small thicket, or coppice. See the article COPPICE.

In this sense, the word is formed from the middle age Latin *bruscia*, *bruscus*, which signifies the same.

BRUSH-*wood* denotes small slender wood or spray. See the article BROWSE.

BRUSHING. Among jockies, a *brushing* gallop denotes a brisk one: a horse should have his *brushing* gallop in a morning before watering. *Brack.* Not. ad Burd. Gent. Farr. p. 33.

BRUTE, an animal destitute of the faculty and use of reason. See the articles ANIMAL, and REASON, *Cycl.* and *Suppl.*

In which sense, *brute* amounts to the same with beast. See the article BEAST, *Cycl.* and *Suppl.*

Among *brutes*, the monkey kind bear the nearest resemblance to man; and this, both in the external shape and internal structure [a], though more in the former than the latter [b]. In the monkey-kind, the highest and the nearest approaching the likeness of man, is the *oran outang*, or *homo sylvestris* [c].—[a Vide *Boyle*'s Phil. Works Abr. T. 1. p. 146. b Phil. Trans. N° 189. p. 373. c Id. N° 256. p. 339.]

The structure and oeconomy of *brutes* make the object of what is called comparative anatomy. See the article ANATOMY.

Philosophers are much divided about the essential characters of *brutes*. Some define *brute* an animal not risible, or a living creature incapable of laughter; others, a mute animal, or a living thing destitute of speech; the Peripatetics, an animal endowed with a sensitive power, but without a rational one [d]. The Platonists allow reason and understanding, as well as sense, to *brutes*, though in a degree less pure and refined than that of men. Lactantius allows every thing to *brutes* which men have, except a sense of religion [e]. Some sceptics [f] have ascribed religion and virtue to *brutes*; and Solomon seems to assure us, that the souls of men have no pre-eminence over those of *brutes* [g].—[d Vid. *Thom.* Phil. Instrum. c. 38. p. 182. *Chauv.* Lex. Phil. p. 78. voc. *Bestia*. e *Lactant.* Inst. Div. l. 3. c. 10. It. de Ira Dei, c. 7. f *Stanl.* Hist. of Philos. P. 12. c. 13. p. 780, seq. g Vid. *Budd.* Exerc. de Error. Stoicor. 1. §. 6. Anal. Hist. Phil. p. 100, seq. Eccles. iii. 18, seq.]

Some speak as if they held *brutes* to be moral beings, and under the obligation of the law of nature. Ulpian [h], and other civil lawyers, are supposed to be of this opinion; as also the Stoics, from whose school this tenet is said to have been first borrowed [i]. It is alleged on the other hand, that *brutes* cannot be subject to a law, unless they have a power of knowing him that made the law, judging whether he have a right to command them, and what is contained in the law, that they may direct themselves accordingly [k]; which seem all to be things out of the reach of *brutes*. But Ulpian's definition of the law of nature, *Jus naturale est quod natura omnia animalia docuit*, when fairly interpreted, does not imply, that *brutes* have reason and reflexion, but may be understood of that natural instinct common to man and *brute*, by which they are impelled to self-defence, propagation of their species, *&c.* See a Vindication of Ulpian, and the Roman lawyers, in *Wolfii Horæ subsec.* Marpurg. an. 1729. — [h *Ulp.* de Just. & Jur. Inst. l. 1. tit. 1. i *Puffend.* de Jur. Nat. & Gent. l. 2. c. 3. §. 2. *Schilt.* Manud. Philos. Moral. ad Jurisprud. c. 6. p. 227. *Budd.* Analect. Hist. Philos. p. 101. *Seld.* de Jur. Nat. & Gent. juxta Disciplin. Ebræor. l. 1. c. 5. k Vid. *Grot.* de Jur. Bell. & Pac. l. 1. c. 1. *Seld.* lib. cit. *Puffend.* de Jur. Nat. & Gent. l. 2. c. 3. *Budd.* Anal. Hist. Phil. p. 100, seq.]

In antiquity, we find *brute* animals deified, and divine honours paid to them, especially among the Hyperborean nations [l]; among the Egyptians, who worshipped crocodiles [m]; the Indians, serpents and vipers; the Siamese, elephants and the like. Hence also images [n], and tombs, epitaphs, *&c.* [o] in honour of *brutes*.—[l Mem. Acad. Inscr. T. 7. p. 326, seq. m *Banier*, Diss. ap. Mem. Acad. Inscr. T. 4. p. 116. n *Pitisc.* Lex. Ant. T. 1. p. 247. o *Lipsius* Cent. 3. Ep. 89.]

Albertus [p] and Schmidius [q] have dissertations express on the divine honours paid to *brutes*. — [p *Albert.* Disp. Hist. de Cultu Idolatra. Bestiar. Lipsi. 1669. q *Schmid.* Diss. Hist. Mor. de Honore Brutis non competente. Lipsi. 1686. *Walc.* Exerc. de Fabul. Hist. Semiram. §. 3. p. 9, seq.]

There are different faculties and degrees of knowledge in different species. Some have only the motive and sensitive faculties, as worms; others have also memory, and some imagination and invention, as monkeys and elephants [r]: besides that in the same species, some in docility and ingenuity exceed others; and that the climate, air, and food, have their influence on the *brute* kind, as on men; so that those of the same species, in different countries, are found to have different qualities; of which English horses, dogs, cocks, *&c.* are a sufficient proof [s]. 'Tis hard therefore to define any thing universally concerning *brutes*. What agrees to the oyster or the star-fish, which differ little from inanimate, will it agree to the oran-outang, which scarce differs, except as to speech, from some species of men? They who agree in ascribing reason to *brutes*, do not all ascribe to them the same species or degree of reason: Galen, for instance, allows *brutes* only internal reason; Porphyry also enunciative; Lactantius only allows them practical reason or prudence; the Stoics also speculative reason or sapience; Anaxagoras only active reason, exclusive of passive; Pythagoras, reason on the second act, exclusive of the first. There is no talent, no virtue belonging to man, but what we see the resemblance of among *brutes*, except perhaps curiosity; they only seem to want speech and curiosity [t]: curiosity, whereby they might be stirred to make inquiries, and speech, by which they might communicate their discoveries [u]. — [r *Rhodig.* Phys. Div. l. 3. c. 16. sect. 2. §. 7. s Vid. *Evel.* Disc. of Medals, c. 9. p. 314, seq. t *Thomas.* Philos. Instrum. l. 38. §. 14. p. 184. *Chauv.* Lex. Phil. p. 78. u *Hobb.* Disc. of Hum. Nat. c. 9. §. 18. p. 111.]

They are incapable of science, for want of names and signs whereby to denote abstract ideas. *Hobb.* lib. cit. c. 5. §. 4. p. 64.

They have sensible knowledge, but want intellectual knowledge; they have apprehension, but not reflexion [w]; are capable

pable of prudence, which is only a great pitch of experience, but not of ſapience, which can only be the fruit of evidence [x]. [[w] *Pardies*, ap. Philoſ. Tranſact. N° 82. p. 4054, and 4071. [x] *Hobb.* lib. cit. c. 6. §. 4. p. 64.]

The chief operation of a rational ſoul is judgment, by which we diſtinguiſh true from falſe; to which the memory and imagination are ſubſervient. But this cannot be aſcribed to *brutes*, ſince they do not make propoſitions. *Walc.* ubi ſupra. *Hobb.* lib. cit. c. 5. §. 13. p. 55.

As for ſpeech or enunciative reaſon, to many it does not ſeem ſo neceſſary, ſince many of the philoſophers condemn it as a vice, and enjoin abſolute ſilence: in reality, ſuppoſing a man naturally dumb, does it follow, that he is void of reaſon? Is it any objection then to the reaſoning of *brutes*, that they have not the uſe of ſpeech, tho', as a late author expreſſes it, they have all the organs neceſſary for that purpoſe? *Budd.* Anal. Hiſt. Philoſ. p. 102, ſeq.

Plato ſeems to allow, that, in the reign of Saturn, *brutes* converſed; and St. Baſil himſelf reckons it as one of the beauties of the terreſtrial paradiſe, that *brutes* ſpoke.

Some have pretended, that they ſtill have a jargon intelligible to one another; and Porphyry relates, that Tireſias and Apollonius Tyanæus underſtood their language. There is at leaſt a ſimilitude of ſpeech in *brutes*, for they know each other by their voices, and have their ſigns whereby they expreſs anger, joy, and other paſſions: thus a dog aſſaults in one ſtrain, fawns in another, howls in another, and cries when beaten in another. 'Tis true, their ſpeech to us appears rude and inarticulate; but perhaps ours is the ſame in their ears [y]. And if the voice of *brutes* be unintelligible to us, does not the ſame hold of the language of our own kind, till we have been inſtructed in it? The language of foreigners, what does it appear to us, but a confuſed unmeaning heap of ſounds [z]. In fine, if laughter be peculiar to man, we ſee the image of it in *brutes*, ſignified by the motion of their ears, eyes, mouth, tongue, &c. Laſtly, what is ſo peculiar to man as foreſight of futurity, but have not beaſts this, which lay up ſtores with great care in their cells, as the ant, bee, &c [a]. — [[y] *Chauv.* Lex. p. 79. [z] *Sext. Empir.* Pyrrhon. Hypot. p. 781. Trev. Dict. loc. cit. *Pitiſc.* Lex. Ant. T. 1. p. 279. [a] *Chauv.* Lex. p. 79.]

'Tis known, the antients allowed birds not only the knowledge of things preſent, but of futurity likewiſe, which they were ſuppoſed to diſcover, among other ways, by their voice. *Sext.* loc. cit. Mem. Acad. Inſcrip. T. 2. p. 376. See the articles AUGURY, BIRD, &c. *Cycl.* and *Suppl.*

Divers moderns have aſſerted, that *brutes* were created immortal, and that they would not have died if Adam had not ſinned; that they will ſtill riſe again at the laſt day, and be taken up with man to heaven. *Thomaſ.* lib. cit. p. 185.

The generality of the antient philoſophers thought that *brutes* reaſoned: this, among the heathens, was the opinion of Anaxagoras, Plato, Porphyry, Celſus, Galen, Plutarch, and others. Among chriſtians, Lactantius, and the whole body of Manichees and Gnoſtics [b]. Among the moderns, Valla, Sonnertus, Arriaga [c], Tho. Campanella [d], Gaſendus [e], F. Daniel, and others, aſſert the ſame. Plutarch has a dialogue under this title, that *brutes* uſe reaſon. All the ſect of Pythagoras ſhould be of the ſame ſentiment, becauſe the metempſychoſis imports that human ſouls paſs into the bodies of *brutes*. Can any perſon, ſays Lactantius, deny that *brutes* have reaſon, when they often outwit man himſelf? *Poteſt aliquis negare brutis ineſſe rationem, quum hominem ipſum ſæpe deludant?* [f]. — [[b] *Maurit.* Specim. de Princip. Jur. Publ. p. 53. *Thomaſ.* lib. cit. p. 186. [c] Diſput. Phyſ. 7. ſect. 6. ſubſ. 2. [d] De Senſu Rerum, l. 2. c. 23. [e] Phyſ. ſect. 3. Membr. Poſter. l. 8. c. 4. p. 409. [f] *Lactant.* Inſt. Divin. l. 3. c. 10.]

The Stoics, holding that the Divine Being is diffuſed through all creatures, were neceſſitated to maintain the ſouls of *brutes* to be divine, and conſequently that they had reaſon. *Walc.* loc. cit.

The Sceptics paralleled *brutes* with men. Sextus, more particularly, gives a compariſon between dogs and the human kind. The former excels the latter as to ſenſe; it has a quicker ſcent, whereby to purſue beaſts unſeen; it diſcovers them ſooner by the eye, and is more acute of hearing. *Sext. Empir.* Pyrrhon. Hypotyp. l. 1. c. 13. *Stanl.* Hiſt. Philoſ. P. 12. p. 780.

A dog is not deſtitute of logic, as appears from Chryſippus's famous inſtance, who obſerved, that a hound coming into a road which divides into three, makes choice of the third by virtue of an induction or ſyllogiſm: for that having ſcented the two ways by which the beaſt did not paſs, he runs ſtraight upon the third without ſcenting it: where the reaſoning is obvious: the beaſt paſſed either that way, or that way, or this way; but he neither paſſed that way, nor that way, and therefore this way. *Stanley*, lib. cit. p. 780.

Hierom Rorarius has attempted to ſhew, that the *brutes* reaſon better than men, *Quod animalia bruta ratione melius utantur homine.* Par. 1645. Amſt. 1666.

J. And. Schmidius has a diſcourſe expreſs on the logic of *brutes*. De Logica Brutorum.

That a dog is poſſeſſed of what they call internal reaſon, appears from his chuſing things convenient, flying the hurtful, purſuing his food, and running away from the whip: add, that, when wounded, he ſeeks for a remedy, by continually licking the part; if a ſplinter be got into his foot, he ſtrives to pull it out with his teeth; ſtrictly obſerving Hippocrates's rule, to keep the part affected, as much as may be, at reſt; and therefore holding it up in walking. When ſick, or troubled with ill humours, he eats graſs, which makes him puke [g]. Of how many medicines, how many arts do we owe the invention to *brutes* [h]? It was from the ſpider, that man learned the art of weaving; from the ſwallow we borrowed architecture; from the gooſe ſwimming, from fiſhes navigation, from ſilk-worms ſowing; to omit many other inſtances of the like kind alleged by Plutarch [i], Voſſius [k], and others [l]. — [[g] *Stanl.* loc. cit. [h] Vid. *Fabric.* Bibl. Græc. l. 4. c. 29. T. 4. p. 334, ſeq. [i] Vid. *Plut.* de Solert. Animal. p. 974. [k] *Voſſ.* de Orig. Idolat. l. 3. c. 67. [l] *Wolf.* Not. ad Caſaubon p. 262.]

How many actions are obſerved of *brutes*, not to be accounted for without reaſon and argumentation? As that commonly noted of a dog, which, running before his maſter, will ſtop at a divarication of the way, till he ſee which hand his maſter takes. Or that when having got a prey, which they fear will be taken from them, they run away and hide it, and afterwards return to it. What account can be given, why a dog, being to leap on a table, which he ſees too high for him to reach, if a ſtool or chair happen to ſtand in the way, firſt mounts up that, and from thence the table? If he were a machine, or piece of clock-work, and this motion cauſed by the ſtriking of a ſpring, there is no reaſon imaginable, why the ſpring, being ſet on work, ſhould not carry the machine in a right line toward the object that put it in motion, as well when the table is high as when it is low; whereas the firſt leap the creature takes up the ſtool, is frequently not directly toward the table, but in a line oblique, and much declining from the object that moved it [m]. Who can but admire the ſagacity and cunning of a hound, in purſuing a hare through all her windings and doublings; of a hare in flying the hounds, with all her ſhifts and devices; of beaſts that lay ſnares for others, as foxes, or cats for mice? What numerous arts and ſtratagems do ſpiders practice in watching flies [n]? Nor is this addreſs only found in beaſts which live by prey, but in the more timorous kind, as deer, ſquirrels, and the like. That all theſe are owing to inſtinct or machinery, without any knowledge or ſenſe, is ſcarce conceivable. Tho' a dog, a fox, or a wolf, may be driven to hunt by inſtinct, or a blind impulſe of nature, yet unleſs there were alſo docility in him, would he, on ſmelling or ſpying the partridge, give notice to his maſter by wagging his tail? You ſay, that dogs, by long habit, and by force of rewards and puniſhments, may be taught many things: but do not this teaching, docility, and remembrance of blows, argue memory, fear and deſire, which cannot ſubſiſt without knowledge, ſenſe, pleaſure and pain? But if *brutes* have knowledge, 'tis allowed they muſt alſo have judgment, and reaſon, and a ſcience of univerſals; ſince a beaſt that hunts, eſpecially the firſt time, can only have a general idea or perception of the prey or enemy it is to purſue; that is, a fox or a cat, in hunting the firſt time for a bird or a mouſe, and, on the contrary, the bird or the mouſe which are hunted for the firſt time, do not the one perceive the prey, or the other the enemy, in this very place or time, and with theſe particular circumſtances, but only perceive prey or enemy in the general? Elephants, when they have once eſcaped the trap, become extremely diſtruſtful ever after; they will not budge a foot without a great bough of a tree, with which they examine every ſtep before they ſet down their feet, to try whether there be any hole in the way. When they march in troops, if any of them perceives an herb whereon a man has trod, he plucks it up, and delivers it to the next, who, having ſmelled it, tranſmits it to a third, and ſo on to the laſt; who hereupon raiſing a huge noiſe, they all betake themſelves to flight; retiring to the hills, woods and other places, not frequented by men [o]. — [[m] *Ray*, Wiſdom of Creat. P. 1. p. 54. [n] *Chauv.* Lex. Phil. p. 377. voc. *Machina.* [o] *Tavern.* Trav. Ind. ap. Phil. Tranſact. N° 326. p. 65.]

Further, whatever imagines or opines, muſt neceſſarily judge, ſince opinion itſelf is only a ſort of judgment; ſo that a ſheep, which fears a wolf that ſhe never ſaw, muſt neceſſarily judge a wolf in the general an enemy to her; add, that the arts which foxes or dogs make uſe of to catch hens or partridges, and thoſe arts which the latter make uſe of to eſcape their hunters, cannot be grounded on any knowledge, excepting that general knowledge which is derived from particular things, whereby, from ſingulars perceived, we infer others not perceived; which is direct reaſoning. *Chauv.* Lex. p. 378.

Now admitting this knowledge of *brutes*, muſt we not alſo admit, that they have thought or conſciouſneſs, and liberty, which are attributes peculiar to ſpiritual beings? Thought muſt be allowed them, ſince all knowledge, even that called ſenſe in man, and conſequently in *brutes*, is thought. Nor can any reaſon be alleged, whereby a man ſhould be judged conſcious of what he perceives by ſenſe, and a beaſt not conſcious; if both have knowledge of what they feel, we muſt alſo allow them liberty, both of contrariety and contradiction; ſince otherwiſe how ſhould the hope of reward, or fear of puniſhment, work on them? Was not the cat at full liberty either to hunt or not hunt? eſpecially in ſuch caſes, where ſhe takes the purſuit without any neceſſity either of preſerving her life, or propagating her kind. And 'tis known that thoſe beaſts are then

moſt ſtudious and active after prey, when they are beſt fed; and that hunting, with them, is rather a kind of recreation, as among our ſportſmen, than a work of neceſſity. On the whole, *brutes*, if they have knowledge, ſince they act as perfectly for the attainment of their ends as man, are of conſequence as liable to praiſe or cenſure, reward or puniſhment, as man. From whence will alſo follow, that their ſouls are immortal, and conſequently there muſt be a future ſtate, and proper manſions reſerved for them in another world, according as they have behaved in this. *Chauv.* lib. cit. p. 378.

In reality, if the ſouls of *brutes* be ſpiritual, they muſt neceſſarily alſo be indiviſible, and therefore immortal; ſince there is no argument deducible from the light of reaſon, in proof of the immortality of human ſouls, more than of *brutes*. And, laſtly, allowing the ſouls of *brutes* to have knowledge, they muſt alſo have religion; ſince an intelligent creature without a duty to God is a contradiction. Certainly, if a *brute* knows any thing truly, it muſt know itſelf in the firſt place, from which knowledge it will naturally be carried to the knowledge of its Creator; ſince one of the firſt and eaſieſt things it can know, is that it did not make itſelf: from all which it will follow, that *brutes* are alſo ſubject to the ſtings of conſcience, *&c.* *Chauv.* lib. cit. p. 79.

Mechaniſm of BRUTES.—The Carteſians, on the other hand, adopt that ſtrange paradox, of the mechaniſm of *brutes*; and aſſert them not only void of all reaſon and thought, but of all perception. This ſyſtem is much older than Des Cartes; it was borrowed by him from Gomez Pereira, a Spaniſh phyſician, who employed thirty years in compoſing a treatiſe, which he entitles *Antoniana Margarita*, from the chriſtian names of his father and mother. It was publiſhed in 1554. But his opinion had not the honour either of gaining partiſans, or even of being refuted; ſo that it died with him. Vid. *Voſſ.* de Orig. Idolol. l. 3. c. 41. where Pereira's tenet is thus repreſented from his own apology: *Illos motus brutales, quicunque in brutis viſuntur, non fieri a brutis videntibus, audientibus aut guſtantibus, ſeu per quemcumque alium ſenſum exteriorem vel interiorem—Sed vel ab ſpeciebus objectorum inductis in eorum organis noſtris ſenſitivis ſimilibus, cum præſentia ſunt ſequenda vel fugienda: vel a phantaſmatis, cum hæc abſunt.*

This was revived by Des Cartes [a], and further aſſerted by Le Grand [b], D'Armaſon [c], and others of his followers, who were led to adopt this doctrine, from that principle of his philoſophy, that the eſſence of the ſoul conſiſts in thinking; ſo that, ſuppoſing knowledge and thought in *brutes*, they muſt have ſouls like thoſe of men; the ſenſitive ſoul of the Ariſtotelians being held by him a mere chimera.—[[a] Vid. *Cart.* P. 2. Ep. 40. *Quod ad bruta attinet, adeo aſſueti ſumus credere quod illa non ſecus quam homines ſentiant, ut facile non ſit opinionem hanc deponere, ſed ſi æque aſſueti eſſemus videre automata, quæ actiones noſtras omnes imitarentur, quas quidem imitari poſſunt, atque illa pro automatis habere, neutiquam dubitaremus, quin animalia ratione deſtituta forent quoque automata.* [b] *Le Grand*, Inſt. Philoſ. P. 7. c. 18. n. 5. Ejuſd. Diſſ. de Carentia Senſus atque Cognitionis in Brutis. [c] *D'Armaſon*, La Bête transformée en Machine, 1684. p. 19, ſeq. *Thomaſ.* Diſſert. Proem. Juriſpruden. Div. §. 40.]

But Pereira does not appear to have been the firſt inventor of the doctrine; ſomething like it having been held by ſome of theantients, as we find from Plutarch [d], and St. Auguſtin [e]. The latter of which reaſoned thus: Miſery being the conſequence of ſin, it follows, that *brutes* which have not ſinned, ſhould not be miſerable. Now they would be miſerable, if they had perception. Therefore they have none. Beſides if *brutes* had a ſoul, God would not have given ſinful man an abſolute power over them, and a right to kill them for nouriſhment. Mr. Du Rondel, profeſſor at Maeſtricht, has proved from Plutarch, that, before the Stoics, Diogenes the Cynic had maintained, that *brutes* had neither perception nor knowledge, and were mere machines. So that Pereira has been unjuſtly taxed for broaching a novelty [f].—[[d] *Plutarch*, de Placit. Philoſ. l. 5. c. 20. [e] *Auguſt.* de Quantit. Animæ. [f] Vid. *Paſch.* Invent. Nov. Antiq. c. 3. *Walc.* Lex. Philoſ. p. 224. voc. *Beſtie.* Trev. Dict. Univ. T. 1. p. 1002. voc. *Beſte.*]

'Tis argued by the retainers to this ſyſtem, that the ſoul of *brutes* is altogether corporeal, and conſequently void of knowledge, which all body, in their ſyſtem, is abſolutely incapable of; that their ſoul is only their blood, or ſome of the purer and finer parts thereof, as frequently expreſſed by Moſes; that *brutes* have indeed life, but that this conſiſts only in an aptitude or diſpoſition of the body for certain motions. In which reſpect alſo they may be ſaid to have ſenſe, as they do many things by inſtinct the ſame as men by reaſon; but that their motions are all ſudden, and blind, not ariſing from any knowledge or perception of the ſoul, but from the fabric and connection of their parts, as the motion of Archytas's wooden dove, Regiomontanus's iron fly, or of innumerable other contrivances of man are known to be [g]. That *brutes* exceed men in their operations, no otherwiſe than as a watch can keep time, and tell the hour better than the artiſt himſelf that made it. And if weak man can make machines to perform things ſeemingly ſo extraordinary, how eaſy was it for an infinitely wiſe Being to make automata, to exhibit all the phænomena which we ſee of *brutes*, without any either ſenſitive or rational ſoul? That the actions of *brutes* may be well accounted for, and are no more indications of knowledge than the action of a vine, which, preſaging that it ſhall not be able to ſupport its own weight, ſeeks out and clings to the elm; or of the ſenſitive plant, which, upon the approach of a hand, ſhrinks or contracts itſelf. How many even of man's actions are reſolvable into the ſame principle of mechaniſm? Is it by knowledge or deſign, or by inſtinct, that we wink when any thing ſuddenly approaches our eyes? that when we ſtumble with one foot, the other preſently flies to its aſſiſtance? that, in falling, we naturally ſtretch out our hands? that a man under torture cries out whether he will or no? that we continue to walk? that an artificer can proceed in his work, and a muſician to play on, when our thoughts are turned to ſomething elſe? How is it we breathe, our heart beats, the limbs are moved, and the ſtomach and inteſtines make a due ſeparation of the food, rejecting what is uſeleſs, and conveying the reſt into the blood [h]? Is the flight of a bird from a gun, or a ſcare-crow, owing to a higher cauſe than that of a man, who, on any ſudden noiſe or danger near him, inſtantly flinches back, or diſpoſes himſelf for flight.—[[g] *Chauv.* Lex. Phil. p. 79. [h] Id. ibid. p. 378. *Walc.* Lex. p. 228, ſeq.]

Thus do the Carteſians reaſon, till they have almoſt brought men to be machines, as well as *brutes*. So near is the affinity between the ſpecies of animals, that one ſect of philoſophers cannot extol man without elevating *brutes* together with him; nor another degrade *brutes*, but that man muſt keep them company. But no direct argument, it is to be obſerved, is alleged in ſupport of the automatiſm of *brutes*. The doctrine is only maintained by what logicians call preſumptions, or prejudices, drawn from the inconveniences ariſing from the ſuppoſition of the contrary. The only ſhadow of an argument is, that God could have created machines to perform every thing that is done by *brutes*. They do not go ſo far as to prove that he has done it. Their fallacy lies in not diſtinguiſhing the poſſible from the probable; but from the poſſibility of a thing inferring its probability. Morhoff, and ſome others, allow of truth on both ſides of the queſtion; and conclude, that the difficulty will never be decided. *Morhof.* Polyhiſt. T. 2. l. 2. P. 2. c. 45. n. 4. p. 437.

Perhaps the beſt argument againſt the ſyſtem of machines is, that it is contrary to the common ſenſe and apprehenſions of all mankind. Ought not thoſe, who deny that *brutes* have ſenſe, to be combated with the ſame weapons that are uſed againſt the Sceptics, who deny all truth and certitude, and againſt the Immaterialiſts, who deny the exiſtence of bodies? God has certainly made fools of men, if *brutes* be machines. *Du Hamel*, de Corp. Animal. l. 3. c. 1. Opp. Phil. T. 2. p. 609. *In eadem vel ſimili cauſa ii mihi videntur eſſe, qui beſtias omni cogitatione privant, ac ſceptici, qui omne veritatis lumen nobis eripiunt. Utrique ſatis validis utuntur rationibus, nec facile refelli poſſunt: ſed ipſa naturæ voce cui obſiſti non poteſt, communi omnium ſenſu, experientia, & ipſa rerum evidentia ita revincuntur, ut ea dicant quæ omnino non ſentiunt.*

Henry More, in his Enchiridicon Metaphyſicum [i], F. Daniel, in his Nouvelles Difficultés, publiſhed in 1693, and in his Voyage du Monde de Deſcartes, as alſo F. Pardies, in a treatiſe of the knowledge of *brutes*, have preſſed the Carteſians hard. Paſchius has alſo a diſputation on the ſenſe and knowledge of *brutes* [k], and Willis [l] a treatiſe on the ſouls of *brutes*.—[[i] c. 24. [k] De Brutorum Senſibus & Cognitione. [l] *Willis*, de Anima Brutorum. Oxon. 1672. 4°. an extract of which is given in Phil. Tranſ. N° 83. p. 4071.]

But to ſay the truth, we are not much wiſer for the labours of theſe learned gentlemen. The common opinion of the untaught and unprejudiced part of mankind ſeems to be, that *brutes* have ſenſe, imagination, memory, and paſſion, but that they are void of underſtanding and reaſon; that is, in the language of philoſophers, they have the inferior faculties of the ſoul, but not the ſuperior. Nor will the diſtinction appear groundleſs to thoſe who attend to the difference between the objects of the mind, and its acts about theſe objects; as alſo to the difference between the confuſed and the diſtinct comprehenſion of any thing.

After all that has been ſaid about the faculties of *brutes*, what a difference between them and even a child, who can ſpeak, reckon, and perform the operations of arithmetic! Some philoſophers gravely tell us, that *brutes* want ſpeech to expreſs themſelves; and aſſign this as a cauſe of their ſeeming want of underſtanding. But will not a parrot, brought up in a nurſery with children, learn to pronounce words ſooner than they? but will he therefore alſo learn to expreſs his thoughts, reckon, *&c?* Ought we not therefore to ſay, that *brutes* cannot ſpeak, or make uſe of general ſigns, which is implied in ſpeech, becauſe they have no underſtanding; inſtead of ſaying, they ſeem to be without underſtanding, becauſe they cannot ſpeak? It is true, *brutes* do many things, from ſome principle incomprehenſible to us, although there are inſtances of a like principle in man; but it does not follow, that this principle is underſtanding and reaſon. A bee does not make honey, nor does an infant ſuck from reaſon. The like may be ſaid of many other actions of *brutes*, as building their neſts, *&c.* What the true principles of ſuch actions is, may perhaps be beyond the power of the human faculties to comprehend. But whatever it be, it is far from putting *brutes* on a level with man. The difference

is immenſe; and thoſe who, in other reſpects, admit of inſenſible gradations from one order of beings to another, muſt own there is a vaſt chaſm between man and the moſt perfect *brutes*. See Mr. *Buffon*, Hiſt. Natur. Vol. 2. p. 443.

BRUTIA, in the medical writings of the antients, a word uſed to expreſs the fatteſt and moſt reſinous kinds of pitch, and ſuch as was propereſt for making the oil of pitch, called *oleum picinum*.

The word *brutia* ſeems to have been an adjective of diſtinction given to this kind of pitch by the antients, from their common cuſtom of naming things from the places whence they were brought; *Brutia* being the name of a country in the extreme parts of Italy. *Plin.* l. 15. c. 7. See the article PITCH.

BRYGMOS, a kind of convulſion, affecting the lower jaw, and ſtriking the teeth together; moſt frequently obſerved in children affected with worms. *Caſt.* Lex. Med. p. 113. *Quinc.* Lex. Phyſ. Med. p. 61.

The word is Greek, βρυγμος, formed from βρυκειν, or βρυχειν, frequently uſed by Hippocrates for chattering of the teeth. *Fæſ.* Oecon. Hippoc. p. 129. See alſo *Suic.* Theſ. Eccleſ. T. 1. p. 714. voc. Βρυγμος.

The *brygmos*, or chattering of the teeth, is a ſymptom of the acceſs of an ague, or intermitting fever.

BRYON, in the botanical writings of the antient Greeks, an abbreviation of the word *bryonia*. Wherever this word occurs in Dioſcorides, Theophraſtus, &c. it means only the white bryony; the later Greek authors, who have copied after the writings of theſe, have called it *bryonia*, always writing it at length; and the virtues aſcribed to it are every where thoſe properly belonging to the white bryony. Yet the Latin tranſlators of the works of Dioſcorides and Theophraſtus, and many among the late botanical writers in general, have given us the word *lupulus* as the tranſlation of *bryon*; and are agreed in the opinion of that word's meaning the hop which we uſe in brewing.

This is a miſtake owing to a too haſty reading; for it is evident to thoſe who enquire deeper into the writings of the antients, that their *cumele*, κυμελη, was our hop; that being deſcribed as a twining plant, as well as the *bryon*, and having all the virtues of the hop, though the other has not. The later Greeks have called this κυμελοβοτανη, *cumelobotane*.

BRYONIA, in botany, a name uſually made to take in two different genera of plants, under the names of *alba* and *nigra*, the white and black kind. Mr. Tournefort, however, has determined this word to expreſs only what we call the *white bryony*, making *tamnus* the name of the black.

BRYONIA *alba*, *white bryony*, is a genus of plants, the characters of which are theſe: The flower is compoſed of only one leaf, which is of the ſhape of a bell, wide open at the mouth, and divided into ſeveral ſegments; and this is uſually ſo nicely ſurrounded by, and firmly incloſed in the cup, that it is not eaſily ſeparated from it. Of the flowers of this plant, which are very numerous, ſome are ſterile, having no embryo of fruit; others have the embryo. The firſt kind are called male flowers, the ſecond female. The embryo in the female flowers ripens into a berry, of a round or oval figure, which contains a number of roundiſh ſeeds. To theſe marks it may be added, that the *bryonies* are all climbing plants, and have tendrils to faſten themſelves to whatever is near them.

The ſpecies of *bryony* enumerated by Mr. Tournefort, are theſe. 1. The rough-leaved white *bryony*, with red berries, called the wild vine. 2. The black-berried white *bryony*; this is called by Dodoneus *black bryony*. 3. The large fruited white *bryony* of Ceylon, with leaves very deeply divided, called by ſome *balſamina ſcandens*, and the ſtinking *momordica*. 4. The ſmaller-berried white *bryony* of Ceylon, with deeply jagged leaves. 5. The yellow-flowered African white *bryony*, with ſmooth and very deeply divided leaves. 6. The tuberoſe-rooted African white *bryony*, with green flowers. 7. The fig-leaved cluſtered white *bryony*. 8. The American white *bryony*, with red berries, reſembling olives. 9. The creeping American white *bryony*, with a ſmooth angular leaf. 10. The creeping American white *bryony*, with rough angular leaves; and, 11. The Canada white *bryony*, with angular leaves and black berries. *Tournef.* Inſt. p. 202.

There has been a ſtrange confuſion among the Greek authors of later date, from the old way of writing the name of this plant; this having been done by abbreviation, *bryon*, βρυον, for *bryonia*, βρυωνια. Commentators have miſtaken *bryon* for the name of another plant, and have rendered it by the word *lupulus*, the hop. See the article BRYON.

Mr. Boulduc, in his examinations of ſeveral purgative medicines, very juſtly obſerves, that *white bryony* is a plant of the ſame nature with the *mechoacan*; its root is the only part of it uſed in medicine. It was once in great eſteem, but has of late loſt its credit, and become diſuſed. However, it is found to be a very briſk purge; ſometimes alſo it operates by vomit, and uſually very ſtrongly by urine. Hence many have celebrated it as a remedy in all dropſical caſes. In its analyſis, it appears to be very different from *mechoacan*, in this, that it contains only a ſaline principle, and no reſinous one.

The root of this plant purges much more ſtrongly in ſubſtance than in any preparation. This is alſo obſerved to be the caſe in all the other vegetable purges; but as this is apt to be too rough in its operation, the ſeveral preparations of infuſions, decoctions, and extracts, are to be preferred to the ſubſtance.

It is, when freſh, full of an uſeleſs and redundant moiſture, and its doſe in infuſion in white wine, which is the beſt menſtruum, is a dram of the dried root, or half an ounce of the green, which is about equivalent in ſtrength. Hiſt. Acad. Par. 1712.

Black BRYONY, *Bryonia nigra*. See the article TAMNUS.

BRYONIA *Indica*, or *Mechoacanna*, a denomination given by ſome to the *mechoacanna*, or white jalap; on a falſe ſuppoſition, that it is a ſpecies of *bryony*. *Quinc.* Diſpenſ. P. 2. ſect. 8. §. 465. *Caſt.* Lex. Med. p. 487. voc. *Mechoacanna*. See the article MECHOACAN, *Cycl.*

BRYONIA *Peruviana*, a denomination given by ſome to jalap, on account of its reſemblance to our *bryony*. *Quinc.* Diſpenſ. P. 2. ſect. 8. §. 478. See the article JALAP, *Cycl.* and *Suppl.*

Wild BRYONY, Βρυωνια Αγρια, is uſed by Dioſcorides for the herb *chamepitys*. *Gorr.* Med. Defin. p. 81. voc. Βρυωνια.

BRYTIA, Βρυτια, among the antient naturaliſts, denotes the maſk or ſolid part of grapes, which remain after expreſſing the juice. *Galen.* de Alim. Fac. l. 2. c. 9. *Caſt.* Lex. Med p. 114.

BRYUM. See the article WALL-*moſs*.

BRYUM *lactucæ folio*, a name given by ſome to the oyſter-green. See the article TREMELLA.

BUBALINUS *ſerpens*, in zoology, a name given by authors to the Anacandaya of the Ceyloneſe, a very terrible ſerpent, common in that part of the world, and very miſchievous among their cattle; whence its Indian name, which ſignifies as much. *Ray*, Syn. Anim. p. 332. See the article SERPENT.

BUBALUS, the *buffalo*, a ſort of wild bull, very common in many parts of Europe, and, in the pope's territories, kept tame, for the ſake of the milk of the female, of which the famous cheeſes, called *caſe di cavallo*, are made. They are alſo commonly employed in the affairs of huſbandry, and have, for this purpoſe, a braſs or iron ring put through their noſes, and, by means of a rope, or thong of leather, put through this, they are managed at pleaſure; though, if ever ſo well tamed, they uſually keep ſomething of their native fierceneſs.

The *buffalo* is ſomewhat larger than the common bull; his body alſo is thicker, and his horns very large, thick, and black; the toughneſs of his skin, of which buff-leather is made, is well known. *Ray*'s Syn. Quad. p. 72. See Tab. of Quadr. N° 12.

BUBO, in zoology, a name uſed by ſome for the owl in general, but, by the more accurate naturaliſts, appropriated to the great horn-owl, called alſo, in ſome places, the eagle-owl. Some authors have deſcribed three ſpecies of this bird; but they ſeem to be only varieties of the ſame ſpecies, according to the differences of age, ſex, and other accidents.

The horn-owl is of the bigneſs of a gooſe, and has large wings, capable of extending to a ſurpriſing breadth. Its head is much of the ſize and figure of that of a cat, and has cluſters of black feathers over the ears, riſing to three fingers height; its eyes are very large, and the feathers of its rump long, and extremely ſoft; its eyes have yellow iriſes, and its beak is ſhort, black, and crooked; it is all over mottled with white, rediſh, and black ſpots. Its legs are very ſtrong, and are hairy down to the very ends of the toes, their covering being of a whitiſh brown. It builds in high and inacceſſible rocks, and feeds on birds, hares, rabbets, and every thing it can lay hold upon. It is as daring as the eagle in this reſpect; and, as it preys in the night, gathers a vaſt quantity of proviſion together, eſpecially at the time of feeding its young. See Tab. of Birds, N° 7. *Ray*'s Ornithol. p. 63.

BUBO, Βουβων, (*Cycl.*) in anatomy, is ſometimes uſed to denote that part otherwiſe called *inguen*, or groin. *Barthol.* l. 1. Anat. in Proem. Dieter. p. 159. *Caſt.* Lex. Med. p. 114. See the article INGUEN, *Cycl.*

Galen, and ſome others after him, alſo give the denomination *bubo* to tumors in the glands of the head, neck, arm-pits, and other parts; but the more exact writers reſtrain the denomination to tumors in the glands of the inguen, on either ſide of the pubis. *Junck.* Conſp. Chir. tab. 21. p. 149.

BUBOES, *venereal*, are tumors ariſing principally in the groin, after contracting the venereal diſeaſe, and they are ſometimes attended with the other ſymptoms of that diſorder, ſometimes they are themſelves the only ſymptoms of it. Theſe ariſe ſometimes ſooner, ſometimes later after contracting the infection. The tumor firſt appears with hardneſs, redneſs, and pain either in one or both the groins, and ſometimes in the arm-pits. Great care is to be taken to diſtinguiſh, in theſe caſes, whether the *bubo* be of a benign kind, or be really from a venereal infection; for miſtakes of this matter are on both ſides very dangerous. If a benign *bubo* be miſtaken for a venereal one, the patient is uſually treated in too harſh a method, and has more trouble and pain than are neceſſary; and, on the other hand, if a venereal *bubo* be miſtaken for a benign one, he is uſually treated ſo improperly as to be brought into a confirmed lues.

The *buboes* are known to be venereal, when they are the conſequences of impure embraces, or are accompanied with or preceded by gonorrhæas, chancres, and other ſymptoms of the venereal diſeaſe. When from theſe attendant ſymptoms, and from the patient's confeſſion, we find the *bubo* to be venereal, a

cure is immediately to be ſet about; for though there is no great difficulty or danger in theſe caſes when taken in time, yet there are few in which delays are of worſe conſequence; for, from theſe, from an irregular courſe of life, or from an improper method of treatment, the cure often becomes extremely difficult, and the patient too frequently gets into a confirmed lues.

It is much diſputed whether the cure of theſe tumors by diſcuſſion be ſafe; many are of opinion, it is by no means to be allowed in theſe any more than in peſtilential *buboes*, ſince in both caſes, by that means, the poiſon is driven back into the blood. But the caſe is not parallel, and the truth is, that, in theſe tumors, the cure by ſuppuration, is ſlow, tedious, and attended with many inconveniences, and that much better effects may be produced, and that with the greateſt ſafety, by purging and mercurial medicines, with the decoctions of the woods, and other purifiers and ſweetners of the blood.

The beſt method, whether the *bubo* be attended with a gonorrhæa or not, is to purge frequently, and give proper doſes of calomel; for *buboes* can never be ſafely cured till the body is perfectly freed from the venereal venom; and, by this means, if there be a gonorrhæa in the caſe alſo, that is cured at the ſame time When there is a great inflammation, and the patient is of a robuſt plethoric habit, it is always neceſſary to bleed; while this method is followed, diſcutient plaſters ſhould be applied externally to the tumor, as the mercurial plaſter or the like, and the patient ſhould be kept to a regular courſe of life, and a proper diet. By this method, venereal *buboes*, which are not become inveterate, may be cured with great eaſe and ſafety.

But if the ſurgeon be called in too late, if the *bubo* will not give way to theſe methods, or if, for any other reaſon, he determines to bring it to ſuppuration, the maturation is in this caſe to be promoted as faſt as poſſible; and one great method to bring on ſuppuration with ſpeed, is to order the part to be rubbed ſtrongly, and for a conſiderable time, either with the fingers wetted with a little oil, or with linen rags, till it look very red and inflamed, and this is to be often repeated, applying after each time a plaſter of diachylon, with the gums, or ſome other of the maturating kind. While the patient is able to go abroad, violent exerciſes of all ſorts, as dancing and the like, are extremely proper, and do ſervice in haſtening a ſuppuration. When the pain will not ſuffer him to walk any longer, then it is proper to keep to the uſe of cataplaſms, inſtead of the plaſter; theſe are indeed ever much more ſerviceable to promote ſuppuration than plaſters, and the beſt on this occaſion are thoſe made of onions, roaſted under the aſhes, or of flour, honey, and yeaſt, or that of crumbs of bread boiled in milk, with the addition of a little ſaffron; theſe are to be applied warm to the parts, and frequently renewed, and it is always beſt to rub the parts till they look very red, before the application of them. During the uſe of theſe external remedies, the patient ſhould be continually taking decoctions of the woods, and ſmall doſes of calomel; for theſe greatly attenuate the blood, drive it toward the skin, and correct the venereal venom. When theſe methods have brought the ſwelling to a perfect ſuppuration, the ſcalpel is to be taken in hand, to make the opening. Great caution is to be uſed in making the inciſion, not to hurt the larger blood-veſſels, which might occaſion very dangerous hæmorrhages. To avoid theſe miſchiefs, the protuberant part of the *bubo* is to be preſſed outward by the fingers, before the ſcalpel is introduced to make the inciſion. Great caution is alſo neceſſary as to the time of opening theſe tumors; for the doing this either too ſoon, or too late, are of very bad conſequence; the firſt brings on violent pains and inflammations, and other bad ſymptoms, and, by the latter, the venom has time given it to mix itſelf with the blood, and bring on a confirmed lues.

If the patient dreads the knife, the *bubo* may be opened with a cauſtic; and by whatever means it is done, it muſt be afterwards well cleanſed. The proper dreſſing on this occaſion is the common digeſtive ointment, with a ſmall quantity of Venice treacle, and a little red precipitate mixed in it; over this is to be applied a plaſter of diachylon, with the gums, or the like; by which means the lips of the *bubo* will be ſufficiently ſoftened: and when ſufficiently deterged in this manner, it may be healed by ſome vulnerary balſam applied on lint. It ſometimes happens, that the ulcerated *bubo* becomes ſo ſtubborn, that it will neither incarn nor cicatrize by the help of any medicines, but always diſcharges a copious quantity of matter. If, in this caſe, burnt alum and red precipitate prove of no ſervice, the actual cautery ought to be applied, and the lymphatics will by this means have their communications for ever cut off. *Heiſter*'s Surgery, p. 207.

BUBOES, *peſtilential*. See PESTILENTIAL *buboes*.

BUBONOCELE (*Cycl.*)—Some make two kinds of *bubonoceles*; the one owing to a deſcent of ſome of the viſcera, as the omentum, or inteſtines, ſtopping in the groin, and not falling ſo far as to the ſcrotum [a]; the other a collection or ſtagnation of excrementitious humours in the inguinal glands; which latter is more properly called *bubo*, and differs little, except in ſeat, from the *bronchocele* [b].—[[a] *Æquet.* l. 3. c. 53. *Gal.* de Tum. Præt. Nat. c. 16. [b] *Caſt.* Lex. Med. p. 114.] See the articles BUBO, and BRONCHOCELE, *Cycl.* and *Suppl.*

BUBONIUM, in botany, a name given by ſome authors to the *aſter atticus*. Ger. Emac. Ind. 2. See the article ASTER.

BUBONIUS *lapis*, a figured ſtone, in ſhape reſembling an owl's head, of a flinty ſubſtance, black within, and cineritious without. It was thus denominated by Dr. Plot, having not been before named by naturaliſts. *Plot*, Nat. Hiſt. Oxfordſh. c. 5. §. 45.

BUBULCA, in zoology, a ſmall freſh-water fiſh, called by ſome *bouviera* and *petenſe*; it is ſmall, flat, and very ſhort, approaching to a round rather than a long ſhape, and of a fine ſilvery whiteneſs. It ſeldom exceeds two inches in length. It has one ſmall fin upon the back, and is covered with large and broad ſcales; its mouth is very ſmall, and has no teeth, and its eyes are of a fine and perfect black. Its gall is ſo large, that it is impoſſible to take out its guts without breaking it; and thus the fiſh gets a diſagreeable bitterneſs in its taſte, which makes it little regarded. *Bellonius* de Piſcib.

BUCA, in natural hiſtory, a name by which ſome authors call the *buccinum*.

BUCAO, in natural hiſtory, a name given by the people of the Philippine iſlands to a ſpecies of ſcreech owl, which is of the ſize of a peacock. It is very common in thoſe iſlands, but wholly unknown to us, and is a very beautiful bird, but makes a hideous noiſe in the night.

BUCARDITES, or BUCARDIA, in natural hiſtory, a name given by many authors to a ſtone, in ſome degree reſembling the figure of an ox's heart. See Tab. of Foſſils, claſs 9.

It is uſually of the ſubſtance of the coarſer ſtones, and is no other than a quantity of the matter of ſuch ſtone received while moiſt into the cavity of a large cockle, and thence aſſuming the figure of the inſide of that ſhell, the depreſſion of the head of the cockle, where the cardo or hinge of this ſhell is, makes a long and large dent in the formed maſs, which gives it a heart-like ſhape.

Theſe, and caſts of a like kind, of the matter of various ſorts of ſtones and other foſſils, of which the common pyrites is not the leaſt common, are very frequent in many parts of the kingdom; the ſtone-pits of Glouceſterſhire, Northamptonſhire, and Oxfordſhire, afford them in great quantities in ſtone; and our own tile clay-pits about London produce great numbers, formed of the matter of the common pyrites. Theſe laſt are principally of the buccinum or nautilus kind, but are caſt in the ſhell, exactly in the ſame manner as the *bucardites*. *Hill*'s Hiſt. of Foſſ. p. 646.

The *bucardites* are the larger ſtones of the ſpecies of cardites; they are generally of a whitiſh colour, ſmooth and plain; tho' there are ſome ribbed on each ſide. Plot mentions a *bucardites*, which he found at Stretford in Staffordſhire, which weighed twenty pounds, tho' broken half away, curiouſly reticulated, with a white ſpar-coloured ſtone. *Plot*, Nat. Hiſt. Oxfordſh. c. 5. §. 145. p. 128. *Grew*, Muſ. Reg. Societ. ſect. 1. c. 1. p. 263.

BUCARDIUM, in natural hiſtory, a name given by authors to a kind of heart-ſhell, reſembling an ox's heart in ſhape; it is of the genus of the cordiformes, or heart-ſhells, and differs from the other kinds, in being of a more globular figure.

The cabinets of the curious afford us ſeven ſpecies of this ſhell: 1. A yellow-furrowed one. 2. A grey ſpinoſe one. 3. A white furrowed one. 4. A thicker narrow one. 5. The thick one, with a cardo ſeparated from the apex. 6. The thick kind, with the cardo at the apex; and, 7. The baſtard Noah's ark-ſhell. See HEART-*ſhells*.

BUCCA FERREA, in botany, a name given by Micheli to a genus of plants, called ſince by Linnæus *Ruppia*. *Michel.* p. 35. See the article RUPPIA.

BUCCÆ *muſculus*, in anatomy, a name given by ſome to the muſcle more uſually called the *buccinator* and *contrahens labiorum*.

BUCCALES *glandulæ* (*Cycl.*)—Steno, and ſome other writers, confound the *buccal* with the maxillary glands [a]; from which they are really diſtinct [b]. — [[a] *Sten.* Obſerv. Anat. p. 14. [b] Phil. Tranſ. N° 304. p. 6, ſeq.] See the article MAXILLARY, *Cycl.* and *Suppl.*

BUCCANEERS (*Cycl.*) are uſually confounded with freebooters, from whom, in ſtrictneſs, they ought to be diſtinguiſhed. The antient inhabitants of Hiſpaniola, and the other Caribee iſlands, after their conqueſt by the Europeans, conſiſted of four ranks or orders of perſons, *viz. buccaneers*, or bull-hunters, who ſcoured the woods; freebooters, who ſcoured the ſeas as pyrates; huſbandmen, who tilled the lands; and ſlaves. Of theſe, the two firſt diſtinguiſhed themſelves moſt, by their military diſpoſition, and the ravages they made, eſpecially among the Spaniards. Their hiſtory, given by Oexmelin, under the title of *The hiſtory of the freebooters and* buccaneers, *from the year* 1670 *to* 1689, is full of the moſt daring reſolute enterprizes, but intermixed with horrible cruelties. Vid. *Charlev.* Hiſt de l'Iſle Eſpagn. T. 3. p. 7, ſeq. Bibl. Raiſon. T. 11. p. 130, ſeq. *Savar.* Dict. Comm. T. 1. p. 417, ſeq. Atlas Marit. p. 320, ſeq.

BUCCEA, or BUCCELLA, a term uſed by medicinal writers in different ſenſes; ſome uſe it to expreſs a fragment of any thing, and others make it the name of what we uſually call a polypus of the noſe. Vid. *Caſt.* Lex. Med. p. 114. *Du*

Cange, Gloſſ. Lat. T. 1. p. 631. *Paracelſ.* de Ulcer. c. 20.

BUCCELLATIO, a word uſed by ſome chirurgical writers for the ſtopping the bleeding of an artery or vein, by applying lint to it.

BUCCELLATON, in the antient medical writers, the name of a medicine, in which ſcammony was the principal ingredient.

They uſed to mix pepper, and the ſeeds of ſmallage, aniſe, and fennel, with ſcammony, and then mixing up the whole with honey into a thick electuary, they ſent it to be baked in an oven. This is the *buccellatum* of Ægineta; but Aetius deſcribes it as made of ſcammony, with its correctives, put into fermented flour, and baked in the oven into a ſort of loaf. *Aetius*, l. 3. c. 100. *Ægineta*, l. 7. c. 5. *Caſt.* Lex. Med. p. 114.

BUCCELLATUM, in antient military writers, denotes camp-bread, or biſcuit baked hard and dry, both for lightneſs and keeping. *Ammian. Marcellin.* l. 17. *Du Cange*, Gloſſ. Lat. T. 1. p 633. *Spartian.* in Nig. c. 10. *Calv.* Lex. p. 127. See the articles BREAD, and BISKET.

The word is formed from *buccea*, or *buccella*, a morſel, or mouthful of meat.

Soldiers always carried with them enough for a fortnight, and ſometimes much longer, during the time that military diſcipline was kept up. *Aquin.* Lex. Milit. T. 1. p. 139. *Pitiſc.* Lex. Ant. T. 1. p. 299. *Briſſ.* de Verb. Signif. p. 87. *Du Cange*, Gloſſ. Græc. T. 1. p. 213. voc. Βουκελατ. ν.

BUCCINA (*Cycl.*) — This inſtrument was in uſe among the Jews, to proclaim their feaſt-days, new-moons, jubilees, ſabbatic years, and the like [a]. At Lacedæmon, notice was given by the *buccina* when it was ſupper-time; and the like was done at Rome, where the grandees had a *buccina* blown both before they ſat down to table and after [b].—[a *Bartoloc.* Bibl. Rabbin. P. 2. p. 186, ſeq. b *Schel.* ad Polyb. p. 1183. *Buleng.* de Imp. Rom. l. 2. c. 33. *Schoetg.* Ant. Lex. p. 235.]

The ſound of the *buccina* was called *buccinus*, or *bucinus*, and the muſician who played on it, *buccinator*. *Du Cange*, Gloſſ. Lat. T. 1. p. 633.

BUCCINA alſo denotes the ſpace or extent to which the ſound of the *buccina* may be heard. *Du Cange*, loc. cit.

BUCCINA *auris*, in middle age writers, denotes the tympanum or drum of the ear. Vid. *Frid.* Imper. de Venat. l. 1. c. 25. *Du Cange*, loc. cit.

BUCCINATOR, Βυκανητης, (*Cycl.*) he that ſounds or winds the buccina. *Aquin.* Lex. Milit. p. 140. *Pitiſc.* Lex. Ant. T. 1. p. 300. *Calv.* Lex. Jur. p. 127.

Among the Romans there was a public ſlave, denominated *buccinator nominum*, whoſe office was to attend the public crier. Trev. Dict. Univ. T. 1. p. 1274. *Pitiſc.* loc. cit.

BUCCINUM, in botany, a name given by ſome authors to the lark-ſpur. *Ger.* Emac. Ind. 2.

BUCCINUM is alſo uſed for the *trumpet-ſhell*. See TRUMPET-*ſhell*.

BUCCO, in anatomy, a name given by Riolanus, and ſome others, to the muſcle more uſually called *buccinata*, and *contrahens labiorum*.

BUCCULA, in anatomy, the fleſhy part under the chin. *Barthol.* Anat. l. 3. c. 11. p. 532. *Caſt.* Lex. Med. p. 114.

Some extend the name farther to the whole lower part of the face, comprehending the under part of the lower lip, with the chin and the fleſhy part under it. Trev. Dict. Univ. T. 1. p. 1275.

BUCCULA, in antiquity, denotes the umbo of a ſhield, or the part prominent in the middle thereof. *Aquin.* Lex. Milit. T. 1. p. 141.

It is thus called, becauſe uſually made in the form of a mouth or face, either of a man or ſome animal. The like figures were ſometimes alſo found on other parts of armour, eſpecially on the loricæ and thoraces. *Du Cange*, Gloſſ. Lat. T. 1. p. 634. Item, Gloſſ. Græc. T. 1. p. 215. voc. Βουκολον.

The generality of writers, after Turnebus, have miſtaken the *buccula* for the vizor [a], or that part of the helmet which covers the mouth. In which ſenſe they interpret that of Juvenal, *Lorica & fracta de caſſide buccula pendens* [b]. But that paſſage quadrates equally well with the former acceptation.—[a *Turneb.* Adverſ. l. 9. c. 16. *Pitiſc.* Lex. Ant. T. 1. p. 300. *Briſſon.* de Verb. Signif. p. 87. *Calv.* Lex. Jur. p. 128. *Kenn.* Rom. Ant. Not. P. 2. l. 4. c. 9. p. 201. b *Juv.* Sat. 10. v. 134.]

BUCHNERA, in botany, the name of a genus of plants, the characters of which are theſe: The perianthium is tubular, conſiſting of one leaf, divided into five ſegments at the edge, and remaining after the flower is fallen. The flower conſiſts of one petal, which forms a very long and capillary arched tube, and its verge is plain and ſhort, and is divided lightly into five ſegments, which are ſmall at the baſe, and broader, and figured like a heart at the top. The ſtamina are four very ſhort filaments; the antheræ are oblong and obtuſe; the germen of the piſtil is oblong and oval; the ſtyle is very ſlender, and of the length of the tube; and the ſtigma is obtuſe. The fruit is a capſule of an oblong oval figure, pointed at the end, containing two cells, and opening at the top into two parts. The ſeeds are numerous, and of an angular figure. *Linnæi* Gen. Plant. p. 302. Hort. Cliff. p. 501.

BUCK, (*Cycl.*) a male horned beaſt of venery or chaſe, whoſe female is denominated a *doe*.

A *buck* the firſt year is called a *fawn*, the ſecond a *pricket*, the third a *ſorel*, the fourth a *ſore*, the fifth a *buck of the firſt head*, and the ſixth a *great buck*. *Cox*, Gent. Recr. P. 1. p. 8.

BUCK is alſo applied to the males of the hare and rabbet kind. Hares commonly go to *buck* in January, February, and March, and ſometimes all the warm months; ſometimes they ſeek the *buck* ſeven or eight miles from the place where they ſit. *Cox*, lib. cit. p. 86.

The *buck* rabbet is ſaid to kill all the young he can come at; on which account the doe is careful to hide her offſpring in ſome remote corner, out of his way.

The doe coney goes to *buck* as ſoon as ſhe has kindned. She cannot ſuckle her young till ſhe have been with the *buck*.

When he has bucked, he uſually falls backward, and lies as in a trance half dead, at which time he is eaſily taken. *Cox*, ib. p. 92.

BUCK-*maſt*, is uſed by ſome for the maſt or fruit of the beech-tree. Dict. Ruſt. T. 1. in voc.

BUCK-*bean*. See TRIFOLIUM *paluſtre*.

BUCK-*ſkins*. See the article SKINS.

BUCK-*ſtall*, in our antient law books, a toil wherein to take deer. *Dugd.* Monaſt. T. 2. p. 827. *Du Cange*, Gloſſ. Lat. T. 1. p. 635.

By an antient ſtatute, no perſon is allowed to keep a *buck-ſtall*, who has not a park of his own. Stat. 19 Hen. 7.

BUCKET, in hydraulics, a kind of veſſel or recipient chiefly of uſe for the raiſing and conveyance of water from wells, and other places.

The word is formed from the French *bacquet*, a pail or tub. *Savar.* Dict. Comm. T. 1. p 209. voc. *Bacquet*.

In an army, *buckets* are carried with the artillery, in the fire-workers ſtores. *Guill.* Gent. Dict. P. 2. in voc.

Town *buckets*, for extinguiſhing fires, are made of thick leather, ſtrongly ſoaked and boiled. Trev. Dict. Univ. T. 4. p. 1589. voc. *Eau*.

One method of raiſing water, deſcribed by hydraulic writers, is by the means of a chain of *buckets*. *Wolf.* Elem. Hydraul. §. 96.

BUCKING, an operation performed on linnen cloth and yarn, to render them ſomewhat white, by working them with lye made of aſhes. Dict. Ruſt. T. 2. voc. *Whitening*.

Bucking of cloth is the firſt ſtep or degree of whitening it.

To drive a buck of yarn, they firſt cover the bottom of the *bucking* tub with fine aſhes of the aſh-tree, then ſpread the yarn thereon, then cover it again with aſhes, and thus ſtratum ſuper ſtratum, till the yarn is all in; when they cover the whole with a *bucking* cloth, and lay on it more aſhes, and pour in warm water, till the tub be full, and let it ſtand all night. Next morning they let the lye run into another veſſel, and, as it waſtes, fill up the tub with warm water from a kettle, and, as this waſtes, fill it up with the lye that runs from the *bucking* tub; ſtill obſerving to make the lye hotter and hotter, till it boils. Thus are both the tub and kettle to be ſupplied for at leaſt four hours, which is called *driving a buck of yarn*. *Hought.* Coll. T. 2. N° 350. p. 397, ſeq.

BUCKLE, in matters of trade, a little metalline machine, whereby to retain and keep faſt certain parts of the habit, as well as of the harneſs of horſes, *&c.*

The word is formed from the French *boucle*, and that, according to Caſſeneuve, from the barbarous Latin *pluſcula*, which ſignified the ſame [a]. According to Menage, from *bucula*, the anſa or handle of a buckler [b].—[a *Caſen.* Orig. Franc. p. 26. b *Menag.* Orig. p. 113. voc. *Boucle*. See alſo *Du Cange*, Gloſſ. Græc. p. 215. voc. Βουκλα.]

The *buckle* is a part of modern dreſs, correſponding to the περονη, and fibula, among the antients.

Buckles are of divers ſorts, as ſhoe and garter *buckles*; ſome round, others ſquare, or oval, or cut, each of which have their reſpective artificers by whom they are made.

The like may be ſaid of the great variety of *buckles* belonging to the pack and hackney-ſaddles, ſuch as ſetts, black or oiled *buckles*, ſanguine *buckles*, crupper *buckles*, breaſtplate *buckles*, and ſurcingle *buckles*: and to theſe may be added divers other *buckles*, made promiſcuouſly with the former, as the heſter *buckle*, plain and knobbed, for the white bridles, and the open and plain crown *buckles* for the black; and ſo the Poland *buckle*, the peaſe *buckle*, chaſed *buckles*, Dutch and Iriſh *buckles*, which are braſs, and made by the copper-ſmith. *Plot*, Nat. Hiſt. Staffordſh. c. 9. §. 80. p. 377.

Girth-BUCKLE, among ſadlers, is a four ſquare hood, with a tongue, which is made ſteady, by going through a hole of leather, and faſtened with narrow thongs. Dict. Ruſt. in voc.

BUCKLER (*Cycl.*) is the ſame with what we otherwiſe call ſhield or target; and by the one or the other we indifferently render what among the antients were denominated ασπις, *clypeus*, *ſcutum*, and *parma* [a]; though the three latter were different from each other [b].—[a Philoſ. Tranſact. N° 241. p. 206. b *Salmuth.* ad Pancirol. P. 1. tit. 54. p. 285. *Pott.* Archæol. l. 3. c. 4. T. 2. p. 32, ſeq. *Kenn.* Rom. Antiq.

Not.

Not. P. 2. l. 4. c. 9. Philoſophical Tranſactions, loc. citat.

The antients were particularly ſolicitous to preſerve their *bucklers* in fight; it being highly infamous, and even penal, to return without them [c]. It was on their *bucklers* that they carried off the bodies of their ſlain, eſpecially thoſe of diſtinction [d].—[c *Pott.* Arch. Att. l. 3. c. 13. p. 115. [d] Id. ibid. c. 4. p. 34, ſeq.]

BUCKLER *of a caſk*, denotes a moveable head, whereby to compreſs the contents of it.

In this ſenſe we ſay, a *buckler* of pilchards. *Pett.* Diſc. Duplic. Proport. p. 114. See the article PILCHARD.

BUCKRAM, a thick ſort of linnen or hempen cloth, ſtiffened with gum, chiefly uſed in the linings of cloaths, to ſuſtain and make them keep their form.

The word is formed from the French *bougram*, which ſignifies the ſame; and this perhaps from the old French word *bouqueran*, a ſort of ſtuff ſuppoſed to be made of goats hair, called *poil de bouc*. Trev. Dict. Univ. voc. *Bouqueran*. *Menage*, Orig. p. 114. *Caſen.* Orig. p. 27.

Buckrams are chiefly made of old cloth, eſpecially ſheets; tho', for want of this, they are frequently alſo made of new linnen, gummed, ſtiffened, callendared, and dyed. *Hought.* Collect. T. 2. p. 409. N° 355. *Savar.* Dict. Comm. T. 1. p. 432. voc. *Bougram*.

BUCKTHORN *berries*, the fruit or ſeed of a thorny tree, called by botaniſts *rhamnus*, or *ſpina cervina*. See the article RHAMNUS.

They are larger than the elder berries, round and black, yielding a bitter purple juice, tinged with green, and holding three or four cornered ſeeds.

The tree grows in woods and hedges, having its branches ſet with long ſtiff thorns.

The ſyrup is the only preparation of thoſe berries now in phyſical uſe.

It is a ſtrong purgative, and effectual in evacuating watery and flatulent humors; on which account it is eſteemed in dropſies, rheumatiſms, and even the gout. *Quinc.* Diſpenſ. P. 2. ſect. 8. n. 472. p. 196, ſeq.

Of *buckthorn* berries are made three ſeveral ſorts of colours; being gathered green, and kept dry, they are called *ſap-berries*; which being ſteeped in alum-water, give a fair yellow colour, uſed by painters, book-binders, and leather-dreſſers; who alſo make a green colour, called *ſap-green*, taken from the berries when they are black. Theſe being bruiſed, and put into a braſs kettle, and there ſuffered to remain for three or four days, with ſome beaten alum put to them, they are afterwards preſſed, and the liquor uſually put into bladders, and hung up till it be dry: this is afterwards diſſolved in water or wine, but Canary is the beſt, to preſerve the colour from ſtarving. The third is of a purpliſh colour, made of the berries, ſuffered to grow upon the buſhes till the middle or end of November, when they are ready to fall of themſelves. Vid. *Boyle*, Phil. Works abr. Vol. 2. p. 76, 77.

BUCOLICA, Βουκολικη, is by ſome uſed for the art of managing, feeding, and breeding cattle. *Micræl.* Lex. Philoſoph. p. 222.

BUCOLIC *poetry* is by ſome called *Aſtrabic*, as being ſuppoſed to have firſt commenced among the antient herdſmen in riding a ſort of waggons called *aſtrabes*.

It is uſually divided into *monoproſopium*, wherein only a ſingle perſon ſpeaks, and *amœbæum*, or dialogue wherein are ſeveral interlocutors.

Theocritus's Idyllia, and Virgil's Eclogues, are the chief of the antient *bucolics* now extant.

Some aſcribe the invention of *bucolic* poetry to the herdſmen of Laconia, who, not being able to hold the cuſtomary feaſt of virgins in honour of Diana Caryatis, by reaſon of the war with Xerxes, inſtituted βεκολιασμοι, or *bucolic* exerciſes, in lieu thereof. *Scal.* Poet. l. 1. c. 4. p. 17, ſeq. *Pott.* Archæol. l. 2. c. 20. T. 1. p. 408.

Hence alſo the origin of a ſort of poetical champions, called βεκολιασται, by the Latins *luctiones*, who went about the country contending for the prizes frequently propoſed for the conquerors in this kind of combat. Of which rank Daphnis was the moſt diſtinguiſhed. They not only rehearſed their verſes, but plaid on a kind of fiſtula or pipe, called *ſyrinx*. *Scal.* loc. cit. p. 17, ſeq.

The abbot Goulley has a diſſertation expreſs on the antient *bucolic* poetry of Sicily; wherein there is a particular enquiry into the birth-place and adventures of Daphnis. Hiſt. Acad. Inſcript. T. 3. p. 123, & 131, ſeq.

BUCTON, a word uſed by Severinus and ſome others, as a name for that part of the pudendum muliebre, commonly called the *hymen*. *Caſt.* Lex. Med. p. 115. See the article HYMEN, *Cycl.*

BUD (*Cycl.*) primarily denotes that part of a ſeed which firſt begins to ſprout or germinate. See the articles SEED, VEGETATION, &c.

In which ſenſe, *bud* amounts to the ſame with germ, germen, gem, or gemma.

In moſt ſeeds is found a true *bud*, conſiſting of perfect leaves, only differing in bigneſs from thoſe which grow on the ſtalk. In many ſeeds this *bud* is very apparent, in others it lies ſo deep between the lobes, as to be almoſt indiſcernible. In ſome plants the leaves of the *buds* are but two, in others four, in others ſix, and in ſome more. *Grew*, Anat. Veget. l. 4. c. 5. §. 3, ſeq. p. 206, ſeq.

BUD is alſo uſed to denote the beginning of a bloſſom, or young ſprout, whether of a branch, foliage, or flower.

The *buds* of flowers and fruits are formed at the ſame time as the branches themſelves on which they ariſe. Mem. Acad. Scienc. an. 1711. p. 59, ſeq.

The *bud* of a branch has its origin from the inner part of the ligneous body next the pith; by which it differs from a thorn, which has its origin from the outer and leſs fruitful part, and ſo produces no leaves, being as it were only the male of a *bud*. *Grew*, ubi ſup. l. 1. c. 4. App. p. 33.

Every *bud*, beſides its proper leaves, wherein it is couched or folded up, is covered with divers leafy pannicles or ſurfoils, which ſerve as a defence to the leaves themſelves. Idem, ib. c. 4. §. 17. p. 32. Item, l. 4. c. 1. §. 2. p. 145, ſeq.

The *buds* or knots on branches ariſe from the inmoſt part of the branches, the ſtructure of the ligneous fibres and little bladders of the branch being ranged ſo nicely in this form, that, upon the putting out of the branch, the *bud*, which is compoſed of the ſame parts, may likewiſe ſhoot with it. *Malpig.* Anat. Plant. P. 26, ſeq. Phil. Tranſact. N° 118. p. 404.

Leewenhoeck aſſures us, that in the *bud* of a curran tree, even in winter, he could diſcover not only the ligneous part, but even the berries themſelves, appearing like ſmall grapes. *Niew.* Relig. Philoſ. p. 374, ſeq.

BUDDLE, (*Cycl.*) in mineralogy, a name given by the Engliſh dreſſers of the ores of metals, to a ſort of frame made to receive the ore after its firſt ſeparation from its groſſeſt foulneſs.

The ore is firſt beaten to powder in wooden troughs, through which there runs a continual ſtream of water, which carries away ſuch of it as is fine enough to paſs a grating, which is placed at one end of the trough; this falls into a long ſquare receiver of wood, called the *launder*: the heavieſt and pureſt of the ore falling at the head of the launder, is taken out ſeparately, and requires little more care or trouble; but the other part, which ſpreads over the middle and lower end of the launder, is thrown into the *buddle*, which is a long ſquare frame of boards, about four feet deep, ſix long, and three wide; in this there ſtands a man bare-footed, with a trambling ſhovel in his hand, to caſt up the ore about an inch thick, upon a ſquare board placed before him as high as his middle; this is termed the *buddle*-head; and the man dexterouſly, with one edge of his ſhovel, cuts and divides it longwiſe, in reſpect of himſelf, about half an inch aſunder, in theſe little cuts; the water coming gently from the edge of an upper plain board, carries away the filth and lighter part of the prepared ore firſt, and then the metalline part immediately after; all falling down into the *buddle*, where, with his bare feet, he ſtrokes it and ſmooths it, that the water and other heterogeneous matter may the ſooner paſs off from it.

When the *buddle* by this means grows full, the ore is taken out; that at the head part, being the fineſt and pureſt, is taken out ſeparate from the reſt, as from the launder. The reſt is again trampled in the ſame *buddle*; but the head, or, as it is called, the forehead of this *buddle*, and of the launder, are mixed together, and carried to another *buddle*, and trampled as at firſt. The foreheads of this laſt *buddle*, that is, that part of the ore which has fallen at the head, is carried to what they call a drawing *buddle*, whoſe difference from the reſt is only this, that it has no tye, but only a plain ſloping board, on which it is once more waſhed with the trambling ſhovel. Tin-ore, when it is taken from this, is called black tin, and this is found to be completely ready for the blowing-houſe. Phil. Tranſ. N° 69.

BUDDLING *of calamine*, denotes the operation of cleanſing it from filth, by waſhing and picking it, preparatory to the baking it in the oven. Philoſ. Tranſact. N° 198. p. 675. See BUDDLE and CALAMINARIS *lapis*, *Cycl.* and *Suppl.*

BUDDLING *diſh*, a ſmall ſhallow veſſel, like the baſons of a pair of ſcales, for the waſhing of ores of metals by the hand. *Shaw*'s Lect. p. 8.

BUDGE-*barrels*, are ſmall barrels well hooped, with only one head, the other end having nailed on it a piece of leather, to draw together upon ſtrings, like a purſe.

Budge-barrels are uſed for carrying powder along with a gun or mortar; as being leſs dangerous, and alſo eaſier than whole barrels. They are alſo uſed upon batteries of mortars, for holding meal-powder. *Guill.* Gent. Dict. P. 2. in voc.

BUDLEIA, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants, the characters of which are theſe: The calyx is an extremely ſmall perianthium, divided into four at the end; placed erect, and remaining after the flower is fallen. The flower conſiſts of a ſingle petal, which is ſlightly divided into four ſegments, placed erect, and is of three times the ſize of the cup; the ſegments are of an oval figure, and acute. The ſtamina are four extremely ſhort filaments, ſituated at the notches of the flower. The antheræ are very ſhort and ſimple. The germen is of an oval figure, the ſtyle is ſimple, of but half the length of the flower, and the ſtigma is obtuſe. The fruit is an oval oblong capſule, marked with two furrows, and containing two cells. The ſeeds are very numerous, and extremely ſmall. *Linnæi* Gen. Plant. p. 26.

BUFETAGE, *Bufetagium*, or *bufetaria*, a duty paid to the lord for the drinking, or rather ſelling of wine in taverns.

The word is formed from *buvetage*, or *buveterie*, of the French *boire*, to drink. *Du Cange*, Gloſſ. Lat. T. 1. p. 635.

BUFF (*Cycl.*)—The ſkin of the American mouſe deer, when well dreſſed, makes excellent *buff*. The Indians make their ſnow-ſhoes of them. Their way of dreſſing it, which is reckoned very good, is thus: After they have haired and grained the hide, they make a lather of the mouſe's brains in warm water, and, after they have ſoaked the hide for ſome time, they ſtretch and ſupple it. Phil. Tranſ. N° 368. p. 168. See the article SKIN.

BUFFALO, *Bubalus*, in zoology. See BUBALUS.

BUFFET-*ſtool*, a little portable ſeat, without back or arms. *Neve*, Build. Dict. in voc.

BUFFOONS, (*Cycl.*) are the ſame with what we otherwiſe find denominated *ſcurræ* [a], *gelaſiani* [b], *mimilogi* [c], *miniſtelli* [d], *goliardi* [e], *joculatores* [f], &c. whoſe chief ſcene is laid at the tables of great men.—[a *Pitiſc.* Lex. Ant. T. 2. p. 713. voc. *Scurræ*. b Id. T. 1. p. 845. voc. *Gelaſiani*. c *Du Cange*, Gloſſ. Lat. T. 3. p. 551. voc. *Mimilogi*. d Id. ibid. p. 558. voc. *Miniſtelli*. e Id. T. 2. p. 637. voc. *Goliardi*. f Id. T. 1. p. 636. voc. *Buffones*.]

Gallienus never ſat down to meat without a ſecond table of *buffoons* by him [g]; Tillemont alſo renders pantomimes by *buffoons* [h].—[g *Pitiſc.* loc. cit. h *Tillemont*, Hiſt. des Emper. T. 2. p. 144. Trev. Dict. Univ. T. 1. p. 1665.]

In which ſenſe he obſerves, the ſhews of the *buffoons* were taken away by Domitian, reſtored by Nerva, and finally aboliſhed by Trajan. However commendable the firſt abolition of them was, it became odious, becauſe done by Domitian. See the article PANTOMIME.

BUFO, in zoology, the name by which many authors call the common toad, denominated by others *rubeta*. See the article RUBETA.

BUFONITÆ, foſſile teeth of the wolf fiſh. See the article LYCODONTES.

Pulvis BUFONUM. See TOAD-*powder*.

BUGA *marble*, in natural hiſtory, a name given by the Spaniards to a ſpecies of black marble, called by our artificers the Namur-marble, and known among the antient Romans by the name of *marmor Luculleum*. It is common in many parts of Europe, and is uſed by the Spaniards in medicine as well as in building; the powder of it being ſaid to be an excellent ſtyptic, applied to freſh wounds. *Hill*'s Hiſt. of Foſſils. See the article *Luculleum* MARMOR.

BUGEE, in zoology, a ſpecies of monkey, which we ſee ſometimes brought over for a ſhew. It is an Indian animal, and a very rare one even there. It is about the ſize of a beaver, and much of the ſame colour, but its tail and claws wholly of the monkey kind.

BUGELUGEY, in zoology, the name of a large ſpecies of lizard, called by Cluſius, and ſome other authors, by the indeterminate name of *Lacertus Indicus*. It grows to four feet long, and will then meaſure nine inches round; the tail is very long, and ends in an extremely ſlender point. It is of a brown colour, but oddly variegated with a blueiſh white in regularly figured ſpots, ſome of them being ſquare, and others of a rhomboidal figure; theſe are irregularly ſcattered over the whole body. The ſkin is covered with ſmall ſcales; thoſe about the head and neck are round, thoſe on the back ſquare, and thoſe on the tail oblong, and diſpoſed in a circular ſeries. Its mouth opens to a great width; its teeth are very ſharp before, but large and blunt behind; and the hinder legs are much longer than the fore ones, and twice as thick, though thoſe are by no means ſlender. Its toes are very long, and the claws long, yellow, and very ſharp. The ſcales which cover the belly are four or five times larger than thoſe on the back. *Ray*'s Synop. Animal. p. 270.

BUGG-*caterpillar*, in natural hiſtory, a name given by Mr. Bonnet to a ſmall ſpecies of caterpillar, which ſmells exactly like a bug. This is not the only ſpecies which yields a ſenſible ſmell, for there is one of the middle-ſized ſmooth kind, which, at the time of the change into the chryſalis ſtate, yield a very pleaſant roſe-like ſcent, and their caſes, which are made of earth and ſilk, retain that ſmell for a long time together, even for ſeveral years. There is another, which ſmells ſtrongly of muſk. Phil. Tranſ. N° 469. p. 467.

BUGGERS, *Bulgarii*, antiently ſignified a kind of heretics, otherwiſe called *Paterini*, *Cathari*, and *Albigenſes*.

The word is formed of the French *Bougres*, which ſignified the ſame, and that from *Bougria* or *Bulgaria*, the country where they chiefly appeared. *Du Cange*, Gloſſ. Lat. T. 1. p. 636. voc. *Bulgari*.

The *Buggers* are mentioned by Matthew Paris, in the reign of Henry III. under the name of *Bugares* [a]. *Circa dies autem illos invaluit hæretica pravitas eorum qui vulgariter dicuntur* Paterini *&* Bugares, *de quorum erroribus malo tacere quam loqui* [b]. They were ſtrenuouſly refuted by Fr. Robert, a dominican, ſurnamed the *Bugger*, as having formerly made profeſſion of this hereſy. Froiſſart, ſpeaking of Don Pedro king of Caſtile, ſays he was excommunicated and declared *bugger* and infidel [c]. He adds, that one Betiſach, the duke of Berry's treaſurer, was burnt alive at Beziers, for having owned himſelf a heretic, and that he maintained the opinion of the *Buggers*, who denied the Trinity and Incarnation [d]. —[a Vid. *Matth. Paris*, in Vit. Hen. III. b *Caſen.* Orig. Franc. p. 26, ſeq. voc. *Bougre*. c *Froiſſart*, l. 1. c. 227. *Et fut en plein conſiſtoire en Avignon & en la chambre des excommuniez, publiquement declare & repute pour* Bougre *& incredule*. d Id. T. 2. l. 7. *Aubert*, Not. ad Richel. T. 1. p. 224.]

BUGGER, or BUGGERER, came afterwards to be uſed for a Sodomite; it being one of the imputations laid, right or wrong, on the Bulgarian heretics, that they taught, or at leaſt practiſed, this abominable crime. *Caſen.* Orig. p. 27. *Menag.* Orig. p. 114. Trev. Dict. Univ. T. 1. p. 1149. voc. *Bougre*. *Du Cange*, Gloſſ. Lat. T. 1. p. 637. voc. *Bulgari*.

BUGGER, *Bulgarius*, is alſo a denomination given to uſurers, a vice to which the ſame heretics are ſaid to have been much addicted. *Du Cange*, Gloſſ. Lat. T. 1. p. 637.

BUGLE, *Bugula*, in botany. See the article BUGULA.

BUGLOSS, *Bugloſſum*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, of a rotated form, and divided into many ſegments at the edges; the cup is divided into ſegments even to the baſe, and from this there ariſes a piſtil, which is fixed in the manner of a nail to the lower part of the flower, and is ſurrounded by four embryos, which afterwards become as many ſeeds, ſhaped like a viper's head, and ripening in the cup, which becomes greatly enlarged to receive them.

The ſpecies of *bugloſs* enumerated by Mr. Tournefort, are theſe: 1. The broad-leaved ever-green *bugloſs*. 2. The great narrow-leaved blue-flowered *bugloſs*. 3. The great narrow-leaved white-flowered *bugloſs*. 4. The great narrow-leaved *bugloſs*, with red or variegated flowers. 5. The great *bugloſs*, with ſinuated leaves. 6. The taller and rougher common *bugloſs*. 7. The great black wild *bugloſs*. 8. The great *bugloſs* of Crete, with a blue or purple flower. 9. The great Cretic *bugloſs*, with a red flower. 10. The great Cretic *bugloſs*, with a white flower. 11. The Portugal *bugloſs*, with undulated leaves, like thoſe of vipers *bugloſs*. 12. The ſmaller narrow-leaved *bugloſs*. 13. The leſſer wild *bugloſs*. 14. The ſmall ſweet Cretic *bugloſs*, with a beautifully variegated flower. 15. The warty or pearled Cretic *bugloſs*. 16. The narrow-leaved *bugloſs*, with echinated ſeeds. 17. The red-rooted *bugloſs*, commonly called the ordinary blue-flowered alkanet. 18. The red-flowered, red-rooted *bugloſs*, or alkanet. 19. The white-flowered red-rooted *bugloſs*, or alkanet, with white flowers. 20. The narrow-leaved indented *bugloſs*. 21. The roſemary-leaved ſhrubby *bugloſs*. 22. The gromwell-leaved Portugal ſhrubby *bugloſs*. 23. The gromwell-leaved annual field *bugloſs*. 24. The ſmalleſt annual yellow-flowered *bugloſs*, called yellow alkanet. 25. The Portugal *bugloſs*, with long, rough, and curled leaves. 26. The Portugal *bugloſs*, with leaves beſet with ſmall ſharp granules. 27. The blue-flowered hoary ſea *bugloſs*.

The flowers of the common *bugloſs* ſtand recommended for the ſame virtues with thoſe of borrage; they are ſuppoſed to be cordials of the very firſt rank, and to be of great uſe in hypochondriac and melancholic caſes. But theſe virtues are not well warranted. *Tournefort*, Hiſt. Plant. p. 133.

BUGLOSSUS, in zoology, a name uſed by many authors for the ſoal fiſh. *Geſner*, p. 785.

BUGULA, *Bugle*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, which is formed into a ſingle lip, and divided into three ſegments; the middle one of theſe is bifid, and the ſmall jaggs ſeem to occupy the place of an upper lip. The piſtil ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower, and is ſurrounded by four embryos, which afterwards ripen into four roundiſh ſeeds; theſe are contained in a capſule, which was before the cup of the flower. To theſe marks it is to be added, that the flowers of *bugle* are placed verticillately.

The ſpecies of *bugle* enumerated by Mr. Tournefort are theſe: 1. The common blue-flowered *bugle*. 2. The greyiſh or white flowered *bugle*. 3. The greateſt Alpine *bugle*. 4. The hairy wild *bugle*, with beautifully red flowers; and, 5. The white-flowered hairy *bugle*. *Tourneſ.* Inſt. p. 209.

Bugle is a noted vulnerary, much uſed in potions of that intention, and alſo in plaſters, eſpecially among the French, with whom it is a proverb, that the perſon who has *bugle* and ſanicle, has no occaſion for a ſurgeon.

It is uſed both internally and externally for all bruiſes, wounds, and contuſions; for ſores and ulcers, ſpitting of blood, and hæmorrhages from any part; alſo for the dyſentery, fluor albus, diſeaſes of the throat, and thruſhes in the mouth. Vid. *James*, Med. Dict. in voc.

BUILDING (*Cycl.*)—The perfection of *building* conſiſts in its adequate agreement with the intention of the founder [a]; its decoration in the aſſemblage of ſuch things as are proper to attract the attention of perſons paſſing by [b]; its ſtrength or firmneſs, in being free from the danger of coming ſhortly to ruin or decay [c]; its utility or conveniency, that diſpoſition of the whole, and each part, which renders its uſe to the owner moſt perfect [d]; its beauty, in the true or apparent perfection of it, conſidered as ſeen [e].—[a *Wolf.* Elem. Archit. §. 8. b Id. ib. §. 14. c Id. ib. §. 6. d Id. ib. §. 7. e Id. ib. §. 9.]

Some will have the proportions of the parts of *buildings* to have been originally taken from thoſe of the parts of the human body. *Perrault*, Treat. Five Ord. in Pref p. 1.

Authors diſtinguiſh two kinds of proportion to be obſerved in *buildings*, viz. ſymmetry, and eurythmy. *Sturm.* Mathem. Compend. p. 52.

There are three ſorts of draughts or repreſentations of a *building* neceſſary to be made before the conſtruction be begun, *viz.* an ichnography or plan, an orthography or profile, and a ſcenography or perſpective. *Sturm.* ubi ſupra, p. 62. See the articles ICHNOGRAPHY, ORTHOGRAPHY, and SCENOGRAPHY, *Cycl.*

We ſay a Doric, a Corinthian edifice, not only in ſpeaking of thoſe which have entire orders, but of ſuch as have only ſome part or characteriſtic of an order; as an entablature, pediment, chambranle, or the like. *Davil.* Cours d'Archit. p. 5. See ORDER, DORIC, CORINTHIAN, *&c. Cycl.*

'Tis a miſtake that *buildings* are to be made loftier in proportion as they are larger. *Perrault*, ubi ſupra, P. 2. p. 127.

The modern *buildings* are much more commodious, as well as beautiful, than thoſe of former times. Of old they uſed to dwell in houſes, moſt of them with a blind ſtair-caſe, low ceilings, and dark windows; the rooms built at random, without any thing of contrivance, and often with ſteps from one to another; ſo that one would think the people of former ages were afraid of light and freſh air: whereas the genius of our times is altogether for light ſtair-caſes, fine ſaſh-windows, and lofty ceilings. And ſuch has been our builders induſtry in point of compactneſs and uniformity, that a houſe after the new way will afford, on the ſame quantity of ground, almoſt double the conveniencies which could be had from an old one. *Davil.* Cours d'Archit. T. 1. in Pref. *Neve*, Build. Dict. in voc.

Public BUILDINGS, according to Daviler, include thoſe belonging to religion, as temples, churches, hoſpitals, moſques, tombs, *&c.* thoſe erected for ſecurity, as walls, towers, baſtions, and other parts of fortification; thoſe ſerving for utility or convenience, as bridges, cauſeways, ports, aquæducts, courts, markets, bazars, caravanſeras; and laſtly, thoſe erected for magnificence, as triumphal arches, obeliſks, amphitheatres, porticos, *&c.* See *Davil.* loc. cit. p. 417. *Schot.* Itin. Ital. l. 2. p. 131. Phil. Tranſ. N° 200. p. 769. Hiſt. Acad. Inſcript. T. 1. p. 119, ſeq. *Hought.* Collect. T. 4. p. 341, ſeq.

Private BUILDINGS, thoſe intended for habitation, ſuitable to the ſtate and condition of perſons, as palaces, hotels, ſeats, convents, houſes of citizens, *&c.* *Davil.* ubi ſupra, p. 417. *Pancirol.* de Reb. Memor. P. 1. tit. 23. p. 70. *Salmuth.* ad eund. ibid. p. 73. Item, ad tit. 51. p. 251. *Briſſ.* Select. Antiq. l. 1. c. 1, ſeq.

Ruſtic or Country BUILDINGS, thoſe which compoſe farm-houſes, granges, menageries, mills, baſſecours, ſtables, *&c.*

Hydraulic BUILDINGS, thoſe wherein are incloſed machines for the moving or raiſing of water, either for uſe or entertainment, as pumps, fountains, reſervoirs, caſcades, *&c.*

Marine BUILDINGS, thoſe wherein ſhips and other veſſels are made or preſerved; ſuch are arſenals, docks, ſtore-houſes, and the like. *Davil.* lib. cit. p. 417, ſeq.

Subterraneous BUILDINGS, thoſe framed under ground, as labyrinths, grottos, caves, temples cut out of rocks, *&c.*

Some take theſe to be of the greateſt antiquity, and to have given occaſion to the firſt erecting of ſuperterranean edifices: the primitive *buildings* ſeem rather to have been intended as ſhelter againſt the ſcorching heats of the climate and ſeaſons in Æthiopia, where the mid-day was ſcarce tolerable without ſome defence. Phil. Tranſ. N° 144. p. 341.

BUILDING is alſo applied to the works of brutes. The caſtor is, by his make, particularly fitted for *building*. With his teeth he can cut wood, and with his feet work the clay; his tail does the office of a trewel in applying, and likewiſe of a hod for carrying mortar. Mem. Acad. Scienc. an. 1704. p. 81.

BUL, in the Hebrew calendar, the eight month of the eccleſiaſtical and ſecond of the civil year, ſince called *marſhevan*; it anſwers to our October, and is compoſed of nine and twenty days.

BUL, in ichthyology, an Engliſh name for the common flounder.

BULATWÆLA, in botany, a name by which ſome authors have called the *betle*, an herb the people of the Eaſt Indies are fond of chewing. *Herm.* Muſ. Zeyl. p. 34.

BULB (*Cycl.*)—The antients divided *bulbs* into eſculent, as the onion and leek; emetic, as the narciſſus; and wild, as the hermodactyl. Nothing, Pliny obſerves, is more prolific than the lilly, a ſingle root often producing no leſs than fifty *bulbs*. *Plin.* Hiſt. Nat. l. 2. c. 5. *Fabr.* Theſ. p. 383.

Modern botaniſts diſtinguiſh two kinds of *bulbs*, *tunicated* and *ſquammous*.

Tunicated BULBS, are thoſe compoſed of ſeveral coats or tunics laid over each other; ſuch are the roots of onion, tulip and jonquil.

Squammous BULBS, are thoſe compoſed of ſeveral ſcales, laid in like manner over each other; ſuch is that of the white lilly.

Some alſo extend the name *bulb*, abuſively, to thoſe more properly called tuberoſe roots [a], which with them conſtitute a third ſort of *bulbs*, called the *cloſe bulb*; ſuch is that of the crocus or cyclamen [b].—[[a] *Mart.* Lect. Bot. p. 4. [b] *Bradl.* Dict. Bot. T. 1. in voc.]

Some conſider the *bulb* as a real plant, out of which a new ſtalk is yearly produced; the ſtalk itſelf withering and falling away with the flower and leaves. In reality, as the leaves which fall yearly, are not neceſſary to the integrity of the plant; ſo neither does the ſtalk ſeem to be, which ſprings out of the bulb, and withers away, the *bulb* itſelf ſtill remaining entire [c]. We may add, that the very leaves and flowers, *e. gr.* of a tulip, have been diſtinctly perceived to be contained in its *bulb* [d].—[[c] *Chauv.* Lex. Philoſ. p 85. [d] *Du Hamel*, Hiſt. Acad. Scien. l. 2. ſect. 3. c. 1. p. 165, ſeq.]

BULBS are alſo taken for the round ſpired beards of flowers. Dict. Ruſt. T. 1. in voc.

BULBOCASTANUM, *Earth-nut*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is umbelliferous, and of the roſaceous kind, being compoſed of ſeveral leaves, arranged in a circular form. The cup finally becomes a fruit, compoſed of two ſmall ſeeds, which are ſometimes ſmooth, ſometimes ſtriated on their gibboſe ſides, and ſmooth on their flat ones. To this it is to be added, that the roots are tuberous and fleſhy.

The ſpecies of *earth-nut*, enumerated by Mr. Tournefort, are theſe. 1. The great broader-leaved *earth-nut*. 2. The leſſer narrow-leaved *earth-nut*. 3. The great Alpine parſnep-leaved *earth-nut*. 4. The Portugal *earth-nut*, with finely divided leaves. *Tournef.* Inſt. p. 307.

BULBOCODIUM, in botany, a name uſed by ſome authors for *pſeudo-narciſſus Anglicus*, or common wild yellow daffodil. *Chabræus*, p. 212.

BULBONACK, in botany, the name by which ſeveral authors call the *viola lunaris*, known in our gardens by the names of *ſatin* and *honeſty*.

BULBOUS, or BULBOSE *plants*, thoſe which have a bulb, or round head in their root. See BULB and ROOT.

Such are tulips, leeks, onions, garlicks, daffodils, hyacinths, crocuſes, *&c.* *Ray*, Synopſ. Stirp. Britan. Gen. 21. p. 228, ſeq. See the article PLANT.

Ray diſtinguiſhes another genus of plants, by their affinity to the *bulbous* kind; ſuch as are the iriſes, orchides, arums, *&c.* Id. ibid. Gen. 22. p. 233, ſeq.

Bulbous roots have a motion of aſcent and deſcent, whereby they obtain different places in the earth, being ſometimes deeper, and ſometimes higher, ſo as to appear in ſome meaſure above ground, as is frequently the caſe of turneps. *Grew*, Anat. Veget. l. 2. P. 1. c. 1. §. 11. p. 59.

Bulbous roots bear an affinity to the perennial ones, and are renewed like them. *Du Hamel*, Hiſt. Acad. Scien. l. 2. ſect. 5. c. 1. p. 177.

The ſeveral rinds or ſcales, whereof bulbs chiefly conſiſt, ſucceſſively periſh, and ſhrink up into ſo many dry thin skins, between which and their center other leaves and ſhells are formed, by which means the bulb is perpetuated. *Grew*, ubi ſupra, p. 61. See PERENNIAL, *Cycl.*

Flowering of BULBOSE *plants*. See the article FLOWERING.

BULBUS *vepictorius*, in the materia medica, the name uſed for the root of the muſcari or muſk-grape plant. *Dale*, Pharm. p. 244.

BULCARD, an Engliſh name for the *galcetta*, or *alauda non criſtata*, of Rondeletius; a ſmall ſea-fiſh caught among the rocks on the Corniſh and other ſhores. *Willughby*, Hiſt. Piſc. p. 133.

BULEF, in botany, a name by which ſome authors call the willow. *Ger.* Emac. Ind. 2.

BULEPHORUS, in the court of the eaſtern emperors, was the ſame officer with *ſummæ rei Rationalis*. *Pancirol.* Notit. Imp. Orient. c. 75. *Schoet.* Ant. Lex. p. 238. See the article RATIONALIS, *Cycl.*

BULEUTÆ, Βουλευται, in the cities of Greece and Aſia, were the ſame with *decuriones* at Rome. *Calv.* Lex. Jur. p. 128. See the article DECURIO, *Cycl.*

The word has been ſometimes alſo uſed to denote ſenators. *Calv.* loc. cit. See the article SENATOR.

BULGARIAN *language*, the ſame with the *lingua Heneta*, or Sclavonic. Vid. *Vogt.* Bibl. Hiſt. Hæreſ. T. 1. p. 135. See the article SCLAVONIC, *Cycl.*

BULGOLDA *lapis*, the name of a ſtone taken out of the head of an animal in America, called by the natives *bulgoldalf*. We have no account of this, but that it poſſeſſes the virtues of the bezoar, as a cordial and reſiſter of poiſons.

BULIMY (*Cycl.*) ſeems the ſame with what is otherwiſe called *furcilla*. Some alſo confound it with the *fames canina*, from which others diſtinguiſh it, in that the canine appetite is attended with vomiting, which the *bulimy* is free from, and the latter is attended with a ſinking of the ſpirits and coldneſs, not perceived in the former. Vid. *Linden.* Exerc. Med. 13. §. 74. *Caſt.* Lex. Med. p. 115. *Quinc.* Lex. Phyſ. Med. p. 61. *Shaw*, New Pract. of Phyſ. p. 177. See the article CANINE.

The *bulimy* is a diſorder of the ſtomach, ſeated either in the fibres thereof, or in the gaſtric liquor. It is incident chiefly to travellers, and is occaſioned by chilling colds, eſpecially in ſevere froſt and ſnow. It begins with a vehement hunger, which going

going off, is ſucceeded by ſwoonings, &c. The beſt remedy againſt it is ſaid to be the ſmell of bread. *Lang.* Epiſt. Med. l. 2. ep. 28. p. 618, ſeq.

Fromundus, relating how he himſelf, by walking long on the ſnow, was ſurprized with the *bulimia*, takes notice, that the chief cauſe of the fainting was in the ſtomach, and that he found, by his own experience, that part diſcompoſed, twitched, and provoked to reachings. He adds, that he thinks the chief cauſe of the *bulimia* to conſiſt in certain ſteams that peculiarly affect the ſtomach, which they gnaw and diſtend. The ſame author notes, that ſtraining to fetch deep coughs, is a preſent remedy in this diſtemper, by diſcharging the ſtomach and lungs of theſe ſnowy ſpirits, which were either attracted in reſpiration, or had ſome other way inſinuated themſelves into thoſe parts. By this it ſeems to appear, that, beſides the cold abſtractedly conſidered, the ſtomach may be peculiarly affected by other attendants of the frigorific corpuſcles, that grow powerful in froſty weather. To this it well agrees, that ſeveral have been ſubject to a *bulimia* in our climate, who endure nothing near ſo great a cold, nor are ſo much diſordered by it, as multitudes of others, who, in Nova Zembla and other frozen regions, never complained of having contracted, even in the midſt of winter, any ſuch diſeaſe. *Boyle*, Philoſ. Works abr. T. 1. p. 696.

BULIMY is alſo leſs properly uſed by modern writers, for any appetite craving and voracious beyond what is natural to the conſtitution. See the article OREXIS.

Dr. Plot mentions a ſtrange *bulimy*, or rather pica, which ſeized one Brian Careſwell of Forton in Staffordſhire, who would gnaw and eat both linnen and woollen; nay, to that height of habit was he brought at length, that he would eat ropes, and the very blankets of the bed whereon he lay; and this not only waking, but the very ſheets and the ſhirt from his back while he ſlept. *Plot*, Nat. Hiſt. Staffordſh. c. 8. §. 62. p. 301.

BULITHOS, Βουλιθος, *Lapis bovinus*, a calculus or ſtone found in the gall-bladder, kidneys, or urinary bladder of oxen.

Inſtances hereof are given by Bromell [a], the Academy Naturæ Curioſorum [b], and other naturaliſts; by which it appears that Ariſtotle was miſtaken in aſſerting, that man alone is ſubject to the ſtone, and enquiring ſolicitouſly into the reaſons hereof [c].—[[a] *Bromell.* Lithograph. Suec. Specim. 1. ſect. 1. c. 2. art. 3. Act. Liter. Suec. an. 1725. p. 74, ſeq. [b] Ephem. Acad. Nat. Cur. Dec. 2. an. 6. [c] *Ariſtot.* Probl. ſect. 10. n. 42. *Caſt.* Lex. Med. p. 115.]

BULKER, a local word, uſed in Lincolnſhire for a beam or rafter. See the article BEAM, *Cycl.* and *Suppl.*

BULL, *Taurus*, in zoology. See the article TAURUS.

One *bull* ſuffices for fifty cows, ſome ſay ſixty. His beſt age is about two, or from one to three, before he arrives at his full growth, when he grows heavy and ſluggiſh. Hence that old rule among countrymen,

He that will have his farm full,
Muſt have an old cock and a young bull.

From that time, being of no further uſe in breeding, he is uſually gelt, and makes what they call a *bull-ſtag*, in the North corruptly a *bull-ſeg*, to be fatted for the market. *Hought.* Collect. T. 1. N° 106. p. 285, ſeq.

Among the antients, thoſe who triumphed, ſacrificed a *bull*, when they arrived at the Capitol. *Bulls* were offered to Apollo and Neptune. It was held a crime to ſacrifice them to Jupiter, tho' we do not want inſtances of that practice. *Pitiſc.* Lex. Antiq. T. 2. p. 904, ſeq.

Bulls were ranked by the Romans in the number of military rewards. *Aquin.* Lex. Milit. T. 2. p. 347. voc. *Taurus.* *Liv.* l. 7 & 26.

Perillus's BULL was a hollow brazen engine of torture, in the ſhape of that quadruped; wherein perſons being ſhut up, and fire applied, their cries imitated the roaring of a *bull*. *Salmuth.* ad Pancirol. P. 1. tit. 48. p. 225.

BULLS *blood*, freſh drawn, is a powerful poiſon, as coagulating in the ſtomach. See the article BLOOD.

BULLS *gall* is an intenſe bitter, more pungent and acrimonious than that of any other animal; whence it is ſometimes uſed to deſtroy worms. *Junck.* Conſp. Therap. tab. 11. p. 339. See the article GALL.

Bannal BULL, denotes a *bull* kept by a lord, who has a right to demand all his tenants to bring their cows to be ſerved by him. See the article BANNALIS.

Free BULL, according to Du Cange, ſignifies the ſame with *bannal bull*. Hence *tauri liberi libertas*; which, however, ſhould rather ſeem to denote a privilege of keeping a *bull* independent of the lord. *Du Cange*, Gloſſ. Lat. T. 4. p. 1075. voc. *Taurus.*

Wild BULLS. The wild *bulls*, now ſo numerous on the continent of America, are ſaid to have ſprung from one *bull* and ſeven cows, which were carried thither by ſome of the firſt conquerors.

In the iſland of Hiſpaniola, the French buccaneers purſue *bulls* with dogs, and kill them with fire-arms. At Buenos Ayres, the Spaniſh tauradors chaſe them on horſeback, armed with a long lance, at the end of which is a half-moon of ſharp ſteel. Having drawn a number of the horned kind together, they let the cows eſcape, but dexterouſly take the *bulls* with their half-moons on the hind legs, by which, diſabling them from flight, they are eaſily diſpatched. *Savar.* Dict. Comm. T. 2. p. 1685, ſeq. voc. *Taureau.*

BULL-*fighting*, a ſport or exerciſe much in vogue among the Spaniards and Portugueze, conſiſting in a kind of combat of a cavalier or torador againſt a wild *bull*, either on foot or on horſeback, by riding at him with a lance.

The Spaniards have *bull-fights*, *i. e.* feaſts attended with ſhews, in honour of St. John, the Virgin Mary, &c. *Beem.* Hiſt. Orb. Terr. P. 2. c. 1. §. 18. p. 468, ſeq.

This ſport the Spaniards received from the Moors, among whom it was celebrated with great eclat. Some think, that the Moors might have received the cuſtom from the Romans, and they from the Greeks. Dr. Plot is of opinion, that the Ταυροκαθαψιων ἡμεραι amongſt the Theſſalians, who firſt inſtituted this game [a], and of whom Julius Cæſar learned and brought it to Rome [b], were the origin both of the Spaniſh and Portugueſe *bull-fighting*, and of the Engliſh *bull*-running [c].—[[a] *Prid.* Not. ad Marmor. Ταυροκαθαψιων, inter Marmor. Oxon. [b] *Plin.* Hiſt. Nat. l. 8. c. 45. *Suet.* in Claud. c. 21. n 8. *Pitiſc.* Lex. Ant. T. 2 p. 904, ſeq. voc. *Taurus.* [c] *Plot*, Nat. Hiſt. Stafford. c. 10. §. 76. p. 440.]

The practice was prohibited by pope Pius V. under pain of excommunication, incurred *ipſo facto* But ſucceeding popes have granted ſeveral mitigations in behalf of the toradors. Trev. Dict. Univ. T. 5. p. 723. voc. *Toreador.*

BULL-*running*, denotes a feudal cuſtom obtaining in the honour of Tutbury in Staffordſhire, where antiently, on the day of the aſſumption of our Lady, a *bull* is turned looſe by the lord to the minſtrels, who, if they can catch him before he paſſes the river Dove, are to have him for their own, or, in lieu thereof, to receive each forty pence; in conſideration of which cuſtom they pay twenty pence yearly to the ſaid lord. *Plot*, lib. cit. p. 439, ſeq.

BULL, in aſtronomy, the conſtellation *Taurus*. See the article TAURUS, *Cycl.*

BULL's-*eye*, in meteorology, a little dark cloud, rediſh in the middle, chiefly appearing about the Cape of Good Hope; thus denominated by the Portugueſe, who, on the appearance of it, inſtantly take down their ſails, as knowing that a terrible ſtorm of thunder, lightning, and a whirlwind, is at hand. *Chauv.* Lex. Phil. p. 454. voc. *Oculus Tauri.*

BULL-*finch*.—This is a very pernicious bird in gardens and orchards. They feed on the young buds of trees in ſpring, which contain the bloſſoms for the ſummer's fruit. The black-thorn, or ſloe-tree, is the great favourite of the *bull-finch*, and keeps him employed in the hedges in mild weather; but if the latter end of the winter have been ſevere, and theſe ſhrubs are backward of their buds in February, he then comes into the gardens, the trees growing there being forwarder than thoſe in the field in a cold ſpring; they will ſometimes come in ſuch numbers as to take off all the buds from the currants, plums, &c. in the gardens of a whole town in a few days.

He is ſo bold a bird, that no ſcarecrow, or other means that can be deviſed, can deter him; his great favourite in the garden is the damſon tree, and he will feed upon this while a perſon comes almoſt cloſe up to him. It is very eaſy to ſhoot theſe birds; but the buds and young branches are uſually much injured by this method, and the beſt way ſeems to be to dawb over the twigs in many places with bird-lime. *Mortim.* Huſb. p. 324.

BULL-*head*, the Engliſh name given to a ſmall fiſh of the cottus kind, found very frequently in ſhallow running waters, and called by the antients *bætus* and *cætus*.

Bellonius, and many others, have called it ſimply *cottus*, and ſome others *cottus capitatus*, the headed cottus, from the bigneſs of the head in proportion to the body; but its moſt uſual name, though a very improper one, is *gobius capitatus*, and Geſner has called it *gobius fluviatilis*, the name of the common gudgeon. It is diſtinguiſhed by Artedi by the name of the ſmooth cottus, without ſcales, and with two ſpines upon the head. *Artedi* Gen. Piſc. p. 34. See the articles COTTUS, and GOBIUS *capitatus*.

BULL-*trout*, an Engliſh name for a fiſh of the ſalmon kind, caught in many of the rivers of England, and more uſually called the *ſcurf*. *Willughby*, Hiſt. Piſc. p. 193. See the article SCURF.

BULL, BULLA, is alſo uſed, in middle age writers, for a ſeal hung to the letters, eſpecially of a prince. *Montfauc.* Palæogr. l. 6. Prol. p. 378. *Du Cange*, Gloſſ. Lat. T. 1. p. 638. *Suic.* Theſ. Eccleſ. T. 1. p. 706. voc. Βελλα. See the article BULL, *Cycl.* and *Suppl.*

Hence alſo the word *bullare*, uſed for ſealing, and *doctores bullati*, for thoſe admitted to the degree, by virtue of diplomata of princes, without undergoing the regular exerciſes and examination. *Du Cange*, Gloſſ. Lat. T. 1. p. 643.

We meet with four kinds of theſe *bulli*, or *bullæ*, golden, ſilver, waxen, and leaden, all in uſe among the emperors and kings of the middle and barbarous ages [a]. In ſome, the impreſſion is made on the ſolid metal itſelf; in others on wax, and only incloſed in a metalline box, or caſe [b].—[[a] *Kirchman.* de Annal. c. 8. p. 51, ſeq. *Nicol.* de Sigill. c. 43. §. 2. *Pitiſc.* Lex. Ant. T. 1. p. 302. in voc. *Fabr.* Theſ. p. 384. [b] *Spelm.* Gloſſ. p. 90.]

Sealing with metals is an illuſtrious privilege, belonging only to princes, tho' aſſumed alſo by prelates, as princes of the church. The doges of Venice durſt not arrogate this honour, till leave was given them by pope Alexander III. about the year 1170, to ſeal their diplomata with lead. Id. ibid. p. 91.

BULL, *Bulla*, is alſo a denomination given to the letters patents and diplomata themſelves, on account of the large ſeal of wax, ſometimes incloſed in a golden, ſilver or leaden box, faſtened to the ſame. *Du Cange*, Gloſſ. Lat. T. 1. p. 638.

Golden BULLS, Χρυσοβεῦλλαι, were in uſe among the eaſtern emperors for a conſiderable time, leaden ones being confined to matters of ſmaller moment. Spelman mentions a golden *bull*, in a treaty of alliance between our Henry VIII. and Francis I. of France; and there are other inſtances in Du Cange and Altaſerra. We alſo find them in uſe among the kings of Italy, Sicily, Spain, *&c.* but they chiefly obtained among the emperors of Germany. On ſome occaſions the popes alſo ſealed their letters with golden *bulls*. Rainaldus aſſures, this was never done but in the confirmation of an emperor of Germany; yet Spelman relates, that the inſtrument whereby Clement VII. gave king Henry VIII. the title of defender of the faith, had a golden *bulla* affixed to it. Vid. *Spelm.* Gloſſ. p. 89. *Du Cange*, lib. cit. p. 639, ſeq. Ejuſd. Gloſſ. Græc. T. 1. p. 217. *Montfauc.* ubi ſupra.

Silver BULLS, Αργυροβεῦλλαι, were not in ſo frequent uſe, though we do not want inſtances of them.

Leaden BULLS, Μολιβδοβεῦλλαι, were ſent by the emperors of Conſtantinople to deſpots, patriarchs and princes; and the like were alſo uſed by the grandees of the imperial court [a], as well as by the kings of France, Sicily, *&c.* and by biſhops, patriarchs, and popes [b]. It is to be obſerved, the leaden *bulls* of theſe latter had on one ſide the name of the pope or biſhop inſcribed [c].—[[a] *Spelm.* ibid. p. 90. *Du Cange*, Gloſſ. Græc. p. 218. [b] *Montfauc.* ubi ſupra, p. 379. [c] Vid. *Fiodoard.* Hiſt. Remenſ. Eccl. l. 3. c. 17. *Spelm.* p. 89. *Du Cange*, Gloſſ. Lat. T. 1. p. 642.]

Polydore Virgil makes pope Stephen III. the firſt who uſed leaden *bulls*, about the year 772. But others find inſtances of them as early as Silveſter, Leo I. and Gregory the Great. The later popes, beſides their own names, ſtrike the figures of St. Peter and St. Paul on their *bulls*; a practice firſt introduced by pope Paſchal II. But why, in theſe *bulls*, the figure of St. Paul is on the right, and that of St. Peter on the left ſide, is a queſtion which has occaſioned many conjectures and diſputes. Vid. *Matth. Paris*, an. 1237. *Leo Allat.* de Conſenſu utriuſque Eccleſ. l. 1. c. 6. *Aleman.* de Læva & Dextra. *Du Cange*, loc. cit. p. 643.

Waxen BULLS, Κηρυβεῦλλαι, are ſaid to have been firſt brought into England by the Normans [a]. They were in frequent uſe among the Greek emperors [b], who thus ſealed letters to their wives, mothers, and ſons. Of theſe there were two ſorts, one red, the other green [c].—[[a] *Du Cange*, Gloſſ. Lat. T. 1. p. 643. [b] *Montfauc.* ubi ſupra. [c] *Spelm.* ib. p. 90. *Du Cange*, Gloſſ. Græc. T. 1. p. 218.]

BULLA, (*Cycl.*) in antiquity, a golden ornament, of a globular figure, and hollow within, wherein was contained ſome amulet, to ſerve as a preſervative from witchcraft and envy, hung about the neck by thoſe who triumphed among the Romans; and alſo by the children of the patricians, and even ingenui, as a badge of their hereditary nobility and freedom, by which they might be animated to behave themſelves worthy of their birth. *Kenn.* Rom. Ant. Not. P. 2. l. 5. c 8. p. 309. *Pitiſc.* Lex. Ant. T. 1. p. 301. *Aquin.* Lex. Milit. T. 1. p. 142. *Calv.* Lex. Jur. p. 128.

The word is Latin, originally ſignifying a bubble of water; to which theſe ornaments bore a reſemblance in figure [a]. Juvenal calls the *bulla*, *Etruſcum aurum*, by reaſon it had been firſt borrowed from the Hetrurians [b].—[[a] *Iſid.* Orig. l. 19. c. 31. *Dictæ bullæ quod ſint ſimiles rotunditate bullis quæ in aqua vento inflantur.* [b] *Juven.* Sat. 5. v. 164. *Fab.* Theſ. p. 384.]

Pliny refers the original of this ornament to the elder Tarquin, who gave the *bulla* to his ſon, on ſome extraordinary courage he had ſhewn at fourteen years of age, in the war againſt the Sabines [c]; in imitation of whom it was afterwards aſſumed by the patricians. Others maintain, that the *bulla* was given by that king to the ſons of all the patricians who had born civil offices [d]. Laſtly, others allege, that Romulus firſt introduced the *bulla*, and gave it to Hoſtus Hoſtilius, the firſt child born of the rape of the Sabines [e].—[[c] *Plin.* Hiſt. Nat. l. 23. c. 1. [d] *Macrob.* Saturn. l. 1. c. 6. [e] *Pigh.* Annal. l. 1. p. 44. *Voſſ.* Etym. in voc. *Pitiſc.* loc. cit. *Kenn*, ubi ſupra.]

As to the figure of the *bulla*, it ſeems to have been flat in the ſide next the breaſt, and round, or emboſſed on the other. Plutarch compares it to the figure of a half-moon [f]; Macrobius indeed ſeems to make it of the figure of a heart [g], tho' his words may bear another ſenſe. Danet aſſures, it was ſometimes flat like a medal, and ſometimes in the form of the privy parts of men, as well as beaſts [h]. But this ſeems to be, to confound the *bulla* with other περιαπτα. What puts their form beyond doubt, is a golden *bulla* lately found in a mauſoleum in the ruins of the city Tibur; of which we have figures given by M. de la Chauſſe, and Sig. Ficoroni, in his *Muſeum Romanum*, in a diſſertation expreſs *della bolla d'or* [i]. 'Tis ſuppoſed to have been a triumphal *bulla*, which ſeems to have been larger than that worn by children.—[[f] *Plut.* Quæſt. Rom. 99. [g] *Macrob.* Saturn. l. 1. c. 6. [h] *Pitiſc.* Lex. Ant. T. 1. p. 301. [i] Hiſt. Acad. Inſcr. T. 2. p. 350, ſeq.]

The *bulla* was not allowed to the children of ſlaves, or even of *liberti*, who, in lieu thereof, wore a leather collar round the neck, much after the manner of the purple ſtring to which the *bulla* was hung. But the great veſtal, and the Roman ladies, wore a *bulla*; the former by way of diſtinction, the latter as a piece of dreſs [k]. We may add, that *bullæ* were ſometimes allowed to ſtatues; whence the phraſe, *ſtatuæ bullatæ*. M. Lepidus, having killed an enemy, and ſaved a citizen, even when a boy, had a *bullated* ſtatue erected to him in the capitol, in memory of the exploit [m]. The Roman youth laid aſide the *bulla* together with the *prætexta*, and conſecrated it to the *Lares*, when they arrived at their fifteenth year, as appears from the Satyriſt [n],

Cum primum pavido cuſtos mihi purpura ceſſit,
Bullaque ſuccinctis Laribus donata pependit.

[[l] Hiſt. Acad. Inſcr. T. 2. p. 352. [m] *Valer. Max.* l. 3. c. 1. *Tigrell.* de Stat. Rom. c. 20. [n] *Perſ.* Sat. 5. v. 30.]

M. Baudelot takes the *bulla* to have been a taliſman, inſcribed with characters and figures under certain conſtellations. The conjecture ſeems ſupported by the account given by Macrobius, *Bulla geſtamen erat triumphantium, quam in triumpho præ ſe gerebant, incluſis infra eam remediis, quæ crederent adverſus invidiam valentiſſima.* The like may be ſaid of the *bullæ* worn by children, to defend them from evil genii, and other dangers, or, as Varro expreſſes it, *Ne quid obſit.* Hence Aſconius, on a paſſage in Cicero's firſt Verrina, where mention is made of it, aſſures that theſe *bullæ*, on the breaſts of children, are as a rampart which defends them, *ſinus communiens, pectuſque puerile.* Mem. Acad. Inſcript. T. 3. p. 476, ſeq.

BULLA was alſo a denomination given to divers other metalline ornaments made after the form of *bullæ*.

In which ſenſe, *bullæ* ſeem to include all golden and ſilver ornaments of a roundiſh form, whether worn on the habits of men, the trappings of horſes, or the like [a]. Such were thoſe decorations uſed by the antients on their belts and doors [b]. Virgil [c], ſpeaking of Pallas's belt or girdle, ſays,

Notis fulſerunt cingula bullis
Pallantis pueri.

[[a] *Aquin.* Lex. Milit. T. 1. p. 142. *Du Cange*, Gloſſ. Lat. T. 1. p. 637, ſeq. [b] *Sagittar.* de Januis Veterum, p. 175. *Taubman.* ad Plaut. Aſinar. Act. 2. Sc. 4. v. 20. *Fabr.* Theſ. p. 384. [c] *Virg.* Æn. l. 12. v. 942.]

The *bullæ* of doors were a kind of large headed nails faſtened on the doors of the rich, and kept bright with great care. The doors of temples were ſometimes adorned with golden *bullæ* [d]. Mr. Baudelot takes the *bullæ* worn by ſoldiers on their belts, as ſomething more than mere ornaments. They ſeem to have been conſidered as preſervatives from dangers and diſcaſes, and even means of acquiring glory, and other advantages [e]. And the like may perhaps be extended to the *bullæ* on doors, which were probably placed there as a ſecurity to them from being broken or violated.—[[d] *Pitiſc.* Lex. Ant. T. 1. p. 302. voc. *Bulla*. [e] Mem. Acad. Inſcr. T. 3. p. 477.]

BULLA alſo denoted a table hung up in the public courts, to diſtinguiſh which days were *faſti* and which *nefaſti*; anſwering in ſome meaſure to our calendar. *Petron.* c. 30. *Lotich.* ad eund. *Pitiſc.* Lex. Ant. T. 1. p. 302. See the article CALENDAR.

BULLARII, in the court of Rome, the makers or drawers of bulls or conſtitutions. *Du Cange*, Gloſſ. Lat. T. 1. p. 644. See the the article BULL.

BULLARY, *Bullarium*, a collection of papal bulls. See the article BULL, *Cycl.* and *Suppl.*

We have extant divers kinds of *bullaries*; ſome containing only the bulls of particular popes; ſuch are the *bullaries* of Innocent XII. and Clement XI. Others contain the bulls granted to particular communities; ſuch is the *bullary* of the order of Cluny, *&c.* *Fabric.* Bibl. Lat. Med. Æv. l. 2. p. 816—822.

Arrhenius has given a Sueco-Roman *bullary*, or collection of all the bulls ſent into Sweden. Maracci promiſed a *Bullarium Marianum*, or collection of bulls in honour of the worſhip of the Virgin Mary.

A general *bullary* of all the papal conſtitutions from Gregory VII. to Sixtus Quintus, was compiled by order of pope Sixtus Quintus, in 1586 [a]; ſince which has been publiſhed a great *bullary*, by Laert. Cherubin, containing the bulls of all the popes from Leo the Great, in 440, to Paul V. in 1559 [b]; ſince continued by Ang. Cherubin to the year 1644 [c], and by Ang. a Lantuſca and Jo. Paulus to the year 1676 [d]; and, laſtly, by an anonymous editor to the time of Benedict XIII. under the title of *Bullarium magnum Romanum* [e]. We have the ſame digeſted in a new method by Bouchardus; a commentary on it begun by Vinc. Petra, and a ſummary of it by Novarias [f].—[[a] Rom. 1586. fol. cum Rubr. Laert. Cherub. [b] Rom. 1617. fol. 3 vol. [c] Rom. 1638. 4 vol. fol. & Lugd. 1655. fol. It. Rothom. in 6 vol. additis Conſtit. Innocent. X. [d] Rom.

1672. 6 vol. fol. & Lugd. 1697. fol. in qua nonnulla omiſſa. [e] Luxemb. 1728. 8 vol. fol. cui poſtea acceſſit nonum volum. ſupplementorum omiſſorum in omnibus edit. [f] Vid. *Fabric.* Bibl. Med. Ævi Lat. l. 2. T. 1. p. 816—822.]

BULLET (*Cycl.*)—*Bullets* ſhot into the water undergo a refraction; ſeveral experiments concerning which are given by Mr. Carré. Vid. Mem. Acad. Scienc. an. 1705. p. 277.

Bullets are caſt in iron-moulds. See BULLET-*mould*, and BULLET-*bore*, *infra*.

The extraction of *bullets* from wounds is an operation deſcribed by chirurgical writers [a]. *Bullets* ſometimes remain eaſy in the body during many years [b]. Agricola aſcribes great virtues to the *bullet* wherewith a deer has been killed, which is repreſented as a ſpecific againſt the parotides [c], ganglia [d], *&c.*—[[a] *Junck* Conſp. Chirurg. tab. 80. p. 544, ſeq. [b] Id. ibid. p. 543 [c] *Joh. Agric.* Chirurg. Parv. ap. Junck. lib. cit. tab. 20. p. 147. [d] *Junck.* ib. tab. 24. p. 165.]

Swallowing of muſket-*bullets* is ſometimes practiſed to remove iliac and colic pains. Mr. Young gives a caſe wherein this had a terrible effect: the *bullet* happening to miſs its way down, and, inſtead of the oeſophagus, got into the trachea [e]. Mr. Chirac has a diſſertation expreſs on the queſtion, which of the two is ſafer in iliac caſes, to ſwallow leaden *bullets*, or crude mercury? He gives the preference to the *bullets* [f].—[[e] Vide *Hook.* Cutl. Lect. 2. Com. p. 105. [f] Phil. Tranſ. N° 263. p. 567.] See the article ILIAC, *Cycl.*

BULLET-*moulds* conſiſt of two concave hemiſpheres, with a handle whereby to hold them; and between the hemiſpheres is a hole, called a gate, at which to pour in the melted metal. The chaps or hemiſpheres of *bullet-moulds* are firſt punched, being blood-red hot, with a round ended punch, of the ſhape and nearly of the ſize of the intended bullets. To cleanſe the inſides, they make uſe of a *bullet-bore*.

BULLET-*bore*, is a ſteel ſhank, having a globe at one end, wherewith to bore the inſide of a mould clean, of the ſize intended. *Moxon.* Mechan. Exerc. P. 1. p. 52—55.

BULLET-*iron*, a denomination given by ſome to Spaniſh or Swediſh bars of iron. *Hought.* Collect. N° 275. T. 2. p. 229. See the article IRON.

BULLIMENTA, is uſed by ſome chemiſts for the waſhings and ſcourings of gold, or ſilver veſſels, in proper liquors, to render them brighter. *Libav.* Synt. Arc. Chem. l. 1. c. 24. *Caſt.* Lex. Med. p. 115.

BULLIMONY, BULLIMONG, BOLLIMONY, or BOLLIMONG, denotes a mixture of ſeveral ſorts of grain, as oats, peaſe, and vetches, called alſo *maſlin* or *mong-corn*. *Kenn.* Gloſſ. ad Paroch. Antiq. voc. *Bulter.* Dict. Ruſt. T. 1. in voc.

BULLION (*Cycl.*)—The word is apparently formed from the French *billon*, a maſs of gold or ſilver below ſtandard, which Du Cange derives further from *billa*, as being *aurum aut argentum in maſſam ſeu billam*, i. e. *baculum conflatum*. Trev. Dict. Univ. T. 1. p. 1044, ſeq. voc. *Billon.*

Silver *bullion* is ſometimes alſo denominated plate. See the article PLATE, *Cycl.* and *Suppl.*

By the Scottiſh laws, the cuſtoms in the exportation of goods were to be paid in *bullion*. Skene gives an A, B, C, of *bullion*, expreſſing the quantities thereof which the merchants were to pay for goods exported out of the realm. *Sken.* de Verb. Signif. p. 32.

BULLITION, is uſed for the effect ariſing upon the mixture of different liquors, which often is a quantity of bubbles, or froth. *Grew*, Diſc. of Mixt. Lect. 2. c. 1. §. 6.

BULTEL, the bran or refuſe of meal after dreſſing.

The word is formed from the barbarous Latin, *bultellus*, or *bultellum*, a ſearce or boulter. *Matth. Paris*, an. 1202. p. 145. *Du Cange*, Gloſſ. Lat. T. 1. p. 636. voc. *Buletellum.* Item, p. 644. voc. *Bultellus.*

BULTEL alſo denotes a bag wherein meal is dreſſed, called alſo a *bulter*, or rather *boulter*.

BULTER-*cloth*, a linnen or hair-cloth for ſifting or ſearching of meal or flour. See the articles BOLTER, and BOLTING.

BUMBUNNY, in botany, a name given by the people of Guinea to a plant common in that place, which ſerves them as an emetic; they boil a few of the leaves in water, and drink this liquor, which vomits very eaſily. Phil. Tranſact. N° 232.

BUN, the dry kexe, or ſtalk of hemp, ſtripped of its rind. *Hought.* Collect. N° 347. T. 2. p. 391. See HEMP.

BUN is alſo a denomination by ſome given to coffee. *Houghton*, ibid. N° 458. T. 3. p. 126. See COFFEE, *Cycl.*

BUNCH, a cluſter or aſſemblage of certain things, as of grapes.

BUNCH alſo denotes a tumour, or protuberance, natural or preternatural, either on an animal or vegetable body. See the article TUMOUR, *Cycl.* and *Suppl.*

The *bunch* growing about the graft of a plant is a ſort of callus formed by the extravaſated ſap. Mem. Acad. Scienc. an 1705. p. 453. See the article ENGRAFTING, *Cycl.* and GRAFTING, *Suppl.*

Camels have one *bunch* on their backs, dromedaries two [a]; though we are told of a ſort of camels in Turkeſtan, which have two *bunches* each, one before the other, the foremoſt being about half a foot high, and the hindmoſt leſs [b].—[[a] Trev. Dict. Univ. T. 1. p. 1129. voc. *Boſſe.* [b] Mem. Acad. Scienc. an. 1693. p. 315.]

Bunches of camels are not formed by the curvity of the ſpina dorſi, which is no higher in this than in other parts, but is a mere fleſhy excreſcence, of a glandulous ſubſtance, much like the udders of other animals, or the tails of thoſe ſheep in Barbary, which weigh from twenty to twenty-five pounds. Mem. Acad. Scienc. an. 1693. p. 316.

BUNCH, in chirurgery, denotes an elevation of the back, ariſing from an exterior luxation of the vertebræ thereof.

The cure is begun by keeping emollients a long time on the vertebræ, whereby to looſen the ligaments, and finiſhed by wearing an iron boddice, which compreſſing the vertebræ, by degrees drives them back to their natural ſituation. *Le Clerc*, Treat. Oper. Luxat. c. 6. Comp. Surg. p. 262. *Van-horn*, Microt. §. 19. p. 63.

Naturaliſts ſpeak of a kind of *bunch*, or *hump-backed* whale, different from that which yields the *ſperma ceti*. Phil. Tranſ. N° 387. p. 258. See the article WHALE.

We are alſo told of *bunch-backed* kine at Quivira, having large prominences on their fore-ſhoulders. *Hought.* Coll. N° 106. T. 1. p. 283.

BUNCHES in horſes, called alſo *knobs*, *warts*, and *wens*, are diſeaſes ariſing from foul meat, bruiſes, hard labour, or the like; whereby the blood becoming putrefied and foul, occaſions ſuch excreſcences. Dict. Ruſt. in voc.

BUNCHED *cods*, among floriſts, are thoſe which ſtand out, and wherein the ſeed is lodged. Dict. Ruſt. T. 1. in voc.

BUNCHED *roots*, thoſe round roots which have knobs or knots in them. Dict. Ruſt. T. 1. in voc. See ROOT, and BULB.

BUNG, the ſtopple of a caſk, barrel, or the like. See the article CASK, *Cycl.*

The *bung* is a wooden plug, ſerving to ſtop the hole left in the top of a veſſel to be filled by. It anſwers to what, among the antients, was called *epiſtomium*, and in the middle age *ſigillus*, the ſeal of a veſſel, by reaſon in thoſe days it was uſually ſealed. *Du Cange*, Gloſſ. Lat. T. 4. p. 856. voc. *Sigillus.*

The name *bung* is alſo given to the hole itſelf, otherwiſe called *bung-hole*.

After tonning new wine, or cider, the *bung* is uſually left open for ſome time, that when the liquor comes to work, there may be vent for the froth or ſcum, and that the hoops may not be in danger of being burſt by the violence of the fermentation. Yet, in ſome caſes, they leave wines to ferment, without giving them vent by the *bung*, in order to render them more briſk and ſpirituous: in which caſe, it is neceſſary the veſſel be hooped with iron, and other precautions taken that the *bung* do not fly. *Savar.* Dict. Comm. T. 1. p. 401. voc. *Bondon.*

BUNK, or BUNKEN, a word frequently occurring in the writings of the Arabian phyſicians. We do not at this time certainly know what it was; but ſo far is plain, that it was an aromatic root uſed in cardiac, ſtomachic, and carminative compoſitions.

BUNT (*Cycl.*)—If a ſail have too much *bunt*, it will hang too much to the leeward-wind, as they call it, and hold much leeward-wind, which will hinder the ſhip's ſailing, eſpecially by the wind: on the contrary, if it have too little, it will not hold wind enough, and ſo not give the ſhip ſufficient way [a]. Seamen all agree, that a bellying or *bunting* ſail carries a veſſel faſter to the windward than a ſtrait or faſt ſail: the contrary of which is aſſerted by Dr. Hooke, who has a diſcourſe expreſs, to ſhew the preference of ſtrait to *bunting* ſails [b].—[[a] *Manwayr.* Seam. Dict. p. 17. [b] Vid. *Hooke*, Poſthum. Works, p. 563, ſeq.]

BUNTING, in zoology, the common Engliſh name of the *emberiza alba*, called by others *calandra*, *conchramus alaudæ congener*, and *ſtrozello*, or *ſtrillozzo*. It is of the hortulanus kind, having a very large tubercle, or hard prominence on the upper chap. Its hinder-toe is long, but the claw of it is more crooked and ſhorter than in the lark. It is all over of a pale brown on the back, and of a ſomewhat yelloviſh hue on the breaſt and belly; the throat is variegated with ſome longiſh black ſtreaks. It feeds on corn and other ſeeds, and ſings very ſweetly, uſually ſitting on the top branches of trees. *Ray's* Ornithology, p. 195.

BUONACCORDO, a ſmall ſtringed muſical inſtrument, reſembling a ſpinet, uſed by children to learn to play on, by reaſon of the ſhortneſs of their fingers. *Galil.* Dial. dell. Muſ. Ant. & Mod. p. 61, ſeq. *Walch.* Muſ. Lex. p. 119.

The word is Italian, where it properly denotes a harpſichord. Vocab. Cruſc. T. 2. p. 248. See the article HARPSICHORD, *Cycl.*

BUOYANT, denotes a thing floating, or apt to float. Hence alſo to *buoy up a cable*, is to make faſt a piece of floating wood, barrel, or the like, to it, ſomewhere near the anchor, that the cable may not touch the ground, when that is ſuſpected to be foul or rocky, for fear of fretting and cutting the cable. *Botel.* Sea. Dial. 4. p. 242.

BUPHONIA, Βυφονια, in antiquity, an Athenian feaſt or ceremony, denominated from a bullock ſlain therein, with quaint formalities.

The *buphonia* was properly a part or appendage of the ceremony of the *diipolia*. See the article DIIPOLIA.

For the origin of the *buphonia*, we are told it was forbidden by the laws of Attica to kill an ox: but it once happened, at the feaſt of the *diipolia*, that an ox eat the corn, others ſay the cakes, which had been dreſſed for the ſacrifice. Thaulon the

prieſt, enraged hereat, preſently killed him, and fled for it. On which the Athenians, fearing the reſentment of the gods; and feigning themſelves ignorant who had committed the fact, brought the bloody axe before the judges, where it was ſolemnly arraigned, tried, found guilty, and condemned. And, in memory of this event, a feaſt was inſtituted under the denomination of *buphonia* [a]. In which it was ſtill cuſtomary for the prieſt to fly, and judgment to be given about the ſlaughter of the ox [b].—[[a] *Suid.* Lex. T. 1. p. 450. *Meurſ.* Attic. Lect. l. 6. c. 22. *Schoettg.* Lex. Ant. p. 244. [b] *Potter*, Archæol. Græc. T. 1. l. 2. c. 20. p. 381.]

Pauſanias relates, that the axe was brought in not guilty [c]. Ælian, on the contrary, reports, that the prieſt and people preſent at the ſolemnity (for they alſo were accuſed as being acceſſary to the fact) were acquitted, but the axe condemned [d].—[[c] *Pauſan.* in Attic. c. 28. p. 70. [d] *Ælian.* Var. Hiſt. l. 8. c. 3. Vid. *Pott.* loc. cit.]

In the *buphonia*, certain cakes, of the ſame ſort with thoſe uſed at ſacrifices, were placed on a table of braſs; round this they drove a ſelect number of oxen, of which he that eat any of the cakes was preſently ſlaughtered; three families were peculiarly retained in this ceremony; they whoſe duty it was to drive the oxen, were called βουτυποι; they who knocked him down, βουτυποι, being deſcended from Thaulon; and thoſe who ſlaughtered and cut him up, δαιδοχοι, butchers or cooks. *Lakemak.* Antiq. Græc. Sacr. P. 4. c. 2. §. 8. p. 599, ſeq. *Pott.* ubi ſupra.

BUPHTHALMUM, *Ox-eye*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the radiated kind; its diſk is compoſed of a number of floſcules, which are ſeparated from one another by ſmall imbricated leaves; the outer circle is compoſed of ſemifloſcules; all theſe are placed upon the embryo-ſeeds, and all contained in one general cup, of a ſquammoſe ſtructure. The embryos finally ripen into long and ſlender ſeeds, of an angular figure. To this it is alſo to be added, that the whole plant has its peculiar appearance, which readily diſtinguiſhes it from all the others of the radiated claſs.

The ſpecies of *buphthalmum*, enumerated by Mr. Tournefort, are theſe. 1. The tawny-leaved *buphthalmum*. 2. The tawny-leaved *buphthalmum*, with white flowers. *Tournefort*'s Inſtit. p. 495.

An infuſion of the flowers of this plant is ſaid to be an excellent diuretic, and the leaves are eſteemed vulnerary; but neither are now in uſe.

BUPHTHALMUS, in botany, a name given by ſome of the antients to the common great houſeleek, or *ſedum majus*, from the manner of its growing in cluſters, reſembling the eyes of large animals.

BUPRESTES, a ſort of oblong cantharides, of a ſtinking ſmell, and very ſevere bite; it is of the ſame nature with the common cantharides, or Spaniſh fly, and is ſaid to do great injury to the cattle, which, feeding, chance to eat it.

BURACO *de velta*, in zoology, the name of a fiſh caught on the ſhores of the Braſils, and more uſually known among authors by its Braſilian name *guaibi coara*. *Ray*'s Ichthyology, p. 315. See the article GUAIBI *coara*.

BURBARUS, in ichthyology, a name given by Paul Jovius, and ſome other writers on fiſhes, to the common carp. See the article CYPRINUS.

BURBER, an Egyptian piece of money. It is a thick piece of copper, about as broad as a ſixpence; twelve of theſe make a *medine* there. *Pocock*'s Egypt, p. 175.

BURBOT, the Engliſh name of the *muſtela fluviatilis*; a fiſh common in the Trent, and many other of our rivers, and called in other places the eel-pout. *Willughby*'s Hiſt. Piſc. p. 125.

BURCA, among the Turks, the name of the rich covering of the door of the houſe at Mecca; it is ten feet long, and five wide; and there are ſeveral figures and Arabic letters on it, very richly embroidered in gold, on a ground of red and green. This is carried about in their ſolemn proceſſions, and is often made to ſtop, that the people may touch it.

BURDA, in ſome middle age writers, denotes a garment made of ruſhes. *Du Cange*, Gloſſ. Lat. T. 1. p. 645.

BURDACK, an Ægyptian veſſel, which ſheep uſually drink out of at Cairo. They are made of a peculiar ſort of earth, which is ſuppoſed to cool the water, and are always ſet out to the north, to keep the cooler, and covered with a ſtrainer, to prevent any thing falling into the water; they are of ſo porous a ſtructure, that the water put into them will get through them in a few days. *Pocock*'s Egypt, p. 186.

BURDEN (*Cycl.*)—The uſual rule whereby a ſhip's *burden* is diſcovered, is, that it will commodiouſly bear a weight equal to that of half the water which would fill its capacity. But this rule is not demonſtrative, and ſome depart from it as unexact, allowing only two fifths, or even one third of the water, for the ſhip's *burden*. Mem. Acad. Scienc. an. 1721. p. 125, ſeq.

Ships of BURDEN, denote thoſe of the larger and heavier ſort, carrying 500 tons, or upwards.

BURDO, in phyſiology, a mongrel beaſt of burden, produced by a horſe and a ſhe-aſs, by which it is diſtinguiſhed from the mule, which is that produced of a male aſs by a mare. *Briſſ.* de Verb. Signif. p. 87. *Calv.* Lex. Jur. p. 128. *Pitiſc.* Lex. Ant. T. 1. p. 302. See the article MULE, *Cycl.* and *Suppl.* The liver and teſticles of the *burdo* are greatly commended by Aldrovand, and ſome other authors, as medicines, but now never uſed. *Aldrovand.* de Quadr.

BURDO, or BURDON, in middle age writers, denotes a pilgrim's long ſtaff, as doing the office on that occaſion of a mule, or other vehicle. Vid. *Caſeneuv.* Orig. p. 27. voc. *Bourdon.* *Du Cange*, Gloſſ. Lat. T. 1. p. 646. voc. *Burdo.*

BURDONARII, an appellation ſometimes given to pilgrims, or thoſe who went out of devotion to the holy land. *Du Cange*, lib. cit. p. 647.

The word is formed from *burdo*, an appellation given the ſtaff wherewith they travelled. See the article BURDO.

BURDUNCULUS, in botany, a name given by ſome to the plant known among moſt of the botanical writers by the name of *bugloſſum echioides capitulis cardui benedicti.*

BURGH-*bote*, is chiefly uſed for an aid or contribution levied for the repairing of a town or caſtle. *Spelm.* Gloſſ. p. 92. *Du Cange*, Gloſſ. Lat. T. 1. p. 649.

By the law of king Athelſtan, the caſtles and walls of towns were to be repaired, and *burgh-bote* levied every year, within a fortnight after rogation days [a]. No perſon whatever was exempt from this ſervice; the king himſelf could not diſpenſe a man from *burgh-bote*: yet, in after-times, exemptions appear to have been frequently granted; inſomuch that, according to Cowel, the word *burgh-bote* came to be chiefly uſed to denote, not the ſervice but the liberty or exemption from it [b].—[[a] Leg. Athelſt. c. 13. *Spelm.* Gloſſ. p. 92. [b] *Cow.* Interpr. in voc. *Du Cange*, loc. cit. p. 650.]

BURGH-*breche*, or *brech*, a fine impoſed on the community of a town, or *burgh*, for the breach of peace among them. Leg. Canut. c. 55. *Spelm.* Gloſſ. p. 92. *Du Cange*, Gloſſ. Lat. T. 1. p. 650. See the article BOROUGH.

BURGH-*maſter*, an officer in the tin-mines, who directs and lays out the meers for the workmen, &c. otherwiſe denominated *bailiff* and *bar-maſter*. *Pett.* Hiſt. Roy. Mines, p. 83, 85, ſeq. See the articles BAR-*maſter*, and TIN.

BURGAGE (*Cycl.*) is ſometimes uſed to denote the rent, or quit-rent paid to the chief lord for the houſes and tenements in a town or borough. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc.

BURGAGE alſo obtains in the laws of Normandy; ſome imagine, that it had its firſt riſe here, and was brought into England by William the Conqueror; others are of opinion, that Rollo, when driven out of England, carried it thence into Normandy. *Aubert*, ap. Richel. T. 1. p. 227.

Free BURGAGE, *Burgagium liberum*, denotes a tenure, whereby the tenants, after having paid their rent to the ſuperior lord, were exempted from the ſervice. *Du Cange*, Gloſſ. Lat. T. 1. p. 647.

BURGAU, in natural hiſtory, the name of a large ſpecies of ſea ſnail, of the lunar or round-mouthed kind; it is very beautifully lined with a coat, of the nature of the mother of pearl, and the artificers take this out, to uſe under the name of mother of pearl, though ſome call it after the name of the ſhell they take it from, *burgaudine.*

BURGAUDINE, the name given by the French artificers to what we call mother of pearl. In their works, they do not uſe the common nacre ſhell for this, but the lining of the American burgau. Hence ſome call all the mother of pearl *burgaudine*, and ſome call the *burgaudine* mother of pearl.

BURGEON, in gardening, a knot or button put forth by the branch of a tree in the ſpring. *Bradl.* Dict. Botan. T. 1. in voc.

The word is formed from the French *bourgeon*, which ſignifies the ſame, formed from the Latin *burrio*, of *burra*. *Menag.* Orig. Franc. p. 119. voc. *Bourgeon.*

Bourgeon amounts to the ſame with what is otherwiſe called *eye*, *bud*, or *germ.*

Froſts are chiefly dangerous when the *burgeons* begin to appear. The *burgeons* have the ſame skin, ſame pith, ſame ligneous body, and ſame inſertions as the ſtalk; that is, all the parts are the ſame in both; only more contracted in the former; the juice which enters them receiving an extenſion like that of gold in paſſing through a wire-drawer's iron, and the parts unfolding much after the manner of the draws of a teleſcope. Trev. Dict. Univ. T. 1. p. 1169.

BURGESS (*Cycl.*)—Antiently *burgeſſes* were held in great contempt; being reputed ſerviſe, baſe, and unfit for war; ſo that the gentry were not allowed to intermarry in their families, or fight with them; but, in lieu thereof, were to appoint champions [a]. A *burgher*'s ſon was reputed of age, when he could diſtinctly count money, meaſure cloth [b], &c.—[[a] *Spelm.* Gloſſ. p. 92. [b] *Glanvil.* l. 7. c. 9.]

King's BURGESS, *Burgenſis regis*, was he who, though reſiding in another's juriſdiction, was exempt therefrom, and only ſubject to the juriſdiction of the king, unleſs the lord alſo enjoyed royal juriſdiction. Vid. Leges Burgor. Scot. c. 2. p. 53. *Du Cange*, Gloſſ. Lat. T. 1. p. 649.

In a ſtatute under Rich. II. *viz.* 5 Rich. II. c. 4. where the ſeveral claſſes of perſons in the commonwealth are enumerated, we meet with count, baron, banneret, chivaleer de countee, citizein de citie, and *burgeſs* de burgh. *Spelm.* Gloſſ. p. 92. No man is qualified to be a *burgeſs* in parliament, who hath not

a freehold eſtate of 300 l. a year, clear of all incumbrances. Stat. 9 Ann. c. 7.

BURGMOTE (*Cycl.*)—The word is alſo written *burgemotus*, *burgimotus*, *burgmotus*, and *burgemote*, from *burgh*, *oppidum*, and *mote*, or *gemote*, *conventus*. *Du Cange*, Gloſſ. Lat. T. 1. p. 648. *Spelm.* Gloſſ. p. 92. voc. *Burgemotus*.

The *burgmote*, by the laws of king Edgar, was to be held thrice in the year [a]. By thoſe of Henry I. twelve times [b].—[[a] Leg. Edgar. Reg. c. 10. ap. *Brompt.* [b] Leg. Hen. I. c. 7. Vid. *Du Cange*, Gloſſ. Lat. T. 1. p. 648.]

BURGOMASTER *of Greenland*, in zoology, a whimſical name given by the Dutch ſailors to a ſpecies of larus or ſea gull, common on that and many other coaſts. 'Tis known among authors by the name of *martinezze*. See the article MARTINEZZE.

BURGOO, a ſea-faring diſh, made of whole oatmeal, or greets, boiled in water till they burſt; then mixed with butter. Dict. Ruſt. T. 2. voc. *Oatmeal*.

Burgoo, otherwiſe called *loblolly*, is held by Cockburn very proper to correct that thickneſs of humours and coſtiveneſs to which the other diet of ſailors much diſpoſes them. Yet the *burgoo* victualling is the leaſt liked of all their proviſions, by reaſon of the ſcanty allowance of butter to it. The ſame author thinks it might be worth the conſideration of thoſe to whom the care of the ſeamen is committed, to contrive to render this food more agreeable to them. *Cockburn*, Treat. of Sea Diſ. §. 17. p. 32, ſeq.

BURGRAVE (*Cycl.*)—The *burgraves* were originally the ſame with what we otherwiſe call *caſtellans*, or *comites caſtellani*; but their dignity was conſiderably advanced under Rudolph of Hapſburgh; before his time they were ranked only as counts, and below the princes, but under him began to be eſteemed on a footing with princes. *Schurzfl.* Epiſt. 37. Act. Erud. Lipſ. Supp. T. 3. p. 510.

In ſome parts, the dignity is much degenerated, eſpecially in the Palatinate. There were formerly, according to Leti, fifteen families who enjoyed the title of *burgraves*, thirteen of which are now extinct [a]. But this is differently repreſented by others [b].—[[a] *Leti*, Leterre, &c. P. 1. p. 74, & 251. Mem. de Trev. Sept. 1702. p. 74. [b] Vid. *Corn.* Dict. des Arts, T. 1. p. 147. *Limn.* Jur. Imp. l. 4. c. 4. Trev. Dict. Univ. T. 1. p. 1289.]

In Bohemia, the title *burgrave* is given to the chief officer, or he that commands in quality of viceroy.

In Pruſſia, the *burgrave* is one of the four chief offices of the province.

In Guelderland, the *burgrave* of Nimeguen is preſident of the ſtates of the province.

BURGRAVIATE, the office or dignity of burgrave. See the article BURGRAVE, *Cycl.* and *Suppl.*

The word is alſo uſed to denote the territory or diſtrict of a burgrave.

BURGWARD, *Burgwardus*, or *burgwardium*, in middle age writers, the ſame with bulwark. *Du Cange*, Gloſſ. Lat. T. 1. p. 652. See the article BULWARK, *Cycl.*

The name is alſo extended to the town, and even the country about ſuch a fortreſs. It is formed from the Teutonic *burg*, town, and *ward*, cuſtody, keeping.

BURIAL, the act of interring a dead body, and depoſiting it in the ground.

Burial and baptiſm are parochial rights, and belong not to chapels of eaſe, unleſs by uſurpation. *Kenn.* Paroch. Antiq. p. 590, ſeq.

Weſtminſter abbey is the *burial*-place of moſt of our Engliſh kings [a]. Mabillon has a diſcourſe on the *burial* of the antient kings of France [b].—[[a] *Dugd.* Monaſt. Abr. p. 15, ſeq. [b] Mem. Acad. Inſcr. T. 4. p. 369.]

The deſire of *burial* has been ſtrong in moſt ages [c], and the denial of it reputed the laſt and ſevereſt of puniſhments; yet the Cynics appear to have deſpiſed it; and Pliny ranks the concern for it in the number of weakneſſes peculiar to man [d]. —[[c] *Potter*, Arch. Græc. l. 4. c. 1. T. 2. p. 161, ſeq. [d] *Plin.* Hiſt. Nat. l. 7.]

Yet it is ſaid, we find ſomething like it in ſome ſpecies of brutes. Naturaliſts aſſure us, that elephants, paſſing by the corpſe of others, gather graſs, and break branches off trees with their trunks, wherewith they cover the dead [e]. Diogenes the Cynic being asked on his death-bed, how he would be buried, anſwered, Throw me naked into a ditch. His friends repreſented, that he would be liable to be dragged out and devoured by the beaſts and birds: Lay a good ſtick by me then, anſwered the philoſopher, that I may drive them away. This, it was told him, could be of no ſervice, ſince he would not have ſenſe to uſe it: Then, ſaid he, I ſhall have no ſenſe of their devouring me [f].—[[e] Phil. Tranſ. N° 326. p. 64. [f] *Cic.* Tuſc. Quæſt. l. c.]

Burial is an office or a debt of humanity. Some found this obligation on the law of nature, others on the law of nations, and others on the divine law [g]. 'Tis certain it is warranted by them all. One of the ſeven corporal works of mercy, recited by antient divines, is *burying* the dead. The primitive chriſtians ventured on it at the hazard of their lives: they never ſcrupled it either in times of perſecution, or of the plague, when the greateſt dangers attended it [h]. [[g] Vid. *Vitriar.* Inſt. Jur. Nat. l. 2. c. 19. qu. 3, ſeq. *Budd.* Inſt. Phil. Pract. c. 4. ſect. 9. §. 12, ſeq p. 324, ſeq. [h] *Bingh.* Orig. Eccleſ. l. 23. c. 3. §. 1.]

The heathens believed, that the ſouls of thoſe who lay unburied, remained in a wandering ſtate the ſpace of an hundred years. The invention of *burial* among the Greeks is aſcribed to Pluto, who, on this account, was deified, and made to preſide over the world of ſhades [i]. The Rabbins pretend, that the firſt hint was taken from birds: Adam and Eve, ſay they, being utterly at a loſs what to do with the body of Abel killed by his brother; under this perplexity, a crow was ſeen to throw earth and leaves over the body of one of its dead companions. This was enough for the patriarch: he went preſently and did the ſame to his ſon [k]. The Egyptians carried their dead for *burial* over a certain lake; for the paſſage of which, one Charon, a farmer under one of the Pharoahs, procured a toll to be impoſed, by which he was ſpeedily enriched [l]. Whence the whole tradition of the ferryman of hell. Cicero refers the origin of the vulgar opinion concerning hell to the antient manner of *burying* the dead by interment: for from hence the earth became to be conſidered as the laſt habitation of mankind, who were here ſuppoſed to lead a new life under ground [m].—[[i] *Diod. Sicul.* l. 5. c. 15. [k] Vid. *Fabric.* Cod. Pſeudop. Vet. Teſt. T. 1. §. 38. p. 113, ſeq. [l] Hiſt. Acad. Inſcr. T. 2. p. 10. [m] Idem, ibid. p. 38.]

Among the Greeks, drowning was no *burial*; for which reaſon, it was a cuſtom to faſten to ſome part of their bodies a reward for him that ſhould take them up, and *bury* them in caſe they were caſt aſhore [n]. Among us, however, thoſe who die at ſea are uſually *buried* there, unleſs they be near land: The ceremony is ſhort; the corpſe being ſewed up in its hammock, or quilt, is thrown over from the ſtar-board, under the diſcharge of a gun. 'Tis a great diſgrace to be thrown over the lar-board [o].—[[n] *Hought.* Collect. N° 330. T. 2. p. 353. [o] *Aubin.* Dict. Mar. p. 569. voc. *Mort.*]

The Arwaces, a people of Guiana, pulverize the bones of their great men, and drink them in their liquor.

Some nations among the Braſilians are ſaid to eat their dead, not out of hunger, much leſs deſpight, but affection and reverence [p]. We are told of a great controverſy held before king Darius of Perſia, on the queſtion, which was the moſt honorable kind of *burial*; that of the Greeks, who burnt their dead to preſerve their aſhes; or that of the Calatians, a people of India, who eat the bodies of their parents, that they might in ſome meaſure be revived in themſelves [q]. — [[p] *Hought.* ibid. p. 340. [q] Trev. Dict. Univ. T. 4. p. 1661. voc. *Sepulture.*]

See the article ANTHROPOPHAGIA.

At the ſame time that the Romans uſed to burn the bodies of their dead, the cuſtom was, to avoid expence, to throw thoſe of the ſlaves to rot in holes dug perpendicularly, called *puticuli*. Phil. Tranſ. N° 265. p. 645.

Among the antient Saxons, the bodies of thoſe ſlain in the field, were not laid in graves, but on the ſurface of the ground, and covered over with turfs or clods of earth; and the more in reputation the perſons had been, the greater and higher were the turfs raiſed. *Verſteg.* Reſtit. Dec. Intellig. c. 7. p. 165. See the article BARROW.

The Danes and northern nations, in their ſecond age, *buried* their dead under earthen hillocks [r]. Sometimes huge pyramids of ſtone were raiſed over their bodies, many of which are ſtill remaining in divers parts of England [s].—[[r] *Ol. Worm.* Monum. Dan. l. 1. c. 7. [s] *Plot*, Nat. Hiſt. Staff. c. 10. §. 63.]

In Japan, Peru, Pegu, Mexico, Tartary, Siam, and the Great Mogul's dominions, they burn their dead. For the great ones, the fires are made with aromatic woods, gums, balſams, and oils [t]. The like method obtained among the Jews as early as Saul's time, whoſe body was burnt at Jabeſh, and his bones afterwards *buried* [u]. Aſa was burnt in the bed which he had made for himſelf, filled with ſweet odours, and divers kinds of ſpices [w].—[[t] *Hought.* Collect. N° 325. p. 338. [u] 1 Sam. xxxi. 11, ſeq. [w] 2 Chron. xvi. 14.]

They who thought human bodies were compounded of earth, inclined to have them committed to the earth: Heraclitus and his followers, imagining fire the firſt principle of all things, preferred burning. *Potter*, Archæol. l. 4. c. 6. p. 207.

Euſtathius aſſigns two reaſons for the prevalency of burning in Greece; the firſt, that bodies being thought to be unclean after the ſoul's departure, were to be purified by fire: that the ſoul, or purer part, being ſeparated by the flames from the groſs inactive matter, might take its flight to the heavenly manſions with more freedom [x]. This latter opinion obtained ſo much, that the Indian philoſophers had not patience to wait for burning till after death; they had recourſe to it in their life-time; erecting themſelves piles for the purpoſe, to looſen their ſouls from confinement. Calanus, who followed Alexander out of India, finding himſelf indiſpoſed, obtained that prince's leave to prevent the growth of his diſtemper, by committing himſelf to the flames; and Hercules, before his reception into heaven, was purified from the dregs of earth by the ſame means [y].—[[x] *Quintil.* Declam. 10. [y] *Potter*, Archæol. Gr. l. 4. c. 6. p. 208.] See the article BURNING.

The antients *buried* by day, as deeming the night of ill omen, on account of the evil ſpirits then abroad: only perſons who died in the flower of their days, were *buried* in the morning before ſun-riſe. *Potter*, ibid. l. 4. c. 4. p. 191, ſeq.

Some nations *bury* in linnen; the Braſilians *bury* in ſilk, the Engliſh *bury* in woollen, by virtue of a ſtatute made under king Charles II. *Hought.* Collect. T. 2. p. 340.

Among the Romans, we find two kinds of *burial*, mentioned in the Theodoſian code; one, the *burying* of whole bodies in coffins under ground; the other, *burying* the bones and aſhes in urns above ground. Both appear to have been uſed at the ſame time; though interring appears to be the older practice. Cod. Theodoſ. lib. 9. tit. 17. *Bingh.* Orig. Eccleſ. p. 429. See the article BURNING.

Mr. Monro takes the catacombs about Rome to have been the *burial*-place of the antient Romans, before burning came into faſhion; and which, on the new mode's taking place, fell into diſuſe, till they were revived by the primitive chriſtians. Phil Tranſ. N° 265. p. 649, ſeq. See CATACOMB, *Cycl.* and *Suppl.*

The Romans in Britain *buried* their warriours near the via ſtrata, or military way, to put their bodies out of danger of inſult; and, to prevent the ſcattering of their aſhes in haſte, the whole army caſt on them graſſy turfs; which is the origin of many of the tumuli ſtill found among us [a]: As it was the greateſt diſhonour to lie unburied, it was moſt glorious to be covered with a large tumulus; which might be one reaſon of the Romans *burying* their generals near public ways, that paſſengers might be continually adding to the heap, which it was judged a work of piety to do [b].—[[a] *Plot*, Nat. Hiſt. Oxf. c. 10. §. 47. [b] Idem, ibid. §. 41. p. 330.] See the article BARROW.

Tho' burning was the ordinary uſage among the Romans, yet ſome ſtill retained the antient one of *burying*. The family of the Cornelii interred their dead all along till the time of Sylla the dictator, who, in his will, gave particular order to have his body burnt, probably to avoid the indignities which might have been offered it after *burial*, by the Marian faction, in return for the violence ſhewn by Sylla's ſoldiers to the tomb and relicks of Marius. *Cic.* de Leg. l. 2. p. 345. *Plin.* Hiſt. Nat. l. 7. c. 54.

Burial was denied by the antients to traytors, proſcribed perſons, ſuicides, and even frequently to enemies killed in war [c]; though this was reputed by the more moral and civilized nations a violation of the laws of nature [d]. Among the Greeks, ſpendthrifts and inſolvent debtors were alſo refuſed the rights of *burial* [e]. By the laws of the church, this penalty has been carried further, to perſons excommunicated, to thoſe who could not ſay their creed and pater-noſter, to ſtrikers of eccleſiaſtics, and to thoſe who ſhould omit communicating at Eaſter [f].—[[c] *Potter*, Archæol. Græc. l. 4. c. 1. p. 165, ſeq. *Pitiſc.* Lex. Ant. T. 2. p. 768. voc. *Sepultura*. *Calm.* Dict. Bibl. T. 1. p. 330, ſeq. [d] Vid. *Grot.* de Jure Belli, l. 2. c. 19. §. 2. n. 6. & §. 3. n. 1. *Seld.* de Leg. Nat. l. 6. c. 16. *Vitriar.* Inſt. Jur. Nat. l. 2. c. 19. qu. 4. *Budd.* Inſt. Phil. Pract. loc. cit. §. 17. p. 326. [e] *Potter*, lib. cit. p. 167. [f] Vid. *Johnſ.* Eccleſ. Law, an. 960. §. 22. Idem ibid. ann. 1138. §. 10. Id. ibid. an. 1378. §. 4.]

Among the antient Egyptians, kings themſelves were to undergo a trial after their death; and, if their behaviour had been ill, were refuſed the privilege of Charon's boat, that is, to be carried to *burial*. Mem. Acad. Inſcr. T. 2. p. 11.

Chriſtian BURIAL, that performed in holy ground, and with the uſual ſervice or ceremonies of the church.

The chriſtians were always tenacious of the plain way of *burying* by inhumation, and could never be brought to uſe any other; reckoning it a great piece of barbarity in their perſecutors whenever they denied them this decent interment after death, as they ſometimes did, either by expoſing their bodies to the fury of wild beaſts and birds of prey, or burning them in ſcorn and deriſion of their doctrine of a future reſurrection. *Bingh.* Orig. Eccleſ. l. 23. c. 2. §. 4. p. 429.

They ſeem to have had a particular averſion to burning; their method was to put the body whole in the ground, or, if there was occaſion for any other way of *burying*, they embalmed the body, and laid it in a catacomb. *Bingh.* Orig. Eccleſ. l. 23. c. 2. §. 4. p. 429. *Minut. Fel.* p. 20, & 101. *Tertull.* de Anima, c. 51. Item, de Reſurr. c. 1. *Bingh.* loc. cit. p. 429.

BURIAL *of an aſs*, *Aſini ſepultura*, an ignominious kind of *burial* out of holy ground, under the gallows, or in a high way, where ſeveral roads meet, and performed by public hangmen, or the like [g]. Such is that of ſuicides, excommunicated perſons, &c. ſometimes denoted *canine burial*, or *burial* of a dog [h].—[[g] *Du Cange*, Gloſſ. Lat. T. 4. p. 815. voc. *Sepultura*. [h] *Vitriar.* Inſt. Jur. Nat. l. 2. c. 19. qu. 2.]

In the middle age we alſo find mention of a peculiar kind of *burial*, called imblocation, practiſed on the bodies of perſons excommunicated. *Du Cange*, Gloſſ. Lat. voc. *Imblocatus*. See the article IMBLOCATION.

BURIAL *of the crucifix*, *Sepultura crucifixi*, denoted a repreſentation of the *burial* of Chriſt, antiently performed annually in churches on the day of the paraſceue. *Du Cange*, Gloſſ. Lat. T. 4. p. 815.

BURIALS, in computations of mortality, denote deaths, and ſtand oppoſed to births.

In this ſenſe, we have eſtimates of the *burials* in Brandenburg [a], in Francfort [b], Breſlaw [c], &c. The *burials* in London exceed the births; in other towns they come ſhort of them [d]. The number of yearly *burials* at Paris was computed, in the year 1686, to be at a medium 16381, at London 23212 [e]. At Edinburgh, the *burials*, in 1731, amounted to 1119 [f]; in the year 1732, to 1247 [g].—[[a] Phil. Tranſ. N° 261. p. 508. [b] Idem, N° 229. p. 559. [c] Idem, N° 196. p. 597, ſeq. [d] Idem, loc. cit. [e] Idem, N° 185. p. 239. [f] Med. Eſſ. Edinb. T. 1. p. 45. [g] Idem, T. 2. p. 35.]

By a ſtatute under king Charles II. a regiſter is to be kept in every pariſh, of all perſons buried within the ſame, or at the common *burial*-places thereof. Stat. 30 Car. II. c. 3.

BURIAL is alſo uſed to denote the dues paid for interment, eſpecially to the miniſter.

The *burial*-fee paid to the prieſt on opening the grave, was called by our Saxon anceſtors *ſoul-ſcot*. Phil. Tranſact. N° 189. p. 357.

BURIAL is alſo uſed for the incloſing of vegetable or mineral bodies in the ground, for divers purpoſes. Lord Bacon gives divers experiments of *burying* fruits, &c. for preſervation and condenſation. *Bac.* Nat. Hiſt. §. 376. Works, T. 3. p. 80, ſeq.

Some commend *burials* in the earth, others in wheat, to ſeaſon timber when firſt felled, and make it of more durable uſe [a]. Chemiſts ſometimes *bury* their cements. The Chineſe are reported to *bury* their porcellane, to give it the greater beauty [b].—[[a] *Mortim.* Art of Huſband. T. 2. l. 12. c. 10. p. 101. [b] *Bacon*, lib. cit. p. 253.] See TIMBER, &c.

It has been a tradition, that pearl, coral, and turquois ſtones, when they have loſt their colours, recover them again by *burial* in the ground. But the experiment did not ſucceed with Lord Bacon, upon trial of a ſix weeks *burial*. *Bacon*, Nat. Hiſt. §. 380. Works, T. 3. p. 81.

BURIS, a name given by Aviſenna, and ſome other old authors, to a ſchirrous hernia, cauſed by a hard abſceſs. *Caſtel.* Lex. Med. in voc.

BURLAW, or BYRLAW, *Burlawa*, in middle age writers, denotes country laws, or the laws concerning country affairs. *Sken.* de Verb. Signif. p. 33. *Du Cange*, Gloſſ. Lat. T. 1. p. 653. *Spelm.* Gloſſ. p. 79.

BURNERS, *Uſtores*, in antiquity, perſons whoſe office and employment it was to burn the bodies of the dead. *Pitiſc.* Lex. Antiq. T. 2. p. 1119. voc. *Uſtores*. See the articles BURNING, and BURIAL.

BURNET, *Burneta*, or *Burnetus*, in middle age writers, denotes brown cloth made of dyed wool.

In which ſenſe, the word ſtands contradiſtinguiſhed from *brunus*, which was applied to the wool undyed. *Blunt* ap. *Jac.* Law Dict. in voc.

BURN *(Cycl.)*— *Burns* are divided into dry and humid.

Dry BURNS are thoſe occaſioned by the application of a naked fire, or ignited body, as coals, flame, red-hot metals, gunpowder, lightning, and the like, which are attended with a corrugation or ſhrivelling of the part.

Humid BURNS, more uſually among us called *ſcalds*, are thoſe occaſioned by fluid ſubſtances, as hot water, oil, wax, or the like. *Junck.* Conſp. Chir. Tab. 11. p. 98.

Others make five degrees of *burns*: the firſt, when the ſkin only is hurt without any great redneſs: in the ſecond, the pain is conſiderable, and the redneſs deep, attended with puſtules: the third inſtantly produces puſtules, with a throbbing pain, inflammation, and ulceration of the part: in the fourth degree, a great havock is made in the fibres, by which the ſkin is much corrugated, ſeparated from the fleſh, and as it were roaſted, occaſioning an eſchar: the fifth degree is, when the fire penetrates deeper, and burns to the membranes, veſſels and nerves underneath, attended with a great ſhrivelling of the part, a violent inflammatory pain, and blackiſh eſchar. *Junck.* loc. citat.

Dry *burns* are of a worſe kind than moiſt ones. Of the dry, the worſt and moſt penetrating of all is that of lightning; the next are thoſe cauſed by melted metals and gun-powder; the next, by fats and oily ſubſtances; the ſlighteſt of all *burns* is that by hot water. *Junck.* ubi ſupra.

As *burns* nearly reſemble inflammatory diſorders in their ſeveral degrees, ſo they alſo do in their method of cure. In the ſlighter degree of *burns*, the beſt method is to have recourſe to emollients and aſtringents. The beſt ſlight aſtringent is either common proof ſpirit, or rectified ſpirit of wine, or, when it is neceſſary, ſpirit of wine camphorated: theſe may be applied to the part with linnen rags, as may alſo oxycrate, or the pickle of cabbages, or litharge vinegar; and theſe applications muſt be repeated as there is occaſion. Oil of turpentine has alſo very good effects, if applied in time, and repeated frequently. And the vulgar method of holding the injured part, when that is the hand or a finger, to the fire, as long and as near as can be born, is often attended with ſucceſs; for the ſtagnating fluids are, by this degree of heat, driven back into their proper channels, and, by that means, the veſication, and other troubleſome ſymptoms, which naturally ſucceed, are often prevented. Another remedy, however, there is, very efficacious on the ſame occaſions, though founded on a contrary intention. This is by emollient remedies, which remove the tenſion of the fibres and veſſels, and reſtore the blood to its natural courſe before any bad ſymptoms come on, as the injured part may be fomented with water, made as warm as the patient can bear, till all the pain and heat entirely diſappear. Sydenham very highly,

and

and with great reaſon, extols this method. It is eaſy, however, to add to the efficacy of it, by giving the virtues of a fomentation to the water before it is uſed, by boiling in it marſhmallows, mallows, mullein, linſeed, fenugreek ſeed, or quince ſeed. Cataplaſms made of the ſame ingredients, are alſo of great ſervice, as are alſo the emollient oils of linſeed, and the like. Whatever remedies are uſed in this caſe, ſhould be very frequently repeated; and when it is the face that is *burnt*, they ſhould be ſpread on a linnen maſk, to be kept conſtantly moiſt by the application of the ſame remedy.

When the *burn* is ſomething greater than this, and attended with veſication, or puſtules, the puſtules are by no means to be opened, which always brings on great pain; ſome of the remedies before-mentioned will always prove of more ſervice, applied while the bliſters are whole, and, by the uſe of them, the heat and pain will quickly go off, and the cuticle will ſeparate from the cutis, without either deformity or pain. But if theſe remedies do not abate the pain, the part is to be dreſſed with linſeed oil, or the litharge ointment, or the unguentum diopompholigos, or ſomething of a like kind. Theſe are to be applied either by rubbing them frequently on the parts, or ſpreading them on a linnen rag, and applying that, and often renewing it. After theſe, a plaſter of the emplaſtrum de minio, or any of a like kind, will keep the ſkin ſmooth, and forward the renovation of the cuticle. If the *burn* or ſcald, which ever it be, be very conſiderable in extent, and great part of the body be burnt, it is neceſſary to bleed plentifully, even till the patient faints, and to give a briſk purge. This method will often prevent ill conſequences, that too frequently elſe attend large *burns*; ſuch as foul ulcers, large cicatrices, and ſometimes even gangrenes. When infants are the ſubjects of theſe accidents, bleeding being not ſo convenient, the revulſion is to be made by repeated purges; and, in grown perſons, a regularity of diet is above all things to be obſerved.

In the yet greater degree of *burns*, where the burnt part is covered by a cruſt or eſchar, the cure cannot be performed without ſuppuration. When this accident happens to the face, great caution is neceſſary, to avoid making a deformed cicatrix; for this reaſon, all ointments and plaſters whatever are to be forbidden, even though they are the moſt valuable ſecrets, as there are in almoſt all families many ſuch; for the miſchief of theſe remedies is, that they all dry up the wound too faſt, and contract the fibres and the skin, and by that means leave an uneven cicatrix. The forwarding the caſting off the eſchar is by all means to be attempted, and the diſcharge of the matter that is contained under it. The eaſieſt and moſt ſucceſsful method of doing this, is by the repeated application of emollients. Three or four times every day the dreſſings are to be changed; and if, at any of theſe times, any part of the eſchar is found to be looſe, it muſt be raiſed with the forceps, and removed, if that conveniently may be; at the ſame time, the reſt of the eſchar muſt be anointed with butter, and warm fomentations, made of emollient herbs, &c. applied. Two, three, or four days employed in this manner, generally afford a ſeparation of all the cruſt or eſchar; and the next intention is then to heal the wound. It is firſt therefore to be thoroughly cleanſed, by means of ſome mild digeſtive mixed with honey of roſes, and afterwards healed up with any of the lead or litharge ointments. If the eſchar in theſe caſes ſhould not ſeparate in a proper time, it will be neceſſary to make a deep inciſion through the middle of it, to let out the included ſanies. *Burns* of the moſt extreme and worſt kind, where the *burn* has penetrated ſo deep as to deſtroy all the parts quite down to the bone, can have no relief from medicines; nor is there any thing in the ſurgeon's power, but amputating the limb. *Heiſter*'s Surgery, p. 220.

BURNING *(Cycl.)* —The appearances of *burning* ariſe ſucceſſively, and in a certain order: a heat muſt precede greater than what ſuffices to boil oil; the lighteſt and moſt volatile parts of the body burn the firſt; the heavier are ſlower in taking fire, but burn the longeſt. *Boerh.* Element. Chem. P. 2. T. 1. p. 294, ſeq.

Burning is a ſeparation of the parts of bodies made by means of fire [a]. Some conſider it as a ſpecies of ſolution [b], and ſuppoſe it effected by a diſſolvent power inherent in fire, which acts as a menſtruum in reſpect of the ſulphureous parts of bodies.— [[a] Vid. *s'Graveſ.* Inſt. Phil. Newt. n. 846. p. 243. [b] *Chauv.* Lex. Phil. p. 118, ſeq voc. *Combuſtio.*]

Dr. Hooke, conſidering the neceſſity of air to *burning*, and that heat, however great, does not alone ſuffice to burn a body, does indeed take *burning* for a ſolution of the ſulphureous parts of bodies; but ſuppoſes the menſtruum, by which it is done, to be the air, or at leaſt ſome ſubtile, ſaline, nitrous ſubſtance diffuſed in the air.

This diſſolution, like many others, does not take place till the ſubject body be ſufficiently heated, and the operation is performed with ſo much violence, as to agitate all the minuteſt parts of the body with great rapidity; from whence alſo ariſes the pulſe of light in the air; and from the ſame cauſe may be deduced the origin of the ſmoke, ſoot, aſhes, &c. *Hook*, Microgr. Obſ. 16. p. 103. *Walter*, Life of Hook, p. 21. ap. Poſthum. Works.

Divers bodies are only ſet on *burning* by the application of water to them; as lime, oil of vitriol, ſulphur, and iron-filings [c]. Others, by the acceſs of air to them, as the phoſphorus ardens. Some bodies will burn even under water, and that with violence, as that antient compoſition called *Ignis Græcus*, water-rockets, &c. Notwithſtanding the expence in fumes, the weight of certain bodies is increaſed by *burning* [d]. — [[c] *Newent.* Relig. Philoſ. Cont. 20. §. 74. p. 374. [d] *s'Graveſ.* Inſt. Phil. Newt. §. 867, ſeq.] See the articles CALX, FIRE, and CALCINATION.

Burning bodies are preſently extinguiſhed by taking away the air. *s'Graveſ.* ibid. §. 865. See the article EXTINGUISHING.

BURNING *mountains*, are more particularly called *volcanos*. See the article VOLCANO, *Cycl.*

The antients deſcribe a meteor under the denomination of *burning buckler*, *clypeus ardens*. *Plin.* Hiſt. Nat. l. 2. c. 34. Mem. Acad. Inſcript. T. 6. p. 95, ſeq.

BURNING *phoſphorus*— The flame of *burning* phoſphorus is different from that of all other bodies, and comes neareſt to that of lightning: that which extinguiſhes other fires, lights this, and what kindles this, extinguiſhes others: it ſpares ſome bodies which others conſume, and conſumes others which the reſt will not touch. Mem Acad. Scienc. an. 1692. p. 133, ſeq. See PHOSPHORUS and LIGHTENING, *Cycl.* and *Suppl.*

Travellers into Italy deſcribe a *burning* ſpot of ground at Firenzuola, in the Appennines, out of which a crackling flame continually ariſes, yet without any cleft for it to iſſue out at. Maffei ſuppoſes the ſteams which the place yields, to be a kind of native phoſphorus ardens, which take fire on their coming in contact with the air. *Maffei*, ap. Mem. de Trev. an. 1731. p. 1937.

Extraordinary caſes of BURNING.—We have inſtances of perſons *burnt* by fire kindled within their own bodies. A woman at Paris, who uſed to drink brandy in exceſs, was one night reduced to aſhes by a fire from within, all but her head and the ends of her fingers. Novum Lumen Phoſphor. accenſ. Amſt. 1717. Signora Corn. Z ngari, or, as others call her, Corn. Bandi, an aged lady, of unblemiſhed life, near Ceſena in Romagna, underwent the ſame fate in March, 1731. She had retired in the evening into her chamber ſomewhat indiſpoſed, and in the morning was found in the middle of the room, reduced to aſhes, all except her face, ſkull, three fingers, and legs, which remained entire with the ſhoes and ſtockings on. The aſhes were light, and, on preſſing between the fingers, vaniſhed, leaving a groſs ſtinking moiſture behind, with which the floor was ſmeared; the walls, and furniture of the room, being covered with a moiſt cineritious ſoot, which had not only ſtained the linnen in the cheſts, but had penetrated into the cloſet, as well as into the room over-head, the walls of which were moiſtened with the ſame viſcous humour. Mem. de Trev. an. 1731. p. 1923, ſeq.

Sig. Mondini, Bianchini, and Maffei [e], have written diſcourſes expreſs, to account for the cauſe of ſo extraordinary an event: common fire it could not be, ſince this would likewiſe have burnt the bed and the room; beſides that it would have required many hours, and a huge quantity of fuel, to reduce a human body to aſhes; and, after all, a conſiderable part of the bones would have been left entire, as they were antiently found after the fierceſt funeral fires [f]. Some attribute the effect to a mine of ſulphur under the houſe; others to miracle; while others ſuſpect that art or villainy had ſome hand in it. Sign. Mondini attributes it to lightening. A philoſopher of Verona maintains, that ſuch a conflagration might have ariſen from the inflammable matters wherewith the human body naturally abounds [g]. Sig. Bianchini accounts for it from an internal fire, occaſioned by ſpirit of wine camphorated, which the lady uſed by way of bath or lotion, when ſhe found herſelf out of order [h]. Maffei's ſyſtem is a combination of the three laſt: he ſuppoſes it owing to lightening, but lightening generated in her own body; agreeable to his doctrine, which is, that lightening does not come from the clouds, but is always produced in the place where it is ſeen, and its effects perceived [i]. — [[e] Mem. de Trev. an. 1731. p. 1922. [f] *Maffei*, ubi ſupra, p. 1924. [g] Bibl. Ital. T. 10. p. 280, ſeq. [h] Id. T. 14. p. 266, ſeq. [i] Mem de Trev. an. 1731. p. 1925, ſeq.]

The humours of her body, naturally inflammable enough, were become preternaturally ſo, by her putrid indiſpoſition; and theſe, by perſpiration, had enveloped her body with an atmoſphere of the ſame kind, replete likewiſe with mineral matters, whereby its activity was heightened. She had probably riſen in the night to uſe her lotion, and, by the friction of her hand, had helped to kindle the flame. Idem, ibid. p. 1950, ſeq.

We have various relations of ſeveral other perſons being *burnt* to death in this unaccountable manner; as Jo. Hitchell, in 1613, and Grace Pet of Ipſwich, in 1744. The *burning* of Hitchell was occaſioned by lightening; but that does not appear to have been the cauſe of the death of many other perſons that occur in authors. We have had a late attempt to eſtabliſh the opinion, that theſe deſtroying internal fires are cauſed in the intrails of the body by inflamed effluvia of the blood, by juices and fermentations in the ſtomach, by the many combuſtible matters which abound in living bodies, for the uſes of life; and, finally, by the firy evaporations which exhale from the ſettlings of ſpirit of wine, brandies, and other hot liquors, in the tunica villoſa of the ſtomach, and other adipoſe or fat membranes;

membranes; within which those spirits engender a kind of camphor, which in the night-time, in sleep, by a full respiration, are put in a stronger motion, and are more apt to be set on fire; see Phil. Trans. N° 476. p. 453, seq. to which we must refer the reader.

Others ascribe the cause of such persons being set on fire, to lightening, and their *burning* so entirely, to the greater quantity of phosphorus, and other combustible matter they contained. Philos. Transact. ibid. p. 478, 479. See the article PHOSPHORUS.

It is well known, that divers putrid bodies will glow, and even sparkle in the dark; not to mention those lambent flames produced from putrid humours in church-yards, and the like places, called *ignes fatui*.

Flashes of light have been often produced from the bodies of men, as well as other animals, by a brisk motion. Fortunius Licetus mentions a person, who, by only rubbing his body with his hand, could make fire issue; and Maffei relates the same of Signora Cassandra Buri Rambalda of Verona, who needed only rub her flesh with a linnen cloth, to produce flashes of light. See the articles LIGHT, PHOSPHORUS, *&c.*

BURNING, in antiquity, was a species of sepulture or burial, used by the Greeks, Romans, and northern nations, and still retained by many people in both Indies. Vid. *Pott.* Archæol. l. 4. c. 6. *Kenn.* Rom. Ant Not. P. 2. l. 5. c. 10. Philos. Trans. N° 126. p. 633. *Hought.* Collect. T. 2. N° 332, & 335. *Salmuth.* ad Pancirol. P. 1. tit. 62. p. 339. *Meurs.* de Funer. Græc. c. 25. See the article BURIAL.

In this sense, *burning* stands opposed to burying [a]; tho', after *burning*, the bones remaining, and ashes, have been usually collected into urns, and deposited in the earth [b].—[[a] *Plot*, Nat. Hist. Oxf. c. 10. §. 43. p. 331. [b] *Pitisc.* Lex. Ant. T. 2. p. 341. voc. *Ossilegium.* Phil. Transact. N° 285. p. 1405.] See the articles BURYING, BONE, *&c.*

Kings were burnt in cloth made of the abestos stone, that their ashes might be preserved pure from any mixture with the fuel, and other matters thrown on the funeral pile [c]. And the like usage is still retained for the princes in Tartary [d].—[[c] *Plin.* Hist. Nat. l. 19. c. 1. Mem. Acad. Inscr. T. 6. p. 419, seq. [d] Phil. Trans. N° 172. p. 1059.] See the article ABSESTOS, *Cycl.* and *Suppl.*

Burning is not so antient among the Greeks as interring; tho' we find it obtained in the time of the Trojan war. The antient christians, in this, deviated from the method of the heathens, that the generality of the latter burned their dead, whereas the former buried them in earth. *Potter*, Archæol. l. 4. c. 6. T. 2. p. 207.

For the manner of *burning* among the Greeks: The body was placed on the top of a pile, πυρα, on which were also thrown divers animals, and even slaves and captives, besides unguents and perfumes. In the funeral of Patroclus, we find a number of sheep and oxen thrown in, then four horses, followed by two dogs, and, lastly, by twelve Trojan prisoners. *Hom.* Iliad. xxiii. v. 166. *Pott.* Archæol. l. 4. c. 6. p. 208, seq.

The like is mentioned by Virgil in the funerals of his Trojans; where, besides oxen, swine, and all manner of cattle [e], we find eight youths condemned to the flames [f]. The first thing was the fat of the beasts, with which the body was covered, that it might consume the sooner [g]; it being reputed great felicity to be quickly reduced to ashes. For the like reason, where numbers were to be burnt at the same time, care was taken, that some of humid constitutions, and therefore easily to be inflamed, should be mixed with the rest [h]. Thus we are assured by Plutarch and Macrobius, that for every ten men it was the custom to put in one woman [i]. — [[e] *Virg.* Æn. l. 11. [f] Idem, l. 10. [g] *Eustath.* ad Iliad. loc. cit. [h] *Potter*, loc. cit. p. 209. [i] *Plut.* Sympos. l. 3. Quæst. 4. *Macrob.* Saturn. l. 7. c. 7.]

Soldiers usually had their arms burnt with them [k]. The garments worn by the living [l], were also thrown on the pile, with other ornaments and presents; a piece of extravagance, which the Athenians carried to so great a length, that some of their lawgivers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead [m].—[[k] *Virg.* Æn. l. 6. *Decorantque super fulgentibus armis.* [l] Idem, ibid. *Purpureasque super vestis, velamina, conjiciunt.* [m] *Potter*, lib. cit. p. 210.] See the article BURIAL.

Pliny assures us, that *burning* was first brought into use among the Romans, on occasion of the cruel usage which the bodies of the dead Romans underwent in enemies countries [n]. But these must only be understood in regard of the common usage; since we find mention of *burning* as practised by some even in the earliest ages of Rome: Numa forbad his own body to be burned, commanding it to be laid entire in a stone coffin, which shews, that the practice of *burning* was not then unknown at Rome [o].—[[n] *Plin.* Hist. Nat. l. 7. c. 54. [o] *Kenn.* Rom. Ant. Not. P. 2. l. 5. c. 10. p. 335.]

Some pretend, that the Romans borrowed the method of *burning* from the Barbarians, particularly the Westphalians, among whom the usage was most antient, and so firmly rooted, that Charlemaign had much ado, with the severest penalties, to put a stop to it. Trev. Dict. Univ. T. 4. voc. *Westphaliens.*

But 'tis more probable they had received the method long before from the Greeks. *Kenn*, ubi supra, p. 334, seq.

In some cases, *burning* was expresly forbid, and looked upon as the highest impiety. Thus infants, who died before the breeding of teeth, were intombed, unburnt, in the ground, in a particular place set apart for this use, called *suggrundarium.* The like was practised with regard to those who had been struck dead with lightening, who were never to be burnt again. *Kenn*, ubi supra.

Some say, that *burning* was denied to suicides as a punishment. *Hought.* Collect. N° 332. p. 358.

The manner of *burning* among the Romans, was not unlike that of the Greeks: the corps being brought without the city, if they designed to burn it, was carried directly to the place appointed for that purpose; which, if it joined to the sepulchre, was called *bustum*, if separate from it, *ustrina*, and there laid on the *rogus* or *pyra*, a pile of wood prepared to burn it on, built in shape of an altar, but of different height, according to the quality of the deceased. The wood used was commonly from such trees as contained most pitch or rosin; and if any other were used, they split it for the more easy catching fire: round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was not placed on the bare pile, but on the couch or bed where it lay on [p]. This done, the next of blood performed the ceremony of lighting the pile, which they did with a torch, turning their face all the while the other way [q], as if it were done with reluctance [r]. During the ceremony, decursions and games were celebrated; after which came the *ossilegium*, or gathering the bones and ashes; also washing and anointing them, and repositing them in urns; which were common to both nations [s] — [[p] *Tibull.* l. 1. Eleg. 1. *Flebis & arsuro positum me, Delia, lecto.* [q] *Virg.* Æn. l. 6. *Subjectam, more parentum, aversi tenuere facem.* [r] *Kenn.* Rom. Ant. P. 2. l. 5. c. 10. p. 355, seq. [s] Vide *Potter*, lib. cit. p. 211, seq. *Kenn*, ubi supra, p. 357, seq.]

'Tis commonly supposed the practice of *burning* ceased at Rome under the empire of the Antonines.

Gothofred takes it for a mistake, not only by reason Tertullian speaks of it as still customary among the heathens in his time, but because there is some intimation given of it in Theodosius's laws [t], as subsisting then: though it was not long after till it was totally disused; since Macrobius, who lived early in the fourth century, assures us, that the method of *burning* was then entirely disused [u].—[[t] Cod. Theod. l. 9. tit. 17. leg. 6. [u] *Macrob.* Saturn. l. 7. c. 7.]

BURNING is one of the methods used for the destruction of books.

The antient fathers procured the writings of the heathens to be *burnt*, out of zeal for religion; to the great detriment not only of learning but religion itself [a]. The Talmud was publickly burnt by pope Gregory IX. in 1230, and, after his example, by other popes, and kings of France [b]. Schulz has a treatise expres on *burning* the books of heretics [c]. — [[a] Vide *Shaftesb.* Charact. T. 3. p. 329, seq. [b] *Wolf.* Bibl. Hebr. l. 4. c. 5. T. 2. p. 932. [c] *Thurman.* Bibl. Acad. p. 119.]

Under king Henry IV. a proclamation was published for *burning* the English bible, lest the ignorant multitude should from it extract poison for their souls. Vid. *Steph.* Suppl. to Dugd. T. 2. p. 103.

Diocletian is said to have *burnt* the chemical books of the antient Egyptians, wherein the art of making gold was contained, to prevent the people from growing too rich, and being thereby brought to rebel. Vid. *Borrich.* de Orig. Chem. p. 89.

The emperor Chi-Hoam-Ti, 230 years before Christ, *burnt* all the books of the Chinese, except those relating to agriculture, physic, and divination; obliging the literati, in lieu of study, to take to the trewel, and work at the famous wall then erecting against the Tartars; as only needing two kinds of people, soldiers and masons. Vid. Phil. Trans. N° 230. p. 589. Mem. Acad. Inscr. T. 9. p. 357, seq.

BURNING is also an operation in pharmacy. Simples are frequently *burnt* in earth-vessels, either to reduce them to ashes, as in the preparation of vegetable salts, or in order to dry them, that they may be more commodiously pulverized, as is practised in regard of hartshorn, *&c.* *Cast.* Lex. Med. p. 75. voc. *Ustio.*

BURNING, *Ustio*, in chemistry, is distinguished from calcining; as the former is performed in close vessels, and terminates in charring, or reducing the body to a blackness; whereas the latter turns them white, being performed in the open air. Vid. *Junck.* Consp. Chem. Tab. 27. p. 577, 582, and 588. See the article CALCINATION, *Cycl.* and *Suppl.*

It also differs from roasting, *tostio*, as, in *burning*, the fire is applied in contact with the body, in roasting, at a distance from it. See the article ROASTING.

A dexterous *burning* volatilizes salts, as common salt, sal alkali. *Burning* also produces somewhat of a mineral sulphur out of tartar, *&c.* *Junck.* ibid. p. 596.

BURNING *of metals*, *Ustio metallorum*, is either performed by fire, or by corrosive salts; which latter is also denominated *cæmentation.* Theat. Chem. T. 3. p. 470. *Rolfink.* Chem. l. 2. c. 3. See the article CÆMENTATION, *Cycl.*

The first preparation of most ores is by ustion, or *burning*, whereby to dispose them for fusion. This is usually performed by exposing them, without addition, to a naked fire; some-

times fixed alkalis and abſorbents are added, to hinder the avolation of the metalline particles [a]. Some hold *burning* in the ſtone or glebe moſt advantageous; others *burning* in the meal [b]. —[a *Junck.* Conſp. Chem. Tab. 30. p. 667, ſeq. b Vid. *Alonz. Barb.* Art. Metal. l. 2. c. 9. Phil. Tranſ. N° 109. p. 212.]

The baſer metals, tin and lead, may be burnt like plants to aſhes. For gold and ſilver, the caſe is otherwiſe. *Junck.* ubi ſupra, Tab. 32. p. 828.

BURNING, among painters—Several of the painters colours require *burning*, to fit them for uſe, as lamp-black, umber, ivory, *&c.* See COLOUR, *&c. Cycl.* and *Suppl.*

The *burning*, or rather drying, of lamp-black, is performed by ſetting it over the fire in an iron laddle or crucible, till no ſmoke ariſes from it. To *burn* umber, they put it in large lumps into a naked fire, where it is left till thoroughly red-hot. Ivory muſt be *burnt*, to make a black, in two crucibles, luted, covered with coals. Vid. *Smith*, Art of Paint. c. 3. p. 30.

BURNING, among ſurgeons, denotes the application of an actual cautery, that is, a red-hot iron inſtrument to the part affected; otherwiſe denominated cauterization. *Horn.* Microtec. ſect. 1. §. 15. p. 50. *Junck.* Conſp. Chir. Tab. 79. p. 540. *Caſt.* Lex. Med. p. 435. voc. *Inuſtio.*

The whole art of phyſic, among the Japoneſe, lies in the choice of places proper to be *burnt*; which are varied according to the diſeaſe. *Ten. Ryne*, Diſſ. de Arthrit. P. 3. Phil. Tranſ. N° 148. p. 228.

In the country of the Mogul, the colic is cured by an iron ring applied red-hot about the patient's navel. Lett. Edif. T. 9. p. 253, ſeq.

Burning is particularly recommended in the gout, as a ſevere but adequate cure of that ſtubborn diſeaſe. *Ten. Ryne*, ubi ſup. p. 225.

The Japoneſe are many of them covered with ſcars all over their bodies, by the frequent *burnings* of moxa. Idem, ibid. p. 226. See the article MOXA, *Cycl.* and *Suppl.*

Burning pyramidal pieces of tow or cotton on the joints, is an antient practice revived in Europe, chiefly by Fab. ab Aquapendente, and Severinus, againſt pains of the joints ariſing from cold and viſcous humours impacted in them. The operation is alſo ſpoke of by Hippocrates [c] and Celſus [d]; the former of whom recommends the uſe of raw flax. Severinus calls it the Arabian *burning*, becauſe moſt frequently uſed among that people, tho' common enough alſo among the Egyptians [e].—[c *Hippoc.* Aph. ult. l. 6. Item, de Affectib. Text. 30 & 32. *Horn.* Microtec. ſect. 2. §. 35. p. 141, ſeq. d *Celſ.* l. 4. c. 22. e *Alpin.* de Medic. Ægypt. l. 3. p. 101.]

Accidents have often been the means of great diſcoveries, and a very remarkable one, commemorated by Mr. Homberg in the Memoirs of the Academy of Paris, inſtructed him in the cure of a diſeaſe, which had long baffled his ſkill. A woman of about five and thirty became ſubject to a head-ach, which at times was ſo violent, that it drove her out of her ſenſes, making her ſometimes ſtupid and fooliſh, and at others raving and furious. The ſeat of the pain was in the forehead, and over the eyes, which were inflamed and looked violently red and ſparkling; and the moſt violent fits of it were attended with nauſeas and vomitings. In the times of the fits ſhe could take no food; but out of them had a very good ſtomach. Mr. Homberg had in vain attempted her cure for three years with all kinds of medicines; only opium ſucceeded, and that but little, all its effect being only the taking off the pain for a few hours. The redneſs of her eyes were always her ſign of the violence of an approaching fit. One night feeling a fit coming on, ſhe went to lie down upon the bed, but firſt walked up to the glaſs with the candle in her hand, to ſee how her eyes looked; in obſerving this, the candle ſet fire to her cap, and, as ſhe was alone, her head was very terribly burnt before the fire could be extinguiſhed. Mr. Homberg was ſent for, and ordered bleeding and the proper dreſſings; but it was perceived, that the expected fit this night never came on; the pain of the *burning* wore off by degrees, and the patient found herſelf from that hour cured of her head-ach, which had never returned in four years after; which was the time when the account was given. Mem. Acad. Par. 1708.

Another not leſs remarkable cure of this kind was communicated to Mr. Homberg by a phyſician at Bruges. A woman had been long ſubject to terrible pains and ſwellings of her legs and thighs, and had been accuſtomed, by way of remedy, to rub them with brandy by the fire-ſide night and morning. One evening as ſhe was doing this, the whole quantity of brandy took fire by ſome accident, and burnt her, but not violently; ſhe uſed the common means for the burn, and, in the night, all the water which had been uſed to ſwell her legs, voided itſelf by urine: in the morning, the limbs were found free from the ſwelling, which never afterwards returned. Thus accident often does more than medicine; and it is pity that its good effects are not more common. It is certain, that, among the people of earlier times, theſe violent remedies were much more in uſe, and perhaps diſeaſes were cured by them, which now baffle all our art: and it is very certain, that accident has taught the ſavage inhabitants of many nations to cure diſeaſes in this manner greatly to their advantage; and many of them are fond of ſuch remedies, becauſe they are painful, and give them opportunities of ſhewing their courage. Mr. Homberg, who was born in the iſland of Java, ſays, it is a common practice with the natives to cure violent colics, by *burning* the ſoles of their feet with hot irons; and that, in the common caſe of a whitlow or felon on the finger, their remedy is to dip the finger into boiling water, and repeat this as often as neceſſary, at a minute's diſtance between each time. The accounts travellers give us of cures of other diſeaſes among the ſavages by *burning*, are very numerous; and even at home, we ſeem to know its efficacy very well, daily experiencing its ſalutary effects on horſes and other animals, though we are too delicate and tender to ſuffer it ourſelves. We ſeem to prefer long and leſs violent pains to ſhorter and ſharper; and even in that terrible caſe the gout, cannot bring ourſelves to the *burning* with moxa, the moſt ſlight of all cauterizations. Mr. Homberg, however, gives an account of a Dutch gentleman, who tried this under his care, and was by it relieved from a fit of the gout in ſeven or eight days, which he otherwiſe expected would have held him two months, and ever afterwards had the returns much leſs frequent. Mem. Acad. Par. 1708.

Burning for diſeaſes may cure three ways; firſt, by ſetting the noxious humours in a violent emotion, and by that perhaps determining them to new courſes; or, ſecondly, by rendering the juices fluid, which were before tough and viſcous, and by that means fitting them for being carried off; or, laſtly, deſtroying a part of the veſſels which furniſh them to the part in too large abundance.

BURNING *alive*, among the Romans, a puniſhment inflicted on deſerters, betrayers of the public councils, incendiaries, and even coiners: it was called *crematio. Pitiſc.* Lex. Ant. T. 1. p. 588. voc. *Crematio.* Idem, ibid. p. 952. voc. *Incendere.*

The Jews had two manners of *burnings*; one called *burning* of the body, performed with wood and faggots; the other, *burning* of the ſoul, *combuſtio animæ*, performed by pouring ſcalding hot lead down their throats. This laſt was not frequent. The criminal was ſet up to the knees in the ground; two perſons ſtrained a towel round his neck till they found his mouth open, upon which the lead was poured in [a]. The prieſt's daughter, who committed whoredom, he that lay with his own daughter, or grand-daughter, or his mother in law, were *burnt* alive [b].—[a *Schoetg.* Lex. Ant. p. 1422. b *Godwyn*, Moſes and Aaron, l. 5. c. 7. p. 201, ſeq.]

BURNING *on the forehead*, *Frontis inuſtio*, was antiently the penalty of a calumniator [a]. In the middle age, we find frequent inſtances of burning in the cheek; a puniſhment allotted to bondmen or villains guilty of theft [b].—[a *Kenn.* Rom. Ant. Not. P. 2. l. 3. c. 18. b *Du Cange*, Gloſſ. Lat. T. 1. p. 1073. voc. *Combuſtio.* Item, T. 3. p. 488. voc. *Maxilla.*]

BURNING is alſo a denomination given by phyſicians to divers diſorders, on account of a ſenſation of heat that attends them. In which ſenſe we ſay, a *burning* fever. See the articles FEVER and CAUSUS.

Among the divers ſpecies of madneſs incident to dogs, one is called the *burning* madneſs. If a mare which has been covered, and the colt knit within her, be covered by another horſe, he is ſaid to *burn* her. *Cox*, Gent. Recr. P. 1. p. 131.

BURNING is more particularly uſed for the herpes, or *ignis ſacer*, called *eryſipelas* and *arſura*. *Du Cange*, Gloſſ. Lat. T. 1. p. 344. voc. *Arſura.* See the article ERYSIPELAS, *Cycl.* and *Suppl.*

BURNING is alſo applied to the action of divers things which are cold to the touch, or do not contain fire.

In this ſenſe, aqua fortis is ſaid to *burn* cloth: There are certain fogs which *burn* or ſcorch the corn: Virgil obſerves, that ſevere cold itſelf will *burn*, that is, have much the ſame effects on the parts of the body, as fire itſelf in cauſing gangrenes. Vid. Hiſt. Acad. Scienc. an. 1709. p. 594.

Seamen talk much of the *burning* of ſea water; by which they only mean its yielding a briſk light, which it ſometimes does to that degree, that the water, as it paſſes off the oars, appears like liquid fire, chiefly during eaſterly and ſoutherly winds. Phil. Tranſact. N° 27. p. 497.

Some conſider the ſmutting of corn as a kind of *burning*; the beſt way to prevent the *burning* or ſmutting of grain, is to lime the ſeed. *Ray*'s Collect. Loc. Words, p. 130, ſeq. See the article SMUTT.

The tradition concerning Archimedes and his *burning*-glaſs, though defended by ſome modern writers [a], is held for a fable by the more intelligent in optics; and the rather, as neither Polybius, Livy, Diodorus, nor Plutarch, make any mention of it: Lucian [b] indeed aſſures us, that Archimedes *burnt* the enemies veſſels by art or ſtratagem; but does not ſay it was done by *burning* ſpecula [c]. Wolfius ſuggeſts divers reaſons for the impoſſibility of the thing [d]. But of late Monſ. Buffon has put the poſſibility of the thing beyond all doubt, by the combination of a multitude of *plana ſpecula*.—[a *Liebknecht*, Diſſ. de Specul. Cauſt. c. 1. *Walch.* Lex. Philoſ. p. 310. *Voſſ.* de Math. Scien. c. 24. §. 7. p. 101. Item, in Addend. p. 442. *Naud.* Synt. Mil. l. 2. p. 658. *Budd.* Obſerv. ad Hiſt Phyſ. §. 31. b *Lucian.* in Hippia, T. 2. p. 742. c *Fabric.* Bibl. Græc. l. 3. c. 22. T. 2. p. 552. d *Wolf.* Elem. Catoptr. §. 217.] See the article MIRROR.

Archimedes has a work extant on *burning*-mirrors [e], tranſlated into Latin from the Arabic by Gogava; though by ſeveral authors ſuſpected for ſpurious, and by ſome attributed to Ptolemy.

lemy [f].—[[e] Περι Κατοπτρων καυστικων. [f] *Fabric.* Bibl. Græc. l. 3. c. 22. §. 11. T. 2. p. 548.]

BURNING *of land*, in husbandry, is the setting fire to the sod or turf of some particular sorts of land, by way of improving them.

This is a very great means of improvement of land, and is not only at this time used in many parts of this and other kingdoms, but it has been practised from the earliest times of husbandry that we have any account of. Virgil very expressly mentions, and greatly recommends it, and all the old writers of husbandry say much in its praise.

It does not take effect, however, in all sorts of ground. It is not proper for rich soils, nor for stony or chalky ones; nor is it a practice to be often repeated on any land, especially where the surface is shallow; nor must corn be sown too long upon the land afterwards; for *burning* exhausts the good juices of the land, in some degree, as well as the bad ones. It is most profitably used to such lands as have lain a long time uncultivated, and are over-run with rank weeds, such as sowre-grass, fern, heath, furze, and the like. Some lands, when corn is sown upon them, run it up into straw, and make the ears but poor and light; these are, beyond all others, improved by *burning*. The usual method of plowing up for this is with a breast-plow, which a man pushes before him, and cuts the turf off the surface, turning it over when he has cut it to about eighteen or twenty inches long. The common way is only to pare it about half an inch thick; but if it be very full of weeds, with stubborn roots, it is better to go deeper.

If the season proves dry, the turf needs no more turning, but dries as it lies. If it be wet, it is necessary to set it on edge, and keep it hollow till the wind and air have sufficiently dried it. It is then to be piled up in little heaps, about the quantity of two wheel-barrows full in each heap; and if there be much roots and a good head upon it, there needs no farther care but the setting it on fire, and the whole heap will be reduced to ashes; but if it be earthy and too dead to burn out by itself, there must be a heap of furze or heath laid under every parcel.

When the heaps are reduced to ashes, they are left upon the place till some rain comes to wet them; otherwise, in the spreading, they would all blow away. When they are wetted, the farmer takes the opportunity of a calm day, and spreads them as equally as possible over the whole land, cutting away the earth a little under the heaps, to abate its over great fertility there. After this, the land is to be plowed but very shallow, and the corn is to be sown upon it only in half the quantity that it is upon other land, and the later this is sown the better. If it be wheat, the best time is the latter end of October; for, if sown sooner, it is apt to grow too rank. The beginning of May is the proper time for cutting the turf off from these lands, because there is then time sufficient to get the land in order for sowing at the proper season. The whole charge of cutting, carrying, and *burning* the turf, is generally about twenty-four shillings an acre.

The turf is not to be burnt to white ashes, for this wastes a great part of its salt; it is only to be burnt so as to crumble all to pieces, and be in a condition to spread well upon the land; and it is better that the heaps of it should burn slowly and gradually than furiously.

Some farmers stub up furze, heath, and the like, and, covering heaps of them with the parings of the earth, set fire to them; others burn the stubble of the corn-fields, and others the stalks of all sorts of weeds, and add half a peck of unslaked lime to every bushel of the ashes. They cover the lime with the ashes, and leave the heaps in this manner till there comes some rain to slake the lime; and, after this, they spread the mixture carefully over the field. There is one great advantage attending this sort of manure, which is, that it does not breed weeds like the common way with dung, but only fills the ears of the corn, not running them up into stalk; but it is proper to add some dung to these lands at the time of plowing them up for a second or third crop of corn. *Mortimer*'s Husbandry.

BURNING *spring*, in natural history. See the article SPRING.

BURNING *zone*, in geography. See TORRID *zone*, *Cycl.*

BURNISHED *gold* or *silver*, denotes those metals laid on any work or leaves, and afterwards passed over with a burnisher to heighten their lustre. *Park.* Treat. Japann. c. 20. p. 61, seq.

BURNISHERS (*Cycl.*)—*Burnishers* for gold and silver are commonly made of a dog's or wolf's tooth, set in the end of an iron or wooden handle. Of late, agates and pebbles have been introduced, which many prefer to the dog's tooth. *Felib.* Princ. de l'Archit. p. 363. voc. *Bruniſſoir.*

The *burnishers* used by engravers in copper, usually serve with one end to burnish, and with the other to scrape. *Park.* Treat. Japann. c. 19. p. 60. *Felib.* ibid. l. 2. c. 10. p. 281. Item, p. 263 & 284.

BURNT, (*Cycl.*) in speaking of medicines, imports as much as imperfectly calcined. *Libav.* Synt. Arc. Chym. T. 2. p. 147. See CALCINATION, *Cycl.* and *Suppl.*

Burnt bodies are generally dry and astringent. The other medicinal qualities belonging to bodies are frequently destroyed, at least impaired by the *burning*. *Cast.* Lex. Med. p. 751. voc. *Uſtus.*

BURNT *way*, *combuſta via*, among astrologers, that part of the zodiac from the beginning of Libra to the middle of Scorpio; or, according to others, from the middle of Libra to the end of Scorpio, comprehending 45 degrees: a space supposed very unfortunate, and in which the planets are much enfeebled in their virtues, especially the moon. *Vital.* Lex. Math. p. 118. voc. *Combuſta.*

BURNT *planet*.—A planet is said to be *burnt*, *combuſtus*, when it is in conjunction, or nearly so, with the sun. Thus Saturn is said to be *burnt*, when not above five degrees distant from the sun, Jupiter, when six, &c. Planets, in this situation, are supposed to be much weakened or enfeebled in their influences. *Vital.* Lex. Math. p. 117, seq. *Wolf.* Lex. Math. p. 402. voc. *Combuſtus.*

BURRS, denote bits of flesh adjoining to the horns of a beef's hide, cut off by poor women after it is brought to market. *Haught.* Collect. T. 1. N° 128. p. 337.

BURRAS-*pipe*, an instrument used by goldsmiths, consisting of a copper box, with a spout, having teeth like a saw; sometimes also used by surgeons for the application of certain solid medicines by insperſion. *Horn.* Introd. Chirurg. sect. 1. p. 72.

BURREL-*fly*, in natural history, the name given by the people of many parts of England to the *curvicauda*, or wringle-tail; a species of bee-fly, very troublesome to horses. It is very like the common bee, but has only two wings, and has no sting. See the article WRINGLE-*tail.*

BURROCK, a small wear or dam, where wheels are laid in a river for the taking of fish. Dict. Rust. in voc. See the article WEAR, *Cycl.*

BURROUGH-*duck*, in zoology, a common English name for the *tadoma*, a species of duck of many beautiful colours, called also thence the shell-drake. It is common on the coast of Lancashire, and in some other places, and seems to have obtained its name *borrough-duck* from its often lying in deserted rabbet-holes. See the article TADOMA.

BURROWS, holes in a warren, serving as a covert for rabbets, &c. Dict. Rust. T. 1. in voc. See the article WARREN, *Cycl.* and *Suppl.*

A coney's coming out of her *burrow*, is called *bolting*. To catch coneys, they sometimes lay purse-nets over the *burrows*, then put in a terrier close muzzled, which making the creature bolt, she is caught in the net. *Cox*, Gent. Recr. P. 1. p. 93.

BURROW, or BARROW, is also a denomination given by our Saxon ancestors to what the Romans called *tumulus*. *Plot*, Nat. Hist. Oxford. c. 10. §. 48. p. 332. See the article BARROW.

BURSA, *Burſe*, originally signifies a purse. *Spelm.* Gloss. p. 95. *Du Cange*, Gloss. Lat. T. 1. p. 654. *Caſen.* Orig. Franc. p. 28.

Revocatio per BURSAM, in the Norman laws, is a right belonging to the next akin, to redeem or purchase back, within a year after sale, a fee or tenement alienated by his kinsman, on paying the price it had been sold at. *Du Cange*, ubi supra.

BURSA is more particularly used in middle age writers for a little college or hall in an university, for the residence of students, called *burſales*, or *burſarii*. *Schoet.* Lex. Ant. p. 245.

BURSA, *Burſe*, or *Bourſe*, in the French universities, still denotes a foundation for the maintenance of poor scholars in their studies.

The nomination to *burſes* is in the hands of the patrons and founders thereof. The *burſes* of colleges are not benefices, but mere places assigned to certain countries and persons. A *burſe* becomes vacant by the bursars being promoted to a cure, as being incompatible. In the college of cardinal Maine at Paris, there are two sorts of *burſes*, lesser, for young scholars, who can only enjoy them six years, that is, as long as suffices for their rising to the degree of master of arts; and greater, which may be held nine years, or till the students obtain the degree of doctors. Trev. Dict. Univ. T. 1. p. 1182. voc. *Bourſe.*

BURSA *paſtoris*, *Shepherd's purſe*, in botany, the name of a genus of plants, the characters of which are these: The flower consists of four leaves, and is of the cruciform kind. The pistil arises from the cup, and finally becomes a flat triangular seed-vessel, filled with small seeds, and divided into two cells by an intermediate membrane, to which there adhere valves on each side. The species of *burſa paſtoris*, enumerated by Mr. Tournefort, are these: 1. The larger *ſhepherd's purſe*, with whole leaves. 2. The larger *ſhepherd's purſe*, with sinuated leaves. 3. The larger *ſhepherd's purſe*, with elegantly divided leaves, like those of buckshorn plantain. 4. The lesser *ſhepherd's purſe*. 5. The daisy-leaved mountain *ſhepherd's purſe*. *Tourn.* Inst. p. 216.

This is an officinal plant; its juice is reputed astringent and vulnerary, and as such is used against hæmorrhages, dysenteries, diarrhæas, &c.

The country people apply it to cuts and fresh wounds; and some hold it of great virtue when made up into a cataplasm, and applied to the wrists against tertians and quartans. *Quinc.* Dispens. P. 2. sect. 2. n. 99. p. 94. *Junck.* Consp. Ther. p. 437.

BURSALIS *muſculus*, in anatomy, a name given by Cowper and others to a muscle of the thigh, called also *marſupialis* by the same authors. It is the *obturator internus* of Winslow and Albinus,

nus, and is described by Vesalius under the name of *decimus tertius moventium*, and by Spigelius under that of *circumagentium tertius*, or *obturator internus*.

BURSAR, or BURSER, *Bursarius*, is used in middle age writers for a treasurer, or cash-keeper.

In this sense, we meet with *bursers* of colleges. Conventual *bursars* were officers in monasteries, who were to deliver up their account yearly on the day after Michaelmas. *Kenn.* Gloss. ad Paroch. Ant. in voc. *Bursars*. *Du Cange*, Gloss. Lat. T. 1. p. 654. voc. *Bursarius*. *Spelm.* Gloss. p. 95. voc. *Bursa*.

The city of Bern is commanded by four bannerets, who are the heads of the militia of the whole canton, and two *bursers*, who are the treasurers general, one for the German district, the other for the Roman or French. Trev. Dict. Univ. T. 1. p. 1183. voc. *Bourser*.

The word is formed from the Latin *bursa*; whence also the English word *purse*: and hence the like officer who in a college is called *bursar*, in a ship is called *purser*. See the article PURSER, *Cycl.*

BURSARS, or BURSERS, *Bursarii*, also denote those to whom stipends are paid out of a burse or fund appointed for that use [a]. At Paris, all exhibitioners, or stipendiary scholars, are still called *bursars*, or *boursiers*, either in regard they live on the endowments of the founder, or benefactor, or, as others think, because they were originally such novices as were sent to the university, and maintained by the religious out of their public burse or stock [b]. Actions brought for the effects of a college, are entered in the name of the principal and *bursars* [c].—[[a] *Du Cange*, Gloss. Lat. T. 1. p. 654. *Spelm.* Gloss. Lat. p. 95. voc. *Bursarii*. [b] *Kenn.* Gloss. ad Paroch. Ant. in voc. [c] Trev. Dict. Univ. p. 1183.] See BURSA.

BURSARIA, *Bursary*, in middle age writers, denotes the place of receiving and paying money and rents by the bursars or officers of account in religious houses. *Kenn.* Gloss. ad Paroch. Antiq in voc. See the articles BURSA, and BURSAR.

BURSE, in matters of commerce, denotes a public edifice in certain cities, for the meeting of merchants to negotiate bills, and confer on other matters relating to money and trade.

In which sense, *burse* amounts to the same with what we otherwise call an exchange. See the article EXCHANGE, *Cycl.*

The first place of this kind to which the name *burse* was given, Guicchardin assures us, was at Bruges; and it took its denomination from a hotel adjoining to it, built by a lord of the family *de la Bourse*, whose arms, which are three purses, are still found on the crowning over the portal of the house. Catel's account is somewhat different, *viz.* That the merchants of Bruges bought a house or apartment to meet in, at which was the sign of the purse. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amsterdam, Berghen in Norway, and London. This last, antiently known by the name of the *Common burse of merchants*, had the denomination since given it by Q. Elizabeth, of the *Royal Exchange*. *Catel.* Hist. de Langued. p. 199. *Menag.* Orig. Franc. p. 121. voc. *Bourse*.

In the times of the Romans there were public places for the meeting of merchants in most of the trading cities of the empire: that built at Rome in the year after its foundation 253, about 492 years before Christ, under the consulate of Appius Claudius and Publius Servilius, was denominated the *College of merchants*; some remains of which are still seen, known among the modern Romans by the denomination *loggia*, in the place St. George. The hans towns, after the Roman example, gave the name *colleges* to their *burses*. *Savar.* Dict. Comm. T. 1. p. 451.

The most considerable *burse* is that of Amsterdam, which is a large building, 230 feet long and 130 broad, round which reigns a peristyle or portico, 20 feet wide. The columns of the peristyle, amounting to 46, are numbered, for the convenience of finding persons. It will hold 4500 people. *Sav.* Supp. p. 86.

BURSE *of merchants*, *Bourse des marchands*, denotes a court or jurisdiction established in several trading cities of France, for the taking cognizance, at the first instance, of all disputes arising between merchants, bankers, negotiants, and the like, and from which no appeals lie but to the parliament.

The *burse* is a kind of consular jurisdiction, the judges whereof are also denominated *priors* and *consuls*.

The *burse* of merchants at Tholouse was established by Henry II. in 1549, after the manner of the judges conservators of the privileges of the fairs at Lyons. The chief officers are a prior and two consuls, chosen yearly, and empowered to chuse and associate, to the number of 60, several merchants, to assist them in the decision of differences. These are called judges *conseillers de la retenuë*. *Savar.* Dict. Comm. T. 1. p. 449, seq. Trev. Dict. Univ. T. 1. p. 1182.

The *burse* of Rouen, or, as it is commonly called, the convention of Rouen, is of some years later standing than that of Tholouse, having only been erected in 1566.

The latest of the consular *burses* is that of Marseilles, established by Louis XIV. in 1691; whose jurisdiction extends through several of the neighbouring dioceses. *Savar.* loc. cit. p. 450.

BURSTEN, a person ruptured, called by physicians *hernioſus*; in middle age writers, *ponderoſus*. *Spelm.* Gloss. p. 463. voc. *Ponderoſus*. See the articles HERNIA, *Cycl.* and *Suppl.* and RUPTURE, *Cycl.*

BURTHEN, properly signifies a heavy weight or load.

Ringelberg recommends the bearing *burthens* as the best sort of exercise; especially to strengthen men of study. To this end, he had a gown lined with plates of lead, which he could just lift with both his hands. This load he bore six or seven days together, either increasing or diminishing it as he found occasion; by which means he could both write and exercise at the same time, without the one being any hinderance to the other. *Ringelberg.* Diss. de Stud. Instit. *Junck.* Consp. Physiol. Tab. 5. p. 500.

BURTHEN also denotes a fixed quantity of certain commodities. A *burthen* of gad-steel is two score, or 120 pounds. *Moor*, Math. Compend. c. 2. p. 12.

BURTON, in the sea language, a small tackle, consisting of two single blocks, capable of being made fast any where at pleasure, for hoisting of small things in or out, and which will purchase more than a single tackle with two blocks. *Guill.* Gent. Dict. P. 3. in voc.

BURY, is sometimes used to denote the hole or den of some animal under ground. See the article BURROW.

In which sense we say, the *bury* of a mole, a tortoise, or the like. The grillotalpa, or male cricket, digs itself a *bury* with its fore-feet, which are made broad and strong for that purpose [a]. Naturalists speak of a kind of urchins in the island of Maraguan, which have two entries to their *buries*, one towards the north, the other to the south, which they open and shut alternately, as the wind happens to lie [b].—[[a] *Grew*, Mus. Reg. Societ. P. 1. sect. 7. c. 1. p. 160. [b] Idem, ibid. sect. 2. c. 1. p. 17.]

BURYING, the same with interment or burial. See the article BURIAL.

BURYING *alive*, was the punishment of a Vestal who had violated her vow of virginity. The unhappy priestess was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on: but this provision was but show, for the moment she was at the bottom, they began to cast in the earth upon her, till the pit was filled up. Vid. Mem. Acad. Inscr. T. 5. p. 278. See the article VESTALS, *Cycl.*

Some middle age writers seem to make *burying alive*, *defoſſio*, the punishment of a woman thief. *Du Cange*, Gloss. Lat. T. 2. p. 42.

Lord Bacon gives instances of the resurrection of persons who had been buried alive. The famous Duns Scotus is of the number, who having been seized with a catalepsis, was thought dead, and laid to sleep among his fathers, but raised again by his servant, in whose absence he had been buried. Vid. *Bac.* Hist. Vit. & Mort. ap. Works, T. 2. p. 178.

Bartholin gives the relation of a woman, who, on recovering from an apoplexy, could not be convinced but that she was dead, and solicited so long and earnestly to be buried, that they were forced to comply, and performed the ceremonies, at least in appearance. Vid. *Barth.* Act. Med. T. 5. Obs. 60. p. 151.

The famous emperor Charles V. after his abdication, took it into his head to have his burial celebrated in his life-time, and assisted at it. Vid. *Gedd.* Misc Tracts.

BURYING-*place*.—The antients buried out of cities and towns; an usage which we find equally among Jews, Greeks, and Romans [a]. Among the last, *burying* within the walls was expressly prohibited by a law of the twelve tables: *Hominem mortuum in urbe ne ſepelito, neve urito.* The usual places of interment were in the suburbs and fields, but especially by the wayſides [b]. Partly, says Kennet, to put passengers in mind of their mortality, and partly also to save the best of their land [c].——[[a] *Kenn.* Rom. Ant. Not. P. 2. l. 5. c. 10. p. 352. *Potter*, Archæol. l. 4. c. 7. T. 2. p. 218, seq. [b] *Salmuth.* ad Pancirol. P. 1. tit. 62. p. 339. [c] *Kenn*, ubi supra, l. 5. c. 10. p. 353.]

Two reasons are alleged, why the antients *buried* out of cities; the first, an opinion, that the touch, sight, or even neighbourhood of a corpse, defiled a man, especially a priest: whence that rule in A. Gellius, that the *Flamen Dialis* might not on any account enter a place where there was a grave [d]: the second, to prevent the air from being corrupted by the stench of putrefied bodies, and the buildings from being endangered by the frequency of funeral fires [e]. We have instances, however, of persons *buried* in the city; but it was a favour only allowed a few of singular merit to the commonwealth. Plutarch says, those who had triumphed were indulged in it. Be this as it will, Val. Publicola, and C. Fabricius, are said to have had tombs in the forum; and Cicero adds Tubertus to the number [f].—[[d] *A. Gell.* Noct. Att. l. 10. c. 15. [e] *Kenn*, Rom. Ant. Not. P. 2. l. 5. c. 10. p. 353. [f] *Plut.* Quæst. Rom. *Crinit.* de Honest. Discipl. l. 21. c. 12.]

Lycurgus allowed his Lacedemonians to *bury* their dead within the city, and around their temples, that the youth being enured to such spectacles, might be the less terrified with the apprehension of death. *Potter*, Archæol. Græc. l. 4. c. 7. p. 219.

Burying in churches was not allowed for the first three hundred years after Christ; and the same was severely prohibited by the christian emperors for many ages after. The first step towards it appears to have been the practice of erecting churches over the graves of some martyrs in the country, and translating the relicts of others into churches in the city: the next was, allowing

lowing kings and emperors to be *buried* in the atrium or church-porch. In the ſixth century, the people began to be admitted into the church-yards, and ſome princes, founders, and biſhops, into the church. From that time the matter ſeems to have been left to the diſcretion of the biſhop. Vid. *Somn.* Antiq. Canterb. p. 233, ſeq. *Bingh.* l. 23 c. 1. §. 2, ſeq. *Durand.* de Ritib. Eccleſ. l. 1. c. 23. n. 7. p. 219, ſeq.

BUSELAPHUS, in zoology, the name of an animal of the goat kind, called alſo *moſchelaphus*. It is of a ſort of middle ſhape between the ſtag and ox kind. Its head and its ears are long, its legs and feet ſmall, its tail about a foot long, and of the ſhape of that of a heifer; its upper part reddiſh and very naked, its lower covered with long hairs. The hair of its whole body is of a tawney or rediſh yellow colour; its horns are black, ſmooth at the top, and rough every where elſe. It has two teats, and is an extremely tame and quiet animal, and naturally full of play. It is extremely ſwift in running, and in moſt reſpects, except in ſize, greatly reſembles the common antelope. *Ray*, Syn. Quad. p. 8.

BUSH, a tuft or aſſemblage of boughs or branches.

Lime-BUSH, among bird-catchers, denotes an arm or bough of a buſhy tree, full of thick and long, yet ſmooth and ſtrait twigs, dawbed over with bird-lime, and placed on ſome hedge where birds frequent, uſed eſpecially for the taking of pheaſants and fieldfares. Dict. Ruſt. T. 1. in voc. *Lime*. See the articles BIRD and LIME.

Burning-BUSH, that wherein the Lord appeared to Moſes at the foot of mount Horeb. Exod. iii. 2.

'Tis diſputed who the perſon was that appeared to Moſes in the *buſh*. In divers places of Scripture it is ſaid to be God himſelf; in others, the angel of the Lord [a]. The fathers find great myſteries in the burning *buſh*: ſome will have the incarnation typified by it, others the hypoſtatic union, others the purity of Mary, who brought forth without injury to her virginity [b]. The Mahometans hold, that one of Moſes's ſhoes, which he put off as he approached the burning *buſh*, was repoſited in the ark of the covenant, to perpetuate the memory of that miracle [c]. —— [[a] *Budd.* Hiſt. Eccleſ. Vet. Teſt. P. 2. ſect. 1. §. 3. p. 396. ſeq. *Calm.* Dict. Bibl. T. 1. p. 331, ſeq. [b] Vid. *Suic.* Theſ. Eccleſ. T. 1. p. 672. voc. Bat☉. *Budd.* lib. cit. p. 396. [c] *Calm.* loc. cit.]

BUSH alſo denotes a coronated frame of wood hung out as a ſign at taverns. It takes the denomination from hence, that, anciently, ſigns where wine was ſold were *buſhes* chiefly of ivy, cypreſs, or the like plant, which keeps its verdure long. *Kenn.* Gloſſ. Paroch. Ant. voc. *Buſche*.

BUSHEL, (*Cycl.*) *Buſſellus*, appears to have been firſt uſed for a liquid meaſure of wine, equal to eight gallons. *Octo libræ faciunt galonem vini, & octo galones vini faciunt* buſſellum *London, quæ eſt octava pars quarterii* [a]. The word was ſoon after tranſferred to the dry meaſure of corn of the ſame quantity—*Pondus octo librarum frumenti facit* buſſellum, *de quibus octo conſiſtit quarterium* [b].—[[a] Compoſit. Menſur. an. 51 Hen. III. ap. *Spelm.* Gloſſ. p. 254. voc. *Galo*. [b] *Flet.* l. 2. c. 12. §. 1. *Kenn*, Gloſſ. Paroch. Antiq. in voc. *Buſſellus*.]

The Engliſh ſtandard *buſhel* is that of Henry VII. which is kept in the exchequer. This being filled with common ſpring water, and the water meaſured before the houſe of commons in 1696, in a regular paralleliopiped, was found to contain 2145, 6 ſolid inches [c]; and the ſaid water being weighed, amounted to 1131 ounces and 14 penny-weights troy [d].—— [[c] *Everard.* Stereom. [d] *Greav.* Orig. of Weights, p. 25, ſeq.]

Beſides the ſtandard or legal *buſhel*, we have ſeveral local *buſhels*, of different dimenſions in different places. At Abingdon and Andover, a *buſhel* contains nine gallons; at Appleby and Penrith, a *buſhel* of peaſe, rye and wheat, contains 16 gallons; of barley, big, malt, mixt malt, and oats, 20 gallons. A *buſhel* contains at Carliſle 24 gallons; at Cheſter, a *buſhel* of wheat, rye, &c. contains 32 gallons, and of oats 40; at Dorcheſter, a *buſhel* of malt and oats contains 10 gallons; at Falmouth, the *buſhel* of ſtricken coals is 16 gallons, of other things 20, and uſually 21 gallons; at Kingſton upon Thames, the *buſhel* contains eight and a half; at Newbury, 9; at Wiccomb and Reading, eight and three fourths; at Stamford, 16 gallons. *Hought.* Collect. T. 1. n. 46. p. 42. See the article WEIGHT.

Cenalis, in his treatiſe of weights and meaſures, makes his *buſhel* one third of the Roman amphora. Merſennus obſerves, that the Paris *buſhel* of wheat, heaped, contains 220160 grains, and when ſtroked, 172000 grains. At the time of Severus death, there was corn in the public granaries of Rome for ſeven years ſubſiſtence, at the rate of 75000 *buſhels per* day, that is, to ſubſiſt 600,000 men ſo long, the Roman *buſhel* being the ordinary allowance for eight men *per* day. Trev. Dict. Univ. T. 1. p. 1098. voc. *Boiſſeau*.

BUSS, in navigation, a kind of fly-boat uſed by the Dutch in the herring-fiſhing. See the articles HERRING and FISHERY, *Cycl.*

The word is originally Flemiſh, *buis*, or *buys*, which ſignifies the ſame.

BUSS, *Buſſa*, is alſo the name of a large ſort of veſſel of war in uſe in the middle age; ſpoke of by antiquaries and hiſtorians under the ſeveral denominations of *buſſa*, *buſcia*, *burcia*, *buza*, *bucca*, and *bucia*. *Spelm.* Gloſſ. p. 95. *Aquin.* Lex. Milit. T. 1. p. 143, ſeq. *Du Cange*, Gloſſ. Lat. T. 1. p. 656.

The herring-*buſs* is uſually about 60 tun. The officers on board it are the maſter or patron, his mate, and a boatſwain, who directs the fiſhermen, barrellers, &c. The only diet in a *buſs* is ſea-biſcuit, gruel, and the fiſh they catch. *Fæſch.* Ing. Lex. p. 400. voc. *Herring-buyſe*. See alſo *Aubin.* Dict. Mar. p. 130. voc. *Buche*; where the fabric and proportions of the ſeveral parts of a *buſs* are deſcribed, and a figure of this ſort of veſſel is given.

BUSSORIES, a name given by ſome to that ſpecies of pigeon called the *carrier*. The original of theſe pigeons came from Bazora in Perſia, being ſometimes brought from place to place by ſhipping, and ſometimes in the caravans; and the name *buſſories* ſeems only a corruption of *Bazoras*, or Bazora pigeons. *Moore*'s Columb. p. 28.

BUSTUARIÆ *mœchæ*, a kind of public whores, who proſtituted their bodies among the *buſta* or tombs, which it ſeems were ordinary places of rendezvous for affairs of this kind. *Turneb.* Adverſ. l. 13. c. 19. *Calv.* Lex. Jur. p. 129.

BUSTUM, (*Cycl.*) in antiquity, was properly the place where the corpſe of a dead man was burnt, and his bones and aſhes buried.

When the body was only burnt there, and buried elſewhere, the place was not properly called *buſtum*, but *uſtrina*, or *uſtrinum*. *Feſt.* in voc. *Kirchman.* de Funer. Rom. l. 3. c. 1. *Pitiſc.* Lex. Ant. T. 1. p. 303.

BUSTA *Gallica*, was a place in antient Rome, wherein the bones of the Gauls, who firſt took the city, and were ſlain by Camillus, were depoſited. *Varr.* de Ling. Lat. l. 4. *Aquin.* Lex. Milit. T. 1. p. 144. *Pitiſc.* Lex. Antiq. T. 1. p. 303. It differed from

BUSTA *Gallorum*, a place on the Appennines, thus called by reaſon of many thouſands of Gauls killed there by Fabius.

BUSTUM, in the Campus Martius, was a ſtructure whereon the emperor Auguſtus firſt, and, after him, the bodies of his ſucceſſors were burnt.

It was built of white ſtone, ſurrounded with an iron paliſade, and planted within ſide with alder trees. *Pitiſc.* ubi ſupra.

BUSTUM was alſo figuratively applied to denote any tomb. See the article TOMB, *Cycl.*

Whence thoſe phraſes, *facere buſtum*, *violare buſtum*, &c.

BUSTUM *of an altar*, was the hearth or place where the fire was kindled. Idem, ibid. See the article ALTAR, *Cycl.* and *Suppl.*

BUTCHER (*Cycl.*)—In London, the furniſhing the markets with *butchers* meat is cantoned into ſeveral offices. We have carcaſs *butchers*, who kill the meat in great quantities, and ſell it out to another ſort called retail *butchers*, diſperſed in all out-parts, villages, and towns near the city. There are, beſides, cow-jobbers, or ſaleſmen, who buy and ſell cattle, acting between the *butchers* and the breeders, or feeders [c]. Something like this alſo obtains at Paris [d].—[[c] Compl. Engl. Tradeſm. T. 2. p. 81. [d] Trev. Dict. Univ. T. 1. p. 1140. voc. *Boucher*.

BUTCHER-*bird*, the Engliſh name of the *lanius*. *Ray*'s Ornithol. p. 53. See the article LANIUS.

BUTCHERS-*broom*, a plant called by authors *ruſcus*. See the article RUSCUS.

BUTEO, the common *buzzard*, a bird of the long-winged hawk kind, of the ſize of a pheaſant, or ſmall pullet. Its head is large and flat, and its beak ſhort, crooked, and of a blueiſh black, and covered above with a yellow ſkin down to the noſtrils. Its back and wings are of a rediſh or yellowiſh brown, tending to black, or, as ſome call it, a ruſty black, ſometimes variegated with white ſpots near the ſhoulders. Its breaſt and belly are of a yellowiſh white, but on the breaſt there are ſeveral oblong ruſty coloured ſpots. Its thighs are covered with yellowiſh white feathers, with tranſverſe ſtreaks of a ferrugineous colour; between its eyes and noſtrils there are ſeveral black briſtles. The tail is not forked, the legs are ſhort, thick, ſtrong, ſcaly, and of a yellowiſh colour. It feeds on moles, field-mice, and other ſuch animals; ſometimes on ſmall birds, and ſometimes will ſeize on rabbets. In want of better food, it will alſo ſometimes live on beetles, worms, and the like. Its eggs are white, more or leſs ſprinkled with irregular red ſpots. In age, or by ſome other accidents, the head and back in this ſpecies are ſometimes found grey. *Ray*'s Ornithology, p. 88. See the article BUZZARD.

Apivorous BUTEO. See the article APIVORUS.

BUTHYSIA, Βυθυσια, in antiquity, a ſacrifice of the greateſt kind; ſuch were the hecatombs. See the articles SACRIFICE and HECATOMB, *Cycl.*

The Greeks frequently prefixed the particle βε, *bu*, to words, to denote things of extraordinary magnitude, as alluding to the bigneſs of oxen. *Varr.* de Re ruſtica, l. 2. c. 5. *Feſt.* de Verb. Signif. in voc. *Fab.* Theſ. p. 386.

BUTIGA, is an inflammation of the whole face, otherwiſe called *gutta roſacea*. *Rul.* Lex. Alch. p. 107. *Quinc.* Lex. Phyſ. Med. p. 61.

BUTLER, or BOTILER, an officer whoſe chief charge is over the cellar and drinkables,

BUTLERS, *Buticularii*, among the Normans, denote wine taſters, appointed to examine liquors, and ſee that they be right and

and legal. *Du Cange*, Gloſſ. Lat. T. 1. p. 659.

BUTLER *of France*, *Buticularius Franciæ*, was one of the four great officers in the houſhold of the antient kings of that country, who ſigned all the royal patents, or at leaſt was preſent at the diſpatch of them [a]. His ſeat was among the princes, and he even diſputed the precedency of the conſtable of France. He had a right of preſiding at the chamber of accounts; and, in the regiſters of that office of the year 1397, mention is made, that John de Bourbon, grand *butler* of France, was admitted there as firſt preſident. But the title is now aboliſhed, and, in lieu thereof, a new office of *grand echanſon*, or cupbearer, erected [b]. — [a *Du Cange*, ubi ſupra. *Spelm.* Gloſſ p. 96. voc. *Buticularius*. b Trev. Dict. Univ. T. 1. p. 1191.]

BUTLER'*s ſtone*, a medicinal preparation, of which Van Helmont tells us wonderful things; ſuch as, that, by ſlightly plunging it into oil or almond milk, they would acquire the virtues of curing the head-ach, eryſipelas, and many other diſorders; nay, even corpulency could not withſtand the power of this medicine, if the patient did but nimbly lick a ſmall fragment of this ſtone every morning. Mr. Boyle does not ſeem to diſcredit theſe ſtories. See his Works abr. Vol. 1. p. 50.

The inventor, from whom it takes its name, was a Scotchman, in great favour with king James I. and is ſaid to have done wonders with it, not only in the ſpeedy cure of the moſt dangerous diſtempers, but in the making of gold out of lead, and quickſilver.

The preparation of this ſtone is given by Morley. Collect. Chym. Leyd. c. 375.

BUTMENT (*Cycl.*)—*Butments* of arches are the ſame with butreſſes. They anſwer to what the Romans call *ſublices*, the French, *culees* and *butees*.

BUTMENTS, or ABUTMENTS of a bridge, denote the two maſſives at the end of a bridge, whereby the two extreme arches are ſuſtained and joined with the ſhore on either ſide. *Hawkſ.* Account of Lond. Bridge, p. 47. *Davil.* Explic. Term. Archit. p. 538. voc. *Culee*. *Felib.* Princ. Archit. p. 486.

The *butments* of bridges next the banks, ſhould be built more firm and ſolid, as ſerving to ſuſtain the whole ſeries of arches, and hinder them from ſpreading. See the article BRIDGE.

BUTOMUS, the *flowering ruſh*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the roſaceous kind, being compoſed of ſeveral petals, arranged in a circular form; from the center of the flower ariſes a piſtil, which finally becomes a membranaceous fruit, compoſed of ſeveral ſmall capſules, each terminating in a ſort of point. Theſe ſplit open longitudinally when ripe, and are found to contain oblong ſeeds. There is only one known ſpecies of the *butomus*, with its variety. 1. The common or pale red-flowered *butomus*. 2. The white-flowered *butomus*. *Tournef.* Inſtit. p. 271.

Butomus is ſaid to be of an aperient and deobſtruent quality. *James*'s Medic. Dict. in voc.

BUTORIUS, in zoology, a name by which ſome have called the *ardea ſtellaris*, or bittern, a bird of the heron kind. See the article BITTERN.

BUTRO, in natural hiſtory, the name of a ſort of wild bull common in Florida, having a large bunch on his back like that of a camel; the ſame with that deſcribed by Geſner under the name of *bos camelita*, and ſeeming the ſame with the *biſon* of Mr. Ray, and other authors. See Bos *camelita*.

BUTT, in our antient cuſtoms, denotes a place erected for archers to ſhoot at, and in which a mark or white was fixed.

BUTTER (*Cycl.*) is properly the fatty oleaginous part of milk; whence ſome have called it the oil of milk, *oleum ex lacte* [a]. A denomination which it ſeems well entitled to in many parts of the Eaſt Indies, where the *butter* is always fluid the year through, and ſold like other liquors by meaſure, not weight [b]. The ſame appears to have been the caſe in Job's country, who ſpeaks of brooks of *butter*, and waſhing his ſteps in *butter* [c]. *Butter*, when ſolid or conſiſtent, appears in a ſtate of violence. Mr. Boyle makes an inquiry which of the two is the moſt natural [d]. Some conſider *butter* rather as the produce of cream than of milk [e]. Tacitus ſeems to ſpeak of it under the name of *lac concretum*, clotted milk; agreeably enough to what Pliny ſays, that milk is condenſed into *butter*, *denſari lac in pingue butyrum* [f].—[a *Caſt.* Lex. Med. p. 116. b *Boyle*, Phil. Works abr. T. 3. p. 404. c Job xx. 6. Idem, xxix. 6. d *Boyle*, lib. cit. T. 1. p. 466, ſeq. e *Savar.* Dict. Comm. T. 1. p. 325. f *Conring.* de Habit. Corp. Germ. p. 57, ſeq.]

Butter is made in greateſt plenty from cows milk, but ſometimes alſo from goats, and the richeſt from ſheeps milk, as is obſerved by Pliny [g]; tho' Galen ſeems to doubt it. Inſtances have alſo been known of *butter* made from woman's milk, which is extolled by Hoffman as a ſovereign remedy againſt the phthiſis [h]. Add, that the antient Scythians, according to Hippocrates, made *butter* of mares milk; the method of preparing which is deſcribed by that author [i].—[g *Plin.* Hiſt. Nat. l. 28. c. 35. h *Hoffm.* Clav. ad *Schrod.* Pharm p. 662. *Hipp.* l. 4. de Morb. 25. p. 22, ſeq. *Linden*, Exerc. 16. §. 110, ſeq. i *Caſt.* Lex. Med. p. 116. *Conring.* ubi ſupra, p. 59, ſeq.]

Plot mentions a woman at Little Worley in Staffordſhire named Mary Eagle, who, beſides ſuckling a child, made two pounds of *butter per* week of her own milk, during upwards of five months after her being brought to bed. It was afterwards adminiſtred by the neighbouring apothecaries againſt ſwellings [k]. Borellus gives a like caſe of a woman at Boulogne, but her *butter* was chiefly uſed againſt conſumptions [l].—[k *Plot*, Nat. Hiſt. Stafford. c. 8. §. 31. p. 285. l *Borell.* Hiſt. & Obſervat Med. Phyſ. Cent 3. Obſ. 82.]

Pliny ſpeaks of *butter* as a delicacy peculiar to the Barbarians, and that which chiefly diſtinguiſhed the richer ſort from the poor. *Plin.* Hiſt. Nat. l. 28. c. 35.

The firſt time the word βουτυρον occurs is in Hippocrates, in ſpeaking of the Scythians, from whom the Greeks appear to have firſt learnt the art of making it. In reality, what reaſon can be given, why Herodotus ſhould deſcribe the Scythian proceſs of making *butter* with ſo much exactneſs, if the ſame had been in uſe among the Greeks. *Herodot.* Melpom. *Conring.* de Habit. Corp. Germ. p. 60.

It muſt not be forgot, that the antient Jews appear to have been acquainted with the method of preparing *butter*. Solomon [m], Eſaiah [n], and even Moſes, ſpeak of it. The laſt repreſents it as in uſe in Abraham's time [o], unleſs we ſhould ſuppoſe, with ſome modern writers, that by *butter* in theſe paſſages we are to underſtand cheeſe [p].—[m Prov. xxx. 33. *Churning of milk bringeth forth* butter. n Eſa. vii. 15. Butter *and honey ſhall he eat.* o *Conring.* lib. cit. p. 61, ſeq. p *Calm.* Dict. Bibl. T. 1. p. 332.]

In the cathedral of Rouen there is a tower called the *butter tower*, *tour de beurre*, by reaſon George d'Amboiſe, archbiſhop of Rouen in 1500, finding the oil fail in his dioceſe during Lent, permitted the uſe of *butter*, on condition that each inhabitant ſhould pay ſix deniers for the liberty, with which ſum this tower was erected. There are other *butter* towers at Notre Dame, Bourges, &c. Trev. Dict. Univ. T. 1. p. 1010.

Butter is an emollient, and has virtues approaching to thoſe of oil; having a peculiar power of reſiſting poiſon, and obtunding the acrimony thereof [q]. By its ſuppling and relaxing the parts, Dr. Quincy thinks it has a tendency to ſtop in the capillaries and glands, and foul the viſcera. Some repreſent it as a diuretic, purgative, and promoter of expectoration [r].—[q *Dioſcor.* l. 2. c. 81. *Foreſt.* Obſerv. l. 30. n. 8. in Schol. *Caſt.* Lex. Med. p. 116. r *Quinc.* Diſpenſ. P. 2. ſect. 13. n. 591. p. 232. *Junck.* Conſp. Therap. tab. 9. p. 287, ſeq.]

Writers on the dairy deſcribe the proceſs of making and ordering *butter*. The chief means whereby *butter* is produced, is a long continued agitation of milk, whereby its texture is broken. After the *butter* is come, as they call it, they take it out, waſh it, and beat it, to expreſs the milk [s]. In Bengal, *butter* is eaſily made, by the ſlight turning of a ſtick in milk [t].—[s Ruſt. Dict. T. 1. in voc. t Lett. Edif. T. 4. p. 424. Phil. Tranſ. N° 337. p. 227.]

If the milk be not well wrought out, the *butter* will not keep. In India we are told of *butter* four hundred years old, which is valued there equally with gold, for curing old aches, ſore eyes, &c. Vid. Phil. Tranſ. N° 244. p. 343.

When *butter* begins to decay and taſte amiſs, working it well anew, and waſhing it in water, will reſtore it.

In Bengal, to make *butter* paſs for freſh when old and rank, they melt it, and pour on it ſour curdly milk; ſome hours after which, they ſtrain it through a cloth for ſale. Phil. Tranſ. N° 337. p. 227.

If cows feed on ſhort graſs, they will yield more *butter*, though leſs milk, than if they fed on long rank graſs. The milk of ſome cows, though fed on the ſame graſs, will not yield ſo much *butter* as that of others. In many caſes, the *butter* is found to retain the taſte of the plant on which the cows feed. *Boyle*, Philoſ. Works abr. T. 3. p. 550.

The trade of *butter* is very conſiderable; ſome compute 50000 tons conſumed annually in London [u]. It is chiefly made within forty miles round the city. Fifty thouſand firkins are ſaid to be ſent yearly from Cambridge and Suffolk alone; each firkin containing 56 pounds [w]. Utoxeter in Staffordſhire is a market famous for good *butter*, inſomuch that the London cheeſemongers have an eſtabliſhed factory here for *butter*. It is bought by the pot, of a long cylindrical form, weighing 14 pounds.—[u Compl. Engl. Trad. T. 2. p. 134. w Idem, ib. p. 31. Atlas Marit. p. 110.]

Divers abuſes are practiſed in the packing and ſalting of *butter*, to increaſe its bulk and weight, againſt which we have a ſtatute expreſs [x]. Pots are frequently laid with good for a little depth at the top, and with bad at bottom; ſometimes the *butter* is ſet in rolls, only touching at the top, and ſtanding hollow below. To prevent theſe moorlandiſh cheats, the factors at Utoxeter keep a ſurveyor, who, in caſe of ſuſpicion, try the pots with an iron inſtrument, called a *butter-bore*, made like a cheeſe-taſter, to be ſtruck in obliquely to the bottom [y]. — [x Stat. 4. Car. 2. c. 26. Abr. T. 1. p. 128. *Coll.* Diſc. Salt. p. 137, ſeq. y *Plot*, Nat. Hiſt. Stafford. c. 3. §. 3. p. 109.]

BUTTER *of antimony*, is prepared of the ſimple regulus of antimony, by mixing it with twice its own weight of ſublimate mercury, and either by letting it ſtand a day or two in a cellar, or putting it directly in a retort, and urging it with a proper degree of fire in a ſand furnace, by which means the acid ſpirit of the ſublimate, diſſolving and imbibing the regulus, carries it

over

over with itself in form of *butter of antimony*. Vid. *Stahl.* Phil. Princ. Chem. P. 2. sect. 4. n. 135. p. 350. See also *Boerh.* Elem. Chem. P. 3. Proceſſ. 221. T. 2. p. 331, ſeq.]

Of *butter of antimony* are prepared the mercurius vitæ and bezoar mineral. See the articles MERCURY and BEZOAR.

It appears from experiments, that *bezoar of antimony* is compoſed of the reguline parts of antimony and the acid of ſea-ſalt. Med. Eſſ. Edinb. Abridg. Vol. 2. p. 434. in not.

It has been conjectured, that Ward's famous medicine owes its efficacy to the *butter of antimony* it contains. Med. Eſſ. ibid. See WARD's *Pill.*

It is a very ſingular property of this preparation, that it makes a very violent effervescence with ſpirit of nitre, and makes none at all with any other acid whatever: but Hoffman, in his treatiſe on cinnabar of antimony, has explained this phænomenon, by obſerving that the ſpirit of nitre, by mixing with the ſalts in the ſublimate, becomes an aqua regia, which works upon the included antimonial particles, juſt as that corroſive menſtruum is obſerved to work upon the powder of common crude antimony.

Butter of antimony is very cauſtic and acrimonious, and only uſed externally in regular practice [a]. It is a ſecret among ſome for ſtopping a mortification, by drawing a line with it round the part affected, which defines the bounds of the ſpreading evil [b].—[[a] *Quinc.* Diſpenſ. P. 2. ſect. 15. p. 280. [b] *Junck.* Conſp. Med. p. 94, ſeq. Ejuſd. Conſp. Chir. p. 95.]

The operation of making *butter of antimony* furniſhes an inſtance of the power of the Newtonian principle of attraction. When mercury ſublimate is ſublimed from antimony, or from regulus of antimony, the ſpirit of ſalt lets go the mercury, and unites with the antimonial metal, which attracts it more ſtrongly, and ſtays with it till the heat be great enough to make them both aſcend together, and then carries up the metal with it in the form of a *butter of antimony*; though the ſpirit of ſalt alone be almoſt as volatile as water, and the antimony alone as fixed as lead. *Newt.* Opt. Q. 31. p 357. See the article ATTRACTION, *Cycl.*

BUTTER *of arſenic*, *Butyrum arſenici*, is commended by Paracelſus againſt cancers, though not given without danger. *Libav.* Synt. Chem. T. 1. l. 7. c. 26.

Poterius alſo contrived a peculiar antihectical *butter* of pearls, *butyrum margaritarum. Rolfink.* Chem. l. 3. ſect. 1. art. 4. c. 41. *Caſt.* Lex. Med. p. 116.

BUTTER *of cacao*, denotes a thick oil raiſed by diſtillation from the chocolate nut, reputed good againſt burns, inflammations, &c. *Hought.* Collect. N° 451. T. 3. p. 111, ſeq.

BUTTER *of flax*, a greaſy ſubſtance of the conſiſtence of oil of mace, produced from that plant in lieu of oil, by treating it in a retort. *Grew*, Idea Phil. Hiſt. Plant. ſect. 51.

Jeſſamin or *Jaſemin* BUTTER, denotes the oil of the ben-nut, impregnated with the odorous ſpirit of jeſſamin flowers [a]. For the ben oil ſome ſubſtitute hogs lard [b].—[[a] *Grew*, Muſ. Reg. Societ. P. 2. ſect. 2. c. 1. p. 217. [b] *Hought.* Collect. N° 398. p. 4.]

BUTTER *of lead*, *Butyrum Saturni*, is a kind of liquid unguent made of vinegar and lead, incorporated with roſate oil, commended by many for the cure of tetters. *Savar.* Dict. Comm. T. 1. p. 327. voc. *Beurre.*

May BUTTER, *Butyrum majale*, is a medicine in ſome repute among good women for ſtrains, aches, and wounds. It is made of *butter* churned at that time, and expoſed to the ſun of the whole month, till, by repeated fuſions, it be brought to a whiteneſs [a]. Helmont calls it magiſtery of graſs [b]. Quincy affirms it is no better than plain lard [c]. — [[a] *Quinc.* Diſpenſ P. 3. ſect. 12. p. 547. Ruſt. Dict. T. 1. voc. *May.* [b] *Junck.* Conſp. Therap. tab. 9. p. 288. [c] Ubi ſupra.]

Naturaliſts ſpeak of ſhowers and dews of *butter*. In the year 1695, there fell in Ireland, during the winter and enſuing ſpring, a thick yellow dew, which had the medicinal properties of *butter*. Philoſ. Tranſact. N° 220. p. 224.

BUTTER *of nitre*, a kind of medicine procured from ſaltpetre by means of tartar, the proceſs whereof is deſcribed by Charas. *Savar.* Dict. Comm. T. 1. p. 327. voc. *Beurre.*

BUTTER *of ſtone*, a kind of mineral drug found on the higheſt mountains and hardeſt rocks of Siberia, being drawn by the ſun's heat, in the way of tranſudation, from the dry ſubſtance of the ſtones themſelves, and adhering to the ſurface thereof like a ſort of calx, which, having received its full coction, is ſcraped off by the inhabitants under the name of *kamine maſla.* The Ruſſians aſcribe many virtues to it. It is much uſed for the dyſentery and venereal diſeaſes; but its operation is ſo violent, however corrected by other ingredients, that none but the Ruſſians dare uſe it. *Savar.* Dict. Comm. Supp. p. 911. voc. *Kamine.*

BUTTER *of wax*, a ſoft unctuous ſubſtance, reſembling often the diſtillation of the ſpirit of wax. Hiſt. Acad. Scienc. an. 1708. p. 65. See *Oil of* WAX.

BUTTER-*bur*, *Petaſitis*, an officinal plant, both in figure and virtues reſembling maſter-wort; it is reputed an alexipharmic and detergent, and uſed in many compoſitions, eſpecially of the firſt of thoſe intentions. There is alſo a compound water denominated from it, though rejected in the laſt college diſpenſatory *Quinc.* Pharmac. P. 2. ſect. 6. n. 435. p. 176.

Among botaniſts this plant is denominated *petaſitis major & vulgaris*; by ſome, *petaſitis vulgaris rubens rotundiori folio.* See the article PETASITIS.

BUTTER-*fiſh*, a ſmall fiſh common in Cornwal, ſhaped ſomewhat like an eel, and diſtinguiſhed by two rows of black ſpots along its back. See GUNELLUS. *Willughby*, Hiſt. Piſc p. 115.

BUTTER-*fly*, in zoology. See the article PAPILIO.

Generation of BUTTER-*flies*. See the article GENERATION.

BUTTER-*fly fiſh*, the Engliſh name for the fiſh called by authors *blennus*, or *blennius*. Artedi makes the *blennus* a generical name, comprehending a great many ſpecies; among which he diſtinguiſhes that called by us the *butter-fly fiſh*, by the name of the *blennus*, with a furrow between the eyes, and with a large round ſpot in the back fin.

It has its name of the *butter-fly fiſh* from this ſpot in the fin, which reſembles thoſe in the wings of ſome butter-flies.

BUTTER-*milk*, the milk which remains after the butter is come by churning. See the article MILK, *Cycl.* and *Suppl.*

Some make curds of *butter-milk*, by pouring into it a quantity of new milk hot.

BUTTER-*nut*, a fruit in New England, whoſe kernel yields a great quantity of ſweet oil. *Grew*, Muſ. Reg. Societ. ſect. 1. c. 4. p. 205.

BUTTER-*wort*, in botany. See the article PINGUICULA.

BUTTERY.—Officers in the king's *buttery*, are a gentleman, yeoman, and three grooms of the *buttery* [a]. The *buttery* among us is uſually placed near the cellar, being commonly the room next the top of the cellar-ſtairs [b].—[[a] *Chamberl.* Preſent State, P. 2. l. 3. N° 18. p. 335. [b] *Neve*, Build. Dict.

BUTTING, *Imbotare*, in middle age writers, is uſed for tunning of wine, or putting it into butts. *Du Cange*, Gloſſ. Lat. T. 1. p. 662. voc. *Buſtellus.*

BUTTON, (*Cycl.*) among gardeners, denotes a flower or cluſter of leaves not yet expanded.

Buttons are a kind of ova, out of which ariſe either leaves alone, or intermixed with flowers Leaf-*buttons* are ſmaller and more pointed than flower-*buttons*, which are bigger and rounder. Among trees which bear kernel-fruit, each *button* produces ſeveral flowers; and, among ſtone-fruit trees, each *button* yields but one flower. Trev. Dict. Univ. T. 1. p. 1193. voc. *Bouton.*

The term *button* is chiefly uſed in ſpeaking of vines and roſes; and is otherwiſe denominated *eye*, *ſprout*, *bud*, *burgeon*, &c.

BUTTON, in fencing, ſignifies the end or tip of a foil, being made roundiſh, and uſually covered with leather, to prevent making contuſions in the body. Trev. Dict. Univ. T. 1. p. 1192. voc. *Bouton.*

BUTTON, in building, denotes a ſlight faſtening for a door or window, made to turn on a nail. *Neve*, Build. Dict. in voc. *Felib.* Princ. Archit. l. 1. c. 20. p. 154, 156, & 170. where divers ſorts and forms of *buttons* are deſcribed.

BUTTON *of a lock*, denotes a round head ſerving to move the bolt.

BUTTON *of the reins of a bridle*, is a ring of leather with the reins put through it, running all along the length of the reins. See BRIDLE and REINS.

To put a horſe under the *button*, is when he is ſtopt, having no rider on his back, by the reins being laid on his neck, and the *button* lowered, ſo far as that the horſe's head is brought in by the reins, and fixed to the true poſture or carriage. *Guill.* Gent. Dict. P. 1. in voc.

BUTTON *antennæ*, a name given by naturaliſts to thoſe *antennæ* or horns, as they are called, of butterflies, which are ſlender and terminated at the top by a ſort of *button*, in form of an olive, or of part of one. The French naturaliſts, from Reaumur, call theſe *antennes a boutons.* See the article FEELERS.

BUTTON-*ſtone*, in natural hiſtory, a kind of figured ſtone, ſo denominated from its reſembling the *button* of a garment.—— *Woodw.* Method of Foſſ. l. 2. art. 3. p. 17.

The *button-ſtone* is called by naturaliſts *porpites.* Some make it a ſpecies of echinites. See the article ECHINITES.

Dr. Hook gives the figure of three ſorts of *button-ſtones*, which ſeem to have been nothing elſe but the filling up of three ſeveral ſorts of ſhells. They are all of them very hard flints, and have this in common, that they conſiſt of two bodies, which ſeem to have been the filling up of two holes or vents in the ſhell. *Hook*, Poſthum. Works, p. 284.

Dr. Plot deſcribes a new ſpecies of *button-ſtone*, finely ſtriated from the top, after the manner of ſome hair buttons, on which account it may be denominated *porpites*, unleſs we ſhould rather take it for a new ſpecies of echinites. *Plot*, Nat. Hiſt. Oxford. c. 5. §. 178. p. 140.

This name is alſo given to a peculiar ſpecies of ſlate found in the marquiſate of Bareith, in a mountain called Fichtelberg; which is extremely different from the common ſorts of ſlate, in that it runs with great eaſe into glaſs in five or ſix hours time, without the addition of any ſalt or other foreign ſubſtance, to promote its vitrification, as other ſtones require.

It contains in itſelf all the principles of glaſs, and really has mixed in its ſubſtance the things neceſſary to be added to promote the fuſion of other ſtony bodies.

The Swedes and Germans make *buttons* of the glaſs produced from it, which is very black and ſhining, and it has hence its name *button-ſtone*. They make ſeveral other things alſo of this glaſs, as the handles of knives, and the like, and ſend a large quantity of it unwrought in round cakes, as it cools from the fuſion, into Holland. Mem. Acad. Scienc. Par 1736.

BUTTRESS (*Cycl.*)—*Buttreſſes* amount to the ſame with what the French call *arcboutants* [a], the Engliſh ſometimes alſo *butments*, the Italians, *contraforti* and *ſperoni*. Among the antients they were denominated *anterides*, Ανηρίδες, *eriſmæ*, Ερεισματα, and Ανηρεισματα [b].—[[a] *Davil.* Explic. Term. Archit. p. 385. voc. *Arcboutant.* [b] *Vitruv.* de Archit. l. 6. c. 11. Item, l. 10. c. 1. *Philand.* in Vitruv. l. 6. c. 11. *Salmaſ.* ad Solin. p. 1216. *Pitiſc.* Lex. Ant. T. 1. p. 115. voc. *Anterides.*]

The theory and rules of *buttreſſes*, or props for eaſing walls, is ranked among the deſiderata of architecture. They are uſually placed leaning againſt the edifice they are to ſuſtain. We find them uſed againſt the angles of ſteeples, churches, and other buildings of ſtone; alſo along the walls of ſuch buildings as have great and heavy roofs, which would otherwiſe be ſubject to thruſt the wall out. They are alſo placed as ſupports againſt the feet of arches turned croſs great halls, and at the head of ſtone walls where there are large crocket windows. *Neve*, Build. Dict. in voc.

BUTUMOS, in botany, a name by which ſome have called the *ſparganium*, or bur-reed. *Dale*, Pharm. p. 259.

BUTYROUS, or BUTYRACEOUS, ſomething that partakes of the nature or qualities of butter. See BUTTER, *Cycl.* and *Suppl.*

Milk conſiſts of three kinds of ſubſtances, a caſeous, a ſerous, and a *butyraceous* part. See MILK, *Cycl.* and *Suppl.*

The *butyrous* part is the cream, *i. e.* the unctuous or oily part, which riſes above the reſt. See CREAM, *Cycl.*

BUVETTE, or BEUVETTE, in the French laws, an eſtabliſhed place in every court, where the lawyers and counſellors may retire, warm themſelves, and take a glaſs of wine by way of refreſhment, at the king's charge.

There is one for each court of parliament, but theſe are only for perſons belonging to that body; there are others in the palais whither other perſons alſo reſort. Trev. Dict. Univ. T. 1. p. 1011. voc. *Beuvette.* Richel. T. 1. p. 252.

BUXUS, *Box*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the apetalous kind, being compoſed of a number of ſtamina which ariſe from the ſquare bottom of a foliaceous cup; theſe, however, are barren flowers, and the embryo fruits appear in other parts of the ſame plants: theſe finally become fruits, ſomewhat reſembling an inverted veſſel, and burſting when ripe, into three parts, being compoſed of three cells, and furniſhed with ſeeds placed in elaſtic capſules.

The ſpecies of *box* enumerated by Mr. Tournefort are theſe: 1. The common ſhrubby *box*. 2. The *box* with leaves variegated with yellow. 3. The large *box* with yellow edges to the leaves. 4. The ſmaller *box*, with leaves edged with yellow. 5. The long-leaved *box*, with ſharp pointed leaves. 6. The round-leaved *box*. Vid. *Tourn.* Inſt. p. 578.

Box is an evergreen ſhrub, cloathed with ſmall even leaves, and yielding a cloſe compact wood, of conſiderable uſe in divers arts.

The word *buxus* is formed from the Greek πυξος, which ſignifies the ſame. *Skinn.* Etym. in voc.

There are divers kinds of *box* cultivated for the ornament of gardens, chiefly for hedges and borders, the ſmallneſs of its leaf making it cut very cloſe and even [a]. Its wood is yellow, hard, cloſe, even, very heavy, and eaſily taking a poliſh: whence its uſe in making muſical inſtruments, combs, ſpoons, toothpick-caſes, and other Tunbridge ware [b]. It does not ſwim in water, nor is it liable to rot or worm-eat; whence its uſes for the axle-trees of wheels [c], &c.—[[a] *Mill.* Gardn. Dict. in voc. *Box.* *Bradl.* Bot. Dict. in voc. *Buxus.* [b] *Savar.* Dict. Com. T. 1. p. 434. voc. *Bouis.* *Mortim.* Art of Huſbandry, T. 2. l. 11. c. 27. p. 60. [c] *Aubin.* Dict. Mar. p. 113. voc. *Bouis*]

It yields a chemical oil and ſpirit by diſtillation [d], of ſome uſe in medicine, and its decoction is by ſome held equal in virtue to guiacum, for the venereal diſeaſe [e].—[[d] *Boyle*, Phil. Works abr. T. 3. p. 301. [e] *Quinc.* Diſpenſ. P. 2. ſect. 2. n. 167. p. 104. See alſo *Ray*'s Synop. Stirp. Britan. p. 310.]

Among the antients, the *box*-tree was conſecrated to Cybele, by reaſon flutes were then made of its wood, as is done to this day. Pitiſcus imagines it was alſo ſacred to Bacchus, from a paſſage in Statius, *Cum Bacchica mugit buxus* [f]; but without much foundation, the word *buxus* here only denoting flutes, as being the matter they were uſually made of; not that the tree was conſecrated to Bacchus [g].—[[f] *Stat.* Theb. l. 9. p. 579. *Pitiſc.* Lex. Ant. T. 1. p. 304. voc. *Buxus.* [g] Trev. Dict. Univ. T. 1. p. 1152, ſeq. voc. *Bouis.*]

BUYER, *Emptor*. See BUYING and EMPTOR.

BUYING, the act of making a purchaſe, or of acquiring the property of a thing for a certain price. See the article PURCHASE, *Cycl.*

Buying ſtands oppoſed to ſelling, and differs from borrowing or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter is not. See BORROWING, &c.

It differs from permutation or exchanging, as, in *buying*, the thing is paid for in money; in exchanging, with goods. *Calv.* Lex. Jur. p. 326, ſeq. *Pitiſc.* Lex. Ant. T. 1. p. 712. voc. *Emptio.* See EXCHANGE and PERMUTATION, *Cycl.*

By the civil law, perſons are allowed to *buy* hope, *ſpem pretio emere*, that is, to purchaſe the event or expectation of any thing. *E. gr.* The fiſhes or birds a perſon ſhall catch, or the money he ſhall win in gaming. *Calv.* Lex. Jur. p. 327. voc. *Emptio.*

In the Indies, people *buy* their wives, paying a certain price for them to their parents [h]. One of the methods of marriage in uſe among the Romans was called *coemption*, or mutual *buying* of each other [i].—[[h] Lett. Edif. T. 14. p. 38, ſeq. [i] *Scal.* Poet. l. 3. c. 100. *Pitiſc.* Lex. Ant. T. 1. p. 482. *Calv.* Lex. Jur. p. 195. voc. *Coemptio.*]

There are divers ſpecies of *buying* in uſe among traders, as *buying* on one's own account, oppoſed to *buying* on commiſſion [k]. *Buying* for ready money, which is when the purchaſer pays in actual ſpecie on the ſpot; *buying* on credit, or for a time certain, is when the payment is not to be preſently made, but, in lieu thereof, an obligation given by the buyer for payment at a time future [l]; *buying* on delivery, is when the goods purchaſed are only to be delivered at a certain time future [m].——[[k] *Savar.* Dict. Comm. T. 1. p. 22. voc. *Acheter.* [l] *Malc.* Treat. Book-keep. c. 2. ſect. 2. p. 39. [m] Idem, ibid. p. 47, ſeq.]

BUYING *the refuſal*, is giving money for the right or liberty of purchaſing a thing at a fixed price, in a certain time to come; chiefly uſed in dealing for ſhares in ſtock. This is ſometimes alſo called by a cant name, *buying the bear*. *Hought.* Collect. N° 102. T. 1. p. 272.

BUYING *the ſmall-pox*, is an appellation given to a method of procuring that diſeaſe by an operation nearly akin to inoculation; frequent in South Wales, where it has obtained time out of mind. See the article INOCULATION.

It is performed either by rubbing ſome of the *pus* taken out of a puſtule of a variolous perſon on the ſkin, or by making a puncture in the ſkin with a pin dipped in ſuch *pus*. Vid. Philoſ. Tranſ. N° 375. p. 262. Item, p. 464, & 267. See POX.

BUZ, in ichthyography, the name of a fiſh more commonly known by that of *albula*, and caught in the German lakes. *Willughby*, Hiſt. Piſc. p. 185. See the article ALBULA.

BUZIDAN, in the materia medica of the antients, a name given by Aviſenna and others to a wood produced in Africa, which had the ſame virtues with the radix behen, or white and red behen or ben root. We are not acquainted with this medicine at this time, but it appears to have been of the colour of our red ſaunders; ſo that it could only ſerve to adulterate the red ben root; though they ſay in general, that it was uſed to adulterate the ben when ſcarce.

BUZZARD, the Engliſh name of a bird of prey, of the long-winged hawk kind; of which there are ſeveral ſpecies. 1. The bald *buzzard*, ſo called from the whiteneſs of his crown. 2. The common *buzzard*, diſtinguiſhed from the former by the ſhortneſs of its wings and its ſmaller ſize. 3. The honey *buzzard*, or apivorous *buzzard*, which feeds its young from the beehives. 4. The *ſubbuteo*, the male of which is called the hen-harrier, the female the ring-tail; and, 5. The moor *buzzard*, common in marſhy places, and called *milvus æruginoſus* by authors. *Ray*'s Ornithol. p. 37, 38, 39, 40. See BUTEO, MILVUS *æruginoſus*, &c.

BYAS, is uſed by Petty for the central point ſuppoſed in the middle of each atom. *Pett*, Diſc Duplic. Proport p. 18, & 126. See ATOM and CORPUSCLE, *Cycl.*

BYRSODEPSICON, an epithet given to Sumach, denoting its uſe in dying of leather. *Caſt.* Lex. Med. p. 117. See the article RHUS.

BYSSUS, or BYSSUM, Βυσσος, a fine ſort of thready matter produced in India, Egypt, and about Elis in Achaia, of which the richeſt apparel was antiently made, eſpecially that wore by the prieſts both Jewiſh and Egyptian. *Poll.* Onomaſt. l. 7. c. 17. *Iſid.* Orig. l. 19. c. 27. *Plin.* Hiſt. Nat. l. 19. c. 1. & l. 13. c. 1. *Caſt.* Lex. Med. p. 117. Mem. Acad. Inſcr. T. 7. p. 339, ſeq. *Briſſ.* de Verb. Signif. p. 87. voc. *Byſſinum.* *Pitiſc.* Lex. Ant. T. 1. p. 304. *Calv.* Lex. Jur. p. 129. *Fab.* Theſ. T. 1. p. 387, ſeq.

Some interpreters render the Greek, Βυσσος, which occurs both in the Old and New Teſtament, by fine linnen.

But other verſions, as Calvin's and the Spaniſh printed at Venice in 1556, explain the word by ſilk; and yet *byſſus* muſt have been different from our ſilk, as appears from a multitude of antient writers, and particularly by Jul. Pollux [a]. M. Simon, who renders the word by fine linnen, adds a note to explain it, *viz.* There was a kind of fine linnen very dear, which the great lords alone wore in this country as well as in Egypt. This agrees perfectly with the account given by Heſychius, as well as what is obſerved by Bochart, that the *byſſus* was a finer kind of linnen, which was frequently dyed of a purple colour [b]. —[[a] *Poll.* Onomaſt. l. 7. c. 17. [b] *Bochart.* Phaleg. l. 3. c. 4.]

Some other authors will have the *byſſus* to be the ſame with our cotton [c]; others take it for the *linum aſbeſtinum* [d]; and a late author, for the lock or bunch of ſilky hair found adhering to the pinna marina, by which it faſtens itſelf to

the neighbouring bodies [c].—[[c] *Bradl.* Dict. Bot. T. 1. voc. *Gossipium.* Mem. Acad. Inscr. T. 7. p. 339, seq. [d] *Calmet*, Dict. Bibl. T. 1. p. 333. [e] Mem. Acad. Scienc. an. 1712. p. 270, seq.]

In reality, the antients seem to have applied the name indifferently to any kind of matter that was spun and wove finer than wool: so that it is probable there were divers sorts of *byssus*. This is certain, that Aristotle gives the name *byssus* to the hair or silken threads of the pinna marina; whether it were on account of its resemblance to the *byssus* of which cloths were made, or whether it were that this was the true *byssus* itself. What countenances this latter opinion is, that the *byssus* of the pinna marina may be spun, and consequently there is little doubt but that in ages when silk was scarce, it might be used in the cloaths of great men. Add, that this *byssus*, though grossly spun, appears much finer and more beautiful than wool, and comes not much short of silk. Stockings and other like works are still made of it, which would be more valuable if silk was less common. To spin this *byssus*, they leave it some days in a cellar to moisten and grow soft, after this they comb it, to get out the impurities, and, lastly, spin it as they do silk. Mem. Acad. Scienc. loc. cit. p. 271.

The pinnæ marinæ being plac'd upright on the tips of their shells, have occasion for such threads, which they spread all around them like so many ropes from a mast, to keep themselves steady in this situation. 'Tis probable these threads are spun by the pinna after the same manner as those of the sea muscle, described by Mr. Reaumur, to which they bear a resemblance; only that they are finer and more silky; differing from them, according to Rondeletius, as silk does from hemp. Mem. Acad. Scienc. ann. 1712. p. 272.

Authors usually distinguish two sorts of *byssus*, that of Elis, and that of Judea, which was the finest. Of this latter were the priestly ornaments made. Bonfrerius notes, that there must have been two sorts of *byssus*, one finer than the ordinary, by reason there are two Hebrew words used in Scripture to denote *byssus*, one of which is always used in speaking of the habit of the priests, and the other of that of the Levites. Trev. Dict. Univ. T. 1. p. 1297, seq.

Byssus, in botany, a word used to express a genus of mosses the most imperfect of the whole class of vegetables. The characters of this genus are, that the mosses of it are composed of simple and uniform parts, and always appear in form of excrescences, either of a woolly or of a dusty matter. It seems properly a genus of vegetables of a middle kind, between the mushrooms and the mosses, but most approaching to the latter, in that the several species of it are of a longer duration, and want that fleshy texture which distinguishes the fungus class, and in that they never produce heads, nor have any thing of the figure or texture of fungi. The *byssi* differ from the *confervæ*, in that they do not grow in the water, and in their being composed of slenderer and shorter filaments. They have not yet been discovered to have either flower or seed, but appear always in form of threads or of a light down, or fine powder, on the surfaces of many different bodies, but principally on such as are liable to putrefaction. Micheli, in his *Nova genera plantarum*, p. 210. mentions the seeds of some of the *byssuses*; but later observers, and particularly the indefatigable Dillenius, were never able to observe them. This last author has described 20 species of these small plants. 1. The green paper-like *byssus*. This is found in spring covering the surface of standing waters, with a fine green skin. 2. The white-wash *byssus*, a kind found incrusting over the surfaces of mosses, and other substances, in form of mortar or white-washing on a wall. 3. The mealy *byssus*. This is found in great plenty on the trunks of old trees, on the decaying branches of other mosses, and on the ground, in form of a fine white or hoary powder. 4. The yellow powder *byssus*. This crusts over old walls, trees, and the tiles of houses, with spots of a yellow downy matter. 5. The green cluster *byssus*. This is composed of a number of green globules clustered together, which are very small, and, when viewed with a microscope, appear gelatinous and transparent. It is found in summer on the sides of hollow ways, where the sun does not come. 6. The downy violet-coloured *byssus*. This has by some been called a small fungus, creeping like a herpes on wood; it is usually found on old boards, sometimes on the rotted stacks of moss, and is of a lanuginous structure, consisting of fine short threads: it flourishes principally in winter. 7. The pleasant green verdigrease-coloured *byssus*. This consists of fine threads, and is found on the stalks of decayed fern and other vegetables. 8. The purple bay-tree *byssus* of Micheli. This is composed of short interwoven fibres, and is common in Italy on the bark of the bay-tree. 9. The flaky snow *byssus*. This is described by some under the name of a white branched fungus. It is common in damp cellars, and spreads itself to a great extent. 10. The hairy-skinned *byssus*. This grows in the manner of some of the crustaceous lichens on the bark of old trees, and is white and membranaceous on the under-side, and all over hoary on the upper surface. 11. The black silky *byssus*. This is composed of short filaments, some single, others bifid, and is found on the barks of old trees in many places. 12. The mouse-skin cask *byssus*. This is common on old wine casks, and is of a tough cloth-like structure, and greenish black colour. 13. The yellow cloth *byssus*. This grows on the barks of old trees, and somewhat resembles the former in texture. 14. The green velvet-ground *byssus*. This is common on the surface of the earth, in woods and on garden walks. 15. The elegant branching hairy *byssus*. This, from a hairy basis, sends out a number of branches, which spread themselves every way, and sometimes divide at the extremities into small filaments, and sometimes form flat masses. It is sometimes white, sometimes blueish, sometimes yellowish, and always lies very close upon the things it grows from, which are rotten wood, decayed leaves, *&c.* 16. The saffron-coloured rock *byssus*. This is composed of hairy globules, and grows on stones. 17. The reddish hairy wood *byssus*. This grows on old boards. 18. The black haired rock *byssus*. This is composed of very short and very thick tufted filaments. 19. The red beard wood *byssus*. This is composed of very close-set hairs, and grows to half an inch in height. It is found on old rotten wood. 20. The whitish bristly *byssus*. This is composed of single and very stiff bristles, of a whitish colour, and about half an inch in length, and grows on stones and old walls. *Dillen.* Hist. Musc. p. 1—10.

C.

CAABA, a ſquare ſtone edifice in the temple of Mecca, ſuppoſed to have been built by Abraham and his ſon Iſhmael; being the part principally reverenced by the Mahometans, and to which they always direct themſelves in prayer. See KEBLA, *Cycl.*

The word is Arabic, *caaba*, and *caabah*, a denomination which ſome will have given to this building, on account of its height, which ſurpaſſes that of the other buildings in Mecca; but others, with more probability, derive the name from the quadrangular form of this ſtructure.

The *caaba*, or *al caaba*, is alſo called *allah-beit*, i. e. the houſe of God, as being hallowed or ſet apart for his worſhip. Vide *Sale*, Prelim. Diſc. to Koran, ſect. 4. p. 114, ſeq.

The Mahometans will have the *caaba* to have been a place of worſhip in Adam's days; at firſt it was only a tent, which had been ſent down from heaven, as a proper place wherein to worſhip the true God. It was accordingly often viſited by Adam on that account, as well as by Seth his ſon, who firſt built a ſtone temple on the ſpot. This having been demoliſhed by the deluge, was afterwards rebuilt by Abraham and Iſhmael. The tradition adds, that it was on occaſion of Abraham's ſacrifice of his ſon Iſhmael, that this edifice was raiſed by order of God himſelf; and that the horns of the ram, which had been ſacrificed in Iſhmael's place, were faſtened to the golden ſpout of the *caaba*, where they continued to the time of Mahomet, who took them away, to remove from the Arabs all occaſion of idolatry. *D'Herbel.* Bibl. Orient. p. 219, ſeq.

The length of the *caaba* is about 24 cubits, its breadth twenty three, and height 27 cubits; the door which is on the eaſt-ſide, being four cubits from the ground, and the floor level with the bottom of the door. In the corner next this door, is the famous black ſtone, which is ſet in ſilver, and exceedingly reſpected by the Mahometans. The pilgrims kiſs it with great devotion, and it is by ſome called the right-hand of God on earth. 'Tis fabled to be one of the precious ſtones of Paradiſe, which fell down to the earth with Adam, and being taken up again at the deluge, was brought back by the angel Gabriel to Abraham when he was building the *caaba*. It was at firſt whiter than milk, but grew black long ago; ſome ſay by the touch of a menſtruous woman, others by the ſins of mankind, others by the numerous kiſſes of the devotees. On the north-ſide of the *caaba*, within a ſemicircular incloſure, lies the white ſtone, ſaid to be the ſepulchre of Iſhmael, which receives the rain-water that falls off the *caaba*, by a ſpout formerly of wood, but now of gold. The *caaba* has a double roof, ſupported within by three octangular pillars of aloes wood, between which, on a bar of iron, hang ſome ſilver lamps. The out-ſide is covered with rich black damaſk, adorned with an embroidered border of gold, which is changed every year, and was formerly ſent by the caliphs, afterwards by the ſultans of Egypt, but now provided by the Turkiſh emperors. At a ſmall diſtance from the *caaba*, on the eaſt-ſide is the ſtation or place of Abraham, where is another ſtone wherein they pretend to ſhew the footſteps of that patriarch, ſuppoſed to have been made when he ſtood on it in building the *caaba*, where it ſerved him for a ſcaffold, with this peculiar advantage, that it roſe and fell of itſelf as he had occaſion. *Sale*, loc. cit. *Reland.* de Relig. Mahom. l. 1. c. 12. p. 118, ſeq.

CAAMINI, in botany, a name given by the Spaniards and others to the fineſt ſort of the Paraguay tea. It is the leaves of a ſhrub which grows on the mountains of Maracaya, and is uſed in Chili and Peru as the tea is with us. The mountains, where the trees which produce this valuable leaf grow naturally, are far from the inhabited parts of Paraguay; but the people of the place know ſo well the value and uſe of it, that they conſtantly furniſh themſelves with great quantities of it from the ſpot. They uſed to go out on theſe expeditions many thouſands together, and their country is left to the inſults of their enemies in the mean time, and many of them periſh with the fatigue.

To remedy theſe inconveniences, they have of late planted the trees about their habitations; but the leaves of theſe cultivated trees have not the fine flavour or the virtues of the wild ones.

The king of Spain has permitted the Indians of Paraguay to bring to the town of Santfoy twelve thouſand arobes of the leaves of this tree every year; but they are not able to procure ſo much of the wild leaves annually; about half the quantity is the utmoſt they bring of this; the other half is made up of the leaves of the trees in their own plantations, and this ſells at a lower price, and is called *pabos*. The arobe is about five and twenty pound weight, the general price is four piaſtres for the arobe, and the money is always divided equally among the people of the colony. Obſerv. ſur les Coutumes de l'Amerique, c. 1. p. 374.

CAAPIBA, in botany, the name given by Plumier to a genus of plants, called afterwards by Linnæus *ciſſampelos*. *Plumier*, p. 29. See the article CISSAMPELOS.

CAA-APIA, in botany, the name of a Braſilian plant, deſcribed by Marcgrave, Piſo, and others; the root of which ſo much reſembles the ipecacuanha in its virtues, that ſome have erroneouſly called it by the ſame name. It is an aſtringent and emetic, as the ipecacuanha, but it poſſeſſes both theſe qualities in a much weaker degree, and is therefore neceſſarily given in a much larger doſe, a dram being the quantity commonly given at once. The Braſilians bruiſe the whole plant, and expreſs the juice, which they take internally, and alſo apply it externally to wounds made by poiſoned arrows, and by the bites of ſerpents. Some have ſuppoſed the root of this plant to be the white ipecacuanha; but this is an error, that being little different from the grey. Mem. Acad. Par. ann. 1700.

CAB, or KAB, denotes a Hebrew meaſure of capacity, equal to the ſixth part of the ſeah, or an eighteenth of the epha. *Hoſt.* de Veter. Menſ. & Pond. l. 1. p. 122. *Cumberl.* Eſſ. Jew. Meaſ. c. 3. p. 86, & 137. *Beverin.* Synt. de Menſur. p. 133, ſeq. *Arbuth.* Tab. Ant. Coins, &c. n. 14, & 15. See the article EPHA, *Cycl.*

The *cab* of wine contained two Engliſh pints; the *cab* of corn, 2 $\frac{5}{6}$ pints corn meaſure.

At the ſiege of Samaria, the famine was ſo great, that a *cab* of pigeons dung was ſold for five pieces of ſilver; that is, five ſhekels, equivalent to about eleven ſhillings and ſix-pence ſterling. 2 Kings vi. 25.

We alſo find mention of the *cab* as a dry meaſure, in Grecian and Roman writers: ſome make it equal to the Grecian chœnix, and aſſert it to be the quantity of what a labourer eats *per* day, as aſſigned by Cato. *Suid.* Lex. in voc. Κάβος. *Pollux*, Onomaſt. l. 6. *Cat.* de Re Ruſt. c. 56. Trev. Dict. Univ. T. 1. p. 1300. *Hoſt.* loc. cit. See the article CHOENIX.

CABAL, a name given to a ſort of drink made of dried raiſins. The manner in which the Portugueſe make *cabal* is this; they take out the ſtones of about twenty pounds of raiſins, and then bruiſing the raiſins a little, they put them into a barrel of white wine, in the month of January or February, and let them ſtand till about Eaſter. It is then very clear and rich, luſcious and palatable to the taſte. It is recommended to ſtop coughs, and give ſtrength to the ſtomach. It is worth while to try the experiment with the ſame proportion of raiſins to the ſame quantity of our Engliſh cyder, which would probably prove a fine drink. Phil. Tranſ. N° 157.

CABALA *vein*, in natural hiſtory, a name given by our Suſſex miners to one kind of the iron-ore commonly wrought in that country. It is a ſtony ore, of a browniſh colour, with a bluſh of red, which is more or leſs conſpicuous in different parts of the ſame maſſes. It is uſually found in thin ſtrata, lying not far from the ſurface, and is not very rich in iron, but it runs very readily in the fire. *Woodw.* Cat. Foſſ. V. 1. p 225.

CABALATAR, in natural hiſtory, a name given by ſome of the chemical writers to nitre, called alſo *cerberus chemicus* and *ſal infernalis*.

CABALLI, among myſtic philoſophers, denote the ſhades, or aſtral bodies of men who died any ſudden or violent death, before the expiration of their predeſtinated term of life.

The *caballi*, called alſo *cabales* and *cobales*, are ſuppoſed to wander as goblins or ghoſts over the face of the earth, till their deſtined term is accompliſhed; being doomed to live out the time as ſpirits, which they ought to have ſeen in the fleſh. *Rul.* Lex. Alch. p. 108. *Caſt.* Lex. Med. p. 118.

CABALLINE, *Caballinus*, ſomething relating to, or partaking of the nature and qualities of a horſe.

Aloe CABALLINA, is a denomination given to the coarſeſt and rankeſt kind of aloes, as being little uſed unleſs for purging horſes.

horſes. Vid. Hiſt. Acad. Scienc. an. 1708. p. 66. *Hought.* Collect. T. 2. N° 324. p. 336. See the article ALOES.

Sulphur CABALLINUM, denotes common brimſtone. *Quincy*, Pharmac. P. 2. ſect. 4. n. 382. p. 157. See the article SULPHUR.

The word is formed from the middle age Latin *caballus*, and that from the Greek καβαλλης; a horſe. *Du Cange*, Gloſſ. Græc. T. 1. p. 525, ſeq.

CABBAGES, in gardening.—All the common ſorts of *cabbages* are largely cultivated about London. The common white, red, flat, and long-ſided ones, are chiefly for winter uſe. The ſeeds of theſe ſorts muſt therefore be ſown in the middle of March, in beds of good freſh earth; and in April, when the young plants will have about eight leaves apiece, they are to be pricked out into ſhady borders, about three inches ſquare, and, about the middle of May, they muſt be tranſplanted to the places where they are to remain: and this is commonly between cauliflowers or artichokes, at about two feet diſtance in the rows. They muſt be watered at times, and the earth muſt be houghed up about their roots, and kept clear from weeds.

Theſe *cabbages* will be fit for uſe ſoon after Michaelmas, and will continue till February, if not deſtroyed by bad weather; to prevent which, the gardners about London pull up their *cabbages* in November, and trench the ground in ridges, laying their *cabbages* againſt the ridges, as cloſe as poſſible on one ſide, burying their ſtems in the ground; and in this manner they let them remain till after Chriſtmas, when they cut them for market.

The Ruſſian *cabbage* is ſmall, and not much cultivated now. It is to be raiſed as the others, but may be planted nearer, as not ſo large. It is fit for uſe in July.

The early Batterſea and ſugar-loaf *cabbages* are ſown for ſummer uſe, and are commonly called Michaelmas *cabbages*. The ſeaſon for ſowing theſe is the beginning of July, in an open ſpot of ground. It is common to ſow ſpinage in the ſame beds with theſe, houghing it up from about their ſtalks in ſpring; in May and June theſe begin to turn their leaves for *cabbaging*, and may be brought to it much ſooner than naturally they would, by tying them about the top with an ozier band.

The Savoy *cabbages* are for winter uſe, and are to be ſown about the beginning of April; they are to be treated as the common *cabbage*, and planted out at two feet diſtance, in an open place.

The *bore-cole* may be cultivated in the ſame manner, but muſt be planted only at one foot diſtance; theſe are not fit to cut till the froſts have nipped them.

The method of getting good *cabbage*-ſeed is this: Chooſe out ſome fair plants in October, pull them up, and hang them up three days, with the root upward, in a ſhady place; then plant them under a warm hedge, burying the whole ſtalk and half the *cabbage* in the earth; cover them with culm if the winter be ſevere, and in ſpring they will ſhoot out many branches. When theſe begin to pod, the ends of the upper ones ſhould be cut off, to give ſtrength to the other pods. The ſeed muſt be preſerved from the birds, by planting ſome lime twigs about the plants, where the catching one or two will intimidate the reſt. When ripe, it muſt be threſhed out, and kept for uſe. *Miller*'s Gardn. Dict. in voc. See BRASSICA.

The *cabbage* removes, as it is ſaid, the conſequences of hard drinking; and it has been well known to be a cuſtom among many at this time, as well as among the antient Egyptians of old, to eat raw or boiled *cabbage*, as a preſervative againſt the effects of wine. This ſeems to have ſprung from the opinion of the great antipathy of the plants to one another; it having been affirmed, that the vine and *cabbage* will by no means grow together; and ſome of the moderns have endeavoured to account for this, from the nature of theſe two plants, by ſaying, that they are both ſo fond of nutritive juice, as greedily to ſuck up all the juices of the earth, and by that means, when planted near, to ſtarve one another. But we have no reaſon to have recourſe to theſe ſalvoes, ſince there is not the leaſt truth in the obſervation, but the vine and *cabbage* grow as well together as any two plants in the world. Ephemerid. German. N. C. D. 297.

CABBAGING, among gardners, is ſometimes uſed to denote the knitting or gathering of certain pot-herbs into round bunched heads.

In which ſenſe the word amounts to the ſame with what Evelyn calls poming, *pommer* [a]; *q. d.* appling, or growing apple-wiſe. Others call it ſimply heading or bunching [b].—[a Vid. *Evel.* French Garden. p. 175. b Trev. Dict. Univ. T. 4. p. 739. voc. *Pommer.*]

To make lettice *cabbage*, they tranſplant it, taking care, during the great heats, to water it; otherwiſe, inſtead of poming, it runs to ſeed [c]. To promote the *cabbaging* of cabbage, thoſe who live on the ſea-coaſt, put ſea-weed, with a little nitre, under their roots [d].—[c *Evel.* lib. cit. p. 183. d *Vallem.* Curioſ. de la Nat. & de l'Art, ap. Jour. des Scav. T. 46. p. 259.]

Cabbage plants of the early kind begin to turn in their leaves for *cabbaging* in May [e]. The Batterſea ſort *cabbage* apace when they once begin, and as ſoon grow hard and burſt open; but the ſugar-loaf kind is longer before it comes, and is as ſlow in its *cabbaging* [f].—[e *Mill.* Gard. Dict. in voc. f Id. ibid.]

CABBALA, (*Cycl.*)—This is by ſome called the acroamatic philoſophy of Moſes, by way of contradiſtinction from the exoteric or popular doctrine. *Budd.* Introd. ad Philoſ. Hebr. p. 48. See the article ACROAMATIC.

The generality of Jews prefer the *cabbala* to the Scripture; comparing the former to the ſparkling luſtre of a precious ſtone, and the latter to the fainter glimmering of a candle. *Cherubin.* Bibl. Crit. Sacr. T. 3. Diſſ. 1. Jour. des Scav. T. 36. p. 30.

It is divided into nominal and real. The nominal or literal *cabbala* is that employed in the myſtic uſe of letters, names and numbers; or that which, from the names of God, and the letters, words, ſyllables, numbers and numerals of the Hebrew text, draws myſtical doctrines and applications.

To which head belong eſpecially the compoſition of anagrams, chronograms, and other frivolous purſuits of that kind, only allowed among us to children and novices. *Burn.* Archæol. l. 1. c. 7. Phil. Tranſ. N° 201. p. 800.

The *cabbala* only differs from *maſorah*, as the latter denotes the ſcience of reading the Scripture, the former of interpreting it. Both are ſuppoſed to have been handed down from generation to generation by oral tradition only, till at length the readings were fixed by the vowels and accents, as the interpretations were by the miſnah and gemara. *Prideaux*, Conn. P. 1. l. 5. p. 506.

The real *cabbala* is that employed in diſcovering the myſteries of nature and religion, the properties of ſpirits, the heavens, elements, &c. from the contemplation of the ten ſephiroth, and the four cabbaliſtical worlds, *Azilath*, *Briah*, *Jetzizah*, and *Aſſiah*; i. e. the worlds of emanation, creation, formation, and of the fabric; before which they ſometimes alſo put the *Enſophic*, or infinite world; from which all the others are ſuppoſed to ſpring. *Burn.* Archæol. Philoſ. l. 1. c. 7. Philoſ. Tranſact. N° 201. p. 800, ſeq.

The generality of latter critics hold the *cabbala* a mere figment or invention of the modern rabbins.

The literal ſort appears to have been utterly unknown to the antient Jews. Joſephus makes no mention of it; and Philo, Origen, and Epiphanius, who were moſt converſant in the Jewiſh literature, ſay not one word of the *cabbala*. Nor is there the leaſt footſtep of it in the Talmud, or any of the antient Jewiſh writers. *Cherubin*, Bibl. Crit. Sacr. loc. cit.

For the real ſort, it is chiefly borrowed from the philoſophy of Plato and Pythagoras; tho' ſome pretend to deduce it from the hieroglyphic wiſdom of the Egyptians.

The firſt author who delivered any thing of the *cabbala*, was Joachaides, or Simon ſon of Joachai, who publiſhed that famous cabbaliſtical work entitled *Zohar*. Some ſay, he lived about the time of the deſtruction of Jeruſalem by Titus; others only in the tenth century. *Baſn.* Hiſt. des Juifs, l. 3. c. 10.

Several chriſtians have given into the *cabbala*, particularly Picus Mirandula, Reuchlin, Henry More, and Knorre a Roſenroth, counſellor of the prince of Sultzbach, who beſtow the higheſt encomiums on it, and repreſent it as the key to all pure and real knowledge. Henry More aſſures us, that all his learning and philoſophy ended in mere ſcepticiſm, till he applied his mind to the divine and hidden ſcience of the *cabbala*, which, in a ſhort time, brought him forth into the moſt glorious light, and filled his ſoul with notices utterly ineffable. *More*, Opp. Philoſ. T. 1. in Pref.

Galatinus will have the antient rabbins to have known and believed the myſtery of the Trinity by the *cabbala*; and Paracelſus, and his followers, aſſert Aaron, Elias, David, Bildad, &c. to have been great cabbaliſts.

Dr. Burnet examines into the merits of the ſeveral parts of the *cabbala*, which he finds to be without rational foundation, and not conducing to any real knowledge. But he conjectures, that the moſt antient *cabbala*, before it was confounded and defiled with fables, might contain ſomething of the original of things, and their gradations; particularly, that, before the creation, all things had their being in God; that from him they flowed as emanations; that they will all flow back again into him, when they are deſtroyed; and that there will ſucceed other emanations and regenerations, and other deſtructions and abſorptions to all eternity, as they had been from all eternity; that nothing is produced out of nothing; and that the things produced never return to nothing, but always have their ſubſiſtence in God. *Burn.* Archæol. l. 1. c. 7. Phil. Tranſ. N° 201. p. 800.

CABBALIC *art*, *Ars caballica*, is uſed by ſome writers for *ars palæſtrica*, or the art of wreſtling. *Gal.* ad Thraſyb. c. 45. *Fœſ.* Œcon. Hippoc. p. 294. *Caſt.* Lex. Med. p. 118.

CABBALISTIC *art*. See CABBALA, and CABBALISTS.

D. Franc. Berlendi, a theatin of Venice (under the fictitious name of C. Berardo Schinſlini) has publiſhed a *caballomachia*, or refutation of the *cabbaliſtic* art. Giorn. de Letter. d'Ital. T. 30. p. 456. Venet. 1718. 8°.

CABBALISTS, in the primitive ſenſe, the ſame with thoſe otherwiſe called *Tanaim*, *Amoraim*, *Seburaim*, &c.

Cabbaliſts differ from maſorites, as the former were employed about the interpretation of Scripture, and the latter about the

true reading of the Hebrew text. *Prid.* Connect. P. 1. l. 5. p. 507.

CABBIN. See CABIN.

CABEBI, a name given by ſome authors to the ſcales of iron. *Rulandus.*

CABILIAU, in zoology, a name by which ſome authors have called the common cod-fiſh, the *morhua* and *aſellus major* of other writers. *Willughby*, Hiſt. Piſc. p. 165. See COD-*fiſh*.

CABIN, or CABBIN, (*Cycl.*) is ſometimes uſed for the huts or cottages of ſavages, and other poor people.

The habitations of the Indians in Virginia are *cabins*, about nine or ten feet high, which are made after this manner: They fix poles into the ground, and bring the tops of them one within another, and ſo tie them together; the outſide of theſe poles they line with bark, to defend them from the injuries of the weather, but they leave a hole in the top, right in the middle of the *cabin*, for the ſmoke to go out; round the inſide of their *cabins* they have banks of earth caſt up, which ſerve inſtead of ſtools and beds. Philoſ. Tranſ. N° 126. See the article CABINS, *Cycl.*

CABINET (*Cycl.*) is ſometimes particularly uſed for a place at the end of a gallery, wherein are preſerved the paintings of the beſt maſters [a], conveniently ranged, and accompanied with buſts, and figures of marble and bronze, with other curioſities [b].—[[a] *Felib.* Princ. de l'Archit. p. 364. [b] *Daviler.* Expl. Term. Archit. p. 438, ſeq.]

In this ſenſe, *cabinet* amounts to the ſame with what is called by Vitruvius, *pinacotheca*. Sometimes there are ſeveral pieces or rooms deſtined for this uſe, which are all together called *cabinet*, or *gallery*. *Vitruv.* de Archit. l. 6. c. 5. *Daviler.* loc. cit. See GALLERY, *Cycl.*

CABINET alſo denotes a kind of bufet or cheſt of drawers, partly for the preſervation of things of value, and partly as a decoration of a chamber, gallery, or other apartment. Thus we ſay, an open *cabinet*, a walnut-tree *cabinet*, a Japan or Chineſe *cabinet*, &c. *Savar.* Dict. Comm. T. 1. p. 506.

In the repoſitory of the Royal Society is a Chineſe *cabinet*, filled with the inſtruments and ſimples uſed by the ſurgeons of that country. The moſt remarkable are thoſe which are contrived for ſcratching, picking and tickling the ears, in which the Chineſe take great pleaſure. Phil. Tranſ. N° 246. p. 390, ſeq.

CABINET, in gardening, is a little inſulated building in manner of a ſummer-houſe, built in ſome agreeable form, and open on all ſides; ſerving as a place of retirement, and to take the freſh air under cover. *Daviler.* Cours d'Archit. P. 2. p. 439.

According to Miller, a *cabinet* is a kind of ſaloon, placed at the end or in the middle of a long arbour. See the article ARBOUR, *Cycl.*

It differs from an arbour, which is long, in form of a gallery, and arched over head; whereas the *cabinet* is either ſquare, circular, or in cants, making a kind of ſaloon. *Mill.* Gard. Dict. in voc.

CABINET is alſo uſed in ſpeaking of the more ſelect and ſecret councils of a prince or adminiſtration.

Thus we ſay, the ſecrets, the intrigues of the *cabinet*.

To avoid the inconveniences of a numerous council, the policy of Italy, and practice of France, have introduced *cabinet* councils; a remedy worſe than the diſeaſe. *Bacon*, Mor. Eſſ. 21. Works, T. 3. p. 330. Trev. Dict. Univ. T. 1. p. 1307.

King Charles I. is charged with firſt eſtabliſhing this uſage in England. Beſides his privy council, that prince erected a kind of *cabinet*-council, or junto, under the denomination of a council of ſtate; compoſed of archbiſhop Laud, the earl of Stafford, and lord Collington, with the ſecretaries of ſtate. *Clarend.* Hiſt. Rebell. T. 1. l. 2. Bibl. Choiſ. T. 18. p. 68.

Yet ſome pretend to find the ſubſtance of a *cabinet*-council of much greater antiquity, and even allowed by parliament, who antiently ſettled a quorum of perſons moſt confided in, without whoſe preſence no arduous matter was to be determined; giving them power to act without conſulting the reſt of the council. As long ſince as the 28th of Henry III. a charter paſſed in affirmance of the antient rights of the kingdom [a]; which provided, that four great men, choſen by common conſent, who were to be conſervators of the kingdom [b], among other things, ſhould ſee to the diſpoſing of monies given by parliament, and appropriated to particular uſes; and parliaments were to be ſummoned as they ſhould adviſe [c]. But even of theſe four [d], any two made a quorum; and generally the chief juſtice of England, and chancellor, were of the number of the conſervators [e].—[[a] Vid. *Matth. Par.* 28 Hen. III. [b] *Per viſum & teſtimonium eorum tractetur theſaurus domini regis, & pecunia ab univerſis ſpecialiter conceſſa ad commodum domini regis & regni expendatur*, &c. [c] *Nec ſine ipſis ſed cum neceſſe fuerit & ad eorum inſtantiam iterum conveniant univerſi.* [d] *Et ſi non omnes duo ad minus præſentes ſint*, &c. [e] *Et quia frequenter debent eſſe cum rege poterunt eſſe de numero conſervatorum.*]

In the firſt of Henry VI. [f] the parliament provides, that the quorum for the privy council be ſix, or four at the leaſt; and that in all weighty conſiderations, the dukes of Bedford and Gloceſter, the king's uncles, ſhould be preſent; which ſeems to be erecting a *cabinet* by law [g].—[[f] Rot. Parl. 1 Hen. VI. n. 30, 31. [g] Accompt Land Forc. Engl. p. 54.]

CABIRI, in antiquity, certain deities worſhipped more eſpecially by the Samothracians, and in the iſle of Imbros, and ſome other parts of Greece.

The *Cabiri*, according to Sanchoniathon, were alſo adored by the Phœnicians [a]. Diodorus Siculus aſcribes to them the invention of fire, and the art of working iron [b]. Whence it is, that on a medal of Gordian [c], and another of Furia Sabina Tranquillina, both ſtruck at Carrhæ, where the *Cabiri* were worſhipped, we find the figure of a *Cabirus* on a column, holding a hammer in his right hand. For the ſame reaſon, Herodotus obſerves, they were repreſented like Vulcan [d].—[[a] *Euſeb.* de Prepar. Evang. l. 1. [b] *Diod. Sic.* l. 5. [c] *Vaillant*, Num Imper. P. 2. p. 205, 223. [d] *Herodot.* l 3. Trev. Dict. Univ. T. 1. p. 1307.]

'Tis diſputed who, and how many, the *Cabiri* were, whether they be of Phœnician, Samothracian, or Egyptian origin; and whether the ſons of Vulcan or of Jupiter? V. *Pitiſc.* Lex. Ant. T. p. 306. *Schoetg.* Lex. Ant. p. 274.

The common opinion limits them to two, viz. Caſtor and Pollux, otherwiſe called Dioſcuri. Others, on the authority of Mnaſeas, cited by the ſcholiaſt on Apollonius Rhodius, admit four more, *viz.* Axieros, or Ceres, Axiokerſa, or Proſerpine, Axiokerſos, or Pluto, and Caſmilos, or Mercury. But the reaſon of the denomination is by no means agreed on. The generality derive the word from the Hebrew *cabir*; or rather *ghabir*, powerful: on which principles the *Cabiri* are ſuppoſed to be the ſame with thoſe otherwiſe called *Dii magni*, or the greater Gods; tho' Gutberleth makes them to be the Penates, brought by Æneas into Italy, after the deſtruction of Troy. *Gutberleth*, Diſſ. Philol. de Deorum Cabirorum myſteriis. ap Ejuſd. opuſc. Franck. 1704. 8°. Act. Erud. Lipſ. 1705. p. 536.

Aſtorius derives the name from *chobir*, an inchanter, as ſuppoſing them to have originally been a ſort of magicians, before or ſoon after the Egyptian flood, to whom divine honours were paid [e]. M. Reland from *chabar*, to unite, aſſociate; on which principle the *dii Cabiri* ſhould import as much as ſocial or aſſociated Gods. An appellation which quadrates exactly with Caſtor and Pollux, whoſe union is ſo famous in all antiquity; and no leſs with the other four, whoſe fellowſhip did not conſiſt in their being of the number of great Gods, a quality which was by no means peculiar to them, but in what related to them as infernal Gods, and jointly charged with the care of the dead [f].—[[e] *Aſtor*, Diſſ. de Diis Cabiris. Venet. 1703. [f] *Reland* Diſſert. Miſcell. P. 1 Diſſ. 5. Act. Erud. Lipſ. 1707. p. 72. ſeq. Jour. des Scav. T. 39. p. 483. ſeq.]

CABIRI is alſo uſed to denote the *gabri*, or Perſian fire-worſhippers. *Hyde*, de Relig. Perſ. c. 29 *Cabiri ſunt gabri, voce Perſica aliquantulum detorta.* Trev. Dict. Univ. T. 1. p. 1307, ſeq. See GABRES, *Cycl.*

CABLING, in architecture, the figure of a ſtaff, or reed, either plain or carved, in reſemblance of a rope, or a ruſh, wherewith a third part of the flutings of a column are ſometimes filled up; hence called *cabled flutings*.

There are alſo *cablings* in relievo without fluting, eſpecially on certain pilaſters, as in the church of Sapienza at Rome. *Daviler.* Cours d'Archit. P. 2. p. 842. voc. *Rudenture.*

CABLISH, *cablicia*, in the foreſt law, denotes bruſh, or browſe wood [a]; tho' Spelman [b] takes it more properly to ſignify trees, or branches thrown down by the wind; from the French *chablis* or *bois chablis*, which denotes the ſame.—[[a] *Manwood*, For. Law. p. 84. Cromp. Juriſd. p. 165. *Cowel*, Interpr. in voc. [b] *Spelm.* Gloſſ. p. 96. *Du Cange*, Gloſſ. Lat. T. 1. p. 670. *Skinn.* Etym. voc. *Forenſ.*]

CABOCHED, in heraldry, a deer's, leopard's, or bull's head, is ſaid to be *caboched*, when it is born full-faced without any part of the neck. *Coas*, Dict. Her. p. 61.

The word is formed from the obſolete French *caboche*, from *caput*, head. *Menag.* orig. p. 143. *Skinn.* Etym. Angl. in voc.

CABOCLES, a name given in the Weſt-Indies by the Portugueſe to thoſe produced between Americans and Negroes. See *Boyle*'s Works, abr. Vol. 2. p. 45.

CABOTE, in zoology, the name of a fiſh of the cuculus kind, more uſually known among authors by the name of the *corax Piſcis*. *Geſner*, de Piſc. p. 356. See CORAX.

CABRUSI, in the writings of the antients, a word frequently uſed to expreſs Cyprian, or coming from the iſland of Cyprus. The antient Greeks had almoſt all their vitriols and vitriolic minerals from this iſland; they therefore ſometimes called theſe *cabruſi*, without any addition. It is very probable that our word copperas, the common name of green vitriol, is a falſe pronunciation of this word *cabruſi*.

CABUIA, a Weſt-Indian ſpecies of hemp, produced in the province of Panama, from a plant ſomewhat like the Chardon or Iris; when ripe, they lay it to ſteep in water, and after drying it again, beat it with wooden mallets till nothing but the hemp remains, which they afterwards ſpin and make thread and ropes of it; the former of which is ſo hard and tough, that with it they ſaw iron, by fitting it on a box, and laying a little fine ſand over the metal as the work proceeds. *Savar.* Dict. Com. T. 1. p. 506.

CABURE, in zoology, the name of a ſmall Braſilian bird of the owl kind; very beautiful, and very eaſily tamed. It is of a brown colour, variegated with white, and is feathered down to the toes. The Braſilians keep it tame for its diverting tricks; it will play with people like a monkey, and is perfectly harmleſs. *Marggraves*, Hiſtor. Braſil.

CABUREIBA, in botany, a name by which ſome authors have called the tree which affords the black Peruvian balſam of the ſhops. *Pſo*, p. 57.

CABURNS, in the ſea language, denotes ſmall lines made of ſpun yarn, wherewith to bind cables, ſeize tackles, and the like. *Botel.* Sea Dial. 4. p. 163. *Marwar.* Sea Dict. p. 18. *Guill.* Gent. Dict. P. 3. in voc.

CACABOGA, in zoology, the name of an American ſpecies of ſerpent, by ſome accounted the ſame with the *tareiboia*, or black water-ſnake of that part of the world; but by others deſcribed as yellow in colour, living about houſes, and doing great miſchief among poultry, tho' not fatal to mankind in its bite. *Ray*'s Synops, p 329. See TAREIBOIA.

CACAGOGA, in the antient medicinal writings, a word uſed for certain ointments intended for rubbing on the fundament to procure ſtools. The moſt common of theſe was made of alum mixed with honey, and boiled till the whole was of a tawny colour. This anointed on the fundament, procur'd a great many ſtools, but not without ſome pain.

CACALIA, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the floſculous kind, being compoſed of ſeveral ſmall floſcules, each divided into four ſegments at the end; theſe are placed on the embryo fruit, and are contained in a general cup of a cylindric figure. The embryos ripen into ſeeds, which are winged with down.

The ſpecies of *cacalia* enumerated by Mr. Tournefort, are theſe.: 1. The woolly leaved *cacalia*. 2. The *cacalia*, with thick hairy leaves. 3. The *cacalia*, with their ſmooth and ſharp pointed leaves. 4. The Pyrenæan *cacalia*, with alliaria leaves. 5. The Alpine *cacalia*, with leaves covered on both ſides with a thick woolly down. *Tourn.* Hiſt. p. 451.

The antient Greek writers all mention a plant of this name, famous for curing diſeaſes of the aſpera arteria; but it is plain from their deſcriptions, that this was not at all of the nature of our *cacalia*: Some deſcribe it as having flowers like the olive; others like thoſe of the oak; but the old manuſcripts of Dioſcorides ſay like bryony, and therefore not at all agreeing with thoſe of the plant we call *cacalia*.

The root of *cacalia*, macerated in wine, and made into an eclegma, or chewed by itſelf, is ſaid to cure coughs. Its ſeeds pulveriſed and made into a cerate, and uſed as an ointment, render the skin ſmooth and free from wrinkles. *James*'s Dict. Med. in voc.

CACAO, the *chocolate-tree*, in botany, the name of a genus of trees, the characters of which are theſe: The flower is of the roſaceous kind, being compoſed of a number of petals arranged in a circular form. The cup is compoſed of one leaf, divided into ſeveral ſegments; and from it there ariſes a piſtil, which finally becomes a large ſtriated fruit, of the ſhape of a cucumber; containing a number of ſeeds uſually collected into five oblong cluſters, which readily part into ſeveral almond ſhaped kernels. There is only one known ſpecies of this tree, which is that which produces the common *cocoa* or *chocolate-nut*. *Tourn.* Inſt. p. 660. For the uſe of the fruit of the *cocoa*, ſee CHOCOLATE, *Cycl.*

CACAOTETE, in natural hiſtory, the name by which the Braſilians call the Belemnites, which is very common there as well as with us. *Klein*, de Tub. Mar. See BELEMNITES.

CACATORY-*Fever*, *Febris Cacatoria*, a denomination given by Sylvius to an intermittent fever, accompanied with a ſevere looſeneſs, and ſometimes gripes. *Sylv.* Prax. Med. l. 1. c. 30. §. 39. *Caſt.* Lex. Med. p. 118.

CACAVATE, in botany, a name given by ſome authors to the cocoa-tree. *Park.* Theatr. 1642.

CACAVERA, in botany, a name given by ſome authors to the cocoa-tree. *Piſo*, Mont. Ar. 197.

CACAVIA, in botany, a name given by the Greek authors and ſome of the others to the *lotus* or nettle-tree; it obtained this name from the reſemblance of its fruit when ripe, to the halicaccabum or winter cherry. See the article HALICACCABUM.

CACCALIA, in botany, a name given by ſome of the old Greek writers to the *halicaccabum* or *alkekengi*, the winter cherry; a kind of nightſhade or plant allied to that family, but diſtinguiſhed from all the others by the fruit being covered with a membraneous bag.

CACCABON, in botany, a name given by ſome authors to the water-lilly or nymphæa. The Arabians called this *nufar*, and that particular kind which grew in the Nile, *nilnufar*, and *nilufar*; by tranſpoſition of ſome of the letters, this word was formed into *linufar*, and the late Greek writers made of this and the others many more names, but this *caccabon*, and another name of the ſame plant which is *rapalon*, are not of this origin.

CACHECTIC, a perſon labouring under a *cachexy*. See CACHEXY.

CACHEF, or CACHEEF, in the Turkiſh affairs, the governour of a city, town, or even province in Egypt. Mem. des Miſſ. T. 2. p. 150, and 152.

The title *cachef* is alſo given to the captains or commanders of little flying armies, intended to keep the Arabs in obedience. *Le Clerc*, Bibl. Univ. T. 5. p. 115.

Egypt is divided by the Turks into thirty nine *cacheſtecks*, or governments. *Sicard*, in Mem. des Miſſ. T. 5 p 205, and 231. Item, T. 7. p. 99.

CACHEXY, in medicine, a flaccid ſtate of the body, eaſily perceived externally, and ariſing from a viſcoſity of the juices, and a remiſſion of the tonic motions of the parts.

Some have imagined a *cachexy* to be the firſt degree of a dropſy, but this is far from truth; for tho', as many diſeaſes are ſubject to degenerate into one another, a dropſy is often the conſequence of a *cachexy*, yet there have been frequent inſtances in which a *cachexy* has remained to the period of life, without the genuine ſymptoms of a dropſy ever appearing; and often a dropſy ariſes in patients and is continued to its utmoſt period, obſerving in all its ſtages its true form, and not running into that of *cachexy*. This miſtake of many is to be carefully avoided, becauſe the methods of cure are not the ſame in theſe two diſeaſes. The *cachexy* is diſtinguiſhed from the anaſarca by the fleſh hanging flaccid and pendulous, and being ſoft in it; whereas in the anaſarca it is often ſo diſtended and hard, that the skin ſhines and looks as if it would burſt. The anaſarca alſo uſually forms œdematous tumors in many parts of the body, but the *cachexy* never does this. It differs from the aſcites in that this diſeaſe only affects the lower parts of the body, but the *cachexy* the whole; but it differs only from the chloroſis as genus from ſpecies. Phyſicians diſtinguiſh the *cachexy* into ſimple and compound; the firſt is when it is combined with no other diſeaſe; in the other, it is frequently compounded with the ſcurvy.

Signs of the cachexy. There is no diſeaſe more readily known than this, as none has ſuch obvious and diſtinctive ſymptoms. The face, hands, feet, and legs, are always bloated, and ſwelled beyond their natural dimenſions; the natural heat of the body decreaſes, and there is an evident and actual ſenſation of cold, in the parts. This is attended with an univerſal languor, and anxiety of mind, and a painful weakneſs in going up ſtairs, or walking up hill: the appetite is very uncertain, and loathings of food are very frequent: after food, there are all the ſymptoms of a bad digeſtion, as tenſions and oppreſſions about the ſtomach, and flatulencies. The bowels are in a very uncertain ſtate, ſometimes remaining coſtive for a long while; and at others, throwing off the food undigeſted, in the manner of a lientery: the patients have always a great propenſity to ſleep, but they are not refreſhed by it. The urine is but ſmall in quantity, and is ſometimes crude and rediſh; ſometimes limpid, but always has a livid appearance. The pulſe is languid and weak, and the blood, if it happen to be ſeen by any accident, is pale and thin, and abounds in ſeroſities. The patients always complain alſo of a ſhortneſs of the breath, and a difficulty of breathing, eſpecially after the body has been at any time in motion. Heats and fluſhings come on at times, and the head is always diſturbed; always torpid and inclined to ſleep, and not unfrequently vertiginous and violently painful; and œdematous tumors appear in the feet, when the patient is ſtanding up, but diſappear again, when he lies down.

There is always alſo a ſenſe of weight and preſſure in the abdomen; ſometimes in the right hypocondrium, ſometimes in the left; and often deeply inward under the navel; ſometimes the whole abdomen is inflated and hard, and ſometimes it is only partially ſo; hardneſſes and inequalities being ſenſible to the touch in it.

It moſt frequently attacks perſons of a phlegmatic habit, and is more common among women than men, as well on account of their ſofter texture, as of the frequent diſorders the irregularity of their menſtrual diſcharges throws them into. Women oftener, however, are brought into it thro' a defect of the menſes, than by the exceſs of that diſcharge.

Cauſes of it. Among theſe are to be rekoned, the living in wet and damp rooms; the leading an idle and ſedentary life; and the feeding on viſcous things, and drinking great quantities of water: on the contrary, the abuſe of ſpirituous liquors will alſo occaſion it; and the taking aſtringent medicines at the times when the blood is in violent emotions, as in hæmorrhages, and in acute fevers; the ſtriking in of cutaneous humors will alſo ſometimes occaſion it; and very often the omiſſion or ſuppreſſion of habitual diſcharges of blood, by whatever paſſages: great loſs of blood is vulgarly ſuppoſed to be one of the principal agents in bringing on this diſeaſe, but improperly; for when this ſucceeds ſuch diſcharges, it is rather owing to their being long continued, than violent, and to the improper diet of the patient afterwards, which prevents a proper ſupply of blood again, than from the actual loſs of it. Improper treatment of the gout, and the abuſe of volatile ſalts in high fevers, are alſo too often the cauſes of this diſeaſe.

Prognoſtiſts. When this diſeaſe is plenary, and the whole craſis of the humours is depraved by it, it is very difficult of cure: It is in general more eaſily cured in young people than

in

in older; and in these last, it usually degenerates into a dropsy, and hectick; and when driven back, it often produces a suffocative catarrh. When the disease is not plenary, or in its full state, but rather may be called a *cachectick* disposition than a *cachexy*, as is frequently the case with young people; particularly with girls, on account of the suppressions of the menses, then it is in general easily cured, unless the bad regimen of the patient for some time before has rendered it more than usually obstinate and violent; in general, the sooner it is undertaken, the more easily it is cured.

The chlorosis of young girls, which seems to be of a middle nature, between a cachectick disposition, and a confirmed *cachexy*, is a chronic case, and seldom admits of a sudden cure, unless there be a remarkable change of life in the patient, as by marriage. This chlorosis is in itself rather troublesome than dangerous, as it gives an universal languor both of body and mind, a bad colour, palpitations of the heart, and other painful symptoms; but it sometimes degenerates into a *cachexy*, or a hectick.

Method of cure. The general method must be by correction of the vitiated humors; a reseration of the viscera; an evacuation of the humors, when thus prepared for it; and, finally, a restitution of the due tone to the solids.

For the first fortnight, the patient should be treated with resolvents and digestives; such as the *tartarum vitriolatum* and absorbents salted with acids; as crab's eyes with lemon juice; and with aperient decoctions of the woods of guaiacum and sassafras; as the roots of pimpernell, and the like; and either during this time, or afterwards, evacuants are to be given; such as sena, jalap, and dwarf-elder. When the improper treatment of a fever has been the occasion of the malady, the mild alexipharmicks are to be given at times; and when an obstruction of the menses is in the case, the time they are to be expected is to be carefully regarded, and emmenegogues and baths for the feet, are to be ordered at those peiods. When obstructions of the hæmorrhoidal discharges are in the case, then, after the first fortnight, leaches should be applyed to the hæmorrhoidal veins; and if the disease has arisen from long continued hæmorrhages, then analepticks are to be trusted to, with very gentle correctives, for fear of exciting new commotions in the blood; and in these cases, bleeding in the arm is sometimes found necessary. *Junk.* Consp. Med. p. 420.

It is of the utmost consequence in this case, that a proper diet be observed; all coarse and heavy foods are to be avoided, as also all acid and salt things; and much water is as carefully to be guarded against, as an over use of spirituous liquors. Finally, when the disease is cured, its return is to be guarded against, by taking proper purgatives once a month. To this purpose, Stahl greatly recommends a mixture of gum, ammoniacum, galbanum and myrrh, and small quantities of calomel, with the purges. It is too common a practice to give boldly the forcing medicines, as they are called, to young women in *cachectick* complaints; such as myrrh, saffron, savin, and the like; but this very often throws them into an ascites, or other disorders worse than the first.

Uterine CACHEXY, a term used by Hofman for the fluor albus. Oper. T. 3. p. 348.

CACHLEX, in natural history, a name used by some authors for the small pebbles found on the sea and river shores, which being heated red hot, and quenched in whey, are said to give an astringent virtue. *Galen*, L. 10.

CACHORRODOMATO, in zoology, the name by which the Portuguese in America, call the *taiibi*; a creature in many things resembling the opossum, and suspected to be the male of that creature. See TAIIBI.

CACHRYS, in botany, the name of a genus of plants of the umbelliferous kind, the characters of which are these: The flower is of the rosaceous kind, being composed of several petals, which stand in a circular order on a cup, which afterwards becomes a fruit composed of two fungous semi-oval parts, sometimes smooth, sometimes rough and striated, and containing each a seed of the shape of a grain of barley.

The species of *cachrys*, enumerated by Mr. Tournefort, are these: 1. The ferulaceous leaved *cachrys*, with smooth fungose seeds. 2. The peucedanum leaved *cachrys*, with large fungous, smooth and flat seeds. 4. The peucedanum leaved *cachrys*, with smaller fungous, smooth and flat seeds. And, 5. The *Hungarian cachrys*, with panax leaves. *Tourn.* Inst. p. 325.

The seed of *cachrys*, tho' not used in the present pharmacy, was recommended by the antients for its heating and drying qualities; and therefore judged a proper ingredient in smegma's. It also made a good plaster for the head in defluxions upon the eyes, provided it is taken off at the end of three days; and taken with pepper and wine, it was said to be good for the epilepsy. Vid. *James*'s Med. Dict. in voc.

CACHRYS, or CANCHRYS, among antient botanists, denoted a scaly tuft, growing like a calkin on certain trees; as the oak, beech, pine, and the like; or according to others, an unseasonable kind of germen or bud, appearing either in the spring, or autumn; and which, after the winter is over, spreads or shoots into branches [a]. The word is sometimes also used for the seed of rosemary, or even the plant itself [b]; sometimes for barley roasted in a furnace, to render it more easy to grind into flower [c].—[a Vid. *Theophr.* Hist. Plant. l. 3. c. 7. *Bradl.* Dict. Bot. T. 1. in voc. b *Dioscor.* l. 3. c. 87. c *Salmas.* Exerc. ad Solin. T. 1. p. 599, seq. *Gorr.* Med. Defin. p. 219. voc. Καγχρυς. *Cast.* Lex. Med. p. 119.]

CACHUNDE, the name of a medicine, highly celebrated among the Chinese and Indians, and made of several aromatick ingredients, the perfumes, medicinal earth, and precious stones: they make the whole into a stiff paste, and form out of it several figures according to their fancy, which are dryed for use: these are principally used in the East-Indies, but are sometimes brought over to Portugal. In China, the greater persons usually carry a small piece in their mouths, which is a continual cordial, and gives their breath a very sweet smell. It is a highly valuable medicine also, in all nervous complaints; and is esteemed a prolonger of life, and a provocative to venery, the two great intentions of most of the medicines in use in the East. *Zacutus Lusitanus.*

CACHYMIA, a term used by Paracelsus, for an imperfect metalline ore, or as he expresses it, an immature metalline body, which is neither a saline substance nor a metal.

The *cachymiæ* may be divided into sulphurous, as marcasite; mercurial, as arsenic or orpiment; and saline, as all tales. *Dorn.* Geneal. Miner. c. 20. Theat. Chym. T. 1. p. 587. *Cast.* Lex. Med. p. 119. *Ruland.* Lex. Alch. p. 109, seq.

CACOCHOLIA, in the writings of the antient physicians, a name given to disorders which arise from an indisposition of the bile.

CACOCHYLIA, a term used by the antient writers on medicine for a distempered or depraved chylification.

CACOCHROI, a term used by the antient writers in medicine, for such persons as had an unnatural colour in their face.

CACODÆMON, Κακοδαιμων, in the antient astrology, denotes the twelfth house from the horoscope; thus called on account of its malignant influence. *Firmic.* Math. l. 2. c. 20. t. c. 22. *Fab.* Thes. p. 390. *Vitæl.* Lex. Math. p. 88. *Wolf.* Lex. Math. p. 279.

The word originally denotes an evil genius, or dæmon.

CACODES, in the antient writers of medicine, a name given to several kinds of matter discharged from the human body, which had an ill smell. The offensive matter voided sometimes by vomit, has this name, as also that evacuated by stool, and the discharge of foul ulcers.

CACOETHES, or CACOETHIA. See MALIGNANT, *Cycl.*

CACOETHE *ulcera*, Κακοηθη ἑλκη, a name given by the antients to all ulcers not cureable by the proper and usual methods, by reason of the putrid acrimony of the matter flowing to them. *Cels.* de Med. l. 5. c. 28. *Plin.* Hist. Nat. l. 22. c. 25. *Gal.* Meth. Med. 4, 5. *Cast.* Lex. Med. p. 119. *Gorr.* Med. Defin. p. 204.

COGAMIA, Κακογαμια, among the antient Spartans, denoted the vice, or failing of persons who used their wives ill; which, among that people, was penal, and severe laws made against it. Vid. *Plut.* in Lycurg. & in Apophth. Clearch. *Solens.* in Libr. Proverb. Mem. Acad. Inscr. T. 5. p. 410.

CACOMACHIA, Κακομαχια, in the antient gymnastic art, denoted foul play in fighting, or other disputes for victory. *Philostr.* l. 2. Mem. Acad. Inscr. T. 2. p. 321.

CACOPHONIA, in medicine, denotes a vice or depravation of the voice, or speech; of which there are two species, *aphonia*, and *dysphonia*. *Gal.* de Diff. sympt. c. 3. *Cast.* Lex. Med. p. 119.

CACOPHRAGIA, in the antient writers on medicine, a term often used for a distemperature of the viscera, by which nutrition is performed.

CACOSYNTHETON, Κακοσυνθετον, in grammar and rhetoric, denotes a vicious and unnatural composition of words. Such is

——— *Versâque Juvencum*
Terga fatigamus Hastâ.
Virg. Æn. l. 9. v. 610. *Fab.* Thes. p. 390.

CACTONITES, in natural history, a name given by some old writers, to a beautiful pale red stone, supposed to be the same with our pale cornelian. In the fabulous accounts of the virtues of stones, among the writers of the middle ages, this is said to have a power of resisting enchantments.

CACTUS, in botany, a name given by some of the Greek writers to all the plants of the thistle kind; others apply it only to some peculiar species; and others to some thorny shrubs very different from thistles. The general acceptation of the word is, that it signifies the artichoak; but Hippocrates gives it as a name of the shrub which bears the gumm tragacanth; he orders this to be given in insusion to horses, in cases of bad breath; and the common people of Greece, about the time of Hippocrates, it appears from many other authors, had no name for the tragacanth, but this of *cactus*. Athenæus allows, that the *cactus* of Theophrastus was the artichoak; and tho' some of the Greeks of after-times, used the word Κυναρα *cinara*, for this plant; yet the old name *cactus*, still continued in the more general use.

The *cinara* and *cactus* are properly, therefore, the same plant, and are synonyms of the same countries at different times; yet Columella distinguishes them as two plants; and says,

that the one was prickly, and the other not ſo. This, however, is but an accidental and trivial difference; for as the *cactus*, according to this author, was prickly, and the *cinara* ſmooth, but both were in other reſpects the ſame, it is probable, that the ſpecies were the ſame, and the difference was owing to culture; the wild plant being naturally ſmaller and prickly, and the garden plant larger, ſmooth, and with finer and fuller heads.

CACULE, in the materia medica, a name given by Aviſenna, Serapio, and all the other Arabian writers, to the cardamom ſeeds. They diſtinguiſh two kinds of this fruit, a larger, and a ſmaller. The larger is the grain of paradiſe, and the ſmaller the common cardamom ſeed of theſe times. They alſo called the cardamoms, in general, by the name *heil*, and diſtinguiſhed the ſmall kind, now principally in uſe, by the word *hilbanc*, which after writers corrupted into *hilbave* and *hilbua*, or *helbua*. Garcias tells us, that the cardamom ſeeds were in his time, called *hil*, in Bengal, and many other parts of the Eaſt.

CADE *(Cycl.)* — Antiently the *cade* of herrings appears to have contained 600 fiſh, reckoning ſix ſcore to the hundred. *Dugd.* Monaſt. Ang. T. 1. p. 83. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc.

CADE-*Lamb*, a young lamb weaned, and brought up by hand, in a houſe; called in the North, pet-lamb. *Skinn.* Etym. Angl. Dict Ruſt. T. 1. in voc.

CADE-*oil*, in the materia medica, a name given to an oil much in uſe in ſome parts of *France* and *Germany*. The phyſicians call it *oleum cadæ*, or *oleum de cada*. This is ſuppoſed by ſome to be the piſſelæum of the antients, but improperly; it is made of the fruit of the oxycedrus, which is called by the people of theſe places, *cada*. Some have imagined it to be the piſſelæum, made by the antients of the fruit of the cedars mentioned by Pliny; but this does not appear to be the piſſelæum of any other of the antients, theirs being the oil of pitele, made from the pine, or turpentine trees; and the oil of the cedar, which was the ſame ſort of ſubſtance, made from the cedar-wood, being the cedrelæum of theſe authors. Pliny and ſome others, have called all theſe by the general name, biſſelæum, but this is only a falſe ſpelling of piſſelæum.

CADE-*worm*. See PHRYGANIUM.

CADENCE, *(Cycl.)* among the French muſicians, is uſed to ſignify a trillo, or ſhake, but improperly, according to Broſſard. In effect, the *cadence* is properly the tranſition from the note on which the ſhake is made, to a note which is a tone lower, or a ſemi-tone major higher, in the treble parts. See CADENZA SFUGGITA.

CADENCE, in the manege, denotes an equal meaſure, or proportion, obſerved by a horſe in all his motions, when he is thoroughly managed, and works juſtly either at the gallop, terra a-terra, or the airs.

A horſe's working in *cadence* imports, that his times or motions are uniform, and that one does not take in more ground than another. *Guill* Gent Dict. P. 1. in voc.

CADENCY, in heraldry, the ſtate, or quality of a cadet. See CADETS, *Cycl.*

Niſbet has an eſſay on the additional figures and marks of *cadency*. See DIMINUTION, *Cycl.*

CADENT *of the horoſcope*, in the Chaldaic aſtrology, the ſame with *cacodæmon*, or ill genius. *Stanl.* Hiſt. Philoſ. P. 15. p. 1048. See CACODÆMON.

CADENZA *Sfuggita*, in the Italian muſic, is uſed when a part inſtead of aſcending or deſcending the proper interval, to form a *cadence*, proceeds by ſome other interval. For inſtance, when the baſs, inſtead of riſing a fourth, or falling a fifth, aſcends only by a tone, or ſemi-tone major.

Thus, in Ex. 1. where the baſs inſtead of proceeding to C, the key-note, after G, goes to A. Thus alſo, in Ex. 2. after E, the ear would naturally expect to hear A, the key-note, but this is avoided, and F put in its place.

CADGE, a round frame of wood, on which falconers carry their hawks when they expoſe them to ſale. Dict. Ruſt. T. 1. in voc.

CADI *(Cycl.)*—We find numerous complaints of the avarice, extortion, and iniquity of the Turkiſh *cadis*; all juſtice is here venal; the people bribe the *cadis*; the *cadis* bribe the moulas; the moulas the cadileſchers, and the cadileſchers the mufti. *Tournef.* Voy. du Levant. T. 2. p. 57.

Each *cadi* has his ſerjeants, who are to ſummon perſons to appear and anſwer complaints. If the party ſummoned fails to appear at the hour appointed, ſentence is paſſed, by proviſion, in favour of his adverſary. It is uſually vain to appeal from the ſentences of the *cadi*; ſince the affair is never heard anew, but judgment is paſſed on the caſe, as ſtated by the *cadi*. But the *cadis* are often caſhiered, and puniſhed for crying injuſtice with the baſtonado and mulcts; but the law forbids them to be put to death. Conſtantinople has had *cadis* ever ſince the year 1390, when Bajazet I. obliged John Palæologus, emperor of the Greeks, to receive *cadis* into the city, to judge all controverſies happening between the Greeks and the Turks ſettled there.

In ſome countries of Africa, the *cadis* are alſo judges of religious matters. Among the Moors, *cadi* is the denomination of their higher order of prieſts, or doctors, anſwering to the rabbins among the Jews. Vid. Journ. des Scav. T. 81. p. 100.

CADILESCHER *(Cycl.)* — The *cadileſchers* have much the ſame authority in the provinces, that the muftis have at Conſtantinople [a]: they even frequently riſe to be muftis: their chief ſtudy is the alcoran, which is the code of their civil as well as canon law. Their place at the divan is at the ſide of the grand vizir. Appeals are ſometimes brought to them from the ſentences of the *cadis* in civil affairs; and they have the ſuperintendence of all other officers of juſtice within the empire. They nominate the *cadis*, and *moula-cadis*; but theſe laſt only with the conſent of the grand ſeignor. On any grievous complaints againſt the *cadis*, they condemn and depoſe them [b]. — [a Vid. Jour. des Scav. T. 58. p. 441. b *Tournef.* Voyag. du Levant. T. 2. Lett. 14. p. 57.]

A *cadi leſcher*, in Egypt, is an officer like a lord high chancellor, ſent yearly from Conſtantinople to Grand Cairo, to whom the people may appeal from the *cadis*, and many cauſes of importance in Cairo go immediately before him. *Pocock's* Egypt, p. 170.

CADITES, an appellation given by Plot to a kind of figured ſtone, reſembling a *cadus*, or barrel.

The *cadites* ſwells in the middle, and goes tapering to both ends, being divided lengthwiſe with ſuch equidiſtant lineaments, as are uſually made by the ſtaves of a barrel, but without hoops, nor yet hollow. *Plot.* Nat. Hiſt. Staffordſh. c. 5. §. 42. p. 198.

CADMEAN-*Letters*, the antient Greek, or Jonic characters, ſuch as they were firſt brought by Cadmus from Phœnicia; whence Herodotus alſo calls them, *Phœnician*-letters. Vid. *Montfauc.* Palæogr. Græc. l. 2. c. 1. p. 116. Mem. Acad. Inſcr. T. 3. p. 311.

According to ſome writers, Cadmus was not the inventor, nor even importer of the Greek letters, but only the modeller and reformer thereof; and it was hence they acquired the appellation *Cadmean*, or *Phœnician*-letters; whereas before that time they had been called *Pelaſgian*-letters. *Nouv.* Rep. Lett. T. 45. p. 506.

CADMIA, Καδμια, *(Cycl.)* originally denoted the tower or caſtle of Thebes, built by Cadmus ſon of Agenor. From hence the name has been transferred by alchemiſts, to denote divers other things, as the matter of the philoſopher's ſtone, or even the ſtone itſelf; on account of which the adepts ſometimes call themſelves fellows or companions of Cadmus, *q. d.* men who have ſtormed and taken the ſtrong, and otherwiſe impregnable caſtle of nature.

Sometimes it ſignifies a foſſil ſubſtance, as the *Lapis calaminaris*; ſometimes a flower, or ſublimate of like uſe with calamine, for tinging copper yellow; ſometimes a ſubſtance which yields vitriol either *per ſe*, or by accident; ſometimes a ſort of pyrites called cobalt, of which a blue colour is prepared. Vid. *Lynk.* Comm. de Cobalt. ap. Philoſ. Tranſ. N° 396. p. 193. *Woodw.* Catal. For. Foſſ. p. 26, ſeq. *Mercat.* Metall. Arm. 7. c. 3. p. 146.

CADMIA is alſo uſed by Pliny for copper ore, or the ſtone of which copper is made [a]. And hence the ſeveral appellations, *cadmia foſſilis*, *cadmia fornacum*, *cadmia metallica*, *cadmia atramentoſa*, and *cadmia pro cæruleo* [b].—[a *Plin.* Hiſt Nat. l. 34. c. 10. It. c. 1. *Hardouin*, Not. ad Eund. b *Lynk.* loc. cit.]

CADMIA-*foſſilis*, a name given by ſome to the mineral called more uſually *cobalt*; this is a greyiſh or whitiſh ore, conſiderably firm and very heavy; much reſembling ſome of the ſilver ores, and in ſome ſpecimens looking like the white pyrites, but leſs gloſſy. It contains arſenick or ratsbane, and a fixt earth, which on fuſion with fluids and potaſh, or any other alkali ſalt, yields that fine blue glaſs which we call ſmalt, and which our painters and waſher women uſe under the names of ſmalt and powder-blue. It is dug about Sneeberg and Annaberg, and in ſome parts of Bohemia. It is always found below, not mixt with the ores of metals, and is very rich in the arſenick in ſome places, and but poor in others: all our arſenick is made from it. The miners are directed where the veins of *cobalt* lie, by a ſort of foſſil which they call therefore the flower of *cobalt*: it is a very elegant ſubſtance, of a fine blooming red colour, and of a radiated ſtructure; ſometimes of a paler red, and in form of powder. This is found on the ſurface of the earth where the veins of *cobalt* are within; and the people who dig where it is found, are ſeldom deceived in their expectations. When a mineral of this nature is met with, there requires great skill in the miner to diſtinguiſh it from the white pyrites, a grey copper ore, and from ſome of the white ſilver ores, to all which it bears a great external reſemblance, and they to it; but they all differ extremely in their nature and properties. The eye is able to judge of this after a long experience, but not without it; but when there is any expectation of advantage from the

ore,

ore, it is eaſily tried by fire; for the glaſs producible from theſe ſeveral things, ſo like in external appearance, is wholly different. The glaſs from the white pyrites is black, that from the grey copper ore is red, and that from the ſilver blackiſh; but that from the *cobalt* is of the fine blue of which we make ſmalt. This is an exact ſapphire colour, and probably from this colour obtained the name of zaffer, which is at preſent generally uſed to ſignify roaſted *cobalt*, which is blue, and becomes of a ſtrong hardneſs on lying by a little wetted; but ſome uſe it in general, either for this, or for the ſmalt prepared of it.

Cobalt, when expoſed for a conſiderable time by itſelf in a heap to the ſun and rain, yields an efflorescence of a roſe or peach bloſſom colour, called by the miners the flower of *cobalt*, and very much reſembling the native flowers of *cobalt* deſcribed before, but leſs beautiful: this efflorescence when properly treated affords a very fine red colour for the painter's uſe, and a little green vitriol Spirit of nitre diſſolves the *cobalt* with a violent effervescence; four times the quantity of the acid is ſufficient to diſſolve ſome *cobalt*, but other ores require ſix times or more: this is owing to the purity or impurity of the ore. The ſolution is of an uncertain colour, according to the other matters contained in the *cobalt*; when it contains vitriol it is blue, when it contains copper, as is often the caſe, but particularly in that kind called by the miners *copper nickle*, which has an appearance of copper on the ſurface, the ſolution is then green; it is alſo ſometimes green from the pureſt ores to appearance. This green colour reſembles very much that of ſalt of ſteel well purified, but it ſtill ſeems to have ſome ſhare of copper in it.

When the ſolution is rediſh, it ſhews that there is a mixture of biſmuth ore in the *cobalt*; and finally, when it is yellowiſh, it ſhews the *cobalt* to be richeſt of all for the making of ſmalt.

The ſolutions of *cobalt*, when an alkali is added, ſuch as oil of tartar, or the like, precipitate a fine blue ſmalt, which is the richeſt of all colours for china ware: it is poſſible that this was the old blue employed by the Chineſe, which we find ſo greatly ſuperior to that uſed at preſent, but our ſmalt being afforded ſo much cheaper than they could make this elegant colour, they ſoon diſuſed it, and made their blues wholly from our ſmalt. Oil of vitriol, and ſpirit of ſea ſalt, act on *cobalt*, but do not properly diſſolve it: they may rather be ſaid to erode it, and particularly the acid of vitriol, which turns it into a white powder, ſo that ſpirit of nitre ſeems the proper ſimple ſolvent of it. Philoſ. Tranſ. N° 396. p. 199.

Cobalt put into a coated retort, and ſet over a ſtrong fire, yields thick fumes, which by degrees aſſemble themſelves in the neck, and upper part of the veſſel, in form of a ſolid ſubſtance. This is white arſenick, or ratſbane, but the ore is ſeldom ſo pure as to yeild theſe flowers white and perfect from the beginning; they are often blackiſh at firſt, and after this red, which ſhews that there is ſome portion of common ſulphur in the *cobalt*, which mixing with the arſenick, turns it red, as it will common white arſenick, eſpecially if a little ſcoriæ of copper be added, or in the firſt caſe if a little copper be contained in the *cobalt*.

Theſe red flowers form themſelves into a ſolid ſubſtance of a laminated ſtructure, and have much the appearance of a regulus of ſome kind, but they alter on being expoſed to the air, and though very bright and gloſſy at firſt, they become opake and dull afterwards. When roaſted, as the miners term it, in a reverberatory oven, in which the flame of the wood is beat back upon the ore, it yields a white duſty ſubſtance like meal, which ſticks to the top of the oven, and is collected for the making of the common white arſenick, and the other kinds. The remaining ſubſtance, after all theſe white flowers are raiſed, is only the fixed earth which turns into that blue glaſs called ſmalt.

Biſmuth ores, treated in the ſame manner, yield their metal for the common uſes, as the *cobalt* yields its arſenick, and the remainder, like that of the *cobalt*, is an earth eaſily fuſible into the ſame blue glaſs.

CADMIA *Fornacum*. See TUTTY.

CADMITES, in natural hiſtory, a kind of gem, nearly reſembling the oſtracitis; from which it only differs in that the latter is ſometimes girt with blue ſpots. *Plin.* Hiſt. Nat. l. 37. c. 10. See OSTRACITIS.

In ſome MSS. for *cadmites*, we read *calamites*. *Hardouin.* Not. ad Plin. loc. cit.

CACUEATOR, in antiquity, a denomination given to heralds or meſſengers of peace. *Aquin.* Lex. Milit. T. 1. p. 146. See CADUCEUS, *Cycl.* and *Suppl.*

CADUCEUS (*Cycl.*)—F. Lafitau pretends to have found the *caduceus* among the ſavages of America. The famous myſtic tobacco pipe, or calumet, according to this author, is the true and original *caduceus*, of which the Greek and Roman ones were only types. *Lafitau*, Paral. des Mœurs. Sauv. ap. Mem. Trev. 1725. p. 216, ſeq. See CALUMET.

Wedelius has given a diſſertation expreſs on *caduceated* medals, De Nummis Caduceatis. Ext. in Ejuct. Exercit. Med. Dec. 6. Ex. 5. p. 22, ſeq.

CADUCEUS is alſo a name given to a kind of ſtaff covered with velvet, and decorated with *flower de luces*, which the French heralds of arms bear in their hands on ſolemn occaſions. That born by the king at arms has a golden *flower de luce* at the end; and is by ſome called ſceptre. Trev. Dict. Univ. T. 1. p. 1322.

CADUS, Κάδος, an antient liquid meaſure of capacity, containing ten, ſometimes twelve congii; and ſixty, or according to others, ſeventy-two ſextaries. *Linden.* Exerc. 10. §. 140. *Gorr.* Med. Def. p. 292. *Caſt.* Lex. Med. p. 120. *Fab.* Theſ. p. 396. *Pitiſc.* Lex. Ant. T. 1. p. 312.

The *cadus* is the ſame with what is otherwiſe denominated *metretes* [a] and *cerameon* [b], &c.—[a *Gorr.* Def. Med. p. 292. voc. μετρητης. b *Paul.* Addit. ad Beverin. p. 135]

St. Jerom alſo makes it the ſame with the *batus*, or *bath*. *Hieron.* ad Ezech. c. 45. See BATH.

According to Beverinus, the *cadus* was different from the μετρητης, and contained three modii, or the third part of a corus; and conſequently, eighty pounds of water, or ſixty of wheat; being alſo equal to the amphora. *Beverin.* Synt. de Ponder. P. 2. p. 134. See AMPHORA, *Cycl.* and *Suppl.*

CÆCÆ *Glandulæ*. See GLANDULÆ *Cæcæ*.

CÆCILIA, in zoology, the name of the ſlow-worm, or blind-worm, called by the Greeks *typhlinus*. It is a ſmall ſpecies of ſerpent, which has ſuch extremely ſmall eyes, that it has been uſually ſuppoſed to have none at all. It is diſtinguiſhed from all our ſnakes by its ſmallneſs, and by the ſhape of its tail, which runs out a great way beyond the anus, and yet is blunt and conſiderably thick at the end. The colours vary much in the different ſexes, and probably often alſo in the ſame ſex; the common colour is a duſky greyiſh yellow on the back, and the ſides are variegated with ſtreaks of black and white: it reſembles the viper in its manner of producing its young, which are put forth alive. *Ray*'s Syn. p. 289.

CÆCILIA, in icthyography, a name uſed by ſome authors for the fiſh more uſually known by the name of the *acus*. *Geſner*, de piſc. p. 1225. See the article ACUS.

CÆCILIANA, in botany, a name uſed by Pliny and ſome other authors for the *Tutſan* or *androſæmum*. *Gerr.* Emac. Ind. 2.

CÆCUM *inteſtinum*. See INTESTINUM *Cæcum*.

CÆLATURA, or COELATURA, the art of engraving on metals, ſtones, woods, or the like, with inſtruments of ſteel, diamond, &c. *Libav.* Synt. Arc. Chym. l. 1. c. 23. *Caſt.* Lex. Med. p. 120. *Fab.* Theſ. p. 402. *Pitiſc.* Lex. Ant. T. 1. p. 313. See ENGRAVING, SCULPTURE, &c. *Cycl.*

CÆLESTIANS, CÆLESTIANI, or CÆLESTII, antient heretics, the followers of Cæleſtius, a monk, who flouriſhed under the empire of Arcadius, about the year 405, and taught moſt of the ſame errors with Pelagius. See PELAGIANS, *Cycl.*

The *Cæleſtiani* aſſerted, that no man need ſin unleſs he will; and that it is in every perſon's power to be righteous, and arrive at a ſtate of perfection, if he do his utmoſt; laſtly, that man may fulfil all the commands of God without divine grace, and obtain ſalvation by his own works alone.

The *Cæleſtians* were condemned with the Pelagians at the council of Epheſus. Their arguments were refuted by St. Auguſtin, whom St. Jerom compliments as having driven the *Cæleſtians* off the ſtage. *Prateol.* Elench. Hæreſ. l. 2. p. 126.

CÆMENT, or CEMENT, the ſolution of metals by acid menſtrua, ſuch as aqua fortis, ſpirit of nitre, and the reſt, is a thing commonly practiſed and well known; but theſe menſtrua all evaporate over a fire ſtrong enough to make them boil; and yet it was found neceſſary for the metallurgiſts and aſſayers to know the effects of the ſame menſtrua in a much greater degree of heat; and as this could not be given them in their fluid form, by reaſon of their evaporation, they have found a method of uſing the ingredients which afford them in their dry ſtate: theſe ingredients thus uſed are called *cements*, and the operation *cementation*.

It was ſoon found, that the acid ſalts, when condenſed into liquors, could not bear any great degree of fire, but were by it reſolved into vapours, and flew off; yet that theſe very liquors or acid ſpirits, could not be ſeparated from their ſalts but by a very violent and ſtrong fire; and thence it was learned, that to have the effects of theſe powerful menſtrua, with the effect of a ſtrong fire at the ſame time, it was neceſſary to uſe, not the menſtrua already extracted in a fluid ſtate, but the ingredients from which they were to be made in their dry form. The bodies therefore to be thus wrought upon by the acid ſpirits, and by a violent fire at the ſame time, muſt be put into the veſſel wherein the ſaid ſpirits are produced, that being made red hot therein, they may be ſurrounded on every ſide by the agitated vapours of theſe ſpirits: this is eaſily done by firſt ſlightly moiſtening the matter which affords theſe acid ſpirits, then preſſing the mixture a little, and expoſing the metal mixed with this matter to the fire.

The proportion of the ingredients and additions to them, uſed in making *cements*, is much the ſame as in the diſtillation of the acid ſpirits from the ſame ingredients; but common ſalt, nitre and vitriol, being the melting menſtrua of metals; and vitriol being apt to become extremely hard, by the ſame fire which is proper to be uſed in *cementations*, that is not a very violent one, on this account they uſe a quantity of brick-duſt, or other ſuch ſubſtance with them, three or four times greater than their own; leſt the ſalts melting by a ſomewhat ſtronger fire being employed, ſhould put the metals, eſpecially gold and ſilver, in fuſion: but by this method you prevent the melting

melting of the ſalts, or if they melt, you at leaſt prevent them by it from running together and hardening to ſuch a degree, that the maſs cannot be got aſunder, or the metal ſeparated without great difficulty. Some uſe bole alone on theſe occaſions, but from what has been obſerved it may be found not proper to do that, becauſe bole hardens into a ſort of ſtone in the fire.

That the ſpirits which are driven out of the matter uſed in the *cementation* may act on the metal the longer, and with the greater force, the veſſels in which the operation is performed, muſt be cloſed; the junctures of them muſt not, however, be perfectly ſtoped, but covered with clay, leaving ſome vent. By this means the ſpirits are beaten back, and yet not ſo abſolutely confined as not to be able, when the fire is increaſed, to make their way thro' the cloſures of the veſſels; which vent not being given them, the veſſels muſt inevitably burſt.

Among the metals, copper, iron, lead, and tin; and all the ſemi-metals are totally corroded in a few hours, by any of the ingredients of the acid ſpirits uſed as *cements*; and this is yet the ſooner done, if they are intermixed with the matter of the *cement*, in form of lamina or thin plates, or if they are granulated.

Silver alſo is immediately conſumed by the ſeveral ſpecies of ſpirit of nitre; nay, even the ſpirit of common ſalt conſumes it in this operation, tho' in the form of a fluid body it does not corrode it; nor does ſilver reſiſt the vapours of vitriol in *cementation*; nay, even the vinegar of vegetables concentrated in the cryſtalls of verdigreaſe, and mixed with terreſtrial bodies, and uſed as a *cement*, takes ſomething from ſilver.

Gold remains untouched in all the before-mentioned *cements*. The other metals, as alſo all ſemi-metals, when intermixed with gold, if this be granulated or reduced into thin plates, are all eroded from it by *cementation*. Silver, however, is with more difficulty ſeparated from it than the other metals; and ſometimes a ſmall quantity of copper mixed with it, tho' a larger is very quickly eroded, is found to be with great difficulty ſeparated entirely by *cementation*. *Cramer*, Art. Aſſ. 46, 48.

CÆMENT, in architecture. Mr. Boyle ſpeaks of a *cement* he knew for rejoining the parts of broken ſtatues; and by the ſame he could counterfeit marble ſo well, that tho' large cavities were filled up with the *cement*, the work would paſs for entire, and be undiſtinguiſhable from natural marble. Works abr. Vol. 1. p. 111.

The ſame author tells us, that the beſt method to cloſe and mend pipes of ſubterraneous aquæducts, is with tobacco-pipe clay pulverized, and mixed with a large quantity of pulverized flocks, and carefully beat up with linſeed oil into a ſtiff paſte. Ib. p. 148.

To faſten the receiver of an air-pump to a metalline plate: This may be done by a cement of bees wax and turpentine, made with equal parts for the winter; and three parts of the former to two of the latter, for the ſummer. *Boyle*'s Works, abr. Vol. 2. p. 475.

Receivers, when cracked may be mended by a *cement*. See RECEIVER.

CÆMENT-*pots*, in aſſaying, are veſſels made for the *cementation* of metals with ſalts, and the ingredients of the ſtrong acid menſtrua, where the force of thoſe menſtrua, and a ſtrong fire, are required together.

Theſe pots are cylindrical veſſels, made of potters clay, with tiles adapted to them, and may be conveniently turned by the potters. The ſize of theſe veſſels muſt be proportioned to the quantity of *cement* to be put in them. It is not prudent, however, to make them of more than eight or ten inches broad, becauſe when they are larger the fire acts but difficultly and unequally upon them, eſpecially on that part of the matter near their center.

It is to be obſerved, in the making theſe veſſels alſo, that all kinds of clay contract and take up a ſmaller ſpace in the drying and baking; the purer clay will contract one tenth part of their diameter, but the more ſand or other dry powder there is in the mixture, the leſs it contracts. If a veſſel, therefore, of any determinate ſize is to be made of clay without admixture, it muſt be made one tenth larger than the expected ſize; if of clay with theſe admixtures, experience alone can ſhew what muſt be the exceſs in ſize, when moiſt. *Cramer*, Art. Aſſ. p. 711.

CÆMENTATION (*Cycl.*) is defined by Stahl, a method of corroding metals in a dry form by the fumes of dry ſalts. *Stahl*, Phil. Princ. Chem. P. 1. Sect. 2. n. 20. p. 28.

CÆMENTATION *of gold*. See the article GOLD.

CÆRITES, or CÆRITUM *tabulæ*, in antiquity, denote the cenſors tables, wherein were entered the names of ſuch perſons as for ſome miſdemeanor, were to loſe their right of ſuffrage in elections at Rome.

The origin of the appellation aroſe hence, that during the captivity of Rome under the Gauls, the *Cærites* or inhabitants of Cære, a city in Etruria, preſerved their ſacred books and other matters belonging to the worſhip of the Gods, in gratitude for which, the Romans dignified the *Cærites* with the appellation of Roman-citizens, but without admitting them into any part of the adminiſtration. *A. Gell.* Noct. Att. l. 16. c. 13. *Sigon.* de Ant. Jur. Ital. l. 2. c. 6. *Donat.* ad Liv p. 31. *Pitiſc.* Lex. Antiq. T. 1. p. 314. See the article MUNICIPAL, *Cycl.*

CÆRULEUS, in zoology, a name given by authors to a bird of the thruſh or blackbird kind, and ſomewhat reſembling that ſpecies of blackbird commonly called the ſolitary ſparrow. It loves rocks and old buildings, and is thence called by ſome petrocoſſyphus or the ſtone blackbird, and from its colours is called by the Germans blauvogel: it is of the ſize of a ſtarling; its breaſt, back, and neck are of a very fine deep blue; it lives among the mountains; it ſings very ſweetly, and in winter loſes its fine blue colour, and becomes black. *Ray*'s Orintholeg. p. 141.

CÆRULEUS is alſo a name given by Solinus to the great Indian worm deſcribed by Pliny and others, as inhabiting the Ganges. No author but this has ever uſed the word in this ſenſe, and he ſeems to take it from a falſe underſtanding of Pliny; who ſays, that it was called *vermis cæruleus*, from its external appearance. Solinus miſtakes the author ſo far as to think he allows it to be a worm, and ſays it was called *cæruleus* from its colour; but his true ſenſe is, that it was called *vermis* from its reſembling a worm, tho' it was not one: it is probable that all the accounts we have of this monſtrous animal are only falſe deſcriptions of the crocodile. See VERMIS *Cæruleus*.

CÆSALPINOIDES, in botany, a name given in the Hortus Cliffortianus to the genus of plants called by others, *glediſtia*. Hort. Cliffort. p. 489. See the article GLEDISTIA.

CÆSALPINA, in botany, the name of a genus of plants deſcribed by Plumier, the characters of which are theſe: The flower has no cup; it is monopetalous, and of the gaping kind; the tube of it is inflated, and of a globular figure: it is divided into four parts at the edge, and the upper ſegment is twice as large as any of the others; this is hollow and undivided: the oppoſite ſegment to this is ſomewhat erect, tho' open; this alſo is undivided: the ſide petals are placed erect, and are equal to one another in ſize, and crenated at the edges: theſe are about the ſize of the lower ſegment. The ſtamina are five extremely long and ſlender filaments; they are intorted and directed toward the upper ſegment; the autheræ are ſimple. *Linnæ.* Gen. Plant. p. 522.

The piſtil has a ſlender oblong germen, of the length of the ſtamina is the ſtyle, which is ſimple and the ſtigma is headed. The fruit is an oblong pointed pod, containing only one cell; the ſeeds are numerous and of an oval figure. Linnæus confeſſes that this flower is a ſort of botanical paradox; for he cannot conceive how a cup ſhould be wanting, or what a monopetalous flower with five ſtamina ſhould do with a leguminoſe pod. *Plumier*, 9.

CÆSAR (*Cycl.*)—To this day the emperors of Germany bear the title *cæſar*: 'tis not known when this uſage was firſt reſtored; for Charlemaign and his ſucceſſors had declined the appellation, uſing that of Auguſtus in lieu of it. Goldaſtus takes it to have been firſt aſſumed by the emperor Lewis IV. in 1338. *Goldaſt.* Conſtit. T. 3. p. 410. *Boecler.* Notit. Imper. l. 4. c. 1. p. 82.

The Julian family becoming extinct by the death of Nero, *Cæſar* became a name or title of dignity which the ſucceeding emperors aſſumed, who had no pretenſions to a deſcent from the Julian family; as appears from Galba, who ſucceeded Nero, and took the title *Cæſar*. Vitellius, indeed, rejected it at firſt, as well as the title *Auguſtus*, but he afterwards aſſumed both out of condeſcenſion to the reigning taſte of the people. The Veſpaſians, and others, did the like, without pretending to be iſſued from the family of the *Cæſars*; as is largely proved by M. Spanheim [a] againſt Hardouin, who, on ſome ſtrange principles of his own, had denied that ever *Cæſar* was the name of a dignity, or was given to any but thoſe deſcended from *Cæſar*, or thoſe who married the daughters of *Cæſars* [b].—[a *Spanheim*, de Uſu & Præſt. Numiſm. T. 2. Diſſ. 12. Bibl. Anc. Mod. T. 7. p. 169. b *Hardou.* Hiſt. Auguſt. ex Numiſm. Reſtit. Nuov. Rep. Lett. T. 48. p. 296.]

Under the lower empire *Cæſar* became the title of the deſtined ſucceſſor to the empire.

From the time of Marcus Aurelius to that of the emperor Valens, none had the title of *Auguſti* given them, till they had been firſt created *Cæſars*. Spartian ſays Ælius Verus was the firſt that was called *Cæſar* before he was made emperor [a]; not that all the medals where we only find *Cæſar*, with Auguſtus, were ſtruck in honour of the *Cæſars* deſigned ſucceſſors of the empire; for ſome emperors only aſſumed the title *Cæſar*, as Diadumenus; and others only that of *Auguſtus*, as Adrian; and others rejected both, at leaſt for a time [b].—[a *Spartian* in Æl.Ver. §. 2. b *Vander Meulen*, Diſſ. de Ortu Imper. Rom. p. 161, ſeq. *Kuſt.* Bibl. Nov. Libr. An. 1698. p. 157, ſeq. Ouvr. des Scav. 1698. p. 262, ſeq.]

Both the *Cæſar* and *Sebaſtocrator* wore crowns, tho' much inferior to that of the emperor in ſplendor and magnificence. Till this time, thoſe dignified with the title of *Cæſar* were looked on as ſucceſſors, at leaſt partners of the future empire [c]. But after the introduction of the dignity of *Sebaſtocrator*, that of *Cæſar* dwindled to a mere title of honour: both the one and the other became at length inferior to the dignity of deſpot [d].—[c *Ann. Commen.* l. 3. *Alexand.* p. 78. *Codin.*

de

de Offic. Aul. Conſtant. c. 1. p. 1. Item, c. 3. p. 16 & 21. Item, c. 19. p. 1. [d] *Du Cange*, Gloſſ. Græc. p. 542. voc. Καισας.]

Some pretend that the laurel crown on medals is never given to *Cæſars*, but only to *Auguſti*, which is overthrown by a medalion of Maximus; not to mention another medal of the lower empire, wherein Criſpus *Cæſar* is crowned with laurel. Vid. Trev. Dict. Univ. T. 1 p. 1578. voc. *Cæſar*.

Card. Noris obſerves, that the years of the *Cæſars* were frequently marked on their medals; of which we have inſtances in the medals of Conſtantine, Chlorus, and divers others, whoſe years are expreſſed on their coins, tho' they were never more than *Cæſars*. Trev. loc. cit.

Emplaſtrum-CÆSARIS, among phyſicians, a name given to a plaſter compoſed of aſtringents, to prevent abortion. *Quinc.* Lex. Phyſ. Med. p. 62.

CÆSAREAN-*Section*. See SECTION.

CÆSARIANS, or CÆSARIENSES, in antiquity, were miniſters or officials of the procurator *cæſaris*, to whom belonged the keeping the fiſcal accounts, and taking poſſeſſion of effects devolving or eſcheating to the emperor.

Theſe were alſo called *catholiciani*. From the appellation *cæſarianus* ſome deduce the modern word ſergeant. *Du Cange*, Gloſſ. Lat. T. 1. p. 675. *Calv.* Lex. Jur. p. 133. See SERGEANT, *Cycl.*

CÆSIAS, in meteorology, denotes the north eaſt wind [a]; called in the Mediterranean, *vento græco*, or *greco levante* [b].—[a *Plin.* Hiſt. Nat. l. 2. c. 47. *Hardouin.* Not. ad loc. b *Vocab. Cruſc.* voc. *Greco levante*.]

CÆSONES, a denomination given to thoſe cut out of their mothers womb. *Plin* Hiſt. Nat. l. 7. See the article SECTION, *Cycl.* and *Suppl.*

Pliny ranks this as an auſpicious kind of birth; the elder Scipio Africanus, and the firſt of the family of Cæſars, were brought into the world in this way. *Plin.* loc. cit.

CÆSTURA, in botany, a name given by Serapion and the other Arabian writers to a plant very much fam'd for its virtues as a cephalick. It is the ſame with the *ferrata* of the Italians, which is our *ſawwort*, but has been miſtaken to mean the plant we call *betony*; this error is very natural: *betony* is a name but of late given to the peculiar plant we call by it, and was originally only a ſynonym of the *ferrata* or *ſawwort*. Pliny tells us, that the plant called *ferrata* by the Italians was called *betonica* by the Gauls; and Dioſcorides, who deſcribes the plant under its proper Greek name *ceſtrum*, ſays that it was called by the Latins *betonica* and *ferratula*, and by the other Greek writers *priorites* and *pſuchrotrophon*. It is very evident, that the *cæſtura*, or as it is ſometimes written *caſtaron* of the Arabians, was the *caſtrum* of the Greeks; for the word is formed of it; and it is certain alſo, that tho' the names *betonica* and *ferrata*, were both given to this plant, and even a third, which is *roſmarinus*, by ſome of the old Roman authors according to the ſame Dioſcorides; the plant we call *ſawwort* is only meant by the name, becauſe the deſcription anſwers to that and to no other of the plants whoſe names are mentioned.

CAFFACA, in natural hiſtory, a name given by the Turks and Tartars to a peculiar kind of earth of a grey colour, having a ſlight caſt of green in it. It is very ſoft and unctuous, and ſomething reſembles our fullers earth; but is more aſtringent, and adheres very firmly to the tongue: theſe people bath very frequently, and they uſe this earth on thoſe occaſions.

CAGADO DE AGOA, in zoology, a name by which the Portugueſe in America call a ſpecies of tortoiſe common there, and uſually known among authors by its Braſilian name *jurura*. See JURURA.

CAGADO *de Terra*, in zoology, the name by which the Portugueſe in America call a remarkable ſpecies of tortoiſe, called by the Braſilians *jaboti*. See the articles JABOTI and TESTUDO.

CAGANUS, or CACANUS, an appellation antiently given by the Hunns to their kings.

The word appears alſo to have been formerly applied to the princes of Muſcovy, now called *czar*. See CZAR, *Cycl.*

From the ſame alſo, probably, the Tartar title *Cham* or *Can*, had its origin. *Du Cange*, Gloſſ. Lat. T. 1. p. 675. See CHAM, *Cycl.*

CAGAO, in natural hiſtory, the Indian name for a large bird which inhabits the mountains, and feeds on the piſtachia nuts, and many other fruits, all which it ſwallows whole: it is very voracious, and its food paſſes off very quickly; the piſtachias only looſe their rind in its ſtomach, and the almonds their pulpy covering; the kernel and the ſtone being voided whole: it is of the ſize of a common hen, but has a longer neck; its belly is black, and its back of a greyiſh brown; the neck and head are of a rediſh colour; the head is ſmall, and has a blackneſs about the eyes, which have a grey pupil, and a whitiſh iris.

CAGASTRUM is uſed by Paracelſus to denote a morbific ſemen, not connate or hereditary, but acceſſional, owing to corruption.

In which ſenſe the word ſtands oppoſed to *iliaſtrum*. The pleuriſy, plague, fever, &c. are ranked by that author in the number of *cagaſtric* diſeaſes. *Caſt.* Lex. Med. p. 121.

CAGE, an incloſure made with wire, wicker, or other matter interwoven latticewiſe, for the detention of wild beaſts or birds.

The word is French, *cage*, formed from the Italian *gaggia*, of the Latin *cavea*, which ſignifies the ſame: *a caveis theatralibus in quibus includebantur feræ*. Vid. *Menag.* Orig. Franc. p. 145. *Skin.* Etym. Angl. in voc.

Beaſts were uſually brought to Rome ſhut up in oaken or beechen *cages*, artfully formed, and covered or ſhaded with boughs, that the creatures deceived with the appearance of a wood, might fancy themſelves in their foreſt. The fiercer ſort were pent in iron *cages*, leſt wooden priſons ſhould be broke through. *Claud.* in Conſ. Stilich. ap. *Pitiſc.* Lex. Ant. T. 1. p. 384.

In ſome priſons there are iron *cages* for the cloſer confinement of criminals; as in the caſtle of Amboiſe. Philip de Comines was claped up eight months in a *cage* of iron, wherein he had not room to ſtir [c]. Tamerlane is ſaid to have confined Bajazet in an iron *cage*. The tradition adds, that this latter unable to brook the infamy, knocked out his brains againſt the bars of his *cage* [d].—[c *Varill.* Hiſt. Charl. 8. Ouvr. des Scav. 1691. p. 334. d Trev. Dict. Univ. T. 1. p. 1329.]

The French laws diſtinguiſh two ſorts of bird-*cages*, *viz.* high, or ſinging-*cages*, and low or dumb-*cages*; thoſe who expoſe birds to ſale are obliged to put the hens in the latter, and the cocks in the former, that perſons may not be impoſed on, by buying a hen for a cock. *Savar.* Dict. Comm. Suppl. p. 106.

CAGES, *caveæ*, denote alſo places in the antient amphitheatres, wherein wild beaſts were kept, ready to be let out for ſport. The *caveæ* were a ſort of iron *cages* different from dens, which were under ground and dark; whereas the *caveæ* being airy and light, the beaſts ruſhed out of them with more alacrity and fierceneſs than if they had been pent under ground. *Pitiſc.* Lex. Ant. T. 1. p. 384.

CAGE, in carpentry, ſignifies an outer work of timber, encloſing another within it.

In this ſenſe we ſay, the *cage* of a windmill. *Savar.* Dict. Com. T. 1. p. 518.

The *cage* of a ſtair-caſe denotes the wooden ſides, or walls which encloſe it.

CAGGAW, in botany, a name given, by the people of Guinea, to a plant which they boil in water, and uſe the decoction to waſh the mouth with, as a cure for the toothach. The leaves of this are ſmooth and ſhining, like thoſe of the laurel, but they are thin and bend like thoſe of the bay. They are four or five inches long, and a little more than two inches wide; they are rounded at the baſe, and pointed at the tip, and they are placed on foot ſtalks of half an inch long, which are black at each end, and green in the middle; its veins are very conſpicuous on the leaves, and are on both ſides divided, and ramify'd into fibres of a great fineneſs. Phil. Tranſ. N° 232.

CAGIT, in natural hiſtory, a name given by the people of the Philippine iſland, to a ſpecies of parrot, very common in their woods: it is of a middling ſize, and is all over of a fine green colour.

CAGUI, in zoology, the name of a kind of Braſilian monkey, called alſo *pougi*, of which there are two ſpecies, the one larger, the other ſmaller. The large kind is of a grey colour, with a mixture of black, and its hairs are longer than thoſe of the ſmall ſpecies, its face is round, and it has ſomething of the look of a lion; its ears are ſmall, round, black, and naked; its eyes are alſo black, as is its mouth, and its forehead is covered with a mixture of grey and black hairs; its tail is above a foot long, and is covered with hairs of a tawney colour. *Rays* Syn. Quad. p. 154.

The leſſer *cagui* is a ſmall and tender animal, but has the ſame lion-like face with the larger. Its body is not above ſix fingers breadth long; its tail about ten fingers; its head is ſmall, ſcarce ſo large as a ſmall apple; its noſe is ſmall and elate; its eyes very tender, its mouth little, and its teeth extremely ſharp; its ears are round, and ſurrounded with white hairs in a very beautiful order; its hair is all of a rediſh tawney toward the body, and toward the ends of a mixture of white and brown, and its tail is variegated with circular rings of white and brown; its voice is extremely ſhrill; it is naturally an extremely lively and nimble creature, but cannot bear the leaſt cold.

CAHLLO, in ichthyology, a name given by ſome authors to the fiſh uſually called the *lupus marinus*, or wolf fiſh. It is properly a ſpecies of pearch, and is diſtinguiſhed by Artedi under the name of the pearch with thirteen rays in the ſecond fin of the back, and fourteen in the primary. See PERCA.

CAIA, in the Turkiſh military orders, an officer ſerving in the poſt of a deputy or ſteward, and acting for the body of the Janizaries. *Pocock*'s Egypt, p. 168.

CAIANI, in eccleſiaſtical antiquity, a ſort of heretics thus denominated from one Caianus of Alexandria, their leader, otherwiſe denominated *Aphthardocitæ*. See APHTHARDOCITÆ, *Cycl.*

The ſame name is ſometimes alſo given to the ſect of Cainians or Cainites. *Damaſcen.* Hær. 84. *Fabric.* Cod. Pſeud. vet. Teſt.

Teſt. T. 1. p. 138. *Suic.* Theſ. Eccleſ. T. 2. p. 17. See CAINITES, *Cycl.*

CAIC, *Caique*, *Caica*, in the ſea language, is uſed to denote the ſkiff, or ſloop belonging to a galley.

The Coſſacs give the ſame name *caic* to a ſmall kind of bark uſed in the navigation of the black ſea. It is equipt with 40 or 50 men, all ſoldiers: Their employment is a kind of piracy [a]. The Turks have alſo a ſort of *caics*, which ſome render by biremes [b]. — [a *Aubin.* Dict. Mar. p. 142. b *Du Cange*, Gloſſ. Græc. p. 540. voc. Καικ.]

CAJEPUT, an oil brought from the Eaſt-Indies. The ſmell of the oil of *cajeput* reſembles that of cardamoms; hence Dr. Trew judges the plant from which it is obtained to be the *elegans melegettæ ſpecies*, deſcribed by Sobelius, or the *granis paradyſi ſive me'igittæ affinis fructus.* C. B. pin. *Commerc. Norimb.* 1737. *Hebd.* 17. §. 2.

Four or five drops of this oil of *cajeput*, in a proper liquor, is recommended as an excellent nervous medicine, and as of great efficacy in the cardialgia. *Com. Norimb.* 1732. *Hebd.* 2. 1737. *Hebd.* 24. and 1734. *Hebd.* 5.

CAINS, in the iſland of Candia, denote Greeks revolted, and retired to the Venetians, either at Suda, or Spina longa; who in time of war, burn, pillage, and commit all manner of cruelties on their antient brethren under the Turks.

When a *cain* or falſe brother is taken, there is no mercy for him, they either impale him, or put him to the ganche. *Tourneſ.* Voyag. du Levant. T. 1. Lett. 2. p. 36.

CAJOU, *caſhew*, or *caſſu*, an American fruit, ſhaped like a pear, having the large end next the ſtalk, and at the ſmall end a nut, in ſhape and ſize reſembling a hare's kidney, which is the ſeed of the plant.

The *cajou* is the fruit of the acajou, a tree frequent in Jamaica and the Carribee iſlands. The nut or ſeed, called in Engliſh the *caſhew-nut*, and ſometimes the apple-bean, bears a near affinity in figure as well as virtues, to the anacardium, or Malacca bean, of which ſome make it a ſpecies, under the denomination of *anacardium occidentale*. See ACAJOU and ANACARDIUM.

Cluſius deſcribes the *cajou* as reſembling a gooſe egg, both for ſize and figure, of a yellow colour, and ſweet; full of a liquor like that of a citron: both the fruit and nut are eaten in Jamaica with great pleaſure; as the former grows bigger, the nut diminiſhes. Between the rind and ſhell of the latter is a ſpongy ſubſtance full of a cauſtic oil, uſed againſt tetters, but which muſt be diſcharged by roaſting the nut in embers, ere the kernel is eaten. The thin aſh-coloured ſkin wherewith the kernel is covered, is uſed as an exciter of venery. *Bradl.* Dict. Bot. *Mill.* Gard. Dict. in voc. *Ajacou. Quinc.* Pharmac. P. 2. ſect. 1. n. 27. p. 75.

CAIRINA, in zoology, a name by which ſome authors have called the Muſcovy duck.

CAISSON, in the military art, is ſometimes uſed for a cheſt; and in particular for a bomb-cheſt. See BOMB-CHEST, *Cycl.*

The *caiſſon* is conſidered as a ſuperficial mine, or tourneau. See MINE, *Cycl.*

CAISSON is alſo a covered waggon to carry bread, or ammunition. Milit. Dict. in voc.

CAISSON is alſo uſed for a kind of cheſt uſed in laying the foundations of the piers of bridges. See BRIDGE and CHEST-WORK.

CAITAIA, in zoology, the name of an American monkey, remarkable for its ſweet ſmell; it has indeed ſomewhat of a ſcent of muſk about it; its hair is long and of a whitiſh yellow colour; its head is round; its forehead depreſſed, and very ſmall; its noſe ſmall and flatted, and its tail arch'd. It is eaſily tamed and kept about houſes, but it is very clamorous and quarrelſome. *Ray*'s Syn. Quad. p. 158.

CAKE, a finer ſort of bread, denominated from its flat, round figure. See BREAD.

We meet with divers compoſitions under the name of *cakes*; as *ſeed-cakes*, made of flower, butter, cream, ſugar, coriander and caraway ſeeds, mace, and other ſpices and perfumes baked in the oven; *plumb-cake*, made much after the ſame manner, only with fewer ſeeds, and the addition of currants; *pan-cakes*, made of a mixture of flower, eggs, &c. fried; *cheeſe-cakes*, made of cream, eggs and flower, with, or without cheeſe-curd, butter, almonds, &c. [a]; *oat-cakes*, made of fine oaten-flower, mixed with yeſt, rolled thin, and laid on an iron or ſtone to bake over a ſlow fire [b]; *ſugar-cakes*, made of fine ſugar beaten and ſearced with the fineſt flower, adding butter, roſe-water, and ſpices [c]; *roſe-cakes*, *placentæ roſaceæ*, are leaves of roſes dryed and preſſed into a maſs, ſold in the ſhops for epithems [d] —[a *Hought.* Collect. T. 1. N° 91, ſeq. p. 245, ſeq. b Dict. Ruſt. T. 2. in voc. *Oat.* c Id. ibid. in voc. *Sugar.* d Vid. *Morl.* Collect. Chym. Leid. c. 363. *Caſt.* Lex. Med. p. 592.] See EPITHEM, *Cycl.*

CAKE-*wax*, a denomination ſometimes given to the white or virgin wax. *Savar.* Dict. Com. Supp. p. 1049. voc. *Pain.* See WAX, *Cycl.* and *Suppl.*

CAKE-*ſoap*, ſtands diſtinguiſhed from ſoft-ſoap, and ball-ſoap *Stat.* Abr. T. 1. voc. *Cuſtoms*, p. 82. See SOAP, *Cycl.* and *Suppl.*

CALABA, in botany, the name given by Plumier to a genus of plants afterwards called by Linnæus *caryophyllum.* *Plumier*, Gen. 8. See CARYOPHYLLUM.

CALABASH, in commerce, a light kind of veſſel made of the ſhell of a gourd, emptied and dried, ſerving for a caſe to put divers kinds of goods in, as pitch, roſin, and the like.

The word is Spaniſh, *calabaça*, which ſignifies the ſame.

The Indians alſo, both of the north and ſouth ſea, put the pearls they have fiſhed in *calabaſhes*, and the Negroes on the coaſt of Africa do the ſame by their gold duſt.

The ſmaller *calabaſhes* are alſo frequently uſed by theſe people as a meaſure, by which they ſell theſe precious commodities to the Europeans.

The ſame veſſels likewiſe ſerve for putting in liquors, and do the office of cups as well as of bottles for ſoldiers, pilgrims, &c. Def. Scots Settl. at Darien, p. 65. *Savar.* Dict. Com. T. 1. p 525.

CALABRINA, in botany, a name by which ſome authors call the rough ſpleenwort or *lonchitis aſpera.* *Ger.* Emac. Ind.

CALADE, in the manege, a deſcent, or ſlope in a riding ground, by which to bring a horſe to bend his haunches, and form his ſtop, with the aids of the calves of the legs, bridle, and caveſon, ſeaſonably given.

The *calade* is alſo called by the French, *baſſe.* They ſay to ride or gallop down the *calade.* *Guill.* Gent. Dict. P. 1. in voc.

CALAE, CALAEM, or CALAEMUM, denotes a ſpecies of Indian tin, which by force of fire is tranſmutable into ceruſs, like that made of our lead.

Alchemiſts alſo pretend, that it may be converted by cementation into ſilver, and alledge it as an argument in behalf of a poſſibility of tranſmutation of other metals into gold. *Caſt.* Lex. Med. p. 121.

CALAINUS, in natural hiſtory, a name given to the ſubſtance otherwiſe called *callimus.* See CALLIMUS.

CALAMBA, or CALAMBAC, in commerce, a kind of wood brought from China, uſually ſold under the denomination of *lignum aloes*, or *agallochum.* See ALOES, and AGALLOCHUM.

Sir Phil. Vernatti makes *calambac*, and *lignum aloes*, ſynonymous [a]. Others ſeem to diſtinguiſh, reſtraining *calamba* wood to the beſt ſort of aloes-wood, growing chiefly in Malacca, and Sumatra; and much uſed in India for making of beads and crucifixes [b]. — [a Phil. Tranſ. N° 43. p. 863. b *Linſch.* Voyag. l. 1. c. 76. *Grew*, Muſ. Reg. Societ. P. 2. Sect. 1. c. 1. p. 180. *Salmaſ.* Exerc. ad Solin. p. 1057.]

CALAMIFEROUS, a denomination given by ſome to thoſe otherwiſe called *culmiferous* plants. *Moriſ.* Hiſt. Plant. P. 3. Sect. 8. Works of Learn. T. 2. p. 509. See CULMIFEROUS, *Cycl.*

CALAMINARIS *Lapis*, (*Cycl.*) in natural hiſtory, the name of a mineral ſubſtance, which is properly the ore of zink. It is a ſpungy ſubſtance, of a lax and cavernous ſtructure, yet conſiderably heavy. It is found in maſſes of various and irregular figures, with rugged protuberant and cavernous ſurfaces; theſe are of all ſizes, from an ounce to ten or twelve pound weight, and often much more than that.

Calamine, when pure, is of a pale browniſh grey colour, but its lax and ſpungy ſtructure makes it liable to receive various admixtures of extraneous matters, earths, &c. and hence it is often found yellowiſh or rediſh. *Lapis calaminaris* is much uſed externally in cerates for burns, and in collyriums for the eyes: its reguline matter, which is zink, ſerves much better for the purpoſe of turning copper into braſs than the crude ſtone or ore. *Hill*'s Hiſt. of Foſ. p. 62.

Dr. Lawſon was the firſt who publickly proved *calamine* to be the ore of zink. See ZINK.

Calamine ſtone is a ſpecies of foſſil cadmia; ſome even take it for the true cadmia of Galen and the antients, to which it is certain it bears a near reſemblance: when burnt, its fume gathers and grows on the ſides of the chimney. *Mercat.* Metalloth. Arm. 7. c. 3. p. 146. See CADMIA, *Cycl.* and *Suppl.*

It lies in maſſes in perpendicular fiſſures from near the day to ten fathom deep, among clay, coarſe ſpar, and riders of ſtone: as to appearance it bears a near reſemblance to many of the ſorts of lead ores in the north. At Shipham in Somerſetſhire, the *calamine* has frequently ſparks of lead concreted with it; they have ſometimes even found conſiderable quantities of lead at the bottom of their *calamine* veins, and might probably find it in the reſt, if they ſought for it. *Woodw.* Nat. Hiſt. Eng. Foſſ. T. 1. p. 19. Item, p. 106. Item, T. 1. p. 184.

There are no certain ſigns to direct the miners where to find this mineral ſubſtance, only they expect none in grounds that have no communication with hills. In the *calamine*-works they uſe the ſame way and inſtruments as they do in the lead-mines. When they have landed a good quantity of it, which is done by winding it up in buckets from their works, they next carry it away to places where they waſh, clean, or buddle it, as their term is; which is performed in this manner: A ſmall piece of ground is incloſed with boards or turfs, through which a clear ſtream of water runs; within this incloſure they ſhovel their *calamine* with the reſt of the impure and earthy parts, which laſt are waſhed away with the running water, leaving the lead (ſome of which is always found in theſe works) *calamine* and heavier ſtony or ſparry parts be-

hind. When they have thus waſhed it as clean as they can, by turning and ſtirring it often in the running ſtream, they remove the bigger parts both of the lead and *calamine* and put the ſmaller parts, that none of their ore may be loſt, into ſieves with bottoms made of ſtrong wire; this they dip and ſhake up and down in a great tub of water, by which ſhaking of the ſieves, the parts of lead, being heavieſt, ſink or pitch down to the bottom, the parts of the *calamine* in the middle, and the other parts riſe to the top; which laſt being ſkim'd off and thrown away, they then take off the *calamine*, and after that the lead. The *calamine* is next ſpread on a board in order to pick out with the hand what traſh there ſtill remains among it.

When the *calamine* is ſufficiently prepared by waſhing and picking, they carry it to the oven, which reſembles that of a baker's in form, but is much bigger, and has a hearth on one ſide which is ſeparated from the reſt by a hem or partition made open at the top, whereby the flame paſſes over and bakes the *calamine*. They let it lie in the oven for four or five hours, during which time they turn it ſeveral times with long iron rakes; when it is ſufficiently burnt, baked and dried, they beat it to a powder with long iron hammers like mallets, upon a thick plank, picking out what ſtones they find amongſt it; ſo that at laſt the *calamine* is reduced to duſt to be uſed in diſtemperatures of the eyes. Vid. Phil. Tranſ. N° 198.

Glauber holds it of an aluminous, others of a ferruginous nature. It is aſtringent and deterſive, abſorbs acids and humidities, and thence becomes of uſe in the cure of ulcers, and takes off films from the eyes of horſes: ignited and extinguiſhed in ophthalmic waters, it is applauded as a collyrium [a]. Crato's great arcanum for the eyes was the ſtone ground fine and mixed up with the marrow of calves ſhanks, or May butter [b]. Paracelſus alſo gave the *lapis calaminaris* internally [c]. —[[a] *Libav.* Alchym. Pharm. c. 10. [b] *River.* Prax. Med. l. 2. c. 8. p. 162. [c] *Caſt.* Lex. Med. p. 121. *Boyle*, Phil. Works, Abr. T. 2. p. 327. *Vat.* Phyſ. Exper. p. 449, ſeq. *Grew*, Diſc. of Mixt. l. 2. c. 2. §. 9.]

Some of the modern writers have been fond of deriving the word *calamine*, from the Indian *calaem*, which with the people of that nation is the name of the zink, or *tutenag*; and had the great alliance which there really is between the *calamine* and zink been known at the time when this name was given, it would ſeem a probable opinion enough; but as it is certain, that this is but a very modern diſcovery, and there is not the leaſt reſemblance in appearance between theſe two ſubſtances; it is not probable that the one ſhould have been named from the other. The word *calamine* is much more naturally deduced from the general origin of theſe ſort of modern names in the materia medica, that is, the Arabic. Aviſenna, Serapio and the other Arabian phyſicians call this ſubſtance *climia*, and ſometimes this word is written *calimia*. The modern Greeks write it *celimia*, and the word *calamia* is ſo very little different from this, that there need be no farther ſearch after its origin or etymology.

CALAMINT, *Calamintha*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the labiated kind; the upper lip is roundiſh, erect and bifid; the lower is divided into three ſegments. The piſtil ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower, and is ſurrounded by four embryos, which afterwards become ſo many roundiſh ſeeds to which the cup of the flower ſerves as a capſule. To theſe marks it may be added, that the flowers of all the *calamints* grow in the alæ of the leaves, and ſtand on ramoſe pedicles.

The ſpecies of *calamint* enumerated by Mr. Tournefort, are theſe: 1. The common *calamint*, or mountain-*calamint*, with a large flower. 2. The large flowered taller *calamint*. 3. The *calamint*, with the ſmell of penny-royal. 4. The very tall mountain-*calamint*, with the ſmell of penny-royal, with dentated leaves and pale blue flowers on long and branched pedicles. 5. The great leaved and large flowered *calamint*. 6. The white large flowered large leaved *calamint*. 7. The ſmall flowered *calamint*. 8. The low round-leaved *calamint*, commonly known under the name of *ground-ivy*. 9. The purple-flowered *ground-ivy*. 10. The ſmaller elegant roundiſh-leaved *ground-ivy*. 11. The hoary baſil-leaved *calamint*. 12. The ſhrubby *calamint*, with the leaves, appearance, and ſmell of winter-ſavory. 13. The marum-leaved ſhrubby Spaniſh *calamint*. 14. The long and narrow-leaved cretic *calamint*. 15. The annual thyme-leaved *calamint*. *Tourn.* Inſt. p. 73.

CALAMINT is an officinal plant, whoſe leaves ared reputed warm, aperient, and diaphoretic, and enter ſeveral alexipharmic compoſitions.

There are three ſorts of *calamint* in uſe, *viz.* the *ſylveſtris*; the *vulgaris*, or *montana*; and *paluſtris*, or *aquatica*; of which the firſt ought to be the officinal ſort, tho' the ſcarcity of it among us uſually brings the ſecond to market in its ſtead; the third is taken into the college diſpenſatory, but rarely uſed. In the college diſpenſatory, we find a compound powder denominated from *calamint*. Pharmac. Coll. Med. Lond. p. 119. *Quinc.* Pharmac. P. 2. ſect. 6. n. 416. *Gorr.* Med. Defin. p. 205. voc. Καλαμινθα. *Ray*, Synopſ. Stirp. Brit. p. 131. *Junck.* Conſp. Therap. p. 313.

CALAMISTRUM, in natural hiſtory, a name by which Linnæus and ſome authors have called a ſmall plant, known among us by the name of *pepper-graſs*, from its having graſſy leaves, and round globules at their inſertions reſembling pepper-corns. Mr. Vaillant has more properly nam'd it *pilularia*. *Linnæi* Gen. Plant. See PILULARIA.

CALAMITA, or CALAMITIS, (*Cycl.*) is uſed to denote the magnet or loadſtone. Trev. Dict. Univ. T. 1. p. 1339. *Menag.* Orig. Fr. p. 149. See MAGNET, *Cycl.* and *Suppl.*

CALAMITIS is alſo uſed for a ſpecies of artificial *cadmia*, found adhering to the ſticks, ladles, and other utenſils wherewith they ſtir the copper when in fuſion in the furnace.

It is denominated *calamitis*, from the Latin *calamus*, a reed, on account of its reſemblance to the figure of a reed cloven in the middle. *Schrod.* Pharm. l. 3. c. 19. *Caſt.* Lex. Med. p. 121. *Savar.* Dict. Comm. T. 1. p. 525.

Agricola alſo gives the denomination *calamites* to a kind of ſtone-plant growing in the ſea, bearing ſome reſemblance to the figure of a reed. *Agric.* Foſſil, l. 4. in fin. *Caſt.* Lex. Med. p. 121.

CALAMITA *Alba*, in natural hiſtory, the name of an earth dug in Spain and Italy, of a hard texture, a white colour, and ſtyptic taſte; they pretend that this attracts fleſh in the ſame manner as the magnet does iron, and thence call it *magnes carneus*. See the article MAGNES *Carneus*.

CALAMITA *Styrax*. See STYRAX.

CALAMITES, in natural hiſtory, a name given by ſome to the oſteocolla, which when in ſmall pieces, ſometimes pretty exactly reſembles the barrel of a quill; others have called ſome of the foſſile *coralloides* by this name, there being frequently in them the reſemblance of ſeveral quills cemented together in ſtone.

CALAMUS, Καλαμος, in phyſiology, the ſame with *arundo*, a reed, ruſh, cane, or flag. *Plin.* Hiſt. Nat. l. 16. c. 35. *Gorr.* Med. Defin. p. 205. voc. Καλαμος.

CALAMUS *aromaticus*, in the materia medica, a drug very erroneouſly confounded with the acorus by moſt writers, and uſually called by the ſame name as a ſynonym. The acorus-root, which is too often improperly called by the name of this drug, is well known to be a root; whereas this is the ſtalk of a ſmall reed: the true *calamus aromaticus* is of the thickneſs of a gooſe quill, full of joints, and three or four foot high. It ſhould be choſen large, freſh, clean, without leaves or roots among it; of a browniſh red without, and white and full of a ſpungy pith within. This pith alſo ſhould be of a fair white, for when the drug is old it always becomes yellow, and falls into duſt as if the worms had eaten it; it ought eaſily to break into ſmall ſplinters, and to be of a very bitter taſte, and very agreeable ſmell. *Pomet's* Hiſt. of Drugs, p. 62.

It is the ſtalk of an arundinaceous plant, common in Egypt, and called by Proſper Alpinus, *coſſabell darrira*. It is an ingredient in the Venice treacle, and is ſaid to be good againſt diſeaſes of the head and nerves.

CALAMUS *indicus petrefactus*, in the natural hiſtory of the antients, a name given to a ſubſtance found often in the foſſile world, uſually of about three inches long, half an inch broad, and one third of an inch thick, and covered all over its ſurface with large round figures, in form of radiated ſtars within. This very much reſembled in external appearance the root of our common *calamus* aromaticus of the ſhops turn'd into ſtone, and ſeems to have been vulgarly ſuppoſed to be that ſubſtance petrified. The more accurate among the earlier writers however have by no means countenanced ſo wild a conjecture, and Theophraſtus though he records the ſubſtance under that name, as it had no other in his time, yet joins it to the corals which, he ſays, grow in the ſea, and are vegetables, and adds, that thoſe, and this ſubſtance, are properly the ſubjects of another treatiſe, not of a hiſtory of ſtones. See Tab. of Foſſils, Claſs 7.

This author's placing it among the corals is perfectly right, ſince the ſpecimens of it now found are plainly no other than corals of the ſtellated kinds, which have been long buried in the earth. *Hill's* Theophr. p. 99.

CALAMUS *odoratus*, in the materia medica, the name of a reed of the Eaſt Indies of a very ſweet ſmell. Our *calamus* aromaticus which is the root of a water plant is a very different ſubſtance. *Camell.* Syllab. p. 22. See CALAMUS *aromaticus*, Supr.

CALAMUS *ſcriptorius*, properly denotes a reed, or ruſh to write with, anſwering the uſe of the antient ſtylus and modern pen. *Montfauc.* Palæogr. Gr. l. 1. c. 3. p. 21. *Pitiſc.* Lex. Ant. T. 1. p. 318, ſeq.

The antient Ægyptian *calamus* was a ſort of *arundo aquatica* growing plentifully about Memphis, and on the banks of the Nile; whence it was alſo called *calamus Memphiticus*, *Niloticus*, &c.

CALAMUS, in the antient poets, denotes a ſimple kind of pipe, or fiſtula, the muſical inſtrument of the ſhepherds and herdſmen; uſually made either of an oaten ſtalk, or a reed. *Salmaſ.* Exerc. ad Solin. p. 117. *Pitiſc.* Lex. Ant. T. 1. p. 318. *Heder.* Schul. Lex. p. 636.

CALAMUS *aucupatorius*, or *calamus ſtructus*, among fowlers, a bird-call. *Salmaſ.* ub. ſup. p. 118, et 1087. *Pitiſc.* Lex. Ant. T. 1. p. 318. See CALL, *Cycl.* and *Suppl.*

CALAMUS alſo denotes a ſort of meaſure otherwiſe called *canna*, or reed. *Beverin.* Synt. de ponder. p. 178, 224, & 262. *Montfauc.* Palæogr. Gr. p. 365. *Pitiſc.* Lex. ub. ſup. See CANNA.

CALANDRE, in natural hiſtory, a name given by the French writers to an inſect that does vaſt miſchief in granaries. It is properly of the ſcarab claſs; it has two antennæ, or horns, formed of a great number of round joints, and covered with a ſoft and ſhort down; from the anterior part of the head there is thruſt out a trunk, which is ſo formed at the end, that the creature eaſily makes way with it through the coat or ſkin that covers the grain, and gets at the meal or farina, on which it feeds; the inſide of the grains is alſo the place where the female depoſits her eggs, that the young progeny may be born with proviſion about them. When the female has pierced a grain of corn for this purpoſe, ſhe depoſits in it one egg, or at the utmoſt two, but ſhe moſt frequently lays them ſingle; theſe eggs hatch into ſmall worms which are uſually found with their bodies rolled up in a ſpiral form, and after eating till they arrive at their full growth, they are changed into chryſalis, and from theſe, in about a fortnight, comes out the perfect *calandre*. The female lays a conſiderable number of eggs, and the encreaſe of theſe creatures would be very great, but nature has ſo ordered it, that while in the egg ſtate, and even while in that of the worm, they are ſubject to be eaten by mites; theſe little vermin are always very plentiful in granaries, and they deſtroy the far greater number of theſe larger animals. *Deſlandes* Trai. de Phyſ.

CALANGAY, in natural hiſtory, a name given by the people of the Philippine iſlands to a ſpecies of Parrot very common there; it is all over white, and has a creſt of white feathers on its head; it is of the ſize of a pigeon, and is eaſily kept tame, and learnt to talk. It is called alſo in ſome of the Philippines *catatua* and *abacay*.

CALASH, or CALESH, a ſmall light kind of chariot, or chair, with very low wheels, uſed chiefly for taking the air in parks and gardens.

The word is French *caleche*, which Menage derives from the latin *carrus*, *carri*, *carriſcus*, *carriſca*, *carreſca*, *caleſca*, *caleche*. *Menag.* Orig. p. 150. voc. *caleche*.

The *calaſh* is for the moſt part richly decorated, and open on all ſides, for the conveniency of the air, and proſpect; or at moſt incloſed with light mantlets of wax cloth, to be opened and ſhut at pleaſure. *Savar.* Dict. Com. T. 1. p. 577. voc. *carroſſe*.

In the Philoſophical Tranſactions, we have a deſcription of a new ſort of *calaſh*, going on two wheels, not hung on traces, yet eaſier than the common coaches, over which it has this further advantage, that whereas a common coach will overturn if one wheel go on a ſurface a foot and half higher than that of the other, this will admit of a difference of $3\frac{1}{3}$ of a foot, without danger of overturning. Add, that it would turn over and over, that is, after being turned ſo as that the ſpokes are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed in *ſtatu quo*, without any diſorder to the horſe, or rider. Phil. Tranſ. N° 172. p. 1028.

CALASIRIS, or CALASSIS, in antiquity, a linnen tunic worn by the Phœnician, Ægyptian, Roman and other Prieſts.

We alſo find mention of the *calaſiris* as worn by the ſoldiers, and by women. In which laſt ſenſe it ſeems to have been a knot in the womens gown, whereby it was drawn about the neck. *Feſt.* in voc. *calaſſis*. *Voſſ.* Etym. p. 91. *Ferrar* de re veſt. c. 23. *Pitiſc.* Lex. Ant. T. 1. p. 319.

CALATHIANA *viola*, in botany, a name given by many writers to a ſpecies of gentian, called alſo by others *pheumonantne*. See GENTIANA.

CALATHUS, καλαθος, in antiquity, a kind of hand-baſket made of light wood, or ruſhes; uſed by the women ſometimes to gather flowers, but chiefly, after the example of Minerva, to put their work in. *Pitiſc.* Lex. Ant. T. 1. p. 319.

The figure of the *calathus*, as repreſented on antient monuments, is narrow at the bottom, and widening upwards, like that of a top. Pliny compares it to that of a lilly. *Plin.* Hiſt. Nat. l. 21. c. 5. *Fab.* Theſ. p. 411. ſeq.

The *calathus* or work-baſket of Minerva, is no leſs celebrated among the poets, than her diſtaff. Hiſt. Acad. Inſcr. T. 3. p. 400.

CALATHUS is alſo uſed to denote a drinking cup [a]. Pliny ſeems likewiſe to uſe it for the calyx of a flower [b].—[[a] *Fab.* Theſ. p. 412. [b] *Plin.* Hiſt. Nat. l. 25. c. 7.] See CALYX.

CALATOR, in antiquity, a cryer, or officer appointed to publiſh ſomething aloud, or call the people together.

The word is formed from the Greek καλεω, *voco*, I call. Such miniſters the pontifices had, whom they uſed to ſend before them when they went to ſacrifice on feriæ or holydays, to advertiſe the people to leave off work. *Serv.* ad Geor. l. 1. v. 268.

The magiſtrates alſo uſed *calatores*, to call the people to the comitia, both curiata and centuriata. The officers in the army alſo had *calatores*, as had likewiſe many private families, to invite their gueſts to entertainments. *Pitiſc.* Lex. Ant. T. 1. p. 320. See COMITIA, *Cycl.* and *Suppl.*

CALAUDRA, in zoology, the name of a bird of the lark kind, and of the ſhape of the common lark, but conſiderably larger; its head is large and thick, its beak ſhorter, and ſtronger than in the common larks, but its feet made exactly as theirs. Its breaſt is of a ſhining grey, ſpotted with black, like the breaſt of a thruſh; its back, tail, and wings are of an umbre colour, or ſomewhat greeniſh brown, and it has a ring of black feathers round its neck. This bird is either the ſame with the common Engliſh bunting called by authors emberiza alba, or very like it. *Geſner* de Avib.

CALAURITIS, in the materia medica of the antients, a name given to a ſort of litharge; we find the litharge made in the ſame operation will be of different colours, according to the degree of heat it receives, and we have accordingly dignify'd it with the founding names of litharge of gold, and litharge of ſilver; the Greeks went yet farther, and added to theſe a third kind which they called litharge of lead or molybditis. All theſe ſorts of litharge were brought in great abundance from Calauros, a ſmall iſland near Crete, to the Greeks, for their uſe in medicine. The fires here not being ſo ſtrong however as in ſome other places, where furnaces were worked, there was leſs of the yellow litharge brought from this place than of the others. This therefore kept its uſual name of chryſites among them, but the other two were indifferently called *calauritis*. It is not eaſy to diſtinguiſh in theſe writers which of the two they mean by this name; but there is ſo little real difference between them that an error is of very little conſequence.

CALCADIS, in the materia medica, a name given by the Arabians to white vitriol, or to ſome white vitriolic mineral. All the account we have of the *calcadis* is in Aviſenna, who in treating of the zagi or alzagiat, which is his general name for all the vitriolic minerals, tells us, that there are four kinds, the colcothar which is yellow, the ſory which is rediſh, the calcanthum which is green, and the *calcadis* which is white.

CALCAGIUM, in middle age writers, a tax or contribution paid by the neighbouring inhabitants towards the making or repairing a common cauſeway. *Kenn.* Gloſs. ad Paroch. Antiq. in voc. *Du Cange*, Gloſs. Lat. T. 1. p. 680.

CALCANTHUM (*Cycl.*)—That ſulphur is contained in vitriol is evident from the ſmell it yields in calcination, and in diſtillation. If it be urged with a ſtrong fire from the beginning; and the ſpirit thus drawn be rectify'd, the liquor which firſt comes over has a highly ſulphureous ſmell. The common oil of vitriol digeſted on antimony, and then diſtilled, yields a much greater quantity of ſulphur than could have been produced if any other acid liquor had been employed; and the ſame oil of vitriol digeſted with ſpirit of vitriol, and diſtiled, yields at the latter end of the diſtillation an oil and a large quantity of ſulphureous flowers. The acid ſaline principle in vitriol, is manifeſt in its ſpirit, or in that ſtronger acid liquor commonly, but improperly, called its oil. Theſe are the principles of vitriol in general; but to theſe ſome add another, which is the ſalt ſeparated from the colcothar, or caput mortuum of vitriol after diſtillation; but this is not different from the ſaline acid matter, which goes off in form of the oil, only that it is more fixed: and it is therefore not to be ſuppoſed an additional principle. Phil. Tranſ. N° 103.

CALCAR, in anatomy, the ſame with *calcaneum*. See CALCANEUM, *Cycl.*

CALCAR, in glaſs-making, is the name of a ſmall oven, or reverberatory furnace, in which the firſt calcination of ſand, and ſalt of potaſhes is made for the turning them into what they call *frit*. *Boerhaave*, Chym. p. 184.

This furnace is made in the faſhion of an oven, ten foot long, ſeven broad in the wideſt part, and two foot deep. On one ſide of it is a trench ſix inches ſquare, the upper part of which is level with the *calcar*, and ſeparated only from it at the mouth, by bricks nine inches wide. Into this trench they put ſea coal, the flame of which is carried into every part of the furnace, and is reverberated from the roof upon the frit, over the ſurface of which, the ſmoak flies very black, and goes out at the mouth of the *calcar*; the coals burn on iron grates, and the aſhes fall through. *Neri*'s Art of Glaſs, p. 240.

CALCARIOUS, ſomething that partakes of the nature and qualities of calx, or lime.

We ſay a *calcarious* earth, *calcarious* ſtone.

Liſter ſpeaks much of a *calcarious* nitre. *Liſter*, de Therm. p. 6 & 24, 38, & 58. See NITRE.

Several authors attribute the heat of thermæ, or hot ſprings, to the admixture of a *calcarious* earth or ſtone with the water. *Giorn.* de Lettr. d'Ital. T. 28. p. 93. Phil. Tranſ. N° 169. p. 924.

CALCARIUS *Lapis*, the ſtone of which lime is made.

The *lapis calcarius* is found unfit for the making of glaſs, by reaſon of the acid ſalt it abounds with. *Helmont*, de Lithias. c. 3. n. 7. *Caſt.* Lex. Med. p. 122.

CALCEARIUM, or CALCIARIUM, in antiquity, a donative, or largeſs beſtowed on the Roman ſoldiers for buying ſhoes. *Pitiſc.* Lex. Ant. T. 1. p. 320. *Aquin.* Lex. Milit. T. 1. p. 149.

In monaſtries, *calcearium* denoted the daily ſervice of cleaning the ſhoes of the religious. *Du Cange*, loc. cit.

CALCEDO-

CALCEDONIANS, a denomination given by copt-writers to the Melchites, on account of their adherence to the council of Calcedon. Mem. des Miſſ. T. 2 p. 12. See MELCHITES, COPHTI, MONOPHYSITES, *&c. Cycl.*

CALCENA, a term uſed by ſome medicinal writers to denote a morbid tartareous humor in the body.

CALCEOLUS, *Ladies-ſlipper*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the polypetalous, anomalous kind, conſiſting of ſix irregular petals, four of which are placed in a ſort of uniform order; and the other two ſtand in the middle; a bifid petal lying upon an undivided turgid one, which is hollow, and emulates, in ſome degree, the figure of a ſlipper or wooden-ſhoe. The cup becomes afterwards a fruit which is pervious, by means of three feneſtræ, each of which has its valve: the ſeeds are ſmall and reſemble duſt. The ſpecies of *calceolus* enumerated by Mr. Tournefort, are theſe: 1. The common *ladies-ſlipper*. 2. The *ladies-ſlipper*, with a larger flower. 3. The canada *ladies-ſlipper*. 4. The yellow flowered *ladies-ſlipper*. See Tab. 1. of botany, Claſs 11. *Tournef.* Inſt. p. 436.

CALCHACCA, in botany, a name by which ſome authors have called the tree whoſe bark is the caſſia lignea, uſed in medicine. *Piſo*, Mant. Arom. p. 165.

CALCHOCHRUM, in botany, a name by which ſome authors call the *fumaria* or *fumitory*. *Ger.* Emac. Ind. 2.

CALCHOPHONOS *Lapis*, among the antients, a name given to a ſtone of a black colour and conſiderable hardneſs, which when cut into thin plates and ſtruck againſt by any other hard body, gave a ſound like that of braſs: it ſeems to have been one of the hard black marbles.

CALLIFRAGA, in botany, a name given by ſome authors to ſamphire. *Ger.* Emac. Ind. 2.

The antients alſo gave the appellation *calcifraga*, to the ſea-fennel, though on a different account, by reaſon of its ſprouting up in the middle of ſtones. *Plin.* Hiſt. Nat. l. 27. c. 9. *Hardou.* Nat. ad loc.

CALCIFRAGUS, *ſtone-breaking*, an appellation given by ſome to the ſcolopendrium; by others to pimpernel, on account of their lithontriptic quality. *Caſt.* Lex. Med. p. 122. *Salmaſ.* Exerc. ad Solin. p. 1295.

CALCINATION, *(Cycl.)* is ſometimes alſo called *incineration*, and *cinefaction*; from which, however, in ſtrictneſs it differs, as a ſpecies from the genus, or as a calx from mere aſhes. *Caſt.* Lex. Med. p. 423.

Calcining differs from mere burning, as the latter leaves the bodies of a black colour, the former of a white one.

If white wine, tartar, or the white chryſtals of ſuch tartar, are burnt without being truely *calcined*, the caput mortuum will be black. But if the *calcination* be continued till the tartar is perfectly reduced to aſhes, and kept long enough in a ſtrong fire, the remaining calx will be white. And ſo we ſee, that not only other vegetable ſubſtances, but even white woods, as the hazel, will yield a black charcoal, and afterwards whitiſh aſhes. Thus alſo animal ſubſtances, naturally white, as bones and egg ſhells, grow black upon being burnt, and white again when perfectly *calcined*. *Boyle* of Colours, Phil. Works abr. T. 2. p 39.

Hence the rule *aduſta nigra*, *peruſta alba*; which yet does not hold ſo univerſally but that Mr. Boyle finds ſeveral exceptions to it. Lead *calcined* by a ſtrong fire turns to minium; which is of a red colour. See MINIUM, *Cycl.* and *Suppl.*

Calcination alſo differs from meer combuſtion, or burning, in that the former requires the preſence and aſſiſtance of the air, whereas the latter may be done without it. Thus a coal kept in a veſſel exactly cloſed, will not be *calcined* tho' kept ever ſo long in a ſtrong fire; but when taken out into the open air, readily falls to pure white aſhes without the help of any new *calcination*. *Boyle*, Scept. Chym. ap. Phil. Works abr. T. 3. p. 270.

By *calcination*, the parts of bodies are not only much broken, but rarified and rendered ſpecifically lighter. Thus the gravity of crude-lead compared to water, is above 11 to one; of *calcined*-lead only as nine to one. And the like holds of other metals, yet in ſome bodies *calcination* ſometimes increaſes the abſolute gravity while it diminiſhes the ſpecific. Thus four ounces of regulus of antimony, by being kept in fuſion an hour and a half, will gain two drams and a half, notwithſtanding all that it has loſt by evaporation: the reaſon of which ſeems difficult to aſſign. The acceſſion of the particles of the fire, which become fixed and retained in the pores of the body, are ſuppoſed by Quincy to be the cauſe both of the increaſe of the abſolute gravity, and the decreaſe of the ſpecific, taking it for granted, that the particles of fire are much lighter than thoſe of the body *calcined* [a]. But this Boerhaave will by no means allow him, who makes fire the moſt ponderous of all the bodies in the univerſe [b]. — [a *Quinc.* Lex. Phyſ. Med. p. 63. b *Boerh.* Elem. Chem. P. 2. T. 1. c. de Igne.]

The native virtues of metals and gems, ſome urge, are not loſt by *calcination*, which is rather a key whereby we are admitted to their intimate nature and powers. Quercetanus even aſſerts, that metalline bodies are not diminiſhed, but rather multiplied by *calcination*; which ſeems ſupported by Mr Boyle, who from a number of experiments concerning the ponderability of fire and flame, draws this concluſion, that in *calcination*, the humid and other volatile particles of metals are not loſt, but only diſſolved; ſince from their calces a true metalline ſubſtance may be again procured. *Caſt.* Lex. Med. p. 122. See METAL, *Cycl.* and *Suppl.*

Potential, *philoſophical* or *chymical* CALCINATION, comprehends amalgamation, precipitation, evaporation, fumigation, and cæmentation. See AMALGAMATION, *&c.*

Detonation by nitre is alſo reduced by Libavius to this ſpecies of *calcination*. See DETONATION, *Cycl.*

CALCINATION *by dry corroſion*, is that effected without moiſture, by the application of dry corroſive ſalts; to which head belongs cæmentation.

CALCINATION *by vaporous corroſion*, is when metalline bodies being reduced to thin plates, are expoſed to the action of an acrimonious fume or vapour.

There are divers ways of performing this; ſometimes the plates are ſuſpended over aqua fortis; ſometimes over vinegar, or the recrements of preſſed grapes; ſometimes, eſpecially the nobler metals, over melted lead or quick ſilver, *&c.* *Rul.* Lex. Alch. p. 126.

Humid CALCINATION is either by vapour, or immerſion. Iron is calcined to a ſubtile crocus, by a vaporous corroſion over ſtrong aqua fortis. Lead is calcined to ceruſe over vinegar, copper over the recrements of grapes.

Humid CALCINATION by immerſion, is when the body is dipt into the corroſive fluid, and is either performed by amalgamation or præcipitation.

Reverberatory CALCINATION, properly denotes the ſolution or reduction of a body into a calx or impalpable powder; ſometimes alſo denominated *alcohol*. See ALCOHOL, *Cycl.* and *Suppl.*

CALCINATUM, a calx or body which has undergone calcination. See CALX and CALCINATION.

CALCINATUM *majus* is uſed by alchemiſts for any thing rendered ſweet by chemical art, which of its own nature was not ſo; as *mercurius dulcis*, or *ſaccharum ſaturni*.

CALCINATUM *minus* denotes a thing which is naturally ſweet, as ſugar, manna, *&c.* *Rul.* Lex. Alch. p. 127. *Caſt.* Lex. Med. p. 121.

CALCIS *Os.* See Os *Calcis*.

CALCULARII, in antiquity, a ſort of juglers who practiſed ſlight of hand. Their art conſiſted in laying ſeveral calculi, or counters on the table, then covering them with cups, and ſhifting and changing them with dexterity, like what is practiſed by our jugglers. *Buleng*, de Theatr. T. 1. p. 40. *Pitiſc.* Lex. Ant. T. 1. p. 324.

CALCULARY *of a pear*, a congeries of little ſtony knots diſperſed through the whole parenchyma of the fruit.

The *calculary* is moſt obſerved in rough taſted or choak pears. The knots lie more continuous and compact together towards the pear, where they ſurround the acetary. See ACETARY. About the ſtalk they ſtand more diſtant, but towards the cork or ſtool of the flower, they ſtill grow cloſer, and there at laſt gather together into the firmneſs of a plumb-ſtone.

The *calculary* is no vital, or eſſential part of the fruit; the ſeveral knots whereof it conſiſts being only ſo many concretions or precipitations out of the ſap, as we ſee in urines, wines, and other liquors. *Grew*, Anat. of Plant. l. 1. c. 6. §. 3. ſeq. p. 41.

CACULATORES, in antiquity, accountants who reckoned their ſums by calculi. There were ſeveral ſervants under this denomination in great families. Children alſo at ſchool were taught to practiſe the ſame. *Pignor.* de Serv. p. 336. *Pitiſc.* Lex. Ant. T. 1. p. 324.

In the antient canons, we find a ſort of diviners, or enchanters, cenſured under the denomination of *calculatores*. *Bingh.* Orig. Eccleſ. l. 16. c. 5. §. 6.

CALCULUS *(Cycl.)* primarily denotes a little ſtone or pebble, antiently uſed in making computations, taking of ſuffrages, playing at tables, and the like.

In after times, pieces of ivory, and counters ſtruck of ſilver, gold, and other matters, were uſed in lieu hereof, but ſtill retaining the antient names. *Pitiſc* Lex. Ant. T. 1. p. 324, ſeq.

Hence the phraſe *ponere calculos*, to denote a ſeries of reaſons, and a multitude of others alluding to the uſe of theſe *calculi* in accounts. Computiſts were by the lawyers called *calculones*, when they were either ſlaves, or newly freed men; thoſe of a better condition were denominated *calculatores*, or *numerarii*: ordinarily there was one of theſe maſters in each family of diſtinction; the title of whoſe office was *a calculis*, or *a rationibus*. Hiſt. Acad. Inſcr. vol. 3. p. 392.

The Roman judges antiently gave their opinions by *calculi*, which were white for abſolution, and black for condemnation. *Calv.* Lex. Jur. p. 135.

Hence *calculus albus*, in antient writers, denotes a favourable vote, either in behalf of a perſon to be abſolved and acquitted of a charge, or elected to ſome dignity or poſt; as *calculus niger* did the contrary.

This uſage is ſaid to have been borrowed from the Thracians, who marked their happy or proſperous days by white, and their unhappy, by black pebbles put each night into an urn. — Hence alſo the phraſes, *ſignare*, *notare aliquid albo*, *nigrove lapillo ſeu calculo*. *Heder. Schul.* Lex. p. 638, ſeq.

Beſides

Beſides the diverſity of colour, there were ſome alſo which had figures or characters painted or graven on them, as thoſe which were in uſe in taking the ſuffrages both in the ſenate and at aſſemblies of the people.

The *calculi* were made of thin wood, poliſhed and covered over with wax of the ſame colour: this we learn from Cicero, *ceratam unicuique tabellam dari cerâ legitimâ*. Their form is ſtill ſeen in ſome medals of the Caſſian family; and the manner of caſting them into the urns, in the medals of the Licinian family. *Cic.* de Divin. c. 7.

The letters marked upon theſe *calculi* were U. R, for *uti rogas*, and A for *antiquo*; the firſt of which expreſſed an approbation of the law, the latter a rejection of it.

Afterwards the judges, who ſat in capital cauſes, uſed *calculi* marked with the letter A, for *abſolvo*, C for *condemno*, and N. L, for *non liquet*; ſignifying a more full information was required. Hiſt. Acad. Inſcr. ubi ſupra.

We may alſo mention another ſpecies of *calculi* uſed at the public games, whereby the rank and order in which the athletæ were to fight was determined. If for inſtance they were twenty, then twenty of theſe pieces were caſt into an urn; each ten were marked with numbers from one to ten, and the law was, that each of thoſe who drew, ſhould fight him who had drawn the ſame number.

Theſe were called *calculi athletici*. *Mahudel.* in Hiſt. Acad. Inſcr. T. 3. p. 394, ſeq.

CALCULUS *Minervæ*, among the antient lawyers, denoted the deciſion of a cauſe, wherein the judges were equally divided. The expreſſion is taken from the hiſtory of Oreſtes, as repreſented by Æſchylus and Euripides; at whoſe trial, before the Areopagites for the murder of his mother, the votes being equally divided for and againſt him, Minerva interpoſed and gave the caſting vote, or *calculus*, in his behalf. *Hofm.* Lex. Univ. Hiſt. T. 3. p. 470. Bibl. Germ. T. 28. p. 161.

M. Cramer, profeſſor at Marpurg, has a diſcourſe expreſs, *de calculo minervæ*; wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cauſe *in ſtatu quo*.

CALCULI *tiburtini*, a ſort of figured ſtones, formed in great plenty about the cataracts of the Anio, and other rivers in Italy; of a white colour, and in ſhape oblong, round, or echinated. They are a ſpecies of the ſtiriæ lapideæ, and generated like them; and ſo like ſugar-plumbs in the whole, that 'tis a common jeſt at Rome to deceive the unexperienced, by ſerving them up at deſerts. *Mercat.* Metalloth. Arm. 9. c. 20. p. 254.

CALCULUS is alſo uſed in antient grammatic writers for a kind of weight equal to two grains of cicer. Some make it equivalent to the ſiliqua, which is equal to three grains of barley. Two *calculi* made the ceratium. *Fab.* Theſ. p. 412.

CALDA, or CALDUM, in the antient diet, denotes hot water, uſed much among the Romans, antiently, as a drink, partly for pleaſure, and partly for health.

The word is form'd for *calidus*, hot; aqua being underſtood; *calda*, q. d. *calida aqua*.

Lipſius, Caſtalio, Mercurialis, Baccius, and Freinſhemius, have treated largely *de potu caldæ*, or *caldi*. Act. Erud. Lipſ. 1721. p. 354, ſeq.

CALDARIA *Judiciaria*, the method of trial, or purgation by boiling water. See PURGATION and ORDEAL, *Cycl.*

CALDARIUM, in the antient baths, denoted a brazen veſſel or ciſtern, placed in the hypocauſtum full of hot water, to be drawn thence into the piſcina or bath, to give it the neceſſary degree of heat. See BATH, *Cycl.* and *Suppl.*

In this ſenſe, the *caldarium* ſtood contradiſtinguiſhed from the *tepidarium* and *frigidarium*. *Vitruv.* de Archit. l. 5. c. 10. Philoſ. Tranſ. N° 306. p. 2132.

CALDARIUM alſo denoted the ſtove, or ſudatory, being a cloſe vaulted room, wherein by hot dry fumes, without water, people were brought to a profuſe ſweat.

In which ſenſe, *caldarium* was the ſame with what was otherwiſe denominated *vaporarium*, *ſudatorium*, and *laconium*; in the Greek baths, *hypocauſtum*, ὑποκαυσον. *Dempſt.* Parallip. ad Roſin. l. 1. c. 14. p. 82. *Mercurial.* Gymnaſt. l. 1. c. 10. *Pitiſc.* Lex. Ant. T. 1. p. 326.

CALDARIUM *Æs*, denotes pot-metal. *Plin.* Hiſt. Nat. l. 34. c. 8. See POT-*metal*.

CALDRON, a large kitchen utenſil, commonly made of copper; having a moveable iron handle, whereby to hang it on the chimney hook.

The word is form'd from the French *chaudron*, or rather the Latin *caldarium*, of *caldus*, or *calidus*, hot. *Savar.* Dict. Comm. T. 1. p. 704. Trev. Dict. Univ. T. 1. p. 1702. voc. *Chaudron*.

Boiling in CALDRONS, *caldariis decoquere*, is a capital puniſhment ſpoken of in middle age writers, decreed to diverſe ſorts of criminals, but chiefly to debaſers of the coin. *Du Cange*, Gloſſ. Lat. T. 1. p. 682.

One of the torments inflicted on the antient Chriſtian martyrs, was boiling in chaldrons of water, oil, &c. *Schoetg.* Lex. Ant. p. 251.

CALENDAR *(Cycl.)*—The word *calendar* is alſo written *kalendar*, *kalendarium*, being form'd from the word *kalendæ*; antiently written in capital letters at the head of each month.

Calendar amounts to much the ſame with what is otherwiſe called *almanac*, and by the Romans *faſti*. See ALMANAC, *Cycl.* and *Suppl.*

The days in *calendars* were originally divided into octoades, or eights, but afterwards, in imitation of the Jews, into hebdomades, or ſevens; which cuſtom, Scaliger obſerves, was not introduced among the Romans till after the time of Theodoſius. *Scal.* de Emend. Temp. l. 4. *Fab.* Theſ. p. 413.

There are divers *calendars*, according to the different forms of the year, and diſtributions of time, eſtabliſhed in different countries. Hence the Roman, the Jewiſh, the Perſian, the Julian, the Gregorian, &c. *calendars*.

The antient Roman *calendar* is given by Ricciolus [a], Struvius [b], Danet [c], and others; by which we ſee the order and number of the Roman holy days, and work days. How it ſtood according to the deſcriptions of Ovid, Columella, and Pliny, is alſo ſhewn by Petavius [d] in his uranologium, wherein are repreſented the riſings and ſettings of the principal ſtars, and alterations of the weather. How it ſtood in the time of Conſtantine the great, *anno Chriſti* 325, is alſo ſhewn by the ſame Petavius [e]. Blondel, Clavius, and Gaſſendi, have written expreſly on the Roman *calendar* [f].—[a Chronol. Reform. l. 1. c. 22. p. 49, ſeq. b Synt. Antiq. Rom. c. 8. p. 352, ſeq. c Dict. Ant. Rom in voc. d De Doctr. Temp. Ed. Ult. Batav. an. 1703. P. 3. p. 60, ſeq. e Lib. cit. p. 67, ſeq. f Trev. Dict. Univ. T. 1. p. 1348]

From the time of the council of Nice, held in 327, to the year 1582, the Julian Roman *calendar* obtained through chriſtendom, only with the addition of the dominical letter, golden number, and cycle of the ſun; on which the time of celebrating Eaſter depends. To which have been ſince added, the Chriſtian feaſts, both moveable and immoveable, and the names of the ſaints commemorated in the Romiſh church on each day of the month. Regio Montanus firſt began to inſert the courſe of the ſun, moon, and planets, with aſtronomical predictions of the weather. *Wolf.* Lex. Math. p. 294.

The Gregorian *calendar* is largely explained by Clavius, and defended againſt the obſervations of Mæſtlinus, Joſ. Scaliger, Georg. Germanus, and Franc. Vieta.

The three Chriſtian *calendars* are given by Wolfius in his elements of chronology.

The Jewiſh *calendar* was fixed by Rabbi Hillel, about the year 360, from which time the days of their year may be reduced to thoſe of the Julian *calendar*, which before, by reaſon of the uncertainty of the commencements of their months and years, and of the quantity of their intercalations, they could not be. Concerning the Jewiſh *calendar*, ſee *Wolf*, Elem. Chron. where he alſo ſhews how to reduce, or accommodate the Turkiſh *calendar*. See alſo *Prid.* Connect. T. 1. pref. p. 13. Item, l. 3. p. 264.

CALENDAR, *Kalendarium*, originally denoted among the Romans, a book containing an account of monies at intereſt, which became due on the calends of January; the uſual time when the Roman uſurers let out their money. *Senec.* de Benef. l. 7. c. 10. Item, l. 1. c. 2. Ejuſd. Epiſt. 14. Item, Ep. 87. *Fab.* Theſ. p. 413.

CALENDAR is alſo applied to divers other compoſitions reſpecting the twelve months of the year.

In this ſenſe Spencer has given the ſhepherds *calendar*; Evelyn, the gardners *calendar*, &c.

CALENDAR is alſo extended to an orderly table, or enumeration of perſons or things.

L^d. Bacon wiſhes for a *calendar* of doubts [a]. A late writer has given a *calendar* of the perſons who may inherit eſtates in fee ſimple [b].—[a *Bac.* de Augm. Scient. l 3. c. 4. Opp. T. 1. p. 106. b Lond. 1736, 8°.

CALENDAR *Glaſs*, *vitrum calendare*, a name formerly given by ſome writers to a thermometer, or graduated tube, whereby to meaſure the degrees of heat. *Bac.* Nov. Organ. l. 2. Opp. T. 1. p 330. Item, p. 325. See THERMOMETER, HEAT, &c. *Cycl.* and *Suppl.*

CALENDAR *Brothers*, *fratres calendarii*, a ſort of devout fraternities, compoſed of eccleſiaſtics as well as lay-men; whoſe chief buſineſs was to procure maſſes to be ſaid, and alms diſtributed, for the ſouls of ſuch members as were deceaſed. They alſo made laws and regulations for church diſcipline within their ſeveral diſtricts; which became of force by being confirmed by abbots or other prelates. They received legacies and donations of money, lands, &c. out of which they defrayed the charge of obits, wax-candles, and the like; what remained was ſpent in a collation in memory of the dead. *Schoet.* Ant. Lex. p. 252.

They were alſo denominated *calend brothers*, by reaſon they uſually met on the *calends* of each month, though in ſome places only once a quarter.

Aſtronomical CALENDAR, an inſtrument engraved upon copper-plates, printed on paper, and paſted on board, with a braſs-ſlider which carries a hair, and ſhews by inſpection, the ſun's meridian altitude, right aſcenſion, declination, riſing, ſetting, amplitude, &c. to a greater exactneſs than our common globes will ſhew, *Harris*, Lex. in voc. *Aſtronomical*.

CALENDARIUM *Feſtum*. The Chriſtians retained much of the ceremony and wantonneſs of the Calends of January, which for many ages was held a feaſt, and celebrated by the clergy with great

great indecencies, under the names *feſtum kalendarum*, or *hypodiaconorum*, or *ſtultorum*, that is, the feaſt of fools: ſometimes alſo *libertas decembrica*. The people met maſked in the church, and in a ludicrous way proceeded to the election of a mock pope, or biſhop, who exerciſed a juriſdiction over them ſuitable to the feſtivity of the occaſion: fathers, councils, and popes long laboured to reſtrain this licence to little purpoſe. We find the feaſt of the Calends in uſe as low as the cloſe of the 15th century. *Du Cange*, Gloſſ. Lat. T. 3. p. 183, ſeq. voc. *Kalendæ*. Ejuſd. Gloſſ. Græc. T. 1. p. 547. voc. Καλανδων εορτη. *Schoet.* Ant. Lex. p. 251.

CALENDER *(Cycl.)*—At Paris they have an extraordinary machine of this kind, called the *royal calender*, made by order of M. Colbert; the lower table or plank of which is made of a block of ſmooth marble, and the upper lined at bottom with a plate of poliſhed copper.

There are alſo *calenders* without wheels, which are wrought by a horſe harneſſed to a wooden bar, which turns a large arbor placed upright; at the top of which, on a kind of lanthorn, is wound a rope, the two ends of which being faſtened to the two extremities of the upper plank of the engine, give it motion. But the horſe *calender* is in leſs eſteem than the wheel kind, as the motion of this latter is more equable and certain. *Savar.* Dict. Comm. T. 1. p. 526. voc. *Calendre.*

CALENDER alſo denotes the workman who manages the machine above deſcribed; applying the cloth or ſtuff underneath, after having firſt wound it on the rollers.

CALENDERS is alſo the name of a ſort of derviſes ſpread thro' Turky and Perſia, whoſe order is not in general eſteem among the Mahometans, as being reputed leſs abſtemious and ſtrict in morals than ſome other orders. *D'Herbel*, Bibl. Orient. p. 244. See DERVIS, *Cycl.*

CALENDRING, the paſſing of cloths thro' the calender. See CALENDER, *Cycl.* and *Suppl.*

We read of *calendring* worſteds [a]. To improve linen farther, the drapers get ſeveral ſorts of their cloths *calendred*; whereby their threads are made to lie flatter and ſmoother. Houghton deſcribes *calendring* as performed by rolling the cloths on great wooden rollers, and laying them under a huge wooden box full of weighty materials, which is drawn by a horſe to and *fro on* ſeveral of theſe rollers [b].—[[a] Stat. 5. *Hen.* VIII. c. 4, & 35. Ejuſd. c. 5. *Cowel*, Interp. in voc. [b] *Hought.* Coll. T. 2. N° 352. p. 402.]

CALENDS *(Cycl.)*—Hederic [a] and others give us tables of the *calends*, to ſhew the days of our months correſponding to each day of the Roman *calendæ*. But they may be found without tables by this rule: To the number of the days in the preceding month, add two, and from the ſum ſubſtract the number of the *calends* given, the remainder is the day of our month. [[a] Schul. Lex. p. 630, ſeq.]

Thus the fifth of the *calends* of October will be found to anſwer to the 27th of September. For

Sept. 30 was prid. Kalend.
29 —— tert°. ——
28 —— quart. ——
27 —— quint. ——
&c.

CALENDS, *Kalendæ*, are alſo uſed in church hiſtory to denote conferences antiently held by the clergy of each deanry, on the firſt day of every month, concerning their duty and conduct, eſpecially in what related to the impoſition of penance. *Du Cange*, Gloſſ. Lat. T. 3. p. 185. voc. *Kalendæ*. Trev. Dict. Univ. T. 1. p. 1347.

CALENDS is alſo an appellation given to religious and devout ſocieties, otherwiſe called *confraternitates*; probably named *kalendæ*, by reaſon of their meeting on the calends of each month. *Du Cange*, Gloſſ. Lat. T. 3. p. 185. voc. *Kalendæ*.

CALENDS *of January*, in Roman antiquity, was a ſolemn feſtival conſecrated to Juno and Janus; wherein the Romans offered vows and ſacrifices to thoſe deities, and exchanged preſents among themſelves as a token of friendſhip.

It was only a melancholy day to debtors, who were then obliged to pay their intereſts, &c. Hence Horace calls it *triſtes calendæ*. *Hor.* l. 1. Serm. Sat. 3.

CALENDULA, in pharmacy, the herb, or flower popularly called *marygold*, uſed in the ſhops as a cardiac and alexipharmic, of like, though of inferior virtue to ſaffron. *Quinc.* Diſpenſ. P. 2. Sect. 6. p. 425. *Junck.* Conſp. Phyſ. p. 122, & 215. See MARYGOLD.

CALENTES, in philoſophy, a ſort of ſyllogiſm in the fourth, commonly called *galenical* figure, wherein the major propoſition is univerſal and affirmative; and the ſecond or minor, as well as the concluſion, univerſal and negative.

This is intimated by the letters it is compoſed of, where the A ſignifies an univerſal affirmative, and the two E's as many univerſal negatives. *Ex. gr.*

CA. Every affliction in this world is only for a time.
lEn. No affliction, which is only for a time, ought to diſturb us.
tEs. No affliction ought to diſturb us which happens in this world.

The Ariſtotelians not allowing the fourth figure of ſyllogiſms, turn this word into *CElAntEs*, and make it only an indirect mood of the firſt figure. *Walch.* Lex. Phil. p. 338. See CELANTES.

CALENTURE *(Cycl.)*—This diſtemper ſometimes comes on without a fever, and may be carried off, by proper methods, in a few days without any feveriſhneſs growing upon the patient from its continuance. The firſt ſymptom is, the perceiving green leaves as it were on the water, and a deſire of getting at them: yet this is ſo far from being attended with a fever, that it is certain, the fleſh of the patient is colder than uſual, and the pulſe ſlow and temperate.

The firſt ſtep toward a cure is, the giving a briſk vomit; this has the immediate effect of diſpelling the fancy of the green leaves and trees in the water; after this, ſalt of wormwood, a little diaſcordium and conſerve of roſes vitriolated are proper, and bleeding in the arm; and if that does not take effect, the opening of the temporal artery is proper: a thin diet and cream of tartar in water-gruel, after theſe things, generally cures the remains of the diſeaſe.

The ſeat of this diſorder is in the ſtomach, and its principal ſource ſeems to be the eating ſalt proviſions for a long time together. Hence it is that a vomit has ſo immediate a good effect, and that diluting medicines alone are neceſſary to compleat the cure. Phil. Tranſ. N° 98.

The word *calenture* is Spaniſh, *calentura*, ſignifies a heat, fever, or ague; from the Latin *calere*, to be hot.

Calentures are chiefly found in ſailing towards the Weſt-Indies, as they approach the tropic. Thoſe affected with them have a fierce look, and are very unruly, being ſo eager to get to their imaginary cool verdure, and ſo ſtrong that ſix men ſometimes ſcarce ſuffice to detain them. The diſeaſe chiefly ſeizes the young and ſtrong, eſpecially of a ſanguine complexion; the pulſe is extremely low. When taken in time it rarely proves mortal. *Bonet.* Medic. Septentr. l. 1. Sect. 6. c. 2. p. 83. *Shaw*, New Pract. Phyſ. p. 406, ſeq. *Caſt.* Lex. Med. p. 123. Phil. Tranſ. N° 290. p. 1562, ſeq.

CALERUTH, a word uſed by ſome authors to expreſs an indication of a deſire to the firſt perpetual; as when any thing has a deſire to return to the firſt matter from which it proceeded. *Ruland.*

CALF, *vitulus*, in zoology. There are two ways of breeding *calves* that are intended to be reared; the one is to let the *calf* run with its dam all the year round: this is the method in the cheap breeding countries, and is generally allowed to make the beſt cattle. The other way is to take them from the dam after they have ſuck'd about a fortnight; they are then to be taught to drink flat milk, which is to be made but juſt warm for them, it being very dangerous to give it them too hot.

The beſt time of weaning *calves* is from January to May; they ſhould have milk for twelve weeks after, and a fortnight before that is left off, water ſhould be mixed with the milk in larger and larger quantities. When the *calf* has fed on milk about a month, little whiſps of hay ſhould be placed all about him in cleft ſticks to induce him to eat. In the beginning of April they ſhould be turned out to graſs; only for a few days they ſhould be taken in for the night, and have milk and water given them; the ſame may alſo be given them in a pail ſometimes in the field, till they are ſo able to feed themſelves that they do not regard it. The graſs they are turned into muſt not be too rank, but ſhort and ſweet, that they may like it and yet get it with ſome labour.

Calves ſhould be always weaned at graſs, for if it be done with hay and water, they often grow big-belly'd on it and are apt to rot. When thoſe among the males are ſelected which are to be kept as bulls, the reſt ſhould be gelt for oxen: the ſooner the better. Twenty days old is a very good time, or any thing between that age and ten days. About London almoſt all the *calves* are fatted for the butcher. The reaſon of this is, that there is a good market for them; and the lands here are not ſo profitable to breed upon as in cheaper countries. The way to make the *calves* fat and fine is, the keeping them very clean, giving them freſh litter every day, and the hanging a large chalk ſtone in ſome corner where they can eaſily get at it to lick it, but where it is out of the way of being fouled by their dung and urine. The coops are to be ſo placed as not to have too much ſun upon them, and ſo high above the ground that the urine may run off. They alſo bleed them once when they are a month old, and a ſecond time before they kill them; this is a great addition to the beauty and whiteneſs of their fleſh; the bleeding is by ſome repeated much oftener; but this is ſufficient.

Calves are very apt to be looſe in their bowels; this waſtes and very much injures them. The remedy is, to give them chalk ſcraped into milk, pouring it down with a horn. If this does not ſucceed, they give them bole armenic in large doſes, and uſe the cold bath every morning. If a cow will not let a ſtrange *calf* ſuck her, the common method is to rub both her noſe and the *calf*'s with a little brandy: this generally reconciles them after a few ſmellings. *Mortimer*'s Huſbandry, p. 230.

CALF, among ſportſmen, is uſed for a male hart, or hind of the firſt year. *Cox*, Gent. Recr. P. 1. p. 6, ſeq. Dict. Ruſt. T. 1. in voc.

CALF alſo denotes the young of the whale. Phil. Tranſ. N° 387. p. 260.

CAF's *skins*, in the leather manufacture, are prepared and dreſſed by the tanners, ſkinners, and curriers, who ſell them for the uſe of the ſhoemakers, ſadlers, bookbinders, and other artificers, who employ them in their ſeveral manufactures.

CALF-*ſkin dreſſed in ſumac*, denotes the ſkin of this animal curried black on the hair ſide, and dyed of an orange colour on the fleſh ſide, by means of ſumac, chiefly uſed in the making of belts.

The Engliſh *calf-ſkin* is much valued abroad, and the commerce thereof very conſiderable in France and other countries; where divers attempts have been made to imitate it, but hitherto in vain. Mr. Colbert, to whom France owes a great number of uſeful arts and eſtabliſhments of this kind, ſet on foot a company of undertakers in 1665; who ſet up a manufactory of this kind under the denomination of *bonnets tanneurs*. But after an hundred thouſand livres ſunk in the undertaking, they were forced to deſiſt.

The attempt however had the effect to facilitate the procurement of the true Engliſh *calf*-ſkins. Till that time, the ſmaller ſkins only had been allowed to be exported; the larger from 36 to 45 pds. being forbid to be carried out of England. But Charles II. fearing a total interdict of the Engliſh *calf*-ſkins in France, where the chief demand for them was, in caſe the new company ſucceeded, took off the prohibition, and allowed foreigners to carry away ſkins of all weights and qualities, and even greatly reduced the duty on exportation.

What is like to baffle all endeavours for imitating the Engliſh *calf* in France is, the ſmallneſs and weakneſs of the *calves* about Paris; which, at 15 days old, are not ſo big as the Engliſh ones when they come into the world.

The laſt war of 1702, put the French on divers ways to do without the help of the Engliſh *calf*-ſkin; and at preſent 'tis certain they make a ſhift without it; generally contenting themſelves with what their own country affords. *Savar.* Dict. Comm. T. 2. p. 1846, ſeq. See alſo *Hought.* Collect. T. 1. N° 123. p. 323, ſeq. Item, N° 126. p. 331.

CALI is uſed to denote potaſhes, or the ſalt of the plant *kali*. See KALI.

CALICAPHA, in botany, a name uſed by ſome authors for the whitethorn.

CALICULARIS, in botany, a name given by ſome authors to the common hyoſciamus, or henbane. *Ger.* Emac. Ind. 2. See HYOSCIAMUS.

CALIDUCTS *(Cycl.)*—This name ſeems to owe its origin to Sir Henry Wotton. It is formed by analogy to ventiducts, and aquæducts.

Whether the antient *caliducts* were a cuſtom or a delicacy, they ſeem both for thrift and uſe preferable to the German ſtoves; and might even challenge the advantage over our own faſhion, were it not that the very ſight of a fire adds ſomething of luſtre to a room. *Wolf.* Elem. Archit. T. 1. p. 17.

CALIETA, in botany, a name uſed by ſome authors for a ſort of yellow fungus common about the roots of trees, as the juniper, &c. *Paracelſus.*

CALIGA, in Roman antiquity, was the proper ſoldier's ſhoe, made in the ſandal faſhion, without upper leather to cover the ſuperior part of the foot, tho' otherwiſe reaching to the middle of the leg, and faſtened with thongs. The ſole of the *caliga* was of wood, like the ſabot of the French peaſants, and its bottom ſtuck full of nails; which clavi are ſuppoſed to have been very long [a] in the ſhoes of the ſcouts and ſentinels; whence theſe were called by way of diſtinction, *caligæ ſpeculatoriæ* [b]; as if by mounting the wearer to a higher pitch, they gave a greater advantage to the ſight. The others will have the *caligæ ſpeculatoriæ*, to have been made ſoft and woolly, to prevent their making a noiſe [c].—[[a] Vid. *Plin.* Hiſt. Nat. l. 34. c. 14. Item, l. 9. c. 18. *Hardouin*, Not. ad. loc. [b] *Suet.* in Calig. c. 52. *Tertull.* de Coron. [c] *Aquin.* Lex. Milit. T. 1. p. 151.]

Nigronius gives us the figure of a *caliga clavata*, at the end of his work *de Caliga veterum*. *Hardouin*, Not. ad Plin. l. 9. c. 18.

From theſe *caligæ* it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common ſoldier. *Suet.* in Calig. c. 9. *Kenn.* Rom. Ant. P. 2. l. 5. c. 8. p. 328. *Nigron.* de Caliga. *Pitiſc.* Lex. Ant. T. 1. p. 327, ſeq.

In the decline of the empire, the *caliga* was alſo worn by the ſenators, though of a form ſomewhat different from that of the ſoldiery. *Pitiſc.* Lex. Ant. T. 1. p. 328.

Eccleſiaſtical writers ſpeak alſo of *caligæ*, as a particular ſort of ſhoes or ſandals worn by monks; and alſo by biſhops when they celebrated maſs pontifically. *Du Cange*, Gloſſ. Lat. T. 1. p. 684. Ejuſd. Gloſſ. Græc. p. 549. voc. Καλιγα. *Magr.* vocab. Eccleſ. p. 40.

CALIGATI, an appellation given by ſome antient writers to the common ſoldiers in the Roman armies, by reaſon of the caliga, a peculiar ſort of ſhoe worn by them. *Juv.* Sat. 16. v. 24. *Suet.* in Auguſt. c. 25. *Kenn.* Rom. Ant. P. 2. l. 5. c. 8. p. 325. *Fab.* Theſ. p. 414. *Calv.* Lex. Jur. p. 136.

The caliga was the badge, or ſymbol of a ſoldier; whence to take away the belt and caliga, imported a diſmiſſion or caſhiering. *Du Cange*, Gloſſ. Græc. p. 550. voc. Καλιγατος.

CALIGO, or CALIGATIO, in medicine, an opacity, or cloudineſs of the anterior ſurface of the chryſtalline, cauſing a dimneſs or ſuffuſion of ſight. *Plin.* Hiſt. Nat. l. 29. c. 6. Mem. de Trev. 1726. p. 2186.

The *caligo* is the ſame with what the Greeks call Αχλυς, *achlys*; *Gorr.* Med. Def. p. 67. voc. Αχλυς. See ACHLYS.

CALIMUS. See the article CALLIMUS.

CALIN, the name of a ſort of mixt metal, ſeeming compoſed of lead and tin. It is prepared by the Chineſe, and they make ſeveral utenſils of it, as tea-caniſters, coffee-pots, and the like. In ſome places alſo they cover their houſes with it as we do with lead. *Lemery*, des Drog.

CALIPH *(Cycl.)*—One of the chief functions of the *caliph*, in quality of imam, or chief prieſt of muſulmaniſm, was, to begin the public prayers every Friday in the chief Moſque, and to deliver the *khothbah* or ſermon. In after times, they had aſſiſtants for this latter office; but the former the *caliphs* ever performed in perſon. The *caliph* was alſo obliged to lead the pilgrims to Mecca in perſon, and to march at the head of the armies of his empire. He granted inveſtitures to princes, and ſent ſwords, ſtandards, gowns, and the like, as preſents to the princes of the Mahometan communion; who, though they had thrown off the yoke of the *caliphate*, nevertheleſs held of it as vaſſals. They alſo honoured them with titles, as *defender*, *ſupport*, or *pillar* of the faith, &c. for which they ſometimes made them pay dear.

The *caliphs* uſually went to the Moſque mounted on mules, and the ſultans ſelgiucides, though maſters of Bagdat, held their ſtirrups, and led their mule by the bridle ſome diſtance on foot, till ſuch time as the *caliphs* gave them the ſign to mount on horſeback.

At one of the windows of the *caliph*'s palace, there hung always a piece of black velvet 20 cubits long, which reached to the ground, and was called the *caliph*'s-ſleeve; which the grandees of his court never failed to kiſs, with great reſpect, every day.

The honours paid the *caliphs* were exceſſive, and bred a pride in them of which they ceaſed not to give marks even when their authority was at the loweſt. They affected great ſplendor and magnificence in every thing. Abulpharagius relates, that the *caliph* Motazem had no leſs than 100 women in his ſeraglio, and 300 eunuchs to keep them.

But this ſplendor was much diminiſhed during the reign of the Bonides in Perſia; who ſtript them of every thing, taking from them their vizirs, and leaving them no higher officer than a ſecretary to take care of their affairs. At that time, and eſpecially under the *caliphate* of Radhi, the 20th of the family of Abbas, the dominions of the empire of Mahomet became ſo diſmembred and divided, that this prince was reduced to the ſingle poſſeſſion of the city of Bagdat. Such was its ſtate in the year of the hegirah 325. But this was not the loweſt ſtate of the *caliphs*, who when the Bonides afterwards rendred themſelves maſters of Bagdat, were reduced to the ſingle functions of the Moſque; being put up or depoſed by thoſe princes at pleaſure. By the diſorders of the Turkiſh ſoldiery ſeveral were even put to death in different manners; but ſtill ſo as not to ſhed their blood out of a reſpect always preſerved to their high dignity. In this low ſtate, one of them is ſaid to have begg'd alms at the door of the Moſque among the blind.

Several of them made efforts to ſhake off the yoke of this foreign domination. The *caliph* Raſched gathered an army privately, but not ſucceeding, was depoſed. His ſucceſſor Moktafi, the 31ſt *caliph* of the line of Abbas, carried his point, and threw off the yoke of the ſultan of ſelgiucides; from which time the *caliphs* recovered much of their antient ſplendor, and received many marks of the veneration and obedience of the Mahometan princes their neighbours, till their entire ruin; which was occaſioned by the diviſion between the ſunnites and ſchiites [a]. The *caliphs* loſt their authority, and almoſt their name, in that deluge of deſtruction by the Tartars, who over-run all the Eaſt. Since the deſtruction of the *caliphate*, the Mahometan princes have a particular officer appointed in their reſpective dominions, who ſuſtains the ſacred authority of *caliph*. In Turkey he goes under the denomination of *mufti*, and in Perſia under that of *ſadne* [b].—[[a] *D'Herbel.* Bibl. Orient. p. 985, ſeq. voc. *Khalifah*. [b] Life of *Mahom.* p. 70, ſeq.]

CALIPHATE, or *Kaliphate*, a ſovereign dignity antiently ſubſiſting among the Mahometans, veſted with abſolute power in every thing relating to religion as well as policy. See CALIPH.

The *Caliphate* comprehended the power both of the royalty, and prieſthood.

The double character of prince and pontiff, which Mahomet acquired for himſelf, he tranſmitted to his ſucceſſors under the title of *caliphs*, who like the *Jewiſh* princes of the Maccabee race, were both kings, and chief prieſts of their people at the ſame time. The empire of the *caliphs* was of vaſt extent, including all Arabia, Syria, Perſia, and Egypt, with other parts of Africa, and even Spain.

The ſucceſſion of *caliphs* laſted till the 655th year of the Hegirah, when the Tartars took the city of Bagdat, and put to death Moſtaazem, the laſt *caliph* of the line. 'Tis true there were perſons after that time who claimed the *caliphate*, as pretending

tending to be of the family of the Abaſſides, and to whom the ſultans of Egypt rendered great honours at Cairo, as the true ſucceſſors of Mahomet: But this honour was merely external, and the rights allowed them only in matters relating to religion; and though they bore the ſovereign title of *caliphs*, they were nevertheleſs ſubjects and dependents of the ſultans.

The Fathimites erected a kind of *caliphate* in Africa, which commenced about the year of the Hegirah 361, and laſted till it was ſuppreſſed by Saladin.

There was alſo another *caliphate* in Africa and Spain, which begun under the Reign of Joſeph, ſon of Baſchkehin.

Hiſtorians alſo ſpeak of a third *caliphate* in Yeman, or Arabia Fœlix, erected by ſome Princes of the family of the Jobites. *D. Herbe'*, Bibl. Orien. p. 985, ſeq. *Okel.* Hiſt. Conq. Syria, &c. Lond. 1708. Bibl. Angl. T. 3. p. 153. ſeq.

The emperors of Morocco aſſume the title of grand cherifs, and pretend to be the true *caliphs*, or ſucceſſors of Mahomet, though under another name.

CALIXTINS (*Cycl.*)— The *Calixtins* made one of the two parties of reformers in Bohemia, at the time of the council of Baſle; the other being the Taborites. See TABORITES, *Cycl.* The *Calixtins* are not ranked by Romaniſts in the Liſt of Heretics [a], ſince in the main they ſtill adhered to the Doctrine of Rome. The Reformation they aimed at terminated in the four following articles. 1°. In reſtoring the cup to the laity. 2°. In ſubjecting the criminal clerks to the puniſhment of the civil magiſtrate. 3°. In ſtripping the clergy of their lands, lordſhips, and all temporal juriſdiction. 4°. In granting liberty to all capable prieſts to preach the word of God [b]. —[[a] *Trev.* Dict. Univ. T. 1. p. 1353. [b] *Lenfant.* Hiſt. de la Guerre des Huſſ. T. 2. Bibl. Germ. T. 23. p. 2. ſeq.

CALKINS, or CALKERS, a part prominent from a horſe-ſhoe, intended to ſecure the beaſt from ſliding.

The *calkins* are the end or extremity of horſe-ſhoes, turned or bent downwards, and forged to a ſort of point, to make the beaſt ſtep more ſafe and ſteady on the ice. *Savar.* Dict. Com. T. 1. p. 1598. voc. *crampon.*

The inconvenience of *calkins* is, that they hinder the horſe from treading evenly on the ground, and thus occaſion wrenches of the foot, or ſtrains of the ſinews; eſpecially in ſtony ways, where the hardneſs of the bottom will not ſuffer the *calkins* to penetrate: Add that they are apt to make a horſe cut. Dict. Ruſt. T. 1. in voc. item in *horſe-ſhoe.*

Calkins are either ſingle or double, i. e. at one end of the ſhoe, or at both; the latter are reputed leſs hurtful, as they allow the creature to tread more even; ſome are made large and ſquare; the beſt are in form of the point of a hare's ear.

CALL, (*Cycl.*) among fowlers, the noiſe or cry of a bird, eſpecially to its young, or its mate in coupling time.

One method of catching partridges, is by the natural *call* of a hen trained for the purpoſe, which drawing the cocks to her, they are entangled in a net. Dict. Ruſt. T. 1. in voc.

Different Birds require different ſorts of *calls*; but they are moſt of them compoſed of a pipe or reed, with a little leathern bag or purſe, ſomewhat in form of a bellows; which, by the motion given thereto, yields a noiſe like that of the ſpecies of bird to be taken. *Savar.* Dict. Comm. T. 1. p. 116. voc. *appeau.*

The *call* for partridges is formed like a boat, bored through, and fitted with a pipe or ſwan's quill, &c. to be blown with the mouth, to make the noiſe of the cock partridge, which is very different from the *call* of the hen.

Calls for quails, &c. are made of a leathern purſe in ſhape like a pear, ſtuffed with horſe hair, and fitted at the end with a bone of a cat's, hare's, or coney's leg, formed like a flageolet: They are plaid by ſqueezing the purſe in the palm of the hand, at the ſame time ſtriking on the flageolet part with the thumb to counterfeit the *call* of the hen quail.

CALLARIAS, by ſome called *aſellus callarias*, a fiſh of the truttaceous kind called by Aldrovandus *Tinca marina*, and by Rondeletius and Geſner *Phycis*. It uſually grows to about a foot in length, and is in ſhape ſomething flattiſh; it is covered with ſmall ſcales, and is of a greyiſh colour, but ſomewhat purple on the head. Its mouth is very large, its lips thick, its teeth are numerous, and very ſmall, and in the top of the palate there is a cluſter of ſmall teeth amaſſed together in a congeries of a triangular form; and in the lower part of the mouth are four tubercles rough alſo with ſmall teeth; its tongue is ſmooth, and from the angle of the lower jaw there hangs a ſingle fleſhy filament, by way of beard; its tail is roundiſh, not forked; it is a very well taſted fiſh, and is common in the Mediterranean, and brought to market, at Rome, Venice, &c. *Willughby*'s Hiſt. piſc. p. 205.

CALLIBLEPHARA, in the medicinal writings of the antients, a name given to certain compoſitions intended to make the eye-lids beautiful; and as the eye-lids are ſubject to be deformed ſeveral ways, there were ſeveral different ſorts of theſe medicines.

The principal deformities of this part, they accounted either the two great abundance of hairs, or the falling off and defect of them, or their ill colour, or irregular arrangement. Their over abundance they eſteemed owing to a redundance of humors, their falling off to an acrimony of them, and their whiteneſs or redneſs to particular humors of that co'our. The principal ingredients in theſe *calliblephara*, were ſuch medicines as they eſteemed moderately drying and proper to conſume the vitiated humours, ſuch were lapis Armenus, ampelitis, ſoot of frankincenſe, burnt antimony, and lead, ſquamma æris, and the like. *Gor.* Med. Defin. in voc.

Marcellus, in his explanations of Dioſcorides, ſays, that the old Greeks called thoſe medicines meant to remedy diſeaſes of this part, as well as to give it beauty, by the ſame common name *calliblephara.*

CALLICHTHUS, in zoology, a name given by ſome writers to the *anthias* a ſmall fiſh caught in the Adriatick, and ſuppoſed to be a certain token of there being no voracious fiſhes near the place where it is found; it is called alſo *ſacer piſcis* the holy fiſh, and is a very beautiful fiſh. *Rondelet*, de Piſc.

CALLICO, in commerce, a ſort of cloth reſembling linnen, made of cotton.

This name is taken from that of *Callicut*, a city on the coaſt of Malabar, being the firſt place at which the Portugueſe landed when they diſcovered the India trade. The Spaniards ſtill call it *callicu.* *Atlas* Marit. p. 218. *Skin.* Etym. in voc.

Callicoes are of divers kinds, plain, printed, painted, ſtain'd, dyed, chints, muſlins, and the like, all included under the general denomination of *callicoes.*

A great naturaliſt has ſuggeſted that the Indian *callico* is made of the fibres of nettle-ſtalks [a]; but this is not confirmed: on the contrary, there are *callicoes* alſo made in the iſland of Candia, which 'tis known are made of cotton [b]. —[[a] *Ray*, Phil. Lett. p. 174. ſeq. [b] *Atlas* Marit. p. 209. ſeq.]

By an act of parliament made in 1722. the uſe of dyed, painted, or printed *callicoes* is forbid, either in apparel or furniture, on the forfeiture of five pounds to the informer for every offence. 7 Geo. I. Stat. 1. c. 7. § 2. but this prohibition does not extend to *callicoes* dyed blue. Ibid, § 11.

The deſign of this prohibition was to promote the conſumption of our own manufactures. But its chief effect has been to promote the uſe of printed linnen. Upon the act's taking place, the *callico*-printer's fell to work to imitate the Indian *callicoes*, by making the ſame ſtamps and impreſſions, and with the ſame beauty of colours upon linen. This fell chiefly on Scots and Iriſh linen, the manufacture of which have been hereby greatly increaſed, many hundred thouſand ells thereof being yearly imported from thoſe countries, and printed, or ſtamp'd in England. Plan of Engl. Comm. P. 2. c. 2. p. 295, ſeq.

CALLIDRYS, in zoology, a name given by Bellonius and ſome other authors to a water bird, known among us by the name of the *redſhank.* See REDSHANK.

CALLIDRYS *nigra*, in zoology, the name of a bird, deſcribed by Bellonius, and ſuppos'd by ſome to be that bird which we call the *knot.* *Bellon.* de Avib. See the article KNOT.

CALLIDRYS *rubra*, in zoology, the name of a long-leg'd water bird of a browniſh grey on the back, and a whitiſh grey on the rump and neck: on each ſide of the temples it has two black ſpots which ſeem to make a ſort of ſhade to the eye-lids, which are diſtinguiſhed by a very white ſpeck; its beak is about three fingers breadth long, and its legs of a rediſh yellow. The French call this bird *chevalier aux pieds rouges*, and the *limoſa* to which it very much approaches, the *chevalier aux pieds verds.* Theſe have by ſome been ſuſpected to be only the different ſexes of the ſame bird. *Ray*'s Ornithology p. 22.

CALLIGRAPHY, Καλλιγραφια, the art of fair writing.

Cocker, Gerin, Gething, Skelton and Hoar, are comparable for their ſkill in *calligraphy* to the moſt renowned of the antients [a]. Callicrates is ſaid to have written an elegiac diſtich on a Seſamum ſeed [b]. Junius ſpeaks of him as a miracle, who wrote the apoſtles creed, and beginning of St. John's Goſpel in the compaſs of a farthing: What would he have ſaid of our famous Peter Bale, who in 1575, wrote the Lord's prayer, creed, ten commandments, and two ſhort prayers in latin, with his own name, motto, day of the month, year of the Lord, and reign of the queen, in the compaſs of a ſingle penny, inchaſed in a ring and bordure of gold, and covered with a cryſtal, all ſo accurately wrought, as to be very legible [c]? —[[a] *Evel.* Diſc. of Med. c. 8. p. 267. [b] *Ælian.* Var. Hiſt. l. 1. c. 17. [c] *Evel.* loc. cit. V. Montfauc. Palæogr. Græc. l. 1. c. 5, ſeq. where we have the ſeveral kinds of notes and ſubſcriptions of the antient *calligraphi*, as alſo a liſt of the names of the principal *calligraphers* from the 3d to the 13th century.]

CALLIGRAPHY is alſo uſed to denote the *calligraphers* work, in tranſcribing fair and at large. See CALLIGRAPHUS, *Cycl.*

In which ſenſe *caligraphy* made an article in the manual labour of the antient monks. *Du Cange* Gloſſ. Græc. p. 522, ſeq. voc. Καλλιγραφια.

CALLIMUS, Καλλιμος, in phyſiology, a ſtony ſubſtance found in the cavity of the ætites, or eagle ſtone. See ÆTITES.

The word is alſo written *calimus*, and in ſome copies of Pliny *calainus*; which latter reading Salmaſius receives.

The *callimus* fills the hollow of the ætites, much as the yolk does the white of an egg. *Grew.* Muſ. Reg. Societ. P. 3. Sect. 1. c. 5. p. 298.

The Geodes, inſtead of a *callimus*, or ſolid ſtone, has a looſe, ſandy, chalky, or earthy ſubſtance, and the enhydros a liquid ſubſtance. *Plin.* Hiſt. Nat. l. 36. c. 21. *Salmaſ.* Exerc. ad Solin.

Solin. p. 713, seq. *Mercat.* Metalloth. p. 261. *Woodw.* Nat. Hist. Eng. Foss. T. 1. p. 235. See GEODES and ENHYDROS.

CALLING *the house*, in a parliamentary sense, has been sometimes practised, to discover whether there be any in the house not returned by the clerk of the crown; but more frequently to discover what members are absent without leave of the house, or just cause.

In the former case, the names of the members being called over, every person answers to his name, and departs out of the house, in the order wherein he is called. In the latter, each person stands up, uncovered at the mention of his name. Memor. of Proceed. of Parl. c. 13. p. 84, seq.

CALLION, in botany, a name given by Pliny, and some other authors to the alkekengi, or winter cherry. *Ger.* Emac. Ind. 2. Some of the Greeks called it also *cystis*, from its fruit being wrapped in a kind of bag or bladder, but the general name was *hallicaccabum*.

CALLIONYMUM, in botany, a name given by some authors to the lilly of the valley. *Ger.* Emac. Ind. 2. 322.

CALLIONYMUS, in zoology, a name used by Appian and some other authors for the fish called the *uranoscopus*, or the stargazer. *Dale*'s Pharm. p. 376. *Willughby*, Hist. Pisc. p. 287.

CALLIPÆDIA, Καλλιπαιδεια, the art of getting or breeding fine and beautiful children.

The word is formed from καλος fair, and παις puer, either boy or girl.

We find divers rules and practices relating to this art, in antient and modern writers: Among the magi, a sort of medicines called ermesia was prescribed to pregnant women, as a means of producing a beautiful issue. Of this kind were the kernels of pine nuts ground with honey, myrrh, saffron, palm wine, and milk. *Gorr.* Med. Def. p. 156. *Cast.* Lex. Med. p. 315.

The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child (such as was Jochanan the disciple of Judah, author of the mischna) placed at the door of the public baths, that the women at going out being struck with his appearance, and retaining the idea, might all have children as fine as he. *Basnage*, Hist. des Juifs, l. 6. p. 2. Jour. des Sçav. T. 37. p. 99. The Chinese take still greater care of their breeding women, to prevent uncouth objects of any kind from striking either their sense or imagination: musicians are retained to entertain them nightly with agreeable songs or odes, in which are set forth all the duties and comforts of the conjugal and domestic life; that the infant may take good impressions even before it is born, and not only come forth agreeably formed in body, but well disposed in mind. *Wolf.* Orat. de Sinar. Phil. Pract. ap. Act. Erud. *Lipsi.* 1726. p. 238.

Callipædia, nevertheless, seems to have been first erected into a just art by Claude Quillet de Chinon, a French abbot, who under the fictitious name of Calvidus Lætus, has published a fine latin poem, in four books, under the title of *callipædia, seu de pulchræ prolis habendæ ratione*; wherein are contained all the precepts of that new art. Lugd. Bat. 1655, 8vo. Paris, 1656, 8vo. and Lond. 1708, 8vo. In which last edit. several verses were restored, which the author at the request of cardinal Mazarin had omitted in the Paris edit. 1665. Jour. des Sçav. T. 41. p. 214. *Morhof*, Polyhist. Liter. l. 2. c. 1. p. 323. Act. Erud. Lipsi. 1725. p. 90. *Monnoy*, Not. ad Baill. Jugem. des Sçav. T. 4. P. 2. p. 300, seq.

CALLISTIA, Καλλιστια, in antiquity, a Lesbian festival, wherein the women presented themselves in Juno's temple, and the prize was assigned to the fairest.

The word is formed from the greek καλλος, beauty, q. d. beauty's rewards. The like contest of beauty was held at the festival of Ceres Eleusinia, among the Parrhasians, first set on foot by Cypselus, whose wife Herodice was honoured with the first prize. Another obtained among the Eleans, where the contest was among the men, the most beautiful of whom was presented with a suit of armour which he consecrated to Minerva, to whose temple he walked in procession, adorned with ribbons, and crowned with a myrtle garland. *Athen.* Deipnos. l. 12. *Meurs*, Græc. Færiat. de Fæst. Græc. l. 3. c. 2. *Pott.* Arch. Græc. l. 2. c. 20. p. 407.

CALLOSUM *corpus*, in anatomy, denotes a part in the medulla of the brain of a white colour, and a texture somewhat harder and more compact than the rest; approaching to that of a *callus*. V. *Barthol.* Anat. l. 3. c. 6. *Willis*, Anat. Cerebr. c. 10. n. 5. *Malpighi*, de Cerebr. *Cast.* Lex. Med. p. 125, seq.

The *corpus callosum* runs along the whole tract of the falx; at the extremity next the cerebellum it sends out two processes, whose juncture constitutes the fornix; under which lies the septum lucidum. *Drak.* Anthrop. l. 3. c. 3. p. 275.

The *corpus callosum* is an assemblage of bundles of fibres springing from the glands, which compass the cineritious part, and serving as excretory ducts thereto: these fibres as descending towards the medulla oblongata, all meet there; and serve to connect the lobes of the brain. Signior Lancisi makes the *corpus callosum* to be the immediate seat of the soul. *Malpigh.* Diss. de sede Cogitant. Anim. Mem. de Trev. 1717. p. 1474.

CALLOUS, *callosus*, something of the nature or consistence of a *callus*. See CALLUS *Cycl.* and *Suppl.*

Physicians speak of *callous* nodes or excrescences,[a] *callous* ulcers, and the like[b]; — [[a] Ephem. Acad. N. C. dec. 1. an. 6. obs. 101. [b] *Junck*, Comp. Chir. p. 257.]

CALLOUS *eggs*, *ova callosa*, the longer and better sort, supposed to contain male chicks; having a denser white, and richer flavour than the rest. *Hor.* l. 2. Sat. 4. v. 14. *Fab.* Thes. p. 417. See EGGS.

CALLUS (*Cycl.*) — In cases of fractures, when the bones are properly replaced, and care taken to preserve them in that situation, the surgeon has done his part, and nature provides for the rest, by supplying the divided parts with a *callus*, which sweats out from the small arteries, and bony fibres of the divided parts in form of a viscous liquid matter or jelly, and soon fills up the chinks and cavities between them: this first appears of a cartilaginous substance, but at length it becomes quite bony, and joins the fractured parts so firmly together, that the limb will make a greater resistance to any external violence in that than in any other part.

But as the new flesh in wounds will frequently sprout up too fast, so will also the *callus* in fractures; and by this means render the limb uneven and deformed. The only methods that can be taken to prevent the *callus* from exceeding its due bounds, are to make the bandage somewhat tighter than ordinary, and wet it with spirit of wine, for by this means the *callus* is not only often kept within its due bounds, but the induration of it is also much forwarded; but when once the *callus* is indurated, we have no medicines by which it can be taken down or destroyed. *Heister*'s Surg. p. 115.

CALLUS *microscopically examined.* Mr. Lewenhoek examining the *callus* form'd on the hands and feet, observed that it was a substance composed of several layers of particles so loosely connected, that it was a wonder they could hang together; on putting a piece of this into fair water, after it had stood a considerable time to steep, he found that the particles of which it was composed would easily separate from one another with a little touch of a quill, and these separated particles put into a drop of water, and examined before the microscope, were found to be all of the same regular shape, which was like that of a weaver's shuttle, being broad in the middle, and pointed at each end, with a line in the middle like those upon the uppermost or outside skins of fruits, or of our bodies, but generally irregular. These pieces were thick in proportion to their size, and when they are put into water, and separated again, they naturally form a great number of other particles, all of which are of the same regular figure with the original piece. Phil. Transf. N° 373. p. 160.

By this we see the reason of the increase in thickness of the skin of the hands of those who labour hard, and of the feet of such people as walk much, which is wholly owing to the addition of vast numbers of these shuttle-like particles which form combinations together, but those so loosely, that it is no wonder they are so easily separated on moistening; and in carefully examining pieces of this thick skin transversely cut, we may see that they are composed of several layers of different thicknesses, which have been added from time to time, and that each of these layers is only a congeries of an almost infinite number of these parts.

The *callous* skin for these examinations must not be cut from the hands of those persons who use extreme hard labour, such as masons and the like, for in them by the continual pressing the hand upon hard bodies, the several particles of which these *callous* layers are composed are pressed down so closely upon one another, that no art is able to separate them, and all that can be discovered by a view of such skin is, the distinct layers of which its thick parts are composed.

The people who labour ever so hard will have no *callus* upon their hands, if they wash them often; the washing the hands daily rubs off a great quantity of these particles or scales if they may be so called, but they are quickly renewed, and so much of them must come off on occasions of rubbing, that we must necessarily eat every day a large quantity of those from our cooks hands among our food, and have them turn with it to digestion. It is amazing to see the vast quantities of these scales which are daily thrown off from our hands and feet, though from no other part of the body, and we may learn from this the great bounty of nature to us in so carefully supplying those parts which are destined for walking or labour, with an additional matter for their defence, which is not in any other part of the body.

CALLUS is by some also applied to those knots or tophaceous nodes generated in the joints of gouty patients. *Cast.* Lex. Med. p. 125. voc. *Callositas.* See TOPHUS, NODE, &c. *Cycl.*

CALLUS is also especially used to denote a hardness of the eyebrows, occasioned by the congestion of an acid, or tartareous juice therein. *Scrib. Larg.* n. 26, seq. *Sennert.* Med. Pract. l. 1. P. 3. sect. 2. c. 3. *Cast.* Lex. Med. p. 125.

Paracelsus also gives the denomination *callus*, to an abscess or ulcer, caused by the acrimonious or arsenical quality of the nutricious juice, and exciting a vehement itching. *Paracels.* Chirurg. Tr. de Ulcer. c. 59, seq. *Cast.* loc. cit.

CALLYCHTHIS, in zoology, the name of a broad and flat sea-fish, brought to market at Rome under the name of the *lampuga*, and commonly called the *stromateus*; and by the Venetians the *licette*. *Gesner*, de pisc. p. 1109. See the article STROMATEUS.

CALLYONYMUS, in zoology. See CALLIONYMUS.

CALM, in the sea language, that state of the air and water when there is no wind stirring.

They say a flat *calm*, a dead or stark *calm*. A *calm* is more terrible to a sea-faring-man than a storm, if he have a strong ship and sea-room enough [a]; for under the line excessive heat sometimes produces such dead *calms* that ships are obliged to stay two or three months without being able to stir one way or other [b].—[a *Manwar*. Sea Dict. p. 18. *Aubin*, Dict. Mar. p. 149. b Jour. des Scav. T. 5. p. 192.]

Two opposite winds will sometimes make a *calm*. This is frequently observed in the gulf of Mexico, at no great distance from the shore, where some gust or land-wind will so poise the general easterly wind, as to produce a perfect *calm*. Phil. Transf. N° 36. p. 707.

Calms are never so great on the ocean as on the Mediterranean, by reason the flux and reflux of the former keep the water in a continual agitation, even when there is no wind; whereas there being no tides in the latter, the *calm* is sometimes so dead, that the face of the water is as clear as a looking-glass; but such *calms* are almost constant presages of an approaching storm [a]. On the coasts about Smyrna, a long *calm* is reputed a prognostic of an earthquake [b].—[a *Savar*. Dict. Comm. Supp. p. 109. b Mem. des Miss. T. 1. p. 44.]

Calms are said to reign perpetually on the tops of very high mountains; whence the antient tradition concerning mount Olympus, that the ashes of the annual sacrifice performed there, remained on the altar the whole year without the least atom being blown away, or disturbed by wind. The jesuit Casati has a treatise entitled, *The ashes of mount Olympus blown away*; wherein he shews this to be a vulgar error. Le Cineri dell Olimpo ventilate. Parm. 1677. Mem. de Trev. 1708. p. 1457.

When a ship is close under the lee of another, the windward vessel is said to *becalm* the leeward.—A ship is also said to be *becalmed* when near the land, which keeps the wind from it. *Guill*. Gent. Dict. P. 3. in voc. *Manwar*. Sea Dict. p. 18, seq.

It is not uncommon for the vessels to be *calmed*, or *becalmed*, as the sailors express it, in the road of the constant levantine winds, in places where they ride near the land. Thus between the two capes of Cartooche toward the main, and cape Antonio in Cuba, the sea is narrow, and there is often a *calm* produced by some gust of a land-wind, that poises the levantine wind, and renders the whole perfectly still for two or three days.

In this case, the current that runs here is of use to the vessels, if it set right; when it sets easterly, a ship will have a passage in three or four days to the Havannah; but if otherwise, it is often a fortnight or three weeks sail; the ship being embayed in the gulf of Mexico.

When the weather is perfectly *calm*, no wind at all stirring, they try which way the current sets, by means of a boat which they send out, and which will ride at anchor, though there is no bottom to be found, as regularly and well as if fastened by the strongest anchor to the bottom. The method is this: They row the boat to a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about two hundred fathom; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as can be. Phil. Transf. N° 36.

CALOGERI, or CALOYERS, (*Cycl.*) are the Greek monastics, and differ from the papas, Παπας, which are the secular priests.

Out of the body of the *caloyers* come all the prelates of the Greek church; the papas being incapable of any dignity above that of archpriest, πρωτοπαπας.

Though the denomination be taken from their age, there are many of them in the prime of youth. Tournefort assures us, that in many convents they admit religious at 10 or 12 years of age. For the females, he adds, they are most of them only a more moderate sort of Magdalens, who, as they grow old, make a vow to practise those virtues they had much neglected in their youth; and retire into convents to lead a life somewhat less scandalous than before, under the eyes of a superior or hegumeniss, who is far from being too severe.

The *caloyers*, in some places, are divided into cœnobites, anachorites, and ascetics, or hermits; the life of which last is the most severe and recluse.

The simple *caloyers* are not qualified to say mass; if they be ordained priests, they commence hieromonachi, or holy monks; in which quality they may celebrate mass on the solemn festivals, but for the ordinary service there are papas retained in all the convents. Vid. *Suic*. Thes. T. 2. p. 26. Καλογηρος. *Du Cange*, Gloss. Lat. T. 1. p. 688. *Montfauc*. Palæogr. Græc. p. 434. *Tournef*. Voyag. du Levant. T. 1. Lett. 3. p. 40—43.

CALOMEL (*Cycl.*) is the panchymagogum of Quercetanus. It is an effectual purge, and given not only to adults, but even to children to carry off the slimy humors from whence the worms arise [a]. *Calomel* rubbed with sulphur of antimony, is also found a powerful alterant [b].—[a *Quinc*. Pharmac. P. 2. Sect. 15. p. 265. b Med. Ess. Edinb. T. 1. p. 47.] See PLUMMER'S *Æthiops*.

CALONDRONIUS, a name given by the writers of the middle ages to a stone of which they have left us no description, but only a wide account of its great virtues, in giving chearfulness to the person who wears it, and preventing the power of magic and enchantments.

CALOPHYLLUM, in botany, the name given by Linnæus to a genus of plants called by Plumier *calaba*, the characters of which are these: The cup is coloured and deciduous, and consists of one leaf divided into four acute segments; the flower consists of four roundish hollowed and expanded petals; the stamina are numerous capillary filaments, shorter than the flower; the antheræ are roundish; the germen of the pistil is roundish; the style is simple, and of the length of the stamina; the stigma is headed; the fruit is a large globose unilocular drupa; and the seed is a large pointed nut, of a roundish figure. *Linnæi* Gen. Plant. p. 234. *Plumier*, Gen. 8. Hort. Malabar, v. 4. p. 38.

CALTHA, *Marygold*, in botany. See MARYGOLD.

CALTROP (*Cycl.*)—The word is formed from *calvatrapa*, used in middle age writers for a sort of thistle, called also *carduus stellatus*, in English *caltrope*, to which this instrument bears some resemblance.

The *caltrop* is the same with what is otherwise called *crows-foot*, by the Latins *murex* [a], the Greeks Τριβολος [b], and the French *chausse trape* [c].—[a *Pitisc*. Lex. Ant. T. 2. p. 238. b *Calv*. Lex. Jur. p. 916. voc. *Tribuli*. c Trev. Dict. Univ. T. 1. p. 1707. voc. *Chausse trape*.]

CALTROP, in botany. See TRIBULUS.

CALUEGIA, in natural history, a name by which some authors have called the *galangal*; an aromatic root used in physic. *Ger*. Emac. Ind. 2. See GALANGALA.

CALVARIA, or CALVA, terms used by anatomists to denote the whole cranium or scull.

In which sense, they include the whole bony and hairy part of the head.

The external parts of the *calva* are the synciput, occiput, vertex, and temples; all invested with hair, and the common integuments of the body.

The *calvaria* in adults consists of eight bones, one of the forehead, another of the occiput, two of the synciput, two of the temples, and two others common also to the upper jaw, *viz*. the cuneiforme and spongiosum. *Barthol*. Anat. l. 3. in Proœm. Item, l. 4. c. 4. *Cast*. Lex. Med. p. 126.

CALVINISTS, a religious sect of Protestants distinguished by their adherence to the principles of calvinism. See CALVINISM, *Cycl*.

Calvinist is a name of reproach, which those to whom it is given generally reject, and assume some other taken not from the name of any man, but from the quality or character of their doctrine; they therefore call themselves the reformed, a title which not only the Roman catholics, but the lutherans contest them. The latter pretend that it belongs more properly to themselves, as being the first who began the reformation. Among catholics, the *calvinists* are called the pretended reformed. In England they go by the name of puritans and presbyterians. Vid. *Radrauf*. Protheor. Theol. P. 1. Sect. 1.

The *calvinists* differ from the lutherans in what relates to the ubiquity of Christ's body, and the presence of Christ in the eucharist; but chiefly in the doctrine of predestination and grace, which makes the great *pomum discordiæ* between the two religions. Vid. *Basn*. Ouvr. des Scav. Mars, 1697. p. 300, seq.

Though 'tis said Luther himself was, in this matter, of the opinion of Calvin; and that his successors have herein departed from their leader. See LUTHERANISM, *Cycl*.

The *calvinists* readily admit the lutherans to their communion, and demand to be admitted to the communion of the lutherans [a]. But 'tis generally refused them, chiefly on account of their doctrine of absolute predestination and particular grace; which, according to the lutherans, absolutely overturn the whole œconomy of the Christian religion [b].—[a Vid. *Turret*. Nubes Testium, in Pref. Bibl. Germ. T. 10. p. 176. Jour. Liter. T. 11. p. 277, seq. b Vid. *Puffend*. Jus Feudale Divin. ap. Ouvr. des Scav. Mars, 1697. p. 303.]

The *calvinists* differ from the zuinglians in what relates to the eucharist; the former only allowing a figurative presence, the latter a real, though spiritual presence. Though M. de Brueys asserts, that the modern *calvinists* have in this point abandoned the sentiment of Calvin and their predecessors, and are become thorough zuinglians. *Brueys*, Entret. Pacif. 1. Bibl. Univ. T. 3. p. 510, seq. and Nouv. Rep. Lett. T. 14. p. 1255. See ZUINGLIANS, *Cycl*.

The *calvinists* agree with the jansenists and thomists in the articles of grace and predestination, at least the modern *calvinists*; who, according to M. Germain, have herein departed from the doctrine of their founder. *Germ*. Tradit. de l'Egli. Rom. sur la Grace. T. 3. Nouv. Rep. Lett. T. 17. p. 351.

Some indeed make a distinction between the followers of Calvin and those of Jansenius, and St. Thomas; in that the former assert necessitating or irresistable grace, the latter only efficacious grace. According to the former we are made to do good or evil, whether we will or no; according to the latter,

latter, the will itself is made to give its consent; so that in the one case we act voluntarily and out of choice, in the other we are driven as by a physical impulse, and a necessity we are not able to resist.

But in reality, the irresistable grace of Calvin is the same with the efficacious grace of Jansenius and the thomists; the difference lying only in the terms. Calvin would have allowed that the will, stirred and excited by grace, yields its consent, and is brought to will and nill, by a sort of charm which does not violate its liberty; at least it is thus the modern *calvinists* explain the opinion of their leader [a]. And what confirms it is, that Calvin drew no consequences from his necessitating grace, which the predeterminants do not draw from their efficacious grace. 'Tis plain the necessity Calvin admits is only a necessity *secundum quid*, not an absolute necessity, or a necessity which does not arise from the nature of the will, but from the nature of grace [b].—[a *Basn.* Ouvr. des Scav. Juill. 1690. p. 479, seq. b Mem. de Trev. an. 1731. p. 112, seq.]

The *calvinists* in their progress have divided into various branches or lesser sects; as into remonstrants and contra-remonstrants, or arminians and gomarists; into supralapsarians and infralapsarians, particularists and universalists, cocceians and voetians, episcopalians and presbyterians. Vid. Bibl. Germ. T. 24. p. 158, seq.

The episcopal government, liturgy, and ceremonies retained in the English church, were antiently a sore offence to the pure *calvinists* of Geneva. But they are become of late better reconciled to them, and now speak of episcopacy and ceremonies in a style very different from that of Calvin and Beza: and the episcopalians seem to meet the Genevois with open arms. This appears from a letter written in 1706, in the name of the church of Geneva, to the university of Oxford; and the answer of that university the same year.

The presbyterians in England, who retain the same doctrine as well as discipline with those of Geneva, were scandalised at those proceedings; apprehending an union intended between the episcopalians and *calvinists* of Geneva, of which they were to be the victim [a]; and published remarks on those letters, wherein they accused messieurs of Geneva with a defection from the principles of their predecessors [b].—[a *Jour.* des Scav. T. 42. p. 437, seq. b Stricturæ Breves in Epistol. D D. Genevens. et Oxoniens. Lond. 1707. 4to.]

CALUMET, among travellers, a mystic kind of pipe used by the American savages as the ensign of peace, and for religious fumigation.

The *calumet* is a sort of tobacco pipe, made of red, black, or white marble. The shank is decorated with rounds of feathers and locks of hair, or porcupines quills: in it they smoke in honour of the sun. F. Lafitau will have it to be the original caduceus of Mercury, of which that used by the Greeks and Romans, with its wings and its serpents, was only the copy.

The *calumet*, is the symbol and security of traffic; by it they pronounce life and death, peace and war: they also ascribe to it a power of raising the souls of the dead. Mem. de Trev. An. 1725. p. 216, seq. Trev. Dict. Univ. T. 1. p. 1358, seq. See CADUCEUS, *Cycl.* and *Suppl.*

CALUMNY, the crime of accusing another falsely, and knowingly of some heinous offence. *Calumnia est malitiosa & mendax informatio.* *Chauv.* Lex. Philos. p. 90. *Non. Marcell.* c. 4. §. 74.

It is an antient maxim, which experience shews but too much truth in, *Audacter calumniare, semper aliquid hærebit.* *Bacon*, de Augm. Scient. l. 8. c. 2.

Oath of CALUMNY, *Juramentum*, or rather *Jusjurandum calumniæ*, among civilians and canonists, was an oath which both parties in a cause were obliged to take; the plaintiff, that he did not bring his charge, and the defendant, that he did not deny it with a design to abuse each other, but because they believed their cause was just and good [a]; that they would not deny the truth nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refused this oath, the complaint or libel was dismissed; if the defendant, it was taken *pro confesso* [b].—[a *Kenn.* Rom. Ant. Not. P. 2. l. 3. c. 17. p. 136. b *Wood*, Inst. Imp. Law. l. 4. c. 1. p. 297.]

This custom was taken from the antient athletæ, who, before they engaged, were to swear that they had no malice, nor would use any fraudulent or unfair means for overcoming the other. *Pitisc.* Lex. Ant. T. 1. p. 331.

The *juramentum calumniæ* is much disused, as a great occasion of perjury. *Wood*, lib. cit. c. 3. p. 314.

Antiently the advocates and proctors also took this oath; but of late it is dispensed with, and thought sufficient that they take it once for all at their first admission to practice.

Judicium CALUMNIÆ was an action brought against the plaintiff in a court for a false and malicious accusation. *Kenn.* Rom. Ant. Not. P. 2. l. 3. c. 17. p. 137.

Where an accuser did not prove his charge, nor seemed to have sufficient or probable grounds for bringing any, the judges in pronouncing sentence used the formula *calumniosus es*; which gave the defendant a right to bring an action of *calumny*; the penalty of which was *frontis inustio*, or burning on the forehead. Vid. *Pitisc.* Lex. Ant. T. 1. p. 331. *Calv.* Lex. Jur. p. 137.

CALX *(Cycl.)*—The more imperfect metals are all extremely subject to be reduced to *calxes*, and receive a destructive change in the fire. This is no where more evidently seen than in the operation of cupelling; in which we find these metals very readily burning to ashes, or else running into glass along with the lead.

On this disposition of metals, indeed, the whole art of cupelling depends; but by the contriving to melt these metals in contact with coals, their metallic form is greatly preserved, especially as the stony vitrifiable matter, wherewith such ores are usually mixed, occasions them, by their clinging nature, to unite more intimately with the glowing coals.

This doctrine receives a remarkable confirmation from the usual method of recovering metals burnt to ashes at the smelting furnace; for if the litharge blown off in testing, or even the glass of lead, or the ashes of any other of the imperfect metals be only melted in contact with charcoal, the *calx* immediately re-assumes its former metalline state; and the same thing is also effected by adding any unctuous or inflammable matter. Whence it seems to be the unctuous or inflammable matter of the coals which thus insinuating itself into the metalline *calces*, restores their metallic nature. *Shaw*'s Lectures, p. 274.

CALX *antimonii*, a name given in the late London dispensatory to the preparation of antimony, called before *antimonium diaphoreticum*. This is made by mixing antimony with three times its weight of nitre, throwing it into a hot crucible; and when removed from the fire, washing it both from its salts and from such parts as have not been well calcined; the washing is to be continued till the water come away tasteless, and the finer part separated for use by pouring off the water turbid, and leaving the coarse particles behind, taking only the sediment of this water. *Pemberton*'s Lond. Disp. p. 233.

CALX *nativa*, in natural history, a native marley earth, which, without burning, has some of the qualities of the artificial lime, and was called by the antients, *gypsum tymphaicum*.

It is a hard, dry, and somewhat coarse earth; it never constitutes a stratum of itself, but is sometimes found in the fissures of other strata, and sometimes lying loose upon or among the laxer strata of gravel and the like. It is usually found in masses of two, three, or four inches in diameter, of irregular surfaces, and generally flatish. It is of a dead whitish colour, with some faint admixtures of a greyish brown; it breaks with a rough surface, is harsh to the touch, adheres very firmly to the tongue, and does not stain the hands; it is of a harsh disagreeable taste, and if thrown into water it makes a considerable bubbling and hissing noise, and has, without previous burning, the quality of making a cement like lime, or plaster of Paris; it makes a considerable efforvescence with aqua fortis, and in burning acquires a pure and fine white. These are the characters by which this is distinguished from all other earths. It is found in some parts of England, and appears to have been well known to the antients, and in common use among them about cloaths. *Hill*'s Hist. of Fossils, p. 42.

CALX, or *Os* CALCIS, in anatomy, the same with calcaneum. See CALCANEUM.

CALX *solis*, denotes calcined gold. See GOLD.

CALX *lunæ*, the *calx* of silver. See SILVER.

CALX *mercurii*, precipitated mercury. See MERCURY.

CALX *veneris*, verdigrease. See VERDIGREASE.

CALX *martis*, the crocus or saffron of iron. See IRON.

CALX *jovis*, the *calx* of tin. See TIN.

CALX *saturni*, is ceruse calcined with spirit of vinegar, or in the sun. *Isaac.* Oper. Miner. c. 42. Theat. Chym. T. 3. p. 297.

CALX *saturni*, is also used for minium or red lead. *Teichmey.* Instit. Chem. P. 2. c. 11. p. 162, seq. *Junck.* Lex. Pharm. P. 1. p. 78, seq. See MINIUM.

CALX *viva*, quick-lime, that on which no water has been cast since its burning, in opposition to *calx extincta*, that slacked by the effusion of water. *Plin.* Hist. Nat. l. 29. c. 3. & l. 36. c. 23. See LIME, *Cycl.* and *Suppl.*

Paracelsus calls the bolar and argillaceous earths, *calces terræ*, as chalk. See BOLE and CHALK.

The same author also gives the denomination *calx* to the chalky matter formed in the joints of gouty persons. *Cast.* Lex. Med. p. 126, seq.

Calxes differ from ashes not only as the former is the effect of calcination, and the latter of mere burning, but as the former is of a more solid consistence than the latter; and that the bodies reduced to a *calx*, as metals and minerals, may frequently be restored out of these *calces*; which can never be done out of the ashes of wood and other bodies consumed by burning. *Casat.* Diss. 10. de igne ap. Nouv. Rep. Lett. T. 12. p. 179. See BURNING and CALCINATION.

Calxes are divided into reducible and irreducible, fixed and volatile. Chemists speak of fire retained and fixed in all *calces* [a], of fixed salt procurable from *calces* [b].—[a Hist. Acad. Sciene. An. 1712. p. 56, seq. b Hist. Acad. Sciene. l. 4. sect. 6. c. 3.] See FIRE, SALT and LIME.

Many metals and some minerals, whose parts are most homogeneous, do not appear to lose their nature with their form.

Thus gold, silver, and quicksilver, cannot be so destroyed by *calcination*, but that they may easily be revived. So out of *calx* of tin, the tin itself may be restored, and the like holds of the *calx* of lead, though the most impure of all metals; and even of antimony, the first substance of which may be extracted either from its *calx* or even glass. So that calcination in such bodies appears but imperfectly performed, many of the particles being so little altered by it that they readily re-assume their natural figure. *Friend*, Chym. Lect. 2. p. 27, seq.

CALX is also the produce of a metalline or mineral substance, consumed by corrosion, called *philosophical calcination*. See CALCINATION and CORROSION.

In respect hereof, *calces* are of two kinds, one procured by ignition, the other by corrosion. The latter again are of different species, some procured by immersion, others by vapour, or corrosive fumes. *Kirch.* Mund. Subter. l. 11. sect. 1. c. 6. T. 2. p. 243.

CALX *viva philosophorum*, denotes that made of quicksilver.

CALX, *lime*, is also made of the bones of large fishes, and from the shells of buccinæ, oisters, and the like burnt. This is more particularly called *calx peregrinorum* and *calx manica alba*. *Vitruv.* Arch. l. 11. c. 5. *Pitisc.* Lex. Ant. T. 1. p. 332. *Fab.* Thes. p. 424. *Rul.* Lex. Alch. p. 130. *Cast.* Lex. Med. p. 126.

CALYBITES, Καλυβιτης, the inhabitant of a cottage, an appellation given to divers saints on account of their long residence in some hut, by way of mortification.

The word is formed from the Greek Καλυπτω, *tego*, I cover; whence Καλυβη, a little cot.—The Romish church commemorates St. John the *calybites* on the 15th of December. *Belland.* Act. Sanct. Jan. T. 1. p. 1029 & 1031. *Du Cange*, Gloss. Græc. T. 1. p. 558. *Magr.* Not. Voc. Eccl. p. 42. Trev. Dict. Univ. T. 1. p. 1359.

CALYCISTÆ, among the botanical authors, such as have established the classes and distinctions of plants upon the differences of the calix or cup of the flower, as Magnol. *Linnæi*, Fund. Bot. p. 2.

CALYCULUS, in antient naturalists, denotes a siliqua or seed-case. *Plin.* Hist. Nat. l. 20. c. 19. Item, l. 27. c. 5. See SILIQUA and CAPSULA.

CALYCULATED, an appellation given by some naturalists to the fruits of those trees which have the calyx of their flower non-deciduous, and whose fruit stands as in a cup. *Dale*, Pharmacol. l. 2. cl. 3. p. 4. Phil. Trans. N° 204. p. 928. See CALYX, FRUIT, PLANT, TREE, *&c.*

CALYPTRA, among botanists, a thin membranous involucrum, usually of a conic figure, which covers the parts of fructification. The capsules of most of the mosses have *calyptræ*. See MOSSES.

CALYX (*Cycl.*)—CALYX, among botanists, a general term expressing the cup of flowers, or that part of a plant which surrounds, incloses, or supports the other parts of the flower.

The cups of flowers are very various in their structure, and are distinguished by the names of *perianthium*, *involucrum*, *spatha* and *gluma*. See PERIANTHIUM, *&c.*

Botanists distinguish two sorts of *calices*, one external, called the *calyx* of the flower; by the antients *perianthium*, as encompassing the flower and seed; the other internal, called the *calyx* of the fruit; by the antients *pericarpium*, as being the capsule which compasses the fruit, and is itself encompassed by the petala.

The external *calyx* may also be divided into two sorts, one which surrounds the flower, another which sustains it, different from the pedicle; in that this latter spreads itself underneath the flower to give room for the nutritious juice to rise more freely; the cavity of the pedicle enlarged, is reputed part of the *calyx* both external and internal.

M. Magnol makes the *calyx* the characteristic of plants, which, according to him, may be better distinguished from the conditions and varieties of their *calyces*, than either of their petala or fruits. Some have only an external, others only an internal, some surrounding, others a supporting *calyx*, all which he makes so many genera or classes. *Magnol*, Nov. Charact. Plantarum, Jour. des Scav. T. 76. p. 525, seq.

Auctus CALYX, in botany, a term used by authors to express one kind of the perianthia of the compound flowers. A cup is thus called when it consists of a single and equal series of scales, which are of an oblong figure and surround the flowers; and another small series of scales, which only surround these, close to the base.

CALYX. The antients have often used this word to express the rose when in the bud, and not yet shewing its petals, except between the segments of the cup.

CALYX, in antient aquæducts, denoted a brazen module or cup, put over a head or castellum, and to which pipes were fitted. Vid. *Pitisc.* Lex. Ant. T. 1. p. 330.

CAMÆA, in natural history, the name of a genus of the semipellucid gems, the characters of which are these: They are obscurely transparent stones approaching to the onyx structure, being composed of zones, and formed on a crystalline basis, but having their zones very broad and thick, and laid alternately on one another with no other matter between. *Hill's* Hist. of Foss. p. 498.

Of this genus we have four known species.

The first is that with broad zones of black and white, called the *camea* by the moderns, and the *Arabian onyx* by the antients. This is only composed of alternate zones, or plates of black and white, and those so debased by earth, that they have been taken for marble by many who have written on this subject: they differ, however, from marble, in that they will not ferment with acids, and will give fire with steel; so that they are truely of a crystalline basis, and properly of the gem class. This stone, in the hands of the lapidaries, makes a very beautiful figure; for they cut a head or other figure in the black zone, and then cutting away all the rest of that surface, leave only a white ground; so that it seems a head of one sort of stone fastened on a plate of another; or else they cut their figure through the black or outer zone to the white one, and leaving the rest of the black zone on, the figure looks as if painted white at the bottom.

The second is the dull broad zoned green and white *camea*, called the *jaspicamea* by the Italians. See the article JASPICAMEO.

The third is the hard *camea*, with broad white and chesnut coloured zones. This is a very elegant and beautiful species, and though now not frequently found, must have been very common among the antient Romans, since many of the antique figures are found engraved on it. It is composed of zones, or plates only of two colours, the one a very bright white and the other a fine bright chesnut colour; and so much approaching to the nature and texture of the cornelian, that were these any cornelians known of that colour, one should readily declare these zones to be of the matter of those stones.

The fourth is the hard *camea*, with broad zones of bluish white and flesh colour, which was the sardonyx of Pliny's time. This is the most elegant, and also the most scarce of all the gems of this kind; and though the common red sardonyx was the stone called by that name in the earliest ages, yet, in the days of Pliny, the same name had been appropriated to this stone, though of a different genus from that originally called so. It is of a very fine texture, and is always found small; it is composed only of two sorts of zones which are laid in thick tables very regularly one over another; the one sort are of a bluish white, or the colour of the common chalcedony, the other of a fine pale red, and truly of the matter of the finest pale cornelians. It is at present very scarce, being found only in the East-Indies, and there but very rarely. Our jewellers are very little acquainted with it; but among the antient Romans it must have been very common, many of the fine antique heads, in the cabinets of the curious, being cut in it. The stone most frequent among our dealers in these things, under the name of the sardonyx, is no other than an agate artificially stained. *Hill's* Hist. of Foss. p. 500.

CAMAHA, in the materia medica, a name given by Avicenna and others to the large truffles found in the deserts of Numidia, and many other parts of Africa, in great abundance. These are white on the outside; the modern Africans call them *terfon*, and are very fond of them; they eat them stew'd with milk, water, and spices, and account them very wholesom and nutritive. *Leo Africanus.*

CAMAIEU (*Cycl.*)—This is also called *gamahe* [a]; the Latins call it *camæus* [b], sometimes *camahutus* and *camahelus*; the Italians *cameo* [c].—[[a] *Jun.* Paint. of Ant. l. 2. c. 1. p. 95. [b] *Du Cange*, Gloss. Lat. T. 1. p. 690. voc. *Camæus*. [c] *Menag.* Orig. p. 151.]

Gattarel derives the word from the Hebrew *chemaija*, water of God, alluding to the appearance of waves visible in several of these stones [a]. Others chuse to deduce it from χαμαι, a word frequently used by the Greeks to express a thing low; alluding to the dents or carvings of these stones, or to the caverns where they are found [b].—[[a] *Gattar.* Curios. Inou. c. 5. p. 76. [b] *Menag.* Orig. p. 151.]

'Tis of these *camayeux* Pliny is to be understood when he speaks of the manifold picture of gems, and the party-coloured spots of precious stones: *Gemmarum pictura tam multiplex, lapidumque tam discolores maculæ. Plin.* Hist. Nat. l. 2. c. 93.

The same naturalist rehearses divers admirable instances of such stones; particularly that of king Pyrrhus, whereon were seen the nine muses, and Apollo holding a lute, each muse with her peculiar attribute: The whole expressed by spots or stains spread over the stone by the hand of nature herself. Id. ib. l. 37. c. 1. *Solin.* Polyhist. c. 12.

Gaffarel speaks of a figure of a crucifix at Venice, represented in a marble so naturally, that the nails, the wounds, nay the very drops of blood were expressed.

Cardan will not allow these pictures to be the mere work of nature, that of Pyrrhus's stone he supposes to have been first painted by some artist on marble, which being long lost, and lying under ground, had changed its nature, and grown into an agate [a]. Gaffarel treats it as a ridiculous conceit, to suppose all the stones of this kind had been painted; and resolves the whole after Albertus Magnus into the influence of the stars: Whence it is that the *camaieux* are said to be more frequent as the countries are hotter, by reason the constellations are there more powerful [b]. — [[a] *Card.* de Subtilit. l. 7. [b] *Albert.* Tract. 3. c. 4. *Gaffar.* c. 5. p. 77. seq.]

CAMAIEU is also frequently applied to any kind of gem, whereon figures may be engraven either indentedly, or in relievo.

In

In this ſenſe the lapidaries of Paris are called in their ſtatutes, *cutters of camayeux*. *Savar.* Dict. Comm. T. 1. p. 532.

A ſociety of learned men at Florence have undertaken to procure all the *cameos* or *camayeux*, and intaglio's in the great duke's gallery to be engraven: they have already begun to draw the heads of divers emperors in *cameo's*. New Mem. of Liter. T. 3. Art. 32. p. 235.

CAMALDULIANS (*Cycl.*) are alſo called *camaldolites*, *camaldulites*, and *camaldulenſes*.

Their habit is white, occaſioned by the viſion of a ladder, to St. Romuald, on which white monks were ſeen to aſcend to heaven. They have no common dormitory nor refectory, their cells being in ſeparate houſes; they only eat together twelve times in the year, nor do they meet at divine offices except on ſundays and holydays. *Gedd.* View of Monks, p. 9. Miſc. Tract. T. 3.

Guido Grandi mathematician of the great duke of Tuſcany, and a monk of this order, has publiſhed *camaldulian* diſſertations, on the origin and eſtabliſhment of it. Diſſertationes *Camaldulenſes*, Luc. 1707, 4°. An extract of it is given in Act. Erud. Lipſ. 1709. p. 49. ſeq.

CAMARA, a name given by Plumier to an American ſpecies of lantana. See LANTANA.

CAMAROSIS, Καμαρωσις, among phyſicians, denotes a fracture of a bone, wherein the two broken ends riſe and form a kind of *camera*, or arch. *Junck.* Conſp. Chir. Tab. 53. p. 340. *Gorr.* Defin. p. 206. *Caſt.* Lex. Med. p. 127. See FRACTURE.

This is alſo called *camaroma*, and by modern latin writers *cameratio*, ſometimes *fornicatio*. — It is commonly reſtrained to fractures of the ſcull.

CAMBERED-*deck*, in ſhip-building, is uſed for one that lies compaſſing, and is by no means proper for a man of war.

CAMBLET (*Cycl.*)—The true or oriental *camblet* is made of the pure hair of a ſort of goat, frequent about Angora, and which makes the riches of that city, all the inhabitants whereof are employed in the manufacture and commerce of *camblets*. *Tournef.* Voy. du Levant. T. 2. Lett. 21. p. 185.

'Tis certain we find mention in middle age writers of ſtuffs made of camel's hair, under the denominations of *cameletum* and *camelinum*; but theſe are repreſented as ſtrangely coarſe, rough, and prickly, and ſeem to have been chiefly uſed among the monks by way of mortification, as the hair ſhirt of later times. *Du Cange*, Gloſſ. Lat. T. 1. p. 699.

We have no *camblets* made in Europe of the goats hair alone; even at Bruſſels, they find it neceſſary to add a mixture of woollen thread. *Savar.* Dict. Comm. T. 1. p. 535, ſeq.

CAMBNITES *lapis*, a name given by the writers of the middle ages to a ſtone of which they record virtues which appear to ſavour too much of imaginary ones, ſuch as the curing the dropſy by being worn tied to the arm: it ſeems to have been only a cloudy and leſs valuable kind of brown cryſtal.

CAMEL, *camelus*, in the Linnæan ſyſtem of zoology. This is a diſtinct genus of animals; the great characters of which is, the want of horns, which all the other genus's of the pecora have.

The animals of this genus are the camel, the dromedary, the bactrianus, and the glama. *Linnæi* Syſtema Naturæ, p. 41.

The characters Mr. Ray has given us of this creature are: that it is one of the unguiculated quadrupeds, chewing the cud, having bifid feet, without horns, and without the foreteeth of the upper jaw, but as all other ruminating beaſts, and having four ventricles.

There are four ſpecies of camels. 1. The camel, with one bunch on its back, called the *dromedary*. 2. The Bactrian *camel*, with two bunches. 3. The Peruvian *camel* called *glama*, and by ſome *elaphocamelos*. And 4. The *pacos*, uſually called the Indian or Peruvian ſheep. *Ray*'s Syn. Quad. p. 143.

The dromedary is principally uſed for riding on, the Bactrian *camel*, or that with two bunches on its back for travelling with loads. See DROMEDARY, &c.

The *camel* is a domeſtic beaſt of burden, of a gentle diſpoſition, much uſed for carriage in divers parts of Aſia; and making the chief riches of the Arabs.

The word is formed from the Greek Καμηλος, which ſignifies the ſame; and according to Nicod, from the Hebrew *gamal*; but according to others from Καμπυλον, on account of the bunch on his back. Trev. Dict. Univ. T. 1. p. 1607. voc. *Chameau*.

In Perſia they only diſtinguiſh two ſorts of *camels*, viz. the ſouthern, which are ſmaller, and not fit to carry above 700 weight; and the northern, which are bigger, and able to carry 12 or 1300 weight.

The name *camel*, among us, is vulgarly reſtrained to that ſort which has but one bunch on the back; the appellation *dromedary* being given to thoſe which have two. In this we follow the example of Solinus [a], contrary to Pliny [b], Ariſtotle, and the generality of antient naturaliſts, who diſtinguiſh two ſorts of *camels*; one of which retains the name of the genus, and has two bunches; chiefly found in the eaſtern parts of Aſia; whence it is alſo called *bactrianus*. The others, which are ſmaller and fitter for the courſe, are hence called δρομαδες, *dromedaries*, having but one bunch, and chiefly found in the weſtern parts of Aſia, *viz.* Syria and Arabia [c].—[a *Solin.* Polyhiſt. c. 49. p. 76. b Vid. *Plin.* Hiſt. Nat. l. 8. c. 18. c *Salmaſ.* Exerc. ad Solin, p. 309 & 987. Mem. Nat. Hiſt. Anim. p. 27.]

The bunch on the *camel*'s back is uſually ſaid to be a callous ſort of fleſh. The academiſts of Paris found it mere hair; and that when this was preſſed cloſe down, the creature appeared no more bunch-back'd than a ſwine.

Pliny affirms, that the *camel* can endure four days without drink [a]; whence Perſius gives it the appellation *Sitiens*. *Tolle recens primus pipere ſitiente camelo* [b].—[a *Plin.* Hiſt. Nat. l. 8. c. 18. *Fab.* Theſ. p. 426. b *Perſ.* Sat. 5. v. 136.]

Tavernier aſſures us, on his own knowledge, that it will endure nine days without drink; and even in the coupling ſeaſon, forty days without either drink or meat [a]. In order to this, the *camel* is ſaid to have a great number of reſervoirs in his ſtomach, wherein he lays up water for future occaſions. This is contradicted by the jeſuits, who, diſſecting many *camels* in China, found no ſuch thing. Yet it is confirmed by the royal academiſts, who, in the ſecond ventricle of a dromedary diſſected by them, found ſeveral ſquare holes, which were the orifices of about twenty cavities, made like ſacks, placed between the two membranes, which compoſe the ſubſtance of the ventricle [b].—[a *Tavern.* Voy. T. 1. p. 117. *Hardouin*, Not. ad Plin. l. 8. c. 18. b Mem. for Nat. Hiſt. Anim. p. 39, ſeq.]

'Tis even pretended, that travellers in the laſt extremity of thirſt, open their *camels* for a ſupply of water. But this is doubtleſs a fable. Mem. Acad. Scienc. An. 1693. p. 316.

The Arabs, Perſians, and other oriental nations, eat the fleſh of *camels*; which is a delicacy ſerved up at the beſt tables. Phil. Tranſ. N° 218. p. 156, ſeq. *Plin.* Hiſt. Nat. l. 11. c. 41. *Athen.* l. 4. *Ariſtot.* Hiſt. Anim. l. 6. c. 26. *Herodot.* in Clio. *Calmet.* Dict. Bibl. T. 1. p. 350.

Camel's milk is ſaid to be ſovereign againſt the dropſy, for which purpoſe the Arabs drink a pint per day for three weeks. Native ſal armoniac is commonly ſuppoſed to be the urine of *camels*. See ARMONIAC.

Camels caſt their hair in the ſpring, which is gathered up with great care, on account of the traffic thereof, which is very conſiderable. When left bare of hair, they pitch them over to defend them from the flies.

They ſpin the *camel*'s hair and weave it into ſtuffs: it is ſometimes alſo uſed with other hairs in making of hats. The beſt hair is that from the *camel*'s back. *Savar.* Dict. Comm. T. 1. p. 631. voc. *Chameau*.

Camels are the chief vehicles in caravans. See CARAVAN, *Cycl.* and *Suppl.*

They are very apt to ſlide; for which reaſon, in paſſing ſlippery ways, their leaders ſtrew carpets under them, ſometimes to the number of 100 one before another.

As ſoon as a *camel* is brought forth, they tie his four feet under his belly, put a carpet over his back and ſtand on the borders of it that he may not be able to riſe for twenty days. Thus is he taught the habit of bending his knees to reſt himſelf, or when he is to be loaded or unloaded. They dreſs him with a ſwitch inſtead of a curry comb; with this they beat him as they would do a carpet to clear it of the duſt. *Calm.* Dict. Bibl. T. 1. p. 351.

The *camel* that carries Mahomet's ſtandard, which the caravan of pilgrims offer yearly on the tomb of their prophet, is exempted the reſt of its life from all ſervice. 'Tis even pretended that this happy beaſt will riſe again at the general reſurrection, and enjoy the pleaſures of paradiſe. Trev. Dict. Univ. T. 1. p. 1607.

On medals, the *camel* is the ſymbol of Arabia, when found on the coins of any other nation. Thus on a medal of the gens Plautia, we find a woman's head with a mural crown, *A. Plautius Æd. Cur. S. C.* and on the reverſe, *Judæus*; and in the exergue, *Bacchius*; the deviſe, a man on his knees holding with his right hand a *camel* by the bridle, and with the left, a branch of palm. It alſo denotes alliance with Arabia. Vid. Trev. Dict. loc. cit.

CAMEL, in mechanics, a kind of machine uſed in Holland for raiſing or lifting ſhips.

The *camel* was invented by a burgo-maſter of Amſterdam, towards the cloſe of the laſt century. It took the denomination from its heavineſs or ſtrength. Vid. *Aubin*, Dict. Mar. p. 187, ſeq.

Its uſe is to raiſe veſſels, in order to bring them over the Pampus, which is at the mouth of the river Y, where the ſhallowneſs of the water hinders large ſhips from paſſing. Vid Jour. des Scav. T. 67. p. 300, ſeq. where its ſtructure is deſcribed.

CAMEL is alſo a denomination given to a kind of pit-coal, otherwiſe called *canel*. Stat. abr. 8° T. 6. tit. Rivers, §. 33, & 135. See CANEL-*coal*.

CAMELS *hay*, *fœnum camelorum*, an appellation given to the plant *ſcœnanthus*, or *juncus odoratus*. *Quinc.* Pharm. P. 2. Sect. 1. n. 12. p. 71. See SCÆNANTH.

CAMELEON (*Cycl.*)—This is not the only animal poſſeſſed of the property of changing its colour; Grew mentions another ſort of lizzard, which, when he ſwells with anger, changes his colour from green to a kind of ruſſet [a]. The like is ſaid of the naque mouſche, an inſect in the iſland of Nevis [b].—[a *Grew*, Muſ. Reg. Societ. P. 1. ſect. 2. c. 3. p. 47. b Bibl. Univ. T. 6. p. 249.]

The bird of paradiſe is ſometimes called *chamæleon aerius*, the aerial camæleon. *Grew*, Muſ. Reg. Societ. P. 1. Sec. 4. p. 56.

There is ſomething very extraordinary in the motion of the *camæleon*'s tongue, which, in order to catch flies for the creature's food, is darted out to ſuch a length as even to equal that of the whole animal; and on being drawn in, contracts again into a very ſmall compaſs. To account for this in a mechanical way, is a problem not eaſy to be ſolved, as there appear no muſcles adequate to the effect. Mr. De la Hire, however, thinks the tongue of the *camæleon* muſt be provided with two kinds of muſcles, the one circular, and the other longitudinal; by the action of the former whereof it is extended, and by that of the latter contracted again. By this mechaniſm worms extend and contract themſelves in a no leſs remarkable proportion than the tongue of the *camæleon*. Vid. *De la Hire* Mecanique, Prop. 112. p. 240, ſeq

See further concerning the hiſtory and phænomena of the *camæleon*, *Wheel*. Voy. Greece, l. 3. p. 239, ſeq. Bibl. Univ. T. 13. p. 236, ſeq. Jour. des Sçav. T. 83. p. 494, ſeq. *Grew*, Muſ. Reg. Societ. P. 1. Sec. 2. c. 3. p. 40, ſeq. Acad. Scien. Mem. for Nat. Hiſt. Anim. p. 17. ſeq. Extracts of which are given in Phil. Tranſ. N° 49. p. 991, ſeq. Jour. des Sçav. T. 2. p. 533, ſeq. *Du Hamel*, Hiſt. Acad. Scient. l. 1. Sect. 11. c. 2. p. 126, ſeq. See alſo *Valiſnieri*, Iſtoria del cameleonte Affricano, Venez. 1715. 4°; of which an extract is given in *Giorn.* de Letter. d' Ital. T. 23. Art. 2. p. 28, ſeq.

CAMELITA *bos*, in natural hiſtory, the name of a ſpecies of wild bull, deſcribed by Geſner, remarkable for having a bunch upon his back like that of the camel, and probably the ſame with that of the biſon. *Geſner*, de Quad.

CAMELLIA, in botany, a name given by Linnæus to a genus of plants mentioned in Kempfer's Japan, under the name of *tſubaki*. The characters of the genus are theſe: the perianthium is compoſed of ſeveral leaves, and is of a roundiſh figure, and imbricated, being formed of a number of roundiſh ſcales, the internal ones growing gradually larger than the others, and all of them hollowed and deciduous.

The flower is compoſed of five petals of an oval figure, and growing together at the baſe. The ſtamina are a great number of filaments that ſtand erect, and are formed in the lower part into a ſort of corona, which is larger than the ſtyle. They are free at the top, and are ſhorter than the flower; the antheræ are ſimple; the piſtil has a roundiſh germen, the ſtyle is pointed, and of the ſame length with the ſtamina, and the ſtigma is acute and bent; the fruit is a turbinated woody capſule, with ſome furrows on its ſurface. *Linn.* Gen. Pl.

CAMELOPARDALUS, in zoology. See ZURNAPA.

CAMELOPARDALUS in aſtronomy, a new conſtellation of the northern hemiſphere, formed by Hevelius, conſiſting of 32 ſtars firſt obſerved by him, ſituate between Cepheus, Caſſiopeia, Perſeus, the two bears, and draco. Vid. *Hevel.* Firmam. Sobieſc. fig. O. ejuſd. Prodrom. Aſtron. p. 278, ſeq. *Wolf.* Lex. Math. p. 297.

The name and figure are taken from thoſe of an animal in Æthiopia, taller than an elephant, though not ſo bulky; in the head and neck reſembling a camel, but ſpotted like a leopard: whence the denomination of *camelopardos*, *camelopardalus*, or *camelopardalis*, q. d. camel-leopard. See ZURNAPA.

CAMELUS, the *camel*, in zoology. See CAMEL.

CAMERA (*Cycl.*)--CAMERA *Æolia*, a contrivance for blowing the fire, for the fuſion of ores, without bellows; by means of water falling through a funnel into a cloſe veſſel, which ſends from it ſo much air or vapour, as continually blows the fire: if there be the ſpace of another veſſel for it to expatiate in by the way, it there lets fall its humidity, which otherwiſe might hinder the work. See BELLOWS, *Cycl.* and *Suppl.*

This contrivance was named *camera Æolia* by Kircher. *Hook*, Phil. Coll. N° 3. p. 80.

CAMERA *lucida*, a contrivance of Dr. Hook for making the image of any thing appear on a wall in a light room, either by day or night.

Oppoſite to the place or wall, where the appearance is to be, make a hole of at leaſt a foot in diameter, or if there be a high window with a caſement of this dimenſion in it; this will do much better without ſuch hole, or caſement opened. At a convenient diſtance, to prevent its being perceived by the company in the room, place the object or picture intended to be repreſented, but in an inverted ſituation. If the picture be tranſparent, reflect the ſun's rays by means of a looking glaſs, ſo as that they may paſs through it towards the place of repreſentation; and to prevent any rays from paſſing aſide it, let the picture be encompaſſed with ſome board, or cloth. If the object be a ſtatue, or a living creature, it muſt be much enlightened by caſting the ſun's rays on it, either by reflection, refraction, or both. Between this object and the place of repreſentation put a broad convex glaſs ground to ſuch a convexity as that it may repreſent the object diſtinctly in ſuch place. The nearer this is ſituate to the object, the more will the image be magnified on the wall, and the further the leſs; ſuch diverſity depending on the difference of the ſpheres of the glaſſes. If the object cannot be conveniently inverted, there muſt be two large glaſſes of proper ſpheres, ſituate at ſuitable diſtances, eaſily found by trial, to make the repreſentations erect. This whole apparatus of object, glaſſes, &c. with the perſons employed in the management of them, are to be placed without the window or hole, ſo that they may not be perceived by the ſpectators in the room, and the operation itſelf will be eaſily performed. Phil. Tranſ. N° 38. p. 741, ſeq.

CAMERLINGO, or CAMARLINGO, the chamberlain of the pope's court, or he who has the adminiſtration of the apoſtolical chamber.

The word imports as much as keeper of the chamber, or treaſure; though the *camerlingo* has divers other juriſdictions which have no relation to the office of treaſurer. The name antiently denoted a cubicularius, or gentleman of the bed-chamber; but this is now expreſſed by *cameriere*. Vocab. Acad. Cruſc. T. 2. p. 215.

The *camerlingo* is the moſt conſpicuous officer in the court of Rome; by reaſon all the revenues of the holy ſee are managed by the chamber of which he is preſident. *Trev.* Dict. Univ. T. 1. p. 1366.

This office was antiently performed by the archdeacon of Rome, a dignity which was ſuppreſſed by pope Gregory the 7th, as of too great power and intereſt; inſomuch that he could often controul the pontiff himſelf, and generally by his intrigues raiſed himſelf to the papacy. In his ſtead was placed a cardinal, under the title of *camerlingo*, who is aſſiſted in his function by twelve prelates called clerks of the chamber, *clerici di camera*. *Magri*, Notiz. de voc. eccles. p. 42. ſeq. *Du Cange*, Gloſſ. Lat. T. 1. p. 703.

The cardinal *camerlingo*, on the death of a pope, does not enter the conclave with the reſt, to aſſiſt at the election of a new one, but ſtays without, keeps poſſeſſion of the pope's apartments in the vatican, and whenever he goes abroad is attended with the ſwiſs guards, like the pope himſelf [a]. He even coins money in his own name, and with his own arms; and, in fine, is a kind of vice pope, governing the eccleſiaſtical ſtate during the vacancy of the holy ſee [b]. — [a] *Trev.* loc. cit. [b] *Miſt.* Miſc. Lett. T. 4. p. 230. ſeq.

The cardinals have alſo their *camerlingo*, or treaſurer of their college, diſtinct from that of the pope: the former is elected every year, whereas the latter is for life. The perſon choſe to this office has the receipt of all the revenues belonging to the college, which he is to diſtribute at the end of the year in equal portions to the cardinals then at Rome; thoſe who are abſent having no ſhare therein after they have been ſix months from court. Jour. des Sçav. T. 37. p. 360.

CAMERONIANS, a ſect or party in Scotland who ſeparated from the preſbyterians in 1666, and continued to hold their religious aſſemblies in the fields.

The *cameronians* took the denomination from Richard Cameron, a famous field preacher, who refuſing to accept the indulgence to tender conſciences, granted by king Charles IId. as ſuch an acceptance ſeemed an acknowledgment of the king's ſupremacy, and that he had before a right to ſilence them, made a defection from his brethren, and even headed a rebellion, in which he was killed. His followers were never entirely reduced till the revolution, when they voluntarily ſubmitted to king William.

The *cameronians* adhered rigidly to the form of government eſtabliſhed in 1648. Vid. Bibl. Angl. T. 14. p. 240, ſeq.

CAMERONIANS, or CAMERONITES, is alſo the denomination of a party of calviniſts in France, who aſſerted that the will of man is only determined by the practical judgment of the mind; that the cauſe of mens doing good or evil proceeds from the knowledge which God infuſes into them; and that God does not move the will phyſically, but only morally, on virtue of its dependence on the judgment of the mind.

They had this name from John Cameron, a famous profeſſor, firſt at Glaſgow, where he was born in 1580, and afterwards at Bourdeaux, Sedan, and Saumur; at which laſt place he broached his new doctrine of grace and free-will, which was followed by Amyraut, Cappel, Bochart, Daille, and others of the more learned among the reformed miniſters, who judged Calvin's doctrine on theſe heads too harſh.

The *cameronians* are a ſort of mitigated calviniſts, and approach to the opinion of the arminians. They are alſo called *univerſaliſts*, as holding the univerſality of Chriſt's death; and ſometimes *amyraldiſts*

The rigid adherents to the ſynod of Dort, accuſed them of pelagianiſm, and even manicheiſm. The controverſy between the two parties was carried on with a zeal and ſubtilty ſcarce conceivable; yet all the queſtion between them was only, whether the will of man is determined by the immediate action of God upon it, or by the intervention of a knowledge which God impreſſes into the mind? The ſynod of Dort had defined that God not only illumines the underſtanding, but gives motion to the will, by making an internal change therein. Cameron only admitted the illumination, whereby the mind is morally moved, and explained the ſentiment of the ſynod of

Dort ſo as to make the two opinions conſiſtent. *Du Pin*, Bibl. des Ant. Separ. T. 22. p. 335, ſeq. Mem. de Trev. 1714. p 626. *Le Clerc*, Bibl. Univ. T. 4. p. 348.

CAMES, a name given to the ſmall ſlender rods of caſt-lead, of which the glaziers make their turned lead.

Their lead being caſt into ſlender rods of 12 or 14 inches long each, is called the *came*; ſometimes alſo they call each of theſe rods a *came*, which being afterwards drawn through their vice, makes their turned lead. *Neve*, Build. Dict. in voc.

CAMILLI and CAMILLÆ, in antiquity, boys and girls of ingenuous birth, who miniſtred in the ſacrifices of the gods; and eſpecially thoſe who attended the flamen dialis, or prieſt of Jupiter. Vid. *Macrob.* Saturn. l. 3. c. 8. *Serv.* ad Virg. Æn. l. 11. v. 542. *Feſt.* de Verb. Signif. p. 29. *Scalig.* in Feſt. ejuſd. Conject. ad Varr. Item, Caſtigat. ad Propert. l. 4. *Piriſc.* Lex. Ant. T. 1. p. 334. *Fab.* Theſ. p. 427.

The word ſeems borrowed from the language of the antient Hetrurians, where it ſignified miniſter, and was changed from *caſmillus*. *Boch.* Hieroz. l. 2. c. 36. Ejuſd. Canaan. l. 1. c. 12. *Trev.* Dict. Univ. T. 1. p. 1366.

The Tuſcans alſo gave the appellation *Camillus* to Mercury, in quality of miniſter of the gods.

CAMINI, or *yerva* CAMINI, an American herb, the ſame with what is otherwiſe called *paraguay*, or *yerva con-pallos*. *Savar.* Dict. Comm. p. 537. See PARAGUAY.

CAMIS, or KAMIS, in the Japoneſe theology, denote deified ſouls of antient heroes, who are ſuppoſed ſtill to intereſt themſelves in the welfare of the people over whom they antiently commanded.

The *camis* anſwer to the heroes in the antient Greek and Roman theology, and are venerated like the ſaints in the modern Romiſh church.

Beſides the heroes or *camis* beatified by the conſent of antiquity, the mikaddos, or pontiffs, have deified many others, and continue ſtill to grant the apotheoſis to new worthies; ſo that they ſwarm with *camis*: the principal one is *Tenſio Dai Sin*, the common father of Japan, to whom are paid devotions and pilgrimages extraordinary. *Kæmpf.* Hiſt. Japan. ap. Bibl. Angl. T. 15. p. 58 and 64, ſeq.

CAMLET, a kind of ſtuff, otherwiſe called *camblet*. See the article CAMBLET.

CAMLETINE, in commerce, denotes a ſlight, narrow kind of camblet, little valued. See CAMBLET.

The name is alſo given to a ſlender ſort of ſtuff made of hair mixed with wool, in imitation of a *camblet*. *Savar.* Dict. Comm. T. 1. p. 537.

CAMMOROS, in botany, a name given by ſome of the old writers to the poiſonous plant called by the Romans *cicuta* or hemlock.

Cacomoros was a common name among the Greeks for hemlock, and this *cammoros* is the ſame word, only ſpoke according to the Doric dialect.

As hemlock was a poiſonous plant, it ſoon became a cuſtom to call other poiſonous plants alſo by its name, and *cammoros* became hence a name for the mandrake, and ſome of the nightſhades, with ſome authors. Dioſcorides has called one kind of aconite or wolf's-bane by this name, and others have adapted it to other ſuch plants; but the more judicious have only given it as an additional epithet to theſe, expreſſing their being poiſonous, and have added the peculiar name of the plant before it.

Many of the moderns, and even ſome among the antients, have erred greatly in confounding the *cammoros* with the *cammaros*. Hippocrates has mentioned this poiſonous *cammoros*, and Galen reading it *cammaros*, or confounding it with that word, ſays that Hippocrates cannot have meant to ſay this of the root of the poiſonous aconite of Dioſcorides, called *cammoros*, (which however he certainly does mean) but of the inſect which he calls *cammaros*, and which, he ſays, is like a ſmall ſhrimp, and whoſe body reſembles the figure of the root of this aconite.

This is a very erroneous expoſition of Galen, for the plant is certainly meant by Hippocrates, not the animal; and though the Greeks had two of the aconites whoſe roots they ſaid reſembled the bodies of animals, the one the ſcorpion, and the other the ſhrimp, being fringed with ſmall fibres as that inſect is with feet; the other, or ſcorpion kind being bare; yet the latter of theſe was never called *cammarus* by any author, though the former generally was.

CAMP *(Cycl.)*—The order and contrivance of the Roman *camp* was admirable. Its figure was a ſquare divided into two principal parts: in the upper part, were the generals pavilion, or prætorium, and the tents of the chief officers; in the lower, thoſe of the inferior degree were placed.

On one ſide the prætorium ſtood the queſtorium, or apartment of the treaſurer of the army, and near this, the forum, both for a market-place, and the aſſembling of councils. On the other ſide of the prætorium were lodged the legati, and below it, the tribunes had their quarters, oppoſite to their reſpective legions. Aſide of the tribunes were the præfecti of the foreign troops, over againſt their reſpective wings; and behind theſe were the lodgments of the evocati, then thoſe of the extraordinarii and ablecti equites, which concluded the higher part of the camp.

Between the two partitions was a ſpot of ground called *principia*, for the altars and images of the gods, and probably alſo the chief enſigns.

The middle of the lower partition was aſſigned to the Roman horſe; next to whom were quartered the triarii, then the principes, and cloſe by them the haſtati; afterwards the foreign horſe, and laſtly, the foreign foot. *Kenn.* Rom. Ant. P. 2. l. 4. c. 12. p. 211, ſeq.

They fortified their *camp* with a ditch and parapet, which they termed foſſa and vallum: in the latter, ſome diſtinguiſh two parts, *viz.* the agger or earth, and the ſudes or wooden ſtakes driven in to ſecure it.

The *camps* were ſometimes ſurrounded with walls made of hewn ſtone; and the tents themſelves formed of the ſame matter.

Mr. Thoresby gives the deſcription of a Roman chiſſel, uſed in cutting ſtones and other materials ſerviceable for building their *camps*. Phil. Tranſ. N° 323. p. 407.

The Spartan *camp* was of a circular figure, which was preſcribed by Lycurgus as the beſt fitted for defence, contrary to the Roman rule, whoſe *camps* were always quadrangular. All angular forms were rejected by Lycurgus, by reaſon the angles are neither fit for ſervice, nor defenſible, unleſs guarded by a river, mountain, wall, or other work. *Pott.* Archæol. Græc. l. 3. c. 8. T. 2. p. 70.

In the Grecian *camps*, the moſt valiant of the ſoldiers were placed at the extremities; the reſt in the middle, that the ſtronger might be as a guard to the weaker, and ſuſtain the firſt onſets. Thus Achilles and Ajax are poſted by Homer at the ends of the Grecian *camp* before Troy, as bulwarks on each ſide. *Hom.* Il. λ. v. 806.

In *camps* for continuance, they erected altars to the Gods, places for public aſſemblies, courts of juſtice, and the like.

According to Plutarch, the Lacedæmonians alone had no ſtage-players, buffoons, dancers, or ſongſtreſſes in their *camps*. Yet the Spartan lawgiver allowed his people greater liberty in the *camp* than in the city, to allure them to ſerve with more delight in the wars. Hence their exerciſes were more moderate, their fare leſs hard, and their actions leſs ſeverely noted when in the field than at home; ſo that they were the only people in the world to whom war gave repoſe. *Plut.* in Cleom. Item, in Lycurg. *Pott.* Archæol. Græc. l. 3. c. 8. p. 72.

Yet the magnificence of the Turkiſh court appears more in the *camp* than in the ſeraglio: the tents of the great officers appear ſo many palaces, both for extent, ornament, and coſtly furniture; having all the accommodations both of city and country. Each grandee has two ſets of tents; one of which is advanced a conac, or days journey before the other; ſo that leaving one tent in the morning, they find another ready-furniſhed in the evening.

In the front of the Turkiſh *camp* are quartered the janizaries, and other foot, whoſe tents encompaſs their aga. In the rear are the quarters of the ſpahis and other horſemen. The body of the *camp* is poſſeſſed by the ſtately tents or pavilions of the vizier or general, reis effendi or chancellor, kahija or ſteward, the tefterdar baſcha or lord treaſurer, and kapiſler kahiaſee or maſter of the ceremonies.

In the middle of theſe tents is a ſpacious field, wherein are erected a building for the divan, and a hafna or treaſury. *Rycaut*, Preſ. Stat. Ottom. Emp. l. 3. c. 11. p. 204.

When the ground is marked out for a *camp*, all wait for the pitching of the tent *lailac*, the place where the courts of juſtice are held; it being the ſituation of this that is to regulate the diſpoſition of all the reſt. *Marſigl.* Stato Milit. delle Imper. Ottom. c. 20. Mem. de Trev. 1733. p. 1136.

The Arabs ſtill live in *camps*, as the antient Scenites did. The *camp* of aſſyne emir, or king of the country about Tadmor, is deſcribed by a traveller who viewed it, as ſpread over a very large plain, and poſſeſſing ſo vaſt a ſpace, that though he had the advantage of a riſing ground he could not ſee the utmoſt extent of it. His own tent was near the middle, ſcarce diſtinguiſhable from the reſt, except that it was bigger, being made, like the others, of a ſort of hair-cloth. Phil. Tranſ. N° 218. p. 154.

Flying CAMP is uſed for the ground on which a flying body is encamped. *Guill.* Gent. Dict. P. 2. in voc.

Summer CAMP, *caſtra æſtiva*, among the Romans, was ordinarily light and moveable; ſo that they might be ſet up or taken down, and removed in a night. In which caſe it was alſo called ſimply *caſtra*.

Standing CAMP, *caſtra ſtativa*, was that wherein they deſigned to continue longer in a place; and therefore more pains was taken to fortify and regulate it. *Veget.* de re milit. l. 3. c. 8. The Roman *camps*, in a march, were alſo called in the middle age *manſiones*. *Horſl.* Brit. Rom. l. 1. c. 7. p. 100, ſeq.

Winter CAMP, *caſtra hyberna*, or winter quarters, were uſually taken up in ſome city or town; or elſe ſo contrived as to make almoſt a town of themſelves.

The Roman *camps* ſometimes gave the origin to cities, which were formed of them, and often took their denomination from thoſe whoſe *camps* they had been. This chiefly happened when an army continued long in a place, eſpecially in the winter, where they were obliged to build many works, and fortify themſelves exactly. Thus the *Caſtra cornelia*, a city of Africa, not far from Utica [a], was originally the *camp* of Cornelius Scipio [b].—[a *Cæſ.* bell. civ. l. 2. c. 25 and 27. b Liv. l. 29. c. 35.]

Antiquarians

Antiquarians obſerve, that all the modern towns among us, whoſe names end in ceſter, or cheſter, were originally theſe *caſtra hyberna* of the Romans.

Mooned CAMPS, *caſtra lunata*, thoſe made in figure of a half-moon. *Pitiſc.* Lex. Ant. T. 1. p. 376.

Tertiated CAMPS, *caſtra Tertiata*, thoſe which were a third part longer than broad, which Hyginus repreſents as the Roman model. *Schel.* in Hygin. *Græv.* Thæſ. Art. R. T. 10. p. 1087. *Caſtra in quantum fieri potuerit tertiata eſſe debebant — ut puta in longum duo millia quadringenti, in latum mille ſexcenti pedes. Pitiſc.* Lex. Ant. T. 1. p. 377.

Naval CAMP, *caſtra nautica*, or *navalia*, denoted a ſtation of ſhips. *Cæſ.* Bell. Gall. l. 5. c. 22.

City CAMP, *caſtra urbana*, was a place near the city wall, not far from the *via nomentana*, where the prætorian guards were encamped; whence it was alſo called the *pretorian camp*, *caſtra prætoria*, or *prætoriana* [a]. The like we alſo read of at Jeruſalem, called by St. Luke abſolutely the *camp*, παρεμβολη [b]. By which we are doubtleſs to underſtand the *caſtra antonia*, which Joſephus tells us, was afterwards uſed as a caſtle [c].—[a *Suet.* in Claud. c. 21. *Capitol.* in Vit. Balbin, c. 10. Vet. Schol. Juven. ad Sat. 10. v. 95. *Tacit.* Ann. l. 4. c. 1. b *Luke*, c. 21. v. 34 and 37. c *Fab.* Theſ p. 485.]

CAMP is alſo uſed among the Siameſe and Eaſt-Indians, for a quarter of a town aſſigned to foreigners, wherein to carry on their commerce.

In theſe *camps*, each nation forms itſelf a kind of city apart, in which their ſtore houſes and ſhops are, and the factors and their families reſide.

The Europeans at Siam, and in moſt other cities of the Eaſt, are exempted from this reſtraint, and allowed to live in the cities or ſuburbs, as they find them moſt commodious. *Savar.* Dict. Comm. T. 1. p. 538, ſeq.

CAMP *Duty*, in its utmoſt extent, includes every part of the ſervice performed by the troops during the campaign. But in a more particular ſenſe, denotes the guards ordinary and extraordinary kept in *camps*. *Bland*, Milit. Diſcipl. c. 15. P. 1. p. 206.

A great part of the *camp duty* is performed in the ſame manner as that of a gariſon.

CAMP *Colour-men*, are ſoldiers appointed to attend and aſſiſt the quartermaſter general, in marking out and keeping the *camp* clean, receiving and diſtributing proviſions, *&c.*

The *camp colour-men*, are drawn a man out of a company, and are exempt from all other duty during the campaign: each carries either a ſpade or a hatchet. *Bland*, Milit. Diſcipl. c. 17. Art. 3. p. 247, ſeq.

CAMP *fight*, or KAMP-*fight*, in law writers, denotes the trial of a cauſe by duel, or a legal combat of two champions in the field, for deciſion of ſome controverſy. *Kenn.* Gloſſ. ad Paroch. Antiq. voc. *Bellum*. *Coke*, 3. Inſtit. p. 221.

In the trial by *camp-fight*, the accuſer was, with the peril of his own body, to prove the accuſed guilty; and by offering him his glove, to challenge him to this trial, which the other muſt either accept of, or acknowledge himſelf guilty of the crime whereof he was accuſed.

If it were a crime deſerving death, the *camp-fight* was for life and death: if the offence deſerved only impriſonment, the *camp-fight* was accompliſhed when one combatant had ſubdued the other, ſo as either to make him yield, or take him priſoner. The accuſed had liberty to chuſe another to fight in his ſtead, but the accuſer was obliged to perform it in his own perſon, and with equality of weapons.

No women were permitted to be ſpectators, nor men under the age of 13. The prieſt and the people who looked on, were engaged ſilently in prayer, that the victory might fall to him who had right. None might cry, ſhriek, or give the leaſt ſign; which in ſome places was executed with ſo much ſtrictneſs, that the executioner ſtood ready with an ax to cut off the right hand or foot of the party that ſhould offend herein.

He that being wounded, yielded himſelf, was at the others mercy either to be killed or ſuffered to live. But if life were granted him, he was declared infamous by the judge, and diſabled from ever bearing arms, or riding on horſeback. *Verſteg.* Reſtit. Dec. Intell. c. 3. p. 51.

CAMP-*Law*, a method of deciding controverſies by duel or *camp*-fight. See CAMP-*fight*.

CAMP *Diſeaſes*, *morbi caſtrenſes*, thoſe chiefly prevalent in armies. Under *camp*, or *field diſeaſes*, come the plague, malignant fever, ſcurvy, flux, *&c.* Willius, phyſician to the king of Denmark, has a treatiſe on *camp diſeaſes*. De Morbis Caſtrenſibus Internis. Hafn. 1676, 4to. Phil. Tranſ. N° 136. p. 918. See DISEASE.

The *camp diſeaſe*, *morbus caſtrenſis*, abſolutely ſo called, is a malignant fever. Dudley Digges died of the *camp diſeaſe*, which raged in the gariſon at Oxford, in 1643 [a]. On which Ed. Greaves, phyſician to K. Charles II. has a treatiſe expreſs under the title of *Morbus Epidemicus*, or the New Diſeaſe [b].—[a *Wood.* Ath. Oxon. T. 2. n. 37. p. 32, ſeq b Oxon. 1643. Vid. *Wood.* lib. cit. n. 528. p. 669.]

CAMP *Fever*, *febris caſtrenſis*, a ſpecies of malignant and contagious fever, uſually epidemical, thus denominated by reaſon ſoldiers in *camp* are more than ordinary liable to it *Nenter.* Fund. Medic. T. 2. tab. 150. c. 22. p. 633.

The *camp fever* is the ſame with what is otherwiſe called the hungarian fever, and bears a near affinity to the petechial fever. See FEVER.

CAMP *Flux*, a name frequently given to the dyſentery; not as if it were of a different kind in armies, but by reaſon it is more uſual there than elſewhere.

CAMPANA-*floræ*, in botany, a name given by Helwing and ſome other of the German authors to the plant we call *pulſatilla*, or the *paſque flower*. It was named *campana floræ*, or Flora's bell, by Helwing, becauſe of its being the ſignal of the approach of ſpring, and as it were the caller forth of the other flowers.

This author has written a compleat treatiſe on this plant. He obſerves, that the antients did not know the name *pulſatilla*, but that it was given to it by the Italians, from the pulſatile motion of the long threads of down which are faſtened to its ſeeds, and are thrown into a tremulous undulation by every breath of wind. Dioſcorides ſeems to have made it an anemone, and Pliny calls it limonium, a word very likely to occaſion much miſunderſtanding in the haſty reader, as we know a very different plant at this time under that name; and many others have ranked it among the ranunculi or crowfoots.

We generally find the *pulſatilla* on dry and barren places, as ſandy hills, ſterile downs, and the like; but this author tells us, that in Pruſſia, it is moſt frequent in woods, and among pines and firs, and often is found in a looſe, ſpungy, and wet ſoil. There is in Pruſſia, a very remarkable ſpecies of it, according to this author, which has a white flower; the leaves are of the jagged kind, and reſemble thoſe of the anemone, and the back part of the petals is tinged with a faint blue.

The whole genus of the *pulſatillas*, are of an acrid and cauſtic quality, approaching to that of the ranunculus; and if they are given internally, without proper correctors, are poiſonous; but like the colchicum root, and ſome other of thoſe cauſtic plants, when given with proper mixtures, and in proper doſes, it proves a very valuable alexipharmic: externally it is of great ſervice in cleanſing foul ulcers. *Helwing*, de Campana Floræ.

CAMPANIAN *Diſeaſe*, *morbus campanus*, in antiquity [a], is variouſly explained by modern writers. Some will have it only a ſort of tubercles, or warts on the face, to which the people of Campania were liable [b]. Others maintain it to be the venereal diſeaſe; and hence draw an argument againſt the ſuppoſed novelty of that malady [c]. Dacier will have it to be ſomething ſtill worſe; the Campanians, it ſeems, were addicted to a ſort of commerce too abominable to be named; *ore morigeri erant*. Whence it is, Plautus repreſents them as more pathic or paſſive, than the Syrians themſelves [d].—[a *Hor.* Sat. 5. l. 1. v. 62. b Vid. Jour. des Scav. T. 33. p. 1229. *Heder.* Schul. Lex. p. 667. c Jour. des Scav. loc. cit. d *Dacier*, Not. ſur Hor. ſat. 5. l. 1. v. 62.]

CAMPANIFORMIS *Flos*, in botany, the term uſed for a flower reſembling a bell in ſhape, and making the character of one of Mr. Tournefort's genus's.

He defines the *campaniform* flower to be compoſed of one leaf, and form'd into the ſhape of a bell, but with ſome differences in the figure, which conſtitute four ſubordinate ſpecies. 1. The bell-flower, ſimply ſo called, which approaches to no other figure but that expreſſed by that name. 2. The tubular narrow kind, which is always conſiderably long. 3. The expanded kind, which opens very wide at the extremity, and repreſents, in ſome degree, a diſh or baſon. And, 4. The globular bell-flower, the mouth of which is narrower and ſmaller than the belly. See Tab. 1. of Botany, Claſs 1. *Tournefort's* Inſt. p. 76.

CAMPARCIUM. See CHAMPART.

CAMPANOLOGIA, the art or ſcience of ringing bells.

An anonymous author has publiſhed a *campanologia* improved, or the art of ringing made eaſy, by plain and methodical rules, and directions for ringing all manner of double, triple, or quadruple changes, with variety of new peals upon 5, 6, 7, 8 and 9 bells; as alſo the method for calling bobs for any peal of triples from 168 to 2500; (being the half peal) alſo for any peal of quadruples or cators, from 324 to 11340. Lond. 1703. 12°.

CAMPANULA, in botany, the name of a very large genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the ſhape of a bell, whence the plants of this genus have the Engliſh name *bell-flower*. The flower is divided into ſeveral ſegments at the end, and its cup finally becomes a membranous fruit divided into three or more cells, with an axis fixed in the commiſſure, and furniſhed with three placentæ, to which adhere a great numbers of ſeeds. In ſome ſpecies theſe are extremely ſmall, in others, they are larger, flat and oval, and ſurrounded with a ſort of ring; theſe are diſperſed abroad, when ripe, through a hole which each cell has. See Tab. 1. of Botany, Claſs 1. *Tourn.* Inſt. p. 108.

The ſpecies of this genus enumerated by Mr. Tournefort are theſe: 1. The greateſt broad-leaved blue *campanula*, with large flowers, called by ſome authors trachelium or throatwort. 2. The great broad-leaved *campanula*, with white flowers. 3. The great broad-leaved *campanula*, with grey flowers. 4. The great broad-leaved *campanula*, with pale red flowers. 5. The

great broad-leaved *campanula*, called by authors *trachelium giganteum*, or giant throatwort. 6. The common rough nettle-leaved *campanula*. 7. The purple-flowered rough nettle-leaved *campanula*. 8. The double-flowered rough nettle-leaved *campanula*. 9. The white-flowered rough nettle leaved *campanula*. 10. The double-white nettle-leaved *campanula*. 11. The long-leaved nettle *campanula*, with ſmoother leaves. 12. The ſmoother long-leaved nettle *campanula*, with white flowers. 13. The tall pyramidal *campanula*, called rampions. 14. The alpine pyramidal *campanula*, with leaves like vipers bugloſs. 15. The ſmooth alpine *campanula*, with very pale blue flowers. 16. The white-flowered Bononian *campanula*. 17. The ſmall pyramidal *campanula*. 18. The great flowered *campanula*, with leaves like thoſe of lampſana or nipplewort. 19. The tuberous-rooted *campanula* of the Canaries, with leaves like thoſe of the atriplex. 20. The field *campanula*, with roots like thoſe of the garden rampions. 21. The garden *campanula*, with long leaves and flowers. 22. The white-flowered garden *campanula*, with long leaves and flowers. 23. The pale whitiſh-flowered garden *campanula*, with long leaves and flowers. 24. The purple-flowered garden *campanula*, with long leaves and flowers. 25. The variegated blue and white garden *campanula*, with long leaves and flowers. 26. The blue-flowered double *campanula*, with long leaves and flowers. 27. The middle-ſized *campanula*, with the lower leaves hoary. 28. The Spaniſh cut-leaved *campanula*, with long flowers. 29. The long-leaved alpine *campanula*, with ſhining leaves. 30. The cluſter-flowered wild *campanula*. 31. The cluſter-flowered white field *campanula*. 32. The field *campanula*, with ſingle flowers placed at diſtances on the ſtalks. 33. The white-flowered field *campanula*, with ſcattered flowers. 34. The round-headed alpine *campanula*. 35. The round-headed hairy alpine *campanula*, with roundiſh leaves. 36. The common round-leaved *campanula*. 37. The alpine *campanula*, with an angular leaf, like that of the teucrium. 38. The echium-leaved *campanula*, with hairy flowers. 39. The alkanet-leaved *campanula*, with long flowers. 40. The large flowered ſtone *campanula*, with leaves like thoſe of echium. 41. The hoary alpine *campanula*, with a pyramidal ſpike of flowers. 42. The umbellated *campanula*, with long hairy leaves. 43. The tall alpine hairy *campanula*, with a ſmall flower. 44. The alpine *campanula*, with leaves like thoſe of goats beard. 45. The red cluſter-flowered meadow *campanula*. 46. The purple-flowered globular-headed alpine *campanula*. 47. The large-flowered white ſtone *campanula*, with echium leaves. 48. The curled echium-leaved ſtone *campanula*. 49. The peach-leaved *campanula*. 50. The double blue peach-leaved *campanula*. 51. The white-flowered peach-leaved *campanula*. 52. The double white peach-leaved *campanula*. 53. The great narrow-leaved wood *campanula*, with large flowers. 54. The leſſer narrow-leaved large-flowered wood *campanula*. 55. The ſmall-flowered narrow-leaved wood *campanula*. 56. The branched white ſmall-flowered *campanula*. 57. The blue *campanula*, with eatable roots, called the eſculent rampions. 58. The white-flowered *campanula*, with eſculent roots. 59. The little American *campanula*, with rigid leaves and a white wide flower. 60. The little alpine *campanula*, with a pyramidal ſpike of flowers. 61. The hairy daiſy-leaved *campanula*. 62. The little flax-leaved alpine *campanula*. 63. The ſcarcer flax-leaved blue *campanula*. 64. The dwarf creeping alpine *campanula*, with large flowers. 65. The ſtone *campanula* of Crete, with daiſy-like leaves, and a large flower. 66. The common ſmall round-leaved *campanula*. 67. The white-flowered common ſmall round-leaved *campanula*. 68. The little round-leaved *campanula*, with a ſingle flower at the end of each ſtalk. 69. The leaſt round-leaved alpine *campanula*. 70. The leaſt round-leaved *campanula*. 71. The ivy-leaved *campanula*. 72. The thyme-leaved *campanula*. 73. The black-flowered broad-leaved alpine *campanula*. 74. The ſmall annual *campanula*, with jagged leaves. 75. The white-flowered ſmall cut-leaved annual *campanula*. 76. The long rooted round-leaved *campanula*. 77. The little round-leaved *campanula*, with a large pentangular flower. 78. The roundiſh ſerrated-leaved *campanula*. 79. The hairy *campanula*, with leaves like baſil, each ſurrounding the ſtalk, and pendulous flowers. 80. The dwarf narrow-leaved ſingle-flowered Portugal *campanula*. 81. The upright field *campanula*, called by many viola arvenſis, is the field violet. 82. The procumbent field *campanula*. 83. The long and broad-leaved field *campanula*. 84. The ſmall field *campanula*, with hairy ſeed-veſſels. 85. The upright field *campanula*, with a white flower. 86. The large-leaved Thracian field *campanula*. 87. The perfoliate field *campanula*. *Tourn.* Inſt. p. 110, 111, 112.

The different ſorts of this plant make beautiful ornaments for chimnies, and other places, being very tall, very much branched, and full of large and beautiful flowers, which retain their beauty a long time.

They are propagated by ſowing their ſeeds in March, in a bed of light and undung'd ſoil, or by parting the roots; but the latter method being the more expeditious, is moſt practiſed. Almoſt every ſlip, taken from the roots in September, and in March, will thrive; but the plants raiſed from ſeeds are ſeen to produce the fineſt flowers: they are very tedious, however, this way, being three or four years before they flower. They ſhould, therefore, be tranſplanted the September after their ſowing into nurſery-beds, which ſhould be of a light ſoil and not wet; they ſhould be ſet here at ſix inches ſquare, and in froſty weather, the whole beds ſhould be covered with mats, which will greatly ſtrengthen the roots. In the September of the third year, they ſhould be removed into pots, and ſheltered, during the ſevere weather, in glaſs frames; or elſe in wet weather, the pots muſt be turned ſideways; and in very cold, they muſt be ſet under a warm wall, and covered with haulm, and ſurrounded with a little dung on the outſides of the pots, to preſerve the roots from the froſts. Theſe plants will often ſucceed without this care, but with it they produce their flowers in ſuch beauty and plenty, as amply to reward it. *Miller's* Gard. Dict.

CAMPECHE *Wood (Cycl.)* ſeems to ſome to be the ſame with what is otherwiſe called *braſil*. *Jour.* des Scav. T. 86. p. 551. Nouv. Rep. Lett. T. 26. p. 518. See BRASIL, *Cycl.*

It takes the former denomination from the city *Campeche*, about which it grows in greateſt plenty.

CAMPECHIA, in botany, the name by which Sir Hans Sloane has called the logwood-tree, called by Linnæus *hæmatoxylum*. See HÆMATOXYLUM.

CAMPESTRE, in antiquity, a ſort of cover for the privities, worn by the Roman ſoldiers in their field exerciſes; being girt under the navel, and hanging down to the knees.

The name is ſuppoſed to be formed from *campus*, the field or place where the Roman ſoldiers performed their exerciſes. *Turneb.* Adverſ. l. 27. c. 22. *Pitiſc.* Lex. Ant. T. 1. p. 337. *Du Cange*, Gloſſ. Lat. T. 1. p. 724. Trev. Dict. Univ. T. 1. p. 1371.

CAMPHOR *(Cycl.)*—It has been diſputed to what ſpecies of vegetable juices *camphor* properly belongs? ſome will have it a gum, others a reſin, others a volatile ſalt. Phil. Tranſ. N° 389. p. 322.

But *camphor* is well known to be a vegetable production, and much has been written of it by the chemiſts, yet we do not ſeem to have any ſatisfactory account of it, either as to the manner in which it is collected in the Indies, or as to what it truly is; and while we readily acknowledge it a vegetable production, yet it is odd, that we cannot produce any other ſubject perfectly like it, either from the animal, vegetable, or mineral kingdoms.

It is evident, that it is neither a ſalt nor a gum, ſince it is not ſoluble in water; nor is it a reſin, ſince it does not yield by diſtillation either a phlegm or oil, or an acid ſpirit, as all reſins do; much leſs does it leave a caput mortuum like thoſe bodies. It totally vaniſhes and evaporates in the open air; in hot water, it firſt runs and then evaporates, and in ſpirit of wine, or ſpirit of nitre, it wholly diſſolves. It is no oil, becauſe it is not unctuous to the touch, but is a firm, dry, cryſtalliz'd matter; in its evaporation in the air, it leaves no remainder; and in cloſe veſſels over the fire, it riſes entire without diſtillation, and appears at the top of the veſſel in a dry form. It leaves no caput mortuum, is ſubject to no ſeparation of parts, and takes no empireumatic ſmell; in mixing with concentrated ſpirit of nitre, it makes no ebullition, but placidly reſolves into a ſort of oil. This is extremely different from the effect of all vegetable oils, which are known to efferveſce violently with this acid, and ſome even to take fire, and are finally converted by it into a dry reſin. *Camphor* is therefore an inflammable ſubſtance, ſui generis, an artificial, ſublimated, dry, white, pellucid, and cryſtallized body, acrid to the taſte, of an aromatic ſmell, extremely fragrant, brittle, and eaſily evaporable by fire, or in a warm air. When broken, it appears bright, ſmooth, and ſaponaceous, but not unctuous to the touch; it conſiſts of a copious inflammable principle, a ſmall portion of water, and yet leſs of a very fine and ſubtile earth, mixt intimately together. Act Eruditor, 1727. p. 524.

The common ways of keeping it from evaporation, are by burying it in linſeed, millet, pepper, or the like, but the rational way is, by keeping it from the external air; this is beſt done by wraping it up in a paper or bladder, and putting it then into a leaden box, or an earthen, or glaſs veſſel ſet in a cool place. Or it may be preſerved in large quantities, only by papering it up carefully, and putting it in wooden veſſels in a cellar. Notwithſtanding that it is a body ſo nicely and intimately combined, in its own texture, yet it is ready at all times for medicinal uſe; and as it is not eaſy to give it any preparation, ſo it needs none. In its natural ſtate, it readily mixes with all oils and inflammable ſpirits, and this without fear of evaporation; it has no change of colour in ſolution with ſpirit of nitre, but when diſſolved with oil of vitriol, it becomes brown, and finally, red; and if water be added to either of theſe ſolutions, the *camphor* is precipitated in its proper and ſolid form: it may, however, be abſolutely diſſolved, by long maceration and frequent drawing over by the retort, with either of theſe menſtruums.

The two medicinal preparations of *camphor*, in uſe now in the ſhops, are the ſolution of it in wine and in oil; the one called camphorated ſpirit of wine, the other, oil of *camphor*.

The preparation of the firſt is by bare mixture, and requires no diſtillation, whether ſalt of tartar be or be not added to it.

The oil of *camphor*, is either prepared by ſolution, or ſublimation; the firſt is, either by diſſolving *camphor* in ſome ex-

preſſed vegetable oil, or by ſeparating the oil which ſwims upon the ſurface of a ſtrong ſolution of *camphor*, in ſpirit of wine. To prepare the other, one part of *camphor* is to be mixed with three parts of bole armenic, and put over the fire in a retort. The ſublimed *camphor*, is to be again mixed with freſh bole, and this ſo often repeated till no more *camphor* is found to be ſublimed in the proceſs; from this, the liquid matter, ſeparated by diſtillation, is to be ſeparated, and the oil preſerved. Act. Eruditor. 1727. p. 523.

Camphor may alſo be diſſolved in oil of turpentine, or mixed with Venice ſoap, and thus diſtilled, and finally, rectified. All theſe oils are ſtrongly empireumatic, and therefore the *camphor*, in its natural ſtate, is greatly preferable to them all. *Camphor* water, and the flowers of *camphor*, are alſo greatly inferior to the crude ſubſtance. When *camphor* is to be mixed with powders, it ſhould be gently moiſtened, in the rubbing, with ſpirit of wine; when it is to be mixed with aqueous menſtruums, it ſhould be rubb'd with blanched almonds, or incorporated with the yolk of an egg.

The uſual way of extracting *camphor* from the tree, is by cutting the root in ſmall pieces, and putting them in a veſſel, covering them with water, cloſing the veſſel with a ſtraw covering, and making a gentle fire under it; the volatile parts are ſublimed and caught, and condenſed by the covering, and formed into cakes of *camphor*. *Bradl.* Dict. Bot. in voc.

Some naturaliſts aſſert, that beſides the common *camphor*, another may be procured from the root of the cinnamon tree, the zedoary of Ceylon, ſome ſpecies of roſemary, ſouthern wood, and other aromatic plants; which is, in ſome meaſure, confirmed by the experiments of Mr. Neuman, chemiſt of the king of Pruſſia; who has produced a true denſe chryſtali-form *camphor*, poſſeſſed of all the qualities, except the ſmell, of the oriental *camphor*, from the common garden thyme. Phil. Tranſ. N° 389. p. 323, ſeq.

But Mr. Brown, ſoon after, made remarks on Mr. Neuman's paper, and mentioned ſeveral experiments, by which it appeared, that common *camphor* differed conſiderably from that cryſtalliform ſubſtance ariſing from thyme. Phil. Tranſ. N° 389 and 390.

Camphor is ſometimes purified by diſſolving it in ſpirit of wine, and then diſtilling the ſpirit from it, the *camphor* being afterwards melted in glaſſes, is formed into cakes of the form of the glaſſes. Act. Acad. Nat. Curioſ. Vol. 5. Obſ. 98.

Dr. Shaw recommends a mixture of nitre and *camphor*, as a quieter, inſtead of opium. Chem. Lect. p. 234.

The learned Fr. Hoffman extols the virtues of *camphor* given internally, as a moſt excellent diſcutient, reſiſting putrefaction, and as the chief alexipharmic. He adviſes it in malignant fevers, and in the venereal diſeaſe: in inflammations he adds nitre. See his Diſſertation, *De camphoræ uſu interno ſecuriſſimo et præſtantiſſimo.* Oper. T. 6. p. 60.

Kempfer deſcribes a ſort of laurel, growing in the weſtern parts of Japan, called by the literati *ſſio*, by the populace, *kus noki*, which yields *camphor*. The extracting it is the work of the peaſants in the province of Satzuma, and the neighbouring iſlands, Gotho, &c. where the tree is plentiful. They chop the wood and roots ſmall, boil them in an iron veſſel, over which is put a large earthen capital, furniſhed with a beak: as the reſin or *camphor* riſes into the capital, it gathers and hangs on the ſtraw placed there to receive it. Vid. *Kæmpf.* Amæn. Exot. Faſc. 5. cl. 1. p. 770. *Seba.* Theſ. Rer. Natur. T. 1. Fig. 33. Bibl. Raiſ. T. 12. p. 372.

Though the virtues of *camphor* are in many caſes very great, yet Boccone gives us a remarkable inſtance of its efficacy in external applications, which ſeems to argue that the uſe of this medicine is not free from danger. A certain empiric being ſent for to a woman, who, after a ſevere fit of an apoplexy, had fallen into a palſy of the whole left ſide; he anointed her from head to foot every morning and evening on that ſide, with *camphor* diſſolved in ſpirit of wine, and other things: in the whole time of his uſing this medicine, which was ſix weeks, he employed no leſs than twelve pounds of *camphor*. This vaſt quantity had no ſenſible effect upon the woman, nor at all relieved her in the diſeaſe. She was with child all the while, and went her proper time when ſhe was delivered of a ſon ſeemingly perfect, but that all his bones were ſoft and flexible; the bones of his legs and arms ſeeming like tendons. The child lived eighteen months, and the bones never hardened. This being a ſingle inſtance, it is not eaſy to ſay, with any degree of certainty, whether it was owing to the *camphor*; though there ſeems ſome room to believe that it was. *Boccone* Muſeo de Piante.

Principles of CAMPHOR.—Mr. Lemery, in his analyſis of this drug, made it his great care to ſeparate its principles without the intervention of any foreign ſubſtance, that he might be aſſured of having them pure and genuine; but he found it impoſſible ever to ſucceed perfectly in this attempt. He found that its principles were an oil and a volatile ſalt; but that theſe were ſo intimately united together in the mixt, that they were not to be perfectly ſeparated by any pains in this manner, but always afforded ſimple ſolutions, or ſimple ſublimations. The *camphor* he uſed, was the rough or native kind; and the reſult of his experiments was as follows:

Camphor is not ſoluble in aqueous liquors, but in ſulphureous ones; which is a property common with it to all ſulphureous ſubſtances, at leaſt ſo far as they are ſulphureous. If a ſolution of *camphor*, in ſpirit of wine, be ſet on fire, the flame will be bluiſh at firſt. This is owing to the ſpirit of wine, which naturally burns firſt. As this conſumes, the *camphor* will be ſeen collecting itſelf into a maſs; and when the ſpirit is all burnt away, the flame will not ceaſe, but only will appear white, becauſe the *camphor* alone is burning. If a ſtrong ſolution of *camphor* be mixt with water, the *camphor* will ſeparate itſelf in form of a white butter, the ſpirit being, when ſo weakened, no longer able to retain it in ſolution.

If a ſolution of *camphor*, in ſpirit of wine, be mixed with ſpirit of ſal armoniac, made with ſalt of tartar, the whole is immediately converted into a ſnow-white, tolerably firm ſubſtance; but if the ſpirit of ſal armoniac, made with lime, be uſed, there is only found a ſlight precipitation, which is diſſolved again in a little time. Oil of tartar, though an alkali not leſs powerful than the ſpirit of ſal armoniac, produces no change at all in the ſolution of *camphor*. Spirit, or oil of turpentine, and oil of olives both diſſolve *camphor*, both being ſulphureous liquors: each of theſe, however, is capable of diſſolving only a fourth part of its own weight. In diſtilling theſe ſeveral ſolutions of *camphor*, its proportionate weight to the ſolvents was found; for it is certain, that a body lighter than another will riſe before it in diſtillation; that two bodies equally light, will riſe together. Thus Mr. Lemery found, that *camphor* was heavier than ſpirit of wine; equally heavy with oil of turpentine, and lighter than oil of olives. Mem. Acad. Par. 1708.

This is the hiſtory of the ſolutions of *camphor* in ſulphureous fluids, but it was alſo proper to examine the effects of acid, and alkaline liquors upon it. Oil of tartar, and ſpirit of ſal armoniac, were both tried in vain as ſolvents, neither diſſolving any part of it. Spirit of vitriol, ſpirit of alum, and diſtilled vinegar, are alſo as unable to diſſolve it; and in attempting a ſolution of it over the fire in theſe liquors, the *camphor* ſublimes away from them, and ſticks to the head of the matraſs unaltered.

The black oil of vitriol, containing ſome ſulphur, diſſolves *camphor* in the proportion of four parts of the liquor, to one of the ſubſtance; and good ſpirit of ſalt, diſſolves it imperfectly in the proportion of three parts to one; but it is perfectly ſoluble in ſpirit of nitre, and requires only twice its own weight of that liquor: and it is to be obſerved, that *camphor* is the only known reſin that is ſoluble in this menſtruum. This ſolution is called *oil of camphor*.

CAMPHOR *Julep*. See JULEP.

CAMPHOR *Oil*. See OIL *of camphor*.

CAMPHORATA, a medicinal plant, called in Engliſh, ſtinking ground pine; reputed cephalic and nervine; though little uſed in the modern practice. *Quinc.* Pharmac. P. 2. Sect. 1. n. 3. See CHAMÆPITYS.

It takes the name from its ſmell, which bears ſome reſemblance to that of camphor.

The *camphorata Monſpelienſis*, growing by the road ſides in Langueduc, and eſpecially about Montpelier; has been lately produced as a ſpecific for the dropſy and aſthma. M. Burlet has given its hiſtory and analyſis. Vid. Hiſt. Acad. Scienc. An 1703. p. 65, ſeq.

CAMPHORATED, denotes a thing tinctured, or impregnated with camphor. See CAMPHOR.

Spirit of wine *camphorated*, is a remedy frequently applied externally in caſes of inflammations, &c.

CAMPICURSIO, in the antient military art, a march of armed men for ſeveral miles, from and back again to the camp, to inſtruct them in the military pace. This exerciſe was nearly akin to the *decurſio*, from which it only differed, in that the latter was performed by horſemen, the former alſo by foot. *Aquin.* Lex. Milit. T. 1. p. 155.

CAMPIDOCTORES, or CAMPIDUCTORES, in the Roman army, were officers who inſtructed the ſoldiery in the diſcipline and exerciſes of war, and the art of handling their weapons to advantage. Theſe are alſo ſometimes called *campigeni*, and *armidoctores*. Vid. *Salmaſ.* de. re Milit. c. 6. *Du Cange*, Gloſſ. Lat. T. 1. p. 714. *Pitiſc.* Lex. Ant. T. 1. p. 338. *Kenn.* Rom. Ant. P. 2. l. 4. c. 13. p. 215. *Aquin.* Lex. Milit. T. 1. p. 155.

CAMPIDUCTOR, Καμπιδεκτωρ, in middle age writers, ſignifies the leader or commander of an army, or party. *Du Cange*, Gloſſ. Lat. T. 1. p. 715. Item, Gloſſ. Græc. T. 1. p. 566. voc. Καμπιδεκτωρ.

CAMPIPARS. See CHAMPART.

CAMPITÆ, in church hiſtory, an appellation given to the donatiſts, on account of their aſſembling in the fields for want of churches. *Du Cange*, Gloſſ. Lat. T. 1. p. 727. See DONATISTS, *Cycl.*

For a ſimilar reaſon, they were alſo denominated *montenſes* and *rupitani*.

CAMPINSA, in botany, a name given by Myrepſus and others to the plant we call *ſcabious*.

It was more uſually written *ſcampinſa*, and was a barbarous Greek word formed of the Latin *ſcabioſa*, by the common

practice of changing o into u, and b into mp; thus ſcabioſa becomes ſcampiuſa, and without the initial ſ, *campiuſa*.

CAMPOIDES, in botany, a name given by Rivinus to a plant compriſed by Linnæus under the genus of ſcorpiurus, the ſerpioides of other authors. *Rivin.* 4. 115.

CAMPUS, (*Cycl.*) in antiquity, a field or vacant plain in a city not built on, left vacant either on account of ſhews, combats, exerciſes, or other uſes of the citizens. *Fabric.* Deſcrip. Urb. Rom. c. 8. *Pitiſc.* Lex. Ant. T. 1. p. 388.

CAMPUS *martius*, a large plain field in the ſuburbs of antient Rome, lying between the quirinal and capitoline mounts, and the Tyber, thus called becauſe conſecrated to the god Mars, and ſet apart for military ſports and exerciſes, to which the Roman youth were trained; as the uſe and handling of arms, and all manner of feats of activity.

Here were the races run, either with chariots or ſingle horſes; here alſo ſtood the villa publica, or palace for the reception of ambaſſadors, who were not permitted to enter the city. Many of the public comitia were held in the ſame field, part of which, for that purpoſe, was cantoned out. The place was alſo nobly decorated with ſtatues, arches, columns, porticos, and the like ſtructures. *Pitiſc.* Lex. Ant. T. 1. 339. *Kenn.* Rom. Ant. P. 2. l. 1. c. 4. p. 47. *Schoet.* Lex. Antiq. p. 259.

CAMPUS *martius* is alſo uſed in a more general ſenſe by middle age writers, for any large plain open place near a great city, wherein the inhabitants were trained to the exerciſe of arms.

Of ſuch we find mention at Verona, Triers, Dornic, and even Conſtantinople. *Du Cange*, Gloſſ. Lat. T. 1. p. 730. *Schoet.* Lex. Ant. p. 260.

Among the French, *campus martius* was an appellation given to the yearly aſſemblies of the people called by the kings, either for enacting new laws, or deliberating on the great affairs of the nation. They were thus denominated, either becauſe uſually held in the month of March, or in imitation of the *campus martius* of the Romans, which was alloted for the like uſe. In aftertimes, they were called *campus majus*, and by corruption, *campus madius* and *magius*, by reaſon the time of holding them was altered by Pepin to the month of May. *Le Gendre*, Meurs des Franc. p. 12. Item, T. 1. p. 409. Trev. Dict. Univ. T. 1. p. 1610. voc. *Champ.*

F. Daniel takes the *campus martius* to have denoted, not the aſſembly, but the place where the general review of the forces was made; which, according to this hiſtorian, was ſo called, not as being the particular name of any field, for that their reviews were held ſometimes in one place, ſometimes in another, but in honour of Mars; who, among the heathens, was adored as the god of war. *Daniel*, Hiſt. de Franc. T. 1. p. 7.

Under the third line of kings, their aſſemblies took the denomination of ſtates general, *etats generaux*.

CAMPUS *ſceleratus*, a place without the walls of antient Rome, where the veſtals, who had violated their vows of virginity, were buried alive. *Kenn.* Rom. Ant. P. 2. l. 2. c. 6. p. 70.

CAMSHALL, a word uſed in Zetland to denote the *os ſapiæ*, which is ſometimes found on the ſhores of that iſland. Phil. Tranſ. N° 473. Sect. 8.

CAMURI, in zoology, the name of a ſea-fiſh of the lupus or baſſe kind, common in the ſeas and larger rivers of America. It grows to about two foot long, and a foot thick.

Its head is monſtrouſly large, and its mouth extremely wide; it has a large and ſtrong fin on its back, which is armed with ſharp prickles, and has a furrow in the back behind it, into which the fiſh can lay it down upon occaſion; its ſides are yelloviſh, and its belly white; its fins of a browniſh yellow, and its ſide lines, which run from the gills to the tail, broad and of a fine black. *Willoughby*, Hiſt. Piſc. p. 273.

CAN, in the ſea language.—A pump's *can*, is a ſort of wooden jug or pitcher, wherewith ſeamen pour water into pumps to make them work. *Guill.* Gent. Dict. P. 3. in voc.

CANADA *ſtag*, *cervus canadenſis*, the ſame with the Virginian deer. See Tab. of Quadrupeds, N° 9. and the article DEER.

CANADA *worm*. See WORM.

CANAL, *canalis*, in general, denotes a long, round, hollow inſtrument, through which a fluid matter may be conveyed.

In which ſenſe, it amounts to the ſame with what we otherwiſe call a pipe, tube, channel, &c.

CANAL more particularly denotes a kind of artificial river.

Canals are contrived for divers purpoſes; ſome for forming a communication betwixt one place and another, as the *canals* between Bruges and Ghent, or between Bruſſels and Antwerp; others for the decoration of a garden, or houſe of pleaſure, as the *canals* of Verſailles, Fontainbleau, St. James's Park, &c. Others are made for draining wet and marſhy lands; which laſt, however, are more properly called water-gangs, ditches, drains, &c. *Ozan.* Dict. Math. p. 362.

Egypt is full of *canals*, dug to receive and diſtribute the waters of the Nile, at the time of its inundation. They are dry the reſt of the year, except the *canal* of Joſeph, and four or five others, which may be ranked as conſiderable rivers. Mem. des Miſſ T. 7. p. 115, ſeq.

There were alſo ſubterraneous *canals*, dug by an antient king of Egypt, whereby thoſe lakes, formed by the inundations of the Nile, were conveyed into the Mediterranean.

M. Gaudereau attributes the frequency of the plague in Egypt of late days, to the decay, or ſtopping up of theſe *canals*; which happened upon the Turks becoming maſters of the country. Jour. des Scav. T. 71. p. 561, ſeq.

CANALS *of communication* are artificial cuts, uſually furniſhed with locks and ſluices, and ſuſtained by banks or mounds, in order to make a quicker paſſage and ſhorten the way between one place and another, by means of veſſels. *Davil.* Courſ. d'Archit. P. 2. p. 444.

Store of navigable *canals* and rivers, is one of the marks of good policy in a country; in which reſpect, Italy, the Netherlands, and France, but eſpecially China, abound, as much as England is defective.

We have but one remarkable *canal*, and that made by other people, and ſuffered to decay by ourſelves. By this I mean, that antient *canal* from the river Nyne, a little below Peterborough, to the river Witham three miles below Lincoln; called by the modern inhabitants *caerdike*; which may be ranked among the monuments of the Roman grandeur, though 'tis now moſt of it filled up. It was 40 miles long; and ſo far as appears from the ruins, muſt have been very broad and deep; ſome authors take it for a Daniſh work Morton will have it made under the emperor Domitian. Urns and medals have been diſcovered on the banks of this *canal*, which ſeem to confirm that opinion. *Mort.* Nat. Hiſt. Northampt. c. 10. Mem. de Trev. an 1714. p. 846.

In China, there is ſcarce a town or village but has the advantage either of an arm of the ſea, a navigable river, or a *canal*, by which means navigation is rendered ſo common, that there are almoſt as many people on the water as the land. Nouv. Relat. de la Chin. c. 9. Nouv. Rep. Lett. T. 14. p. 1195.

The *canal of Languedoc*, called alſo the *canal of the two ſeas*, as ſerving to join the Mediterranean and Cantabrian ſeas, was firſt propoſed under Francis I. but begun and finiſhed under Louis XIV. By means of it, a ready communication is made between the two fertile provinces of Guyenne and Languedoc. The *canal* is 64 leagues long, extended from Narbonne to Tholouſe, and receiving ſeveral little rivers in the way, ſupported at proper intervals with 104 ſluices. In ſome places it is conveyed over aquæducts and bridges of incredible height, built on purpoſe, which give paſſage underneath to other rivers. What is moſt extraordinary is, that in ſome places for a mile together, a paſſage is dug for it through the rock. The expence was thirteen millions of livres, of which the king contributed near ſeven millions; the province of Languedoc the reſt. Vid. *Savar.* Dict. Comm. Supp. p. 110, ſeq. Atlas Marit. p. 67.

The *canal of Briere*, called alſo *canal of Burgundy*, makes a communication between the Loire and the Seine, and ſo to Paris; to the great advantage of all this part of France, and even to Burgundy itſelf. Atlas Marit. p. 55, ſeq.

The *canal of Orleans* was begun in 1675, for eſtabliſhing a communication between the Seine and the Loire. It is conſiderably ſhorter than that of Briere, having twenty ſluices.

The *canal of Bourbon* was but lately undertaken; its deſign being to make a communication from the river Oiſe to Paris. *Savar.* Dict. Comm. Supp. p. 110, ſeq. Atlas Marit. p. 67.

The *new canal of the lake Ladoga*, cut from Volhowa to the Neva, whereby a communication is made between the Baltic, or rather ocean, and the Caſpian ſea, was begun by the czar Peter I. in 1719: by means of it, the Engliſh and Dutch merchandiſe are eaſily conveyed into Perſia without being obliged to double the Cape of Good Hope [a]. There was a former *canal* of communication between the Ladoga lake and the river Wolga, whereby timber, and other goods had been brought from Perſia to Petersburg; but the navigation of it was ſo dangerous, that a new one was reſolved on [b].—[[a] Journ. des Scav. T. 82. p. 401. [b] New Mem. of Liter. T. 1. p. 383.]

The *canal of Egypt*, for a communication between the Nile and the Red-ſea, was begun, according to Herodotus, by Necus ſon of Pſammeticus, who deſiſted from the attempt on an anſwer from the oracle, after having loſt ſix ſcore thouſand men in the enterprize. It was reſumed and compleated by Darius ſon of Hyſtaſpes, or according to Diodorus and Strabo, by Ptolemy Philadelphus; who relate, that Darius relinquiſhed the work on a repreſentation made to him by unſkilful engineers, that the Red-ſea being higher than the land of Egypt, would overwhelm and drown the whole country [a]. It was wide enough for two galleys to paſs a-breaſt; its length was four days ſailing [b]. Diodorus adds, that it was alſo called *Ptolemy's river*; that this prince built a city at its mouth on the Red-ſea, which he called *Arſinoe* from the name of his favourite ſiſter; and that the *canal* might be either opened or ſhut, as occaſion required: policy probably had ſome ſhare in the diſuſe to which it afterwards fell.—[[a] *Diod. Sic* Bibl. l. 1. *Strab.* Rer. Geogr. l. 17. [b] *Herodot* Hiſt. l. 2.]

It ſeems to have been opened afreſh about the year 635, under the Caliph Omar. Elmacin indeed ſays, that a new *canal* was then made for the conveyance of the corns of Egypt to Arabia; but this is more naturally underſtood of a renewal of the antient one, the navigation of which, towards the decline of the Roman empire, had been much neglected. The ſame author adds, that it was ſtopped again on the ſide next the Red-ſea by the Caliph Abugiafar Almanzor II. of the family

of

of Abbas, in the year of the Hegira 150, anſwering to the year of Chriſt 775. There are ſome traces of it ſtill ſubſiſting: M. Boutier, in 1703, diſcovered the end which ariſes out of the moſt eaſterly branch of the Nile. Hiſt. Acad. Scienc. An. 1702. p 110. ſeq.

The Great CANAL *of China*, is one of the wonders of art, made about 800 years ago. It runs from North to South quite croſs the empire; beginning at the city Canton. By it all kinds of foreign merchandize entered at that city are carried directly to Pekin, a diſtance of 825 miles. Its breadth and depth are ſufficient to carry barks of conſiderable burden, which are managed by ſails and maſts, as well as towed by hand: On this *canal* the emperor is ſaid to employ 10000 ſhips, abating one, for a reaſon very peculiar. It paſſes through, or by, 41 large cities; there are in it 75 vaſt locks, and ſluices to keep up the water, and paſs the barks and ſhips where the ground will not admit of a ſufficient depth of channel, beſides ſeveral thouſand draw and other bridges. Atlas Marit. p. 199. See alſo *Kircher*, Chin. illuſt. l. 5. Phil. Tranſ. N° 26. p. 487.

F. Magaillane aſſures us, there is paſſage from one end of China to the other, the ſpace of 600 French leagues, always either by *canals* or rivers, except a ſingle day's journey by land, neceſſary to croſs a mountain, an advantage which this jeſuit, who made the voyage himſelf, obſerves is not to be found in any other ſtate of the univerſe. De *Magaillane* Nouv. Relat. de la Chine. c. 8. Nouv. Rep. Lett. T. 14. p. 1194, ſeq.

We alſo read of divers projects and undertakings of *canals*, which were never atchieved. Demetrius Poliorcetes, Julius Cæſar, the emperors Caligula and Nero, attempted in vain to cut through the Iſthmus, whereby Peloponeſus is joined to the reſt of Greece, and make a canal of communication between the Ionian and Ægean ſeas. Plin. Hiſt. Nat. l. 4. c. 4. Mem. de Trev. Juin 1702. p. 149.

'Tis commonly alledged that ſeveral attempts have been made to cut the Iſthmus or tract of land, which ſeparates the Mediterranean from the Red Sea. But this ſeems to be a popular error ariſing from a miſtake of the place where the *canal* was to be cut. *Kirch.* Œdip. Ægypt. Synt. 1. c. 8. *Brown*, Vulg. Error. l. 6. c. 8. p. 269. See alſo *Becman*, Hiſt. Orb. Terr. P. 1. c. 3. §. 4.

Seleucus Nicanor had a deſign to make a *canal* between the Euxine and Caſpian ſeas. Lucius Verus, who commanded the Roman army in Gaul under Nero, attempted to make a *canal* between the Moſelle and the Rhine.

A new *canal* for conveying the waters of the Nile from Æthiopia into the Red Sea without paſſing into Ægypt was projected by Albuquerque, viceroy of India for the Portugueſe, in order to render Ægypt barren and unprofitable to the Turks. *Becman*, Hiſt. Orb. Terr. P. 1. c. 3. §. 5.

The Spaniards have ſeveral times had in view the digging a *canal* through the iſthmus of Darien from Panama to Nombre de dios, to make a ready communication between the Atlantic and the South Sea, and thus afford a ſtrait paſſage to China and the Eaſt Indies. *Becman*, Hiſt. Orb. Terr. P. 1. c. 3. § 21.

CANAL *of an aqueduct*, is the part through which the water paſſes; which in the antient edifices of this kind, is lined with a coat of maſtic of a peculiar compoſition. *Davil.* Courſ. de l'archit. P. 2. p. 444.

CANAL *of a garden*, is a long extended piece of water, bordered with ſtone or turf. Id. ibid.

CANAL is alſo applied to the furrows on the face of, or underneath a larmier; ſometimes called porticos; and fitted up with reeds or flowers. Sometimes to thoſe cavities ſtrait or winding made on the caulicoles of a capital. Id. ibid. p. 445.

CANALS is alſo uſed for the flutings of a column or pilaſter.

CANAL, in anatomy. Under *canals* are included all kinds of veſſels, as arteries, veins, nerves, &c. See ARTERY, VEIN, &c. *Cycl.* and *Suppl.*

The hole or perforation through the vertebræ of the neck, whereby the ſpinal marrow communicates with the brain, is by ſome called the ſacred or great *canal*, ἱερὰ συριγξ. *Caſt.* Lex. Med. p. 128.

CANALICIUM *aurum*, or *canalienſe*, that gold which is dug out of mines, or veins under ground. *Plin.* Hiſt. Nat. l. 33. c. 4. Bibl. Raiſ. T. 3. p. 28.

CANALICULATE *leaf*, among botaniſts. See LEAF.

CANALICULATE *ſtalk*. See the article STALK.

CANALIS is uſed by ſurgeons for an oblong concave inſtrument, in which to put a broken limb, leg, or thigh [a]. It is made either of braſs, wood, or earthen ware, ſometimes even of ſtraw fitted with linnen cloth [b].—[a] *Celſ.* de Medic. l. 8. c. 10. N° 5. *Junck.* Conſp. Chir. tab. 2. p. 13. [b] *Scultet.* Arm. Chirurg. P. 1. tab. 13. *Caſt.* Lex. Med. p. 128. *Fab.* Theſ. p. 429.

CANALIS *arterioſus* (*Cycl.*)—Dr. Agricola deſcribes a valve at the entry of the *canalis arterioſus* into the aorta deſcendens, compoſed of four ſides. Two of them prevent its being ſhut till after birth, and the other two prevent its being thruſt off from the orifice of the *canalis arterioſus*. Commerc. Norimb. 1735. Hebd. 4. §. 2.

There have been ſome diſputes between meſſieurs Mery, Buiſſiere, Rohault and others, about the real uſe of the *canalis arterioſus*, as well as of the foramen ovale. Vid. Mem. Acad. Scienc. an. 1693. p. 198, ſeq. Bibl. Ital. T. 4. p. 83, ſeq. See FORAMEN *ovale*, *Cycl.* and *Suppl.*

CANALIS *naſalis*, a kind of ſulcus or furrow formed in the oſſa unguis and maxillaria, whereby a mucous humour is conveyed from the puncta lacrymalia to the noſe. *Junck.* Conſp. Phyſiol. tab. 15. p. 264. *Heiſt.* Comp. Anat. §. 82. 85. p. 31. ſeq.

CANALIS *venoſus*, a duct in the liver of a fœtus, whereby a communication is maintained between the porta and cava; which becoming uſeleſs after the birth, the canal gradually dries up. *Drak.* Anthrop. l. 1. c. 22. p. 173. *Heiſt*, Comp. Anat. § 243. p. 159.

CANALIS, in zoology. See the article TUBULUS *marinus*.

CANARIA *lappa*, in botany, a name given by the antient Romans ſometimes to the rough fruit of the common aparine or clivers, and ſometimes to the plant itſelf. Pliny calls the plant *lappa* and *lappago*, and the fruit of it *lappæ boariæ*, *lappæ canariæ*, and *lappæ caninæ*.

CANARIUM, in antiquity, a Roman ſacrifice, wherein dogs of a red or ruddy colour were ſacrificed; for a ſecurity of the fruits of the earth againſt the raging heats, and diſorders of Sirius in the dog days. *Feſt.* de verb. ſignif. in voc. *Rutilæ.* *Ovid.* Faſt. l. 4. v. 905. 906. *Briſſon.* de form. l. 1. p. 57. *Pitiſc.* Lex. Ant. T. 1. p. 342. *Salmaſ.* exerc. ad Solin. p. 309.

CANARY *birds*, a ſpecies of ſinging birds, greeniſh in colour, formerly brought only from the *Canary* iſlands, but of late chiefly from Germany and Switzerland; which laſt, called alſo German birds, are preferred to the former.

Canary birds are diſtinguiſhed by different names at different times and ages: Such as are about three years old are called *runts*; thoſe above two, are named *eriffs*; thoſe of the firſt year under the care of the old ones are termed *branchers*; thoſe that are new-flown, and cannot feed themſelves, *puſhers*; and thoſe brought up by hand, *neſtlings*.

Canary birds are various in their notes; ſome having a ſweet ſong, others a laviſh note, others a long ſong, which is beſt, as having greateſt variety of notes. Some prefer thoſe which whiſk and chew like a tit lark; others are for thoſe which begin like a ſky lark, continuing their ſong with a long yet ſweet note; others chuſe thoſe which begin their ſong with the ſky lark, and then run on the notes of the nightingale; others again prefer a loud note and laviſh, regarding little more than the noiſe. *Cox*, Gent. Recr. of Fowl, p. 59. ſeq. *Savar.* Dict. Com. T. 2. p. 1532. voc. *Serin.* See PASSERES *Canarienſes*.

CANATTE CORONDE, a name given by the Ceyloneſe to a peculiar kind of cinnamon growing in that iſland; this is eſteemed the ſecond kind in value, and the name they give to it ſignifies bitter and aſtringent cinnamon. The bark of this kind of cinnamon tree comes off very eaſily, and is of a very fragrant ſmell when freſh, but it has a bitter taſte. It is not very common in the iſland, and is not eaſily diſtinguiſhed on the tree from the beſt cinnamon. The trees which yield the eight different kinds of cinnamon, ſo very various in flavour and virtue, are all ſo like one another, that it requires a great deal of attention to diſtinguiſh them. The root of this kind of cinnamon tree yields a very fine ſort of camphor. Phil. Tran. N° 409.

CANAVAY, in natural hiſtory, a name given by the inhabitants of the Philippine iſlands to a ſea bird which is deſcribed as being of the bigneſs of a pigeon, and laying its eggs on the naked rocks, where it ſits and hatches them. Some ſuppoſe this bird no other than the common kingfiſher. But this is ſcarce probable; as we have no account of its being very beautifully coloured; and this is a circumſtance which can hardly have eſcaped thoſe who mentioned it, being ſo very remarkable. It is much more probably ſome ſea bird wholly unknown in this part of the world.

CANCAMUM, in the materia medica, a name given by the Greeks to a gum or reſin, and continued down to the preſent age, though not without ſome uncertainty in its ſignification. The Arabian writers in general have looked on the word *cancamum* as a ſynonymous term for gum lack, which the Greeks have called lancha and lacha, and Aviſenna loch.

This however is an erroneous opinion, and the lacha and *cancamum* of the Greeks are evidently different druggs. Serapion has deſcribed the *cancamum* from Dioſcorides, tranſlating the very words of that author; but this he has done in the chapter of lacca, and under that name. And Aviſenna in one part of his writings tells us that many people in his time were of opinion that the gum called lacca or *cancamum* was the ſame thing with carabe or amber; and in another place under the name *keckim*, which is plainly a word formed out of the Greek κανκαμον *cancamum*, he tells us that many people believed it to be the ſame thing with ſandaracha or ſandarus; for this laſt is the true name of the gum ſince called ſandarax and ſandaracha, the laſt of which names is a notoriouſly improper one, as it confounds this gum with the mineral ſandarach a ſubſtance of the orpiment claſs.

The gum ſandarach is indeed very like yellow reſin, and therefore cannot be unlike to common yellow amber. The Arabian authors have alſo ſometimes called this gum by the name vernix, the varniſh gum. It was an extremely improper, but yet very common cuſtom among them, to call whatever ſubſtances concurred in the ſame general qualities, and had the ſame uſes, by the ſame name, and confound them one with another. Thus the ſandarach, *cancamum*, and verniſh are called the

the ſame gum in their writings, and expreſſed indiſcriminately by the ſame name.

CANCELLI, in building, lattices, or a ſort of windows made with croſs bars of wood or iron, chequer-wiſe.

The term is alſo applied to the baluſters or rails which compaſs a court of juſtice, a communion table, or the like. *Du Cange* Gloſſ. Lat. T. 1. p. 736. *Calv.* Lex Jur. p. 140. *Neve*, build. Dict. in voc. *Bingh.* Orig. Eccleſ. l. 8. c. 6. §. 6.

CANCELLI, in a military ſenſe, the ſame with barrier. *Aquin.* Lex. Milit. T. 1. p. 156. See BARRIER, *Cycl.*

CANCER, in zoology. See the article CRAB.

CANCER, *(Cycl.)* in medicine, amounts to the ſame with what is otherwiſe called *carcinus* or *carcinoma*, καρκινωμα; though ſome diſtinguiſh them making the carcinoma a tumor only tending to a *cancer*. *Nent*, Fund. Med. T. 2. tab 8. c. 9. p. 341.

A *cancer* differs from a *ſchirrus*, in that the latter is without pain. *Shaw*, new pract. of Phyſ. p. 616. See SCHIRRHUS.

Cancers alſo differ from thoſe called ſimply *cancerous ulcers*, or tumors, which though of a like general nature, vary in many circumſtances. See CANCEROUS.

Cancers appear with ſuch a diverſity, that it ſeems impoſſible to give a definition which ſhall agree to all. Some have a round, unequal, livid, painful hardneſs; others are flat without lividity, and ſometimes indolent. The variety ariſes chiefly from their riſe, and the different parts they are ſeated in, as the breaſt, womb, lips, noſe, eyes, ears, &c. Phil. Tranſ. N° 260. p. 476.

Some reſtrain *cancers* to thoſe on womens breaſts, which alone exhibit the appearance of crabs; and give the name *carcinoma*, and *cancerous ulcer*, to thoſe on the other parts. *Junck.* Conſp. Chir. Tab. 50. p. 299.

The generality of authors aſcribe the cauſe of *cancers* to an acid ferment which firſt coagulates the juices in the glands, and afterwards corrodes and ulcerates the part. Gendron refuting this theory, ſubſtitutes another; the *cancer*, according to him, is not a diſeaſe of the fluids, but of the ſolids. It ariſes from a diſorder of the lymphatic and excretory veſſels of the glands, which becoming by ſome accident impervious, and ceaſing to filtrate and convey their liquors, by degrees degenerate into a compact horny maſs, capable of germination and ulceration. What ſeems to confirm this origin is, that in grown *cancers* there is always found a hard callous ſubſtance not unlike horn, with blood veſſels diſſeminated through it, which yet are ſmaller and narrower than before the formation of the hardneſs. This calloſity is found in cutaneous *cancers*, though it there extends itſelf in a different manner, appearing at firſt like a ſmall wart from which ſpring cutaneous filaments. When the ulceration has made ſome progreſs, theſe appear like pin-heads in the fleſh, which are no other than the extremities of the filaments. This ſubſtance always found in true *cancers*, according to M. Gendron, is the *cancer* itſelf, formed by the tranſmutation of the glandular and lymphatic veſſels. On this principle he reſolves the ſpreading of a *cancer*, into a vegetation performed by the conveyance of the nutritious juices through the ramifications of the tumor, as through horns, nails, or the like ſubſtances. The pain proceeds from the compreſſion of the nervous parts, as that in corns, and the lividity from the obſtruction of the blood; not as commonly ſuppoſed from a cauſtic ſalt, which would ſoon cauſe an eſchar. *Gendron*, Recherch. ſur la Nat. &c. des *cancers*. c. 3. ſeq. Phil. Tranſ. N° 260. p. 477. ſeq. Act Erud. Lipſ. an. 1701. p. 306. ſeq.

The *cancer* is one of thoſe diſeaſes for which no competent remedy has been yet found, not even when taken early, or in its occult ſtate. The moſt that medicine can do, is to palliate, or keep it back by diet and general remedies. *Le Clerc*, Treat. Chir. Operat. c. 8. p. 198, ſeq. Where the operation of cutting off a cancerous breaſt is deſcribed.

'Tis a famous aphoriſm, that occult *cancers* are better uncured than cured; and that the patient will live longer with them than without them [a]. But phyſicians are not to be deterred by an old aphoriſm; they attempt not only a palliative, but a radical cure. The former partly by externals of the narcotic kind, to allay the pain, and hinder the ſpreading of the *cancer*; partly by internals, the chief of which are the diaphoreticum poterii, martials, ſeveral preparations of earth worms, and tincture of antimony [b], but eſpecially the juice of the ſolanum lethale, which is a topic of great fame for the palliative cure of *cancers*. It was the great ſecret of Percival Willougby. Gendron improves it by the addition of ſaccharum ſaturni [c]. Paracelſus and Helmont boaſt of their arſenical preparations, and other mineral abſorbents, which may indeed conſume the fungous fleſh, but the cure, according to Gendron, conſiſts only in eradicating the callous body, which is rather irritated and increaſed by the injudicious application of corroſive medicines [d]. — [a *Hippoc.* aphor. 38. ſect. 6. b Act. Erud. Lipſ. an. 1701. p. 310. c Phil. Tranſ. ubi ſupra. p. 481. d Id. ib. p. 480.]

The true cure of *cancers*, according to this writer, is either by exſection or amputation of the part, or by the application of cauteries. The former may be uſed where the tumor is moveable, and its baſe terminates abruptly, does not adhere to the adjacent parts, and conſequently has ſent no filaments to the ſame; as is the caſe in all *cancers* ariſing from ſchirrhous or ſcrophulous tumors. *Gendron*, lib. cit. c. 8. Act. Erud. Lipſ. 1701. p. 308, ſeq.

But the true *cancers*, he obſerves, are ſeldom extirpated with ſucceſs; and the operation would be leſs in repute, if ſchirrhi, ſtrumæ, and other ſimilar tumors were not frequently miſtaken for *cancers*. Phil. Tranſ. loc. cit. p. 479.

Dr. Cheyne ſays, that a total aſs milk diet, about two quarts a day without any other food or drink, will in time cure a *cancer*. Nat. meth. of curing diſ. p. 263, 264.

In the memoirs of the royal academy of ſciences mention is made of the radical cure of three inveterate *cancers*, by an infuſion of the leaves of plumbago in olive oil; theſe *cancers* had been deemed incurable by reaſon of their adherence to bony parts. The author of that memoir, Monſieur Sauvages de la Croix, obſerves, that the cancerous ulcers were anointed three times a day with the beforementioned infuſion of plumbago, and that the operation was repeated, till the black eſchar thereby formed was ſufficiently encruſted for the patient to feel no ſharp pains upon the application; and that this happened in about a fortnight's time. See Mem. Acad. Scienc. An. 1739. p. 471. Edit. Pariſ.

Cancers are ſometimes internal. We have hiſtories of two ſuch in the philoſophical Tranſactions [a], from which Dr. Burton endeavours to deduce the diagnoſtics of a *cancer* within the abdomen [b]. — [a N° 464. ſect. 2. b Ib. p. 111.]

To prevent CANCERS. — When there is danger of an approaching *cancer*, the acrimony of the blood is, if poſſible, to be corrected by the uſe both of internal and external remedies, and a ſtrict regimen in regard to diet is to be obſerved. Broths and ſoups made of the fleſh of young animals, and with proper herbs boiled in them, as ſcorſonera, and the others of that tribe, are very beneficial in theſe caſes; the moſt wholeſome drink is either fair water, or a decoction of China Root, or ſarſaparilla, or the like; and when the pains are violent from the ſchirrus, which is now threatning to become a *cancer*, white poppy ſeeds may be added in conſiderable quantities to the decoction, and it may be ſweetened with a proper quantity of ſyrup of diacodium. Two or three times a day alſo ſhould be taken a doſe of Gaſcoin's powder, ſalt of wormwood, native cinnabar, crude and diaphoretic antimony, adding to each doſe as there ſhall be occaſion, half a grain of laudanum to aſſuage the violence of the pain. Great benefit is alſo ſometimes received in this caſe by taking either the powder or juice of millepedes, with ſperma ceti.

Purges alſo of the mercurial kind frequently do great ſervice, as does alſo bleeding and cupping frequently in the ſpring and autumn. A thin plate of lead well impregnated with quickſilver may alſo be very conveniently worn on the part and with great advantage, for this method cannot but weaken the ſenſe of pain, and may often prevent a *cancer*.

If the application of the plate of lead ſhall prove inſufficient, plaiſters and ointments compoſed of ſuch ingredients as are known to aſſuage pains may alſo be applied; the following are of this kind, and are frequently found of ſervice. Take of the unguentum diapompholygos two ounces, of opium half a ſcruple, mix theſe into an ointment, and frequently rub the part affected with it; or take of an amalgama of quickſilver and lead two ounces, mix this with a ſufficient quantity of ointment of roſes, or any the like unguent, then ſpread a part of it on a linen rag, and apply it in the manner of a plaiſter to the part; or take litharge vinegar an ounce, expreſſed oil of henbane ſeeds, poppy ſeeds, and the infuſed oil of roſes, of each two ounces, mix them by a long and continued ſtirring together into an ointment, adding toward the end of the operation purified opium from ſix to ten grains, as the urgency of the ſymptoms may require: this is to be ſpread in like manner on linen rags, and applied at times to the part.

If the daubing of theſe ointments is diſliked, a refrigerent plaiſter may be uſed in their ſtead, ſuch is the lead plaiſter of Mynſycht, the plaiſters of red lead, or pompholyx, or the excellent plaiſter made by the following preſcription: take of the freſh and depurated juices of henbane, garden poppy, and water hemlock, of each four ounces, boil theſe to a thickneſs over a gentle fire, adding toward the end of the boiling eight ounces of white wax, and one ounce of oil of roſes, and make the whole into a plaiſter; or take of ſugar of lead, of ceruſe of the amalgamation of quickſilver and lead, and of the expreſſed oil of henbane ſeed, and infuſed oil of roſes, of each two ounces, make theſe into a plaiſter. If the pains are very violent, a ſmall quantity of opium may be added to either of theſe plaiſters. *Heiſter's* ſurgery, page 223.

CANCER, in a more vague ſenſe, is extended to all ulcers diſpoſed to putridity. See ULCER.

Such are moſt inveterate, malignant, cavernous, fiſtulous, varicous and colliquative ulcers. The Arabs call the elephantiaſis the univerſal *cancer*. Journ. des Sçav. T. 67. p. 312. *Junck.* Conſp. Chir. Tab. 50. p. 300. Celſus even ranks the gangrene and ſphacelus in the claſs of *cancers*.

Others include the caries of bones in the number. The reaſon is, that what a *cancer* is in the glands, that a caries is ſuppoſed to be in the bones, and a gangrene in the fleſhy parts; the juſtneſs of which ſuppoſition may bear much diſpute. Ephem. Acad. N. C. dec. 1. An. 1. p. 18.

Cancers are by ſome divided into *primitive* and *degenerate*.

Primitive CANCERS are thoſe which come of themſelves, appearing at firſt about the bigneſs of a pea, and only painful at in-

intervals; but growing bigger, and more troublesome by degrees.

Degenerate CANCERS, are those which succeed obstinate, ill-managed tumors, or imposthumes. These commence ulcerated *cancers*, without ever having been occult ones. *Le Clerc*, Treat. Chir. Disc. c. 3. art. 4. Comp. Surg. p. 123, seq.

CANCER *albus*, the white *cancer*, is used by French writers for a white chalky recrement, sometimes found adhering to the tongue, and internal parts of the mouths of children, and which, unless timely brushed away, is apt to ulcerate. *Pare*, Chir. l. 23. c. 17.

In which sense it seems to amount to the same with *aphthæ*, *Cast.* Lex. Med. p. 129. See APHTHÆ, *Cycl.* and *Suppl.*

CANCER is also applied to a species of bandage for the head, and divided into several parts, resembling the legs of a crab fish. *Gal.* de Fasc. *Cast.* Lex. Med. p. 129. See BANDAGE.

CANCER, in astronomy, is the fourth constellation in the starry zodiack, and that from which one quadrant of the ecliptic takes its denomination. The reason generally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to the crab fish. As the latter walks backwards, so the former in this part of his course begins to go backwards, or recede from us [a], though the disposition of stars in this sign is by others supposed to have given the first hint to the representation of a crab [b]. — [a Phil. Trans. N° 301. p. 2067. b *Vital.* Lex. Math. p. 90.]

Cancer is known by divers other names, as *Octipes*, *Nepo*, *Astacus*, *Cammarus*, *Alsartan* and *Asartan*. Schiller, in lieu of the figure of a crab, represents the evangelist St. John; Harsdorff, the christian in armour; Weigelius, the manger, or countryman's arms. *Wolf.* Lex. Math. p. 301. Ephes. c. 6. v. 14, seq.

CANCER, in the military art, denotes a long, ponderous beam, used for beating down walls, not unlike the manner of a ram. *Aquin.* Lex. Milit. T. 1. p. 157. *Du Cange*, Gloss. Lat. T. 1. p. 737. See ARIES, *Cycl.*

CANCEROUS, or CANCEROSE, something that belongs to, or partakes of the nature and qualities of a *cancer*. See CANCER.

In which sense the word signifies the same with *carcinomatous*. See CARCINOMATOUS.

CANCEROUS *ulcer*, is frequently used for an open *cancer*, or a *cancer* when come to an ulceration.

CANCEROUS *tumor* is sometimes used for an occult *cancer*, or a *cancer* before it bursts.

CANCEROUS, or CANCRIFORM, is also an apellation given to all disorders which bear a resemblance to *cancers*, yet are not strictly such.

In this sense we say a *cancerous* ulcer. See ULCER, *Cycl.* and *Suppl.*

Cancerous tumors bear a near affinity to schirrous ones. When a schirrhus comes to suppurate, it it generally called a *cancerous* ulcer. *Shaw*, New Pract Phys. p. 441, and 616. See SCHIRRHUS, *Cycl.* and *Suppl.*

CANCRIFORM, *cancriformis*, the same with *cancroides*, or *cancerous*. See CANCEROUS.

Wedelius gives a discourse of hard rebellious *cancriform* tumors. Ephem. Acad. N. C. Dec. 2. An. 1. Obs. 12.

CANCRINE *verses*, the same with retrograde. *Baill.* Jugem. des Scav. T. 4. P. 1. p. 50. See RETROGRADE, *Cycl.*

CANDELARIA, in botany, a name by which some authors have called the great white mullein. *Ger.* Emac. Ind. 2.

CANDERROS, in the materia medica, a name of an East Indian gum, not much known among us, though sometimes imported. It has much of the appearance of common amber, only that it wants its yellow colour, being white and pellucid; we sometimes see it turned into toys of various kinds, which are very light, and of a good polish. Garcias and some other authors tell us, that the people of Borneo, and some other places where camphor is produced, have the art of adulterating the crude camphor, which they send over to us with large quantities of this gum.

Scaliger observing that there is a kind of camphor called by authors *canzuri*, supposes that to be the kind thus adulterated with the *canderros*; he says that the camphor which is brought from the island of Borneo has always a large quantity of foulness, and extraneous substances mixed among it; particularly that it contains fragments of stones, and a large quantity of the gum *canderras*, which, he adds, is an oriental gum, resembling amber.

It is not probable, however, that this is the camphor called *canzuri*, because this is always described as the best sort of camphor, which would scarce be the case, were it an adulterated kind; it is more probable that it had this name from some place called *Canzur*, where it was either produced, or brought to market.

CANDIDATE (*Cycl.*) — The white gown worn by *candidates* was loose and ungirded, nor was there any close garment under it, which some interpret as done with design to avoid any suspicion people might have of bribery; though Plutarch rather thinks it done to gain the affections of the people by suing in such an humble garb; or else that such as had received wounds in the service of their country, might more easily demonstrate those tokens of their courage and fidelity. Vid. *Plut.* in Coriol. *Ferrar.* de re Vest. l. 1. c. 1. 8. *Schoetg.* Lex. Ant. p. 262. *Pitisc.* Lex. Ant. T. 1. p. 343, seq. *Kenn.* Rom. Ant. Not. P. 2. l. 5. c. 8. p. 306, seq.

The Roman *candidates* usually declared their pretensions a year before the time of election, which was spent in making interest and gaining friends. Various arts of popularity were practised for this purpose, and frequent circuits made round the city, and visits and compliments to all sorts of persons, the process of which formed what was called *ambitus*. See AMBITUS, *Cycl.* and *Suppl.*

CANDIDATI *principis*, were those who were recommen offices by the emperors.

Thus supported they needed not much to court the people, so that their behaviour is represented as rather disobliging, at least negligent. Hence that jest in Quintilian, *L. Galba pilam negligenter petente, sic inquit petis tanquam Cæsaris candidatus.* i. e. He aimed at the ball with as much negligence as the emperors *candidates* did at honours. *Quint.* Inst. l. 6. c. 3. *Pitisc.* Lex. Ant. T. 1. p. 344. *Schoetg.* Lex. Ant. p. 262.

CANDIDATUS *principis*, in antiquity, an office in the court of the emperor of Constantinople, answering to a secretary of state among us.

The *candidatus principis* was also denominated *Quæstor principis* or *Augusti*. *Brisson*, Sel. Ant. l. 1. c. 16. *Kenn.* Ant. Rom. P. 2. l. 3. c. 8. p. 115.

CANDIDATES *of baptism*, in the antient church were called catechumens. See CATECHUMEN, *Cycl.*

CANDIDATES, in the college of physicians, London, is the order of members out of whom the fellows are chosen. See COLLEGE, *Cycl.*

The *candidates* must be natives of England, doctors of physic, admitted to the degree in our own universities, and ought to have practised physic four years before they are admitted into the order. The number of *candidates* is never to exceed twelve. Stat. Coll. Reg. Med. Lond. c. 11.

CANDIDATE, in academical orders or degrees, denotes a person to whom, after full examination, and the performance of inaugural exercises, licence is granted to take up the highest or doctoral dignity when he pleases. Itter. de Honor. et Grad. Acad. c. 3. *Kust.* Bibl. Nov. Libr. An. 1698. p. 481. See DEGREE, DOCTOR, LICENTIATE, &c. *Cycl.*

CANDLE (*Cycl.*) — The ascent of the tallow up the wick in a burning *candle*, may be resolved into the same principle of filtration, or attraction as that of water up a heap of ashes, or even up a capillary tube. The wick of a *candle* is but slightly twisted, that all its hairs may be easily come at; which being very small, and abounding in sulphur, soon take the flame; and the flame by its heat rarifying the air, and dissolving the tallow underneath, makes the globules thereof ascend into the rarified spaces of the wick, and these, with the air about it, prove food for the flame. *Hought.* Collect. T. 1. N° 19. p. 57.

The flame of a *candle* is found to be hotter at the bottom, and the edges, than in the middle; and hence it is, that holding a thread through the middle of the flame, it first breaks or burns in a part where the edge of the flame touched, not in the middle. Helmont and others compare the sensitive soul or principle of life in animals to the flame of a *candle*. *Hook*, Microgr. Obs. 20. p. 429. *Helm.* de Lithias c. 9. n. 35.

Several authors assert, that the stench of a tallow *candle* extinguished, is of a poisonous nature, and is said to promote abortion [a]; Lanzoni gives an instance of a young man in liquor killed by the repeated application of the snuff of a *candle* to his nose, when asleep, by his comrades. After half an hour's practice, the youth was seized with a difficulty of breathing, and convulsions, and died the following night [b]. — [a *Amman.* Medic. Crit. p. 367. *Cast.* Lex. Med. p. 129. b *Ephem.* Acad. N. C. Dec. 2. An. 9. Obs. 205.]

The Roman *candles* were at first little strings dipt in pitch, or surrounded with wax; though afterwards they made them of the papyrus, covered likewise with wax; and sometimes also of rushes, by stripping off the outer rind, and only retaining the pith. — For religious offices, wax *candles* were used; for vulgar uses, those of tallow. *Serv.* ad Æn. l. 1. v. 731. *Plin.* Hist. Nat. l. 17. c. 37.

Lord Bacon proposes *candles* of divers compositions and ingredients, as also of different sorts of wicks; with experiments of the degrees of duration, and light of each.

Good housewives bury their *candles* in flour, or bran, which 'tis said increases their lasting, almost half [a]; — Some speak of perpetual *candles* made of salamander's wool [b]. — [a *Bac.* Nat. Hist. Cent. 4. § 369, seq. b Id. ibid. Cent. 8. § 774.]

CANDLE-*snuffer*. In Spain, the great *candle-snuffer* is said to be an officer of great dignity; he is called *espavillador major*. Trev. Dict. Univ. T. 1. p. 1622.

Shoemaker's CANDLE, a kind of double *candle*, composed of two mould *candles* joined by clapping them together, when on the rod or broch, and cementing them still further by giving them one or two dips in the melted tallow.

They are thus called because chiefly used by the artificers of that denomination, to work by in the winter nights.

King's CANDLE, or *Royal* CANDLE, denotes a very large sort of *candle*, made in a mould, and decorated with ornaments of painting and sculpture. *Savar.* Dict. Comm. T. 1. p. 648. voc. *Chandelle.*

Rush CANDLES, uſed in divers parts of England, are made of the pith of a ſort of ruſhes, peeled, or ſtripped of the ſkin, except in one ſide, and dipt in melted greaſe.

Medicinal CANDLES, *candelæ fumales*, are compoſitions of odoriferous, aromatic, and inflammable matters, as benzoin, ſtorax, olibanum, turpentine, and the like, mixed up with mucilage of tragacanth, and formed into maſſes in ſhape of *candles*. The effluvia and odours whereof when burnt, are ſuppoſed to be ſalutary to the breaſt, &c. *Junck*, Lex. Chym. Pharm. P. 2. p. 110, ſeq.

Candles for caruncles of the urinary paſſage, are made of wax and turpentine melted, and wicks dipt into the ſame, till brought to the due thickneſs; then ſmeared over with an unguent of ceruſs, and precipitate and butter of antimony; to be thruſt up the yard till they reach the caruncula. Id. ibid. p. 111.

CANDLE-*tree*, in the Weſt Indies, a tree of whoſe fruit boiled to a thick fat conſiſtence, are made good *candles*. *Ray*, Wiſd. of Creat. P. 2. p. 210. It ſeems to be the ſame as the

CANDLE *berry tree*, a denomination of an aromatic evergreen, from whoſe berries are drawn, by boiling, a green wax, of which *candles* are made. It is alſo called the *Virginia myrtle*. *Bradl.* New Improv. Gard. P. 3. p. 265.

CANDLE *wood*, ſlips of pine about the thickneſs of the finger, uſed in New England and other colonies to burn inſtead of *candles*, giving a very good light. *Hought*, Collect. T. 3. N° 417. p. 42. The French inhabitants of the iſland of Tortuga uſe ſlips of yellow ſantal wood for the ſame purpoſe, and under the ſame denomination of *bois de chandelle*, which yields a clear flame, though of a green colour. *Trev.* Dict. Univ. T. 1. p. 1095. voc. *Bois*.

CANDLE-*lighter*, an officer in the antient church, called alſo *accenſor* and *acolythus*. *Du Cange*, Gloſſ. Lat. T. 1. p. 34. voc. *accenſor*.

CANDLESTICK, a houſhold utenſil, contrived to hold one, or more lighted candles. Larger, and more ſtately *candleſticks* contrived for holding a great number of candles, are called *branches* and *girandoles*; and when made of glaſs, *luſtres*.

Moſes made a golden *candleſtick* with ſeven branches, ſupporting as many lamps, to be placed in the tabernacle, to illumine the altar of perfumes and table of ſhew-bread [a]; it weighed a talent, or, according to Joſephus, ſeventy minæ. Solomon when he built the temple, inſtead of one, erected ten golden *candleſticks* of the ſame form with that deſcribed by Moſes [b]. On a triumphal arch erected to Veſpaſian, is repreſented the golden *candleſtick* with ſeven branches [c].—[a *Exod.* xxv. v. 31. ſeq. b 1 *King.* c. vii. v. 49. c *Baron.* an. 73. n. 2. *Calm.* Dict. Bibl. T. 1. p. 354. Jour. Liter. T. 9. p. 309.]

Water CANDLESTICK, a kind of jet or fountain raiſed on a foot which ſupports a little baſon reſembling the diſk of a *candleſtick*, down which the water falls into another larger baſon. *Davil.* Courſ. d'Archit. P. 2. p. 457. in voc. *Chandelier*.

CANE, *(Cycl.)* in commerce, the ſame with reed, called among botaniſts *arundo*.

Canes make a conſiderable article in commerce. There are imported two ſorts, viz. walking and rattan *canes*. Stat. Abr. 8vo. Art. Cuſtoms, T. 1. p. 193, ſeq. *Hought.* Collect. T. 2. N° 307, ſeq. p. 300, and 302.

Walking-CANES are ſaid by Bradley to be joints of the roots of a ſort of reed, called *canna Indica*. This plant ſhoots in joints about three or four feet long, near the ſurface of the ground, and at every knot produces great numbers of fibres, by which it receives its nouriſhment. The joints are made ſtrait by the fire, which occaſions thoſe ſhades or clouds frequently ſeen in them. Bradley thinks the *cane* tree might be propagated here by planting ſome of the roots with their knots in artificial bogs, &c. *Bradl.* Dict. Botan. T. 1. voc. *cannæ*.

Canes may be ſtained like tortoiſe ſhell, by a mixture of aqua fortis and oil of vitriol, laid on them at ſeveral times, over live coals, to cauſe it to penetrate the deeper, and afterwards giving them a gloſs with a little ſoft wax, and a dry cloth. *Boyle*'s Works, abr. Vol. 1. p. 133.

Rattan CANES are a ſmaller ſort brought from China and Japon, very tough; which being ſplit, are uſed for making of *cane* chairs. — They are the produce of a reed called *rottang malabarica minor*, or leſſer rattan [a]. Theſe when dry, being ſtruck againſt each other, will give fire, and are uſed accordingly in ſome places in lieu of flint and ſteel. Being twiſted together they make cordage of them. The Chineſe and Japoneſe veſſels are ſaid to have their cables made hereof, which are leſs liable to rot in the water than hemp [b]. — [a Vid Phil. Tranſ. N° 244. p. 326, ſeq. Item, N° 267, p. 717. b *Salmon*, Preſ. Stat. Chin. p. 67.]

CANE *apple*, in natural hiſtory, a name given by the common people of Ireland to the arbutus or ſtrawberry tree, which is a native of that country, and flouriſhes very particularly in it. The moſt ſouthern parts of France, Italy, and Sicily, are given us by authors as the places of growth of this tree, and in all theſe places it grows but low and in form of a ſhrub: whereas in the rocky parts of the county of Kerry, about Loughlane, and in the iſlands of the ſame Lough, it grows up into a large and tall tree.

Bellonius, in his obſervations ſays, that it grows in this manner alſo in mount Athos in Macedony, and Pliny quotes Juba as mentioning it as a very ſtrange thing, that the arbutus or ſtrawberry tree grows to a tall tree in ſome parts of Arabia. In Ireland the body of the tree is often three or four foot in circumference, and its height between twenty and thirty. Phil. Tranſ N° 227. p. 510.

CANELLA *alba*, in botany, the ſame with what is otherwiſe called *cortex winteranus*. See WINTERANUS *cortex*.

CANENTES, in natural hiſtory, a name uſed by ſome of the older writers for a ſpecies of foſſil ſhell not known to us in its recent ſtate, but deſcribed by Klein under the name of the *tubulus marinus concameratus*, and by other of the late authors under thoſe of *polythalamium* and *orthoceratites*. *Aldrovand.* Muſ. Met. p. 732.

CANEPHORÆ *(Cycl.)* — The learned are at variance about the contents of the baſkets bore by the *canephoræ*. Some will have it, that neither they, nor the prieſteſs herſelf knew what was in them. Others conjecture that it was the things neceſſary for ſacrifice. Others with more probability aſſert, it was a woman's privities, which had a peculiar ſhare in thoſe myſteries. Vid. *Sigon.* de Rep. Ath. l. 4. c. 7. *Meurs.* Cecrop. c. 23. Ejuſd. Panath. c. 23. *Pitiſc.* Lex. Ant. T. 1. p. 344. *Schoetg.* Cur. Lex. Ant. p. 261, ſeq.

There were alſo *canephoræ* in the ceremonies of Ceres and Bacchus [a]. Thoſe in the Bacchanalia carried golden baſkets, in which, beſides divers ſorts of firſt fruits [b], were contained a man's privities. Among antient monuments, we find mention of divers figures of *canephoræ* [c]. In that famous cornelian called Michael Angelo's ring, there are three *canephoræ* with their baſkets on their heads. — [a Vid. *Fab.* Theſ. p. 435. *Pitiſc.* Lex. Ant. T. 1. p. 344, ſeq. b *Lakemac.* Antiq. Græc. Sacr. P. 4. c. 2. § 12. *Schoetg.* Lex. Ant. p. 263. c *Cic.* Verr. 6. c. 3.] See CANEPHORIA, *Cycl.*

The appellation *canephoræ* was alſo given to virgins at Athens, when becoming marriageable, they preſented certain baſkets full of little curioſities to Diana, in order to procure leave to quit her train, and change their ſtate of life. *Pott.* Archæol. Græc. l. 4. c. 11. p. 279.

CANES, in Egypt and other Eaſtern countries, a poor ſort of buildings for the reception of ſtrangers and travellers. People are accommodated in theſe with a room at a ſmall price, but with no other neceſſaries; ſo that, excepting the room, there are no greater accommodations in theſe houſes than in the deſarts, but that there is a market near. *Pocock*'s Egypt, 8vo. p. 37.

CANES *Venatici*, in aſtronomy, the greyhounds, two new conſtellations, firſt eſtabliſhed by Hevelius, between the tail of the great bear, and Bootes arm, above the Coma Berenices [a]. The firſt is called *aſterion*, being that next the bear's tail, the other *chara*. They comprehend 23 ſtars, of which Tycho only obſerved two. The longitudes and latitudes of each are given by Hevelius [b]. — [a *Hevel.* Firmam. Sobieſc. Fig. E. b *Hevel.* Prodrom. Aſtron. p. 277. ſeq. *Wolf.* Lex. Math. p. 303.]

CANGA, in the Chineſe affairs, a wooden clog borne on the neck by way of puniſhment for divers offences.

The *canga* is compoſed of two pieces of wood notched, to receive the criminal's neck; the load lies on his ſhoulders, and is more or leſs heavy according to the quality of his offence. Some *cangas* weigh 200 pounds; the generality from 50 to 60 pounds. The mandarins condemn to the *canga*. Sentence of death is ſometimes commuted for by the penalty of the *canga*. Lett. Edifiant. et Cur. T. 18. p. 444. Item, T. 19. p. 392.

CANIA, in botany, a name given by Pliny and ſome other authors to the common ſtinging nettle. *Ger.* Emac. Ind. 2.

CANICULA, in zoology, the name by which Ariſtotle, and ſince him Rondeletius, Aldrovandus, and ſome others have called the *catulus*. *Willughby*'s Hiſt. Piſc. p. 62. See CATULUS.

CANICULA was alſo uſed by Pliny and the old Romans for that fiſh which the Italians expreſs by the ſame ſort of diminutive name, at this time the *lamiola*. It is the *galeus canis* of authors, the fiſh we in Cornwall call the *tape*. It is a ſpecies of ſqualus called by Artedi the ſqualus with the noſtrils placed near the mouth, and with ſmall foramina near the eyes. See the articles GALEUS and SQUALUS.

CANICULAR *(Cycl.)* — *Canicular* days are computed by Harris to extend from the 24th of July to the 28th of Auguſt; by Ozanam from the 24th of July only to the 24th of Auguſt [a]. By the body of almanac-makers from the 19th of July to the 28th of Auguſt [b]. Though by ſome from the 19th of July to the 26th of Auguſt [c]. — [a Vid *Wolf.* Lex. Math. p. 1289, voc. *Sirius*. *Ozan.* Dict. Math. p. 155. *Harr.* Lex. Tech. in voc. *Caniculus*. b Vid. *Park.* Ephem. & *Gadb.* Alman. an. 1732. c Vid. Lady's Diary ann. 1732.]

Tis obſervable, that the ſame qualities and influences are popularly aſcribed to the *dog-days* among us as among the antients, though the grounds as well as computations be ſo different; for whereas they obſerved the canicula's riſing heliacally, we obſerve it coſmically. The reaſon of the change may perhaps be owing to this, that before the canicula riſes heliacally in our latitude, the heat of the ſummer is uſually ſpent. So that we deduce our *dog-days* from the hot weather, rather than the hot weather from them. But this is not the only variation; for the antients computed from the riſe of the greater dog-ſtar or Sirius, whereas the moderns, at leaſt ſome of them, reckon from that of the leſſer dog-ſtar or Procyon, the one in Orion's dog, the other in that of Cephalus [a]. And hence our almanac-makers ſet down the 19th of July for the beginning of the

dog-

dog-days, which is about the time when the leſſer dog-ſtar riſes with the ſun; whereas the greater dog-ſtar does not riſe till near a month after. Yet is not the vulgar error on the whole ſo great as Dr. Brown would make it. The *canicular* days, according to the true account, commencing twenty days before the riſing of Sirius, will begin the 27th of July, and end the 4th of September. Dr. Bainbrigge, aſtronomy profeſſor at Oxford, has a treatiſe expreſs on the *dog-days*, under the title of *canicularia* [b]; to which is added by Greaves, a demonſtration of the heliacal riſing of Sirius for the parallel of the Lower Egypt.—[a *Vital.* Lex. Math. p. 387. *Trev.* Dict. Univ. T. 1. p. 1386. b Oxon. 1648. 12°.]

CANICULAR *year*, *annus canicularis*, denotes the Egyptian natural year, which was computed from one heliacal riſing of canicula to the next. *Strauch.* Brev. Chronol. l. 1. c. 6. § 14. This is alſo called *annus canarius*, and *annus cynicus*; by the Egyptians themſelves the *Sothic year*, from *Soth* a denomination given by them to Sirius. Some alſo call it the *heliacal year*.

The *canicular* year conſiſted ordinarily of 365 days, and every 4th year of 366 days, by which it was accommodated to the civil year. The reaſon of their choice of canicula before the other ſtars, to compute their time by, was not only the ſuperior brightneſs of that ſtar, but becauſe its heliacal riſing was in Egypt a time of ſingular note, as falling on the greateſt augmentation of the Nile, the reputed father of Egypt. Epheſtion adds, that from the aſpect of canicula, its habit and colour the Egyptians drew prognoſtics concerning the riſe of the Nile; and, according to Florus, predicted the future ſtate of the year. So that the firſt riſing of this ſtar was yearly obſerved with great attention. *Bainbrig.* Canicul. c. 4. p. 26. ſeq.

CANICULUM, or CANICULUS, κανικλειον in the Byzantine antiquities, a golden ſtandiſh, or ink veſſel, decorated with precious ſtones, wherein was kept the ſacred *encauſtum*, or red ink, wherewith the emperors ſigned their decrees, letters, &c. The word is by ſome derived from *canis* or *caniculus*, ; alluding to the figure of a dog, which it repreſented; or rather becauſe it was ſupported by the figures of dogs [a]. By Salmaſius from Κανον, an inkhorn [b]. — [a *Aleman.* ad Procop. Hiſt. Arcan. *Du Cange*, Gloſſ. Gr. T. 1. p. 574. b *Salmaſ.* Exerc. ad Solin. T. 1. p. 129.]

The *caniculum* was under the care of a particular officer of ſtate, hence called *caniclinus* or *canicleus*, κανικλειος. or ὁ επι τε κανικλειε, who was in great requeſt. *Du Cange* will have the *caniclinus* to have been the ſame with the *logotheta*. *Du Cange*, Gloſs. Græc. T. 1. p. 574. Ejuſd. Gloſſ. Lat. T. 1. p. 741. *Salmaſ.* Exerc. ad Solin. p. 129. *Montfauc.* Palæogr. Gr. l. 1. c. 3.] See LOGOTHETA.

CANICUM, in botany, a name given by Avicenna, and ſome other authors, to the ſmall celandine or pile-wort. *Ger.* Emac. Ind. 2.

CANINA *lappa*, in botany, a name given by ſome of the old Roman authors to the fruit of the aparine or gooſe-graſs. They are called by others *lappæ boariæ*, and *lappæ canariæ*, and the plant *lappa* and *lappago*.

CANINANA, in zoology, the name of a ſpecies of ſerpent found in America, and eſteemed one of the leſs poiſonous kinds. It grows to about two foot long, and is green on the back, and yellow on the belly. It feeds on eggs and ſmall birds; the natives cut off its head and tail, and eat the body as a delicate diſh. *Ray*'s Syn. anim. p. 328.

CANINE, (*Cycl.*) in a general ſenſe, ſomething that relates to dogs.

Dr. Douglaſs gives frequent compariſons between the *canine* muſcles and the human. *Dougl.* Myol. in Præf. p. 6.

The voice of perſons ſeized with the hydrophobia is frequently uttered with a *canine* hoarſeneſs, and bears ſome reſemblance to the barking of a dog [a]. Dr. Liſter accounts for the cynical appearances in the hydrophobia from a ſuppoſition, that the patient has undergone ſomewhat of a transformation into the *canine* nature, or that certain of the organical parts of his body, eſpecially the gula, tongue, &c. are diſpoſed after the manner of a dog [b]. — [a Phil. Tranſ. N° 207. p. 25. b Phil. Tranſ. N° 147. p. 169.]

CANINE *appetite*, *appetentia*, or *fames canina*, amounts to much the ſame with *bulimia*, though the more exact writers make a diſtinction between the two. See BULIMY.

We have a late ſurpriſing inſtance of the *canine* appetite, mentioned in the Philoſophical Tranſactions, N° 476. p. 366, ſeq. and p. 381. A boy had this extraordinary craving appetite to ſuch a degree as to make him devour about 380 pounds of food in ſix days. It can hardly be called eating, as nothing paſſed the ſtomach, but every thing was thrown up again; this diſorder ſucceeded a fever. The boy loſt the uſe of his legs and thighs, and died a few months after, quite emaciated.

CANINE *laughter*, *riſus caninus*, that wherein the lips are drawn far back, and the mouth much extended. *Trev.* Dict. Univ. T. 1. p. 1387.

CANINE *ligament*, κυνοδεσμιον, is that whereby the prepuce of the human penis is faſtened to the glans, otherwiſe called the *frænum*. *Gorr.* Med. Defin. voc. κυνοδεσμιον. *Caſt.* Lex. Med. p. 130. See PENIS, FRÆNUM, &c. *Cycl.*

CANINE *madneſs*. *rabies canina*, is uſually ſuppoſed the ſame with hydrophobia, though ſome diſtinguiſh, applying the former denomination where the patient raves, or has loſt all uſe of reaſon; the latter, where he ſtill retains his reaſoning faculty, only his members are ſubject to certain involuntary convulſive motions, as thoſe of an epileptic or aguiſh perſon. Ephem. Acad. N.C. Dec. 3. an. 2. Obſ. 104. p. 136. ſeq. See HYDROPHOBIA and MANIA, *Cycl.* and *Suppl.*

The *rabies canina* is never without the hydrophobia, but the latter frequently without the former.

CANINE *ſulphur*, a ſort of native ſulphur diſcovered near Reggio, intermixed with earthy or ſtony matters; thus called by reaſon that dogs are ſo fond of it as to dig it out of the earth. *Giorn.* de Lettre d' Ital. T. 30. p. 266. ſeq. See SULPHUR.

CANINE *teeth*, theſe are alſo called *cynodontes*, κυνοδοντες [a]; and by the women *eye-teeth* [b]. — [a *Caſt.* Lex. Med. p. 238. voc. *cynodontes*. b *Drak.* Anthrop. l. 4. c. 3.]

CANINUS *ſerpens*, in zoology, a name given by ſome writers to the *mauballa* of the Ceyloneſe, a ſnake that has a way of flying at every thing that comes in its way, in the manner of our dogs. *Ray*'s Syn. An. p. 337.

CANIS, *dog*, in the Linnæan ſyſtem of zoology, makes a diſtinct but very large genus of animals, taking in all the dog kind, which this author only accounts ſo many varieties, and the wolf and fox, which he accounts diſtinct ſpecies. The characters of this genus are, that the creatures of it have ten paps, four on the breaſt, and ſix on the belly, feet adapted to running with five toes on the fore ones, and four on the hinder. The common dog he diſtinguiſhes by his crooked tail, the fox he calls the dog with a ſtrait tail, as long as his body; and the wolf the dog with a ſtrait tail ſhorter than its body. *Linnæus*'s Syſtem Naturæ, p. 36. See DOG.

CANIS *carcharias*, in natural hiſtory, a name given by Rondeletius, and other authors, to that ſpecies of ſhark called the *lamia*, or white ſhark by others, or *carcarias*, *lamia*, &c. See Tab. of Fiſhes. N° 3.

CANIS *galeus*, in zoology, the name of a large fiſh of the ſhark kind. It has three rows of extremely ſharp teeth; the eyes are ſmall for the ſize of the fiſh, the pupils areproportionably ſmall, and the iris of a fine bright ſilver colour, with a caſt of blue or green. The noſtrils are ſmall, and ſituated between the mouth and the end of the noſe; and the noſe, ſo far as it is extended beyond the noſtrils, is pellucid. It is of a duſky colour on the back, and a ſilver white on the belly, and its fleſh is tender, and not ill taſted. It is brought to market in Rome, and is ſometimes caught alſo on our own coaſts, as about Penzance in Cornwall. It is extremely fond of human fleſh, and will venture to leap up even upon the ſhoar for it. *Willughby*'s Hiſt. Piſc p. 51.

CANIS *volans*, in zoology, the name of an animal properly of the bat or veſpertilio kind, and diſtinguiſhed by Linnæus by the name of *veſpertillio cauda nulla*, the tailleſs Bat. *Seba*, T. 1. p. 91.

CANKER, (*Cycl.*) denotes any gnawing ulcer that corrodes the fleſh about it.

CANKER ſeems alſo popularly uſed for a gangrene, or beginning mortification. See GANGRENE.

CANKER is alſo a diſeaſe in dogs, which ſeizes their ears. Dict. Ruſt. T. 1. in voc.

CANKER, in hawks, breeds in the throat and tongue, occaſioned by foul feeding. It is cured by waſhing the mouth with honey, and white wine boiled together, then ſtrewing it with chervil powder. *Trev.* Dict. Univ. T. 1. p. 1621. voc. *chancre*.

CANKER, in horſes, is a loathſome ſorrance, which if it continue long uncured, ſo feſters and putrifies the part, that it will eat to the very bone, and if it happens to come upon the tongue will eat it aſunder; lighting upon the noſe it devours the griſtle through. Dict. Ruſt. T. 1. in voc.

CANKER, in trees, a term uſed by our farmers to expreſs a wound or blemiſh in the trunk of a tree, which does not heal up by nature, but will encreaſe and damage, if not endanger, the whole tree. Theſe wounds are ſometimes occaſioned by accidents, as blows, or by the branches of one tree galling another by the motion they are put into by the winds; if this latter be the caſe, the offending branch muſt be cut off, or drawn another way, or elſe all remedies are vain.

The wound muſt be cut and enlarged every way to the quick, and all the decayed wood muſt be taken clean out, then the whole internal ſurface of the wound muſt be rubbed over with tar mingled with oil, and after this it muſt be filled up with clay and horſe dung mixed together, or with horſe dung alone, which many eſteem beſt of all; in this caſe the dung muſt be bound over with a rag; hogs dung is by many preferred to horſe dung for this purpoſe, and it is proper to add to this application the keeping of the roots cool and moiſt, by laying fern and nettles about them. If the *canker* be only in one of the boughs of the tree, the ſhort way is to cut off the bough at once. If that be a large one, it ſhould be cut off at ſome diſtance from the body of a tree, but if a ſmall one it ſhould be cut off cloſe. The adding a coat of dung, and pond or river mud about the roots of trees, if they are ſubject to this from their ſtanding in a dry barren land, as is often the caſe, is a very good cure. *Mortimer*'s Huſbandry, V. 2. p. 79.

CANKER *worm*. See SCARABÆUS.

CANNA, in the Linnæan ſyſtem of botany, the name of a genus of plants, called *cannacorus* by Tournefort and other authors. It characters are, that the flower-cup is compoſed of three leaves, which are ſmall, coloured, pointed, placed erect, and remain a long time.

The flower is monopetalous, but divided into six parts; the several parts are pointed, and grow together at their bases; the three exterior ones are placed erect, and are twice as large as the cup, the three interior are long, two of them are erect, and one reflex.

The stamen is a single-pointed filament, very like in shape to the last segment of the flower, and affixed opposite to it; and bent back; the antheræ strait and slender, and fixed to the edge of the stamen; the pistilum is composed of a roundish, rough germen, placed under the receptacle of the seeds; a single pointed stylus, of the length and shape of one of the divisions or jags of the flower, and a long, slender, or narrow stigma on the margin of the stylus. The fruit is a roundish, rough capsule divided into three parts. The seeds are roundish. *Linnæi*, Gen. Pl. p. 1. See CANNACORUS.

CANNA, in the antient pharmacy and botany, denoted the calamus aromaticus, or according to others, cassia, fistula. *Salmas.* Exerc. ad Solin. T. 1. p. 1303.

CANNA also denotes a sort of long measure, otherwise called by modern authors a *cane*, by the Latins *calamus*, and in scripture a reed. *Calm.* Dict. Bibl. T. 1. p. 342.

The Roman *canna* contains four *braccios* [a], or palms, equivalent to six feet eleven inches Paris measure [b]. — [a *Cruse.* Vocab. T. 2. p. 273. b *Davil.* Cours. d' Archit. P. 2. p. 445. *Pitisc.* Lex. Ant. T. 1. p. 347.]

The *canna* appears to have been antiently used for a land-measure, answering to our rod, or pole. The *canna* was estimated at eight palms. Regist. Walt. Giff. Archiepisc. Ebor. p. 45. *Jac.* Law Dict. in voc.

CANNABIS, *hemp*, in botany, the name of a genus of plants, the characters of which are these: the flowers are of the apetalous kind, being composed only of a number of stamina placed in a cup. These are barren, and the embryo fruits grow on such plants of *hemp* as have no flowers. The species of *hemp* enumerated by Mr. Tournefort are these. 1. The common male *hemp*. 2. The common female *hemp*. And 3. The tall African *hemp* with small seeds. *Tourn.* Hist. p. 535. See HEMP.

CANNACORUS, in botany, the name of a genus of plants, the characters of which, according to Tournefort, are these: the flower is lilliaceous, and consists of one leaf of a tubular form, and divided into six segments at the edge; from one of these segments there grows a slender body which seems to supply the office of a pistil, and as if it also was to supply that of the stamina, it is furnished with a sort of apex or head. The cup, which is tubular, encloses the flower, and finally becomes a fruit of an oblong or roundish shape and membranaceous structure, divided into three cells, and contains several roundish seeds.

The species of *cannacorus* enumerated by Mr. Tournefort are these: 1. The common broad-leaved *cannacorus*. 2. The *cannacorus*, with yellow spotted flowers. 3. The *cannacorus*, with very large leaves, and red flowers. 4. The *cannacorus*, with shining scarlet flowers. 5. The narrow leaved *cannacorus*, with yellow flowers. And, 6. The *cannacorus*, with yellow roots, said to be the curcuma or turmerick of the shops. *Tourn.* Inst. p. 367.

CANNEL *coal*, a black bituminous fossil, frequent in Staffordshire and Lancashire, of a fine hard texture, so as to receive a polish, and become of service for divers works instead of ivory, but chiefly used for fuel, as affording a brighter, and purer flame than the common sea-coal. See COAL.

Dr. Woodward takes our *cannel coal* to be the same with the lapis ampelites of the antients, and the lapis obsidianus of some later writers. *Plin.* Hist. Nat. l. 35. c. 16. *Dioscor.* l. 5. c. 181. *Woodw.* Meth. Foss. cl. 4. c. 2. Ejusd. Nat. Hist. Engl. Foss. T. 1. cl. 7. P. 1. See AMPELITES, &c.

Cannel-coal, or as some call it *canal-coal*, is also found in Cumberland, and some other counties of the North. — It is of so close a texture, that it will take a tolerable polish. The choir of the cathedral of Litchfield is said to be in a great measure paved with *cannel-coal* for the black, and alabaster for the white, which when clean resembles marble. It also turns like ivory into many pretty works, as ink standishes, salts, candlesticks, &c. *Woodw.* Nat. Hist Engl. Foss. T. 2. p. 17.

In disposing it for fire regard is had to the grain. If they would have it burn slow they lay it flatwise on the fire, if clear, they set it edgewise, in which case it burns as light as a candle. *Hought.* Collect. N° 239. p. 152.

CANNEVAROLA, in zoology, a name by which Aldrovandus and some other authors have called the lesser reed sparrow, called by others, ficedula cannabina, and by Mr. Ray passer arundinaceus minor. It is of the size of the common redbreast, or somewhat smaller, and lives among reeds in watery places, on which it sings very sweetly. Its rump is olive-coloured, the rest of its back greyish; its breast is white, its throat yellowish, and its legs and beak are very large in proportion to its size. *Ray*'s Ornithol. p. 99. See Tab. of Birds, N° 16.

CANNIBAL, or CANIBAL, is used by modern writers for an anthropophagus, or man-eater, more especially of the West Indies. See ANTHROPOPHAGI, *Cycl.* and *Suppl.*

The denomination *cannibal* most properly belongs to the natives or savages of the Caribbee islands, among whom it is an established custom to kill and eat their prisoners of war. The name is properly that of the nations who were antiently possessed of all the Carribbee islands, and still remain possessors of some of them, either in the whole, or in part; particularly those of St. Vincent, Bekia, and St. Domingo. Some represent them as a gigantic people, whose arrows are dipt in a poison which give the hydrophobia to those wounded with them. *Zach.* Quest. Med. Leg. l. 2. tit. 1. quæst. 17. n. 7. *Cast.* Lex. Med. p. 131.

The origin of the word is unknown: 'Tis supposed to be American. The people themselves give the name *callinago* to their men, and *callipona* to their women. The Europeans are first said to have given them the denomination, *Caraibas* or *Caribbees*. They are supposed to be descended from the Galibis, a people of the neighbouring continent. *Trev.* Dict. Univ. T. 1. p. 1433. *Martin*, Dict. Geogr. T. 2. P. 2. p. 236. seq. voc. *caraibe*.

Some derive the origin of the venereal disease from the *cannibals*, attributing it to I know not what venomous quality in man's flesh, of which those people feed [a]. The *cannibals* themselves eat no flesh of those who die a natural death, as being unwholesome [b]. When the *cannibals* of St. Vincent take any of the Arouages, their hereditary enemies, prisoners, they feed them high four or five days, and then make a feast, and sacrifice them to Maboya. Such of their enemies as are killed in battle they eat on the spot. They only save women and children for slaves; they have eaten persons of all nations that have come among them. They say the French are tenderer than the Spaniards. Since their conversion to christianity they shew more humanity to their victims than before; they kill and eat them without exercising other cruelties before-hand [c]. — [a *Bac.* Nat. Hist. Cent. 1. §. 26. b Id. Cent. 9. §. 859. c Bibl. Univ. T. 6. p. 256.]

CANNOCK, or CANNOT-*stone*, a base sort of iron oar, in Staffordshire mines, of which the worst metal is made. *Plot*, Nat. Hist. Stafford. c. 4. §. 17, & 20. *Hought.* Collect. T. 2. N. 271. p. 220.

CANNON (*Cycl.*) — In the list of aids raised for the redemption of king John of France, in 1368, mention is made of an officer in the French army called *master of the king's cannons*, and of his providing four great *cannon* for the garrison of Harfleur. Du Cange even finds mention of the same engines in Froissart, and other French historians some time earlier [a]. The Germans carry the invention of *cannon* farther back, and attribute it to Albertus Magnus, a Dominican monk, about the year 1250 [b]. Is. Vossius rejects all these conjectures, and finds *cannons* in China almost 1700 years ago. According to him they were mounted by the emperor *Kitey*, in the year of Christ 85 [c]. — [a *Du Cange*, Gloss. Lat. T. 1. p. 751. voc. *canones*. b *Reiman*, Enleit. Hist. Liter. l. 2. c. 98. p. 210. c *Voss.* Var. Observ. c. 14. p. 83.]

Cannon are sometimes cooled by smeering them with sheep skin dip'd in water mixed with vinegar. Without this precaution they are apt to burst after many discharges. 'Tis also requisite to clean them with the spunge, that no fire may be left behind to endanger the next charge of powder. *Fasc.* Inq. Lex. p. 864. voc. *stuck*.

Cannon of battery, among the Italians, are those which carry an iron ball from 20 to 50 pound weight.

Culverins, those which carry a ball from 14 to 30 pound weight.

Feild peices, or small artillery, those which carry a ball from 1 to 10 or 12 pound weight.

Pattereros those which carry a stone shot from 14 to 100 pound weight. *Moore*'s Treat. Artill. P. 1. c. 6.

Different nations, it is to be observed, give different proportions to pieces of the same denomination. So that we have an Italian, a German, a French, and an English set of *cannons*, all differently adjusted. Among the Germans, the

Extraordinary reinforced CANNON, is that which shoots a ball above 70 pound weight. We find mention of divers such among the older writers on the military art; some carrying 80 pounds, and even upwards; but they are disused.

Double CANNON, is intended more for curiosity than use, being too bulky for service. It carries an iron ball of 96 pound, and is 17 calibres, or 14 foot long, weighing 128 hundred weight.

Whole CANNON, that which carries a ball of 48 pound weight. It is 18 calibres long; weighs 86, or according to Wolfius from 70 to 80 hundreds, requires 24 pounds of powder to each shot, three cannoneers to attend it, and ten labourers, and to remove it 30 horses.

Three Quarter CANNON, that which shoots a ball of 36 pounds weight, being 20 calibres long, and weighing 72, or, according to Wolfius from 60 to 70 hundreds. Its charge is 18 pound of powder, and to the management of it are required two cannoneers, and 8 servants, and to bring it into the field 26 horses are necessary. It carries the ball a somewhat less distance than the whole cannon.

Demi CANNON, or *Half* CANNON, *Mezzo cannone*, that which shoots a ball of 24 pound weight. It is 23 calibres long, 55, or according to Wolfius, from 50 to 60, hundreds weight, requires 12 pounds of powder to each shot, two cannoneers, and 6 labourers, and to bring it to the field 20, or according to Wolfius, 16 horses.

Quarter CANNON, that which shoots a ball of 12 pound weight. It is 28 calibres long, weighs 33, or, according to Wolfius, from 28 to 30 hundreds weight. Its charge of powder is 6 pound; to manage it are required two cannoneers, with 5 or 6 labourers; to bring it to the field 12, or according to Wolfius,

from

from 8 to 10 horſes. *Fæſch.* Ing. Lex. p. 156, ſeq. *Wolf.* Lex. Math. p. 312, ſeq. voc. *carthaune.*

Half Quarter CANNON, that which ſhoots a ball of 6 pound weight. It weighs from 19 to 20 hundred weight.

CANNON, among the French, is that which carries a ball of 33 pounds, is 11 foot 1 inch long, and weighs 6200 pounds.

Demi CANNON *of Spain*, that which carries a ball of 24 pounds, is 10 foot 11 inches ½ long, and weighs 5100 pounds.

*Demi*CANNON *of France*, or *culverin*, carries a ball of 16 pounds, is 10 foot eleven inches long, and weighs 4100 pounds.

Quarter CANNON *of Spain*, carries a ball of 12 pounds, is 10 foot 9 inches ½ long, and weighs 3400 pounds.

*Quarter*CANNON *of France*, or *baſtard*, carries a ball of 8 pounds, is 10 foot 7 inches ½ long, and weighs 1950 pounds.

Middle piece, *la moyenne*, carries a ball of 4 pound weight, is 10 foot 7 inches long, and weighs 1300 pounds.

Faucon and *Fauconnear* carries a ball from 2 pound to ¼ of a pound, is 7 foot long, and weighs from 800 to 150 pounds. *Saint Remy*, Mem. d'Artill. T. 2. p. 58, ſeq. *Wolf.* Elem. Pyrotech. c. 4. §. 99, & 110. *Fæſch.* Ing. Lex. p. 142. voc. *canon.*

Among the Italians, the *whole cannon* carries a ball from 70 to 120 pounds; the *cannon* from 30 to 50 pounds, and formerly to 60 pounds; the *demi cannon* from 20 to 28 pounds; the *quarter cannon* from 6 to 18 pounds; the *cannon baſilisk* among the Turks from 130 to 150, or even 200 pound. *Moore*, Treat. Artill. P. 2. c. 4.

*Ordinary*CANNONS, are thoſe of the common or middling length, each according to the proportions of its kind, *ex. gr.* 32 callibers for a culverin.

Extraordinary CANNONS, are thoſe which are longer than the uſual proportion allowed to their ſpecies, *ex. gr.* from 32 to 48 or 50 callibers for a culverin. *Moore*, Treat. Artill. P. 2. c. 3.

Baſtard CANNON, thoſe which are ſhorter than ordinary, whether they be of the whole cannon, cannon, or demi-cannon, or quarter cannon kind. Such, *ex. gr.* are culverins from 32 to 26 callibers.

Some call thoſe *baſtard cannon* which are longer than ordinary *cannons*, yet do not reach the length of culverins. But theſe ought rather to be called *extraordinary cannons*, or baſtard culverins. *Moore*, Treat. Artill. c. 4.

Cannons longer than ordinary are alſo called *ſlings*, *drakes*, &c. as thoſe ſhorter are called *cuts*.

Chambered or *camerated* CANNON is that which has a chamber near the breaſt, about 4 diameters of the piece in length, and ⅝ of a diameter in width. *Moore*, ibid. c. 4.

The thickneſs of metal in theſe is at the touch-hole ⅞, in the middle ⅝, and at the neck ⅜ of their calliber.

Reinforced, or *fortified* CANNONS, thoſe ſtronger and thicker in metal than ordinary, have their metal at the touch-hole one diameter thicker, in the middle 5 or ⅝, and at the neck ⅜.

All chamber'd *cannons* are reinforced. *Moore*, ibid. c. 4.

See further concerning the ſeveral kinds of the antient *cannons*, Semionovicz, Artill. p. 24. St. Remy, Mem. d' Artill. P. 2. p. 55. The modern pieces are deſcribed by Meith, in Artill. Recent. Prax.

Ship CANNON are ſtronger in metal than thoſe uſed by land, on account of the neceſſity they are often under of being charged with chain ſhot. They lie on ſhip carriages, having four ſmall wheels, without ſpokes, with two ropes to ſtop their running back, and bring them back to their place upon the battery.

CANNON *of courſe*, or *chaſe* CANNON, in a gally, is the largeſt, middlemoſt, and moſt effective of the guns placed in the prow, or chaſe of the veſſel, and which delivers its ſhot over the very ſtem, generally carrying a ſhot of 33 or 34 pound weight. It is a long piece, and recoils all along the middle of the gally to the maſt. *Moore*, Treat. Artill. P. 5. p. 103, ſeq. See GUN.

Braſs CANNON. What are commonly called *braſs cannon*, are not made of pure braſs; they cannot be made either of this, or of pure copper, but it is always found neceſſary to mix with theſe metals ſome coarſer ones, in order to make the whole run the cloſer and ſounder: ſuch are lead, and what the founders call pot metal. As bell metal is a mixture of copper and tin, ſo pot metal is copper and lead. About twenty pound of lead is uſually put to a hundred weight of pot metal, but about ſix pounds is ſufficient for a hundred weight of gun metal, and is of vaſt ſervice.

Firing of CANNON is performed by the application of a quick-match to the touch-hole.

The antients had their fiery tubes, or *cannæ*, which being loaden with pitch, ſtones, and iron balls, were exploded with a vehement noiſe, ſmoke, and great effect; though much inferior to our bombs. Vid. *Aquin.* Lex. Milit. T. 1. p. 159.

CANNON *mouth of a bit*, denotes a round, long piece of iron, ſometimes compoſed of two pieces coupled together, and bent in the middle. See BIT.

CANNON *mouths*, in the manege, are contrived to keep a horſe in ſubjection, being ſo ordered that they riſe gradually toward the middle, and aſcend towards the palate, that the void ſpace left underneath may afford a liberty to the tougue. *Guill.* Gent. Dict. P. 1. in voc.

CANNONEER, or CANNONIER, an officer in the artillery, who has the care of charging, pointing, and firing a cannon. *Aubin*, Dict. Mar. p. 161. *Trev.* Dict. Univ. T. 1. p. 1397. See CANNON.

The *cannoneer* is the ſame with what is otherwiſe called *gunner*; in the ſtreights *captain*; and in other places *connoſtable*. *Moore*, Treat. Artill. P. 5. p. 105.

CANNOW. See the article CANOW.

CANNULA, or CANOLA, *(Cycl.)* in eccleſiaſtical writers, was a tube of ſilver, or other metal, wherein were put the relicks, which the pope ſent as preſents to princes, &c. *Schmid.* Lex. Eccleſ. P. 1. p. 109. voc. *canola.* *Du Cange*, Gloſſ. Lat. T. 1. p. 749.

CANNULA, or CANOLA, was alſo a ſort of ſiphon, through which they antiently ſucked the wine in the euchariſt. *Schmid.* loc. cit. Item, P. 3. p. 47. voc. *ſiphon.* *Schoetg.* Cur. Ant. Lex. p. 263.

CANOE. See the article CANOW.

CANONARCHA, or CANONARCHUS, Κανωναρχης, or Κανωναρχων, a dignity in the Greek church, anſwering to the precentor in the Latin, or chanter in the Engliſh church. See PRAECENTOR and CHANTER, *Cycl.*

The word is formed from κανων and αρχη, beginning, or governing; in regard it belongs to this officer to ſet the canons, or church hymns, and to direct the choir in ſinging them. *Fabric.* Bibl. Græc. l. 5. c. 32. *Du Cange*, Gloſſ. Græc. T. 1. p. 583.

A like officer we alſo find in the antient monaſteries, under the denomination *canonarcha*, whoſe buſineſs was to beat the ſemantrum, or wooden inſtrument, whereby the monks were called to the choir to ſing canons. There appear to have been ſeveral *canonarchæ* in the ſame monaſtery. *Suic.* Theſ. Eccleſ. T. 2. p. 33. ſeq. *Du Cange*, loc. cit. *Magr.* Not. Voc. Eccl. p. 50. *Moſch.* Vit. Patr. l. 10. c. 11. and c. 50. *Trev.* Dict. Univ. T. 1. p. 1396.

CANONE *al ſoſpiro*, in the Italian muſic, a canon, the parts of which ſucceed each other by a ſoſpiro, that is, the time of a crochet. *Broſſard.*

CANONICA, in philoſophical hiſtory, an appellation given by Epicurus to his doctrine of logic.

It was called *canonica*, as conſiſting of a few canons, or rules for directing the underſtanding in the purſuit and knowledge of truth.

Epicurus's *canonica* is repreſented as a very ſlight and inſufficient logic, by ſeveral antients [a] who put a great value on his ethics and phyſics. Laertius [b] even aſſures, that the Epicureans rejected logic, as a ſuperfluous ſcience; and Plutarch [c] complains that Epicurus made an unſkilful and preſpoſterous uſe of ſyllogiſms. But theſe cenſures ſeem too ſevere. Epicurus was not averſe to the ſtudy of logic, but even gave better rules in this art than other philoſophers who aimed at no glory but that of logics. He only ſeems to have rejected the dialectics of the ſtoics, as full of vain ſubtilties and deceits, and fitted rather for parade and diſputation than real uſe [d].—[a *Cic.* de Finib. l. 1. c. 7. Item Acad. quæſt. l. 3. b *Laert.* l. 10. Sec. 31. c *A. Gel.* Noct. Att. l. 2. c. 8. d *Gaſſend.* de Vit. et Morib. Epicur. l. 8. c. 4. & c. 10. *Walc.* Hiſt. Log. l. 2. Sec. 1. §. 16. Parerg. Acad. p. 543, ſeq.] See DIALECTICA, *Cycl.*

The ſtreſs of Epicurus's *canonica* conſiſts in his doctrine of the criteria of truth.

All queſtions in philoſophy are either concerning words or things: concerning things we ſeek their truth, concerning words their ſignification: Things are either natural or moral; and the former are either perceived by ſenſe, or by the underſtanding. Hence, according to Epicurus, ariſe three *criterions* of truth, viz. ſenſe, anticipation, or prænotion, and paſſion. The great canon, or principle of Epicurus's logic is, that the ſenſes are never deceived; and therefore that every ſenſation, or perception of an appearance is true. Vid. *Gaſſend.* Synt. Phil. Epicur. P. 1. de orig. & variet. c. 7. *Stanl.* Hiſt. Philoſ. P. 13. p. 351. *Thomas*, Introd. Phil. Aulic. c. 5. §. 18. ſeq. p. 106. ſeq. *Walc.* loc. cit.

CANONICA, κανονικη is alſo uſed by ſome antients to denote the art of muſic. *A. Gell.* l. 16. c. 18. *Voſſ.* de quat. Art. Popul. c. 4. §. 2.

CANONICA is more particularly uſed to denote that ſpecies of muſic, which does not determine the intervals of ſounds by the ear, but by a canon, or ſtretched chord. Vid. *Ptolem.* Harm. l. 1. c. 8. *Boet.* de Muſ. l. 1. c. 9. *Vitruv.* l. 1. c. 1. *Voſſ.* Scient. Mathem. c. 19. §. 5. p. 81, ſeq. See CANON, *Cycl.*

CANONICAL, ſomething that belongs to, or partakes of the nature of a rule or canon.

Canonical amounts to much the ſame with what we otherwiſe call regular.

CANONICAL *obedience*, is that ſubmiſſion which by the eccleſiaſtical laws the inferior clergy are to pay to their biſhops; and religious to their ſuperiors. To the Textus Roffenſis are ſubjoined ſeveral formulæ of *canonical obedience* antiently paid by the Engliſh biſhops, not excepting the archbiſhop of York, to the Archbiſhop of Canterbury. Vid. Text. Roffens. Ed. Hearn. Oxon. 1720. 8vo. Bibl. Angl. T. 8. p. 342. See OBEDIENCE.

CANONICAL *ſins*, in the antient church, thoſe which were capital or mortal: Such eſpecially were idolatry, adultery, murder, hereſy, and ſchiſm. *Du Pin*, Bibl. Eccleſ. T. 17. p. 231. Jour. des Scav. T. 52. p. 15. See SIN, *Cycl.*

CANONICAL *punishments* are those which the church may inflict: Such are excommunication, degradation, and penance in Roman catholic countries; also fasting, alms, whipping, &c. See PUNISHMENT, PENANCE, &c. *Cycl.*

CANONICAL *purgations*, were antient methods of proving innocency, by ordeal, &c. See PURGATION, ORDEAL, JUDICIUM *Dei*, &c. *Cycl.*

CANONICAL *liberty*, a freedom to which certain churches are left, being governed by the antient canons and usages established before the papal hierarchy was carried to its height: Such is that which, of later days, the French call the *Gallican liberty*. *Du Pin*, Bibl. Eccles. T. 17. p. 151.

CANONICAL *institution*, a regular and legitimate collation to a benefice, agreeable to the rules of the canon law. *Calv.* Lex. Jur. p. 141.

CANONICAL *portion*, so much of the effects of a person deceased as the canons allow to the parish church he belonged to. *Calv.* loc. cit.

CANONICAL *life*, the method or rule of living prescribed by the antient clergy who lived in community.

The *canonical life* was a kind of medium between the monastic and clerical lives.

Originally the orders of monks and clerks were intirely distinct. But pious persons in process of time instituted colleges of priests and canons, where clerks brought up for the ministry, as well as others already engaged therein, might live under a fixed rule, which though somewhat more easy than the monastic, was yet more restrained than the secular. This was called the *canonical* life; and those who embraced it canons. See REGULAR, RELIGIOUS, &c. *Cycl.*

Authors are divided about the founder of the *canonical* life. Some will have it instituted by the apostles: others ascribe it to pope Urban I. about the year 230, who is said to have ordered bishops to provide such of their clergy as were willing to live in community, with necessaries out of the revenues of their churches. The generality attribute it to St. Augustin, who having gathered a number of clerks to devote themselves to religion, instituted a monastery within his episcopal palace, where he lived in community with them. Onuphrius Panvinius brings the institution somewhat lower; according to him, pope Gelasius I. about the year 495, placed the first regular canons of St. Augustin in the lateran church. *Bingh.* Orig. Eccles. l. 7. c. 2. §. 9. *Trev.* Dict. Univ. T. 1. 1629.

CANONICAL *letters*, in the antient church, were a sort of testimonials of the orthodox faith, which the bishops and clergy sent each other, to keep up catholic communion, and distinguish orthodox christians from arian, and other heretics.

They were denominated *canonical*; either as being composed according to a certain rule, or form; or because they were given to the *canonici*, that is, those comprehended in the canon, or catalogue of their church.

When they had occasion to travel into other dioceses, or countries, dimissory and recommendatory letters, also letters of peace, &c. were so many species of *canonical letters*. See DIMISSORY, *Cycl.*

CANONICAL is also an appellation given to those epistles in the new testament, more frequently called catholic, or general epistles.

CANONICAL *hours*, are certain stated times of the day, consigned more especially by the Romish church to the offices of prayer and devotion: Such are *mattins*, *lauds*, *sixth*, *ninth*, *vespers*. Bibl. Angl. T. 13. p. 341. *Bingh.* Orig. Eccles. l. 13. c. 9. §. 8.

CANONICAL *horses*, *canonici equi*, was an antient tax, or tribute imposed on certain provinces, whereby they were obliged to furnish the emperor with so many horses to mount his cavalry. *Bingh.* Orig. Eccles. l. 5. c. 3. §. 4.

CANONICAL, *canonicus*, was also an appellation given to all the officers and ministers of a church or monastery, from the bishop or abbot, to the meanest servant, including priests, monks, virgins, and all who were entered in canon, that is, in the matricula or register of the church. *Helyot*, Hist. des Ord. Monast. T. 2. p. 55. *Stev.* Suppl. to Dugd. T. 2. p. 68.

CANONICAL is an appellation more peculiarly given to those writings designed by God to be the canon, or rule of our faith and practice; and which have been solemnly received as such by the church, and comprehended in the canon, or catalogue of the scriptures. *DuPin*, Prelim. sur la Bibl. l. 1. c. 1. §. 1. In which sense, *canonical* stands contra-distinguished from *apocryphal*; ακανονιστοι, or *non-canonical*; spurious, doubtful, and even merely ecclesiastical.

Canonical differs from divine or inspired, as the former imports a book authentically received by the church or synagogue, as coming from God, and placed in the canon accordingly; which is not supposed in the latter. 'Tis alledged there are many prophetical books which were never received by the synagogue, nor publickly read in churches, which yet are by no means to be rejected, as not dictated by God [a]; these though never actually taken into the canon, yet were capable of being made *canonical*, in case more books had been wanting to be read in the assemblies of christians. Who doubts but the books of Nathan, and Gad, Ahija and Jeddo, the visions of Hosea, &c. were divinely inspired, though not taken into the canon? And such, according to a modern Lutheran writer is the book of Wisdom [b]. — [a Vid. *Simon.* Hist. Crit. du vieux. Testam. p. 56, seq. b Vid. Observ. Halens. T. 5. Sect. 13. §. 12, seq. Nouv. Rep. Lett. T. 33. p. 420.]

The conditions then requisite to constitue a book *canonical*, are; that it be written by divine inspiration, and that it be solemnly accepted, and consigned by the church for a perpetual guide or rule of faith, and practice. *Carpzov.* Introd. ad Libr. Biblic. P. 1. c. 1. §. 2.

Divines generally hold, that those books only of the new testament are to be accounted *canonical*, which were either written or at least approved and authorized by the apostles. *Cosin*'s Hist. of Canon of Old Testam. §. 73. p. 80. *Richard.* Vindic. Can. New Test. §. 2. p. 6. *Clark*, Reflect. on Amynt. p. 37, seq.

Formerly these were not so well distinguished as among us. In the first ages of the church, Dodwell observes, the genuine writings of the apostles used to be bound up together with those now called spurious, and apocryphal; so that it was not manifest by any public judgment, which of them was to be preferred to the other, but later times thought fit to make a separation. *Dodw.* ap. Nye. Def. Can. New Test. p. 18.

The Jews allow of no book for *canonical*, but those written before or soon after the return from the Babylonish captivity, when the gift of prophecy ceased among them. *Basnage*, Diss. sur le Canon, in Ouvr. des Scav. 1704. p. 25.

Eusebius lays down three marks, by which the spurious writings forged by heretics, under the names of the apostles, were distinguished from the genuine and *canonical*. 1mo, Their not being cited as scripture by the doctors of the church; which, however, must not be taken without some restriction; since several such are indeed quoted as scripture by Origen and Clemens Alexandrinus [a], the most learned of the antient fathers, as Eusebius himself elsewhere owns; but we are to suppose he meant not cited as divine scripture in those places, where they speak expressly what books were *canonical*, and what not. 2do, Their manner of writing, which is wholly different from the spirit, genius, and manner of the apostles. 3tio, The doctrines, opinions, and other matters advanced in their books, which were so contrary to truth and orthodoxy, that it is not enough to call them spurious, but they must also be denominated absurd and impious [b]. — [a *Richard.* Can. N. T. Vindic. §. 6. p. 25. *Euseb.* Hist. Eccles. l. 3. c. 25. *Nye.* Def. Can. New Test. p. 68.]

A late writer alledges two marks, or arguments of a book's being *canonical*: 1mo, its being cited by the antient fathers, under the name of scripture; and, 2do, its having been read in the antient churches: Both which characters agree to the epistles of Clemens and Barnabas, and the pastor of Hermas. But it has been shewn him that these criterions are not sufficient. The word scripture was not always used by the fathers in its proper, but sometimes in a lax sense; and as to reading of books in churches, the practice of our own church is to this day a proof that it does not imply their canonicity. Some of the Romish doctors distinguish the inspired writings into three classes, *canonical*, or proto-*canonical*, deutero-*canonical*, and apochryphal. Vid. *Richardf.* Vindic. Can. New Test. §. 6. p. 26, seq.

Post-CANONICAL, or *deutero*-CANONICAL, are those doubtful books, which were never regularly allowed for scripture, nor admitted into any canon before that of the council of Carthage [a]; though otherwise frequently cited as scripture by ecclesiastical writers, and read in many churches. The first catalogue wherein the books of Wisdom, Ecclesiasticus, Tobit, Judith, and the two Maccabees were put in the number of *canonical* books, was that of the third council of Carthage, held in 397, which confirmed the decree of a council of Hippo in 393, whereby those books had been declared part of the canon, but on condition, that the churches on the other side of the sea should be consulted about confirming this decision. The same decree was also repeated in a council of Carthage held in 419, with this clause, that it should be communicated to the pope and bishops of Italy. Pope Innocent came into it, so did his successor pope Gelasius, in a council at Rome in 494. Pope Eugenius, and the council of Trent, confirmed it yet more solemnly [b]. — [a *Du Pin*, Diss. Prelim. l. 1. c. 1. §. 5. b Idem, l. 1. c. 1. §. 4. ibid.]

CANONICUM, κανονικον, in a general sense, denotes a tax, or tribute.

CANONICUM is more particularly used in the Greek church for a fee paid by the clergy to bishops, archbishops, and metropolitans, for degrees and promotions. Vid. *Du Cange*, Gloss. Gr. T. 1. p. 578.

CANONICUM also denotes a due of first fruits, paid by the Greek laity to their bishops, or according to Du Cange, to their priests. The *canonicum* is assessed according to the number of houses, or chimnies in a place.

The emperor Isaac Comnenus made a constitution for regulating the *canonicum* of bishops, which was confirmed by another made in 1086, by his nephew Alexis Comnenus. A village containing 30 fires, was to pay for its *canonicum*, one piece of gold, two of silver, one sheep, six bushels of barley, six of wheat flower, six measures of wine, and thirty hens. Vid. *Du Cange*, Gloss. Gr. T. 1. p. 578. *Trev.* Dict. Univ. T. 1. p. 1397.

CANONIST, a person skilled in, or who makes profession of the study and practice of the canon law. See CANON *law*, *Cycl.*

Canonists and civilians are usually combined in the same persons.

persons. And hence the title of *doctor juris utriusque*, or *legum doctor*, usually expressed in abreviature, L. L. D. or J. U. D.

CANOO. See the article CANOW.

CANOPUS, in astronomy, a bright star of the first magnitude in the rudder of Argo, a constellation of the Southern hemisphere. See ARGO, *Cycl.*

Vitruvius places *canopus* in the tip of the rudder, Bayer in the place where the helm touches the water. Vitruv. de Archit. l. 9. c. 7.

Hyginus calls it the last star of the river Eridanus, Pliny describes it as a huge bright star, *sidus ingens et clarum* [a]. Proclus calls it λαμπρὸν ἀστρον. F. Thomas, the jesuit, assures it is the biggest in the heavens after Sirius [b]. It is also called *fuchel*, *fihel* or *fohail* [c]. Sometimes *Rubayl*, *Ptolemæus*, *Ptolemæon*, &c. [d] By the Chinese, *lao-ginsing*, the star of long livers [e]. — [a *Plin.* Hist. Nat. l. 6. c. 22. b Mem. Acad. Scienc. An. 1693. p. 390. c *D' Herbel.* Bibl. Orient. p. 817. voc. *fohail.* d *Bayer*, Uranometr. Tab. Trev. Dict. Univ. T. 1. p. 1400. e Lett. Edif. T. 7. p. 172.]

The longitude of *canopus*, as given by Halley, for the year 1700, is 10° 52′ of Cancer, and its southern latitude, 72° 49′. F. Noel, in 1697, found its right ascension, 93° 54′, its declination southwards, 52° 29′ [a]. F. Feuille, in the beginning of March 1709, observed the declination of *canopus* 52° 30′ 4″. F. Thomas, in January 1682, found the declination 52° 31′ 33″ its right ascension 93° 32′ 20″, longitude, 8°. 52′, of Cancer, latitude southern, 75° 55′ [b]. — [a *Wolf.* Lex. Math. p. 305, seq. b Mem. Acad. Scienc. an. 1693. p. 390, seq.]

CANOPY, in architecture and sculpture, a magnificent kind of decoration, serving to cover, and crown an altar, throne, tribunal, pulpit, chair, or the like. *David.* Cours. d' Architect. P. 2. p. 539. voc. *dais.* See BALDACHIN.

The word is formed from the barbarous latin *canopeum* [a], of the Greek κωνωπειον, a net spread over a bed to keep off the gnats, from κωνωψ, *culex*, a gnat [b]. — [a *Du Cange*, Gloss. Lat. T. 1. p. 761. b *Skin.* Etym. Angl. in voc.]

Canopies are also borne over the head in processions of state, after the manner of umbrellas.

The *canopy* of an altar is more peculiarly called *ciborium*. *Bingh.* Orig. Eccles. l. 8. c. 6. §. 18. See CIBORIUM.

The Roman grandees had their *canopies*, or spread veils, called *thensæ*, over their chairs: the like were also in temples over the statues of the gods. The modern cardinals still retain the use of *canopies*. *Pitisc.* Lex. Ant. T. 2. p. 950. voc. *thensæ.*

CANOSA, in zoology, the name by which Salvian, and some other authors have called the *canis galeus*, and *mustelus levis*, a kind of shark. *Willughby*'s Hist. Pisc. p. 51.

CANOW, a kind of boat in use among the Indians of America.

The word is also written *canoo* [a], *canoe* [b], and *cannow* [c]. It is borrowed from the Spanish *canoa*, which signifies the same, and that from the language of the Indians. — [a *Grew* Mus. Reg. Societ. P. 4. Sec. 2. p. 364. b *Skin.* Etym. Angl. in voc. c *Boyle*, Phil. Work. abr. T. 1. p. 12.]

The common *canows*, among the Indians, are those made of trees hollowed; being either greater or less, according to the size of the tree they are made of. They are rowed with paddles, and rarely carry sails; the loading is laid at the bottom: but having no ballast they are frequently turned upside down. They have no rudder, the want of which is supplied by the hind oars. The negroes of Guinea use the same sort of *canows*, though made in a different manner. They are long shaped, having only room for one person in width, and 7 or 8 in length; they shew little wood above the water; those who row are extremely dexterous, not only in giving the strokes with cadence and uniformity, by which their *canows* seem to fly along the surface of the water, but also in ballancing the vessel with their bodies, and preventing their overturning, which otherwise, on account of their lightness, would continually happen. Add, that when they are overturned, they have the address to turn them up again in the water itself, and mount them anew. They venture as far as four leagues to sea, but dare not venture further.

They are usually 16 foot long, and a foot or two wide, though there are some larger, as far as 35 foot long, 5 wide, and 3 high, used for the carriage of cattle, and expeditions in war. They are fitted with sails made of rushes.

On return from a voyage the *canows* are not left in the water, but presently drawn ashore, where they are hung by the two ends, and left to dry; in which state they are so light, that two men will easily carry them on their shoulders.

The *canows* of the Canadese are made of the bark of the birch-tree, sometimes large enough to hold 4 or 5 persons. Those of the savages of Terra del Fuego, and the other islands of the straits of Magellan, are also of bark, and fashioned with great skill, from 10 to 16 foot long, and two wide, capable of holding 8 men, who row standing, with a swiftness which gives surprize. *Aubin.* Dict. Mar. p. 161, seq.

In the repository of the Royal Society is the model of a Greenland *canow*, covered with seal skins, and resembling a great bladder; so as that, however the waves dash over it, the person in it sits safe. It is rowed with a single paddle. *Grew*, Mus. Reg. Societ. P. 4 Sect. 2. p. 364, seq.

CANSTRISIUS, Καστρισιος, an officer in the church of Constantinople, whose business is to take care of the patriarchs pontifical vestments, assist in robing him, and during mass to hold the incense pot, and sprinkle holy water among the people, while the hymn of the trinity is singing.

The word is also written *Canstrinsius*, Καστρησιος; it is usually derived from *canistrum*, a name which some suppose given to the incense pot, others to the kind of basket in which the patriarchs vestments were kept. *Du Cange*, Gloss. Gr T. 1. p. 576. *Magri*, Notiz. de Vocab. Eccles. p. 51. Trev. Dict. Univ. T. 1. p. 1400.

CANT, a quaint, affected manner of speaking, or writing, adapted chiefly to the lower sort. See CANTING *language.*

Skinner racks his invention for the origin of the word *cant*, which he deduces successively from the German, Flemish, Latin and Saxon tongues. But his learning in this, as on many other occasions, serves only to puzzle and mislead him.

Cant is originally the proper name of a Cameronian preacher in Scotland, who, by exercise, had obtained the faculty of talking in the pulpit in such a tone and dialect as was understood by none but his own congregation.

Since Andrew *Cant*'s time, the word has been extended to signify all sudden exclamations, whining, unmusical tones, and in fine, all praying and preaching like that practised by the more zealous and less knowing, among the presbyterian ministers.

CANT is also applied to words and phrases affected by particular persons, or professions for low ends, and not authorized by the established language. See CANTING.

Cant is not restrained to the style of gypsies, thieves, and beggars, but possesses a large department in the politer provinces of the English language.

A late writer assigns divers sources of *cant* words; one is the natural taciturnity of the English people, which leads them to clip their longer words, by pronouncing only the first syllable, and dismissing the rest; whence the words *phizz*, *hippo*, *mobb*, *pozz*, *bamm*, &c. Tatl. N° 230. T. 4. p. 171.

The sea language will most of it come under the denomination of *cant*; and the like holds of the terms in alchemy, heraldry, not to say in astrology, or even chemistry, pharmacy, &c. In reality, the difference between a *cant* term, and a technical term is not easy to assign, unless we chuse to restrain the former to words introduced out of folly, affectation, or imposture; and the latter to such are introduced for the sake of clearness, precision, and significancy.

CANT is also used to denote a sale by auction. Stat. Abr. 8vo. tit. *Taxes*, n. 681. T. 4. p. 107.

The origin of the word, in this sense, is dubious; it may come, according to some, from *quantum*, how much; according to others, from *cantare*, to sing, or cry aloud; agreeably to which, we sometimes also call it an *out-cry.* Trev. Dict. Univ. T. 2. p. 1153. voc. *encan.*

CANT is also a term used by some carpenters; when a piece of timber comes the wrong way in their work, they say *cant* it; i. e. turn it over. *Neve*, Build. Dict. in voc.

CANT is also popularly used for an angle, or corner.

CANTABRIAN, the antient language of the north eastern part of Spain, in use before the country was subdued by the Romans.

Dr. Wallis [a] seems to make the *Cantabrian* the antient language of all Spain: Which, according to him, like the Gaulish, gave way to a kind of broken latin called *romance* or *romanshe*; which by degrees was refined into the Castilian or present Spanish. But we can hardly suppose, that so large a country, inhabited by such a variety of people, spoke all the same language [b]. — [a Vid. *Wall.* Gram. Angl. in Pref. *Greenw.* Engl. Gram. Pref. p. 12. §. 15. b *Wilk.* Real Charact. l. 1. c. 2. §. 3.]

The antient *Cantabrian*, in effect, is still found to subsist in the more barren and mountainous parts of the province of Biscay, Asturias, and Navarre, as far as Bayonne, much as the British does in Wales; but the people only talk it: for writing, they use either the Spanish or French, as they happen to live under the one or the other nation. Some attribute this to a jealousy of foreigners learning the mysteries of their language; others to a poverty of words and expressions. The *Cantabrian* does not appear to have any affinity with any other known language, abating that some Spanish words have been adopted into it for things whose use the Biscayans were antiently unacquainted with. Its pronunciation is not disagreable, and the greater part of its nouns end in *a* in the singular, and in *ac* in the plural. Such are *cerva*, and *cervac*, heaven; *lurra* and *lurrac*, earth; *eguzquia*, sun; *izarquia*, moon; *izarra*, star; *odeya*, cloud; *fua*, fire; *ibaya*, river; *uria*, village; *echea*, house; *ocea*, bed; *oguia*, bread; *ardava*, wine, &c.

The Lords prayer, in the *Cantabrian* tongue, runs thus: *Gure aita cervetan aicena, sanctifica bedi hire icena, ethor bedi hire resuma, eguin bedi hire vorondatea cervan becala lurrean ere*, &c. Vid. les Delices de l' Espagne, T. 1. p. 107, seq. Act. Erud. Lipsi. 1707. p. 99, seq.

CANTABRICA, in botany, a name by which different authors call two different species of plants. The *cantabrica* of Pliny is the rapunculus. The *cantabrica* of Turner the clove gilliflower. *Ger.* Emac. Ind. 2.

CANTABRICA is also a name used by Clusius and some others for the little narrow-leaved bind weed. See the article CONVOLVULUS.

CANTABRUM, in antiquity, a large kind of flag used by the Roman emperors, distinguished by its peculiar colour, and bear-

ing on it ſome words, or motto of good omen, to encourage the ſoldiers. *Pitiſc.* Lex. Ant. T. 1. p. 348. *Du Cange* Gloſſ Lat. T. 1. p. 671. *Schoet.* Cur. Ant. Lex. p. 267.

CANTALIVERS (*Cycl.*) — Thoſe which project much are now out of faſhion, and with good reaſon, eſpecially in London, as they darken, by their hanging over, the upper chambers at leaſt; and are apt to ſpread, and communicate fire, in caſe of a misfortune of that kind; beſides, that in the preſent mode of building, uſe, conveniency and ſimplicity are more ſtudied than ornament. *Neve*, Build. Dict. in voc.

CANTAR, or CANTARO, an eaſtern weight, of different value in different places, equivalent at Acra in Turkey to 603 pounds, at Tunis and Tripoli to 114 pounds. Lex. Mercat. p. 388.

CANTAR is alſo an Egyptian weight, which is denominated a *quintal*, and conſiſts of a hundred, or of a hundred and fifty *rotolos*, according to the goods they are to weigh. *Pocock*'s Egypt, p. 175.

CANTARO is alſo an Egyptian weight, which at Naples is equivalent to 25 pounds, at Genoa to 150 pounds. *Du Cange*, Gloſſ. Lat. T. 1. p. 762. Vocab. Cruſc. T. 2. p. 275.

At Leghorn there are three kinds of *cantaros*, one weighing 150 pounds, another 151, and a third 160 pounds. *Savar.* Dict. Comm. T. 1. p. 550.

CANTARO is alſo a Spaniſh liquid meaſure, in uſe eſpecially at Alicant, containing three gallons. Lex. Mercat. p. 388.

CANTARO is alſo a meaſure of capacity, uſed at Cochin, containing four rubies, the rubi 32 rotolos. *Savar.* Dict. Comm. T. 1. p. 557.

CANTATOR, Καυλατωρ, in the Greek empire, a name given to thoſe who exhorted and encouraged the ſoldiers to behave gallantly in battle. *Du Cange*, Gloſſ. Græc. T. 1. p. 576.

CANTATRICES, in middle age writers, hired weepers, and waiters at funerals. *Du Cange*, Gloſſ. Lat. T. 1. p. 763.

CANTEL, *cantellum*, in antient Engliſh writers, denotes a cuſtom of ſelling by the lump, without tale or meaſure.

Spelman derives the word from *quantillum*, and defines it by over meaſure, or what is added over and above ſtrict meaſure. *Spelm.* Gloſſ. p. 114. *Du Cange*, Gloſſ. Lat. T. 1. p. 763.

Kennet derives it from the old word *cant*, a hundred, q.d. the ſale of about a hundred weight; anſwering to what we now call the taking of a hundred pound on content; as when we take it in a bag, ſealed up, without telling the pieces. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc.

CANTERII, or CANTHERII, in the antient architecture, rafters or joiſts of a houſe, which reach down from the ridge to the eaves. *Vitruv.* Archit. l. 4. c. 2. and c. 7. *Bald.* Lex. Vitruv. p. 19. *Philand.* not. ad Vitruv. p. 63. *Pitiſc.* Lex. Ant. T. 1. p. 349.

CANTHARÆ, among the antients, a kind of candleſtick. See BRANCH.

CANTHARIAS *lapis*, in natural hiſtory, a name given by ſome writers to a foſſile ſubſtance ſuppoſed to reſemble a beetle. We ſometimes meet with parts of the ichthyperia or bony parts of fiſhes, which are ridged longitudinally, much in the manner of the outer wing of ſome of the beetle tribe, and from their ſize and ſhape which is an oblong, or oval one of the bigneſs of a common beetle, and ſometimes of the largeſt, and at others of the very ſmalleſt kinds; theſe have been called by ſome petrified beetles and *cantharidæ lapides*, others have extended the name to ſuch pieces of amber as have in them the body or any fragment of the beetle of any ſpecies.

CANTHARIDES (*Cycl.*) — The antients held them a poiſon when taken internally, by reaſon doubtleſs of their tendency to ulcerate the bladder [a]. Yet ſome moderns, as Langius [b], Bartholin [c], and others [d], have ventured to give them internally, ſupported by the authority of Hippocrates, who appears to have given them in dropſies and jaundices. — [[a] *Hildan.* Cent. 6. Obſ. 99. [b] *Lang.* Epiſt. Medic. l. 1. Ep. 47. [c] *Barthol.* Cent. 5. Hiſt. 82. [d] Ephem. Acad. N. C. Dec. 1. ann. 1. Obſ. 133. p. 260, ſeq.]

Groenvelt has a treatiſe expreſs on the ſafe internal uſe of *cantharides*, wherein he recommends them, eſpecially againſt ulcers in the bladder; for which he ſuffered a perſecution from the college of phyſicians, though further experience has ſhewn he had juſtice on his ſide. Vid. *Groenv.* Tract. de tut. Canthar. in Medic. uſu intern. Act. Erud. Lipſ. 1707. p 182.

Dr. Morgan propoſes a tincture of *cantharides*, made with the elixir vitrioli, as good in the diabetes. See DIABETES.

CANTHARUS *of a fountain*, among Roman writers, denotes the part, or apparatus out of which the water iſſued. See FOUNTAIN, *Cycl.*

It was made in divers forms, ſometimes in that of a ſhell, at other times in that of an animal, which yielded water at its mouth, eyes, and the like. *Ferret.* Muſ. Lapid. 2. Mem. 32. *Brod.* Miſcell. l. 10. c. 13. *Pitiſc.* Lex. Ant. T. 1. p. 348.

CANTHARUS, in eccleſiaſtical writers, denotes a fountain, or ciſtern in the middle of the atrium, before the antient churches, wherein perſons waſhed their hands and faces before they entered. *Bingh.* Orig. Eccleſ. l. 8. c. 3. §. 6. *Du Cange*, Gloſſ Lat. T. 1. p. 764.

CANTHARUS, in zoology, the name of a ſea fiſh much reſembling the ſparus and ſargus in ſhape, but of a duſkier and blacker colour, covered with ſmall ſcales, and not marked with the annular black ſpots which both theſe fiſh have near the tail. Its teeth alſo are ſlender and ſharp, not broad and obtuſe as in thoſe, and has very remarkable yellow lines running longitudinally down its ſides. It has only one back-fin, the anterior rays of which are prickly, the others not at all ſo. It is common in the Mediterranean; and is frequently brought to market in Rome, &c. being eſteemed a very well taſted fiſh. *Rondelet*, de Piſc. l. 5. c. 4. p. 120. *Geſner*, de Piſc. p. 111.

The *cantharus* of the antients is called by Artedi the *ſilver-eyed ſparus*, with longitudinal and parallel yellow lines on each ſide. Gaza calls this fiſh *ſcarabæus*. See the article SPARUS.

CANTICLES, a canonical book of the old teſtament, otherwiſe called the ſong of Solomon, by the Jews, the ſong of ſongs, *canticum canticorum*.

The Book of *canticles* is uſually ſuppoſed to be an epithalamium compoſed by Solomon, on occaſion of his marriage with the king of Egypt's daughter. But thoſe who penetrate further into the myſtery, find in it the marriage of Jeſus Chriſt with human nature, the church, and good men.

On this principle the *canticles* is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and ſpiritual marriage is expreſſed.

This ſong contains the adventures of ſeven days, and ſeven nights, the exact time allowed for the celebration of marriage among the Hebrews.

The Jews themſelves apprehending the book liable to be underſtood in a groſs and carnal manner, prudently prohibited the reading of it before the age of thirty, and the ſame uſage antiently obtained in the chriſtian church. *Orig.* Præf. in Cant. *Theodoret*, Opp. T. 1. p. 985. *Hieron.* in Ezek. *Calm.* Dict. Bib. T. 1. p. 356. *Wolf.* Bibl. Hebr. T. 2. p. 126.

Among the antients, Theodore Mopſuetanus rejected the book of *canticles*, as not divine. Divers Rabbins have alſo queſtioned its being written by inſpiration. The anabaptiſts generally lay it aſide, as a dangerous compoſition. 'Tis alledged, that the name of God is not once found in it. Mr. Whiſton has a diſcourſe expreſs to prove, that the *canticles* is not a ſacred book of the old teſtament [a]. He alledges it indeed to have been written by king Solomon, the ſon of David, but aſſerts, that it was compoſed at the time when that prince, blinded by his concubines, was ſunk in filthy love, and even idolatry. This he chiefly infers from the general character of vanity and diſſoluteneſs which reigns through the *canticles*, in which there is not, according to Whiſton, one thought that leads the mind toward religion, but all is worldly and carnal, to ſay no worſe. For the myſtic ſenſe, he aſſerts it to be without any foundation, and that the book is not cited as canonical by any writer before the deſtruction of Jeruſalem. Mr. Whiſton will have it to have been taken into the canon between the years 77 and 128, when allegories came in vogue, and the rabbins began to corrupt the text of ſcripture. Grotius, Nierembergius, the Dutch divines who criticiſed F. Simon, Menetrier, Baſnage, and ſome others, ſeem alſo to take the *canticles* for a prophane compoſition, on a footing with the love pieces of Catullus or Ovid. But this opinion is refuted by Michaelis, Majus, Witſius, Nat. Alexander, Outrein, Trancius, and others [b]. Mr. Whiſton's arguments have been particularly conſidered by Itchener [c]. — [[a] Lond. 1723. 12°. Bibl. Angl. T. 11. p. 74, ſeq. [b] *Wolf.* Bibl. Hebr. T. 2. l. 1. ſect. 2. ſubſ. 7. §. 10. [c] Defence of canon of old Teſt. Lond. 1723, 12°. Vid. Bibl. Angl. T. 11. p. 463, ſeq.]

R. Akiba finds the book of *canticles* more divine than the reſt: The whole world, according to this rabbin, is not worth that day when the *canticles* was given to Iſrael; for whereas all the hagiographers are holy, the *canticles* is the holy of holies. *Cartwright*, Mellific. Hebr. l. 4. c. 4. ap Crit. Sacr. T. 7. p. 855. *Carpzov.* Introd. ad Libr. Vet. Teſt. P. 2. p. 256, ſeq.

CANTING *language*, *or dialect*, is a myſterious ſort of jargon uſed by gypſies, thieves, and ſtrolling beggars, to expreſs their ſentiments to each other, without being underſtood by the reſt of mankind.

The *canting dialect* is a confuſed jargon, and not grounded on any rules; yet even out of that irregularity many words ſeem to retain ſomething of ſcholarſhip, as *togeman*, a gown, from *toga*, in the Latin; *pannam*, bread, from *panis*; *caſan*, cheeſe, from *caſeus*, &c.

It is obſervable, that, even unknown to ourſelves, we have inſenſibly adopted ſome of their terms into our vulgar tongue, as *bite*, and *bilk*, to cheat; *bounce*, to vapour; *bowſe*, ſtrong drink; *filch*, to ſteal; *flog*, to whip; *rig*, game or ridicule; *roaſt*, to rally; *rhino*, money. And from the ſame ſource proceed the words *ſham*, *banter*, *bubble*, *bully*, *ſharper*, *cutting*, *ſhuffling*, *palming*, &c. Cant. Dict. in Præf.

An anonymous author has given a *canting* dictionary, comprehending all the terms uſed in the ſeveral tribes of gypſies, beggars, ſhoplifters, highwaymen, footpads, and other clans of cheats and villains, with a collection of ſongs in the *canting* dialect. Lond. 1725. 8vo.

CANTING *arms*, among heralds, are thoſe which expreſs their owners ſurname. See ARMS, *Cycl.* and *Suppl.*

Theſe anſwer to what the French call *armes parlantes*, they are a ſort of rebus's, and are never preſumed to be noble. *Niſb.* Eſſ. on Arm. c. 1. p. 14. and 20. See REBUS, *Cycl.*

CANTING *coins*, in ſhip building, the ſame as *cantic coins*. See QUOIN, *Cycl.*

In Harris's Lex. Techn. they are called *canoigne coins*, but this ſeems an error of the preſs. Manwayring calls them *cantick-quoynes*.

CANTO denotes a part or diviſion of a poem, anſwering to what is otherwiſe called a book.

The word is Italian, where it properly ſignifies ſong.

Taſſo, Arioſto, and ſeveral other Italians, have divided their longer or heroic poems into *cantos* [a]. In imitation of them Scarron has alſo divided his Gigantomachia, and Boileau his Lutrin, into *chants*, or ſongs [b]. The like uſage has been adopted by ſome Engliſh writers, as Butler, who divides his Hudibras, and Dr. Garth his diſpenſary into *cantos*. A late Tranſlator of part of Virgil's Æneid, has even ſubdivided a book of Virgil into ſeveral *cantos* [c]. — [a Vocab. Acad. Cruſc. T. 2. p. 276. b *Trev.* Dict. Univ. T. 1. p. 1635. voc. *chant*. c *Theob.* Third Book of Æneis.]

CANTO, in the Italian muſic, ſignifies a ſong: hence *canto ſimplice* is where all the notes or figures are equal, called alſo *canto fermo*: *canto figurato*, that where the figures are unequal, and expreſs different motions.

CANTO alſo ſignifies the treble part of a ſong; hence *canto concertante*, the treble of the little chorus; *canto ripieno*, the treble of the grand chorus, or that which ſings only now and then, in particular places.

Canto ſignifies the firſt treble, unleſs ſome other word be added to it, as *ſecondo*, in which caſe it denotes the ſecond treble. *Broſſ.* Dict. Muſ. p. 16. *Walth.* Lex. Muſ. p. 135, ſeq.

CANTON (*Cycl.*) — The Swiſs *cantons* are divided into proteſtant, popiſh, and thoſe which are partly one, partly the other. The proteſtant *cantons* are four; Zurich, Bern, Baſle, and Schaffhauſen. The popiſh *cantons* are ſeven; viz. Lucern, Uri, Underwald, Zug, Fribourg, Soleure, and Schwitz, which gives the denomination to all the reſt. Thoſe compoſed of both religions are Glaris and Appenzel.

The compoſition of the *cantons* differs from that of the united provinces, in that each *canton* may do what it thinks good; whereas in Holland one province can undertake nothing without the concurrence of the reſt. Jour. des Scav. T. 1. p. 253. The *cantons* have no dependency on each other, having each their ſeparate laws, and forms of government, which in ſome is abſolutely democratical, in others ariſtocratical [a]. They are obliged by the alliance between them to aſſiſt each other when attacked. They hold an ordinary aſſembly yearly in June, at Baden, where their deputies treat of the affairs which concern the whole body. The *canton* of Zurich holds the firſt place, and its deputies preſide at the aſſembly; but Bern is far the richeſt and ſtrongeſt, making near one third part of the whole. Some compare it to the duchy of Milan [b]. — [a *Chavigni*, Scienc. des perſon. de la Cour. T. 1. p. 229, ſeq. b Souver. du Mond. T. 3. p. 12, ſeq.]

The Swiſs *cantons* date their freedom from the year 1308, when driven by the ill uſage of their Auſtrian governors, the three *cantons* of Uri, Schwitz, and Underwald, combined together, drove out the Auſtrians, and ſollicited the reſt to join with them; In 1351 Zurich, in 1352 Zug and Glaris, in 1353 Bern, in 1481 Fribourg and Soleure, in 1501 Baſle and Schaffhauſen, and laſtly Appenzel in 1513. The eight firſt are ſometimes diſtinguiſhed by the appellation of the *antient cantons*. Souver. du Mond. T. 3. p. 6, ſeq. Nouv. Rep. Lett. T. 21. p. 295.

CANTONING, in middle age writers, denotes the dividing a thing into hundreds, or ſelling it by hundred weights, or hundreds in tale. *Kenn.* Gloſſ. ad Paroch. Antiq.

CANTONING, in the military art, is a method of quartering troops in a town, where the garriſon is ſo numerous, that ſeveral regiments muſt be quartered on the inhabitants for want of caſerns or barracks to contain them.

In this caſe they divide the town into as many parts as there are regiments to be ſo quartered, that the officers and ſoldiers of each may have a diſtinct part to themſelves. This, in the military phraſe, is called *cantoning of a town*. Vid. *Bland.* Treat. Milit. Diſcipl. c. 10. art. 2. p. 149.

CANTRED or CANTREV, denotes a diſtrict or diviſion of an hundred towns, or villages. See HUNDRED, *Cycl.*

The word is Britiſh, compounded of *cant*, hundred, and *trev*, or *tref*, town or village.

In Wales, the counties are divided into *cantreds*, as thoſe in England are into hundreds. Angleſey, in particular [a], is divided into three *cantrevs* or *cantreds*, which are each ſubdivided into ſix *comots* or *commotes*, each *commote* containing about ſixty *trevs*, or townſhips. The general partition of Wales into *cantrevs* and *comots* is very antient [b]. — [a *Kenn.* Gloſſ. ad Paroch. Antiq. in voc. *cantredum*. *Du Cange*, Gloſſ. T. 1. p. 767. b *Rowl.* Mona. Antiq. Eſſ. Sect. 10. p. 110, ſeq. *Spelm.* Gloſſ. p. 115.]

CANVAS (*Cycl.*) is the cloth on which painters uſually draw their pictures; the *canvas* being ſmoothed over with a ſlick-ſtone, then ſized, and afterwards whited over, makes what the painters call their *primed cloth*, on which they draw their firſt ſketches with a coal or chalk, and afterwards finiſh with colours. *Salm.* Polygr. l. 3. c. 2. ſect. 6. *Savar.* Dict. Com. T. 2. p. 1769. voc. *toile*.

CANVAS alſo denotes a coarſe kind of hempen cloth, wove pretty open, uſed in divers parts of men's, but eſpecially women's dreſs *Trev.* Dict. Univ. T. 1. p. 1386.

We have divers ſorts and denominations of *canvas*, moſt of them imported from abroad; as Dutch, Barras, and Heſſian *canvas*; packing *canvas*; guttings and ſpruce *canvas*; Poledavies, Ebbing, or Queenſborough *canvas*; working *canvas*, for botts or cuſhions, narrow, broad, and broadeſt. *Hought.* Collect. T. 4. N° 11. p. 119.

CANVAS is alſo a name ſometimes given to ſail-cloth. *Savar.* Dict. Comm. T. 1. p. 546.

CANVAS-*bags*, in the military art, contain about a cubic foot of earth or ſand, with which they are filled. Their uſe is to raiſe a parapet in haſte, or to repair one, when beaten down. See SACKS *of earth*, *Cycl.*

CANZONE, in the Italian muſic, in the general, ſignifies a ſong; particularly a ſort of Italian ode, or Lyric poem, conſiſting of ſeveral ſtanzas, through all which the ſame order and diſpoſition of verſes, meaſures, and rhimes, are obſerved as in the firſt.

The *canzone* is uſually very long, and may be ſet to muſic in much the ſame ſtyle with the cantata. See CANTATA, *Cycl.*

There are alſo pieces of ſymphony without words, called *canzone*, much the ſame with ſonata's. *Broſſ.* Dict. Muſ. p. 16. Explic. Term. Muſ. p. 19. *Walth.* Lex. Muſ. p. 139. Cruſc. Vocab. T. 2. p. 277.

The word *canzone* in ſonatas, ſerves to indicate that the airs it is put under, are airs of briſk movement; ſuch as are the uſual fugues otherwiſe marked with *allegro*. See ALLEGRO, *Cycl.* and *Suppl.*

CANZONETTA denotes a little *canzone*. See CANZONE.

The word is a diminutive of the Italian *canzona*, or *canzone*. Cruſc. Vocab. T. 2. p. 277.

CANZURI, a name given by ſome authors to a peculiar kind of camphor more eſteemed than any other ſort. Some have ſuppoſed it thus called from *Kanzur* or *Chanzur*, the name of a place where they ſuppoſe it to be produced, which ſeems the more probable opinion, though Scaliger rejects it, and will have it that this fine camphor had its name from a certain gum called *canzur*, which, according to Garcias, and ſome others, is frequently mixed with the camphor by the people who collect it for ſale.

This gum, he ſays, is called alſo *canderros*; and that it is ſomewhat like the crude amber, only that it is whiter. There is this great objection to this being the true ſenſe of the word, that it expreſſes an adulterated kind, which it is ſcarce probable ſhould be true of that which all the authors who have mentioned this kind of camphor have agreed in calling the beſt and moſt excellent of all the ſorts.

CAOUANNE, in zoology, the name of a ſpecies of tortoiſe very much reſembling the jurucua of the Braſilians, but having a thicker ſhell, and a harſh, tough, and ſtringy fleſh, of but very bad taſte. *Ray*'s Syn. Quad. p. 257. See JURUCUA.

CAOUKE, in the Turkiſh dreſs, a high ſtiff turban, worn by the odabaſhees, or heads of the chambers of janizaries, when they go in proceſſion. *Pocock*'s Egypt. p. 167.

CAP (*Cycl.*) — The Romans were many ages without any regular covering for the head: when either the rain or ſun was troubleſome, the lappet of the gown was thrown over the head; and hence it is that all the antient ſtatues appear bareheaded, excepting ſometimes a wreath, or the like. And the ſame uſage obtained among the Greeks, where, at leaſt during the heroic age no *caps* were known.

Yet on ſome occaſions we find the Romans uſing a ſort of coverings for the head, as at ſacrifices, public games, feaſts of Saturn, and on journeys and military expeditions. Some perſons were alſo allowed to have their heads always covered, as thoſe who had lately been made free, and were thereupon ſhaved cloſe on their head. Theſe might wear the *pileus* both as a defence from the weather, and a badge of liberty; and the like privilege was granted to perſons under any indiſpoſition. *Lipſ.* de Amphitheat. c. 19. *Kenn.* Ant. Rom. P. 2. l. 5. c. 8. p. 320.

The ſorts of *caps* or covers of the head in uſe among the Romans on divers occaſions were the *mitra*, *pileus*, *cucullus*, *galerus*, and *palliolum*; the differences between which are often confounded by antient as well as modern writers.

The French clergy wear a ſhallow kind of *cap*, called *calotte*, which only covers the top of the head, made of leather, ſattin, worſted, or other ſtuff.

The *red cap* is a mark of dignity allowed only to thoſe who are raiſed to the cardinalate. *Savar.* Dict. Com. T. 1. p. 531.

The ſecular clergy are diſtinguiſhed by black leathern *caps*, the regulars by knit and worſted ones.

CAP *of a gun*, is a piece of lead which is put over the touch-hole of a gun, to keep the priming from being waſted or ſpilt. *Guill.* Gent. Dict. p. 3. in voc.

To cap, is ſaid of a ſhip, in the trials of the running or ſetting of currents. *Guill.* Gent. Dict. p. 3. in voc.

CAP or *great* CAP, a denomination of a kind of compendious bandage, ſerving for almoſt all occaſions of the head, being in figure not unlike a helmet. Vid. *Le Clerc*, Deſcr. of Band. p. 13. ſeq. where the manner of making the *great cap* is deſcribed.

Among chirurgical inſtruments we meet with a ſilver *cap*, *pileolus argenteus*, (though of late alſo made of wood, or even white wax) perforated at both ends, applied to the paps of nurſing women, when ulcerated, for the more commodious giving of ſuck. Vid. *Scultet.* Arm. Chir. P. 1. tab. 13. fig. 7. *Caſt.* Lex. Med. p. 500.

CAP, in phytology, a name given to the huſk or green ſucculent coat which covers the upper part of a nut, and connects it to the parent tree. *Grew*, Anat. of Plant. l. 1. c. 6. §. 8.

The *cap* conſiſts of a pilling and parenchyma derived from the bark, and ramulets from the lignous body of the branch.

CAP *of a muſhroom* is the head or ſuperior part expanded over the footſtalk, ſomewhat in manner of a canopy, or umbrello. *Bradl.* new Improv. Garden. P. 2. p. 121. See MUSHROOM.

Neptune's CAP. See the article NEPTUNE.

CAPASH, a kind of head-dreſs worn by the women of Candia. It is of a ſtiffened fine muſlin, and is made ſo as to ſtand up very high, and extends out a great way on the right ſide. *Pocock's* Egypt, V. 2. P. 2. p. 10.

CAPEDUNCULA, in Roman antiquity, the veſſels wherein the ſacred fire of Veſta was preſerved. See VESTALS, *Cycl.*

CAPEL, CAPELLA, in chemiſtry. See VESSELS.

CAPELAN, in zoology, a name given by ſome authors to the ſmall ſpecies of whiting called by the Venetians *matlo*, and by others the *aſellus omnium minimus*, and *merlangus*. *Willughby*, Hiſt. Piſc. p. 171.

CAPELINE, a kind of bandage uſed by the French ſurgeons in caſes of amputations; conſiſting of a roller with two equal heads. *Trev.* Dict. Univ. T. 1. p. 1408. *Le Clerc*, Trait. Chir. Oper. c. 21. Compl. Surg. p. 219, ſeq. where the manner of making the *capeline* is deſcribed.

CAPELLA (*Cycl.*) in zoology, the name of the bird commonly known in England by the name of the lapwing or baſtard plover, and called by ſome, in Latin, *vanellus*. It is a very well known bird, about the ſize of a pigeon, and has a beautiful creſt upon its head. Its legs are long and red, and it is remarkable for running very ſwiftly; it lays in open places on the ground, but uſually covers its eggs with a few looſe ſtraws. It is very clamorous about its breeding time, and it is ſaid has the cunning to fly about, and make a great noiſe where its neſt is not, to lead people away from the place where it is. *Ray's* Ornitholog. p. 228.

CAPER (*Cycl.*) — When the *capers* are budded for flowering, the ſhoots are cut away, and the leaves and flower-buds ſtript off; and being paſſed through a ſieve, the *capers* are thereby ſeparated from the leaves.

This is a ſpeedy way, without which they would come too dear for common uſe. *Bradl.* Dict. Botan. in voc.

Some ſay the plant grows in Oxfordſhire, and might doubtleſs be propagated in other places. In England broom-buds pickled are frequently ſubſtituted for *capers*. *Hough.* Coll. T. 3. N. 349. p. 6. *Savar.* Dict. Com. T. 1. p. 553.

Long CAPERS are the ſtyle or piſtil of the flower which grows into a fruit, long and round like an olive or acorn when ripe, containing divers hard brown ſeeds, like the acini of grapes. *Bradl.* loc. cit.

Capuchin CAPERS are produced by a plant formerly brought from India, thus called by reaſon the bottom of the calix of the flower reſembles the *capouche* of the religious of St. Francis. *Savar.* Dict. Com. T. 1. p. 554. See CIPARIS.

CAPER is alſo a veſſel uſed by the Dutch, for cruizing and taking prizes from the enemy.

In which ſenſe *caper* amounts to the ſame with *privateer*. See PRIVATEER, *Cycl.*

Capers are commonly double officered, and crouded with hands even beyond the rate of ſhips of war, in regard the thing chiefly in view is boarding the enemies. *Aubin.* Dict. Mar. p. 170.

CAPH, a Jewiſh meaſure of capacity for things eſtimated by kimhi at the 30th part of the log, by Arbuthnot at the 16th part of the hin, or 32d of the ſeah, amounting to five eighths of an Engliſh pint. *Arbuthn.* Tab. Anc. Coins, &c. p. 14.

The *caph* does not occur in ſcripture as the name of any meaſure. *Hoſt.* de veter. menſur. & ponder. l. 1. p. 123.

CAPHURA (*Cycl.*)--The original name of the drug which we call *camphor*. The Arabians call it caphur and cofor. The authors who have written firſt of the navigation and trade of the Eaſt Indies, have diſtinguiſhed three kinds of camphor, which they ſay are put to different uſes, and bear a different price in the Indies. The firſt kind is the camphora craſſa; this we call the crude or unrefined camphor, and import it in large and dirty cakes, which are purified into the clear and pellucid form we ſee it in, in Holland and elſewhere. The ſecond kind is the camphora ſana the Indians put this to no other uſe; but the anointing the ſtatues of their gods. And the third is called eſculent or eatable camphor; this is uſed by them in foods, and is called alſo camphor of Borneo, from the iſland of that name, which is the place it is principally brought from.

This is more proper for internal uſe than any other kind. The camphor of the Arabians in general is the ſame with the drug that we know by this name; only it is to be obſerved, that what we find deſcribed in Averrhöes under the name of camphora Indica, as it ſtands in the interpretations of the works of that author, muſt needs be a ſubſtance wholly different from our camphor, or that of the antients. The Arabians in general agreed that camphor was cold and dry, in the third degree, as they expreſs it, but Averröes ſays, that the camphora Indica is dry and hot in the ſecond degree.

Theſe authors paid too great a reſpect to one another, to differ ſo widely as this without alledging a reaſon for it, and as Averröes in this place gives none, it is probable he was not ſenſible of this account differing from that of the others, but meant ſome other ſubſtance, and not camphor, by the phraſe. He ſays that this camphor was called in the Arabic, cofor algend. There ſeems to have been a double error in the place, one of the original copyiſts, and another of the tranſlator; the name probably at firſt ſtood hofer alithend, and then the text is reconcileable to what the reſt of theſe authors ſays, for kofer ſignifies bitumen, and by the addition of the alihend becomes the name of bitumen Judaicum, which all the ſame authors attribute theſe very qualities to; and the tranſlator miſtaking the word Judaicum for Indicum, made the text much leſs intelligible than it would have been; for had he called it caphura Judaica, we ſhould have known that as no camphor came from Judæa, ſome other thing muſt have been meant by the word. What moſt of all confirms this opinion of what is called the Judæan camphor of Averröes not being what we call camphor, is that himſelf deſcribes our camphor in the ſame chapter, and gives it the ſame degree of cold and dry that the Arabians do. See CAMPHOR.

CAPICATINGA, in the materia medica, a name by which ſome authors have called the *acorus aſiaticus*, or Aſiatick ſweet flag. *Piſo*, p. 241.

CAPIDOLIUS, in ichthyology, a name given by Paulus Jovius, and ſome others, to the fiſh we call the *grampus*, and the generality of authors the *orca*. According to the Artedian ſyſtem, it is a ſpecies of the delphinus or dolphin, and it is diſtinguiſhed by that author by the name of the dolphin with the ſnout bending upwards, and with broad ſerrated teeth. See the articles ORCA and GRAMPUS.

CAPILLAMENT (*Cycl.*) — Bradley ſeems to reſtrain *capillaments* to the ſmaller flowers; and *ſtamina* (which he corruptly calls *apices*) to the larger. *Bradl.* Bot. Dict. T. 1. in voc.

CAPILLAMENT is alſo applied to the ſtrings or threads about the roots of plants. *Mill.* Gard. Dict. in voc. *Trev.* Dict. Univ. T. 1. p. 1411.

CAPILLARY (*Cycl.*) — *Capillary plants* amount to much the ſame with what are otherwiſe denominated *acauloſe plants*. Vid. *Ray*, Hiſt. Plant. T. 1. l. 3. Phil. Tranſ. N° 186. p. 284. *Quinc.* Lex. Phyſ. Med. p. 66. See ACAULOSE.

Arbor CAPILLARIS or CAPILLATA, an antient tree at Rome, on which the veſtal virgins when ſhaven for their office, hung up their hair, and conſecrated it to the gods. *Plin.* Hiſt. Nat. l. 10. c. 44. *Feſt.* in voc. *Fab.* Theſ. p. 448.

CAPILLARY is alſo uſed by mineraliſts in ſpeaking of ores which ramify or ſhoot out fine branches like threads.

In which ſenſe it amounts to the ſame ſenſe with what is otherwiſe called *arboreſcent* and *ſtriated*. Woodward ſpeaks of *capillary* or arboreſcent ſilver, and iron [a]; Grew deſcribes a piece of pure *capillary* copper from the mine at Heragrunt, the ſeveral ſtriæ, or capilli of which are ſhort, of a rediſh golden colour, growing together almoſt like thoſe of the little ſtone-moſs [b]. —[[a] *Woodw.* Nat. Hiſt. Engl. Foſſ. T. 1. p. 114. [b] *Grew*, Muſ. Reg. Societ. P. 3. Sec. 2. c. 1. p. 326.]

CAPILLARY *roots*. See FIBROSE *roots*.

CAPILLARY *tube*. — Some doubt whether the law holds throughout, of the aſcent of the fluid being always higher as the tube is ſmaller; Dr. Hook's experiments, with tubes almoſt as fine as cobwebs, ſeem to ſhew the contrary. The water in theſe, he obſerves, did not riſe ſo high as one would have expected. The higheſt he ever found was at 21 inches above the level of the water in the baſon, which is much ſhort of what it ought to have been by the law above-mentioned. *Hook*, Microgr. Obſ. 6. p. 11. See TUBE.

CAPILLARY *veſſels*. Many ſmall veſſels of animal bodies have been diſcovered by the modern invention of injecting the veſſels of animals with a coloured fluid, which upon cooling grows hard. But though moſt anatomiſts know the manner of filling the large trunks, few are acquainted with the art of filling the *capillaries*. Mr. Monro has given us what he, after many trials has found moſt ſucceſsful, in the Medic. Eſſ. Edinb. Vol. 1. art. 9. where he enters into a very nice detail of the operation, to which we muſt refer the curious. Some particulars we ſhall give under the head *injection*.

CAPILLARY *worms*, in children, are the ſame with what are otherwiſe called *crinones*, *comedones*, and *dracunculi*: See CRINONES, *Cycl.*

CAPILLITIUM *veneris*, in phyſiology, denotes a meteor appearing in the air, in form of fine threads reſembling a ſpider's web.

Some think that the *capillitium veneris* derives its origin from a cloud, the watery parts of which having been exhaled by the ſun's heat, only the earthy and ſulphureous parts are left behind, which ſhoot into this figure.

It is ſometimes alſo found hanging about woods and coppices, or even extended on the ground like a fine net, frequently enough miſtaken for ſpiders webs. *Chauv.* Lex. Philoſ. p. 90.

CAPILLUS *Veneris*, maiden-hair, in botany, &c. See ADIANTUM.

CAPIPLENIUM is uſed by ſome authors for a catarrh [a];but more properly, by the Italian phyſicians, for a continual heavineſs of the head, frequent at Rome, and almoſt endemic.[b]—[a *Schneid.* de Catarrh. l. 1. c. 3. [b] *Bagliv.* de Prax. Med. l. 1. c. 13 n. 4. p. 116. *Caſt.* Lex. Med. p. 132, ſeq.]

CAPISCOLUS or CAPISCHOLUS, in eccleſiaſtical writers, denotes a dignitary in certain cathedrals, who had the ſuperintendency of the choir, or band of muſic, anſwering to what in other churches is called *chanter* or *precentor*. See CHANTOR, *Cycl.*

The word is alſo written *cahiſcolus*, and *caputſcholæ*, q. d. the head of the ſchool, or band of muſic.

The *capiſcolus* is alſo called *ſcholaſticus*, as having the inſtruction of the young clerks and *choiriſters*, how to perform their duty. Vid. *Fleur.* Trait. des Etud. Sect. 8. p. 42. *Du Cange*, Gloſſ. Lat. T. 1. p. 826, ſeq. *Menag.* Orig. p 156. Trev. Dict. Univ. T. 1. p. 1411.

CAPISTRUM (*Cycl.*) among the antient muſicians was a kind of head ſtall, or bridle made of leather, faſtened round the head, which paſſing over the mouth, compreſſed the lips and cheeks ſo cloſe, that the perſon, whatever effort he made, could not give his pipe, or flute, above the due quantity of wind requiſite to make it ſpeak.

The figure of a muſician equipt with a *capiſtrum* is given by Salmaſius, who maintains it to be that of Marſyas the ſatyr, who, according to Plutarch, was the inventor of this inſtrument; in virtue of which he had even dared to contend with Apollo [a]. It was copied from an antient ſeal, formerly belonging to Velſerus [b]. — [a *Plut.* Sympoſ. l. 7. c. 8. [b] *Salmaſ.* Exerc. ad Solin. p. 585. Jour. des Scav. T. 6. p. 270.]

Some pretend that the uſe of the *capiſtrum* was to hide the deformity of bloated cheeks, and a gaping mouth, eſpecially where the teeth were naught; others, that it was intended to ſave the lips and cheeks from being extended ſo as to endanger burſting; others, to fortify the part, that it might yield the ſtronger noiſe. But the chief uſe appears to have been, to temper and moderate the breath, and prevent its animating the pipe beyond the due pitch. *Barthol.* de Tib. l. 3. c. 4. *Pitiſc.* Lex. Ant. T. 1. p. 351. See PHORBÆA.

The chemiſts give the denomination *capiſtrum auri* to borax. *Mercat.* Metalloth. p. 43. *Rul.* Lex. Alch. p. 131. See BORAX.

CAPITA or CAPITUM, in antiquity, denotes a tax among the Romans for the maintenance of the horſes in the army, levied according to the number of heads thereof.

The *capitum* was an obligation to furniſh hay to the emperor's ſtables, from whence it was afterwards diſtributed to the equites or horſe guards, and their officers [a]. It was deemed a mark of extraordinary honour, when the emperor ordered livery, or allowance of meat and provender to any perſon during his ſtay at Rome, ſo that both himſelf and horſes were ſupported at the public expence, as Valerian did to Aurelian [b]. — [a *Burm.* Diſſ. de Vectig. c.4. *Pitiſc.* Lex. Ant. T. 1. p. 352. [b] *Vopiſc.* in Aurel. c. 9.]

CAPITAL (*Cycl.*) — M. Bayle has a diſcourſe on the advantages of being born and living in the *capital* of the country. *Bayle*, Rep. aux Queſt. d' un Provinc. T. 1. c. 1. ſeq. Jour. des Scav. T. 37. p. 44.

Some pretend to limit the magnitude of a *capital* from the proportion to the reſt of the country, founded on a ſuppoſed analogy between the *capital* of a country, and the head of an animal. But the analogy is falacious, and ſo are the complaints grounded on it, that the city draws away the nouriſhment from the country, and that England is in the condition of an hydropic, where one part indeed ſwells immoderately, and the whole waſtes by the ſame means. 'Tis certainly an advantage to trade to have one great *capital* city in a kingdom, rather than to have the ſame number of people diſperſed in ſeveral places. ex. gr. ſuppoſing the city of London to contain fifteen hundred thouſand people, as by ſome computations it does, it is more advantageous to the whole kingdom, that theſe ſhould be ſo collected, than that the ſame ſhould be divided equally between 15 ſeveral cities at a diſtance from each other.

Spain is an inſtance of the effects of wanting a *capital*; there are abundance of great cities in it, as Madrid, Seville, Granada, Cadiz, Barcelona, Malaga, Valentia, Toledo, Cordova, &c. The three firſt of which contain each thre hundred thouſand people, and the reſt from one hundred to two hundred thouſand; but they want a center towards which their motions may be directed, and, like the heart in the body, produce a circulation of money and buſineſs to the remoteſt parts. A middling city, as Briſtol, or Madrid, will indeed influence trade, but this influence will only reach to the adjacent country, ſome 20. or 30 miles from the place, whereas a million and a half of people in London, and half a million more in the adjacent parts, which receive their proviſions from London, engage the whole kingdom, and ſet the wheels of trade going almoſt over the whole iſland. Comp. Engl. Tradeſman. T. 2. c. 4. p. 122, ſeq.

CAPITAL *court*, *capitalis curia*, the chief manor-houſe, or place-houſe where the lord of the manor holds his court, called alſo in Kent the court-lodge. See COURT, *Cycl.* and *Suppl.*

Capital court is ſometimes uſed for the ſame with *capital* meſſuage. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc. See MESSUAGE, *Cycl.*

CAPITAL *honour*, *capitalis honor*, denotes the chief honour, or prime barony of the whole county, as that in antient times uſually enjoyed by the count or earl of ſuch county. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc.

CAPITAL *lord*, *capitalis dominus*, the lord of the fee, from whom the eſtate is held by inferior tenants. *Kenn.* Paroch. Antiq. p. 162. an. 220. Ejuſd. Gloſſ. ad Eund. ibid.

CAPITAL *picture*, in painting, denotes one of the fineſt and moſt excellent pieces of any celebrated maſter.

F. Chamillard gives a liſt of the pieces of each famous painter, and the places where they are found. Such are the transfiguration of Raphael, in the church of St. Peter in Montorio, at Rome. The nativity of Corregio, in the palace of the duke of Modena. The St. Peter Martyr of Titian, at Venice, in the church of St. John. The paradiſe of Tintoret, in the hall of the great council in the ſame city. The judgment of Michael Angelo, in the pope's chapel in the Vatican. The St. Michael of Guido, in the capuchin church at Rome. The St. Jerom dying, of Dominichino, in the church of St Jerom de la Carita, at Rome. The marriage of Canna, by Paolo Veroneſe, in the Louvre at Paris [a]. Raphael painted a multitude of fine madonas, but the moſt *capital*, in the judgment of all the conoiſſeurs, is that in the palace Chigi, repreſenting the holy virgin holding the child Jeſus by the hand, and St. Joſeph approaching to kiſs him — [a *Chamill.* Diſſ. ſur. plus Med. & Pier. de ſon Cabin. ap. Mem. de Trev. 1712. p. 489, ſeq. [b] *Raguen.* Monum. de Roma, ap. Mem. de Trev. Mar. 1702. p. 90.

CAPITAL, in matters of uſury, denotes the ſum of money put out to intereſt.

In which ſenſe it amounts to the ſame with principal, and ſtands oppoſed to intereſt. *Ozan.* Lex. Math. p. 58.

Folded CAPITAL, in architecture, that of a pilaſter in a re entering angle whether right or obtuſe.

Mutilated CAPITAL, that whoſe projecture is leſs on one ſide than on another, as being too near ſome adjacent body or angle. *Davil.* Courſ. d' Archit. p. 462.

Attic CAPITAL, that which has water-leaves in the gorgerin.

Symbolical CAPITALS, thoſe adorned with the attributes of heathen deities Such are moſt of the antique *capitals*, in which we find thunderbolts and eagles for Jupiter, trophies for Mars, lyres for Apollo, &c. Such alſo among the moderns are thoſe which bear the arms and devices of a nation, the marks of a victory, a dignity, or the like. *Davil.* Courſ. d' Archit. P. 2. p. 460. in voc. *chapiteau.*

The *capitals* of triglyphs, according to Vitruvius, are to be a ſixth part of the module. Over them is to be placed a corona. *Vitruv.* d' Archit. l. 4. c. 3.

CAPITAL *of a lanthorn*, the covering which terminates the lanthorn of a dome, either in the figure of a bell, as that of the Sorbonne, or of a cupola, or a ſpiral, as that of the church of Sapienza at Rome.

CAPITAL *of a mill*, the covering thereof in form of a cone, which turns vertically on the round tower, in order to expoſe the ſails to the wind. *Davil.* Courſ. d' Archit. P 2. p. 462.

CAPITAL *letters*. The antient MSS. both Greek and Latin, are written wholly in *capitals*. Phil. Tranſ. N° 189. p. 364. In the early days of printing, there were alſo ſeveral editions of books in *capitals*, as of Homer, the Greek Anthology, Apollonius, &c. Johannes Laſcaris ſeems to have brought the antient printers to give editions in *capitals*. Mataire gives a Greek epigram, and a Latin epiſtle of Laſcaris in *capitals*. *Mattair.* Annal. Typogr. T. 1. *Le Clerc*, Bibl. Choiſ. T. 11. p. 368.

CAPITAL-*line*, in fortification. See LINE, *Cycl.*

CAPITAN *baſhaw*. See CAPTAIN *baſhaw*.

CAPITAN *reis*, or CAPIDAN *reis*, an appellation given by the Turks to the grand pilot, anſwering to pilot royal among the French. *D' Herbel.* Bibl. Orient. p. 251. voc. *capudan.*

CAPITANA or CAPTAIN *gally*, the chief or principal gally of a ſtate, not dignified with the title of a kingdom. *Aub.* Dict. Mar. p. 169.

The *capitane* was antiently the denomination of the chief galley of France, which the commander went on board of. But ſince the ſuppreſſion of the office of captain-general of the gallies in 1669, they have no *capitana*, but the firſt galley is called *Reale*, and the ſecond *Patrone*. Trev. Dict. Univ. T. 1. p. 1414.

CAPITANEALE, in a general ſenſe, the ſame with capitania See CAPITANIA.

Capitaneates, in Pruſſia, are a kind of noble feuds, or eſtates, which beſides their revenue, raiſe their owners to the rank of nobility. They are otherwiſe called *ſtaroſties*. Vid. Bibl. Germ. T. 6 p. 11.

CAPITANEI or CATANEI, in Italy, was a denomination given to all dukes, marquiſſes, and counts, who were called *capitanei regis*. The ſame appellation was alſo given to perſons of inferior rank who were inveſted with fees, formerly diſtinguiſhed by the appellation *valvaſores majores*. *Du Cange*, Gloſſ. Lat. T. 1. p. 803, ſeq.

CAPITANEUS, in antient law writers, denotes a tenant in capite, or chief. *Spelm.* Gloſſ. Lat. p. 118. See CAPITE, *Cycl.* and *Suppl.*

CAPITANEUS *eccleſiæ*, the ſame with *advocate*. *Du Cange*, Gloſſ. Lat. T. 1. p. 802.

CAPI-

CAPITANIA, the office or dignity of a captain, and more eſpecially a perpetual feud. *Du Cange*, Gloſſ. Lat. T. 1. p. 803. See CAPITANEATE.

CAPITANIA is alſo a denomination given to the twelve governments eſtabliſhed by the Portugueſe in Braſil. Trev. Dict. Univ. T. 1. 1414.

CAPITATUS, in ichthyology, a name given by Joannes Cuba, and ſome others, to that fiſh which we commonly call the bull-head and miller's thumb, the cottus and gobio capitatus of authors. It is of the genus of the cotti, according to the Artedian ſyſtem, and is diſtinguiſhed by that author by the name of the ſmooth ſcaleleſs *cottus*.

CAPITE *cenſi*, in antiquity, the loweſt rank of Roman citizens, who in public taxes were rated the leaſt of all, being ſuch as were never worth above 365 aſſes.

They were ſuppoſed to have been thus called by reaſon they were rather counted and marſhalled by their heads than their eſtates. *A. Gell.* l. 7. c. 13.

The *capite cenſi* made part of the 6th claſs of citizens, being below the *proletarii*, who formed the other moiety of that claſs. *Kenn.* Rom. Antiq. P. 2. l. 3. c. 16.

The *capite cenſi* were not enrolled in the army, as being judged not able to ſupport the expences of war; for in thoſe days the ſoldiers maintained themſelves. It does not appear that before Caius Marius any of the Roman generals liſted the *capite cenſi* in their armies. *Saluſt.* Bell. Jugurth. p. 135. *Pitiſc.* Lex. Ant. T. 1. p. 360. *Panvin.* de civ. Rom. c. 52. *Sigon.* de Ant. Juris civ. Rom. l. 1. c. 4. *Schoetg.* Lex. Ant. p. 270.

CAPITIS *nonus*, in anatomy, the name given by Fallopius to one of the muſcles of the head, deſcribed by Albinus under the name of the *rectus capitis internus major*, and by Winſlow and others under that of the *rectus capitis anterior longus*. See the article HEAD.

CAPITIS *par tertium*, in anatomy, a name given by Fallopius and others of his time, to a muſcle ſince called by Winſlow, *complexus minor* and *maſtoidæus lateralis*, and by Cowper and Albinus *trachelomaſtoidæus*.

CAPITO, in ichthyology, the *chubb*, is called alſo by ſome authors the *cephalus* and *ſqualus*, and in ſome parts of England the *chevin*. It is a longer-bodied fiſh than the carp, and its head is black, large, and ſomewhat flat. Its back is of a duſky green, and its belly and ſides are uſually white and ſilvery, but in the larger and fatter fiſh they become yellow, and ſpotted with ſmall black ſpots; its ſcales are very large, and its mouth ſmall.

It has no teeth either in the jaws, palate, tongue, or throat; its tail is forked, and all its fins are of a blueiſh black colour. Its belly is ſomewhat prominent; it is a river fiſh, and loves the covert of old ſtumps of trees and hollow banks, and gives the angler much diverſion; it will not live in ponds; it ſpawns in May, and is in beſt ſeaſon in April, when full of ſpawn, but is never a very delicate fiſh. *Ray*'s Ichthyogr. p. 255.

CAPITO is alſo a name given by ſeveral authors to the mugil or mullet. Gaza ſeems to have given riſe to this error, he found the word *cephalus* in Ariſtotle as the name of the mullet, and tranſlated it by the word *capito*, not conſidering that he by that name confounded this fiſh with another, namely, the *chubb*. See CEPHALUS.

CAPITO *cæruleus*, the blue *chubb*, a fiſh common in the Danube, and other of the larger rivers in Germany, and frequently called the *jentling*. *Geſner*, de piſc. p. 1266. See JENTLING.

CAPITO *rapax*, in zoology, a name given by ſome authors to the *corvus piſcis*, a fiſh of the ſhape of our river chubb. *Willughby*'s Hiſt. Piſc. p. 246. See the article CORVUS *piſcis*.

CAPITOLINI, in Roman antiquity, a college of men reſiding in the capital and arx, to whom was committed the care of celebrating the Capitoline games. *Liv.* Hiſt. l. 5. c. 50. *Pitiſc.* Lex. Ant. T. 1. p. 352.

CAPITOUL or CAPITOL, an appellation given to the chief magiſtrates of Tholouſe, who have the adminiſtration of juſtice and policy both civil and mercantile in the city.

The *capitouls* at Tholouſe are much the ſame with the echevins at Paris, and the conſuls, bailiffs, burger-maſters, mayors, and aldermen, &c. in other cities. In antient acts they are called *conſules capitularii*, or *capitolini*, and their body *capitulum*: From this laſt come the words *capitularii* and *capitouls*. The appellative *capitolini* aroſe hence, that they have the charge and cuſtody of the town-houſe, which was antiently called *capital*. Trev. Dict. Univ. T. 1. p. 1416. *Savar.* Dict. Comm. T. 1. p. 553.

The office only laſts one year, and ennobles the bearers. In ſome antient acts they are called *capitulum nobilium Toloſæ*. Thoſe who have borne it, ſtyle themſelves afterwards burgeſſes[a]. They are called to all general councils, and have the *jus imaginum*, that is, when the year of their adminiſtration is expired, their pictures are drawn in the town-houſe; a cuſtom which they have retained from the antient Romans, as may be ſeen in Sigonius[b]. — [[a] *Seld.* Tit. of Hon. p. 482. [b] *Sigon.* de Antiq. Jur. Civ. Rom. l. 2. Trev. Dict. loc. cit.]

CAPITOULATE, an appellation given to the ſeveral quarters, or diſtricts of the city Tholouſe, each under the direction of a *capitoul*; much like the wards of London, under their aldermen. See CAPITOUL.

Tholouſe is now divided into eight *capitulates* or quarters, which are ſubdivided into *moulans*, each of which has its tithing man, whoſe buſineſs is to inform the *capitoul* of what paſſes in his tithing, and to inform the inhabitants of the tithing, of the orders of the *capitoul*. *Catel.* Hiſt. de Langued. l. 2. p. 144, ſeq. Trev. Dict. Univ. T. 1. p. 1416.

CAPITULA *ruralia*, denote chapters held by the rural dean and clergy within the precincts of each deanry, antiently held every three weeks, then once a month, and more ſolemnly once a quarter *Kenn.* Paroch. Antiq. p 640. Ejuſd. Gloſſ. ad Eund.

CAPITULATION (*Cycl.*) — The imperial *capitulation*, according to Conringius, is a kind of convention, whereby the emperor, nominated by the electors, accepts, before the ceremony of his coronation, the conditions propoſed to him, and vows to obſerve the ſame. The king of the Romans alſo when elected, ſigns the emperor's *capitulation*, as being in right of ſuch election to ſucceed to the empire after the death of the emperor. *Conring.* Diſſ. Acad. 3. Th. 20. Bibl. Univ. T. 4. p. 173.

Some authors date the origin of imperial *capitulations* from the time of Charlemaign. Others will have it to have been firſt eſtabliſhed in the Time of Conrade I. as being the firſt who came to the empire by election; all his predeceſſors having mounted the throne by right of conqueſt, it is not natural to ſuppoſe they would receive laws and conditions from thoſe they had conquered. Journ. des Scav. T. 50. p. 176.

The deſign of the *capitulation* is, on the one hand, to prevent the emperor from abuſing his power to the oppreſſion of the people, and on the other, to prevent the people from breaking in on the juſt rights of the emperor. The imperial *capitulations* are conſidered as fundamental laws of the empire; and though the drawing up, preſenting, procuring the ſignature, and taking care of the execution of it, be committed to the electors, it is reputed the act of the ſtates of the empire. *Schurſchiſl.* Diſſ. de Elect. Frid. III. §. 10. *Imhof.* Not. Imp. l. 4. c. 2. §. 5. Trev. Dict. Univ. T. 1. p. 1418.

CAPITULUM, (*Cycl.*) in anatomy, a little head, eſpecially of a bone, anſwering to the Greek *condylus*. *Caſt.* Lex. Med. p. 133.

CAPITULUM, in the antient military art, was a tranſverſe beam, wherein were holes through which paſſed the ſtrings whereby the arms of huge engines, as baluſtæ, catapultæ, and ſcorpion, were played or worked. *Vitruv.* de Archit. l. 1. c. 1. *Bald.* Lex. Vitruv. p. 19. *Aquin.* Lex. Milit. T. 166.

CAPITULUM, in eccleſiaſtical writers, denoted part of a chapter of the bible read and explained.

In which ſenſe they ſaid, *ire ad capitulum*, to go to ſuch a lecture. Afterwards the place or apartment where ſuch theological exerciſes were performed was denominated *domus capituli*. *Hopfn.* Saxon. Evang. p. 598. *Fab.* Theſ. p. 460.

CAPIVI (*Cycl.*) — Beſide the common uſes of this balſam, the art of the modern chemiſts has found a new and very profitable one, that is the debaſing and adulterating the dearer eſſential oils with it, as the ſmell in its oil is much ſweeter than that of turpentine or deal wood.

This balſam yields a very large proportion of eſſential oil, by diſtillation with water, even to the quantity of five or ſix ounces from a pound, and the chemiſts who know this, adulterate their oils, either by mixing them with the oil of *capivi*, or more cunningly, by putting a proper quantity of this balſam with the ingredients into the ſtill, and ſo drawing off the oil of both mixed intimately together. There ſeems no eaſy way of detecting this fraud; the nice uſe of a hydroſtatical balance indeed would do it; and it is worth obſerving whether the oils thus adulterated will not, on long keeping, diſcharge the ink of their written label, as the eſſential oils, adulterated with the oil of turpentine, are known to do, on account of the acid vapour which continually exhales from that oil. *Shaw*'s Lectures, p. 115.

CAPNELÆON, Καπνελαιον, among antient naturaliſts, denotes a ſpecies of reſin, which flows ſpontaneouſly, being warmer, thinner, and more fluid than all other ſorts of reſins, ſo as nearly to approach the nature of oil, and evaporating plentifully on being expoſed to the fire; whence the denomination which imports as much as ſmoking oil. It is ſometimes alſo called *piſſanthos*, or flower of pitch. *Caſt.* Lex. Med. p. 133.

CAPNICON, in antiquity, chimney-money, or a tax which the Roman emperors levied for ſmoke, and which of conſequence was due from all, even the pooreſt, who kept a fire. This was firſt invented by Nicephorus. *Zonar.* l. 3. p. 100. *Buling.* de Vectig c. 74. *Pitiſc.* Lex. Ant. T. 1. p. 355.

CAPNISTON, Καπνιστον, among antient phyſicians, denotes oil whoſe fumes rendred aromatic by burning ſpices, are conveyed to a part affected.

CAPNITIS, or *capnias jaſpis*, in the natural hiſtory of the antients, the name of a ſpecies of *chalcedony*, of a browniſh ground, clouded with a large miſt of blackiſh, looking like a column of ſmoak. The antients alſo called our common *chalcedony* a jaſper, not alloting any peculiar generical name to theſe miſty ſtones; and the name they gave this ſpecies very happily expreſſed its character, as it looks exactly as if obſcured by a cloud of thick ſmoke.

It is the leaſt beautiful of all the *chalcedonies*, and is found in large maſſes, in the ſhape of our common flints and pebbles; the whole is very opake, and is never variegated with any veins; it is nearly as hard as the oriental onyx, and takes a very fine poliſh. It is very common in the Eaſt-Indies, and is ſometimes found in Germany and France, but is ſeldom worked into any thing better than knife-hafts. *Hill*'s Hiſt. of Foſſ. p. 167.

CAPNOIDES, in botany, the name of a genus of plants, the characters of which are theſe: the flower wholly reſembles that of the fumitory, but the piſtil which ariſes from the cup finally becomes a long bivalve cylindrical pod containing many roundiſh ſeeds. *Tourn.* Inſt p 423.

There is only one known ſpecies of this genus, which is the plant called by many authors the evergreen fumitory.

CAPO, in ichthyology, a name given by Paulus Jovius and ſome others to the fiſh called *coccyx* by the antient Greeks, *cuculus* by the Latin writers, and by ſome *lyra*. It is a ſpecies of the triglæ, diſtinguiſhed by Artedi by the name of the red trigla, with a bifid ſnout, and with the coverings of the gills ſtriated.

CAPO *negro*, in zoology, the name of a ſpecies of duck called *mergus cirratus minor*, and *anas folligula prima* by Geſner, and *querquedula criſtata* and *colymbus* by Bellonius, in Engliſh the tufted duck.

Its beak is blueiſh, and the upper part of its head of a deep purple, tending to black, and from this there hangs a creſt of the ſame colour, of an inch and half in length. Its neck, ſhoulders and back, are all of a deep duſky colour, nearly approaching to black. Its wings are ſhort, and altogether black, except for a little whiteneſs, on ſome of the longer feathers; its tail is very ſhort, and altogether black; its throat, and the anterior part of its breaſt are ſomewhat blackiſh, but its belly of a ſilvery white; its legs are ſhort, and are placed very backward, they are of a blueiſh colour. *Ray*'s Ornitholog. p. 280.

CAPO *roſſo*, in zoology, the name of a ſmall ſpecies of ſea duck, called by ſome *anas fera fuſca minor*, the ſmall wild brown duck. It is ſomething larger than the teal; its beak is of a duſky blue, its head is very large, and all over of a rediſh brown, but has a ſmall white ſpot at each angle of the mouth. The neck is ſhort, as in moſt other birds of this kind, and has a ring of brown round its middle. Its back and wings are brown, but the long feathers have ſome whiteneſs in them which gives the appearance of a white ſtreak to the ſides of them when folded. The iris of the eye in this bird, is of a pure white, as milk or ivory, which is a very great ſingularity. The tail is very ſhort and brown, and the breaſt of a rediſh brown. *Ray*'s Ornithol. p. 281.

The deſcription Bellonius gives of the bird he calls *glaucium* and *morillon*, ſo nearly agrees with this, that there is great reaſon to ſuſpect they are both the ſame ſpecies of fowl. See DUCK.

CAPO *roſſo maggiore*, in zoology, the Italian name of a ſpecies of duck, for which we have no Engliſh one, nor have authors honoured it with a Latin one. It is ſomewhat larger than the common duck; its beak is of a blood red, and appears very large. Its head is of a beautiful red at the top; theſe feathers are large, ſomewhat elevated above the ſurface of the reſt, ſo as to form a ſort of very large creſt, the neck, breaſt, ſhoulders, and belly, are all black, and the ſides and under-part of the wings white, with a faint caſt of rediſhneſs. The long wing feathers are white and grey with black tips. The back is of a colour which yet wants a name, and can be only very imperfectly expreſſed by calling it a greyiſh red, but the rump is black, the tail is of a greyiſh red, and the legs and feet are red, but the membrane of the feet is black. *Ray*'s Ornithol. p. 279.

CAPON, a cock chicken, caſtrated young, generally as ſoon as left by the dam.

The word is formed from the Latin *capo*, of the Greek Κοπων, which ſignify the ſame.

Capons, beſides their uſe for the table, ſerve to lead chickens, ducklings, turkey-pouts, pea-hens, pheaſants, or partridges, in lieu of their natural dams, over which they have ſeveral advantages, by the largeneſs of their body, which will brood, or cover, thirty or forty young. Trev. Dict. Univ. T. 1. p. 1652. voc *chapon*. Dict. Ruſt. T. 1. in voc.

CAPONE, in ichthyology, a name given by the Italians to the fiſh called the *hirundo* and *corvus* by authors, and by Artedi made a ſpecies of the trigla. It is diſtinguiſhed from the reſt of this genus by that author, under the name of the trigla with an aculeated head, and with three appendages on each ſide to the pectoral fins.

CAPONIERE (*Cycl.*) — The *caponiere* differs from the coffer in that the latter poſſeſſes the whole breadth of the ditch, whereas the former only takes up a part of it. *Ozan.* Dict. Math. p. 602. Dict. Milit. in voc. See COFFER, *Cycl.*

Caponieres are partly under ground, and partly above it. They are ſo well ſcreened a-top, that no bomb or carcaſs can penetrate them. *Wolf.* Lex. Math. p. 308.

CAPOT, at picquet, is when one of the gameſters wins all the cards, in which caſe he gains forty points. Trev. Dict. Univ. T. 1. p. 1420.

CAPPANUS, in natural hiſtory, the name given by ſome authors to the ſea-worm which bores into the bottoms of ſhips. See the article SOLEN.

CAPPARIS, *capers*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, conſiſting uſually of four petals, which are diſpoſed in a circular form. The piſtil ariſes from the cup of the flower, and is furniſhed with an embryo which afterwards becomes a pear-faſhioned fruit of a fleſhy ſubſtance, in which are contained a number of ſeeds of a roundiſh, or ſomewhat kidney-ſhaped form. The ſpecies of *capers* enumerated by Mr. Tournefort are theſe: 1. The ſmall fruited, round-leaved prickly *capparis*. 2. The *capparis*, with ſharp-pointed leaves. 3. The Sicilian *capparis* with ſharp-pointed leaves and double prickles. 4. The larger fruited *capparis*, without prickles. 5. The bay-leaved American tree *capparis*, with white flowers, and very long fruit 6. The bay-leaved American *capers*, with white flowers and roundiſh fruit. *Tourn.* Inſt. p. 267. See CAPER.

CAPPEROL *coronde*, a name given by the Ceyloneſe to a peculiar kind of cinnamon, eſteemed the third in value: this has a very ſtrong taſte and ſmell of camphor, and its name with the natives ſignifies camphorated cinnamon. The tree which produces it grows very plentifully in many parts of the iſland of Borneo, but is not met with in the eaſtern parts of it. This is often ſold to the Danes and Engliſh who come to trade on the coaſts of Coromandel; it is prohibited exportation from the iſland, but ſo long as only one port is open there are people enough who will carry out great quantities of it.

There is a ſpecies of canella very much reſembling this kind of cinnamon tree, which grows very frequently on the continent of India toward Goa, and another canella or wild cinnamon on the coaſt of Malabar, in many things reſembles this. The barks of all theſe trees are greatly inferior to the true cinnamon in ſmell, taſte, and virtue, yet they are too often ſold to the leſs judicious traders in theſe things, either alone or mixed with the ſeveral better kinds of cinnamon, to the great damage of all that afterwards buy them. Phil. Tranſ. N° 409.

CAPRA, the *goat*, in the Linnæan ſyſtem of zoology, makes a diſtinct genus of animals of the order of the pecora, the diſtinguiſhing characters of which from the reſt of the animals of that order, are: that its horns are hollow, turned upward, and not ſmooth, but annulated on their ſurface. This genus comprehends all the goat kind, the gazella, ibex, rupicapra, &c. *Linnæi* Syſtem Natur. p. 42. See GOAT.

CAPRA *ſaltans* (*Cycl.*) — The *capræ ſaltantes* are not ſo called from their figure, which is various, ſometimes round, ſometimes long, but from their moving by jerks ſomewhat like the leaps of that animal; and from the little languets of fire which hang at, and ſometimes fall from them, which antiquity has been pleaſed to fancy like the beard or locks of a goat's hair. Ariſtotle diſtinguiſhes the *capra* from the trabs, in that the latter proceeds with an uniform motion, the former with an irregular one, and as it were by jumps. *Ariſt.* Meteor. l. 1. c. 5. Mem. Acad. Inſcr. T. 6. p. 95.

The *capræ* ſeem to be very low, yet ſometimes fly ſo high, that meteorologiſts have placed them in the upper region, though not ſo conſtantly, but they are ſometimes alſo found in the middle region.

Of globular *capræ* we have divers inſtances, in antient as well as modern naturaliſts. Such was the flame ſaid by Seneca to have been ſeen in form of a huge ball, about the bigneſs of the moon, when Paulus Æmilius waged war againſt Perſeus. Such another, he tells us, was ſeen at the death of Auguſtus; another on the tragedy of Sejanus, another at the death of Germanicus [a]. Such alſo was that ſeen about Michaelmas 1676 by no leſs than twelve counties at once [b]; it is deſcribed by Mr. Naſh, as it appeared near Seighford in Staffordſhire, as of a globular figure, moving by jerks, and making ſhort reſts at every one of them, letting fall drops of fire, which were part of its body; for it decreaſed in magnitude the farther it went, and the oftener it dropped, till at length it wholly diſappeared [c]. — [[a] *Senec.* Nat. Queſt. l. 1. c. 1. [b] Phil. Tranſ. N° 135. p. 863. ſeq. [c] *Plot.* Nat. Hiſt. Stafford. c. 1. §. 40.]

CAPRA *trituratoria*, in the antient huſbandry, was a kind of iron log, made in the figure of a goat, which was laid on the tribula, to make it more effectual in ſeparating the corn from the ears, the antient way of threſhing. *Schoetg.* Antiq. Tritur. ap. pref. Stat. Rep. Lett. T. 1. p. 153.

CAPRARIA, in the Linnæan ſyſtem of botany, a diſtinct genus of plants, the characters of which are theſe: the calyx is a hollow perianthium, conſiſting of one leaf divided into four ſegments at the end, which are ſlender and rough; the flower conſiſts of one petal which is hollow, and divided into four obtuſe ſegments; the ſtamina are four pointed filaments ſhorter than the flower; the antheræ are ſimple; the germen of the piſtillum is of a conic form; the ſtyle is of the length of the flower, of a pointed figure, and remains after the flower is fallen; the ſtigma is acute. The fruit is an oblong conic capſule, with a narrow end; it is compoſed of only one cell, divided by two valves; the ſeeds are numerous, and of an oblong figure. *Linnæi*, Genera Plant. p. 282.

CAPREOLUS, in zoology, the name of an animal called *caprea* by Pliny, and known among us by the name of the roe-deer. Its Latin names are extremely improper, ſince it has not the leaſt reſemblance or analogy to the goat kind in any

any reſpect. It is properly of the deer kind, but differs from all the other ſpecies in the ſmallneſs of its ſize, and ſhortneſs of its horns. The horns in this ſpecies are not palmated or compreſſed as in moſt of the deers, but are rounded, and ſerve very aptly for the making knife hafts, and other ſuch things. *Ray*'s Syn. Quad. p 89.

CAPREOLUS, among botaniſts, ſometimes alſo called *clavicula*, is the part of a ſtalk which curls or lays hold on any adjacent body. *Mart.* Lect. Bot. 1. p. 7.

CAPREOLUS, in anatomy, denotes the helix, or outer ambit of the ear. *Barthol.* Anat. l. 3. c. 9. *Caſt.* Lex. Med. p. 133.

CAPREOLI, in the antient architecture, a ſort of rafters or timbers ſerving to ſuſtain the canterii, either in buildings, or machines

They were thus called, not as Philander imagines, from their reſemblance to the *capreoli*, or tendrils of vines, but, from the affinity of their form and office to wild goats; as theſe butt and repel things with their horns, ſo do the former oppoſe their heads or horns to the weight of the canterii. *Vitruv.* de Archit. l. 10. It. l. 4. c. 2. *Philand.* Comm. ad Eund. ib. *De Laët.* Lex. Vitruv. p. 20. *Aquin.* Lex. Milit. T 1. p. 167.

CAPREOLUS, in the antient huſbandry, a kind of iron hoe or inſtrument with two forks or fangs, wherewith to ſtir and move the ground. *Columel.* l. 11. c. 3. *Pitiſc.* Lex Ant. T. 1. p. 355. *Voſſ.* Etym. in voc.

CAPRICE, in muſic, is ſometimes uſed for an irregular compoſition, which ſucceeds rather by the force of genius, than obſervation of the rules of art.

The word is French, where it ſignifies humouroufneſs, fantaſticalneſs. Some deduce it from the Italian *capriccio*, and that from the Latin *capra*, goat, to whoſe wantonneſs it is ſuppoſed to bear alluſion [a]. St. Amant has given poems under the title of *caprices*. The Abbe Pic has alſo publiſhed his *caprices* [b]. The *caprices*, or poſtures of Calot the engraver, are famous [c]. The Italians, according to Huarte, give the appellation *capricious*, to inventive wits. — [[a] *Morhof.* Polyhiſt. T. 1. l. 2. c. 1. n. 41. [b] Mem. de Trev. an. 1704. p. 1119. [c] Trev. Dict. Univ. T. 1. p. 1427.]

Broſſard defines *caprice* to be a ſong, or compoſition not reſtrained to any certain meaſure, or deſign, but wherein the compoſer gives a full looſe to his fancy and humour, otherwiſe called *phantaſia*, *voluntary*, *boutade*, &c. *Broſſ.* Dict. Muſ. p. 17. *Walth.* Lex Muſ. p. 141.

CAPRICE is applied in architecture to an edifice of a ſingular taſte, and deviating much from the common rules of building. *Davil.* Courſ. d' Archit. P. 2. p 445.

CAPRICORN (*Cycl.*) — This ſign is known by divers other appellations, as *Neptunia proles*, *æquoris hircus*, *caper*, *imbrifer*, *gelidus*, *corniger*, *capra*, *Pan*, *Ægipan*, *Algedi*, and *Alcantarus*.

Schiller, in lieu of *capricorn*, repreſents the apoſtle Simon; Schickhard, *azazel*, or the ſcape goat; Weigelius the horns in the Naſſavian arms. *Wolf* Lex. Math. p. 309.

The emperor Auguſtus was born under *capricorn*, which he took care to publiſh as a happy horoſcope, by a gold coin, on which this ſign was repreſented. This account we have from Suetonius [a], who elſewhere relates, that this prince was born on the 9th of the calends of October, that is, as Dion alſo aſſures on the 23d of December [b]. According to which account, *capricorn* muſt have been in the meridian of the antipodes at the time when Auguſtus was born. Chronologers are here terribly at a loſs; Scaliger and Petavius ſolve the difficulty by making Suetonius to have been deceived [c]. The editor of Suetonius in uſum Delphini, has found a more natural and eaſy ſolution; according to him Auguſtus's horoſcope was not taken from the time of his birth, but from that of his conception: Now being born on the 23d of September, if we go backwards 9 months, we ſhall fall on the 23d of December, the day when the ſun entered *capricorn*, a point of time, ſays Julius Firmicus, peculiarly happy for a horoſcope, and which promiſes nothing leſs than ſceptres and empires [d]. — [[a] *Suet.* in Aug. c. 94. n. 24. *Carrio*, Emend l 2. c. 2. [b] *Suet.* in Aug. c. 5. *Dio*, Hiſt. l. 56. [c] *Scalig.* de Emend. Temp. l. 5. p. 441. Item in Manil. p. 147. *Petav.* de Doctr. Temp. l. 10. c. 64. & l. 11. c. 6. [d] *Firmic.* Matheſ. l. 8. Trev. Dict. Univ. T. 1. p. 1423. *Pitiſc.* Lex. Ant. T. 1. p. 356.]

CAPRICORN *beetle*, — There are ſix different ſpecies of this inſect deſcribed by Liſter in his treatiſe *De ſcarabæis*, publiſhed at the end of Mr. Ray's hiſtory of inſects. The generical characters of theſe inſects are theſe: they have long and ſlender bodies; their horns are long and jointed; and they are fond of places in the neighbourhood of rivers.

The ſpecies are theſe: 1. The great ſweet ſmelling *capricorn*, called by ſome authors *cerambyx*, and by others the *muſk beetle*. This is one of the moſt beautiful of the Engliſh beetles; the male is much ſmaller than the female, and is of a mixed colour of purple and gold, the female is more of a green colour, the horns of the males alſo conſiſt of longer joints, and in both ſexes the horns hang over the back, and are longer than the whole body. It is found among old willows, and often in the very wood; it is moſt frequent in the month of July.

It makes a mournful ſound when taken, and Mouffett obſerves that it loſes its perfumed ſmell when dead; but Liſter obſerves farther, that this ſmell is only found in it at the time of copulation. 2. The ſmall gilded *capricorn*; this is of a true gold colour, but in ſome lights has a caſt of purple and of green. It is found very frequently among reeds by the banks of rivers. 3. The yellow *capricorn*, with a large black ſpot on each of the caſes of the wings; this is found among dry hay in April. 4. The yellow legged *beetle*, with a black body, variegated with yellow ſtreaks. This is found in gardens among the kitchen herbs, principally in the month of May. 5. The black *capricorn*, with the caſes of the wings yellow at the top, and white at the bottom, with ſome other white marks about them; this is found in the meadows in the month of May. 6. The green *capricorn*; this is of the ſize, ſhape, and colour of the cantharides; it is found in May in woods. *Ray*'s Hiſt. Inſect. p. 386.

CAPRIFICATION, a name given in the iſlands of the Archipelago to a peculiar method of propagating and ripening the fruits of the domeſtic fig trees, by means of inſects. *Plin* Hiſt. Nat. l. 15. c. 19. Act Erud. Liſp. 1721. p. 84. *Savar.* Dict. Comm. Supp. p. 117.

The word is formed from *caprificus*, the wild fig-tree, from whoſe fruits the inſects are produced, which are the chief inſtruments of *caprification*.

Caprification, or the manner of impregnating fig-trees, of which the antients ſpeak with ſo much wonder, is not imaginary, as many have ſuppoſed. M. Tournefort aſſures us it is ſtill practiſed every year in moſt of the Grecian iſlands, by means of a ſort of gnats, or flies peculiar to the country. The fig-trees there bear much fruit; but this fruit, in which part of the riches of the country conſiſts, would be of no advantage, if it was not managed in the following manner:

There are two ſorts of fig-trees cultivated in theſe iſlands; the firſt called *ornos*, from the Greek ὄρνος, which is the wild fig-tree, or the *caprificus* of the Latins, the ſecond is the domeſtic fig-tree. The former bears three kinds of fruits, none of them fit to eat, but abſolutely neceſſary for ripening the domeſtic ones. Theſe fruits of the wild fig-tree are called *fornites*, *cratitires*, and *orni*.

The fornites appear in Auguſt, and continue unripe till November. In theſe ſmall worms are bred, from the puncture of certain gnats, obſerved only about the fig-trees. In October and November, the ſame gnats wound the ſecond fruits of the ſame trees. Theſe which are called cratitires only appear at the end of September, and the fornites fall gradually off after their flies have quitted them. But the cratitires remain on the tree till May, and incloſe the eggs left by the flies of the fornites. In May the third kind of fruit begins to bud on the ſame trees which bore the other two; this is by far the largeſt fruit, and is called ornus. When it is arrived at a certain magnitude, and its buds begin to open, it is wounded in that part by ſuch of the flies of the cratitires as can ſhift from one fruit to the other, to depoſit their eggs.

It ſometimes happens that the flies of the cratitires lie in ſome places, and do not come out, though the orni are fit for their reception. In this caſe the cratitires muſt be fetched from elſewhere, and put on the extremities of thoſe branches whoſe orni are in a good forwardneſs, in order that they may wound them. If that ſeaſon be loſt, the orni fall, and the inſects of the cratitires fly away, finding no orni to prick. The peaſants who apply themſelves to the culture of fig-trees are the only judges of the proper ſeaſon in which this may be prevented; in order to which they carefully obſerve the bud of the fig; for this part not only ſhews the ſeaſon of the fly's exit, but alſo that in which the fruit may be ſucceſsfully wounded. If the bud be too hard and cloſe, the fly cannot depoſit its egg, and the fig drops when the ſame eye is too lax and open.

But this is not all: theſe three kinds of fruit abovementioned are not good to eat; they are only appointed by the author of nature to ripen the fruit of the domeſtic fig-tree. The method of managing them is thus: in June and July the peaſants take the orni, when their flies are ready to come out, and hang them on the domeſtic fig trees; ſeveral of theſe they ſtring on a ſtraw, and lay on the tree, more or leſs in quantity, as they ſee occaſion. If they miſs this ſeaſon, the orni drop off, and the fruit of the domeſtic fig-tree not ripening, falls alſo in a little time. The country people know ſo well theſe precious moments, that every morning in making their review, they lay only the beſt conditioned orni on the fig-trees, otherwiſe they would loſe their harveſt. 'Tis true they have a ſort of remedy for this, by ſtrewing on the domeſtic fig-trees the flowers of a plant called *aſcolimbros*, in the tops of which flowers are ſometimes found flies fit to wound the figs; or poſſibly the flies of the orni feed on this plant. In fine, the peaſants manage the orni ſo well, that their flies ripen the domeſtic figs in about forty days.

Theſe figs are very good crude; to dry them they are laid in the ſun for ſome time, after which they give them a heating in the oven, to preſerve them for the reſt of the year. They are the chief food of the peaſants of the Archipelago, whoſe ordinary fare is only barley bread and dry figs. Yet are theſe figs far from being ſo good as thoſe of Provence, Italy, and Spain; the heat of the oven deprives them of their fine reliſh, but on the other hand it deſtroys the eggs of the flies of the orni, which would infallibly produce little worms, which would deſtroy the fruit. This, one may ſay, is taking a great deal of pains for fruit that is naught at laſt. M. Tournefort could not enough admire the

patience

patience of the Greeks who ſpent above three months in carrying the flies from one fig-tree to another; but he ſoon underſtood the reaſon, for aſking them why they did not cultivate the French and Italian figs, he was anſwered, that the great quantity of fruit which their own trees yielded, made them preferable. In reality, one of theſe trees produces generally 224 pounds of figs, whereas the French trees yield not 25 pounds.

As to the manner wherein the puncture of the flies contribute to the maturation of the fruit, poſſibly it may be by lacerating the veſſels, and extravaſating the nutritious juice when they depoſit their eggs; or when with the egg they alſo convey ſome liquor which gently ferments with the juice of the fig, and ſoftens its pulp. Even the Provence and Paris figs ripen much ſooner by wounding their buds with a ſtraw or feather dipped in oil olive; plumbs and pears alſo wounded by inſects, are found to ripen the ſooneſt, and in theſe the pulp about the wound is more exquiſite than the reſt. Mem. Acad. Scienc. An. 1705. p 447, ſeq.

CAPRIFICATION is alſo applied in a leſs proper ſenſe to the art of propagating the palm tree. Act. Erudit. Lipſ. 1721. p. 84.

CAPRIFICUS, in botany, a term by which ſome authors, particularly Pliny, call the ſmall ſpurge or eſula. *Ger.* Emac. Ind. 2.

CAPRIFICUS was alſo uſed by the antients for the wild fig-tree. See CAPRIFICATION.

CAPRIFOLIUM, the *honey-ſuckle*. See HONEY-*ſuckle*.

CAPRIMULGUS, in zoology, the name of a ſpecies of owl, called the churn owl, or fern owl, and in ſome places the goat-ſucker, according to its Latin name. It obtained this from an opinion that it uſed in the night to ſuck the goats dugs for their milk; but there has been no proof of the truth of that tradition. It is a moderately large owl; its head is large in proportion to its body, yet leſs ſo than in the other owls. Its beak is black, very ſmall, and ſomewhat crooked, but the opening of its mouth is extremely wide. Its breaſt and belly are mottled with ſtreaks of a browniſh white, and a duſky or blackiſh grey; its head is grey, the middle of the feathers being all black; its wings and back are of a duſky brown, variegated with black; its legs are ſhort or ſmall, and feathered almoſt to the toes before; it is upon the whole a very beautiful bird, and more reſembles the cuckow than the owl kind in its ſhape. It is common in the northern counties of England. *Ray*'s Ornitholog. p. 70.

CAPRISCUS, the *goat-fiſh*. See GOAT-FISH.

CAPSARIUS, in antiquity, a ſervant who attended the Roman youth to ſchool, carrying a ſachel with their books in it, ſometimes alſo called *librarius*. *Pignor.* de Serv. p. 238. *Pitiſc.* Lex. Ant. T. 1. p. 356.

CAPSARIUS was alſo an attendant at the baths, to whom perſons committed the keeping of their cloths. *Pitiſc.* Lex. Ant. ib.

CAPSARIUS, among the Roman bankers, was he who had the care of the money-cheſt, or coffer. *Pitiſc.* Lex. Ant. ib.

CAPSICUM, *Guinea pepper*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is rotated and divided into ſeveral ſegments at the edge. From the cup ariſes a piſtil, which is fixed in the manner of a nail to the middle of the flower, and by degrees ripens into a ſoft and membranaceous fruit, which contains a number of flat ſeeds uſually of a kidney-like ſhape. The ſpecies of *capſicum* enumerated by Mr. Tournefort are theſe: 1. The common *capſicum* with long hanging-down pods. 2. The crooked podded *capſicum*. 3. The leſſer *capſicum* with crooked pods. 4. The yellow podded *capſicum*. 5. The long upright podded *capſicum*. 6. The upright podded *capſicum* with long and very ſmall pods. 7. The upright podded *capſicum* with oblong but ſhort pods. 8. The *capſicum* with bifid fruit. 9. The *capſicum* with cylindric pods of a ſpan long. 10. The *capſicum* with long pods, turned in the middle, and ſquare at the end. 11. The *capſicum* with flat and rounded pods. 12. The *capſicum* with long heart-faſhioned hanging pods. 13. The *capſicum* with roundiſh heart-faſhioned hanging pods. 14. The *capſicum* with olive-ſhaped pods. 15. The *capſicum* with cherry-ſhaped hanging pods. 16. The largeſt round-fruited *capſicum*. 17. The *capſicum* with large prickly fruit. 18. The *capſicum* with ſmaller prickly fruit. 19. The *capſicum* with upright round pods. 20. The *capſicum* with upright round pods a little pointed at the end. 21. The *capſicum* with upright heart-faſhioned pods. 22. The *capſicum* with upright heart-faſhioned angular pods. 23. The *Capſicum* with upright cherry-like pods. 24. The large flowered hairy ſtalked *capſicum*. 25 The *capſicum* with the ſmalleſt round fruit. And 26, The American *capſicum* with the oblong ſweet fruit. *Tourn.* Inſt. p. 153.

Guinea pepper is more uſed as a ſauce, and in pickle, than in phyſic, being frequently put into fiſh ſauce, or into any thing that is flatulent and windy; for which purpoſe it is ordered divers ways, either green or ripe, pickled, or rubbed to powder with ſalt. A decoction of it with peny royal is commended by ſome to expel a dead child. The ſkins boiled, and uſed as a gargle, are good againſt the toothach; a cataplaſm of the ſeeds, powdered and mixed with honey, applied to the throat, is good for the quinſy. Vid. *James*'s Med. Dict. in voc.

CAPSTAN (*Cycl.*) — The word is alſo written, *capſtand*, *capſtern*, and even *capſtow* [a]; it is formed from the French *cabeſtan*, which ſignifies the ſame [b]. — [[a] *Skin.* Etym. Angl. in voc. *capſtow*. [b] Trev. Dict. Univ. T. 1. p. 1305. voc. *cabeſtan*.]

The power of the *capſtan* is reducible to that of the axis in peritrochio. See AXIS *in peritrochio*, *Cycl.*

De Camus conſiders the *capſtan* as a perpetual lever. *De Camus*, Tr. des Forces Mouvant. ap. Mem. de Trev. 1723. p. 718. See LEVER, *Cycl.*

The parts of a *capſtan* are, the foot, which is the loweſt part; the ſpindle, the ſmalleſt part; the whelps a ſort of brackets ſet into the body of the *capſtan* cloſe under the bars; the barrel, the main body of the whole; the holes for the bars to be put into; the bars, which are ſmall pieces of timber by which the men heave; laſtly, the pawl, which is a piece of iron bolted to one end of the beams of the deck, cloſe to the body of the *capſtan*, but ſo as that it have liberty to turn about every way; and againſt it do the whelps of the *capſtan* bear; ſo as that by it the *capſtan* may be ſtopped from turning back. *Botel.* Sea Dial. 4. p 113, ſeq. *Manwar.* Sea Dict. p. 19, ſeq.

CAPSULE, among botaniſts, a ſpecies of pericarpium compoſed of dry elaſtic valves, which uſually burſt open at the points: this kind of pericarpium ſometimes contains only one cell or cavity, ſometimes more; in the firſt caſe it is called *unilocular*; in the ſecond, *bilocular*, *trilocular*, &c. according to the number of cells in it for the reception of ſeeds. See PERICARPIUM.

CAPTAIN (*Cycl.*) — The duty of this officer is to be careful to keep his company full of able bodied ſoldiers, to viſit their tents and lodgings, to ſee what is wanting, pay them well, cauſe them to keep themſelves neat and clean in their cloaths, and to keep their arms bright. He has power in his own company of making ſerjeants, corporals, and lanſpeſades. *Cruſ.* Milit. Inſtr. Cavalr. P. 1. c. 6. *Guill.* Gent. Dict. P. 2. in voc.

Second CAPTAIN, one whoſe command having been taken away, he is joined to another *captain*. to ſerve under him, and receive pay as a *captain* reformed. Milit. Dict. Voc. *Second*.

Among the French, there are alſo *ſecond captains*, who never had companies of their own.

CAPTAIN *en pied*, a *captain* kept in pay, that is not yet reformed.

The expreſſion, though altogether French, occurs ſometimes.

CAPTAIN *General of Great Britain* is the higheſt military poſt in our army. *Bland.* Treat. of Milit. Diſcipl. c. 14. Art. 4. p. 201.

In Holland the office of *Captain General* is uſually joined with that of ſtadtholder, and though by the perpetual edict paſſed in 1667, the two offices were for ever disjoined; ſo that whoever was poſſeſſed of one, was rendered incapable of the other; this regulation laſted but five years. *Baſn.* Hiſt. des Oeuvr. des Scav. Oct. 1702. p 468, ſeq. See STADTHOLDER, *Cycl.*

CAPTAIN *of a man of war*, is held equivalent to that of a colonel at land. The *captain* is accountable for the ſhip, if loſt or taken by his miſconduct. *Botel.* Sea Dial. 1. p. 41, ſeq. *Guil.* Gent. Dict. P. 3. in voc. *Ozan.* Dict. Math. p. 321.

In admiral ſhips, and all ſhips of the firſt rate, the French have two *captains*, two lieutenants, and two enſigns. *Aubin.* Dict. Mar. p. 166.

The pay of ſea *captains*, in the Engliſh ſervice, was formerly ſmall, which defect was made up to them, by indulging them in many privileges not now allowed, as plundering of prizes, taking convoy monies, and even carrying merchants goods, plate, &c. K. James II taking this laſt privilege away, in lieu thereof granted them an annual allowance of table monies, almoſt equal to their whole former pay. But this not taking place by reaſon of the abdication, king William III. in 1693, ordered the pay of the *captains* to be doubled, but the fund for this failing at the peace of Ryſwick, a new eſtabliſhment was made in 1700, whereby nearly one third was retrenched from the ſea pay, and that of a firſt rate fixed at 1 *l.* 0 *s.* 0 *d*; of a ſecond rate at 0 *l.* 16 *s.* 0 *d.*; of a third rate at 0 *l.* 13 *s.* 6 *d.*; of a fourth rate at 0 *l.* 10 *s.* 0 *d.*; of a fifth rate at 0 *l.* 8 *s.* 0 *d*; of a ſixth rate at 0 *l* 6 *s.* 0 *d. per* day. Treat. of Domin. and Laws of Sea. p. 591, ſeq.

CAPTAINS *of port*, in the French marine affairs, officers eſtabliſhed in ſome conſiderable ſea ports where there are arſenals. To them belongs the command of the guard of the place, the watching of the ſea, and the care and cuſtody of the veſſels brought into port.

There are ſuch *captains* at Toulon, Rochfort, Breſt, Havre, Dunkirk, and port Lewis [a]. They are to take care of mooring the king's ſhips, and oblige all to give the due ſalutes. *Aubin.* Dict. Mar. p. 167, ſeq. *Ozan.* Dict. Math. p 371.

CAPTAIN *baſhaw*, in the Turkiſh affairs — This officer is governor of the iſlands of the Archipelago, though his reſidence is at Gallipoli on the continent [a]; his office is the ſecond in the empire, there being none but the grand vizier above him. His power is ſo abſolute, that without the Dardanelles, he may ſtrangle viceroys and governors on the coaſts, without waiting for the ſultan's order. Not only the ſea officers, but the governors of all the maritime provinces receive their orders from him. [b] — [[a] Trev. Dict. Univ. T. 1. p. 1413. voc. *capitan*. [b] *Tournef.* Voy. du Lev. T. 2. Let. 13. p. 38.]

The Turks call him *capudan pacha*, a denomination taken from the Italian word *capitano* [a], very current in the ſtates of Greece, ſubject to the grand ſignior, having been ſo before the Turks

Turks were masters of them. The Greek emperors gave the title *cattano*, to the governors of some provinces, whom they sent into Italy, particularly that of Puglia Piana. This Vossius and others derive from the Latin *capitaneus*; though signior Redi chuses to deduce it by contraction from *castellano*, and others from the Greek Καταπανω [b]. — [a] *D'Herbel.* Bibl. Orient. p. 251. voc. *capudan bacha.* [b] *Aquin.* Lex. Milit. T. 1. p. 165, seq.]

CAPTAIN *of the guides*, an officer appointed for providing guides for the army. Of these he ought always to have a sufficient number with him, who know the country very well; that they may guide the army on a march, or go with convoys, parties, baggage, artillery, and detachments. To provide such, the *captain* ought to have a party of horse to go to the adjacent villages, castles, or forts, to demand boors, whom he brings to his quarters, and keeps under a guard, till the army comes to another ground, where he may be provided with others. He ought to understand several languages, especially that of the country in which the army is.

CAPTAINRY, *capitainerie*, in the French law, denotes the government or command of a royal palace, and the lands dependent thereon.

The name is also applied to the office of *captains* of chaces or woods. Such are the *captainries* of Fontainbleau, the wood of Boulogne, &c. *Menestr.* Hist. de Lion. p. 525. Trev. Dict. Univ. T. 1. p. 1412.

CAPTIVES, *captivi*, *(Cycl.)* among the Romans, differed from dedititii, as the former were taken by force, whereas the latter surrendred themselves. *Aquin.* Lex. Mil. T. 1. p. 167.

By the LexCornelia, aRoman citizen taken *captive*, in case he returned, was reputed as having never been taken; if he died in captivity he was reputed for dead the moment he was taken: In the former case he recovered all his rights, and even the dominion over his children; in the latter his son became free from the time of his father's detention. *Justin.* Inst. l. 1. Tit. 12. §. 5.

Formerly, *captives* in war became the slaves of those who took them [a]; and though slavery, such as obtained among the antients, be now abolished, some shadow of it still subsists in respect of prisoners of war, who are reputed the property of their captors, and have no right to liberty, but by concession from them [b]. — [a] Id. ibid. Tit. 3. §. 3. [b] *Calv.* Lex. Jur. p. 147.]

The Romans used their *captives* with great severity; their necks were exposed to the soldiers to be trampled on, and their persons afterwards sold by public auction. *Pitisc.* Lex. Ant. T. 1. p. 356, seq.

Captives were frequently burnt in the funeral piles of the antient warriors, as a sacrifice to the infernal gods. See BURIAL. Those of royal or noble blood had their heads shaven, and their hair sent to Rome, to serve as decorations in female toys, &c. They were led in triumph loaden with chains through Rome, in the emperors train, at least as far as the foot of the Capitoline mount, for they were not permitted to ascend the sacred hill, but carried thence to prison. Those of the prime quality were honoured with golden chains on their hands as well as feet, and golden collars on their necks. If they made their escape, or killed themselves, to avoid the ignominy of being led in triumph, their images or effigies were frequently carried in their place.

CAPTIVITY. The state or condition of a captive. See CAPTIVE, *Cycl.* and *Suppl.*

Princes of the CAPTIVITY, are heads or chiefs of the Jewish nation, appointed for the administration of justice among them, during their captivity both in the East and West, since the destruction of their temple by the Romans.

The prince of the *captivity* in the east, is said to have had the government of the Jews who dwelt at Babylon, in Chaldæa, Assyria and Persia. The Prince of the *captivity* in the West, had the direction of those who lived in Judæa, Egypt, Italy, and other parts of the Roman empire. *Basn.* Hist. des Juifs, T. 2. l. 4. c. 3.

The former were called *Rabbana*, and were supposed to have descended from David, in a direct line by the males; the latter called *Rabban*, only descended from David by the females.

The Jews, we are told by Prideaux, after the loss of their authority, still kept up the title, and for many ages had a person of the house of David resident about Babylon, who, under the name of the head of the *captivity*, was acknowledged and honoured as a prince among that people, and had some sort of jurisdiction, as far as was consistent with the subordination they were under, always invested in him, and sometimes even a ratification of it was obtained from the sovereigns of the country; something of this pageantry is said to be still kept up. Perhaps that they may be furnished with an answer to the christians, when they urge the prophecy of Jacob against them. The scepter they pretend being still preserved among them in the head of the *captivity*. *Prid.* Conn. P. 1. l. 2. p. 153. Item P. 2. l. 9. p. 934. See ÆCHMALOTARCHA, *Cycl.* and *Suppl.*

The prince of the *captivity* in Judæa usually resided at Tiberias, and assumed the title of *Roch-abboth*, q. d. head of the fathers, or patriarchs; he presided in the synagogues, and at all assemblies, decided all important cases of conscience, levied taxes to provide for the expences of his visits, and had officers under him, who were dispatched through the provinces to execute his orders. Some reckon 10, others 13, of these princes, the first of which was Killel, the last Gamaliel the 4th. *Basn.* Hist. des Juifs, l. 4. c. 1, seq.

CAPUCHINS *(Cycl.)* — The *capuchins* were at first restrained from spreading out of Italy; but Charles IX. of France, writing to pope Gregory XIII. to demand some *capuchins*, that pope, by a bull dated in 1575, took off the prohibition, and granted them leave to settle any where. The cardinal of Lorrain built them a convent at Meudon, and Henry III. another at Paris, in the rue St. Honoré. F. Zach. de Boverio has written the annals of the *capuchins* in Latin, in three volumes folio, from the year 1524 to 1634. Trev. Dict. Univ. T. 1. p. 1426.

CAPUCHIN is also the name of a particular species of pigeon, in shape and make much like the jacobine or jack, but something larger than that; its beak also is longer; and it has a tolerable hood of feathers on the back part of its head, but has no cravat or chain down to the shoulders as that species has. Its marks are the same with the jacobine, and it seems to be no other than a bastard breed between that and a common pigeon. *Moore's*, Columbarium, p. 47.

CAPUCIATI, an appellation given to the followers of Wickliff in the 14th century, by reason they did not uncover themselves before the host, but kept on their *capuce*, or cap used in those times. Spondanus speaks of the *capuciati*, under the year 1387. Trev. Dict. Univ. T. 1. p 1426.

CAPUCIATI is also the denomination of a faction which appeared in Auvergne in 1183, having at their head a carpenter named Durand; thus called becaus they wore the image of the virgin in their white linnen capuces, as the badge of their engagement. *Du Cange*, Gloss. Lat. T. 1. p. 828.

CAPUCINE, in botany, the name by which the French call the cardamindum or nasturtium Indicum, a plant commonly kept in our gardens for the beauty of its flower, and its use in sallads and pickles. See CARDAMINDUM.

CAPUENA, in zoology, the name of a fish caught in the American seas among the rocks, and about the shore, and esteemed a very delicate one for the table. It is of a long and rounded shape: its usual length is about five inches; its nose is obtusely pointed, and it has in each jaw one row of small teeth. Its mouth is of a deep purple colour within, and it has seven fins, and is covered with small silvery scales, with a cast of yellow among them. Its fins are all of a pale grey, and it has two longitudinal lines on each side, which are considerably broad and of a fine gold colour. *Margrave*, Hist. Bras.

CAPUT *concutiens*, in anatomy, the name given by Douglass and some others to a muscle, described by Albinus under the name of the *intertransversarius colli*, among some others of the same nature, which he distinguishes according to their situation into *priores* and *posteriores*. This being of the former number, Winslow calls it the *transversarius secundus anterior*, which see.

CAPUT *cordis*, a name sometimes given to the upper and larger side of the heart, otherwise called its basis. See HEART and BASE, *Cycl.*

CAPUT *draconis*, a denomination given by some to a fixed star of the first magnitude, in the head of the constellation *draco*, called also by the Arabs *rasaben* and *eltanin*. See DRACO, *Cycl. Vital.* Lex. Math. p. 92. & p. 158.

CAPUT *jejunii*, a name given to Ash-wednesday, as being the first day of the Lent-fast. *Schoetg.* Lex. Ant. p. 274. *Du Cange*, Gloss. Lat. p. 826. See LENT, *Cycl.*

CAPUT *moventium secundus*, in anatomy, a name given by Fallopius and others to a muscle called by Albinus *biventer cervicis*, and by some the *complexus*.

CAPUT *porcinum*, *swine's head*, a denomination given by the Romans to an order of battle more frequently called *cuneus*. *Kenn.* Rom. Ant. P. 2. l. 4. c. 10. *Aquin.* Lex. Milit. T. 1. p. 169. *Pitisc.* Lex. Ant. T. 1. p. 360. See BATTLE.

CAPUT *purgia*, a barbarous term used by some physicians to denote medicines which cleanse the head, either in the way of sneezing, more properly called *errhines*; or by chewing in the way of salivation, called *apophlegmatizants*. *Cast.* Lex. Med. p. 134, seq. *Du Cange*, Gloss. Lat. T. 1. p. 826. See ERRHINA, STERNUTATIVE, and APOPHLEGMATIZANTS, *Cycl.*

CAPYBARA, in zoology, the name of an animal found in many parts of America, and somewhat approaching to the nature of the river-horse, but with so much of the general figure of the hog kind, that Marggrave and some others have called it the porcus marinus, or sea hog. It is of the size of a half grown hog, measuring in length, from the head to the rump, about two foot: its belly is as prominent as that of a fat hog. It has no tail, its feet are wholly like those of the hog, but that the fore ones have four claws each, and the hinder ones only three. Its head is very thick, and proportionably too large for the body; its eyes are large and black, its ears small and round; the lower jaw is shorter than the upper, and each has two long crooked teeth that stand out a finger and a half from the jaw, and are buried two fingers in it, but these do not shew themselves outwardly when the mouth is shut. It feeds on vegetables, and its flesh is eaten by the Indians, but is not well tasted. *Ray's* Syn. Quad. p. 185.

CARA, in botany, a name given by the old Roman authors to a plant with large and eſculent roots. We are told that the ſoldiers of Cæſar, in ſome of their marches, when diſtreſſed for proviſions, made a ſort of bread of the root of the *cara*. And we learn from Paulus, Ægineta, and Dioſcorides, that this plant was of the paſtinacha or parſnip kind. It was probably the elaphoboſcum, or wild parſnip, which has roots long and thick, and of as good a taſte as the garden parſnip, only that they are not ſo tender: Pliny tells us that the bears, as ſoon as they are able to crawl out of their den, eat up the leaves and roots of this plant, to give them ſtrength, and clear their inteſtines from any thing that may be in them. Pliny tells us, that the plant is arum; but the acrid nature of arum is too great to let it be eaten by any animal, ſo that the *cara* is certainly the plant here meant, that being the word ſtanding in many manuſcripts of this author. It is ſuppoſed by ſome that our word carrot is derived from this *cara*. Some of the copies alſo have it tamus inſtead of *cara*. This tamus is in another part of Pliny's works mentioned as a plant growing ſpontaneouſly in Italy, and it ſeems to be the ſame with our tamnus, or black bryony.

CARABE, a name given to amber. See the article SUCCINUM.

CARACALLA, in antiquity, a long garment, having a ſort of capuchin, or hood a-top, and reaching to the heels; worn equally among the Romans by the men and the women, in the city and the camp. Trev. Dict. Univ. T. 1. p. 1429.

Spartian and Xiphilin repreſent the emperor Caracalla as the inventor of this garment, and hence ſuppoſes the appellation *caracalla* was firſt given him [a]. Others with more probability make the *caracalla* originally a Gallic habit, and only brought to Rome by the emperor above-mentioned [b], who firſt enjoined the ſoldiery to wear it. The people called it *antoninian*, from the ſame prince, who had borrowed the name of Antoninus. — [a *Spart.* in Caracallam. c. 9. b *Bingh.* Orig. Eccleſ. l. 6. c. 4. §. 20.]

The *caracalla* was a ſort of caſſock, or ſurtout. Salmaſius, Scaliger, and after them Du Cange even take the name *caſaque*, to have been formed from that of *caraque*, for *caracalla* [a]. This is certain from St. Jerom, that the *caracalla*, with a retrenchment of the capuchin, became an eccleſiaſtical garment [b]. It is deſcribed as made of ſeveral pieces cut and ſewed together, and hanging down to the feet; but 'tis more than probable there were ſome made ſhorter, eſpecially out of Rome, otherwiſe we do not ſee how it could have fitted the ſoldiers purpoſes [c]. — [a *Scalig.* ad Spart. loc. cit. *Du Cange*, Gloſſ. Lat. T. 1. p. 830. b *Hieron.* de veſt. ſacerdot. ap. *Eucher.* act. ſanct. T. 4. p. 148. *Bingh.* loc. cit. *Magr.* Not. Vocab. Eccleſ. p. 56. c *Tillem.* ap. Trev. Dict. ubi ſupra. *Pitiſc.* Lex. Ant. T. 1. p. 360, ſeq. *Fab.* Theſ. p. 467.]

CARACARA, in zoology, the name of a Braſilian bird of the genus of the hawk, called by the Portugueſe gavicaou. It is properly of the ſparrow hawk kind, but of the ſize of a kite.

It is of a greyiſh yellow colour, variegated with white and yellow ſpots; its tail is variegated with white and brown; its beak is conſiderably large and black; its legs yellow, and its claws extremely ſharp; the belly and breaſt in ſome of the birds has been obſerved to be white. They are great deſtroyers of the poultry. See Tab. of birds, N° 4. *Marggrave*'s Hiſt. Braſ.

CARACOLI, in commerce, a factitious metal whereof the natives of the Caribbee iſlands make a kind of ornament, in form of a half moon, which is called by the ſame name.

The metal is brought from the terra firma; and the common opinion is, that it is compoſed of gold, ſilver, and copper, but the mixture is ſo perfect that a metal reſults from the whole which never ruſts nor tarniſhes how long ſoever kept either in the ſea or the ground. The Engliſh and French goldſmiths have made frequent attempts to imitate it. Thoſe who have ſucceeded beſt, uſe ſix parts of ſilver, three of purified copper, and one of gold. But the curious find all the imitations much inferior in beauty to the original metal of the ſavages.

M. Hauterire, procuror general of Martinico, makes the *caracoli* to be a compound of gold only with a ſort of copper found in the terra firma of America. The Spaniards repreſent it as a ſpecific againſt megrims, or head-achs [a]. F. Labat takes it for a native, or ſimple metal. The Americans alſo make rings, buckles, cane-heads, and the like of *caracoli* [b]. — [a Hiſt. Acad. Scienc. an. 1724. p. 26. b *Savar.* Dict. Comm. Supp. p. 117.]

CARACT *(Cycl.)* — The Arabs ſtill call the fruit *ſiliqua*, mentioned in the Cyclopædia, *kerath* [a], a denomination which they alſo give to a weight, which is half their *danek*, or $\frac{1}{6}$ of their *dirhem* [b]. In Latin writers, we alſo find caratium uſed for the 24th part of an ounce, otherwiſe called a ſcruple [c]. — [a *Caſt.* Lex. Med. p. 158. voc. *ceratium*. b *D' Herbel.* Bibl. Orient. p. 959. voc. *kerath*. c Vid, *Pancirol.* Not. Dignit. c. 75. *Pitiſc.* Lex. Ant. T. 1. p. 361.]

The grains of the jewel *caract* are ſomewhat heavier than thoſe uſed on other occaſions. According to Sir Jonas Moor, 20 *caract* grains are equal to 24 grains troy weight [a]. The great mogul's diamond is ſaid by Tavernier to weigh 279 *carats* [b]. Eighty eight *carats* make an hundred ruttees [c]. — [a *Moor*, Math. Compend. c. 2. p. 16. b Dict. Trev. in voc. c Coins, weights, &c. uſed in India. p. 4.]

CARAGUATA, a Braſilian name, by which ſome authors have called the common great aloe. *Marggr.* p. 27. *Piſo*, p. 193. From an inciſion made in the ſhoots of this plant, there flows a great quantity of liquor, whereof the Braſilians make wine, vinegar, honey and ſugar. Vid. *Boyle*'s works, abr. Vol. 1. p. 53. ſeq.

CARANDA, in the materia medica, a name uſed by ſome authors for the tamarind tree. *Bont.* p. 24.

CARANNA *(Cycl.)* — This gum, called alſo *caragna* and *karagna*, both in figure and virtue bears a near reſemblance to the *tacamahaca*. *Caſt.* Lex. Med. p. 135. See TACAMAHACA, *Cycl.*

It oozes from a tree reſembling the palm; and is at firſt white, but with keeping turns browniſh, bordering on green, and is imported in lumps wrapt up in leaves. The beſt ſort is ſoftiſh, of an agreeable aromatic ſmell, and the whiter the better. It is ſaid to be excellent againſt head-achs, and good alſo againſt pains of the joints, inſomuch that 'tis become a proverb among the Spaniards, *Whatever tacamahaca has not cured, caranna will cure* [a]. Among us, its internal uſe is much diminiſhed; and it is given chiefly as a topic againſt tumors, aches, &c. [b]. — [a *Savar.* Dict. Comm. T. 1. p. 556. ſeq. b *Quinc.* Pharmac. P. 2. Sect. 4. n. 278. Trev. Dict. Univ. T. 1. p. 1433. voc. *caragne*.

CARANTIA, in the materia medica, a name given by ſome authors to the carob, or *ſiliqua dulcis*, the ſweet pipe. See CAROB. *Dale*, Pharmac. p. 340.

CARAPO, in zoology, the name of a fiſh, of which there are two kinds caught in many parts of the lakes of America.

The firſt has a long and thin body, of the ſhape of a knife blade, the back being thick, the belly very thin and narrow; the tail is pointed, and the uſual ſize of the fiſh is a foot in length, and two fingers broad in the broadeſt part; the head is flat and pointed, and the lower jaw runs out a little farther than the upper; the mouth is very narrow, and the bottow jaw is furniſhed with very ſmall and ſharp teeth; the upper is toothleſs; its eyes are very ſmall; and it is covered with little ſcales.

It is of a brown colour, with a faint admixture of red, and the back and head are ſomewhat blackiſh; there runs a duſky line all along the ſides in their middle, and under this the fiſh is ſpeckled with black ſpots of the ſize of a ſeed of muſtard.

The ſecond kind no way differs from the firſt, but that it is much narrower in proportion to its length, and has no ſpots. They are both eatable. *Marggrave*'s Hiſt. Braſ. p. 113.

CARAPOPEBA, in zoology, the name of a ſmall ſpecies of lizard common in the Braſils, and eſteemed a poiſonous animal: Its body is of a liver colour, and has ſeveral white ſpots. There are marks of white on the tail, variegated with ſome ſmall quantity of yellow; the eyes are remarkably bright and vivid. *Ray*'s Syn. Quad. p. 267.

CARARA, a weight at Leghorn, and in other parts of Italy, uſed in the ſale of wool and codfiſh, equivalent to ſixty pounds of that country. *Savar.* Dict. Comm. T. 1. p. 557.

CARASSIUS, in zoology, the name of a genus of leather-mouthed fiſhes of the carp or bream kind, of which there are three ſpecies, no better diſtinguiſhed by names among authors, than by thoſe of Geſner, the firſt, ſecond, and third ſpecies, or *caraſſii prima*, *ſecunda*, and *tertia ſpecies*; the laſt of theſe is the more common kind, and is uſually ſimply called *caraſſius*. It is a ſmall freſh water fiſh, of about three, four, or five inches long, with a flatted body, and a riſing back; it reſembles the bream indeed in ſhape very nearly, but is ſomewhat thicker; its colour is a pale yellow, and its belly of a deeper yellow, without any redneſs. The mouth is ſmall and round, and the eyes ſmall, and ſunk in their orbit. *Willughby*, Hiſt. Piſc. p. 250.

The firſt ſpecies of Geſner and other authors, is ſmaller than this, and thinner, and is of a yellowiſh blue, with a mixture of brown upon the back; the tail and back fin are of a plain brown; the reſt of the fins have a rediſhneſs mixed with the brown in them. This ſpecies ſeldom exceeds four inches in length, and principally inhabits weedy and muddy ſtanding waters.

The ſecond ſpecies of theſe authors is longer and thicker than either of the others, and is leſs broad; it has a blackneſs alſo mixt with its yellow. Theſe love ſtanding waters, but ſometimes paſs out of lakes or ponds into rivers of a ſlow current. All the ſpecies are eaten, and their fleſh looks yellow, and is of a viſcous nature. *Geſner*'s Paralipon p. 1275.

CARATH, in the materia medica, a name given by the Arabian writers to the acacia. The word ſeems formed upon the Greek word *ceration*, which was given by that nation to the carob tree or ſiliqua dulcis, on account of the fruit being a pod ſomewhat reſembling a horn, κερας. The Arabians uſed their name charnub both for the carob and the acacia tree, and probably they uſed this word *carath* originally for both; but we find it in the works of thoſe authors handed down to us, only given for the acacia.

CARAVAN (*Cycl.*) — There are four regular *caravans* which go yearly to Mecca; the firſt from Damaſcus, compoſed of the pilgrims from Europe and Aſia; the ſecond from Cairo, for the Mahometans of Barbary; the third from Zibith, a place near the mouth of the Red Sea, where thoſe of Arabia and India meet; the fourth from Babylon, where the Perſians aſſemble. Moſt of the inland commerce in the Eaſt is carried on by *caravans*. The late czar, Peter the Great, eſtabliſhed a trade between Ruſſia and China by means of a *caravan*[a]. M. Bougnon[b], geographer of the duke of Lorraine, has given a treatiſe of the *caravans* of merchants in Aſia, wherein he ſhews of what they are compoſed; how many ſorts there are; the ſeveral uſes of the different ſorts of animals in them; the price given for them; the officers and men appointed to conduct them; and the pay of each; with their manner of marching, halting, fighting, treating, &c. — [[a] Atlas Marit p. 128. [b] *Bougnon*, Relation exacte concernant les *Caravannes* des marchants d'Aſie, Nanc 1711. 12°.]

Caravans of this kind are large convoys of armed men, merchants, and travellers, with divers ſorts of animals, for the carriage of their proviſions.

To form a *caravan*, the permiſſion of the ſovereign muſt be obtained in writing, which permiſſion is to expreſs the number of men and carriages, and the quantity of merchandizes it is to be compoſed of, and muſt alſo be legalized by at leaſt two other neighbouring ſovereigns: this is called the *commiſſion of the caravan*, a term borrowed from the military uſage.

There are commonly four chief officers of a *caravan*; viz. the *caravan bachi*, or chief; the captain guide; captain of reſt; and captain of diſtribution.

The firſt has an abſolute command over all the reſt; the ſecond is abſolute in the march; the office of the third only commences when the *caravan* ſtops, and makes a ſtay; to the fourth it belongs to diſpoſe of every part of the corps, in caſe of an attack, or battle; he has alſo the inſpection over the diſtribution of proviſions, which is made under him by ſeveral diſtributers, who give ſecurity to the maſter of the *caravan*, and have each of them a certain number of perſons, elephants, dromedaries, &c. to take care of at their own peril.

The treaſurer of the *caravan* makes the fifth officer, who has under him ſeveral agents and interpreters, who keep journals of all that paſſes, for the ſatisfaction of thoſe concerned in fitting out the *caravan*. Another ſort of officers are the Arab mathematicians, who, to the number of three, in large *caravans*, do the office of quarter-maſters, as well as aids de camp, in caſe the *caravan* be attacked.

There are five ſorts of *caravans*, viz.

Heavy CARAVAN, compoſed of elephants, dromedaries, camels, and horſes.

Light CARAVAN, in which there are but few elephants.

Ordinary CARAVAN, that in which there are no elephants.

CARAVAN *of horſes*, that in which there are neither camels nor dromedaries, but only horſes.

Sea CARAVANS, are companies of merchant veſſels, loaden with goods, and conveyed by ſhips of war.

In the heavy *caravans*, to five hundred elephants there are a thouſand dromedaries, and at leaſt two thouſand horſes, eſcorted by four thouſand cavaliers. Two men are required to lead each elephant; five to three dromedaries; and ſeven to twelve camels. Such a number of ſervants joined with the officers and paſſengers, the number whereof is not limited, renders the body very formidable; the paſſengers indeed are not obliged to fight, but in caſe they refuſe, proviſion will ſcarce be allowed them afterwards, even for their money.

As few of the Arab princes have any other ſubſiſtance than what they can get by pillage, they keep continually ſpies on foot, to give them intelligence of the departure and motions of *caravans*, which they frequently attack with ſuperior forces: in caſe of repulſe they come to an accommodation; but if the *caravan* be beaten, it is abſolutely plundered, and the whole guard made ſlaves; though more indulgence is ſhewed to ſtrangers. The taking of a ſingle *caravan* ſometimes enriches a prince for ever.

The profits to be made in a *caravan*, during its march, are often incredible; Mr. Bougnon gives inſtances where, by repeated bargains and exchanges, a perſon has made twenty thouſand crowns out of a ſingle gold watch, and 30 louis d' ors. Relat. de carav. d' Aſie. *Savar.* Dict. Comm. Supp. p. 118, ſeq. Jour. des Scav. T. 49. p. 88, ſeq.

Any dealer is at liberty to form a company, in order to make a *caravan*. He in whoſe name it is raiſed, is conſidered as the *caravan-bachi*, or chief of the *caravan*, unleſs he appoint ſome other in his place. If there be ſeveral merchants equally concerned, they elect a *caravan bachi*, after which they appoint officers to conduct the *caravan*, and decide all controverſies which may ariſe during the journey. *Bougnon*, Relat. des caravan. ap. Jour. des Scav. T. 49. p. 88.

CARAVANSERA *(Cycl.)* — Meninſki writes the word *karwaan ſerai*, and derives it from the Turkiſh *karwan*, or *kerwan*, a *caravan*, and *ſarai*, houſe or palace. Trev. Dict. Univ. T. 1. p. 1440.

Caravanſera's are places of ſhelter, erected in the habitable parts of Turky and Perſia, where caravans are ſecured from the enemy and the weather.

There are *caravanſera's* where moſt things may be had with money; and as the profits of theſe are conſiderable, the magiſtrates of the cities to whoſe juriſdiction they belong, take care to ſtore them well. There is an inſpector, who, at the departure of each caravan, fixes the price of the night's lodging, from which there is no appeal. *Bougnon*, ubi ſupra, Jour. des Scav. T. 49. p. 92, ſeq.

CARAUNA, in zoology, the name of a ſmall Braſilian fiſh, in many reſpects approaching to the turdus kind, and much reſembling the itacara of the ſame place: its mouth is of a ſemilunar figure; and its teeth very ſmall, and extremely ſharp; its covering of the gills are terminated behind by a ſharp prickle; the eyes are ſmall, and ſtand very cloſe together in the upper part of the head; its ſcales are all of a ſemilunar figure, and its colour a fine bright red, all over ſpotted with very ſmall black ſpots. *Marggrave's* Hiſt. Braſil.

CARBASA *caryſtia*, a term uſed by many of the antient writers to expreſs pieces of cloth made of the *linum incombuſtibile*, or Aſbeſtus ſtone, which being found plentifully about Caryſtium, was thence called by the name of the place. Pauſanias calls it linum Carpaſium, for the ſame ſort of reaſon, Carpaſus, a town in the iſland of Cyprus, being a place famous for affording large quantities of the ſtone in its neighbourhood. Pauſanias expreſly ſays of his, that being thrown into the fire, it ſuffered nothing by it; wherever therefore the words caryſtium or carpaſium is added to the word linum, it is to be underſtood of this ſort of manufacture, and the word *carbaſa*, which is indeed but a derivative of carpaſium, being added to the other epithet caryſtium, expreſſes the ſame thing; but when the word *carbaſa* is uſed without this epithet of place, it generally ſignifies no more than linum, flax, or linen made of flax.

CARBENSIS *aqua*, in the materia medica, the name of a mineral water of Germany, of which Hoffman from Petzlerus has given the following account: All about the place of its origin, and along the canals through which it paſſes, it depoſits an earthy and ferruginous matter, which concretes into a ſtony hardneſs. When any alcaline liquor, whether fixed or volatile, is added to theſe waters, they become turbid, and precipitate a whitiſh earthy matter to the bottom of the veſſel; after the evaporation of the water they leave a ſal enixum, and an alkaline earth; two quarts of them yield two ſcruples and ten grains of the earth, and twelve grains of the ſalt. If it be kept for any time in a glaſs, or earthen veſſel, it depoſits a ſediment of a yellow ochreous earthy matter, and when immediately taken from the ſpring, it changes to a blueiſh brown colour, on being mixed with galls. It contains a very large portion of a ſubtile mineral ſpirit; for if a long necked veſſel be filled half full with it, and the orifice ſtopped with the thumb, the whole on a little ſhaking, ſends up a froth to the top; and when the thumb is taken off, the water ſpirts out to ſeveral foot diſtance. It makes an effervеſcence on mixing oil of vitriol with it; but this laſts but a very little time. From the whole it ſeems to contain a large quantity of calcareous earth, and ſome ſmall portion of ferruginous matter; whence it purges both by ſtool and urine, though moſtly the latter way; the former operation which is pretty conſtant, is owing to this alkaline earth meeting with an acid in the prima via, and being by it changed into a bitter purging ſalt, of the nature of Glaubers.

CARBONADE, or CARBONADO, in cookery, fleſh, fowl, or the like, ſeaſoned, and broiled on the coals.

CARBUNCLE *(Cycl.)* — The name of a gem very commonly uſed, but very little underſtood. The diſtinguiſhing character of the *carbuncle* is, that it is a gem of great hardneſs, and of a deep red with an admixture of ſcarlet. It was known among the antients by the name ανθραξ, which was uſed metaphorically to ſignify that this gem was in ſome lights of a fire colour, the proper ſignification of the word being a piece of lighted charcoal. The Latin name is a tranſlation of the Greek, and moſt nations have agreed to call it by a name of the ſame ſignification.

Our jewellers, among whom it is very rare, know it by no peculiar name, and not only now, but for many ages back, this has been the caſe; and while the genuine *carbuncle* was often ſeen, it was yet generally thought not to exiſt, and this merely from an error: its name importing a reſemblance to a burning charcoal, the world, in general, grew into an opinion of its having the properties of a burning coal, one of which is the ſhining in the dark; and ſuppoſing that property ſtrongly commemorated in the name, and finding no gem which had it, they took it for granted that the *carbuncle* no longer exiſted; nay, the fertile imaginations of ſome travellers have gone ſo far as to affirm, that a gem with this property is yet to be ſeen in ſome places, and have given a thouſand abſurd relations about it.

To all this it is only to be anſwered, that the whole is an abſurd error; for that the antients never attributed any ſuch quality to their *carbuncle*, but that the whole reaſon of their giving the name anthrax to that gem, was, that it was of itſelf of a very deep and ſtrong red, but when held up againſt the ſun, or when ſet upon a bright pale foil, it was exactly of that ſort of red colour which is ſeen in burning charcoal.

Theophraſtus, the greateſt naturaliſt of antiquity, aſſerts this in plain words, and calls the gem that had this property anthrax. Other of the antients have called it the Garamantine or Carthaginian *carbuncle*; and it has been ſuppoſed by the better writers among the moderns to be the ſame ſtone with the true garnet: this, however, on comparing the ſtones, appears to be

an

an egregious error, the difference in colour, and even in figure, between theſe two gems being obvious and eſſential.

The *carbuncle* is uſually found pure and faultleſs, and is of the ſame degree of hardneſs with the ſapphire, being ſecond only to the diamond. It is ever found naturally of an angular figure, ſmaller at one end than at the other, and at that ſmall end tapering to a pointed pyramid, compoſed of the ſame number of planes with the column, which is ſix, and thoſe uſually very unequal. It is found adhering by its baſe to a heavy and hard ferruginous ſtone of the emery kind, and is always more finely coloured toward the point than at the baſe of the column. Its uſual ſize is near a quarter of an inch in length, and two thirds of that in diameter in its thickeſt part. Its colour is a very beautiful, and very deep red, reſembling that of a mulberry when nearly ripe, and where paleſt, going off into a fine ſcarlet, not into the purpliſh or violet tinge of the garnet; but when held up againſt the ſun, it loſes its deep dye, and becomes exactly of the colour of a burning charcoal; ſo that the propriety of the name given it by the antients immediately ſtrikes one on making the trial. It bears the force of fire unaltered, not parting with its colour by it, as do moſt of the gems, nay, it even will not be at all affected by fire, nor become a whit the paler. This has been an experiment diligently tried by ſome of our jewellers, who being diſguſted by its too deep colour, have endeavoured the rendering it more vivid and ſtriking to the eye, by diveſting it of a part of it by this means, but always without ſucceſs.

It is found only in the Eaſt Indies ſo far as is yet known, and that but very rarely.

The diſtinctions between the ſeveral red gems are very nice, and their names in ſome degree arbitrary. Many authors have confounded the *carbuncle* with the ruby, and determined with Garcias, that every ruby which exceeded twenty-four carats in weight, was properly a *carbuncle*. This gem, however, is by all trials proved to be evidently the *carbuncle* of the antients, and eſſentially different from the ruby in wanting the purpliſh tinge into which the colour of that gem goes off, as is extremely evident in all the deep ones; this going off into a true ſcarlet, and for that reaſon giving the colour of a lighted charcoal in the ſun, which neither the ruby, garnet, nor any other gem can do which has the blue or purple caſt. *Hill*'s Hiſt. of Foſſ. p. 589.

The fineſt *carbuncles* are ſaid to be produced in the iſland of Ceylon, the king of which country is poſſeſſed of a *carbuncle* a palm broad, and three inches thick, of the brightneſs of fire. *Paul Venet.* ap. Eraſm. Franciſc. Hort. Indic. P. 2. p. 1229. *D'Herbel.* Bibl. Orient. p. 780.

Some include granats and hyacinths under the claſs of *carbuncles*. *Caſt.* Lex. Med. p. 135. See GRANAT, &c.

CARBUNCLE is alſo, in medicine, ſometimes uſed for the *furunculus*. *Junck.* Conſp. Chir. Tab. 8. p. 81. See FURUNCULUS.

This is more particularly called *carbunculus benignus*, by way of contra-diſtinction from that mentioned in the Cyclopædia, which is of the malignant kind. *Junck.* loc. cit.

CARBUNCLE is alſo frequently uſed to denote a ſmall eruption, which, coming on any part of the body, ſoon diſcharges its contents, and afterwards appears in form of a cruſty tubercle, of the ſize of a millet ſeed, ſurrounded with a red fiery circle. *Shaw*, New Pract. Phyſ. p. 170. See PESTILENTIAL *carbuncle*.

CARBUNCLE, *carbunculus*, alſo denotes a ſort of ſandy matter found in Hetruria, formed of a hard earth of the ſame name, concocted in the viſcera of the mountains, by the heat of the ſubterranean vapours. *Vitruv.* de Archit. l. 2. c. 4. & c. 6. *Bald.* L. Vitruv. p. 20.

Pliny and Varro ſpeak of the *carbunculus*, as a peculiar kind of hot, dry, lean ſoil. *Plin.* Hiſt. Nat. l. 17. c. 4. *Varro*, de Re Ruſt. l. 1. c. 2.

CARBUNCULATION, *(Cycl.)* a diſeaſe of plants, otherwiſe called *pruina* [a]. It happens chiefly in the ſpring and autumnal ſeaſons, when vegetables being covered with dewy vapours, a ſudden cold comes on them, which, congealing thoſe vapours, the nutritious juice of the plant is coagulated, and the texture of its fibres deſtroyed [b]. — [a *Plin.* Hiſt. Nat. l. 17. c. 24. b *Vat.* Phyſ. Exper. P. 2. Sec. 6. c. 4. p. 511.]

CARCARIAS *canis*. See LAMIA and SHARK.

CARCASSES, *(Cycl.)* in war, are come to diſuſe, being found not to anſwer what was expected from them. Bombs and fire-balls prove equally ſerviceable, though of much leſs trouble and expence. *Remy*, Mem. Artill. T. 1. p. 343. *St. Julien*, Forge de Vulcan. p. 78. *Guill.* Gent. Dict. P. 2. in voc. *Fæſch.* Ing. Lex. p. 153. *Wolf.* Lex. Math. p. 310.

In lieu of the antient *carcaſſes*, a new ſort has been introduced made of iron bands, or ribs, which incloſe a canvaſs bag, filled with combuſtible matter, hardly to be extinguiſhed. *Fæſch.* loc. cit.

We have alſo a third ſort of *carcaſſes*, of a late invention, for the ſea ſervice, differing in nothing from a bomb, except in their being filled with a compoſition like that above-mentioned, and having five holes all primed with powder and quick match, which take fire from the flaſh of the mortar, and having fired the compoſition, it burns vehemently from thoſe holes. *Guil.* Gent. Dict. P. 2. in voc.

CARCERES, in antiquity, were the liſts, or barriers of the circus, within which the horſes were confined, till the ſignal was given by the magiſtrate for ſtarting.

The word is Latin, ſuppoſed to be formed *a coercendo*, as they ſerved as a reſtraint to the horſes ready to run. *Varr.* de Ling. Lat. l. 4. c. 32.

The number of *carceres* was twelve. In the early days of Rome they were made of wood, which Claudius afterwards changed for marble [a]. They were kept faſt with bolts, ſuſtained by ropes, which, the moment the ſignal was given, flew open all at once. Some think that only four were uſed at a time [b]. — [a *Suet.* in Claud. c. 21. n. 6. b *Pitiſc.* Lex. Ant. T. 1. p. 362.]

CARCHARIAS *canis*. See the article CANIS and SHARK.

CARCINOMA *(Cycl.)* is ſometimes uſed to denote a diſorder of the tunica cornea of the eye, wherein the little veins of the part appear turgid and livid. *Caſt.* Lex. Med. p. 136, item p. 126, voc. *cancer*.

CARCINOMATOUS, the ſame with cancerous. See CANCEROUS.

Schirrhi and ſtrumæ, which are formed of the humors ſtopped by their viſcidity, or coagulated by an acid, as alſo polypus's, wherein the veſſels retain their order and diſtribution, are originally different from *carcinomatous* tumors, which, according to Gendron, ariſe from an indiſpoſition of the glandular veſſels. Yet, when the ſtructure of the veſſels is once deſtroyed, the former degenerate into a hard indiſſolvable lump, capable of germination, ſo that they loſe their former nature, and become cancerous. Vid. *Gendron*, Recherch. ſur les cancers c. 6. Phil. Tranſ. N° 260. p. 479.

CARD, *(Cycl.)* in the woollen manufactory, a ſort of inſtrument beſet with ſmall teeth of iron wire, ſerving to range the hairs of wool, hemp, and the like. See CARDING, *Cycl.* and *Suppl.*

The word ſeems formed from the Latin *carduus* (*fullonum*) which denotes the fuller's teazle; a kind of thiſtle whoſe head is uſed to range and ſmooth the nap of cloth, &c. *Skin.* Etym. Angl. in voc.

There are divers ſorts of theſe *cards*, as ſtock-*cards*, hand-*cards*, wool-*cards*, tow-*cards*, &c.

CARDS *for play*. — Among ſharpers divers ſorts of falſe or fraudulent *cards* have been contrived; as marked *cards*, breef-*cards*, corner-bend, middle-bend, &c.

Marked CARDS are thoſe where the aces, kings, queens and knaves, are marked on the corners of the backs with ſpots of different number and order, either with clear water, or water tinged with pale Indian ink, that thoſe in the ſecret may diſtinguiſh them. Aces are marked with ſingle ſpots on two corners oppoſite diagonally; kings with two ſpots at the ſame corners; knaves with the ſame number tranſverſed, &c.

Breef CARDS are thoſe which are either longer or broader than the reſt; chiefly uſed at whiſt and picquet.

The broad *cards* are uſually for kings, queens, knaves and aces; the long for the reſt. Their deſign is to direct the cutting, to enable him in the ſecret to cut the *cards* diſadvantageouſly to his adverſary, and draw the perſon unacquainted with the fraud, to cut them favourably for the ſharper. As the pack is placed either endwiſe or ſidewiſe to him that is to cut, the long or broad *cards* naturally lead him to cut to them. *Breef cards* are ſometimes made thus by the manufacturer, but in defect of theſe, ſharpers pare all but the breeſs with a razor or penknife.

Corner bend denotes four cards turned down finely at one corner, to ſerve as a ſignal to cut by.

Middle bend, or *Kingſton-bridge*, is where the tricks are bent two different ways, which cauſes an opening or arch in the middle, to direct likewiſe the cutting. Myſt. of Mod. Gam. p. 95, ſeq.

The inventor of *cards* is not known, nor even the age when they firſt appeared; but by the matter they were always made of, viz. leaves of paper, they ſhould ſeem to be much poſterior to the time of Charlemaign. F. Meneſtrier ſhews, that they were unknown in France 400 years ago. According to this jeſuit they had their origin ſoon after the year 1392, about the time when Charles VI. was ſeized with a phrenſy, to divert whoſe melancholy they ſeem to have been at firſt intended. In an antient account of that king's ſilverſmith, mention is made of three packs of *cards*, gilt and covered with divers devices, carried to the king for his amuſement. What ſeems to confirm their having been invented in France, is that all the figures had antiently flower de luces in their habits. Perhaps la Hire might be the inventor, whoſe name was put at the bottom of the knave of hearts; being partner in this honour with Hector and Ogier the Dane, which are the knaves of ſpades and diamonds. Others make *cards* of earlier date, and to have been invented by the Germans, adding that, in lieu of the kings, queens, knaves, and other figures now repreſented on them, they had antiently the figures of heathen gods and idols, and had even miniſtred to the purpoſes of idolatry. *Meneſtr.* Bibl. Cur. T. 2. p. 174. Mem. de Trev. 1720. p. 935, ſeq.

Be this as it will, we know not whether any expreſs mention is made of *cards* before the year 1404, when a ſynod held at Langres prohibited the clergy the uſe of them. *Meneſtr.* loc. cit. Nouv. Rep. Lett. T. 35. p. 514, ſeq.

CARDAMINDUM, *Indian graſs*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the polypetalous kind, and is compoſed of five petals irregular in ſhape and ſize, and growing from the diviſions of the cup; the piſtil ariſes from the bottom of the cup, which terminates in a ſpur or tail, and finally becomes a fruit compoſed of three or more capſules, of a roundiſh form, arranged into a roundiſh head, and containing roundiſh ſeeds.

The ſpecies of *cardamindum* enumerated by Mr. Tournefort are theſe: 1. The *cardamindum* with large leaves and flowers. 2. The common, or ſmaller *cardamindum*. 3. The ſmaller *cardamindum* with pale yellow flowers. *Tourn.* Inſt. p. 430.

This plant is eſteemed a good antiſcorbutic; its young ſhoots and fruits are uſed in pickles. *James*, Med. Dict. in voc. *acriviola*.

CARDAMINE, *ladies-ſmock*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of four leaves, and is of the cruciform kind; the piſtil ariſes from the cup, and becomes finally a long pod, which is divided by an intermediate membrane into two cells, and contains uſually roundiſh ſeeds. To theſe marks it is to be added, that the pods, when ripe, fly open with violence, and throw out the ſeeds to a conſiderable diſtance. See Tab. 1. of Botany, Claſs 5.

The ſpecies of *cardamine* enumerated by Mr. Tournefort are theſe: 1. The large purpliſh-flowered meadow *cardamine*. 2. The large white-flowered meadow *cardamine*. 3. The large double-flowered meadow *cardamine*. 4. The ſmaller-flowered *cardamine*. 5. The very ſmall-flowered annual *cardamine*. 6. The fumitory-leaved Sicilian *cardamine*. 7. The little rounder-leaved white-flowered *cardamine*. 8. The taller large-flowered *cardamine*, called bitter water creſs. 9. The ſmall Alpine *cardamine* with rocket leaves. 10. The mountain *cardamine* with aſarum leaves. 11. The purple-flowered hairy *cardamine* with celandine leaves. 12. The ſmooth celandine-leaved *cardamine*. 13. The trifoliate Alpine *cardamine*. 14. The trifoliate African *cardamine*. *Tourn.* Inſt. p. 224.

This plant is alſo known by the names of *cuckow-flower*, and *meadow-creſſes*. It is a kind of naſturtium, and is pungent and diſcuſſive, but is not uſed either in compoſition, or common preſcription. Vid. *Quinc.* Pharm. P. 2. Sect. 4. p. 121.

CARDANES, in natural hiſtory, the name of a ſmall inſect reſembling a beetle, of a very ſweet ſmell, and very ſoft to the touch. It is very ſwift in its motions, and is of a blackiſh colour, having two ſhort wings, which do not nearly reach to the tail; it is likewiſe remarkable for having the tail of the ſame ſhape with the head, ſo that when it ſtands ſtill, it looks as if it had two heads, one at each end.

CARDIACA, *motherwort*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the labiated kind; the upper lip which is imbricated, is conſiderably longer than the lower which is divided into three ſegments; the piſtil ariſes from the cup, and is fixed in the manner of a nail into the hinder part of the flower; this is ſurrounded by four embryo's, which afterwards ripening into as many angular ſeeds, are contained in, and occupy the whole ſpace of the cup, which before contained the flower.

The ſpecies of *cardiaca* enumerated by Mr. Tournefort are theſe: 1. The common *cardiaca*. 2. The white-flowered *cardiaca*. And, 3. The *cardiaca* with elegantly-curled leaves.

The *cardiaca's*, when not in flower, are eaſily known from the reſt of this claſs of plants by their having leaves divided into many parts like the aconites. *Tourn.* Inſt. p. 186.

The *cardiaca* is accounted attenuating, drying, deterſive and cordial. It promotes urine and the menſes, is good in aſthma's and palpitations, and is ſaid to facilitate delivery. It may be taken either in powder, or in decoction. Vid. *Lemery*, des Drog. in voc. *cardiaca*.

CARDIALGIA (*Cycl.*) is otherwiſe called *cardiogmus*, Καρδιαγμὸς; though ſome diſtinguiſh, reſtraining the latter to the ſeverer degrees of this diſorder, which riſe to palpitations and fevers, and *cardialgia* to the ſlighter acceſſes of it. Vid. *Gorr.* Med. Defin. in voc. *Linden*, Sel. Med. Ex. 13. §. 133, ſeq. *Caſt.* Lex. Med. p. 136.

The *cardialgia* is a ſpaſmodic and conſtrictory pain at the orifice of the ſtomach. Phyſicians divide this diſtemper into the ideopathic and ſymptomatic; the firſt, which is alſo called by ſome the *cardialgia nauſeoſa*, takes its riſe from crudities in the primæ viæ, and is often owing to worms; the other uſually is owing to a ſuppreſſion of the menſtrual, or hæmorrhoidal diſcharges. Theſe differ greatly in degree, the ſymptomatic being much the moſt violent, as the viſcera and vena porta are brought into conſent with it; but the moſt violent degree of the *cardialgia* is that which is attended with fainting: in this the whole meſentery is drawn into conſent, and is affected with ſpaſmodic contractions. Sometimes alſo in the idiopathic *cardialgia* there is a great apprehenſion of ſuffocation; this ariſes from the conſent of the diaphragm and pericardium.

Signs of a CARDIALGIA. Theſe are a ſenſation of preſſure and tenſion about the pit of the ſtomach, a ſtraitneſs and anxiety of the precordia, and often there comes on a nauſea, and ſometimes actual vomiting. When there are worms in the caſe, water comes into the mouth in great quantities, and the mucous matter is felt in the bottom of the jaws, as if a piece of ſomething cold lay there. Heat and cold often return ſucceſſively and ſuddenly on the perſon, and the complaint is always worſe upon an empty ſtomach, and mitigates on taking a full meal; whenever the patient can belch alſo, it gives him conſiderable relief for the time; and finally where the commotions of blood in the vena porta are in fault, there is uſually a ſlight touch of a fever attending it.

Perſons ſubject to the CARDIALGIA. — Theſe are principally valetudinary people, who have foulneſſes of the primæ viæ; ſometimes hypochondriac perſons have it to a very great degree, theſe people being uſually troubled with flatulences; women ſubject to hyſteric complaints alſo, and ſuch as have ſuppreſſions of the menſes often fall into it, and not uncommonly infants, in caſes of worms. The cauſe of the complaint is either flatulency or a foulneſs in the ſtomach and inteſtines, which occaſion a reciprocal laxation and ſtricture of the tone of the ſtomach and inteſtines, and other parts which are drawn into conſent; when the tone is relaxed, the flatus has room to expand, and the parts are conſequently diſtended, and the conſtriction of the ſame parts coming on afterwards is attended with a very ſenſible pain by the conſent of the nerves; ſo that in violent caſes the patients often faint away, and ſeem to be ſuffocated.

The occaſional cauſes of its coming on are coſtiveneſs and the retention of flatulencies; ſudden cooling of the abdomen when the body is hot; coarſe foods, and ſuch as are hard of digeſtion, and the ſwallowing the victuals in large quantities without chewing it; the change of a common coarſe diet into a finer will ſometimes occaſion it, and ſometimes the ſuppreſſing a violent paſſion of anger, while eating. Tender conſtitutions are in general moſt ſubject to it.

Prognoſtics in a CARDIALGIA. — This, in its ſimple ſtate and firſt ſtages, is no very terrible complaint, but its long continuance often brings on habitual faintings, and ſometimes there is danger of congeſtions of the blood and inflammations. The ſymptomatic kind is more difficult of cure as well as more violent than the idiopathic, for this often is but of ſhort duration, whereas the other often becomes habitual, and brings on convulſions, eſpecially in caſes where hot medicines have been given in it with intent to ſtrengthen the tone of the ſtomach. There have alſo been inſtances where vomits given to hypochondriac perſons have brought on deliriums and even abſolute madneſs. *Juncker's* Conſpect. Med. p. 580.

Method of curing the CARDIALGIA. — In the idiopathic *cardialgia* the peccant matter is to be prepared and corrected by reſolvent, abſtergent, and inciding medicines, ſuch as the tartarus tartariſatus, and vitriolated tartar; after this the acrid aromatics are to be given, among which common pepper is one of the very beſt; with this may be given the acrid roots, as thoſe of pimpernell, arum, and the like; and with all theſe it will be very proper to drink at certain intervals wine made hot, and aromatized with the ſpices. Muſtard ſeed is particularly recommended by ſome on this occaſion, and, in many caſes, the common abſorbents ſerve in the place of correctors, by rendering the matter ſoft and pulpy.

After a few days taking theſe things, if there be no contra-indication in the caſe, it will be very proper to give a vomit; to which purpoſe two or three grains of tartar emetic, with ſome of the tartariſed tartar is a very proper medicine. Where there are worms in the caſe, after the bitter digeſtives have been given, ſuch things are to follow as will deſtroy thoſe animals, as mercurius dulcis, and the like; after theſe things, it will be very proper to give the theriaca every night in ſmall doſes, by way of anodyne, and after all this the tone of the parts is to be ſtrengthened by chalybeates, with the common bitters.

In caſes of the ſymptomatic *cardialgia*, attended with fainting, the hot medicines preſcribed in the laſt caſe are wholly to be abſtained from, and in their place the temperating nitrous ones are to be taken, with a little cinnabar, and the digeſtive ſalts impregnated with a few drops of the eſſential oils of the ſpices. Medicines of this kind are always of ſingular ſervice in caſes of ſtraitneſs and conſtriction of the præcordia, and diſorders of a like kind, from whatever cauſe, and in either ſex. In the intermediate days during a courſe of theſe, the patient is to take ſome purgatives of the gentler kind, and afterwards the common chalybeates and bitters for the reſtoring the tone of the parts, and finally the beſt of all preſervatives againſt a return of this complaint are bleedings at the ſpring and autumnal ſeaſons. Aromatic medicines, in general, not only render the peccant matter more fluid, but at the ſame time ſtrengthen the tone of the parts, and for this reaſon when there is no febrile heat in the caſe they are extremely valuable remedies; but they muſt by no means be given where there is any febrile heat, as is very often the caſe in the ſymptomatic *cardialgia*; for in this caſe they always increaſe the complaint. The vulgar remedy in many places for an idiopathic *cardialgia* is ten or twelve grains of pepper ſwallowed in a ſpoonful of brandy, and this is no deſpicable medicine, ſince it not only corrects the matter, but gives a gentle diaphoreſis, which is always highly uſeful in theſe caſes. Id. ibid. p. 581.

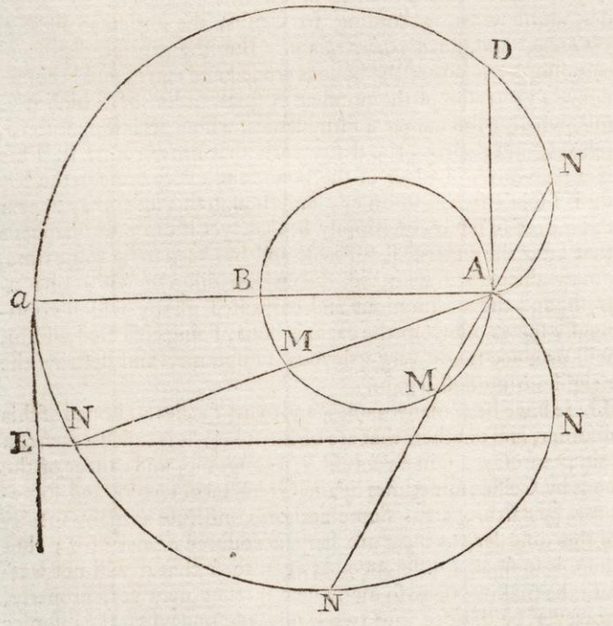
CARDINAL, (*Cycl.*) *cardinalis*, was an appellation given under the eaſtern empire to the præfecti prætorio of the dioceſes of Aſia, as being greater and more conſiderable than the reſt. *Piſc.* Lex. Ant. p. 363.

CARDINAL, in the Romiſh church. — Duarenus takes *cardinals* to have originally been thoſe prieſts who officiated together with

with the bishop, in all those greater churches called by us cathedrals, though in after-times the name became restrained to those of the Roman church alone, being as it were the council or senate of the bishop. *Pitisc.* Lex. Ant. T. 1. p. 363.

See further concerning the origin and rights of *cardinals* in Onuphrius, Duarenus, Ciaconus. Traité de l' origine des *cardinaux*. Aubery has given the general history of *cardinals* in 5 volumes 4°. See also *Du Cange*, Gloss. Lat. T. 1. p. 835. Trev. Dict. Univ. T. 1. p. 1446, seq.

CARDINAL-*signs*, in astronomy, are *aries*, *libra*, *cancer* and *capricorn*. See SIGN, *Cycl.*



CARDINALITIUS, in zoology, a name given by some to the coccothraustes indica cristata, commonly called the Virginian nightingale. *Aldrovand.* de avib. See NIGHTINGALE.

CARDING (*Cycl.*) answers to what the Latins call *carminare*, and antiently *carere*; as appears from Plautus in his Menæchmus: *inter ancillas sedere jubeas, lanam carere.* Janus Laurembergius takes the French *carder* and our *carding* to have been formed from *carere*, by an interposition of the letter d. Joseph Scaliger derives both *carere* and *cardrius* from the Greek κειρω, εκαρον, to shear. *Casen.* orig. Franc. p. 30.

CARDIOGMUS, Καρδιωγμος, is sometimes used for the same with cardialgia. See CARDIALGIA.

CARDIOGMUS, in a more restrained sense, denotes a peculiar species of cardialgia, attended with an anxiety of the præcordia, and a painful heaviness, caused by a flatulent distention of the abdomen and stomach, which compresses the diaphragm. *Nent.* Fund. Medic. T. 2. tab. 209. c. 9.

CARDIOID, in geometry, is thus formed; let the diameter AB

of the circle A M B A, revolve about the point A, and on A B produced let B *a*, M N, A D, M N, &c. be always equal to A B; then will the point *a* describe a curve, which from its figure resembling a heart, is called *cardioid.*

From the construction it appears, that A N = B A + A M, and that N A N is always double of the diameter A B, and is bisected by the circle in M.

This curve is algebraical; if A B = *a*, *a* E = *x*, E N = *y*, its equation will be,

$$y^4 - 6ay^3 + 12x^2y^2 - 6ax^2y + x^4 = 0 + 12a^2y^2 - 8a^3y + 3a^2x^2$$

For the method of drawing tangents, and other properties of this curve, see Phil. Transf. N° 461. Sect. 8. See also Mem. Acad. Scienc. 1705. where Monsieur Cané first proposed this curve.

CARDIOSPERMUM, in botany, the name by which Linnæus calls that genus of plants named *corindum* by Tournefort and other authors. *Linnæi*, Gen. Plant. p. 171. See CORINDUM.

CARDISCE, in natural history, the name of a stone mentioned by the old authors, and called also *encardia.* Pliny tells us there were three kinds of it; the one black, in which there was the plain figure of a heart delineated in white, another green in that part where the heart was figured; and the third white all over, except that the heart is marked in black. We know of no such stones as these at present, unless they are to be sought for among the agates, the various and accidental course of the veins in which, represent sometimes a thousand singular figures, among which imagination may easily trace hearts, eyes, and the like. Our modern writers understand by this name a very different stone, more usually called *bucardites* from its resembling the heart of an ox. This does not shew the delineation of a heart, but represents in some measure the shape of one in its whole figure, and owes its form to its being the matter which has once filled up the cavity between the two shells of a large bivalve of the cockle kind. The writers of the middle ages imagined the wearing the encardia of the antients about them, a cure for the palpitation and other disorders of the heart; we attribute no virtue to ours. See BUCARDITES.

CARDITES, in physiology, a figured stone in the form of a heart. Of these there are divers species, which receive different denominations from the particular animals whose hearts they are supposed to represent; as the *anthropocardites*, the *bucardites*, &c. See BUCARDITES.

Plot describes a stone of the former kind, found near Stoken church, so exactly like the heart of a man, that the very trunks of the descending and ascending parts of the vena cava, with a part of the aorta, were represented in it, in their due position. *Plot*, Nat. Hist. Oxfordsh. c. 5. §. 154.

CARDONIUM, among antient physicians, denotes wine medicated with herbs.

It is made by pouring must, or new wine on the herbs. *Cast.* Lex. Med. p. 136.

CARDOPATIUM, in botany, a name applied by some authors to the carline thistle. *Ger.* Emac. Ind. 2.

CARDUELIS, in zoology, the name of a very well known bird, called in English the *gold-finch*, and by the old naturalists the *chrysomitres* and *acanthis*; the first from its yellow head, and the last from its feeding among thistles.

CARDUS, in botany, a name given by the Romans to the plants called *cactos* by the Greeks. These words were sometimes used by both as the general names of the thistle kind, and in that sense the word *cardus* and *carduus* are the same; but some of the Roman authors have used this as the Greeks did *cactos*, in a more limited sense, expressing by it only the artichoak. This they knew both in its wild state, and in its garden state; the wild plant was very prickly, and the garden one much larger in all its parts, and smooth.

Columella is almost the only author among the antients who seems to make the *cactos* and *cinara* different plants; but his distinction turning only upon the one being prickly, the other not, it comes to no more than that *cactus* was the name of the plant in its wild state, and *cinara* in its garden state.

CARDUUS, the *thistle*, in botany, &c. See THISTLE.

CAREOPULI, in botany, a name given by some authors to the tree which affords us the gamboge, the *gutta gamba*, and *gambogium* of the shops. *Park.* Theatr. p. 1635.

CARETTA, in zoology, the name of that species of tortoise, the shell of which is of the greatest value, and is principally used with us under the name of tortoise-shell.

This is but a small tortoise in comparison of many others, and its flesh is very coarse and ill tasted: its eggs, however, which it lays in great numbers among gravel, are very delicate food. The shell of this kind is composed of fifteen pieces, some larger, some smaller; ten of these are flat, four considerably bent and the other, which is what covers the neck, is of a triangular figure, and is hollowed so as to look like a small shield. The spoils of this creature usually weigh about four pound, and sometimes the several scales are so long and thick as to rise to six or seven pound. *Ray*, Syn. Quad. p. 258.

CARETTI, in botany, a name by which many authors have called the *acacia glorioſa*, or the tree which produces the marsao, or bezoar nuts. Hort. Mal. Vol. 2. p. 35.

CAREX, in botany, a word used by Linnæus as the name of a genus of plants, comprehending those called *cyperoides* by Tournefort and others, and the *scirpoides* of other authors. The characters of the genus are these: it produces male and female flowers, in most species, on the same plant; the male flowers are digested into a long spike; the cup is an oblong and imbricated amentum, consisting of acute, hollow, and lanceolated scales, each containing one flower; there is no corolla; the stamina are three erect, setaceous filaments, of the length of the cup; the antheræ are oblong, and not pendulous, but erect.

In the female flowers the cup is the same as in the male; there are no petals, but there is an inflated oblong nectarium; the germen is three square, and is placed within the nectarium; the style is very short; the stigmata are sometimes three, sometimes but two; they are long, crooked, pointed, and hoary. The nectarium grows larger when the flower is fallen, and contains the seed in it; the seed is single, of an acute, and somewhat oval form, three-cornered, and has one of its angles usually much smaller than the others. The *scirpoides* of authors usually have the male and female flowers on the same plant. *Linnæi*, Gen. Pl. p. 446. *Tourn.* Inst. p. 299. *Shenk.* Agrost. p. 10. *Micheli*, p. 32. seq. *Dillen.* Gen. p. 13.

CARGADORS, at Amsterdam, a kind of brokers who make it their sole business to find freight for ships which want loading, and vessels for merchants or passengers who want conveyance to such or such a place. *Savar.* Dict. Comm. Supp. p. 120.

CARGO (*Cycl.*) — *Sortable* CARGO, is that which contains something of every sort, necessary to furnish the tradesmen of the place it is sent to, with parcels fit to fill their shops, and invite their customers. Compl. Engl. Tradesm. T. 1. Lett. 7. p. 84.

Officers and sailors on board a vessel are allowed to carry a small *cargo* or *pacotille*, not exceeding a certain bulk or weight for their own account, without paying any freight. *Savar.* Dict. Comm. T. 2. p. 947. voc. *pacotille.*

CARGO also denotes a weight used in Spain and Turky, amounting to about 300 English pounds. Lex. Mercat. p. 388.

CARIA, in natural history, a name given by authors to a very mischievous species of ant, common in some parts of the East-Indies,

Indies. This creature is larger than our ant, and is the common food of a great many other animals, as the squirrels, serpents, lizards, and a great many birds. In order to defend itself from so many enemies, it enters into large communities, which together erect great hills of earth, of five or six foot high. The fields in some places are full of these, and it is in vain to attempt beating them down, since they would be immediately made up again; the creature builds them with firm and tough clay which it wets as it uses it, and the walls or outer case is built so thick and firm that scarce any rain can hurt them. The whole space within is full of different compartments, to every one of which there is a particular pathway, and these separate paths joining as they come near one another, make at length one great and general road to the door or gate of the city. These animals are generally busied in their cells, and never go out but at the necessary time to search for food; this excursion they always make regularly at one time of the day, and fall to work on the first corn, or other valuable plant, they find, which they gnaw off very quick, and carry into their habitation.

There is another species of the *caria* much smaller than this, which builds in the peoples houses, not in the fields. In the center of the habitation of this creature there is usually found a sort of comb, or collection of cells, resembling a honeycomb. This insect is very particular in the covering its path near the nest, which it does with earth, in such a manner that it forms a sort of pipe or tube, in which it walks to some distance from home. This little species feeds on the leaves of the palm, and many other plants, and will sometimes eat dry straw or stubble, gnawing the thatch on the houses. Observations sur l'Asie, p. 380.

CARIAMA, in zoology, the name of a Brasilian bird of the size of the heron, and, like that bird, frequenting watery places. On the top of the head it has a high, erect, plumose crest, of a mixt colour of black and grey; the back is short, and a little bending upwards; the wings are short, and, when folded, reach but a little beyond the origin of the tail; its legs are very long and yellow; its general colour is grey, variegated with brown, and a slight admixture of an obscure yellow; the ends of the wings and tail are wholly brown, except that at the very ends they have slight variegations of a yellowish and grey colour It makes a loud noise like the turkey, and is a very valuable and well tasted fowl. *Marggrave*'s Hist. Brasil.

CARIBO, or MACARIB, a name given by Josselyn, in his New England Voyages, to an animal which he describes a species of the deer kind; but later naturalists are of opinion, that the whole account is fiction, and that there is in reality no such animal.

CARICA, in botany, the name by which Linnæus calls the *papaya* of other authors. The characters of this remarkable plant are these: it produces both male and female flowers; in the male flower the cup is scarce visible; the flower is monopetalous, and funnel-shaped; the tube is slender, and very long, narrow in its lower part, and at the mouth divided into five obtuse, lanceolated segments, which are obliquely turned into a spiral line; the stamina are ten filaments placed in the top of the tube of the flower; the antheræ are oblong.

In the female flowers the cup is small, divided into five segments, and remains on the fruit; the flower is composed of five leaves, which are lanceolated, blunt at each extremity, and very long; the pistil has an oval germen, and scarce any style; the stigmata are five in number: they are oblong, crenated, and truncated at their ends. The fruit is an extremely large berry, containing only one cell, but made angular by five very deep sulci; the seeds are numerous and oval. *Linnæi*, Gen. Pl. p. Inst. 483. *Tourn.* p. 441.

CARICA, among the antient naturalists, denotes a kind of fig peculiar to Syria; sometimes also the dried fig[b]. — [[a] *Plin.* Hist. Nat. l. 13. c. 5. [b] Id ib. l. 15. c. 19.]

CARICA is also used in antient writers to denote the fruit of the palm tree, otherwise called *cariata*, which was sent annually by clients, on New Year's day, as a present or acknowlegment to their patrons. *Calv.* Lex. Jur. p. 149.

CARICATURA, in painting, a loading, or exaggerating of the defects of an object represented, with a concealment of the beauties or advantages of it; yet so as still to preserve a resemblance. Vid. Spectat. N° 537. T. 7. p. 244.

The word is Italian, formed of *carica*, a load, burden, or the like.

CARICOUS *(Cycl.)* — Quincy represents the *caricous* tumor as the same with what Hippocrates called *carycoides*, which seems to be a mistake; Καρυκοειδὲς, in Hippocrates denoting an excrement of a bloody colour, resembling a kind of condiment or confection, antiently called *caryca*, made of blood, and invented by the Lydians.

CARIES *(Cycl.)* — There are several species of *caries* in the bones. The learned Mr. Monro mentions seven which he has seen. These he distinguishes by the appellations of 1°, The dry or gangrenous *caries*; 2°, The worm-eaten *caries*, or ulcer of the bones. 3°, The carnous *caries* or ulcer of the bones with hyperfarcosis. 4°, The phagedenic *caries*, with hyperfarcosis. 5°, The scrophulous *caries*. 6°, The schirro-cancrous *caries*. 7°, The spreading cancrous *caries*.

He enters into a curious detail of the several natures of these kinds of *caries*, and of the topical management. A speedy and safe separation of all the corrupted part is the principal indication to be pursued. See Medic. Ess. Edinb. Vol. 5. Art. 24. Abridg. Vol. 2. p. 150, seq. Where he shews the analogy between these diseases of the bones to those of other parts of the body. This is not surprising, since bones have the same general texture, and are only distinguished from other parts by a greater solidity or firmness.

A *caries* differs from a spina ventosa, in that the latter begins within the substance of the bone, and proceeds outward; whereas the former begins on the surface, and proceeds inward. See SPINA *ventosa*.

Caries's are divided into idiopathic and symptomatic.

Idiopathic or *simple* CARIES, is an erosion of a bone, happening without any other disease, commonly owing to some external cause, rarely to an internal one, as the afflux of humours.

Symptomatic CARIES, that which oftnest happens to persons deeply affected with some other disorder, especially the scurvy, or venereal disease.

Caries's may also be divided in respect of their degree.

Those in the first degree, discover a yellow fattiness on the surface of the bone. In the 2d a blackness. In the 3d a roughness, and inequality of the bone, caused by a multitude of foramina or little holes. In the 4th the corruption penetrates deeper through the whole substance, which it seems as it were to dissolve. *Junck* Consp Chir. Tab. 51. p. 318. *Le Clerc*, Treat. Chir. Diss. c. 4. Compl. Surg. p. 177.

A *caries* is properly a disorder in which the bone, from whatever cause, is deprived of its periosteum, and having lost its natural heat and colour, becomes fatty, yellow, brown, and at length black; this is the first and lightest degree of the disorder, and is what, according to Celsus, the antients called *os vitiatum*, and the *nigrities ossium*. But the greater degree of this disorder is where the bone is eroded and eaten, and becomes uneven by reason of the number of small holes, of which it is full, when it discharges a filthy sanies, whose acrimony softens, relaxes, and destroys the fleshy parts that grow round it. This is a true *caries* or ulcer of the bone, and every bone in the body is subject to this disorder; and though this ulcer may appear to be ever so safely or happily healed, yet it too often happens that after the cicatrix is formed, and has been so for some time, a new abscess will be made, the whole disorder will return afresh, and the acrimonious and corrupted matter which continually spews out from the carious bone, being collected within, will produce many very grievous symptoms, and destroy the neighbouring flesh again.

There have been many names, and many species reckoned of this disorder, and of others that are of kin to it; it is called a *caries*, a spina ventosa, a spinæ ventositas, a gangrene, and cancer of the bone by Celsus, sometimes by the Greek term teredo, and sometimes pædarthrocaces. Some authors constitute as many species of this disorder, as there are here accounted names of it; but there is so small a difference between these, that it will not warrant the making them so many species: they may very properly, however, be divided into two kinds, the one when the disorder begins in the internal part of the bone, the other when it begins on the outside, or from an external cause. This may be called a *caries*, and that a spina ventosa, or where it happens in children, according to Severinus, a pædarthrocaces.

There are two principal causes of a *caries* of the bones, the one where the bone is deprived of its periosteum, by a wound, fracture, or other accident, and is corrupted, either by being exposed to the external air, or heated with greasy dressings; the other where the fluids are interrupted in their circulation by any external violence, or internal cause whatsoever, from whence inflammation and suppuration succeed, and the bone and periosteum suffer, to such a degree that the vessels which are sent to the part for its nourishment and support, being inflamed and corrupted, the bone is brought into consent, and quickly becomes carious: this disorder, if not quickly remedied, spreads and communicates itself to the neighbouring parts of the bone, and makes the same progress that ulcers do in the softer parts. There are therefore several degrees of the *caries* of the bones; the first is when the bone is laid bare, looks greasy, and turns yellowish: as soon as it becomes thoroughly yellow, or brown, or black, the incipient *caries* then degenerates into a worse state. The third degree is when the bone becomes uneven, rough, and rotten, and the greater erosion the bones have suffered, the more rough and uneven they will appear. When the cranium is perforated through both its tables, or the tibia or femur are eaten through to the marrow, this is a *caries* of a very bad kind; but the worst of all *caries*, and that in which the case may indeed be almost pronounced desperate, is that which falls upon the joints, or those parts of the bones that lie very deep, because in this case there is no access for the hands to clean the bone, and there is no remedy but the amputating the limb.

Many methods have been attempted for the cure of a *caries*; the first and mildest is applied to the slightest degree of the disease, and is performed by the application of spirituous remedies, such as spirit of wine, hungary-water, or by slight balsamics, such as the powder of birthwort, florentine, iris, myrrh, or aloes. Either of these powders is to be sprinkled on the part, after the sanies has been carefully wiped away with dry lint, and this continued till the cure is perfected. In a *caries* that penetrates

penetrates ſomewhat deeper, ſtronger remedies take place, ſuch as powder of euphorbium, or its eſſence, made in well rectified ſpirit of wine; or oil of cloves, cinnamon, or guaiacum; either of theſe may be touched on with a pencil, or laid upon dry lint, and applied: ſome alſo uſe the corroſive medicines, the phagadenic water, and ſpirit of vitriol, or of ſulphur; and, in the place of theſe, a ſolution of quickſilver in aqua fortis may be uſed with great ſucceſs. When, by theſe means, an exfoliation of the bone has been produced, the buſineſs is then to treat it with balſamics.

A ſecond method of cure for a greater degree of *caries*, is perforating the bone with the trepan, and dreſſing the part afterwards either with balſamics or with dry lint. By theſe means the exfoliation of the bone is forwarded, and new veſſels puſh themſelves through the foraminula, which, joining with the neighbouring fleſh, make a new covering for the bone.

The third method of cure is performed by the raſpatory, or chiſſel, taking off the corrupted or vitiated part of the bone, till all beneath appears white or ruddy, and ſound: and the fourth, which is the moſt antient, and the moſt ſpeedy, and certain method, is by the actual cautery, burning down the vitiated part of the bone. This method, however, is not neceſſary, except in great degrees of this diſorder; and in the performing it great care muſt be taken not to injure the neighbouring ſoft parts: for this reaſon, an aſſiſtant ſhould always draw back the lips of the wound both ways, while this is performed; and if the opening be not wide enough, it ſhould be opened and enlarged by ſponge tents before, or widened by the knife, till the bone lies fair, and the part muſt be carefully wiped firſt with dry lint, from the ſanies; and if there be any fungous fleſh, that muſt alſo firſt be removed. One application of the cautery, when the diſorder is conſiderable, will ſeldom prove ſufficient; it uſually requires to be repeated ſeveral times, at proper intervals; and if the *caries* be of ſuch extent that one cautery will not cover it all over, the firſt muſt be applied to the middle, and the ſucceeding towards its edges. This operation is not attended with any great pain, if care be taken not to injure the adjacent ſoft parts; for the bones are, in themſelves, free from any ſenſe of pain. Where the cranium is the ſeat of this diſorder, the cautery is attended with great hazard, as it is alſo in a *caries* of the ribs, or ſternum, from the neighbourhood of parts of the utmoſt conſequence to life. The carpus and tarſus alſo will very badly admit of cauterizing, becauſe of the neighbourhood of the tendons and ligaments, which it is ſcarce poſſible to avoid injuring in the operation. After cauterizing the part is to be dreſſed with dry lint only, or if the patient complain of great heat in the part, the lint may be dipped in ſpirit of wine before it is applied; afterwards balſamics are to be applied, till the part exfoliate, and then, if the cure be perfect, the vacuity will be ſoon filled with new ſound fleſh. But if the bone remains bare, or the fleſh it is covered with be ſoft and ſpungy, and does not adhere ſufficiently to the ſubjacent bone, or where the bone remains diſcoloured; in either of theſe caſes the cure will not ſtand, but the diſorder will break out again, unleſs prevented. In theſe caſes therefore, the work muſt be all done over again, the ſpungy fleſh removed, and the actual cautery again applied, otherwiſe the cure can never ſtand. *Heiſter*'s Surgery, p. 204.

CARIGOI, in zoology, the name by which ſome authors have deſcribed a very remarkable American animal, more uſually known by the name of the *opoſſum*. See OPOSSUM.

CARIGUEYA, in zoology, the Braſilian name for a very remarkable American animal, which we know by the name of the *opoſſum*. See OPOSSUM.

CARIMPANA, in botany, the name of an Indian palm tree, deſcribed in the hortus Malabaricus, the leaves of which, when full grown, are thirty foot long, and nine foot broad, or more, if carefully extended.

CARINA *(Cycl.)* is uſed by anatomiſts to denote the *ſpina dorſi*. *Gal.* de uſu Part. l. 2. c. 11. *Hofm.* Comm. ad Eund. ibid. n. 905. See SPINA, *Cycl.* and *Suppl.*

CARINA is alſo uſed, by ſome chemiſts, for the twentieth part of a drop. *Rul.* Lex. Alch. p. 134.

CARIOUS, the ſtate of a bone putrified or rotten. See CARIES.

Horchius gives the hiſtory of a tophus, taken out of a *carious* bone. Ephem. Acad. N. Cur. Dec. 2. An. 10. Obſ. 167. p. 177.

CARISSIMI, in antiquity, a quality, or appellation, given by the emperors to preſidents, governors of provinces, and others. *Pitiſc.* Lex. Ant. T. 1. p. 365.

CARITAS.—The *poculum caritatis*, or grace cup, was an extraordinary allowance of wine, or other liquors, wherein the religious, at feſtivals, drank in commemoration of their founder and benefactors. Cartul. Abb. Glaſt. MS. p. 29. *Jac.* Law Dict. in voc.

CARK, or CARKE, a certain quantity, or meaſure, of wool, equal to a thirtieth part of a ſarplar. Stat. 27. Hen. 6. c. 2. *Cow.* Interp. in voc. Term. de Ley. p. 43. b. See SARPLAR.

CARLIN, CARLINE, or CAROLINE, a ſmall ſilver coin, current in Naples and Sicily, equivalent to about four-pence Engliſh. *Savar.* Dict. Com. T. 1. p. 564.

CARLINA, in botany, the name of a genus of plants, the characters of which are theſe: the flower is naturally of the radiated kind; its diſk is made up of a number of floſcules, affixed to the embryo ſeeds, but its outer edge or circle not of ſemifloſcules, but merely of flat petals, affixed to no embryos, but contained in the ſame general cup with the floſcules, which is large and prickly. The embryos finally ripen into ſeeds, winged with down, and divided from one another by imbricated leaves.

The ſpecies of *carline*, enumerated by Mr. Tournefort, are theſe: 1. The common *carline*, without a ſtalk, and with large purple flowers. 2. The common *carline*, with a large white flower, without a ſtalk. 3. The large-flowered, no-ſtalked *carline*, with perennial roots. 4. The ſtalkleſs, gummiferous *carline*, commonly called the white chamelion thiſtle. 5. The ſtalky *carline*, with large white flowers. 6. The ſtalky *carline*, with large red flowers. 7. The many-headed white *carline*. 8. The common wild *carline*. 9. The wild perennial *carline*, with gold-yellow flowers. 10. The leſſer Spaniſh wild *carline*. 11. The ſpreading *carline*, with the leaves and whole appearance of the atractylis. 12. The umbellated *carline* of Apulia. 13. The *carline*, with a ſpreading purpliſh red flower. *Tourn.* Inſt. p. 500.

CARLINÆ *radix*, in the materia medica, the name of a root kept in the ſhops in ſome places, and diſtinguiſhed into two kinds, the white and the black; the white is the root of the common *carline* thiſtle, which produces no ſtalk, the other of the *carlina cauleſcens*, called the black chamelion thiſtle.

The white *carline* root is of the thickneſs of one's thumb, and is often two foot long; it is brown on the outſide, and white within, and ſhould be choſen plump, firm, and well dried. It is accounted a very great medicine in peſtilential diſeaſes.

The black is a ſmaller and ſhorter root than the white, and is much leſs eſteemed in medicine. The plant which produces the white grows very frequent with us on hilly places, and is a very ſingular plant, producing a number of fine long prickly and jagged leaves, and, in the center of them, a large purple flower, of the thiſtle kind, but growing cloſe to the ground; the other is very frequent in France, but is not met with in England.

Carline is eſteemed a very powerful ſudorific and alexipharmic. Schroder tells us alſo, that it is good againſt worms, and in dropſies; and that it is a powerful emmenagogue and diuretic. *Pomet*'s Hiſt. of druggs, p. 46.

CARLOSTADIANS. See CAROLOSTADIANS.

CARMEN *(Cycl.)* was antiently a denomination given to precepts, laws, prayers, imprecations, and all ſolemn formulæ, couched in a few words, placed in a certain order, though written in proſe. Vid. *A. Gell.* l. 9. c. 2. *Fabric.* Bibl. Græc. l. 1. c. 9. §. 14. Ejuſd. Bibl. Lat. l. 1. c. 2. §. 7.

In which ſenſe it was that the elder Cato wrote a *carmen de moribus*, which was not in verſe, but proſe.

CARMEN *ſaliare*, a ſet of antient verſes compoſed by Numa, and ſung by the Salii, accompanied with the claſhing of ancylia, or ſacred bucklers. *Kenn.* Rom. Ant. P. 2. l. 2. c. 5. p. 75. See SALII and ANCYLE, *Cycl.*

CARMEN alſo denotes a form of prayer, or words whereby divers among the antients devoted themſelves. Such was that of the Decii, ſpoken of by Pliny. *Plin.* Hiſt. Nat. l. 38. c. 2. *Pitiſc.* Lex. Ant. T. 1. p. 365.

CARMENIAN *wool*, a denomination given to a kind of goat's hair, brought from Carmenia, or Caramania, a country of Aſia minor. Stat. Abr. 8vo. Vol. 1. Tit. Cuſtoms. §. 209.

CARMINE *ſeed*. See CHOUAN.

CARNABADIUM, in the materia medica of the antients, a name given to a drug frequently mentioned by the Greek and Arabian writers. It is properly an Arabian word which the Greeks have adopted, and given a Greek termination to, writing it Καρναβάδιον. Guillandini ſuppoſes this to be the ſame with the durunegi or doronicum of the ſame authors; but nothing can be more abſurd than ſuch an opinion, an examination of theſe writers themſelves ſhewing that they commonly uſed it for caraway, or caruiſeed, and ſometimes for the Æthiopian cummin ſeed. Nicomedes, in his gloſſary, tranſlates the *carnabadion*, Æthiopian cummin. Myrepſus gives it the ſame meaning, and Hierophylus, who mentions it among the ſeeds uſed in preſerving fruits, ſays that it comes from the Eaſt, and that it is the ſame that is called Æthiopian cummin by others. It ſeems, therefore, that a great many authors uſed it as a name of this ſeed, and we find as many uſing it alſo for caraway ſeed: none, however, have ever named it as a root, which muſt be allowed before it could rationally be ſuſpected to be doronicum, even though its virtues were as like thoſe of that drug as they are different.

CARNATIONS, in gardening. — Theſe flowers are propagated two ways, the one by ſeed, the other by layers; the firſt of theſe methods is the way to raiſe new flowers, the other is the way to preſerve and multiply thoſe of former years.

For the raiſing them from ſeed, great care muſt be taken to procure good ſeed, and ſome pots or boxes muſt be filled with very freſh light earth, mixed with rotten cow-dung. The ſeed is to be ſown not too thick on this, and a little of the ſame light earth ſifted over it; then the pots are to

be

be expoſed to the morning ſun, till eleven a clock, and gently watered as they require. The ſeed muſt be ſown in April. In a month the plants will appear; they muſt be kept clear of weeds, and in June they muſt be tranſplanted into ſome beds of the ſame earth, in an open airy ſituation. They muſt be ſet here at four inches diſtance, and kept clear from weeds, and watered as there ſhall be ſeen occaſion; they may remain here till Auguſt; from hence they muſt then be removed into other beds of the ſame earth, and planted at ſix inches diſtance, and in this place they are to be left to flower.

When they are in flower the fineſt kinds ſhould be marked, and all the layers that can be, ſhould, during the time of their flowering, be laid down from them: toward the latter end of Auguſt theſe will have taken root, and they are then to be taken off, and planted out into pots, two in each pot. The method of laying them is this. Slip off the leaves from the lower part of the ſhoot intended to be laid, and cut a ſlit in one of the middle joints, and cut off the tops of the leaves, and cut out the ſwelling part of the joint, where the ſlit is made; then raiſe the earth about the place a little, and bend down the ſlit part of the joint into it, keeping the top upright, and faſten it in its place by a hooked ſtick, ſtuck into the ground over it, and cover it with earth; then give it a gentle watering, and repeat this as often as is neceſſary, and in ſix weeks the layers will have taken ſo much root as to be ready to tranſplant; they are then to be planted ſingle, in pots of a prepared earth, of a hazel land, or under turf-earth of paſture, with a mixture of old cow-dung, or the rotten dung of a melon bed. The turf ſhould be taken with the ſoil, and the whole ſuffered to lie and mellow together for ſix or eight months before it is wanted, turning it often in the mean time. They require ſhelter in the winter ſeaſon, and as it is difficult to ſhelter a large number in their pots, which are uſually nine inches over, it may be a better way to plant them out in Auguſt in very ſmall pots, ſheltering a number of theſe all winter in a frame; and in the middle of February they may be tranſplanted into the pots they are to flower in: theſe, in April, ſhould be ſet out upon a ſtage of boards, open to the South-eaſt, but defended from the weſt winds, and not too near trees, walls, or buildings, where they are to flower. *Mill.* Gard. Dict. in voc.

CARNEIA, Καρνεια, in antiquity, a feſtival in honour of Apollo, ſurnamed Carneus, held in moſt cities of Greece, but eſpecially at Sparta, where it was firſt inſtituted.

The reaſon of the name, as well as the occaſion of the inſtitution, is controverted. It laſted nine days, beginning on the 13th of the month Carneus. The ceremonies were an imitation of the method of living, and diſcipline uſed in camps. Nine σκιαδες, or tents, were erected, in each of which nine men of three different tribes lived the ſpace of nine days, during which time they were obedient to a public cryer, and did nothing without expreſs order from him. The chief prieſt who attended this ſolemnity was named *Agetes*; beſides whom, there were five miniſters called *carneatæ*, who were obliged to hold their office four years, and to remain batchelors during that time. *Meurs.* Græc. Feriat. *Caſtelan*, de Feſt. Græc. *Pott.* Arch. Græc. l. 2. c. 20. p. 408.

CARNELIAN. See the article SARDA.

CARNEUM *operculum*, in anatomy, a name given by ſome writers to a muſcle of the abdomen, called by Veſalius the *principium recti abdominis*; and by Fallopius, the *muſculus carnoſus*. It is now generally known by the name of *pyramidalis*. See the article PYRAMIDALIS.

CARNEY, a diſeaſe in horſes, wherein their mouths become ſo furred that they cannot eat. Dict. Ruſt. T. 1. in voc.

CARNICULA is uſed by ſome for a caruncle, more particularly for that fleſhy ſubſtance which inveſts the teeth. *Caſt.* Lex. Med. p. 137.

CARNID, in natural hiſtory, a name given by Averrhoes to what is called zarnich by more antient writers. He calls the yellow orpiment by the name *carnid*, without any epithet or addition; but the red he diſtinguiſhes by the epithet akmer. This ſeems, however, not to be a diſtinctive term, but to take in the red arſenic, and the ſandarach of that author; which he diſtinguiſhes, however, in his writings, as two very different ſubſtances.

Serapio deſcribes the ſandarach and yellow orpiment of Dioſcorides under the name of *narneth*, which is evidently the ſame word with *zarnich*, only corruptly ſpelt; and he no where uſes the word ſandarach as a name for any mineral ſubſtance, but always applies it to the gum of the juniper, ſo called alſo by Dioſcorides. Aviſenna's interpreter, on the contrary, uſes the word ſandarach as a name of orpiment, and that not only of the red kind, but of orpiment in general, calling the title of one of his chapters, *De arſenico*, id eſt, ſandaracha. We have applied the word arſenic of late days to the common ratſbane, a poiſonous preparation of cobalt; but the antients, not acquainted with this poiſon, uſed the word arrenicon, or arſenicon, as they differently ſpelt it, for orpiment. Aviſenna mentions three kinds of this mineral, the white, the yellow, and the red; the two latter of theſe have been always well known, but the white kind was ſuppoſed never to have exiſted, but to have been an error of the copies, till Dr. Hill proved it to exiſt in nature, and deſcribed it among the zarnichs in his hiſtory of foſſils. See the article ZARNICH.

CARNIFEX, among the Romans, the common executioner.

By reaſon of the odiouſneſs of his office, the *carnifex* was expreſly prohibited by the laws from having his dwelling-houſe within the city. *Cic.* Orat. pro Rabir. c. 5. *Pitiſc.* Lex. Ant. T. 1. p. 366. *Kenn.* Rom Ant. P. 2. l. 3. c. 13. p. 123. In middle age writers *carnifex* alſo denotes a butcher. *Du Cange* Gloſſ. Lat. T. 1. p. 848.

Under our Daniſh kings, the *carnifex* was an officer of great dignity; being ranked with the archbiſhop of York, earl Goodwin, and the lord ſteward. Flor. Wigorn. An. 1040. *Rex Hardecanutus Alfricum Ebor. Archiep. Goodwinum comitem, Edricum diſpenſatorem, Throndſuum* carnificem, *& alios magnæ dignitatis viros Londinum miſit.* *Spelm.* Gloſſ. p. 125.

CARNIFICATION, the making of, or turning to fleſh.

Phyſicians give inſtances of the *carnification* of bones, that is, where the bones loſe their natural conſiſtence, and become ſoft and fleſhy. This is a tranſmutation which is the reverſe of oſſification. Vid. Jour. des Scav. T. 80. p. 267, ſeq. Mem. de Trev. 1722. p. 1623, ſeq. Item 1726. p. 1146. See OSSIFICATION and BONE.

CARNIVAL. See CARNAVAL.

CARNIVOROUS *(Cycl.)* — To the arguments uſed by Dr. Wallis and others, to prove that man is not naturally *carnivorous*, Dr. Tyſon anſwers, that if man had been deſigned by nature not to be *carnivorous*, there would doubtleſs have been found ſomewhere in the globe, people who do not feed on fleſh; and as hiſtory ſeems not to furniſh any inſtance hereof, may not we ſay, that what is done univerſally by the whole ſpecies, is natural? For what the Pythagoreans did in abſtaining from fleſh, was on the principle of a tranſmigration, a miſtake in their philoſophy, not a law of nature: and though in ſome countries, men feed more ſparingly on fleſh than in others, this is owing to their own choice, from the advantage they perceive by it.

That *carnivorous* animals are not always without a colon and cæcum; nor are all animals *carnivorus* which have thoſe parts; but that the carigueya, or opoſſum, for inſtance, has both a colon and a cæcum, yet feeds on poultry, and other fleſh; whereas the hedge-hog has neither colon nor cæcum, and therefore ought to be *carnivorous*, yet it feeds only on vegetables; add, that hogs, which have both, will feed on fleſh greedily enough when they can get it; and that rats and mice, which have large cæcums, feed on bacon, as well as bread and cheeſe.

That from the multitude of *carnivorous* animals which want thoſe parts, and of non-*carnivorous* which have one or both, no ſafe concluſion can be drawn; ſince we might as well argue, that becauſe the neat-kind, ſtag-kind, goat-kind, and ſheep-kind, which live on herbage, have four ſtomachs, therefore all thoſe which have not four ſtomachs were not deſigned by nature to be graminivorous; whereas the horſe-kind and hare-kind have but one ſtomach, yet feed on graſs like the former: Add, that in many animals which live on the ſame ſort of food, the ſtructure of the ſtomach is found very different; and that in others which live on different foods, *ex. gr.* on fleſh, on fruits, on graſs, &c. the ſtomachs are found ſo like, that 'tis difficult to aſſign any difference between them; and if we cannot make a judgment what food is moſt natural to an animal from the ſtructure of its ſtomach, which is the part moſt concerned in digeſting it, much leſs can we judge from the colon or cæcum, which are parts remote from the ſtomach, and rather ſeem as a cloaca for the reception of the fæces, than of uſe for digeſting or diſtributing the food.

In fine, ſince man has all manner of teeth, fit for the preparation of all ſorts of foods, ſhould it not rather ſeem that nature intended we ſhould live on all? And as the alimentary duct in the human-kind is fitted for digeſting all ſorts of food, may we not rather conclude that nature did not intend to deny us any? Vid. Phil. Tranſ. N° 269. p. 775, ſeq.

'Tis no leſs diſputed, whether mankind were *carnivorous* before the flood? St. Jerom, Chryſoſtom, Theodoret, and other antients maintain that animal food was then totally forbidden; which opinion is alſo ſtrenuouſly ſupported among the moderns, by Curcellæus [a], and refuted by Heidegger, Danzius, Bochart, &c. [b] — [a Vid. *Curcell.* de eſu Sang. inter Chriſtian. b *Heidegg.* de Libert. Chriſtian. a lege cibaria, c. 2. ſeq. Item Hiſt. Patriarch. P. 1. Exerc. 15. p. 390. *Wal.* Lex. Phil. p. 235, ſeq. *Danz.* Diſp. de Creophagia ante diluvium licita. *Selden.* de Jur. Nat. & Gent. ſecund. diſcipl. Hebr. l. 7. c. 1. *Bochart*, Hieroz. l. 1. c. 2. *Budd.* Hiſt. Eccleſ. Vet. Teſt. T. 1. p. 185.]

CARNIUS, in chronology, the Syracuſian name for the Athenian month *metagitnion*; which was the ſecond of their year, and anſwered to the latter part of our July and beginning of Auguſt. See METAGITNION, and MONTH.

CARNOUS *leaf*, among botaniſts. See LEAF.

CARNOSUS *muſculus*, in anatomy, a name given by Fallopius and others to a muſcle, called by Veſalius the beginning of the ſtraight muſcle of the abdomen, and now generally known by the name of *pyramidalis*.

CARNUBIA, in the materia medica, a name by which ſome authors have called the carob, or ſweet pipe. *Dale*, Pharm. p. 461.

CAROB, *caroba*, a medicinal pod or fruit, called alſo *ceratia*, and *ſiliqua dulcis*, reputed a dryer and aſtringent. *Alleyn*, Diſpenſ. P. 1. Sect. 2. c. 36. n. 55.

CAROB is alſo a ſmall goldſmith's weight, amounting to the 24th part of a grain. It is alſo called *prime*. Ruſt. Dict. T. 1. in voc. Trev. Dict. T. 1. p. 1463.

CARCŒNON, Καρωνον, ſometimes alſo called *carenum*, denotes wine boiled down, till a third be evaporated. *Gor.* Med. Def. p. 210. *Linden*, Ex. 10. §. 19, ſeq. *Caſt.* Lex. Med. p 138.

CAROLI, among ſome phyſicians, denote venereal puſtules on the penis; called alſo *caries pudendorum*. *Caſt.* Lex. Med. p. 138.

CAROLOSTADIANS, or CARLOSTADIANS, an antient ſect, or branch, of Lutherans, who denied the real preſence of Chriſt in the euchariſt.

They were thus denominated from their leader Andrew Caroloſtadius, who having originally been archdeacon of Wittemberg, was converted by Luther, and proved the firſt of all the reformed clergy who took a wife; but diſagreeing afterwards with Luther, chiefly in the point of the ſacrament, founded a ſect apart. The *Caroloſtadians* are the ſame with what are otherwiſe denominated *Sacramentarians*, and agree in moſt things with the Zuinglians. *Prateol.* Elench. Hæret. l. 2. n. 8. Jour. des Scav. T. 47. p. 653. See SACRAMENTARIAN, and ZUINGLIAN, *Cycl.*

CAROLUS (*Cycl.*) is uſed for a ſmall copper French coin, mixt with a little proportion of ſilver, firſt ſtruck by Charles VIII. of France, whence it took its name; being at the time when it ceaſed to be current, valued at ſix deniers. *Savar.* Dict. Com. T. 1. p. 566.

CAROPI, in botany, a name given by the inhabitants of the Philippine iſlands to a plant more uſually known among authors by the name of *tugus*, a plant greatly eſteemed by the natives, and ſuppoſed by Camelli to be the true amomum of the Greeks, ſo much valued in thoſe antient times. See TUGUS.

CAROTEEL, in matters of commerce, denotes a certain weight or quantity of divers kinds of goods, *ex. gr.* of cloves, from four to five hundred weight, of currants from five to nine hundred weight, of mace about three hundred weight, and of nutmegs from ſix to ſeven and an half hundred weight. Dict. Ruſt. T. 1. in voc.

CAROTIC is uſed by ſome writers to denote thoſe who are ſeized with the *carus*. Ephem. Acad. N. C. Dec. 2. An. 1. p. 4. Trev. Dict. Univ. T. 1. p. 1464. See CARUS, *Cycl.*

CARP, in ichthyology, ſee the article CYPRINUS.

The *carp* is the moſt valuable of all kinds of fiſh for the ſtocking of ponds. It is very quick in its growth, and brings forth the ſpawn three times in a year; ſo that the increaſe is very great: the female does not begin to breed till eight or nine years old, ſo that in breeding-ponds a ſupply muſt be kept of *carp* of that age. The beſt judges allow, that in ſtocking a breeding pond four males ſhould be allowed to every twelve females. The uſual growth of a *carp* is two or three inches in length in a year, but in ponds which receive the fattening of common ſewers they have been known to grow from five inches to eighteen in one year.

A feeding pond of one acre extent will very well feed two hundred *carp* of three years old, three hundred of two years old, and four hundred of a year old. *Carp* delight greatly in ponds that have marley ſides; they love alſo clay ponds well ſheltered from the winds, and grown with weeds, and with long graſs at the edges, which they feed on in the hot months. *Carp* and tench thrive very faſt in ponds and rivers near the ſea, where the water is a little brackiſh, but they are not ſo well taſted as thoſe which live in clear water. No fiſh will thrive in a pond where there are many roach, except the pike which feeds on them. Grains, blood, chickens guts, and the like, may be at times thrown into ponds where there are *carp*, to help to fatten the fiſh.

If the breeding and feeding this fiſh were a thing more underſtood than it is at preſent, the advantages might be very great, and fiſhponds become as valuable an article as gardens. The gentleman who has land in his own hands, may, beſide furniſhing his own table, and making preſents to his friends, raiſe a great deal of money, and very conſiderably improve his land at the ſame time, ſo as to make it really yield more this way, than by any other employment whatever. Suppoſe the place a meadow of forty ſhillings an acre, four acres of this in pond will return every year very eaſily a thouſand fed *carps* from the leaſt ſize that is eaten to fifteen inches long, beſide pikes, pearch, tench, and other fry. Suppoſe the *carps* are ſaleable at from ſixpence to a ſhilling apiece, they will bring twenty-five pound, which is ſix pound five ſhillings an acre for the land made into the pond.

When a great deal of water is deſigned to be brought, they firſt ſpit off the ground on which the bank is to ſtand, and form the pan of the pond. The gentleman who keeps land in his own hand, and will do this, will find no expence in the making his pond, if near his other land; for the earth that is dug out may be laid on the lands, and will ſave all the price of manure for a long time.

If the ſoil about the waters be mooriſh, the making a pond will keep up a ſupply of water that will make it always moiſt, and it will ſerve excellently for the planting of oziers, which will turn to a very conſiderable account. If cattle graze near the large ponds they will ſerve them for watering places, and they will delight to ſtand in them in hot weather, in which caſe their dung which falls in is a fine food for the fiſh, at the ſame time that it does great good alſo to the cattle.

The *carp* is a very cunning and wary fiſh, it very often eſcapes the net, and, when angled for, requires great ſkill and patience in the ſportſman to make any great work of it. The *carp* always chuſes the deepeſt parts of ponds and rivers, and in the laſt it is generally found in places where the ſtream is leaſt perceptible. The *carp* will never bite in cold weather; and in the hot months the angler can never be either too early in the morning, or too late in the evening for the ſport; when he has once taken the bait, there is no fear of his getting away, for he is one of the leather-mouth'd fiſhes.

The tackle in fiſhing for *carp* muſt be very ſtrong, and it will be proper to bait the place before-hand where he is to be fiſhed for, with a coarſe paſte. The red worm is the beſt bait in March, the cade in June, and the graſs-hopper in July, Auguſt, and September.

Not only theſe baits, but a ſweet paſte may be uſed in angling for *carp*, with great ſucceſs. There are many kinds of theſe paſtes made up by the anglers, but the general baſis of them all is ſugar or honey with flour: theſe ſort of paſtes are not only proper to bait the hook with, but they may be thrown into the water ſome hours before to draw the fiſh together. It may be proper alſo to bring the *carp* to the place intended for the angling for them, by throwing in cow-dung and blood, or bran and blood mixed together, ſome chickens guts cut ſmall, and ſmall pellets of theſe ſweet paſtes: this will learn them to frequent the place, as a part beſt ſupplied with food, and the having fed with ſafety before, will make them the leſs ſuſpect the bait on the hook. A very much eſteemed paſte is made thus; take common wheat flour, and veal, or any other young meat, of each equal quantities, beat them together in a mortar, till the meat is thoroughly diſſolved, or broke to pieces, then add about half the quantity of honey; beat it well together again, and finally add more flour till the whole is of a proper conſiſtence. This has the advantage of a paſte, and an animal bait at once, and hangs well upon the hook, ſo that it ſeldom miſſes ſucceſs. *Mortim.* Huſbandry, T. 1. p. 294.

To make the *carp* in a pond grow large and fat, the growth of graſs under the water ſhould be by all means poſſible encouraged; to this purpoſe as the water decreaſes in the beginning of ſummer, the ſides of the pond left naked and dry, ſhould be well raked with an iron rake, to deſtroy all the weeds, and cut up the ſurface of the earth; hay-ſeed ſhould be ſown plentifully in theſe places, and more ground prepared in the ſame manner as the water falls more and more away. By this means there will be a fine and plentiful growth of young graſs along the ſides of the pond to the water's edge, and when the rains fill up the pond again this will be all buried under the water, and will make a feeding place for the fiſh, where they will come early in the morning, and will fatten greatly upon what they find there.

CARP-*ſtone*, *lapis carpionis*, a kind of gem ſaid to be found in the ſauces, by others in the back-bone of the *carp* fiſh, about the ſize of a pea, of a triangular figure, and white colour without, but yellow within. It is ſuppoſed to be of uſe againſt the ſtone, and ebullitions of the bile, being taken in powder, or held in the mouth. *Rul.* Lex. Alch. p. 279. voc. *lapis*. *Nicolſ.* Lapid. P. 3. c. 47.

CARP-*meals*, a coarſe kind of cloth, made in the Northern parts of England. Dict. Ruſt. T. 1. in voc.

CARPACK, in the Ægyptian dreſs, a ſort of red cap turned up with furr, which ſome make a cuſtom of wearing in common, though it is properly a part of the dreſs of the interpreters only, the ſame cap with muſlin tied round it being more properly the common dreſs. *Pocock*'s Ægypt, p. 191.

CARPASIUM *linum*. See LINUM *Carpaſium*.

CARPASUM, or CARPASIUM, in the materia medica of the antients, the name of a poiſonous gum, exſudating from a tree, ſo like myrrh in appearance that many periſhed by the error of uſing it inſtead of myrrh, or mixed among it. We are, at this time, wholly ignorant of what it was, but that it was a gum exſudating from a tree is plain from the account of Dioſcorides, who calls it *opocarpaſum*, as we do the flowing balm of Gilead, *opobalſamum*. The wood of the tree which produced it, he calls *xylocarpaſum*, in the ſame manner as the other wood is called *xylobalſamum*. This wood was little leſs poiſonous than the *carpaſum*, or gum itſelf.

Galen tells us that the *carpaſum* was like myrrh of the very pureſt and fineſt kind, and that thoſe people who were moſt curious of all to have fine myrrh, often met with the *carpaſum* among it, and gave death, inſtead of relief to the perſons they adminiſtred it to. We find by the words of Galen in this place, that this gum was not only like myrrh, but was alſo brought from the ſame places, and was often mixed with

it The fineſt myrrh uſually had moſt of this poiſon among it, and we may collect from the ſame account that it was a ſweet-ſcented gum, for otherwiſe no body could have miſtaken it for myrrh.

Uranius, in treating of the Abyſſines, a people of Arabia, from whoſe country the antients had their fineſt myrrh, mentions a poiſonous drug, which he calls *cerpathos* or *carpathus*; this is a ſmall variation of the name, one of the moſt common dialects of the Greek language changing the σ, s, into θ, th; and in this very word, though given in another meaning, we find an inſtance of it; for the city *Carpaſus* or *Carpaſia*, in the iſland of Cyprus is, according to Stephens, called *Carpathus* by Xenagoras.

The word *carpaſus* among the Greeks ſignifies alſo a ſort of linnen made of manufactured flax, and the Latin carbaſus uſed as the name of a ſail, is, by the beſt critics, ſuppoſed to be a word ſtretched too far, the original meaning being no more than that of the Greek *carpaſus*, linnen.

CARPENTER, (*Cycl.*) an artificer whoſe buſineſs is to cut, faſhion, and join timber, and other wood for the purpoſes of building.

The word is formed from the French *charpentier*, which ſignifies the ſame, formed of *charpente*, which denotes timber; or rather from the Latin *carpentarius*, a maker of *carpenta*. Vid. *Savar.* Dict. Comm. T. 1. p. 684, ſeq. voc. *charpente* and *charpentier*.

Some will alſo have *carpentarius* to have been uſed for him who drove a *carpentum*, or carriage [a]; anſwering to a coachman among us: but Henninius denies this acceptation of the word [b]. — [a *Berg.* de Viis Milit l. 4. Sect. 10. §. 8. b *Hennin.* Not ad eund. ibid. *Pitiſc.* Lex. Ant. T. 1. p. 367.] See CARPENTUM.

Carpenters were antiently denominated by the French, *carpenters* of the great hatchet, *de la grand coignée*, by way of diſtinction from joiners, who were called *carpenters* of the little hatchet, *de la petite coignée*. *Savar.* Dict. Comm. Supp. p. 136.

Ship-CARPENTER is he employed in the docks, in the conſtruction and repairing of veſſels. *Aubin.* Dict. Mar. p. 194.

CARPENTER *of a ſhip* is an officer at ſea, whoſe buſineſs is to have things in readineſs for keeping the veſſel in repair; and to attend the ſtopping leaks, fiſhing maſts or yards, alſo caulking, careening, breaming, and the like.

He is to watch the timber of the veſſel that it do not rot; conſult frequently with other officers on the ſtate of the maſts, yards; and in time of battle he is to have plugs, tampions, and planks ready for repairing breaches made by the enemies cannon. *Aubin.* Dict. Mar. p. 194.

The *carpenter* has a mate under him, and a crew or gang to command on neceſſary occaſions.

CARPENTUM, in antiquity, a denomination common to divers ſorts of vehicles, anſwering to coaches as well as waggons, or even carts among us. Vid. *Pitiſc.* Lex. Ant. T. 1. p. 367, ſeq.

The *carpentum* was originally a kind of carr, or vehicle wherein the Roman ladies were carried; though in after-times it was alſo uſed in war.

Some derive the word a *carro*; others from *Carmenta*, mother of Evander, by a converſion of the m into p, *carpentum* for *carmentum*. Thus Ovid,

Nam prius Auſonias matres Carpenta vehebant
Hæc quoque ab Evandri dicta parente reor.
Ovid. Faſt. l. 1. *Calv.* Lex. Jur. p. 150.

CARPERA, in ichthyology, a name given by Cuba, and ſome other writers on fiſhes, to the carp. See the article CYPRINUS.

CARPERITARIA, in botany, a name uſed by ſome authors for the barbarea or winter-creſs, a wild plant common in hedges in ſpring. *Chabræus*, p. 278.

CARPESIA, in the materia medica of the antients, a name given to a kind of ſpice, or aromatic drug, often mentioned by Ægineta and others, and made an ingredient in cordial and ſtomachic medicines. This was a vegetable ſubſtance, being the top ſhoots of young twigs of an odoriferous ſhrub, growing in Pamphylia, and ſmelling very like the fineſt cinnamon.

Galen, who mentions this drug very frequently, makes two kinds of it different in goodneſs: the one he calls *Laerticum*, and the other *Ponticum*, but he ſays that they both were gathered on the mountains of Pamphylia. Some of the copies of Galen have the word πικρον bitter, inſtead of *Ponticum*; but as we learn by Stephens's accounts that the Laerticum was derived from Laertes, the name of a mountain in Pamphylia, where the drug was gathered, it is moſt probable that the other name alſo was derived from the name of ſome other place where it was gathered; and it does not ſeem from any accounts given us of either kind of *carpeſium*, that the epithet bitter could by any means be applied to them. *Galen*, de Med. Simp. l. 7.

Julius Scaliger, in his exercitations againſt Cardan, is of opinion that this latter kind had the name Pontic, becauſe of its being brought from Pontus, but he forgets that Galen ſays expreſly that both were gathered on the mountains of Pamphylia. It is evident that the ſecond, as well as the firſt name is a derivative of the name of ſome mountain of that country, and it may be a falſe ſpelling for *Adricon* or *Suedricon*, either of which give us the known names of mountains there. The likeneſs in ſound of the words *carpaſium* and *carpeſia* have given occaſion to ſome to ſuppoſe them the ſame thing; but they muſt have read very little of the antients who fall into this error. The *carpaſium* was a gum ſo nearly reſembling the fineſt myrrh, that it was often miſtaken for it: it came from the country of the Abyſſines, and was often mixed with the myrrh, and was ſo terrible a poiſon that many lives were loſt by the taking it among, or inſtead of, myrrh. This Galen aſſures us. That the *carpeſium* was not this ſubſtance, is very evident, ſince it was neither a gum nor a poiſon, but a ſafe and cordial internal medicine, and the young ſhoots of a tree, or ſhrub: but what it really was is not ſo clear. Actuarius is of opinion that the *carpeſia* and the cubebs were the ſame thing; but this is evidently erroneous: they are nearer the mark who ſuppoſe it to have been the young ſhoots of the tree whoſe fruit was the cubebs; but there are great reaſons even againſt this. *Scaliger*, Exercit.

As the antients uſed both this drug and cubebs, it is certain that had they both been the produce of the ſame tree, they muſt have known it; and this it is plain they did not know, for they have no where named any ſuch thing, but, on the contrary they have expreſly ſaid, that the *carpeſia* was the ſhoots of a tall tree, which produced no fruit. Aviſenna gives alſo this account, and adds, that it grew, in his time, on mount Lebanon, and that the part gathered for uſe was certain twigs, very long, cylindric, and but little thicker than a needle, which had a very fragrant ſmell.

CARPESIUM, in the materia medica, a name given by ſome authors to cubebs. *Ger.* Emac. Ind. 2. See CARPESIA

CARPET (*Cycl.*) — The chief furniture of the Turkiſh houſes are *carpets*, or mats of Grand Cairo, neatly wrought with ſtraw, ſpread on the ground. Vid. Phil. Tranſ. N° 155. p. 444, ſeq.

CARPET-*knights*, a denomination given to gown-men and others of peaceable profeſſions, who, on account of their birth, office, or merits to the public, or the like, are, by the prince, raiſed to the dignity of knighthood.

They take the appellation *carpet*, by reaſon they uſually receive their honours from the king's hands in the court, kneeling on a *carpet*.

By which they are diſtinguiſhed from knights created in the camp, or field of battle, on account of their military proweſs.

Carpet-knights poſſeſs a medium between thoſe called *truck*, or *dunghill-knights*, who only purchaſe, or merit the honour by their wealth; and *knights-batchelors*, who are created for their ſervices in the wars. Vid. *Markh.* Book of Hon. Dec. 2. Ep. 8.

CARPINUS, the *hornbeam*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the catkin kind, being compoſed of a number of ſmall leaves, affixed to an axis in a ſquammoſe manner, under each of which there ſtand a great number of ſtamina: theſe are the barren male flowers, the embryo fruits appearing in other parts of the tree, between the leaves of larger and more beautiful ſpikes; which finally become a fruit of an umbilicated kind, compreſſed and ſtriated, and containing a roundiſh nut or kernel, pointed at one end.

There is only one known ſpecies of the *carpinus*, which is the common hornbeam. *Tourn.* Inſt. p. 582.

CARPIONE, in ichthyology, a name given by Salvian to the fiſh called by other writers *carpio lacus Benaci*. It is a ſpecies of the ſalmon-kind, and is the ſame with that fiſh called in ſome parts of England the *gilt charre*. Artedi diſtinguiſhes it from the other ſpecies of the ſalmons by calling it the ſmall ſalmon with five rows of teeth in the palate. See the article SALMO.

CARPOS, Καρπος, *fruit*. The word in this ſenſe is too well known and underſtood to admit of any explanation; but it is neceſſary to obſerve that the old Greek writers did not keep ſtrictly to the ſenſe of the word, limiting it, as we do, to that part of a plant or tree which ſucceeds the flower, and in which the ſeeds are contained; but they often uſed it in a larger ſenſe, and expreſſed by it the eſculent part of a plant, though it did not ſerve to this purpoſe. Thus the roots of the bulbus edulis, and many other plants of this kind, are called, even by Theophraſtus, *carpi*; and, in ſome of the leſs known plants, great errors have ariſen from this. The Arabians expreſſed by the word *hab*, what the Greeks did by *carpos*, and uſed it in the ſame unlimited ſenſe, and this having not been obſerved, we have many commentators arguing for certain ſubſtances not being roots, becauſe called *hab* and *carpi*; and yet theſe certainly are ſuch, only called fruits becauſe they ſupply the uſe of fruits to the eater. The roots of the traſi or avellanda are called fruits by many of the old authrs, and Theophraſtus expreſly calls the tuberous roots of the arachidna its fruit.

CARPUM *flectentium interior*, in anatomy, a name given by Spigelius to the muſcle called by Albinus *ulnaris internus*, and by Winſlow, *internus cubitalis*.

CARPUS. See the article WRIST.

CARR, *carrum*, in the middle age, denoted any ſort of vehicle, or carriage, either by land or ſea. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc. *caracta*.

CARRAC, or CARRACA, a name given by the Portugueſe to the

the veſſels they ſend to Braſil and the Eaſt-Indies; being very large, round built, and fitted for fight, as well as burthen. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have ſometimes ſeven or eight floors; they carry about 2000 ton, and are capable of lodging 2000 men; but of late they are but little uſed. Formerly they were alſo in uſe among the knights of Rhodes, as well as among the Genoeſe, and other Italians. Vid. *Du Cange*, Gloſſ. Lat. T. 1. p. 171. *Aquin.* Lex. Milit. T. 1. p. 171. Vocab. Cruſc. T. 2. p. 287.

It is a cuſtom among the Portugueſe, when the *carracs* return from India, not to bring any boat or ſloop for the ſervice of the ſhip, beyond the iſland of St. Helena; at which place they ſink them on purpoſe, in order to take from the crew all hopes or poſſibility of ſaving themſelves, in caſe the veſſel be thrown away. *Aubin.* Dict. Mar. p. 171.

CARRAGO, in antiquity, a kind of fortification, or defence about a camp, compoſed of carts, waggons, and the like vehicles, chained or faſtened together; chiefly uſed by the barbarous nations. Vid. *Veget.* l. 3. c. 10. *Stewech.* ad eund. ibid. *Pitiſc.* Lex. Ant. T. 1. p. 868.

CARRARA *marble*, among our artificers, the name of a ſpecies of white marble, which was called marmor Lunenſe, and Liguſtrium by the antients: it is diſtinguiſhed from the Parian, now called the ſtatuary marble, by being harder and leſs bright. See the article LUNENSE *marmor*.

CARRAT *(Cycl.)* — The *carrat* by which jewellers eſtimate the weight of diamonds and pearls, is about $\frac{1}{130}$ of a troy ounce. *Jeffreys* on diamonds.

Hence the *carrat* is about $3\frac{1}{4}$ grains troy.

Carrats are divided into halves, quarters, or grains; and farther, into eighths, ſixteenths, and thirty-two parts. Id. ibid.

CARRIAGE *(Cycl.)* ſignifies the removal of goods, or other things, from one place to another, eſpecially with a carr or cart. *Savar.* Dict. Comm. T. 1. p. 684. voc. *chariage.*

CARRIAGE alſo denotes the money or hire paid to a carrier, or other bearer of goods.

The *carriage* of letters is called *poſtage*. See POST, *Cycl.*

CARRIAGE *by ſea*, is denominated *freight*. See the article FRAIGHT, *Cycl.*

Bill of CARRIAGE, *lettre de voiture*, among the French, denotes a paper given to a carrier, expreſſing the quantity and quality of the goods and parcels committed to him, partly to entitle him to receive his hire from the perſon to whom they are directed, and partly that this letter may ſhew whether all be brought, and whether in due time, and in the condition required. *Savar.* Dict. Comm. T. 2. p. 1935. voc. *voiture.*

CARRIAGE *of a cannon*, conſiſts of the cheeks, the tranſums, the bolts, the plates, the train, the bands, the keys and locks, the bridge, the bed, the hooks, the trunion holes, and the cap ſquare. *Guill.* Gent. Dict. P. 2. in voc.

The *carriages* for mortars are low, with four wheels, each of one piece, exactly like the ſea *carriages*. Milit. Dict. in voc.

The parts of a ſea *carriage* are the two cheeks, the axle-trees, bolts, cap-ſquares, hooks, forelocks, trucks, linſpins. *Manw.* Sea Dict. p. 21.

Block-CARRIAGE is a cart made on purpoſe for carrying of mortars, and their beds, from one place to another.

Truck-CARRIAGES are two ſhort planks of wood, ſupported on two axle-trees, having four trucks, or wheels, of ſolid wood, about a foot and a half, or two foot diameter, for carrying mortars or guns upon battery, when their own *carriages* cannot go; and are drawn by men. *Guill.* Gent. Dict. P. 2. in voc. *carriage.*

CARRIAGE is alſo uſed to denote a ſpace of ground, over which the inhabitants of New France, and other colonies of North America, who trade with the ſavages uſually by means of canoes, are obliged to carry their boats and proviſions, &c. on their ſhoulders. This they are forced to when they come to places in lakes or rivers, covered with willows, or otherwiſe rendered impracticable to paſs by water, till they meet with ſome new place convenient for reimbarking. *Savar.* Dict. Comm. T. 2. p. 1188. voc. *portage.*

CARRIAGES, *(Cycl.)* in agriculture, are of two kinds, the main *carriage*, whoſe mouth is of breadth ſufficient to receive the whole ſtream intended; and leſſer *carriage* ariſing from ſpace to ſpace, out of the former. Dict. Ruſt. T. 1. in voc.

CARRIER, he who undertakes to convey perſons, goods, papers, money, or the like, from place to place, on condition of a certain price, either fixed by authority or cuſtom, or left to private agreement. *Savar.* Dict. Comm. T. 2. p. 1938. voc. *voiturier.*

In Holland *carriers* are called *routiers*, becauſe they always keep the ſame road, or rout; ſetting out, and arriving, at fixed hours. Id. in Supp. p. 1180. voc. *routier.*

CARRIER *pidgeon*, a ſort of pidgeon uſed, when properly trained up, to be ſent with letters from one place to another.

It is larger in ſize than moſt of the other kinds. Its length from the tip of the beak to the end of the tail being often fifteen inches; but its greateſt weight not twenty ounces. Its fleſh is firm, and its feathers cloſe; it is long-necked, and of a better ſhape than moſt other pidgeons. The upper chap of the bill is half covered from the head with a white or blackiſh tuberous furfuraceous fleſh, which projects or hangs over both its ſides, on the upper part neareſt the head, and ends in a point about the middle of the bill. This is called the *wattle*. The eyes are ſurrounded with the ſame ſort of corrugated fleſh for the breadth of a ſhilling, and their iris is red. Their beak is long, ſtrait, and thick; their wattle generally broad acroſs the beak, ſhort from the head toward the point, and tilting forward from the head; and the head narrow, long, and flat; the neck very long and thin, and the breaſt broad; the feather is chiefly black or dun, though there are blues, whites, and pieds.

It has its name from its remarkable ſagacity in carrying a letter from one place to another: though you carry them hoodwinked, twenty or thirty, nay ſixty or an hundred miles, they will find their way, in a very little time, to the place where they were bred. They are trained to this ſervice in Turky and Perſia, and are carried firſt, while young, ſhort flights of half a mile, afterwards more, till at length they will return from the fartheſt part of the kingdom. Every baſhaw has a baſket of theſe pidgeons, bred at the ſeraglio, which, upon any emergent occaſions, as an inſurrection, or the like, he diſpatches with letters, braced under their wings to the ſeraglio, which proves a more ſpeedy method, as well as a ſafer, than any other, only ſending out more than one, for fear of accidents. Lightow aſſures us, that one of theſe birds will carry a letter from Babylon to Aleppo, which is thirty days journey, in forty eight hours. This is alſo a very antient practice; Hirtius and Brutus, at the ſiege of Modena, held a correſpondence with one another by means of pidgeons. And Ovid tells us, that Tauroſthenes, by a pidgeon ſtained with purple, gave notice to his father of his victory at the Olympic games, ſending it to him at Ægina. *Moor*'s Columbarium, p. 28.

CARROBALISTA, in the antient military art, denotes a ſpecies of *baliſta* mounted on wheels, and drawn by horſes; by which it differed from the *manubaliſta*, which being leſſer and lighter was thrown by the hand. *Veget.* l. 2. c. 25. *Aquin.* Lex. Milit. T. 1. p. 172. See BALISTA, *Cycl.* and *Suppl.*

CARROCIUM, or CARROCERUM, in middle age writers, denotes the banner, or chief flag of an army, which was mounted on a kind of chariot, and drawn by oxen. *Aquin.* Lex. Milit. T. 1. p. 172. See BANNER.

CARROT. See the article DAUCUS.

CARUCCA, in antiquity, a ſplendid kind of carr, or chariot, mounted on four wheels, richly decorated with gold, ſilver, ivory, &c. in which the emperors, ſenators, and people of condition, were carried. Vid. *Pitiſc.* Lex. Ant. T. 1. p. 369. *Aquin.* Lex. Milit. T. 1. p. 173.

The word comes from the Latin *carrus*, or Britiſh *carr*, which is ſtill the Iriſh name for any wheel carriage. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc. *caruca.*

CARRUCA or CARUCA is alſo uſed in middle age writers for a plough. Vid. *Du Cange*, Gloſſ. Lat. T. 1. p. 858. *Kenn.* Gloſſ ad Paroch. Antiq. in voc. *caruca.* See PLOUGH.

CARRUCA was alſo ſometimes uſed for *carrucata*. *Kenn.* Paroch. Antiq. p. 82. ejuſd. Gloſſ. ad eund. See CARRUCATE.

CARRUCAGE, *carucagium*, a kind of tax antiently impoſed on every plough, for the public ſervice. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc. *carucata.* See CARUCATE, *Suppl.* and HIDAGE, *Cycl.*

CARRUCAGE, CARUCAGE, or CARUAGE, in huſbandry, denotes the ploughing of ground, either ordinary, as for grain, hemp, and flax; or extraordinary, as for woad, dyers weed, rape, and the like. Dict. Ruſt. T. 1. in voc.

CARRUCATE, *carucata*, in our antient laws and hiſtory, denotes a plough-land, or as much arable ground as can be tilled in one year, with one plough. See PLOUGH.

In doomſday inquiſition the arable land is eſtimated in *carrucates*, the paſture in hides, and meadow in acres. See HIDE, and ACRE, *Cycl* and *Suppl.*

Skene makes the *carrucata* the ſame with *hilda*, or *hida terræ*; Littleton the ſame with *ſoc*. Vid. *Skeu.* de Verb. Signif. p. 36. *Cow.* Interpr. in. voc. *carve.* Terms de Ley. p. 44. See SOC. *Cycl.*

The *carrucata terræ*, in the reign of Richard I. was eſtimated at 60 acres [a]; though in another charter of the ſame reign, the *carrucate* is rated at an hundred acres. Fleta, who lived under Edward I. allows nine ſcore acres to a *carrucate*, viz. ſixty for winter tillage, ſixty for ſpring tillage, and ſixty for fallowing. He adds, that if the land lay in two fields, eight ſcore of it made a *carrucate*, one half of it for tillage, the other for fallow [b]. — [a *Dugd.* Monaſt. T. 2. p. 107. b *Flet.* l. 2. c. 72. § 4.]

The meaſure of a *carrucate* appears to have differed in reſpect of place, as well as time. Thus, in the 23d of Edward III. a *carrucate* of land in Burceſter contained 112 acres, and in Middleton 150 acres. *Kenn.* Paroch Antiq. p 471. Ejuſd. Gloſſ. ad eund. *Du Cange*, Gloſſ. Lat. T. 1. p. 859.

By a ſtatute under William III. for charging perſons to the repair of the highways, a plough-land is rated at 50 pounds *per annum*, and may contain houſes, mills, wood, paſture, &c. Stat. 7 and 8. Will. III.

CARRYING, in falconry, ſignifies a hawk's flying away with the quarry.

Carrying is one of the ill qualities of a hawk, which ſhe acquires either by a diſlike of the falconer, or not being ſufficiently broke to the lure. *Cox*, Gent. Recr. P. 2. p. 15. See LURE.

CARRYING, among riding-maſters. A horſe is ſaid to *carry* low, when, having naturally an ill-ſhaped neck, he lowers his head too much. All horſes that arm themſelves *carry* low, but a horſe may *carry* low without arming. A French branch, or a gigot is preſcribed as a remedy againſt *carrying* low.

A horſe is ſaid to *carry* well, when his neck is raiſed, or arched, and he holds his head high and firm, without conſtraint. *Guill.* Gent. Dict. P. 1. in voc.

CARRYING, among huntſmen. When a hare runs on rotten ground (or even ſometimes in a froſt) and it ſticks to her feet, they ſay ſhe *carries*. *Cox*, Gent. Recr. P. 1. p. 17.

CARRYING *wind*, a term uſed by our dealers in horſes to expreſs ſuch a one as frequently toſſes his noſe as high as his ears, and does not carry handſomely. This is called *carrying wind*; and the difference between *carrying* in the wind, and beating upon the hand, is this: that the horſe who beats upon the hand, ſhakes the bridle and reſiſts it, while he ſhakes his head; but the horſe that carries in the wind puts up his head without ſhaking, and ſometimes beats upon the hand. The oppoſite to *carrying* in the wind, is arming and carrying low; and even between theſe two there is a difference in wind.

CART, a vehicle mounted on two wheels, drawn by one or more horſes, uſed for the carriage of various ſorts of heavy things.

The word ſeems formed from the French *charrette*, which ſignifies the ſame; or rather the Latin *carreta*, a diminutive of *carrus*. Trev. Dict. Univ. T. 1. p 1677. voc. *charrette*. *Savar.* Dict. Comm T. 1. p. 688. See CARR.

A *cart* differs from a wain in that the former is drawn by horſes, and has two ſides called *trills*; whereas a wain is drawn by oxen, and has a wain cope.

The parts and apparatus belonging to a *cart* are, the *trill hooks*, and *back band*, which hold the ſides of the *cart* up to the horſe; the *belly band*, paſſing from one ſide, under the horſe's belly, to the other; the *cart raers*, being the two rails on the top of the *cart* [a]; *cart ſtaves*, thoſe that hold the *cart* and the raers together; *cart* body, all that part where the loading is laid for carriage, called, in Suſſex, the *buck*, q. d. belly of the *cart* [b]; *cart ladders*, the crooked pieces ſet over the wheels to keep hay and ſtraw loaden off them; *cart ſaddle*, the leathern or wooden pannel laid on the fillar horſe; the *ſloats*, the under pieces which keep the bottom of the *cart* together; a *trigen*, a pole to ſtop the wheel of a *cart*, when it goes too faſt down a ſteep place [c]. — [[a] Dict. Ruſt. T. 1. in voc. [b] *Kenn.* Gloſſ. ad Paroch. Antiq. in voc. [c] Dict. Ruſt. T. 1. in voc. *cart*.]

Criminals are drawn to execution in a *cart*. Bawds, and other malefactors, are whipped at the *cart's* tail. By the laws of the city, carr-men are forbid to ride, either on their *carts*, or horſes. They are to lead, or drive them on foot, through the ſtreets, on the forfeiture of forty ſhillings. Stat. 1. Geo. I. c. 57. Sect. 8. Abr. T. 5. p. 86. 8vo.

Scripture makes mention of a ſort of *carts*, or drags, uſed by the Jews, to do the office of threſhing. They were ſupported on low thick wheels, bound with iron, which were rolled up and down on the ſheaves, to break them, and force out the corn [a]. Something of the like kind alſo obtained among the Romans, under the denomination of *plauſtra*, of which Virgil makes mention [b].

Tardaque Eleuſinæ matris volventia plauſtra,
Tribulaque, traheæque ——

On which Servius obſerves, that *trahea* denotes a *cart* without wheels, and *tribula* a ſort of *cart* armed on all ſides with teeth, uſed chiefly in Africa, for threſhing corn. The Septuagint and St. Jerome repreſent theſe *carts* as furniſhed with ſaws, in regard their ſurface was beſet with teeth. David, having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be cruſhed to pieces under ſuch *carts*, moving on wheels ſet with iron teeth; and the king of Damaſcus is ſaid to have treated the Iſraelites of the land of Gilead, in the ſame manner [c]. — [[a] *Hieron.* Comm. ad Eſai. c. 25. *Calm.* Dict. Bibl. T. 1. p. 366. [b] Georg. I. [c] 2 Sam. c. 12. v. 31. Amos. c. 1. v. 3. *Calm* Dict. Bibl. T. 1. p. 366.]

CARTEL *(Cycl.)* originally ſignifies a placart, or manifeſto in writing, poſted in public places to notify its contents.

The word comes from the Italian *cartello*, or Latin *cartellus*, which ſignifies the ſame; formed by diminution of *charta*, paper. *Du Cange*, Gloſſ. Lat. T. 1. p. 861. voc. *cartellus*. Cruſc. Vocab. T. 2. p. 296. voc. *cartello*.

The uſe of *cartels*, or challenges to fight, is very antient, there being divers inſtances of them in Homer, Virgil, and other Greek and Latin poets [a]. Rymer gives the *cartel* which Edward III. ſent to Philip de Valois, challenging him either to fight him, body to body, or an hundred men againſt an hundred, or army to army, within ten days, before the gates of Tournay [b]. — [[a] Trev. Dict. Univ. T. 1. p. 1476. [b] *Rym.* Fœd. T. 5. Bibl. Choiſ. T. 23. p. 271, ſeq.]

CARTEL alſo denotes a treaty or agreement between two princes or generals, relating to the exchange of priſoners each have taken in war. *Fæſch.* Ing. Lex. p. 154.

There are alſo *cartels* ſettled between princes in time of war, for what relates to commerce, that it may be carried on without interruption, notwithſtanding other hoſtilities.

CARTEL alſo denotes a meaſure of capacity for corn, uſed in divers parts of France, being of different values from 30 to 50 pounds. *Sav.* Dict. Comm. Supp. p. 122, ſeq.

CARTHAMUS, *Baſtard Saffron*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the floſculous kind, and is compos'd of numerous ſmall floſcules, divided into many ſegments at their ends, and ſtanding on the embryo ſeeds, contain'd in a ſcaly and foliaceous cup. The embryos finally ripen into ſeeds which are not winged with down. The ſpecies of *carthamus* enumerated by Mr. Tournefort, are theſe, 1. The *carthamus* of the ſhops, with ſaffron-coloured flowers; and, 2. The *carthamus* of the ſhops, with white flowers. *Tourn.* Inſt. p. 457

Carthamus ſeeds are ſaid to be emetic and cathartic, but at preſent they are very little uſed. Its flowers are ſometimes uſed in medicine, but their chief uſe is in dying.

CARTHUSIAN *(Cycl.)* — The word is formed from *Carthuſianus* or *Carthuſienſis*, a denomination given them in Latin, from a village in Dauphiny called *Chartreuſe*, in Latin *Cartuſium*, *Caturcium*, as ſome ſay, where the firſt monaſtry of this kind was erected. Hence the French ſtill call the religious of this order *Chartrets*, and their convents *Chartreuſes*. An appellation which appears alſo to have formerly obtained in England; whence the name of that celebrated hoſpital, or rather college, in London, the *Charter-houſe*, by corruption from *Chartreuſe*. Dict. Trev. in voc.

The *Carthuſian* habit is all white within, their ſcapular being joined in the ſides by two pieces of the ſame ſtuff. Their prior and procurator, who may go abroad upon the neceſſary affairs of the houſe, appear in a black cloak down to the ground, and a black hood over the white one; the hood not round, but tapering to a point. *Stev.* Suppl. to Dugd. Monaſt. T. 1. p. 239.

CARTHUSIAN *powder*, *Poudre des Chartreux*. See KERMES *mineral*.

CARTILAGE *(Cycl.)* — A *cartilage* is a whitiſh or pearl coloured ſubſtance, which covers the extremities of bones joined together by moveable articulations, increaſes the volume of ſome of them after the manner of epiphyſes, unites others very cloſely together, and has no immediate adheſion or connection with others. The ſubſtance of *cartilages* is more tender, and leſs brittle, than that of bones; but with age they ſometimes grow ſo hard as to become perfectly bony. The *cartilages* which belong to the bones differ from each other in ſize, figure, ſituation, and uſe, and may all be ranked under two general heads: thoſe which are cloſely united to bones, and thoſe which are not immediately connected with them. The *cartilages* united to bones are of four kinds; ſome cover both ſides of the moveable articulations, and are very ſmooth and ſlippery; ſome unite the bones to each other, either ſo firmly as to allow no ſenſible motion, as in the ſymphyſis of the oſſa pubis, and ſtill more in that by which the epiphyſes are joined to the bones; or in ſuch manner as to allow of different motions, as in thoſe by which the bodies of the vertebræ are connected. The firſt eaſily grow hard, but the others appear in ſome degree viſcid, and retain their flexibility.

Some increaſe the ſize and extent of bones, as the cartilaginous portions of almoſt all the true ribs: theſe are articulated with bones; others with *cartilages*, as the ſeptum narium; others ſerve only for borders, as thoſe of the baſis of the ſcapula, and of the criſta of the os ilium, the ſupercilia of cavities, and thoſe of the ſpinal and tranſverſe proceſſes of the vertebræ. Some, in fine, have a ſingular form, as thoſe of the ears, and moſt of thoſe of the noſe; in which laſt, their elaſticity appears moſt ſenſibly. The *cartilages* belonging to the ſecond general claſs, or thoſe not immediately joined to bones, are for the moſt part placed in the moveable joints; and theſe may likewiſe be ſubdivided into ſeveral kinds. Some lie altogether looſe, being neither joined to the articulated bones, nor to the *cartilages* which cover them, but ſlide freely between them in different directions; as thoſe which are placed in the articulation of the tibia with the os femoris; in that of the lower jaw with the oſſa temporum; and in that of the clavicle with the ſternum. Thoſe between the clavicle and acromium, and between the firſt and ſecond vertebræ of the neck, are of the ſame kind. Some are partly joined to other *cartilages*, and partly ſlide between the cartilaginous extremities of the articulated bones, as the *cartilage* at the lower extremity of the radius. There may alſo be reckoned among the *cartilages*, tho' not ſo properly, ſeveral of the ſmall ſeſamoide bones, which remain long cartilaginous; and alſo the cartilaginous portions of tendons, which do the ſame office with the ſeſamoide bones. *Winſlow's* Anat. p. 112.

It is commonly held, that all bones in their original were only *cartilages*, and arrived at the hardneſs of bones by a gradual induration. *Caſt.* Lex. Med. p. 139. See BONE.

Hence it is, that in ſome caſes the *cartilages* themſelves have been

been found offified; of which a famous inſtance happened ſome years ago at Milan, where a malefactor was judged innocent, and ſaved by a miracle, becauſe his aſpera arteria being turned bony, he was not ſuffocated by the hangman's rope. *Chauv.* Lex. Phil. p. 92.

Articulating-CARTILAGES. See JOINT-*Cartilages*.

CARTILAGINOUS *Fiſhes*, thoſe, whoſe ſpine, or back-bone, is of the conſiſtence of a cartilage, being hollow withal, and containing medulla.

Cartilaginous fiſhes are of two kinds; flat, as the raia or ſkate; and long and round, as the aſellus or cod. Vide *Aldrov.* de piſc. l. 3. c. 31. *Caſt.* Lex. Med p. 139.

CARTILAGINOUS *leaf*, among botaniſts. See LEAF.

CARTOUCHE, or CARTOOZE, (*Cycl.*) in architecture, a member or ornament nearly akin to a modillion; from which it only differs in this, that the latter is uſed under the cornice in the eaves of a houſe, and the former in wainſcotting within doors. Some workmen call the *cartoozes* dentils. See DENTILE, *Cycl. Neve*, Build. Dict. in voc. *cartoozes*.

CARTOUCHES, in heraldry, a name given to a ſort of oval ſhields, much uſed by the popes and ſecular princes in Italy, and others, both clergy and laity, for the painting or engraving their arms on. Many ſuppoſe this form derogatory to the honour of the perſon; but tho' the ſquare ſhield, with the rounded and pointed bottom, is more in uſe with us, as alſo with the French and Germans, yet this is ſuppoſed more truly the figure of the Roman ſhield worn by the ſoldiery, and therefore more antient and honourable than either that or the indented ſhield of the Germans. *Niſbet*'s Heraldry, p. 12.

CARTRIDGE (*Cycl.*) — CARTRIDGE-*box*, a wooden or iron caſe, covered with leather, holding a dozen or more muſket *cartridges*, borne by the ſoldier on his belt, hanging a little above the right pocket-hole. *Guill.* Gent. Dict. P. 2, in voc.

CARVA, in botany, a name given by the Indians to one of the kinds of cinnamon tree. This is of all others the moſt eſteemed among them, and ſerves for the moſt purpoſes. They extract camphor and a liquid oil from the roots; they extract oil of cinnamon from the bark, and from the leaves they make another oil, which is called oil of cloves, and ſold as ſuch. The fruits yield them an oil reſembling that of juniper, and afterwards they extract from them a thick, fat ſubſtance, like wax, ſerving them for the making unguents and plaiſters, and alſo for the making their candles. Hort. Malab.

CARVAGE, *carvagium*, the ſame with *carrucage*. *Kenn.* Gloſſ. ad Paroch. Antiq. in voc. *Carucata*. *Cow.* Interpr. voc. *carve*. See CARRUCAGE.

Henry III is ſaid to have taken *carvage*, that is, two marks of ſilver of every knight's fee, towards the marriage of his ſiſter Iſabella to the emperor. *Stow*, Ann. p. 271. *Cow.* Interp. in voc. *carve*.

Carvage could only be impoſed on the tenants in capite. *Tyrr.* Hiſt. of Engl. T. 4. p. 102.

CARVAGE alſo denotes a privilege whereby a man is exempted from the ſervice of *carrucage*.

CARUCATARIUS, in antient law books, he that held land in *ſoccage*, or by plough tenure. *Kenn.* Gloſſ. ad Paroc. Antiq. in voc. See SOCCAGE, *Cycl.*

CARVER, a cutter of figures or other devices in wood. See CARVING.

Carvers anſwer to what the Romans called *ſculptores*, who were different from *cælatores*, or engravers, as theſe laſt wrought in metal. *Pancir.* de Corp. Artif. §. 10. *Pitiſc.* Lex. Ant. T. 2. p. 712. voc. *ſculptores*.

CARVER is alſo an officer of the table, whoſe buſineſs is to cut up the meat, and diſtribute it to the gueſts.

The word is formed from the Latin *carptor*, which ſignifies the ſame. The Romans alſo called him *carpus*, ſometimes *ſciſſor*, *ſcindendi magiſter*, and *ſtructor*. *Pitiſc.* Lex. Ant. T. 1. p. 368. In the great families at Rome, the *carver* was an officer of ſome figure. There were maſters to teach them the art regularly, by means of figures of animals cut in wood. Vid. *Juven.* ſat. 11. v. 133. *Pitiſc.* Lex. Ant. T. 2. p. 867. voc. *ſtructores*. The Greeks alſo had their *carvers*, called Διατροι, *q. d.* deribitores, or diſtributors. In the primitive times, the maſter of the feaſt carved for all his gueſts. Thus in Homer, when Agamemnon's embaſſadors were entertained at Achilles's table, the hero himſelf carved the meat. Of latter times, the ſame office on ſolemn occaſions was executed by ſome of the chief men of Sparta[a]. Some derive the cuſtom of diſtributing to every gueſt his portion, from thoſe early ages when the Greeks firſt left off feeding on acorns, and learned the uſe of corn. The new diet was ſo great a delicacy, that to prevent the gueſts from quarrelling about it, it was found neceſſary to make a fair diſtribution[b]. — [[a] *Athen.* Deipnoſ. l. 1. c. 10. [b] *Pott.* Archæol. l. 4. c. 20.]

CARUI, *the carraway plant*, in botany, the name of a genus of plants of the umbelliferous kind; the characters of which are theſe: the flower is roſaceous, being compos'd of ſeveral heart-faſhioned petals, irregular in ſize, and diſpos'd in a circular form; the cup finally becomes a fruit, compos'd of two ſmall oblong ſeeds, ſtriated and gibboſe on one ſide, and flat and ſmooth on the other. To this it may be added, that the leaves are narrow, and ſtand in pairs on their ribs. The ſpecies of *carui* enumerated by Mr. Tournefort, are theſe; 1. The common *carui*, call'd by ſome meadow cummin; and, 2. The fine-leav'd *carui*, with tuberoſe roots. *Tourn.* Inſt. p. 306.

The ſeed of *carui* is one of the greater hot ſeeds; it is ſtomachic and carminative, and therefore good for the colic, a bad digeſtion, weakneſs of ſight, and dizzineſs of the head *James*, Med Dict. in voc. *carum*.

CARVING, (*Cycl.*) in a general ſenſe, the art or act of cutting or faſhioning a hard body by means of ſome ſharp inſtrument, eſpecially a chiſſel.

In which ſenſe, *carving* includes ſtatuary and engraving, as well as cutting in wood.

CARVING, in a more particular ſenſe, is the art of engraving or cutting figures in wood.

In this ſenſe, *carving*, according to Pliny, is prior both to ſtatuary and painting. *Plin.* Hiſt. Nat. l. 36. c. 5. *Pitiſc* Lex. Ant. T. 2. p. 713, voc. *ſculptura*.

To *carve* a figure or deſign, it muſt firſt be drawn, or paſted on the wood; which done, the reſt of the block not covered by the lines of the deſign, are to be cut away with little narrow-pointed knives. The wood fitteſt for this uſe is that which is hard, tough and cloſe, as beech, but eſpecially box. To prepare it for drawing the deſign on, they waſh it over with white lead, tempered in water, which better enables it either to bear ink or the crayon, or even to take the impreſſion by chalking. When the deſign is to be paſted on the wood, this whitening is omitted, and they content themſelves to ſee the wood well planed. Then wiping over the printed ſide of the figure with gum tragacanth diſſolved in water, they clap it ſmooth on the wood, and let it dry; which done, they wet it ſlightly over, and fret off the ſurface of the paper gently, till all the ſtrokes of the figure appear diſtinctly. This done, they fall to cutting, or *carving*, as above. *Salm.* Polygr. l. 2.

CARVIST, in falconry See FALCON.

CARYATES, Καρυάτες, in antiquity, a feſtival in honour of Diana, ſurnamed Caryatis, held at Caryum, a city of Laconia. The chief ceremony was a certain dance, ſaid to have been invented by Caſtor and Pollux, and perform'd by the virgins of the place.

During Xerxes's invaſion, the Laconians not daring to appear and celebrate the cuſtomary ſolemnity, to prevent incurring the Goddeſs's anger by ſuch an intermiſſion, the neighbouring ſwains are ſaid to have aſſembled and ſung paſtorals or *bucoliſmi*, which is ſaid to have been the origin of bucolic poetry. *Meurs.* Græc. Fer. *Caſtelan* de Feſt. Græc. *Pott.* Arch. Græc. l. 2. c. 20. See CARYATIDES, *Cycl.*

CARUNCULA (*Cycl.*) — Some have given the name *caruncula* to that pendant fleſhy part, called *uvula*, or *columella*. See UVULA, *Cycl.* and *Suppl.*

CARUNCULA is alſo applied to certain fleſhy morſels preternaturally contained in divers parts and humours of the body.

We ſometimes meet with capillary *caruncles* excreted with the urine. *Hippocr.* 4. Aph. 76. See TRICHIASIS.

Celſus alſo ſpeaks of certain *carunculæ* generated in the noſtrils. *Celſ.* de Medic. l. 6. c. 8.

To the head of *carunculæ* alſo belong thoſe fleſhy excreſcences called *polypus's*. *Caſt.* Lex. Med. p. 140. See POLYPUS, *Cycl.* and *Suppl.*

CARUS (*Cycl.*) — Galen deſcribes the *carus* as a privation of ſenſe and motion through the whole body, the reſpiration remaining entire, followed by a profound ſleep, the eyes always cloſed: but ſenſation not ſo abſolutely deſtroyed, but that the patient can feel a puncture with a pin, tho' he is not thereby awakened either to open his eyes or ſpeak. *Gal.* de Loc. Affect. l. 4. c. 2. Item Meth. Med. l. 13. c. 21. *Caſt.* Lex. Med. p. 138.

The *carus* is deſcribed by modern phyſicians, as a drowſy diſeaſe, ſlighter than an apoplexy, but ſeverer than a lethargy, and frequently degenerating into the former, occaſioned by an obſtruction of the courſe and diffuſion of the animal ſpirits from the medulla of the brain, towards the cortex thereof. *Willis*, de Anim. Brut. P. 2. c. 4.

CARYOCATACTES, in zoology, the name of a bird of the magpie kind, of a browniſh colour, all over beautifully variegated with white triangular ſpots, and very full of white feathers about the anus and origin of the tail. The tail and long feathers of the wings are black, but variegated in ſome places with white. It makes the ſame ſort of chattering noiſe with our magpie, and feeds on nuts and other fruits, and is common in the mountainous parts of Germany. *Ray*, Ornitholog. p. 90.

CARYOCOSTYNUM, in pharmacy, a kind of purging electuary, the two principal ingredients of which, that give the denomination to the whole, are cloves, and coſtus. It works briſkly, and fetches the humours from the moſt remote parts; whence, and by reaſon of its warmth, it is preſcribed againſt rheumatic, arthritic, hydropic, paralytic, &c. diſorders. *Quinc.* Pharm. P. 3. §. 6. p. 450.

CARYOPHYLLATA, *avens*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, conſiſting of ſeveral petals, diſpoſed in a circular form, and growing from the ſegments of a one-leav'd cup, of a hollowed ſhape. The piſtil ariſes from the center of this cup, and finally becomes a roundiſh fruit, conſiſting of a number of ſeeds, each ending in a ſort of tail.

The ſpecies of *caryophyllata*, enumerated by Mr. Tournefort, are theſe; 1. The common, or ſmall flowered *avens*. 2. The large flowered *avens*. 3. The ground ivy leav'd *avens*. 4. The Virginian *avens*, with ſmall white flowers, and ſcentleſs roots. 5. The marſh or water *avens*, with a purple bending flower. 6. The purple mountain *avens*, with flowers growing one upon another. 7. The purple mountain *avens*, with flowers growing in a triple order on one another. 8. The marſh mountain *avens*. 9. The double flowered marſh mountain *avens*. 10. The leſſer purple water *avens*, with bending flowers. 11. The mountain *avens*, with a drooping yellow flower. 12. The Pyrenean *avens*, with very large and rounded leaves, and drooping flowers. 13. The yellow flower'd alpine *avens*. 14. The purple flower'd alpine *avens*. 15. The white flower'd alpine *avens*. 16. The ſmaller alpine *avens*. 17. The ſmallage leav'd alpine *avens*. 18. The germander leav'd alpine *avens*. *Tourn.* Inſt. p. 294.

The *caryophyllatæ* differ from the ranunculus's in the cup of the flower, and from the cinquefoils in the ſhade of their ſeeds.

Avens is ſuppoſed to be good to dry up catarrhs, and diſſolve coagulated blood.

CARYOPHYLLEOUS, in botany, a term uſed by Mr. Tournefort to expreſs a ſort of flowers of the pink kind, or reſembling the pink flowers in ſhape. Theſe are compos'd of ſeveral petals diſpoſed in an orbicular form, and ariſe from the bottom of the cup as from a ſort of tube. See Tab. 1. of Botany, Claſs 1. and *Tourn.* Inſt. p. 329.

CARYOPHYLLON *Plinii*, the fruit of the caſſia caryophyllata, or cloveberry tree, whoſe bark is uſed in medicine. *C. Bauhin.* Pin. p. 119.

CARYOPHYLLUS, the *pink*. See PINK.

CARYOPHYLLUS *aromaticus*, the *clove ſpice*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, and is compos'd of ſeveral petals arranged in a circular form, and placed on a cup, which finally becomes an oval, umbilicated, unicapſular fruit, containing one oblong ſeed. There is no other known ſpecies of this tree, but that which produces the common clove. *Tourn.* Inſt. p. 661.

Clove ſpice are eſteemed ſtomachic, carminative, and alexipharmic. See CLOVE, *Cycl.* and *Suppl.*

CARYOPHYLLUS *marinus*, a name given by Dr. Woodward to a foſſil mycetites, or coralloide body, found in ſeveral parts of Germany.

CARYOTA, in botany, the name of a genus of plants deſcribed by the author of the Hortus Malabaricus, under the name of *ſchunda-pana*. The characters are theſe: it produces male and female flowers in the ſame ear; the male flowers have for their cup the whole compound ſpatha; the flower is divided into three parts, and the petals are very ſmall and ſharp-pointed; the germen of the piſtil is roundiſh, the ſtile is pointed, and the ſtigma ſimple; the fruit is a roundiſh berry, containing only one cell, in which are contained two large and oblong ſeeds, which are cylindric or rounded on one ſide, and flatted on the other. *Linnæi* Gen Pl. p. 515. Muſeum Cliffort. p. 12. Hort. Mal. T. 1. p. 11.

CARYSTIUM *linum*. See LINUM *caryſtium*.

CARYSTIUM *marmor*. See MARMOR.

CARYUS, in the materia medica, a name given by Dioſcorides, and ſome other of the antient Greeks, to the eryngium, or ſea holly, called by us eryngo. It was thus named from its having a ſmall head or cluſter of flowers like a walnut. See ERYNGIUM.

CASA, in antient and middle age writers, is uſed to denote a cottage or houſe.

CASA *Santa*, denotes the chapel of the holy virgin at Loretto.

The *Santa Caſa* is properly the houſe, or rather chamber, in which the bleſſed virgin is ſaid to have been born, where ſhe was betrothed to her ſpouſe Joſeph, where the angel ſaluted her, the Holy Ghoſt overſhadowed her, and, by conſequence, where the Son of God was conceived, or incarnated.

This building, they tell us, was brought in a wonderful manner from Nazareth to Dalmatia, and lodged there upon the top of a hill or rock called Terſatto, on the 12th of May 1291; but that being threatened by the infidels, it was removed again by the ſame angels, who all along guarded it; and they brought it over the ſea, and ſet it down on the firſt land they came at, which was near the city of Ancona; from whence, not pleaſed with the place, they removed it to the hill near Loretto, where it continues to this day; tho' it ſuffered a little diſlocation again, ſometime after its firſt remove; but it was not many paces, and nearer to the plain, beneath the hill, where it ſtill remains. Here, to prevent any new remove, they built a magnificent church over it, in the middle of which the ſacred depoſitum is ſecured, for the duration of the papacy; unleſs ſome invaſion of the Turks ſhould fall upon and diſmantle it.

Ferreri, an hundred years after the pretended tranſlation, ſpeaks of it as ſtill at Nazareth. Vid. Voyag. Hiſt. de l'Ital. Lett liii.

Be this as it will, devout people, 'tis ſaid, have often attempted to bring away a bit of ſtone of this building, as a precious relick; but no ſooner were they got a little diſtance off, than the ſtones diſappeared, and returned ſpontaneouſly to their former place. Bibl. Ital. T. 7. p. 62.

The *Santa Caſa*, or holy chamber, conſiſts of one room, 44 ſpans long, 18 broad, and 23 high: over the chimney, in a nich, ſtands the image called the great *Madona*, or lady, four foot high, made of cedar, and, as they ſay, wrought by ſaint Luke; who was a carver as well as a phyſician. The mantle or robe ſhe has on, is covered with innumerable jewels of ineſtimable value. She has a crown given her by Lewis XIII. of France, and a little crown for her ſon. Vid. Atlas Marit. p. 74, ſeq.

CASCABEL, the knob or button of metal behind the breech of a cannon, as a ſort of handle whereby to elevate and direct the piece. See CANNON.

The diameter of the *caſcabel* is the diameter of the bore of the piece; the neck of the *caſcabel* is the part which joins it to the breech-mouldings. *Moor*, Treat. of Artill. P. 1. c. 1. p. 2. Item. P. 2. c. 1. p. 27. *Guill.* Gent. D. P. 2. in voc.

CASCADE (*Cycl.*) — A natural *caſcade*, falling with a great noiſe, is more properly called a *cataract*. *Ozan*, Dict. Math. p. 550. See CATARACT, *Cycl.*

CASCARILLA, a name by which ſome authors have called the jeſuit's bark: the quinquina or china china of other writers. *Mont.* Exot. p. 8.

CASCA *vela*, in zoology, a name by which the Portugueſe in America call the rattle-ſnake. See RATTLE-*ſnake*.

CASE (*Cycl.*) ſometimes denotes a veſſel or receptacle in form of a tomb, commonly decorated with gold and ſilver, wherein the body of a ſaint, or ſome relicks of it, are preſerv'd. See RELICKS, *Cycl.*

In which ſenſe, the word is formed from the French *chaſſe*. Trev. Dict. Univ. T. 1. p. 1684, voc. *chaſſe*.

Originally theſe *caſes* were made in the figure of little Gothic churches, purſuant to that antient chriſtian maxim, that the ſaints having been the living temples of the Holy Ghoſt, are entitled, after their death, to have their bones encloſed in the figure of the viſible houſe of God. *Davil*, Archit. P. 2. p. 463, ſeq. voc. *chaſſe*.

The *caſe* of St. Genevieve is never brought down without great ceremony, nor except in time of extreme public dangers or calamities. Trev. Dict. Univ. T. 1. p. 1684.

A frame of *caſes*, in printing, uſually conſiſts of two pair, viz. an upper and lower, Roman and Italic. A ſhallow *caſe* ſhews the letter beſt, as being leaſt ſhadowed by the ſides of the boxes. A deep *caſe* has the advantage of holding a great number of letters, ſo that the compoſitor need not diſtribute ſo often; beſides that it does not grow low ſo ſoon. *Hought.* Collect. N° 364. p. 427. Item. N° 366, p. 431.

CASE of a ſilk-worm, is a lodge framed within its web, wherein to depoſite its ova.

CASE is alſo uſed for a certain numerous quantity of divers things: a *caſe* of piſtols implies a brace; a *caſe* of Normandy glaſs contains 120 foot. Dict. Ruſt. T. 1. in voc.

CASE is alſo uſed for a frame ſurrounding a door window, or the like. In which ſenſe we ſay a door-*caſe*, window-*caſe*, &c. *Mox.* Mechan. Exerc. p. 153, ſeq.

CASEI *di cavallo*, the name of a peculiar cheeſe, famous in Italy and many other places, and made of the milk of the female buffalo, that ſpecies being as commonly tamed and kept there as the ox and heifer with us.

CASEOUS, ſomething that partakes of the nature or qualities of cheeſe. See CHEESE, *Cycl.* and *Suppl.*

Milk conſiſts of a *caſeous*, a butyrous, and a ſerous part. See MILK.

Wax, according to ſome naturaliſts, is formed of the *caſeous* parts of the juices of plants, ſeparated by the bees from the ſerous parts, which make the honey. Phil. Tranſ. N° 224. p. 368. See WAX and HONEY.

Cataracts are by ſome divided into milky, and *caſeous*, differing only in the degree of hardneſs or conſiſtence. Mem. de Trev. Oct. 1710. p. 1812. See CATARACT.

Konig gives a caſe of a *caſeous* empyema. Ephem. Acad. N. C. dec. 2. an. 5. obſ. 98. See EMPYEMA, *Cycl.*

CASEMENT, in architecture, the ſame with *cavetto*, which is a hollow moulding; which with ſome is $\frac{1}{4}$, and with others $\frac{1}{6}$ of a circle in compaſs.

CASEMENT is alſo uſed in building for a little moveable window uſually within a larger, being made to open or turn on hinges. We ſay, a ſingle *caſement*, a folding *caſement*, a *caſement* with a lock, with a turn-about or turn-buckle, a *caſement* with a cock-ſpur or pull-back at the hind ſide, wherewith to draw it to. *Neve*, Build. Dict. in voc.

CASHEW-*nut*. See CAJOU.

CASIA, in botany, the name of a genus of plants, of which there are two ſpecies: 1. The Montpelier poetick *caſia*, called the berry-bearing ſhrub oſyrus. 2. The tall myrtle-leav'd Spaniſh *caſia*.

CASING, among hunters, denotes the ſtripping off the ſkin of a hare, fox, or badger. They ſay, *flay* a deer, *caſe* a hare, and all ſorts of vermin. This is done by beginning at the ſnout or noſe of the beaſt, and ſo turning his ſkin over his ears down to the body, and the very tail. *Cox* Gent. Recr. P. 1. p. 15.

CASING of timber-work is beſt done on heart laths, by reaſon the mortar is apt to decay the ſap laths in a ſhort time. 'Tis com-

commonly laid on at two thickneſſes, the ſecond before the firſt is dry. *Neve*, Build. Dict. in voc.

CASINGS, a country word for cow-dung dried, and uſed as fuel Dict. Ruſt. T. 1. in voc.

CASKET, in a general ſenſe, a little coffer, or cabinet. See CABINET, &c.

CASKETS, in the ſea language, are ſmall ropes made of ſinnet, and faſtened to gromets, or little rings upon the yards; their uſe is to make faſt the ſail to the yard when it is to be furled.

Breaſt-CASKETS, are the longeſt and biggeſt of theſe, or thoſe in the midſt of the yard, betwixt the ties. *Guill.* Gent. Dict. P. 3. in voc.

CASPARGUS, in ichthyology, a name given by Salvian, from Ælian, to the fiſh commonly called by authors, ſparus, and by the Italians, ſparo. It is diſtinguiſhed by Artedi by the name of the plain yellowiſh ſparus, with a large annular ſpot near the tail. See SPARUS.

CASQUE, in natural hiſtory, a name given to a kind of murex, called the helmet-ſhell. There are ſeveral ſpecies of this ſhell, and they all approach ſomewhat to a triangular figure, and are ſmoother than the other murexes; yet they have all a ſort of tubercles near the lip.

CASSADA *bread.* See YUCCA.

CASSAMUNAIR, or CASSUMUNIAR, in medicine, an aromatic vegetable drug, brought from the Eaſt Indies, highly valued as a nervine and ſtomachic, and reputed a ſpecific in epileptic and convulſive diſeaſes [a]. It is ſuppoſed by ſome to be a ſpecies of galangal, by others of zedoary: its true name is not known, that of *caſſamunair* being apparently feigned to hide it: of late it has been imported by the name of *bengalle* [b]. — [a *Quinc.* Lex. Phyſ. Med. p. 70. b Vid. Phil. Tranſ. N° 264. p. 580.]

CASSANDRA, in natural hiſtory, a name given by ſeveral authors to a very elegant ſea ſhell of the concha globoſa, or dolium kind, more uſually known under the name of the lyra, or harp-ſhell. It is ſuppoſed to be called *caſſandra*, becauſe of its being found on the ſhores of the iſland of Caſſan. There are three ſpecies of it. See LYRA.

CASSAON, in zoology, the name of a ſmall fiſh of the ſhark-kind, but leſs miſchievous, called cucuri by the Braſilians. See CUCURI.

CASSAVI, or CASSADA, an American root, of whoſe farina, or powder, the natives make bread, tho' its juice be rank poiſon. Some call the root *manioc*, others *yucca*; this being ground, dried, and baked, becomes a nouriſhing bread, under the name of *caſſavi*. Vid. *Acoſt.* Nat. Hiſt. Ind. l. 4. c. 17. See YUCCA.

CASSIA, in botany, the name of a genus of trees, the characters of which are theſe: the flower is uſually compoſed of five petals diſpoſed in a circular form. The piſtil which ariſes from the midſt of theſe finally becomes a pod, which in ſome of the ſpecies is rounded or cylindric, and in others flatted or compreſſed, and divided by tranſverſe partitions into many cells, which contain a pulpy matter, of a blackiſh colour, in which there are lodged many hard ſeeds.

The ſpecies of *caſſia* enumerated by Mr. Tournefort are theſe: 1. The common *caſſia* fiſtula, the Alexandrine, or Levant *caſſia*. 2. The Braſilian *caſſia*. 3. The *caſſia* fiſtula of the iſland of Java, with fleſh-coloured flowers. 4. The American *caſſia*, with flat pods. 5. The ſtinking American *caſſia*, with leaves like the ſenna. 6. The ſtinking American *caſſia*, with ſmooth oblong leaves. 7. The ſtinking American *caſſia*, with large hairy leaves. 8. The ſtinking American *caſſia*, with roundiſh pointed leaves. 9. The ſtinking American *caſſia*, with obtuſe leaves. 10. The ſix leaved American *caſſia*, with bicapſular pods. *Tourn.* Inſt. p. 619.

CASSIA *bark.* The antients had two kinds of this bark; the κασία συριγξ, and the other the *xylocaſia*. We are ſo much miſtaken about theſe words at preſent, as to ſuppoſe they meant two the moſt different things, the one the bark of a tree, the other a fruit; but they were only the names of the thing collected in a different manner. It was a cuſtom with the antients to collect the barks of trees, ſometimes ſeperate from the wood, ſometimes with the wood itſelf, thus: they collected the cinnamon bark, ſometimes ſtripped, ſometimes cut with the wood. The *caſſia* being thus cut ſometimes with, and ſometimes without the wood, had two names to expreſs theſe two ſtates; that with the wood was called *xylocaſia*, and that without the wood κασία σύριγξ. The plain tranſlation of the firſt word is *caſſia lignea*, and that of the other *caſſia fiſtula*; but we have at this time appropriated the *caſſia fiſtula* to the pudding pipe tree, a tree whoſe fruit is a long hollow pipe, or pod, containing a black pulp, which is a gentle cathartic. Thus we have loſt the original ſenſe of the term; it is neceſſary to obſerve, however, in reading the antients, that they do not mean what we do by *caſſia fiſtula*, but only the *caſſia* bark cleared from the wood. See XYLOCASSIA.

CASSIA *caryophyllata.* See CARYOPHYLLUS *aromaticus.*

CASSIA *mellis*, denotes a kind of extract of caſſia uſed for glyſters, having honey mixt with it to make it keep. *Caſt.* Lex. Med. p. 140.

CASSIA is alſo uſed by the antients for aroma. See AROMA.

CASSIA *ſtake*, in the glaſs trade, is that iron with a piece of wood placed on it, on which they lay the glaſs after they have taken it off the pipes, and on which they turn the glaſs, to faſten the pontee to it. *Neri*, Art of Glaſs, Appendix.

CASSIANI, a ſect in the civil law, who adhered to the ſyſtem and interpretations of Caſſius, a celebrated lawyer, in oppoſition to thoſe of Proculus, whoſe adherents were denominated proculiani. The diviſion took its riſe from Q. Tubero, who having two diſciples, Ateius Capito, and Antiſtius Labeo, the former adhered ſtrictly to the precepts of his maſter, and the interpretations of the antient lawyers; while the latter, truſting to his own judgment, took the liberty to vary, and innovate. By ſuch means a kind of ſchiſm was made in the ſcience of the law; which was carried ſtill farther by the diſciples of the two leaders, viz. Maſſurius Sabinus, who ſeconded Ateius, and Nerva, Labeo; the ſucceſſors of theſe were Caſſius and Proculus, under whom the two parties aſſumed the denominations of *Caſſiani* and *Proculiani*; as they afterwards did thoſe of *Sabiniani*, and *Pegaſiani*, under Cœlius Sabinus, who ſucceeded Caſſius, and Pegaſus, Proculus. Vid. *Gravin.* Orig. Jur. civ. l. 1. p. 83. ap. Giorn. de Lett. d' Ital. T. 6. p. 25. *Calv.* Lex. Jur. p. 151.

CASSIANISM is ſometimes uſed for the hereſy of *Semipelagianiſm.* Act. Erud. Lipſ. an. 1690. p. 528. See SEMIPELAGIANISM, *Cycl.*

CASSIDA, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of the labiated kind; the upper lip reſembles a helmet with two ears, and the lower is divided into two ſegments. The upper part of the flower-cup is creſted, and from the baſe of it there ariſes a piſtil, which is fixed in the manner of a nail to the lower part of the flower. This is ſurrounded by four embryo's which afterwards become ſo many ſeeds, of an oblong form, encloſed in a capſule, which was the cup of the flower; this capſule alſo repreſents very exactly a head armed with a helmet, the upper part of it very well reſembling the creſt of the helmet, and the lower that part of it which receives the chin. The ſpecies of *caſſida* enumerated by Mr. Tournefort are theſe: 1. The *caſſida* of Columna, called ſcutellaria, and lamium exoticum by others. 2. The whitiſh flowered *caſſida*. 3. The large-flowered procumbent Alpine *caſſida*. 4. The tall American *caſſida*. 5. The common blue-flowered water *caſſida*. 6. The common white-flowered water *caſſida*. 7. The ſmaller water *caſſida*, with red flowers. 8. The mallow-leaved American *caſſida*. 9. The procumbent Alpine *caſſida*, with a very large whitiſh flower. 10. The balm-leaved *caſſida*. And, 11. The low American origanum-leaved *caſſida*. *Tourn.* Inſt. p. 182.

CASSIDARIUS, in the antient armories, he who had the care and cuſtody of the *caſſides*, or helmets. *Pitiſc.* Lex. Ant. T. 1. p. 371.

Spon gives an antient inſcription found at Rome, on a tomb erected to a *caſſidarius* of the emperor Domitian.

CASSIDONY, a name given by the Italians and Germans to a ſort of beads made of the yellow and red chalcedony, a very beautiful ſtone, or of an agate ſomething reſembling it in colour. They alſo call the ſtones themſelves by this name; but are by no means determinate in what they mean by the word, not reſtraining it to any one peculiar ſpecies. *Hill*'s Hiſt. of Foſſ. p. 466.

CASSILI, in natural hiſtory, a name given by the inhabitants of the Philippine iſlands to a ſpecies of water raven, called alſo *colocolo.*

CASSINE, in the military language, is a farm-houſe, where a number of ſoldiers have poſted themſelves, in order to make a ſtand againſt the approaches of an enemy.

CASSIOPEIA (*Cycl.*) is otherwiſe denominated *cathedra*, *mulier ſedis*, *ſiliquaſtrum*, *ſella*, *ſolium*, *ſedes regalis*, and *thronus*; by the Arabs, *canis*, or *cerra*, and by the Hebrews, *abenezzam.* Schiller, in lieu of *caſſiopeia*, repreſents St. Mary Magdalen; Harſdorff, Bathſheba; and Weigelius, the cornucopia. *Wolf.* Lex. Math. p. 316.

CASSIS, in antiquity, a plated, or metalline helmet, different from the galea, which was of leather.

CASSIS *lævis*, the *ſmooth helmet ſhell*, a name given by Rumphius, though very improperly, to the genus of ſhells called dolia and conchæ globoſæ; theſe have no alliance at all with the helmet ſhells, and what makes the name ſtill the worſe is, that *caſſis* itſelf is not a generical name, though uſually ſo underſtood, all the caſſides or helmet ſhells being only a peculiar kind of murex, as the figure of their mouths, and their rudiments of ſpines or protuberances evidently make appear. See MUREX.

CASSITERIA, in natural hiſtory, the name of a genus of cryſtals. The word is derived from the Greek κασσιτερος, tin; and expreſſes cryſtals which are influenced in their figures by an admixture of the particles of that metal. See Tab. of Foſſils, Claſs 3.

Theſe are all pyramidal, without columns, and compoſed only of four ſides or planes. Of this genus there are only two known ſpecies. 1. A whitiſh, pellucid one: this is not very common in large ſpecimens, but in very ſmall ones is frequent in the mines of Devonſhire and Cornwall. And, 2. A brown one: this is very well known in Cornwall, and other places where there are tin mines; and contains a great deal of that metal. Its natural colour is a deep brown, but where there is iron in the neighbourhood is often found tinged rediſh.

CASSO-

CASSOWARY, in zoology, the name of an African bird of the oſtrich kind, but not quite ſo tall, though larger bodied; called alſo by many authors *emeu*, *eme*, or *ema*, and *caſoarius*. It has a crown on the middle of its head; and its head and neck are almoſt naked, having only a few hairs, which are ſet ſtraggling; the ſkin is of a purpliſh blue, but toward the bottom of the neck, on the hinder part, it is a little rediſh. At the bottom of the neck there are alſo two fleſhy protuberances, which hang over the breaſt; its mouth opens very wide; its legs are very long and very robuſt; it has three toes on each foot, all placed before; it has the rudiments of wings, but they are very ſhort, and have only five quills each, which are almoſt naked. It has no tail; its body is large, and is thinly covered with browniſh feathers, which have more the appearance of briſtles, than of real feathers, to a ſlight obſerver. It is very common in Africa, and is caught alſo in many parts of the Eaſt-Indies. It feeds on fleſh or vegetables, and is eaſily made tame. *Ray*, Ornithol. p. 105.

CAST is particularly uſed to denote a figure, or ſmall ſtatue of bronze. See BRONZE.

CAST, among wax-chandlers, denotes a laddleful of melted wax, poured on the wicks of candles made by the laddle.

CAST, among founders, is applied to tubes of wax, fitted in divers parts of a mould of the ſame matter, by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before poſſeſſed.

CAST, among *bowlers*. See BOWLING.

CAST alſo denotes a cylindrical piece of braſs, or copper, ſlit in two, lengthwiſe, uſed by the founders in ſand to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be *caſt*. *Savar*. Dict. Com. T. 2. p. 392. voc. JET.

CAST, among plumbers, denotes a little brazen funnel, at one end of a mould, for caſting pipes without ſoldering, by means of which the melted metal is poured into the mould.

CAST *of the country*, with miners, the colour of the earth. *Neve*, Build. Dict. in voc.

CAST, in falconry, denotes a ſet or couple of hawks. Dict. Ruſt. T. 1. in voc.

To *caſt* a hawk to the perch, ſignifies to ſet her upon it.

CAST, or CASTE, in ſpeaking of the Eaſtern affairs, denotes a tribe, or number of families, of the ſame rank and profeſſion.

The diviſion of a nation into *caſts* chiefly obtains in the empire of the great mogul, kingdom of Bengal, iſland of Ceylon, and the great peninſula of India oppoſite thereto. In each of theſe, there are, according to father Martin [a], four principal *caſts*; viz. the *caſt* of the *bramins*, which is the firſt and moſt noble; the *caſt* of the *rajas*, or princes, who pretend to be deſcended from divers royal families; the *caſt* of the *choutres*, which comprehends all the artificers; and that of the *parias*, the loweſt and moſt contemptible of all; though Henry Lord, it muſt be obſerved, divides the Indians about Surat in four *caſts*, ſomewhat differently from Martin; viz. into *bramins*, or prieſts; *cuttery*, or ſoldiers; *ſhuddery*, which we call banians, or merchants; and *wyſe*, the mechanics, or artificers [b]. —[a Lett. Edif. T. 5. p. 17, ſeq. b *Lord*, Diſcov. of Sect. of Banians, c. 1. p. 4, ſeq.] See BRAMIN, &c.

Every art and trade is confined to its proper *caſt*, nor is allowed to be exerciſed by any but thoſe whoſe fathers profeſſed the ſame. So that a taylor's ſon can never riſe to be a painter, nor a painter's ſon fall to be a taylor. Though there are ſome employments which are common to all the *caſts*: e. g. every body may be a ſoldier or a merchant. There are alſo divers *caſts* which are allowed to till the ground, but not all. The *caſt* of *parias* is held infamous, inſomuch that it is a diſgrace to have any dealings, or converſation with them. And there are ſome trades in the *caſt* of *choutres* which debaſe their profeſſors almoſt to the ſame rank. Thus ſhoemakers, and all artificers in leather, as alſo fiſhermen, and even ſhepherds, are reputed as no better than *parias*. The Portugueſe committed an irreparable miſtake for want of being acquainted with this diſtinction of *caſts*. On their firſt diſcovery of theſe countries, they dealt, and converſed indifferently with all ſorts, and took *parias* or fiſhermen, without ſcruple, into their ſervice, which gave the reſt an idea of them, as people without honour or ſhame, an idea which they have never yet been able to efface. Another falſe ſtep of the Portugueſe was to oblige the people of the places they conquered to renounce their *caſts*, and conform to the European cuſtoms; which enraged them beyond meaſure. To theſe cauſes chiefly it is, that the modern miſſionaries in thoſe parts, attribute the ſmall ſucceſs of their preaching the goſpel; few, by their own confeſſion, are fairly converted to chriſtianity, except the very ſink of the people, the *parias*, or thoſe who have loſt their *caſt* by their wickedneſs and debauchery. And the number of theſe who are received into the chriſtian congregation, helps ſtill more to excite the averſion of the reſt for Europeans and chriſtianity. *Martin*, Lett. au Pere Gobien. in Lett. Edif. T. 5. p. 19, ſeq.

CASTAGNOLE, in ichthyology, a name given by the Italians to the fiſh called by the generality of authors *chromis*, and reduced by Artedi to the genus of the *ſpari*; he diſtinguiſhes it by the name of the ſparus with the ſecond ray of each belly-fin carried out into a great length. *Willughby*'s Hiſt. Piſc. p. 330. See CHROMIS, and SPARUS.

CASTANEA, the *cheſnut*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the amentaceous kind, being compoſed of a number of ſtamina ariſing from a five-leaved cup, and affixed to a ſlender capillament or axis. Theſe are the male flowers, but the fruit grows in other parts of the tree: theſe are roundiſh, echinated, and open into four parts, and contain *cheſnuts* with their kernels. The ſpecies of *cheſnut* enumerated by Mr. Tournefort are theſe: 1. The common cultivated *cheſnut*. 2. The common wild *cheſnut*. 3. The dwarf cluſter *cheſnut*. 4. The large-leaved American *cheſnut*, with ſlightly-echinated fruit. *Tourn.* Inſt. p. 584.

CASTARON, in botany, a name given by the old Arabian writers to the *ſerrata*, or ſaw-wort. Serapion writes it *cæſtura*, but the plant is the ſame, and the words are both derived from the Greek name of the *ſerratula*, which, according to Dioſcorides, is ceſtrum. See CESTRUM.

CASTELLANY, the diſtrict or extent of land under the juriſdiction of a lord *caſtellan*.

The province of Flanders is divided into ſo many *caſtellanies*, each of which bears the name of the capital, as the *caſtellany* of Liſle, of Ypres, of Gant, &c. The court of *caſtellany* was antiently compoſed of the caſtellan, a fiſcal, procurator, notary, regiſter, &c.

In Poland, a *caſtellany* is a petty government under the adminiſtration of a caſtellan, ſubordinate to the palatine, whoſe palatinate comprehends ſeveral *caſtellanies*. Trev. Dict. Univ. T. 1. p. 1693. voc. *caſtellanie*.

CASTELLARIUS, the keeper, or curator, of a caſtellum.

Gruter gives an antient ſepulchral inſcription in memory of a *caſtellarius*. *Grut.* Inſcr. p. 609. p. 7. Fab. Theſ. p. 486.

CASTELLATION, *caſtellatio*, in middle-age writers, the act of building a caſtle, or of fortifying a houſe, and rendering it a caſtle. See CASTLE.

By the antient Engliſh laws, *caſtellation* was prohibited, without the king's eſpecial licence. *Wilk.* Gloſſ. ad Leg. Angl. Sax. p. 393. *Spelm.* Gloſſ. voc. *kernellare*. *Du Cange*, Gloſſ. Lat. T. 1. p. 871.

CASTIGATION, *caſtigatio*, among the Romans, the puniſhment of an offender by blows, or beating, with a wand or ſwitch. *Caſtigation* was chiefly a military puniſhment. the power of inflicting which on the ſoldiery was given to the tribunes. Some make it of two kinds, one with a ſtick or cane, called *fuſtigatio*: the other with rods, called *flagellatio*; the latter was the moſt diſhonourable. *Lipſ.* de Milit. Rom. l. 5. c 18. *Pitiſc.* Lex. Ant. Rom. T. 1. p. 374. *Schoetg.* Cur. Ant. Lex. p. 281. See FLAGELLATION, *Cycl.*

But Sichterman, on better grounds, diſtinguiſhes *caſtigation* from fuſtigation, reſtraining the former to blows with a wand, the latter to thoſe with a ſtaff. *Sichterm.* de pœn. Milit. Roman. c. 2. Jour. des Scav. T. 41. p. 474. ſeq.

CASTIGATIONS, in a literary ſenſe, denote corrections, or emendations of the text of an antient writer.

CASTILLAN, a gold coin, current in Spain, valued at fourteen rials, and a half.

CASTILLAN alſo denotes a weight uſed by the Spaniards in the weighing of gold, containing the hundredth part of a Spaniſh pound. It is alſo uſed at Buenos Aires, and the mines of Chili and Potoſi. *Savar.* Dict. Comm. T. 1. p. 586.

CASTING is ſometimes uſed for the quitting, laying, or throwing aſide any thing; thus, deer *caſt* their horns, ſnakes their ſkins, lobſters their ſhells, hawks their feathers, &c. annually.

CASTING *of feathers* is more properly called *moulting* or *mewing*.

Some have pretended that deer alſo *caſt* their penis; and are yearly ſupplied with a new one: but experience ſhews this to be a vulgar error. Vid *Brown*, Vulg. Err. l. 3. c. 9. p. 103. See PENIS, *Cycl.* and *Suppl.*

A horſe *caſts* his hair or coat, at leaſt once a year, viz. in the ſpring, when he *caſts* his winter coat, and ſometimes at the cloſe of autumn, he *caſts* his ſummer coat, in caſe he have been ill kept.

Horſes ſometimes alſo *caſt* their hoofs, which happens frequently to coach-horſes brought from Holland, viz. being bred in a moiſt, marſhy country, have their hoofs too flabby; ſo that coming into a drier ſoil, and leſs juicy provender, their hoofs fall off, and others, that are firmer, ſucceed. *Guill.* Gent. Dict. P. 1. in voc.

CASTING is alſo uſed for overthrowing.

In which ſenſe, we ſay to *caſt* a horſe, an ox, or the like. Dict. Ruſt. T. 1. in voc.

CASTING is alſo uſed for diſtributing or diſpoſing the parts of a thing to the beſt advantage.

The *caſting* of a building is more properly called *compartition*. Vid. *Wolf.* Elem. of Archit. P. 1. p. 18. See COMPARTITION, *Cycl.*

Theatrical writers ſpeak of *caſting* a play, *i. e.* diſpoſing the ſeveral parts or characters to proper actors.

CASTING *of drapery*, among painters, a free, eaſy, negligent way of cloathing a figure. *Neve*, Build. Dict. in voc.

CASTING *of timber work*, with builders, is when a houſe being plaiſtered all over on the outſide with mortar, it is ſtruck wet, by a ruler, with the corner of a trowel, &c. to make it look like joints of free ſtone. *Neve*, Build. Dict. in voc.

CASTING *a point of traverſe*, among ſeamen, ſignifies the pricking down on a chart, the point of the compaſs any place bears from you; or finding what point of the compaſs the ſhip bears at any inſtant, or what way the ſhip has made. *Guill.* Gent. Dict. P. 3. in voc.

CASTING *a colt*, denotes a mare's being abortive.

CASTING *a figure*, among aſtrologers, the erecting a celeſtial theme, and dividing the heavens into houſes.

CASTING-*net*, a ſort of fiſhing-net, ſo called becauſe it is to be *caſt* or thrown out, which when exactly done, nothing eſcapes it, but weeds, and every thing within its extent is brought away. Dict. Ruſt. T. 1. in voc.

CASTLE, *caſtellum*, (*Cycl.*) in antient writers, denotes a town or village ſurrounded with a ditch and wall, furniſhed with towers at intervals, and guarded by a body of troops. *Iſid.* orig. l. 15. c. 4. *Fab.* Theſ. p. 485, ſeq.

The word is originally Latin, *caſtellum*, a diminutive of *caſtrum*. *Iſid.* orig. l. 1. c. 2.

Caſtellum originally ſeems to have ſignified a ſmaller fort, for a little garriſon. Though Suetonius uſes the word where the fortification was large enough to contain a cohort. *Suet.* in Vit. Jul. c. 68. *Horſl.* Brit. Rom. l. 1. c. 8. p. 118, ſeq.

The *caſtella*, according to Vegetius, were often like towns, built in the borders of the empire, and where there were conſtant guards, and fences againſt the enemy. *Veget.* l. 1. c. 22. Horſley takes them for much the ſame with what were otherwiſe denominated ſtations. *Horſl.* Brit. Rom. l. 1. c. 7. p. 101.

CASTLE, or CASTLE-*ſteed*, is alſo an appellation given by the country people in the North to the Roman *caſtella*, as diſtinguiſhed from the caſtra ſtativa, which they uſually call cheſters. Horſley repreſents this as an uſeful criterion, whereby to diſcover, or diſtinguiſh, a Roman camp or ſtation. Id. ibid. c. 8. p. 118.

There are divers of theſe *caſtella* on Severus's wall: they are generally ſixty foot ſquare, their North ſide is formed by the wall itſelf, which falls in with them; the intervals between them are from ſix furlongs and an half to ſeven; they ſeem to have ſtood cloſeſt where the ſtations are wideſt.

The neighbouring people call them *caſtles*, or *caſtle-ſteeds*; by which it ſeems probable, that their antient Latin name had been *caſtellum*. Some modern writers call them *mile caſtles*, or milliary *caſtellæ*: Horſley ſometimes *exploratory caſtles*.

In theſe *caſtella* the *areans* had their ſtations, who were an order of men whoſe buſineſs was to make excurſions into the enemy's country, and give intelligence of their motions. *Cambd.* Brit. p. 839.

Between every two *caſtella* there ſeem to have been eight ſmaller turrets, or towers. *Horſl.* loc. cit. See TOWER, *Cycl.* Beſides the fixed *caſtella* there alſo appears to have been moveable ones, made occaſionally of branches of trees and earth, for the defence of camps [a]. Some deſcribe theſe as a kind of moveable wooden forts or towers, which were advanced and drawn back in battle, as occaſion required [b]. But it muſt be owned we have no diſtinct or certain account hereof. — [a *Aquin.* Lex. Milit. T. 1. p. 175. b *Pitiſc.* Lex. Ant. T. 1. p. 372.]

The *caſtle* of St. Angelo, on the banks of the Tyber, oppoſite to Rome, was antiently the mauſolæum of Adrian, formed, in great part, of Parian marble, to which have ſince been ſuperadded fortifications. *Pitiſc.* Lex. Ant. T. 1. p. 184. voc. *arx*.

CASTLE, *caſtellum*, in hydraulics, is uſed for a kind of pavillion, or water-houſe, in which are encloſed the cocks of ſeveral water-pipes with a little baſon, in order to make a diſtribution thereof.

In which ſenſe the antient *caſtella* amount to much the ſame with piſcinæ, or reſervoirs, among us. See RESERVOIR, *Cycl.* Ulpian defines *caſtellum*, a ſort of baſon, moduled out, of certain dimenſions, from which the water was diſtributed by pipes, and carried into the houſes of great men, by grant from the emperor. *Ulpian.* in Pandect. l. 43. de Aqua Cotid. L. 1. *Buddæus* ad Eund.

Vitruvius deſcribes the *caſtellum*, as an appendage of an aquaduct, with a triple emiſſary, for receiving the water, and pipes to convey it thence. *Cumque venerit ad mœnia efficiatur* caſtellum, & caſtello *conjunctum ad recipiendam aquam triplex emiſſarium, collocenturque in* caſtello *tres fiſtulæ æqualiter diviſæ intra receptacula conjuncta, uti cum abundaverit, ab extremis in medium receptaculum redundet.* *Vitruv.* de Archit. l. 8. c. 7.

The *caſtella* of the antient aquæducts are ſtill viſible at Rome, though half ruined. They are lined with a durable kind of cement, which, according to Pliny, ſurpaſſes in hardneſs the ſtones themſelves. It is made of lime ſlacked in wine, and beaten up with hog's greaſe, and the juice of figs or pitch. See AQUÆDUCT, *Cycl.*

Water-CASTLE, a piece of hydraulic work furniſhed with one or more fronts of building, with ſeeming windows and the like, containing a reſervoir which gives play to caſcades, &c. *Davil.* Archit. P. 2. p. 465.

Or, a *water*-CASTLE may be defined a receptacle of the public water furniſhed by an aquæduct, or otherwiſe; contrived to diſtribute and ſend it to different parts.

Modern writers on hydraulics treat of the laws of the efflux of water out of *caſtella* into pipes, canals, &c. Vid. *Herman.* Phoron. l. 2. c. 10. p. 410. p. 427, ſeq.

Signior Poleni has a treatiſe expreſs on *caſtles*, or reſervoirs, whereby the waters of rivers are derived, the ſides of which *caſtles* are made converging. *Polen.* de caſtellis per quæ derivantur fluviorum aquæ, habentibus latera convergentia. Patav. 1718. 4°. Extracts of which are given in Giorn. de Letter. d'Ital. T. 31. Art. 1. p. 1. ſeq. and Act. Erud. Lipſ. An. 1720. p. 402, ſeq.

CASTOR, the *beaver*, in the Linnæan ſyſtem of zoology, makes a diſtinct genus of animals, the characters of which are, that they have all the marks of the glires, with feet which have five toes on each, and palms adapted for ſwimming. Under this genus the author comprehends the *caſtor*-kind, the flat tailed, and round tailed, or common water rat. *Linnæi*, Syſtem natur. p. 39. See FIBER.

The beaver, diſtinctively ſo called, has two very different ſorts of hair, the one very ſoft and fine, the other long and thick; the firſt ſerves to defend the creature from the cold, the other to receive the mire in which it often wallows, and to prevent its getting to the ſkin. The teeth of this creature are formed in a very particular manner, and are extremely fit to cut trees, with which they build themſelves lodgings to defend them from the weather, and to breed their young in. The fore-feet are formed exactly like the human hand, and by this means they are able to carry their materials, and work at their habitations: the hinder feet, which are deſtined to be of uſe to them in ſwimming, are on the contrary web'd like thoſe of a gooſe.

The bladders in this animal deſtined for receiving the medicinal ſubſtance called *caſtor*, are diſtinct from the teſticles, and are four large ones, placed about the lower part of the os pubis; two of theſe ſtand above the other two, but cloſely joined to one another, the two upper being to prepare that matter, and the two other to bring it to the greater perfection and unctuouſneſs, and render it of a ſtronger ſcent and deeper colour, as it is always found with this difference in theſe bags from what is in the upper ones. The lower bags, for this reaſon, are of a glandular ſtructure; and under theſe lower bags there is another long one full of a matter, more yellow and liquid, and ſeeming more elaborated than any of the others. This is of a different ſmell from the former, and more than any thing elſe reſembles the yolk of an egg. It is ſaid that the creature uſes this liquor to get itſelf an appetite, and that it gets it out by ſqueezing the bag that contains it with its paws. The people of Canada ſet ginns for theſe creatures, and catch many of them that way; and knowing how fond they are of this liquor, they always anoint the ginns with ſome of it.

It has been generally ſaid that the teſticles of this creature were faſtened to the back-bone, but they are, in reality, not ſo, but placed on the ſides of the os pubis about the groin, and are altogether hid, not appearing at all any more than the penis, till the ſkin is removed: and the penis, contrary to that of a dog, which goes from the os pubis to the navel, deſcends in this animal downwards to the vent of the excrements, at which hole it terminates. Mem. Acad Scienc.

CASTOR more particularly denotes a fixed ſtar, of the ſecond magnitude, in the head of the firſt of the twins. See GEMINI, *Cycl.*

Its latitude Northwards, for the year 1700, according to Hevelius, was 10° 4′ 23″, and its longitude, of Cancer 16° 4′ 14″. It is alſo called *Raſalgenze*, *Apollo*, *Aphellan*, *Avellar*, and *Anelar*. *Hevel.* Firmam. Sobieſc. p. 287. *Wolf.* Lex. Math. p. 317.

Caſtor and *Pollux*, in meteorology, is called by the Spaniards, San Elmo; by the French St. Elme, St. Nicholas, St. Clare, St. Helene; by the Italians, Hermo; by the Dutch Vree Vuuren.

When the meteor ſticks to the maſts, yards, &c. they conclude from the air's not having motion enough to diſſipate this flame, that a profound calm is at hand: if it flutter about, it indicates a ſtorm. *Aubin.* Dict. Mar. p. 356. voc. *elme*.

CASTOREA, in botany, the name given by Plumier to a genus of plants ſince called by Linnæus *duranta*. See the article DURANTA.

CASTRATING *a book*, among bookſellers, is the taking out ſome leaf, ſheet, or the like, which renders it imperfect, and unfit for ſale. The word is alſo applied to the taking away particular paſſages, on account of their obſcenity, too great freedom with reſpect to government, &c.

CASTRATING is alſo uſed among gardeners, in ſpeaking of melons and cucumbers; where it ſignifies the ſame with pruning or pinching of other plants. Trev. Dict. Univ. T. 1. p. 1096. voc. *chaſtrer*. See PRUNING and PINCHING, *Cycl.*

CASTRATION (*Cycl.*) — By the civil law it is made penal in phyſicians and ſurgeons to *caſtrate*, even with conſent of the party, who is himſelf included in the ſame penalty, and his effects forfeited. *Calv.* Lex. Jur. p. 152.

The antients mention two ſorts of *caſtration*, viz. by exſection, where the teſticles were cut out; and colliſion, whereby they were only bruiſed, or rubbed, but ſo as to put a ſtop to their growth, and make them waſte and wither away; the vein which brought them nouriſhment being ruined. This latter operation is uſually performed by putting the patient in a warm

bath, in order to ſoften the parts, and render them more eaſy to be bruiſed and diſſolved. After he has been there ſome time, they compreſs the veins of the neck called the jugulars, and by this means render him ſtupid and inſenſible, as if he were ſeized with an apoplexy; in which ſtate the mutilation is eaſily performed, without his feeling any thing of it. It is uſually performed on young children by the mother or nurſe. Trait. des Eunuch. c. 3. p. 11, ſeq.

Antiently they uſed to give the patient a doſe of opium; and while he was aſleep, by the influence of this, the operation was performed with a knife; but it being found that the greater part of thoſe who were eunuchized in this manner died by the narcotic, recourſe was had to the other method above-mentioned.

The Perſians and other Eaſtern nations have divers methods of making eunuchs different from thoſe which obtain in Europe: we ſay, of making eunuchs, for it is not always done among them by cutting, or even colliſion. Cicuta and other poiſonous herbs do the ſame office, as is ſhewn by Paulus Ægineta. Thoſe eunuchized in this manner are called *thlibiæ*. Beſides which there is another ſort named *thlaſiæ*, in whom the genitals are left intire, and only the veins which ſhould feed them are cut; by which means the parts do indeed remain, but ſo lax and weak, as to be of no uſe. Id ibid. p. 12, ſeq.

Caſtration was for ſome time the puniſhment of adultery. *Valer. Maxim.* l. 6. c. 1. n. 13. See ADULTERY.

By the laws of the Viſigoths ſodomites underwent the ſame puniſhment. *Du Cange*, Gloſſ. Lat. T. 1. p. 873.

CASTRATION, in reſpect of brutes, is called *gelding*, *ſpaying*, &c. See GELDING and SPAYING, *Cycl.*

CASTRATION is alſo uſed by ſome phyſicians for correcting the more violent medicines, eſpecially purgatives. *Helm.* Tr. Pharmac. ac Diſpenſ. Modern. n. 49. *Brun.* Exerc. 1. de Remor. Purg. θ. 38. *Caſt.* Lex. Med. in voc. See CORRECTION, and CORRECTORS, *Cycl.*

CASTRATION alſo denotes the art of retrenching, or cutting away any part of a thing from its whole.

The antients ſpeak of *caſtrating* a bee-hive, by taking out the honey-combs; *caſtrare arbores*, *vites*, and the like, is uſed by Pliny, for the boring a hole in their bottom. *Plin.* Hiſt. Nat. l. 24. c. 8. *Cato*, de Re Ruſt. c. 23. *Fab.* Theſ. p. 486.

CASTREL, a kind of hawk reſembling the lanner in ſhape, but the hobby in ſize. The *caſtrel* called alſo *keſtrel*, is of a ſlow and cowardly kind,; her game is the growſe, though ſhe will kill a partridge. Dict. Ruſt. T. 1. in voc. See HAWK, and FALCONRY, *Cycl.* and *Suppl.*

CASTRENSIANI, or CASTRENSES, in antiquity, an order of ſervants in the Greek emperor's houſhold, to whom belonged the care and ſervice of what related to his table, and clothing.

They were thus called either on account of their attending the emperor, when in camp, or becauſe they obſerved a ſort of camp-diſcipline in the court; or rather becauſe they were conſidered as ſoldiers, were paid as ſuch, and had the privileges belonging to the military body. The *caſtrenſiani* were alſo called *caſtrenſes miniſtri*, and *miniſteriani*. *Pitiſc.* Lex. Ant. T. 1. p. 377. *Du Cange*, Gloſſ. Lat. T. 1. p. 874. Item Gloſſ. Græc. p. 576, & 604. *Schoetg.* Cur. Ant. Lex. p. 282.

To this order belonged the bakers, butlers, waiters, fullers, taſters, &c. They had a head, or ſuperior, who was called *comes caſtrenſis*, which was a Palatine dignity under the chamberlain.

CASTRENSIS, in medicine, an appellation given to certain contagious and epidemic diſeaſes, eſpecially fevers. Vid. *Helm.* de Febr. c. 10. n. 7. *Willis*, de Febr. c. 14. *Caſt.* Lex. Med. p. 141. See CAMP-*diſeaſe*, &c.

CASTRUM *doloris*, in middle-age writers, denotes a catafalco, or a lofty tomb of ſtate, erected in honour of ſome perſon of eminence, uſually in the church where his body is interred; and decorated with arms, emblems, lights, and the like. *Fæſc.* Ing. Lex. p. 161.

Eccleſiaſtical writers ſpeak of a ceremony of conſecrating a *caſtrum doloris*; the edifice was to be made to repreſent the body of the deceaſed, and the prieſt and deacon were to take their poſts, and ſay the prayers after the ſame manner as if the corpſe were actually preſent. *Magr.* Notit. Vocab. Eccleſ. p. 58. See alſo *Du Cange*, Gloſſ. Lat. T. 1. p. 878.

CASUAL, ſomething that happens fortuitouſly, or without any deſign or meaſures taken to bring it to paſs.

CASUAL *revenues*, are thoſe which arrive from forfeitures, confiſcations, deaths, attainders, &c.

CASUAL *theology*, a denomination given by ſome to what is more frequently called caſuiſtry. See CASUISTRY.

Adam Oſiander, chancellor of the univerſity of Tubingen, has publiſhed a ſyſtem of *caſual theology*, containing the ſolution of dubious queſtions, and caſes of conſcience. Theologia caſualis, 6 vol. 4°. Tubing. 1682. Vid. Act. Erud. Lipſ. 1682. p. 282.

CASUALTY, in the tin-mines, a word uſed to denote the earth and ſtony matter which is, by waſhing in the ſtamping-mills, &c. ſeparated from the tin ore, before it is dried and goes to the crazing mill.

CASUARIUS, the *caſſowary* or *Emeu*, a large bird ſomewhat reſembling the oſtrich.

In the Linnæan ſyſtem of zoology this makes a diſtinct genus of birds of the order of the gallinæ; the diſtinguiſhing characters of which are, that there are three toes on each foot, and thoſe placed before, the creature having no hinder toe, and the head has a creſt and naked wattles. *Linnæi* Syſtem. Naturæ, p. 47.

CASUIST, a perſon who profeſſes to reſolve caſes of conſcience.

Eſcobar has made a collection of the opinions of all the *caſuiſts* before him. Trev. Dict. Univ. T. 1. p. 1500.

M. le Feore, preceptor of Lewis XIII. called the books of the *caſuiſts*, the art of quibbling with God [a]; which does not ſeem far from the truth; by reaſon of the multitudes of diſtinctions and ſubtilties they abound withal. The ſame perſon uſed to call Cicero his *caſuiſt*, on account of his book of offices [b]. Mayer has publiſhed a bibliotheca of *caſuiſts*, containing an account of all the writers on caſes of conſcience, ranged under three heads; the firſt comprehending the Lutheran, the ſecond the Calviniſt, and the third the Romiſh *caſuiſts* [c]. — [a] L'Art. de Chicaner avec Dieu. Vid. Nouv. Rep. Lett. T. 28. p. 293. [b] Trev. Dict. Univ. T. 1. p. 1500. [c] Biblioth. Script. Theol. Mor. & Conſcient. annexed to Strauch. Theol. Moral. Griphiſis, 1708. 8vo. Vid. Jour. des Scav. T. 40. p. 461.]

CASUISTICAL *theology*, the ſcience of caſuiſtry. See the article CASUISTRY.

Caſuiſtical theology bears a near affinity to *moral* theology.

CASUISTRY, the doctrine and ſcience of conſcience, and its caſes; the rules and principles of reſolving the ſame; drawn partly from natural reaſon and equity; partly from authority of ſcripture, the canon law, councils, fathers, &c.

To *caſuiſtry* belong the deciſion of all difficulties ariſing about what a man may conſcientiouſly do, or not do; what is ſin, or not ſin; what things a man is obliged to do in order to diſcharge his duty, and what he may let alone without breach of it. Vid. *Du Pin*, Meth. of Stud. Divin. c. 27. p. 304.

CATS-*eye*, among naturaliſts, a kind of precious ſtone, of a lucid texture, whoſe colours are variable, according to the poſition of the ſtone to the light.

Cat's-eye is by the Latins called *oculus cati*, and ſometimes *onycopalus*, as having white zones or rings like the onyx; and its colours variable like opal, from which laſt it differs chiefly by its ſuperior hardneſs. *Grew*, Muſ. Reg. Societ. P. 3. Sect. 1. c. 4. p. 290. See ONYX and OPAL.

The *cat's-eye* is of a gliſtering grey, interchanged with a ſtraw colour, and anſwers the deſcription given by Pliny of the Aſteria, between which and our *cat's-eye* there appears no other difference than that the antients took their denomination from the brightneſs and ſhining of the ſtone, whereas the modern name is taken from the figure of it. *Woodw.* Meth. Foſſ. Claſs. 2. p. 21. See ASTERIA.

CAT-*gut*, a denomination given to ſmall ſtrings for fiddles, and other inſtruments, made of the inteſtines of ſheep or lambs dried and twiſted, either ſingly, or ſeveral together.

Theſe are ſometimes coloured red, ſometimes blue, but are commonly left whitiſh or browniſh, the natural colour of the gut. They are uſed alſo by watch-makers, cutlers, turners, and other artificers. Great quantities are imported into England, and other northern countries, from Lyons and Italy. *Savar.* Dict. Comm. T. 1. p. 1510. voc. *corde.*

CAT-*harpings*, are ſmall ropes running in little blocks from one ſide of the ſhrowds to the other, near the deck: their uſe is to force the ſhrowds, and make them taught, for the more ſecurity and ſafety of the maſts. *Guill.* Gent. Dict. P. 3. in voc.

CAT, or CAT-*head*, in a ſhip, is a ſhort piece of timber, lying aloft right over the hawſe, having at one end two ſhivers, wherein is reeved a rope, with a great iron hook faſtened to it, called *cat-hook*. *Botel.* Sea Dial. 4. p. 112.

Its uſe is to trice up the anchor from the hawſe to the top of the fore-caſtle. *Guill.* Gent. Dict. P. 3. in voc.

CAT's-*head* is alſo a denomination given to a ſort of waſte ſtony lumps, not inflamable, found in coal mines. In theſe there are frequently impreſſions of ferns. Phil. Tranſ. N° 366. p. 970.

CAT-*holes*, in a ſhip, are over the ports, as right with the capſtan as they can be: their uſe is to heave the ſhip a-ſtern upon occaſion, by a cable or a hawſer called ſtern-faſt. *Botel.* Sea Dial. 4. p. 112. *Guill.* Gent. Dict. P. 3. in voc.

CAT-*hooks*. See the article HOOK.

CAT *of mountain*, the name of a beaſt of prey approaching to the leopard kind. See the article *Catus* PARDUS.

CAT-*rope*. See the article ROPE.

CAT-*ſalt*, a name given by our ſaltworkers to a very beautifully granulated kind of common ſalt. It is form'd out of the bittern or leach brine, which runs from the ſalt when taken out of the pan. When they draw out the common ſalt from the boiling pans, they put it into long wooden troughs, with holes bor'd at the bottom for the brine to drain out; under theſe troughs are placed veſſels to receive this brine, and acroſs them are placed certain ſmall ſticks, to which the *cat-ſalt* affixes itſelf in very large and beautiful cryſtals. This ſalt contains ſome portion of the bitter purging ſalt, and is very ſharp and pungent, and is white when powdered, tho' pellucid in the maſs. It is uſed by ſome for the table, but the greateſt part of what is made of it is uſed by the makers of hard ſoap.

CAT-*silver*, a name given to certain fossil substances, usually called also glimmer, and in Latin, micæ. They are various species of the bracteria, or foliaceous talcs, in small spangles. See MICA.

CATABASION, Καταβασιον, in the Greek church, a place under the altar, wherein the relicks are kept.

The word is formed from καταβαινω. I descend; by reason they went down into it. *Du Cange*, Gloss. Gr. T. 1. p. 606. *Schoetg.* Cur. Ant. Lex. p. 283.

CATABATHMOS, Καταβαθμος, in antiquity, a steep valley, dividing Ægypt from Africa. *Sallust.* Bell. Jugurth. c. 20 and 21. Bibl. Choisi. T. 21. p. 367, seq. Fab. Thes. p. 487. *Heder.* Schul. Lex. p. 721, seq.

The word is formed from the Greek, καταβαινειν, to descend, on account of the hastiness and precipitation of its descent.

CATABULENSES, in the middle age, a sort of ministers or servants of the empire, appointed to conduct the public carriage from one *catabulum*, or stage, to another.

The *catabulenses* appear also to have had the charge of conveying the public corn to and from the mills; whence in the Theodosian code they are joined with bakers. *Cujac.* Observ. l. 16. c. 5. *Du Cange*, Gloss. Lat. T. 1. p. 878. *Schoet.* Ant. Lex. p. 283.

CATABULUM, in the middle age, a kind of stable or building, wherein beasts, especially of burthen and carriage, were kept for the public service. See CATABULENSES.

The antient christians were sometimes condemned to serve in the *catabula*, that is, to work at the cleaning of them, attending the beasts, &c. *Du Cange*, Gloss. Lat. T. 1. p. 878. *Schoet.* Lex. Ant. p. 283, seq. *Spelm.* Gloss. Lat. p. 129.

CATAC, in botany, a name by which some authors call agrimony. *Ger.* Emac. Ind. 9.

CATACAUSTIC. See *caustic by* REFLEXION.

CATACLASIS, Κατακλασις, in medicine, denotes a disorder of the eye, wherein the eye-lid is inverted by a convulsion of the muscles that close it; called also campylon. *Cast.* Lex. Med. p. 142. Item. p. 128. voc. *campylon.*

CATACLEIS, Κατακλεις, in anatomy, a cartilaginous bone, or rather a cartilage in the juncture of the omoplata, or shoulder-blade. *Cast.* Lex. p. 142.

CATACOMB (*Cycl.*) — The *catacombs* of Rome have made the greatest noise in the world; but there are such belonging to many other cities: Bishop Burnet[a] describes those of Naples, which he says are without the city, and much more noble and spacious than those of Rome. The like are also said to be in the neighbourhood of all the great towns in that part of Italy: and others have been discovered at Syracuse and Catanea in Sicily, and in the island of Malta[b]. The Roman *catacombs* take particular names from the churches in their neighbourhood, and seem to divide the circumference of the city without the walls, between them, extending their galleries every where under, and a vast way from it; so that all the ground under Rome, and for many miles about, some say for 20 miles, is hollow[c]. The largest, and those commonly shewn strangers, are the *catacombs* of San Sebastiano, those of Saint Agnese, and the others in the fields a little off Saint Agnese: For the *catacombs* in the church-yards of the Vatican, women are only allowed to go into them one day in the year, viz. on Whitsun Monday, on pain of excommunication[d]. — [a *Burn.* Trav. Lett. 4. p. 201. b *Bingh.* orig. Eccles. l. 23. c. 1. §. 3. Ouvr. des Sav. 1688. Maij. p. 38. c Phil. Trans. N° 265. p. 644 and 650. d *Cyprian*, de Eccles. Subterr. §. 13.]

There are men kept constantly at work in the *catacombs*. As soon as these labourers discover a grave, with any of the supposed marks of a saint about it, intimation is given to the cardinal Camerlingo, who immediately sends men of reputation to the place, where finding the palm, the monogram, the coloured glass, &c. the remains of the body are taken up with great respect, and translated to Rome. After the labourers have examined a gallery, they stop up the entry that leads into it; so that most of them remain thus closed; there being only a few left open, to keep up the trade of shewing them to strangers. This they say is done to prevent poeple's losing themselves in these subterraneous labyrinths, which has often happened: but more probably to deprive the public of the means of knowing whither and how far the *catacombs* are carried. *Monro*, in Phil. Trans. N° 265. p. 644. The opinion, that the catacombs were Heathen burying places, is confirmed from hence, that the antient Romans are known to have had such burying places, under the name of *puticuli*; and even in the very places where now the *catacombs* are found[a], that there are divers indications of Heathenism about the tombs in the *catacombs*; such are the names of the persons interred, the formula *diis manibus*, at the head of the inscriptions; the figures of Orpheus, Cupid, and other Heathen deities, which Christians would never have engraved on their dormitories. For the monogram ☧, it proves nothing, since this way was in use among the Heathens before the time of Christianity, as has been shewn by Menckenius, in a dissertation express, published in 1696. Add, that the figures of doves and palms were also frequently used on the tombs of the Heathens; that 'tis impossible the Christians could have had the instruments of torture from the Heathens, since the former durst scarce appear at executions. How much less would they have been able to bring away phials of blood from the execution of their martyrs? Above all, that 'tis no-ways probable the Christians under the Heathen emperors should have been able to dig such vast works, without being perceived by the Heathens. The very earth they dug out must have made mountains, which itself must have discovered them[b]. — [a Vid. *Kirchman.* de Funer. Rom. l. 2. c. 24. b Vid. *Basnage*, Ouvr. des Sc. iv. 1688. Mai, p. 38. *Horn.* Diss. de Catacombis seu Cryptis Sepulchralibus SS. Martyrum. Lipsi. 1703. *Schoetg.* Lex. Ant. p. 285, seq.]

All this may be allowed just, except what relates to the identity of the *catacombs* with the *puticuli*; which Mr. Monro thinks carries less probability with it than the common opinion of the Romanists.

Would Festus have called such immense works as the *catacombs*, by the diminutive name *puticuli*? Would he have confined them to a single place, viz. without the Esquiline gate, when the *catacombs* are found every where about Rome? How could holes, wherein bodies were thrown together in heaps to rot, be confounded with repositories, cut regularly in the face of a long gallery, one over another, sometimes to the number of seven, in each of which a single body is laid, and handsomely done up again, so that nothing could offend the sight of those who went in; especially with the little rooms interspersed in the fashion of chapels, which have all the appearances of being the sepulchres of people of distinction? *Monro*, ubi supra, p. 646.

Monro therefore takes a medium between the two contrary extremes: he supposes the *catacombs* to have been originally the common sepulchres of the first Romans, before the practice of burning was introduced.

CATADIOPTRICAL *telescope*, the same with reflecting *telescope*. See TELESCOPE.

CATADROMUS, Καταδρομος, in antiquity, a stretched sloping rope in the theatres, down which the funambuli walked, to shew their skill. See FUNAMBULUS, *Cycl.*

Some have taken the word to signify the hippodrome, or decursorium, wherein the Roman knights used to exercise themselves in running and fighting on horseback.

But the most natural meaning is that of a rope, fastened at one end to the top of the theatre, and at the other to the bottom, to walk or run down, which was the highest glory of the antient schænobates, or funambuli. Elephants were also taught to run down the *catadromus*[a]. Suetonius speaks of the exploit of a Roman knight, who run down the *catadromus* mounted on an elephant's back[b]. — [a *Xiphil.* l. 61. p. 697. b *Suet.* in Ner. c. 11. p. 5. Vid. *Pitisc.* Lex. Ant. T. 1. b. 378. *Fab.* Thes. p. 488.]

CATADUPA (*Cycl.*) — The appellation *catadupa* seems to have been peculiarly given to a place in Æthiopia joining on Egypt, where the Nile, which here first assumes that name, rushed down a steep rock into the subjacent plain, with a noise so impetuous, that the inhabitants are said to have lost all sense of hearing. *Cic.* de Somn. Scipion. Vid. Etiam *Senec.* Nat. Quæst. l. 4. c. 2. *Ammian. Marcellin.* l. 22. c. 34, &c. 36. *Plin.* Hist. Nat. l. 5.. c. 9. *Vitruv.* de Archit. l. 8. c. 2. *Fab.* Thes. p. 488.

CATAGOGION, Καταγωγιον, a Heathen festival at Ephesus, celebrated on the 22d of January, in which the devotees run about the streets dressed in divers antic and unseemly manners, with huge cudgels in their hands, and carrying with them the images of their gods; in which guise they ravished the women they met with, and abused, and often killed the men, and committed many other disorders, to which the religion of the day gave a sanction. Vid. *Du Cange*, Gloss. Græc. T. 1. p. 607.

Meursius and Castellanus, who wrote *de Festis Græcorum*, have taken no notice of this. *Schoetg.* Lex. Ant. p. 287.

CATAGRAPHA, Καταγραφα, in antiquity, denote oblique figures, or views of mens faces; answering to what the moderns call *profiles*. See PROFILE, *Cycl.* and *Suppl.*

Catagrapha are said to be the invention of Simon Cleonæus, who first taught painters to vary the looks of their figures, and sometimes direct them upwards, sometimes downwards, and sometimes sidewards or backwards. Vid. *Plin.* Hist. Nat. l. 35. c. 8. *Hardou.* Not. ad eund. ib. *Jun.* Paint. of Anc. l. 3. c. 4. p. 290.

CATALEPSIS (*Cycl.*) is the same with what is otherwise denominated *catoche*, or *catochus*, and *gelatio* or *congelatio*. *Cast.* Lex. Med. p. 359, voc. *gelatio.* See CATOCHE, &c.

Some also make it the same with *coma vigil*[a]; others will have it different[b]; tho' wherein the distinction lies is not easy to assign[c]. — [a Vid. *Lang.* Epist. Medic. l. 1. Ep. 25. b Dieter. Jater. n. 863. c *Cast.* Lex. Med. p. 143. *Shaw*, New Pract. Phys. p. 8.] See COMA, *Cycl.*

CATALEPSY (*Cycl.*) — In the history of the royal academy of sciences at Paris, we have an account of a woman who had a surprising *catalepsy*, her members keeping all the postures they were put into, as if she had been made of wax. An. 1738.

CATALOGUE (*Cycl.*) — *Catalogues* of books are digested in different manners, some according to the order of the times when the books were printed, as that of Mattaire; others according

cording to their form and size, as the common booksellers *catalogues*; others according to the alphabetical order of the author's names, as Hyde's *catalogue* of the Bodleian library; others according to the alphabetical order of matters or subjects which are called real or classical *catalogues*, as those of Lipenius and Draudius; lastly, others are digested in a mixed method, partaking of several of the former, as de Seine's *catalogue* of cardinal Slusius's library, which is first divided according to the subjects or sciences, and afterwards the books in each are recited alphabetically. Catalog. Biblioth. Slusian. Rom. 1690, 4to. *Struv.* Introd. Notit. Rei Liter. c. 1. §. 23. Item. Not. p. 113, seq.

Some *catalogues* are valued for the multitude of their books, others for their choice and excellency, others for their manuscripts, and others for the conveniency of their method, and the justness of their arrangment.

The bibliotheca Telleriana excels chiefly in books of theology and ecclesiastical history; that of the Colbertin library, in historical books; that of Bridges, in antient poets; that of Dr. Bernard in mathematical books, &c. The *catalogue* of Nic. Heinsius's library is in great esteem for the exquisite choice of the books [a]: that of the Coislin library [b], composed by Montfaucon, excels in manuscripts, both Oriental and Latin, but chiefly Greek: it is drawn up after the manner of the Vienna library, and contains a notitia or short history of each manuscript, the time when wrote, the copist by whom, the number of leaves, place where it had lain hid, &c.[c] Scavenius's *catalogue* of the royal library at Copenhagen [d], is much esteemed for the orderly method of its digestion; but it has been long scarce. F. Garnier's *catalogue* of the jesuits library at Paris, is not so properly an account of the books in the library, as a plan of a just method of disposing a library. The *catalogue* of the Cordesian library composed by Naude[e], is ranked in the number of the best *catalogues*, by reason of the exactness of the order wherein the books are ranged. The *catalogue* of the Barberin library is valuable on many accounts; as for the number, the splendor, the choice, order and usefulness of the books, &c.[f] But the most applauded of all *catalogues* is that of Thuanus's library, in which are united the advantages of all the rest. It was first drawn up by the two Puteani in the alphabetical order, then digested according to the sciences and subjects by Isham. Bullialdus, and published by F. Quesnel at Paris in 1679 [g]; and reprinted, tho' incorrectly, at Hamburgh, in 1704. The books are here ranged with justness under their several sciences and subjects, regard being still had to the nation, sect, age, &c. of every writer. Add, that only the best and choicest books in every subject are found here, and the most valuable editions. Yet the *catalogue* of M le Telliers, archbishop of Rheims', library [h], made by M. Clement, is not inferior to any published in our age, either on account of the number and choice of the books, or the method of its disposition: On the plan of this, a *catalogue* of the king of France's library was proposed to be published, which we are still in expectation of. One advantage peculiar to this *catalogue*, is the multitude of anonymous and pseudonymous authors detected in it, scarce to be met with elsewhere [i]. Some even prefer it to Thuanus's *catalogue*, as containing a greater variety of classes and books on particular subjects.—[[a] *Morhof.* lib. infra cit. c. 18. §. 10. *Struv.* ubi supr & Not. p. 115. [b] Bibliotheca Coisliniana, olim Segueriana, Par. 1714. fol. [c] *Coler.* Anal. ad *Struv.* lib. cit. p. 117, seq. [d] Designatio Bibliothecæ Regiæ Hafnienſis, Hafn. 1665. 4to. [e] Catalogus Bibliothecæ Cordesianæ, Paris 1643. 4to. *Morhof.* Polyhist. Liter. l. 1. c. 5. §. 7. *Struv.* lib. cit. [f] Index Bibliothecæ quæ Franc. Barberinus's S. R. E. Cardin, &c. Rom. 1681, 2 vol. fol. the title-page indeed mentions 3 volumes; but the 3d, which was to contain the MSS. is not yet published. [g] Bibliotheca Thuanea, Par. 1679, 8vo. 2 vol. and Hamb. 1704, fol. & 8vo. Vid. *Morhof.* Polyhist. Liter. l. 1. c. 5. §. 11, seq. *Baillet*, Jugem. des Scav. T. 2. p. 260. *Struv.* Introd. ad Hist. Liter. c. 1. §. 23. [h] Catalogus Bibliothecæ Pellerianæ, Par. 1693, fol. *Struv.* lib. cit. [i] Vid Act. Erud. Lipsi. 1694, p. 353. *Coller.* Anal. ad *Struv.* p. 116.]

The conditions required in a *catalogue* are, that it indicate at the same time the order of the authors and of the matters, the form of the book, the number of volumes, the chronological order of the editions, the language it is written in, and its place in the library; so as that all these circumstances may appear at once, in the shortest, clearest, and exactest manner possible. In this view, all the *catalogues* yet made will be found to be defective. Draudius's *catalogue* is an alphabetical table of matters divided under four classes, in which are indicated the books which treat on each subject, the year of their edition, name of the editor, title of the work, and form of the volume. Its defects are, that no chronological order is observed; that the works of the same writer are too much dispersed, and that the whole is only a compilation full of faults and ill digested, of the *catalogues* of the Francfort fairs.

Dr. Hyde's *catalogue* of the Bodleian is also disposed according to the alphabetical order, not of the matters, but of the authors only, referred to four classes, and under each book notice is given to which of those classes it belongs. Its defects are, that we cannot by it find all the authors who have treated on any subject; that the anonymous authors cannot be here conveniently introduced; that the order of the editions does not appear; that the forms are confounded, and the translations with the originals.

The *catalogue* of M. le Tellier's library has the advantages of all the former, being disposed in the order of the subjects, and having at the same time an alphabetical index of the authors: besides, that in works printed in several languages, the natural order of texts is observed, by placing the original first, and then the versions, each according to its merit or its antiquity. Lastly, that the chronological order of the editions is exactly observed. Its defects are, that the chronology of the editions is somewhat confused, that we are obliged to seek the writings of the same author in different places, when they happen to be in different forms, and that there wants an alphabetical table of the matters.

The *catalogue* of abbot Faultrier's library, composed by M. Marchand, is disposed according to the order of matters, but in a manner peculiar to itself, in as much as the authors on each subject are also ranged in their chronological order. Its defects are, that the different forms are confounded, as well as the chronology of the texts, and that the exactitude observed in the chronology of the authors is not perceived.

An anonymous French writer has laid down a new plan of a *catalogue*, which shall unite all the advantages, and avoid all the inconveniencies of the rest. Lett. a l'Abbe ***, sur un Nouveau Projet de Catalogue de Bibliotheque. Par. 1712. Vid. Jour. des Scav. T. 52. p. 33, seq.

CATALONGAY, in botany, the name given by some authors to the plant which produces the faba sancti Ignatii, or saint Ignatius's beans of the shops. Pluk. Mont. p. 60.

CATAMENIA, Καταμηνια, in medicine, women's monthly purgations, called also *menses*. *Gorr.* Med. Defin. p. 213. *Drak.* Anthrop. l. 1. c. 23. See MENSES, *Cycl.* and *Suppl.*

CATANADROMI, in Ichthyography, a term of the same signification with the more used word *anadromi*, the distinctive term of a set of fishes, which at times leave the fresh water for the salt, and afterwards return to the fresh water again. *Gesner*, de Pisc. See ANADROMOUS.

CATANANCE, in botany, the name of a genus of plants, the characters of which are these; the flower is of the semifloscular kind, being composed of a number of floscules, standing upon the embryo seeds, and all contained in a general squammose cup. The embryos finally become seeds, crowned with a sort of foliaceous heads, and are contained till ripe in the cup. The species of *catanance* enumerated by Mr. Tournefort, are these: 1. The coronopus-leav'd blue-flowered *catanance*, called by some the cyanus-headed blue succory. 2. The *catanance* with double blue flowers. 3. The broad leav'd yellow-flower'd *catanance*, called the plantain-leav'd stæbe; and, 4. The narrow-leav'd yellow-flowered *catanance*. *Tourn.* Inst. p. 478.

CATAPELTÆ, Καταπελται, in antient writers, sometimes denote arrows, and sometimes engines wherewith either arrows, stones, or even huge pieces of timber were cast. Pliny ascribes the invention of the *catapeltæ* to the Syrians; Plutarch and Diodorus to the Sicilians. *Pott.* Arch. Græc. l. 3. c. 10. p. 95.

It is more frequently written *catapulta*. See CATAPULTA.

CATAPHORA, in a theme of the heavens, an appellation given to the houses falling from the 3d, 6th, 9th, and 12th angles. In which sense the word stands opposed to *anaphora*. *Vital.* Lex. Math. p. 96. See ANAPHORA, *Cycl.*

CATAPHRACTA, Καταφρακτη, in the antient military art, a piece of heavy defensive armour, formed of cloth or leather, fortified with iron scales or links, wherewith sometimes only the breast, sometimes the whole body, and sometimes the horse too, was covered.

The *cataphracta* was in antient use among the Sarmatians [a], Persians, and other barbarians. The Romans also adopted it early for their foot; and according to Vegetius, kept to it till the time of Gratian, when the military discipline growing remiss, and field exercises and labour discontinued, the Roman foot thought the *cataphracta*, as well as the helmet, too great a load to bear, and therefore threw both by, chusing rather to march against the enemy bare-breasted: by which in the war with the Goths, multitudes were destroyed [b].—[[a] *Tacit.* Hist. l. 1. c. 79. [b] *Veget.* de Re Milit. l. 1. c. 20. *Aquin.* Lex. Milit. T. 1. p. 182.]

CATAPHRACTA, Καταφρακτα, among surgeons, denotes a bandage or ligature of the thorax; thus denominated from its resemblance to a Roman breast-plate, called *cataphracta*. *Castel.* Lex. Med. See BANDAGE.

CATAPHRACTÆ *naves*, those armed and covered in fight, so that they could not be easily damaged by the enemy.

The *cataphractæ* naves were covered over with boards or planks, on which the soldiers were placed to defend them. The rowers sitting underneath, thus skreened from the enemies weapons.

CATAPHRACTUS, Καταφρακτος, denotes a thing defended or covered on all sides with armour. *Pitisc.* Lex. Ant. T. 1. p. 379.

CATAPHRACTUS, or CATAPHRACTARIUS, more particularly denotes a horseman, or even horse, armed with a cataphracta. See CATAPHRACTA.

The *cataphracti equites* were a sort of cuirassiers, not only fortified

tified with armour themſelves, but having their horſes guarded with ſolid plates of braſs or other metals, uſually lined with ſkins, and wrought into plumes or other forms. *Pott.* Arch. Græc. l. 3. c. 3. p. 18.

The uſe of the *cataphracti equites*, was to bear down all before them, to break in upon the enemies ranks, and ſpread terror and havock wherever they came, as being themſelves invulnerable and ſecure from danger. But their foible was their unweildineſs, by which, if once unhorſed, or on the ground, they were unable to riſe, and thus fell a prey to the enemy.

CATAPHRACTUS *pogge*, in zoology. See POGGE.

CATAPLASM (*Cycl.*) — CATAPLASMA *é cymino*, the *cummin ſeed cataplaſm*, a form of medicine preſcribed in the late London diſpenſatory, and meant as a ſubſtitute for the theriaca Londinenſis, or London treacle, of former diſpenſatories, which has of late been uſed only externally, and for ſuch purpoſes as it is thought this will better ſerve for. The compoſition is this: take cummin ſeeds half a pound; bay-berries and leaves of ſcordium dried, of each three ounces; of cloves one ounce; honey, three times the weight of the whole; mix all together into a *cataplaſm*. *Pemberton*'s Lond. Diſp. p. 378.

CATAPLASMA *maturans*, a form of medicine in the late London pharmacopœia, ordered to be made in the following manner: take dried figs, four ounces; yellow baſilicon, one ounce; ſtrained galbanum, half an ounce: beat well the figs with a little wine, or ſtrong ſtale beer, and then carefully mix in the ointment, firſt melted with the galbanum. *Pembert.* Lond. Diſp. p. 379.

CATAPOTIA, Καταποτια, dry medicines, in a form fit to be ſwallowed whole; otherwiſe called *pills*. *Caſt.* Lex. Med. p. 145. voc. *Catapoſis*. *Junck.* Conſp. Form. Med. Tab. 3. p. 29.

CATAPULTA (*Cycl.*) — The word is originally Greek, Καταπελτης, formed απο της πελτης, which according to Heſychius, denotes a ſpear or dart. Hence it is ſometimes alſo written *catapelta*. See CATAPELTA.

The *catapeltæ* were alſo denominated οξυβολοι, in regard they threw ſharp wooden weapons, whereas thoſe caſt by the baliſtæ were obtuſe, viz. ſtones. *Felib.* Princ. de l'Archit. p. 368. *Perrault*, Abr. of Vitruv. c. 3. art. 7. p. 156. *Wolf.* Lex. Math. p. 320.

The *catapulta* differed from the baliſta, in that the latter threw ſtones, the former darts and javelins. The authors of the middle age, and even Cæſar himſelf, ordinarily confound the two, uſing the word balliſta for what the antients called *catapulta*. *Lipſ.* Poliorcet. 3. 2. de Laët. Lex. Vitruv. p. 22. *Pitiſc.* Lex. Ant. T. 1. p. 379. See BALISTA.

The *catapulta* conſiſted of two huge timbers, like maſts of ſhips, placed againſt each other, and bent by an engine for the purpoſe; theſe being ſuddenly unbent again by a ſtroke of an hammer, throw the javelins with incredible force. Its ſtructure, and the manner of working it, are deſcribed by Vitruvius, and a figure of it is alſo given by Perrault [a]. M. Folard aſſerts, that the *catapulta* made infinitely more diſorder in the ranks than our cannon loaden with cartridges [b].—[[a] Vid. *Vitruv.* de Archit. l. 10. c. 15. & c. 18. *Perr.* Not. ad eund. p. 335. Item, Abr. of Vitruv. c. 3. art. 7. p. 156. [b] *Folard* Not. ſur Polyb. T. 2. p. 587. 592, ſeq. 601. *Fæſch.* Ing. Lex. p. 162.]

CATAPUTIA, in botany, the name of a ſpecies of ſpurge, called alſo by ſome *lathyris*, and diſtinguiſhed among authors by the name *tithymalus latifolius*. See the article TITHYMALUS.

Some make two ſorts of *cataputia*, the major called alſo ricinus Americanus, and palma Chriſti; and the minor, which, as before ſaid, is a ſpecies of ſpurge. Both agree in their purgative quality, which is ſo violent, that they are rarely ordered, except by empirics [a], tho' the college retains them both [b]. 'Tis a traditionary fable, tho' of great antiquity, that the leaves of *cataputia* being plucked upwards, work by vomit, and when plucked downwards, by ſtool [c].—[[a] Vid. *Quinc.* Pharm. Lect. 4. p. 49. Item, in Diſpenſ. P. 2. Sect. 8. n. 470. *Junck.* Conſp. Ther. p. 42. & 67. [b] Pharm. Coll. Reg. Med. Lond. p. 121. [c] *Brown*, Vulg. Err. l. 2. c. 7. p. 83.]

The leaves of the *cataputia* reſemble thoſe of the plane-tree, but are larger, blacker, and more gloſſy: Its branches, as well as trunk, are hollow like a reed. Of its ſeed is made an oil commended againſt burns, and uſed in the compoſition of ſome plaiſters. *Savar.* Dict. Comm. T. 1. p. 590.

CATARACT (*Cycl.*)—The *cataract* is now generally agreed to be, for the moſt part, the chryſtalline humor rendered opaque. We have the hiſtories of ſome diſſections of cataractous eyes, by Dr. Scheuchzer, in the Act. Phyſic. Medic. Acad. Nat. cur. Tom. 3. Obſ. 36. and by Dr May, in the Commerc. Norimb. 1733. Hebd. 4. §. 3. and by Dr. Agricola in 1735. Hebd. 18. tending to confirm this doctrine. Med. Eſſ. Ed. Abrid. Vol. 2. p. 438, 508.

We have an account by Mr. Monro of an eye of a man who had had a *cataract*. The opaque chryſtalline lens was not ſo large as it commonly is in a ſound eye, and inſtead of being circular, was of a triangular form. Its anterior convexity was ſcabrous and unequal, and of a yellow white colour. Med. Eſſ. Edinb. Vol. 5. Art. 54.

CATARACTA, in zoology, the name of a bird of the larus or ſea-gull kind, very much approaching to the nature of our gannet, but ſmaller, and with ſhorter and weaker claws. It much reſembles the goſhawk. Its back and wings are variegated with brown, yellow, and white; its breaſt and belly are white, variegated with brown ſpots; its wings are long, and when folded, reach to the end of the tail; its legs are grey, its feet webbed, and its claws crooked and ſmall. *Aldrovand.* de Avib.

CATARACTES, in zoology, a name by which ſome authors have called the large ſea-gull; called in Cornwall, where it is very common, the gannet. See GANNET.

CATARIA, *catmint*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of the labiated kind; the upper lip is roundiſh, erect, and bifid; the lower is divided into three ſegments, the middle one of which is hollowed like a ſpoon, and the others ſurround like wings a remarkable orifice there is between the two lips: the piſtil ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower; this is ſurrounded by four embryos, which ripen into as many ſeeds of a roundiſh figure, to which the flower-cup ſerves as a capſule. The ſpecies of *catmint* enumerated by Mr. Tournefort, are theſe: 1. The common great *catmint*. 2. The common ſmaller *catmint*. 3. The common great narrow-leav'd *catmint*. 4. The ſmall alpine *catmint*. 5. The leſſer narrow-leav'd *catmint*. 6. The narrow betony-leav'd *catmint* of Spain, with blue flowers. 7. The narrow betony-leav'd *carmint* of Spain, with white flowers. 8. The Portugal betony-leav'd *catmint*, with tuberous roots. 9. The ſmaller Portugal betony leav'd *catmint*, with fibroſe roots. *Tourn.* Inſt. p. 201, ſeq.

CATARRHS (*Cycl.*) are of as many ſpecies as are the parts on which the rheum or matter falls. Hippocrates enumerates eight kinds of defluxions from the head, viz. on the eyes, noſe, ears, breaſt, abdomen, ſpinal marrow, vertebræ, and muſcles of the loins, and os ſacrum. The moderns only allow of three ſorts under the name of *catarrhs*; the firſt, wherein the matter falls on the noſe, more properly called *coryza*; the ſecond, on the fauces, called *branchus*; and the third on the thorax or breaſt, more particularly denominated a *catarrh*. The ſum of which is couched in the following diſtich,

Si fluit ad Pectus dicatur Rheuma Catarrhus,
Ad fauces branchus, ad nares eſto Coryza. *Caſt.* Lex. Med. p. 146. *Shaw*, New Pract. Phyſ. p. 31. See CORYZA, &c.

Slow CATARRH, that wherein the peccant matter flows gently.

Haſty CATARRH, that wherein it ruſhes on the part with vehemence.

Suffocative CATARRH, a rapid defluxion of a ſerous humour from the head to the organs of reſpiration. *Sylv.* Prax. Med. c. 22. §. 11. *Nent.* Fund. Med. T. 2. tab. 80. p. 146. See SUFFOCATIVE *catarrh*.

Pituitous CATARRHS are aſcribed by Sylvius to a viſcid food, and cold air [a]. Helmont has a treatiſe expreſs *de Deliramentis Catarrhorum*, wherein he pleads for their being thrown out of the conſideration of medicines, and left to nature alone [b].—[[a] *Sylv.* loc. cit. c. 13. §. 14. [b] Vid. *Helm.* de Deliram. Catarrh. Item de Lithiaſi. c. 1.]

CATARRHAL *fever*, a ſecondary or ſymptomatic fever, by means whereof nature endeavours to correct the vitious quality of the lymph, and expel it the body. *Nent.* Fund. Med. T. 2. tab. 136. c. 9. p. 525. *Junck.* Conſp Med. tab. 48. p. 309 See FEVER.

There is alſo a malignant *catarrhal* fever, nearly akin to the petechial fever. *Nent.* loc. cit. c. 10. p. 533. *Junck.* ubi ſupra, tab. 49. p. 317.

CATASARCA, Καταſαρκα, in the Greek church, denotes the undermoſt altar cloth, or that next the table. See ALTAR.

Over the *cataſarca* is the *antimenſa*. *Du Cange.* Gloſſ. Græc. T. 1. p. 613. *Schoet.* Lex. Ant. p. 287, ſeq. See ANTIMENSA.

CATASCOPIUM, in antiquity, an exploratory veſſel, anſwering in ſome meaſure to a brigantine among us. *Gyrald.* de Navig. c. 18. *Pitiſc.* Lex. Ant. T. 1. p. 380. See BRIGANTINE.

We find *cataſcopium* uſed in this ſenſe by Cicero, ad Attic. l. 5. ep. 11.

CATASCOPUS, in antiquity, denotes a ſpy. *Hirt.* de Bell. Afric. c. 26. *Fab.* Theſ p. 490. See SPY.

In eccleſiaſtical writers, *cataſcopus* is ſaid ſometimes to denote an archdeacon. *Jac.* Law Dict in voc.

CATASTA, in antiquity, a wooden ſcaffold, whereon ſlaves were placed for ſale naked, that thoſe diſpoſed to purchaſe, might ſee every limb and part. *Pitiſc.* Lex. Ant. p. 380. *Schoet.* Lex. Ant. p. 288.

Some will have the *cataſta* to have been a ſort of ſtocks, or oblong wooden frame, in which ſlaves for ſale were kept faſt with chains, to prevent their flight. *Plin.* Hiſt Nat. l. 35. c. 18. *Hardou.* Not. ad loc. *Calv.* Lex. Jur. p. 154.

The word was alſo uſed for an elevation, on which perſons were executed; and for an engine of torture, otherwiſe called *equuleus*. *Fabr.* Theſ. p. 490. See EQUULEUS, *Cycl.*

The *cataſta* does not appear to have been the ſame with the equuleus, but rather a kind of frame or ſcaffold, on which the equuleus was mounted, to render the executions more public

and visible. Prudentius calls the cratis, or grid-iron, on which some of the martyrs were broiled, *ignea catasta*. *Pitisc.* Lex. Ant. T. 1. p. 380.

CATASTROMATA, in antient military writers, a sort of scaffolds or floorings in ships of war, whereon the soldiers were posted for their defence in fight.

The *catastromata* appear to have been chiefly erected over the head and stern of the vessel, it being in these parts that the soldiers were most commonly posted. Vid. *Scheff.* de Milit. Naval. l. 2. c. 5. *Aquin.* Lex. Milit. T. 1. p. 186.

CATCH *fly*, in botany. See LICHNIS.

CATCH-*word*, among printers, denotes the first word of a page, which is put also at the bottom of the preceding page, in order to shew how the leaves and sheets follow each other, and facilitate the folding and binding.

The French sometimes only put the *catch-words* at the end of each sheet, or even quire or gathering. *Savar.* Dict. Com. T. 2. p. 1284. voc. *reclame*.

CATCHES, in clock-work, those parts of a clock that hold by hooking, and catching hold.

CATE, in botany, a name given by some authors to the *lycium Indicum*, or Indian thorn. *J. Bauhin*, vol. 1. p. 61. See LYCIUM.

CATECHESIS, Κατηχησις, in a general sense, denotes an instruction given any person in the first rudiments of an art or science, but more particularly in the principles of the christian religion. Journ. Liter. T. 11. P. 2. p. 311.

In the antient church, *catechesis* was an instruction given, viva voce, either to children, or adult Heathens, preparatory to their receiving of baptism. *Fab.* Thes. p 491.

In which sense *catechesis* stands contradistinguished from mystagogica, which were a higher part of instruction given to those already initiated, and containing the mysteries of faith.

Those who give such instructions are called *catechists*, and those who receive them *catechumens*. See CATECHIST.

CATECHESIS is also used for a book containing the rudiments of the christian religion, adapted to the use and instruction of novices. See CATECHISM.

The *catecheses* of St. Cyril, are the principal work of that father. *Du Pin*, Bibl. Eccles. T. 2. p. 134, seq. & p. 144.

CATECHETIC, or CATECHETICAL, something that relates to oral instruction in the rudiments of christianity. See CATECHESIS and CATECHISM.

In the early ages of the church there were *catechetic* schools, wherein sacred learning and philosophy were taught. These were public auditories, distinct from the church, but probably adjoining thereto. In a novel of the emperor Leo, they are called κατηχεμενα, and represented as a sort of edifices belonging to the church. St. Ambrose speaks of these auditories as held in the baptistery. *Bingh.* Orig. Eccles. l. 3. c. 10. §. 4.

CATECHISM, *catechismus*, in its primary sense, an instruction or institution in the principles of the christian religion, delivered viva voce, and so as to require frequent repetitions from the disciple or hearer of what had been said. *Calv.* Lex. Jur. p. 154.

The word is formed from κατηχεω, a compound of κατα and ηχος, q. d. *circum sono*, alluding to the noise or din made in this exercise, or to the zeal and earnestness wherewith things are to be inculcated over and over on the learners.

Antiently the candidates of baptism were only to be instructed in the secrets of their religion by tradition, viva voce, without writing; as had also been the usage among the Egyptian priests, and the British and Gaulish druids, who only communicated the mysteries of their theology by word of mouth. *Calv.* Lex. Jur. p. 155. *Shaftsb.* Char. T. 3. p. 241. not.

CATECHISM is more frequently used in modern times, for an elementary book, wherein the principal articles of religion are summarily delivered in the way of question and answer.

CATECHIST, Κατηχιστης, *catecheta*, he that catechises, *i. e.* instructs novices in the principles of religion. See CATECHESIS.

CATECHIST more particularly denotes a person appointed by the church, to instruct those intended for baptism, by word of mouth, in the fundamental articles of the christian faith.

The *catechists* of churches were ministers usually distinct from the bishops and presbyters, and had their auditories or catechumena apart. Their business was to instruct the catechumens, and prepare them for the reception of baptism. But the *catechists* did not constitute any distinct order of the clergy, but were chosen out of any other order. The bishop himself sometimes performed the office; at other times presbyters, or even the readers or deacons were the *catechists*. Origen seems to have had no higher degree in the church than that of lector, when he was made *catechist* at Alexandria, being only eighteen years of age, and consequently incapable of the diaconate. *Hieron.* de Scriptor. Eccles. in Origin.

The *catechists* are by some Greek authors called Ναυλολογοι, an appellation properly given among mariners to those whose business it was to admit passengers into the ship, and contract with them for their fare. This tallied to the *catechists* duty, which was to shew the catechumens the contract they were to make, and the conditions they were to perform, in order to their admittance into the christian church. *Clem.* Ep. ad Jacob. p. 14.

CATECHUMENUM, Κατηχεμενον, or *catechumenium*, a name given to the upper galleries in the antient churches.

There are two different opinions concerning the reason of this denomination; the first, that of Baronius, Wolfius and Meursius, who hold that it was in those galleries the catechumens were seated during the time of service, or at least that they were catechised there [a]. Du Cange, on the contrary, maintains that women were seated in those galleries, which were denominated *catechumena* from the instructions which that sex there received [b].—[a *Suic.* Thes. Eccles. T. 2. p. 75. seq. b *Du Cange*, Gloss. Lat. T. 1. p. 888, seq. Item, Gloss. Gr. p. 621. Trev. Dict. Univ. T. 1. p. 1507. *Bing.* Orig. Eccles. l. 8. c. 5. §. 7.]

The name *catechumenum* was also given to a sort of schoolhouse near the church, where the *catechumens* met to receive the instructions of the catechists. Leo. Novel. 73. *Bingh.* Orig. Eccles. l. 3. c. 10. §. 4. See CATECHETIC.

CATEGOREMA is defined a noun substantive, so absolute and independent, that it may stand at the head of a class apart. *Chauv.* Lex. Phil.

CATEGOREMA (*Cycl.*) also denotes a term which may be predicated of another.

In which sense it amounts to the same with predicable. *Micræl.* Lex. Phil. p. 245. & p. 1082. See PREDICABLE, *Cycl.*

CATEGOREMA is also frequently used for the same with predicament or category. *Walch.* Lex. Phil. p. 352. See CATEGORY, *Cycl.*

CATEGORIÆ, *prædicamenta*, in literary history. Aristotle has a book extant under the title of Κατηγοριαι, which Curio, Tonstius, Vives, and others, deny to be written by him, and ascribe to Andronicus; but without much foundation, since that work is cited as Aristotle's by Simplicius, Ammonius, and Lucianus. Vid. *Voss.* de Nat. & Const. Log. c. 10. §. 3. *Walch*, Hist. Log. l. 2. c. 1. Sec. 1. §. 6. *Parerg.* Acad. p. 521, seq.

CATEGORIARES, Κατηγοριαρης, a minister in the Greek church, whose business it is to publish or proclaim the feast days. He has also the care of the lights, and to see the church kept clean. *Du Cange*, Gloss. Græc. T. 1. p. 619. *Schoet.* Lex. Ant. p. 290.

CATEGORICAL, in a general sense, is applied to those things ranged under a category. See CATEGORY, *Cycl.*

CATEGORICAL also imports a thing to be absolute, and not restrained to conditions. See ABSOLUTE.

In which sense it stands opposed to hypothetical. *Micræl.* Lex. Phil. p. 246. See HYPOTHETICAL and CONDITIONAL, *Cycl.*

We say a *categorical* proposition, a *categorical* syllogism, &c. See PROPOSITION, SYLLOGISM, &c. *Cycl.*

A *categorical* answer denotes an express and pertinent answer made to any question or objection proposed.

CATEGORUMENUM, Κατηγορεμενον, denotes the predicate, or that part of a proposition which is affirmed of the subject. *Micræl.* Lex. Phil. p. 246. See PREDICATE, *Cycl.*

Some mistakenly call this *categorema*. *Scherz.* Man. Phil. p. 30.

CATEIA, in antient writers, a kind of dart or javelin, in use among the antient Gauls and Germans, made of heavy matter, and therefore not fitted to fly far, but doing great execution where it did reach, having withal an apparatus by which the person who threw it might draw it back again. *Isid.* Orig. lib. 18. c. 7. Lipf. Poliorc. 44. *Du Cange*, Gloss. Lat. T. 1. p. 889. *Pitisc* Lex. Ant. T. 1. p. 290. *Schoet.* Lex. Ant. p 290. It is spoken of by Virgil,

Teutonico ritu soliti vibrare catcias. *Virg.* Æneid. l. 7. v. 741.

CATEMIA, a name given by some of the writers of the middle ages to a soft black stone used in the soldering of silver, and some other metals, and more commonly called *horcus lapis*. We do not at this time know what stone they mean.

CATENA, (*Cycl.*) in a general sense, a chain. See CHAIN, *Cycl.*

CATENA *patrum*, in ecclesiastical writers, denotes a sort of commentary on scripture, composed of separate passages or interpretations of the fathers, reduced to the order of chapters and verses of the book.

The first who used *catena* in this sense, was Thomas de Aquinas. The reason of the appellation seems to be this: that as a chain consists of several links connected together, so do these commentaries consist of a number of different passages, or the sentiments and expositions of different writers, tacked together so as to form one work. Vid. *Fabric.* Bibl. Græc. T. 7. l. 5. c. 17. p 728.

We have *catenæ* of divers kinds and qualities, some compiled with judgment, and methodized with diligence, and others without either. In some *catenæ* the words of the original authors are not copied fairly, but either maimed or adulterated with interpolations; in most of them, the reasons on which divers interpretations are grounded, and which are very necessary to be known, are omitted. Add, that the authors are often confounded, and what was written by one is placed to the account of another. The different opinions of several writers are sometimes also jumbled into one. Some critics reject the whole design of *catenæ* as useless [a]. Yet are not

catenæ, compiled with judgment, without their uſe, as they diſcover to us what has been ſaid on each text of ſcripture by the beſt doctors and interpreters of the antient church, without the trouble of turning over ſo many volumes. Add, that as the authors from whom paſſages are taken are cited in the *catenæ*, a reader is hereby directed to the fountains, where he may find full ſatisfaction. But the chief benefit of *catenæ* is, that in them fragments have been preſerved of many works of the fathers long ſince loſt [b]. Wolfius has a diſſertation on the *catenæ* of the Greek fathers, wherein their uſes are ſpecified at large [c].—[[a] Vid. *le Moyn.* in Proleg. ad Varia Sacra. p. 53, ſeq. *Budd.* Iſag. ad Theol. l. 2. c. 8. § 10. p. 1635, ſeq. [b] Vid *Grab* Pref. ad Spicil. Patr. T. 1. [c] *Wolf.* Diſſ. de Catenis Patrum Græcorum iiſque potiſſimum Manuſcriptis, §. 4. p. 7, ſeq.]

The invention of the method of *catenæ* is attributed to Olympiodorus, deacon of the church of Alexandria, in the fifth or ſixth century, who compiled a *catena* on Job, firſt printed at Lyons in 1586, and ſince at Venice: tho' ſome will have it to be compoſed by Nicetas, archbiſhop of Heraclea, in the eleventh century, and give the honour of the firſt *catena* to Procopius Goræus, whoſe epitome of the comments of various writers on the prophet Iſaiah, were publiſhed in Greek and Latin at Paris in 1580; tho' the reſt, and eſpecially his ἐξηγητικων ἐκλογων ἐπιτομη on the proverbs, remains ſtill in manuſcript. Theſe expoſitions of Procopius, tho' they have not, like the other *catenæ*, the names of the authors cited to each paſſage, yet being compiled out of various authors, may properly enough be ranked in the number of *catenæ* [a]. For Œcumenius's commentaries on the acts, the epiſtles of Paul, &c. tho' much of them be taken from other writers, yet as the author frequently intermixes his own ſentiments, they have leſs title to the appellation of *catenæ*. Procopius was followed in the catenarian method by Nicetas, to whom, beſides the *catena* on Job, is uſually attributed another on Matthew, publiſhed by Poſſinus in 1646, and by Corderius in 1647; tho' F. Simon and Fabricius will not allow either of them to have been written by Nicetas [b].—[[a] Vid. *Fabric.* Bibl. Græc. T. 7. l. 5. c. 17. p. 735, ſeq. [b] *Simon*, Hiſt. Crit. Comment. Vieux Teſt. c. 3. p. 426. *Fabric.* Bibl. Græc T. 7. l. 5. c. 17. p. 765.]

The firſt *catena* of the Latin fathers was Thomas Aquinas's *catena aurea* on the four evangeliſts, which, tho' written in Latin, was compiled both out of Greek and Latin fathers. In ſome editions of his works, this is called *gloſſa continua*; tho' the title given it by the author was doubtleſs *catena*. The ſame method was afterwards purſued by Lipomannus, who compoſed a *catena* on geneſis, exodus, and pſalms, not much eſteemed by the connoiſſeurs.

For the *catenæ* of the Greek fathers, there are ſeveral whoſe authors are unknown; and of thoſe which are known, ſome have paſſed the preſs, while others remain ſtill in manuſcript. Again, of thoſe which have been publiſhed, ſome are only printed in Latin, as the *catenæ* of the Greek fathers on the pentateuch and the canticles; the former tranſlated by Zephyras, the latter by Caraffa; alſo, the golden *catena* on 50 of David's pſalms, and the *catena* of the Greek fathers on the proverbs: others are printed both in Greek and Latin, as the *catena* Græcorum patrum on all the pſalms, publiſhed by Corderius; another on John, and another on Luke, both publiſhed by the ſame editor [a]. Ittigius has given an ample detail of the *catanæ* of the fathers, and their editions, in the order wherein they were publiſhed [b].—[[a] *Budd.* Iſag. ad Theol. l. 2. c. 8. §. 10. p. 1636, ſeq. *Rump.* Crit. Comm. ad Nov. Teſt. §. 52. p. 455, ſeq. [b] *Ittig.* de Biblioth. & Catenis Patrum Lipſ. 1707. 8vo.]

CATERPILLAR, *eruca*, in the hiſtory of inſects. See the article ERUCA.

CATERPILLAR *eaters*, a name given by ſome authors to a ſpecies of worms which are bred in the body of a caterpillar, and eat its fleſh: theſe are owing to a certain kind of fly which lodges her eggs in this animal, and they, after their proper changes, become flies like their parents.

Mr. Reaumur has given us, in his hiſtory of inſects, ſome very curious particulars in regard to theſe little worms. Every one of them, he obſerves, ſpins itſelf a very beautiful caſe, of a cylindric figure, and firm texture, and made of a very ſtrong ſort of ſilk: theſe are the caſes in which this animal paſſes its ſtate of chryſalis; and they have a mark by which they may be known from all other animal productions of this kind, which is, that they have always a broad ſtripe or band ſurrounding their middle, which is black when the reſt of the caſe is white, and white when that is black.

Mr. Reaumur has had the patience and pains of finding the reaſon of this ſingularity, which is this: the whole ſhell is ſpun of a ſilk produced out of the creature's body; this, at firſt, runs all white, and toward the latter end of the ſpinning becomes black. The outſide of the caſe muſt neceſſarily be formed firſt, as the creature works from within; conſequently this is truly white all over, but it is tranſparent, and ſhews the laſt ſpun or black ſilk thro' it. It might be ſuppoſed that the whole inſide of the ſhell ſhould be black: but this is not the caſe; the whole is faſhioned before this black ſilk comes, and this is employed by the creature, not to line the whole, but to fortify certain parts only; and therefore is all applied either to the middle, or to the two ends omitting the middle, and ſo gives either a black band in the middle, or elſe makes a blackneſs at both ends, leaving the white in the middle to appear. It is not unfrequent to find a ſort of ſmall caſes lying about in garden walks which move of themſelves; when theſe are opened, they are found to contain a ſmall living worm. This is one of the ſpecies of theſe *caterpillar eaters*, which as ſoon as it comes out of the body of that animal, ſpins itſelf a caſe for its tranſformation long before that happens, and lives in it without food till that change comes on, and it becomes a fly like that to which it owed its birth. Mem. Acad. Scienc. Par. 1736.

CATERVA, in antient military writers, a term uſed in ſpeaking of the Gauliſh or Celtiberian armies, denoting a body of 6000 armed men. *Veget.* l. 2. c. 2.

The word *caterva*, or *catervarius*, is alſo frequently uſed by antient writers to denote a party or corps of ſoldiers in diſorder or diſarray: by which it ſtands diſtinguiſhed from cohort or turma, which were in good order. *Suet.* in Auguſt. *Aquin.* Lex. Milit. T. 1. p. 187. See COHORT, *Cycl.*

CATHALOGON, in the materia medica, a name by which ſome call the fruit we know by the name of ſaint Ignatius's bean. Pluk. Mant. p. 80. See IGNATIUS's *bean.*

CATHÆRETIC (*Cycl.*) only differs in degree from cauſtic or ſeptic, which are more violent in their operation. *Caſt.* Lex. Med. See CAUSTIC.

CATHARI, Καθαροι, in eccleſiaſtical writers, antient heretics, who made profeſſion of greater purity in diſcipline and ſanctity of life than other chriſtians.

The appellation *cathari* was chiefly given to the ſect of Novatians. *Euſeb.* Hiſt. Eccleſ. l. 6. c. 43. *Epiphan.* Hær. 59. See NOVATIANS, *Cycl.*

In after-times, however, the ſame was alſo applied to ſeveral other ſects, who pretended to extraordinary purity; as the apotactici, who profeſſed to renounce all worldly things; many of the Montaniſts, by reaſon they never admitted any among them who had once renounced the faith, tho' under the cruelleſt torments. Roman catholics alſo give the appellation *cathari*, by way of antiphraſis or irony, to the patarini or Albigenſes. The nonconformiſts in England and Scotland were formerly denominated *puritans*, a word of the ſame import with that of *cathari*. Trev. Dict. Univ. T. 1. p. 1508. See PURITANS, *Cycl.*

Some writers ſpeak alſo of a ſect of *cathariſts*, *catharitæ*, who were a branch of Manichees, infamous for their impurities. Trev. loc. cit.

CATHARMA, Καθαρμα, in antiquity, ſome miſerable or flagitious wretch, ſacrificed to the gods as an expiation for the plague, or other calamity. Such was the prophet Jonas, caſt into the ſea; and ſuch does St. Paul wiſh himſelf to be. Vid. *Budd* in Annot. ad leg. 2. ff. de Pæn. *Calv.* Lex. Jur. p. 502. *Fab.* Theſ. p. 492.

CATHARTIC (*Cycl.*) — A ſafe, pleaſant, gentle, and effectual purgative, or *cathartic* may be at any time prepared in the following manner. Take a quart of Dulwich water, or any other water of a like kind, diſſolve in this over the fire an ounce of manna, and half an ounce of black tamarinds; ſtrain off the liquor, and let it be taken at ſeveral draughts, at an half hour's diſtance or leſs, the whole being drank in an hour and half, or two hours.

The purging mineral waters act with more eaſe, gentleneſs, and ſafety, than any of the ſhop medicines; all that they require is to be either concentrated by boiling away a part, or elſe quickened as in this manner; and a general trial of a purge of this kind would perhaps encourage the practiſers of phyſic to reject almoſt all the common rough purges in uſe. *Shaw's* Lectures, p. 224.

CATHARTIC *extract.* See EXTRACTUM *catharticum.*

CATHARTIC *ſalt*, *ſal catharticum amarum*, a denomination given to what we improperly call *Epſom ſalt.* Vid. Phil. Tranſ. N° 377. p. 348. See EPSOM *ſalt.*

CATHEDRA, Καθεδρα, in a general ſenſe, a chair.

The word is more particularly uſed for a profeſſor's chair, and a preacher's pulpit.

CATHEDRA is alſo uſed for the biſhop's ſee, or throne, in a church. *Pitiſc.* Lex. Ant. T. 1. p. 381.

Ex CATHEDRA, a phraſe uſed in ſpeaking of the ſolemn dictates or deciſions of prelates, chiefly the popes, delivered in their pontifical capacity.

The advocates for the papacy maintain, that the pope is infallible *ex cathedra*, a term of modern theology entirely unknown to the antients. Even thoſe who uſe it do not agree in the explication of it. To ſpeak or pronounce *ex cathedra*, according to ſome, is to ſpeak at the head of a general council: according to others, to ſpeak *ex cathedra*, is to ſpeak agreeably to the ſenſe of ſcripture and tradition: others aſſert that to ſpeak *ex cathedra*, is to pronounce after a ſtrict and mature examination of the thing defined: the moſt common explication of the term *ex cathedra*, is that of Cajetan, Bellarmine, and Du Val, who aſſert that the pope is then judged to ſpeak *ex cathedra*, when he ſpeaks as ſovereign pontiff, or vicar of Chriſt, to teach the church ſomething relating either to faith, or manners, and not as a private perſon [a]. When the proteſtants object errors to divers popes, *ex. gr.* monothelitiſm to pope Honorius, the Romaniſts

Romaniſts have recourſe to the diſtinction *ex cathedra*; and aſſert, that though Honorius had erred in the faith, this is no objection to the infallibility of St. Peter's chair, ſince Honorius in that caſe did not err as pope, or in any ſolemn authentic deciſion pronounced *ex cathedra*, but only as a private doctor, in an epiſtle to Sergius, which he had not fully and maturely enough conſidered [b]. — [a] Vid. *Du Pin.* Trait. de la Puiſſance Eccleſ. & Tempor. Prop. 4. Nouv. Rep. Lett. T. 42. p. 589, ſeq. [b] Remarq. ſur Maimbourg de l' Eſtabliſ. & Prerog. de l' Egliſe de Rome. Nouv. Rep. Lett. T. 12. p. 236.] See INFALLIBLE and POPE, *Cycl.*

CATHEDRATIC *doctor*, *doctor cathedraticus*, denotes a doctor poſſeſſed of a chair or fellowſhip in ſome of the univerſities of Spain.

They ſay a *cathedratic doctor of Salamanca*, of *Alcala*, &c. Trev. Dict. Univ. T. 1. p. 1509.

CATHEDRATICUM, in eccleſiaſtical writers, denotes a ſum of money, amounting to two ſhillings, antiently paid annually by the inferior clergy to their biſhops, or as often as he viſited his dioceſe, *ob honorem cathedræ*, i. e. as an argument of their ſubjection, and for the honour of the biſhop's ſee or *cathedra*. *Du Cange*, Gloſſ. Lat. T. 1. p. 893. *Pitiſc.* Lex. Ant. T. 1. p. 382. Trev. Dict. Univ. T. 1. p. 1509. See CATHEDRA. This was otherwiſe denominated *ſynodaticum*, and in modern writers *procuration*. See PROCURATION, *Cycl.*

CATHEDRATICUM alſo denotes a ſum which biſhops newly ordained gave partly to the biſhops, or patriarchs, by whom they were conſecrated, and partly to the clerks and notaries who officiated therein.

This was alſo called ενθρονιστικον, as being given on account of the throne, or chair, they had now obtained. *Du Cange*, Gloſſ. Lat. T. 1. p. 893. *Pitiſc.* Lex. Ant. T. 1. p. 382.

Biſhops conſecrated by patriarchs or metropolitans, provided their church were not worth leſs than thirty pounds of gold, were to pay an hundred ſolidi by way of *cathedraticum*. *Guther.* de Offic. Dom. Aug. 11. 17.

CATHERINE *(Cycl.)* — The *fraternity of St. Catherine of Sienna*, is a ſort of religious ſociety inſtituted in that city, in honour, and under the patronage, of St. *Catherine* of Sienna, a ſaint famous for her revelations, and for her amours and marriage with Jeſus Chriſt: whoſe wedding ring, given her by her divine ſpouſe, is ſtill preſerved as an unexceptionable relick.

The fraternity of St. *Catherine* give portions yearly to a certain number of maids left unprovided for; who, on condition hereof, accept of huſbands. In order to match them, a fine proceſſion is made of the girls, who are to be thus endowed; and during the march, the young men, who are willing to be ſuitors, preſent them an handkerchief. If the maid return it as ſhe received it, it imports that the offer is rejected. If ſhe tie it in a knot, the bargain is made, and the parents themſelves cannot hinder it: by reaſon ſuch matches are ſuppoſed to come from heaven, and to be made by St. *Catherine* herſelf. Voyag. Hiſtor. de l' Ital. T. 1. Lett. 38. Bibl. Ital. T. 5. p. 152, ſeq.

The ſame fraternity has alſo a privilege of redeeming annually two criminals condemned for murther; and it ſets at liberty the ſame number of debtors, by paying their debts.

CATHETER *(Cycl.)* — Helmont rejects the common metalline *catheter* uſed by Galen and his followers, as cruel, and even noxious; and ſubſtitutes another in its place, made of leather. *Caſt.* Lex. Med. p. 148.

Mr. Hales deſcribes a *catheter* of a new ſtructure, contrived for the more advantageous injection of lithonthriptics into the bladder: its cavity is divided lengthways by a thin partition into two ſeparate channels, which end in two divaricating branches. By one of theſe branches the menſtruum is to be injected into the bladder, in the common, or rather in the hydroſtatical way, while it returns mixed with urine by the other. *Hales* Hæmaſtat. p. 212. Med. Eſſ. Edinb. T. 2. p. 400. See STAFF.

CATHETERISMUS, καθετηρισμος, a chirurgical operation, whereby either ſomething medicinal is injected into the bladder, or ſome foreign body prejudicial to the making of urine, as coagulated blood, a ſtone, or the like, is drawn away; and this by means of a crooked, tubular inſtrument, called a catheter. *Caſt.* Lex. Med p. 148. *Nent.* Fund. Med. P. 1. Tab. 5. §. 3. p. 395. *Junck.* Conſp. Chir. p. 621. See CATHETER, *Cycl.* and *Suppl.*

CATHETOLIPES, in natural hiſtory, the name of a genus of foſſils of the claſs of the ſelenitæ, but differing from the common kinds in the diſpoſition of the conſtituent plates. The word is derived from the Greek καθετος perpendicular, and λεπις a ſcale or plate, and expreſſes a ſet of theſe bodies whoſe plates are arranged perpendicularly. All the known ſelenitæ, except thoſe of this genus, are compoſed of a number of parallel plates, or thin flakes ranged evenly horizontally on one another. Thoſe of this genus are regularly figured bodies, conſiſting of eight planes or ſides, and two truncated ends: their top and bottom are more depreſſed and flatted than any of the other planes; their ends regularly and evenly ſtruck off; and their ſeveral ſides nearly equal to one another; but the angles they make are ſo obtuſe, that the body may eaſily be miſtaken for one conſiſting of only four ſides and two ends.

The ſtructure of theſe bodies is this: they are made up of plates, and thoſe compoſed of arrangements of filaments, running obliquely, ſometimes the whole length of the plate, but oftener making an obtuſe angle by the meeting of two rows of lines, or ranges of filaments; but theſe plates are diſpoſed perpendicularly in the body, and for that reaſon it does not ſplit horizontally, or in a direction parallel to the top and bottom, but perpendicularly to that direction. *Hill*'s Hiſt. of Foſſ. p. 123.

CATHETO-PLATEUS, in natural hiſtory, a term with its oppoſite, which is *plagioplateus*, very much uſed by Artedi, and others who adopt his ſyſtem, in the deſcription of fiſhes: they may be very well explained in Engliſh, by the two familiar words, *compreſſed* and *depreſſed*. The heads of fiſhes are the principal part charactered by theſe terms. Thus the *catheto-plateus*, or compreſſed head of a fiſh, is that ſort of head which is flatted upwards, or ſeems to have had its two ſides ſqueezed together, and neceſſarily is larger in its perpendicular, than in its tranſverſe meaſure. On the other hand, the plagioplateus or depreſſed head is that which is flatted downwards, or ſeems to have its top and bottom, not its two ſides, cruſhed together, and is conſequently much larger in its horizontal meaſure, than in its perpendicular. The ſame terms, in the ſame ſenſe, are alſo uſed to expreſs the ſhape of the body of the fiſh. We have inſtances of the compreſſed or *catheto-plateus* head in the ſalmon, cyprinus, pearch, &c. and of the plagioplateus, or depreſſed head, in the ſcorpæna, ſturgeon, conger, &c.

CATHETUS *(Cycl.)* is ſometimes applied to a line in the Ionic capital, paſſing perpendicularly through the eye or center of the volute. *Vitruv.* Archit. l. 3. c. 3. *Bald.* Lex. Vitruv. p. 23. *Evel.* Account of Archit. p. 23. *Davil.* Courſ. d' Archit. P. 2. p. 446. See VOLUTE, *Cycl.*

This is otherwiſe denominated the axis of the volute.

CATHOLICIANI, in middle-age writers, the officials or miniſters of the catholici, or receivers of the taxes of a dioceſe, ſometimes alſo denominated Cæſariani. *Du Cange*, Gloſſ. Lat. T. 1. p. 894. See CATHOLICUS and CÆSARIANI.

CATHOLICUS, καθολικος, the title of a dignitary, or magiſtrate, under the Roman emperors, who had part of the adminiſtration, and particularly the care and receipt of the revenues and taxes in Roman dioceſes. *Guther.* de Offic. dom. Auguſt. l. 3. c. 18. *Du Cange*, Gloſſ. Gr. T. 1. p. 538. It. Gloſſ. Lat. T. 1. p. 894. *Pitiſc.* Lex. Ant. T. 1. p. 392. *Schoet.* Ant. Lex. p. 292.

The *catholicus* was the ſame with what was denominated by the Latins *procurator*, and *rationalis Cæſaris*. Such was the *catholicus* of the dioceſe of Africa, mentioned in Euſebius, and other antient writers.

CATHOLICUS, among eccleſiaſtical writers, an appellation given to the primates or metropolitan prelates of ſeveral churches in Aſia, ſubject to the ſee of Antioch; but whoſe juriſdiction and dioceſes are of ſuch extent that they have aſſumed the title of catholici, q. d. univerſal biſhops. *Suic.* Theſ. T. 2. p. 13. *Bingh.* Orig. Eccleſ. l. 9. c. 1. §. 12. See PRIMATE and METROPOLITAN, *Cycl.*

Such is the *catholicus* of Armenia, who is ſaid to have above a thouſand biſhops under him. Such alſo was the *catholicus* of Seleucia, to whom the council of Nice gave the power of creating archbiſhops, a privilege otherwiſe reſerved to patriarchs. But the dignity of *catholicus* of Seleucia was afterwards divided, and two *catholici* created inſtead of one, both ſubject to the archbiſhop of Antioch. *Du Cange*, Gloſſ. Græc. p. 539. Item Gloſſ. Lat. T. 1. p. 894, ſeq. *Suic.* Theſ. T. 2. p. 16. ſeq. See PATRIARCH, *Cycl.*

CATHSUM, in botany, a name given by ſome authors to the abrotanum, or ſouthernwood. *Ger.* Emac. Ind. 2.

CATKIN, among botaniſts, a cluſter of flowers affixed to an axis: in ſome caſes, there are ſquammæ on the axis which do the office of cups; in others the flowers are naked. This is otherwiſe called *julus*, and *amentum*.

CATOCHE, or CATOCHUS, in medicine, a kind of waking ſleep; or a vehement diſpoſition of the body to ſleep, without being able to attain it; the eyes ſtill remaining open, and the breathing entire, but the body motionleſs, and in the ſame poſture wherein the patient was firſt ſeized.

The *catoche* is the ſame with *catalepſis*. It differs from the *coma* and *cataphora*, in that the eyes are open in the former, and cloſed in the latter. *Gorr.* Med. Defin. p. 216. voc. Κατοχη. *Caſt.* Lex. Med. p. 150. *Shaw*, New Pract. Phyſ. p. 8. See COMA, *Cycl.*

CATOCHITES, in natural hiſtory, the name of a foſſil mentioned among the antients, as having great virtues in medicine, and in the cure of wounds. It is ſaid to have been found in Corſica, and Pliny records this remarkable property of it, that if the hand were held upon it for ſome time, it would ſtick to it in the manner of glue. Hence it appears to have been a bitumen.

CATOCYSTUS, in natural hiſtory, a name given to one of the general diviſions of the echinodermata, or ſea hedge-hogs. Theſe have their aperture for the anus not at the top of the ſhell, as the anocyſti have it, but in ſome part of the baſe.

For the more accurately diſtinguiſhing theſe into genera, the baſes of the ſhell are to be divided into the regular and irregular. The regular are thoſe which are round or oval; the irregular thoſe which are made with ſinus's and angles.

CATODON, in zoology, the name by which Linnæus calls the *cete*, or whale of Clusius, &c. This, with him, makes a distinct genus of fishes of the order of the plagiuri: the characters of which are, that the back has no fin, and the teeth are all placed in the under jaw. *Linnæi* System Natur. p. 51.

CATODON, in the Artedian system of ichthyology, the name given to a genus of the plagiuri, or cetaceous fishes, the characters of which are these: the teeth are placed only in the lower jaw; there is no fin upon the back; and the fistule is placed either in the head or the snout. The species of this genus are only two. 1. The *catodon*, with the fistule in the snout. This is the whale with no back fin, described by Sibbald; it is about twenty-four foot long, and its head is roundish. The mouth does not open wide, and the fistule resembles a nose placed on the snout. The other is the *catodon*, with the fistule in the neck. This is the *cete* of Clusius, and the great headed two-finned whale of Ray, and is that species called by Purchas a trumpe. It grows to sixty foot long, and between thirty and forty foot thick, and has forty-two teeth in the lower jaw. This was the first species of whale which was found to yield the sperma ceti, and has therefore been called by many the sperma ceti whale. *Artedi*, Gen. Pisc. 50.

The word *catodon* is of Greek origin, and is derived from κατα below, and οδους a tooth; and expresses that the fish has teeth only in the lower part of its mouth.

CATOMUM, or CATOMUS, Κατωμιν, in middle-age writers, denotes that part of the body below the neck, and between the shoulders.

The word is supposed to be originally Greek, formed of κατ' ωμων q. d. *inter scapulas*, between the shoulders: In which sense it amounts to the same with what is otherwise called *interscapulum*, or *interscapulium*, sometimes also *conscapulium*.

Hence also, according to Scaliger, the terms, *catomodiari*, and *catomis cædi*, to denote being beaten on the shoulders, a punishment mentioned to have been inflicted on prodigals, as well as on divers primitive christians. *Scalig.* Epist. 144, & 146. Item in Manil. p. 400. *Gronov.* Observ. 4. 13. *Pitisc.* Lex. Ant. T. 1. p. 383.

Du Cange gives another acceptation of the word *catomus*, which appears to have sometimes denoted a sort of scourge, or rod, made either of iron, or even birchen twigs, wherewith criminals were lashed, which affords a more natural explication of the terms, *catomis cædi*, or *catomodiari*. *Du Cange*, Gloss. Lat. T. 1. p. 8 7

Hence also *catomo suspendi*, to be hoisted up from the ground, in order to be whipped.

CATOPTRITES, in natural history, a name given by some writers to a stone of the marble kind, which, when polished, was capable of serving as a speculum, either flat, and only used to represent the images of things; or concave, and used as our reflecting burning glasses. The hard black marbles were most frequently used for this purpose; but sometimes the redish ones, and sometimes one or other of the jaspers. All these were indiscriminately called by the name *catoptrites*, when put to this use.

CATOPTROMANTIA, Κατοπτρομαντεια, a kind of divination performed with a looking-glass and water, and sometimes with the glass alone. *Pott.* Archæol. Græc. l. 2. c. 18. See HYDROMANTIA.

CATTUTIRPALI, in botany, a name by which some authors call the plant which produces the long pepper used in medicine. Hort. Mal. v 7. p. 27.

CATTE CORONDE, in the language of the Ceyloneſe, prickly cinnamon. This is a bark very much resembling cinnamon, but produced by a tree which differs very much in the shape of the leaves, and is full of sharp thorns, which the true cinnamon tree is not. The bark has nothing either of the taste or smell of cinnamon, though so like it externally. The natives use the root, leaves, and bark of this tree externally, to soften tumors. Philos. Transf. N° 409.

CATTLE, a collective name, importing all quadrupeds, used either in tilling the ground, or for the food of man. See BEAST, *Cycl.* and *Suppl.*

Under *cattle* some include all quadrupeds which associate, or go in herds, as sheep, oxen, horses, hogs, &c. Others define *cattle* to be all tame animals which graze. *Calv.* Lex. Jur p. 683. voc. *pecus*.

Cattle is sometimes divided into great, comprehending oxen, bulls, cows, calves, horses, &c. and small, including sheep, lambs, goats, and the like. *Savar.* Dict. Comm. T. 1. p. 323. Trev. Dict. Univ. T. 1. p. 1002. voc. *beſtail.*

Black CATTLE more particularly denotes the cow kind. These are also denominated *neat cattle*. Phil. Transf. N° 387. p. 200.

The management of *cattle* makes a considerable branch of what is called *husbandry*. See HUSBANDRY.

The diseases of *cattle* make the subject of that art, called by the antients *mulo medicina*, and *veteratoria*, and by us, *farrying*.

The antient riches consisted wholly in the number of *cattle*; whence it is supposed to be, that the Romans called money by a name formed from that of *cattle*, *pecunia* from *pecus*.

The importation of *cattle* into England, whether living or dead is prohibited on pain of forfeiture [a]; but *cattle* may be exported, or even transported, paying the duties [b]. Factors, and those who sell *cattle* for others, are prohibited to buy any, except swine or calves, within eight miles of London. — [a Stat. 3 & 4. Edw VI. c. 19. b 18 Ch. II. c. 2. 22 Ch. II. c. 13. *Jac.* Law Dict. in voc.]

Dr. Maneschelli tells us, that in the plague among the *cattle* in Italy, in 1735, rue, wormwood, garlic, and such other strong smelling plants, hung about their noses and mouths, were esteemed preservatives against the infection. Nitrous medicines, gunpowder, sulphur, and the sharper aromatics did hurt. Bleeding, crude antimony with setons, and a diet of the most mild softening herbs did service. Med. Ess. Edinb. Abrid. Vol. 2. p. 502.

Stealing of *cattle*, or killing them with an intent to steal any part of the carcasses, or assisting in such offences, are now made felony without benefit of clergy. See 14 Geo. II. c. 6. & Sect. 1.

By *cattle*, in this act, is to be understood any bull, cow, ox, steer, bullock, heifer, calf, sheep, and lamb, and no other *cattle* whatever. Stat. 15 & 16. Geo. II. c. 34.

CATTUPHUS, or COSSOPHUS, in ichthyology, a name given by Aristotle, and other of the Greek writers, to the fish called by the Latin writers merula and turdus nigricans. It is a species of the labrus, easily known from all the others by its colour, and called, by authors who acknowledge the generical name labrus, the blueish black labrus.

CATTUS, or CATUS, in the antient military art, a kind of machine or device for covering or screening the men; much, if not intirely, the same with vinea. *Veget.* l. 4. c. 15. *Aquin.* Lex. Milit. T. 1. p. 187. See VINEA, *Cycl.*

CATULUS, in the history of fishes, the name of a sea fish, of which authors describe three species; the major, maximus, and minimus. It is properly of the galeus kind, and has a variously spotted skin, and a wide and large mouth, furnished with strong teeth, sharp-edged, and hollowed inward. The first kind is common in our seas, and often caught on the coast of Cornwall, and the two others principally in the Mediterranean, though sometimes also in our seas. *Aldrov.* de Pisc. l. 3. c. 34.

CATUS *pardus*, in zoology, the name of a beast of prey, called also by some catus montanus, and by us the cat of mountain. It is of the size of a mastiff dog, but it resembles in all respects, the common domestic cat in shape, except that the tail is in proportion to the creature's size, considerably shorter. It is also, if any thing, shorter, in proportion to its length, than our cat, and is of the common colour of that animal, only that it is variegated with black spots. Its throat is white, and its spots are long upon the back, and round upon the sides and legs; the beard or whiskers are plainly the same as in the cat. It is less fierce against the human species than many of the other beasts of prey, and may even be tamed. It naturally grows very fat. *Ray*, Syn. Quad. p. 16.

CATUS *Zibethicus*, in zoology, a name improperly given to the creature which produces the perfume called civet; it not being of the cat, but of the wolf or dog kind. See ZIBETHICUM *animal.*

CATY, CATI, or CATTI, an East-India weight, used especially in China. It is equivalent to one pound five ounces, and two drams English. Lex. Mercat. p 388.

The *cati* is divided into sixteen *taels*, and the *pic* into an hundred *cati's*.

The *cati* is also used in Japan, Batavia, and other parts of the Indies, where it weighs more or less, according as it contains a greater or less number of *taels* [a]: the *cati* of Java is equivalent to 20 *taels*; that of Cambaya, to 27; the *cati* of Siam is double that of China, and amounts to about 150 French pounds [b]. — [a *Savar* Dict. Comm. T. 1. p. 590. b Jour. des Scav. T. 87. p. 679.]

The Chinese also give the denomination *cati* to the Siamese *schan. Savar.* Dict. Comm. T. 2. p. 1489.

CATI is also a small weight whereby the lapidaries of the East weigh their emeralds, equivalent to three grains.

CATI is also a money of account, used in Java, and some of the neighbouring islands, amounting to about 19 florins Dutch money. *Savar.* Dict. Comm. T. 1. p. 590.

In the island of Sumatra *caty* is said to denote a piece of money valued at six shillings, and eight-pence sterling. Lex. Mercat. p. 388.

CAVAGIRO, in zoology, the name of a fish common in the Mediterranean, and brought to the markets in many places. It is something of the eel shape, but thinner and more flatted. It grows smaller by degrees from the head to the tail, and ends in an extremely thin point. The belly is white; but the back, sides, and tail are all red, like the red gurnet. It has no visible scales; its mouth is large, and turned upwards. Its teeth long, slender, and sharp; it has a little above the opening of the mouth, on the hinder part of the upper jaw on each side a black spot; its eyes are large; the fins and tail in the older fish are finely variegated with pale red, yellow, and purple; beside the long back fin it has two pair, one at the gills, the other in the lower part of its body. *Ray's* Ichthyogr. p. 117.

CAVALCADOUR, or CAVALCADEUR, antiently denoted a riding-master; but at present is disused in that sense, and only employed to denote a sort of equerries, or officers who have the direction of princes stables. The French say, *ecuyer cavalcadeur* of the king, the duke of Orleans, &c.

Menage writes it *cavalcadour*, and derives it from the Spaniſh *cavalgador*, a horſeman. *Guill.* Gent. Dict. in voc. Trev. Dict. Univ. T. 1. p 1513. in voc. *cavalcadeur*.

CAVALET, in the glaſs art, a ſmall iron ring which ſurrounds the lumella, or hole in the center of the floor, in the tower of the leer, uſed for annealing glaſs veſſels. *Neri*'s Art of glaſs. p. 242. See LEER.

CAVALLERIA, among the antient Spaniards, a kind of tax, or impoſition on the inhabitants of great towns and cities, for the ſupport of horſemen. *Aquin.* Lex. Milit. T. 1. p. 188.

CAVALRY (*Cycl.*) — The Roman *cavalry* conſiſted wholly of thoſe called equites, or knights, who were a diſtinct order in the diſtribution of the citizens.

As it ſeems hard to conceive that all the Roman horſe in the army ſhould be knights, Sigonius and ſome others have recourſe to a diſtinction between thoſe who ſerved equo publico, who were the knights, and thoſe who ſerved equo privato, below the equeſtrian dignity. But Grævius and others ſhew the conjecture to be without foundation, and that from the beginning of the Roman ſtate till the time of Marius, no other horſe entered the legions but the true and proper knights. *Kennet*'s Rom. Ant. Not. P. 2. l. 4. c. 2. p. 187. See LEGION, *Cycl.*

The chief uſe of the *cavalry* is to make frequent excurſions to diſturb the enemy, intercept his convoys, and deſtroy the country [a]; in battle to ſupport and cover the foot, and to break through, and put the enemy in diſorder; alſo to ſecure the retreat of the foot. Formerly the manner of fighting of the *cavalry* was, after firing their piſtols or carabines, to wheel off, to give opportunity for loading again. Guſtavus Adolphus is ſaid to have firſt taught the *cavalry* to charge thro', to march ſtraight up to the enemy, with the ſword drawn in the bridle hand, and each man having fired his piece, at the proper diſtance, to betake himſelf to his ſword, and charge the enemy as was found moſt advantageous [b]. — [a *Guill.* Gent. Dict. P. 2. in voc. b *Cruſc.* Milit. Inſt. for cavalry. P. 4. c. 8. It. in Addit. Bibl. Univ. T. 3. p. 450.] See BATTLE.

The Grecian *cavalry* were divided into *cataphractæ*, and *non cataphractæ*, i. e. into heavy, and light armed.

Of all the Greeks the Theſſalians excelled moſt in *cavalry*. The Lacedæmonians inhabiting a mountainous country, were but meanly furniſhed with *cavalry*, till, carrying their arms into other countries, they found great occaſion for horſes to ſupport and cover their foot. The Athenian *cavalry*, for a conſiderable time, conſiſted only of ninety-ſix horſemen: after expelling the Perſians out of Greece, they increaſed the number to three hundred, and ſome time after to twelve hundred, which was the higheſt pitch of the Athenian *cavalry*. *Pott.* Arch. Græc. l. 3. c. 3. T. 2. p. 16. ſeq.

The Turkiſh *cavalry* conſiſts partly of ſpahis, and partly of horſemen raiſed, and maintained, by the Zaims and Timariots. *Rycaut*, Preſ. Stat. Ottom. Emp. l. 3. c. 2. & c. 6. See SPAHI, ZAIM, and TIMARIOT, *Cycl.*

CAVATUM *ſal*, in the materia medica, a term uſed by ſome of the old Roman writers, as a name for the fineſt ſort of *ſal gemmæ*.

CAVAZION, or CAVASION, in architecture, the underdigging, or hollowing of the earth, for the foundation of a building. Paladio ſays, it ought to be the ſixth part of the height of the whole building. *Neve*, Build. Dict. in voc. See FOUNDATION, *Cycl.*

CAUCALIS, in botany, the name of a genus of plants, the characters of which are theſe: the flowers are diſpoſed into umbells, and are of the roſaceous kind, conſiſting of ſeveral petals, arranged in a circular form, on a cup which afterwards becomes a fruit compoſed of two ſeeds, of an oblong ſhape, gibboſe on one ſide, furrowed longitudinally with deep lines, and ſurrounded with an edge of a denticulated, and ſomewhat prickly rim. The petals of the flower are heart-faſhioned, and irregular in ſize.

The ſpecies of *caucalis* enumerated by Mr. Tournefort are theſe: 1. The broad-leaved field *caucalis*, with echinated ſeeds. 2. The white-flowered broad-leaved field *caucalis*, with echinated ſeeds. 3. The echinated field *caucalis*, with large flowers. 4. The echinated field *caucalis*, with ſmall flowers, and ſmall fruit. 5. The French *caucalis*, with very large fruit. 6. The dwarf ſea *caucalis*. 7. The great *caucalis*, with the appearance of the wild daucus. 8. The wild daucus-leaved *caucalis*, with large echinated fruit. 9. The ſpignell-leaved Portugal *caucalis*. *Tourn.* Inſt. p. 313.

CAUCII *nummi*, καυκιοι, a baſe ſort of coin, current under the lower empire; thus called becauſe concave, like a little cup, from the barbarous Latin, *caucus* a cup. Haloander and Meurſius are miſtaken in ſaying this coin was ſo called from having the figure of a cup on it. *Du Cange*, Gloſſ. Lat. T. 1. p. 902.

The *caucii* are the ſame with what are popularly called among the Italians, *Medaglie di S. Elena*, ſometimes ſuperſtitiouſly worn by the women. *Paul.* Mantiſſ. ad Beverin. de Ponder. p. 235.

CAUCON, in botany, a name uſed by Pliny, and ſome other authors, for the *Equiſetum*, or horſetail. *Ger.* Emac. Ind. 2.

CAUDA, (*Cycl.*) in a general ſenſe. See TAIL.

CAUDA is ſometimes alſo uſed in anatomy to denote the clitoris. *Caſt.* Lex. Med. p. 151. See CLITORIS, *Cycl.* and *Suppl.*

CAUDA *Capricorni*, a fixed ſtar of the third magnitude, in the tail of Capricorn, called alſo by the Arabs *Dineb Algedi* [a]. Its longitude, according to Hevelius [b], for the year 1700 was 17° 36′ 48″ of Aquarius, and its latitude Southward, 20° 25′ 38″ [c]. —[a *Vital.* Lex. Math. p. 97. b Prodrom. Aſtronom. p. 279. c *Wolf.* Lex. Math. p. 325.]

CAUDA *ceti*, a fixed ſtar of the ſecond magnitude, called alſo by the Arabs, *Dineb Kaetos*. Its longitude in the year 1700, according to Hevelius, was 28° 22′ 14″ of Piſces, and its latitude Southward 20° 44′ 35″. *Hevel.* Prodrom. Aſtron. p. 282. *Wolf.* Lex. Math. 325. *Vital.* Lex. Math. p. 97.

CAUDA *cygni*, a fixed ſtar of the ſecond magnitude in the ſwan's tail, called by the Arabs *Dineb Adigege*, or *Eldegiagich*. Its longitude, according to Hevelius, in the year 1700, was 1° 16′ 45″ of Piſces, and its latitude northward 59° 57′ 23″. *Wolf.* Lex. Math. p. 325. *Vital.* Lex Math. p. 97. *Hevel.* Prodrom. Aſtron. p. 279.

CAUDA *delphini*, a fixed ſtar of the third magnitude, in the tail of the dolphin. Its longitude, according to Hevelius, in the year 1700, was 9° 55′ 17″ of Aquarius, and its latitude Northward 29° 9′ 20″. *Hevel.* Prodrom. Aſtrom. p. 285. *Wolf.* Lex. Math. p. 326. *Vital.* Lex. Math. p. 97.

CAUDA *equina*, in anatomy, a denomination given to the loweſt part of the ſpinal marrow, from the laſt vertebræ of the thorax, to the end of the os ſacrum. *Heiſt.* Comp. Anat. §. 273. It is thus denominated from its form, which is ſuppoſed to reſemble a horſe's tail. Its ſubſtance is fibrous, and very tenacious.

CAUDA *equina* alſo denotes a medicinal herb, whoſe leaves are reputed to have a ſtrengthening virtue. This, in Engliſh, is called the horſe tail. The officinal kind is more particularly called by botaniſts *equiſetum majus*, in Engliſh the great marſh horſe tail. *Quinc.* Diſpenſ. P. 2. Sect. 2. n. 100. See EQUISETUM.

CAUDA *leonis*, a fixed ſtar of the firſt magnitude in the lion's tail, called alſo by the Arabs *Dineb Eleced* [a]. Its longitude, according to Hevelius, in the year 1700, was 17° 27′ 46″ of Virgo, and its latitude Northern 12° 18′ 55″ [b]. — [a *Vital.* Lex. Math. p. 97. b *Hevel.* Prodrom. p. 191. *Wolf.* Lex. Math. p. 326.]

CAUDA *urſæ majoris*, a fixed ſtar of the ſecond magnitude, in the extreme part of the tail of the great bear, called alſo by the Arabs *Alalioth* and *Benenath* [a] Its longitude, according to Hevelius, in the year 1700, was in 22° 39′ 24″ of Virgo, and its latitude Northward 54° 25′ 7″ [b]. — [a *Vital.* Lex. Math. p. 98. b *Hevel.* Prodrom. Aſtron. p. 306. *Wolf.* Lex. Math. p. 327.]

CAUDA *urſæ minoris*, a fixed ſtar of the ſecond magnitude, in the extreme part of the tail of the leſſer bear, called alſo the polar ſtar, and by the Arabs *Alrukabah*. *Vital.* Lex. Math. 4. 98. *Wolf.* Lex. Math. 327.

CAUDISONA *vipera*, in zoology, a name by which authors call the rattle-ſnake, a ſpecies of ſerpent common in many parts of America, and diſtinguiſhed from every thing elſe of the ſerpent kind by the rattle in its tail, and by its dreadful poiſon. See RATTLE-SNAKE.

CAUDIVERBA, in zoology, the name of an animal of the lizard kind, called alſo uromaſtyx, but more commonly known among authors by the name cordylus. See CORDYLUS.

CAVE. *Caves* were doubtleſs the primitive habitations; before men bethought themſelves to erect edifices above ground, they took ſhelter under thoſe. The primitive manner of burial was alſo to repoſite bodies in *caves*, which appears to have been the origin of the catacombs. Phil. Tranſ. N° 244. p. 344. See BURIAL and CATACOMB.

Badmington *caves*, in Wiltſhire, conſiſt of a ſeries or row of uniform holes, wherein pieces of armour are ſaid to have been found, whence they are by many ſuppoſed to have been tombs of antient warriors. Dict. Ruſt. T. 1. in voc. *Badmington.*

Caves long continued the proper habitation of ſhepherds. Among the Romans, *caves*, *antra*, uſed to be conſecrated to the nymphs, who were worſhipped in *caves*, as other gods in the temples. *Cuper.* Apoth. Homer. p. 31. *Pitiſc.* Lex. Ant. T. 1. p. 119. voc. *antra*. *Pott.* Archæol. l. 2. c. 2. p. 192.

The Perſians alſo worſhipped their god Mithras in a natural *cave*, conſecrated for the purpoſe by Zoroaſter. *Stanl.* Hiſt. Philoſ. P. 17. c. 4. p. 1061.

Kircher, after Gaffarellus, enumerates divers ſpecies of *caves*, divine, human, brutal, natural, and artificial. *Kirch.* Mund. Subterr. l. 2. c. 20. p. 118.

Of *natural caves*, ſome are poſſeſſed of a medicinal virtue, as the grotto de ſerpente; others are poiſonous or memphitical; others are replete with metalline exhalations, and others with waters. There are alſo icy *caves*, full of ſnow and cryſtal, as in mount Sora; and the Æolian *caves* which emit a continual wind; petrifying *caves*, replete with a juice which turns into ſtone; aromatic *caves*, which breathe a fragrant ſpicy odor, ſaid to inſpire enthuſiaſm. We are alſo told of ſome *caves* which incite to chaſtity, and others to luſt; ſome are narcotic, and diſpoſe to ſleep; others render perſons wakeful; ſome flow with oil, naphtha, and bitumen; others

are loaden with vitriol, ſalt, and the like. Vid. *Becman.* Hiſt. Orb. Terr. P. 1. c. 7. §. 17. *Kirch.* loc. cit. p. 118, ſeq. Some of theſe *caves* again are near the ſurface of the earth; others deeper hid in its bowels, and inacceſſible to human induſtry. The latter are divided with regard to their contents, into *hydrophylacia*, *pyrophylacia*, and *aerophylacia*. *Kirch.* Mund. Subterr. l. 2. c. 20. p. 118.

Divers oracular *caves* occur among the antients, the fumes of which intoxicated the head, and produced a ſort of furor or madneſs, which was interpreted inſpiration, prophecy, and divination. Such were the ſacred caverns at Delphi, which inſpired the Pythia [a]. Such alſo was the ſybil's cave at Cumæ in Campania, ſtill ſhewn near the lake Avernus: Tho' Borrichius takes this to be of modern date [b], and not the true *antrum ſibyllæ*, ſo finely deſcribed by Virgil [c]. Homer likewiſe gives a deſcription of *αντρον νυμφων*, the *cave* of the nymphs [d], on which Porphyry has a treatiſe ſtill extant, containing many of the ſecrets of the heathen theology, both natural and ſymbolical [e]. — [[a] Nouv. Rep. Lett. T. 12. p. 284. [b] *Borrich.* Diſſ. de Ort. Chem p. 100, ſeq. [c] *Virg.* Æn. l. 6. [d] *Hom.* Odyſſ. l. 13. [e] Vid. *Fabric.* Bibl. Græc. l. 4 c. 27. p. 186. *Holſten.* de Vit. Porphyr. c. 7. ap. *Fabric.* loc. cit. p. 245.]

The *cave* of the nymph Egeria, where Numa held nightly converſations with that deity, is ſtill ſhewn at Rome. Vid. *Piſc.* Lex. Ant. T. 1. p. 827.

The *cave* of Trophonius, originally the manſion of that celebrated Bœotian, became afterwards famous for the oracles which Apollo rendered in it. Pauſanias who viſited it, gives a large deſcription of the ceremonies obſerved by thoſe who entered the *cave* to conſult that god. Vid. *Pott.* Arch. l. 2. c. 10. p. 290, ſeq.

CAVEA, the place in the antient theatres where the ſpectators were ſeated.

The *cavea*, called by the Greeks *κοιλον*, ſtands contradiſtinguiſhed from the ſcena, *σκηνα*, which was the place for the actors.

The *cavea* was divided by partitions into three equal parts, riſing one over another; *ima cavea*, appointed for the people of quality, and magiſtrates; the middlemoſt, *media cavea*, for the commonality; and the uppermoſt, *ſumma cavea*, for the women. *Pott.* Archæol. l. 1. c. 8. p. 42. *Pitiſc.* Lex. Ant. T. 1. p. 384. *Heder.* Schul. Lex. p. 739.

CAVEA alſo denoted the middle part in amphitheatres, otherwiſe called *arena*. *Kenn.* Rom. Ant. Not. P. 2. l. 1. c. 4. p. 44. *Lipſ.* de Amphitheat. c. 2. & 14. *Pitiſc.* l. c. *Schoet.* Lex. Ant. p. 293.

CAVEA was alſo uſed for the cage or den of a wild beaſt, kept for the amphitheatrical ſhews. See CAGE.

CAVEAR (*Cycl.*) — The word is alſo written *caviac*, *cavia*, *kavia*, *caviat*, *cavial*, *caviare*, and *caviary*. It is formed from the Italian *caviale*, or barbarous Greek *καβιαρι*, which ſignifies the ſame. *Menag.* Orig. p. 167. *Skin.* Etym. Ang. in voc. Trev. Dict. Univ. T. 1. p. 1518.

The manner of making the *caviar* is by taking out of the ſpawn of the ſturgeon all the nerves or ſtrings, then waſhing it in vinegar or white wine, and ſpreading it on a table. They dry and ſalt it with the hand, and preſs it in a fine bag, that the liquor may run out; this done they caſe it up in a veſſel with a hole at bottom, that if there be any moiſture left it may run out. In this ſtate being well preſſed and covered, it is fit for ſale. *Hought.* Collect. N° 537. T. 3. p. 282.

Caviar is alſo prepared of the ſpawn of ſome other fiſhes: what we otherwiſe call *botargo* is a *caviar* made from a ſort of mullet caught in the Mediterranean. See BOTARGO.

According to Savary, the beſt *caviar* brought from Muſcovy is that made from the belluga, a fiſh eight or ten feet long, caught in the Caſpian ſea, which is much preferable to that made of the ſpawn of ſturgeon. *Savar.* Dict. Com. Sup. p. 911. voc. *Kaviac.*

CAVEATING, in fencing, the act or art of diſengaging, or ſhifting the ſword from one ſide the adverſary's ſword to the other.

Caveating is a motion whereby a man brings in an inſtant his ſword which was preſented on any ſide of his adverſaries, generally beneath its hilt, to the oppoſite ſide; either from within, to without, or vice verſa; or from having its point high, to be low, or the reverſe; and either on the ſame ſide it is preſented in, or the oppoſite ſide.

Caveating is ſo neceſſary a motion in fencing, that without it, there could be ſcarce any offenſive part, or purſuit. It is withal ſo eaſily performed againſt the ordinary tierce and quart guards, that it gives a conſtant opportunity to make a variety of quick ſubtle feints againſt them, which by reaſon of the ſmall croſs made by the weapons on theſe guards, makes the purſuit very eaſy, and the parade or defence very difficult. See PURSUIT, *Suppl.* and PARADE and FEINT, *Cycl.*

The conſideration of this put Sir William Hope on the ſearch of a new method or guard, which, by reaſon of its greater croſs on the adverſaries ſword, renders the *caveating*, and making feints more ſlow, and conſequently the parade more certain. *Hope*, new Meth. of Fenc. c. 4. Sect. 12. p. 97, ſeq. See FENCING, GUARD, &c *Cycl.*

CAVEDO, in commerce, a long meaſure uſed in Portugal, and equal to 27 $\frac{11}{1000}$ Engliſh inches. [Treat. Pract. Geom. p. 9.

CAVERS, in the language of miners, are any poor people that go about the mines to beg or ſteal ore from the miners. *Houghton's* Compl. Miner, in the explan. of the term.

CAVESON (*Cycl.*) — An iron *caveſon* ſpares a young horſe's mouth in the breaking, ſince by means hereof he is accuſtomed to obey the hand, and bend the neck and ſhoulders, without injuring his mouth. All iron *caveſons* are mounted with a head-ſtall, a throat-band, and two ſtraps, or reins, with three rings: through the middle ring, one rein is paſſed to make a horſe work round a pillar, and through the two ſide rings the two other reins are paſſed, which the rider holds in his hand, or faſtens to his ſaddle, to keep the horſe's head in ſubjection. *Guill.* Gent. Dict. P. 1. in voc. Trev. Dict. Univ. T. 1. p. 1518. Vocab. Cruſc. T. 2. p. 307. voc. *cavezzone.*

CAVETTO (*Cycl.*) is the ſame with what is otherwiſe denominated a caſement. Moxon ſhews how to deſcribe the *cavetto*, both from the oxygon, and the ſemicircle. *Mox.* Mechan. Exerc. p. 268.

CAUHQ-ROY, in natural hiſtory, a name given by the natives of the Eaſt-Indies to a ſort of foſſil which they calcine, and afterwards give in large doſes in the hiccough, and many other complaints. It is alſo uſed in dying. The Indians boil it in water, and dye or ſtain their cloths with it, to make them appear different from others: it is a kind of ochre, or clayey iron ore, and is found in great abundance in the hills, and iron is ſometimes extracted from it. *Woodw.* Cat. for. Foſſ. vol. 2. p. 47.

CAVIA *cobaya*, in zoology, the name by which the Braſilians, and from them many writers, call the creature commonly known among us by the name of the Guinea pig. *Ray's* Syn. Quad. p. 223.

CAVIA. See the article CAVEAR.

CAVIDOS, or CABIDOS, a Portugueſe long meaſure, uſed in the menſuration of cloth, linnen, and the like, equivalent to two foot eleven lines Paris meaſure. *Savar.* Dict. Com. T. 1. p. 506. voc. *cabidos.*

CAVIL, *cavillatio*, is defined by ſome a fallacious kind of reaſon, carrying ſome reſemblance of truth, which a perſon knowing its falſhood, advances in diſpute for the ſake of victory.

The art of framing ſophiſms or fallacies is called by Boethius, *cavillatoria*. *Fab.* Theſ. p. 499.

CAVITY, among anatomiſts and phyſicians, makes a ſpecies of organical conformation, either natural, or morbid. *Caſt.* Lex. Med. p. 151.

CAVITIES *of the bones* are of two kinds; the firſt formed from articulation, called *cotyles* and *glenes*; the ſecond for other purpoſes, called *cells*, *caverns*, *foramina*, *foſſæ* and *ſulci*. *Heiſt.* Comp. Anat. §. 56, ſeq.

CAUK, or CAWK, is uſed by the miners in the peak to denote a coarſe ſort of ſparr [a]; being a ponderous white ſtone found in the lead mines, and which will draw a white line like chalk, or the galactites [b]. — [[a] *Woodw.* Meth. Foſſ. Claſs 2. p. 18. [b] Phil. Tranſ. N° 110. p. 226. item N° 39. p. 770]

The word is formed probably of the German *kaalq*, ſpar. *Woodw.* loc. cit.

Dr. Martyn juſtly cenſures Woodward for calling this ſubſtance a talky ſpar, as it has no flexibility nor elaſticity, which are the characteriſtics of talc. It is properly no other than a ſparry matter, rendered very coarſe, by being mixed with a large portion of earth. In ſome places it is found more clear and tranſparent than in others: it approaches in this ſtate to the nature of cryſtal, and is called baſtard cauk, and bright cauk. Philoſ. Tranſ. N° 407.

It is of a much more denſe and compact nature than galactites, and reſembles cryſtal, except that it wants tranſparence. There is a ſingular proceſs mentioned by Dr. Liſter, which is that of vitrifying antimony by its means. This is done with great readineſs and ſpeed by it, and the glaſs, thus made, will produce ſome effect on other metals, which no other glaſs will, nor indeed any other preparation of antimony. The method of preparing it is this: take a pound of antimony, flux it clear; have in readineſs an ounce or two of *cauk* in a lamp red-hot; put it into the crucible to the melted antimony, and continue it in fuſion; then caſt it into a clean mortar not greaz'd, decanting the clear liquor from the lump of *cauk*. This proceſs gives more than fifteen ounces of glaſs of antimony, like poliſhed ſteel, and bright as the moſt refined quickſilver. The *cauk*, in the mean time, is found to be diminiſhed, not encreaſed in its weight, and will never flux with the antimony, though ever ſo ſtrong fire be given it. This is a very odd mineral, and this learned author ſuppoſes it to be allied to thoſe white, milky, and mineral juices which are found in mines. The effect of both is evidently the ſame; for the milky juice of lead mines vitrifies the whole body of antimony, in the ſame manner that the *cauk* does in this experiment. Phil. Tranſ. N° 110.

That there is ſomewhat very peculiar in the *cauk* is plain from this effect on antimony, which no other thing of this kind is poſſeſſed of; for lapis calaminaris, ſulphur vivum, galactites, mundicta, alum ore, ſpar, and many others thing have been tried with

with antimony in the ſame manner, but not one of them has this effect.

CAUKING, in architecture, ſignifies dove-tailing a-croſs. *Neve*, Build. Dict. in voc. See DOVE-TAILING, *Cycl.*

CAUKING *time*, in falconry, a hawk's treading time. Dict. Ruſt. T. 1. in voc.

CAUKING *irons*, denote iron chiſſels for the purpoſe of *cauking* veſſels. *Guill.* Gent. Dict. P. 3. in voc. *caulking.*

CAUL, or CAULE, among mineraliſts, a rediſh pink-coloured ſtone, found in the ſtrata of the tin mines. Phil. Tranſ. N° 69. p. 2102. *Grew*, Muſ. Reg. Societ. P. 3. Sect. 1. c. 6. p. 321. See TIN.

CAULEDON, καυληδον, or *caulatim*, in ſurgery, is applied to fractures which happen tranſverſely, wherein the parts of the broken bone ſtart aſunder, ſo as not to lye directly againſt each other. *Caſt.* Lex. Med. p. 151. *Gorr.* Med. Defin. p. 217. voc. καυληδον. See FRACTURE.

CAULIAS, καυλιας, an appellation given to the juice drawn from the ſtalk of the ſilphium, contradiſtinguiſhed from that drawn from the root of the ſame plant, which is called *rhizias*. *Lang.* Epiſt. Med. l. 1. Ep. 62. *Salmaſ.* Exerc. ad Solin. p. 354. Schroder makes the *caulias* the ſame with our aſa-fœtida. *Schrod.* Pharmacop. l. 4. cl. 2. n. 172. See ASA.

CAULIFEROUS. Herbs are ſometimes divided into *cauliferous* and acauloſe. See ACAULOSE.

The former are either perfectly *cauliferous*, as cabbage, or imperfectly, as moſſes. *Ray*, Synopſ. Stirp. Britan. p. 25.

CAULIFLOWERS are the produce of a kind of cabbage, and have of late years been ſo far improved in England, as to exceed in ſize and goodneſs any that are raiſed in the reſt of Europe. They are in ſeaſon in the months of May, June, and July, but the ſkill of the gardener can continue them much longer. The manner of propagating them is this:

Having procured ſome good ſeed, you muſt ſow it before the middle of Auguſt, upon an old cucumber or melon bed, ſifting earth over the ſeeds to a quarter of an inch thickneſs: if the weather prove very hot and dry, the beds muſt be ſhaded with mats, and be lightly watered at times. In about a week's time the ſeeds will appear above ground, and they muſt be uncovered by degrees, but not expoſed to too much ſun at firſt. In about a month more they ſhould be pricked out on another old bed, at three inches diſtance, and ſhaded and watered when firſt tranſplanted; but after this this they muſt not be much watered, nor be ſuffered to have too much rain, which will make them black-ſhanked, or rotten in the ſtalks. In this bed they are to remain till the middle of October, when they are to be planted out for the winter ſeaſon: they are then to be planted out in rich beds, and thoſe which are to be early ripe, are to be ſhaded with bell-glaſſes, two under each glaſs, and in February to be planted out again: the reſt are to be at firſt ſet at a greater diſtance, and to ſtand.

When the *cauliflowers* begin to fruit, they muſt be carefully watched, and ſome of the inner leaves muſt be bent down over the flower, to ſhade it from the ſun, which would otherwiſe turn it yellow. The very fineſt of the *cauliflowers*, which are not looſe and frothy about the edges, and very firm, ſhould be ſaved for ſeed; and the flower ſtems, as they ſhoot out, ſupported with ſticks till the ſeeds are ripened, which muſt then be carefully gathered, and dried for uſe. *Mill.* Gard. Dict.

CAULINE *leaf*, among botaniſts. See LEAF.

CAULINE *peduncle*, among botaniſts. See PEDUNCLE.

CAULIS, among botaniſts, the ſtalk, or ſtem of an herbaceous plant; or that part which riſes ſingle above the earth, and from which the branches and leaves ſhoot upward. See PLANT.

In trees and ſhrubs this is properly called *caudex*, or trunk; in herbs *caulis* or ſtalk; in corn and the graſſes, *culmus* or ſtem. *Fab.* Theſ. p. 800. *Bradl.* Dict. Botan. *Mill.* Gard. Dict. in voc.

CAUNGA, in botany, a name given by ſome authors to the areca, the tree of whoſe fruit the terra Japonica of the ſhops is made. Hort. Malab. v. 1. p. 9.

CAURIS, in natural hiſtory, a name given by ſome to the genus of ſhells called by the generality of writers, *porcellana*, and *concha venerea*. It is from a falſe pronunciation of this word *cauris*, that we call theſe ſhells Gowries. See PORCELANA.

CAURSINES, *caurſini*, in the Engliſh hiſtory, denote Italian bankers or money-changers who flocked into England, France, and the Netherlands, about the year 1235, calling themſelves the pope's merchants, but driving no other trade than uſury. They were ſeveral times baniſhed the kingdom for their extortions, and re-admitted by the intereſt and intrigues of the popes. *Mat. Paris*, Hiſt. Angl. p. 403. *Du Cange*, Gloſſ. Lat. T. 1. p. 771. *Spelm.* Gloſſ. p. 130. Trev. Dict. Univ. T. 1. in voc. They are alſo called *caorcini*, *caorſini*, *catarcini*, *cawarſini*, and *corſini*. Some will have the name formed from *Cahors*, a city of France, where they flouriſhed more than ordinary. Others derive it from the *Corſini*, a family of wealthy merchants at Florence.

CAUSALTY, in metallurgy, the lighter parts of ſulphureous and earthy ores of metals carried off in the water uſed in waſhing them, and ſubſiding afterwards from it. *Boerhaave*, Chem. p. 100. n.

In the tin works the *cauſalty* is thrown in heaps upon banks, which in ſix or ſeven years they work over again, and receive a new ſupply of metal from it. Phil. Tranſ. N° 138. p. 952. Dict. Ruſt. T. 2. voc. *tin.* See TIN.

CAUSE (*Cycl.*) — the Romans allowed divers juſt *cauſes*, even of ſuicide: ſuch were the ruin of one's country, grief, wearineſs of life, and long ſickneſs; the only *cauſes* pronounced unjuſt were, when a perſon having deſerved death, choſe to anticipate it, to avoid the infamy of an execution. Cato is repreſented as having been much favoured by the gods, in affording him ſo juſt and legitimate a *cauſe* for quitting this earth. Vid. *Guther.* de jure Manium. l. 1. c. 9. *Pitiſc.* Lex. Ant. T. 1. p. 386.

CAUSE *of a diſeaſe* is defined by Galen to be that, during the preſence of which we are ill, and which being removed, the diſorder immediately ceaſes. *Gal.* de loc. Aff. l. 1. c. 2. *Caſt.* Lex. Med. p. 151.

The doctrine of the *cauſes* of diſeaſes is called ætiology. See ÆTIOLOGY, *Cycl.* and *Suppl.*

Phyſicians divide *cauſes* into procatarctic, antecedent, and continent.

Procatarctic CAUSE, αιτια προκαταρκτικη, called alſo *primitive* and *incipient cauſe*, is either an occaſion which of its own nature does not beget a diſtemper, but happening on a body inclined to diſeaſes, breeds a fever, gout, or the like, (ſuch as are watching, faſting, and the like) or an evident and manifeſt *cauſe*, which immediately produces the diſeaſe, as being ſufficient thereto, ſuch as is a ſword in reſpect of a wound.

This latter is alſo called an *external cauſe*, becauſe frequently happening without the body.

Antecedent CAUSE, αιτια προηγεμενη, a latent diſpoſition in the body, from which ſome diſeaſe may ariſe; ſuch is a plethora in reſpect of a fever, a cacochymia in reſpect of a ſcurvy.

Continent, *conjunct*, or *proximate* CAUSE, that principle in the body which immediately adheres to the diſeaſe, and which being preſent, the diſeaſe is alſo preſent, or which being removed, the diſeaſe is taken away; ſuch is the ſtone in a nephritic patient. *Brun.* Dogm. Med. Gen. P. 1. c. 5. P. 11. c. 7. *Charl.* Exerc. Pathol. 4. *Roſſink.* Ord. & Meth. Spec. l. 2. Sec. 3. c. 2. *Caſt.* Renov. p. 151. *Walc.* Lex. Phil. p. 354. *Micræl.* Lex. Phil. p. 250, ſeq.

Orators and lawyers diſtinguiſh three kinds of *cauſes*, demonſtrative, deliberative, and judicial, of which the laſt alone is properly called a *cauſe*. To theſe the ſchools have added a fourth, viz. the didaſcalic, obtaining in indefinitive queſtions.

Among the Romans, perſons accuſed were ſometimes forced to plead their *cauſe* in chains; eſpecially where there were any apprehenſions of an eſcape or reſcue. *Briſſon.* de Formul. l. 5. p. 472. *Pitiſc.* Lex. Ant. T. 1. p. 386.

Pious CAUSE, among civilians and canoniſts, that whereby ſomething is contributed to religious uſes.

Fiſca CAUSE, that wherein the emperor's revenue is concerned.

Public CAUSES are alſo called criminal ones, by reaſon in theſe latter, the inquiry is uſually concerning ſome crime. *Pitiſc.* Lex. Ant. T. 1. p. 386.

Civil CAUSES were always tried *ſub dio*, and the orators uſed to hire a crowd of applauders. Vid. *Plin.* Epiſt. l. 2. Ep. 14. *Pitiſc.* loc. cit. p. 385. See APPLAUSE.

Liberal CAUSES, *cauſæ liberales*, thoſe wherein the ſtate of perſons was to be decided, viz. whether they were free or ſlaves.

Amiable, or *amicable* CAUSES, *cauſæ amabiles*, thoſe otherwiſe called by civilians *favorabiles*; of which there were four kinds, viz. *cauſes* of liberty, matrimony, dowry, and teſtament.

Capital CAUSES, thoſe wherein life, either natural or civil, was at ſtake. Under capital *cauſes*, the Romans ſometimes alſo included thoſe which did not concern a man's life, but his honour or reputation. *Pitiſc.* Lex. Ant. T. 1. p. 385.

CAUSEWAY (*Cycl.*) — Some derive this from the Latin *calx*, or French *chaux*, as ſuppoſing it primarily to denote a way paved with chalk ſtones. *Ken.* Gloſſ. ad Paroch. Antiq. in voc. *Menage* Orig. Franc. p. 168. *Caſeneuv*, Orig. p. 31. voc. *chauſſée.*

CAUSEWAY, *calcetum*, or *calcea*, more uſually denotes a common hard raiſed way, maintained and repaired with ſtones and rubbiſh.

Devils CAUSEWAY, a famous work of this kind, which ranges thro' the county of Northumberland, commonly ſuppoſed to be Roman, tho' Mr. Horſley ſuſpects it to be of later times. *Horſley*, Brit. Rom. l. 3. c. 2. p. 449.

Giants CAUSEWAY is a denomination given to a huge pile of ſtony columns, in the diſtrict of Coleraine in Ireland. See GIANT'S *cauſeway.*

CAUSTIA, καυσια, in antiquity, a kind of woollen cap uſed by the Macedonians; which was ſo ſtrong as ſometimes to ſerve inſtead of a helmet. Mem. Acad. Inſcript. vol. 2. p. 394, ſeq.

CAUSTIC, καυστικος, (*Cycl.*) in a general ſenſe, ſomething endued with a fiery or burning quality. See BURNING.

The ſtrong *cauſtic*, now generally uſed by our ſurgeons, is prepared in this manner: boil ſoap lyes to a fourth part of their quantity, then ſprinkle in, while they are boiling, lime that has been kept in a veſſel pretty cloſe ſtopped for ſeveral months; continue to add this lime till all the liquor is abſorbed, and the whole is reduced to a paſte, which is to be kept in a veſſel

cloſe

close stopped. The design of thus keeping the lime is, that its acrimony may be a little abated. *Pemberton*'s Lond. Disp. p. 185.

The common *caustic* of quick lime and soap lyes, deserves the preference to any of those composed of acid spirits. It does not give near so much pain, and is not so apt to occasion convulsions, when applied to carious bones. It penetrates better than the dry forms of eroded metals, and does not run so much when it melts, as the more liquid acids do. It either is not absorbed, or its effects are not observed in the blood; whereas mercurial preparations frequently raise an unexpected salivation *Monro*, in Med. Ess. Edinb. vol. 5. art. 24.

Heister says, that the shortest and most approved method of making this is as follows: take pot-ashes and strong quick lime, of each six ounces, powder them separately, and afterwards mix them together in a large glass or earthen vessel, and dissolve them in a large quantity of river water, letting them stand an hour or two that they may dissolve perfectly; the liquor is then to be filtrated thro' a linen cloth from its gross sediment, and evaporated over the fire in an iron pan; the hard mass left from this evaporation is to be put into a crucible, and melted over a strong fire till it flows like oil; it is then to be cast into a mortar or broad pan, and either cut or beat into small pieces before it is quite cold: these are the *caustic* stones. They are to be put into a clean glass, and stopped very close, and kept in a warm place. *Heister*'s Surgery, p. 187.

Arsenical CAUSTIC. See MAGNET.

Lunar CAUSTIC, called also *lapis causticus*, is a preparation of silver, sometimes of copper, usually made by dissolving the metal with spirit of nitre, evaporating two thirds of the fluid, and boiling the rest to an oily consistence, which when cold grows hard. Quinc. Pharmac. P. 2. Sect. 15. p. 252.

CAUSTIC *curves* are usually supposed to be the invention of M. Tschirnhausen; but 'tis only the name he invented. The first mention he made of them was in the year 1682 [a], when he produced no instance but that of the *caustic* in a circle, which he might have learned from Dr. Barrow's *Lectiones Opticæ*, published in 1669. It would have been easy for him to have done the same for any curve, by the help of the radius of curvature published by Huygens in his *Horologium Oscillatorium* in 1673. 'Tis certain this had been done by Sir Isaac Newton as early as the year 1669, as appears from his *Lectiones opticæ* [b], which were read that year at Cambridge, tho' not published till after his death, viz. in 1728 [c].—[[a] Act. Erud. Lipsi. an. 1682. p. 364. [b] *Newt.* Lect. Opt. Sect. 4. [c] Pref. Stat. Rep. Lett. T. 1. p. 50, seq.]

CAUSTIC *fluid*. Some imagine a *caustic* fluid, by which the blood is detained in a fluid state, and by which the red globules are formed. See BLOOD.

CAUSTIC *by reflexion*. See *caustic by* REFLEXION.

CAUSTIC *by refraction* See *caustic by* REFRACTION.

CAUSTICUM *antimoniale*, the name given in the late London dispensatory to what was before called butter of antimony; it is prepared of one pound of antimony, and two pounds of corrosive sublimate, powdered and mixed, and then distilled in a retort with a wide neck, in a gentle sand heat. What ascends into the neck of the retort is to be exposed to the air, that it may run into a liquor. The congealed substance has been used to be called the butter, and when liquified, the oil of antimony. *Pemberton*'s Lond. Disp. p. 234.

CAUSUS, καυσος, in medicine, denotes a burning fever, or a kind of acute continual fever, attended with a vehement heat, and other indications of an uncommon inflammation. *Hoffm.* de Feb. c 52. *Willis* de Feb. c. 11. *Cast.* Lex. Med. p. 152. *Gorr.* Med. Defin, p. 217. voc. καυσος. See FEVER.

CAUTERIZATION, the act of burning or searing some morbid part by the application of fire, either actual or potential. See CAUTERY, *Cycl.* and *Suppl.*

In some places they *cauterize* with burning tow, in others with cotton or moxa, in others with live coals; others use Spanish wax; others pyramidal pieces of linnen, others gold, or silver: Severinus recommends flame blown thro' a pipe: but what is usually preferred among us is a hot iron. See MOXA.

Cauterizing irons are of various figures; some flat, others round, some curved, &c. of all which we find draughts in Albucasis, Scultetus, Ferrara, and others. Sometimes a cautery is applied thro' a capsula, to prevent any terror from the sight of it. This method was invented by Placentinus, and is described by Scultetus. In the use of all cauteries, care is to be taken to defend the neighbouring parts, either by a lamina, defensive plaister, or lint moistened in oxycrate. Sometimes the hot iron is transmitted thro' a copper cannula, for the greater safety of the adjoining parts.

The degrees and manners of *cauterizing* are varied, according to the nature of the disease, and the part affected: In a mortification they *cauterize* more freely than in any other case; in the soft parts more sparingly: in a hæmorrhage, or a caries, they repeat the operation, till an eschar is induced on the vessel, or the humidity of the bone is discharged. *Junck.* Consp. Chir. Tab. 79. p 540, seq. See the following article.

CAUTERY (*Cycl.*) — For the right application of the actual *cautery*, various observations are necessary; in the first place, the surgeon should see that the size and figure of the *cautery* correspond to that of the disordered part, and while the patient is preparing for the operation, to let the *cautery* be heating in the fire, and to secure the sound parts, that it may give no more pain than what is absolutely necessary. In cases of a carious bone, the fleshy parts are to be drawn aside and held out of the way of the iron; and in these cases, as also in large hæmorrhages, it is necessary to have three or four *cauteries* kept hot together, that if one does not finish the operation, there may be no waiting for another.

It has been found that *cauteries* have succeeded in apoplexies when all other means have failed. In this case some apply the *cautery* to the occiput; but others between the first and second vertebræ of the neck; others are for cauterizing the meeting of the coronal and sagital sutures, and others will have it best to be done in the soles of the feet. Which of all these places it succeeds best in, seems yet left to experience to determine. *Heister*'s surgery, p 318.

Potential CAUTERY. See CAUSTIC.

CAUTING *iron*, among farriers, an iron instrument wherewith they cauterize and sear the parts of a horse which require burning. Rust. Dict. T. 1. in voc. See CAUTERIZATION and CAUTERY.

CAUTIO, in the civil law, denotes an assurance or security given or taken for any thing trusted. *Calv.* Lex. Jur. p. 162.

CAUTIONE *admittenda*, in common law, a writ which lies against a bishop, who holds an excommunicated person in prison, notwithstanding he offers sufficient security for obeying the commands of the holy church for the future. *Fitzherb.* Nat. Brev. p. 63. *Cow.* Interp. in voc.

CAUTIONARY *towns*, places of strength, which one prince or power puts in the possession of another, as a security either for the payment of a debt, or performance of some other matter stipulated between them. Rochel, Saumur, and some other cities in France, were allowed to the reformed, for their strength and security. Rouen was given to queen Elizabeth, by Henry IV. of France, as a *cautionary* town or place of retreat for the English army. The *cautionary* towns of Ramekins, Flushing and the Brill, which the Dutch also put into the hands of queen Elizabeth, partly as a curb on the new republic, and partly for the repayment of 8 8,408*l.* sterling, advanced for the service of the states, were sold or given up by king James I. for a trifling consideration, not above a fourth part of what they had been engaged for. *Rapin* Extr. de Rym Fœd. T. 16. Bibl. Anc. Mod. T. 18. p 324, seq.

CAUTO, in botany, a name given by the people of Guinea to a shrub common in that part of the world, a decoction of which they use as a cure for the running of the reins, or a clap. Phil. Trans. N° 232.

CAUTURIER, in anatomy, a name given by the French writers to a muscle of the leg, called by the old writers primus flectentium tibiam, and by the later writers, Cowper, Albinus, &c. sartorius; by Roslan, sutorius.

CAXOU, in metallurgy, a word used to express a chest of ores of silver, or any other metal, that has been burnt, ground, and washed, and is ready to be refined.

CAY, in zoology, the name of a small monkey of the Brasils, an extremely small kind, and of a coal black. It lives only in the thick woods, and is usually found sitting on the boughs of some of the trees which bear pods, the fruit of which it feeds upon. *Ray*'s Syn Quad. p. 155.

CAYMAN, in zoology, the name of a species of crocodile found in the southern parts of America, and on the coast of Guinea, and more usually called by authors by its Brasilian name *jacare*. See JACARE.

CAYMANUM *lapis*, in natural history, the name of a stone found in the beds of rivers in many parts of America, and of a yellowish colour, veined with red and white.

The Indians have an idle tradition, that it is originally found in the stomach of a crocodile, which in their language they call *caymanes*, and thence authors have named it lapis caymanum. The natives of America pretend that it has great virtues in medicine, and particularly that it cures quartans by being applied to the wrists; and to enhance its value, they pretend to take it from the crocodile.

CAYNTANA, in the materia medica, a name given by some authors to the fruit called fagara by other writers. Camell. Syllab. p. 74. See FAGARA.

CAZIC, or CAZIQUE, a general title given by the Spaniards to the petty kings, princes and chiefs of the several countries of America, excepting those of Peru, who are stiled *curatas*.

The French call them *caciques*, a denomination which they also give to the chiefs of the Tartarian hords. *Ozan* Dict. Math p. 376.

The *cazics* in some places do the office of physicians, and in others of priests, as well as captains. The dignity of *cazic* among the Chiites, a people of South America, does not descend to children, but must be acquired by valour and merit. One of the prerogatives annexed to it is, that the *cazic* may have three wives, while the other people are only allowed one. Mem. de Trev. an. 1717. p 25. & p. 27.

Mexico comprehended a great number of provinces and islands, which were governed by lords called *caziques*, dependent on, and tributary to the emperor of Mexico: thirty of these *caziques* or vassals are said to have been so powerful, that they could each of them bring an army of an hundred thousand

ſand men into the field. *Solis*, Hiſt. de la Conq. du Mexique ap. Bibl. Univ. T. 23. p. 202.

CAZIMI, among the Arabian aſtronomers, denotes the center or middle of the ſun. A planet is ſaid to be in *cazimi*, when it is not diſtant from the ſun either in longitude or latitude above 17′, or the aggregate of the ſemi diameter of the ſun's diſk and that of the planet.

This amounts to the ſame with what is otherwiſe called in *corde ſolis*, or in the ſun's heart, which paſſes for a dignity and fortitude of a planet, equal to that of being in its own houſe; whereas in other caſes, a planet's conjunction with the ſun is held detrimental, or a diminution to it; as the ſun, by his ſuperior power, is ſuppoſed to abſorb the virtue of the planet, and even ſcorch or burn it up. *Wolf.* Lex. Math. p. 327. *Vital.* Lex. Math. p. 98.

CEANIDES, or CEANTIDES, in natural hiſtory, a name given by many of the antients to the ſtone more generally known under the name of enchymonites. It was the ſame with our ſparry incruſtations on the walls and roofs of ſubterranean caverns; and, from the opinion of the times, that theſe ſtones brought forth young ones, which was founded on their finding little ones daily produced among them, it became a cuſtom to give this internally to women in labour, as a thing that would, by a ſort of ſympathy, haſten the time.

CEDAR, *cedrus*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the amentaceous kind, conſiſting of a great number of little leaves, furniſhed with a number of apices: this is the male flower. The fruit which grows on other parts of the tree is a roundiſh berry, containing angular kernels, which have each oblong ſeeds. To this it is to be added, that the leaves reſemble thoſe of cypreſs.

The ſpecies of *cedrus* enumerated by Mr. Tournefort, are theſe: 1. The greater cypreſs-leav'd *cedrus*, with yellow berries. 2. The middle-ſized cypreſs-leav'd *cedrus*, with very large berries; and, 3. The tall Spaniſh *cedrus*, with large black berries. *Tourn.* Inſt. p. 588.

This tree is of great beauty, and bears the openeſt expoſures ſo well, that it is a wonder it is not more cultivated in England.

The cones of this tree are brought us from the Levant, and if preſerved entire, will keep their ſeeds many years: theſe cones are to be ſplit open, and the ſeeds picked out with the fingers: theſe are to be ſown and propagated in the ſame manner as the firs. See the article FIR. Only that when the plants begin to ſhoot ſtrong, the leading ſhoot generally inclines to one ſide, and muſt therefore be ſupported by tying it to a ſtake driven upright by its ſide.

Theſe trees ſpread greatly, and the ends of their branches bending down, they ſhew very beautifully their upper ſurface, which looks like a green carpet, and as it plays in the wind makes a very elegant appearance, and is therefore a fine tree for planting on an eminence to terminate a viſta.

They thrive beſt of all in a poor ſoil, and are of very quick growth, as appears very plainly by thoſe fine ones in the phyſic garden at Cheſſea, which were planted in the year 1683, and were then only two foot high, and in the year 1736 were above ten feet in the girth, at two feet above ground. *Miller*, Gard. Dict. in voc.

CEDAR, in building, &c. a denomination given to a ſpecies of the wood of the *cedar*-tree, famous for its duration and incorruptibility.

The tree which bears it, is that popularly called by us the *cedar* of Lebanon, by the antients *cedrus magna*, or the great *cedar*, alſo *cedrelate*, κεδρελάτη, and ſometimes the Phœnician or Syriac *cedar*, from the country where it grows in greateſt perfection. *Plin.* Hiſt. Nat. l. 24. c. 5. *Fab.* Theſ. p. 514. Trev Dict. Univ. T. 1. p. 1529. voc. *cedre*. *Gorr.* Med. Defin. p. 219.

It is a coniferous ever-green, of the bigger ſort, large and tall, bearing large roundiſh cones, of ſmooth ſcales, ſtanding erect, the leaves being ſmall, narrow, and thick ſet.

They ſometimes counterfeit *cedar*, by dying wood of a reddiſh hue; but the ſmell diſcovers the cheat, that of true *cedar* being very aromatic. In ſome places the wood of the cajou tree paſſes under the name of *cedar*, on account of its reddiſh colour, and its aromatic ſmell, which ſomewhat reſembles that of ſantal.

Cedar wood is reputed almoſt immortal and incorruptible, a prerogative which it owes chiefly to its bitter taſte, which the worms cannot endure. For this reaſon it was, the antients made uſe of *cedar* tablets to write on, eſpecially for things of importance, as appears from that expreſſion of Perſius, *Et Cedro digna locutus. Perſ.* Sat. 1. v. 42.

A juice was alſo drawn from *cedar*, with which they ſmeered their books and writings, or other matters, to preſerve them from rotting; which is alluded to by Horace[a]: By means of which it was that Numa's books, written on papyrus, were preſerved entire to the year 535, as we are informed by Pliny[b]. [[a] *Horat.* Ars Poet. v. 331. [b] *Plin.* Hiſt. Nat. l. 12. c. 13. *Fab.* Theſ. p. 514.] See CEDRIA.

Solomon's temple, as well as his palace, were both of this wood. That prince gave king Hiram ſeveral cities for the *cedars* he furniſhed him on thoſe occaſions. Cortes is ſaid to have erected a palace at Mexico, in which were 7000 beams of *cedar*, moſt of them 120 feet long, and 12 in circumference, as we are informed by Herrera. Some tell us of a *cedar* felled in Cyprus 130 foot long, and 18 in diameter. It was uſed for the main maſt in the galley of king Demetrius. Le Bruyn aſſures us, that the two biggeſt he ſaw on Mount Lebanon meaſured one of them 57 palms, and the other 47 in circumference. Trev. Dict. p. 1529, ſeq. *Calm.* Dict. Bib. T. 1. p. 370.

In the temple of Apollo at Utica, there were *cedar* timbers of near 2000 years old; which yet were nothing to that beam in an oratory of Diana at Saguntum in Spain, ſaid to have been brought thither 200 years before the deſtruction of Troy.

Cedar is of ſo dry a nature, that it will not endure to be faſtened with iron nails, from which it uſually ſhrinks, ſo that they commonly faſten it with pins of the ſame wood.

The *cedar* brought from Barbadoes and Jamaica is a ſpurious ſort, of ſo porous a nature, that the wine will leak thro' it. That produced in New-England is a lofty grower, and makes excellent planks, and flooring that is everlaſting. They ſhingle their houſes with it, and uſe it in all their buildings. This is the Oxycedrus of Lycia, which Vitruvius deſcribes as having its leaves reſembling thoſe of cypreſs. *Evelyn.* Sylv. c. 25. §. 14.

The *cedar* of Greece and Aſia was no other than a ſmaller kind of juniper, which having prickly leaves, was by ſome called oxycedrus, and the common juniper was at that time called alſo by the name of *cedar*. The Lycian *cedar* of the Greeks was this juniper kind; but the cedrium and cedrelæum, which were a kind of pitch and an oil ſeparated from it by melting, were not prepared from this *cedar*, but from the Syrian *cedar*, which was a larger ſhrub, and reſembled the cypreſs, and therefore was confounded with that tree, being called by ſome the wild cypreſs. The cedrium was always made from this ſpecies; but the oleum de coda, or code oil, was made from the fruit of the oxycedrus, or prickly-leav'd juniper, called *cedar* by the Greeks, and growing in their own country.

The ſhittim and the almug mentioned in ſcripture, are uſually ſuppoſed to have been kinds of *cedar*.

Johnſton, in his *dendrographia*, is of opinion, that pitch was antiently made of *cedar*, as well as of the pine and fir, grown old and oily. Bp. *Berkeley*, Siris, ſect. 18.

CEDAR *cups*, a ſort of wooden ware brought from the Weſt-Indies. They are made out of the wood of the baſtard *cedar*, and appear of a very cloſe and firm grain; but they are really ſo porous, that when any liquor is pour'd into them, it runs out at the bottom.

CEDILLA, in the Spaniſh and French languages, denotes a ſort of ſmall c, to the bottom of which is affixed a kind of virgula, as ç, to denote that it is to be pronounced like ſ.

The *cedilla* is called by ſome of our printers a *ceceril*. It is uſed before the vowels a, o, and u; as in braços, choça, commença, leçon, deça, &c. In the Spaniſh, it is ſometimes uſed at the beginning of a word, as in çamarra, çurzar, &c. Trev. Dict. Univ. T. 1. p. 1529. *Steph.* Span. Dict. in voc. Mem. de Trev. 1707. p. 1265.

CEDRELATON, in botany, a name given by Pliny to an imaginary tree, and faithfully copied by many authors. The word ſeems evidently formed of *cedrus*, the cedar, and *elate*, the fir-tree; and hence the original author of the blunder has deſcribed it as a large and high cedar, with few branches: and thoſe who have copied from him, have deſcribed it as being of a middle nature, between the cedar and fir. It is eaſy to trace Pliny up to his original authors in his botanical account; and by doing this, in the preſent caſe it is found, that there never was any tree at all called by this name by the authors whom he follows; but that the whole is an error, founded on his reading in ſome of them *cedrelaton* inſtead of cedrelaion, a name by which all the antient Greeks have called the oil of cedar. Pliny taking this for the name of a tree, ſays, that the ſeed was like the cypreſs, and the tree higher than any other cedar. He mentions it in another place alſo, and ſays, that it yields the cedria, or a peculiar kind of pitch, called oil of cedar by ſome. *Pliny*, l. 25. c. 3.

CEDRIA, κεδρία, a reſinous liquor iſſuing from the great cedar tree, or cedar of Lebanon. The word is alſo written *cedrium*, κεδρίον, and *cedrinum*, κεδρινον.

Cedria, when good, yields a ſtrong ſmell, is tranſparent, of a thick fatty conſiſtence, ſo that in pouring it out, it does not fall too faſt or freely, but equally drop by drop. It is poſſeſſed of two oppoſite qualities, viz. to preſerve dead bodies, by its drying and conſuming ſuperfluous moiſture, without damaging the ſolid parts; and to putrify the ſoft and tender parts of living bodies, without exciting any pain. Trev. Dict. Univ. T. 1. p. 1530. *Savar.* Dict. Comm. T. 1. p. 596. *Ruland*, Lex. Alch. p. 137.

The *cedria* is properly the tear of the cedar. Some call it the gum, others the pitch of the *cedar*. The ſame denomination is alſo given to the *cedrelæon*, or oil of the cedars, which differs little from the reſin, except that it is of a thinner conſiſtence. *Gorr.* Med. Defin. p. 219. voc. κεδρίον. *Caſt.* Lex. Med. p. 153. *Fab.* Theſ. p. 514.

CEGINUS, in aſtronomy, a fixed ſtar of the third magnitude, in the left ſhoulder of Bootes. See BOOTES, *Cycl.* and *Suppl.* Its longitude, according to Hevelius, for the year 1700, was 13° 26′ 4″, and its latitude northern 49° 35′ 47″.

Some alſo give this denomination to the ſtar otherwiſe called *cepheus*.

cepheus. *Wolf*. Lex. Math p. 327, ſeq. *Vital*. Lex. Math. p. 99. See CEPHEUS, *Cycl*. and *Suppl*.

CEGOLITES, in natural hiſtory, a name by which ſome authors have called the lapis judaicus, or tecolithus of the antients. See JUDAICUS *lapis*.

CEIMELIA, Κειμηλια, in antiquity, denotes choice or precious pieces of furniture or ornaments, reſerved or laid up for extraordinary occaſions and uſes.

In which ſenſe, ſacred garments, veſſels, and the like, are reputed of the *ceimelia* of a church. Medals, antique ſtones, figures, manuſcripts, records, &c. are the *ceimelia* of men of letters. *Suic*. Theſ. T. 2. p. 81. *Calv*. Lex. Jur. p. 166. *Caſt*. Lex. Med. p. 153.

CEIMELIARCHIUM, Κειμηλιαρχειον, the repoſitory or place where ceimelia are preſerved. *Bingh*. Orig. Eccleſ. l. 8. c. 7. §. 7. *Du Cange*, Gloſſ. Gr. T. 1. p. 628.

CEIMELIOPHYLAX, Κειμηλιοφυλαξ, the keeper or curator of a collection of *ceimelia*; ſometimes alſo denominated *ceimeliarcha*, κειμηλιαρχης.

The *ceimeliarcha*, or *ceimeliophylax*, was an officer in the antient churches and monaſteries, anſwering to what was otherwiſe denominated *chartophylax*, and *cuſtos archivorum*. *Bingh*. Orig. Eccleſ. l. 3. c. 13. §. 3. *Du Cange*, Gloſſ. Græc. T. 1. p 628.

CEIXUPEIRA, in zoology, the name of a fiſh caught in the American ſeas, and eſteemed a very fine and delicate one, tho' of an enormous ſize. It grows to nine or ten feet long, and to the thickneſs of a man's body, but is chiefly eaten while young. Its body is oblong, and its head flatted. Its mouth is but ſmall for the ſize of the fiſh, and it has no teeth in the jaws; but the whole mouth is thick ſet with ſmall tubercles. Its eyes are white, and not large. It has ſix fins, beſide the tail: all its fins are armed with ſoft prickles; and in the ſpace between the head and back-fin, it has eight ſtrong, bony, triangular ſpines, which it can at pleaſure draw in and hide within the fleſh. Its head is bony and ſmooth; and its whole body is covered with ſuch ſmall ſcales, that it appears ſmooth. Its back and ſides are black, and its belly of a fine bright white. Its fins are all black, except the belly ones, which are white, with a rim of black at their edge. *Margrave*'s Hiſt. Braſil.

CELANDINE, in botany. See CHELIDONIUM.

CELANTES, in logic, a denomination given by the peripatetics to the Galenical ſyllogiſm; otherwiſe called calentes. *Walch*. Lex. Phil. p. 338. See CALENTES.

CELARENT, in logic, a mode of ſyllogiſms in the firſt figure, wherein the major propoſition and concluſion are univerſal negative, and the minor or medium univerſal affirmative. E. gr.

CE No bad book ought to be read:
lA Every obſcene book is a bad one:
rEnt. Therefore no obſcene book ought to be read.

Walch. Lex. Phil. p. 359.

CELE, Κηλη, in a general ſenſe, denotes any tumour, but more particularly that proceeding from a rupture or hernia. *Gorr*. Med. Defin p. 224. *Blanc*. Lex. Med. p. 143. See TUMOUR and RUPTURE.

CELERI, a name given by our gardeners to ſome ſpecies of apium. See APIUM.

We have two ſorts of this plant cultivated in our gardens, the Italian *celeri*, and the celeriac.

The ſeeds of this plant ſhould be ſown at two different ſeaſons, the better to continue it for uſe thro' the whole ſeaſon, without its running up to ſeed. The firſt ſowing ſhould be in the beginning of March, in an open ſpot of light earth; but the ſecond ſowing ſhould be in April, in a moiſter ſoil. In about a month's time after ſowing, the plants will come up; they muſt be kept clear of weeds, and if the ſeaſon is dry they muſt be watered. When they have been a month or five weeks above ground, they will be fit to tranſplant. They muſt now be ſet at three inches diſtance, in beds of moiſt, rich earth. In the middle of June ſome of the plants of the firſt ſowing will be fit to tranſplant for blanching; the ſoil in which it is now planted muſt be moiſt, rich, and light.

The manner of planting it at this time is this: you muſt dig a trench of ten inches wide, and eight or nine inches deep, looſening the earth at the bottom, and laying it level; and the earth which comes out of the trench, is to be equally laid on each ſide the trench, to be ready to draw in again to earth the *celeri* as it advances in height. The trenches ſhould be made at three feet aſunder, and the plants ſet in them at ſix inches diſtance. The tops of their leaves, and ends of their roots, are to be cut off when planted; and they are to be watered, to fix the earth to their roots: after this, they require little care but the drawing up the earth to them as they advance in height; it muſt be carefully obſerved in doing this, never to bury the heart of the plant, nor ever to perform it but in dry weather; for if done in wet, the plants will rot. The earth between the trenches is to be uſed, when that that was thrown out in the digging of them is all employed; and ſoon after Midſummer ſome of the firſt ſowing will be ready to cut, and the ſucceeding ones, if rightly managed, will continue it till April or May. Many plantations are indeed to be made out of one ſowing, by pulling up the ſtrongeſt plants firſt, then ſome time after the ſtrongeſt of the remaining, and finally, the leaſt of all, which will be got to a proper growth by that time. *Miller*'s Gardener's Dict.

CELERINUS, in ichthyology, a name by which ſome authors have called the pilchard; called by others the apua membras, and chalcis. *Bellonius*, de Piſc. See the article PILCHARDUS.

CELERINUS is alſo uſed by Bellonius, and ſome other authors, for the common herring. See the articles HALEE and CLUPEA.

CELESTIAL *globe*. See GLOBE, *Cycl*.

CELESTIAL *fire*. See FIRE.

CELETES, or CELETÆ, in antiquity, denote ſingle or ſaddle-horſes; by way of contradiſtinction from thoſe yoked or harneſſed together, called *bigarii*, *quadrigarii*, &c.

The ſame denomination is alſo given to the cavaliers, or riders on horſeback; and hence ſome deduce *celeres*, the name of Romulus's guard. *Aquin*. Lex. Mil. T. 1. p. 191. *Pitiſc*. Lex. Ant. T. 1. p. 388.

CELEUSMA, or CELEUMA, Κελευσμα, in antiquity, the ſhout or cry of the ſeamen, whereby they animated each other in their work of rowing.

The word is formed from the Greek, κελευειν, to call, to give the ſignal.

CELEUSMA was alſo a kind of ſong or formula, rehearſed or played by the maſter, or others, to direct the ſtrokes and movements of the mariners, as well as to encourage them to labour. *Aſcon. Pedian*. in Divinat. Verr. p. 37. See CELEUSTES.

Some diſtinguiſh the *celeuſma* from the ſong, making the former to conſiſt in a ſingle word or formula, ſpoken aloud; as, *rhippape*, to give notice to row; and *oop*, to ſtop. *Pitiſc*. Lex Ant. T. 1. p. 388.

Aquinus, without much foundation, extends the *celeuſma* to the military ſhouts in land armies. *Aquin*. Lex. Mil. T. 1. p. 191, ſeq.

When chriſtianity got footing, hymns and pſalms were ſung in veſſels, by way of *celeuſma*, in which the words *amen* and *halleluja* were frequently repeated. *Bingh*. Orig. Eccleſ. l. 14. c. 2. §. 4. *Fab*. Theſ. p. 517.

CELEUSTES, Κελευστης, in the antient ſhips, the boatſwain or officer appointed to give the rowers the ſignal, when they were to pull, and when ſtop their hands. *Ovid*. Metam. l. 3. v. 618, ſeq. See CELEUSMA.

He was alſo denominated *epopeus*, and by the Romans *portiſculus*; ſometimes ſimply *hortator*. *Fab*. Theſ. p. 517. *Pitiſc*. Lex. Ant. T. 1. p. 388. *Kenn*. Rom. Ant. Not. P. 2. l. 4. c. 20. p. 244.

CELIBACY. The antient Romans uſed all means imaginable to diſcourage *celibacy*. Nothing was more uſual than for the cenſors to impoſe a fine on old batchelors. Dionyſius Halicarnaſſeus mentions an antient conſtitution, whereby all perſons of full age were obliged to marry. But the firſt law of that kind, of which we have any certainty, is that enacted under Auguſtus, called *Lex Julia de maritandis ordinibus*. It was afterwards denominated *Papia Poppæa*, and more uſually *Julia Papia*, in regard of ſome new ſanction and amendments made to it under the conſuls Papius and Poppæus. By this law, divers prerogatives were given to perſons who had many children; penalties impoſed on thoſe who lived a ſingle life, as that they ſhould be incapable of receiving legacies, except from their neareſt relations, and not exceeding a certain proportion, &c. *Pitiſc*. Lex. Ant. T. 1. p. 480. voc. *cælibatus*. *Calv*. Lex. Jur. p. 195. voc. *cælibes*.

CELIBATE (*Cycl*.) is chiefly uſed in ſpeaking of the ſingle life of the clergy, or the obligation they have been ſuppoſed under to abſtain from the uſe of marriage.

In this ſenſe we ſay, the law of *celibate*; monks and religious take a vow of *celibate*, and what is more, of chaſtity.

The church of Rome impoſes an univerſal *celibacy* on all its clergy, from the pope to the loweſt deacon and ſubdeacon. The advocates for this uſage pretend, that a vow of perpetual *celibacy* was required in the antient church, as a condition of ordination, even from the earlieſt apoſtolic ages. But the contrary is evident, from numerous examples of biſhops and archbiſhops, who lived in a ſtate of matrimony, without any prejudice to their ordination or their function. 'Tis generally agreed by antient writers, that moſt of the apoſtles were married: ſome ſay all of them, except St. Paul and St. John: others ſay St. Paul himſelf was married, becauſe he writes to his yoke-fellow, whom they interpret his wife. Be this as it will, in the next ages after the apoſtles, we have accounts of divers married biſhops, preſbyters and deacons, without any reproof or mark of diſhonour ſet on them: *ex. gr*. Valens, preſbyter of Philippi, mentioned by Polycarp; and Chæremon, biſhop of Nilus. Novatus was a married preſbyter of Carthage, as we learn from Cyprian, who himſelf was alſo a married man, as Pagi confeſſes; and ſo was Cæcilius the preſbyter, who converted him; and Numidius, another preſbyter of Carthage. *Bingh*. Orig. Eccleſ. l. 4. c. 5. §. 5.

The reply which the Romaniſts give to this is, that all married perſons, when they come to be ordained, promiſed to live ſeparate from their wives by conſent, which anſwered the vow of *celibacy* in other perſons [a]. But this is ſaid not only without proof, but againſt it. For Novatus, preſbyter of Carthage, was certainly allowed to cohabit with his wife after ordination; as appears from the charge that Cyprian brings againſt him, that he had ſtruck and abuſed his wife, and there-

by

by caused her to miscarry. There seems indeed in some places to have been a tendency toward introducing such a law, by one or two zealots; but the motion was no sooner made, than it was quashed by the authority of wiser men. Thus Eusebius observes, that Pinytus, bishop of Gnossus in Crete, was for laying the law of *celibacy* upon his brethren; but Dionysius, bishop of Corinth, wrote to him, that he should consider the weakness of men, and not impose that heavy burden on them. In the council of Nice, an. 325, the motion was renewed for a law to oblige the clergy to abstain from all conjugal society with their wives, which they had married before their ordination: but Paphnutius, a famous Egyptian bishop, and one who himself never married, vigorously declaimed against it, upon which it was unanimously rejected. So Socrates [b] and Sozomen tell the story. To which all that Valesius [c], after Bellarmin, has to say, is, that he suspects the truth of it.— [[a] *Pagi* Critic. in Baron. an. 248. p. 4. [b] *Socrat.* l. 1. c. 11. *Sozom.* l. 1. c. 23. [c] *Valef.* Not. in Socrat. l. 1. c. 11.]

The council in Trullo held in 692, made a difference in this respect between bishops and presbyters, allowing presbyters, deacons and all the inferior orders to cohabit with their wives after ordination; and giving the Roman church a smart rebuke for the contrary prohibition, but at the same time laying an injunction upon bishops to live separate from their wives, and appointing the wives to betake themselves to a monastic life, or become deaconesses in the church. And thus was a total celibate established in the Greek church, as to bishops, but not any others. In the Latin church the like establishment was also made, but by slow steps in many places. For in Africa even bishops themselves cohabited with their wives at the time of the council of Trullo. *Bingh.* Orig. Eccles. T. 1. l. 4. c. 5. §. 5. seq. *Suic.* Thes. Eccles. T. 1. p. 733.

The *celibacy* of the clergy, however, appears of an antient standing, if not as a matter of command and necessity, yet as of council and choice.

The historian Socrates relates, that in Thessaly the priests were excommunicated who lived with their wives, though married before their ordination; and the same was practised in Macedonia and Greece: he adds, that all the churches of Asia voluntarily observed the same rule [a]. St. Jerome, before Socrates, assures us, that the churches of the East, Egypt, and Rome, that is the three grand patriarchates, and almost all the churches under their jurisdiction, admitted only single persons to the clericate, or if they had wives, they from that time ceased to converse with them as husbands. And St. Epiphanius before Jerom, though in the same age, declares that a person who had been married, though but once, was not admitted to be either deacon, priest, or bishop, during his wife's life, unless he abstained from her: and that if any thing contrary hereto be allowed in certain places, it is contrary to the rule of the church, and only connived at out of condescension for human weakness. By which it may seem as if there were then some decree or canon which established *celibate* [b]. — [[a] *Socrat.* Hist. Eccles. l. 5 c. 22. [b] *Walk.* Disc. on celibacy of clergy. §. 20. seq. Trev. Dict. Univ. T. 1. p. 1538, seq. *Suic.* Thes. T. 1. p. 733.]

CELIDOGRAPHIA, the description of the spots which appear on the faces of the sun and planets. See SPOT.

The word is formed from the Greek κηλις, *macula*, spot, and γραφω, I describe.

Signior Bianchini has published a *celidographia* or description of the spots of the sun. Vid. Bibl. Ital. T. 7. p. 82. Act. Erud. Lipsi. An. 1729. p. 493.

CELIMIA, in the materia medica, a name given by the modern Greeks to the calamine or lapis calaminaris. The Arabians called this substance climia, and sometimes calimia; and celimia was but a very small change from this.

CELL, *cella*, (*Cycl.*) in antient writers, denotes a place or apartment usually under ground, and vaulted; in which were stored up some sort of necessaries, as wine, honey, wheat, and the like; according to which it was peculiarly denominated *cella vinaria*, *oleria*, *mellaria*, *penaria*, &c. *Cic.* de Senect. c. 16. *Fab.* Thes. p. 517.

The word is formed from the Latin *celare*, to hide, or conceal.

CELLA was also used for the lodge, or habitation of a common woman or prostitute, as being under ground; hence also denominated *fornix*.

Intravit calidum veteri centone lupanar,
Et cellam vacuam. —— *Juv.* Sat. 6. v. 121.

On which place an antient scholiast remarks, that the names of the whores were written on the doors of their several *cells*; by which we learn the meaning of *inscripta cella*, in Martial. *Mart.* Epigr. l. 11. Ep. 46. *Fab.* Thes. p. 517.

CELLA was also applied to the bed-chambers of domestics, and servants; probably as being low and narrow.

Cicero inveighing against the luxury of Antony, says, the beds in the very *cellæ* of his servants were spread with pompous purple coverlets.

CELLA is also applied to the members or apartments of baths. *Cic.* Philip. 2. c. 27. *Fab.* Thes. p. 518. See BATH.

Of these there were three principal called *frigidaria*, *tepidaria*, and *caldaria*. To which may be added a fourth called *cella affa*, and sometimes *sudatoria*. Vid. *Pallad.* de re Rust. l. 1. c. 40. *Salmas.* Observ. ad Vopisc. *Fab.* Thes. p. 518.

CELLA was also applied to the *adyta*, or inmost and most retired parts of temples, wherein the images of the gods to whom the edifices were consecrated, were preserved. In this sense we meet with *cella Jovis*, *cella Concordiæ*, &c. Pub. Victor calls them *delubra*; and Pliny by a more comprehensive name *ædes*. *Plin.* Hist. Nat. l. 35. c. 10.

The Roman capitol, we are told by Dionysius, had three such *cellæ*, or chapels; the middlemost of which was sacred to Jupiter, that on the right hand to Minerva, and that on the left to Juno. *Fab.* Thes. p. 518.

CELL is also used for a lesser or subordinate sort of monastery, dependent on a great one, by which it was erected, and continues still to be governed. The great abbies in England had most of them *cells* in places distant from the mother abbey, to which they were accountable, and from which they received their superiors.

The alien priories in England were *cells* to abbies in Normandy, France, Italy, &c. *Stev.* Suppl. to Dugd. T. 2. p. 230.

The name *cell* was sometimes also given to rich and considerable monasteries not dependent on any other. Such was that called *cella vetus*, erected by Otho, surnamed the rich marquess of Misnia, in the middle of the 12th century, the most splendid abby in that country. Vid. Jour. des Scav. T. 33. p. 263, seq.

CELLAR, *celarium*, in antient writers, denotes the same with *cella*, viz. a conservatory of eatables, or drinkables. See the article CELLA.

Cellar differs from a vault, as the latter is supposed to be deeper, the former being frequently little below the surface of the ground. See VAULT, *Cycl.*

In which sense, *cellarium* only differed from *penus*, as the former was only a store-house for several days, the latter for a long time [a]. Thus it is, the *Bactroperitæ*, a sort of antient cynics, are said by St. Jerom to carry their *cellar* about with them [b]; [[a] *Serv.* ad Æn. l. 1. v. 704. [b] *Hieron.* in Math. c. 10 *August.* Confess. l. 9. c. 8. *Fab.* Thes. p. 519.] See the article BACTROPERITÆ.

CELLARIUM also denoted an allowance of bread, wine, oil, or other provision furnished out of the *cella*, to the use of the governor of the province, and his officers, &c.

In which sense the word amounts to much the same with *annona*. See ANNONA.

CELLARS, in modern building, are the lowest rooms in a house, the ceilings of which usually lye level with the surface of the ground on which the house is built. *Neve*, Build. Dict. in voc.

Cellars, and other places vaulted under ground, were called by the Greeks *hypogæa*: the Italians still call them *fundi delle case*. *Vitruv.* de Archit l. 6. c. 11. *Fe ib.* Princ. Archit. p. 369.

CELLARER, or CELLERER, *cellerarius*, or *cellarius*, an officer in monasteries, to whom belong the care and procurement of provisions for the convent.

The denomination is said to be borrowed from the Roman law, where *cellerarius* denotes an examiner of accounts and expences: Ulpian defines it thus: *cellerarius*, *id est*, *ideo præpositus ut rationes salvæ sint*. Trev. Dict. Univ. T. 1. p. 1539.

The *cellerarius* was one of the four obedientiarii, or great officers of monasteries: under his ordering was the pistrinum or bakehouse, and the bracinum, or brewhouse. In the richer houses there were particular lands set apart for the maintenance of his office, called in antient writings, *ad cibum monachorum*.

The *cellerarius* was a great man in the convent.

In archbishop Winchelsey's statutes for the priory of Christ Church at Canterbury, 'tis said the great *cellerarius* ought to be the father of the monastery. He had a *subcellerarius* under him, to assist and bear part of the burthen. He held a hall or halimote, conventus aulæ, to which resorted a great number of inferior officers specified by Somner. Abbots were oftener taken out of the *cellerarii*, than out of any other order of people. Vid. *Somn.* Antiq. Canterb. p. 201, seq.

The origin of *cellerers* seems to be civil: the appellation was first given to an officer of lay-lords, who had the care and management of their domestic affairs; answering to what is now called a steward, major-domo, or intendant. After them, bishops and abbots affected to give the same title to their agents. Philip of Savoy, notwithstanding his high birth, was *cellerer* of the archbishop of Vienne in 1243.

The *cellerer* was properly the person who had the direction of what related to the belly, which comprehended all eatables and drinkables: *qui cellæ vinariæ & escuariæ præsit*. His whole office in antient times, had a respect to that origin: he was to see his lord's corn got in, and laid up in granaries; and his appointment consisted in a certain proportion thereof, usually fixed at a thirteenth part of the whole; together with a furred gown. The office of *cellerer* then only differed in name from those of bailiff and minstrel; excepting that the *cellerer* had the receipt of his lords rents through the whole extent of his jurisdiction. Trev. Dict. Univ. T. 1. p. 1539. Journ. des Scav. T. 88. p. 47.

CELLARER was also an officer in chapters, to whom belonged the care of the temporals, and particularly the distributing of bread, wine, and money to the canons, on account of their attendance in the choir. In some places he was called *cellarer*, in others *burser*, and in others *currier*. Trev. Dict. Univ. T. 1. p. 1540.

CELLEPORÆ, in botany, the name of a genus of marine plants, the characters of which are, that they are of the ſubſtance of the lithophyta, and have oblong creeping hollows in ſeveral parts.

CELLULÆ, in the colon, a ſort of ſpaces wherein the excrements continue ſome time before they are voided. See COLON and EXCREMENT.

CELLULANUS, a monk inhabitant, or reſident in a cell. *Fab.* Theſ. p. 518. See CELLA.

He is alſo denominated *concellaneus* and *ſyncelliſta*, by which are imported the relation of fellow monks, or thoſe who live in the ſame cell or convent. *Du Cange*, Gloſſ. Lat. T. 1. p. 916. *Magr.* Not. voc. Eccleſ. p. 61.

CELLULAR, or CELLULOSE, an appellation given by Ruyſch, to the ſecond coat of the inteſtines; in which fat is often found. *Heiſt.* Comp. Anat. §. 211. p. 104.

Wharton alſo takes notice of a *celluloſe* coat in the meſentery, wherein fat is contained. See MESENTERY, *Cycl.*

Heiſter thinks that a *celluloſe* coat may alſo be added to the three coats in the human bladder, by reaſon fat is often found between the outermoſt and muſcular coat, where it is ſecreted, collected, and preſerved in little adipoſe cells. Id. ibid. in Not. p. 353. See BLADDER, *Cycl.* and *Suppl.*

CELSIA, in botany, the name of a genus of plants, the characters of which are theſe: the perianthium is divided into five oblong and obtuſely pointed ſegments, which remain after the flower is fallen. The flower conſiſts of one petal; the tube is extremely ſhort; the limb is very plane, and lightly divided into five ſegments of a rounded figure; the two lower ones of theſe are ſmaller than the two upper, and the ſingle ſegment that ſtands at the bottom is largeſt of all. The ſtamina are four capillary filaments which ſtand near the ſmaller ſegments of the flower, and two of them are longer than the others, and are woolly on the outer ſide; the antheræ are ſmall and roundiſh; the germen of the piſtil is roundiſh; the ſtyle is capillary, and of the length of the ſtamina; and the ſtigma is obtuſe. The fruit is a roundiſh bilocular capſule, compreſſed and pointed at the top, and is fixed in the baſe of the flower. The ſeeds are ſmall, numerous, and of an angular figure; the receptacles are hemiſpheric. It is evident, from the characters, that this genus of plants differs extremely from the verbaſcum, or mullein. *Linnæi* Gen. Plant. p. 298.

CELTIS, the *nettle-tree*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, being compoſed of ſeveral petals arranged in a circular form, and filled with very ſhort ſtamina. The piſtil ariſes from the cup, and finally becomes a fruit or berry, containing a roundiſh kernel.

The ſpecies of *celtis* enumerated by Mr. Tournefort are theſe: 1. The *celtis* with black fruit. 2. The *celtis* with pale purple fruit. And, 3. The American *celtis*, with citron-like leaves of a gold colour underneath, and with red fruit. *Tourn.* Inſt. p. 612.

CEMENT. See the article CÆMENT.

CEMENTATION. See CÆMENTATION.

CEMENTATION *of gold*. See GOLD.

CEMETERY, *cœmeterium*, (See COEMETERIUM, *Cycl.*) denotes a place ſet apart, or conſecrated, for the burial of the dead. *Bingh.* Orig. Eccleſ. l. 23. c. 1. §. 1. ſeq. See BURIAL, and BURYING.

The word is originally Greek, κοιμητηριον, formed of κοιμαω, dormio, I ſleep.

In which ſenſe *cemetery* amounts to the ſame with dormitory, ſepulchre, ſepulchretum, &c. It is ſometimes alſo called *polyandrium*, q. d. a concourſe of a multitude of men [a], and *andropolis*, or the city of men [b]. —[[a] Vid. *Du Cange*, Gloſſ. Lat. T. 4. p. 338. voc. *polyandrium*. [b] Id. ibid. T. 1. p. 198. voc. *andropolis*.]

Antiently none were buried in churches or church-yards: it was even unlawful to inter in cities; inſtead of which they had *cemeteries* without the walls [a]. Theſe were held in great veneration among the primitive chriſtians. The council of Elvira prohibited the burning of torches or tapers in the day time in *cemeteries*. The practice of conſecrating *cemeteries* is of ſome antiquity [b]: the biſhop walked round it in proceſſion, with the crozier, or paſtoral ſtaff, in his hand, the holy water pot being carried before, out of which aſperſions were made [c]. In the early ages, the chriſtians held their aſſemblies in the *cemeteries*, as we learn from Euſebius and Tertullian, the latter of whom calls thoſe *cemeteries* where they met to pray, *areæ*. Valerian ſeems to have confiſcated the *cemeteries*, and places deſtined for divine worſhip, which were reſtored again to the chriſtians by Gallian: In the reſcript of that emperor, which is preſerved by Euſebius, *cemeteries* and places of worſhip are uſed as ſynonymous terms [d]. It being here the martyrs were buried, the chriſtians choſe thoſe places to have churches in, when leave was given them by Conſtantine to build. And hence ſome derive that rule which ſtill obtains in the church of Rome, never to conſecrate an altar, without putting under it the relicks of ſome ſaint [e]. —[[a] *Suic.* Theſ. T. p. 3002. [b] Vid. *Bingh.* Orig. l. 23. c. 2. §. 1. [c] *Lobin.* Hiſt. de Bret. T. 2. p. 208. [d] *Bingh.* Orig. Eccleſ. l. 8. c. 1. §. 9. Item l. 23. [e] *Tillem.* Hiſt. des Emper. T. 3. p. 282, ſeq. Trev. Dict. Univ. T. 1. p. 1812.]

CENCHRAMIDEA, in botany, a name given by Plukenet to a genus of plants afterwards called by Plumier and Linnæus cluſia. *Plukenet*, Alm. 257. f. a. See CLUSIA.

CENCHRAMUS, in zoology, a name by which ſome authors have called the emberiza alba, called in Engliſh, the bunting. *Ray*'s Ornithol. See EMBERIZA *alba*.

CENCHRIS, in zoology, the name given by many authors to the keſtrel, or windhover, a ſpecies of hawk, of the long-winged kind called the tinnunculus, and by ſome in Engliſh, the *ſtannel*. *Ray*'s Ornithol. p. 50. See TINNUNCULUS

CENCHRIS is alſo the name of a ſpecies of ſerpent, ſo called becauſe of its ſmall ſpots, which reſembled the ſeeds of millet. It grows to five feet, or more, in length, and is conſiderably thick and large, and grows very taper at the tail. It is of a greeniſh yellow colour, and is yelloweſt toward the belly. It is found in the iſlands of the Archipelago, particularly in Lemnos and Samos. *Ray*'s Syn. Anim. p. 290.

CENCHRUS, in botany, the name given by Linnæus to a genus of plants, called by Micheli panicaſhella, the characters of which are theſe: the cup conſiſts of a number of involucra, collected into a ſort of head. Theſe are jagged and echinated, and each of them contains three calyxes: the perianthia are bivalve glumes of a hollowed and pointed figure, each containing two flowers, and are ſhorter than thoſe flowers. The flowers are ſome male and others of the hermaphrodite kind. Each flower is bivalve, the valves being pointed, hollow, and without awns, and the inner one ſmaller than the outer. The ſtamina are three in each flower, and are long pointed filaments, each ſuſtaining a ſagittated apex. The piſtil in the hermaphrodite flowers is formed of a roundiſh germen, a ſlender ſtyle of the ſame length with the ſtamina, and two oblong hairy ſtigmata: this is ſucceeded by a ſingle ſeed to every flower, which is of a roundiſh ſhape. *Linnæ*, Gen. Pl. p. 492. *Michel.* Plant. Gen. 31.

CENEGILD, in the Saxon antiquities, an expiatory mulct, paid by one who had killed a man, to the kindred of the deceaſed. The word is compounded of the Saxon *cinne*, i. e. *cognatio*, relation, and *gild*, *ſolutio*, payment.

CENEONTLATOTI, in zoology, the name of an American bird deſcribed by Nieremberg, and called by that author avis polyglotta. It is famous for the different modulations of its voice, and excels even the nightingale in melody. See the article POLYGLOTTA *avis*.

CENNING, *cenninga*, or *kenninga*, in our antient books, denotes notice given by the buyer to him of whom he had bought, that the thing purchaſed was claimed by another; that he might appear and avow, or warrant his bargain. *Du Cange*, Gloſſ. Lat. T. 1. p. 919. *Spelm.* Gloſſ. p. 131.

The word is formed of the Saxon *cennan*, auctorem advocare, to call an author.

CENOTAPH (*Cycl.*) amounts to the ſame with monument, properly ſo called; and ſtands diſtinguiſhed from ſepulchre, in which a corpſe is actually depoſited. *Florent* Ict. leg. 42. D. De religioſ. monumentum — Si corpus vel reliquiæ inferantur, fiet ſepulchrum; ſi vero nihil inferatur erit monumentum memoriæ cauſa factum, quod Græci κενοταφιον appellant.

Cenotaphs are honorary tombs, erected either to perſons buried in another place, or to thoſe who have received no burial, and whoſe relicks cannot be found, as being killed in battle, loſt at ſea, or the like [a]. Among the antients the ſame privileges and religious regard were allowed to theſe *tumuli inanes & honorarii*, as to real tombs [b]. Card. Norris has a treatiſe expreſs on the *cenotaphs* of the Cæſars, Caius and Lucius, which are ſtill ſeen at Piſa [c]. —[[a] *Lamprid.* in Alexand. c. 63. Cenotaphium in Gallia, Romæ ampliſſimum ſepulchrum meruit. *Fab.* Theſ. p. 521. [b] *Kenn.* Rom. Ant. Not. P. 2. l. 5. c. 10. p. 359. [c] Cenotaphia Piſana Caii & Lucii Cæſarum diſſertationibus illuſtrata. Venet. 1681. fol. Act. Erud. Lipſ. 1683. p. 113, ſeq.] See BURIAL.

CENOTZQUI, in zoology, the name of an American bird deſcribed by Nieremberg, and called avis evocatrix nivis, becauſe it always is very clamorous before ſnow falls, and afterwards becomes ſilent. It is a very beautifully variegated bird. Its breaſt is yellow; its legs are whitiſh; its belly is variegated with white and black; the under ſides of its wings are white and grey, and their upper ſides yellow and blackiſh, and at their hinder parts grey ſpotted with black; the tail is black and white underneath, and black and yellow on its upper ſide; the head is black, and is ſurrounded with a circle of grey, and variegated between with a line of yellow. It lives as well in the colder as hotter climates, but is principally ſeen among the mountains. It has a very remarkable way of twiſting its head about; ſo that without moving its body, it eaſily ſees every way round it. There is another ſpecies of it a little differing in the diſpoſition of the colours, which ſome call liceto. *Ray*'s Ornithol. p. 305. See LICETO.

CENSAL, in the Mediterranean parts, denotes a regular or eſtabliſhed broker, authoriſed to negotiate between merchant and merchant. *Savar.* Dict. Comm. T. 1. p. 601. Trev. Dict Univ. p. 1546. *Aub.* Dict. Mar. p. 181.

CENSER, in antiquity, a kind of veſſel wherein incenſe was burnt to the gods.

Cenſer is chiefly uſed in ſpeaking of the Jewiſh worſhip. In the

the Greek and Roman affairs it is more frequently called thuribulum, λιβανωτὸς, and acerra. *Pitiſc.* Lex. Ant. T. 2. p. 957. voc. *turibulum.* See ACERRA.

The Jewiſh *cenſer* was a ſmall ſort of chaffing diſh, covered with a dome, and ſuſpended by a chain. Joſephus tells us that Solomon made twenty thouſand gold *cenſers* for the temple of Jeruſalem, to offer perfumes in, and fifty thouſand others to carry fire in. Trev. Dict. Univ. T. 2. p. 1156. voc. *encenſoir.*

CENSIO, in antiquity, the act, or office of the cenſor. Vid. *Calv.* Lex Jur. p. 168. *Fab.* Theſ. p. 522. See CENSOR, and CENSUS.

Cenſio included both the rating, or valuing a man's eſtate; and the impoſing mulcts and penalties.

CENSIO *haſtaria*, a puniſhment inflicted on a Roman ſoldier for ſome offence, as lazineſs or luxury, whereby his haſta or ſpear was taken from him, and conſequently his wages, and hopes of preferment ſtopped. *Feſt.* in voc. *Aquin.* Lex. Mil. T. 1. p. 192. Miſcel. Lipſ. T. 9. Obſ. 183. §. 4.

CENSITUS, a perſon cenſed, or entered in the cenſual tables. See CENSUS. *Fab.* Theſ. p. 529.

In an antient monument found at Ancyra, containing the actions of the emperor Octavius, we read

Quo luſtro civium Romanorum
Cenſita ſunt capita quadragies
Centum millia & ſexaginta tria.

CENSITUS is alſo uſed in the civil law for a ſervile ſort of tenant, who pays capitation to his lord for the land he holds of him, and is entered as ſuch in the lord's rent-roll. In which ſenſe, the word amounts to the ſame with *capite cenſus*, or *capite cenſitus.* Vid. l. 11. Cod. tit. de Agricolis, Colonis & Cenſitis. *Fabr.* Theſ. p. 525. See CAPITE *cenſi.*

CENSOR (*Cycl.*) — Beſides the taſk of holding the cenſus and luſtrum, which was purely miniſterial, the *cenſors* of antient Rome had the particular cognizance and inſpection of all the citizens, and in conſequence of it, a power to cenſure or animadvert upon any vice or immorality, in all orders of men whatſoever; which they took an oath to diſcharge without favour or affection. But this power reached no farther than to inflict ſome public mark of ignominy, on lewd and vicious perſons, in proportion to the ſcandal which they had given, by degrading or ſuſpending them from the privileges of that particular rank which they held in the city. This was their proper juriſdiction, and the foundation of their power over the ſenate; by virtue of which they frequently purged it of ſome of its unworthy and profligate members, by leaving out of the new roll the names of thoſe ſenators whom they found unworthy to ſit in that auguſt aſſembly, for the notoriety of their crimes; which they uſed commonly to aſſign as the cauſe of their inflicting this diſgrace [a]. There are many examples of ſenators thus expelled by the *cenſors*, generally for good reaſons, yet ſometimes through mere peeviſhneſs, envy or revenge [b]: but in ſuch caſes, there was always the liberty of an appeal to the final judgment of the people. So that the cenſorian power, properly ſpeaking, was not that of making or unmaking ſenators, but of enrolling only thoſe whom the people had made; and of inſpecting their manners, and animadverting upon their vices; over which they had a ſpecial juriſdiction delegated by the people. Their rule of cenſuring ſeems to have been grounded on an old maxim of the Roman policy, injoining, *that the ſenate ſhould be pure from all blemiſh, and an example of manners to all the other orders of the city:* as we find it laid down by Cicero [c] in his book of laws, which were drawn, as he tells us, from the plan of the Roman conſtitution. — [[a] *Cic.* pro Dom. 51. *Liv.* 4. 8. Id. 39. 42. [b] *Liv.* 39. 37. [c] *Cic.* de Leg. 3. *Middlet.* of Rom. Senat. p. 59, ſeq.]

The *cenſors* were generally men of the firſt dignity in the city, and always of conſular rank; ſo that their acts had naturally a great weight: and the ſeverity of their diſcipline was conſidered by the honeſt of all orders, as a great guard and ſecurity to the republic: and when they acted even on ſpiteful and peeviſh motives, yet the parties injured would not always take the trouble of going through a trial, ſince they could be relieved without it, either by the next *cenſors* [a], or otherwiſe, as ſhall be more particularly mentioned hereafter. But if any of theſe animadverſions continued to have a laſting effect, it was always owing to an univerſal approbation of them from all the orders of the city: for whenever they appeared to be violent or groſly unjuſt, neither the ſenate nor the people would endure them for a moment [b]. — [[a] *Aſcon.* in Divinat. 3. [b] *Middleton*, lib. cit. p. 68.]

The office of *cenſor*, at its firſt inſtitution, was deſigned to be *quinquennial*, or to continue in the ſame hand for five years; but this length of magiſtracy, unknown before to Rome, was reduced ſoon after to one year and an half, by a law of Mamercus Æmilius the dictator. *Middlet.* l. c. p. 70.

The *cenſors* continuing in their office for eighteen months only, if we ſuppoſe them, with the generality of writers, to have been created every five years, the office muſt have lain dormant for three years and an half. *Middlet.* l. c. p. 106. See CENSUS and LUSTRUM.

It was one part of the cenſorian juriſdiction to fill up the vacancies of the ſenate, upon any remarkable deficiency in their number, with new members from the equeſtrian order, who had not yet born any magiſtracy: but this was not done arbitrarily, or without the conſent and approbation of the people. For by obſerving the manner of proceeding on ſome extraordinary occaſions, we may collect the legal and regular method in ordinary caſes. For example [a], after the battle of *Cannæ*, the ſenate being greatly exhauſted, and no *cenſors* in office, a dictator was created for the ſingle purpoſe of filling up the vacancies, who preſently aſcended the roſtra, and in the preſence of the people aſſembled in the forum, ordered all thoſe who remained alive of the laſt cenſorian liſt, to be firſt called, and enrolled anew; then thoſe who, ſince that time, had born a curule magiſtracy, but had not been enrolled, each according to the order of his creation; then thoſe who had been ædiles, tribunes of the people, or quæſtors; and laſtly, thoſe of the equeſtrian rank, who had born no magiſtracy at all, but had ſignalized themſelves in the war, and taken ſpoils from the enemy: and having thus added one hundred and ſeventy-ſeven new ſenators to the laſt roll, with the univerſal approbation of the people, he laid down his office [b]. Upon another occaſion likewiſe, when Sylla the dictator, after the deſtruction made by his civil wars and proſcriptions, found it neceſſary to fill up the exhauſted ſenate with three hundred knights, he gave the choice of them to the people in an aſſembly of their tribes [c]. — [[a] *Middleton*, of Rom. Sen. p. 8. [b] *Liv.* l. 23. 23. [c] *App.* de Bell. Civ. l. 1. p. 413. *Middleton*, l. c. p. 10.]

The power of the *cenſors* being naturally odious and unpopular, was generally exerciſed with temper and caution, unleſs when an extraordinary licence and corruption of the times ſeemed to demand a particular ſeverity and enforcement of diſcipline. The cenſures, however, of theſe magiſtrates were not perpetual or irreverſible, nor conſidered as bars to any future advancement; for what was inflicted by one *cenſor*, was ſometimes reverſed by the other; and what was done by them both, by an appeal to the people, or by the ſucceeding *cenſors*, who commonly reſtored the diſgraced party to his former dignity; or elſe by obtaining a ſecond time, any of the magiſtracies abovementioned, the perſon ſo diſgraced entered again into the ſenate, and was enrolled of courſe by two *cenſors*. Thus we find ſome who had ſuffered the cenſorian note of infamy, choſen *cenſors* afterwards themſelves. *Cicero*, pro Cluent. 42. It. 43. *Val. Max.* l. 2. 9. 9. *Middlet.* l. c. p. 10.

The ſeverity of the cenſorſhip of L. Gallius and Corn. Lentulus furniſhed a pretext to P. Clodius, for procuring a law to prohibit the *cenſors* from ſtriking any one out of the roll of the ſenate, or diſgracing him in any manner upon the report of common fame, or the notoriety of any crime, till he had been formally accuſed, and found guilty by the common judgment of both the *cenſors.* *Dio.* l. 37. p. 66. E. *Middlet.* l. c. p. 79.

Beſides this taſk of enrolling the ſenators, and inſpecting their manners, it was a part likewiſe of the cenſorian juriſdiction, to let out to farm all the lands, revenues, and cuſtoms of the republic; and to contract with artificers for the charge of building and repairing all the public works and edifices, both in Rome, and the colonies of Italy [a]. Now in this branch of their office it is certain that they acted merely under the authority of the people, and were prohibited by law to let out any of the revenues, except in the roſtra, under the immediate inſpection, and in the very preſence of the people [b]. — [[a] *Liv.* 29. 37. *Polyb.* l. 6. 464. C. [b] *Cic.* de Leg. Agrar. 1. 3. Ib. 2. 21. *Liv.* 41. 2. *Middlet.* l. c. p. 83, 85.]

In the general cenſus and review of the city, held by them every five years, though every ſingle citizen was particulary ſummoned and enrolled by name in his proper tribe, as a freeman of Rome, yet that ſolemn enrollment, as Cicero tells us, did not confirm any man's right to a citizenſhip, but ſignified only, that he had paſſed for a citizen at that time [a]; becauſe the proper power of determining that right reſided always in the people [b]. — [[a] *Cic.* pro Arch. 5. [b] *Liv.* X. 52. *Middlet.* l. c. p. 85, 86.]

The *cenſor* was originally called indifferently by this name, or that of *cenſitor*; tho' in after-times a diſtinction was made, the appellation *cenſitor* being reſtrained to thoſe who performed the office of cenſing or aſſeſſing the people in the provinces; and that of the *cenſor* reſtrained to the magiſtrates of Rome. *Fab.* Theſ. p. 526.

The office continued to the time of the emperors, who aſſumed the authority of it to themſelves, but without the name, calling themſelves inſtead of *cenſors*, *morum præfecti* [a]: tho' Veſpaſian and his ſons took a pride to be called *cenſors*, and put this among their other titles on their coins [b]. Decius attempted to reſtore the dignity to a particular magiſtrate [c]. After this we hear no more of it till Conſtantine's time, who made his brother *cenſor*; the laſt who ſeems to have enjoyed the office [d]. — [[a] *Plut.* in Cat. Major. *Fab.* Theſ. p. 523. [b] *Walk.* on Coins and Medals, P. 1. c. 9. §. 7. [c] *Trebell.* Poll. in Decio. [d] *Walk.* loc. cit. *Fab.* Theſ. loc. cit. Trev. Dict. Univ. T. 1. p. 1547. *Pitiſc.* Lex. Ant. Rom. T. 1. p. 392, ſeq. *Schoetg.* Ant. Lex. p. 299.]

CENSORIAL, *cenſorius*, ſomething that relates to the office of cenſors. See CENSOR.

In which ſenſe we meet with *cenſoria nota*, or *animadverſio*, *cenſoria virgula*, &c.

CENSORIAL *law*, *cenſoria lex*, denotes a law paſſed or enacted by the cenſors *Cic.* Ep. 1. ad Quint. Frat. l. 1.

CENSORIAL *man*, *homo cenſorius*, a perſon who has born the dignity, and ſerved the office of cenſor. *Cic.* de Orat. l. 2. c. 89.

CENSORIAL *note*, *virgula cenſoria*, among the antient grammarians and critics, denoted a note or mark of reprobation, affixed to thoſe paſſages of a book or writing, which the critic diſapproved or condemned. *Quintil.* Inſt. Orat. l. 1. c. 2. *Fab.* Theſ. p. 524.

CENSUAL *books*, *libri cenſuales*, thoſe wherein the cenſus was taken down. Leg. 4. Cod. de Agric. & Cenſit. *Fab.* Theſ. p. 526.

CENSUALES, in a ſubſtantive ſenſe, denoted the clerks or public ſcribes who wrote the *cenſual* books. *Fab.* Theſ. p. 526. *Pitiſc.* Lex. Ant. T. 1. p. 394.

CENSUS *(Cycl.)* — The *cenſus* among the old Romans was held, as is commonly thought, every five years; but this muſt not be taken to be preciſely true: on the contrary, Dr. Middleton has ſhewn, that both the *cenſus* and luſtrum were for the moſt part held irregularly and uncertainly, at very different and various intervals of time. *Middleton* of the Roman Senate, p. 107, ſeq. See LUSTRUM.

The *cenſus* was an excellent expedient for diſcovering the ſtrength of the ſtate: by it they learnt the number of the citizens, how many were fit for war, and who for offices of other kinds; how much each was able to pay of taxes towards the charge of the war.

The *cenſus*, according to Salmaſius, was peculiar to the city of Rome. That in the provinces was properly called *profeſſio* and ἀπογραφή. But this diſtinction is not every where obſerved by the antients themſelves. *Salmaſ.* de Mod. Uſurar.

In the provinces, the *cenſus* not only ſerved to diſcover the ſubſtance of each perſon, but where, and in what manner and proportion, tributes might be beſt impoſed.

CENSUS was alſo uſed for the book or regiſter wherein the profeſſions of the people were entered.

In which ſenſe, the *cenſus* was frequently cited and appealed to, as evidence in the courts of juſtice *Marcell.* J. C. Leg. 10. de Probat. &. Præſumpt. *Fab.* Theſ. p. 525.

CENSUS is alſo uſed to denote a man's whole ſubſtance or eſtate.

CENSUS *ſenatorius*, the patrimony of a ſenator, which was limited to a certain value; being at firſt rated at eight hundred thouſand ſeſterces, but afterwards, under Auguſtus, enlarged to twelve hundred thouſand. *Suet.* in Cæſar. c. 41. *Torrent.* ad loc.

CENSUS *equeſter*, the eſtate or patrimony of a knight, rated at four hundred thouſand ſeſterces, which was required to qualify a perſon for that order, and without which no virtue or merit was available. *Suet.* in Cæſar. c. 33. *Plin.* Hiſt. Nat. l. 33. c. 1. Witneſs Horace,

Si quadringentis ſex ſeptem millia deſunt
Eſt animus tibi, ſunt mores, & lingua, fideſque;
Plebs eris. Hor. l. 1. ep. 1.

CENSUS was alſo uſed for a perſon worth an hundred thouſand ſeſterces, or who was entered as ſuch in the cenſual tables, on his own declaration. *Aſcon.* ad Verr. Ciceron.

In which ſenſe, *cenſus* amounts to the ſame with *claſſicus*, or a man of the firſt claſs: tho' Gellius limits the eſtate of thoſe of this claſs to an hundred twenty-five thouſand aſſes [a]. By the Voconian law, no *cenſus* was allowed to give by his will above a fourth part of what he was worth to a woman [b].— [a *A. Gell.* Noct. Att. l. 7. c. 13. *Fab.* Theſ. p. 525. [b] *Cic.* in Verr. 3. *Kenn.* Rom. Ant. Not. P. 2. l. 3. c. 34.]

CENSUS was alſo uſed to denote a tax or tribute impoſed on the ſubjects of the empire. *Du Cange*, Gloſſ. Lat. T. 1. p. 920.

CENSUS *agrorum* was a tax or impoſt on lands and poſſeſſions.

CENSUS *capitis* denoted a perſonal tax or tribute, impoſed on perſons, and called alſo capitation. *Bingh.* Orig. Eccleſ. l. 5. c. 3. §. 2. See CAPITE *cenſi*.

CENSUS *dominicatus*, in writers of the lower age, denotes a rent due to the lord.

CENSUS *duplicatus*, a double rent or tax, paid by vaſſals to their lord on extraordinary or urgent occaſions; as expeditions to the holy land, &c.

CENSUS *eccleſiæ Romanæ*, was an annual contribution, voluntarily paid to the See of Rome by the ſeveral princes of Europe.

CENSUS *ficcus*, that paid in money. *Du Cange*, Gloſſ. Lat. T. 1. p 921, ſeq.

CENSUS *magiſter*, among the Romans. See MAGISTER *cenſus*.

CENTAURS, *(Cycl.)* in mythology, a kind of fabulous monſters, half men, half horſes.

The poets feign that the *centaurs* were the ſons of Ixion and a cloud. The reaſon of this fancy is, that the caſtle to which they retired was called Νεφέλη, which ſignifies cloud. *Pind.* Pyth. Od. 2.

This fable is differently interpreted: ſome will have the *centaurs* to have been a body of ſhepherds and herdſmen, rich in cattle, who inhabited the mountains of Arcadia, and to whom is attributed the invention of bucolic poetry.

Palæphatus, in his book of incredibles, relates, that under the reign of Ixion, king of Theſſaly, a herd of bulls on mount Theſſaly run mad, and ravaged the whole country, rendering the mountain inacceſſible; that ſome young men who had found the art of taming and mounting horſes, undertook to clear the mountain of thoſe animals, which they purſued on horſeback, and ſhot with arrows, and thence gained the appellation of *centaurs*. This ſucceſs rendering them inſolent, they inſulted the Lapithæ, a people of Theſſaly; and becauſe when attacked they fled with great rapidity, it was ſuppoſed they were half horſes and half men. *Palæphat*, de incred. l. 1. *Serv.* ad Virg. Geor. l. 3. v. 115. *Oroſ.* l. 1. c. 13. *Fab.* Theſ. p. 527. Trev. Dict. Univ. T. 1. p. 1550.

The *centaurs* in reality were a tribe of Lapithæ, who inhabited the city Pelethronium, adjoining to Mount Pelion, and firſt invented the art of breaking horſes, as is intimated by Virgil. *Virg.* Geor. l. 3. v. 115.

Pliny aſſures us he ſaw a *centaur*, which had been ſent out of Egypt to the emperor Claudius, preſerved in honey. He adds, that the ſame emperor mentioned another born in Theſſaly, and which died the ſame day [a]. St. Jerom, in his life of the hermit Paul, relates that St. Anthony had ſeen a *centaur*; but the father ſuſpects, that it was rather ſome illuſion of the devil [b].— [a *Plin.* Hiſt. Nat. l. 7. c. 3. [b] *Voſſ.* de Idolal. l. 1. c 15. *Fab.* Theſ. p. 528.]

CENTAUR, in aſtronomy, is called by divers others names, *Typhon*, *Pholos*, *Chiron*, *Phyllyrides*, *Semivir*, *Minotaurus*, *Albeze* and *Aſmeath*. Schiller, in lieu of the *centaur*, repreſents Abraham and Iſaac.

The ſtars in the *centaur* have been obſerved by Dr. Halley [a] and F. Noel [b]. Bayer repreſents it in his *uranometria*, tab. R r. and Hevelius in his *firmamentum ſobieſcianum*, fig. X x. [c] [a *Hevel.* Prodrom. Aſtron. p. 315. [b] *Noel.* Obſerv. Math. & Phyſ. p 50, ſeq. [c] *Wolf.* Lex. Math. p. 328]

CENTAURIUM *majus*, *great centaury*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the floſculous kind, being compoſed of a number of tubular floſcules, divided into ſeveral ſegments at the ends; theſe all ſtand upon the embryo fruits, and are all contained in one common ſcaly cup: the embryos finally ripen into ſeeds, which are winged with down. To this it is to be added, that all the plants of this genus are large, and in that obviouſly different from the jaceas.

The ſpecies of *great centaury* enumerated by Mr. Tournefort, are theſe: 1. The *great centaury*, with the leaves divided into many ſegments. 2. The *great centaury*, with undivided leaves. 3. The artichoak-leav'd *great centaury*. 4. The yellow-flowered alpine *great centaury*. 5. The African *great centaury*, with deeply divided leaves. 6. The degenerate African divided-leav'd *centaury*. 7. The purple-flowered *great centaury*, with divided leaves. 8. The *great centaury*, with hoary elecampane leaves. 9. The *great centaury*, with narrow elecampane leaves. 10. The pine-headed low, hoary, *great centaury*. 11. The woolly mullein-leav'd alpine *great centaury*, with ſcarce any ſtalks. 12. The low, jagged-leav'd, woolly, Portugal *great centaury*. 13. The great Portugal *centaury*, with coronopus leaves. *Tourn.* Inſt. p. 449.

Great centaury. The root and leaves of the plant are eſteemed vulnerary and aſtringent: they are given in infuſion, in dyſenteries, profluvia of the menſes, and hæmorrhages of all kinds. The common people alſo are very fond of the root in France, as a remedy for bruiſes, and for diſſolving coagulated blood. Schroder alſo gives it great praiſes as a deobſtruent: he tells us it is of excellent uſe in diſtemperatures of the liver, and in obſtructions of the meſeraic glands. He preſcribes the root in powder.

CENTAURIUM *minus*, *ſmall centaury*, (See CENTAURY, *Cycl.*) in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the infundibuliform kind, conſiſting of one leaf, and divided into ſeveral ſegments at the edge: the piſtil ariſes from the cup, and perforates the lower part of the flower, and is afterward changed into a fruit of an oval or cylindric figure, which naturally ſeparates lengthwiſe into two parts, and uſually contains a number of very ſmall ſeeds.

The ſpecies of *ſmall centaury*, enumerated by Mr. Tournefort, are theſe: 1. The common *ſmall centaury*. 2. The long-ſtalk'd *ſmall centaury*. The ſtalks of this ſometimes grow to two ells long. 3. The white flowered *ſmall centaury*. 4. The ferrugineous flowered *ſmall centaury*. 5. The blue flowered *ſmall centaury*. 6. The branched *ſmall centaury*, with a large, elegant and open purpliſh-red flower. 7. The common-branched *ſmall centaury*. 8. The long and narrow-leav'd *ſmall centaury*. 9. The ſhort and narrow-leav'd *ſmall centaury*. 10. The ſhorteſt narrow-leav'd *ſmall centaury*. 11. The creeping Portugal ſea narrow-leav'd *ſmall centaury*, with cluſtered flowers. 12. The red-flowered ſpiked *ſmall centaury*. 13. The broad, bluiſh green-leav'd, deep-red flowered, ſpiked *centaury*. 14. The white flowered, ſpiked, *ſmall centaury*. 15. The ſmalleſt purple-flowered *centaury*. 16. The ſmall American ſea *centaury*, with large blue flowers. 17. The ſmall African pink-leav'd *centaury*, with a bright red flower. 18. The perfoliate, yellow-flowered *centaury*. 19. The ſmaller perfoliate yellow *centaury*, with leaves like thoſe of the yellow vetch. 20. The leaſt perfoliate yellow *centaury*. 21. The trefoil perfoliate yellow *centaury*. 22. The leaſt yellow marſh *centaury*. 23. The perfoliate

perfoliate yellow *centaury*, with an alated ſtalk. *Tourn.* Inſt. p. 122.

CENTAURIUM *minerale*, among Chemiſts, a name given by ſome to the panacea of antimony, called alſo by Glauber, *purgans univerſale*; the preparation of which is given by Jungken. Vid. *Jungk.* Lex. Chym. Pharm. P. 1. p. 186, ſeq. See PANACEA.

CENTAUROIDES, in medicine and pharmacy, the ſame with *gratiola*. *Quinc.* Diſpenſ. P. 2. Sect. 4. n. 310. See GRATIOLA.

Others give the denomination to the greater *centaury*. See CENTAURIUM.

CENTENARIUS, or CENTENARIO, in the middle age, was an officer who had the government or command, with the adminiſtration of juſtice, in a village. The *centenarii*, as well as vicarii, were under the juriſdiction and command of the court. We find them both among the Franks, Germans, Goths, Lombards, &c. Trev. Dict. Univ. T. 1. p. 1552. voc. *centenier*.

CENTENARIUS is alſo uſed for an officer who had the command of an hundred men; more frequently called centurion. *Veget.* l. 2. c. 13. *Calv.* Lex. Jur. p. 170. See CENTURION, *Cycl.*

CENTENARIUS, in monaſteries, was an officer who had the ſuperintendance of an hundred monks. *Bingh.* Orig. Eccleſ. l. 7. c. 3. §. 7.

CENTENARIUS was alſo uſed for a perſon worth an hundred thouſand ſeſterces; otherwiſe called *cenſus*. *Calv.* Lex. Jur. p. 170. See CENSUS.

CENTENINUM *ovum*, among naturaliſts, denotes a ſort of hen's egg, much ſmaller than ordinary, vulgarly called a *cock's egg*; from which it has been fabulouſly held that the cockatrice or baſiliſk was produced. *Brown*, Vulg. Err. l. 3. c. 7.

The name is taken from an opinion, that theſe are the laſt eggs which hens lay, having laid an hundred before; whence *centeninum*, q. d. the hundredth egg.

Theſe eggs have no yolks, but in other reſpects are like common eggs, having the albumen, chalazas, membranes, &c. in common with others.

In the place of the yolk is found a body reſembling a little ſerpent coiled up, which doubtleſs gave riſe to the tradition of the baſiliſk's origin from hence. Vid. *Valliſn.* Prim. Raccolt. d' Oſſervaz. p. 66, ſeq. Giorn. de Letter. d' Ital. T. 5. p. 173.

Their formation is probably aſcribed by Harvey to this, that the yolks in the vitellary of the hen are exhauſted before the albumina. *Harvey* de Generat. Animal. Exerc. 12.

M. La Peyronie has carried the hiſtory of the *ova centenina* to a greater length, as well as certainty: a hen was brought to him which for a conſiderable time laid no other eggs: the ſame hen was alſo obſerved to crow like a cock, and to render by the cloaca a thin yellow matter, much like the yolk of an egg diluted in water. Upon opening her, ſhe was found hydropical; a bladder as big as the fiſt, full of water, was found contiguous to the oviduct, which it preſſed and crouded in ſuch manner, as not to leave the cavity thereof above five lines in diameter; ſo that a common egg, ſuch as it is when it falls from the ovary into the tube, could not paſs without burſting, by which the yolk was let out, and diſcharged another way. Mem. Acad. Scienc. an. 1710. p. 730, ſeq.

CENTER (*Cycl.*) — CENTER *of the equant*, in the old aſtronomy, a point in the line of the aphelion; being ſo far diſtant from the *center* of the excentric, towards the aphelion, as the ſun is from the *center* of the excentric towards the perihelion.

CENTER *of gravity*. When any number of bodies move in right lines with uniform motions, their common *center of gravity* moves likewiſe in a right line with an uniform motion: and the ſum of their motions eſtimated in any given direction, is preciſely the ſame as if all the bodies, in one maſs, were carried on with the direction and motion of their common *center of gravity*. Nor is the *center of gravity* of any number of bodies affected by their colliſions or actions on each other. *Mac Laurin*, Account of Sir Iſ. Newton's Diſcov.

CENTERING *of an optic glaſs*, the grinding it ſo as that the thickeſt part is exactly in the middle.

One of the greateſt difficulties in grinding large optic glaſſes is, that in figures ſo little convex, the leaſt difference will put the center two or three inches out of the middle [a]. Dr. Hook notes, that tho' it were better the thickeſt part of a long object glaſs were exactly in the middle, yet it may be a very good one when it is an inch or two out of it [b].—[[a] Phil. Tranſ. N° 4. p. 57. [b] Id. ibid. p. 64, ſeq.]

M. Caſſini the younger has a diſcourſe expreſs on the neceſſity of *well centering the object glaſs* of a large teleſcope, that is, of grinding them ſo, that the center may fall exactly in the axis of the teleſcope. Mem. Acad. Scienc. an. 1710. p. 299, ſeq.

CENTESIMA *uſura*, that wherein the intereſt in an hundred months became equal to the principal; *i. e.* where the money is laid out at one per cent. per month, anſwering to what in our ſtile would be called 12 per cent. for the Romans reckoned their intereſt not by the year, but by the month. *Briſſ.* de Verb. Signif. p. 117. *Calv* Lex. Jur. p 170.

CENTESIMATION, *centeſimatio*, the puniſhing every hundredth man.

Macrinus ſometimes decimated, and ſometimes *centeſimated* the ſoldiers. The latter term ſeems to have been introduced by himſelf, to the honour of his clemency, as being contented to *centeſimate* thoſe who deſerved decimation, or viceſimation. *Pitiſc.* Lex. Ant. T. 1. p. 398. *Calv.* Lex. Jur. p. 170.

CENTGRAVIUS, in middle age writers, the ſame with centenarius. *Calv* Lex. Jur. p. 171. See CENTENARIUS.

CENTILOQUIUM, denotes a collection of an hundred ſentences, opinions, or ſayings.

The *centiloquium* of Hermas contains an hundred aphoriſms, or aſtrological ſentences, ſuppoſed to have been written by ſome Arab, falſely fathered on Hermes Triſmegiſtus. It is only extant in Latin, in which language it has been ſeveral times printed. *Fabric* Bibl Græc. l. 1 c. 9. §. 5.

The *centiloquium* of Ptolemy is a famous aſtrological piece, frequently confounded with the former, conſiſting likewiſe of an hundred ſentences or doctrines, digeſted into ſhort aphoriſms, entitled alſo in Greek καρπὸς, as being the fruit or reſult of the former writings of that celebrated aſtronomer, viz. his *quadripartitum* and *almageſtum*; or rather, by reaſon that herein is ſhewn the uſe of aſtrological calculations. Cardan, Argol, and ſome others, deny it to be the work of Ptolemy, and aſcribe it to Hermes, or ſome later writer: but Voſſius and Fabricius ſhew this opinion is founded on a miſtake. *Voſſ.* de Scient. Mathem. c. 37. §. 10. *Fabric.* Bibl. Græc. l. 1. c. 9. § 6. *Vital.* Lex. Mathem. p 99, ſeq.

CENTINODIUM, an officinal plant, popularly called knotgraſs; by the botaniſts *polygonum*; reputed an aſtringent and vulnerary. Vid *Gorr.* Med. Defin. voc. πολυγονον. *Quinc.* Diſpenſ. P. 2. Sect. 2. n. 101. See POLYGONUM.

CENTIPES. See the article SCOLOPENDRA.

CENTNER. See HUNDRED *decimaſtic*.

CENTONARII, in antiquity, a ſort of officers or operators, whoſe buſineſs was to make *centones*, or coats patched of leather and cloth, wherewith to cover the vineæ under which the beſiegers made their approaches, as well as the towers and machines uſed to batter the place, and prevent their being ſet on fire by the enemy. In the Theodoſian code we have a title, *de centonariis & dendrophoris*. And in antient inſcriptions, the *centonarii* are joined with the *tignarii*, or carpenters, *ferrarii* or ſmiths, &c. who made but one company, under the denomination of *collegium fabrorum & centenariorum*. *Pitiſc.* Lex. Ant. T. 1. p. 398. *Aquin.* Lex. Milit. T. 1. p. 14.

CENTRATION, *centratio*. See CONCENTRATION, *Cycl.* and CONCENTRATING, *Suppl.*

Paracelſus uſes the word *centratio*, for the change or converſion of a ſaline principle into a corroſive and ulcerating quality. According to him, a *centrum ſalis* is the beginning of ulcers. *Caſt.* Lex. Med. in voc.

CENTRINE, in zoology, the name by which moſt authors call the porcus piſcis. It is properly of the galeus kind, but much thicker and ſhorter than any other of that genus, and from head to tail is ſomewhat of a triangular figure; its broad and flat belly making one ſide of the triangle, and its two ſides, which meet at the back, the other two. It is of a duſky brown colour; its head is ſmall for the ſize of the body, ſomewhat compreſſed, and full of rough tubercles: the eyes are of an elliptic figure, the pupils black, and the iris green: its mouth is ſmall, and placed in the under part of its head, as in all the galei: it has three rows of teeth in the upper jaw, and in the under only one, which contains nine teeth, the middle one of which is placed upright, the others ſlanting to the right and left. *Aldrov.* de Piſc. l. 3. c. 141.

It has its name of porcus piſcis either from the ſhape of its back, which riſing into a ridge reſembles that of a hog, or from his loving like the hog to wallow in mud.

CENTRINES, in phyſiology, a ſpecies of inſects hatched in the wild fig-tree, and uſed in caprification. *Plin.* Hiſt. Nat. l. 17. c. 27. See CAPRIFICATION.

CENTRISCUS, in zoology, the antient name for the common little prickly fiſh, which we call in Engliſh the ſtickleback, or barnſticle, uſually known among authors by the names of pugnitius, and aculeatus piſciculus. *Ray*'s Ichthyog. p. 341. See the article PUGNITIUS.

CENTUMMORBIA, in botany, a name uſed by ſome authors for the common moneywort or nummularia, from its ſuppoſed virtues. *Ger.* Emac. Ind. 2.

CENTUMVIRI, in antiquity, an order of judges, to the number of an hundred and upwards, under the Roman prætors.

The *centumviri* were a body of men choſen three out of each tribe; ſo that their number amounted to five more than their name imports: their buſineſs was to judge of matters relating to teſtaments, tutorage, inheritances, and ſuch other matters of leſſer weight and moment, as the prætors committed to them. Their body was afterwards increaſed to an hundred and eighty. Vid. *Cic.* de Orat. l. 1. c. 38. *Kenn.* Rom. Ant. Not. P. 2. l. 3. c. 13. & 16.

The *centumviri* were called together by ſetting up a ſpear; at firſt, by thoſe who had diſcharged the office of quæſtor; afterwards, by the decemviri. *Suet.* in Auguſt. c. 36. See alſo *Briſſ.* de Verb. Signif. p. 117. *Calv.* Lex. Jur. p. 171. *Pitiſc.* Lex. Ant. T. 1. p. 399, ſeq.

CENTUNCULUS, in botany, a name uſed by ſome authors for the gnaphalium, or cudweed. *Ger.* Emac. Ind. 2.

CENTUNCULUS, in the Linnæan ſyſtem of botany. This makes a diſtinct genus of plants, the characters of which are theſe: the cup is a wide perianthium, divided into four oval and pointed ſegments, and remaining after the flower is fallen; theſe alſo are larger than the ſegments of the flower. The flower is compoſed of a ſingle petal, in form of a roundiſh tube, with a rim divided into four ſegments of an oval figure: the ſtamina are four filaments nearly of the length of the flower: the antheræ are ſimple: the germen of the piſtil is roundiſh, and ſituated in the tube of the flower: the ſtile is ſlender, of the length of the flower, and remains when the petal is fallen; the ſtigma is ſimple: the fruit is a globoſe capſule, containing only one cell, which ſplits open horizontally: the ſeeds are ſmall, numerous and roundiſh. *Linnæi* Gen. Plant. p. 47.

CENTURIAL *inſcriptions*, a denomination given by ſome to thoſe inſcriptions inſerted in the face of Severus's wall, which make mention of the centuries and cohorts by whom ſuch parts of the wall are ſuppoſed to have been erected. In which ſenſe, *centurial inſcriptions* ſtand contradiſtinguiſhed from *legionary*. *Horſl.* Britan. Rom. l. 1. c. 8. p. 127.

CENTURIATA *comitia*, in antiquity. Thoſe aſſemblies of the Romans, wherein the people gave their votes by centuries. *Fab.* Theſ. p. 532. *Calv.* Lex. Jur. p. 173. See COMITIA.

CENTURIATOR, an appellation given to certain learned Germans of the city of Magdeburg, who in the early days of the reformation compoſed a body of church hiſtory, divided into centuries of years. *Sagittar.* Introd. Hiſt. Eccleſ. c. 13. §. 2, ſeq. See CENTURY.

Baronius is ſaid to have written his Annals by way of oppoſition to the *centuriators* of Magdeburg. *Sagitt.* lib. cit. c. 14. §. 1. ſeq.

CENTURY (*Cycl.*) — The marquiſs of Worceſter has publiſhed a *century* of inventions: Dr. Hook has given a decimate of inventions, as part of a *century*, of which he affirmed himſelf maſter. 'Tis remarkable, that both in the *century* of the former, and the decimate of the latter, we find the principle on which Savary's fire engine is founded. Vid. *Waller.* Life of Hook, p. 21. prefixed to his poſthum. Work.

Among the Romans, the denomination *century*, *centuria*, was given to the horſemen or equites belonging to each tribe, which at firſt were only 100; but the ſame name, *centuria equitum*, was retained when the number was afterwards doubled, and even tripled [a]: juſt as it was with the word tribe, which at firſt denoted a third part of the people; but was ſtill retained, after the people were divided into ſix parts [b].—[[a] *Liv.* l. 1. c. 36. [b] *Var.* de Ling. Lat. l. 4. Mem. Acad. Inſcr. T. 2. p. 101, ſeq.]

CENTURY is alſo a denomination given to the leſſer claſſes or orders, into which the Roman people were divided by Servius Tullius, for the conveniency of giving their ſuffrages. *Liv.* l. 1. c 43. *Fab.* Theſ. p. 532.

CENTURY, in chronology. Cave gives particular denominations to the ſeveral *centuries* of the church, from the perſons, ſects, &c. who prevailed therein. The firſt *century* is called the Apoſtolic age; the ſecond, the Gnoſtic; the third, the Novatian; the fourth, the Arian; the fifth, the Neſtorian; the ſixth, the Eutychian; the ſeventh, Monotheletic; the eighth, the Iconoclaſtic; the ninth, the Photian; the tenth, the Obſcure; the eleventh, the Hildebrandine; the twelfth, the Waldenſian; the thirteenth, the Scholaſtic; the fourteenth, the Wickleſian; the fifteenth, the Synodal; the ſixteenth, the Reformed age. Vid. *Cave* Chartophyl. Eccleſ. ejuſd. Hiſt. Liter.

CENTURIES *of Magdeburg*. This work is highly extolled by Mountague, Caſaubon, Hornbeck, and other proteſtants, both as to the matter, method, learning and impartiality: on which account, ſome will have it the moſt excellent work the church of late ages has produced. Sturmius cenſures the ſtile, as not ſufficiently hiſtorical: others remark other failings and overſights: many Romaniſts damn the whole, as an infamous compoſition of lies; particularly Baronius, who calls the centuriators a thouſand raſcals, ſlaves, &c. See CENTURIATOR. The *centuries* were publiſhed at Baſil in many volumes, from the year 1561 to 1574; they have been ſince collected, reviſed, and publiſhed together in 1624, by Lud. Lucius, profeſſor at Baſil, in three volumes folio; who is cenſured by ſome, and applauded by others, for omitting the prefaces, dedications, &c. to the ſeveral *centuries*. Moller, in an expreſs diſſertation on the Magdeburg *centuries*, charges them with other corruptions, and alterations of the text; from which, however, they are generally acquitted.

CENTUSSIS, a Roman coin, containing an hundred aſſes. Vid. *Beverin* Synt. de Ponder. p. 39. *Macrob.* Saturn. l. 3. c. 17. *Fab.* Theſ. p. 532. See As, *Cycl.*

CEOAN, in zoology, the name of a bird, common in the Spaniſh Weſt-Indies, and deſcribed by Nieremberg, who alſo calls it avis nivea. It is a little larger than our largeſt thruſh, and very remarkable for the facility with which it learns to imitate the human ſpeech. Its breaſt, belly and ſhoulders are yellowiſh; near the tail it has ſome grey feathers intermixed; the tips of its wings and tail are alſo grey underneath, but its whole upper part is of a browniſh black: its beak is ſmall and yellowiſh, and its feet are yellow: the upper part of its throat is white, with a few black feathers intermixed with it: its natural note is ſomewhat like the human laugh. *Ray*'s Ornithol. p. 304.

CEPA, the *onion*, in botany, &c. See ONION.

CEPÆA, in botany, a name given by ſome authors to the common anagallis aquatica, or water-brook-lime *Ger.* Emac. Ind. 2.

CEPHALÆA. See HEAD-ACH.

CEPALALGIA. See HEAD-ACH.

CEPHALALGIA *Hiaco-hæmatitica*, a name given by ſome medical writers to that ſpecies of head-ach, called by others the clavus hyſtericus.

CEPHALOIDES, Κεφαλοειδης, a denomination given by ſome writers, who diſcover virtues in plants from their ſignatures, to thoſe which bear any reſemblance to a human head; ſuch are the poppy, piony, and the like. *Caſt.* Renov. p. 156.

CEPHALOMANTIA, Κεφαλομαντεια, an antient ſpecies of divination, or method of foretelling futurity, by a dead man's head or ſkull. *Prator.* Alectryom. c. 5. *Fabric.* Bibl. Antiq. c 12. p. 413.

CEPHALONOMANTIA, Κεφαλονομαντεια, a method of divination, or revealing ſecrets, by means of an aſs's head broiled on the coals.

The word is compounded of the Greek κεφαλη, head, and ονος, aſs, and μαντεια, divination.

After muttering a few prayers, the names of ſeveral perſons ſuſpected of a theft, or the like, were repeated over: he at whoſe name the aſs's jaws made any motion, or the teeth began to chatter, was held for convicted. *Potter*, Archæol. Græc. l. 2. c 18. p. 352.

CEPHALOPONIA, Κεφαλοπονια, a denomination given by ſome to the *cephalalgia*, or head-ach. *Caſt.* Renov. p. 156. *Blanc.* Lex. Med. p. 145. See HEAD-ACH.

CEPHALUS, in ichthyology, a name given by Ariſtotle, Ælian, Appian, and others, to the mugil or mullet, called alſo by ſome capito. Theſe words being generally underſtood as the names of the chubb, it has occaſioned much confuſion among the later writers, to find them thus applied to a fiſh of an extremely different kind. Gaza has tranſlated the *cephalus* of Ariſtotle, by the word capito. It is plain, indeed, by the context, and by the general conſent of the Greek writers, that he means the mullet by his *cephalus*; but this tranſlation has made many think that he was writing on the chubb.

CEPHALUS is alſo a name given by ſome naturaliſts to the ſargus, called alſo gardo, and gardon; a fiſh very little, if at all, differing from our roach. *Ray*'s Ichthyogr. p. 260.

CEPHEUS (*Cycl.*) is alſo known by the names of *Ceginus*, *Iaſides*, *Chegnius*, *Cancans*, *Keiphus*, *Vir Regius*, *Dominus Solis*, *Flammiger*, *Incenſus*, *Sonans*, *Phicares* and *Cheichius*. *Vital.* Lex. Math. p. 101. *Wolf.* Lex. Math. p. 335.

Schiller, in lieu of *cepheus*, repreſents St. Stephen; Harſdorff, king Solomon; Weigelius, the arms of Holſtein.

CEPION, Κηπιων, in antiquity, the name of a particular air, invented by a diſciple of Terpander, and deſigned to be played on the *cithara*. Mem. Acad. Inſcript. T. 14. p. 360, ſeq. See CITHARA, *Cycl.*

CEPIONITES, in natural hiſtory, a name given by Pliny, and other antient writers, to a ſpecies of ſtone, ſeeming to approach to the nature of the jaſper. Pliny tells us, that there were many kinds of it, ſome more pellucid than others, and ſome colourleſs; others variegated with green, and the other colours of the jaſpers and agates: they were all uſed in the ornamenting houſes; and the leaſt beautiful ſerved, when well poliſhed, to make ſpeculums of.

CEPITES, in natural hiſtory, a name uſed by the antients to expreſs a gem which gave the repreſentation of the ſeveral cluſters of plants and flowers in the beds of a garden, with naked veins, expreſſing the walks between. The common text of Pliny is unintelligible, where he gives the deſcription of this ſtone; but Salmaſius has reſtor'd it from ſome old copies, ſo as to make it ſenſe, and expreſſive of this meaning. The ſtone was probably no other than a peculiar kind of that agate which the antients called dendrites, and we the mocoa ſtones. What gave it a right to this appellation muſt have been, that the delineations of trees did not ſtand ſingle in it, as they uſually do in our mocoa ſtones, but were arranged in different compartments with veins of the white matter, of which the variegations in that agate are uſually compoſed, running irregularly between them. This might all be done in the common courſe of nature in this ſtone; for we well know, that all its delineations of trees are only the effect of ſo many cracks, and that theſe cracks never go thro' the white or more opake veins of the ſtone; ſo that if among a cluſter of theſe flaws there run ſome of theſe veins, they muſt naturally divide them into ſeveral compartments, and would themſelves, by their various courſe, reſemble the winding walks uſually faſhioned to run between the beds of flower plats.

CEPOLAPITES, in natural hiſtory, a name given by ſome to the ſtone properly called cepites, a kind of mocoa agate. See CEPITES, ſupra.

CEPPHUS, in zoology, the name of a bird of the larus or gull kind; but, except in its feet and beak, very much reſembling the common duck. It is a moderately large bird, but is ſo thick feathered, that it appears much more ſo than it really is.

It is of a variegated colour, of a mixture of white, brown, and yellow; but the long wing and tail feathers are black: its legs are greeniſh; but the membrane which connects the toes is brown. *Al'drov.* de Avib.

CEPULA, a name by which Geſner and ſome other authors have called the common tænia. It is derived from the Italian cepole; the common name of the ſame fiſh in the markets of Rome. *Geſner* de Piſc p. 106.

CEPUS, in zoology, a name given by ſome to thoſe monkeys of the ſmaller kind, which have more or leſs green among their other colours. There is a very pretty kind of this, which is for the moſt part of a reddiſh colour, but has a great deal of green on its back, and of a greeniſh grey on its breaſt, belly, and the inner part of its legs. *Ray*'s Syn. Quad. p. 157.

CERACHATES, in the natural hiſtory of the antients, the name of a ſpecies of agate of a plain yellow colour, and very much reſembling yellow wax; found alſo frequently to this day, and called by Dr. Hill the achates flaveſcens, without any farther addition, as being never variegated with any other colour than the ſeveral ſhades of yellow. It is naturally of a pure, but not very bright yellow, and ſo exactly reſembles yellow wax, that a rough piece of it at a yard's diſtance is ſcarce to be diſtinguiſhed from a piece of wax: it is conſiderably hard, but has not much tranſparence. We have it from the Eaſt-Indies, as alſo from New Spain, and ſome other parts of America, and our jewellers ſometimes work it into toys of ſmall value. *Hill*'s Hiſt. of Foſſ. p. 486.

CEROFERARIUS, in eccleſiaſtical writers, an inferior order of miniſters in the antient church, appointed to walk in certain parts of the office with lighted tapers in their hands.

The *ceroferarii* are repreſented by Iſidorus, as the ſame with what were otherwiſe denominated *acolythi*. *Iſid.* Orig. l. 7. c. 12. See ACOLYTHI.

Their buſineſs was to light the tapers, and march before the deacon, &c. when the goſpel was to be read, or the eucharift adminiſtered, as a demonſtration of the joy cauſed by the goſpel light. *Du Cange*, Gloſſ. Lat. T. 1. p. 937. *Pitiſc.* Lex. Ant. T. 1. p. 408. *Magr.* Vocab. Eccleſ. p. 63.

Bingham maintains, that the *ceroferarii*, or taper-bearers in the latter ages, were not ſo properly a particular ſpecies of *acolythi*, as the ſucceſſors of the antient acolythi under another name, and with a great diminution of their office. *Bingh.* Orig. Eccleſ. l. 3. c. 3. §. 4.

The word is formed of the Latin *cereus*, a taper or wax candle, and *fero*, I bear.

CEROTUM, Κηρωτον, in the antient pharmacy, the ſame with cerate. See CERATE, *Cycl.*

CERAMIUM, Κεραμιον, an antient meaſure, anſwering to what was otherwiſe called *amphora* and *cadus*. *Beverin* Synt. de Ponder. p. 135. *Caſt.* Lex. *Gorr.* Med. Defin. p. 221. See AMPHORA, &c.

CERASTES, the *horned ſnake*, in zoology, the name of a ſpecies of ſerpent, which has on its forehead two protuberances, looking like ſhells, but of a more ſolid texture, and from their reſemblance of horns, have given it its name: theſe are often no larger than grains of barley: its teeth are like thoſe of the viper, and are placed in the ſame order: it is of the number of viviparous ſerpents, and is remarkable among the ſerpent claſs for its long enduring thirſt. It is found in Lybia and Arabia, particularly about the town of Suez. *Belon.* Obſ. l. 2. c. 54.

CERASTES was alſo a name given by the antient Greeks to a ſtag when at its full growth, or at the end of its fourth year. Theſe authors had peculiar names for this creature in every year of its growth; in the firſt, they called it nebros; in the ſecond, pattalea; in the third, dicrotus; in the fourth, cladius; and at the end of the fourth, when they ſuppoſed it to be come to its full maturity, *ceraſtes*. The interpreter of Apollonius tells us, that author means by the word *ceraſtes*, a large and full grown ſtag with great horns. The modern huntſmen have taken up the old cuſtom, of giving names to this animal according to the growth of its horns.

CERASUS, the *cherry tree*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, or compoſed of ſeveral petals arranged in a circular form: the piſtil ariſes from the cup, and finally becomes a roundiſh or heart-faſhioned fleſhy fruit, containing a ſtone of the ſame ſhape with its kernel.

The ſpecies of *cherry* enumerated by Mr. Tournefort, are theſe: 1. The garden *cherry*, with round red and ſharp taſted fruit. 2. The garden *cherry*, with large round red fruit. 3. The *cherry* whoſe fruit has no ſtone. 4. The late acid *cherry*, with blood-red juice. 5. The late inſipid *cherry*. 6. The late *cherry*, with very long and foliated pedicles. 7. The great heart *cherry*. 8. The watery *cherry*. 9. The white ſweet *cherry*. 10. The great wild *cherry*, with ſweet blackiſh juice. 11. The Sicilian *cherry*, with cheſnut-coloured fruit. 12. The *cherry* with great red turbinated fruit. 13. The round, gloſſy, black *cherry*. 14. The *cherry* with great oblong and crooked black fruit. 15. The *cherry* with a large fruit, carinated on each ſide. 16. The early *cherry*, with a ſmall, oblong, inſipid fruit. 17. The May *cherry*, with a hard ſweet fruit. 18. The wild cluſter birds *cherry*, with fruit not eatable. 19. The wild cluſter *cherry*, with red not eatable fruit. 20. The garden cluſter *cherry*. 21. The cluſter *cherry*, with ſmall very red fruit. 22. The garden *cherry*, with roſe-coloured flowers. 23. The double-flowered garden *cherry*. 24. The great double-flowered wild *cherry*. 25. The northern Engliſh *cherry*, with a ſmall, red, late ripening fruit. 26. The wild *cherry*, with a ſmall heart-faſhioned fruit. 27. The wild bitter *cherry*, ſuppoſed to be the mahaleb: and, 28. The round-leav'd alpine *cherry*. *Tourn.* Inſt. p. 625. See CHERRY.

CERATE (*Cycl.*) — See CERATUM.

CERATIAS, Κεραΐας, among antient naturaliſts, denotes a horned comet. *Plin.* Hiſt. Nat. l. 2. c. 25. *Vital.* Lex. Math. p. 101.

The word is Greek, formed from κερας, cornu, a horn. Such is that ſaid to have appeared when Xerxes paſſed his army into Greece. *Fab.* Theſ. p. 536.

CERATION, among the antients. See CERATIUM.

CERATITES, a name given by many authors to the ſubſtance more uſually called by authors *unicornu foſſile*, and found in great plenty in the caverns of Hart's foreſt in Germany. *Hill*'s Hiſt. of Foſſ. p. 360. See UNICORNU *foſſile*.

CERATIUM, or CERATION, a name given by the antient phyſicians to a ſmall weight. The *ceration* is properly the name of a tree called the carob, or ſiliqua dulcis, the ſweet pipe tree: this tree bears a long pod, in which are contained ſeveral ſeeds among the pulp: theſe ſeeds are alſo called *ceration* and jembut by the Arabians, and being dried, they were uſed as a weight to proportion the doſes of medicines: thus the ſmall weight which took its origin from them, was called *ceration*; as that ſmall weight, which took its origin from a grain of barley, was called granum. *Galen.*

CERATIUM was alſo a ſmall ſilver coin, the third part of an obolus, and the ſame with what the Romans called *ſolis*. *Pitiſc.* Lex. Ant in voc. *ceratium.*

CERATOCARPUS, in botany, a name given by Buxbaum to a new genus of plants, the characters of which are, that the leaves are ſlender and graſſy, the flowers apetalous, and having no cup, but ſtanding upon the embryo fruit: the fruit, when ripe, is of a triangular figure, reſembling that of the ſhepherd's purſe, but running out into horns, and compoſed of two valves. Each of theſe fruits contains only one ſeed, and that of a very ſingular figure: it is long and ſlender, and not flat, but rounded, and each of its extremities is bent round in the manner of an arch, which are held together in their approach to one another by a membrane; the root is fibroſe and annual, the ſtalk woody and branched, the leaves rigid and hollowed along the middle, and the flowers are yellow. It grows in marſhy places near the Caſpian ſea, and in the neighbourhood of Aſtracan; and toward autumn the ſtalks are uſually torn up by the winds, and blown about the marſhes in great abundance. Act. Petrop. v. 1. p. 244.

The author named it *ceratocarpus*, horned fruit, from the ſeed veſſels running out into two horns: he obſerves, that the deſcription of the ceratoides of Tournefort's corollary approaches to this plant in many points, but differs ſo much in others, that either Tournefort muſt mean another plant, or elſe he muſt have informed himſelf but very imperfectly as to this.

CERATOIDES, Κεραλοειδης, in anatomy, the cornea tunica. *Caſt.* Renov. p. 158. See CORNEA, *Cycl.*

CERATOIDES is alſo a denomination given to the os hyoides, or bicorne. *Drak.* Anthrop. l. 3. c. 15. p. 351. See HYOIDES, *Cycl.*

CERATOMALAGMA, Κεραλομαλαγμα, a cerate or cerecloth. *Caſt.* Renov. p. 158. *Blanc.* Lex. Med. p. 146. *Earchuys.* Pharm. Synopſ. p. 49. See CERATE, *Cycl.*

CERATONIA, a name given by ſome botanical authors to the carob tree.

CERATOPHYLLUM, in botany, the name by which Linnæus calls a genus of plants, called by others dichotophyllum, and hydroceratophyllum. The characters are theſe: the flowers are ſome male, others female, on the ſame plant: in the male flowers the cup is divided into many ſegments, which are pointed, and equal in ſize. There are no petals: the ſtamina are ſlender filaments, double in number to the ſegments of the cup, being uſually ſixteen or twenty, and are ſcarce conſpicuous: the antheræ are oblong, erect, and longer than the cup. In the female flowers the cup and corolla are the ſame as in the male: the germen of the piſtil is compreſſed, and of an oval figure: there is no ſtile, but the ſtigma is obtuſe and oblique: the fruit is an oval nut, of a pointed figure, and having only one cell. Vaillant deſcribes one ſpecies of this genus, the ſeeds of which have three ſpines, one ſtanding forward, and the other two behind. *Linnæi* Gen. Pl. p. 459. *Vaill.* Act. Germ. 1719 *Dillen* Gen. 3.

CERATUM *epuloticum*, a name given in the late London diſpenſatory to the compoſition commonly called Turner's cerate, and there ordered to be made in this manner: take oil olive, a pound; yellow wax and prepared calamy, of each half a pound; melt the wax in the oil, and when the mixture begins to congeal again, ſprinkle in the powder, and continue ſtirring it till the whole is cold. *Pemberton*'s Lond. Diſp. p. 376.

CERATUM *mercuriale*, a form of medicine preſcribed in the late London pharmacopœia, and ordered to be made in the following

ing manner: take yellow wax and tried hog's lard, of each half a pound; quickſilver, three ounces; ſimple balſam of ſulphur, a dram: melt the wax and lard, and then add to them gradually the quickſilver, firſt well divided by the balſam of ſulphur. *Pemberton*'s Lond. Diſp. p. 376.

CERAULA, Κεραυλης, in antiquity, a kind of muſician, who blows or plays on the horn.

In which ſenſe, the word amounts to the ſame with the Latin *cornicen*.

The *ceraulæ* ſeem to have been originally employed in making a mournful kind of muſic at funerals; but they were afterwards transferred into the army. *Salmaſ.* Exerc. ad Solin. p. 123. *Aquin.* Lex. Mil. T. 1. p. 197.

CERAUNIA, CERAUNIAS, or CERAUNIUS *lapis*, in natural hiſtory, a ſort of flinty figured ſtone, of no certain colour, but of a pyramidal or wedge-like figure; popularly ſuppoſed to fall from the clouds in thunder ſtorms, and to be poſſeſſed of divers notable virtues, as of promoting ſleep, preſerving from lightening, &c. *Vater.* Phyſ. Exper. P. 2. Sect. 5. c. 8. Th. 13. *Caſt.* Lex. *Lemeri*, Trait. des Drog. p. 207.

The word is formed from the Greek, κεραυνος, *thunder-bolt*.

The *ceraunia* is the ſame with what is otherwiſe called the thunder-ſtone or thunder-bolt, and ſometimes alſo *ſagitta*, or arrow's head, on account of its ſhape.

The *ceraunia* are frequently confounded with the ombriæ and brontiæ, as being all ſuppoſed to have the ſame origin *Plin.* Hiſt. Nat. l. 37. c. 10. See BRONTIA and OMBRIA.

The generality of naturaliſts take the *ceraunia* for a native ſtone, formed among pyrites, of a ſaline, concrete, mineral juice. Mercatus and Dr. Woodward aſſert it to be artificial, and to have been faſhioned thus by tools.

The *ceraunia*, according to theſe authors, are ſicilices, or heads of the antient weapons of war, in uſe before the invention of iron; which, upon the introduction of that metal, growing into diſuſe, were diſperſed in the fields thro' this and that neighbouring country. Some of them had poſſibly ſerved in the early ages for axes, others for wedges, others for chizzels, but the greater part for arrow-heads, darts and lances. *Mercat.* Metalloth. Arm. 9. loc. 12. c. 16. *Woodw.* Lett. 3. on Meth. Foſſ. p. 38, ſeq. Ejuſd. Catal. For. Foſſ. p. 51, ſeq.

The *ceraunia* is alſo held by Pliny for a white or chryſtal coloured gem, which attracted lightning to itſelf. What this was is hard to ſay. *Plin.* Hiſt. Nat. l. 37. See CERAUNUS *albus*, infra.

Prudentius alſo ſpeaks of a yellow *ceraunia*[a], by which he is ſuppoſed to mean the carbuncle or pyropus[b].—[[a] *Prudent.* Pſychom. v. 470. [b] *Fab.* Theſ. p. 536.]

CERAUNIA, in botany, is uſed by ſome authors for orpin. *Ger.* Emac. Ind. 2.

CERAUNIAS *albus*, in natural hiſtory, a name given by Pliny to a gem or precious ſtone, of the nature of the aſteria, but ſomewhat inferior to it in beauty. Pliny tells us, that it was a very bright gem, of a cryſtalline appearance, but with a caſt of bluiſh, and that it was found in Caramania. Solinus gives us much the ſame account, but makes Germany the place of its origin. It is indeed written Germania in ſeveral of the old copies of Pliny, but the moſt correct have it as it is printed, Caramania; and Caramania was a country from which the Romans had many gems.

CERAUNITES, in natural hiſtory, a name given by ſeveral writers to the belemnites. See the article BELEMNITES.

CERBERUS, among chemiſts, denotes *mercury*. See MERCURY.

The name *cerberus* is alſo given by ſome to a famous purging powder, more uſually called *pulvis cornachinus*, and *pulvis comitis Warwicenſis*. *Caſt.* Renov. p. 158.

CERBERUS *chemicus*, in chemiſtry, a phraſe uſed by Hoffman and others to expreſs the common nitre or ſalt-petre, which they have called alſo *ſal infernalis*.

CERCASI, in the Eaſtern military orders, are a body of horſe in the ſervice of the grand ſignior. See *Pocock*'s Egypt, p. 166.

CERCELE, (*Cycl.*) in heraldry. The croſs *cercele* differs from the croſs anchored, as the latter turns but a little rounding, whereas the former turns quite round. *Coats*, Dict. Herald. p. 71, ſeq. See ANCHORED, *Cycl.*

CERCIS, in botany, the name given by Linnæus to the genus of plants called ſiliquaſtrum by Tournefort, Rivinus, and others. See SILIQUASTRUM.

CERCOPITHECUS, in natural hiſtory, the name of a ſpecies of long-tailed monkeys.

The word is derived from the Greek κερκος, a tail, and πιθηκος, a monkey.

Aldrovandus, Marcgrave, and others, have given the figures and hiſtories of many of the *cercopitheci*. The former of theſe authors ſpeaks of ſome as large as maſtiff dogs, having tails five cubits long. In Braſil there is a yellowiſh kind, which ſmells of muſk. As theſe monkeys climb trees, if in danger of falling, they ſave themſelves not only by their feet, but by their tails, wrapping them round the boughs of trees. The Zygantes in Africa eſteem their fleſh a good meat. *Grew*'s Muſæum, p. 10.

Among the various ſpecies of this animal, authors have particularly deſcribed the great-bearded kind, and two large ones without beards, which are different from all that we know by the peculiar names which have been given them by the inhabitants of the places where they are found.

The great bearded monkey is a very elegant and neat creature; its hairs are ſhort, and very bright and gloſſy: its breaſt and the fore part of its belly are white, and it has a white beard hanging down from its chin, of a hand's breadth long, and pointed at the end: its tail is of the ſhape that the monkeys tails uſually are, and does not end in a bunch of hair, as that of the bearded monkey called exquima. *Ray*'s Syn. Quad. p. 159

Of the two bearded ones, the firſt has long hair of a yellowiſh colour; its breaſt and all its belly are white; its tail is not very hairy, and looks indeed as if the hair had been ſtripped off from it all the way, except at the very extremity, where there is always a bunch of longer hairs. The other is larger than this; its noſe is all over brown, and its head ornamented with white hairs; its neck and breaſt are cloathed with long hairs, like the mane of a lion, and theſe are of a whitiſh colour; thoſe of the reſt of its body are of a pale yellowiſh tawny colour. The monkeys deſcribed under the names they are known by among the inhabitants, are, the guariba, cagui, ſagouin, cay, caitaia, macaquo, exquima, bugee, elawandum, and wandru; which ſee under their ſeveral heads.

CERCOSIS, Κερκωσις, in medicine, a preternatural extention and tumidity of the female clitoris, as to project beyond the labia pudendi *Caſt.* Lex. in voc. See CLITORIS.

CEREALES *ædiles*, two officers of antient Rome, erected under Julius Cæſar, appointed to have the ſuperintendency of the corn and grain for the proviſion of the city. They alſo preſided in the cerealia *Vives* in Auguſt. de Civit. Dei, l. 7. c. 20. *Hoſtin* de Orig. Teſt. p. 148. *Pitiſc.* Lex. Ant. T. 1. p. 404, ſeq. *Calv.* Lex. Jur. p. 173. See ÆDILE, *Cycl.*

CEREALES *ludi*, ſolemn ſports held in honour of Ceres, wherein the matrons repreſented the grief and lamentation of Ceres for the loſs of her daughter Proſerpine, and her travels to find her again.

The *ludi cereales* were borrowed by the Romans from the Greeks, and were held in the circus for eight days, from the 12th of April to the 19th incluſive. In them were repreſented combats, and races of horſe, and other diverſions; as alſo with a grand proceſſion of men, women, and gods, called *pompa cerealis*. *Kenn.* Rom. Ant. Not P. 2. l. 5. c. 7. *Fab.* Theſ. p. 538.

Pompa CEREALIS, or *circenſis*, a ſolemn proceſſion of the perſons who were to engage in the exerciſes and combats of the *ludi cereales*, accompanied with the magiſtrates and ladies of quality, as alſo with the ſtatues of the gods, which were carried in ſtate chariots. *Kenn.* Rom. Ant. Not. P. 2. l 5. c. 7.

CEREALIA *ſemina*, an appellation given by ſome to what we call *legumina* or pulſe. *Caſt.* Renov. p. 159.

CEREBELLUM (*Cycl.*)—Willis and Boerhaave ſuppoſe the *cerebellum* to be the ſeat of the vital principle: but this opinion is liable to difficulties. The obſervations of M. de la Peyronie ſhew, that wounds in the *cerebellum* of dogs are not immediately mortal; and we have more than one account of perſons living with a ſchirrhous *cerebellum*. See Phil. Tranſ. N° 474. Sect. 3. and Mem. de l'Acad. Royale des Scienc. 1705.

CEREBRUM (*Cycl.*)—The brain in fiſh, in general, is very ſmall, in reſpect to the great ſize of their heads. The internal or medullary part is brown, but the external or cortical part is fattiſh and whitiſh. The olfactory nerves may be traced with great eaſe, running in a ſtrait line from the brain to the noſtrils.

CEREBRUM *jovis*, in ichthyology, a name given by Ennius the poet to a peculiar fiſh of the labrus kind, called by the generality of authors ſcarus: it is diſtinguiſhed by Artedi from the other ſpecies of the ſame genus, by the name of the labrus, qui ſcarus auctorum eſt.

CEREFOLIUM. See CHERVIL.

CEREIS, in botany, a name uſed by ſome authors, and ſuppoſed to have been uſed by the antients for the *ſiliquaſtrum*, or Judas tree. *Ray*'s Hiſt. v. 1. p. 1717.

CERELÆUM, Κηρελαιον, a compoſition of wax and oil. See WAX.

Some alſo give the denomination to the *oleum ceræ*, otherwiſe called *butter of wax*. *Caſt.* & *Blanc.* Lex. Med.

CEREMONIAL, *ceremoniale*, a book in which is preſcribed the order of the ceremonies to be obſerved in certain actions and occaſions of ſolemnity and pomp.

The *ceremonial* of the Roman church is called *ordo Romanus*.

The Roman *ceremonial* was firſt publiſhed by the biſhop of Corcyra, in 1516; at which the college of cardinals were ſo ſcandalized, that ſome of them voted to have the author as well as book burnt, for his temerity in expoſing the ſacred ceremonies to the eyes of the profane people. The majeſty half divine, which they aſcribed to the public worſhip, would become contemptible, and have the common fate of human things, when viewed too near. Vid. *Mabill.* Muſ. Ital. T. 2. Ouvr. des Scav. Marſ. 1689 p 76, ſeq.

CEREMONIAL is alſo uſed for the ſet or ſyſtem of rules and ceremonies which cuſtom has introduced for regulating our behaviour, and which perſons practiſe towards each other, either

out of duty, decency, or civility. Trev. Dict. Univ. T. 1. p. 1567.

CEREMONIAL, in a more particular ſenſe, denotes the manner wherein princes and their embaſſadors uſe to receive, and treat one another. The *ceremonial* is a kind of law introduced by compact, cuſtom, preſcription, &c. which ſovereigns and their embaſſadors are to obſerve at their interviews, that none of them may either receive more or leſs marks of reſpect than they are entitled to. Some diſtinguiſh three occaſions on which the *ceremonial* is to take place: viz. when princes meet in perſon; when they write to each other; and when they ſend embaſſadors.

The original of the *ceremonial* is ambition, or the affectation of a dignity above others, to which by degrees the quality of right has been annexed, and the title of prerogative or precedency given.

There are endleſs diſputes among ſovereigns about the *ceremonial:* ſome endeavouring to be on a level, and ſome to be ſuperior, to others. Numerous ſchemes have been propoſed for fixing the place and rank of each prince, but they have not been accepted of by any, except ſome alternate princes, as they are called in Germany. The chief of the expedients which have been propoſed for this purpoſe, are 1^mo, to accommodate the difference by compromiſe, or alternation, ſo that one ſhall precede now, another the next time; or one in one place, and the other in another; 2^do, by ſeniority, ſo that an elder prince in years ſhall precede a younger without any other diſtinction. Vid. *Callieres*, Maniere de Negocier avec les Souverains, c. 10. *Walch.* Lex. Phil. p. 360. See PRECEDENCY, *Cycl.*

CEREMONIAL is more particularly uſed in ſpeaking of the laws and regulations given by Moſes, relating to the worſhip of God among the antient Jews.

In which ſenſe it amounts to much the ſame with what we otherwiſe call *levitical* law, and ſtands contra-diſtinguiſhed from the *moral*, as well as the *judicial* law.

'Tis diſputed whether the obſervation of the ſabbath be a *ceremonial*, or a moral law. See SABBATH, *Cycl.*

The *ceremonial* law preſcribed the forms, uſages, rites, &c. relating to ſacred places, utenſils, prieſts, levites, prophets, congregations, garments, feaſts, ſacrifices, ſabbaths, &c.

Moſt of the *ceremonial* laws which God gave the Jews had ſome relation to thoſe idolatrous cuſtoms which had been eſtabliſhed among them before the publication of the levitical law. God thought fit to adopt ſuch things as the Jews before held for ſacred, and appropriate them to his worſhip, but with ſuch reſtrictions as would for ever diſtinguiſh his religion from that of the falſe gods. *Saurin.* Diſſert. on Old Teſt. P. 1. Diſſ. 53. p. 460.

By the multitude of external obſervances Moſes aimed to check the inclination which the Hebrews diſcovered to idolatry, and oppreſs them, as it were, with the yoke of ceremonies; that they might be induced to deſire their liberty, and the coming of their great deliverer with more ardour. *Calm.* Dict. p. 377.

Some have dared to call in queſtion the wiſdom and equity of many of the *ceremonial* laws! Spencer has a learned work on the Jewiſh *ceremonial* laws, and the reaſons of them; wherein he endeavours to aſſign reaſons of each ceremony, worthy of the wiſdom of God [a]. The principal view in them all, was to ſerve as a preſervative againſt idolatry. But there was alſo a political view in many of them, viz. to keep the Jews ſeparate from the neighbouring nations [b]; to which may be added a typical reaſon, viz. to ſerve as figures of a new and ſpiritual law, and to ſhadow out Chriſt. This laſt reaſon appeared ſo eſſential to Origen, that without it the laws given to the Jews appeared to him unworthy of God, and inferior to thoſe of the Greeks and Romans [c]. — [a De legibus Hebræorum ritualibus & earum nationibus. Nouv. Rep. Lett. T. 6. p. 430. [b] *Pfaff.* Theol. P. 2. c. 3. §. 4. [c] *Orig.* Homil. 7. in Levit. c. 10.]

CEREMONY (*Cycl.*) — We have an ample and magnificent account of the religious *ceremonies* and cuſtoms of all the nations in the world, repreſented in figures deſigned by Picart, with hiſtorical explications, and divers curious diſſertations, &c. *Ceremonies* & Coutumes religeuſes de tous les Peuples du Monde, 6 vol. Fol. Amſt. 1723. Mem. de Trev. 1720. p. 2160, ſeq.

M. Porree in 1646, publiſhed a hiſtory of antient *ceremonies*, tracing the riſe, growth, and introduction of each rite into the church, and its gradual advancement to ſuperſtition therein. Traite des anciennes *Ceremonies*, Amſt. 1646. 12°. Nouv. Rep. Lett. T. 54. p. 128, ſeq.

Many of them were borrowed from judaiſm, but more as it ſhould ſeem from heatheniſm. Some will have the introduction of pagan rites into chriſtianity to have been contrived by the intrigues and avarice of the clergy, who found their advantage in reviving and propagating impoſtures, which had been of old ſo profitable to their predeceſſors. Others alledge, that the genius of Rome was ſo ſtrongly turned to fanaticiſm and ſuperſtition, that they were forced, in condeſcenſion to the humour of the people, to accommodate and dreſs up their new religion to the modes and fopperies of the old one. 'Tis on this laſt principle that ſeveral of their own writers defend the adoption of heathen *ceremonies*. *Aringh.* Rom. Subterr. T. 1. l. 1. c. 21. *Middl.* Let. from Rome p. 68, ſeq.

The near conformity obſervable between the *ceremonies* and obſervances of the Jews and Egyptians, has occaſioned a ſtrong diſpute, whether the Jewiſh *ceremonies* be imitations of thoſe practiſed by the Egyptians, or the Egyptian *ceremonies* copied originally from the Jews. Among the antient Romans the Jewiſh and Egyptian ſuperſtitions were commonly confounded, and held equally odious. *Sueton.* in Tiber. c. 36. *Tacit.* Annal. l. 2.

Marſham maintains, in his canon chronicus, that in many things, as in the *ceremony* of circumciſion, Moſes imitated the Egyptians; in which opinion he ſeems followed by Spencer *de legibus Hebræorum ritualibus*; and in his diſſertation *de Urim & Thummim*, where the levitical worſhip and prieſthood are deduced from the Egyptian. In this God is ſuppoſed to have condeſcended to the weakneſs of the Jews, and to prevent their communication with the Egyptians, giving them the ſame laws and rites among themſelves. This ſyſtem Witſius in his Egyptiaca has endeavoured to refute. Others maintain that the Jewiſh rites were the originals from which all the heathen cuſtoms were borrowed. Of which number are Huetius in his *demonſtratio evangelica*, and his *quæſtiones Alnetanæ de concordia rationis & fidei*; Bochart in his *Phaleg*; Voſſius *de idolatria*; and others. *Walch.* Lex. Phil. p. 362. *Calm.* Dict. Bibl. T. 1. p. 377.

Dr. Middleton has given a fine diſcourſe on the conformity between the popiſh and pagan *ceremonies*, which he exemplifies in the uſe of incenſe, holy water, lamps, and candles before the ſhrines of the ſaints, votive gifts or offerings round the ſhrines of the deceaſed, &c. In effect, the altars, images croſſes, proceſſions, miracles and legends; nay even the very hierarchy, pontificate, religious orders, &c. of the preſent Romans, he ſhews are all copied from their heathen anceſtors [a]. Who then can doubt of the idolatry of popery, when we ſee the preſent people of Rome worſhipping at this day in the ſame temples, at the ſame altars; ſometimes the ſame images, and always with the ſame *ceremonies* as the old Romans [b]? — [a *Middlet.* Lett. from Rome. p. 15, ſeq. See alſo *Fabric.* Biblioth. Antiq. c. 4. §. 6. [b] Id. ibid. p. 69, ſeq.]

CEREMONY is alſo applied to thoſe reſpects and honours which people pay to each other, out of mere civility and good breeding. China is the land of *ceremonies*. The Chineſe have annexed ſuch an idea of reſpect and gravity to certain garments, that the miſſionaries dare not ſay maſs without their boots on. Mem. de Trev. 1724. p. 1792.

Habit of CEREMONY denotes the ornaments and external badges of a profeſſion, dignity, or office.

Officers of CEREMONY, thoſe whoſe buſineſs is to ſee the cuſtomary *ceremonies* duly obſerved in actions of pomp and ſolemnity. Such are marſhals, ſerjeants at arms, &c.

In our court is a maſter and aſſiſtant of the *ceremonies:* the French have a grand maſter of the *ceremonies*, as well as a maſter and aſſiſtant. In churches of the Romiſh communion there are alſo maſters of the *ceremonies*, to ſee that every thing be performed as preſcribed in the ritual.

CEREPOLLUM, in botany, a name uſed by Pliny to expreſs the gingidium, an umbelliferous plant of the nature of the chervil or cerefolium; and it is very probable that this name is only a falſe ſpelling of that word. Columella makes the *cerepollum* and gingidium different, but it may only be that in different ages they applied theſe names to different ſpecies of the ſame genus of umbelliferous plants. Neophytus tells us, that the gingidium of the antients was called by the later writers biſacutum, a name very well expreſſing its ſeeds which are long and ſlender, and are pointed at both ends.

CEREUS. See TORCH-*thiſtle.*

CERIGO, in natural hiſtory, a name by which many authors have called that remarkable American animal called the opoſſum. See OPOSSUM.

The Americans in ſome places call this animal in their language carigueya; and it is probable that this name *cerigo* is only a corruption of that word, though it be received generally in the world as a proper name, and uſed as ſuch by Maffei, Barlæus, Nieremberg, and many others.

CERINTHE, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe: the cup is a perianthium divided into five equal ſegments, and remaining after the flower is fallen: the flower is compoſed of a ſingle petal, which forms a thick cylindric tube, with a bellied mouth, divided into five ſegments at the extremity, and naked and open at the end; the ſtamina are five very ſhort tapering filaments; the antheræ are acute and erect. The germen of the piſtil is divided into four parts; the ſtyle is ſlender, and of the length of the ſtamina; and the ſtigma is obtuſe. The fruit is compoſed of two oval bodies, plane on the inſide, and gibboſe on the out; each having a rim round the edge, and containing two cells, which do not open. The ſeeds are ſingle, roundiſh, and pointed. The eſſential character of this genus is the open mouth of the flower. *Linnæi* Gen. Plant. p. 61. See HONEY-*wort.*

CERINTHE, among the antients, was uſed by ſome to expreſs that ſubſtance called by others ambroſia and ſandarach, and by ſome

erithace. This is a yellow matter collected into lumps on the thighs of the hinder legs of bees, and is ſuppoſed by the generality of the world to be real yellow wax. This, however, is an error, ſince it has none of the qualities of wax, and is only the farina of flowers which the bees probably feed upon, and which after having paſſed through their bowels becomes wax. See WAX.

CERITES, the *wax-ſtone*, a name uſed by ſome old authors for that yellow agate uſually called cerachates. See the article CERACHATES.

CERNUA, in ichthyography, the name of a ſmall freſh water fiſh, called by others the *aurata*, *aſpredo*, and *perca minor*, or *ſmall pearch*, and in Engliſh the *ruffe*. It is very much of the ſhape and figure of the common pearch, ſeldom, at its utmoſt growth being known to exceed ſix inches; and it differs in this alſo, that it has none of thoſe black tranſverſe lines with which the back and ſides of the common pearch are variegated. Its ſcales are moderately large, and are ſo bent and fimbriated, or ſerrated at their edges, that they make the whole fiſh very rough. It has alſo a very large quantity of a viſcous matter adhering to its ſcales. Its back is of a yellowiſh green; its ſides are of a pale and obſcure yellow, but about its gills it is of a fine bright gold colour. Its belly is white; and its back, ſides, and fins, except thoſe under the belly, are variegated with black ſpots. Its mouth is moderately large, and its jaws rough, in the manner of a file; and it has one long back fin, the anterior rays of which are rigid and prickly. It is caught in many of our rivers, as the Yare at Norwich, &c. *Willughby*'s Hiſt. Piſc. p. 334.

CEROCHYTOS, Κηροχυτος γραφη, in antiquity, a method of painting in wax, melted and coloured with pigments for the purpoſe, and applied with pencils. *Plin.* Hiſt. Nat. l. 35. c. 11. & l. 21. c. 14. *Du Cange*, Gloſſ. Gr. T. 1. p. 647.

The word is compounded of κηρος, *cera*, wax, and χυω, *fundo*, I melt down.

CEROMA (*Cycl.*) — The name *ceroma* is ſometimes applied by antient phyſicians to a cerate or cerecloth. *Blanch.* Lex. Med. p. 148.

The champions ready to engage in the palæſtra having ſtripped themſelves naked, were firſt anointed with oil, then ſtrewed over with duſt, to which was laſtly added wax. From the laſt ingredient, this compoſition was denominated κηρωμα, *ceroma*, from *cera*, wax. *Fabr.* Theſ. p. 535.

CEROMANTIA, κηρομαντεια, an antient method of divination, by means of wax melted over a veſſel of water, and let drop in three diſtinct ſpaces, obſerving the figure, ſituation, diſtance, and concretion of the drops. *Pott.* Arch. Græc. l. 2. c. 18. p. 353. See DIVINATION, *Cycl.*

CEROSTROTUM, κηροστρωτον, in antient writers, denotes a ſort of picture compoſed of pieces of horn; anſwering to what among us is called Moſaic work. *Plin.* Hiſt. Nat. l. 11. c. 37. *Vitruv.* de Architect. l. 4. c. 6. *Fab.* Theſ. p. 535. See MOSAIC, *Cycl.*

Some write the word *ceroſtratum*, and ſuppoſe it primarily to denote a ſort of pavement compoſed of pieces of wood, inlaid and joined with ſlips of horns, variouſly coloured and figured. *Pitiſc.* Lex. Ant. T. 1. p. 408.

Salmaſius will alſo have *ceroſtrata* to denote a method of painting, or enamelling with wax, otherwiſe called *cerochytos*. *Salmaſ.* Exerc. ad Solin. p. 231. C. See CEROCHYTOS.

CERPASUS, in natural hiſtory, a name given by Uranius to a poiſonous drug of the Abyſſines; probably the ſame with the *carpaſus* of the Greeks.

CERRUS, in botany, a name given by many authors to the ægilops, or bitter oak; or oak that has large acorns, and a prickly cup. *Aldrov.* Dendr. p. 253.

CERRUS, in ichthyology, a name given by ſome of the old writers, Pliny, Martial, and others, to the fiſh called by the generality of writers ſmaris, by ſome mæna candida. It is of the ſparus kind, according to the Artedian ſyſtem, and is diſtinguiſhed from the other fiſhes of that genus by its having a black ſpot in the middle of each ſide, and the pectoral and tail fins red. See the article SPARUS.

CERTHIA, in zoology, the name of a bird made by Linnæus a diſtinct genus of the order of the picæ. The characters of this are, that the bill is not flat at the end, but round in figure, and pointed, and ſomewhat hooked, and the tail rigid. There is but one known bird of this ſpecies, which is the reptatrix, or creeper. *Linnæi* Syſtem. Naturæ, p. 45.

This ſmall bird is called in Engliſh the creeper, from its climbing and running up the branches of trees, which it does in the ſame manner with the woodpecker, and has thence by ſome been ranked among the birds of that genus, but improperly; its toes being placed as in the generality of birds, and not two of them behind, as is the diſtinguiſhing character of the woodpecker or picus kind.

It is an extremely ſmall bird, ſcarce exceeding the wren in ſize; its beak is long, hooked, ſlender and ſharp; its tongue is not longer than the beak, as it is in all the woodpeckers, but it terminates, as in thoſe birds, in a bony point; its throat, breaſt, and belly are white; its rump of a tawney colour, and its back of the ſame, but mottled a little with white, as is alſo the head, but this is of a ſomewhat more duſky and deep colour. It has on each ſide a white ſpot over the eye; its long wing feathers are ſome all over brown, others brown tip'd with white; the ſmaller feathers of its wings are blackiſh, and its tail is very long in proportion to its ſize, and is ſtiff and rigid, as in the woodpecker kind; all the feathers of it are of a browniſh colour. It climbs trees exactly as the woodpecker, in which it greatly aſſiſted by the rigidity of its tail. It builds in holes of trees, and lays a great number of eggs, ſometimes eighteen or twenty. *Ray*'s Ornithol. p. 100.

CERVICARIA, in botany, a term uſed by ſome authors to expreſs the thapſia of the ſhops, or leſſer libanotis of Theophraſtus. *J. Bauhin*, V. 3. p. 164.

CERVICARIA is alſo a name given by ſome to the trachelium. *Ger.* Emac. Ind. 2.

CERVICEM *flectentium primus*, in anatomy, a name given by Spigelius, and ſome others, to a muſcle of the neck, called by Cowper, Winſlow, and Albinus, by a much ſhorter name, the longus colli.

CERVICIS *tertius*, in anatomy, a name given by Fallopius and others, to a muſcle called by Albinus tranſverſalis cervicis, and by Winſlow, tranſverſalis magnus.

CERVIX (*Cycl.*) — CERVIX *of the ſcapula*, denotes the head of the ſhoulder blade, or that upper proceſs whoſe ſinus receives the head of the humerus. *Drake*, Anthrop. l. 4. c. 6. p. 406. See the article SCAPULA, *Cycl.*

CERUSE, (*Cycl.*) or CERUSS, is the ſame with what we popularly call *white lead*, though ſometimes a diſtinction is made, and the appellation *ceruſe* reſtrained to the purer, clearer, and finer ſort, by way of oppoſition to the coarſer, which is called ſimply *white lead*. *Smith*, Art of paint. p. 15, ſeq.

The manner of preparing *ceruſe* in quantities at Venice is deſcribed by Sir Phil. Vernatti. The plates for this purpoſe are large, and about the thickneſs of a knife's back, and rolled up, but ſo as that the ſurfaces no where touch. Each roll is put in a ſeveral pot, wherein it is upheld by a little bar from the bottom, that it may not touch the vinegar, which is alſo put into the pot, to effect the converſion. The pots are then covered with a plate of lead as cloſe as may be, and over this with a board; after which they are let down into a bed of horſe dung, big enough to contain 400 pots. After three weeks continuance the pots are taken up, the plates unrolled, laid on a board, and beaten with battledores till all the flakes come off, which, when they prove good, are hard, thick, and weighty; when otherwiſe, porous and light, and ſometimes black or burned, if the dung proves not well ordered: ſometimes alſo there will be no flakes, or *ceruſe* at all. From the beating table it is carried to the mill, ground with water between two ſtones to an almoſt impalpable fineneſs: laſtly, it is moulded into ſmall parcels, and expoſed to the ſun to dry, and harden for uſe. *Vernatti* in Phil. Tranſ. N° 138. p. 935, ſeq.

CERUSS, in medicine, is uſed externally in ointment, or dry powders, ſprinkling it on old ulcers, watery running ſores, &c. Inwardly it is accounted poiſonous, or at leaſt very dangerous.

CERUSE, in the manufacture of China. — The Chineſe make an uſe of this preparation of lead, which it is eaſier to ſee the advantages of, than to comprehend the manner in which they are brought about. The China veſſels, when they have been baked and finiſhed as to the matter, and even covered with their varniſh, will yet receive into their very ſubſtance, the colours which thoſe people mix up with an addition of *ceruſe*; and, as ſome of the old accounts ſay of copperas and ſaltpetre; but though theſe latter ingredients had uſe to be added, the *ceruſe* alone ſupplies their place at this time, at leaſt in very many things. It would be worth while to try an admixture of *ceruſe* with the colours uſed in painting on glaſs, and this, after a ſecond baking, might perhaps be found to incorporate itſelf in the ſame manner that it does into China ware, and recover the long loſt ſecret of letting in the ſtrongeſt colours without hurting the tranſparence. Obſerv. ſur l' Aſie.

CERUSE *of antimony*, a preparation of the regulus of that mineral, powdered, mixed with ſpirit of nitre, and diſtilled in a retort till no more fumes will riſe. What remains at the bottom being pulverized and waſhed ſweet, makes the *ceruſa antimonii*, a medicine preſcribed as a diuretic, and by ſome reckoned equal to the mineral bezoar. Some prepare the *ceruſe* by fuſing and fulminating the regulus with nitre in ſubſtance; the produce of which is a fixed powder called the *ceruſe* of antimony. *Quinc.* Diſpenſ. P. 2. Sect. 15. p. 276. *Teichmey*, Inſt. Chem. P. 2. c. 11. p. 165. & c. 17. p. 232. *Stahl.* Phil. Princ. Chem. P. 2. Sect. 4. n. 154.

CERVULA, or CERVULUS, in middle-age writers, a kind of ſport, celebrated by pagans, and after their example, by the chriſtians, on New Year's Day; when they run about in maſquerade, dreſſed in imitation of deer, and other beaſts. We find divers cenſures of the fathers, and decrees of councils againſt the obſervance of this ceremony. Even litanies were compoſed, and faſting preſcribed, for that day, *ad calcandam gentilium conſuetudinem*. *Du Cange*, Gloſſ. Lat. T. 1. p. 940. Item Gloſſ. Græc. p. 638. *Bingh.* Orig. Eccleſ. l. 20. c. 1. §. 3. *Spelm.* Gloſſ. p. 133.

CERVUS, the *ſtag*. In the Linnæan ſyſtem of zoology, this makes a diſtinct genus of animals, the characters of which are, that they are of the order of the pecora, and have horns hairy while young, but growing ſmooth afterwards, renewed every year, ſolid, and growing from the points. Theſe are gene-

rally branched, and the females ſeldom have them. The creatures of this genus are the ſtag, the camelopardalis, the capreolus, the rein deer, the tragelaphus, the hippelaphus, and the elk. *Linnæi* Syſtem. Natur. p. 41. See DEER.

CERVUS *volans*, in natural hiſtory, a name given by authors to the ſtag fly, or ſtag-horned beetle, a very large ſpecies of beetle with horns ſloped, and ſomewhat like thoſe of a ſtag. It is of a blackiſh colour, and its horns are uſually of the ſame colour, though in ſome of a purpliſh caſt, and in ſome few they have been found of the colour of red coral. They are an inch and half, or more, in length, when full grown. Theſe are of great uſe to the creature, as it can at pleaſure cloſe their points together, and take faſt hold of any thing with them, as a crab or lobſter does with the end of its claws. The eyes are hard, prominent, and of a pale colour; and near theſe it has two pair of antennæ; ſo that the horns in this creature are a ſingular thing, and are not antennæ of a particular kind. It has ſix legs, of which the firſt pair are much the ſtrongeſt and longeſt. The males of this ſpecies are much ſmaller than the females. This is the kind of ſtag-beetle uſually found in Eſſex, and ſome other counties; but beſide this we have another ſpecies which is produced of a hexapode worm, frequently found in old wood. This ſpecies is of a deeper black than the former, and its horns ſend out only one branch. *Ray*'s Hiſt. Inſ. p. 74.

CERYX, in natural hiſtory, a name by which Pliny, and other old authors have called the three genera of ſhell fiſh, ſince diſtinguiſhed under the names of buccinum, purpura, and murex. This, however, is a confuſion that has obtained alſo in later times; and though we have long had theſe three names, yet ſcarce any author has avoided the confounding the ſeveral ſhells ſignified by them, till a late French author, who, from the ſhape of the mouth, and ſome other obvious and invariable characters, has eſtabliſhed the three genera, or, as he calls them, families, in ſuch an exact manner, that want of obſervation alone can occaſion errors in regard to them hereafter. Hiſt. Nat. Eclair. p 281. See BUCCINUM.

CERYX, in antiquity. The *ceryces* were a ſort of public miniſters, appointed to proclaim, or publiſh things aloud in aſſemblies.

The *ceryces* among the Greeks, anſwered to the *præcones* among the Romans. See PRÆCO.

Our cryers have only a ſmall part of their office and authority. There were two kinds of *ceryces*, civil and ſacred.

Civil CERYCES. Thoſe appointed to call aſſemblies, and make ſilence therein; alſo to go on meſſages, and do the office of our heralds, &c. *Feith.* Antiq. Homer. l. 2. c. 5. p. 128. *Lakemak.* Ant. Græc. Sacr. P. 2. c. 2. §. 3.

Sacred CERYCES, Ἱεροκηρυκες, were a ſort of prieſts whoſe office was to proclaim ſilence in the public games, and ſacrifices, publiſh the names of the conquerors, proclaim feaſts, and the like. *Pollux.* in Onomaſt. l. 4. c. 12. §. 91.

The prieſthood of the *ceryces* was annexed to a particular family, the deſcendants of *Ceryx*, ſon of Eumolpus. To them it alſo belonged to lead ſolemn victims to ſlaughter. *Lakemak.* Antiq. Græc. Sacr. P. 2. c. 1. §. 3.

Before the ceremonies began they called ſilence in the aſſembly, by the formula, Ευφημειτε σιγη πας εσω λεως, anſwering to the *favete linguis* of the Romans. When the ſervice was over, they diſmiſſed the people with this formula, Λαων αφεσις, *Ite miſſa eſt.*

CESARE, in logic, a mode of ſyllogiſms in the ſecond figure, wherein the major propoſition, and concluſion, are univerſal negatives, and the minor an univerſal affirmative. Such is,

CE No man who betrays his country deſerves praiſe.
SA Every virtuous man merits praiſe.
RE Therefore no man who betrays his country is virtuous.

Walch. Lex. Phil p. 368.

CESIS, in botany, a name by which ſome authors expreſs the common daucus ſylveſtris, wild carrot, or birds neſt. *Ger.* Emac. Ind. 2.

CESSATION, the act of intermitting, diſcontinuing, or interrupting the courſe of any thing, work, action, or the like. *Calv.* Lex. Jur. p. 177. Trev. Dict. Univ. T. 1. p. 1579.

CESSATION *of arms*, an armiſtice, or occaſional truce. See TRUCE, *Cycl.*

When the commander of a place finds things reduced to an extremity, ſo that he muſt either ſurrender, or ſacrifice the garriſon and inhabitants to the mercy of the enemy, he plants a white flag on the breach, or beats the chamade; on which a *ceſſation* of arms, and hoſtilities commences, to give room for capitulation. See CAPITULATION, *Cycl.* and *Suppl.*

CESTRATUM, a work enamelled, or painted with a ceſtron. The word is alſo written *ceroſtrotum* and *ceroſtratum*. *Plin.* Hiſt. Nat. l. 11. c. 37. *Vitruv.* Archit. l. 4. c. 6. *Turneb.* Adverſ. l. 13. c. 24. *Salmaſ.* Exerc. ad Solin. p. 545. *Pitiſc.* Lex. Ant. T. 1. p. 410. See CEROSTROTUM.

CESTREUS, in zoology, the name of a fiſh of the mullet kind, but having a much ſmaller and narrower head, and its ſides variegated with much ſhorter longitudinal lines; it is eaten in many places, but is accounted much inferior to the mullet. *Geſner.* de Aquat. p 650. See the article MUGIL.

CESTRON, Κεστρον, in antiquity, the inſtrument wherewith they painted, or enamelled, in horn, or ivory. *Plin.* Hiſt. Nat. l. 35. c. 11. *Fab.* Theſ. p. 545. *Pitiſc.* Lex. Ant. T. 1. p. 410.

CESTROPHENDONA, in the antient military art, a compound kind of dart, or miſſive weapon, balanced with feathers like an arrow, and caſt by a large ſling; uſed chiefly by the Macedonians, in their wars under Perſeus, with the Romans.

The word is compoſed of κεστρον, a ſort of dart called by the Latins *tragula*, and σφενδονη, *funda*, a ſling. *Liv.* l. 42. §. 65. *Lipſ. Poliorcet.* 4. Dial. 3. *Pitiſc.* Lex. Ant. T. 1. p. 410. *Aquin.* Lex. Mil. T. 1. p. 199.

CESTRUM, κεστρον, in the materia medica of the antients, a name given to a plant often mentioned, but very ill explained to us by the generality of writers. Dioſcorides ſays, that the Greeks called it alſo pſuchrotrophon from its growing in damp places, and that the Latins called it betony or ſerrata, and ſome roſemary. It ſeems very ſtrange to us to hear the ſame plant called by three names, which, with us, expreſs three ſuch very different ones; but when we examine the deſcription, we find that what we call roſemary is wholly left out of the number; for its leaves are ſaid to be ſinuated, or cut in, and indented about the edges. They generally uſe the oak leaves as the moſt known leaf to reſemble them to, but theſe are not ſo deeply or ſo acutely cut as thoſe of the *ceſtrum*; and as to the identity of the plant mentioned by the other two names, we have not only this account of Dioſcorides to prove it, but Apuleius confirms it, and Pliny expreſly ſays, that the ſame plant which was called by the Gauls betony, was called by the Romans in his time ſerrata. The whole queſtion therefore turns, whether this was the plant called at this time betony, or that called ſerratula; but the deſcription helps us out in that, and the leaves of our betony not being ſinuated at all, it remains evident, that our ſaw wort, or ſerratula, is the *ceſtrum* and pſuchrotrophon of the Greeks, and the betonica or vettonica of the Latins, and ſometimes their roſmarinus.

Pliny and Apuleius ſeem indeed to have perplexed this enquiry by ſaying, that the leaves of betony or *ceſtrum* were like thoſe of the dock; but it is plain that in this caſe they have not diſtinguiſhed between betonica and brittanica; nay, Pliny himſelf in one place makes theſe the ſame, ſpeaking of betony, and ſo does Apuleius; they ſay the plant called betony or brittanica was called *ceſtrum*, &c. by the Greeks. This explains their mentioning the leaves to be like docks; for Dioſcorides in his deſcription of the brittanica ſays, that its leaves are like thoſe of the dock, which is very juſt, this plant being the great hydrolapathum, or water dock, but no way reſembling the betony.

CETACEOUS, (*Cycl.*) in a proper ſenſe, denotes only thoſe large fiſh which are viviparous, or breed their young within their own bodies, and have no gills, but lungs, with which they breath like quadrupeds, having but one pair of fins, and giving ſuck to their young. *Ray*, Coll. Loc. Word. p. 98. *Hought.* Collect. N° 531. T. 3. p. 272, ſeq.

Theſe ſcarce differ in any thing from quadrupeds, except the want of feet. They have no air bladder, but are enabled by the air they receive into the lungs in reſpiration, to render their bodies equiponderant to water. *Ray*, Wiſd. of Creat. P. 1. p. 26. See AIR *bladder.*

CETACEOUS, in the ordinary uſe, is alſo extended to all larger fiſh, called by the Latins *belluæ marinæ*, or ſea beaſts.

In which view, *cetaceous* fiſhes are divided into greater, including the whale kind, properly ſo called; and leſſer, to which belong the porpoiſe, ſhark, dog fiſh, &c. Theſe latter are more properly called *cartilaginous* fiſhes.

The ſea fox is ranked by authors in the claſs of *cetaceous cartilaginous* fiſhes, not flat, called alſo *galeolæ*; whoſe ſpecific difference conſiſts in this, that they have two livers, five gills, or branchiæ, on each ſide, and tufts hanging from the fins, which in the males are under the belly on each ſide the navel. Jour. des Scav. T. 2. p. 214. See GALEOLA.

Of the *cetaceous* kind, properly ſo called, there are divers ſpecies: ſome without teeth, or tube to caſt up water; others with teeth and a water tube; and others with a large long horn. *Hought.* loc. cit.

CETERACH, an officinal, agglutinant plant; the ſame with what is otherwiſe denominated *aſplenium* and *ſcolopendrium*. Pharm. Coll. Reg. Med. Lond. p. 121. *Gorr.* Med. Defin. voc. ασπληνιον. *Quinc.* Diſpenſ. P. 2. Sect. 2. n. 113. See ASPLENIUM and SCOLOPENDRIUM.

This plant ſtands recommended as an excellent diuretic, and a promoter of the menſes. The whole plant is to be uſed, and ſhould be gathered in the month of September. It is given by ſome in jaundices, in quartan agues, and in obſtructions of the ſpleen; but it is much neglected in the preſent practice. In ſome parts of Eſſex, where it is common on the walls of their churches, and on the tombs in the church yards, the common people tell us wonders of its effects in the ſtone. *Dale*, Pharm.

CETRA, in antiquity, a ſmall leathern ſhield, uſed by the antient Spaniards, Moors, and even Britons. Vid. *Tacit.* Vit. Agricol. c. 36.

The African *cetræ* are ſaid by Pliny to have been impenetrable, and made of elephants ſkins. *Plin.* Hiſt. Nat. l. 11. c. 39. *Pitiſc.* Lex. Ant. *Aquin.* Lex. Milit. T. 1. p. 199.

The *cetra* was much the ſame with the *pelta*. Whence Livy calls the Macedonians *peltaſtæ*, *cetrati*. *Liv.* l. 28. c. 5. Id. ib. l. 31. c. 36. See PELTA.

CETUS, (*Cycl.*) in aſtronomy, is alſo called *cete*, *balæna*, *draco*, *leo*, *urſus marinus*, *bellua*, *monſtrum marinum*, *piſtrix*, *ophus*, *orphas*, *elkaitos*, or *elketos*. *Vital.* Lex. Math. p. 83. voc. *belæna*. *Wolf.* Lex. Math.

Schiller, in lieu of piſces, repreſents the parents of the virgin Mary, viz. Joachim and Anna: Schickard, the fiſh which ſwallowed Jonas; Wigelius, the pope's triple crown and keys; alſo the croſs of the Teutonic knights.

Cetus is repreſented by the poets as the ſea monſter which Neptune, at the ſuit of the nymphs, ſent to devour Andromeda, for the pride of her mother, and which was killed by Perſeus. In the mandible of *cetus* is a variable ſtar, which appears and diſappears periodically, paſſing thro' the ſeveral degrees of magnitude, both increaſing and diminiſhing, in about 333 days. *Hevel.* in Phil. Tranſ. N° 66, p. 2028. *Marald.* in Mem. Acad. Scienc. an. 1719. p. 122, ſeq.

CETUS, in zoology. See CETACEOUS and WHALE.

CEVADILLA, in botany, a name uſed by ſome authors for the hordeum cauſticum Indicum, or Indian cauſtic barley. *Park.* Theat. p. 1625.

CHAA, in botany, a name given by ſome authors to the tea-tree. *C. Bauhin.* Pin. p. 247.

CHACK, in the manege, is taken in the ſame ſenſe, as *beat upon the hand*; it is applied to a horſe when his head is not ſteady, but he toſſes up his noſe, and ſhakes it all of a ſudden, to avoid the ſubjection of the bridle. Turkiſh horſes have this fault frequently. We ſay, they beat upon the hand; and the beſt bits, nor the beſt hand, can never fix their heads. Croats or Croatian horſes, are alſo ſubject to *chack* upon the hand; which proceeds from this, that their bars are too ſharp and ridged, or edged, ſo that they can't bear the preſſure of a bit, tho' never ſo gentle. If a horſe had not too ſenſible, or too tender a mouth, he would not beat upon the hand: but in order to fix and ſecure his head, you need only to put under his noſe-band a ſmall flat band of iron, bent archwiſe, which anſwers to a *martingale*. This will hinder him to beat upon the hand, but will not break him of the habit; for as ſoon as the *martingale* is taken off, he will fall into the ſame vice again. *Guil.* Gent. Dict. in voc.

CHADCHOD, in Jewiſh antiquity. Ezekiel[a] mentions *chadchod* among the ſeveral merchandizes which were brought to Tyre. The old interpreters not very well knowing the meaning of this term, continued it in their tranſlation. St. Jerom acknowledges that he could not diſcover the ſignification of it. The Chaldee interprets it pearls; others think that the onyx, ruby, carbuncle, chryſtal, or diamond is meant by it[a].—[a *Ezek.* xxvii. 16. b *Calmet.* Dict. Bibl. in voc.]

CHÆLÆ *cancrorum*. See CRABS *claws*.

CHÆROPHYLLUM, *chervil*, in botany, &c. See CHERVIL.

CHÆRUS, in ichthyology, a name given by Strabo, and ſome other of the old Greek writers, to the fiſh we now call the capriſcus. Rondeletius and Salvian were the firſt who properly deſcribed this fiſh. See the article GOAT-*fiſh*.

CHÆTODON, in ichthyology, the name of a genus of the acanthopterygious fiſhes, the characters of which are theſe: the branchioſtege membrane on each ſide contains four or five ſmall bones: the body is compreſſed, broad, thin, and ſhort: the back has but one fin, which reaches all along it: the tail is large, and there are in all ſix fins beſide it: the mouth is ſmall, the lips may be opened and extended, but naturally they cover a part of the teeth: the teeth in the jaws are oblong, contiguous to each other, and flexile: the ſcales are rough; and the eyes are not covered with the ſkin of the head. The ſpecies of this genus are theſe; 1. The black *chætodon*, variegated with yellow lunulated ſpots. This is a Braſilian fiſh, called the puru, or acarauna major. 2. The *chætodon*, with a forked tail, and a prickle on each ſide near the tail. This is the acarauna of the Braſilians: its ſcales are black. 3. The ſquare *chætodon*, with many ſpines about the head. This is the ſquare acarauna, or nauti s vitula. 4. The black *chætodon*, with two ſpines upon the head, and four crooked tranſverſe lines on each ſide. This is the guarerua of the Braſilians. *Artedi*, Gen. Piſc. 36.

The name is originally Greek, and is derived from χαῖτα, a thin filament, and ὀδους, a tooth, and expreſſes that the teeth may be divided into thin and fine filaments, reſembling briſtles.

CHAFE, or CHAFING *of a rope*, in the ſea language, is ſaid of a rope that is galled or fretted, or when the rope rubs againſt any thing.

The cable is chafed in the hawſe, ſignifies that it is fretted or begun to be worn out there. *Guill.* Gent. Dict. P. 3. in voc.

CHAFF. Great uſe is made of *chaff* in ſome places of Italy to preſerve ice: the ice-houſe for this purpoſe need only be a deep hole dug in the ground on the ſide of a hill, from the bottom of which they can eaſily carry out a drain, to let out the water which is ſeparated at any time from the ice, that it may not melt and ſpoil the reſt. If the ground is tolerably dry, they do not line the ſides with any thing, but leave them naked, and only make a covering of thatch over the top of the hole: this pit they fill either with pure ſnow, or elſe with ice taken from the pureſt and cleareſt water; becauſe they do not uſe it as we do in England, to ſet the bottles in, but really mix it with the wine. They firſt cover the bottom of the hole with *chaff*, and then lay in the ice, not letting it any where touch the ſides, but ramming in a large bed of *chaff* all the way between: they thus carry on the filling to the top, and then cover the ſurface with *chaff*, and in this manner it will keep as long as they pleaſe.

When they take any of it out for uſe, they wrap the lump up in *chaff*, and it may then be carried to any diſtant place, without waſte or running. Phil Tranſ. N° 8.

CHAFERY, in the iron works, the name of one of the two principal forges. The other is called the *finery*. When the iron has been wrought at the finery into what is called an ancony or ſquare maſs, hammered into a bar in its middle, but with its two ends rough, the buſineſs to be done at the *chafery* is the reducing the whole to the ſame ſhape, by hammering down theſe rough ends to the ſhape of the middle part. *Ray's* Engliſh Words.

CHAFFERS, in our ſtatutes, ſeems to ſignify wares or merchandize. 3 Edw. IV. c. 4.

The original French of the ſtatute is *chaffares*.

CHAFFING of the fleſh in infants. See INFANT.

CHAIN (*Cycl.*) The *chain* of 66 feet, commonly called *Gunter's chain*, is very convenient for ſurveying. It is divided into 100 links, each of which conſequently will be $7\frac{92}{100}$ inches; whence it is eaſy to reduce any number of thoſe links to feet, or any number of feet to links Treat. Pract. Geom. p. 5. This *chain* is entirely adapted to Engliſh meaſures; and its chief convenience is in finding readily the numbers contained in a given field. Where the proportions of ſquare feet and acres differ, the *chain*, to have the ſame advantages as Gunter's *chain*, muſt alſo be varied. Thus in Scotland, the *chain* ought to be of 74 feet, or 24 Scotch ells, if no regard be had to the difference between the Scotch and Engliſh foot; but if regard be had to this difference, the Scotch *chain* ought to conſiſt of $74\frac{2}{3}$ Engliſh feet, or 74 feet 4 inches, and $\frac{8}{3}$ of an inch. This *chain* being divided into 100 links, each of theſe will be $8\frac{2368}{10000}$ inches. Treat. Pract. Geom. p. 6. See FOOT and ACRE.

CHAINS, in ſhip-building, are thoſe irons to which the ſhrowds of the maſts are made faſt to the *chain-walls*. *Guill.* Gent. Dict. P. 3. in voc.

CHAIN-WALLS, in a ſhip, are the broad timbers which are made jetting out of her ſides, to which, with *chains*, the ſhrowds are faſtened, and by them ſpread out, the better to ſecure the maſts. *Guill.* Gent. Dict. P. 3. in voc. *Manwar.* Seam. Dict. in voc.

CHALASTICUM *ſal*, in the materia medica, a name given by ſome writers to the ſal gemm. The antient Greek writers uſed the word *chalaſtica* as a general epithet for all thoſe medicines which acted as reſolvents and diſcutients; and this ſalt having much of that power, became diſtinguiſhed by that name.

CHALAZIAS, in natural hiſtory, the name of a ſmall ſtone, deſcribed by Pliny and other antient writers, and ſaid to have been of the ſize and colour of a common hail-ſtone, and of the hardneſs of the diamond. It was probably no other than the ſmall pebble cryſtals of the Indies, which are at this time frequent on the ſhores of rivers there, from the bigneſs of a large pin's head to that of a pea; and as they lie in great cluſters together, without any other ſtones among them, they make a ſort of coarſe ſand, which much reſembles a cluſter of hail-ſtones. The more imaginary accounts of this ſtone are, that it had the coldneſs of hail, and that it retained that coldneſs even in the fire; and ſome have added, that it was of power to avert hail-ſtones from any place where it was kept. Theſe idle opinions are too much of a piece with the accounts the writers of the middle ages give of the virtues of the gems, and ſtones in general.

CHALAZITES, in natural hiſtory, a name given by ſome to the chalazias.

CHALCANTHUM, (*Cycl.*) in natural hiſtory, a name uſed by many authors to ſignify the ſubſtance called by others *chalcitis*. See CHALCITIS.

Dr. Hill has uſed the word *chalcanthum* as the generical name of a ſet of foſſils, the characters of which are; that they are compound or metallic ſalts, of a coarſe and irregular ſtructure, conſiderably hard, and naturally impure and opake; in which they differ from the native vitriols, which are fine, of a regular ſtructure, and naturally pure and pellucid.

CHALCANTHUM, in medicine, a name given by ſome to all kinds of vitriol in general. Vitriol conſiſts of an inſipid phlegm, earth, or ochre, ſome metal, mineral ſulphur, an acid ſpirit or ſalt, and ſome portion of a volatile aërial ſalt: that it contains water, needs no great proof, ſince no ſaline ſubſtance can cryſtallize without it, and diſtillation will convince any one that it exceeds all the other principles in quantity. The earth or ochre may be thus ſeparated; diſſolve vitriol in common water, a yellow powder will ſoon ſeparate from it, and ſubſide to the bottom of the veſſel. It has appeared ſtrange to ſome, that the more water there is uſed in the lixivium, the greater quantity of ochre or yellow earth will ſubſide; but this is plainly owing to this cauſe, that the weaker the lixivium is, the leſs able it is to ſuſtain heterogene particles, ſuch as earth. Phil. Tranſ. N° 103.

The vitriol, when made ever ſo pure, ſtill retains a part of this earth, which is therefore not an accidental foulneſs of it, but an innate and neceſſary ingredient in its compoſition: vitriol, twenty times diſſolved and filtred, and re-cryſtallized each time,

leaves

leaves this earth in every operation, and will ſo as long as it continues to be vitriol. Every time of the purification makes it indeed yield leſs and leſs ochre, but it ſeems as if it would always yield ſome. Baſil Valentine pretends indeed that it will, after a vaſt number of ſolutions, yield no more earth, and that then only it is fit for the ſeveral operations and wonderful experiments which he relates of it. But this is probably not true; and if it were, it ſhould ſeem to prove no more, than that vitriol, when diveſted of this earth, was a ſubſtance different from what it was before; that is, that it ceaſed to be vitriol, in the proper ſenſe of that word.

If the abſence of this earth could make this ſalt fit for purpoſes, which in its natural ſtate it was not fit for, it follows, that it muſt be a very eſſential part of its compoſition in that ſtate.

CHALCANTHUM *chlorum*, in the materia medica, a name given by ſome of the old Greek writers to the melanteria, a yellowiſh vitriolic mineral, which turned black on being wetted with common water.

CHALCEDONIUS, the name of a medicine deſcribed by Galen, and directed by him to be infuſed into the ears, in inveterate diſorders of that part. *Caſt.* Lex. in voc.

CHALCEDONY, (*Cycl.*) in natural hiſtory, the name of a genus of the ſemi-pellucid gems, the characters of which are theſe: they are obſcurely-tranſparent ſtones, of an even and regular, not tabulated ſtructure, of a ſemi-opake cryſtalline baſis, and variegated with different colours, but thoſe ever diſperſed in form of miſts or clouds, and, if nicely examined, found to be owing to an admixture of various coloured earths, but imperfectly blended in the maſs, and often viſible in diſtinct moleculæ.

It has been doubted by ſome, whether the antients were at all acquainted with the ſtone we call *chalcedony*, they having deſcribed a chalcedonian carbuncle and emerald, neither of which can at all agree with the characters of our ſtone; but we are to conſider, that they have alſo deſcribed a chalcedonian jaſper, which ſeems to have been the very ſame ſtone, as they deſcribe it by the word turbida, which extremely well agrees with our *chalcedony*.

There are four known ſpecies of the *chalcedony*. 1. A bluiſh white one. This is the moſt common of all, and is found in the ſhape of our flints and pebbles, in maſſes of two or three inches or more in diameter: it is of a whitiſh colour, with a faint cloud of blue diffuſed all over it, but always in the greateſt degree near the ſurface. This is a little leſs hard than the oriental onyx. The oriental *chalcedonies* are the only ones of any value; they are found in vaſt abundance on the ſhores of rivers in all parts of the Eaſt-Indies, and frequently come over among the ballaſt of the Eaſt-India ſhips. They are common in Sileſia and Bohemia, and other parts of Europe alſo; but with us are leſs hard, more opake, and of very little value. 2. The ſecond ſpecies is the dull milky-vein'd *chalcedony*. This is a ſtone of little value, and is ſometimes met with among our lapidaries, who miſtake it for a kind of nephritic ſtone. It is of a ſomewhat yellowiſh white or cream colour, with a few milk-white veins. This is principally found in New Spain. 3. The third is a browniſh, black, dull and cloudy one, known to the antients by the name of the ſmoaky jaſper, or jaſpis capnitis. This is the leaſt beautiful ſtone of all this claſs; it is of a pale browniſh white, clouded all over with a blackiſh miſt, as the common *chalcedony* is with a blue. It is common both in the Eaſt and Weſt-Indies, and in Germany, but is very little valued, and ſeldom worked into any thing better than handles of knives. See the article CAPNITIS.

4. The fourth and laſt ſpecies is the yellow and red *chalcedony*. This is greatly ſuperior to all the reſt in beauty, and is in great repute in Italy, tho' very little known with us. It is naturally compoſed of an admixture of red and yellow only, on a clouded cryſtalline baſis, but is ſometimes found blended with the matter of the common *chalcedony*, and then is mixt with blue: it is all over of the miſty hue of the common *chalcedony*. This is found only in the Eaſt-Indies, and there not plentifully. The Italians make it into beads, and both they and the Germans call theſe *caſſidonies*; but they are not determinate in the uſe of the word, but call beads of ſeveral of the agates by the ſame name. *Hill*'s Hiſt. of Foſſ. p. 465.

CHALCEDONY, in the glaſs trade. See GLASS-*chalcedony*.

CHALCEMBOLON, Χαλκεμβολον, in antiquity, a ſhip, the roſtrum of which was of braſs.

The word is compounded of χαλκος, braſs, and εμβολον, roſtrum. *Pitiſc.* Lex. Ant. in voc.

CHALCHUS, in ichthyology, a name given by the antient Greeks to the fiſh which we call the doree. It ſeems to have obtained both theſe names from its colour; the one from the word *chalcos*, braſs, and the other from *doree*, gilded. See FABER.

CHALCIDICA *lacerta*, a ſort of ſerpent, ſo called from its reſemblance in colour to the chalcedony. Its bite is ſucceeded by a pellucid tumour, which has a kind of ſhining blackneſs at the margin. Drank in wine, it cures its own bite, according to Paulus Ægineta. It is alſo called *ſeps*. *Caſt.* Lex. in voc.

CHALCIDICUM, in antiquity, ſometimes denoted a dining-room. See CHALCIDIC, *Cycl.*

CHALCIS, in ichthyology, a name by which ſome have called the pilchard; called by others celerinus, and apua membras. *Rondel.* de Aquat. p. 85. See the article PILCHARDUS.

CHALCIS was alſo the name given by Ariſtotle, Ælian, Appian, and the other Greek writers, to the common herring. See the article CLUPEA.

CHALCITARIUM, in the materia medica of the antients, a name given by the Greeks of the middle ages to the colcothar, or calcanthum. Some have applied it to the chalcitis alone, but others make it expreſs the vitriols in general. It is derived from the Arabian word colcothar, which is ſometimes written chabcuthar; from this to chalcitis is but a ſmall change, and from chalcitis this word *chalcitarium* is formed by theſe writers, according to the cuſtom of their times, of adding to words a termination, which ſeemed to make them diminutives of the words they were formed of, tho' no ſuch thing was really meant, but it was merely the cuſtom of the times. Thus they called the plant orchis, orchidium, and ſo in numerous other inſtances. *Myrepſus*, *Ætius*.

CHALCITIS, (*Cycl.*) in natural hiſtory, the name of a foſſile ſubſtance, very well known by name among the modern authors, but ſeeming to have been perfectly underſtood but by few of them. Many have accounted it a native pure red vitriol, which is by no means the caſe; and the generality have eſteemed it one of the loſt foſſils of the antients, tho' its name ſtill ſtands in the preſcription for the Venice treacle. This is, however, as erroneous an opinion as the other, the true *chalcitis* of the antients being yet exiſtent, and in the Turkiſh dominions commonly known, and in frequent uſe as a medicine. It is a ſoft and friable ſubſtance, of a very irregular ſtructure, and is conſiderably heavy, and is found at different depths in the earth in looſe maſſes of different ſizes, from an ounce to two or three pounds in weight. It is uſually of a flatted ſurface, and undulated or clouded with various lines: it breaks with a ſmall blow, and is then uſually ſeen to be compoſed of various ſeries of ſhort, waved, and undulated ſtriæ; there are often five or ſix ſeries of theſe in a piece of three quarters of an inch thick; but other parts of the ſame maſs are ſometimes quite plain, and have no appearance of theſe ſtriæ. It is of a browniſh red colour, much reſembling that of unpoliſhed copper: if put into the fire, it burns firſt to a duſky orange colour, and afterwards to a deep purple; and if boiled in water, its ſaline part is diſſolved, and may be afterwards ſeparated from the liquor, in form of cryſtals of a greeniſh vitriol, but of a faint tendency toward a rhomboidal figure, which is the ſhape proper to thoſe of the blue vitriol; ſo that this ſubſtance properly is a mixt ore of the cupreous and ferrugineous vitriol. The Turks calcine it in a ſtrong fire, and afterwards give it internally as a powerful aſtringent, and, it is ſaid, with great ſucceſs.

There is no doubt but that this is the very ſubſtance deſcribed by the antient Greeks, under the name *chalcitis*; the deſcription of Dioſcorides perfectly agreeing with, and very well expreſſing it; he ſays expreſsly, that *chalcitis* was of the colour of copper, friable, not ſtony, and marked with ſhining ſtreaks or veins. He accounts it one of the more ſlightly corroſive medicines, and recommends the external uſe of it in collyriums, and in hæmorrhages, in an eryſipelas, and in the herpes. But the antients ſeem not to have known the uſe of it internally ſo early as in theſe times; tho' among the Romans it was well known alſo in internal preſcription, and made an ingredient in the famous theriaca andromachi. *Hill*'s Hiſt. of Foſſ. p. 605.

CHALCITIS, among the Arabians. The words *chalcitis* and *colcothar*, were of the ſame ſignification; they expreſſed a vitriolic mineral, which Aviſenna tells us was yellow. It was a kind of what he calls *alzagiat*, or *zagi*, a word expreſſing all the vitriolic minerals in general: the other ſorts of which were, the calcadis, which was white; the calcanthum, which was green; and the ſory, which was red. *Aviſenna*.

CHALCOLIBANON, a word mentioned in the apocalypſe of St. John, and very much miſunderſtood by the intepreters, who generally render it braſs; but the word will bear no ſuch ſignification. When the name of a metal is prefixed to ſome other word, it only denotes the thing mentioned after the metal to be of the colour of that metal. This word is formed of the Greek chalcos, χαλκος, braſs, and olibanum, frankincenſe. We have many parallel compounds, and all underſtood in the ſame way, the name of the metal only expreſſing the thing to be of its colour: thus chryſomela are apples of the colour of gold, &c. This, therefore, can only ſignify frankincenſe of the colour of braſs, that is, yellow. Some interpret it to ſignify a kind of braſs, which was dug out of Mount Lebanon in Syria; but there are many reaſons againſt this: in the firſt place, we do not find by any of the antients that there ever were any mines of copper in Mount Lebanon; and, in the next, if this had been the ſenſe to be expreſſed, the word would not have been *chalcolibanos*, but libanochalcos. This all parallel compound words will evince; and among the reſt, the common compound of the name of this metal, uſed to ſignify braſs, which being called mountain copper, was not expreſſed by the word chalcoreos, but oreochalcos, which by degrees ſoftened into orichalcum, and among the Romans into aurichalcum, a name erroneouſly ſuppoſed to have been formed of the word aurum, gold, and chalcos, copper. It is plain, however, that the Greeks meant nothing of gold by it, for they have mentioned a white orichalcum or

braſs,

braſs, as well as a yellow one; which Ariſtotle gives us the manner of making, and ſays, that it was prepared by adding a certain earth to copper while in fuſion, as the yellow braſs was by adding calamine.

Chalcolibanos, therefore, ſignifies no more than braſs-coloured frankincenſe. The Greeks called one ſort of frankincenſe olibanum xanthum, that is, reddiſh olibanum. A ſecond kind they called by a name formed of a metal, and the name of the thing itſelf, with the name of the metal prefixed, as in this word, argyrolibanum; this was white. The third kind, a yellow, was called *chalcolibanon*. This word is compounded ſo like the former, argyrolibanum, that this alone might lead any one to the right meaning of it.

Pliny divides the frankincenſe into male and female, the one white, the other yellowiſh: this latter is probably the *chalcolibanos* of the apocalypſe. And even Arethas, who has given the other explanation of braſs of Lebanon to this word, acknowledges, that it may be underſtood of olibanum, one kind of which, he obſerves, is of the colour of that metal. It is plain alſo from the hymns of Orpheus, that this word *chalcolibanos* was in uſe among the Greeks as a name of olibanum or male frankincenſe; for he orders the uſe of it under this very name for a ſuffumigation, in the addreſs to Latona and Apollo, and to ſome other of the deities.

CHALCOMUIA, the *braſs-fly*, in natural hiſtory, the name of a fly, whoſe wings are of the colour of poliſhed braſs. It is of the carnivorous kind, feeding on other flies, beetles, and on the bodies of ſerpents when dead; whence it has been alſo called by ſome ophioborus; others have called it Heſycius.

CHALCOPHTHONGUS, in natural hiſtory, a word uſed by Pliny, and other writers, as the name of a peculiar ſpecies of marble, which was very hard, and of a deep black colour, and when ſtruck upon, ſounded like braſs. It is alſo called by ſome chalcotes, and chalcoponus. The antients, who had a great opinion of the ſympathetic and hidden virtues of ſtones, recommended this to people upon the ſtage, who acted in their tragedies, always to be worn about them, to preſerve the voice clear. It was alſo eſteemed a ſpecific to prevent incontinency, and the young ſingers, in their public diverſions, were in the ſame manner adviſed to wear it, to keep them in abſtinence from thoſe things which would hurt and break their voices. The antients were fond of theſe imaginary virtues in ſtones, and our writers of the middle ages have handed down all their traditions.

CHALCOSMARAGDUS, in natural hiſtory, a name given by the antients to what they called a ſpecies of the emerald, found about the copper mines of the iſland of Cyprus, and of a duſky appearance, and vein'd with yellow.

The antients were very indeterminate in the characters of the gems, and one or other of them have called almoſt every green ſtone in the world an emerald. This was probably only a dirty green ſpar or cryſtal tinged with copper, and ſuch as we daily find about our own copper mines.

CHALCUS, Χαλκῦς, among the antient Greek phyſicians, a weight of about two grains, the ſame as æreolus or æreolum. *Caſt.* Lex. in voc.

CHALEF, in the botanical writings of the antient Arabs, the name of a tree often occurring, and ſeldom explained, tho' that be a very neceſſary taſk, as the other plants they deſcribe are often compared to this; and we are left in the dark, after all the accounts, by not knowing what the *chalef* was. Some have ſuppoſed it to be the bay-tree; others, mint; and others, the quince tree: three very different things, and all equally wrong interpretations. The beſt account we have of the *chalef* or *chalaf*, is in the writings of Proſper Alpinus on the Egyptian plants. He tells us, that it is a kind of willow, growing in Egypt and in Meſopotamia. This agrees very well with all that we know concerning the *chalef* of the antients, and ſerves to explain the account Dioſcorides gives of his hydropiper, which from every thing elſe that was ſaid of it, was ſuppoſed to be the common arſmart; but this has been doubted by many, becauſe Aviſenna, who deſcribes it under the name of zinziber caninum, or dog's ginger, calls its leaves oblong, and like thoſe of the *chalef*. While *chalef* was underſtood to mean the bay or quince tree, this could not be ſuppoſed to be the arſmart; but when we find that *chalef* is a willow, this very circumſtance pleads as much in favour of its being the arſmart, as it before ſeemed to make againſt it, the leaves of our perſicaria or arſmart being very like thoſe of the willow. Thus the explaining of one word often explains many more.

CHALINOS, Χαλινος, in antiquity, the bit, or that part of a bridle which is put into the mouth of a horſe: but it was, among the antient phyſicians, alſo uſed to expreſs that part of the cheeks, which, on each ſide, is contiguous to the angles of the mouth. *Blanc.* & *Caſt.* Lex. in voc.

CHALIZA, in the Jewiſh cuſtoms, the ceremony whereby a woman who is left a widow, pulls off her brother-in-law's ſhoes, who ſhould eſpouſe her, and by this means is allowed to be at liberty to marry whom ſhe pleaſes. The word ſignifies *extractio* vel *exuviæ*. *Calm.* Dict. Bibl.

CHALK (*Cycl.*)—The hard, dry, and firm *chalk*, is much the propereſt for burning into lime; but the ſoft unctuous *chalk* is greatly the beſt for lands, becauſe it diſſolves with froſt and rain in the manner of marl. This ſort of *chalk* uſed inſtead of marl by way of a manure, is a very fine improvement for ſome ſorts of land, eſpecially the firſt time it is laid on. It changes the very nature of the ſoil, and makes it rich for a time, but it ſoon exhauſts itſelf, and requires dunging to keep it in heart afterwards. A ſecond chalking will prove of very little benefit to thoſe lands which ſucceeded ever ſo well with the firſt, unleſs they have lain a long time to recover themſelves after it. It is from hence that the farmers have their trite ſaying, that *chalk* makes a rich tenant, but a poor landlord.

The beſt method therefore of uſing *chalk*, is to mix one load of it with two loads of dung or mud; this will make it not only a temporary, but a laſting advantage to the ground. It is the beſt improvement for ſowre and cold lands, and is obſerved always to do moſt good to thoſe lands that lie fartheſt off from any natural beds of it; the ground near *chalk* beds partaking of their nature, tho' there is no *chalk* diſtinguiſhable in them by the eye. The common method of *chalking* lands, is to lay twelve or fourteen load of *chalk* upon every acre, and this will ſometimes make the land bring very rich crops for fourteen or fifteen years together.

'Tis beſt to *carry the chalk upon a lay* a year or two before it is plowed up; by this means it will ſweeten the ſurface of the earth, and will not work ſo much downwards, as it will if plowed up at firſt. It makes corn yield well; and when laid upon graſs ground, it makes the graſs ſweet and rich; and cattle that feed upon it grow fat ſoon. The cows alſo that feed in theſe paſtures, are obſerved to give better milk than ordinary.

They have a very eaſy way of digging *chalk* in Kent. It lies on the ſides of hills, and the workman undermines it as far as he thinks proper, then digging a trench at the top, as far diſtant from the edge as the undermining goes at bottom, they fill this with water, and that ſoaks thro' in the ſpace of one night, and the whole flake falls down at once.

In other parts of the kingdom, *chalk* generally lies deeper, and they are often forced to dig for it to conſiderable depths, and draw it up in buckets; yet in theſe places, it ſells cheap enough at the mouth of the pit to be worth buying, even to carry a great way, for manure. *Mortimer*'s Huſbandry.

Black CHALK, a name given by the painters to a ſpecies of ochreous earth, with which they draw on blue paper, and other ſubſtances. It is very improperly called *chalk*, being more of the nature of the Cologn earth than any other known ſubſtance, but containing much leſs vegetable matter than that.

It is found in the earth in broad flat pieces, from two to ten foot long, and from four inches to twenty in breadth; generally flat, but ſomewhat riſing in the middle, and thinner toward the edges, and commonly lies in large quantities together. While in the earth, it is moiſt and flaky, but being dried, it becomes conſiderably hard, and very light; but always breaks in ſome particular direction; and if attentively examined when freſh broken, appears of a ſtriated texture. It is of a fine black colour, of a cloſe even ſtructure, and rough and duſty ſurface. It adheres firmly to the tongue, and is ſomething harſh to the touch. It breaks tolerably eaſy between the fingers, and ſtains the hands. It ſinks in water, in which it differs from the nature of the Cologn earth, and makes no effervеſcence with acids. When put into the fire, it readily takes fire, and burns to a fine white ſubſtance, harder than before, and ſeeming as if made of a mixture of tobacco-pipe clay and wood aſhes. This calcined ſubſtance on trial yields a ſmall quantity of an alkaline ſalt; and all experiments prove it to be partly of vegetable, partly of foſſile origin. It is dug in Spain, Italy, and ſome parts of the German dominions. *Hill*'s Hiſt. of Foſſ. p. 66.

Red CHALK, an earth much uſed by painters and artificers, and common in the colour-ſhops of London, and elſewhere. It is properly an indurated clayey ochre, and is dug in Germany, Italy, Spain, and France, but in the greateſt quantity in Flanders. Its characters by which it is diſtinguiſhed from other red earths, are theſe: it is of a fine, even, and firm texture, very heavy, and very hard, of a pale red on the outſide, but when broken, of a deep duſky chocolate colour within. It adheres firmly to the tongue, is perfectly inſipid to the taſte, and makes no effervеſcence with acids. *Hill*'s Hiſt. of Foſſ. p. 62.

CHALK *land*. Barley and wheat will ſucceed very well on the better ſort of *chalky land*, and oats generally do very well on any kind of it.

The natural produce of this ſort of land in weeds, is that ſort of ſmall vetch called the tine tare, with poppies, May-weed, &c. Saint foin and hop-clover will generally ſucceed tolerably well on theſe lands; and where they are of the better ſort, the great clover will do. The beſt manure for theſe lands is dung, old rags, and the ſheep dung left after folding them on it. If rain happens to fall upon theſe lands juſt after the ſowing, the earth will bind ſo hard after it, that the ſhoots from the ſeed cannot pierce thro' it, and the greater part of the crop will be by this means loſt. In Hertfordſhire they manure their *chalk lands* with pidgeons dung, aſhes, and ſoot, and with ſome horſe dung: and in Oxfordſhire they uſe no other manure than half-rotten dung, with which they mix ſand; and this, they ſay, prevents the earth from binding. They generally ſow theſe lands there with wheat, meſlin, and barley, only after

after wheat, they ſow peaſe and vetches; in the ſowing of theſe, they are particularly forced to wait for fair weather, becauſe of the land's binding. *Mortimer*'s Huſbandry.

CHALK-*ſtones*, in medicine, is uſed for the concretions of calcarious matter in the hands and feet of people violently afflicted with the gout Lewenhoek has been at the pains of examining theſe by the microſcope. He divides them into three parts. The firſt part is compoſed of various ſmall parcels of matter, looking like grains of white ſand: this is harder and drier, and alſo whiter than the reſt. When examined with large magnifiers, theſe are found to be compoſed of oblong particles, laid cloſely and evenly together: tho' the whole ſmall ſtones are opake, theſe component parts of them are pellucid, and reſemble pieces of horſe hair cut ſhort, only that they are ſomewhat pointed at both ends. Theſe are ſo extremely thin, that Mr. Lewenhoek computes that a thouſand of them placed together would not amount to the ſize of one hair of our heads. The whole ſtones in this harder part of the *chalk*, are not compoſed of theſe particles, but there are confuſedly thrown among them ſome broken parts of other ſubſtances, and in a few places ſome globules of blood, and ſmall remains of other juices.

The ſecond kind of *chalky* matter is leſs hard and leſs white than the former, and is compoſed of fragments or irregular parts of thoſe oblong bodies which compoſe the firſt or hardeſt kind, and theſe are mixed among tough and clear matter, interſperſed with the ſmall and broken globules of blood diſcoverable in the former, but in much greater quantity. And the third kind appears red to the naked eye, and when examined with glaſſes, is found to be a mere tough and clammy white matter, in which a great number of globules of blood are interſperſed; theſe give it the red appearance it has. Phil. Tranſ. N° 168. p. 906.

CHALKING, in our old laws, ſeems to be ſome duty laid on merchandize; what it was particularly we do not find: but in the rolls of parliament it is ſaid, the merchants of the ſtaple require to be eaſed of divers new impoſitions, as *chalking*, ironage, wharfage, &c. Rot. Parl. 50 Edw. III. ap *Blount* Law Dict. in voc.

CHALYBEATE *waters*. See MINERAL *waters*.

CHALYBEATE *wine*, *vinum chalybeatum*. See WINE.

CHAMA, in natural hiſtory, the name of a large genus of bivalve ſhells, the characters of which are theſe: it is uſually ſmooth, tho' in ſome places a little rugoſe, and has in ſome few a number of ſpines. The valves of the ſhell are equal, elate, and convex, and the mouth gaping, not cloſing faſt, and even in all parts, as in the oiſter.

The fiſh contained in this genus of ſhells, have all a hot taſte like that of pepper, and enflame the mouth in a troubleſome manner. The French have hence called them flames and flammets, and in ſome parts of the ſame nation they are called lavignons and pelourdes.

The Greek word for this ſpecies of ſhell is μονοκερωμα; but this is followed in no other language. The antients uſed the ſeveral ſpecies of this ſhell to engrave figures on; and as they thought proper, could give the ſeveral parts of the engraved figure the colours of the ſeveral coats of the ſhell, by cutting deeper or leſs deep into it. Thus they could give the fleſh of a man its natural white, and his garments a blue or a yellow, according to the nature of the ſpecies of *chama* they worked on. We find ſeveral of theſe antique works; and it is thought by ſome, that this was the firſt invention of that ſort of engraved gem, which we call camea.

It has been a very common error of authors to confound many of the ſpecies of the *chamæ* and oiſters together; but there are ſufficient obvious diſtinctions to guard againſt this, notwithſtanding ſome ſlight external reſemblance. The *chamæ* areuſually ſmooth on the ſurface, and both ſhells are convex, and that more than the under ſhell of the oiſters, and they do not faſten themſelves to one another, or to other ſubſtances, as the oiſters do.

The moſt remarkable ſpecies in the genus of *chamæ* are, 1. The coucha veneris, commonly miſtaken for a cockle. This has two rows of ſpines, very oddly placed about its mouth, and its ſides are deeply ribbed and furrowed. 2. The violet *chama*, of a truncated form. 3. The old woman ſhell. This is wrinkled and prickly.

The *chama* is not only confounded with the oiſter, but many writers have alſo confounded it with the tellinæ and the pectines. But theſe errors are all eaſily avoided, by paying a proper regard to the characters of each genus. The *chama* is of a rounder figure than the tellina, which is uſually oblong, and it is alſo thicker than the generality of tellina; and it is diſtinguiſhed from the pecten by having its ſhell tranſverſe and very deep, whereas thoſe of the pecten are uſually ſlight and longitudinal. The pecten alſo is uſually auriculated, the *chama* never is ſo.

The ſpecies of the *chama* being very numerous, it is proper to diſtinguiſh them under ſeveral general heads.

1. Of the oblong, plain, and tranſverſly ſtriated *chama*, the cabinets of the curious afford us the following ſpecies: 1. The Arabic or lettered *chama*, ſo called becauſe its figures are ſuppoſed to repreſent the Arabic characters. 2. The brown ſpotted Arabic *chama*. 3. The virgated *chama*. 4. The *chama* with deep tranſverſe ſtriæ.

2. Of thoſe *chamæ* which are of an oblong figure, elate, and ſtriated from the apex, we find the following ſpecies. 1. The grey *chama*. This, when its outer coat is taken off by poliſhing, becomes of a purple colour, and is kept in many cabinets as a different ſpecies, under the name of the amethyſtine *chama*. 2. The yellow *chama*. 3. The reddiſh *chama*. 4. The variegated *chama*.

3. Of the rounder ſhaped equilatera' *chamæ*, we have the following ſpecies: 1. The *chama* called the ſea nut. 2. The fill *chama*. 3. The granulated *chama*. 4. The reticulated *chama*. 5. The hurdle *chama*. The ridges in this ſpecies run ſo among one another, as to give it the appearance of a hurdle of ſticks wound together. 6. The painters *chama*, ſo called from its being uſed by the painters in many places to keep their colours in. 7. The cancellated *chama*. 8. The coarſe buckram *chama*. 9 The rugated *chama*. 10. The cheſnut *chama*. 11. The optic *chama* of Rumphius. 12. The punctuated *chama*. 13. The variegated *chama*. 14. The red faſciated *chama*. 15. The thin yelloviſh *chama*. 16. The faſciated amethyſtine *chama*. 17. The thick, white, plicated, Weſt-Indian *chama*. 18. The milk-white *chama*, called galades by Rondeletius. 19. The *chama* pelorides of Bellonius, ſo called becauſe frequent about Peloro. 20. The *chama* glycymeris of Ælian, ſo called becauſe it is of a clean black colour. 21. The *chama* trachea, which is very rough on the ſurface. 22. The pepper *chama*, ſo called from its violent taſte of pepper. 23. The *chama læia*, or light *chama*. This is remarkable for the thinneſs of the ſhell. 24. The tyger's tongue *chama*, a rough ſpecies, ſo called by Rumphius. 25. The thin, white, reticulated *chama*.

4. Of thoſe *chamæ* which have unequal ſides, and are called *chamæ* venereæ, we have the following ſpecies: 1. The amethyſtine mutilated *chama*, with an oval hollow. 2. The occidental *concha veneris*, with rows of ſpines. 3. The oriental *concha veneris*. This has no ſpines, but a number of wrinkles. 4. The ſmooth amethyſtine *concha veneris*, with an oval aperture. 5. The ſmooth white *concha veneris*, with a purpliſh oval aperture. 6. The white ſmooth *concha veneris*, with a grey oval aperture. 7. The ſmooth white *concha veneris*, with a brown oval aperture. 8. The mutilated *chama*, with a ſtriated apex. 9. The brown, tranſverſely, ſtriated, mutilated *chama*. 10. The variegated, agate-coloured *chama*. 11. The wrinkled *chama*, called the old woman ſhell, with prickles. 12. The larger amethyſtine *chama*, of the iſland of Rondo. 13. The great grey *chama* of Canada, of a ſilvery white, with a bluſh of red within. 14. The great grey *chama* of Senegal: this is white within. 15. The irregular ſtriated *chama*: and, 16. The white *chama* with a few ſpots. Hiſt. Nat. Eclaire, p. 322.

CHAMÆBALANUS, in botany, a name given by many of the Greek authors to the apios, from its having numerous tubera among its roots, buried under the ground. Some have explained the ſame word as a name of the bulbocaſtanum or earth nut, but it is wrong to confound two roots of ſuch very different characters together, and it does not appear that the Greek authors of note ever uſed it in any other ſenſe but as the name of the apios. The name pſeudo-apios has indeed been given by ſome to the bulbocaſtanum roots, but it was a name founded on ignorance, and likely to produce great errors. See Tab. of Shells, N° 18.

CHAMÆBATOS, in the materia medica, the name given by ſome to the common dewberry-buſh, or rubus. *Dale* Pharm. p. 423. See RUBUS.

CHAMÆCERASUS, the *dwarf honeyſuckle*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of a tubular form, and divided into two lips, the upper one divided into many ſegments, the under one whole, and of the ſhape of a tongue. Theſe flowers ſtand each on its ſeveral cup, and are placed two on the ſame pedicle. The cup finally becomes a fruit, compoſed of two berries placed cloſe together, and containing each a ſingle roundiſh, but flatted ſeed.

The ſpecies of *chamæceraſus* enumerated by Mr. Tournefort, are theſe: 1. The alpine *chamæceraſus*, with a double red fruit marked with two ſpots. 2. The alpine *chamæceraſus*, with a double black fruit. 3. The mountain *chamæceraſus*, with a ſingle blue fruit. 4. The buſh *chamæceraſus*, with a double bright red fruit. *Tourn.* Inſt. p. 609.

CHAMÆCERASUS is alſo uſed by Dioſcorides, and ſome of the old botaniſts, for the alkekengi, or as we call it, the winter cherry. It had this name from its fruit greatly reſembling a cherry, and the plant not growing up to a tree, but riſing only a little way from the ground. Care muſt be taken in the reading the botanical writers, to diſtinguiſh when this plant is meant by the name *chamæceraſus*, and when the ſhrub.

CHAMÆCLEMA, in botany, a name by which ſome authors call the ground-ivy. *Boerh.* Ind. 172.

CHAMÆDAPHNE, in botany, a name by which Pliny and ſome other authors call the *vinca pervinca*, or periwinkle, and others the ſpurge laurel. *Ger.* Emac. Ind. 2.

It is alſo uſed by Columna, and ſome other authors, for the broad-leav'd *ruſcus*, commonly called the Alexandrian bay, *laurus Alexandrina*. See RUSCUS.

CHAMÆDAPHNE is alſo the name given by Buxbaum to a new genus of plants, not obſerved by former botaniſts, and found

frequently

frequently in boggy places, in the northern parts of the world. The flowers conſiſt of one leaf each, and are of the globoſe campaniform kind; the fruit is divided into five cells, and contains very numerous, and very ſmall ſeeds, of a roundiſh ſhape; and the whole plant, in its manner of growth, much reſembles our Solomon's ſeal. One thing very ſingular is obſerved in this plant, which is, that it retains its leaves all the winter, but ſheds them in the middle of ſummer. In the latter end of May, and beginning of June, the flowers are ſeen to wither, and at this time there ariſe a number of new ſhoots from the alæ of the lower leaves; theſe all riſe up to bear leaves, and by the middle of July are well covered with them. In the mean time the old leaves fall off, and the ſtalks of the former year are left naked, except that they have the fruit on them. The new ſhoots have, beſides leaves, the buds of the next year's flowers, and thoſe ſo perfect, that on opening them the minute parts of the ſtamina may be perceived. In Auguſt and September, when the cold comes on, the leaves become blackiſh, and the whole plant ſeems to be decaying; but in the ſucceeding ſpring, as ſoon as the ſun has appeared bright for a few days, the leaves re-aſſume their former green, the whole plant ſeems to revive, and is ſoon ſeen covered with flowers, and exhibiting a beautiful appearance. The ſtalks of the former year die down to the origin of theſe new ones; ſo that though the plant annually grows ſeveral inches in height, yet it is never the taller for its great age, as much dying of the height of a former year as is added anew for the ſucceeding one. Act. Petrop. V. 1. p. 243.

Buxbaum, who firſt deſcribed this plant, called it chamedaphne, the dwarf bay, from its low ſtature, and its reſemblance to the common bay-tree in the ſhape of its leaves, which are oval and pointed.

CHAMÆDROPE, in botany, a name given by ſome of the antient writers to the common germander. See GERMANDER.

CHAMÆDRYS. See GERMANDER.

CHAMÆLEON *thiſtle*, in botany, the name of a kind of thiſtle, of which there are two kinds deſcribed by Dioſcorides, and others of the antient Greeks, and called the white and the black *chamæleon* thiſtles. The white *chamæleon* is an innocent plant, its root eſculent, and a gum which exſudates from it in the hot countries, not only innocent but agreeable, the women uſing it to perfume their breath, and chewing it in their mouths as we do maſtick.

It may ſeem ſtrange to ſome to find this plant thus mentioned as a ſafe, eſculent, and uſeful one; whereas Pliny and many other writers have declared it to be a poiſon. The later authors are to be excuſed in this, as having followed Pliny. The error of this author who has miſled the others may be eaſily diſcovered by tracing his accounts up to the Greeks from whom he borrowed the greater part of what we find in him, and whom he often, as in this caſe, has copied careleſsly, and tranſlated badly.

The Greeks in general have ranked birdlime among the ſlow poiſons, and the name of birdlime with them is ἶξος, ἰξὸς in the maſculine, or ixias, ἰξίας in the feminine: the latter, however, is moſt uſed. Some of the antients obſerving the viſcous gum exſudated from the white *chamæleon*, called it from this the birdlime *chamæleon*, or ixias *chamæleon*, by way of diſtinction from the other, or black kind, which did not yield this viſcous gum. It is plain that they meant only to expreſs the viſcous nature of birdlime, not its poiſonous quality, by this word, the gum itſelf being known to be ſafe, and in common uſe among the women of their time. Notwithſtanding however, that they call birdlime always ἡ ἰξίας, uſing the word alone as a ſubſtantive, and that of the feminine gender, and the *chamæleon* thiſtle that yielded this ὁ ἰξίας χαμαιλέων. The word ixias there uſed as a maſculine adjective; yet ſubſtantive or adjective, maſculine or feminine, ixias was ixias with Pliny, and he has tranſlated it into the poiſon, whether ſpoken of the birdlime, in which ſenſe the Greeks from whom he copies uſed it, as the name of a poiſon, or as the name of the *chamæleon*, in which ſenſe they eſteemed it the name of an eſculent plant.

The Arabian phyſicians call the poiſon ixias, that is birdlime, and the eſculent ixias, or *chamæleon* thiſtle, by the ſame name *aldebac*; but this is probably owing to the error of the tranſlator of Dioſcorides into Arabic; for Aviſenna, in his chapter of artanita, excuſes his own errors, by frankly confeſſing that he uſed this tranſlation, not the original; and we may find by his blunders in that chapter, that he did not underſtand Greek. Scribonius Largus, in his treatiſe of poiſons, unwilling to admit the ixias, falls into the ſame error with Pliny, and the old Arabian tranſlator of Dioſcorides, and ſays, that there is much danger in the ixias which ſome writers call the *chamæleon* thiſtle. It is probably owing to this error that the later writers on the materia medica, have all mentioned the lachrymæ or tears of the white *chamæleon* as a poiſon, whereas there is no account that at all favours this among the antients; for they all mention the maſtich of the *chamæleon*, as they call it, as a ſafe and pleaſant ſubſtance. They caution people againſt the black *chamæleon* thiſtle indeed, as an unſafe plant, but this never yields this viſcous ſubſtance, but only the white kind. Nicander diſtinguiſhes them in this manner, and Galen even preſcribes the white *chamæleon* as a remedy againſt the poiſon of the ixias or birdlime. No one ſure can be ſo hardy as to aſſert that the author here preſcribes the poiſon itſelf in a ſecond doſe againſt the firſt. See IXIAS.

CHAMÆLUCE, in botany, a name by which ſome authors have called the colt's foot, or tuſſilago. *Ger. Emac. Ind.* 2. See TUSSILAGO.

CHAMÆACTE, in botany, a name given by ſome authors to the dwarf elder. *Dale* Pharmac. p. 319

CHAMÆMELUM, *chamæmile*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the radiated kind; the diſk is compoſed of floſcules, and the outer edge of ſemifloſcules, all ſtanding upon embryo ſeeds, and all incloſed in one common ſquammoſe cup. The embryo's finally ripen into ſeeds, and are affixed to the thalamus of the flower. To this it is to be added, that the leaves are finely divided, and the whole face and appearance of the plant has ſomething peculiar, which readily diſtinguiſhes it from the other plants with radiated flowers.

The ſpecies of *chamæmile* enumerated by Mr. Tournefort are theſe: 1. The common *chamæmile*. 2. The noble or ſweet-ſcented *chamæmile*. 3. The double-flowered, ſweet-ſcented *chamæmile*. 4. The yellow-flowered *chamæmile*, with naked flowers. 5. The common, ſcentleſs *chamæmile*. 6. The ſcentleſs *chamæmile*, with double flowers. 7. The ſtinking *chamæmile*, called cotula fœtida. 8. The double-flowered, ſtinking *chamæmile*. 9. The ſea ſtinking *chamæmile*. 10. The ſcentleſs ſea *chamæmile*. 11. The ſmall, hairy, Spaniſh, white-flowered *chamæmile*. 12. The ſouthernwood-leaved, Alpine *chamæmile*. 13. The great *chamæmile*, with very fine leaves, and red ſtalks. 14. The double-flowered, fine-leaved, red-ſtalked, great *chamæmile*. 15. The ſcentleſs, Alpine *chamæmile*, with fine leaves, and large flowers. 16. The narrow-leaved, mountain *chamæmile*. 17. The wormwood-leaved, ſea *chamæmile*. 18. The ſweet-ſcented corn *chamæmile*, with wormwood-like leaves. 19. The flixweed-leaved *chamæmile*. *Tourn.* Inſt. p. 494.

The common *chamæmile* is digeſtive, laxative, and emollient; it mitigates pain, and promotes the menſes and urine; the leaves dried are ſaid to anſwer theſe purpoſes better than any other part of the plant: for all others, the flowers are uſed. Theſe are given in infuſion, as a gentle emetic, very large quantities of the infuſion being drank warm. They are alſo uſed in emollient decoctions, and are a general ingredient in clyſters. The people who furniſh the apothecaries with them uſually ſell the double flowers, but the ſingle ones have greatly more virtue. It is very remarkable of the flowers of this plant that like thoſe of the common yarrow, they yield by diſtillation a fine ſky-blue oil.

CHAMÆNERIUM, or CHAMÆNERION, in botany, the name of a large genus of plants, commonly called *lyſimachiæ ſiliquoſæ*, or podded willow herbs.

The characters of the *chamænerions* are theſe: the flower is of the roſaceous kind, being uſually compoſed of four leaves, diſpoſed in a circular order; from the center of the flower ariſes a piſtil, which very often ſplits into four parts, and the cup, which is of a cylindric figure, and uſually ſurrounded by four leaves, finally becomes a fruit divided into four cells, and opening into four parts, when ripe. This contains a great number of ſeeds, each of which is winged with down, and affixed to a placenta.

The ſpecies of *chamænerion* enumerated by Mr. Tournefort are theſe: 1. The common, broad-leaved, beautiful, purple *willow-herb*, called *anagra* by ſome authors. 2. The broad-leaved *chamænerion*, with white flowers. 3. The broad-leaved, Alpine *chamænerion*. 4. The narrow-leaved, purple, Alpine *chamænerion*. 5. The narrow-leaved, Alpine *chamænerion*, with white flowers. 6. The narrow-leaved, Alpine *chamænerion*, with variegated flowers. 7. The hairy *chamænerion*, with large violet-coloured flowers. 8. The hairy *chamænerion*, with a large purple flower. 9. The large hairy *chamænerion*, with ſmall red flowers. 10. The leſſer hairy *chamænerion*, with ſmall flowers. 11. The Alpine *chamænerion*, with leaves growing three at every joint. 12. The Alpine *chamænerion*, with ſhining, dentated leaves. 13. The ſmaller Alpine *chamænerion*, with leaves like thoſe of the prunella. 14. The great ſmooth *chamænerion*. 15. The great ſmooth *chamænerion*, with white flowers. 16. The great, ſmooth, almond-leaved, Sicilian *chamænerion*. 17. The leſſer ſmooth *chamænerion*. 18. The leſſer ſmooth *chamænerion*, with white flowers. 19. The ſmooth, narrow-leaved *chamænerion*. 20. The origanum leaved *chamænerion*. *Tourn.* Inſt. p. 302.

CHAMÆPITYS, *ground pine*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of the one lip'd kind; this lip is divided into three ſegments; the middle of theſe is bifid, and there are ſmall jags ſupplying, in ſome ſort, the place of an upper lip. The piſtil ariſes from the bottom of the flower, and is ſurrounded by four embryos, which finally become four oblong ſeeds, and are contained in an open capſule, which was the cup of the flower. To this alſo it is to be added, that the flowers of the *ground pines* grow ſcatteredly in the alæ of the leaves, and are not placed verticulately.

The ſpecies of *ground pine* enumerated by Mr. Tournefort are theſe: 1. The ſweet-ſmelling *ground pine*, with ſerrated leaves. 2. The white-flowered, ſweet-ſcented *ground pine*, with ſerrated leaves. 3. The yellow-flowered, ſweet-ſcented

ground

ground pine, with ſerrated leaves. 4. The common, yellow-flowered *ground pine*, with bifid leaves. 5. The Portugal, trifid-leaved *ground pine*, with roſe-coloured flowers. *Tourn.* Inſt. p. 208.

Chamæpitys, or *ground pine*, though highly extolled as an aperient, cephalic, and nervous medicine, is however little uſed, except as an ingredient of the *theriaca*, and ſome other officinal compoſitions.

CHAMÆRHODODENDROS, in botany, the name of a genus of trees, the characters of which are theſe: the flower is compoſed of only one leaf, and is of a tubular, and ſomewhat funnel-like ſhape. The piſtil ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower. This finally becomes an oblong fruit, divided into five cells, and finally burſting into ſo many capſules, which are all affixed to an axis, and contain ſmall ſeeds.

The ſpecies of *chamærhododendros* enumerated by Mr. Tournefort are theſe: 1. The ſmooth Alpine *chamærhododendros*. 2. The hairy Alpine *chamærhododendros*. 3. The ſerpyllum-leaved Alpine *chamærhodadendros*. 4. The Indian *chamærhododendros*, with large crimſon flowers.

CHAMÆRIPHES, in botany, a name given by Pontedera to a genus of plants called by Linnæus *chamærops*. *Ponteder.* 10. See CHAMÆROPS.

CHAMÆROPS, in botany, the name of a very ſingular genus of plants, which produce diſtinct plants, ſome hermaphrodite, and ſome only male flowers. The characters are theſe: in the hermaphrodite flower the general cup is the whole ear, which is compreſſed and bifid; but beſide this each flower has its ſeparate perianthium, which is very ſmall, and divided into three parts. The flower is in the ſame manner divided into three parts, and theſe are of a coriaceous ſubſtance, and oval figure; they ſtand erect, and have a ſharp point bending a little backward; the ſtamina are ſix compreſſed and pointed filaments, very ſlightly cohering at the baſe; the antheræ are very ſlender and double, and grow to the inner ſide of the filaments; the piſtil has three roundiſh germina, to which are joined as many diſtinct ſtylus's, which do not fall off with the flower; the ſtigmata are acute; the fruit is compoſed of three globoſe berries, each being unilocular, and containing a ſingle roundiſh ſeed. The male flowers reſemble the female in their whole ſtructure, except that they have in the place of the ſtylus a gibboſe, impervious receptacle, which terminates in ſix ſtamina. *Linnæi* Gen. Pl. p. 513. *Ponteder.* 10.

CHAMÆROPS is alſo uſed by Pliny, and ſome other of the old authors, for the low, or dwarf palm, called by others the palmites. *Ger.* Emac. Ind. 2.

CHAMANIM, in the Jewiſh antiquities, is the Hebrew name for that which the Greeks call *Pyreïa*, or *Pyrateria*; and St. Jerom in Leviticus has tranſlated *ſimulachra*, in Iſaiah, *delubra*. Lev. c. xxvii. v. 30. Iſai. c. 27. v. 9.

Theſe *chamanim* were, according to rabbi Solomon, idols expoſed to the ſun upon the tops of houſes. Abenezra ſays, they were portable chapels or temples, made in the form of chariots, in honour of the ſun.

What the Greeks call Pyræia, were temples conſecrated to the ſun and fire, wherein a perpetual fire was kept up. They were built upon eminences, and were large encloſures, without covering, where the ſun was worſhipped. Herodotus and Strabo ſpeak of them; and the Guebres or worſhippers of fire in Perſia and the Indies have ſtill theſe *Pyræïa*. Strabo ſays, that in his time there were many of theſe temples to be ſeen in Cappadocia, conſecrated to the goddeſs *Anaita*, and the god *Homanus*. *Anaita* is in all probability the moon, and *Homanus*, the ſun. *Herodot.* l. 1. p. 87. *Strabo*, l. 15.

The word *chamanim* is derived from *chaman*, which ſignifies *to warm, to burn*. *Calm.* Dict. Bibl. in voc. *chamanim*.

CHAMARIM, a word mentioned in ſeveral places of the Hebrew bible, and generally tranſlated *the prieſts of the idols*, or *prieſts cloathed in black*, becauſe *chamar* ſignifies black or blackneſs. St. Jerom [a] in the ſecond book of kings, renders it *aruſpices*. In Hoſea [b], and Zephaniah [c], he tranſlates it *ædituï*, churchwardens; but the beſt commentators are of opinion, that by this word we are to underſtand the prieſts of the falſe gods, and in particular of the worſhippers of fire; becauſe they were, as they ſay, dreſſed in black; or perhaps the Hebrews gave them this name in deriſion, becauſe, as they were continually employed in taking care about the fewel, and keeping up the fire, they were as black as ſmiths or colliers. — [a 2 Kings xxiii. 5. b c. x. v. 5. c c. i. v. 4.]

We find prieſts among thoſe of Iſis called *melanephori*, that is to ſay, that wear black; but whether this might be by reaſon of their dreſſing in black, or whether it were becauſe they wore a certain black ſhining veil, in the proceſſions of this goddeſs, is not certain.

Camar, in Arabic, ſignifies the moon: Iſis is the ſame deity. Grotius thinks the Roman prieſts called *camilli*, came from the Hebrew *chamarim*. They, among the heathens, who ſacrificed to the infernal gods, were dreſſed in black. *Calmet.* Dict. Bibl.

Viäi egomet nigrâ ſuccinctam vadere pallâ
Canidiam pedibus nudis, paſſoque capillo. *Horat.* l. 1. Sat. 8.

CHAMÆXYLON, in botany, a name by which ſome authors have called the gnaphalium, or cudweed. *Ger.* Emac. Ind. 2.

CHAMBERDEKINS, in our old ſtatutes, a denomination for certain Iriſh beggars, which by ſtatute were to leave England within a certain time [a]. They were called in the ſtatute [b] *chamberdeukynz*, and ſaid to be clerks mendicants [c]. Blount [d] ſays they are called *chamber deacons* in the parliament roll. — [a Terms de ley. in voc. b 1 Hen. 5. c. 8. c *Clercs irroyis mendinaunts*. d Law Dict. in voc.]

CHAMBER (*Cycl.*) — CHAMBERS *of the king*, *regiæ cameræ*, in our old records, is uſed for the havens or ports of the kingdom. *Selden.* Mar. Clauſ. p. 242. ap. *Blount.* Law Dict.

CHAMELÆA, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of only one leaf divided into three ſegments, and that ſometimes ſo deeply as to appear on a ſlight view, a three leaved flower. The piſtil finally becomes a tricoccous fruit, or one compoſed of three kernels, covered and held together by a thin ſkin, and containing within them oblong ſeeds.

The ſpecies of *chamelæa* enumerated by Mr. Tournefort are theſe: 1. The common *chamelæa*. 2. The white-flowered *chamælea*, with box-like, blackiſh green leaves. *Tourn.* Inſt. p. 651.

CHAMELEIA, in natural hiſtory, a word uſed by ſome authors as a name for a peculiar ſpecies of chama, but by others as a name for all thoſe chamæ which have ſmooth ſurfaces, which are a very great number. See CHAMA.

CHAMELEON, in zoology, the name of a ſmall animal, of which many ſtrange things have been reported, ſome true, ſome falſe.

It is of the claſs of oviparous quadrupeds, and approaches much to the lizard kind, but that its head and back are not depreſſed and flatted as in the lizards, and that the legs are longer.

There are four diſtinct ſpecies of this animal. 1. The Arabian kind, which is ſmall, and hardly exceeding the green lizard in ſize: this is of a whitiſh colour variegated with yellowiſh and rediſh ſpots. 2. The Ægyptian, which is twice as large as the Arabian, and is of a middle colour between the whitiſh hue of the Arabian and a fair green: this changes its colour to a paler or deeper yellow. 3. The Mexican. And fourthly, a kind ſometimes ſhewn about as a ſight, and met with by J. Faber Lynceus at Rome, which differed from all the others. The Arabian and Mexican *chameleons* ſeldom exceed ſix inches in length; the Ægyptian is nine or more; its head is large, but the thickneſs of its body is not to be determined, as the creature alters that at pleaſure, as it more or leſs inflates its body; and this inflation not only goes through the whole body, but into the legs and tail. This inflation is not at all like the breathing of other animals, for the body when thus puffed out will remain ſo two hours, only gradually and inſenſibly ſinking all the time, and afterwards will be inflated again, but that much more quickly than it ſubſided. It is able a long time to continue either of theſe ſtates, but more frequently remains empty for a conſiderable ſpace, in which time, though before it appeared in good caſe, it looks miſerably lean and lank, and its back-bone may be ſeen perfectly, its ribs counted, and even the large tendons of the feet diſtinctly obſerved by the naked eye through the ſkin. The back-bone, however, is not ſerrated as many have affirmed, but makes, in this its lean ſtate, a plain ſharp ridge, and the whole animal looks ſo miſerably meagre, that it has not unaptly been called a living ſkin. The head is very like that of ſome fiſhes, and is joined almoſt immediately to the breaſt, the neck being extremely ſhort, and has at the ſides two cartilaginous eminences, in the manner of fiſhes. It has a creſt ſtanding up in the middle of the forehead, and two others over the eyes, and between the creſts there are two remarkable depreſſions, the noſe and mouth running from the eyes with a double edge to the end of the ſnout, reſemble thoſe of a frog: at the extremity of the noſe there are two perforations, which ſeem to ſerve as noſtrils; the mouth being always kept cloſe ſhut, and the creature appearing to have no power of reſpiring but by means of theſe. Its mouth is furniſhed with teeth, or rather with continued denticulated bones. Theſe are of no ſervice to the creature in eating, ſince it preys on flies, and ſwallows them whole; but may ſerve for its defence in holding faſt a ſtick in its mouth, which, according to Ælian, this creature does, placing the ſtick croſs-ways, to prevent its being ſwallowed by ſerpents.

The ſtructure and motion of this creature's eyes is very ſurprizing; they are very large, and ſet in large cavities, appearing to be large ſpheres, of which one half ſtands out of the head, and is covered with a thin ſkin, perforated with a ſmall hole at the top, through which is ſeen a very vivid and bright pupil, ſurrounded with a yellow iris; this hole is properly a longitudinal ſlit, which the creature opens more or leſs wide at pleaſure, and the eye ſeems fixed to this eyelid ſo as to follow all its motions, not turning round within it, as in other creatures. The motion of the eyes of this creature is not leſs ſingular than their ſtructure, ſince it can turn them ſo as to ſee what paſſes either far backward, on either ſide, or directly behind it, without at all moving the head, which is fixed to the ſhoulders, and the creature can give one eye all theſe motions while the other is perfectly ſtill. The trunk of the body is properly all breaſt, for the creature has no belly, its ribs being continued to the ilia; the feet have all five toes, two behind, and three before, the hinder ones being as large as the others. This creature moves as ſlow as the tortoiſe, which appears very ſingular, as its legs are ſufficiently long, and it has no great weight of body to carry; but it is ſaid, that on trees, in its wild ſtate,

it

it moves very nimbly. Its tail when inflated is round as that of a rat or ſnake, when empty, it is very lank, and has three longitudinal ridges running along it, which are owing to the apophyſes of the ſpine. This tail is a great ſafety to the creature on trees, as it twiſts it round the branches when in any danger of falling. See Tab. of Quadrupeds and Serpents, N°29. The accounts given by the antients, and later writers, of the long hollow tongue of the chameleon, which it can dart with ſuch celerity to take flies, by means of a ſpongy nodule at the end, is found on experience, of thoſe who have kept the creature alive, to be true. Thoſe among the former therefore, who ſuppoſed the *chameleon* lived on the air only, were greatly miſtaken; ſome, of late, have alſo favoured this opinion becauſe of the long time the creature will live without food; but this is the caſe with all the ſerpent kind alſo, which yet we know to eat ſolid food when they can get it. *Ray*'s Syn. Quad. p. 276. See CAMELEON.

As to the change of colour in this creature, on its approaching different objects, the accounts are erroneous; it is indeed liable to changes of colour from other cauſes, as from cold, ſickneſs, and the like, but not from any external object.

CHAMEPITYS. See CHAMÆPITYS.

CHAMOIS, in zoology, is uſed by ſome, particularly the French, for the creature from whoſe ſkin the *chamois* leather is made. See Tab. of Quadrupeds and Serpents, N° 8. and RUPICAPRA.

CHAMOS, or CHEMOSH, the idol or god of the Moabites.

The name of *Chamos* comes from a root which, in Arabic, ſignifies *to make haſte*, for which reaſon many believe *Chamos* to be the ſun, whoſe precipitate courſe might well procure it the name of ſwift or ſpeedy. Others have confounded *Chamos* with the god *Hammon*, adored not only in Libya, and Egypt, but alſo in Arabia, Ethiopia, and the Indies. *Lucan*. Pharſ. l. 9. Macrobius ſhews that Hammon was the ſun, and the horns with which he was repreſented denoted his rays Calmet is of opinion that the god Homanus and Apollo Chomeus, mentioned by Strabo and Ammianus Marcellinus, was the very ſame as *chamos*, or the ſun. Theſe deities were worſhipped in many of the eaſtern provinces. Some, who go upon the reſemblance of the Hebrew term *Chamos* with the Greek *comos*, have believed *Chamos* to ſignify the god Bacchus, the god of drunkenneſs, according to the ſignification of the Greek *comos* St. Jerom, and with him moſt interpreters, take *Chamos* and *Peor* for the ſame divinity. But it ſeems that Baal Peor was the ſame as Tammuz or Adonis; ſo that *Chamos* muſt be the god whom the heathens call the ſun.

They who derive this word from the Hebrew *camos*, with a caph, mem, and ſamech, pretend that it ſignifies the hidden god, or Pluto, whoſe abode is in hell. In this ſenſe it will ſignify the ſame as Tammuz, and is taken for Adonis; becauſe this god was adored as one that had been concealed and buried in a coffin, then raiſed from the dead, and appearing alive again. But the god *Chamos* is never written in ſcripture after the manner we have been ſpeaking of, ſo as to ſignify the hidden god. *Calm*. Dict. Bibl.

Farther particulars may be ſeen in Calmet's diſſertation on Baal Peor and *Chamos*, prefixed to his comment on the book of Numbers.

CHAMPADA, in natural hiſtory, the name of a tree common in the woods of Malacca, and bearing a fruit much valued by the natives. It is a large tree, very full of branches, and theſe are very knotty, and, when cut, throw forth a thick and acrid juice like that of the tithymal. The fruit grows on the trunk and thick branches of the tree: the firſt appearance toward this is a large button or bud; this by degrees opens into a flower conſiſting of a great number of leaves, among which, when open, are ſeen the rudiments of the fruit; this appears very ſmall at firſt, but it ſoon grows to a very conſiderable bigneſs, being, when ripe, twelve or fourteen inches long, and as much in circumference; it is ſhaped much like a melon. The rind is green, and is all over divided into ſmall pentagons, in the center of each of which is a ſmall black ſpot. The pedicle is thick and woody, and entering into the ſubſtance of the fruit, it divides itſelf into ſeveral branched fibres, which run through the whole ſubſtance of it, and meet in a point at the end. Within this large fruit there are contained a large number of kernels of the ſize of our common cheſnuts, all hanging together in bunches, ſo as to reſemble a cluſter of grapes; theſe are confined in a narrow compaſs, being preſſed firmly upon one another while the fruit is whole, but as ſoon as this is cut or burſt open, they fly farther aſunder, and hang to the ſtalks like grapes that are placed at a diſtance on the bunch, as ſome of our oblong kinds are. The people of Malacca are very fond of this fruit; they ſuck the pulpy matter which ſurrounds the kernels, and which is of a ſweet and luſcious taſte, but of a diſagreeable raw ſmell. The Indians are very fond of this fruit, as well for its qualities, as its taſte, for it is very heating, and when taken in large quantities, will inebriate people in the ſame manner as ſtrong liquors. The kernels are much of the nature of our cheſnuts, but of a leſs agreeable taſte; they are eaten by way of food rather than as a delicacy, and the common way of eating them is boiled in water. Mem Acad Scienc. Par. 1699.

CHAMPAGNE, in heraldry, a name given by Ferne, and ſom other writers to a line differing from the common lines, an called alſo *urdee*, and by Upton, *vere*, from its reſemblance to the ends of the figures of that ſort of fir which is called *vair* by the heralds. See URDEE.

CHAMPART, in our old cuſtoms, a duty, or tenure, by which the tenant was to pay part of the fruits of the ground to the lord [a]. It is alſo written *chaumpert* [b], and in the middle age Latin is called *campipars*, *camparcium* [c]. — [a *Blount*. Law Dict. b Vid. *Du Cange*, Gloſſ. Lat. Tom. 1. p. 726. c *Du Cange*, loc. cit.]

CHANCERON, in natural hiſtory, a name given by the French writers to the ſmall caterpillar that eats the corn, and does vaſt miſchief in their public granaries. The butterfly which produces this creature has white wings with black ſpots in them. The caterpillar, when firſt hatched, is one of the ſmalleſt that we are acquainted with. It ſpins a great number of fine threads, as ſoon as hatched from the egg, and in many of theſe it faſtens itſelf to every thing that lies near it.

Toward the latter end of ſummer theſe caterpillars leave the corn, and mount up the walls of the granary, where they ſearch for a proper place of reſt, and when they have pitched upon ſuch a one, they eat their way into it, and burying themſelves in a hole, they cover their whole body with a web of ſilk of their own ſpinning, and there change into a ſort of browniſh red chryſalis's. Theſe remain the whole winter without life or motion, but in the months of April and May the butterflies hatch out of them, and the males and females couple together, immediately after which the female lays her eggs, and the foundation is laid for a new progeny, who, during the remainder of the ſummer, are to deſtroy and ſpoil the corn, under the form of caterpillars. The female thruſts out a ſort of tube from her tail, by means of which ſhe opens a way into the grain, and lodges her egg, which in fifteen or ſixteen days hatches into the caterpillar; as ſoon as hatched, it begins to eat, and devouring greedily, it ſoon marks the place where it lies by a quantity of the huſks which it leaves there. *Deſlandes*, Trait. Phyſ.

CHANCERY (*Cycl.*) — Appeals from the decrees of the court of *chancery* may be brought into the houſe of lords. See HOUSE *of lords*.

The juriſdiction of this court was impugned about the time of its original creation [a], and even in the reign of queen Elizabeth it was ſtrongly holden by the judges of the common law courts, that the chancellor could not by his decree ſequeſter the party's lands, that is, he could only *agere in perſonam*, but not *in rem*; and agreeably hereunto it was reſolved 16. Eliz. in the caſe of Coleſton and Gardener, that if a man killed a ſequeſtrator in the execution of ſuch proceſs, it was no murder [b]. — [a Vid. New Abr. Law. Vol. 1. p. 588. b Cro. Eliz. 651. 4 Inſt. 84. 1. Rol. Rep. 86. 190. Lit. Rep. 166.]

Alſo in the reigns of queen Elizabeth, and king James the firſt, there are ſeveral ſtrong opinions, that a court of equity could not examine, or give any redreſs in a cauſe after judgment at law; and that ſuits in equity, to relieve againſt a judgment at law, are within the ſtatutes, which makes it a premunire to appeal to any foreign court, eſpecially if the end thereof be to controvert the very point determined at law, or to ſeek relief after judgment in a caſe wherein the law may relieve, as againſt exceſſiveneſs of damages But ſuch opinions ſeem now to be wholly exploded. Vid. Caſ. Eq. Abr. p. 130.

The antient rule for the juriſdiction of the extraordinary court of *chancery*, was confined to frauds, accidents, and truſts; and though at this day, by its power of granting injunctions, it curbs the juriſdiction of other courts, and thereby has ſwallowed up the greateſt part of the buſineſs of the common law; yet it is ſtill under ſome of theſe notions, that it exerciſes a juriſdiction in relieving againſt forfeitures, penalties, where a compenſation can be made, in preventing multiplicity of ſuits, decreeing a ſpecific execution of agreements, aſſiſting defective conveyances, &c. But in no caſe will it relieve againſt an act of parliament, nor directly againſt a fundamental rule or maxim of the common law, nor retain a ſuit where the party appears to have a plain and adequate remedy at law. Three things, ſays my lord Coke, are to be adjudged in a court of equity. 1°. All covins, frauds, and deceits, for which there is no remedy by the ordinary courſe of law. 2°. Accidents, as when a ſervant, obligor, or mortgagor, is to pay money on a certain day, and they happen to be robbed in going to pay it. 3°. Breaches of truſt and confidence. 4 Inſt. 84.

Upon this foundation, that a court of equity could not relieve againſt a maxim of the common law, it was formerly holden, that one executor could not compel the other to account; that one joint tenant could not ſue his companion; that if an obligee loſt his bond, he was without remedy: ſo where the leſſer entered upon his leſſee, and ſuſpended his rent, it was held that he had no remedy: ſo where the party became remedileſs by his own act, as by paying money without an acquittance: ſo where one on valuable conſideration promiſed to make a leaſe, it was held that the party could not ſue on this promiſe in equity, becauſe he might have an action on the caſe. But theſe laſt opinions are now of no weight or authority, as appears by daily experience. Vid. New Abrid. vol. 1. p. 590. All matters of truſt are particularly within the juriſdiction of the court of *chancery*. Vid. Caſ. Eq. Abrid. p. 131. See the article COURT.

CHANE, in ichthyology, a name given by Ariſtotle, Athenæus, and the other Greek writers, to the fiſh called by other authors *hiatula chauna*, and *chaunus*. It is truly a ſpecies of the labrus, and is diſtinguiſhed by Artedi by the name of the forked-tailed labrus, with the lower jaw longer than the upper, and with black tranſverſe lines on the ſides. See the articles CHAUNA and LABRUS.

CHANFRIN, in the manege, is the fore-part of a horſe's head, extending from under the ears, along the interval between the eye-brows, down to his noſe. *Guill.* Gent. Dict. in voc.

CHANGE, in the manege. To *change* a horſe, or *change* hand, is to turn or beat the horſe's head from one hand to the other, from the right to the left, or from the left to the right. You ſhould never *change* your horſe without puſhing him forward upon the turn; and after the turn, puſh him on ſtreight, in order to a ſtop. *Guill.* Gent. Dict. in voc.

CHANGE *of ſpecies*, in huſbandry. See SPECIES.

CHANGES *of inſects*. See TRANSFORMATION.

CHANNA, in zoology, the name of a fiſh caught in great plenty in the Mediterranean, and brought to market in Italy, and elſewhere, among the ſea pearch, which it ſo nearly reſembles, that it would not be diſtinguiſhable from it, but that the ſea pearch is bigger, and has only broad tranſverſe lines on its back, whereas the *channa* has them both tranſverſe and longitudinal. It has a very wide mouth, and its lower jaw is longer than the upper, ſo that its mouth naturally falls open. Its eyes are ſmall, and its teeth very ſharp: its back is of a blackiſh red: it has ſeveral longitudinal lines of a reddiſh hue, and its tail is marked with reddiſh ſpots. *Bellon.* de Aquat.

There is an obſervation, that in all the fiſh of this kind which have been examined by naturaliſts, there have been found none but females. This is as old as the days of Ariſtotle. Whether it be true in fact, would require many obſervations: if it ſhould prove ſo, the whole ſeems to end in this; that the *channa* is no diſtinct ſpecies, but only the female of ſome other fiſh. *Geſner*, de Piſc. p. 260.

There is another fiſh, not unlike this, called *cannadella*, or rather *channadella*, which at Marſeilles is known by the name of *channa*. Vid. *Caſt.* Lex. in voc.

CHANNADELLA, in ichthyology, a name given by Bellonius and others to a ſpecies of the labrus, called alſo *ſachettus*, and *hepatus piſcis*. It is diſtinguiſhed by Artedi by the name of the *labrus*, with the lower jaw longer than the upper, with a forked tail, and with black tranſverſe lines on each ſide. See the article LABRUS.

CHANNEL (*Cycl.*)—CHANNEL, in the manege, is uſed for that concavity in the middle of the lower jaw of a horſe, where the tongue lies. This hollow being bounded on each ſide by the bars, terminates in the grinders or maxillary teeth. The barbles grow in this *channel*. *Guil.* Gent. Dict. in voc.

CHANTOR, (*Cycl.*) in the Jewiſh antiquities. In the temple of Jeruſalem there was a great number of Levites, who were employed in ſinging the praiſes of God, and in playing upon inſtruments before his altar. In the reign of David there were four thouſand ſinging men, with their heads and preſidents.

The *chantors* and Levites who were employed in ſinging, playing upon inſtruments, and other functions of the temple, had no habits diſtinct from the reſt of the people. Nevertheleſs, in the ceremony of removing the ark to the temple of Jeruſalem built by Solomon, the *chantors* appeared dreſſed in tunics of byſſus or fine linnen [a]. Joſephus remarks, that in king Agrippa's time they obtained the favour from that prince of wearing a linnen robe in the temple, like the prieſts. Agrippa believed it would be for the honour of his reign, to ſignalize it by ſo conſiderable a change as this. The other Levites, employed in different exerciſes under the command of the prieſts in the temple, procured likewiſe commiſſion to learn to ſing, to the end that they might enjoy the ſame privileges with their brethren [b].—[a 2 Chron. v. 12. b *Calmet.* Dict. Bibl.]

CHAOMANTIA, amongſt the enthuſiaſtical chymiſts, is the art of making preſages from obſervations on the air. *Ruland.* & *Johnſ.* ap *Caſt.* Lex. in voc.

CHAOS (*Cycl.*)—CHAOS, in the phraſe of Paracelſus, imports the air. It has alſo ſome other ſignifications amongſt the alchemiſts. Vid. *Caſt.* Lex. in voc.

CHAOASES, an order of horſe in the ſervice of the grand ſignior. Theſe and the muteferriker were originally the guards of the ſultans in Egypt, and their leaders were his two vizirs, that always accompanied him. They now always go out with the baſha.

The body of the *chaoaſes* ſeem originally to have been the guard out of which the ſultan uſed to ſend perſons to execute his orders. *Pocock*'s Egypt, p. 166.

CHAPE *of a fox*. See BRUSH *of a fox*.

CHAPELET, in the manege, a couple of ſtirrup leathers, mounted each of them with a ſtirrup, and joining at top in a ſort of leather buckle, called the head of the *chapelet*, by which they are made faſt to the pummel of the ſaddle, after being adjuſted to the rider's length and bore. They are uſed both to avoid the trouble of taking up or letting down the ſtirrups every time that a gentleman mounts on a different horſe and ſaddle, and to ſupply what is wanting in the academy ſaddles, which have no ſtirrups to them. *Guill.* Gent. Dict. in voc.

CHAPELRY, *capellania*, is uſed for a certain precinct belonging to a chapel, having the ſame relation to it that a pariſh has to a church. *Blount* Law Dict. & in Terms de Ley, in voc.

CHAPERON *of a bit-mouth*, in the manege, is only uſed for ſcatch mouths, and all others that are not canon-mouths, ſignifying the end of the bit that joins to the branch juſt by the banquet. In ſcatch-mouths the *chaperon* is round, but in others 'tis oval: and the ſame part that in ſcatch and other mouths is called *chaperon*, is in canon-mouths called *fronceau*. *Guill.* Gent. Dict. in voc.

CHAPITERS, in architecture, the crowns or upper parts of a pillar. See CAPITAL, *Cycl.*

CHAPOTENSIS, in writers of the middle age, a kind of coin. We do not find any certain account of its value. Du Cange inclines to think it the ſame as the *chatus*. See CHATUS.

CHARA, in botany, the name given by Linnæus to a genus of plants, reſembling the horſetails in general appearance, and called by ſome hippuris. The characters of the genus are theſe: the cup is very ſmall, and conſiſts of two leaves. Vaillant deſcribes a monopetalous flower in this cup; but others ſay there is no flower or corolla at all. There is no appearance of ſtamina, but the ſingle anthera or apex is of a globoſe figure, and is affixed to the cup: the germen of the piſtil is of an oval figure: there is no ſtile, but the ſtigma are three in number, and are very broad: the ſeed is ſingle, and of an oval oblong figure. *Linnæi* Gen. Plant. p. 508. *Michel.* 56. *Vaillant*, A. G. 1719. T. 3. *Dillen*, Gen. 2.

CHARABE, or CARABE, is ſometimes uſed for amber, as alſo for the juice of the poplar tree. Vid. *Caſt.* Lex. in voc.

CHARACTER (*Cycl.*) In Roman inſcriptions, we meet with the *characters* ⅠↃ and ∞, uſed to expreſs a thouſand. The uſual note of a thouſand, is either I between two CC's, (direct and reverſed) thus, CIↃ, or elſe X, thus, CXↃ. The former figure, when cloſed at top, exactly reſembles an antient M, thus, ↀ; and the latter, when ſhut up, the figure of 8, inclined thus ∞.

We alſo find in ſome inſcriptions, the *character* ⊗, which is X between CↃ's, but cloſed on all ſides. But the learned Dr. Taylor ſeems to ſuſpect the accuracy of the copy of the inſcription from whence this *character* is taken. See Phil. Tranſ. N° 482. Sect. 2. P

As to the origin and uſe of the *character* X, ſo often met with on the coins, utenſils, and manuſcripts of the antients, ſee X. *Hebrew* CHARACTERS. See HEBREW.

CHARACTERS *of fiſhes*, *characteres piſcium*, are thoſe marks by which each particular fiſh is diſtinguiſhed from thoſe other ſpecies of the ſame genus to which it belongs, and by which it is to be referred to its genus. Theſe *characters* are the eſſential foundation of all the natural diviſions in this part of hiſtory, and by means of theſe alone the young ſtudent is led to the real knowledge of the bodies under conſideration, whether, according to the works of other authors, or ſome new ſyſtem of his own. The naturaliſts of former ages did not pay a ſufficient regard to theſe marks, and conſequently could not hit upon the natural diviſions of bodies, but had recourſe to the artificial diſtinctions taken from accidents or variable properties in them, and the general external appearance uſually gave rules to them; hence the uncertainty and confuſion of the diviſions of the old authors, and method and regularity of thoſe of the moderns. *Artedi* de Piſc. See the article GENERICAL *name*.

CHARADRIUS, in zoology, a name by which Geſner and Aldrovand have called the œdicnemus, a bird very improperly called in Engliſh the ſtone curlew. *Aldrov.* l. 13. c. 15. See ŒDICNEMUS.

CHARADRIUS, in the Linnæan ſyſtem of zoology, is a diſtinct genus of birds, of the order of the ſcolopaces; the diſtinguiſhing character of which is, that the feet have each three toes, and the point of the bill is cylindrical. *Linnæi* Syſt. Nat. p. 47. See Tab. of Birds, N° 45.

Ælian fabulouſly relates, that the ſight of the *charadrius* cures a perſon of the jaundice. It is alſo called *galgalus* and *hiaticula*. Vid. *Aldrov.* Ornithol. l. 20. c. 67. who deſcribes this bird. *Caſt.* Lex. in voc.

CHARAIMS, a ſect of the Jews in Egypt. They live by themſelves, and have a ſeparate ſynagogue; and as the other Jews are remarkable for their eyes, ſo theſe are for their large noſes, which run thro' all the families of this ſect. Theſe are the antient Eſſenes. They ſtrictly obſerve the five books of Moſes, according to the letter, and receive no written traditions. It is ſaid that the other Jews would join the *Charaims*, but thoſe not having obſerved the exact rules of the law with regard to divorces, theſe think they live in adultery. *Pocock*'s Egypt, p. 177.

CHARANTIA, in botany, a name by which ſome authors have called the male balſam. *Ger.* Emac. Ind. 2.

CHARAX, in ichthyology, a name given by Ælian, Appian, and many other of the Greek writers, to the fiſh called by later writers the caraſſius. See CARASSIUS.

It is properly a ſpecies of the cyprinus, diſtinguiſhed by the name of the cyprinus, with twenty rays in the back fin, and with the linea lateralis ſtrait. *Artedi* Gen. Piſc.

CHARBON, in the manege, ſignifies that little black ſpot or mark that remains after a large ſpot, in the cavity of the corner

ner teeth of a horſe. About the ſeventh or eighth year, when the cavity fills, the tooth being ſmooth and equal, it is ſaid to be raſed. *Guil.* Gent. Dict. in voc.

CHARCOAL (*Cycl.*)—Mathematical inſtrument-makers, engravers, &c. find *charcoal* of great uſe to poliſh their braſs and copper plates, after they have been rubbed clean with powdered pumice ſtone. Mr. Boyle ſays, that the more curious burn it a ſecond time, and quench it in a convenient fluid. Plates of horn are poliſhable the ſame way, and a gloſs may be afterward given with tripoly. *Boyle*'s Works, abr. vol. 1. p. 147.

CHARGE (*Cycl.*)—The common allowance for the *charge* of powder of a piece of ordnance, is half the weight of the ball. In the Britiſh navy, the allowance for thirty-two pounders is but ſeven-ſixteenths of the weight of the bullet. But a late author is of opinion, that if the powder in all ſhip-cannon whatever was reduced to one third of the weight of the ball, or even leſs, it would be a conſiderable advantage, not only by ſaving ammunition, but by keeping the guns cooler and quieter, and at the ſame time more effectually injuring the veſſels of the enemy. With the preſent allowance of powder, the guns are heated, and their tackle and furniture ſtrained, and this only to render the bullet leſs efficacious. For a bullet which can but juſt paſs thro' a piece of timber, and loſes almoſt all its motion thereby, has a much better chance of rending and fracturing it, than if it paſſed thro' with a much greater velocity. Vid. *Robins*, Propoſ. for increaſing the ſtrength of the Britiſh navy, p. 17 to 20.

CHARGE, in the ſea language, is ſometimes uſed for burden; thus *a ſhip of charge* is ſuch as draws much water, or ſwims deep in the ſea: tho' ſometimes an unweildy ſhip, that will not ware nor ſteer, is called a ſhip of *charge*. *Guill.* Gent. Dict. P. 3. in voc.

CHARGED (*Cycl.*)—CHARGED *cylinder*, is that part of the chaſe of a gun where the powder and ball are contained. *Guill.* Gent. Dict. P. 2. in voc.

CHARIOTS (*Cycl.*)—CHARIOTS *of war*, in antiquity. The antients made uſe of *chariots* in war. Theſe were of different kinds; but the moſt terrible were thoſe armed with pikes and ſcythes, thus; the beam to which the horſes were faſtened was armed with pikes, having iron points to them which projected forward; the yokes of the horſes had likewiſe two long points of three cubits: to the axle-tree alſo were fixed iron ſpits, armed at their extremities with ſcythes; between the ſpokes of the wheels were placed javelins, and the very fellies of the wheels were furniſhed with ſcythes, which tore every thing they met with to pieces.

The axle-tree was longer than uſual, and the wheels ſtronger, that they might be able to reſiſt the ſhock of the motion, and the *chariot* be leſs ſubject to overturn. The driver's ſeat was a kind of little tower, made of very ſolid wood, and raiſed breaſt high. The charioteer was armed all over, and covered with iron. Sometimes ſeveral men well armed were put in theſe *chariots*, who fought with darts and arrows. *Diodor.* Sicul. l. 17. *Q. Curt.* l. 4. *Xenoph.* Cyropæd. l. 6.

CHARIOTS, in the Heathen mythology, were ſometimes conſecrated to the ſun: and the ſcripture obſerves, that Joſiah[a] burnt thoſe which had been offered to the ſun by the kings his predeceſſors. This ſuperſtitious cuſtom was an imitation of the Heathens, and principally of the Perſians, who had horſes and *chariots* conſecrated in honour of the ſun. Herodotus, Xenophon, and Quintus Curtius[b], ſpeak of white *chariots*, crowned, which were conſecrated to the ſun, among the Perſians, which in their ceremonies were drawn with white horſes, conſecrated to the ſame luminary[c].—[[a] 2 Kings xxiii. 11. [b] *Herodot.* l. 7. *Xenoph.* Cyropæd. l. 8. *Q. Curt.* l. 3. [c] *Calmet.* Dict. Bibl.]

CHARISIA, Χαρισια, in the Heathen theology, a wake or night-feſtival inſtituted in honour of the graces. It continued the whole night, moſt of which time was ſpent in dancing; after which, cakes made of yellow flower, mixed with honey, and other ſweet-meats, were diſtributed among the aſſiſtants.

CHARISIA is ſometimes alſo uſed to ſignify the ſweet-meats diſtributed on ſuch occaſions. *Pitiſc.* in voc.

CHARISIUS, Χαρισιος, in the Heathen theology, a ſurname given to Jupiter.

The word is derived from χαρις, gratia, *i. e.* grace or favour; he being the god by whoſe influence men obtain the favour and affection of one another. On which account the Greeks uſed at their meals to make a libation of a cup to Jupiter *Chariſius*. *Pott.* Archæol. Græc. T. 2. l. 4. c. 20.

CHARLOCK, *rapiſtrum*, in huſbandry, a very troubleſome weed among corn, being more frequent than almoſt any other. There are two principal kinds of it; the one with a yellow flower, the other with a white. Some fields are particularly ſubject to be over-run with it, eſpecially thoſe which have been manured with cow-dung alone, that being a manure very favourable to the growth of it. The farmers in ſome places are ſo ſenſible of this, that they always mix horſe-dung with their cow-dung, when they uſe it for arable land. See RAPISTRUM. When barley, as is often the caſe, is infeſted with this weed to ſuch a degree as to endanger the crop, it is a very good method to mow down the *charlock* in May, when it is in flower, cutting it ſo low as juſt to take off the tops of the leaves of the barley with it: by this means the barley will get up above the weed; and people have got four quarters of grain from an acre of ſuch land, as would have yielded them ſcarce any thing without this expedient. Where any land is particularly ſubject to this weed, the beſt method is to ſow it with graſs ſeed, and make a paſture of it; for then this plant will not be troubleſome, it growing no where where there is a coat of graſs upon the ground. *Mortimer*'s Huſbandry, p. 319.

CHARNUB, in the materia medica, a name given by ſome of the antient writers to the ſiliqua dulcis, or carob tree. The Arabian phyſicians mention two kinds of this; the Syrian, and Nabathæan; the firſt they call aljembut, and the other alnabat. Aviſenna tells us, that the firſt of theſe was a purge, and was given with ſucceſs in pains of the bowels; and the other an aſtringent, given in profluvia of the menſes.

CHARONIUS, Χαρωνειος, *charonean*, is uſed as an epithet for caves, ſome of which are found in Italy, and in other parts of the world, where the air is ſo loaded with a poiſonous vapour, that animals cannot live in them even a few moments. *Caſt.* Lex. in voc.

CHARRE, an Engliſh name for a fiſh of the truttaceous kind, of which there are two ſpecies, diſtinguiſhed by the red *charre*, and the gilt *charre*; the former of which is called by the ichthyographiſts *umbla minor*, and the latter, the *carpio lacus benaci*.

Red CHARRE, called by the Welch *torgoch*, is a large fiſh, longer and ſlenderer in its general ſhape than the trout. The back is of a duſky olive-colour, and is ſpotted with obſcurely white ſpots: the belly is not carried to an edge, but is about a finger broad: this, in moſt of theſe fiſhes, is of an elegant red, ſometimes deeper, and ſometimes paler; but in ſome, particularly in the female, it is white. The ſcales are very ſmall, and the ſide lines running from the gills to the tail are perfectly ſtrait: the belly fins are red: the opening of the mouth is wide, and the jaws are nearly of the ſame length, the lower being only a very little longer than the other, and more pointed: the teeth are ſmall and ſharp. It is caught in the lakes of Wales, and is eſteemed a very fine fiſh; but its fleſh does not boil ſo red as that of the trout. *Willoughby*, Hiſt. Piſc. p. 197.

Gilt CHARRE is ſomething like the trout in figure, but it is broader, and its belly is prominent, eſpecially when the fiſh is large: the uſual ſize is about a foot in length, which it rarely exceeds. The ſcales are very ſmall, and the back is variegated with black ſpots. Its belly and the lower parts of its ſides are of a fine bright ſilver colour: the ſkull is pellucid, and the noſe bluiſh. This is very common in ſome of the lakes of Italy, but is not peculiar to that kingdom, as has by ſome been imagined, being frequent in ſome foreign, and in ſome of the Northern lakes; and there is no doubt, but that the fiſh there caught, and called the gilt *charre* and the carpio lacus benaci, are entirely the ſame fiſh. It is a very finely flavoured fiſh, and much valued at great tables. *Willoughby*, Hiſt. Piſc. p. 197.

CHARRING denotes the reducing vegetables to charcoal. See CHARCOAL, *Cycl.*

CHARTARIUS, the ſame with *chartophylax*. See CHARTOPHYLAX, *Cycl.*

CHARTERER is in ſome places, as Cheſhire, uſed for a freeholder. *Blount* Law Dict. in voc.

CHARTOPHYLACIUM, a place where records were kept. See CHARTOPHYLAX, *Cycl.*

CHARYBDIS, a word uſed by Dr. Plot to expreſs certain openings which he ſuppoſes in the bottom of the ſea, by which its waters are received and conveyed by a ſubterranean circulation to the origin of fountains and ſprings. The fluxus moſchonicus, or maalſtrome on the coaſt of Norway, is ſuppoſed to be owing to ſome ſuch ſubterranean indraught; and it is advanced alſo, that the Mediterranean ſea could not be emptied of the vaſt quantities of waters it receives, but muſt overflow the land of Egypt, unleſs ſwallowed by ſome ſuch *charybdis*, which is either in ſome part of the baſon of that ſea, or near the mouth of it; in which caſe, it may be the occaſion of that ſtrong under-current, deſcribed by all thoſe who have treated of this ſea. An immenſe *charybdis*, placed near the Strait's mouth, may be hid under the immenſity of waters there; but as it would abſorb the deep waters continually, and that in large quantities, it would neceſſarily cauſe ſuch an under-current there. *Plot*, de Orig. Font.

CHASCUSA, or CASCUSA, in the botanical writings of the antients, a name given by the Greeks to the antirrhinum of the Latin writers. It has been ſuppoſed by ſome, that the *ceſcuſa*, or *chaſcuſa*, was the ſame with the phyteuma of Dioſcorides; but that author tells us the phyteuma was prickly, and had leaves like the ſtruthium, which was a kind of thiſtle uſed in the dying of wool: whereas Pliny tells us, that the *chaſcuſa*, or antirrhinum has leaves like thoſe of flax, that is, ſmooth, narrow, and oblong.

CHASING (*Cycl.*)—In *chaſing* at ſea, theſe rules are generally obſerved: if the *chaſed* be found any thing to the windward, the *chaſer* is to bring all his tacks aboard, and to ſhape his courſe to meet her at the neareſt angle. If the *chaſed* be to the leeward, then the *chaſer* may come in with her, except ſhe bear upright before the wind, and ſo outſail her; or that ſhe bring herſelf cloſe by a wind, and the *chaſer* prove the more

leeward

leeward ſhip, and ſo loſe her that way. If the *chaſe* be found right a-head, and ſo the *chaſer* be put to a ſtern-*chaſe*, then the beſt ſailor ſhall carry it, if there be ſea-room and day-light Being come up cloſe with the *chaſe*, endeavour to croſs her fore-foot, and by that means you will both hinder her way, and avoid the fury of her ordnance, (except thoſe in her *chaſe*) and uſe your own, if required, to more advantage; and that as well your *chaſe*-pieces, at your firſt getting up within reach, as your broadſide and quarter-pieces, as you paſs thwart her hawſe, and ſcour her decks from ſtem to ſtern. If ſhe makes away from you, ply your guns, as many as poſſible, at her ſails, yards, maſts, and general tackling; and being near, ſpare not your caſe-ſhot, or croſs-bar ſhot, to make the greater damage. *Guill.* Gent. Dict. P. 3. in voc. See alſo *Manwar*. Seam. Dict.

CHASME, or CHASMOS, Χασμη, or χασμος, among antient phyſicians, denotes oſcitation, or gaping. Hippocrates informs us, that long reſpiration is a cure for continual oſcitation. *Caſt.* Lex. in voc. See CHASME.

CHASTE-*tree*. See the article VITEX.

CHASTISEMENTS, or CORRECTIONS, in the manege, are the ſevere and rigorous effects of the aids; for when the aids are given with ſeverity, they become puniſhments. *Guill.* Gent Dict. in voc.

CHATE, in botany, a name given by ſome authors to a ſpecies of wild cucumber, called by others *cucumis Ægyptius rotundifolius*, the round-leav'd cucumber of Egypt. See CUCUMIS.

CHAT-PARD, in natural hiſtory, a creature of the leopard kind. See CATUS *pardus* and LEOPARD.

The French academicians, who diſſected this creature with great care, found a defect of ſpermatic veſſels, and other parts abſolutely neceſſary to generation, and this not proceeding from caſtration, but from ſome other cauſe.

The ſterility which is ordinary in ſome of thoſe animals which are born of two different ſpecies, muſt have in this ſubject a very particular cauſe.

That which renders mules ſteril, is not the defect of any of the organs neceſſary to generation; in regard that the difference which may be found in the conformation of a mare, and of that of a ſhe-aſs, cannot, as ſome pretend, be a ground of this cauſe of ſterility; the mare, in which ſomething is deficient that is found in the ſhe-aſs, not being however deſtitute of any of the parts abſolutely neceſſary to engender, becauſe it doth engender, and the difference of the organs being not the cauſe of barrenneſs; for as much as the difference of organs which is between the ſpecies of horſes and aſſes, hinders not the breeding of mules, which are the product of both ſpecies. Whence Ariſtotle, following Empedocles, imputes this defect only to the temperament of thoſe animals, whoſe parts have contracted a hardneſs that renders them incapable to contribute to a new mixture. So that if it be true, that moſt of the animals which are produced by the mixture of two kinds, are notwithſtanding furniſhed with the organs of generation; it is probable, that the defect of theſe organs in this *chat-pard* was peculiar and accidental. The mule ſeems to be the only animal which the confuſion of ſpecies has rendered barren; and if ſo, there muſt neceſſarily be ſomething particular in thoſe animals that have engendered it, which is not found in others; and that is, perhaps, as Ariſtotle thinks, the hardneſs of the matrix in mares and aſſes, which, like an earth, is rendered ſteril by dryneſs; whereas that reaſon has no place in leopards, foxes, and the like, which animals are fruitful enough to tranſmit to their poſterity the ſtrong diſpoſitions they have for generation, notwithſtanding the reſiſtance which the mixtures of the ſpecies may bring with it. *Pitfield*'s Hiſt. of Animals.

CHATUS, in middle-age writers, a kind of gold coin. Peireſe ſays, *Nota, qu' audit an* 1465. *les eſpeces de monnoies, qui couroient pour lors, etoient telles; ſçavoir*, Arnulfius, *valants un ducat & demi preice.* 98 *ducats faiſoient* 2081. *Trois* Lions *valoient* 71. *Trois eſcus, un Florin de pape, & un* florin chatti *valoient* 8 ff. 1 s.

CHATUS was alſo called by ſome French writers, *mailles au chat*.

Du Cange makes it a queſtion, whether the *chatus* was the ſame coin as the *chapotenſis*, and ſuppoſes that the latter might be formed from *chati pictavenſes*; in French, *chats de poitou*. See Gloſſ. Lat. in voc.

CHATZINZARII, in church hiſtory, heretics of Armenia, who worſhipped the croſs, *chazus* ſignifying the croſs in the Armenian tongue. *Hofm.* Lex. in voc.

CHAULIODONTA, Χαυλιοδοντα, among antient naturaliſts, is applied to thoſe animals, the teeth of which grow to a great length out of their mouths; as the boar, and the elephant. *Galen* de Uſ. Part. l. 1. c. 2. *Caſt.* Lex. in voc.

CHAUMPERT. See CHAMPART.

CHAUNTER. See CHANTOR, *Cycl.* and *Suppl.*

CHAURUS, or CHORUS, among the Romans, the North-Weſt wind, or that which blew between the wind called *favonius* and the North. *Hofm.* Lex. in voc.

CHAUSSE' *trop-haut*, in the manege: a white-footed horſe is ſaid to be ſuch, when the white marks run too high upon the legs. *Guill.* Gent. Dict. P. 1. in voc.

CHAYQUARONA, in zoology, a name given by the Portugueſe to a fiſh of the turdus kind, caught on the Braſilian ſhores, and more frequently called by authors by its Braſilian name, piraumbu. *Ray*'s Ichthyogr. p. 328. See PIRAUMBU.

CHECKER-*courſe*, in brick-making. See BRICK.

CHEEK (*Cycl.*)—The wounds of the *cheeks*, if ſmall, may be cured by means of the dry ſuture; but if very large, will require the bloody one, to bring their lips together: they are then eaſily healed with vulnerary balſams. But if it happen that one of Steno's ſalivary ducts is wounded in its paſſage acroſs the *cheek* from the parotid gland, the conſtant diſcharge of ſaliva into the wound will prevent the cure, till the duct is perforated in the internal part of the *cheek*, to make a paſſage for the ſaliva into the mouth. This method is propoſed by Cheſelden in his anatomy. *Heiſter*'s Surg. p. 81.

CHEEKS, in ſhip building, are two pieces of timber, fitted on each ſide of the maſt, at the top, ſerving to ſtrengthen the maſts there. The uppermoſt bail or piece of timber in the beak of a ſhip, is called the *cheek*. The knees which faſten the beak-head to the bow of the ſhip, are called *cheeks*; and the ſides of any block, or the ſides of a ſhip's carriage of a gun, are called *cheeks*.

Upper and lower CHEEKS, are thoſe pieces of timber on each ſide of the trail-board. *Guill.* Gent. Dict. P. 3. in voc. See TRAIL-BOARD, *Cycl.*

CHEEKS *of a mortar*, or BRACKETS, in artillery, are made of ſtrong planks of wood, bound with thick plates of iron, and are fixed to the bed by four bolts; they riſe on each ſide of the mortar, and ſerve to keep her at what elevation is given her, by the help of ſtrong bolts of iron which go thro' both *cheeks*, both under and behind the mortar, betwixt which are driven coins of wood; theſe bolts are called the bracket-bolts, and the bolts which are put one in each end of the bed, are the traverſe-bolts, becauſe with hand-ſpikes the mortar is by theſe traverſed to the right or left. *Guill.* Gent. Dict. P. 2. in voc.

CHEESE (*Cycl.*)—The Laplanders make a ſort of *cheeſe* of the milk of their rain deer, which is not only of great ſervice to them as food, but on many other occaſions. It is a very common thing in theſe ſevere climates to have a limb numbed and frozen with the cold; their remedy for this is, the heating an iron red hot, and thruſting it thro' the middle of one of theſe *cheeſes*; they catch what drops out, and with this anoint the limb, which ſoon recovers it. They are ſubject alſo to coughs and diſeaſes of the lungs, and theſe they cure by the ſame ſort of medicine: they boil a large quantity of the *cheeſe* in the freſh deer's milk, and drink the decoction in large draughts, warm, ſeveral times a day. They make a leſs ſtrong decoction of the ſame kind alſo, which they uſe as their common drink for three or four days together at ſeveral times of the year. They do this to prevent the miſchiefs they are liable to from their water, which is otherwiſe their conſtant drink, and is not good; tho' to prevent miſchief from it, they often drink ſuch as has had both fleſh and fiſh boiled in it. Their taſte is not delicate, and their diſeaſes, as well as their remedies, are few. *Scheffer*'s Lapland.

CHEEVANCE. See CHEVISANCE.

CHEGGIO, in botany, a name given to a ſort of lacteſcent plant, common in Cambaya. It is reported by authors, and by the people of the country, that thoſe knobs and beards of this plant which grow facing the north, are a very noble medicine in the cure of apoplexies and other nervous diſorders, but that thoſe knots and beards of the ſame plant which look ſouthward are poiſonous. Redi proved ſome of this famous plant, and gave it ſeveral fair trials, but found the hiſtory of its nature and effects wholly falſe. *Redi* Experienz.

CHEILOCACE, among phyſicians, literally ſignifies the *lip-evil*. It is a ſwelling of the lips, to which the inhabitants of northern countries, eſpecially children, are ſaid to be very ſubject; particularly thoſe in England and Ireland, if we may credit Caſtellus. *Caſtel.* Lex. Med. in voc. who quotes *Arn. Bootii* de affectib. omiſſ. c. 10.

CHEKAO, in natural hiſtory, the name of an earth found in many parts of the Eaſt Indies and ſometimes uſed by the Chineſe in their porcelain manufactures It is a hard and ſtony earth, and the manner of uſing it is this: they firſt calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water, and ſtirring the whole together, they let the coarſer part ſubſide, and pouring off the reſt, yet thick as cream, they leave it to ſettle, and uſe the matter at the bottom, which is found in form of a ſoft paſte, and will retain that humidity a long time. This ſupplies the place of the earth called hoache, in the making that elegant ſort of China ware which is all white, and has flowers which ſeem formed by a mere vapour within its ſurface. The manner of their uſing it is this: they firſt make the veſſel of the common matter of the manufacture; when this is almoſt dry, they paint upon it the flowers, or whatever other figures they pleaſe, with a pencil dipt in this preparation of the *chekao*; when this is thoroughly dry, they cover the whole veſſel with the varniſh, in the common way, and bake it as uſual. The conſequence is, that the whole is white; but the body of the veſſel, the figures, and the varniſh, being three different ſubſtances, each has its own particular white, and the flowers being painted in the fineſt white of all, are diſtinctly ſeen thro' the

the varnish upon the vessel, and seem as if traced by a fine vapour only. The hoache does this as well as the *chekao*, and has beside this the quality of serving for the making the porcelain ware, either alone, or in the place of the kaolin: the *chekao* has not this property, nor any other substance beside this hoache, which appears to be the same with our steatites or soap-rock. Observat sur les Coutumes de l'Asie.

CHELA, χηλη, in medicine, has several significations. It imports a forked probe, mentioned by Hippocrates, lib. ii. *de morbis*, used in extracting a polypus of the nose. But in Rufus Ephesius, cap. 4. χηλαι, *chelæ*, implies the extremeties of the cilia, which touch each other when the eyes are shut. But the most frequent signification of *chelæ* is claws, particularly those of the crab.

Chelæ further signifies fissures in the heels, feet or pudenda. *Cast.* Lex. Med. in voc.

CHELANDIUM, in middle age writers, is used for a kind of vessel or ship [a]. It is also called *chelandrium*, *chelindrus*, *chelindra*, *salandra*, and *salandria*, and by the Byzantine writers, χελανδιον [b]. The salandria is mentioned by Ditmar [c] as a vessel of great length, carrying oars, and 150 seamen. It seems to have resembled an Italian galley [d].— [[a] *Du Cange*, Gloss. Lat. T. 1. p. 959. [b] Ibid. [c] L. 3. p. 33. ap. *Du Cange*, loc. cit. [d] *Du Cange*, Ibid.]

CHELANDURUS, χελανδυρος, in middle age writers, a small kind of *chelandium*. *Du Cange*, Gloss. Lat. T. 1. p. 959. See CHELANDIUM, supra.

CHELAZIUM, a name used by some authors for a moveable tubercle in the eye-lid, commonly called in English a stithe or stye. *Heister*'s surgery, p. 436.

CHELERIA, in botany, a name given by Haller and Linnæus to a genus of plants, the characters of which are these: the perianthium is composed of five equal lanceolated leaves. There are no petals; but there stand within the cup five very small roundish and emarginated nectaria, disposed in a circular order. The stamina are ten subulated filaments, five of which are affixed to the nectaria. The antheræ are simple: the germen of the pistil is of an oval figure; the stiles are three, and stand open: the stigmata are simple. The fruit is an oval capsule, composed of three valves, and divided into three cells. The seeds are numerous, convex on one side, and angular on the other.

The nectaria of this genus shew, that they are of kin to the sedums or houseleeks, but in the fruit it differs altogether from the sedums, and rather approaches to the nature of the lychnis; it would therefore be very improper to confound it with either of those genera. *Linnæi* Gen. Plant. p. 196.

CHELIDON, in ichthyology, the name given by many of the old Greek writers to a kind of flying fish, called by some authors milvus and hirundo, and by some accipiter, or the hawk fish. It is properly a species of trigla, and is distinguished by Artedi by the name of the trigla, with the head a little aculeated, and with a singular fin near the pectoral fins. This method of reducing the fish to their true genera, and distinguishing thereby their proper specific names, is the only method of truly knowing them. The arbitrary names of milvus and hirundo carry so little idea of the peculiar fish with them, that they may be as well applied to one species as another; and accordingly we find two or three different species of the trigla called milvus, &c. by different authors.

CHELIDONIA, among the Romans, a name given to the wind more commonly called *favonius*. *Hofm.* Lex. in voc. See FAVONIUS.

It was only called *chelidonia* for a fortnight in the middle of February, because at that time the swallow makes its first appearance. Id. ibid.

CHELIDONIUM, *celandine*, in botany, the name of a genus of plants, the characters of which are these: the flower consists of four leaves, which are disposed in form of a cross: the pistil arises from the cup of the flower, and finally becomes a unicapsular pod, containing roundish seeds.

The species of *celandine* enumerated by Mr. Tournefort, are these; 1. The common large *celandine*. 2. The oak-leav'd great *celandine*. 3. The oak-leav'd great *celandine*, with variegated leaves. 4. The great *celandine*, with both the leaves and flowers very finely divided. *Tourn.* Inst. p. 231.

Boccone has very strongly recommended this plant as a specific in the cure of consumptions: he proposes the taking it in infusion, or drinking its juice, and says enough in its praise to recommend it at least to a fair trial, which would be easily made in a country where consumptions are so common. *Boccon.* de Plant.

CHELIDONIUS, *(Cycl.)* in botany, a name given by some writers to the *anemone*. Some have pretended, that the anemonies used in garlands and other ornamental things among the antients, were called by that name alone, and that the others were called chelidonii; but this is not warranted by sufficient testimony: on the contrary, it appears that some authors have called all these plants anemonies; others have called them all chelidonii; others, all adonides; and so on. Those used in medicine seem to be no way really different from the others. See the articles ADONIAS, ANEMONE, &c.

This name has, however, led some into the error of supposing the common *chelidonium majus*, or great celandine of the antients, was a species of anemone. Athenæus seems to give into this opinion; but they are of too different a nature for any body who ever saw them both, to suppose them allied to one another. The reason of the name chelidonius being given to the anemone, seems to have been its flowering about the time of the swallows coming from their winter retreats.

CHELIDONIUS, in the history of insects, the name of a fly called the swallow-fly, by reason of its swift flight. It is in most parts of a brown colour, and has black prominent shoulders, a black head, and short black antennæ. The wings are silvery, and edged with black. It often sits a long time together on the leaves of plants; but is very quick-sighted, and when any person comes near it it is gone in a moment, and usually takes such long flights, that it is not easily caught afterwards.

CHELIDONIUS *lapis*. See SWALLOW-*stone*.

CHELINDRA, in middle-age writers, a kind of vessel or ship. *Obligavit se imperator ad centum* chelindras *& quinquaginta galeias ducendas ultra mare. Mat. Paris* An. 1238. ap Du Cange Gloss. Lat. T. 1. p. 959. & *Blount*, Law Dict. See the article CHELANDIUM.

CHELON, in zoology, the name of a fish of the mullet kind, and much resembling the common mullet in its general shape, but its eyes are more prominent, and its head smaller. It has also its side lines, which run from the head to the tail, very evenly ranged, and placed at equal distances, and its lips are remarkably thick and prominent. It is of the size of the common mullet. *Willughby*, Hist. Pisc. p. 276.

CHELONE, in botany, a name by which Linnæus and Dillenius have called a genus of plants, which Gronovius in his Virginia has called anonymos. The characters are these: the perianthium is very short, and remains after the flower is fallen: it is composed of one leaf, divided into five erect and oval segments: the flower is one-leav'd, and is of the labiated kind: the tube is cylindric, and marked with four ridges, and is placed under the cup: the stiles are four in number; they are pointed, crooked, and of the heigth of the stamina: the stigmata are hoary, and are placed longitudinally on the stile. The fruit is composed of a coriaceous crust, made square by four membranes, placed in the manner of wings at its four ridges; this contains one bony nut, which has four cells, and contains as many oblong kernels. *Linnæi* Gen. Plant. p. 249.

CHELYDRUS, in natural history, a species of serpents, the same with the chersydrus. *Hofm.* Lex. in voc. See CHERSYDRUS.

CHELYSMA, in antiquity, a thick piece of wood which the Greeks fixed to the keels of their ships, to save them from being worn or broken. It was also called *cuneus*. *Pitisc.* Lex. Ant. in voc.

CHEMA, χημη, according to Blancard, is the name of a certain measure sometimes mentioned by the Greek physicians, and which he thinks contained two small spoonfuls. But it must be observed, that the Athenians had two *chemas*, the larger of which weighed three drams, and the lesser two; which latter is equivalent to the thirtieth part of the *cotyle* or half pint. It is not improbable, that, by the *chema*, a certain measure is denoted, containing as much as a certain sea-shell, called *chama*, holds. The determined weight of this quantity cannot be accurately ascertained, in consequence of the different specific gravities of different substances: just as, at present, the word *spoonful* is used in a vague and undetermined sense, especially with respect to substances, of which 'tis a matter of indifference whether a little more or a little less be used. *Blanc.* Lex. Med. Renov. in voc.

CHEME, among the Romans, was a liquid measure, containing the fifth part of a *cyathus*. *Pitisc.* Lex. Ant. in voc. See CYATHUS.

CHEMIN *des rondes*, in fortification. See WAY *of the rounds*, *Cycl.*

CHEMISTRY *(Cycl.)*—*Commercial* CHEMISTRY is used to denote the application both of technical and philosophical *chemistry*, to the establishing, supporting, or improving any branch of trade or commerce. *Shaw*'s Lectures, p. 413.

Oeconomical CHEMISTRY, the application of philosophical, technical, or commercial *chemistry*, to the service and accommodation of the affairs of a family. *Shaw*'s Lect. p. 413.

Philosophical CHEMISTRY. Philosophic *chemistry* consists of three parts, viz. invention, rationale, and experiment; whence we may define it to be a particular exercise of the rational and inventive faculties of the mind, leading to experiments, and thence to the discovery of causes, so as to form axioms that shall rationally account for phænomena, and discover rules of practice for producing useful effects. And thus philosophical *chemistry* is not only the key to all the other parts, but it discovers of itself the causes of many natural phænomena, as particularly, earthquakes, volcanoes, vegetation, the growth of minerals, and the like.

This branch of *chemistry* also explains the general forms and qualities of bodies, whereon their properties and effects depend; as volatility and fixedness, fluidity and firmness, colours, tastes, odours, effervescences, fermentation, solution, precipitation, congelation, extraction, and the like.

To this part of *chemistry* it also belongs to bring new inventions to the test, to discover their validity or insufficiency. Thus when any hint is started for a new trade, or method invented

vented for the improvement of an old one, before any attempt is made to apply it in the larger way, it ſhould be experimented in miniature; as the aſſay-maſter tells the owner of an ore whether it will be worth the erecting large works for it, or not. *Shaw*'s Lect. p. 414.

Technical CHEMISTRY. By technical *chemiſtry* is meant the application of philoſophical *chemiſtry* to the immediate ſervice of arts, ſo as by its means to invent, form, aſſiſt, promote, or perfect them in the large way of buſineſs. *Shaw*'s Lectures, p. 413.

Theory of CHEMISTRY. See THEORY.

CHEMOSIS, χημωσις, ſometimes corruptly written χυμωσις, in medicine, a diſeaſe of the eyes, proceeding from an inflammation, when the white of the eye ſwells above the black, and overtops it to ſuch a degree, that there appears a ſort of hiatus or gap between them, whence it takes its name. Galen calls it a red and carnous inflammation of the cornea tunica. Vid. *Gorr.* Def. Med. p. 507. and *Caſt.* Lex. Med. in voc.

Dr. Burghart, in a *chemoſis* where the cornea was already burſt, dilated the opening, and extracted the cryſtalline lens, which had come forward before the iris. The lens was ſo changed and ſuppurated, that it reſembled a piece of white amber: after extracting it, the pain of the eye became milder. Med. Eſſ. Edinb.

CHENCE, in old cuſtoms, ſeems to be much the ſame as amabyr. *Blount.* Law Dict. See AMABYR, *Cycl.*

Fauſſe CHENILLES, *baſtard caterpillars*. See FAUSSE.

CHENISCUS, among the antients, an ornament in the form of little geeſe, uſed on the prows and ſterns of their ſhips. *Hofm.* Lex. in voc.

CHENOCOPRUS, χηνοκοπρος, *gooſe-dung*, in medicine, is accounted very acrimonious and reſolvent, and therefore preſcribed with ſucceſs in the jaundice. The greeniſh dung is eſteemed the beſt. It is gathered in the meadows in ſpring time, and being dried with a moderate heat, and pulveriſed, is given from half a dram to a full dram at a doſe. It is recommended alſo in the ſcurvy, and other diſeaſes. Vid. *James*, Med. Dict. in voc.

CHENOPODIUM, in botany, the name of a genus of plants, the characters of which are theſe: the flower has no petals, but is compoſed only of a multitude of ſtamina ariſing from a many-leav'd cup. The piſtil finally becomes a flat orbiculated ſeed, which is contained in a ſtar-faſhioned capſule, which was the cup.

The ſpecies of *chenopodium* enumerated by Mr. Tournefort, are theſe: 1. The *chenopodium* commonly called *gooſe-foot*. 2. The *gooſe-foot*, with more pointed leaves. 3. The *chenopodium*, with white ſinuated leaves, commonly called wild ſinuated atriplex. 4. The ſtinking *chenopodium*, called the ſtinking orache. 5. The leſſer narrow-leav'd jagged *chenopodium*. 6. The jagged-leav'd *chenopodium*, with purple tops. 7. The jagged *chenopodium*, with great tops. 8. The triangular-leav'd *chenopodium*. 9. The beet-leav'd *chenopodium*. 10. The American *chenopodium*, with ſilvery ſerrated leaves. 11. The blite-leav'd American *chenopodium*. 12. The *chenopodium* called botrys and oak of Jeruſalem, with ſinuated leaves. 13. The Mexican *botrys*. 14. The hairy, flax-leav'd *chenopodium*. 15. The annual procumbent *chenopodium*, with ſhort capillaceous leaves. 16. The tall Spaniſh *chenopodium*, with deltoide leaves. *Tourn.* Inſt. p. 506.

CHENSERS, in our ſtatutes, is uſed for ſuch as paid tribute or *cenſe*, quit-rent or chief-rent. *Blount.* Law Dict. in voc.

CHERAMIS, χηραμις, in antiquity, a medical meaſure. According to Erotian on Hippocrates, it was the hollow of a ſhell fiſh called *myax*, and took that name from χηραμος, which ſignifies a hollow place. It frequently occurs in Hippocrates, and ſeems not much different from the *chema*, which in Galen's exegeſis is expounded by it. Cornavius alſo explains *cheramis* by the meaſure of a *chema*; and Calvus on another paſſage expounds it by a pugil. Vid. Foeſ. p. 678. *Caſt.* Lex. Med. in voc. See CHEMA.

CHEREF, a title aſſumed by the emperors of Morocco. See CALIPHATE.

CHEREM, among the Jews, is uſed to ſignify a ſpecies of annihilation. See ANNIHILATION.

The Hebrew word *cherem* ſignifies properly to deſtroy, exterminate, devote, anathematize. *Calm.* Dict. in voc.

CHEREM is ſometimes likewiſe taken for that which is conſecrated, vowed or offered to the Lord, ſo that it may no longer be employed in common or profane uſes. No devoted thing that a man ſhall devote unto the Lord, of all that he hath, of man and beaſt, and of the field of his poſſeſſion, ſhall be ſold or redeemed; every devoted thing is moſt holy to the Lord: none devoted, which ſhall be devoted of men, ſhall be redeemed, but ſhall ſurely be put to death. There are ſome who aſſert, that the perſons thus devoted were put to death; whereof Jepththa's daughter is a memorable example. Judg. xi. 29, &c. *Calm.* Dict. Bibl. in voc.

CHEREM is alſo uſed for a kind of excommunication in uſe among the Jews. See NIDDUI.

CHERMITES, or CHERNITES, in the natural hiſtory of the antients, a name given by many to a ſpecies of very bright and white marble or alabaſter, which ſeems to have been the ſame with that called afterwards lygdinum marmor. See LYGDINUM.

CHERNIBS, χερνιψ, in antiquity, a veſſel wherein people uſed to waſh their hands before they went to attend religious ſervice. The word is derived from χειρ, the hand, and νιπτω, to waſh.

CHERRY (*Cycl.*)—The ſeveral ſorts of *cherry* trees are propagated by binding or grafting the ſeveral kinds into ſtocks of the black or wild red *cherries*, which are ſtrong ſhooters, and of a longer duration than any of the garden kinds. The ſtones of theſe two kinds are ſown in a bed of light ſandy earth in autumn, and the young ſtocks produced from them are to remain where they riſe till the ſecond autumn after their ſowing, when in October they ſhould be planted out into a rich earth, at three foot diſtance from row to row, and at about ten inches diſtance in the rows. The ſecond year after the planting out, they will be fit to bud, if they are intended for dwarfs, but if they are intended for ſtandards, they will not be tall enough till the fourth year; for they ſhould be budded or grafted near ſix feet from the ground. The grafting is uſually performed in ſummer, and the head of the ſtock is to be cut off in the beginning of the March following, about ſix inches above the bud; and if the bud has ſhot well, and there is any fear of its being diſplaced by winds, it muſt be gently tied up to the part of the ſtock left above it. The autumn afterwards, theſe trees will be fit to remove, and be ſet where they are to remain; or they may be left two years. Many, when they plant theſe trees in their places, lop off a great part of their heads, but this is an injury that often kills them; and when they eſcape, they ſeldom get well over it for four or five years. If the trees are intended for walls, it is adviſable to plant dwarfs between the ſtandards, that theſe may cover the lower part of the wall, while the others ſpread over the upper part; and when the dwarfs riſe to fill the whole walls, the ſtandards ſhould be taken entirely away. When theſe trees are taken up from the nurſery, the dead fibres of the roots muſt be carefully taken off, and the upper part of the ſtock which is above the bud, muſt be cut off cloſe down to the back part of it: the bud muſt be placed directly from the wall. *Cherry* trees thrive beſt on a dry hazley loam, and in a gravelly ſoil are very ſubject to blights, and ſeldom ſtand long good. They ſhould be placed at fourteen feet aſunder, with a ſtandard tree between each two. In pruning theſe trees, their ſhoots ſhould never be ſhortened, for they moſtly produce their fruit from their extreme part. All the foreright ſhoots are to be diſplaced, and the others trained horizontally; and where there is a vacancy in the wall, the branches being ſhortened, will throw up a ſhoot or two to fill it. *Mill.* Gard. Dict. See the article CERASUS.

CHERSA, called alſo *fecula*, in ſome medical writers, ſignifies a root reduced to a farinaceous powder. This way of preparation ſome condemn [a], as exhauſting the virtues of the drug, and rendering it good for nothing; others defend it [b].—[[a] Vid. *Zwoelfer.* Animad. ad Pharm. Aug. *Etmul.* ad Ludovic. Diſſ. Pharm. [b] *Wedel.* Pharm. Acroamatic. l. 2. §. 3. c. 2. p. 317, ſeq. *Caſt.* Lex. in voc.]

CHERSÆA, χερσαια, *earthy*, an epithet of one of the three ſpecies of aſps. It is mentioned by Galen and Ægineta. *Caſt.* Lex. in voc.

CHERSETUM, in old cuſtoms, is uſed for *churcheſſet*. See CHURCH-SCOT, *Cycl.*

CHERSYDRUS, χερσυδρος, an amphibious ſerpent; ſo called, becauſe it lives firſt in watery places, whence it is called *hydrus*; after which it ſhifts its habitation, and lives on dry ground, and thence has its compound appellation *cherſydrus*. Vid. *Aldrov.* l. 1. de Serp. & Drac. c. 17. *Caſt.* Lex. Med. in voc.

CHERT, in natural hiſtory, a name given by ſome of our miners to a peculiar fine kind of ſtone found in ſtrata, but of the hardneſs and ſmoothneſs of flint. It is called alſo in ſome places *whern*, and by ſome authors *nicomia*. See NICOMIA.

Dr. Martyn, when he examined the mines of Derbyſhire, found great quantities of this ſtone, and that in ſome places varying from its common colours and manner of appearance. In ſome places, inſtead of the thin ſtrata which this ſtone uſually forms, he found it in beds of three or four yards thick, and ſometimes much more. Such thick ſtrata of it he alſo found in the peak of Derbyſhire. He obſerved, that they were always found among ſtrata of limeſtone, and that ſometimes the *chert* did not form regular ſtrata, but lay in large looſe nodules. In many places the *chert* was black, and in others of a dark greeniſh colour, much like what painters call ſap green, which is a preparation of the juice of buckthorn berries; the workmen hence call them black *cherts*, and green *cherts*. Phil. Tranſ. N° 407.

CHERUB, or CHERUBIM *(Cycl.)* — The term *cherub* in Hebrew is ſometimes taken for a calf or an ox. Ezekiel ſets down the face of a *cherub*, as ſynonymous to the face of an ox [a]. The word *cherub* in Syriac and Chaldee, ſignifies to till or plough, which is the proper work of oxen. *Cherub* alſo ſignifies ſtrong and powerful. Grotius ſays, that the *cherubims* were figures much like that of a calf. Bochart thinks likewiſe, that the *cherubims* were more like to the figure of an ox than to any thing beſides; and Spencer is of the ſame opinion. Laſtly, St. John [b] in the Revelations calls *cherubims*, beaſts. Joſephus ſays [c], the *cherubims* were extraordinary creatures, and of a figure unknown to mankind. Clemens of Alexandria [d] believes that

that the Egyptians imitated the *cherubims* of the Hebrews in the repreſentation of their ſphinx's and their hieroglyphical animals. All the ſeveral deſcriptions which the ſcripture gives us of *cherubims* differ from one another; but all agree in repreſenting them as a figure compoſed of various creatures, as a man, an ox, an eagle, and a lion. Such were the *cherubims* deſcribed by Ezekiel [e]. Thoſe which Iſaiah ſaw [f], and are called *ſeraphims* by him, had the figure of a man with ſix wings, with two whereof they covered their faces, with two more they covered their feet, and with the two others they flew. Thoſe which Solomon placed in the temple of Jeruſalem [g], are ſuppoſed to have been pretty nearly in the ſame form. Thoſe which St. John deſcribes in the Revelations, were all eyes before and behind, having each ſix wings. The firſt was in the form of a lion, the ſecond of a calf, the third of a man, and the fourth of an eagle. — [[a] Ezek. i. 10. compared with Ezek. x. 14. [b] Rev. iv. 6. 7. [c] Antiq. l. iii. c. 6. p. 83. [d] *Clem. Alexandr.* l. 5. Stromat [e] Ezek. i. 5. ſeq. & x. 20, 21. [f] Cap. vi. ver. 2. [g] 1 Kings vi. 23.]

The figure of the *cherubims* was not always uniform, ſince they are differently deſcribed in the ſhapes of men, eagles, oxen, lions, and in a compoſition of all theſe figures put together. Moſes likewiſe calls theſe ſymbolical or hieroglyphical repreſentations, which were repreſented in embroideries upon the veils of the tabernacle, *cherubims* of coſtly work [a]. Such were the ſymbolical figures which the Egyptians placed at the gates of their temples, and the images of the generality of their gods, which were commonly nothing but ſtatues compoſed of men and animals [b]. — [[a] Exod. xxvi. 1. [b] Vid. *Calmet.* Dict. Bibl.]

Omnigenumque deum monſtra, & latrator Anubis. Virg. Æneid. 8.

CHERUBIM. See CHERUB.

CHERVIL, *chærophyllum*, in botany, the name of a genus of umbelliferous plants, the characters of which are theſe: the flower is of the roſaceous kind, compoſed of ſeveral leaves irregular in ſize, and diſpoſed in a circular form on a cup, which afterwards becomes a fruit compoſed of two ſeeds, reſembling the beak of a bird, not ſtriated, but ſometimes rough, ſometimes ſmooth, and gibboſe on one ſide, and flat on the other.

The ſpecies of *chervil* enumerated by Mr. Tournefort are theſe: 1. The common cultivated *chervil*. 2. The wild perennial, hemlock-leaved *chervil*, called by authors the ſmooth-ſeeded myrrhis. 3. The wild *chervil*, with ſhort hairy ſeeds. 4. The Sicilian *chervil*, with leaves like ſlixweed, and with hairy ſeeds. 5. The wild *chervil*, with ſtalks ſwelling into knots at the joints, called by ſome the rough-ſeeded, knotty-ſtalked myrrhis *Tourn.* Inſt. p. 314.

The common garden *chervil* flowers in May and June. Its leaves and ſeeds are uſed in medicine; the ſeed contains the principal virtue of the plant, and is eſteemed a great medicine in jaundices and dropſies. It is very certain that it is a powerful diuretic, and a promoter of the menſes. It reſolves coagulated blood, and generally diſpoſes the perſon to ſleep. It is uſed alſo externally in fomentation in colicky pains and retention of urine.

The leaves of this plant are what the good women call *ſweet fern*, from which they diſtil a water, and eſteem it a very great remedy for colics.

CHESSE-*trees*, in ſhip-building, are two ſmall pieces of timber with a hole in them, on each ſide of the ſhip, a little before her looſ; their uſe is for the main tack to run thorough, and hale it down to. *Guill.* Gent. Dict. P. 3. in voc.

CHEST-*rope*, in a ſhip, is the ſame with the gueſt or gift-rope, and is added to the boat-rope, when the boat is towed at the ſtern of the ſhip, to keep her from ſhearing, i. e. from ſwinging to and fro.

CHEST-*works*. See CAISSON, *Append.*

CHEVALER, in the manege. A horſe is ſaid to *chevaler*, when in paſſaging upon a walk, or a trot, his far fore-leg croſſes or over-laps the other fore leg every ſecond time or motion. *Guill.* Gent. Dict. P. 1. in voc.

CHEVAN, See CHIUN.

CHEVANTIA, in our old law writers, is uſed for a loan or advance of money upon credit.

CHEVAUX *de friſe*. See CHEVAL *de friſe*, *Cycl.*

CHEVILS, or KEVILS, in ſhip-building. See KEVILS.

CHEVIN, a name uſed in ſome parts of England for the chubb. *Willughby*, Hiſt. Piſc. p. 255. See CAPITO.

CHEVISANCE, in the law of England is ſaid to be an agreement, or compoſition, or bargain between a creditor and debtor; but it ſeems chiefly to denote an indirect gain, in point of uſury, &c. In our ſtatutes it is often mentioned, and moſt commonly uſed for an unlawful bargain or contract. See the ſtatutes againſt uſury. Anno 12° Annæ.

The word is ſaid to be derived from the law French *chevir*, to come to the end, or finiſh any thing, in the ſame ſenſe as the modern French uſe *achever*. Terms de Ley, & *Cowel.* Interpr. in voc.

CHEVRETTE, in artillery, an engine to raiſe guns or mortars into their carriages; it is made of two pieces of wood of about four feet long, ſtanding upright upon a third, which is ſquare; they are about a foot aſunder and parallel, and are pierced with holes exactly oppoſite to one another, having a bolt of iron, which being put through theſe holes, higher or lower at pleaſure, ſerves with a hand-ſpike, which takes its poiſe over this bolt, to raiſe any thing by force. *Guill.* Gent. Dict. P. 2. in voc.

CHEWING *balls*, a ſort of balls contrived for horſes to *chew*, not ſwallow at once; not intended as food, but as incentives to appetite, and on other medicinal occaſions very uſeful to the creature. The receipt now moſt eſteemed for theſe balls is this: take liver of antimony, and of aſſa fœtida, of each one pound; wood of the bay-tree, and juniper wood, of each half a pound; pellitory of Spain, two ounces: let all theſe be powdered together; then add as much fine grape verjuice as is neceſſary to make the whole into a paſte. This is to be formed into balls of about an ounce and half weight, which are to be dried in the ſun. Theſe are the *chewing* balls, and theſe are to be uſed one at a time in the following manner. The ball is to be wrapped up in a linnen rag, and a thread is to be faſtened to this, in ſuch manner that it may be tied to the bit of the bridle, and kept in the mouth: when the bridle is taken off, the horſe will immediately eat, and when one ball is conſumed another is to be tied up, and put in its place till the intent is anſwered.

CHIA *terra*. See TERRA *Chia*.

CHIASMOS, χιασμὸς, in antient Greek medical writers, is the concourſe or meeting of any two things under the form and figure of a croſs, or the letter x *chi*, whence it is named. The adverbs *chiaſti* χιαστὶ, and *chiaſticos*, χιαστικῶς, ſignify the ſame thing: thus the optic nerves are ſaid to meet χιαστικῶς, ſo as to croſs each other. Vid. *Caſtel.* Lex. Medic. in voc.

CHIASTOS, χιαστὸς, the name of a bandage in Oribaſius, ſo called from its reſembling a croſs, or the letter x. *Caſt.* Lex. Med. in voc.

CHIASTOS, in rhetoric, the ſame with what is otherwiſe called diallelos. See DIALLELOS.

CHIAUSI, among the Turks, officers employed in executing the vizirs, baſhaws, and other great men; the orders for doing which the Grand Signior ſends them wrapped up in a black cloth, on the reception of which they immediately perform their office. *Hofm.* Lex. in voc.

CHICK-*weed*. See the article ALSINE.

CHICUATLI, in zoology, the Indian name of a bird deſcribed by Nieremberg, and by him called *noctua canora*. Its beak is long, black, and ſlender; its head is marked with undulated ſtreaks of yellow near the eyes. Its breaſt and belly are of a whitiſh colour, and it has ſome black feathers intermixed with white ones on the throat; its back is variegated with black, yellow, and grey. It is found principally among the mountains. It generally is found running about the ground, and is eaſily bred in cages, and feeds on any thing that is offered it. It is moſt frequent in the hotter climates, and is uſually fat and of good nouriſhment. *Ray's* Ornithol. p. 305.

CHIEPA, in zoology, a name uſed by ſome authors for the fiſh more uſually known by the name of the *alauſa*, and called in Engliſh the ſhad, or the mother of herrings. *Willughby*, Hiſt. Piſc. p. 227. See the articles SHAD and AGONUS.

CHIFFIR, or CHIFIR, according to Libavius [a], in the preparation of the philoſophers ſtone, is called *lapis animalis*, as the mineral is called *chaos minerale*. Johnſon ſays, that the *chifir minerale* is by ſome interpreted gold, but that he rather takes it to be any ſulphur of the metalline kind [b]. — [[a] Synt. Art. Chym. c. 8. [b] *Caſtel.* Lex. Med. in voc.]

CHIFUNG, among the Chineſe, the name of an herb found about Canton, by which the ſailors pretend to know how many ſtorms will happen every year. This they do from the number of knots or joints, for according as theſe are more or leſs in number, ſo will the number of ſtorms be; and from the diſtances of the knots from the root, they determine what months the ſtorms will fall in. *Hofm.* Lex. in voc.

CHILD (*Cycl.*) — *Petrified* CHILD. Bartholine, Paré, Licetus, and many other writers, give an account of a *petrified child*, which has ſeemed wholly incredible to ſome people. The *child* however, which they deſcribe, is ſtill in being, and is kept as a great rarity in the king of Denmark's muſeum at Copenhagen. The woman who went big with this lived at Sens in Champaign in the year 1582; it was cut out of her belly, and was univerſally ſuppoſed to have lain there about twenty years: That it is a real human fœtus, and not artificial, is evident to the eye of any obſerver, and the upper part of it, when examined, is found to be of a ſubſtance reſembling the gypſum or ſtone of which they make the plaiſter of Paris; the lower part is much harder; the thighs and buttocks being perfect ſtone, of a rediſh colour, and as hard as common quarry ſtone; the grain and ſurface of this part appears exactly like that of the calculi, or ſtones taken out of human bladders; and the whole ſubſtance examined ever ſo nearly, and felt ever ſo carefully, appears to be abſolute ſtone. It was carried from Sens to Paris, and there purchaſed by a goldſmith of Venice; and Frederick the Third, king of Denmark, purchaſed it at Venice of this man for a very large ſum, and added it to his collection of rarities. Philoſ. Tranſ. N° 285. p. 1400.

Expoſing of CHILDREN. See the article EXPOSING.

Naming of CHILDREN. See the article NAMING.

Proviſion for ſoldiers CHILDREN. See SOLDIER.

Overlaying of CHILDREN. This is a misfortune which frequently happens; to prevent which the Florentines have contrived an inſtrument called arcuccio. See ARCUCCIO.

CHILD- *blains*. See PERNIONES.

CHILIARTÆ, in church hiſtory, the ſame with millenarii. See MILLENARII, *Cycl.*

CHILIAGON, in geometry, a regular plane figure of 1000 ſides and angles. Though the imagination cannot form a diſtinct idea of ſuch a figure, yet we may have a very clear notion of it in the mind, and can eaſily demonſtrate, that the ſum of all its angles are equal to 1996 right ones; for the internal angles of every plane figure are equal to twice as many right angles as the figure hath ſides, except thoſe four which are about the center of the figure, from whence it may be reſolved into as many triangles as it has ſides. The author of *L' Art. de Penſer*, p. 44, 45. brings this inſtance to ſhew the diſtinction between imagining and conceiving. See NOTION.

CHILTENHAM *water* contains a neutral purgative ſalt, ſomewhat reſembling Glauber's ſal mirabile. It contains no alkaline, nor acid ſalt, no iron, copperas, nor brimſtone. They are thought uſeful in lax conſtitutions, where the humours are alcaleſcent, but hurtful when aceſcent. See Phil. Tranſ. N° 461. Sect. 21. and the remarks.

CHILON, Χειλων, among the Greek phyſiologers, one who has great lips, called by the Latins *labeo*. Thus alſo among the ſpecies of fiſhes under the claſs of *capitones*, ſome are called *chilones*, that is *labeones*. *Caſtel.* Lex. in voc.

CHIMALATH, in botany, a name given by ſome authors to the great *corona ſolis*, or ſun-flower.

CHIMERA (*Cycl.*) is uſed in writers of the middle age for a kind of veſſel or ſhip. It ſeems to have been leſs than the chelandium. *Du Cange*, Gloſſ. Lat.

CHIMPANZEE, in natural hiſtory, the name of an Angolan animal very much approaching to the human figure, but of a fierce diſpoſition, and remarkably miſchievous. In the year 1738, we had one of theſe creatures brought over into England by the captain of a ſhip in the Guinea trade; it was of the female ſex, and was two foot four inches high: it naturally walked erect, and was hairy on ſome part of the body and limbs, and of a ſtrong muſcular make. It would eat very coarſe food, and was very fond of tea, which it drank out of a cup with milk and ſugar, as we do; it ſlept in the manner of the human ſpecies, and in its voice made ſome imitation of the human ſpeech, when people ſpeak very haſtily, but without any articulate ſounds. The males of this ſpecies are very bold, and will fight a man, though they ſee him armed. It is ſaid that they often ſet upon, and raviſh the negro women when they meet them in the woods. The creature we ſaw here was but about twenty months old, and very tame; the parent had it in her arms in the country, and did not part with it till ſhe was killed with a ſpear by one of the moors: ſhe was five feet high. Act. Eruditor. Germ. Ann. 1739.

CHINA *ware*. See PORCELANE, *Cycl* and *Suppl.*

Gilding on CHINA. See GILDING *on China.*

Party CHINA. See PARTY.

CHIN-COUGH (*Cycl.*) — In the *chin-cough* Dr. Huxham uſes the common evacuations, and propoſes to correct the lentor of the blood, and to ſtrengthen the nerves and ſtomach by mercurials, the cortex and proper ſtomachics. Obſ. de Aere & morb. Epid.

Dr. Burton declares againſt bleeding, vomiting, and purging in the *chin-cough*, except in very urgent caſes; the medicine which he ſays, has had great ſucceſs, is a ſcruple of fine powder of cantharides, and as much camphor, mixed with three drams of the extract of jeſuits bark. Of this mixture he gives eight or nine grains to children every third or fourth hour, in a ſpoonfull of ſome ſimple water, or ſome julep, in which a little balſam of capivi had been diſſolved. He ſays this method is not proper in ſuch *chin-coughs* as proceed from thin ſharp rheum, but, he believes, that in the *chin-cough* from a tough viſcid phlegm, it will ſcarce ever fail, at leaſt it has not failed yet. Med. Eſſ. Edinb.

CHINE, in the manege, is uſed for the back-bone, or the ridge of the back of a horſe. The French call it *echine*, and the antient Italian maſters *eſquine*. *Guill.* Gent. Dict P. 1. in voc.

CHIO *pear*, a name given to a ſmall ſpecies of pear called alſo by ſome the baſtard muſk pear, from its reſembling the little muſk pear in its ſweet flavour. Its ſkin is yellow ſtreaked with red, it is of a roundiſh ſhape, and does not hang in cluſters, but ſingly on the tree.

CHIPPING, a phraſe uſed by the potters and China-men to expreſs that common accident both of our own ſtone and earthen ware, and the porcelain of China, the flying off of ſmall pieces, or breaking at the edges. Our earthen wares are particularly ſubject to this, and are always ſpoiled by it before any other flaw appears in them. Our ſtone wares eſcape it better than theſe, but leſs than the porcelain of China, which is leſs ſubject to it than any other manufacture in the world. The method by which the Chineſe defend their ware from this accident, is this: they carefully burn ſome ſmall bambou canes to a ſort of charcoal, which is very light, and very black; this they reduce to a fine powder, and then mix it into a thin paſte, with ſome of the varniſh which they uſe for their ware. they next take the veſſels when dried, and not yet baked, to the wheel, and turning them ſoftly round, they, with a pencil dipt in this paſte, cover the whole circumference with a thin coat of it: after this, the veſſel is again dried, and the border made with this paſte appears of a pale greyiſh colour when it is thoroughly dry. They work on it afterwards in the common way, covering both this edge and the reſt of the veſſel with the common varniſh. When the whole is baked on, the colour given by the aſhes diſappears, and the edges are as white as any other part; only when the baking has not been ſufficient, or the edges have not been covered with the ſecond varniſhing, we ſometimes find a duſky edge, as in ſome of the ordinary thick tea cups.

It may be a great advantage to our Engliſh manufacturers to attempt ſomething of this kind. The willow is known to make a very light and black charcoal; but the elder, tho' a thing ſeldom uſed, greatly exceeds it. The young green ſhoots of this ſhrub, which are almoſt all pith, make the lighteſt and the blackeſt of all charcoal; this eaſily mixes with any liquid, and might be eaſily uſed in the ſame way that the Chineſe uſe the charcoal of the bambou cane, which is a light hollow vegetable, more reſembling the elder ſhoots than any other Engliſh plant. It is no wonder that the fixed ſalt and oil contained in this charcoal ſhould be able to penetrate the yet raw edges of the ware, and to give them in the ſubſequent baking a ſomewhat different degree of vitrification from the other parts of the veſſel, which, tho' if given to the whole, it might take off from the true ſemivitrified ſtate of that ware, yet at the edges is not to be regarded, and only ſerves to defend them from common accidents, and keep them entire.

The Chineſe uſe two cautions in this application; the firſt in the preparation; the ſecond, in the laying it on. They prepare the bambou canes for burning into charcoal, by peeling off the rind. This might eaſily be done with our elder ſhoots, which are ſo ſucculent, that the bark ſtrips off with a touch. The Chineſe ſay, that if this is not done with their bambou, the edges touched with the paſte will burſt in the baking: this does not ſeem indeed very probable; but the charcoal will certainly be lighter made from the peeled ſticks, and this is a known advantage. The other caution is, never to touch the veſſel with hands that have any greaſy or fatty ſubſtance about them; for if this is done, they always find the veſſel crack in that place. Obſ. ſur les Cout. de l'Aſie.

CHIPOTENSIS, the ſame with *chapotenſis*. See CHAPOTENSIS.

CHIPPINGAVEL, or CHEAPINGAVEL, in our old writers, toll paid for buying and ſelling. *Blount.*

CHIRAMAXIUM, in antiquity, a kind of chariot or conveyance, which was drawn by men inſtead of horſes. *Pitiſc.* Lex. Ant. in voc.

The word is derived from χειρ, the hand, and αμαξα, a chariot.

CHIRCHSED. See CHURCH-SCOT, *Cycl.*

CHIRITES, in natural hiſtory, a name given by authors to a ſtone reſembling the human hand. The accounts we have of it ſay, that it is of a white colour, and of the nature of gypſum or plaiſter-ſtone, and that it repreſents the palm of the hand, with the fingers, and their nails on the other ſide. This ſeems to have been a name given to ſome ſingle ſpecimen in a cabinet of ſome collector; for it is certainly no diſtinct ſpecies of foſſil, but a mere luſus naturæ, in the configuration of ſome accidental piece of gypſum. Imagination will do much in aſſiſting reſemblances of this kind; and if one would give way to it, we might name in this manner ſtones of one kind or other from all the parts of the human body. As theſe, however, are not different ſpecies, this way of giving them peculiar names is of great hurt to the ſtudy of foſſils, as it confounds the memory with unneceſſary diſtinctions.

CHIRONIA, in botany, a name by which ſome have called the black bryony. *Ger.* Emac. Ind. 2.

CHIRONIUM, in medicine, is ſometimes uſed to ſignify a great ulcer, and of difficult cure. *Blanc.*

CHIRONOMI, Χειρονομοι, on the Grecian ſtage, were thoſe actors who performed without uſing words, by the motions of the hand. *Hofm.* Lex. in voc. See CHIRONOMIA.

CHIRONOMIA, in antiquity, the art of repreſenting, by the motions of the hand and other geſtures of the body, any paſt tranſaction, whether of true or fabulous hiſtory. This made a part of a liberal education among the antients: it had the approbation of Socrates, and was ranked by Plato among the political virtues. *Pitiſc.* Lex. Ant. in voc.

CHIROTHECA. See GLOVE, *Cycl.* and *Suppl.*

CHISELY *land*, in agriculture, a term appropriated to that ſort of land which breaks, when it is turned up by the plough, into pieces like the chips made by the ſtone-cutter's chizzel in the hewing of ſtones. It is of a middle nature, between the ſandy land that falls off from the plough-ſhare, like bran or ſaw-duſt, and the clayey, that is raiſed in large glebes.

It is of ſeveral colours, grey, brown, reddiſh, and blackiſh, and uſually contains a large quantity of ſand, and no ſmall number of pebbles. *Moreton's* North. p. 39.

CHITSEE, in botany, the name of a Chineſe tree, called alſo *ſetſe*. See SETSE.

CHI-TUA, in the materia medica, a name uſed by ſome authors for a kind of lignum aloes, which is rediſh, and of a very fine ſcent. *Dale*, Pharm. p. 448.

CHIVAGE. See CHEVAGE, *Cycl.*

CHIUDENDO, in the Italian muſic, to end, finiſh, or conclude; as *chiudendo col ritornello, col l' aria*, ſignifies to end with a ritornello, or ſome paſſage which has been before ſung in ſome part of the piece. Vid. *Broſſ.* Dict. Muſ. in voc. See RITORNELLO, *Cycl.*

CHIVEN, in zoology, a name given by many to the muſcicapa, or fly catcher, a ſmall bird little bigger than the wren. *Aldrovand.* de Avib. See MUSCICAPA.

CHIUM *marmor*, in the natural hiſtory of the antients, the name of a black marble, called alſo the lapis obſidianus. It is very hard, and of a fine black, and beſide the many uſes which the antients put it to, is well known among our goldſmiths by the name of the touch-ſtone, moſt of them being furniſhed with nothing better for that purpoſe than a piece of this, though the baſaltes, which might be had plentifully enough, is greatly preferable for thoſe uſes; any black marble, however, that is tolerably hard will do.

This is a very fine and elegantly ſmooth marble, of a compact texture, and fine gloſſy black, but ſhewing no glittering particles, when freſh broken, as moſt others of the black marbles do. It is extremely hard, and cuts very difficultly, but is capable of the higheſt poliſh of any marble. The antients had it from Æthiopia, and the iſland of Chios; we have it from Italy. *Hill*'s Hiſt. of Foſſ. p. 466.

CHIUM *vinum*, Χιον οινον, *Chian* wine, or wine of the growth of the iſland of Chios, now Scio, is commended by Dioſcorides [a], as affording good nouriſhment, fit to drink, leſs diſpoſed to intoxicate, endued with the virtue of reſtraining defluxions, and a proper ingredient in opthalmic medicines. Hence Scribonius Largus [b], directs the dry ingredients in collyria for the eyes, to be made up with *Chian wine*. — [a Lib. 5. c. 10. b *Caſtel.* Lex. in voc.]

CHIUN, or CHEVAN, in Hebrew antiquity. We meet with this word in the prophet Amos, cited in the Acts of the Apoſtles. St. Luke reads the paſſage thus: *Ye took up the tabernacle of Moloch, and the ſtar of your god Remphan, figures which ye made to worſhip them* [a]. The import of the Hebrew is as follows; *Ye have born the tabernacle of your kings, and the pedeſtal* (the Chiun) *of your images, the ſtar of your gods, which ye made to yourſelves*. The Septuagint in all probability read *Rephan* or *Revan*, inſtead of *Chiun* or *Chevan*, and took the pedeſtal for a god. Others are of opinion, that three falſe deities are to be diſtinguiſhed here, Moloch, *Chiun*, and Remphan. Others again affirm, that the three mean only one god, adored under ſo many different names, and that this god was Saturn and his planet. Salmaſius and Kircher aſſert that Kiion is Saturn, and that his ſtar is called Keiran among the Perſians and Arabians, and that Remphan or Rephan ſignified the ſame thing among the Egyptians. They add, that the Septuagint, who made their tranſlation in Egypt, changed the word *Chiun* into that of Remphan, becauſe they had the ſame ſignification. M. Baſnage, in his book intitled *Jewiſh Antiquities* [b], after having diſcourſed a good deal upon *Chion* or Remphan, concludes that Moloch was the ſun, and *Chion*, *Chiun*, or Remphan, the moon [c]. — [a Act. vii. 43. b Tom. 2. p. 576, 581, 610, 614, 617. c *Calmet.* Dict. Bibl.]

CHIUREA, in natural hiſtory, a name given by Cardan, Oviedo, and ſome others to the *opoſſum*. See OPOSSUM.

CHLÆNA, in antiquity, a kind of thick, ſhaggy, upper garment; its uſe was very antient, for we find Homer makes his heroes firſt put off their *chlænæ*, and afterwards their tunics, or coats.

CHLAMYDULA, in antiquity, a ſmall upper garment worn by children. See CHLAMYS, *Cycl.*

CHLIASMA, χλιασμα, in medicine, a warm fomentation of the moiſt kind; as πυρια (pyria) is of the dry kind. *Caſtel.* Lex. in voc.

CHLOEIA, χλοεια, in the Greek antiquity, a feſtival celebrated at Athens, in honour of Ceres, to whom, under the name *Chloe*, χλοη, i. e. graſs, they ſacrificed a ram. *Pott.* l. 2. c. 20. T. 1. p. 438.

CHLOREUS, in zoology, a name by which Turner and ſome others have called the common yellow-hammer, or emberiza lutea. See YELLOW-*hammer*.

CHLOREUS, in zoology, is alſo a name by which ſeveral authors, and particularly many of the earlieſt writers, have called the *galbula*, a very elegant and beautiful bird of the thruſh kind, almoſt all over yellow. *Aldrovand.* de Avib. See GALBULA.

CHLORIS, in ornithology, the name of the bird commonly called in Engliſh the greenfinch, a well-known bird of the ſize of a common ſparrow, and remarkable for its green colour, whence it has its name, and for the largeneſs of its beak, in which it approaches to the coccothrauſtes; it builds in our hedges, and feeds on the ſeeds of vegetables.

CHLORITES, in natural hiſtory, a name given by the antients to a green ſtone ſeeming to have been a jaſper, but ſo pellucid as to approach to the nature of the coarſer emeralds. There has been an idle tradition of its being found in the ſtomach of a water-wagtail, and many imaginary accounts have been given of its virtues. The old writers had a like opinion of the animal origin of the lycodontes, or buſonitæ, which they ſuppoſed were found in the head of an old toad; but we may at preſent be as well aſſured of the *chlorites* being found in the earth as we are of the lycodontes, or buſonitæ, being the foſſile teeth of the wolf fiſh.

CHOANA, χοανη, in antient anatomiſts, a cavity in the brain like a funnel, called alſo πυελος or pelvis. *Caſt.* Lex. in voc.

CHOASPITES, a name given by the antients to a ſpecies of the chryſopraſius, a gem of a mixed colour between yellow and green. It was called *choaſpites* from the name of a river in which it was frequently found.

CHOENICIS, χοινικις, in the antient ſurgery, the trepan, ſo called by Galen and Ægineta, and mentioned by Celſus, where he calls it *modiolus*. Lib. 7. c. 3. *Caſtel.* Lex. in voc.

CHOENIX, χοινιξ, an Attic dry meaſure, containing three *cotylæ*, or one Sextarius and an half, which is two pounds and a quarter [a]. Its mark was a χ with a ι over it [b]. — [a *Caſtel.* Lex. in voc. b *Gorr.* Def. Med. p. 508.]

The *choenix* likewiſe contained the forty eighth part of a medimnus, and was otherwiſe called *hemerotrophis*. *Pitiſc.* Lex. Ant. in voc. See HEMEROTROPHIS.

CHOERINÆ, Χοιρινοι, in antiquity, a kind of ſea-ſhells, with which the antient Greeks uſed to give their ſuffrage, or vote. *Pott.* l. 1. c. 2. T. 1. p. 119.

CHOEROGRYLLUS, the hedge hog. This animal is declared to be unclean by the law of Moſes. The legiſlator ſays, that the hedge hog chews the cud, but as it divides not the hoof it is judged unclean. Levit. xi. 5.

The Hebrew *ſchaphan* is not very well underſtood by us; ſome ſay it is the hare, others the rabbit: but Moſes had before ſpoken of the hare, and the rabbit does not chew the cud. It cannot therefore be either of theſe animals, nor can it be the *chœrogryllus*, or hedge hog, becauſe it does not chew the cud. Bochart believes it to be a kind of large rat common in Arabia, good to eat, and called aliarbucha. Theſe animals chew the cud, dwell in rocks, and go in troops; qualities which the ſcripture aſcribes to the *ſchaphan*. *Calmet.* Dict. Bibl.

CHOES, in antiquity, an Athenian feſtival in honour of Bacchus, celebrated in the month Antheſterion. Vid. *Hofm.* Lex. in voc.

CHOIR (*Cycl.*) — CHOIR *muſic*, *muſica chorale*, muſic ſung in a chorus, as in churches. It is ſometimes uſed for *muſica piena*, *canto fermo*, or what we call *plain chant*, or *ſong*.

CHOIROS, in ichthyology, a name given by Ariſtotle and others of the old Greek writers to the cernua or acerina of the Latins, called by us the ruffe. This fiſh has been called by a great variety of names, but it is properly a ſpecies of pearch, and is diſtinguiſhed from the others of that genus by Artedi under the name of the pearch with only one fin on the back, and with a cavernous head. See PERCA.

CHOLIC. See COLIC.

CHOLOBAPHIS, in natural hiſtory, a name given by ſome of the antient Greeks to a peculiar kind of emerald which was inferior to many others, and was of a colour tending to yellow. Pliny tells us that the worſt emeralds were thoſe which had the colour of gall, or of braſs, as the text is uſually explained; but this is erroneous, for what is uſually printed *æris*, is properly *acris olei*. This is a name given by the Latins to the omphacium of the Greeks, that is the oil of unripe olives; this was of a coarſe greeniſh colour, with a tinge of yellow, and we are told by all the old writers that there were emeralds of this colour, from which thoſe which were more yellow were diſtinguiſhed by the names cholos and *cholobaphis*. Some ſuppoſe that the word *chole* ſhould be ſpelt *chloere*, but this is reducing it to no diſtinctive meaning at all; this word only ſignifying green, and that being the colour of all the emeralds that were of any value among the antients who uſed the word. It is plain that the Romans called all the green cryſtals found in copper mines by the name of emeralds, for they expreſs in their deſcriptions all the defects we find in theſe cryſtals, ſuch as their having hairs, or ſubſtances like hairs within, as alſo ſalts and the like.

CHOLOMA, or CHOLOSIS, in antient medical writers, ſignifies, according to Galen, any diſtortion of a member, or depravation of it with reſpect to motion. It is taken alſo, in a particular ſenſe, for halting or lameneſs of a leg, ariſing from luxation. *Hipp.* 6 Aph. 80. *Caſt.* Lex. in voc.

CHOLOSIS. See CHOLOMA.

CHOMER. See CORUS.

CHONDRILLA, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the ſemifloſcular kind, being compoſed of a number of ſemifloſcules, each ſtanding on an embryo ſeed, and all contained in a cup of a cylindric form, and ſeeming tubular: the embryos finally ripen into ſeeds, winged with down.

The ſpecies of *chondrilla* enumerated by Mr. Tournefort, are theſe: 1. The viſcous, field, ruſhy-ſtalk'd *chondrilla*. 2. The annual hawkweed-leav'd *chondrilla*. 3. The ſonchus-leav'd *chondrilla*, with pale yellow flowers. 4. The great ſonchus-leav'd *chondrilla*, with purple flowers. 5. The leſſer ſonchus-leav'd *chondrilla*, with purple flowers. *Tourn.* Inſt p. 475.

CHONDROPTERYGII, in natural hiſtory, a name given by Artedi and Linnæus to one of the great claſſes or families of the fiſhes; the characters of which are, that the rays of the fins are not bony, but cartilaginous. *Artedi* Gen. Piſc. *Linnæi* Syſt. Nat p. 51.

The bones of the body of theſe fiſhes are alſo cartilaginous, and the mouth in moſt of the ſpecies is placed in the lower part of the body.

The word is derived from the Greek χόνδρος, a cartilage, and πλευγιον, a wing or fin. Of this order are the ſcate, ſturgeon, lamprey, &c.

CHONDROS, χόνδρος, in antient medical writers, the ſame as alica. Vid. *Gorr.* Def. Med. See ALICA.

It ſignifies alſo ſome grumous concretion, as of maſtich, or frankincenſe. *Caſt.* Lex. in voc.

It is, beſides, the Greek word for a cartilage. *Gorr.* ubi ſupra.

CHONDROSYNDESMUS, in antient medical writers, ſignifies a cartilaginous ligament. *Galen.* de Temper. l. 1. c. 9. *Caſt.* Lex in voc.

The word is Greek, χονδροσυνδεσμος, derived from χονδρος, a cartilage, and συνδεσμο, a ligament.

CHOPIN, a liquid meaſure uſed in Scotland, being the half of their pint. Treat. Pract. Geom. p. 113.

CHORAGIUM, in antiquity, was uſed to denote the funeral of a young unmarried woman. Some think it ſhould be writ *coragium*, from κορα, puella, and αγω, duco. But Pitiſcus chooſes rather to derive it from *chorus*; becauſe a chorus or company of virgins always attended ſuch funerals. *Pitiſc.* Lex. Ant. in voc.

CHORAGIUM ſignified alſo the tiring or dreſſing room belonging to the ſtage; and ſometimes was taken for the dreſs itſelf.

CHORAGUS, in antiquity, he who had the ſuperintendence of the chorus, whoſe buſineſs it was to take care they obſerved the rules of the muſic, and performed their parts with decorum. *Pitiſc.* Lex. Ant. in voc.

CHORAGI were likewiſe certain Athenian citizens choſen annually, who were obliged to be at the expence of players, ſingers, dancers and muſicians, as often as there was occaſion, at the celebration of their public feſtivals. *Pott.* Archæol. Græc. l. 1. c. 15. T. 1. p. 86.

CHORAIC *muſic*, *muſica choraica*, a ſort of muſic, proper for dancing, by the variety of its different motions.

CHORAL, *choralis*, ſignifies any perſon that, by virtue of any of the orders of the clergy, was in antient times admitted to ſit and ſerve God in the choir. *Blount* & *Cowel.*

Dugdale, in his hiſtory of St. Paul's church, ſays, that there were with the chorus formerly ſix vicars *choral* belonging to that church. *Blount.*

CHORD (*Cycl.*)—To find the number of vibrations made by a muſical *chord* or ſtring, in a given time, its weight, length, and tenſion being given. Let N repreſent the weight of the *chord*; L its length; P the tenſion, or weight equivalent to it, by which the *chord* is extended; and D the length of a given pendulum; *p* the circumference of a circle, the diameter of which is 1: then will the number of vibrations made by the given *chord*, while the pendulum vibrates once, be expreſſed by $p\sqrt{\frac{DP}{LN}}$ [a]. If we take L for the number of inches and decimals contained in the length of the *chord*, and the proportion of the tenſion to the weight of the *chord*, as n to 1, then will the number of vibrations of the *chord* in one ſecond be $\frac{355}{113}\sqrt{\frac{39.2\,n}{L}}$. Where $\frac{355}{113}$ denotes the proportion of the circumference to the diameter of the circle; and 39. 2 the length of a pendulum vibrating ſeconds, in inches and decimals of an inch, Engliſh meaſure. This laſt expreſſion coincides with Mr. Euler's rule [b], only we here expreſs in Engliſh what he gives in Rhinland meaſure. To illuſtrate this rule by an example; ſuppoſe the length of the *chord* to be 18. 7 inches, its weight 6 ½ grains, and the tenſion or weight extending this *chord* to be 8 lb troy, or 46080 grains. Then $a = 18.7$, & $n = \frac{46080}{6.2} = 7432$. The number of vibrations therefore by the rule will be $\frac{355}{113}\sqrt{\frac{39.2\times 7432}{18.7}} = 392$.—[a *Taylor* Method. Increm. Prop. 23. b Tentam. Nov. Theor. Muſ. p. 6, 7. See alſo *Mac Laurin*'s Fluxions, Sect. 929.]

By logarithms the rule may be thus expreſſed, $\frac{L+W}{2} + C = V$.

Where L is the logarithm of the ratio of a pendulum, vibrating ſeconds, to the length of the given ſtring; W the logarithm of the ratio of the tenſion to the weight of the ſtring; C the logarithm of the ratio of the circumference of a circle to its diameter, or 0.4971500; and laſtly, V = logarithm of the required number of vibrations in one ſecond. In every *chord*, the number of vibrations in a given time will be as $\sqrt{\frac{n}{a}}$, that is, as the ſquare root of the extending weight divided by the weight of the *chord*, and its length. If therefore *chords* be of the ſame length, their vibrations in a given time will be as the ſquare roots of the extending weights, divided by the weights of the *chords*. If *chords* be equal in length and weight, their vibrations will be as the ſquare roots of their extending weights or tenſions; and if the tenſions be equal, and the *chords* differ only in length, their vibrations will be as the ſquare roots of their lengths, multiplied by their weight: that is reciprocally as the lengths of the *chords*, becauſe the weights of the *chords* will in this caſe be proportional to their lengths. *Euler*, ibid. p. 7.

Mr. Euler informs us [a], that he found the *chord*, making 392 vibrations in a ſecond, to be at uniſon with the key called *a* in inſtruments, that is an octave and ſixth major above the loweſt C in our harpſichords or vio oncellos. Conſequently the note C, being to *a* as 3 to 10, will make 118 vibrations in one ſecond. And the higheſt C, or c''', as Mr. Euler ca ls it, being four octaves above the loweſt c. will vibrate 1888 times in one ſecond of time. Mr. Euler ſuppoſes the limits of the human ear to be, with reſpect to gravity, two octaves lower than C; and with reſpect to acuteneſs, two octaves higher than c''' [b].—[a *Euler*, ibid. p. 7. b Ibid p 8. §. 13.]

CHORD is ſometimes alſo uſed for accord. Thus we ſay the common *chords* to ſuch a baſs note, meaning its third, fifth and octave.

Line of CHORDS. A *line of chords* is thus made; let the quadrant of a circle be divided into 90 degrees, then to its ſubtenſe, or to the *chord* of 90 degrees, transfer the *chord* of every arch of the quadrant; and theſe *chords*, ſet off on the *chord* of 90°, and marked reſpectively with the number of degrees in the correſponding arch, do conſtitute what is called the *line of chords*. Treat. Pract. Geom.

CHORDA *membranæ tympani*. See CHORD, *Cycl.*

CHOREA *ſancti viti*. See VITI *chorea*.

CHORIZANTES, the name of a ſect in Germany, an. 1374, ſaid to be demoniacs that aſſembled in ſtreets and churches. *Du Cange*, Gloſſ. Lat. in voc.

We may ſuppoſe that their enemies called them demoniacs, on account of ſome heterodoxy. Du Cange does not mention any of their tenets.

CHOROIDES (*Cycl.*)—Some creatures, ſuch as the porcupine and ſea calf, have the optic nerves inſerted into the axis of their eyes. This fact, according to Dr. Porterfield, overturns Mariotte's hypotheſis of the *choroid*'s being the principal and immediate organ of ſight. Vid. Med. Eſſ. Edinb. vol. 3. art. 12.

Mr. Le Cat ſtrenuouſly defends Mariotte's opinion, that the *choroid* coat, and not the retina, is the immediate organ of viſion. The retina, according to him, is to the *choroid* what the epidermis is to the ſkin. Med. Eſſ. Edinb. Abr. vol. 2. p. 482.

CHORO *ſpezzato*, in the Italian muſic, is often met with inſtead of *tutti* or *da capella*, which mean the grand chorus. *A doi*, *a tre*, *a quatro chori*, is for two, three, or four choruſſes. When after the name of a part we find *primo*, 1° *choro*, we muſt underſtand that it is to be played in the firſt chorus; if 2°, II^do, or *ſecondo choro*, the part muſt be ſung or played in the ſecond chorus. And conſequently it ſhews, that the compoſition is for eight voices or different parts. Vid. *Broſſ.* Dict. Muſ. in voc.

CHOUAN, in the materia medica, the name of a ſmall ſeed, called by ſome alſo carmine ſeed. It is a very light and chaffy ſeed, in a great meaſure reſembling worm ſeed, of an acid taſte, and a yellowiſh green colour, but is larger than worm-ſeed. It is brought into Europe from Turkey, and many parts of the Eaſt, and the choice ſhould be made of ſuch as is largeſt, cleaneſt, of the greeneſt colour, and leaſt full of ſpecks or holes. It is not uſed in medicine, but is of ſome value among the people who make carmine for the painters. It is called ſantonium viride, or the green worm ſeed, in our catalogues of the materia medica, but is unknown in the ſhops. *Lemery*'s Dict. of drugs.

CHOUS, in the Eaſtern military orders, the title of the meſſengers of the divan of janiſaries. There are ſeveral degrees of honour in this poſt. When a perſon is firſt advanced to it, he is called a *cuchuk*, or little *chous*; after this he is advanced to be the *alloy chous*, that is, the meſſenger of the ceremonies; and from this, having paſſed thro' the office of *petelma*, or procurator of the effects of the body, he is advanced to be the *bas chous*. *Pocock*'s Egypt, p. 168.

CHOUX, in natural hiſtory, a name given by the French to a ſpecies of ſhell fiſh of the cordiform or bucardium kind. The French are very fond of a ſort of cabbage which they call *chouxe decoupé*, cut and curled cabbage, and this ſhell which is full of tranſverſe laminæ which riſe above the ſurface, and are of an undulated form, very much reſembles the leaves of that cabbage; it is truncated at the end, and is covered with longitudinal ribs, which are eight or nine in number, and being hollowed, not ſolid, repreſent ſo many tubes; theſe hollows, however, do not penetrate into the ſhell, whoſe cavity is uniform, theſe hollows only reaching to the thin cover of the whole fiſh. Pliny mentions this peculiar ſpecies of ſhell, and other naturaliſts have not omitted the hiſtory of it. Fabius Columna has elegantly deſcribed it, and Liſter has given a figure of it twice over, in two different parts of his book. There is another ſpecies leſs elegant, and wanting the hollowed ribs. *F. Columna*, de Purpura, c. 17. p. 36. *Charl.* Exercit. p. 64. See CORDIFORMIS.

CHRABRATE, in natural hiſtory, a name given by the writers of the middle ages to a pellucid ſtone, ſaid to have great virtues againſt diſorders of the liver, and ſpleen, and many other imaginary qualities. It appears by their deſcriptions to have been no other than the common pebble chryſtal.

CHREMPS, in ichthyology, a name given by the eldeſt Greek writers to the fiſh ſince called chromis. It is a ſpecies of the ſpari, and is diſtinguiſhed by Artedi by the name of the ſparus with the ſecond ray of the belly fins very long.

CHRIST-

CHRIST-*thorn*, in botany. See PALIURUS.

CHRISTOGENON, Χριστογενὼν, in the Greek church, a faſt of forty days, immediately preceding Chriſt's nativity. *Hofm.* Lex. in voc.

CHRISTOMACHI, Χριστομαχοι, in church hiſtory, a deſignation given to all ſorts of heretics who deny the divinity of our ſaviour, or hold heterodox opinions concerning his incarnation. *Hofm.* Lex. in voc.

The word comes from the Greek Χριστὸς, *Chriſt*, and μαχομαι, *I fight*, or *oppoſe*.

CHRISTOPHORIANA, the herb *chriſtopher*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, or compoſed of ſeveral petals arranged in a circular form; the piſtil ariſes from the center of the flower, and finally becomes a ſoft fruit or berry, uſually of an oval figure, and containing ſeeds often adhering to one another in a double order.

The ſpecies of *chriſtophoriana* enumerated by Mr. Tournefort are theſe: 1. The common branched *chriſtophoriana*, with racemoſe fruit. 2. The American racemoſe *chriſtophoriana*, with white berries. 3. The racemoſe American *chriſtophoriana*, with red berries. 4. The racemoſe American *chriſtophoriana*, with red berries ſtanding on long foot-ſtalks. *Tourn.* Inſt. p. 299.

CHRISTOPHORUS *piſcis*, a name by which ſome have called the faber, or as we call it, the doree, or jaune doree, the gilded fiſh.

It has obtained its name of *Chriſtopher* fiſh from an old traditional ſtory, that when St. Chriſtopher walked through the ſea with our Saviour, he ſeized on one of the fiſh of this ſpecies, which ever ſince has been commemorated in the whole ſpecies by the marks of his thumb and finger on the two ſides. *Ray*'s Ichthyogr. p. 294. See the article FABER.

CHROÆ, χροαι, in the muſic of the antients. See COLOURS, GENUS, and SPECIES.

CHROMA, (*Cycl.*) in the botanical writings of the antients, a word uſed to expreſs a famous root brought from Syria into Greece, and uſed by the women of that country to paint their cheeks red. It was alſo called *rhizium* and *fucus*, and by the Latins *radicula*. Pliny calls it *lanaria radix*, but very improperly, for that name confounds it with the ſtruthion of the Greeks, which was a very different plant. The Greeks themſelves ſeem to have known nothing of the plant whoſe root this *rhizium* or *chroma* was, and have left us no deſcriptions of it; but it ſeems, by their account of the root itſelf to have been the common anchuſa or alkanet, which grows in great plenty in Syria, and has its colour very high and elegant, and is fit for all the purpoſes to which the Greeks employed it, in painting the fleſh, &c.

CHROMA, in the Italian muſic. The Italians take this term from the Greeks, but uſe it to ſignify a note or character of time, by us called a quaver, and when the word ſemi is added thereto, it means our ſemiquaver. Eight of the former are contained in a bar, and ſixteen of the latter in common time. *Broſſ.* Dict. Muſ. in voc.

CHROMA is alſo a graceful way of ſinging, or playing, with quavers and trilloes. Vid. *Broſſ.* Dict. Muſ. in voc.

CHROMA alſo ſometimes ſignifies the ſame as the chromatic dieſis or ſemitone minor. Vid. Miſcel. *Berol.* T. 1. p. 279, 280. See DIESIS.

CHROMA is alſo uſed to ſignify the genus chromaticum. In this ſenſe we find it uſed by Ariſtoxenus [a], and in Ptolemy's harmonics [b]. — [[a] p. 44. Edit. Meibom. [b] Vid. *Wallis* Append. ad Ptolem. Harm. p. 166.]

CHROMATIC (*Cycl.*) — The moderns have been much perplexed to underſtand the different ſpecies of *chromatic* muſic in uſe among the antient Greeks. Moſt of our muſicians have no other notion of the *chromatic*, than of a melody proceeding by ſemitones major, and minor. This is what Broſſard ſays of it [a]. But this is not ſufficient to convey a true notion of the *chromatic*. It is but in one ſpecies of the *chromatic* that we proceed by a ſemitone major and minor; in one of the other two ſpecies, no ſemitone major occurs, and in the other no ſemitone minor; and this laſt ſpecies is uſed among the moderns; ſo that it is not univerſally true that our *chromatic* muſic proceeds by ſemitones major and minor. Dr. Pepuſch has given us a clearer light in this affair; his doctrine is as follows:

The antients diſtinguiſhed three ſorts of *chromatic*, which were denoted by the names, *molle*, *ſeſquialterum*, and *toniæum*.

The *chromaticum molle* was a diviſion of the diateſſaron, or fourth, into three intervals, which were two ſubſequent ſemitones minor, and the interval, which is the complement of theſe two to the fourth; and this interval will be found equal to a third minor added to an enharmonic dieſis. This ſpecies is not to be met with among the moderns [b].

The *chromaticum ſeſquialterum*, or *hemiolium* [c], was a diviſion of the fourth into a ſemitone major, a ſemitone minor, and a third minor. This is mentioned by Ptolemy as the *chromatic* of Didymus. It occurs in modern compoſitions [d].

The *chromaticum toniæum*, or *tonicum* [e], was a diviſion of the fourth into a ſemitone major ſucceeded by another ſemitone major, and the complement of theſe two to the fourth, which is the interval, commonly called a ſuperfluous tone [f]. This often occurs in modern muſic. — [[a] Dict. de Muſique, p. 19. [b] Phil. Tranſ. N° 481. p. 272. [c] *Wallis*, Append. Ptolem. Harm. p. 164. [d] Phil. Tranſ. ib. [e] *Wallis*, ibid. [f] Phil. Tranſ ibid.]

CHROMATIC is alſo applied by ſome to the ſcience of colours. *Caſtel.* Math. univer p. 76, 77.

Chroma originally ſignifies colour, but has been applied by muſicians to ſounds.

CHROMIS, in zoology, the name of a little fiſh caught frequently in the Mediterranean. It ſeldom exceeds three inches in length, and is moderately thick; it is of a duſky brown colour, but is variegated by a number of longitudinal lines of a paler and brighter colour. Its ſcales are large; its head ſmall; and its noſe ſhort; its mouth is ſmall, and its teeth very minute; it has only one back fin, which is very long, and has its anterior ray, or nerves, prickly, the hinder ones ſoft and flexile. The tail is forked; the fin behind the anus is ſupported by twelve rays, the two foremoſt of which only are rigid and prickly; the firſt but ſmall and ſhort, the ſecond very long and ſharp. Its ſide lines are dotted, and do not, as in other fiſhes, run from the gills to the tail, but terminate a little beyond the back fin. *Aldrovand.* de Piſc. l. 2. c. 14. p. 167. *Geſner*, de Piſc. p. 264.

Artedi, who has very accurately examined this fiſh, does not allow it a diſtinct generical name, but makes it only a ſpecies of his genus of the ſpari, calling it the ſparus with the ſecond ray of each belly fin carried to a great length.

CHROMIS is alſo the name by which Bellonius, and ſome others, have called a large fiſh caught in the Mediterranean, more uſually known by the name of umbra, and brought to market in Italy while young and ſmall. *Geſner.* de Piſc. p. 1230. See UMBRA.

CHRONOSCOPE is ſometimes uſed for a pendulum to meaſure time. See PENDULUM, *Cycl.*

CHRYSAETOS, the *golden eagle*, a large and beautiful bird of prey. Its weight is uſually twelve pounds; his general colour a cheſnut brown, with a number of white ſpots, there are but few of them on the back, but a large number on the belly; his feet are feathered to the toes, and yellow. He is extremely bold and fierce, and will ſeize upon almoſt any thing for prey; his voice is clear and ſhrill, and often he makes a moaning noiſe.

That ſpecies of eagle which we call ſimply the eagle, without any addition, is of this kind, and is properly characterized by the name of *chryſaetos cauda annulo albo cincta*; a tranſverſe white line on its tail being its moſt obvious diſtinction. *Willughby*'s Ornithol. p. 28.

CHRYSALIS *of the ſilk-worm*. See FEVE.

CHRYSANTHEMUM, *corn marygold*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the radiated kind; the diſk is made up of floſcules, and the outer border of ſemifloſcules; theſe all ſtand upon the embryo ſeeds, and are contained in a ſquammoſe, ſemi-orbicular cup; the embryos finally ripen into ſeeds, which are uſually of an angular or ſtriated appearance, and ſometimes very ſlender and ſharp-pointed.

The ſpecies of *chryſanthemum* enumerated by Mr. Tournefort are theſe: 1. The *chryſanthemum* with leaves like feverfew. 2. The great *chryſanthemum*, with deeply-divided leaves, and large flowers, called the Cretic *corn marygold*. 3. The Cretic *chryſanthemum*, with the petals of the outer circle fiſtulous. 4. The double-flowered Cretic *corn marygold*. 5. The *chryſanthemum*, with flowers partly yellow and partly white. 6. The *chryſanthemum* with double flowers, partly yellow and partly white. 7. The great *corn marygold*, with large ſulphur-coloured flowers. 8. The *corn marygold*, with finely divided leaves, and red joints to the ſtalk. 9. The great *corn marygold*, with leaves divided into numerous ſmall ſegments. 10. The *corn marygold*, with blueiſh, green, leſs-divided leaves. 11. The common *corn marygold*, with ſulphur-coloured flowers. 12. The broad leaved *corn marygold*. 13. The little *chryſanthemum*, called by ſome the little, broad-leaved, yellow daiſy. 14. The Portugal *chryſanthemum*, with maudelin leaves. 15. The Portugal *chryſanthemum*, with narrow, ſerrated leaves. 16. The dwarf ranunculus-leaved American *corn marygold*. *Tourn.* Inſt. p. 491.

CHRYSANTHERINUS *lapis*, in natural hiſtory, a name given by old writers to a ſtone famous for its imaginary virtues of preventing children from ſickneſſes during the time of dentition, by being worn round the neck by way of necklace; we have no farther account given us of it by authors, than that it was a very brittle ſtone, and not eaſily worked into form.

CHRYSITES, a name given by the antients to yellow litharge, ſuch as we call litharge of gold. We diſtinguiſh this only in regard to the colour, and ſo did the antient Greeks; but Aviſenna and the reſt of the Arabians have uſed this word only for the name of ſuch litharge as was made from gold, of whatever colour that happened to be; the reſt they called all by the name of argyrites, as themſelves tell us, whether it was made of ſilver, copper, or even of the marcaſite melted, and refined by lead. See KLIMIA.

CHRYSOBALANUS, in botany, the name of a genus of plants called by Plumier *icaco*, the characters of which are theſe: the perianthium conſiſts of one leaf, and is plane and permanent, and divided into five ſegments. The flower conſiſts of five

plane,

plane, oval, and expanded petals: the ſtamina are a number of erect, hairy filaments, placed in a circular direction; the antheræ are ſmall; the germen of the piſtil is of an oval figure, and the fruit is a large oval berry, having only one cell, in which is lodged a rugoſe and friable nut of an oval figure marked with five lines running its whole length. *Linnæi* Gener. Plant. p 237. *Plumier*, Gen. 5.

CHRYSOCERAUNUS *palvis*, is ſometimes uſed for *aurum fulminans*. See AURUM *fulminans*, *Cycl.*

CHRYSOCERI, χρυσοκεροι, in antiquity, a deſignation given to oxen deſigned for ſacrifices. They were ſo called from their horns being gilded.

CHRYSOCOLLA, (*Cycl.*) in the materia medica of the antients, the name of a fine green arenaceous powder, properly one of the ſaburræ, and found at this day in many parts of the world.

It is of a very elegant colour, ferments violently with aqua fortis, and is wholly diſſolved by it, and tinges it with a blueiſh green; and being calcined it loſes all its green colour.

It is now found on the ſhores of the Red Sea, on thoſe of ſome parts of America, and in Ruſſia; and that found at this time has all the properties of that mentioned by the antients. It ſerves to the ſoldering of gold and other metals, and given internally is a violent and dangerous emetic. *Hill*'s Hiſt. of Foſſ. p. 580.

CHRYSOCOLLA was alſo the name given by the antient Arabians to the gum ammoniacum of the Greeks. The plain interpretation of the word *chryſocolla* is gold glue, and in this ſenſe it was uſed for the ſubſtance employed in the ſoldering gold together; but here it is only uſed to expreſs a golden colour, which had the property of adhering like glue to the paper it was laid upon. Aviſenna tells us, that this gum was uſed to ſtain books and papers, and that the colour it gave was a gold yellow, which nothing would take off. This could not be the ſame with our ammoniacum. Pliny tells us of the two kinds of ammoniacum uſed by the antient Greeks, the one of which was brittle and pure, and the other tough and foul; it is poſſible that the latter of theſe, which is the kind called phyrama, may be the ſame with the ammoniacum now uſed, but the other kind called thrauma, or thrauſton, which was of a rediſh brown, and very brittle, could not be ſo. Neophytus endeavours to reconcile both deſcriptions to our gum ammoniacum in its different ſtates; but while he does this, he forgets that the characters of the thrauſtum are ſo different, that the thing cannot be the ſame with ours, even if both the kinds mentioned by the Greeks were the ſame, which does not appear at all probable.

CHRYSOCOME, in botany, a name by which ſome authors call the ſtæchas citrina, or goldylocks. *Parkinſon*, Herb. p. 79.

CHRYSOGONON, or CHRYSOGONUM, in botany, a name by which ſome authors have expreſſed the moth mullein, or blattaria. *Ger.* Emac. Ind. 2. See BLATTARIA.

CHRYSOGONUM, in the materia medica, is alſo the name of a Syrian plant, called the red turnep, the leontopetalon coſta ſimplici of Tournefort. *Park.* Theatr. p. 683. See LEONTOPETALON.

CHRYSOLACHANON, in botany, a name by which Pliny, and ſome other authors have expreſſed the white garden beet. *Ger.* Emac. Ind. 2.

CHRYSOLITE, (*Cycl.*) the name given by the moderns to a gem which was called the topaz by the antients. All the modern jewellers, and thoſe of ſeveral ages before them, have agreed in calling this gem the *chryſolite*; and the true *chryſolite* of the antients, which had its name from its fine gold yellow colour, they now univerſally call the topaz.

The *chryſolite* of our times, the topaz of the antients, is even in its moſt pure and perfect ſtate, a gem of but ſmall beauty, and of no great value. It is found of various ſizes, and ſome of the coarſer pieces of it are vaſtly larger than any of the other gems are ever found to be; its moſt frequent ſize, however, when perfect, is about the bigneſs of a nutmeg. It is found of very various figures, but never columnar, or in the form of cryſtal; it is in ſome places found ſmall, and in roundiſh, or irregular, pebble-like maſſes, and in others generally oblong and flatted, and is always of a rude ſurface, and leſs bright than any other of the native gems. Its colour is a dead green, with a faint admixture of a pale yellow; it has theſe different tinges in the ſeveral ſpecimens in different degrees of mixture, but its moſt uſual colour is that of an unripe olive, with ſomewhat of a braſſy colour mixt with it, and ſometimes is a pale and duſky green obſcured by a mixture of brown, and with a ſlight caſt of the ſame braſſy yellow. It is much ſofter than any of the pellucid gems; its fineſt pieces do not excel cryſtal in hardneſs, and its coarſer are greatly ſofter; it takes a good poliſh, however, and in ſome of its finer ſpecimens makes a tolerable figure, though greatly inferior to the other gems. *Hill*'s Hiſt. of Foſſ. p 598. Our jewellers take very little notice of it, and inſtead of having two or three names for it, as they have for moſt other of the gems, they call it very often a praſius, and the leſs accurate among them often call the chryſopraſius a *chryſolite*.

The *chryſolite* is found in New Spain, and in ſeveral parts of Europe, as Sileſia, Bohemia, &c. The American, however, are greatly ſuperior to the European, but are uſually ſmall; the Bohemian are large, but very few of them are of a good colour, or free from flaws.

CHRYSOPAGION, in natural hiſtory, a name by which ſome of the middle ages have called the gem deſcribed by Pliny, under the name of the chryſolampis. All that Pliny tells us of this gem is, that it was very bright, and was of a pale yellow colour by daylight, but of a flame colour in the night; but this has been improved by thoſe who have copied it, into a ſtory of ſhining in the dark, and loſing its luſtre by day-light. Many ſtones of the coloured kind have a different appearance by day-light, and when viewed with a candle; and all that Pliny ſeems to have meant by this paſſage, is, that the ſtone was plainly of a yellow colour by day-light, but had ſomething of rediſh mixed with it, when viewed by candle light; it was probably either of the topaz, or of the hyacinth kind. Salmaſius is of opinion that it was only a foul kind of the chryſopraſius, of which Pliny ſays, that ſome of them were full of ſpecks, and of a variable colour.

CHRYSOPETRON, in natural hiſtory, a name given by Pliny and others, to the yellower kind of the antient topaz, that is, our chryſolite. The old authors have diſtinguiſhed two kinds of this gem, according as the green or yellow colour predominated in the mixture: when the yellow bore the ſway, they called it *chryſopetron*, the golden ſtone; when the green was moſt predominant, they called it praſiodes. Some, inſtead of the word *chryſopetron*, have it *chryſopteron*, and ſome only *chryſoteron*, which, leaving out the word ſtone or gem, ſignifies only more yellow, or gold-coloured. Orpheus, or the author of the hiſtory of gems, under his name, calls the green topazes hyaloides, or glaſſy; many have ſuppoſed the word hyaloides to ſignify only tranſparent as glaſs; but this, and many other paſſages of the antients prove, that it was alſo uſed for glaſs-coloured, that is green.

CHRYSOPHRYS, in ichthyology, a name given by the antient Greek and Latin authors to a fiſh called at this time the aurata; it is a ſpecies of ſparus. See the articles AURATA, and SPARUS.

CHRYSOPILON, in natural hiſtory a name given by ſome antients to a ſpecies of the beryl, which had a yellowiſh tinge.

CHRYSOPIS, the *golden eye*, in natural hiſtory, the name of a ſpecies of fly, ſo called from the beautiful gold colour of its eyes. It is a long-bodied fly, with extremely thin and tranſparent wings of a ſilvery colour, with green ribs or nerves; the body is green, and the antennæ very ſlender, and blackiſh. This is a very ſlow flyer, and is common in gardens; it is frequently found on the common elder; it is of a very ſtrong ſmell.

CHRYSOPRASUS, in chriſtian antiquity, the tenth of thoſe precious ſtones which adorned the foundation of the heavenly Jeruſalem [a], the colour of it was green, much like that of a leek, but ſomething inclining to that of gold, as its name imports [b]. — [a Revelat St. John. b *Calm.* Dict. Bibl.]

CHRYSOSPLENIUM, *golden ſaxifrage*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of a rotated form, and divided into ſegments at the edge; there is no flower cup, but the piſtil riſes immediately from the center of the flower, and ripens into a two-horned, membranaceous capſule, which contains a great number of very minute ſeeds.

The ſpecies of this genus enumerated by Mr. Tournefort are three: 1. The large, auriculated-leaved, *golden ſaxifrage*. 2. The ſmaller, rounder leaved, *golden ſaxifrage*. And, 3. The *golden ſaxifrage*, with leaves ſtanding on long foot-ſtalks. *Tourn.* Inſt. p. 146.

CHRYSOXYLON, in botany, a name given by ſome to the Scytharion, or Scythicum lignum, a wood famous for its beautiful yellow colour, and in tinging the hair yellow. This was one of the many ſubſtances called by the name of thapſum by the antient Greeks from its colour, the word thapſus ſignifying a pale yellow, and being applied by theſe authors to every thing that had that colour in itſelf, or could give it to other things. See the article THAPSUM.

CHRYSTAL. See CRYSTAL.

CHRYSTALLINE (*Cycl.*) — The veſſels of the *chryſtalline* humour of the eye are all the branches of an artery, which being ſent off from the artery which enters at the central part of the retina, paſſes through the vitreous humour, and when it reaches the *chryſtalline*, diſperſes its branches along the ſurface of the lens like radii, till they are exceeding minute when they pierce into its ſubſtance. Med. Eſſ. Edinb Vol. 1. p. 337.

CHTHONIA, χθονια, in antiquity, a feſtival kept in honour of Ceres, called *Chthonia*. For the ceremonies obſerved in it, ſee *Pott.* Archæol. l. 2. c. 20.

CHUBB, the Engliſh name for the fiſh called the *capito* and *cephalus* by authors, and by ſome of the antient Romans *ſqualus*. It is, according to the Artedian ſyſtem, a ſpecies of the cyprinus, and is the fiſh called by the French the vilain and teſtard. See the articles CEPHALUS, CAPITO, and CYPRINUS.

The reſorts of this fiſh are eaſily found, for they are generally holes overſhaded by trees, and the fiſh will be ſeen floating in ſuch almoſt on the ſurface of the water in a hot day in great numbers. They are but a poor fiſh for the table, and are very full of bones, but they entertain the angler very much, and are of the number of thoſe that are eaſily taken. The beſt manner of fiſhing for him is thus: prepare a very ſtrong rod of a ſufficient length; fix to the hook a graſshopper; place yourſelf ſo as to be perfectly out of ſight of the fiſh, and drop in the bait about two foot from the place where a large *chubb* lies; if he does not ſee the angler he very ſeldom fails biting, and is immediately taken, but he is ſo ſtrong a fiſh that he

ſhould be taken out carefully, after a great deal of playing, otherwiſe the tackle will be in danger; a beetle, or any large fly will anſwer the purpoſe in the place of a graſshopper, and if there are none of them to be had, the method of fiſhing muſt be altered, and the line be long enough for fiſhing at the bottom. In March and April this fiſh is to be caught with large red worms; in June and July with flies, ſnails, and cherries; but in Auguſt and September the proper bait is good cheeſe pounded in a mortar, with ſome ſaffron, and a little butter; ſome make a paſte of cheeſe and Venice turpentine for the *chubb* in winter, at which ſeaſon this fiſh is better than at any other; the bones are leſs troubleſome in this ſeaſon, and the fleſh is more firm and better taſted; the row is alſo well flavoured in general. The angler muſt keep his bait for this fiſh at the bottom in cold weather, and near the top in hot, and the fiſh will bite eagerly.

CHUCHIA, in zoology, a name given by Cardan, Oviedo, and ſome others to the opoſſum. See OPOSSUM.

CHUM-*owl*, in zoology, a name given by many to the bird called the caprimulgus, or goat-ſucker, a very beautiful owl of the ſhape of the cuckow. *Ray*'s Ornithol. p. 70. See the article CAPRIMULGUS.

CHUNNA, in the Salic law, is uſed for an hundred; or rather an hundred pence or denarii: the pecuniary penalties of that law are eſtimated by *chunnæ*, and reduced to *ſolidi*, by reckoning forty *denarii* to the *ſolidum*. *Du Cange*, Gloſſ. Lat. in voc.

CHURCHESSET. See CHURCH-SCOT, *Cycl.*

CHURR-*worm*, a name given by ſome to the gryllotalpa. See GRYLLOTALPA.

CHYLE (*Cycl.*) — Some think that all the groſs ſecretions are from the *chyle*; and particularly that *pus* is the product of the *chyle*, and not of the blood or ſerum. See Phil. Tranſ. N° 427. §. 2.

CHYMICA *materia*. See MATERIA *chemica*.

CHYMICAL *oils*. See *chemical* OIL.

CHYMOLOGI, among the botanical ſtudents, ſuch as have employed their time in inveſtigating the qualities and properties of plants from their taſte and ſmell. *Linn.* Fund. Bot. p. 3.

CHYTLA, χυτλα, in antiquity, a liquor made of wine and oil, and ſometimes uſed in divination. *Pott.* Archæol. Græc. l. 2. c. 18.

CHYTRI, among the Athenians, a feſtival in honour of Bacchus and Mercury, kept on the thirteenth of the month Antheſterion. *Hoſm.* Lex. in voc.

CIBDELOPLACIA, in natural hiſtory, the name of a genus of ſpars. The word is derived from the Greek κιβδηλος, impure, and πλαξ, a cruſt. The bodies of this genus are terrene ſpars, that is, are compoſed of ſpar, debaſed by a very large admixture of earth, and are not therefore of the leaſt brightneſs or tranſparence, and are found formed into thin cruſts, coating over vegetable and other extraneous bodies in form of incruſtations. Of this genus there are five known ſpecies, ſome of them uſed in medicine, and diſtinguiſhed by particular names. 1. A greyiſh white friable one, with a tuberous ſurface. This is found in England, Ireland, aud Germany; ſometimes incruſting various bodies in ſprings, and ſometimes in marl pits. 2. A ſmooth, friable, whitiſh brown one, found in the marl pits of Derbyſhire, and in ſome ſprings in Northamptonſhire. 3. A hard, pale brown, thick and rough one, which is the oſteocolla of the ſhops. See OSTEOCOLLA. 4. A white, grey, friable one, called the foſſile unicorn by authors. See UNICORNU *foſſile*. 5. A whitiſh brown tuberoſe, and unequal coraliform one, called erdmangon by the Germans. This is very common in the brick clay pits about London, and is ranged by Dr. Woodward very oddly among the cruſtated, ferrugineous bodies: the workmen call this *race* or *rance*. *Hill*'s Hiſtory of Foſſils, p. 356.

CIBDELOSTRACIA, in natural hiſtory, the name of a genus of ſpars. The word is derived from the Greek κιβδηλος, fouled or adulterated with extraneous matter, and οστρακον, a cruſt, or ſhell.

The bodies of this genus are cruſtaceous ſpars, ſo highly debaſed with earth, that they appear to the naked eye mere earths; they are deſtitute of all brightneſs or tranſparence, and are formed into thin plates, and uſually found incruſting over the ſides of fiſſures of ſtone.

Of this genus there are ſeven known ſpecies. 1. A hard browniſh white one much of the nature and ſtructure of the oſteocolla of the ſhops, and found in many parts of Germany, coating over the tops and ſides of ſubterraneous caverns. 2. A hard and whitiſh one, with thin cruſts, and a ſmooth ſurface. This is found in many parts of Germany and England on the ſides and roofs of caverns. 3. A hard, pale, brown one, with very numerous thin cruſts, found alſo in many parts of England. 4. A white, light, and friable one, found in Germany and England. 5. A light, hard, pale brown one, with a ſmooth ſurface. This is very common in form of incruſtations on moſs, and other ſubſtances, in ſeveral of our ſprings. 6. A whitiſh friable one, with a rougher ſurface, found in form of cruſts in the caverns on Mendip hills, and in incruſtations on vegetable bodies in many parts of Glouceſterſhire. And, 7. A browniſh white friable one, with a duſty ſurface, found frequently in Ireland. *Hill*'s Hiſt. of Foſſ. p. 349.

CIBORIA, κιβωρια, in antiquity, the large huſk of Egyptian beans, which are ſaid to have been ſo large as to ſerve for drinking cups, whence they had their name *ciborium*, ſignifying a cup, in the Egyptian language. *Pitiſc.* Lex Ant. in voc.

CIBORIUM, in eccleſiaſtical writers, the covering for the altar. This covering is ſupported by four high columns [a], and forms a kind of tent for the euchariſt, in the Romiſh churches. Some authors call it *turris geſtatoria*, and others *pyxis* [b]. But the *pyxis* is properly the box in which the euchariſt is preſerved. — [a *Du Cange*, Gloſſ. Lat. b *Magri*, vocaboli eccleſ.]

CIBUS *ferialis*, in antiquity, an entertainment peculiar to a funeral; for which purpoſe, beans, parſley, lettuce, bread, eggs, lentils, and ſalt were in uſe. *Pitiſc.* Lex. Ant. in voc.

CICADA, the *balm cricket*, in zoology, the name of an inſect common in Italy, and ſome other parts of the world; but not found in England. It has large wings, and makes a loud noiſe, ſomething like that of the cricket. See Tab. of Inſects, N° 5. and HARVEST-*fly*.

They are recommended by ſome in medicine as remedies for colics, powdered, and mixed with pepper; or burnt to aſhes alone, are given in nephritic caſes. *Dale*, Pharm. 357. *Schroder*, Pharm. 196.

CICADA *aquatica*, the *water graſshopper*, a name very injudiciouſly given by Rondeletius to an animal found frequently in ſtanding waters. It is of a greyiſh colour, with ſix legs, and the appearance of the rudiments of wings; it is remarkable for having alſo a ſort of maſk before the face, which it removes or lifts up at pleaſure. It is a poor defenceleſs animal, and is a prey to almoſt all the other water animals, even to many that are ſmaller than itſelf; it has no ſort of relation to the graſshopper; but is the hexapode, or worm ſtate of one of the libellæ, or dragon flies. See LIBELLA.

This inſect has ſix legs, and the hinder pair are much longer than the others, and are uſed in ſwimming as oars, in the manner of thoſe of the notonecta.

CICADULA, in natural hiſtory, the name given by Mr. Ray to a ſmall ſpecies of inſect, called by Swammerdam, *locuſta pulex*, and found in May and June on the ſtalks and leaves of plants, involved in a ſpumous white matter, commonly called cuckow ſpit. This ſpume is not exſudated, as ſome ſuppoſe, from the plant, but from the mouth of the animal, and if it be well wiped away, without injuring the creature, more will be immediately ſeen iſſuing out of its mouth, till there is as large a quantity of it as before.

There are ſeveral ſpecies of this animal, and while they lye in froth they are of the ſhape of a louſe, ſome being of a whitiſh, ſome of a yellowiſh, and ſome of a green colour. Their hinder legs are ſomewhat larger than the others, and there is an appearance of the rudiments of wings at the ſhoulders. They often change their ſkins while they live in this froth, and only creep at this time; but when they leave the plant, they hop and fly, having large wings which cover the whole body. *Ray*'s Hiſt. Inſect. p. 67.

CICATRISANTIA, in medicine. See CICATRISIVE, *Cycl.*

CICATRIX (*Cycl.*) — In large wounds, where there has been a a loſs of ſubſtance, an even *cicatrix* is not to be expected without great care in the ſurgeon. When an even thick and white matter appears in the wound, it is to be dreſſed either every day, or every other day, as occaſion ſhall require: the ſuperfluous matter muſt at every dreſſing be wiped away with a very light hand; and it is indeed much better to leave ſome of it in the wound, than to treat that roughly in the taking it away; for wiping the wound too roughly hinders the growth of new fleſh; but a little matter being left, only performs the office of oil or balſam, in keeping the parts moiſt. Theſe rules being obſerved, new fleſh will preſently ſpring up, and the wound unite: but that an even *cicatrix* may be procured, the ſurgeon muſt endeavour by degrees to harden the new fleſh by the application of a dry lint, covered with a tight bandage. When this does not prove ſufficient, it may be proper to uſe ſome of the drying balſams, or drying powders, ſuch as tutty, lapis calaminaris, maſtich, colophony, &c. Rectified ſpirit of wine is frequently uſed for this purpoſe alſo, with great ſucceſs, for it carries a very great aſtringent and drying virtue with it. *Heiſt.* Surg. p. 41. See WOUND.

CICATRIZING, in medicine. See CICATRISIVE, *Cycl.*

CICER, the *chich pea*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the papilionaceous kind, and its piſtil finally becomes a ſhort pod, which ſeems as if inflated with wind, and contains ſeveral ſeeds, ſomewhat reſembling in ſhape the head of a ram.

The ſpecies of *cicer* enumerated by Mr. Tournefort, are theſe: 1. The common white-flowered cultivated *cicer*. 2. The cultivated *cicer*, with purpliſh red flowers, and red ſeeds. 3. The cultivated *cicer*, with brown ſeeds. 4. The cultivated *cicer*, with deep red ſeeds. 5. The cultivated *cicer*, with black ſeeds. See Tab. 1. of Botany, Claſs 10. *Tourn.* Inſt. p. 389.

The antient Hebrews made uſe of *chich peaſe* as their common proviſion, when they took the field. They parched them, and ſo eat them. At this day in Egypt, when people undertake a journey, they lay in a good ſtock of *chich peaſe*, parched in a frying

frying pan. Bellonius [a] assures us, that at Grand Cairo and Damascus there are abundance of shops where people do nothing else but fry pease, it being a sort of provision with which they furnish travellers. In Ethiopia they take barley with them, roasted in the same manner. In Turkey they lay in a stock of rice on these occasions, which they prepare and shell. The Hebrew term *cali*, signifies properly any thing roasted in general; and by it is understood roasted pease, rice or barley. Some will have even coffee to be meant by it [b].—[[a] *Bellon.* l. 2. c. 52. [b] *Calm.* Dict. Bibl.]

CICERBITA, in botany, a name given by some authors to the common sonchus, or sowthistle. *Ger. Emac.* Ind. 2.

CICERONIASTRI, or CICERONIANI, an appellation given by way of contempt to those moderns, who dispute the propriety of all expressions and words not found in Cicero.

Their pretences are certainly ill founded; for as Cicero has not written on every subject, it is impossible his works should contain proper terms and expressions for every thing. It must indeed be allowed, that this truly illustrious author is an excellent standard for the purity of Latin diction, but not the only one. *Voss.* Rhet. l. 4. p. 14.

CICERUM *lapis*, the *chich stone*, in natural history, a name given by some authors to a sort of small round stones, of the nature of the pisolithe or pea-stones, but smaller than those usually are, and of a dusky grey colour. They very exactly resemble the fruit of the cicer or chich pea, and are found in great abundance near the Old Jerusalem. See PISOLITHUS.

CICERELLUS, in ichthyology, a name given by Boccone, and some other authors, to the ammodytes or sand eel, the tobianus of Schoneveldt. See AMMODYTES.

CICHORIUM, *succory*, in botany, the name of a genus of plants, the characters of which are these: the flower is of the semiflosculous kind, being composed of a great many semifloscules, which stand upon the embryo fruits, and are contained in a common cup, which afterwards contracts itself so as to form a sort of capsule, containing a number of angular, umbilicated, and somewhat wedge-like or cuneiform seeds.

The species of *succory* enumerated by Mr. Tournefort, are these: 1. The common weed *succory*. 2. The *succory*, with rose coloured flowers. 3. The white flowered *succory*. 4. The wild *succory*, with leaves scarce at all divided. 5. The common garden *succory*. 6. The garden *succory*, with jagged flowers. 7. The white flowered garden *succory*. 8. The broad-leav'd *succory*, or common endive. 9. The white-flowered *endive*. 10. The narrow-leav'd *endive*. 11. The white-flowered, narrow-leav'd *endive*. 12. The curled leav'd *succory*. 13. The cretic prickly *succory*. 14. The cretic *succory*, without thorns. See Tab. 1. of Botany, Class 1. and *Tourn.* Inst. p. 478.

The common *succory* stands recommended by most of the medical writers, as one of the best known aperients and detergents: it is prescribed in all diseases of the liver, and is a powerful diuretic. Schroder tells us, that it has also great virtues attributed to it against hæmorrhages; but it is not much regarded at present in that light.

CICINDELA, in natural history, the name of the glow-worm. See the article PYROLAMPIS.

CICINDELA *volans*. See GLOW-*worm*.

CICLA, in botany, a name given by some to the white beet. *C. Bauhin.* p. 118.

CICLA, in ichthyology, a name given by Artedi, and other late writers, to a species of fish called *chichle* by Aristotle and Ælian, and *turdus minor* by the generality of late writers. Artedi has taken its size as an article of distinction, and has distinguished it by the name of the *cicla palmaris*. The eyes have a fine yellow iris; the tail is broad, and is not forked at the end. The fish is broad, and somewhat resembles the sea tench: the head, back, tail and fins are of a dusky grey colour: the sides are of a pale whitish grey; and the belly is white, spotted with black. It seldom exceeds a hand's breadth in length.

This is the character of the more usual species of the *cicla* called turdus minor. But there is another larger fish truly of this kind, called by Artedi, by way of distinction, *cicla cubitalis*. This is the *turdus major* of authors, called by the Venetians tordo and verdone. It is of a longer shape than the former, and its colour is all over either of a fine green, or a bright red; but there are some small blue spots on the back, and the sides and belly are ornamented with a confused set of the same sort of spots, only that they are much smaller. *Artedi*, Ichthyol. See the articles TORDONE and TURDUS.

CICONIA, in zoology, the name by which authors call the stork, a bird much approaching to the nature of the heron, of which there are three kinds; the white, the black, and the grey Brasilian kind, called maguari. See MAGUARI.

The white stork is larger than the common heron, but its neck is shorter and thicker. Its head, neck, breast and belly are white: its rump, and the outer feathers of the wings are black: its tail is white, and its beak long and reddish. Its legs also are red.

The black stork is somewhat smaller than the white. Its head, neck, back and wings are black, with a greenish cast among it: the belly, breast and sides are white, and the beak and legs are green. Many are of opinion, that this is the bird mentioned by Ovid under the name of mergus. *Ray*'s Ornithol. p. 212.

In the Linnæan system of zoology, the *ciconia* makes a distinct genus of birds of the macrorynchæ or long-beak'd kind, the characters of which are, that the claws are smooth and roundish. *Linnæi* Syst. Natur. p. 45.

CICUTA, *hemlock*, in botany, the name of a genus of plants, the characters of which are these: the flower is umbelliferous, and of the rosaceous kind, being composed of several heart-fashioned petals, irregular in size, disposed into a circular form. The cup finally becomes a roundish fruit, composed of two seeds, striated and gibbose on one side, and flat and smooth on the other.

The species of *hemlock* enumerated by Mr. Tournefort, are these: 1. The common great broad-leav'd *hemlock*. 2. The common great *hemlock*, with narrower leaves: and, 3. The parsly-leav'd *hemlock*, called by some *cicutaria*, and fool's parsly. *Tourn.* Inst. p. 306.

There are not wanting authors among the Germans, who recommend the seed of the common *hemlock* against obstructions in the spleen; but as we have already remedies enough in the same intention, which are not suspected as poisonous, it is best to be contented with them, till a great many more trials have been made of this new medicine than we have accounts of at present.

CICUTARIA, in botany, the name of a genus of the umbelliferous plants, the characters of which are these: the flower is of the rosaceous kind, being composed of several petals, arranged in a circular form around a cup, which afterwards becomes a fruit composed of two seeds, which are considerably thick, long, gibbose, and, as it were, of a lunated form, and very deeply striated. To this it is to be added, that the leaves much resemble those of hemlock.

The species of *cicutaria* enumerated by Mr. Tournefort, are these: 1. The broad-leav'd stinking *cicutaria*. 2. The broad-leav'd Thapsia-like *cicutaria*. *Tourn.* Inst. p. 312.

CIDARIS, the mitre used by the Jewish high priests. Whenever there is mention of the high priest's mitre, the Hebrew word made use of to express it is always *miznepheth*; and *mygbaoth* is used to signify the bonnet belonging to common priests. The rabbins say the same thing is meant by both these terms, and that the bonnet used by priests in general was made of a piece of a linnen cloth sixteen yards long, which covered their heads like an helmet or a turban: and they allow no other difference to be between the high priest's bonnet, and that of other priests, than this, that one is flatter, and more in the form of a turban, whereas the other worn by ordinary priests rose something more in a point. Exod. xxviii. 4.

The form of these bonnets is not now well understood, the descriptions which are given us of them being so various and different. Moses expressly tells us, that the high priest's tiara was made of *schesh*, that is cotton, and that of other priests of linen only. The tiara and the priests bonnets were tied with a ribbon, which Ezekiel calls crown; but that used by the high priest was richer, and remarkable for the plate of gold, with the name of God engraven on it, which was placed in the fore-part of the tiara, and covered some of the high priests forehead; the ribbon was tied behind his head. Lastly, the Hebrew term *migbaoth*, whereby the bonnet of the common priests was expressed, and which St. Jerome translates *mitra*, intimates, that this bonnet had some resemblance with an helmet. And that of *miznepheth*, which denotes the high priest's tiara, and is translated *cidaris* by the same Jerome, was probably of another form, and perhaps like those streight tiara's which were worn by the kings of Persia [a]. We see in Isaiah that the kings of Judah wore a bonnet on their heads called *zenuph*, which is derived from the same word as *miznepheth*. [[a] *Xenophon.* de Expedit. de Cyri.]

It is to be observed, that the Hebrew priests never appeared in the temple without covering their heads. And still at this day it is reckoned an incivility in the East, and a mark of contempt, for any man to pull off his hat or turban to another, or to shew his naked head before any one. *Calm.* Dict. Bibl.

CIDARIS, in conchyliology. See TURBAN *shell*.

CIERGE, in conchyliology, a name given by the French to a sea shell, a species of voluta. This is of the colour of common yellow wax, without any variegations on the surface; but when its rough coat is taken off, it makes a very different appearance, having the zones and colours of the onyx. It is preserved in many cabinets in this state, under the name of the onyx shell. See the article VOLUTA.

CIGALE, in natural history, the French name for the cicada, particularly for the large kind, called *acheta* by the antients. See HARVEST-*fly*.

CIGNE, in conchyliology, the swan shell, a name given by the French virtuosi to a species of voluta, which, beside this name, is known by two other very different ones, *cierge* and *onyx*, and is taken by the generality of collectors for three different shells. When it has its natural coat on, it is of a rough surface, and yellow colour, much like that of common wax, whence it is called cierge, or the wax shell. When this coat is just taken off, it appears of a very beautiful white, and is then called the *cigne*, or swan shell; and when it is polished farther down, so as to shew its inner structure, it appears zoned in the manner of the onyx, and is then called the onyx shell.

CIGALON, in natural hiſtory, the name by which the French writers call the ſmaller ſpecies of cicada, as they do the larger the cigale. The antients were acquainted with two ſpecies of cicada, a great one, and a ſmaller one: the laſt of theſe they called *tettigonia*, and the firſt *acheta*. It has been uſually ſuppoſed, that the *cigalon* of the moderns was their tettigonia: but Mr. Reaumur obſerves, that we have in reality three kinds of them, a large, a middling, and a ſmall one; and that the large was their acheta, the middle one their tettigonia, and that the *cigalon*, or ſmall one, which is about the ſize of a hornet, was wholly unknown to them. See HARVEST-*fly*.

CILIATED *leaf*, among botaniſts. See LEAF.

CILICIA *terra*, in the natural hiſtory of the antients, a bituminous ſubſtance, tho' called an earth, which, by boiling, became tough like bird-lime, and was uſed inſtead of that ſubſtance to cover the ſtocks of the vines, for preſerving them from the worms. It probably ſerved in this office in a ſort of double capacity, driving thoſe animals away by its nauſeous ſmell, and entangling them if they chanced to get among it. *Hill*'s Theophr. p. 119.

CILICIUM, a ſort of habit made of coarſe ſtuff, of a black or dark colour, formerly in uſe among the Hebrews, in times of mourning or diſtreſs. It was called *cilicium*, becauſe it came from Cilicia, or rather becauſe the Cilicians invented this kind of habit, made of goat's hair, and uſed principally in camps and ſhips, by ſoldiers and mariners. The Septuagint and Hebrew call that ſackcloth, which St. Jerome tranſlates *cilicium*, either becauſe ſacks were made of this ſort of ſtuff, or becauſe haircloths were ſtrait and cloſe like a ſack. St. John, in the revelations, ſhews plainly, that theſe ſackcloths or haircloths were black, when he ſays that *the ſun became black as ſackcloth made of hair*. The old monks were often cloathed with theſe haircloths. *Calmet* Dict. Bibl.

CIMELIANTHUS, in natural hiſtory, a name given by authors to a ſpecies of the *oculus beli*. It is deſcribed to be of a white colour, reſembling that of marble, with a yellow pupil in the middle. It was found on the ſhores of the Euphrates.

CIMEX, in natural hiſtory, the name of a genus of inſects, the characters of which are theſe: the head is ſmall: the back, toward the ſhoulders, is broad, and is covered with a cruſtaceous ſubſtance: its ſhoulders are of an angular make, and its wings partly cruſtaceous, partly membranaceous, and are ſo formed, that they exhibit the figure of a croſs, where they meet at the middle of the back; and they have a long proboſcis, which is bent under the belly, and always lies ſtrait, not in a ſpiral form.

Mr. Ray divides the *cimices* into two kinds, thoſe of a ſhorter, and thoſe of a longer and narrower make. Of the firſt kind he deſcribes eight ſpecies: 1. The great green *cimex*. This is broad and ſhort, and its legs and belly are of a paler green than its back. 2. The brown ſhort-bodied *cimex*, with prominent ſhoulders, and a large yellowiſh red ſpot in the center of the croſs on the back. This ſeems to be the ſecond of Mouffet, and is all over of a brown colour, legs, belly and head, as well as back. 3. The duſky grey *cimex*, with a ſomewhat longer body, with acute ſhoulders, and a ſmall pale yellow ſpot in the center of the croſs on the back. 4. The duſky brown *cimex*, without ſpots, with a long head, and very long red antennæ, and with a body growing narrow beneath the ſhoulders. 5. The ſmall round-bodied *cimex*, variegated with a deep ſhining black and white. 6. The ſmall flat-bodied blue *cimex*. 7. The ſmall flat-bodied reddiſh *cimex*. 8. The ſmall flat-bodied *cimex*, with a line of yellow under the belly. *Ray*'s Hiſt. Inſect. p. 54. *Mouffett*, Hiſt. Inſect.

Of the other kind of *cimices*, which have longer and narrower bodies, Mr. Ray mentions five kinds: 1. The ſmall red *cimex*, variegated with black ſpots. 2. The great red *cimex*, variegated with black, in ſtreaks as well as ſpots. This is three quarters of an inch long, and is only variegated on and about the ſhoulders. 3. The long-bodied flat *cimex*, with black and red variegations. 4. The ſmall red bellied *cimex*, with a ſingle black ſpot in each triangle of the back. 5. The ſhort winged *cimex*, with the violently ſtinking ſmell. This is about half an inch long. Its antennæ are as long as its body, and are compoſed of three joints: the body is rounded and full: the head is ſmall: the wings do not reach to more than half the length of the body. It is of a brown colour, but has a line of white running down its middle.

Beſide theſe, there are two ſpecies of water *cimices*: the firſt has a long body, and its ſhoulders are black; the wings, and the triangle under the ſhoulders are of a ſhining brown, and the hinder pair of legs are very long, and ſerve as oars. The other is ſmaller, and is of a rounded, but depreſſed figure. Its colours are black and a ſhining yellow: the antennæ are very ſhort, and the legs do not ſeem made for ſwimming.

Beſide all theſe, which are properly of the *cimex* kind, there is another ſet of inſects mentioned by Mr Ray, as nearly approaching to them, and deſcribed under the name of cimiciformes muſcæ. *Ray*'s Hiſt. Inſect. p. 55. See the article CIMICIFORMIS.

CIMICIFORMIS *muſca*, in natural hiſtory, a name given by Mr. Ray to a kind of inſects, partly of the fly, and partly of the *cimex* kind. See CIMEX. Of theſe there are eleven ſpecies deſcribed in his hiſtory: 1. A brown one of half an inch long, with a ſhining body. 2. A black one, with large and round ſpots, of a much deeper black. 3. A large one, with a ſmall head. The croſs upon the back is ſcarce viſible in this ſpecies. Its colour is black. 4. A black-headed one, with ſhoulders variegated with black and yellow. 5. A ſmall one, with brown ſhoulders, and a white line in the middle. 6. A browniſh grey one, with a very elevated neck. 7. A green kind, with black and yellow ſtreaks upon the ſhoulders. 8. A green kind, with a black triangle under the ſhoulders, terminating in a yellow point. 9. A black-bodied kind, with bluiſh wings, and a large yellow ſpot at the end of the triangle at the ſhoulders. 10. A long and ſlender kind, variegated with black and red. 11. A large kind, half an inch long, with blackiſh wings and a purple body. Theſe are all found about our hedges in dry places, and are a beautiful ſet of inſects. *Ray*'s Hiſt. Inſect. p. 56.

CIMOLIA *terra*, in natural hiſtory, a name by which the antients expreſſed a very valuable medicinal earth; but which later ages have ſuppoſed to be no other than our common tobacco-pipe clay and fuller's earth. See the articles PIPE-*clay* and FULLER's *earth*.

The *cimolia terra* of the antients was found in ſeveral of the iſlands of the Archipelago, particularly the iſland Cimolus, from which it had its name, and which is now called Argentiere, and was uſed with great ſucceſs in the St. Anthony's fire, inflammations, and other external affections of a like kind, being applied by way of a cataplaſm to the part. They alſo uſed, as we do, what we call *cimolia*, or fuller's earth, for the cleaning of cloaths. This earth of the antients, tho' ſo long diſregarded, and by many ſuppoſed loſt, is however yet very plentiful in Argentiere, Sphanto, and many other of thoſe iſlands, and is a marl of a lax and crumbly texture, and a pure bright white colour, and very ſoft to the touch. It adheres firmly to the tongue, and if thrown into water, raiſes a little hiſſing and ebullition, and moulders into a fine powder. It makes a conſiderable efferveſcence with acids, and ſuffers no change of colour in the fire. Theſe are the characters of what the antients called ſimply the *terra cimolia*: but beſide this, they had from the ſame place another earth, which they therefore called by the ſame general name, but diſtinguiſhed by the epithet purple, *purpuraſcens*. This they deſcribed to be fattiſh, cold to the touch, of a mixed purple colour, and nearly as hard as a ſtone. And this was evidently the ſubſtance we now call ſteatites, or the ſoap rock, common in Cornwal, and alſo in the iſland of Argentiere or Cimolus. *Hill*'s Hiſt. of Foſſ. p. 36.

CIMOLIA *alba*, the officinal name of the earth of which we now make tobacco-pipes. Its diſtinguiſhing characters are, that it is a denſe, compact, heavy earth, of a dull white colour, and very cloſe texture; it will not eaſily break between the fingers, and ſlightly ſtains the ſkin in handling. It adheres firmly to the tongue; melts very ſlowly in the mouth, and is not readily diffuſible in water. It is found in many places. That of the iſle of Wight is much eſteemed for its colour. We have vaſt plenty of it alſo near Pole in Dorſetſhire, and near Weddenſbury in Staffordſhire. *Hill*'s Hiſt. of Foſſ. p. 18.

CINÆDA, in natural hiſtory, the name of a ſtone found in the head of a fiſh, and of a whitiſh colour, and oblong figure. The antients ſuppoſed it preſaged tempeſts when its ſurface looked duſky and obſcure; and, on the contrary, fair weather, when it looked bright and clear.

CINÆDOLOGIA, among the antients, a kind of ſatyrical poetry, the chief ſubject of which were the cinædi. *Hofm.* Lex. in voc.

CINÆDUS, in antiquity, is uſed to ſignify a dancer or pantomime.

At firſt they performed only on the ſtage, but afterwards were admitted to the entertainments of princes. *Pitiſc.*

CINÆDUS, in zoology, the name of a fiſh common in the Archipelago, about the ſhores and rocks, ſuppoſed by many to be the ſame ſpecies with the alpheſtes, and of the turdus kind, only with its back fin prickly all its length. It is of a yellowiſh hue all over, blended and variegated with an admixture of purple; its ſcales are rounded and indented, and its teeth very ſtrong and firm, and diſpoſed in two rows in each jaw, and are long and ſharp. *Bellonius* de Aquat. p. 132.

CINARA, *artichoak*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the floſculous kind, or compoſed of numbers of ſmall floſcules, which are divided into many ſegments at the end, and ſtand upon embryo ſeeds, and are contained in a ſcaly, and uſually a prickly general cup. The ſeeds are winged with down; to this it is to be added, that there is a peculiar appearance and habit of the plant, by which it is readily diſtinguiſhed from the common thiſtles.

The ſpecies of *cinara* enumerated by Mr. Tournefort are theſe: 1. The common ſmooth-leaved garden *cinara*. 2. The common ſmooth garden *cinara*, with purple heads. 3. The prickly garden *cinara*. 4. The large Engliſh *cinara*. 5. The prickly *cinara*, with eatable ſtalks. 6. The broad leaved wild *cinara*. 7. The wild Bætic *cinara*. 8. The wild Cretic *cinara*. And, 9. The ſmalleſt Portugal *cinara*, with the appearanc

pearance of the carline, and with blue flowers. *Tourn.* Inſt. p. 132. See ARTICHOAK.

CINCHONA, in botany, the name by which Linnæus calls the tree which produces the jeſuits bark; this is a peculiar genus of plants, the characters of which are theſe: the cup is a ſmall perianthium, compoſed of one leaf, divided into five ſegments, and remaining after the flower is fallen. The flower conſiſts of one petal, and is of a funnel ſhape; it is a long and cylindric tube, terminating in a wide expanded edge, which is divided into five ſerrated and pointed ſegments; the ſtamina are five ſmall filaments, and the apices oblong, and placed within the tube of the flower; the piſtil conſiſts of a roundiſh germen placed below the cup, a ſtyle which is of the length of the flower, and a thick oblong ſimple ſtigma; the fruit is a roundiſh capſule, at the top of which ſtands the cup by way of a crown; this capſule contains two cells, and when ripe opens longitudinally into two parts. The ſeeds are very numerous, and are oblong, compreſſed, and ſurrounded with a foliaceous edge. *Linnæi* Gen. Plant. p. 529.

CINCLUS, in zoology, a name by which ſome authors have called the bird more uſually known by the name tringa. *Bellonius*, de Avib. See TRINGA.

CINCLUS is a name alſo given by ſome to the bird called in Engliſh the greater reed ſparrow, and by the generality of authors junco. *Turner.* See JUNCO.

CINCLUS *prior*, is alſo a name given by Aldrovandus to a bird the ſame with what we call the ſtint. See STINT.

CINCLUS *minor*, is with that author the name of a bird more commonly called tringa minor, and known in England by the name of the ſandpiper. *Aldrovand.* Tom. 3. p. 492. See the article TRINGA.

CINCLUS *tertius*. See GIAROLO.

CINEFACTION. See CINERATION, *Cyc.*

CINERARIA, in botany, a name by which ſome authors have called the jacobæa maritima, or ſea ragwort, becauſe of the grey colour of its leaves. *Ger.* Emac. Ind. 2.

CINERARIUS, in antiquity, an officer retained by the women, whoſe buſineſs it was to provide aſhes proper for tinging the hair with a deep yellow colour. He was otherwiſe called *ciniflo*.

CINERARIUS is alſo uſed to ſignify one who paid a veneration to the aſhes and relicks of martyrs and ſaints.

CINERES *Ætnæ*, a name given by authors to a duſty and ſaline ſubſtance thrown out of mount Ætna, in form of powder, and reſembling aſhes. After an eruption of this mountain, theſe ſaline aſhes are found ſcattered about the opening itſelf, down the ſides of the mountain, and over the country for ten miles, or more, round; thoſe aſhes, which are found thrown to the diſtance of eight or ten miles, are generally taken up in form of a very dry duſt, almoſt inſipid to the taſte. But what lie upon, and round about the ſkirts of the mountain are very different; they are never dry, though they lie many months expoſed to the ſun's heat, which is very great there, but always feel damp and wet, and are compoſed of larger or ſmaller lumps, and not of a fine powder, as the more diſtant are. They are of a very ſtrongly vitriolic taſte, reſembling that of our common green copperas. From this taſte, and from the great quantities of matter reſembling a ſort of crocus Martis, and with theſe a great abundance of ſulphur, which is burnt away, and the vaſt quantities alſo which are ſublimed about the mouths, and left unburnt, it appears, that the common pyrites is contained in vaſt abundance in the bowels of the mountain, ſince green vitriol and ſulphur are its produce, and nothing is ſo eaſy as to calcine it with the purple powder reſembling crocus Martis, which is the third ſubſtance ſo frequent there. This gives great weight to the opinion of thoſe who believe all the eruptions of the burning mountains in the ſeveral parts of the world to be owing to this mineral. See the articles PYRITES and VOLCANO.

CINIFLO, in antiquity, the ſame with *cinerarius*. See CINERARIUS.

CINNABAR *of antimony* (*Cyc.*) — It is evident both from the manner of preparing this medicine, and from experiments and obſervations made on it, that theſe three principles exiſt in it, mercury, ſulphur of antimony, and an acid ſpirit impregnated with a vitriolic ſulphur. That mercury does chiefly conſtitute this *cinnabar*, is evident from its weight, which is nearly equal to that of common precipitate. Mercury revived from *cinnabar* of antimony is greatly to be preferred to that obtained by any other means, both for amalgamating with metals, and for all uſes in medicine; for this mercury is perfectly freed and depurated from its metallic, terrene, and heterogeneous particles, by the ſulphur of antimony.

The manner of reviving mercury from *cinnabar* of antimony is variouſly delivered by different authors, but moſt of them prefer the uſe of pot aſhes to any thing elſe on the occaſion. Hoffman, however, who has written expreſly on the ſubject, ſays, that filings of ſteel or copper are greatly to be preferred to theſe ſalts. In the making *cinnabar* of antimony it ſhould be ſublimed often in order to render it quite pure, and perfect; and afterwards when it is to be given internally, it ſhould be powdered extremely fine, ſince in the common way of giving theſe medicines groſly ground, they can only exert their operations in the primæ viæ, it being impoſſible for them ever to reach the lacteals, and thence to be received into the maſs of blood. Many ways have been thought of for the exalting the virtues of this excellent medicine, ſuch as ſolution, fixation, and the drawing a tincture from it. Solution in acid menſtrua is wholly to be condemned, for it renders it corroſive and dangerous to be taken internally; and the other inſipid and æthereal diſſolvents which many chymiſts boaſt of, are not yet known. The only medicinal preparation that has been contrived of *cinnabar* on this plan, is that by pouring ſweet ſpirit of vitriol on it. This makes only a ſlight and ſuperficial ſolution, but the liquor becomes very rich, in virtues far exceeding the *cinnabar* itſelf when taken in powder.

Many ways have been attempted to fix *cinnabar* by means of common ſalt, oil of ſulphur, and oil of vitriol; and Hoffman gives a method of doing this in ſo perfect a manner, by means of ſpirit of nitre and oil of vitriol, that the mercury of it will not tinge gold white, and a piece of the *cinnabar* thus fixed being thrown upon burning charcoal, will burn all away, leaving no remainder. Cnefelius boaſts of a preparation of *cinnabar* of this kind with which he cured the gout; and by his own accounts this ſeems to be the very preparation; and the ſame preparation has been found an excellent cure for ſtubborn quartans, mixed with extract of bark, gentian, and ſalt of wormwood.

The drawing a tincture from *cinnabar* of antimony ſeems impracticable for many reaſons; all that is pretended to be done of this kind being in reality only drawing a tincture from one part, not from the whole of the medicine, and therefore ſuch a tincture cannot be expected to contain all its virtues.

Cinnabar is the beſt of all correctors of opium, and an excellent preparation of this kind is publiſhed by the ſame author.

Cinnabar is by ſome much dreaded as a medicine, in all caſes of inflammation, hæmorrhages, and the like diſtemperatures of the body, but Stahl reports from repeated experience that it is one of the greateſt of all medicines in theſe very caſes, nothing more efficaciouſly quieting the violent emotions of the blood, or ſupplying ſo happily the place of opiates; his general preſcription in hæmorrages, headachs, and other the like affections, being nitre, crabs eyes, and *cinnabar*. *Frid. Hoffman*, Differt. de Cin. Ant.

CINNAMOLOGUS, in the writers of natural hiſtory among the antients, the name given to a bird which built its neſt either in the cinnamon tree, or upon rocks and precipices, with the broken branches of that tree. The antients have a great many idle traditions concerning this bird; ſome ſay it is the phœnix, and others that it is a peculiar ſpecies of fowl. The aſſertors of the latter opinion bring the accounts of ſome of the old writers to countenance it, who ſay, that the fineſt and moſt valuable cinnamon was that collected by this bird for this purpoſe, and that it built its neſt on inacceſſible rocks and precipices, from whence the natives daily beat it down with ſtones and arrows, and found a conſtant ſupply from what the old ones brought to ſupply the place of what they threw down. Avienus, and many other authors, however, plainly expreſs themſelves of this bird as the ſame with the phœnix; and it is pretty certain, that all that have written intelligibly have been of that opinion. The common opinion of the phœnix building its neſt of ſpices, ſeems to have given birth to all the idle ſtories that we hear of this bird in Pliny and other credulous authors.

CINNAMON *tree*, in botany. See the article WINTERANUS *cortex*.

CINNAMUM, the name given by many of the old writers on the materia medica to *cinnamon*. It is evident, from a ſtrict examination of the writings of the antients, that *cinnamum* and *cinnamomum* were ſynonymous words, and always uſed to expreſs the ſame thing; but the barbarous ages that ſucceeded theſe, obſerving that there was great difference in ſtrength and virtue between the bark of the trunk of the tree, which came to them in thick pieces, and the bark of the young branches which came in thin quills, determined to diſtinguiſh theſe by the names of *cinnamum* and *cinnamomum*; ſo that in their writings the word *cinnamum* is always to be underſtood of the coarſe and large *cinnamon* of the tree; and the word *cinnamomum* with them only means the bark of the young branches. Macer tells us, that there were three kinds of *cinnamon* in uſe in his time, but that the ſmalleſt and fineſt was the beſt.

The Arabian writers when they treat of *cinnamon*, have three words by which they expreſs it; theſe are *felicha*, *daſini*, and *karfe*. The laſt word is tranſlated, by the writers of the middle ages, *cinnamomum*, the word darſini is tranſlated *cinnamum*, and the word felicha is rendered caſſia lignea; but this is not at all warrantable from the writings of the Arabian authors, for all that they mean by the three words is to expreſs three ſorts of *cinnamon*, differing in value and goodneſs, not to take in either the caſſia lignea, or the bark of the trunk of the *cinnamon* tree. The *cinnamum* or *cinnamomum* of the antients agrees leſs with this account than the writings of the Arabians; for what the earlieſt writers meant by *cinnamomum* was not a mere bark, but the young ſhoots of the tree covered with their bark, and the wood and bark were ſold together, and uſed ſo by the phyſicians. The Greeks called this alſo καρφη. from whence the Arabians have derived their name kerfe, which they attribute to all kinds of *cinnamon*. See CINNAMON, *Cyc.*

CINNOR. See KINNOR, and CINYRA.

CINNUS, in the antient medicine, a drink made of the decoction of wheat, to which was added some flower of barley, honey, and wine.

CINQUEFOIL, *quinquefolium*, in botany, the name of a genus of plants, the characters of which are these: the flower is of the rosaceous kind, consisting of several petals arranged in a circular form; the cup is one-leaved, but divided into several segments; from this arises a pistil which finally becomes a fruit of a globular figure, composed of a number of seeds, and covered in part by the cup. To this it is to be added that the leaves grow in regular numbers on the stalks, and are always more than three on each, by which it is distinguished from the strawberry.

The species of *cinquefoil* enumerated by Mr. Tournefort are these. 1. The upright Alpine *cinquefoil*, with silvery leaves, jagged at the ends. 2. The great, upright, white-flowered *cinquefoil*. 3. The larger-flowered, upright, white *cinquefoil*. 4. The lesser white-flowered *cinquefoil*. 5. The lesser white-flowered *cinquefoil*, with narrower leaves. 6. The common larger creeping *cinquefoil*. 7. The common smaller creeping *cinquefoil*. 8. The yellow-flowered small *cinquefoil*, with leaves of a silvery white underneath. 9. The woolly, small creeping yellow-flowered *cinquefoil*. 10. The small, golden-flowered, creeping Alpine *cinquefoil*. 11. The common upright *cinquefoil*, with leaves silvery underneath. 12. The upright yellow-flowered *cinquefoil*. 13. The upright, white-flowered *cinquefoil*. 14. The great upright *cinquefoil*, with soft hairy leaves. 15. The smaller *cinquefoil*, with pale yellow flowers. 16. The low Canada *cinquefoil*. 17. The upright hairy yellow-flowered mountain *cinquefoil*. 18. The late flowering, creeping Alpine *cinquefoil*. And, 19. The Pyrenæan *cinquefoil*, with leaves hairy underneath. *Tourn.* Inst. p. 296.

CINQUEFOIL *root*, in the materia medica, the name of a root which is an ingredient in several of the officinal compositions. The plant which produces it is the common *cinquefoil*, which grows every where by way sides. The root consisting of a cortical, and ligneous or sticky part, the cortical only is used. It is esteemed drying and astringent, and antifebrific. Some have given it in agues in as large doses as the cortex, and have cured with it. It stops fluxes of the bowels, and is good in disorders of the lungs, and in the fluor albus, and gonorrhœas, either in men or women. It is, however, very little regarded in the present practice.

CINQUE PORT *net*. See NET.

CINTRE, in building, the mould on which an arch is turned; popularly called *centre*, sometimes also *cradle*. *Davil.* Cours. d' Archit. P. 2. p. 477. *Neve*, Build. Dict. in voc.

CINYRA, in the Jewish antiquities, a musical instrument. This and the Hebrew *cinnor*, which is generally translated *cithara*, *lyra*, or *psalterium*, are the same. It was made of wood, and was played on in the temple of Jerusalem. Josephus [a] says, that the *cinyra* of the temple had ten strings, and that it was touched with a bow. In another place he says that Solomon made a great number of them with a precious kind of metal called *electrum*, wherein he contradicts the scripture [b], which informs us that Solomon's *cinnors* were of wood [c]. — [[a] Antiq. l. vii. c. 20. p. 243. ibid. l. viii. c. 2. [b] 1 Kings x. 12. [c] *Calmet*, Dict. Bibl.]

CIONES, Κίονες, in antiquity, a kind of idols very common, being only oblong stones erected pillar-wise; whence also they had their name. *Pott.* Archæol. l. 2. c. 2. T. 1. p. 190.

CIRCADA, a tribute antiently paid to the bishop or archdeacon, for visiting the churches. *Du Fresne. Blount.*

CIRCÆA, a plant called in English the *enchanter's nightshade*. This, in the Linnæan system of botany is a separated genus of plants, the characters of which are, that the calyx or flower cup is a perianthium composed of two leaves, which are oval, concave, and bent downwards, and which fall off with the flower. The flower is composed of two petals, rounded and notched like a heart, equal to one another in size, spread open, and rather shorter than the cup. The stamina are two erect, and longitudinal capillary filaments of the same length of the cup, and are terminated by two roundish antheræ; the pistil is composed of a turbinated germen placed under the receptacle; the style is single, threadlike, and of the same length with the stamina, and the stigma which terminates it, is of an orbicular form. The fruit is a hairy, and oval, turbinated capsule, bivalve, and containing two cells, and naturally opening from the base all along to the extremity. The seeds are contained one in each cell of the fruit, and are oblong, and narrower on their under than on their upper part. *Linnæi* Gen. Plant. p. 3.

The characters of the *circæa*, according to Tournefort, are these: the flower consists of only two leaves, which stand upon a two-leaved cup, which finally becomes a pear-fashioned fruit, divided into two cells, and containing oblong seeds.

The species of *circæa* enumerated by this author are these. 1. The common, or larger, *circæa*. 2. The broad-leaved, white flowered, Canada *circæa*. And, 3. The least *circæa*. *Tourn.* Inst. p. 301.

CIRCEA. See the article CIRCÆA.

The name *circea* is given by some to the mandrake, or common mandragora. *Ger.* Emac. Ind. 2

CIRCIAS *anas*, in zoology, the name of a fresh-water fowl of the duck kind, but smaller than any other species, and known in English by the name of the *summer teale*. It is all over of a dusky yellowish brown, the back a little variegated with white at the tips of the feathers, and the belly diluted with a cast of grey; on the lower part of the belly there are some large black spots. The legs are blueish, and the feet black; it feeds on herbs that grow in fresh waters. *Ray*'s Ornithol. p. 291.

CIRCERELLUS, in zoology, a name used by some authors for the fish usually called ammodytes, or the sand eel. *Boccone*, Mus. de fisci. p. 129. See AMMODYTES.

CIRCITOR, in the antient military discipline, one whose business it was to go the rounds. See ROUNDS, *Cycl.*

CIRCITOR is also used to signify a hawker, or pedlar, who goes about from place to place to vend his goods. *Pitisc.*

CINCINNALIS, in botany, a name given by some authors to the adiantum or maiden-hair. *Ger.* Emac. Ind. 2.

CIRCLE (*Cycl.*) — CIRCLE *of dissipation*. See the article DISSIPATION.

CIRCLE *of curvature*, in geometry, that *circle* the curvature of which is equal to that of any curve at a certain point. See CURVATURE.

It is also called the *circle* of equi-curvature.

CIRCOLO *mezzo*, in the Italian music, is a diminution of four quavers or semiquavers, or notes of equal value, which represent a semi-circle proceeding by conjoint degrees.

CIRCUITS (*Cycl.*) — There are three *circuits* in Scotland, viz. South, West, and North, which the *lords of justiciary* go twice a year, viz. in May and October. See CIRCUIT, *Cycl.* and JUSTICIARY, *Suppl.*

CIRCULATION (*Cycl.*) — The curious in microscopic observations have found an easy method of seeing the *circulation* of the blood in the bodies of animals: for these enquiries it is necessary to choose such animals as are small, and easily manageable, and which are either wholly, or in part, transparent.

The observations we may make by this means are preferable to any others we can have recourse to; since in dissections the animal is in a state of pain, or dying; whereas in animals small enough to be thus viewed, all is left in its usual course, and we see what nature does in her own undisturbed method.

In these creatures also, after viewing, as long as we please, the natural state and current of the blood, we may by pressure and several other ways, impede its course, and by putting various mixtures into the creature's water, induce a morbid state, and finally see the creature die, either by means of this or by any other method, and we may thus accurately observe all the changes it undergoes, and see what occasions the trembling pulse, &c. of dying people. *Baker*'s Microscope, p. 117.

In several of these little creatures also, we are able not only to discover the general course of the blood, but are able perfectly to distinguish the figure and circumstances of the globules of which it is compounded, and the alterations they suffer when they pass out of larger into smaller vessels; for many of the vessels at the extremities are so small, that even the minutest single globules of the blood cannot get through them, without being pressed out of their orbicular into an oval or oblong figure, and the larger of these fine vessels first compress the larger or complex globules of the blood, and then divide them into their smaller constituent globules.

It is amazing to see how careful providence has been to prevent the blood from running into concretions, or coagulations, which might be dangerous to life, even by the very disposition of the vessels it is to run through, which, whether separating or uniting, are so contrived as to cause the globules to come frequently together, with a brisk collision or striking against one another. The arteries which convey the blood from the heart to the extremities, continually lessen as they recede from their source, and the globules of blood must rush with force against one another, as they are driven on impetuously; and the veins which bring it back from the extremities to the heart, enlarging all the way as they go on, and the streams of several continually running into one another, each of these ingresses causes new commotions, capable, though not of dissolving the natural compages of the blood, yet of dividing its unnatural coagulations

The current of the blood in small animals, that is, its passing on through the vessels, either from, or towards the heart, is very easily seen by the microscope; but its *circulation*, that is, its running to the extremities of the parts, and thence returning, is more difficult, because the vessels where this should be seen are so extremely minute, as not easily to come under a regular observation.

The larger arteries are easily distinguishable from the veins by the motion of the blood through them, which, in the veins, is always smooth and regular; but in the arteries, by several propulsions in the manner of pulsation. But this difference is not to be seen in the more minute vessels, in all which, as well arteries as veins, the motion of the blood seems even and regular. The transparent membrane, or web, between the toes of a frog's hinder foot, is a very proper object to observe the *circulation* of the blood in. *Baker*'s Microscope, p 122.

The tails, or fins, of fishes are also very fine objects; and when the fish is very small, these are very manageable, and

afford a view of a great number of veins, and arteries, with a very quick and beautiful ſucceſſion of blood through them. The tail of a flounder may be very conveniently placed before the double microſcope on a plate of glaſs, and its body being ſupported by ſomething of equal height, the fiſh will lye ſtill, and the *circulation* may be ſeen very agreeably. In the minuteſt veſſels, thus examined, the blood always appears pale or colourleſs, but in the large ones it is plainly red. The arteries uſually branch out extremely before they join the veins to carry the blood back to the heart; but this is not always the caſe, for Mr. Lewenhoek has obſerved, that on each ſide of the little griſtles, which give a ſtiffneſs to the tail of a flounder, there may be ſeen a very open communication of the veins and arteries; the blood running toward the extremities, through arteries, and returning back again through veins, which were evidently a continuation of thoſe arteries, and of the ſame diameter with them. The whole fiſh on the tail of which this examination was made, was not more than half an inch in length; it is eaſy to conceive how ſmall the tail muſt therefore be, and yet in it there were ſixty-eight veſſels which carried or returned the blood; and yet theſe veſſels were far from being the moſt minute of all. How inconceivably numerous then muſt the *circulations* in a whole human body be? Mr. Lewenhoek is of opinion, that a thouſand different *circulations* are continually carried on in every part of a man's body in the breadth of a finger nail. See Tab. of microſcopical objects, Claſs 1.

The tail of a newt, or water-lizard affords alſo a very entertaining proſpect of the *circulation* of the blood through almoſt numberleſs ſmall veſſels; but no object ſhews it ſo agreeably as one of theſe animals while ſo young as not to be above an inch long; for then the whole body is ſo very tranſparent, that the *circulation* may be ſeen in every part of it, as well as in the tail; and, in theſe objects, nothing is more beautiful than the courſe of the blood into the toes, and back again, where it may be traced all the way with great eaſe. Near the head there are alſo found three ſmall fins, which afford a very delightful proſpect: theſe are all divided like the leaves of polypody, and in every one of the branches of theſe, the blood may be very accurately traced, running to the end through the artery, and there returning back again by a vein of the ſame ſize, and laid in the ſame direction; and as the veſſels are very numerous and large in this part, and the third or fourth magnifyer may be uſed, there are ſometimes ſeen thirty or forty channels of the running blood at once; and this the more as the globules of blood in the newt are large, and are fewer in number, in proportion to the quantity of ſerum, than in any other animal and their figure, as they are protruded through the veſſels, changes in a very ſurpriſing manner. *Baker*'s Microſcope, p. 122.

Dr. Nichols has contradicted the received doctrine of the motion of the heart, and of the *circulation* of the blood, both in adults and fœtus's. The *circulation* of the blood, according to him, depends on ſix motions: 1°, Of the right auricle. 2°, Right ventricle. 3°, Pulmonary artery. 4°, Left auricle. 5°, Left ventricle; and, 6°, Of the aorta. Of theſe, the firſt, third and fifth, are ſynchronous, as are likewiſe the ſecond, fourth and ſixth; but the firſt, third and fifth are aſynchronous to the reſt: and therefore

The two auricles, The two ventricles, The two arteries } are alternately { relaxed, contracted.

See *Nichols*, Compend. Anat. & Prælect. xv. ap. Med. Eſſ. Edinb. vol. 3.

As for the *circulation* of the blood in fœtus's, we refer to the author himſelf, in his Prælect. xxiv. and to the Medic. Eſſ. Edinb. Abrid. vol. 2. p. 436, 437. where it is obſerved, that the doctor's opinion concerning the *circulation* of the blood in born and unborn animals, is ſo different from what has prevailed ſince Harvey's time, that it were to be wiſhed he would add the experiments and other proofs that can be brought to ſupport his doctrine.

According to Mr. Queſnay, the motions of the heart, and the *circulation* of the liquors, depend on the motion of the lungs, which ſending the blood forcibly into the left auricle, revive and increaſe its elaſticity and contraction by this ſhock, which the auricle communicates to the ventricle, which affects the arteries in the ſame way; and theſe do the ſame to the veins which act upon the right auricle, and that upon its ventricle: and thus the *circulation* is continued. L'Œconomie Animale, p. 227. ap. Med Eſſ. Edinb.

CIRCULATION *in plants*. Blair is of opinion, that there are certain parts of plants which have their peculiar juices, and maintain a *circulation* in themſelves, independent of the reſt of the plant. The fleſhy and thick roots of ſome plants, and the fruits of others, are of this number of peculiar parts. This is analogous to what we ſee in ſome parts of animal bodies alſo. On this ſcheme, the bark, the wood, and the pith of a tree, may be compared to the bones, the ſkin, and the marrow of animals: while the nouriſhment is ſent in abundance to one part of theſe, it is allowed more ſparingly to the reſt. Thus while a young tree ſhoots out its tender boughs in ſpring, the juice aſcends upward to them from the root; but when theſe have acquired their due length, the motion of the ſap is determined upward with leſs violence, and the bark and wood are nouriſhed and increaſed by it. This is the reaſon why in ſpring trees grow in height, and in autumn increaſe in thickneſs. *Blair*'s Tentam. Botan.

Subterranean CIRCULATION. Dr. Plot is one of the many authors who have argued for a ſubterranean *circulation* of water, by means of which many ſprings and rivers are ſupplied with that water which they give again to the ſea. It is probable, indeed, that many of the ſmaller ſprings are ſupplied by rains, only where the country and ſituation are favourable: but the larger rivers, and the ſprings which ſupply them, muſt have their origin from ſuch a ſubterranean *circulation*, ſince all the water that falls in a year in the whole earth, is not one five hundredth part the quantity of that diſcharged into the ſea at the mouths of rivers, as appears by careful and moderate calculations. There are ſome ſprings which ebb and flow with the ſea: theſe cannot be doubted as to their origin, which is evidently from that body of water whoſe motions they are influenced by. Nor is the caſe much leſs clear in regard to thoſe lakes which have ſalt water and ſea fiſh in them, and yet have no communication with any ſea by any known cut or paſſage.

The number of ſhell-fiſh and parts of ſea animals dug up in ſeveral places, at great depths at land, are alſo urged by ſome as proofs of ſuch ſubterranean paſſages of the ſea water; but theſe are too univerſally diſtributed thro' the ſtrata of the earth, to have been brought in this manner, and are therefore rather ſuppoſed to be owing to the great change made in the earth at in the days of Noah.

CIRCUMAGENTIUM *femoris primus*, in anatomy, a name given by Spigelius, and ſome others, to a muſcle of the thigh, called by Riolan and ſome others the iliacus externus, but more generally, from its ſhape, the pyriformis and pyramidalis.

CIRCUMAGENS *interior*, in anatomy, a name given by Spigelius and others to one of the muſcles of the eyes, called by Albinus and others the obliquus ſuperior oculi, and trochlearis muſculus. See TROCHLEARIS.

CIRCUMCELLIONES, in church hiſtory, a ſet of heretics who went about from town to town, calling themſelves the vindicators of the public liberty. *Hofm.* Lex. in voc.

CIRCUMGYRATION, the wheeling motion of any body round a center.

CIRCUMPOTATIO, in antiquity, a funeral feaſt, provided in honour of the dead.

This was very frequent among the antient Romans, as well as among the Athenians. Solon at Athens, and the decemviri at Rome, endeavoured to reform this cuſtom, thinking it abſurd that mirth and drunkenneſs ſhould mingle with ſorrow and grief. *Pitiſc.* Lex. Ant. in voc.

CIRCUMSCRIBED *figure*, in geometry. See CIRCUMSCRIBING, *Cycl.*

CIRCUMSCRIBED *hyperbola*, one of the ſecond order, according to Sir Iſaac Newton, which cuts its aſymptotes, and contains the parts cut off within its own ſpace. *Stone*, Math. Dict. See HYPERBOLA, *Cycl.*

CIRCUMSCRIPTION. See CIRCUMSCRIBING, *Cycl.*

CIRCUMSPECTE *agatis*, the title of a ſtatute made ann. 13 Edw. I. relating to prohibitions, preſcribing certain caſes to the judges, wherein the king's prohibition lies not. *Blount.* Law Dict. in voc.

CIRCUS, in zoology, a name by which Bellonius and ſome others have called the milvus æruginoſus, or moor buzzard. *Bellon.* de Avibus. See the article MILVUS.

CIRLUS *ſtultus*, in zoology, the name of a bird of the hortulanus kind, and of the ſize and ſhape of our common yellow-hammer. The hinder part of the head and the back are of a ferrugineous colour, variegated with large black ſpots: the fore-part of the head has a very large grey ſpot: the breaſt and belly are of a ferrugineous colour, without any variegation: the tail and the long feathers of the wings are black, but are tipped at the extremities with the colour of the back: the wings have ſome ſmall white ſpots alſo; and the tail has two feathers on each ſide which are variegated with white. *Aldrov.* Hiſt. Avium, l. 18. c. ult.

CIRRIS, in zoology, the name of a ſmall ſpecies of heron, called by ſome the ardea hæmatopus, or the red-legged heron. It is very ſmall: its neck is ſhort for a bird of the heron kind, and it is all over of a yellowiſh cheſnut colour, deeper below, and paler on the back and wings: its tail is ſo ſhort that it ſeems to have none; and its head and neck have black variegations on their yellowiſh feathers. Its legs and feet are very beautifully red. *Ray*'s Ornithol. p. 206.

CIRSIUM. See *gentle* THISTLE.

CIRSOS, Κιρσος, in medical writers, is uſed for *varix*. See VARIX, *Cycl.*

CIRRUS (*Cycl.*) — CIRRUS, in ichthyology, a name given by authors to certain oblong and ſoft appendiculæ hanging from the under jaw of fiſhes, or from other parts about the mouth, in the manner of little worms, and uſually of a cylindric figure, or nearly ſo. Theſe *cirri* are in ſome fiſh hollow at the root; in others they are not ſo: in thoſe which are hollow at the root, the cavity never runs quite thro'. The way of finding it is by introducing a hog's briſtle or a hair into it; but this cannot be forced thro' to the point, nor can any fluid matter be expreſſed out of them.

Theſe

These *cirri* often afford characters of distinction to several kinds of fishes, and differ in the several species in regard to number, size, and proportion. As to number; 1. in the greater part of fishes there are none. 2. In some of the gadi, and some other fish, there is only one *cirrus*; and, 3. They are more than one, as in the mullet, sturgeon, and cyprinus nobilis.

In regard to situation, they are in some placed on the under jaw, as in the gadi, liggri, &c. 2. In others, they are placed at the angles of the mouth, as in the barble, the cyprinus, nobilis, &c. and, 3. In some they are placed both on the upper and under jaw, as in the silurus, cobitis, &c.

In regard to their differences in proportion, they are, 1. In most fishes small, and much shorter than the head, as in the gadi, mullets, &c. 2. They are in some longer than the whole head, as in the case of the two upper *cirri* of the silurus. The use that these *cirri* are of to the fish, is little more known than that of the antennæ of insects. If nature had given them only to those fishes which had the eyes placed on the upper part of the head, then they might be supposed to serve to distinguish prey at the bottom, while the eyes were directed to such as offered itself nearer the surface: but as the several kinds of fish which have them are of different kinds, and have their eyes in various directions, this use cannot be allotted them. It is possible they may be of use to the fish, in giving it the first notice of any distant motion of the water, which they may perceive by their hanging posture sooner than any other part, and thus give notice of the neighbourhood of prey, or of the approach of an enemy. *Artedi*, Ichthyol.

CIRRUS, in antiquity an ornament added to the edges and borders of garments, much in the manner of the *fimbriæ* or fringes, only that these were single, and run along the borders of the dress; whereas the *cirri* were knotted together, and hung down from the extremities of the robe. *Pitisc.* Lex. Ant in voc.

CIRRUS, among botanists, expresses the little fibres which plants send out from their stalks, and by which they are attached to other bodies. See STALK.

CISLEU, the ninth month in the ecclesiastical year, and the third in the civil or political year among the Hebrews: it answers pretty nearly to our November. *Calm* Dict. Bibl.

CISSAMPELOS, in botany, the name of a genus of plants, called by Plumier *caapeba*. The characters of the genus, as collected by Linnæus from that author, are these: the flower consists of four oval petals, which are flat and expanded. The fruit which succeeds the female flowers is a globose berry, containing only one cell, with a single rugose seed. This fructification is at present very little known; and it is much to be wished, that some accurate observer would take a stricter account of it upon the spot. *Plumier*, 29. *Linnæi* Gen. Plant p. 517.

CISSITES, in natural history, a name given by the antients to that species of the flinty ætites, or eagle-stone, which is covered with the common white coat of the flints. Pliny mentions it as found principally about Captos, and being externally of a white colour, and rattling when shaken.

CISSUS. This is properly in the Greek writers the name of the ivy. They write it κισσος. But the word κισθος, *cistus*, when the θ is changed into an σ by the Cretan and Cyprian dialect, is also κισσος, *cissus*.

The commentators on Pliny have been strangely confounded, about goats eating ivy, and the ivy of the antients bearing great red flowers, and instead of the stinking gum it affords with us, yielding the sweet labdanum in Cyprus: but all this is reconciled by knowing, that Pliny translated it all from Theophrastus, and mistook the *cissus* in this place of the text to mean ivy, whereas it really means *cistus*. See CISTUS.

CISSYBIUM, in antiquity, a drinking cup, most in use among country people. It was so called either because it was made of the wood of ivy, or was usually crowned with its leaves.

CISTERN (*Cycl.*) — Antiently there were *cisterns* all over the country in Palestine. There were some likewise in cities and private houses. As the cities for the most part were built on mountains, and the rains fell regularly in Judea at two seasons of the year only, in spring and autumn, people were obliged to keep water in *cisterns* in the country, for the use of their cattle, and in cities, for the conveniency of the inhabitants. There are *cisterns* of very large dimensions to be seen still at this day in Palestine, some whereof are an hundred and fifty paces long, and fifty-four wide. There is one to be seen at Ramah of two and thirty paces in length, and eight and twenty in width. Wells and *cisterns*, fountains and springs, are generally confounded in the scripture language. *Calmet* Dict. Bibl.

If the farmers of England would fall into the method used in Spain, and at Amsterdam, Venice and other places, of saving the rain-water of the whole year, or at least so much of it as would be necessary, in *cisterns*, they would have always water for their cattle in the summer droughts, and many thousand acres of land, now left useless, might be turned to profit.

The best way of preserving the water for the service of the house, is in *cisterns* in the cellars. These may be made with brick or stone, joined with plaister of Paris, which will keep out the wet very well; or with a kind of mortar made of slaked sifted lime, with linseed oil, and tow or cotton. A bed of good sound clay may be laid at the bottom, and on this the bricks for the floor, and then the walls may be raised in the same manner, only leaving spaces behind them, into which clay is to be rammed in the like manner. Thus it will be a clay *cistern*, faced with brick; and the bricks will keep the clay moist, and prevent it from cracking, tho' it be not full of water. This will do in any shadowy place, as well as in cellars: and thus may a *cistern* be made in a garden, in some shady place, and covered over, which may receive the water running from the walks, and will retain it at hand, for the service of the garden, all the year.

Where there is want of water for the cattle in the fields, the way is to dig a pond in some place into which there is a descent; then cover the bottom and sides with a double coat of tough clay, each six inches thick, and each very well rammed: then to cover the bottom with large stones, which will keep the clay moist, and prevent its cracking, when not covered with water. But this is a troublesome thing; for if there happen to be a crack in any part, it is often found necessary to go over the whole work again before the pond will hold a drop of water.

Another method of making a pond hold water, is to daub it over with clay and mortar mixed together, and then with mortar alone. This has an advantage over the other way, in that if any crack happen, it may be mended by a cement of clean hair and tallow, mixed with slaked lime and the yolks of eggs, well beat together. This applied to the crack, will close it safely, without the necessity of undoing the whole work, as in the other case.

In chalky countries it is common to find a low place on the downs, and digging a hole by way of a pit there, they cover the bottom evenly with the chalk rubbish, and when it is wetted by the rain, they ram it well, and afterwards drive cattle into it, and fold sheep in it: the consequence of all which trampling is, that the bottom at length becomes so firm, that it holds the water perfectly well. By one or other of these means, *cisterns* or reservoirs may be made in all countries: and our farmers, if they would carefully try one or the other of them, as their land most required, would not have so much to complain of from droughts. *Mortimer*'s Husbandry, p. 299.

CISTUS, in botany, the name of a genus of plants, the characters of which are these: the flower is of the rosaceous kind, composed of several petals, arranged in a circular form. The pistil arises from the cup of the flower, and finally becomes a roundish or pointed multicapsular fruit, which, when ripe, opens at the top, and generally contains a number of small seeds.

The species of *cistus* enumerated by Mr. Tournefort, are these: 1. The larger male *cistus*, with a roundish leaf. 2. The larger male *cistus*, with a longish leaf. 3. The male *cistus*, with shorter leaves. 4. The Portugal *cistus*, with large hoary leaves. 5. The small *cistus*, with long hoary leaves. 6. The male *cistus*, with curled and undulated leaves. 7. The female, erect, sage-leav'd *cistus*, with upright shoots. 8. The low, procumbent, sage-leav'd, female *cistus*. 9. The ladanum *cistus* of Montpelier. 10. The Spanish willow-leav'd ladanum *cistus*, with white flowers. 11. The Spanish willow-leav'd ladanum *cistus*, with white flowers with black spots. 12. The bay-leav'd ladanum *cistus*. 13. The large ladanum *cistus*, with leaves like the black poplar. 14. The smaller ladanum *cistus*, with leaves like the black poplar. 15 The broad-leav'd cretic ladanum *cistus*. 16. The hairy ladanum *cistus*. 17. The narrow, olive-leav'd, ladanum *cistus* 18. The common, narrow leav'd, ladanum *cistus*. 19 The rough, rosemary-leav'd, ladanum *cistus*: and, 20. The smooth, rosemary-leav'd ladanum *cistus*. *Tourn.* Inst. p. 259.

The several species of this beautiful shrub are to be propagated by sowing their seeds on a gentle hot bed, or on a warm border of common rich earth in March. When the plants are grown to be three inches high, they should be transplanted either into small pots, or into a border of rich earth, placed at ten inches distance. They will require some screening from hard weather for the first winter, and must be watered at times. In the spring following, they must be very carefully removed, with as much as possible of their own earth about them, and be placed where they are to remain. They are very bad plants to remove when old.

They may also be propagated by cuttings, planting them in a rich bed, and shading them with mats, and watering them carefully for two months: they will by that time have taken root, and may be treated as the seedling plants of the same age. *Mill.* Gard. Dict.

CISTUS, in the writings of the antient Greeks. The Greeks wrote this word κισθος, *cisthus:* and, as the word in the Latin tongue is only the Greek name with a Roman termination, it undoubtedly ought to be spelt *cisthus*, not *cistus*. The antient writers have been subject to many misrepresentations from the near resemblance of this word κισθος, *cisthus*, to κισσος, *cissus:* the former being the name of the plant we call *cistus*, a shrubby herb, with leaves like sage, and a large flower resembling a rose; and the other, the name of the common ivy that climbs upon our walls and trees. Pli-

ny has been deceived by the near reſemblance of the two words, and has given the qualities of ivy to the *ciſtus*, and thoſe of *ciſtus* to the ivy: but he is the more excuſable in this, ſince we find the two names uſed indiſcriminately, tho' certainly by a miſtake of the copyiſts, in the books of Theophraſtus.

This author certainly meant it of the *ciſtus*, that it was of two kinds, the male and female; ſo he expreſſes the having two colours in the flowers, red and white; for he never could give us this account of the ivy: yet his tranſcribers have given κιττος, *ciſſus*, ivy, not *ciſthus*, or *ciſtus*, for the name of the plant of which the author ſays this. Theophraſtus, in another place, ſays, that the male *ciſtus* has a flower in all reſpects reſembling a roſe, but that it is ſingle, and has no ſmell: this alſo is attributed to the *ciſſus* by the copies; and from this is derived that ſtrange error of Pliny, who ſays, that the ivy has a large purple flower, like the ſingle wild roſe. It is true, indeed, that Pliny gives the word hedera here, which has no alliance with, or reſemblance to the name of any other plant, and therefore it could not eaſily be believed that he could mean any other. But when we find that Pliny, who was himſelf no botaniſt, but only a compiler of the opinions of others, tranſlated this paſſage from ſo warrantable an author as Theophraſtus, and that the copyiſts of Theophraſtus had given the word *ciſſus* inſtead of *ciſthus* in the place, which word *ciſſus* might very juſtly, in the general, be tranſlated *ivy*, we find Pliny, as a collector (which is the light in which all judicious people look upon him) to be very pardonable. The variation in the orthography of the word κισθος, *ciſthus*, may be indeed juſtified, as to the ſtrictneſs of grammar, by the uſe of one of the Greek dialects, which turns θ into σ: thus the word αθανα is written by ſome ασανα, and Θεος, Σεος. But in a caſe where the uſe of this dialect was wholly unneceſſary, and where it brought in ſo much confuſion, by rendering the names of two different plants the ſame, it is not to be imagined that ſo correct a writer as Theophraſtus, or ſo judicious a botaniſt as he appears to be throughout his whole treatiſe of plants, would have himſelf indulged the uſe of it.

Paulus Ægineta has a chapter about *ciſſus*, which is not to be underſtood as the name of ivy, but of the *ciſtus*; and Theocritus, when he tells us that the *ciſſus* flowers like the roſe, evidently means the *ciſtus*, not the ivy. The Greek writers of later times have added yet to the confuſion, by calling the common wild or dog roſe *ciſſus*; but this is more rarely met with. The old ſcholiaſt on Theocritus gives the *ciſſus* and cynorrhodon as ſynonymous words. See the article HEDERA.

CITADINESCA, in natural hiſtory, a name given by ſome writers to the Florentine marble, which is ſuppoſed to repreſent towns, palaces, ruins, rivers, &c. Theſe delineations are merely accidental, and are uſually much aſſiſted by the imagination, tho' the natural lines of a ſtone may ſometimes luckily enough repreſent the ruins of ſome antient building, or the courſe of a river. We have in England a kind of ſeptaria, or ludus helmontii, which has ſometimes delineations of this kind conſiderably beautiful, tho' very irregular. The Florentine marble, as we ſee it wrought up in the ornaments of cabinets, &c. owes a great deal to the ſkill of the workmen, who always pick out the proper pieces from the maſs, and diſpoſe them in the work ſo as to make them repreſent what they pleaſe.

CITHARA. See KINNOR.

CITHAROEDUS, in antiquity, the ſame with *cithariſta*. The *citharoedi* had the preference of all other muſicians, from whom they were diſtinguiſhed by an embroidered cloak, which was peculiar to them. *Pitiſc.* Lex. Ant. in voc.

CITHARUS, in zoology, the name of a fiſh common in the markets of Rome and Venice, and frequent in the German and Mediterranean ſeas. It is a flat fiſh, of the turbut kind; but it is covered with large ſcales. *Geſ.* p. 269.

CITILLUS, in zoology, the name of a ſmall animal of the mouſe kind, which lives in caves and holes of the earth. Its body is of the ſhape of the common weaſels, very long and thin: the tail is very ſhort. Its colour is a pale ſilvery grey, like that of ſome rabbits. It reſembles the mole in its want of external ears; but it has apertures which ſerve it to the ſame purpoſe, in the manner of birds. They live together in communities, great numbers being uſually found in the ſame cave, with a large ſtore of nuts, cheſnuts, and other fruits. Their fleſh is very well taſted, and their ſkin much uſed in cloathing in the cold countries. They are found not only in the very cold climates, but in Bohemia, Auſtria, and Hungary. *Ray*'s Syn. Quad. p 220.

CITIZEN (*Cycl.*) — The Romans were antiently ſo particularly careful to preſerve even their common *citizens* from any mixture of ſervile blood, that they prohibited all marriages between them and freed ſlaves, or their children. And it was decreed, as a ſpecial privilege and reward to one Hiſpala, of libertine condition, for her diſcovery of the impieties of the bacchanalian myſteries, that a *citizen* might take her to wife, without any diſgrace and diminution of his rights[a]. Theſe diſtinctions, indeed, began to be diſregarded towards the end of the republic, with reſpect to the ordinary *citizens*, but were kept up to the laſt, with regard to the ſenate[b]. — [a *Liv.* xxxix. 19. b *Middlet.* of Rom. Sen. p. 105.] See the article SENATOR.

CITRAGO, in botany, a name given by ſome authors to the common garden balm. *Ger.* Emac. Ind. 2.

CITREÆ *menſæ*, in antiquity, tables made of the wood of the citron-tree, very beautiful, and greatly eſteemed by the antient Romans. See CITREUM.

Many people have ſuppoſed this citrum to be the ſame with the cedar, and have judged partly from the ſimilitude of ſounds between *citreæ* and *cedreæ menſæ*, that theſe works of the antients were all made of cedar: but the Greeks diſtinguiſh them every where, calling the cedar, cedrus, κεδρος, not thya; nor did they ever confound the two trees together.

CITREUM, the *citron tree*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, being compoſed of ſeveral petals, arranged in a circular form. The piſtil ariſes from the cup, and finally becomes an oblong fruit, with a very thick pulp, divided into ſeveral cells, and containing juicy matter, and veſicles with callous ſeeds. To this it is to be added, that the leaves are ſimple, not heart-faſhioned at the bottom, as thoſe of the orange.

The ſpecies of *citron* enumerated by Mr. Tournefort, are theſe: 1. The common *citron*. 2. The ſweeter taſted *citron*. 3. The great-fruited *citron*. 4. The *citron* of Corcyra: and, 5. The Cretic *citron*. *Tourn.* Inſt. p. 620. See CITRON.

CITRIL, in zoology, a name given by many to the citrinella, or verzellino, a bird common in Italy, and kept in cages for its beauty and fine notes: called by many authors alſo thraupis. See the following article.

CITRINELLA, in zoology, the name of a ſmall bird, common in Italy, and very much reſembling our common linnet in ſhape. Its head and back are green; its rump of a greeniſh yellow, and its neck, with ſomewhat of the hindmoſt part of the head, grey. In ſome birds of this ſpecies, the head, the upper part of the neck, and the ſhoulders, are of a variegated colour, with a mixture of brown and yellowiſh green. Its breaſt and belly are all green in the female, but in the male the upper part of the breaſt and the belly are yellow: the tail is black, tipped with green; and the wings are alſo black, tipped ſometimes with green, ſometimes with white. Its beak is very ſhort and ſtrong, and its feet fleſh-coloured, or whitiſh. It ſings very finely, and is kept in cages in many parts of Italy. *Ray*'s Ornithol. p. 193.

CITRINUS, in natural hiſtory, the name of a peculiar ſpecies of ſprig cryſtal, which is of a beautiful yellow. Many of the common cryſtals, when in the neighbourhood of lead mines, are liable to be accidentally tinged yellow, by an admixture of the particles of that metal; and all theſe, whether finer, or coarſer, have been too frequently confounded together, under the name *citrine*; but Dr. Hill has aſcertained this to be a peculiar ſpecies of cryſtal, different from all the other kinds in form, as well as colour, and diſtinguiſhed by the name of *ellipomacroſtylum lucidum flaveſcens pyramide brevi*. It is never found colourleſs, like the other cryſtals, but has great variety of tinges, from that of deeper ochres to a pale lemon colour. It is very plentiful in the Weſt Indies, and is found in ſome parts of Bohemia. Our jewellers have learnt from the French and Italians, who are very fond of it, to call it *citrine*, and often cut ſtones for rings out of it, particularly out of the pyramid, which is always finer than the column, and theſe, after they have paſſed through two or three hands, are generally miſtaken for topazes. *Hill*'s Hiſt. of Foſſ. p. 180.

CITRON (*Cycl.*) — We have ſeveral ſpecies of this tree in the greenhouſes about London; their culture and management is the ſame with that of the orange, ſee ORANGE; but they are tenderer and ſhould have a warmer ſituation in winter, otherwiſe they are ſubject to caſt their fruit; they ſhould alſo continue a little longer in the houſe in ſpring, and be carried ſooner into it in autumn, and have a warmer, and better-defended ſituation in ſummer. *Miller*'s Gardner's Dict. See CITREUM.

CITRON *wood*, the wood of an American tree, called by the natives candle-wood, becauſe being cut into ſplinters, it burns like a candle. The tree is frequent in the Leeward iſlands, and grows to a conſiderable ſize; the leaves are like thoſe of the bay tree, but of a finer green; the flower is ſweet and much like thoſe of the orange; the fruit ſucceeding theſe is black, and of the ſize of a pepper-corn. The trunk is ſo like the yellow ſaunders in colour, that there was once an opinion that it was the ſame tree, and much of it was imported into Europe, and ſold as ſuch; but they were ſoon found to be different, the true ſaunders being of a ſweet ſcent, and but moderately heavy and reſinous, but the *citron* wood conſiderably heavy, very oily, and of a ſtrong ſmell. It is of no known uſe in medicine, but is uſed in France and Germany by the turners, being a firm fine grained wood, and taking a fine poliſh, and with age becoming of a very beautiful brown. *Pomet*'s Hiſt. of Drugs, p. 64.

CITRUL, *citrullus*, in botany, a name given to a genus of plants otherwiſe called *anguria*. See ANGURIA.

The

The ſeeds of this plant have the ſame medicinal virtues aſcribed to them with the gourd. See GOURD.

CITRUM. The antient Romans had a ſort of tables made of an elegant wood, and called *citrum*; theſe have been ſuppoſed by ſome to be made of the wood of the *citron* tree, and by others of the cedar; but it appears plainly that they were made of neither, but of a wood peculiar for its fineneſs, and very different from both. The antient Greeks have deſcribed the cedar under the name κεδρος, and the *citron* tree under the name *malus medica*; and beſide theſe they have deſcribed another tree under the name of *thya*. This was different from both the others, and was that which afforded the wood of which the fine *citreæ menſæ* of the Romans were made, the Greeks calling them thyina. Though Theophraſtus, however, never confounds the thya and cedrus together, yet Ariſtotle is by ſome ſuſpected to have done ſo; and either that is the caſe, or elſe Vitruvius has miſtaken him, for he has tranſlated what he ſays of the cedrus to the name of the *citrum*, the Latin name of the thya. Ariſtotle ſays, that there is a ſpring near Carthage, on which there ſwims an oil ſmelling like the ſaw duſt or ſhavings of the cedrus, and Vitruvius has tranſlated it ſmelling like the ſhavings of the *citrum*.

The more modern writers of the Mooriſh hiſtory tell us, that about mount Atlas, and in ſome of the iſlands on the coaſts of Africa, there grow cedars which much reſemble the cypreſs tree; and of the wood of their trunk, they at this time make very beautiful tables, and of a large price. The name cedar is become very uncertain in its ſignification, and we at preſent call the junipers of the Weſt Indies the Virginia and Bermudas, cedars. It is poſſible that this cedar of the Africans which grows like the cypreſs, may be the *citrum* of the Latins, and thya of the Greeks, and that the *citreæ* and *thyinæ menſæ* may have been made of its wood. Vitruvius alſo tells us of trees reſembling the cedar in their growth, and the cypreſs in their leaves. Theſe muſt be different from both, and muſt have a peculiar name, and might probably have been the trees called *thya* by the Greeks, and *citra* by the Latins, of which theſe famous tables were made.

The words cedrus and *citrum* ſeem to have been ſtrangely confounded together by writers of various nations. The Arabian phyſicians call the pitch of the cedar tree, not cedrum, as might have been ſuppoſed, but *citran*, as if it came from the *citrum*; and the modern Greeks and Latins have called the *citron* fruit κεδρομηλα, and cedromela, not citromela, as if they grew upon the cedar, not the *citron* tree. Neophytus and Iſidore always uſe theſe words in this ſenſe. Athenæus is of opinion that the words are properly the ſame in their origin, and that the *citrum* is a new corruption of the word cedrium, as the old writers ſometimes call the cedrus. But this is an unwarrantable opinion. It is ſcarce certain that the word *citrum* is properly Latin for the tree which bears the *citron* fruit, they having always called this medica malus, and expreſſed only the tree of whoſe wood they made tables, &c. by the name *citrum*. Juba is the firſt of the Greek writers who has called the *citron* tree by the name *citrum*. He ſeems to expreſs its having been called by that name by ſome of the Romans; and the whole confuſion will be found at length to turn upon this: The Romans originally gave the name of the *citrum* to the unknown tree whoſe wood they received from Africa for making their tables; after this finding that the *citron* fruit, or medica malus came alſo in great abundance from the ſame country, they haſtily concluded, that it grew upon the tree whoſe wood they ſo much valued, and called it the *citrum* fruit. Theſe fruits were alſo called the Heſperian apples, and Pliny ſeems of opinion, that a tree very like that which produced the *citron* wood bore theſe, though not wholly the ſame: he ſays it was called by the ſame name. The antients called theſe fruits the Heſperides, the mala medica, and mala Aſſyria, as they received them from Aſſyria, Media, and other places. Vid. *Vitruv.* l. 2. c. 11.

CITULA, in ichthyology, a name given by Paulus Jovius, and others to the fiſh we call the doree, and the generality of authors faber. Pliny calls it zeus, and Artedi has hence made zeus the generical name, comprehending this, and ſeveral other ſpecies, under this arrangement. The faber is called the zeus, with the prickly belly, and with the tail rounded at the end. This is the true ſpecific name of the *citula*.

CIVES, in botany, a very ſmall ſpecies of onion, which never produces any bulbs, and ſeldom grows above ſix inches high in the blade, which is very ſmall and ſlender, and grows in tufts and bunches. This uſed to be in great requeſt for ſallads in ſpring, as being milder than other onions which had ſtood the winter, but at preſent it is not much regarded. The way of propagating it is by parting the roots in autumn, and planting them, at ſmall diſtances, three or four in a hole, they will ſtand the winter very well, and be fit for uſe early in the ſpring.

CIVET-*cat*. See ZIBETHICUM *animal*.

CLADEUTERIA, κλαδευτηρια, in antiquity, a feſtival celebrated at the time of pruning the vines. It was likewiſe called *biſbæa*. *Pott.* Archæol. Græc. l. 2. c. 20. T. 1. p. 409.

CLADIUS, in natural hiſtory, a name given by the antients to the ſtag, or deer, when four years old; in this year, or at the end of it, it was alſo called *ceraſtes*. The Greeks had names for all the years growth of this animal up to its perfection: in the firſt year they called it *nebrus*; in the ſecond *pattalea*; in the third *dicrotus*; and in the fourth *cladius*, or *ceraſtes* toward the end of that year. This name the creature retained all its life afterwards, it being ſuppoſed at its full maturity at that time.

CLAIM (*Cycl.*) — CLAIM *of liberty*, a ſuit or petition to the king in the court of Exchequer, to have liberties and franchiſes confirmed there by the king's attorney-general. Co Ent. 93.

CLAKIS, in zoology, a name given by the people of Lancaſhire, and ſome other places, to the bernacle, a ſmall ſpecies of wild gooſe. See BERNACLE.

CLAMATOR, in antiquity, was uſed to ſignify a domeſtic officer, whoſe buſineſs was to call the gueſts to dinner.

CLAMOR *bellicus*, in antiquity. See HUZZA, and SHOUT.

CLAMP-*nails* are ſuch nails as are uſed to faſten on *clamps* in building and repairing of ſhips.

CLAMPONNIER, or CLAPONNIER, in the manege, a long-jointed horſe, that is, one whoſe paſterns are long, ſlender, and over pliant. *Guill.* Gent. Dict. in voc. *Corneille*, Dict. des Arts in voc. *claponnier*.

The word is obſolete, and is properly applicable only to the ox kind: for *la claponniere* in French, is in them what the paſtern is in a horſe. *Guil.* & *Corneille* Dict. des Arts, ibid.

CLANDESTINA, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of the perſonated kind, being tubular in its lower part, and in its upper, divided into two lips, the upper of which is ſingle and arched, the lower is divided into three ſegments; the cup is tubular, and crenated at the edge, and from it there ariſes a piſtil, which perforates the lower part of the flower, and finally becomes a longiſh unicapſular fruit, which is endued with an elaſtic force, and burſts open with violence, when ripe, diſcharging many roundiſh ſeeds.

The ſpecies of *clandeſtina* are; 1. The blue-flowered *clandeſtina*. And, 2. the *clandeſtina* with white flowers, which is properly only a variety of the former. *Tourn.* Inſt. p. 652.

CLANGULA, in zoology, the name of a ſpecies of duck found about the ſea coaſts, and called in Engliſh the golden eye. Its body is ſhort and thick; its head large, and its neck ſhort; its beak is ſhort and broad, and is all over black; its head is of a very obſcure and duſky green, yet gloſſy, and there is a large white ſpot at each angle of the beak; the iris of the eyes are of a beautiful yellow; the neck, ſhoulders, breaſt and belly are white, and the back black; the wings are black and white, and the tail is wholly black; the legs are very ſhort, and the feet very broad, and both are of a ſaffron colour; the hinder toe is ſmall, but is edged on each ſide by a membrane, which adds much to its breadth. See Tab. of Birds, N° 50. and *Ray*'s Ornitholog. p. 282.

CLAP (*Cycl.*)— CLAP-*board*, a board cut, in order to make caſks or veſſels.

CLAP-*net*, in birding, a ſort of net contrived for the taking of larks with the looking-glaſs, by the method called daring, or doring. The nets are ſpread over an even piece of ground, and the larks are invited into the place by other larks faſtened down, and by a looking-glaſs compoſed of five pieces, and fixed in a frame, ſo that it is turned round very ſwiftly, backwards and forwards, by a cord pulled by a perſon at a conſiderable diſtance behind a hedge. See DORING.

CLAR, or CLAER, in metallurgy, bone aſhes perfectly calcined, and finely powdered, kept purpoſely for the covering the inſides of coppels. *Cramer*, Art of Aſſ. p. 53. See COPPEL.

CLARAMONT *powder*, the name of a medicinal powder, very famous in Venice, and ſome other places, for its virtues in ſtopping hæmorrhages of all kinds, and in the cure of malignant fevers. It has its name from the perſon who firſt found out its virtues, and who has written a book expreſly about it. It is a white earth found near Baira, not far from Palermo, and is thence called alſo by ſome writers, *Terra de Baira*. *Boccone.*

CLARETUM, in pharmacy. See CLARET, *Cycl.*

CLARIAS, or CLARIAS *Niloticus*, in zoology, the name of a fiſh of the muſtela kind, common in the Nile, and brought to market at Memphis, and in many other parts of Egypt, but of an inſipid taſte, and eaten only by the poorer ſort of people. Its common ſize is a foot in length, and the thickneſs of a man's arm; its head is ſomething like that of the uranoſcope, and is large and fleſhy; the ſpace between the eyes is large, and the eyes themſelves are large alſo, and are placed as in the before-mentioned fiſh; it has two long beards of half a foot each; the upper jaw has two rows of teeth, and the under one is only notched like a file; the tail is broad and forked, and has externally two horny appendages of a round figure, and a hand's breadth in length, in which it differs from all other fiſhes. *Bellonius.*

CLARIGATIO, in Roman antiquity, a ceremony that always preceded a formal declaration of war. It was performed in this manner; firſt four heralds crowned with vervain were ſent to demand ſatisfaction for the injuries done the Roman ſtate. Theſe heralds, taking the gods to witneſs that their demands were juſt, one of them, with a clear voice, demanded reſtitution within a limited time, commonly thirty three days; which being expired, without any reſtitution made, then the *pater patratus*, or prince of the heralds, proceeded to the enemies frontiers, and declared war.

CLARIGATIO is alſo uſed for the apprehending a man, and holding him to bail. The Greeks called this action *androlepſion*.

CLARINO, in the Italian muſic, ſignifies a trumpet; thus, *a doi clarini*, added to any compoſition, denotes that it was made for

for two trumpets. *Broſſ.* Dict. Muſ. in voc. See the articles TRUMPET and CORNET.

CLARISSIMI, among the Romans, a title of honour belonging to the third rank of nobility under the emperors. See the article SPECTABILES.

CLARK-*goose*, in natural hiſtory, a ſpecies of wild-gooſe found in Zetland. Phil. Tranſ. N° 473. Sect. 8.

CLARY, *horminum*, in medicine, &c. See HORMINUM.

CLASMIUM, in natural hiſtory, the name of a genus of foſſils of the claſs of the gypſums, the characters of which are, that they are of a ſoft texture, and of a dull and opake look, being compoſed, as all the other gypſums, of irregularly arranged flat particles.

The word is derived from the Greek κλασμα, a fragment, or ſmall particle, from the flaky ſmall particles of which theſe bodies are compoſed: of this genus there is only one known ſpecies; this is of a tolerably regular and even ſtructure, though very coarſe and harſh to the touch. It is of a very lively and beautiful pale red in colour, and is found in thick roundiſh maſſes, which, when broken, are ſeen to be compoſed of irregular arrangements of flat particles, and emulate a ſtriated texture. It will neither give fire with ſteel, nor ferment with acids, but calcines very freely and eaſily, and affords a very valuable plaiſter of Paris, as do all the purer gypſums. It is common in Italy, and is greatly eſteemed there; we have of it alſo in ſome parts of Derbyſhire, but with us it is not particularly regarded, but burnt among the reſt. *Hill*'s Hiſt. of Foſſ. p. 117.

CLATHARUS, in botany, a name given by Micheli, and continued by Linnæus, to a genus of muſhrooms, the characters of which are theſe: they are always of a roundiſh figure, and have a reticulated and hollowed body, as if full of windows, with ramifications every where annexed.

CLATHRI, in antiquity, bars of iron, or wood, uſed in ſecuring doors and windows.

There was a goddeſs that preſided over *clathri*, called *Clathra*. *Pitiſc.* Lex. Ant. in voc.

CLATTE, in heraldry, a term borrowed from the French, to expreſs ſuch lines as are ſometimes found in the old paintings, and engravings of arms. Theſe lines are of an irregular kind, and not reducible to any other proper lines of heraldry, as the engrailed, indented, embattled, or the like. *Niſbet*'s Heraldry, p. 22.

CLAVARIA, in botany, the name given by Vaillant, and continued by Linnæus, to a genus of fungus's, the characters of which are, that they grow perpendicularly, and have a ſimple and uniform ſurface; theſe have been called alſo by the ſame Vaillant, under ſome ſmall varieties in the ſpecies, *corallo-fungus*, and by Tournefort *coralloides*. Dillenius has called them *fungoides*. From this confuſion of names among the other authors, may appear the uſe of the new names given to the genera of plants by Linnæus, ſince no body hereafter will fail to know what is meant by the word *clavaria*, whereas fungoides was a name common to this genus, and to many others in different authors, every thing having been called by it that was of a fungous ſubſtance, and manner of growth, and yet differed from the common muſhrooms in figure: and the other name coralloides is uſed by Dillenius in a very different ſenſe, he making it a claſſical character for a large ſeries of moſſes, including under it all thoſe that are of a tough texture, and want leaves, ſuch as the horned moſs, the branched heath moſs, the cup moſs, and many others, which form diſtinct genera under the name of cup coralloides, ſhrub coralloides, horned coralloides, and the like.

CLAVARIUM, in antiquity, an allowance the Roman ſoldiers had for furniſhing nails to ſecure their ſhoes with. They raiſed frequent mutinies, demanding largeſſes of the emperors under this pretence. *Pitiſc.* Lex. Ant. in voc.

CLAVATA *veſtimenta*, in antiquity, habits adorned with purple *clavi*, which were either broad or narrow. See CLAVUS.

CLAUDENS *palpebras*, in anatomy, a name given by Spigelius, and ſome others, to one of the muſcles of the face, called by Albinus and Winſlow, *muſculus orbicularis palpebrarum*, and by others *ſphincter palpebrarum*.

CLAVICULÆ, *clavicles (Cycl.)* — The two *clavicles* are ſituated tranſverſely, and a little obliquely oppoſite to each other, about the ſuperior and anterior part of the thorax, between the ſcapula and the ſternum. Each *clavicle* reſembles in ſome meaſure an Italic *S*, being a long bone irregularly cylindric, bent forwards near the ſternum, and backwards near the ſcapula, as if it were made up of two arches joined end-wiſe in oppoſite directions, that which lies on the fore part of the breaſt being the largeſt. The *clavicles* are each divided into a body, or middle part, and two extremities, one anterior, inferior, and internal, which may be termed the pectoral or ſternal extremity, the other ſuperior, poſterior, and external, which may be named the humeral, or ſcapular extremity. The pectoral extremity is the thickeſt, and is of a triangular figure, eſpecially near the end, where it is a little enlarged, and ſhews a cartilaginous ſurface, with three angles, of which the loweſt is the moſt prominent, and is turned a little toward the cavity of the thorax; near theſe angles there are ſeveral muſcular and ligamentary impreſſions, one of which near the inferior angle is ſometimes raiſed like a tubercle. The humeral extremity is flat and broad, and two ſides may be conſidered in it, one ſuperior, the other inferior; as likewiſe two edges, one anterior, the other poſterior, and a ſmall articular ſurface.

The upper ſide has ſeveral inequalities, and in the lower there is a kind of oblong, rough oblique, tuberoſity. The poſterior edge is convex, thick, and uneven, being that of the ſmall arch of the *clavicle*: the anterior edge is concave, thin, and ſmooth, every where except near the great arch, where it has a rough impreſſion. The articular ſurface terminates this extremity, being cartilaginous, turned obliquely forward, and of an oval figure, like that of the acromium, with which it is articulated. The body or middle portion, which, together with the pectoral extremity, forms the great curvature of the *clavicle*, is not ſo thick as the extremities; it is a little flatted both on the upper and lower ſides, and therefore two edges may likewiſe be diſtinguiſhed in it; the upper ſide is pretty even, the lower ſomething rougher, and a little depreſſed by a ſuperficial channel. The edges are rounded, the anterior being convex, the poſterior concave; the inner ſubſtance of the extremities is cellular, the reſt is more ſolid, conſiſting of very thick ſides, with a narrow cavity more or leſs, filled with reticular bony filaments. *Winſlow*'s Anatomy, p. 76.

Mr. Weitbrecht has deſcribed and delineated a ligament, which had not been obſerved by anatomical writers, ſtretched from the poſterior part of the anterior extremity of each *clavicle*, behind the ſternum, to the ſame part of the other *cavicle*, which makes the articulation of the ſternum and *clavicles* ſtronger. See Comment. Acad. Petrop. Tom. 4. p. 255.

Fracture of the CLAVICLE. The *clavicle* is extremely ſubject to be fractured, both from its tranſverſe poſition, and from its ſmallneſs. Whether it happens to be broken near the humerus, or near the ſternum; its end that is next the humerus always deſcends lower than the other from the weight of the arm which was before ſuſtained by the *clavicle* and head of the ſternum; and notwithſtanding that part of it next the ſternum remains immoveable by the deſcent of its other end, it can ſcarce happen but they will in ſome degree collapſe over one another.

The reduction of a fractured *clavicle* is not very difficult, eſpecially when the fracture is tranſverſe, nor is it uſual for the humerus, with the fragment of the *clavicle*, to be ſo far diſtorted as not to be eaſily reduced by the fingers. The difficulty, however, is much greater to keep the bone in its place when the fracture has been reduced; and that moſt of all when the bone has been broken obliquely. For this there are two reaſons; for the circular bandages, with which the bones of the arms, and other extremities are uſually held very firm, cannot be applied here, by reaſon of the form and diſorder of the part, and then the weight of the depending arm ſoon pulls to pieces what the ſurgeon has been replacing.

This fracture is to be reduced in the following manner: the patient muſt be placed on a low ſeat, and an aſſiſtant is to thruſt his knee againſt the middle of the patient's back, between his two ſhoulders; then laying hold of the heads of both the patient's arms with his hands, he muſt pull them gently and gradually backwards, by which means the *clavicles* will be properly extended: while this is doing, the ſurgeon muſt ſtand before, and endeavour to replace the bone with both his hands, ordering the aſſiſtant to hold the bone in that poſition; he is then to apply a narrow and thick compreſs, ſo as to fill up the cavities above and below the *clavicle*; upon theſe he is to lay two more narrow compreſſes made in the form of an X; over all theſe he is to apply a piece of paſte-board, accommodated to the ſhoulders and neck, and firſt ſteeped in ſpirit of wine, or oxycrate; then he muſt place a ball under the arm, or elſe bind it ſeveral times with a thick roller, to prevent the humerus from ſubſiding; and laſtly, the whole is to be properly bound up, and the arm ſuſpended by a ſaſh or ſling hung acroſs the ſhoulder, about the neck. The plaiſters that have been uſed to be employed on this occaſion, have, of later years, been found to be wholly uſeleſs. Whenever there are any looſe ſplinters of the bone that are entirely ſeparated, which, though they ſhould not wound, or hurt the fleſh, yet will obſtruct the meeting of the *clavicle*, it ſeems altogether requiſite to open the ſkin, and remove them before the reduction of the bone, treating the wound as uſual: but if there ſhould be any ſplinters which ſtill adhere to the bone, and prick the adjacent parts, and impede the reduction, they muſt be alſo either taken off with the forceps, or elſe forced back into their places, by which they may be again united to the bone. But to divide the parts, and remove the fragments requires great caution, leſt ſome of the large ſubclavian veins, or arteries, be wounded in the operation, and thereby a fatal hæmorrhage be produced. *Heiſter*, Surg. p. 120.

Luxated CLAVICLE. The *clavicles* are but ſeldom diſplaced, by reaſon of their ſtrong ligaments: but they may be diſlocated, however, either from the top of the ſternum, or proceſſus acromion of the ſcapula, to which they are naturally connected. This may be occaſioned either by a fall or a blow, or by the lifting ſome great weight. With regard to the cure, the ſooner aſſiſtance is had, the more eaſily may the reduction of the *clavicle* be performed: but loſs of time in this caſe is of the utmoſt conſequence, inveterate luxations of the *clavicle* being found

found incurable. The *clavicles* may be diſlocated in two manners from the ſternum, either internally toward the larynx, or externally upon the breaſt. When the firſt caſe happens, a cavity may be generally perceived upon the part affected, and the trachea, with the carotid veins, and arteries and nerves, and the œſophagus, which are all together, will be very much diſturbed or compreſſed. On the contrary, when it is luxated forward upon the breaſt, it ſhews itſelf by a preternatural tumour, inſtead of a cavity, in that place.

The *clavicles*, when luxated, are to be replaced by the patient's being ſet in a low ſeat, and an aſſiſtant's thruſting his knee againſt the middle of his back, between his ſhoulders, and laying hold of the heads of both his arms, and pulling them gently backwards. By this means the *clavicles* will be extended, and are in that ſtate eaſily replaced. When this is done, it muſt be carefully regarded to remove the injuries of the neck. If any kind of luxation requires an accurate retention by bandage, it muſt certainly be this of the *clavicle*, eſpecially when the luxation has happened ſome time before the reduction; for beſide that the *clavicles* have ſcarce any muſcles to ſupport them, their ligaments are uſually ſo much ſtretched and weakened in this caſe, that they are in no wiſe ſufficient to ſuſtain the weight of the arms. Such luxations of the *clavicles* as happen near the proceſſus acromion, are generally much more difficult to diſcover, and have been too often miſtaken, even by ſurgeons, for luxations of the humerus. Whenever this luxation happens, the ſuperior part of the ſcapula ſticks up; but in the place, when the *clavicles* are ſeparated from the acromion proceſs, a cavity may be obſerved: moſt acute pains alſo ariſe from this luxation, and the arm can by no means be lifted up. If therefore the luxated *clavicle*, in this caſe, is not timely reduced, it is no wonder that the uſe of the arm is entirely loſt afterwards. A ſtrict bandage continued about the part for forty days, to make the diſunited bones again coaleſce, will be found of great ſervice in theſe caſes, and, indeed, is the principal part of the cure. The bones may be replaced by the before-adviſed manner of extenſion, but nothing can keep them ſo but a proper and accurately applied bandage. *Heiſter*, Surg. p. 158.

CLAVICYMBALUM, in antiquity, a muſical inſtrument with thirty ſtrings. *Hoſm.* Lex. in voc.

Modern writers apply the name to our harpſichords.

CLAVI *veſtium* were flowers or ſtuds of purple, interwoven with, or ſowed upon, the garments of ſenators and knights; only for diſtinction, the former uſed them broad, and the latter narrow. *Pitiſc.* Lex. Ant. in voc.

CLAVUM *veneris*, in botany, a name given by ſome authors to the water lilly, or nymphæa. *Ger.* Emaç. Ind. 2.

CLAVUS *annalis*, in antiquity. So rude and illiterate were the Romans towards the riſe of their ſtate, that the driving or fixing a nail was the only method they had of keeping a regiſter of time; for which reaſon it was called *clavus annalis*. There was an antient law, ordaining the chief prætor to fix a nail every year on the ides of September; it was driven into the right ſide of the temple of Jupiter Opt. Max. towards Minerva's temple. *Pitiſc.* Lex. Ant. in voc.

This cuſtom of keeping an account of time, by means of fixing nails, was not peculiar to the Romans, for the Etrurians likewiſe uſed to drive nails into the temple of their goddeſs Nortia, with the ſame view. Vid. *Liv.* l. 7. c. 3.

CLAVUS *hyſtericus*, in medicine, a name given to a peculiar ſpecies of head-ach, more frequently attacking women than men, and with them uſually owing its origin to a ſuppreſſion of the menſtrual diſcharges. In ſome caſes, the pain is leſs violent, and only attends people during the three or four firſt days of the menſtrual diſcharge. In others, the pain is more violent, and almoſt continual; and when to the common cauſes of it there is added a venereal taint, which is no uncommon caſe, it becomes then the moſt terrible of all pains in the head.

Signs of it. Theſe are a piercing pain about the forehead or temples, reſembling that of a nail driven into the head: this pain ſometimes alſo extends itſelf over the whole head: with this there generally is a ſenſation of pain about the ſagittal ſuture in particular, and a remarkable coldneſs there: often there is an inflation and redneſs of the face, with a noiſe and ringing in the ears. To theſe there are not unfrequently added a ſlight fever, a chillneſs of the extremities, a remarkable laſſitude, and want of appetite, with frequent eructations and nauſeas, and a coſtiveneſs of the bowels. It generally returns about the time of the menſes; or in caſes where it is continual, it rages with more than ordinary violence at that time. Among the women, thoſe are moſt ſubject to it who live ſedentary lives, and feed high, and who are naturally paſſionate, and of a haſty temper. *Junker*'s Conſp. Med. p. 106.

Cauſes of it. Among the natural cauſes of this terrible pain, the moſt powerful are, an excretion of blood toward the head, and a ſtoppage of the menſes, and of the diſcharges by the hæmorrhoidal veins, by injudicious treatment.

Prognoſtics from it. Nothing gives phyſicians greater trouble, or more expoſes the inſufficiency of the art of healing, than the head-achs to which women are ſubject. The manner of life of the patients is, however, more in fault in theſe obſtinate caſes, than either the nature of the diſeaſe, or the ſkill of the preſcriber: high living, and idleneſs, have too many charms, to be quitted eaſily by thoſe who can enjoy them; and, therefore, while the cauſe always ſubſiſts, the cure can be only palliative or temporary, the diſorder always returning after a time: yet it is certain by experience, that the moſt terrible and inveterate diſorders of this kind may be removed ſo as not to return, by the uſe of proper medicines, and a thorough change in the diet and manner of life of the patient.

Method of cure. The firſt care in this reſpect is to keep the bowels lax, for they are almoſt always naturally coſtive in this diſeaſe: emollient clyſters are the moſt proper means of this; and where purges are required beſide, they muſt always be of the moſt gentle and leaſt vellicating kind. After theſe, the violent emotions of the blood are to be quieted by powders of nitre, antimony diaphoretic, crab's eyes, and cinnabar; and if there be a ſpiſſitude in it, the neutral and diuretic ſalts are to be given, in a ſcruple at a time, every day. Tartarum vitriolatum alone, given in this manner, frequently has a very great effect. If it be found neceſſary, beſide this, a gentle opiate may be ſometimes given, ſuch as a ſmall doſe of the ſtorax pill: and externally, ſpirit of wine and camphor is not a little ſerviceable. By way of prevention, it is extremely proper to bleed at ſpring and autumn every year: and above all things, to keep regular in regard to the menſtrual diſcharges. Gentle purges are to be given at times, and neceſſary exerciſe above all things to be adviſed; and this ſhould always be the more inſiſted upon, the more averſe the patients are to it, and the more they love to indulge in a ſedentary courſe. *Junker*'s Conſp. Med. p. 110.

CLAWS (*Cycl.*) — Claws is alſo uſed for a cloſe or ſmall meaſure of land. *Blount.*

CLAYS, (*Cycl.*) in natural hiſtory, earths principally uſed in the potter's trade. Their diſtinguiſhing characters are theſe: they are firmly coherent, weighty and compact; ſtiff, viſcid and ductile to a great degree while moiſt; ſmooth to the touch, not eaſily breaking between the fingers, nor readily diffuſible in water, and when mixed in it, not readily ſubſiding from it. *Hill*'s Hiſt. of Foſſ. p. 17.

Clay *lands*. See Land.

CLEAT, in ſhip-building, a piece of wood faſtened to the yard-arm of a ſhip, to keep the ropes from ſlipping off the yard. *Manwayring.*

CLEAVERS, in botany and medicine. See Aparine.

CLEFT (*Cycl.*) — Green timber is very apt to ſplit and cleave in ſeveral places, after it is wrought into form; and theſe cracks are a very diſagreeable ſight in it. The common method of the country carpenters, is to fill up theſe cracks with a mixture of greaſe and ſaw-duſt; but the neateſt way of all is the ſoaking both ſides well with the fat of beef broth, and then dipping pieces of ſponge into the ſame broth, and filling up all the cracks with them: they ſwell out ſo as to fill the whole crack, and accommodate themſelves ſo well to it, that the deficiency is hardly ſeen. *Mortimer*'s Huſbandry, vol. 2. p. 104.

CLEIDION, in antiquity, the ſame with *clavicula*. See Clavicul*æ*, *Cycl.* and *Suppl.*

CLEIDOMASTOIDEUS, in anatomy, a name given by Albinus to a muſcle, called by others ſimply *maſtoidæus*, and by Euſtachius *ſeptimus caput moventium*. See the articles Mastoidæus and Head.

CLEMA, in antiquity, a ſpecies of vine, a twig of which was the enſign of a centurion's office. *Hoſm.* Lex. in voc.

CLEMATITIS. See Virgin's *bower*.

CLEOME, in botany, a name given by ſome to the ſea-holly, or eringo. *Ger.* Emac. Ind. 2.

CLERODENDRUM, in botany, the name of a genus of plants, the characters of which are theſe: the perianthum is compoſed of one leaf divided into five ſegments, of an oval figure, ſharp-pointed, and broader than the tube of the flower: theſe remain after the flower is fallen. The flower conſiſts of one petal, and is of the labiated kind: its tube is ſlender and long; its upper lip is hollow, erect, bifid and obtuſe, and its under lip of the ſame length, but bent, and divided into three equal ſegments. The ſtamina are four capillary filaments, much longer than the flower, but two of them ſomewhat ſhorter than the others. The antheræ are ſimple: the germen of the piſtil is roundiſh: the ſtile is of the length, figure and ſituation of the ſtamina; and the ſtigma is ſimple. The fruit is a roundiſh drupe, ſtanding upon a very large cup, and containing a ſingle roundiſh ſeed. In the Hortus Malabaricus, the flower is ſomewhat differently deſcribed, and the fruit is ſaid to contain three or four ſeeds; the mouth of the flower is oblong, and inflated, and is convex above, and plane underneath: the limb is ſmall, and is ſhut: the upper lip is obtuſe, and emarginated, and the under lip is of the ſame ſize with the upper, but is lightly trifid. The ſtamina are four filaments, hid beneath the back of the flower: the two ſide ones are a little ſhorter than the others. The antheræ are of an oval figure, and hairy. There ſtands alſo between the upper pair of ſtamina, a rudiment of a fifth, in form of a ſmall point. This makes a very obvious mark of diſtinction for this plant. The germen of the piſtil is oval, the ſtile is capillary, and of the length of the ſtamina, and the ſtigma is obtuſe. The fruit is an oval capſule, longer than the cup, and containing two cells. The ſeeds are numerous, and of a roundiſh figure, and are ſurrounded with a foliaceous edge. *Linnæi* Gen. Plant. p. 290.

Burman. Zeyl. 29. Hort. Mal. vol. 2 p 25. *Linnæi* Gen. Plant. p. 287. *Dillen*, Hort. Elth. Gen. 11. *Gronov.* Virgin p. 71, 72.

CLEROTI, Κληρωτοι, among the Athenians, a kind of public arbitrators. See DIÆTETÆ.

CLETHRA, in botany, the name of a genus of plants, the characters of which are these: the perianthium is small and permanent, and is composed of five erect, hollowed, and oval leaves. The flower is composed of five oblong and broad petals, somewhat longer than the leaves of the cup. The stamina are ten subulated filaments, of the length of the flower: the antheræ are oblong and erect, and open at the points: the germen of the pistil is roundish: the stile is capillary, erect, and permanent, and grows after the flower is fallen: the stigma is obtuse, and divided into three segments. The fruit is a roundish capsule, surrounded by the cup: it is composed of three valves, and has three cells, in which are contained a number of seeds of an angular figure. *Gronov.* Virgin. p. 43. *Linnæi* Gen. Plant. p. 187.

CLETHRITES *lapis*, a name given by the antients to such pieces of fossil wood as shewed a grain resembling that of the wood of the alder.

CLEW *of the sail of a ship*, is the lower corner of it which reaches down to that earing where the tackles and sheets are fastened; so that when a sail is made goring, or sloping by degrees, she is said to have a *great clew:* and a ship is said to have a *great clew*, when she has a very long yard, and so has much canvas in her sails.

CLEW-*garnet*, in ship-building, a rope fastened to the *clew* of the sail, and from thence running in a block seized to the middle of the main and fore-yard. Its use is to hale up the *clew* of the sail close to the middle of the yard, in order to its being furled.

CLEW-*line* is the same to the top-sails, top-gallant-sails, and sprit-sails, that the *clew-garnet* is to the main-sail and fore-sail, and has the very same use. In a gust of wind, when a topsail is to be taken in, they first hale home the lee *clew-line*, and by that means the sail is taken in much easier.

CLIFFORTIA, in botany, the name of a shrub given by Dillenius, and continued by Linnæus. The characters are these: it produces male and female flowers. In the male flower, the cup is a perianthium, composed of three oval, pointed, and hollow leaves, which stand open. There are no petals, but in this cup stand about thirty stamina, which are erect capillary filaments, of the length of the cup. The antheræ are double, and are oblong, obtusely pointed, compressed, and placed in an erect position. In the female flowers, the cup is a three-leaved erect perianthum: the leaves are all equal in size, and are of an oval pointed figure; but they stand upon the germen of the pistil, and remain there after the stamina are fallen. The flower has no petals, but has a pistil of an oblong form, standing under the cup; two long plumose and very slender stiles, and simple stigmata. The fruit is an oblong capsule, of a cylindric form, containing two cells, and remains crowned with the cup. The seeds are contained one in each cell, and are very slender, oblong, and of a cylindric form. This shrub has been supposed by some allied to the mercurialis in its male and female fructification; but they appear extremely different on a close inspection; and indeed the leaves of the cup remaining on the fruit in this, are an obvious distinction. *Linnæi* Gen. Plant. p. 484. *Dill.* Elth. 31. fol. 5.

CLIFT, in the manege, a deficiency in the new, soft, and rough uneven hoof that grows in horses feet, upon the hoof-cast. *Guill.* Gent Dict. in voc.

It is also called *chink*, *crack*, or *chop*, and by the French *avalure*. *Guill.* Gent. Dict. & Dict. de Richelet. in voc. *avalure*.

CLIFTS, in timber. See CLEFTS.

CLIMACIDES, Κλιμακιδες, among the Greeks, were women servants who assisted their mistresses to get on horseback, by serving as steps for them to ascend by. *Hofm.* Lex. in voc.

CLIMATARCHÆ, Κλιματαρχαι, were governors of provinces to the Greek emperors. *Hofm.* Lex. in voc.

CLIMATE *for plants*. See TEMPERATURE.

CLIMIA of the Arabs. See KLIMIA.

CLINCH *of a cable*, is that part of it which is bent about the ring of the anchor, and then seized or made fast.

CLINCH-*bolts*, in a ship, are such as are *clinched* with a rivetting hammer at those ends which come through.

CLINCHING, in the sea language, a kind of slight calking used about the ports on a prospect of foul weather: it is done by driving a little oakum into their seams, that the water may not come in at them.

CLINIC *baptism*. See BAPTISM.

CLINKERS, among brickmakers. See BRICK.

CLINOPODIUM, in botany, the name of a genus of plants, the characters of which are these: the flower consists of one leaf, and is of the labiated kind: the upper lip is erect, roundish, and usually bifid, and the lower is divided into three segments. The pistil arises from the cup, and is fixed in the manner of a nail to the hinder part of the flower: it is surrounded by four embryos, which afterwards ripen into so many seeds of an oblong figure, to which the flower-cup serves as a calyx. To these marks it may be added, that the flowers always grow verticillately round the stalks.

The species of *clinopodium* enumerated by Mr. Tournefort, are these: 1. The taller, large-leaved, origanum like *clinopodium*. 2. The low, small-leaved, origanum-like *clinopodium*. 3. The white-flowered, origanum-like *clinopodium*. 4. The Basil-like, field *clinopodium*. 5. The mountain *clinopodium*. 6. The spiked and verticillate Portugal *clinopodium*. 7. The hyssop-leaved Alpine *clinopodium*. *Tourn.* Inst. p. 194.

CLIPEUS, in natural history, the name of a class of the echinodermata, which are very depressed and flat, and in some measure resemble a shield. Of this class there are only two known species.

The first is the discoide echinites of Plot, and the second that of Longius, which has a little higher top. *Klein*'s Echinod.

CLITONES, the eldest, and all the sons of kings. This word is often met with in our antient authors. *Blount.*

CLITOREA, in botany, the name of a genus of plants, including the *ternatea* of Tournefort and Dillenius, the *clitorius* of the last author, and the *phaseoli species* of Rivinus The characters are these: the cup is an erect perianthium, consisting of one leaf, of a tubular form, and divided into five segments at the end. The flower is of the papilionaceous kind: the vexillum is very large, strait and expanded, and is marginated and undulated at the edges. The alæ are of an oblong figure; they are strait, obtuse, and somewhat shorter than the vexillum. The carina is shorter than the alæ, and is of a roundish foliated form The stamina are diadelphous filaments, and the antheræ are simple. The germen of the pistil is oblong; the stile points upwards, and the stigma is obtuse. The fruit is an extremely long pod, of a compressed figure, composed of two valves, and pointed at the end. The seeds are very numerous, and kidney-shaped. *Linnæi* Gen. Plant. p. 350. *Tournefort*, A. G. 1706. *Dillen.* Gen. 10. Hort. Eltham. p. 76. *Rivin.* 4.

CLITORIDIS *musculus*, a name given by Verheyen to the muscle of the female pudenda, usually called *erector clitoridis*. This is the only muscle that is proper to this part; the other, called the inferior *clitoridis*, being properly a sphincter vaginæ, or as Albinus calls it, constrictor cunni.

CLITORIDIS *inferior*, in anatomy, a name given by Riolanus, and many others, to a muscle of the female pudenda, called the vaginæ constrictor, and sphincter vaginæ; by Albinus, the constrictor cunni.

CLITORIS (*Cycl.*) — This part is thought by some to have been first discovered by modern anatomists; but Dr. Tronchin quotes several antient authors who knew the *clitoris*, and proves that Bonaciolus mentioned it before Columbus or Fallopius. See his Origine ancienne de la physique nouvelle.

CLONARIUM, in botany, that small pedicle which supports every separate flower, or fruit in a cluster, as every grape in a bunch, every berry in a corymbus of ivy, &c. Dioscorides has used this word in his description of the hydropiper or arsmart, which is the zinziber caninum of the Arabians. He says, the fruit stands on botryoide clonaria; and the interpreters and translators of his works having applied this term to the young shoots, and misunderstood its meaning so far as to make it stand for a branch full of leaves, have quite perverted the sense, and rendered the whole chapter unintelligible, by making the description not agree with the plant. Avisenna, who professedly copies the account of Dioscorides, has in the same manner destroyed the merit of his translation, and makes the description of his zinziber caninum not agree with our arsmart, tho' that be evidently the plant meant by it.

CLOSE-*fights*, aboard a ship, are such bulk-heads as are in a fight put up fore and aft in the ship, that the men may stand behind them secure, and fire upon the enemy; and if the ship is boarded, scour or clear the decks.

CLOSE-*quarters*, on board a man of war. See QUARTERS.

CLOSH, in our old customs, an unlawful game, forbidden by stat. 14. Edw. IV. c. 3. & 33. Hen. 8. c. 9. It is said to have been the same with our *nine-pins*, and is called *closh-coyls* by the 33d Hen. VIII. *Blount* & *Cowel.*

CLOT-*bird*, in zoology, a name by which the common œnanthe is called in many parts of England. See ŒNANTHE.

CLOTH *incombustible*. See INCOMBUSTIBLE *cloth*.

Hair CLOTHS, in military affairs. See HAIR.

CLOUD (*Cycl.*) — From the observable motions of the *clouds* it appears, that there are different currents in the air at the same time, and in the same quarter, under one another. Phil. Transf. N° 458. p. 537.

CLOUDS *magellanic*. See MAGELLANIC *clouds*.

CLOVES (*Cycl.*) — This spice acquires weight by imbibing water, which it will do at some considerable distance. The Dutch, who trade in *cloves*, make a considerable advantage by knowing this secret. They sell them always by weight; and when a bag of *cloves* is ordered, they hang it several hours before they send it in, at about two foot distance over a vessel of water. They carefully watch the time when the *cloves* have imbibed the proper quantity, that the fraud may pass undiscovered. This will add many pounds to the weight, which the unwary purchaser pays for on the spot. This is often practised in the spice islands, and sometimes in Europe: but the degree of moisture must be more carefully watched in the former place; for there a bag of *cloves* will in one night's time attract so much water, that it may be pressed out of them by squeezing them with the hand.

CLOVE-

CLOVE, in commerce, is uſed for the two and thirtieth part of a weigh of cheeſe, *i. e.* eight pounds. 9 Hen. VI. c 8. *Blount & Cowel.* See WEIGH, *Cycl.*

CLOVE-*july-flowers*, a ſpecies of caryophyllus, greatly recommended as cordials, and given in diſorders of the head, palpitations of the heart, and in nervous complaints of all kinds. See CARYOPHYLLUS.

CLOVE-*tongue*, a name uſed by ſome Engliſh writers, for the common black hellebore, the root of which is uſed in medicine. *Ger.* Emac. Ind. 4.

CLOVER *graſs*. See TREFOIL and TREFOLIUM.

CLOUTS, in gunnery, are thin plates of iron nailed on that part of the axle-tree of a gun-carriage, which comes through the nave, and thro' which the linſpin goes.

CLOYED. The ſeamen, when any thing is got into the touch-hole of a great gun, ſo that they cannot with a priming iron make way for the powder to be put in to prime her, ſay *the touch-hole is cloyed*: wherefore when guns are nailed, &c. they ſay they are *cloyed*.

CLUB *antennæ*, in natural hiſtory, a name given by naturaliſts to ſuch of the horns or antennæ of butterflies as repreſent a *club*, being larger at the extremities than at the origin.

CLUPEA, in the Artedian ichthyology, the name of a fiſh, the characters of which are theſe. It is one of the genus of the malacopterygii, or ſoft-finned kind. The branchioſtege membrane contains on each ſide eight bones. The belly is very acute, or, as it were, ſerrated, from the ſingular ſituation of the ſcales; and the back-fin is placed ſomewhat nearer to the ſnout than to the tail. *Artedi*, Gen. Piſc. 5.

The ſpecies of this genus, enumerated by Artedi, are theſe: 1. The *clupea*, with the lower jaw longer than the upper, and without ſpots. This is our common herring. There are ſmall teeth in both jaws, as alſo on the tongue and palate: the vertebræ are fifty-ſix in number, and the appendices of the pylorus are ſeventeen. 2. The *clupea* of four inches length, with the lower jaw longer than the upper, and the belly very ſharp. This is the fiſh we call the ſprat, and vulgarly ſuppoſe to be only a young herring. The vertebræ in this fiſh are only forty eight in number, and the points of the belly-ſcales are more acute than in the herring. 3. The *clupea*, with the apex of the upper jaw divided into two parts, variegated on each ſide with black ſpots. This is the *clupea*, *alauſa* or *aloſa*, and *thriſſo* of authors, and is called by us the ſhad. The lower jaw is longer than the upper, but the upper only has teeth. The vertebræ are in number fifty-five; the ribs thirty of a ſide: the ſcales of the belly are aculeated, and are in number from thirty-five to thirty-ſeven. There are on each ſide five, ſix, or ſeven black ſpots near the back. The appendices of the pylorus are eighty in number. 4. The *clupea*, with the upper jaw the longeſt. This is the anchovie or encraſicholus of authors. The vertebræ are forty-five or ſix. See Tab. of Fiſhes, N° 39. *Artedi* Gen. Piſc. 4.

CLUSIA, in botany, the name of a genus of plants, the characters of which are theſe. The perianthium is compoſed of five roundiſh, hollow, and expanded leaves, and the flower is compoſed of five very large, roundiſh, aud expanded petals. The nectarium is globoſe: it conſiſts of one leaf, and encloſes the germen, and is open at the top to give way to the ſtigma. The ſtamina are extremely numerous ſimple filaments, ſhorter than the flower: the antheræ are ſimple: the germen of the piſtil is of an oval, oblong figure. There is ſcarce any ſtile. The ſtigma is ſtellated, plane, obtuſe, and divided into ſix ſegments. The fruit is an oval capſule, containing ſix cells, with a number of oval ſeeds in each. *Linnæi* Gen. Plant. p. 229. *Plum.* Gen. 10. *Pluk.* p. 257.

CLUSTER *polype*. See POLYPE.

CLUTIA, in botany, a name given by Boerhaave to a genus of plants, the characters of which are theſe. In the male flower, the cup is a perianthium of the bigneſs of the flower, compoſed of five oval obtuſe leaves, which are hollow, and ſtand open. The flower is compoſed of five petals, which ſtand very wide open, and are of a cordated figure, with plain ungues, ſhorter than the cup. There are in this flower five external and five internal nectaria: the external ones are tripartite, oblong, open, of the ſame length with the ungues of the petals, and are diſpoſed in a circular form within the petals. The internal nectaria ſtand between the others, and are a ſmall ſort of glands, with an aperture, diſcharging honey at their tops. The ſtamina are five filaments, placed within the ſtile, and ſtanding at a diſtance from the petals: the antheræ, which theſe ſupport, are round, and turn about upon them: the piſtil has no germen: the ſtile is very long, of a cylindric figure, and truncated, and produces the ſtamina in its middle. In the female flower, the perianthium and the petals are the ſame as in the male; but the external nectaria are only double, and appear roundiſh. Their ſize and ſituation are the ſame as in the male, and there are in thoſe flowers no internal nectaria. The piſtil is a roundiſh germen, crowned with three bifid ſtiles of the length of the flower, and theſe terminated by obtuſe ſtigmata. The fruit is a globular capſule, compoſed of three cells, and having ſix furrows running along it; in each of the cells is contained a ſingle ſeed, which is roundiſh, and has a ſort of appendage at one of its extremities. *Linnæi* Gen. Plant. p. 488. *Boerh.* Ind. Alt. p. 318. Hort. Amſt. 1. 91.

CLYDON, Κλυδων, in medical writers, is uſed for the fluctuation of food taken into the ſtomach, ariſing from the laxity or weakneſs of its fibres, and of the abdominal muſcles. *Blanc.*

CLYMENUM, in botany, the name of a genus of plants, the characters of which are in all reſpects the ſame with thoſe of the lathyrus; only in this plant there grow but two leaves on each rib, whereas on the *clyme* there are ſeveral pairs, the rib finally terminating in a clavicle or tendrill.

The ſpecies of *clymenum* enumerated by Mr. Tournefort, are theſe: 1. The Spaniſh *clymenum*, with a variegated flower, and a ſmooth pod. 2. The Spaniſh *clymenum*, with a variegated flower, and jointed pod: and, 3. The common, wild, blue-flowered *clymenum*, called the vetch lathyrus. *Tourn.* Inſt. p. 396.

CLYPEOLA, in botany, the name given by Linnæus to a genus of plants, called by Tournefort and others *jonthlaſpi*. *Linnæi* Gen. Plant. p. 315. See JONTHLASPI.

CLYSSUS, in chemiſtry, a compound extract, either made from ſeveral different ſimples, or from the ſeveral ſimple preparations of the ſame ſubſtance mixed together: as when from wormwood, or any other plant, we draw the water, ſpirit, oil, ſalt, and tincture; and afterwards, according to the rules of art, unite all theſe again into a maſs compounded of them all, and containing the joint virtues of them all. *Boerhaave's* Chem. p. 171.

To this claſs are reducible many of the nobleſt productions of the art, as the more curious ſapos, and many others.

CLYSTERS, (*Cycl.*) in medicine. See ENEMA.

CNEORUM, in botany, a name uſed by many authors for a ſpecies of convolvulus, uſually diſtinguiſhed among botanical writers by the name of *convolvulus argenteus umbellatus erectus*; the upright, umbellated, ſilvery bind-weed. See CONVOLVULUS.

In the Linnæan ſyſtem of botany, the *cneorum* makes a diſtinct genus of plants, the characters of which are that the cup is a perianthium, with three notches, very ſmall, and remaining after the flower is fallen. The flower is compoſed of three petals, which are oblong ſtrait, pointed, concave, placed erect, and very quickly falling off. The ſtamina are three pointed filaments, ſhorter than the flower: the antheræ are very ſmall: the piſtillum has an obtuſe germen, divided into three lobes: the ſtile is erect, firm, and of the length of the ſtamina: the ſtigma is broad and trifid. The fruit is a dry berry, ſomewhat round, but made of three lobes, and containing three cells. The ſeeds are ſingle and round. *Linnæi* Gen. Plant. p. 9.

The *cneorum* is called chamælea by Tournefort and others. See CHAMÆLEA.

CNICUS, *ſaffron-flower*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the floſculous kind, or compoſed of ſeveral ſmall floſcules, divided into ſegments at their ends: theſe are placed upon the embryo ſeed, and are all collected into one head, and ſurrounded by a common cup, furniſhed with large outer leaves. The embryo fruit finally ripen into ſeeds, winged with down.

The ſpecies of *cnicus* enumerated by Mr. Tournefort, are theſe: 1. The rough blue-flowered *cnicus*. 2. The blue-flowered perennial *cnicus*. 3. The wild hairy *cnicus*, called carduus benedictus. 4. The meadow *cnicus*, with acanthus leaves, and yellow flowers. 5. The meadow *cnicus*, with acanthus leaves, and purple flowers. 6. The ſpear-leav'd *cnicus*, with very ſtrong prickles. 7. The white-ſpotted *cnicus*, with purple flowers. 8. The white-flowered, white-ſpotted *cnicus*. 9. The yellow-flowered *cnicus*, called the yellow atractilis. 10. The low, prickly, purple-flowered *cnicus*. 11. The low, blue-flowered, mountain *cnicus*. 12. The blue mountain *cnicus*, with weaker thorns. 13. The little *cnicus*, with cancellated heads, and woolly ſeeds. 14. The hoary, many-headed *cnicus*, with yellow thorns. 15. The Spaniſh, ſtinking-tree *cnicus*. 16. The Spaniſh *cnicus*, with large laciniated leaves: and, 17. The blue-flowered Spaniſh *cnicus*, with calcitrapa leaves. See Tab. 1. of Botany, Claſs 12. *Tourn.* Inſt. p. 450.

CNIMODACTYLÆUS, in anatomy, a name given by Spigelius, and ſome others, to a muſcle of the foot, generally known by the name of the extenſor digitorum pedis. See EXTENSOR, *Cycl.*

COA, in natural hiſtory, the name given by Plumier to a genus of plants, called by Linnæus hippocratea. See the article HIPOCRATEA.

COACERVATE *vacuum*. See VACUUM, *Cycl.*

COACH, (*Cycl.*) in the navy, a ſea term for the council-chamber on board a flag-ſhip.

COAGULATION (*Cycl.*) — *Chymical* COAGULATION is performed by ſix different agents in the general operations in chemiſtry, and by each of theſe in ſeveral manners.

1. It is performed with water, by congealing, cryſtallizing, and precipitating; as in the mercurius vitæ, and ſome other ſuch preparations.

2. With oil, which, by the force of fire, unites to itſelf ſulphur, ſalts, and metals.

3. With

3. With alcohol, upon the ſpirit of ſal armoniac, the white of eggs, the ſerum of the blood, &c.

4. With acid and alkali, growing ſolid together, as in the tartarum vitriolatum.

5. With fixed alkali, as in milk. And, 6. With acid ſalts, as in milk, ſerum, and whites of eggs. *Boerh.* Chem. P. 2. p. 338.

COAGULUM *aluminoſum*, *alum curd*, a form of medicine, preſcribed long ſince by Riverius, and now taken into the London diſpenſatory. It is ordered to be made by putting whites of eggs into a pewter or earthen veſſel, and ſtirring them about with a large lump of alum till they are coagulated *Pemberton's* Lond Diſp. p. 379.

COAL (*Cycl.*)—The common pit *coal* contains a large quantity of ſal armoniac. The mouths of our ſubterranean fires in the *coal* countries all afford it, and it is even found in brick-kilns, where nothing but *coal* is burnt with the clay. It may appear ſtrange indeed to ſome, that this black ſubſtance ſhould yield ſo white and fine a ſalt; but chemiſts know, that all volatile ſalts whatever may be freed from their fœtor and intenſe colour, by tranſmuting them into a ſal armoniac, by the mediation of an acid, as the ſpirit of ſalt, vitriol, or alum; after ſublimation with which, they become white, ſweet, and pure. The reaſon of this change is, that tho' the ſalts always carry over ſome of the fœtid oil with them in a ſtate of volatility, yet being thus in a manner fixed, the fœtid oil muſt by force of fire riſe firſt, leaving the ſubſequent ſal armoniac without ſmell: tho' it is ſtill a doubt, whether the ſalt be the better or the worſe for this labour. Phil. Tranſ. N° 130.

COAL-*balls*. In the country of Liege, they uſe a kind of balls made of *coal* and clay, for firing. Theſe balls are made with $\frac{1}{3}$ of clay, without ſand or gravel, and $\frac{2}{3}$ of *coal*-duſt, well mixed, and formed either into round balls, or into bricks. This *coal*-duſt being the refuſe of the mine, makes this ſort of firing cheap. See Phil. Tranſ. N° 460. Sect. 3.

COAL-*mines*. Wilfully ſetting *coal*-mines on fire, is by ſtatute felony without benefit of clergy. 10 Geo. II. c. 32. §. 6.

COAL-*ſpirit*. *Coals* diſtilled in a retort not only afford a phlegm, and black oil, but a ſpirit, which is apt to force the lute and break the glaſſes, and will catch fire at the flame of a candle. We are told that bladders may be filled with this ſpirit, which may be kept a conſiderable time. If the bladder be pierced with a pin, and ſqueezed near the flame of a candle, the ſpirit will take fire, and afford an amuſing ſpectacle. See Phil. Tranſ. N° 452. Sect. 5.

COAMINGS, in ſhip-building, are thoſe planks, or that frame, which raiſe up the hatches higher than the reſt of the deck. Loop-holes for muſkets to ſhoot out at, are often made in the *coamings*, in order to clear the deck of the enemy when a ſhip is boarded.

COANE, among the Greeks, a name given to a pecular ſpecies of tutia or tutty, which was always found in a tubular form. It had its name from κωνη, a word uſed to expreſs a ſort of cylindric tube, into which the melted braſs was received from the furnace, and in which it was ſuffered to cool. In cooling, it always depoſited a ſort of recrement on the ſides of the veſſel or tube, and this was the tutty called *coane*.

COATS, in a ſhip, are pieces of tarred canvas put about the maſts at the partners. They are alſo put about the pumps at the decks, that no water may go down there; and they are alſo uſed at the rudder's head.

COATI, in zoology, the Braſilian name for an animal of the dog or fox kind, common in many parts of America, and ſometimes kept for curioſity with us, and called the rackoon. See Tab. of Quadrupeds, N° 20. and the article RACKOON.

COATING, in chemiſtry. See LORICATION.

COBALT, *cobaltum* (*Cycl.*)—*Cobalt* is a denſe, compact, and ponderous mineral, very bright and ſhining, and much reſembling ſome of the antimonial ores.

It is ſometimes found of a deep, duſky, bluiſh black, very heavy and hard, and of a granulated ſtructure, looking like a piece of pure iron, when freſh broken. At other times, it is more compact and heavy, of a very even texture, and not granulated, or compoſed of any ſeparate moleculæ, but reſembling a duſky maſs of melted lead, not an ore.

The inner part, when freſh cut or broken, is in ſome ores found much more beautiful than in either of theſe ſtates, being of a fine bright ſilvery grey, and of a beautiful and evenly ſtriated ſtructure; the ſtriæ all running great lengths, but being all variouſly inflected and undulated, and in ſome parts broken. Theſe are the more uſual appearances of *cobalt* in its ore: but beſide theſe, it is ſubject to an alteration in the bowels of the earth, by means of ſubterraneous fires and ſulphur, which reduce it to a body which cannot be ſuppoſed at firſt ſight the ſame with *cobalt*, tho' it prove to be exactly the ſame ſubſtance, on a chemical analyſis.

In theſe ſtates, inſtead of the lead-like appearance of the common kind, it is of a fine florid red colour, tho' ſometimes debaſed by accidental mixtures to a grey, black, or yellow, either wholly, or in part: and in this ſtate it has two ſubordinate diſtinctions, as it appears ſometimes in form of a compact maſs of an uniform texture, and ſometimes in a ſtriated and beautifully ridged maſs, reſembling the fibraria. The three firſt ſtates of *cobalt*, are commonly called *cobalt* ore, without any diſtinction; but the firſt of theſe red kinds is called by the Germans kupffer nicol, and the latter, or ſtriated one, the flower of *cobalt*.

Cobalt is found in Germany, Saxony, Bohemia and England. Ours is but a poor kind, but is met with in conſiderable plenty on Mendip-hills. The German *cobalt* generally contains a large quantity of biſmuth, and the Bohemian of ſilver.

The world is obliged to Kunkell, for the hiſtory of the ſeveral arſenics, zaffre and ſmalt, which are all the produce of *cobalt*. See ARSENIC, &c.

The *cobalt* is roaſted in a reverberatory furnace, and the flowers, which it yields in great abundance, are collected in long wooden funnels, which ſupply the place of chimnies, on the inſides of which it ſticks in form of ſoot, and from this ſoot or flower are made all the ſeveral ſorts of arſenic or ratſbane. If this is only reſublimed, or but barely melted in a covered veſſel, the ſubſtance which we call white arſenic or common ratſbane is produced. If a tenth part of ſulphur be mixed with them, and they are ſublimed together, the product is our yellow arſenic; and the red arſenic is made by adding to the flowers only one fifth of ſulphur, and a little copper ſlag.

When the flowers or ſoot of *cobalt* is all diſcharged, the remaining matter is powdered very fine, and being mixed with three times the weight of common flints in powder, and wetted with water, the whole concretes into a ſolid maſs, and is what is called zaffer. See ZAFFER.

Two parts of this being fuſed with three parts of common ſalt, and one part potaſh, the whole becomes a beautiful blue ſubſtance, called ſmalt. See SMALT.

The ſprinkling the powder of the calx of flints and *cobalt*, for the making them into zaffer, giving them a pretty firm coaleſcence, and even the hardneſs of a common ſtone, perſons who were unacquainted with the proceſs, have taken zaffer for a native mineral. *Hill's* Hiſt. of Foſſ. p. 625.

COBALT is alſo uſed by ſome to expreſs that ſuffocative vapour or damp in mines, which often proves fatal to the miners. It is common among the Germans to ſay on this occaſion, that the *cobalt* roſe and choaked them.

COBITIS, in zoology, the name of a ſmall freſh-water fiſh, commonly called in Engliſh the loach. It very much reſembles our common gudgeon, both in figure and colour, but it is much ſmaller, about two inches being its uſual length, and three, or a little more, the utmoſt that it ever arrives at. Its body is ſoft and ſlippery; its tail flat and broad, and it has either extremely minute ſcales, or none at all. It is of a brown colour, ſpotted all over with black ſpecks, and it has three pair of beards at its upper jaw. It is caught in freſh waters in many parts of the world, and is eſteemed by many a very delicate fiſh, eſpecially when very young and ſmall. *Willughby*, Hiſt. Piſc. p. 265.

The generical characters of the *cobitis*, according to Artedi, are theſe: the head and the body are both of a compreſſed form: the fiſh is of the malacopterygious kind: the back and belly fins are placed at the ſame diſtance from the roſtrum or ſnout: there are always cirri at the mouth, and the body is always ſpotted.

The ſpecies of this fiſh enumerated by Artedi, are theſe: 1. The *cobitis*, with a forked ſpine under each eye. 2. The ſmooth and ſpotted *cobitis*, with a cylindric body. 3. The bluiſh *cobitis*, marked with five black lines on each ſide, running longitudinally on the body. This is the fiſh called miſgum and fiſgum at Nuremberg and Ratiſbon. It has ten or more cirri at the mouth. *Artedi* Gen. Piſc.

The word *cobitis* is truly Roman, and uſed by the beſt authors to expreſs the ſame fiſh we now call by it; but its derivation is uncertain.

COBITIS *aculeata*, called alſo *cobitis oxyrynchus*, a ſmall freſh-water fiſh of the loach kind, but armed with two prickles on the coverings of each of its gills, by means of which it moves nimbly about among the ſtones. *Willughby*, Gen. Piſc. p. 265. See DACOLITHUS.

COBIUS, in ichthyology, a name given by Ariſtotle, Ælian, Appian, and the other Greek writers, to the gobius marinus, or ſea gudgeon of authors, diſtinguiſhed by Artedi by the name of the blackiſh variegated gobius, with fourteen rays on the ſecond fin of the back. It is called by the French goulerot, or boulerot. See GOBIUS.

COBIUS *leucoterus*, in ichthyology, a name given by Ariſtotle, Athenæus, and ſome other of the old Greek writers to the fiſh called *gobius albus* by later authors. It is a genuine ſpecies of the gobius, and is diſtinguiſhed by Artedi by the name of the gobius with the ventral fin blue, and the rays of the anterior back fin riſing above the membrane. This is a ſufficient diſtinction from all the other gobii. See GOBIUS.

COBOB, the name of a diſh among the Moors. It is made of ſeveral pieces of mutton wrapt up in the cawl, and afterwards roaſted in it; the poorer people, inſtead of the meat, uſe the heart, liver, and other parts of the entrails, and make a good diſh, though not equal to the former. Philoſ. Tranſ. N° 251.

COBRA *de las cabeças*, in zoology, the Portugueſe name for an American ſpecies of ſerpent of the amphiſbena kind, whoſe bite is very fatal. It lives under ground, and feeds on ants. See the article IBIJARA.

COBRA *de coral*, in zoology, the name of a ſpecies of ſerpent found in America, and called by the natives *ibiboboca*; it is about two foot long, and has a great deal of a fine red in its variegations. See IBIBOBOCA.

COBRA *de cipo*, in zoology, the name given by the Portugueſe in America to a ſpecies of ſerpent more uſually known by its Braſilian name *boitjapo*. See the article BOITJAPO.

COBRAS *de capello*, in zoology, the Portugueſe name of a peculiar ſpecies of ſerpent, called by authors *ſerpens indicus coronatus diademate, ſeu conſpicillo inſignis*, and by us, the *ſpectacle ſnake*, from a ſtrange reſemblance on the back of his head and neck to a pair of ſpectacles. It grows to ſomewhat more than the ſize of our viper; its ſnout is long; its head flat or depreſſed; its bite is very terrible. It is thought by many that there is a ſtone in the back part of its head, which is a remedy for the bite; but the ſtones commonly ſold with us, under the name of *lapides cobræ de capello*, are well known to be all artificial compoſitions.

COBRE *vega*, in zoology, the name of a ſpecies of ſnake found in the Weſt Indies, and called alſo *ibijara*. It is of the amphiſbena kind, being equally thick at both ends. It lives under ground, and its bite is very fatal. *Ray*'s Syn. Anim. p. 289. See IBIJARA.

COBRE *de verd*, in zoology, the name given by the Portugueſe in America to a ſpecies of ſerpent called by the natives, and from them by moſt authors, *boiobi*. See the article BOIOBI.

COCCEIRA, in botany, a name by which ſome authors have called the coco nut tree, the *palma nucifera indica* of moſt writers. *Piſo*, p. 63.

COCCODES, in natural hiſtory, a name given by Mercatus to thoſe ſtones of the *ammites* kind, whoſe grains are very large. Vid. *Mercat.* Metaloth. Arm. 9. c. 58. p. 318. See the article AMMITES.

COCCOTHRAUSTES, in zoology, the name of a very remarkable bird, conſiderably larger than the chaffinch, very ſhort bodied, and large-beaked, whence it is called in Engliſh the *groſs-beak*, or *hawfinch*. Its head is very large in proportion to its body, and its great beak tapers from a very thick baſe to a ſharp point, reſembling the ſhape of a funnel; its feet are of a pale red; at the baſis of the beak there is a ſeries of fine orange-coloured feathers, and between the back and the eyes it is black; the reſt of the head is of a rediſh yellow; the neck is grey; the back of a rediſh brown; the middle parts of all the feathers being whitiſh, and the rump of a greyiſh yellow. Its breaſt and ſides are of a greyiſh red; but under the tail, and in the middle of the belly it is whiter.

It is common in Germany, and lives there in the woods and mountains all ſummer, in winter it comes into the flat country. It is never ſeen in England, except in the winter months; it feeds on the kernels in the ſtones of fruits, as cherry-ſtones, and the like, and breaks theſe with great dexterity; it will alſo eat the ſeeds of many different plants. *Ray*'s Ornithology, p. 178.

COCCOTHRAUSTES *criſtata*, in zoology, the name by which naturaliſts call the bird uſually known among us by the name of the *Virginia nightingale*, it being truly a *coccothrauſtes*, though called by the improper name *nightingale*. *Ray*'s Ornithol. p. 179. See NIGHTINGALE.

COCCULUS *indicus*, a ſmall roundiſh fruit of the Eaſt Indies. It is little uſed in the ſhops, being eſteemed poiſonous. Fiſhermen have a way of mixing it with paſte: this the fiſh ſwallow greedily, and are thereby rendered lifeleſs for a time, and float on the water. The good women uſe it with ſtaveſacre, for deſtroying vermin in childrens head. Brewers have uſed it alſo in their brewing; but this is expreſly prohibited by act of parliament.

COCCUS, in botany, the name of a genus of plants called in the Hortus Malabaricus, *teuga*; the characters are theſe. It produces male and female flowers on the ſame plant. The male flowers have the whole ear for their cup. The flower is divided into three ſegments, which are of an oval figure, and ſharp-pointed; the ſtamina are ſix ſingle filaments, of the length of the flower; the apices are oblong and incumbent. The germen of the piſtil is ſo ſmall in theſe flowers as to be ſcarce viſible. The ſtyle is ſhort and thick, and is obſcurely trifid, and the ſtigma is ſmall. Theſe flowers never produce any fruit, yet they are not ſimply male flowers, but a ſort of hermaphrodite ones, the female organs of which are always abortive. The female flowers grow on the ſame ſpike with the male. They are divided in like manner into three parts, but the ſegments are very ſmall; the germen of the piſtil is of an oval figure, and terminates in a ſhort-pointed ſtyle; the ſtigma is ſmall, and is divided into three parts. The fruit is very large, and membranaceous; it is of a ſomewhat rounded figure, but with ſome obſcure traces of a trigonal form; the ſeed is a very large nut of an oval form, pointed, trivalve, and obtuſely trigonal, as the fruit is; it has three holes in the baſe, and the kernel is hollow. *Linnæi* Gener. Plant. p. 514. Hort. Mal. l. 1. 4.

COCCUS, in the writings of the antients, a name given by ſome authors to that fine ſhining red colour uſed to illuminate the capital letters in manuſcripts, and more generally known by the name of *encauſtum ſacrum*, from its being uſed in the ornamenting the manuſcript bibles, and its reſembling the fine red glow of the enamel of that colour.

COCCUS *maldivia*, the maldivia nut, in the materia medica, the name of the fruit of the *palma maldivienſis* of Johnſton, an oval-figured fruit, of a ſweet taſte, and famous for its virtues in nervous diſorders. *Dale*, Pharm. p. 276.

COCCUS *Polonicus*, an inſect which may properly enough be called the *cochineal* of the Northern part of the world. As the cochineal loves only the hot climates, this creature affects only the cold ones. It is collected for the uſe of dyers, but the crops of it are much ſmaller, more difficultly made, and the drug itſelf greatly inferior to the true cochineal. It is commonly known by the name of *coccus Polonicus*, or the ſcarlet grain of Poland. Poland is indeed the place where it is gathered in greateſt abundance, but it is not the only one; it is found in many other of the northern countries, and may very poſſibly be produced in ſome of the more temperate ones, where it is not known, as it is very much hid by nature from the eyes of common obſervers.

This kermes of Poland, if it may be ſo called, is found affixed to the root of a ſmall plant, and uſually to the ſame plant, which has been thence called the *polygonum cocciferum*. Authors have informed us of the ſame berry, as it is often called, alſo growing at the roots of the mouſe ear, rupture-wort, pimpernel, and pellitory of the wall, and that it is in no other than dry ſandy places, that it is found at the roots of theſe plants. Breynius, in 1731, printed at Dantzick, a very curious account of this production, which proves it inconteſtably to be an animal, and give us many reaſons for knowing it to be of the progall-inſect claſs. *Reaumer*, Hiſt. Inſ. Vol. 4. p. 111.

Toward the end of June, the *coccus Polonicus* is found in a ſtate to be gathered. Every one of the creatures is then nearly of a ſpherical form, and of a fine violet colour; ſome of them, however, are not larger than poppy ſeeds, and others of the ſize of a pepper corn, and each of them is lodged either in part, or entirely in a ſort of cup, like that of an acorn. More than half the ſurface of the body of the animal is uſually covered by this cup. The outſide of this covering is rough, and of a blackiſh brown, but the inſide is ſmooth, poliſhed, and ſhining. On ſome plants they find only one or two of theſe, and on others more than forty; and they are ſometimes placed near the origin of the ſtalks of the plant.

Breynius began his obſervations on the animals in this ſtate, ſeveral of them being put into veſſels of glaſs; and by the 24th of July there was produced from every one of them a hexapode or ſix legg'd worm, with two antennæ on its head. Several of theſe were kept a fortnight, and ſhewed no inclination to eat any thing. They run about, however, very ſwiftly for ſome time, but then began to be more quiet, drew up their bodies ſhorter, and ceaſed to run about any longer. They were now of a purple colour; but in this ſtate, though they did not walk about, their bodies were ſubject to various contortions. At length, when they were become wholly motionleſs, their bodies became covered with a fine down; this was white, and formed them a perfect covering, which was ſometimes of a ſpherical, ſometimes of an irregular figure; it was always, however, very elegant, and the downy matter plainly enough tranſpired out of the animal's body, as is the caſe in the other progall-inſects. The creatures remained in this ſtate of reſt, and covered with this down, for five or ſix days; but at the end of that time every one of them laid more than a hundred and fifty eggs. Theſe eggs were depoſited upon the paper on which the animals were placed, and were enveloped, in ſome meaſure, with a downy matter. Id. Ibid. p. 113.

When the creatures had laid all their eggs, they died, and about the 24th of Auguſt there came from every egg a ſmall inſect, which, to the naked eye, appeared no other than a ſmall long, red point; it might be obſerved, however, very plainly to move about. Theſe young animals lived about a month, though all the time wholly without ſuſtenance.

Mr. Breynius was induced, at firſt, to believe, that theſe animals came to be in a ſtate to produce perfect eggs, from whence young ones would be hatched, without any congreſs with the male; but farther obſervations convinced him of the error of this opinion. He ſaw afterwards a ſort of very ſmall flies with two white wings, bordered with red, produced from ſeveral of the cocci. Theſe flies are plainly of the ſame kind with the male gall-inſects. Ibid. p. 114.

It has been before obſerved, that theſe *cocci* differ in ſize. It is the ſmall ones not larger than poppy-ſeeds which produce theſe flies; the others give the worms deſcribed before; and one obſervation of Mr. Breynius's gives a plain proof that theſe flies are the male inſect of the ſpecies, ſince all thoſe of the females which had been a day, or two, accompanied by theſe flies, quickly covered themſelves with down, and began to lay their eggs, whereas thoſe which had not this commerce with the flies, remained in the ſame ſtate, or elſe got only a very thin and ſlight covering of down, and never laid any eggs. This is a very ſtrong proof, and, indeed, ſuch as could not have been expected; ſince in other inſects, the want of a male does not prevent the female from laying her eggs; the only conſequence is that they are barren. Ibid p. 115. & ſeq.

All that is wanting from farther obſervation to make the hiſtory of this creature compleat, is to be informed of that part of its life which it paſſes between the time of its being hatched from the egg, and that of its being found in its caſe at the

roots of the plants, and in a condition to be gathered for uſe. The analogy of the life of other animals of this kind, gives us, however, no room to doubt but that they, ſoon after their coming from the egg, fix themſelves to ſome plant, and there grow and continue to receive their nouriſhment; but how after this they acquire the ſhape of a ball lodged in a cup, requires a nice future obſervation. Ib. p. 117.

COCCYGÆUS *anterior*, a muſcle fixed, by a broad inſertion, in the anterior portion of the ſmall tranſverſe ligament at the upper part of the foramen ovale of the os innominatum; from thence it runs between this great ligament and the muſculus obturator intimus, with which it is often confounded by anatomiſts, and contracting in breadth, it is inſerted in the lower part of the os coccygis. *Winſlow*'s Anatomy, p. 250.

COCCYGÆUS *poſterior*, a muſcle fixed to the inner, or concave edge of the two firſt vertebræ of the os ſacrum, to the inner and lower edge of the ligamentum ſacro-ſciaticum, and to the ſpine of the os iſchium; from thence, contracting in breadth, it is inſerted in the inſide of the os coccygis, above the anterior. *Winſlow*'s Anatomy, p. 250.

COCCYGIS *os* (*Cycl.*) — This is in ſome meaſure an appendix to the os ſacrum; its figure is in ſome degree like that of an inverted pyramid a little bent forward toward the pelvis. The anterior ſide is flat, the poſterior a little convex; the four or five pieces it is made up of are ſomething like falſe vertebræ; they are uſually joined by cartilages more or leſs pliable, and ſometimes all the pieces are entirely cemented together. The firſt piece is the largeſt, and on each ſide of its baſis there are ſometimes ſmall apophyſes, or cornua, which are cloſely joined to the extremity of the os ſacrum. It has alſo ſometimes a kind of tranſverſe apophyſes with ſmall notches on their upper part, which joining with thoſe of the laſt piece of the os ſacrum, form a pair of holes ſituated in the ſame row with the other large ones. The other pieces of the *os coccygis* are a kind of irregular ſquares, diminiſhing in ſize as they deſcend, ſo that the laſt is like a ſeſamoide bone. *Winſlow*'s Anatomy, p. 61. The *os coccygis* may be thruſt inwards by a violent fall or blow, and it is often puſhed outward in hard births. When this happens it is uſually attended with violent pain and inflammation about the lower part of the ſpine; abſceſſes form in the inteſtinum rectum, and the fæces are conſtipated, or ſuppreſſed. The replacing this bone is not very difficult, if an able ſurgeon is applied to in time. If it be thruſt outwards, it muſt be depreſſed into its right place by the thumb; after which compreſſes dipt in warm wine, or ſpirit of wine, are to be applied to the part; theſe are to be made broad above, and narrow below, that they may fill up the poſterior ſinus of the nates; and theſe may be conveniently held on by the T bandage.

When the *os coccyx* happens to be luxated inwards, the fore-finger is to have its nail cut cloſe, and being dipt in oil, is to be introduced up the anus, and muſt be thruſt in as far as poſſible, that it may the more readily drive out the depreſſed bone: the other fingers being placed externally, are to conduct the bone into its right poſture. When the bone is replaced, the patient muſt reſt ſome time upon a bed, and when he ſits up, it muſt be in a chair with a hole in its bottom, leſt the affected part ſhould otherwiſe be compreſſed or diſturbed. *Heiſter*, Surg. p. 157.

COCCYGIS *oſſis muſculi*. Theſe are ſmall, thin, radiated muſcles, lying on the inner, or concave ſide of the os ſacrum, and neighbouring parts of the pelvis. They are four in number, two on each ſide, one placed more forward, the other more backward; for which reaſon the firſt muſt be termed *coccygæus anterior*, five *Iſchio-coccygæus*, and the other *coccygæus poſterior*, five *ſacro-coccygæus*. *Winſlow*'s Anatomy, p. 249.

COCCYX, in ichthyology, a name given by Ariſtotle and the other old Greek writers to the fiſh called *cuculus* and *lyra* by other authors. It is a ſpecies of the trigla, diſtinguiſhed by Artedi by the name of trigla all over red, with a bifid ſnout, and the coverings of the gills ſtriated. See the articles CUCULUS, and TRIGLA.

COCETUM, among the antients, a kind of drink made of honey and poppies. *Pitiſc.* Lex. Ant. in voc.

COCHINEAL (*Cycl.*) — Beſides the uſes of *cochineal* enumerated in the *Cyclopædia*, it has many medicinal virtues aſcribed to it, being eſteemed a great cordial, ſudorific, alexipharmic, and febrifuge. For the hiſtory of *cochineal*, ſee the article PROGALL *inſect*.

COCHLEA, (*Cycl.*) the name of a very large family of ſea ſhell-fiſh, which are divided by authors into three diſtinct genera from the figure of their mouths, ſome of which are circular, ſome ſemicircular, and ſome oval. Theſe are expreſſed by the generical names, *cochleæ lunares*, *cochleæ ſemilunares*, and *cochleæ ore depreſſo*. The two former genera ſee under the articles LUNARIS *cochlea*, and SEMILUNARIS *cochlea*.

The characters of the third are theſe; it is an univalve ſhell of a broad figure with a conoide baſe, and an elevated ſummit, or ſometimes a plane and depreſſed one. It is umbilicated, and of a pearly colour within, and has a mouth of an oval figure, ſometimes furniſhed with teeth, ſometimes without any. The conic figure of theſe ſhells uſually diſtinguiſhes them at firſt ſight from all the other kinds.

Some of the ſpecies of this genus have their apex elevated to a conſiderable height, and forming ſeveral ſpiral turns. Theſe are properly called *ſabots* by the French, and *trochi* by the authors of other nations. Others have the apex leſs elevated, and are more of the common ſhape of ſnails. And finally, ſome of them have the apex quite depreſſed. This is enough to ſhew that in ſhells, in general, the elevation of the apex is no genuine character of a genus. Among the *trochi* there is one ſingle ſpecies which is umbilicated, the others are none of them ſo; and hence this forms a very grand diſtinction. Rondeletius obſerves that this genus of *cochleæ* was called trochus from the reſemblance of ſome of the ſpecies to the ſhape of a boy's top, which he whips about. *Rondelet.* de Aquat. *Aldrovand.* de Teſtac.

The ſpecies of the *trochus* are theſe: 1. Of the exerted-headed, there are theſe. 1. The variegated or marbled *trochus*. 2. The punctuated *trochus*. 3. The green *trochus*. The ſecond and third ſpecies aſſume very different appearances when they have paſſed through the hands of the poliſher, and are preſerved in the cabinets of collectors in ſuch a ſtate as to be with difficulty known; the marbled *trochus* appearing elegantly ſmooth, and ſpotted with red and white, and the other, or green *trochus*, loſing all its diſtinguiſhing colour, and appearing wholly like mother of pearl. Beſide theſe, there are ſome ſpecies remarkable for their tuberoſities, and thence called knotted *trochi*. Of theſe there are, 1. The green kind. 2. The red, knotty *trochus*. 3. The grey, knotted *trochus*. And, 4. The yellow one.

Of thoſe *trochi* which have the apex leſs exerted, and have a larger and rounder mouth, and are umbilicated, we have the following ſpecies. 1. The widow *trochus*. 2. The magpye *trochus*. 3. The tiger *trochus*. 4. The ſharp-headed *trochus*, with exerted ribs. 5. The *trochus* furniſhed with tubera, and prickles. 6. The lamp, or pagod *trochus*. 7. The white *trochus*, with high ribs. 8. The *trochus*, with a regular ſeries of ſpines. 9. The rough *trochus*, with an operculum. 10. The rough button *trochus*, with teeth in the mouth. 11. The ſpur *trochus*, with ſpines diſpoſed in a regular circle. 12. The leſs aculeated ſpur *trochus*. 13. The golden *trochus*, with a ſilver umbo; this, when robb'd of its outer coat, by poliſhing, appears all over ſilvery. Theſe are the known ſpecies of *trochi* with exerted apices.

Of the *trochi* with depreſſed apices we have only the following known ſpecies. 1. The antique lamp *trochus*, with a wide and flat mouth. 2. The red and white lin'd *trochus*. 3. The *trochus*, with a dentated mouth. 4. The *trochus* called St. Hubert's horn, with a folded lip. 5. The hollow-headed *trochus*, with yellow ſtreaks. 6. The all yellow, hollow-headed, *trochus*. 7. The flat-mouthed ladder *trochus*. 8. The brown *trochus*, veined with white and yellow. And, 9. The whitiſh *trochus*, with yellow lines and ſpots.

From the figures of theſe ſeveral ſpecies of ſhells, it will be eaſily ſeen that the name *trochus*, according to the common derivation of the word, very badly expreſſes the ſeveral kinds, ſome of which are of that figure, and ſome no way approaching to it. They are much better expreſſed by the name *cochlea ore depreſſo*, which conveys an idea of an abſolute diſtinction, which takes place in them all, and in no other ſhells. See Tab. of Shells, N° 5, 6, 7. Hiſt. Nat. Eclair. p. 260.

COCHLEA *of the ear*. The parts to be diſtinguiſhed in this in its true ſituation, are the baſis, the apex, the ſpiral lamina, the half ſeptum, by which its cavity is divided into two half canals; the ſpindle round which the *cochlea* turns; and laſtly, the orifices and union of the two ducts. The baſis is turned directly inward, toward the internal foramen auditorium; the apex outward; and the axis of the ſpindle is nearly horizontal; but in all of theſe allowance muſt be made for the obliquity of the os petroſum, in which they lie. The baſis of the *cochlea* is gently hollowed, and towards the middle is perforated by ſeveral ſmall holes. The ſpindle is a kind of ſhort cone, with a very large baſis, which is the middle of the baſis of the *cochlea*; through its whole length runs a double ſpiral groove, which, through a microſcope, ſhews a great number of pores. The *cochlea* makes about two turns and a half from the baſis to the apex, and the two ducts being ſtrictly united together, through their whole courſe, form an entire common ſeptum, which muſt not be confounded with the half ſeptum, or ſpiral lamina, as is often done. The firſt of theſe may be properly termed the common ſeptum, the other the particular, or half ſeptum; both of them are cloſely joined to the ſpindle, being thicker there than in any other place. The common ſeptum is compleat, and ſeparates the turns entirely from one another, whereas the half ſeptum in the ſkeleton is only a ſpiral lamina, the breadth of which is terminated all round by a very thin border lying in the middle cavity of the *cochlea*. In a natural ſtate there is a membraneous half ſeptum, which completes the partition between the two ducts. The two half canals turn jointly about the ſpindle, one being ſituated toward the baſis of the *cochlea*, the other toward the apex; for which reaſon, one of them may very well be termed the internal, the other the external; the uſual diviſion of them into the upper and lower flight, not being agreeable to the natural ſtate, but liable to convey a falſe idea of it. The ſpiral volute of the *colchea* begins at the lower part of the veſtibulum, runs from thence forward to the top, then backward down to the bottom, afterwards upward and forward, and ſo on from the baſis, which is

turned inward, to the apex which is turned outward. It is eaſy hence to know to which ear a *cochlea* has belonged, when it is ſeen prepared. The two half canals communicate fully at the apex of the *cochlea*. Their ſeparate openings are toward the baſis, one of them being immediately into the lower part of the veſtibulum, the other into the feneſtra rotunda. Theſe two openings are ſeparated by a particular turning. *Winſlow*'s Anatomy, p. 51.

COCHLEARIA, *ſcurvy-graſs*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of four leaves, and is of the cruciform kind; the piſtil ariſes from the cup, and becomes afterwards a ſeed veſſel of a roundiſh figure, divided by an intermediate membrane, to which there adhere valves on each ſide. The ſeeds contained in this capſule are roundiſh.

The ſpecies of *cochlearia* enumerated by Mr. Tournefort are theſe: 1. The common, round leaved *ſcurvy-graſs*. 2. The great, Dutch, long-leaved *ſcurvy-graſs*. 3. The *ſcurvy-graſs* with ſinuated leaves. 4. The ivy-leaved *ſcurvy-graſs*. 5. The procumbent Daniſh *ſcurvy-graſs*. 6. The little, erect, Daniſh *ſcurvy-graſs*. 7. The tall *ſcurvy-graſs*, with leaves reſembling thoſe of woad called by authors, woad-leaved lepidium, and dittander. 8. The dock-leaved *ſcurvy-graſs*, commonly known by the name of horſe-radiſh. *Tourn.* Inſt. p. 215. See SCURVY-*graſs*.

COCK (*Cycl.*) — *Gor* COCK. See GOR *cock*.

Game COCK. See the article GAME.

Wood-COCK. See WOOD-*cock*.

COCK *of the mountain*, or COCK *of the wood*, an Engliſh name for the great tetrao, or urogallus major. See the article UROGALLUS.

COCK-*boats*, ſmall boats uſed in rivers, or near the ſhore, which are of no ſervice at ſea, becauſe too tender, weak and ſmall.

COCK *paddle*, the Scotch name for the lumpus, or ſea-fiſh, common on the Engliſh coaſts, and called the lump-fiſh, or ſea owl. *Willughby*'s Hiſt. Piſc. p. 208.

COCK *water* is a ſtream of water brought in a trough, through a long pole, in order to waſh out the ſand of the tin-ore into the *launder*, while it is bruiſing in the coffer of a ſtamping mill. See TIN.

COCKS aboard a ſhip, are little ſquare pieces of braſs, with holes in them, and put into wooden ſhivers, to keep them from ſplitting and galling by the pins of the blocks in which they move.

COCKATOON, a name uſually given to the white macaw, but more properly belonging to the whole macaw tribe. See MACAW.

COCKERINGS, an exaction, or tribute, in Ireland, now reduced to chief rents. *Blount.* See BONAGHT.

COCOI, in zoology, the name of a very beautiful bird of the Braſils, of the heron kind. It is of the bigneſs of the common ſtork; its head is of a mixt colour of black and grey, and it has, on the back part of it, a creſt of a very beautiful ſtructure, of the ſame colour, from which there hang two feathers of five fingers breadth long, and of a blackiſh grey colour; its back, belly, wings, and neck, are of different variegations of black and grey, and on the lower part of its throat has ſeveral very long, and very beautiful feathers of the ſame colour. Its fleſh is very well taſted. *Marggrave*'s Hiſtor. Braſil.

COCROTALEON, in natural hiſtory, a name given by the antients to an animal generated between the hyæna and the lioneſs. This animal is deſcribed as having many of the qualities of the mantichora; and it ſeems with ſome to be only another name for the ſame beaſt. It is called alſo *leococrotta*, and *leucocrotta*, and ſometimes ſimply *crocotta*, or *cocrotta*. *Pliny*. See the article LEOCROCOTTA.

CODFISH is the largeſt of the genus of the *aſelli*, called *aſellus maximus* by authors, and ſometimes, *aſellus varius*, *ſive ſtriatus*. The characters by which this is diſtinguiſhed from other fiſhes of the ſame genus are theſe: its colour on the back and ſides is a duſky olive colour, variegated with yellow ſpots; its belly is white; its ſides have a long white line running their whole length, from the gills to the tail, which, at the abdomen, is curved, but elſewhere is ſtrait; its ſcales are very ſmall, and adhere firmly to the ſkin; its eyes are large; at the angle of the lower jaw there hangs a ſingle beard, which is ſhort, ſeldom exceeding a finger's length; its tongue is broad; it has ſeveral rows of teeth, one of which is much longer than all the others. Among theſe there are ſome moveable teeth, as in the pike; and in the palate, near the orifice of the ſtomach, and near the gills, it has ſmall cluſters of teeth. It has three back fins, two at the gills, and two at the breaſt, and two others behind the anus; and the tail is plain. *Willughby*'s Hiſt. Piſc. p. 165.

This fiſh, according to its age, the places where it is caught, or cured, and other accidents, has alſo ſeveral names given it. From the various places, it is called the *haberdeen*, from Aberdeen in Scotland; the *green-fiſh*, from Greenland; the *north-ſea cod*, from the northern ocean; and the *iceland-fiſh*, from Iceland. From other cauſes, it is called *ſtock-fiſh*, from the neceſſity of beating it with ſticks, before it is fit to be dreſſed; *barrelled cod*, when cured, and put up in barrels; and, when young, a *codling*. *Willughby*'s Hiſt. Piſc. p 166.

According to the Artedian ſyſtem, it is a ſpecies of gadus, and it is diſtinguiſhed from the other ſpecies of that genus by having beards at the mouth, the upper jaw longeſt, and the tail not forked. See GADUS.

CODA, in the Italian muſic, literally ſignifies a *tail*, but is uſed often at the end of a canon, for two or three meaſures to cloſe with, after having repeated it ſeveral times. The *coda* ſerves only to end the piece, which, without it, might be carried on to infinity. *Broſſ.* & *Graſſineau*, Dict. Muſ. in voc.

CODA *lancea*, in zoology, the name given by the Italian authors to the ſpecies of duck called by others the *anas caudacuta*, and vulgarly known, in ſome parts of England, by the names of the *cracker*, or *ſea pheaſant*. It differs from all other birds of the duck kind in the ſhape of its tail, which has two feathers longer than the reſt, and ending in a point. *Ray*'s Ornithol. p. 290. See CRACKER.

CODAGA, *bark*, a name given to that otherwiſe called *coneſſi*, or *coneſti*. See CONESSI.

CODDAM *pulli*, in botany, a name by which ſome authors have called the tree which produces the gamboge, the gutta gamba of the ſhops. Hort. Mal. V. 1. p. 41.

CODDY *moddy*, in zoology, the Engliſh name of a common water fowl of the larus, or gull kind, and diſtinguiſhed by the name of the *larus fuſcus*, or *larus Hybernus*, by authors.

It is a moderately large bird, weighing above a pound; its neck, breaſt, and belly are all white, except that there is a little brown about the throat; its head is white, variegated with brown ſpots; its back is grey, and its rump white; its tail and wings are variegated with black and white, and its hinder toe is very ſmall. *Ray*'s Ornithol. p. 266.

CODEX, in antiquity, a kind of puniſhment by means of a clog, or block of wood, to which ſlaves, who had offended, were tied faſt, and obliged to drag it along with them; and ſometimes they ſat on it cloſely bound.

CODON, κώδων, in antiquity, a cymbal, or rather little braſs bell, reſembling the head of a poppy. They were faſtened to the trappings and bridles of horſes.

CODON is alſo uſed to ſignify the orifice of a trumpet.

COEFFICIENT (*Cycl.*) — COEFFICIENTS *of the ſame order*, in algebra, is a term ſometimes uſed for the *coefficients* prefixed to the ſame unknown quantities, in different equations;

Thus, in the equations, $\begin{cases} ax + by + cz = m \\ dx + ey + fz = n \\ gx + hy + kz = p \end{cases}$

The *coefficients*, *a*, *d*, *g*, are of the ſame order, being the *coefficients* of *x*; alſo *b*, *e*, *h*, are of the ſame order, being the *coefficients* of *y*, &c. The *coefficients* alſo that affect no unknown quantity, are ſaid to be of the ſame order. Vid. *Mac Laurin*'s Algebr. p. 81.

Oppoſite COEFFICIENTS, ſuch as are taken each from a different equation, and from a different order of *coefficients*. Thus, in the foregoing equations, *a*, *e*, *k*, and *a*, *h*, *f*, as alſo *d*, *b*, *k*, are *oppoſite coefficients*. *Mac Laurin*, ibid. p. 81, 82.

COELICOLOR, in natural hiſtory, a name given by ſome to the opal. See OPAL.

COELOMA, in medicine, a hollow and round ulcer, in the horny tunic of the eye. *Blancard.*

COEMTIONALES, among the Romans, an appellation given to old ſlaves, which were ſold in a lot with others, becauſe they could not be ſold alone. *Hofm.* Lex. in voc.

COENOBIUM, κοινόβιον, the ſtate of living in a ſociety, or community, where all things are in common. Pythagoras is thought to be the author, or firſt inſtitutor of this kind of life, his diſciples, though ſome hundreds in number, being obliged all to give up their private eſtates, in order to be annexed to the joint ſtock of the whole. The Eſſenians among the Jews, and Platoniſts, are ſaid to have lived in the ſame manner. Many of the Chriſtians alſo have thought this the moſt perfect kind of ſociety, as being that in which Chriſt and his apoſtles choſe to live. *Hofm.* Lex. in voc. See COENOBITE, *Cycl.*

COES, among miners, are little houſes which the miners make over their mines to lay ore in. *Houghton*'s Compl. Miner, in the explication of the terms.

COFFEE (*Cycl.*) — Mr. Boyle mentions an inſtance of a perſon to whom *coffee* always proved emetic. Works abr. Vol. 1. p. 95. It is alſo known to be purgative to others.

COGNIOL, in zoology, a name given by ſome to the fiſh more uſually called *colias*, a kind of mackrel, differing from the common kind in nothing but that it is much ſmaller. *Willughby*'s Hiſt. Piſc. p. 181. See COLIAS.

COGNITIVE is ſometimes applied to that faculty or power of the human mind, by which we know any thing, or are enabled to diſtinguiſh truth from falſity.

Latin writers uſe the term *facultas cognoſcitiva* in the ſame ſenſe. *Wolf.* Phil. Rat. Sect. 1.

Hobbes has made uſe of the term *cognitive* power, for the power of knowing, or conceiving, in contradiſtinction to *motive* power, or appetite. Hum. Natur. p. 4, 5. Edit. 1651.

COGNITIONIBUS *mittendis*, in law, a writ to any of the king's juſtices of the common pleas, who has the

power of taking a fine, and who, having taken a fine, defers to certify it, commanding him to certify the same. Reg. Orig. 684. *Blount* and *Cowel*.

COGNOVIT *actionem*, in law, is where a defendant acknowledges or confeſſes the plaintiff's cauſe againſt him to be juſt and true, and after iſſue, ſuffers judgment to be entered againſt him without trial.

COGS, *cogones*, a kind of boats, or veſſels, uſed in the rivers Ouſe and Humber. Stat. 23 Hen. VIII. c. 18. *Blount*.

COGWARE, is ſaid to be a ſort of coarſe cloaths, made in divers parts of England, of which mention is made in 13 R. 2. c. 10.

COHOBATE, in chemiſtry. See COHOBATION, *Cycl.*

COHORS *equitata*, in old inſcriptions, has perplexed ſeveral antiquaries, who have been taught to conſider the *cohorts* as appropriated to the foot ſervice, as the *alæ* and *turmæ* were to the horſe. Mr. Horſeley, in particular, imagines, the *cohors prima Claudia equitata*, which he had met with, was intended to intimate that this *cohort* had been promoted from the foot to the horſe ſervice; but when, by another inſcription, he was led to conſider that corps as conſiſting of a thouſand horſe, his difficulty is increaſed to that degree, that he knows not what to affirm upon it. But the learned Dr. Taylor thinks there is an eaſy ſolution of this difficulty.

The auxiliary, or provincial *cohorts* were either entirely, or purely, foot, like the legionary, or ordinary *cohorts*; or elſe they had a mixture of both kinds of militia, as appears from Gruter, DLXXIV. 5. This latter ſort, as they could not properly be ranked under either denomination of horſe, or foot, being made up of both, ſeem to have appropriated to themſelves the diſtinguiſhing title of *cohortes equitatæ*, corps of infantry with a mixture of horſe. And of this term we find frequent mention in inſcriptions, as in *Gruter* DXXXIV. 2. DXXXIV. 4. DL. 4. DL. 5. *Reineſ.* VI. 128.

Hyginus alſo, *de caſtrametatione*, gives us a full and deciſive proof of this denomination, and of the number of which ſuch *cohorts* conſiſted. Theſe troops conſiſted of a thouſand men, part horſe, and part foot, and were hence called *milliariæ*. The proportion of the horſe to the foot was 240 to 760. His words are; *Habet* cohors equitata *milliaria pedites ſeptingentos ſexaginta, centurias decem, equites ducentos quadraginta, turmas decem.* Vid. Phil. Tranſ. N° 482. Sect. 3. See COHORT, *Cycl.*

COHORS *milliaria*. See above COHORS *equitata*.

COHUAGIUM, a tribute paid by thoſe who meet promiſcuouſly in a market, or fair: *cohua* ſignifying a promiſcuous multitude of men in a fair, or market, probably from the French *cohue*. *Blount*.

COILE, on board a ſhip. See QUOIL, *Cycl.*

COILON, κοιλον, *cavea*, in antiquity, that place of the Greek theatres which was appointed for the ſpectators. It conſiſted of three parts, placed in equal dgrees, one above another; the loweſt of which belonged to magiſtrates and perſons of quality; the middle to the commonalty; and the uppermoſt to the women.

Theſe theatres being open at top, porticos were erected behind the *cavea*, where the audience might retire for ſhelter, in caſe of rain. *Pott.* Archæol. Græc. l. 1. c. 8. p. 42.

COIN (*Cycl.*) — To take the repreſentation of a *coin* on paper, card, or paſte-board. See MEDAL.

COIN, or QUOIN, in artillery, a wedge of wood, ſerving to raiſe, or lower, the breech of a gun. See QUOIN, *Cycl.*

COINS, on board a man of war. See QUOINS, *Cycl.*

COIN *moulds*. See MOULDS.

Cantic COIN, or QUOIN. See QUOIN, *Cycl.*

Canting-COINS, on board a ſhip, little ſhort pieces of wood, or billets, cut wedge-like, to lie betwixt the caſks.

Standing-COINS, on board a ſhip, billets, or pipe-ſtaves, to keep the caſks from ſtirring, or giving way.

Standing-coins are made of barrel boards, about four inches broad, and of a fit length to be driven in between the ends of a caſk, about two or three hoops from the Chine hoops, to keep the buts from jogging. *Harris* and *Manwayring*.

CO-INDICATIONS, in medicine, ſigns which do not indicate by themſelves alone, but together with other things, circumſtances, &c. help the phyſician to form a judgment.

COINING, in the tin-works, is the marking the tin, when caſt into blocks, or ſlabs, with the figure of the lion rampant. This is done by the king's officer. The king's cuſtom is four ſhillings for every hundred weight. *Ray*'s Engl. word. p. 124.

COINUS, κοῖνος, in natural hiſtory, a name given by ſome writers to the genus of ſhells called *porcellana* and *concha venerea*. See the article PORCELLANA.

COJUMERO, in ichthyology, a name given by ſome to the *manati*, or *ſea-cow*.

COLAPTICE, the art of carving, or cutting, the reſemblances and figures of natural things in ſtone. The term for the artiſt is *lithoxos*.

COLASISI, in natural hiſtory, a name given by the people of the Philippine iſlands to a very ſmall, but very beautiful ſpecies of parrot, common in that part of the world, and called by others *cuſi* and *gula ſiſi*.

COLCHICUM, in botany. See MEADOW *ſaffron*.

The ſeveral ſpecies of this plant are very valuable in a flower garden, as they are in their beauty in autumn, when moſt other plants are dead. The flowers come up, and are blown ſome time before the green leaves appear, which makes ſome people call them naked ladies; the green leaves come up in winter, and in ſpring are extended to a great length; in May, theſe leaves begin to decay, and ſoon after this is a proper time to take up, and tranſplant the roots. The roots ſhould be kept above ground till the middle of Auguſt, at which time, if they are not planted, they will produce their flowers as they lie out upon the ground. For the manner of planting the roots of this ſort of plants, ſee the article TULIP; and for that of raiſing them from ſeeds, for the ſake of producing varieties of the flower, ſee XIPHION.

COLCHIUM, in medicine. The general conſent of authors condemns the root of the *colchicum* as a poiſon, on account of its acid and corroſive quality: yet it is evident that the antients eſteemed it greatly: they called it hierobulbus. Some even gave it internally, in caſes where it was neceſſary to make the patient vomit, it being eſteemed a very good emetic: and others ordered its uſe externally, bruiſing it, and applying it to places where there were fixed and violent pains.

Wedelius recommends it as an alexipharmic, and has written a treatiſe expreſsly on this ſubject. He frankly confeſſes to have taken his knowledge of its virtues from an obſcure author, who, in a treatiſe of the plague, recommends it internally as a very beneficial medicine, and tells us, that people were ſo well acquainted with its virtues, that they took it in conſiderable doſes, and wore it about their necks, as a preſervative againſt the infection. Wedelius lived in a time when dyſenteries, with petechial malignant fevers, attended with deliriums and inflammations of the jaws, were very frequent; and on the credit of this author he ventured to give it internally, under a proper guard of other roots, and ſuch things as might obtund its acrimony. Plantane root and bezoar were the two things he at length found moſt efficacious for this purpoſe; and this compoſition of three ingredients, he called arcanum duplicatum catholicum, and the peſtilential alexipharmic. This he gave in moderate doſes, and found ſo great effects from it, that the root before eſteemed poiſonous, and expunged from the liſt of remedies, was again taken in as a part of the materia medica; and the author publiſhed the ſecret, by which he had had ſo much greater ſucceſs than other phyſicians of the time. On farther trials, he found the virtues of this medicine were not confined to the peſtilential and petechial fevers alone, but he gave it with the ſame ſucceſs in the ſmall pox, the purple fever, and even in the worſt kinds of the meaſles. *Wedelius* de Colchico.

COLCOTHAR (*Cycl.*) — COLCOTHAR *of vitriol*, after the action of the fire being dulcified, or the metallic parts precipitated by an alkali, or by zink, or any other of the imperfect metals, and ſublimed with ſal armoniac, in either caſe an inflammable ſuphur is prepared in the operation, and may be ſeparated both from the ſublimed flowers, and from the caput mortuum. This, and the ſulpherous ſmell of ſpirit of vitriol, together with the ſulphur produced by oil of vitriol and ſpirit of wine, prove abundantly what has been ſuſpected by ſome, that vitriol contains ſulphur as one of its principles, and a natural and neceſſary part of its compoſition. Phil. Tranſ. N° 103.

Mr. Le Fevre propoſes an eaſy way of making *colcothar of vitriol*: he mixes two parts of filings of iron with one of ſulphur, and a little water. After the acid of the ſulphur has diſſolved the iron, he expoſes the paſte to the air, and it changes into *colcothar*.

COLCUICUILTIC, in zoology, the American name of a bird of the partridge kind, deſcribed by Niremberg. It is variegated with black, white and red, and is a very beautiful bird. Its colours are for the moſt part diſpoſed not in ſpots, but in longitudinal lines on the back; but on the belly they are rather in form of ſmall and ſhort ſpots. Its legs and feet are blue. It is a well-taſted bird. *Ray*'s Ornithol. p. 314.

COLD (*Cycl.*)—It is affirmed by Olaus Magnus and others, that in ſome parts of Ruſſia and Livonia, hares, foxes, and partridges change their colours, and become white, in the depth of winter, by reaſon of the great *cold*. Mr. Boyle ſeems to confirm theſe relations. See his Work abr. vol. 1. p. 672. and vol. 2. p. 43, 44.

Mr. Reaumur having made ſeveral very curious experiments on the different degrees of *cold*, produced by the mixing the ſeveral ſalts and other bodies with ice, in the making artificial congelations, determined, when he knew exactly what the degrees were, to try their effects upon animal life in many creatures. He tried his experiments on ſeveral ſpecies of inſects, freezing their juices; the conſequence of which was, as might be expected, their loſing all their ſoftneſs, and becoming wholly rigid and hard.

Among the caterpillar kinds, this gentleman found that ſome ſpecies became frozen by a *cold* of ſeven or eight degrees on the thermometer; while others, very much ſmaller, bore without freezing a *cold* of ſeventeen degrees, which is three degrees

degrees more than that of the ſevere winter of 1709: and, unhappily for us, theſe long-lived ones are of the moſt common kinds, and ſuch as do us the greateſt injuries. We have therefore no room to believe, that the *cold* of any of our winters can be ſo great as to rid us of theſe miſchievous animals. Mem. Acad. Scienc. Par. 1734.

Cold is the deſtroyer of all vegetable life, when increaſed to an exceſſive degree; and it is hard to ſay how much increaſe of it the hardier of them are, or are not able to bear. We find many of our garden plants and flowers, which ſeem to be very ſtout and hardy, go off at a little increaſe of *cold* beyond the ordinary ſtandard. In the ſevere winter in 1683, Mr. Robarts tells us, that the artichoaks and colliflowers all periſhed; and that the odoriferous ſuffrutices, ſuch as thyme, ſage, lavender, cotton, and the like, were generally killed, very few eſcaping, except ſuch as had been planted the preceding year, and were therefore ſo low as to have the advantage of a covering of ſnow over them; which is the defence nature has given to the natives of the coldeſt countries, and proves ſuperior to any thing that can be invented by art for their preſervation. In the corn fields, ſuch parts of them as had remained covered with ſnow, had eſcaped very well, the corn all looking freſh and vigorous, after the melting of it in the ſpring: but when the lands had lain ſo expoſed that the ſnow had melted off, the crop was generally deſtroyed, and the farmer obliged to new ſow the place. Phil. Tranſ. N° 165. See FROST.

COLD, in medicine. To prevent the catching of *cold*, the jeſuits bark is recommended in the philoſophical tranſactions. Phil. Tranſ. N° 478. p. 3. See PERUVIAN *bark*.

COLD *water*. See WATER.

COLDSHIRE *iron* is ſuch as is brittle when it is cold. See the article IRON.

COLE-*fiſh*, an Engliſh name for a fiſh of the whiting kind, called by authors *ajellus niger*, and in Cornwall, and ſome other parts of England, the *rawlin pollack*. It is a long and thin fiſh, for one of this genus, more reſembling the whiting pollack than any other ſpecies; but differing in the length and thinneſs of its body, and in the ſide-lines which run from the gills to the tail: theſe in the whiting pollack are raiſed into an arch under the firſt back-fin, and in the *cole-fiſh* are ſtrait, and are very broad and white. It is of a darker colour than the others of theſe ſpecies, yet looks, tho' blackiſh, very bright and ſhining, and has none of thoſe yellowiſh lines, which mark the ſides of the whiting pollack. The fins are all of a bluiſh black colour, and the eyes large and protuberant; the ſcales very ſmall: and, as in the cod the upper jaw is longer than the under; in this, on the contrary, the under is longer than the upper. This has alſo no beard. It is very common on the coaſts of Northumberland, Yorkſhire, and other northern counties of England, and is called the *cole-fiſh*, or coal-fiſh, from its blackneſs. It is ſomething of the taſte of the cod, but much inferior to it. *Willughby*'s Hiſt. Piſc. p. 168.

COLE-*mouſe*, in zoology, the name of a ſmall bird of the titmouſe kind, diſtinguiſhed from all the reſt by being the ſmalleſt of all the titmouſe kind, and having a white ſpot on the back part of its head. *Ray*'s Ornithol. p. 176. See the article PARUS.

COLE-*pearch*, in natural hiſtory, a name given to a ſmall fiſh, much eſteemed about Dantzick and other places, for its delicate flavour. It is very like the common river-pearch, but that it does not grow ſo large, and has a greater variety of colours, and its head is proportionably larger. Phil. Tranſ. N° 83.

COLE-*ſeed*, the ſeed of the naphew or napus, propagated in many parts of England to great advantage, for the oil expreſſed from the ſeeds. It is much ſowed in the moory land in the fen countries. The freſheſt mould is found beſt for it, or what the farmers call a luſty ſoil, which is newly broken up, and has been long at reſt. They commonly give two tilths to the ground they ſow with *cole-ſeed*; but if they manure it, then only one. They lay on the manure a little before they begin to plow; and, plowing in the morning, ſow that very day. The time of ſowing is June, July, and Auguſt: July is the beſt month. They ſow the ſeed over furrow, a peck to an acre, and cruſh harrow it: they then have a crop that time twelvemonth, which they ſheer or reap as they do wheat, diſpoſing it into little heaps. When it has lain about a fortnight upon the ground, they thraſh it upon a ſail-cloth, with common flails; then winnow it, and afterwards ſend it to the mills. *Moreton*'s Northampt. p. 484.

This ſeed is principally brought from Holland, though it is very good when taken from our own plants, for growth as well as other uſes. The ſowing this ſeed is a very advantageous piece of huſbandry. It loves rich and fat lands, and ſucceeds very well on marſh and fen lands, and particularly on ground newly recovered from the ſea. The ranker the land is for *cole-ſeed* the better; but it will do on any that is dry and warm. The beſt ſeed is that which is largeſt, faireſt, and of the cleareſt colour. It is very apt to be mouldy, if not kept very dry. It is to be ſown in the end of June, or beginning of July: the land being fallowed in May, muſt be twy-fallowed in June, and muſt be laid very ſmooth and even before it is ſown: the ſeed is finally to be ſown the ſame day that the land is plowed, and about a gallon is ſufficient for an acre.

Some ſow it for the ſake of the ſeed; others by way of a winter food for the cattle in the months of January, February and March, when other food is wanting. It will do very well in poor lands for this purpoſe; but the richer grounds only will make it rank enough for ſeed. If the winter be mild, it will after feeding grow again, and afford a ſecond winter's ſupply, and after cutting up the ſtump, will ſhoot out young ſprouts, very ſweet, and in great abundance.

When it is kept for ſeed, it is to be reaped in the manner of wheat, as ſoon as one half of the ſeed looks brown: it is to be left a fortnight to dry on the ground, never turning it, for fear of ſhedding the ſeed; and when this time is over, it is to be gathered up in large ſheets, and carried to the barn for immediate thraſhing; or it may be thraſhed in the field on a large ſheet. Its common produce is five quarters of ſeed from an acre, and the value of this is about five pounds.

The land where this has grown, is very well prepared by it for wheat; tho' ſome ſow oats upon it, as what ſucceeds beſt of all after it. When the oil is preſſed out of the ſeeds, they uſe the remaining cakes in ſome places as firing; but in others they give them to their cows and other cattle in winter, when other food is ſcarce. In ſome places, they mix the powder of theſe cakes with water, and give it to their calves till they are three or four days old, inſtead of milk, and it does as well for them, till they are able to eat graſs or hay. It is a good method to burn the ſtubble on the *cole-ſeed* lands, for it is ſo ſtumpy that it is of no uſe to plow it in. *Mortimer*'s Huſbandry.

COLIAS, in zoology, the name of a ſpecies of mackrel, caught very plentifully in the Mediterranean and ſome other ſeas, and never growing to near the ſize of the common mackrel; but differing from that in no other particular. The Italian fiſhermen call this ſpecies cogniol. *Bellon.* de Piſc. p. 86.

COLIC (*Cycl.*) — Medical writers diſtinguiſh the *colics* into ſeveral ſpecies: 1. The flatulent or pituitous *colic*. This is diſtinguiſhed by an unuſual inflation and diſtenſion of the abdomen, attended with a rumbling and noiſe of the guts, and with eructations and other ſymptoms of wind, eſpecially in the beginning of its period.

2. The bilious *colic*. This is attended with an acrid and gnawing pain and twiſting, as it were, of the bowels, and dreadful pain, as if they were wounded and cut with ſharp inſtruments. This often is the effect of violent paſſion, and is then always attended with head-achs, and often with a violent diarrhœa.

3. The hæmorrhoidal and nephritic *colic*. Theſe are diſtinguiſhed by a ſpaſtic contraction of the abdomen, and a compreſſion as it were of it; and in theſe caſes, there are uſually no ſtools. This alſo is attended with pains in the head, and with laſſitudes, and frequent returns of chillneſs and of febrile heats.

4. The hyſteric *colic*. In this caſe the bowels are always bound, and there are tenſive pains, and a retraction, as it were, of the navel. There is alſo a ſenſation of rolling about of the bowels; but this is perceived moſtly in the ſmaller inteſtines; whereas in common *colics* it is the larger that are principally affected.

5. The convulſive *colic*. This differs from the former only in degree, being known by remarkable twiſtings and contortions of the colon and other bowels, felt quite up to the ſcrobiculum cordis.

6. The iliac paſſion, or miſerere mei, is uſually accounted a ſpecies of *colic*: but this is ſingly treated of under its proper name. *Junker*'s Conſp. Med. 1. 563. See the articles MISERERE *mei* and ILIACA *paſſio*.

Signs of the colic. Theſe are in general vehement and laſting pains, felt above and about the region of the navel: they give a ſenſation of a volution and twiſting about of the inteſtines, and ſometimes of ſo violent a tenſion, that it ſeems as if they would burſt: and often there are noiſes and tremors within the abdomen. To theſe are joined ſymptoms of the greateſt anxiety, and general uneaſineſs; and often there are ſudden chillneſs and ſhiverings of the body, with cold ſweats, and attempts to vomit; with theſe there uſually is a flatulence, and obſtinate coſtiveneſs of the bowels: ſometimes, on the contrary, there is a violent purging; but this is very rarely the caſe, except in the bilious and hæmorrhoidal *colics*; and in the laſt of theſe, this is uſually attended with a teneſmus, and with bloody ſtools. Theſe are the ſymptoms of *colics* in general. Thoſe peculiar to the ſeveral kinds, are deſcribed under thoſe heads.

Perſons ſubject to colics. Theſe are diſeaſes that attack both ſexes, but in general the women are more ſubject to them than the men, and they are the more violent, and uſually of longer duration in that ſex than in the other. In women they uſually appear gentle, and often trifling at firſt; but they gain ſtrength by time, and often become convulſive. The perſons of that ſex, peculiarly ſubject to *colics*, are thoſe of a ſanguine temperament, and ſuch as have had obſtructions of the menſes. Women in child-bed are alſo very ſubject to flatulent *colics*, when the belly has not been properly bound round after delivery: in this caſe, the *colics* not only are troubleſome during the month of lying-in, but often become habitual, and do not leave them afterwards. In men, the middle-age is more ſubject to *colics*, than either the young or old periods of life; and people are moſt ſubject to fall into them who have been ſubject to irregularities in the hæmorrhoidal diſcharges, and who have nephritic complaints. Men are often thrown into the bilious

colic by violent paſſions of anger, eſpecially if they eat or drink immediately afterwards, or they themſelves be of a *coleric* temperament.

Prognoſtics in colics. The oftener any perſon has been afflicted with *colics*, the more ſubject they are to return on any ſlight occaſion, and the more likely to become habitual. All *colics* that attack perſons with a chillneſs firſt, are more violent than thoſe which do not, and they often are either attended at the very firſt with an inflammation, or have one come on ſoon afterwards. In general alſo, *colics* attended with coſtiveneſs are worſe than thoſe in which the patients have ſome ſtools. Reachings to vomit are always bad ſymptoms in *colics*, and give a ſuſpicion of the caſe turning to a miſerere or iliac paſſion: but this is to be obſerved, that when the patient has juſt before eaten very heartily, and drank much, eſpecially of cold liquors, then ſuch reachings are natural, and are not to be accounted the bad ſymptoms they are at other times. In women, when the reachings are violent, there is always danger of a vomiting of blood. The more violent the pains of the *colic* are, the more danger there is of their bringing on convulſions. A *colic* ariſing from a ſtoppage of the menſes, and attended with a ſtagnation of blood about the viſcera, when it is of long ſtanding, threatens the coming on of a quartan, a dropſy, or a cachexy. And a hæmorrhoidal *colic*, when ariſing from a retropulſion of the gout or ſciatica, by wrong medicines, is always a caſe of great danger. This, however, always happily goes off, if there come on a diſcharge of blood, or even of a ſerous matter, from the hæmorrhoidal veins. Sometimes alſo it goes off at once, but very unhappily, by a ſudden regurgitation of the matter upon the viſcera, eſpecially upon the liver; the conſequences of which are, obſtructions of that viſcus, aſcites, hectics, or dropſies. Sometimes alſo this *colic* goes off by the appearance of ſcorbutic ſpots on the body, in different parts.

The bilious *colic*, if the offending matter be not immediately evacuated, after its acrimony has been obtunded by a proper medicine to fit it for evacuation, too often brings on dangerous inflammatory fevers. In *colics* which have held the patient a long time, a hiccough coming on is a very bad omen. Finally, a *colic*, when improperly treated with opiates and anodynes, often brings on a palſy.

Method of cure. The general method which holds good in all kinds of *colics*, is, firſt to attemperate the painful ſpaſms of the bowels, and to carry off whatever peccant matter is lodged in them. To this purpoſe glyſters, made of ſuch ingredients as the nature of the particular caſe requires, are very proper, and after theſe gently laxative medicines are to be given, ſuch as rhubarb, ſena, glauber's ſalt, and calomel. After theſe, carminative medicines and the digeſtive ſalts are to be given internally; and externally may be applied bags with carminative ingredients, ſuch as the roots of iris, cyprus, angelica, with flowers of pennyroyal, chamæmile and lavender, and ſeeds of aniſe, caraway and cummin; and, finally, the oils of caraways, and the like, may be rubbed in on the abdomen, and the ſtomachic and carminative plaiſters applied, and fomentations of warm herbs, with the heat of a brick or ſtone boiled in water, or of a bladder half filled with warm water. After the pain and other ſymptoms have been by theſe means removed, the parts are to be reſtored to their natural tone by the volatile ſalts, mixt with alcaline tinctures, by gentle chalybeates, and by warm carminative and aromatic medicines; and externally, by the nervine and corroberating applications before deſcribed. This is the general method in all *colics*. For the particular kinds, in

The flatulent and mucous colic, carminative and emollient glyſters are to be injected, compoſed of decoctions of chamæmile flowers, marſhmallows, and a mixture of the elixir proprietatis, or common ſalt, by way of ſtimulus; and after this the carminative medicines, ſuch as angelica root, winter's bark, aniſe and caraway ſeeds, and cloves, with the other ſpices, are to be given, with intermediate doſes of laxative medicines; and to theſe medicines may be added occaſionally, the digeſtive ſalts, ſuch as vitriolated tartar, with nitre and cinnabar, and the ſpirit of tartar, and ſweet ſpirit of nitre, with the eſſence of orange peel, &c.

In the bilious colic, the attemperating and abſorbent medicines are to be given, as nitre, mother of pearl, calcined cryſtal, oil of almonds, and manna, with the broths of white meats, and the carminative ſeeds. If theſe things are thrown up by vomit, recourſe muſt be had to clyſters, and to applications of warm things to the abdomen, ſuch as are before deſcribed.

In the hæmorrhoidal and nephritic colic, glyſters are to be frequently given of oil of olives and linſeed, with a little nitre. After this, warm broths, with oil of ſweet almonds, are to be drank in frequent draughts, and powders compoſed of nitre, crab's eyes, and cinnabar, are to be given at frequent intervals, and if the pains are vehement, a ſmall doſe of theriaca, or of the ſtorax pill, may be given with the powder, to be taken at night. When the violence of the fit is over, the gentle alexipharmics are to be given, with ſtrengthening medicines, to reſtore the due tone of the parts. Externally, fomentations may be applied to the rectum, and cataplaſms of the leaves of mullein and mellilot, on which the patient may ſit while they are warm; and heat may be applied to the abdomen by bladders half filled with water, or milk made of a due warmth, and by bricks heated a little, and by bags containing carminative and nervine ingredients. Liniments may alſo be rubbed in of the oils of nutmeg and bays, and ſpirit of wine and camphor, particularly in the part where the pain is moſt violent.

In the hyſteric colic, clyſters are frequently to be injected, made of decoctions of the herb veronica in broth, with a little oil of dill and common ſalt. When the patient is averſe to clyſters, and the caſe is not violent, warm baths for the feet, and the ſitting over the ſteam of warm water, will ſometimes prove ſufficient, and gentle purges of decoctions of ſena, and the like, are to be given, or a gentle doſe of the reſin of jalap, diſſolved with the yolk of an egg in ſome of the uterine waters: after theſe, alexipharmics and carminatives are to be given, ſuch as the roots of pimpernel and angelica, with aniſe, and the other warm ſeeds. If the caſe is violent, the attemperating nitrous medicines may be given, and with them gentle anodynes; and, finally, ſuch things as will reſtore the due tone of the parts. The perſon ſhould be kept in a gentle warmth during the whole time of the diſeaſe, and ſpirit of caſtor may be occaſionally rubbed in on the abdomen.

By way of preſervative from the hæmorrhoidal and hyſteric *colic*, it is very proper to bleed in the foot at the ſpring and autumn ſeaſons, and proper uterine medicines ſhould be taken to keep up the menſtrual diſcharges; and to prevent ſuppreſſions of the hæmorrhoidal, leeches ſhould be applied to the parts, and the bowels ſhould be carefully kept gently lax. *Junker*'s Conſp. Med. p. 573.

This diſtemper has ſometimes taken its riſe from concretions formed on plumb-ſtones lodged in the guts. See Medic. Eſſ. Edinb. vol. 1. art. 32. Abridgm. vol. 2. p. 214.

Colic pains ſometimes ariſe from viſcidities in the inteſtines; and the vitrum antimonii ceratum has been found ſucceſsful in ſuch caſes. See VITRUM *antimonii ceratum.*

COLIC-*ſhell*, in natural hiſtory, a name given by ſome to the porcellana, or concha venerea, from its ſuppoſed virtue in curing that diſeaſe.

COLIC-*ſtone*, in natural hiſtory, the name given by ſome modern authors to a ſtone found in New Spain, and ſome other parts of America, and eſteemed of great virtues there in the cure of the colic, and in diſeaſes of the womb. It is a ſpecies of jaſper very nearly approaching to the lapis nephriticus, and called by the natives *tlayotic*, and by the Spaniards, *piedra de hyada*. It is of a conſiderable weight and hardneſs, and is of a duſky green colour, without any variegations. The Indians cut it into various forms, ſometimes of men, ſometimes of their idols; ſometimes alſo they figure it into long and even columns, and ſometimes into round and flat pieces. All theſe are nicely poliſhed, and thoſe of the laſt ſhape are what are principally uſed in the cure of the colic. They wet theſe with their ſpittle, and then rubbing them, till hot, with their hands, they apply it to the navel in a fit of the colic; and they ſay, that it immediately carries it off, by determining the humors to paſs off, either upwards, or downwards, or both ways. They ſometimes cut it into flat plates alſo, with two holes cut at each end, by means of which it may be worn, tied to the wriſt by a ribband, and it is ſuppoſed thus to be a preſervative from all diſeaſes of this kind, and from many others.

COLIN, in zoology, the name of an American bird, called by moſt authors a quail, but ſuppoſed by Nieremberg to be rather a ſpecies of partridge. There are ſeveral diſtinct ſpecies of this bird, ſome of which are of a brown colour, and have creſts on their heads; others are of the ſame colour, but ſmaller, and without creſts; others larger than either of theſe, and of a yelloviſh colour, but with the head variegated with black and white. They are all very common in the Spaniſh Weſt Indies, and are very well taſted, and much valued at table. *Ray*'s Ornithol. p. 304.

COLIPHIUM, a name given by Athenæus, and ſome other authors, to coarſe bread made of meal with the bran among it, and ſuch as is eaten by the poorer people in moſt countries.

The word is derived from the Greek κῶλον a limb, and ἴφι ſtrength, and is a very expreſſive word, as this ſort of bread makes people robuſt and ſtrong, and is greatly preferable to any other kind for people of ſtrong conſtitutions, who uſe hard labour, or much exerciſe.

COLIPHIUM was alſo a kind of food compoſed of bread, new cheeſe, and roaſted fleſh, which Pythagoras taught the athletæ to uſe, who before had been uſed to live on figs. *Pitiſc.* Lex. Ant. in voc.

COLITES, in natural hiſtory, a name given by ſome writers to a ſtone ſuppoſed to imitate the human penis, or teſtes, ſeparately, or both together. It is a very idle thing in writers to give names to ſtones on ſuch merely accidental figures; this being no other than a common pebble, which, in the almoſt infinite variety of ſhape into which they are formed, has chanced to aſſume this. When ſtones have been formed in ſhells, or from part of animals, their figure is as determinate and certain as that of the body they owe their origin to; ſuch ſtones are therefore properly called by names expreſſing the thing they owe their form to; as bucardites, for the name of a ſtone, found in, and preſerving the exact figure of the cockles called bucardia; and mytulites, for a ſtone found in, and repreſenting, the ſhape of a muſcle; but when a ſtone acci-

dentally reſembles the figure of a hand, a foot, or any other part of the body, it can never be neceſſary to name it as a diſtinct foſſil.

COLLARS, (*Cycl.*) in antiquity, were not only worn by way of ornament, but alſo as amulets, againſt incantations, &c. See AMULET and BRACELET.

COLLAR, in ſhip-building, a rope faſtened about her beak-head, into which the dead man's eye is raiſed that holds the main ſtay. There is alſo a *collar*, or garland, about the main maſt head, which is a rope wound about there, to ſave the ſhrouds from galling.

COLLAR *of the plough*, a term uſed by our farmers to expreſs a ring of iron, which is fixed to the middle of the beam, and ſerves to receive the ends of two chains, the lower one called the tow chain, and the upper one called the bridle chain. The lower chain is fixed at its other end to the box, and the upper, or bridle chain, to the ſtake which runs parallel with the left hand crow-ſtaff. Theſe chains, by means of this *collar*, and their other inſertions, ſerve to join the head and tail of the plough together. In ſome places the bridle chain is not fixed to the *collar*, but to the beam itſelf, by means of a pin; and this is the better way on many accounts. *Tull*'s Huſbandry. See the article PLOUGH.

COLLATERALIS *penis*, in anatomy, a name given by Spigelius, and ſome other writers, to a muſcle of the penis, now generally called the *erector*. See ERECTOR.

COLLATION, *collatio*, συμβολη, in rhetoric, is uſed for compariſon. See COMPARISON, *Cycl.*

But Scaliger diſtinguiſhes, alledging, that in *collation*, one thing is compared to another that has preceded it; and that the contrary happens in compariſon. That to which any thing is compared is called protaſis, and that which is compared, is called antapodoſis. *Voſſ.* Rhet. l. 5. p. 381.

COLLATIONE *facta uni poſt mortem alterius*, in law, a writ directed to the juſtices of the common-pleas, commanding them to iſſue their writ to the biſhop, for the admiſſion of a clerk, in the place of another preſented by the king, who died during the ſuit between the king and the biſhop's clerk: for, judgment once paſſed for the king's clerk, and he dying before admittance, the king may beſtow his preſentation on another. Reg. Orig. 31. *Blount*, and *Cowel.*

COLLATIONE *heremitagii*, in law, a writ whereby the king conferred the keeping of an hermitage upon a clerk. Reg. Orig. 303, 308. *Cowel.*

COLLECTION, *collectio*, in logic, a term uſed by ſome for what is commonly called *ſyllogiſm*, and *ratiocination*. See SYLLOGISM, and RATIOCINATION, *Cycl.*

COLLECTORS, in botany, ſuch ſtudents as have attempted the knowledge of plants, without reducing it to any certain ſcience, being barely employed about the obſerving, or getting together the various ſpecies. *Linnæi*, Fund. Bot. p. 1.

COLLEGE (*Cycl.*) — COLLEGE *of juſtice*, in Scotland. See SESSION.

COLLET, in the glaſs trade, that part of a glaſs veſſel, which, in the making, ſticks to the hollow iron by which the metal is firſt taken out of the melting pot. This is broken off before the veſſel is faſhioned, and is never ſeen in the leaſt mark, when finiſhed. *Neri*'s Art of Glaſs, p. 447. Theſe they throw together, and afterwards grind them down, and put into the green glaſs metal, for the pureſt green glaſs, but never into any other, though they be the product of the fineſt virgin metal. *Merret*'s Notes on *Neri*, p. 277.

COLLET, among jewellers, the ſmall horizontal plane, or face, at the bottom of the brilliant. *Jeffries* on Diamonds.

COLLICIÆ, in anatomy, is uſed by ſome, as Steno, for the *carunculæ lacrymales*. See CARUNCULA, *Cycl.*

COLLIERY (*Cycl.*) — The moſt remarkable *colliery*, or coal-work, that we have ever had in this iſland, was that wrought at Burrowſtoneneſs, under the ſea. The veins of coal were found to continue under the bed of the ſea in this place, and the colliers had the courage to work the vein near half way over; there being a mote half a mile from the ſhore, where there was an entry that went down into the coal pit, under the ſea. This was made into a kind of round key, or mote, as they call it, built ſo as to keep out the ſea, which flowed there twelve feet. Here the coals were laid, and a ſhip, of that draught of water, could lay her ſide to the mote, and take in the coal

This famous *colliery* belonged to the earl of Kinkardin's family. The freſh water which ſprung from the bottom and ſides of the coal pit, was always drawn out upon the ſhore by an engine moved by water, that drew it forty fathom. This coal pit continued to be wrought many years, to the great profit of the owners, and the wonder of all that ſaw it; but, at laſt, an unexpected high tide drowned the whole at once, aud the labourers had not time to eſcape, but periſhed in it. Phil. Tranſ. N° 93.

COLLUCIANISTÆ. in church hiſtory, a deſignation given to the Arians, from the martyr Lucian, a preſbyter of Antioch. *Hofm.* Lex. in voc.

COLLURIO, in zoology, a name by which ſome authors have called the lanius, or butcher bird, a very ſmall ſpecies of hawk, not larger than a thruſh, but a great deſtroyer of ſmall birds. *Ray*'s Ornithol. p. 52. See the article LANIUS.

COLLUTION, *collutio*, in medical writers, is ſometimes uſed for the waſhing of the mouth, particularly, when done to clean or faſten bad or looſe teeth; or free the gums, &c from ulcers.

COLLYBUS, in antiquity, the ſame with what is now called the rate of exchange. See EXCHANGE, *Cycl.*

COLLYRÆ, or COLLYRIDES, in antiquity, a certain ornament of hair, worn by the women on their necks. It was made up in the form of the ſmall, roundiſh cakes, called *collyræ*. *Pitiſc.* Lex. Ant. in voc.

COLLYRIUM *Samium*. See SAMIUM *collyrium*.

COLMESTRE, in zoology, the name of a bird of the lagopus kind, more uſually called *otomo*, and ſuppoſed not to differ from the lagopus, otherwiſe than by its changing its colour, in the ſummer months. *Ray*'s Ornithol. p. 127. See OTOMO and LAGOPUS.

COLOBIUM, among the antients, a kind of upper garment, without ſleeves, which was longer than the tunic. *Hofm.* Lex. in voc.

COLOBOMA, in medical writers, is uſed for the præternatural growing together of the lips, or eyelids, or for the adhæſion of the ears to the head. *Blancard.*

COLOCOLO, in natural hiſtory, a name given by the people of the Philippine iſlands to a ſpecies of bird, called alſo there *caſſili*, and by ſome authors, the water raven, *corvus fluviatilis*. It is very much of the ſhape of a common raven, but is truly an amphibious bird, living more of its time under water than in the air; it is black in colour; its neck is remarkably long; and it feeds on fiſh, which it hunts under water, as they do one another; it feeds likewiſe on frogs, ſerpents, and ſhell-fiſh. It is common to ſee it under water in clear rivers, where it ſeems perfectly at eaſe, and runs about with great ſwiftneſs; at times it comes up to the ſurface, and dries its wings in the air and ſunſhine. Phil. Tranſ. N° 285. p. 1896.

COLOCYNTHIS, in botany, the name of a genus of plants of the gourd kind, of which there are many ſpecies, the *coloquintida* of the ſhops being the pulp of one of them. The characters which diſtinguiſh this genus from the others of the ſame claſs, are, that the leaves are very deeply divided, and the fruit is not eatable, but of an intolerable bitterneſs.

The ſpecies of this plant enumerated by Mr. Tournefort are theſe: 1. The great, round-fruited *colocynth*, the pulp of which is the common *coloquintida* of the ſhops. 2. The ſtriated, round-fruited *colocynth*. 3. The great, round, green-fruited *colocynth*. 4. The ſmall, round-fruited, *colocynth*. 5. The ſmall, variegated-fruited *colocynth*. 6. The great, variegated-fruited, *colocynth*. 7. The orange-fruited *colocynth*. 8. The rough-leaved, long fruited, *colocynth*. 9. The ſmooth-leaved, long-fruited, *colocynth*. 10. The turbinated, pear-faſhioned, *colocynth*. 11. The pear-faſhioned *colocynth*, with variegated leaves. And, 12. The flat-fruited *colocynth*. *Tourn.* Inſt. p. 107.

Colocynth frequently purges by eroſion, whence the conſequence is often a number of bloody ſtools. And hence ſome have affirmed, that it purged by reaſon of the great quantity of volatile ſalt it contained; and that, from the ſame principle, it rendered the blood fluid, and prevented coagulations of it. Experiment, however, does not prove this, nor has it any ſuch power upon the humors out of the body; for being put into recent blood, and recent milk, it is not able to prevent the coagulation of either, at the common time: and hence, as well as from many other obſervations, it appears much more probable, that it abounds in a highly acrid ſalt, by means of which it is able to open the mouths of the veſſels, and, by this means, to produce that effect. The antients had another opinion of the cauſe of theſe effects: they thought that it was not capable of concoction, or any alteration, by the juices in the ſtomach, but that, being of a ſpungy, and porous nature, it there remained a ſort of ſpunge, and fixing itſelf to the ſides of the inteſtines, exulcerated there, and cauſed all its bad ſymptoms by that means. And it has been obſerved of later years that when given in infuſion, it has not all thoſe ill effects, nor, indeed, ſcarce any of them, which it has when given in ſubſtance; but its inſupportable bitterneſs renders it ſcarce poſſible to be taken this way, and therefore it is ſtill preſcribed in ſubſtance, becauſe it may be better diguiſed in form of pills, or the like. The difference is, that when a medicine is given in ſubſtance, it is given in all its force; whereas, in infuſion, there is no one menſtruum that can be uſed, which can ſo perfectly extract all its virtues, but that much will be left in the reſidue; and therefore, the infuſion, as in this caſe, will be much the gentler medicine. This purge, though ſo rough, and miſchievous alone, yet is of great uſe, when mixed with other purgatives, as it carries them farther than they could otherwiſe go, and diſlodges viſcous and pituitous humors, from the moſt diſtant parts.

In the common analyſis by chemiſtry, there appears no principle predominant in this fruit, by which its violent effects may be accounted for. Diſtilled by the retort, it yields firſt a phlegm; then a phlegm with an acid ſalt diſſolved in it; after this, a phlegm leſs acid, and containing a quantity of an urinous alkaline ſalt, which ſtrongly affects the ſmell. Theſe three liquors bring over with them a fætid oil, and the fixed ſalt drawn from the remainde in the retort, was of the nature

ture of the reſt of the ſorts of that kind. Mem. Acad. Par. 1701.

The kernels, or ſeeds, of this fruit, which are carefully thrown away by the apothecary, according to the direction of the diſpenſatory writers, when treated in the ſame manner, yield much the ſame principles with the pulp, except that the laſt running liquor contains much leſs volatile ſalt than that of the pulp, as is not only ſenſible by its want of ſmell, but by its fermenting very ſlightly with acids, whereas that from the pulp ferments very ſtrongly. As theſe ſort of analyſes give, however, but little light into the nature of bodies, Mr. Boulduc tried many other experiments upon it; he fermented it with muſt, or new wine, and then diſtilling it in a balneum mariæ, he obtained a very penetrating ſpirit, which poſſeſſed all the bitterneſs of the *colocynth*, and made an extract from the reſiduum. The bitter ſpirit proved a purge, but operated roughly, occaſioning gripings and naufeas.

The quantities uſed in this proceſs were four ounces of *colocynth*, and ſix pints of muſt, and from the remainder of the diſtillation well clarify'd, there was made two ounces of an extract; the quantity proving plainly that a large portion of the eſſential ſalts of the wine remained with the matter of the *colocynth* This extract is the ſafeſt and beſt of all the preparations of *colocynth*; it purges gently, and without irritation, in a doſe of ten or twelve grains.

Colocynth, infuſed in rain water, yields only an inſipid phlegm by diſtillation, but the remainder yields a very fine extract of a tolerably mild purgative virtue; a pound of the pulp of *colocynth* thus yields two ounces and an half of extract, and the remaining maſs of the *colocynth* does not appear to contain any reſin. It is uſual to attribute the violence of all purgative medicines to their abounding in reſinous parts. To try whether this was the caſe in this ſimple, Mr. Boulduc finiſhed his experiments on it by making an extract from it, by means of ſpirit of wine. Eight ounces of the clean pulp yielded only half an ounce of a reſinous extract, and the reſiduum yielded two ounces of a coarſe extract, by means of water, but this was of a bad conſiſtence, and would ſcarce hang together. Mem. Acad. loc. cit.

Either of theſe extracts, given alone, proved troubleſome medicines: and all that appeared from this, and from the whole, was, that in order to have the virtues of this fruit in a gentle, and ſafe manner, its ſaline and reſinous parts muſt be left together, and only ſeparated from its terreſtrial and mucilaginous ones, by means of long fermentation with muſt or water, before its being evaporated into an extract; for that all its violent effects are owing to theſe terreſtrial and mucilaginous particles. See COLOQUINTIDA, *Cycl.*

COLOGN *earth*, a ſubſtance uſed in painting, much approaching to amber in its ſtructure, and of a deep brown. It has generally been eſteemed a genuine earth, but has been diſcovered to contain a great deal of vegetable matter, and indeed, is a very ſingular ſubſtance.

It never conſtitutes an entire ſtratum in the earth, but is lodged among other ſtrata in large flat detached moſſes. It is moderately dry, while in the earth, and of a ſoft crumbly texture. When dried, it is of a deep, duſky brown, of a very cloſe, compact, and fine ſtructure, and very remarkably light; it is of a ſmooth, even ſurface, dry, but not harſh to the touch, crumbles eaſily to pieces between the fingers, and ſlightly ſtains the hands; it adheres firmly to the tongue, and is of a very auſtere and aſtringent taſte, but not at all reſembling the aſtringency of the boles, or any thing elſe of the mineral kingdom, but plainly reſembling the taſte of oak bark It makes no efferveſcence with acids; if thrown into water, it ſwims on the ſurface, till thoroughly wetted; and if brought into contact with burning coals, it takes fire, and burns of itſelf, till reduced to yelloviſh aſhes.

It is eaſy to diſcern from this account, that though this is generally eſteemed an earth, and known to the world by no other name, it is no pure native foſſile, but contains more vegetable, than mineral matter, and owes its origin to the remains of wood which has been long buried in the earth. It is dug in Germany and France: the quantities conſumed in painting, in London, are brought from Cologne, where it is found very plentifully; but our own kingdom is not without it, it being found near Birmingham, and on Mendip hills in Somerſetſhire; but what has been yet found there is not ſo pure or fine, as that imported from Cologn. *Hill*'s Hiſt. of Foſſils, p. 64.

COLONEL (*Cycl.*) — Formerly, inſtead of *colonel*, the French uſed the word *coronel*; and this old ſpelling comes nearer to our common way of pronouncing the word *colonel*.

COLONUS, an huſbandman, or villager, who was bound to pay yearly a certain tribute, or at certain times of the year, to plough ſome part of the lord's land; and from hence comes the word *clown*, who is called by the Dutch *boor*. *Blount*.

COLOR, in the antient muſic. See COLOURS.

COLOR *conchiliacus*. See CONCHILIACUS *color*.

COLOR *Indicus*. See INDICUS *color*.

COLORATURA, in the Italian muſic, is uſed to denote all ſorts of variations, trillos, diminutions, &c. that can render a ſong agreeable. *Broſſ.* Dict. Muſ. in voc. See TRILLO, DIMINUTION, &c.

COLOURS (*Cycl*) — The greateſt perfection in the art of *colours*, would be to find the means of preparing the fineſt *colours*, without the uſe either of acid or alkaline ſalts, which uſually ſubject the *colours* to change, or eſe are apt to prey upon the cloth, canvas, &c. as we ſee in verdigreaſe, the blue and green chryſtals of copper, &c. It appears highly probable, that the Indians, for making the fine bright and durable *colours*, wherewith their chinces and callicoes are ſtained, make uſe of metalline ſolutions; for ſome ſtained callicoes, brought from thence, having been kept for forty or fifty years, the bright *colours* have been obſerved to eat out the cloth, exactly in the ſame manner as acid ſpirits, which diſſolve metals, are found to do. *Shaw*'s Lectures, p. 186.

Since theſe, then, are the inconveniences attending ſuch *colours*, we ought to ſearch for menſtruums with which to extract *colours*, which are neither acid, nor alkaline; and for ſuch metalline calxes, precipitates, or powders, as will not loſe their *colours*, by being well waſhed to get out their ſalts: to prepare certain metalline matters by mere calcination, or the bare aſſiſtance of ſize; and laſtly, to look out for native *colours*, wherein no ſaline matter abounds.

Mr. Geoffroy has given a very curious proceſs for the making two clear, ſpirituous, inflammable liquors, which differ very little in taſte and ſmell, and being mixt together give a fine carnation *colour*, without any ſenſible fermentation.

To make the firſt of theſe liquors, put a ſmall handfull of dried red roſes into a glaſs bottle, pour on them rectified ſpirit of wine, till it covers them an inch; let this ſtand in a cold infuſion four or five hours; then pour off the liquor, which will be clear and colourleſs, as when put on. The ſecond liquor is made by dropping into rectified ſpirit of wine ſo much oil of ſulphur, by the bell, or ſpirit of vitriol, as will be borne in it without giving it any very ſenſible acidity when taſted. When theſe liquors are thus prepared, let a ſmall quantity of the latter be dropped into ſome of the former, and the whole will become of a fine carnation *colour*, though there is no fermentation, nor any other change perceived in it, but barely that of *colour*. If, inſtead of this laſt liquor, there be added to the firſt a few drops of the ſpirit of ſal armoniac, the whole will become green.

Make a ſlight infuſion of galls in water, ſo as not to *colour* the water; make alſo a weak ſolution of green vitriol in water, ſo that it may appear colourleſs; mix theſe two colourleſs liquors together, and an inky blackneſs is immediately produced; add to this black liquor a little oil of vitriol, and the liquor becomes pellucid and colourleſs again; then add to this a little ſalt of tartar, and the whole is black again.

Put a little bruiſed camphor into rectified clear oil of vitriol; ſhake the mixture, and it will become black, and the camphor will be diſſolved; add to this a little water, and the liquor becomes clear, and the camphor is found ſeparated at top, in its own form, and native whiteneſs.

Infuſe lignum nephriticum in cold water, and pour off the clear liquor. This held up againſt the light, appears of a fine yellow, but viewed from the light, of a beautiful blue; a little ſpirit of nitre put to this liquor, makes it loſe the power of reflecting the blue rays, and a little oil of tartar, afterwards added, recovers that power again.

Logwood, infuſed in water, gives a red colour. Put to this a little ſpirit of urine, and it becomes of a fine purple; and drop in afterwards a little ſpirit of ſalt, and it becomes of a pale red.

A beautiful blue tincture may be made from filings of copper, by digeſting them in ſpirit of urine, hartſhorn, or the like. The addition of oil of vitriol deſtroys the blue *colour*; and a little ſpirit of ſalt turns it green.

Pellucid oil of vitriol, mixed with pellucid oil of turpentine, produces a thick red balſam. And common oil, mixed with fair water, by means of a little wax, and continued rubbing turns into a thick white balſam, called cold cream.

Oil of vitriol, diſtilled from quickſilver, leaves a white powder behind, which, if water be poured on it, becomes yellow.

Diſſolve quickſilver in ſpirit of nitre, and to part of it add ſpirit of urine, and a white powder is precipitated; to another part of the ſolution add oil of tartar, and a yellow powder falls to the bottom.

Dip a new pen in ſpirit of vitriol, and write with it on common blue paper, and the letters will appear red.

A pellucid ſolution of ſaccharum Saturni being written with on paper, becomes inviſible, when dried; but the bare fumes of an infuſion of quick lime, and orpiment, in water, will render the inviſible writing black and legible.

Volatile ſalt of ſal Armoniac, which is white, mixed with cryſtals of copper, which are green, produce a fine purple. *Shaw*'s Lectures, p. 173 — 176.

The original and ſimple, as well as the mixt, *colours* are producible by mixture. Thus, if the ſun's rays paſs through two pieces of glaſs, the one blue, and the other yellow, and be afterwards received upon a white paper, the *colour* there ſeen, is green. The dyers make cloth blue with woad, and then turn it green by the yellow herb called luteola, or dyer's weed.

weed. To a yellow ſolution of gold in aqua regia, add a blue one of copper in ſpirit of urine, and the mixture becomes green. The painters every day practiſe this art of producing new colours by mixture.

Metalline and mineral matters are reducible to a conſiderable degree of ſubtlety, or ſmallneſs of parts by fire, or dry calcination, ſo as to leave them durably poſſeſſed of their native or adventitious *colours*. Thus lapis lazuli, by being calcined, becomes the fine rich blue called ultra-marine; light ochre, by the ſame treatment, becomes a light red, or fleſh colour, the moſt uſeful fleſh-colour in painting. Lead, by calcination, becomes durably red, and iron durably brown; but a proper method ſeems wanting for the dry calcinations of the nobler metals gold and ſilver; though for the uſes of gilding, theſe are eaſily prepared by dipping linnen rags in their reſpective ſolutions, and then drying, and burning them to aſhes, whereby a dry and fine metalline powder is procured. *Shaw*'s Lectures, p. 187.

COLOURS from metals. See METAL.

Gold COLOUR. See GOLD.

COLOURS, *colores*, χρόαι, in the antient muſic, was uſed to ſignify the muſical ſpecies belonging to a genus. *Wallis*'s Append. ad Ptolem. Harm. p. 165.

In this ſenſe the chromatic genus was ſaid to have three *colours*; and the diatonic two. The enharmonic having no ſubordinate ſpecies, had but one *colour*. Hence the antients reckoned three genera, and ſix *colours* in muſic; that is, ſo many different diviſions of the diateſſaron, or fourth. *Wallis*, ibid. See GENUS, ENHARMONIC, CHROMATIC, and DIATONIC.

COLOURING *of glaſs*. See GLASS.

COLOURING *of earthen ware*. See GLAZING.

COLOURING *of porcelane*. See STAINING.

COLOURING *of ſpirits*. See SPIRITS.

COLPISCIS, a name given by ſome to the *falx Venetorum*, or ſickle fiſh, commonly called the marmot fiſh by the people of Venice. *Willughby*'s Hiſt. Piſc. p. 117. See FALX.

COLT, in zoology. See FOAL.

COLT *evil*, a diſeaſe incident both to horſes and geldings. It is an unnatural ſwelling of the yard and cods, proceeding from wind, or elſe through the abundance of ſeed in horſes. It happens to geldings for want of natural heat. Dict. Ruſt. in voc.

COLT'S-*foot*, in botany. See TUSSILAGO.

COLTIE, among the timber merchants, a word uſed to expreſs a tree which has a defect in ſome one of its annual circles, which renders it unfit for many of the uſes it might have been otherwiſe fit for. In this caſe ſome one of the annual circles near the center, is perceived by the eye to be thicker than the reſt, and its ſap veſſels larger. It has an appearance much different from that of the others, and is ſo looſely connected both to its inveſtient, and inveſted circles, that on ſawing a tranſverſe piece of the trunk off, it will ſlip out from the others, and ſo leave the heart looſe, and the reſt hollow, ſeeming to have been only fitted, not connected, to the others. In ſplitting the wood for other uſes, it yet more readily drops out, and the timber of ſuch a tree is therefore much leſs fit for general uſe than that of others. It is not eaſy to ſay to what accident, in the growth of the tree, this is owing, but it ſeems probable that it expoſes the tree to other accidents; in particular Bobart ſeems to think, that among the trees which were ſplit by the hard froſt, in the year 1683, while other trees of the like ſizes and kinds eſcaped, this *coltineſs* might be the occaſion of the miſchief, as well as their being wind-ſhaken, or lagged. Phil. Tranſ. N° 165.

COLUBRINUM *lignum*. See LIGNUM *Colubrinum*.

COLUMBA, the *pidgeon*. In the Linnæan ſyſtem of zoology this makes a diſtinct genus of birds, of the order of the paſſeres, the general characters of which are, that the tongue is whole and even; the beak ſtrait, and ſcurſy at the baſe; the noſtrils long, and covered externally with a membrane. *Linnæi* Syſtem. Natur. p. 48.

COLUMBA *Greenlandica*, in zoology, a name given by authors to a ſmall, well-taſted, water-fowl, called in Engliſh, the *ſea turtle dove*. See TURTLE *dove*.

COLUMBA *marina*, the *ſea dove*, in zoology, the name of an Eaſt Indian fiſh, and appearing to be a ſpecies of the orbis, or moon-fiſh. It has its name from its head, and prominent cheſt, reſembling that of the dove; it has no ſcales, but is variegated with ſeveral very oddly placed marks on the back and ſides. It is a ſcarce fiſh, and not much valued, being but an ill-taſted one. *Ray*'s Ichthyogr. Append. p. 5.

COLUMBA is alſo the name of a military order inſtituted by John I. of Caſtile, about the year 1379. *Hiſm.* Lex. in voc.

COLUMBINA, a name given by Actuarius, and ſome other medical writers, to the verbena, or common vervain. *Ger.* Emac. Ind. 2.

COLUMBINES, *aquilegia*, in botany. See AQUILEGIA.

The manner of propagating theſe flowers is either by ſowing, or parting the old roots, but the old roots being very apt to degenerate, the ſowing them is much the beſt method.

The ſeeds muſt be ſown in a nurſery bed in Auguſt or September, and in the March following, the plants will appear above the ground, at which time they muſt be carefully cleared of weeds, and watered gently at times, if the dryneſs of the ſeaſon requires it. In the beginning of May, they will be ſtrong enough to tranſplant, and muſt then be placed at eight inches diſtance, in beds of good, freſh, undunged earth, and they muſt here be alſo kept cleaned from weeds, and watered as they may require it; at Michaelmas they may be removed into the borders of the flower-garden, and in the May following they will flower. *Mill* Gard. Dict.

COLUMELLA, in natural hiſtory, a name given by Mr. Lhuyd to the mycetitæ, or fungitæ, a ſort of ſea corals, when found foſſile, as they very frequently are, in beds of clay, or lodged in ſtone. See FUNGITÆ.

COLUMELLA, in anatomy. See UVULA, *Cycl.*

COLUMELLÆ *muſculus teres*, a name given by Morgagni, and ſome others, to the muſcle called by Albinus *azygos uvulæ*.

COLUMNARIS, in botany, a name given by ſome to the tall, milky bell flower, the *campanula latifolia*. *Ger.* Emac. Ind. 2.

COLUMNARIUM, in Roman antiquity, a heavy tribute, demanded for every pillar of a houſe. It was firſt laid on by J. Cæſar, in order to put a ſtop to the extravagant expences laid out on ſumptuous buildings. *Pitiſc.* in voc.

COLUMNEA, in botany, the name of a genus of plants, deſcribed by Plumier and Linnæus; the characters of which are theſe. The perianthium conſiſts of one leaf, divided into five erect, and pointed, ſegments, and remains after the flower is fallen. The flower is compoſed of only one petal, and is of the gaping, or ringent kind; the tube is long, and ſomewhat bellied, and the verge is divided into two lips. The upper lip is erect, hollow, and undivided, and the lower is divided into three lanceolated ſegments; the ſtamina are four filaments, two of which are longer than the reſt, and they are all hid under the upper lip of the flower; the antheræ are ſimple; the germen of the piſtil is roundiſh; the ſtyle is ſlender, and of the length of the upper lip of the flower; and the ſtigma is bifid and acute. The fruit is a globoſe berry, containing two cells, ſtanding on the cup, and being of its ſize; the ſeeds are numerous, and oblong, and are contained in large receptacles. *Plumier*, Gen. 33. *Linnæi* Gen. Plant. p. 296.

COLURE (*Cycl.*) — It is diſputed over what part of the back of aries the equinoctial *colure* paſſed in the time of Hipparchus. Sir Iſaac Newton, in his chronology, takes it to have been over the middle of the conſtellation. Father Souciet inſiſts on its having paſſed over the dodecatemorion of aries, or midway between the rump and firſt of the tail. We have ſome obſervations, in the Philoſophical Tranſactions, N° 466. concerning the poſition of this *colure* in the antient ſphere, from a draught of the conſtellation aries, in the Aratæa publiſhed at Leyden and Amſterdam 1652; which ſeem to confirm Sir Iſaac's opinion; but the antiquity and authority of the original draught may ſtill remain in queſtion.

COLUTEA, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the papilionaceous kind, and from its cup there ariſes a piſtil, which finally becomes a membranaceous capſule, inflated in the manner of a bladder, and contained in kidney-ſhaped ſeeds.

The ſpecies of *colutea* enumerated by Mr. Tournefort are theſe. 1. The common bladder *colutea*. 2. The *colutea*, with red bladders. 3. The purple-flowered, Æthiopian *colutea*. 4. The Syrian, dwarf *colutea*, with violet-coloured flowers. And, 5. The bladder *colutea* of La Vera Cruz. *Tourn.* Inſt. p. 649.

COLYMBIS, in zoology, a name given by Bellonius to a ſpecies of duck, remarkable for a large tuft of feathers behind its head, and thence called by us the tufted duck, and known among authors by its Venetian name *capo negro*. *Aldrovand.* de Avib. See CAPO *negro*.

COLYMBUS, the *diver*, in the Linnæan ſyſtem of zoology, the name of a diſtinct genus of birds, of the order of the anſeres; the diſtinguiſhing characters of which are, that they have a pointed beak, and that their feet are placed far behind. *Linnæi* Syſtem. Natur. p. 46. See DIVER.

COLYTEA, in botany, is uſed by ſome to denote the *arbor Judæ*, or *ſiliquaſtrum*. *Ray*'s Hiſt. V. 1. p. 1717. See SILIQUASTRUM.

COMARCHIOS, Κωμαρχικὸς, in antiquity, the name of a particular air, or tune, deſigned to be ſung at entertainments. Mem. Acad. Inſcrip. p. 359.

COMARIS, in lithology, a name given by the Greek writers to the ſelenitis, or aphroſelene. See the article SELENITIS.

They called this ſtone alſo cupholithos.

COMARUM, in botany, the name of a genus of plants, the characters of which are theſe. The perianthium is very large and coloured. It conſiſts only of one leaf, divided into ten ſegments, which are alternately ſmaller one than the other, and remain after the flower is fallen. The flower conſiſts of five oblong pointed petals, much ſmaller than the ſegments of the cup to which they are fixed. The ſtamina are twenty filaments inſerted into the cup; they are of the length of the flower, and are of a ſubulated figure. The antheræ are lunular in figure, and very ſoon fall; but the ſtamina are permanent. The germina of the piſtils are very numerous; they are ſmall, roundiſh, and collected together in a head; the ſtyles are ſimple and ſhort, and placed at the ſides of the germina; and the ſtigmata are ſimple. The common receptacle of the ſeeds is of the figure of a ſcrotum, and is fleſhy, and very large and permanent. The ſeeds are numerous and pointed,

pointed, and ſo placed that they cover the receptacle. *Linnæi* Gen. Plant. p. 222.

COMBINATORY *diſtillation*. See DISTILLATION.

COMBINATORY *muſic*, *muſica combinatoria*, that part of muſic which teaches the manner of combining ſounds variouſly; that is, of changing their place and figure in different manners. See MUSIC.

COMEDONES, a name given to a ſpecies of worm, with which the children of Miſnia, and ſome other countries, are terribly afflicted; and of which Hoffman, in his treatiſe of endemial diſeaſes, gives this account: children in the country are frequently ſeized with a ſort of tabes, which ſo deſtroys their fleſh, that they appear merely like ſhadows. The common people generally ſuppoſe theſe children to be under the influence of witchcraft, but ſuch as have enquired more narrowly into the diſtemper, have found that it is owing to certain worms, reſembling black hairs, or cords, lodged under the ſkin. When the ſkin is rubbed with honey, in a bath, or any warm place, they will appear and come out; but when it is contracted by cold, they keep concealed within.

COME *ſopra*, in the Italian muſic, literally ſignifies *as above*, and is uſed when any foregoing part is to be repeated. *Broſſ.* Dict. Muſ. in voc.

COMET (*Cycl.*) — *Tails of* COMETS. See TAILS *of comets*.

COMETITES, in natural hiſtory, a name given by ſome writers to a kind of aſtroites, which has ſtars much larger than thoſe of the common kind, and therefore called comets.

COMFREY, *ſymphytum*, in botany, &c. See SYMPHYTUM.

Comfrey root is a famous vulnerary, both externally, and internally. It is a noble balſamic and agglutinant, and given with ſucceſs in diarrhæas from dyſenteries, and ſpittings of blood. The beſt way of taking it is in decoction, or ſyrup, but the decoction muſt not be too ſtrong.

COMIOLA, in botany, a name given by ſome of the old Roman authors to the plant commonly called luteola, or dyer's weed. It grows in moſt parts of the world. The Greeks, of old, uſed it in dying yellow, as we do at this time, and called it *cymene*, and ſometimes *thapſia*, that word ſignifying, with them, ſeveral different things which had the property of dying yellow. It was called alſo by ſome *robia*, or *rubia*; but thoſe who gave it this name have always diſtinguiſhed it by ſome peculiar epithet from the common *rubia*, or madder. Paulus Ægineta mentions it as an herb uſed in dying cloths; and Neophytus, and ſeveral others, give it a place among the things uſed to tinge the hair.

COMITATU *commiſſo*, in law, a writ, or commiſſion, by which a ſheriff is authorized to take upon him the charge of the county. Reg. Orig. 295. *Blount* and *Cowel*.

COMITATU *et caſtro commiſſo*, a writ by which the charge of a county, together with the keeping of a caſtle, is committed to the ſheriff. Reg. Orig. ibid. *Blount* and *Cowel*.

COMITIA (*Cycl.*) — COMITIA *centuriata*. Servius Tullius, the ſixth king of Rome, in order to correct the inconvenience of the *comitia curiata*, inſtituted a new diviſion of the people into ſix claſſes, according to a cenſus, or valuation of their eſtates: then he ſubdivided theſe claſſes into one hundred and ninety-three centuries, and contrived to throw a majority of theſe centuries, that is, ninety-eight of them, into the firſt claſs of the richeſt citizens. By which regulation, though every man voted now in his century, as before in his curia; yet, as all matters were decided by a majority of the centuries, ſo the ballance of power was wholly transferred into the hands of the rich; and the poorer ſort deprived of their former weight and influence in the affairs of ſtate [a]: which wiſe inſtitution was ever after obſerved, through all ſucceeding ages, in the elections of the principal magiſtrates, and the determination of all the principal tranſactions of the republic [b]. — [[a] *Liv.* l. 1. c. 43. *Dionyſ.* Halic. l. 4. c. 20, 21. [b] *Middleton*, of Rom. Sen. p. 27, 28.]

COMITIA *curiata*. Romulus inſtituted the *comitia curiata*, or the public aſſemblies of the people, called to vote in their ſeveral curiæ; and it is agreed by all, that the matters ſubjected to their deciſion, were the choice of all the magiſtrates, and the right of making laws, war, and peace: an ample juriſdiction, and in the moſt important articles of government, yet not wholly abſolute, according to Dionyſius, unleſs the ſenate concurred with them. *Dionyſ. Halic.* l. 2. c. 14. *Middlet.* of Rom. Sen. p. 26.

This method of tranſacting all the greater affairs by the people, aſſembled in their curiæ, after it had ſubſiſted through five ſucceſſive reigns, was found to be inconvenient; ſo that Servius Tullius inſtituted the *comitia centuriata* above mentioned. *Middleton*, of Rom. Sen.

COMITIAL *days*. Paulus Manutius is of opinion, that there were certain days on which the Roman ſenate might regularly be aſſembled, and others, on which it could not: and that theſe laſt were called *comitial* days, and marked under that name in the kalendars, as days wholly deſtined, and ſet apart by law, for the aſſemblies of the people [a]. But Sigonius contends, that the ſenate might meet on any of thoſe days, unleſs when the people were actually aſſembled, and tranſacting buſineſs on them; and conſequently that the title of *comitial* denoted ſuch days only, on which the people might be legally aſſembled, not ſuch on which they were of courſe to be aſſembled [b]. — [[a] De Senatu Rom. [b] Vid. *Joh. Sarium Zamoſc.* de Senatu Rom. l. 2. 7. written by Sigonius under the name of his diſciple. *Middlet.* of Rom. Senat. p. 138, ſeq.

The truth of the matter ſeems to be this, that though the days called *comitial* were regularly deſtined to the aſſemblies of the people, yet, the ſenate alſo might not only be convened on the ſame, after the popular aſſemblies were diſſolved, but had the power likewiſe, whenever they found it expedient, to ſuperſede and poſtpone the aſſemblies of the people to another day; and, by a particular decree, to authoriſe their own meetings upon them, for the diſpatch of ſome important affair, therein ſpecified. *Middlet.* ib.

COMITIALIS *morbus*. See MORBUS *comitialis*.

COMITIUM, in antient Rome, that part of the forum where the comitia always aſſembled. It was in this place that the roſtra were placed. See COMITIA, *Cycl.* and *Suppl.*

COMMA, (*Cycl.*) in muſic. It is aſſerted in the Cyclopædia, that the *comma* is the ſmalleſt of all ſenſible intervals of tune; but this is a miſtake, if it be meant that the ear cannot diſtinguiſh any thing leſs; for the diminution of fifths in temperate ſcales is very ſenſible, though this diminution be leſs than $\frac{1}{4}$ of a *comma* in harpſichords and organs. See TEMPERAMENT.

The *comma* is about $\frac{1}{56}$ of an octave. Vid. *Euler*, Tent. Nov. Theor. Muſic. p. 106.

COMMA *of Pythagoras*, is the difference between ſix tones major, and the octave; or between 19 octaves, and 12 twelfths. It will therefore be expreſſed by the proportions $\frac{531441}{524288} = \frac{9^6}{8^6} : \frac{2}{1} = \frac{3^{12}}{2^{19}}$. The ſmall figures written above the larger, ſignify the exponents of their powers. See EXPONENT, *Cycl.* and *Suppl.*

COMMELINA, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants, the characters of which are, that the flower cup is a ſpatha, in form of a heart, very large, compreſſed, and ſhutting together, and remaining after the flower is fallen. The flower is compoſed of ſix petals, the three exterior ones ſmall, of an oval form, hollow, and reſembling a perianthium; the three inner ones interwoven with one another, large, roundiſh, and coloured. This flower has alſo three nectaria which reſemble ſtamina, of the figure of a croſs, placed on filaments, and each in an horizontal direction. The ſtamina are three bent and pointed filaments, in figure reſembling the filaments of the nectaria, but placed below them. The antheræ are of an oval figure; the germen of the piſtillum is roundiſh; the ſtyle is pointed, and of the length of the ſtamina, and the ſtigma is ſingle; the fruit is a naked capſule, of a ſomewhat roundiſh figure, but marked with three lines, divided into three cells, and having three valves. The ſeeds are placed ſingly in each cell of the capſule, and are roundiſh. *Linnæi* Genera Plantarum, p. 11.

COMMENTACULA, among the Romans, the rod which the flamins carried in their hands, when going to ſacrifice. *Hofm.* Lex. in voc.

COMMENTARIENSIS, among the Romans, an officer who had the keeping of the priſon, and was to obey the *triumviri capitales*. *Hofm.* Lex. in voc.

COMMISSARY (*Cycl.*) — COMMISSARY *of horſes*, an officer in the artillery, appointed to have the inſpection of the artillery horſes, to ſee them muſtered, and to ſend ſuch orders as he receives from the commanding officer of the artillery, by ſome of the conductors of horſes, of which he has a certain number for his aſſiſtants.

COMMISSARY *of proviſions*, is he who has the inſpection of the bread, and proviſions of the army.

COMMISSARY *of ſtores*, an officer in the artillery, who has the charge of all the ſtores, for which he is accountable to the office of ordnance; he is allowed an aſſiſtant, clerks, and conductors, under him.

COMMISSION (*Cycl.*) — COMMISSIONS *of charitable uſes* go out of the chancery to the biſhop and others, where any lands given to charitable uſes are miſemployed, or there is any frauds or diſputes concerning them, to enquire of, and redreſs the abuſe, &c. 43 Eliz. c. 4.

COMMISSION *of lunacy*, a commiſſion out of chancery to enquire whether a perſon repreſented to be lunatic, be ſo or not; that, if lunatic, the king may have the care of his eſtate, &c. 17 Ed. II. c. 10.

COMMISSION *of ſewers*, is directed to certain perſons to ſee drains and ditches well kept, and maintained, in the marſhy and fenny parts of England, for the better conveyance of water into the ſea, and preſerving the graſs upon the land. Stat. 23. Hen. VIII. c. 5. 13. Eliz. c. 9.

COMMITMENT, the ſending of a perſon to priſon by warrant or order, who hath been guilty of any crime or offence. It may be by the king and council, by the judges of the law, juſtices of peace, and other magiſtrates, who have authority by the laws and ſtatutes of the realm to do it, which muſt be exactly purſued. Every *commitment* to priſon ought generally to be made by warrant, under the hand and ſeal of him who commits the party, and the cauſe of *commitment* to be expreſſed in the warrant, &c.

COMMODAVIENSIS, an appellation given by ſome authors to a ſpecies of lapis calaminaris found in Bohemia. But as it yields

yields no zink, Mr. Marggraf denies it to be true calamine. See the article ZINK.

COMMOIGNE, in law, a word ſignifying a fellow-monk, that lives in the ſame convent. 3 Inſt. 15. *Blount.*

COMMON, (*Cycl.*) *communis*, κοινος, in the antient muſic, was an appellation given to the ſeventh ſpecies of the diapaſon. *Euclid.* Introd Harm. p. 16. Edit. Meibom. See DIAPASON.

COMMON *bench.* The court of *common pleas* was antiently called *common bench.* *Blount* and *Cowel.*

In law books and references, the court of common pleas is writ C. B. from *communi banco*: and the juſtices of that court are ſtiled *juſticiarii de banco.*

COMMON *chords*, in muſic, is ſometimes uſed to denote the third, fifth and octave of any note, conſidered as a baſs.

COMMON *day*, in plea of land, ſignifies an ordinary day in court, as *octabis hillarii*, *quindena paſchæ*, &c. It is mentioned in 13 Rich. II. ſtat. 1. c. 17. and in the ſtatute 51 Hen. III. concerning general days in bank. *Blount* and *Cowel.*

COMMON *diviſor*, in arithmetic, that number which exactly divides any two other numbers, without a remainder.

COMMON *meaſure*, in arithmetic, a number that exactly meaſures two other numbers, without a remainder. And the greateſt number that can meaſure any two other numbers, is called their greateſt *common meaſure*; thus 4 is the greateſt common meaſure of 8 and 12.

COMMON *pleas.* This court was originally eſtabliſhed for the determination of pleas merely civil, and was at firſt ambulatory, and removed with the king wherever he went: but was fixed to one place by magna charta, cap. 11. *Communia placita non ſequantur curiam noſtram ſed teneantur in aliquo certo loco.*

The juriſdiction of this court is founded on original writs, iſſuing out of the chancery, which are the king's mandates for them to proceed on to determine ſuch and ſuch cauſes [a]. But this is to be underſtood when the cauſe is between common perſons; for when an attorney, or any perſon belonging to the court, is plaintiff, he ſues by writ of privilege, and is ſued by bill, which is in nature of a petition; both which originally commence in the *common pleas*, and have no foundation in the chancery.—[[a] 4 Inſt 99. [b] 4 Inſt. ibid.]

This court, Sir Edward Coke ſays, is the lock and key of the common law in *common pleas*; for herein are real actions, whereupon fines and recoveries do paſs; as alſo all other real actions by original writs; alſo *common pleas*, mixt or perſonal, in divers of which the king's bench has a concurrent juriſdiction with this court [a]. But the juriſdiction of each court is at this day ſo well eſtabliſhed, that as the court of king's bench cannot determine a mere real action, ſo neither can the court of *common pleas* enquire of felony or treaſon [b].—[[a] 4 Inſt. ibid. [b] Vid. 2 *Hawk.* P. C. p. 2.]

This court, without any writ, may, upon a ſuggeſtion only, grant prohibitions, to keep as well temporal as eccleſiaſtical courts within their bounds and juriſdiction. See 4 Inſt. 99. and *Vaughan*'s Reports, p. 157.

In term time, this court may award a habeas corpus by the common law, for any perſon committed for any cauſe under treaſon or felony; and thereupon diſcharge him, if it ſhall clearly appear by the return, that the commitment was againſt law, as being made by one who had no juriſdiction of the cauſe, or for a matter, for which, by law, no man ought to be puniſhed. Vid. *Vaugh.* 154, ſeq 2 *Jones* 14.

Houſe of COMMONS. The *houſe of commons*, in Forteſcue's time, who wrote during the reign of Henry VI. conſiſted of upwards of three hundred members: in Sir Edward Coke's [a] time their number amounted to 493. At the time of the union, there were five hundred and thirteen members for England and Wales, to which forty-five repreſentatives for Scotland were added; ſo that the whole number of members is at this day 558.—[[a] 4 Inſt. fol. 1.]

COMMUNICATION, *communicatio*, in rhetoric, the ſame with *anacoenoſis.* See ANACOENOSIS.

COMORTH, in our ſtatutes, is uſed for a contribution or ſubſidy. It is ſaid to be derived from the Britiſh *cymorth*, *ſubſidium.*

The ſtat. 4 Hen. IV. c. 27. and 27 Hen. VIII. c. 6 prohibit the levying any ſuch in Wales, or the Marches.

It is ſaid this *comorth* was gathered at marriages, and when young prieſts ſaid their firſt maſſes, and ſometimes for redemption of murders or felonies. *Blount.*

COMOSANDALOS, Κομοσανδαλος, in antiquity, a crown of flowers worn in the feſtival chthonia. *Pott* Archæol. See the article CHTHONIA.

COMPAGES *circularis montium*, a term deviſed by Kircher to expreſs what he in other places calls the annularity, or annular diſpoſition of mountains, which he ſays run in continued chains, forming belts or ridges in the manner of ſpines, all round the globe of the earth, from north to ſouth, and ſo on from that point to north again, and in the ſame manner from eaſt to weſt, and from weſt to eaſt again. *Kircher*, Mund. Subt. See the article MOUNTAIN.

COMPAGUS, in antiquity, a kind of ſummer ſhoe worn by the Roman ſenators, conſiſting only of a ſole at the bottom; it was faſtened with leathern ſtraps, croſſing one another many times about the leg. *Dacier*, Not. ſur Hor. l. 1. ſat. 6. *Kenn.* Rom. Ant. P. 2. l. 5. c. 8. p. 324.

Rubenius makes the *compagi* to have been a ſort of caligæ worn by the Roman generals as well as ſenators. Under the later emperors, in the middle age, we read of the ſame worn by popes, biſhops and abbots. *Rubien.* de re Veſt l. 2. c. 5. *Ferrar.* Anal. de re Veſt. c. 37. *Du Cange*, Gloſſ. Lat. T. 1. p. 708, ſeq. *Pitiſc.* Lex. Ant. T. 1. p. 337. *Schoet.* Lex. Ant. p. 257.

COMPANY (*Cycl.*) — *Companies* of foot on the Britiſh eſtabliſhment commonly uſed to conſiſt of one captain, one lieutenant, one enſign, three ſerjeants, three corporals, two drums, and 49 private centinels; in all 60. But of late years, *companies* have been increaſed, by the addition of 20 centinels, to 80 men. Ten, and ſometimes twelve *companies*, make a regiment.

COMPARTMENTS, (*Cycl.*) in gardening, are beds, plats, borders and walks, laid out according to the form of the ground, and depend more on a good fancy than on any ſet of rules, for their conſtruction. They are alſo ſometimes merely diverſities or knots of flower gardens or parterres, of which there are an infinite variety, according to the fancy of the deſigner. Plain *compartments*, are pieces of ground divided into equal ſquares and flower-beds, marked out by lines, and made of regularly equal length and breadth. Some allow to theſe ſquares borders of two feet broad, if the plot of ground be ſmall, and if larger, of three feet, and edge the borders with box, or with upright hardy thyme: the alleys up between are to be laid with ſand or gravel, and kept clean weeded.

COMPASS (*Cycl.*) — The *compaſs* has been ſometimes obſerved to be diſturbed by the electricity of its glaſs cover, and this from ſo ſlight an application of the finger as was barely neceſſary to wipe off a little duſt. The ſame glaſs, rubbed a little more with the finger, a bit of muſlin, or of paper, would attract either end of the needle, ſo as to hold it to the glaſs for ſeveral minutes, far out of the due direction, according to what part of the glaſs was moſt excited. And when the needle, after adhering to the glaſs, has dropt looſe, and made vibrations, thoſe would not be biſected, as uſual, by that point where the needle ſhould reſt, but either be made all on one ſide, or be very unequally divided, by means of ſome remains of electrical virtue in that part of the glaſs which had attracted the needle, until at length, after fifteen minutes or more, all the electricity being evaporated, the magnetical power took place. Phil. Tranſ. N° 480. p. 243.

The cure for this inconvenience, is to moiſten the ſurface of the glaſs: a wet finger will do it immediately and effectually. Phil. Tranſ. N° 480. p. 244.

There is reaſon to believe, that glaſs does at times become in ſome degree attractive, without any friction at all, and may poſſibly be excited by great concuſſions in the air, ſuch as thunder, or the diſcharge of great ordnance, and ſo may diſturb the compaſs.

The mariner's *compaſs*, with a chart, is much leſs dangerouſly moved than the common *compaſs* with a bare needle. And the deeper or farther diſtant the needle hangs below the glaſs, the leſs diſturbance it is likely to receive.

The minute, irregular, reciprocating variations, which have been obſerved in the directions of dipping and horizontal needles, and mentioned in the philoſophical tranſactions [a], may probably have been cauſed by the glaſſes which covered the inſtruments made uſe of [b].—[[a] N° 425. [b] Phil. Tranſ. N° 480. p 245.]

COMPETENTES, in church hiſtory, an appellation given to the *catechumens*, when being ſufficiently inſtructed in the chriſtian religion, they required baptiſm. *Hoſm.* Lex. in voc. See BAPTISM.

COMPITA, in zoology, a name by which ſome have called the colymbus major, or ſiſanelle, the great Venetian diver. See FISANELLE.

COMPLEXI *pars*, in anatomy, a name given by Riolanus, and others, to a muſcle called by Albinus *biventer cervicis*, and by ſome the *complexus.*

COMPLEXUS, (*Cycl.*) a pretty long and broad muſcle, lying on the poſterior lateral part of the neck, all the way to the occiput. It is complicated, by reaſon of the decuſſations of its different portions, but is generally looked upon to be but one muſcle. It is fixed below by ſmall ſhort tendons, to the tranſverſe apophyſes of all the vertebræ of the neck, except the firſt, to which it is fixed only near the root of its tranſverſe apophyſis; from thence it runs up obliquely backward, croſſing under the ſplenius, and after communicating with it by ſome faſciculi of fibres, it is afterwards inſerted above, by a broad fleſhy plane, in the poſterior part of the ſuperior tranſverſe line of the os occipitis, near the criſta or ſpine of that bone. At its inſertion, it joins by one edge the *complexus* of the other ſide, and by the other the ſplenius, which covers it a little. *Winſlow*'s Anat. p. 235.

COMPLEXUS *minor*, a muſcle called alſo *maſtoidæus lateralis.* It is long, ſlender, narrow, and indented, and lies along all the inſide of the neck up to the ear, where it increaſes a little in breadth. It is fixed by one extremity in all the tranſverſe apophyſes of the neck, except the firſt, by the ſame number of branches or digitations, which are moſtly fleſhy, and are diſpoſed obliquely; from thence it aſcends, and having reached above the tranſverſe apophyſis of the firſt vertebra, it forms a

ſmall broad plane, by which it is inſerted in the poſterior part of the apophyſis maſtoidæus. It is here covered by the ſplenius, and covers a little the obliquus ſuperior. It is often miſtaken for a portion of the longiſſimus dorſi. *Winſlow's* Anat. p. 236.

COMPOSITE (*Cycl.*) — COMPOSITE *numbers*, thoſe that can be meaſured by ſome number above unity; as 12, by 2, 3, 4, and 6.

Compoſite numbers between themſelves, are ſuch as have ſome common meaſure beſides unity; as 12 and 15, being both meaſured by 3.

COMPOSITE *ſtalk*. See the article STALK.

COMPOSITIO *menſurarum*, the title of an antient ordinance for meaſures, not printed; it is mentioned in the ſtatute of 23 Hen. VIII. cap. 4.

COMPOUND, in chemiſtry. See AGGREGATE.

COMPOUND *flower*. See FLOWER, *Cycl.*

COMPOUND *leaf*, among botaniſts. See LEAF.

COMPRESS (*Cycl.*)—It is frequently the cuſtom among ſurgeons, after the plaiſter and other dreſſings are applied, to cover all with a *compreſs*, which is made of the ſofteſt old linnen, four, ſix, or eight times doubled. Theſe are of ſervice, not only by preſerving the parts from the injuries of the external air, but alſo for the ſecuring and fixing the plaiſters and other dreſſings. *Compreſſes* are alſo frequently applied where no plaiſter is made uſe of, and that ſometimes dry, ſometimes wetted with certain liquors, which are ſuppoſed to be ſtrengthening, emollient, reſolving, lenient, cooling, &c. They are frequently dipped in the decoctions of certain herbs, into wine, ſpirit of wine, vinegar, or oxycrate, and ſometimes into lime water, and are adminiſtered either cold or hot, as the nature of the caſe requires.

Compreſſes are of various forms; ſome are ſquare, others oblong, others triangular, and others in form of a croſs, according to the part they are to be applied to, and according to the occaſion and ſituation. Some are called ſtrait, others oblique, others tranſverſe, and others annular, as thoſe that ſurround the arm or foot. There are ſome alſo neceſſarily made in the form of an aſteriſm; ſome are divided either on one or both ſides, as far as the middle; ſometimes they form a hexagon, and ſometimes are round or globular, reſembling a ball: theſe are uſed in luxations of the os humeri, and are placed under the axillæ. Sometimes *compreſſes* of a much ſmaller ſize are required, which are either ſquare for the wounds of the blood-veſſels, to reſtrain hæmorrhages, or taper, for ſutures of wounds, or in ligatures of the arteries.

Compreſſes of all kinds are intended for theſe purpoſes: 1. To preſerve and cheriſh the natural heat of the body. 2. To ſecure the dreſſings that are laid under them. 3. To convey liquid remedies to parts wounded or otherwiſe diſordered, and to prolong the uſe of them. 4. To fill up any cavities or depreſſions of the parts, that the dreſſings (eſpecially in fractures) may be applied with greater ſecurity: and laſtly, to prevent bandages from bringing on a troubleſome itching, or other pain or uneaſineſs on the ſkin. *Heiſter's* Surg. p. 19.

COMPRESSED *leaf*, among botaniſts. See LEAF.

COMPRESSOR *naris*, in anatomy, a name given by Albinus and ſome others to one of the muſcles of the face, called by Winſlow the *tranſverſalis naſi*, and *inferior naſi*; and by Cowper, the *elevator alæ naſi*. See ELEVATOR.

COMPTROLLER (*Cycl.*) — COMPTROLLER *of the artillery*, an officer whoſe duty it is to inſpect the muſters of the artillery, to make the pay-liſt, and take the accounts and remains of ſtores. He is accountable to the office of ordnance. *Guil.*

CONAR *lapis*, a ſtone ſaid by ſome authors to have the virtue of preventing wrinkles, and preſerving youth. We have no deſcription of it; but de Boot tells us, that in China they make ſome of their veſſels of it.

CONCAVE *glaſs*, or lens, one that is flat on one ſide and ground hollow on the other, but uſually ſpherical. It is called by ſome a *plano-concave*, and if the glaſs be concave on both ſides, it is called a *double concave*. See GLASS and MIRROUR, *Cycl.*

CONCAVITY (*Cycl.*) — An arch of a curve has its *concavity* turned one way, when the right lines that join any two of its points are all on the ſame ſide of the arch.

Archimedes, intending to include ſuch lines as have rectilinear parts, in his definition, ſays, a line has its *concavity* turned one way, when the right lines that join any two of its points are either all upon one ſide of it, or while ſome fall upon the line itſelf, none fall upon the oppoſite ſide. *Archim.* de Sphær. & Cyl. Def. 2. *Mac Laurin's* Fluxions, Art. 180.

When two lines, having their *concavity* turned the ſame way, have the ſame terms, and the one includes the other, or has its *concavity* towards it, the perimeter of that which includes, is greater than the perimeter of that which is included. *Archim.* ib. Ax. 2.

CONCENTRATING, in chemiſtry, is the bringing the required parts of a ſubject cloſer together. Salt water is thus concentrated by evaporation of the aqueous humidity; and wine, by freezing out, or ſeparating its water in the form of ice. *Shaw's* Lectures, p. 9.

CONCENTRATION (*Cycl.*) — Dr. Shaw, in his eſſay on the diſtillery, is for introducing a method of concentrating the fermentable parts of vegetables, from which their ſpirits are to be drawn by diſtillation; which, if it can be brought to be practiſed in the large way, will prove of very great uſe to the Britiſh diſtillery, as it will greatly ſhorten the diſtiller's buſineſs, which at preſent, including the brewing, fermenting, &c. is much too long. He propoſes only to evaporate carefully the wort, or other tinctures or decoctions of vegetables made for the diſtilling of their ſpirits, to the conſiſtence of treacle: in this form they might be ſold to the diſtiller, who might keep them by him as long as he pleaſed, and occaſionally uſe them, by the eaſy method of reducing them into wort, by mixing warm water with them. *Shaw's* Eſſ. on Diſtill.

CONCEPTACULUM, among botaniſts, a kind of pericarpium, compoſed of ſoft and leſs rigid valves, and containing one cavity. See PERICARPIUM.

CONCEPTION (*Cycl.*) — It has been advanced by ſeveral writers, that women may poſſibly *conceive* in their ſleep, and be with child without any knowledge of the occaſion of it.

As ridiculous and abſurd as this doctrine may appear to the generality of the world, no leſs an author than Genſili has thought it worthy a particular diſſertation. The occaſion of this treatiſe was; that a young woman of twenty, a ſervant in a family in which he was acquainted, proved with child, and atteſted in the moſt ſolemn manner imaginable, that ſhe had no knowledge of the occaſion. The girl's life and behaviour inclined people, who would have rejected ſuch a ſtory from another perſon with contempt, to believe it firmly from her. She gave the ſame account on oath before the juſtices of the place, and confirmed it in the agonies of child-bearing. All that ſhe could recollect in regard to it was, that a certain acquaintance of her maſter's had given her once a glaſs of wine, after the drinking of which, ſhe almoſt immediately fell into a very profound ſleep: ſhe ſuſpected that there might be ſome narcotic medicine in the wine, and ſuppoſed that the injury was done her during the deep ſleep into which this threw her; tho' ſhe continued to declare, in the ſolemneſt manner, that ſhe had no remembrance of any ſuch thing, and certainly not the leaſt ſenſibility of it at the time. The perſon accuſed ſwore to his innocence, and the principal juſtice reſolved to determine his judgment by the opinion of this author, to whom he in the moſt ſolemn manner put this plain queſtion, Whether it is or is not poſſible, that a woman ſhould conceive in her ſleep, without her knowledge of the intercourſe of the man? The doctor gave his anſwer, that he believed it was poſſible; that there were ſimilar inſtances in Montanus, and other authors; and that provided all the neceſſary requiſites to *conception* were employed, that it could not be otherwiſe but that the woman muſt conceive, tho' the whole was done either againſt her inclination, or without it. It is very certain, that *conception* does not depend upon the will of the woman, ſince women are daily with child greatly againſt their wills, as is the caſe in the unlawful intercourſes of unmarried perſons; and among married people, ſuch women as thro' a cold phlegmatic conſtitution, or any other peculiar temperament of body, have no ſenſe of pleaſure in the action, yet conceive as frequently, and perhaps more frequently, than thoſe who have their inclinations ever ſo violently bent on ſuch things. Not only common experience ſhews us this, but the greateſt writers on theſe ſubjects confirm it. There is no reaſon to doubt, but that ſuch perſons would conceive as well in their ſleep as if awake, ſince their paſſions or ſenſibility have no ſhare in occaſioning it. In ſhort, it ſeems that if the ova are properly impregnated, the woman muſt conceive, and that her own ſenſations have nothing to do with it. Act. Erud. Ann. 1715. p. 122. See the article PREGNANCY.

CONCERTANTE, in the Italian muſic, is uſed for the reciting parts of a piece of muſic, to diſtinguiſh them from thoſe which ſing only in the grand chorus [a]. Graſſineau [b] makes *concertante* ſignify thoſe parts that ſing or play throughout the whole piece.— [a *Broſſ.* Dict. Muſ. in voc. b Muſ. Dict. p. 35.]

CONCERTATO, in the Italian muſic, is uſed for a piece compoſed in ſuch a manner, as that all the parts may have their recitals, be it for two, three, four, or more voices or inſtruments: thus they ſay *meſſe concertate*, *ſalmi concertati*, a 2, a 3, a 4 *voci*, &c. *Broſſ.* Dict. Muſ. in voc.

CONCERTO *groſſo*, in the Italian muſic, is uſed to denote the grand chorus of a concert, or thoſe places where all the ſeveral parts perform or play together. *Broſſ.* Dict. Muſ. in voc.

CONCHA (*Cycl.*) — CONCHÆ *anomiæ*, in natural hiſtory, the name of a foſſile ſhell-fiſh, found in great abundance, and in a great variety of ſpecies, but not known in any of them living, on the ſhores or in the ſeas of our own or other countries. In Glouceſterſhire, and ſome other of our counties, theſe are found as common as pebbles on the ploughed lands in other places. They are a ſort of bivalve ſhell, the valves of which are of unequal extent, both of them convex, and the head or beak of the longer valve crooked, and falling over the head of the other. See Tab. of Foſſ. Claſſ. 9

The great general diſtinction of this numerous claſs of bodies, is into thoſe which are of a ſmooth ſurface, and thoſe which are of a ſtriated or rough one.

Of the ſmooth *conchæ anomiæ* we find great numbers of ſpecies: ſome are rounded at the margin, others are crenated, and others deeply ſinuated, and others are cornered on each ſide, and end in two angles, with a broad flattiſh ſurface between them.

Of thoſe whoſe margin is rounded, we find many with thick edges, and others with thin ones; ſome alſo are broad and flattiſh, while others are ſo much rounded on each ſide, as to approach to an oval form. Moſt of theſe have rounder and blunter beaks than the other kinds, and many of them have a hole at the ends, looking as if done by art. Theſe are the terebratulæ of Mr. Lhuyd. Of thoſe with the cornered margin, ſome are thicker in the middle, and others at the end or rim; and others have a ridge running down the middle of the back. Of thoſe which are ſtriated from the cardo or hinge to the margin, we have alſo very numerous ſpecies: in ſome the lines are ſlight, and in others they make deep ridges and furrows. Theſe have generally a ſharper beak than the ſmooth ones, and are, like them, various in the ſhape of the margin, ſome having it ſmooth and plane, and others more lightly or deeply ſinuated or cornered. In the more common ſpecies of theſe, the middle ſegment of the longer valve is depreſſed, or ſunk into a kind of hollow, and running out in length beyond the corners, bends round the margin, and meets the depreſſed middle part of the oppoſite valve, which is much ſhorter. Some of theſe are of a more convex, others of a more flatted figure, and ſome have their ridges and furrows much more numerous than others, in ſome there being only one to the depreſſed or middle part of the ſhell.

Others alſo of the ſame claſs, or of one very nearly allied to it, are found in many of our inland counties, ſome very long from the cardo, or hinge, to the margin; and others very ſhort, and very long the contrary way. They are found indifferently in all ſorts of ſtrata, in earth, in ſtone, in ſand, and among gravel. *Hill*'s Hiſt. of Foſſ. p. 650.

CONCHA *fortificata*, in natural hiſtory, a name given by ſome authors to the genus of ſhells, called by others the *murex*. See MUREX.

CONCHA *globoſa*, in natural hiſtory, the name of a large genus of ſhells, called by authors the *dolium*, and in French the *tonne*. See DOLIUM.

CONCHÆ *latitans muſculus*, a name given by Riolanus and others to one of the muſcles of the ear, called by Cowper *internus auris*, and by Albinus, very properly, the *tenſor tympani*.

CONCHÆ *narium*, in anatomy. See NARIUM *conchæ*.

CONCHÆ *proprius muſculus novus*, a name given by Santorini to a muſcle of the ear, called by Albinus, and the French writers, *auris alæ anterior*.

CONCHA *ſpectrorum*, the *ſpectre ſhell*, a name given by authors to a ſpecies of voluta, from ſome odd figures deſcribed on its ſurface, repreſenting rough draughts of terrible phantoms. It is an elegant ſhell, of a middle ſize, and is of a white ground, and the figures are reddiſh; theſe form three large and broad bands, ſurrounding the ſhell at the top and bottom, and in the middle; and between theſe there are ſeveral ſeries of ſmall ſpots. It is a ſcarce ſhell, and uſually ſells at a large price.

CONCHITES *marmor*, a name given by the antients to a ſpecies of marble dug near Megara, and remarkable for containing a great number of ſea ſhells, and other marine bodies immerſed in it.

CONCHYLIA. See the article SHELL *fiſh*.

CONCIATOR, in the glaſs art, is for the cryſtal glaſs what the founder is at the green glaſs houſes. He is the perſon that weighs and proportions the ſalt on aſhes and ſand, and works them with a ſtrong fire, till they run into lumps, and become white; and if the metal be too hard, and conſequenty brittle, he adds ſalt, or aſhes; and if too ſoft, ſand; ſtill mixing them to a fit temper, which is only known by the working. *Neri*, Art of Glaſs, p. 240.

CONCLAMATIO, in antiquity, a ſhout raiſed by thoſe preſent at burning the dead, before they ſet fire to the funeral pile. See SHOUT, and BURIAL.

CONCOU, in botany, a name given by the people of Guinea to an herb which is in great eſteem with them for killing that troubleſome ſort of worm called the Guinea worm, which breeds in their fleſh. They bruiſe the leaves, and mixing them with oil, apply them in form of a cataplaſm. The leaves of this ſhrub ſomewhat reſemble thoſe of the caggow, but they are thicker and ſtiffer, and are not ſo full of veins. They are broadeſt within one third of the baſe, and from thence they go tapering to each end. They are placed on long footſtalks of a fine green throughout. Phil. Tranſ. N° 232.

CONCORDIA, in botany, a name uſed by ſome authors for agrimony. *Ger.* Emac. Ind. 2.

CONCRETE *juices*. See the article JUICES.

CONCURRING, or CONGRUENT *figures*, in geometry, ſuch as, being laid upon one another, do exactly correſpond to, and cover one another, and conſequently muſt be equal among themſelves. See CONGRUITY, *Cycl.*

CONDALUS, in antiquity, a kind of ring uſually worn by ſlaves.

CONDEMNATION (*Cycl.*) — CONDEMNATION *of prizes* taken from the enemy. See PRIZES.

CONDENSING *of wines*. See WINES.

CONDUCTOR (*Cycl.*) — *Conductors*, in military affairs, are aſſiſtants given to the commiſſary of the ſtores, to receive or deliver out ſtores to the army; to attend at the magazines by turns, when in garriſon; and to look after the ammunition waggons in the field. They bring their accounts every night to the commiſſary, and are immediately under his command.

CONE, in aſſaying. See MELTING-*cone*.

CONE-*ſtone*, in natural hiſtory, the name given by many to a ſpecies of tubulus marinus, not known to us in its recent ſtate, but frequently found foſſile in the Swediſh ſtones uſed in pavements. See TUBULUS *concameratus*.

CONEPATL, in zoology, the name of an American animal, very like the rackoon in ſhape, but variegated with two long ſtreaks of white, one on each ſide of the ridge of the back, which run even into the tail. It is a tame and harmleſs animal, but of a ſtinking ſmell, and when purſued, or provoked, will diſcharge its excrements at the perſon who offends it, to ſix or eight foot diſtance; theſe have a very ſad ſmell, and ſpoil peoples cloaths, by leaving indelible yellow ſpots on them. *Ray*'s Syn. Quad. p. 182. See the article YZQUIEPATL.

CONESSI, or CONESTI, in the materia medica, a bark brought from the Eaſt Indies. It is frequent in Ceylon, and Malabar, where the natives take it in diarrhœas, lienteries, and dyſenteries. We uſe it in powder for the ſame purpoſes, the doſe being from half a dram to a dram. It is proper to give a doſe of ipecacuanha before taking it.

This tree grows alſo on the Coromandel coaſt, in the Eaſt Indies, and is not unlike the cadagopala of the hortus Malabaricus. The *coneſſi-ſeca*, or bark of the ſmall young branches of the tree is ſaid to be a good medicine in diarrhœas. The bark of the ſmall young branches of the tree is to be choſen, and the moſs or ſcurf is to be ſcraped off; the bark is then made into an electuary, with ſyrup of oranges, and taken to the quantity of half a dram, or more, four times a day, for three or four days. It is to be oberved, that this bark ſhould be freſh powdered, and the electuary made every day, or every other day, otherwiſe it loſes its proper effect. Mr. Monro cured an obſtinate dyſentery of three years ſtanding with this medicine. See Med. Eſſ. Edinb. Vol. 3. Art. 4.

CONFECTIO *cardiaca*, a name given in the late London diſpenſatory to the ſo much eſteemed medicine, commonly known by the name of the *confectio Raleighana*, or Sir Walter Raleigh's cordial. The compoſition is alſo altered, as well as the name, and is ordered now to be made in the following manner: take freſh tops of roſemary, and juniper berries, of each a pound; the leſſer cardamum ſeeds, freed from their huſks, zedoary, and ſaffron, of each half a pound. Draw a tincture from theſe, with a gallon and half of proof ſpirit; reduce this tincture, when filtred, to the weight of about two pounds and an half, by a gentle evaporation; then finiſh the electuary by adding the following ſpecies finely powdered; viz. of compound powder of crab's claws, ſixteen ounces; cinnamon and nutmeg, of each two ounces; cloves, an ounce; double refined ſugar, two pound. *Pemberton*'s London Diſp. p. 338.

CONFECTIO *paulina*, a name given in the late London diſpenſatory, to the compoſition which uſed to be called *confectio archigenis*. It is now ordered to be made in the following manner: take coſtus or zedoary, cinnamon, long pepper, black pepper, ſtrained ſtorax, galbanum, opium, and Ruſſia caſtor, of each two ounces; of ſimple ſyrup, boiled to the conſiſtence of honey, an equal weight to thrice the ſpecies. *Pemberton*'s London Pharm. p. 339.

CONFERTA *folia*, among botaniſts. See LEAF.

CONFERVA. We find many of our pools and rivers in the ſummer months thick covered with the green *confervæ*; they are alſo frequently driven by the winds againſt the ſhores of our rivers, and cover the whole ſurface with a green mantle; this, with us, has never been found to be of any ill conſequence to animals; but there is a peculiar ſpecies of it in ſome parts of the world, that is undiſtinguiſhable from ours in appearance, but is poiſonous. Near a ſmall village, two German miles from Dantzick, weſtward, there is an inland water made by the joining of three rivulets, ſome ſmaller ſprings, and the rains and the ſnow water from the hills: it is about half a German mile long, and an eigthth of ſuch a mile broad. The ſoil of the bottom is ſand and clay, and the water does not ſtagnate, but delivers out two, or more, conſiderable ſtreams, and there are good fiſh in it. The water is alſo ſweet, and wholeſome to drink, but in the months of June, July, and Auguſt, it becomes covered with this green *conferva*, which renders it poiſonous and fatal to all the cattle that drink of it. Dogs, cows, and even fowls, drinking of it, certainly die; yet the water itſelf is not affected by it, for horſes that are rode in to drink beyond the reach of the green covering never come to any injury; ſo that it is the *conferva* itſelf, ſwallowed in ſubſtance, which deſtroys the animals. Phil. Tranſ. N° 83.

CONFERVA, in botany. See HAIR-*weed*.

CONFESSION, *confeſſio*, in rhetoric, the ſame with what is otherwiſe called *parhomology*. See PARHOMOLOGY.

CONFIGURATIONS *of ſalts*, a term uſed by ſome to expreſs the combinations of the particles of the ſalts of plants, and other ſubſtances, into certain figures, on the evaporating the water in which they had been diſſolved, ſo haſtily as not to admit of their ſhooting into their own regular cryſtals.

CONFUSED *viſion*, in optics. See VISION.

CONGE (*Cycl.*) — CONGE *d'accorder*, i. e. leave to accord, or agree, is uſed in the ſtatute of fines, anno 18. Edw. I. to the following purpoſe.--*When the original is delivered, in preſence of the parties before juſtices, a pleader ſhall ſay this: Sir, juſtice*, conge d'accorder;

and

and the juſtice ſhall ſay to him, What ſaith Sir R, and ſhall name one of the parties, &c.

CONGEABLE, from the French *congè*, (i. e. leave, licence, or permiſſion) ſignifies as much as lawful, or lawfully done, or done with leave and permiſſion; as, *then entry of the diſſeiſee is* congeable. *Littl.* Sect. 420.

CONGELATIONS *by artificial cold.* See ARTIFICIAL *freezing.*

CONGELATION *of wines.* See WINES.

CONGENERES *muſculi*, in anatomy, are ſuch muſcles in an animal body, as ſerve together to produce the ſame motion; and they are ſo called becauſe they aſſiſt one another in their action.

CONGER, in zoology, the name of the ſea eel, a very voracious and extremely large fiſh of the eel kind.

The name is derived from the Greek γογγρος, which is formed of a duplication of the adjective γραος, or γερος voracious, from γρω to devour.

It grows to an enormous ſize, four or five cubits being a common length with it, and its thickneſs that of a man's thigh. It is of a pale grey on the back, and a fine milk white on the belly, and has on each ſide a ſtrait white line, ſomewhat broad, made as it were of a double row of dots, and running from the head to the tail; the top of its back fin is black all the way; and in the end of his upper jaw, juſt at the noſe, he has two ſhort tubular horns, out of which a mucous liquor may be ſqueezed. Their fleſh is very agreeable, but is not eaſy of digeſtion. *Willughby*'s Hiſt. Piſc. p. 112.

CONGERIES, in rhetoric. See SYNATHROISMUS.

CONGESTIONES, in medicine. See STUFFINGS.

CONGITELLA, in antiquity, half a *congius*. *Pitiſc.* Lex. Ant. See CONGIUS, *Cycl.*

CONGO *money*, or Guinea money, a name given to a peculiar ſpecies of concha veneris, or porcelane ſhell, which paſſes by way of money among the natives of thoſe places. It is diſtinguiſhed from the other porcelanes by having a dentated mouth, and ſix gibbous protuberances on its ſurface.

CONGREGATIONALISTS, a branch of the independents, who agreeing with the preſbyterians in doctrine, do notwithſtanding reject all church government, beyond that of a ſingle congregation, under the direction of one paſtor. *Hofm.* Lex. in voc. *congregationales*. See INDEPENDENTS, *Cycl.*

CONICHTHYODONTES, in natural hiſtory, a name given by Dr. Hill to a genus of foſſile bodies, called by other authors plectronitæ, from their ſuppoſed reſemblance to the ſpur of a fighting cock. As this name carried with it, however, no idea of the nature and origin of the body, and as it appears very plainly that theſe are the teeth of fiſhes, though our preſent imperfect knowledge in the animal hiſtory is not able to aſcertain what ſpecies they belong to; it ſeems more rational to call them by a name which at once expreſſes their general origin, and their conic figure.

They are of ſeveral varieties of ſhape, but all of the ſame general form, which is an oblong conic figure, broad at the baſe, and narrower at the point: they are ſometimes perfectly ſtrait, but more uſually a little crooked; very often they not unaptly reſemble the beak of a bird, and ſometimes approach to the figure of the lamiodontes, and ſometimes to that of the belemnitæ, being, like thoſe bodies, hollowed at the root. Some of them terminate in a round, and perfectly ſmooth point; others are near the ſummit, ridged on each ſide with a prominent edge; and, in ſome, theſe ridges run all the way down the tooth; but this is very rare. Sometimes alſo they emulate a ſquared, or pyramidal figure; and ſome of them are very broad at the baſe, very ſhort, and rounded at the top, ſeeming as if they had had the points worn down by long uſe.

Their external ſurface is ſometimes ſmooth and gloſſy, as in the lamiodontes, but much more frequently they are ridged longitudinally, or from top to bottom, and that ſometimes with finer, ſometimes with deeper, or coarſer ſtriæ. They are all plainly of the ſame bony ſubſtance with the bufonitæ, or lycodontes, and ſometimes, though that happens but rarely, they are found with their roots. They are of various ſizes, from a tenth of an inch to two inches long, and are moſt uſually of a bright cheſnut colour, though ſometimes whitiſh, ſometimes blueiſh, and ſometimes quite black. They are found in ſome places in the ſtrata of clay, but more uſually in thoſe of ſtone; and ſeem more frequent in England, than in any other part of the world. *Hill*'s Hiſt. of Foſſ. p. 645.

CONIFERA *ſalicis facie*, in botany. See *ſilver* PINE *tree.*

CONIFERA *aïypi folio*, in botany. See *ſpurge-leav'd* PINE.

CONIRA, in botany, a name uſed by ſome authors for the myrrhis. *Ger.* Emac. Ind. 2.

CONISSALÆ, in natural hiſtory, the name of a claſs of foſſile bodies; the word is derived from the Greek κονισαλος, powder, all the ſpecies of bodies of this claſs being found like common ſand, in form of powder, have been uſually confounded together, under the common name of ſands. The *coniſſalæ* are defined to be ſtones of a differently debaſed, cryſtalline, or ſparry matter, but always found in form of ſmall and diſunited particles, great numbers of which being amaſſed together, form a kind of powder.

Of this claſs of bodies there are two diſtinct and large genera. 1. The ſands properly ſo called, which are compoſed of particles all appearing to have a tendency to the ſame regular figures, tranſparent, vitrifiable by a ſtrong fire, and not ſoluble in, or effervеſcing with acids. 2. The ſaburræ, or gritt of ſtone found looſe; theſe are found in form of powder, the particles of which, in general, have no tendency to any particular figure, but appear to be rudely broken fragments of larger maſſes. *Hill*'s Hiſt. of Foſſ. p. 543. See the articles ARENÆ and SABURRÆ.

CONISTERIUM, κονιστηριον, in antiquity, that part of the gymnaſium where the duſt was kept with which thoſe who had been anointed, were ſprinkled. It was alſo called κονιστρα. *Pett.* Archæol. Græc. l. 1. c. 8. T. 1. p. 38.

CONISTRA, κονιστρα. See CONISTERIUM.

CONJUGATE *point*, in geometry. See POINT.

CONNA, in botany, a name uſed by ſome authors for the tree which produces the caſſia fiſtula uſed in medicine. Hort. Malab. Vol. 1. p. 37.

CONNARUS, in the materia medica, a name given by ſome authors to a large ſpecies of jujube. *Ger.* Emac. Ind. 2.

CONNATA *folia*, among botaniſts. See LEAF.

CONNECTING *oil.* See OIL.

CONNOUGH *worm.* See WORM.

CONOPEUM, κωνωπειον, in antiquity, a ſort of net-work, made to keep away flies.

The word comes from κωνωψ, a fly.

CONSCRIBED is ſometimes uſed for circumſcribed. *Harris.* See CIRCUMSCRIBING, *Cycl.*

CONSECRATRIX, in botany, a name given by ſome authors to the common iris paluſtris, or yellow flag flower. *Ger.* Emac Ind. 2.

CONSENT, *(Cycl.)* in medicine. See SYMPATHY.

CONSEQUENTE, CONSEQUENZA, or *in* CONSEQUENZA, in the Italian muſic. A part of a fugue, or canon, is ſaid to be *in conſequenza*, when it follows the firſt part called the guide, imitating its motions, notes, and figures. *Broſſ.* Dict. Muſ. in voc.

CONSERVATOR *(Cycl.)* — CONSERVATOR *of the truce, and ſafe conducts*; *conſervator induciarum, & ſalvorum regis conductuum*, was an officer appointed in every ſea-port, under the king's letters patent. His charge was to enquire of all offences committed againſt the king's truce, and ſafe-conducts upon the main ſea, out of the franchiſes of the cinque-ports, as the admirals were wont to do, and ſuch other things as are declared anno 2 Hen. V. cap. 6. Touching this matter, ſee alſo Stat. 4. Hen. V. cap. 7.

CONSERVATORY, *(Cycl.)* is ſometimes uſed for a place to preſerve ſnow and ice. Phil. Tranſ. N° 8. p. 140. See SNOW and ICE.

CONSISTENTES, in church hiſtory, a kind of penitents who were allowed to aſſiſt at prayers, but could not be admitted to receive the ſacrament. See *Hofm.* Lex. in voc.

CONSOLIDATION *(Cycl.)* — Among the many inſtances of the *conſolidating* power of blood and raw fleſh, we have a very remarkable one in Bartholine's medical obſervations, which is, that a man being condemned to have his noſe cut off by the hand of the common executioner, the friends who were to be preſent, provided a warm loaf of new bread, which was cut in the middle, and the noſe received in it, as it fell from the face; the noſe was, after this, nicely placed on the face again, and being ſewed on, the whole, in time, *conſolidated*, and left no more marks of the ignominy than the ſcar round the whole noſe, and the marks of the ſtitches.

CONSONANCE *(Cycl.)* is ſometimes uſed to ſignify a ſound ariſing from ſeveral others ſounding together, whether agreeable, or diſagreeable to the ear. *Euler.* Tentam. Nov. Theor. Muſ. p. 57.

In this ſenſe *conſonance* may be divided into concord and diſcord. Id. p 62. §. 14. See CONCORD, and DISCORD, *Cycl.*

CONSONANTE, in the Italian muſic, is uſed to ſignify concords, or thoſe intervals which afford pleaſure, be they either perfect, as the fifth and eighth, or imperfect, as the third, ſixth, &c. *Broſſ.* Dict. Muſ. in voc. See OCTAVE, &c.

CONSPIRATIONE, a writ that lies againſt conſpirators. *Fitz.* Nat. Br. fol. 114. d. *Compton*, Juriſd. fol. 209. Regiſter, fol. 134.

CONSPIRATORS, according to the ſtatute, are thoſe that do confederate, or bind themſelves by oath, covenant, or other alliance, that every of them ſhall aid, and bear the other, falſely and maliciouſly, to indite, or cauſe to indite, or falſly to move, or maintain pleas: and all ſuch as cauſe children, within age, to appeal men of felony, whereby they are impriſoned, and ſore grieved: and ſuch as retain men in the country, with liberties, or fees, to maintain their malicious enterprizes: and this extendeth as well to the takers, as the givers. And ſtewards, and bailiffs, of great lords, which, by their ſeigniory, office, or power, undertake to bear, or maintain quarrels, pleas, or debates, that concern other parties than ſuch as touch the eſtate of their lords, or themſelves. Anno 33 Edw. I. Stat. 2. 2. Inſt. fol. 384 and 562.

CONSTANT *(Cycl.)* — CONSTANT *quantity*, in geometry, that which remains the ſame, while others increaſe or decreaſe. Thus, the ſemi-diameter of a circle is a *conſtant quantity*; for while the abſciſs and ſemi-ordinates increaſe, it remains the ſame.

CONSTAT *(Cycl.)* is held to be ſuperior to a *certificate*; becauſe this may err or fail in its contents, that cannot, as certifying

tifying nothing but what is evident upon record. Alſo the exemplification under the great ſeal of the inrolment of any letters patent, is called a *conſtat*. *Coke* on Littl. fol. 225. b. The difference between a *conſtat*, *inſpeximus*, and *vidimus*, is treated of at large in Page's caſe, *Coke*'s 5. report.

CONSTIPATION *(Cycl.)*— A *conſtipation*, or obſtinate coſtiveneſs, is thought by Dr. Stevenſon to be firſt or laſt owing to, or attended with, a kind of palſy of the inteſtines, and may ſometimes be cured by fomenting the belly with wine, in which aromatics have been boiled, and drinking a little of the ſame when the pulſe is ſlow, and the body cool. This diſorder, tho' of long continuance, and come to a dangerous height, has been cured by a cold pediluvium, and by placing the patient with his bare ſoles on a cold floor, and daſhing his feet, legs, and thighs, with cold water. See Medic. Eſſ. Edinb. Abrid. Vol. 1. p. 249, ſeq.

CONSTITUENT *parts*, in chemiſtry. The *conſtituent parts* of bodies are their diſſimilar parts, or principles, into which they may be reſolved, by the rules of that art. They are thus called in diſtinction from the integrant parts of bodies, which are parts of the ſame nature and properties with the bodies themſelves. Thus quickſilver, diſſolved by aqua fortis, may be ſeparated from the diluted menſtruum, by means of a copper plate, in its own form; this therefore was only divided into its integrant parts: but cinnabar reſolved by chemiſtry into ſulphur and mercury, is divided into its *conſtituent* parts, neither of theſe, nor any particle of them being cinnabar, or having its properties. *Shaw*'s Lectures, p. 15.

CONSTRICTOR, *(Cycl.)* in anatomy, a name given by Spigelius, and ſome others, to a muſcle now very well known by the name of the *ſphincter ani*.

CONSTRICTOR *cunni*, in anatomy, the name given by Albinus to a muſcle called by others the *ſphincter vaginæ*; by ſome the *orbicularis pudendi*, and the *inferior clitoridis muſculus*. See SPHINCTER.

CONSUALES *ludi*, among the Romans, the ſame with *Circenſes ludi*. See CIRCENSES *ludi*, *Cycl.*

CONSUL *(Cycl.)* — The right of convoking the ſenate in antient Rome, on all occaſions, belonged of courſe to the *conſuls*, as the ſupreme magiſtrates of the city [a], which, in their abſence, devolved regularly to the next magiſtrates in dignity, the prætors, and the tribunes [b]. — [a Vid. *A. Gell.* 14. 7. b *Cic.* Ep. Fam. X. 12. See TRIBUNE, *Cycl.* and *Suppl.*

CONSUMPTION. See PHTHISIS.

CONTAGION *(Cycl.)* — In times of peſtilential *contagion*, the phyſician, and others who attend upon the ſick, are in the moſt imminent danger of falling into the ſame condition; nor have any of the ſo much boaſted preſervatives againſt this been found of any conſequence; on the contrary, the very remedies, many of them at leaſt, which have been contrived on this occaſion, are very dangerous when lodged in imprudent hands, as well as uſeleſs and improper in all. The beſt methods of ſafety are firſt never to viſit a patient in any infectious diſorder when one is faſting, but ſome generous wine ought always to be drank firſt. Some are of opinion that it is proper to eat firſt a piece of bread and butter, ſoaked in vinegar, either ſimple, or with rue firſt ſtamped in it. When one is in the patient's apartment, great care is to be taken never to eat or drink there, nor to ſwallow one's ſpittle; and it is no idle cuſtom in thoſe who are continually in the infected room to chew zedoary, myrrh, angelica, cinnamon, or the like warm and aromatic drugs; for all theſe things promote a plentiful diſcharge of ſaliva from the mouth, which it is certain, when ſwallowed, cannot but often carry peſtilential particles down with it into the ſtomach, whence they will eaſily find their way into the blood. It may be added as a good rule, that we never ſtay too long in an infected room; for a conſtitution that could have reſiſted the *contagion* for a ſmall time, may eaſily be overpowered by too long a continuance in the way of it.

After one is returned home from a viſit of this kind, it is always proper to waſh one's hands and mouth with vinegar and water; to change cloths, hanging the former in the air, and then to drink ſome warm liquor, as tea of ſcordium, ſage, or other herbs of that kind, or, in their place, coffee; for this opens the pores, and if any ſmall quantity of the peſtilential virus ſhould have mixed itſelf with the blood, expels it by a gentle perſpiration. It may be alſo of great aſſiſtance to all about the ſick, for preventing them from being infected, to hold frequently ſponges dipt in vinegar to their noſes, and frequently to ſprinkle vinegar on a red hot iron, in the room, to correct and mend the air. *Heiſter*'s Surgery, p. 201.

CONTARA, in botany, a name given by ſome authors to the plant which produces the *faba Sancti Ignatii*, or St. Ignatius's bean. *Plukenet*, Mantiſſ. p. 60.

CONTARII, in antiquity, a kind of horſemen, whoſe chief armour was the *contus*, a kind of long ſpear.

CONTIGUITY, the relation of bodies touching one another. It differs from *continuity*, which is the immediate union of the parts which compoſe any natural body; ſo that it cannot be diſtinguiſhed where one begins, and the other ends.

CONTINENT *fevers*, a term uſed by medical writers to expreſs ſuch fevers as continue through their whole courſe exactly in the ſame tenor in which they begun, without the leaſt viſible intermiſſion: they are thus called in oppoſition to the continuous fevers, which, though they never regularly go off ſo as to have intermiſſions, yet have frequent remiſſions. Of the number of *continent fevers* are the *ephemera*, whether it be ſtrictly diary, or continues more days; alſo the *ſynocha*, which is called the *continent fever*, by way of eminence. *Junker*'s Conſp. Med. p. 252.

CONTINGENCY *of blood*, in the writers of the laws of Scotland, is uſed for proximity of blood. *Bayne*, Crim. Law. p. 48.

CONTINUAL *(Cycl.)*—CONTINUAL *proportionals*. When in a ſeries of quantities, the firſt is to the ſecond as the ſecond to the third, and the third to the fourth, and the fourth to the fifth, &c. they are called *continual proportionals*.

CONTINUATO, in the Italian muſic, is uſed to direct a ſinger, or player, to continue or hold on a ſound, in equal ſtrength or manner; or to continue a movement in an equal degree of time all the way. *Broſſ.* Dict. Muſ. in voc.

CONTINUED *(Cycl.)* — CONTINUED *zocle*, or *ſocle*, in architecture. See SOCLE, *Cycl.*

CONTINUITY *(Cycl.)* — An eminent mathematician has ſuppoſed what he calls a law of *continuity* to obtain in the univerſe, by which law every thing that is executed or done in nature, is done by infinitely ſmall degrees. He urges, that good ſenſe dictates this truth, *natura non operatur per ſaltum*, or that nothing can paſs from one extreme to another, without paſſing through all the intermediate degrees. *Bernoulli* Opera, Tom. 3. p. 9, ſeq.

This law ſeems ſubject to difficulties. Rigourouſly taken, it ſuppoſes actual, and yet infinitely ſmall changes, which ſome philoſophers cannot reliſh; and if we ſuppoſe changes only imperceptible to our ſenſes, but finite, the law of *continuity* is no leſs violated, than if the univerſe were to be ſuddenly deſtroyed, as M. Maupertuis juſtly obſerves. Mem. de l'Acad. de Berlin. Tom. 2. p. 284.

This law of *continuity* led Mr. Bernoulli to reject all hard-bodies, as chimeras, and naturally impoſſible. See HARD-*bodies*.

CONTINUO, in the Italian muſic, is ſometimes applied to *baſſo*, to ſignify the thorough baſs. Thus *baſſo continuo*, is the continual, or thorough baſs. It is ſometimes marked in muſic books by the letters B. C. *Graſſin*, Muſ. Dict. in voc.

CONTINUO is alſo uſed for a ſpecies of harmony mentioned by Julius Pollux, and which, ſays Zarlino, anſwers to the perpetual burden of our bag-pipes, which now and then muſt be harmonious. *Broſſ.* Dict. Muſ. p. 23. See DESCANTO.

CONTINUOUS *fevers*, a term uſed by the medical writers to expreſs ſuch fevers as have no intermiſſions, but have ſome ſort of regular remiſſions from the violence of their ſymptoms every day. They are thus called by way of diſtinction from the continent fevers, which never have the leaſt remiſſions.

Of the number of *continuous fevers*, are the *quotidiana continua*, and the catarrhal fevers, which are more violent every day toward evening, and are much more mild in the middle of the day. *Junker*'s Conſp. Med. p. 252.

CONTOPÆCTÆ, Κοντοπαικται, in antiquity, a ſort of artiſts who ſupported a pole on their foreheads ſo firmly, that boys could play, dance, and wreſtle together on it. *Hofm.* Lex. in voc. who quotes St. Chryſoſtom.

CONTOR, or CUNTOR, a bird of Peru, ſaid to be the largeſt in the world. With its wings expanded, it meaſures 16 feet from the tip of the one to the other; a ſingle feather of it is four feet two inches long; its beak is ſtrong enough to tear off the hide, and rip up the bowels of an ox. Two of them will attempt a bull, and devour him. Phil. Tranſ. N° 208. p. 61.

CONTRA *formam collationis*, was a writ that lay againſt an abbot, or his ſucceſſor for him, or his heir, who had given land to an abbey, for certain good uſes, and found a feoffment made thereon by the abbot, with aſſent of the tenants, to the diſinheriſon of the houſe and church. This was founded on the ſtatute of Weſtm. 2. c. 41. See Reg. of writs, fol. 238. and *Fitz.* Nat. Br. fol. 210.

CONTRA *formam Feoffamenti*, a writ that lies for the heir of a tenant, enfeoffed of certain lands, or tenements, by charter of feoffment of a lord, to make certain ſervices and ſuits to his court, and is afterwards diſtrained for more than is contained in the ſaid charter. Reg. of Writs, fol. 176. Old. Nat. Br. fol. 162.

CONTRARY *(Cycl.)* — CONTRATY *propoſitions*, in logic, univerſal propoſitions, one of which affirms, and the other denies, the ſame predicate of the ſame ſubject; as *every ſquare is a parallelogram*, and *no ſquare is a parallelogram*. Theſe propoſitions differ in quality, but not in quantity, and therefore are diſtinguiſhed from contradictory propoſitions, which differ in quantity and quality. See CONTRADICTORY, *Cycl.*

Contrary propoſitions cannot be both true, but may both be falſe: whereas, in contradictory propoſitions, one is neceſſarily true, and the other falſe.

CONTRARY *flexure*, or *flexion*. See POINT *of contrary flexure*.

CONTRE *queue d' hironde*, in fortification. See QUEUE *d' aronde*, *Cycl.* where *queue d' aronde* is corruptly written for *queue d' hironde*, or rather, *queue d' hirondelle*, which is French, and imports a ſwallow's tail.

CONTUS, in antiquity, a long ſpear, chiefly uſed by the horſe. *Pitiſc.* Lex. Ant. in voc.

CONTUSIONS *(Cycl.)* — When the ſmall veſſels, and fibres have been broken by a *contuſion*, the fluids that were contained in them will be forced out, and hence will proceed obſtructions, corruptions, inflammation, and ulcers, or even a gangrene, in proportion to the violence of the cauſe, and the nature of the affected part. When a bony part is the ſubject of a *contuſion*, the ſame miſchiefs will enſue from the injury inflicted on the periofteum, as happen to the pericranium in wounds of the head; and when the medullary juice of the bones is affected, very violent diſorders are to be expected, though the bone is not fractured. When *contuſions* happen on the joints, they uſually bring on violent pains and inflammations, convulſions, gangrenes, ſphacelus, rigidity of the limbs, and caries; and the ſame miſchiefs will indeed ſometimes happen from *contuſions* of the muſcular parts. When the internal parts are *contuſed* great miſchiefs uſually enſue; but theſe entirely depend upon the nature of the injured part: theſe are ſometimes inflammations, ruptures of the veſſels, varixes, aneuriſms, hæmorrhages, ſtagnation of the fluids, corruption, gangrene, and ſuppuration, and very often death, is the neceſſary attendant on theſe ſymptoms. When the head receives a conſiderable *contuſion*, the ſenſes are taken away, the limbs become either convulſed, or rigid, and death preſently follows. In *contuſions* of the thorax, a difficulty of breathing follows, with ſpitting of blood, fainting fits, inflammation, and ulcers of the lungs, and death. After *contuſions* of the abdomen we may expect vomitings of blood, inflammations, ſuppurations, or gangrenes of the viſcera, and at length death; but if any large internal veſſel is burſt by the blow, it is no wonder if the patient dies upon the ſpot, even though there be no mark of violence left upon the external parts. Laſtly, if the eye is *contuſed*, tumor and inflammation will ſucceed, and frequently loſs of ſight.

Theſe are the effects of violent *contuſions* on the different parts. In the cure of ſlight *contuſions* the principal care is to divide the inſpiſſated fluids, and prevent the parts from ſuppurating, or being affected by the gangrenes: this may be done by hot wine, ſpirit of wine, ſpirit of wine with camphor, or Hungary water; or by applying cold water, or vinegar mixed with ſalt, to the part; or by clapping a broad piece of money, or a plate of lead, upon the tumor, and faſtening it on with a very tight bandage: or linnen rags dipped in freſh warm urine ſhould be applied to the part. Theſe different methods ſucceed very well in tumors of the foreheads of children from falls, or any other ſlight *contuſion* in perſons of a tender make.

Larger *contuſions* are to be fomented with decoctions of the warm herbs, as ſcordium, ſavin, ſouthernwood, and ſuch like, either alone, or mixed with wine, or with ſalt water; great benefit alſo ariſes from the applying to the parts a ſpunge dip'd in a decoction of Venice ſoap made in freſh urine, or warm applications of lime water, ſpirit of wine camphorated, vinegar with litharge, and vinegar with carraway ſeeds boiled in it. But when the *contuſion* is ſo violent that it is apparently impoſſible to divide the ſtagnating fluids, and return them into circulation, and the parts are tending towards a gangrene, they muſt be ſcarify'd without delay, and by this means the ſtagnating fluids will be let out, and all danger of ſuppuration and gangrene prevented. After ſcarification warm fomentations are to be uſed, and the tumor ſhould be well rubbed with warm cloths before it is fomented, which will keep the blood in its fluid ſtate; or, if it is already concreted, will divide it, and make it fit to return to the veſſels, or, at leaſt, to eſcape thro' the pores of the ſkin. Into all theſe fomentations it is very proper to put wine, or ſpirit of wine, or elſe ſome other ſpirituous liquor; but if theſe are not to be had, ſalt water is to be uſed, which, if you are not near the ſea, may be had by adding a handful of ſalt to a quart of water: attenuating decoctions muſt alſo be taken inwardly, and bleeding, eſpecially in plethoric habits, is extremely neceſſary.

It ſometimes happens, when the *contuſed* parts lie very deep, or when the ſurgeon does not uſe the proper means, or the patient refuſes to ſubmit to proper treatment, that the ſtagnating fluids will corrupt and ſuppurate. When a ſuppuration on theſe occaſions is once begun, it muſt be carried on and forwarded by emollient cataplaſms, made of mallow, marſhmallow, and white-lilly roots, linſeed, fænugreek ſeed, pellitory, mercury, and other herbs of that kind, with crumbs of bread, and the emollient oils of lillies, chamomile, &c. Theſe muſt be laid on the part as hot as they can be born; and ſometimes it is neceſſary to add the warm herbs, ſuch as onions, &c. and the gums, as galbanum, ammoniacum, and the others of that kind. Sometimes, in ſmall *contuſions*, a plaiſter of diachylon with the gums, without any other application, will anſwer the purpoſe.

When the whiteneſs and ſoftneſs of the tumor evidently ſhew that the matter is formed, and fit to be diſcharged, the part is to be laid open with a knife, and, after the diſcharge of the matter, muſt be healed in the common way. Large *contuſions* are frequently attended with violent inflammations and gangrenes: in this caſe numerous and deep inciſions muſt be made on the part, and the wounds dreſſed with Venice treacle, ſoftened with ſpirit of wine with camphor, applying at the ſame time externally the warm fomentations. And when the parts are from very large and deſperate *contuſions*, abſolutely ſphacelated, the limb muſt be taken off in time. *Heiſter's* Surg. p. 92.

CONTUSIONS *of the cranium*. When the cranium is violently *contuſed*, it will be diſcovered by the tumor and ſoftneſs of the part, by the ſeparation of the integuments from the cranium, and by the collection of ſtagnating blood which appears to be confined under the ſkin. In this caſe you are to endeavour to divide the confined fluids, by attenuating medicines externally applied, or to diſcharge them by making an opening with a knife; or, laſtly, to bring them to ſuppuration. When the extravaſation of fluids is very conſiderable, it is beſt to diſcharge the greateſt part of them inſtantly by inciſions, and what remains will then eaſily be diſperſed. Fomentations, and medicated bags of the warm herbs, rue, wormwood, ſavin, ſcordium, &c. quilted into bags, and boiled in wine, or in water, with a mixture of ſpirit of wine, or malt or melaſſes ſpirit. But where it is found impracticable to divide and attenuate the ſtagnating fluids, the ſuppuration of them muſt be attempted; and if the *contuſion* have been but ſmall, after the ſuppuration is formed, and the matter diſcharged, the wound will eaſily heal, by the application of a vulnerary balſam.

In violent *contuſions*, when there is no opening, or but a very ſmall one, the wound muſt be enlarged with the knife, to prevent the neighbouring parts from being corroded; and by this means the wound will be eaſily cleaned, and the cure performed by the method before laid down. When the pericranium is wounded, but not in ſo great a degree as to lay the cranium bare, the wound is to be dreſſed with warm balſamic medicines. But where the cranium is expoſed and laid bare, its external lamella being robbed of its nouriſhment, by the deſtruction of the veſſels by which it was conſtantly ſupplied, it will loſe its natural colour, and become yellow, livid, black, and, by degrees, ſeparate from the neighbouring parts, and exfoliate, which will greatly protract the cure of the wound. To haſten this exfoliation, the ſurgeon ought to bore ſeveral holes thro' the denudated part, as deep as the diploe, with an awl, or ſuch like inſtrument. This operation not only forwards the exfoliation of the part, but makes way alſo for the ſprouting up of new veſſels. The dreſſing, which ought to be repeated each time with great expedition, is to be applied in the following manner: when the wound is well cleaned, pledgits thoroughly ſaturated with the mild balſamics, with the addition of a ſmall quantity of honey of roſes, are to be laid upon the injured part of the cranium; over theſe a ſticking plaiſter is to be applied; and over that, the proper bolſter and bandage. Theſe applications ſhould be continued till the cranium appears ſound, and the wound in a condition to heal. *Heiſter's* Surg. p. 84.

CONTUSIONS of the eye. See the article EYE.

CONVENTION, in our law books, is uſed when a parliament is called, which ſits and is diſſolved without any act paſſed, or judgment given. It is then ſaid not to be a ſeſſion of parliament, but a convention. 4 Inſt. 38. See *Raym.* 187. *Lev.* 442. 2 *Kebl.* 529.

CONVENTION *of Rouen*, the ſame with burſe of Rouen. See the article BURSE.

CONVERSOS *(Cycl.)*—The Jews here in England were formerly called *converſos*; viz. becauſe they were converted to the chriſtian religion. Henry III. built a houſe for them in London, and allowed them a competent proviſion or ſubſiſtence, for their lives; and this houſe was called *Domus converſorum*. 'Tis mentioned by our hiſtorians, Matt. Paris, and Matt. Weſtm. anno 1244. But by reaſon of the vaſt expences of the wars, and the increaſe of theſe converts, they became a burthen to the crown; and therefore they were placed in abbeys and monaſteries, for their ſupport and maintainance. But the Jews being afterwards baniſhed, Edward III. in the fifty-firſt year of his reign, gave this houſe for the keeping of the rolls; and it is the ſame which is at this time enjoyed by the maſter of the rolls.

CONVERTIBILITY *of ſpirits into one another*. See SPIRITS.

CONULUS, in natural hiſtory, the name of a genus of the echinodermata, of the general claſs of the fibulæ. Theſe are raiſed from a circular baſe into a taller and more pointed, or a ſhorter and more obtuſe cone. The echinitæ of this genus have been called by authors *ſcolopendritæ*, *pileæ*, and by ſome *bufonitæ*; and are generally known in Engliſh by the name of cap-ſtones. Of theſe there are four ſpecies: 1. The *albogalerus*, or white-hat ſtone, found foſſile in our chalk-pits. 2. The *globulus*. 3. The *nodus*, the ſeries of the lines of which are flexuous, and make the ſuperficies ſomewhat gibboſe. 4. The *bulla*, the orders of lines in which are ſtrait, and reſemble a button. *Klein's* Echinod.

CONVOLVULUS, *bindweed*, in botany, the name of a very large genus of plants, which ſome have alſo made much larger than it really is, by making every climbing plant belong to it.

The characters, however, of the *convolvulus*, properly ſo called, are theſe: they have flowers conſiſting only of one leaf each, formed into the ſhape of a bell, and uſually very wide at the mouth. From the cup of the flower ariſes a piſtil, fixed to the lower part of the flower, in the manner of a nail; this ripens into a roundiſh membranaceous fruit, which is uſually ſurrounded by the cup, and in ſome ſpecies is unicapſular, in others tricapſular, and contains ſeeds uſually of an angular figure. See Tab. 1. of Botany, Claſs 1.

The ſpecies of *convolvulus* are theſe: 1. The common great white *bindweed*. 2. The great purple-flowered kind. 3. The great *bindweed*, with variegated flowers. 4. The great ſea kind, with auriculated leaves. 5. The purple-flowered, arrow-headed leav'd kind. 6. The purple-flowered round-leav'd one. 7. The Indian white-flowered one. 8. The Indian, variegated, flowered kind, with white ſeeds. 9. The violet-leav'd purple one. 10. The yellow many-flowered one. 11. The round-leav'd, white, many-flowered one. 12. The hairy yellow flowered one, with a purple baſe. 13. The large ſea kind, with cordated leaves, and a large purple flower. 14. The large American kind, with very large leaves, and a great white flower. 15. The purging ſea kind, with a leaf like ſorrel, and a ſnow-white flower. 16. The purging ſea kind, with a roundiſh leaf, and a purple flower. 17. The Ceylon ſea kind, with a thick heart-faſhioned leaf. 18. The Italian ſea kind, with a ſinuated leaf. 19. The round-leav'd ſea kind, commonly, but improperly, called *ſoldanella*. 20. The ſmall roſe flowered field *bindweed*. 21. The ſmall field kind, with a purple flower with white rays. 22. The little white-flowered field kind. 23. The little field kind, with a white flower, and purple umbo. 24. The little field kind, with a white flower, ſtreaked with red. 25. The ſmall field kind, with auriculated leaves. 26. The ſmall branched kind. 27. The blue-flowered Portugal *bindweed*. 28. The ſmall African kind. 29. The dwarf African kind. 30. The ſmall *bindweed*, with very ſmall auriculated flowers. 31. The Syrian *bindweed*, called ſcammony. 32. The ſcammony-leav'd *bindweed*. 33. The long-rooted ſcammony *bindweed*. 34. The ſmall Syrian kind. 35. The upright kind, with toad-flax leaves. 36. The ſmaller kind, with toad-flax leaves. 37. The little creeping ſilvery *bindweed*, which has ſcarce any ſtalk. 38. The umbellated, erect, ſilvery *bindweed*, called by many authors *cneorum*, and *dorycnium*. 39. The creeping, umbellated, ſilvery *bindweed*, called by many *lichnis campanulæ flore*, the bell-flowered lichnis; and *campanula lichnidea* by John Bauhine. 40. The branched hoary kind, with leaves like thoſe of mouſe-ear, called by many *ceſſampelus ramoſus*. 41. The ſmall hairy American kind, with ciſtus leaves. 42. The blue-flowered creeping kind, with leaves like thoſe of moneywort. 43. The blue-flowered kind, with angular and ivy-like leaves. 44. The broad leaved, angular, ivy-leav'd kind, with blue flowers. 45. The hairy, ivy-leav'd, Indian *bindweed*. 46. The great alated Indian kind, with leaves like thoſe of marſhmallows, and whoſe root is the turbith of the ſhops. 47. The great American *bindweed*, called mechoacan. 48. The thick-rooted, ſeven-leav'd, American kind, with ſcarlet flowers. 49. The white-flowered, jagged-leav'd, ſea *bindweed* of America. 50. The great, many-leav'd, American *bindweed*, with a red flower, and red fruit. 51. The five-leav'd American kind, with ſmooth dentated leaves, and hairy tendrils. 52. The five-leav'd or ſix-leav'd hairy, great, American kind. 53. The ſmaller five or ſix-leav'd hairy *bindweed* of Ceylon. 54. The ſmooth kind, with multifid leaves. 55. The elegant foreign *bindweed*, with leaves like thoſe of betony. 56. The elegant ſilvery *bindweed*, with leaves very deeply cut. *Tourn.* Inſt. p. 84, 85.

COPE, (*Cycl.*) among miners, is ſixpence for every load of ore, nine diſhes making one load. *Houghton*'s Compl. Miner, in the Explan. of the Terms.

COPHOSIS, in medical writers, is uſed for deafneſs, whether beginning or perfect, from what cauſe ſoever.

The word is Greek, derived from κωφὸω, *ſurdus ſum*. *Blanc.*

COPIOUS *ſtile*, in rhetoric. See MACROLOGY and DICTION.

COPOS, in medical writers, is uſed for a wearineſs of the body, when the muſcles, or their fibres rather, are loaded and obſtructed with viſcous humours, ſo as to render them unfit for motion. *Blanc.*

COPPEL, (*Cycl.*) in metallurgy, is a veſſel of great uſe in the aſſaying of metals. It muſt be made of a matter that will contain melted metals, ſo long as they are in their true metallic ſtate, but will abſorb them, as well as all other bodies, when they are vitrified.

The matter of which *coppels* are to be made, muſt be choſen, therefore, ſuch as can reſiſt the ſtrongeſt fire, ſuch as will not run eaſily into glaſs with vitrifiable bodies, as glaſs of lead, &c. and ſuch as may be reduced into a well coherent, tho' porous maſs. The beſt earth for this purpoſe is found to be that which is made of calcined bones of all animals, a very few excepted, eſpecially ſwines bones; for a *coppel* made of the bones of this creature is found to receive ſomething metallic into it, at the ſame time that it abſorbs the glaſs. The beſt bones for this purpoſe are thoſe of calves, horſes, ſheep, and oxen; and of theſe, the ſmalleſt bones are always to be preferred, as they are the more eaſily calcined, eſpecially ſuch as have been long expoſed to the injuries of the air.

The calcination of theſe bones is to be made in an open fire, for a few hours or more, according to their ſize, and ſuch ſhould be choſen as have leaſt fat about them. The calcination is known to be perfect, when there is not a black ſpot remaining, either on the outſide of the bone, or within it, when broken. When the bones are perfectly calcined, they muſt be reduced to a very fine powder, either by grinding on a porphyry, or ſifting thro' a fine ſieve, after beating. This powder muſt be alſo carefully waſhed in warm water; for during the calcination, the bones become almoſt always impregnated with the ſalt of the aſhes of the fuel.

This powder is called by ſome *clar*, and is an excellent ſubſtance for *coppels*. The bones of fiſhes, when ſmall, are yet more eaſily calcined than thoſe of other animals: this may be done with eaſe in an open earthen veſſel, and the powder of theſe is preferable even to the former.

Parget, or plaiſter of Paris, made of various kinds of ſpar, tho' all kinds will not do for this purpoſe, is alſo excellent: but as there are ſome ſorts of ſpar which will not afford a proper plaiſter, it is proper to try in a ſmall quantity firſt. The calcination is to be made in an earthen veſſel, covered with a tile, in an open fire. The ſpar crackles a little with the heat, and when this noiſe is over, the calcination is perfect.

As the preparation of bone-aſhes for this uſe, however, is tedious, and the proper ſorts of ſpar not always or every where to be had, the want of them may be ſupplied with the aſhes of vegetables, properly prepared: but, leſt the *coppels* ſhould vitrify, by reaſon of the alkaline ſalt in theſe aſhes, the following method muſt be obſerved in their preparation:

Waſh off the lighteſt and fineſt part of the aſhes from hot wood embers, with warm water, thro' a ſieve, that the fineſt part of the aſhes may not fly away, nor any of the embers be mixed among them; pour upon this duſt pure boiling water, and ſtir it with a ſtick: when the aſhes have ſubſided, decant off the water, and pour on freſh boiling water, ſtirring all together, as before: when this has ſettled, decant it off again; and repeat this operation with freſh water every time, till the water have not the leaſt taſte of the ſalt, but is perfectly inſipid. When this laſt water is decanted off, add a freſh quantity; ſtir the aſhes thoroughly up, and after eight, ten, or twelve ſeconds, pour off the liquor, as yet thick with the aſhes, into a clean veſſel: part of the aſhes will now remain in the former veſſel; on theſe pour more water, ſtir them, and, after a ſhort reſt, pour off as before into the other veſſel. Repeat this, till in the firſt veſſel there remains only a little ſandy matter, or a few coarſer particles. Let the waſhed aſhes now ſtand, till the water is perfectly clear above them; then decant this carefully off, and you will find theſe aſhes now become a good earth for this uſe, and free from redundant ſalt and oil, and immutable by fire. Theſe, however, if made into a paſte, and rolled into ſmall balls, and burnt again in a potter's oven, and then waſhed anew, become purer and better ſtill.

Finally, put a ſmall quantity of the aſhes of beaſt or fiſh bones, into a very clean earthen veſſel, and calcine them a ſecond time, for a few hours, in a moſt violent fire; afterwards waſh them with water, and grind them to a perfectly fine powder on a porphyry, and keep this preparation, as alſo each of the others, ſeparate, for the more or leſs nice uſes. This laſt is the preparation properly called *clar*, or *claer*, by the German metallurgiſts.

The hollow of the *coppels*, which is to contain the metal, muſt be a ſpherical ſegment, and not very deep: firſt, that the ſurface of the melted maſs, be it ever ſo ſmall, be diſtinctly viſible to the artificer's eye; and, ſecondly, that the metal left in that cavity, may melt together into one globule. But the outſides of the *coppel* muſt be only a ſmall matter convergent towards the baſis, like a truncated cone, that it may ſtand firmly on its baſe: and that this figure may be regularly given to theſe veſſels, it is convenient to have copper or braſs moulds for the making them. See Tab. of Chemiſtry, N° 24.

Now to make *coppels* from theſe preparations, take bone-aſhes of beaſts or fiſhes, either alone, or take two parts of wood-aſhes to one part of theſe, and mix them perfectly in a marble mortar, or on a porphyry or levigating ſtone; then add to the mixture, by very ſmall quantities, juſt ſo much either of pure water, or of the whites of eggs diluted with water, as will be neceſſary to make the matter ſtick together, when ſtrongly preſſed between the fingers: and great caution muſt be uſed, not to exceed or fall ſhort of this exact proportion of the fluid. If you uſe the calcined ſpar, it muſt be made up with a ſolution of vitriol.

Put a ſufficient quantity of this matter, thus wetted, into a ſmall mortar, ſupported on a firm prop, and preſs down the matter cloſely with your fingers, that the capacity of the mortar may be quite full: lay the reſt aſide.

Then put the peſtle, made for a mould to make the *coppels*, perpendicularly on the ſurface of the matter in the mortar, and with a mallet drive it down with three or four blows, according to the different diameter of the *coppel* that is to be made: thus make the maſs conſiderably compact; but take great care that the peſtle do not rub againſt the ſides of the mortar. When this is done, remove the peſtle, and ſtrew the cavity it has made in the maſs with aſhes of dry bones of the preparation called claer, ground extremely fine, and ſifted thro' a fine ſieve: after this, wipe the peſtle with a clean cloth,

and

and put it into the cavity again, driving it in with one or two more blows. Then having at hand a ſmall wooden plank, ſtrewed a quarter of an inch thick with dry aſhes, put upon it the mortar, containing the *coppel* already prepared; the *coppel* will eaſily quit its mould, and its inequalities at the upper edge and bottom being taken evenly off with a knife, let it be inverted, and laid aſide in a dry place.

The dry fine aſhes are applied to the inſide of the *coppel*, that the little inequalities commonly remaining there may be filled, and it may make a ſort of fine ſieve, admitting thro' it vitrified bodies, but retaining gold and ſilver. The cavity being regularly covered with this perfectly fine ſubſtance, prevents any harm from the common matter of the *coppels* being a little defiled with ſand, or other powder, eaſy to be vitrified, which is a fault indeed hardly poſſible to be avoided, eſpecially when wood aſhes are uſed. Hence it is plain, that this powder muſt needs be prepared with very great caution, and even the levigating it muſt be done on a very hard ſtone, leſt, if on a ſoft one, ſome particles might perhaps be abraded from its ſurface, and ſpoil the powder.

Coppels had better be too compact than too looſe in their texture, ſince the latter is always a miſchievous accident, whereas the former, by abſorbing the glaſs more ſlowly, is of no other hurt than the retarding the operation a little.

Coppels made of bone aſhes, or of calcined ſpar, are more valuable than thoſe of wood aſhes, as they require not ſo much caution and regularity in the management of the fire; but if wood aſhes enter the compoſition, the *coppel* muſt be made pretty hot before the metal is put into it, otherwiſe the aqueous vapours, forcing their way out, will cauſe the metal to be thrown out in drops; for *coppels* of this kind can never be perfectly dried by the air alone, there being always ſomething of an alkaline ſalt yet remaining in wood aſhes, which makes them attract the water out of the air, as the dark colour of theſe aſhes, and the ſolution of ſal armoniac poured on them, alſo ſhew: for this reaſon, theſe aſhes are alſo more diſpoſed to vitrification than thoſe of bones, the latter approaching much nearer to the nature of the incombuſtible ſtones.

As to the moiſtening the matter of the *coppels*, great care muſt be taken not to uſe a fluid too mucilaginous and fat; for this makes the *coppels* ſo compact, that they not only either abſolutely reject vitrified bodies, which they are intended to receive, or yield them but a very ſlow or difficult paſſage; but alſo are apt to ſplit, when made very hot, and diveſted of their oily part.

Neither muſt ſuch mucilaginous fluids by any means be uſed, as may produce a great deal of fixed alkaline ſalt in the heating of the *coppel*, as the tartareous dregs of fermented bodies do. Nor muſt the aſhes be moiſtened too much; for if they are, the ſurface of the veſſel will never be perfectly neat.

Some artificers mix about a tenth part of fine waſhed clay to their aſhes, for the making their *coppels*: when this is done, the matter muſt be moiſtened with water only, the clay making the whole ſtick ſufficiently together. Great care, however, muſt be taken, that too much clay is not added, and the different degree of the fatneſs of the clay be attentively conſidered.

The aſhes of bones uſed alone, and ground to a ſufficient fineneſs, require no clay or mucilaginous fluid to increaſe their coheſion, but do very well with pure water alone: and *coppels* of this kind, and ſuch as are made of the calcined ſpars, need hardly be made at all hot before the metal is put into them.

The operation, however, when performed in a *coppel* made of bone aſhes, or of calcined ſpar alone, takes up a little more time, but it is more ſecurely performed than in *coppels* where wood aſhes make a part of the matter of them: for as theſe bone or ſpar veſſels receive the vitrified metal more ſlowly, on account of their compact ſtructure, ſo it is leſs to be feared that any of the perfect metal ſhould be abſorbed alſo, even tho' the management of the fire be not ſo critically minded. *Cramer*, Art. of Aſſ. p. 52 to 59.

COPELLING. Silver may be precipitated out of its ore by *copelling* alone, in the following manner: roaſt a centner of the ſilver ore in the common way; when roaſted, powder and ſift it very fine, and if it melts with difficulty, mix with it one centner of litharge: when it is an ore that melts eaſily, this may be omitted. Divide the powder into five or ſix parts, and wrap up every one of them ſeparately in ſmall pieces of paper. Put a large coppel under a muffle in the furnace; heat it thoroughly; then put into it ſixteen centners of lead. When the lead begins to ſmoak and boil, put upon it one of the ſmall parcels of powdered ore, in its paper; then diminiſh the fire a little. The paper will be immediately conſumed, and the ore caſt to the ſide of the coppel, in form of ſcoriæ. When this is done, increaſe the fire again, and add a ſecond parcel of the ore; and continue this method till all the ore is put in; after which, ſcorify the lead in a ſtronger fire. The ſilver contained in the ore, with that contained in the lead, will now be found in form of a bead in the coppel; and ſubtracting the known quantity yielded by the lead, the remainder of the weight gives the quantity of ſilver in that centner of ore.

Silver is not the only ore that can be thus worked; many others may be aſſayed in the ſame manner, by *coppelling* alone: thoſe are indeed to be excepted from this proceſs, which ſplit, or which corrode the coppels. *Cramer*'s Art of Aſſ. p 233.

COPPER *(Chal.)* — This metal, expoſed to the focus of a powerful burning glaſs, at firſt becomes white on the ſurface, after that it turns black, being covered with a black ſcale or ſkin, and after this it melts.

If it be taken away in the firſt ſtate, there is found no remarkable difference in it, and the whiteneſs of the ſurface very ſoon goes off again. It is not eaſy to ſay to what this white colour is owing, whether to an arſenical ſalt in the metal, or to the mere change of poſition in its parts; but the black that follows, is plainly occaſioned by an oily matter ſeparated from the reſt of the metal, which is the firſt thing that gets into fuſion, and is carried to the ſurface by the violence of the heat. If the *copper* is held longer in fuſion in the focus of the glaſs, it emits ſome light fumes, and by degrees diſſipates wholly away. If it be put into a coppel, and in that placed before the focus of the glaſs, it ſoon melts, and afterwards becomes fluid like oil. If it be taken away in this ſtate, it cools into a browniſh, red, reguline maſs, which is brittle, and not at all extenſible under the hammer. This may be rubbed to powder, and reſembles cinnabar in colour, and the grains of the powder being viewed by the microſcope, appear like ſo many rubies, very beautifully tranſparent, and of a fine red; ſo that it is eaſy to ſee, this regulus is truly a deep red glaſs. If this regulus or glaſs be mixed with common white glaſs in powder, and then melted, the alkali ſalts of the glaſs act upon the *copper*, and the glaſs produced by the mixture is blue or green.

This regulus is, properly ſpeaking, no other than *copper*, diveſted, by the ſolar fire, of that oily or ſulphurous principle which gave it the form of a metal, its malleability and other properties: and a clear proof of the truth of this is, that if this regulus of *copper* be again expoſed to the focus of the glaſs upon a piece of charcoal, it in a very little time imbibes the oil or ſulphur of the charcoal, and reaſſumes its metalline ſtate, and if taken away, and left to cool, is found to be as good *copper* as it was before the firſt experiment; as malleable, and as ductile as before. Any other calx of *copper* alſo may, by the ſame means, be reduced to the true metalline ſtate again. It follows, therefore, from the whole, that the baſis of *copper* is a red friable matter, ſuſceptible of vitrification; that this matter receives its metallic form from an oily, or ſulphureous principle; and that this oil does not appear to be any way different from the common oils of vegetable, and of animal ſubſtances; that *copper* may be deprived of this oil by holding it long in fuſion in the ſolar fire, and is then diveſted of its metallic form; but that if it be afterwards laid on a piece of charcoal, in the ſame heat, it receives from that charcoal an oil like that which it before had loſt, and becomes a metal again. Mem. Acad. Par. 1709.

Copper put into the fire with iron promotes its fuſion, but it becomes more rigid and more pale by the mixture. It is often neceſſary, to render this fuſion the eaſier, to add as much tartar and common glaſs, as will cover the ſurface of the whole maſs.

As to the other metals, *copper* is well known to mix readily with ſilver and gold, and to give them a rigidity which renders them much more fit for the uſes of life, than they would be in their natural ſoft ſtate.

Copper, when hid, as it frequently is, in an ore full of the matter of the pyrites, may be diſcovered by a ſolution and liquid precipitation, in the following manner: make a ſolution of vitriol out of the ore, by a ſlight roaſting in an open fire, and by expoſing it afterwards to an air ſomewhat moiſt, and pouring warm water upon it. Put into this ſolution ſmall iron plates, perfectly clean, and free from greaſe; if there is any ſmall quantity of *copper* in the pyrites, it will now ſtick to the iron plates, in form of a ſubtle powder, of a deep yellow colour, and all of it will be thus fetched out of the ſolution, if there be time enough, and a moderate warmth. *Cramer*'s Art of Aſſaying, p. 327.

When ſilver is contained in *copper*, it may be ſeparated in the following manner: Reduce the *copper* into filings; put one centner of this by for the operation; then put the double and ſextuple quantity of granulated lead into a large, well-baked copell; make the fire ſtrong, and continue it ſo till the lead begins to ſmoak and boil; then add the *copper* wrapped up in a paper, ſo that it may be immerſed together into the middle of the boiling lead. When all the *copper* is diſſolved, ſuppreſs the fire till there is a ſmoak ſeen wandering over the ſurface, and the maſs is not raiſed up very high in the middle, and the coppel looks brown as far as it has been penetrated by the litharge: take care, however, that the boiling of the lead does not entirely ceaſe. When the greateſt part of the metal is conſumed, encreaſe the fire gradually, and make it very ſtrong toward the end. When the operation is finiſhed, the ſilver will be found pure in the center of the coppel, ſurrounded with yellow ſcoriæ in form of cryſtals. *Cramer*'s Art of Aſſaying, p. 227.

Copper, in medicine, muſt not be given internally in any form, unleſs under the direction of a very cautious phyſician. Crude *copper*, like crude mercury, may be ſwallowed in great quantities with perfect ſafety; it is returned again unaltered, nature having furniſhed us with no menſtruum within our bodies, that is capable of acting on it. It is much otherwiſe with regard to its preparations, which are generally eſteemed poiſonous;

poiſonous; but this is carrying the terror of them too far. *Copper* in any form is a violent and inſtantaneous emetic. A ſingle grain of the common verdigreaſe is an immediate vomit, working as ſoon as ſwallowed; and therefore, in caſes of poiſon, juſt taken, where the firſt buſineſs is to throw it up again, nothing is ſo efficacious. We find that even foods, ſuffered to ſtand long in *copper* veſſels, acquire an emetic quality, which ſometimes has very bad effects. Milk, oil, and butter, are good antidotes in this caſe.

The preparations of *copper*, are, 1. *Flos æris*, or flowers of *copper*. 2. *Ærugo æris*, or verdigreaſe. 3. *Æs uſtum*, or burnt *copper*. 4. *Squamma æris*, or the flake of *copper*. 5. The *ens veneris* of Mr. Boyle. 6. *Aqua ſapphirina*, a famous eye-water, of a blue colour. See Æs, VERDIGREASE, &c.

COPPER *ore*. The method of procuring the metal from a pure and fuſible *copper ore* is this: mix one or two centners of the ore for an aſſay, beaten to a very fine powder with ſix centners of the black flux; put the powder into a crucible, and cover it half an inch high with common ſalt; preſs the whole down with the finger, but let the capacity of the veſſel be ſuch, that it may be only half full; ſhut the veſſel cloſe with a lute, and put it into the furnace. Increaſe the fire ſlowly, till the common ſalt crackles; then increaſe it ſo far that the veſſel may preſently be made red hot, and after about a quarter of an hour's ſtanding in this heat, the metal will be ſeparated: then take out the veſſel, and ſetting it on the floor, ſtrike with a few blows of a hammer near where it ſtands, to make the metal get together at the bottom. Break the veſſel, when grown cold, in two, from top to bottom, as nearly as you can, and you will find a ſolid, and malleable regulus at the bottom. *Cramer*'s Art of Aſſaying, p. 301.

COPPERAS (*Cycl.*) — The alum workers in Yorkſhire have an opinion that if their liquor ſtands beyond the uſual time in the pans, it will turn to *copperas*. The maſters of the works have inculcated this ſtory to make them diligent, and it is as firmly believed among them as if it were a real truth.

COPPERAS *ſtone*. See PYRITES.

COPPICES. See WOODS.

COPROCRITICA, medicines which purge away the excrements in the guts. *Blancard*.

COPROPHAGOS, the *dung-fly*, in natural hiſtory, the name given by many authors to the common yelloviſh fly found on human excrements. There are ſeveral other ſpecies found on the excrements of various animals, and thence called *merdivoræ*. See FLY.

COR (*Cycl.*) — COR *marinum*, in natural hiſtory, the name of one of the claſſes of the *echini marini*, the characters of which are, that the anus is placed in the ſide of that point of the ſhell which appears as if cut off; and the mouth has two lips, and is placed in the third region of the axis of the baſe. *Klein*'s Echin. p. 34.

COR *Veneris*, *Venus's heart*. a name given by authors who treat of ſhells, to a very elegant kind of the *cordiformis*, or heart-ſhell, which has more of the ſhape of a real heart than the *bucardium*, or any other ſhell of this genus. There are only three known ſpecies of the *cor Veneris*. 1. A denticulated one, with very elegant, roſe-coloured ſpots. 2. The white boat-ſhell, furrowed on the inſide. And, 3. The little, roſe-coloured kind. Theſe are all very elegant ſhells. See HEART-*ſhell*.

CORACIAS, in natural hiſtory, a name given by many writers to the *belemnites*, called by others *lapis Lyncurius*, and *dactylus Idæus*. See BELEMNITES.

CORACIAS, in zoology, a name uſed by Linnæus for the *pica* or *pye*. This bird makes, in that author's ſyſtem, a diſtinct genus; the characters of which are, that the inner tail feathers grow gradually one longer than another. See Tab. of Birds, N° 8. and *Linnæi* Syſtem. Natur. p. 44.

This bird is called by ſome the *pyrrhocorax*, and in Engliſh the *Corniſh chough*. It is of the ſhape of the jackdaw, but of the ſize of the common crow. Its beak is red, long, and ſomewhat hooked at the end. It frequents rocks, and ruined buildings about the ſea ſhores, and is found about the high cliffs, all along the weſtern ſhore of England. Its voice is much like that of the jackdaw, but is more hoarſe and rough. *Ray*'s Ornithol. p. 86.

CORACINUS, in zoology, the name of a ſea fiſh caught in the Mediterranean, and called by ſome authors *skiæna*, and by Aldrovand and Salvian *umbra*; it is of the colour of the common tench, but in figure more approaches to the pearch: its ſcales are ſmall; its mouth not very large, but well furniſhed with teeth; and its tail is not forked, but when extended, ſeems of a roundiſh figure; the ends of the rays or nerves of the tail-fin are black, and the other fins are all black, and ſeem as if dyed with ink. *Rondelet* de Piſc. l. 5. c. 8. p. 128.

CORACOBRACHIALIS (*Cycl.*) — This is a long muſcle, lying on the inſide of the upper half of the os humeri, that is, on that ſide which anſwers directly to the hemiſphere of the head of the bone, and to the prominent internal condyle. It is fixed above to the point of the *coracoide* apophyſis, between the inſertions of the biceps, and the pectoralis minor, by a tendon, which as it deſcends, adheres a good way to the tendons of theſe two muſcles; afterwards it becomes fleſhy, and is inſerted by a broad thin extremity, with a ſmall mixture of tendinous fibres in the middle part of the os humeri, cloſe by the ligamentary frænum of the latiſſimus dorſi, and teres major. Its inſertion is continued down below the frænum, near the internal intermuſcular ligament, to which it likewiſe adheres a little. This muſcle paſſes behind the tendon of the pectoralis major; and as it is perforated in the middle, to give paſſage to a nerve, it has by ſome been termed *perforatus Caſſerii*, that author being the firſt who gave a particular figure of it. Its other name is taken from its inſertions. *Winſlow*'s Anatomy, p. 184.

CORACOMANTES, Κορακομαντεις, in antiquity, a kind of diviners, who made their predictions by obſerving the crows. *Pott.* Arch. l. 2. c. 8. T. 1. p. 266.

CORACORADIALIS, in anatomy, a name given by ſome authors to a muſcle generally known by the name of the *biceps*; the *peſcetto* of the Italian authors; and the *primus flectentium cubitum*, of Veſalius, and others of his time.

CORAL, (*Cycl.*) *corallium*, in botany, the name of a genus of ſea plants, diſtinguiſhed from all others by a ſuperior hardneſs, approaching to that of ſtones. See Tab. 1. of Botany, Claſs 17.

The ſpecies of *coral* enumerated by Mr. Tournefort are theſe: 1. The common red *coral*. 2. The elegant, bright red *coral*. 3. The bright, light red *coral*. 4. The roſe-coloured *coral*. 5. The browniſh red *coral*. 6. The yelloviſh *coral*. 7. The variegated, red and white *coral*. 8. The plain white *coral*. 9. The white, geniculated *coral*. 10. The white fingered *coral*, with contiguous and flattiſh branches. 11. The brittle, white, many-fingered *coral*, with equal and contiguous branches. 12. The foliated, white *coral*. 13. The foliated, curled, violet-coloured, American *coral*. 14. The red, curled, American *coral*. *Tourn.* Inſt p. 572.

We hear ſome naturaliſts talk of blue, green, and yellow *corals*, and we are apt to deſpiſe ſuch accounts, as knowing that all the *corals* preſerved in the cabinets, and found in the works of artiſts in all nations, are either white or red. It ſeems, indeed, very certain, that there is no *coral* intrinſically of any other than one or the other of theſe colours, yet if the perſons who deſcribe theſe painted kinds have been at ſea, they may, in ſome places have ſeen what they deſcribe, though they would never be able to bring any ſuch thing home with them. All the *corals*, as they grow at the bottom of the ſea, are, as we ſee them, red or white, in their proper ſubſtance; but thoſe which grow in deep water are often covered completely over with a coat of a tough, gelatinous matter, reſembling glue. This is frequently coloured with thoſe elegant tinges which dye the bottom of the ſea in deep water; and they, in this ſtate appear, as taken up out of the water, to be blue, green, purple, and the like. Thus thoſe who ſay they have ſeen *corals* of theſe colours taken up out of the ſea, may be in the right, as to appearance; but this colour being only in the jelly that covers the plant, is not to be preſerved, but if this is rubbed off, the ſurface goes with it, and leaves the plant of its natural colour; and if the whole be attempted to be dryed together, the colour vaniſhes as the moiſture evaporates, and the plant, when dried, is found only covered with a dirty yelloviſh cruſt. *Marſigli*, Hiſt. Phyſ. de la Mer.

Red CORAL. The effects of vegetable diſtilled oils on *coral*, by the help of a long digeſtion, is ſuch as could not have been imagined, till the experiments of Dr. Langelot ſhewed that they were a ſort of ſolvent for that refractory ſubſtance. This gentleman had put fragments of *red coral* into ſome diſtilled vegetable oil, and let them ſtand many months, in hopes of drawing a tincture from them; but without ſucceſs. At length having a digeſting furnace at work, he placed the glaſs in which the *coral* and oil were, in the furnace among the other things; the conſequence was, that after about a month's digeſtion, the pieces of *coral* were found to be ſwelled, and higher coloured than before, and with a few days longer continuance of the ſame heat, the whole quantity of *coral* had loſt its original figure, and was blended together into a red mucilage, the oil ſtill ſwimming above it in its priſtine form, and not at all altered in colour: the moſt violent agitation of the veſſel could not cauſe theſe two ſubſtances to mix together, and all the artifice that could be uſed, proved vain toward the tinging the oil with a red colour. After long trial in the ſame, and an advanced heat, the oil was poured off as clear as before, and very little altered in ſmell, or other qualities; and tartariſed ſpirit of wine being poured on the remainder, with a very ſhort digeſtion took a very highly red tincture. This proceſs is a great proof of the power of digeſtion.

The common *red coral* yields, by diſtillation in a retort, a volatile vitreous ſpirit, in no inconſiderable quantity; this turns ſyrup of violets green, and makes an effervescence with acids, and renders a ſolution of corroſive ſublimate white and milky. And the fixed ſalt drawn from the reſiduum produces a white coagulum in the ſame ſolution; from which it is evident that it is not a mere alkali, but a ſal ſalſum, in ſome degree.

Red coral calcined, even in a very gentle fire, becomes white; the ſame change alſo happens to it when infuſed a long time in ſome oily ſubſtances, as the oils of aniſe, fennel, or in white wax kept in fuſion. The menſtrua in this caſe acquire a red colour in proportion as the *coral* loſes it. It appears from theſe, and ſeveral other experiments, that *coral* is not, as ſome ſuppoſe, a mere terreſtrial abſorbent, but that it contains a volatile urinous ſalt, and a bituminous oil combined with its earthy

earthy matter; and on theſe its virtues in medicine principally depend. The red colour of *coral* is evidently owing to its bituminous oil, which it is found not difficult to ſeparate, and wholly diveſt it of. It is obſerved, that *coral* newly taken up out of the ſea contains both the ſalt and oil in greater abundance than that which has been long kept; and it is ſuſpected by many, that its external or cortical ſubſtance contains more of it than the interior, harder, and more ſtony matter.

The antients uſed *coral* in many external medicines for diſtemperatures of the eyes; and internally as an aſtringent, and refrigerating medicine. We uſe it only internally, and that principally in diarrhœas, and bleedings, in too great evacuations of the menſes, and in the fluor albus. The vulgar attribute to it, beſide theſe virtues, many others, which we have not ſufficient warrant for; ſuch as its ſtrengthening the heart, curing malignant fevers, and reſiſting poiſon; and they tell us, that it will do all this as well if worn externally, as if taken inwardly; which may very poſſibly be true. *Geoffroy*, Mat. Med. Vol. 2. p. 254.

White CORAL. There is no part of the world where *white coral* is produced in ſuch abundance as on the ſhores of the iſland of Ceylon, and other of the neighbouring Indian coaſts. The lime uſed in that part of the world, for building houſes, fortifications, &c. is all made by burning this *coral*. It lies in vaſt banks which are uncovered at low water, and it is ſpungy and porous. While young, it grows erect, in form of little ſhrubs, and is then firm and ſolid, and ſmooth on the ſurface, but the branches continually ſhoot out more, and theſe other new ones, till the whole is one confuſed buſh. Theſe branches are all covered with a white viſcous matter, which, in time, hardens upon them, and becomes *coral*; and this filling up all the interſtices between the branches, when they become ſo numerous, and hardening between and over them, the whole becomes one coarſe rock, and the adjoining maſſes of this kind uniting to one another, form at laſt a continued bank, which has the appearance of a great white rock. In the places where the *coral* grows in this manner, there are like banks formed of oyſter ſhells; the oyſters here grow often to a foot in diameter, and a foot in thickneſs, and, it is ſaid, that they continue to increaſe in bulk after the animal is dead. Phil. Tranſ. N° 282. p. 1277.

Foſſile CORAL. It has been matter of ſurprize to naturaliſts, that as red *coral* is ſo common in the ſea, and is a ſubſtance of ſo firm and durable a nature, it is not frequently found among other remains of the ſea productions in the foſſile ſtate. We find the tendereſt ſhells, the teeth and bones of ſea fiſhes, and the white *corals*, in great abundance in the ſtrata of earth and ſtone; yet there is ſcarce one certain account of red *coral* being found foſſile. This had long puzzled the naturaliſts, when Agoſtino Scilla attempted to account for it by ſome ſpecimens in his own cuſtody. This gentleman, living at Meſſina, had an opportunity of ſearching the quarries in the neighbourhood of thoſe ſeas, where red *coral* grows in abundance, and whither it might moſt eaſily be carried by any inundation. Accordingly he found, among a vaſt quantity of white *coral*, ſome ſpecimens, which doubtleſs had once been red, and theſe, though they had, in a great meaſure, loſt their colour on the outſide, yet they retained ſo much of it within, as plainly ſhewed that they had once been red; and the whole truth ſeems to conſiſt in this, that though the ſubſtance of the *coral* is permanent, the colour is not ſo; and that we, perhaps, often meet with red *coral* which we know not to be ſuch, becauſe of the changes it has ſuffered in the earth. This is a ſtrong argument againſt the opinion of thoſe who ſuppoſe that the foſſile *corals* and ſhells were never truly marine bodies, but produced in the beds of ſtone, &c. in which they are found; ſince it ſeems very clear, from the loſs of the colour of theſe foſſile red *corals*, that they are in an altered ſtate, and in part decaying; and that the places where we find them contribute to their deſtruction, not to their generation. *Auguſtin. Scilla* de Petrifac.

That theſe have once been marine *corals* is alſo evident from many other things; they are not unfrequently found with the fragments of ſea ſhells yet adhering to them, ſuch as the *tubuli vermiculares*, and other ſuch ſhells as we continually find growing to them, as they grow in the ſea: and about Meſſina, where the foſſile *corals* are found embodied in looſe maſſes of ſtone, not in ſtrata, it is a very common thing to find the parts of the ſame piece of *coral* buried in two, or more of theſe maſſes of ſtone, it having been broken there, and part retained in one ſtone, part in another; the two ſtones thus containing the two parts of a piece of *coral* are frequently found at conſiderable diſtances from one another, yet, when they are brought together, the broken pieces are found to tally exactly with one another. Can this be ſuppoſed the caſe, if they were each produced ſeparately in the ſtone, from its own peculiar ſeminal principle.

Beſide the great variety of *corals* found in their natural ſtate, in the ſea, we find great numbers buried in the earth, and immerſed even in the bodies of ſolid ſtones, and marble: of theſe many are the ſame with the ſpecies now known to us at ſea, and many differ from all the known recent ones. The foſſile *corals* are found ſometimes nearly in their own natural ſtate, but much more frequently they have their pores filled up with ſtony particles, ſo as to ſeem mere ſtones. Thoſe which are not reducible to any of the known recent ſpecies, are probably the produce of ſeas and ſhores yet unſearched; but it is very remarkable, that the common red *coral*, though ſo frequent at ſea, is ſo ſcarce in the foſſile world, that there is hardly one credible account of its having ever been met with.

The ſeveral white *corals*, known as marine productions, are almoſt all of them found alſo foſſile in ſome part of the world; and, of the ſeveral which are leſs known, many have been honoured in their foſſile ſtate with peculiar names. *Hill*'s Hiſt. of Foſſ. p. 641. See the articles MYCETITÆ, PORPITÆ, TUBULARIA, PERUS, ASTROITES, LITHOPHYTA, *marine* PRODUCTIONS, &c.

CORALLINA, *coralline*, in botany, the name of a genus of ſea plants, the characters of which are, that they grow naturally under water, and are finely divided, or compoſed of parts jointed into one another by regular articulations, and terminating in very fine and ſmall branches. See Tab. 1. of Botany, Claſs 17. The ſpecies of *coralline* enumerated by Mr. Tournefort are theſe: 1. The common *coralline*. 2. The thick, brittle, hollow *coralline*. 3. The ſlenderer, brittle, hollow *coralline*. 4. The purple, jointed *coralline*. 5. The hollow *coralline* of Jamaica, with ſhort white joints, ſeeming as if ſtrung on threads. 6. The ſoft, geniculated, American *coralline*, with flat compreſſed ſegments. 7. The ſmalleſt, Engliſh, geniculated *coralline*. 8. The knotty *coralline*, reſembling the ſea dier's weed, with tubular ſegments. 9. The ſeeding ſea *coralline*, with capillaceous leaves. 10. The procumbent, denticulated, moſſy *coralline*, with very ſlender ſtalks, and oppoſite jaggs. 11. The alternately denticulated, moſſy *coralline*, with branches divided into numerous thin filaments. 12. The moſſy *coralline*, with oppoſite denticulations. 13. The moſſy, feathered *coralline*, with hooked branches, commonly called the ſickle-feathered ſea moſs. 14. The feathered, ſcrupoſe *coralline*, with thick, rigid ſtalks. 15. The lobſter's horn *coralline*. 16. The ſmall, fir-like, ſea *coralline*. 17. The narrow-leaved, purple *coralline*. 18. The duſky green, Spaniſh *coralline*, with capillaceous leaves, and a ſpungy ſtalk. 19. The Spaniſh *coralline*, with brown, capillaceous leaves. 20. The white, ſea *coralline*, with capillaceous, multifid leaves. 21. The capillaceous *coralline*, with black, multifid leaves. 22. The capillaceous *coralline*, with green, multifid leaves. 23. The ſmalleſt, knitty, ſea *coralline*. 24. The very much branched, red, capillaceous *coralline*. 25. The very much branched, white, capillaceous *coralline*. 26. The gold-coloured, capillaceous *coralline*, with forked leaves. 27. The pale-coloured, capillaceous, tough *coralline*. 28. The ſea *coralline*, reſembling the tuberoſe roots of trees. 29. The dodder-like, ſea *coralline*. 30. The ſea *coralline*, with long, fennel-like, leaves. 31. The ſea *coralline*, with ſhorter, fennel-like leaves. 32. The abrotanum-leaved *coralline*. 33. The ſhrubby and knotty, ſouthernwood-leaved *coralline*. 34. The ſmalleſt *coralline*, divided into extremely ſmall, ſhort branches. 35. The capillaceous ſea *coralline*, with the appearance of the coſtus Indicus. 36. The ſilvery, capillaceous *coralline*.

It is to be obſerved, that Mr. Tournefort brings into the claſs of *corallines*, all thoſe ſea plants which terminate in finely divided branches; and therefore takes in many of thoſe plants which others called the fine-leaved fucus's, retaining the name *coralline* only to the ſcrupoſe or jointed kinds.

The antients have ſaid great things of the virtues of the common *coralline*. Dioſcorides preſcribes it for mitigating the pain of the gout, and for preventing ſtagnations of the humours in any part; he ſays nothing of its virtues againſt worms, which are what we alone eſteem it for. We give it in powder from ten grains to a ſcruple, or half a dram twice a day in theſe caſes, and that with conſiderable good effect. *Geoffroy*, Mat. Med. Vol. 2. p. 238.

CORALLO-ACHATES, in the natural hiſtory of the antients, the name of a very beautiful ſpecies of agate, found at this time in the Eaſt-Indies, but not in any plenty, and called by Dr. Hill *achates miniaceus flavo variegatus*, or the red lead coloured agate, variegated with yellow. Its baſis, or ground colour, is a pale, but very bright red, in which there are diſcovered, on a cloſe inſpection, in moſt of the pieces, multitudes of veins of a darker red, drawn in very fine and cloſe concentric circles, round one or more points, the whole giving a mixt red, not unlike that of our red lead, or that of the common red coral in its rough ſtate, when firſt drawn out of the ſea. It is always variegated alſo with a number of ſmall and beautiful blotches of a fair yellow, which are ranged with great irregularity in the maſs, but never interſect, or are interſected, by the veins; they are all ſmall, and either round or oblong. It is very hard, and capable of a fine poliſh, and, when wrought, is an extremely elegant ſtone. *Hill*'s Hiſt. of Foſſ. p. 484.

CORALLODENDRON, *coral-wood*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the papilionaceous kind, but of a very ſingular make;

its vexillum is remarkably long, and of the ſhape of a ſword; its alæ and carina ſhort; from the cup of the flower there ariſes a cylindric piſtil, ſurrounded by a fimbriated membrane, which finally becomes a ſort of knotty pod, compoſed of two valves, and containing a number of kidney-ſhaped ſeeds.

The ſpecies of *corallodendron* enumerated by Mr. Tournefort, are theſe: 1. The prickly, trifoliate, American *corallodendron*, with bright red flowers. 2. The ſmaller, American trifoliate *corallodendron*, with black ſpines, and black ſeeds. 3. The aſh-leaved, American *corallodendron*. 4. The American *corallodendron*, with ſingle oblong leaves, and with flat pods. 5. The American *corallodendron*, with leaves like the pſeudo-acacia, hoary underneath, and with yellow flowers. *Tourn.* Inſt. p. 661.

CORALLOFUNGUS, in botany, the name by which Vaillant has called the *clavaria*, a genus of fungus, growing erect, and having every where one even and uniform ſubſtance. This is called *fungoides* by others. See CLAVARIA.

CORALLOIDE *marble.* See *coralloide* MARBLE.

CORALLOIDES, in botany, a term uſed by Mr. Tournefort to expreſs a genus of muſhrooms; the diſtinguiſhing characters of which are, that they are of a fleſhy fungoſe texture, and are branched in the manner of coral. See Tab. 2. of Botany, N° 5. The ſpecies of *coralloides* enumerated by Mr. Tournefort, are theſe: 1. The yellow fungous *coralloides*. 2. The white fungous *coralloides*. 3. The pale purple fungous *coralloides*. 4. The tall white fungous fir *coralloides*. 5. The violet-coloured fungous *coralloides*, with ſhort horns. 6. The purple Alpine fungous *coralloides*. 7. The ſmall, duſky yellow, fungous *coralloides*. 8. The ſmall, yellow, branched, fungous *coralloides*. 9. The ſmall branched, orange-coloured, fungous *coralloides*. 10. The white, fingered, branched, fungous *coralloides*. 11. The black, compreſſed, fungous *coralloides*, with white edges. 12. The ſmall, broad-horned, Virginian, fungous *coralloides*. 13. The echinated fungous *coralloides*. 14. The briſtly fungous *coralloides*. 15. The ſtag's horn fungous *coralloides*, with ſhort branches. 16. The ſtag's horn fungous *coralloides*. 17. The fungous *coralloides*, with ſnow-white horns. 18. The fungous *coralloides*, with reddiſh horns. 19. The fungous *coralloides*, reſembling the horns of the fallow deer. *Tourn.* Inſt. p. 564.

CORALLOIDES is alſo uſed in a different ſenſe. Bauhine and Chabræus have made it the name of the great *dentaria heptaphyllos*; and Dillenius, that of a whole genus of the dry leafleſs moſſes. *Dale*, Pharm. p. 200. See HEATH-*moſs*.

CORALLOIDES is alſo a name given by many authors to the foſſile corals. See *foſſile* CORALS.

CORALLORHIZA, in botany, a name given by Ruppius to the plant called by Linnæus *neottia*, and by others *nidus avis*.

CORALLUM, in mineralogy, a name given by ſome of the writers on theſe ſubjects to the common *pyrites*. It is not eaſy to gueſs the reaſon of giving the ſame name to two ſuch different ſubſtances as *coral* and *pyrites*.

CORAN. See ALCORAN.

CORANA, or *nai* CORANA, the name of a peculiar ſort of phaſeolus, or kidney-bean, the down of the pod of which is the couhage, or, as it is commonly called, cowitch. Hort. Mal. Vol. 3. p. 199.

CORAX *piſcis*, the *crow-fiſh*, in zoology, the name of a fiſh of the cuculus kind, and much approaching to the ſwallow fiſh in ſhape and figure. The bones which cover the gills in this fiſh, all terminate in ſharp thorns. The gill-fins are ſmaller than in the ſwallow-fiſh, and are white on the outſide, and of a blackiſh green within. The back is of a bluiſh black; the ſides reddiſh, and the belly milk white. The head is very large; and there are two rows of pointed bony ſubſtances on the back. The forehead, between the eyes, is marked with ſeveral figures; and the mouth is of a pale yellow, much leſs coloured than that of the milvus. *Geſner*, de Piſc. p. 356. See MILVUS *piſcis*.

CORBEIL, in natural hiſtory, the name of a curious ſpecies of *chama*. It is of the larger kind, and is deeply ſtriated, both longitudinally and tranſverſely; ſo that it has a ſort of reticulated ſurface, like baſket-work. See CHAMA.

CORBETT, in architecture, is uſed by ſome, as Harris, in his lexicon, for *corbel*. See CORBEL, *Cycl.*

CORCELET, in natural hiſtory, that part of the fly claſs which is analogous in its ſituation to the breaſt in other animals. Many have called it the breaſt in theſe alſo, but improperly; becauſe the breaſt of other animals is the place of the lungs and trachea; but theſe organs are in the fly claſs diſtributed thro' the whole body. The wings are affixed to this part of the fly claſs: and there are ſome diſtinctions of great conſequence, in regard to the arrangement and diſtribution of thoſe animals into genera. *Reaumur*'s Hiſt. Inſect. T. 4. p. 126.

Some flies have a double *corcelet*, or one divided into two parts; and this is the caſe of the fly produced from the formica-leo, which therefore does not carry its only diſtinction in the figure of its antennæ. One pair of the legs of this fly are attached to the firſt or anterior *corcelet*, which is alſo capable of moving on the other.

The *corcelets* of ſome flies is much more elevated alſo than thoſe of others; and in ſome this elevation is carried ſo far, that the head is forced by it to be bent downward, and the creature is plainly made hump-backed by it. The great kind, and the *tipulæ*, furniſh inſtances of this elevated and humped *corcelet*.

A ſeries of flies of two wings, are known by a very particular armament which they carry on the *corcelet*, uſually called their breaſt. This is two long, ſlender, and ſharp pointed prickles, which are immoveable in their inſertions, and ſeem meant as defenſive or offenſive weapons; but in what manner they are uſed, is not eaſily to be determined.

All theſe flies are produced from long water-worms, with open and funnel-faſhioned tails, or furniſhed with their aperture for reſpiration at the hinder extremity. Theſe tails are bordered with hairs, which the creature makes to diverge from their inſertion, and form a ſort of funnel at the ſurface of the water, when it throws up its tail for air.

There are three known ſpecies of this ſort of fly, with armed *corcelets*, which differ much in ſize, but are all produced of worms of this kind. The largeſt of theſe flies is produced from the largeſt and longeſt worm, and are ſomething longer than the bee. The ſmalleſt are produced of worms very ſmall and ſlender, and are themſelves extremely minute: and the third kind is of a middle ſize between theſe, and produced of a proportionably ſmaller worm than that of the firſt, and proportionably larger than that of the ſecond ſpecies.

All theſe ſpecies have their wings but little diſtinguiſhable at their firſt production from the ſhell; they appear, indeed, only like two ſlender filaments, laid along their bodies, but they ſoon ſhew, that in this ſtate they were only very nicely folded together, and very ſoon expand, and ſhew their full extent and proportion.

When firſt produceed from the ſhell, theſe flies are of a pale green, and the under part of their belly, in many, continues green, but in the greater number it becomes of a pale dead brown. Some of them have the outſide of their bodies of a deep brown, approaching to black, with lines of a dead brown between the commiſſures of the rings. The back of ſome others has only a blackiſh brown band, which runs ſtrait down from the *corcelet* to the end of the body, the whole body beſide being of a dead brown. The *corcelet* in theſe flies is brown, and the prickles are yellowiſh near their inſertions, but nearly black at their points. They have three of the ſmall gloſſy eyes, diſpoſed in figure of a triangle on the back part of their head; and their reticular eyes are brown, and at ſome diſtance from one another. *Reaumur*, Hiſt. Inſect. Vol. 4. p. 346, 347.

CORCULUS, the *little heart*, in natural hiſtory, a name given by authors to a ſmall ſpecies of cordiformis, or heart ſhell, of a roſe colour. See HEART-*ſhell*.

CORD (*Cycl.*) — *Magical* CORD, an inſtrument in great uſe among the Laplanders, and ſuppoſed to be of great virtues among them. It is a *cord* or rope, with three knots tied in it. They uſe many magical rites and ceremonies in the preparing and tying this *cord*; and when thus prepared, it is ſuppoſed to have power over the winds, and they will ſell, by means of it, a good wind, or at leaſt a promiſe of one, to a ſhip. If they untie only one of theſe knots, a moderate gale ſucceeds; if two, it is much ſtronger; and if three, then there is ſure to be a ſtorm.

CORDATED *leaf*, among botaniſts. See LEAF.

CORDAX, in antiquity, a gay ſort of dance. See DANCE, *Cycl.*

CORDIA, in botany, the name by which Linnæus and Plumier have called a genus of plants, called *ſebeſtena* by Dillenius in his Hortus elthamenſis. The characters are theſe: the cup is a one-leav'd perianthium, divided into three pointed ſegments, from a tubular baſe, and remaining after the flower is fallen. The flower conſiſts of one leaf, which is of the funnel faſhioned kind: its tube is of the length of the cup: the verge is partly erect, but expanded, and is divided into four, five, or ſix obtuſe ſegments. The ſtamina are pointed filaments of the length of the tube, and of the ſame number with the ſegments of the flower. The apices are ſimple: the germen of the piſtillum is round, and pointed at the end: the ſtile is pointed, and of the length of the tube of the flower, and divided into two parts at the end. Theſe ſegments are again bifid, and the ſtigmata that terminate them are of an obtuſe figure. The fruit is a drupe of the dry kind, and is of a globoſe pointed form, and covered with the cup. The ſeed is a ſingle nut, furrowed on the ſides, and divided into two ſegments. *Dill.* Elth. 226. *Linnæi* Gen. Plant. p. 520.

CORDIAL *waters*. See STRONG *waters*.

CORDIFORMES *conchæ*. See HEART-*ſhells*.

CORDYLA, or CORDYLUS, in zoology, a name by which ſome authors call the *thynnus* or tunny-fiſh, while young and ſmall. *Willughby*'s Hiſt. Piſc. p. 177. See the article THYNNUS.

CORDYLINE, in botany, a name given by Van Royen to the plant called by others the *yucca*. See the article YUCCA.

CORDYLUS, in zoology, the name of a ſpecies of lizard, called alſo *uromaſtyx* and *cauriverba*. It is larger than the green lizard. Its tail is rounded, and is divided into a number of circles covered with ſcales, which coat them over, and cover the whole tail like the tiling of the roof of a houſe. *Ray*'s Syn. Quad. p. 263.

CORDYLUS, in ichthyology. See CORDYLA.

COREGONUS, in ichthyology, the name of a genus of fishes of the malacopterygious, or soft-finned kind, the characters of which are these: the branchiostege membrane on each side contains seven, eight, nine or ten bones. The pinna dorsi is placed nearer the snout than the ventral fins are. The teeth are so small, that in several of the species they are scarce discernable.

The species of this genus, enumerated by Artedi, are these: 1. The toothless *coregonus*, with the lower jaw longer than the upper. This is the fish called by the Swedes the *sik-loya*, or stint. Its length is from four to seven inches. The vertebræ are very small, and in number thirty eight. 2. The *coregonus*, with the upper jaw longer than the under, and flatted, and with fourteen bones in the back-fin. This is the fish called the *albula nobilis* by authors. Its length is ten or twelve inches. 3. The *coregonus*, with the upper jaw longest, and with twenty three bones in the back-fin. This is the *thymallus* of authors; the fish we call the grayling. 4. The *coregonus*, with the upper jaw longest, and of a conic figure. This is the *oxyrynchus* of authors, or the *hantin* or *antin*. It has no visible teeth; but the tongue is rough. The pinna ani has fourteen bones. *Artedi*, Gen. Pisc. 7.

The name *coregonus* is of Greek origin, and is formed of the words κόρη, the pupil of the eye, and γωνια, an angle or corner; and is given it from the singular structure of this part of the eye, the pupil in this fish running out into an acute angular corner in the anterior part, and this regularly in all the species.

COREHORUS, in botany, the name of a genus of plants, the characters of which are these: the flower is of the rosaceous kind, consisting of several leaves, disposed in a circular form. The pistil arises from the cup, and finally ripens into a cylindric quinquecapsular fruit, which opens in five places, when ripe, and is full of angular-shaped seeds. To these marks it is to be added, that the leaves stand alternately on the stalks.

The species of *corehorus* enumerated by Mr. Tournefort, are these: 1. The common Ægyptian *coreborus*, or *melochia*. 2. The American *corehorus*, with hornbeam leaves, and longer fruit: and, 3. The American *corehorus*, with narrower leaves, and slenderer fruit. These plants are called by some *alceas*. *Tourn.* Inst. p. 259.

COREIA, Κορεια, in antiquity, a festival in honour of Proserpine, named *Core*, Κορη, which in the Molossian dialect signifies a beautiful woman. *Pott.* Archæol. T. 1. p. 409.

COREOPSIS, in botany, the name given by Linnæus to a genus of plants, called by Dillenius, in the Hortus elthamensis, a species of *bidens*. The characters are these: the common cup is double, the exterior consisting usually of eight rude leaves, disposed in a sort of circle, and the inner of as many large, broad, and elegant leaves, regularly disposed and coloured. The flower is compound, and radiated. The hermaphrodite floscules are very numerous, and are placed in the disc. The female flowers are eighteen in number, and are placed in the radius. The hermaphrodite floscules are tubulose, and divided into five segments at the end. The female are larger, and are divided only into four. The hermaphrodite flowers have five very short capillary filaments: the antheræ are cylindric and tubular: the germen of the pistil is compressed, and divided into two horns, in the hermaphrodite flower: the stile is capillary, and of the length of the stamina; and the stigma is bifid, acute and slender. In the female flowers, the germen is the same as in the hermaphrodite; but there is no stile or stigma. There is no other fruit than the cup. In the hermaphrodite flowers, the seeds are single and orbiculated, convex on one side, and concave on the other, with a transverse protuberance, running from the apex to the base, and surrounded with a membranaceous rim, terminated in two points. *Linnæi* Gen. Plant. p. 416. *Dillen.* Hort. Elth. p. 48.

CORETT, in zoology, the name of a large East-Indian fish, of the tunny kind, and suspected to be no other than the common tunny. It grows to six or seven feet long. Its eyes are large, and their irises yellow: its tail is broad and forked, and in colour of a yellowish green: its belly fins are yellowish, and its belly of a fine bright glossy blue, with a silvery cast. It is generally caught with hooks, and is a very fine tasted fish. *Ray*'s Ichthyogr. Append. p. 5. See THYNNUS.

CORIANDER, (*Cycl.*) *Coriandrum*, in botany, the name of a genus of umbelliferous plants, the characters of which are these: the flower is of the rosaceous kind, consisting of several heart-fashioned leaves, sometimes regular, sometimes irregular in size, disposed in a circular order round a cup, which afterwards becomes a fruit, composed of two seeds of a spherical, or hemispherical shape.

The species of *coriander* enumerated by Mr. Tournefort, are these: 1. The common or larger *coriander*. 2. The smaller *coriander*, with testiculate seeds. *Tourn.* Inst. p. 316.

This plant, while green, has a nauseous disagreeable smell, like bugs; but the seed, when dry, smells gratefully. It is reckoned strengthening to the stomach, and carminative, and therefore frequently used with purging medicines [a]. *Coriander* seeds have also a great acrimony, when fresh gathered, which they lose with time [b]. — [[a] *Quincy*, Pharm. Edit. 1736. p. 83. [b] *Boyle*'s Works, Abrid. Vol. 1. p. 141, 142.]

CORICEUM, Κωρικιον, in antiquity, the undressing-room belonging to the Gymnasium. *Pott.* Archæol. Græc. l. 1. c. 8. p. 38.

CORINDUM, in botany, the name of a genus of plants, the characters of which are these: the flower is of the polypetalous anomalous kind, being composed of four leaves, disposed in form of a cross, and of four smaller, of a crooked shape, placed between them. The cup is composed of four leaves, and from it there arises a pistil, which finally becomes a fruit of an inflated, bladder-like appearance, and divided into three cells, which contain seeds of a roundish shape, marked with a heart-fashioned spot.

The species of *corindum* enumerated by Mr. Tournefort, are these: 1. The large-leav'd *corindum*, with large fruit, called by some authors the black bladder pea. 2. The large leav'd *corindum*, with extremely large fruit: and, 3. The *corindum*, with smaller leaves, and smaller fruit. *Tourn.* Inst. p. 431.

CORION, in botany, a name given by some authors to the plant which produces the coriander seeds used in the shops. *Ger.* Emac. Ind. 2.

CORIS, in botany, the name of a genus of plants, the characters of which are these: the flower consists only of one leaf, and is of the personated kind, tubulated behind, and expanded in the manner of a fan before. The pistil arises from the cup, and is fixed in the manner of a nail to the hinder part of the flower: this finally becomes a fruit, nearly of a globose figure, which, when ripe, splits into several parts, and contains a number of roundish seeds, being itself hid in the cup of the flower.

The species of *coris* enumerated by Mr. Tournefort, are these: 1. The blue-flowered sea *coris*. 2. The red-flowered sea *coris*: and, 3. The white-flowered sea *coris*. The two last are properly only varieties of the first. *Tourn.* Inst. p. 652.

CORIS is also used in the East-Indies for a kind of shells which pass for money. See BIA.

CORISPERMUM, in the Linnæan system of botany, the name of a genus of plants, called before *stellaria*. The characters of this genus are, that the flower has no calyx, and consists of two petala, which are compressed, bent and pointed, equal in size, and placed opposite to one another. The stamen is single, long, and crooked, and terminated by a simple anthera. The pistillum is composed of a roundish, compressed germen, and two bent capillary stiles, with pointed stigmata. The fruit is a roundish, but compressed capsule, with a furrowed rim, and divided into two cells, each containing a single seed. The essential distinction of this plant consists in the flower; for the fructification has some varieties. *Linnæi* Gen. Plant. p. 1.

CORIZIOLA, in the materia medica, is a name given by some authors, particularly by Rhasis, to the scammony. *Ger.* Emac. Ind. 2.

CORK, or CORKING *of a saddle*, are pieces of wood upon which the bolsters are made fast. See BOLSTERS.

This part of the saddle was formerly made of *cork*, whence it still retains the name.

Tubulated CORKS. See TUBULATED *corks*.

CORMORANT, in zoology, a large sea bird, called by authors *corvus aquaticus*, or the sea raven. Our shagg is a true species of this bird. See SHAGG and CORVUS *aquaticus*.

CORN (*Cycl.*) — *Guinea* CORN. See GUINEA *corn*.

Indian CORN. See MAIZE.

Preservation of CORN. See PRESERVATION *of corn*.

Transportation of CORN. See TRANSPORTATION.

CORNEA *tunica of the eye* (*Cycl.*) — It is sometimes necessary to make incisions thro' this tunic, in order to discharge not only matter, but even blood, when extravasated by external injuries, if it will not give way to the common methods of dispersion, to prevent the stagnant blood from suppurating and destroying the eye. There have been instances, when this has been done with great success, and without any deforming cicatrix, the sight having been also perfectly restored by it. See *Heister*'s Surgery, p. 427.

CONET, in conchyliology, a name given by some French writers to a genus of shells, called by others *cuculli*, and by the generality of writers *volutæ*. See VOLUTÆ.

CORNICABRA, in botany, a name by which the Spaniards call the turpentine tree. The name is founded on the singular production of this tree, in form of a horn or pod. This is not the fruit of the turpentine tree, as has been supposed by some; but is a mere excrescence, of the nature of the galls on the leaves and stalks of other trees and plants, and is inhabited by a number of small insect of the puceron kind. *Garcias* ab Orto.

CORNICULARIUS, among the Romans, an officer who published the orders of the tribunes with the sound of an horn. *Hofm.* Lex. in voc.

CORNISH *diamond*, a name given by many people to the crystals found in digging the mines of tin in Cornwall. These crystals are of the nature of the Kerry-stone of Ireland, but somewhat inferior to it: they are usually bright and clear, except toward the root, where they are coarse and foul, or whitish. They are usually found in the common form of an hexangular column, terminated at each end by an hexangular pyramid. See CRYSTAL.

CORNISH *ring*, or *astragal of a gun*, is the small ring near the muzzle.

CORNISH *chough*, in zoology. See CORACIAS.

COR-

CORNIX, in zoology, the name of the *crow*, distinctively from the raven. Naturalists reckon four distinct species of this bird: 1. The common *crow*, sufficiently known in most countries, and feeding on dead carcases, &c. 2. The *rook*, not less known, which loves vegetable food best, but will eat worms, &c. when hungry. 3. The grey *rook*, or Royston *crow*: and, 4. The *cornix cærulea*, or blue *crow* of Gesner, which Mr. Ray suspects to be no other than the *roller*. *Ray*'s Ornithol. p. 83, 84, 85. See ROLLER.

CORNU (*Cycl.*) — CORNU *ammonis*. The only recent shell we have of this kind, is a species of *tubulus marinus*, which is concamerated or divided into several cells within, between all which there runs a siphunculus, or pipe of communication. It is wreathed toward the tail, and is of a very tender structure. It is white, and very glossy. It is found on the shores of the Molucca isles.

CORNUCOPIA, (*Cycl.*) in botany, the name of one of the species of the grass kind, which, in the Linnæan system of botany, makes a distinct genus of plants: the characters of which are, that the cup is a common perianthium of one leaf, very large, and made in the fashion of a funnel, indented at the edge, and obtuse, and somewhat erect, and spread open. The glume has two valves, and contains only one flower: the valves are oblong, obtusely pointed, and equal in size. The flower is composed of a single valve, in figure and situation much resembling the valves of the cup. The stamina are three capillary filaments, and the antheræ are oblong. The germen of the pistillum is of a turbinated form: the styles are two in number, and very slender: the stigmata are fibrose. The flower contains the seed, which is single, of a turbinated form, and convex on one side, and plain on the other. *Linnæi* Gen. Plant. p. 13.

CORNUS, in the Linnæan system of botany, a distinct genus of plants, the characters of which are these: the cup is a common involucrum of many flowers, and is composed of four leaves of an oval figure, of different sizes, coloured, and falling with the flowers, of which it bears the peduncles. The separate perianthia belonging to each flower are small, notched into four segments, situated on the germen of the pistillum, and falling with the flower. The flower consists of four very small petals, oblong and pointed. The stamina are four erect pointed filaments, longer than the perianthium, and the antheræ, which are roundish, lie on them. The germen of the pistillum is roundish, and placed below the calyx: the style is slender, and of the length of the stamina: the stigma is obtuse. The fruit is an umbilicated roundish drupe. The seed is an oblong cordated nut, containing two cells, the kernel being oblong. *Linnæi* Gen. Plant. p. 48.

The *cornus* is what we call the *cornel-tree*. Its characters, according to Tournefort, are these: the flower is of the rosaceous kind, being composed of several petals, disposed in a circular form, the cup of which finally becomes an olive-shap'd fruit, or else a roundish one: these are soft, fleshy, and contain a nucleus, divided into two cells, with kernels.

The species of *cornus* enumerated by Mr. Tournefort, are these: 1. The common male *cornus*, or garden *cornel-tree*. 2. The garden *cornel-tree*, with yellow or wax-coloured fruit. 3. The male or garden *cornel-tree*, with white fruit. 4. The male or garden *cornel*, with a deep red fruit, with a short and hard kernel. 5. The male wild *cornel*. 6. The common wild female *cornus*, called the *dogwood*, or *dogberry-tree*: and, 7. The female *cornus* or *dogwood*, with variegated leaves. *Tourn.* Inst. p. 641.

CORNUTA, in ichthyology, a name given by Gesner and others to the fish called also *lyra*, and *lyra altera* by others. It is of the *trigla* kind, and is distinguished by Artedi by the name of the *trigla*, with many cirri, and with an octagonal body.

CORNUTIA, in botany, the name of a genus of plants, called by Vaillant *agnanthus*. The characters are these: the perianthium is very small, of a roundish figure, and consisting only of one leaf: it is divided into five segments at the end, and remains when the flower is fallen. The flower is composed of one petal, and is of the gaping kind: the tube is cylindric, and much longer than the stamina: the edge is divided into four parts, the upper segment being erect and roundish, the side ones standing distinct from one another, the lower one being roundish and undivided. The stamina are four filaments: the antheræ are simple, and inclined: the germen of the pistil is roundish: the style is very long, and divided into two parts: and the stigmata are very thick. The fruit is a globose berry, adhering to the bottom of the cup, and containing one seed of a kidney-like shape. *Linnæi* Gen. Plant. p. 302. *Plumier* 17. *Vaillant*, A. G. 1722.

CORNUTUS *piscis*, in zoology, a name given by Mr. Ray to the fish commonly called by the Dutch in the East-Indies, where it is very common, *hoorn visch*. It has a horn of a very singular kind in the back part of its head, or beginning of its back, and two others on the belly: these are crooked, and very brittle. They seem much of the nature of the spines, which several fish have placed before their back and belly fins; and it is dangerous to be wounded by them, the wound being generally very difficult of cure, especially if any part of the horn or spine is left in it, which, from the brittleness of those substances, is generally the case. See Tab. of Fishes, N° 66. and *Ray*'s Ichthyogr. App. p. 5.

COROCORO, in zoology, the name of a Brasilian fish, somewhat resembling the coracinus of the Mediterranean. Its back is prominent and crooked, and its nose obtuse; its teeth small, and not sharp: the coverings of its gills are large, and terminate in a very sharp spine. It has six fins, two behind the gills; two others, of a somewhat triangular figure, under the belly; these have before them a very strong and sharp spine; and one behind the anus, with a very thick, strong, and pointed spine, with another very small spine standing just before it. The back fin begins about the middle, and runs a good way down the back: this is supported by prickly rays; and where it terminates, there immediately begins another lower and softer fin, which reaches to the tail. Its scales are considerably large: its back is of a pale browniish white: all the rest of the body of a fine silvery hue, but that the sides have a few transverse pale brown lines. Its belly, and belly fins, are perfectly white; and it has a sinus in the back, in which, at pleasure, it can bury the fins. *Marggrave*'s Hist. Brasil.

CORODIO *habendo*, a writ, whereby to exact a *corody* of an abbey or religious house. See Reg. of Writs, fol. 264.

CORODY, CORRODY, or CORREDY, in law, (*corrodium*, from *corrodo*, also *conredium* & *corredium*) a sum of money, or allowance of meat, drink and cloathing, due to the king from an abbey, or other house of religion, whereof he is the founder, towards the reasonable subsistance of any servant he thinks fit to bestow it on.

The difference between a *corody* and pension is said to be, that a *corody* is allowed towards the maintainance of any of the king's servants in an abbey; but a pension is given to one of the king's chaplains, for his better maintainance, till he may be provided with a benefice. See *Fitzherb.* Nat. Br. fol. 250. who sets down all the *corodies* and pensions certain, that abbeys, when they stood, were bound to perform to the king.

COROLLA, among botanists, is the most conspicuous part of a flower. It expresses the coloured, tender part, which surrounds the organs of generation. The parts it is composed of are called *petals*; if it consist only of one piece, it is called *monopetalous*; if of more, it is said to be *dipetalous*, *tripetalous*; and so on, as it consists of two, three, four, or more parts. See PETAL, &c.

COROLLARY, or CONSECTARY, in mathematics, is used for a consequence drawn from some proposition already advanced or demonstrated: as if from this theorem, *That a triangle, which has two equal sides, has also two equal angles*, this consequence should be drawn, *that a triangle, which hath the three sides equal, has also its three angles equal.* *Ozanam*, Dict. Math. p. 9.

COROLLISTÆ, among the botanical authors, are those who have attempted the establishing the classes and distinctions of plants, on the different form of the corolla, or leafy part of the flower, without paying the due regard to the apices, stamina, and pistillum, the parts of fructification contained within it. Of these are Rivinus, and the great Tournefort. *Linnæi* Fund. Bot. p. 2.

COROLLULA, among botanists, a term used to express those little partial flowers, which together constitute the whole compound ones. They are of two kinds, the tubulated, and ligulated; the former are always furnished with a campanulated limb, divided into four or five segments: the latter, or ligulated *corollulæ*, have a flat linear limb, terminated by a single point, or by a broader extremity, divided into three or five segments.

CORONA, (*Cycl.*) in anatomy, is that edge of the glans of the penis where the preputium begins.

CORONA, among botanists, expresses any thing growing on the head of the seed. The *coronæ* of seeds are of various kinds; sometimes simple, consisting only of a dentated membrane; sometimes pappose, consisting of downy matter, which in some cases is immediately fixed to the seeds; in others it has a pedicle growing from it. Sometimes the *coronæ* are composed of simple filaments, and sometimes they are ramose.

CORONA *æthiopica*, in natural history, the name of a sea shell of the *dolium*, or *concha globosa* kind. See the article DOLIUM.

CORONA *imperialis*, in conchyliology, a name given by authors to a kind of *voluta*, differing from the other shells of that family, by having its head ornamented with a number of points, forming a sort of crown. See VOLUTA.

There are four species of this shell found in the cabinets of the curious: 1. The common kind. 2. The *corona imperialis*, with fewer and smaller fasciæ, or circular lines. 3. The variegated brown kind: and, 4. The marbled kind. This is elegantly stained with black.

CORONA *imperialis*, *crown imperial*, in botany, the name of a genus of plants, the characters of which are these: the flowers are collected into a sort of crown near the top of the stalk, and have over them a large tuft of leaves. The flowers are of the lilliaceous kind, being each composed of six petals. The pistil stands in the center of the flower, and finally becomes an oblong fruit, edged with a sort of membranaceous wings. This is divided into three cells, which contain a large number of seeds, of a flatted shape, lying closely upon one another. To this it is to be added, that the root is

tunicated, and has a number of fibres iſſuing from its baſe.

The ſpecies of *crown imperial* enumerated by Mr. Tournefort, are theſe: 1. The common *crown imperial*. 2. The *crown imperial*, with beautiful red flowers. 3. The *crown imperial*, with pale, faint, yellow flowers. 4. The *crown imperial*, with yellow ſtriated flowers. 5. The *crown imperial*, with plain, deep, yellow flowers. 6. The great *crown imperial*. 7. The late flowering *crown imperial*, with very large leaves, and deep purple flowers. 8. The many flowered *crown imperial*, with a broad flatted ſtalk. 9. The *crown imperial*, with a double circle of flowers. 10. The *crown imperial*, with variegated flowers. 11. The double-flowered *crown imperial*. 12. The *crown imperial*, without ſmell. 13. The branched *crown imperial*: and, 14. The monſtrous *crown imperial* of John Bauhine. *Tourn.* Inſt. p. 372.

CORONA *ſolis*. See SUN-*flower*.

CORONARIA, in botany, the name given by Linnæus to a genus of plants, uſually confounded by other authors under the name of *lychnis*. See LYCHNIS *coronaria*.

CORONATORE *eligendo*, a writ, which, after the death or diſcharge of any *coroner*, is directed to the ſheriff, out of the chancery, to call together the freeholders of the county, for the choice of a new *coroner*, to certify into chancery both the election, and the name of the party elected, and to give him his oath. See Weſtm. 1. c. 10. *Fitzh.* Nat. Br. fol. 163. and Reg of Writs, fol. 177.

CORONEOLA, in botany, a name given by ſome authors to the *lyſimachia*, or purple willow herb, vulgarly called with us codlings and cream. *Ger.* Emac. Ind. 2.

CORONILLA, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the papilionaceous kind, and the piſtil which ariſes from the cup, finally becomes a pod compoſed of many parts joined together by a ſort of articulation, each containing an oblong ſeed.

The ſpecies of *coronilla* enumerated by Mr. Tournefort are theſe: 1. The ſmall *coronilla*, called by ſome the leaſt *colutea*. 2. The *colutea* with a fungous, broom-like ſtalk. 3. The ſea *coronilla*, with blueiſh green leaves. 4. The *coronilla* with thick pods, and large ſeeds. 5. The ſilvery, Cretic *coronilla*. 6. The ſmalleſt *coronilla*. 7. The herbaceous *coronilla*, with variegated flowers. And, 8. The herbaceous *coronilla*, with double, variegated flowers. *Tourn.* Inſt. p. 650.

There have been pieces of amber found, with the pennated leaves of *coronilla* included in them, and as elegantly expanded as the moſt curious botaniſt could have expected it, for preſerving them in his hortus ſiccus. Breynius gives us an account of one of theſe pieces of amber, in which the middle part of one of theſe leaves was thus elegantly preſerved; he examined the ſpecimen with the greateſt accuracy, but could not find the leaſt mark of fraud or deceit in it, and is very particular in the deſcription of the piece, and in the diſpoſition of the leaf in it.

Mercatus in his Metallotheca Vaticana has an entire leaf of the ſame plant figured; but his has got into diſrepute, by being placed among ſome other things which muſt have been fictitious, ſuch as a ſmall fiſh, a water newt, or eft, and a compleat frog. Theſe were certainly let in by art between two pieces of amber which were afterwards nicely cloſed together again; but the figure of the leaf gains credit from the obſervation of Breynius: to this it is to be added, that the *coronilla* is a ſhrub commonly wild in Pruſſia, where amber is produced. Phil. Tranſ. N° 396.

CORONOPUS, *buckſhorn*, in botany, the name of a genus of plants which have flowers and fruits like thoſe of the plantains, but differ from them by having their leaves divided into ſeveral ſegments, whereas thoſe of the plantains are for the moſt part ſmooth at the edge, and never more than lightly notched.

The ſpecies of *coronopus* enumerated by Mr. Tournefort are theſe: 1. The common *buckſhorn* plantain, ſo called from the leaves being ſo divided as to reſemble the horns of that creature. 2. The broad-leaved hairy *coronopus*. 3. The narrow-leaved, deeply-jagged *coronopus*. 4. The ſmalleſt, hairy, ſea *coronopus*. 5. The ſea roſe *coronopus*. *Tourn.* Inſt. p. 128.

CORPUS *Chriſti day*, a feaſt held always on the next thurſday after Trinity ſunday. It was inſtituted in the year 1264, in honour of the bleſſed ſacrament, to which alſo a college in Oxford is dedicated. We find it mentioned in 32 Hen. VIII. c. 21. By which ſtatute Trinity term is appointed for ever to begin the morrow after this feaſt.

CORRECTION, (*Cycl.*) in the manege, is uſed for aids given with ſeverity. See CHASTISEMENTS.

CORRECTION, *correctio*, in rhetoric, the ſame with what is otherwiſe called *epanorthoſis*. See EPANORTHOSIS, *Cycl.*

CORRECTOR (*Cycl.*) — CORRECTOR *of the ſtaple*, an officer, or clerk, belonging to the ſtaple, who makes and records the bargains of merchants there made, anno 27. Edw. III. Stat. 2. c. 22, and 23. The Romans called them *merſarii*.

CORRIDOR, in fortification. See CORIDOR, *Cycl.*

CORRODENTS, *corrodentia*, in medical writers, is applied to ſuch things as eat, conſume, or deſtroy excreſcent fleſh. *Blancard.* in voc.

CORRODY. See the article CORODY.

CORROSIBILITY, } in chemiſtry. See CORROSION, *Cycl.*
CORROSIVENESS, }

CORRUGATOR (*Cycl.*)—CORRUGATORIS *ordo exterior*, in anatomy, a name given by Santorini to certain faſciculi of the great zygomatic muſcle, running under the fleſhy part of the lower lip. See the articles LABIUM *attollens*, and ZYGOMATICUS *major*.

CORRUGATOR *ſupercilii muſculus*, in anatomy, a name given by Albinus, and by Douglaſs, and ſome others, to one of the muſcles of the face, called alſo by Douglaſs the *frontalis verus*, and by Winſlow the *ſuperciliaris*.

CORRUGATORIS *inferior ordo*, in anatomy, a name given by Santorini, and ſome others, to that muſcle of the mouth called by Albinus *orbicularis oris*; by Cowper *conſtrictor labiorum*; and by Douglaſs *ſphincter labiorum*.

CORRUPTICOLÆ, in church hiſtory, heretics who maintained that Chriſt is ſtill corruptible, and ſtands in need of meat, drink, and reſt. See *Hoffm.* Lex. in voc.

CORSOIDES, in natural hiſtory, a name given by ſome authors to a ſpecies of agate of a greyiſh white, full of ſlender veins of a clearer white, reſembling hairs. It is one of the German agates, and ſometimes ſeen among our jewellers, cut into tops of ſnuff boxes, and other toys, but is not much eſteemed.

CORTEX, (*Cycl.*) the *rind* or *bark* of trees. The wounds of the *bark*, and its ſeparations from the wood, whether natural, or experimentally made, are eaſily cured, and made to unite again, by proper care. If ſections be made in the *rinds* of the aſh, and ſycamore, of a ſquare figure, three ſides cut, and the fourth uncut, and the whole be afterwards bound round with a packthread, it will all unite again, only leaving a ſcar in each of the ſides where it was cut. If ſeveral parts of the *bark* of either of theſe trees be cut off, and entirely ſeparated from the tree, ſome ſhallower, leaving a part of the *bark* on, and others deeper, to the wood itſelf; theſe pieces being again put into their places, and bound on with packthread, will not indeed unite, but a freſh *bark* will grow in their places, and thruſt them away; but if they be firſt carefully laid on in the exact direction in which they originally grew, and then the whole part beyond the wound on every ſide covered with a large plaiſter of diachylon, or the like, and this bound over with packthread to keep all firmly in their places, the pieces of *bark*, whether cut off ſhallower, or deep down to the very wood of the tree, will firmly unite themſelves to the places where they originally grew. This cure will be performed in the ſpace of about three weeks, but the outer *rind* of the ſeparated pieces will not be plump, but ſomewhat ſhrivelled; the edges alſo will recede ſomewhat from their original place, ſo that there remains a ſort of ſcar all round. Theſe experiments are beſt made in the ſpring ſeaſon, for in the autumn and winter the ſap ariſing but weakly, the parts that ſhould unite wither before that is brought about. The ſucceſs of theſe experiments has made ſome think, that the whole branch of a tree ſeparated and bound on again, might grow on again; but the experiments that have been made in the moſt favourable manner for ſuch a trial have all proved vain, the branch cut off withering always in a few days, however well united, and carefully kept on. Phil. Tranſ. N° 25. See BARK.

CORTEX *Peruvianus* (*Cycl.*) See PERUVIAN *bark*.

CORTEX *Winteranus* (*Cycl.*) See WINTERANUS *cortex*.

CORTUSA, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe: the cup is a ſmall perianthium, remaining when the flower is fallen, and compoſed of one leaf divided into five obtuſe ſegments, with their ends bent back. The flower conſiſts of one petal, forming a very ſhort tube, with a plain large rim divided into five roundiſh ſegments, at the baſes of which there ſtand five tubercles. The ſtamina are five ſhort obtuſe filaments; the antheræ are compoſed of two lamellæ, and are oblong, erect, and fixed to the outer ſide of the ſtamina; the germen of the piſtillum is of an oval figure; the ſtyle is ſlender, and ſhorter than the ſtamina, and the ſtigma is ſimple; the fruit is an oval, oblong, pointed capſule, furrowed longitudinally on each ſide, containing only one cell, and having two valves with twiſted edges; the ſeeds are numerous, ſmall, oblong, and obtuſe. *Linnæi* Gen. Plant. p. 63.

CORVINA, in zoology, a name by which ſome have called a ſea fiſh of very great beauty, and a delicate taſte, caught on Braſilian ſhores, and more commonly known among authors by its Braſilian name *guatucuſa*. *Willughby*'s Hiſt. Piſc. p. 302. See GUATUCUSA.

CORVINDUM *nella*. See NELLA *corvindum*.

CORVINUS *lapis*, a name given by ſome to the *belemnites*; but by others to a very different body of a whitiſh colour, and oval figure, convex on one ſide, and concave on the other, and in the middle of the concave ſide there ariſes a tubercle: this is ſaid to be taken out of the head of a fiſh; and it is very poſſible that the authors may mean by this no other than our crab's eyes.

CORVIPETA *avis*, in zoology, a name under which Nieremberg has deſcribed a ſmall green bird, not larger than a wren, which, he ſays, drives whole flocks of ravens before it. The whole is ſuppoſed a mere fabulous ſtory. See GUITGUIT.

COR-

CORVO, in zoology, a name by which many call the *umbra*, or *chromis* of authors, a large ſea fiſh, common in the Mediterranean, and, while young, brought to the markets of Italy. *Ray*'s Ichthyogr. p. 300. See the article UMBRA.

CORUS, OMER, HOMER, or CHOMER, in the Jewiſh antiquities, a meaſure containing ten baths, or ſeventy-five gallons, and five pints, as a meaſure of things liquid, and thirty two pecks and one pint, as a meaſure for things dry. The *corus*, or *omer*, was moſt commonly a meaſure for things dry[a], and the greateſt that was uſed among the Jews. It contained, according to the Rabbins, ten ephahs, or thirty ſata or ſeahs. *Corus* is the moſt uſual term in the hiſtorical writers, and *omer* or *chomer* among the prophets[b]. — [[a] *Calmet*, Dict. Bibl. [b] *Arbuthnot*, Tables, &c. p. 100.]

CORUS, is alſo uſed in ſome of our old writers for eight buſhels, or a quarter; *decem* coros *tritici*, *ſive decem quarteria*. *Bracton*, l. 2. c. 16. parag. 7.

CORUSCATIONS (*Cycl.*). — There is a method of producing *artificial coruſcations*, or ſparkling fiery meteors, which will be viſible not only in the dark, but at noon day, and that from two liquors actually cold; the method is this: fifteen grains of the ſolid phoſphorus are to be melted in about a dram of water; when this is cold pour upon it two ounces of oil of vitriol; let theſe be ſhaken together, and they will at firſt heat, and afterwards they will throw up fiery balls in great number, which will adhere like ſo many ſtars to the ſides of the glaſs, and continue burning a conſiderable time; after this, if a ſmall quantity of oil of turpentine be poured in, without ſhaking the vial, the mixture will of itſelf take fire, and burn very furiouſly. The veſſel ſhould be large, and open at the top. Phil. Tranſ. N° 150. See INFLAMMABILITY.

Artificial *coruſcations* may alſo be produced by means of oil of vitriol and iron, in the following manner. Take a glaſs body, capable of holding three quarts; put into this three ounces of oil of vitriol, and twelve ounces of common water; then warming the mixture a little, throw in, at ſeveral times, two ounces or more of clean iron filings; upon this an ebullition, and white vapours will ariſe: then preſent a lighted candle to the mouth of the veſſel, and the vapour will take fire, and afford a bright fulmination, or flaſh like lightning. Applying the candle in this manner ſeveral times, the effect will always be the ſame; and ſometimes the fire will fill the whole body of the glaſs, and even circulate to the bottom of the liquor, and at others it will only reach a little way down its neck. The great caution to be uſed in this experiment is the making the matter of a proper heat; for, if too cold, few vapours will ariſe, and if made too hot, they will aſcend too faſt, and will only take fire in the neck of the glaſs, without any remarkable *coruſcation*. *Shaw*'s Lectures, p. 397.

CORUSCATULA, in natural hiſtory, a name given by Mr. Lhuyd to a ſpecies of foſſile plant of the fern kind, which that gentleman happened to find covered with a ſhining or gloſſy coat. See PLANTS *foſſile*.

CORVUS, (*Cyc.*) the *crow*, or *raven*. In the Linnæan ſyſtem of zoology, this makes a diſtinct genus of birds of the order of the *pica*, the diſtinguiſhing character of which is, that the tail feathers are all of an equal length. Of this genus are the *crow*, raven, jackdaw, &c. *Linnæi* Syſtem. Natur. p. 44.

CORVUS, the *raven*, is particularly uſed for a large bird of the crow kind, well known throughout the world, as being found in all climates, and all regions. The *ravens* build in high trees, or upon the ruins of old lofty buildings; they lay four, five, or ſix eggs, of a blueiſh green, variegated with ſpots and ſtreaks of black. There are many fabulous ſtories of the longævity of the *raven*, but birds are in general long-lived, and the crow kind not leſs ſo than the reſt. *Ray*'s Ornithol. p 82.

CORVUS, in ichthyology, a name given by Paulus Jovius to the *faber*, or *dree*. See FABER.

CORVUS, in antiquity, a machine invented by the Romans at the time of their wars in Sicily, when they firſt engaged the Carthaginian fleet. According to Polybius, the *corvus* was framed after this manner:

On the prow of their ſhips they erected a round piece of timber about 1¼ foot diameter, and 12 feet in length, on the top of which was a block, or pulley; round this piece of timber was a platform of boards 4 feet in length, which was about 18 feet long, and well framed and faſtened with iron; the entrance was longways, and it was moveable round the aforeſaid upright piece of timber, and could alſo be hoiſted up and down within ſix feet of the top: about this frame was a ſort of parapet knee high, which was defended with upright bars of iron, ſharp at the ends, and towards the top there was a ring, by the help of which, and a pulley, or tackle, it was hoiſted and lowered at pleaſure; with this moveable gallery, they boarded the enemies ſhips (when they did not lie ſide by ſide) ſometimes on their bow, and ſometimes in the after part of the ſhip; the ſoldiers keeping the boſs of their bucklers level with the top of the parapet, &c and by the means of this new engine got a victory over the Carthaginians in their firſt ſea-fight with them, though the enemy were long before well ſkilled in naval affairs, and the Romans raw and ignorant.

CORVUS *aquaticus*, in zoology, the name given by authors to the bird commonly known by the name of the *cormorant*. It is of the ſize of a gooſe, and is of a very deep duſky brown on the back, with ſome admixture of a greeniſh gloſs, and white on the belly and breaſt; its long wing feathers are greyiſh; its tail is a hand's breadth and a half long, and when expanded, looks roundiſh at the end; its beak is between three and four fingers breadth long, and is a little hooked at the end; its legs are very ſhort, but very thick and ſtrong, and (which is a very peculiar thing) are flat, or compreſſed, eſpecially while the creature is young; and another ſingularity is, that the baſe of the lower chap is covered by a naked yellow membrane, in the manner of the wild ſwan's beak; its legs are black, and covered with a ſeries of cancellated ſcales; the toes are all joined by one membrane. It builds not only among rocks, but often alſo on trees. Tab. of Birds, N° 9. *Ray*'s Ornithol. p. 248.

CORVUS *aquaticus*, the *water raven*, is alſo a name given by ſome authors to the *acacalotl*, a very beautiful Mexican water bird, of a ſhining, greeniſh, blackiſh, and purpliſh hue. It feeds on fiſh, and is eaten, but is of a coarſe and fiſhy taſte. *Ray*'s Ornithol. p. 219.

CORVUS *aquaticus minor*, in zoology, a name by which Mr. Ray has very properly called a bird common on our northern coaſts, and called there the *ſhagge*, and in ſome places the *crane*, it being a genuine ſpecies of *cormorant*.

CORVUS *cornutus*, in zoology, a name by which ſome have called the Indian raven, with the horned beak, more uſually called the *rhinoceros* bird. See RHINOCEROS *avis*.

CORVUS *fluviatilis*, the *river raven*, a name given by ſome writers to a very remarkable bird of the Philippine iſlands, reſembling the common raven, but being of the amphibious kind. It is called, in the language of the place *caſſili*, or *colocolo*. See COLOCOLO.

CORVUS *indicus*, in zoology, the name of a bird of the raven kind, very common in the Molucca iſlands, very large, and armed with a very ſtrong beak and claws; it does not feed on carrion, as our raven, but eats the nutmegs, and does vaſt damage, in deſtroying that fruit. Its fleſh is very delicate, and has plainly the aromatic flavour of its food. *Ray*'s Ornithol. p. 86.

CORVUS *ſylvaticus*, the *wood raven*, in zoology, the name of a bird deſcribed by Geſner, and ſuppoſed by Mr. Willughby to be no other than the *coracias*, or *pyrrhocorax*; but, if rightly deſcribed, it differs eſſentially from that bird in ſize, and in having a creſt on its head. Geſner ſays, it is of the ſize of the common hen; it appears at a diſtance of a deep black, but, when viewed nearer, and in the ſunſhine, it appears of a fine gloſſy green; its tail is ſhort; its toes very long, and not webbed; and it has a creſt on its head. It feeds on frogs, fiſh, and other ſmall animals, and builds in the ruins of old buildings, and lays two or three eggs. They fly very high; the young ones are accounted a very well taſted food. *Ray*'s Ornithol. p. 366.

CORVUS *piſcis*, the *crow-fiſh*, a river fiſh of the chub kind, common in Italy, and in ſome parts of Germany, and called by Geſner, *capito fluviatilis rapax*, and by the common people *roppe*.

It is a long, thick, and fleſhy fiſh; its back is of a blueiſh brown, and its ſides and belly white, and of a ſilvery gloſs; its ſcales are broad, and very thin and pellucid, and have under them a fine thin pellicle, of a great gloſs, and ſilvery whiteneſs, which is ſeen through the ſcales, and make the fiſh look as if plated over with ſilver; its gills are ſoft like thoſe of the ſalmon, and its fins of a browniſh red. It ſeldom grows to more than ſix or ſeven pound weight; it is an extremely rapacious fiſh, not leſs ſo than the pike, and very frequently chaces its prey ſo hard as to drive them out upon the bank; and, in that caſe, he uſually follows them alſo, and both are frequently taken, ſtranded together. It is caught at all ſeaſons of the year, but never in any great abundance; it is eſteemed a very delicate fiſh. *Geſner* de Piſc. p. 1267.

CORYBANTICA, κορυβαντικα, a feſtival held in Crete, in memory of the *Corybantes*, who educated Jupiter when he was concealed in that iſland, from his father Saturn, who would have devoured him. *Pott.* Arch. l. 2. c. 20. T. 1. p. 409.

CORYCEUM, in antiquity, that part of the gymnaſium, where people undreſſed. It was otherwiſe called *apodyterion*. See APODYTERION.

CORYCUS, among the Greeks, a kind of exerciſe with the hand-ball. See its deſcription in *Hoſm.* Lex. in voc.

CORYDALEPODIUM, in botany, a name given by ſome authors to the *delphinium*, or *larkſpur*. *Ger.* Emac. Ind. 2.

CORYDALIUM, or CORYDALIS, a name uſed by ſome authors for the *fumaria*, or *fumitory*, a red-flowered little plant, improperly called by ſome *mayweed*. *Ger.* Emac. Ind. 2.

CORYLUS. See HAZLE.

CORYMBIUM, in antiquity, an ornament of hair worn by the women. Its form was that of a *corymbus*. See the article CORYMBUS, *Cycl.*

CORYPHA, in botany, a name by which Linnæus calls a genus of plants called *codda panna* in the hortus Malabaricus, the characters of which are theſe: the cup of the flower is the whole compound ſpatha; the flower is divided into three obtuſe, oval ſegments, which ſtand in an expanded form; the ſtamina are ſix pointed filaments, which are longer than the flower, with antheræ growing to them; the germen of the piſtil is roundiſh; the ſtyle is ſubulated and ſhort; the ſtigma ſimple; the fruit is a large unilocular berry, containing a large hard ſeed. *Linnæi* Gen. Pl. p. 514. Hort. Mal. p. 11. Muſ. *Cliffort.* 11.

CORY-

CORYPHÆNÆ, in ichthyology, the name of a genus of fiſhes of the malacopterygious kind, the characters of which are theſe: the branchioſtege membrane contains on each ſide five bones, beſide two others which lie under the bony coverings of the gills, and cannot be ſeen. The fins are ſeven in number, one upon the back, reaching from the top of the head to the tail; the head is very obtuſe at the end, or, as it were, perpendicularly declivious from the vertex to the mouth; the head and body are both ſomewhat compreſſed.

The ſpecies of this genus enumerated by Artedi are theſe: 1. The *coryphæna* with a forked tail. This is the *guaracapema* of the Braſilians; the *hippurus* of moſt authors, and is what we often call the *dolphin*. Its length is ſix or ſeven feet; the pectoral fins have twenty rays each, the ventral have ſix; the rays, or bones in the tail, are eighteen in number, and are oblong. 2. The ſmall *coryphæna*, elegantly variegated, with an acute back. This is the *novacula piſcis*, and *peſce pectine* of authors; the teeth are large and ſtand forward; the tail is broad; the eyes are ſmall, and are ſituated on the top of the head; the anus is nearer the head than the tail; the body is compreſſed, and variouſly coloured. 3 The *coryphæna* with an even tail, and crooked lateral lines. This is the *pompilus* of authors. *Artedi* Gen Piſc. 12.

CORYPHE, in medical writers, is uſed for the crown of the head; as alſo for the interior extremity of the fingers next the nails. *Blanchard.*

CORYZA, (*Cycl*) in medicine, a catarrhal affection, conſiſting in the excretion of a ſerous and viſcous humor, by the noſe and fauces. Some alſo underſtand the ſame thing by the word *gravedo*, making this and the *coryza* ſynonymous terms, but improperly; for the *gravedo* is, ſtrictly ſpeaking, a catarrhal affection, in which there is no actual excretion of a ſerous matter, but only a congeſtion of it with ſtagnation; whence it is eaſy to conceive, that the ſymptoms attending the *gravedo*, when the matter is confined, are worſe than thoſe in the *coryza*, in which it is evacuated. *Junker*'s Conſp. Med.

Signs of a coryza. This diſeaſe is generally preceded by an itching, and by ſneezing; ſometimes by what is called a *gravedo*, a congeſtion of matter without excretion; this is followed by the excretion of a ſerous and viſcous matter by the noſtrils and mouth, and ſometimes by the eyes; the more thin and acrid this matter is, the more ſeverely it affects the part through which it is evacuated, ſo that ſometimes it is attended with a ſenſation of pain, and ſoreneſs in them.

Perſons ſubject to coryzas and gravedines. Theſe diſeaſes are very frequent; and among children, they uſually take their riſe in them from obſtructions of perſpiration, or from ſuppreſſions of urine. Young people, as they grow farther up, are ſubject to them from an abundant quantity of the ſalival matter: and in more advanced years, thoſe people fall into them, in whom nature is not able to relieve herſelf, by a hæmorrhage: and people of phlegmatic habits, and ſleepy diſpoſitions, are moſt ſubject to them.

Cauſes of them. The general cauſes of theſe defluxions, are the ſame with thoſe of hæmorrhages by the noſe, that is, a congeſtion of blood in the head, by means of a diſcharge of which, nature meant to relieve herſelf of a plethora: but in theſe caſes, the blood being very abundant in ſeroſities, theſe being the thinner part, are moſt eaſily thrown out, and ſo paſs off alone, leaving the red part behind. Sometimes alſo theſe diſeaſes are produced by a mere retention of the ſerous and lymphatic juices in and about the glands of theſe parts; but this is much more rarely the caſe. The occaſional or accidental cauſes which bring on theſe congeſtions and ſtagnations, are, the ſuppreſſion of other evacuations, ſuch as habitual and natural diarrhœas, or the evacuations by purging medicines, which perſons had long accuſtomed themſelves to at the ſpring and autumn ſeaſons: the cold and moiſt temperature of the air, or a ſudden chilling of the body in a hot and moiſt place: the leaving off a copious uſe of tobacco, and the abuſe of ſnuff, or other ſternutatory powders. To this is to be added, every thing that impedes natural perſpiration, and ſometimes ſuppreſſions of urine.

Prognoſtics. The ſimple *coryza* and *gravedo* are attended with no great danger, not even when they are of long ſtanding, provided that the conſtitution be ſtrong and healthy in other reſpects. But this is not the caſe in old and weak people; for in theſe, this continual defluxion upon the head too often brings on vertiginous complaints, and ſometimes paralytic, and even apoplectic diſorders, or elſe aſthma's, and ſuffocative catarrhs, are the conſequence: and if this matter, ſo copiouſly ſecreted from the blood, be thrown upon the lungs, it may occaſion exulcerations, and even a true phthiſis.

Method of cure. This is a diſeaſe which few people trouble a phyſician about, being uſually left to nature; but it is, however, in the power of medicine to do great ſervice, and, uſually, wholly to remove the complaint; which, even where it is not attended with danger, is ſo far troubleſome, as that any one would wiſh to be rid of it. In caſes of a *gravedo*, a juſt and neceſſary excretion of the congeſted matter muſt be provided for; and this may eaſily be contrived to be made, by leſs troubleſome evacuations than thoſe to which nature ſeems to point, and by more convenient outlets; and by continuing this method, the future diſtempers of this kind may be anticipated and prevented. For the ready diſcharge of the matter, according to the intent of nature, errhines are to be uſed; the powders of the cephalic herbs, as thyme, betony, lavender, and the like, may be ſnuffed up the noſe, and the volatile pungent ſalts may be ſmelled to: by theſe means the mucid humor, which cauſed the infarction, will be rendered thin, and fitted to diſcharge itſelf. After this, it will be proper to give a gentle purge. And when the cure is perfected, the return may be prevented by bleeding and purging in ſpring and autumn. When the defluxion is very violent, Stahl recommends the uſe of gentle diaphoretics, and of a powder compoſed of cinnabar, and a gentle opiate. In caſes where the matter of a *coryza* is very acrid, and there is a violent pain in the head, the external uſe of camphor is of great ſervice; it is in this caſe to be applied to the temples; and the patient ſhould at the ſame time take internally, powders compoſed of nitre and the common abſorbents, and diaphoretic antimony, and afterwards ſhould take ſome gentle purges, and frequently bathe the feet in warm water. *Junker*'s Conſp. Med. p. 500, 501.

CORYZA, in infants. See the article INFANT.

COSCYLIUM, in natural hiſtory, a name given by ſome of the old writers to the *kermes*, the true nature of which they did not know, but ſuppoſed it to be a ſort of ſcabrous excreſcence, formed of the abundant juices of the tree, and of the nature of the galls on the oak, and other trees.

COSENAGE, in law, a writ that lies where the treſail, that is, the tritavus, the father of the beſail, or great grandfather, being ſeized in fee at his death of certain lands, or tenements, dies; a ſtranger enters, and abates; then ſhall his heir have this writ of *coſenage*; the form of which ſee in *Fitzh.* Nat. Br. fol. 221.

COSENING, in law, an offence whereby any thing is done deceitfully, in, or out of, contracts, which cannot be fitly termed by any eſpecial name. *Weſt.* Symbol. P. 2. Tit. Indictment. Sect. 68. In the civil law it is called *ſtellionatus*. See STELLIONATE, *Cycl.*

COSHERING, in the feudal cuſtoms, a kind of right of the lords to lie, and feaſt themſelves, and their followers, at their tenant's houſes.

We find this term in *Harris*'s lexicon technicum, and in *Jacobs*'s law dictionary, which laſt quotes Spelman of parliaments MSS. for it. The word *coſhering* may perhaps be derived from the old Engliſh *coſhe*, a cot, or cotage. See *Spelm.* Gloſſ. Verb. *coſcez.*

COSMOLOGY, the ſcience of the world in general. This Wolfius calls *general*, or *tranſcendental coſmology*, and has written a treatiſe on the ſubject, wherein he endeavours to explain how the world ariſes from ſimple ſubſtances; and treats of the general principles of the modifications of material things, of the elements of bodies, of the laws of motion, of the perfection of the world, and of the order and courſe of nature. *Wolf.* Coſmologia generalis, Francfort. & Leipſic. 1731. 4°.

COSMOPŒIA. See WORLD.

COSSE and COSSIC, is uſed in old writers for algebra. *Harris.*

COSSE *de geniſte*, an order of knighthood inſtituted by Lewis the IX. at his marriage with Margaret of Provence. *Hofm.* Lex. in voc.

CASSILAGO, in botany, a name given by ſome authors to the poiſonous plant called *henbane*. *Ger.* Emac. Ind. 2.

COSTA *canina*, in botany, a name given by ſome authors to the *plantago quinquenervia*, or narrow-leaved plantain, commonly called *ribwort*. *Ger.* Emac. Ind. 2.

COSTARUM *depreſſores proprii*, in anatomy, a name given by Douglaſs, from Cowper, to what Albinus affirms to be only that part of the internal intercoſtal muſcles which lie neareſt the ribs. See INTERCOSTALS.

COSTARUM *levatores*, a name given by Steno, Morgagni, and others, to the muſcles of the ribs called by Albinus, the *levatores breviores coſtarum*, and by others the *ſupracoſtales*, the *ſur coſtaux* of the French.

COSTIVENESS (*Cycl.*)—See OBSTRUCTIO *alvi*.

COSTIVENESS, in infants. See INFANT.

COSTOHYOIDES, in anatomy, a name given by Santorini to one of the muſcles of the mouth now generally called the *coracohyoidæus*.

COSTRANGULA, in botany, a name uſed by ſome for the *ſcrophularia*, or *figwort*. *Ger.* Emac. Ind. 2.

COSTUS (*Cycl.*) — COSTUS *Arabicus*. Mr. Geoffroy has obſerved that this root ſeems to be a ſpecies of elecampane; and that our common elecampane, when plump, well fed, and carefully dried, after it has been kept a long time, aſſumes exactly the ſmell of the *coſtus*, and wholly differs from the common elecampane roots ſold and uſed in the ſhops. Memoires Acad. Scienc. Par. 1740.

Coſtus Arabicus is an attenuant, diuretic, and ſudorific; it is given in obſtructions of the menſes, and chronic caſes, ariſing from infarctions of the viſcera. Its doſe is from ten grains to half a dram, but is ſeldom preſcribed ſingly.

COSTUS *dulcis*, in the materia medica, the name of a root, which being apt to contract a bitterneſs in growing old, is called in that ſtate, by many authors, bitter *coſtus*, and ſuppoſed a different drug.

It is the root of the *coſtus indicus violæ martis odore*, called by the

the Indians *tſiana cua*. It grows to ſix or ſeven feet high; the leaves are of a lively green, but ſomething paler on the upper ſide than the lower; the flowers are four leaved, white, and ſhaped like a bell; the fruit is three cornered, and divided into three cells, containing a number of triangular ſeeds. The root always contracts a bitterneſs, and grows darker coloured in keeping, though freſh it was pale and ſweet; and hence the ſuppoſed difference, the deſcriptions of authors agreeing alike to each in all but theſe accidents.

The leaves of the common garden *coſtmary*, are ſtomachic and detergent. They are given with ſucceſs againſt crudities of the ſtomach, belchings, and vomittings after meals. They have alſo great reputation for the curing an offenſive breath, heart-burns, and many of the moſt obſtinate and inveterate head-achs, the cauſes of which lie in the ſtomach.

COTATUA, in natural hiſtory, a name given by the people of the Philippine iſlands to a ſpecies of parrot, called alſo *calangay*. It is all over white, and has a creſt of feathers on the head. It is of the bigneſs of a common pigeon.

COTATUA *major* is a very beautiful ſpecies of parrot, common in the woods of the Philippine iſlands. This is of the ſize of a common hen. It is all over white, except that its beak and legs are black; its tongue alſo is black. This is the moſt eaſily taught to talk of any of the parrot kind, and when taught, ſpeaks the moſt diſtinctly of all the kinds.

COTE, a term uſed in courſing, to expreſs the advantage one greyhound has over another, when he runs by the ſide of it, and, putting before it, gives the hare a turn. See the article COURSING.

COTE-*gare*, a kind of refuſe wool, ſo clung or clotted together, that it cannot be pulled aſunder. By 13 Rich II. Stat. 1. c. 9. it is provided, that neither denizen or foreigner make any other refuſe of wools but *cote-gare* and *villein*. So the printed ſtatute has it: but in the parliament roll of that year, it is *cod-land* and *villein*. *Cot*, or *cote*, ſignifies as much as cottage in many places, and was ſo uſed by the Saxons, according to Verſtegan.

COTESWOLD, ſeveral ſheep-cotes, and ſheep feeding on hills. It comes from the Saxon *cote*, i. e. *caſa*, a cottage, and *wold*, a place where there is no wood.

COTICULA, in the natural hiſtory of the antients, the word by which the Romans expreſſed the ἄξων of the Greeks; a ſtone of very great hardneſs, brought from Armenia, and uſed on many occaſions; one of which was, the working on ſuch of the harder ſtones as iron inſtruments would not touch.

Many of the antient Greeks, who had this ſtone from the iſland of Cyprus, called it, from its hardneſs, by the ſame name with the diamond, as they ſometimes did iron alſo; which manner of writing has much miſled thoſe who have copied too careleſsly from them; and even Pliny, who after having in one part of his book given a right account of this ſtone, and called it *cos*, in another gives a different hiſtory of it, miſtaking it for a diamond.

This *coticula* was long in great eſteem with the antient artificers on gems, and ſerved not only to work upon ſuch of the gems as iron could not touch, but was uſed to bore holes thro' ſuch as they ſtrung on threads, and hung in rows in their ornaments of the bracelet kind. And Pliny's account of the other gems being bored with Cyprian diamonds, means no more, than that they were worked with this *coticula*, which was antiently had from the iſland of Cyprus, and afterwards from Armenia, and was called by ſome, in a metaphorical ſenſe, *adamas*, from its great hardneſs. *Hill*'s Theophr. p. 108.

COTICULA is alſo a name given by many to the touch-ſtone; not from its being of the nature of the *coticula* of the Romans, but from its being, for the convenience of carriage and uſe, frequently found in the ſhape of a whetſtone.

COTINUS, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, or compoſed of ſeveral petals, arranged in a circular form. From the cup of the flower there ariſes a piſtil, which finally becomes a fruit: This does not ripen in Europe, but ſeems to be of the unicapſular kind, and is placed on branches, which terminate in villoſe capillaments. *Tourn.* Inſt. p. 610.

The only known ſpecies of the *cotinus*, is the *cotinus coriaria*, or *coccygria*.

COTINUS was alſo uſed by the antients for the olive tree, eſpecially the *olea ſylveſtris*, or wild olive, which is always called *cotinus*, κότινος, by the Greeks. To diſtinguiſh this from the ſhrub uſed in dying, and called by the ſame name, the Latins have added the epithet *coriaria* to this laſt: but as this is often omitted, ſome confuſion has been occaſioned by that omiſſion. The *cotinus* of the Latins, or *cotinus coriaria*, is at preſent called by the Italians *ſcotano*, and is ſuppoſed by ſome to be the ſame with the *ſcythicum lignum*, but improperly. See SCYTHICUM *lignum*.

COTONASTER, in botany, a name given by ſeveral authors to a ſpecies of the *cratægus*, called by Mr. Tournefort the *cratægus*, with oblong ſerrated leaves, green on both ſides. See CRATÆGUS.

COTTON (*Cycl.*) — *Philoſophic* COTTON, a name given by ſome chemical writers to the flowers of zink, from their whiteneſs, and ſilky or cottony appearance.

COTTUS, in ichthyology, the name of a genus of the acanthopterygious fiſhes, the characters of which are theſe: the branchioſtege membrane on each ſide contains ſix very diſtinct bones: the head is broader than the body, and is depreſſed and prickly: there are two fins on the back; the foremoſt has ſeveral flexile prickles in it. The fins of the belly are ſmall, and have only four bones in each, and the ſkin of the whole fiſh is ſmooth, not ſcaly. The ſpecies of this genus are three: 1. The ſmooth *cottus*, with two prickles on the head. This is the little fiſh which we call the *miller's thumb*. 2. The rough *cottus*, with four horn-like prickles in the middle of the head. This is the fiſh called by the Swedes the *hornſimper*. The upper jaw is a little longer than the under one. 3. The ſmooth *cottus*, with ſeveral ſpines on the head, and with the upper jaw longer than the under. This is the *ſcorpio marina* of Schonveld, and the *ſcorpæna* of Bellonius. The head is very prickly, but it has none of thoſe horns in the middle which the former has. 4. The *cottus*, with ſeveral cirri, and with an octangular body. This is the *cataphractus* or *pogge*. 5 The *cottus*, with the ſecond fin of the back white. This ſeems to be the *draunculus marinus* of Rondeletius, and other authors. *Artedi*, Gen. Piſc. 34. See DRACUNCULUS, &c.

COTULA, in botany, the name of a genus of plants, the characters of which are theſe: the flower is in ſome plants radiated, and in others floſculous: the diſk is compoſed of floſcules, and the outer circle, where there is one, of ſemifloſcules. Theſe all ſtand upon the embryo ſeeds, and are all contained in a general ſquammoſe cup. The embryos finally ripen into ſeeds, which are flat, heart-faſhioned, and alated.

The ſpecies of *cotula* enumerated by Mr. Tournefort, are theſe: 1. The yellow flowered, radiated *cotula*, called by many the *cotula* leav'd oxeye. 2. The *cotula*, with yellow naked flowers. 3. The dwarf, procumbent, Portugal *cotula*: and, 4. The African *cotula*, with a beautiful blue cup. *Tourn.* Inſt. p. 495.

COTULA *fœtida*, a name given by ſome to the ſtinking *chamæmile*. See CHAMÆMELUM.

The *cotula fœtida* has all the virtues of caſtor, but in a more remiſs degree. A decoction of it, when carefully dried, is of great uſe in all diſorders of the hyſteric kind. It is alſo uſed externally, by way of fomentation, in pains and tumors. Some alſo uſe the expreſſed juice of the freſh leaves, as a remedy in ſcrophulous caſes. The flowers have much the ſame virtues as thoſe of the common chamæmile.

COTURNIX, in zoology, the *quail*, the leaſt of all the birds of the gallinaceous kind. They have, however, the genius of the cock kind, and may be bred to fight like our game cocks. This was an old cuſtom among the Athenians, and is ſtill kept up in ſome parts of Italy, and in Aſia *Ray*'s Ornithol. p. 122.

COTYLEDON, in botany, a name by which ſome authors call the *umbilicus veneris*, or *navelwort*, a round-leaf'd plant, found on old walls. *Tourn.* Inſt. p. 90. See NAVEL-*wort*.

COTYLISCUS, or COTYLUS, in antiquity, a veſſel with a narrow mouth, a very wide belly, and only one handle. *Pitiſc.* Lex. Ant. in voc.

COTYTTIA, or COTYTTIS, in antiquity, a nocturnal feſtival, in honour of *Cotys*, or *Cotytta*, the goddeſs of wantonneſs. *Pott.* Archæol. Græc. l. 2. c. 20.

COUCH. See WET-*couch*.

COUCH, in heraldry, a term uſed to expreſs the ſhield of a coat of arms, when it does not ſtand erect, but hangs downward. The origin of this poſition of the ſhield ſeems to have been, that the perſons who were to fight in tournaments were compelled, from the time that proclamation was made till the day of fighting, to hang up their ſhields, by one corner, from the windows or balconies of the neighbouring houſes, or on the trees or barriers of the ground, if the exerciſe was performed in the fields. The horſe combatants hung up their ſhields by the left corner, and the foot combatants by the right. Hence the left corner hanging became the moſt honourable; and we ſee, in all the ſons of the royal blood of England and Scotland, that the ſhields with their arms all hang that way. Some writers on heraldry expreſs this diſpoſition by the word *pendant*. *Niſbet*'s Herald. p. 12.

COUCHER, or COURCHER, in our ſtatutes, is uſed for a factor, or one that continues in ſome place or country for traffic; as formerly in Gaſcoign, for the buying of wines. Anno 37 Edw. III. c. 16.

COUCHER is alſo uſed for the general book, in which any religious houſe or corporation regiſter their particular acts. Anno 3 and 4 Edw. VI. c. 10.

COVERTURE (*Cycl.*) — By the law of England, *coverture*, in ſome caſes, will excuſe the woman from the pains of felony, &c. Vid *Hawk.* P. C. l. 1. c. 1. See FEME *covert*.

COUGH (*Cycl.*) — *convulſive* COUGH. The method of cure often followed in this diſeaſe, is by evacuations: but this has been obſerved rather to prevent the diſeaſe from becoming fatal, than to ſhorten it, ſuch *coughs* continuing ſeveral months notwithſtanding. However, a remiſſion for ſome days happens after bleeding and purging, eſpecially when the purgatives work upwards as well as downwards. Pectorals, balſamics and attenuants have been ſometimes found to do little or no good;

good, and opiates rather to do hurt. Medic. Eſſ. Edinb. abridg. vol. 1. p. 70. See TUSSIS.

COUGH, *in infants*. See INFANT.

COVINUS, among the antients, a kind of chariot, in which the Gauls and Britons uſed to fight in battles. See *Hoffm.* Lex. in voc.

COULTER, in huſbandry, that part of a plough which forms the edge, ſtanding before the ſhare of the plough, and cutting the clods as the ſhare tears them up. The *coulter* is an iron inſtrument of two foot eight inches in length, of near two inches breadth, and near one inch thick. It is driven through the beam of the plough, and fixed in its proper direction by a wedge. See PLOUGH.

The modern improvement of the plough by Mr Tull, gives it four *coulters*; the conſequence of which is, that the earth ploughed up is cut four times as ſmall as by the common plough, which has only one.

In all *coulters*, the length and direction are to be nicely regulated. The cutting the hole and driving the wedge, regulate the direction, and its length is altered from the beam by the driving it farther down, as its point wears away. The firſt *coulter* in all ploughs ought to be laid in the beam, in the following manner: Its back is to bear againſt the back of the *coulter* hole, its right ſide above, to bear againſt the upper edge of the *coulter* hole, and its left ſide to bear againſt its lower edge; ſo that there ſhould always be at leaſt three wedges to hold the *coulter*; the pole wedge before it, another on the left ſide of it above, and a third on the right ſide underneath; and the hole muſt be ſo made, that the *coulter* ſtanding thus acroſs the hole, its point may incline ſo much toward the left, as to be about two inches and a half farther to the left than the point of the ſhare, if it were driven down ſo low as it. But it never ought to be ſo low in any plough.

As to its bearing forward, the point of the *coulter* ſhould never be before the middle of the point of the ſhare; but if it be ſet too obliquely, it will in the working, have greater power to move up the pole-wedge and get looſe.

In the four *coultered* plough, the three additional *coulters* muſt all ſtand in the ſame poſition with this, in regard to the inclination of their points one to another. This is a vaſt advantage to them; for by this means, when the fin of the plough is raiſed up, by turning the handles toward the left, their point do not riſe out of the ground as they would do were it not for this inclination. In regard to their pointing forward, experience ſhews, that it is beſt that every one of the three ſhould be a little more perpendicular than that next behind it: by this means there is a greater ſpace left between them above than below, and the roots of weeds can never clog them up as they otherwiſe would do, and by that means raiſe the plough out of the ground, if not picked clean by a man at times.

None of theſe *coulters* ought to deſcend ſo low as the ſhare, except when the land is to be ploughed very ſhallow; it is always ſufficient for them to cut through the turf, let the plough go as deep as it will; in plowing ſhallow, the fin of the ſhare muſt alſo be broad enough to cut off the fourth piece or furrow; elſe that lying very faſt, will be apt to raiſe up the groundwriſt, and throw out the plough; but when the land is ploughed deeper, the groundwriſt will break off this fourth furrow, though the fin be not broad enough to reach it. *Tull*'s Huſbandry.

COULTER-*neb*, or COUNTER-*neb*, in zoology, a name which the people in ſome parts of England call the *anas arctica clusii*. See DUCK.

COUNCIL *and Seſſion*, in Scotland. See SESSIONS.

COUNTER (*Cycl.*)—*Counters* in ſhip building are diſtinguiſhed into upper and lower. The *upper counter* is reckoned from the gallery to the lower part of the ſtreight piece of the ſtern. The *lower counter* is between the tranſom and lower part of the gallery.

COUNTING-*board*. See ABACUS.

COUNTORS, CONTOURS, or COUNTERS, has been uſed for ſerjeants at law, retained to defend a cauſe, or to ſpeak for their client in any court of law. *Horn*'s Mirror, lib. 2. cap. des Loyers.

It is of theſe Chaucer ſpeaks,

——A ſheriff had he been, and a *contour*,
Was no where ſuch a worthy vavalour.

They were antiently called ſerjeant *contours*. *Coke* on *Littl.* fol. 17.

COUNTRIES, among the miners, a term or appellation they give to their works under ground. Phil. Tranſ. No. 198.

COUP *de bride*, in the manege. See EBRILLADE.

COUP *de grace*, in the French muſic, the ſame as what the Italians call *tronco per grazia*. See TRONCO.

COURBARIL, the name of a genus of plants. See HYMENÆA.

COURSES, (*Cycl.*) in the ſea language, is uſed for a ſhip's main ſail and fore ſail. When ſhe ſails under them only, without lacing on any bonnets, they ſay, ſhe goes under *a pair of courſes*.

COURSING. There are three ſeveral *courſes* with greyhounds. 1. At the hare. 2. At the fox, and 3. At the deer.

For the deer there are two ſorts of *courſes*, the one in the paddock, the other either in the foreſt or purlieu. For the paddock *courſe*, there muſt be the greyhound and the terrier, and the mungril greyhound, whoſe buſineſs it is to drive away the deer before the greyhounds are ſlip'd; a brace, or a leaſh, are the uſual number ſlip'd at a time, ſeldom at the utmoſt more than two brace.

In the *courſing* the deer in the foreſt or purlieu, there are two ways in uſe, the one is *courſing* from wood to wood, and the other upon the lawns by the keeper's lodge. In the *courſing* from wood to wood, the way is to throw in ſome young hounds into the wood, to bring out the deer; and if any deer come out that is not weighty, or a deer or antler, which is buck, ſore or ſorrel, then you are not to ſlip your greyhounds, which are held at the end of the wood, where the keepers, who can gueſs very well on theſe occaſions, expect that the deer will come out. If a proper deer come out, and it is ſuſpected that the brace or leaſh of greyhounds ſlip'd after him, will not be able to kill him, it is proper to waylay him with a couple of freſh greyhounds.

The *courſing* upon the lawn is the moſt agreeable of all other ways. When the keeper has notice of this, he will lodge a deer for the courſe, and then by coming under the wind, the greyhound may be brought near enough to be ſlip'd for a fair *courſe*.

The beſt method of *courſing* the hare, is to go out and find a hare ſitting, which is eaſily done in the ſummer, by walking acroſs the lands, either ſtubble, fallow or corn grounds, and caſting the eye up and down; for in ſummer they frequent theſe places for fear of the ticks, which are common in the woods at that ſeaſon; and in autumn, the rains falling from the trees offend them. The reſt of the year there requires more trouble, as the buſhes and thickets muſt be beat to rouſe them, and often they will lie ſo cloſe, that they will not ſtir till the pole almoſt touches them: the ſportſmen are always pleaſed with this, as it promiſes a good *courſe*.

If a hare lies near any cloſe or covert, and with her head that way, it is always to be expected that ſhe will take to that immediately on being put up: all the company are therefore to ride up, and place themſelves between her and the covert before ſhe is put up, that ſhe may take the other way, and run on an open ground. When a hare is put up, it is always proper to give her ground or law, as it is called, that is, to let her run twelve-ſcore yards or thereabouts, before the greyhounds are ſlip'd at her; otherwiſe ſhe is killed too ſoon, and the greater part of the ſport thrown away, and the pleaſure of the ſeveral windings and turnings that the creature will make to get away, is all loſt. A good ſportſman had rather ſee a hare ſave herſelf, after a fair *courſe*, than ſee her murder'd by the greyhounds as ſoon as ſhe's up.

In *courſing* the fox, no other art is required than ſtanding cloſe, and on a clear wind, on the outſide of ſome grove, where it is expected he will come out; and when he is come out, he muſt have head enough allowed him, elſe he will turn back to the covert. The ſloweſt greyhound will be able to overtake him after all the odds of diſtance neceſſary; and the only danger is, the ſpoiling the dog by the fox, which too often happens; for this reaſon, no greyhound of any value ſhould be run at this courſe, but the ſtrong, hard bitten dogs, that will ſeize any thing.

The laws of *courſing* eſtabliſhed by the duke of Norfolk, and the ſportſmen of the kingdom in the reign of queen Elizabeth, are theſe:

1. He that is choſen fewterer, or letter looſe of the dogs, ſhall receive the greyhounds matched to run together into his leaſh, as ſoon as he comes into the field; he is to march next to the harefinder, or him who is to ſtart the hare, until he come to the form; and no horſeman or footman is to go before or ſideways, but all ſtrait behind, for the ſpace of about forty yards. 2. A hare ought never to be *courſed* with more than a brace of greyhounds. 3. The harefinder is to give the hare three ſo-hoes before he puts her up from her form or ſeat, to the end that the dogs may be prepared, and may attend her ſtarting. 4. If there be not a particular danger of loſing the hare, ſhe ſhould have about twelve-ſcore yards law. 5. The dog that gives the firſt turn, if after that there be neither cote, ſlip nor wrench, wins the wager. 6. If one dog gives the firſt turn, and another beats the hare, then he that beats the hare wins the wager. 7. A go-by, or bearing the hare, is accounted equivalent to two turns. 8. If neither dog turn the hare, he that leads laſt to the covert wins. 9. If any dog turns the hare, ſerves himſelf and turns her again, it is as much as a cote, and a cote is eſteemed as much as two turns. 10. If all the *courſe* be equal, he that bears the hare ſhall win, and if he be not born, the *courſe* ſhall then be judged dead. 11. If a dog take fall in his *courſe*, and yet perform his part, he may challenge the advantage of a turn more than he gave. 12. If a dog turn the hare, ſerve himſelf, and give divers cotes, and yet in the end ſhall ſtand ſtill in the field, the other dog, if he turns home to the covert, although he gives no other turn, ſhall be adjudged to win the wager. 13. If by misfortune a dog be rid over in the *courſe*, that *courſe* is to be adjudged void; and he that did the miſchief is to make reparation to the owner. 14. If a dog gives the firſt and laſt turn, and there be no other advantage betwixt them, he that gives the odd turn wins. 15. A cote is, when a greyhound goes end ways by the ſide of his fellow,

and gives the hare a turn. 16. A cote ſerves for two turns, and two trippings or jerkings for a cote; and if the hare turns not quite about, ſhe only wrencheth, in the ſportſman's phraſe. 17. If there be no cotes given by either of the brace of greyhounds, but that one ſerves the other at turning, then he that gives the moſt turns wins the wager; and if the turns are equal in number, then he that bears the hare wins the wager. 18. Sometimes a hare does not turn, but wrenches; for ſhe does not turn, except ſhe turn as it were round. In theſe caſes two wrenches ſtand for one turn. 19. He that comes in firſt to the death of the hare takes her up, and ſaves her from breaking, he cheriſhes the dogs, and cleanſes their mouths from the wool; he is adjudged to have the hare for his pains. 20. Finally, thoſe who are judges of the leaſh muſt give their judgment before they depart out of the field, or elſe it is not to ſtand as valid. Sportſman's Dict. in voc.

COURT (*Cycl.*) — By the law of England, no *court* in this kingdom can claim any juriſdiction, unleſs it be ſome way or other derived from the crown; the king being the fountain of juſtice, and the ſupreme magiſtrate of the kingdom, intruſted with the whole executive power of the land. *Hawk.* Pl. Cr. B. 2. c. 2.

Yet the king cannot give any addition of juriſdiction to an antient *court*; but all ſuch *courts* muſt be held in ſuch manner, and proceed by ſuch Rules, as their known uſage has limited and preſcribed. Whence it follows, for inſtance, that the *court* of King's-Bench cannot be authorized to determine a mere real action between ſubject and ſubject; nor can the court of Common Pleas inquire of treaſon or felony.

The moſt general diviſion of *courts* of law in England, is, into ſuch as are of *record*, or *not of record*.

Courts of record are again divided into ſuch as are *ſupreme*, *ſuperior*, and *inferior*.

Every *court*, by having power given it to fine, and impriſon, is thereby made a *court* of record. 1. *Salkeld*, 200.

Courts of record are created by act of parliament, letters patent, or preſcription. *Coke*, *Litt.* 260. a.

The *ſupreme court* is the *court* of parliament. See PARLIAMENT, *Cycl.*

Superior courts of record are diſtinguiſhed into *more principal*, and *leſs principal*.

The *more principal courts* are the *Houſe of Lords*, the *Court of Chancery*, the *King's-Bench*, *Common Pleas*, and *Exchequer*; and alſo, according to Sir Matthew Hale, the *juſtices itinerant ad communia placita*, and *ad placita foreſtæ*.

The *leſs principal courts of record* are ſuch as are held, 1°. By commiſſions of *goal delivery*, *oyer* and *terminer*, *aſſize*, *niſi prius*, and ſome others. 2°. By cuſtom, or charter; as the *courts* of the counties palatine of *Lancaſter*, *Cheſter*, *Durham*. 3°. By virtue of an act of parliament, and the king's commiſſion; as the *court of ſewers*, *juſtices of the peace*, &c. See *Hale*, Analyſis, p. 36.

Inferior courts of record are *corporation courts*, *courts leet*, and the *ſheriff's torn*.

Every *court* of record is the king's *court*, though the profits may be another's. If the judges of ſuch *courts* err, a writ of error lies. The truth of its records ſhall be tried by the records themſelves, and there can be no averment againſt the truth of the matter recorded. *Coke*, *Litt.* 117. b. 8. *Coke*, 38. b.

Courts not of record, are the *courts baron*, *county courts*, *hundred courts*, and others. *Hale*, Anal. 36.

Theſe *courts* cannot impoſe any fine on an offender, nor award a capias, nor hold plea of debt or treſpaſs, if the debt or damages amount to 40 ſhillings; nor of a treſpaſs done *vi & armis*, though the damage be laid under 40 ſhillings. And their proceedings may be denied and tried by a jury, and a writ of falſe judgment, not of error, lies on their judgments. *Coke Litt.* 117. b. 260. a. 2 Inſt. 311, 312.

The *court* of Chancery proceeding by *ſubpœna*, is not a *court* of record. 1. Rol. abr. 527.

On the ſubject of *courts*, ſee New Abr. of the Law, Tit. *Courts*.

COUSINAGE. See COSENAGE.

COW, *bos*, in zoology. See the article BOS.

The uſe of the *cow* is either for the dairy, or for the breed. The red *cow* is generally ſuppoſed to give the beſt milk, and the black *cow* to bring the beſt calves. The *cow* that gives the milk longeſt is the beſt both for the breed and dairy; and, for the latter uſe, it is moſt convenient that the *cow* ſhould calve in the ſpring. Either in the month of March or April, when a *cow* is near calving, ſhe ſhould be put into good graſs three or four weeks before the time; or if it happen in winter, ſhe is to be fed well with hay. The day and night after ſhe has calved, ſhe ſhould be kept in the houſe, and the water that ſhe drinks ſhould be a little warmed. The next day, at noon, ſhe may be turned out; but ſhe ſhould be taken in at night, for three or four days afterwards, and then ſhe may be left to herſelf. Every night that ſhe is taken in, ſhe ſhould be kept till the cold of the morning is over, and a drink of warm water given her before ſhe goes out.

COWSLIP, *primula veris*, in botany, &c. See the article PRIMULA *veris*.

COXENDIX, in anatomy, the hip. See its bones and muſcles under COXÆ, *Cycl.*

COXSWAIN, on board a ſhip. See COCKSWAIN, *Cycl.*

COYOLCOZQUE, in zoology, the name of an American bird deſcribed by Hernandez and Nieremberg, as a ſpecies of quail, or partridge. Its back is of a mixt white and yellow colour, its breaſt and belly wholly yellow; and its head and neck are ornamented with ſpots of black and white; its eyes are black, and its legs yellow. It is very common in many parts of New Spain, and is a very well taſted bird. *Ray*'s Ornithol. p. 314.

COZCACOAUHTLI, in zoology, the Mexican name of a large bird of the eagle kind, deſcribed by Nieremberg, and called *regina aurarum*, the queen of the winds, from its being able to fly againſt any wind.

CQUILAQUIL, in natural hiſtory, a name given by the people of the Philippine iſlands, to the ſpecies of parrot common with them, and diſtinguiſhed from all the other kinds, by being very large, and all over of a fine green.

CRAB, in zoology. See the article SQUILLA.

The *cancer major*, or common large *crab*-fiſh, has its abode from twenty to forty fathom water. Theſe animals herd together in diſtinct tribes, and have their ſeparate haunts for feeding and breeding, and will not aſſociate with their neighbours. This has been carefully tried, by marking the ſhell of a *crab*, and carrying it to two or three miles diſtance, and there leaving it among the ſame ſpecies: this *crab* has, after this, found its way home, and been caught in its old abode by the ſame fiſhermen.

The fiſhermen find the *crabs* of this ſpecies from the ſize of a cheſnut to twelve pound weight. Nothing, in the hiſtory of this creature is ſo ſingular as its breaking off its own limbs, which it occaſionally does, in the following manner: the creature is able to do this in any poſition, but the moſt advantageous way of making the experiment is to lay it on its back; then, with a pair of iron pincers, break the ſhell, and bruiſe the fleſh of one of the outer joints of a ſmall leg; the wound will bleed, and the creature ſhew ſigns of pain, by moving it about; afterwards it holds it quite ſtill, in a direct and natural poſition, without touching any part of its body, or other legs with it; then, on a ſudden, with a gentle crack, the wounded part of the leg drops off, at the internodium of the ſecond joint, from the body. If a hole be pierced in the great claws, or legs, and an iron put in to lacerate the muſcle, the effect is the ſame, and this large limb is thrown off in the ſame manner, only with more violence.

When the leg is off, a mucus overſpreads the wound, and ſtops the bleeding; and a ſmall leg is, by degrees, produced, which afterwards attains to the ſize of the former. Nature ſeems to have given this ſingular power to this creature for the preſervation of its life, in the mutual quarrels it very frequently has with others of its own ſpecies: in theſe, one *crab* lays hold of the claws of another, and cruſhes it in ſuch a manner, that it would bleed to death had it not this power of giving up the limb, and healing the wound. Phil. Tranſ. N° 478. S. 14.

CRAB, or GIN, in mechanics, an engine uſed for mounting guns on their carriages. It is made of three pieces of oak, aſh, or other ſtrong wood, of about 14 feet long, two of which are joined by tranſomes; ſo that they are wide aſunder at bottom, and join at top, on a ſtrong piece of wood, crooking forwards, called the head, in which are three braſs pullies. Over theſe comes a rope called the *gin-rope*, which likewiſe goes through other pullies in a block, and returns through the head, down the back of the *gin*, and then goes round a windlace. The third piece of the *crab* is round; one end of it goes into the head, and the other ſtands on the ground; ſo that all three make a triangle called the *pye*. When a gun is to be mounted, a ſtrong rope is tied through the block and the trunnions; and then, the windlace being turned round, the gun is lifted up, and placed in her carriage with eaſe. *Guillet.*

The *crab* is uſed alſo to launch ſhips, or heave them into the dock, or off the key. *Manwayring.*

CRAB's *claws*, or CRAB's *eyes*, *chelæ cancrorum*, in the materia medica, the tips of the common *crab* broken off at the verge of the black part; ſo much of the extremity of the claws only being uſed in medicine, as is tinged with this colour. The blackneſs, however, is only ſuperficial; they are of a greyiſh white within, and, when levigated, furniſh a tolerably white powder: this is of the number of the alkaline, abſorbent powders, but ſuperior to moſt of them. It makes the baſis of the famous *Gaſcoign* powder, the *lapis contrayerva*, and many other of the compound, ſudorific powders, and is ſometimes, though rarely, preſcribed ſingly.

It is the common opinion, that theſe *crab's eyes* act as mere abſorbents in the primæ viæ, and extend their efficacy no farther than thoſe paſſages. The French memoirs, however, give us an account of their certainly paſſing into the blood, in this remarkable caſe. A woman who complained of acid humors in her ſtomach, was preſcribed a draught with ſome *crab's eyes* in it, when, to the great ſurprize of the phyſician, her head, face, and breaſt were the next day found vaſtly ſwelled and inflamed. He ſuſpected there might have been ſome miſchievous mixture with the medicine, or that the *crab's eyes* might have been powdered in a braſs mortar, and taken ſome tincture of the metal; but on repeating the doſe, with other *crab's eyes*, the ſame ſymptoms were produced; and perhaps would never have been underſtood, had not the patient heard the word *crab's eyes* mentioned, and told them that the ſame accident always happened to her on eating *crabs*, or cray-fiſh; and that even a ſon of hers

was always affected in the ſame manner on eating either. Mem. Acad. Par. 1709.

CRACKER, in zoology, the name of a freſhwater fowl, of the duck kind, known by authors under the title of *anas caudacuta*, and *coda lancea*, and called in ſome parts of England the *ſea pheaſant*. It is of the ſize of the common wigeon; its head is all over of a ferrugineous brown, but behind the ears there is a ſlight tinge of purple; its neck is ſomewhat longer than in the wigeon, and its beak of a blueiſh black; its head is ſmall, and there is a white ſtreak on each ſide of it, which reaches down to the throat; the throat is grey, variegated with tranſverſe lines, as is alſo the back, but the ſhoulder feathers are, in a great meaſure, black. The tail is grey, with a mixture of white about the edges of the feathers, and is of a very different ſhape from that of all the other ſpecies of the duck kind, having two feathers much longer than the reſt, and running out into narrow points, whence the fowl has the name of the *ſea pheaſant*. The female differs much in colour from the male, and much reſembles the common tame duck; ſhe has the ſame long feathers, however, in the tail. *Ray*'s Ornithol. p. 289.

CRACKS, in timber. To remedy *cracks*. See CLEFTS.

CRADLE, in ſhip-building, a frame of timber raiſed along the outſide of a ſhip, by the bildge, for the more commodious and ſecure launching of the veſſel. The *cradle* is much uſed in Italy, Spain, and Turky, where they alſo trim great ſhips in the *cradle*.

CRAMA, in metallurgy, a name given by the antients to braſs, made by the mixture of copper and the lapis calaminaris, as at this time. They had alſo a kind of white braſs, or mixt metal, made of copper, in uſe among them, which they eſteemed much above the yellow. We find mention of this in Virgil, under the name of *album orichalcum*, and the other old writers often call it *album crama*. We know of many ways of turning copper white: arſenic and many other minerals will do it; and the ſpoons, and other utenſils, which ſome years ago uſed to be made of a mixt metal, called alchymy metal, were a ſort of white braſs. But it does not appear, that any of our methods have been the ſame with that of the antients: the copper is rendered more brittle, and in ſome ſort debaſed, in all our compoſitions of this kind; but in thoſe of the antients, it ſeems to have been rendered more ductile than at firſt.

CRAMA, CROMA, and CHRAMA, in medical writers, are uſed to ſignify a mixture of things, whether medicines or elements. *Blancard.*

CRAMASPARAGUS. See ASPARAGUS.

CRAMBE, *wild-ſea cabbages*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of four leaves, and is of the cruciform kind: the piſtil ariſes from the cup, and finally becomes an unicapſular fruit, containing one oblong ſeed. See Tab. 1. of Botany, Claſs 5. The ſpecies of *crambe* enumerated by Mr. Tournefort, are theſe: 1. The cabbage-leav'd ſea *crambe*, called *ſea cale*, and *ſea cabbage*. 2. The broad rocket-leav'd ſea *crambe*, with a fruit of the ſhape of a ſpear point. This is uſually eſteemed a ſpecies of rocket: and, 3. The narrower-leav'd, rocket-like ſea *crambe*, with ſpear-pointed ſeed veſſels. *Tourn.* Inſt. p. 211.

CRAMP *fiſh*, or NUMB *fiſh*, in ichthyology, the Engliſh name of the *torpedo*. See RAJA and TORPEDO.

CRAMPER, in zoology, a name given by ſome to the *brama ſaxatilis*, or *Pagrus indicus*, a large and broad ſea fiſh, caught among the rocks on the ſhores of many parts of the Eaſt-Indies. *Ray*'s Ichthyogr. Append. p. 1. See the article BRAMA *ſaxatilis*.

CRANE (*Cycl.*) — CRANE, in zoology, a name improperly given in many parts of England to the ſhagg or ſmall cormorant, a bird common about our ſhores.

CRANE, in zoology. See GRUS.

CRANE's *bill*, a kind of forceps uſed by ſurgeons, and ſo named from its figure.

CRANE's *bill*, in botany, &c. See GERANIUM.

CRANE-*fly*, a name given by ſome to the creature we commonly call father long-legs, and the authors of hiſtories of inſects, *tipula terreſtris*. This creature affords the microſcopic obſerver many curious particulars; but the moſt remarkable is, the ſurpriſing contraction of the muſcular fibres in the legs. Theſe being diſſected in a drop of water, and placed before the microſcope, the fleſhy fibres contract and diſtend themſelves in a manner not to be imagined, and continue this motion for ſeveral minutes; and this is conſtantly to be obſerved in this inſect, and never in any other, ſo far as has been yet obſerved. *Lewenhoek*, Arcan. Nat. T. 3. p. 109.

The inteſtines of this creature are alſo very wonderful, conſiſting of numberleſs veſſels and organs, which may be ſeen as plainly by the microſcope, as the bowels of larger animals can by the naked eye. The tails both of the male and female are alſo of an amazing ſtructure; the female's ends in a ſharp point, with which ſhe perforates the ground, and depoſites her eggs under the graſs in meadows. *Baker*'s Microſcope, p. 290.

It is alſo called *macropedium*, and by ſome *pedo*.

CRANIOLARIA, in botany, the name of a genus of plants, called by Houſton, the firſt obſerver, *martyniæ ſpecies*, but improperly. The characters are theſe: the perianthium is compoſed of four ſhort and ſlender leaves, which ſtand wide expanded, and remain after the flower is fallen. The ſpatha is large, inflated, and of an oval figure, and is open on one ſide all the way along. The flower conſiſts of one irregular petal: the tube is extremely long and ſlender: the limb is plane, and bilabiated: the upper lip is roundiſh, and cut into ſome ſegments, of which the middle one is the largeſt: the lower lip is trifid: the ſegments are all round, and the middle one much larger than the reſt. The ſtamina are four filaments, two of which are ſomewhat ſhorter than the others; but all nearly of the length of the tube of the flower. The antheræ are ſimple: the germen of the piſtil is oval: the ſtyle is ſlender, and of the length of the tube of the flower. The ſtigma is thick and obtuſe. The fruit is a bivalve capſule, of an oval figure, pointed at each end, and of a coriaceous texture; and within this is contained a woody nut, of a depreſſed figure, pointed at each end, and furrowed on the ſurface; ſo that it in ſome degree reſembles the ſkull of ſome quadruped. *Linnæi* Gen. Plant. p. 292.

CRANIUM, in natural hiſtory, the name of a ſpecies of the *echinus marinus*, of the genus of the *briſſoides*. *Klein*'s Echin. p. 36. See BRISSOIDES.

CRANIUM, the ſkull. See SKULL.

CRANNY, in the glaſs trade, a round iron, whereon the workmen in the glaſs-houſes roll the glaſs, to make the neck of it ſmall. *Neri*'s Art. of Glaſs, Append.

CRASSIROSTRÆ, in zoology, the name of a genus of ſmall birds, diſtinguiſhed by the thickneſs of their beaks, as the ſparrow, greenfinch, and the like. *Ray*'s Ornithol. p. 148.

CRATÆGUS, in botany, the name of a genus of trees, the characters of which are theſe: the flower is the ſame with that of the pear; but the fruit differs from the pear both in ſize and ſhape, being more properly called a berry than a large fruit, and containing a number of callous ſeeds, lodged in certain cells within it.

The ſpecies of *cratægus* enumerated by Mr. Tournefort, are theſe: 1. The *cratægus*, with roundiſh ſerrated leaves, hoary underneath. 2. The *cratægus*, with oblong ſerrated leaves, green on both ſides. 3 The arbutus-leav'd Virginian *cratægus:* and, 4. The jagged-leav'd *cratægus*, called the parſley-leav'd medlar, and the *ſorbus torminalis*. *Tourn.* Inſt. p. 633.

CRATERITES, in natural hiſtory, the name of a gem mentioned by Pliny, and ſaid to be extremely hard, and of a middle colour between that of the chryſolite, and of the common yellow amber. This was plainly a ſpecies of chryſolite.

CRATEVA, in botany, the name of a genus of plants, the characters of which are theſe: the perianthium conſiſts of one leaf, divided into four ſegments at the edge: theſe are of an oval figure, and ſtand expanded, and the baſe of the cup is plane. The flower is compoſed of four petals, of an oval figure, all bending upwards in the ſame direction, and having ungues of the length of the cup. The ſtamina are ſixteen ſetaceous filaments, ſhorter than the flower, and ranged on that ſide oppoſite to the petals. The antheræ are erect and oblong: the ſtyle is very long and crooked: and the germen, which is of an oval figure, ſtands upon this. The ſtigma has no pedicle, and is of the capitate kind. The fruit is a very large, globoſe, fleſhy berry, ſtanding upon the ſtyle, which grows thick, in order to become a proper pedicle for it. The ſeeds are numerous, round, and emarginated, and are contained in one cell. *Linnæi* Gen. Plant p. 231. *Plumier*, Gen. 21.

CRATICULA, a chemical inſtrument, made of ſquare pieces of iron of about a finger's thickneſs, placed ſo as to have half a finger's ſpace betwixt them. It is uſed in making of fires to keep up the coals. *Blancard.*

The word is Latin, importing a roaſter or gridiron. *Ainſworth.*

CRAVANT, in zoology, a name by which Bellonius and ſome others have called the *bernacle*, a ſmall ſpecies of wild gooſe, common in winter on the coaſts of Lancaſhire, and idly ſuppoſed to breed out of ſhells. *Ray's* Ornithol. p. 274. See the article BERNICLA.

CRAX, in the Linnæan ſyſtem of zoology, the name of a diſtinct genus of birds, the diſtinguiſhing character of which, from the reſt of the gallinæ is, that the feet have each four toes, and the head is ornamented with a kind of feathery crown, bending backwards. *Linnæi* Syſt. Nat. p. 47.

CRAY *fiſhes*. The delicate flavour of theſe fiſh ſeems to be in a great meaſure owing to their food. When they have well-taſted food, their fleſh preſerves the reliſh of it: but when they feed on other things, they are often rendered of no value, by the flavour communicated to their fleſh by them. There are great quantities of theſe fiſh in the river Obra, on the borders of Sileſia; but the people find them ſcarce eatable, becauſe of a bitter aromatic flavour, very diſagreeable in food. It has been ſince obſerved, that the calamus aromaticus grows in vaſt abundance on the banks of that river, and that theſe creatures feed very greedily upon its roots. Theſe have a very remarkable bitterneſs mixed with their aromatic flavour, while freſh, which goes off very much in the drying; and on comparing the taſte of theſe roots with that of the *cray-fiſh*, there remains no doubt of the one being owing to the other. Act. Leipſ. 1690.

In Swiſſerland, there are ſome *cray-fiſh* which are red, while they are alive, and others blueiſh. Some kinds of them alſo will never become red, even by boiling, but continue blackiſh.

CRAYER, a kind of ſmall ſea veſſel or ſhip. It is mentioned in the Stat. 14 Car. II. c. 27. and in old records, *Et tranſitus craerarum & batellorum cum victualibus & aliis neceſſariis, &c.* Parl. 6. Ric. II. Par. 2. M. 13.

CREENGLES, in a ſhip, are ſmall ropes ſpliced into the bolt-ropes of the ſails of the main-maſt and fore-maſt, into which the bowling bridles are made faſt; and are alſo to hold by when a bonnet is ſhaken off. *Manwayring.*

Harris, in his lexicon technicum, has the ſame deſcription under *Crenyles*, and the gentleman's dictionary under *Crencles*.

CREMATION is ſometimes uſed for burning, particularly when applied to the antient cuſtom of burning the dead. This cuſtom is well known to have prevailed among moſt eaſtern nations, and continued with their deſcendants after they had peopled the different parts of Europe. Hence we find it prevailing in Greece, Italy, Gaul, Britain, Germany, Sweden, Norway and Denmark, till chriſtianity aboliſhed it. Phil. Tranſ. N° 458. Sect. 3.

In Pruſſia we are told, that the deceaſed's beſt cloaths, arms, horſes, hunting dogs, and whatever was moſt agreeable to him in his life time, were thrown on the funeral pile. It was likewiſe cuſtomary to throw in his braſs rings, and bracelets, eſpecially if he had been a chriſtian. From whence it ſeems, that the chriſtian religion did not immediately aboliſh the cuſtom of *cremation*. See *Hartknoch* diſſ. 13. de funerib. veter. Pruſſ. p. 193. Phil. Tranſ. N° 457. Sect. 3. where we have an account and draught of ſome of theſe funeral remains of the antient Pruſſians.

CRENOPHYLAX, κρηνοφυλαξ. The *Crenophylaces* at Athens were magiſtrates who had the inſpection and management of fountains under their care. *Pott.* l. 1. c. 15. T. 1. p. 84.

CRENATED *leaf*, among botaniſts. See LEAF.

CREPIDÆ, among the Romans, a kind of ſlippers or ſhoes, which were always worn with the *pallium*, as the *calcei* were with the *toga*. See *Hofm.* Lex. in voc.

CREPIS, in botany, the name of a genus of plants, the characters of which are theſe. The common cup is double, the exterior is very ſhort, wide, open, and deciduous; the interior is of an oval figure, and is ſimple, ſulcated, and permanent. The ſquammæ are very narrow, and meet at the points. The flower is of the compound kind, and is imbricated. It is of an uniform ſtructure, being compoſed of ſeveral hermaphrodite little flowers, all of equal ſize; each of theſe is compoſed only of one leaf, and is ligulated, truncated and narrow, and divided at the extremity into five ſegments. The ſtamina are five very ſhort and capillary filaments. The antheræ are of a cylindric figure, and tubular. The germen of the piſtil ſtands below the flower; the ſtyle is capillary, and of the length of the ſtamina; and the ſtigmata are two in number, and are reflex; the cup ſerves in the place of the fruit, and is of a roundiſh figure; the ſeeds are ſingle and oblong, and have each a long and plumous piece of down; the receptacle is naked. This genus of plants is called by Vaillant, *Hieracnioides*. *Linnæi* Gen. Pl. 376.

CREPUNDIA, in antiquity, tokens left with expoſed children, by which they might be afterwards known. Theſe were of conſiderable value, if the child happened to be nobly born, in order to defray part of the expence of its education.

CREPUNDIA was alſo uſed in a leſs proper ſenſe, for the ſwadling cloths in which children were expoſed; becauſe by them they might be known again. See EXPOSING *of Children.*

CRESCENTIA, in botany, the name given by Linnæus to a genus of plants, called by Plumier, who firſt deſcribed them, *cujete*. The characters are theſe: the cup is a ſhort deciduous one-leaved perianthium, divided into two erect, concave, obtuſe ſegments. The flower is monopetalous and unequal. The tube is crooked and gibbous. The limb is erect, and divided into five ſegments, which are equal in ſize, and placed in an expanded poſture. The ſtamina are four ſubulated filaments, nearly of the length of the former; two of theſe, are ſomewhat longer than the others, and they ſtand in a ſpreading poſture. The antheræ are obtuſe and incumbent. The germen of this piſtil is flatted and oval, the ſtyle is long and ſlender, and the ſtigma is headed. The fruit is a hard, oval berry, with one cell, and the ſeeds are numerous and cordated, and are bilocular. *Linnæi* Gen. Pl. p. 297. *Plumier*, 16.

CRESSES, in botany. See NASTURTIUM.

Indian CRESS. The ſeveral kinds of this plant are eaſily propagated, by ſowing their ſeeds in March or April, in a good ſoil, and warm ſituation, and ſhould be planted near a hedge or wall, being great climbers, and their lying on the ground being ſubject to rot them. They flower in June, and continue flowering till October, when the froſts ſoon deſtroy the whole plant

The double flowered kind produces no ſeeds, and muſt therefore be propagated by planting cuttings of it. This may be done in any of the ſummer months; but the plants muſt be carefully preſerved in winter, being very ſubject to rot. If this be confined in pots, and thoſe filled with a poor ſoil, it will ramble leſs in the branches, and will produce more flowers. The flowers of this kind, though very beautiful, are not near ly ſo well taſted in ſallads as thoſe of the ſingle kind, which are very warm, and agreeable. *Miller*, Gard. Dict.

CRETA, *Chalk*, in natural hiſtory. See CHALK, *Cycl.* and *Suppl.*

CRETIO, in antiquity, a certain number of days allowed the heir to conſider, whether he would act as heir to the deceaſed, or not; after which time, if he did not act, he was excluded from the eſtate. *Pitiſc.* Lex. Ant.

CREX, in zoology, the name of a bird, common about the Nile, and remarkable for the noiſe which it makes, which is no other than *crex, crex*, whence it has its name. It beak is moderately long and black, as are alſo its head and its legs; its neck, back and breaſt, are white, but the back a little greyiſh; the wings are black, variegated with white. It feeds on inſects, and generally makes a very loud noiſe all the time it is on the wing. *Bellonius* de avibus.

CRIB, in the Engliſh ſalt works, the name given to a ſort of caſe uſed in ſome places inſtead of the *drab*, to put the ſalt into as it is taken out of the boiling pan.

Theſe *cribs* are like hay-racks, wide at the top, and tapering to a narrow bottom, with wooden ribs on each ſide, placed ſo cloſe, that the ſalt cannot eaſily fall through them. Through theſe apertures, however, the ſuperfluous ſaline liquor drains out, and leaves the ſalt, after a few days, dry enough to be added to the heaps that ſtand ready for ſale. At Limington, and in ſome other places, they uſe, inſtead of theſe *cribs*, a ſort of wooden troughs with holes in the bottom, through which the ſaline liquor drains from the ſalt, and falls into veſſels placed underneath to receive it; and in other places they uſe barrows or wicker baſkets, out of which the liquor runs with great eaſe on all ſides at once. See DRABS.

CRIBRUM *benedictum antiquorum*. The antients fancied two cavities placed lengthwiſe in the reins: the upper cavity into which the ſerous blood was poured from the emulgent arteries: the lower, which they thought was diſtinguiſhed with a certain tranſverſe membrane, full of little holes like a ſieve. Hence they called it *colatorium*, a ſtrainer; and *benedictum cribrum*, a bleſſed ſieve, through which they would have the ſerum percolated into the ureters, and the good blood ſtay behind, for the nouriſhment of the reins. *Blancard.*

CRIC, in mechanics. See JACK.

CRICELASIA, κρικηλασια, among the Greeks, the exerciſe of rolling the circle or trochus. See TROCHUS.

CRICKET, in zoology. See GRYLLUS.

Mole CRICKET. See GRYLLOTALPA.

CRICETUS, in zoology, the name of an animal of the mouſe kind. Its ſize is between that of a common rat and a rabbit. See the article MUS.

Its legs are very ſhort; its back is of the colour of a hare's; its ſides have more redneſs; and its belly is black; each ſide is variegated alſo with three large white ſpots; the head and neck are of the ſame colour with the back, the temples are rediſh, and the throat is white; the tail is a hand's breadth long, and of the colour of the back. The hairs of this creature are ſo firmly rooted in the ſkin, that they can by no means be pulled out, but ſooner tear away the ſkin with them; and for this reaſon, as well as for the variety of colour, the ſkins are much valued. It is a very bold and deſperate creature; and if a man a horſeback moleſt it, will fly up at the noſe of the horſe, and hold him very faſt. It lives in holes in the earth, as the rabbit, and heaps up large quantities of vegetable fruits and corn for its ſtore, and is uſually found very fat. It is very apt to ſit on its buttocks, and in that poſture looks like a little bear, whence ſome have called it *arctomys ſalæſtinorum*. It has two large teeth in the front of each jaw, and it uſes its fore feet by way of hands, like the ſquirrel. *Ray's* Syn. Quad. p. 221.

CRIMNOIDES, or CRIMOIDES, in medical writers is uſed for urine with thick ſediments at the bottom, like bran. *Blancard.*

CRINONES (*Cycl.*) — The common way of getting out theſe worms is by the point of a needle; and to prevent their forming there again, the uſual cuſtom is to waſh the parts with wine or vinegar, with alum, nitre, or common ſalt, or with a ſtrong lixivium of oak aſhes, and afterwards anointing them with an ointment of the common kind, uſed for ſcorbutic eruptions, with a ſmall mixture of quick-ſilver.

CRINONIA, a kind of cap, worn by the emperors of Conſtantinople on ſolemn occaſions. *Hoff.* Lex. in voc.

CRISIS (*Cycl.*) — Dr. Albertinus obſerves, that all feveriſh, nay, almoſt all diſeaſes are followed by *criſes*, and that particularly after intermitting fevers are ſtopped by the bark, critical evacuations are to be expected. If they do not come timely, the patient is in danger of ſome other diſeaſe, eſpecially if any uſual evacuation has been hindered; in which caſe it is dangerous to give the bark, unleſs we promote a ſuitable excretion, if a *criſis* does not ſoon come. Med. Eſſ. Edinb. Dr. Martine defends the antients in the rules they have laid down concerning the periods and *criſes* of diſeaſes, endeavouring to prove that they are founded on accurate obſervations.

CRISP *leaf*, *criſpum folium*, among botaniſts See LEAF.

CRISTA (*Cycl.*) — CRISTA *galli*, in conchyliology, the name of a peculiar ſpecies of oiſter, called alſo by ſome *auris porci*, or the hog's ear-ſhell. See OSTREA.

CRISTA *pavonis*, in botany, a name by which ſome authors have

called the *poinciana*. See the article POINCIANA.

CRISTA *pavonis* is alſo a name given to the tree, the wood of which is uſually denominated *logwood*. See LOGWOOD.

CRITHE, in medicine, a ſmall tubercle, hard, red, and immoveable, ſeated upon the eyelid, above the cilia, or range of hairs. It is always included in a kind of cyſt, and by inflammation degenerates into a thickiſh matter, from whence frequently proceed intenſe pains, and various diſorders of the ſight. It is ſometimes ſeated immediately under the ſkin of the eyelid; ſometimes it is within, under the muſcle. When this tubercle is moveable, it is generally called *chalazium*, or in Engliſh *ſtye*, or *ſtithe*. *Heiſter*'s Surgery, p. 365.

CRITHMUM, *ſamphire*, in botany, the name of a genus of plants, the characters of which are theſe: the flowers ſtand in umbels, and are of the roſaceous kind, being compoſed of ſeveral leaves, diſpoſed in a circular form, upon a cup, which afterwards becomes a fruit compoſed of two flat, and lightly ſtriated ſeeds, which uſually throw off their covering. To this it is to be added, that the leaves are fleſhy, narrow, and divided into three parts *Tourn.* Inſt. p. 916.

The ſpecies of *crithmum* enumerated by Mr. Tournefort, are theſe: 1. The greater *crithmum*, or ſea fennel, with the ſmell of parſley. 2. The leſſer *crithmum*, or ſea fennel.

The ſeeds of the common *ſamphire* are carminative and aperient: they are uſed by the people about the ſea coaſts, where the plant is common, in the colic, and in caſes of the gravel, or ſtones in the kidneys. The whole plant is alſo diuretic; it is good againſt obſtructions of the viſcera, and to create an appetite.

CRITHOMANTIA, Κριθομαντεια, in antiquity, a ſpecies of divination, by which predictions were made from the flower with which the victim was beſprinkled. *Pott.* Archæol. Græc. l. 2. c. 14. T. 1. p 319.

CRIZZELLING, in the glaſs trade, a kind of roughneſs ariſing on the ſurface of ſome kinds of glaſs. This was the fault of a peculiar ſort of glaſs made in Oxfordſhire, and ſome other places, of black flints, a cryſtallized ſand, and a large quantity of nitre, tartar, and borax. The glaſs thus made is very beautiful, but, from the too great quantities of the ſalts in the mixture, is ſubject to *crizzel*; that is, the ſalts in the mixture, from their too great proportion, are ſubject, either from the adventitious nitre of the air from without, or from warm liquors put in them, to be either increaſed in quantity, or diſſolved, and thereby induce a ſcabrities, or roughneſs, irrecoverably clouding the tranſparence of the glaſs. This is what was called *crizzeling*; but by uſing an Italian white pebble, and abating the proportions of the ſalts, the manufacture is now carried on with advantage, and the glaſs made with theſe ſalts is whiter than the fineſt Venetian, and is ſubject to no faults. *Plot*'s Oxfordſhire, 258.

CROCALLIS, in natural hiſtory, the name given by the antients to a ſtone famous for its virtues againſt poiſons, and venomous bites. All the deſcription Pliny gives of it, is, that it was of the ſize and ſhape of a cherry.

CROCARDS, an old name given by the Iriſh to a certain kind of foreign money brought over into that kingdom from France, and other parts beyond the ſeas, and uttered there for pennies, though not really worth ſo much as a halfpenny. They were a ſmall ſort of coin, made of a mixture of copper, ſulphur, and a ſmall quantity of ſilver, and were called by ſeveral other names, as *mitres*, *lionines*, *roſaries*, and the like, from the figures they were impreſſed with. They went current in Ireland, and in ſome parts of England a great many years; but were afterwards denied, and prohibited importation, both in England and Ireland, under the penalty of the forfeiture of life and effects. At this time, mints were ſet up in Dublin, for the coining of good money, and, in a few years, the whole quantity of the *crocards* was deſtroyed. See POLLARDS.

CROCIAS *lapis*, in natural hiſtory, a name given by ſome of the old authors to a ſpecies of agate, of a yellow colour, but deeper than the cerachates, or wax-coloured agate, and approaching to what is called a ſaffron colour.

CROCINUM, a name given by the antient phyſicians to a ſort of oil of ſaffron, which is thus deſcribed by Dioſcorides.

Eight drams of ſaffron are to be put into three pints of inſpiſſated oil, and they are to be ſtirred together ſeveral times in a day, for five days together; then the oil is to be ſeparated from the ſaffron, and a like quantity is to be added to the ſame ſaffron, and ſtirred about at times, for three days; then this oil is to be cleanſed off, and to it is to be added fifty ounces of powdered myrrh. Theſe having been well ſtirred together, are then to be ſet by for uſe.

Some uſed an oil, impregnated with aromatics, in the compoſition of the *crocinum*, but that was uſually eſteemed beſt, which ſmelt the moſt ſtrongly of ſaffron, or elſe of myrrh.

The *crocinum* was eſteemed heating and narcotic; whence it was frequently preſcribed by way of embrocation, or elſe held to the noſe in frenſies. It was alſo eſteemed uſeful as a ſuppurative, and to cleanſe old ulcers: it was much eſteemed alſo in hardneſſes, obſtructions, and other diſorders of the uterus, being uſed with wax, marrow, and double the quantity of oil; for a glaucoma, it was alſo uſed with ſucceſs, when mixt with water, and the eyes anointed frequently with it. *Dioſcor.* l. 1. c. 64.

CROCODES, in medicine, the name of a ſort of *troches*, mentioned by Paulus Ægineta, of which ſaffron was one of the principal ingredients.

CROCODILE, *(Cycl.)* *Crocodilus*, a very large and terrible animal; its head is broad; its noſe like that of a hog; the opening of its mouth monſtrouſly large, reaching even to the ears, and the upper jaw moving in the opening it, which gives it a very terrible aſpect. The teeth are large, white, and very numerous, and ſet by one another, like the teeth of a comb; the legs ſtand ſideways; and the feet are armed with extremely ſharp claws. The length of the tail is equal to that of the whole body; the ſkin of the belly is ſoft and eaſily wounded, but that of the reſt of the body ſo hard as to be impenetrable to ſpears or darts, and is covered with ſtrong prickly ſcales. The colour is in ſome a duſky rediſh yellow, but in moſt a diſagreeable brown, with a mixture of grey; and even thoſe which, when alive, had much yellowneſs, always acquire this duſky colour in drying.

It is a very ſlow and unweildy animal, turning ſideways with difficulty; it has an agreeable ſmell, but is a very terrible creature, tearing to pieces, and devouring every living thing that is ſo unhappy to come in its way.

Its eggs are about the ſize of a gooſe egg, and its lays ſixty of theſe for one brood, burying them in the ſands, and leaving them for the ſun to hatch them. The *crocodile* is found in the great rivers of the Nile, the Niger, and the Ganges, and in ſome other places. *Ray*'s Syn. Quad. p. 261. *Worm.* Muſ p. 815.

Foſſile CROCODILE. One of the greateſt curioſities in the foſſile world, which the late ages have produced, is the ſkeleton of a large *crocodile*, almoſt entire, found at a great depth under ground, bedded in ſtone. This was in the poſſeſſion of Linkius, who wrote many pieces in natural hiſtory, and particularly an accurate deſcription of this curious foſſile. It was found in the ſide of a large mountain, in the midland part of Germany, and in a ſtratum of a black foſſile ſtone, ſomewhat like our common ſlate, but of a coarſer texture, the ſame with that in which the foſſile fiſh of many parts of the world are found. This ſkeleton had the back and ribs very plain, and was of a much deeper black than the reſt of the ſtone, as is alſo the caſe in the foſſile fiſhes, which are preſerved in this manner. The part of the ſtone where the head lay was not found, this being broken off juſt at the ſhoulders, but that irregularly, ſo that, in one place, a part of the back of the head was viſible in its natural form. The two ſhoulder bones were very fair, and three of the feet were well preſerved; the legs were of their natural ſhape, and ſize, and the feet preſerved, even to the extremities of the five toes of each.

CROCODILION, in botany, a name given by ſome authors to the plant commonly called the *echinopus*, or *globe-thiſtle*. See ECHINOPUS.

CROCOTTA, in natural hiſtory, a name given by the antients to a very fierce and terrible animal, produced by copulation between the large hyæna and the lioneſs See LEOCROCOTTA.

CROCUS, *ſaffron*. In the Linnæan ſyſtem of botany, this makes a diſtinct genus of plants, the characters of which are, that the flower cup is compoſed of two ſpathæ, or films, placed one near the other. The flower is divided into ſix parts, which are all equal in ſize, of a longiſh, oval figure, and ſtand erect. The ſtamina are three pointed filaments, ſhorter than the flower; the antheræ are of the ſhape of an arrow head; the piſtillum has a roundiſh germen, a thread-like ſtyle of the length of the ſtamina, and the ſtigmata are three in number, convoluted, and notched at the edges; the fruit is a roundiſh capſule, compoſed of three lobes, and containing three cells, and three valves. The ſeeds are numerous and round. *Linnæi* Gen. Plant. p. 10.

The characters of the *crocus*, according to Mr. Tournefort are theſe: the flower is of the liliaceous kind, being compoſed of one leaf, tubular below, and growing much larger, and being divided into ſix ſegments toward the end. The flower ſtands on a pedicle, and from its center there ariſes an oblong piſtil, which terminates in three creſted capillaments. The cup finally becomes an oblong, trigonal ſeed veſſel, which is divided into three cells, and contains a number of roundiſh ſeeds. To this it may be added, that the root is tuberoſe, and double. The ſmaller root, which is enveloped in the ſame membrane with the larger, which is fleſhy and fibrated, is always placed upon it.

The ſpecies of *crocus* enumerated by Mr. Tournefort, are theſe: 1. The common, cultivated *ſaffron*. 2. The ſweet-ſcented *crocus*, which produces in autumn, leaves without flowers. 3. The Alpine, autumnal *crocus*. 4. The blue, many-flowered, autumnal *crocus*. 5. The narrow-leaved, autumnal, mountain *crocus*, with ſilvery, white flowers. 6. The autumnal mountain *crocus*, with a large violet-coloured flower. 7. The ſmaller-flowered, autumnal *crocus*. 8. The narrow-leaved *crocus*, which never produces flowers. 9. The narrow-leaved, Italian *crocus*, with large flowers, and a roſtrated root, called *ſiſyrinchium*. 10. The narrow-leaved, Italian *crocus*, with ſmall flowers, called the ſmall-flowered *ſiſyrinchium*. 11. The broad-leaved, Italian *ſiſyrinchium*. 12. The wild, late-flowering, Conſtantinople *crocus*, with white flowers, with a faint caſt of blueiſh. 13.

The

The broad-leaved, ſpring *crocus*, with variegated, purple flowers. 14. The broad-leaved, ſpring *crocus*, with very large, plain, purple flowers. 15. The broad-leaved, ſpring *crocus*, with white, variegated flowers. 16. The violet-coloured, ſpring *crocus*, with broad leaves, with a white line in the middle, and yellow edges. 17. The broad-leaved, ſpring *crocus*, with flowers ſtreaked with red on the inſide, and with white on the out. 18. The ſpring *crocus*, with three ſegments of the flower of a bright red, and the reſt variegated. 19. The ſpring, changeable-flowered *crocus*. 20. The broad-leaved, ſpring *crocus*, with blueiſh, purple flowers. 21. The white-flowered, ſpring *crocus*, with a blueiſh purple baſe. 22. The broad-leaved, ſpring *crocus*, with flowers purple at the top, and yellow at the baſe. 23. The broad-leaved, ſpring *crocus*, with variegated blue flowers. 24. The broad-leaved, ſpring *crocus*, with pale blue flowers, ſtreaked with violet-coloured lines. 25. The double, ſpring *crocus*. 26. The broad-leaved, ſpring *crocus*, with violet purple flowers, ſtreaked with white. 27. The many-flowered, broad-leaved, ſpring *crocus*, with white flowers, variegated with blueiſh purple lines. 28. The leſſer, white, ſpring *crocus*. 29. The leſſer, purple, ſpring *crocus*. 30. The broad-leaved, whitiſh, or greyiſh-flowered *crocus*. 31. The broad-leaved, ſpring *crocus*, with a large, deep, yellow flower. 32. The broad leaved, ſpring *crocus*, with a ſmaller, pale, yellow flower. 33. The broad leaved, ſpring *crocus*, with a yellow flower, and a green bottom. 34. The broad-leaved, ſpring *crocus*, with a yellow flower, with a purple edge. 35. The broad leaved, ſpring *crocus*, with a gold yellow flower. 36. The broad-leaved ſpring *crocus*, with a pale, whitiſh, yellow flower. 37. The broad-leaved, yellowiſh, ſpring *crocus*, with a variegated flower. 38. The broad-leaved, yellow, ſpring *crocus*, with a more variegated flower. 39. The broad-leaved, ſpring *crocus*, with variegated double flowers. 40. The narrow-leaved, ſpring *crocus*, with a large, blue flower. 41. The narrow-leaved, ſpring *crocus*, with a very large, white flower. 42. The narrow-leaved, ſpring *crocus*, with double bulbs. 43. The narrow-leaved, ſpring *crocus*, with ſmall blue flowers. 44. The purple flowered, ruſh-leaved, ſpring *crocus*. 45. The ſpring *crocus*, with capillaceous leaves. 46. The narrow-leaved, ſpring *crocus*, with variegated flowers. *Tourn.* Inſt. p. 350 — 352.

The variety of the ſeveral ſpecies of *crocus* produced in the gardens of the curious, by raiſing them from well choſen ſeeds, is almoſt incredible. For the manner of raiſing them, ſee the article XIPHIUM.

They are all very hardy, and will increaſe exceedingly by the roots, if ſuffered to remain ſome years in the ground. They will grow in all ſoils and ſituations, and are great ornaments to a garden, as they flower when ſcarce any thing elſe is up. The fibres of theſe roots periſh when their leaves do, and they may, therefore, like all other roots of that kind, be taken up as ſoon as the leaves appear dead, and laid by, in a dry place till September, at which time they muſt be planted again for the ſpring flowering. They ſhould be planted in holes made with a debble, about two inches deep, and at two inches diſtance from one another; the earth being raked over them, they ſhould remain covered about an inch deep with it. If the weather is mild, they will, in January, appear above ground, and in February they will be in full flower. The leaves are ſo ſhort when the flower appears, that it ſeems produced on a naked ſtalk, but as that decays they grow to a conſiderable length; theſe look but unſightly after the flower is gone, but they ſhould not be cut, for that greatly weakens the root for the next ſeaſon's flowering.

CROCUS, in chemiſtry. The preparations of metals which are generally known by this name, as the *crocus martis*, and the like, ſeem to have obtained it from their ſaffron-like colour. They are the calxes of metals, conſiſting of their fixed parts ſeparated from their ſulphureous; they are made either by the means of fire, or by the action of ſalts of various kinds; and are either naturally in a powder, or very eaſily reducible into one.

The general ſubjects of this ſort of proceſs are gold, ſilver, iron, and antimony, and there are many ways of making the proceſſes. The virtues aſcribed to the gold and ſilver *crocus's* ſeem, in a great meaſure, imaginary: that of antimony are far from being the beſt ſort of preparations of that metal; but thoſe of iron are, more than all others, uſeful in medicine. Hoffman, in his *Acta Laboratorii*, has many improvements on the common proceſſes for the making theſe preparations.

CROCUS *Indicus*, Indian *ſaffron*, in the materia medica, a name given by ſome authors to the *curcuma*, or *turmeric* root of the ſhops. *Pont.* p. 116.

CROCUS *antimonii*, the name given in the late London diſpenſatory, to the preparation of antimony and nitre commonly known by the name of *crocus metallorum*. It is made of equal parts of antimony and nitre, powdered fine, and thrown, at times, into a red hot crucible, and, when thoroughly melted, poured out, and ſeparated from its ſcoriæ. This looks more yellow the longer it has been melted: it is but little uſed, except among horſes; but when intended for internal uſe among men, ſhould be procured faithfully prepared in this manner; for our chemiſts generally abate of the nitre to ſave charges, and render the medicine of a very different effect. *Pemberton's* Lond. Diſp. p. 230.

Waſhed *crocus* of antimony is made by boiling the *crocus* of antimony, reduced to a very fine powder, in water, ſtill changing the water, till it comes off inſipid. Of this is made the *vinum antimoniale*, called alſo *vinum emeticum*, and *vinum benedictum*. See VINUM *emeticum*, *Cycl.*

CROCUS *martis*, a chemical preparation, uſed alſo by the glaſs-makers, to give a red colour to glaſs. The glaſs-makers prepare this themſelves, and have four ways of doing it. The firſt is this: take filings of iron, mix them with three parts of powdered brimſtone, and keep them in a melting pot, in a furnace, to calcine, and burn off the ſulphur; let them ſtand four hours in this ſtate, then take them out, and, when cold, powder and ſift them, and put the powder into a crucible, which lute over, and ſet it in the leer of the furnace for fifteen days, or more, it will then be of a rediſh purple, and muſt be kept for uſe. *Neri's* Art of Glaſs, p. 31.

The ſecond way of making this, is by ſprinkling filings of iron with ſtrong vinegar, and ſetting them in the ſun to dry; when dry, powder and ſift them, and wet them again with vinegar, and, when dry, powder them again. Repeat this eight times, and then powder the whole, and ſift it fine for uſe.

The third way is to uſe aqua fortis, inſtead of vinegar, in the ſame manner.

The fourth way, which is the beſt of all, is this: diſſolve filings of iron in aqua regia, and let the ſolution ſtand three days in a veſſel cloſe-ſtopped, ſhaking it about at times; then evaporate the liquor gently, and there will remain a moſt valuable *crocus martis*. Id. ibid.

CROCUS *martis aperiens* is preſcribed in caſes of obſtructions, the doſe being from ten to thirty grains.

CROCUS *martis aſtringens* is preſcribed in hæmorrhages, dyſenteries, and diarrhœas, the doſe being the ſame as in the former. The beſt way is to give it in a bolus, or pills, becauſe in liquids it ſinks to the bottom too ſuddenly to be taken without waſte. See CROCUS, *Cycl.*

CRONICAL, in aſtronomy. See ACRONYCAL, *Cycl.*

CRONIUS, Κρονιών, in chronology, the antient name of the Athenian month, *hecatombæon*, which was the firſt of their year, and anſwered to the latter part of our June, and beginning of July. See HECATOMBÆON and MONTH.

CROOKEDNESS. See DISTORTION.

CROOTES, a ſubſtance found about the ore in the lead mines, at Mendip, being a mealy, white, ſoft ſtone, matted with ore.

CROPS *of corn*. The great buſineſs of the farmer is to produce the largeſt *crops* he can, and, at the ſame time, to injure his land the leaſt. The common way of ſowing exhauſts the whole land, without giving half the nouriſhment that it might give to the corn. Inſtead of the ſcattering way of ſowing corn by the hand, if it be let in with the drill, in ſingle, double, treble, or quadruple rows, and an interval of five feet of naked ground be left between theſe ſeries of rows, the uſe of horſe-hoeing in theſe intervals will be found to give all that the farmer requires: the *crop* will be larger, though ſo great a quantity of ground is left vacant, than if all were ſown over, as the plants will ſtand vaſtly thicker in the rows, and will have twenty or thirty ſtalks a-piece; and the more the ſucceſſive *crops* are planted, and the oftener the ground is hoed in this manner, the better will the plants be maintained, and every *crop* will be larger and larger from the ſame ground, without dunging, or without changing the ſort of plant, as is uſually neceſſary in other caſes. See HUSBANDRY, and INTERVAL.

This is very evident in ſeveral parts of the ſame field, where this ſort of huſbandry has been entered upon at different times, and ſome have a firſt *crop*, others a ſecond, and others a third, all growing up at the ſame time, the older worked land always invariably ſhewing the beſt *crop*. Dunging and fallowing are both neceſſary to recover land to its virtue, in the common way, after a few *crops*. Theſe are both of them expences to the farmer; but the horſe-hoeing, when the corn is ſown in rows, anſwers all the intent of them, and is much leſs expenſive. It has, in ſhort, every year, the good effect of a ſummer fallow, though it every year produces a good *crop*, and no time, or uſe of it, is loſt to the farmer. *Tull's* Horſe-hoeing Huſbandry.

CROPPER, or *Dutch* CROPPER, the name of a particular ſpecies of pidgeon, called the *columba gutturoſa Bataviæ*, by Moore. It is naturally thick, and has its name from its large crop, or bag of wind, which it carries under its beak, and can, at pleaſure, either raiſe, or depreſs. Theſe are thick-bodied, and ſhort; their legs are alſo thick and ſhort, and are feathered down to the feet; the crop is large, and hangs low; the feathers on the thighs hang looſe; and their legs ſtand wide; they are gravel-eyed, and are generally very bad feeders.

There are of theſe pidgeons of all colours, and thoſe who are careful of them, generally take them away from their proper parent, while young, and breed them under the females of other ſpecies. *Moore's* Columbarium, p. 32.

CROSS *(Cycl.)*— Crosses, in mining, are two nicks cut on the ſuperficies of the earth, thus +, which the miners make when they take the ground, to dig for ore. This *croſs* gives the miners three days liberty to make, and ſet on ſtones. As many of theſe *croſſes* as the miner makes, ſo many mears of ground he may have in the vein, if he ſet on ſtones within three days after the making his *croſs*, or *croſſes*. But if he make but one *croſs*, and a ſtander-by makes the ſecond, and a ſtranger makes the third, every one is ſerved with the next mear, according as they have firſt or laſt, ſooner or later, made their *croſs*, or *croſſes*, upon the ground. *Houghton*'s compl. Miner, in the Explan. of the Terms.

Cross, in coins, a name given to the face, or right ſide, the other being called the pile, or reverſe. It has been a common error that the reverſe was meant by the *croſs*, becauſe at this time with us marked with figures diſpoſed in that form; but the ſtamping the head of the prince in theſe kingdoms, on the right ſide of the coin, was preceded by a general cuſtom of ſtriking on that part the figure of a *croſs*, while the other, called the pile, contained the arms, or ſome other device. *Simons*, Hiſt. Coins.

Crosses were uſually in former times erected on the tops of houſes, by which tenants pretended to claim the privileges of the templars hoſpitallers, to defend themſelves againſt their rightful lords. This was condemned by the ſtatute W. 2. c. 37. It was uſual alſo, in thoſe days, to ſet up *croſſes* in places where the corps of any of the nobility reſted, as it was carried to be buried, that *a tranſeuntibus pro ejus animo deprecetur*. *Walſingham*, anno 1291.

Cross-*bar ſhot*, a round ſhot, or great bullet, with a bar of iron put through it, coming out at both ends 6 or 8 inches. It is of good uſe in fight, for cutting and ſpoiling ropes, ſails, &c. *Manwayring*.

Cross-*bill*, in zoology, the Engliſh name of the *loxia*, a ſmall bird remarkable for its beak, which is hooked both ways, and has the points croſſing one another. It feeds on the kernels of fruits, and is very deſtructive in orchards. *Ray*'s Ornithol. p. 184. See Loxia.

Cross-*jack*, in a ſhip, is a yard at the upper end of the mizen maſt, under the top, where it is ſlung; it hath no halliards, nor ties, belonging to it. Its uſe is to ſpread, and hale on the mizen-top-ſail ſheets. *Manwayring*.

Cross-*piece*, in ſhip-building, a great piece of timber going a-croſs the bit-pipes, and to which the cable is belayed. *Manwayring*.

Cross-*trees*, in a ſhip, *croſs* pieces of timber ſet on the head of the maſt, and bolted, and let into one another very ſtrongly. They are four in number, and are generally called *croſs-trees*, but, ſtrictly ſpeaking, only thoſe which go thwart ſhips, are called *croſs-trees*; the other, in the largeſt ſhips, are called treiſſel-trees. Their uſe is to keep and bear the top maſts up; for the foot of the top-maſt is always faſtened into them, ſo that they bear all the ſtreſs. They alſo bear the tops, and are neceſſary to all maſts which carry any other top, or flag-ſtaff, at the head. *Manwayring*.

Cross-*tree yard* is a yard ſtanding ſquare, juſt under the mizen top, and to it the mizen top is faſtened below. See Cross-*jack*.

CROSSE, a name given by the people of Guinea, and ſome other parts of Africa, to a kind of fruit very common among them. It very much reſembles our common hazel-nut, but that the ſhell is not ſo hard. Phil. Tranſ. N° 108.

CROTALARIA, in botany, the name of a genus of plants, the characters of which are theſe: the flowers are the ſame with thoſe of the broom, but the pods are very different, as they are tumid and ſwollen in the manner of thoſe of the anonis, not flatted, as in the broom; but the leaves ſtand ſingle, as in the broom, not trifoliately, as in the anonis.

The ſpecies of *crotalaria* enumerated by Mr. Tournefort, are theſe: 1. The Aſiatic *crotalaria*, with ſingle-hearted leaves, and blue flowers. 2. The Aſiatic *crotalaria*, with ſingle, heart-faſhioned leaves, and yellow flowers. 3. The ſmall, hairy, American *crotalaria*, with arrow-headed leaves. 4. The ſtorax-leaved, African *crotalaria*, with blue flowers. 5. The purple-flowered, American *crotalaria*, with arrow-headed, arum-like leaves. 6. The moneywort-leaved, Eaſt-Indian *crotalaria*, with very ſmall flowers, and pods. And, 7. The aſarum-leaved, American *crotalaria*. *Tourn.* Inſt. p. 644.

CROTALOPHORUS *anguis*, in zoology, the name uſed by the generality of authors for the *rattle-ſnake*. See the article Rattle-*ſnake*.

Crotalophorus *anguis*, in zoology, is alſo the name of a very remarkable ſpecies of ſerpent, more uſually known by the name of *cobra de capello*. See the article Cobra *de capello*.

CROTALYSTRIÆ, in antiquity, a kind of morrice-dancers admitted to entertainments, in order to divert the company with their dancing, and playing on an inſtrument called *crotalum*, whence they had their name. See Crotalum, *Cycl.*

CROTAPHIC *artery* is uſed, by ſome medical writers, to denote the tendon of the muſcle called *crotaphites*, or *temporalis*. See Crotaphites, *Cycl.*

CROTAPHIUM, in medical writers, is uſed for a pain in the head. *Blancard*. See Head-*ach*.

CROTON, in botany, the name given by Linnæus to a genus of plants including the *ricinoides* of Tournefort, and the *bernhardiæ* of Houſton. The characters are theſe: it produces both male and female flowers ſeparate, but on the ſame plant. The male flowers are ſmaller than the female. In theſe the perianthium is five-leaved, the leaves being of a long, acute, oval figure, and erect. The flower conſiſts of five oblong, and obtuſe petals, ſcarce longer than the leaves of the cup; the nectaria are five ſmall glands affixed to the cup; the ſtamina are ten or fifteen filaments, of the length of the flower; the antheræ are roundiſh and double. In the female plants the cup and flower are the ſame as in the males; the piſtil has a roundiſh germen, and three ſtyles of the length of the flower, and bifid at the ends. The ſtigmata are reflex and bifid. The fruit is a roundiſh capſule, ſeeming divided into three lobes, and really containing three cells. Each of theſe is bivalve, and of the bigneſs of the leaves of the cup; the ſeeds are of a roundiſh figure, and are placed one in each cell. The *bernhardia*, in ſome ſpecies, produces male and female flowers on ſeparate plants, which is not the caſe in the other plants of this genus. *Linnæi* Gen. Pl. 457. *Tourn.* 423. *Houſt.*

CROW, in zoology. See Corvus.

Crow-*net*. See the article Net.

Crow-*ſtaves*, in huſbandry, a name given to a part of a plough, ſignifying two upright pieces ſtanding perpendicularly, inſerted into the box of the plough, near the wheels, and each pierced with two rows of holes; by means of which they ſupport a tranſverſe piece, called the pillow of the plough, running a-croſs them, and ſerving to raiſe or ſink the beam, by being pinned higher or lower, according as the ground is to be ploughed deeper or ſhallower. *Tull*'s Huſbandry. See Plough.

Crow's-*foot*, in botany. See Ranunculus.

CROWN, *(Cycl.)* in antiquity. See Corona.

Crown, among jewellers, the upper work of the roſe diamond, which all centers in the point at the top, and is bounded by the horizontal ribs. *Jeffries* on Diamonds.

Crown *imperial*, in botany. See Corona *imperialis*.

There are ſeveral diſtinct ſpecies of this plant preſerved in the gardens of the curious, all which make a very elegant appearance; there are alſo a great number of varieties which are propagated from the ſeeds of one or other of the ſpecies, in the ſame manner with thoſe of the tulip. See Tulip.

When they are thus raiſed, the beſt time for tranſplanting their roots is in July or Auguſt, before they puſh forth new fibres; or they may be taken up out of the ground in June, after their green leaves are decayed, and kept till Auguſt, and then planted out into beds of rich earth, with ſome rotten dung buried deep in them. The moſt pleaſing method of planting them is at eight or ten feet diſtance, in the middle of long flower beds: a hole of ſix inches deep ſhould be opened with a ſpade, and the root put into it, and the earth put in with the hand upon it, and all the ſtones picked out, and the lumps broke. They now require no farther care, but in February will ſhoot up, and grow ſo quick, if the weather be mild, as to flower in March. As this is uſually a windy ſeaſon, it is proper to plant ſtakes in the earth, to tye theſe plants to, to prevent their being blown down; and it is a good caution never to gather the flowers, which much weakens the roots; they ſhould, therefore, always be ſuffered to die upon the ſtalks. The roots ſhould be removed once in three years, and their off-ſets ſeparated, and planted in beds. *Miller*'s Gardener's Dict.

CRUCIANELLA, a name by which Linnæus has called the plant uſually known by that of *rubeola*. This, according to the ſyſtem of that author, makes alſo a diſtinct genus of plants; the characters of which are, that the calyx is a three leaved perianthium, with narrow, rigid, compreſſed, and hollowed, pointed leaves; the flower conſiſts of a ſingle petal, which forms a tube very ſlender, of a cylindric form, and longer rhan the cup, with a narrow rim, divided into four ſegments. The ſtamina are four filaments, placed in the orifice of the tube; the antheræ are ſimple; the germen of the piſtillum is compreſſed, and placed between the cup and the flower; the ſtyle is ſlender, and of the length of the tube; the ſtigmata are two in number, and are obtuſe; the one of theſe terminates the ſtyle, and the other is applied cloſe to it, below its apex: the fruit is compoſed of two capſules growing together; the ſeeds are ſingle and oblong. *Linnæi* Syſtem. Natur. p. 26.

CRUCIATA, *croſs-wort*, in botany, the name of a genus of plants, the characters of which are theſe: that the flowers and fruit wholly agree with thoſe of the aparine, but the leaves grow in form of ſtars round the ſtalks, and only four at a joint. See Aparine.

The ſpecies of *croſſwort* enumerated by Mr. Tournefort, are theſe: 1. The common, hairy *croſſwort*. 2. The ſmooth *croſſwort*. 3. The broad-leaved, ſmooth, mountain *croſſwort*. 4. The cluſter flowered *croſſwort*. 5. The ſmooth, ſlender-leaved, mountain *croſſwort*. 6. The roundiſh-leaved, hairy, Pyrenean *croſſwort*. 7. The ſmooth, broad-leaved, white-flowered Portugal *croſſwort*. 8. The white, marſh *croſſwort*. 9. The leaſt *croſſwort*. *Tourn.* Inſt. p. 115.

A decoction of this plant in wine has been recommended as a very excellent vulnerary and detergent. Camerarius tells us, that it is of great efficacy in attenuating and expectorating tough humors.

CRUCIBLE (*Cycl.*)—Theſe veſſels, ſo much uſed by aſſayers, &c. are beſt made of a pure and well-waſhed clay, with an admixture of the pureſt ſand, powder of flint, or the powder of other broken *crucibles*, which have already ſuſtained a great fire, and are very clear. They are formed in wooden, or braſs moulds, divided longitudinally into two parts, and to be disjoined or put together again at pleaſure: for this purpoſe alſo a broad iron ring is adapted to the outſide of the mould, in ſuch manner, that the two ſides are kept firmly together while this ring is on, and fall aſunder as ſoon as it is taken off. This mould, however, gives only the outer ſhape of the *crucible*, its cavity muſt be made by a peſtle, or other ſuch inſtrument.

When theſe veſſels are to be made, the ring is put upon the mould, and the whole ſet upon a ſtrong ſupport: then the cavity of the mould is to be filled with the matter very ſtiff; this is to be preſſed down firſt with the fingers, or with a ſtick, making a hollow in the middle, and leaving the edges of the matter above the ſides of the mould; then apply to this hollow the peſtle, rubbed over with the fat of bacon, and drive it in with ſeveral ſtrong ſtrokes of a mallet: then take away the peſtle, and, taking the ring off from the mould, the *crucible* is taken out perfect, and finiſhed, and is to be dried, and baked in a potter's kiln. See Tab. of Chemiſtry, N° 25.

If, from the too great moiſture of the matter, when put into the mould, or from any inequalities or roughneſſes in the mould, the *crucible* will not readily ſeparate from it ſides, as ſoon as made, place the mould in a dry, warm place, for a few minutes, and the veſſel will, after that, come out eaſily.

In the making theſe veſſels, a ſufficient quantity of the matter muſt always be put at once into the mould; for if you add to the matter once compreſſed, a new lump of the ſame, it will not cohere with the firſt. If the matter be put into the mould in ſmall maſſes, not moulded thoroughly together firſt by handling, theſe never cohere neither; but the veſſel, when finiſhed, will be full of chinks, and pores, which, though not to be diſcovered either by the eye, or by the ſound of the veſſel when ſtruck, yet let the ſalts in fuſion paſs through them.

If theſe veſſels are not made with a large bottom, the concave mould muſt not be greaſed; for if it be, the veſſel comes out of it with the peſtle, and ſticks ſo firmly to it, as not to be got off without breaking. *Cramer*, Art of Aſſ. p. 66.

CRUCIFIX (*Cycl.*) — Superſtitious people will not be without *crucifixes*, or ſomething which they ſuppoſe to reſemble them, even in the mineral kingdom. The *lapis crucis*, or *croſs-ſtone*, is well known, but this has only a repreſentation of two lines croſſing one another; yet this thePortugueſe ſailors carry to ſea with them, and fixing them up againſt a maſt, or board, pray to them in time of danger: but much more regular *crucifixes* than theſe are found in the collections of the curious, in minerals. In the muſæum of the king of Denmark, at Copenhagen, there is preſerved a piece of marble which has an elegant figure of a *crucifix* delineated on its outſide, by the natural veins of the marble. Dr. Hartman, who wrote a book of amber, has alſo given an account of a whitiſh piece of amber, in which was a figure of a woman holding a child in her arms. This he would have to be the virgin Mary, with our Saviour. Dr. Oliver obſerves, in the philoſophical tranſactions, that he ſaw the thing itſelf; he ſays he ſuſpected it to be artificial, but that Hartman was firmly perſuaded that it was natural, and kept it very ſacredly.

Scheuchzer alſo, in his *Herbarium diluvianum*, among the variety of odd repreſentations of things which he has there got together, figures a piece of cryſtal, in which, I ſuppoſe, with the help of a little fancy, himſelf and the engraver, had made out the figure of a man on a croſs. The weak minds of ſome have led them to ſuppoſe that theſe were miraculous delineations; but reaſon ſpeaks the contrary, and we ſee, every day, figures, at leaſt as exact as theſe, wildly delineated in various foſſils, by the mere natural flaws, or other accidents of them.

CRUCIFORM *flowers*, in botany, a term for ſuch flowers as are compoſed of four leaves, diſpoſed in form of a *croſs*. Some of theſe flowers have a cup, others have not: thoſe which have cups, uſually have them compoſed of four leaves, and placed in the ſame order and direction with thoſe of the flower. Of this claſs of plants are the cabbage, rocket, wall-flower, &c. *Tourn.* Inſt. p. 210. See Tab. 1. of Botany, Claſs 1.

CRUCICOLÆ, a deſignation given to the primitive chriſtians, by the heathens. *Hofm.* Lex. in voc.

CRUISERS, in the navy, are ſmall men of war, made uſe of to and fro in the channel, and elſewhere, to ſecure our merchant-ſhips, and veſſels, from the enemy's ſmall frigats, and privateers They are generally ſuch as ſail well, and are commonly well manned: and, indeed, the ſafety of the trade in the channel, and up and down the ſoundings, and other places, abſolutely requires the conſtant keeping out of ſuch ſhips at ſea.

CRUMENA, in zoology, the name given by Cardan, and ſome others, to the purſe, or pouch, which the opoſſum has under its belly, and into which it receives the young in time of danger. See OPOSSUM.

Scaliger ſuppoſing there might be other animals, as well as the opoſſum, to which nature might have given this ſort of pouch, has erected a generical diſtinction, under the name of *animalia crumentata*; but the opoſſum is the only ſpecies yet known to belong to this genus. The only inſtance that naturaliſts ſeem to afford us of a like proviſion of nature for the care of the young, is what is related of ſome of the fiſh kind. Oppian, in his *Halieutics*, mentions this property of receiving the young into the body, in time of danger, to be in the dog-fiſh, and in the ſquatina, and ſome others; and Tyſon obſerves, that, in the anatomy of a female dog-fiſh, he ſaw two ſlits under the belly, cloſed up in their natural ſtate, but eaſily diſtenſible, ſo as to be capable of receiving the young fiſh; and that theſe went not into the womb, nor any other peculiar part, but only into the cavity of the abdomen.

The account given by Oppian is, that, in time of danger from a ſtorm, or from any fiſh of prey purſuing the young fry, they go into their parent's belly. If therefore, after this account of Tyſon's, any young fiſh ſhould ever be found looſe, in the cavity of the mother's belly, it will prove the truth of this paſſage in Oppian, which has been ſo much diſputed. Phil. Tranſ. N° 239. p. 120.

CRUMENTATA, a term uſed by JuliusScaliger to expreſs ſuch animals as have a pouch, or bag, under their belly, into which young ones may be received in time of danger. This author ſeems to ſuppoſe that there may be ſeveral animals for whoſe preſervation nature has made this proviſion; but as we yet know of only one, which is the opoſſum of America, Tyſon has judged it proper to call that by a name expreſſive of this ſurpriſing character, *marſupiale*. This, while we know of no other creature of the quadruped kind that has ſuch a purſe, is a ſufficiently diſtinctive name, and if it ſhould happen that hereafter more ſuch ſhould be diſcovered, it may ſtill be reſerved as the generical name.

CRUPEZIA, Κρυπεζια, in antiquity, wooden ſhoes, or clogs, worn by the *meſochori*. See MESOCHORI.

CRUPINA, in botany, a name by which ſome authors call the *carduus ſtellatus*, or ſtar-thiſtle. *Dill.* Nov. Gen. p. 140.

CRUSTA (*Cycl.*) — CRUSTA *lactea*, in ſurgery, ſignifies a cruſt of ſcabby ulcers, apt to affect the faces of children. The cure of it depends principally on regulating the diet of the nurſe, and giving her gentle purges, and ſweetening powders; the infant ought alſo to take at times a few gentle doſes of phyſic, and, in the intervals, between the purges, to take powders of crude, or diaphoretic antimony, with flower of brimſtone, and crab's claws, and other of the teſtaceous powders. When this method has been purſued for ſome time, the parts may be anointed with cream, with a ſmall quantity of chalk, or ceruſe, mixed in it, or with a mixture of oil of eggs, with a ſmall quantity of oil of bricks. Ointments of mercury, or ſulphur, are very dangerous in the beginning of this diſorder, or to weakly infants; and when ſuch have been uſed by ignorant perſons, the beſt method to be taken is the endeavouring to throw out the humor again by ſudorifics. *Heiſter's* Surgery, p. 269.

CRUSTACEOUS *animals*. See MALACOSTRACA.

CRUSTULA, in medical writers, the ſame as *ecchymoma*, in the eye being a deſcent of the blood from the arteries into the *tunica conjunctiva*, occaſioned by a wound, ſtroke &c. *Blancard.*

CRUYSHAGE, in zoology, the name of a fiſh of the ſhark kind, ſomewhat approaching to that ſtrange fiſh the zygæna, but much leſs monſtrous, its head being only triangular, or ſomething like the figure of an heart, whence Willughby has named it, *zygænæ affinis capite triangulo*. The eyes are very ſmall, and are placed, as in the zygæna, at the ſides of the head: the mouth is ſmall and triangular, and placed a vaſt way below the end of the noſe, and is furniſhed with three rows of very ſmall teeth. *Marggrave*, p. 132.

CRYMODES, in medical writers, a cold, ſhivering fever, but often accompanied with an inflammation of the inner parts. *Blancard.*

CRYPTOGAMIA, in botany, a claſs of plants whoſe flowers are either wholly inviſible, or ſcarce diſcernable by the eye.

The word is formed of the Greek κρυπτω, hidden, and γαμος, marriage. Theſe are a claſs of plants whoſe fructification is concealed, and under it are comprehended thoſe plants which either flower, as is generally ſuppoſed, within the fruit, or have the organs of their fructification ſo minute, as to eſcape our obſervation. Of this claſs are the ferns, moſſes, liver-worts, muſhrooms, &c. See Tab. 1. of Botany, Claſs 1.,

CRYSTALS, (*Cycl.*) in natural hiſtory, are defined to be hard, pellucid, and naturally colourleſs bodies, of regularly angular figures, compoſed of ſimple not filamentous plates, not flexile nor elaſtic, giving fire with ſteel, not fermenting in acid menſtrua, and calcining in a ſtrong fire.

This claſs of bodies is arrang'd into three diſtinct orders, and under thoſe is divided into nine genera.

Of *the firſt order*, are the perfect columnar *cryſtals*, with double pyramids, compoſed of eighteen planes, in an hexangular column, terminated by an hexangular pyramid at each end. See Tab. of Foſſils, Claſs 3.

Of *the ſecond order*, are the perfect *cryſtals*, with double pyramids, and without a column. Theſe are compoſed either of twelve or of ſixteen planes, in two hexangular pyramids, joined cloſely baſe to baſe, without the intervention of any column.

Of *the third order*, are the imperfect *cryſtals*, with ſingle pyramids. Theſe are the *cryſtals* of the common kind, and are compoſed either of twelve or of ten planes, in an hexangular or pentangular column, affixed irregularly at one end

to ſome ſolid body, and terminated at the other, by an hexangular or pentangular pyramid.

The genera of the firſt order are two: 1. The *macroteloſtyla*, or perfect *cryſtals*, with a longer intermediate column. 2. The *brachyteloſtyla*, or thoſe with a ſhorter intermediate column.

Thoſe of the ſecond order are alſo two: 1. The *pauraëdryſtyla*, which are dodecahedral *cryſtalls*, compoſed of two hexangular pyramids, joined baſe to baſe, without any intermediate column. 2. The *polyedraſtyla*; theſe are hexadecahedral *cryſtals*, compoſed of two octangular pyramids, join'd baſe to baſe, without any intermediate column.

Thoſe of the third order are five. 1. The *ellipomacroſtyla*. Theſe are dodecahedral *cryſtals*, with thin hexangular columns, terminated by hexangular pyramids. 2. The *ellipopachyſtyla*. Theſe are dodecahedral *cryſtals*, with thick hexangular columns, terminated by hexangular pyramids. 3. The *oligedra*. Theſe are decahedral *cryſtals*, with thick pentangular columns, terminated by pentangular pyramids. 4. The *pangonia*. Theſe are tetraicoſihedral *cryſtals*, compoſed of dodecangular columns, terminated by dodecangular pyramids. 5. The *arthrodia*. Theſe are dodecahedral *cryſtals*, with very ſhort and ſlender columns, and moderately long pyramids, generally found cluſtered together on the ſurface of cryſtalline or ſtrong roundiſh nodules, or incruſting cavities within ſuch. Theſe are called by ſome echinated and concave *cryſtalline* balls. *Hill*'s Hiſt. of Foſſ. p. 153, ſeq.

Adding to theſe regular genera, the accidental varieties of *cryſtals*, owing to the admixture of metalline particles, influencing their ſhape as well as colour; the three principal of which are thoſe impregnated with lead, iron, and tin; the firſt cubic, the ſecond rhomboidal, and the laſt quadrilateral pyramids, without columns; we have the whole ſeries of the figured *cryſtals*: the firſt of theſe are called *molybdia*, the ſecond *ſideria*, and the third *caſſiteria*. Beſide all theſe, *cryſtal* is alſo ſometimes found in a pebble-like form, which is an accidental variety, like thoſe in the chryſtallizations of ſalts, where many concretions entirely want their naturally angular form.

The origin and formation of *cryſtals*, as to the time and manner of them, deſerve a very nice enquiry, ſince many of the more compound foſſile bodies are principally compoſed of either *chryſtal* or ſpar, a body in many things reſembling it; and the aſcertaining the great queſtion, whether it was all form'd at one time, and that long ſince, or does continue to be formed at this day, will ſo far alſo aſcertain the time of the coaleſcence of thoſe other bodies, of which it is the baſis.

The original coaleſcence and formation of thoſe bodies of which ſpar is the baſis, we well know may have been but of yeſterday, ſince we have evident proofs, that ſpar is concreting to this day, and that ſparry bodies are forming every moment. This is evident, from the ſparry ſtalactitæ in the arches of modern buildings, particularly in one ſo lately built as the new bridge at Weſtminſter, the roofs of the arches of which were filled with theſe ſpars within a year after the arches were built; and there are evident proofs, that ſpars are not made of matter edued from the ſtone, ſince brick arches equally abound with them; and the brick vault which ſupports part of the grand terrace at Windſor, has been of late found ſo full of them, that there was not room to walk for them. See the article STALACTITES, *Cycl.*

From theſe obſervations, as alſo thoſe of the ſparry incruſtations round vegetable, and other bodies in ſprings, and at the bottoms of our tea-kettles being all incruſted with it; we have evident proof, that ſparry bodies are form'd to this day, but we have no ſuch clear evidence of the preſent growth of *cryſtal*. Whether or not it is ſo, however, we may be led by a few propoſitions to prove, by the only ſure teſt, experiment.

1. If *cryſtal* and ſpar can be at this day diſſolved in water, or ſuſpended in it, in their minima or ultimate particles, and again ſeparated from it, then ſtony or other foſſils compoſed of *cryſtal* and ſpar, may be form'd at this day: if theſe bodies are not thus diſſolved, they cannot.

2. If *cryſtal* and ſpar can be raiſed in vapour, or ſuſpended in effluvia, then cryſtalline and ſparry concretions may at this day be formed in places where water cannot be ſuppoſed to have come; if they cannot be thus ſuſpended, then the *cryſtals* and ſpars found in ſuch places cannot have been form'd at this day, but muſt have been there from ſome diſtant time.

The ſubject of enquiry is by theſe propoſitions reduced to a narrow compaſs; and all that experiments have to determine is: 1. Whether *chryſtal* or ſpar are at this time found ſuſpended in water, in imperceptible particles, or whether they are not; and 2. If they are thus ſuſpended, whether they are or are not capable of being raiſed in vapours.

Theſe things Dr. *Hill* has been at the pains to determine, by a great number of experiments.

The bottom of every tea-kettle, as has been before obſerv'd, informs us, that ſome ſolid foſſile body is ſuſpended in imperceptible particles in all, even the cleareſt water, and is eaſily ſeparated from it by no other agent than heat; as heat therefore is found capable of ſeparating this ſubſtance, and no other agent that we know of is ſo, that is, the natural means to be uſed in the inveſtigation of the ſubject.

The ſubſtance encruſting tea-kettles, &c. is found to be a genuine ſpar, with a greater or leſſer admixture of earth, and is wholly the ſame with the encruſtations on vegetables in ſprings, &c. Here therefore, is a proof of ſpar and earth being ſuſpended in common water, but none of *cryſtal*. This was alone to be determined by repeated and cautious diſtillations. In diſtilling the water of the ſame ſpring, with different degrees of fire, a different quantity of matter was found left at the bottom of the veſſel. It appeared hence, that in a greater degree of heat, a great part of the matter had been raiſed in vapour, and the remainder on tryal, always proved to be only ſpar and earth. Here were therefore, both the queſtions anſwered in the affirmative, in regard to ſpar, viz. that it is continually ſuſpended in water, and may be raiſed in vapour. The water of theſe diſtillations being returned into the cucurbit, and rediſtilled, leaves a ſecond ſediment in ſmall quantity, and of a whiter colour. This being examined according to the known laws of foſſils, proves to be part ſpar, and part *cryſtal*, an undiſſolv'd powder remaining from it, after pouring on aqua fortis to take up the ſpar; and this in all teſts appearing to be true and perfectly pure *cryſtal*. A third diſtillation of the ſame water, produced not the leaſt reſiduum. Hence therefore, it is evident, that *cryſtal* as well as ſpar is continually ſuſpended in water, and may be raiſed in vapour, and ſeparated by no other agent than heat. And hence the concluſion is plain, that *cryſtalline* as well as ſparry bodies may be, and doubtleſs are, continually form'd in the earth to this day, and need not be ſuppoſed all of as old a date as the creation or deluge. *Hill*'s Hiſt. of Foſſ p 157.

Having thus from experiments gone thro' the hiſtory of what may be the origin of many of the *cryſtalline* bodies we daily meet with, it remains to ſay ſomething of their form.

The perfect regularity of the figures of *cryſtals*, cannot but be the effect of ſome fixed, permanent and invariable cauſe; theſe being ever, unleſs altered by accidents, which rarely happens, the very ſame in the ſame genus. The antients eſteemed *cryſtal* a congelation of water, and thought it only ice harder than ordinary. Signior Lana, who had an opportunity in the Val-ſabbia, of ſeeing many of the perfect double pointed kinds, imagined, that they owed their origin to dews congealed by nitrous exhalations. Rohault imagines the figure of common *cryſtal* the effect of ſix drops of water thrown together.

Others are for its being formed of radiations; others, from all its parts being like the whole; and others from the mutual tendency of the parts of it toward the ſame center. But all theſe the laws of action in matter, and the ſtructure of *cryſtal* in the ſeveral ſpecies, eaſily ſhew to be erroneous.

Many think they have ſolved all difficulties, when they ſay, that *cryſtals* are ſalts; but we know no more of the true cauſe of the figure of ſalts, than we do of thoſe of *cryſtals*. And it is to be added, that if *cryſtals* are ſalts, then ſalts are ſomething elſe from what we have been taught to think they are, *cryſtals* by no means anſwering to the definitions given us of them by authors. As we yet know ſo little of the cauſes of the regular cryſtalizations of ſalts, why are we to ſuppoſe no other bodies but ſalts capable of ſuch cryſtalizations; and why may not the ſame almighty agent, who has implanted in the minima of ſaline bodies, a tendency to theſe their ſeveral appropriated forms, have allotted the ſame tendency to other bodies?

How is it, that *cryſtal*, in its ſmalleſt concretions, obtains its determinate figure, according to the genus it is of, is aſſuredly yet to us unknown; but how it is enlarged afterwards, yet ſtill kept in its ſame form, ſeems not to be ſo difficult to be accounted for, and may indeed be traced from obſervations of the ſeveral bodies in their preſent ſtate.

We are not to doubt, but that the ſmalleſt concretions are regularly formed in all *cryſtals*, according to their kinds, and we ſee the ſmalleſt that even the microſcope can diſcover to us, regularly are ſo. Theſe are formed among water or vapour, ſolid with the ſame particles, and only wanting a ſlow evaporation to part them from the water or vapour.

Theſe particles, though when collected in a body, they be of more than twice the ſpecific gravity of water, yet while ſuſpended in a vaſt proportion of water, attract the particles of the water more ſtrongly than they do one another, and hence give way to that repulſive power ſo well known in nature, which is properly the effect of another attraction, by which all things are made to aſcend in water, which are leſs than water attracted by the gravitating power of the earth: the particles of *cryſtal* therefore attracting the particles of water more ſtrongly than one another, recede from one another as far as the quantity of water they are ſuſpended in will permit. When this quantity of water is ſo far evaporated, that the particles of *cryſtal* are nearer to one another, and brought within the verge of one another's attraction, they become more attracted by one another than by the particles of water and thence form concretions. This they uſually do in many parts of the ſame fluid at once; and hence it is, that we uſually find many ſhoots in the ſame place. The whole cryſtalline matter might now be expected to form itſelf into theſe ſmall concretions: but there is now a new law or power eſtabliſhed in the evaporating fluid; for theſe ſmall aggregates

gregates of bodies now formed in ſeparate concretions, attract the particles yet ſuſpended in the fluid, more than they do one another: hence they naturally become applied to theſe, and being every way equally extended over them by the ambient fluid, they no way alter their firſt figure, while they ever ſo much increaſe their bulk. And it is evident, from examining the columns of *cryſtals*, which are ridged and ſtriated acroſs, while their pyramids are all ſmooth, that this new matter has ever been added to the pyramidal planes, and thence extended down the ſides of the columns. *Hill*'s Hiſt. of Foſſ. p. 159.

Henkel, a very accurate chemiſt, gives us a remarkable account of the formation of *cryſtal* out of human urine, which ſeems ſo ſtrange, that it would have been deſpiſed had it come from an author of leſs credit; and as it is, will require repeated experiments to convince the world there was no error in the caſe. He tells us, that he once filled a large round glaſs veſſel half way up, with the recent urine of a young lad, and tying a bladder over the mouth of the veſſel, he ſet it in a ſtove for four years together, never ſtirring it during that whole time. At the end of this time he found a number of ſmall white ſtones, growing to the inſide of the glaſs; they were of the ſize of an oat ſeed, of a priſmatic figure, and tolerably pellucid; they ſtuck ſo faſt to the ſides of the glaſs, as not to be waſhed of by the ſhaking about of the urine, and when taken out, had no ſalt taſte, and were not ſoluble even in hot water. Act. Erudit. anno 1720, p. 272.

The largeſt and fineſt *cryſtals* we have any account of, were found in the mountains of Grimſule, between immenſe ſtrata of ſtone; they were all, as pure and limpid as the cleareſt water, and the largeſt of them meaſured near three foot in length, and little leſs in circumference; its weight was two hundred and fifty pounds; others of a hundred and thirty, a hundred, and ſo on, down to thoſe of ten pound weight, were found in the ſame place: but theſe laſt were the ſmalleſt there. They were all exactly of the ſame figure, being hexangular columns, terminated at one end by an hexangular pyramid, and at the other end fixed to the rock. They were in general perfectly clear throughout; but in ſome the baſe was foul, and in others, the point, which is leſs common in *cryſtal*; but the middle column in them all was pure and fine. It is uſual with the largeſt *cryſtals* of the German mountains, to have flaws and blemiſhes; and they are commonly ſo irregularly conſtructed within, that they give all the priſm colours in reflection; but theſe wholly wanted that quality, and were like ſo many columns of the pureſt glaſs, only much clearer than any glaſs can be made. Phil. Tranſ. N° 398.

When any piece of workmanſhip in *cryſtal* is become foul and dark, the method of recovering its luſtre without hurting its poliſh, is this: mix together ſix parts common water, and one part brandy, boil theſe over a briſk fire, and let the *cryſtal* be kept in it, in a boiling ſtate, a quarter of an hour; then take it out, and rub it carefully over, with a bruſh dipped in the ſame liquor; after this, it is not to be left to dry of itſelf, but to be wiped with a clean napkin, and its ſurface will by this means be perfectly cleaned, and rendered as bright as at firſt, without that injury to the points of the cutting, or to the ſurfaces of the planes or facets, which would naturally have been the conſequence of doing it by mere rubbing or wiping.

Natural *cryſtal* may be reduced by calcination, into the ſtate of the bodies proper for making glaſs with alkaline ſalts, and makes a moſt fine and valuable fritt. The method of doing it is this: calcine natural *cryſtal* in a crucible; when it is red hot, throw it into cold water to quench it; repeat this eight times, covering the crucible, that no duſt or aſhes may get in and mix with the *cryſtal*; dry this calcined maſs, and reduce it to an impalpable powder; mix this powder with the pure ſalts of polverine, and with theſe make fritt, in the uſual proportions, and with the common quantity of manganeſe; waſh this often in cold water, and after a proper time, work it; it will yield a moſt beautiful glaſs. *Neri*'s Art of Glaſs, p. 102. See FRITT.

Natural *cryſtal* may be coloured of ſeveral colours, without melting or running it into glaſs, in the following manner: Take a number of pieces of fine, clear and pure *cryſtal*, of various ſizes, of crude antimony and yellow orpiment in powder, of each two ounces; ſal armoniac one ounce; powder this alſo, and mix them well together; put this powder into a ſtrong crucible, and lay upon it the pieces of *cryſtal* in their natural ſtate, then cover this crucible with another, mouth to mouth; lute them well, and when the lute is dry, ſet them in coals, which kindle by little and little; and when they begin to fire, let them kindle of themſelves, and they will then ſmoak very much. Let this be done in a large chimney, taking care to avoid the fumes. When it fumes no more, let the fire go out of itſelf, and let all ſtand till cool; then unlute the crucibles, and take out the *cryſtals*; thoſe at top will be coloured to a fine yellow, with a deep and pale red, the colours of the common fine and balaſs ruby, with beautiful ſpots; and thoſe which be at the bottom upon the powder, will be of a watery colour, motled like that of the viper. This *cryſtal* comes out ſo fair from this proceſs, that it may be cut as a gem, and though many are ſpoiled, yet in making a large quantity, there are always ſome fair and perfect. *Neri*'s Art of Glaſs, p. 117. See the article OPAL.

Improper CRYSTALS, a term introduced into the world by Dr. Coppeler, in his *prodromus chryſtallographiæ*, to diſtinguiſh bodies which have the figure of *cryſtals*, but are not ſuch from the proper or true genuine *cryſtals*

Improper *cryſtals* are, according to this author, ſuch bodies, either ſtones, metals, or ſalts, as have any reſemblance with true *cryſtal*, either as to their multangular, regular, or irregular figure; or as to their pellucidity, or any other of their eſſential properties. As the number of theſe bodies is very extenſive, it was a work of great accuracy to arrange them into any ſort of order; but this is one of the principal attempts of the author. Among the firſt claſs of improper *cryſtals*, that is ſuch as are ſtones, come all thoſe gems which have any determinate figure, as the diamond, emerald, amethyſt, and the like. To the ſecond belong all ſorts of regularly figured, metalline bodies, ſuch as pyritæ and macraſites, as alſo thoſe ores of ſilver, where the native metal has aſſumed ſome regular form; as when this or any other metal ſhoots in its natural bed, into the form of a tree or the like.

Under the third claſs of improper *cryſtals*, including the ſalts, come in all the chemical preparations of ſalts and ſaline bodies. The figure in this claſs is more determinate and accurate than in either of the former claſſes of bodies. See Tab. of Microſcopical Objects, Claſs 3.

We are happy enough to have at preſent, much better arrangements of foſſils than this. *Coppeler*'s Prodrom. Cryſtall. See FOSSILS.

Prepared CRYSTAL, a term among the makers of counterfeit gems, for a powder of natural *cryſtal*, made for their purpoſe. The manner of preparing it is as follows: Take the pureſt and cleareſt natural *cryſtal*, put it into a crucible covered at the top, ſet it among burning coals; let the *cryſtal* be made red hot, then plunge it into a large veſſel of cold water. When the *cryſtal* is cold, put it into the fire again, heat it red hot, and quench it again; and repeat this operation twelve times, carefully keeping aſhes or any other foulneſs out of the crucible. When the calcination is finiſhed, the *cryſtal* will be brittle and crumbly, powder it, and levigate it on a porphyry to an impalpable powder. This powder muſt be made perfectly fine, otherwiſe the gems made with it will be all foul and coarſe, and no braſs or copper veſſels muſt be uſed about the operation. If the *cryſtal* ſhould be powdered in a braſs or bell-metal mortar, there could be no gem but an emerald ever be made of it, from the quantity of copper it would take up in the powdering. When carefully prepared, it receives all the colours of the gems, by proper additions, and affords a maſs ſofter indeed, but not leſs bright and pellucid, or not leſs beautifully tinged than the fineſt of the oriental gems. *Neri*'s Art of Glaſs, p. 125.

CRYSTAL, in medicine, has many virtues attributed to it, being eſteemed an aſtringent and lithontriptic; hence it has been given in diarrhœas, the fluor albus, and in caſes of gravel in the kidneys. Its doſe is a ſcruple, or half a dram, being firſt reduced to a fine powder, by repeated calcinations and extinctions in cold water.

Many are afraid of the uſe of theſe ſtony medicines, in nephritic caſes. The objection againſt ſpar will hold good againſt *cryſtal*; but there wants ſufficient proofs to determine this point. In general, however, ſpar is an alkali, which *cryſtal* is not. See SPAR.

Cryſtal has been recommended by ſome, as a dentifrice, and there is no doubt of its cleaning the teeth; but, like other hard bodies, it is apt to wear away their enamel, and thereby ſubject them to decay.

Iſland CRYSTAL. See ISLAND *Cryſtal*.

CRYSTAL *dews*. See the article DEWS.

Formation of CRYSTALS. See FORMATION.

Diſdiaclaſtic CRYSTAL. See DISDICLASTIC *cryſtal*.

Rock CRYSTAL. See ROCK *cryſtal*.

CRYSTALLINE (*Cycl.*) — Mr. Petit, the phyſician, has many minute obſervations and experiments on the colour, conſiſtence, meaſure, weight, &c. of the *cryſtalline* humor of the eye, and its capſula in different animals: but his obſervations are ſo numerous that we can only take notice of ſome of them. He ſhews the *cryſtalline* to conſiſt of concentrical laminæ: he always found the capſula tranſparent, and denies any connection between this membrane and the *cryſtalline*, or that there are any veſſels going from the one to the other; but affirms that the *cryſtalline* is nouriſhed by abſorbing the lymph lodged between it, and its capſula.

When the *cryſtalline*, or vitreous humors are fallen out of the eye, it is eaſy to conceive, that not only the ſight, but the figure of the eye, muſt be entirely deſtroyed; therefore, an accident of this kind muſt at firſt be dreſſed with compreſſes dipped in warm wine, or ſpirit of wine, and afterwards with ſome vulnerary balſam. But it ſometimes happens, when only the tunica albuginea, and ſclerotica, are ſlightly wounded, the cornea and uvea remaining unhurt, that the eye recovers itſelf: and though both the vitreous and *cryſtalline* humors fall out by the wound, yet they are renewed again by the benefit of nature, and the office of ſight performed as well as before the injury happened. *Heiſter*, Surg. p. 80.

CRSYTALLIZATION (*Cycl.*) — A great number of pigments

or colours are obtainable by *cryſtallization* from metalline bodies, but theſe are ſubject to corrode and eat the canvas, &c. and are not capable of waſhing, by which ſome naturally corroſive colours are rendered mild and harmleſs. The blue and green vitriols, or *cryſtals* of copper, cannot be deprived of their aqueous, or ſaline parts, by a dry air, or by waſhing, without ſuffering extreme alterations, or being left in the form of a dry groſs, terreſtrial matter, differently coloured from what they were before: and thus the fine green *cryſtals* of iron being expoſed to the air, become white; and when well waſhed in water, looſe their greenneſs, and turn to a reddiſh, or yellow, ochreous earth; and if deprived of their ſaline and aqueous parts, by a ſtrong diſtillation, they leave behind a brown, or red caput mortuum, which being waſhed in water, affords not a green, but a brown-coloured pigment; and as this holds proportionably of other colours obtained by *cryſtallization*, there are little hopes of procuring durable pigments by this operation, which ſhall be of the ſame colour with themſelves, tho' after waſhing, ſome other colours may be thus procured. *Shaw*'s Lectures, p. 187. See FORMATION *of cryſtals*.

CHRYSTALLOMANTIA, Κρυσταλλομαντεια, an antient kind of divination, performed by poliſhed cryſtals, in which future events were ſuppoſed to be ſignified by certain marks and figures. Vid. *Pott.* Archæol Græc. l. 2. c. 18.

CRYSTALLUS *lapis*, a word uſed by ſome of the old authors, not in the expreſs ſenſe in which we now make it ſignify *rock cryſtal*, but as a general term for all pellucid ſtones. Some extend it even to the factitious, as well as the natural gems.

CUANDA in zoology. See the article PORCUPINE.

CUBBRIDGE-*heads*, in ſhip-building, is ſometimes uſed for the bulk-heads of the fore-caſtle, and the half-deck: the firſt being called the *cubbridge-head before*; the other the *cubbridge-head abaft*. *Manwayring*.

CUBEBS (*Cycl.*) — It is a general opinion that the carpeſia of the antient Greeks was the *cubebs*; and, on the ſtrength of this opinion, the word *cumamus*, *cumachus*, and the like, which are the old Greek names of *cubebs*, are ſaid to be ſynonyms with carpeſia, which is only looked upon as an antiquated ſynonym of that fruit. It is indeed certain, that the Greeks did ſometimes call the *cubebs* carpeſia; but this is only to be found among the later writers of that nation. The older Greeks meant quite another drug by carpeſia; and Galen has deſcribed it as being the odoriferous twigs of a tree growing on the mountains of Pamphylia, and uſed as a ſuccedaneum for cinnamon. See CARPESIA.

CUBIC (*Cycl.*)— CUBIC *Hyperbola*, in conics, one expreſſed by the equation $x y^2 = a$, having two aſymptotes, and conſiſting of two hyperbolas, lying in the adjoining angles of the aſymptotes, and not in the oppoſite angles, like the *Apollonian hyperbola*. It is alſo called an *hyperboliſmus* of a parabola.

CUBIDIA, in natural hiſtory, the name of a genus of ſpars. The word is derived from the Greek κυβος, a die, and is given them from their being of the ſhape of a common die, or of a cubic figure. Theſe bodies owe this ſhape to an admixture of particles of lead, and there are only two known ſpecies of the genus. 1. A colourleſs cryſtalline one, with thin flakes, found in the lead mines of Yorkſhire, and ſome other parts of the kingdom. And, 2. A milky white one, with thicker cruſts. This is found in the lead mines of Derbyſhire and Yorkſhire, but is uſually ſmall, and is not found plentifully. *Hill*'s Hiſt. of Foſſ. p. 376.

CUBITUS (*Cycl.*) — *Fractured* CUBITUS. The lower part of the arm, which is called the *cubitus*, contains two bones, the radius and ulna: fractures of this part, therefore, ſometimes happen only to one, ſometimes to both theſe bones, and that ſometimes near their extremities, but oftener toward their middle: but, when they are both broke together, the bones are not only very eaſily diſtorted from each other, but they are not to be replaced without very great difficulty alſo: if one only ſhould, on the contrary, be broken while the other remains whole, the fractured parts do not much recede out of their places, nor are they very difficult to reduce and retain; for the bone remaining ſound, is found, in this caſe, to be a better direction and ſupport than either ſplints, or bandages. When the fracture happens toward the lower head, near the pronator quadratus muſcle, the fractured part is ſtrongly drawn by that muſcle, and the intervening ligament that is extended between the radius and ulna, toward the ſound bone; and this makes it more difficult to replace. If the radius is to be replaced, whoſe fragment is contracted towards the ulna, an aſſiſtant muſt hold the arm, while the ſurgeon inclines the patient's hand towards the ulna, to draw back the contracted part of the radius. When this is done he muſt carefully reduce them by compreſſion on both ſides with his hands, ſo as to reſtore the compreſſed muſcle between the radius and ulna, and the fragments of the radius, to their proper places. The arm is then to be bound up with the proper bandage, and the limb muſt afterwards be placed in a ſort of caſe made of paſteboard, or light wood, to be ſuſpended in a ſling put about the neck.

In ſetting a fracture of the ulna, the whole method muſt be the ſame with this of the radius, except that in the extenſion, the hand muſt be bent toward the thumb, and radius, before the diſtorted part of the ulna can be compreſſed into its proper place. When both bones of the *cubitus* are broken, the method of cure is much the ſame with that uſed to each of them, when broken ſingly: but there is required more ſtrength and circumſpection, both in the replacing them, and a great deal of caution in applying the bandage to retain them. Care muſt alſo be taken, that while the arm continues in this caſe a great while, without motion, the mucilage of the joint does not harden, or the ligament become ſtiff, and the arm, or *cubitus*, be thereby rendered immoveable. To guard againſt this, it will be proper to unbind the arm once in two or three days, and to move it a little carefully and gently, backwards and forwards; and ſometimes to foment it with warm water or oil; by which means its motion will be preſerved. *Heiſter*, 172.

Luxated CUBITUS. The *cubitus* conſiſting of two bones, the ulna and radius, is articulated by a gynglymus; and the connection of theſe bones is ſuch, that the ulna, or *cubitus*, as being the largeſt bone, and ſeated in the lower part of the arm, does of itſelf perform the whole flexion, and extenſion of the arm, yet it cannot perform thoſe motions without carrying the radius along with it; but, on the other hand, the radius may be turned along with the hand both inward and outward, without at all moving or bending the ulna, as when the pronation and ſupination of the hand are made thereby. Both theſe bones of the *cubitus* are ſo articulated with the lower head of the os humeri, that large protuberances are received into deep cavities, or grooves, and the whole inveſted and faſtened with exceeding ſtrong ligaments; ſo that, notwithſtanding the *cubitus* may be luxated in all four directions, outward or inward, backward or forward, yet it is but ſeldom that it ſuffers a perfect or entire diſlocation, unleſs the upper part of the ulna be broken, or the ligaments of the *cubitus* much weakened by ſome great external violence. The ſlighter, and more recent luxations of this kind are, the more eaſy is the reduction of them. Be the caſe better or worſe, however, the patient muſt be placed in a chair, and both parts of the limb, the humerus and the *cubitus*, muſt be extended in oppoſite or contrary directions, by two ſtrong aſſiſtants, till the muſcles are found pretty tight, with a free ſpace between the bones: then the luxated bone muſt be replaced, either with the ſurgeon's hands alone, or with the aſſiſtance of bandages, that the proceſſes may fall into their ſinuſes; and when that is done, the *cubitus* muſt be ſuddenly bent. But if the tendons and ligaments are ſo violently ſtrained that they can ſcarce perform their office, it will be proper to anoint them with emollient oils, ointments, and the fat of animals; or to apply emollient cataplaſms and fomentations. As ſoon as the reduction has been effected, the articulation muſt be bound up with a proper bandage, and the arm afterwards ſuſpended in a ſling hung about the neck. But care muſt be taken that the bandage is not kept on too long, nor the arm kept entirely without motion all the time, leſt the mucilage of the joint ſhould become inſpiſſated, and the articulation rendered, by that means, ſtiff, or the motion of the part be entirely loſt. To prevent this, it will be proper to undo the bandage every other day, and gently to bend, and extend the limb: afterwards compreſſes dipt in warm wine may be applied, and held on with the bandage. *Heiſter*, Surg. p. 164.

CUBOIDES (*Cycl.*)— CUBOIDES *tarſi*. This bone is ſituated before the os calcis, on the ſide of the os ſcaphoides: it is a maſs with ſix ſides, all very unequal, and very irregular. The upper ſide is flat and rough, for the inſertion of the ligaments which connect it with the neighbouring bones: the lower ſide has an oblique eminence, and, immediately below that, a canal, or groove, which is alſo oblique: the eminence divides this ſide into two, and is a little cartilaginous on that ſide next the groove; the groove appears to be cartilaginous from a ligament which lines it, and both that, and the edge of the eminence, ſerve for the inſertion of an annular ligament, and for the paſſage of the tendon of the peronæus longus. The poſterior ſide is cartilaginous, broad, oblique, partly convex, and partly concave, anſwering to the anterior ſide of the os calcis. The anterior ſide is pretty broad, and is divided into two portions by a narrow prominent line, by which portions this bone is articulated with the third and fourth bones of the metatarſus. The inner ſide is the longeſt of all: it has a ſmall cartilaginous ſurface, by which it is articulated with one of the two oſſa cuneiformia: the reſt is rough, with ſeveral depreſſions in which veſſels and glands are lodged. Behind the cartilaginous portion there is, in ſome ſubjects, another narrow ſurface, which is articulated with the neighbouring portion of the circumference of the os ſcaphoides. This articulation, when wanting, is ſupplied by ligaments. The outſide is the leaſt of all; it is irregular, ſhort, and narrow, and it has a notch which communicates with the groove, on the lower ſide. *Winſlow*'s Anatomy, p. 99.

CUBROS *gezira*. See GEZIRA *cubros*.

CUCKOW, *cuculus*, in ornithology. See CUCULUS.

CUCKOW-*ſpit*, a frothy ſubſtance found on ſeveral plants. See FROTH-*ſpit*.

CUCUBALUS, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the caryophylleous kind, being compoſed of ſeveral petals, which grow out of

of a membranaceous cup; the piſtil ariſes alſo from the cup, and finally becomes a ſoft fruit, or berry, of an oval ſhape, containing a number of kidney-ſhaped ſeeds.

There is only one known ſpecies of *cucubalus*, which is the plant called by many the *berry-bearing chickweed*. *Tourn.* Inſt. p. 389. See Tab. 1. of Botany, Claſs 8.

CUCULLARIS, in anatomy, a name given by Spigelius, Cowper, and Albinus, to a muſcle called by Winſlow and others, *trapeſius*; and deſcribed by Veſalius under the name of the *ſecundus ſcapulam moventium*.

CUCULLUS, in conchyliology, the name of a genus of ſhells called by other authors, *cornet*-ſhells, and *volutæ*. See the article VOLUTA.

CUCULUS, the *cuckow*. In the Linnæan ſyſtem of zoology this makes a diſtinct genus of birds of the order of the *picæ*: the characters of this genus are, that the feet have two toes before, and two behind; the bill is ſmooth; the tail whole, and compoſed but of a few feathers; the tongue membranaceous, and terminated by hairs, and the noſtrils prominent. The *cuckow*, and the jynx, or wry-neck, are the only known birds of this genus. *Linnæi* Syſtem. Natur. p. 45.

The *cuckow* is a bird well known in England by the ſingularity of its note; it beak is long, and ſtrait, only it is a little hooked at the end, of a blackiſh brown above, and of a yellowiſh white below; its mouth is yellow within, and the iris of its eyes of a hazel colour; its noſtrils round, open, and ſtanding out beyond the ſurface of the bill, by which mark alone it is to be diſtinguiſhed from all other birds; its throat, breaſt, and belly, are white, variegated with tranſverſe ſtreaks of brown; the feathers of its head are brown, with white edges, and its rump is grey; its back, neck, and wings are of a browniſh hue; its long wing-feathers have white tips, and are variegated with black, brown, and white; and the tail feathers are beautifully variegated with white. Its feet and legs are yellow. Its food is caterpillars, and other inſects. *Ray*'s Ornithol. p. 63.

It never builds itſelf a neſt, but ſeizes upon that of any other ſmall bird, and deſtroying its eggs, leaves its own in their place.

Whether it hides in hollow trees, &c. during the winter, with us, or whether it leaves us for a warmer climate, is not certainly known. It is pretended that many have been found in hollow trees, but the truth of it has never been well atteſted.

CUCULUS *piſcis*, in zoology, the name of a large genus of fiſhes, the characters of which are, that they have two or three filaments running from the under part of their gills, which are commonly called fingers; that they can make a ſort of noiſe; hence the Latins called them *cuculi*, from their imitating, in ſome ſort, the voice of the *cuckow*. See Tab. of Birds, N° 46.

The Engliſh *gurnard*, which is their common name, ſeems alſo taken from their grunting; and one ſpecies of them is called the *piper*, or the *muſician*, from its reſembling with its voice a ſmall pipe. See GURNARD.

They have all large, broad, and thin gill fins, ſome of which ſerve the ſpecies which have them, for flying; and all of them have large bony heads, of a ſomewhat ſquare figure, and are tapering in ſhape from the head to the tail. The *corax*, *hirundo*, *milvus*, and *lyra* of authors, are all of this genus. *Ray*'s Ichthyogr. p. 278. See the article CORAX, &c.

CUCUMIS, the *cucumer*, or *cucumber*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, faſhioned like a bell, very wide and open at the mouth, and divided into ſeveral ſegments. Some of the flowers of this genus of plants are male, or ſteril, having no embryo of fruit; others are female, or fruitful; theſe have an embryo which ripens into a large fleſhy fruit, uſually of a cylindric figure, and divided either into three or four cells, and full of oblong ſeeds.

The ſpecies of *cucumber* enumerated by Mr. Tournefort are theſe: 1. The common garden *cucumber*, the fruit of which is yellow when fully ripe. 2. The garden *cucumber*, the fruit of which is white, when ripe. 3. The long, crooked *cucumber*. 4. The wild *cucumber*, or ſquirt, called by authors, *cucumis aſininus*, or the aſs *cucumber*, of the juice of which the elaterium of the ſhops is made. 5. The wild *cucumber*, with ſinuated and jagged leaves. 6. The round-leaved, Egyptian *cucumber*, called by ſome authors *chate*. *Tourn.* Inſt. p. 104.

The *cucumber* is one of the four great coolers of the ſhops. It is almoſt an univerſal ingredient in emulſions, and is found of ſervice in fevers, and nephritic complaints.

There are three ſpecies of this plant cultivated in gardens, the common kind, the white one, and the long green one. The firſt is what we bring to market in England; the ſecond is the common Dutch kind, and is greatly preferable to ours, as being much firmer, and having fewer ſeeds; and the third is better even than that, but it is raiſed with difficulty.

The common one, which is what our gardeners almoſt ſolely cultivate, is raiſed at three different ſeaſons of the year; the firſt is on hot beds, under garden frames, for early fruit; the ſecond is under bell, or hand-glaſſes, which is for the middle crop; and the third is on the common ground, which is for a late crop, or to pickle. The *cucumbers* which are ripe before April are unwholeſome, being raiſed wholly by the ferment of dung, not by the ſun's heat. Thoſe ripe in April are good fruit, and are raiſed in the following manner: toward the latter end of January, a quantity of freſh horſe dung muſt be procured, with the litter among it, and a ſmall proportion of ſea coal aſhes ſhould be added to it. In four or five days the dung will begin to heat, at which time a little of it may be drawn flat on the out ſide, and covered with two inches thickneſs of good earth: this muſt be covered with a bell glaſs, and after two days, when the earth is warm, the ſeeds muſt be ſown on it, covered with a quarter of an inch of freſh earth, and the glaſs then ſet on again. The glaſs muſt be covered with a mat at nights, and, in four days, the young plants will appear; when theſe are ſeen, the reſt of the dung muſt be made up into a bed for one or more lights. This muſt be three feet thick, and beat cloſe together, and covered three inches deep with fine freſh earth; the frame muſt then be put on, and covered at night, or in bad weather with mats.

When the earth is hot enough, the plants from under the bell muſt be tranſplanted into it, and ſet at two inches diſtance. The glaſſes muſt be now and then a little raiſed to give air to the plants, and turned often, to prevent the wet from the ſteam of the dung from dropping down upon them. The plants muſt be watered at times with water, ſet on dung till as warm as the air in the frame: and as the young plants grow up, the ſtalks of them ſhould be earthed up, which will give them great additional ſtrength. If the bed is not hot enough, ſome freſh litter ſhould be laid round its ſides; and if too hot, ſome holes ſhould be bored into ſeveral parts of it with a ſtake, which will let out the heat, and when the bed is thus brought to a proper coolneſs, the holes are to be ſtopped up again with freſh dung. When theſe plants begin to ſhoot their third, or rough leaf, another bed muſt be prepared for them like the firſt, and when it is properly warm through the earth, the plants of the other bed muſt be taken up, and planted in this, in which there muſt be a hole in the middle of each light, of about a foot deep, and nine inches over, filled with light and fine freſh earth, laid hollow, in form of a baſon: in each of theſe holes there muſt be ſet four plants; theſe muſt be, for two or three days, ſhaded from the ſun, that they may take firm root, after which they muſt have all the ſun they can, and now and then, a little freſh air, as the weather will permit. When the plants are four or five inches high, their ſtalks ſhould be gently pegged down toward the earth, in as different directions as may be from one another, and the branches afterwards produced, ſhould be treated in the ſame manner. In a month after this, the flowers will appear, and, ſoon after, the rudiments of the fruit. The glaſſes muſt now be carefully covered at nights, and, in the day time, they ſhould have gentle waterings, ſprinkling over the whole plants. Theſe will produce fruit till about midſummer, at which time thoſe of the ſecond crop will come in to ſupply their place: theſe are to be raiſed in the ſame manner as the early crop, only they don't require quite ſo much care and trouble. This ſecond crop ſhould be ſowed in the end of March, or beginning of April. *Miller*'s Gardener's Dict.

The ſeaſon for ſowing the *cucumbers* for the laſt crop, and for pickling, is toward the latter end of May, when the weather is ſettled: theſe are ſown in holes dug to a little depth, and filled up with fine earth, in form of a baſon, eight or nine ſeeds in each hole. Theſe will come up in five or ſix days, and till they are about a week old, are in great danger from the ſparrows; after this they require only watering now and then, and keeping clear from weeds. There ſhould be only five plants left at firſt in each hole, and when they are grown a little farther up, the worſt of theſe is to be pulled up, that there may finally remain only four. The plants of this crop will begin to produce fruit in July.

CUCUMIS *capparis*, in the botanical writings of the Arabians, a name given by Aviſenna, and others, to the plant which produced the fruit called *bel*. This fruit was like the capers in ſhape, and had a hard ſhell over its kernel, like that of a hazel nut. Such is the deſcription they give of it, and of the *fel* and *ſel*, two other fruits as like it in ſhape and other reſpects, as in virtue. Some have ſuſpected all theſe to be the fruits of the turpentine trees of various ſpecies: but this cannot be, becauſe thoſe trees were common in the countries where the writers lived, and yet they had the *bel*, &c. brought from the Eaſt Indies, and expreſly mention a plant, not a tree, as producing it. See the articles BEL, FEL, and SEL.

CUCURBITA the *gourd*. See the article GOURD.

CUCURBITINI *lumbrici*, are broad worms that breed in the inteſtines, like the ſeed of a gourd. *Blancard.*

CUCURI, in zoology, the Braſilian name of a fiſh of the ſhark kind, but not miſchievous, called *caſſaon* by the Portugueſe.

It is of about two feet and a half long. The head ends in an hyperbolic figure, and the mouth is placed far below its end; it has only one row of teeth, and thoſe very ſmall; its eyes are of the ſize of a large pea; its belly is of a ſilver white, and its back and ſides aſh coloured; its tail is aſh coloured, as are alſo all its fins, except the two ſmall ones, under its belly, which are white. *Willughby*'s Hiſt. Piſc. p. 53.

CUCURUCU, in zoology, the name of a ſerpent found in America, growing to ten or twelve foot long. It is very thick alſo in proportion to its length, and is of a yellowiſh colour, ſtrongly variegated with black ſpots, which are irregularly mixed among the yellow, and often have ſpots of yellow within

within them, and are plainly black. It is a very poiſonous ſpecies, and greatly dreaded by the natives; but its fleſh is a very rich food, and greatly eſteemed among them, when properly prepared. *Ray*'s Syn. Anim. p. 327.

CUDGELLING, among the Romans. See FUSTIGATIO.

CUDWEED, in botany. See FILAGO and GNAPHALIUM.

CUGNACUARANA, in zoology, the name of an American beaſt of prey, uſually confounded with the tyger, and deſcribed by Marggrave as one of the three ſpecies of American tygers, the *jaguara*, and *jaguarete*, being the two others. Thoſe two animals are plainly rather of the leopard, or lynx, than of the tyger kind; and perhaps, this is as little of the tyger as they. It is a large and very fierce beaſt, of the ſhape of the jaguara, but of one ſimple colour, which is a very pale tawney, like the colour of ſome goats, but not ſo ſtrong. It is a little duſkier on the back than on the ſides, and there is a little white under the chin, and on the belly. Its hair is very ſhort. *Ray*'s Syn. Quad. p. 169.

CUGUACUETE, and CUGUACUAPARA, in zoology, the Braſilian names of an animal of the caprea kind, ſeeming the male and female of the ſame ſpecies, and not diſtinct animals. The former has no horns, the latter has, and is probably the male; the horns are compoſed of three branches; they ſend out one near the inſertion, and from this they run up ſingle to the extremity, where they are bifid.

We have not ſeen the animal in England, but its horns, which are very ſingular in their ſhape, are preſerved in the muſæum of the Royal Society. This is the animal which Johnſon has figured under the name of the *capreolus marinus*. Tab. 33. *Ray*'s Syn. Quad. p. 90.

CUGUPUGUACU, in zoology, a name by which many call the *meros*, a Braſilian fiſh of conſiderable ſize, and a very good taſte. *Marggrave*'s Hiſt. Braſ. See MEROS.

CUJETE, in botany, a name given by Plumier to a genus of plants which Linnæus has ſince deſcribed under the name *creſcentia*. *Plumier*, 16. See CRESCENTIA.

CUIRIRI, in zoology, the name of a Braſilian bird of the ſtarling kind, very like the common ſtarling, and no way differing from the *pitanguaguacu*, but that it has a yellow ſpot upon its head. *Marggrave*'s Hiſt. Braſil.

Probably this is the male of the ſame ſpecies.

CUITPALLI, in natural hiſtory, the American name of a very beautifully variegated ſtone, found in New Spain, and ſome other places: its name expreſſes the painted ſtone. It is a ſpecies of jaſper of a beautiful green, variegated with very beautiful lines, and clouds of black, and is in ſome parts tranſparent.

CULCASIA, a name given by ſome of the old writers to an Egyptian plant growing near the ſea ſhores. It is by many ſuppoſed to have been the *colocaſia*, but improperly. The reſemblance of the name was the only thing that gave the idea of its being this plant, but the virtues attributed to it, and the uſes it was put to in the common affairs of life, ſhew that it was the *kali*, or *cali*, the plant of whoſe aſhes they made a ſalt uſeful in many arts, and ſtill the baſis of the glaſs, and ſoap manufactures, and called by Aviſenna *uſnen*.

CULCUL, a ſort of grain brought from Egypt to Conſtantinople, where it is much eſteemed, eſpecially when freſh. Authors are not agreed what plant it is produced from. *Hofm.* Lex in voc.

CULDEES, in church hiſtory, a deſignation given to the monks, or prieſts, in Scotland, in the firſt ages of chriſtianity, whence the term paſſed into Ireland.

They were called *culdees*, quaſi *cultores dei*, from their great piety and devotion. *Hofm.* Lex. Univ. in voc.

CULEUS, the name of a meaſure of liquids, the greateſt of all the meaſures among the Romans: it contained twenty amphoræ. Pliny interprets ſeven *culei* to be an hundred and forty amphoræ, when he ſays, ſpeaking of vineyards, that one acre will often yield ſeven *culei*, that is, a hundred and forty amphoræ of wine; and other authors ſpeak of it as containing forty urns, and it is very well known that an urn is the half of an amphora. Columella reckons the *culeus* of wine at the vineyard, to be worth three hundred nummi, or ſeventy-five denarii, that is, according to Engliſh rate, a hundred and forty gallons three pints and an half, for two pounds eight ſhillings and five-pence farthing, which is about a halfpenny the pint. *Columella*, l. 3. c. 3.

The *culeus* is, by others, deſcribed to contain 160 congii, or 960 ſextarii. We read of *dolia culearia*, and *ſeſquiculearia*, the latter of which muſt have been very large, being about $3\frac{1}{7}$ hogſheads, and therefore larger than our pipes. The word *culeus* is uſed alſo by ſome Roman authors for a leather ſack.
